NOTE: When seated correctly, the halfshaft retainer circlip can be felt as it snaps into the differential side gear groove.

NOTE: After insertion, pull the halfshaft inner end to make sure the circlip is locked.

3.
Install the halfshaft until the halfshaft circlip is fully seated.

4.

Install the wheel knuckle. Refer to: Wheel Knuckle .

5.

Check and top off the rear differential fluid. Refer to: DIFFERENTIAL FLUID LEVEL CHECK .

Service Manual: BATTERY, MOUNTING AND CABLES

SPECIFICATIONS > SPECIFICATIONS

General Specifications

5.2L Ti-VCT (SVT) vehicles	
Item	Specification

Item	Specification
Voltage	12 Volts
Battery amps rating	56 amp/hr
Cold Cranking Amps (CCA) measured at -18 C (-0.4 F)	590 Cold Cranking Amps (CCA)

DESCRIPTION AND OPERATION > BATTERY AND CABLES - OVERVIEW > OVERVIEW

The battery and cable system consists of the following:

- Battery
- Battery cable, with a battery current sensor and a generator current sensor
- BJB
- Battery tray

DESCRIPTION AND OPERATION > BATTERY AND CABLES - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > BATTERY AND CABLES - SYSTEM OPERATION

AND COMPONENT DESCRIPTION > BATTERY AND CABLES

The battery is a 12V DC source connected in a negative ground system and is a voltage stabilizer for the 12V electrical system.

The battery cable has a battery current sensor and a generator current sensor attached to the cable. Refer to: Charging System - System Operation and Component Description .

NOTE: The 5.2L Ti-VCT (SVT) vehicles do not have state-of-charge battery eye.

NOTE: The primary purpose of the battery eye is to be a quick indicator of the battery's state-of-charge for the dealership pre-delivery process.

The battery eye indicates the battery state-of-charge by responding to the specific gravity of a single battery cell electrolyte. The battery eye has a viewing plate, 2 colored balls of different specific gravity and a small passage. As the battery's state-of-charge and specific gravity changes, the balls change their position in the passageway and display a different color in the viewing eye.

Do not install a new battery based only on the battery eye color. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow/black battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, recharge the battery before testing its condition.

- Red - low state-of-charge
- Yellow/Black - between high and low state-of-charge
- Green - high state-of-charge
- No color can occur after the battery has been in service for several years and some of the plate material has coated the balls
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates

DIAGNOSIS AND TESTING > BATTERY

Special Tool(s)

 E165532	GR1 190 V3.0 Intelligent Diagnostic Charger 162-00036

Battery Condition Test

Battery condition is determined by measuring battery terminal voltage after a specific discharge current

is applied for a specified time period.

Visual Inspection and Diagnostic Pre-checks

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

- Inspect wiring, terminals and connectors.
- Inspect the battery.
- Inspect the battery mounting.
- Inspect the BJB connections.

PINPOINT TEST A : BATTERY CONDITION TEST

> *NOTE: Failure to fully charge the battery before retesting may cause false readings.*

> *NOTE: A red state-of-charge battery eye indicates the battery is discharged, not necessarily damaged.*

> *NOTE: The 5.2L Ti-VCT (SVT) vehicles do not have state-of-charge battery eye.*

A1 TEST THE BATTERY CONDITION

Using the Intelligent Diagnostic Charger and the battery cables removed from the battery, verify the battery condition.

Is the battery OK?

Yes	RETURN the battery to service.

No	If the analyzer reads REPLACE BATTERY or REPLACE-BAD CELL, INSTALL a new battery. REFER to: Battery .

GENERAL PROCEDURES > BATTERY CHARGING

Special Tool(s) / General Equipment

 ST3285-A	162-00036GR-1-190 Diagnostic Charger

Charging

WARNING: Before beginning any service procedure in this article, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

NOTE: Batteries will discharge due to normal parasitic key off-loads when the vehicle is on a dealer lot or parked by the customer for an extended period of time. Vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

NOTE: The vehicle charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back to near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to recharge the battery. Use an external charger to charge discharged batteries.

NOTE: Cold batteries will not readily accept a charge. Allow batteries to warm to approximately 5 °C (41 °F) before charging. This may require 4 to 8 hours at room temperature.

1.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

2.

Connect the positive (red) charger clamp to the positive battery post. Use Special Service Tool: 162-00036 GR-1-190 Diagnostic Charger.

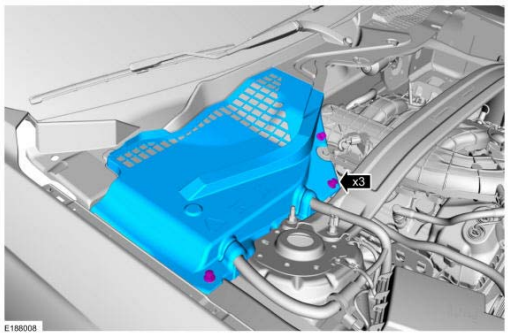
3.

Connect the negative (black) charger clamp to the negative battery post.

4.

Charge the battery following the battery charger manufacturer's instructions.

GENERAL PROCEDURES > BATTERY DISCONNECT AND CONNECT



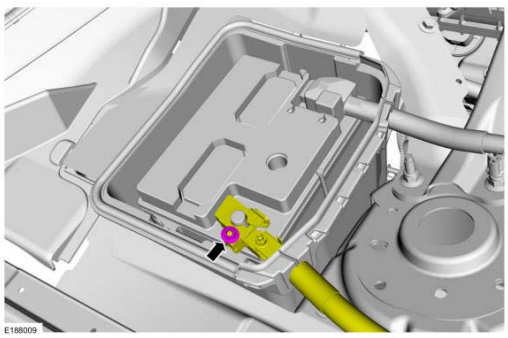
Disconnect

NOTE: When the battery is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven to allow the PCM to relearn the adaptive strategy values.

NOTE: The following 2 steps are for disconnecting the negative battery cable to interrupt power to the vehicle electrical system. It is not necessary to disconnect the positive battery cable.

1.

Remove the retainers and the battery cover.

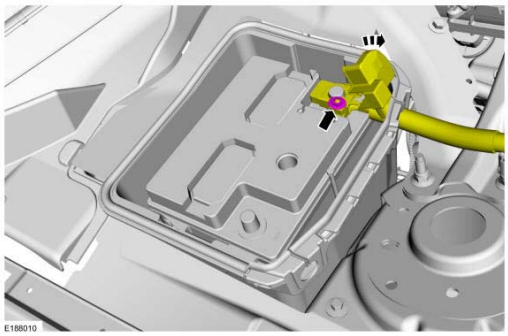


2.

Loosen the nut and position the negative battery cable.

Torque

: 44 lb.in (5 Nm)



3.

Position the positive battery cable cover, loosen the nut and position the positive battery cable.

Torque

: 44 lb.in (5 Nm)

Connect

1.

To connect, reverse the disconnect procedure.

GENERAL PROCEDURES > BATTERY DRAIN CHECK

Check

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw. Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Typically, a drain of approximately 1 amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used between the negative battery post and its respective cable. Use of a test lamp or voltmeter is not an accurate method.

1.

Make sure the junction box(es)/fuse panel(s) are accessible without turning on the interior lights or the underhood lights.

2.

Drive the vehicle for at least 5 minutes over 48 km/h (30 mph) to activate the vehicle systems.

3.

Allow the vehicle to sit with the ignition off for at least 40 minutes to allow the modules to time out/power down.

4.

Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting.

5.

Disconnect the negative battery cable from the negative battery post without breaking the connection of the fused jumper wire.

> *NOTE: The meter must be capable of reading milliamps and should have a 10 amp capability.*

> *NOTE: It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, repeat the time out/power down procedure.*

6.
Connect a meter between the negative battery cable terminal and the negative battery post.

> *NOTE: If the meter settings need to be switched or the test leads need to be moved to another jack, reinstall the fused jumper wire to avoid breaking continuity.*

7.
Remove the fused jumper wire.

8.

Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

> *NOTE: For vehicles equipped with aftermarket equipment containing electrical connections, disconnect the aftermarket to factory connections to isolate the body from the chassis.*

NOTE: If the vehicle sits for an extended period of time and the battery drains, there is the possibility of a control module staying alive and not going into sleep mode. If a control module stays alive, it can result in battery drain. If a control module is suspected, isolate individual modules by disconnecting them one at a time and note if the excessive draw goes away.

9.

If the current draw is excessive, remove the fuses from the BJB one at a time and note the current drop. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located. The excessive draw can be isolated by continuing to pull subsystem fuses. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

10.

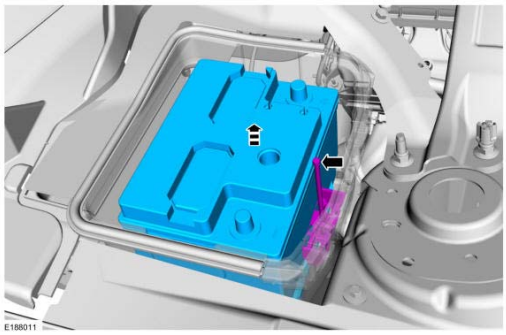
Once the main circuit is identified, continue to remove the fuses from the BCM one at a time and note the current reading. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

11.

Check the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION for any circuits that run from the battery without passing through the BJB or the BCM. If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections and retest if the draw cannot be located. The generator may be internally shorted, causing the current drain.

REMOVAL AND INSTALLATION > BATTERY > REMOVAL

1.



Disconnect the battery. Refer to: Battery Disconnect and Connect .

2.

Loosen and remove the battery hold-down bolt and clamp. Remove the battery.

Torque

: 71 lb.in (8 Nm)

REMOVAL AND INSTALLATION > BATTERY > INSTALLATION

1.

To install, reverse the removal procedure.

2.

If installing a new battery, use the scan tool to carry out the Battery Monitoring System (BMS) reset after the battery is connected.

REMOVAL AND INSTALLATION > BATTERY CABLES - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: This procedure provides information about routing, retaining points and connectors of the cable. It does not include the steps for removing components to gain access to the cable.

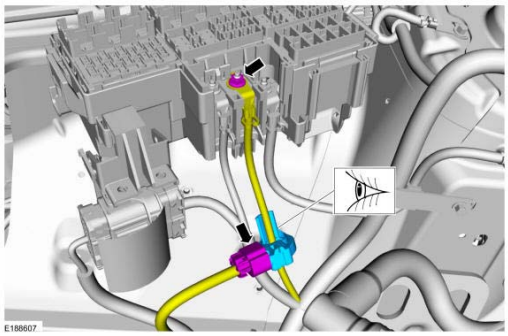
REMOVAL AND INSTALLATION > GENERATOR CURRENT SENSOR > REMOVAL

1.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

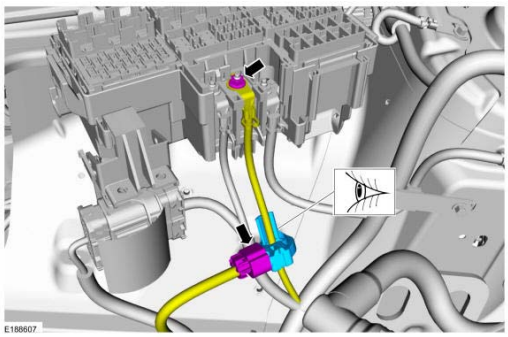


2.

Release the retainer and remove the BJB cover.

NOTE: Note the orientation and position of the generator current sensor tape tab.

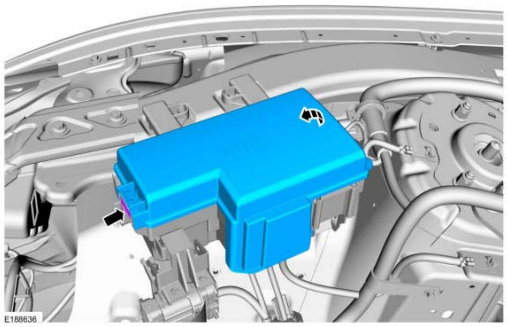
3.
Remove the nut and position the battery cable. Disconnect the generator current sensor electrical connector. Index-mark the battery cable at the generator current sensor. Remove and discard the tape securing the generator current sensor to the battery cable and remove the generator current sensor.



REMOVAL AND INSTALLATION > GENERATOR CURRENT SENSOR > INSTALLATION

NOTE: The generator current sensor must be installed in the proper position and orientation to function correctly.

1.
With the generator current sensor tape tab pointing away from the generator, position the generator current sensor to the index-mark on the battery cable and secure with electrical tape. Connect the generator current sensor electrical connector. Position the battery cable and install the nut.



Torque

: 89 lb.in (10 Nm)

2.

Install the BJB cover.

3.

Connect the battery. Refer to: Battery Disconnect and Connect .

DESCRIPTION AND OPERATION > CHARGING SYSTEM - OVERVIEW > OVERVIEW

The generator is driven by the FEAD belt. When the engine is started, the generator begins to generate AC voltage which is internally converted to DC voltage. The DC voltage level is controlled by the voltage regulator (located on the rear of the generator) and is supplied to the battery.

The PCM controls the voltage regulation setpoint and communicates this information to the generator internal voltage regulator over a generator communication (GENCOM) communication circuit. The PCM receives generator load and error conditions from the generator over the generator monitor (GENMON) circuit.

This vehicle is equipped with load shed strategy. With the engine off, the BCM monitors the battery state of charge using the battery current sensor attached to the negative battery cable. With the engine running, the PCM monitors system voltage on the VPWR and PSCM.

The PCM monitors the generator current using the generator current sensor attached to the generator B+ battery cable. The information supplied to the PCM from the generator current sensor is used by the PCM to adjust the engine idle stability and torque control.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages - Body Control Module (BCM)

Broadcast Message	Originating Module	Message Purpose
Alternator fault	PCM	The PCM has detected a fault in the generator or generator circuits.

Module Network Input Messages - Instrument Panel Cluster (IPC)

Broadcast Message	Originating Module	Message Purpose
Power system status	BCM	Reports any generator/charging system faults. Used for charging system fault indicator.
Load Shed Request	BCM	Used to indicate what level of load shed is commanded.

Module Network Input Messages - Powertrain Control Module (PCM)

Broadcast Message	Originating Module	Message Purpose
Load Shed Request	BCM	Used to indicate what level of load shed is commanded.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > CHARGING SYSTEM

The PCM controlled Smart Charge charging system determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. The Smart Charge charging system sets Diagnostic Trouble Codes (DTCs) when a charging system fault is present. All of the Diagnostic Trouble Codes (DTCs) can set continuous faults, but not all Diagnostic Trouble Codes (DTCs) set as on-demand faults.

This system uses 2 communication lines between the PCM and the generator/voltage regulator: A generator communication (GENCOM) line communicates the desired setpoint from the PCM to the voltage regulator, and a generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. Both of these use PWM. The PCM sends the GENCOM command only when it is necessary to adjust the voltage setpoint. If the setpoint does not need to be changed, several seconds may elapse between PCM GENCOM commands. This normal operation appears in the PID as occasional bursts of pulse-width commands. In addition to these two circuits, a third pin on the voltage regulator, the "A" circuit pin, is dedicated to monitor, or sense, the battery voltage.

The PCM simultaneously controls and monitors the generator output. When the current consumption is high or the battery is discharged, the PCM raises engine speed as needed to increase generator output. The generator charges the battery and at the same time supplies power for all of the electrical loads. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm.

The PCM turns off the generator during cranking to reduce the generator load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to the desired voltage.

The PCM reports any charging system faults and sends a message through the High Speed Controller Area Network (HS-CAN) to the BCM. The BCM controls the charging system warning indicator by sending a message over the Medium Speed Controller Area Network (MS-CAN) to the IPC. The IPC then controls charging system warning indication based on the message from the PCM through the BCM. The status of the PCM charging system warning indicator and/or message is confirmed by viewing PCM PID generator fault indicator lamp (GENFIL). Any charging system fault detected by the PCM results in 1 or more Diagnostic Trouble Codes (DTCs) being set and the PID GENFIL having a status of On. If equipped with a charging system warning indicator, the IPC turns the indicator on or off. If equipped with a message center, the IPC displays a CHECK CHARGING SYSTEM message. In some instances, the CHECK CHARGING SYSTEM message may not display if the ignition is on and the engine is off.

Under certain circumstances, the charging system may have a concern but still keeps the battery charged and the vehicle running. GENCOM normally initiates charging but with a fault in this circuit, the generator can self-excite and start charging on its own. The charging system warning indicator is illuminated and/or the CHECK CHARGING SYSTEM message is displayed, and the generator operates in a default mode (approximately 13.5 volts).

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND

COMPONENT DESCRIPTION > ELECTRICAL ENERGY MANAGEMENT

NOTE: When any vehicle module is being programmed, connect an external battery charger to make sure the module programming is completed without interruption due to the load shedding feature becoming active. The external battery charger must maintain a system voltage above 13 volts. This may require a charger setting higher than the lowest charge setting. The external battery charger negative connection must be made to an engine or vehicle chassis ground and not the negative battery terminal. If the connection is to the negative battery terminal, load shedding may begin and module programming may be corrupted. After charging has begun, start the engine to clear any load shed states and then turn the engine off and proceed with programming.

This vehicle is equipped with an Electrical Energy Management system which manages battery charging and monitors the battery state of charge. The Electrical Energy Management system software is housed in the BCM. It has the algorithms and control structure for the Smart Regenerative Charging, and Load Shed Control Strategy. The Electrical Energy Management system is equipped with 2 unique sensors to monitor the battery depending on the vehicle system features / operation.

- Battery current sensor
- Generator current sensor

These sensors serve as input to the Electrical Energy Management system software. If the sensors malfunction due to wiring issues or failure, a DTC will be set. In most cases the Electrical Energy Management system functions will be turned off until the sensor operation is restored.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BATTERY STATE OF CHARGE

The BCM uses the battery current sensor to keep track of the battery state of charge. The battery current sensor is a Hall-effect sensor attached to the battery ground cable. During a drive cycle the Electrical Energy Management software adjusts the battery state of charge by monitoring the charge and discharge current and adjusting the state of charge up during charging, and down during discharge. During rest periods (key off with no electrical loads) when the vehicle enters sleep mode, the battery voltage is sampled to calibrate the State of Charge. The BCM automatically executes this calibration anytime the vehicle enters sleep mode and when the total vehicle current draw is below 300mA. It takes 8 hours in the sleep mode to calibrate the battery state of charge to high accuracy. If the system draw does not allow the battery state of charge calibration over the previous 7 to 10 days the State of Charge quality factor changes to flag this and some Electrical Energy Management Functions which rely on the accuracy of the battery state of charge may be temporarily turned off until a calibration takes place.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > ENGINE OFF LOAD SHED

When the engine is off, and the BCM determines the battery state of charge is below 40% or 10% of the charge has been drained or 45 minutes have elapsed, a load shed message is sent over the CAN. This message turns off the audio/navigation system to save the remaining battery charge. Under this condition, the FDIM displays SYS OFF TO SAVE BATT (without navigation) or BATTERY SAVER - SYSTEM OFF PLEASE START THE ENGINE (with navigation) to notify the driver that battery protection actions are

active.

Engine off load shed occurs when the engine is not running, and the ignition is in the ACC or RUN position. To clear the load shed state, restart the engine.

> *NOTE: To maintain correct operation of the load shed system, any electrical devices or equipment must be grounded to the engine or chassis ground and not the negative battery terminal. A connection to the negative battery terminal may cause an inaccurate measurement of the battery state of charge and may cause incorrect load shed system operation.*

When the ignition is in the RUN position and load shed occurs, the IPC message center displays either TURN POWER OFF TO SAVE BATT (base message center) or TURN POWER OFF TO SAVE BATTERY (optional message center). The audio/navigation system will shut down after the message center displays it's warning.

If a fault occurs with the battery current sensor or circuit(s), the only engine off load shed strategy is a 45 minute timer. After 45 minutes have elapsed, the audio/navigation system turns off. To clear the load shed state, restart the engine.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > ENGINE RUNNING LOAD SHED

When the BCM and/or PSCM voltage is low, with the engine running, a message is sent by the BCM to either minimize or shut down the climate controlled seats, rear defrost, heated mirrors and DATC blower motor to improve system voltage. Under this condition, the IPC message center displays either LOW BATTERY LESS FEATURES (base message center) or LOW BATTERY FEATURES TEMPORARILY TURNED OFF (optional message center) to notify the driver that battery protection actions are active.

For more information on message center messages, Refer to the Owner's Literature or Refer to: Message Center - System Operation and Component Description .

There are 3 states of engine running load shed:

Load Shed State	Entry Conditions	Impact to Features	Clear Conditions
Load shed 1	If vehicle speed is **below 16 km/h (10 mph)** , and voltage to the PSCM is less than 11.5 volts or the PSCM measures current draw greater than 0 amps. If vehicle speed is **above 16 kp/h (10 mph)** , and the voltage to the BCM is less than 11.6 volts.	These loads are incrementally reduced (if equipped): Heated steering wheel and climate controlled seats. These loads are turned off (if equipped): smart trailer tow battery charge, heated mirrors, heated backglass, and heated windshield.	Voltage to the BCM is greater than 12.7 volts **or** the generator field duty cycle is less than 88%.
Load shed 2 transient	PSCM indicating reduced voltage and increased current. System voltage less than 11 volts	If equipped, climate controlled seats are disabled, but the indicators remain illuminated. If equipped, rear defrost and	Voltage to the BCM is greater than 12.4 volts.

		heated mirrors are disabled, but the indicator remain illuminated.	
Load shed 2 continuous	Load Shed 2 Transient condition in excess of 20 seconds	If equipped, climate controlled seats are disabled and the indicators are off. If equipped, rear defrost and heated mirrors are disabled and the indicator is off. If equipped with DATC, the blower motor is reduced to 50% speed. If equipped, DC/AC inverter (AC powerpoint) is disabled. The base IPC message center displays LOW BATTERY LESS FEATURES. The optional IPC message center displays LOW BATTERY FEATURES TEMPORARILY TURNED OFF.	Voltage to the BCM is greater than 12.4 volts for more than 60 seconds.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BATTERY CHARGING

When charging the vehicle battery by **connecting the charger to engine or chassis ground** , the negative charger clamp must be connected to an unpainted chassis surface or a solid engine component such as a generator mount or engine lifting eye. In this instance, after charging, the BMS Reset **is not required** . Through this method of charging the BCM updates the battery state of charge during the charging process.

When charging the vehicle battery by **connecting the charger to the negative battery terminal is necessary** , such as when using a combination battery charger and battery tester/analyzer, like the GR 1 190 V3.0 Intelligent Diagnostic Charger, the BCM does not immediately update the battery state of charge. In this instance, the BMS Reset must be carried out using a diagnostic scan tool. This reset is needed for proper engine off load shedding and to prevent invoking of engine off load shedding earlier than normal.

If the reset is not carried out, when the battery is charged by connecting the charger to the negative battery terminal, it takes approximately 8 hours for the BCM to learn the new battery state of charge. During this 8 hour period, the vehicle must be undisturbed, with no doors opened or keyless entry button presses. If the vehicle is used before the BCM is allowed to learn the new battery state of charge, engine off load shedding can still occur and a message may be displayed.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > JUMP STARTING

When it is necessary to jump start the vehicle it is important to connect the cables properly in order for the

Electrical Energy Management system to measure the energy input to the system to keep an accurate state of charge. Connect the positive cable to the battery positive post and the jump start negative cable to a vehicle ground. Do not connect to the negative battery terminal. Connecting directly to the battery negative post bypasses the ability of the vehicle to measure the input current, and does not adjust the battery state of charge accordingly. For a good connection point, follow the negative cable from the battery monitoring sensor to the vehicle body connection (typically on the shock tower sheet metal). If the vehicle was improperly jump started, the Electrical Energy Management system calibrates the battery state of charge after about 8 hours.

DESCRIPTION AND OPERATION > CHARGING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BATTERY REPLACEMENT

If the vehicle battery is replaced, it is very important to perform the BMS Reset using a diagnostic scan tool. If the BMS Reset is not carried out, it holds the old battery parameters and time in service counter in memory. Additionally it tells the system the battery is in an aged state and may limit the Electrical Energy Management system functions. For more information, Refer to: BATTERY, MOUNTING AND CABLES .

Component Description

Generator

The generator is equipped with an electronic internal voltage regulator.

Generator Current Sensor

The generator current sensor is attached to the generator B+ cable. It is supplied a 5-volt reference voltage and a ground from the PCM. The generator current sensor is a Hall-effect sensor that supplies an analog feedback signal to the PCM. The PCM uses this information for battery charging strategy and idle stability and torque control.

Battery Current Sensor

The battery current sensor is attached to the battery negative cable. It is supplied a 5-volt reference voltage and a ground from the BCM. The battery current sensor is a Hall-effect sensor that supplies an analog feedback signal to the BCM. The BCM reads the battery current sensor feedback voltage to determine how much current is flowing through the battery ground cable. The BCM uses this information for battery state of charge.

Powertrain Control Module (PCM)

The PCM monitors and controls the charging system.

Generator Clutch

Some vehicles are equipped with a one-way clutch (OWC) in the generator pulley. The primary function is to separate the generator rotor inertia from the FEAD belt, lowering belt tension at high engine deceleration rates and reducing NVH. The generator clutch is serviced separately from the generator.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > INSPECTION AND VERIFICATION

1.

Verify the customer concern by operating the charging system.

2.

Before diagnosing or repairing the charging system inspect the following items:

- Check the battery for loose, damaged or corroded connections.
- Check the generator for loose, damaged or corroded connections.
- Check engine and battery grounds for loose, damaged or corroded connections.
- Check high current BJB for loose or corroded connections.
- Verify fuses or fusible links.
- Inspect wiring, terminals and connectors.

3.

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

4.

Check for abnormal ignition-off current drain(s). REFER to: Battery Drain Check .

5.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

6.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs). Refer to the appropriate DTC Chart .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > DTC CHARTS (2.3L)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

PCM DTC Chart

DTC	Description	Action
P0562	System Voltage Low	GO to Pinpoint Test B
P0563	System Voltage High	GO to Pinpoint Test A
P0620	Generator Control Circuit	GO to Pinpoint Test F
P0625	Generator Field Terminal Circuit Low	GO to Pinpoint Test G
P0626	Generator Field Terminal Circuit High	GO to Pinpoint Test G

P065B	Generator Control Circuit Range/performance	GO to Pinpoint Test F
P0A5A	Generator Current Sensor Circuit Range/Performance	GO to Pinpoint Test E
P0A5B	Generator Current Sensor Circuit Low	GO to Pinpoint Test E
P0A5C	Generator Current Sensor Circuit High	GO to Pinpoint Test E
P1397	System Voltage Out Of Self-Test Range	If combined with P0562, GO to Pinpoint Test B If combined with P0563, GO to Pinpoint Test A
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

BCM DTC Chart

NOTE: Diagnose all PCM DTCs first.

DTC	Description	Action
B130C:12	Load Shed Control Circuit Short To Battery	GO to Pinpoint Test I
B130C:14	Load Shed Control Circuit Short To Ground or Open	GO to Pinpoint Test I
B1438:03	Battery Current Sensor: FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	GO to Pinpoint Test I
All Other DTCs	-	REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > SYMPTOM CHART(S)

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

Refer to Charging System for schematic and connector information.

NOTE: Diagnostic Trouble Code (DTC) P0563 can be set if the vehicle has been recently jump started or the battery has been recently charged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above or below their calibrated setpoints, a DTC sets.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0563	System Voltage High	This DTC sets in the PCM when the PCM detects voltage from the charging system greater than 15.9 volts with vehicle speed above 8 km/h (5 mph).
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been

		recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Generator
- Engine, generator or battery ground
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

A1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

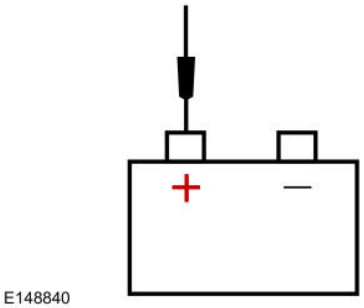
Yes	CORRECT the cause as necessary.

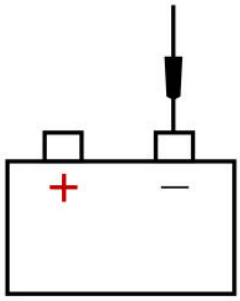
No	GO to A2

A2 RETRIEVE THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.





Is DTC P0620, P0625 or P0626 present?

Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

No	GO to A3

A3 COMPARE THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WITH BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

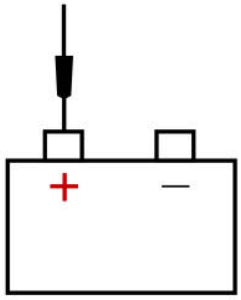
Using a diagnostic scan tool, view the PCM PID GENVDSD.

Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to A6

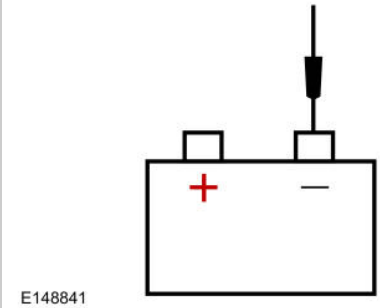
No	GO to A4

A4 MEASURE THE "A" SENSE VOLTAGE



Ignition OFF.

Disconnect Generator C102B .



Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Measure:

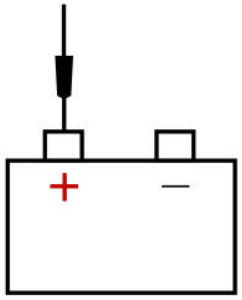
Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

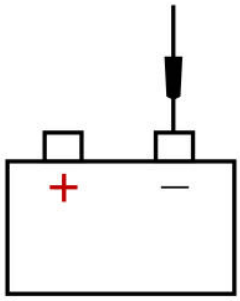
Is the "A" sense voltage equal to the recorded battery voltage?

Yes	GO to A5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.





NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A5 "A" SENSE CIRCUIT LOAD TEST

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

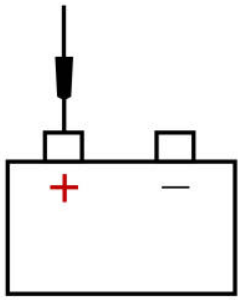
 E148840		 E148841

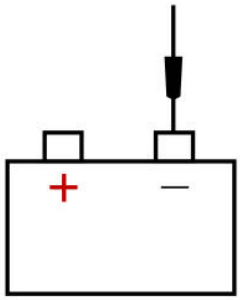
Connect the load to the circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to A6





No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

A6 CHECK FOR INTERMITTENT IN THE REGULATOR CIRCUIT

Connect Generator C102B .

Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

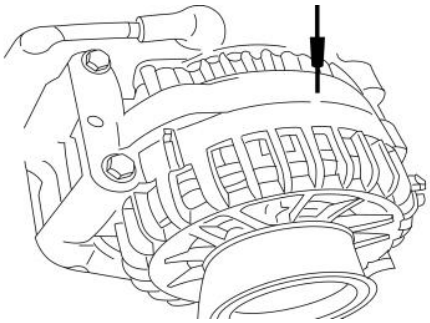
Perform a wiggle test on the generator wiring and following connections while measuring voltage:

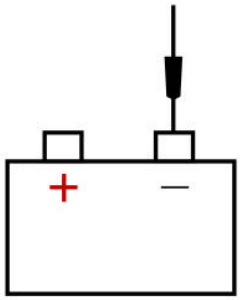
Generator C102B

Inline C1046

Does battery voltage change more than 0.5 volt?

Yes	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.





No	GO to A7

A7 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

Connect Generator C102B .

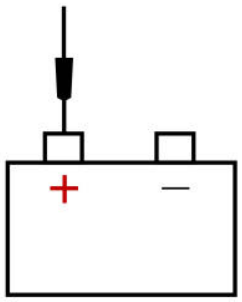
Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to A8



No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

A8 CHECK THE GENERATOR OUTPUT

Increase the engine RPM until the generator starts to generate output.

With the engine running, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		Ground

Is the voltage above 15.2 volts?

Yes	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

No	GO to A9

A9 MONITOR THE GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD) PIDS

Ignition OFF.

Disconnect Generator C102B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

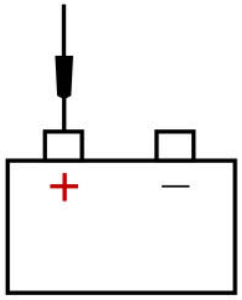
Start the engine.

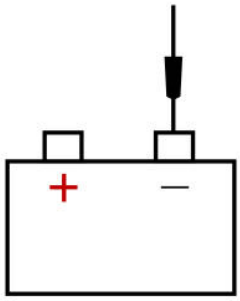
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENVDSD.

Do the Parameter Identifications (PIDs) read within 5% of each other?





Yes	GO to A10

No	GO to A13

A10 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		 E148841

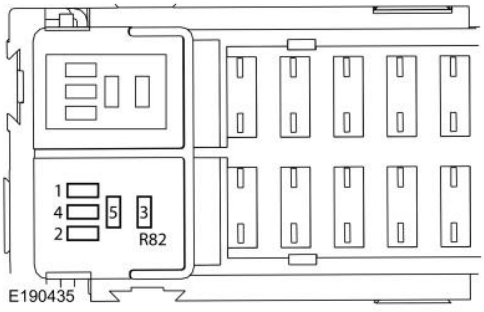
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

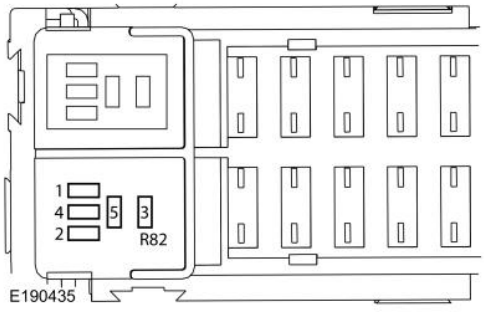
Monitor the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

No	GO to A11

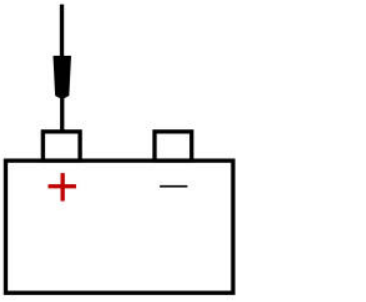




A11 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

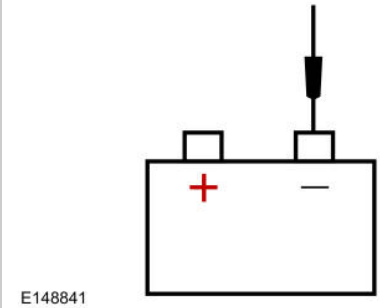
Ignition OFF.

Disconnect BJB PCM power relay.



Disconnect PCM C1551B .

Connect a fused jumper wire:



Positive Lead	Measurement / Action	Negative Lead
 E190435 BJB PCM Relay pin 3		 E190435 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-101		Ground
C1551B-102		Ground
C1551B-103		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to A12

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

A12 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

Connect the load to a suitable 12 volt power connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-96		Ground
C1551B-97		Ground
C1551B-98		Ground

C1551B-99		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to A13

No	REPAIR the affected circuit(s).

A13 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The PCM monitors this B+ voltage through its own voltage supply circuit.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0562	System Voltage Low	If voltage drops 1.5 volts or more below the generator voltage desired (calculated by the PCM), this DTC sets after 30 seconds.
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Fuses or fusible links
- Generator
- Generator clutch
- PCM
- High current BJB
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the battery.
- Inspect the high current BJB for loose or corroded connections.
- Inspect the generator clutch.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to B2

B2 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0620, P0625 or P0626 present?

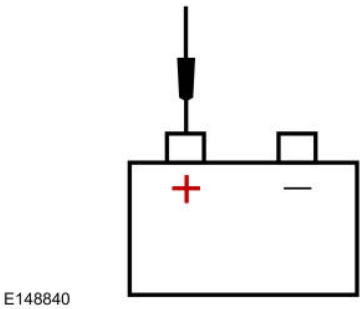
Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

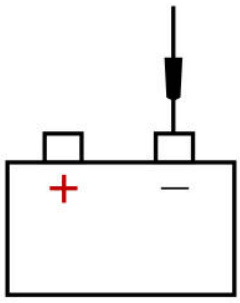
No	GO to B3

B3 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102A-1	V	Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to B4

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

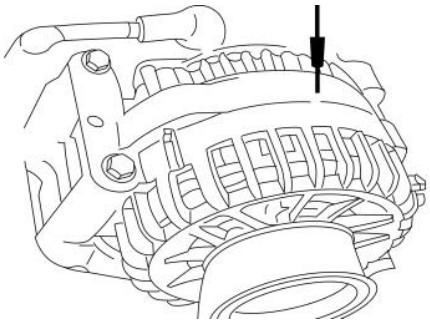
B4 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

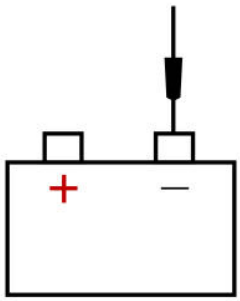
Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102A-1	V	

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.





Is the voltage drop less than 0.5 volt?

Yes	GO to B5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

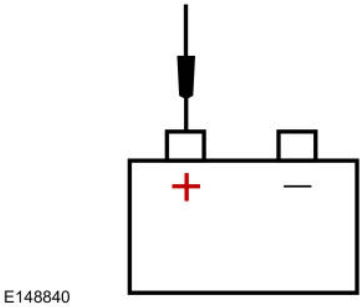
B5 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

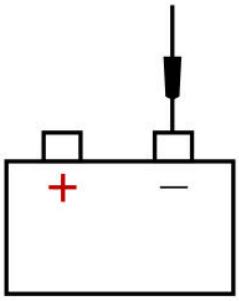
With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case	V	 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to B6





No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

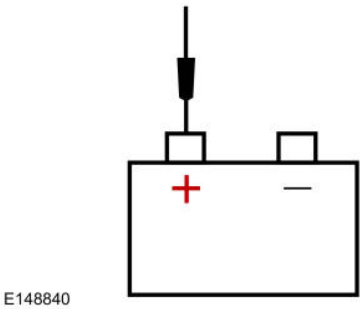
B6 MONITOR THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WHILE COMMANDED

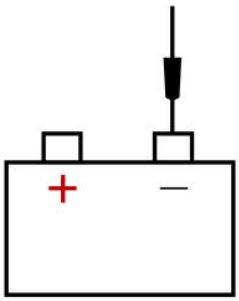
Using a diagnostic scan tool, view the PCM GENVDSD PID.

Using a diagnostic scan tool active command, set the PCM PID GENVDSD to 14 volts.

With the engine running at idle, measure battery and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841





Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to B7

No	GO to B11

B7 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, headlamps on and blower on high, measure and record:

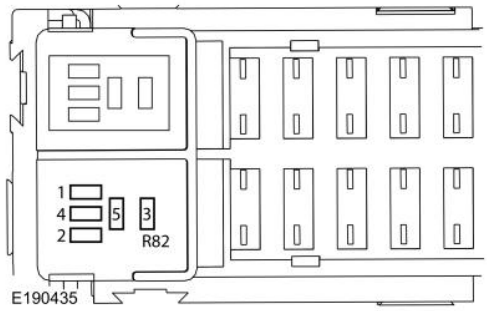
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

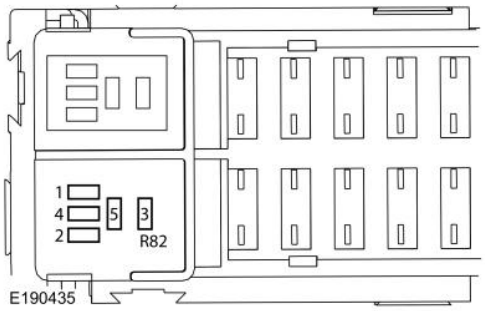
Using a diagnostic scan tool, view the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to B8

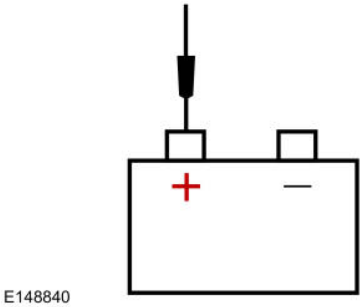
No	REPAIR high resistance or loose connections in the affected PCM power circuit(s).

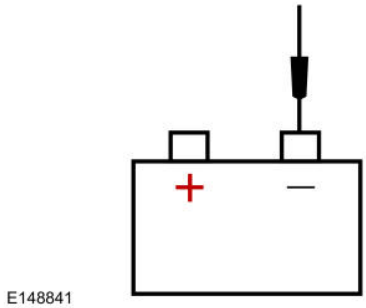




B8 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

Ignition OFF.





Disconnect BJB PCM power relay.

Disconnect PCM C1551B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 BJB PCM Relay pin 3		 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
		

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-101		Ground
C1551B-102		Ground
C1551B-103		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to B9

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

B9 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

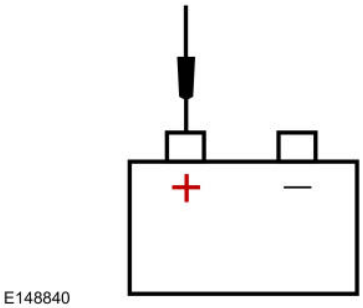
Connect the load to a suitable 12 volt power connection.

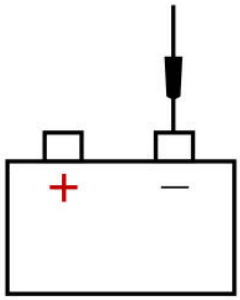
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-96		Ground
C1551B-97		Ground
C1551B-98		Ground
C1551B-99		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to B10





No	REPAIR the affected circuit(s).

B10 MONITOR THE SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION)

NOTE: Measure battery voltage at the battery.

With the engine running at idle, turn off all accessory loads.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Using a diagnostic scan tool, view PCM PID VPWR and record.

Momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the PID.

Does the PID stay within 0.5 volt of the recorded battery voltage when the engine Revolutions Per Minute (RPM) are increased?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSPECT and REPAIR any connector or pin issues found. If no connector or pin issues are found, Perform the battery drain test. REFER to: Battery Drain Check .

No	GO to B12

B11 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

No	INSTALL a new generator clutch. REFER to: GENERATOR PULLEY .

B12 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

Normal Operation and Fault Conditions

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures can also produce an audible noise.

Possible Sources

- FEAD belt
- Loose bolts/brackets
- Generator/pulleys

Visual Inspection and Diagnostic Pre-checks

- Inspect the FEAD belt.
- Inspect for loose bolts/brackets.
- Inspect the generator/pulley.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

C1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

Ignition OFF.

Check the FEAD belt and tensioner for damage and correct installation. REFER to: Accessory Drive .

Is the accessory drive OK?

Yes	GO to C2

No	REPAIR as necessary.

C2 CHECK THE GENERATOR MOUNTING

Check the generator mounting for loose bolts or misalignment.

Is the generator mounted correctly?

Yes	GO to C3

No	REPAIR as necessary.

C3 CHECK THE GENERATOR FOR NOISE

Start the engine.

With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.

Is the generator the noise source?

Yes	GO to C4

No	REFER to: ENGINE SYSTEM - GENERAL INFORMATION to diagnose the source of the engine noise.

C4 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

No	INSTALL a new generator clutch. REFER to: GENERATOR PULLEY .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) >

PINPOINT TESTS (2.3L) > PINPOINT TEST D : RADIO INTERFERENCE

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

> *NOTE: If the Original Equipment Manufacturer (OEM) Audio Control Module (ACM) has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to Original Equipment Manufacturer (OEM) condition before following this pinpoint test.*

> *NOTE: If the engine is operated at greater than 2, 000 Revolutions Per Minute (RPM) momentarily, the generator self-excites. Make sure when the generator is disconnected the engine RPM stays below 2, 000 Revolutions Per Minute (RPM). If it rises above 2, 000 Revolutions Per Minute (RPM), turn the ignition to the OFF position and start the test over again.*

> *NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.*

Possible Sources

- Generator
- In-vehicle entertainment system
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator.
- Inspect the in-vehicle entertainment system.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST D : RADIO INTERFERENCE > PINPOINT TEST D : RADIO INTERFERENCE

D1 VERIFY THE GENERATOR IS THE SOURCE OF THE AUDIO SYSTEM INTERFERENCE

Start the engine.

Allow the engine to idle.

Tune the audio system to a station where interference is present.

Ignition OFF.

Disconnect Generator C102B .

Disconnect Generator C102A .

Start the engine.

Allow the engine to idle.

Is the interference present with the generator disconnected?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

Refer to Power Distribution for schematic and connector information.

Normal Operation and Fault Conditions

The generator current sensor is a Hall-effect sensor attached to the generator B+ cable. It is supplied a 5 volt reference and ground from the PCM. The PCM reads the generator current sensor feedback voltage to determine how much current is flowing through the generator B+ cable.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0A5A	Generator Current Sensor Circuit Range/Performance	Sets in the PCM when the PCM does not detect current through the generator current sensor and there are no generator current sensor circuit Diagnostic Trouble Codes (DTCs) set.
P0A5B	Generator Current Sensor Circuit Low	Sets in the PCM when the PCM senses lower than expected voltage on the generator current sensor feedback circuit, indicating an open or a short directly to ground.
P0A5C	Generator Current Sensor Circuit High	Sets in the PCM when the PCM senses higher than expected voltage on the generator current sensor feedback circuit, indicating a short directly to voltage.

Possible Sources

- Generator current sensor
- Generator clutch
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator current sensor.
- Inspect the generator current sensor connector.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

E1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to E2 For DTC P0A5B, GO to E3 For DTC P0A5C, GO to E6

E2 CHECK THE GENERATOR CURRENT SENSOR

Ignition OFF.

Inspect the generator current sensor for the following:

physical damage

corrosion

disconnected electrical connector

generator B+ cable routed through the generator current sensor

debris between the generator current sensor and the generator B+ cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor .

No	GO to E10

E3 CHECK THE GENERATOR CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E4

No	If the voltage is less than 4.8 volts, REPAIR the circuit for an open or high resistance. If the voltage is greater than 5.2 volts, REPAIR the circuit for a short to voltage.

E4 CHECK THE GENERATOR CURRENT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E5

No	REPAIR the circuit for an open or high resistance.

E5 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E6

No	REPAIR the circuit for an open or high resistance.

E6 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to E7

E7 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E8

No	REPAIR the circuit.

E8 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR VOLTAGE REFERENCE CIRCUIT

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	C1645-1
C1645-3	Ω	C1645-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to E9

No	REPAIR the affected circuit.

E9 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-94	Ω	C1645-3

Is the resistance less than 3 ohms?

Yes	GO to E10

No	REPAIR the circuit.

E10 CHECK THE GENERATOR CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Generator current sensor C1645 .

Inspect the generator current sensor connector for the following:

- corrosion (install new connector or terminals - clean module pins)
- damaged or bent pins - install new terminals/pins
- pushed-out pins - install new pins as necessary

Connect and correctly seat the generator current sensor connector.

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the PCM self-test

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to E11

No	The system is operating correctly at this time. The concern may have been caused by an intermittently loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

E11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST F : DTC P0620, P065B

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit. The PCM uses the generator command (GENCOM) circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the "A" sense circuit are open or shorted to ground, the PCM will not be able to control the generator output. When the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage output of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0620	Generator Control Circuit	The PCM sets this DTC if the GENCOM circuit, "A" sense circuit, or B+ circuit is open or shorted to ground.
P065B	Generator Control Circuit Range/performance	The PCM sets this DTC when the generator reports an internal regulator failure.

Possible Sources

- Fuses or Fusible Links
- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST F : DTC P0620, P065B > PINPOINT TEST F : DTC P0620, P065B

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

F1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

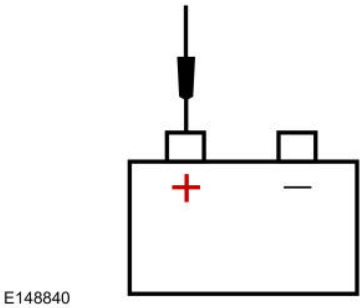
Yes	GO to F2

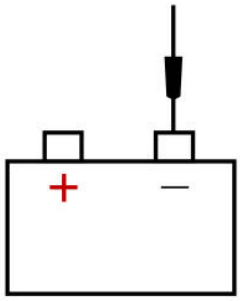
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

F2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to F3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102A-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

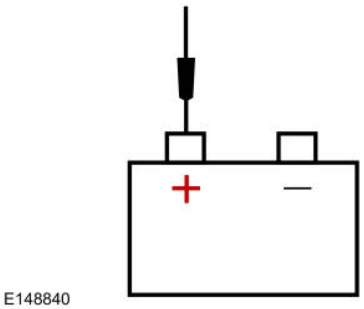
Is the voltage drop less than 0.5 volt?

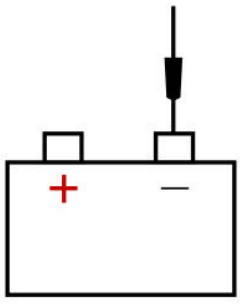
Yes	GO to F4

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.





F4 "A" SENSE CIRCUIT LOAD TEST

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to F5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F5 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1551B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to F6

F6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to F7

No	REPAIR the circuit.

F7 CHECK THE GENERATOR COMMAND CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-59	Ω	C102B-2

Is the resistance less than 3 ohms?

Yes	GO to F8

No	REPAIR the circuit.

F8 COMPARE THE GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD) PIDS

Ignition OFF.

Connect PCM C1551B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

No	REMOVE the fused jumper wire. GO to F9

F9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST G : DTC P0625, P0626

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and results in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and results in DTC P0626 setting in the PCM.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0625	Generator Field Terminal Circuit Low	The PCM sets this DTC if the GENMON circuit is shorted to ground, the "A" sense circuit is open or the B+ circuit is open. This DTC also sets by a faulted PCM or generator.
P0626	Generator Field Terminal Circuit High	The PCM sets this DTC if the GENMON circuit is open or shorted to power. This DTC can also be set by a faulted PCM or generator.

Possible Sources

- Battery
- Fuses or Fusible Links
- Generator

- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST G : DTC P0625, P0626 > PINPOINT TEST G : DTC P0625, P0626

G1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

Yes	GO to G2

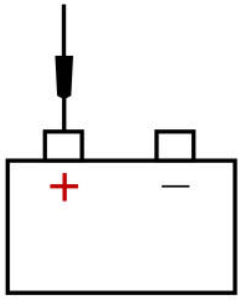
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

G2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

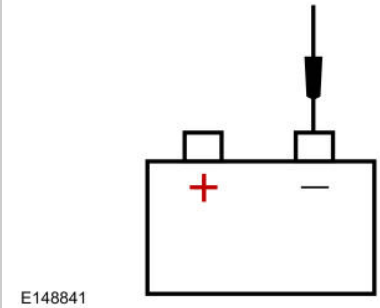
Disconnect all of the generator connectors and inspect for:

corrosion (install new connector or terminals - clean module pins)



damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary



Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to G3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102A-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

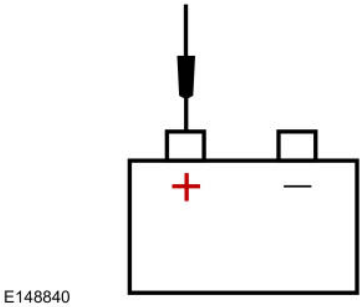
Is the voltage drop less than 0.5 volt?

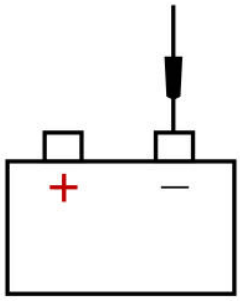
Yes	For DTC P0625, GO to G4 For DTC P0626, GO to G5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.





G4 "A" SENSE CIRCUIT LOAD TEST

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to G5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G5 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1551B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to G6

G6 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to G7

No	REPAIR the circuit.

G7 CHECK THE GENERATOR MONITOR CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-26	Ω	C102B-1

Is the resistance less than 3 ohms?

Yes	GO to G8

No	REPAIR the circuit.

G8 CHECK THE GENERATOR B+ INTERNAL RESISTANCE

Disconnect Generator C102B .

Disconnect Generator C102A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator B+ Terminal	Ω	Generator case

Is the resistance greater than 25K ohms?

Yes	GO to G9

No	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

G9 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator pin 1 (Component Side)	Ω	Generator case
Generator pin 2 (Component Side)	Ω	Generator case
Generator pin 3 (Component Side)	Ω	Generator case

Are the resistances greater than 10, 000 ohms?

Yes	GO to G10

No	INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

G10 COMPARE THE GENMON PID (PARAMETER IDENTIFICATION) AND THE GENCMD PID (PARAMETER IDENTIFICATION)

Connect PCM C1551B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

No	REMOVE the fused jumper wire. GO to G11

G11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

When the engine is off and the key is in on or accessory mode, and the BCM determines the battery state of charge is below 50%, or 45 minutes have elapsed, a load shed message is sent over the CAN. This message turns off the audio/navigation system to save the remaining battery charge. Under this condition the a load shed message will be displayed to notify the driver that battery protection actions are active:

- System Off to Save Battery Turn Ignition Off displays on the FCDIM (without touchscreen controls)

- SYSTEM OFF TO SAVE BATTERY PLEASE TURN IGNITION OFF OR START ENGINE displays on the FDIM (with touchscreen controls)
- Battery Saver - System Off displays on the FDIM (with Sync)

These messages displaying may be normal operation and not indicate a fault. Refer to the Owner Literature and REFER to: Charging System - System Operation and Component Description . Load shed messages displaying with the **engine running** or only on the FCDIM or the FDIM (with touchscreen controls) indicates the audio system has detected a fault.

Possible Sources

- Normal operation
- Audio system
- Battery
- BCM
- Fuses or Fusible Links
- Generator
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.
- Inspect the battery for loose or corroded connections.
- Inspect the generator for loose or corroded connections.
- Inspect the BJB for loose or corroded connections.
- Inspect the high current BJB for loose or corroded connections.
- Inspect C1046 for loose or corroded connections.
- Inspect battery and engine grounds for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

H1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to H2

H2 VERIFY THE CUSTOMER CONCERN

Verify the customer concern by operating the charging system.

Did the customer indicate battery saver message only appeared in the centerstack with the engine running?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	GO to H3

H3 VERIFY THE NETWORK

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the APIM, BCM, and PCM pass the Network Test?

Yes	GO to H4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

H4 PERFORM PCM (POWERTRAIN CONTROL MODULE) SELF TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	REFER to PCM DTC chart .

No	GO to H5

H5 RETRIEVE ALL CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	For BCM Diagnostic Trouble Codes (DTCs) refer to BCM DTC chart . For APIM or ACM Diagnostic Trouble Codes (DTCs), Refer to the appropriate article for the procedure. For other

	battery or charging system related Diagnostic Trouble Codes (DTCs), REFER to: Diagnostic Trouble Code Charts .

No	GO to H6

H6 CHECK BCM (BODY CONTROL MODULE) BAT_ST_CHRG PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	GO to H8

No	GO to H7

NOTE: The battery state of charge is too low and needs to be relearned. Refer to the Description and Operation for more information on battery state of charge.

H7 RELEARN BATTERY STATE OF CHARGE

Remove all accessories from the lighter, all power outlets and DC/AC inverter (if equipped).

NOTE: The key should not be left in the vehicle but should be left in a secure location away from the vehicle such as a lock box.

Allow vehicle to sit undisturbed for at least 6 hours.

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	The concern may have been caused by too low of a battery state of charge. REVIEW Energy Management operation with customer and return vehicle to customer.

No	GO to H8

H8 VERIFY INLINE CONNECTOR

Inspect inline connector C1046 for secure connection.

Disconnect Inline connector C1046 .

Inspect for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Were any concerns present?

Yes	CORRECT the cause as necessary.

No	GO to H9

H9 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

For information on the battery current sensor, REFER to: Charging System - System Operation and Component Description .

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B130C:12	Load Shed Control Circuit Short To Battery	This DTC sets in the BCM when the BCM senses a short in the battery current sensor control circuit.
B130C:14	Load Shed Control Circuit Short To Ground or Open	This DTC sets in the BCM when the BCM senses an open or ground in the battery current sensor control circuit.
B1438:03	Battery Current Sensor, FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	This DTC sets in the BCM when the BCM does not indicate current from the battery current sensor.

Possible Sources

- Battery current sensor
- Generator clutch (if equipped)
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the battery current sensor
- Inspect the battery current sensor connector

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS (2.3L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

I1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to I2 For DTC P0A5B, GO to I6 For DTC P0A5C, GO to I10

I2 CHECK THE BATTERY CURRENT SENSOR

Inspect the battery current sensor for the following:

physical damage

corrosion

disconnected electrical connector

battery ground cable routed through the battery current sensor

debris between the battery current sensor and the battery ground cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary. GO to I14

No	GO to I3

I3 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT

Ignition OFF.

Disconnect Battery current sensor C1646 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I7

No	If the voltage is less than 4.8 volts, GO to I5 If the voltage is greater than 5.2 volts, GO to I4

I4 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Using the Terminal Release Kit, release and temporarily remove BCM C2280F-3 .

Connect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	INSTALL C2280F-3 and GO to I15

I5 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I6

No	REPAIR the circuit.

I6 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	C2280F-3

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I7 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		C1646-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I10

No	GO to I8

I8 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I9

I9 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect BCM C2280C .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2	Ω	C2280F-19

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I10 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I11

I11 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I12

No	REPAIR the circuit.

I12 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C2280F-8

Is the resistance less than 3 ohms?

Yes	GO to I13

No	REPAIR the circuit.

I13 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1646-3	Ω	C1646-1
C1646-3	Ω	C1646-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to I14

No	REPAIR the affected circuit.

I14 CHECK THE BATTERY CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Battery Current Sensor C1646 , if necessary.

Inspect the battery current sensor connector for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect Battery Current Sensor C1646 .

Connect BCM C2280F .

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the BCM self-test.

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new battery current sensor. REFER to: Battery Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to I15

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

I15 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

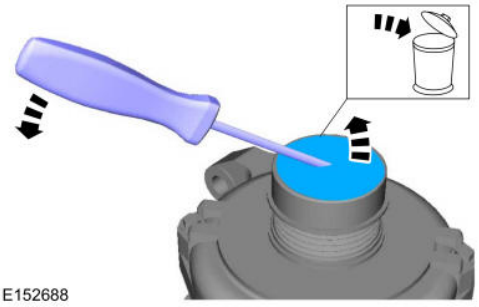
damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

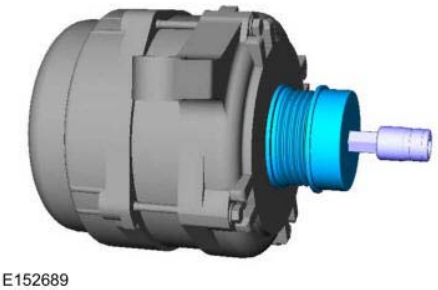
Is the concern still present?



Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) > COMPONENT TEST - GENERATOR CLUTCH



1.

Remove the generator. REFER to: Generator - 2.3L EcoBoost (201kW/273PS) .

E152688

2.

Using a small screwdriver or similar tool, insert the tool through the rubber button on the center of the pulley cap and pry off the cap. Discard the cap. A new cap must be installed if the clutch is OK.

E152689

3.

Using a 17 mm hex tool bit (such as a Snap-on ® SAM17E2 or equivalent) and socket wrench, insert

the 17 mm hex tool bit into the end of the clutch shaft.

4.

While holding the clutch pulley firmly by hand, turn the clutch shaft clockwise. The shaft should rotate smooth and freely. If the shaft rotation is rough or seized, install a new generator clutch. REFER to: GENERATOR PULLEY .

5.

While holding the clutch pulley firmly by hand, turn the clutch shaft counterclockwise. There should be some resistance (a spring feel). If the shaft rotates freely, install a new generator clutch. REFER to: GENERATOR PULLEY .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > INSPECTION AND VERIFICATION

1.

Verify the customer concern by operating the charging system.

2.

Before diagnosing or repairing the charging system inspect the following items:

- Check the battery for loose, damaged or corroded connections.
- Check the generator for loose, damaged or corroded connections.
- Check engine and battery grounds for loose, damaged or corroded connections.
- Check high current BJB for loose or corroded connections.
- Verify fuses or fusible links.
- Inspect wiring, terminals and connectors.

3.

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

4.

Check for abnormal ignition-off current drain(s). REFER to: Battery Drain Check .

5.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

6.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs). Refer to the appropriate DTC Chart .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > DTC CHARTS (3.7L)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

BCM DTC Chart

NOTE: Diagnose all PCM DTCs first.

DTC	Description	Action
B130C:12	Load Shed Control Circuit Short To Battery	GO to Pinpoint Test I
B130C:14	Load Shed Control Circuit Short To Ground or Open	GO to Pinpoint Test I
B1438:03	Battery Current Sensor: FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	GO to Pinpoint Test I
All Other DTCs	-	REFER to: Body Control Module (BCM) .

PCM DTC Chart

DTC	Description	Action
P0562	System Voltage Low	GO to Pinpoint Test B
P0563	System Voltage High	GO to Pinpoint Test A
P0620	Generator Control Circuit	GO to Pinpoint Test F
P0625	Generator Field Terminal Circuit Low	GO to Pinpoint Test G
P0626	Generator Field Terminal Circuit High	GO to Pinpoint Test G
P065B	Generator Control Circuit Range/performance	GO to Pinpoint Test F
P0A5A	Generator Current Sensor Circuit Range/Performance	GO to Pinpoint Test E
P0A5B	Generator Current Sensor Circuit Low	GO to Pinpoint Test E
P0A5C	Generator Current Sensor Circuit High	GO to Pinpoint Test E
P1397	System Voltage Out Of Self-Test Range	If combined with P0562, GO to Pinpoint Test B If combined with P0563, GO to Pinpoint Test A
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT

		DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > SYMPTOM CHART(S) (3.7L)

Symptom Chart: Charging System

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
System voltage high	Refer to the Pinpoint Test	GO to Pinpoint Test A
System voltage low or battery is discharged	Refer to the Pinpoint Test	GO to Pinpoint Test B
The generator is noisy	Refer to the Pinpoint Test	GO to Pinpoint Test C
Radio interference	Refer to the Pinpoint Test	GO to Pinpoint Test D
Charging system warning indicator is never or always on	Wiring, terminals or connectors IPC Generator PCM	RETRIEVE Diagnostic Trouble Codes (DTCs) from all modules. If any Diagnostic Trouble Codes (DTCs) are found, Refer to DTC Chart . If no Diagnostic Trouble Codes (DTCs) are found, REFER to: Instrumentation, Message Center and Warning Chimes .
Load Shed Message Displays in IPC message center and/or centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H
Battery Saver - System Off displays in centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

Refer to Charging System for schematic and connector information.

NOTE: Diagnostic Trouble Code (DTC) P0563 can be set if the vehicle has been recently jump started or the battery has been recently charged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above or below their calibrated setpoints, a DTC sets.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0563	System Voltage High	This DTC sets in the PCM when the PCM detects voltage from the charging system greater than 15.9 volts with vehicle speed above 8 km/h (5 mph).
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Generator
- Engine, generator or battery ground
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

A1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

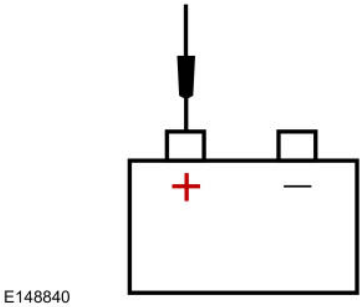
Yes	CORRECT the cause as necessary.

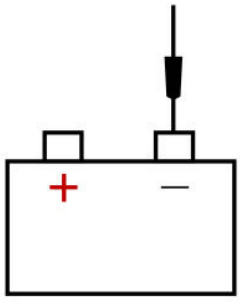
No	GO to A2

A2 RETRIEVE THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.





Is DTC P0620, P0625 or P0626 present?

Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

No	GO to A3

A3 COMPARE THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WITH BATTERY VOLTAGE

With the engine running at idle, measure and record:

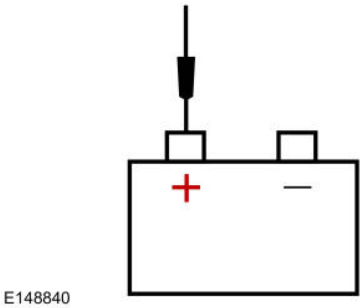
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

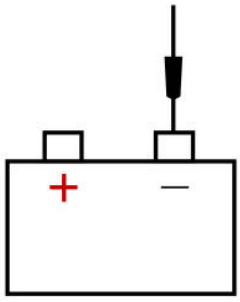
Using a diagnostic scan tool, view the PCM PID GENVDSD.

Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to A6

No	GO to A4





A4 MEASURE THE "A" SENSE VOLTAGE

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

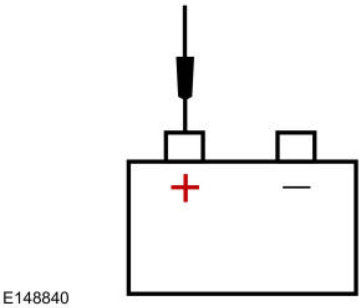
Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

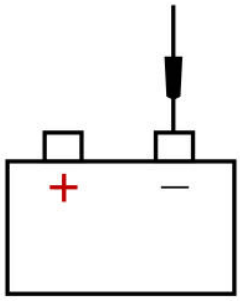
Is the "A" sense voltage equal to the recorded battery voltage?

Yes	GO to A5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.





NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A5 "A" SENSE CIRCUIT LOAD TEST

Ignition ON.

Measure and record:

Positive Lead	Measurement	Negative Lead

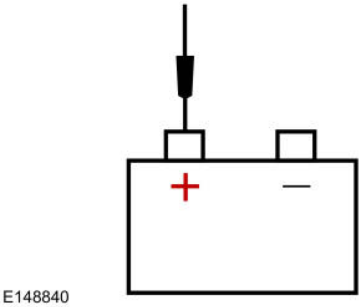
	/ Action	
 E148840		 E148841

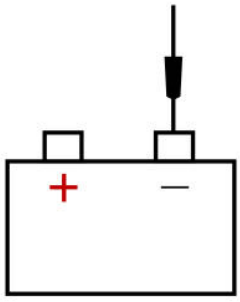
Connect the load to the circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to A6





No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

A6 CHECK FOR INTERMITTENT IN THE REGULATOR CIRCUIT

Connect Generator C102B .

Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

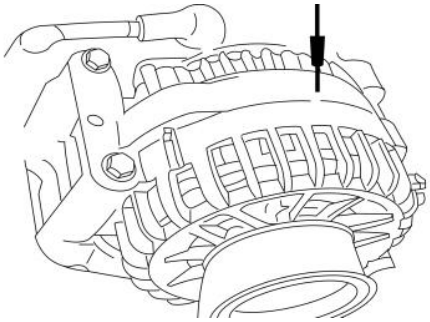
Perform a wiggle test on the generator wiring and following connections while measuring voltage:

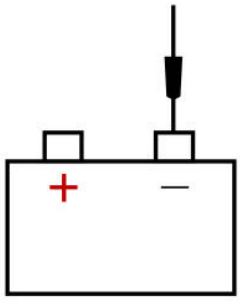
Generator C102B

Inline C1046

Does battery voltage change more than 0.5 volt?

Yes	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.





No	GO to A7

A7 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

Connect Generator C102B .

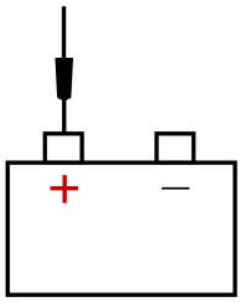
Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to A8



No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

A8 CHECK THE GENERATOR OUTPUT

Increase the engine RPM until the generator starts to generate output.

With the engine running, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		Ground

Is the voltage above 15.2 volts?

Yes	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

No	GO to A9

A9 MONITOR THE GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD) PIDS

Ignition OFF.

Disconnect Generator C102B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

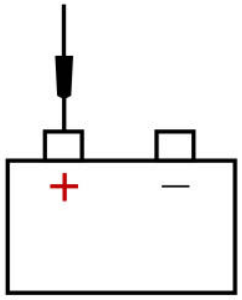
Start the engine.

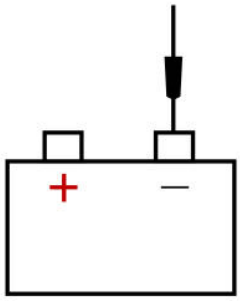
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENVDSD.

Do the Parameter Identifications (PIDs) read within 5% of each other?





Yes	GO to A10

No	GO to A13

A10 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		 E148841

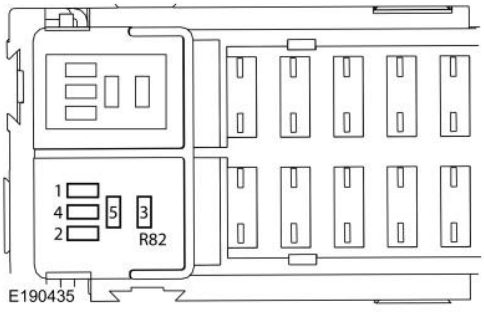
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

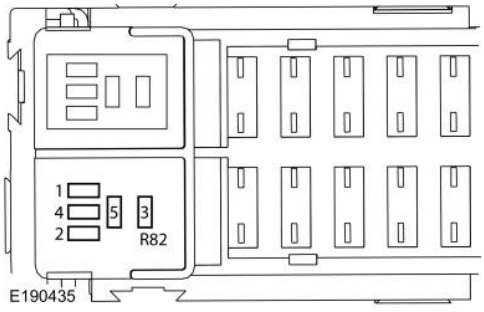
Monitor the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

No	GO to A11

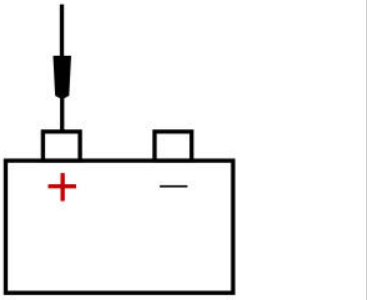




A11 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

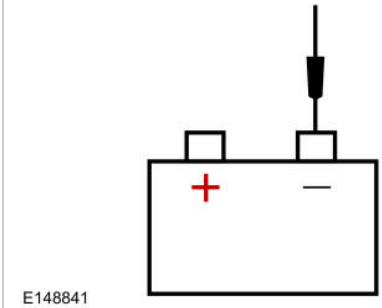
Ignition OFF.

Disconnect BJB PCM power relay.



Disconnect PCM C1381B .

Connect a fused jumper wire:



Positive Lead	Measurement / Action	Negative Lead
 E190435 BJB PCM Relay pin 3		 E190435 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-97		Ground
C1381B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to A12

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

A12 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

Connect the load to a suitable 12 volt power connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-5		Ground
C1381B-100		Ground
C1381B-102		Ground
C1381B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to A13

No	REPAIR the affected circuit(s).

A13 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

System Voltage Low or Battery is Discharged

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The PCM monitors this B+ voltage through its own voltage supply circuit.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions

P0562	System Voltage Low	If voltage drops 1.5 volts or more below the generator voltage desired (calculated by the PCM), this DTC sets after 30 seconds.
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Fuses or fusible links
- Generator
- Generator clutch (if equipped)
- PCM
- High current BJB
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the battery.
- Inspect the high current BJB for loose or corroded connections.
- Inspect the generator clutch (manual transmission only).

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to B2

B2 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0620, P0625 or P0626 present?

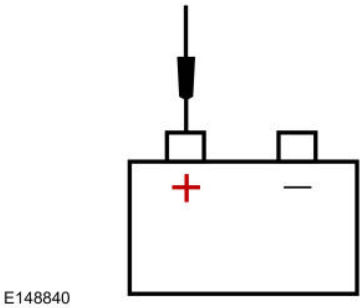
Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

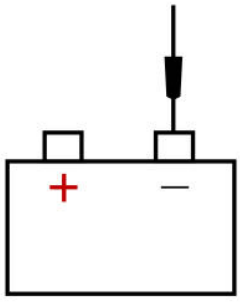
No	GO to B3

B3 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead

C102D-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to B4

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 3.7L Duratec (227kW/301PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

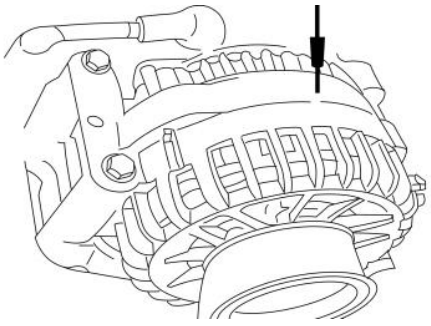
B4 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

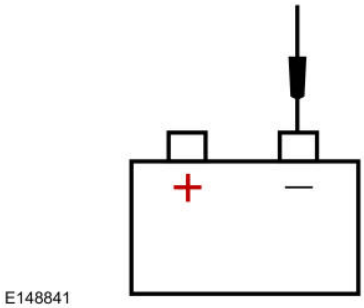
Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102D-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.





Is the voltage drop less than 0.5 volt?

Yes	GO to B5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

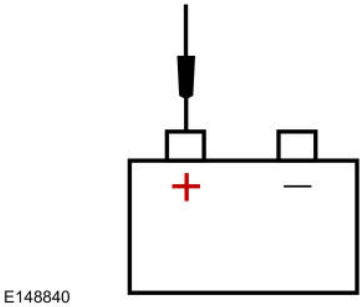
B5 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

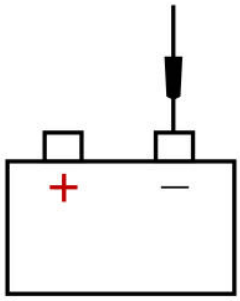
With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to B6





No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

B6 MONITOR THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WHILE COMMANDED

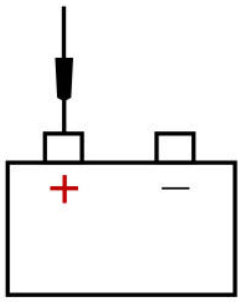
Using a diagnostic scan tool, view the PCM GENVDSD PID.

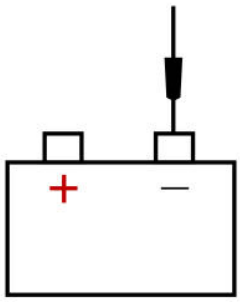
Using a diagnostic scan tool active command, set the PCM PID GENVDSD to 14 volts.

With the engine running at idle, measure battery and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Is the recorded battery voltage within ±0.5 volt of the PID?





Yes	GO to B7

No	With automatic transmission, INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) . With manual transmission, GO to B11

B7 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, headlamps on and blower on high, measure and record:

Positive Lead	Measurement / Action	Negative Lead

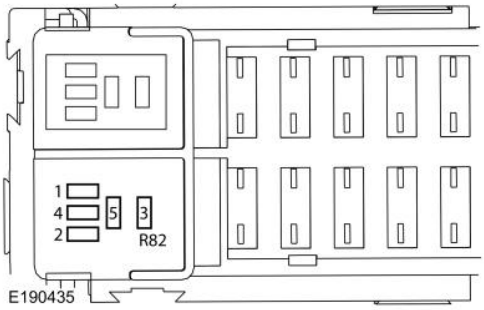
 E148840		 E148841

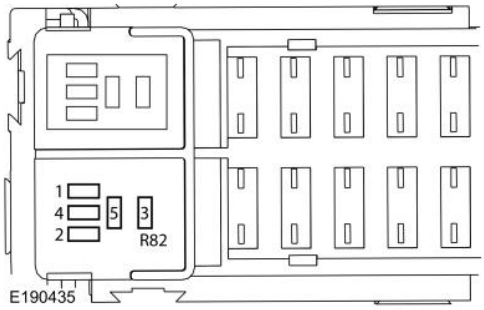
Using a diagnostic scan tool, view the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to B8

No	REPAIR high resistance or loose connections in the affected PCM power circuit(s).

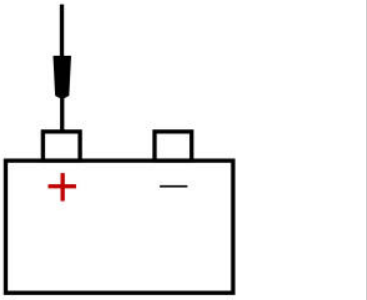




B8 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

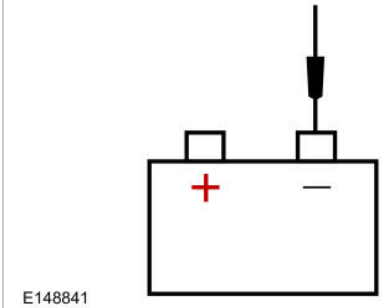
Ignition OFF.

Disconnect BJB PCM power relay.



Disconnect PCM C1381B .

Connect a fused jumper wire:



Positive Lead	Measurement / Action	Negative Lead
 E190435 BJB PCM Relay pin 3		 E190435 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-97		Ground
C1381B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to B9

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

B9 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

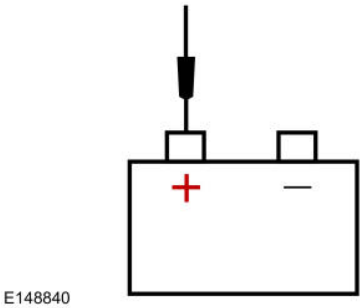
Connect the load to a suitable 12 volt power connection.

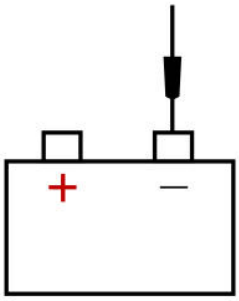
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-5		Ground
C1381B-100		Ground
C1381B-102		Ground
C1381B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to B10





No	REPAIR the affected circuit(s).

B10 MONITOR THE SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION)

NOTE: Measure battery voltage at the battery.

With the engine running at idle, turn off all accessory loads.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Using a diagnostic scan tool, view PCM PID VPWR and record.

Momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the PID.

Does the PID stay within 0.5 volt of the recorded battery voltage when the engine Revolutions Per Minute (RPM) are increased?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSPECT and REPAIR any connector or pin issues found. If no connector or pin issues are found, Perform the battery drain test. REFER to: Battery Drain Check .

No	GO to B12

B11 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

No	INSTALL a new generator clutch. REFER to: GENERATOR PULLEY .

B12 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

Normal Operation and Fault Conditions

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures can also produce an audible noise.

Possible Sources

- FEAD belt
- Loose bolts/brackets
- Generator/pulleys

Visual Inspection and Diagnostic Pre-checks

- Inspect the FEAD belt.
- Inspect for loose bolts/brackets.
- Inspect the generator/pulley.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

C1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

Ignition OFF.

Check the FEAD belt and tensioner for damage and correct installation. REFER to: Accessory Drive .

Is the accessory drive OK?

Yes	GO to C2

No	REPAIR as necessary.

C2 CHECK THE GENERATOR MOUNTING

Check the generator mounting for loose bolts or misalignment.

Is the generator mounted correctly?

Yes	GO to C3

No	REPAIR as necessary.

C3 CHECK THE GENERATOR FOR NOISE

Start the engine.

With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.

Is the generator the noise source?

Yes	With automatic transmission, INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) . With manual transmission, GO to C4

No	REFER to: ENGINE SYSTEM - GENERAL INFORMATION to diagnose the source of the engine noise.

C4 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

No	INSTALL a new generator clutch. REFER to: GENERATOR PULLEY .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST D : RADIO INTERFERENCE

Radio Interference

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

NOTE: If the Original Equipment Manufacturer (OEM) Audio Control Module (ACM) has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to Original Equipment Manufacturer (OEM) condition before following this pinpoint test.

NOTE: If the engine is operated at greater than 2, 000 Revolutions Per Minute (RPM) momentarily, the generator self-excites. Make sure when the generator is disconnected the engine RPM stays below 2, 000 Revolutions Per Minute (RPM). If it rises above 2, 000 Revolutions Per Minute (RPM), turn the ignition to the OFF position and start the test over again.

NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Possible Sources

- Generator
- In-vehicle entertainment system
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator.
- Inspect the in-vehicle entertainment system.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST D : RADIO INTERFERENCE > PINPOINT TEST D : RADIO INTERFERENCE

D1 VERIFY THE GENERATOR IS THE SOURCE OF THE AUDIO SYSTEM INTERFERENCE

Start the engine.

Allow the engine to idle.

Tune the audio system to a station where interference is present.

Ignition OFF.

Disconnect Generator C102B .

Disconnect Generator C102D .

Start the engine.

Allow the engine to idle.

Is the interference present with the generator disconnected?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

Refer to Power Distribution for schematic and connector information.

Normal Operation and Fault Conditions

The generator current sensor is a Hall-effect sensor attached to the generator B+ cable. It is supplied a 5 volt reference and ground from the PCM. The PCM reads the generator current sensor feedback voltage to determine how much current is flowing through the generator B+ cable.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0A5A	Generator Current Sensor Circuit	Sets in the PCM when the PCM

	Range/Performance	does not detect current through the generator current sensor and there are no generator current sensor circuit Diagnostic Trouble Codes (DTCs) set.
P0A5B	Generator Current Sensor Circuit Low	Sets in the PCM when the PCM senses lower than expected voltage on the generator current sensor feedback circuit, indicating an open or a short directly to ground.
P0A5C	Generator Current Sensor Circuit High	Sets in the PCM when the PCM senses higher than expected voltage on the generator current sensor feedback circuit, indicating a short directly to voltage.

Possible Sources

- Generator current sensor
- Generator clutch (if equipped)
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator current sensor.
- Inspect the generator current sensor connector.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

E1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to E2 For DTC P0A5B, GO to E3 For DTC P0A5C, GO to E6

E2 CHECK THE GENERATOR CURRENT SENSOR

Ignition OFF.

Inspect the generator current sensor for the following:

physical damage

corrosion

disconnected electrical connector

generator B+ cable routed through the generator current sensor

debris between the generator current sensor and the generator B+ cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor .

No	GO to E10

E3 CHECK THE GENERATOR CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E4

No	If the voltage is less than 4.8 volts, REPAIR the circuit for an open or high resistance. If the voltage is greater than 5.2 volts, REPAIR the circuit for a short to voltage.

E4 CHECK THE GENERATOR CURRENT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E5

No	REPAIR the circuit for an open or high resistance.

E5 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E6

No	REPAIR the circuit for an open or high resistance.

E6 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1381B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to E7

E7 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C1381B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E8

No	REPAIR the circuit.

E8 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR VOLTAGE REFERENCE CIRCUIT

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	C1645-1
C1645-3	Ω	C1645-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to E9

No	REPAIR the affected circuit.

E9 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-53	Ω	C1645-3

Is the resistance less than 3 ohms?

Yes	GO to E10

No	REPAIR the circuit.

E10 CHECK THE GENERATOR CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Generator current sensor C1645 .

Inspect the generator current sensor connector for the following:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect and correctly seat the generator current sensor connector.

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the PCM self-test

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to E11

No	The system is operating correctly at this time. The concern may have been caused by an intermittently loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

E11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by

	module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST F : DTC P0620, P065B

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit. The PCM uses the generator command (GENCOM) circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the "A" sense circuit are open or shorted to ground, the PCM will not be able to control the generator output. When the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage output of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0620	Generator Control Circuit	The PCM sets this DTC if the GENCOM circuit, "A" sense circuit, or B+ circuit is open or shorted to ground.
P065B	Generator Control Circuit Range/performance	The PCM sets this DTC when the generator reports an internal regulator failure.

Possible Sources

- Fuses or Fusible Links
- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST F : DTC P0620, P065B > PINPOINT TEST F : DTC P0620, P065B

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint

test.

NOTE: Do not have a battery charger attached during vehicle testing.

F1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

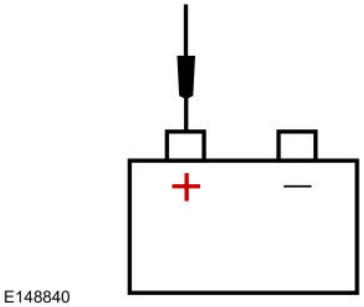
Yes	GO to F2

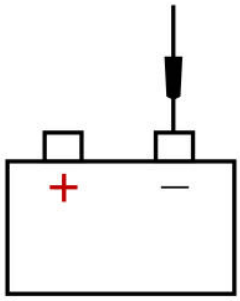
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

F2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to F3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 3.7L Duratec (227kW/301PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102D-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

Is the voltage drop less than 0.5 volt?

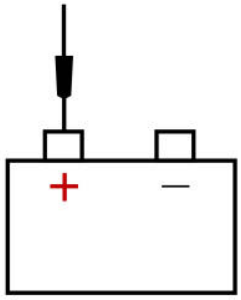
Yes	GO to F4

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

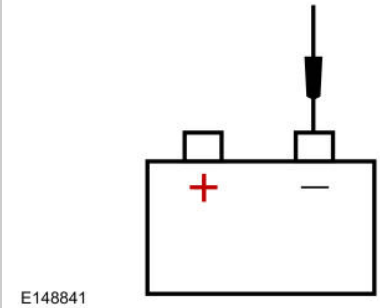
NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

F4 "A" SENSE CIRCUIT LOAD TEST



Ignition OFF.

Disconnect Generator C102B .



Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to F5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F5 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1381B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to F6

F6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to F7

No	REPAIR the circuit.

F7 CHECK THE GENERATOR COMMAND CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-13	Ω	C102B-2

Is the resistance less than 3 ohms?

Yes	GO to F8

No	REPAIR the circuit.

F8 COMPARE THE GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD) PIDS

Ignition OFF.

Connect PCM C1381B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

No	REMOVE the fused jumper wire. GO to F9

F9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST G : DTC P0625 OR P0626

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and results in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and results in DTC P0626 setting in the PCM.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions

P0625	Generator Field Terminal Circuit Low	The PCM sets this DTC if the GENMON circuit is shorted to ground, the "A" sense circuit is open or the B+ circuit is open. This DTC also sets by a faulted PCM or generator.
P0626	Generator Field Terminal Circuit High	The PCM sets this DTC if the GENMON circuit is open or shorted to power. This DTC can also be set by a faulted PCM or generator.

Possible Sources

- Battery
- Fuses or Fusible Links
- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST G : DTC P0625 OR P0626 > PINPOINT TEST G : DTC P0625 OR P0626

G1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

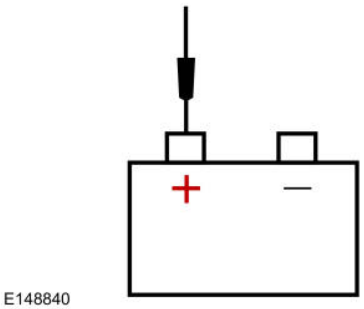
Yes	GO to G2

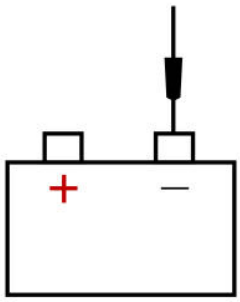
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

G2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to G3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 3.7L Duratec (227kW/301PS) . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102D-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

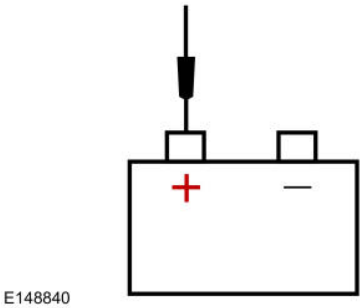
Is the voltage drop less than 0.5 volt?

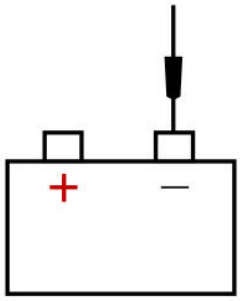
Yes	For DTC P0625, GO to G4 For DTC P0626, GO to G5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.





G4 "A" SENSE CIRCUIT LOAD TEST

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to G5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G5 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C1381B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to G6

G6 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to G7

No	REPAIR the circuit.

G7 CHECK THE GENERATOR MONITOR CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-26	Ω	C102B-1

Is the resistance less than 3 ohms?

Yes	GO to G8

No	REPAIR the circuit.

G8 CHECK THE GENERATOR B+ INTERNAL RESISTANCE

Disconnect Generator C102B .

Disconnect Generator C102D .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator B+ Terminal	Ω	Generator case

Is the resistance greater than 25K ohms?

Yes	GO to G9

No	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

G9 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator pin 1 (Component Side)	Ω	Generator case
Generator pin 2 (Component Side)	Ω	Generator case
Generator pin 3 (Component Side)	Ω	Generator case

Are the resistances greater than 10, 000 ohms?

Yes	GO to G10

No	INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

G10 COMPARE THE GENMON PID (PARAMETER IDENTIFICATION) AND THE GENCMD PID (PARAMETER IDENTIFICATION)

Connect PCM C1381B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

No	REMOVE the fused jumper wire. GO to G11

G11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN

MESSAGE CENTER

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

When the engine is off and the key is in on or accessory mode, and the BCM determines the battery state of charge is below 50%, or 45 minutes have elapsed, a load shed message is sent over the CAN. This message turns off the audio/navigation system to save the remaining battery charge. Under this condition the a load shed message will be displayed to notify the driver that battery protection actions are active:

- System Off to Save Battery Turn Ignition Off displays on the FCDIM (without touchscreen controls)
- SYSTEM OFF TO SAVE BATTERY PLEASE TURN IGNITION OFF OR START ENGINE displays on the FDIM (with touchscreen controls)
- Battery Saver - System Off displays on the FDIM (with Sync)

These messages displaying may be normal operation and not indicate a fault. Refer to the Owner Literature and REFER to: Charging System - System Operation and Component Description . Load shed messages displaying with the **engine running** or only on the FCDIM or the FDIM (with touchscreen controls) indicates the audio system has detected a fault.

Possible Sources

- Normal operation
- Audio system
- Battery
- BCM
- Fuses or Fusible Links
- Generator
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.
- Inspect the battery for loose or corroded connections.
- Inspect the generator for loose or corroded connections.
- Inspect the BJB for loose or corroded connections.
- Inspect the high current BJB for loose or corroded connections.
- Inspect C1046 for loose or corroded connections.
- Inspect battery and engine grounds for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN

MESSAGE CENTER > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

H1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to H2

H2 VERIFY THE CUSTOMER CONCERN

Verify the customer concern by operating the charging system.

Did the customer indicate battery saver message only appeared in the centerstack with the engine running?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	GO to H3

H3 VERIFY THE NETWORK

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the APIM, BCM, and PCM pass the Network Test?

Yes	GO to H4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

H4 PERFORM PCM (POWERTRAIN CONTROL MODULE) SELF TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	REFER to PCM DTC chart .

No	GO to H5

H5 RETRIEVE ALL CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	For BCM Diagnostic Trouble Codes (DTCs) refer to BCM DTC chart in this article. For APIM or ACM Diagnostic Trouble Codes (DTCs), Refer to the appropriate article for the procedure. For other battery or charging system related Diagnostic Trouble Codes (DTCs), REFER to: Diagnostic Trouble Code Charts .

No	GO to H6

H6 CHECK BCM (BODY CONTROL MODULE) BAT_ST_CHRG PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	GO to H8

No	GO to H7

NOTE: The battery state of charge is too low and needs to be relearned. Refer to the Description and Operation for more information on battery state of charge.

H7 RELEARN BATTERY STATE OF CHARGE

Remove all accessories from the lighter, all power outlets and DC/AC inverter (if equipped).

NOTE: The key should not be left in the vehicle but should be left in a secure location away from the vehicle such as a lock box.

Allow vehicle to sit undisturbed for at least 6 hours.

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	The concern may have been caused by too low of a battery state of charge. REVIEW Energy Management operation with customer and return vehicle to customer.

No	GO to H8

H8 VERIFY INLINE CONNECTOR

Inspect inline connector C1046 for secure connection.

Disconnect Inline connector C1046 .

Inspect for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Were any concerns present?

Yes	CORRECT the cause as necessary.

No	GO to H9

H9 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

For information on the battery current sensor, REFER to: Charging System - System Operation and Component Description .

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B130C:12	Load Shed Control Circuit Short To Battery	This DTC sets in the BCM when the BCM senses a short in the battery current sensor control circuit.
B130C:14	Load Shed Control Circuit Short To Ground or Open	This DTC sets in the BCM when the BCM senses an open or ground in the battery current sensor control circuit.
B1438:03	Battery Current Sensor, FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	This DTC sets in the BCM when the BCM does not indicate current from the battery current sensor.

Possible Sources

- Battery current sensor
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the battery current sensor
- Generator clutch (if equipped)
- Inspect the battery current sensor connector

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS (3.7L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

I1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to I2 For DTC P0A5B, GO to I6 For DTC P0A5C, GO to I10

I2 CHECK THE BATTERY CURRENT SENSOR

Inspect the battery current sensor for the following:

physical damage

corrosion

disconnected electrical connector

battery ground cable routed through the battery current sensor

debris between the battery current sensor and the battery ground cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary. GO to I14

No	GO to I3

I3 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT

Ignition OFF.

Disconnect Battery current sensor C1646 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I7

No	If the voltage is less than 4.8 volts, GO to I5 If the voltage is greater than 5.2 volts, GO to I4

I4 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Using the Terminal Release Kit, release and temporarily remove BCM C2280F-3 .

Connect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	INSTALL C2280F-3 and GO to I15

I5 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I6

No	REPAIR the circuit.

I6 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	C2280F-3

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I7 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		C1646-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I10

No	GO to I8

I8 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I9

I9 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect BCM C2280C .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1646-2	Ω	C2280F-19

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I10 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I11

I11 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I12

No	REPAIR the circuit.

I12 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C2280F-8

Is the resistance less than 3 ohms?

Yes	GO to I13

No	REPAIR the circuit.

I13 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C1646-1
C1646-3	Ω	C1646-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to I14

No	REPAIR the affected circuit.

I14 CHECK THE BATTERY CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Battery Current Sensor C1646 , if necessary.

Inspect the battery current sensor connector for:

- corrosion (install new connector or terminals - clean module pins)
- damaged or bent pins - install new terminals/pins
- pushed-out pins - install new pins as necessary

Connect Battery Current Sensor C1646 .

Connect BCM C2280F .

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the BCM self-test.

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new battery current sensor. REFER to: Battery Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to I15

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

I15 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

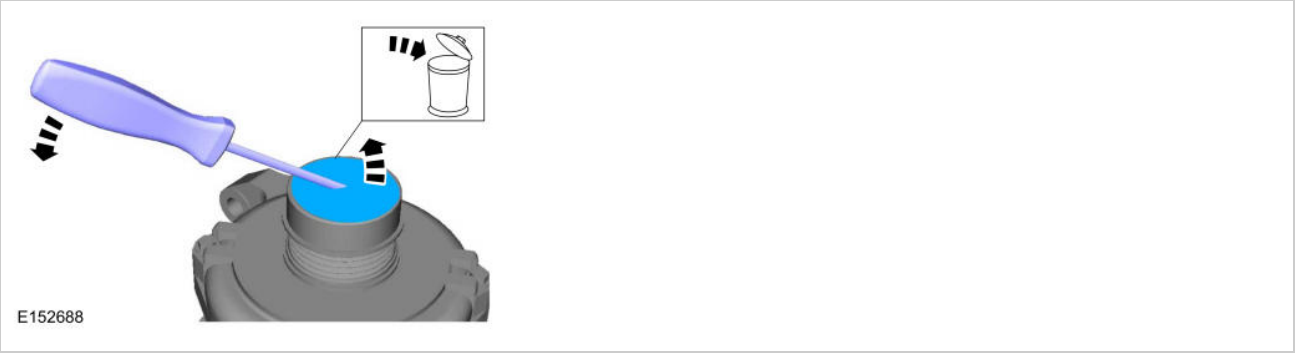
damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

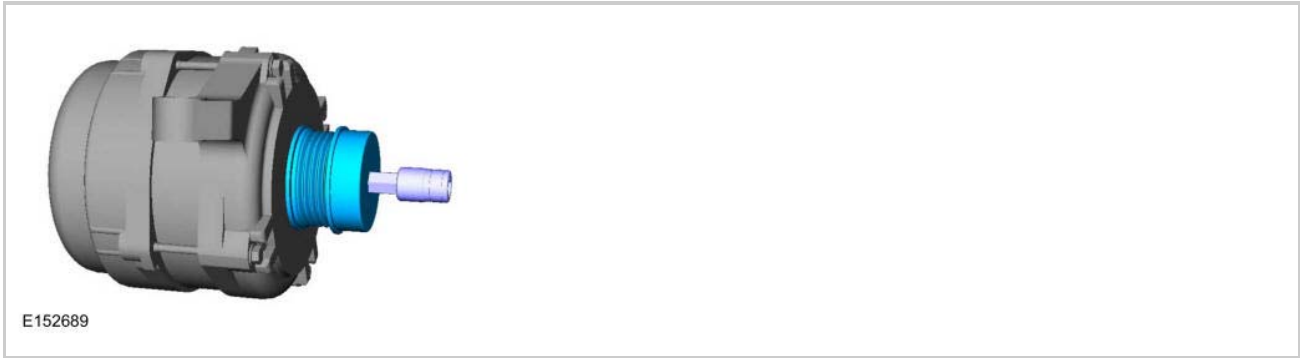
Is the concern still present?



Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) > COMPONENT TEST - GENERATOR CLUTCH



1.

Remove the generator. REFER to: Generator - 3.7L Duratec (227kW/301PS) .

2.

Using a small screwdriver or similar tool, insert the tool through the rubber button on the center of the pulley cap and pry off the cap. Discard the cap. A new cap must be installed if the clutch is OK.

3.

Using a 17 mm hex tool bit (such as a Snap-on ® SAM17E2 or equivalent) and socket wrench, insert the 17 mm hex tool bit into the end of the clutch shaft.

4.

While holding the clutch pulley firmly by hand, turn the clutch shaft clockwise. The shaft should rotate smooth and freely. If the shaft rotation is rough or seized, install a new generator clutch. REFER to: GENERATOR PULLEY .

5.

While holding the clutch pulley firmly by hand, turn the clutch shaft counterclockwise. There should be some resistance (a spring feel). If the shaft rotates freely, install a new generator clutch. REFER to: GENERATOR PULLEY .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > INSPECTION AND VERIFICATION

1.

Verify the customer concern by operating the charging system.

2.

Before diagnosing or repairing the charging system inspect the following items:

- Check the battery for loose, damaged or corroded connections.
- Check the generator for loose, damaged or corroded connections.
- Check engine and battery grounds for loose, damaged or corroded connections.
- Check high current BJB for loose or corroded connections.
- Verify fuses or fusible links.
- Inspect wiring, terminals and connectors.

3.

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

4.

Check for abnormal ignition-off current drain(s). REFER to: Battery Drain Check .

5.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

6.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs). Refer to the appropriate DTC Chart .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > DTC CHARTS (5.0L)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

BCM DTC Chart

NOTE: Diagnose all PCM DTCs first.

DTC	Description	Action
B130C:12	Load Shed Control Circuit Short To Battery	GO to Pinpoint Test I
B130C:14	Load Shed Control Circuit Short To Ground or Open	GO to Pinpoint Test I
B1438:03	Battery Current Sensor: FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	GO to Pinpoint Test I
All Other DTCs	-	REFER to: Body Control Module (BCM) .

PCM DTC Chart

DTC	Description	Action
P0562	System Voltage Low	GO to Pinpoint Test B
P0563	System Voltage High	GO to Pinpoint Test A
P0620	Generator Control Circuit	GO to Pinpoint Test F
P0625	Generator Field Terminal Circuit Low	GO to Pinpoint Test G
P0626	Generator Field Terminal Circuit High	GO to Pinpoint Test G

P065B	Generator Control Circuit Range/performance	GO to Pinpoint Test F
P0A5A	Generator Current Sensor Circuit Range/Performance	GO to Pinpoint Test E
P0A5B	Generator Current Sensor Circuit Low	GO to Pinpoint Test E
P0A5C	Generator Current Sensor Circuit High	GO to Pinpoint Test E
P1397	System Voltage Out Of Self-Test Range	If combined with P0562, GO to Pinpoint Test B If combined with P0563, GO to Pinpoint Test A
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > SYMPTOM CHART(S) (5.0L)

Symptom Chart: Charging System

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
System voltage high	Refer to the Pinpoint Test	GO to Pinpoint Test A
System voltage low or battery is discharged	Refer to the Pinpoint Test	GO to Pinpoint Test B
The generator is noisy	Refer to the Pinpoint Test	GO to Pinpoint Test C
Radio interference	Refer to the Pinpoint Test	GO to Pinpoint Test D
Charging system warning indicator is never or always on	Wiring, terminals or connectors IPC Generator PCM	RETRIEVE Diagnostic Trouble Codes (DTCs) from all modules. If any Diagnostic Trouble Codes (DTCs) are found, Refer to DTC Chart . If no Diagnostic Trouble Codes (DTCs) are found, REFER to: Instrumentation, Message Center and Warning Chimes .
Load Shed Message Displays in IPC message center and/or centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H
Battery Saver - System Off displays in centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

Refer to Charging System for schematic and connector information.

> *NOTE: Diagnostic Trouble Code (DTC) P0563 can be set if the vehicle has been recently jump started or the battery has been recently charged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.*

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above or below their calibrated setpoints, a DTC sets.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0563	System Voltage High	This DTC sets in the PCM when the PCM detects voltage from the charging system greater than 15.9 volts with vehicle speed above 8 km/h (5 mph).
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Generator
- Engine, generator or battery ground
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS

(5.0L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

A1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

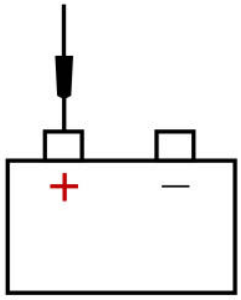
No	GO to A2

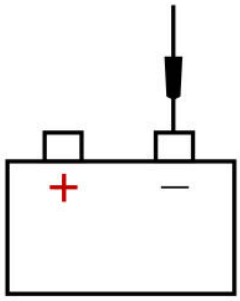
A2 RETRIEVE THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0620, P0625 or P0626 present?





Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

No	GO to A3

A3 COMPARE THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WITH BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead

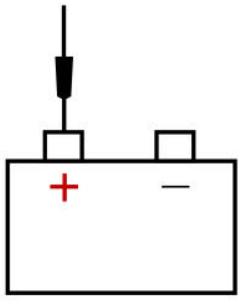
 E148840		 E148841

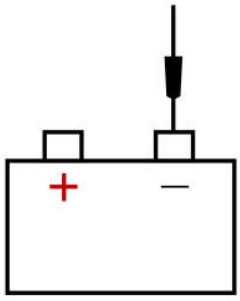
Using a diagnostic scan tool, view the PCM PID GENVDSD.

Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to A6

No	GO to A4





A4 MEASURE THE "A" SENSE VOLTAGE

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

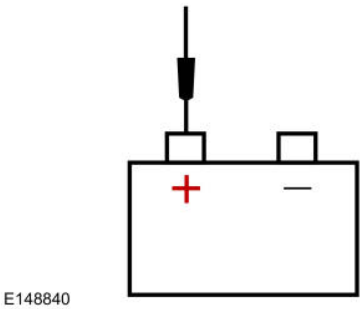
Measure:

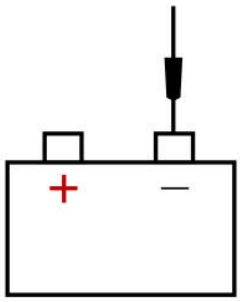
Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage equal to the recorded battery voltage?

Yes	GO to A5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.





NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A5 "A" SENSE CIRCUIT LOAD TEST

Ignition ON.

Measure and record:

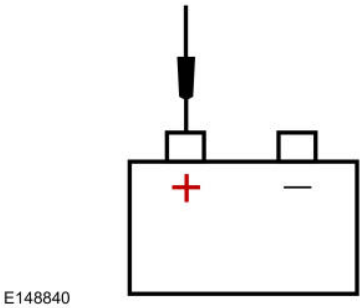
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

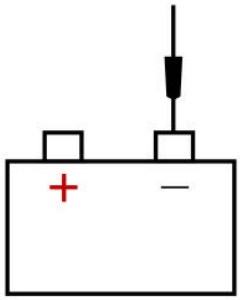
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to A6





No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

A6 CHECK FOR INTERMITTENT IN THE REGULATOR CIRCUIT

Connect Generator C102B .

Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

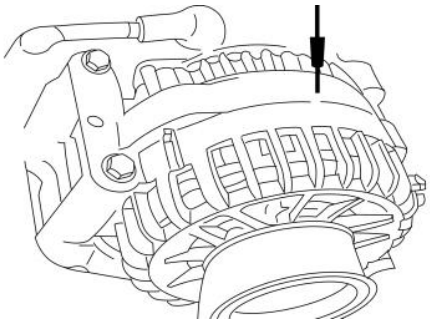
Perform a wiggle test on the generator wiring and following connections while measuring voltage:

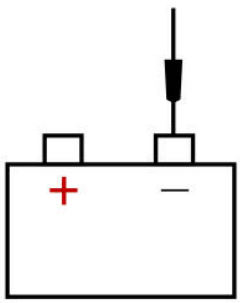
Generator C102B

Inline C1046

Does battery voltage change more than 0.5 volt?

Yes	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.





No	GO to A7

A7 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

Connect Generator C102B .

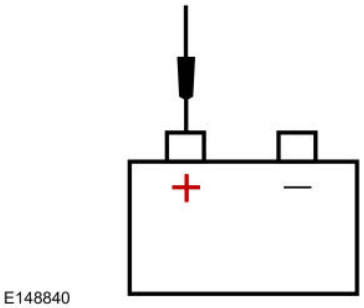
Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
		 E148841

Generator case		

Is the voltage drop less than 0.5 volt?



Yes	GO to A8

No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

A8 CHECK THE GENERATOR OUTPUT

Increase the engine RPM until the generator starts to generate output.

With the engine running, measure and record:

Positive Lead	Measurement / Action	Negative Lead
		Ground

Is the voltage above 15.2 volts?

Yes	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

No	GO to A9

A9 MONITOR THE GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD) PIDS

Ignition OFF.

Disconnect Generator C102B .

Connect a fused jumper wire:

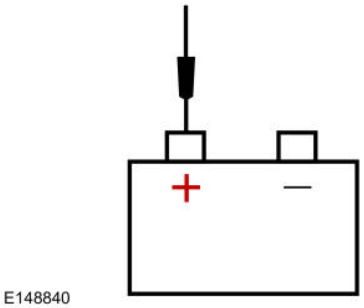
Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

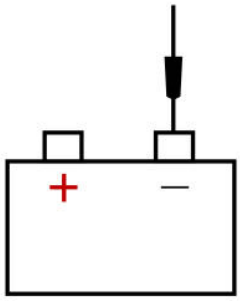
Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENVDSD.





Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	GO to A10

No	GO to A13

A10 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

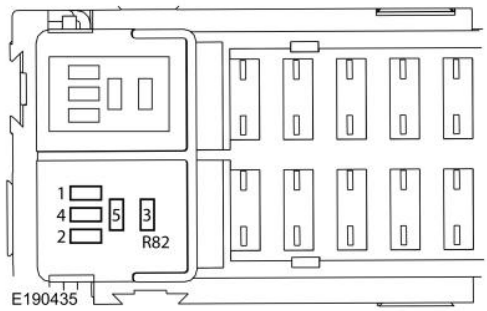
Monitor the PCM PID VPWR.

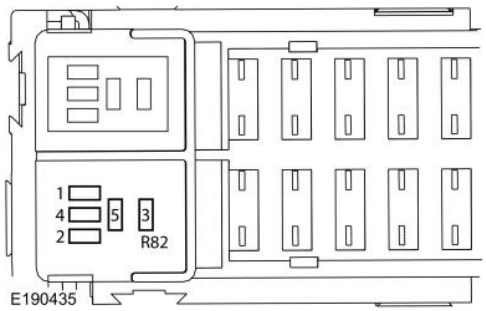
Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

No	GO to A11

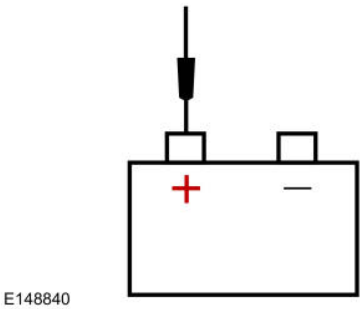
A11 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

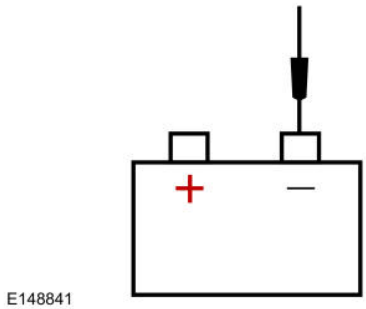




Ignition OFF.

Disconnect BJB PCM power relay.





Disconnect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead

		
BJB PCM Relay pin 3		BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
		

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-97		Ground
C175B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to A12

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

A12 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

Connect the load to a suitable 12 volt power connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-5		Ground
C175B-100		Ground
C175B-102		Ground
C175B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to A13

No	REPAIR the affected circuit(s).

A13 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The PCM monitors this B+ voltage through its own voltage supply circuit.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0562	System Voltage Low	If voltage drops 1.5 volts or more below the generator voltage desired (calculated by the PCM), this DTC sets after 30 seconds.
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Fuses or fusible links
- Generator
- Generator clutch (if equipped)
- PCM
- High current BJB
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the battery.
- Inspect the high current BJB for loose or corroded connections.
- Gen "A" Sense
- Gen B+
- Generator clutch (if equipped)

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED >

PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to B2

B2 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0620, P0625 or P0626 present?

Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

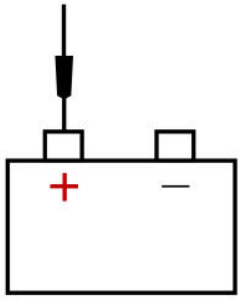
No	GO to B3

B3 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

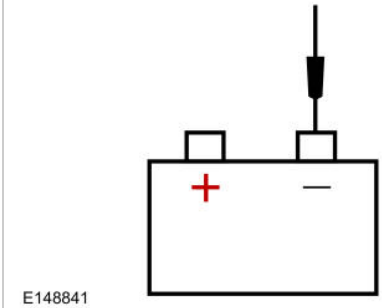
Disconnect all of the generator connectors and inspect for:

corrosion (install new connector or terminals - clean module pins)



damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary



Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to B4

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 5.0L 32V Ti-VCT . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

B4 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

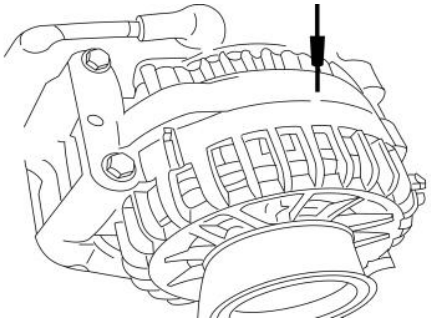
Start the engine.

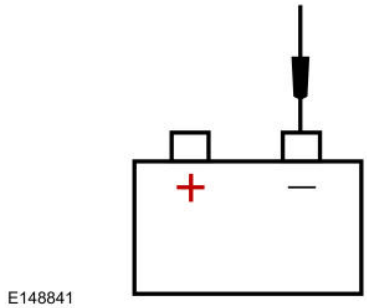
With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

Is the voltage drop less than 0.5 volt?





Yes	GO to B5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

B5 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

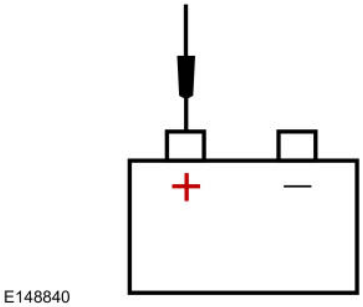
With the engine running at idle, headlamps on and heater blower on high, measure:

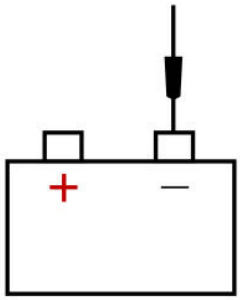
Positive Lead	Measurement / Action	Negative Lead

 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to B6





No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

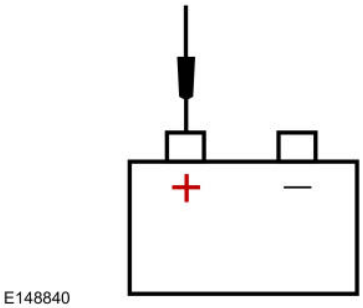
B6 MONITOR THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WHILE COMMANDED

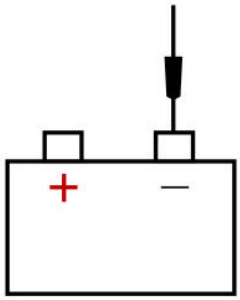
Using a diagnostic scan tool, view the PCM GENVDSD PID.

Using a diagnostic scan tool active command, set the PCM PID GENVDSD to 14 volts.

With the engine running at idle, measure battery and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841





Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to B7

No	With automatic transmission, INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT . With manual transmission, GO to B11

B7 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, headlamps on and blower on high, measure and record:

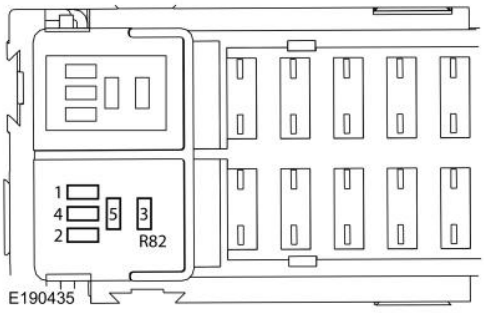
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

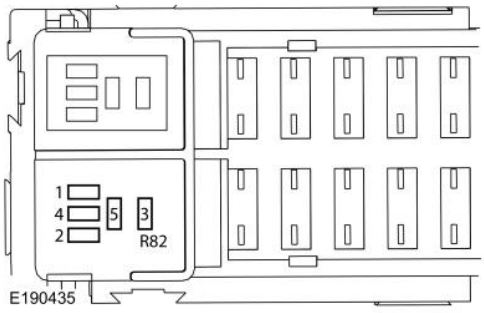
Using a diagnostic scan tool, view the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to B8

No	REPAIR high resistance or loose connections in the affected PCM power circuit(s).

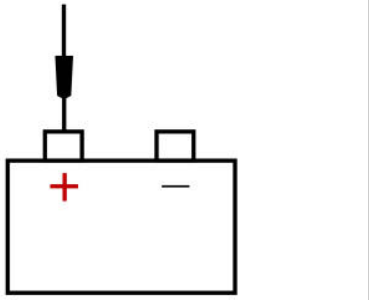




B8 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

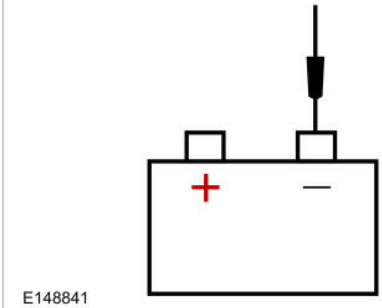
Ignition OFF.

Disconnect BJB PCM power relay.



Disconnect PCM C175B .

Connect a fused jumper wire:



Positive Lead	Measurement / Action	Negative Lead
 E190435 BJB PCM Relay pin 3		 E190435 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-97		Ground
C175B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to B9

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

B9 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

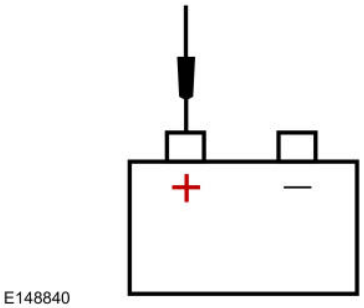
Connect the load to a suitable 12 volt power connection.

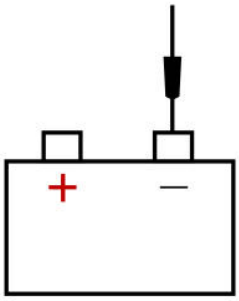
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-5		Ground
C175B-100		Ground
C175B-102		Ground
C175B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to B10





No	REPAIR the affected circuit(s).

B10 MONITOR THE SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION)

NOTE: Measure battery voltage at the battery.

With the engine running at idle, turn off all accessory loads.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Using a diagnostic scan tool, view PCM PID VPWR and record.

Momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the PID.

Does the PID stay within 0.5 volt of the recorded battery voltage when the engine Revolutions Per Minute (RPM) are increased?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSPECT and REPAIR any connector or pin issues found. If no connector or pin issues are found, Perform the battery drain test. REFER to: Battery Drain Check .

No	GO to B12

B11 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

No	INSTALL a new generator clutch. REFER to:GENERATOR PULLEY .

B12 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

Normal Operation and Fault Conditions

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures can also produce an audible noise.

Possible Sources

- FEAD belt
- Loose bolts/brackets
- Generator/pulleys

Visual Inspection and Diagnostic Pre-checks

- Inspect the FEAD belt.

- Inspect for loose bolts/brackets.
- Inspect the generator/pulley.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

C1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

Ignition OFF.

Check the FEAD belt and tensioner for damage and correct installation. REFER to: Accessory Drive .

Is the accessory drive OK?

Yes	GO to C2

No	REPAIR as necessary.

C2 CHECK THE GENERATOR MOUNTING

Check the generator mounting for loose bolts or misalignment.

Is the generator mounted correctly?

Yes	GO to C3

No	REPAIR as necessary.

C3 CHECK THE GENERATOR FOR NOISE

Start the engine.

With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.

Is the generator the noise source?

Yes	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

No	REFER to: ENGINE SYSTEM - GENERAL INFORMATION to diagnose the source of the engine noise.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS

(5.0L) > PINPOINT TEST D : RADIO INTERFERENCE

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

> *NOTE: If the Original Equipment Manufacturer (OEM) Audio Control Module (ACM) has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to Original Equipment Manufacturer (OEM) condition before following this pinpoint test.*

> *NOTE: If the engine is operated at greater than 2, 000 Revolutions Per Minute (RPM) momentarily, the generator self-excites. Make sure when the generator is disconnected the engine RPM stays below 2, 000 Revolutions Per Minute (RPM). If it rises above 2, 000 Revolutions Per Minute (RPM), turn the ignition to the OFF position and start the test over again.*

> *NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.*

Possible Sources

- Generator
- In-vehicle entertainment system
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator.
- Inspect the in-vehicle entertainment system.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST D : RADIO INTERFERENCE > PINPOINT TEST D : RADIO INTERFERENCE

D1 VERIFY THE GENERATOR IS THE SOURCE OF THE AUDIO SYSTEM INTERFERENCE

Start the engine.

Allow the engine to idle.

Tune the audio system to a station where interference is present.

Ignition OFF.

Disconnect Generator C102B .

Disconnect Generator C102C .

Start the engine.

Allow the engine to idle.

Is the interference present with the generator disconnected?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

Refer to Power Distribution for schematic and connector information.

Normal Operation and Fault Conditions

The generator current sensor is a Hall-effect sensor attached to the generator B+ cable. It is supplied a 5 volt reference and ground from the PCM. The PCM reads the generator current sensor feedback voltage to determine how much current is flowing through the generator B+ cable.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0A5A	Generator Current Sensor Circuit Range/Performance	Sets in the PCM when the PCM does not detect current through the generator current sensor and there are no generator current sensor circuit Diagnostic Trouble Codes (DTCs) set.
P0A5B	Generator Current Sensor Circuit Low	Sets in the PCM when the PCM senses lower than expected voltage on the generator current sensor feedback circuit, indicating an open or a short directly to ground.
P0A5C	Generator Current Sensor Circuit High	Sets in the PCM when the PCM senses higher than expected voltage on the generator current sensor feedback circuit, indicating a short directly to voltage.

Possible Sources

- Generator current sensor
- Generator clutch (if equipped)
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator current sensor.
- Inspect the generator current sensor connector.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

E1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to E2 For DTC P0A5B, GO to E3 For DTC P0A5C, GO to E6

E2 CHECK THE GENERATOR CURRENT SENSOR

Ignition OFF.

Inspect the generator current sensor for the following:

physical damage

corrosion

disconnected electrical connector

generator B+ cable routed through the generator current sensor

debris between the generator current sensor and the generator B+ cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor .

No	GO to E10

E3 CHECK THE GENERATOR CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E4

No	If the voltage is less than 4.8 volts, REPAIR the circuit for an open or high resistance. If the voltage is greater than 5.2 volts, REPAIR the circuit for a short to voltage.

E4 CHECK THE GENERATOR CURRENT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E5

No	REPAIR the circuit for an open or high resistance.

E5 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E6

No	REPAIR the circuit for an open or high resistance.

E6 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to E7

E7 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C175B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E8

No	REPAIR the circuit.

E8 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR VOLTAGE REFERENCE CIRCUIT

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	C1645-1
C1645-3	Ω	C1645-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to E9

No	REPAIR the affected circuit.

E9 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-53	Ω	C1645-3

Is the resistance less than 3 ohms?

Yes	GO to E10

No	REPAIR the circuit.

E10 CHECK THE GENERATOR CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Generator current sensor C1645 .

Inspect the generator current sensor connector for the following:

- corrosion (install new connector or terminals - clean module pins)
- damaged or bent pins - install new terminals/pins
- pushed-out pins - install new pins as necessary

Connect and correctly seat the generator current sensor connector.

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the PCM self-test

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to E11

No	The system is operating correctly at this time. The concern may have been caused by an intermittently loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

E11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST F : DTC P0620, P065B

DTC P0620, P065B

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit. The PCM uses the generator command (GENCOM) circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the "A" sense circuit are open or shorted to ground, the PCM will not be able to control the generator output. When the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage output of 13.5 volts and the PCM sends a request to the IPC to

illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0620	Generator Control Circuit	The PCM sets this DTC if the GENCOM circuit, "A" sense circuit, or B+ circuit is open or shorted to ground.
P065B	Generator Control Circuit Range/performance	The PCM sets this DTC when the generator reports an internal regulator failure.

Possible Sources

- Fuses or Fusible Links
- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST F : DTC P0620, P065B > PINPOINT TEST F : DTC P0620, P065B

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

F1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

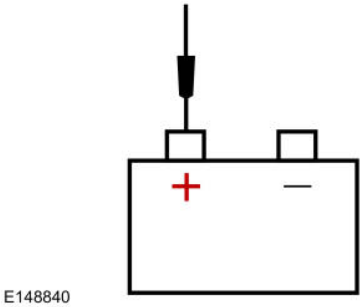
Yes	GO to F2

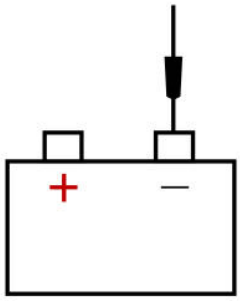
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

F2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to F3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 5.0L 32V Ti-VCT . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead

C102C-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

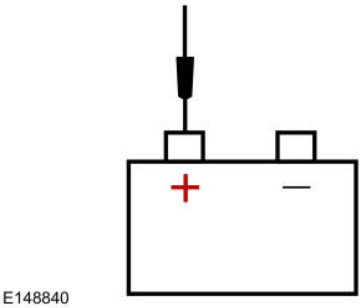
Is the voltage drop less than 0.5 volt?

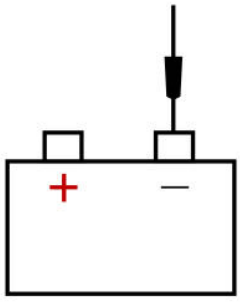
Yes	GO to F4

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.





F4 "A" SENSE CIRCUIT LOAD TEST

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to F5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F5 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to F6

F6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to F7

No	REPAIR the circuit.

F7 CHECK THE GENERATOR COMMAND CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-13	Ω	C102B-2

Is the resistance less than 3 ohms?

Yes	GO to F8

No	REPAIR the circuit.

F8 COMPARE THE GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD) PIDS

Ignition OFF.

Connect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

No	REMOVE the fused jumper wire. GO to F9

F9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST G : DTC P0625 OR P0626

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and results in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and results in DTC P0626 setting in the PCM.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0625	Generator Field Terminal Circuit Low	The PCM sets this DTC if the GENMON circuit is shorted to ground, the "A" sense circuit is open or the B+ circuit is open. This DTC also sets by a faulted PCM or generator.
P0626	Generator Field Terminal Circuit High	The PCM sets this DTC if the GENMON circuit is open or shorted to power. This DTC can also be set by a faulted PCM or generator.

Possible Sources

- Battery
- Fuses or Fusible Links

- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST G : DTC P0625 OR P0626 > PINPOINT TEST G : DTC P0625 OR P0626

G1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

Yes	GO to G2

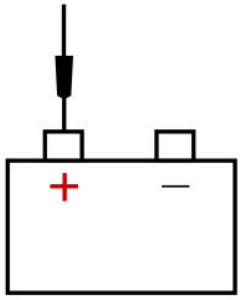
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

G2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

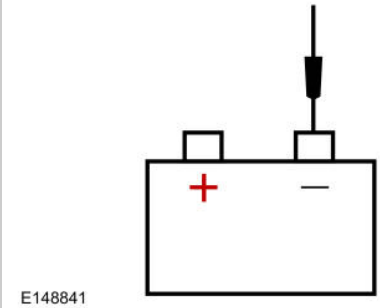
Disconnect all of the generator connectors and inspect for:

corrosion (install new connector or terminals - clean module pins)



damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary



Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to G5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G5 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to G6

G6 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to G7

No	REPAIR the circuit.

G7 CHECK THE GENERATOR MONITOR CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-26	Ω	C102B-1

Is the resistance less than 3 ohms?

Yes	GO to G8

No	REPAIR the circuit.

G8 CHECK THE GENERATOR B+ INTERNAL RESISTANCE

Disconnect Generator C102B .

Disconnect Generator C102C .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator B+ Terminal	Ω	Generator case

Is the resistance greater than 25K ohms?

Yes	GO to G9

No	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

G9 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator pin 1 (Component Side)	Ω	Generator case
Generator pin 2 (Component Side)	Ω	Generator case
Generator pin 3 (Component Side)	Ω	Generator case

Are the resistances greater than 10, 000 ohms?

Yes	GO to G10

No	INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

G10 COMPARE THE GENMON PID (PARAMETER IDENTIFICATION) AND THE GENCMD PID (PARAMETER IDENTIFICATION)

Connect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 5.0L 32V Ti-VCT .

No	REMOVE the fused jumper wire. GO to G11

G11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

When the engine is off and the key is in on or accessory mode, and the BCM determines the battery state of charge is below 50%, or 45 minutes have elapsed, a load shed message is sent over the CAN. This message turns off the audio/navigation system to save the remaining battery charge. Under this condition the a load shed message will be displayed to notify the driver that battery protection actions are active:

- System Off to Save Battery Turn Ignition Off displays on the FCDIM (without touchscreen controls)
- SYSTEM OFF TO SAVE BATTERY PLEASE TURN IGNITION OFF OR START ENGINE displays on

the FDIM (with touchscreen controls)

- Battery Saver - System Off displays on the FDIM (with Sync)

These messages displaying may be normal operation and not indicate a fault. Refer to the Owner Literature and REFER to: Charging System - System Operation and Component Description . Load shed messages displaying with the **engine running** or only on the FCDIM or the FDIM (with touchscreen controls) indicates the audio system has detected a fault.

- Fuses or Fusible Links
- Generator
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.
- Inspect the battery for loose or corroded connections.
- Inspect the generator for loose or corroded connections.
- Inspect the BJB for loose or corroded connections.
- Inspect the high current BJB for loose or corroded connections.
- Inspect C1046 for loose or corroded connections.
- Inspect battery and engine grounds for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

H1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to H2

H2 VERIFY THE CUSTOMER CONCERN

Verify the customer concern by operating the charging system.

Did the customer indicate battery saver message only appeared in the centerstack with the engine running?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	GO to H3

H3 VERIFY THE NETWORK

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the APIM, BCM, and PCM pass the Network Test?

Yes	GO to H4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

H4 PERFORM PCM (POWERTRAIN CONTROL MODULE) SELF TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	REFER to PCM DTC Chart .

No	GO to H5

H5 RETRIEVE ALL CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	For BCM Diagnostic Trouble Codes (DTCs) refer to BCM DTC Chart . For APIM or ACM Diagnostic Trouble Codes (DTCs), Refer to the appropriate article for the procedure. For other battery or charging system related Diagnostic Trouble Codes (DTCs), REFER to: Diagnostic Trouble Code Charts .

No	GO to H6

H6 CHECK BCM (BODY CONTROL MODULE) BAT_ST_CHRG PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	GO to H8

No	GO to H7

NOTE: The battery state of charge is too low and needs to be relearned. Refer to the Description and Operation for more information on battery state of charge.

H7 RELEARN BATTERY STATE OF CHARGE

Remove all accessories from the lighter, all power outlets and DC/AC inverter (if equipped).

NOTE: The key should not be left in the vehicle but should be left in a secure location away from the vehicle such as a lock box.

Allow vehicle to sit undisturbed for at least 6 hours.

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	The concern may have been caused by too low of a battery state of charge. REVIEW Energy Management operation with customer and return vehicle to customer.

No	GO to H8

H8 VERIFY INLINE CONNECTOR

Inspect inline connector C1046 for secure connection.

Disconnect Inline connector C1046 .

Inspect for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Were any concerns present?

Yes	CORRECT the cause as necessary.

No	GO to H9

H9 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

Battery Current Sensor Faults

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

For information on the battery current sensor, REFER to: Charging System - System Operation and Component Description .

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B130C:12	Load Shed Control Circuit Short To Battery	This DTC sets in the BCM when the BCM senses a short in the battery current sensor control circuit.
B130C:14	Load Shed Control Circuit Short To Ground or Open	This DTC sets in the BCM when the BCM senses an open or ground in the battery current sensor control circuit.
B1438:03	Battery Current Sensor, FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	This DTC sets in the BCM when the BCM does not indicate current from the battery current sensor.

Possible Sources

- Battery current sensor
- Generator clutch (if equipped)
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the battery current sensor
- Inspect the battery current sensor connector

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > PINPOINT TESTS (5.0L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

I1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to I2 For DTC P0A5B, GO to I6 For DTC P0A5C, GO to I10

I2 CHECK THE BATTERY CURRENT SENSOR

Inspect the battery current sensor for the following:

physical damage

corrosion

disconnected electrical connector

battery ground cable routed through the battery current sensor

debris between the battery current sensor and the battery ground cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary. GO to I14

No	GO to I3

I3 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT

Ignition OFF.

Disconnect Battery current sensor C1646 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I7

No	If the voltage is less than 4.8 volts, GO to I5 If the voltage is greater than 5.2 volts, GO to I4

I4 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Using the Terminal Release Kit, release and temporarily remove BCM C2280F-3 .

Connect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	INSTALL C2280F-3 and GO to I15

I5 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I6

No	REPAIR the circuit.

I6 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	C2280F-3

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I7 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		C1646-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I10

No	GO to I8

I8 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I9

I9 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect BCM C2280C .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2	Ω	C2280F-19

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I10 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I11

I11 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I12

No	REPAIR the circuit.

I12 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C2280F-8

Is the resistance less than 3 ohms?

Yes	GO to I13

No	REPAIR the circuit.

I13 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1646-3	Ω	C1646-1
C1646-3	Ω	C1646-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to I14

No	REPAIR the affected circuit.

I14 CHECK THE BATTERY CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Battery Current Sensor C1646 , if necessary.

Inspect the battery current sensor connector for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect Battery Current Sensor C1646 .

Connect BCM C2280F .

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the BCM self-test.

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new battery current sensor. REFER to: Battery Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to I15

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

I15 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

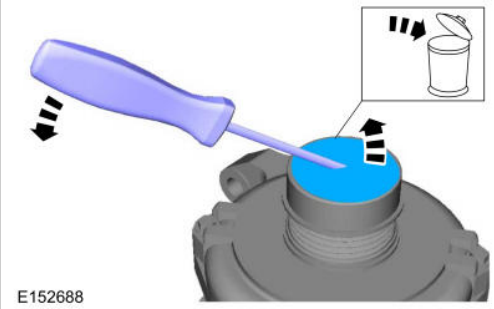
damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

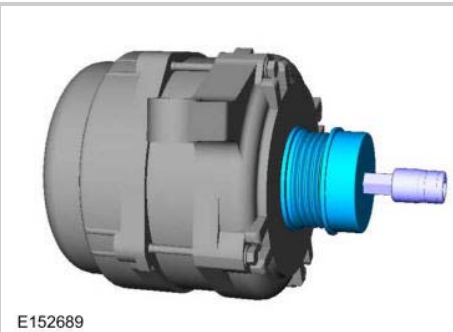
Is the concern still present?



Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.0L 32V TI-VCT > COMPONENT TEST - GENERATOR CLUTCH



1.

Remove the generator. REFER to: Generator - 5.0L 32V Ti-VCT .

2.

Using a small screwdriver or similar tool, insert the tool through the rubber button on the center of the pulley cap and pry off the cap. Discard the cap. A new cap must be installed if the clutch is OK.

3.

Using a 17 mm hex tool bit (such as a Snap-on ® SAM17E2 or equivalent) and socket wrench, insert

the 17 mm hex tool bit into the end of the clutch shaft.

4.

While holding the clutch pulley firmly by hand, turn the clutch shaft clockwise. The shaft should rotate smooth and freely. If the shaft rotation is rough or seized, install a new generator clutch. REFER to: GENERATOR PULLEY .

5.

While holding the clutch pulley firmly by hand, turn the clutch shaft counterclockwise. There should be some resistance (a spring feel). If the shaft rotates freely, install a new generator clutch. REFER to: GENERATOR PULLEY .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > INSPECTION AND VERIFICATION

1.

Verify the customer concern by operating the charging system.

2.

Before diagnosing or repairing the charging system inspect the following items:

- Check the battery for loose, damaged or corroded connections.
- Check the generator for loose, damaged or corroded connections.
- Check engine and battery grounds for loose, damaged or corroded connections.
- Check high current BJB for loose or corroded connections.
- Verify fuses or fusible links.
- Inspect wiring, terminals and connectors.

3.

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES 414-01.

4.

Check for abnormal ignition-off current drain(s). REFER to: Battery Drain Check .

5.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

6.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs). Refer to the appropriate DTC Chart .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > DTC CHARTS (5.2L)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

BCM DTC Chart

NOTE: Diagnose all PCM DTCs first.

DTC	Description	Action
B130C:12	Load Shed Control Circuit Short To Battery	GO to Pinpoint Test I
B130C:14	Load Shed Control Circuit Short To Ground or Open	GO to Pinpoint Test I
B1438:03	Battery Current Sensor: FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	GO to Pinpoint Test I
All Other DTCs	-	REFER to: Body Control Module (BCM) .

PCM DTC Chart

DTC	Description	Action
P0562	System Voltage Low	GO to Pinpoint Test B
P0563	System Voltage High	GO to Pinpoint Test A
P0620	Generator Control Circuit	GO to Pinpoint Test F
P0625	Generator Field Terminal Circuit Low	GO to Pinpoint Test G
P0626	Generator Field Terminal Circuit High	GO to Pinpoint Test G
P065B	Generator Control Circuit Range/performance	GO to Pinpoint Test F
P0A5A	Generator Current Sensor Circuit Range/Performance	GO to Pinpoint Test E
P0A5B	Generator Current Sensor Circuit Low	GO to Pinpoint Test E
P0A5C	Generator Current Sensor Circuit High	GO to Pinpoint Test E
P1397	System Voltage Out Of Self-Test Range	If combined with P0562, GO to Pinpoint Test B If combined with P0563, GO to Pinpoint Test A
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT

		DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > SYMPTOM CHART(S) (5.2L)

Symptom Chart: Charging System

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
System voltage high	Refer to the Pinpoint Test	GO to Pinpoint Test A
System voltage low or battery is discharged	Refer to the Pinpoint Test	GO to Pinpoint Test B
The generator is noisy	Refer to the Pinpoint Test	GO to Pinpoint Test C
Radio interference	Refer to the Pinpoint Test	GO to Pinpoint Test D
Charging system warning indicator is never or always on	Wiring, terminals or connectors IPC Generator PCM	RETRIEVE Diagnostic Trouble Codes (DTCs) from all modules. If any Diagnostic Trouble Codes (DTCs) are found, Refer to DTC Chart . If no Diagnostic Trouble Codes (DTCs) are found, REFER to: Instrumentation, Message Center and Warning Chimes .
Load Shed Message Displays in IPC message center and/or centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H
Battery Saver - System Off displays in centerstack infotainment display	Refer to the Pinpoint Test	GO to Pinpoint Test H

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

Refer to Charging System for schematic and connector information.

NOTE: Diagnostic Trouble Code (DTC) P0563 can be set if the vehicle has been recently jump started or the battery has been recently charged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above or below their calibrated setpoints, a DTC sets.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0563	System Voltage High	This DTC sets in the PCM when the PCM detects voltage from the charging system greater than 15.9 volts with vehicle speed above 8 km/h (5 mph).
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Generator
- Engine, generator or battery ground
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST A : SYSTEM VOLTAGE HIGH > PINPOINT TEST A : SYSTEM VOLTAGE HIGH

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

A1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

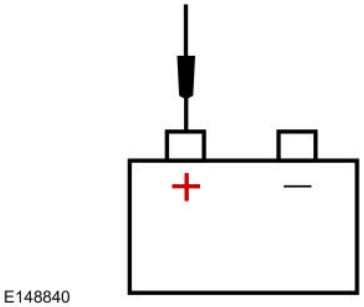
Yes	CORRECT the cause as necessary.

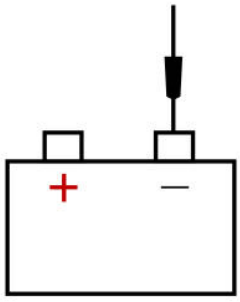
No	GO to A2

A2 RETRIEVE THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.





Is DTC P0620, P0625 or P0626 present?

Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

No	GO to A3

A3 COMPARE THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WITH BATTERY VOLTAGE

With the engine running at idle, measure and record:

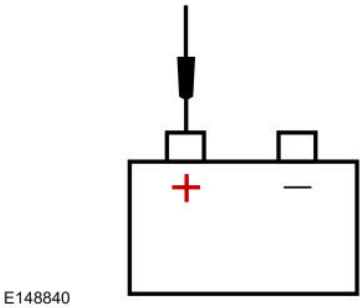
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

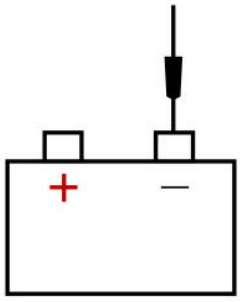
Using a diagnostic scan tool, view the PCM PID GENVDSD.

Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to A6

No	GO to A4





A4 MEASURE THE "A" SENSE VOLTAGE

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

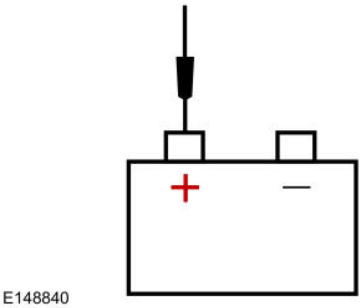
Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

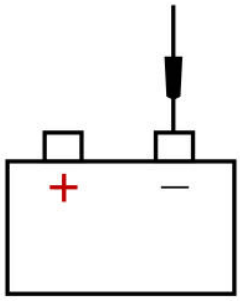
Is the "A" sense voltage equal to the recorded battery voltage?

Yes	GO to A5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.





NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A5 "A" SENSE CIRCUIT LOAD TEST

Ignition ON.

Measure and record:

Positive Lead	Measurement	Negative Lead

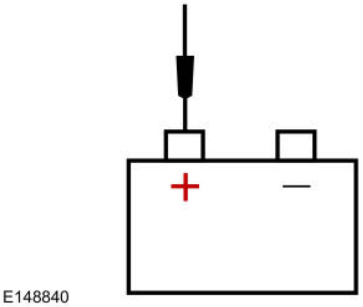
	/ Action	
 E148840		 E148841

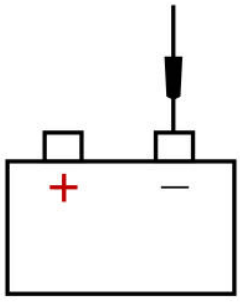
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to A6





No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

A6 CHECK FOR INTERMITTENT IN THE REGULATOR CIRCUIT

Connect Generator C102B .

Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

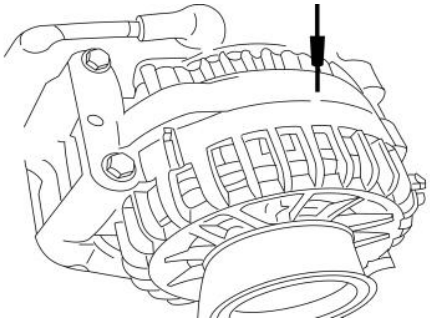
Perform a wiggle test on the generator wiring and following connections while measuring voltage:

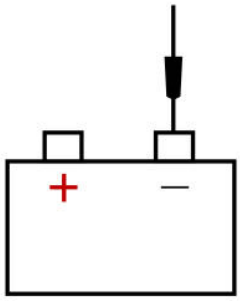
Generator C102B

Inline C1046

Does battery voltage change more than 0.5 volt?

Yes	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.





No	GO to A7

A7 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

Connect Generator C102B .

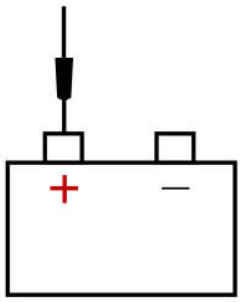
Start the engine.

With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to A8



No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

A8 CHECK THE GENERATOR OUTPUT

Increase the engine RPM until the generator starts to generate output.

With the engine running, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		Ground

Is the voltage above 15.2 volts?

Yes	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

No	GO to A9

A9 MONITOR THE GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD) PIDS

Ignition OFF.

Disconnect Generator C102B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

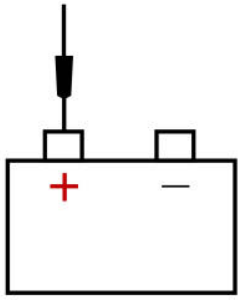
Start the engine.

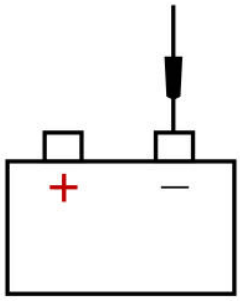
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENVDSD.

Do the Parameter Identifications (PIDs) read within 5% of each other?





Yes	GO to A10

No	GO to A13

A10 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, measure and record:

Positive Lead	Measurement / Action	Negative Lead

 E148840		 E148841

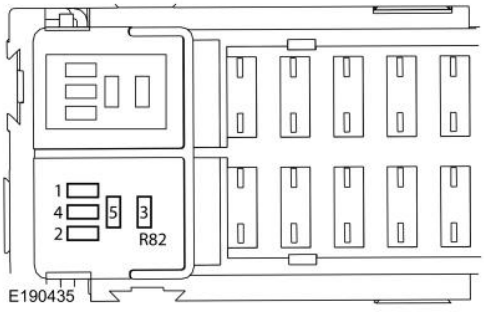
Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

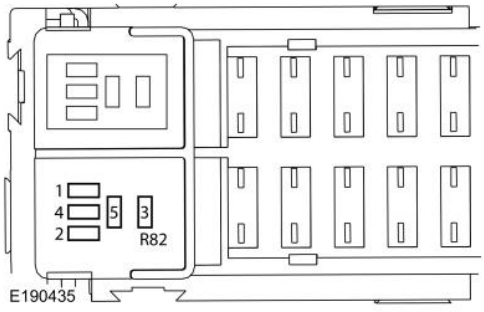
Monitor the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

No	GO to A11

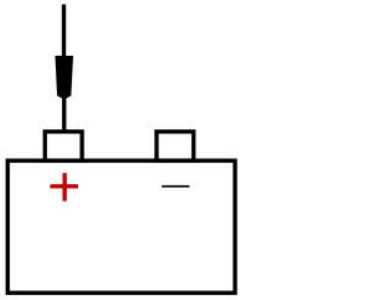




A11 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

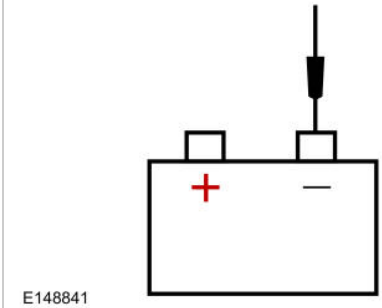
Ignition OFF.

Disconnect BJB PCM power relay.



Disconnect PCM C175B .

Connect a fused jumper wire:



Positive Lead	Measurement / Action	Negative Lead
 BJB PCM Relay pin 3		 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-97		Ground
C175B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to A12

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

A12 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

Connect the load to a suitable 12 volt power connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-5		Ground
C175B-100		Ground
C175B-102		Ground
C175B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to A13

No	REPAIR the affected circuit(s).

A13 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the high current BJB and battery B+ cable. The PCM monitors this B+ voltage through its own voltage supply circuit.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0562	System Voltage Low	If voltage drops 1.5 volts or more below the generator voltage desired

		(calculated by the PCM), this DTC sets after 30 seconds.
P1397	System Voltage Out of Self-Test Range	If the voltage rises above or drops below the calibrated set point, the PCM sets this DTC. This DTC may also be set if the vehicle has been recently jump started or has had a discharged battery.

Possible Sources

- Battery
- Fuses or fusible links
- Generator
- Generator clutch (if equipped)
- PCM
- High current BJB
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the battery.
- Inspect the high current BJB for loose or corroded connections.
- Inspect generator clutch (if equipped)

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED > PINPOINT TEST B : SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

B1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to B2

B2 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0620, P0625 or P0626 present?

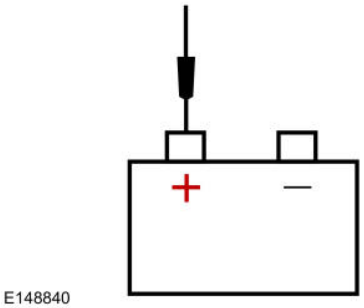
Yes	For DTC P0620, GO to Pinpoint Test F For Diagnostic Trouble Codes (DTCs) P0625 and P0626, GO to Pinpoint Test G

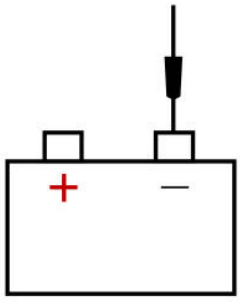
No	GO to B3

B3 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to B4

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 5.2L 32V Ti-VCT . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

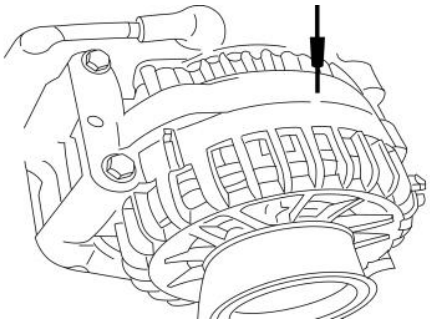
B4 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

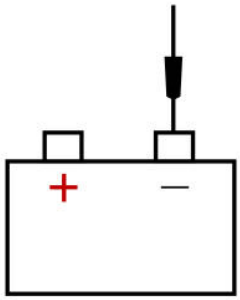
Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.





Is the voltage drop less than 0.5 volt?

Yes	GO to B5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

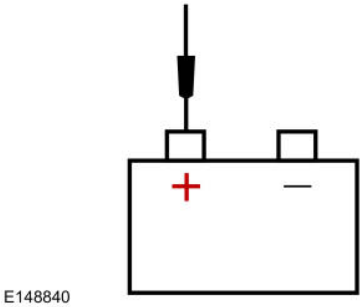
B5 CHECK THE VOLTAGE DROP IN THE VEHICLE GROUNDS

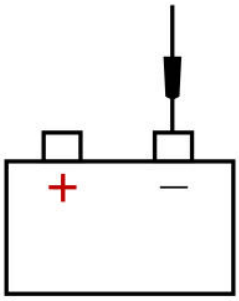
With the engine running at idle, headlamps on and heater blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
 Generator case		 E148841

Is the voltage drop less than 0.5 volt?

Yes	GO to B6





No	INSPECT and REPAIR the engine ground, generator ground or the battery ground for corrosion.

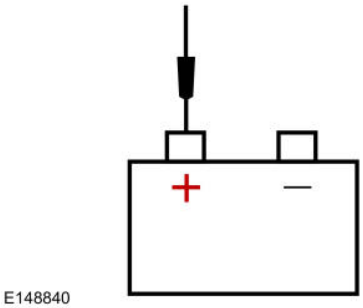
B6 MONITOR THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID (PARAMETER IDENTIFICATION) WHILE COMMANDED

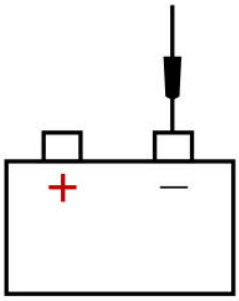
Using a diagnostic scan tool, view the PCM GENVDSD PID.

Using a diagnostic scan tool active command, set the PCM PID GENVDSD to 14 volts.

With the engine running at idle, measure battery and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841





Is the recorded battery voltage within ±0.5 volt of the PID?

Yes	GO to B7

No	GO to B11

B7 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION) TO BATTERY VOLTAGE

With the engine running at idle, headlamps on and blower on high, measure and record:

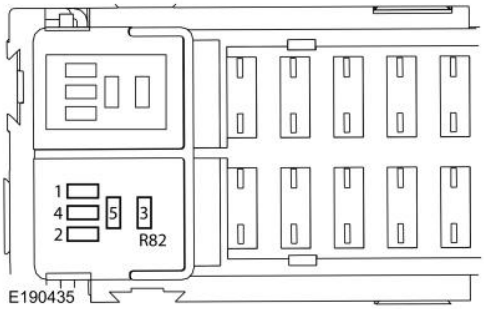
Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

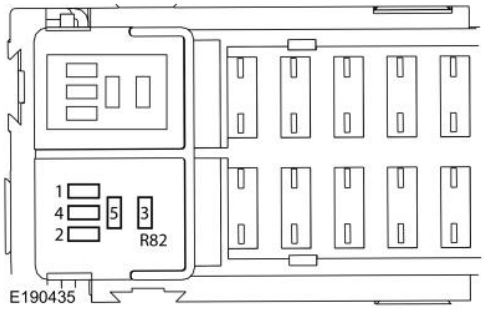
Using a diagnostic scan tool, view the PCM PID VPWR.

Does the PID accurately display battery voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to B8

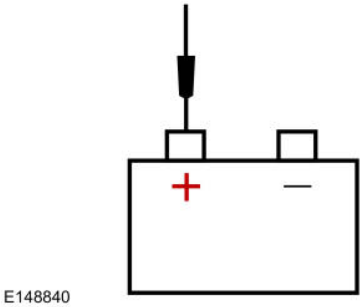
No	REPAIR high resistance or loose connections in the affected PCM power circuit(s).

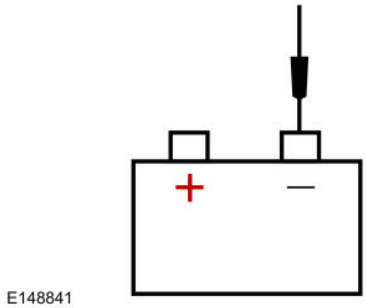




B8 CHECK PCM (POWERTRAIN CONTROL MODULE) SUPPLY VOLTAGE CIRCUITS

Ignition OFF.





Disconnect BJB PCM power relay.

Disconnect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 BJB PCM Relay pin 3		 BJB PCM Relay pin 5

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
		

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

Connect the load to a suitable ground connection.

Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-97		Ground
C175B-99		Ground

Are the voltages within 0.5 volt of the recorded battery voltage?

Yes	REMOVE the fused jumper wire. GO to B9

No	REPAIR the affected circuit(s).

NOTE: The following step will load test the circuit. A headlamp bulb would be an effective load. To avoid connector terminal damage, use the Flex Probe Kit for connector connections.

B9 CHECK PCM (POWERTRAIN CONTROL MODULE) GROUND FOR HIGH RESISTANCE

Connect the load to a suitable 12 volt power connection.

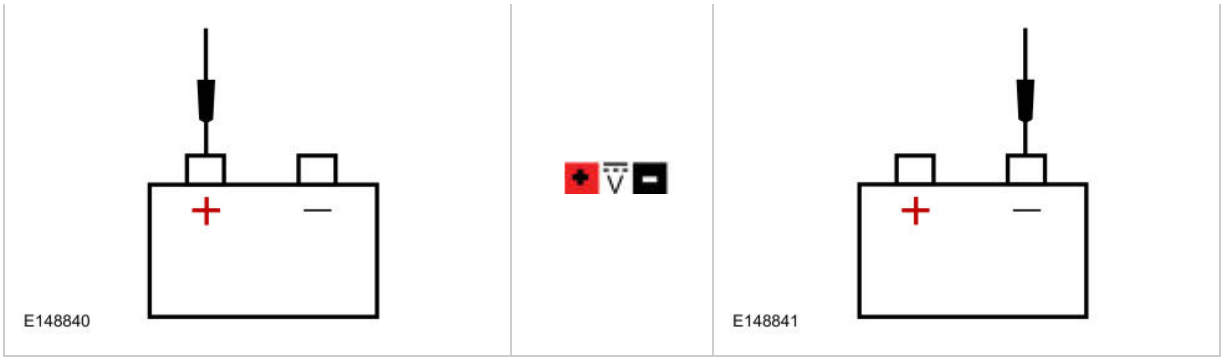
Connect the load to each circuit and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-5		Ground
C175B-100		Ground
C175B-102		Ground
C175B-103		Ground

Is the voltage drop less than 0.5 volt?

Yes	GO to B10

No	REPAIR the affected circuit(s).



B10 MONITOR THE SUPPLY VOLTAGE (VPWR) PID (PARAMETER IDENTIFICATION)

NOTE: Measure battery voltage at the battery.

With the engine running at idle, turn off all accessory loads.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Using a diagnostic scan tool, view PCM PID VPWR and record.

Momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the PID.

Does the PID stay within 0.5 volt of the recorded battery voltage when the engine Revolutions Per Minute (RPM) are increased?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSPECT and REPAIR any connector or pin issues found. If no connector or pin issues are found, Perform the battery drain test. REFER to: Battery Drain Check .

No	GO to B12

B11 CHECK GENERATOR CLUTCH OPERATION

Ignition OFF.

Perform the generator clutch component test .

Is the generator clutch OK?

Yes	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

No	INSTALL a new generator clutch. REFER to: GENERATOR PULLEY .

B12 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

- corrosion (install new connector or terminals - clean module pins)
- damaged or bent pins - install new terminals/pins
- pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

Normal Operation and Fault Conditions

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures can also produce an audible noise.

Possible Sources

- FEAD belt
- Loose bolts/brackets
- Generator/pulleys

Visual Inspection and Diagnostic Pre-checks

- Inspect the FEAD belt.
- Inspect for loose bolts/brackets.
- Inspect the generator/pulley.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE > PINPOINT TEST C : GENERATOR NOISE OR MECHANICAL PERFORMANCE

C1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

Ignition OFF.

Check the FEAD belt and tensioner for damage and correct installation. REFER to: Accessory Drive .

Is the accessory drive OK?

Yes	GO to C2

No	REPAIR as necessary.

C2 CHECK THE GENERATOR MOUNTING

Check the generator mounting for loose bolts or misalignment.

Is the generator mounted correctly?

Yes	GO to C3

No	REPAIR as necessary.

C3 CHECK THE GENERATOR FOR NOISE

Start the engine.

With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.

Is the generator the noise source?

Yes	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

No	REFER to: ENGINE SYSTEM - GENERAL INFORMATION to diagnose the source of the engine noise.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST D : RADIO INTERFERENCE

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

NOTE: If the Original Equipment Manufacturer (OEM) Audio Control Module (ACM) has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to Original Equipment Manufacturer (OEM) condition before following this pinpoint test.

NOTE: If the engine is operated at greater than 2, 000 Revolutions Per Minute (RPM) momentarily, the generator self-excites. Make sure when the generator is disconnected the engine RPM stays below 2, 000 Revolutions Per Minute (RPM). If it rises above 2, 000

Revolutions Per Minute (RPM), turn the ignition to the OFF position and start the test over again.

NOTE: Inspect for any aftermarket accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Possible Sources

- Generator
- In-vehicle entertainment system
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator.
- Inspect the in-vehicle entertainment system.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST D : RADIO INTERFERENCE > PINPOINT TEST D : RADIO INTERFERENCE

D1 VERIFY THE GENERATOR IS THE SOURCE OF THE AUDIO SYSTEM INTERFERENCE

Start the engine.

Allow the engine to idle.

Tune the audio system to a station where interference is present.

Ignition OFF.

Disconnect Generator C102B .

Disconnect Generator C102C .

Start the engine.

Allow the engine to idle.

Is the interference present with the generator disconnected?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS

Refer to Power Distribution for schematic and connector information.

Normal Operation and Fault Conditions

The generator current sensor is a Hall-effect sensor attached to the generator B+ cable. It is supplied a 5 volt reference and ground from the PCM. The PCM reads the generator current sensor feedback voltage to determine how much current is flowing through the generator B+ cable.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0A5A	Generator Current Sensor Circuit Range/Performance	Sets in the PCM when the PCM does not detect current through the generator current sensor and there are no generator current sensor circuit Diagnostic Trouble Codes (DTCs) set.
P0A5B	Generator Current Sensor Circuit Low	Sets in the PCM when the PCM senses lower than expected voltage on the generator current sensor feedback circuit, indicating an open or a short directly to ground.
P0A5C	Generator Current Sensor Circuit High	Sets in the PCM when the PCM senses higher than expected voltage on the generator current sensor feedback circuit, indicating a short directly to voltage.

Possible Sources

- Generator current sensor
- PCM
- Generator clutch
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the generator current sensor.
- Inspect the generator current sensor connector.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST E : GENERATOR CURRENT SENSOR FAULTS > PINPOINT

TEST E : GENERATOR CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

E1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to E2 For DTC P0A5B, GO to E3 For DTC P0A5C, GO to E6

E2 CHECK THE GENERATOR CURRENT SENSOR

Ignition OFF.

Inspect the generator current sensor for the following:

physical damage

corrosion

disconnected electrical connector

generator B+ cable routed through the generator current sensor

debris between the generator current sensor and the generator B+ cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor .

No	GO to E10

E3 CHECK THE GENERATOR CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E4

No	If the voltage is less than 4.8 volts, REPAIR the circuit for an open or high resistance. If the voltage is greater than 5.2 volts, REPAIR the circuit for a short to voltage.

E4 CHECK THE GENERATOR CURRENT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-1		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E5

No	REPAIR the circuit for an open or high resistance.

E5 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		C1645-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to E6

No	REPAIR the circuit for an open or high resistance.

E6 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to E7

E7 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C175B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E8

No	REPAIR the circuit.

E8 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR VOLTAGE REFERENCE CIRCUIT

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1645-3	Ω	C1645-1
C1645-3	Ω	C1645-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to E9

No	REPAIR the affected circuit.

E9 CHECK THE GENERATOR CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-53	Ω	C1645-3

Is the resistance less than 3 ohms?

Yes	GO to E10

No	REPAIR the circuit.

E10 CHECK THE GENERATOR CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Generator current sensor C1645 .

Inspect the generator current sensor connector for the following:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect and correctly seat the generator current sensor connector.

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the PCM self-test

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new generator current sensor. REFER to: Generator Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to E11

No	The system is operating correctly at this time. The concern may have been caused by an intermittently loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

E11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST F : DTC P0620, P065B

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit. The PCM uses the generator command (GENCOM) circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the "A" sense circuit are open or shorted to ground, the PCM will not be able to control the generator output. When the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage output of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0620	Generator Control Circuit	The PCM sets this DTC if the GENCOM circuit, "A" sense circuit, or B+ circuit is open or shorted to ground.
P065B	Generator Control Circuit Range/performance	The PCM sets this DTC when the generator reports an internal regulator failure.

Possible Sources

- Fuses or Fusible Links
- Generator

- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST F : DTC P0620, P065B > PINPOINT TEST F : DTC P0620, P065B

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

F1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

Yes	GO to F2

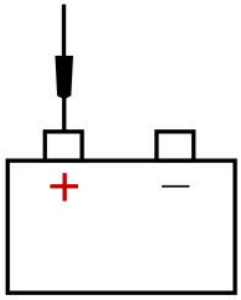
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

F2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

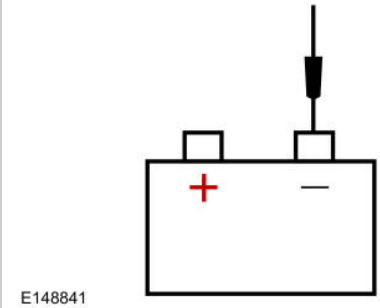
Disconnect all of the generator connectors and inspect for:

corrosion (install new connector or terminals - clean module pins)



damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary



Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to F3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 5.2L 32V Ti-VCT . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

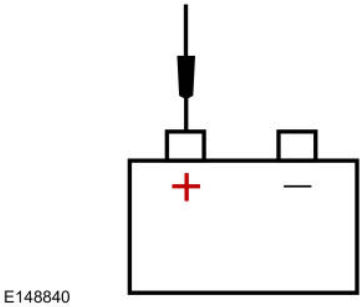
Is the voltage drop less than 0.5 volt?

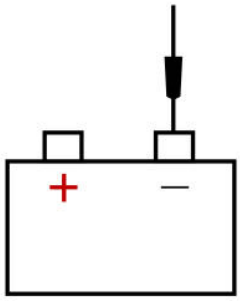
Yes	GO to F4

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.





F4 "A" SENSE CIRCUIT LOAD TEST

Ignition OFF.

Disconnect Generator C102B .

Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to F5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

F5 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to F6

F6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to F7

No	REPAIR the circuit.

F7 CHECK THE GENERATOR COMMAND CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-13	Ω	C102B-2

Is the resistance less than 3 ohms?

Yes	GO to F8

No	REPAIR the circuit.

F8 COMPARE THE GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD) PIDS

Ignition OFF.

Connect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

No	REMOVE the fused jumper wire. GO to F9

F9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS

(5.2L) > PINPOINT TEST G : DTC P0625 OR P0626

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM monitors the generator output via the generator monitor (GENMON) circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine speed is greater than 2, 000 RPM, the generator defaults to a steady voltage of 13.5 volts and the PCM sends a request to the IPC to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and results in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and results in DTC P0626 setting in the PCM.

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0625	Generator Field Terminal Circuit Low	The PCM sets this DTC if the GENMON circuit is shorted to ground, the "A" sense circuit is open or the B+ circuit is open. This DTC also sets by a faulted PCM or generator.
P0626	Generator Field Terminal Circuit High	The PCM sets this DTC if the GENMON circuit is open or shorted to power. This DTC can also be set by a faulted PCM or generator.

Possible Sources

- Battery
- Fuses or Fusible Links
- Generator
- PCM
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect for abnormal ignition-off current drain(s).
- Inspect the high current BJB for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST G : DTC P0625 OR P0626 > PINPOINT TEST G : DTC P0625 OR P0626

G1 CHECK THE BATTERY CONDITION

Check the battery condition and state of charge. REFER to: BATTERY, MOUNTING AND CABLES .

Does the battery pass the condition test?

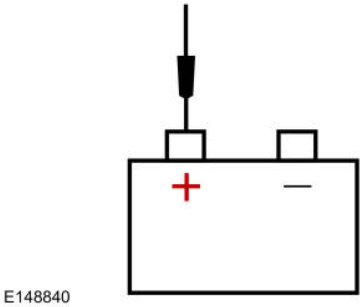
Yes	GO to G2

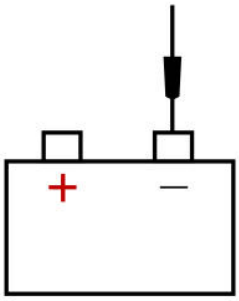
No	CHARGE or INSTALL a new battery as necessary. REFER to: Battery .

G2 CHECK THE GENERATOR CONNECTIONS

Ignition OFF.

Disconnect all of the generator connectors and inspect for:





corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the generator connectors. Make sure they seat and latch correctly.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148841

Measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is the voltage within 0.5 volt of the recorded battery voltage?

Yes	GO to G3

No	TIGHTEN or INSTALL a new generator B+ nut as needed. REFER to: Generator - 5.2L 32V Ti-VCT . VERIFY high current BJB MEGA fuse (275A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G3 CHECK THE VOLTAGE DROP IN THE GENERATOR B+ CIRCUIT

Start the engine.

With the engine running at idle, headlamps on and blower on high, measure:

Positive Lead	Measurement / Action	Negative Lead
C102C-1		

Perform a wiggle test of the generator wiring and connections while measuring voltage drop.

Is the voltage drop less than 0.5 volt?

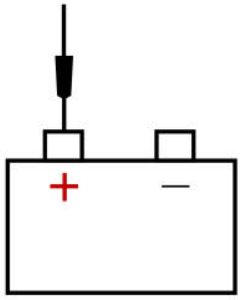
Yes	For DTC P0625, GO to G4 For DTC P0626, GO to G5

No	INSPECT and REPAIR any corrosion in the generator B+ circuit or positive battery cable connections.

NOTE: This step puts a load on the "A" sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit cannot be loaded correctly using an LED-style test lamp.

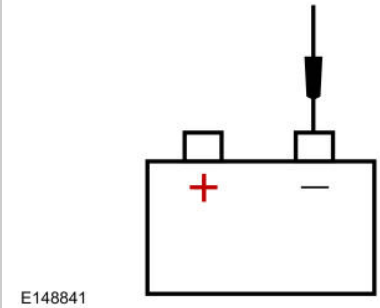
NOTE: The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this article. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

G4 "A" SENSE CIRCUIT LOAD TEST



Ignition OFF.

Disconnect Generator C102B .



Ignition ON.

Measure and record:

Positive Lead	Measurement / Action	Negative Lead

Install a test lamp between:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-3		Ground

Is the "A" sense voltage within ±0.5 volt of the recorded battery voltage?

Yes	GO to G5

No	VERIFY the BJB fuse 36 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G5 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175B .

Ignition ON.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to G6

G6 CHECK THE GENERATOR MONITOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C102B-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to G7

No	REPAIR the circuit.

G7 CHECK THE GENERATOR MONITOR CIRCUIT FOR AN OPEN

Perform a wiggle test on the generator wiring and measure:

Positive Lead	Measurement / Action	Negative Lead
C175B-26	Ω	C102B-1

Is the resistance less than 3 ohms?

Yes	GO to G8

No	REPAIR the circuit.

G8 CHECK THE GENERATOR B+ INTERNAL RESISTANCE

Disconnect Generator C102B .

Disconnect Generator C102C .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator B+ Terminal	Ω	Generator case

Is the resistance greater than 25K ohms?

Yes	GO to G9

No	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

G9 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
Generator pin 1 (Component Side)	Ω	Generator case
Generator pin 2 (Component Side)	Ω	Generator case
Generator pin 3 (Component Side)	Ω	Generator case

Are the resistances greater than 10, 000 ohms?

Yes	GO to G10

No	INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

G10 COMPARE THE GENMON PID (PARAMETER IDENTIFICATION) AND THE GENCMD PID (PARAMETER IDENTIFICATION)

Connect PCM C175B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C102B-1		C102B-2

Start the engine.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Using the active command, set the PID GENVDSD to 14 volts.

Monitor the PCM Parameter Identifications (PIDs) GENMON and GENCMD.

Perform a wiggle test of the generator wiring and connections.

Do the Parameter Identifications (PIDs) read within 5% of each other?

Yes	REMOVE the fused jumper wire. INSTALL a new generator. REFER to: Generator - 5.2L 32V Ti-VCT .

No	REMOVE the fused jumper wire. GO to G11

G11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . CLEAR all Diagnostic Trouble Codes (DTCs) in all modules.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

When the engine is off and the key is in on or accessory mode, and the BCM determines the battery state of charge is below 50%, or 45 minutes have elapsed, a load shed message is sent over the CAN. This message turns off the audio/navigation system to save the remaining battery charge. Under this condition the a load shed message will be displayed to notify the driver that battery protection actions are active:

- System Off to Save Battery Turn Ignition Off displays on the FCDIM (without touchscreen controls)
- SYSTEM OFF TO SAVE BATTERY PLEASE TURN IGNITION OFF OR START ENGINE displays on the FDIM (with touchscreen controls)
- Battery Saver - System Off displays on the FDIM (with Sync)

These messages displaying may be normal operation and not indicate a fault. Refer to the Owner Literature and REFER to: Charging System - System Operation and Component Description . Load shed messages displaying with the **engine running** or only on the FCDIM or the FDIM (with touchscreen controls) indicates the audio system has detected a fault.

- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the high current BJB for loose or corroded connections.
- Inspect the battery for loose or corroded connections.
- Inspect the generator for loose or corroded connections.
- Inspect the BJB for loose or corroded connections.
- Inspect the high current BJB for loose or corroded connections.
- Inspect C1046 for loose or corroded connections.
- Inspect battery and engine grounds for loose or corroded connections.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER > PINPOINT TEST H : LOAD SHED MESSAGE DISPLAYS IN MESSAGE CENTER

H1 PERFORM INSPECTION AND VERIFICATION

Perform Inspection and Verification procedure in this article.

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to H2

H2 VERIFY THE CUSTOMER CONCERN

Verify the customer concern by operating the charging system.

Did the customer indicate battery saver message only appeared in the centerstack with the engine running?

Yes	REFER to: Information and Entertainment System (without touchscreen) , or REFER to: Information and Entertainment System (with touchscreen) .

No	GO to H3

H3 VERIFY THE NETWORK

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the APIM, BCM, and PCM pass the Network Test?

Yes	GO to H4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

H4 PERFORM PCM (POWERTRAIN CONTROL MODULE) SELF TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	REFER to PCM DTC Chart .

No	GO to H5

H5 RETRIEVE ALL CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Were any battery or charging system related Diagnostic Trouble Codes (DTCs) retrieved?

Yes	For BCM Diagnostic Trouble Codes (DTCs) refer to BCM DTC Chart . For APIM or ACM Diagnostic Trouble Codes (DTCs), Refer to the appropriate article for the procedure. For other battery or charging system related Diagnostic Trouble Codes (DTCs), REFER to: Diagnostic Trouble Code Charts .

No	GO to H6

H6 CHECK BCM (BODY CONTROL MODULE) BAT_ST_CHRG PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	GO to H8

No	GO to H7

NOTE: The battery state of charge is too low and needs to be relearned. Refer to the Description and Operation for more information on battery state of charge.

H7 RELEARN BATTERY STATE OF CHARGE

Remove all accessories from the lighter, all power outlets and DC/AC inverter (if equipped).

NOTE: The key should not be left in the vehicle but should be left in a secure location away from the vehicle such as a lock box.

Allow vehicle to sit undisturbed for at least 6 hours.

Ignition ON.

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Monitor the BCM BAT_ST_CHRG PID.

Does the PID indicate 50% or more?

Yes	The concern may have been caused by too low of a battery state of charge. REVIEW Energy Management operation with customer and return vehicle to customer.

No	GO to H8

H8 VERIFY INLINE CONNECTOR

Inspect inline connector C1046 for secure connection.

Disconnect Inline connector C1046 .

Inspect for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Were any concerns present?

Yes	CORRECT the cause as necessary.

No	GO to H9

H9 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

Refer to Charging System for schematic and connector information.

Normal Operation and Fault Conditions

For information on the battery current sensor, REFER to: Charging System - System Operation and Component Description .

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B130C:12	Load Shed Control Circuit Short To Battery	This DTC sets in the BCM when the BCM senses a short in the battery current sensor control circuit.
B130C:14	Load Shed Control Circuit Short To Ground or Open	This DTC sets in the BCM when the BCM senses an open or ground in the battery current sensor control circuit.
B1438:03	Battery Current Sensor, FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failure	This DTC sets in the BCM when the BCM does not indicate current from the battery current sensor.

Possible Sources

- Battery current sensor
- Generator clutch
- Wiring, terminals or connectors

Visual Inspection and Diagnostic Pre-checks

- Inspect the battery current sensor
- Inspect the battery current sensor connector

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > PINPOINT TESTS (5.2L) > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS > PINPOINT TEST I : BATTERY CURRENT SENSOR FAULTS

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

I1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test

Is DTC P0562 present?

Yes	GO to Pinpoint Test B

No	For DTC P0A5A, GO to I2 For DTC P0A5B, GO to I6 For DTC P0A5C, GO to I10

I2 CHECK THE BATTERY CURRENT SENSOR

Inspect the battery current sensor for the following:

physical damage

corrosion

disconnected electrical connector

battery ground cable routed through the battery current sensor

debris between the battery current sensor and the battery ground cable

Are any of these conditions found during inspection?

Yes	REPAIR as necessary. GO to I14

No	GO to I3

I3 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT

Ignition OFF.

Disconnect Battery current sensor C1646 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I7

No	If the voltage is less than 4.8 volts, GO to I5 If the voltage is greater than 5.2 volts, GO to I4

I4 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Using the Terminal Release Kit, release and temporarily remove BCM C2280F-3 .

Connect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	INSTALL C2280F-3 and GO to I15

I5 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO

GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I6

No	REPAIR the circuit.

I6 CHECK THE BATTERY CURRENT SENSOR REFERENCE VOLTAGE CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	Ω	C2280F-3

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I7 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-1	V	C1646-2

Is the voltage between 4.8 and 5.2 volts?

Yes	GO to I10

No	GO to I8

I8 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I9

I9 CHECK THE BATTERY CURRENT SENSOR SIGNAL RETURN CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect BCM C2280C .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-2	Ω	C2280F-19

Is the resistance less than 3 ohms?

Yes	GO to I14

No	REPAIR the circuit.

I10 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I11

I11 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I12

No	REPAIR the circuit.

I12 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C2280F-8

Is the resistance less than 3 ohms?

Yes	GO to I13

No	REPAIR the circuit.

I13 CHECK THE BATTERY CURRENT SENSOR FEEDBACK CIRCUIT FOR A SHORT TO THE SIGNAL RETURN OR REFERENCE CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1646-3	Ω	C1646-1
C1646-3	Ω	C1646-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to I14

No	REPAIR the affected circuit.

I14 CHECK THE BATTERY CURRENT SENSOR CONNECTION

Ignition OFF.

Disconnect Battery Current Sensor C1646 , if necessary.

Inspect the battery current sensor connector for:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect Battery Current Sensor C1646 .

Connect BCM C2280F .

Ignition ON.

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs) in all modules.

Using a diagnostic scan tool, perform the BCM self-test.

Did the DTC return?

Yes	REPAIR as necessary or INSTALL a new battery current sensor. REFER to: Battery Current Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the DTC returns, GO to I15

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

I15 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

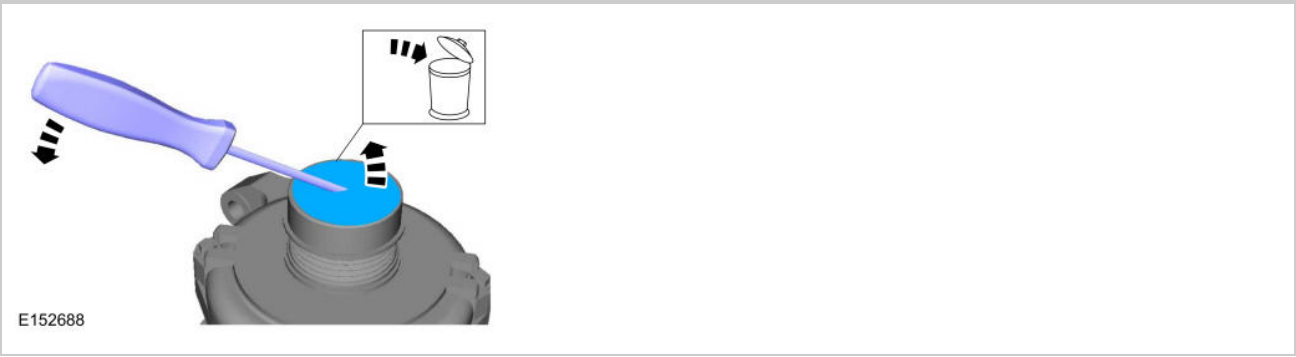
pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

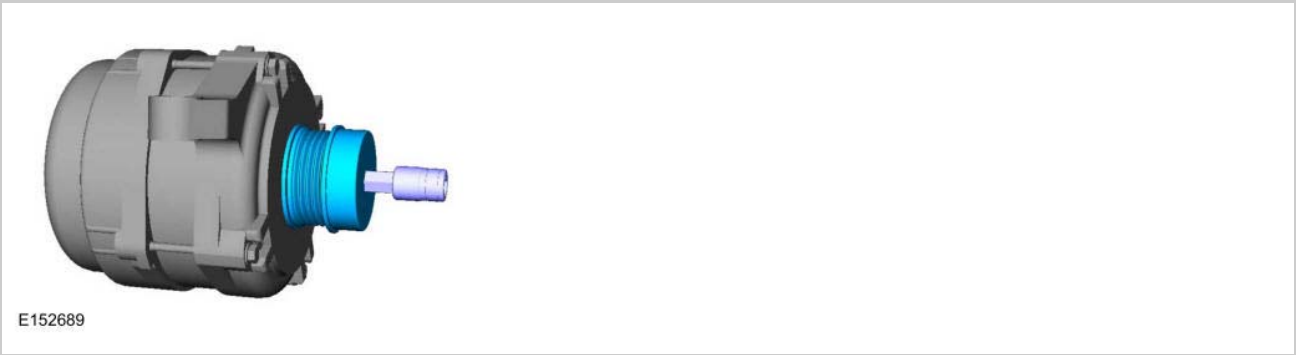
Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,



No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CHARGING SYSTEM - 5.2L 32V TI-VCT > COMPONENT

TEST - GENERATOR CLUTCH



1.

Remove the generator. REFER to: Generator - 5.2L 32V Ti-VCT .

2.

Using a small screwdriver or similar tool, insert the tool through the rubber button on the center of the pulley cap and pry off the cap. Discard the cap. A new cap must be installed if the clutch is OK.

3.

Using a 17 mm hex tool bit (such as a Snap-on ® SAM17E2 or equivalent) and socket wrench, insert the 17 mm hex tool bit into the end of the clutch shaft.

4.

While holding the clutch pulley firmly by hand, turn the clutch shaft clockwise. The shaft should rotate smooth and freely. If the shaft rotation is rough or seized, install a new generator clutch. REFER to: GENERATOR PULLEY .

5.

While holding the clutch pulley firmly by hand, turn the clutch shaft counterclockwise. There should be some resistance (a spring feel). If the shaft rotates freely, install a new generator clutch. REFER to: GENERATOR PULLEY .

Service Manual: GENERATOR AND REGULATOR

SPECIFICATIONS > SPECIFICATIONS

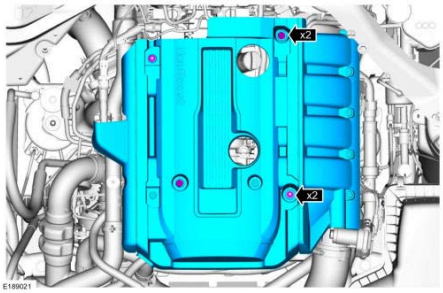
General Specifications

Item	Specification
2.3L EcoBoost 175A (base)	
Generator pulley ratio	2.47:1
Rating	90 amps at 700 RPM (min) to 155 amps at 2, 400 RPM (max)
Voltage regulator type	Electronic internal with generator
2.3L EcoBoost - 200A (optional)	
Generator pulley ratio	2.47:1
Rating	110 amps at 700 RPM (min) to 185 amps at 2, 400 RPM (max)
Voltage regulator type	Electronic internal with generator
3.7L Ti-VCT - 175A (base)	
Generator pulley ratio	2.69:1
Rating	100 amps at 650 RPM (min) to 160 amps at 2, 200 RPM (max)
Voltage regulator type	Electronic internal with generator
5.0L Ti-VCT - 175A (base)	
Generator pulley ratio	2.47:1
Rating	70 amps at 600 RPM (min) to 155 amps at 2, 400 RPM (max)
Voltage regulator type	Electronic internal with generator
5.0L Ti-VCT - 200A (optional)	
Generator pulley ratio	2.47:1
Rating	80 amps at 600 RPM (min) to 185 amps at 2, 400 RPM (max)
Voltage regulator type	Electronic internal with generator

REMOVAL AND INSTALLATION > GENERATOR - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



Disconnect the battery ground. Refer to: Battery Disconnect and Connect .

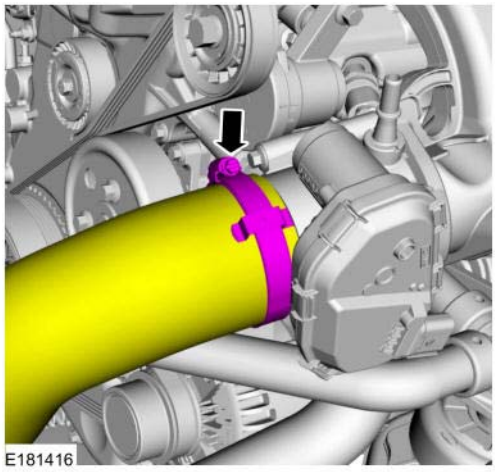
2.

Remove the bolts and nuts and the engine appearance cover.

Torque

: 80 lb.in (9 Nm)

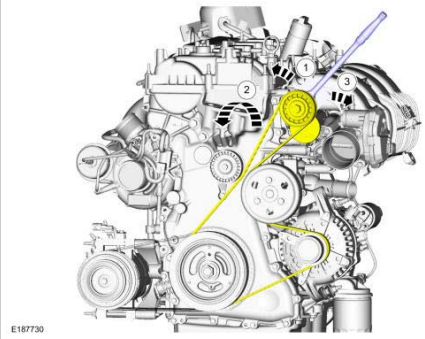
3.



Remove the air cleaner. Refer to: Air Cleaner .

4.

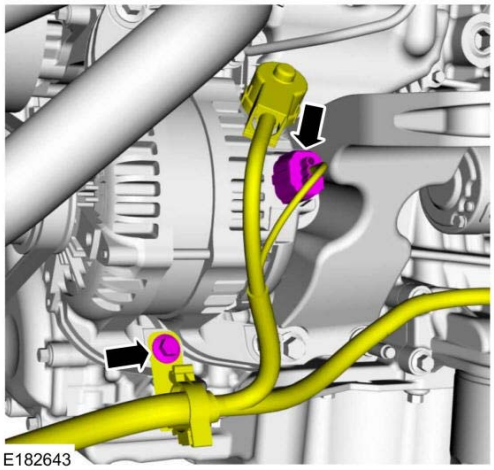
Loosen the clamp and position aside the CAC outlet tube.



Torque

: 44 lb.in (5 Nm)

5.



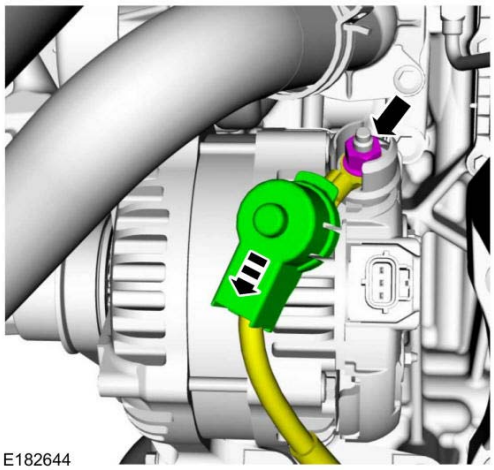
Rotate the accessory drive belt tensioner counterclockwise and position aside the accessory drive belt.

6.

Remove the bolt and the wire harness retainer from the generator.

Disconnect the generator electrical connector.

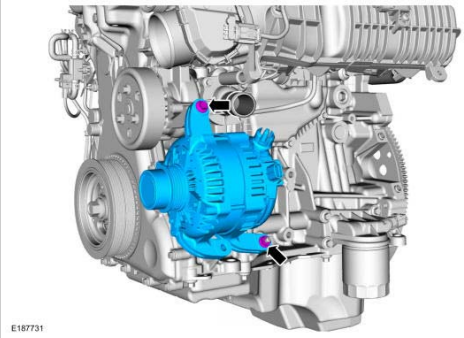
7.



Position the protective cover aside.

NOTE: When installing the B+ terminal nut to the generator, finger-start the nut before tightening or component damage may occur.

Remove the nut and position the B+ cable.



Torque

: 159 lb.in (18 Nm)

8.

Remove the nut, bolt and the generator.

REMOVAL AND INSTALLATION > GENERATOR - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

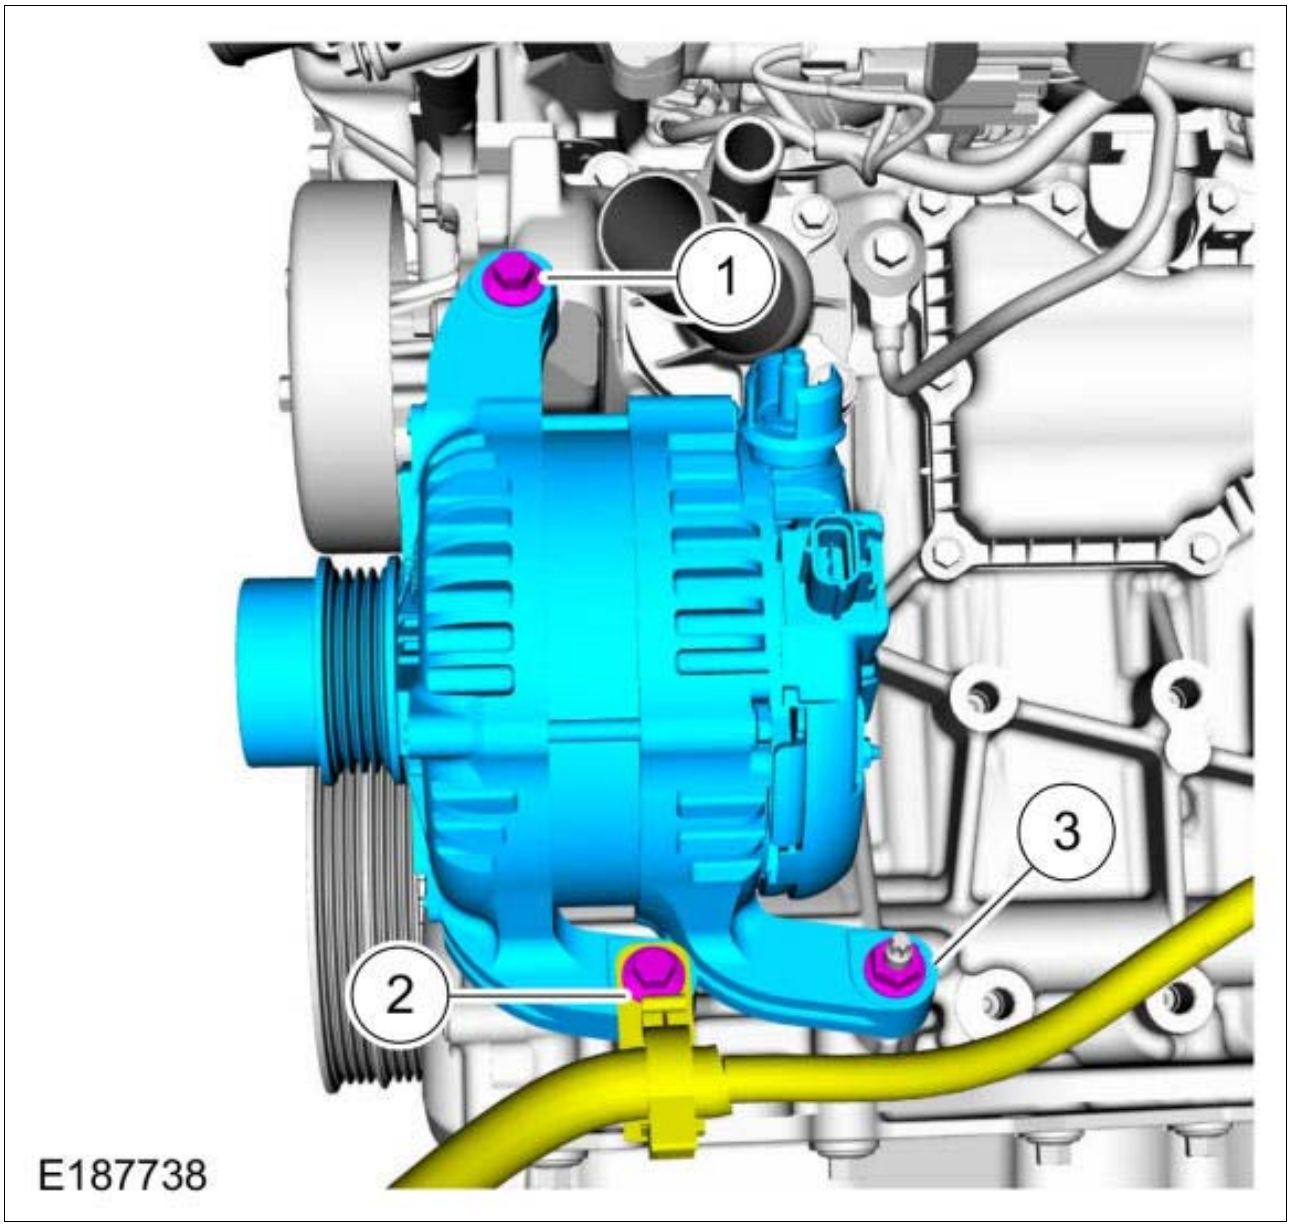
2.

1.

Position the generator onto the engine and finger-tighten the bolt and nut.

2.

Position the wire harness retainer on generator and finger-tighten the bolt.



3.

Tighten the bolts and the nut in the sequence shown.

Torque

: 18 lb.ft (25 Nm)

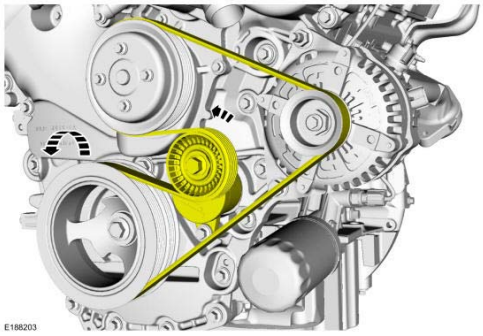
Fig 1: Generator Bolts Tightening Sequence (2.3L)

Courtesy of FORD MOTOR CO.

REMOVAL AND INSTALLATION > GENERATOR - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

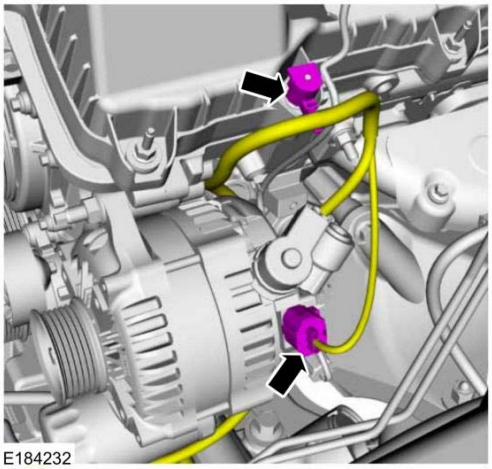


Disconnect the battery ground. Refer to: Battery Disconnect and Connect .

2.

Remove the air cleaner assembly. Refer to: Air Cleaner .

3.



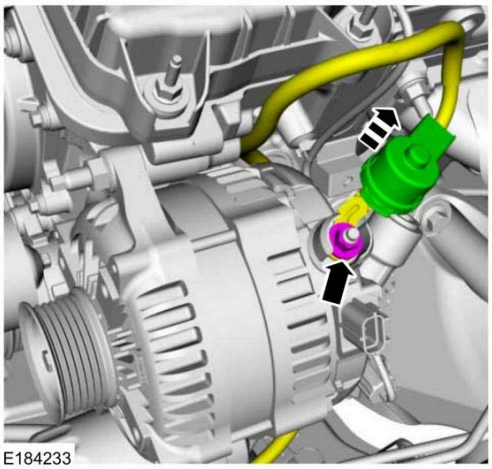
Rotate the accessory drive belt tensioner counter clockwise and position aside the accessory drive belt.

4.

Detach the wire harness retainer from the valve cover stud bolt.

Disconnect the generator electrical connector.

5.



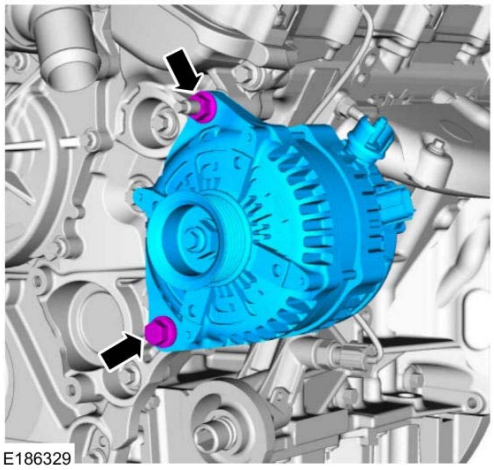
Position the protective cover aside.

NOTE: When installing the B+ terminal nut to the generator, finger-start the nut before tightening or component damage may occur.

Remove the nut and position the generator B+ cable.

Torque

: 159 lb.in (18 Nm)



6.

Remove the nut, bolt and the generator.

Torque

: 35 lb.ft (47 Nm)

REMOVAL AND INSTALLATION > GENERATOR - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > GENERATOR - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .

2.

Remove the air cleaner. Refer to: Air Cleaner .

3.

Remove the accessory drive belt tensioner. Refer to: Accessory Drive Belt Tensioner .

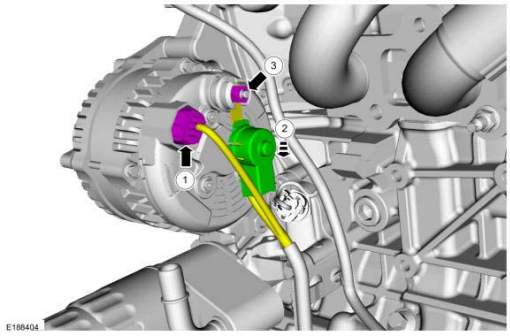
NOTE: When installing the B+ terminal nut to the generator, finger-start the nut before tightening or component damage may occur.

4.

1.

Disconnect the generator electrical connector.

2.



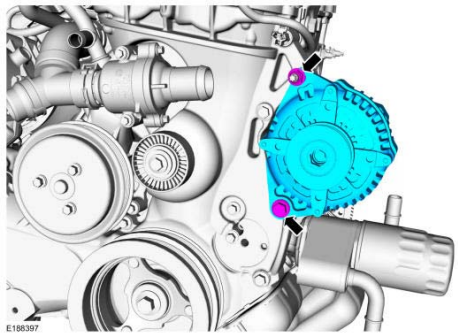
Position the protective cover aside.

3.

Remove the nut and position the generator B+ cable.

Torque

: 159 lb.in (18 Nm)



5.

Remove the nut, bolt and the generator.

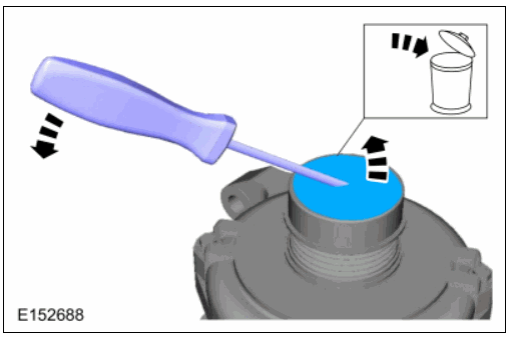
Torque

: 35 lb.ft (47 Nm)

REMOVAL AND INSTALLATION > GENERATOR - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

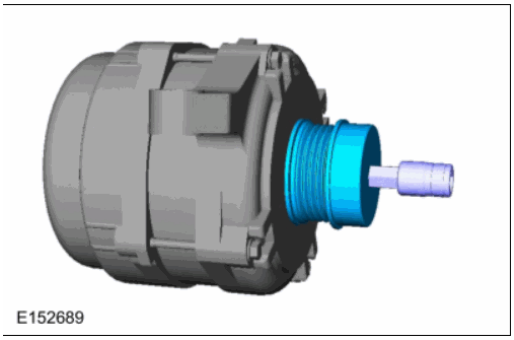


REMOVAL AND INSTALLATION > GENERATOR PULLEY > REMOVAL

1. *WARNING: Before beginning any service procedure in this article, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.*

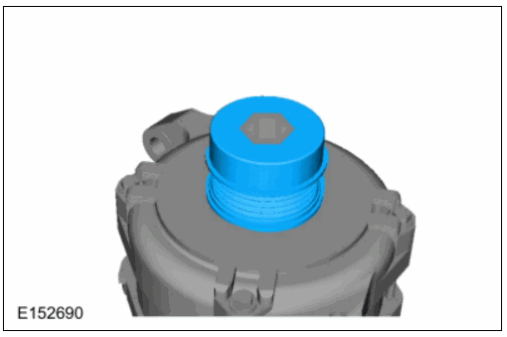
   Follow the health and safety precautions. Refer to: Health and Safety Precautions in GENERAL INFORMATION .

2. Remove the generator. Refer to: Generator - 2.3L EcoBoost (201kW/273PS) , Refer to: Generator - 3.7L Duratec (227kW/301PS) or Refer to Generator 5.0L 32V Ti-VCT



3. Using a small screwdriver or similar tool, insert the tool through the rubber button on the center of the pulley cap and pry off the cap. Discard the cap. A new cap must be installed if the clutch is ok.

4. *NOTE: Do not insert anything into the fins of the generator to prevent the rotor inside the generator from turning. Inserting items into the generator could result in damage to the generator.*

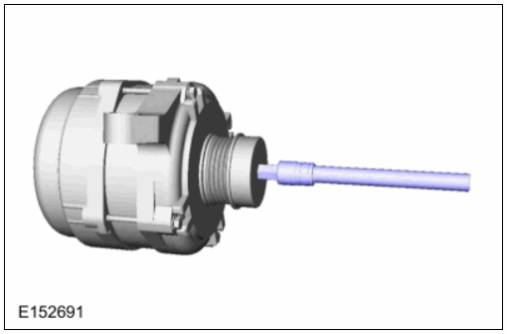


NOTE: The shaft and rotor will turn during removal.

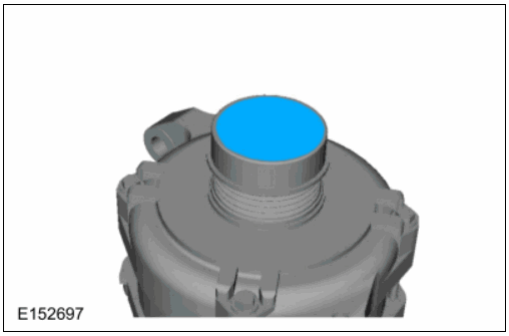
Using a 17 mm hex tool and an impact gun, remove the clutch pulley. A couple of short bursts with the impact gun will remove the clutch pulley.

REMOVAL AND INSTALLATION > GENERATOR PULLEY > INSTALLATION

1. Install the pulley and hand start.



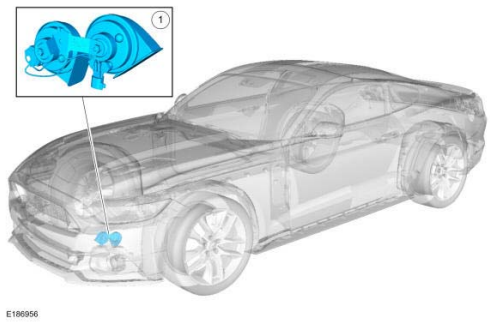
2. *NOTE: Do not insert anything into the fins of the generator to prevent the rotor inside the generator from turning. Inserting items into the generator could result in damage to the generator.*



NOTE: The shaft and rotor will turn during installation.

While holding the outer diameter of the clutch pulley, torque the clutch pulley using a 17 mm hex tool, 75 Nm torque stick and an impact gun for 3-4 seconds. This makes sure the proper torque has been applied.

Torque: 55 lb.ft (75 Nm)



3. Install a new cap onto the pulley with the rubber button facing inwards.

4. Install the generator. Refer to: Generator - 2.3L EcoBoost (201kW/273PS) , Refer to: Generator - 3.7L Duratec (227kW/301PS) or Refer to Generator 5.0L 32V Ti-VCT

Service Manual: HORN

DESCRIPTION AND OPERATION > HORN - COMPONENT LOCATION > HORN

Item	Description
1	Horn **Comments:** Located behind LH fender splash shield.

DESCRIPTION AND OPERATION > HORN - OVERVIEW > OVERVIEW

The BCM controls horn output by energizing the horn relay and sounding the horn.

DESCRIPTION AND OPERATION > HORN - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > HORN - SYSTEM OPERATION AND COMPONENT DESCRIPTION > HORN OPERATION

The horn switch uses sets of contacts separated by springs. The lower set is connected to ground and the upper set is connected to the horn signal circuit. When the driver airbag is pressed, it pushes down on the upper set of contacts, collapsing the springs and allowing the contacts to touch. When the contacts touch, it completes the circuit and provides a ground signal through the clockspring to the BCM horn input. The BCM then grounds the horn relay coil to energize the relay. When energized, the horn relay provides voltage to the horn, enabling the horn to sound.

DIAGNOSIS AND TESTING > HORN

Horn

DIAGNOSIS AND TESTING > HORN > DTC CHART(S)

DTC Chart: Horn

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Body Control Module (BCM) DTC Chart

DTC	Description	Actions
B1323:11	Horn Switch: Circuit Short To Ground	GO to Pinpoint Test B
B1C55:12	Horn Relay: Circuit Short to Battery	GO to Pinpoint Test A
B1C55:14	Horn Relay: Circuit Short to Ground or Open	If the horn is inoperative, GO to Pinpoint Test A If the horn is always on, GO to Pinpoint Test B

DIAGNOSIS AND TESTING > HORN > SYMPTOM CHART(S)

Symptom Chart: Horn

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
The horn is inoperative	Refer to Pinpoint Test	GO to Pinpoint Test A
The horn is always on	Refer to Pinpoint Test	GO to Pinpoint Test B

DIAGNOSIS AND TESTING > HORN > PINPOINT TESTS > PINPOINT TEST A : THE HORN IS INOPERATIVE

Refer to Horn/Cigar Lighter for schematic and connector information.

Normal Operation and Fault Conditions

REFER to: Horn - System Operation and Component Description .

DTC Chart

DTC	Description	Fault Trigger Condition
B1C55:12	Horn Relay: Circuit Short to Battery	A Continuous Memory Diagnostic Trouble Code (CMDTC) that sets when the BCM detects a short to

		voltage on the horn relay control circuit. The BCM disables the horn when this DTC is set.
B1C55:14	Horn Relay: Circuit Short to Ground or Open	This DTC sets when the BCM detects a short to ground or an open on the horn relay control circuit.

Possible Sources

- Fuse
- Wiring, terminals or connectors
- Clockspring
- Horn
- Horn relay
- Horn switch
- BCM

Visual Inspection and Diagnostic Pre-checks

Verify the BJB fuse 21 (20A) is OK.

DIAGNOSIS AND TESTING > HORN > PINPOINT TESTS > PINPOINT TEST A : THE HORN IS INOPERATIVE > PINPOINT TEST A : THE HORN IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE BCM (BODY CONTROL MODULE) OUTPUT BY ACTIVATING THE BCM (BODY CONTROL MODULE) HORN_RELAY PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view BCM Parameter Identifications (PIDs).

Select the active command BCM HORN_RELAY PID and command the horn ON and then OFF.

Does the horn sound when commanded ON?

Yes	GO to A9

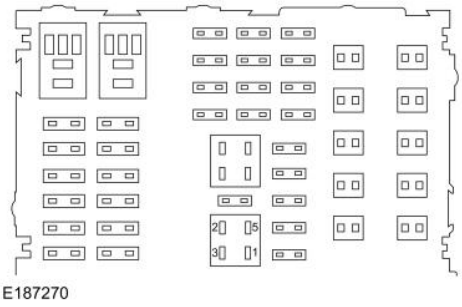
No	GO to A2

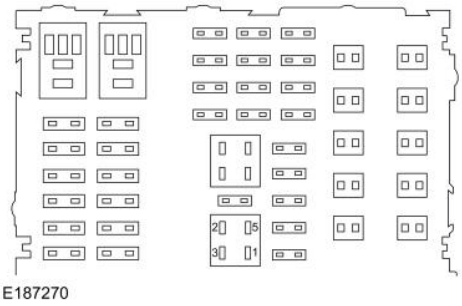
A2 CHECK THE HORN RELAY

Ignition OFF.

Remove the horn relay and install a known-good relay in its place.

Test the horn for normal operation.





Does the horn operate correctly?

Yes	INSTALL a new horn relay.

No	GO to A3

A3 CHECK THE HORN RELAY VOLTAGE SUPPLY CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
 Horn relay pin socket 1		Ground
 Horn relay pin socket 3		Ground

Is the voltage greater than 11 volts?

Yes	GO to A4

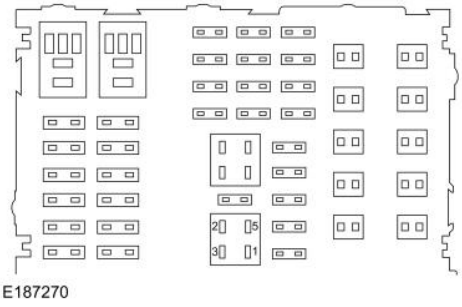
No	VERIFY BJB fuse 21 (20A) is OK. If OK, REPAIR the horn relay voltage supply circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

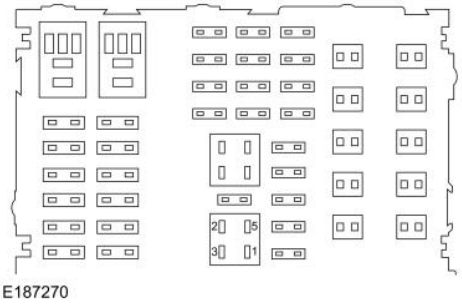
NOTE: The following step uses a test light to simulate normal circuit loads. Use only a Rotunda Test Lamp (SGT27000) or 250-300mA incandescent bulb test lamp. To avoid

connector terminal damage, use the Rotunda Flex Probe kit for the test lamp probe connection to the vehicle. Do not use the test lamp probe directly on any connector.

A4 CHECK THE HORN CIRCUITS

Disconnect Horn C131 or C1102 .





For C131 , connect:

Positive Lead	Measurement / Action	Negative Lead
C131-2		C131-1

For C1102 , connect:

Positive Lead	Measurement / Action	Negative Lead
C1102-2		C1102-1

Momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 Horn relay pin socket 3		 Horn relay pin socket 5

Does the test light momentarily illuminate?

Yes	GO to A5

No	GO to A8

A5 CHECK THE HORN CIRCUIT OPERATION USING THE BCM (BODY CONTROL MODULE) HORN_RELAY PID (PARAMETER IDENTIFICATION)

Install the horn relay.

Ignition ON.

Using a diagnostic scan tool, view BCM Parameter Identifications (PIDs).

Select the active command BCM HORN_RELAY PID and command the horn ON and then OFF.

Does the test light momentarily illuminate?

Yes	INSTALL a new horn. REFER to: Horn .

No	GO to A6

A6 CHECK THE HORN RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Remove the horn relay.

Disconnect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
Horn relay pin socket 2	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to A7

A7 CHECK THE HORN RELAY CONTROL CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
Horn relay pin socket 2	Ω	C2280F-20

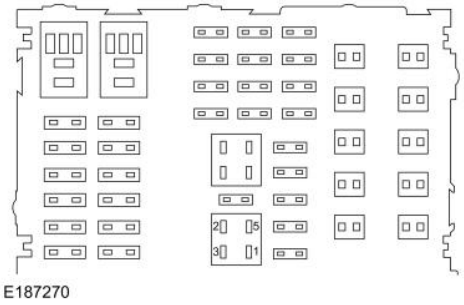
Is the resistance less than 3 ohms?

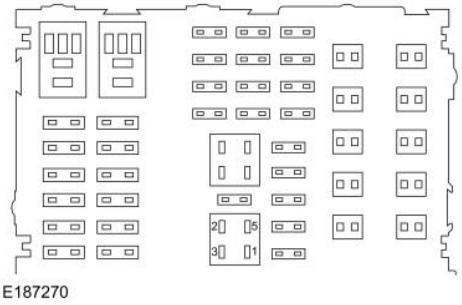
Yes	GO to A16

No	REPAIR the circuit.

NOTE: The following step uses a test light to simulate normal circuit loads. Use only a Rotunda Test Lamp (SGT27000) or 250-300mA incandescent bulb test lamp. To avoid connector terminal damage, use the Rotunda Flex Probe kit for the test lamp probe connection to the vehicle. Do not use the test lamp probe directly on any connector.

A8 CHECK THE HORN POWER SUPPLY CIRCUIT





For C131 , connect:

Positive Lead	Measurement / Action	Negative Lead
C131-2		Ground

For C1102 , connect:

Positive Lead	Measurement / Action	Negative Lead
C1102-2		Ground

Momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 Horn relay pin socket 3		 Horn relay pin socket 5

Does the test light momentarily illuminate?

Yes	REPAIR the horn ground circuit.

No	REPAIR the horn power supply circuit.

A9 CHECK THE HORN SWITCH INPUT TO THE BCM (BODY CONTROL MODULE)

Ignition OFF.

Disconnect BCM C2280B .

While pressing the horn, measure:

Positive Lead	Measurement / Action	Negative Lead
C2280B-18	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A16

No	GO to A10

A10 ISOLATE THE HORN SWITCH

Connect BCM C2280B .

Remove the driver airbag. REFER to: Driver Airbag .

Momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C217-3		C217-4

Does the horn sound?

Yes	REMOVE the fused jumper wire. INSTALL a new driver airbag (includes horn switch). REFER to: Driver Airbag .

No	REMOVE the fused jumper wire. GO to A11

A11 CHECK THE HORN SWITCH GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C217-3	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A14

No	GO to A12

A12 CHECK THE HORN SWITCH GROUND

Disconnect Clockspring C218A .

Disconnect Clockspring C218B .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C218A-4		C218B-1

Measure:

Positive Lead	Measurement / Action	Negative Lead
C217-3	Ω	Ground

Is the resistance less than 3 ohms?

Yes	REMOVE the fused jumper wire. INSTALL a new clockspring. REFER to: Clockspring .

No	REMOVE the fused jumper wire. GO to A13

A13 CHECK THE CLOCKSPRING GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-4	Ω	Ground

Is the resistance less than 3 ohms?

Yes	INSTALL a new steering wheel (includes steering wheel wiring harness). REFER to: Steering Wheel .

No	REPAIR the circuit.

A14 CHECK THE HORN SWITCH SIGNAL CIRCUIT

Disconnect SCCM C226A .

Momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C226A-1		Ground

Does the horn sound?

Yes	REMOVE the fused jumper wire. GO to A15

No	REMOVE the fused jumper wire. REPAIR the open circuit.

A15 CHECK HORN OPERATION WITH STEERING WHEEL HARNESS ISOLATED

Connect SCCM C226A .

Disconnect Clockspring C218B .

Momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
Clockspring C218B, pin 4, component side		Ground

Does the horn sound?

Yes	REMOVE the fused jumper wire. INSTALL a new steering wheel (includes steering wheel wiring harness). REFER to: Steering Wheel .

No	REMOVE the fused jumper wire. INSTALL a new clockspring. REFER to: Clockspring . TEST the system for normal operation. If the horn is still inoperative, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

A16 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Disconnect and inspect the BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Install the horn relay (if previously removed).

Connect Horn C131 or C1102 .

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > HORN > PINPOINT TESTS > PINPOINT TEST B : THE HORN IS ALWAYS ON

Refer to Horn/Cigar Lighter for schematic and connector information.

Normal Operation and Fault Conditions

REFER to: Horn - System Operation and Component Description .

DTC Chart

DTC	Description	Fault Trigger Condition
B1323:11	Horn Switch: Circuit Short to Ground	A Continuous Memory Diagnostic Trouble Code (CMDTC) that sets when the BCM detects a short to ground on the horn signal circuit.
B1C55:14	Horn Relay: Circuit Short to Ground or Open	This DTC sets when the BCM detects a short to ground or an open on the horn relay control circuit.

Possible Sources

- Wiring, terminals or connectors
- Clockspring
- Horn relay
- Horn switch
- BCM

DIAGNOSIS AND TESTING > HORN > PINPOINT TESTS > PINPOINT TEST B : THE HORN IS ALWAYS ON > PINPOINT TEST B : THE HORN IS ALWAYS ON

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: The following test uses a test light to simulate normal circuit loads. Use only a Rotunda Test Lamp (SGT27000) or 250-300mA incandescent bulb test lamp. To avoid connector terminal damage, use the Rotunda Flex Probe kit for the test lamp probe connection to the vehicle. Do not use the test lamp probe directly on any connector.

B1 ISOLATE THE HORN RELAY

Disconnect Horn C131 or C1102 .

For C131 , connect:

Positive Lead	Measurement / Action	Negative Lead
C131-1		C131-2

For C1102 , connect:

Positive Lead	Measurement / Action	Negative Lead

C1102-1		C1102-2

Remove the horn relay.

Does the test light remain illuminated?

Yes	REPAIR the short to voltage on the horn voltage supply circuit.

No	GO to B2

B2 CHECK THE HORN RELAY

Ignition OFF.

Remove the horn relay and install a known-good relay in its place.

Test the horn for normal operation.

Does the horn operate correctly?

Yes	GO to B3

No	INSTALL a new horn relay.

B3 ISOLATE THE BCM (BODY CONTROL MODULE) HORN SWITCH INPUT CIRCUIT

Ignition ON.

Connect a diagnostic scan tool.

Using a diagnostic scan tool, view BCM Parameter Identifications (PIDs).

Monitor the BCM HORN_SW PID.

Does the PID status display OFF?

Yes	GO to B4

No	GO to B5

B4 ISOLATE THE HORN RELAY CONTROL CIRCUIT

Ignition OFF.

Disconnect BCM C2280F .

Install the horn relay.

Does the test light illuminate?

Yes	REPAIR the short to ground on the horn relay control circuit.

No	GO to B9

B5 ISOLATE THE BCM (BODY CONTROL MODULE) HORN SWITCH INPUT CIRCUIT

Ignition OFF.

Install the horn relay.

Disconnect BCM C2280B .

Does the test light illuminate?

Yes	GO to B9

No	GO to B6

B6 CHECK THE HORN SWITCH INPUT CIRCUIT TO THE BCM (BODY CONTROL MODULE) FOR A SHORT TO GROUND

Disconnect SCCM C226A .

Connect BCM C2280B .

Does the test light illuminate?

Yes	REPAIR the circuit.

No	GO to B7

B7 ISOLATE THE HORN SWITCH

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect Clockspring C218B .

Connect SCCM C226A .

Does the test light illuminate?

Yes	INSTALL a new clockspring. REFER to: Clockspring . TEST the system for normal operation. If the test light remains illuminated, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

No	GO to B8

B8 ISOLATE THE STEERING WHEEL WIRING

Connect Clockspring C218B .

Does the test light illuminate?

Yes	INSTALL a new steering wheel (includes steering wheel wiring harness). REFER to: Steering Wheel .

No	INSTALL a new driver airbag (includes horn switch). REFER to: Driver Airbag .

B9 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Disconnect and inspect the BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Connect Horn C131 or C1102 .

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

REMOVAL AND INSTALLATION > HORN > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the LH fender splash shield. Refer to: Fender Splash Shield .

2.

Disconnect the electrical connector, remove the bolt and the horn.

Torque

: 106 lb.in (12 Nm)

REMOVAL AND INSTALLATION > HORN > INSTALLATION

1.

1.

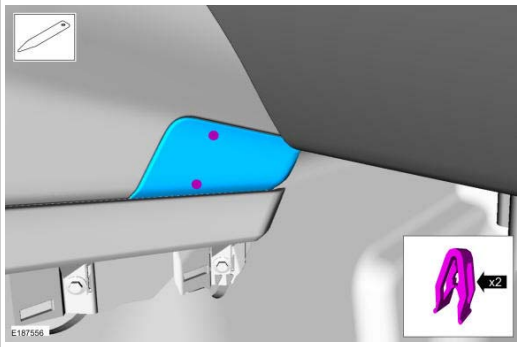
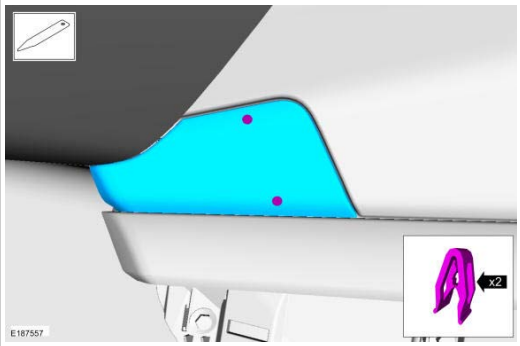
Release the clips and remove the floor console RH side trim panel. Use the General Equipment: Interior Trim Remover



2.

Release the clips and the floor console LH side trim panel. Use the General Equipment: Interior Trim Remover



3.

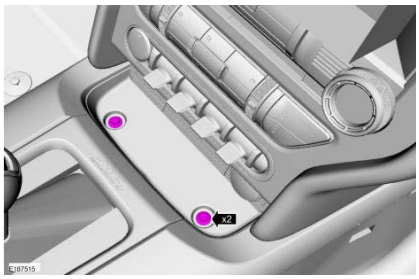
Release the clips and remove the floor console RH side bolt cover. Use the General Equipment: Interior Trim Remover

4.

Release the clips and the floor console LH side bolt cover. Use the General Equipment: Interior Trim Remover

5.

Remove the stowage area mat.

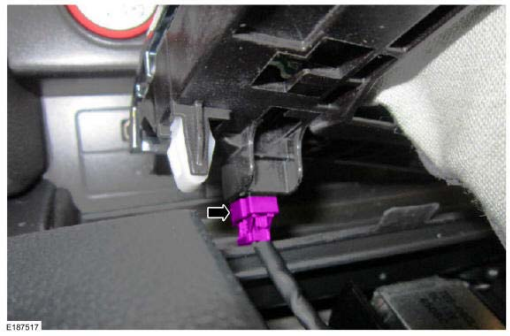


6.

Remove the floor console upper bolts.

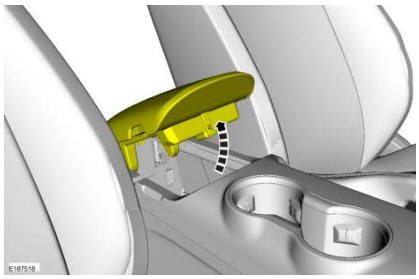
Torque

: 18 lb.in (2 Nm)



NOTE: Automatic transmission shown, manual transmission similar.

7.
Starting from the front corners, carefully pry up the bezel and position it out of the way. Use the General Equipment: Interior Trim Remover

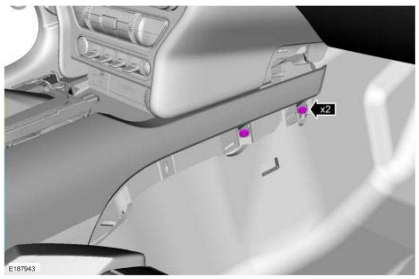


8.

Disconnect the electrical connector.

9.

Open the floor console lid.

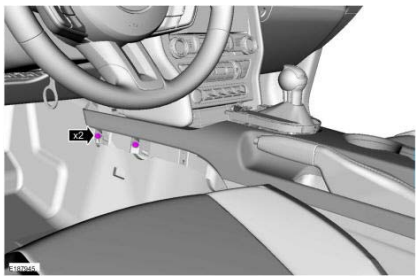


10.

Remove the RH side front retainers.

Torque

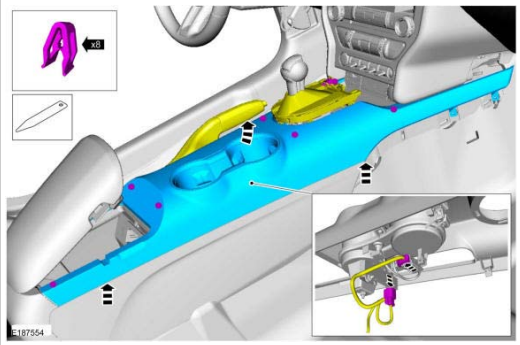
: 18 lb.in (2 Nm)



11.

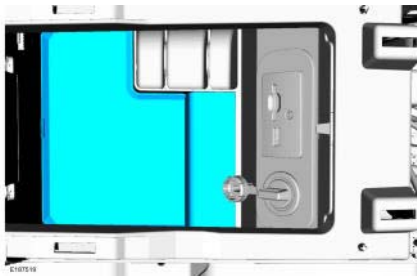
Remove the LH side front retainers.

Torque



: 18 lb.in (2 Nm)

12.

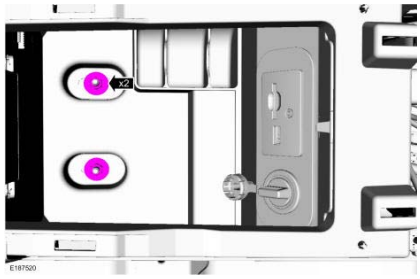


Release the clips, position the gear selector cover aside and remove the floor console upper trim panel.

Disconnect the electrical connectors. Use the General Equipment: Interior Trim Remover

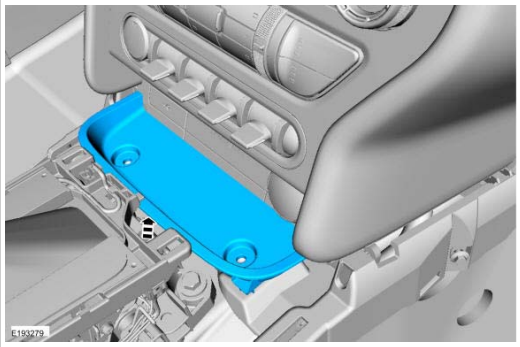
13.

Remove the floor console stowage bin mat.



14.

Remove the two nuts.

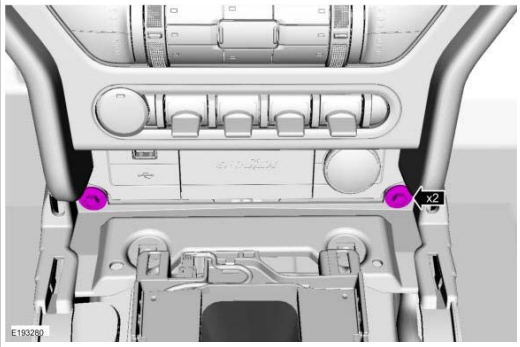


Torque

: 18 lb.in (2 Nm)

15.

Remove the stowage area tray.



16.

Remove the 2 front upper floor console bolts.

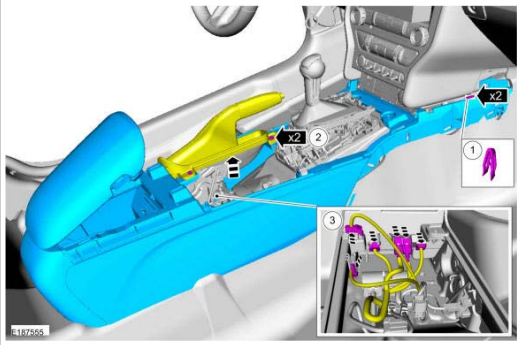
Torque

: 18 lb.in (2 Nm)

17.

Remove the floor console.

1.



On both sides. Release the clips.

2.

Remove the screws and position aside the parking brake boot from the console.

3.

Disconnect the electrical connectors.

1.

Position both front seats fully rearward.

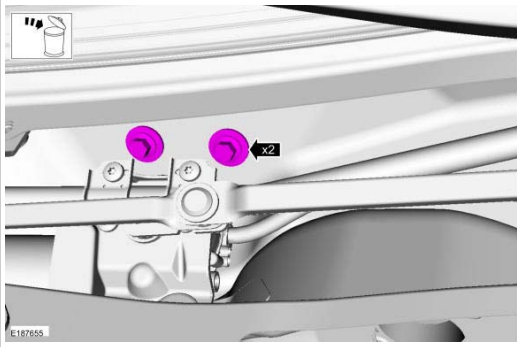
2.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

3.

Remove the cowl panel grille. Refer to: Cowl Panel Grille .

NOTE: Discard the upper instrument panel cowl bolts.



NOTE: Use new factory bolt and washer assemblies or water leaks may occur.

4.

Remove the instrument panel cowl bolts.

Torque

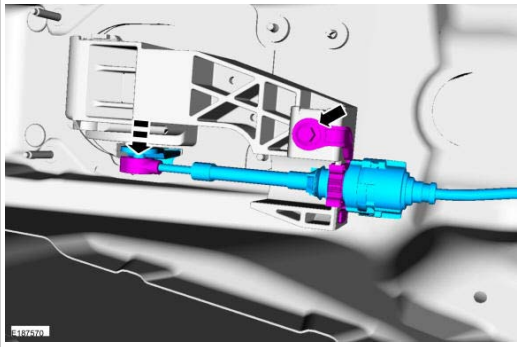
: 133 lb.in (15 Nm)

5.

Remove the floor console. Refer to: Floor Console .

Vehicles with automatic transmission

6.



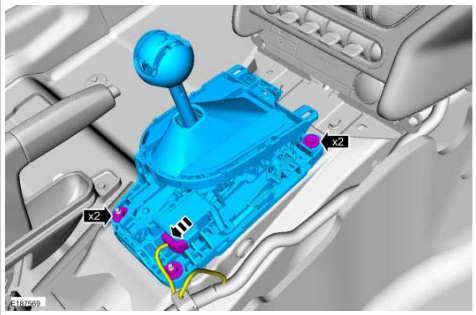
Raise the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

7.

Remove the selector lever cable bracket bolt and remove the selector lever cable.

Torque

: 62 lb.in (7 Nm)



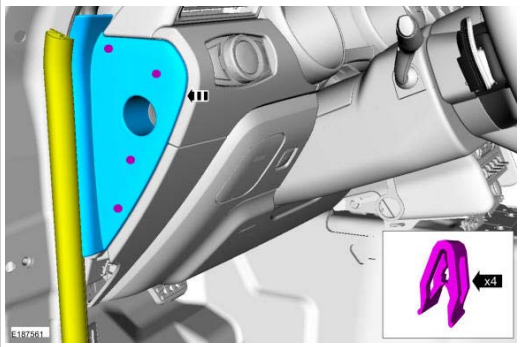
8.

Remove the selector lever assembly.

Disconnect the electrical connector.

Torque

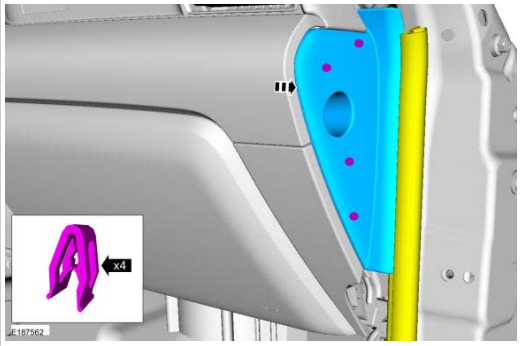
: 80 lb.in (9 Nm)



All vehicles

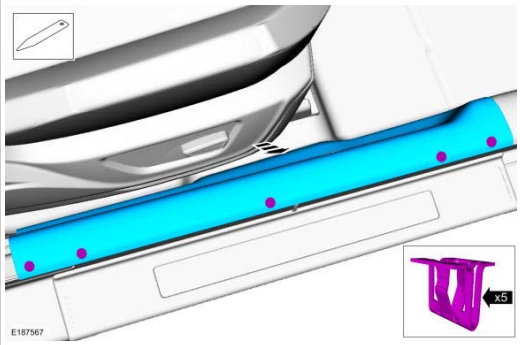
9.

Remove both A-pillar trim panels. Refer to: A-Pillar Trim Panel - Coupe . Refer to: A-Pillar Trim Panel - Convertible .



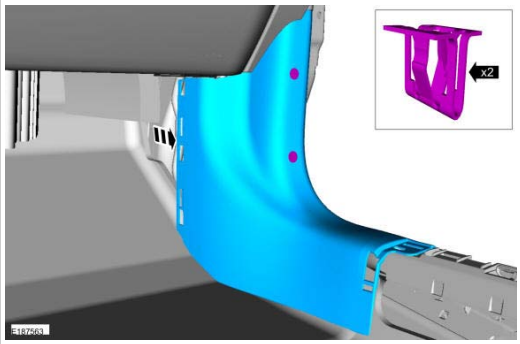
10.

Position aside the weather strip, release the clips and remove the LH instrument panel finish panel.



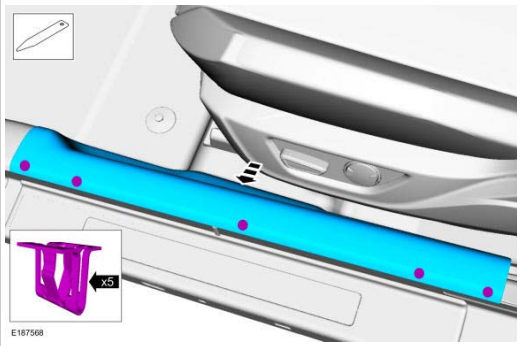
11.

Position aside the weather strip, release the clips and remove the RH instrument panel finish panel.



12.

Release the clips and remove the RH scuff plate. Use the General Equipment: Interior Trim Remover



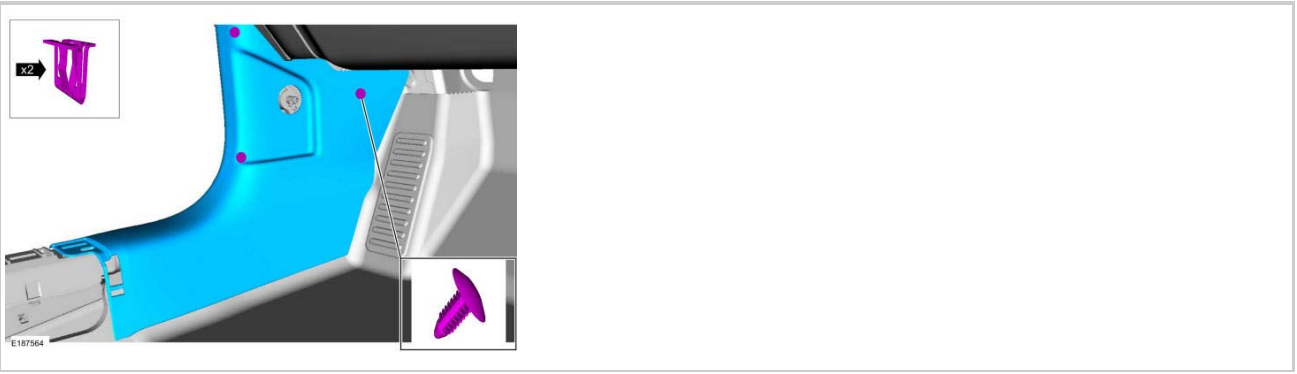
13.

Release the clips and remove the lower RH cowl trim panel.

14.

Release the clips and remove the LH scuff plate. Use the General Equipment: Interior Trim Remover

15.



Remove the driver knee airbag. Refer to: Driver Knee Airbag .

16.

Remove the hood latch release handle. Refer to: Hood Latch Release Handle .

17.

Release the pin-type retainer, the clips and remove the LH cowl trim panel.

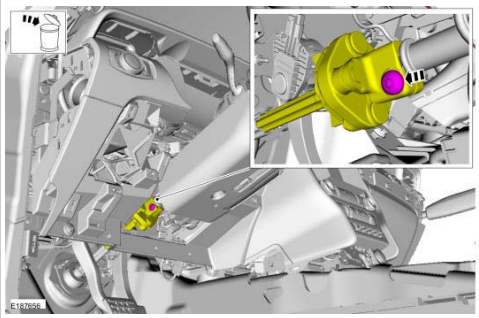
18.

Disconnect the electrical connectors and release the electrical harness retainer.

NOTE: Placing the Steering Column in the Tilt UP position will make shaft disconnection easier.

NOTE: Secure the steering wheel from rotating to prevent damage to clock spring.

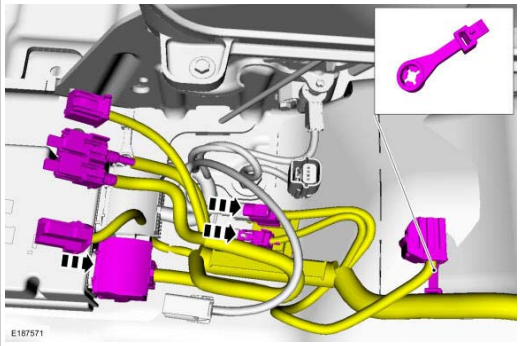
WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.



WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

19.

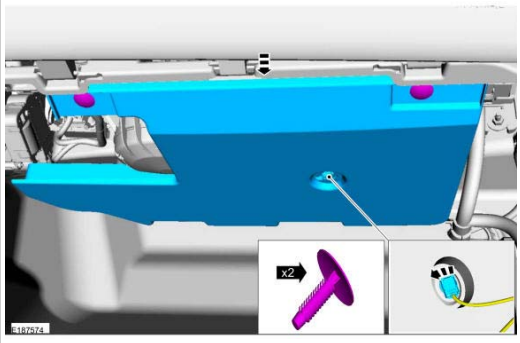
Remove and discard the upper steering column shaft-to-steering column bolt and the position aside the upper steering column shaft.



Torque

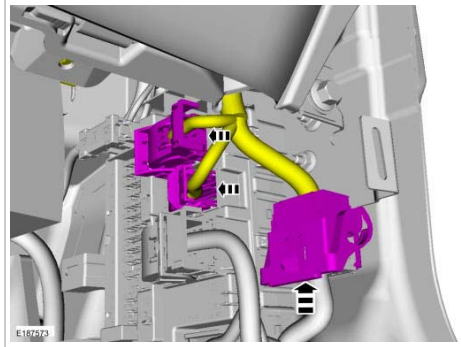
: 16 lb.ft (22 Nm)

20.



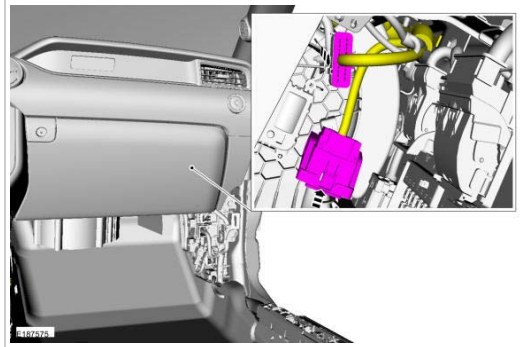
Disconnect the electrical connectors, release the electrical harness retainer(s) and position the electrical harness aside.

21.



Remove the push pins and remove the RH insulation panel.

Remove the insulation panel ambient light.

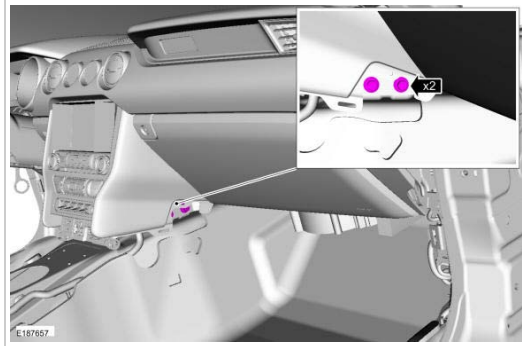


22.

Disconnect the electrical connectors and detach the connector push pin at the RH lower cowl.

23.

Disconnect the electrical connectors behind the glove compartment.

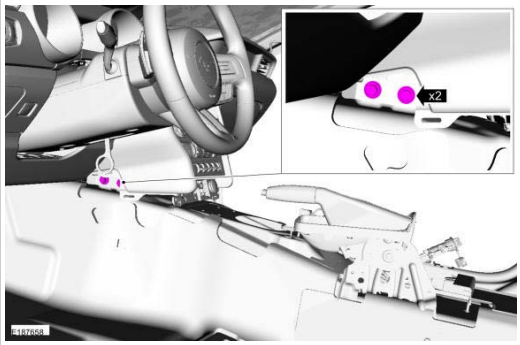


24.

Remove the RH center instrument panel bolts.

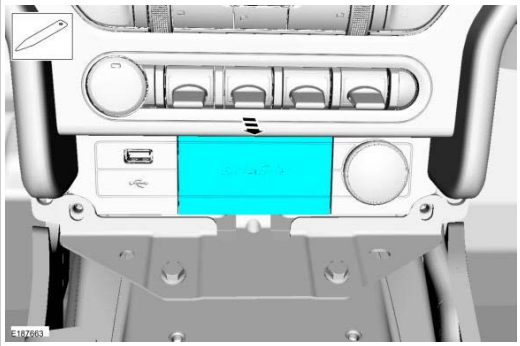
Torque

: 17 lb.ft (22.5 Nm)



25.

Remove the LH center instrument panel bolts.

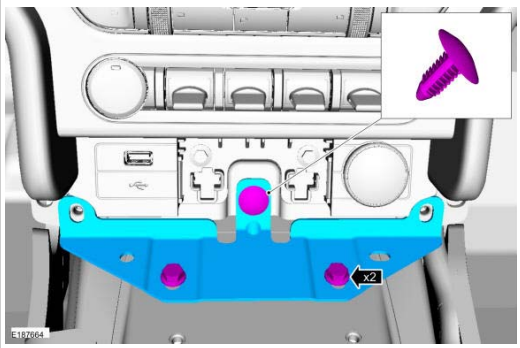


Torque

: 17 lb.ft (22.5 Nm)

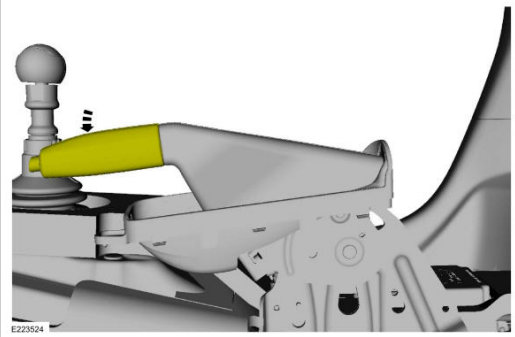
26.

Remove the trim cover. Use the General Equipment: Interior Trim Remover



27.

Remove the 2 bolts the push pin and the instrument panel center bracket.

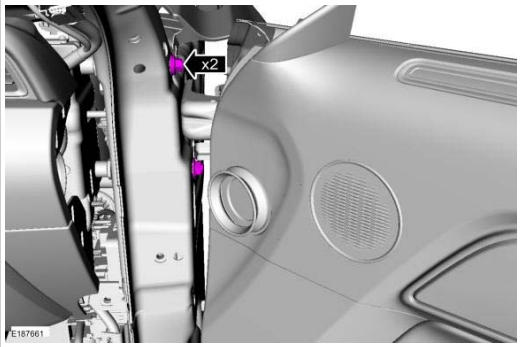


Torque

: 89 lb.in (10 Nm)

28.

Release the emergency brake.

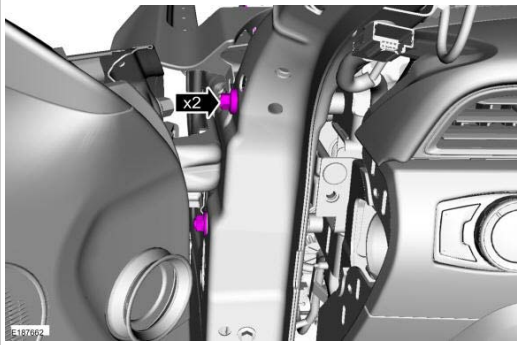


NOTE: The A-pillar to in-vehicle cross beam instrument panel bolts cannot be removed from the A-pillar with the door attached.

29.
Loosen the RH A-pillar to in-vehicle cross beam instrument panel bolts and slide the bolts outward as far as possible.

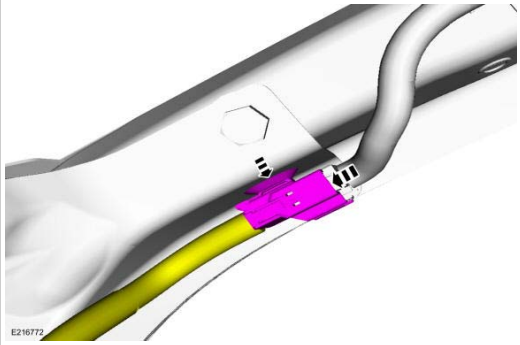
Torque

: 17 lb.ft (22.5 Nm)



NOTE: The A-pillar to in-vehicle cross beam instrument panel bolts cannot be removed from the A-pillar with the door attached.

30.
Completely loosen the LH A-pillar to in-vehicle cross beam instrument panel bolts and slide the bolts outward as far as possible.



Torque

: 17 lb.ft (22.5 Nm)

NOTE: On both sides.

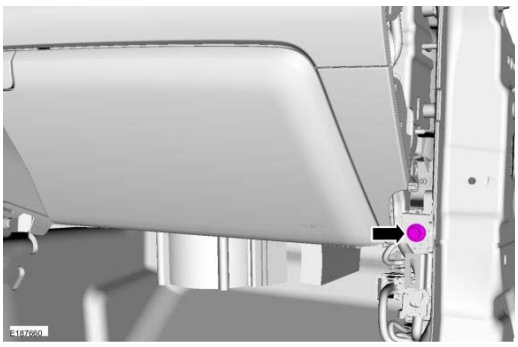
31.
Disconnect the A-pillar electrical connectors and detach the harness retainers.

32.

Remove the LH instrument panel bolts.

Torque

: 16 lb.ft (22 Nm)

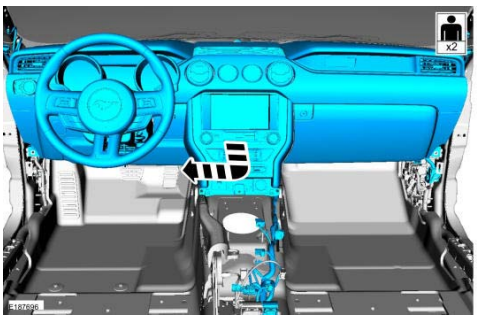


33.

Remove the RH instrument panel bolt.

Torque

: 16 lb.ft (22 Nm)



NOTE: Make sure that all electrical connectors and wiring are not hindered before removing the instrument panel or damage to the components may occur.

NOTE: Make sure not to damage the instrument panel when removing the instrument panel from the vehicle.

NOTE: To avoid damaging the instrument panel, an assistant is required when carrying out this step.

NOTE: Seats shown removed for clarity.

34.
Rotate the instrument panel face down and remove through the LH front door opening.

REMOVAL AND INSTALLATION > INSTRUMENT PANEL > INSTALLATION

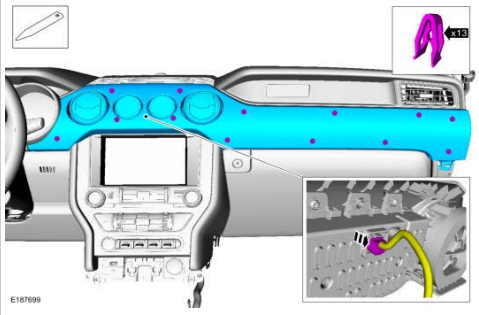
REMOVAL AND INSTALLATION > INSTRUMENT PANEL CENTER FINISH PANEL > REMOVAL

1.



Release the clips and remove RH instrument panel trim panel. Use the General Equipment: Interior Trim Remover

NOTE: Instrument panel center finish panel with optional ICM shown.

2.
Release the clips and remove the instrument panel center finish panel.

Disconnect the ICM electrical connector, if equipped. Use the General Equipment: Interior Trim Remover

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CENTER FINISH PANEL > INSTALLATION

1.

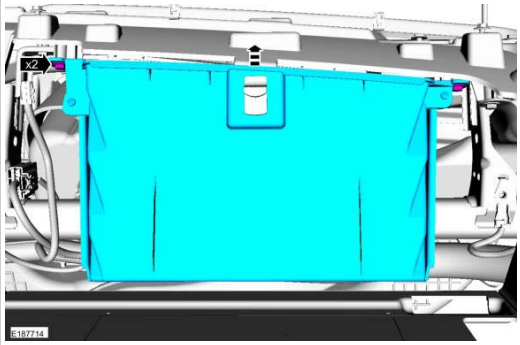
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > INSTRUMENT PANEL UPPER SECTION > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

NOTE: Place the instrument panel on a suitable work surface that will allow the instrument panel to be rotated front to back without damaging the instrument panel.



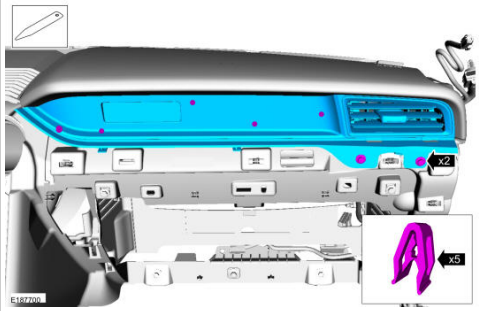
1.
Remove the instrument panel. Refer to: Instrument Panel .

2.

Remove the passenger knee airbag. Refer to: Passenger Knee Airbag .

3.

Remove the bolts and the glove compartment upper stowage bin.

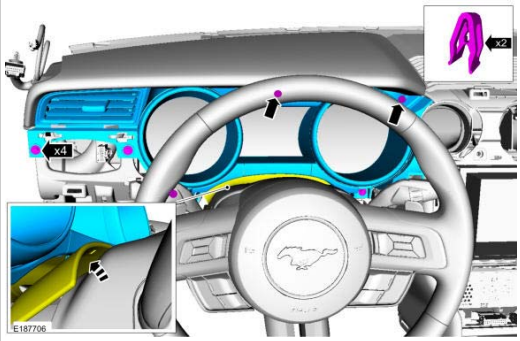


4.

Remove the bolts, release the clips and remove the RH instrument panel finish panel.

Torque

: 18 lb.in (2 Nm)

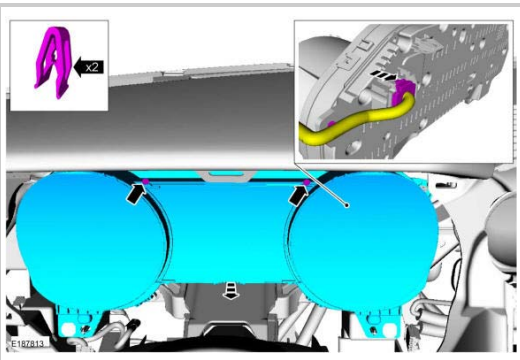


5.

Remove the bolts, release the clips and remove the IPC trim panel.

Detach the gap hider from the upper steering column trim cover.

Torque



: 22 lb.in (2.5 Nm)

6.

Release the clips and remove the IPC.

Disconnect the electrical connector and release the harness retainer.

7.

Release the clips and remove the defroster grille panel.

Disconnect the electrical connector.

8.

Release the clips and remove the instrument panel speaker grille.

9.

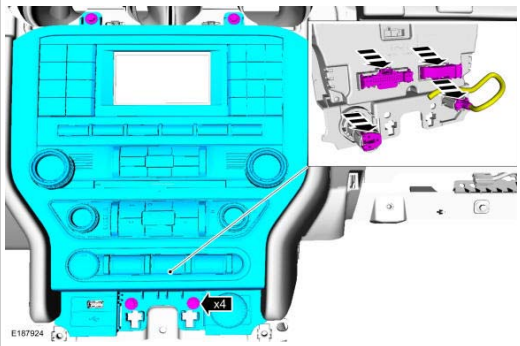
Remove the bolts and the instrument panel speaker.

Disconnect the electrical connectors and release the harness retainer.

Torque

: 22 lb.in (2.5 Nm)

Vehicles with AM/FM/CD/SNYC

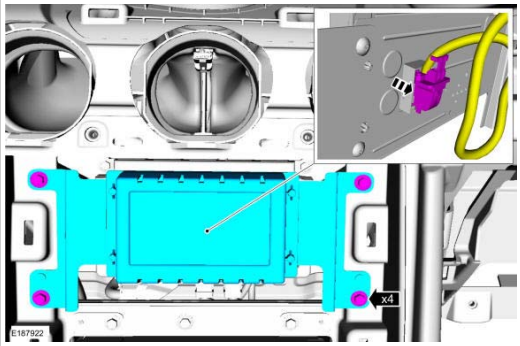


10.

Remove the bolts and the FCIM.

Disconnect the electrical connectors.

Torque

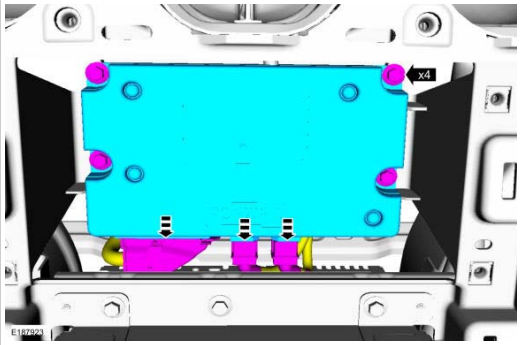


: 22 lb.in (2.5 Nm)

11.

Remove the bolts and the FCDIM.

Disconnect the electrical connector.



12.

Remove the bolts and APIM.

Disconnect the electrical connectors.

Torque

: 13 lb.in (1.5 Nm)

Vehicles with Touchscreen Display

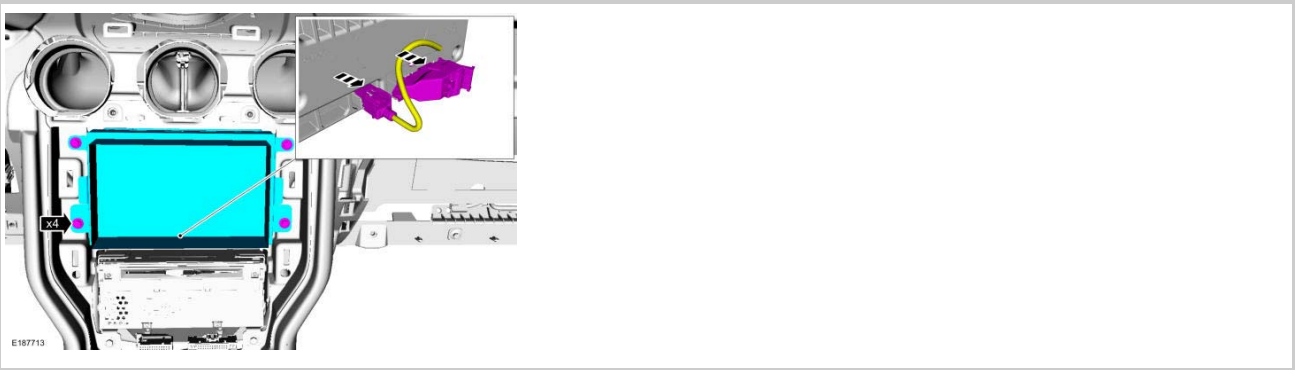
13.

Remove the bolts and the FCIM.

Disconnect the electrical connectors.

Torque

: 22 lb.in (2.5 Nm)



14.

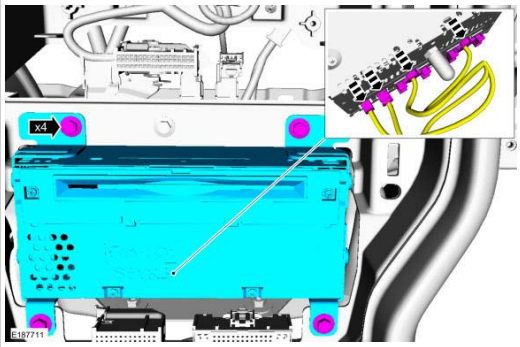
Remove the bolts and the FDIM.

Disconnect the electrical connectors.

Torque

: 22 lb.in (2.5 Nm)

All vehicles



15.

Remove the bolts and the ACM.

Disconnect the electrical connectors.

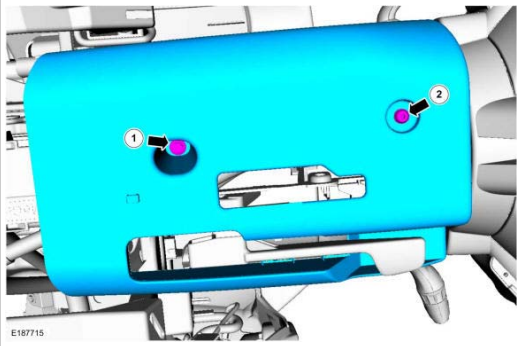
Torque

: 22 lb.in (2.5 Nm)

16.

Remove the bolt, screw and the lower steering column shroud.

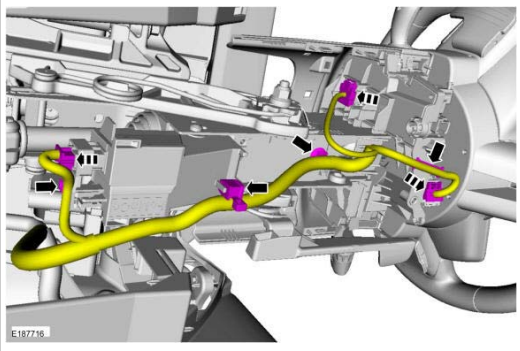
1.



Torque

: 22 lb.in (2.5 Nm)

2.



Torque

: 22 lb.in (2.5 Nm)

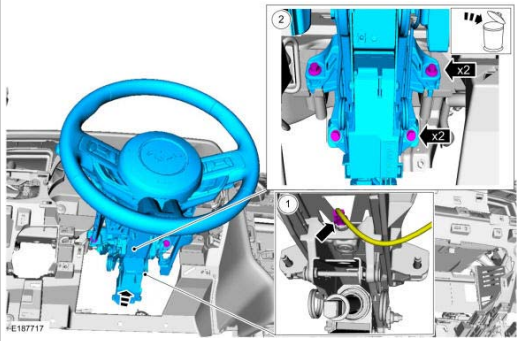
17.

Disconnect the electrical harness, release the harness retainers and position the harness aside.

18.

Remove the steering column.

1.



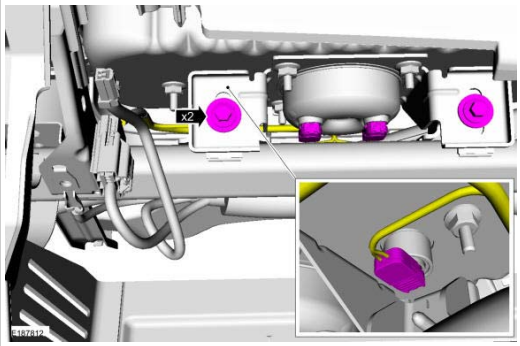
Disconnect the electrical connector.

> *NOTE: The front and rear steering column bolts are not the same, note bolt location before installation.*

2.
Remove and discard the steering column bolts.

Torque

: 18 lb.ft (25 Nm)



19.

Remove the bolts.

Disconnect the 3 electrical connectors.

Torque

: 80 lb.in (9 Nm)

20.

From the rear of the instrument panel position the electrical harness aside on the LH side.

1.

Remove the instrument panel upper section to in-vehicle cross beam bolts.

Torque

: 22 lb.in (2.5 Nm)

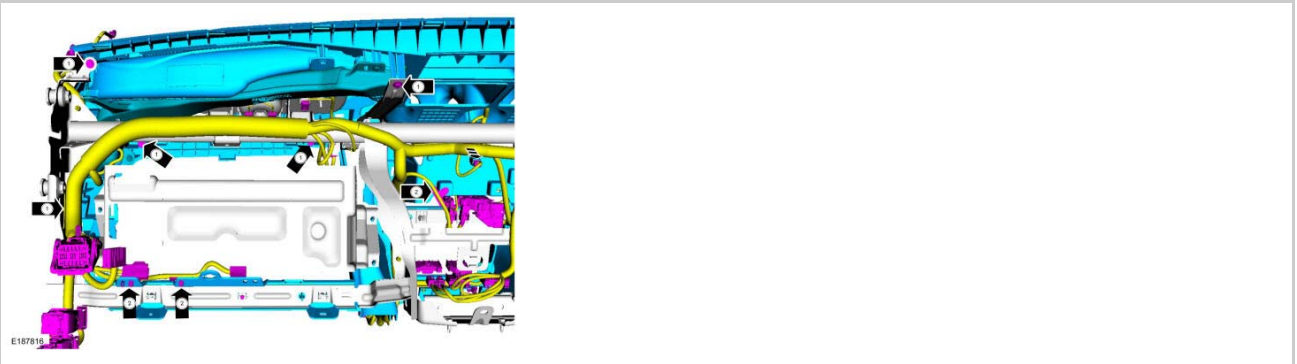
2.

Release the harness retainers.

21.

From the rear of the instrument panel position the electrical harness aside on the RH side.

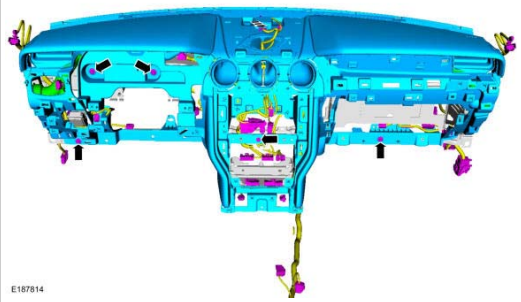
1.



Remove the instrument panel upper section to in-vehicle cross beam bolts.

Torque

: 22 lb.in (2.5 Nm)



2.

Release the harness retainers.

NOTE: Make sure that all electrical connectors and wiring are not hindered before removing the instrument panel upper section or damage to the components may occur.

22.
From the front of the instrument panel position remove the 5 instrument panel upper section to in-vehicle cross beam bolts and remove the instrument panel upper section.

To install, reverse the removal procedure.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - OVERVIEW > OVERVIEW

Dimmable illumination provides backlighting to switches and control components when the headlamps or parking lamps are on. The level of intensity is adjusted by pressing the illumination dim up switch to increase the intensity or the dim down switch to decrease the intensity. The illumination components can be controlled directly (non-networked) or indirectly (networked) by a module.

Non-dimmable illumination is non-networked and provides backlighting to the window switches with the ignition ON or OFF while the accessory relay is energized.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages - APIM, DDM, FCIM,, GWM, IPC and PDM.

Broadcast Message	Originating Module	Message Purpose
Illumination Dimming Level	BCM	Used to command the illumination dimming level for networked modules and outputs that are hardwired to networked modules.

Networked Illumination Operation

The dimmable switches and components are illuminated when the parking lamps are on. The system-wide illumination dimming level is determined by the BCM. Based on the ambient light level input from the light sensor and the requested illumination dimming level input from the dimmer switch, the BCM calculates the correct dimming level. The BCM sends the illumination dimming level message to the GWM on the HS-CAN1.

The GWM distributes illumination messages to the following components:

HS-CAN1

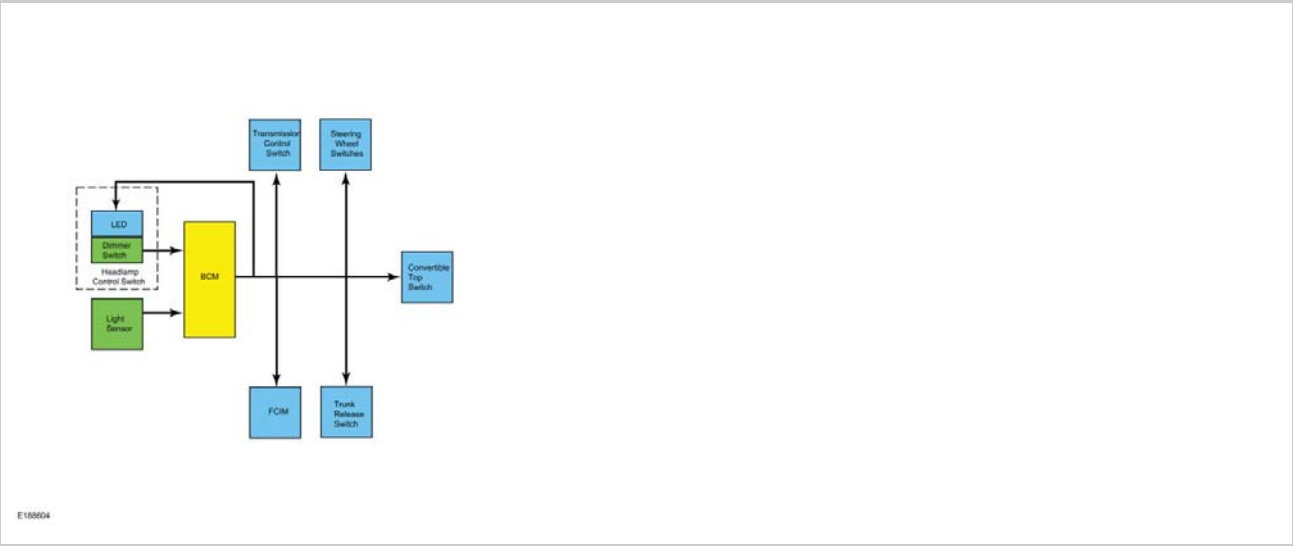
- ICM

MS-CAN

- FCIM
- DDM
- PDM

HS-CAN3

- IPC
- APIM



The receiving modules use the illumination dimming level message to determine the backlighting intensity of internal and external non-networked illumination sources. If a module does not receive the illumination dimming level message or the data received is deemed invalid, the module sets a DTC in continuous memory and defaults to full nighttime intensity.

If the IPC does not receive the dimming level or ambient light level network messages from the BCM for up to 5 seconds, the IPC illumination remains at the last level based on the last message received. If the IPC receives invalid or no signals for more than 5 seconds, the IPC defaults to night illumination level.

On vehicles equipped with autolamps, if the exterior lamps are activated during the daytime, the message center illumination remains at full intensity and does not dim from the illumination dimmer switch. If the vehicle travels under a bridge or through a tunnel, the low level of ambient light causes the illumination level of the message center to change to the level set by the dimmer switch. The message center illumination changes back to full intensity when the intense ambient light is restored.

The hazard switch assembly is integral to the FCIM and cannot be serviced separately.

System Diagram - Non-Networked Illumination

Non-

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORKED ILLUMINATION OPERATION

The dimmable switches and components are illuminated when the parking lamps are on. The system-wide illumination dimming level is determined by the BCM. Based on the ambient light level input from the light sensor and the requested illumination dimming level input from the dimmer switch, the BCM calculates the correct dimming level. The BCM sends the illumination dimming level message to the GWM on the HS-CAN1.

The GWM distributes illumination messages to the following components:

HS-CAN1

- ICM

MS-CAN

- FCIM
- DDM
- PDM

HS-CAN3

- IPC
- APIM

The receiving modules use the illumination dimming level message to determine the backlighting intensity of internal and external non-networked illumination sources. If a module does not receive the illumination dimming level message or the data received is deemed invalid, the module sets a DTC in continuous memory and defaults to full nighttime intensity.

If the IPC does not receive the dimming level or ambient light level network messages from the BCM for up to 5 seconds, the IPC illumination remains at the last level based on the last message received. If the IPC receives invalid or no signals for more than 5 seconds, the IPC defaults to night illumination level.

On vehicles equipped with autolamps, if the exterior lamps are activated during the daytime, the message center illumination remains at full intensity and does not dim from the illumination dimmer switch. If the vehicle travels under a bridge or through a tunnel, the low level of ambient light causes the illumination level of the message center to change to the level set by the dimmer switch. The message center illumination changes back to full intensity when the intense ambient light is restored.

The hazard switch assembly is integral to the FCIM and cannot be serviced separately.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NON-NETWORKED ILLUMINATION OPERATION

Based on the ambient light level input from the light sensor and the requested illumination dimming level input from the dimmer switch, the BCM calculates the correct dimming level for the non-networked illumination sources. The BCM provides a pulse-width modulated voltage to all non-networked illumination sources.

The start/stop switch is non-networked to the BCM but integral to the FCIM and cannot be serviced separately.

Non-dimmable illumination is supplied to the window control switches with the ignition switch ON or OFF, when the accessory relay is energized.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FIELD-EFFECT TRANSISTOR (FET) PROTECTION

Field-Effect Transistor (FET) protection is used to protect the BCM output drivers from damage in the event that an excessive current draw is detected on a BCM output. Each illumination circuit connected to the BCM is separately protected. Refer to the System Diagram in this article to view the different groups of BCM non-networked illumination outputs. For a full description of Field-Effect Transistor (FET) protection, Refer to: Module Controlled Functions - System Operation and Component Description .

DESCRIPTION AND OPERATION > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

Dimmer Switch

The dimmer switch is a momentary contact switch that is integral to the headlamp switch. The headlamp switch is non-networked to the BCM. When the dim up or dim down switch is pressed the switch completes a ground circuit to the BCM corresponding to the desired action (increase or decrease illumination brightness).

The FDIM illumination is inoperative or does not dim	APIM FDIM	VERIFY the audio system can be operated from the FDIM. If the audio system responds normally to FDIM inputs, Refer to APIM HARDWARE TESTING . If the FDIM illumination still does not function correctly after the repair, INSTALL a new FDIM. Vehicles With: Touchscreen Display REFER to: Front Display Interface Module (FDIM) . If the audio system does not respond normally to FDIM inputs, Vehicles With: AM/FM/CD/SYNC REFER to: Information and Entertainment System . Vehicles With: Touchscreen Display REFER to: Information and Entertainment System .

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST A : ALL ILLUMINATION (NETWORKED AND NON-NETWORKED COMPONENTS) DO NOT DIM

Refer to Cluster and Panel Illumination for schematic and connector information.

Normal Operation and Fault Conditions

The dimmer switch is integral to the headlamp switch and provides a corresponding voltage signal to the BCM based on which switch is pressed (dim up or dim down).

DTC	Description	Fault Trigger Conditions
B1436:01	Digital Dimmer Switch Input: General Electrical Failure	A continuous and on-demand DTC that sets in the BCM when the BCM detects an open, short to power or to ground on the dim up or dim down circuits.

Possible Sources

- Wiring, terminals or connectors
- Dimmer switch (part of the headlamp switch)
- BCM

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST A : ALL ILLUMINATION (NETWORKED AND NON-NETWORKED COMPONENTS) DO NOT DIM > PINPOINT TEST A : ALL ILLUMINATION (NETWORKED AND NON-NETWORKED COMPONENTS) DO NOT DIM

A1 RETRIEVE AND RECORD DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs).

Is DTC B1436:01 present?

Yes	GO to A2

No	GO to A6

A2 CHECK THE DIM UP AND DIM DOWN CIRCUITS FOR A SHORT TO VOLTAGE

Disconnect Headlamp switch C205 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-3		Ground

C205-6		Ground

Is any voltage present?

Yes	REPAIR the circuit in question.

No	GO to A3

A3 CHECK THE DIM UP AND DIM DOWN CIRCUITS FOR AN OPEN

Ignition OFF.

Disconnect BCM

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-3	Ω	C2280B-3
C205-6	Ω	C2280B-7

Is the resistance less than 3 ohms?

Yes	GO to A4

No	REPAIR the circuit in question.

A4 CHECK THE DIM UP AND DIM DOWN CIRCUITS FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-3	Ω	Ground
C205-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A5

No	REPAIR the circuit in question.

A5 CHECK THE DIM UP AND DIM DOWN CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-3	Ω	C205-6

Is the resistance greater than 10, 000 ohms?

Yes	GO to A6

No	REPAIR the circuit in question.

A6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH

Perform the instrument panel dimmer switch component test (part of the headlamp switch component test). Refer to Component Testing for schematic and connector information.

Does the instrument panel dimmer switch pass the component test?

Yes	GO to A7

No	INSTALL a new headlamp switch. REFER to: Headlamp Switch .

A7 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for the concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no TSB address this concern, .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES

ILLUMINATION > PINPOINT TEST > PINPOINT TEST B : ALL NON-NETWORKED ILLUMINATION IS INOPERATIVE

Refer to Cluster and Panel Illumination for schematic and connector information.

Normal Operation and Fault Conditions

The dimmer switch is integral to the headlamp switch and provides a corresponding voltage signal to the BCM based on which switch is pressed (dim up or dim down).

DTC	Description	Fault Trigger Conditions
B1315:11	Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Ground	A continuous and on-demand DTC that sets in the BCM when the BCM detects an excessive current draw from the backlighting illumination circuit.
B1315:15	Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Battery or Open	A continuous and on-demand DTC that sets in the BCM when the BCM detects a lower than expected current draw from the backlighting illumination circuit.

Possible Sources

- Wiring, terminals or connectors
- Dimmer switch (part of the headlamp switch)
- BCM

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST B : ALL NON-NETWORKED ILLUMINATION IS INOPERATIVE > PINPOINT TEST B : ALL NON-NETWORKED ILLUMINATION IS INOPERATIVE

B1 RETRIEVE AND RECORD DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs).

Is DTC B1315:11 or B1315:15 present?

Yes	For B1315:15 GO to B2 For B1315:11 GO to B4

No	REFER to Symptom Chart .

B2 CHECK THE BACKLIGHTING ILLUMINATION OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Headlamp switch C205 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-15		Ground

Is any voltage present?

Yes	REPAIR the circuit in question.

No	GO to B3

B3 CHECK THE BACKLIGHTING ILLUMINATION OUTPUT CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-15	Ω	C2280B-45

Is the resistance less than 3 ohms?

Yes	GO to B5

No	REPAIR the circuit in question.

B4 CHECK THE BACKLIGHTING ILLUMINATION OUTPUT CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect Headlamp switch.

Disconnect BCM C2280B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C205-15	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to B5

No	REPAIR the circuit in question.

B5 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for the concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no TSB address this concern, .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST C : ONE OR MORE NON-NETWORKED ILLUMINATION COMPONENTS ARE INOPERATIVE

Refer to Cluster and Panel Illumination for schematic and connector information.

Normal Operation and Fault Conditions

The dimmer switch is integral to the headlamp switch and provides a corresponding voltage signal to the BCM based on which switch is pressed (dim up or dim down).

Possible Sources

- Wiring, terminals or connectors
- Illuminated component

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST C : ONE OR MORE

NON-NETWORKED ILLUMINATION COMPONENTS ARE INOPERATIVE > PINPOINT TEST C : ONE OR MORE NON-NETWORKED ILLUMINATION COMPONENTS ARE INOPERATIVE

C1 CHECK FOR VOLTAGE TO THE INOPERATIVE COMPONENT

Ignition OFF.

> *NOTE: If the headlamp switch illumination is inoperative, set the instrument panel illumination to the brightest setting with the ignition on prior to disconnecting the headlamp switch.*

Disconnect: Inoperative Illuminated Component.

Ignition ON.

Place a shop light over the ambient light sensor to make sure the illumination can reach maximum brightness.

Place the headlamp switch in the PARKING LAMPS ON position.

Press the instrument panel dimmer switch up until the illumination reaches full brightness.

Measure:

Headlamp switch

Positive Lead	Measurement / Action	Negative Lead
C205-15		Ground

FCIM

Positive Lead	Measurement / Action	Negative Lead
C2402A-4		Ground

Interior Luggage Compartment Lid Release Switch

Positive Lead	Measurement / Action	Negative Lead
C2610-3		Ground

TCS

Positive Lead	Measurement / Action	Negative Lead
C3245-3		Ground

Convertable Top Switch

Positive Lead	Measurement / Action	Negative Lead
C9013-8		Ground

Is the voltage greater than 11 volts?

Yes	GO to C2

No	REPAIR the circuit in question.

C2 CHECK THE COMPONENT GROUND CIRCUIT

Measure:

Headlamp Switch

Positive Lead	Measurement / Action	Negative Lead
C205-15		C205-5

FCIM

Positive Lead	Measurement / Action	Negative Lead
C2402A-4		C2402A-1

C2610-3		C2610-2

TCS

Positive Lead	Measurement / Action	Negative Lead
C3245-3		C3245-2

Convertable Top Switch

Positive Lead	Measurement / Action	Negative Lead
C9013-8		C9013-2

Is the voltage greater than 11 volts?

Yes	INSTALL a new component.

No	REPAIR the circuit in question.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST D : ALL NON-NETWORKED ILLUMINATION SOURCES ARE ALWAYS ON (NETWORKED ILLUMINATION FUNCTIONS CORRECTLY)

Refer to Cluster and Panel Illumination for schematic and connector information.

Normal Operation and Fault Conditions

The BCM provides PWM voltage to all non-networked illumination sources.

DTC	Description	Fault Trigger Conditions
B1315:15	Backlighting (Non Reflective Controls) Illumination Output: Circuit Short To Battery or Open	A continuous and on-demand DTC that sets in the BCM when the BCM detects a lower than expected current draw from the backlighting illumination output circuit.

Possible Sources

- Wiring, terminals or connectors

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST D : ALL NON-NETWORKED ILLUMINATION SOURCES ARE ALWAYS ON (NETWORKED ILLUMINATION FUNCTIONS CORRECTLY) > PINPOINT TEST D : ALL NON-NETWORKED ILLUMINATION SOURCES ARE ALWAYS ON (NETWORKED ILLUMINATION FUNCTIONS CORRECTLY)

D1 RETRIEVE AND RECORD DIAGNOSTIC TROUBLE CODES (DTCS)

Using the diagnostic scan tool, retrieve all Diagnostic Trouble Codes (DTCs).

Is DTC B1315:15 present?

Yes	GO to Pinpoint Test B

No	GO to D2

D2 CHECK THE BACKLIGHTING ILLUMINATION OUTPUT CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280B .

Ignition ON.

Do the non-networked components continue to illuminate?

Yes	REPAIR the circuit in question.

No	GO to D3

D3 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for the concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no TSB address this concern, .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST E : THE DRIVER DOOR LOCK/MEMORY SET SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON

Refer to Power Windows for schematic and connector information.

Normal Operation and Fault Conditions

The DDM supplies voltage to illuminate the driver door lock/unlock memory set switch.

DTC	Description	Fault Trigger Conditions
U2010:00	Switch Illumination: No Sub Type Information	A continuous and on-demand DTC that sets in the BCM when the DDM detects a short to ground or open on the switch illumination circuit.

Possible Sources

- Wiring, terminals or connectors
- Driver door lock/unlock switch
- DDM

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST E : THE DRIVER DOOR LOCK/MEMORY SET SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON > PINPOINT TEST E : THE DRIVER DOOR LOCK/MEMORY SET SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON

E1 VERIFY THE DOOR LOCK SWITCH FUNCTIONALITY

Actuate the door locks from the driver door lock switch.

Can the doors be locked and unlocked from the driver door lock switch?

Yes	If the switch illumination is inoperative, GO to E2 If the switch illumination is always on, GO to E5

No	REFER to: Locks, Latches and Entry Systems .

E2 CHECK THE ILLUMINATION CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect Driver lock/unlock switch C541 .

Place the headlight switch in the ON position and increase the illumination to full intensity.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C541-4		Ground

Is the voltage greater than 11 volts?

Yes	INSTALL a new driver door lock/unlock switch. REFER to: Door Lock Control Switch .

No	GO to E3

E3 CHECK THE ILLUMINATION CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect DDM C501A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C541-4	Ω	C501A-15

Is the resistance less than 3 ohms?

Yes	GO to E4

No	REPAIR the circuit.

E4 CHECK THE ILLUMINATION CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C541-4	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new DDM. REFER to: Driver Door Module (DDM) .

No	REPAIR the circuit in question.

E5 CHECK THE ILLUMINATION CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect DDM C501A .

Ignition ON.

Is the driver door lock/unlock switch illuminated?

Yes	REPAIR the circuit in question.

No	INSTALL a new DDM. REFER to: Driver Door Module (DDM) .

E6 CHECK FOR CORRECT DDM (DRIVER DOOR MODULE) OPERATION

Disconnect and inspect all DDM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the DDM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for the concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no TSB address this concern, INSTALL a new DDM. REFER to: Driver Door Module (DDM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST F : THE PASSENGER DOOR LOCK AND/OR WINDOW CONTROL SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON

Refer to Power Windows for schematic and connector information.

Normal Operation and Fault Conditions

The PDM supplies voltage to the illuminate the passenger door lock/unlock switch and passenger window control switch. The door lock and window control switch illumination share common power and ground circuits.

DTC	Description	Fault trigger conditions
U2010:00	Switch Illumination: No Sub Type Information	A continuous and on-demand DTC that sets in the BCM when the PDM detects a short to ground or open on the switch illumination circuit.

Possible Sources

- Wiring, terminals or connectors
- Passenger door lock/unlock switch
- Passenger window control switch
- PDM

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST F : THE PASSENGER DOOR LOCK AND/OR WINDOW CONTROL SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON > PINPOINT TEST F : THE PASSENGER DOOR LOCK AND/OR WINDOW CONTROL SWITCH ILLUMINATION IS INOPERATIVE OR ALWAYS ON

F1 VERIFY THE DOOR SWITCH FUNCTION

Ignition ON.

Actuate the door lock/unlock from the passenger door lock/unlock switch.

Actuate the passenger window up/down from the passenger window switch.

Can the doors be locked and unlocked and the window travel up and down from the passenger door switches?

Yes	If the switch illumination is inoperative, GO to F2 If the switch illumination is always on, GO to F5

No	For the door lock/unlock switch, REFER to: Locks, Latches and Entry Systems . For the window switch, REFER to: Glass, Frames and Mechanisms .

F2 CHECK THE ILLUMINATION CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect Inoperative passenger lock/unlock switch C605 or passenger window switch C624 .

Place the headlight switch in the ON position and increase the illumination to full intensity.

Ignition ON.

Measure the inoperative switch:

Positive Lead	Measurement / Action	Negative Lead
C605-4		Ground
C624-4		Ground

Is the voltage greater than 11 volts?

Yes	INSTALL a new passenger door lock/unlock switch. REFER to: Door Lock Control Switch . INSTALL a new passenger door window switch. REFER to: Front Door Window Control Switch .

No	GO to F3

F3 CHECK THE ILLUMINATION CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect PDM C652A .

Measure the inoperative switch:

Positive Lead	Measurement / Action	Negative Lead
C605-4	Ω	C652A-15
C624-4	Ω	C652A-15

Are the resistances less than 3 ohms?

Yes	GO to F4

No	REPAIR the circuit in question.

F4 CHECK THE ILLUMINATION CIRCUIT FOR A SHORT TO GROUND

Measure the inoperative switch:

Positive Lead	Measurement / Action	Negative Lead
C605-4	Ω	Ground
C624-4	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to F6

No	REPAIR the circuit in question.

F5 CHECK THE ILLUMINATION CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect PDM C652A .

Ignition ON.

Is the passenger door lock/unlock switch and/or the passenger window switch illuminated?

Yes	REPAIR the circuit in question.

No	GO to F6

F6 CHECK FOR CORRECT PDM (PASSENGER DOOR MODULE) OPERATION

Disconnect and inspect all PDM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PDM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for the concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no TSB address this concern, INSTALL a new PDM. REFER to: Passenger Door Module (PDM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST G : THE STEERING WHEEL SWITCH(ES) ILLUMINATION IS INOPERATIVE OR ALWAYS ON

Refer to Cluster and Panel Illumination for schematic and connector information.

Normal Operation and Fault Conditions

The steering wheel switches receive illumination voltage from the BCM on the common illumination circuit through the clockspring.

Possible Sources

- Wiring, terminals or connectors
- Steering wheel switch(es)
- Clockspring

- Steering wheel (includes harness)
- SCCM

DIAGNOSIS AND TESTING > INSTRUMENT PANEL AND INTERIOR SWITCHES ILLUMINATION > PINPOINT TEST > PINPOINT TEST G : THE STEERING WHEEL SWITCH(ES) ILLUMINATION IS INOPERATIVE OR ALWAYS ON > PINPOINT TEST G : THE STEERING WHEEL SWITCH(ES) ILLUMINATION IS INOPERATIVE OR ALWAYS ON

G1 INSPECT THE NON-NETWORKED ILLUMINATION COMPONENTS

Ignition ON.

Place the headlamp switch in the PARKING LAMPS ON position.

While pressing the illumination dimmer switch up and down, monitor the non-networked illumination components.

Are all of the non-networked illumination components inoperative or always on?

Yes	If all non-networked illumination components are always on, GO to Pinpoint Test D If all non-networked illumination components are inoperative, GO to Pinpoint Test B

No	If **all** steering wheel switch(es) illumination is inoperative, GO to G2. If one or more but not all switch illumination is inoperative, GO to G5

G2 CHECK FOR ILLUMINATION VOLTAGE AND GROUND AT THE CLOCKSPRING

Place the headlamp switch in the OFF position.

Ignition OFF.

Disconnect SCCM C218A .

Place the headlamp switch in the PARKING LAMPS ON position.

Ignition ON.

Press the illumination dim up switch to the full illumination position.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-1		C218A-4

Is the voltage greater than 11 volts?

Yes	GO to G4

No	GO to G3

G3 CHECK FOR ILLUMINATION VOLTAGE AT THE CLOCKSPRING

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-1		Ground

Is the voltage greater than 11 volts?

Yes	REPAIR the illumination ground circuit.

No	REPAIR the circuit in question.

G4 CHECK FOR ILLUMINATION VOLTAGE AND GROUND TO THE STEERING WHEEL SWITCHES

Place the headlamp switch in the OFF position.

Ignition OFF.

Remove the driver airbag. REFER to: Driver Airbag .

Connect C218A .

Disconnect C218B .

Place the headlamp switch in the PARKING LAMPS ON position.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218B-11 Component side		C218B-1 Component side

Is the voltage greater than 11 volts?

Yes	INSTALL a new steering wheel. REFER to: Steering Wheel .

No	INSTALL a new clockspring. REFER to: Clockspring .

G5 CHECK THE SUSPECT STEERING WHEEL SWITCH FOR ILLUMINATION VOLTAGE AND GROUND

Place the headlamp switch in the OFF position.

Ignition OFF.

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect the suspect switch.

Place the headlamp switch in the PARKING LAMPS ON position.

Ignition ON.

Measure the voltage and ground at the inoperative switch, harness side:

LH upper steering wheel switch

Positive Lead	Measurement / Action	Negative Lead
C2998-4		C2998-1

RH upper steering wheel switch

Positive Lead	Measurement / Action	Negative Lead
C2999-4		C2999-1

LH lower steering wheel switch

Positive Lead	Measurement / Action	Negative Lead
C2366-8		C2366-2

RH lower steering wheel switch

Positive Lead	Measurement / Action	Negative Lead
C2367-8		C2367-2

LH downshift paddle switch

Positive Lead	Measurement / Action	Negative Lead
C2429-1		C2429-4

RH upshift paddle switch

Positive Lead	Measurement / Action	Negative Lead
C2428-1		C2428-4

Is the voltage greater than 11 volts?

Yes	INSTALL a new switch. REFER to: Steering Wheel Multifunction Switch . If the downshift paddle switch is a fault, INSTALL a new switch. REFER to: Downshift Paddle Switch . If the upshift paddle switch is a fault, INSTALL a new switch. REFER to: Upshift Paddle Switch .

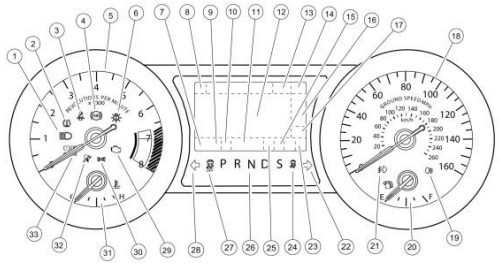
No	REPAIR the circuit in question. If the circuit cannot be repaired, INSTALL a new steering wheel. REFER to: Steering Wheel .

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - OVERVIEW > OVERVIEW

The IPC uses gauges, warning and informational indicators, RTT indicators, warning messages and chimes to alert the driver of vehicle conditions and system operation. The message center provides menu selections to configure various vehicle features. For a complete list and description of the features the message center controls, refer to the Owner's Literature.

The IPC provides a single display screen that contains the message center, RTT indication and virtual gauge displays.

Depending on option level, the IPC provides the following virtual gauge displays:



- Accelerometer
- Air fuel ratio
- Battery voltage
- Vacuum boost gauge (non-SVT only)
- Cylinder head temperature
- Engine oil pressure (SVT only)
- Engine oil temperature
- Inlet air temperature
- Transmission fluid temperature

Informational indicators inform the driver of conditions that exist in the vehicle. Warning indicators provide information to the driver of conditions that could potentially cause personal injury or alter vehicle performance.

RTT indicators illuminate in the message center and replace the typical informational or warning indicator, using the same iconic representation. The message center uses a rotating RTT display area that can display multiple indicators, if needed, while using fixed locations for other indicators and displays.

NOTE: Metric IPC similar.

ICM

In addition to the IPC gauges, the ICM (mounted in the instrument panel) provides additional gauges. The gauges in the ICM vary based on option content as follows:

- Engine oil pressure
- Engine oil temperature (SVT only)
- Vacuum-boost or vacuum (non-SVT only)

Network Messaged Inputs

Module messaging has increased over time and is the standard for sending and receiving information required to operate the IPC. The majority of the inputs required to operate the IPC are received over the CAN.

Hardwired Inputs

The IPC requires hardwired inputs from components that are not on the CAN. These components are required for specific IPC functions.

The hardwired inputs are provided by the following components:

- CAN
- fuel pump assembly
- fuel level sensor
- park detect switch (part of the floor shifter assembly)

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART - IPC GAUGES

Module Network Input Messages - IPC

Broadcast Message	Originating Module	Message Purpose
Air fuel ratio display	PCM	Input used to control the air fuel ratio virtual gauge display.

Cylinder head temperature data	PCM	Input used to control the cylinder head temperature virtual gauge display.
Engine air inlet temperature data	PCM	Input used to control the inlet air temperature virtual gauge display.
Engine coolant temperature data	PCM	Input used to control the engine temperature gauge.
Engine oil temperature	PCM	Input used to control the engine oil temperature virtual gauge display.
Engine RPM data	PCM	Input used to control the tachometer.
Ignition status	BCM	Input used to provide ignition RUN, START and ACC states.
Transmission fluid temperature data	PCM	Input used to control the transmission oil temperature virtual gauge display.
Vacuum/boost display	PCM	Input used to control the vacuum boost virtual gauge display.
Vehicle lateral acceleration	ABS module	Lateral input used to display the accelerometer.
Vehicle longitudinal acceleration	ABS module	Longitudinal input used to display the accelerometer.
Vehicle speed	PCM	Input used to control the speedometer.

Brake (red) warning indicator request	ABS module	Input from the ABS used to control the brake warning indicator.
Driver safety belt buckle status	RCM	Input used to control the safety belt warning indicator.
Front fog lamp indicator request	BCM	Input used to control the front fog lamp indicator.
Headlamp high/low status	BCM	Input used to control the high beam indicator.
Ignition status	BCM	Input used to provide ignition RUN, START and ACC states.
LED low beam malfunction	BCM	Input used to control the LED low beam malfunction indicator.
Left turn lamp on request	BCM	Input used to control the left turn signal indicator.
MIL request	PCM	Input used to control the MIL.
Parking brake status	BCM	Parking brake input used to control the brake warning indicator.
Parklamp status	BCM	Input used to control the lights on indicator.

Rear fog lamp indicator request	BCM	Input used to control the rear fog lamp indicator.
Right turn lamp on request	BCM	Input used to control the right turn signal indicator.
Stability-traction control indicator request	ABS module	Input used to control the stability-traction control indicator (sliding car icon).
Stability-traction control mode indicator	ABS module	Input used to control the stability-traction control disabled indicator (sliding car OFF icon).
Tire pressure warning indicator	BCM	Input used to control the TPMS indicator.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORKED INPUT MESSAGES AND DEFAULT STATES

NOTE: Whenever a network message is suspected as missing and confirmed by a missing message DTC (U-code), it is important to look for other symptoms that can also be present in the IPC and throughout the vehicle. Once a DTC sets in the IPC, it is helpful to review the complete message list to determine which other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same or similar lost communication DTC can also be set in those modules. Confirmation of missing messages common to multiple modules can indicate the originating module is the source of the concern or the communication network may be faulted.

For a list of all the network messages, Refer to: MODULE COMMUNICATIONS NETWORK .

The IPC uses input messages from other modules to control the gauges, informational indicators, warning indicators and message center message displays over the communication networks. The IPC receives all networked data over the HS-CAN3.

The vehicle uses 4 communication networks to transmit the data used by the IPC.

- HS-CAN1
- HS-CAN2
- HS-CAN3
- MS-CAN

Refer to: Communications Network - Overview .

All messaged inputs to the IPC from other networks are received from the GWM over the HS-CAN3. The GWM, as the name implies, acts as a gateway to convert messages from one of the other 3 networks to the HS-CAN3, which is recognized by the IPC.

Network messages can drop out or be missing for a variety of reasons, such as intermittent network concerns or high network traffic on the bus. The IPC incorporates a defined strategy for handling missing network messages based on time. The required time for a network message to be missing differs between the various gauges, indicators and message center displays. The strategy is basically the same for all indication outputs (gauges, indicators or chimes), but differs in the length of time required for the network message to be missing. If a required network message is missing or invalid for less than the programmed length of time, the gauge, indicator or message center display that requires the network message remains at the last commanded state based upon the last network message received. If the messaged input is missing for longer than the programmed length of time, the IPC output (gauge, indicator etc.) reacts according to a pre-defined default action.

For example, if the stability-traction control indicator request network message is missing for less than 5 seconds, and the stability-traction control indicator (sliding car icon) was on, the indicator remains in the on state until the next network message is received. If the network message remains missing or invalid for more than 5 seconds, the IPC sets a U-code DTC and the IPC output becomes a default action for the indicator or gauge. The indicator may default on/off or the gauge may default to the rest position.

Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the diagnostic overview descriptions located before each pinpoint test for further descriptions of the default action specific to each indicator or gauge. If the missing messaged input to the IPC returns at any time, the normal function of the gauge, indicator or message center display resumes.

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- which module controls the output of the feature.
- whether the module that receives the input controls the output of the feature, or whether it outputs a message over the communication network to another module.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > STARTUP-SHUTDOWN

The IPC provides a startup/shutdown sequence also known as a welcome/goodbye strategy. The IPC initiates and follows a progressive strategy providing increasing IPC functionality from IPC wake up to ready to drive status. This sequence begins at RKE unlock or driver door open through the ignition RUN state. During this period, the IPC provides increasing functionality from backlighting or illuminating gauge rings, gauge pointers, illuminating the PRNDL, backlighting of the message center display, displaying a message center splash screen, gauge and LED prove out, gauge sweep and finally normal IPC operation.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MYKEY ®

MyKey ® miles driven by the MyKey ® user can be found in the information display.

- The number of MyKey ® programmed and administrator keys can be found in the MyKey ® menu.
- The parking aid, Blind Spot Monitoring System/Cross Traffic Alert (BLIS ® /CTA), lane departure alert and collision avoidance warning menus are disabled in the message center to force these features always on.

When an administrator key is in use, the IPC provides:

- a menu in the message center guiding the user to create a MyKey ®. When the maximum MyKey ® limit is reached, the MyKey ® creation menu is no longer available.
- a menu in the message center with options for setting 6 MyKey ® features:
  - MyKey ® speed limiter.
  - MyKey ® pre-selected speed warning.
  - MyKey ® radio volume limiter.
  - traction control always on or user selectable.
  - emergency 911 assist feature always on or user selectable.
  - do not disturb feature always on or user selectable.
- a menu in the message center with the option to clear all MyKey ® programmed keys at once.
- MyKey ® mileage driven by the MyKey ® user can be located in system check function of the message center.
- the number of MyKey ® programmed keys and administrator keys can be located in the system check function of the message center.

For information on the MyKey ® features, refer to the Owner's Literature.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > CONFIGURATION

The IPC contains items that are configurable. Most of the configurable items (configurable parameters) are customer preference items, which can be set with a scan tool. The remaining configurable items can only be set through the vehicle configuration parameters. Refer to: MODULE CONFIGURATION .

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PROVE-OUT

The IPC carries out a display prove-out to verify the gauges function and all module controlled warning indicator lamps and monitored systems are functioning correctly within the IPC. Upon initiation of the prove-out (ignition on), the analog gauges sweep from one stop to the other then return to the normal indication state based on the input received. The IPC also provides a timed prove-out of some indicators while other indicators illuminate upon engine start up or have no prove-out. When the ignition is cycled on, the indicators illuminate to prove-out according to the following table:

Indicator	Indicator Type	Prove-Out Duration
ABS	Warning	3 seconds
Airbag	Warning	6 seconds
Brake	Warning	3 seconds
Front fog lamp	Informational	None
High beam	Informational	None
LED low beam malfunction	Informational	3 seconds
Lights on	Informational	None
MIL	Informational	Engine start up
Rear fog lamp	Informational	None
Safety belt	Informational	65 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Stability-traction control (sliding car icon)	Warning	3 seconds
Stability-traction control disabled (sliding car OFF icon)	Informational	3 seconds
TPMS	Warning	3 seconds
Turn indicators	Informational	None

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > DEALER TEST MODE

NOTE: The table lists the displays as they appear when navigating using the down arrow button.

NOTE: If popup warnings exist, the dealer test mode cannot be entered. All message center warnings and popup displays need to be addressed to enter the dealer test mode.

To enter the IPC engineering test mode or dealer test mode, begin with the ignition OFF. Close all doors and luggage compartment then press and hold the LH steering wheel switch OK button. Place the ignition ON and continue to hold the button for 5-8 seconds until an ET RTT appears at the bottom of the main message center display. Press the up or down arrow buttons to navigate through each of the display windows. To exit the IPC dealer test mode, press and hold the OK button for 5-8 seconds or place the ignition in OFF. Each down arrow button press advances the viewing window to the next set of items.

IPC Display	Description

Engineering Test Mode Use Right Up/Down to scroll screens	Initial entry display into the dealer test mode.
ANALOG GAUGE TEST	Carries out the gauge sweep of the analog gauges. When the sweep (zero to maximum then return to zero) is complete, the actual data is displayed.
TELLTALE AND COLOR TEST	Illuminates all cluster microprocessor controlled LED telltales or indicators. Also displays a color palette of boxes below the title.
PartNo: xxxx-xx Core: xxxx-xx Cal#1: xxxx-xx ECU S/W: xxxx-xx	Displays the IPC part number information.
Man Date: xxxxxx B&A Config Bytesxx xx xx xx xxxx xx xx xx xx	Displays the manufacturing information. Date in the format of YYMMDD. B&A configuration bytes
DTC: HIST CURRxxxxxx x xxxxxxx x x	Displays all of the Diagnostic Trouble Codes (DTCs) set (history and current Diagnostic Trouble Codes [DTCs]). An X in the HIST or CURR column means the DTC is active. Three Diagnostic Trouble Codes (DTCs) display on each screen. If more Diagnostic Trouble Codes (DTCs) are present, there will be additional screens listing them. If there are no Diagnostic Trouble Codes (DTCs) in history or current, the display will only be the title row.
Vehicle Speed:xxx.x km/hxxx.x MPH Tach: xxxx RPM	*NOTE: These are the filtered values used to drive the gauge positions, not the actual positions.* Displays the digital representation of the speedometer in mph and km/h.Displays the digital representation of the tachometer in RPM.
Inst Fuel1: xxxx FLPM: xxxx.xx	Displays the instant fuel level and filtered fuel level in percent. This is used for the fuel pump assembly input on a dual sender fuel tank configuration.
Inst Fuel2: xxxx FLPM: xxxx.xx	Displays the instant fuel level and filtered fuel level in percent. This is used for the fuel level sensor input on a dual sender fuel tank configuration.
DTE: Inst 01 Dispkm xxx xxx xxxmi xxx xxx xxx	Displays the values used for calculating the DTE function.
RAFE RAFE_01xxx.x xxx.x 1/100kmxxx.x xxx.x MPGxxx.x xxx.x km/l	Displays the running average fuel economy. The values are derived from the DTE function.

State Val #ofVS Szero1: xxxx xxxx Off: xxxx xxxx On: xxxx xxxx	Displays the key ON initialization, key OFF reference, and zero speed reference fuel level values in fuel level for the fuel pump assembly input on a dual sender fuel tank configuration.
State Val #ofVS Szero2: xxxx xxxx Off: xxxx xxxx On: xxxx xxxx	Displays the key ON initialization, key OFF reference, and zero speed reference fuel level values in fuel level for the fuel level sensor input on a dual sender fuel tank configuration.
Coolant Temp (°C):xxx	Displays the digital representation of the coolant temperature gauge indication in degrees Celsius.
Odo cnts: xx Trip A: xxxxx.x km Trip A: xxxxx.x mi	Displays the values from the odometer count signal and the trip A statistics.
Odo cnts: xx Trip B: xxxxx.x km Trip B: xxxxx.x mi	Displays the values from the odometer count signal and the trip B statistics.
Fuel cnts: xxx Fuel A: xxxxx.x l Fuel A: xxxxx.x g	Displays the values of the fuel flow display signal from the PCM and the approximate fuel used for the trip stats A.
Fuel cnts: xxx Fuel B: xxxxx.x l Fuel B: xxxxx.x g	Displays the values of the fuel flow display signal from the PCM and the approximate fuel used for the trip stats B.
Battery: xx.xV Compass: xx Last Chime: xx	Displays the current battery level. Displays the compass direction. Displays the number of the last chime sounded.
Dim Step: xx Dim Gauge: xxxxx Dim Pointer: xxxxx	Displays the first screen of dimming information. Dim step is the dimming level. Dim gauge is the internal illumination number for the gauge backlighting (1 to 10, 000). Dim pointer is the internal illumination number for the gauge pointer backlighting (1 to 10, 000).
Dim Step: xx Dim PRNDL: xxxxx Dim Display: xxxxx	Displays the second screen of dimming information. Dim step is dimming level. Dim PRNDL is the internal illumination number for PRNDL backlighting (1 to 10, 000). Dim display is the internal illumination number for the display backlighting (1 to 10, 000).
PDS: x LWS: x	Park detect switch (0 = open/not park, 1 = closed/park).
Engineering Test Mode Use Right Up/Down to scroll screens	Repeats the test display cycle.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > ANALOG GAUGES

Fuel Gauge

The IPC sends a reference voltage to the fuel level sender(s). As the fuel level changes, a float actuates the variable resistor fuel level sender, raising or lowering the fuel level signal voltage. The IPC monitors the changes in voltage from both senders and commands the fuel gauge with a corresponding movement of the pointer.

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

The IPC uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Key OFF fueling
- Key ON fueling
- Recovery

Anti-Slosh Mode

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sensor readings caused by fuel moving around in the tank), the fuel gauge takes approximately 40 minutes to go from empty (E) to full (F).

Key OFF Fueling Mode

The key OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions to be met:

- The ignition must be in the OFF mode when refueling the vehicle.
- At least 6% of the vehicle's fuel capacity must be added to the fuel tank.
- The IPC must receive a valid ignition ON fuel sensor reading within one second of the ignition being put into the RUN mode. The key ON sample readings are considered valid if the fuel sensor reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

The key ON fueling mode (approximately 60 seconds to read empty [E] to full [F]) requires the following conditions be met:

- The transmission is in PARK (P) or NEUTRAL (N).
- The ignition is in the RUN mode.
- At least 6% of the vehicle's fuel capacity must be added to the fuel tank

Key ON Fueling Mode

In key ON fueling mode, a 30-second timer activates after the transmission is put into the PARK (P) or NEUTRAL (N) position. When the 30-second time has elapsed and at least 9% of the vehicle's fuel

capacity has been added, the fuel gauge response time is 60 seconds to read from empty (E) to full (F). When the transmission is shifted out of PARK (P) or NEUTRAL (N), the fuel gauge strategy reverts to the anti-slosh mode. The key ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the ignition in the RUN mode.

Recovery Mode

Recovery mode is incorporated into the IPC strategy to recover from a missing fuel level input after a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sensor or its circuits. Recovery mode (empty [E] to full [F] approximately 17 minutes) is initiated when the following 2 conditions are met:

- The IPC is in the anti-slosh (default) mode.
- The actual fuel level in the tank is 5% different from what is being displayed by the fuel gauge.

Speedometer

The PCM receives the wheel speed data from the GWM over the HS-CAN1. The GWM receives the wheel speed data from the ABS module over the HS-CAN2. The PCM uses tire size stored in the vehicle configuration file along with wheel speed inputs to generate a vehicle speed signal.

The IPC receives the vehicle speed message from the GWM over the HS-CAN3. The GWM receives the vehicle speed message from the PCM over the HS-CAN1.

The IPC provides a tolerance that allows the speed indication to display between 3% below and 7% above the actual vehicle speed. This means that with an actual vehicle speed of 97 km/h (60 mph), the speedometer can indicate between 94-103 km/h (58-64 mph). Incorrect tire size or tire size configuration could potentially affect the speedometer accuracy.

Tachometer

The IPC receives the engine RPM data message from the GWM over the HS-CAN3. The GWM receives the engine RPM data message from the PCM over the HS-CAN1.

Temperature

The IPC uses 2 messages to control the temperature gauge. The first is the engine coolant temperature data, which provides the current engine temperature input to the PCM. The second message is the engine overheat indication request, which is sent by the PCM to the IPC when an overheating condition exists. When the IPC receives the engine overheat indication request message, the IPC sends the temperature gauge to full hot and turns on the over-temperature warning indicator.

The IPC receives both temperature gauge inputs from the GWM over the HS-CAN3. The GWM receives the engine coolant temperature data and the engine overheat indication request messages from the PCM over the HS-CAN1.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > VIRTUAL GAUGES

Accelerometer

The accelerometer is a graphical gauge that is selected through the message center. The IPC receives the vehicle lateral acceleration and vehicle longitudinal acceleration messages from the GWM over the

HS-CAN3. The GWM receives the vehicle lateral acceleration and vehicle longitudinal acceleration messages from the ABS module over the HS-CAN2.

Air Fuel Ratio

The air fuel ratio gauge is a graphical gauge with an additional numeric display ranging between 10 and 20 that is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The IPC receives the air fuel ratio display message from the GWM over the HS-CAN3. The GWM receives the air fuel ratio display message from the PCM over the HS-CAN1.

Axle Oil Temperature (If Equipped-SVT Only)

The axle oil temperature gauge is a graphical gauge with an additional numeric display ranging between 50-175 ° C (100-350 ° F) and is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The IPC receives the axle oil temperature data from the GWM over the HS-CAN3. The GWM receives the axle oil temperature data from the PCM over the HS-CAN1.

Battery Voltage

The battery voltage gauge is a graphical gauge with an additional numeric display ranging between 8 and 18 volts that is selected using the message center switch. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The battery voltage gauge uses the voltage input as measured on the hardwired hot at all times voltage input.

Cylinder Head Temperature

The cylinder head temperature gauge is a graphical gauge with an additional numeric display ranging between 60-160 ° C (140-340 ° F) (except SVT) or 50-200 ° C (150-400 ° F) (SVT) that is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The IPC receives the cylinder head temperature data message from the GWM over the HS-CAN3. The GWM receives the cylinder head temperature data message from the PCM over the HS-CAN1.

Engine Oil Pressure (SVT Only)

The engine oil pressure gauge is a graphical gauge with an additional numeric display ranging between 0-150 PSI that is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The IPC receives the oil pressure warning indicator request from the GWM over the HS-CAN3. The GWM receives the oil pressure warning indicator request from the PCM over the HS-CAN1.

Engine Oil Temperature

The engine oil temperature gauge is a graphical gauge with an additional numeric display that is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The engine oil temperature gauge display ranges as follows:

- 38-60 ° C (100-140 ° F) (low)
- 61-137 ° C (141-279 ° F) (normal)
- 138-146 ° C (280-295 ° F) (warm)
- 147-160 ° C (296-320 ° F) (hot)

The IPC receives the oil temperature warning indicator message from the GWM over the HS-CAN3. The GWM receives the oil temperature warning indicator message from the PCM over the HS-CAN1.

Inlet Air Temperature

The air inlet temperature gauge is a graphical gauge with an additional numeric display ranging between -20-120 ° C (0-240 ° F) and is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The IPC receives the engine air inlet temperature data from the GWM over the HS-CAN3. The GWM receives the engine air inlet temperature data from the PCM over the HS-CAN1.

Transmission Fluid Temperature

The transmission fluid temperature gauge is a graphical gauge with an additional numeric display that is selected through the message center. For the virtual gauge display navigation, see the message center menu options in the Owner's Literature. The transmission temperature gauge ranges as follows:

- 24-49 ° C (76-120 ° F) (low)
- 50-120 ° C (121-248 ° F) (normal)
- 121-134 ° C (249-273 ° F) (warm)
- 135-193 ° C (275-379 ° F) (hot)

The SVT transmission fluid temperature gauge display ranges between 50-175 ° C (100-350 ° F).

The IPC receives the transmission fluid temperature data from the GWM over the HS-CAN3. The GWM receives the transmission fluid temperature data from the PCM over the HS-CAN1.

Vacuum-Boost

The vacuum-boost gauge is a graphical gauge with an additional numeric display ranging between 0-30 Hg (vacuum range) and 0-20 PSI (boost range) and is selected through the message center. For the virtual gauge displays, see the message center menu options in the Owner's Literature. The IPC receives the vacuum boost display message from the GWM over the HS-CAN3. The GWM receives the vacuum boost display message from the PCM over the HS-CAN1.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > ICM GAUGES

Engine Oil Pressure

The engine oil pressure gauge is an analog gauge. The ICM receives the oil pressure warning indicator request from the PCM over the HS-CAN1.

Engine Oil Temperature

The engine oil temperature gauge is an analog gauge. The ICM receives the engine oil temperature message from the PCM over the HS-CAN1.

Vacuum Boost Gauge

The vacuum boost gauge is an analog gauge. The ICM receives the vacuum-boost display message

from the PCM over the HS-CAN1.

DESCRIPTION AND OPERATION > INSTRUMENT PANEL CLUSTER (IPC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > INDICATORS

ABS Warning

The IPC receives the ABS warning indicator request message from the GWM over the HS-CAN3. The GWM receives the ABS warning indicator request message from the ABS module over the HS-CAN2. If a fault condition exists in the ABS, the ABS module sends the ABS warning indicator request message to either flash or illuminate the ABS warning indicator.

Refer to ABS/Brake/Stability-Traction Control System Indication description for information on the conditions when the ABS warning indicator is turned on

ABS/Brake/Stability-Traction Control System

The brake/stability-traction control system indication is controlled almost entirely by the ABS module. The ABS module can illuminate multiple indicators for various fault conditions. The following table provides a summary of the basic fault conditions and the indicators that are illuminated for each condition.

> *NOTE: Refer to the Normal Operation and Fault Condition description before each brake/stability-traction control system indicator Pinpoint Test (PPT) for the IPC default action for network/missing message conditions.*

Event/Fault Condition	ABS Warning Indicator Status	Brake Warning Indicator Status	Stability-Traction Control Indicator Status	Stability-Traction Control Disabled Indicator Status
Stable driving (no control events)	Off	Off	Off	On or off based on driver request
Parking brake applied	Off	On	Off	Off
Low brake fluid level or brake fluid level input concern	Off	On	Off	Off
Stability-traction control event	Off	Off	Flashing	On or off based on driver request
Stability-traction control disabled by driver	Off	Off	Off	On
Single wheel speed sensor faults	On	Off	On	Off
2 or 3 wheel speed sensor faults	On	On	On	Off
HCU valve fault	On	On	On	Off

ABS module fault	On	On	On	Off
ABS battery voltage faults	On	On or off	On	On
ABS pump motor fault	On	On	On	Off
HCU pressure sensor fault (master cylinder pressure input)	Off	Off	On	Off
Steering wheel angle sensor center not found fault	Off	Off	On	Off
Total CAN failure	On	Off	On	On
Configuration mismatch or not complete	Flashing	Off	Off	Off
Calibration of internal sensors not complete	Off	Off	Flashing	Off
Vehicle Identification Number (VIN) mismatch	On	On	On	Off
ACC and ABS both active	Off	Off	Flashing	Off
Sport/track mode	Off	Off	Off	On
Full system off (ABS on)	Off	Off	Off	On

Airbag Warning

The IPC receives the airbag warning indicator request from the GWM over the HS-CAN3. The GWM receives the airbag warning indicator request from the RCM over the HS-CAN2. If a SRS concern is detected, the RCM sets a DTC and the IPC illuminates the airbag warning indicator.

Brake Warning

The brake warning indicator informs the driver the brake fluid level is low, there is a failure in the base brake system or the parking brake is applied. The IPC uses 3 messaged inputs to control the brake warning indicator.

The IPC receives the brake (red) warning indicator request, the brake fluid level low message request and the parking brake status messages from the GWM over the HS-CAN3.

The GWM receives the brake (red) warning indicator request from the ABS module over the HS-CAN2.

The GWM receives the brake fluid level low message request and the parking brake status messages from the BCM over the HS-CAN1.

Refer to ABS/Brake/Stability-Traction Control System Indication description for information on the conditions when the brake warning indicator is turned on.

Front Fog Lamp

The fog lamp indicator informs the driver that the fog lamps are turned on. The IPC receives the front fog lamp indicator request from the GWM over the HS-CAN3. The GWM receives the fog lamp indicator request from the BCM module over the HS-CAN1.

High Beam

The high beam indicator informs the driver that the high beams are turned on. The IPC receives the headlamp high/low status message from the GWM over the HS-CAN3. The GWM receives the headlamp high/low status message from the BCM module over the HS-CAN1.

LED Low Beam Malfunction

The LED low beam indicator informs the driver an LED low beam is not functioning correctly. The IPC receives the headlamp low beam out message from the GWM over the HS-CAN3. The GWM receives the headlamp low beam out message from the BCM over the HS-CAN1.

Lights On

When the parking lamps are turned on, the BCM sends the parklamp status message to the GWM over the HS-CAN1. The IPC receives the parklamp status message from the GWM over the HS-CAN3 to illuminate the lights on indicator.

MIL

The IPC receives the MIL request from the GWM over the HS-CAN3. The GWM receives the MIL request from the PCM over the HS-CAN1.

PRNDL

The IPC uses the following messages to control the PRNDL:

- Ignition status
- Power shed level request
- Transmission gear display
- Transmission shift mode display
- Vehicle speed
- Transport mode

The IPC receives the transmission gear display, transmission shift mode display and vehicle speed messages from the GWM over the HS-CAN3. The GWM receives the transmission gear display, transmission shift mode display and vehicle speed messages from the PCM over the HS-CAN1.

The IPC receives the ignition status, power shed level request and transport mode messages from the GWM over the HS-CAN3. The GWM receives the ignition status, power shed level request and transport mode messages from the BCM over the HS-CAN1.

When the vehicle is in transport mode, the PRNDL is not displayed upon entry or exit from the vehicle to prevent battery drain during longer periods of time when the vehicle is not in use, such as those experienced during vehicle transport. When load shed management determines the battery state of charge is low or critical when the ignition is OFF or in ACC, the IPC disables the PRNDL display to

conserve battery voltage.

The IPC also uses a park position detect switch (part of the selector lever) input to signal the IPC the shift lever is fully seated in the PARK (P) position. The IPC compares the park position detect switch input with the transmission gear display message sent from the PCM.

Rear Fog Lamp (If Equipped)

The rear fog lamp indicator informs the driver that the rear fog lamps are turned on. The IPC receives the rear fog lamp indicator request from the GWM over the HS-CAN3. The GWM receives the rear fog lamp indicator request from the BCM module over the HS-CAN1.

Safety Belt Warning

The RCM monitors the driver safety belt position through the driver safety belt buckle switch. The RCM provides the driver safety belt buckle status message to the GWM over the HS-CAN2. The GWM provides the driver safety belt buckle status message to the IPC over the HS-CAN3 to either turn on or turn off the safety belt warning indicator.

Stability-Traction Control Indicator (Sliding Car Icon)

The IPC receives the stability-traction control indicator request message from the GWM over the HS-CAN3. The GWM receives the stability-traction control indicator request message from the ABS over the HS-CAN2.

Refer to ABS/Brake/Stability-Traction Control System Indication description for information on the conditions when the stability-traction control indicator (sliding car icon) is turned on.

Stability-Traction Control Disabled Indicator (Sliding Car OFF Icon)

The stability-traction control is configured on/off using the stability assist-traction control mode switch located in the center console. When the driver enables or disables the stability-traction control system, the ABS module sends the stability-traction control mode indicator message to the GWM over the HS-CAN2. The GWM sends the stability-traction control mode indicator message to the IPC over the HS-CAN3 to illuminate or turn off the stability-traction control disabled indicator (sliding car OFF icon) based upon the system state.

Refer to ABS/Brake/Stability-Traction Control System Indication description for information on the conditions when the stability-traction control disabled indicator (sliding car OFF icon) is turned on.

When a MyKey ® administrator has set the AdvanceTrac ® feature to always on and a MyKey ® programmed key is in use, the stability-traction control system cannot be disabled. The menu selection in the message center used to disable the stability-traction control system does not display when a MyKey ® is in use, but remains active for the MyKey ® administrator to select the AdvanceTrac ® always on feature off. The stability-traction control indicator still functions normally to indicate a stability-traction control system fault and a stability-traction control active event.

Refer to ABS/Brake/Stability-Traction Control System Indication description for information on the conditions when the stability-traction control indicator (sliding car icon) is turned on.

TPMS

The IPC receives the tire pressure warning indicator request from the GWM over the HS-CAN3. The GWM receives the tire pressure warning indicator request from the BCM over the HS-CAN1.

If the BCM determines the tire pressure has exceeded the low tire pressure limits, the tire pressure

warning indicator request message is sent to the IPC to illuminate the TPMS warning indicator.

If a TPMS monitor or sensor fault condition exists, the BCM sends the tire pressure warning indicator request message to the IPC to flash the TPMS warning indicator. The IPC flashes the TPMS warning indicator for 75 seconds then turns the indicator on solid.

Turn Signal/Hazard

When the multifunction switch is in the LH or RH turn position or if the hazard switch is on, the BCM sends the left turn lamp on request or right turn lamp on request message to the GWM over the HS-CAN1. The GWM sends the left turn lamp on request or right turn lamp on request message to the IPC over the HS-CAN3. Upon receipt of the applicable turn signal on/off message, the IPC flashes the turn signal indicator on and off.

Component Description

Brake Fluid Level Switch

The brake fluid level switch is mounted in the master cylinder reservoir. The brake fluid level switch is hardwired to the BCM through a signal circuit and grounded through a separate body ground circuit. The BCM provides a reference voltage to the brake fluid level switch. When the brake fluid level is low, the switch closes, pulling the reference voltage low. When the brake fluid level is high, the switch opens, sending the reference voltage high on the signal circuit to the BCM. The brake fluid level switch uses an internal resistor in parallel to enables the BCM to differentiate between a disconnected brake fluid level switch connector and a low level condition.

Fuel Level Sender

The fuel level sender is mounted to the fuel pump assembly or the fuel level sensor. The fuel level sender is a dual sweep potentiometer style resistor connected to a float mechanism. The dual sweep design provides a second resistance measurement that reduces the intermittent loss of data due to corrosion between the resistor wires and the sweep arm. As the fuel level changes, the float rises or falls with the fuel level moving the sweep arm across the resistor wires. This movement either increases or decreases the resistance through the unit. The fuel level sensor resistance ranges from 180 ohms ± 4 ohms at empty (E) to 10 ohms ± 2 ohms at full (F). When the fuel level is low, the fuel level sensor resistance is high. When the fuel level is high, the fuel level sensor resistance is low.

Both the fuel pump assembly and fuel level sensor are hardwired to the IPC through separate signal and return circuits. The fuel level return circuits are grounded internally in the IPC. The IPC provides a reference voltage on the fuel level signal circuit. As the fuel level changes, the change in resistance raises or lowers the fuel level signal voltage depending on the resistance of the fuel level sender.

IPC

The IPC provides the driver with a system status and alerts the driver when certain conditions exist in the vehicle. The IPC receives the ignition status from the BCM through the GWM over the HS-CAN3. The IPC requires Programmable Module Installation (PMI) when the IPC is replaced.

Oil Pressure Switch (2.3L And 3.7L)

The oil pressure switch is a normally open switch that is hardwired to the PCM through a single signal circuit. The ground is provided by the switch housing when it is mounted on the engine. The PCM provides a reference voltage to the oil pressure switch. When oil pressure is low, the oil pressure switch remains open, sending the reference voltage high. When the oil pressure is sufficient, the oil pressure switch closes, pulling the reference voltage low to the PCM.

Oil Pressure Sensor (5.0L)

The oil pressure sensor is hardwired to the PCM through VREF, signal and return circuits. The PCM provides the sensor voltage supply on the VREF circuit and monitors the change in voltage changes though the signal and return circuits as the oil pressure changes.

Park Position Detect Switch

The park position detect switch is hardwired to the IPC through a single signal circuit and is grounded by a separate circuit through the selector lever. The IPC provides a reference voltage to the park position detect switch. When the selector lever is in PARK (P), the park position detect switch closes to ground, pulling the reference voltage low. When the selector lever is moved out of PARK (P), the park position detect switch opens to ground, sending the reference voltage high to the IPC.

Safety Belt Buckle Sensor

The safety belt buckles contain integrated sensors that are Hall-effect switches. The safety belt buckle sensors are serviced as one component with the safety belt buckle.

DESCRIPTION AND OPERATION > MESSAGE CENTER - OVERVIEW > OVERVIEW

The message center is an integral part of the IPC that receives and acts upon much of the same information that is input and used to operate the IPC (gauges, informational indicators, and warning indicators). The message center uses both hardwired and network-based inputs to receive information. The message center functionality is controlled through the message center switch (part of the LH steering wheel switch).

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning display. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warnings are present, the message center rotates through the messages, displaying each warning for approximately 4 seconds. Warning messages are also generally associated with other observable outputs of the IPC (gauges, informational indicators and Reconfigurable Telltale [RTT] indicators). For example, when the BCM detects a low brake fluid condition, the BCM sends the IPC a request through the GWM to illuminate the brake warning indicator and a request to display the LOW BRAKE FLUID message in the message center. This allows the message center to be a more informative supplement to the IPC gauges and indicators.

The system warning messages alert the operator to possible concerns or malfunctions in the vehicle operating systems. System warning messages can be stand-alone messages, but are often associated with another form of indication, such as a gauge or an indicator. The message center displays the last selected feature if there are no additional warning messages. Once a warning message has been displayed, the message must be acknowledged to allow full functionality of the message center by pressing the OK button to acknowledge and clear the warning message. For a complete list of warning messages displayed, refer to the message center portion of the Owner's Literature.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages - IPC

Broadcast Message	Originating Module	Message Purpose
ABS fault	ABS module	ABS input used to display the check brake system warning message.
Adaptive cruise control warning request	CCM	Input used to display the adaptive cruise control message display.
Battery low state of charge	BCM	Input used to control the charging system RTT and the charging system fault message center warning message.
Body service required request	BCM	BCM controlled system faults input used to control the powertrain malfunction (wrench) RTT.
Brake fluid level low message request	BCM	Input used to display the low brake fluid level warning message.
Brake wear message request	VDM	Input used to display the ceramic brakes-replace front brake pads warning message (SVT only).
Convertible top message request	Moveable Roof Control Module-A (MRCMA)	Input used to display the convertible top messages.
Cross traffic alert left status	SODL	Input used to control the Blind Spot Monitoring (BLIS ®)/Cross Traffic Alert (CTA) message display.
Cross traffic alert right status	SODR	Input used to control the Blind Spot Monitoring (BLIS ®)/Cross Traffic Alert (CTA) message display.
Cruise control override	PCM	Input used to control the cruise control RTT.
Cruise control set speed display	PCM	Input used to control the cruise control set speed display.
Cruise control status	PCM	Input used to control the cruise control RTT.
Driver door ajar status	BCM	Input used to control the following: Door ajar RTT. Driver door ajar message center warning message. Engine on warning message. Transmission not in park warning message.

Engine coolant temperature data	PCM	Used to control the engine over-temperature RTT and the engine over-temperature message center warning message.
Engine idle shutdown status	PCM	Input used to control the automatic engine shutdown message display.
Engine oil life	PCM	Input used to display the engine oil life and oil change messages.
Engine overheat indication request	PCM	Used to control the engine over-temperature RTT and the engine over-temperature message center warning message.
Engine RPM data	PCM	Input used to control the low oil pressure RTT, the low oil pressure message center warning message and the Average Fuel Economy (AFE)/ DTE display.
Engine service required request	PCM	Engine input used to control the powertrain malfunction (wrench) RTT.
Engine status	PCM	Input used to display the engine on warning message and the Average Fuel Economy (AFE)/DTE display.
EPAS Failure	PSCM	Input used to display the EPAS messages.
Forward collision warning message request	CCM	Input used to display the forward collision warning messages.
Fuel fill inlet message display	PCM	Input used to display the check fuel fill inlet message.
Fuel flow volume display	PCM	Input used to display the Average Fuel Economy (AFE)/DTE.
GPS compass direction	GPSM	Input used to display the vehicle compass heading.
Hill start assist status	ABS module	Input used to control the hill start assist not available message.
Ignition key type	BCM	Input used to display the Average Fuel Economy (AFE)/DTE.
Ignition status	BCM	Input used for the following: To provide ignition RUN, START and ACC states. To display the transmission not in park warning message. To display the odometer.

Immobilizer message display	BCM	Input used to display the PATS, passive entry and key programming messages.
Lock system message request	BCM	Input used to display the child lock, key battery low and security mode messages.
Luggage compartment lid ajar	BCM	Input used to control the door ajar RTT and the luggage compartment lid ajar message center warning message.
Odometer count	PCM	Input used to display the Average Fuel Economy (AFE)/DTE and odometer.
Oil pressure warning indicator request	PCM	Input used to control the low oil pressure RTT and the low oil pressure message center warning message.
Parking aid fault status	PAM	Input used to display the check parking aid message.
Parking aid rear status	PAM	Input used to display the parking aid on/off status message.
Parking brake status	BCM	Input used to display the parking brake applied warning message.
Passenger door ajar status	BCM	Input used to control the door ajar RTT and the passenger door ajar message center warning message.
Perimeter alarm chime request	BCM	Input used to display the start vehicle to stop alarm message.
Power shed level request	BCM	Input used to display the load shed messages.
Powertrain drive mode	PCM	Input used to control the following drive mode Reconfigurable Telltales (RTT's): Drag strip (SVT) Launch control (SVT) Normal drive Sport Snow/wet (non-SVT) Track (non-SVT) Weather (SVT)
Remote start status	BCM	Input used to display the remote start messages.
Seat memory command	DSM	Input used to display the memory seat operational messages.

Side obstacle detect status-left	SODL	Input used to control the Blind Spot Monitoring (BLIS ®) off RTT and message display.
Side obstacle detect status-right	SODR	Input used to control the Blind Spot Monitoring (BLIS ®) off RTT and message display.
Stability-traction control chime request	ABS module	Input used to display the service AdvanceTrac ® message.
Starting system fault message request	PCM	Input used to display starting system messages.
Steering effort status	PSCM	Input used to control the steering mode RTT.
Suspension driver mode status	VDM	Input used to control the vehicle dynamics (damper control) RTT.
Tire pressure system status	BCM	Input used to display the TPMS fault and tire training messages.
Transmission gear display mode	PCM	Input used to display the engine on warning message and transmission not in park warning message.
Transmission service required	PCM	Transmission input used to control the powertrain malfunction (wrench) RTT.
Transport mode	BCM	Input used to display the factory and transport mode message and not in park warning message.
Trip odometer verify	PCM	Input used to display the trip odometer.
Vehicle configuration data	BCM	Input used to display the odometer and the tire mobility kit expiration message.
Vehicle dynamics SOS	ABS module	Input used to display the spin out detected message.
Vehicle speed	PCM	Input used for the following displays: Average Fuel Economy (AFE)/DTE display. Digital speed display. Engine on warning message. Not in park warning message. Overspeed warning RTT (Gulf Cooperative Countries [GCC])

Module Network Input Messages - PCM

Broadcast Message	Originating Module	Message Purpose

Engine oil life data reset	IPC	Input used to request the oil life minder reset.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART - HUD (SVT ONLY)

Module Network Input Messages - HUD

Broadcast Message	Originating Module	Message Purpose
HUD display intensity	IPC	Input used to display the performance shift indication intensity.
HUD mode	IPC	Input used to display the performance shift indication mode.
HUD shift point	IPC	Input used to turn on the performance shift indication at the driver selected shift points.

Module Network Input Messages - IPC

Broadcast Message	Originating Module	Message Purpose
Engine RPM data	PCM	Input used to provide RPM data for the performance shift indication.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > HUD - PERFORMANCE SHIFT INDICATION

The HUD provides the performance shift indication to the driver. The performance shift mode, shift points and display intensity are selected by the driver through the message center. The IPC provides the driver selections to the HUD and provides a shift indicator chime tone to correspond with the indication displayed by the HUD. The driver selected HUD modes are as follows:

- Drag
- Tach
- Track
- Off

The IPC receives engine RPM data from the GWM over the HS-CAN3. The GWM receives the engine RPM data from the PCM over the HS-CAN1.

The HUD receives the HUD display intensity, HUD shift point and HUD mode messages from the GWM

over the HS-CAN2. The GWM receives the HUD display intensity, HUD shift point and HUD mode messages from the IPC over the HS-CAN3.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MESSAGE CENTER DISPLAYS

Average Fuel Economy (AFE)

Average Fuel Economy (AFE) is calculated using the following messaged inputs:

- Fuel flow volume display
- Odometer count
- Ignition key type
- Vehicle speed
- Engine RPM data
- Engine status

All messaged inputs, except for the ignition key type, are sent to the GWM by the PCM over the HS-CAN1. The GWM sends all message inputs, except for the ignition key type, to the IPC over the HS-CAN3. The GWM receives the ignition key type message from the BCM over the HS-CAN1. The IPC receives the ignition key type message from the GWM over the HS-CAN3.

Compass

The compass is displayed as a 1 or 2 character display in the message center that indicates the current direction of the vehicle (N, NE, E, SE, S, SW, W, or NW). The IPC receives the GPS compass direction from the GWM over the HS-CAN3. The GWM receives the GPS compass direction from the GPSM over the MS-CAN.

DTE

The DTE is calculated in the IPC using the Running Average Fuel Economy (RAFE), which is the fuel economy over the last 480 km (300 miles), and the fuel level input from the fuel sender(s) to determine how many miles the vehicle can be driven based on the remaining fuel in the fuel tank. If the fuel economy is relatively constant, the DTE can be off over a 50 mile range by -24% to +38%. The DTE display and the fuel gauge both use the fuel level input from the fuel tank to provide their respective functions. If the fuel gauge doesn't function correctly, both the fuel gauge and the DTE display are affected.

The IPC defaults to around 21 mpg when the battery is initially connected and changes based on driving habits and conditions. Generally, the driver should be getting somewhere between 13-27 mpg.

> *NOTE: The actual DTE can be higher or lower than the DTE displayed in the message center due to changes in driving conditions. It is important to understand how the DTE is calculated and the factors that impact the DTE display when determining how to address any DTE concerns.*

Since the DTE is calculated and averaged over a longer period of time (480 km [300 miles]), varying driving conditions can have a significant impact on the current or short term DTE as opposed to the displayed DTE. This difference often leads to customer complaints of incorrect or invalid DTE. The following list provides some (not all) of the driving conditions that may lead to an incorrect or fluctuating DTE concern:

- Changing between towing/not towing
- Changing driving between city and highway
- Allowing the vehicle to idle for long periods of time
- Using the remote start feature frequently to allow the vehicle to warm up, particularly when parked on a grade
- Parking or driving on grades
- Inconsistent use of gasoline or E85 fuels
- Over-fueling or not filling the tank completely (partial refueling)
- To better illustrate the affects of how driving conditions can affect DTE, refer to the 2 following examples. The first example below illustrates how the following observations are normal and expected since the low fuel reminder is triggered from a fuel volume and not from a fixed distance to empty.
    - If while driving, the low fuel reminder (low fuel indicator and low fuel warning message) displays when the DTE equals 94.4 km (59 miles) and the driver adds 11.36 L (3 gallons) of fuel, the new DTE may become 124.8 km (78 miles). After continued driving, the low fuel reminder may now display when the DTE equals 83.2 km (52 miles).
- The second example (below) illustrates what occurs when idling on an incline. In this example, the customer should be made aware of how the condition will correct after a few minutes of idling on a level surface.
    - If the customer stops and parks the vehicle on an incline in a driveway, then in the morning remote starts the vehicle, allowing the engine to idle, the DTE may now equal 184 km (115 miles). As the customer drives, the low fuel reminder displays when the DTE equals 148.8 km (93 miles). Finally, after 5 more minutes of driving, the DTE is back to 80 km (50 miles).

Factory-Transport Mode

During vehicle build, some modules, such as the IPC and the BCM, are set in factory mode. While in the factory mode the IPC displays FACTORY MODE CONTACT DEALER in the message center. If the vehicle is set in factory mode, the system does not automatically exit the mode and must be manually set to either the transport or normal operation mode.

When the vehicle build is complete, the vehicle is set to transport mode. While in transport mode, the IPC displays TRANSPORT MODE CONTACT DEALER in the message center. Transport mode is used to reduce the drain on the battery during longer periods where the vehicle is not used. Various systems may be altered or are disabled when in the transport mode. The vehicle automatically reverts to normal operation mode after being driven 201 km (125 mi).

The IPC receives the life cycle mode message from the GWM over the HS-CAN3. The GWM receives the life cycle mode message from the BCM over the HS-CAN1.

MyKey ® Function

The IPC provides message center displays for the MyKey ® feature. MyKey ® displays are controlled through the IPC software based on the MyKey ® settings, configured through the message center, and the type of key in use (MyKey ® or administrator key). The MyKey ® function also uses messages received by the IPC for other indications such as vehicle speed for speed limiter displays.

Odometer

The IPC uses ignition status, transport mode, vehicle configuration and trip odometer verify messages to determine when to display the odometer and the odometer count message to provide the actual odometer reading. The IPC receives the odometer count message from the GWM over the HS-CAN3. The GWM receives the odometer count from the PCM over the HS-CAN1. The IPC monitors the odometer count input from the GWM and commands the odometer with a digital display in the message center.

The IPC receives the ignition status, transport mode, vehicle configuration and trip odometer verify messages from the GWM over the HS-CAN3. The GWM receives the ignition status, transport mode, vehicle configuration and trip odometer verify messages from the BCM over the HS-CAN1.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > RECONFIGURABLE TELLTALES (RTT'S)

Blind Spot Monitoring System (BLIS) Off

The IPC provides a RTT to inform the driver that the Blind Spot Monitoring System (BLIS) is turned off. The IPC receives the side obstacle detect status-left and side obstacle detect status-right messages from the GWM over the HS-CAN3. The GWM receives the side obstacle detect status-left and side obstacle detect status-right messages from the SODL and SODR over the MS-CAN.

Charging System

The IPC provides a charging system message center indicator along with message displays indicating the status of the charging system. When a charging system fault is present, the BCM sends the battery low state of charge message to the GWM over the HS-CAN1. The GWM sends the battery low state of charge message to the IPC to turn on the charging system RTT and to display the message center warning messages.

Cruise Control

The IPC uses the following messaged inputs to control the cruise control RTT:

- cruise control status
- cruise control set speed display
- cruise control override

The IPC receives the cruise control messages from the GWM over the HS-CAN3. The GWM receives the cruise control messages from the PCM over the HS-CAN1.

Door Ajar

The IPC provides a door ajar RTT along with message displays to indicate the status of the doors or

luggage compartment lid. The BCM monitors each of the ajar inputs and sends the corresponding ajar message (driver door ajar status, passenger door ajar status or luggage compartment lid ajar) to the GWM over the HS-CAN1 when a door or the luggage compartment lid is ajar. The IPC receives the door ajar status message from the GWM over the HS-CAN3.

Drive Mode

The IPC provides multiple RTT indicators to inform the driver of the selected drive mode (sport, sport plus, rain/snow, track mode and drag strip mode). The IPC receives the powertrain drive mode message from the GWM over the HS-CAN3. The GWM receives the powertrain drive mode message from the PCM over the HS-CAN1.

Engine Over-Temperature

The IPC provides a RTT to alert the driver the engine is over temperature. The IPC receives the engine overheat indication request and the engine coolant temperature data messages from the GWM over the HS-CAN3. The GWM receives the engine overheat indication request and the engine coolant temperature data messages from the PCM over the HS-CAN1.

Launch Control

The IPC provides the launch control RTT indicator to inform the driver of the launch control system status. The IPC receives the launch control mode message from the GWM over the HS-CAN3. The GWM receives the launch control mode message from the PCM over the HS-CAN1.

Low Fuel

The IPC provides the low fuel RTT indicator in 2 colors, amber and red. The IPC uses both the hardwired fuel level input and the calculated DTE to control the low fuel RTT. The low fuel RTT illuminates whenever the remaining fuel level is below 1/16 of a tank (with an administrator key) or 1/8 of a tank (with a MyKey ® key).

Low Oil Pressure

The engine oil pressure switch is hardwired to the PCM. The IPC requires 2 messaged inputs to control the low oil pressure RTT. The first is the oil pressure warning indicator request message and the second is the engine RPM data message above 400 RPM. Both the oil pressure warning indicator request and engine RPM data messages are sent from the PCM to the GWM over the HS-CAN1. The IPC receives the oil pressure warning indicator request and engine RPM data messages from the GWM over the HS-CAN3.

Overspeed Warning (Gulf Cooperative Countries [GCC])

The IPC provides an overspeed warning RTT to inform the driver that the vehicle speed has reached or exceeded the 120 km/h (75 mph) threshold. The IPC receives the vehicle speed signal from the GWM over the HS-CAN3. The GWM receives the vehicle speed signal from the PCM over the HS-CAN1.

Powertrain Malfunction (Wrench)

The IPC provides a powertrain malfunction (wrench) RTT to indicate transmission, Electronic Throttle Control (ETC) and BCM concerns.

The IPC receives all the required messages from the GWM over the HS-CAN3.

The GWM receives the body service required message from the BCM over the HS-CAN1.

The GWM receives the transmission service required, engine service required and AWD service

required messages from the PCM over the HS-CAN1.

Steering Mode

The IPC provides the steering mode RTT to indicate the driver steering mode selected (sport, comfort or normal). The IPC receives the steering effort status message from the GWM over the HS-CAN3. The GWM receives the steering effort status message from the PSCM over the HS-CAN2.

Vehicle Dynamics (Damper Control) (SVT Only)

The IPC provides 4 RTT indicators to inform the driver of the selected suspension mode. The IPC receives the suspension driver mode status message from the GWM over the HS-CAN3. The GWM receives the suspension driver mode status message from the VDM over the HS-CAN2.

DESCRIPTION AND OPERATION > MESSAGE CENTER - SYSTEM OPERATION AND COMPONENT DESCRIPTION > WARNING MESSAGES

Adaptive Cruise Control

The message center provides messages intended to assist the driver while operating the adaptive cruise control. The IPC receives the adaptive cruise control warning request from the GWM over the HS-CAN3. The GWM receives the adaptive cruise control warning request from the CCM over the HS-CAN2.

Automatic Engine Shutdown

The message center provides messages to inform the driver about a pending engine idle shutdown and the reasons for the shutdown. The IPC receives the engine idle shutdown status from the GWM over the HS-CAN3. The GWM receives the engine idle shutdown status from the PCM over the HS-CAN1.

Blind Spot Monitoring (BLIS ®)/Cross Traffic Alert (CTA)

The message center provides messages to inform the customer which side a vehicle is approaching and for Blind Spot Monitoring (BLIS ®)/Cross Traffic Alert (CTA) faults. The IPC receives the cross traffic left alert status, cross traffic right alert status, side obstacle sensor status-left and the side obstacle sensor status-right messages from the GWM over the HS-CAN3. The GWM receives the cross traffic left alert status and the side obstacle sensor status-left messages from the SODL and the cross traffic right alert status and the side obstacle sensor status-right from the SODR over the MS-CAN.

Brake System

The message center provides brake system warnings for the following concerns and status:

- Worn ceramic brake pads (SVT only)
- Low brake fluid level
- Parking brake status and faults
- ABS faults

On SVT vehicles only, the message center provides a warning message to indicate to the driver the brake pads are worn and require replacing. This is needed since the brake pads do not use the spring steel brake pad wear indicator used on other brake pads. When the brake pads are worn, the GWM

sends the brake wear message request to the IPC over the HS-CAN3. The GWM receives the brake wear message request from the VDM over the HS-CAN2.

When the parking brake is applied, the BCM sends the parking brake status message to the GWM over the HS-CAN1. The GWM gateways the parking brake status message to the IPC over the HS-CAN3 to illuminate the brake warning indicator and display the parking brake applied message in the message center.

When a low brake fluid level condition exists, the BCM sends the brake fluid level low message request to the GWM over the HS-CAN1. The GWM gateways the brake fluid level low message request to the IPC over the HS-CAN3 to illuminate the brake warning indicator and display the brake fluid level low message in the message center.

When an ABS concern exists, the ABS module sends the ABS fault message to the GWM over the HS-CAN2. The GWM gateways the ABS fault message to the IPC over the HS-CAN3 to illuminate the ABS warning indictor and to display the check brake system message center warning message.

Charging System

The message center provides a warning message indicating the status of the charging system. When a fault is present in the charging system, the BCM sends the battery low state of charge message to the GWM over the HS-CAN1. The IPC receives the battery low state of charge message from the GWM over the HS-CAN3.

Check Fuel Fill

The message center provides a check fuel fill inlet message to warn the driver there is a problem with the fuel fill inlet pipe resulting from a significant evaporative emission leak following vehicle refueling.

The IPC receives the check fuel fill inlet message request from the GWM over the HS-CAN3. The GWM receives the check fuel fill inlet message request from the PCM over the HS-CAN1.

Convertible Top

The message center provides a warning message to inform the driver that a convertible top condition exits. The IPC receives the convertible top message request from the GWM over the HS-CAN3. The GWM receives the convertible top message request from the Manual Roof Control Module-A (MRCMA) over the MS-CAN.

Door Ajar

The message center provides specific door ajar and luggage compartment lid ajar warning messages that supplement the door ajar RTT and to indicate the status of the doors or luggage compartment lid. The BCM monitors each of the ajar inputs and sends the corresponding ajar message (driver door ajar status, passenger door ajar status or luggage compartment lid ajar) to the GWM over the HS-CAN1when a door or the luggage compartment lid is ajar. The IPC receives the door ajar status message from the GWM over the HS-CAN3.

Engine On

The message center provides the engine on warning message to inform the driver they are exiting the vehicle when the engine is running. The IPC uses multiple inputs to determine the vehicle is stopped and the driver is preparing to exit the vehicle. The messages required to control the engine on warning message are as follows:

- Driver door ajar status

- Engine status
- Transmission gear display mode
- Vehicle speed

The IPC receives the driver door ajar status from the GWM over the HS-CAN3. The GWM receives the driver door ajar status from the BCM over the HS-CAN1.

The IPC receives the engine status, transmission gear display mode and the vehicle speed messages from the GWM over the HS-CAN3. The GWM receives the engine status, transmission gear display mode and the vehicle speed messages from the PCM over the HS-CAN1.

Engine Over-Temperature

The message center provides the engine coolant over-temperature message to supplement the engine over-temperature RTT and alert the driver the engine is over temperature. The IPC receives the engine overheat indication request and the engine coolant temperature data from the GWM over the HS-CAN3. The GWM receives the engine overheat indication request and the engine over-temperature message from the PCM over the HS-CAN1.

Forward Collision

The message center provides the forward collision warning messages to inform the driver of the forward collision status. The IPC receives the forward collision warning message request from the GWM over the HS-CAN3. The GWM receives the forward collision warning message request from the CCM over the HS-CAN2.

Hill Start Assist

The message center provides the hill start assist message to inform the driver of the hill start assist system status. The IPC receives the hill start assist status message from the GWM over the HS-CAN3. The GWM receives the hill start assist status message from the ABS module over the HS-CAN2.

Load Shed

The message center provides load shed messages to inform the driver to use less options to conserve battery voltage. The IPC receives the power shed level request from the GWM over the HS-CAN3. The GWM receives the power shed level request from the BCM over the HS-CAN1.

Low Key Fob And Switch Inhibit

The IPC provides a switch inhibit warning to notify the driver that some switches have been purposely inhibited and are inoperative. For security purposes, interior switches are inhibited by the BCM 20 seconds after the vehicle is electronically locked and prevents someone from using a stick (or other object) through an open window and activating the switch.

The IPC provides a low key fob battery warning to alert the driver the key fob battery needs to be replaced.

The IPC receives the lock system message request from the GWM over the HS-CAN3. The GWM receives the lock system message request from the BCM over the HS-CAN1.

Low Oil Pressure

The message center provides the low engine oil pressure warning message to supplement the low oil pressure RTT. The engine oil pressure switch is hardwired to the PCM. The IPC requires 2 messaged

inputs to control the low oil pressure warning message. The first is the oil pressure warning indicator request message and the second is the engine RPM data message above 400 RPM. Both the oil pressure warning indicator request and engine RPM data messages are sent from the PCM to the GWM over the HS-CAN1. The IPC receives the oil pressure warning indicator request and engine RPM data messages from the GWM over the HS-CAN3.

Memory Seat Status

The message center provides memory seat status messages to provide the driver confirmation that memory position storing was successful and that recalling a memory position can not be recalled while driving the vehicle. The IPC receives the seat memory command message from the GWM over the HS-CAN3. The GWM receives the seat memory command message from the DSM over the MS-CAN.

Oil Life

The instrument cluster provides messages to inform the driver about the oil life status, oil life reset status and when an oil change is required. The duration of the interval between oil changes is calculated in the PCM and varies due to driving conditions. The PCM assumes a base mileage of 16, 090 km (10, 000 mi) or 1 year for normal driving. However, this number is adjusted down for conditions such as high engine temperature, high engine RPM, use of flex fuel and possibly low oil level. The PCM calculates and provides the engine oil life percent message to the IPC. The IPC further converts the remaining oil life using the driver's configured oil life start value and displays the oil life percentage, indicating the remaining oil life. The oil change minder can be reset at any time by the driver.

The IPC receives the engine oil life message from the GWM over the HS-CAN3. The GWM receives the engine oil life message from the PCM over the HS-CAN1.

The PCM receives the engine oil life data reset message from the GWM over the HS-CAN1. The GWM receives the engine oil life data reset message from the IPC over the HS-CAN3.

Parking Aid

The message center provides messages to indicate the status of the parking aid system. The IPC receives the parking aid status messages from the GWM over the HS-CAN3. The GWM receives the parking aid status messages from the PAM over the HS-CAN1.

PATS And Passive Key And Immobilizer System

The message center provides the starting system fault message to indicate there is a concern with the PATS. The message center provides passive key and immobilizer system messages to indicate the key is in the luggage compartment, the key is left in the vehicle, no key is detected, accessory power is active, to press the brake to start the vehicle or to place the key in the backup slot. The IPC uses the immobilizer message display messaged input from the BCM to display the applicable message center message.

The IPC receives the immobilizer message display data from the GWM over the HS-CAN3.

The GWM receives the immobilizer message display data from the BCM over the HS-CAN1.

Perimeter Alarm

The message center provides the perimeter alarm message to indicate the perimeter alarm has been activated and to start the vehicle to stop the alarm. The IPC receives the perimeter alarm chime request message from the GWM over the HS-CAN3. The GWM receives the perimeter alarm chime request from the BCM over the HS-CAN1.

PRNDL Not In Park

The message center provides a shift to park message to inform the driver the vehicle is not in PARK (P) under 2 sets of conditions. First, the IPC displays the shift to park message if the selector lever is not in PARK (P), the ignition is OFF and the driver door is open or ajar. Second, the message center displays the shift to park message if the selector lever is not in PARK (P), the ignition is ON or in ACC, the driver door is open or ajar and the brake pedal is not applied with vehicle speed less than 5 km/h (3 mph). The IPC uses multiple messages to control the shift to park message.

The IPC receives all required messages from the GWM over the HS-CAN3.

The GWM receives the transmission gear display mode and vehicle speed messages from the PCM over the HS-CAN1.

The GWM receives the driver door ajar status, transport mode and ignition status message from the BCM over the HS-CAN1.

The IPC also uses the park position detect input to determine whether the vehicle is in PARK (P) along with the transmission gear display mode message.

See Park Position Detect Switch component description. Refer to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

Remote Start

The message center provides remote start messages to inform the driver the vehicle is in the remote start active state and steps required to change the state to a drivable state. The remote start message display is active as soon as the vehicle is remote started (the engine is running, but the ignition status is off).

The IPC receives the remote start status message from the GWM over the HS-CAN3. The GWM receives the remote start status message from the BCM over the HS-CAN1.

Stability-Traction Control

The message center provides a stability-traction control system message to indicate the stability-traction control system has a fault and requires service.

When a fault condition exists in the stability-traction control system, the ABS module sets a DTC and sends the stability-traction control chime request to the GWM over the HS-CAN2. The GWM sends the stability-traction control chime request to the IPC over the HS-CAN3.

Starting System

The message center provides a starting system message to inform the driver of further actions required to start the engine or to explain the reason for the inability to start the engine. The IPC receives the starting system fault message request from the GWM over the HS-CAN3. The GWM receives the starting system fault message request from the PCM over the HS-CAN1.

Steering System

The message center provides a message to indicate there is an EPAS system concern. When a fault exists in the EPAS system, the PSCM sends the EPAS failure message to the GWM over the HS-CAN2.

The IPC receives the EPAS failure message from the GWM over the HS-CAN3.

Tire Mobility

The IPC provides a message to inform the driver the tire mobility kit has passed its expiration date. The life of the tire mobility kit is 4 years and the IPC uses vehicle configuration to determine it is equipped with the kit then uses an internal clock to determine when the 4 year life has expired. The IPC receives the vehicle configuration data message from the GWM over the HS-CAN3. The GWM receives the vehicle configuration data from the BCM over the HS-CAN1.

Tire Pressure Monitoring System (TPMS)

The IPC provides message center displays to indicate the TPMS sensor training status or a malfunction in the TPMS.

The IPC receives the tire pressure system status message from the GWM over the HS-CAN3. The GWM receives the tire pressure system status message from the BCM over the HS-CAN1.

Component Description

Brake Fluid Level Switch

The brake fluid level switch is mounted in the master cylinder reservoir. The brake fluid level switch is hardwired to the BCM through a signal circuit and grounded through a separate body ground circuit. The BCM provides a reference voltage to the brake fluid level switch. When the brake fluid level is low, the switch closes, pulling the reference voltage low. When the brake fluid level is high, the switch opens, sending the reference voltage high on the signal circuit to the BCM. The brake fluid level switch uses an internal resistor in parallel to enable the BCM to differentiate between a disconnected brake fluid level switch connector and a low level condition.

Oil Pressure Switch (2.3L And 3.7L)

The oil pressure switch is a normally open switch that is hardwired to the PCM through a single signal circuit. The ground is provided by the switch housing when it is mounted on the engine. The PCM provides a reference voltage to the oil pressure switch. When oil pressure is low, the oil pressure switch remains open, sending the reference voltage high. When the oil pressure is sufficient, the oil pressure switch closes, pulling the reference voltage low to the PCM.

Oil Pressure Sensor (5.0L)

The oil pressure sensor is hardwired to the PCM through VREF, signal and return circuits. The PCM provides the sensor voltage supply on the VREF circuit and monitors the change in voltage changes though the signal and return circuits as the oil pressure changes.

Park Position Detect Switch

The park position detect switch is hardwired to the IPC through a single signal circuit and is grounded by a separate circuit through the selector lever. The IPC provides a reference voltage to the park position detect switch. When the selector lever is in PARK (P), the park position detect switch closes to ground, pulling the reference voltage low. When the selector lever is moved out of PARK (P), the park position detect switch opens to ground, sending the reference voltage high to the IPC.

Steering Wheel Switch - Message Center

The message center switch is part of the LH steering wheel switch and is comprised of 5 buttons. The message center switch uses different resistance values associated with each specific button. The SCCM sends out a reference voltage to the upper LH steering wheel switch on the input circuit and monitors the voltage drops. The voltage drop varies depending upon the resistance of the specific button pressed, providing indication to the SCCM which button is pressed.

DESCRIPTION AND OPERATION > WARNING CHIMES - OVERVIEW > OVERVIEW

The warning chimes provide the driver with audible warnings that act as reminders and supplemental alerts to visual IPC indications such as gauges, indicators and message center warnings. The IPC controls all warning chimes based on messages received from external modules. The IPC prioritizes the chimes according to a preset hierarchy programmed into the IPC software. When more than one chime request is received by the IPC, the most important chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces or delays the lower priority chime.

The warning chimes are sounded through the audio system speakers and the IPC. The turn signal on (tick-tock) is the only individual chime that the IPC is responsible for sounding. The parking aid and Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) warning chimes are sounded through the rear speakers. All other warning chimes are sounded through the front audio system speakers.

The IPC also acts as a backup. In the event of an audio system chime failure, the IPC sounds all chimes that are required.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages - IPC

Broadcast Message	Originating Module	Message Purpose
Adaptive cruise control warning request	CCM	Input used to control the adaptive cruise control warning chime.
Brake pedal applied	PCM	Input used to control the PRNDL not in park warning chime.
Cross traffic alert left status	SODL	Input used to control the BLIS ®/CTA warning chime.
Cross traffic alert right status	SODR	Input used to control the BLIS ®/CTA warning chime.
Cruise control status	PCM	Input used to control the adaptive cruise control warning chime.
Driver door ajar status	BCM	Input used to control the igntion-engine on warning chime and the PRNDL not in park warning chime.

Driver safety belt buckle status	RCM	Input used to control the safety belt warning chime and the Belt-Minder ®.
Engine status	PCM	Input used to control the ignition-engine on warning chime.
Forward collision chime request	CCM	Input used to control the forward collision warning chime.
Front passenger detect status	RCM	Input used to control the Belt-Minder ®.
Gear lever position	PCM	Input used to control the Belt-Minder ®. Reverse input on automatic transmissions used for the backup chime (Japan only).
Headlamp on warning chime	BCM	Input used to control the headlamp on warning chime.
Ignition status	BCM	Input used for the following: To provide ignition RUN, START and ACC states. To control the PRNDL not in park warning chime.
Key-in-ignition indicator status	BCM	Input used to control the key-in-ignition warning chime.
Left turn lamp request	BCM	Input used to control the turn signal-hazard tick-tock tone chime.
Memory feedback request	DSM	Input used to control the memory feedback confirmation chime.
Parking aid chime request	PAM	Input used to control the parking aid chime.
Parking brake chime request	BCM	Input used to control the parking brake warning chime.
Passenger safety belt buckle status	RCM	Input used to control the Belt-Minder ®.
Perimeter alarm chime request	BCM	Input used to control the perimeter alarm chime.
Reverse gear state	PCM	Reverse input on manual transmissions used for the backup chime (Japan only).
Right turn lamp request	BCM	Input used to control the turn signal-hazard tick-tock tone chime.
Side obstacle sensor status-left	SODL	Input used to control the BLIS ®/CTA warning chime.

Side obstacle sensor status-right	SODR	Input used to control the BLIS ®/CTA warning chime.
Stability-traction control chime request	ABS module	Input used to control the service AdvanceTrac ® warning chime.
Transmission gear display mode	PCM	Input used to control the ignition-engine on warning chime and the PRNDL not in park warning chime.
Turn signal status	SCCM	Input used to control the turn signal left on warning chime.
Vehicle speed	PCM	Input used to control the Belt-Minder ®, PRNDL not in park warning chime.

Module Network Input Messages - ACM and DSP Module

Broadcast Message	Originating Module	Message Purpose
Chime source	IPC	Input used to configure the chime source (IPC or the audio system).
Cross Traffic Alert (CTA) chime request	IPC	Input from the IPC used to control the Cross Traffic Alert (CTA) audio chime output.
IPC chime request	IPC	Input from the IPC used to control the audio chime output.
MyKey Belt-Minder ® audio mute	IPC	Input from the IPC used to mute the audio for the Belt-Minder ® chime.
Power up chime modules	IPC	Input used to initiate the audio system as the chime source.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > WARNING CHIME CHARACTERISTICS

The warning chimes use volume, chime frequency, length of time the chime sounds, decay of the chime tone and the number of chime tones to identify which chime is sounding. Most warning chimes have unique characteristics, however, there are chimes that do sound the same. The chime characteristics are defined by the different chime types:

- Information
- Soft-warning
- Hard-warning
- Tick-tock (on-off)

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > ADAPTIVE CRUISE CONTROL WARNING CHIME

The adaptive cruise control warning chime supplements the message center displays to draw the driver's attention to the need to intervene and take control of the vehicle. There are 2 levels of chime output (high priority and low priority) based upon the nature and urgency of the warning. The audio system sounds the appropriate warning chime through the front speakers when it receives the adaptive cruise control warning request (high priority chime) or cruise control status (low priority chime) message from the CCM.

The low priority adaptive cruise control warning chime is a single-tone, 1-second chime that sounds to alert the driver the adaptive cruise control system has shut itself off due to low vehicle speed (approximately 32 km/h [20 mph]) and the driver needs to intervene if further braking is required or to resume the adaptive cruise control operation.

The high priority adaptive cruise control warning chime is a 0.25-second chime that sounds 12 times. The chime alerts the driver the vehicle is approaching the vehicle ahead at a faster rate than the adaptive cruise control system can brake the vehicle and the driver needs to apply the brakes to slow the vehicle down.

The IPC receives the cruise control status and the adaptive cruise control warning request messages from the GWM over the HS-CAN3.

The GWM receives the cruise control status message from the PCM over the HS-CAN1.

The GWM receives the adaptive cruise control warning request message from the CCM over the HS-CAN2.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > AIR BAG SECONDARY WARNING CHIME

The air bag secondary warning chime warns the air bag warning indicator LED is inoperative. If the IPC detects a fault with the air bag warning indicator LED during the bulb prove out, the air bag secondary warning chime sounds through the front speakers. If the IPC detects a fault in the air bag warning indicator when a SRS fault condition exists and the RCM has sent the IPC the air bag indicator request, the air bag secondary warning chime sounds through the front speakers. The air bag chime is a 0.5-second chime that sounds 5 times.

When a fault condition is detected, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BACKUP WARNING CHIME - JAPAN ONLY

The reverse warning chime warns the vehicle is in reverse. When the selector lever (automatic) or

gearshift lever (manual) is in reverse, the PCM sends the gear lever position (automatic) or reverse gear state (manual) message to the GWM over the HS-CAN1. The GWM sends the gear position status message to the IPC over the HS-CAN3 to sound a 1-second chime tone continuously through the front speakers.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BELT-MINDER ® FEATURE

NOTE: Whenever the vehicle is operated using MyKey ®, the IPC enables the Belt-Minder ®.

The Belt-Minder ® is configurable on or off. Refer to: Seatbelt Minder Deactivating/Activating .

The Belt-Minder ® feature supplements the current safety belt warning function and is enabled after the current safety belt warning is complete. The Belt-Minder ® reminds the driver that the driver or front passenger safety belt is unbuckled by intermittently illuminating the safety belt warning indicator and sounding a chime through the front speakers.

The Belt-Minder ® begins once the current safety belt warning has ended (65 seconds [4 seconds Europe]) and the vehicle speed has exceeded 10 km/h (6 mph) (25 km/h [16 mph] Europe) with the driver or front passenger safety belt unbuckled. While activated, the Belt-Minder ® provides a series of chimes/safety belt warning indicator flash sequences. If the vehicle speed drops below 5 km/h (3 mph) (except Europe) once the Belt-Minder ® chime has activated, the chime turns off and the safety belt warning indicator remains on. For European vehicles, the Belt-Minder ® does not suspend the chime until the driver or passenger safety belt is buckled. When the vehicle speed exceeds 10 km/h (6 mph) again, the Belt-Minder ® chime resumes. With the Belt-Minder ® active for approximately 6 seconds, the safety belt warning indicator continues to flash and the chime suspends for approximately 30 seconds (10 seconds Europe) then resumes the sequence. After approximately 5 minutes the Belt-Minder ® times out and turns off.

When MyKey ® is in use, the driver cannot disable the Belt-Minder ®. Once the Belt-Minder ® is activated, the Belt-Minder ® continues to chime periodically (does not time out after 5 minutes) and the audio system is muted until the driver and passenger safety belts are fastened.

For all markets except Europe, the Belt-Minder ® provides the driver and front passenger with a tollbooth feature where the Belt-Minder ® is suspended for 60 seconds (10 seconds with MyKey ®), after the initial Belt-Minder ® warning and the driver or passenger safety belt is unbuckled (such as when the driver stops at a tollbooth). There is no toll booth feature for Europe.

To control the Belt-Minder ®, the IPC receives the vehicle speed, gear lever position, driver safety belt buckle status, passenger safety belt buckle status and front passenger detect status messages from the GWM over the HS-CAN3.

The GWM receives the vehicle speed and gear lever position messages from the PCM over the HS-CAN1.

The IPC receives the driver safety belt buckle status, passenger safety belt buckle status and the front passenger detect status messages from the RCM over the HS-CAN2.

When the conditions require the Belt-Minder ® chime, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BLIND SPOT INFORMATION SYSTEM (BLIS ®)/CROSS TRAFFIC ALERT (CTA) WARNING CHIME

The Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) warning chime sounds to alert the driver that a vehicle has been detected or that there is a system fault. The Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) warning chime sounds a 0.25-second chime continuously through the rear speakers until the request is ended.

The IPC receives the Cross Traffic Alert (CTA) left status, Cross Traffic Alert (CTA) right status, side obstacle sensor status-left and the side obstacle sensor status-right request messages from the GWM over the HS-CAN3.

The GWM receives the Cross Traffic Alert (CTA) left status, the Cross Traffic Alert (CTA) the right status, side obstacle sensor status-left and the side obstacle sensor status-right request messages from the SODL and SODR over the MS-CAN.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > DOOR AJAR WARNING CHIME

The door ajar warning chime warns that a door is ajar. When a door becomes ajar while the ignition is in RUN with vehicle speed greater than 5 km/h (3 mph), the IPC displays the appropriate door ajar warning message and sounds a single chime tone through the front speakers for each door opened. The door ajar chime only sounds once for each time the door is opened, and only repeats the chime if the door is closed then reopened.

The IPC receives the driver door ajar status and passenger door ajar status from the GWM over the HS-CAN3. The GWM receives the driver door ajar status and passenger door ajar status from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FORWARD COLLISION WARNING CHIME

The forward collision warning chime warns that a forward collision potential has been detected or the CCM detects a forward collision warning system concern. Once the forward collision system detects a possible forward collision, the CCM sends the HUD module the heads up flash rate message to flash the forward collision warning, and the forward collision warning message request to the IPC through the GWM to sound a 0.25-second chime tone 12 times.

The forward collision warning system and chime can be disabled or turned off using the message center. When MyKey ® is in use, the driver cannot disable the forward collision warning system. When the

driver disables the forward collision warning chime, the CCM sends the IPC the forward collision chime request through the GWM to sound a 0.25-second chime tone 12 times at 50% volume. The forward collision warning chime and confirmation chime are both sounded through the front speakers.

The IPC receives the forward collision warning message request and the forward collision chime request from the GWM over the HS-CAN3.

The GWM receives the forward collision warning message request and the forward collision chime request from the CCM over the HS-CAN2.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > HEADLAMPS ON WARNING CHIME

The headlamps on warning chime warns the headlamps are on when exiting the vehicle. When the driver exits the vehicle with the driver door ajar, the headlamp switch is in the PARK or HEADLAMP position and the ignition is OFF, the BCM sends the headlamp switch status message to the IPC through the GWM to sound a 1-second chime tone continuously through the front speakers.

The IPC receives the headlamp on warning chime message from the GWM over the HS-CAN3.

The GWM receives the headlamp on warning chime message from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > IGNITION-ENGINE ON WARNING CHIME

The ignition-engine on chime informs the driver they are exiting the vehicle when the ignition has been left on (engine off) or the engine is running. When the driver exits the vehicle with the ignition on or with the engine running, the ignition-engine on warning chime sounds five 1-second chime tones through the front speakers. The IPC uses driver door ajar status, engine status, and transmission gear display mode messaged inputs to control the ignition-engine on warning chime.

The IPC receives the driver door ajar status, engine status and transmission gear display mode messages from the GWM over the HS-CAN3.

The GWM receives the driver door ajar status message from the BCM over the HS-CAN1.

The GWM receives the engine status and transmission gear display mode messages from the PCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND

COMPONENT DESCRIPTION > KEY-IN-IGNITION WARNING CHIME (WITHOUT PUSH BUTTON START)

The key-in-ignition warning chime warns the key is still in the ignition lock cylinder or the ignition is in ACC when the driver door is ajar. The key-in-ignition warning chime sounds repetitive 0.5-second chime tones through the front speakers until either the key is removed from the lock cylinder, the ignition is in RUN or the driver door is closed.

The IPC receives the key-in-ignition status from the GWM over the HS-CAN3.

The GWM receives the key-in-ignition status from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MEMORY-STORED FEEDBACK CHIME

The memory-stored feedback chime informs the driver their preferences have been successfully programmed through the memory set procedure. The memory-stored feedback chime sounds a 100-millisecond chirp through the front speakers when the DSM successfully stores a memory change.

The IPC receives the memory feedback request from the GWM over the HS-CAN3.

The GWM receives the memory feedback request from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MESSAGE CENTER WARNING CHIME

The message center warning chime feature draws the driver's attention to the message center display to view new warning messages. There are 3 different message center warning chime types that are defined by the length of the chime tone, which are designed to create a greater sense of urgency based on the nature of the condition and message displayed in the message center.

- Informational (1-second chime)
- Soft warning (0.5-second chime)
- Hard warning (0.25-second chime)

When a new message request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PARKING AID CHIME

The parking aid system uses a visual display in the FCDIM and a chime to alert the driver objects are close to the vehicle. The parking aid chime sounds a repetitive chime tone through the rear speakers that decreases the time off between chime tones as objects get closer to the sensor until a continuous tone is heard.

The IPC receives the parking aid chime request from the GWM over the HS-CAN3.

The GWM receives the parking aid chime request from the PAM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PARKING BRAKE WARNING CHIME

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds through the front speakers if the ignition is in ON, the parking brake is engaged, and the vehicle speed is greater than 5 km/h (3 mph). The parking brake warning chime stops sounding and resets if the parking brake is released, the ignition is on, if the vehicle speed is less than 5 kmh (3 mph), or after 90 seconds from the time the chime is activated.

The IPC receives the parking brake chime request from the GWM over the HS-CAN3

The GWM receives the parking brake chime request from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PERIMETER ALARM WARNING CHIME

The perimeter alarm warning chime alerts the driver the perimeter alarm is armed when the driver door is unlocked before disarming the alarm. The IPC displays a perimeter alarm message in the message center and the perimeter alarm warning chime sounds for 12 1-second chime tones through the front speakers when the driver door is opened. The perimeter alarm warning chime turns off when the perimeter alarm is disarmed (either by using the key fob or turning the key to the ON position). After the twelve second warning chime duration, the warning chime stops sounding and the perimeter alarm activates, sounding the horn and flashing the turn signal lamps.

The IPC receives the perimeter alarm warning chime request from the GWM over the HS-CAN3.

The GWM receives the perimeter alarm warning chime request from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PRNDL NOT IN PARK WARNING CHIME

The IPC provides a PRNDL not in park warning chime that sounds along with the transmission not in park message center display to inform the driver the vehicle is not in PARK (P). The IPC displays the shift to park message and the PRNDL not in park warning chime sounds three 0.5-second chime tones through the front speakers if the selector lever is not in PARK (P), the ignition is OFF and the driver door is open or ajar. The IPC requires the transmission gear display mode, brake pedal applied, vehicle speed, driver door ajar and ignition status to control the PRNDL not in park warning chime.

The IPC receives all required messages from the GWM over the HS-CAN3.

The GWM receives the brake pedal applied, transmission gear display mode and vehicle speed messages from the PCM over the HS-CAN1.

The GWM receives the driver door ajar status and ignition status message from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SAFETY BELT WARNING CHIME

The safety belt warning chime warns the safety belt is not fastened. The safety belt warning chime sounds a repetitive 1-second chime tone for 6 seconds through the front speakers when the driver safety belt is not fastened and the ignition is transitioned from OFF or ACC to ON or START. The safety belt warning chime stops sounding when the safety belt is fastened, when the ignition is transitioned from ON or START to OFF or ACC, or when the chime has sounded for 6 seconds.

The IPC receives the driver safety belt buckle status message from the GWM over the HS-CAN3.

The GWM receives the driver safety belt buckle status from the RCM over the HS-CAN2.

When the conditions require the safety belt warning chime, the IPC sends the IPC chime request message to the ACM and DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SERVICE ADVANCETRAC ® WARNING CHIME

The service AdvanceTrac ® warning chime warns the ABS module has detected a fault condition in the stability-traction control system. If a fault condition exists in the stability-traction control system, the ABS module sends the IPC the stability-traction control chime request to display the service AdvanceTrac ® message in the message center and to sound 3 0.5-second chime tones through the front speakers.

The IPC receives the stability-traction control chime request from the GWM over the HS-CAN3.

The GWM receives the stability-traction control chime request from the ABS module over the HS-CAN2.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > TURN SIGNAL ON CHIME TONE

The IPC provides a repetitive 1-second on/off tick-tock chime tone along with visual RH or LH turn indicators to inform the driver the turn signal or hazard lamp function is on.

The IPC receives the left turn lamp request and the right turn lamp request messages from the GWM over the HS-CAN3.

The GWM receives the left turn lamp request and the right turn lamp request messages from the BCM over the HS-CAN1.

DESCRIPTION AND OPERATION > WARNING CHIMES - SYSTEM OPERATION AND COMPONENT DESCRIPTION > TURN SIGNAL LEFT ON CHIME

The turn signal left on or turn signal minder chime uses both odometer and the turn signal status message to determine the turn signals have been left on. The turn signal left on chime sounds a repetitive 1-second chime through the front speakers when the vehicle is driven with the turn signal on for more than 3.2 km (2.0 miles).

The IPC receives the turn signal status from the GWM over the HS-CAN3.

The GWM receives the turn signal status from the BCM over the HS-CAN1.

When a chime request is received, the IPC sends the IPC chime request message to the ACM and the audio DSP module over the HS-CAN3 to sound the chime.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > DTC CHART: INSTRUMENT PANEL CLUSTER (IPC)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DTC Chart - IPC

DTC	Description	Action
P0460:11	Fuel Level Sensor "A" Circuit: Circuit Short To Ground	GO to Pinpoint Test C
P0460:13	Fuel Level Sensor "A" Circuit: Circuit Open	GO to Pinpoint Test C
P1243:06	Second Fuel Pump Fault or Ground Fault: Algorithm Based Failure	GO to Pinpoint Test C
P1346:11	Fuel Level Sensor "B" Circuit: Circuit Short To Ground	GO to Pinpoint Test C

P1346:13	Fuel Level Sensor "B" Circuit: Circuit Open	GO to Pinpoint Test C
P1534:01	Restraint Deployment Indicator Circuit: General Electrical Failure	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) . Diagnose all RCM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .
P1706:00	High Vehicle Speed Observed in Park: No Sub Type Information	GO to Pinpoint Test V
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	GO to Pinpoint Test BM
U0104:00	Lost Communication With Cruise Control Module: No Sub Type Information	GO to Pinpoint Test BO
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	GO to Pinpoint Test BP
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	GO to Pinpoint Test BQ

U0212:00	Lost Communication With Steering Column Control Module: No Sub Type Information	GO to Pinpoint Test BX
U0232:00	Lost Communication With Side Obstacle Detection Control Module - Left: No Sub Type Information	GO to Pinpoint Test BY
U0233:00	Lost Communication With Side Obstacle Detection Control Module - Right: No Sub Type Information	GO to Pinpoint Test BY
U0401:00	Invalid Data Received from ECM/PCM A: No Sub Type Information	This DTC sets when the IPC receives invalid network data for the speedometer, engine temperature, or transmission

		fluid temperature data from the PCM. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the PCM and other modules on the network. Refer to the appropriate article for the procedure. If no Diagnostic Trouble Codes (DTCs) are present in the PCM, DIAGNOSE the observable symptom.
U0401:81	Invalid Data Received from ECM/PCM A: Invalid Serial Data Received	This DTC sets when the IPC receives invalid network data for the speedometer, engine temperature, or transmission fluid temperature data from the PCM. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the PCM and other modules on the network. Refer to the appropriate article for the procedure. If no Diagnostic Trouble Codes (DTCs) are present in the PCM, DIAGNOSE the observable symptom.
U0401:82	Invalid Data Received from ECM/PCM A: Alive/Sequence Counter Incorrect/Not Updated	This DTC sets when the IPC receives invalid network data for the forward collision or adaptive cruise control data from the PCM. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the PCM and other modules on the network. Refer to the appropriate article for the procedure. If no Diagnostic Trouble Codes (DTCs) are present in the PCM, DIAGNOSE the observable symptom.
U0405:56	Invalid Data Received From Cruise Control Module: Invalid/Incompatible Configuration	This DTC sets when the IPC receives invalid network data for adaptive cruise control from the CCM. CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect Programmable Module Installation (PMI) procedures. If

		there have been recent service actions with this module, REPEAT the Programmable Module Installation (PMI) procedure as directed by the diagnostic scan tool. If there have been no recent service actions, INSTALL a new module to correct the failure to retain configuration data.
U0415:00	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	This DTC sets when the IPC receives invalid accelerometer network data from the ABS module. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the ABS module and other modules on the network. REFER to: Anti-Lock Brake System (ABS) and Stability Control . If no Diagnostic Trouble Codes (DTCs) are present in the ABS module, DIAGNOSE the observable symptom.
U0415:81	Invalid Data Received From Anti-Lock Brake System (ABS) Control Module: Invalid Serial Data Received	This DTC sets when the IPC receives invalid accelerometer network data from the ABS module. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the ABS module and other modules on the network. REFER to: Anti-Lock Brake System (ABS) and Stability Control . If no Diagnostic Trouble Codes (DTCs) are present in the ABS module, DIAGNOSE the observable symptom.
U0420:82	Invalid Data Received From Power Steering Control Module: Alive/Sequence Counter Incorrect/Not Updated	GO to Pinpoint Test BZ
U0422:00	Invalid Data Received From Body Control Module: No Sub Type Information	This DTC sets when the IPC receives invalid network TPMS data from the BCM. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the BCM and other modules on the network. REFER to: Body Control Module (BCM) .

		If no Diagnostic Trouble Codes (DTCs) are present in the BCM, DIAGNOSE the observable symptom.
U0452:81	Invalid Data Received From Restraints Control Module: Invalid Serial Data Received	This DTC sets when the IPC receives invalid network data from the RCM due to incorrect Belt-Minder ® configuration in the IPC. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the RCM and other modules on the network. REFER to: Airbag Supplemental Restraint System (SRS) . If no Diagnostic Trouble Codes (DTCs) are present in the RCM, DIAGNOSE the observable symptom.
U046B:86	Invalid Data Received From Global Positioning System Module: Signal Invalid	This DTC sets when the IPC receives invalid network data from the GPSM. RETRIEVE and REPAIR all non-network Diagnostic Trouble Codes (DTCs) in the GPSM and other modules on the network. Refer to the appropriate article for the procedure. If no Diagnostic Trouble Codes (DTCs) are present in the GPSM, DIAGNOSE the observable symptom.
U0533:56	Invalid Data Received From Side Obstacle Detection Control Module-Left: Invalid/Incompatible Configuration	CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect Programmable Module Installation (PMI) procedures. If there have been recent service actions with this module, REPEAT the Programmable Module Installation (PMI) procedure as directed by the diagnostic scan tool. If there have been no recent service actions, INSTALL a new module to correct the failure to retain configuration data.
U0534:56	Invalid Data Received From Side Obstacle Detection Control Module-Right: Invalid/Incompatible	CHECK the vehicle service history for recent service actions related to this module. This DTC

	Configuration	sets due to incomplete or incorrect Programmable Module Installation (PMI) procedures. If there have been recent service actions with this module, REPEAT the Programmable Module Installation (PMI) procedure as directed by the diagnostic scan tool. If there have been no recent service actions, INSTALL a new module to correct the failure to retain configuration data.
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect Programmable Module Installation (PMI) procedures. If there have been recent service actions with this module, REPEAT the Programmable Module Installation (PMI) procedure as directed by the diagnostic scan tool. If there have been no recent service actions, INSTALL a new module to correct the failure to retain configuration data.
U3000:41	Control Module: General Checksum Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:41 is retrieved again, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
U3000:42	Control Module: General Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:42 is retrieved again, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
U3000:44	Control Module: Data Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:44 is retrieved again, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
U3000:46	Control Module: Calibration/Parameter Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the

		self-test. If DTC U3000:46 is retrieved again, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
U3000:54	Control Module: Missing Calibration	CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect calibration files. If there have been recent service actions with this module, REFLASH the IPC. If there have been no recent service actions, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test CA
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test CC
U300A:64	Ignition Switch: Signal Plausibility Failure	DTC U300A:64 sets in continuous memory when the IPC detects a messaged START input for 15 seconds or longer. Once the fault condition is detected, the IPC operates with limited functionality for 15 seconds then returns to full functionality. DIAGNOSE any ignition or starting system concerns. REFER to: Steering Wheel and Column Electrical Components .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > DTC CHART: INFORMATION CENTER MODULE (ICM)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DTC Chart - ICM

DTC	Description	Action
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	GO to Pinpoint Test BN
U0140:00	Lost Communication With Body Control Module: No Sub Type	GO to Pinpoint Test BR

	Information	
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	GO to Pinpoint Test BU
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect Programmable Module Installation (PMI) procedures. If there have been recent service actions with this module, REPEAT the Programmable Module Installation (PMI) procedure as directed by the diagnostic scan tool. REFER to: MODULE CONFIGURATION . If there have been no recent service actions, INSTALL a new module to correct the failure to retain configuration data.
U3000:41	Control Module: General Checksum Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:41 is retrieved again, INSTALL a new ICM. REFER to: Information Center Module (ICM) .
U3000:42	Control Module: General Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:42 is retrieved again, INSTALL a new ICM. REFER to: Information Center Module (ICM) .
U3000:44	Control Module: Data Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:44 is retrieved again, INSTALL a new ICM. REFER to: Information Center Module (ICM) .
U3000:46	Control Module: Calibration/Parameter Memory Failure	CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If DTC U3000:46 is retrieved again, INSTALL a new ICM. REFER to: Information Center Module (ICM) .
U3000:54	Control Module: Missing Calibration	CHECK the vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or incorrect

		calibration files. If there have been recent service actions with this module, REFLASH the IPC. If there have been no recent service actions, INSTALL a new ICM. REFER to: Information Center Module (ICM) .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test CB

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
A module does not respond to the diagnostic scan tool	Fuse Wiring, terminals or connectors Communication concern Module	REFER to: MODULE COMMUNICATIONS NETWORK .
The IPC is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test A
Multiple gauges, indicators, RTT indicators, warnings and chimes are inoperative or always on	Refer to the Pinpoint Test	GO to Pinpoint Test A
A virtual gauge (accelerometer, air fuel ratio, axle temperature, battery voltage gauge, cylinder head temperature, engine oil pressure, engine oil temperature, inlet air temperature, transmission fluid temperature or vacuum-boost), is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test B
Incorrect fuel gauge indication	Refer to the Pinpoint Test	GO to Pinpoint Test C

The speedometer is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test D
Incorrect speedometer indication	Refer to the Pinpoint Test	GO to Pinpoint Test E
The odometer is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test F
The tachometer is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test G
Incorrect tachometer indication	Refer to the Pinpoint Test	GO to Pinpoint Test H
The temperature gauge is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test I
Incorrect temperature gauge indication	Refer to the Pinpoint Test	GO to Pinpoint Test J
The engine oil pressure gauge is inoperative (ICM gauge pack)	Refer to the Pinpoint Test	GO to Pinpoint Test K
The engine oil temperature gauge is inoperative (ICM gauge pack) (SVT only)	Refer to the Pinpoint Test	GO to Pinpoint Test L
The vacuum-boost gauge is inoperative (ICM gauge pack) (except SVT)	Refer to the Pinpoint Test	GO to Pinpoint Test M
The ABS warning indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test N
The airbag warning indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test O
The brake warning indicator is never on	Refer to the Pinpoint Test	GO to Pinpoint Test P
The brake warning indicator is always on	Refer to the Pinpoint Test	GO to Pinpoint Test Q
The LED low beam malfunction indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test R
The LH- RH turn signal, front fog lamp or high beam indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test S
The lights on indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test T
The MIL is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test U
The PRNDL indicator is never on or never displays P	Refer to the Pinpoint Test	GO to Pinpoint Test V
The rear fog lamp indicator is never or always on (if equipped)	Refer to the Pinpoint Test	GO to Pinpoint Test W
The safety belt warning indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test X

The stability-traction control indicator (sliding car icon) is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test Y
The stability-traction control disabled indicator (sliding car OFF icon) is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test Z
The TPMS warning indicator is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AA

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > SYMPTOM CHART(S) > SYMPTOM CHART: INFORMATION AND MESSAGE CENTER

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
The message center is not operating correctly	Refer to the Pinpoint Test	GO to Pinpoint Test AB
The message center display is blank	Refer to the Pinpoint Test	GO to Pinpoint Test A
The compass is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test AC
The digital speedometer display is inoperative or incorrect	Refer to the Pinpoint Test	VERIFY the message center display operates and functions correctly. If the message center functions correctly, DIAGNOSE the speedometer. For an inoperative speedometer, GO to Pinpoint Test D For an incorrect speedometer, GO to Pinpoint Test E If the message center does not function correctly, GO to Pinpoint Test AB
The DTE or Average Fuel Economy (AFE) display is inoperative	Refer to the Pinpoint Test	CHECK the operation of the speedometer, the fuel gauge and the odometer. If the speedometer does not operate correctly, GO to Pinpoint Test D If the odometer does not operate correctly, GO to Pinpoint Test F

		If the fuel gauge does not operate correctly, GO to Pinpoint Test C If the speedometer, the fuel gauge and odometer operate correctly, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
Incorrect or fluctuating DTE display	Refer to the Pinpoint Test	GO to Pinpoint Test AD
The HUD performance shift indication is never on (SVT only)	Refer to the Pinpoint Test	GO to Pinpoint Test AE
The Blind Spot Information System (BLISS ®) off RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AF
The charging system RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AG
The cruise control RTT is never on	Refer to the Pinpoint Test	GO to Pinpoint Test AH
The door or luggage compartment lid ajar RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AI
The drive mode RTT indicators are never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AJ
The engine over-temperature RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AK
The launch control RTT is never on	Refer to the Pinpoint Test	GO to Pinpoint Test AL
The low fuel RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AM
The low oil pressure RTT is never or always on	Refer to the Pinpoint Test	For 2.3L and 3.7L, GO to Pinpoint Test AN For 5.0L and 5.2L, GO to Pinpoint Test AO
The overspeed warning RTT (Gulf Cooperative Countries [GCC]) is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AP
The powertrain malfunction (wrench) RTT is never or always on	Refer to the Pinpoint Test	GO to Pinpoint Test AQ
The steering mode RTT is never on	Refer to the Pinpoint Test	GO to Pinpoint Test AR
The vehicle dynamics (damper control) RTT is never on (SVT only)	Refer to the Pinpoint Test	GO to Pinpoint Test AS

The adaptive cruise control messages are never displayed	Message center concern Cruise control indication concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the adaptive cruise control RTT. REFER to: Cruise Control .
A Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) message is always displayed	Message center concern Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) indication concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) system. REFER to: Blind Spot Information System .
A brake warning (brake fluid level low, parking brake applied or brake system malfunction) message is never or always displayed	Message center concern Brake warning indication concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the brake warning indicator.For never on, GO to Pinpoint Test P For always on, GO to Pinpoint Test Q
The ceramic brake wear warning message never or always displayed (SVT only)	Refer to the Pinpoint Test	GO to Pinpoint Test AT
The charging system warning message is never or always displayed	Message center concern Charging system RTT indication concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed.

		If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the charging system RTT. GO to Pinpoint Test AG
The check fuel fill inlet message is always displayed	Refer to the Pinpoint Test	GO to Pinpoint Test AU
The convertible top warning message is always displayed	Refer to the Pinpoint Test	GO to Pinpoint Test AV
A door or luggage compartment lid ajar warning message is never or always displayed	Message center concern Door ajar RTT indication concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the door ajar RTT. GO to Pinpoint Test AI
The engine on warning message is always displayed (push button start only)	Refer to the Pinpoint Test	GO to Pinpoint Test AW
The engine oil change message is never displayed	Message center concern The PCM has not reached the programmed mileage/time based on the criteria required to display the message.	*NOTE: Using the system check in the message center, verify that the oil life is between 1 and 5% for the ENGINE OIL CHANGE SOON message or at 0% for the OIL CHANGE REQUIRED message.* OPEN then CLOSE the driver door and VERIFY the DRIVER DOOR AJAR message functions correctly.If the DRIVER DOOR AJAR message does not function correctly, GO to Pinpoint Test AI If the DRIVER DOOR AJAR message functions

		correctly with the oil life between 0-5%, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .If the DRIVER DOOR AJAR message functions correctly with the oil life **not** at the specified value, INFORM the customer how the message center functions and how the oil life messages are set.
The engine oil change message is always displayed	The oil life needs reset	RESET the oil life. REFER to the Owner's Literature.
The engine over-temperature warning message is never or always displayed	Message center concern Temperature gauge indication concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test Al If the driver door ajar message functions correctly, DIAGNOSE the temperature gauge. For an inoperative gauge, GO to Pinpoint Test I For an incorrect gauge, GO to Pinpoint Test J
The factory or transport mode message is always on	Vehicle is in factory or transport mode	Place the vehicle in normal operation mode. REFER to: Transport and Factory Mode Deactivation in MULTIFUNCTION ELECTRONIC MODULES .
A forward collision warning message is never or always displayed	Message center concern Forward collision system concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test Al If the driver door ajar message functions correctly, DIAGNOSE the forward collision warning system. REFER to: Collision Warning and Collision Avoidance System .
The hill start assist warning message is always displayed	Refer to the Pinpoint Test	GO to Pinpoint Test AX
The launch control message is never displayed	Message center concern Launch control indication concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message

		does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the launch control RTT. GO to Pinpoint Test AL
A load shed message is always displayed	Message center concern Battey charging system concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the charging system. Refer to the appropriate article for the procedure.
The low oil pressure warning message is never or always displayed	Message center concern Low oil pressure indication concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE low oil pressure RTT. For 2.3L and 3.7L, GO to Pinpoint Test AN For 5.0L and 5.2L, GO to Pinpoint Test AO
A memory seat message is never displayed	Message center concern Memory seat concern.	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE memory seats. REFER to: FRONT SEATS .
A MyKey ® menu is not available or incorrect	MyKey ® programmed key in use Number of keys set to unlimited mode Non-Ford approved remote start system installed	*NOTE: MyKey ® may not be compatible with non-Ford approved remote start systems.*

		REFER to the Owner's Literature.
The parking aid malfunction message is always displayed	Message center concern Parking aid system concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the parking aid. REFER to: Parking Aid .
A passive entry/push button start message (no key detected, key inside vehicle, key not inside vehicle or place key in keyholder) is never or always displayed (push button start only)	Message center concern Passive entry system concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the passive entry system. REFER to: Locks, Latches and Entry Systems .
The PATS message (starting system fault) is never or always displayed	Message center concern PATS concern.	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the PATS. REFER to: Passive Anti-Theft System (PATS) .

The perimeter alarm message is always displayed	Message center concern Perimeter alarm concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the perimeter alarm. REFER to: Perimeter Anti-Theft Alarm .
A push button start message (press brake to start, accessory power active or starting system fault) message is inoperative or always on	Message center concern Push button starting system concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the push button starting system. REFER to: Steering Wheel and Column Electrical Components .
The PRNDL not in park warning message is never or always displayed	Message center concern PRNDL indication concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the PRNDL. GO to Pinpoint Test V
The stability-traction control malfunction warning is never or always on	Message center concern Stability-traction control indication concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed.

		If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the stability-traction control indicator. GO to Pinpoint Test Y
A steering malfunction message is always on	Message center concern EPAS system concern	OPEN then CLOSE the driver door and VERIFY the driver door ajar message displays correctly with the door open and closed. If the driver door ajar message does not function correctly, GO to Pinpoint Test AI If the driver door ajar message functions correctly, DIAGNOSE the EPAS. REFER to: POWER STEERING .
A TPMS malfunction message is never or always on	Message center concern TPMS warning indication concern	*NOTE: Disconnecting the GWM creates an unrelated fault to test the overall message center function and display.* With the ignition OFF, DISCONNECT GWM C2431 . Place the ignition ON and monitor the message center display.If multiple messages and popup displays do not display, GO to Pinpoint Test A If multiple messages and popup displays do display, DIAGNOSE the TPMS. REFER to: Tire Pressure Monitoring System (TPMS) .
The tire training complete message is never on	TPMS sensor training incomplete	*NOTE: This message only appears at the conclusion of the TPMS sensor training procedure.* CARRY OUT the TPMS sensor training. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .
A tire training message (train left front, right front, left rear or right rear tire) message is never on	TPMS warning indicator concern TPMS sensor training concern	*NOTE: These messages*

		only appear during the TPMS sensor training procedure. VERIFY the TPMS warning indicator functions.If the TPMS warning indicator does not operate, GO to Pinpoint Test AA If the Tire TPMS warning indicator operates, CARRY OUT the TPMS sensor training. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .
The tires not trained message is always on	TPMS sensor training concern	*NOTE: This message only appears during the TPMS sensor training procedure.* CARRY OUT the TPMS sensor training. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > SYMPTOM CHART(S) > SYMPTOM CHART: WARNING CHIMES

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
All the chimes are inoperative	IPC	GO to Pinpoint Test A
The adaptive cruise control warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test AY
The airbag secondary warning chime is inoperative	Normal condition IPC	Using a diagnostic scan tool, PERFORM the IPC self-test. If DTC P1534:01 is present, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) . If DTC P1534:01 is **not** present, the system is operating correctly. The airbag secondary warning chime sounds only when a fault in the airbag warning indicator is present and DTC P1534:01 is recorded.

The airbag secondary warning chime has activated	IPC	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
The backup warning chime is inoperative (Japan only)	Refer to the Pinpoint Test	GO to Pinpoint Test AZ
The Belt-Minder ® feature is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BK
The Belt-Minder ® cannot be deactivated	MyKey ® programmed key in use	*NOTE: When a MyKey ® programmed key is used, the Belt-Minder ® is automatically turned on and cannot be disabled (if previously disabled by an administrator, the Belt-Minder ® remains disabled when an administrator key is used).* The system is operating correctly. Use an administrator key to disable the Belt-Minder ®.
The Blind Spot Information System (BLIS ®)/Cross Traffic Alert (CTA) warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BA
The chime always sounds	Refer to the Pinpoint Test	GO to Pinpoint Test BB
The chime only sounds from the IPC	Refer to the Pinpoint Test	GO to Pinpoint Test BC
The door ajar warning chime is inoperative	Door ajar indication concern IPC	With the ignition OFF, the headlamps in the PARKING LAMPS position and the doors closed, OPEN the driver door and VERIFY the headlamps on warning chime sounds. If the headlamps on chime sounds, DIAGNOSE the door or luggage compartment lid ajar RTT. GO to Pinpoint Test AI If the headlamps on chime does not sound, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
The forward collision warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BD
The headlamps on warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BE

The ignition-engine on warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BF
The memory-stored feedback warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BG
The message center warning chime is inoperative	No warnings present IPC	With all the doors closed and the ignition OFF, PLACE the ignition ON. Once the IPC has completed the prove-out, OPEN the driver door and VERIFY the message center displays the door ajar RTT and the chime sounds once. If the chime sounds, the system is operating correctly. The message center warning chime only sounds when a new warning is displayed in the message center. If the door ajar message does not display, GO to Pinpoint Test AI If the door ajar message displays and the chime does not sound, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
The parking aid chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BH
The parking brake warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BI
The perimeter alarm chime is inoperative	Perimeter alarm concern IPC	GO to Pinpoint Test BJ
The PRNDL not in park warning chime is inoperative	PRNDL indication concern IPC	With the ignition OFF, the headlamps in the PARKING LAMPS position and the doors closed, OPEN the driver door and VERIFY the headlamps on warning chime sounds. If the headlamps on chime sounds, DIAGNOSE the PRNDL indicator. GO to Pinpoint Test V If the headlamps on chime does not sound, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
The safety belt warning chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BK
The service AdvanceTrac ® chime is inoperative	Stability-traction control concern IPC	With the ignition OFF, the headlamps in the PARKING LAMPS position and the doors closed, OPEN the driver door and VERIFY the headlamps on warning chime

		sounds. If the headlamps on chime sounds, DIAGNOSE the stability-traction control indicator. GO to Pinpoint Test Y If the headlamps on chime does not sound, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .
The turn signal-hazard on chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BL
The turn signal left on chime is inoperative	Refer to the Pinpoint Test	GO to Pinpoint Test BL

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST A : THE IPC (INSTRUMENT PANEL CLUSTER) IS INOPERATIVE OR MULTIPLE GAUGES, INDICATORS, RTT (RECONFIGURABLE TELLTALE) INDICATORS, WARNINGS AND CHIMES ARE INOPERATIVE OR ALWAYS ON

Normal Operation and Fault Conditions

See IPC component description. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

The IPC receives a hot at all times voltage from the BCM. The IPC receives the ignition status message for the RUN/START or ACC input from the BCM over the HS-CAN3.

Possible Sources

- Fuse
- Communication concern
- GWM
- IPC

Visual Inspection and Diagnostic Pre-checks

Inspect BCM fuse 13 (7.5A).

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST A : THE IPC (INSTRUMENT PANEL CLUSTER) IS INOPERATIVE OR MULTIPLE GAUGES, INDICATORS, RTT (RECONFIGURABLE TELLTALE) INDICATORS, WARNINGS AND CHIMES ARE INOPERATIVE OR ALWAYS ON > PINPOINT TEST A : THE IPC (INSTRUMENT PANEL

CLUSTER) IS INOPERATIVE OR MULTIPLE GAUGES, INDICATORS, RTT (RECONFIGURABLE TELLTALE) INDICATORS, WARNINGS AND CHIMES ARE INOPERATIVE OR ALWAYS ON

A1 PERFORM THE NETWORK TEST FOR ALL MODULES

Ignition ON.

Using a diagnostic scan tool, perform a network test.

Do all equipped modules pass the network test?

Yes	GO to A2

No	REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to A3

A3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	INSTALL a new GWM. REFER to: Gateway Module A (GWM) . TEST the system for normal operation. If the IPC is still inoperative, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST B : A VIRTUAL GAUGE (ACCELEROMETER, AIR FUEL RATIO, AXLE TEMPERATURE, BATTERY VOLTAGE GAUGE, CYLINDER HEAD TEMPERATURE, ENGINE OIL PRESSURE, ENGINE OIL

TEMPERATURE, INLET AIR TEMPERATURE, TRANSMISSION FLUID TEMPERATURE OR VACUUM-BOOST), IS INOPERATIVE

Normal Operation and Fault Conditions

See Virtual Gauges. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

Accelerometer

- If the vehicle lateral acceleration or vehicle longitudinal acceleration data messages are missing, invalid or unknown for less than 5 seconds, the IPC defaults the accelerometer display to the last setting based upon that last message received.
- If the vehicle lateral acceleration or vehicle longitudinal acceleration data messages are missing for 5 seconds or longer, the IPC sets DTC U0121:00 and defaults the red dot in the accelerometer display off.
- If the vehicle lateral acceleration or vehicle longitudinal acceleration data messages are invalid for 5 seconds or longer, the IPC sets DTC U0415:00 and defaults the red dot in the accelerometer display off.
- If the vehicle lateral acceleration or vehicle longitudinal acceleration data messages are unknown for 5 seconds or longer, the IPC sets DTC U0415:81 and defaults the red dot in the accelerometer display off.

Air Fuel Ratio

- If the air fuel ratio display message is missing for less than 5 seconds, the IPC defaults the air fuel ratio gauge and digital display to the last indication state, based upon the last message received.
- If the air fuel ratio display message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the air fuel ratio gauge to the lowest displayed stop (10) and the digital display blank.

Axle Temperature (SVT Only)

- If the axle temperature message is missing for less than 5 seconds, the IPC defaults the axle temperature gauge and digital display to the last indication state, based upon the last message received.
- If the axle temperature message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the axle temperature gauge to the lowest displayed stop and the digital display blank.

Battery Voltage

- The battery voltage gauge uses the hot at all times voltage input to measure the voltage available to the IPC. The IPC applies a filter to the input voltage data to remove or level out fluctuations in the data.

Cylinder Head Temperature

- If the cylinder head temperature data message is missing for less than 5 seconds, the IPC defaults the cylinder head temperature gauge and digital display to the last indication state, based upon the last message received.
- If the cylinder head temperature data message is missing for 5 seconds or longer, the IPC sets

DTC U0100:00 and defaults the cylinder head temperature gauge to the full hot position and the digital display blank.

Engine Oil Pressure

- If the oil pressure warning indicator request message is missing for less than 5 seconds, the IPC defaults the oil pressure gauge and digital display to the last indication state, based upon the last message received.
- If the oil pressure warning indicator request message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the oil pressure gauge to 0 PSI and the digital display blank.

Engine Oil Temperature

- If the engine oil temperature data message is missing or invalid for less than 5 seconds, the IPC defaults the engine oil temperature gauge and digital display to the last indication state, based upon the last message received.
- If the engine oil temperature data message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the engine oil temperature gauge to the full cold position and the digital display blank.
- If the engine oil temperature data message is invalid for 5 seconds or longer, the IPC sets DTC U0401:00 and defaults the engine oil temperature gauge to the full cold position and the digital display blank.

Inlet Air Temperature

- If the engine inlet air temperature data message is missing or invalid for less than 5 seconds, the IPC defaults the inlet air temperature gauge and digital display to the last indication state, based upon the last message received.
- If the engine inlet air temperature data message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the inlet air temperature gauge to the full cold position and the digital display blank.
- If the engine inlet air temperature data message is invalid for 5 seconds or longer, the IPC sets DTC U0401:00 and defaults the inlet air temperature gauge to the full cold position and the digital display blank.

Transmission Fluid Temperature

- If the transmission fluid temperature data message is missing or invalid for less than 5 seconds, the IPC defaults the transmission fluid temperature gauge and digital display to the last indication state, based upon the last message received.
- If the transmission fluid temperature data message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the transmission fluid temperature gauge to the full cold position and the digital display blank.
- If the transmission fluid temperature data message is invalid for 5 seconds or longer, the IPC sets DTC U0401:00 and defaults the transmission fluid temperature gauge to the full cold position and the digital display blank.

Vacuum-Boost

- If the vacuum-boost display message is missing for less than 5 seconds, the IPC defaults the

vacuum-boost gauge and digital display to the last indication state, based upon the last message received.

- If the vacuum-boost display message is missing for 5 seconds or longer, the IPC sets DTC U0100:00 and defaults the vacuum-boost gauge to the rest position and the digital display blank.

Possible Sources

- Communication concern
- PCM input concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST B : A VIRTUAL GAUGE (ACCELEROMETER, AIR FUEL RATIO, AXLE TEMPERATURE, BATTERY VOLTAGE GAUGE, CYLINDER HEAD TEMPERATURE, ENGINE OIL PRESSURE, ENGINE OIL TEMPERATURE, INLET AIR TEMPERATURE, TRANSMISSION FLUID TEMPERATURE OR VACUUM-BOOST), IS INOPERATIVE > PINPOINT TEST B : A VIRTUAL GAUGE (ACCELEROMETER, AIR FUEL RATIO, AXLE TEMPERATURE, BATTERY VOLTAGE GAUGE, CYLINDER HEAD TEMPERATURE, ENGINE OIL PRESSURE, ENGINE OIL TEMPERATURE, INLET AIR TEMPERATURE, TRANSMISSION FLUID TEMPERATURE OR VACUUM-BOOST), IS INOPERATIVE

B1 CHECK THE IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition ON.

Using a diagnostic scan tool, perform the BCM self-test.

Verify all functions of the IPC (gauges, indicators, message center and chimes) operate.

Do all functions of the IPC operate?

Yes	GO to B2

No	GO to Pinpoint Test A

B2 VERIFY THE IPC (INSTRUMENT PANEL CLUSTER) IS SET TO THE DISPLAY/GAUGE IN QUESTION

> *NOTE: The IPC and message center navigation can be found in the Owner's Literature.*

Using the message center controls, make sure the IPC is set to the display/gauge for the

gauge in question.

Is the message center set to the display/gauge for the gauge in question?

Yes	If the engine oil pressure gauge does not display, GO to B3If the virtual gauge in question does not display, GO to B4

No	If the virtual gauge in question functions, the system is operating correctly. The IPC was not set to display the gauge in question. If the virtual gauge in question does not display, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

B3 CHECK THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) OPERATION

Start the engine and monitor the low oil pressure RTT.

Ignition OFF.

Disconnect Engine Oil Pressure Switch C103 (2.3L).

Disconnect Engine Oil Pressure Switch C1642 (3.7L).

Disconnect Engine Oil Pressure Switch C1657 (5.0L).

Disconnect Engine Oil Pressure Switch (5.2L).

Start the engine and monitor the low oil pressure RTT.

Is the low oil pressure RTT off with the engine oil pressure switch connected and turn on with the engine oil pressure switch disconnected?

Yes	GO to B4

No	For 2.3L and 3.7L, GO to Pinpoint Test AN For 5.0L and 5.2L, GO to Pinpoint Test AO

B4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to B5

B5 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to B6

B6 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST C : INCORRECT FUEL GAUGE INDICATION

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See Fuel Gauge and Fuel Level Sender. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0460:11	Fuel Level Sensor "A" Circuit: Circuit Short To Ground	A continuous and on-demand DTC that sets in the IPC if the fuel level input is pulled low out of range on the fuel level input circuit indicating a short to ground for 33 seconds or longer. The IPC defaults the fuel gauge to empty (E).
P0460:13	Fuel Level Sensor "A" Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC if the fuel level input is sent high out of range on the fuel level input circuit indicating an open or short to voltage for 33 seconds or longer. The IPC defaults the fuel gauge to empty

		(E).
P1243:06	Second Fuel Pump Fault or Ground Fault: Algorithm Based Failure	*NOTE: Normal operation of the fuel delivery system allows the fuel level sensor side of the fuel tank (the side opposite of the fuel filler hose) to have less fuel than the side with the fuel pump assembly (side with the fuel filler hose).* Sets when the IPC detects a low fuel condition on the fuel pump module side (active side) of the fuel tank before the fuel level sensor (passive side) indicates empty. DTC P1243:06 indicates a fuel transfer concern with the fuel transfer tube or the jet pump (part of the fuel pump module).
P1346:11	Fuel Level Sensor "B" Circuit: Circuit Short To Ground	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel level sensor is out of range on the fuel level input circuit with a short to ground for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P1346:11.
P1346:13	Fuel Level Sensor "B" Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel level sensor is out of range on the fuel level sensor input circuit with an open or short to voltage for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P1346:13.

PCM DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0461	Fuel Level Sensor "A" Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel

		fill percentage in the fuel tank. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P0462	Fuel Level Sensor "A" Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel pump assembly signal circuit based on the messaged input received from the BCM. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P0463	Fuel Level Sensor "A" Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump assembly signal circuit based on the messaged input received from the BCM. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P2066	Fuel Level Sensor "B" Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P2067	Fuel Level Sensor "B" Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel level sensor signal circuit based on the messaged input received from the BCM. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P2068	Fuel Level Sensor "B" Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel level sensor signal circuit based on the messaged input received from the BCM. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.

P25B0	Fuel Level Sensor "A" Stuck	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P25B1	Fuel Level Sensor "B" Stuck	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.
P25B2	Fuel Level Sensor "A" or "B" Stuck	Sets when the PCM determines the value of either fuel level input signals is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage. Follow the pinpoint test using the Diagnostic Trouble Codes (DTCs) set in the IPC.

Possible Sources

- Wiring, terminals or connectors
- Fuel pump assembly
- Fuel level sender (float and card)
- Fuel level sensor
- Fuel tank
- IPC

Visual Inspection and Diagnostic Pre-checks

Inspect the following:

- fuel tank for signs of damage that can affect the float operation inside the tank.
- gauge needle for signs of binding or damage.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND

WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST C : INCORRECT FUEL GAUGE INDICATION > PINPOINT TEST C : INCORRECT FUEL GAUGE INDICATION

NOTE: Following any fuel gauge repairs, remove BCM fuse 13 (7.5A) for one minute then reinstall to reset the fuel gauge timers.

C1 CARRY OUT THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For DTC P0460:11 or P1346:11, GO to C2For DTC P0460:13 or P1346:13, GO to C6For DTC P1243:06, GO to C14

No	GO to C13

C2 CHECK THE FUEL INPUT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect Fuel Pump Assembly C433 (DTC P0460:11).

Disconnect Fuel Level Sensor C4374 (DTC P1346:11).

Ignition ON.

Wait one minute.

NOTE: DTC P0460:11 or P1346:11 can also be present when carrying out this step and should be disregarded at this time.

Using a diagnostic scan tool, repeat the IPC on-demand self-test.

Is DTC P0460:13 or P1346:13 present?

Yes	GO to C16

No	GO to C3

C3 CHECK THE FUEL PUMP ASSEMBLY AND FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND AT THE IPC (INSTRUMENT PANEL CLUSTER)

Ignition OFF.

Disconnect IPC C220 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-10 (DTC P0460:11)	Ω	Ground
C220-9 (DTC P1346:11)	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	For DTC P0460:11, GO to C4For DTC P1346:11, GO to C5

No	REPAIR the circuit in question.

C4 CHECK THE FUEL PUMP ASSEMBLY SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER AT THE IPC (INSTRUMENT PANEL CLUSTER)

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-10	Ω	C220-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to C21

No	REPAIR the circuits.

C5 CHECK THE FUEL LEVEL SENSOR SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER AT THE IPC (INSTRUMENT PANEL CLUSTER)

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-9	Ω	C220-1

Is the resistance greater than 10, 000 ohms?

Yes	GO to C21

No	REPAIR the circuits.

C6 CHECK THE FUEL PUMP ASSEMBLY OR FUEL LEVEL SENSOR FOR AN OPEN

Ignition OFF.

Disconnect Fuel Pump Assembly C433 (DTC P0460:13).

Disconnect Fuel Level Sensor C4374 (DTC P1346:13).

Connect a fused jumper wire:

DTC P0460:13

Lead 1	Measurement / Action	Lead 2
C433-1		C433-2

DTC P1346:13

Lead 1	Measurement / Action	Lead 2
C4374-1		C4374-2

Ignition ON.

Wait one minute.

NOTE: DTC P0460:13 or P1346:13 can also be present when carrying out this step and should be disregarded at this time.

Using a diagnostic scan tool, repeat the IPC self-test.

Is DTC P0460:11 or P1346:11 present?

Yes	REMOVE the fused jumper wire. GO to C16

No	REMOVE the fused jumper wire. For DTC P0460:13, GO to C7REMOVE the fused jumper wire. For DTC P1346:13, GO to C10

C7 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE AT THE IPC (INSTRUMENT PANEL CLUSTER)

Ignition OFF.

Disconnect IPC C220 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C220-10		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to C8

C8 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR AN OPEN BETWEEN THE IPC (INSTRUMENT PANEL CLUSTER) AND THE FUEL PUMP ASSEMBLY

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-10	Ω	C433-2

Is the resistance less than 3 ohms?

Yes	GO to C9

No	REPAIR the circuit.

C9 CHECK THE FUEL LEVEL RETURN CIRCUIT FOR AN OPEN BETWEEN THE IPC (INSTRUMENT PANEL CLUSTER) AND THE FUEL PUMP ASSEMBLY

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-2	Ω	C433-1

Is the resistance less than 3 ohms?

Yes	GO to C21

No	REPAIR the circuit.

C10 CHECK THE FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE AT THE IPC (INSTRUMENT PANEL CLUSTER)

Ignition OFF.

Disconnect IPC C220 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-9		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to C11

C11 CHECK THE FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN BETWEEN THE IPC (INSTRUMENT PANEL CLUSTER) AND THE FUEL LEVEL SENSOR

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-9	Ω	C4374-2

Is the resistance less than 3 ohms?

Yes	GO to C12

No	REPAIR the circuit.

C12 CHECK THE FUEL LEVEL SENSOR RETURN CIRCUIT FOR AN OPEN BETWEEN THE IPC (INSTRUMENT PANEL CLUSTER) AND THE FUEL LEVEL SENSOR

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-1	Ω	C4374-1

Is the resistance less than 3 ohms?

Yes	GO to C21

No	REPAIR the circuit.

C13 CARRY OUT THE IPC (INSTRUMENT PANEL CLUSTER) FUEL GAUGE ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Ignition ON.

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC fuel gauge (FUELLEVEL) active command.

Command the fuel gauge from 0% to 25%, 50%, 75% and 100% while observing the fuel gauge.

Does the fuel gauge begin at E (empty), move to approximately 1/4, 1/2, 3/4 and F (full)?

Yes	GO to C14

No	GO to C21

C14 INSPECT THE FUEL TANK

Visually inspect the fuel tank for any damage or deformation.

Is the fuel tank OK?

Yes	GO to C15

No	INSTALL a new fuel tank. Refer to the appropriate article for the procedure.

C15 INSPECT THE FUEL TANK TRANSFER TUBE CONNECTIONS

Remove the fuel pump assembly and the fuel level sensor. Refer to the appropriate article for the procedure.

Inspect the fuel tank transfer tube, connections, the fuel pump assembly and the fuel level sensor for any damage or deformation.

Are the fuel tank transfer tube, connections, the fuel pump assembly and the fuel level sensor OK?

Yes	For DTC P1243:06, INSTALL a new fuel pump module. Refer to the appropriate article for the procedure. For all other concerns, GO to C16

No	INSTALL a new fuel tank transfer tube, fuel pump assembly or fuel level sensor as necessary. Refer to the appropriate article for the procedure.

C16 CHECK THE FUEL PUMP ASSEMBLY AND FUEL LEVEL SENSOR

Disconnect and inspect the fuel pump assembly and fuel level sensor connectors.

Repair:

corrosion (install new connector or terminals-clean module pins)

damaged pins-install new terminals/pins

pushed-out pins-install new pins as necessary

Reconnect the fuel pump assembly and fuel level sensor connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	GO to C17

No	The system is operating correctly at this time. The concern may have been caused by component connections. ADDRESS the root cause of any connector or pin issues.

C17 CHECK THE FUEL PUMP ASSEMBLY AND FUEL LEVEL SENSOR

Remove the fuel pump assembly or fuel level sender. Refer to the appropriate article for the procedure.

NOTE: The fuel resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position.

Measure the resistance between the fuel level sender (float and card) input wire and the fuel level sender (float and card) ground while slowly moving the float arm between the lower and upper stop position.

Fuel Pump Assembly

Positive Lead	Measurement / Action	Negative Lead
Fuel Pump Assembly (Component Side) - Pin 1	Ω	Fuel Pump Assembly (Component Side) - Pin 2

Fuel Level Sensor

Positive Lead	Measurement / Action	Negative Lead
Fuel Level Sensor (Component Side) - Pin 1	Ω	Fuel Level Sensor (Component Side) - Pin 2

Does the resistance slowly decrease from approximately 180 ohms at the lower stop to 10 ohms at the upper stop?

Yes	GO to C19

No	GO to C18

C18 CHECK THE FUEL PUMP ASSEMBLY AND THE FUEL LEVEL SENSOR FOR CORRECT OPERATION

Remove the fuel pump assembly or fuel level sensor. Refer to the article for the procedure.

Disconnect the fuel level sender (float and card) input wire from the fuel pump assembly or fuel level sensor.

NOTE: The fuel resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position.

Measure the resistance between the fuel level sender (float and card) input wire and the fuel level sender (float and card) ground while slowly moving the float arm between the lower and upper stop position.

Positive Lead	Measurement / Action	Negative Lead
Fuel Level Sensor - Pin 1	Ω	Fuel Level Sensor - Pin 2

Does the resistance slowly decrease from approximately 180 ohms at the lower stop to 10 ohms at the upper stop?

Yes	INSTALL a new fuel pump assembly or fuel level sensor. Refer to the appropriate article for the procedure.

No	INSTALL a new fuel level sender (float and card). Refer to the appropriate article for the procedure.

C19 CHECK THE FUEL PUMP ASSEMBLY SIGNAL AND RETURN CIRCUITS FOR HIGH RESISTANCE

Ignition OFF.

Disconnect IPC C220 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C433-1		C433-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-10	Ω	C220-2

Is the resistance less than 3 ohms?

Yes	REMOVE the fused jumper wire. GO to C20

No	REMOVE the fused jumper wire. REPAIR the circuits for high resistance.

C20 CHECK THE FUEL LEVEL SENSOR SIGNAL AND RETURN CIRCUITS FOR HIGH RESISTANCE

Ignition OFF.

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C4374-1		C4374-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-9	Ω	C220-1

Is the resistance less than 3 ohms?

Yes	GO to C21

No	REMOVE the fused jumper wire. REPAIR the circuits for high resistance.

C21 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST D : THE SPEEDOMETER IS INOPERATIVE

Normal Operation and Fault Conditions

See Speedometer. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the vehicle speed message is missing or invalid for 5 seconds or longer, the IPC defaults the speedometer to 0 km/h (0 mph).

Possible Sources

- ABS concern
- PCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST D : THE SPEEDOMETER IS INOPERATIVE > PINPOINT TEST D : THE SPEEDOMETER IS INOPERATIVE

D1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to D2

D2 PERFORM THE ABS (ANTI-LOCK BRAKE SYSTEM) MODULE SELF-TEST

Using a diagnostic scan tool, perform the ABS module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	GO to D3

D3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to D4

D4 PERFORM THE SPEEDOMETER ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC speedometer (SPDOMETER) PID.

Command the speedometer on and off while monitoring the speedometer.

Does the speed begin at 0 km/h (0 mph) move to 257 km/h (160 mph) and return to 0 km/h (0 mph)?

Yes	DIAGNOSE all PCM Diagnostic Trouble Codes (DTCs). Refer to the appropriate article for the procedure.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST E : INCORRECT SPEEDOMETER INDICATION

Normal Operation and Fault Conditions

See Speedometer. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the vehicle speed message is missing or invalid for less than 5 seconds, the IPC defaults the speedometer to the last indication state, based upon the last message received. If the vehicle speed message is missing or invalid for 5 seconds or less, the speedometer can appear to momentarily freeze or appear sluggish or erratic.

Possible Sources

- Tire size configuration
- Axle ratio configuration
- ABS concern
- IPC

Visual Inspection and Diagnostic Pre-checks

Verify the tire size on the vehicle matches the tire size listed on the vehicle certification label. REFER to: Identification Codes .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST E : INCORRECT SPEEDOMETER INDICATION > PINPOINT TEST E : INCORRECT SPEEDOMETER INDICATION

E1 CHECK THE TIRE SIZE CONFIGURATION

Ignition ON.

Using a diagnostic scan tool, view Module Programming for the programmed tire size.

NOTE: The correct tire size can be found on the vehicle certification label.

Verify the size of the tires installed on the vehicle matches the vehicle configuration and the vehicle certification label. REFER to: Identification Codes .

Is the tire size correct and is the tire size correctly configured?

Yes	GO to E2

No	INSTALL the correct size tires or CONFIGURE the correct tire size as required.

E2 CHECK THE AXLE RATIO CONFIGURATION

Ignition ON.

Using a diagnostic scan tool, view Module Programming for the programmed axle ratio.

Verify the axle ratio matches the vehicle configuration. REFER to: Identification Codes .

Is the axle ratio correctly configured?

Yes	GO to E3

No	INSTALL the correct axle or CONFIGURE the axle ratio as required.

E3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to E4

E4 PERFORM THE ABS (ANTI-LOCK BRAKE SYSTEM) MODULE SELF-TEST

Using a diagnostic scan tool, perform the ABS self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	GO to E5

E5 PERFORM THE SPEEDOMETER ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC speedometer (SPDOMETER) PID.

Command the speedometer in 10% increments while monitoring the speedometer. The speed indicated should increase in increments of approximately 26 km/h (16 mph) for each 10% change.

Except SVT

Command	Indication Range
10% (26 km/h [16 mph])	26-27 km/h (16-17 mph)
20% (51 km/h [32 mph])	50-55 km/h (31-34 mph)
30% (77 km/h [48 mph])	76-82 km/h (47-51 mph)
40% (103 km/h [64 mph])	100-109 km/h (62-68 mph)
50% (129 km/h [80 mph])	126-138 km/h (78-86 mph)
60% (154 km/h [96 mph])	150-166 km/h (93-103 mph)
70% (180 km/h [112 mph])	175-193 km/h (109-120 mph)

80% (206 km/h [128 mph])	200-220 km/h (124-137 mph)
90% (232 km/h [144 mph])	225-248 km/h (140-154 mph)
100% (257 km/h [160 mph])	249-275 km/h (155-171 mph)

SVT

Command	Indication Range
10% (32 km/h [20 mph])	31-34 km/h (19-21 mph)
20% (64 km/h [40 mph])	63-69 km/h (39-43 mph)
30% (97 km/h [60 mph])	93-103 km/h (58-64 mph)
40% (129 km/h [80 mph])	126-138 km/h (78-86 mph)
50% (161 km/h [100 mph])	156-172 km/h (97-107 mph)
60% (193 km/h [120 mph])	187-206 km/h (116-128 mph)
70% (225 km/h [140 mph])	219-241 km/h (136-150 mph)
80% (257 km/h [160 mph])	249-275 km/h (155-171 mph)
90% (290 km/h [180 mph])	282-311 km/h (175-193 mph)
100% (322 km/h [200 mph])	312-344 km/h (194-214 mph)

Does the speedometer increase within the specified range?

Yes	GO to E6

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

E6 CHECK THE PCM (POWERTRAIN CONTROL MODULE) VEHICLE SPEED PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the PCM vehicle speed (VSS) PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph).

Does the speedometer indicate between 31-34 km/h (19-21 mph), 63-69 km/h (39-43 mph) and 93-103 km/h (58-64 mph) at the 3 PCM PID values?

Yes	GO to E7

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

E7 OBSERVE THE SPEEDOMETER OPERATION

Observe the speedometer while operating at various speeds and stopping frequently.

Does the speedometer begin at 0 km/h (0 mph) and fully return to the 0 km/h (0 mph) position when the vehicle is stopped?

Yes	The speedometer is operating correctly at this time.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST F : THE ODOMETER IS INOPERATIVE

Normal Operation and Fault Conditions

See Odometer. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the odometer count message is missing or invalid from the GWM for 5 seconds or longer, the IPC defaults the odometer display to all dashes (------).

If the NVM becomes corrupted or if any NVM failure occurs, the odometer displays ERROR.

Possible Sources

- PCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST F : THE ODOMETER IS INOPERATIVE > PINPOINT TEST F : THE ODOMETER IS INOPERATIVE

F1 CHECK FOR CORRUPTED NON-VOLATILE MEMORY (NVM)

Ignition ON.

Observe the message center display area.

Does the odometer display ERROR?

Yes	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	GO to F2

F2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to F3

F3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE all PCM Diagnostic Trouble Codes (DTCs). Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST G : THE TACHOMETER IS INOPERATIVE

Normal Operation and Fault Conditions

See Tachometer. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the IPC does not receive the engine RPM data from the PCM for 5 seconds or longer, the IPC defaults the tachometer to 0 RPM.

Possible Sources

- PCM
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST G : THE TACHOMETER IS INOPERATIVE > PINPOINT TEST G : THE TACHOMETER IS INOPERATIVE

G1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to G2

G2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to G3

G3 PERFORM THE TACHOMETER ACTIVE COMMAND USING THE DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC tachometer (TACH_IND) PID.

NOTE: Make sure to set the diagnostic scan tool to 0 RPM before beginning this step.

Command the tachometer on and off while monitoring the tachometer.

Does the tachometer begin at 0 RPM and increase to approximately 800 RPM (except SVT) or 900 RPM (SVT) and return to 0 RPM?

Yes	DIAGNOSE all PCM Diagnostic Trouble Codes (DTCs). Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) . Refer to the appropriate article for the procedure.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST H : INCORRECT TACHOMETER INDICATION

Normal Operation and Fault Conditions

See Tachometer. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the RPM data is missing or invalid for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last good message received. If the engine RPM message is missing or invalid for 5 seconds or less, the gauge can appear to momentarily freeze or appear sluggish or erratic.

Possible Sources

- PCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST H : INCORRECT TACHOMETER INDICATION > PINPOINT TEST H : INCORRECT TACHOMETER INDICATION

H1 RETRIEVE THE RECORDED DTCS FROM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to H2

H2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to I4

I4 PERFORM THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC temperature gauge (ENGCOOLNT) PID.

> *NOTE: Make sure to set the diagnostic scan tool to 0 or full cold before beginning this step.*

Command the temperature gauge on and off while monitoring the temperature gauge.

Does the temperature gauge start at cold (C), move to full hot (H) and return to cold (C)?

Yes	INSTALL a new GWM. REFER to: Gateway Module A (GWM) . CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If the temperature gauge is still inoperative, INSTALL a new PCM. Refer to the appropriate article for the procedure.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST J : INCORRECT TEMPERATURE GAUGE INDICATION

Normal Operation and Fault Conditions

See Temperature Gauge. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the engine coolant temperature data or engine overheat indication request messages are missing for 5 seconds or less or if the IPC receives invalid engine temperature data for 5 seconds or less, the IPC defaults the temperature gauge to the last setting, based upon the last known good temperature status message.

Possible Sources

- Engine cooling system concern
- PCM input concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST J : INCORRECT TEMPERATURE GAUGE INDICATION > PINPOINT TEST J : INCORRECT TEMPERATURE GAUGE INDICATION

J1 CHECK FOR CORRECT OPERATION OF THE COOLING SYSTEM

Ignition ON.

Verify that the engine cooling system and thermostat are functioning correctly.

Does the engine cooling system and thermostat operate correctly?

Yes	GO to J2

No	Refer to the appropriate article for the procedure.

J2 RETRIEVE THE RECORDED DTCS FROM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to J3

J3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to J4

J4 PERFORM THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC temperature gauge (ENGCOOLNT) PID.

NOTE: Make sure to set the diagnostic scan tool to 0 or full cold before beginning this step.

Command the temperature gauge as follows:

Command	Indication Range
0% (under 38 ° C [100 ° F])	Full cold (C)
15% (60 ° C [140 ° F])	Beginning of the normal range
45% (823 ° C [180 ° F]-110 ° C [230 ° F])	Center of the gauge
85% (120 ° C [248 ° F])	End of the normal range
95% (123 ° C [255 ° F])	Hot (H) (red line)

Does the temperature gauge operate according to the above specifications?

Yes	GO to J5

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

J5 CHECK THE PCM (POWERTRAIN CONTROL MODULE) TEMPERATURE PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the PCM Parameter Identifications (PIDs).

Start the engine.

Select the PCM temperature PID (ECT).

With the engine running and temperature increasing, monitor the PCM temperature PID.

Does the PCM PID agree with the temperature gauge indication?

Yes	The temperature gauge is operating correctly at this time.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST K : THE ENGINE OIL PRESSURE GAUGE IS INOPERATIVE (ICM (INFORMATION CENTER MODULE) GAUGE PACK)

Normal Operation and Fault Conditions

See Engine Oil Pressure Gauge. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the ICM does not receive the oil pressure warning indicator request message from the PCM for less than 5 seconds, the ICM defaults the engine oil pressure gauge to the last display state based upon the last message received.

If the oil pressure warning indicator request message is missing for 5 seconds or longer, the ICM sets

DTC U0100:00 and defaults the engine oil pressure gauge to 0 PSI.

Possible Sources

- Communication concern
- Oil pressure indication concern
- PCM concern
- ICM

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST K : THE ENGINE OIL PRESSURE GAUGE IS INOPERATIVE (ICM (INFORMATION CENTER MODULE) GAUGE PACK) > PINPOINT TEST K : THE ENGINE OIL PRESSURE GAUGE IS INOPERATIVE (ICM (INFORMATION CENTER MODULE) GAUGE PACK)

K1 PERFORM THE ICM (INFORMATION CENTER MODULE) SELF-TEST

Ignition ON.

Ignition OFF.

Disconnect Parking Brake Position Switch C306 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C306-1		C306-2

Ignition ON.

Does the brake warning indicator illuminate?

Yes	REMOVE the fused jumper wire. INSTALL a new parking brake position switch.

No	REMOVE the fused jumper wire. GO to P5

P5 CHECK THE PARKING BRAKE POSITION SWITCH GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C306-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to P6

No	REPAIR the circuit.

P6 CHECK THE PARKING BRAKE WARNING INDICATOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect BCM C2280E .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C306-1	Ω	C2280E-47

Is the resistance less than 3 ohms?

Yes	GO to P8

No	REPAIR the circuit.

NOTE: Verify the brake fluid level is low enough to turn on the brake warning indicator or has been reported low enough to turn on the brake warning indicator.

P7 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION

Ignition OFF.

Disconnect Brake Fluid Level Switch C124 .

Ignition ON.

Wait one minute.

Does the brake warning indicator illuminate?

Yes	If the brake fluid level is currently low or has been reported low, INSTALL a new brake fluid reservoir or master cylinder as required. REFER to: Brake Master Cylinder . If the brake fluid level is not currently low or has not been reported low, the system is operating correctly at this time.

No	GO to P8

P8 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Q : THE BRAKE WARNING INDICATOR IS ALWAYS ON

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See Brake Warning Indicator and ABS/Brake/Stability-Traction Control System Indication descriptions and see Brake Fluid Level Switch component description. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the brake (red) warning indicator request, brake fluid level low message request or parking brake status messages are missing for 5 seconds longer, the IPC defaults the brake warning indicator on.

BCM DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1048:01	Brake Fluid Level Switch: General Electrical Failure	A continuous and on-demand DTC that sets in the BCM when the BCM detects an open on the brake fluid level switch input.
B1048:7B	Brake Fluid Level Switch: Low Fluid Level	An on-demand DTC that sets in the BCM if the BCM detects a low brake fluid level input from the brake fluid level switch.
C1D00:11	Park Brake Apply Switch: Circuit Short To Ground	An on-demand DTC that sets in the BCM if the BCM detects a short to ground on the parking brake input circuit.

Possible Sources

- Wiring, terminals or connectors
- Brake fluid level switch
- Parking brake position switch
- Communication concern
- ABS concern

- BCM
- GWM concern
- IPC

Visual Inspection and Diagnostic Pre-checks

Inspect the:

- brake fluid level and verify it is full.
- parking brake is fully released.
- base brake system and the parking brake system for correct operation.
- brake fluid level switch connection and check for signs of connector terminal damage, corrosion or pushed-out pins.
- brake fluid level switch wiring for signs of a cut or opened circuit.
- brake fluid level switch for signs of any external damage.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Q : THE BRAKE WARNING INDICATOR IS ALWAYS ON > PINPOINT TEST Q : THE BRAKE WARNING INDICATOR IS ALWAYS ON

Q1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to Q2

Q2 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For DTC B1048:01, GO to Q8 For DTC B1048:7B, INSTALL a new brake fluid reservoir or master cylinder as required. REFER to: Brake Master Cylinder . For DTC C1D00:11, GO to Q5 For all other Diagnostic Trouble Codes (DTCs), REFER to: Body Control Module (BCM) .

No	GO to Q3

Q3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to Q4

Q4 PERFORM THE ABS (ANTI-LOCK BRAKE SYSTEM) MODULE SELF-TEST

Using a diagnostic scan tool, perform the ABS module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

Q5 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the BCM parking brake position switch PID.

Monitor the parking brake PID (PARK_BRK_SW) with the parking brake released.

Does the PID agree with the parking brake position?

Yes	GO to Q12

No	GO to Q6

Q6 CHECK THE PARKING BRAKE POSITION SWITCH

Ignition OFF.

Disconnect Parking Brake Position Switch C306 .

Ignition ON.

Using a diagnostic scan tool, view the BCM parking brake position switch Parameter Identifications (PIDs).

Monitor the parking brake PID (PARK_BRK_SW) with the parking brake released.

Does the PID indicate the parking brake is released?

Yes	INSTALL a new parking brake position switch.

No	GO to Q7

Q7 CHECK THE PARKING BRAKE POSITION SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280E .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-47	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to Q12

No	REPAIR the circuit.

Q8 CHECK THE BRAKE FLUID LEVEL SWITCH

Ignition OFF.

Disconnect Brake Fluid Level Switch C124 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C124-1		C124-2

Ignition ON.

Does the brake warning indicator turn on?

Yes	REMOVE the fused jumper wire. INSTALL a new brake fluid reservoir or master cylinder as required. REFER to: Brake Master Cylinder .

No	REMOVE the fuse jumper wire. GO to Q9

Q9 CHECK THE BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT FOR AN OPEN AT THE BRAKE FLUID LEVEL SWITCH

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C124-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to Q10

No	REPAIR the circuit.

Q10 CHECK THE BRAKE FLUID LEVEL SWITCH INPUT CIRCUIT FOR AN OPEN BETWEEN THE BCM (BODY CONTROL MODULE) AND THE BRAKE FLUID LEVEL SWITCH

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280F-28	Ω	C124-1

Is the resistance less than 3 ohms?

Yes	GO to Q11

No	REPAIR the circuit.

Q11 CHECK THE BRAKE FLUID LEVEL SWITCH FOR SHORT TO GROUND AT THE BRAKE FLUID LEVEL SWITCH

Measure:

Positive Lead	Measurement / Action	Negative Lead
C124-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to Q12

No	REPAIR the circuit.

Q12 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST R : THE LED (LIGHT EMITTING DIODE) LOW BEAM MALFUNCTION INDICATOR IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See LED Low Beam Malfunction Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the headlamp low beam out message is missing for less than 5 seconds, the IPC defaults the LED low beam malfunction indicator to its last indication state (on or off), based upon the last message received.

If the headlamp low beam out message is missing for 5 seconds or longer, the IPC defaults the LED low beam malfunction indicator off.

Possible Sources

- Low beam lighting concern
- Communication concern
- BCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST R : THE LED (LIGHT EMITTING DIODE) LOW BEAM MALFUNCTION INDICATOR IS NEVER OR ALWAYS ON > PINPOINT TEST R : THE LED (LIGHT EMITTING DIODE) LOW BEAM MALFUNCTION INDICATOR IS NEVER OR ALWAYS ON

R1 DETERMINE THE FAULT CONDITION

Ignition ON.

Check the operation of the low beam headlamps.

Do the low beam headlamps operate correctly?

Yes	GO to R2

No	REFER to: Headlamps .

R2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to R3

R3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to R4

R4 CHECK THE LED (LIGHT EMITTING DIODE) LOW BEAM MALFUNCTION INDICATOR OPERATION USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC LED low beam malfunction indicator (A_F_LIGHT_F) PID.

Command the LED low beam malfunction indicator on then off. Observe the LED low beam malfunction indicator.

Does the LED low beam malfunction indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST S : THE LH (LEFT-HAND) - RH (RIGHT-HAND) TURN SIGNAL, FRONT FOG LAMP OR HIGH BEAM INDICATOR IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See LH- RH Turn Signal Indicator, Front Fog Lamp Indicator Or High Beam Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the turn indication data, fog lamp indicator or high beam status message is missing for less than 5 seconds, the IPC defaults the turn signal, fog lamp or high beam indicator to its last indication state (on or off), based upon the last message received.

If the turn indication data, fog lamp indicator or high beam status message is missing for 5 seconds or longer, the IPC defaults the turn signal, fog lamp or high beam indicator off.

Possible Sources

- Turn signal concern
- Front Fog lamp concern
- High beam concern
- Communication concern
- BCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST S : THE LH (LEFT-HAND) - RH (RIGHT-HAND) TURN SIGNAL, FRONT FOG LAMP OR HIGH BEAM INDICATOR IS NEVER OR ALWAYS ON > PINPOINT TEST S : THE LH (LEFT-HAND) - RH

(RIGHT-HAND) TURN SIGNAL, FRONT FOG LAMP OR HIGH BEAM INDICATOR IS NEVER OR ALWAYS ON

S1 DETERMINE THE FAULT CONDITION

Ignition ON.

Check the operation of the high beams, front fog lamps or turn signals.

Do the high beams, front fog lamps or turn signals operate correctly?

Yes	GO to S2

No	For front fog lamps, REFER to: Fog Lamps , REFER to: Headlamps , REFER to: Turn Signal and Hazard Lamps .

S2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to S3

S3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	For the front fog lamp indicator, GO to S4 For the high beam indicator, GO to S5 For the LH or RH turn indicator, GO to S6

S4 CHECK THE FRONT FOG LAMP INDICATOR OPERATION USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC front fog lamp indicator (F_FOG_IND) PID.

Does the front fog lamp indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

S5 CHECK THE HIGH BEAM INDICATOR OPERATION USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC high beam indicator (HIGH_BEAM) PID.

Command the high beam indicator on and off while observing the high beam indicator.

Does the high beam indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

S6 CHECK THE LH (LEFT-HAND) AND RH (RIGHT-HAND) TURN INDICATOR OPERATION USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC RH (RH_TURN_L) or LH (LH_TURN_L) turn signal indicator PID.

Command the RH or LH turn signal indicator on and off while observing the RH or LH turn signal indicator.

Does the RH or LH turn signal indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST T : THE LIGHTS ON INDICATOR IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Lights On Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the park lamp status message is missing for less than 5 seconds, the IPC defaults the lights on indicator to its last indication state (on or off), based upon the last message received.

If the park lamp status message is missing for 5 seconds or longer, the IPC defaults the lights on indicator off.

Possible Sources

- Exterior lighting concern
- Communication concern
- BCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST T : THE LIGHTS ON INDICATOR IS NEVER OR ALWAYS ON > PINPOINT TEST T : THE LIGHTS ON INDICATOR IS NEVER OR ALWAYS ON

T1 CHECK THE PARKING LAMPS OPERATION

Place the headlamp switch in the PARKLAMP position.

Ignition ON.

Observe the parking lamps.

Do the parking lights operate correctly?

Yes	GO to T2

No	REFER to: Parking, Rear and License Plate Lamps .

T2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to T3

T3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to T4

T4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC lights on indicator (SIDELIGHT_LMP) PID.

Command the lights on indicator on and off while observing the indicator.

Does the lights on indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST U : THE MIL (MALFUNCTION INDICATOR LAMP) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See MIL. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the MIL request message is missing or invalid for less than 5 seconds, the IPC defaults the MIL to its last state (on or off) based upon the last known good message received.

If the MIL request message is missing for 5 seconds or longer, the IPC defaults the MIL on.

Possible Sources

- Communication concern
- GWM concern
- PCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST U : THE MIL (MALFUNCTION INDICATOR LAMP) IS NEVER OR ALWAYS ON > PINPOINT TEST U : THE MIL (MALFUNCTION INDICATOR LAMP) IS NEVER OR ALWAYS ON

U1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to U2

U2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to U3

U3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC (MIL) PID.

Command the MIL on and off while observing the indicator.

Does the MIL illuminate when commanded on and turn off when commanded off?

Yes	If the MIL is always on, DIAGNOSE all PCM Diagnostic Trouble Codes (DTCs). Refer to the appropriate article for the procedure. If the MIL is never on, the system is operating correctly at this time.

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST V : THE PRNDL INDICATOR IS NEVER ON OR NEVER DISPLAYS P

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See PRNDL Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the transmission gear display or transmission shift mode display message is missing for less than 5 seconds, the PRNDL display remains in the last indication state (selected gear displayed), based upon the last message received.

If the transmission gear display or transmission shift mode display message is missing for 5 seconds or longer, the IPC defaults the PRNDL display off.

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P1706:00	High Vehicle Speed Observed in Park: No Sub Type Information	A continuous and on-demand DTC that sets in the IPC if the IPC detects a park detect input with vehicle speed over 16 km/h (10 mph), indicating the vehicle is in park while in motion.

Possible Sources

- Wiring, terminals or connectors
- Communication concern
- Park detect switch (part of the selector lever)
- Transmission concern
- BCM
- GWM concern
- IPC

Visual Inspection And Diagnostic Pre-checks

Verify the vehicle is not in transport mode.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST V : THE PRNDL INDICATOR IS NEVER ON OR NEVER DISPLAYS P > PINPOINT TEST V : THE PRNDL INDICATOR

IS NEVER ON OR NEVER DISPLAYS P

V1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any DTCs recorded?

Yes	For DTC P1706:00, GO to V5 For all other Diagnostic Trouble Codes (DTCs), REFER to DTC Chart: IPC .

No	GO to V2

V2 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any DTCs recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to V3

V3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to V4

V4 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Are any transmission related DTCs recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to V7

V5 CHECK THE PARK DETECT SWITCH CONTROL CIRCUIT FOR A SHORT TO VOLTAGE AT

THE IPC (INSTRUMENT PANEL CLUSTER)

Ignition OFF.

Disconnect IPC C220 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-4		Ground

Is any voltage present?

Yes	GO to V6

No	GO to V7

V6 CHECK THE SELECTOR LEVER FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Selector Lever C3245 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-4		Ground

Is any voltage present?

Yes	INSTALL a new selector lever. REFER to: Selector Lever Assembly .

No	REPAIR the circuit.

V7 BYPASS THE SELECTOR LEVER AND CHECK THE PARK DETECT INPUT TO THE IPC (INSTRUMENT PANEL CLUSTER)

Ignition OFF.

Disconnect Selector Lever C3245 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2

C3245-1		Ground

Ignition ON.

Monitor the PRNDL indicator with the fused jumper wire installed and with the fused jumper wire removed.

Does the PRNDL display P with the fused jumper wire removed and blank with the fused jumper wire connected?

Yes	REMOVE the fused jumper wire. INSTALL a new selector lever. REFER to: Selector Lever Assembly .

No	REMOVE the fused jumper wire. GO to V8

V8 CHECK THE SELECTOR LEVER INPUT CIRCUIT FOR AN OPEN BETWEEN THE IPC (INSTRUMENT PANEL CLUSTER) AND THE SELECTOR LEVER

Ignition OFF.

Disconnect IPC C220 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-4	Ω	C3245-1

Is the resistance less than 3 ohms?

Yes	GO to V9

No	REPAIR the circuit.

V9 CHECK THE SELECTOR LEVER INPUT CIRCUIT FOR A SHORT TO GROUND AT THE IPC (INSTRUMENT PANEL CLUSTER)

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-4	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to V10

No	REPAIR the circuit.

V10 CHECK THE SELECTOR LEVER GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to V11

No	REPAIR the circuit.

V11 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect the IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST W : THE REAR FOG LAMP INDICATOR IS NEVER OR ALWAYS ON (IF EQUIPPED)

Normal Operation and Fault Conditions

See Rear Fog Lamp Indicator. REFER to: Fog Lamps .

If the rear fog lamp indicator request is missing for less than 5 seconds, the IPC defaults the rear fog lamps indicator to its last indication state (on or off), based upon the last message received.

If the rear fog lamp indicator request is missing for 5 seconds or longer, the IPC defaults the rear fog lamps indicator off.

Possible Sources

- Rear fog lamp concern
- Communication concern
- GWM concern
- BCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST W : THE REAR FOG LAMP INDICATOR IS NEVER OR ALWAYS ON (IF EQUIPPED) > PINPOINT TEST W : THE REAR FOG LAMP INDICATOR IS NEVER OR ALWAYS ON (IF EQUIPPED)

W1 CHECK THE REAR FOG LAMPS OPERATION

Turn the rear fog lamps on.

Ignition ON.

Observe the rear fog lamps when on then when turned off.

Do the rear fog lamps operate correctly when turned on and off?

Yes	GO to W2

No	REFER to: Fog Lamps .

W2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to W3

W3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to W4

W4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC rear fog lamp indicator (R_FOG_IND) PID.

Command the rear fog lamp indicator on and off while observing the indicator.

Does the rear fog lamp indicator illuminate when commanded on and turn off when commanded off?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST X : THE SAFETY BELT WARNING INDICATOR IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Safety Belt Warning Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the driver safety belt buckle status is missing for less than 5 seconds, the IPC defaults the safety belt warning indicator to its last indication state (on or off), based upon the last message received.

If the driver safety belt buckle status message is missing for 5 seconds or longer, the IPC defaults the safety belt warning indicator off.

Possible Sources

- Driver safety belt buckle concern
- Communication concern
- GWM concern
- SRS concern

- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST X : THE SAFETY BELT WARNING INDICATOR IS NEVER OR ALWAYS ON > PINPOINT TEST X : THE SAFETY BELT WARNING INDICATOR IS NEVER OR ALWAYS ON

X1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to X2

X2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to X3

X3 CHECK THE DRIVER SAFETY BELT BUCKLE STATUS

Using a diagnostic scan tool, monitor the RCM driver safety belt buckle PID (SBELT_D_ST) while buckling and unbuckling the driver safety belt.

Does the PID display BUCKLED with the safety belt buckled and UNBUCKLED with the safety belt unbuckled?

Yes	GO to X4

No	INSTALL a new safety belt buckle. REFER to: Front Seatbelt Buckle .

X4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC safety belt warning indicator (SBLT_LAMP) PID.

Command the safety belt warning indicator on and off while observing the safety belt warning indicator.

Does the safety belt warning indicator illuminate when commanded on and turn off when commanded off?

Yes	INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Y : THE STABILITY-TRACTION CONTROL INDICATOR (SLIDING CAR ICON) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Stability-Traction Control Indicator (Sliding Car Icon). REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the stability-traction control indicator request is missing or invalid for less than 5 seconds, the IPC defaults the stability-traction control indicator (sliding car icon) to the last indication state (on or off), based upon the last message received.

If the IPC does not receive the stability-traction control indicator request for 5 seconds or longer, the IPC defaults the stability-traction control indicator (sliding car icon) on.

Possible Sources

- Communication concern
- Stability-traction control system concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Y : THE STABILITY-TRACTION CONTROL INDICATOR (SLIDING CAR ICON) IS NEVER OR ALWAYS ON > PINPOINT TEST Y : THE STABILITY-TRACTION CONTROL INDICATOR (SLIDING CAR ICON) IS NEVER OR ALWAYS ON

Y1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to Y2

Y2 PERFORM THE ABS (ANTI-LOCK BRAKE SYSTEM) MODULE SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the ABS module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	GO to Y3

Y3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to Y4

Y4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC stability-traction control indicator (TC/IVD/RSCLMP) PID.

Command the stability-traction control indicator (sliding car icon) on and off while observing the stability-traction control indicator (sliding car icon).

Does the stability-traction control indicator (sliding car icon) illuminate when commanded on and turn off when commanded off?

Yes	If the stability-traction control indicator (sliding car icon) is never on, the system is operating correctly. If the stability-traction control indicator (sliding car icon) is always on, INSTALL a new ABS module. REFER to: Anti-Lock Brake System (ABS) Module .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Z : THE STABILITY-TRACTION CONTROL DISABLED INDICATOR (SLIDING CAR OFF ICON) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Stability-Traction Control Disabled Indicator (Sliding Car OFF Icon). REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the stability-traction control mode indicator request is missing or invalid for less than 5 seconds, the IPC defaults the stability-traction control disabled indicator (sliding car OFF icon) to the last indication state (on or off), based upon the last message received.

If the IPC does not receive the stability-traction control mode indicator request for 5 seconds or longer, the IPC defaults the stability-traction control disabled indicator (sliding car OFF icon) off.

When a MyKey ® programmed key is in use and the AdvanceTrac ® on feature is configured always on, the traction control system cannot be disabled and the traction control indicator does not turn on when the traction control disable button is pressed. The traction control indicator still functions correctly to indicate a traction control system fault and a traction control active event.

Possible Sources

- MyKey ® programmed key in use
- Stability-traction control system concern
- Stability-traction control system cannot be disabled
- Communication concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST Z : THE STABILITY-TRACTION CONTROL DISABLED INDICATOR (SLIDING CAR OFF ICON) IS NEVER OR ALWAYS ON > PINPOINT TEST Z : THE STABILITY-TRACTION CONTROL DISABLED INDICATOR (SLIDING CAR OFF ICON) IS NEVER OR ALWAYS ON

Z1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to Z2

Z2 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to Z3

Z3 CHECK FOR THE KEY TYPE

Check if the key is a MyKey ® programmed key or an administrator key. Refer to the Owner's Literature.

Is the key an administrator key?

Yes	GO to Z4

No	GO to Z5

Z4 CHECK FOR THE ADVANCETRAC ® ON FEATURE CONFIGURED ALWAYS ON

Check if the AdvanceTrac ® feature is configured always on. Refer to the Owner's Literature.

Is the AdvanceTrac ® feature configured always on?

Yes	The traction control system cannot be disabled when the AdvanceTrac ® on feature is configured always on.

No	GO to Z5

Z5 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC stability-traction control disabled indicator (sliding car OFF icon) (STAB_TC_LMP) PID.

Command the stability-traction control disabled indicator (sliding car OFF icon) on and off while observing the stability-traction control disabled indicator (sliding car OFF icon).

Does the stability-traction control disabled indicator (sliding car OFF icon) illuminate when commanded on and turn off when commanded off?

Yes	GO to Z6

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

Z6 CHECK THE TRACTION CONTROL SETTING THROUGH THE MESSAGE CENTER

Using the LH steering wheel switch and an administrator key, navigate to the traction control setting menu and observe the traction control setting.

Configure the stability-traction control on then off again.

Does the traction control selection change when the feature is configured on and off?

Yes	The system is operating correctly at this time.

No	DIAGNOSE the stability-traction control cannot be disabled. REFER to: Anti-Lock Brake System (ABS) and Stability Control .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AA : THE TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See TPMS Indicator. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

If the tire pressure warning indicator message is missing for 5 seconds or less, the TPMS warning indicator remains in its last indication state (on or off), based upon the last message received.

If the tire pressure warning indicator message is missing for 5 seconds or longer, the IPC flashes the TPMS warning indicator for approximately 75 seconds, then illuminates the TPMS warning indicator.

Possible Sources

- Low tire pressure
- Communication concern
- TPMS concern
- GWM concern

- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AA : THE TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS NEVER OR ALWAYS ON > PINPOINT TEST AA : THE TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS NEVER OR ALWAYS ON

AA1 CHECK THE TIRE PRESSURE

Verify the tire pressure in all tires meets the recommended tire pressures on the vehicle certification label. REFER to: Identification Codes .

Do all the tires meet the recommended tire pressures?

Yes	GO to AA2

No	CORRECT the tire pressures.

AA2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AA3

AA3 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any DTCs recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to AA4

AA4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AA5

AA5 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) INDICATOR LAMP CONTROL ACTIVE COMMAND USING A DIAGNOSTIC SCAN TOOL

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC TPMS warning indicator (TPMWARN_LMP) PID.

Command the TPMS warning indicator on and off while observing the TPMS warning indicator.

Does the TPMS warning indicator illuminate when commanded on and turn off when commanded off?

Yes	If the TPMS warning indicator is never on, the system is operating correctly. If the TPMS warning indicator is always on, DIAGNOSE the TPMS. REFER to: Tire Pressure Monitoring System (TPMS) .

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AB : THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See Steering Wheel Switch-Message Center (in Component Description). REFER to: Message Center - System Operation and Component Description .

SCCM DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B137F:09	Steering Wheel Left Switch Pack: Component Failure	A continuous and on-demand DTC that sets in the SCCM when the SCCM detects a message center switch pressed for 2 minutes or longer.
B137F:11	Steering Wheel Left Switch Pack: Circuit Short To Ground	A continuous and on-demand DTC that sets in the SCCM when the SCCM detects a short to ground on the message center switch input circuit.

B137F:17	Steering Wheel Left Switch Pack: Circuit Voltage Above Threshold	A continuous and on-demand DTC that sets in the SCCM when the SCCM detects an open or short to voltage on the message center switch input circuit.

Possible Sources

- Wiring, terminals or connectors
- Clockspring
- Message center switch (part of the LH steering wheel switch)
- SCCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AB : THE MESSAGE CENTER IS NOT OPERATING CORRECTLY > PINPOINT TEST AB : THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

AB1 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AB2

AB2 PERFORM THE SCCM (STEERING COLUMN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the SCCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For DTC B137F:09, INSTALL a new LH steering wheel switch. REFER to: Steering Wheel Multifunction Switch . For DTC B137F:11, GO to AB5 For DTC B137F:17, GO to AB8

No	GO to AB3

AB3 CHECK THE STEERING WHEEL SWITCH INPUT TO THE SCCM (STEERING COLUMN CONTROL MODULE)

Using a diagnostic scan tool, view the SCCM Parameter Identifications (PIDs).

Select the LH steering wheel switch Parameter Identifications (PIDs) (L_CURS_LFT, L_CURS_RGT, L_CURS_UP, L_CURS_DWN and L_CURS_OK).

Do the Parameter Identifications (PIDs) match the switch positions?

Yes	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	GO to AB4

AB4 CHECK THE SCCM (STEERING COLUMN CONTROL MODULE) OUTPUT AT THE LH (LEFT-HAND) STEERING WHEEL SWITCH

Ignition OFF.

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect LH Steering Wheel Switch C2998 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2998-2		C2998-3

Is the voltage approximately 5 volts?

Yes	INSTALL a new LH steering wheel switch. REFER to: Steering Wheel Multifunction Switch .

No	GO to AB13

AB5 CHECK THE MESSAGE CENTER SWITCH FOR A SHORT TO GROUND

Ignition OFF.

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect LH Steering Wheel Switch C2998 .

Ignition ON.

Using a diagnostic scan tool, perform the SCCM self-test.

Is DTC B137F:17 recorded?

Yes	INSTALL a new LH steering wheel switch. REFER to: Steering Wheel Multifunction Switch .

No	GO to AB6

AB6 CHECK THE STEERING WHEEL SWITCH HARNESS FOR A SHORT TO GROUND

Ignition OFF.

Disconnect Upper Clockspring C218B .

Ignition ON.

Using a diagnostic scan tool, perform the SCCM self-test.

Is DTC B137F:17 recorded?

Yes	INSTALL a new steering wheel. REFER to: Steering Wheel .

No	GO to AB7

AB7 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND

Ignition OFF.

Remove clockspring from the SCCM.

Ignition ON.

Using a diagnostic scan tool, perform the SCCM self-test.

Is DTC B137F:17 recorded?

Yes	INSTALL a new clockspring. REFER to: Clockspring .

No	GO to AB13

AB8 CHECK THE MESSAGE CENTER SWITCH FOR AN OPEN

Ignition OFF.

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect LH Steering Wheel Switch C2998 .

Ignition ON.

NOTE: If the fused jumper wire fails, repair the signal circuit for a short to voltage.

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C2998-2		Ground

Ignition ON.

Using a diagnostic scan tool, perform the SCCM self-test.

Is DTC B137F:11 recorded?

Yes	REMOVE the fused jumper wire. INSTALL a new LH steering wheel switch. REFER to: Steering Wheel Multifunction Switch .

No	REMOVE the fused jumper wire. GO to AB9

AB9 CHECK THE STEERING WHEEL HARNESS MESSAGE CENTER SWITCH SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect Clockspring C218B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2998-2	Ω	C218B-14

Is the resistance less than 3 ohms?

Yes	GO to AB10

No	INSTALL a new steering wheel. REFER to: Steering Wheel .

AB10 CHECK THE STEERING WHEEL HARNESS MESSAGE CENTER SWITCH RETURN CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2998-3	Ω	C218B-8

Is the resistance less than 3 ohms?

Yes	GO to AB11

No	INSTALL a new steering wheel. REFER to: Steering Wheel .

AB11 CHECK THE MESSAGE CENTER SWITCH SIGNAL CIRCUIT THROUGH THE CLOCKSPRING FOR AN OPEN

Remove clockspring from the SCCM.

Measure:

Positive Lead	Measurement / Action	Negative Lead
Upper Clockspring (Component Side) - Pin 14	Ω	Lower Clockspring (Component Side) - Pin 6

Is the resistance less than 3 ohms?

Yes	GO to AB12

No	INSTALL a new clockspring. REFER to: Clockspring .

AB12 CHECK THE MESSAGE CENTER SWITCH RETURN CIRCUIT THROUGH THE CLOCKSPRING FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
Upper Clockspring (Component Side) - Pin 8	Ω	Lower Clockspring (Component Side) - Pin 9

Is the resistance less than 3 ohms?

Yes	GO to AB13

No	INSTALL a new clockspring. REFER to: Clockspring .

AB13 CHECK FOR CORRECT SCCM (STEERING COLUMN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all the SCCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the SCCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK On-Line Automotive Service Information System (OASIS) for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AC : THE COMPASS IS INOPERATIVE

Normal Operation and Fault Conditions

See Compass Display. REFER to: Message Center - System Operation and Component Description .

If the GPS compass direction message is missing or invalid for 5 seconds or less, the compass displays the last vehicle direction based upon the last known good compass display message received.

If the GPS compass direction message is missing for more than 5 seconds, the IPC defaults the display to all dashes (---).

Possible Sources

- Communication concern
- GPSM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AC : THE COMPASS IS INOPERATIVE > PINPOINT TEST AC : THE COMPASS IS INOPERATIVE

AC1 PERFORM THE GPSM (GLOBAL POSITIONING SYSTEM MODULE) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the GPSM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to AC2

AC2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	INSTALL a new GPSM. Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AD : INCORRECT OR FLUCTUATING DTE (DISTANCE TO EMPTY) DISPLAY

Normal Operation and Fault Conditions

See DTE Display. REFER to: Message Center - System Operation and Component Description .

Possible Sources

- Fuel gauge concern
- Changes in driving conditions, such as:
  - extended idle times
  - parking on grades
  - alcohol in the fuel
  - refueling patterns
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AD : INCORRECT OR FLUCTUATING DTE (DISTANCE TO EMPTY) DISPLAY > PINPOINT TEST AD : INCORRECT OR FLUCTUATING DTE (DISTANCE TO EMPTY) DISPLAY

NOTE: Make sure to record the Running Average Fuel Economy (RAFE) prior to disconnecting the battery, removing the IPC or BCM fuse 13 (7.5A). If any of the previous conditions occur, the vehicle must be driven over time to allow the DTE calculations to adjust.

AD1 REVIEW AND INVESTIGATE THE FOLLOWING DRIVING CONDITIONS WITH THE CUSTOMER

Determine whether the driver changes the following driving conditions:

Use of extended idle times Use of remote start frequently Park/drive on grades Use E85 fuel exclusively or switch to non- Ethanol fuel Over fueling of the fuel tank Not filling the tank completely (partial refueling)

Does the driver change driving conditions?

Yes	Advise the customer how changing driving conditions can affect the current DTE as opposed to the DTE displayed.

No	GO to AD2

AD2 CHECK THE FUEL GAUGE FOR CORRECT OPERATION

Ignition ON.

NOTE: If necessary interview the customer to find out if there are any fuel gauge indication concerns.

Verify the fuel gauge is functioning and correctly indicating the fuel level.

Is the fuel gauge operating correctly?

Yes	GO to AD3

No	GO to Pinpoint Test C

AD3 COMPARE THE DISPLAYED DTE (DISTANCE TO EMPTY) WITH THE IPC (INSTRUMENT PANEL CLUSTER) INPUTS

NOTE: The Vehicle Identification Number (VIN) must be entered to enable the OASIS tab. Navigate to PTS> OASIS> HvBOM> Window Sticker to find the fuel tank the vehicle was built with.

Locate and record the fuel tank capacity (example: 28 gallons) using the as-built record.

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Select the IPC fuel gauge (FUELLEVEL) active command.

Record the current fuel level percent displayed.

Select the IPC DTE (DIST_2_EMPTY) PID.

Record the instantaneous DTE.

Determine the current DTE.

Multiply the fuel tank capacity by the fuel percent to determine how many gallons of fuel remain in the tank (example: 28 gallons X 50% [.50] = 14 gallons of remaining fuel). Multiply the calculated fuel remaining in the tank by the instantaneous DTE (example: 14 gallons X 20 MPG = 448 km (280 miles) DTE).

Compare the DTE displayed in the message center with the calculated DTE.

Does the current DTE match the displayed DTE?

Yes	The system is operating correctly. REVIEW with the customer the system operation and the conditions that may affect DTE.

No	The vehicle configuration is most likely incorrect for the fuel tank size. INSTALL As-Built data from Professional Technician Society (PTS) following diagnostic scan tool instructions under Module Programming>As-Built.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AE : THE HUD (HEAD UP DISPLAY) PERFORMANCE SHIFT INDICATION IS NEVER ON (SVT ONLY)

Normal Operation and Fault Conditions

See HUD Performance Shift Indication. REFER to: Message Center - System Operation and Component Description .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AE : THE HUD (HEAD UP DISPLAY) PERFORMANCE SHIFT INDICATION IS NEVER ON (SVT ONLY) > PINPOINT TEST AE : THE HUD (HEAD UP DISPLAY) PERFORMANCE SHIFT INDICATION IS NEVER ON (SVT ONLY)

AE1 VERIFY THE PERFORMANCE SHIFT INDICATION FUNCTION IS TURNED ON

NOTE: The IPC and message center navigation can be found in the Owner's Literature.

Using the message center switch, verify through the message center the performance shift indication function is turned on.

Is the performance shift indication function turned on?

Yes	GO to AE2

No	Turn on the performance shift indication function.

AE2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AE3

AE3 PERFORM THE HUD (HEAD UP DISPLAY) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the HUD self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	DIAGNOSE the HUD Diagnostic Trouble Codes (DTCs). REFER to: Collision Warning and Collision Avoidance System .

No	GO to AE4

AE4 RETRIEVE THE RECORDED DTCS FROM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the PCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to AE5

AE5 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	INSTALL a new HUD. REFER to: Head Up Display (HUD) Module .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AF : THE BLIND SPOT INFORMATION SYSTEM (BLIS ®) OFF RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Blind Spot Monitoring System (BLIS ®) Off RTT. REFER to: Message Center - System Operation and Component Description .

If the side obstacle detect status-left or side obstacle detect status-right message is missing or invalid for less than 5 seconds, the IPC defaults the Blind Spot Information System (BLIS) off RTT to the last state (on or off), based upon the last message received.

If the side obstacle detect status-left or side obstacle detect status-right message is missing or invalid for 5 seconds or longer, the IPC defaults the Blind Spot Information System (BLIS) off RTT off.

Possible Sources

- Communication concern
- GWM concern
- SODL concern
- SODR concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AF : THE BLIND SPOT INFORMATION SYSTEM (BLIS ®) OFF RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AF : THE BLIND SPOT INFORMATION SYSTEM (BLIS ®) OFF RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AF1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AF2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AF2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AF3

AF3 PERFORM THE SODL (SIDE OBSTACLE DETECTION CONTROL MODULE LH) AND SODR (SIDE OBSTACLE DETECTION CONTROL MODULE RH) SELF-TESTS

Using a diagnostic scan tool, perform the SODL and SODR self-tests.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Blind Spot Information System .

No	GO to AF4

AF4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE the Blind Spot Information System (BLIS). REFER to: Blind Spot Information System .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AG : THE CHARGING SYSTEM RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Charging System RTT. REFER to: Message Center - System Operation and Component Description .

If the battery low state of charge message is missing for less than 5 seconds, the IPC defaults the charging system RTT to the last indication state (on or off), based upon on the last message received.

If the battery low state of charge message is missing for 5 seconds or longer, the IPC defaults the charging system RTT on.

Possible Sources

- Charging system concern
- Communication concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AG : THE CHARGING SYSTEM RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AG : THE CHARGING SYSTEM RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AG1 CHECK THE MESSAGE CENTER OPERATION

Ignition OFF.

Remove BJB fuse 64 (5A).

Ignition ON.

Monitor the message center display.

Does the message center display the power steering malfunction warning?

Yes	GO to AG2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AG2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AG3

AG3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AG4

AG4 CHECK THE CHARGING SYSTEM OPERATION

Check the charging system operation.

Does the charging system operate correctly?

Yes	If the charging system RTT is never on, the system is operating correctly at this time. If the charging system RTT is always on, DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AH : THE CRUISE CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON

Normal Operation and Fault Conditions

See Cruise Control RTT. REFER to: Message Center - System Operation and Component Description .

If the cruise control status, cruise control override (adaptive cruise) or cruise control set speed display (adaptive cruise) message is missing or deemed invalid by the IPC for less than 5 seconds, the IPC defaults the cruise control indicator to the last indication state (on or off), based upon the last message received.

If the cruise control status, cruise control override (adaptive cruise) or cruise control set speed display

(adaptive cruise) message is missing or if the data is deemed invalid by the IPC for 5 seconds or longer, the IPC defaults the cruise control indicator off.

Possible Sources

- Communication concern
- Cruise control concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AH : THE CRUISE CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON > PINPOINT TEST AH : THE CRUISE CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON

AH1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AH2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AH2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AH3

AH3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE the cruise control system. REFER to: Cruise Control . With adaptive cruise control, REFER to: Cruise Control .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AI : THE DOOR OR LUGGAGE COMPARTMENT LID AJAR RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Refer to Interior Lamps for schematic and connector information.

Normal Operation and Fault Conditions

See Door Ajar RTT. REFER to: Message Center - System Operation and Component Description .

If the driver door ajar status, passenger door ajar status or luggage compartment lid ajar messages are missing for less than 5 seconds, the IPC defaults all door and luggage compartment lid ajar message center displays to the last indication state (on or off), based upon the last message received.

If the driver door ajar status, passenger door ajar status or luggage compartment lid ajar messages are missing for 5 seconds or longer, the IPC defaults all door and luggage compartment lid ajar message center displays off.

BCM DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1178:01	Boot/Trunk Ajar Switch: General Electrical Failure	An on-demand DTC that sets in the BCM if the BCM detects an open on the luggage compartment lid ajar input.

Possible Sources

- Wiring, terminals or connectors
- Interior lighting concern
- Luggage compartment lid latch ajar switch (part of the luggage compartment lid latch)
- Communication concern

- BCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AI : THE DOOR OR LUGGAGE COMPARTMENT LID AJAR RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AI : THE DOOR OR LUGGAGE COMPARTMENT LID AJAR RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AI1 CHECK THE MESSAGE CENTER OPERATION

Ignition OFF.

Disconnect GWM C2431 .

Ignition ON.

Monitor the message center messages and RTT indicators.

Did multiple message center messages and RTT indicators appear?

Yes	GO to AI2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AI2 CHECK THE INTERIOR LIGHTING OPERATION

Open and close each door while monitoring the interior lamps.

Do the interior lamps operate correctly with each door?

Yes	GO to AI3

No	REFER to: Interior Lighting .

AI3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AI4

AI4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AI5

AI5 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For DTC B1178:01, GO to AI6 For all other Diagnostic Trouble Codes (DTCs), REFER to: Body Control Module (BCM) .

No	For a door ajar indication concern, For the luggage compartment lid ajar indication, GO to AI6 For the hood ajar indication never on, DIAGNOSE the perimeter alarm does not arm from the hood ajar switch. REFER to: Perimeter Anti-Theft Alarm .

AI6 CHECK THE LUGGAGE COMPARTMENT LID AJAR INPUT CIRCUIT FOR AN OPEN AT THE BCM (BODY CONTROL MODULE)

Ignition OFF.

Disconnect BCM C2280E .

NOTE: Make sure the luggage compartment lid is fully closed before proceeding with this test step.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-34	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to AI10

No	GO to AI7

AI7 BYPASS THE LUGGAGE COMPARTMENT LID AJAR SWITCH AND CHECK FOR OPEN AT THE BCM (BODY CONTROL MODULE)

Disconnect Luggage Compartment Lid Latch C4339 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C4339-1		C4339-4

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-34	Ω	Ground

Is the resistance less than 3 ohms?

Yes	REMOVE the fused jumper wire. INSTALL a new luggage compartment latch. REFER to: Luggage Compartment Lid Latch - Coupe .

No	REMOVE the fused jumper wire. GO to AI8

AI8 CHECK THE LUGGAGE COMPARTMENT LID LATCH GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4339-4	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to AI9

No	REPAIR the circuit.

AI9 CHECK THE LUGGAGE COMPARTMENT AJAR INPUT CIRCUIT FOR AN OPEN BETWEEN THE BCM (BODY CONTROL MODULE) AND THE LUGGAGE COMPARTMENT LID LATCH

Measure:

Positive Lead	Measurement / Action	Negative Lead

C2280E-34	Ω	C4339-1

Is the resistance less than 3 ohms?

Yes	GO to AI12

No	REPAIR the circuit.

AI10 CHECK THE LUGGAGE COMPARTMENT AJAR INPUT CIRCUIT FOR A SHORT TO GROUND AT THE BCM (BODY CONTROL MODULE)

Ignition OFF.

Disconnect BCM C2280E .

Open the luggage compartment lid.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-34	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to AI12

No	GO to AI11

AI11 CHECK THE LUGGAGE COMPARTMENT AJAR INPUT CIRCUIT FOR A SHORT TO GROUND AT THE BCM (BODY CONTROL MODULE) WITH THE LUGGAGE COMPARTMENT LID LATCH DISCONNECTED

Disconnect Luggage Compartment Lid Latch C4339 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-34	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new luggage compartment lid latch. REFER to: Luggage Compartment Lid Latch - Coupe .

No	REPAIR the circuit.

AI12 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AJ : THE DRIVE MODE RTT (RECONFIGURABLE TELLTALE) INDICATORS ARE NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Drive Mode RTT. REFER to: Message Center - System Operation and Component Description .

If the powertrain drive mode message is missing or invalid for less than 5 seconds, the IPC defaults the drive mode RTT to the last indication state (on or off), based upon on the last message received.

If the powertrain drive mode message is missing or invalid for 5 seconds or longer, the IPC defaults the powertrain drive mode RTT off.

Possible Sources

- Communication concern
- GWM concern
- PCM input concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AJ : THE DRIVE MODE RTT (RECONFIGURABLE TELLTALE) INDICATORS ARE NEVER OR ALWAYS ON > PINPOINT TEST AJ : THE DRIVE MODE RTT (RECONFIGURABLE TELLTALE) INDICATORS ARE NEVER OR ALWAYS ON

AJ1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AJ2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AJ2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AJ3

AJ3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AJ4

AJ4 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) KOEO (KEY ON, ENGINE OFF) SELF-TEST

Using a diagnostic scan tool, perform the PCM KOEO self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	If the drive mode RTT is never on, the system is operating correctly at this time. If the drive mode RTT is always on, INSTALL a new PCM. Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AK : THE ENGINE OVER-TEMPERATURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Engine Over-Temperature RTT. REFER to: Message Center - System Operation and Component Description .

If the engine coolant temperature data or the engine overheat indication request messages are missing or invalid for less than 5 seconds, the IPC defaults the engine over-temperature RTT to the last indication state (on or off), based upon on the last message received.

If the engine coolant temperature data or the engine overheat indication request messages are missing or invalid for 5 seconds or longer, the IPC defaults the engine over-temperature RTT on.

Possible Sources

- Communication concern
- GWM concern
- PCM input concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AK : THE ENGINE OVER-TEMPERATURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AK : THE ENGINE OVER-TEMPERATURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AK1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AK2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AK2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AK3

AK3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AK4

AK4 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) KOEO (KEY ON, ENGINE OFF) SELF-TEST

Using a diagnostic scan tool, perform the PCM KOEO self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	If the engine over-temperature RTT is never on, the system is operating correctly at this time. If the engine over-temperature RTT is always on, INSTALL a new PCM. Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AL : THE LAUNCH CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON

Normal Operation and Fault Conditions

See Launch Control RTT. REFER to: Message Center - System Operation and Component Description .

If the launch control message is missing for less than 5 seconds, the IPC defaults the launch control RTT to the last indication state (on or off), based upon the last message received.

If the launch control message is missing for 5 seconds or longer, the IPC flashes the LC RTT image for 2 seconds.

Possible Sources

- Communication concern
- GWM concern
- PCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AL : THE LAUNCH CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON > PINPOINT TEST AL : THE LAUNCH CONTROL RTT (RECONFIGURABLE TELLTALE) IS NEVER ON

AL1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AL2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AL2 VERIFY THE LAUNCH CONTROL IS ENABLED THROUGH THE MESSAGE CENTER

NOTE: The IPC and message center navigation can be found in the Owner's Literature.

Using the message center controls, verify the launch control is enabled.

Is the launch control enabled through the message center?

Yes	GO to AL3

No	The system is operating correctly. The launch control was not enabled.

AL3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AL4

AL4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE any PCM Diagnostic Trouble Codes (DTCs). Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND

WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AM : THE LOW FUEL RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Low Fuel RTT. REFER to: Message Center - System Operation and Component Description .

Possible Sources

- Fuel gauge concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AM : THE LOW FUEL RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AM : THE LOW FUEL RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AM1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AM2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AM2 VERIFY THE OPERATION OF THE FUEL GAUGE

Ignition ON.

Verify the fuel gauge operates correctly and there are no customer concerns with the fuel gauge operation.

Does the fuel gauge operate correctly without any customer concerns related to fuel gauge indication?

Yes	GO to AM3

No	GO to Pinpoint Test C

AM3 CONFIRM THE CURRENT FUEL LEVEL AND DTE (DISTANCE TO EMPTY)

Using the message center controls, locate and record the current DTE.

Enter the Dealer Test Mode. REFER to: Instrument Panel Cluster (IPC) - System Operation and Component Description .

Scroll to the

Inst Fuel1 display.

Does the FLPM (second value) indicate 104 or less with a DTE of 80 km or less, 280 or less with a DTE of 60 km using an administrator key or 164 or less with a DTE 100 km using a MyKey ® programmed key?

Yes	If the low fuel RTT is always on, the system is operating correctly at this time based on the current fuel level. If the low fuel RTT is never on, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	If the low fuel RTT is always on, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) . If the low fuel RTT is never on, the system is operating correctly at this time based on the current fuel level.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AN : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (2.3L AND 3.7L ENGINE)

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See Low Oil Pressure RTT. REFER to: Message Center - System Operation and Component Description .

If the engine RPM data or oil pressure warning indicator request message is missing less than 5 seconds, the IPC defaults the low oil pressure warning indicator to the last state (on or off), based upon the last message received.

If the engine RPM data or oil pressure warning message is missing for 5 seconds or longer, the IPC defaults the low oil pressure warning indicator on.

DTC Chart - PCM

DTC	Description	Fault Trigger Conditions
P0521	Engine Oil Pressure Sensor/Switch "A" Circuit Range/Performance	Sets in the PCM when the PCM detects signal variation outside of the module parameters on the hardwired input from the oil pressure switch.
P0522	Engine Oil Pressure Sensor/Switch "A" Circuit Low	Sets in the PCM when the PCM detects a short to ground on the hardwired input from the oil pressure switch.
P0523	Engine Oil Pressure Sensor/Switch "A" Circuit High	Sets in the PCM when the PCM detects an open on the hardwired input from the oil pressure switch.
P0524	Engine Oil Pressure Too Low	Sets in the PCM when the PCM detects low oil pressure.

Possible Sources

- Wiring, terminals or connectors
- Tachometer concern
- Engine oil pressure switch
- Base engine concern
- GWM concern
- PCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AN : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (2.3L AND 3.7L ENGINE) > PINPOINT TEST AN : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (2.3L AND 3.7L ENGINE)

AN1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AN2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AN2 CHECK THE TACHOMETER OPERATION

Start the engine.

Verify the tachometer operates.

Does the tachometer operate?

Yes	GO to AN3

No	GO to Pinpoint Test G

AN3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	If the low oil pressure RTT is never on, GO to AN4 If the low oil pressure RTT is always on, GO to AN6

AN4 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH

Ignition OFF.

Disconnect Engine Oil Pressure Switch C103 (2.3L).

Disconnect Engine Oil Pressure Switch C1642 (3.7L).

Ignition ON.

Observe the low oil pressure warning indicator.

Does the low oil pressure warning indicator turn on?

Yes	INSTALL a new engine oil pressure switch. Refer to the appropriate article for the

	procedure.

No	GO to AN5

AN5 CHECK THE OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND AT THE PCM (POWERTRAIN CONTROL MODULE)

Ignition OFF.

Disconnect PCM C1551E (2.3L).

Disconnect PCM C1381E (3.7L).

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1551E-9	Ω	Ground

3.7L

Positive Lead	Measurement / Action	Negative Lead
C1381E-48	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to AN11

No	REPAIR the circuit.

AN6 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to AN7

AN7 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to AN8

AN8 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH

Ignition OFF.

Disconnect Engine Oil Pressure Switch C103 (2.3L).

Disconnect Engine Oil Pressure Switch C1642 (3.7L).

Connect a fused jumper wire:

2.3L

Lead 1	Measurement / Action	Lead 2
C1551E-9		Ground

3.7L

Lead 1	Measurement / Action	Lead 2
C1381E-48		Ground

Ignition ON.

Observe the low oil pressure warning indicator.

Does the low oil pressure indicator turn off?

Yes	REMOVE the fused jumper wire. GO to AN9

No	LEAVE the jumper wire connected. GO to AN10

AN9 CHECK THE OIL PRESSURE

Test the engine for low oil pressure.

Was a low oil pressure concern detected?

Yes	REPAIR the low oil pressure concern. Refer to the appropriate article for the procedure.

No	INSTALL a new engine oil pressure switch. Refer to the appropriate article for the procedure.

AN10 CHECK THE ENGINE OIL PRESSURE INPUT CIRCUIT FOR AN OPEN AT THE PCM (POWERTRAIN CONTROL MODULE)

Ignition OFF.

Disconnect PCM C1551E (2.3L).

Disconnect PCM C1381E (3.7L).

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1551E-9	Ω	Ground

3.7L

Positive Lead	Measurement / Action	Negative Lead
C1381E-48	Ω	Ground

Is the resistance less than 3 ohms?

Yes	REMOVE the fused jumper wire. GO to AN11

No	REMOVE the fused jumper wire. REPAIR the circuit.

AN11 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present

Is the concern still present?

Yes	CHECK On-Line Automotive Service Information System (OASIS) for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this

	concern, INSTALL a new PCM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AO : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (5.0L AND 5.2L ENGINES)

Refer to Instrument Cluster for schematic and connector information.

Normal Operation and Fault Conditions

See Low Oil Pressure RTT. REFER to: Message Center - System Operation and Component Description .

If the engine RPM data or oil pressure warning indicator request message is missing less than 5 seconds, the IPC defaults the low oil pressure warning indicator to the last state (on or off), based upon the last message received.

If the engine RPM data or oil pressure warning message is missing for 5 seconds or longer, the IPC defaults the low oil pressure warning indicator on.

DTC Chart - PCM

DTC	Description	Fault Trigger Conditions
P0521	Engine Oil Pressure Sensor/Switch "A" Circuit Range/Performance	Sets in the PCM when the PCM detects signal variation outside of the module parameters on the hardwired input from the oil pressure switch.
P0522	Engine Oil Pressure Sensor/Switch "A" Circuit Low	Sets in the PCM when the PCM detects a short to ground on the hardwired input from the oil pressure switch.
P0523	Engine Oil Pressure Sensor/Switch "A" Circuit High	Sets in the PCM when the PCM detects an open on the hardwired input from the oil pressure switch.
P0524	Engine Oil Pressure Too Low	Sets in the PCM when the PCM detects low oil pressure.

Possible Sources

- Wiring, terminals or connectors

- Tachometer concern

- Base engine concern
- PCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AO : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (5.0L AND 5.2L ENGINES) > PINPOINT TEST AO : THE LOW OIL PRESSURE RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON (5.0L AND 5.2L ENGINES)

AO1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AO2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AO2 CHECK THE TACHOMETER OPERATION

Start the engine.

Verify the tachometer operates.

Does the tachometer operate?

Yes	GO to AO3

No	GO to Pinpoint Test G

AO3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AO4

AO4 CHECK THE OIL PRESSURE

Test the engine for low oil pressure.

Was a low oil pressure concern detected?

Yes	REPAIR the low oil pressure concern. Refer to the appropriate article for the procedure.

No	GO to AO5

AO5 CHECK FOR VOLTAGE AT THE OIL PRESSURE SWITCH

Ignition OFF.

Disconnect Engine Oil Pressure Switch C1657 (5.0L Engine) or C1652 (5.2L Engine).

Ignition ON.

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-3		C1657-2

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-3		C1652-2

Is the voltage approximately 5 volts?

Yes	GO to AO6

No	GO to AO9

AO6 CHECK THE OIL PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175E .

Ignition ON.

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-1	V	Ground

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-1	V	Ground

Is any voltage present?

Yes	GO to AO7

No	REPAIR the circuit.

AO7 CHECK THE OIL PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-1	Ω	C175E-57

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-1	Ω	C175E-57

Is the resistance less than 3 ohms?

Yes	GO to AO8

No	REPAIR the circuit.

AO8 CHECK THE OIL PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-1	Ω	Ground

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new PCM. Refer to the appropriate article for the procedure. CLEAR the Diagnostic Trouble Codes (DTCs). TEST the system for normal operation. If the oil pressure Reconfigurable Telltale is still never or always on, GO to AO13

No	REPAIR the circuit.

AO9 CHECK THE OIL PRESSURE SENSOR VREF CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM C175E .

Ignition ON.

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-3	V	Ground

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-3	V	Ground

Is the resistance less than 3 ohms?

Yes	GO to AO10

No	REPAIR the circuit.

AO10 CHECK THE OIL PRESSURE SENSOR VREF CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-3	Ω	C175E-34

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-3	Ω	C175E-34

Is the resistance less than 3 ohms?

Yes	GO to AO11

No	REPAIR the circuit.

AO11 CHECK THE OIL PRESSURE SENSOR VREF CIRCUIT FOR A SHORT TO GROUND

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-3	Ω	Ground

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to AO12

No	REPAIR the circuit.

AO12 CHECK THE OIL PRESSURE SENSOR RETURN CIRCUIT FOR AN OPEN

Measure:

5.0L Engine

Positive Lead	Measurement / Action	Negative Lead
C1657-2	Ω	C175E-49

5.2L Engine

Positive Lead	Measurement / Action	Negative Lead
C1652-2	Ω	C175E-49

Is the resistance less than 3 ohms?

Yes	INSTALL a new engine oil pressure sensor. Refer to the appropriate article for the procedure. CLEAR the Diagnostic Trouble Codes (DTCs). TEST the system for normal operation. If the oil pressure Reconfigurable Telltale is still never or always on, GO to AO13

No	REPAIR the circuit.

AO13 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present

Is the concern still present?

Yes	CHECK On-Line Automotive Service Information System (OASIS) for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test

	and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AP : THE OVERSPEED WARNING RTT (RECONFIGURABLE TELLTALE) (GULF COOPERATIVE COUNTRIES [GCC]) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Overspeed Warning RTT. REFER to: Message Center - System Operation and Component Description .

If the vehicle speed message is missing or invalid for less than 5 seconds, the IPC defaults the overspeed warning RTT to the last indication state (on or off), based upon on the last message received.

If the vehicle speed message is missing or invalid for 5 seconds or longer, the IPC defaults the overspeed warning RTT off.

Possible Sources

- Speedometer indication concern
- IPC configuration concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AP : THE OVERSPEED WARNING RTT (RECONFIGURABLE TELLTALE) (GULF COOPERATIVE COUNTRIES [GCC]) IS NEVER OR ALWAYS ON > PINPOINT TEST AP : THE OVERSPEED WARNING RTT (RECONFIGURABLE TELLTALE) (GULF COOPERATIVE COUNTRIES [GCC]) IS NEVER OR ALWAYS ON

AP1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AP2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AP2 CHECK THE SPEEDOMETER OPERATION

Verify the speedometer operates.

Does the speedometer operate?

Yes	GO to AP3

No	GO to Pinpoint Test D

AP3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	CONFIRM the vehicle was built for the Gulf Cooperative Country [GCC] market. If the vehicle was not built for a Gulf Cooperative Country [GCC], the IPC is functioning correctly. If the vehicle was built for a Gulf Cooperative Country [GCC], PERFORM the Programmable Module Installation (PMI) procedure using as built data as directed by the diagnostic scan tool. REFER to: Module Configuration - System Operation and Component Description .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AQ : THE POWERTRAIN MALFUNCTION (WRENCH) RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

Normal Operation and Fault Conditions

See Powertrain Malfunction (Wrench) RTT. REFER to: Message Center - System Operation and Component Description .

If the transmission service required, engine service required or body service required message is missing for less than 5 seconds, the IPC defaults the powertrain malfunction (wrench) RTT to the last indication state (on or off), based upon the last message received.

If the transmission service required, engine service required or body service required message is missing for 5 seconds or longer, the IPC defaults the powertrain malfunction (wrench) RTT on.

Possible Sources

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AQ : THE POWERTRAIN MALFUNCTION (WRENCH) RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON > PINPOINT TEST AQ : THE POWERTRAIN MALFUNCTION (WRENCH) RTT (RECONFIGURABLE TELLTALE) IS NEVER OR ALWAYS ON

AQ1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AQ2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AQ2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AQ3

AQ3 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to AQ4

AQ4 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) KOEO (KEY ON, ENGINE OFF) SELF-TEST

Using a diagnostic scan tool, perform the PCM KOEO self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to AQ5

AQ5 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	If the powertrain malfunction (wrench) RTT is never on, the system is operating correctly at this time. There are currently no vehicle concerns present that require the powertrain malfunction (wrench) RTT display. If the powertrain malfunction (wrench) RTT is always on, INSTALL a new PCM. Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AR : THE STEERING MODE RTT (RECONFIGURABLE TELLTALE) RTT (RECONFIGURABLE TELLTALE) IS NEVER

ON

Normal Operation and Fault Conditions

See Steering Mode RTT. REFER to: Message Center - System Operation and Component Description .

If the steering effort status message is missing or deemed invalid by the IPC for less than 5 seconds, the IPC defaults the steering mode RTT to the last indication state (on or off), based upon the last message received.

If the steering effort status message is missing or if the data is deemed invalid by the IPC for 5 seconds or longer, the IPC defaults the steering mode RTT off.

Possible Sources

- Communication concern
- EPAS concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AR : THE STEERING MODE RTT (RECONFIGURABLE TELLTALE) RTT (RECONFIGURABLE TELLTALE) IS NEVER ON > PINPOINT TEST AR : THE STEERING MODE RTT (RECONFIGURABLE TELLTALE) RTT (RECONFIGURABLE TELLTALE) IS NEVER ON

AR1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AR2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AR2 VERIFY THE STEERING MODE SYSTEM OPERATES CORRECTLY

NOTE: Refer to the Owner's Literature for additional information on selecting the different steering modes.

Verify the steering effort changes modes.

Does the steering effort change when selecting different modes?

Yes	GO to AR3

No	DIAGNOSE the EPAS steering effort mode selection. REFER to: POWER STEERING .

AR3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AR4

AR4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE the EPAS. REFER to: POWER STEERING .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AS : THE VEHICLE DYNAMICS (DAMPER CONTROL) RTT (RECONFIGURABLE TELLTALE) IS NEVER ON (SVT ONLY)

Normal Operation and Fault Conditions

See Vehicle Dynamics (Damper Control) RTT. REFER to: Message Center - System Operation and Component Description .

If the suspension driver mode status message is missing or deemed invalid by the IPC for less than 5 seconds, the IPC defaults the vehicle dynamics (damper control) RTT to the last indication state (on or off), based upon the last message received.

If the suspension driver mode status message is missing or if the data is deemed invalid by the IPC for 5 seconds or longer, the IPC defaults the vehicle dynamics (damper control) RTT off.

Possible Sources

- Communication concern
- Vehicle dynamics concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AS : THE VEHICLE DYNAMICS (DAMPER CONTROL) RTT (RECONFIGURABLE TELLTALE) IS NEVER ON (SVT ONLY) > PINPOINT TEST AS : THE VEHICLE DYNAMICS (DAMPER CONTROL) RTT (RECONFIGURABLE TELLTALE) IS NEVER ON (SVT ONLY)

AS1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AS2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AS2 VERIFY THE VEHICLE DYNAMICS SYSTEM OPERATES CORRECTLY

Verify the vehicle dynamics (damper control) system operates and changes state using the switch.

Does the vehicle dynamics (damper control) system operate and change state using the switch?

Yes	GO to AS3

No	DIAGNOSE the vehicle dynamics system. REFER to: Vehicle Dynamic Suspension .

AS3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AS4

AS4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE the vehicle dynamics system. REFER to: Vehicle Dynamic Suspension .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AT : THE CERAMIC BRAKE WARNING MESSAGE IS NEVER OR ALWAYS DISPLAYED (SVT ONLY)

Normal Operation and Fault Conditions

See Brake System messages. REFER to: Message Center - System Operation and Component Description .

If the brake wear message request is missing for less than 5 seconds, the IPC defaults the ceramic brake warning message center message to the last indication state, based upon the last message received.

If the brake wear message request is missing for 5 seconds or longer, the IPC defaults the ceramic brake warning message center message off.

Possible Sources

- Brake pads

- GWM concern
- VDM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AT : THE CERAMIC BRAKE WARNING MESSAGE IS NEVER OR ALWAYS DISPLAYED (SVT ONLY) > PINPOINT TEST AT : THE CERAMIC BRAKE WARNING MESSAGE IS NEVER OR ALWAYS DISPLAYED (SVT ONLY)

AT1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar warning message.

Open the driver door.

Does the driver door ajar message display with the door open and turn off with the door closed?

Yes	GO to AT2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AT2 CHECK THE BRAKE PADS FOR WEAR

Inspect the brake pads for wear.

Are the brake pads OK?

Yes	GO to AT3

No	INSTALL new brake pads. Refer to the appropriate article for the procedure.

AT3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AT4

AT4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE all brake sensor Diagnostic Trouble Codes (DTCs) in the VDM. REFER to: Vehicle Dynamic Suspension .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AU : THE CHECK FUEL FILL INLET MESSAGE IS ALWAYS DISPLAYED

Normal Operation and Fault Conditions

See Check Fuel Fill Inlet Message. REFER to: Message Center - System Operation and Component Description .

If the fuel fill inlet message display message is missing for less than 5 seconds, the IPC defaults the check fuel fill inlet message center message to the last indication state, based upon the last message received.

If the fuel fill inlet message display message request is missing for 5 seconds or longer, the IPC defaults the check fuel fill inlet message center message off.

Possible Sources

- Evaporative emissions system concern
- GWM concern
- PCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AU : THE CHECK FUEL FILL INLET MESSAGE IS ALWAYS DISPLAYED > PINPOINT TEST AU : THE CHECK FUEL FILL INLET MESSAGE IS ALWAYS DISPLAYED

AU1 CHECK THE MESSAGE CENTER OPERATION

Ignition ON.

Close all doors, the hood and luggage compartment lid.

Clear all message center warnings by pressing the OK button for each warning present.

Monitor the door ajar RTT.

Open the driver door.

Clear the message center popup warning.

Monitor the door ajar RTT.

Is the door ajar RTT off with the door closed, and on with the door open?

Yes	GO to AU2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

AU2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to AU3

AU3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	If the check fuel fill inlet message is never on, the system is operating correctly at this time. There are currently no vehicle concerns present that require the check fuel fill inlet message display. If the check fuel fill inlet message is always on, DIAGNOSE all PCM Diagnostic Trouble Codes (DTCs). Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND

WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST AV : THE CONVERTIBLE TOP WARNING MESSAGE IS ALWAYS DISPLAYED

Normal Operation and Fault Conditions

See Convertible Top Warning Message. REFER to: Message Center - System Operation and Component Description .

If the convertible top message request is missing for less than 5 seconds, the IPC defaults the convertible top warning message to the last indication state, based upon the last message received.

If the convertible top message request is missing for 5 seconds or longer, the IPC defaults the convertible top warning message off.

Possible Sources

- Convertible top system concern
- Moveable Roof Control Module-A (MRCMA) concern
- GWM concern

Using a diagnostic scan tool, perform the ACM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to BC3

BC3 PERFORM THE APIM (SYNC MODULE) SELF-TEST

Using a diagnostic scan tool, perform the APIM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	If equipped with 2.3L automatic, GO to BC4 If **not** equipped with 2.3L automatic, GO to

BC4 PERFORM THE DACMC (DIGITAL AUDIO CONTROL MODULE C) SELF-TEST

Using a diagnostic scan tool, perform the DACMC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	If equipped with touchscreen audio system, GO to BC6 If **not** equipped with the touchscreen audio system, GO to BC5

BC5 CHECK FOR CORRECT AUDIO SYSTEM OPERATION

Operate the audio system in AM/ FM mode.

Does the audio system operate correctly?

Yes	If **not** equipped with the touchscreen audio system, GO to **BC17** . If equipped with the touchscreen audio system, GO to **BC6**

No	Diagnose the audio system. REFER to: Information and Entertainment System .

BC6 PERFORM THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE SELF-TEST

Using a diagnostic scan tool, perform the audio DSP module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For DTC B13F8:13, GO to BC7 For DTC B13FA:13, GO to BC12 For all other Diagnostic Trouble Codes (DTCs), Refer to the appropriate article for the

	procedure.

No	GO to BC17

BC7 CHECK THE LHR (LEFT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE

Ignition OFF.

Disconnect Audio DSP Module C2385A .

Ignition ON.

Operate the audio system in AM/ FM mode.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-6		C2385A-5

Is a fluctuating AC voltage present?

Yes	GO to BC19

No	GO to BC8

BC8 CHECK THE LHR (LEFT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect ACM C240A .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-6		Ground
C2385A-5		Ground

Is any voltage present?

Yes	REPAIR the circuit in question.

No	GO to BC9

BC9 CHECK THE LHR (LEFT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-6	Ω	Ground
C2385A-5	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to BC10

No	REPAIR the circuit in question.

BC10 CHECK THE LHR (LEFT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-6	Ω	C240A-21
C2385A-5	Ω	C240A-9

Are the resistances less than 3 ohms?

Yes	GO to BC11

No	REPAIR the circuit in question.

BC11 CHECK THE LHR (LEFT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-6	Ω	C2385A-5

Is the resistance greater than 10, 000 ohms?

Yes	GO to BC17

No	REPAIR the circuits.

BC12 CHECK THE RHR (RIGHT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE

Ignition OFF.

Disconnect Audio DSP Module C2385A .

Ignition ON.

Operate the audio system in AM/ FM mode.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-2		C2385A-1

Is a fluctuating AC voltage present?

Yes	GO to BC19

No	GO to BC13

BC13 CHECK THE RHR (RIGHT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect ACM C240A .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-2		Ground
C2385A-1		Ground

Is any voltage present?

Yes	REPAIR the circuit in question.

No	GO to BC14

BC14 CHECK THE RHR (RIGHT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO

DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-2	Ω	Ground
C2385A-1	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to BC15

No	REPAIR the circuit in question.

BC15 CHECK THE RHR (RIGHT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-2	Ω	C240A-24
C2385A-1	Ω	C240A-12

Are the resistances less than 3 ohms?

Yes	GO to BC16

No	REPAIR the circuit in question.

BC16 CHECK THE RHR (RIGHT-HAND REAR) AUDIO SIGNAL TO THE AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2385A-2	Ω	C2385A-1

Is the resistance greater than 10, 000 ohms?

Yes	GO to BC17

No	REPAIR the circuit in question.

BC17 CHECK FOR CORRECT ACM (AUDIO FRONT CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all the ACM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the ACM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new ACM. Vehicles With: AM/FM/CD/SYNC REFER to: Audio Front Control Module (ACM) or Vehicles With: Touchscreen Display REFER to: Audio Front Control Module (ACM) . TEST the system for normal operation. If the chimes still do not sound through the audio system, GO to BC18

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BC18 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect all IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for

	this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BC19 CHECK FOR CORRECT AUDIO DSP (AUDIO DIGITAL SIGNAL PROCESSING MODULE) MODULE OPERATION

Ignition OFF.

Disconnect and inspect all the audio DSP module connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the audio DSP module connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, discontinue this test and follow TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new audio DSP module. REFER to: Audio Digital Signal Processing (DSP) Module .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BD : THE FORWARD COLLISION WARNING CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Forward Collision Warning Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Forward collision system concern
- Communication concern

- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BD : THE FORWARD COLLISION WARNING CHIME IS INOPERATIVE > PINPOINT TEST BD : THE FORWARD COLLISION WARNING CHIME IS INOPERATIVE

BD1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BD2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BD2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BD3

BD3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE the collision avoidance system. REFER to: Collision Warning and Collision

	Avoidance System .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BE : THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Headlamps On Warning Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- GWM concern

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BE : THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE > PINPOINT TEST BE : THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

BE1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BE2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BE2 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BE3

BE3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BF : THE IGNITION-ENGINE ON WARNING CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Ignition-Engine On Warning Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Interior lighting concern
- PRNDL indication concern
- GWM concern
- BCM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BF : THE IGNITION-ENGINE ON WARNING CHIME IS INOPERATIVE > PINPOINT TEST BF : THE IGNITION-ENGINE ON WARNING CHIME IS INOPERATIVE

BF1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BF2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BF2 CHECK THE DOOR AJAR INDICATION

Open the driver door.

Observe the door ajar warning indicator or door ajar message center warning indicator.

Does the door ajar warning indicator or door ajar message center warning indicator turn on with the driver door ajar?

Yes	GO to BF3

No	GO to Pinpoint Test AI

BF3 CHECK THE PRNDL OPERATION

Shift the transmission through the ranges while observing the PRNDL indication.

Does the PRNDL indication match the selected transmission range?

Yes	GO to BF4

No	GO to Pinpoint Test V

BF4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BF5

BF5 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE any BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BG : THE MEMORY-STORED FEEDBACK CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Memory-Stored Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Memory set feature concern
- DSM
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BG : THE MEMORY-STORED FEEDBACK CHIME IS INOPERATIVE > PINPOINT TEST BG : THE MEMORY-STORED FEEDBACK CHIME IS INOPERATIVE

BG1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BG2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BG2 CHECK THE MEMORY SET FEATURE

Verify the memory set procedure can successfully change the memory preferences.

Does the memory set procedure successfully change the memory preferences?

Yes	GO to BG3

No	REFER to: FRONT SEATS .

BG3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BG4

BG4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE any DSM Diagnostic Trouble Codes (DTCs). REFER to: FRONT SEATS .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BH : THE PARKING AID CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Parking Aid Chime. REFER to: Instrumentation, Message Center and Warning Chimes .

Possible Sources

- Parking aid system concern
- Communication concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BH : THE PARKING AID CHIME IS INOPERATIVE > PINPOINT TEST BH : THE PARKING AID CHIME IS INOPERATIVE

BH1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BH2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BH2 VERIFY THE CHIMES FUNCTION THROUGH THE AUDIO SPEAKERS

Ignition OFF.

Ignition ON.

Monitor the location of the safety belt warning chime (front/rear audio speakers or IPC) when the ignition is transitioned from OFF to RUN.

Does the chime sound through the audio speakers?

Yes	GO to BH4

No	GO to BH3

BH3 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble

Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BH4

BH4 PERFORM THE PAM (PARKING ASSIST CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PAM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Parking Aid .

No	GO to BH5

BH5 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	DIAGNOSE the audible parking aid. REFER to: Parking Aid .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BI : THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Parking Brake Warning Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Brake warning indication concern
- Communication concern
- GWM concern
- IPC

Visual Inspection And Diagnostic Pre-checks

Check the operation of the parking brake warning chime with the vehicle moving at least 10 km/h (6.2 mph) and the parking brake slightly applied (just enough to turn the brake warning indicator on without damaging the rear brakes).

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BI : THE PARKING BRAKE WARNING CHIME IS INOPERATIVE > PINPOINT TEST BI : THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

BI1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BI2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BI2 CHECK THE BRAKE WARNING INDICATOR FOR CORRECT OPERATION

Apply the parking brake.

Observe the brake warning indicator.

Does the brake warning indicator illuminate?

Yes	GO to BI3

No	GO to Pinpoint Test P

BI3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BI4

BI4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BJ : THE PERIMETER ALARM CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Perimeter Alarm Warning Chime. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Perimeter alarm concern
- BCM
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BJ : THE PERIMETER ALARM CHIME IS INOPERATIVE > PINPOINT TEST BJ : THE PERIMETER ALARM CHIME IS INOPERATIVE

BJ1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BJ2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BJ2 CHECK THE OPERATION OF THE PERIMETER ALARM

Arm the perimeter alarm using the remote key locking feature (key fob).

Wait approximately 15 seconds for the system to arm.

Open the driver door using the interior door handle.

Does the perimeter alarm sound after 12 seconds?

Yes	GO to BJ3

No	REFER to: Perimeter Anti-Theft Alarm .

BJ3 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BJ4

BJ4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BK : THE SAFETY BELT WARNING CHIME OR THE BELT-MINDER ® FEATURE IS INOPERATIVE

Normal Operation and Fault Conditions

See Safety Belt Warning Chime and Belt-Minder ® Feature. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Belt-Minder ® deactivated
- Communication concern
- Safety belt warning indication concern
- Vehicle speed input concern
- BCM concern
- GWM concern
- RCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BK : THE SAFETY BELT WARNING CHIME OR THE BELT-MINDER ® FEATURE IS INOPERATIVE > PINPOINT TEST BK : THE SAFETY BELT WARNING CHIME OR THE BELT-MINDER ® FEATURE IS INOPERATIVE

BK1 CHECK THE HEADLAMPS ON WARNING CHIME

Ignition OFF.

Turn the headlamps on.

Open the driver door.

Monitor the headlamps on warning chime.

Does the headlamps on warning chime operate?

Yes	GO to BK2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BK2 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition ON.

Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	For the Belt-Minder ®, GO to BK3 For the safety belt warning chime, GO to BK4

No	GO to BK5

BK3 CHECK THE SPEEDOMETER OPERATION

Ignition ON.

Verify the speedometer operates.

Does the speedometer operate?

Yes	GO to BK4

No	GO to Pinpoint Test D

BK4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BK5

BK5 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to BK6

BK6 PERFORM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the RCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Airbag Supplemental Restraint System (SRS) .

No	GO to BK7

BK7 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BK8

BK8 CHECK THE DRIVER AND FRONT PASSENGER SAFETY BELT BUCKLE SWITCH

Using a diagnostic scan tool, monitor the RCM driver and front passenger safety belt buckle Parameter Identifications (PIDs) (SBELT_D_ST) and (SBLT_P_ST) while buckling and unbuckling the safety belt.

Do the Parameter Identifications (PIDs) display BUCKLED with the safety belt buckled and UNBUCKLED with the safety belt unbuckled?

Yes	GO to BK9

No	INSTALL a new safety belt buckle. REFER to: Front Seatbelt Buckle .

NOTE: Verify that an administrator key is used for this test and not a MyKey ® programmed key. When a MyKey ® programmed key is used, the Belt-Minder ® is automatically turned on and cannot be disabled (if previously disabled by an administrator, the Belt-Minder ® remains disabled when an administrator key is used).

BK9 CHECK THE BELT-MINDER ® CONFIGURATION

Verify the Belt-Minder ® is activated or configured on for the seating position in question. REFER to: Seatbelt Minder Deactivating/Activating .

Is the Belt-Minder activated for the seating position in question?

Yes	If the Belt-Minder ® is always on above 10 km/h (6 mph) with the safety belt unfastened, the system is operating correctly. If the Belt-Minder ® is always on with the safety belt fastened or never on with the safety belt unfastened above 10 km/h (6 mph), INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

No	ACTIVATE the Belt-Minder ® for the seating position in question. REFER to: Seatbelt Minder Deactivating/Activating .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BL : THE TURN SIGNAL-HAZARD ON CHIME OR TURN SIGNAL LEFT ON CHIME IS INOPERATIVE

Normal Operation and Fault Conditions

See Turn Signal On Chime Tone. REFER to: Warning Chimes - System Operation and Component Description .

Possible Sources

- Turn signal indication concern
- Communication concern
- BCM concern
- GWM concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BL : THE TURN SIGNAL-HAZARD ON CHIME OR TURN SIGNAL LEFT ON CHIME IS INOPERATIVE > PINPOINT TEST BL : THE TURN SIGNAL-HAZARD ON CHIME OR TURN SIGNAL LEFT ON CHIME IS INOPERATIVE

BL1 CHECK THE SAFETY BELT WARNING CHIME OPERATION

Ignition OFF.

Ignition ON.

Unbuckle the driver safety belt.

Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds.

Does the safety belt warning chime operate for approximately 6 seconds?

Yes	GO to BL2

No	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

BL2 CHECK THE TURN SIGNAL INDICATOR OPERATION

Verify the RH and LH turn signal indicators operate correctly.

Do the turn signal indicators operate correctly?

Yes	GO to BL3

No	GO to Pinpoint Test S

BL3 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	DIAGNOSE all GWM Diagnostic Trouble Codes (DTCs). REFER to: MODULE COMMUNICATIONS NETWORK .

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BM : U0100:00

Normal Operation and Fault Conditions

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	Sets in continuous memory in the IPC if data messages received from the PCM through the GWM are missing for 5 seconds or longer.

Possible Sources

- Communication concern
- Battery voltage concern
- GWM concern
- PCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BM : U0100:00 > PINPOINT

TEST BM : U0100:00

BM1 VERIFY THE DIAGNOSTIC SCAN TOOL COMMUNICATES WITH THE PCM (POWERTRAIN CONTROL MODULE)

Connect the diagnostic scan tool.

Check that a vehicle session can be established using the diagnostic scan tool.

Can a vehicle session be established?

Yes	GO to BM2

No	REFER to: MODULE COMMUNICATIONS NETWORK .

BM2 CHECK THE IPC (INSTRUMENT PANEL CLUSTER) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, perform the IPC self-test.

Clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the IPC self-test.

Is DTC U0100:00 retrieved again?

Yes	GO to BM3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BM3 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Are any DTC recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to BM4

BM4 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Is DTC U3003:16 or DTC U3003:17 recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BM5

BM5 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) set?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BM6

BM6 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0100:00 OR DTC (DIAGNOSTIC TROUBLE CODE) U0100:87 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, perform the continuous memory self-test.

Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Does DTC U0100:00 set in the ABS module or DTC U0100:87 set in the BCM?

Yes	GO to BM7

No	GO to BM8

BM7 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BM8 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BN1 VERIFY THE DIAGNOSTIC SCAN TOOL COMMUNICATES WITH THE PCM (POWERTRAIN CONTROL MODULE)

Connect the diagnostic scan tool.

Check that a vehicle session can be established using the diagnostic scan tool.

Can a vehicle session be established?

Yes	GO to BN2

No	REFER to: MODULE COMMUNICATIONS NETWORK .

BN2 CHECK THE ICM (INFORMATION CENTER MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, perform the ICM self-test.

Clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the ICM self-test.

Is DTC U0100:00 retrieved again?

Yes	GO to BN3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BN3 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Refer to the appropriate article for the procedure.

No	GO to BN4

BN4 PERFORM THE ICM (INFORMATION CENTER MODULE) SELF-TEST

Using a diagnostic scan tool, perform the ICM self-test.

Is DTC U3003:16 or DTC U3003:17 recorded?

Yes	REFER to DTC Chart: Information Center Module (ICM) .

No	GO to BN5

BN5 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0100:00 OR DTC (DIAGNOSTIC TROUBLE CODE) U0100:87 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, perform the continuous memory self-test.

Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC U0100:00 set in the IPC, ABS module or DTC U0100:87 set in the BCM?

Yes	GO to BN6

No	GO to BN7

BN6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BN7 CHECK FOR CORRECT ICM (INFORMATION CENTER MODULE) OPERATION

Ignition OFF.

Disconnect and inspect ICM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the ICM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new ICM. REFER to: Information Center Module (ICM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BO : U0104:00

Normal Operation and Fault Conditions

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0104:00	Lost Communication With Cruise Control Module: No Sub Type Information	Sets in continuous memory in the IPC if data messages received from the CCM through the GWM are missing for 5 seconds or longer.

Possible Sources

- Communication concern
- Battery voltage concern
- GWM concern
- CCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BO : U0104:00 > PINPOINT TEST BO : U0104:00

BO1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to BO2

No	Clear the DTC. The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BO2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, perform the network test.

Does the CCM pass the network test?

Yes	GO to BO3

No	REFER to: MODULE COMMUNICATIONS NETWORK .

BO3 PERFORM THE CCM (CRUISE CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the CCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For base cruise control, REFER to: Cruise Control . For adaptive cruise control, REFER to: Cruise Control .

No	GO to BO4

BO4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BO5

BO5 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Is DTC U3003:16 or DTC U3003:17 recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BO6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI), or the Programmable Module Installation (PMI) may not have been carried out.

BO6 RECHECK THE IPC (INSTRUMENT PANEL CLUSTER) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the IPC self-test.

Is DTC U0104:00 still present?

Yes	GO to BO7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BO7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0104:00 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, perform the continuous memory self-test.

Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC U0104:00 set in the ABS module?

Yes	GO to BO8

No	GO to BO9

BO8 CHECK FOR CORRECT CCM (CRUISE CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all CCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the CCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical

	Service Bulletins (TSBs) address this concern, INSTALL a new CCM. REFER to: Cruise Control Module (CCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BO9 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BU5

BU5 PERFORM THE ICM (INFORMATION CENTER MODULE) SELF-TEST

Using a diagnostic scan tool, perform the ICM self-test.

Is DTC U3003:16 or DTC U3003:17 recorded?

Yes	REFER to DTC Chart: Information Center Module (ICM) .

No	GO to BU6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI), or the Programmable Module Installation (PMI) may not have been carried out.

BU6 RECHECK THE ICM (INFORMATION CENTER MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the ICM self-test.

Is DTC U0155:00 still present?

Yes	GO to BU7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BU7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0155:87 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, perform the continuous memory self-test.

Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC U0155:87 set in the BCM?

Yes	GO to BU8

No	GO to BU9

BU8 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect all IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by

	module connections. ADDRESS the root cause of any connector or pin issues.

BU9 CHECK FOR CORRECT ICM (INFORMATION CENTER MODULE) OPERATION

Ignition OFF.

Disconnect and inspect ICM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the ICM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new ICM. REFER to: Information Center Module (ICM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BV : U0159:00

Normal Operation and Fault Conditions

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0159:00	Lost Communication With Parking Assist Control Module "A": No Sub Type Information	Sets in continuous memory in the IPC if data messages received from the Parking Aid Module (PAM) (part of the BCM) through the GWM are missing for 5 seconds or longer.

Possible Sources

- Communication concern

- Battery voltage concern
- GWM concern
- BCM
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST BV : U0159:00 > PINPOINT TEST BV : U0159:00

BV1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to BV2

No	Clear the DTC. The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BV2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, perform the network test.

Does the Parking Aid Module (PAM) pass the network test?

Yes	GO to BV3

No	REFER to: MODULE COMMUNICATIONS NETWORK .

BV3 PERFORM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	For rear parking aid, REFER to: Parking Aid . For parking aid with rear camera, REFER to: Parking Aid .

No	GO to BV5

BV4 CHECK THE GWM (GATEWAY MODULE A) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, check the GWM Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to BV5

BV5 PERFORM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform the IPC self-test.

Is DTC U3003:16 or DTC U3003:17 recorded?

Yes	REFER to DTC Chart: IPC .

No	GO to BV6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI), or the Programmable Module Installation (PMI) may not have been carried out.

BV6 RECHECK THE IPC (INSTRUMENT PANEL CLUSTER) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the IPC self-test.

Is DTC U0159:00 still present?

Yes	GO to BV7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BV7 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the IPC self-test. If DTC U0184:00 is still present, GO to BV8

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

BV8 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Normal Operation and Fault Conditions

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	Sets in the IPC in continuous memory if the IPC detects battery voltage below 9 volts on the voltage supply circuit for 5 seconds or longer.

Possible Sources

- Wiring, terminals or connectors
- High circuit resistance
- Charging system concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST CA : U3003:16 > PINPOINT TEST CA : U3003:16

CA1 RECHECK THE IPC (INSTRUMENT PANEL CLUSTER) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform the IPC self-test.

Is DTC U3003:16 still present?

Yes	GO to CA2

No	Clear the DTC. The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.

CA2 CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTCS) IN THE BCM (BODY CONTROL MODULE)

Using a diagnostic scan tool, perform the BCM self-test.

Are any charging system Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to CA3

CA3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE

Check the battery condition and verify the battery is fully charged. REFER to: BATTERY, MOUNTING AND CABLES .

Is the battery OK and fully charged?

Yes	GO to CA4

No	If the battery is discharged, DIAGNOSE the cause of the low battery condition. REFER to: BATTERY, MOUNTING AND CABLES .

CA4 CHECK THE IPC (INSTRUMENT PANEL CLUSTER) VOLTAGE PID (PARAMETER IDENTIFICATION)

Measure and record the voltage at the battery.

Using a diagnostic scan tool, view the IPC Parameter Identifications (PIDs).

Monitor the IPC voltage (MODULE_VOLT) PID

Is the voltage within 0.2 volt of the recorded battery voltage?

Yes	GO to CA7

No	GO to CA5

CA5 CHECK THE IPC (INSTRUMENT PANEL CLUSTER) VOLTAGE SUPPLY

Ignition OFF.

Disconnect IPC C220 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-8		Ground

Is the voltage greater than 11 volts?

Yes	GO to CA6

No	REPAIR the circuit for high circuit resistance.

CA6 CHECK THE IPC (INSTRUMENT PANEL CLUSTER) GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C220-8		C220-3

Is the voltage greater than 11 volts?

Yes	GO to CA7

No	REPAIR the circuit for high circuit resistance.

CA7 CHECK FOR CORRECT IPC (INSTRUMENT PANEL CLUSTER) OPERATION

Ignition OFF.

Disconnect and inspect the IPC connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the IPC connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

Yes	REFER to: Body Control Module (BCM) .

No	GO to CB3

CB3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE

Check the battery condition and verify the battery is fully charged. REFER to: BATTERY, MOUNTING AND CABLES .

Is the battery OK and fully charged?

Yes	GO to CB4

No	If the battery is discharged, DIAGNOSE the cause of the low battery condition. REFER to: BATTERY, MOUNTING AND CABLES .

CB4 CHECK THE ICM (INFORMATION CENTER MODULE) VOLTAGE SUPPLY

Ignition OFF.

Disconnect ICM C2114 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2114-1		Ground

Is the voltage within 0.2 volt of the recorded battery voltage?

Yes	GO to CB5

No	REPAIR the circuit for high circuit resistance.

CB5 CHECK THE ICM (INFORMATION CENTER MODULE) GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2114-1		C2114-4

Is the voltage greater than 11 volts?

Yes	GO to CB6

No	REPAIR the circuit for high circuit resistance.

CB6 CHECK FOR CORRECT ICM (INFORMATION CENTER MODULE) OPERATION

Ignition OFF.

Disconnect and inspect the ICM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the ICM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new ICM. REFER to: Information Center Module (ICM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST CC : U3003:17

Normal Operation and Fault Conditions

IPC DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	Sets in the IPC in continuous memory if the IPC detects battery voltage above 16 volts on the voltage supply circuit for 5 seconds or longer.

Possible Sources

- Charging system concern
- IPC

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST CC : U3003:17 > PINPOINT TEST CC : U3003:17

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

CC1 CHECK FOR OVERCHARGING DIAGNOSTIC TROUBLE CODES (DTCS) SET IN OTHER MODULES

Ignition ON.

Using a diagnostic scan tool, perform self-test on all modules.

Retrieve the continuous memory DTCs from all modules.

Are any overcharging Diagnostic Trouble Codes (DTCs) set in more than one module?

Yes	DIAGNOSE the overcharging condition. Refer to the appropriate article for the procedure.

No	GO to CC2

CC2 CHECK THE BATTERY VOLTAGE

Turn off all interior/exterior lights and accessories.

Start and run the engine at approximately 2, 000 RPM for 3 minutes while monitoring the battery voltage.

Does the battery voltage rise to 15.5 volts or higher?

Yes	DIAGNOSE the overcharging condition. Refer to the appropriate article for the procedure.

No	GO to CC3

CC3 RECHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U3003:17

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, clear the continuous memory DTCs.

Carry out the IPC self-test.

Is DTC U3003:17 present?

Yes	INSTALL a new IPC. REFER to: Instrument Panel Cluster (IPC) .

No	The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST CD : U3003:17

Normal Operation and Fault Conditions

ICM DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	Sets in the ICM in continuous memory if the ICM detects battery voltage above 16 volts on the voltage supply circuit for 5 seconds or longer.

Possible Sources

- Charging system concern
- ICM

DIAGNOSIS AND TESTING > INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES > PINPOINT TESTS > PINPOINT TEST CD : U3003:17 > PINPOINT TEST CD : U3003:17

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

CD1 CHECK FOR OVERCHARGING DIAGNOSTIC TROUBLE CODES (DTCS) SET IN OTHER MODULES

Ignition ON.

Using a diagnostic scan tool, perform self-test on all modules.

Retrieve the continuous memory DTCs from all modules.

Are any overcharging Diagnostic Trouble Codes (DTCs) set in more than one module?

Yes	DIAGNOSE the overcharging condition. Refer to the appropriate article for the procedure.

No	GO to CD2

CD2 CHECK THE BATTERY VOLTAGE

Turn off all interior/exterior lights and accessories.

Start and run the engine at approximately 2, 000 RPM for 3 minutes while monitoring the battery voltage.

Does the battery voltage rise to 15.5 volts or higher?

Yes	DIAGNOSE the overcharging condition. Refer to the appropriate article for the procedure.

No	GO to CD3

CD3 RECHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U3003:17

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, clear the continuous memory DTCs.

Carry out the ICM self-test.

Is DTC U3003:17 present?

Yes	INSTALL a new ICM. REFER to: Information Center Module (ICM) .

No	The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

GENERAL PROCEDURES > SEATBELT MINDER DEACTIVATING ACTIVATING

Activation

WARNING: Before beginning any service procedure in this article, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

NOTE: The driver and passenger seat Belt-Minder ® deactivating/activating can be carried out using a diagnostic scan tool.

NOTE: If you are using a MyKey ® programmed key, the Belt-Minder ® cannot be disabled and does not time out after 5 minutes. If the Belt-Minder ® has been previously disabled, it is re-enabled when a MyKey ® programmed key is used.

NOTE: The driver and front passenger Belt-Minder ® are deactivated/activated independently. When deactivating/activating one seating position, do not buckle the other position.

1.

Apply the parking brake before deactivating/activating the Belt-Minder ®.

2.

Place the selector lever in Park (P) (automatic transmission) or Neutral (N) (manual transmission).

3.

Place the ignition OFF.

4.

Unbuckle the driver and the front passenger safety belts.

5.

Place the ignition in RUN (do not start the engine).

6.

Wait until the safety belt warning indicator turns off (approximately 1 minute).

> *NOTE: Buckle and unbuckle the safety belt at a moderate rate. If the safety belt buckle/unbuckle/buckle sequence is carried out too quickly, the RCM can fail to recognize one of the sequences and the procedure must be repeated.*

> *NOTE: Steps 7 and 8 must be completed within 30 seconds after the safety belt warning indicator turns off (step 6).*

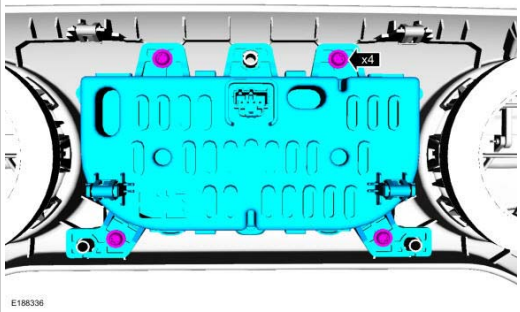
7.
For the seating position to be disabled, buckle then unbuckle the safety belt 3 times at a moderate speed, ending with the safety belt in the unbuckled state. After this step the safety belt warning indicator turns off.

> *NOTE: As confirmation of enabling or disabling the Belt-Minder ®, the safety belt warning indicator, beginning with the safety belt warning indicator in the off state, flashes for 4.5 seconds.*

8.
Within 7 seconds of the indicator turning off, buckle then unbuckle the safety belt at a moderate speed.

9.

After confirmation, the deactivation/activation procedure is complete.



REMOVAL AND INSTALLATION > INFORMATION CENTER MODULE (ICM) > REMOVAL

1.

Remove the instrument panel center finish panel. Refer to: Instrument Panel Center Finish Panel

2.

Remove the screws and the ICM.

REMOVAL AND INSTALLATION > INFORMATION CENTER MODULE (ICM) > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CLUSTER (IPC)

Special Tool(s) / General Equipment

Interior Trim Remover

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CLUSTER (IPC) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

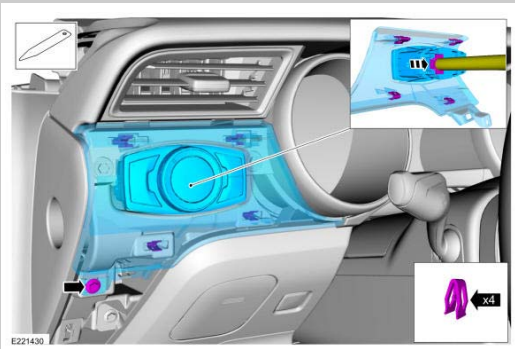
NOTE: If installing a new module, it is necessary to upload the module configuration information to the scan tool prior to removing the module. This information must be downloaded into the new module after installation.

1.
Using a diagnostic scan tool, begin the PMI process for the IPC following the on-screen instructions. Record the odometer value from the original IPC. If the odometer value cannot be obtained from the IPC (display failure), perform the diagnostic routine. If the value cannot be obtained after the diagnostic routine, the customer should supply the approximate odometer value.

2.

Remove the instrument panel center finish panel. Refer to: Instrument Panel Center Finish Panel .

3.

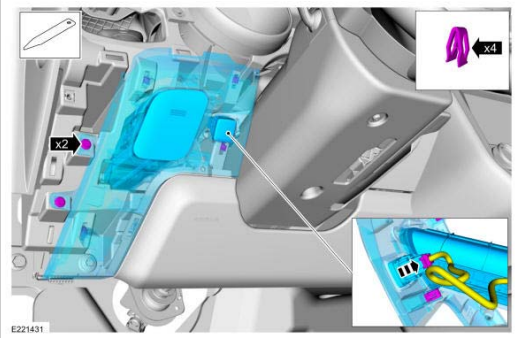


Release the clips and remove LH instrument panel trim panel. Use the General Equipment: Interior Trim Remover

4.

Remove the bolts, release the clips and remove the lighting switch panel.

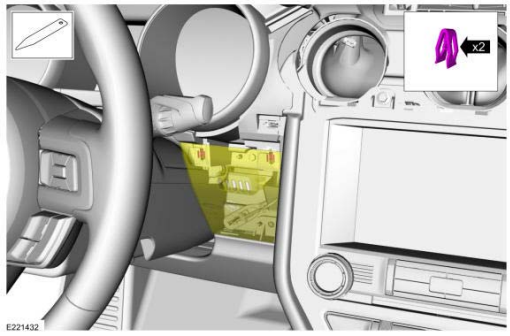
Disconnect the electrical connector. Use the General Equipment: Interior Trim Remover



5.

Remove the bolt, release the clips and remove the LH finish panel.

Disconnect the electrical connector.

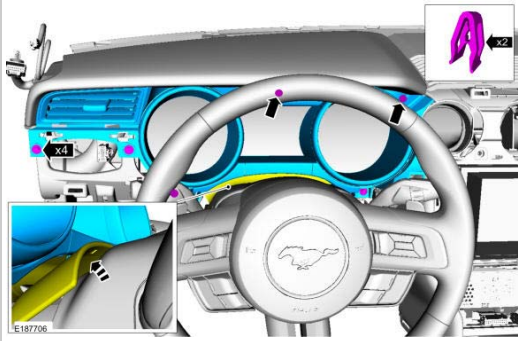


Torque

: 27 lb.in (3 Nm)

6.

Release the clips and position aside the lower instrument panel cover. Use the General Equipment: Interior Trim Remover



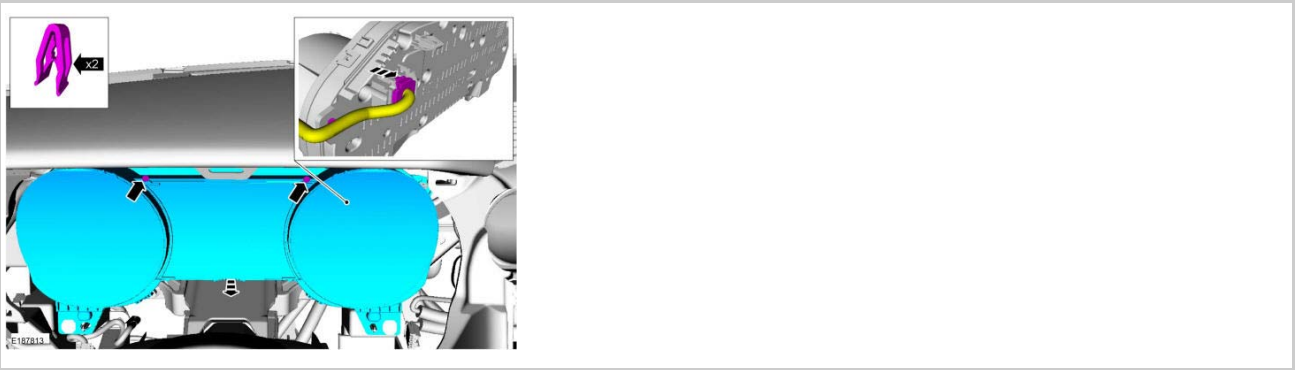
7.

Remove the bolts, release the clips and remove the IPC trim panel.

Detach the gap hider from the upper steering column trim cover.

Torque

: 22 lb.in (2.5 Nm)



8.

Remove the bolts, release the clips and remove the IPC.

Disconnect the electrical connector.

Torque

: 16 lb.ft (22 Nm)

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CLUSTER (IPC) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Using a diagnostic scan tool, complete the PMI process for the IPC following the on-screen instructions.

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CLUSTER (IPC) LENS > REMOVAL

1.

Remove the IPC. Refer to: Instrument Panel Cluster (IPC) .

2.

Remove the screws, release the tabs and remove the IPC lens.

REMOVAL AND INSTALLATION > INSTRUMENT PANEL CLUSTER (IPC) LENS >

INSTALLATION

1.

To install, reverse the removal procedure.

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > INSPECTION AND VERIFICATION

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
Damaged or contaminated accessory drive belt Damaged or contaminated pulley(s) Incorrect accessory drive belt Incorrect fitment of the accessory drive belt Generator Air conditioning (A/C) compressor Pulley(s) Loose hardware

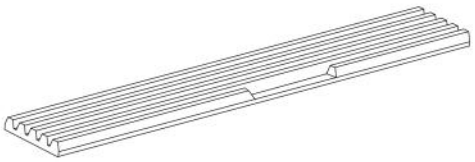
3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > ACCESSORY DRIVE BELT CONCERNS

NOTE: Do not lubricate the accessory drive belt as potential damage to the accessory drive belt material construction may occur.

Cracking



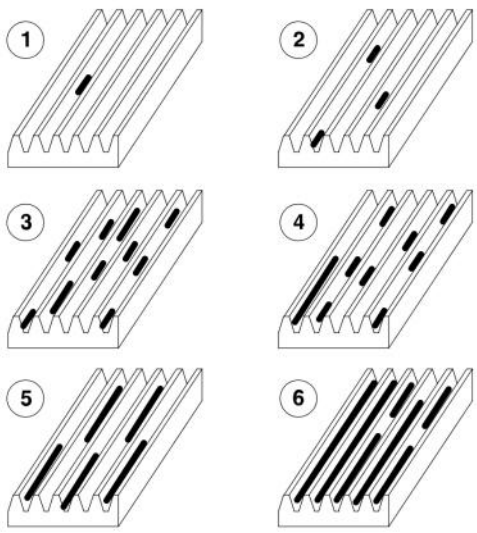
Accessory drive belts are made from rubber which hardens with time and can develop cracks. As the accessory drive belt runs on the back of some of the pulleys, the cracks are opened up. Small cracks are not considered to be a failure of the accessory drive belt. Only if the crack is deep enough to reach the bottom of the groove to expose the cord or any chunks are found to be missing from the accessory drive belt, is the accessory drive belt condition considered to be unacceptable.

1.

Check the accessory drive belt for cracks. If the damage exceeds the acceptable limit, install a new accessory drive belt. REFER to: Accessory Drive Belt .

Chunking

Chunking describes the condition where long lengths of rubber become detached from the ribs of the accessory drive belt. This is considered to be a failure of the accessory drive belt.



MPZ9632071

2.

Check the accessory drive belt for damage. If any chunks are found to be missing, install a new accessory drive belt. REFER to: Accessory Drive Belt .

Pilling

Pilling is dust that forms in between the ribs of the accessory drive belt from rubber that is worn off the accessory drive belt when it is new. There may also be loose particles left on the accessory drive belt during the manufacturing process. These are worn off and form into small balls of rubber that then get trapped in the grooves of the accessory drive belt. This condition will usually clear itself within 4800 km - 8000 km (3000 miles - 5000 miles) of normal driving.

VUE0037805

3.

Check the accessory drive belt for pilling. The condition of the accessory drive belt should be compared against the illustration.

1.

Small scattered pills. Not considered a concern. No action required.

2.

Small scattered pills. Not considered a concern. No action required.

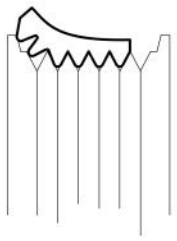
3.

Longer pills up to 50% of the rib height. Possible noise concern. INSTALL a new accessory drive belt if noise is apparent. REFER to: Accessory Drive Belt .

4.

Longer pills up to 50% of the rib height. Possible noise concern. INSTALL a new accessory drive belt if noise is apparent. REFER to: Accessory Drive Belt .

5.



Heavy deposits in the grooves. Possible noise and stability concern. INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt .

6.

Heavy deposits in the grooves. Possible noise and stability concern. INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt .

Incorrect fitment

Accessory drive belt noise can be generated by the accessory drive belt being incorrectly fitted on the pulley as shown in the following illustration. Make sure that all the V grooves on the accessory drive belt contact correctly with the pulley.

VUE0037806

4.

If the cause is not visually evident, verify the symptom and refer to the Symptom Chart .

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > SYMPTOM CHART

Symptom	Possible Sources	Action
Accessory drive belt noise	Accessory drive system	Use a stethoscope or other listening device to determine the source of the noise. INSTALL new

		components as necessary. TEST the system for normal operation.
Accessory drive belt incorrectly installed.		CHECK the accessory drive belt is correctly installed in the pulley grooves. INSTALL a new accessory drive belt as necessary. REFER to: Accessory Drive Belt . TEST the system for normal operation.
Pulley(s).		CHECK the pulley(s) for damage, freedom of rotation, stone entrapment and alignment. INSTALL new components as necessary. TEST the system for normal operation.
Lubricant or other contamination.		CHECK the accessory drive belt for contamination or damage. RECTIFY the source of the leak and INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt . TEST the system for normal operation.
NOTE: Chirp is defined as a twittering noise, often intermittent Accessory drive belt chirp	Pulley misalignment (usually evident at idle).	CHECK that the accessory drive belt is running centrally on the flat pulleys. TEST the system for normal operation. CHECK the pulleys for excessive end float and bent flanges. With the engine running at idle, use a stethoscope to identify the source of the noise. INSTALL new components as necessary. TEST the system for normal operation.
NOTE: Rattle is defined as a metallic knocking noise Accessory drive belt rattle	Loose components or hardware.	CHECK the components or hardware for correct installation and tighten as necessary. TEST the system for normal operation.

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > COMPONENT TESTS

Accessory Drive Belt Tensioner - Static Check

The accessory drive belt tensioner may be checked statically as follows:

1.

Inspect the area surrounding the accessory drive belt tensioner for lubricant or other contamination. Rectify any leaks before installing a new accessory drive belt tensioner. If the accessory drive belt tensioner is contaminated, do not attempt to clean it as the damping mechanism inside may be damaged. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

2.

Detach the accessory drive belt in the area of the accessory drive belt tensioner.

NOTE: The accessory drive belt tensioner has a damping feature, which is usually a friction device, therefore some friction within the system is normal.

3.
Using the correct tool, move the accessory drive belt tensioner from its relaxed position through its full stroke and back to the relaxed position to make sure there is no excessive stick, grab or bind, and to make sure there is tension on the accessory drive belt tensioner spring.

4.

Rotate the accessory drive belt tensioner pulley and check for damage, freedom of rotation and alignment. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

5.

If the accessory drive belt tensioner meets the above criteria, proceed to test the accessory drive belt tensioner dynamically. If the accessory drive belt tensioner does not meet the above criteria, INSTALL a new accessory drive belt tensioner. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

Accessory Drive Belt Tensioner - Dynamic Check

The accessory drive belt tensioner may be checked dynamically as follows:

1.

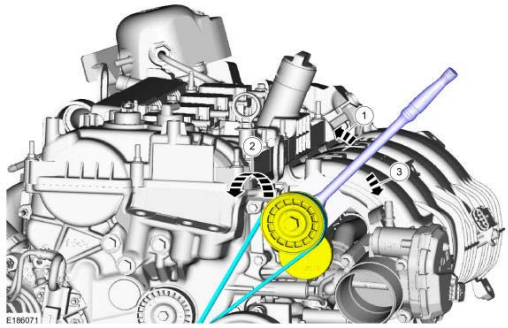
With the engine running, observe the accessory drive belt tensioner movement. The accessory drive belt tensioner should move (respond) when the engine is accelerated rapidly or when the A/C clutch cycles ON and OFF (the degree of movement can be up to 4 mm). If the accessory drive belt tensioner movement is not constant without engine acceleration or A/C clutch cycling, a pulley or shaft is possibly bent, out of round, or the damping mechanism inside the accessory drive belt tensioner may be damaged. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

2.

Excessive accessory drive belt ride out (uneven depth of grooves in the accessory drive belt) may cause excessive accessory drive belt tensioner movement. Check the condition by installing a new accessory drive belt. REFER to: Accessory Drive Belt .

TEST the system for normal operation.



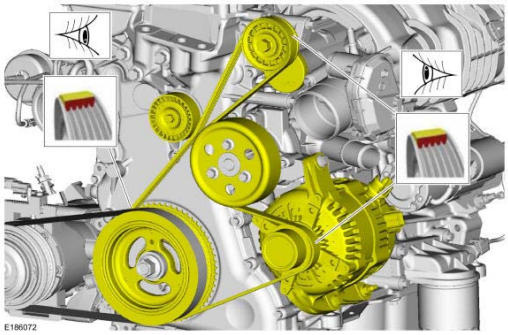
REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > REMOVAL

1.

Remove the A/C belt. Refer to: Air Conditioning (A/C) Compressor Belt .

2.

Rotate the accessory drive belt tensioner counter clockwise and remove the accessory drive belt.



REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > INSTALLATION

1.

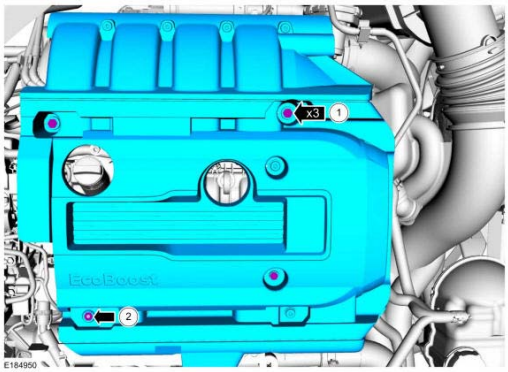
To install, reverse the removal procedure.

2.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.



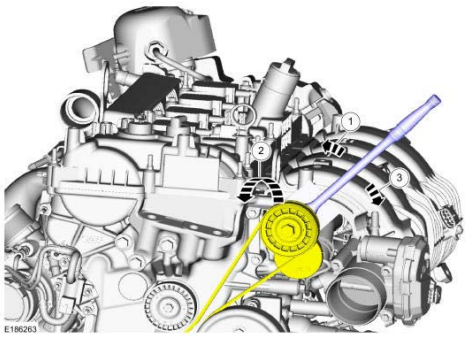
1.

Remove the bolts, nut and the engine appearance cover.

Torque:

1.: 53 lb.in (6 Nm)

2.: 89 lb.in (10 Nm)

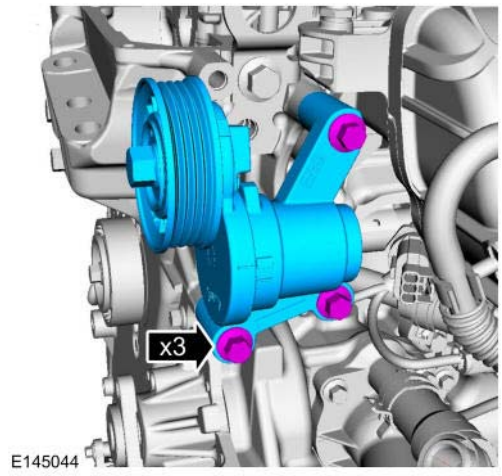


2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

3.

Rotate the accessory drive belt tensioner counter clockwise and position aside the accessory drive belt.

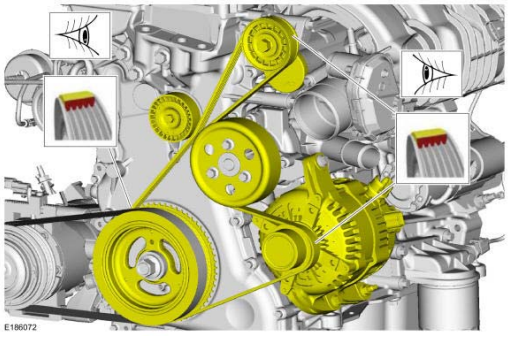


4.

Remove the bolts and the accessory drive belt tensioner.

Torque

: 18 lb.ft (25 Nm)



REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > INSTALLATION

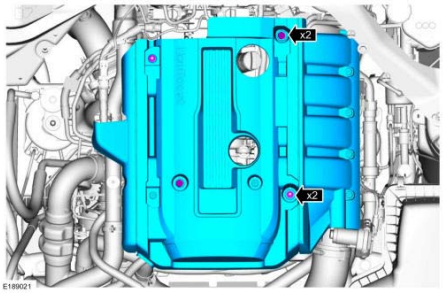
1.

To install, reverse the removal procedure.

2.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT



Special Tool(s) / General Equipment

Cable Ties

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > REMOVAL

1.

Remove the bolts and nuts and the engine appearance cover.

2.

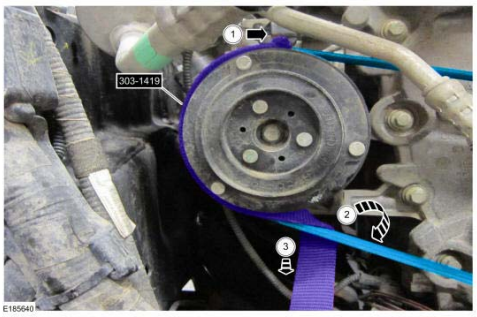
Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

NOTE: Typical application shown in illustration.

3.
Remove the A/C compressor belt.

1.

Turn the crankshaft pulley bolt clockwise and feed the stretchy belt tool on to the A/C

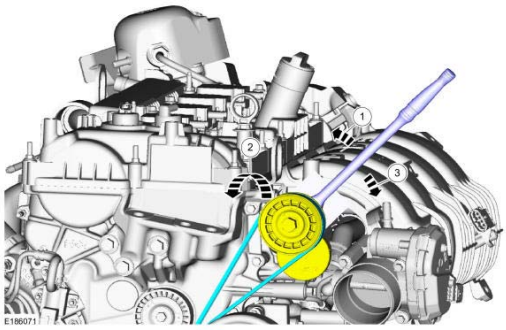


compressor pulley approximately 180°.

2.

Fold the stretchy belt tool under the inside of the A/C compressor belt as shown in illustration.

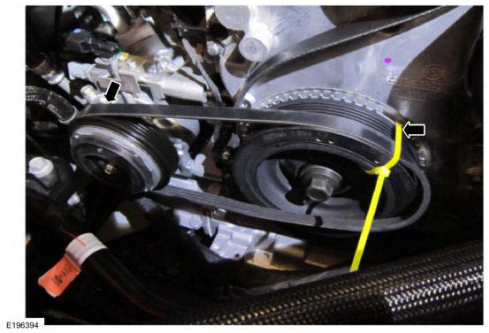
3.



In one quick motion, firmly pull the stretchy belt tool and remove the A/C compressor belt.

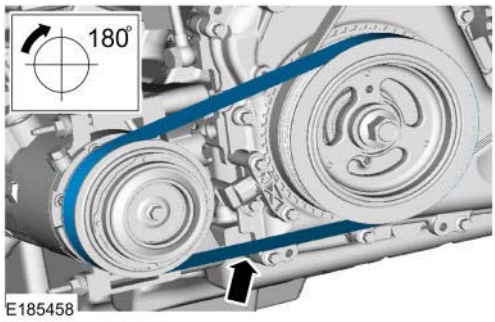
REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > INSTALLATION

1.



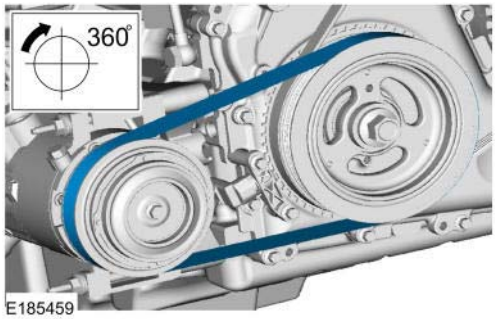
Remove the accessory drive belt from the accessory drive belt tensioner. Position the belt away from the crankshaft pulley.

NOTE: After installation, make sure the A/C compressor belt is correctly seated on the crankshaft and A/C compressor pulleys.



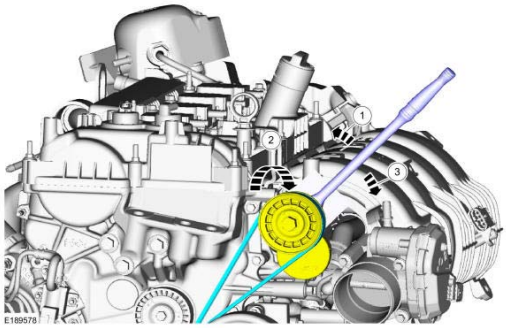
2.
Position the A/C compressor belt onto the A/C compressor pulley. Position the A/C compressor belt on top of the crankshaft pulley and feed a cable tie with a minimum width of 3 mm (0.12 in) through the crankshaft pulley spokes, then up and over the A/C compressor belt and tighten the cable tie as shown in illustration.

Use the General Equipment: Cable Ties



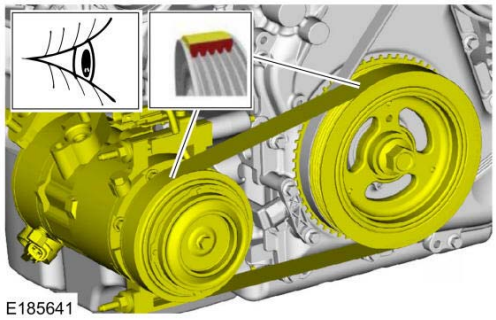
3.

Rotate the crankshaft pulley by hand 180° and install the A/C compressor belt.



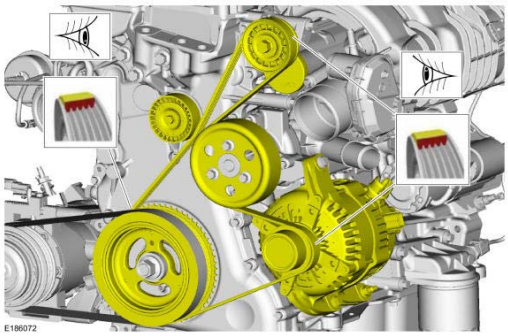
4.

Remove the cable tie and rotate the crankshaft by hand 360° to verify the A/C compressor belt has correctly seated onto the crankshaft and A/C compressor pulleys.



5.

Install accessory drive belt.



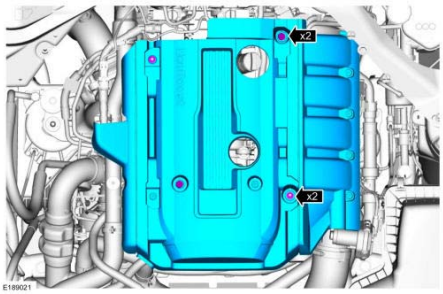
6.

After installation, make sure the A/C compressor belt is correctly seated on all pulleys.

7.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

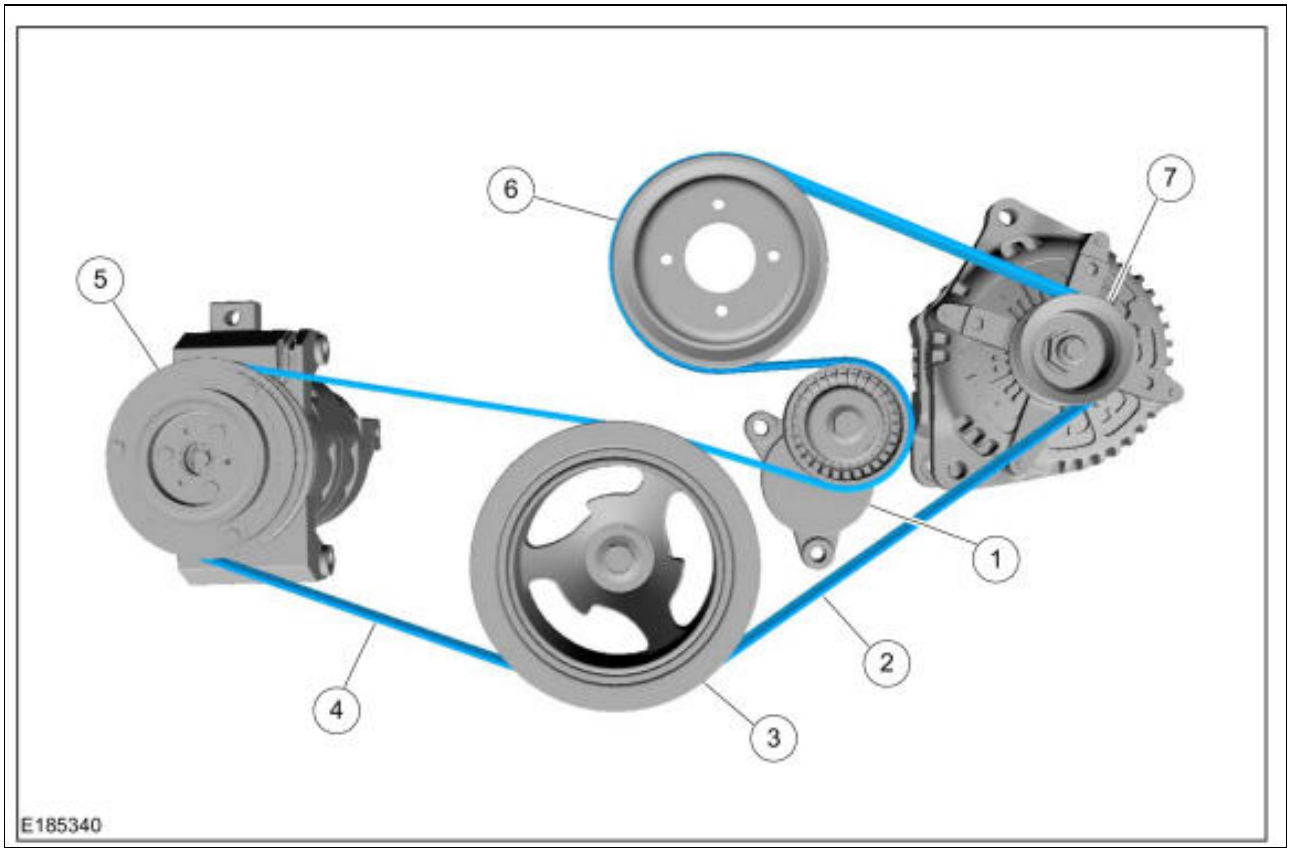
8.



Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

9.

Install the bolts and nuts and the engine appearance cover.



Torque

: 80 lb.in (9 Nm)

2.

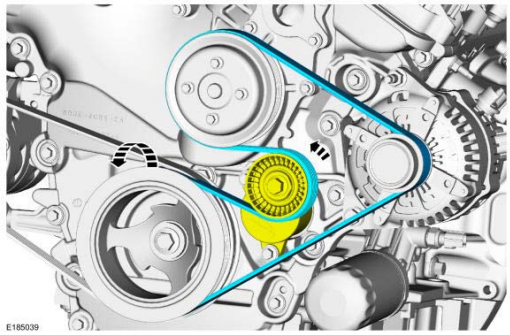
Excessive accessory drive belt rideout (uneven depth of grooves in the accessory drive belt) may cause excessive accessory drive belt tensioner movement. Check the condition by installing a new accessory drive belt. REFER to: Accessory Drive Belt .

TEST the system for normal operation.



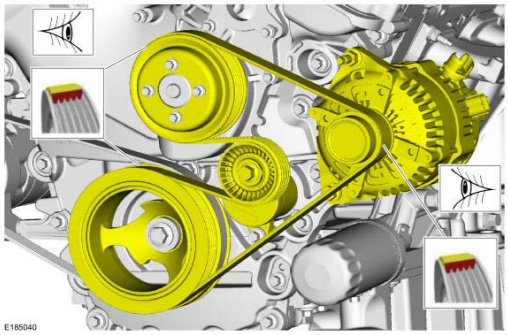
REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > REMOVAL

1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

2.

Rotate the accessory drive belt tensioner counter clockwise and remove the accessory drive belt.



REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > INSTALLATION

1.

To install, reverse the removal procedure.

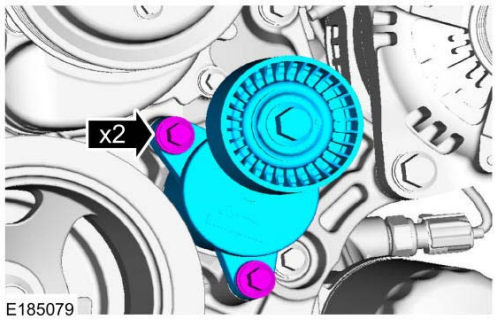
2.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



Remove the accessory drive belt. Refer to: Accessory Drive Belt .

2.

Remove the bolts and the accessory drive belt tensioner.

Torque

: 18 lb.ft (25 Nm)

REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT

Special Tool(s) / General Equipment

Chart Ties

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > REMOVAL

NOTE: Under no circumstances should the A/C compressor belt, accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the A/C compressor belt, accessory drive belt or pulleys.

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

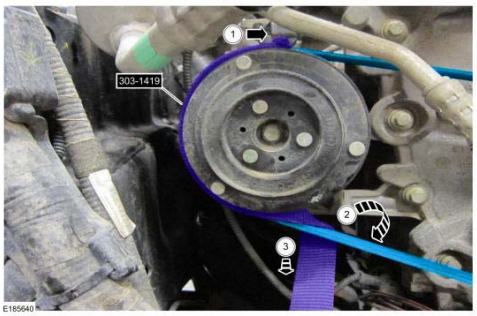
2.

Remove the accessory drive belt. Refer to: Accessory Drive Belt .

NOTE: Typical application shown in illustration.

3.
Remove the A/C compressor belt.

1.



Turn the crankshaft pulley bolt clockwise and feed the stretchy belt tool on to the A/C compressor pulley approximately 180°.

2.

Fold the stretchy belt tool under the inside of the A/C compressor belt as shown in illustration.

3.

In one quick motion, firmly pull the stretchy belt tool and remove the A/C compressor belt.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > INSTALLATION

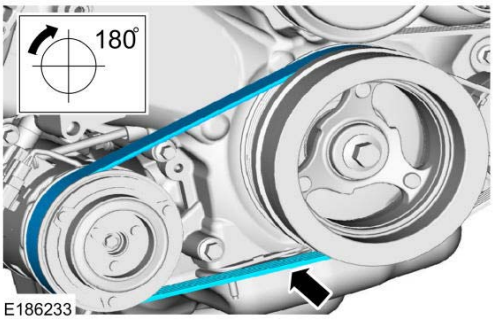
NOTE: Make sure the A/C compressor belt is correctly seated on the A/C compressor pulley.

1.
Position the A/C compressor belt in 3 stages.

Stage 1: Slide the A/C compressor belt between the crankshaft pulley and the accessory drive belt tensioner.

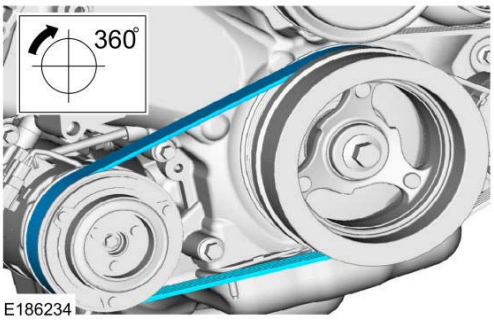
Stage 2: Position the A/C compressor belt behind the crankshaft pulley with the accessory drive belt ribs facing towards the front of the vehicle.

Stage 3: Position the A/C compressor belt onto the A/C compressor pulley with the lower portion of the accessory drive belt ribs facing towards the front of the vehicle and above the oil pan as shown in illustration.



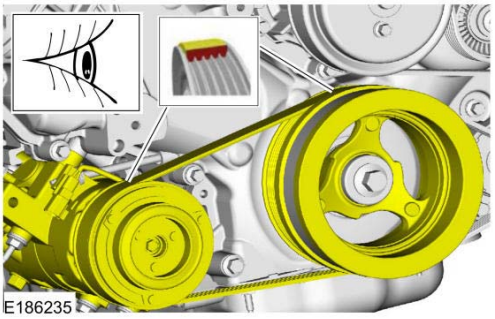
NOTE: After installation, make sure the A/C compressor belt is correctly seated on the crankshaft and A/C compressor pulleys.

2.
Position the A/C compressor belt onto the top of the crankshaft pulley and feed a cable tie with a minimum width of 3 mm (0.12 in) through the crankshaft pulley spokes, up and over the A/C compressor belt and tighten the cable tie. Use the General Equipment: Cable Ties



NOTE: The A/C compressor belt must be above the oil pan flange or damage to the A/C compressor belt and engine can occur.

3.
With the A/C compressor belt positioned above the oil pan flange, rotate the crankshaft by hand clockwise 180°.



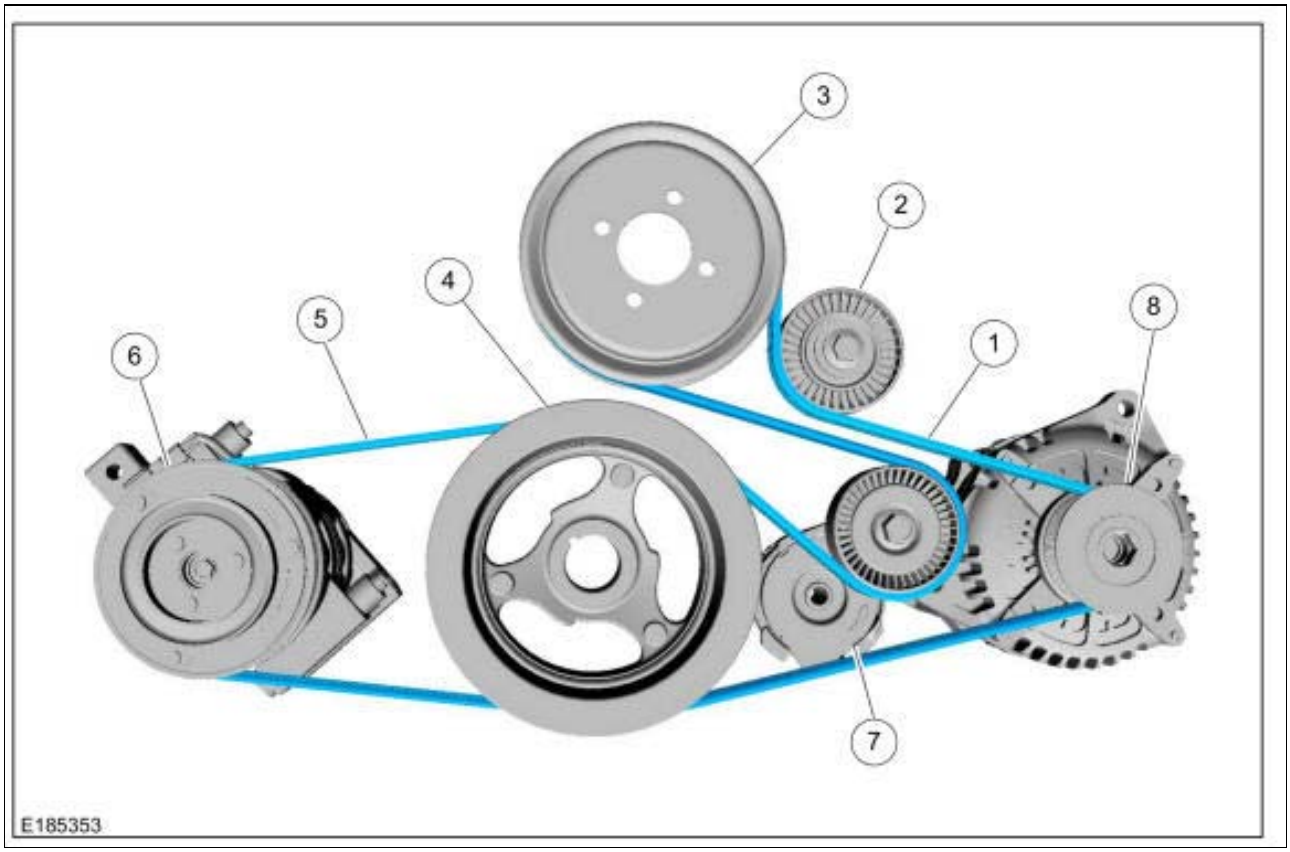
4.

Remove the cable tie and rotate the crankshaft clockwise by hand 360° to verify the A/C compressor belt has correctly seated onto the crankshaft and A/C compressor pulleys.

5.

After installation, make sure the A/C compressor belt is correctly seated on all pulleys.

6.



Install the accessory drive belt. Refer to: Accessory Drive Belt .

7.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

8	Generator pulley

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > INSPECTION AND VERIFICATION

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
Damaged or contaminated accessory drive belt Damaged or contaminated pulley(s) Incorrect accessory drive belt Incorrect fitment of the accessory drive belt Generator Air conditioning (A/C) compressor Pulley(s) Loose hardware

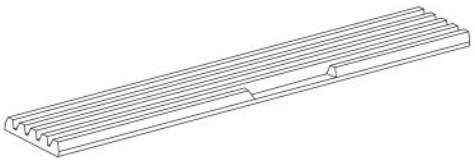
3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > ACCESSORY DRIVE BELT CONCERNS

NOTE: Do not lubricate the accessory drive belt as potential damage to the accessory drive belt material construction may occur.

Cracking



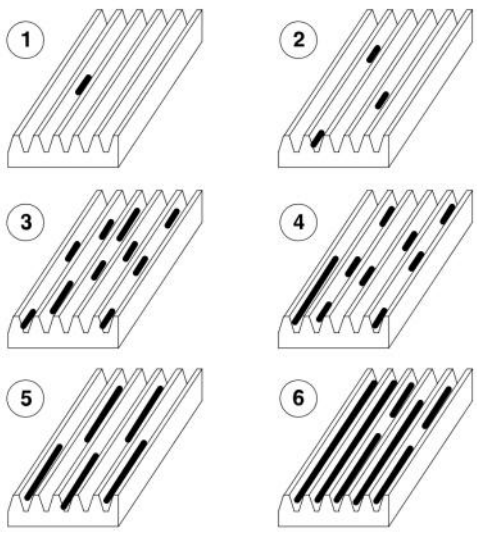
Accessory drive belts are made from rubber which hardens with time and can develop cracks. As the accessory drive belt runs on the back of some of the pulleys, the cracks are opened up. Small cracks are not considered to be a failure of the accessory drive belt. Only if the crack is deep enough to reach the bottom of the groove to expose the cord or any chunks are found to be missing from the accessory drive belt, is the accessory drive belt condition considered to be unacceptable.

1.

Check the accessory drive belt for cracks. If the damage exceeds the acceptable limit, install a new accessory drive belt. REFER to: Accessory Drive Belt .

Chunking

Chunking describes the condition where long lengths of rubber become detached from the ribs of the accessory drive belt. This is considered to be a failure of the accessory drive belt.



MPZ9632071

2.

Check the accessory drive belt for damage. If any chunks are found to be missing, install a new accessory drive belt. REFER to: Accessory Drive Belt .

Pilling

Pilling is dust that forms in between the ribs of the accessory drive belt from rubber that is worn off the accessory drive belt when it is new. There may also be loose particles left on the accessory drive belt during the manufacturing process. These are worn off and form into small balls of rubber that then get trapped in the grooves of the accessory drive belt. This condition will usually clear itself within 4800 km - 8000 km (3000 miles - 5000 miles) of normal driving.

VUE0037805

3.

Check the accessory drive belt for pilling. The condition of the accessory drive belt should be compared against the illustration.

1.

Small scattered pills. Not considered a concern. No action required.

2.

Small scattered pills. Not considered a concern. No action required.

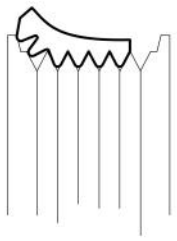
3.

Longer pills up to 50% of the rib height. Possible noise concern. INSTALL a new accessory drive belt if noise is apparent. REFER to: Accessory Drive Belt .

4.

Longer pills up to 50% of the rib height. Possible noise concern. INSTALL a new accessory drive belt if noise is apparent. REFER to: Accessory Drive Belt .

5.



Heavy deposits in the grooves. Possible noise and stability concern. INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt .

6.

Heavy deposits in the grooves. Possible noise and stability concern. INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt .

Incorrect fitment

Accessory drive belt noise can be generated by the accessory drive belt being incorrectly fitted on the pulley as shown in the following illustration. Make sure that all the V grooves on the accessory drive belt contact correctly with the pulley.

VUE0037806

4.

If the cause is not visually evident, verify the symptom and refer to the Symptom Chart .

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > SYMPTOM CHART

Symptom	Possible Sources	Action
Accessory drive belt noise	Accessory drive system	Use a stethoscope or other listening device to determine the source of the noise. INSTALL new

		components as necessary. TEST the system for normal operation.
Accessory drive belt incorrectly installed.		CHECK the accessory drive belt is correctly installed in the pulley grooves. INSTALL a new accessory drive belt as necessary. REFER to: Accessory Drive Belt . TEST the system for normal operation.
Pulley(s).		CHECK the pulley(s) for damage, freedom of rotation, stone entrapment and alignment. INSTALL new components as necessary. TEST the system for normal operation.
Lubricant or other contamination.		CHECK the accessory drive belt for contamination or damage. RECTIFY the source of the leak and INSTALL a new accessory drive belt. REFER to: Accessory Drive Belt . TEST the system for normal operation.
NOTE: Chirp is defined as a twittering noise, often intermittent Accessory drive belt chirp	Pulley misalignment (usually evident at idle).	CHECK that the accessory drive belt is running centrally on the flat pulleys. TEST the system for normal operation. CHECK the pulleys for excessive end float and bent flanges. With the engine running at idle, use a stethoscope to identify the source of the noise. INSTALL new components as necessary. TEST the system for normal operation.
NOTE: Rattle is defined as a metallic knocking noise Accessory drive belt rattle	Loose components or hardware.	CHECK the components or hardware for correct installation and tighten as necessary. TEST the system for normal operation.

DIAGNOSIS AND TESTING > ACCESSORY DRIVE > COMPONENT TESTS

Accessory Drive Belt Tensioner - Static Check

The accessory drive belt tensioner may be checked statically as follows:

1.

Inspect the area surrounding the accessory drive belt tensioner for lubricant or other contamination. Rectify any leaks before installing a new accessory drive belt tensioner. If the accessory drive belt tensioner is contaminated, do not attempt to clean it as the damping mechanism inside may be damaged. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

2.

Detach the accessory drive belt in the area of the accessory drive belt tensioner.

NOTE: The accessory drive belt tensioner has a damping feature, which is usually a friction device, therefore some friction within the system is normal.

3.
Using the correct tool, move the accessory drive belt tensioner from its relaxed position through its full stroke and back to the relaxed position to make sure there is no excessive stick, grab or bind, and to make sure there is tension on the accessory drive belt tensioner spring.

4.

Rotate the accessory drive belt tensioner pulley and check for damage, freedom of rotation and alignment. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

5.

If the accessory drive belt tensioner meets the above criteria, proceed to test the accessory drive belt tensioner dynamically. If the accessory drive belt tensioner does not meet the above criteria, INSTALL a new accessory drive belt tensioner. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

Accessory Drive Belt Tensioner - Dynamic Check

The accessory drive belt tensioner may be checked dynamically as follows:

1.

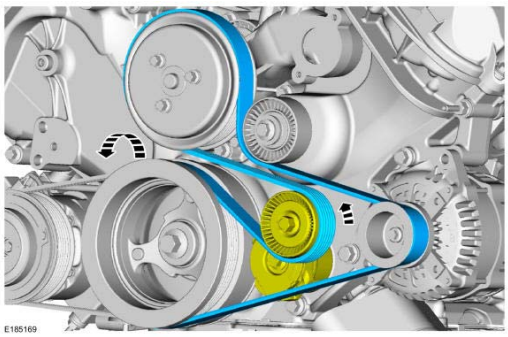
With the engine running, observe the accessory drive belt tensioner movement. The accessory drive belt tensioner should move (respond) when the engine is accelerated rapidly or when the A/C clutch cycles ON and OFF (the degree of movement can be up to 4 mm). If the accessory drive belt tensioner movement is not constant without engine acceleration or A/C clutch cycling, a pulley or shaft is possibly bent, out of round, or the damping mechanism inside the accessory drive belt tensioner may be damaged. INSTALL a new accessory drive belt tensioner as necessary. REFER to: Accessory Drive Belt Tensioner .

TEST the system for normal operation.

2.

Excessive accessory drive belt ride out (uneven depth of grooves in the accessory drive belt) may cause excessive accessory drive belt tensioner movement. Check the condition by installing a new accessory drive belt. REFER to: Accessory Drive Belt .

TEST the system for normal operation.



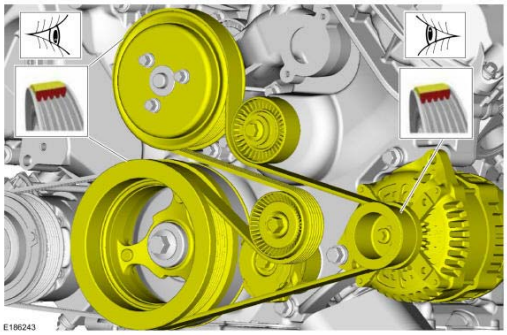
REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > REMOVAL

1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

2.

Rotate the accessory drive belt tensioner counter clockwise and remove the accessory drive belt.



REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT > INSTALLATION

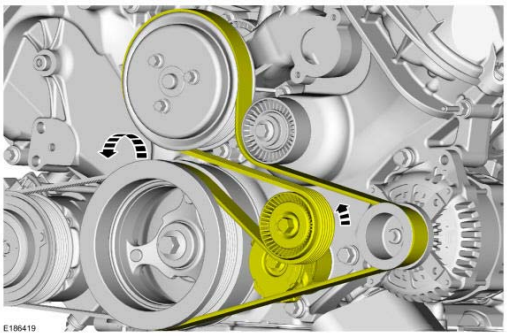
1.

To install, reverse the removal procedure.

2.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > REMOVAL



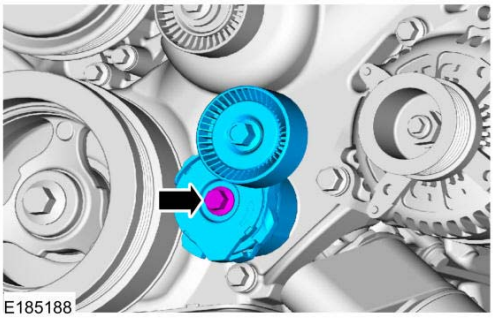
NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

2.

Rotate the accessory drive belt tensioner counter clockwise and position aside the accessory drive belt.

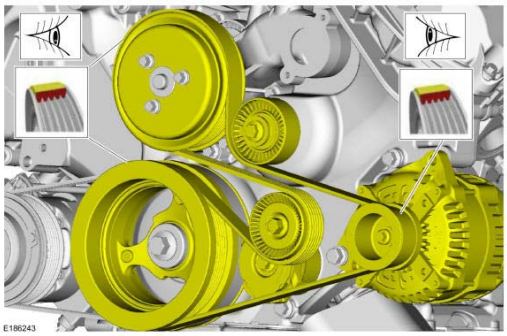


3.

Remove the bolt and the accessory drive belt tensioner.

Torque

: 35 lb.ft (48 Nm)



REMOVAL AND INSTALLATION > ACCESSORY DRIVE BELT TENSIONER > INSTALLATION

1.

To install, reverse the removal procedure.

2.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > REMOVAL

NOTE: Under no circumstances should the A/C compressor belt, accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the A/C

compressor belt, accessory drive belt or pulleys.

1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

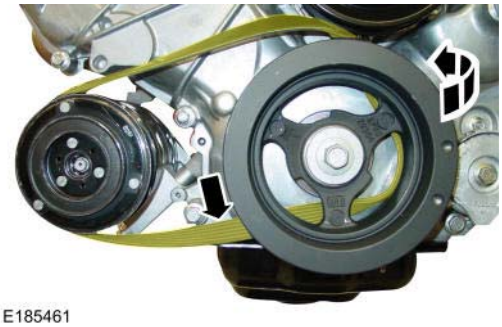
2.

Remove the accessory drive belt. Refer to: Accessory Drive Belt .

3.

Cut the A/C compressor belt and discard the belt.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR BELT > INSTALLATION



NOTE: Make sure the A/C compressor belt is correctly seated on the A/C compressor pulley.

1.
Position the A/C compressor belt in 3 stages.

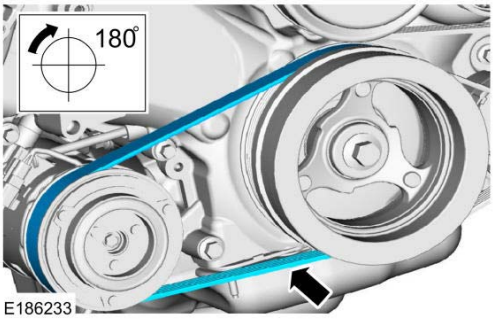
Stage 1: Slide the A/C compressor belt between the crankshaft pulley and the accessory drive belt tensioned.

Stage 2: Position the A/C compressor belt behind the crankshaft pulley with the accessory drive belt ribs facing towards the front of the vehicle.

Stage 3: Position the A/C compressor belt onto the A/C compressor pulley with the lower portion of the accessory drive belt ribs facing towards the front of the vehicle and above the oil pan as shown in illustration.

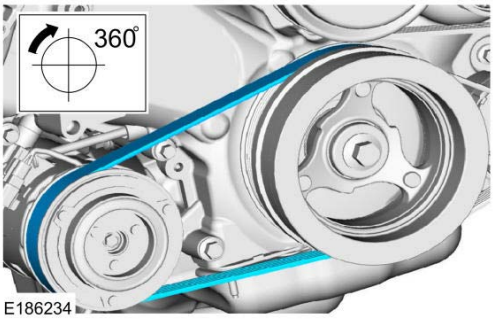
E185461

NOTE: After installation, make sure the A/C compressor belt is correctly seated on the crankshaft and A/C compressor pulleys.



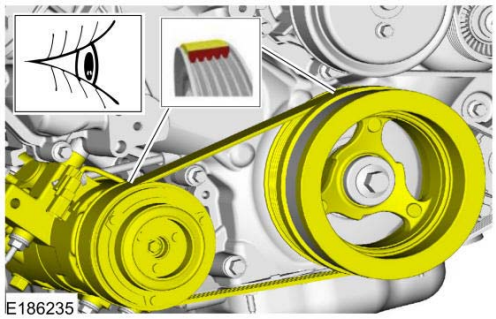
2.
Position the A/C compressor belt onto the top of the crankshaft pulley and feed a cable tie with a minimum width of 3 mm (0.12 in) through the crankshaft pulley spokes, up and over the A/C compressor belt and tighten the cable tie.

Use the General Equipment: Cable Ties



NOTE: The A/C compressor belt must be above the oil pan flange or damage to the A/C compressor belt and engine can occur.

3.
With the A/C compressor belt positioned above the oil pan flange, rotate the crankshaft by hand clockwise 180°.



4.

Remove the cable tie and rotate the crankshaft clockwise by hand 360° to verify the A/C compressor belt has correctly seated onto the crankshaft and A/C compressor pulleys.

5.

After installation, make sure the accessory drive belt is correctly seated on all pulleys.

6.

Install the accessory drive belt. Refer to: Accessory Drive Belt .

7.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

End play	0.0087-0.0177in (.22-.45mm)

CYLINDER HEAD

Item	Specification
Cylinder head flatness	0.08 mm (0.0031 in) maxim overall, a maximum of 0.05 mm (0.0020 in) within 150 mm (5.9055 in) and a maximum of 0.025 mm (0.0010 in) within 25 mm (0.9843 in)
Maximum valve lift @ zero lash (exhaust)	0.291in (7.4mm)
Maximum valve lift @ zero lash (intake)	0.327in (8.3mm)
Valve guide diameter	0.2169-0.2181in (5.509-5.539mm)
Valve seat width - intake	0.0650-0.0807in (1.65-2.05mm)
Valve seat width - exhaust	0.0728-0.0886in (1.85-2.25mm)
Valve seat angle	45°
Valve guide runout	0.001in (.029mm)
Valve tappet bore diameter	1.2205-1.2217in (31-31.03mm)
Cam bore diameter	0.9848-0.9858in (25.015-25.04mm)

VALVE

Item	Specification
Valve head diameter - intake	1.2795in (32.5mm)
Valve head diameter - exhaust	1.1811in (30mm)
Valve stem diameter - intake	0.2165in (5.5mm)
Valve stem diameter - exhaust	0.2165in (5.5mm)
Valve stem-to-guide clearance - intake	0.0012-0.0028in (.03-.07mm)

Valve stem-to-guide clearance - exhaust	0.0012-0.0028in (.03-.07mm)
Valve face runout	0.002in (.05mm)
Valve face angle	45-45.3°

Valve Spring Compression Pressure

Item	Specification
Intake and exhaust (installed)	40lb (180N)
Intake (valve open) 9.2 mm (0.3622 in) of lift	103lb (460N)
Exhaust (valve open) 9.2 mm (0.3622 in) of lift	103lb (460N)
Free length	1.8860in (47.904mm)
Assembled height	1.4921in (37.9mm)

VALVE TAPPET

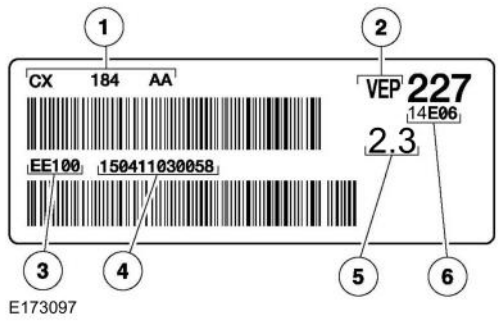
Item	Specification
Diameter	1.2197-1.2191in (30.98-30.964mm)
Tappet-to-valve clearance - intake	0.0075-0.0122in (.19-.31mm)
Tappet-to-valve clearance - exhaust	0.0118-0.0165in (.3-.42mm)
Tappet-to-bore clearance	0.0008-0.0024in (.02-.06mm)

CRANKSHAFT

Item	Specification
Lobe lift - intake	0.327in (8.3mm)
Lobe lift - exhaust	0.291in (7.4mm)
Runout	0.0012in (.03mm)
Thrust clearance	0.0045-0.0057in (.115-.145mm)
Journal diameter	0.9827-0.9835in (24.96-24.98mm)
Journal-to-bore clearance	0.0014-0.0031in (.035-.08mm)

DESCRIPTION AND OPERATION > ENGINE - OVERVIEW > OVERVIEW

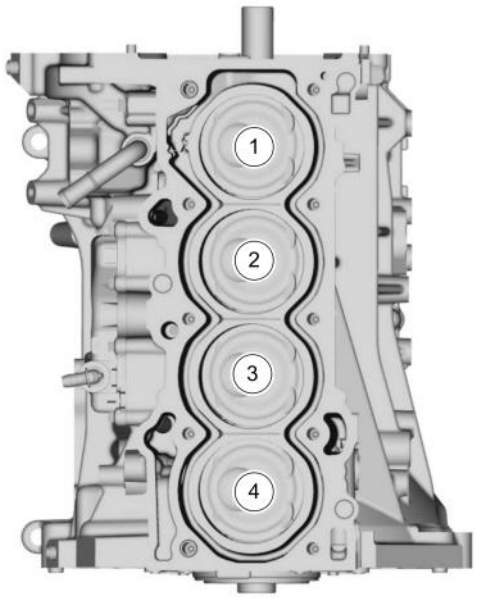
The 2.3L Gasoline Turbocharged Direct Injection (GTDI) 4-cylinder engine has the following features:



- Dual overhead camshafts

- Four valves per cylinder
- Composite intake manifold
- Aluminum cylinder head
- Aluminum cylinder block
- GTDI
- Twin Independent Variable Camshaft Timing (Ti-VCT)

Engine Identification



Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure the correct parts are obtained. The codes contain all the pertinent information relating to the dates, optional equipment and revisions.

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, timing chain tensioners, camshaft bearing caps and VCT solenoids. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the cylinder head gasket.

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is chain driven off of the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity

conditions.

- The relief valve is designed to provide adequate connecting rod bearing lubrication under high temperature and high-speed conditions.

Valve Train

The valve train uses Direct Acting Mechanical Buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Ti-VCT

The Ti-VCT system allows variable control of the valves closing which optimizes combustion at full load providing improved power and low speed torque (broadening the torque curve) which enables variable valve overlap which provides better fuel economy and emissions and provides optimized cold start operation with improved exhaust emissions.

Switchable Engine Mounts

The switchable engine mounts are a hydro dampening design to improve engine vibration at idle.

The switchable engine mounts consists of:

- 2 glycol filled engine mounts.
- Vacuum reservoir and vacuum solenoid switch mounted on the drivers side of the engine compartment frame rail.
- Vacuum hoses with check valves.

Vacuum On trigger is set when all three conditions are satisfied:

- Vehicle speed is below 20 MPH (drive) or vehicle speed is below 10 MPH. (reverse/neutral/park).
- Engine speed is between 360 RPM and 860 RPM.
- Run Time greater than 1.5 seconds.

Vacuum OFF trigger is set when:

- Engine speed is greater than 960 RPM.
- Engine speed is less than 260 RPM.
- Vehicle speed is greater than 22 MPH.

DIAGNOSIS AND TESTING > ENGINE

Engine

1.

For basic mechanical concerns, REFER to: ENGINE SYSTEM - GENERAL INFORMATION . For driveability concerns, Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

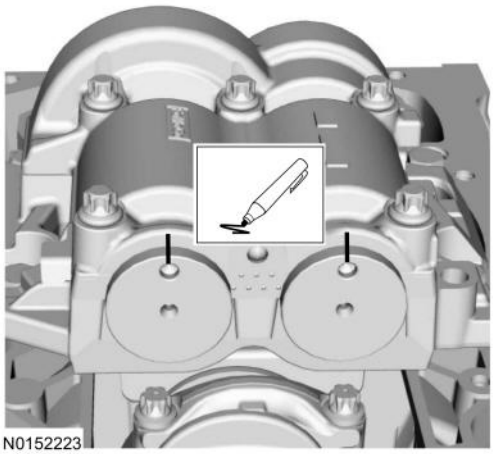
GENERAL PROCEDURES > BALANCE SHAFT BACKLASH

Special Tool(s) / General Equipment

 E139373	100-002 (TOOL-4 201-C) Holding Fixture with Dial Indicator Gauge
 PZ21210	303-507 Timing Peg, Crankshaft TDC TKIT-2001N-FLM TKIT-2001N-ROW

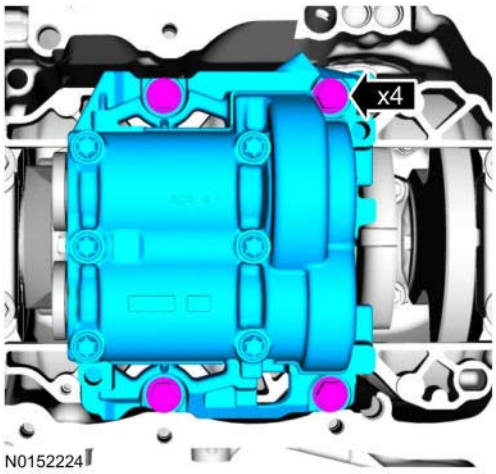
Check

1.



Install the special tool and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at TDC.

Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.



2.

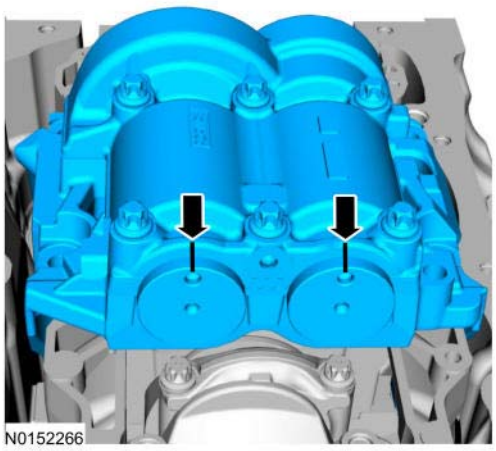
Mark the balancer unit and shafts on the top for reference that the balancer unit is at TDC.

NOTE: Due to the precision interior construction of the balancer unit, it should not be disassembled.

3.
Remove the bolts and the balance unit.

4.

Remove the adjustment shims from the seat faces of the balancer unit.



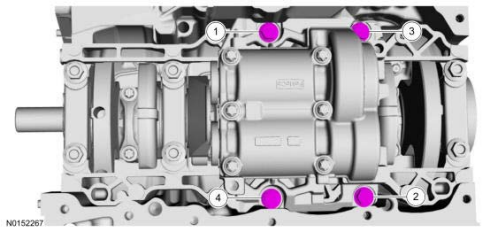
NOTE: Visually inspect the balancer unit gear for damage and verify that the shaft turns smoothly. If there is any damage or malfunction, replace the balancer unit.

5.
Install the master adjustment shims (No. 50) on the seat faces of the balancer unit.

6.

With the balancer unit shaft marks at the TDC position, slowly install the balancer unit to the

cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.

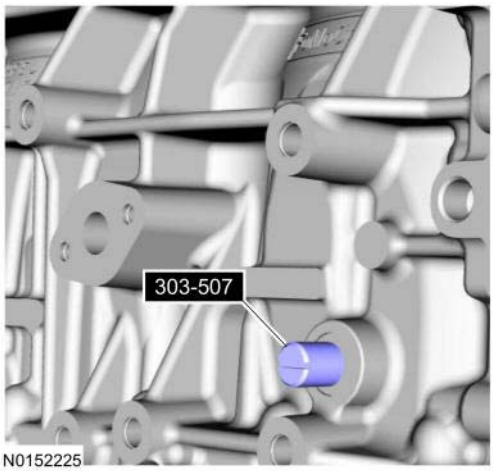


7.

Install the bolts and tighten.

Torque:

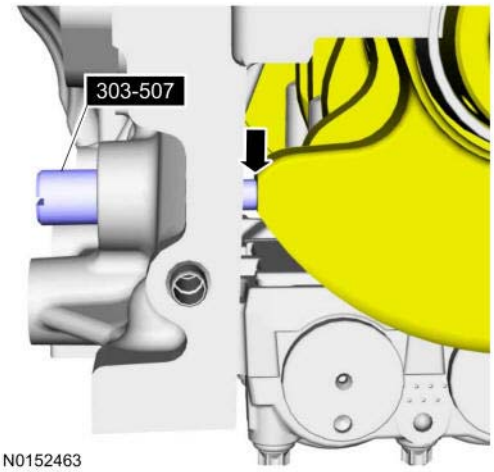
Stage 1: 18 lb.ft (25 Nm)



Stage 2: 31 lb.ft (42 Nm)

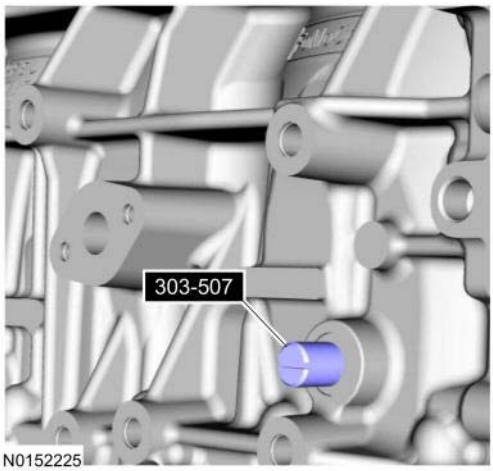
8.

Remove the special tool and rotate the crankshaft to confirm that there are no meshing problems between the balancer unit gear and the crankshaft gear.



Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

9.



Install the special tool and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at TDC.

Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

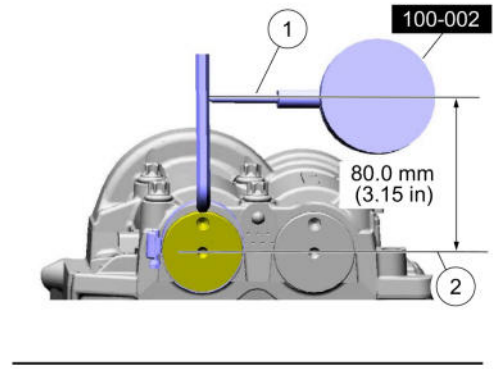
10.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

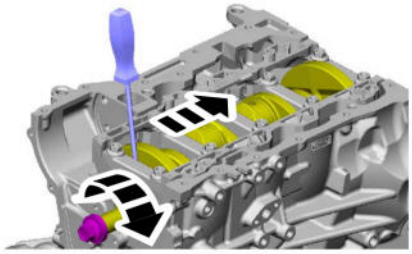
NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown in illustration below.

NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown in illustration. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

NOTE: Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.



11.



Position as shown in illustration. Measure the gear backlash.

Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.

Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.

E152011

NOTE: If maximum backlash exceeds 0.140 mm (0.0055 in), install a new balancer unit.

12.

Using the backlash measurement, select the proper shims from the Adjustment Shim Selection Table in illustration below.

Remove the balancer unit from the cylinder block.

Install the selected adjustment shims on the seat faces of the balancer unit.

ADJUSTMENT SHIM SELECTION TABLE

Backlash mm (in)	Selection shim (No.)	Shim thickness mm (in)	Backlash mm (in)	Selection shim (No.)	Shim thickness mm (in)

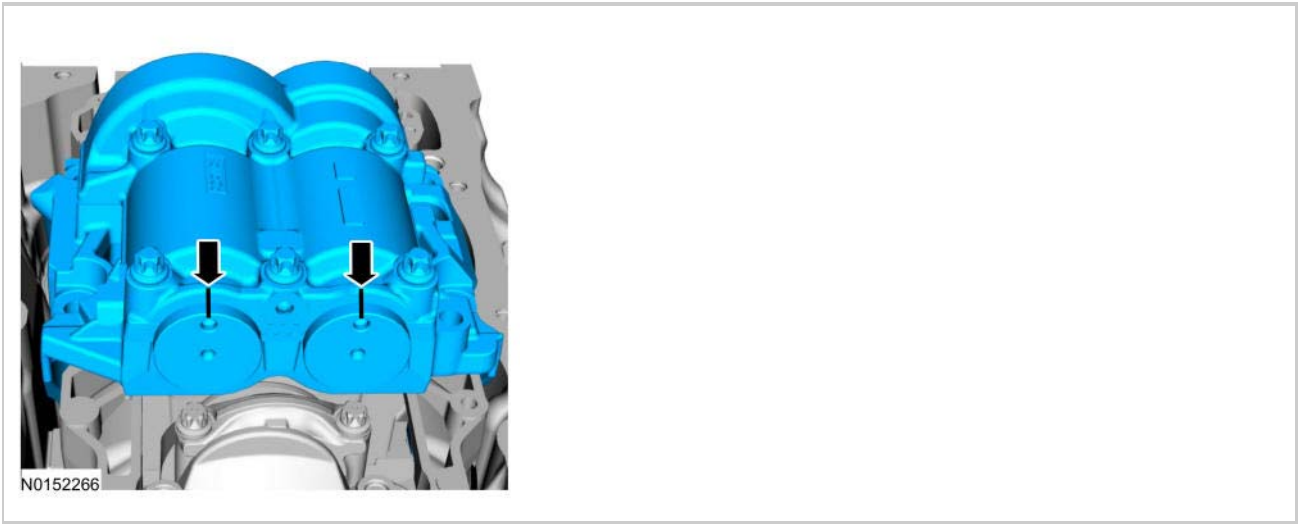
E152012

13.

Install the special tool and rotate the crankshaft slowly clockwise until the crankshaft balance

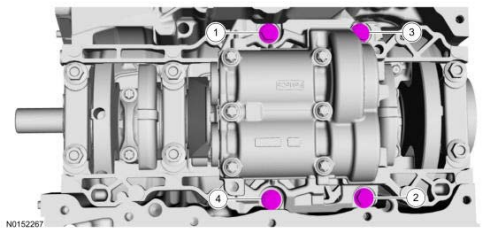


weight is up against the Crankshaft TDC Timing Peg. The engine is now at TDC.

Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

14.

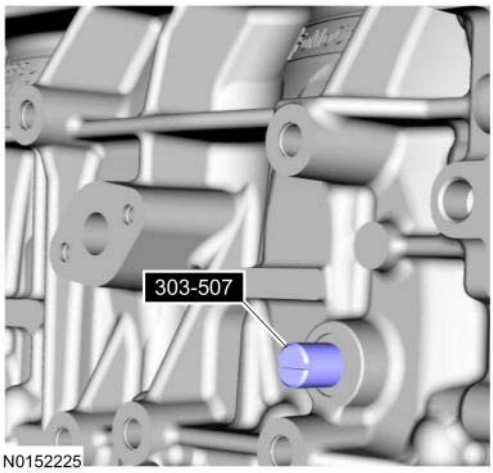
With the balancer unit shaft marks at the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.



15.

Install the bolts and tighten.

Torque:



Stage 1: 18 lb.ft (25 Nm)

Stage 2: 31 lb.ft (42 Nm)

16.

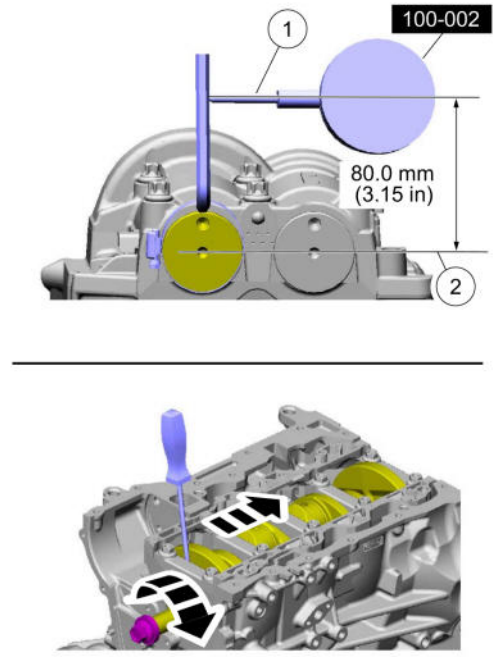
Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown in illustration below.

NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown in illustration. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

NOTE: Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

17.



Position as shown in illustration. Measure the gear backlash.

Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.

Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.

If the backlash exceeds the specified range of 0.040 to 0.140 mm (0.00157 to 0.0055 in), install a new balancer unit and repeat the procedure.

E152011

GENERAL PROCEDURES > VALVE CLEARANCE ADJUSTMENT

Special Tool(s) / General Equipment

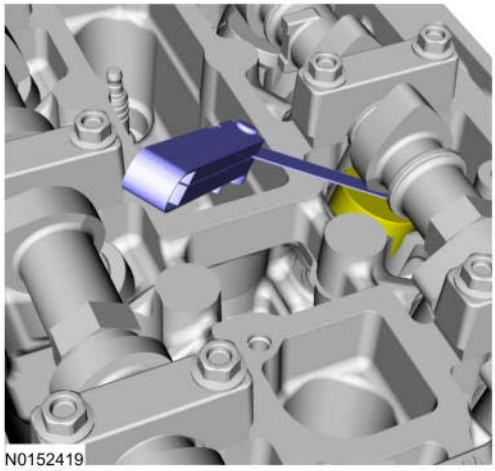
Feeler Gauge

Check

1.

Remove the valve cover. Refer to: Valve Cover .

2.



Remove the air cleaner outlet tube. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

NOTE: Turn the engine clockwise only, and only use the crankshaft bolt.

NOTE: Measure the clearance of each valve at base circle, with the lobe pointed away from the tappet.

3.
Use a feeler gauge to measure the clearance of each valve and record its location.

Use the General Equipment: Feeler Gauge

4.

NOTE: The number on the valve tappet only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

NOTE: Select tappets using this formula: tappet thickness = measured clearance + the existing tappet thickness - nominal clearance.

NOTE: The nominal clearance is:

intake: 0.25 mm (0.0095 in).

exhaust: 0.36 mm (0.0142 in).

NOTE: The acceptable clearances after being fully installed are:

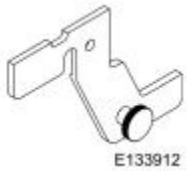
intake: 0.19-0.31 mm (0.007-0.012 in).

exhaust: 0.30-0.42 mm (0.012-0.017 in).

Select the closest tappet size to the ideal tappet thickness available and mark the installation location.

5.

If any tappets do not measure within specifications, install new tappets in these locations.



Adjustment

> *NOTE: The following step is only necessary if adjustment is required.*

1.
Remove the camshafts. Refer to: Camshafts .

REMOVAL AND INSTALLATION > CAMSHAFTS

Special Tool(s) / General Equipment

 E133912	303-1565 Alignment Tool, Camshaft TKIT-2010C-FLM
 PZ21210	303-507 Timing Peg, Crankshaft TDC TKIT-2001N-FLM TKIT-2001N-ROW
Feeler Gauge	

Materials

Name	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A
Gasket Maker TA-16	WSK-M2G348-A5

REMOVAL AND INSTALLATION > CAMSHAFTS > REMOVAL

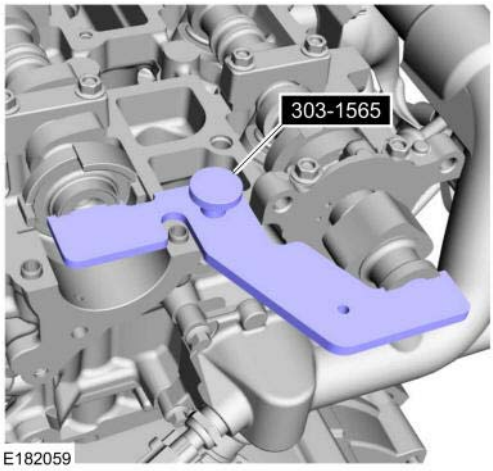
> *NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.*

NOTE: Do not rotate the camshafts unless instructed to in this procedure. Rotating the camshafts or crankshaft with timing components loosened or removed can cause serious damage to the valves and pistons.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

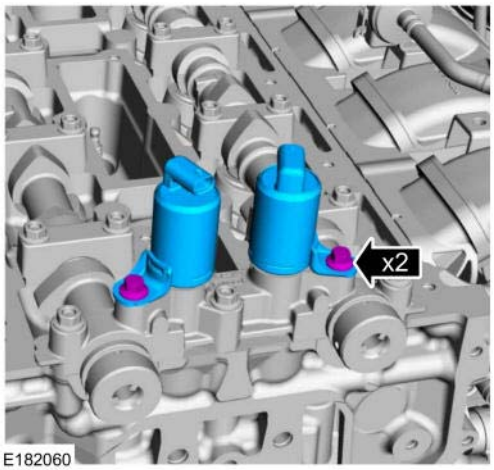
2.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 2.3L EcoBoost (231kW/314PS).

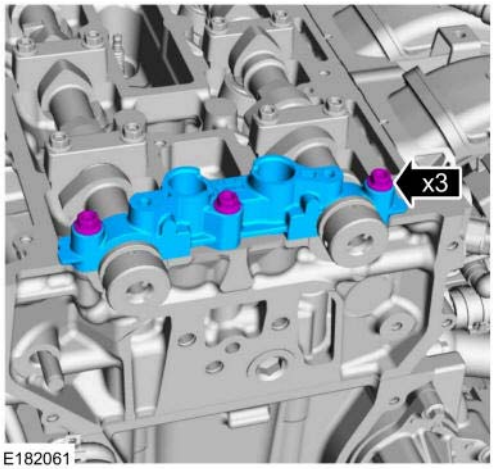
3.

Remove the VCT units. Refer to: Variable Camshaft Timing (VCT) Unit .



4.

Remove Special Service Tool: 303-1565 Alignment Tool, Camshaft.

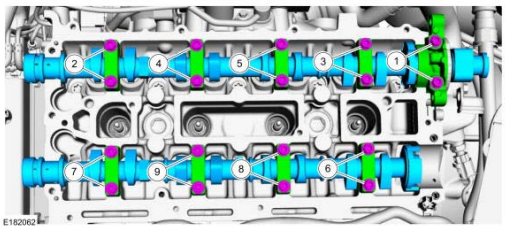


5.

Remove the bolts and the VCT oil control solenoids.

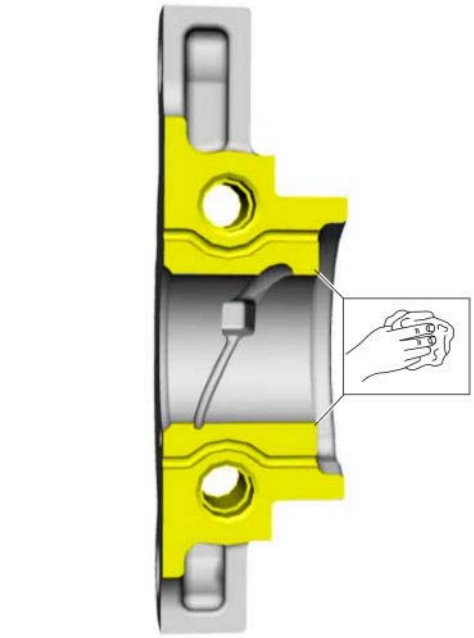
6.

Remove the bolts and the front camshaft cap.



NOTE: Failure to follow the camshaft loosening procedure can result in damage to the camshafts.

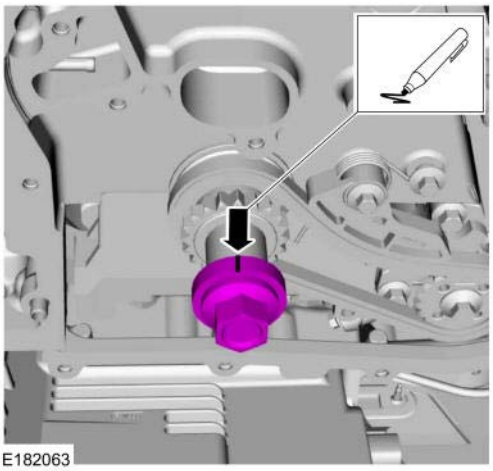
NOTE: Note the location and orientation of each camshaft bearing cap and the position of the camshaft lobes on the No. 1 cylinder for installation reference.



NOTE: Inspect the camshaft bores for any scratches that can be felt by hand.

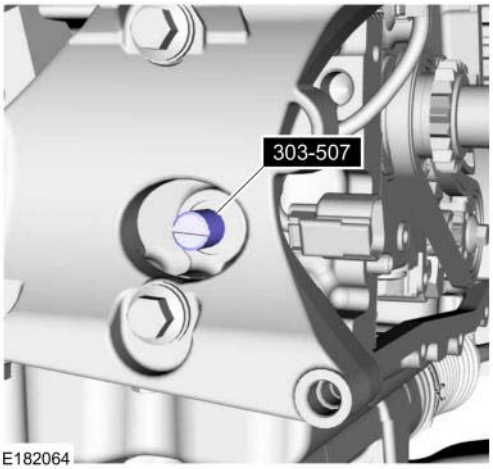
7.
Loosen the camshaft bearing caps in sequence 2 turns at a time until all tension is released from the camshaft bearing caps and remove the bolts, caps and camshafts.

8.



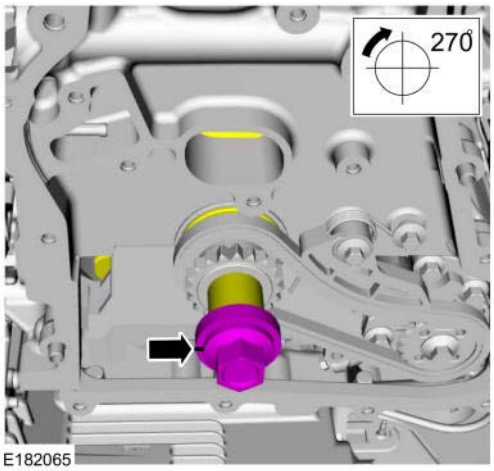
Clean the rear camshaft cap.

REMOVAL AND INSTALLATION > CAMSHAFTS > INSTALLATION



NOTE: If any new parts are being installed (cylinder head, valves, tappets, camshafts) it is necessary to check the valve clearance, follow the next 12 steps exactly or serious damage to the engine may occur. If the original parts are being installed it is not necessary to check the valve clearance so proceed to step 13.

1.
Install the crankshaft bolt, washer and place a paint mark on the crankshaft bolt at the 12 o'clock position.



2.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

NOTE: Rotating the crankshaft will position all of the pistons below the deck of the cylinder block and allow the camshafts to be installed and the valve clearance checked without the possibility of damage to the valves or pistons.

3.
Using the crankshaft bolt and washer, rotate the crankshaft clockwise 270 degrees until the paint mark is at the 9 o'clock position.

NOTE: Failure to follow the camshaft tightening procedure can result in damage to the camshafts.

4.

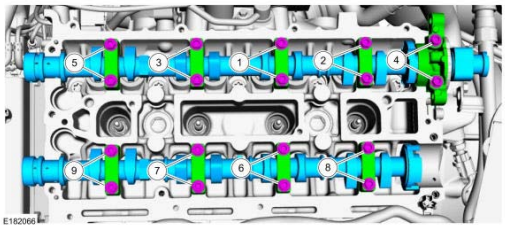
Lubricate the camshafts, camshaft journals and camshaft bearing caps with clean engine oil and install.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Install the camshaft caps and the bolts.

Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Tighten 2 turns at a time in the sequence shown in illustration in 2 stages.

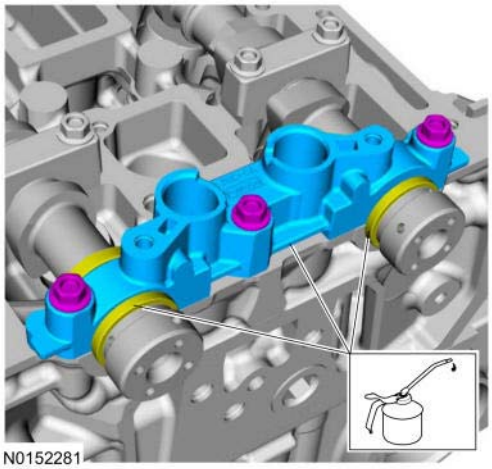
Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

5.

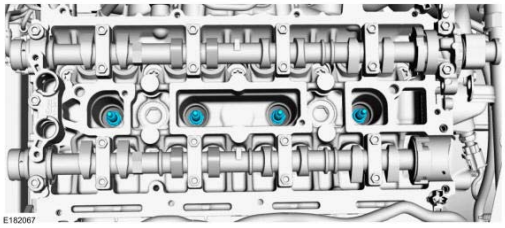
Lubricate the camshafts journals with clean engine oil and install the camshaft cap and the bolts.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:



Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

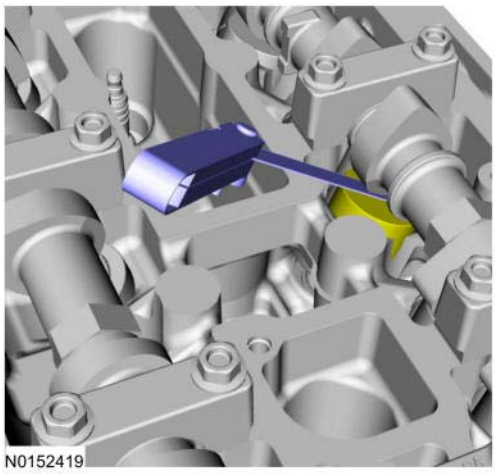
6.

Remove the spark plugs.

7.

1.

Using the flats of the camshaft, rotate the camshaft to place the cam lobe at base circle, with the lobe pointed away from the tappet.



2.

Use a feeler gauge to measure the clearance of each valve and record its location.

Use the General Equipment: Feeler Gauge

3.

Repeat to measure all of the lobe/tappet clearances.

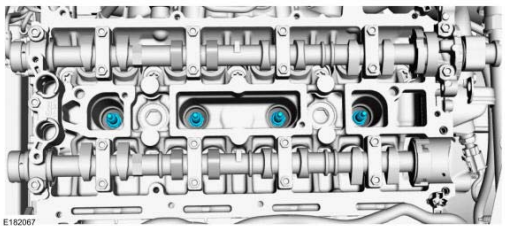
NOTE: The number on the valve tappet only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

NOTE: Select tappets using this formula: tappet thickness = measured clearance + the existing tappet thickness - nominal clearance.

NOTE: The nominal clearance is:

- intake: 0.25 mm (0.0095 in).
- exhaust: 0.36 mm (0.0142 in).

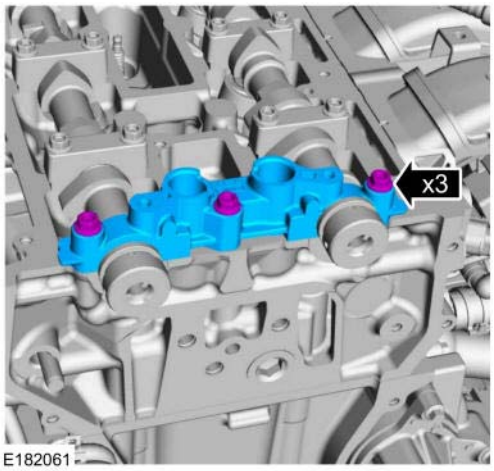
NOTE: The acceptable clearances after being fully installed are:



- intake: 0.19-0.31 mm (0.007-0.012 in).
- exhaust: 0.30-0.42 mm (0.012-0.017 in).

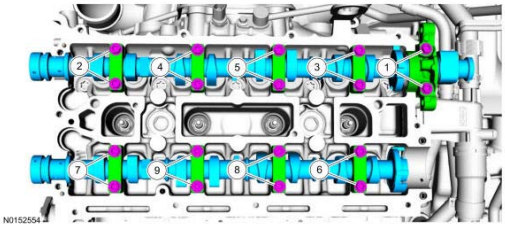
8.

Select the closest tappet size to the ideal tappet thickness available and mark the installation location.



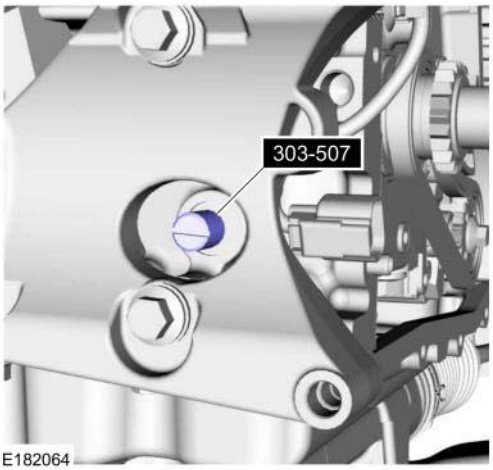
9.

Install the spark plugs.



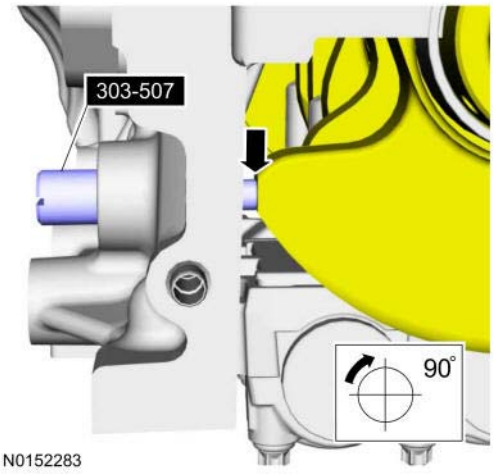
10.

Remove the bolts and the front camshaft cap.



NOTE: Failure to follow the camshaft loosening procedure can result in damage to the camshafts.

11.
Loosen the camshaft bearing caps in sequence 2 turns at a time until all tension is released from the camshaft bearing caps and remove the bolts, caps and camshafts.

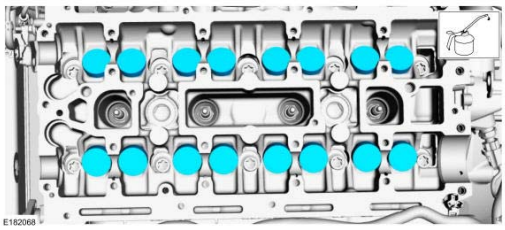


12.

Install Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

NOTE: Rotating the crankshaft will position the engine at TDC and allow you to install the camshafts in the same position as noted during the disassembly.

13.
Rotate the crankshaft clockwise 90 degrees so the crankshaft contacts the crankshaft timing peg.

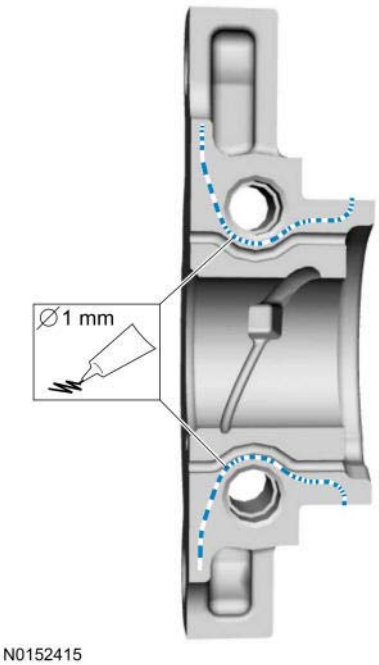


14.

If necessary, replace any tappets with the correct tappets selected during the valve clearance check.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)



NOTE: The exhaust camshaft rear bearing cap must be secured within 10 minutes of gasket maker application. If the bearing cap is not secured within 10 minutes, the gasket maker must be removed and the sealing area cleaned.

NOTE: Do not allow sealant to enter the camshaft bearing journal. If gasket maker is applied to the camshaft bearing journal, the journal and sealing area must be cleaned.

15.
Apply 1 mm (0.039 in) beads of gasket maker to the intake rear camshaft bearing cap mating surface as shown in illustration.

Material

: Gasket Maker / TA-16 (WSK-M2G348-A5)

NOTE: Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal

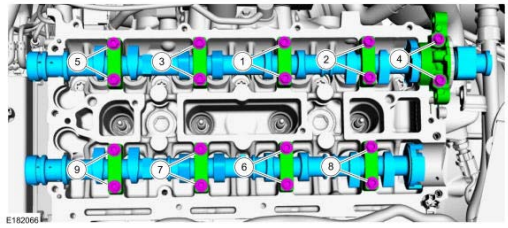
procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.

NOTE: Failure to follow the camshaft tightening procedure can result in damage to the camshafts.

NOTE: Wipe off any excess sealer from the fuel injection pump housing sealing surface of the cylinder head and rear camshaft cap.

NOTE: Lubricate the camshaft, camshaft journals and camshaft bearing caps with clean engine oil.

16.
Install the camshafts, caps, bolts and tighten the camshaft bearing cap bolts one turn at a time, until finger-tight.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

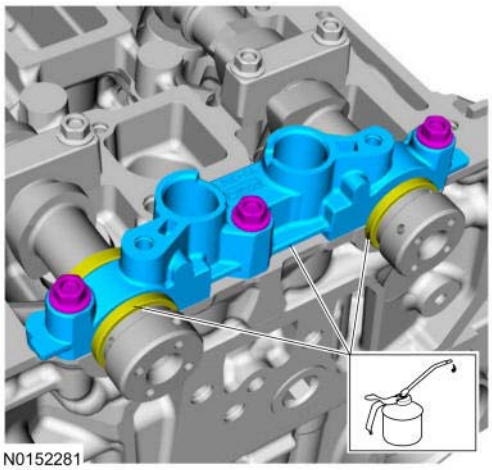
Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

17.

Lubricate the camshafts journals with clean engine oil and install the camshaft cap and the bolts.



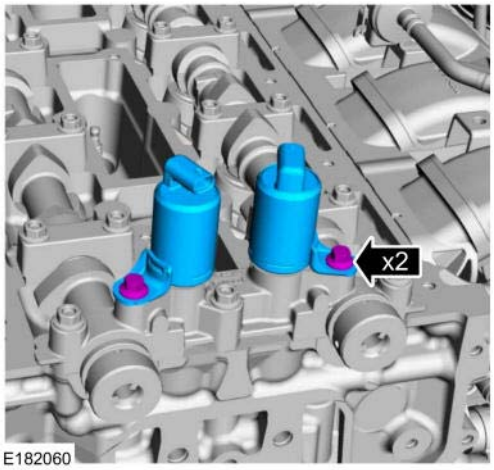
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

Stage 1: 62 lb.in (7 Nm)

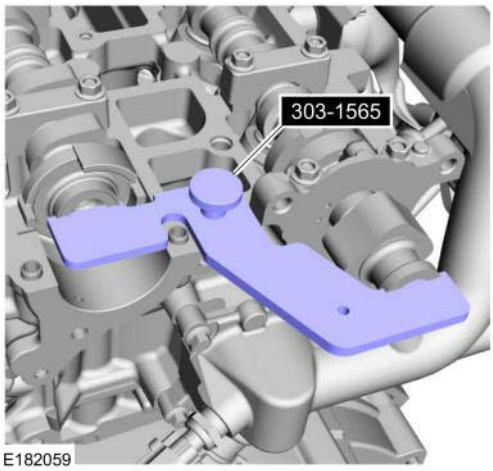
Stage 2: 142 lb.in (16 Nm)



18.

Install the VCT oil control solenoids and the bolts.

Torque

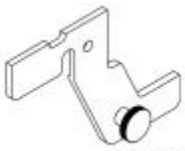


: 89 lb.in (10 Nm)

NOTE: The Camshaft Alignment Tool is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.

19.
Install the special tool into the slots on the back of the camshafts.

Install Special Service Tool: 303-1565 Alignment Tool, Camshaft.



20.

Install the VCT units. Refer to: Variable Camshaft Timing (VCT) Unit .

REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL

Special Tool(s) / General Equipment

Strap Wrench	

Materials

Name	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A
Gasket Maker TA-16	WSK-M2G348-A5

REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > REMOVAL

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.

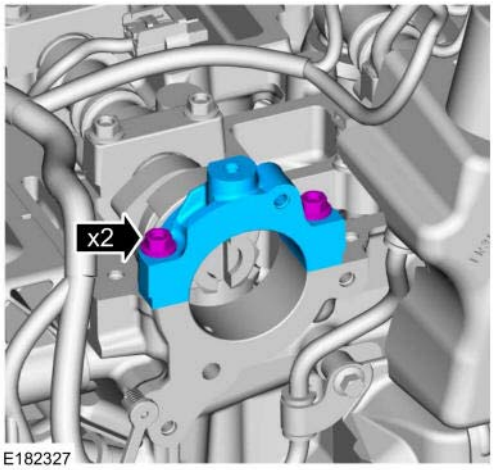
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the following items:

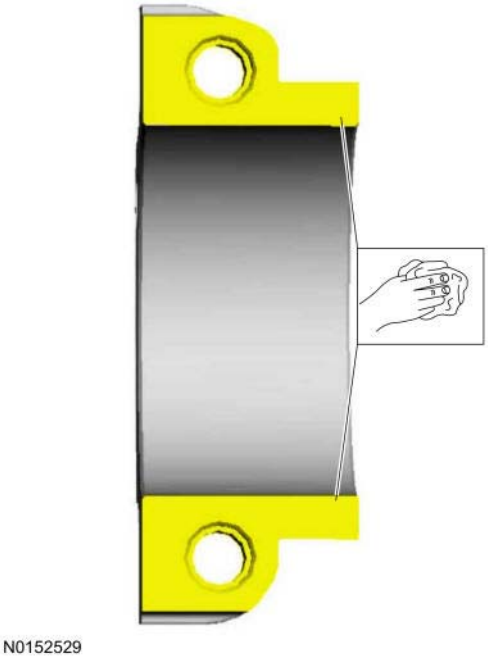
Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).



Refer to: ACCESSORY DRIVE BELT - 2.3L EcoBoost (231kW/314PS).

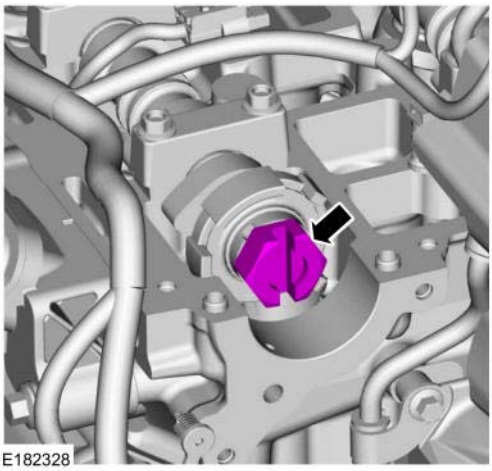
Refer to: Valve Cover .

Refer to: Brake Vacuum Pump - 2.3L EcoBoost (201kW/273PS) .



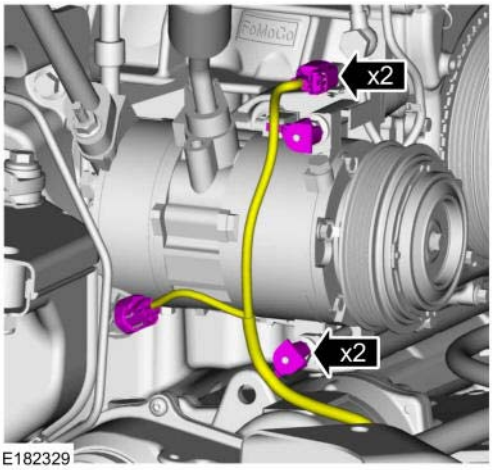
3.

Remove the bolts and the rear intake camshaft cap.



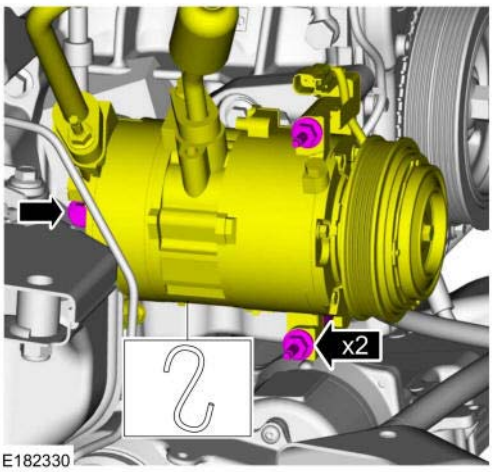
4.

Clean the rear intake camshaft cap.



5.

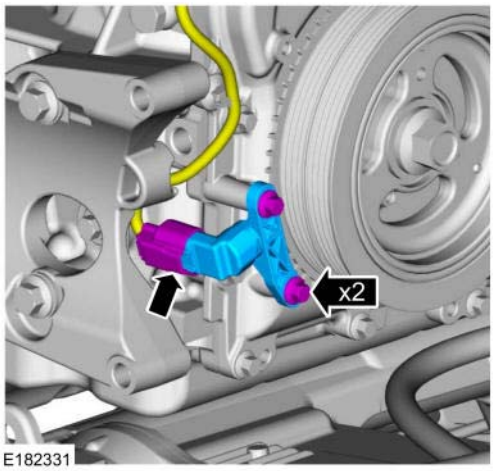
Using a wrench on the flats of the intake camshaft to prevent cam rotation, remove the brake vacuum pump adapter.



6.

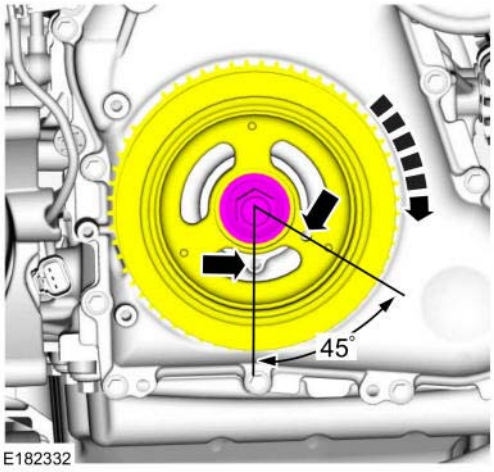
Disconnect the A/C compressor electrical connectors and the wire harness retainers.

7.



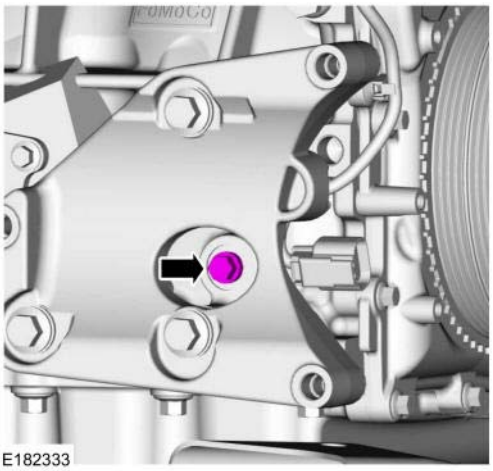
Remove the bolts, position and support the A/C compressor aside.

8.



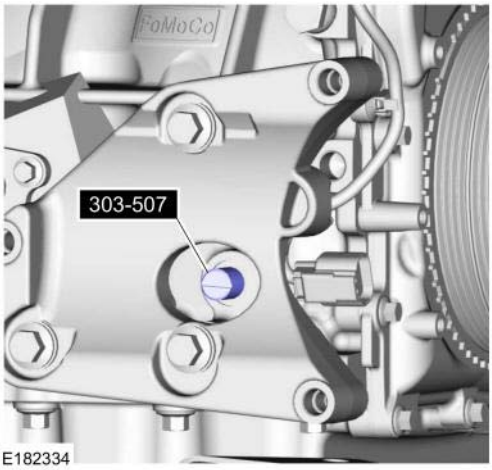
Remove the 2 bolts and the CKP sensor.

Disconnect the CKP sensor electrical connector.



9.

Turn the crankshaft clockwise until the No. 1 piston is 45 degrees BTDC using the guide holes on the engine front cover and the crankshaft pulley.

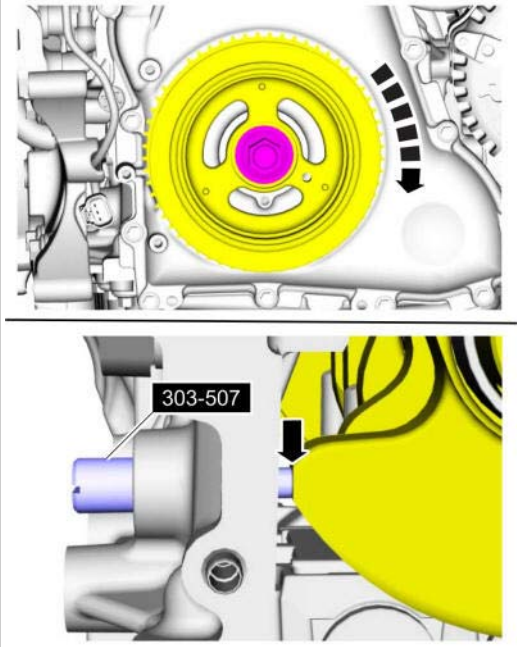


10.

Remove the engine plug bolt.

11.

Install Special Service Tool: 303-507Timing Peg, Crankshaft TDC.

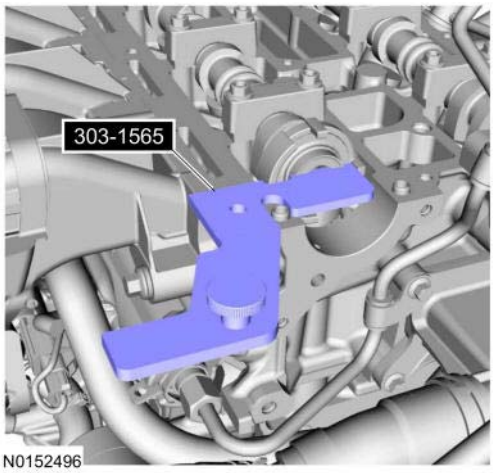


NOTE: The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC. However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the crankshaft pulley removal and installation.

NOTE: The engine front cover is removed from graphic for clarity.

12.
Rotate the crankshaft clockwise until the contacts the special tool.

Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.



E182335

NOTE: The Camshaft Alignment Tool is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.

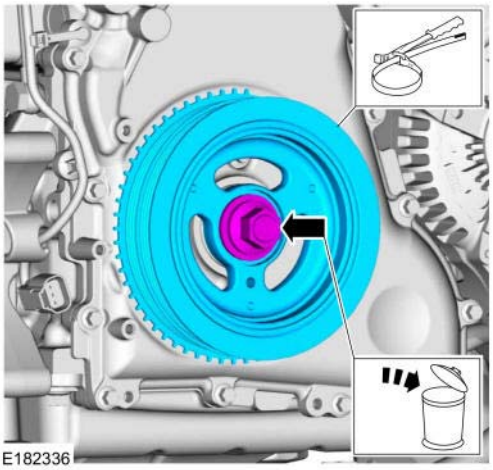
NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Tool cannot be installed, remove the TDC Timing Peg and rotate the crankshaft three-fourths of a revolution clockwise and repeat the previous 2 steps of this procedure.

13.
Install Special Service Tool: 303-1565 Alignment Tool, Camshaft.

N0152496

NOTE: The crankshaft must remain in the TDC position during removal of the

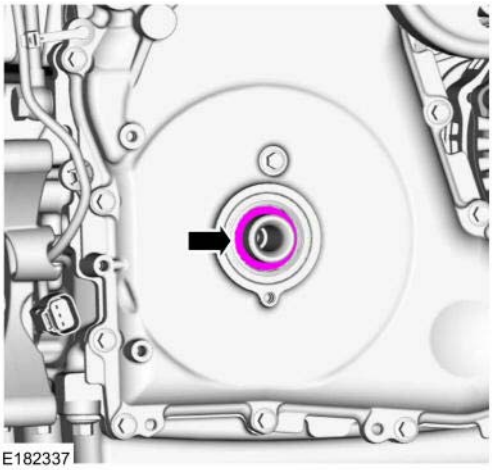
pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Strap Wrench and the bolt should be removed using an air impact wrench (1/2-in drive minimum).



NOTE: The crankshaft sprocket diamond washer may come off with the crankshaft pulley.

14.

Remove the bolt, washer and the crankshaft pulley.

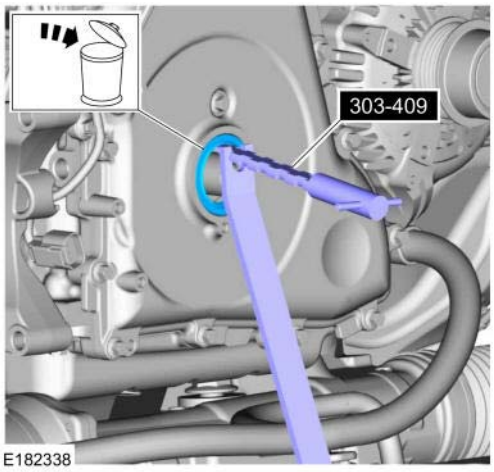


Use the General Equipment: Strap Wrench

Discard the bolt.

15.

If the diamond washer did not come off with the crankshaft pulley, remove the diamond washer.



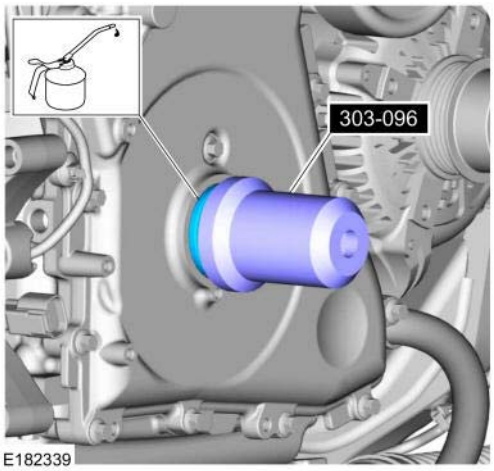
NOTE: Use care not to damage the engine front cover or the crankshaft when

removing the seal.

16.
Using the special tools, remove the crankshaft front seal.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.

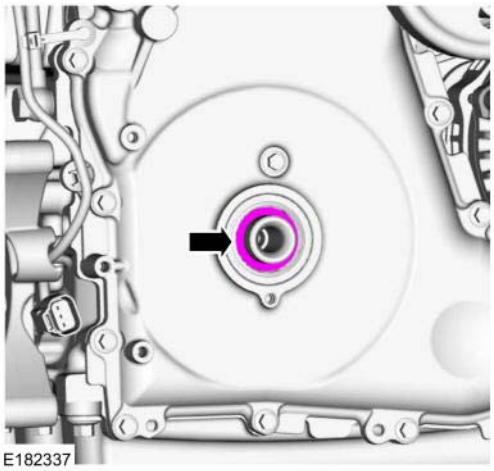
REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > INSTALLATION



NOTE: Remove the through-bolt from the Camshaft Front Oil Seal Installer.

1.
Using the special tools, install the crankshaft front seal.

Use Special Service Tool: 303-096 (T74P-6150-A) Installer, Camshaft Front Oil Seal.

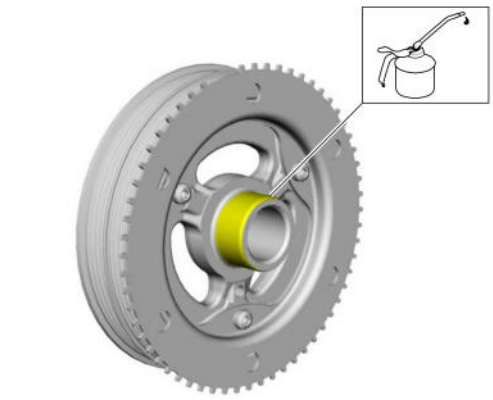


Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

NOTE: The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer should be cleaned and inspected for any damage. If damage is evident, replace the diamond washer. If no damage, the diamond washer is to be reused. If the diamond washer is not installed, engine damage may occur.

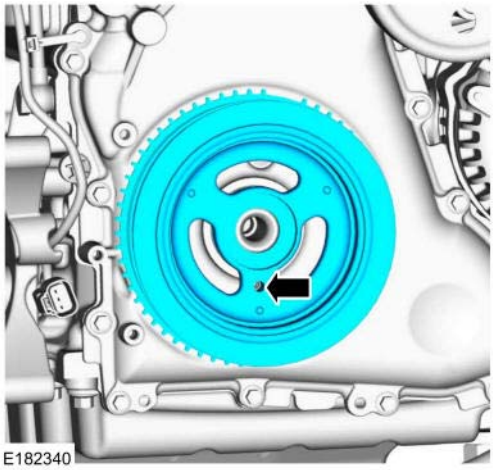
2.
Install the diamond washer onto the crankshaft.



3.

Lubricate the crankshaft pulley with clean engine oil.

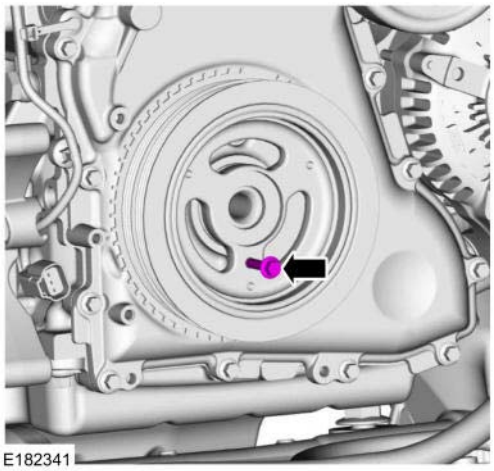
Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

N0152293

4.



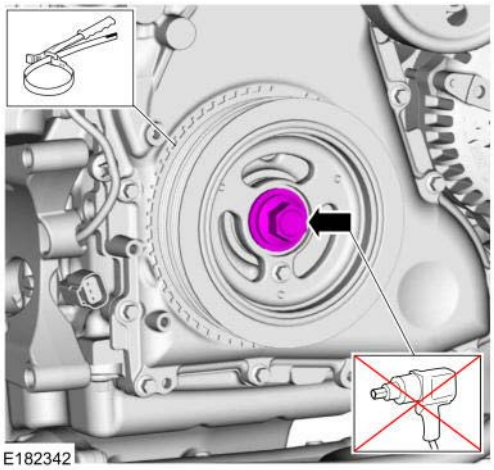
Position the crankshaft pulley onto the crankshaft with the access hole at the 6 o'clock position.

E182340

NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

5.
Install an M6 bolt.

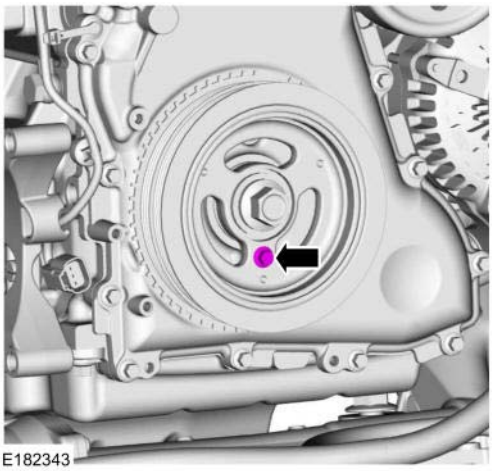
NOTE: The crankshaft must remain in the TDC position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Strap Wrench and the bolt should be installed using hand tools only.



6.
Install the crankshaft bolt and washer and tighten.

Use the General Equipment: Strap Wrench

Torque:

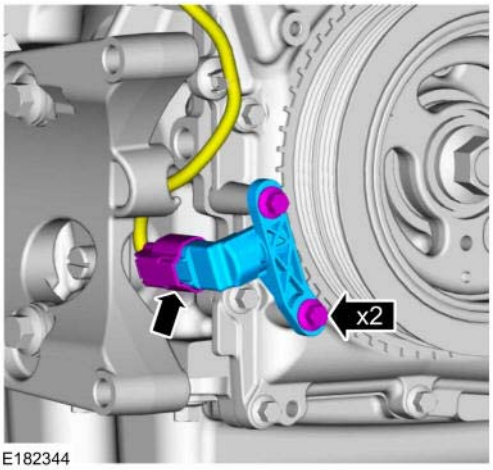


Stage 1: 74 lb.ft (100 Nm)

Stage 2: 90°

7.

Remove the M6 bolt.



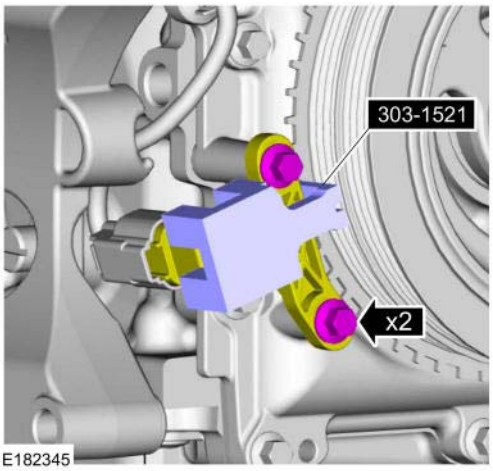
8.

Connect the CKP sensor electrical connector.

> *NOTE: Do not tighten the CKP sensor bolts at this time.*

Install the CKP sensor and the bolts finger tight.

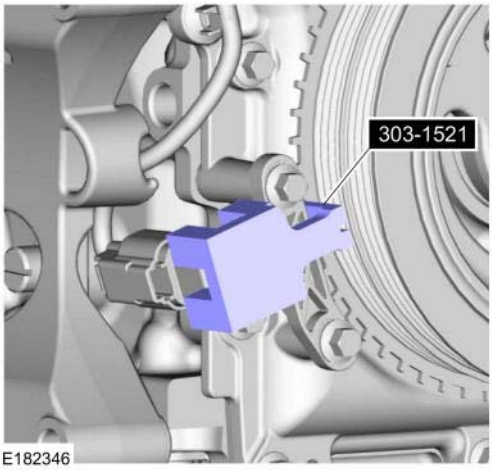
9.



Install the Special Tool onto the CKP sensor and the tooth of the crankshaft pulley trigger wheel.

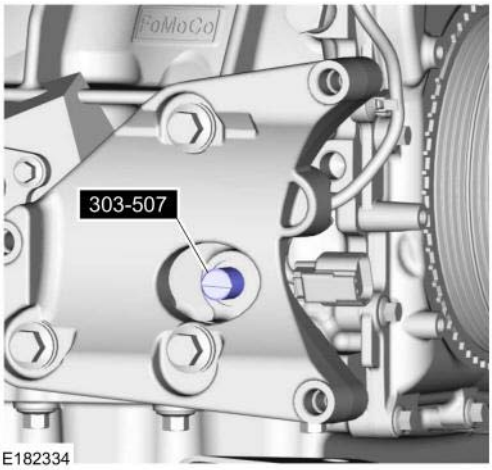
Use Special Service Tool: 303-1521 Alignment Tool, Crankshaft Position Sensor.

Tighten the bolts.



Torque

: 62 lb.in (7 Nm)

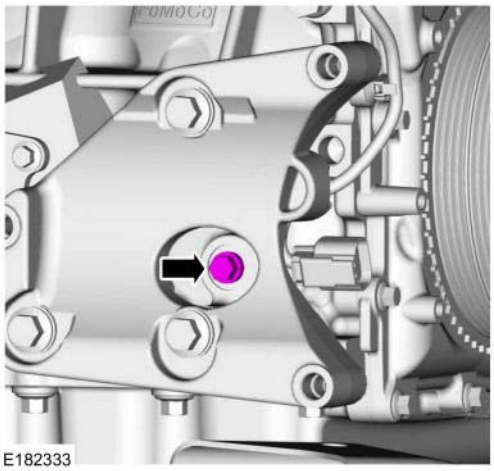


10.

Remove Special Service Tool: 303-1521 Alignment Tool, Crankshaft Position Sensor.

11.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

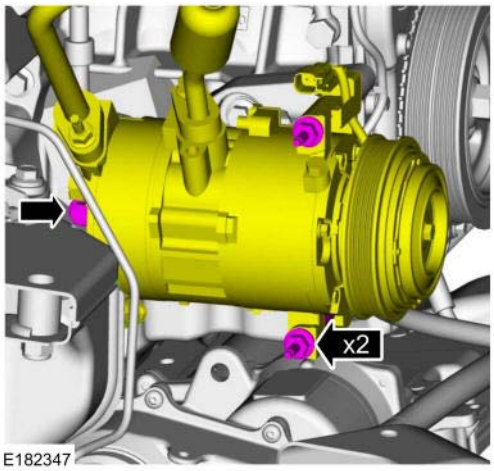


12.

Install the engine plug bolt.

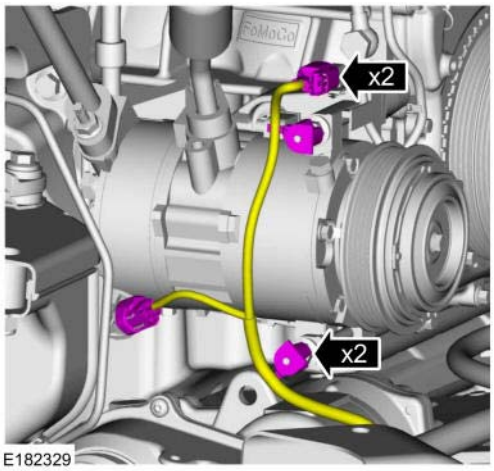
Torque

: 177 lb.in (20 Nm)



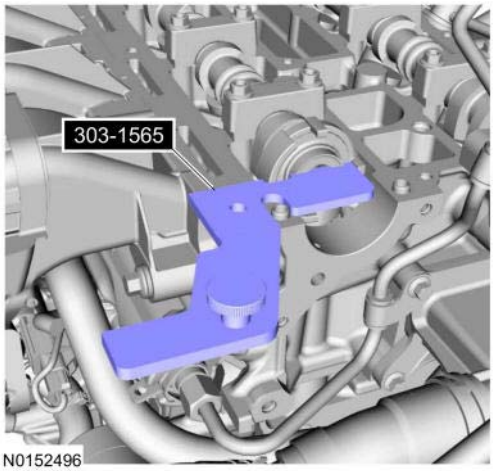
13.

Position the A/C compressor and install the bolts.



Torque

: 18 lb.ft (25 Nm)

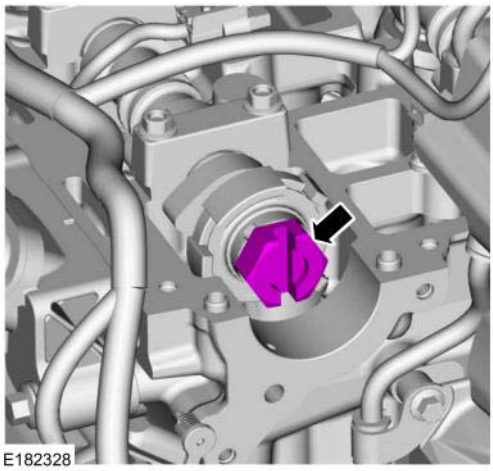


14.

Connect the A/C compressor electrical connectors and the wire harness retainers.

15.

Remove Special Service Tool: 303-1565 Alignment Tool, Camshaft.

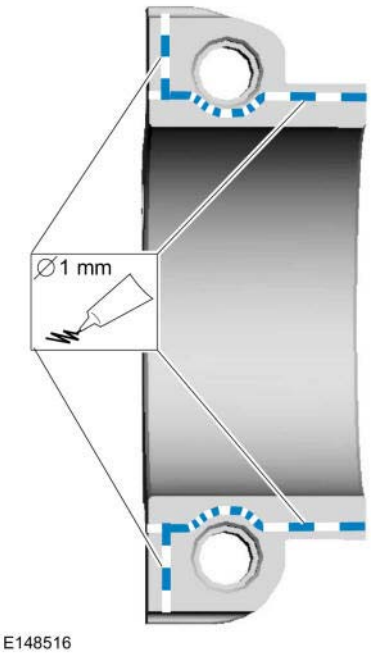


16.

Using a wrench on the flats of the intake camshaft to prevent cam rotation, install the brake vacuum pump adapter.

Torque

: 46 lb.ft (63 Nm)



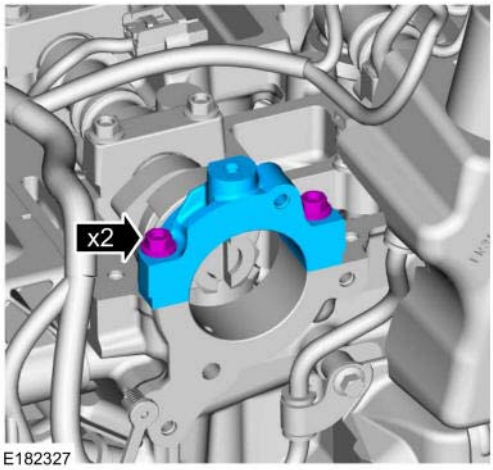
NOTE: The intake camshaft rear bearing cap must be secured within 10 minutes of gasket maker application. If the bearing cap is not secured within 10 minutes, the gasket maker must be removed.

17.
Apply 1 mm (0.039 in) beads of gasket maker to the intake rear camshaft bearing cap mating surface as shown in illustration.

Material

: Gasket Maker / TA-16 (WSK-M2G348-A5)

NOTE: Wipe off any excess gasket maker from the vacuum pump sealing surface



of the cylinder head and camshaft cap.

18.
Install the rear intake camshaft cap and the bolts.

Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

19.

Install the following items:

Refer to: Brake Vacuum Pump - 2.3L EcoBoost (201kW/273PS) .

Refer to: Valve Cover .

Refer to: ACCESSORY DRIVE BELT - 2.3L EcoBoost (231kW/314PS).

Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

20.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL

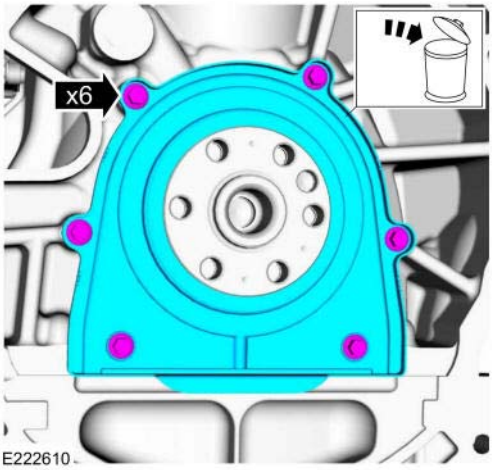
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-



REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > REMOVAL

1.

Remove the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

2.

Remove the bolts and the crankshaft rear seal, discard the crankshaft rear seal.

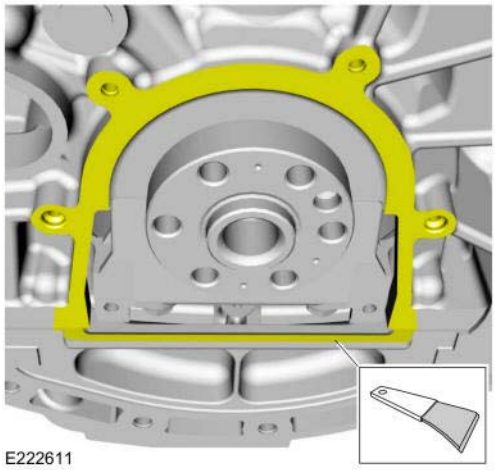
NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

3.
Clean and inspect the oil pan and cylinder block mating surfaces. Refer to: RTV Sealing Surface

Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



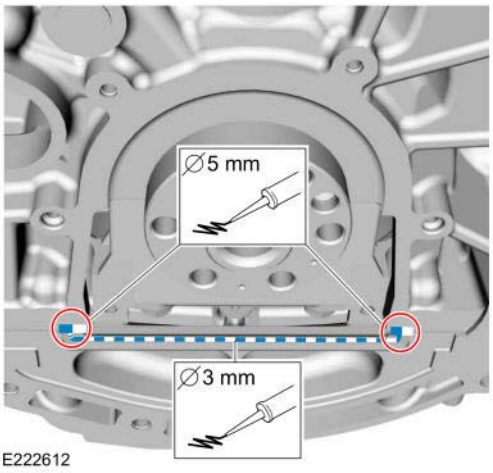
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B



REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > INSTALLATION

NOTE: If the crankshaft rear seal is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

1.
Apply a 3 mm (0.118 in) bead of silicone to the oil pan surface and a 5 mm (0.196 in) bead at the T-joints.

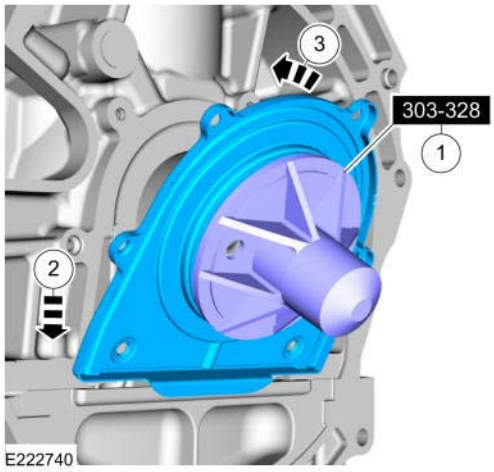
Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

2.

1.

Install the crankshaft rear main oil seal installer.

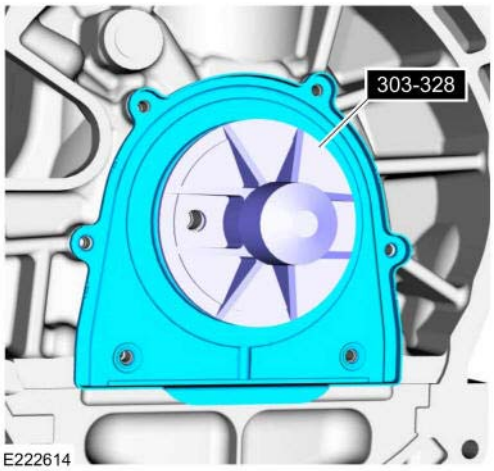


Use Special Service Tool: 303-328 (T88P-6701-B1) Replacer, Rear Seal.

2.

Install the crankshaft rear seal retainer at an angle above the oil pan flange to avoid scraping off the sealer.

3.

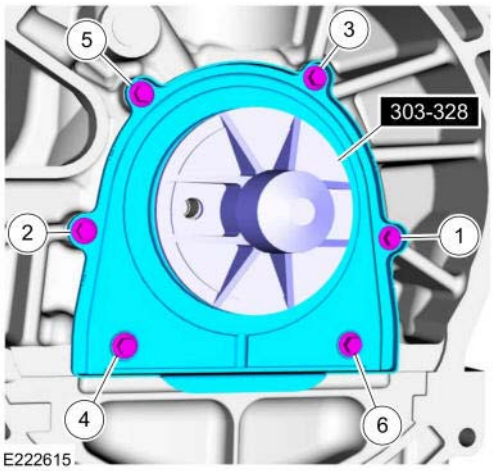


Tilt the seal retainer up and onto the rear of the cylinder block.

3.

Using the special tool, seat the crankshaft rear seal.

Use Special Service Tool:303-328 (T88P-6701-B1) Replacer, Rear Seal.

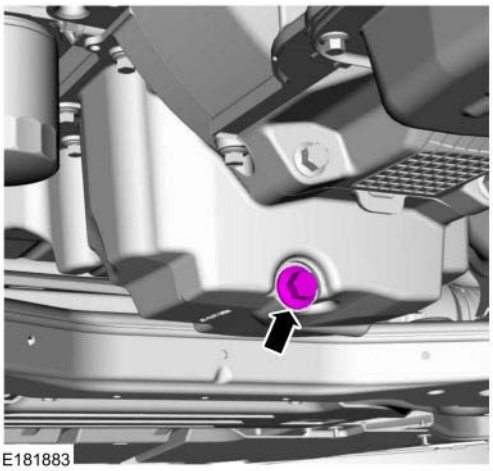


4.

Install the bolts and tighten in sequence shown in illustration. Remove Special Service Tool: 303-328 (T88P-6701-B1) Replacer, Rear Seal.

Torque

: 89 lb.in (10 Nm)

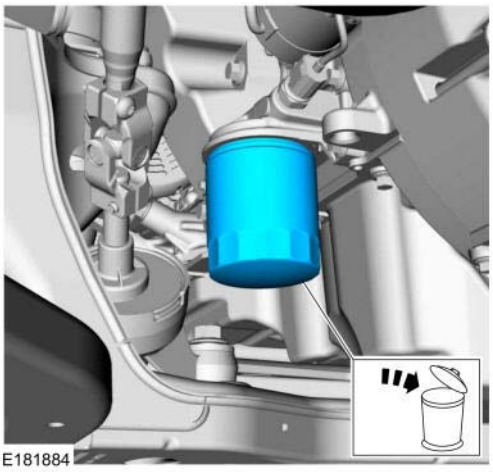


5.

Drain engine oil and install drain plug.

Use the General Equipment: Oil Drain Equipment

Torque



: 20 lb.ft (27 Nm)

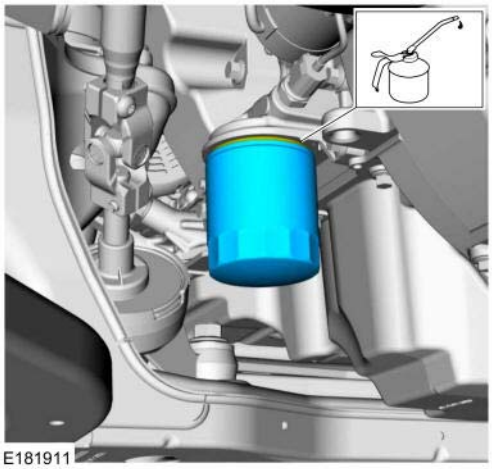
6.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment

NOTE: Lubricate the engine oil filter seal with clean engine oil.

7.
Install a new engine oil filter.



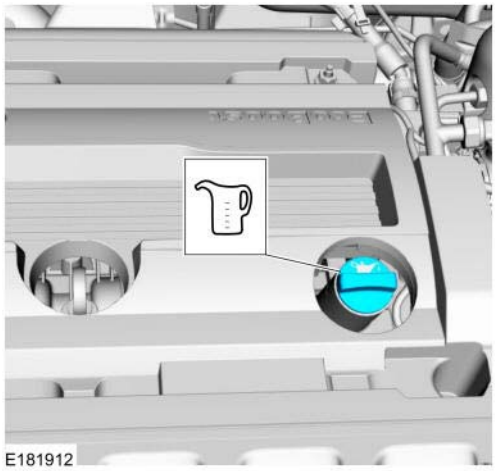
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 180°



8.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

9.

Install the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

REMOVAL AND INSTALLATION > CYLINDER HEAD

Special Tool(s) / General Equipment

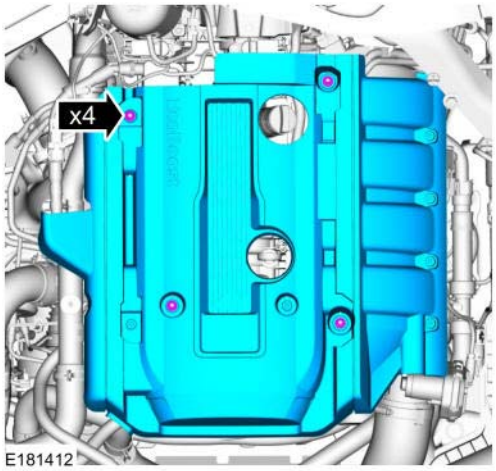
Oil Drain Equipment
Hose Clamp Remover/Installer

Materials

Name	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A
Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.)VC-3DIL-B (U.S.)	WSS-M97B44-D2

REMOVAL AND INSTALLATION > CYLINDER HEAD > REMOVAL

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.



NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the nuts and the engine appearance cover.

3.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 2.3L EcoBoost (231kW/314PS).

4.

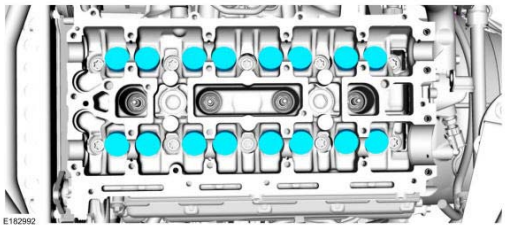
Disconnect the battery ground. Refer to: Battery Disconnect and Connect .

5.

Drain the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

6.

Remove the following items:



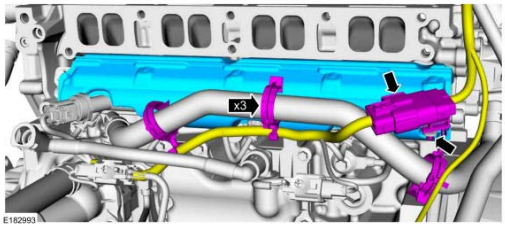
Refer to: Turbocharger .

Refer to: Intake Manifold .

Refer to: Camshafts .

NOTE: If the valve tappets are to be reused, note the location of the valve tappets to make sure they are assembled in their original positions.

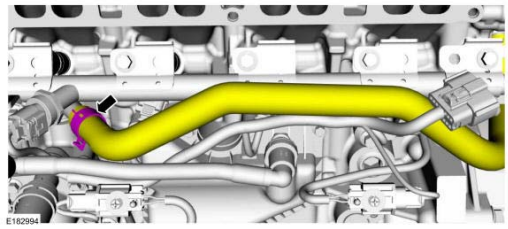
7.
Remove the valve tappets.



8.

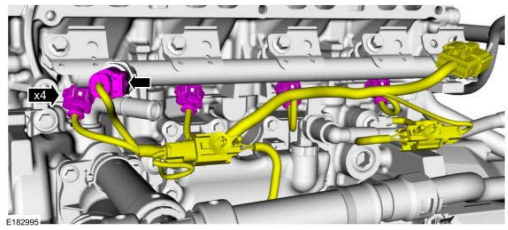
Detach and disconnect the fuel rail electrical connector.

Detach the wiring harness retainers.



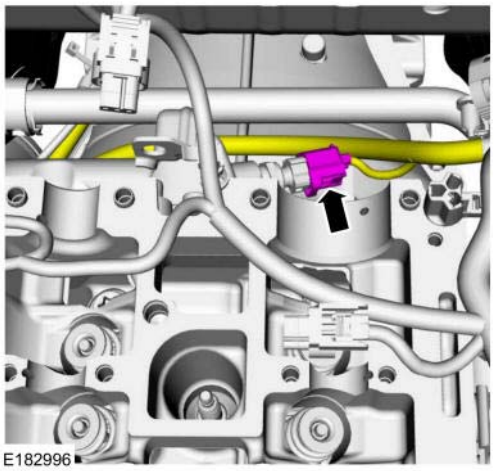
Remove the fuel rail insulator shield.

9.



Disconnect and position the coolant tube aside.

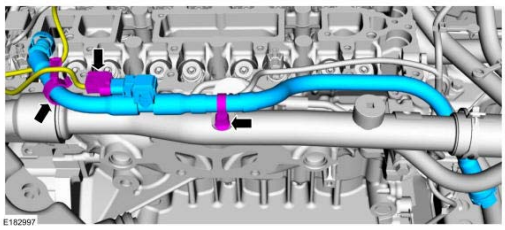
Use the General Equipment: Hose Clamp Remover/Installer



10.

Disconnect the fuel injector and the FRP sensor electrical connectors.

11.

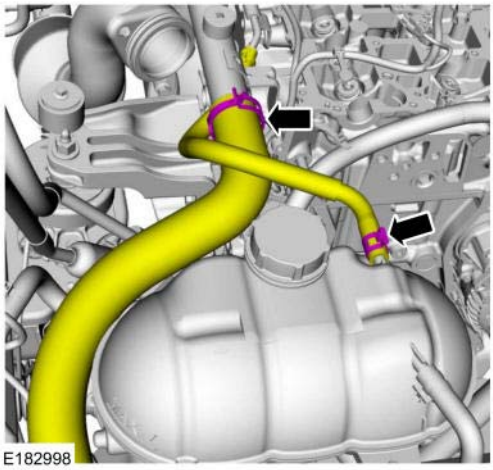


Disconnect the ECT sensor electrical connector from the back of the engine.

12.

Disconnect the crankcase vent tube sensor electrical connector and wire harness retainer.

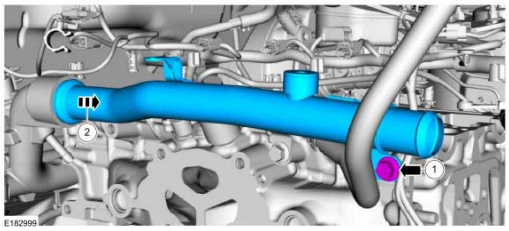
Detach the crankcase vent tube retainer and remove.



13.

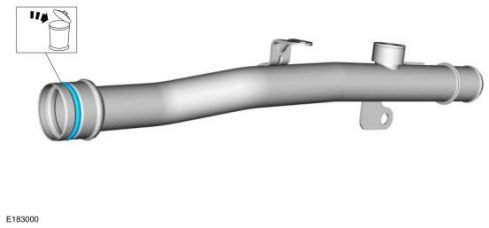
Disconnect the upper radiator hose from the coolant outlet tube.

Use the General Equipment: Hose Clamp Remover/Installer



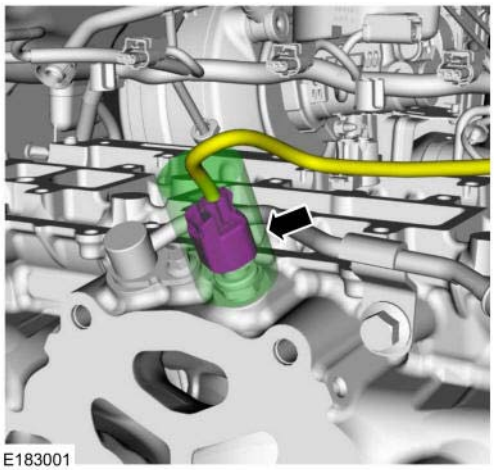
Disconnect the coolant by-pass hose from the degas bottle.

Use the General Equipment: Hose Clamp Remover/Installer



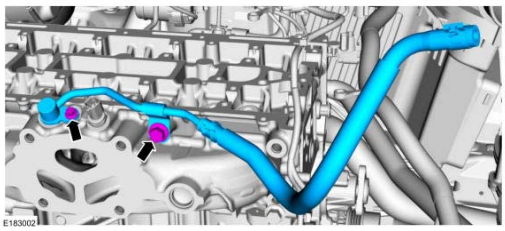
14.

Remove the bolt from the cylinder head and remove the coolant tube from coolant outlet.



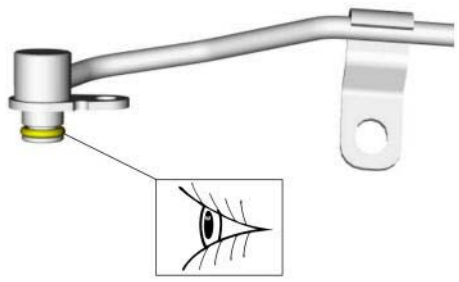
15.

Remove and discard the coolant tube O-ring seal.



16.

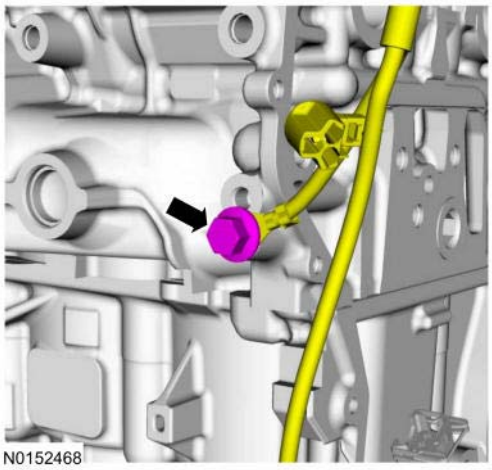
Slide the insulator up and disconnect the CHT sensor electrical connector.



17.

Remove the bolts and the coolant tube.

18.

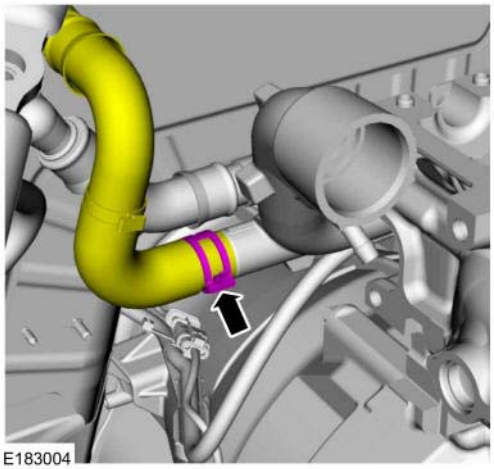


Inspect the coolant tube O-ring seal and replace if necessary.

E183003

19.

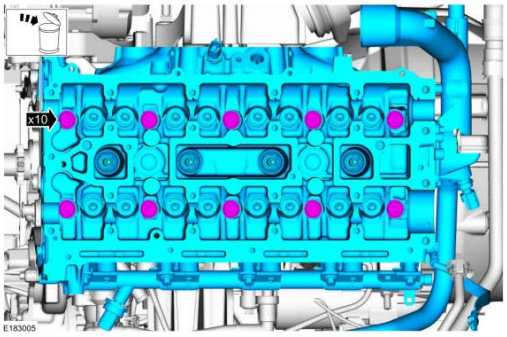
Remove the bolt and the ground wire.



N0152468

20.

Disconnect the heater hose from the coolant outlet.



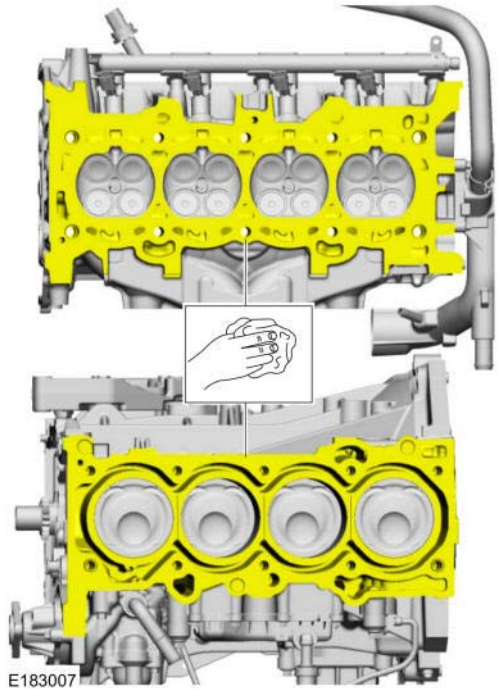
Use the General Equipment: Hose Clamp Remover/Installer

21.

Remove the bolts and the cylinder head.

Discard the bolts.

22.



Remove and discard the cylinder head gasket.

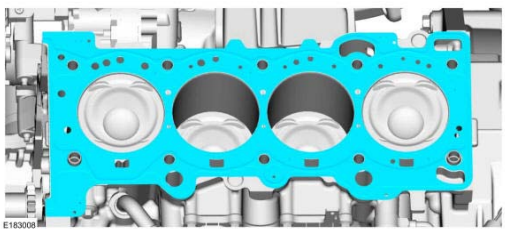
NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

NOTE: Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

23.
Make sure that the mating faces are clean and free of foreign material.

24.

Check the cylinder head distortion. Refer to: Cylinder Head Distortion .



25.

Check the cylinder block distortion. Refer to: Cylinder Block Distortion .

REMOVAL AND INSTALLATION > CYLINDER HEAD > INSTALLATION

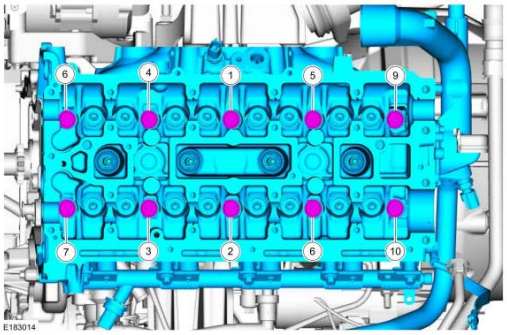
1.

Install the cylinder head gasket.

NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

2.
Install the cylinder head and the new bolts.

Torque:

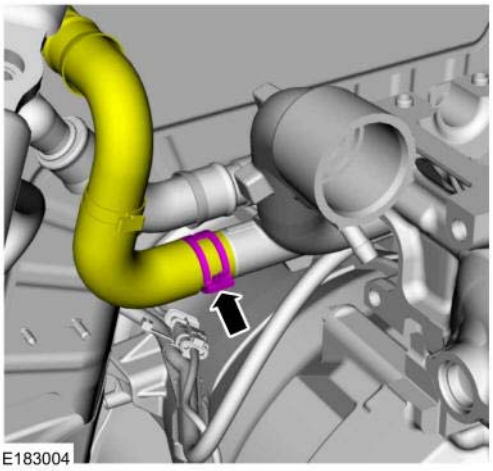


Stage 1: 62 lb.in (7 Nm)

Stage 2: 133 lb.in (15 Nm)

Stage 3: 41 lb.ft (55 Nm)

Stage 4: 90°

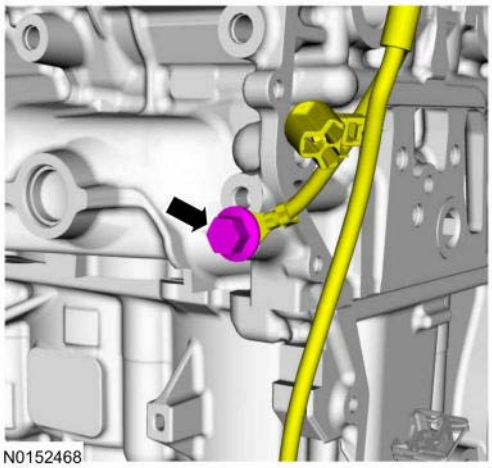


Stage 5: 90°

3.

Connect the heater hose to the coolant outlet.

Use the General Equipment: Hose Clamp Remover/Installer

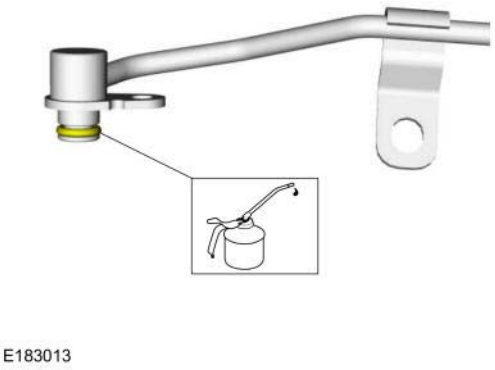


4.

Install the ground wire and the bolt.

Torque

: 177 lb.in (20 Nm)



5.

Lubricate the coolant tube O-ring seal with clean engine coolant.

Material

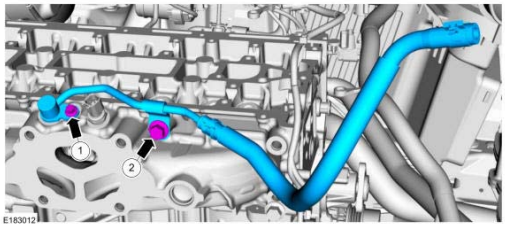
: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

6.

NOTE: The coolant tube must be fully seated prior to tighten the bolt.

1.
Install the coolant tube and the bolt.

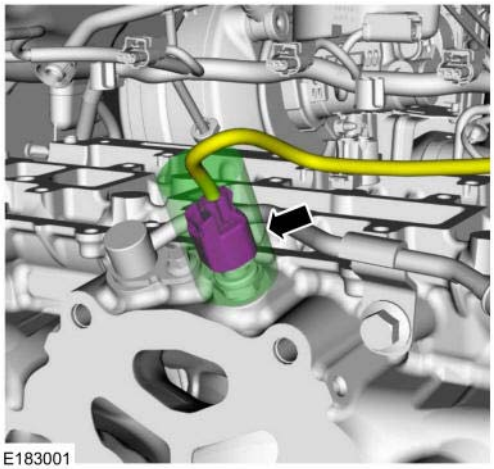
Torque



: 97 lb.in (11 Nm)

2.

Install the coolant tube retainer bolt.

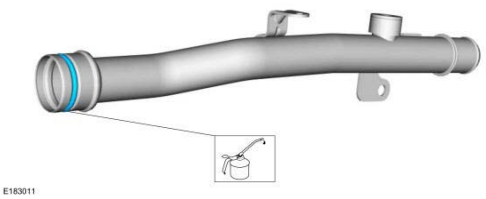


Torque

: 22 lb.ft (30 Nm)

7.

Connect the CHT sensor electrical connector and slide the insulator down.



8.

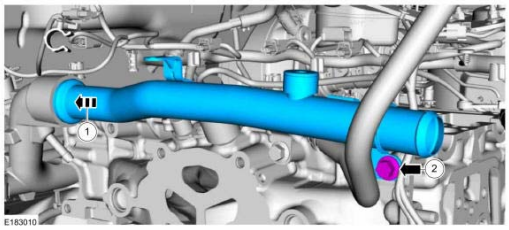
Lubricate the new coolant tube O-ring seal with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

9.

1.



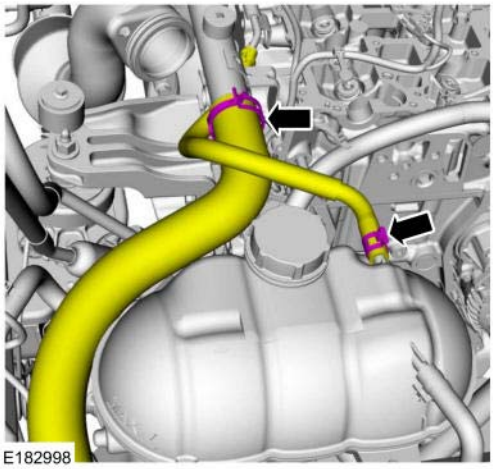
Install the coolant tube coolant outlet.

2.

Install the bolt.

Torque

: 89 lb.in (10 Nm)

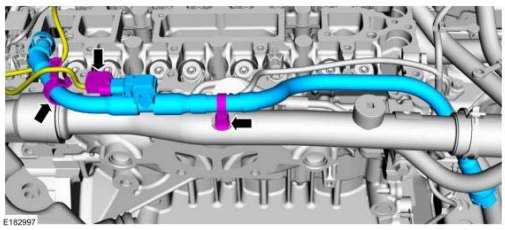


10.

Connect the coolant by-pass hose to the degas bottle.

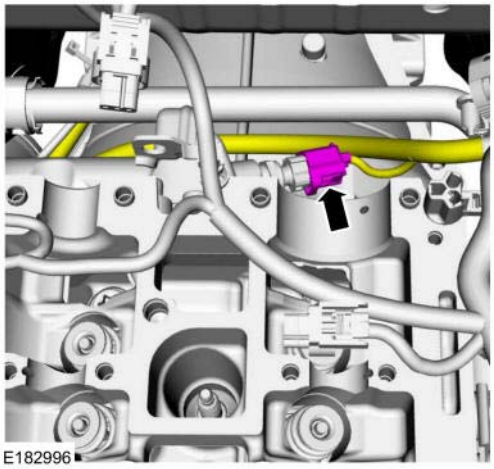
Use the General Equipment: Hose Clamp Remover/Installer

Connect the upper radiator hose to the coolant outlet tube.



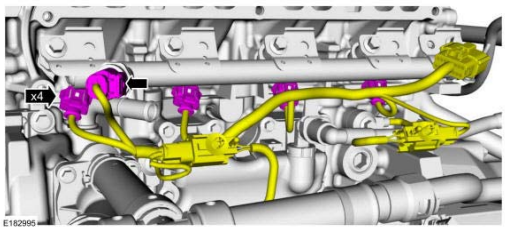
Use the General Equipment: Hose Clamp Remover/Installer

11.



Install the crankcase vent tube and retainer.

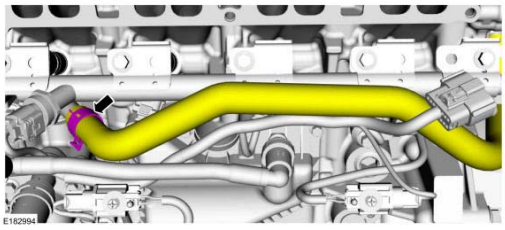
Connect the crankcase vent tube sensor electrical connector and wire harness retainer.



12.

Connect the ECT sensor electrical connector.

13.

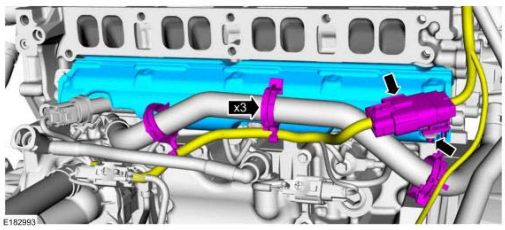


Connect the fuel injector and the FRP sensor electrical connectors.

14.

Position and connect the coolant tube.

Use the General Equipment: Hose Clamp Remover/Installer

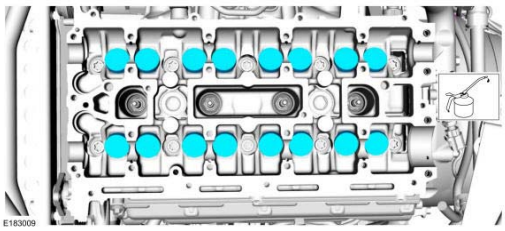


15.

Install the fuel rail insulator shield.

Attach the wiring harness retainers.

Connect and attach the fuel rail electrical connector.



16.

Install the valve tappets in their original position.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

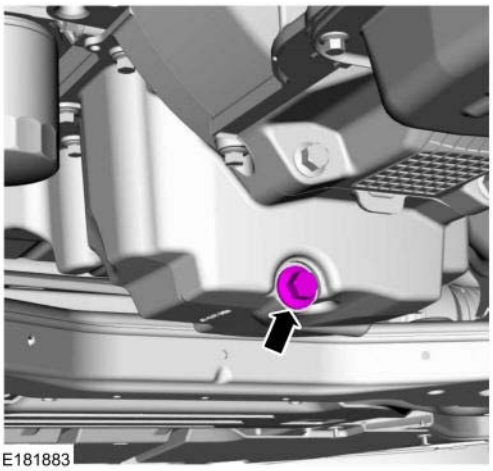
17.

Install the following items:

Refer to: Camshafts .

Refer to: Intake Manifold .

Refer to: Turbocharger .

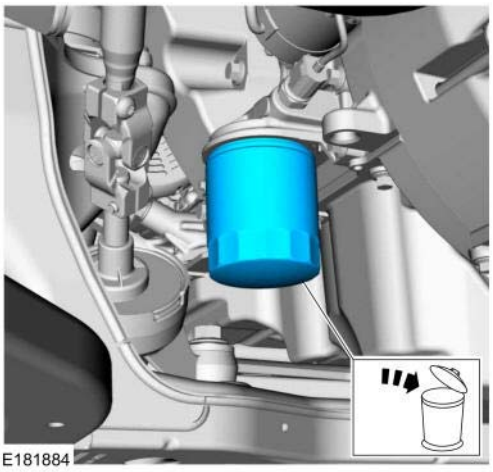


18.

Drain engine oil and install drain plug.

Use the General Equipment: Oil Drain Equipment

Torque



: 20 lb.ft (27 Nm)

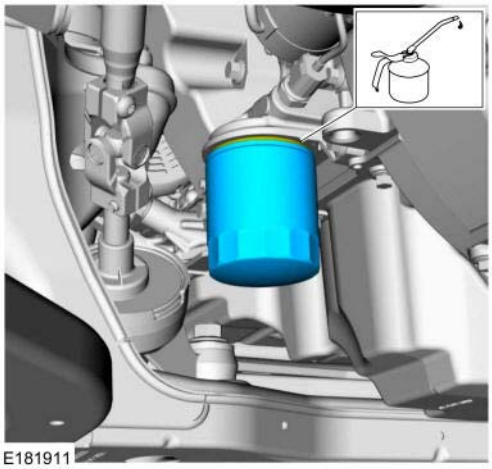
19.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment

NOTE: Lubricate the engine oil filter seal with clean engine oil.

20.
Install a new engine oil filter.



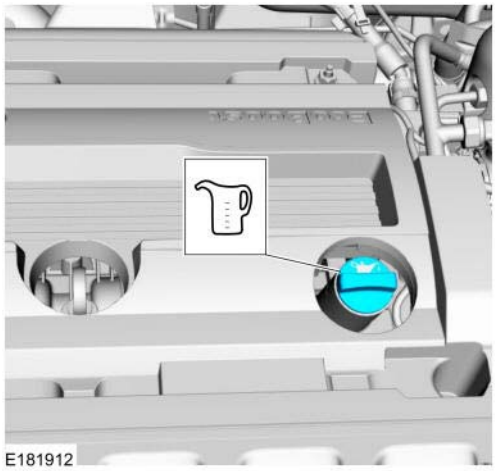
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 180°



21.

Fill the engine with clean engine oil. Refer to: Specifications .

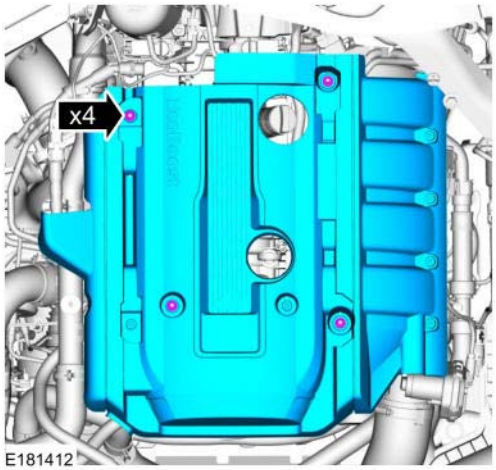
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

22.

Connect the battery ground. Refer to: Battery Disconnect and Connect .

23.



Fill the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

24.

Install the engine appearance cover and the nuts.

Torque

: 80 lb.in (9 Nm)

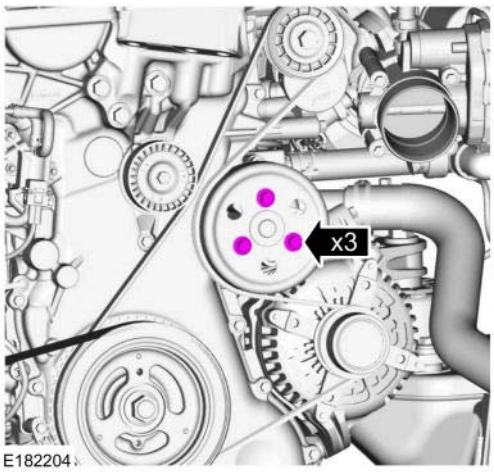
REMOVAL AND INSTALLATION > ENGINE FRONT COVER > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise

severe engine damage can occur.

1.



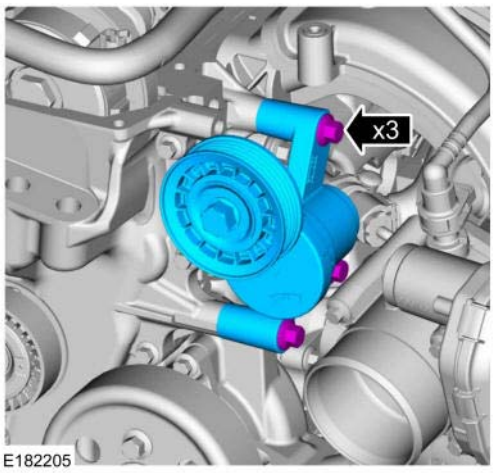
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

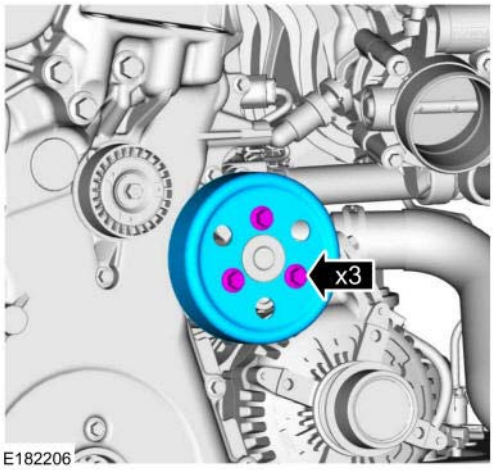
3.

Loosen the coolant pump pulley bolts.



4.

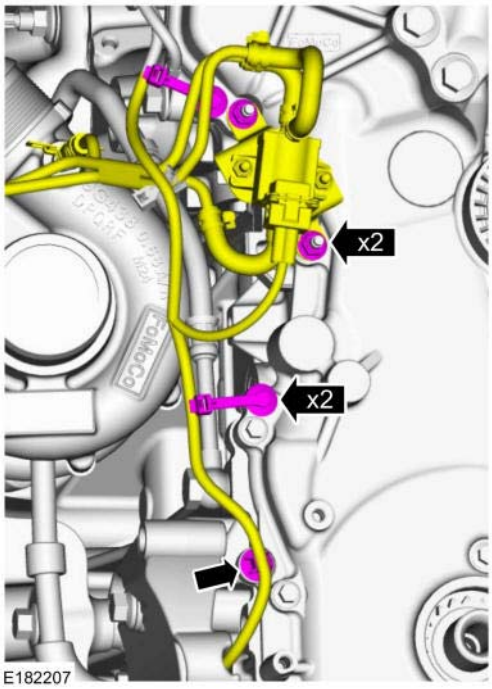
Remove the crankshaft front seal. Refer to: Crankshaft Front Seal .



5.

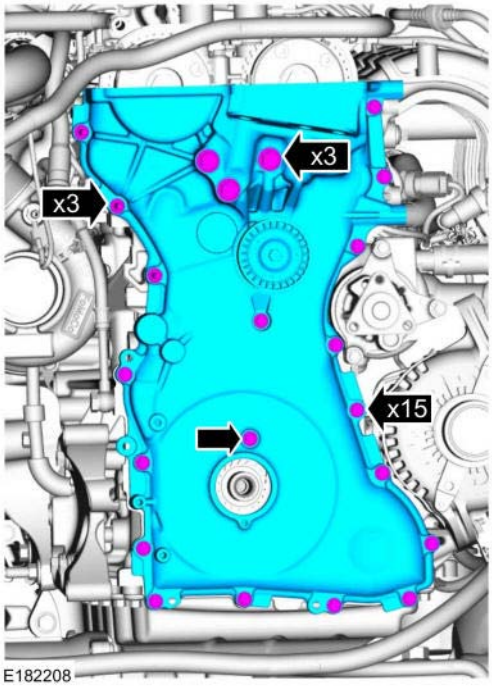
Remove the bolts and the accessory drive belt tensioner.

6.



Remove the bolts and the coolant pump pulley.

7.



Detach the wiring harness retainer.

Remove the nuts and position aside the turbocharger vacuum valve.

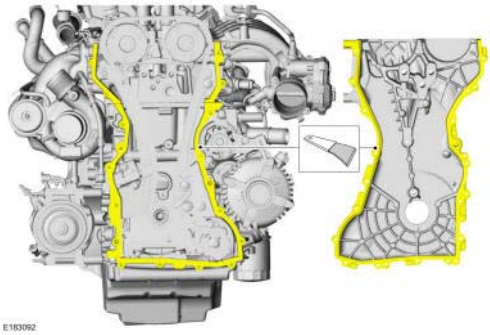
8.

Remove the bolts and the engine front cover.

9.

Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

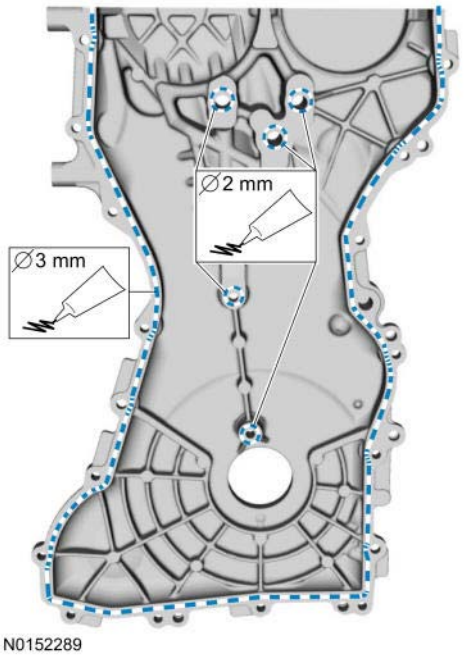
: Motorcraft® Metal Surface Prep / ZC-31-B

REMOVAL AND INSTALLATION > ENGINE FRONT COVER > INSTALLATION

NOTE: The engine front cover must be secured within 10 minutes of Silicone Gasket and Sealant application. If the valve cover is not secured within 10 minutes, the sealant must be removed and the sealing area cleaned.

1.

Apply beads of silicone sealant that are 2 mm (0.078 in) around the inner bolt holes.



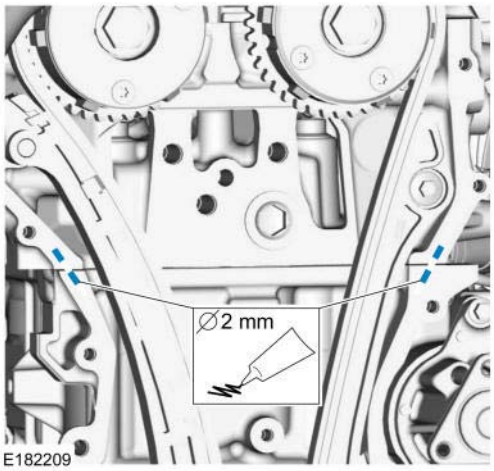
Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

Apply a bead of silicone sealant that are 3 mm (0.00 in) on the edge of the engine front cover.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

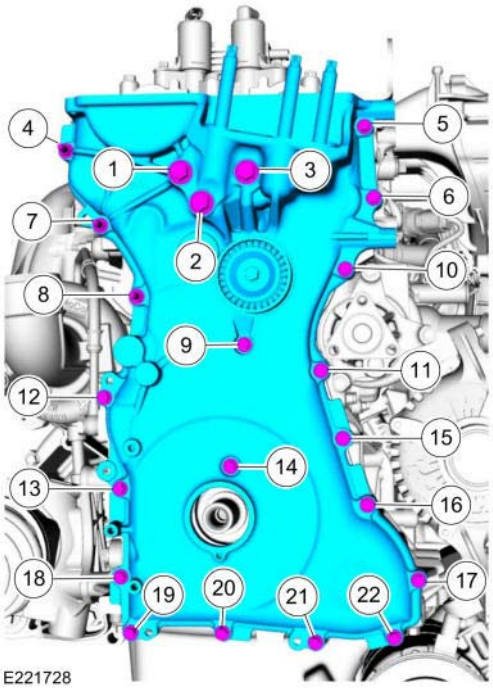


NOTE: The engine front cover must be secured within 10 minutes of silicone sealant application. If the engine front cover is not secured within 10 minutes, the sealant must be removed and the sealing area cleaned.

2.
Apply beads of silicone gasket and sealant that are 2 mm (0.078 in) in diameter and 5 mm (0.19 in) in length across the cylinder head and cylinder block joint areas.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



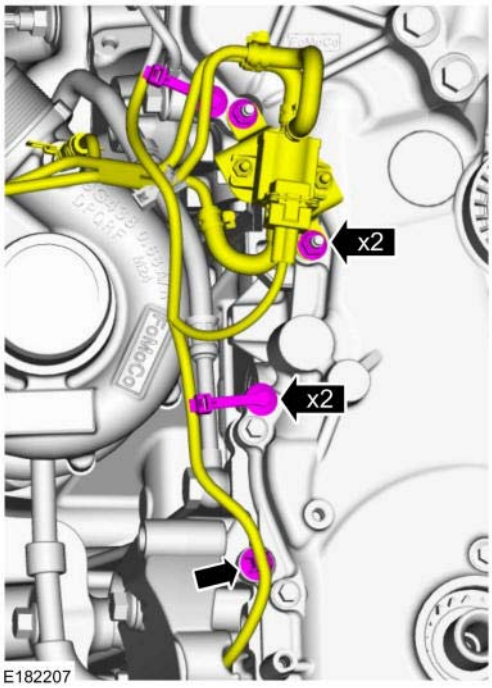
3.

Install the engine front cover and the bolts.

Torque

Bolts 1 - 3: 35 lb.ft (48 Nm)

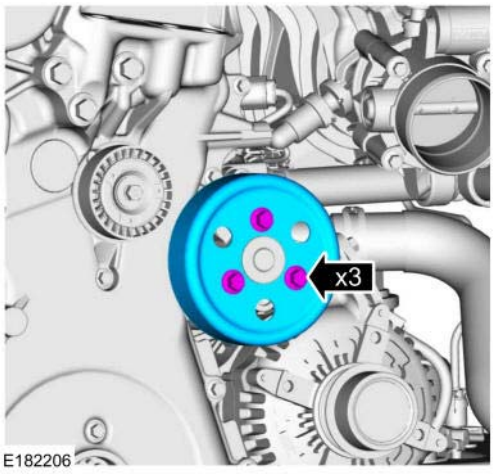
Bolts 4 - 22: 89 lb.in (10 Nm)



4.

Position the vacuum valve and install the nuts.

Torque

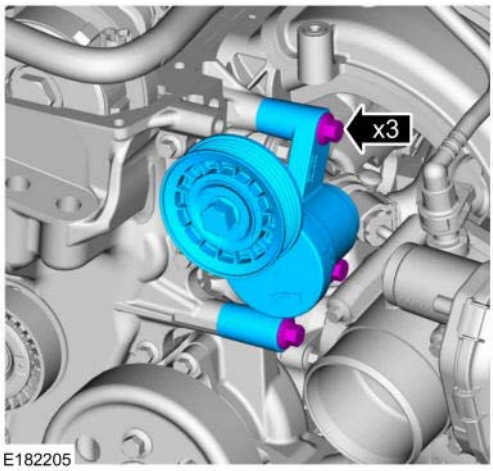


: 89 lb.in (10 Nm)

Attach the wiring harness retainer.

5.

Finger-tight.Install the coolant pump pulley and the bolts finger-tight.



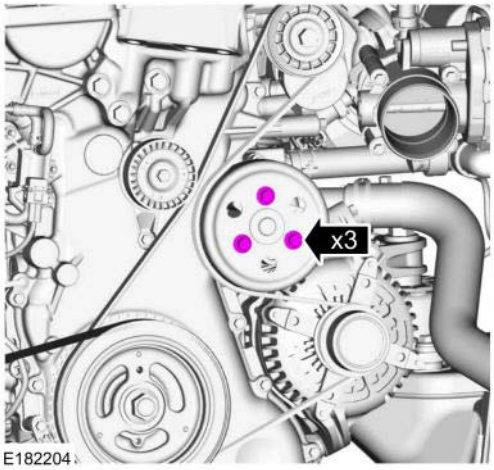
6.

Install the accessory drive belt tensioner and the bolts.

Torque

: 18 lb.ft (25 Nm)

7.



Install the crankshaft front seal. Refer to: Crankshaft Front Seal .

8.

Tighten the coolant pump pulley bolts.

Torque

: 177 lb.in (20 Nm)

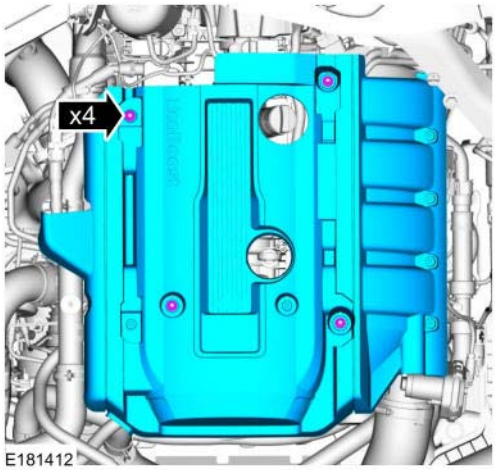
9.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

REMOVAL AND INSTALLATION > ENGINE MOUNT LH

Special Tool(s) / General Equipment

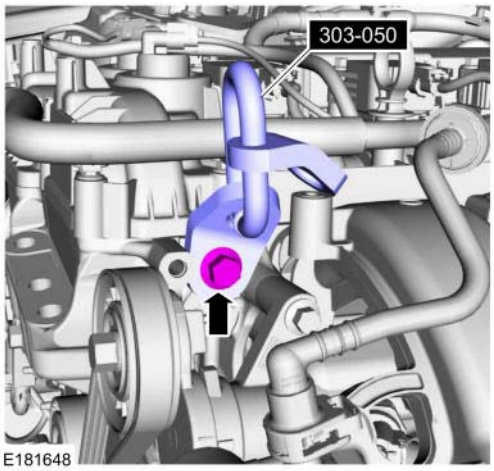
	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine



REMOVAL AND INSTALLATION > ENGINE MOUNT LH > REMOVAL

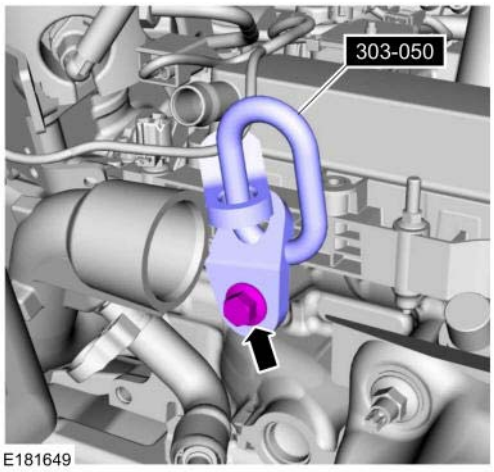
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



2.

Remove the nuts and the engine appearance cover.

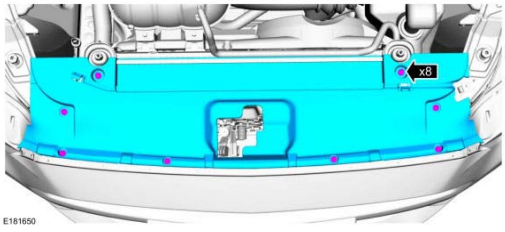


3.

Install the special tool on the LH side of the cylinder head. Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

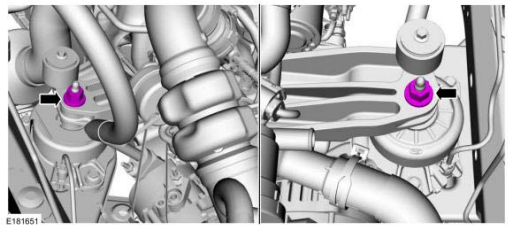
NOTE: Coolant tube removed for clarity.

4.
Install the special tool on the RH side of the cylinder head. Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



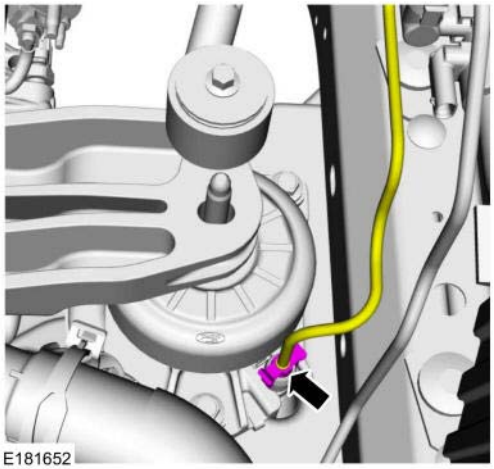
5.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .



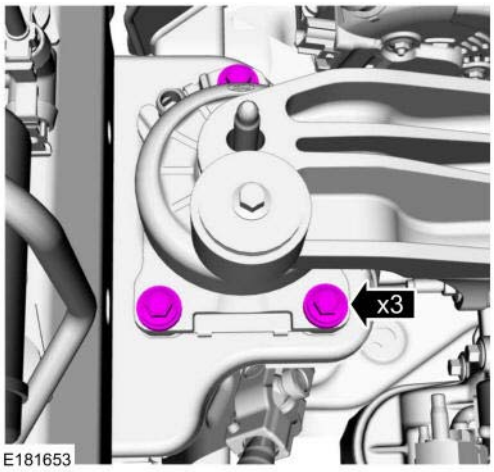
6.

Remove the retainers and the radiator top shield.



NOTE: Both the engine mount nuts must be removed to allow the engine to be raised.

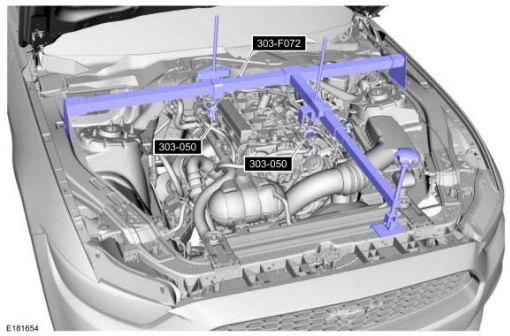
7.
Remove the RH and LH engine mount bracket nuts.



8.

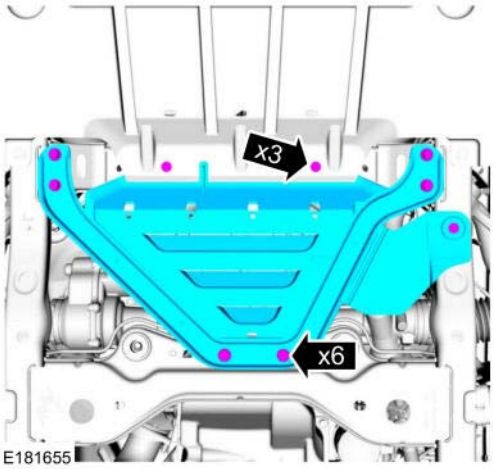
Disconnect the vacuum tube from the LH engine mount.

9.



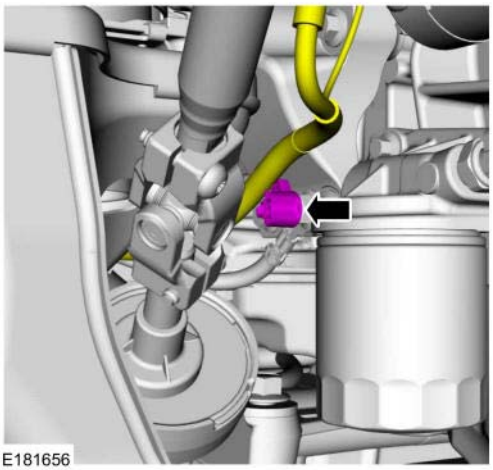
Remove the bolts for the engine mount.

10.



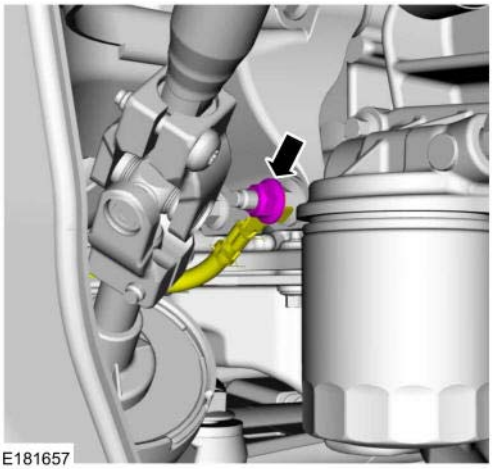
Install the special tool and raise the engine 26 mm (1.0 in).

Use Special Service Tool: 303-F072 Support Bar, Engine.



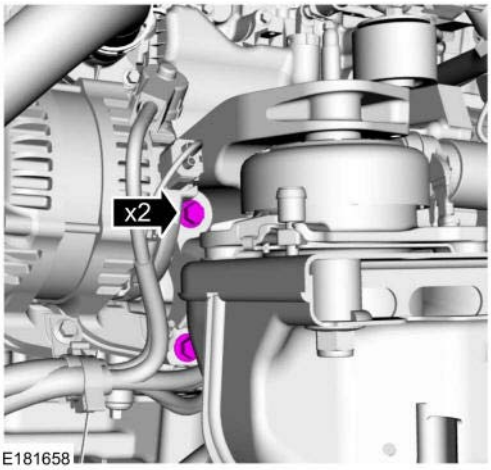
NOTE: The underbody shield will need to be remove for access to the LH front engine mount bracket bolt.

11.
Remove the screws, bolts and the underbody shield.



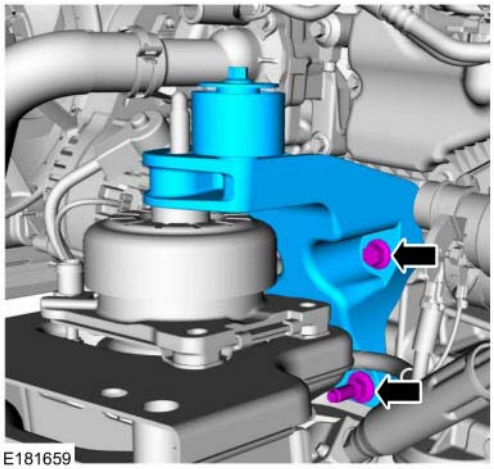
12.

Detach the wire harness retainer from the LH engine mount bracket stud bolt.



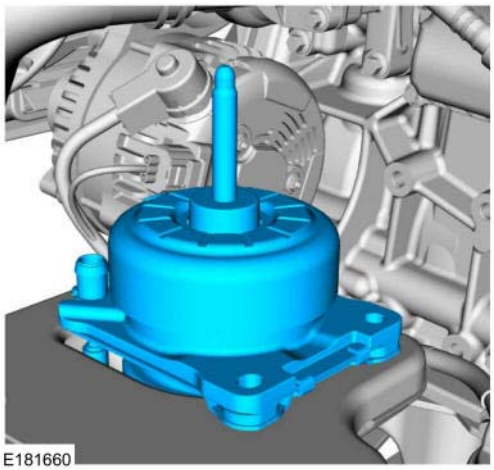
13.

Remove the nut and ground wire from the LH engine mount bracket stud bolt.



14.

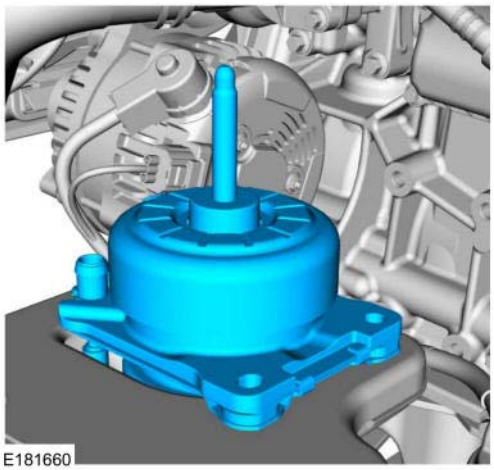
Remove the bolts for the engine mount bracket.



15.

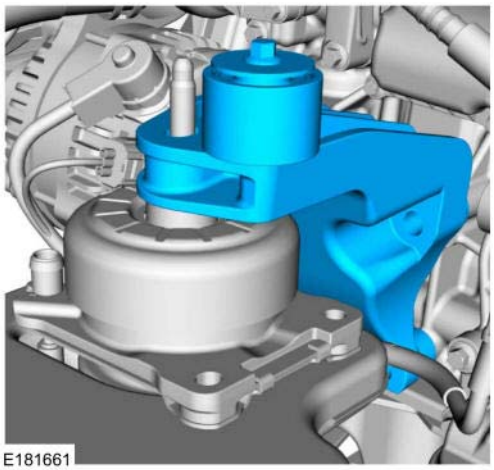
Remove the bolt, stud bolt and the engine mount bracket.

16.



Remove the engine mount.

REMOVAL AND INSTALLATION > ENGINE MOUNT LH > INSTALLATION

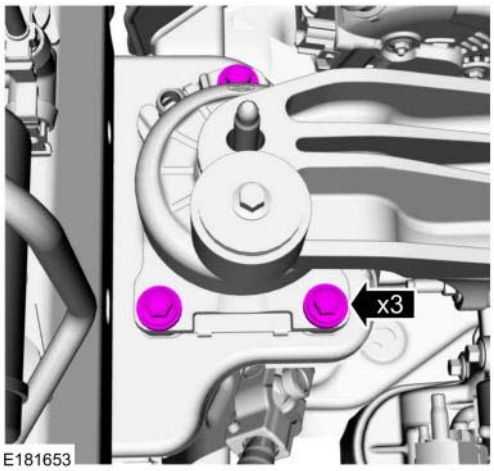


NOTE: Do not install the engine mount bolts at this time.

1.
Install the engine mount.

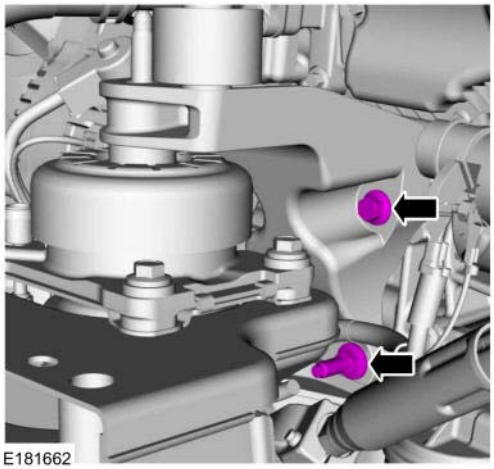
NOTE: Do not install the engine mount bracket bolts at this time.

2.
Install the engine mount bracket.



3.

Install the engine mount bolts.

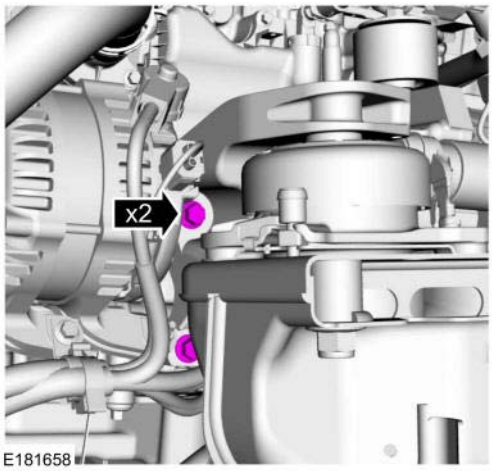


Torque

: 52 lb.ft (70 Nm)

4.

Install the bolt, stud bolt for the engine mount bracket finger tight.

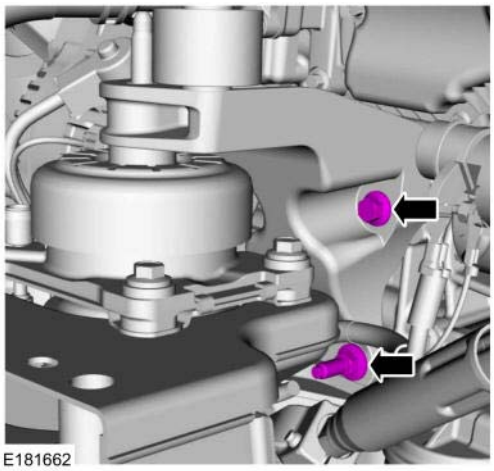


5.

Install the bolts for the engine mount bracket.

Torque

: 41 lb.ft (55 Nm)

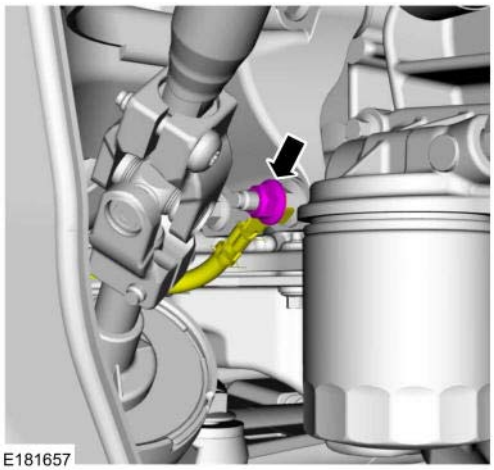


6.

Tighten the bolt, stud bolt for the engine mount bracket.

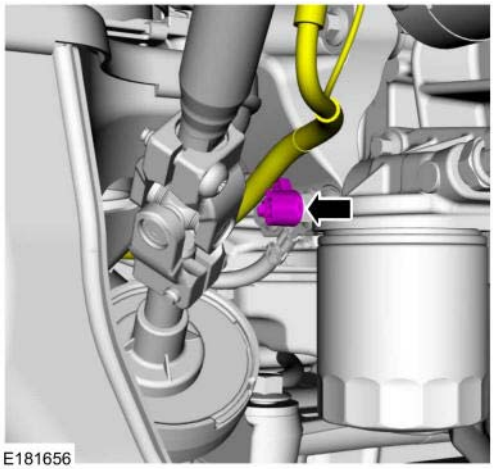
Torque

: 41 lb.ft (55 Nm)



7.

Install the ground wire and nut to the LH engine mount bracket stud bolt.



Torque

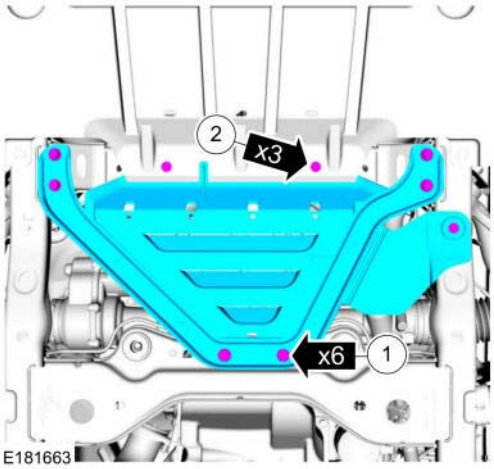
: 35 lb.ft (48 Nm)

8.

Attach the wire harness retainer to the LH engine mount bracket stud bolt.

9.

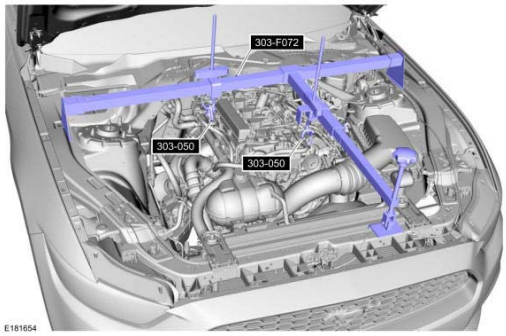
1.



Install the underbody shield and the bolts.

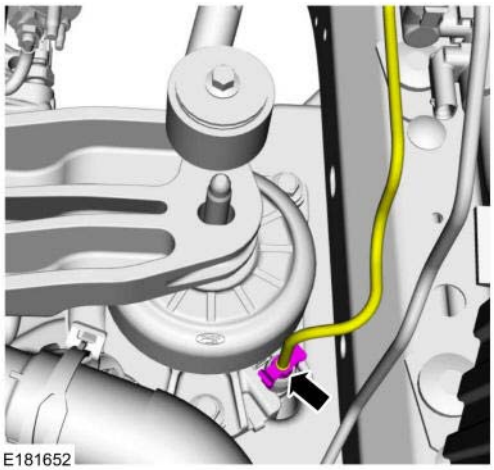
Torque

: 46 lb.ft (63 Nm)



2.

Install the underbody shield screws.

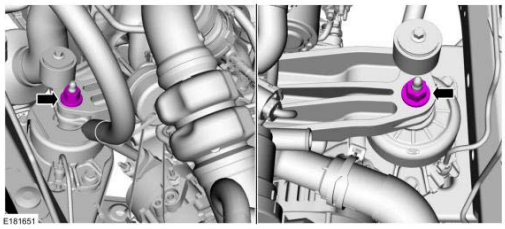


10.

Lower the engine 26 mm (1.0 in) and remove the special tool. Remove Special Service Tool: 303-F072 Support Bar, Engine.

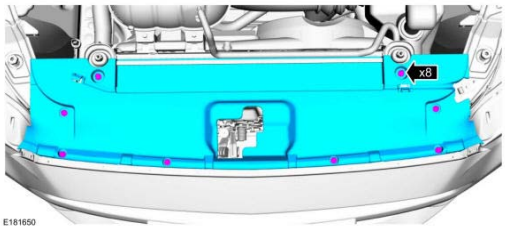
11.

Connect the vacuum tube to the LH engine mount.



12.

Install the RH and LH engine mount bracket nuts.

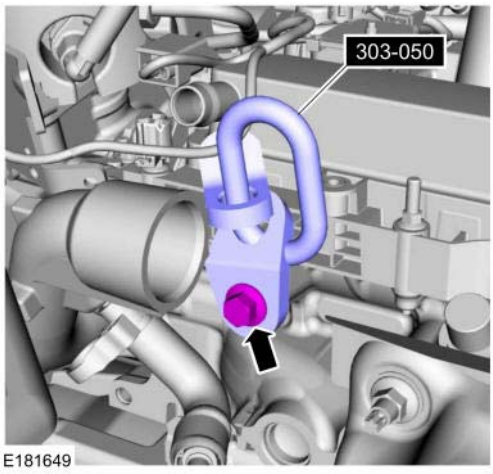


Torque

: 92 lb.ft (125 Nm)

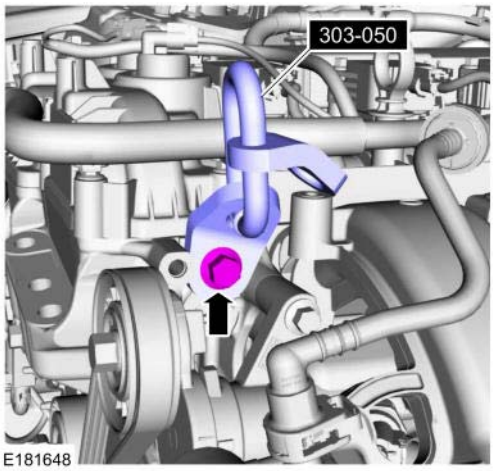
13.

Install the radiator top shield and the retainers.



14.

Connect the battery ground. Refer to: Battery Disconnect and Connect .

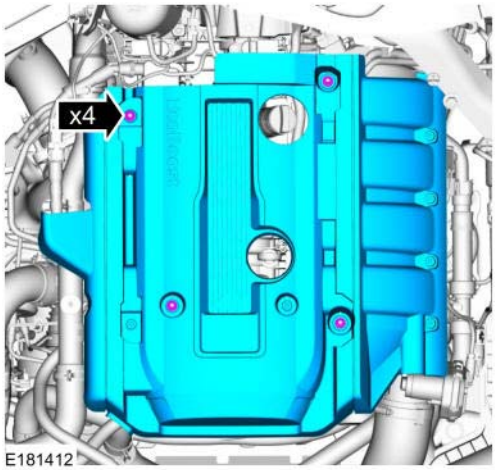


15.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

16.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



17.

Install the engine appearance cover and the nuts.

Torque

: 80 lb.in (9 Nm)

REMOVAL AND INSTALLATION > ENGINE MOUNT RH

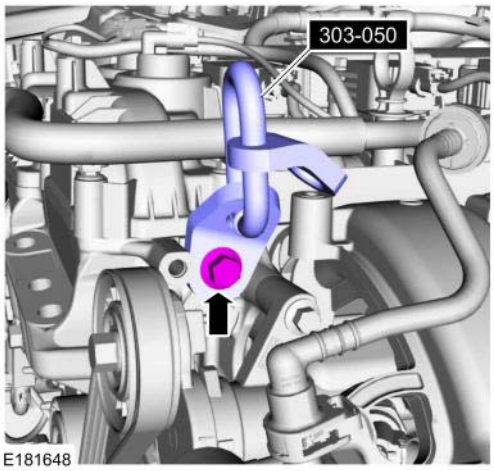
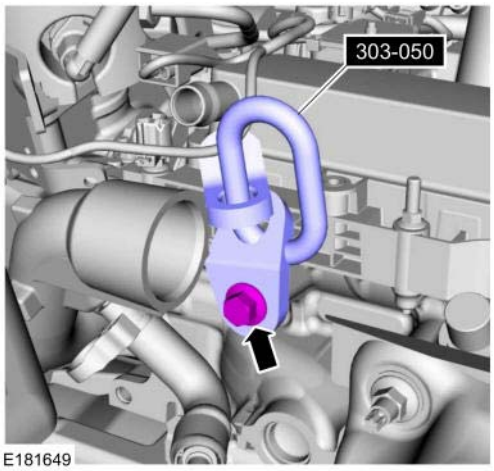
2.



Remove the nuts and the engine appearance cover.

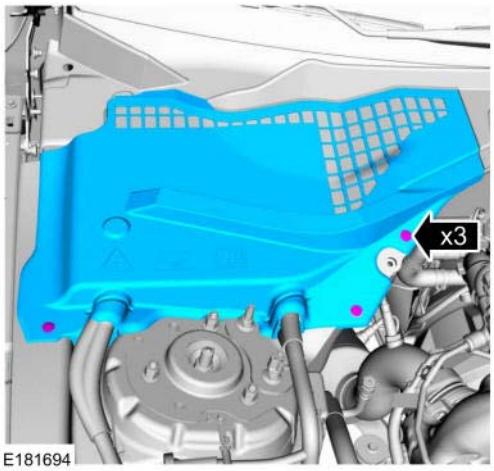
3.

Install the special tool on the LH side of the cylinder head.



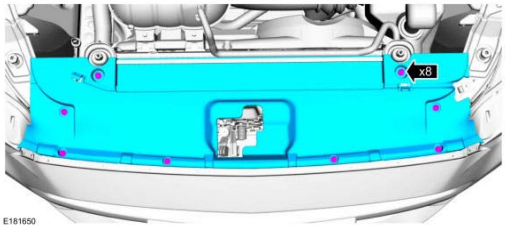
Install Special Service Tool: (T70P-6000) Lifting Bracket, Engine.

NOTE: Coolant tube removed for clarity.



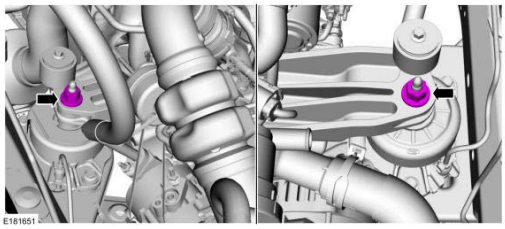
4.
Install the special tool on the RH side of the cylinder head.

Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



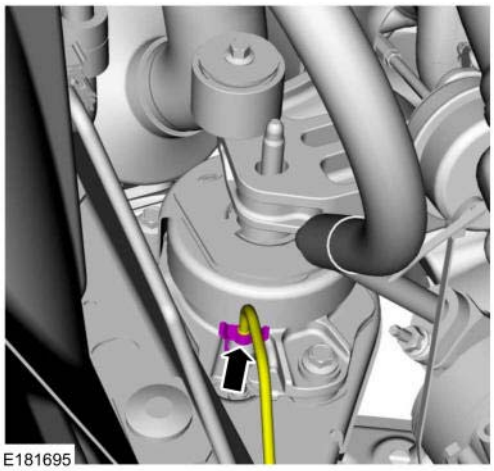
5.

Remove the retainers and the battery cover.



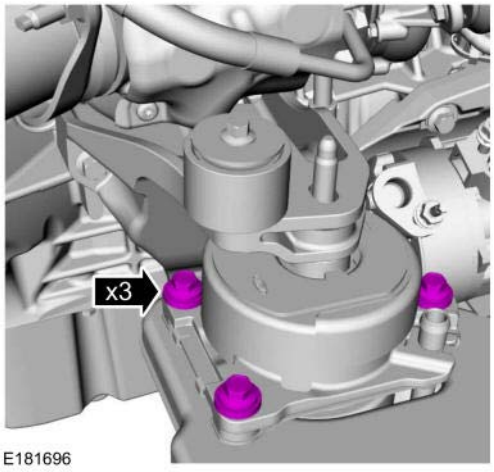
6.

Remove the retainers and the radiator top shield.



NOTE: Both the engine mount nuts must be removed to allow the engine to be raised.

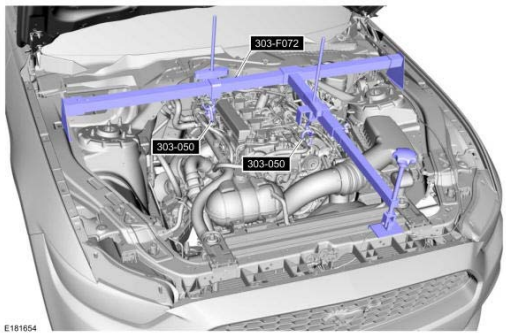
7.
Remove the RH and LH engine mount nuts.



8.

Disconnect the vacuum tube from the RH engine mount.

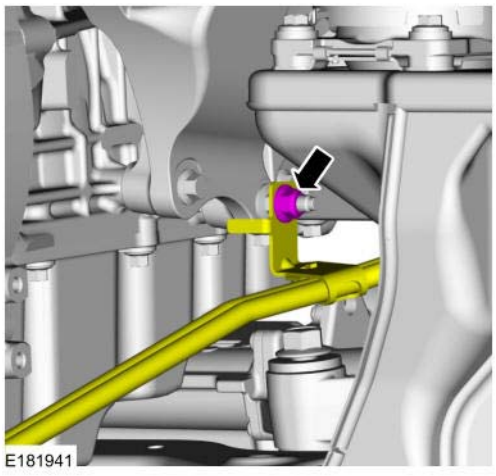
9.



Remove the bolts for the engine mount.

10.

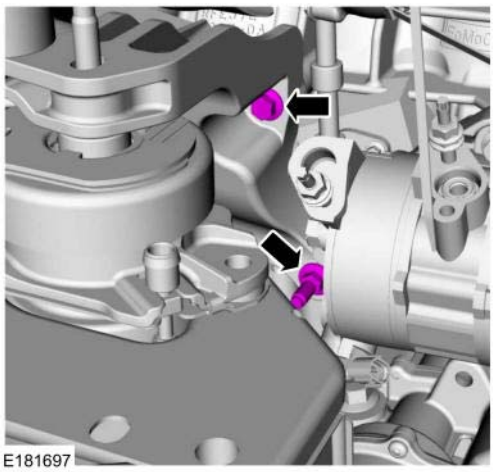
Install the special tool and raise the engine 26 mm (1.0 in).



Use Special Service Tool: 303-F072 Support Bar, Engine.

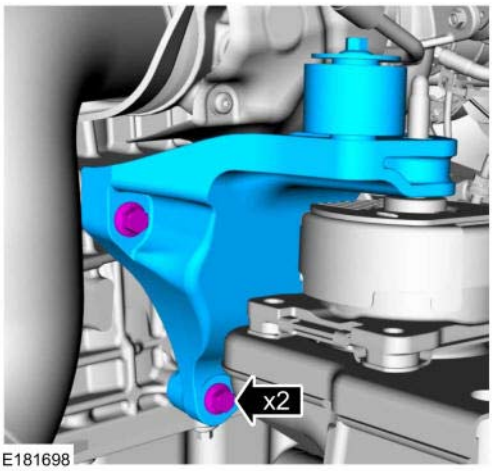
6-Speed Automatic Transmission - 6R80

11.



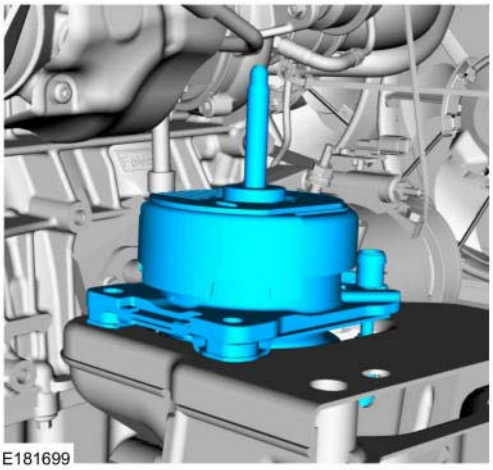
Remove the nut from the engine mount bracket stud bolt and position the automatic transmission tube bracket aside.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



12.

Remove the bolt, stud bolt for the engine mount bracket.

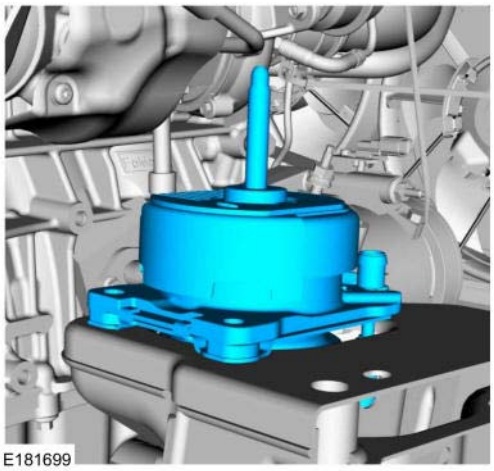


13.

Remove the bolts and the engine mount bracket.

14.

Remove the engine mount.



REMOVAL AND INSTALLATION > ENGINE MOUNT RH > INSTALLATION

1.

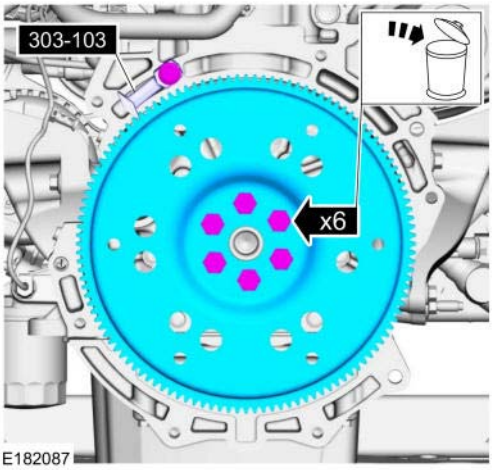
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the automatic transmission. Refer to: Transmission - 2.3L EcoBoost (231kW/314PS) .



3.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

NOTE: Do not reuse the flexplate bolts.

Remove the bolts and the flexplate.

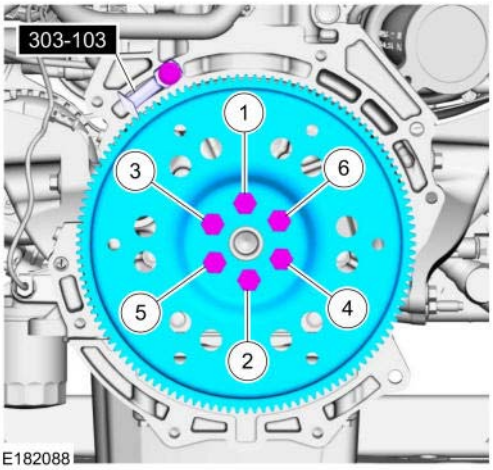
Discard the bolts.

REMOVAL AND INSTALLATION > FLEXPLATE > INSTALLATION

1.

> *NOTE: Special bolts are used for installation. Do not use standard bolts.*

Install the flexplate and the new bolts.



Torque

:Stage 1: 37 lb.ft (50 Nm)

Stage 2: 59 lb.ft (80 Nm)

Stage 3: 83 lb.ft (112 Nm)

Remove Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

2.

Install the automatic transmission. Refer to: Transmission - 2.3L EcoBoost (231kW/314PS) .

3.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > FLYWHEEL

Special Tool(s) / General Equipment

 E222983	303-103 (T74P-6375-A) Holding Tool, Flywheel T74P-77000-A TKIT-2009TC-F

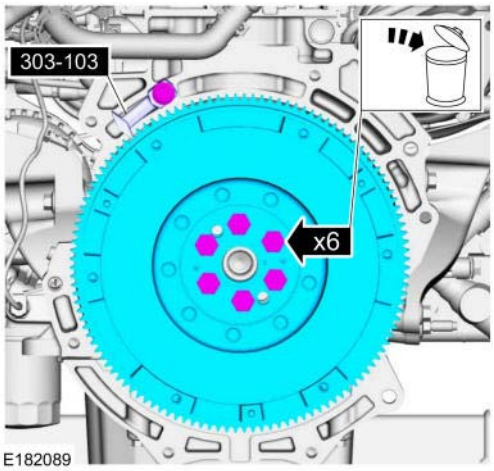
REMOVAL AND INSTALLATION > FLYWHEEL > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the clutch. Refer to: Clutch Disc and Pressure Plate - 2.3L EcoBoost (201kW/273PS) .



3.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

NOTE: Do not reuse the flywheel bolts.

Remove the bolts and the flywheel.

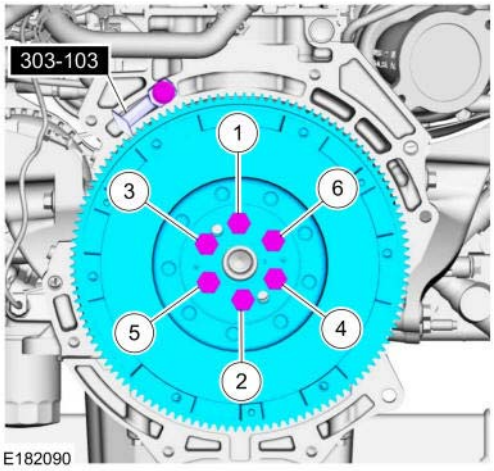
Discard the bolts.

REMOVAL AND INSTALLATION > FLYWHEEL > INSTALLATION

1.

> *NOTE: Special bolts are used for installation. Do not use standard bolts.*

Install the flywheel and the new bolts.



Torque:

Stage 1: 37 lb.ft (50 Nm)

Stage 2: 59 lb.ft (80 Nm)

Stage 3: 83 lb.ft (112 Nm)

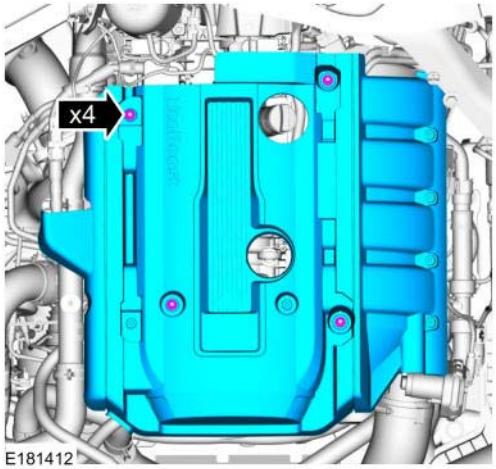
Remove Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

2.

Install the clutch. Refer to: Clutch Disc and Pressure Plate - 2.3L EcoBoost (201kW/273PS) .

3.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.



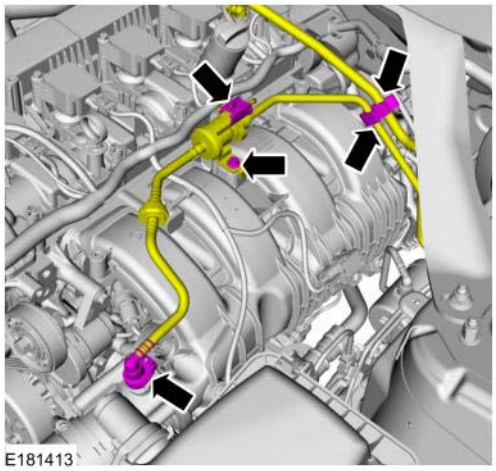
REMOVAL AND INSTALLATION > INTAKE MANIFOLD > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

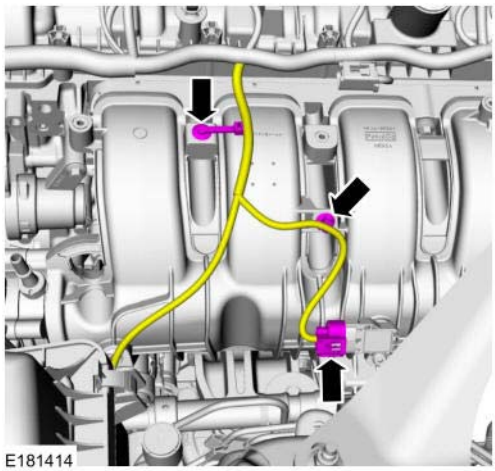
Remove the nuts and the engine appearance cover.



3.

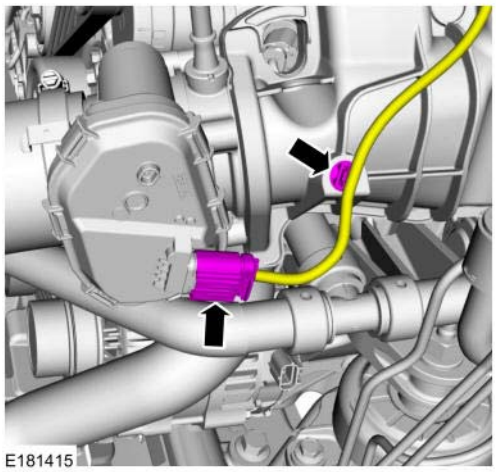
Disconnect the EVAP canister purge valve quick release coupling at the front of the intake manifold. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

Detach the fuel tube and EVAP tube from the retainer on the intake manifold.



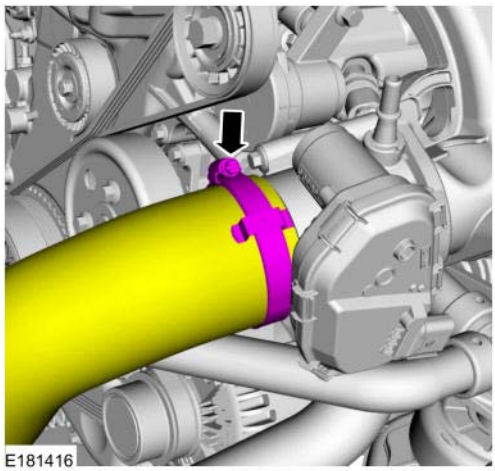
Disconnect the EVAP canister purge valve electrical connector.

Remove the bolt and position the EVAP canister purge valve aside.



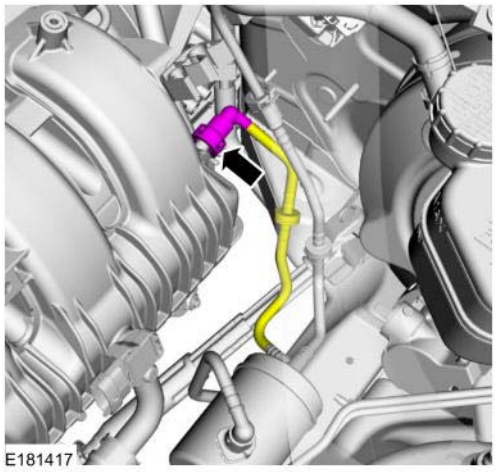
4.

Disconnect the MAPT sensor electrical connector and the wire harness retainers.



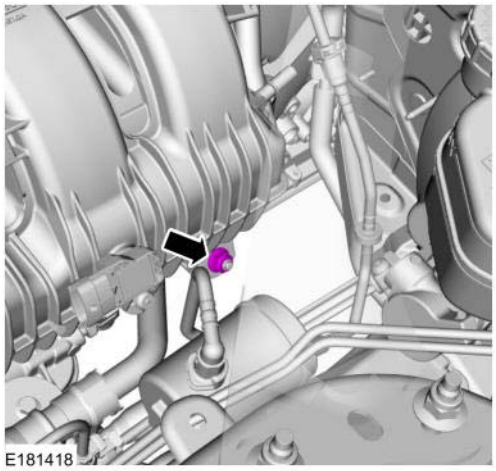
5.

Disconnect the throttle body electrical connector and the wire harness retainer.



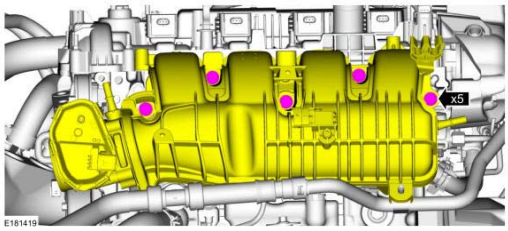
6.

Loosen the clamp and position aside the CAC outlet tube.



7.

Disconnect the vacuum tube quick release coupling at the rear of the intake manifold.

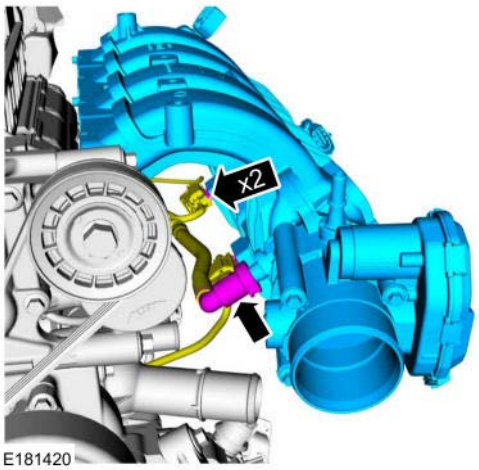


8.

Remove the nut from the coolant tube on the intake manifold.

9.

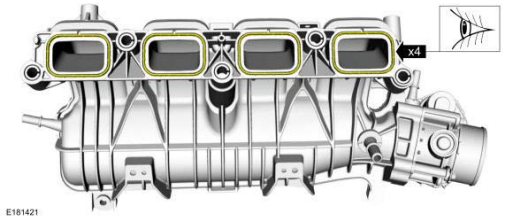
Remove the bolts and position intake manifold back.



10.

Disconnect the PCV tube quick release coupling.

Detach the KS electrical connector retainers from the intake manifold.

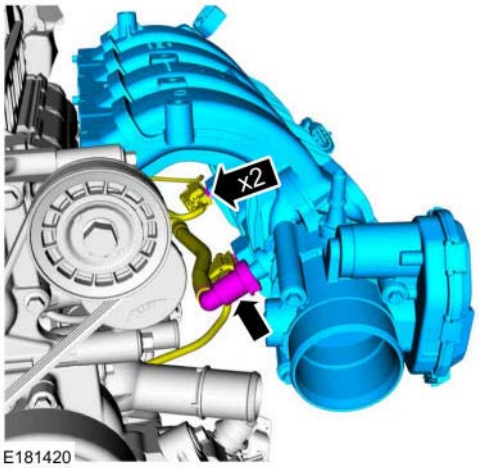


Remove the intake manifold.

NOTE: If the engine is repaired or replaced because of upper engine failure,

typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

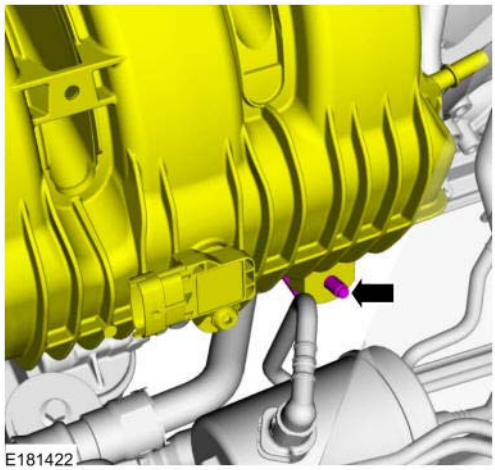
11.
Visually inspect the intake manifold gaskets for nicks, cuts and abrasions. If these conditions are not present, the gaskets may be reused.



REMOVAL AND INSTALLATION > INTAKE MANIFOLD > INSTALLATION

1.

Position the intake manifold for installation.

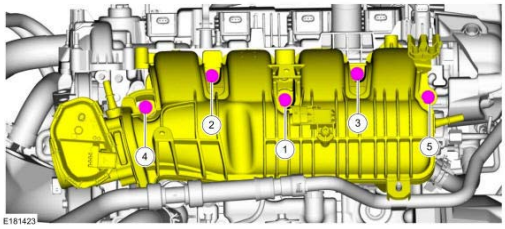


Attach the KS electrical connector retainers to the intake manifold.

Connect the PCV tube quick release coupling.

NOTE: Make sure the coolant tube is in position when intake is installed.

2.
Position the intake manifold on the coolant tube stud.

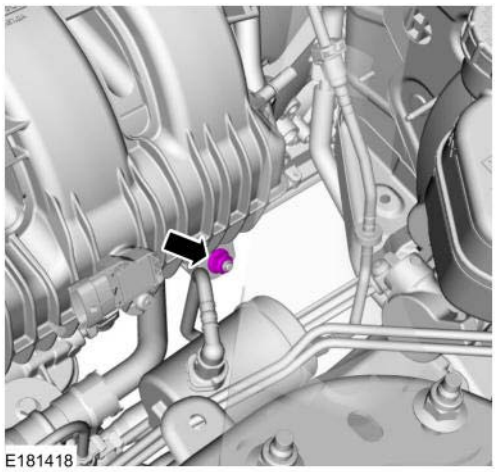


3.

Install the bolts.

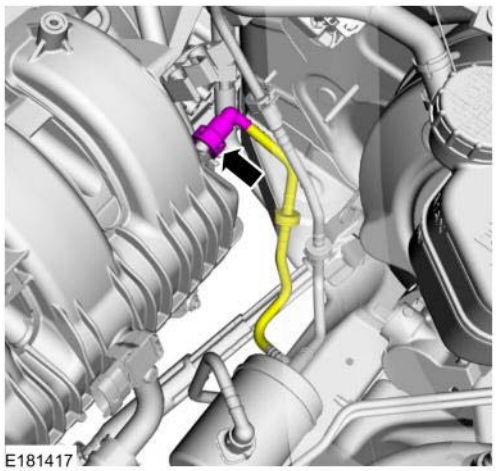
Torque

: 177 lb.in (20 Nm)



4.

Install the nut on the coolant tube.

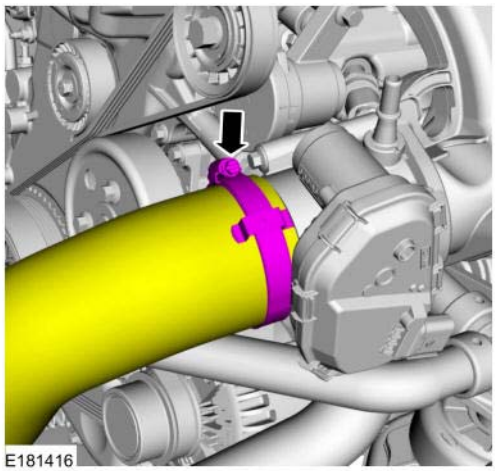


Torque

: 106 lb.in (12 Nm)

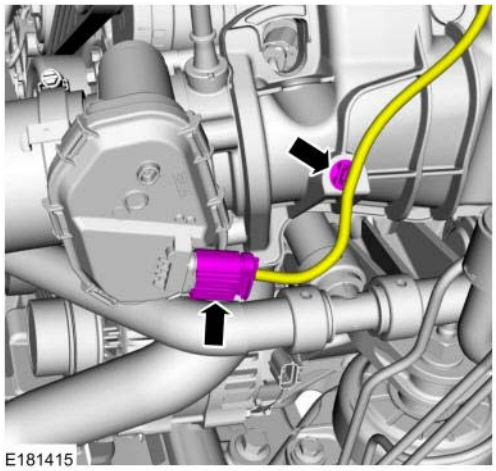
5.

Connect the vacuum tube quick release coupling at the rear of the intake manifold.



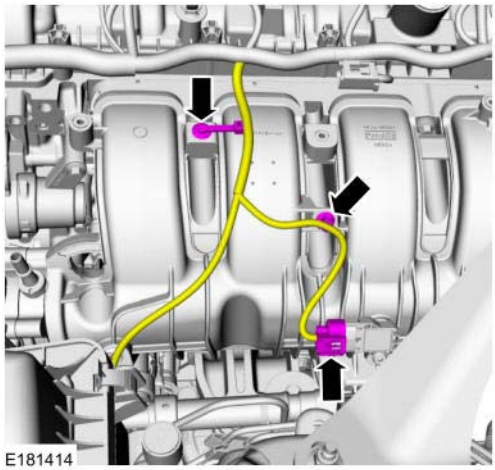
6.

Position the CAC outlet tube and tighten the clamp.



Torque

: 44 lb.in (5 Nm)



7.

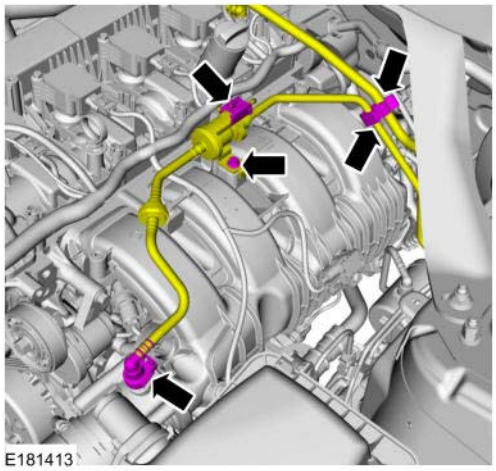
Connect the throttle body electrical connector and the wire harness retainer.

8.

Connect the MAPT sensor electrical connector and the wire harness retainers.

9.

Install the EVAP canister purge valve and the bolt.



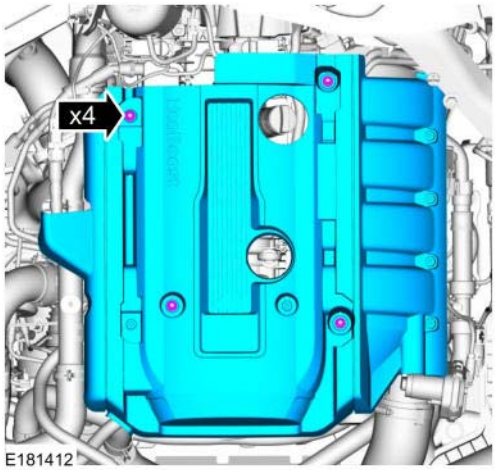
Torque

: 71 lb.in (8 Nm)

Connect the EVAP canister purge valve electrical connector.

Attach the fuel tube and EVAP tube to the retainer on the intake manifold.

Connect the EVAP canister purge valve quick release coupling at the front of the intake manifold.



10.

Install the engine appearance cover and the nuts.

Torque

: 80 lb.in (9 Nm)

REMOVAL AND INSTALLATION > OIL PAN

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine

REMOVAL AND INSTALLATION > OIL PAN > REMOVAL

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

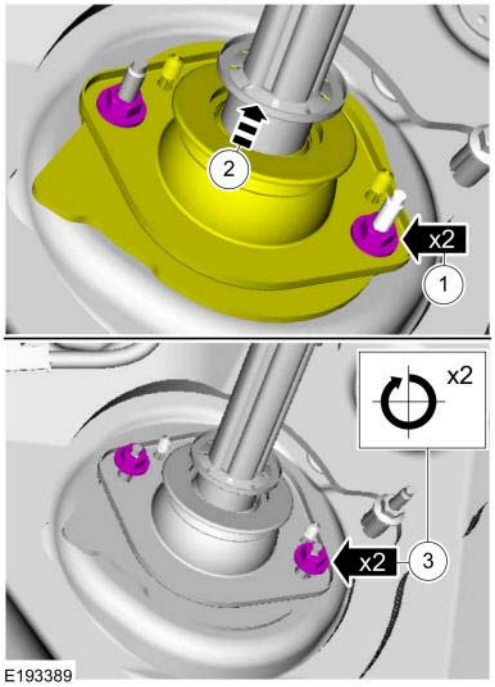
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

2.

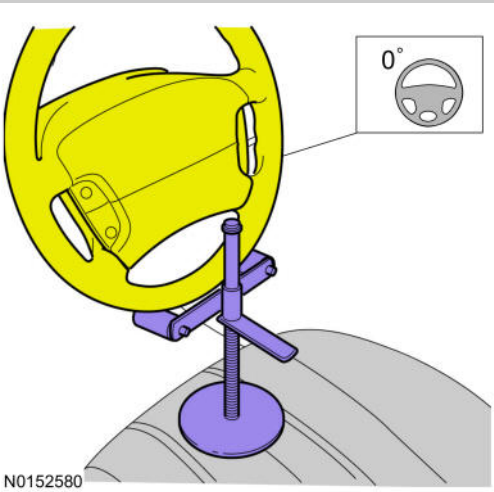
1.



Remove the steering column dash seal nuts.

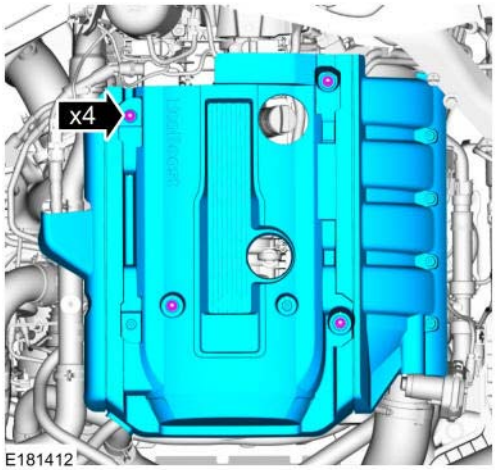
2.

Loosen the dash seal.



3.

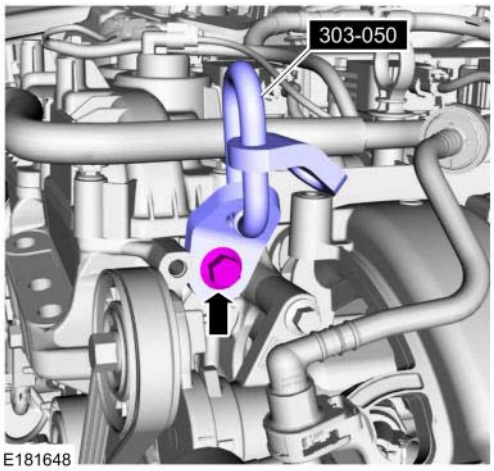
Hand start the dash seal nuts.



3.

Using a holding device, hold the steering wheel in the straight-ahead position.

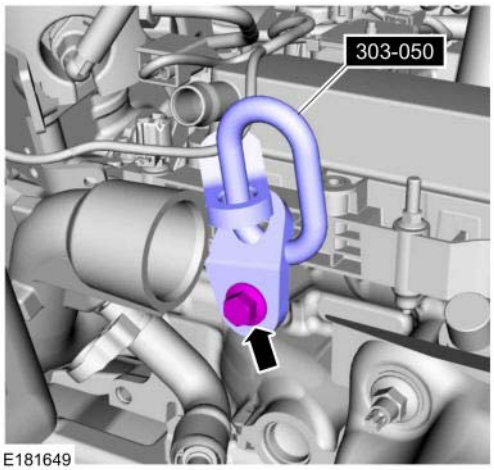
4.



Remove the nuts and the engine appearance cover.

5.

Install the special tool on the LH side of the cylinder head.

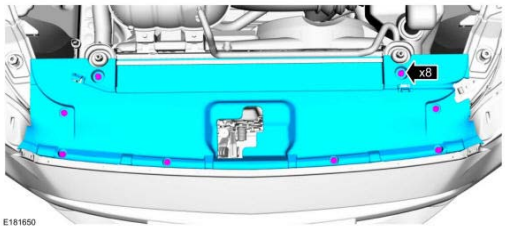


Use Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

NOTE: Coolant tube removed for clarity.

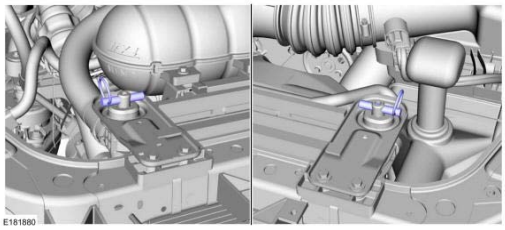
6.
Install the special tool on the RH side of the cylinder head.

Use Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



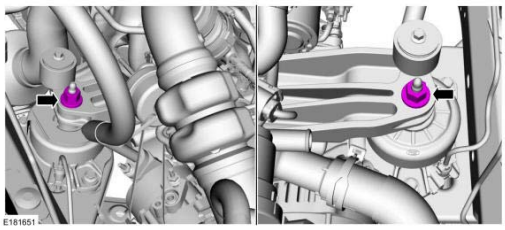
7.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .



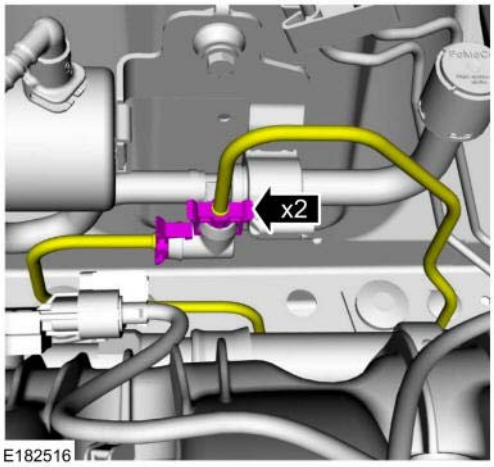
8.

Remove the retainers and the radiator top shield.



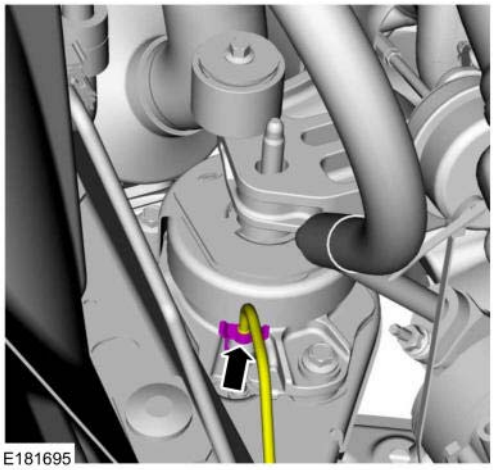
9.

Install retaining pins to support cooling module.



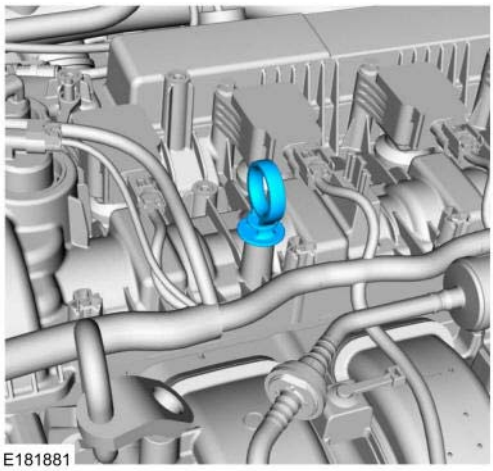
10.

Remove the RH and LH engine mount bracket nuts.



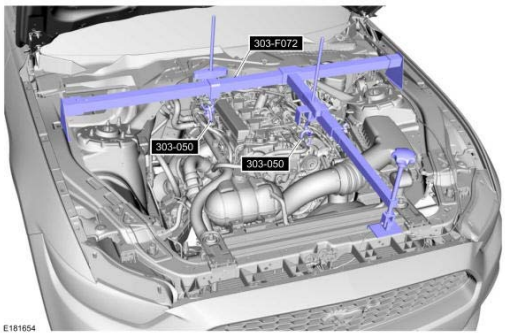
11.

Disconnect the vacuum tubes from the engine mount control vacuum reservoir.



12.

Disconnect the vacuum tube from the RH engine mount.

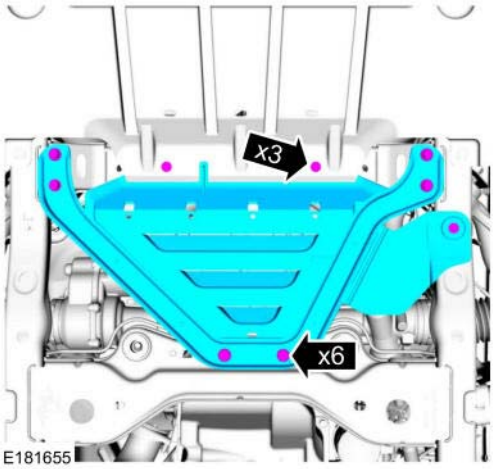


13.

Remove the oil level indicator.

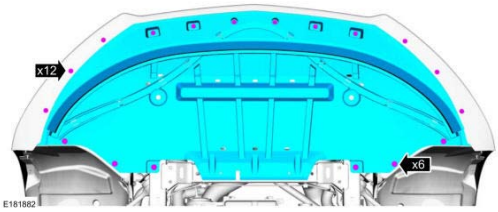
NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, position the legs on the body structure near the suspension strut tower. Failure to follow these instructions may result in body damage.

14.
Install the special tool to support the engine. Install Special Service Tool: 303-F072 Support Bar, Engine.



15.

Remove the front wheels and tires. Refer to: Wheel and Tire .

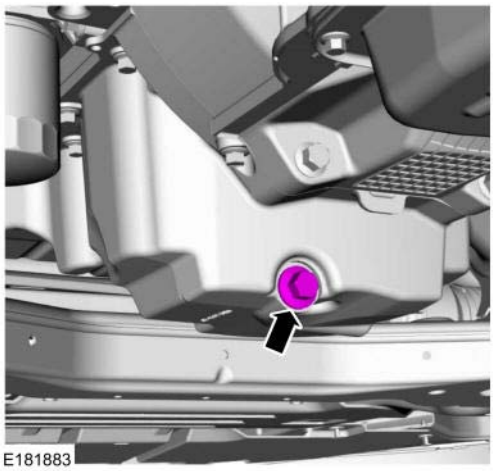


16.

Remove the screws, bolts and the underbody shield.

17.

Remove the pin-type retainers, bolts and the underbody shield.

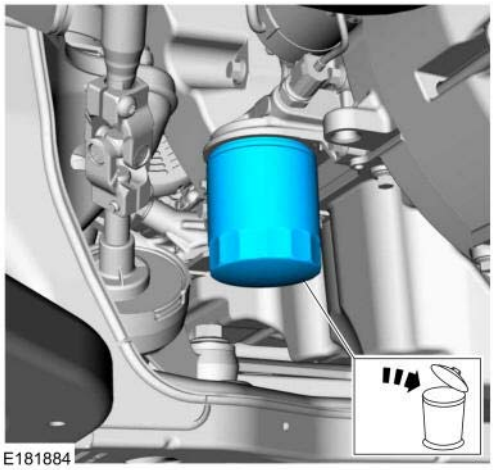


18.

Drain engine oil and install drain plug.

Use the General Equipment: Oil Drain Equipment

Torque



: 20 lb.ft (27 Nm)

19.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

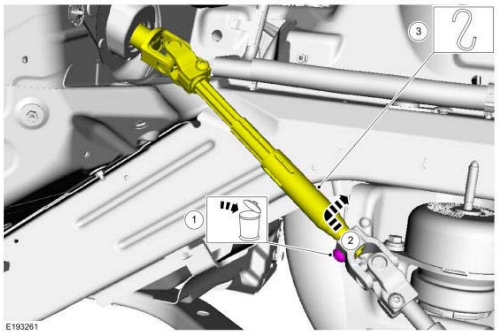
WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

20.

Detach the steering column lower shaft from the lower coupling.

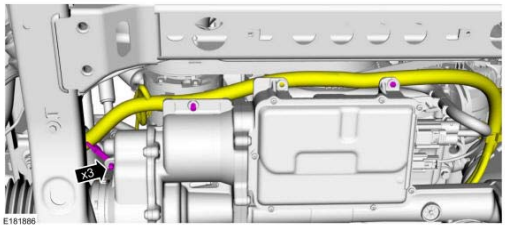
1.



Remove and discard the steering column shaft bolt.

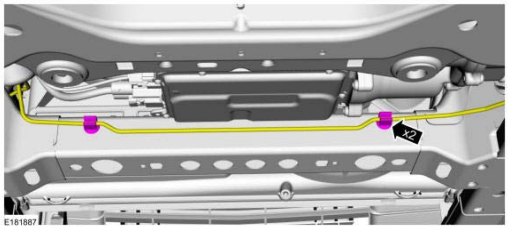
2.

Pull apart the steering column shaft from the coupling.



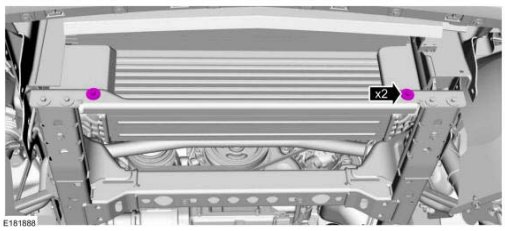
3.

Secure the lower shaft to the frame rail to avoid damaging it during subframe removal.



21.

Detach the EPAS wiring harness pin-type retainers.

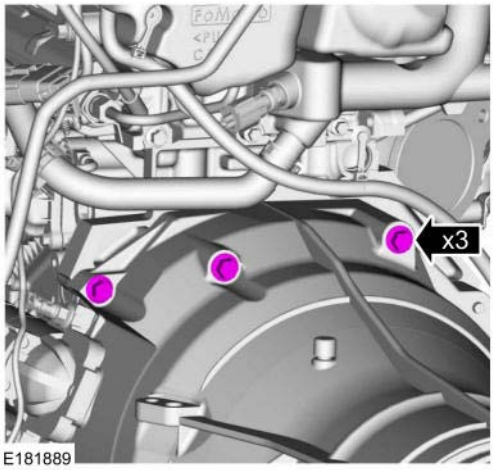


22.

Detach the brake line retainers from the subframe.

23.

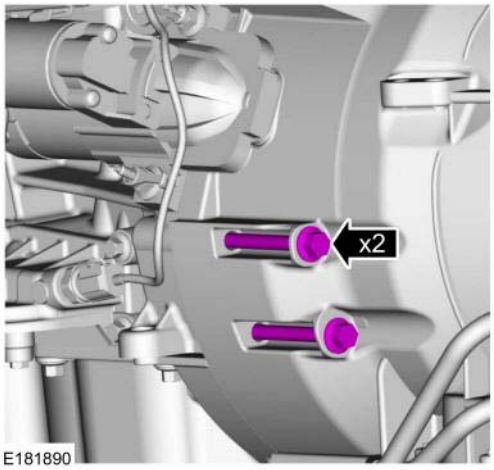
Remove the bolts from the support bar on the front of the subframe.



NOTE: To prevent damage to the transmission, do not loosen the transmission-

to-engine fasteners more than 5 mm (0.19 in).

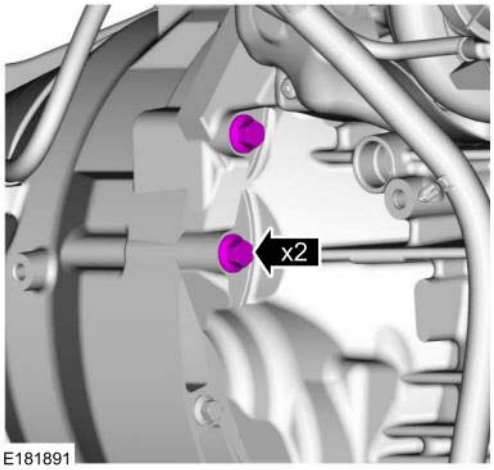
NOTE: Automatic transmission shown in illustration, manual transmission similar.



24.
Loosen the bolts 5 mm (0.19 in).

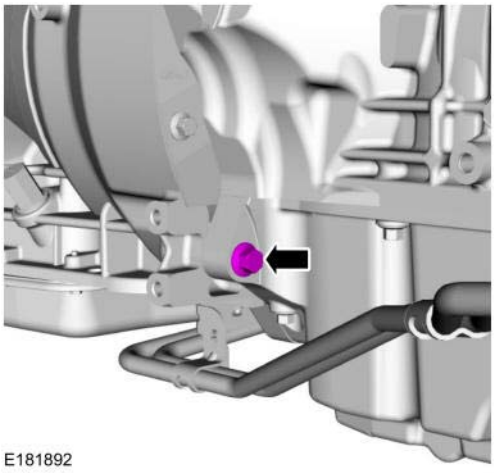
NOTE: Automatic transmission shown in illustration, manual transmission similar.

NOTE: To prevent damage to the transmission, do not loosen the transmission-to-engine fasteners more than 5 mm (0.19 in).



25.
Loosen the bolts 5 mm (0.19 in).

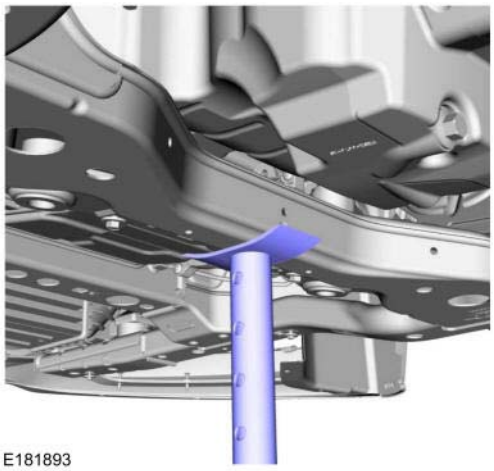
NOTE: Automatic transmission shown in illustration, manual transmission similar.



NOTE: To prevent damage to the transmission, do not loosen the engine-to-transmission fasteners more than 5 mm (0.19 in).

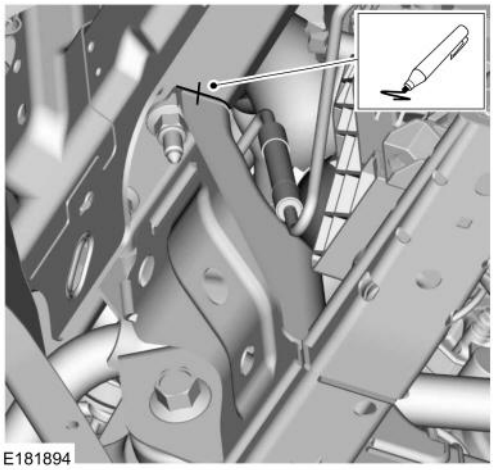
26.
Loosen bolts 5 mm (0.19 in).

NOTE: Automatic transmission shown in illustration, manual transmission similar.



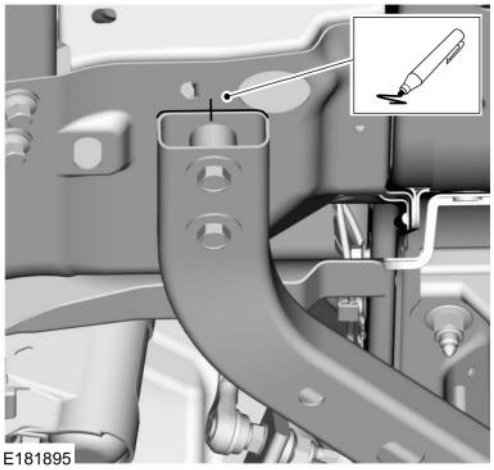
27.
Remove the oil pan bolt.

28.



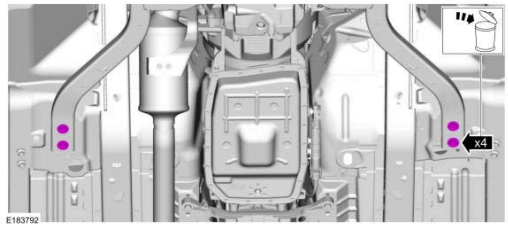
Using an adjustable stand, support the subframe.

Use the General Equipment: Vehicle/Axle Stands



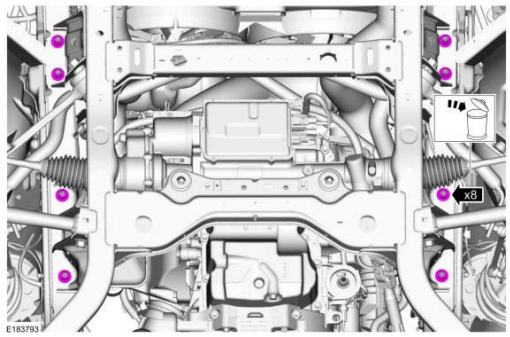
29.

Mark the position of the front subframe for reference during installation.



30.

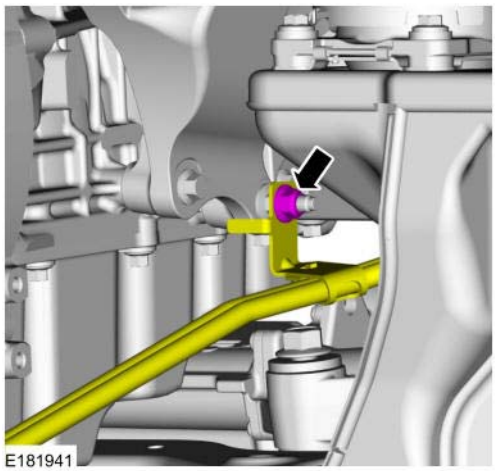
Mark the position of the rear subframe for reference during installation.



31.

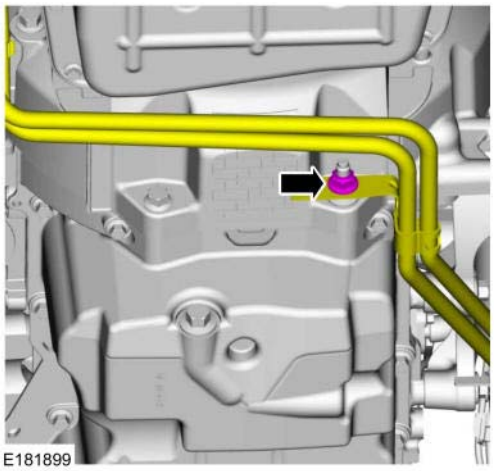
Remove and discard the rear subframe bolts.

32.



Remove and discard the front subframe nuts.

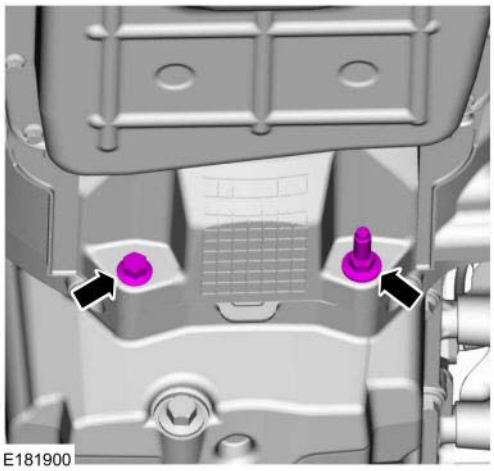
6-Speed Automatic Transmission - 6R80



33.

Remove the nut from the RH engine mount bracket stud bolt for the transmission cooling tubes.

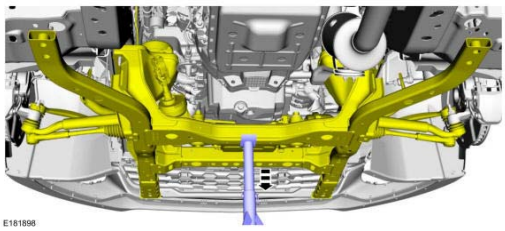
34.



Remove the transmission cooling tube bracket nut and position aside.

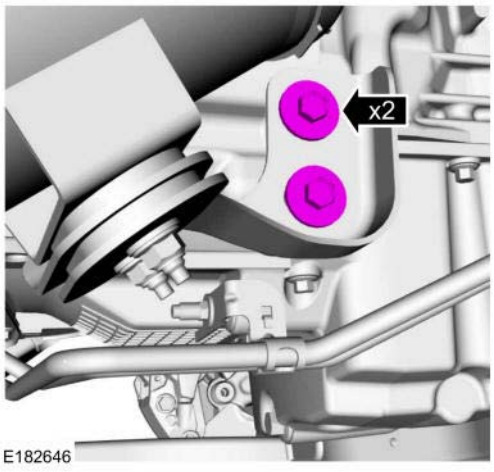
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: Automatic transmission shown in illustration, manual transmission similar.



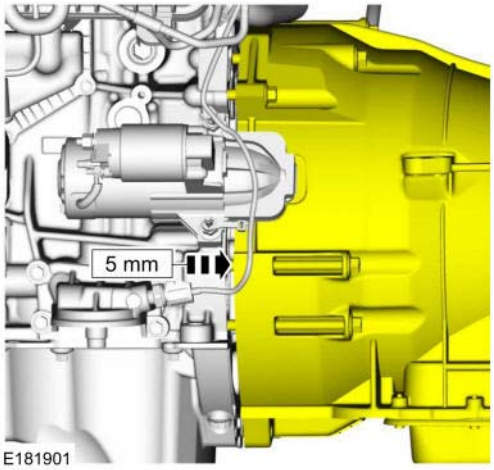
35.
Remove the oil pan bolts.

36.



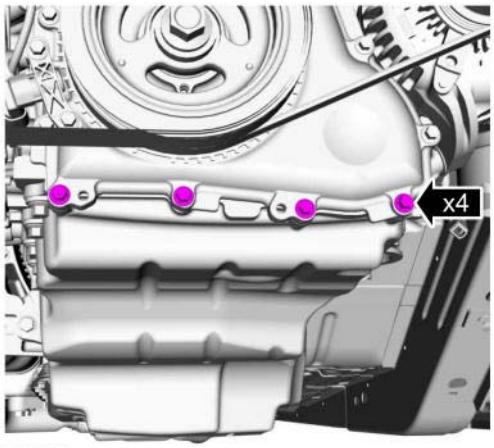
Using an adjustable stand, lower the subframe 102 mm (4.0 in).

Use the General Equipment: Vehicle/Axle Stands



NOTE: Automatic transmission shown in illustration, manual transmission similar.

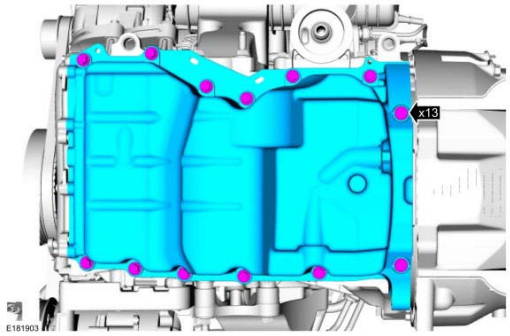
37.
Remove the bolts for the catalytic converter bracket.



38.

Separate the engine from the transmission 5 mm (0.19 in).

39.



Remove the engine front cover bolts.

E181902

40.

Remove the bolts and the oil pan.

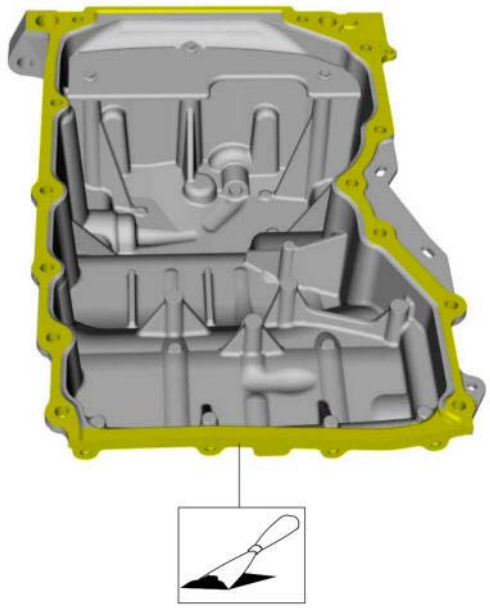
E181903

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

41.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

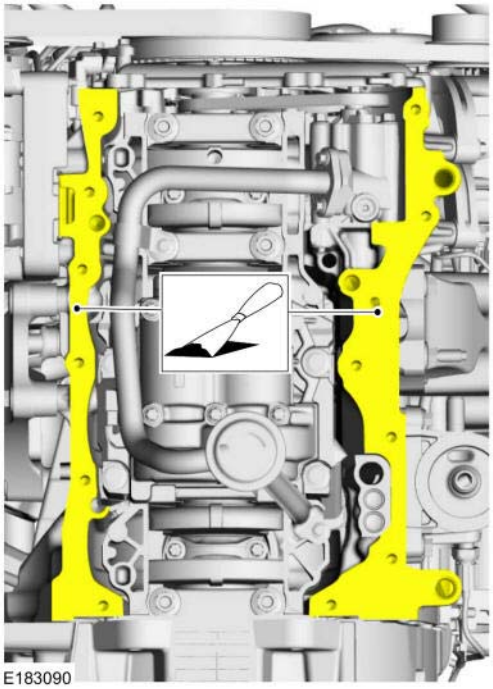
E183089

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

42.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

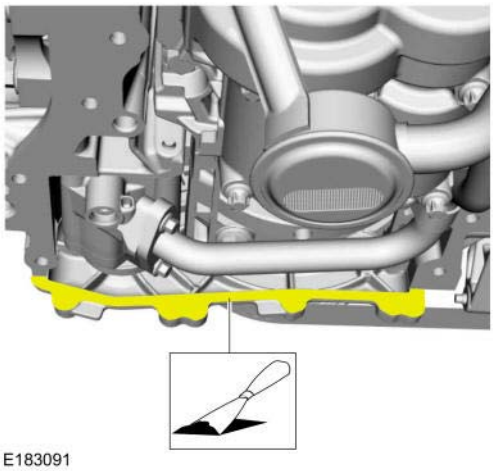
: Motorcraft® Metal Surface Prep / ZC-31-B

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

43.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

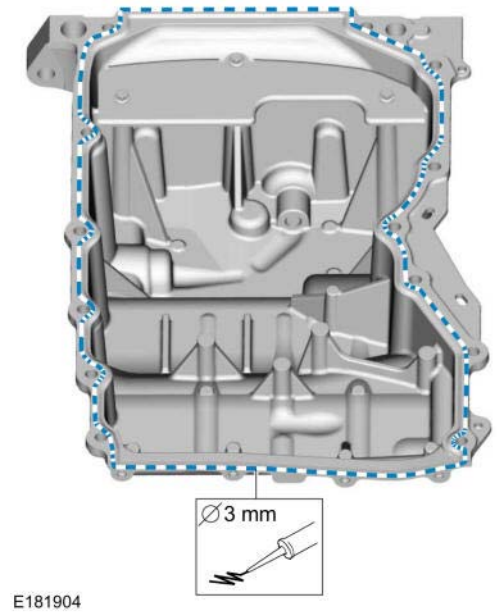
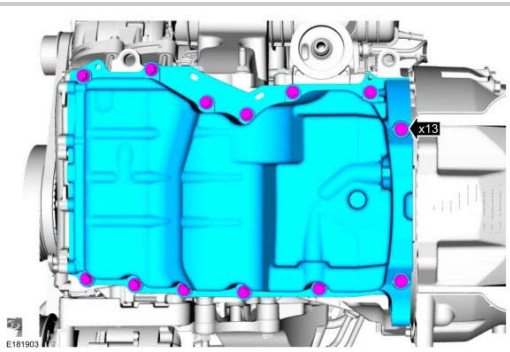
REMOVAL AND INSTALLATION > OIL PAN > INSTALLATION



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: If the oil pan is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned. Allow to dry until there is no sign of wetness, or 10 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

1.
Apply a 3 mm (0.19 in) bead of silicone sealant.

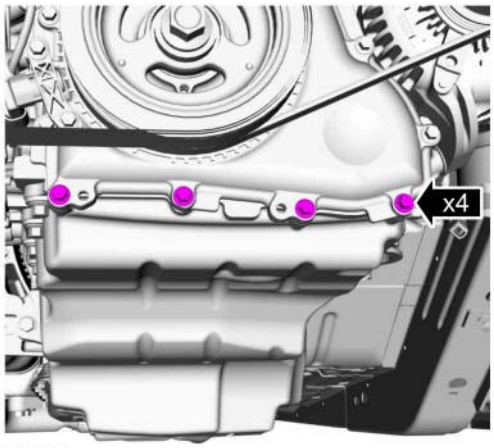


Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

2.

Install the oil pan and the bolts finger tight.

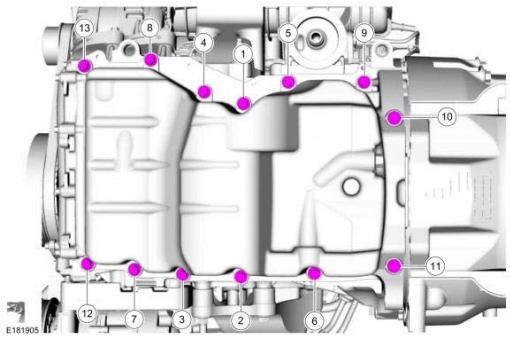


NOTE: The engine front cover-to-oil pan fasteners must be tightened first to align the front surface of the oil pan flush with the front surface of the engine block.

3.
Install the engine front cover bolts.

Torque

: 89 lb.in (10 Nm)



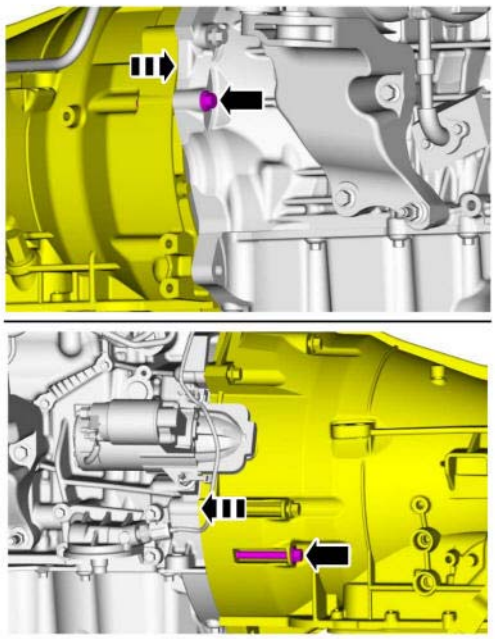
E181902

4.

Tighten the oil pan bolts.

Torque

: 18 lb.ft (25 Nm)



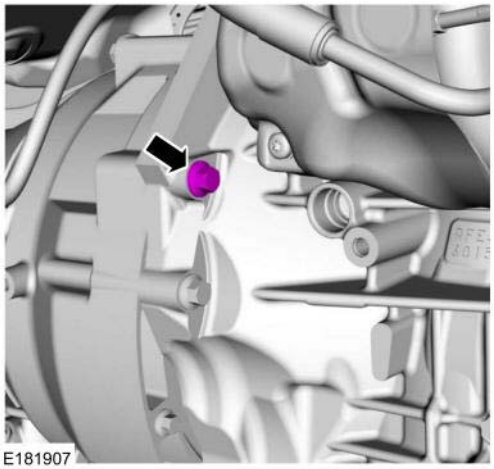
E181905

NOTE: Automatic transmission shown in illustration, manual transmission similar.

5.
Alternate tightening the LH bellhousing-to-engine and RH engine-to-bellhousing lower bolts to draw the transmission and engine together.

Torque

: 35 lb.ft (48 Nm)



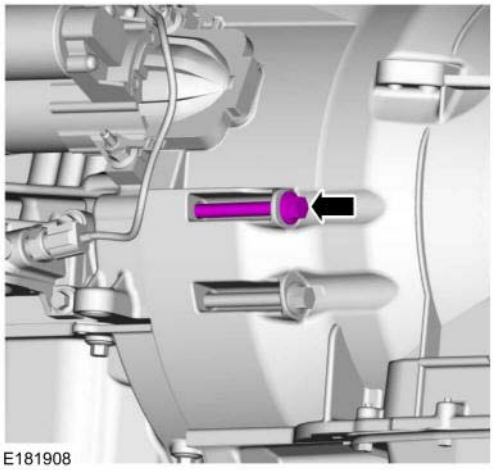
E181906

NOTE: Automatic transmission shown in illustration, manual transmission similar.

6.
Tighten the bolt.

Torque

: 35 lb.ft (48 Nm)



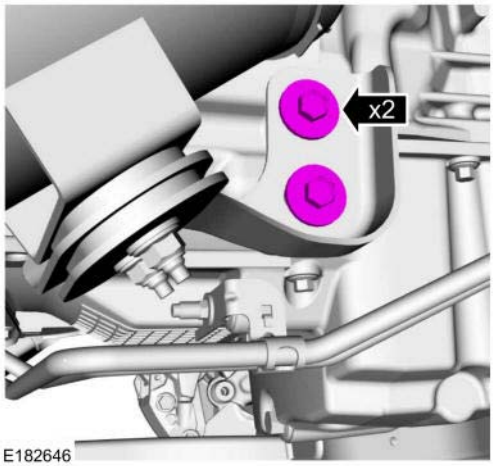
E181907

NOTE: Automatic transmission shown in illustration, manual transmission similar.

7.
Tighten the bolt.

Torque

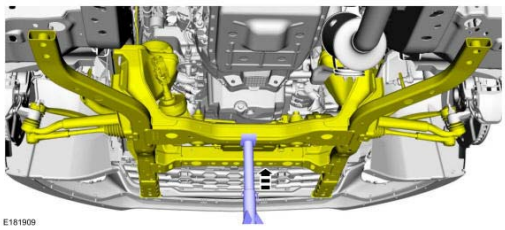
: 35 lb.ft (48 Nm)



NOTE: Automatic transmission shown in illustration, manual transmission similar.

8.
Install the bolts for the catalytic converter bracket.

Torque

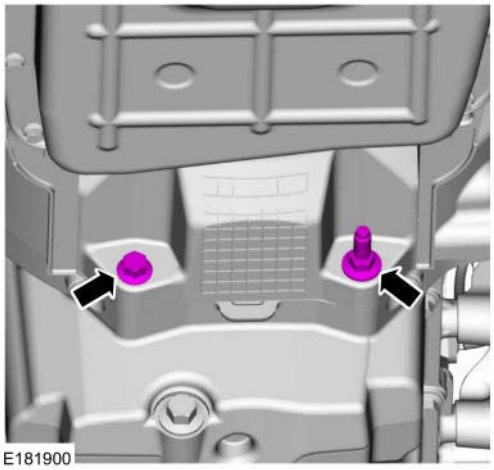


: 18 lb.ft (25 Nm)

9.

Using an adjustable stand, raise the subframe.

Use the General Equipment: Vehicle/Axle Stands

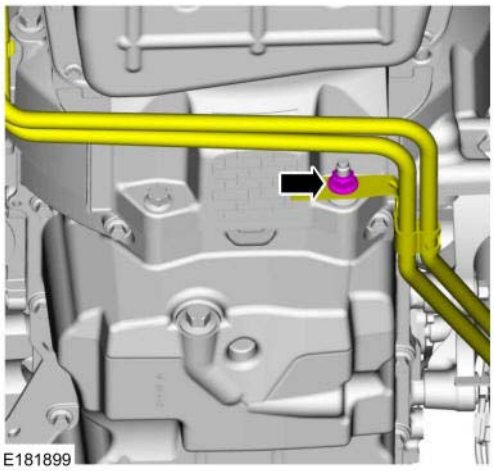


NOTE: Automatic transmission shown in illustration, manual transmission similar.

10.
Install the oil pan bolts.

Torque

: 35 lb.ft (48 Nm)



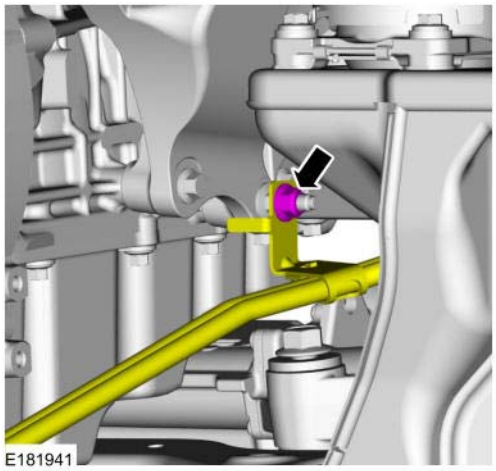
6-Speed Automatic Transmission - 6R80

11.

Position the transmission cooling tube bracket and install the nut.

Torque

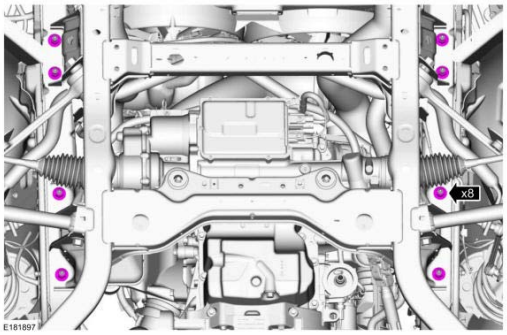
: 124 lb.in (14 Nm)



12.

Install the nut on the RH engine mount bracket stud bolt.

Torque

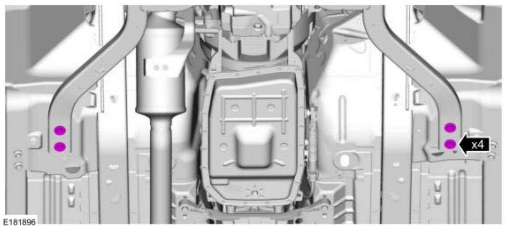


: 35 lb.ft (48 Nm)

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

13.

Install the new front subframe nuts loosely.

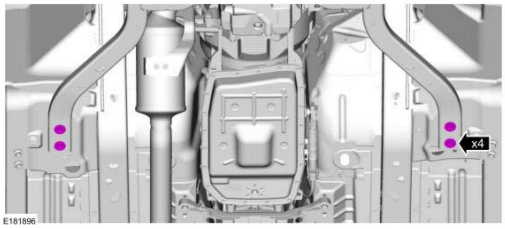


14.

Use a suitable alignment tool with a 15 mm (0.59 in) OD shaft that is long enough to go through the subframe and body.

Align the subframe to the alignment marks made during removal.

Install the new rear subframe bolts loosely.

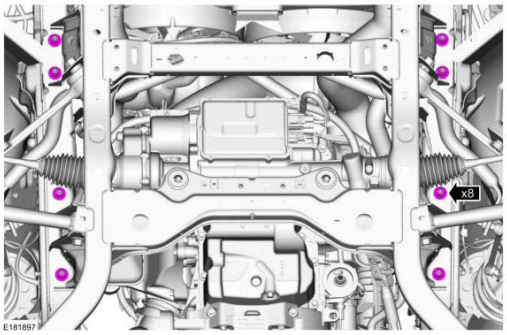


15.

Tighten the rear subframe bolts in a cross pattern.

Torque

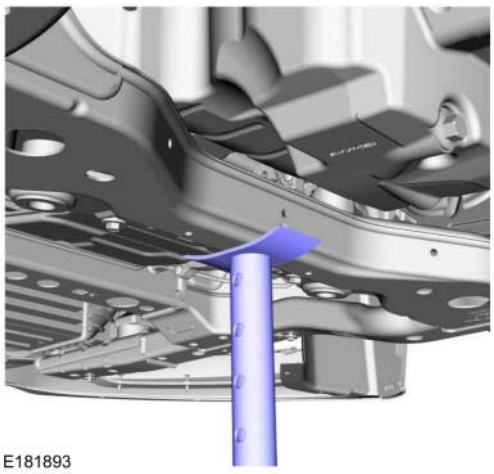
: 85 lb.ft (115 Nm)



16.

Tighten the front subframe nuts in a cross pattern.

Torque

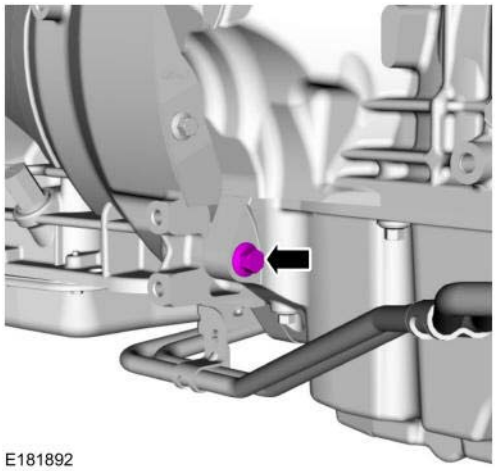


: 85 lb.ft (115 Nm)

17.

Remove the adjustable stand.

Use the General Equipment: Vehicle/Axle Stands

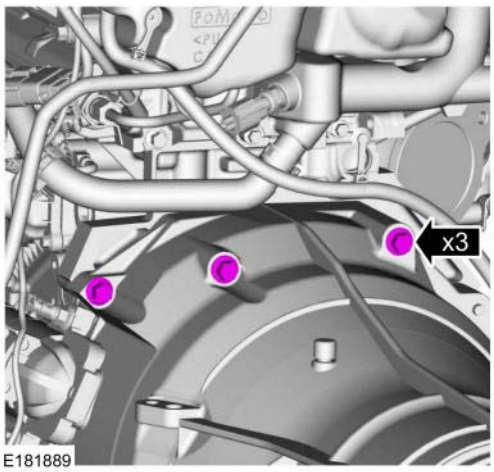


NOTE: Automatic transmission shown in illustration, manual transmission similar.

18.
Install the oil pan bolt.

Torque

: 35 lb.ft (48 Nm)

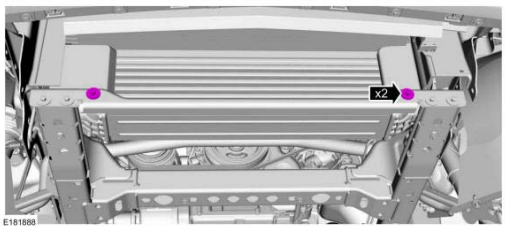


NOTE: Automatic transmission shown in illustration, manual transmission similar.

19.
Tighten the bolts.

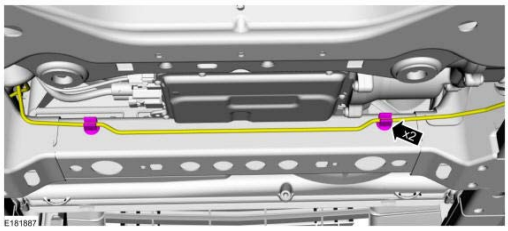
Torque

: 35 lb.ft (48 Nm)



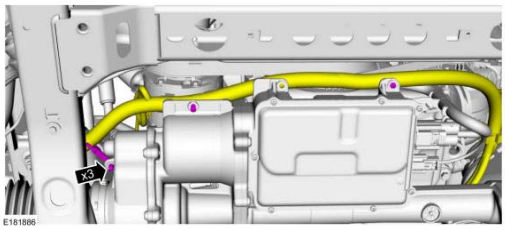
20.

Install the bolts in the support bar.



Torque

: 89 lb.in (10 Nm)



21.

Attach the brake line retainers to the subframe.

22.

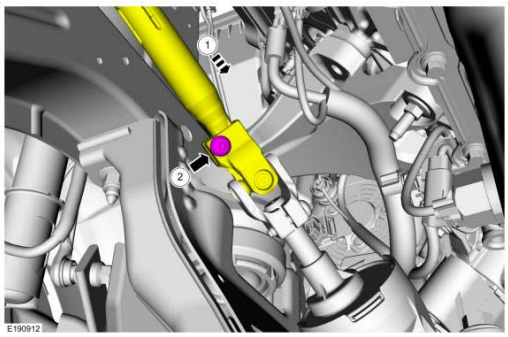
Attach the EPAS wiring harness pin-type retainers.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

23.

1.



Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

Torque

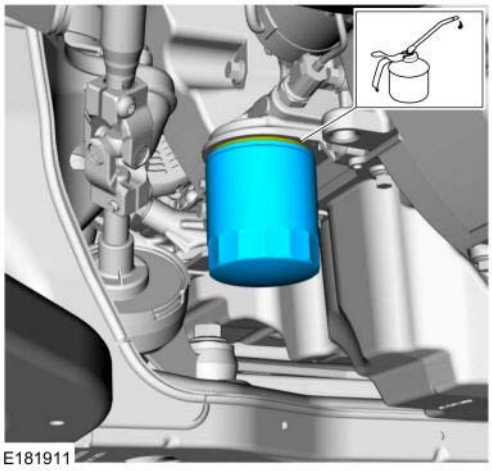
: 22 lb.ft (30 Nm)

24.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

NOTE: Lubricate the engine oil filter seal with clean engine oil.

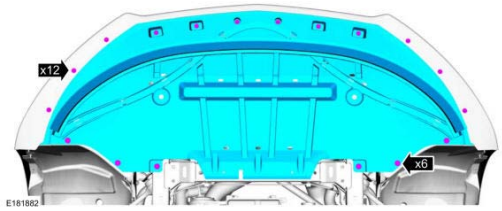
25.
Install a new engine oil filter.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:



Stage 1: 71 lb.in (8 Nm)

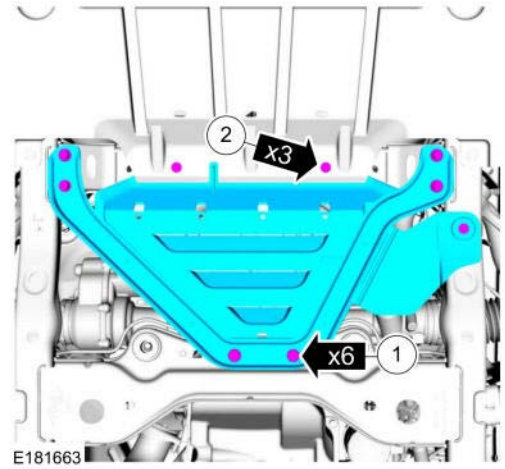
Stage 2: 180°

26.

Install the underbody shield, bolts and the pin-type retainers.

27.

1.



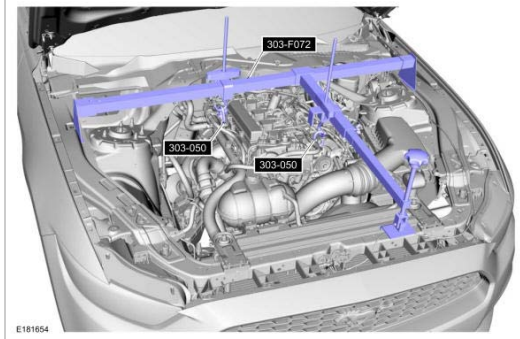
Install the underbody shield and the bolts.

Torque

: 46 lb.ft (63 Nm)

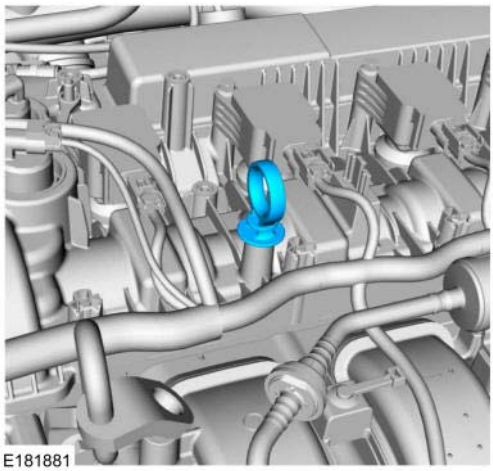
2.

Install the underbody shield screws.



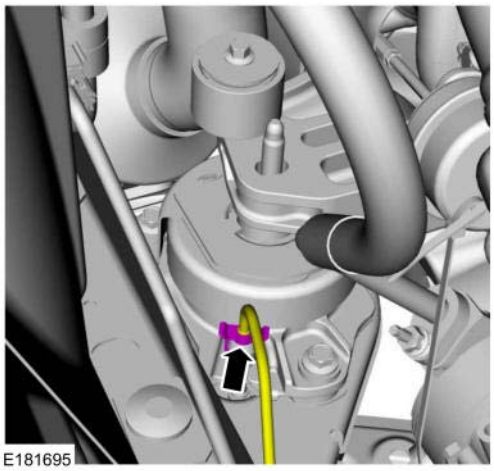
28.

Install the front wheels and tires. Refer to: Wheel and Tire .



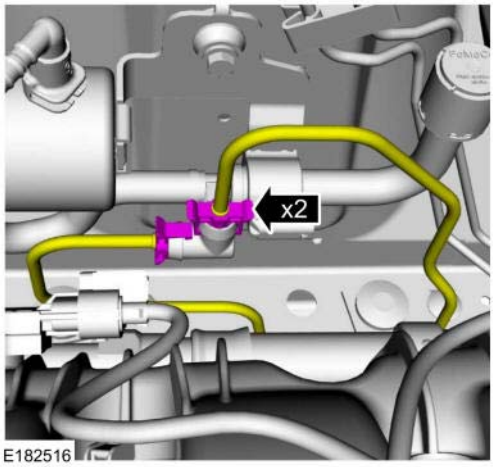
29.

Remove Special Service Tool: 303-F072 Support Bar, Engine.



30.

Install the oil level indicator.

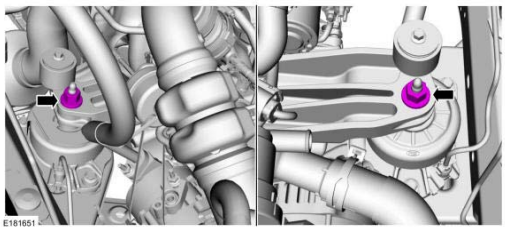


31.

Connect the vacuum tube to the RH engine mount.

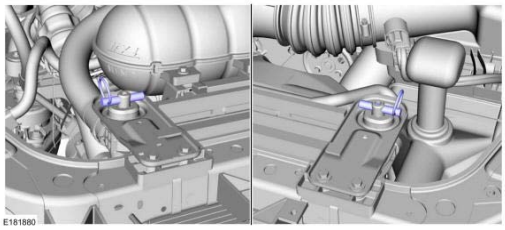
32.

Connect the vacuum tubes to the engine mount control vacuum reservoir.



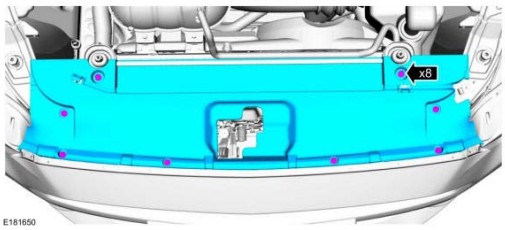
33.

Install the RH and LH engine mount bracket nuts.



Torque

: 92 lb.ft (125 Nm)

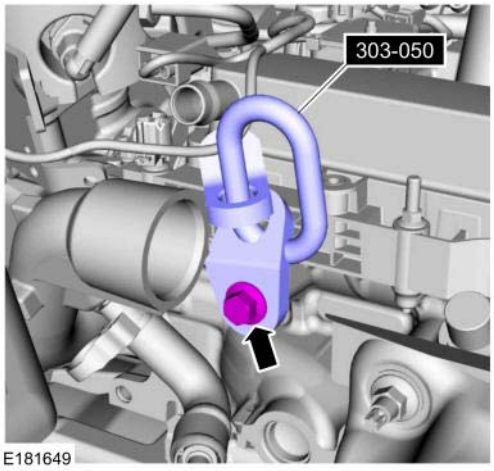


34.

Remove the retaining pins.

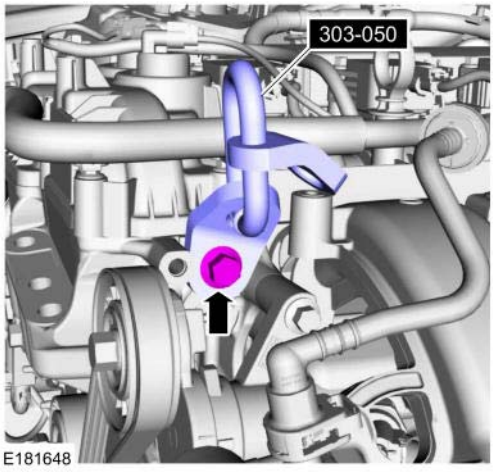
35.

Install the radiator top shield and the retainers.



36.

Connect the battery ground. Refer to: Battery Disconnect and Connect .

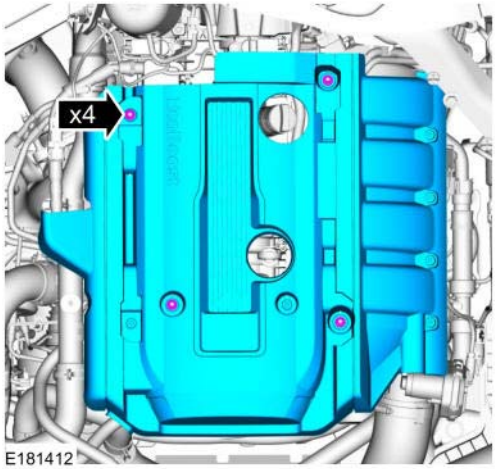


37.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

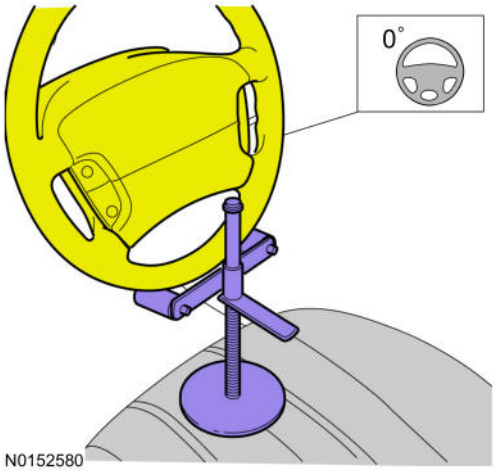
38.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



39.

Install the engine appearance cover and the nuts.



Torque

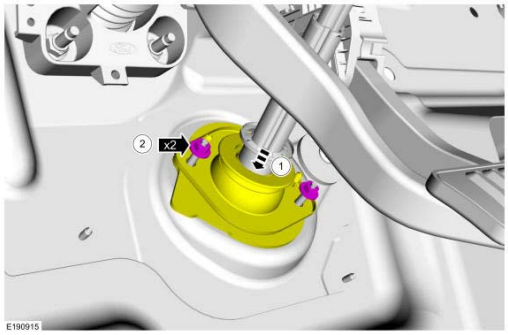
: 80 lb.in (9 Nm)

40.

Remove the holding device.

41.

1.



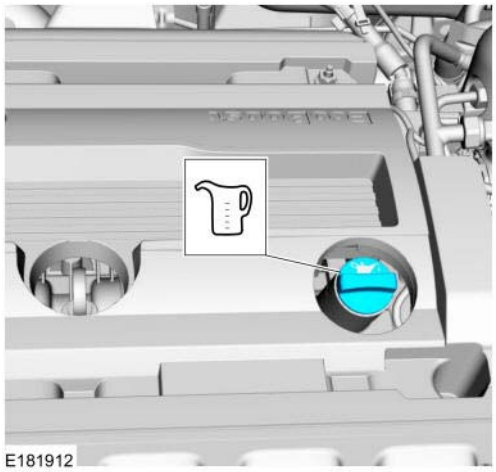
Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

Torque

: 80 lb.in (9 Nm)



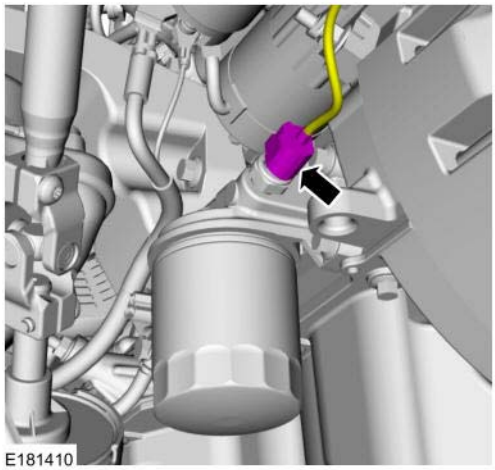
42.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > REMOVAL



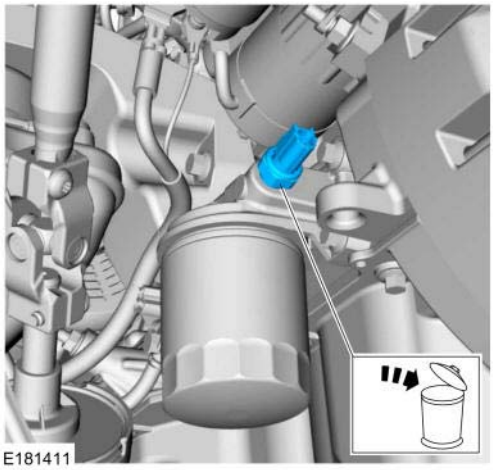
NOTE: Removal steps in this procedure may contain installation details.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the oil pressure switch electrical connector.



3.

Remove and discard the oil pressure switch.

Torque

: 133 lb.in (15 Nm)

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > OIL PUMP

REMOVAL AND INSTALLATION > OIL PUMP > REMOVAL

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

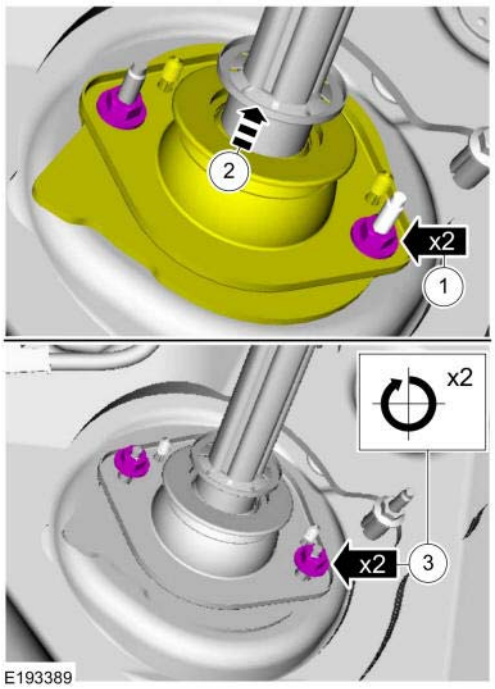
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

> *NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.*

2.

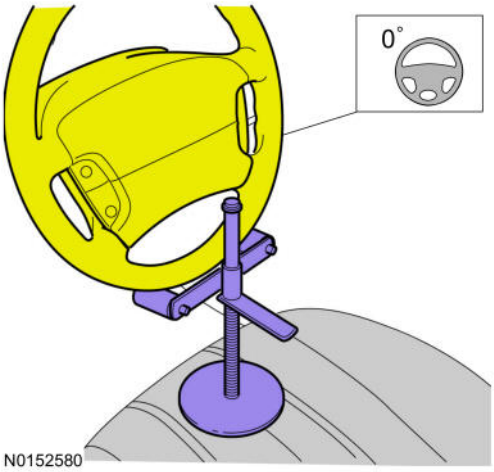
1.



Remove the steering column dash seal nuts.

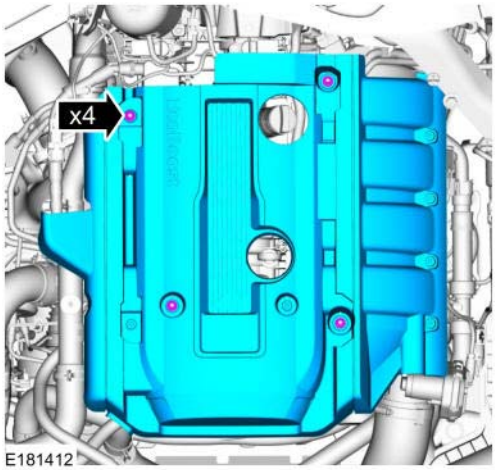
2.

Loosen the dash seal.



3.

Hand start the dash seal nuts.



3.

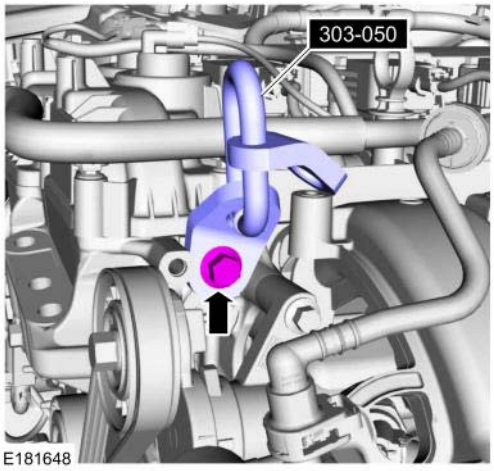
Using a holding device, hold the steering wheel in the straight-ahead position.

4.

Remove the nuts and the engine appearance cover.

5.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .

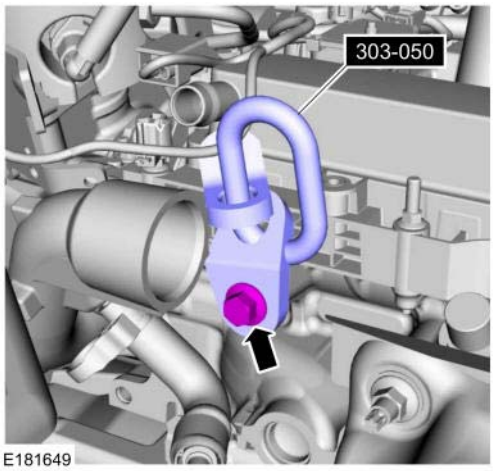


6.

Remove the engine front cover. Refer to: Engine Front Cover .

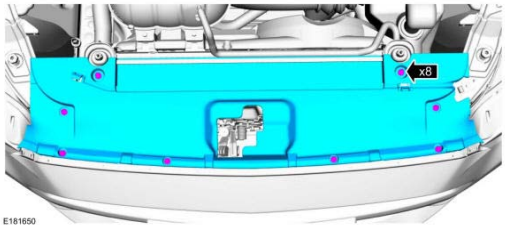
7.

Install the special tool on the LH side of the cylinder head.



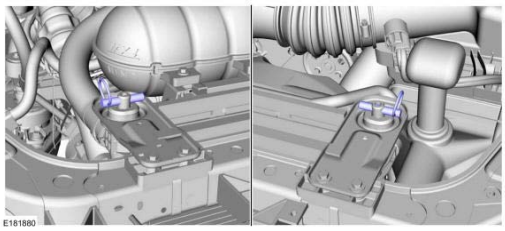
Use Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

NOTE: Coolant tube removed for clarity.



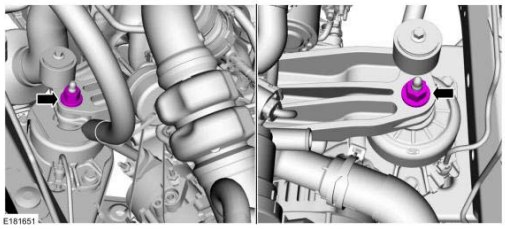
8.
Install the special tool on the RH side of the cylinder head.

Use Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



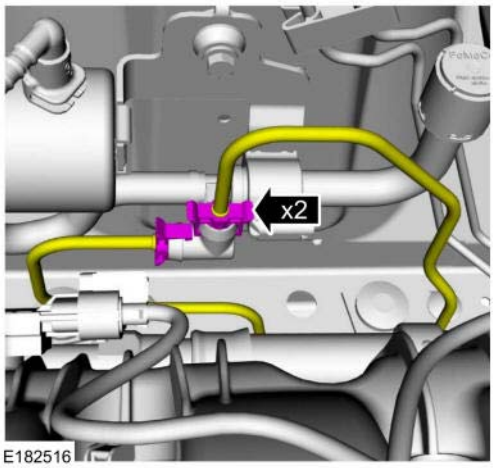
9.

Remove the retainers and the radiator top shield.



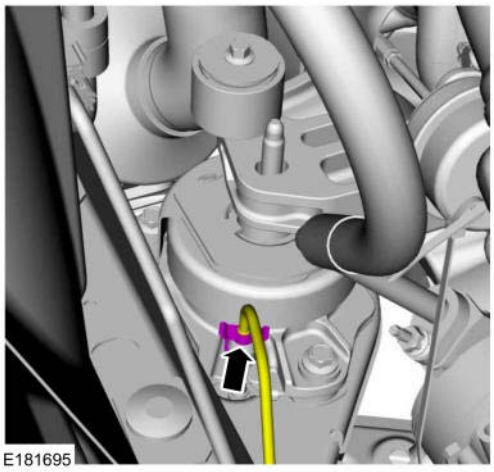
10.

Install retaining pins to support cooling module.



11.

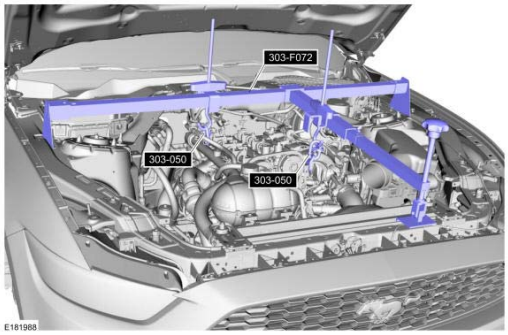
Remove the RH and LH engine mount bracket nuts.



12.

Disconnect the vacuum tubes from the engine mount control vacuum reservoir.

13.

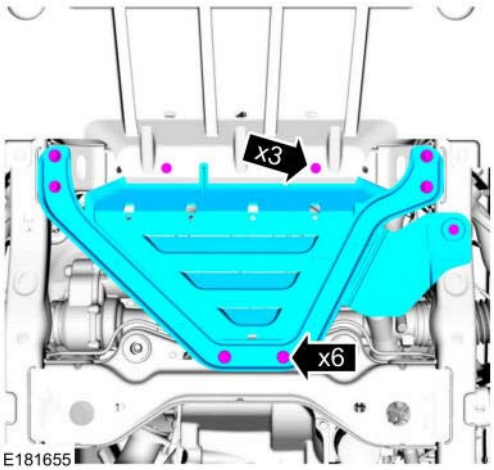


Disconnect the vacuum tube from the RH engine mount.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, position the legs on the body structure near the suspension strut tower. Failure to follow these instructions may result in body damage.

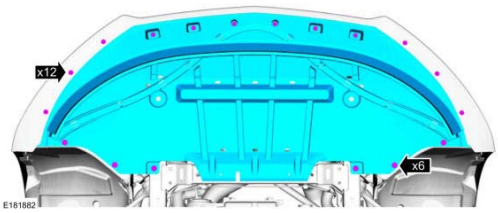
14.
Install the special tool to support the engine.

Install Special Service Tool: 303-F072 Support Bar, Engine.



15.

Remove the front wheels and tires. Refer to: Wheel and Tire .

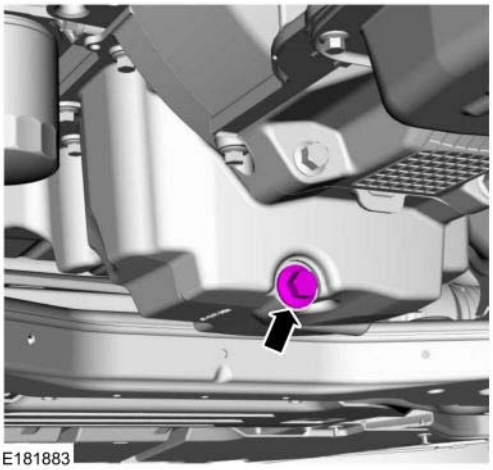


16.

Remove the screws, bolts and the underbody shield.

17.

Remove the pin-type retainers, bolts and the underbody shield.

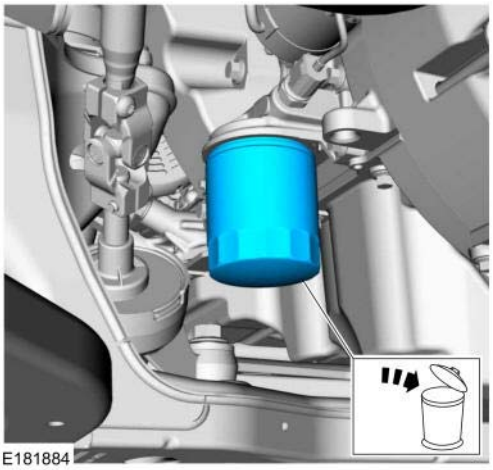


18.

Drain engine oil and install drain plug.

Use the General Equipment: Oil Drain Equipment

Torque



: 20 lb.ft (27 Nm)

19.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment

20.

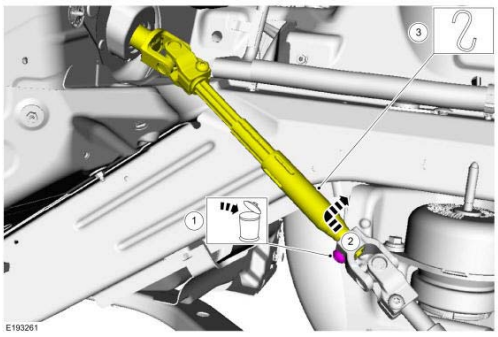
WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

Detach the steering column lower shaft from the lower coupling.

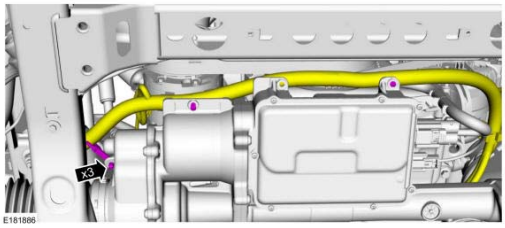
1.



Remove and discard the steering column shaft bolt.

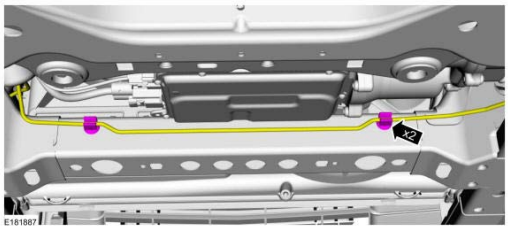
2.

Pull apart the steering column shaft from the coupling.



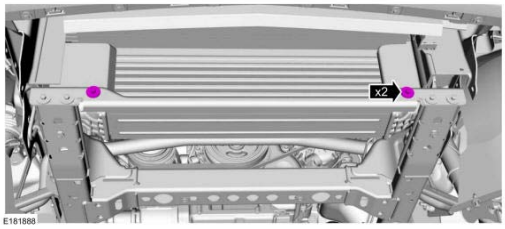
3.

Secure the lower shaft to the frame rail to avoid damaging it during subframe removal.



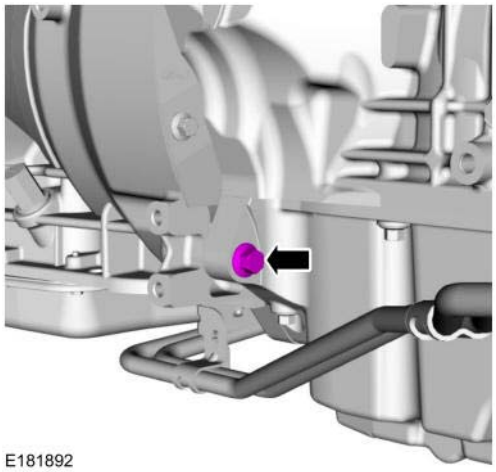
21.

Detach the EPAS wiring harness pin-type retainers.



22.

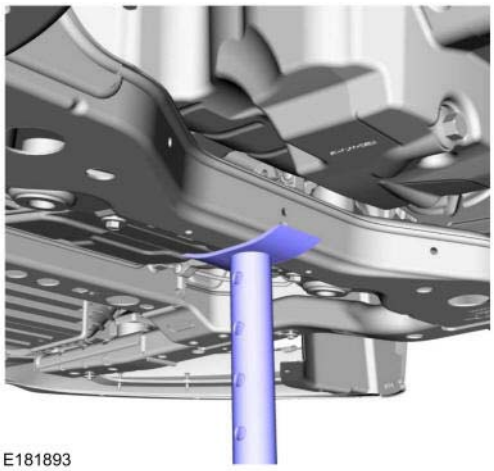
Detach the brake line retainers from the subframe.



23.

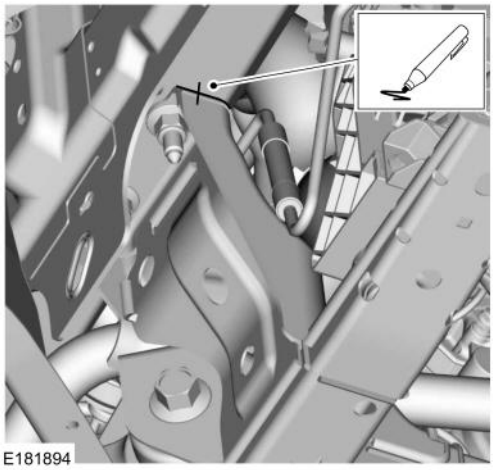
Remove the bolts from the support bar.

24.



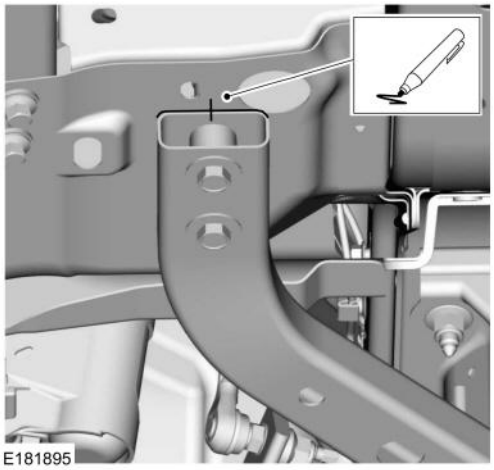
Remove the oil pan bolt.

25.



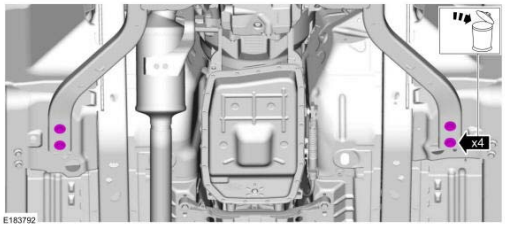
Using an adjustable stand, support the subframe.

Use the General Equipment: Vehicle/Axle Stands



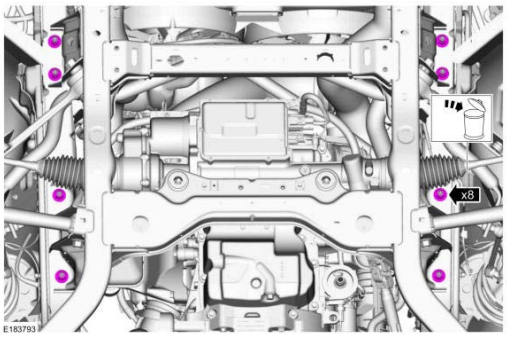
26.

Mark the position of the front subframe for reference during installation.



27.

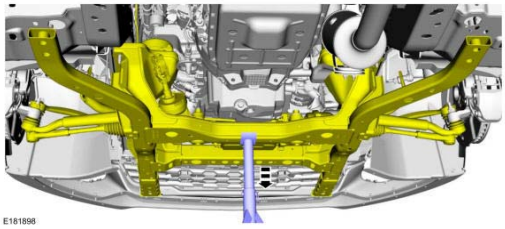
Mark the position of the rear subframe for reference during installation.



28.

Remove and discard the rear subframe bolts.

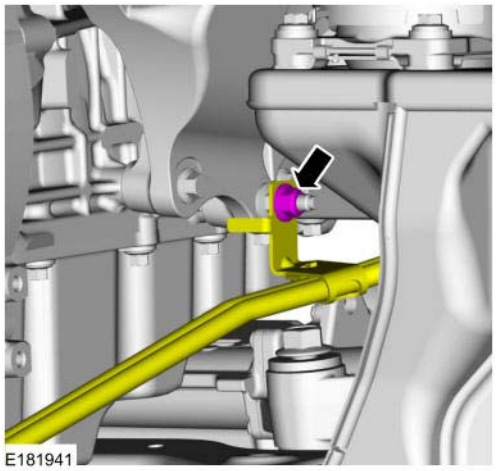
29.



Remove and discard the front subframe nuts.

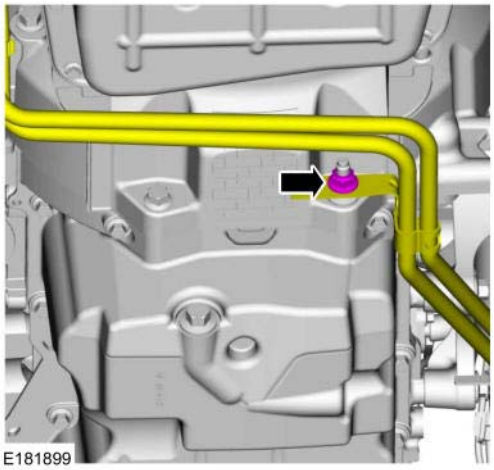
30.

Using an adjustable stand, lower the subframe 101.6 mm (4 in.).



Use the General Equipment: Vehicle/Axle Stands

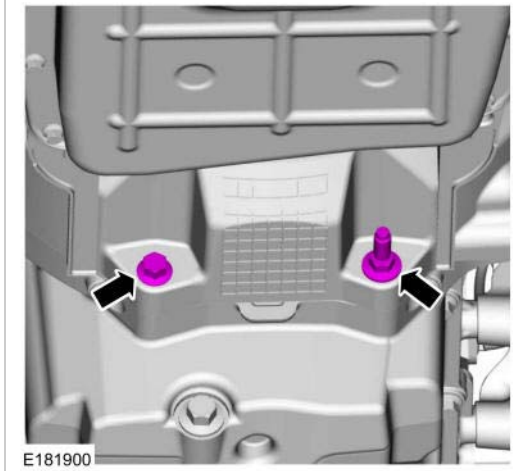
6-Speed Automatic Transmission - 6R80



31.

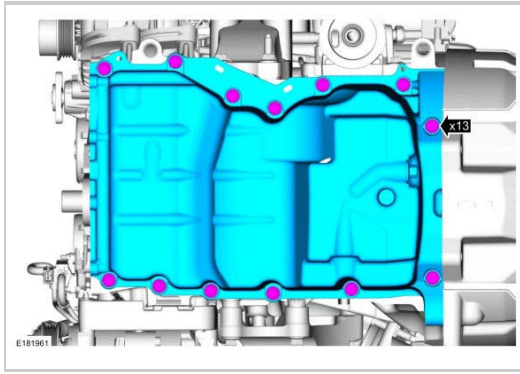
Remove the nut from the RH engine mount bracket stud bolt for the transmission cooling tubes.

32.



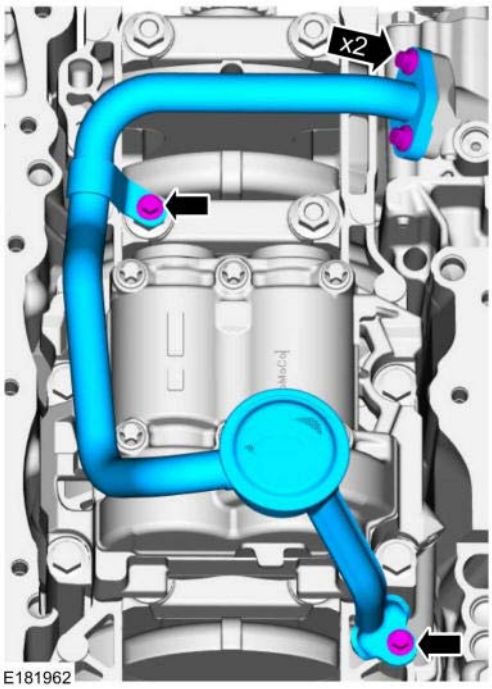
Remove the transmission cooling tube bracket nut and position aside.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



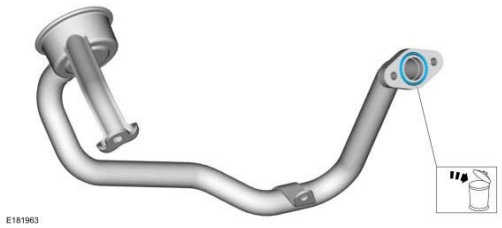
33.

Remove the oil pan bolts.



34.

Remove the bolts and the oil pan.



35.

Remove the bolts and the oil pump screen and pickup tube.

36.

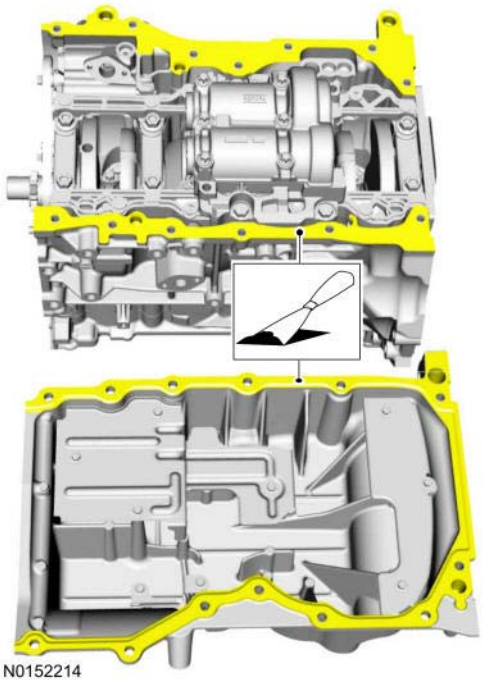
Remove and discard the oil pump screen and pickup tube gasket.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

37.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

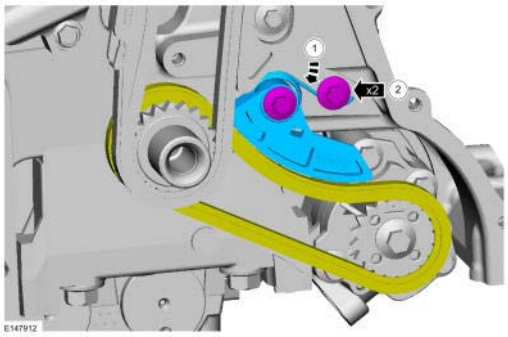
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

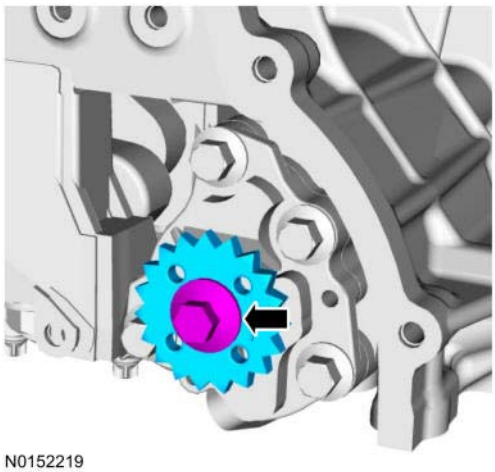
38.



1.

WARNING: Take extra care when handling the compressed spring.

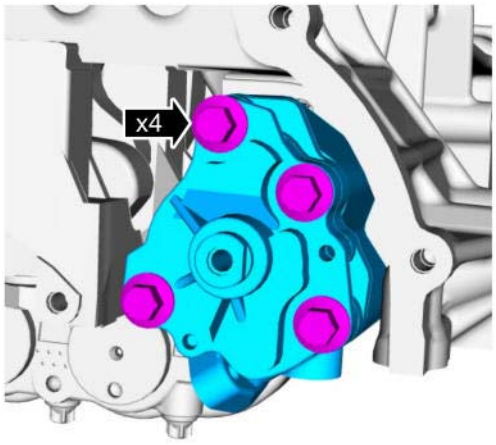
Release the tension on the tensioner spring.



2.

Remove the shoulder bolts and the tensioner and position the chain aside.

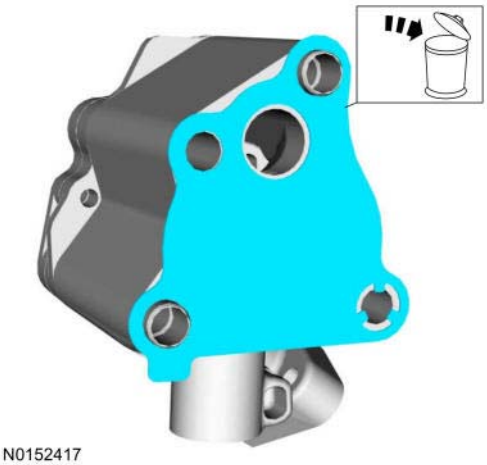
39.



Remove the bolt and oil pump sprocket.

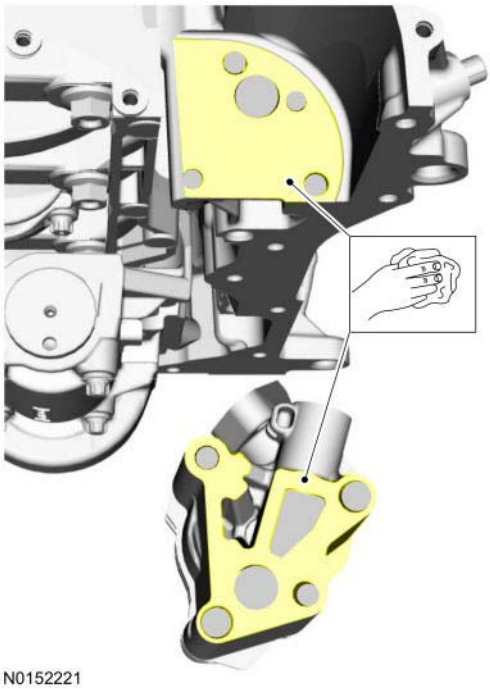
N0152219

40.



Remove the bolts and the oil pump.

N0152220

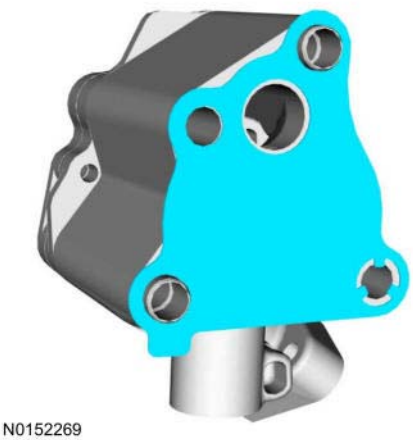


41.

Remove and discard the oil pump gasket.

42.

Clean the mating surfaces of the oil pump.



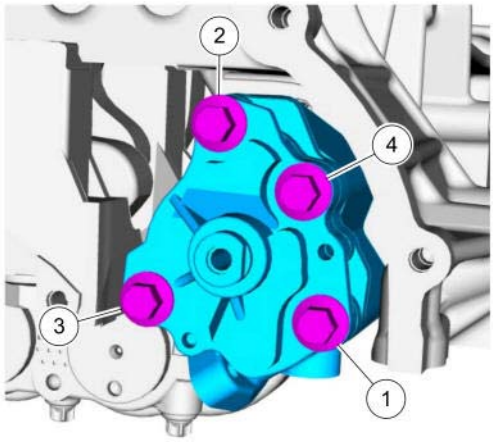
REMOVAL AND INSTALLATION > OIL PUMP > INSTALLATION

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

Install the oil pump gasket.

N0152269



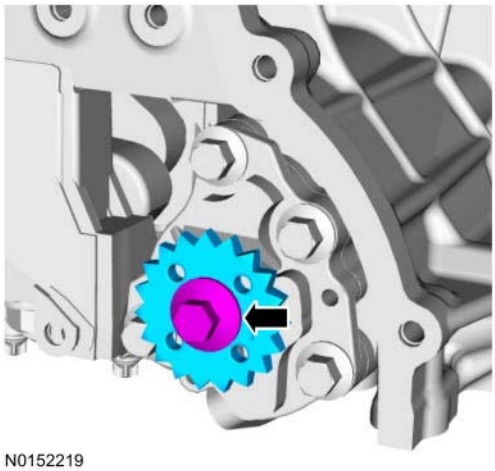
2.

Install the oil pump and the bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 177 lb.in (20 Nm)



N0152268

3.

Install the oil pump sprocket and bolt.

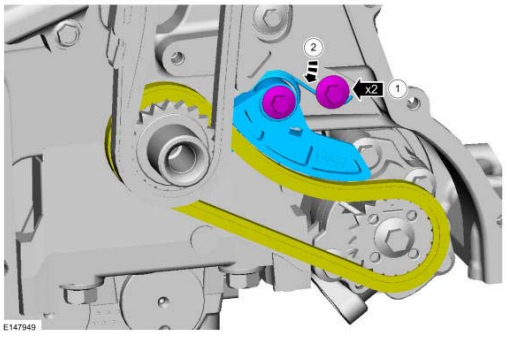
Torque

: 18 lb.ft (25 Nm)

4.

1.

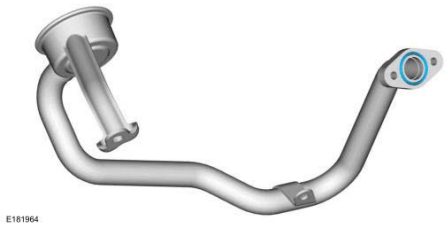
> *WARNING: Take extra care when handling the compressed spring.*



Install the oil pump drive chain, tensioner and the shoulder bolts.

Torque

: 89 lb.in (10 Nm)

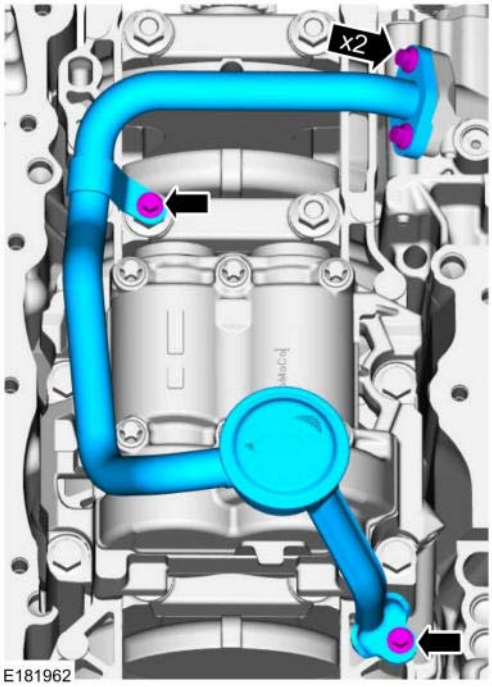


2.

Hook the tensioner spring around the shoulder bolt.

5.

Install the new oil pump screen and pickup tube gasket.

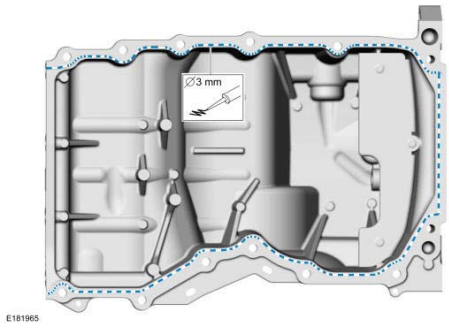


6.

Install the oil pump screen and pickup tube and the bolts.

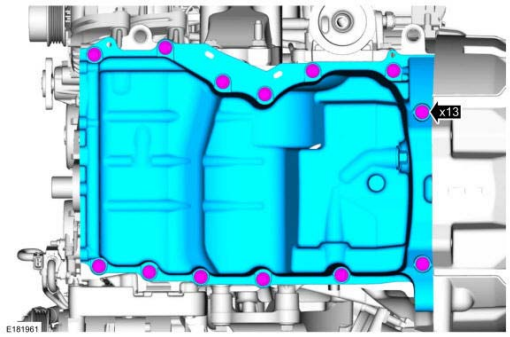
Torque

: 89 lb.in (10 Nm)



NOTE: If the oil pan is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned. Allow to dry until there is no sign of wetness, or 10 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

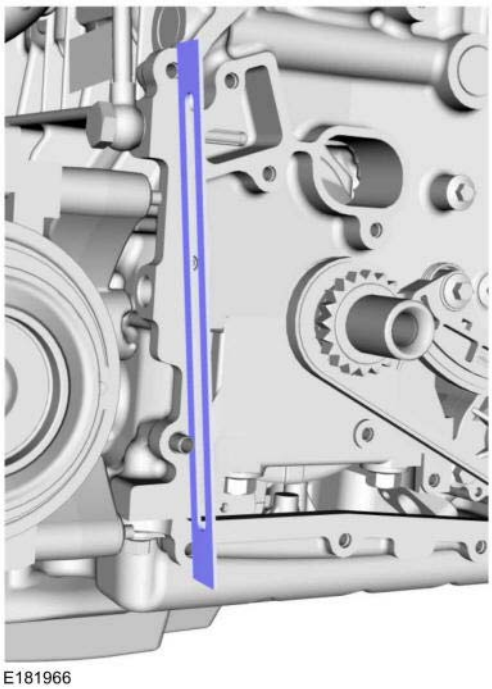
7.
Apply a 3 mm (0.19 in) bead of silicone sealant.



Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

8.

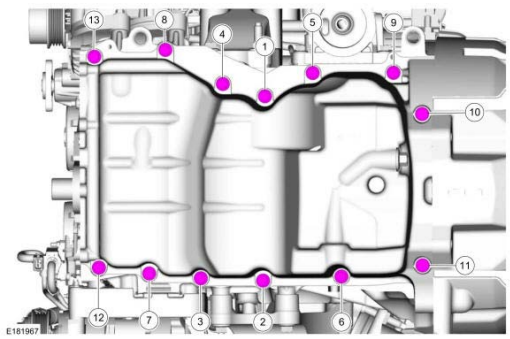


Install the oil pan and the bolts finger tight.

9.

Align the front surface of the oil pan flush with the front surface of the engine block.

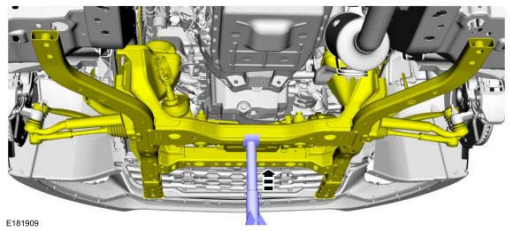
Use the General Equipment: Round-Ended Steel Rule



10.

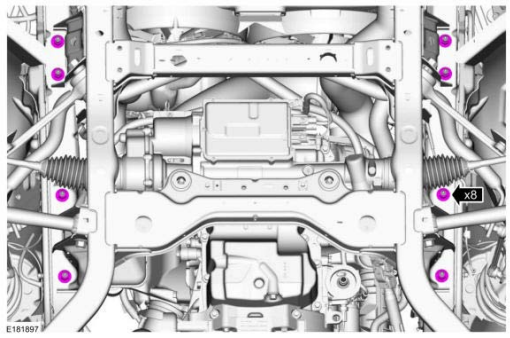
Tighten the oil pan bolts.

Torque



: 18 lb.ft (25 Nm)

11.

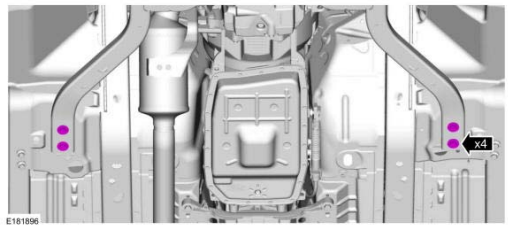


Using an adjustable stand, raise the subframe.

Use the General Equipment: Vehicle/Axle Stands

12.

Install the new front subframe nuts loosely.

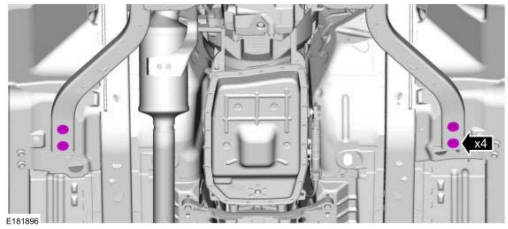


13.

Use a suitable alignment tool with a 15 mm (0.59 in) OD shaft that is long enough to go through the subframe and body.

Align the subframe to the alignment marks made during removal.

Install the new rear subframe bolts loosely.

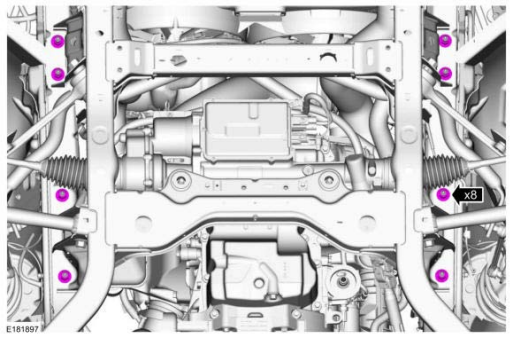


14.

Tighten the rear subframe bolts in a cross pattern.

Torque

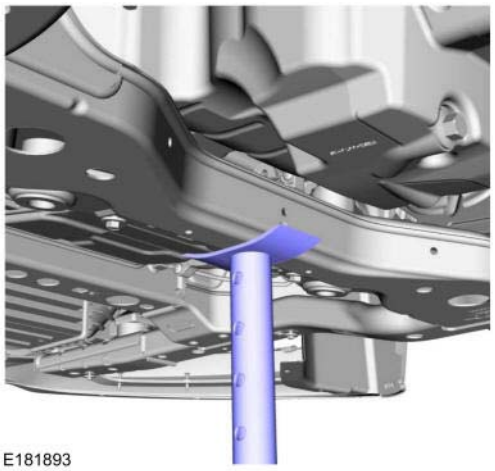
: 85 lb.ft (115 Nm)



15.

Tighten the front subframe nuts in a cross pattern.

Torque

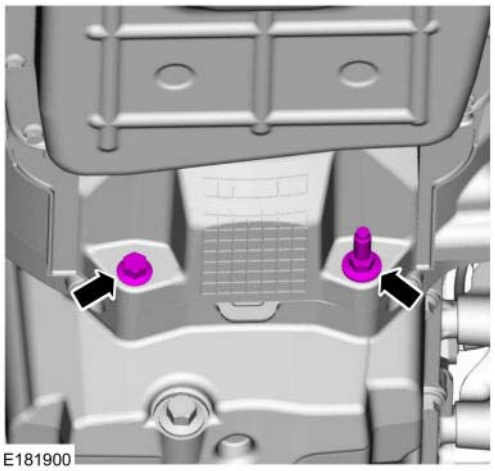


: 85 lb.ft (115 Nm)

16.

Remove the adjustable stand.

Use the General Equipment: Vehicle/Axle Stands

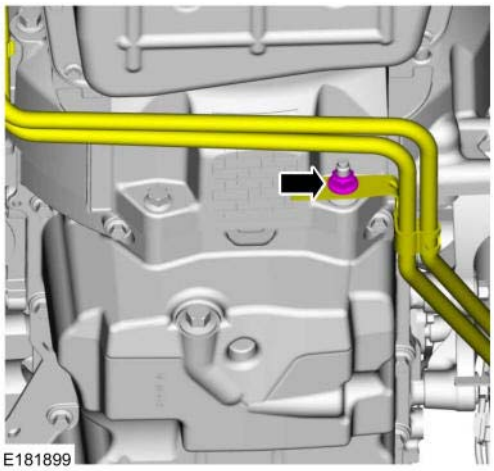


17.

Install the oil pan bolts.

Torque

: 35 lb.ft (48 Nm)



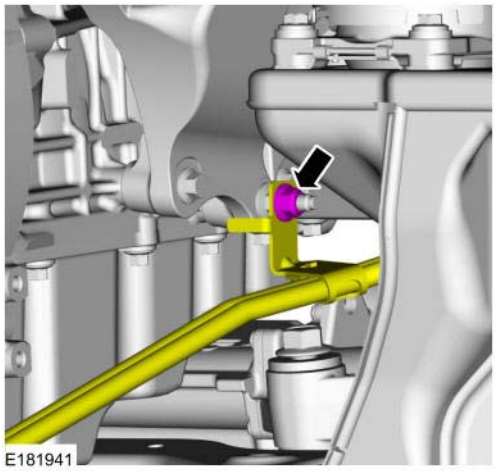
6-Speed Automatic Transmission - 6R80

18.

Position the transmission cooling tube bracket and install the nut.

Torque

: 124 lb.in (14 Nm)

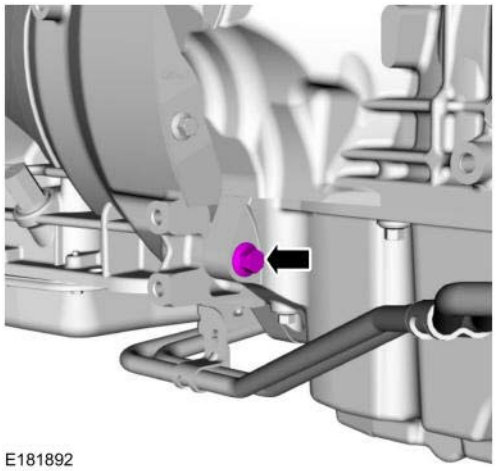


19.

Install the nut on the RH engine mount bracket stud bolt.

Torque

: 35 lb.ft (48 Nm)



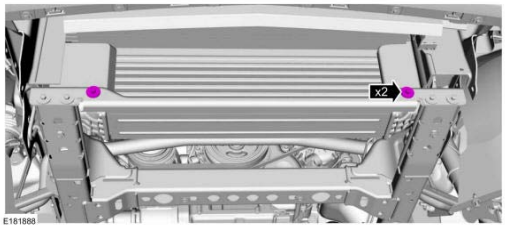
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

20.

Install the oil pan bolt.

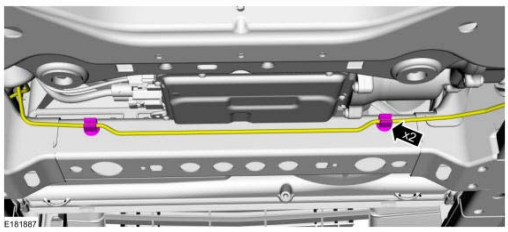
Torque

: 35 lb.ft (48 Nm)



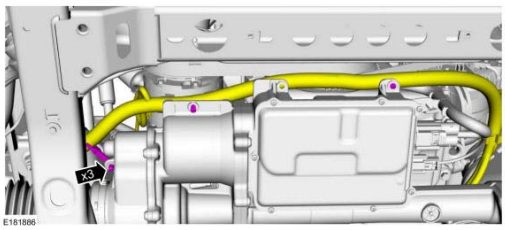
21.

Install the bolts in the support bar.



Torque

: 89 lb.in (10 Nm)



22.

Attach the brake line retainers to the subframe.

23.

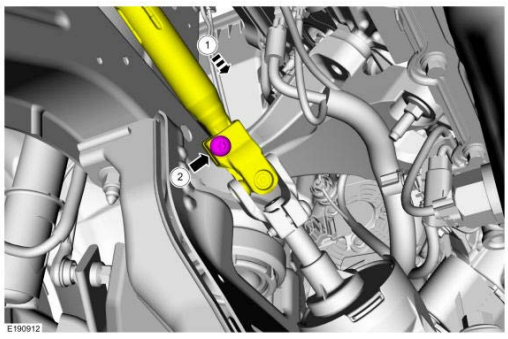
Attach the EPAS wiring harness pin-type retainers.

24.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.



Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

Torque

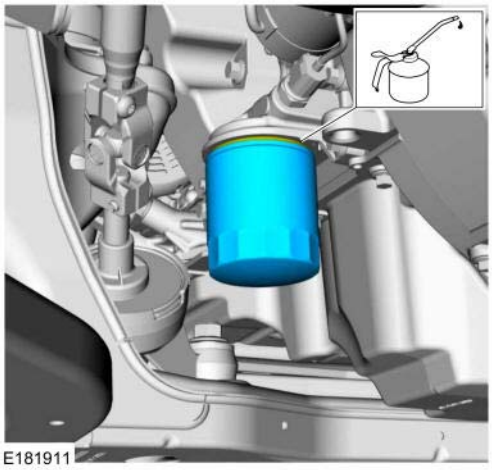
: 22 lb.ft (30 Nm)

25.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

NOTE: Lubricate the engine oil filter seal with clean engine oil.

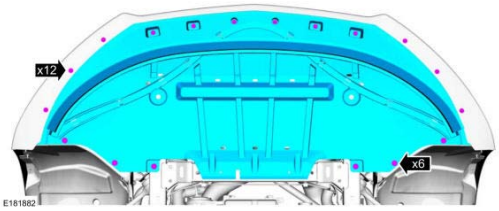
26.
Install a new engine oil filter.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque



Stage 1: 71 lb.in (8 Nm)

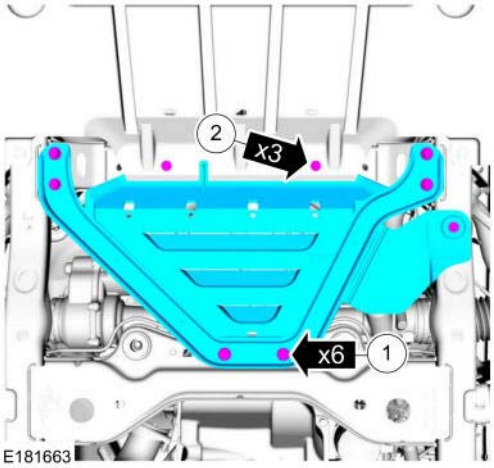
Stage 2: 180°

27.

Install the underbody shield, bolts and the pin-type retainers.

28.

1.



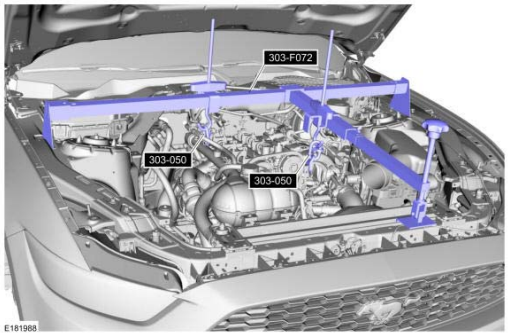
Install the underbody shield and the bolts.

Torque

: 46 lb.ft (63 Nm)

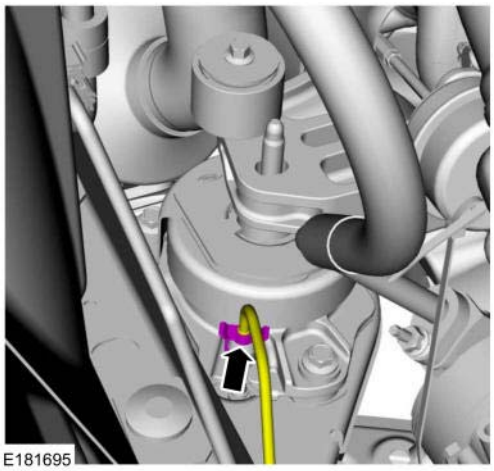
2.

Install the underbody shield screws.



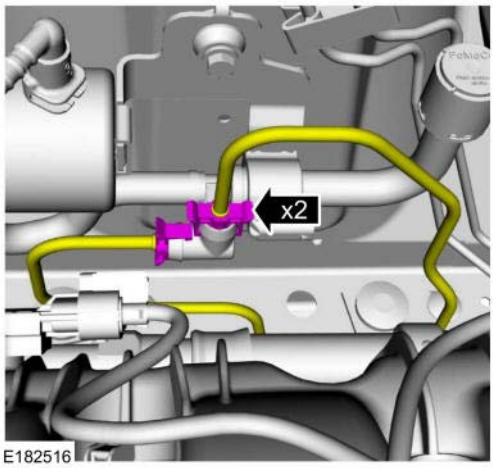
29.

Install the front wheels and tires. Refer to: Wheel and Tire .



30.

Remove Special Service Tool: 303-F072 Support Bar, Engine.

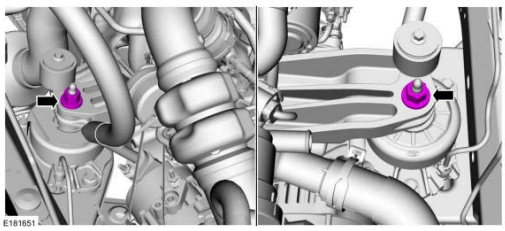


31.

Connect the vacuum tube to the RH engine mount.

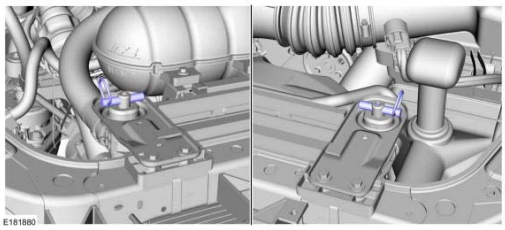
32.

Connect the vacuum tubes to the engine mount control vacuum reservoir.



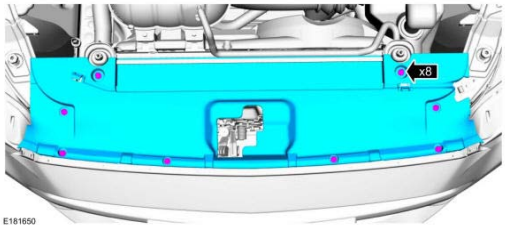
33.

Install the RH and LH engine mount bracket nuts.



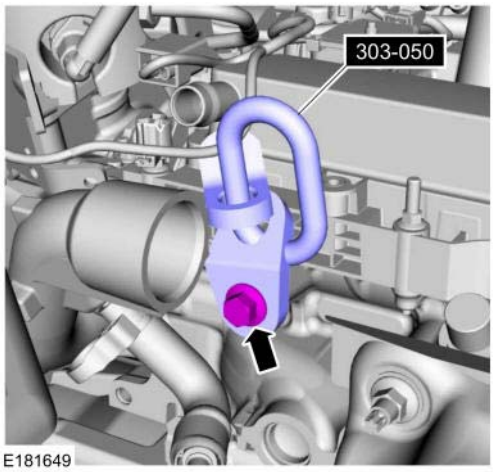
Torque

: 92 lb.ft (125 Nm)



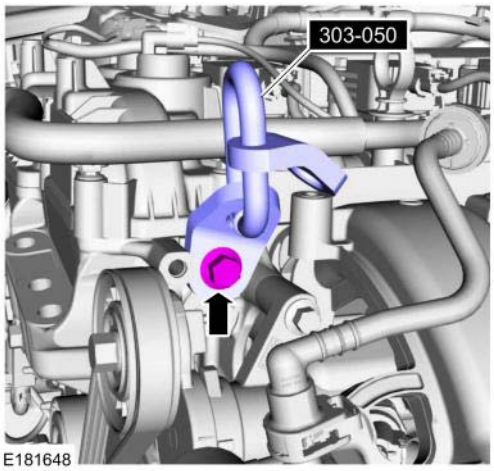
34.

Remove the retaining pins.



35.

Install the radiator top shield and the retainers.



36.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

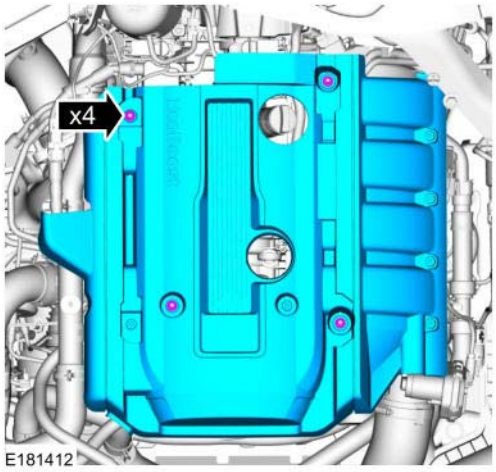
37.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

38.

Install the engine front cover. Refer to: Engine Front Cover .

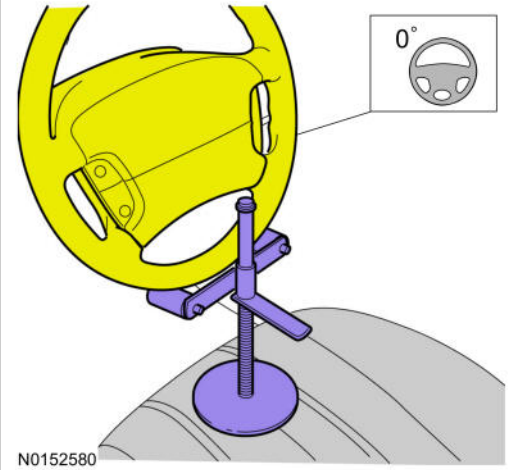
39.



Connect the battery ground. Refer to: Battery Disconnect and Connect .

40.

Install the engine appearance cover and the nuts.



Torque

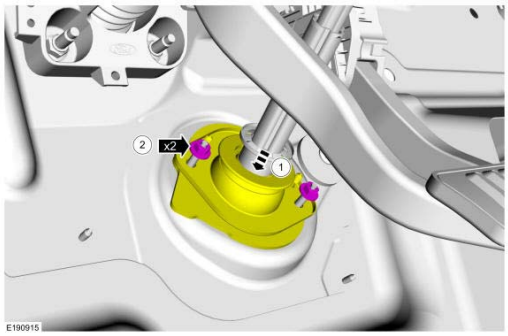
: 80 lb.in (9 Nm)

41.

Remove the holding device.

42.

1.



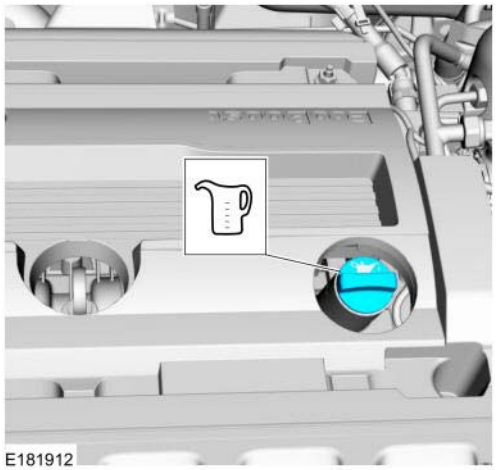
Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

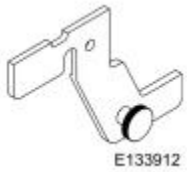
Torque

: 80 lb.in (9 Nm)



43.

Fill the engine with clean engine oil. Refer to: Specifications .



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

REMOVAL AND INSTALLATION > TIMING CHAIN

Special Tool(s) / General Equipment

 E133912	303-1565 Alignment Tool, Camshaft TKIT-2010C-FLM

REMOVAL AND INSTALLATION > TIMING CHAIN > REMOVAL

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.

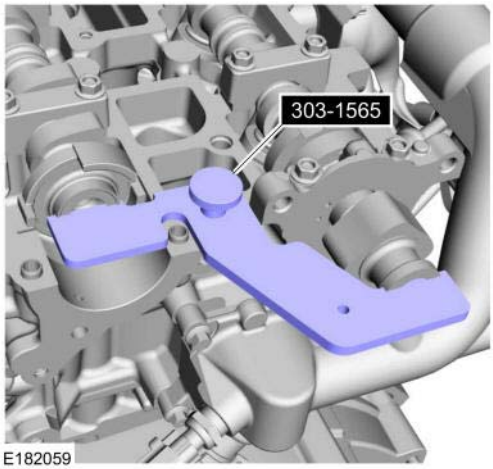
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

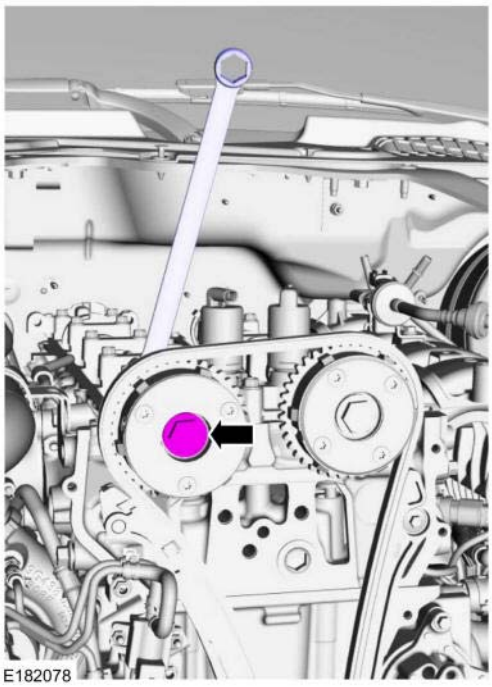
Remove the high-Pressure fuel pump drive unit. Refer to: HIGH-PRESSURE FUEL PUMP DRIVE UNIT - 2.3L EcoBoost (231kW/314PS).



3.

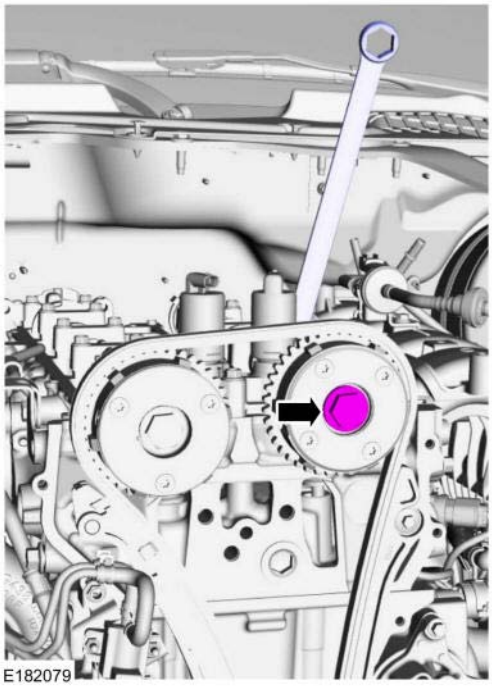
Remove the engine front cover. Refer to: Engine Front Cover .

NOTE: The Camshaft Alignment Tool is for camshaft alignment only. Do not rely on the Camshaft Alignment Tool to prevent camshaft rotation. Damage to the tool or the camshaft can occur.



4.
Install the special tool into the slots on the back of the camshafts.

Install Special Service Tool: 303-1565 Alignment Tool, Camshaft.



NOTE: Use an open-ended wrench to prevent the component from turning.

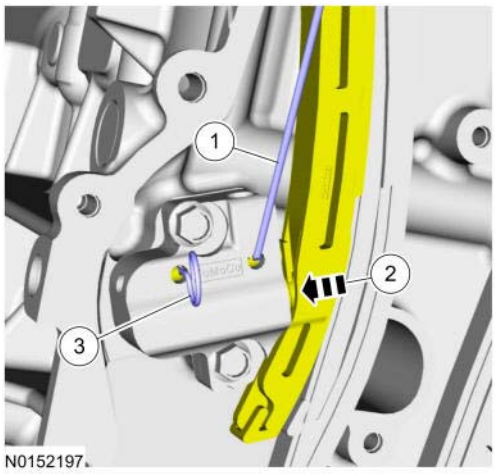
5.
Using an open-ended wrench, loosen the exhaust VCT unit bolt.

NOTE: Use an open-ended wrench to prevent the component from turning.

6.
Using an open-ended wrench, loosen the intake VCT unit bolt.

7.

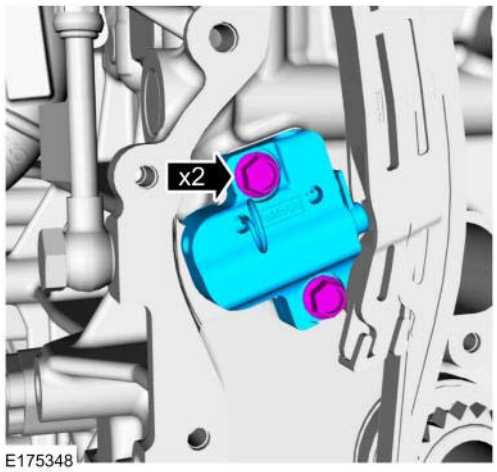
1.



Using a small pick, release and hold the ratchet mechanism.

2.

While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.

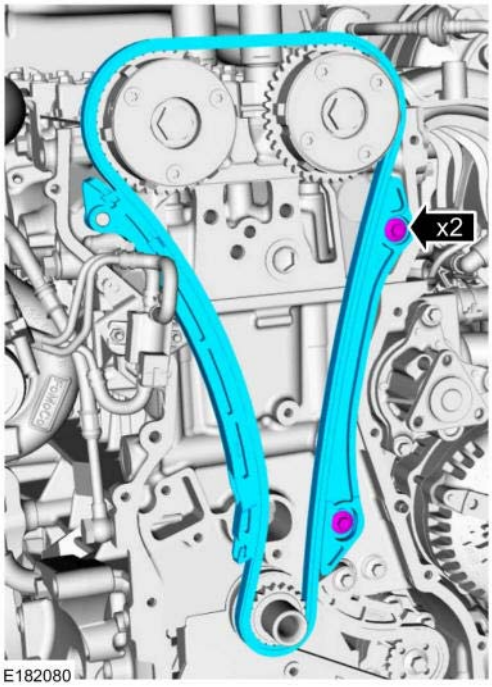


3.

Insert a holding pin into the hole to retain the tensioner.

8.

Remove the bolts and the timing chain tensioner.



9.

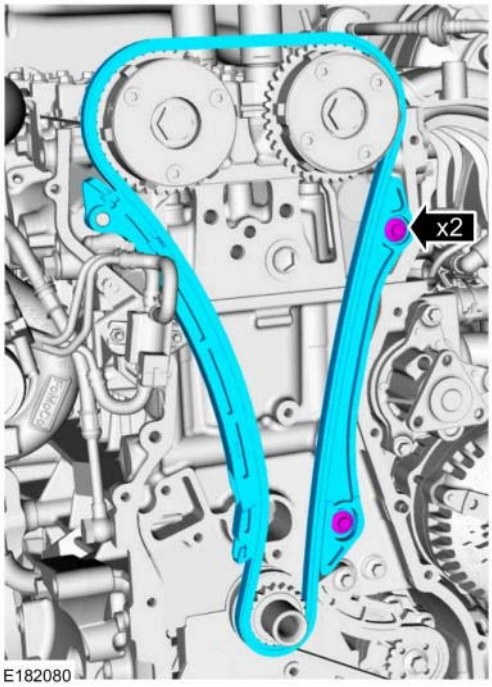
Remove the timing chain tensioner arm.

Remove the timing chain.

Remove the bolts and the timing chain guide.

REMOVAL AND INSTALLATION > TIMING CHAIN > INSTALLATION

1.

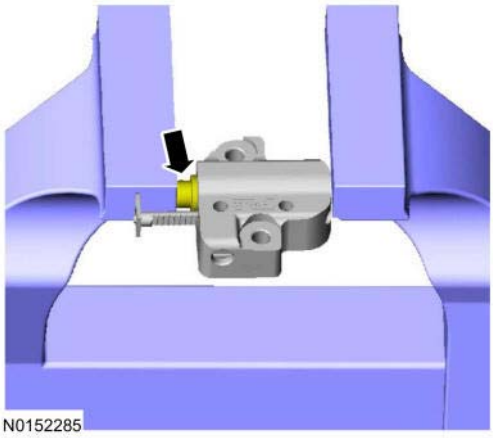


Install the timing chain guide and the bolts.

Torque

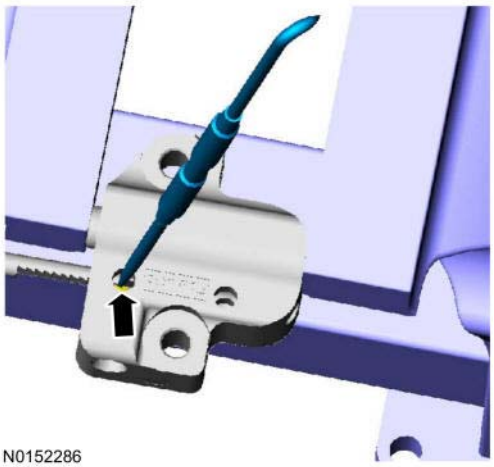
: 89 lb.in (10 Nm)

Install the timing chain.



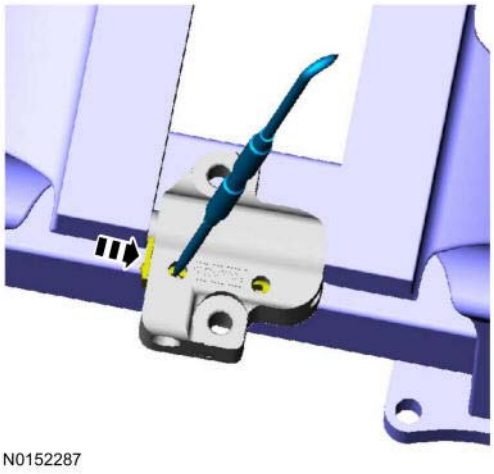
Install the timing chain tensioner arm.

NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.



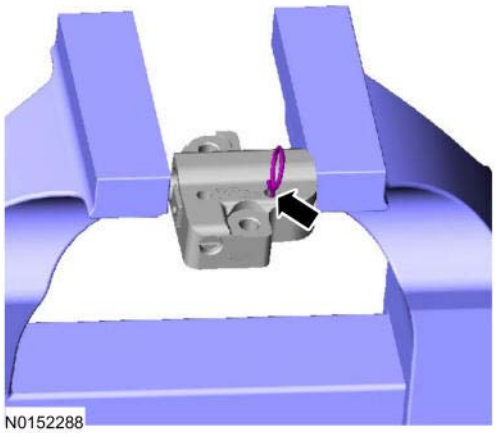
NOTE: Do not compress the ratchet assembly. This will damage the ratchet assembly.

2.
Using the edge of a vise, compress the timing chain tensioner plunger.



3.

Using a small pick, push back and hold the ratchet mechanism.

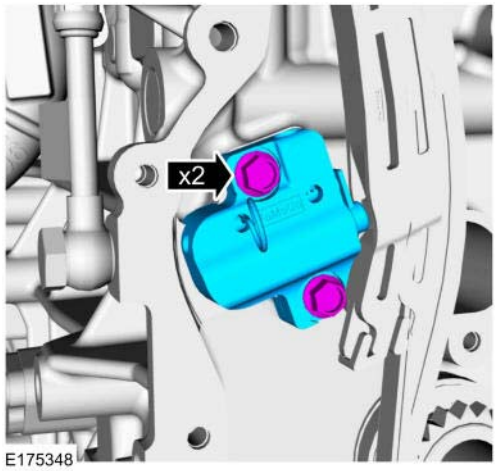


4.

While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

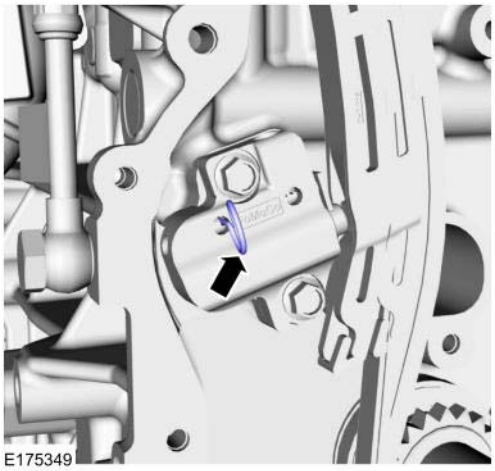
5.

Install a holding pin into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.



NOTE: Do not remove the holding pin until the tensioner bolts are tightened.

6.
Install the timing chain tensioner and the bolts.

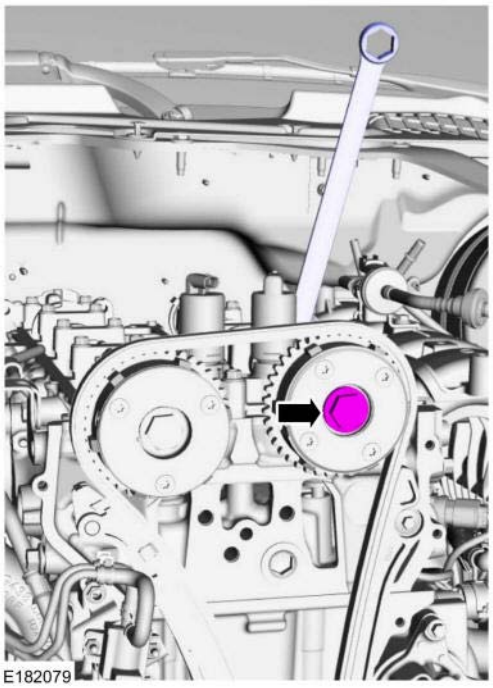


Torque

: 89 lb.in (10 Nm)

7.

Remove the holding pin.



NOTE: Use an open-ended wrench to prevent the component from turning.

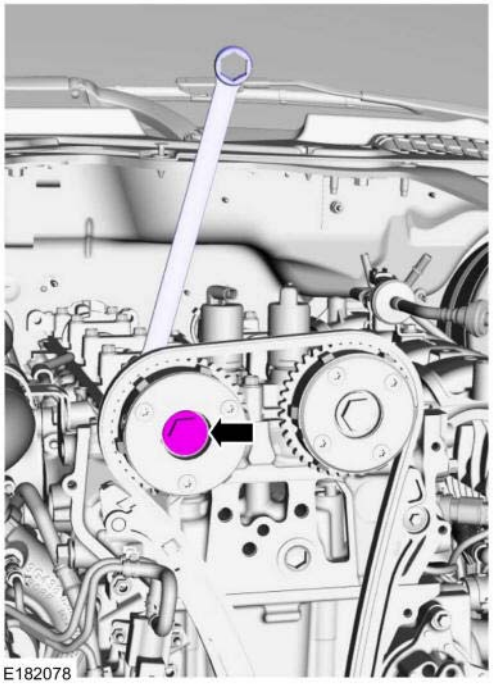
8.
Using an open-ended wrench, tighten the intake VCT unit bolt.

Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: 60°

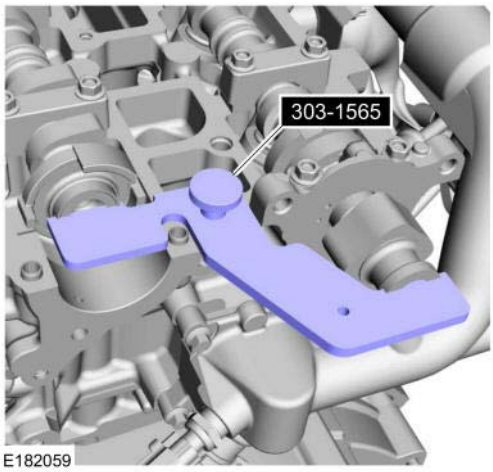
NOTE: Use an open-ended wrench to prevent the component from turning.



9.

Using an open-ended wrench, tighten the exhaust VCT unit bolt.

Torque:



Stage 1: 30 lb.ft (40 Nm)

Stage 2: 60°

10.

Remove Special Service Tool: 303-1565 Alignment Tool, Camshaft.

11.

Install the engine front cover. Refer to: Engine Front Cover .

12.

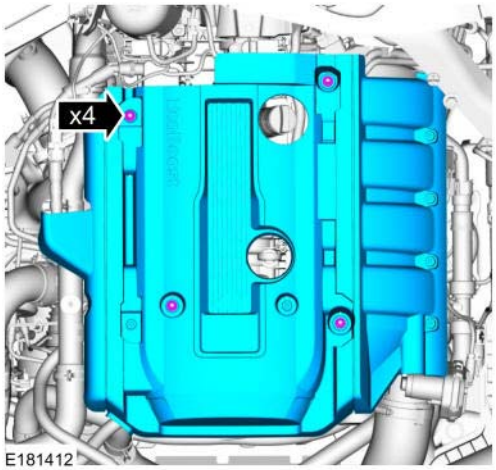
Install the high-Pressure fuel pump drive unit. Refer to: HIGH-PRESSURE FUEL PUMP DRIVE UNIT - 2.3L EcoBoost (231kW/314PS).

REMOVAL AND INSTALLATION > VALVE COVER

Special Tool(s) / General Equipment

 E133913	205-153 (T80T-4000-W) Handle
 E175042	303-1247VCT Spark Plug Tube Seal Remover and Installer TKIT-2006UF-FLM TKIT-2006UF-ROW

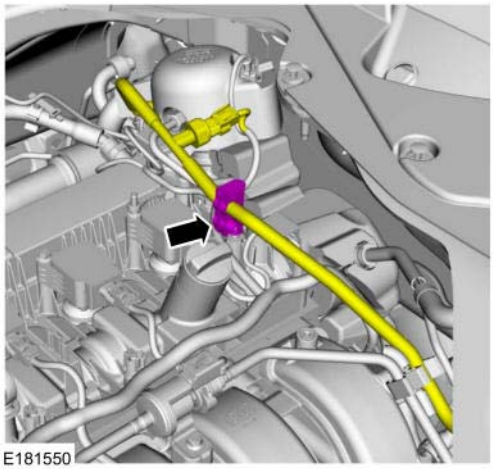
Materials



Name	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

REMOVAL AND INSTALLATION > VALVE COVER > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

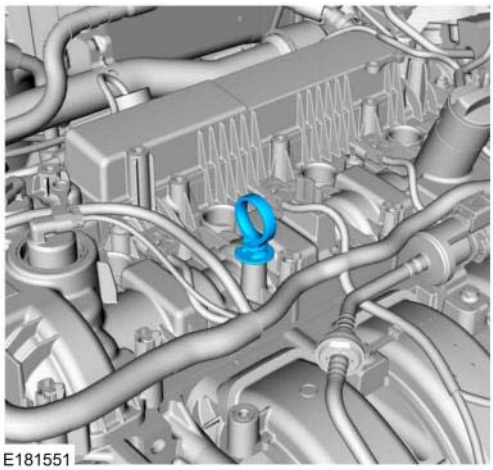


1.

Remove the nuts and the engine appearance cover.

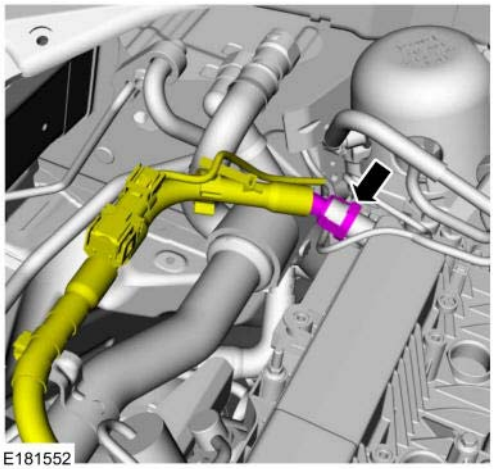
2.

Detach the fuel supply tube retainer from the valve cover stud bolt.



3.

Remove the ignition coil-on-plugs. Refer to: IGNITION COIL-ON-PLUG - 2.3L EcoBoost (231kW/314PS).

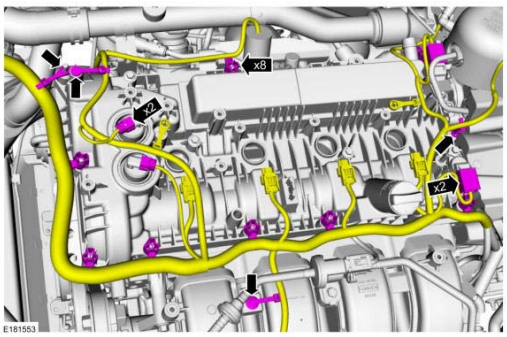


4.

Remove the oil level indicator.

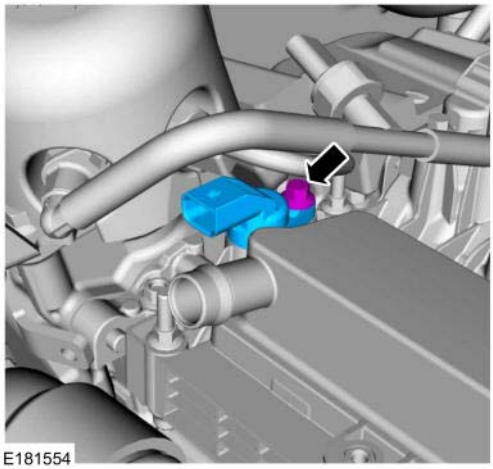
5.

Disconnect the crankcase vent tube quick release connector from the valve cover.



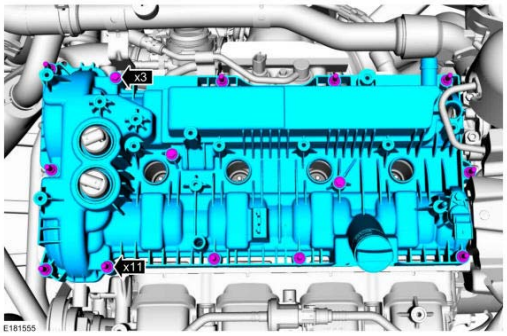
6.

Disconnect the VCT oil control solenoid electrical connectors.



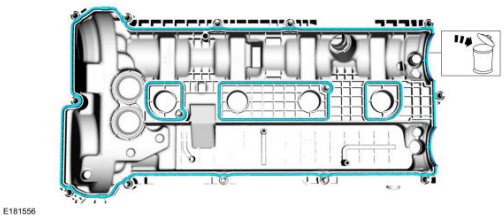
Disconnect the CMP sensor electrical connectors.

Detach the wiring harness retainers.



7.

Remove the bolt and the exhaust CMP sensor.



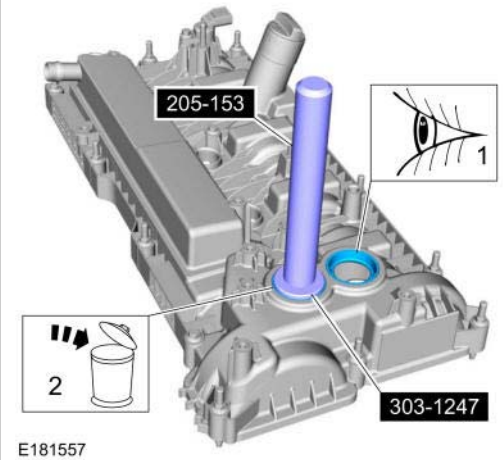
8.

Loosen the fasteners and remove the valve cover.

9.

Remove and discard the valve cover gasket.

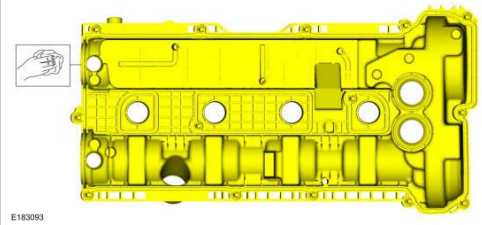
10.



NOTE: The VCT oil control solenoid seals should only be replaced if they are damaged.

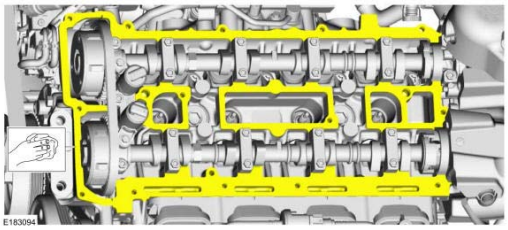
1.
Inspect the VCT oil control solenoid seals for damaged.

2.



If damaged, using the special tools, remove the VCT oil control solenoid seals and discard.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

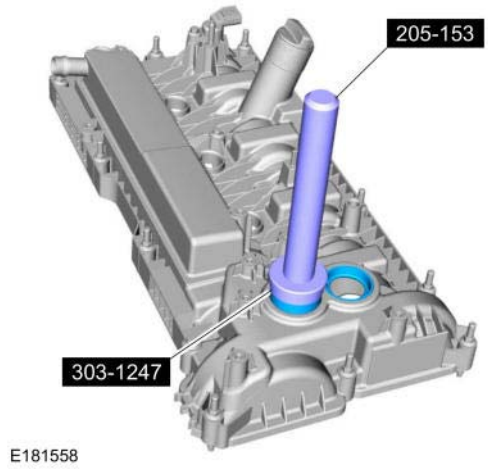


NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

11.
Make sure that the mating faces are clean and free of foreign material.

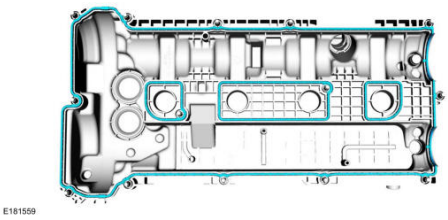
NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

12.
Make sure that the mating faces are clean and free of foreign material.



REMOVAL AND INSTALLATION > VALVE COVER > INSTALLATION

NOTE: Installation of new seals is only required if damaged seals were removed during valve cover removal.

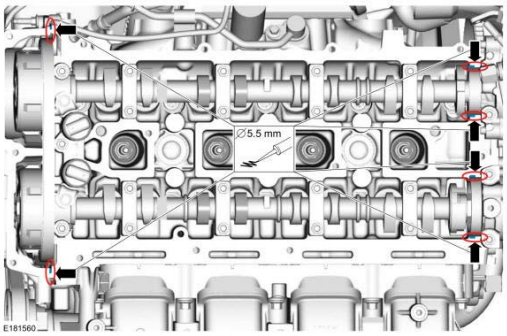


1.
If removed, using the special tools, install the VCT oil control solenoid seals.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

2.

Install a new valve cover gasket.

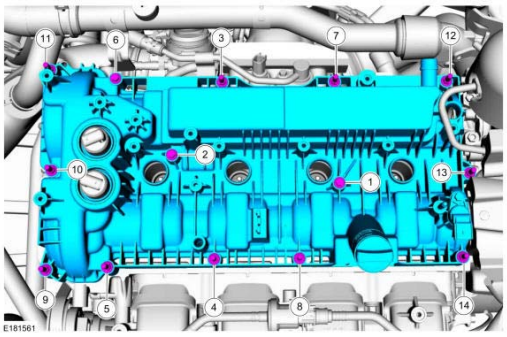


3.

Apply a 5.5 mm (0.22 in) bead of silicone sealant in the 6 places shown in illustration.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

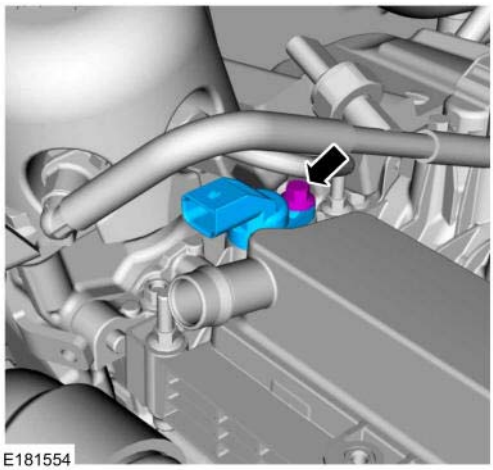


NOTE: The valve cover must be secured within 10 minutes of silicone gasket application. If the valve cover is not secured within 10 minutes, the sealant must be removed and the sealing area cleaned.

4.
Install the valve cover and tighten the fasteners.

Torque

: 89 lb.in (10 Nm)

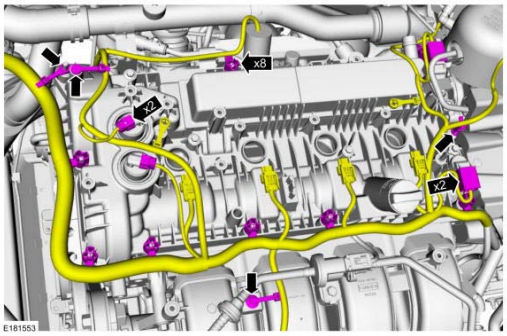


5.

Install the exhaust CMP senor and the bolt.

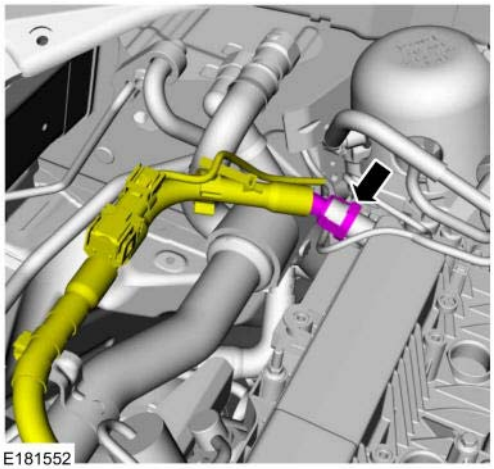
Torque

: 62 lb.in (7 Nm)



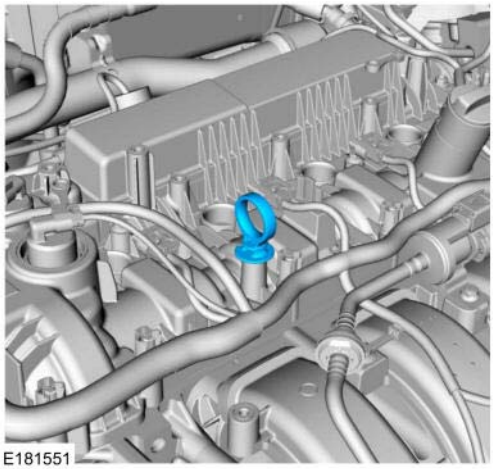
6.

Attach the wiring harness retainers.



Connect the CMP sensor electrical connectors.

Connect the VCT oil control solenoid electrical connectors.

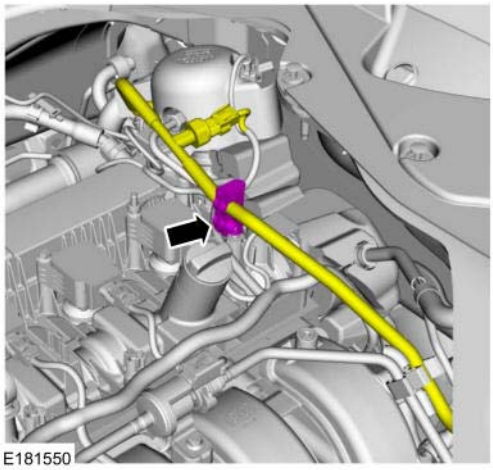


7.

Connect the crankcase vent tube quick release connector to the valve cover.

8.

Install the oil level indicator.

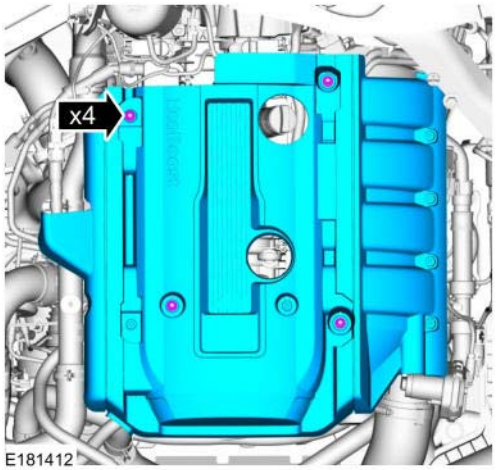


9.

Install the ignition coil-on-plugs. Refer to: IGNITION COIL-ON-PLUG - 2.3L EcoBoost (231kW/314PS).

10.

Attach the fuel supply tube retainer to the valve cover stud bolt.



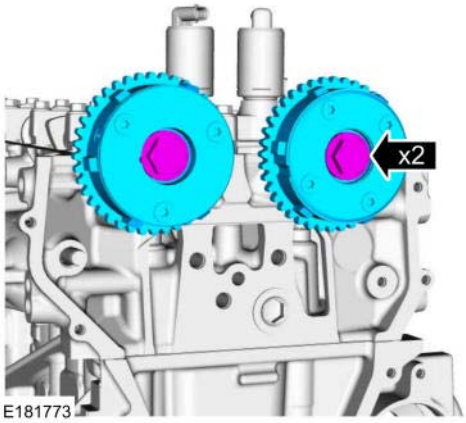
11.

Install the engine appearance cover and the nuts.

Torque

: 80 lb.in (9 Nm)

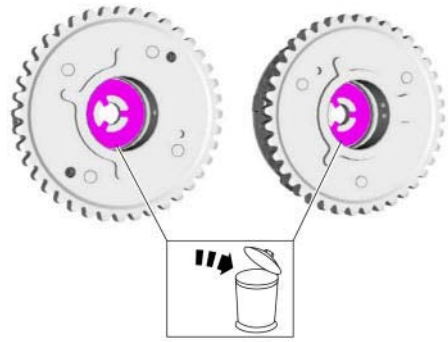
REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT > REMOVAL



NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1.

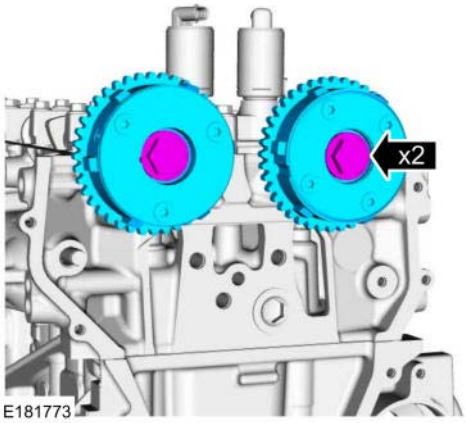
Remove the timing chain. Refer to: Timing Chain .



2.

Remove the bolts and the VCT units.

NOTE: Washers are not required for installation of the VCT units.



3.
If equipped, discard the washers.

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT > INSTALLATION

NOTE: Do not tighten the bolts at this time. The bolts will be tightened during the timing chain installation procedure.

1.
Install the VCT units and the bolts.

2.

Install the timing chain. Refer to: Timing Chain .

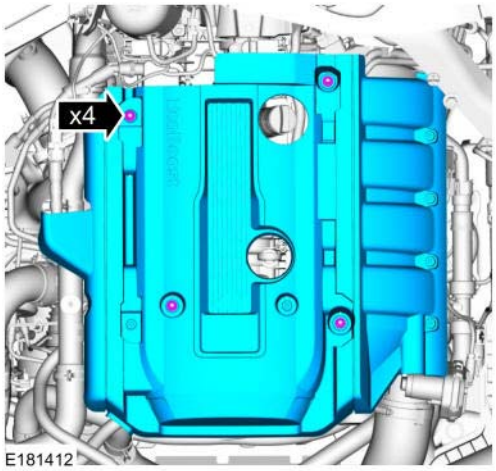
REMOVAL > ENGINE

Special Tool(s) / General Equipment

 ST1341-A	300-OTC1819E 2, 200# Floor Crane, Fold Away
	303-050 (T70P-6000) Lifting Bracket, Engine
Magnetic Socket	
Oil Drain Equipment	
Trolley Jack	
Hose Clamp Remover/Installer	
Wooden Block	

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

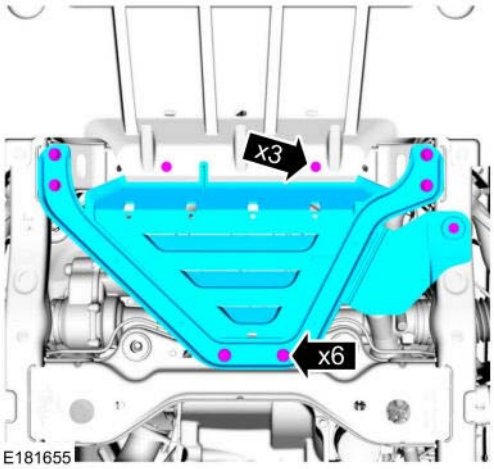
2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 2.3L EcoBoost (231kW/314PS).

3.

Remove the nuts and the engine appearance cover.

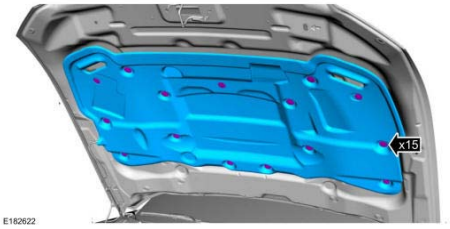
4.



Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

5.

Drain the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

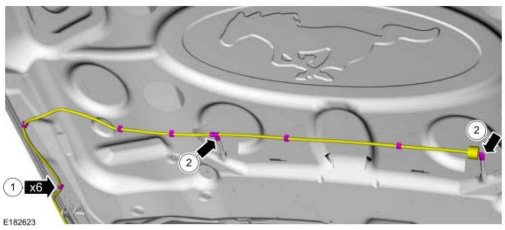


6.

Remove the screws, bolts and the underbody shield.

7.

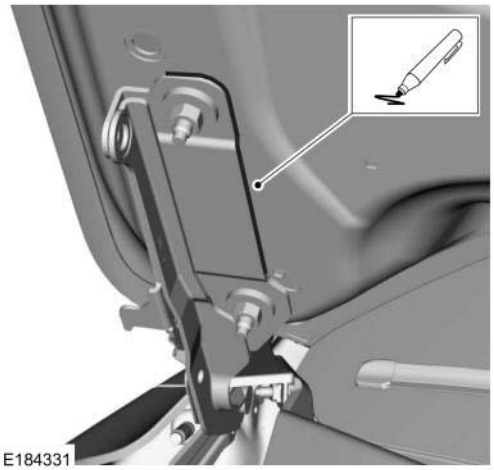
Remove the pin-type retainers and the hood insulation.



8.

1.

Detach the windshield washer hose retainers.



2.

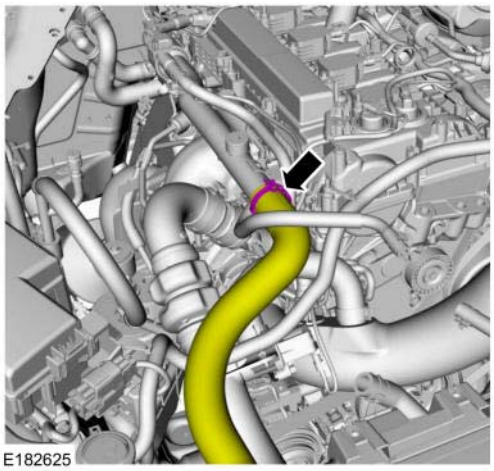
Disconnect the windshield washer hose couplings. Refer to: Washer Hose Coupling .

NOTE: RH side shown in illustration, LH similar.

9.
Index-mark the hood hinge location to aid in hood installation.

10.

Remove the nuts and the hood.



11.

Remove the degas bottle. Refer to: DEGAS BOTTLE .

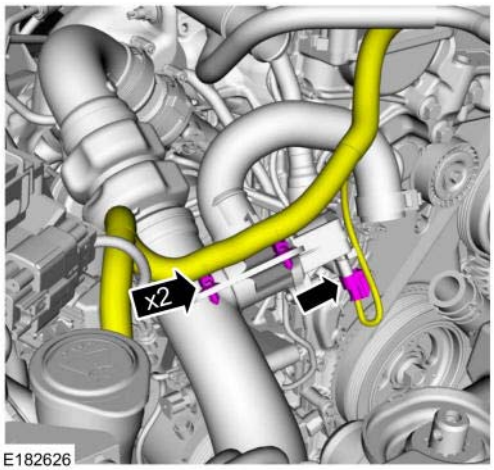
12.

Remove the upper radiator hose from the coolant tube.

Use the General Equipment: Hose Clamp Remover/Installer

13.

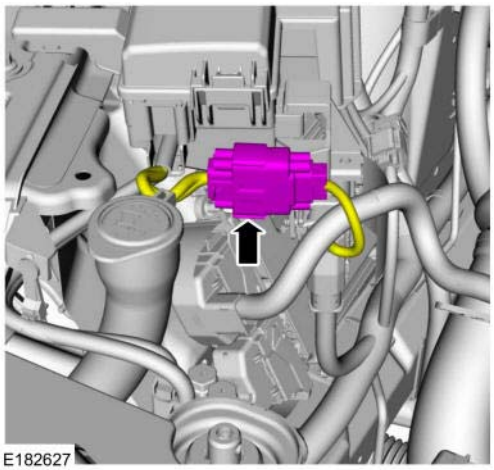
Remove the following items:



Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

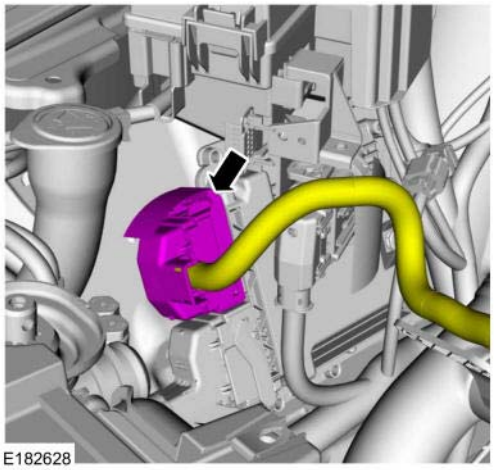
Refer to: AIR CLEANER - 2.3L EcoBoost (231kW/314PS).

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



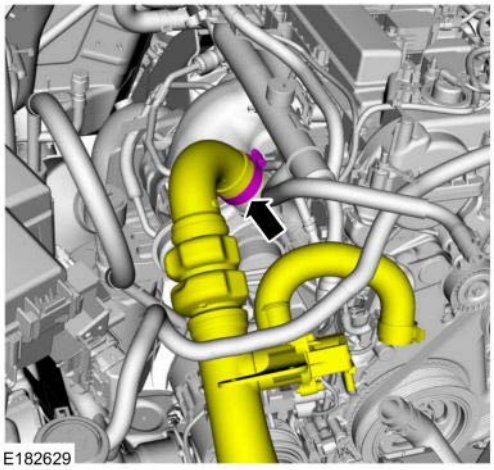
14.

Disconnect the CAC valve electrical connector and the retainers.



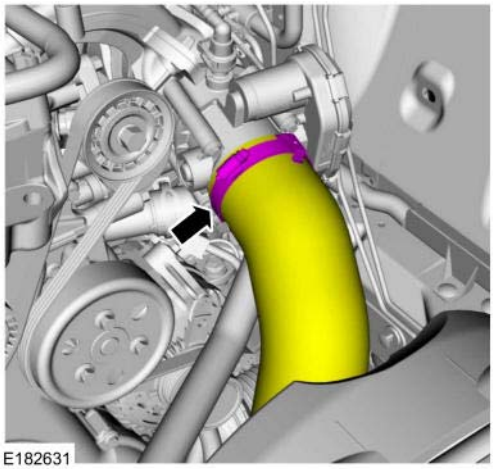
15.

Detach and disconnect the engine harness electrical connector.



16.

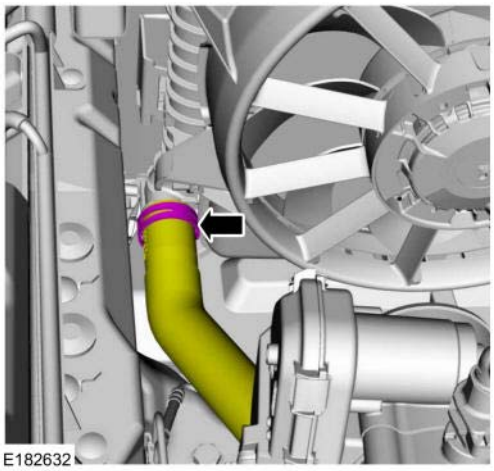
Disconnect the upper PCM electrical connector.



17.

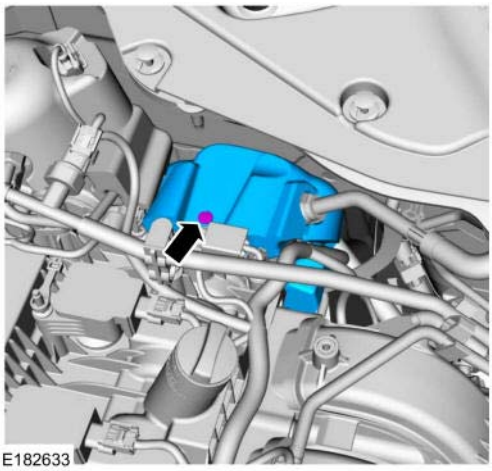
Loosen the clamp and position aside the CAC inlet tube.

18.



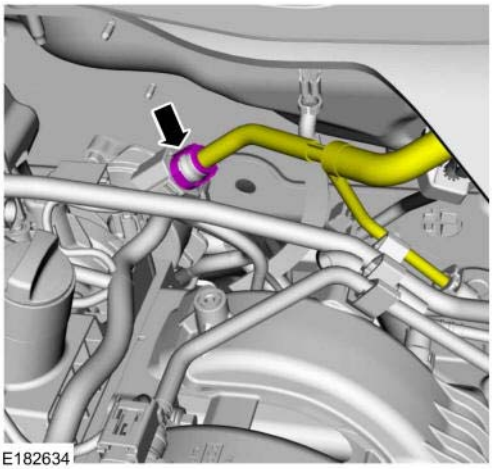
Loosen the clamp and position aside the CAC outlet tube.

19.



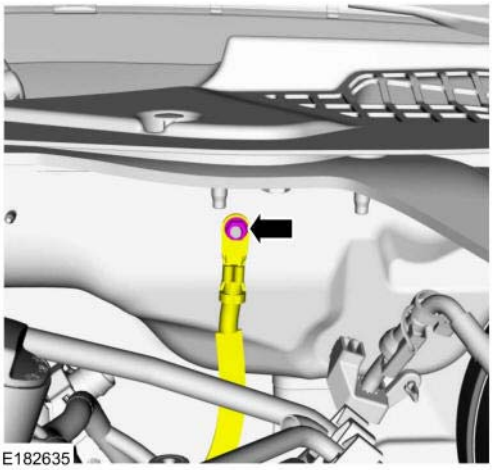
Remove the lower radiator hose from the radiator.

Use the General Equipment: Hose Clamp Remover/Installer



20.

Remove the retainer and the brake vacuum pump insulator cover.



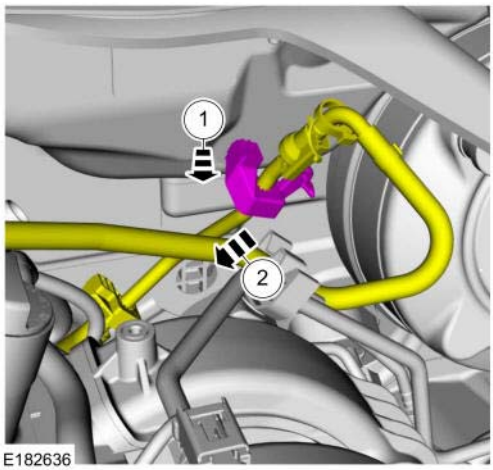
21.

Disconnect the vacuum hose from the brake vacuum pump.

22.

Remove the nut and the engine ground strap from the cowl.

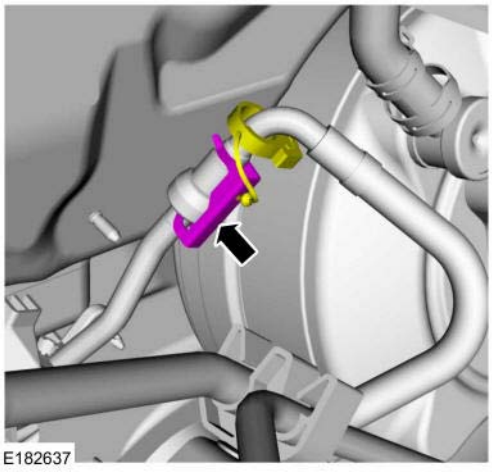
NOTE: It is necessary to move fuel tube retainer for access for the use of fuel disconnect tool.



23.

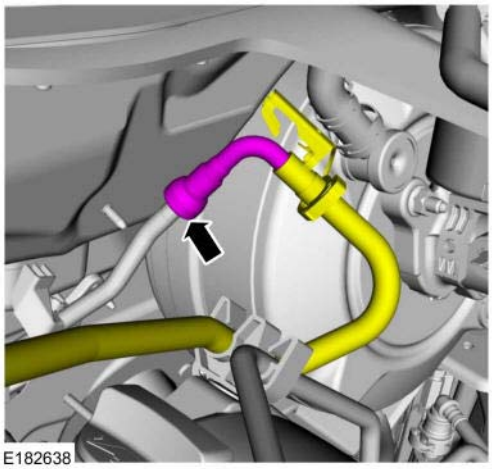
1.

Detach the fuel supply tube retainer from the cowl.



2.

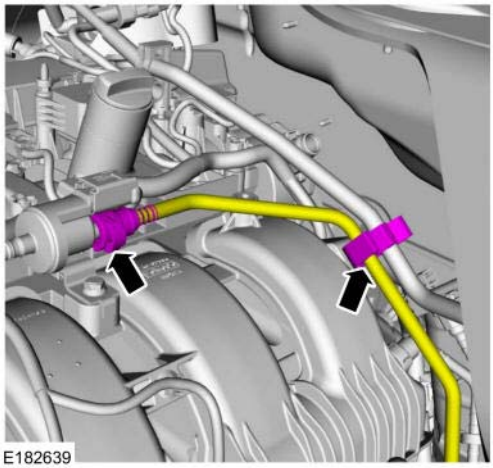
Slide the retainer down the fuel supply tube.



24.

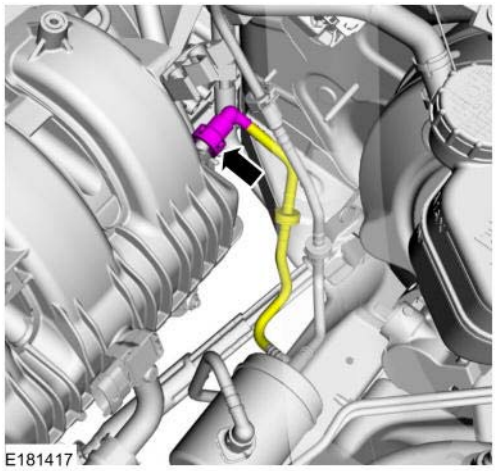
Remove the fuel supply tube spring lock coupling retainer.

25.



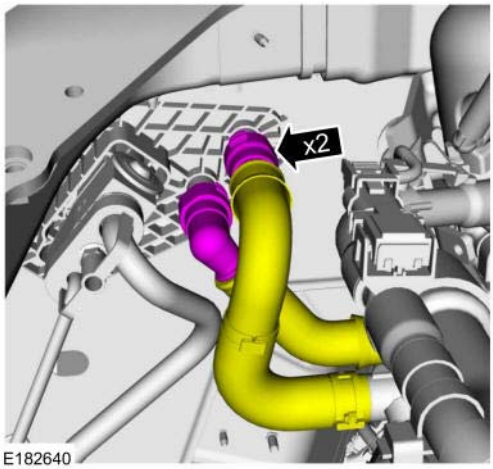
Disconnect the fuel supply tube. Refer to: SPRING LOCK COUPLINGS - 2.3L EcoBoost (231kW/314PS).

26.



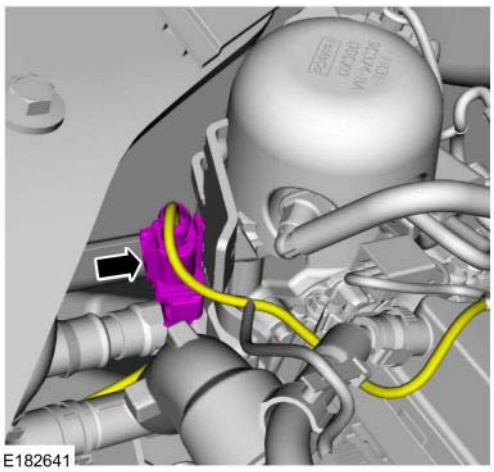
Disconnect the vacuum tube quick release coupling from the EVAP canister purge valve.

Detach the vacuum tube from the intake manifold retainer.



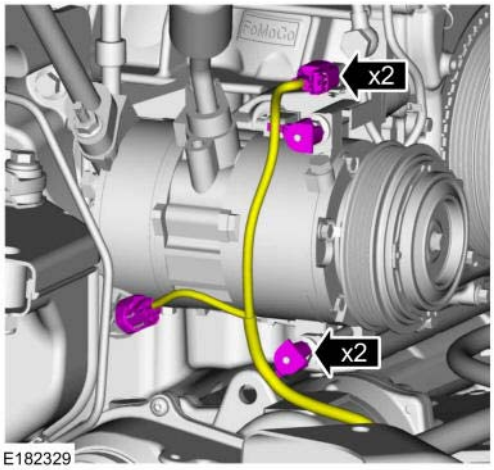
27.

Disconnect the vacuum tube quick release coupling at the rear of the intake manifold.



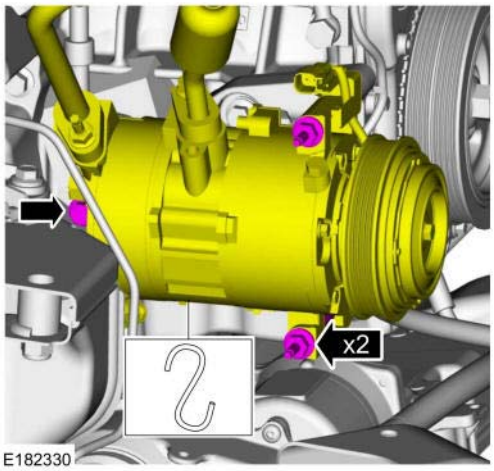
28.

Disconnect the coolant hoses from the heater core.



29.

Detach and disconnect the HO2S electrical connector.

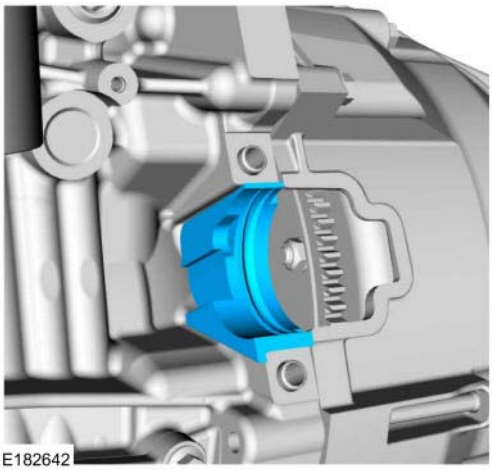


30.

Disconnect the A/C compressor electrical connectors and the wire harness retainers.

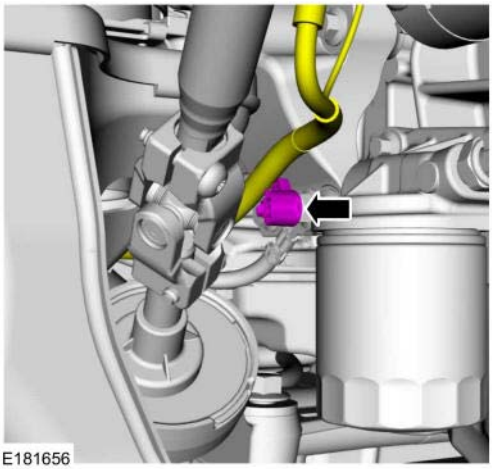
31.

Remove the bolts, position and support the A/C compressor aside.



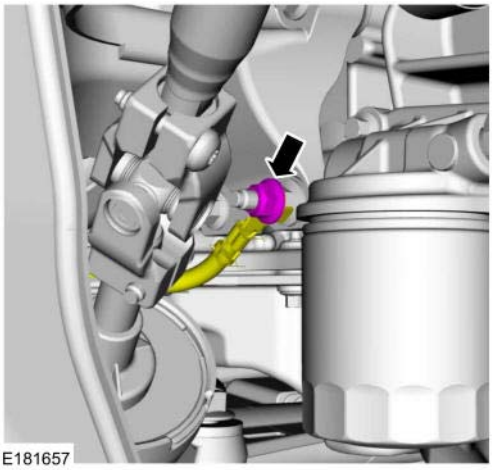
32.

Remove the starter motor. Refer to: STARTER MOTOR .



33.

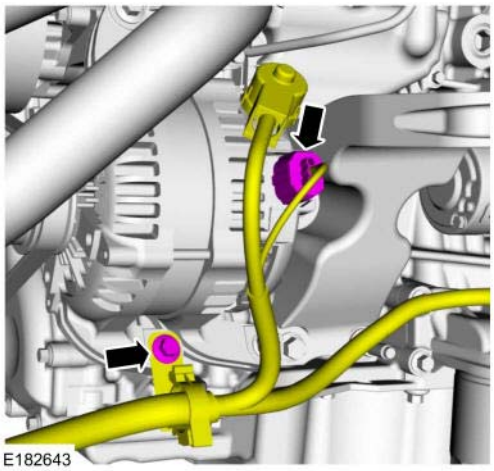
Remove the starter motor insulator.



34.

Detach the wire harness retainer from the LH engine mount bracket stud bolt.

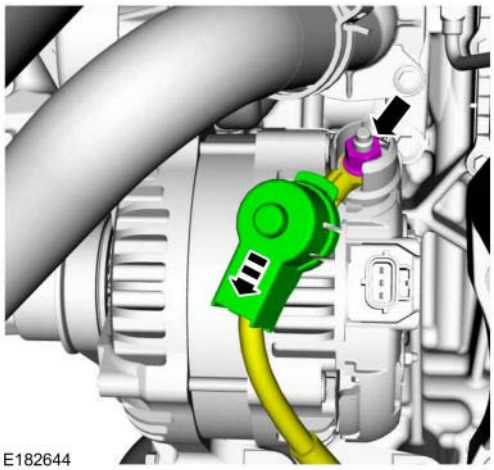
35.



Remove the nut and ground wire from the LH engine mount bracket stud bolt.

36.

Remove the bolt and the wire harness retainer from the generator.

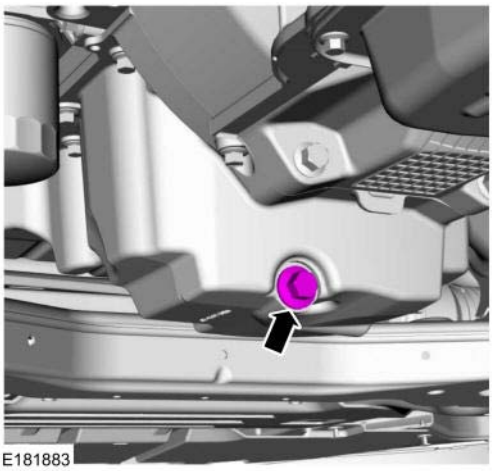


Disconnect the generator electrical connector.

37.

Position the protective cover aside.

Remove the nut and the B+ cable.

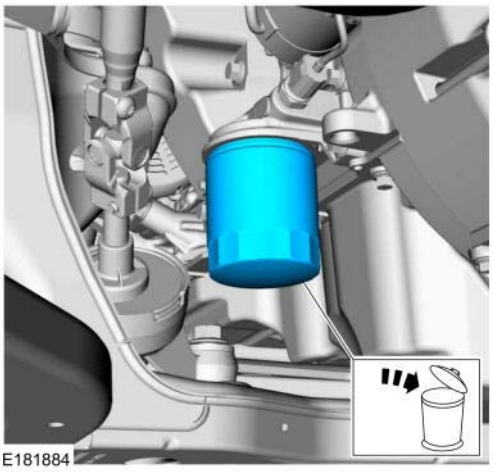


38.

Drain the engine oil and install drain plug.

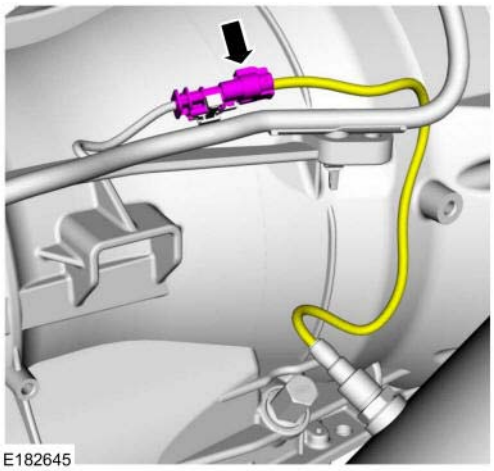
Use the General Equipment: Oil Drain Equipment

Torque



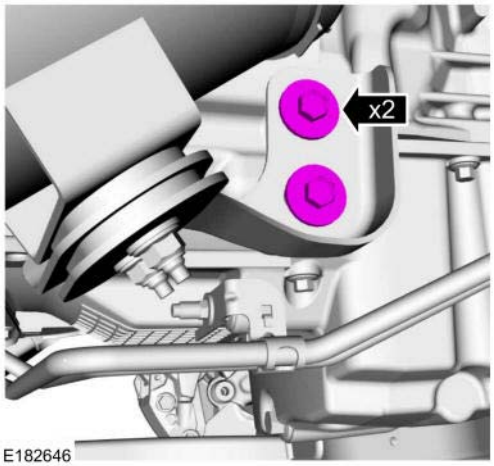
: 20 lb.ft (27 Nm)

39.



Remove and discard the engine oil filter.

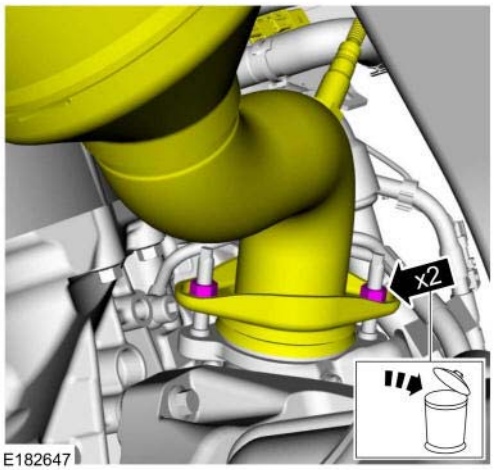
Use the General Equipment: Oil Drain Equipment



NOTE: Automatic transmission shown in illustration, manual transmission similar.

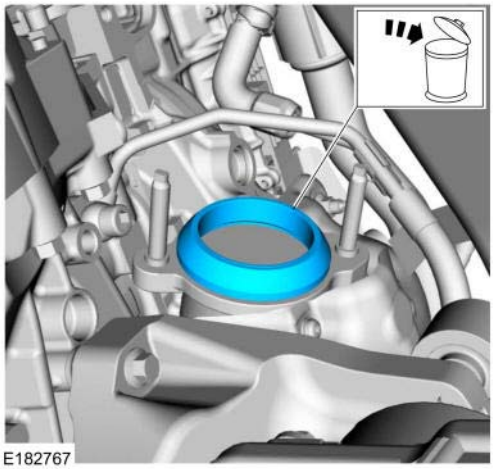
40.
Disconnect the catalyst monitor sensor (CMS) sensor electrical connector.

NOTE: Automatic transmission shown in illustration, manual transmission similar.



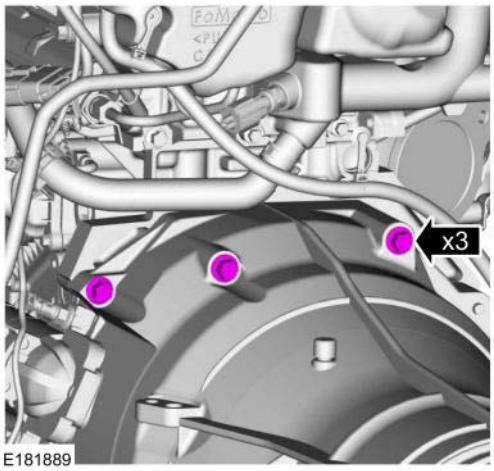
41.
Remove the bolts for the catalytic converter bracket.

42.



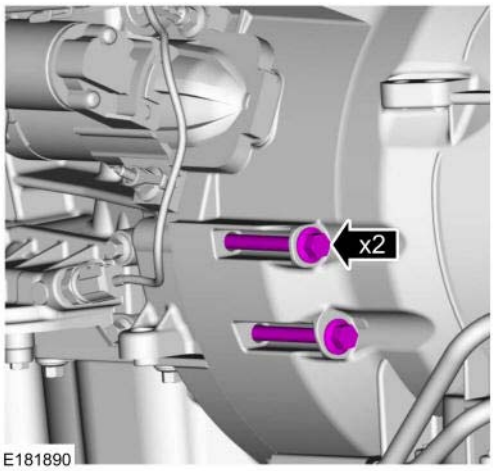
Remove the nuts and position the catalytic converter aside.

Discard the nuts.



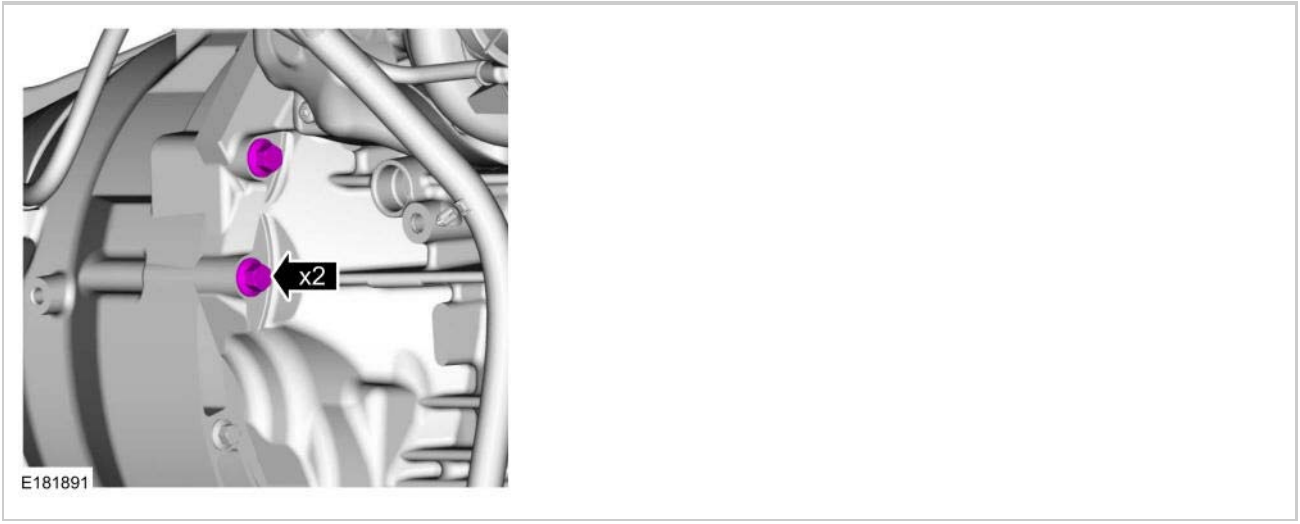
43.

Remove and discard the gasket.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

44.
Remove the transmission bolts.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

45.
Remove the transmission bolts.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

46.
Remove the transmission bolts.

6-Speed Automatic Transmission - 6R80

47.

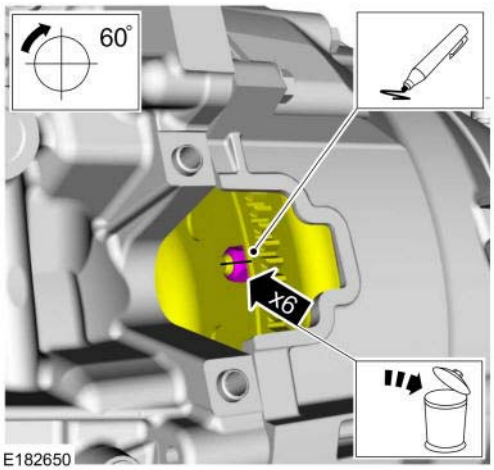
1.

Rotate the transmission electrical connector.

2.

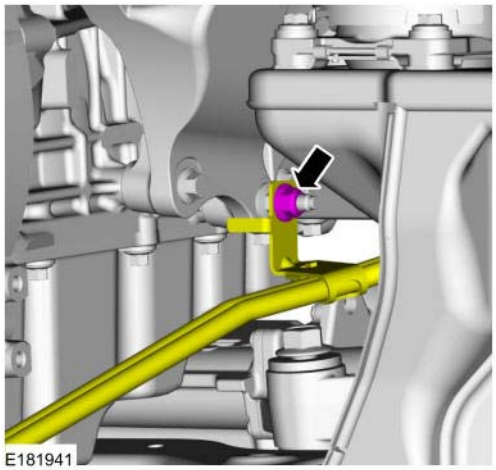
Pull the transmission electrical connector out to disconnect.

Detach the retainers and position the wiring harness aside.



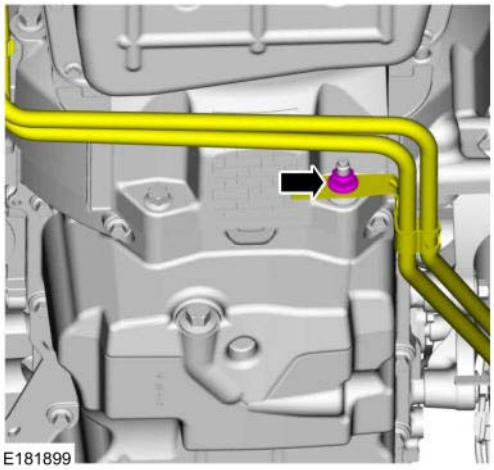
NOTE: Index mark one stud and the flexplate for assembly reference.

NOTE: Only rotate the crankshaft in a clockwise direction.



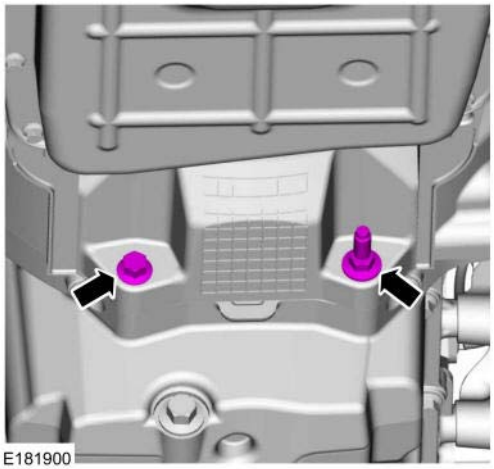
48.
Remove and discard the torque convertor nuts.

Use the General Equipment: Magnetic Socket



49.

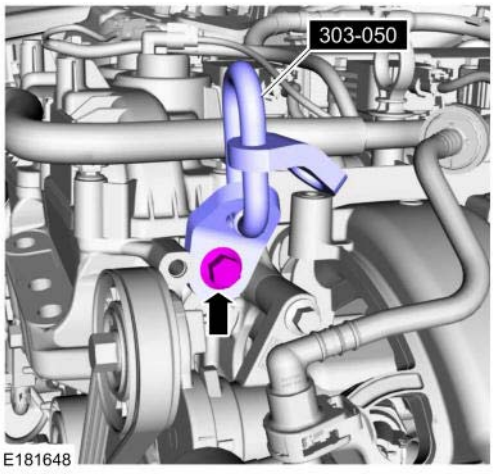
Remove the nut from the RH engine mount bracket stud bolt for the transmission cooling tubes.



50.

Remove the transmission cooling tube bracket nut and position aside.

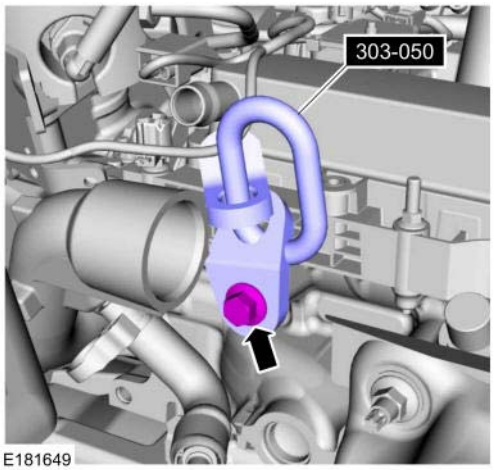
NOTE: Automatic transmission shown in illustration, manual transmission similar.



51.
Remove the oil pan bolts.

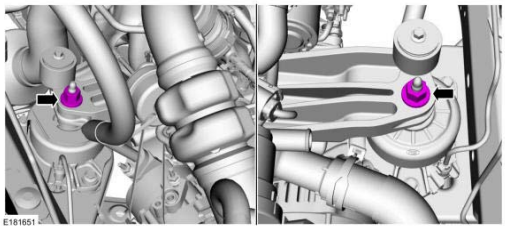
52.

Install the special tool on the LH side of the cylinder head.



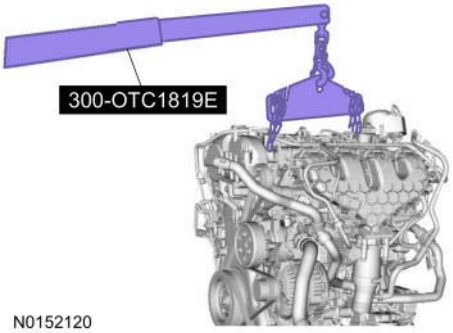
Install Special Service Tool: 303-050 (T70P-6000)Lifting Bracket, Engine.

NOTE: Coolant tube removed for clarity.



53.
Install the special tool on the RH side of the cylinder head.

Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.

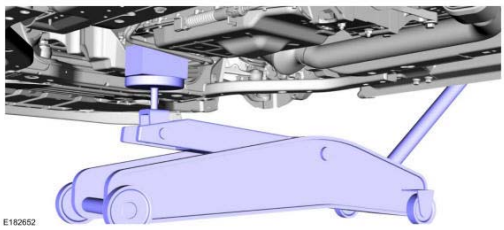


54.

Remove the RH and LH engine mount bracket nuts.

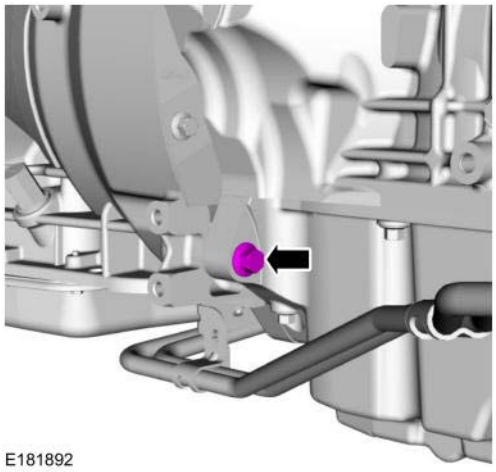
55.

Install Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.



56.

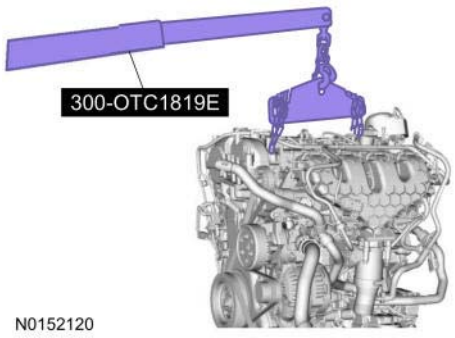
Install a jack and wooden block under the transmission bell housing to support the transmission.



Use the General Equipment: Wooden Block

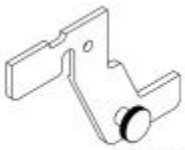
Use the General Equipment: Trolley Jack

NOTE: Automatic transmission shown in illustration, manual transmission similar.



57.
Remove the oil pan bolt.

58.



Using the special tool, remove the engine.

Use Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.

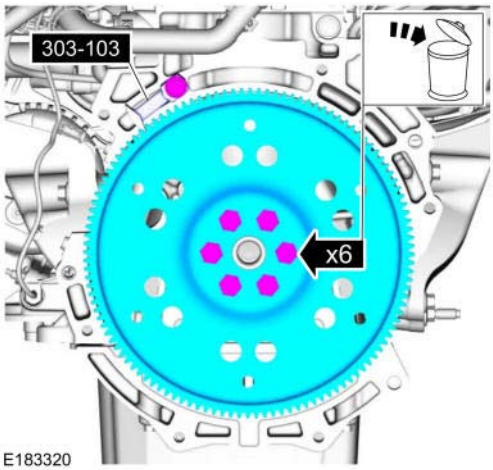
Motorcraft® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



6-Speed Automatic Transmission - 6R80

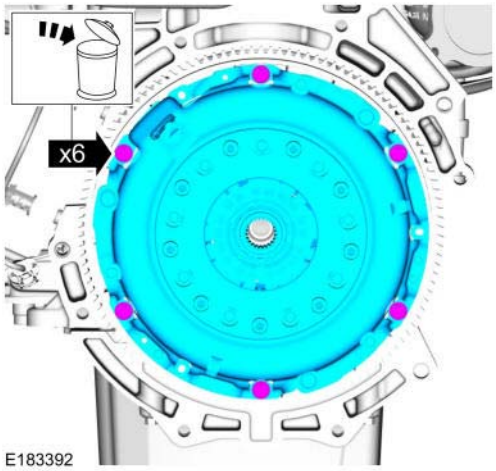
1.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

Remove the bolts and the flexplate.

Discard the bolts.

6-Speed Manual Transmission - MT82



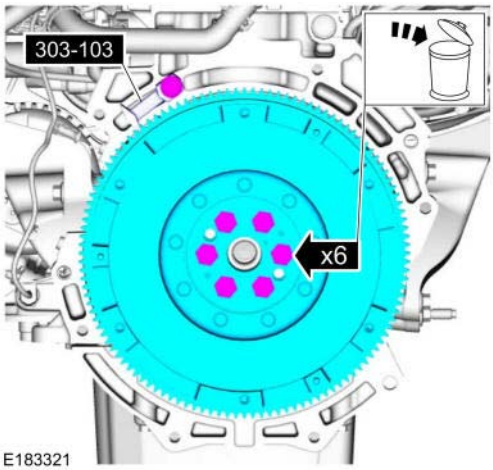
NOTE: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

2.

Loosen the clutch pressure plate-to-flywheel bolts evenly, by two turns at a time.

Remove the clutch.

Discard the bolts.

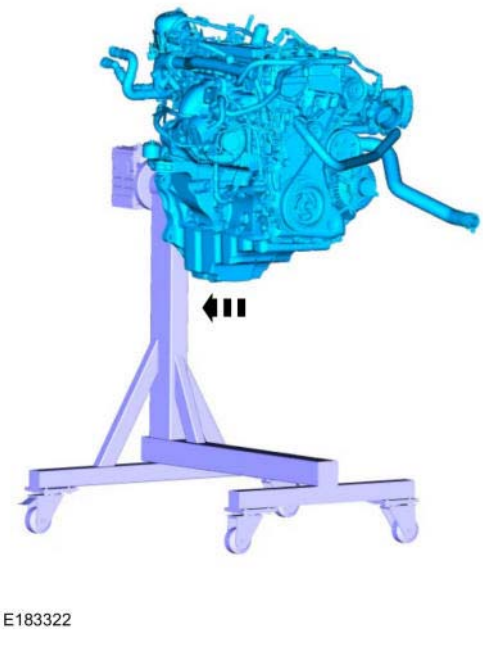


3.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

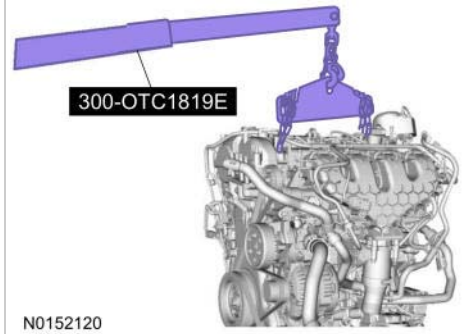
Remove the bolts and the flywheel.

Discard the bolts.



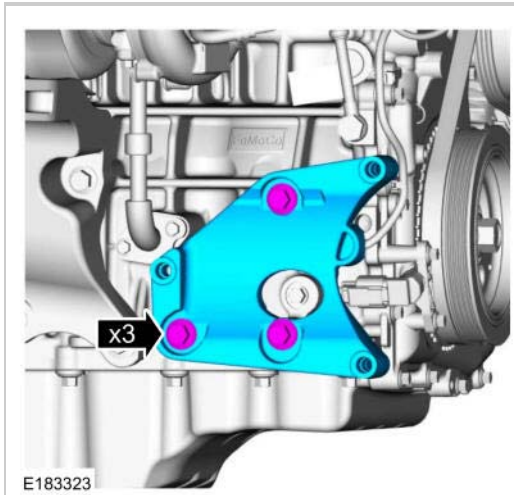
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

4.



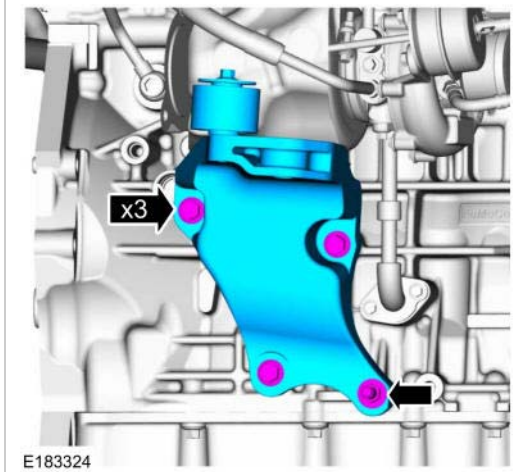
Install engine on the mounting stand.

Use the General Equipment: Mounting Stand



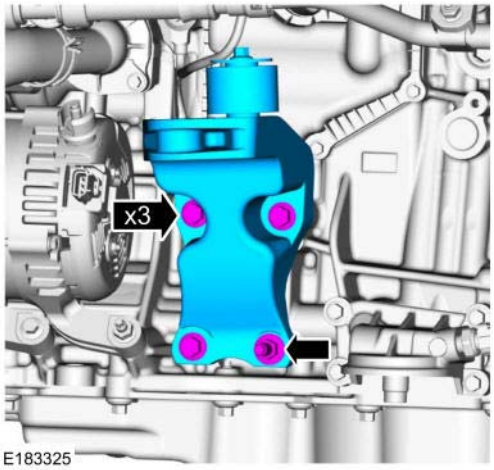
5.

Remove Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.



6.

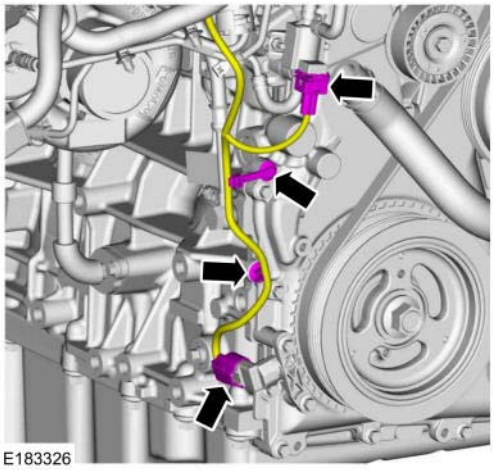
Remove the bolts and the A/C compressor mounting bracket.



7.

Remove the bolts, stud bolt and the RH engine mount bracket.

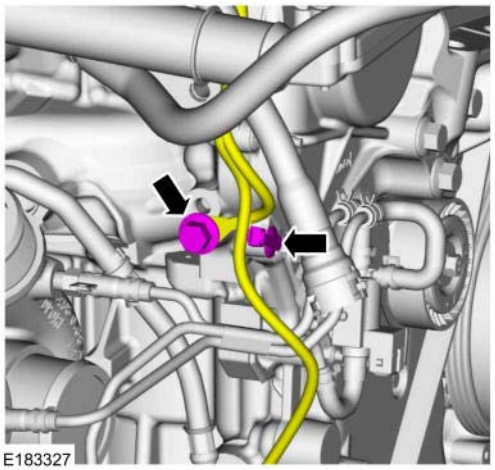
8.



Remove the bolts, stud bolt and the LH engine mount bracket.

9.

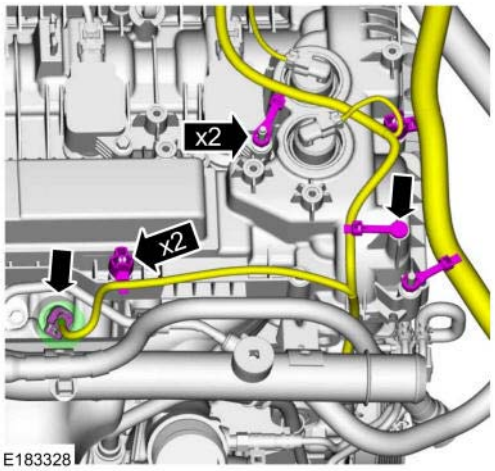
Disconnect the CKP and vacuum valve electrical connectors.



Detach the wiring harness retainers.

10.

Detach the wiring harness retainer.

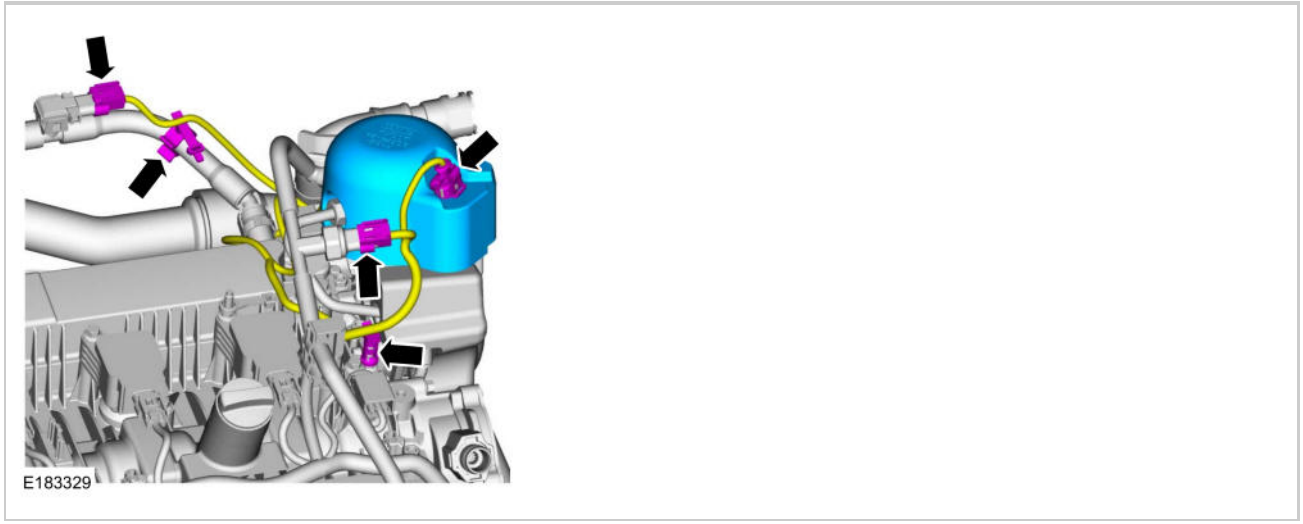


Remove the bolt and position the ground wire harness aside.

11.

Disconnect the CHT sensor electrical connector.

Detach the wiring harness retainers.

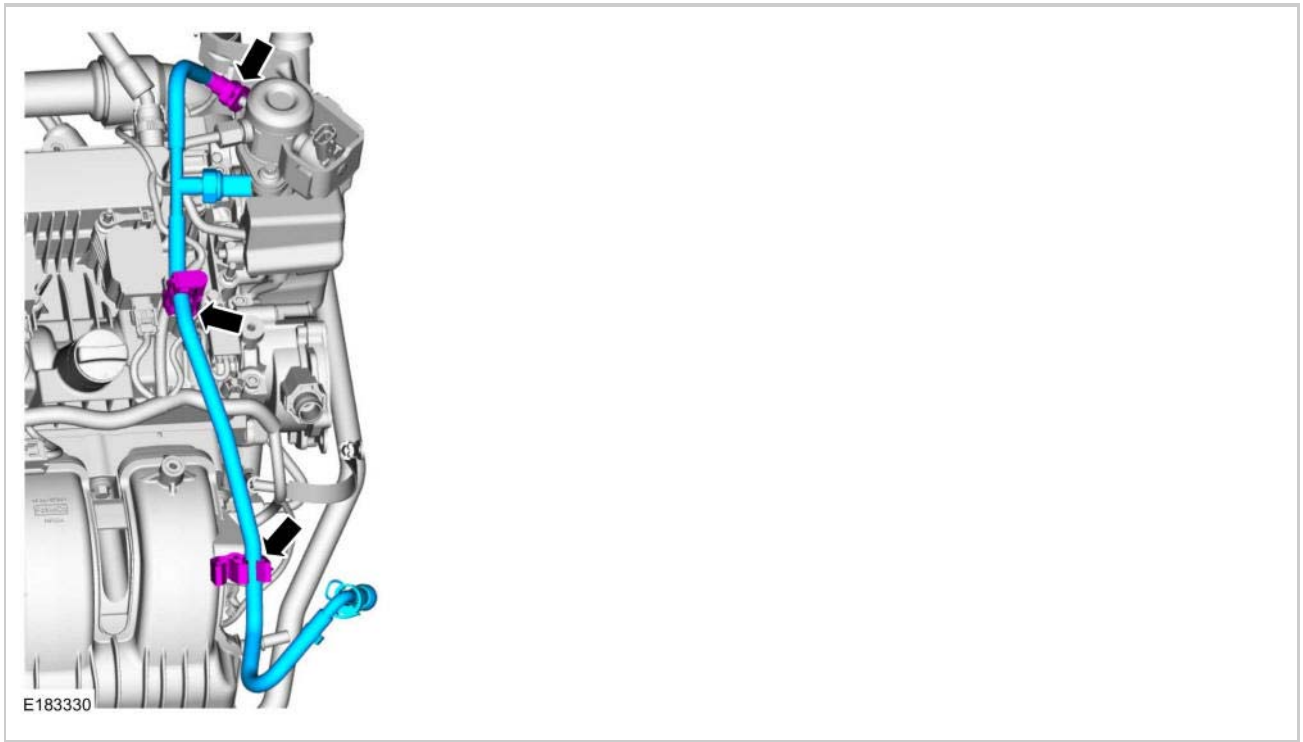


12.

Disconnect the high-pressure fuel pump, fuel supply tube pressure switch and crankcase vent tube electrical connectors.

Detach the wiring harness retainers.

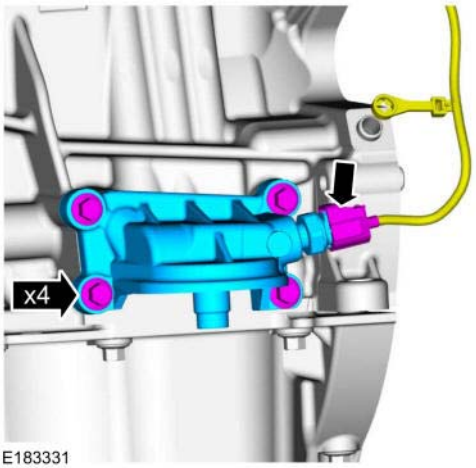
Remove the high-pressure fuel pump cover.



13.

Detach the fuel supply tube from the intake manifold retainer.

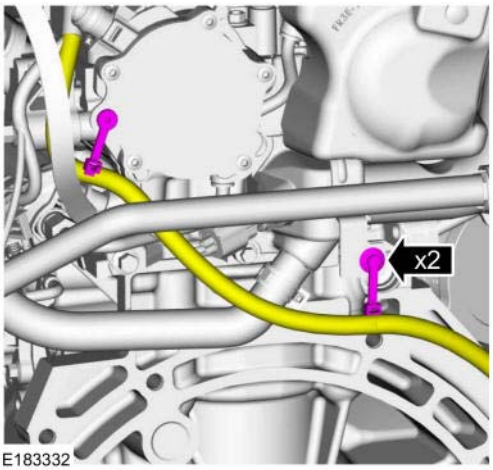
Disconnect the fuel supply tube quick release coupling from the high-pressure fuel pump. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).



Detach the retainer and remove the fuel supply tube.

14.

Disconnect the oil pressure switch electrical connector.

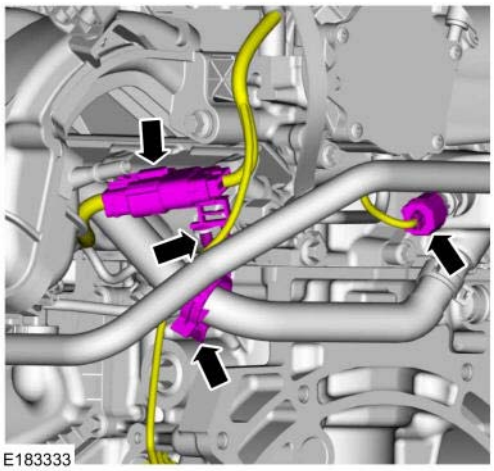


Remove the bolts and the oil filter adapter.

6-Speed Automatic Transmission - 6R80

15.

Detach the wiring harness retainers.

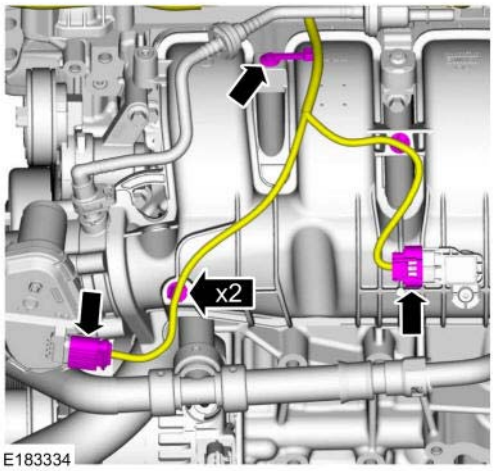


6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

16.

Detach and disconnect the fuel injector harness electrical connector.

Disconnect the ECT harness electrical connector.

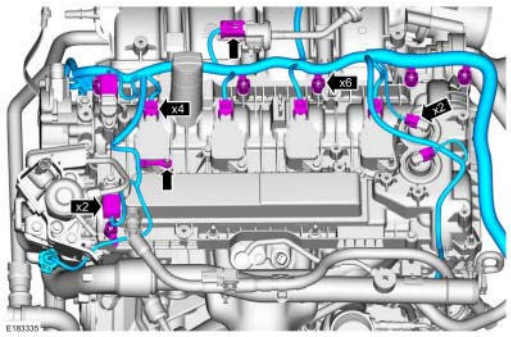


Detach the wiring harness retainer.

17.

Disconnect the throttle body and MAPT electrical connectors.

Detach the wiring harness retainers.

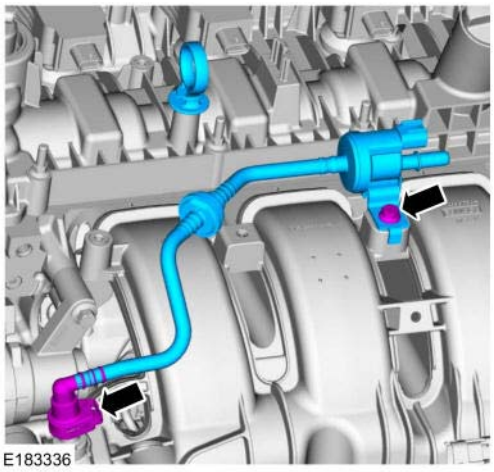


18.

Disconnect the CMP sensor and EVAP canister purge valve electrical connectors.

Disconnect the ignition coil-on-plugs and VCT oil control solenoid sensor electrical connectors.

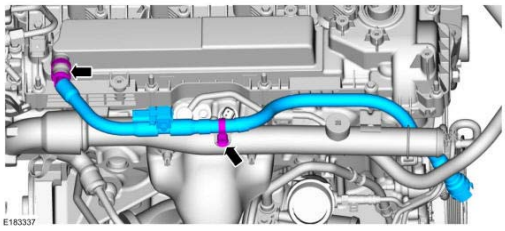
Detach the wiring harness retainer and remove the engine wiring harness.



19.

Disconnect the EVAP canister purge valve quick release coupling.

Remove the bolt and the EVAP canister purge valve.

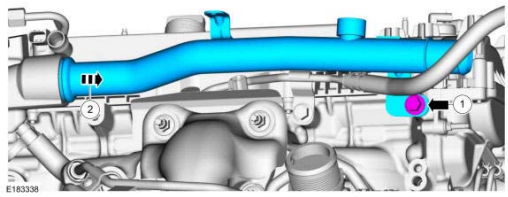


Remove the oil level indicator.

20.

Disconnect the crankcase vent tube from the valve cover.

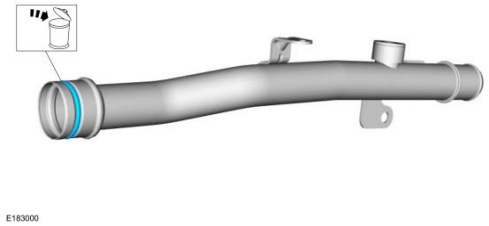
Detach the crankcase vent tube retainer and remove.



21.

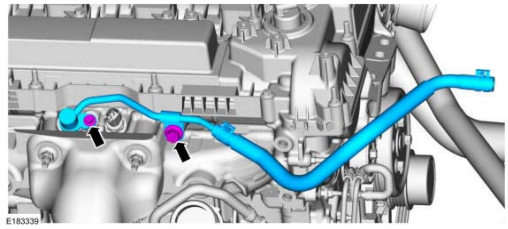
1.

Remove the coolant tube bolt.



2.

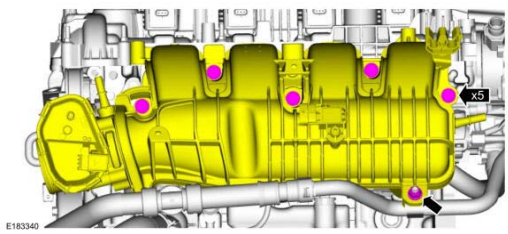
Remove the coolant tube.



22.

Remove and discard the coolant tube O-ring seal.

23.

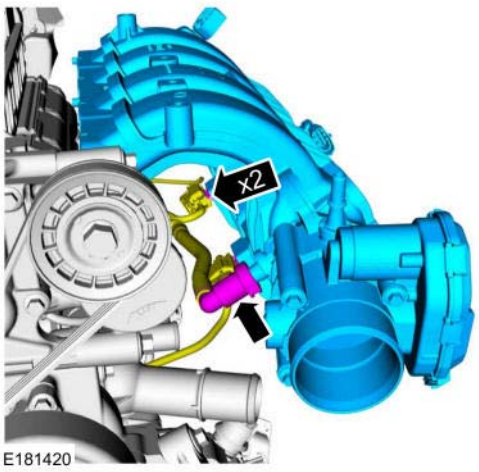


Remove the bolts and the coolant tube.

24.

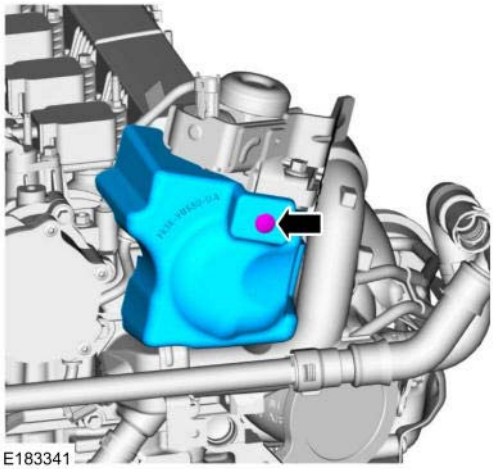
Remove the nut for the coolant tube.

Remove the bolts and position intake manifold back.



25.

Disconnect the PCV tube quick release coupling.

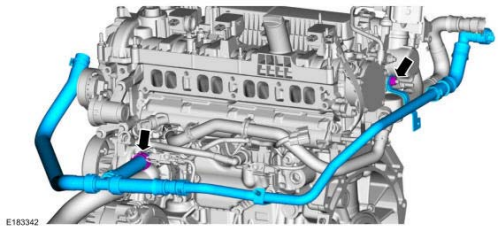


Detach the KS electrical connector retainers from the intake manifold.

Remove the intake manifold.

26.

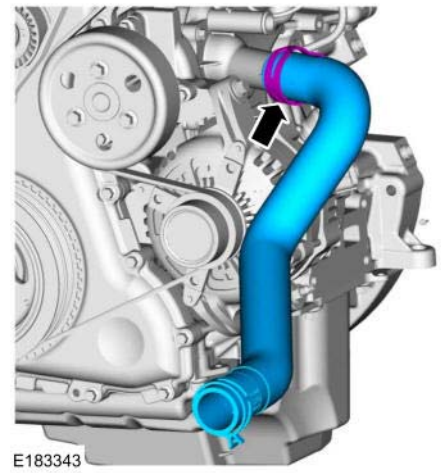
Remove the retainer and the high-pressure fuel pump drive unit cover.



27.

Disconnect the coolant hose from thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer

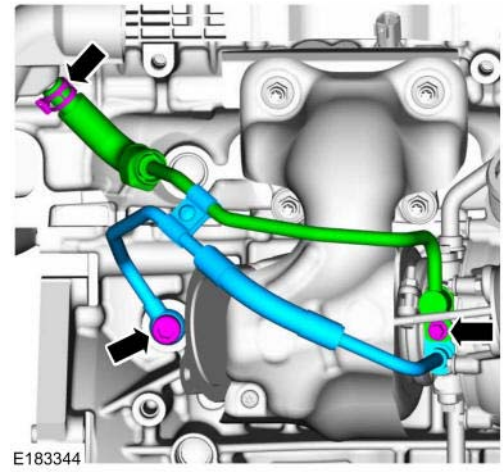


Remove the nut and the coolant hose.

28.

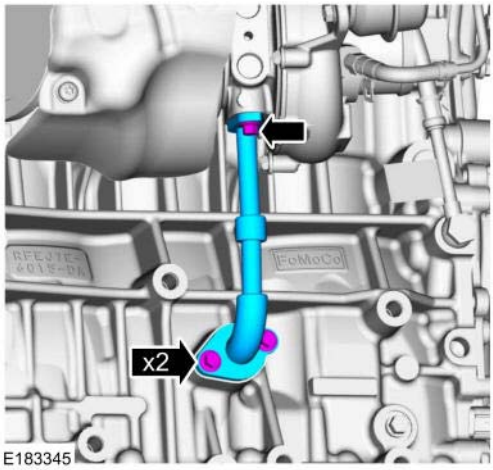
Disconnect the radiator hose from the thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer



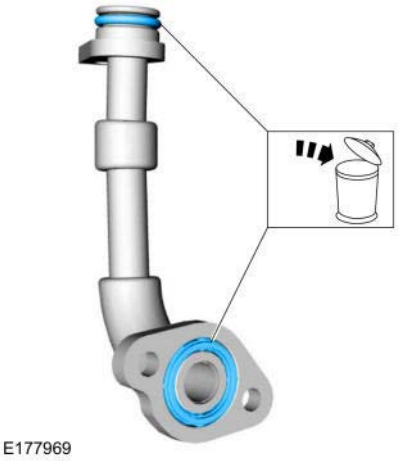
29.

Disconnect the turbocharger coolant hose from the coolant outlet.



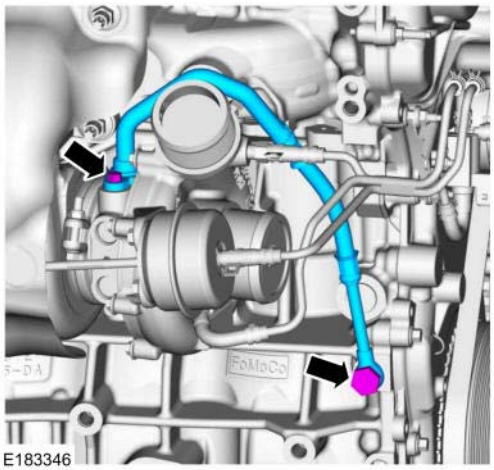
Use the General Equipment: Hose Clamp Remover/Installer

Remove the bolts and the turbocharger coolant tubes.



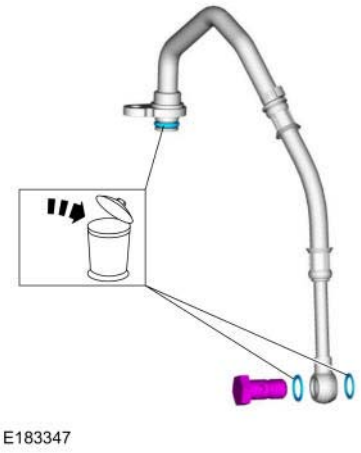
30.

Remove the bolts and the turbocharger-to-cylinder block oil return tube.



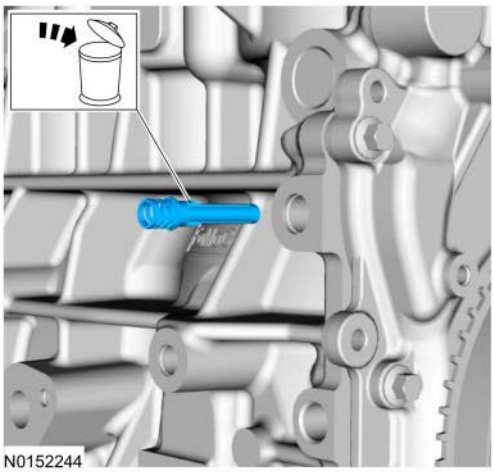
31.

Remove and discard the O-ring seal and gasket.



32.

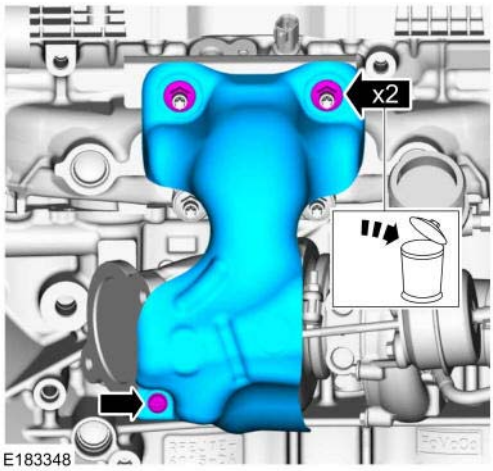
Remove the bolts and the cylinder block-to-turbocharger oil supply tube.



33.

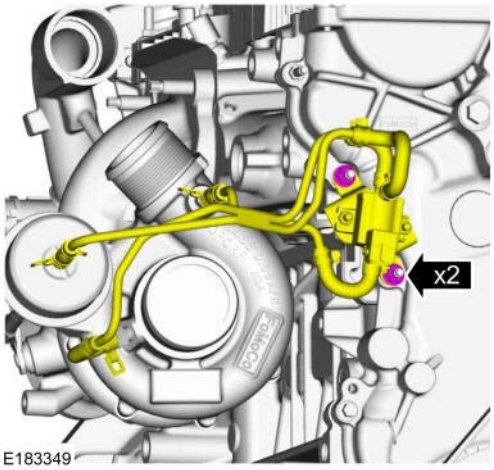
Remove and discard the washers and O-ring seal.

34.



Remove and discard the oil supply filter.

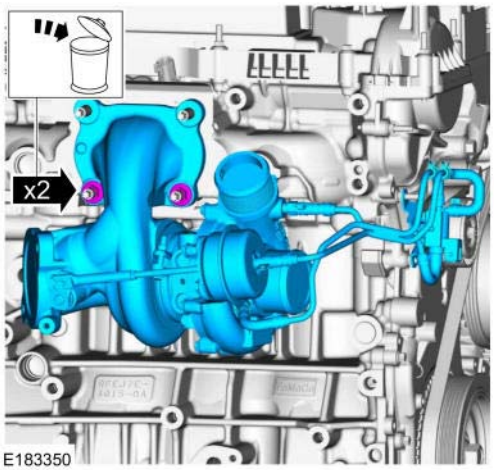
35.



Remove the nuts, bolt and the heat shield.

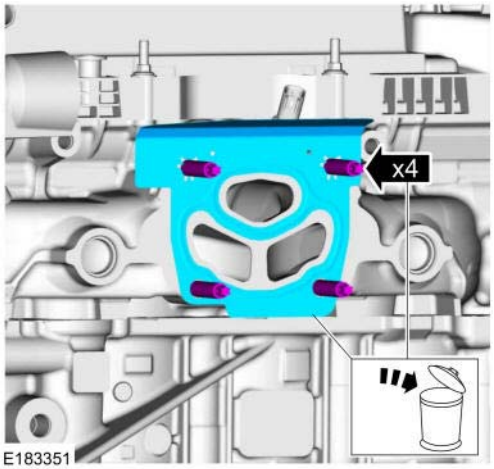
Discard the nuts.

36.



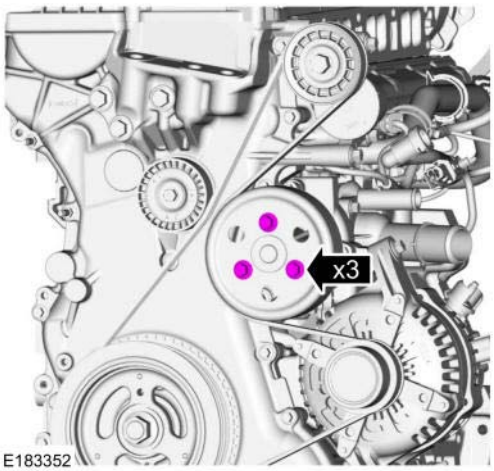
Remove the nuts, turbocharger vacuum valve and position aside.

37.



Remove the nuts and the turbocharger.

Discard the nuts.



38.

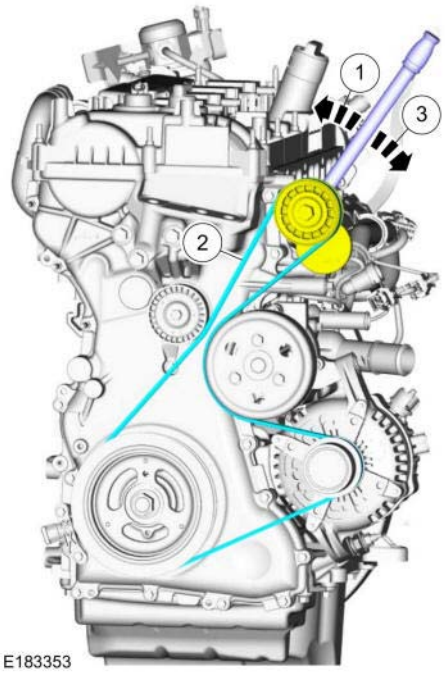
Remove and discard the studs and gasket.

39.

Loosen the coolant pump pulley bolts.

40.

1.



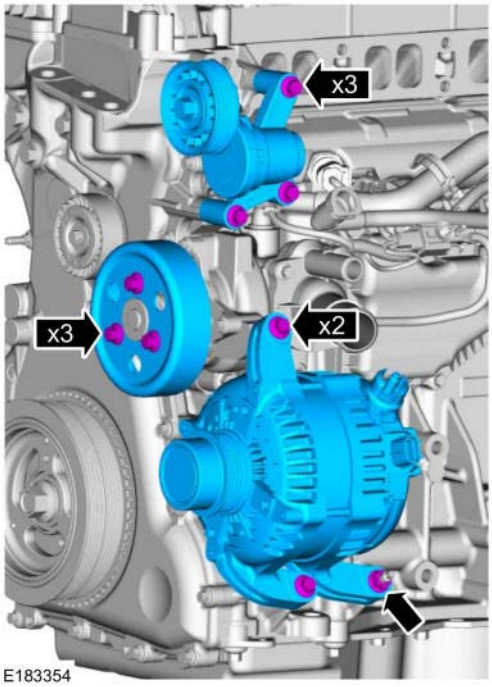
Install the tool and release the tension on the accessory drive belt tensioner.

2.

Remove the accessory drive belt.

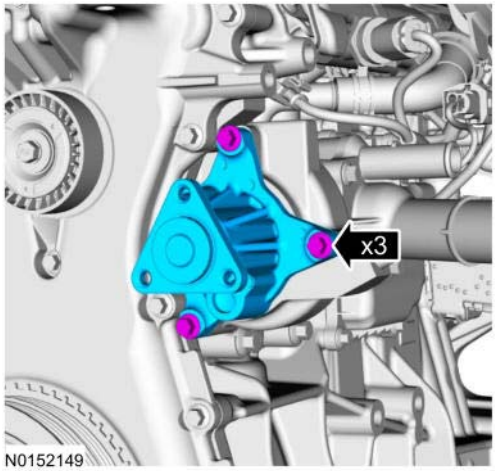
3.

Release the tool and remove.



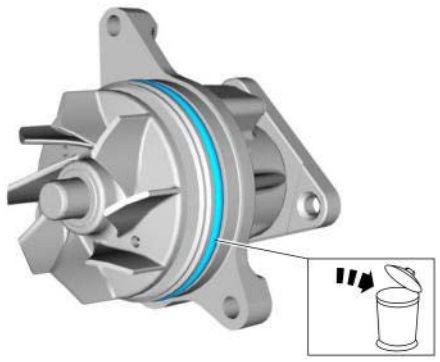
41.

Remove the bolts and the accessory drive belt tensioner.



Remove the bolts and coolant pump pulley.

Remove the nut, bolts and the generator.

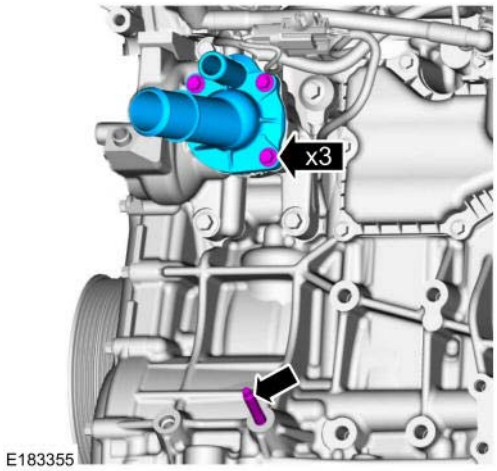


42.

Remove the bolts and the coolant pump.

43.

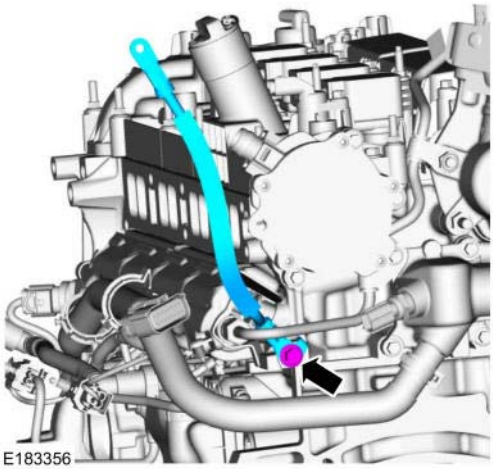
Remove and discard the coolant pump O-ring seal.



N0152150

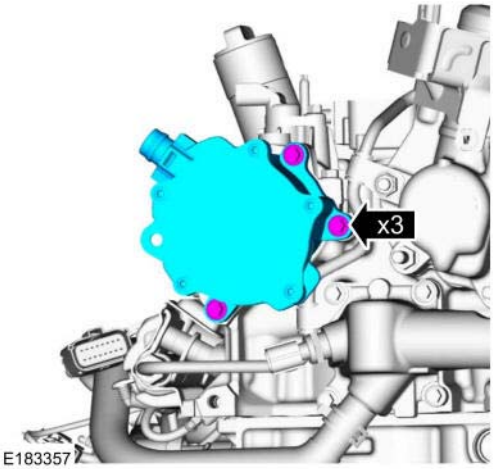
44.

Remove the bolts and the thermostat housing.



Remove the generator stud.

E183355

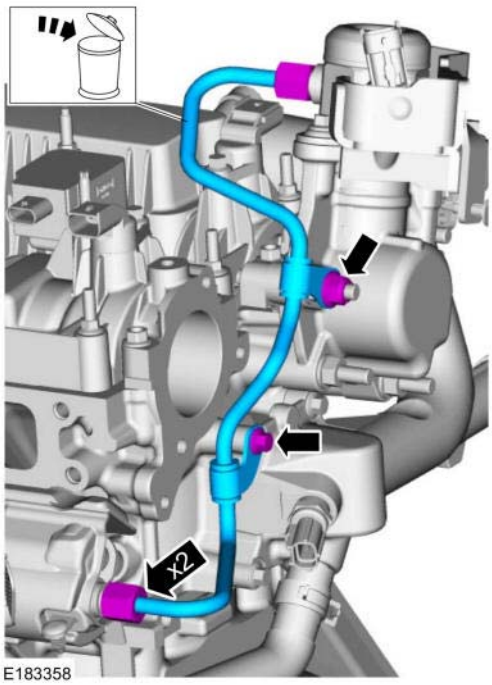


45.

Remove the bolt and the ground strap.

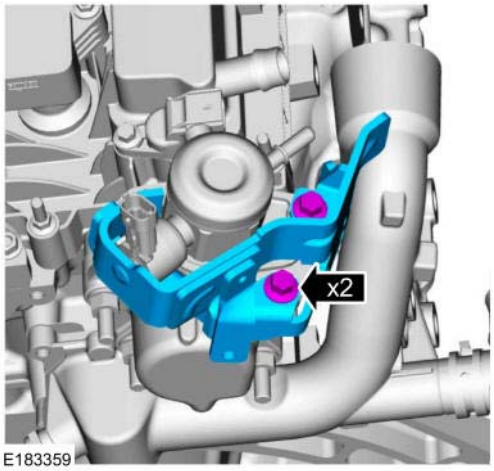
46.

Remove the bolts and the brake vacuum pump.



NOTE: To release the fuel pressure in the high pressure fuel tube, wrap the fuel injection pump flare nut with a shop towel to absorb any residual fuel pressure during the loosening of the fuel injection pump flare nut.

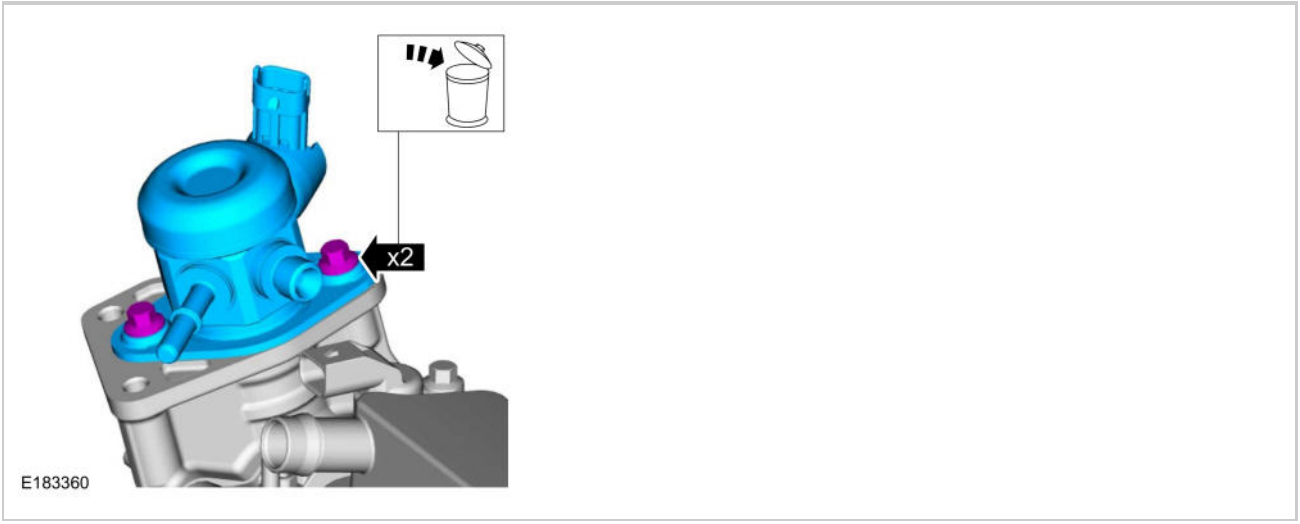
47.



Remove the high pressure fuel tube nut and bolt.

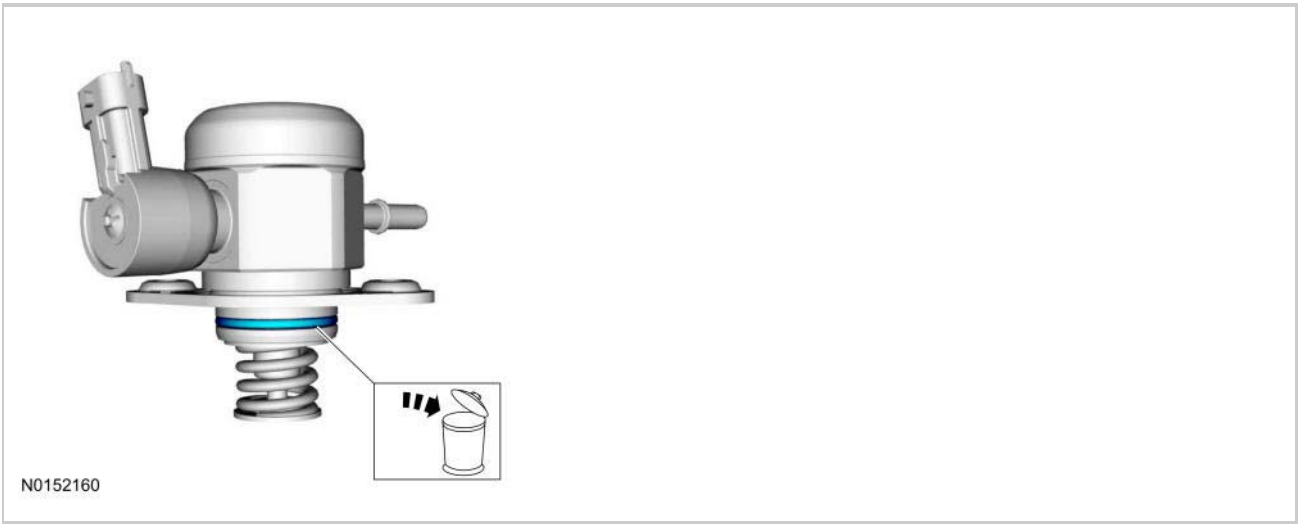
Loosen the flare nuts and discard the fuel tube.

48.



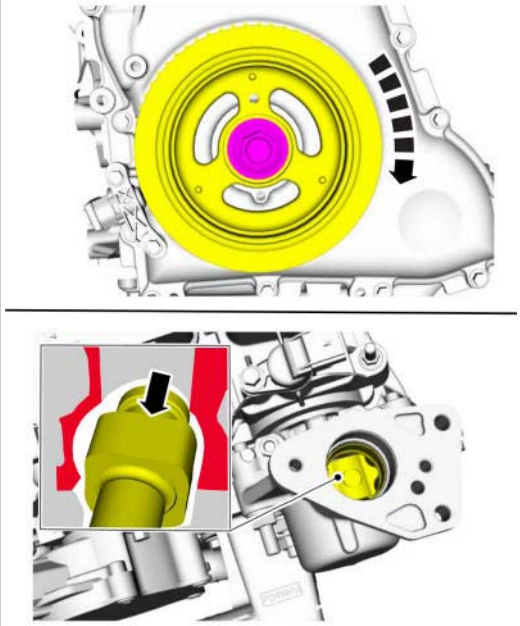
Remove the bolts and high-pressure fuel pump bracket.

49.



Remove the bolts and the high-pressure fuel pump.

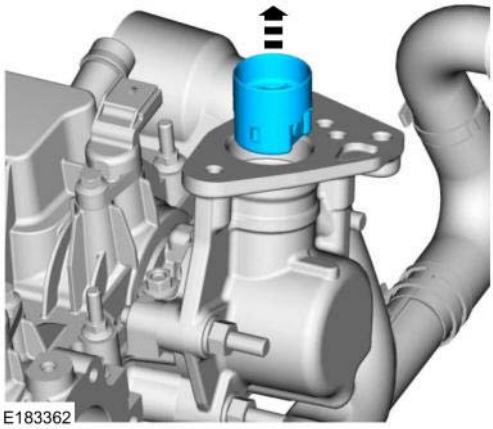
Discard the bolts.



50.

Remove and discard the high-pressure fuel pump O-ring seal.

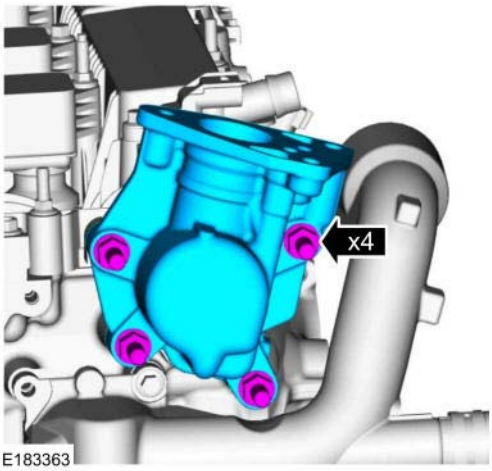
51.



Rotate the crankshaft to position the camshaft at zero lift.

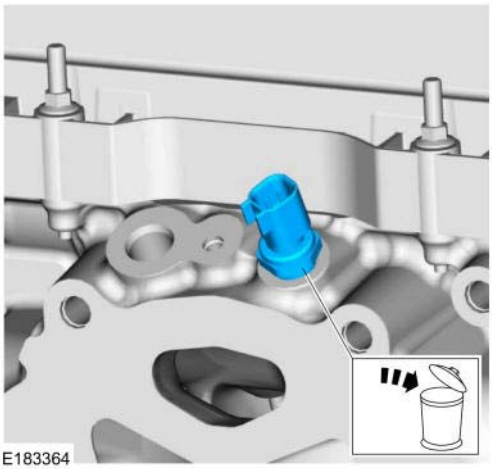
E183361

52.



Remove the high-pressure fuel pump tappet.

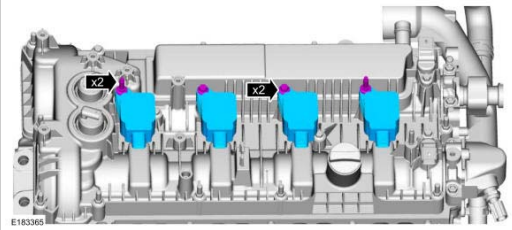
E183362



53.

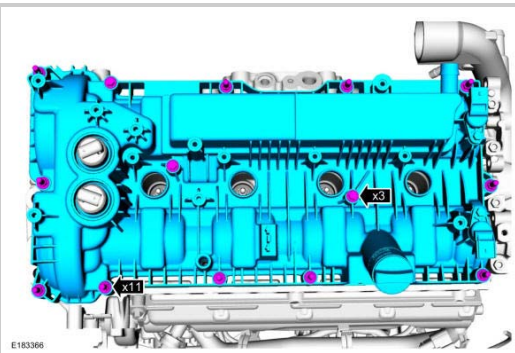
Remove the stud bolts and the high-pressure fuel pump drive unit.

54.



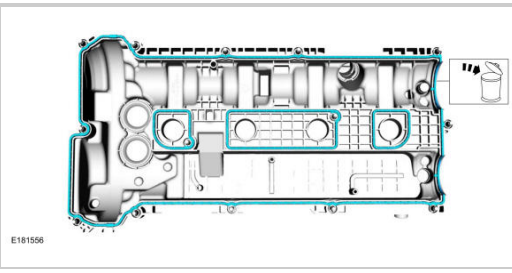
Remove and discard the CHT sensor.

NOTE: When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.



NOTE: Use compressed air to remove any foreign material from the ignition coil-on-plugs and surrounding area before removing the ignition coil-on-plugs.

55.
Remove the bolts, stud bolts and the ignition coil-on-plugs.



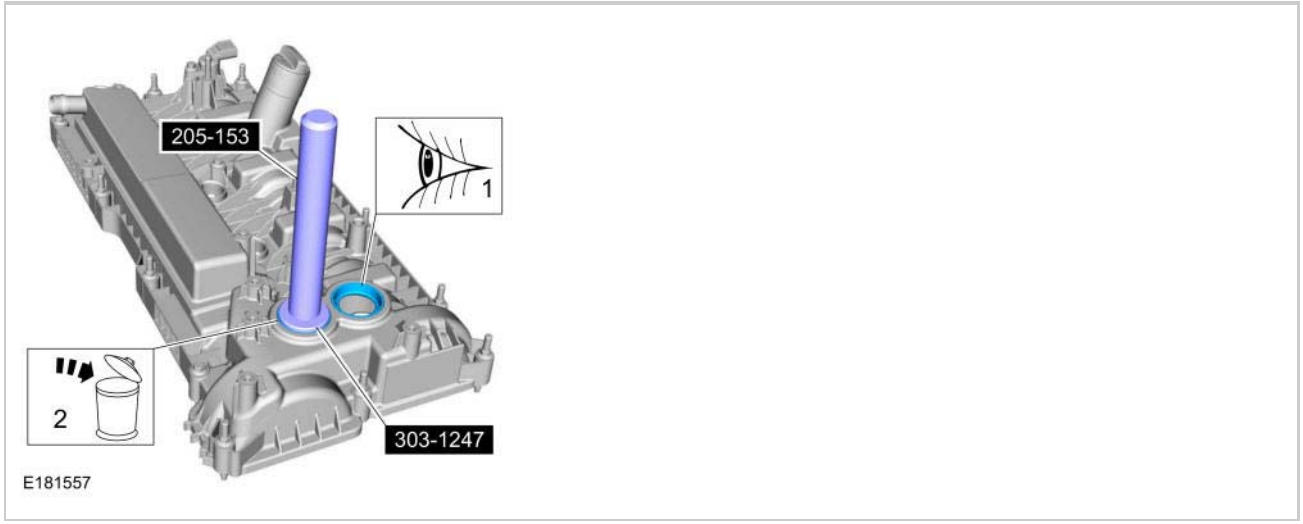
56.

Loosen the fasteners and remove the valve cover.

57.

Remove and discard the valve cover gasket.

58.



NOTE: The VCT oil control solenoid seals should only be replaced if they are damaged.

1.
Inspect the VCT oil control solenoid seals for damaged.

2.

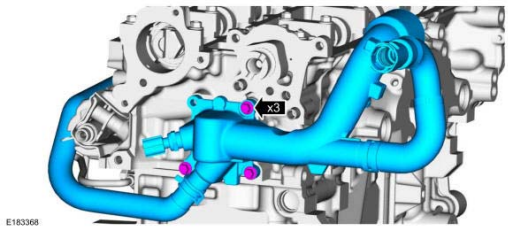
If damaged, using the special tools, remove the VCT oil control solenoid seals and discard.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

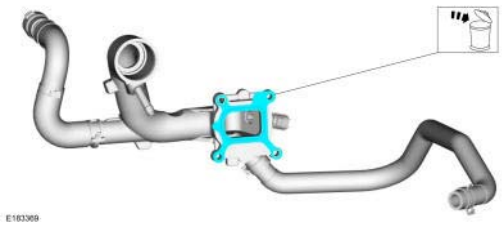
59.
Make sure that the mating faces are clean and free of foreign material.

60.



Disconnect the coolant tube and the retainers.

Use the General Equipment: Hose Clamp Remover/Installer

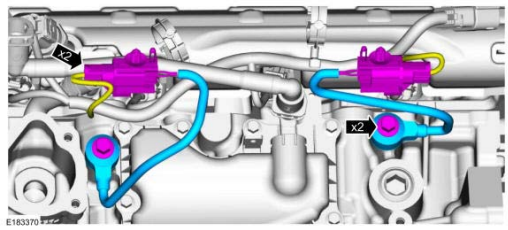


61.

Remove the bolts and the coolant outlet.

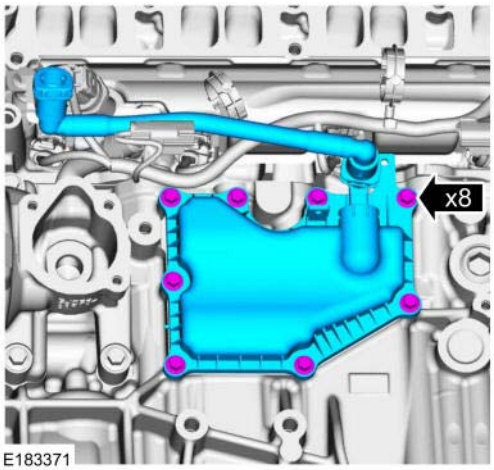
62.

Remove and discard the coolant outlet gasket.



63.

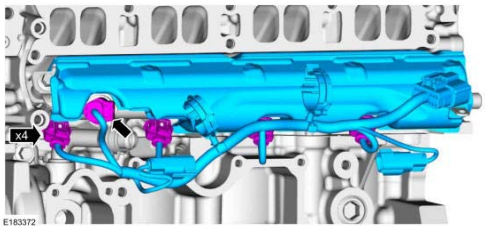
Disconnect the KS electrical connectors.



> *NOTE: Note the position of the KS for installation.*

Remove the bolts and the KS.

64.



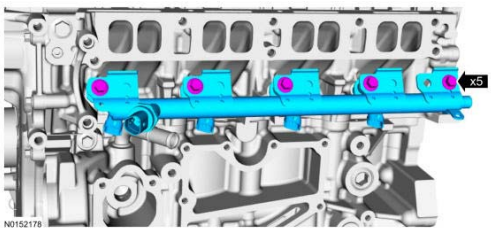
Remove the bolts and the crankcase vent separator.

65.

Remove the fuel rail shield.

Disconnect the fuel injectors and FRP sensor electrical connectors.

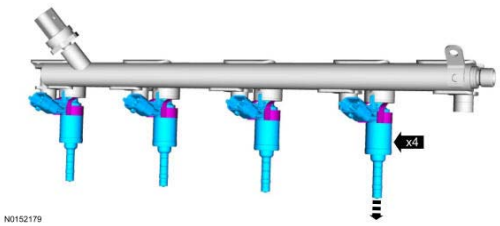
NOTE: Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.



NOTE: Use compressed air and remove any dirt or foreign material from the cylinder head, block and general surrounding area of the fuel rail and injectors.

NOTE: When removing the fuel rails, the fuel injectors may remain in the fuel rails but normally remain in the cylinder head and require the use of a Fuel Injector Remover tool to extract.

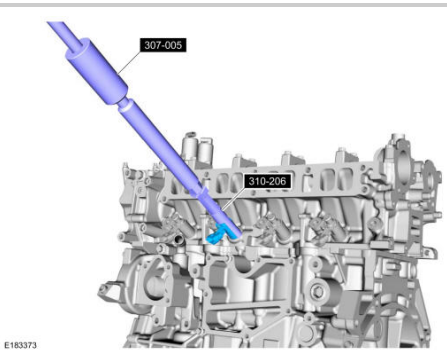
66.



Remove the bolts and the fuel rail.

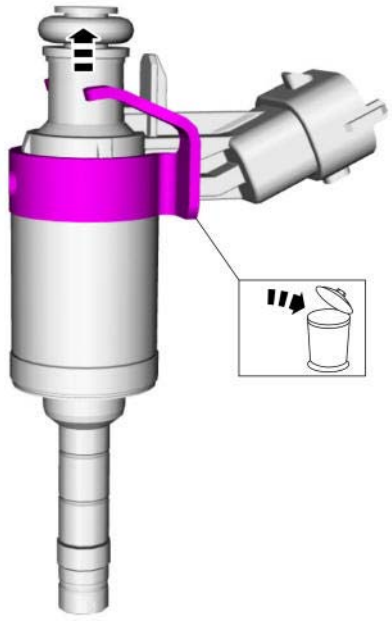
Discard the bolts.

67.



Remove any of the fuel injectors that remained in the fuel rail.

68.



Remove any of the fuel injectors that remained in the cylinder head.

Use Special Service Tool: 307-005 (T59L-100-B) Slide Hammer, 310-206 Remover, Fuel Injector.

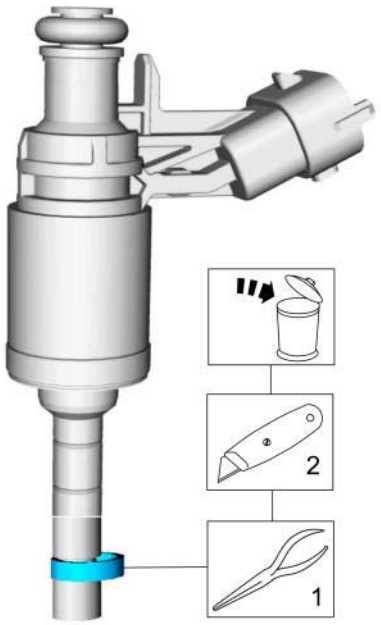
69.

Remove the fuel injector clip.

N0152181

NOTE: Do not attempt to cut the lower Teflon® seal without first pulling it away from the fuel injector or damage to the injector may occur.

NOTE: Be very careful when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.

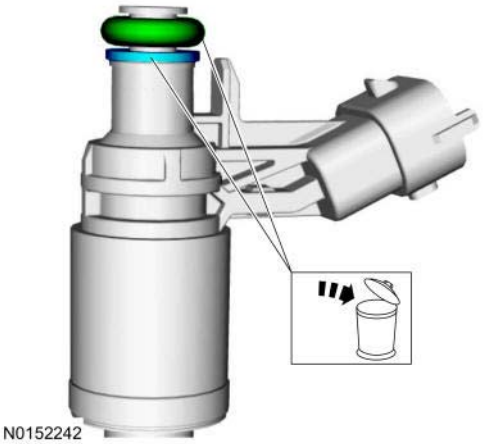


70.

1.

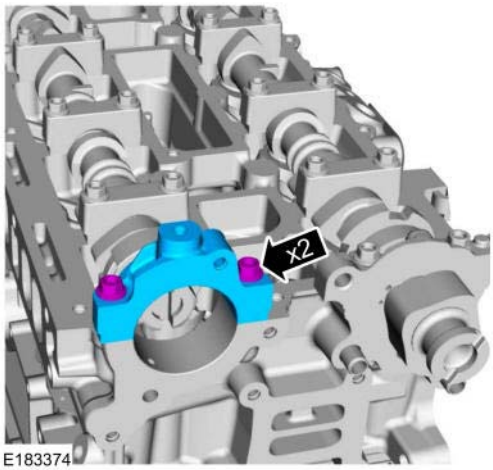
Pull the lower Teflon® seal away from the injector.

2.



Carefully cut and discard the lower fuel injector Teflon® seals.

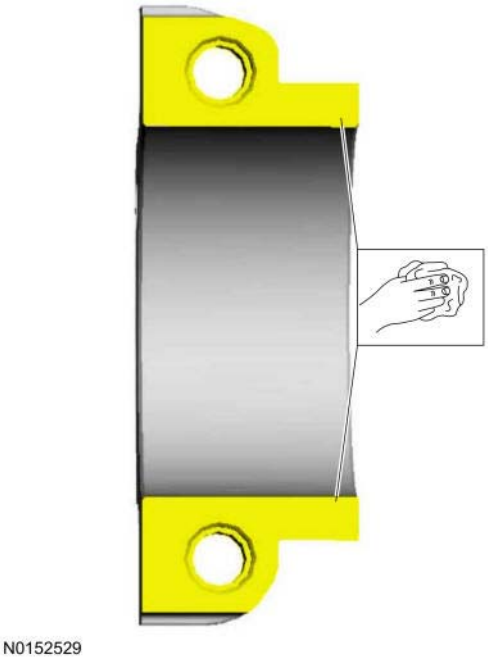
N0152241



71.

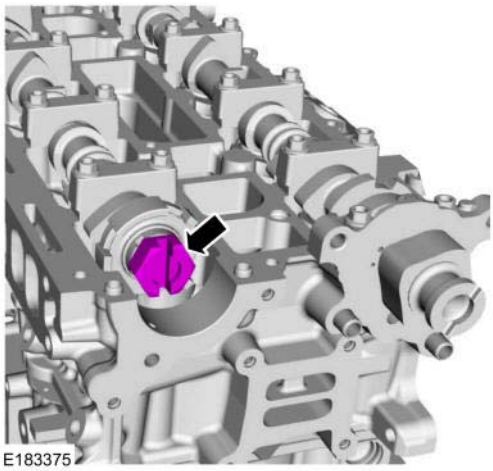
Remove and discard the fuel injector seal and O-ring seal.

N0152242



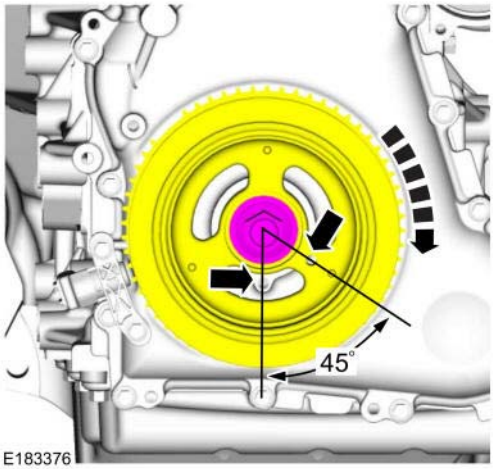
72.

Remove the bolts and camshaft rear bearing cap.



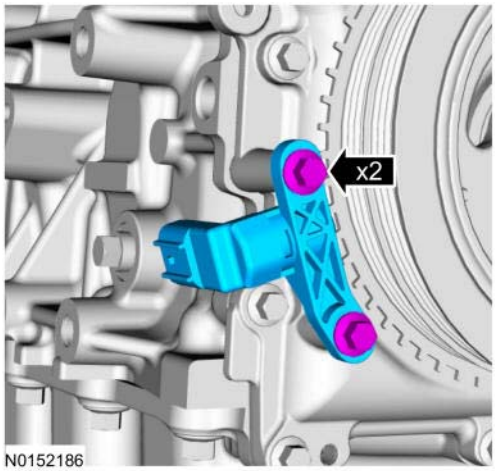
73.

Clean the camshaft rear bearing cap.



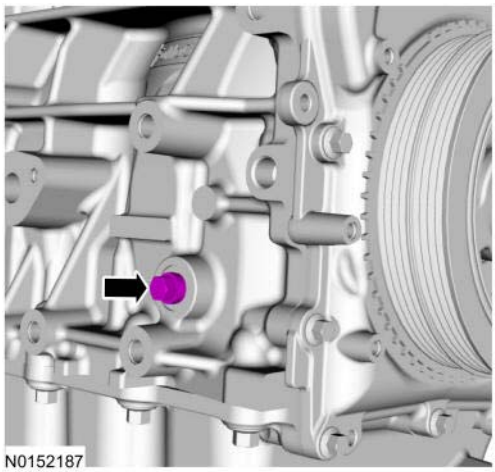
74.

Remove the camshaft drive adapter.



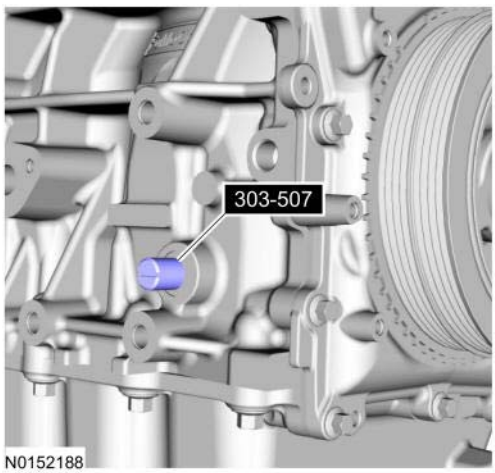
75.

Turn the crankshaft clockwise until the No. 1 piston is 45 degrees BTDC using the guide holes on the engine front cover and the crankshaft pulley.



76.

Remove the bolts and the CKP sensor.

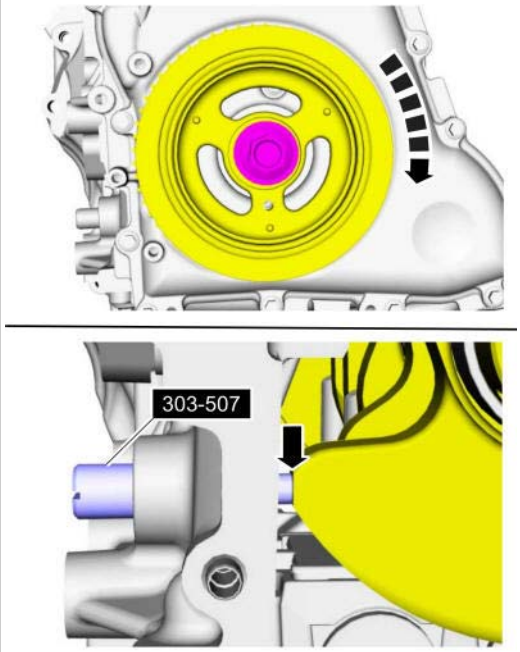


77.

Remove the engine plug bolt.

78.

Install Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

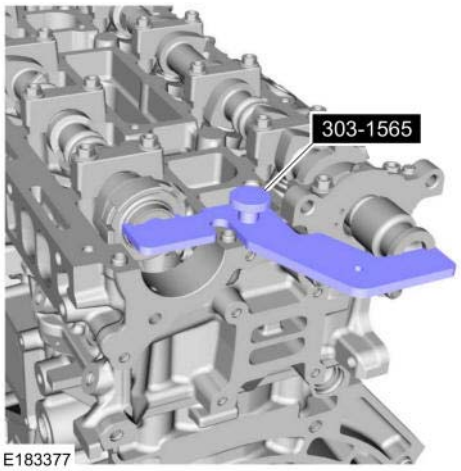


NOTE: The special tool will contact the crankshaft and prevent it from turning past TDC. However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the crankshaft pulley removal and installation.

NOTE: The engine front cover is removed from graphic for clarity.

79.
Rotate the crankshaft clockwise until it contacts the special tool.

Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.



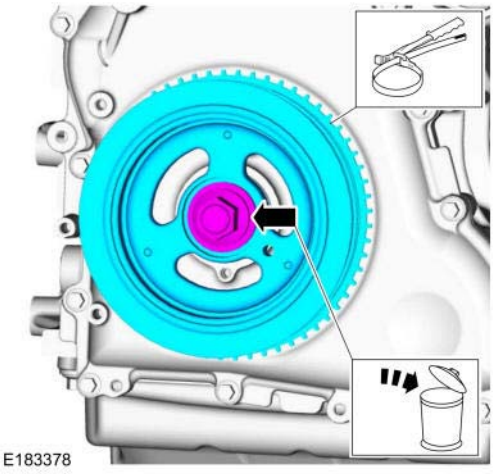
NOTE: The Camshaft Alignment Tool is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.

NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Tool cannot be installed, remove the TDC Timing Peg and rotate the crankshaft three-fourths of a revolution clockwise and repeat the previous 2 steps of this procedure.

80.
Tighten the retainer

Install Special Service Tool: 303-1565 Alignment Tool, Camshaft.

NOTE: The crankshaft must remain in the TDC position during removal of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Strap Wrench and the bolt should be removed using an air impact wrench (1/2-in drive minimum).

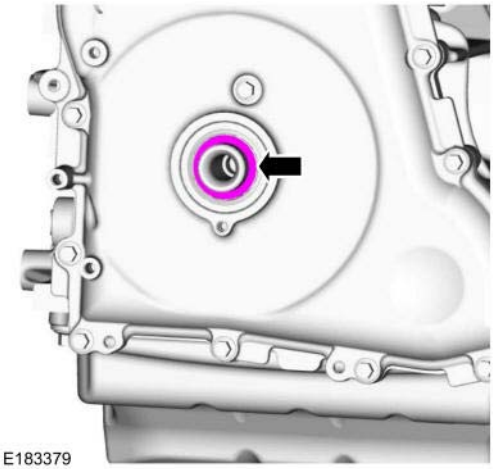


NOTE: The crankshaft sprocket diamond washer may come off with the crankshaft pulley.

81.

Using a strap wrench, remove the bolt and the crankshaft pulley.

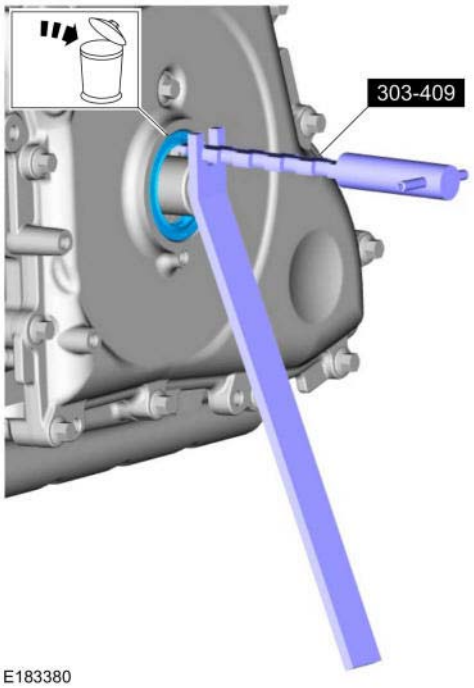
Use the General Equipment: Strap Wrench



Discard the bolt and washer.

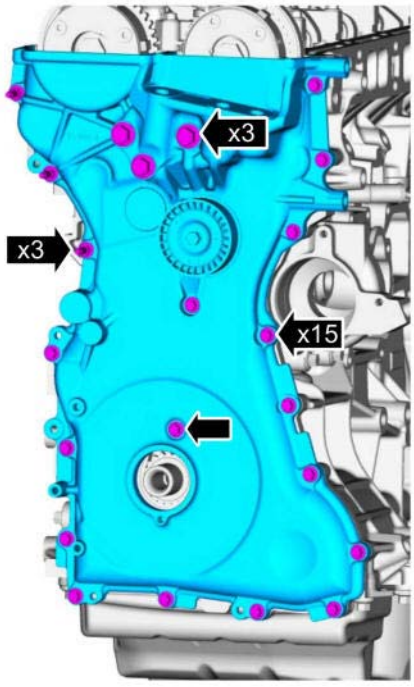
NOTE: The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer should be cleaned and inspected for any damage. If

damage is evident, replace the diamond washer. If no damage, the diamond washer is to be reused during installation. If the diamond washer is not installed, engine damage may occur.



82.
If the diamond washer did not come off with the crankshaft pulley, remove the diamond washer.

NOTE: Use care not to damage the engine front cover or the crankshaft when removing the seal.



83.
Using the crankshaft seal remover, remove the crankshaft front seal and discard.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.

84.

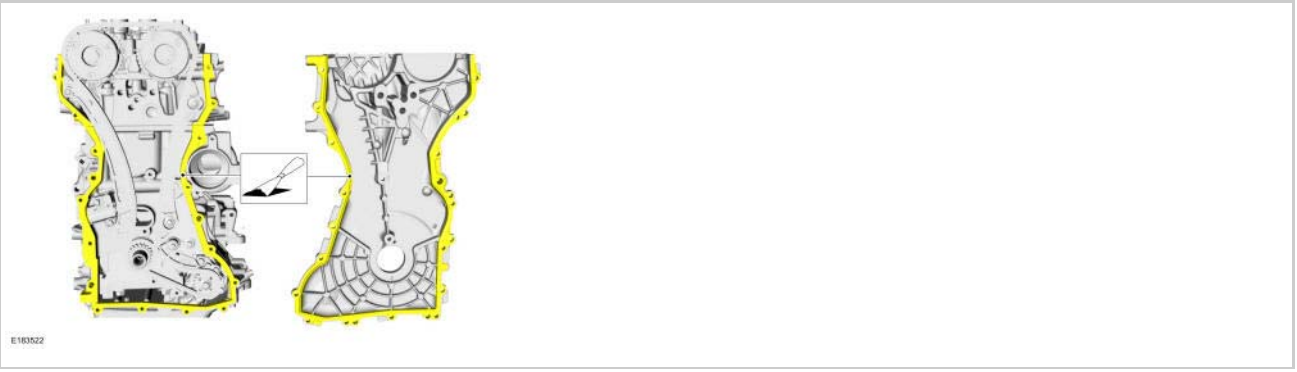
Remove the bolts and the engine front cover.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of silicone sealant.

85.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

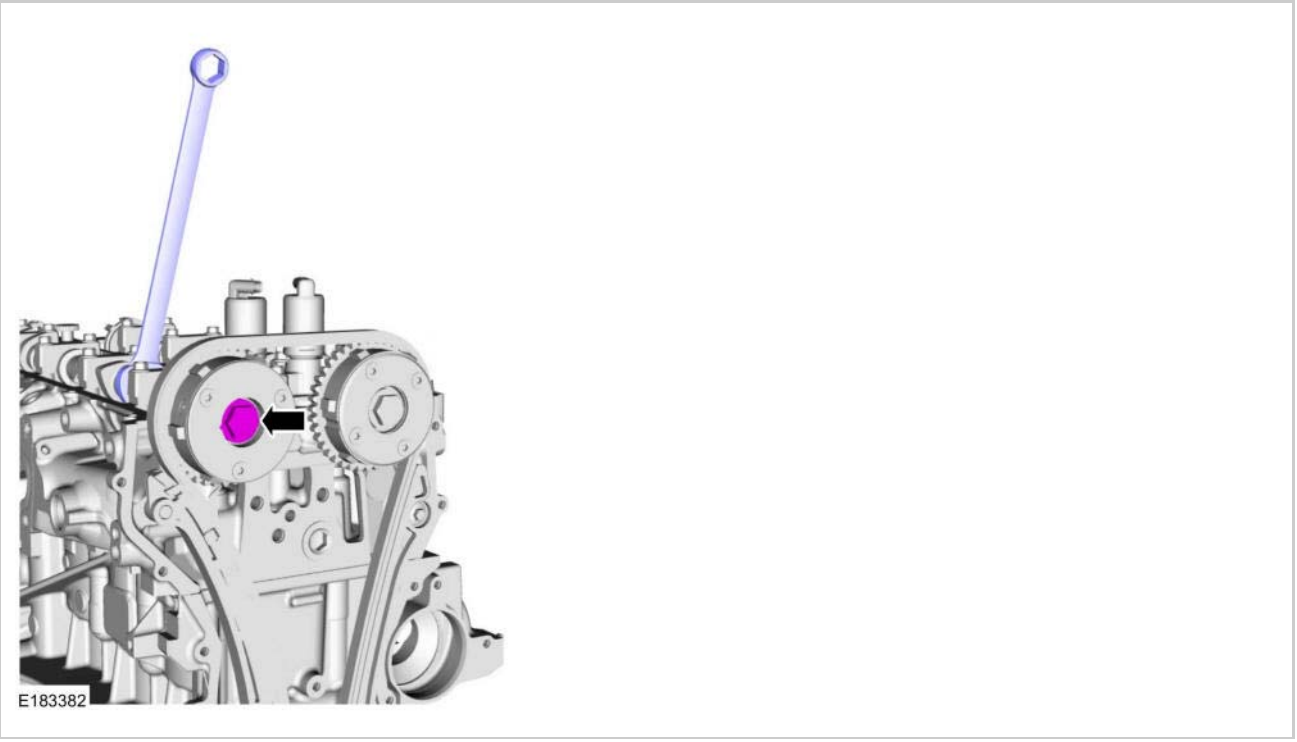
Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

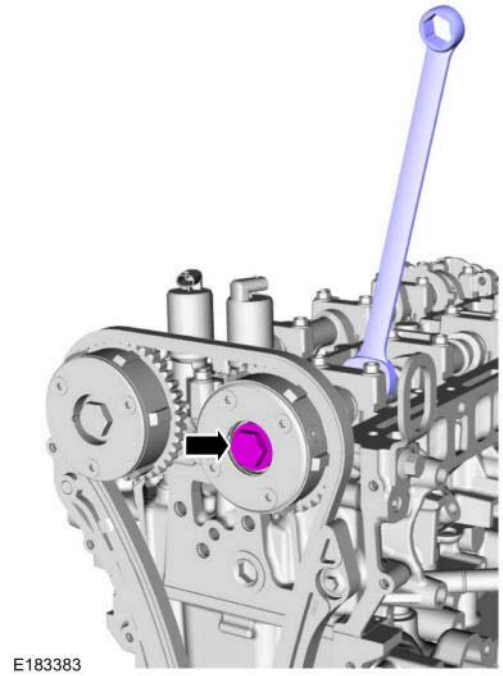
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



Material

: Motorcraft® Metal Surface Prep / ZC-31-B



NOTE: Use an open-ended wrench to prevent the component from turning.

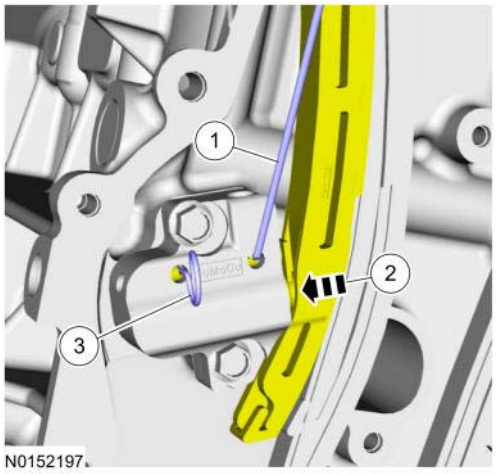
86.
Loosen the bolt for the exhaust VCT unit.

NOTE: Use an open-ended wrench to prevent the component from turning.

87.
Loosen the bolt for the intake VCT unit.

88.

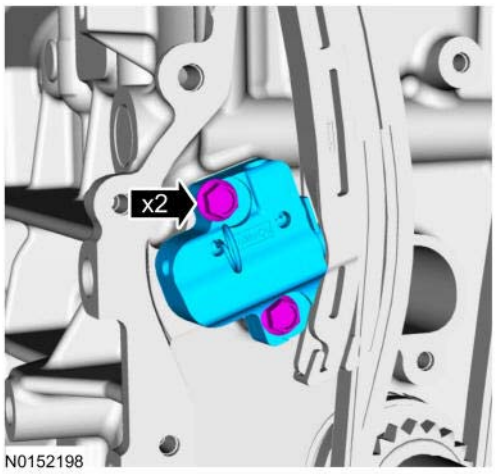
1.



Using a small pick, release and hold the ratchet mechanism.

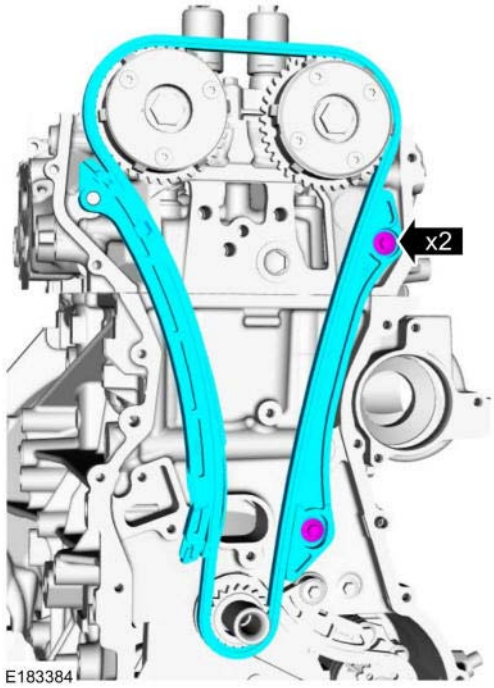
2.

While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.



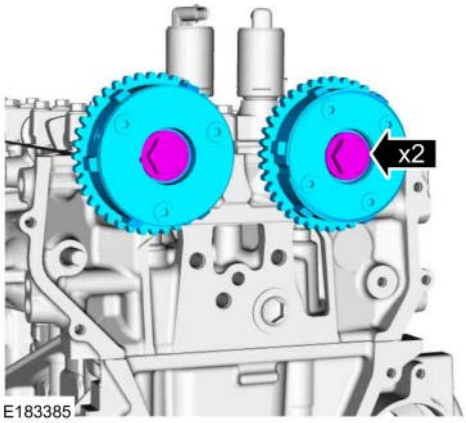
3.

Insert a holding pin into the hole to retain the tensioner.



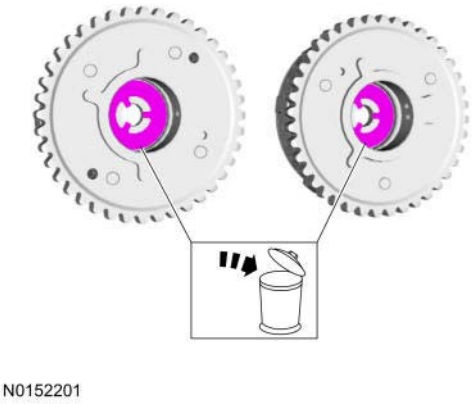
89.

Remove the bolts and the timing chain tensioner.



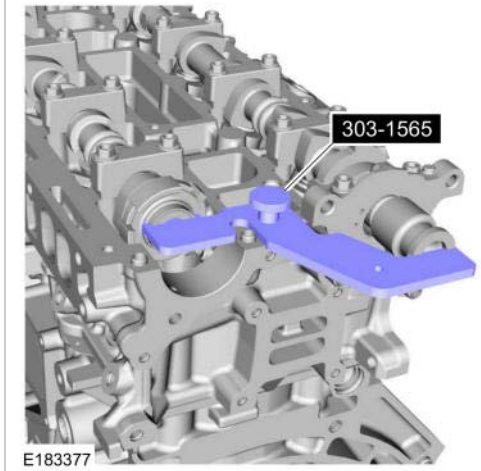
90.

Remove the bolts and the timing chain guide, timing chain and tensioner arm.



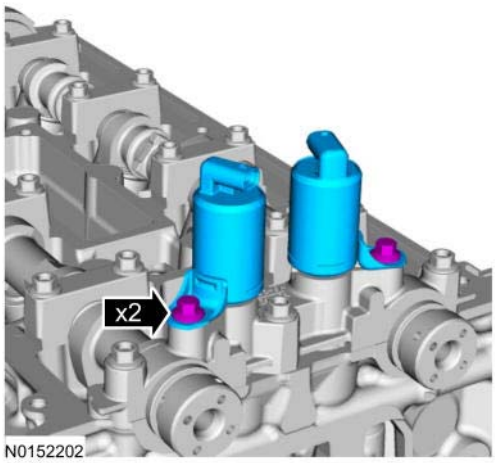
91.

Remove the bolts and the VCT units.



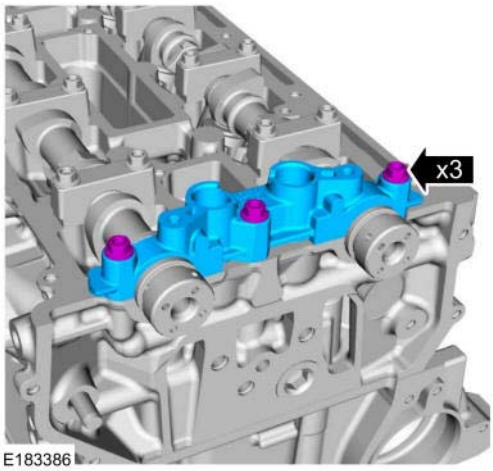
NOTE: Washers are not required for installation of the VCT units.

92.
If equipped, discard the washers.



93.

Remove Special Service Tool: 303-1565 Alignment Tool, Camshaft.

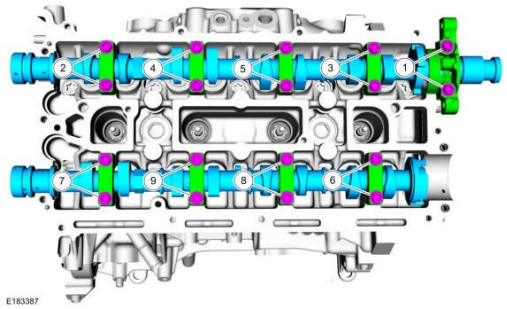


94.

Remove the bolts and the VCT oil control solenoids.

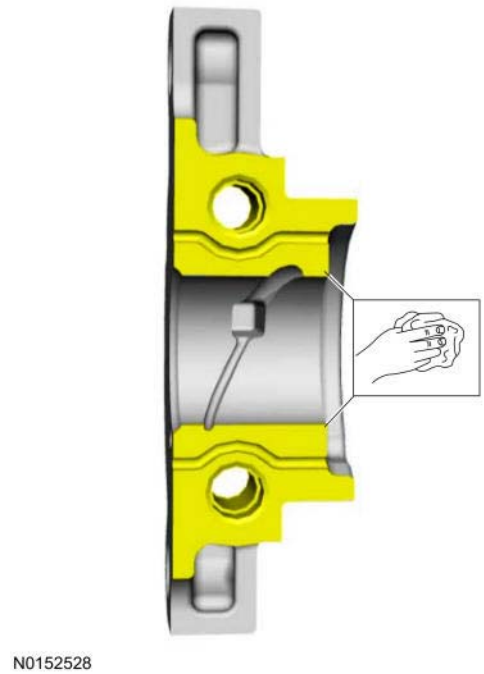
95.

Remove bolts and front camshaft bearing cap.



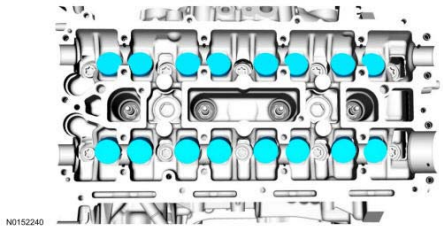
NOTE: Failure to follow the camshaft loosening procedure can result in damage to the camshafts.

NOTE: Note the location and orientation of each camshaft bearing cap and the position of the camshaft lobes on the No. 1 cylinder for installation reference.



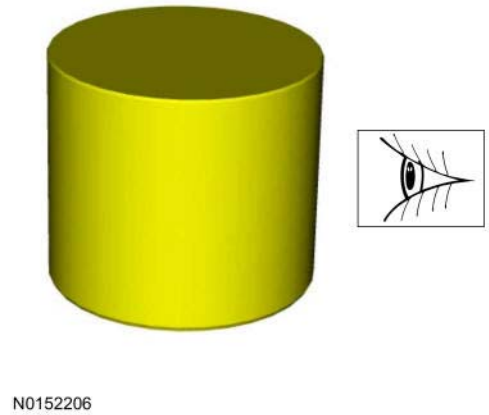
NOTE: Inspect the camshaft bores for any scratches that can be felt by hand.

96.
Loosen the camshaft bearing caps in sequence 2 turns at a time until all tension is released from the camshaft bearing caps and remove the camshaft bearing caps and camshafts.



97.

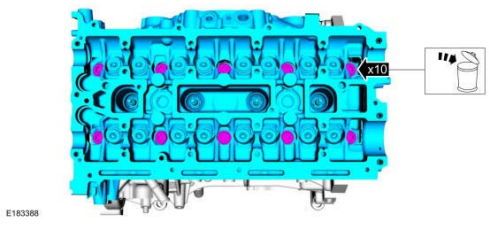
Clean the rear camshaft cap.



NOTE: If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

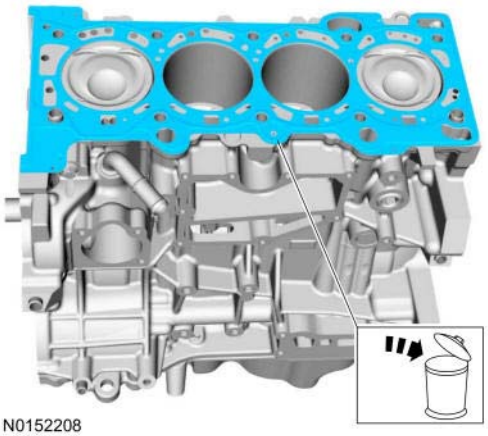
98.
Remove the valve tappets.

NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.



99.
Inspect the valve tappets.

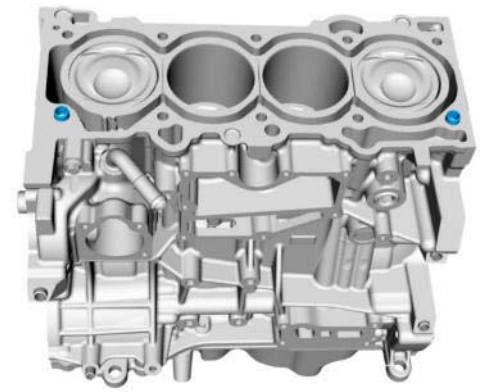
100.



Remove the bolts and the cylinder head.

Discard the bolts.

101.

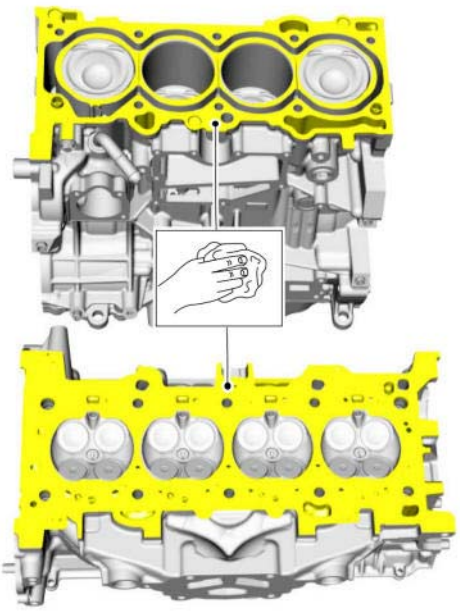


Remove and discard the cylinder head gasket.

N0152208

102.

Remove the cylinder block bushings.



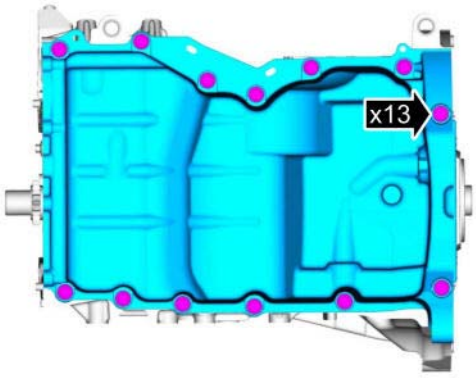
E175369

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

NOTE: Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

103.
Make sure that the mating faces are clean and free of foreign material.

E183389

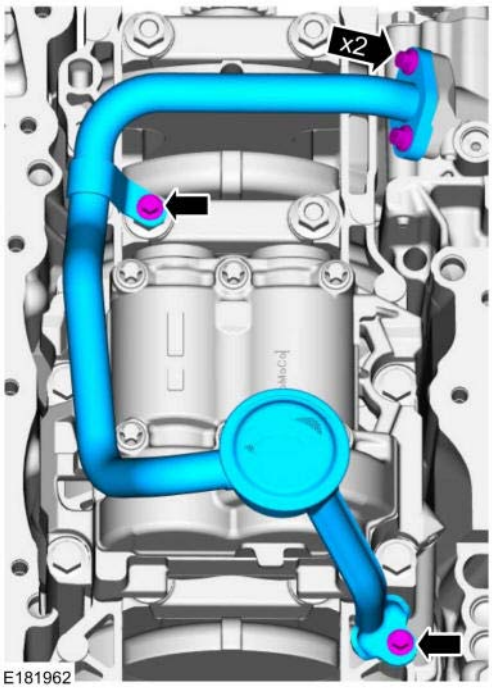


104.

Check the cylinder block distortion. Refer to: Cylinder Block Distortion .

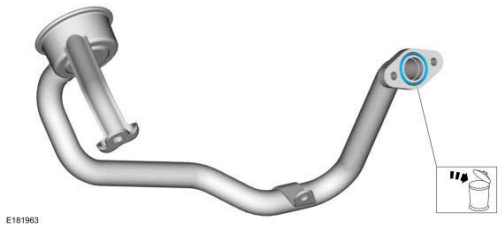
Check the cylinder head distortion. Refer to: Cylinder Head Distortion .

105.



Remove the bolts and the oil pan.

E183390



106.

Remove the bolts and the oil pump screen and pickup tube.

107.

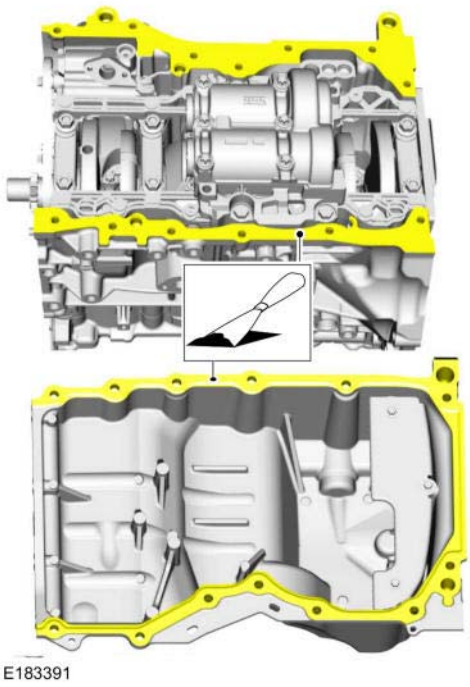
Remove and discard the oil pump screen and pickup tube gasket.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

108.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

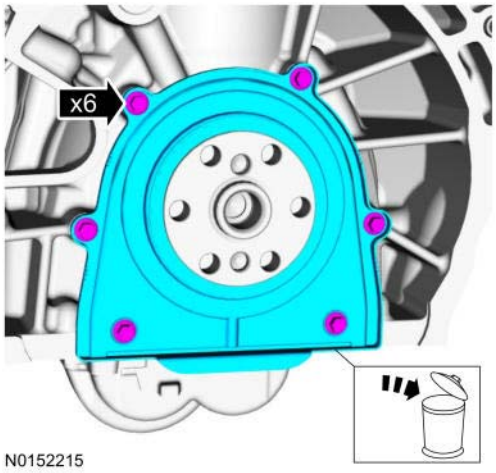
Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

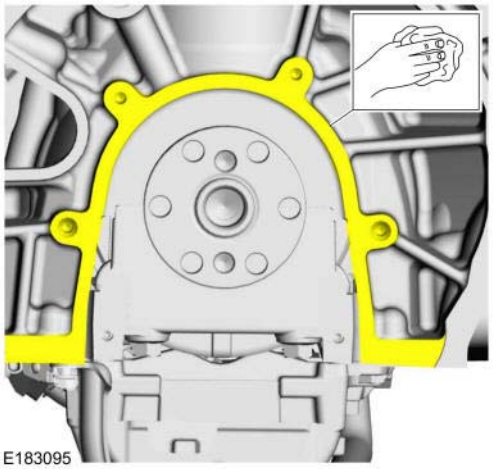


Material

: Motorcraft® Metal Surface Prep / ZC-31-B

E183391

109.

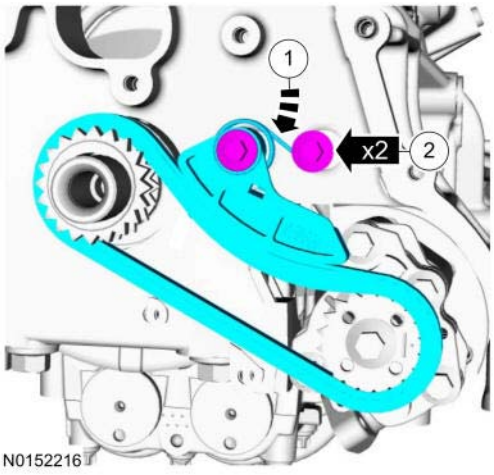


Remove the bolts and the crankshaft rear seal. Discard the crankshaft rear seal.

N0152215

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

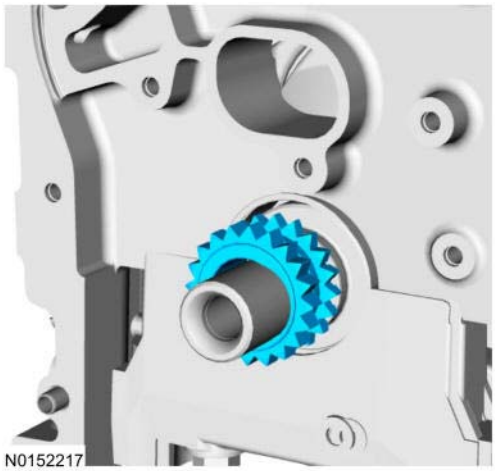
110.
Make sure that the mating faces are clean and free of foreign material.



111.

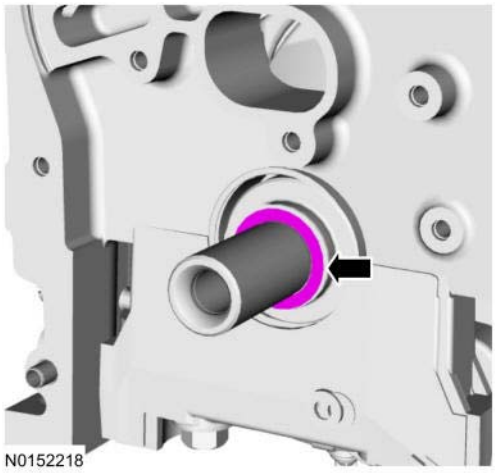
1.

Release the tension on the tensioner spring.



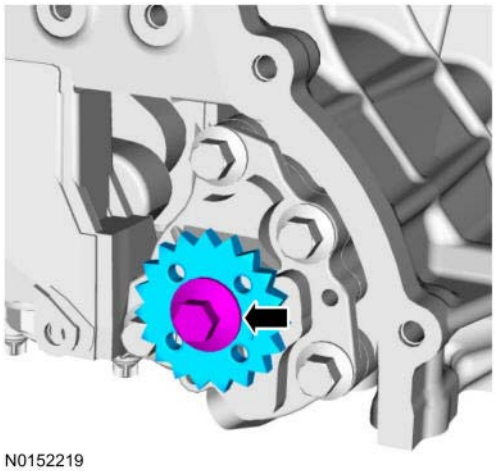
2.

Remove the shoulder bolts, tensioner and timing chain.



112.

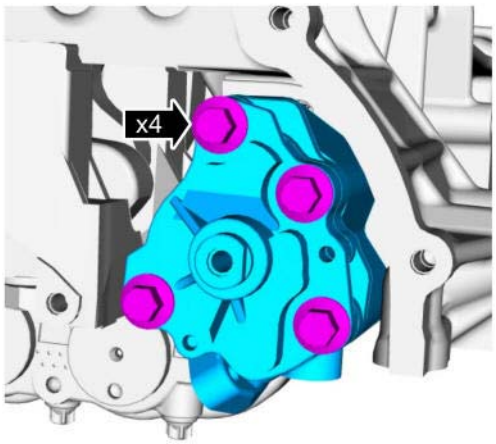
Remove the crankshaft sprocket.



NOTE: The diamond washer should be cleaned and inspected for any damage. If damage is evident, replace the diamond washer. If no damage, the diamond washer is to be reused during installation. If the diamond washer is not installed, engine damage may occur.

113.
Remove the diamond washer.

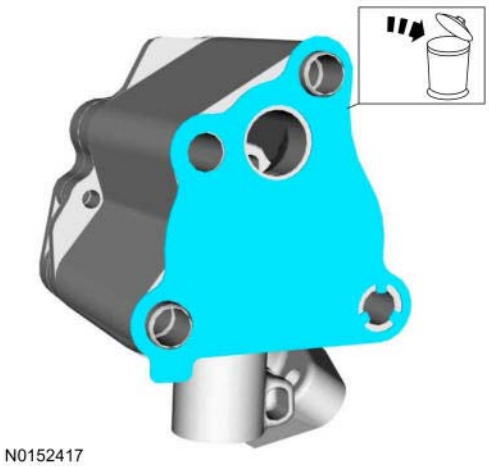
114.



Remove the bolt and oil pump sprocket.

N0152219

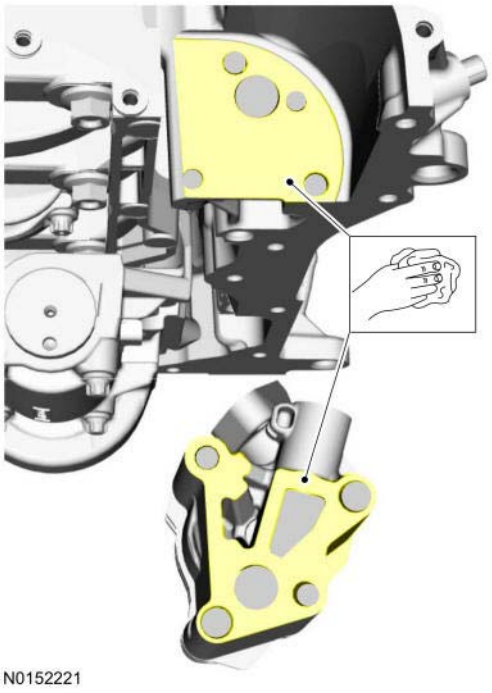
115.



Remove the bolts and the oil pump.

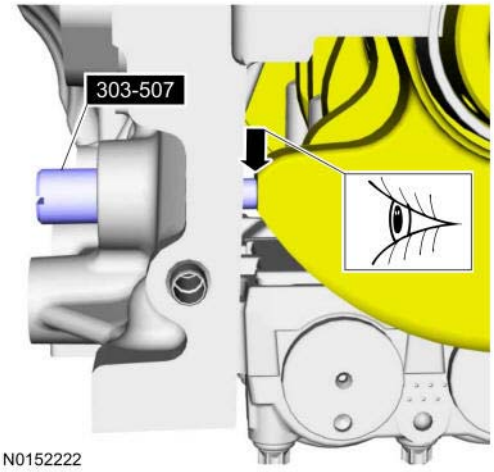
N0152220

116.



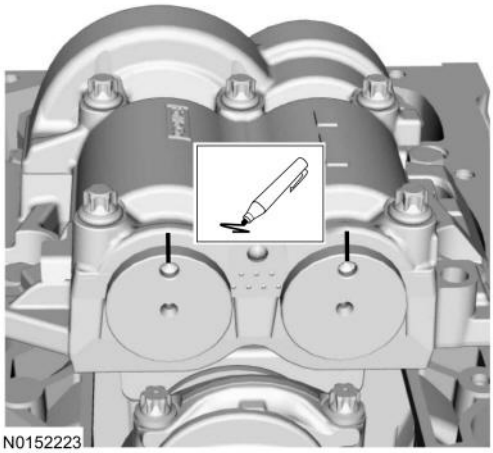
Remove and discard the oil pump gasket.

N0152417



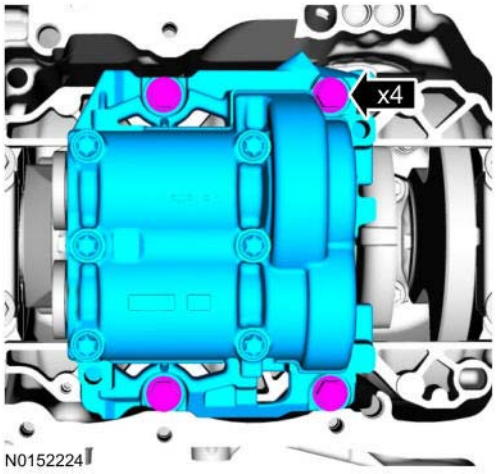
117.

Make sure that the mating faces are clean and free of foreign material.



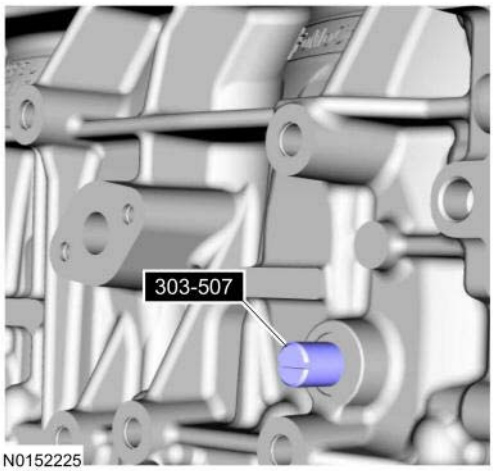
NOTE: Make sure the Crankshaft TDC Timing Peg is still installed and the engine is still at TDC.

118.
Rotate the crankshaft until it contacts the special tool.



NOTE: Mark the balance shaft assembly front shafts on the top for reference that the balance shaft assembly is at TDC.

119.
Index-mark the balance shaft assembly.

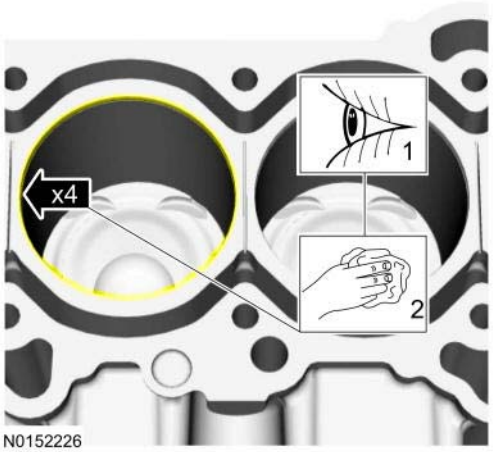


NOTE: Due to the precision interior construction of the balance shaft assembly, it should not be disassembled.

120.
Remove the bolts and the balance shaft assembly.

121.

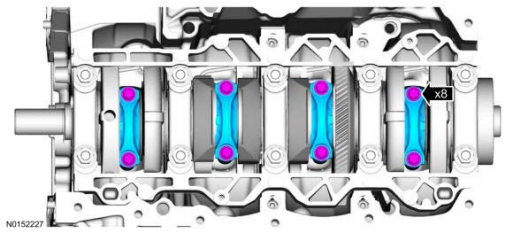
Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.



122.

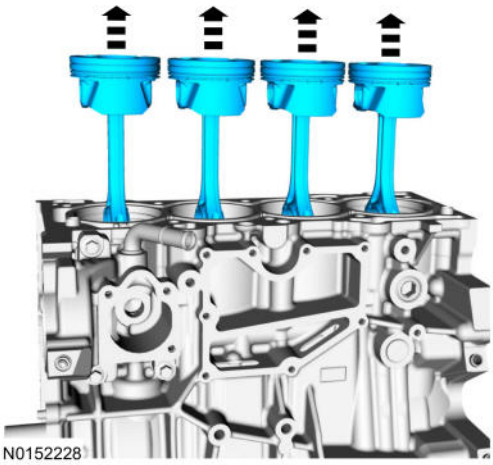
1.

Inspect ridge.



NOTE: Remove the carbon buildup, do not scratch the cylinder wall. Remove all debris from the cylinder.

2.
Clean with abrasive pad.

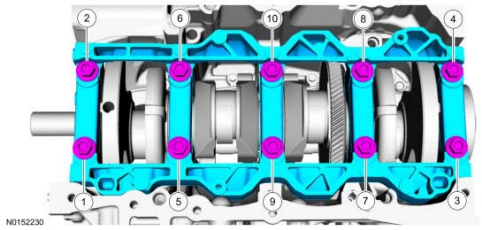


NOTE: Clearly mark the connecting rods, connecting rod caps and connecting rod bearings in numerical order for correct orientation for reassembly.

123.
Remove the bolts and the connecting rod caps.

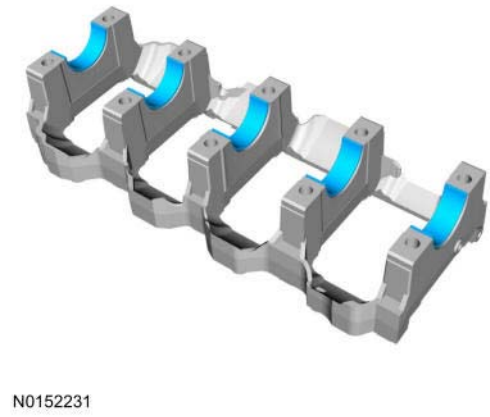
NOTE: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.

124.
Remove the pistons.



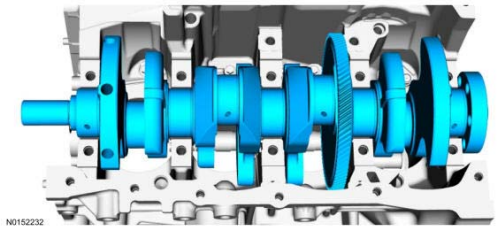
NOTE: Mark the position of the parts, so they can be installed in their original positions.

125.
Remove the connecting rod bearings. Refer to: Piston Inspection .



126.

Remove the bolts and the main bearing beam.

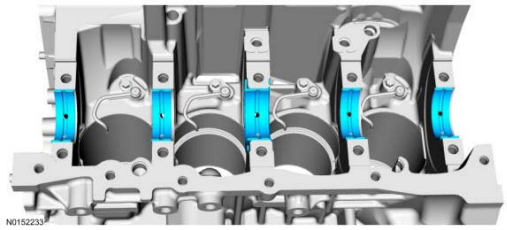


NOTE: If the main bearings are being reused, mark them in order for correct orientation and reassembly.

127.
Remove the main bearing beam bearings.

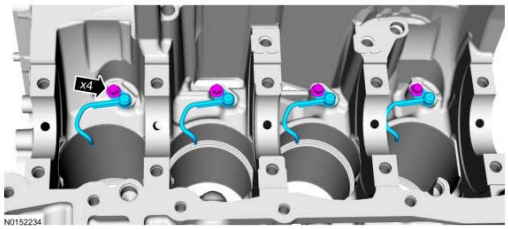
128.

Remove the crankshaft.



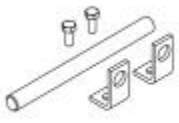
NOTE: The center bulkhead has the thrust bearing.

NOTE: If the main bearings are being reused, mark them in order for correct



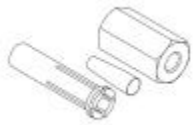
orientation and reassembly.

129.
Remove the crankshaft main bearings.



130.

Remove the bolts and the engine piston oil cooler valves.



DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD

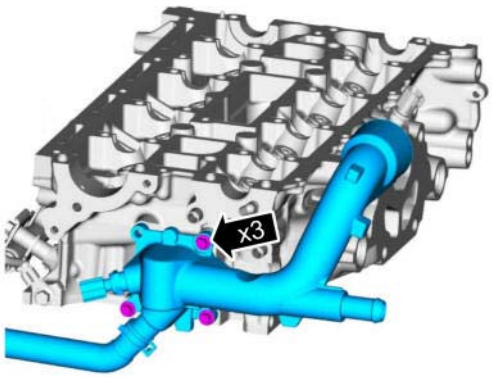
DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > DISASSEMBLY

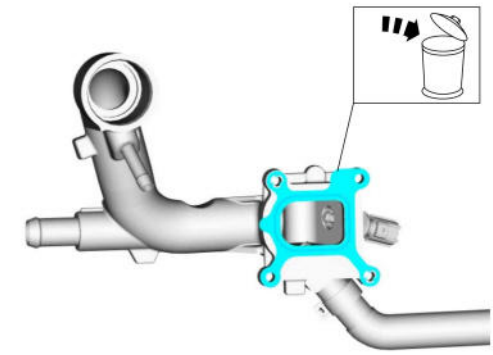


NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: If the components are to be reinstalled, mark the location of the components removed, they must be installed in the same location.

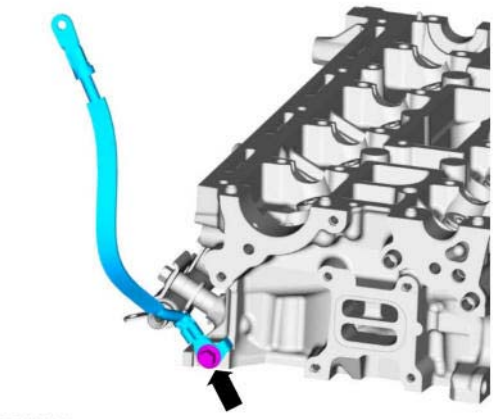
1.



Remove the bolts and coolant outlet.

E182945

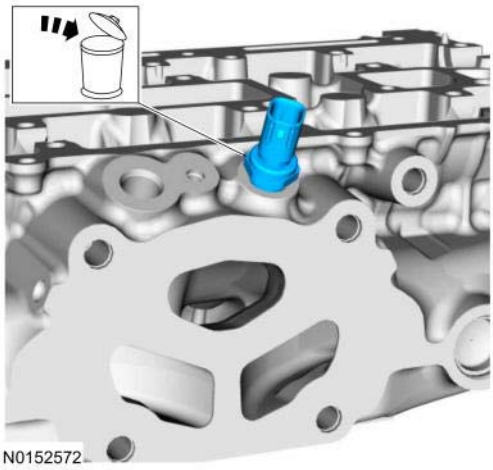
2.



Remove and discard the coolant outlet gasket.

E182946

3.



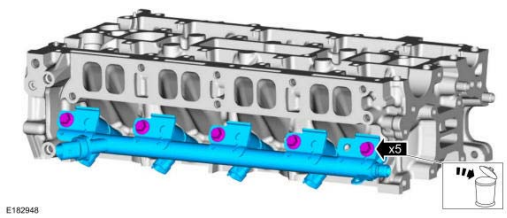
Remove the bolt and the ground wire.

E182947

4.

Remove and discard the CHT sensor.

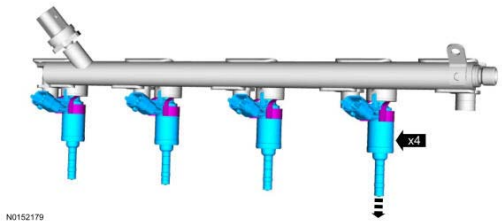
NOTE: Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.



NOTE: Use compressed air and remove any dirt or foreign material from the cylinder head, block and general surrounding area of the fuel rail and injectors.

NOTE: When removing the fuel rails, the fuel injectors may remain in the fuel rails but normally remain in the cylinder head and require the use of a Fuel Injector Remover tool to extract.

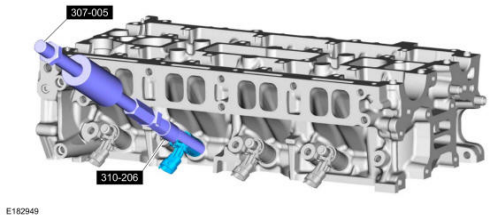
5.



Remove the bolts and the fuel rail.

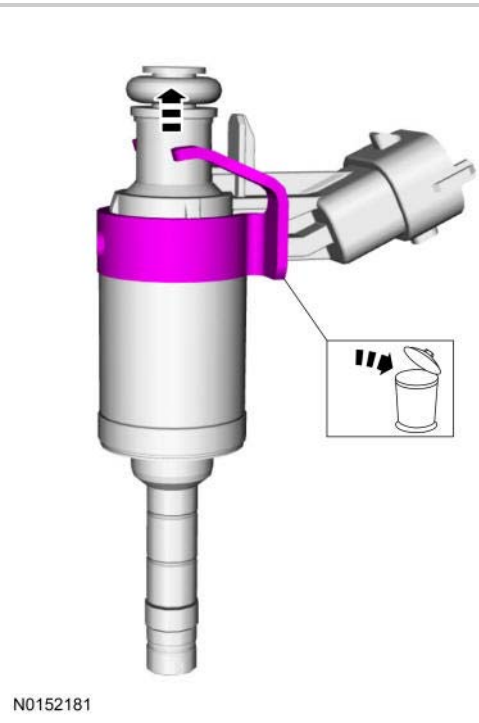
Discard the bolts.

6.



Remove any of the fuel injectors that remained in the fuel rail.

7.



Remove any of the fuel injectors that remained in the cylinder head.

Use Special Service Tool: 310-206 Remover, Fuel Injector, 307-005 (T59L-100-B) Slide Hammer.

8.

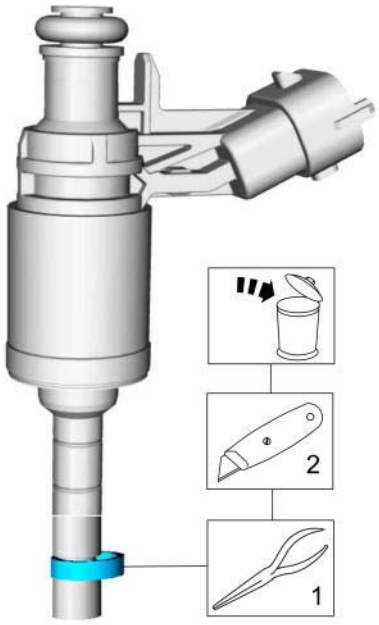
Remove the fuel injector clip.

NOTE: Do not attempt to cut the lower Teflon® seal without first pulling it away from the fuel injector or damage to the injector may occur.

NOTE: Be very careful when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.

9.

1.

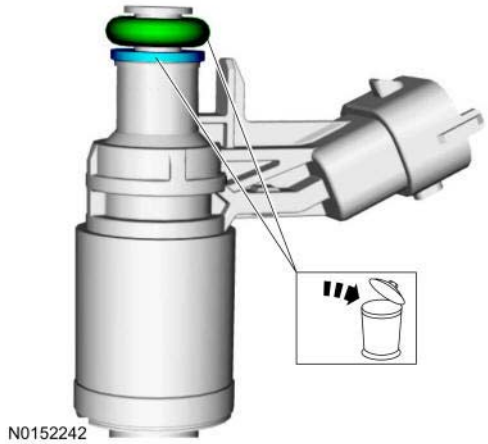


Pull the lower Teflon® seal away from the injector.

Use the General Equipment: Long Nose Pliers

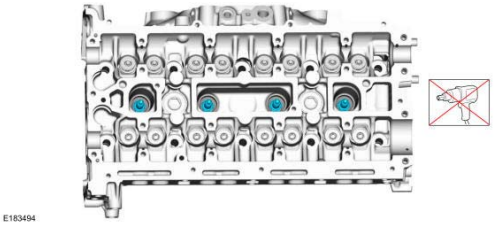
2.

Carefully cut and discard the lower fuel injector Teflon® seals.



Use the General Equipment: Knife

N0152241

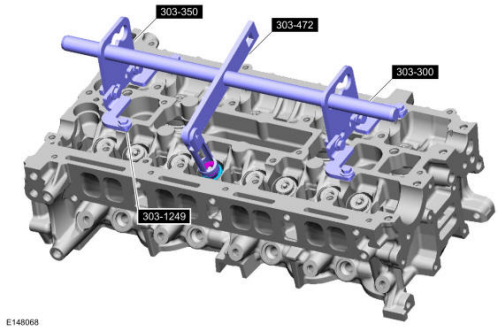


10.

Remove and discard the fuel injector seal and O-ring seal.

NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

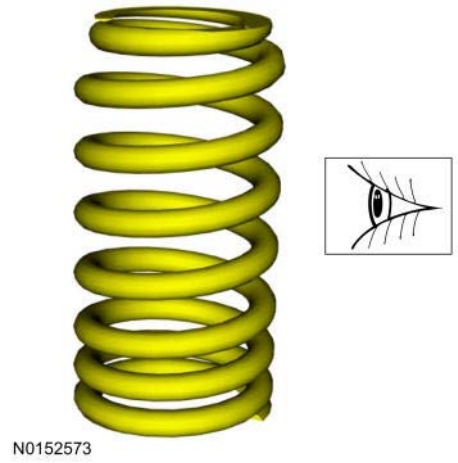
11.
Remove the spark plugs.



NOTE: Use a small screwdriver and multi-purpose grease to remove the valve collets.

12.
Using the special tools, remove the valve collet, valve spring retainer and the valve spring.

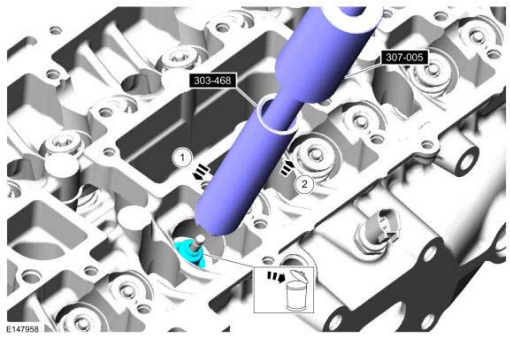
Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350 (T89P-6565-A) Compressor, Valve Spring, 303-472 (T94P-6565-AH) Adapter, Valve Spring Compressor, 303-1249 Valve Spring Compressor.



Material

: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

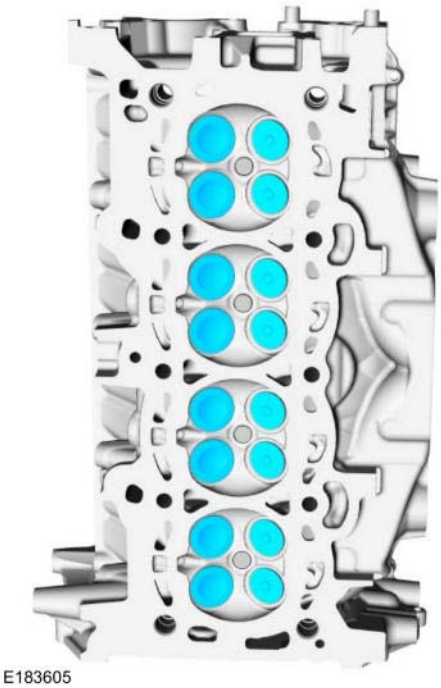
13.



Inspect and install new parts, as necessary.

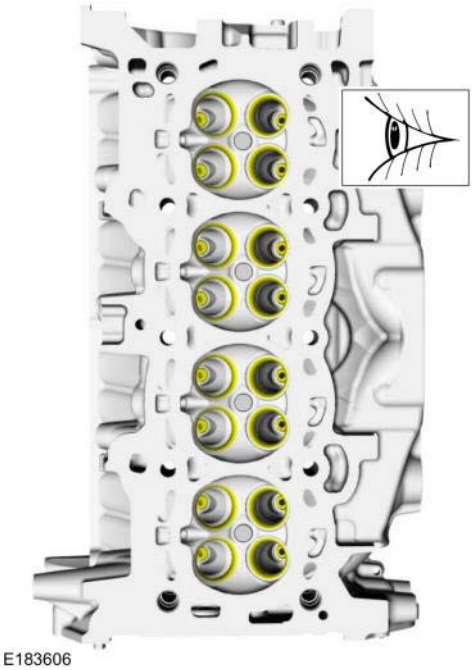
14.

Using the special tool, remove the valve seals.



Use Special Service Tool: 303-468 (T94P-6510-AH) Remover, Valve Stem Oil Seal, 307-005 (T59L-100-B) Slide Hammer.

NOTE: Note the location of the valves if they are to be reused.



15.

Remove the intake and exhaust valves.

E183605

16.

Inspect the intake and exhaust valves seats.

E183606

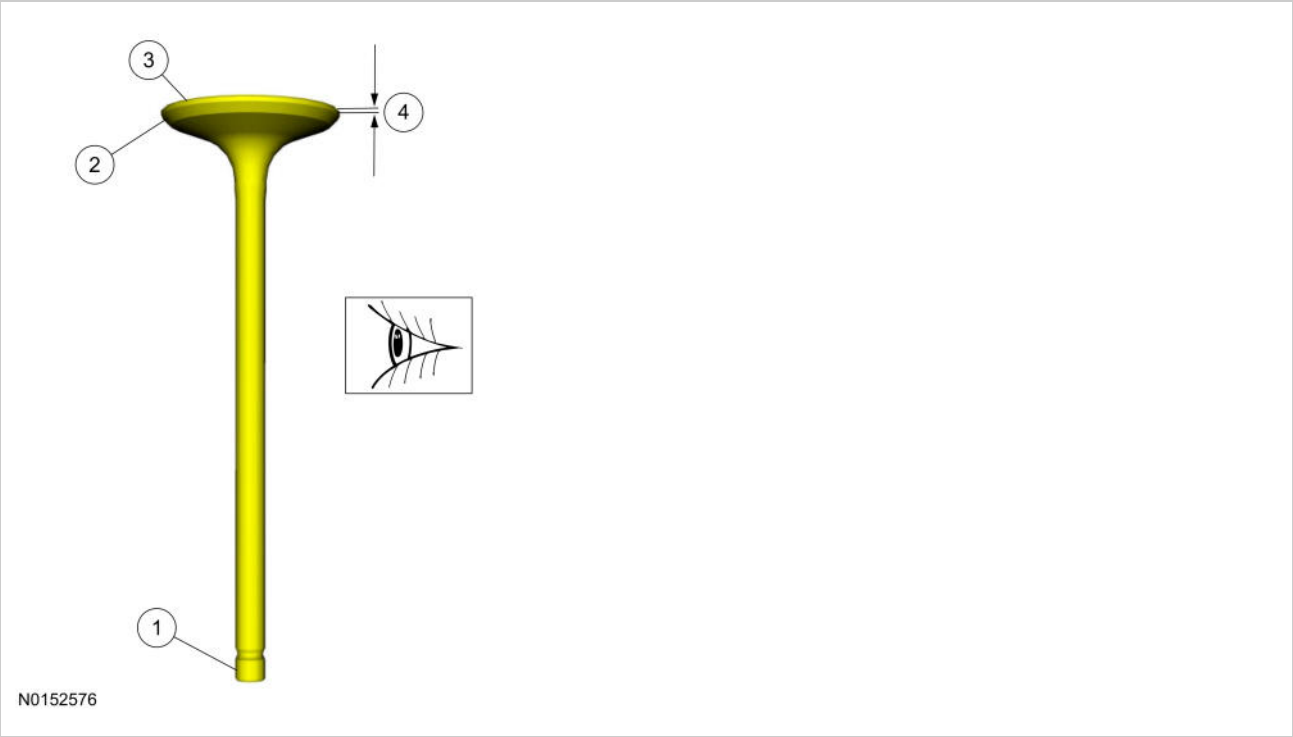
NOTE: Install new parts, as necessary.

17.

1.

Inspect the end of the stem for grooves or scoring.

2.



Inspect the valve face and the edge for pits, grooves or scores.

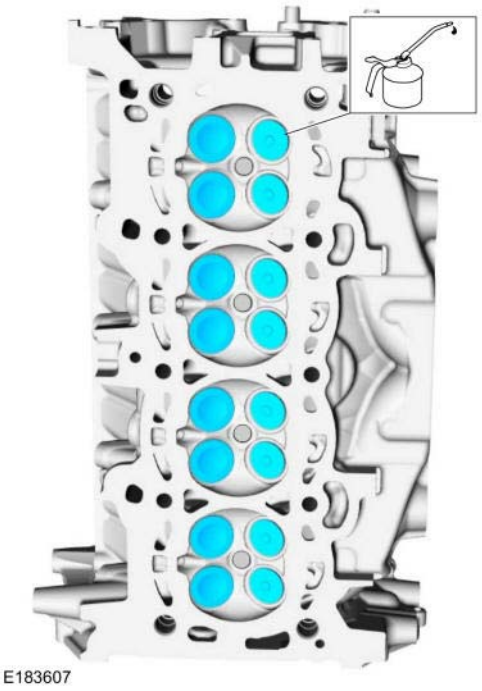
3.

Inspect the valve head for signs of burning, erosion, warpage and cracking.

4.

Inspect the valve margin for wear.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > ASSEMBLY



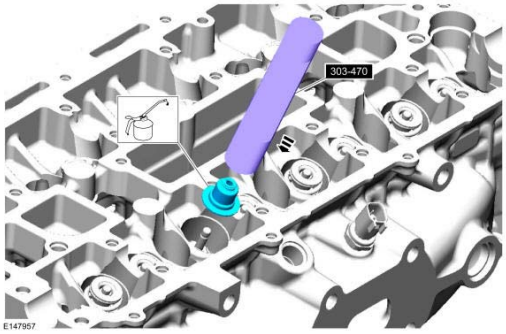
NOTE: If installing the original valves, make sure the valves are installed in the same position from which they were removed. Coat the valve stems with clean engine oil.

1.
Install the intake and exhaust valves.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.)

(WSS-M2C946-A)



2.

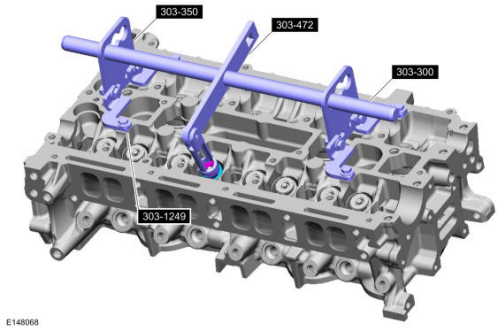
Using the special tool, install the valve seals.

Use Special Service Tool: 303-470 (T94P-6510-CH) Installer, Valve Stem Oil Seal.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

NOTE: Use a small screwdriver and multi-purpose grease to install the valve collets. Check the seating of the valve collet.



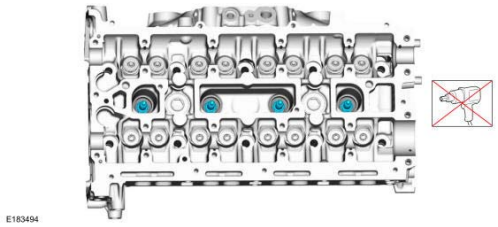
3.
Using the special tools, install the valve spring, valve spring retainer and the valve collet.

Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350

(T89P-6565-A) Compressor, Valve Spring, 303-472 (T94P-6565-AH) Adapter, Valve Spring Compressor, 303-1249 Valve Spring Compressor.

Material

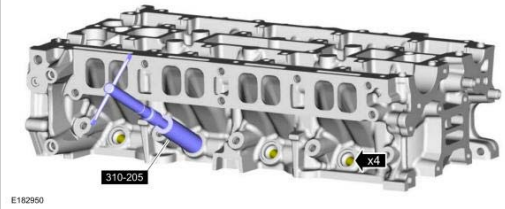
: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)



NOTE: If a spark plug is dropped, internal damage may result and the spark plug must be discarded. The use of a damaged spark plug may cause cylinder misfire resulting in engine damage.

4.
Install the spark plugs.

Torque



: 106 lb.in (12 Nm)

NOTE: Do not use compressed air or the Fuel Injector Brush to clean the tip of the fuel injectors. Failure to follow this instruction may result in damage to the fuel injectors.

NOTE: Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and the general surrounding area of the fuel rails and injectors.

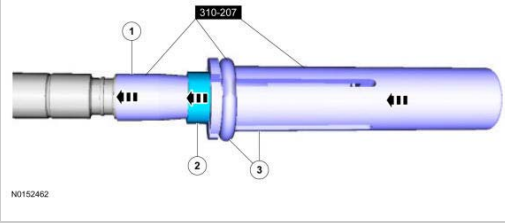
5.
Using the special tool, clean the fuel injector bores. Use Special Service Tool: 310-205 Fuel Injector Brush.

NOTE: Do not lubricate the new lower Teflon® fuel injector seals.

6.

1.

Install the special tool. Use Special Service Tool: 310-207 Installer, Fuel Injector Seal Assembly.



NOTE: Once the Teflon® seal is installed on the Teflon® Seal Guide, it should immediately be installed onto the fuel injector to avoid excessive expansion of the Teflon® seal.

2.
Make sure that new lower fuel injector Teflon® seals are installed.

Use Special Service Tool: 310-207 Installer, Fuel Injector Seal Assembly.

3.

Using the Pusher Tool, slide the Teflon® seals off of the Teflon® Seal Guide and into the groove on the fuel injectors.

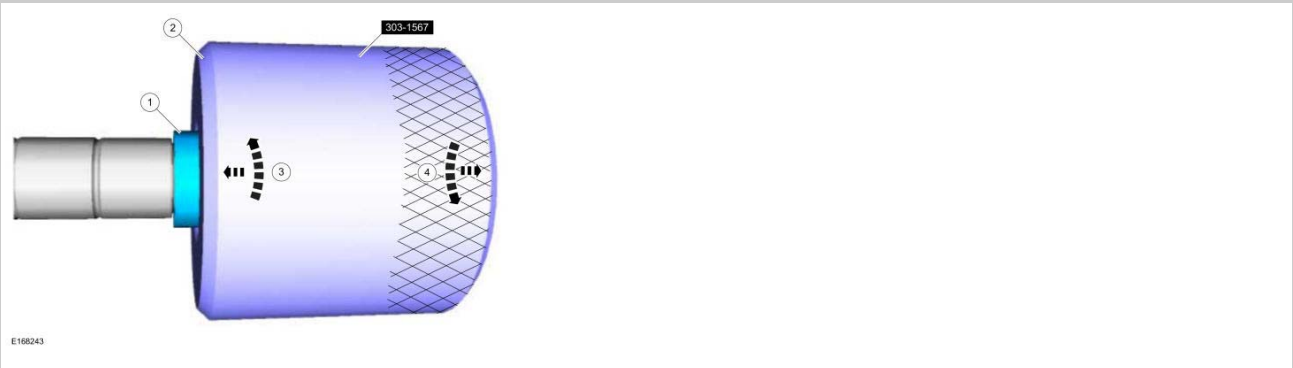
NOTE: Install the fuel injectors into the cylinder head within 15 minutes of sizing the seals due to Teflon® seal expansion.

NOTE: Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the Teflon® seal.

7.

1.

Some massaging of the Teflon® seal with your fingers before the Teflon® seal sizer tool is installed will aid in installing the Teflon® seal sizer tool.



2.

Position the Teflon® seal sizer tool with the larger opening towards the Teflon® seal. Push while turning the Teflon® seal sizer tool 180 degrees.

Use Special Service Tool: 303-1567 Sizer, Teflon Seal.

3.

Once the Teflon® seal sizer tool is installed, check and make sure the Teflon® seal is in the sizing portion of the Teflon® seal sizer tool. After one minute, turn the Teflon® seal sizer tool back 180 degrees and remove.

NOTE: Do not lubricate the new lower Teflon® fuel injector seals.

NOTE: Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-ring seals.

8.

1.

Install the fuel injector seal.

2.

Lubricate with clean engine oil and install the fuel injector O-ring seal.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

3.

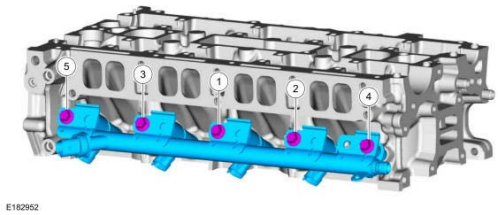
Install the fuel injector clip.

NOTE: The FRP sensor must be replaced if it is removed from the fuel rail.

NOTE: The anti-rotation finger of the fuel injector clip must slip into the groove of the fuel rail cup.

9.
Install the fuel injectors in the fuel rail.

NOTE: Do not lubricate the new lower Teflon® fuel injector seals.



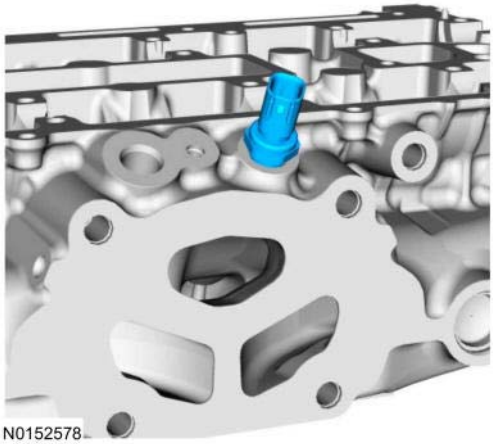
NOTE: Make sure that new fuel rail bolts are installed.

10.
Install the fuel rail by pushing down on the fuel rail above the injectors and install the bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 26°

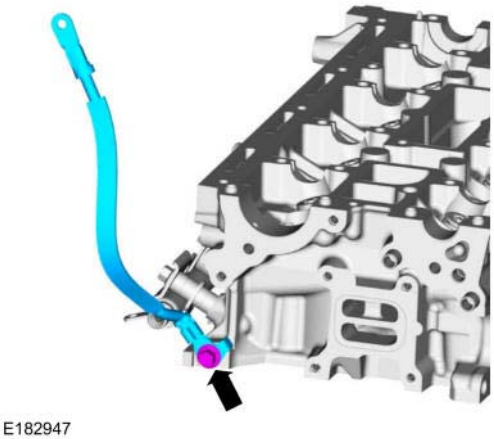


11.

Install a new CHT sensor.

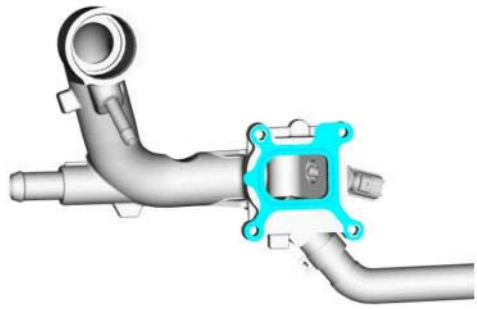
Torque

: 97 lb.in (11 Nm)



12.

Install the ground wire and the bolt.

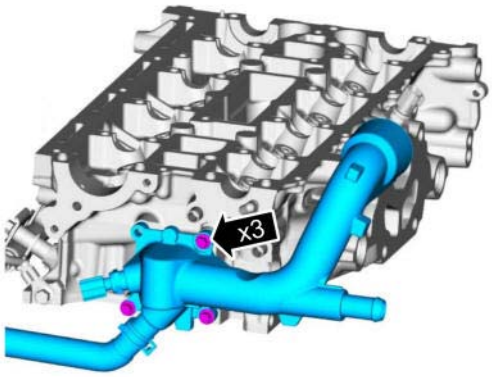


Torque

: 18 lb.ft (25 Nm)

13.

Install a new coolant outlet gasket.



E182951

14.

Install the coolant outlet and the bolts.

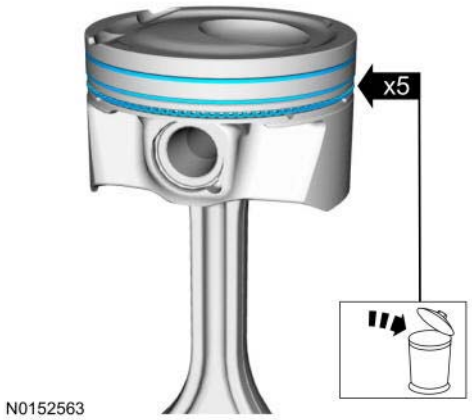
Torque

: 89 lb.in (10 Nm)

E182945

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON

Materials

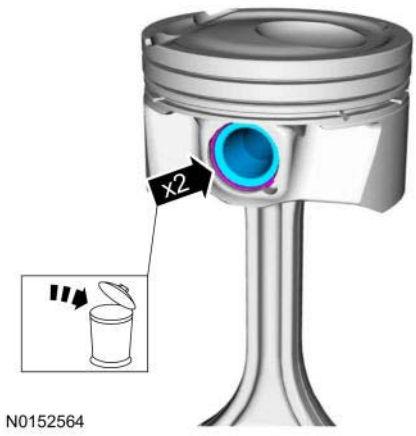


Name	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > DISASSEMBLY

NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod reassembly.

1.



Remove the piston rings and discard.

2.

Remove the piston pin retainers and discard.

Remove the piston pin.

NOTE: If the piston and connecting rod are to be reinstalled, they must be

assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

3.
Remove the piston from the connecting rod. Refer to: Piston Inspection .

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > ASSEMBLY

NOTE: Align the piston-to-connecting rod orientation marks made during disassembly.

1.
Install the piston to the connecting rod.

2.

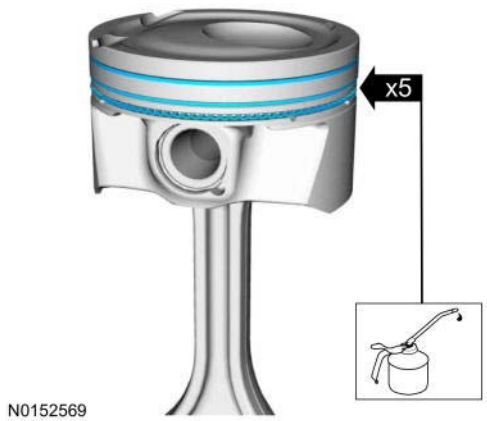
Lubricate with clean engine oil and install the piston pin.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

3.

Install the piston pin retainers.



4.

Lubricate with clean engine oil and install the piston rings.

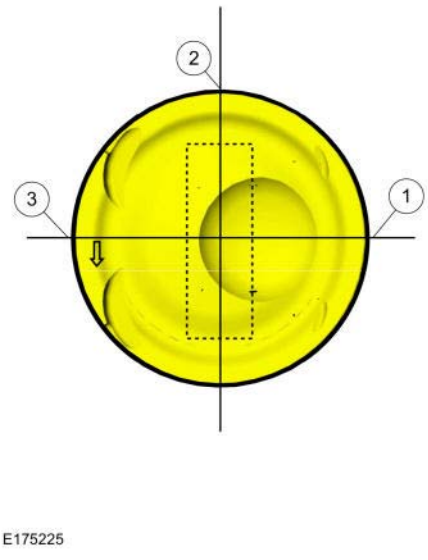
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

NOTE: Align the piston rings on the piston.

5.

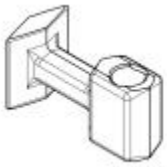
1.



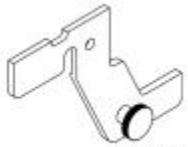
Upper oil control segment ring gap location.

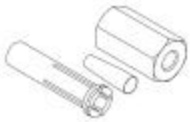
2.

Oil control spacer gap location.



3.





Lower oil control segment ring gap location.

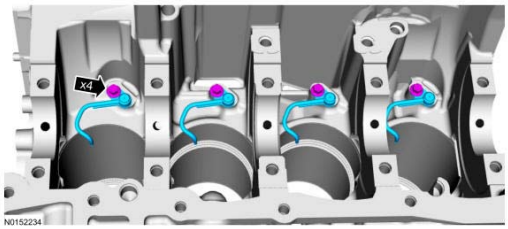
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

NOTE: Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.

NOTE: During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

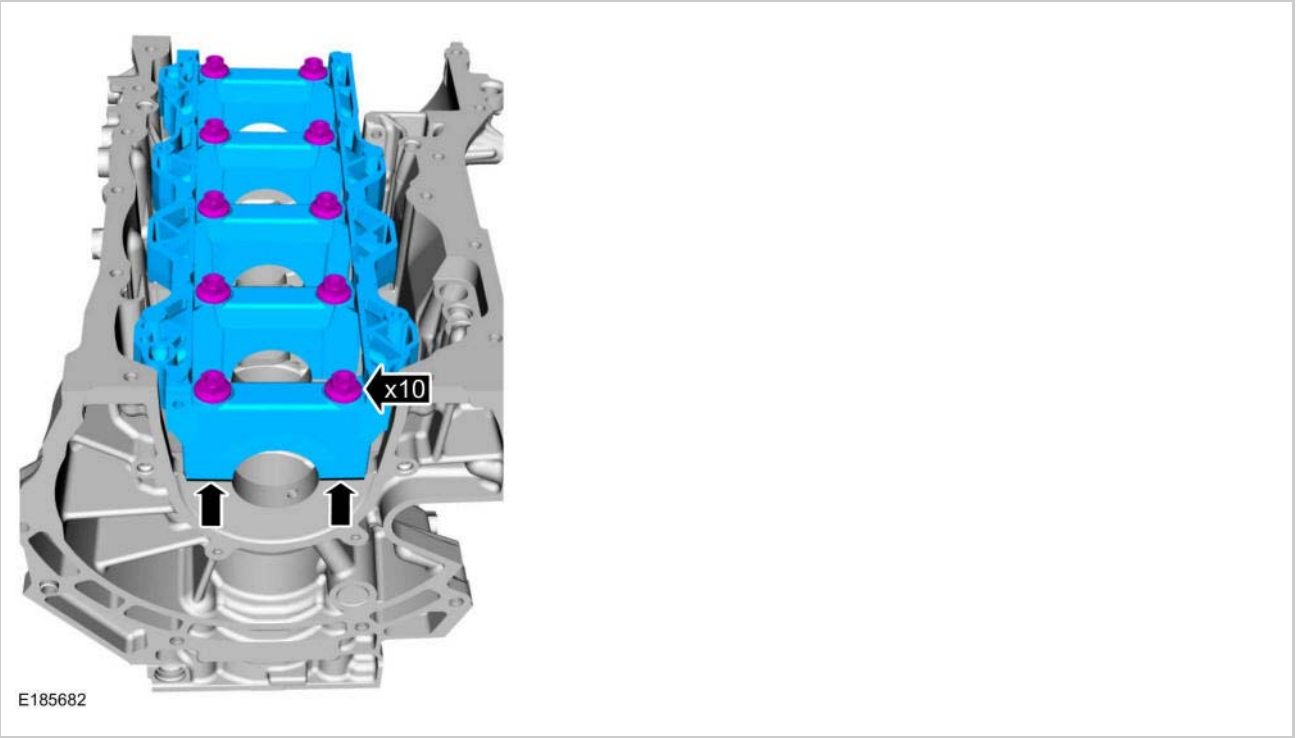
1.

Install the engine piston oil cooler valves and the bolts.

Torque

: 89 lb.in (10 Nm)

2.



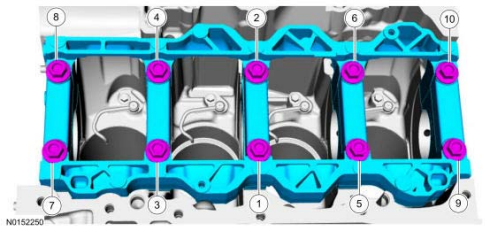
Measure the length or distance in two directions.

Record the smallest measurement for each crankshaft main bearing journal.

3.

Using the original bolts, mount the main bearing beam flush and install the bolts finger tight.

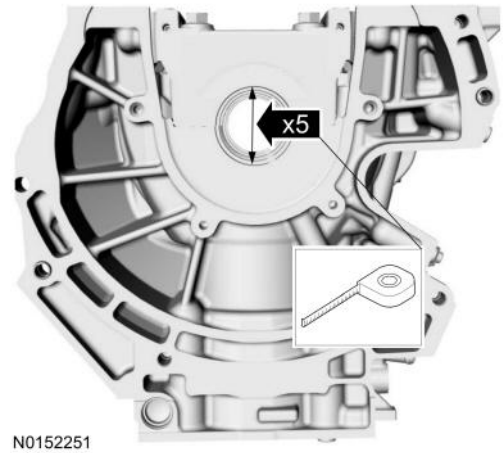
4.



Tighten the bolts in sequence shown in illustration.

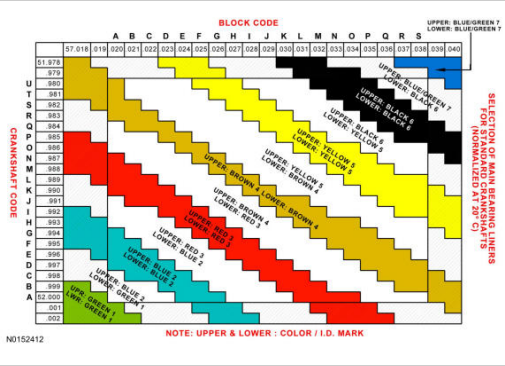
Torque:

Stage 1: 44 lb.in (5 Nm)



Stage 2: 18 lb.ft (25 Nm)

Stage 3: 90°



5.

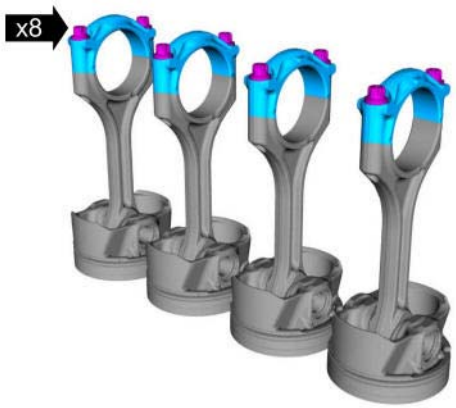
Measure each crankshaft block main bearing bore diameter.

6.

Using the chart in illustration below, select the crankshaft main bearings.

7.

Using the original bolts, install the connecting rod caps.



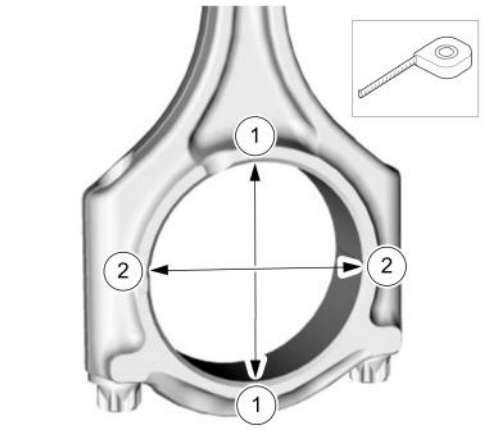
Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 21 lb.ft (29 Nm)

Stage 4: 90°

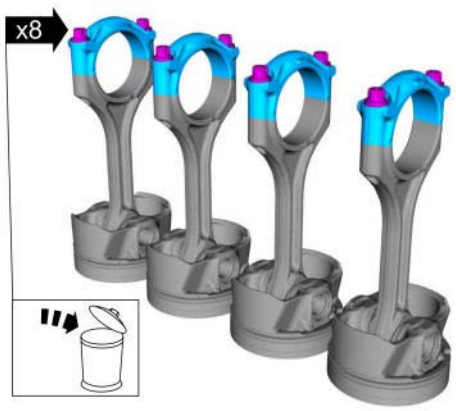


N0152252

8.

Measure the length or distance in two directions.

Record the smallest measurement for each connecting rod.

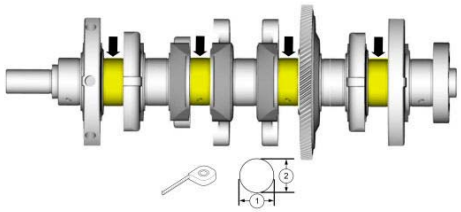


N0152253

9.

Remove the bolts and the connecting rod caps.

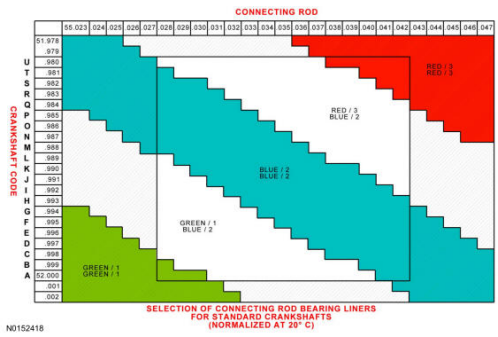
Discard the bolts.



N0152254

10.

Measure the length or distance in two directions.

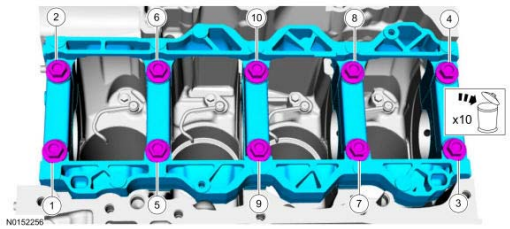


Record the smallest measurement for each connecting rod journal.

N0152255

11.

Using the chart in illustration below, select the correct connecting rod bearings for each crankshaft connecting rod journal.



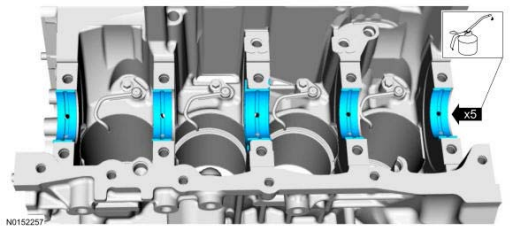
N0152418

12.

Remove the bolts in sequence shown in illustration.

Remove the main bearing beam.

Discard the bolts.



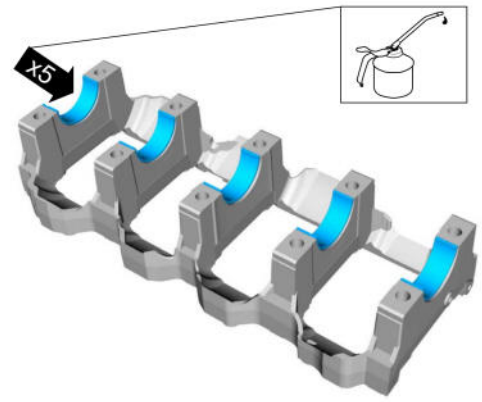
NOTE: Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

NOTE: If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

13.
Lubricate with clean engine oil and install the crankshaft main bearings.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

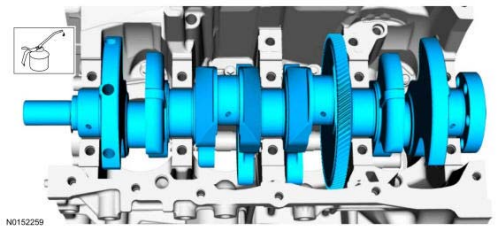


NOTE: If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

14.
Lubricate with clean engine oil and install the main bearing beam bearings.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)



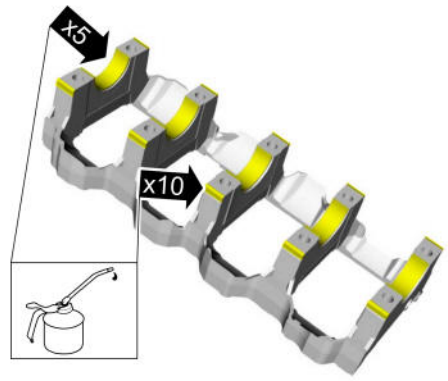
N0152258

15.

Lubricate with clean engine oil and install the crankshaft.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

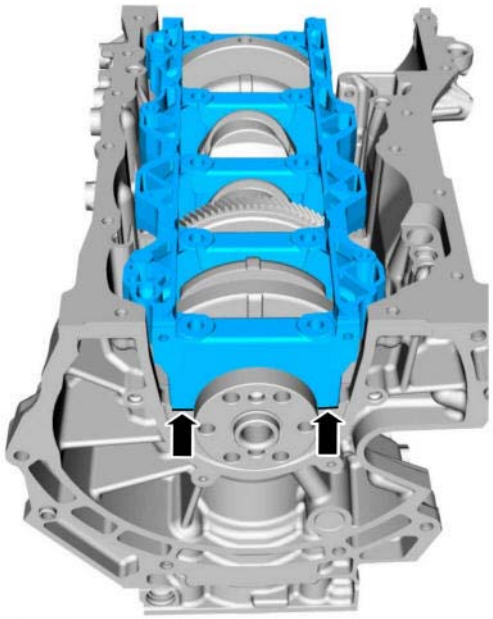


N0152259

16.

Lubricate with clean engine oil.

Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

N0152260

17.

Install the main bearing beam flush.

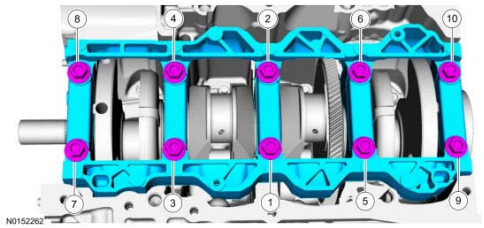
N0152261

NOTE: Lubricate the new main bearing beam bolts threads and under the bolt heads with clean engine oil.

NOTE: Position the crankshaft to the rear of the cylinder block, then position the crankshaft to the front of the cylinder block before tightening the main bearing beam bolts.

18.
Install the bolts and tighten in sequence shown in illustration.

Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 18 lb.ft (25 Nm)

Stage 3: 90°

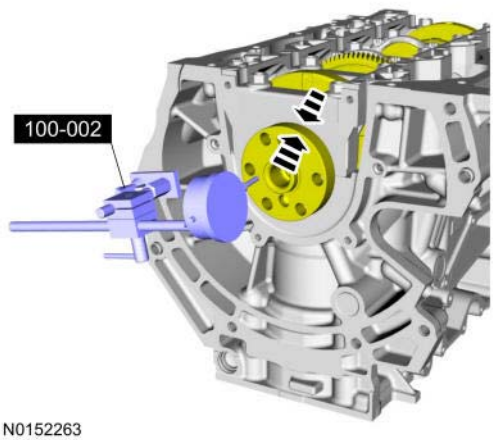
19.

1.

Position the crankshaft to the rear of the cylinder block.

2.

Zero the Dial Indicator Gauge with Holding Fixture.



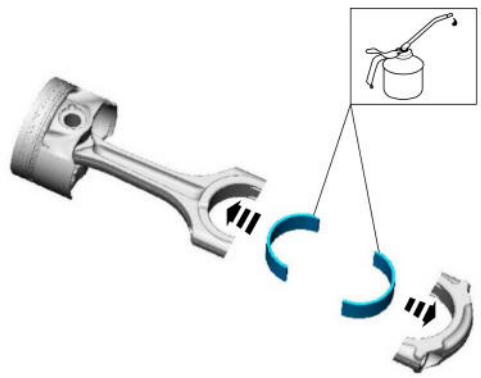
Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

3.

Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

4.

Acceptable crankshaft end play is 0.220-0.450 mm (0.0087-0.0177 in). If the crankshaft end play exceeds the specified range, install new parts as necessary.



N0152263

NOTE: If reusing the connecting rod bearings, install them in their original positions and orientation as noted during disassembly.

20.
Lubricate with clean engine oil and install the connecting rod bearings.

Material

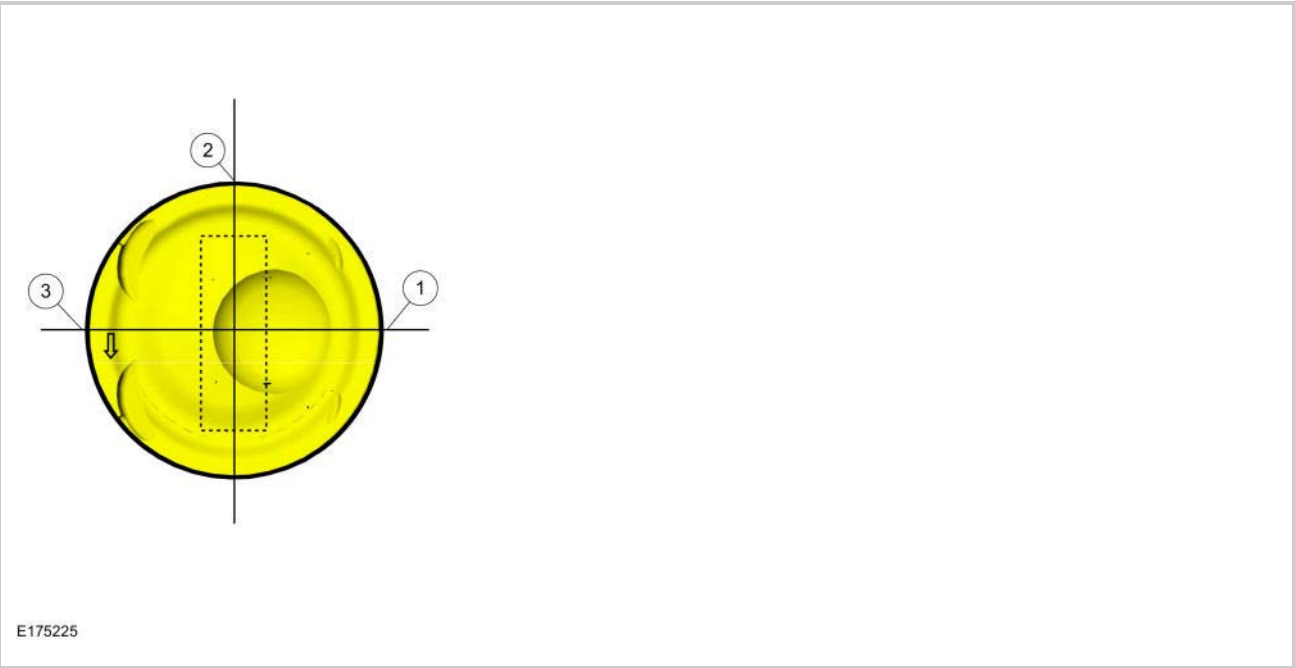
: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

N0152264

NOTE: Align the piston rings on the piston.

21.

1.



Upper oil control segment ring gap location.

2.

Oil control spacer gap location.

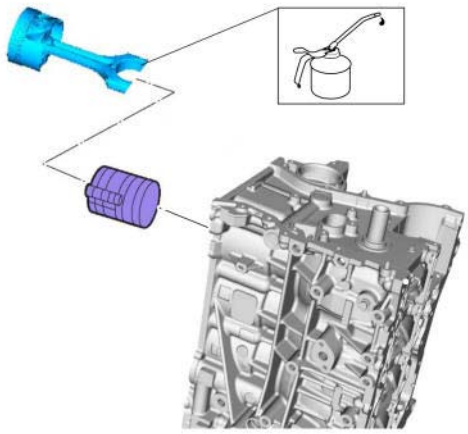
3.

Lower oil control segment ring gap location.

22.

Lubricate the pistons with clean engine oil.

Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

NOTE: Make sure the piston arrow on top is facing toward the front of the engine.

NOTE: Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.

Using a piston ring compressor, install the pistons.

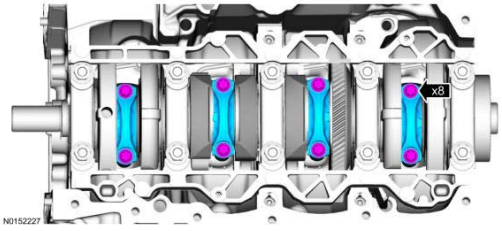
Use the General Equipment: Piston Ring Compressor

N0152413

NOTE: The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

NOTE: After installation of each connecting rod cap, rotate the crankshaft to verify smooth operation.

23.
Install the connecting rod caps, bolts and tighten in 3 stages.



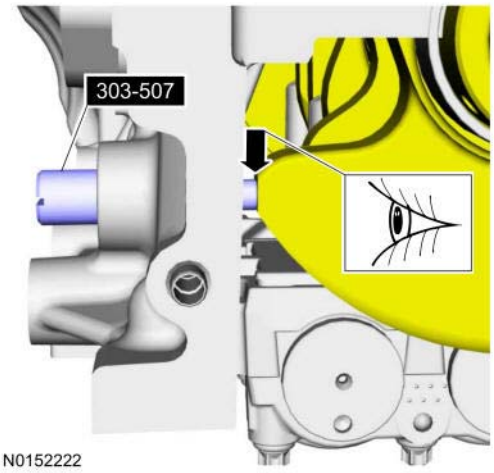
Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: Loosen:: 1 turn(s)

Stage 3: 21 lb.ft (29 Nm)

Stage 4: 90°

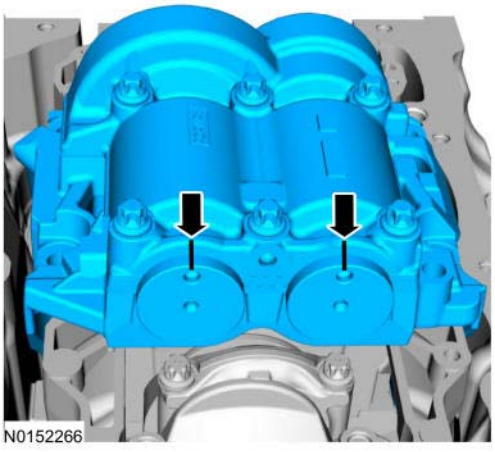


N0152227

24.

Install Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

Rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the special tool. The engine is now at TDC.

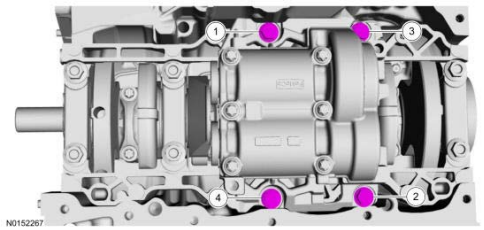


NOTE: Due to the precision interior construction of the balancer unit, it should not be disassembled.

NOTE: The original adjustment shims must be installed in their original positions.

NOTE: Confirm by visual inspection that there is no damage to the balancer unit gear and verify that the shaft turns smoothly. If there is any damage or malfunction, replace the balancer unit.

25.
Install the adjustment shims in their original positions on the seat faces of the balancer unit. With the balancer unit shaft marks in the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.

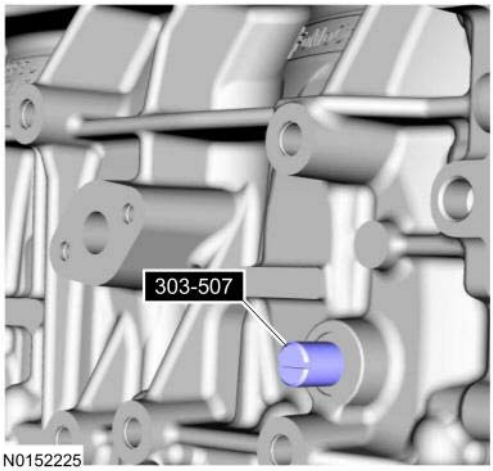


26.

Install the bolts and tighten in 2 stages.

Torque:

Stage 1: 18 lb.ft (25 Nm)



Stage 2: 31 lb.ft (42 Nm)

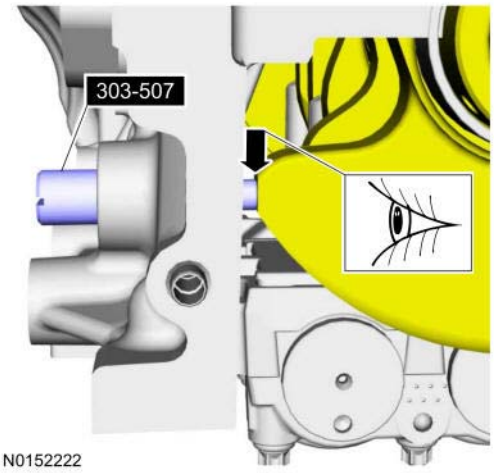
27.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

Rotate the crankshaft to confirm that there are no meshing problems between the balancer unit gear and the crankshaft gear.

28.

1.



Install Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

2.

Rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the special tool. The engine is now at TDC.

3.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

NOTE: Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown in illustration. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown in illustration into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown in illustration.

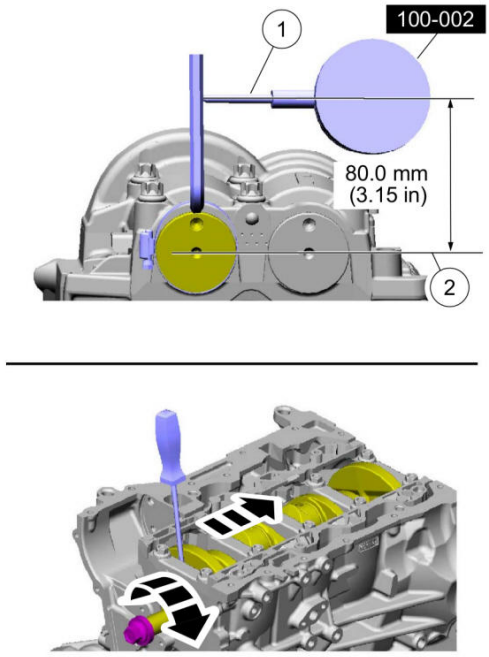
NOTE: Position the Dial Indicator Gauge with Holding Fixture as shown in illustration. Measure the gear backlash.

29.

1.

Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.

2.



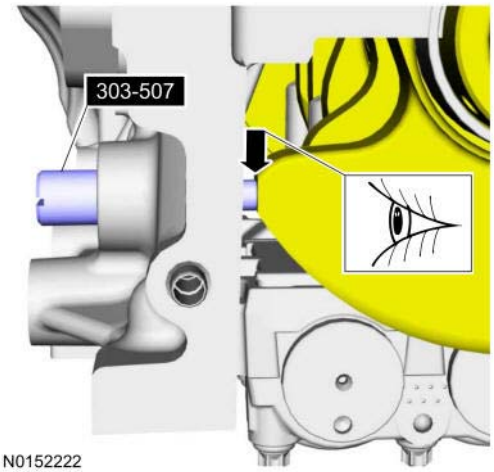
Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.

3.

Backlash specifications are 0.040 to 0.140 mm (0.00157 to 0.0055 in).

4.

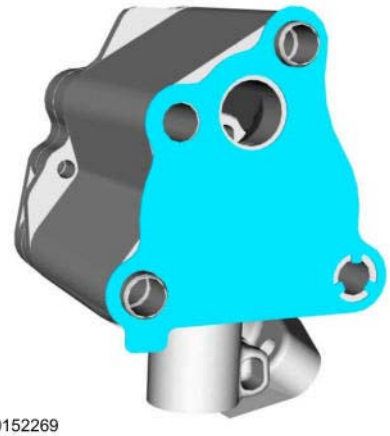
If the backlash exceeds the specified range, carry out the Balance Shaft Backlash procedure. Refer to: Balance Shaft Backlash .



E148014

30.

Install the special tool and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the special tool. The engine is now at TDC and must remain at the TDC position until the timing drive components and crankshaft pulley are installed.



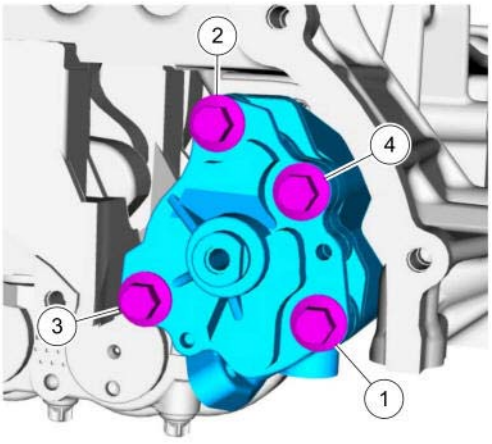
Use Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

N0152222

31.

Install the new oil pump gasket.

N0152269



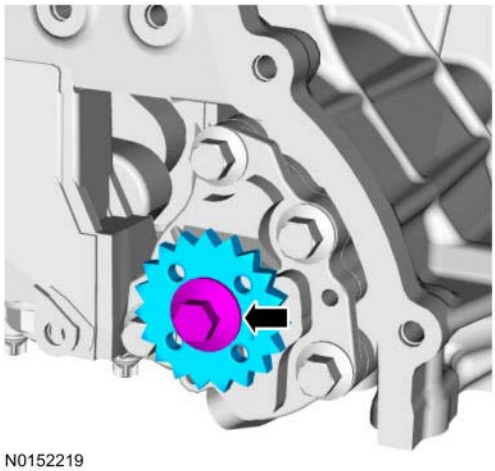
32.

Install the oil pump and the bolts and tighten in the sequence shown in illustration in 2 stages.

Torque:

Stage 1: 89 lb.in (10 Nm)

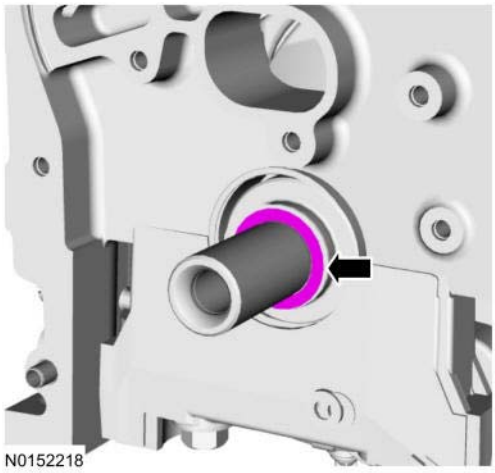
Stage 2: 177 lb.in (20 Nm)



N0152268

33.

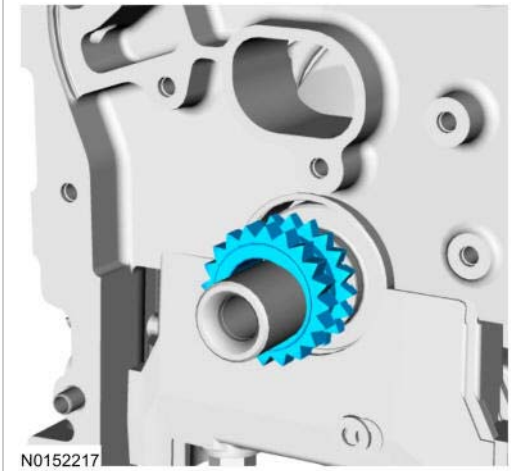
Install the oil pump sprocket and bolt.



Torque

: 18 lb.ft (25 Nm)

N0152219



NOTE: Before installation, clean and inspect the diamond washer for any damage. If damaged is evident, replace the diamond washer. If no damage, the diamond washer is to be reused. If the diamond washer is not installed, engine damage may occur.

34.
Install the diamond washer.

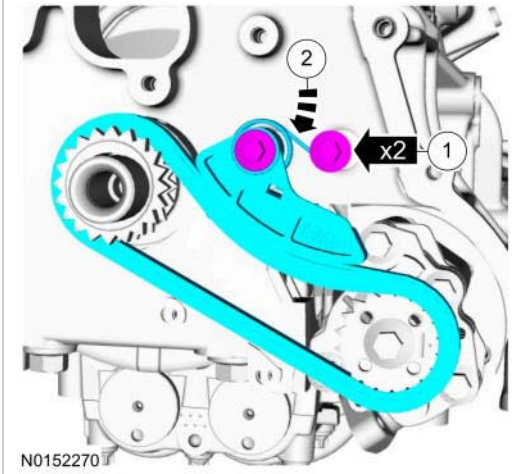
N0152218

35.

Install the crankshaft sprocket.

36.

1.



Install the timing chain, tensioner and the shoulder bolts.

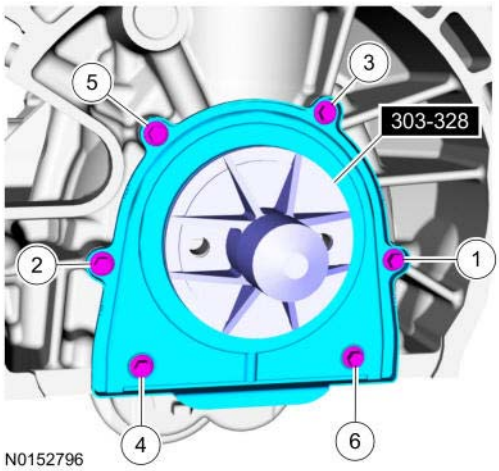
Torque

: 89 lb.in (10 Nm)

2.

Push the tensioner spring down and position the spring under the shoulder bolt.

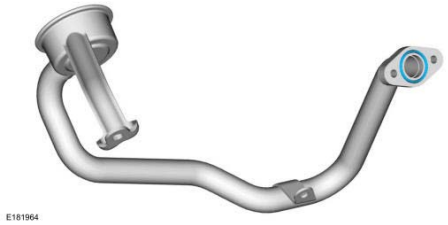
37.



Using the special tool, position the crankshaft rear oil seal onto the crankshaft.

Use Special Service Tool: 303-328 (T88P-6701-B1) Replacer, Rear Seal.

Install the bolts and tighten in sequence shown in illustration.

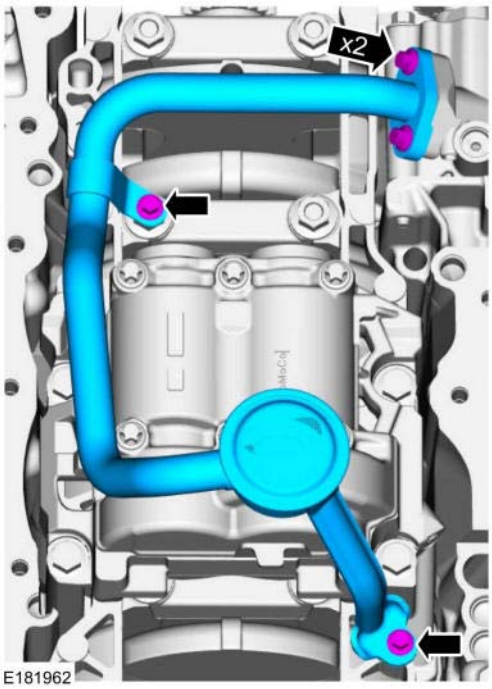


Torque

: 89 lb.in (10 Nm)

38.

Install the new oil pump screen and pickup tube gasket.

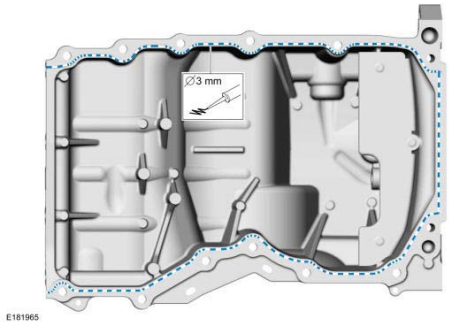


39.

Install the oil pickup and screen and the bolts.

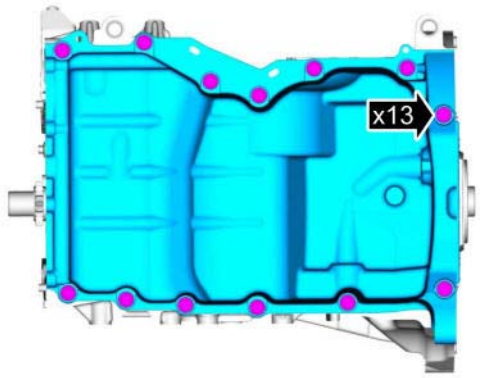
Torque

: 89 lb.in (10 Nm)



NOTE: If the oil pan is not secured within 10 minutes of silicone sealant application, the silicone sealant must be removed and the sealing area cleaned. Allow to dry until there is no sign of wetness, or 10 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

40.
Apply a 3 mm bead of silicone sealant.

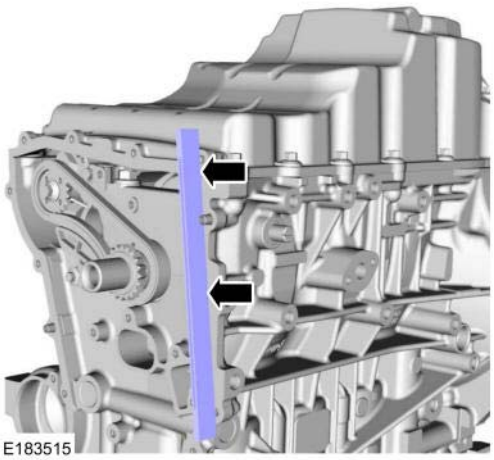


Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

41.

Install the oil pan and the bolts finger tight.

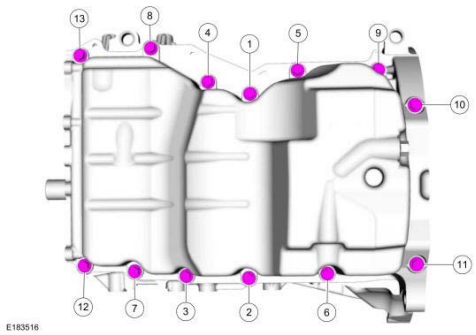


E183390

42.

Using a straight edge, align the front surface of the oil pan flush with the front surface of the engine block.

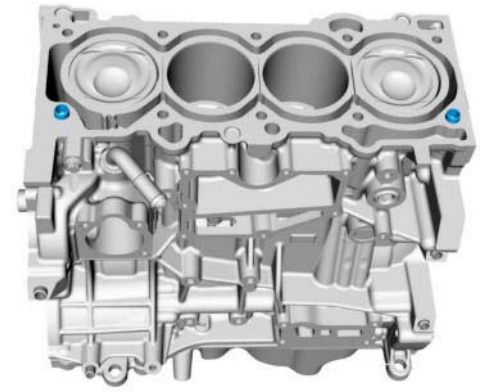
Use the General Equipment: Round-Ended Steel Rule



E183515

43.

Tighten the bolts in sequence shown in illustration.



Torque

: 18 lb.ft (25 Nm)

44.

Install the cylinder block bushings.

45.

Install a new cylinder head gasket.

NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

46.
Install the cylinder head, bolts and tighten in sequence shown in illustration in 5 stages.

Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 133 lb.in (15 Nm)

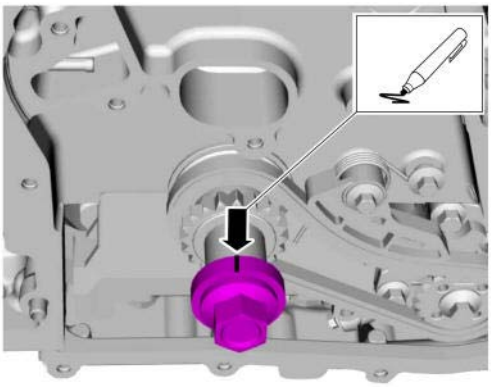
Stage 3: 41 lb.ft (55 Nm)

Stage 4: 90°

Stage 5: 90°

47.

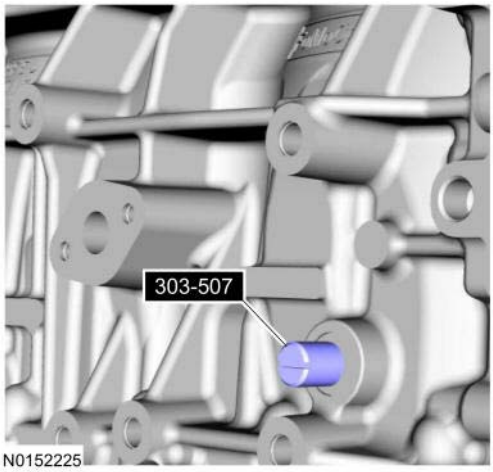
Lubricate with clean engine oil and install the valve tappets.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

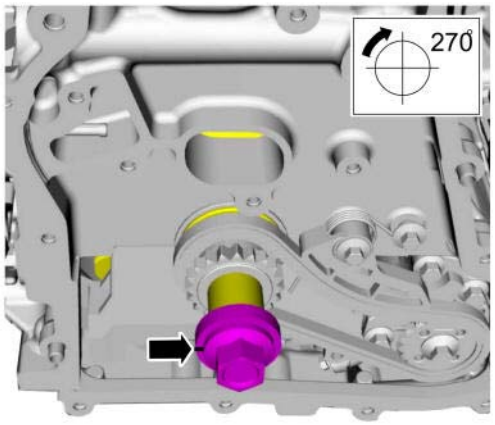
NOTE: If any new parts are being installed (cylinder head, valves, tappets, camshafts) it is necessary to check the valve clearance, follow the next 12 steps exactly or serious damage to the engine may occur. If the original parts are being installed it is not necessary to check the valve clearance so proceed to step 61.



48.
Install the crankshaft bolt and place a paint mark on the crankshaft bolt at the 12 o'clock position.

E183518

49.



Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

N0152225

NOTE: Rotating the crankshaft will position all of the pistons below the deck of the cylinder block and allow the camshafts to be installed and the valve clearance checked without the possibility of damage to the valves or pistons.

50.
Using the crankshaft bolt and washer, rotate the crankshaft clockwise 270 degrees until the paint mark is at the 9 o'clock position.

E183519

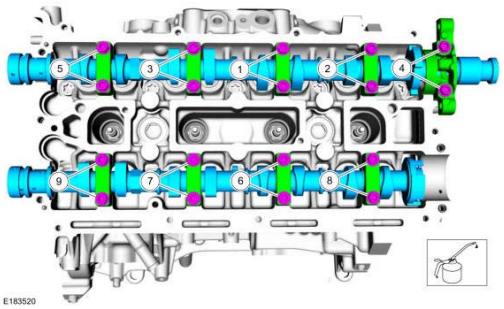
NOTE: Failure to follow the camshaft tightening procedure can result in damage to the camshafts.

NOTE: Lubricate the camshaft journals and camshaft bearing caps with clean engine oil.

51.

Lubricate the camshafts and caps with clean engine oil and install the camshafts, caps and bolts.

Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Tighten 2 turns at a time in the sequence shown in illustration in 2 stages.

Torque:

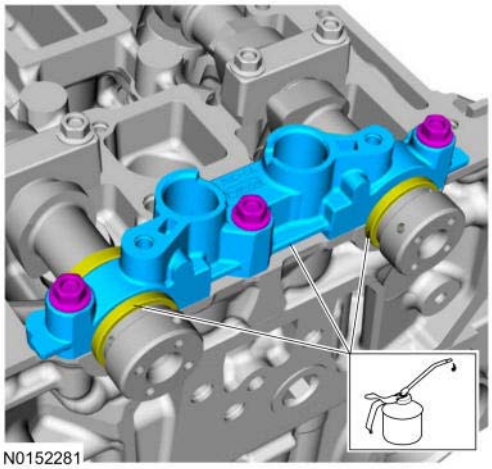
Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

E183520

52.

Lubricate the camshaft journals with clean engine oil and install the front camshaft bearing cap and bolts.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

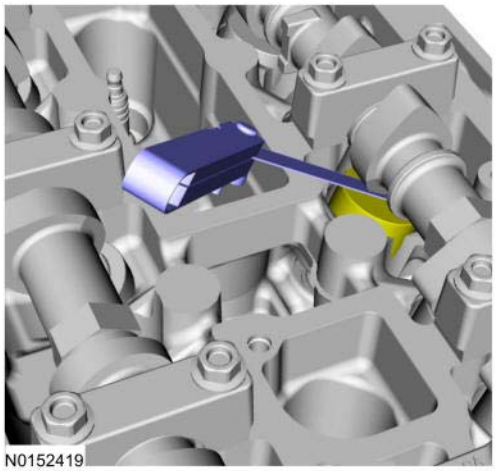
Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

53.

1.

Using the flats of the camshaft, rotate the camshaft to place the cam lobe at base circle, with the lobe pointed away from the tappet.



2.

Use a feeler gauge to measure the clearance of each valve and record its location.

Use the General Equipment: Feeler Gauge

3.

Repeat to measure all of the lobe/tappet clearances.

NOTE: The number on the valve tappet only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

NOTE: Select tappets using this formula: tappet thickness = measured clearance + the existing tappet thickness - nominal clearance.

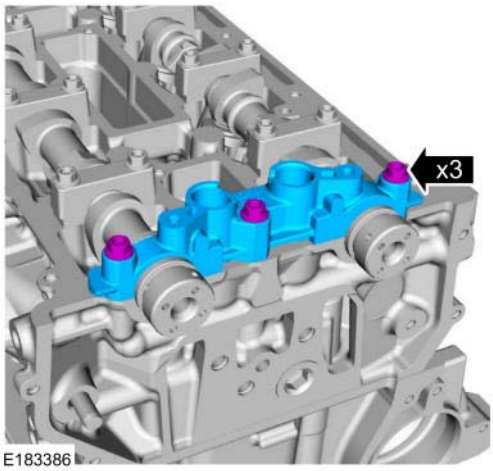
NOTE: The nominal clearance is:

intake: 0.25 mm (0.0095 in).

exhaust: 0.36 mm (0.0142 in).

NOTE: The acceptable clearances after being fully installed are:

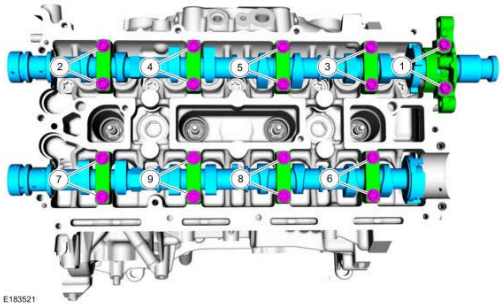
54.



intake: 0.19-0.31 mm (0.007-0.012 in).

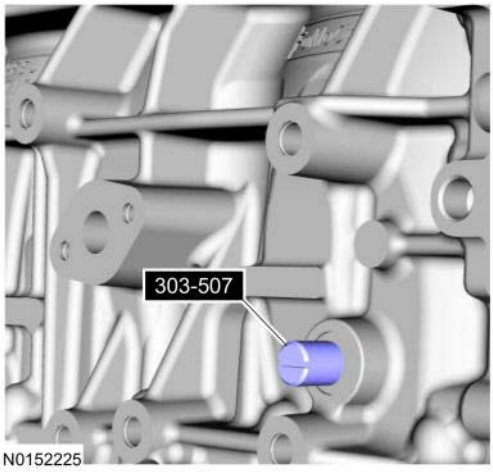
exhaust: 0.30-0.42 mm (0.012-0.017 in).

Select the closest tappet size to the ideal tappet thickness available and mark the installation location.



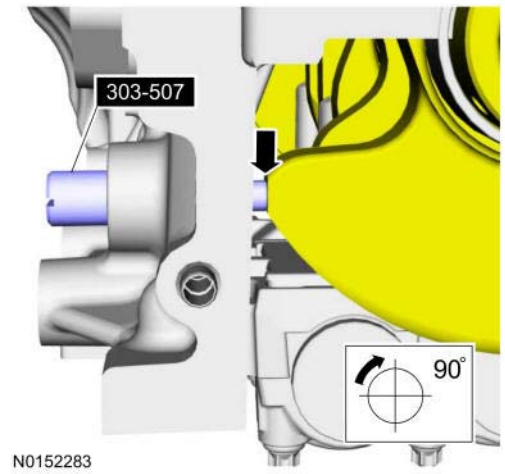
55.

Remove the bolts and the front camshaft bearing cap.



NOTE: Failure to follow the camshaft loosening procedure can result in damage to the camshafts.

56.
Loosen the camshaft bearing caps in sequence 2 turns at a time until all tension is released from the camshaft bearing caps and remove the bolts, caps and camshafts.

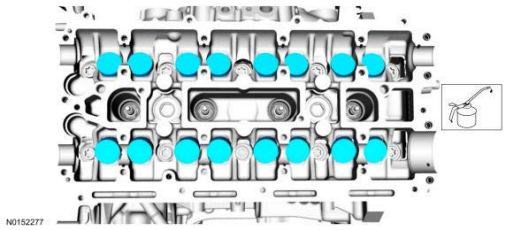


57.

Install Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

NOTE: Rotating the crankshaft will position the engine at TDC and allow you to install the camshafts in the same position as noted during the disassembly.

58.
Rotate the crankshaft clockwise 90 degrees so the crankshaft contacts the special tool.



59.

If necessary, replace any tappets with the correct tappets selected during the valve clearance check and lubricate with clean engine oil.

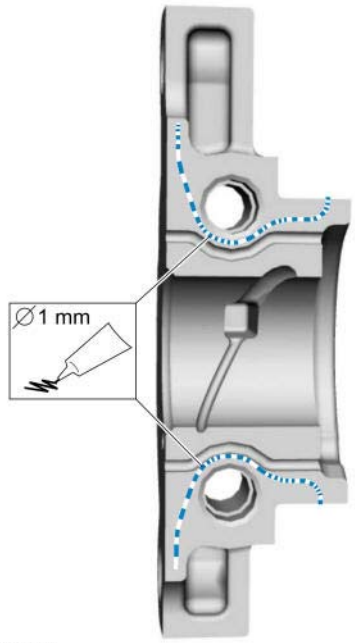
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

NOTE: The exhaust camshaft rear bearing cap must be secured within 10 minutes of silicone sealant application. If the bearing cap is not secured within 10 minutes, the gasket maker must be removed and the sealing area cleaned.

NOTE: Do not allow gasket maker to enter the camshaft bearing journal. If gasket maker is applied to the camshaft bearing journal, the journal and sealing area must be cleaned.

60.



Apply a 1 mm bead of gasket maker.

Material

: Gasket Maker / TA-16 (WSK-M2G348-A5)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

NOTE: Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.

NOTE: Failure to follow the camshaft tightening procedure can result in damage to the camshafts.

NOTE: Wipe off any excess sealant from the fuel injection pump housing sealing surface of the cylinder head and rear camshaft cap.

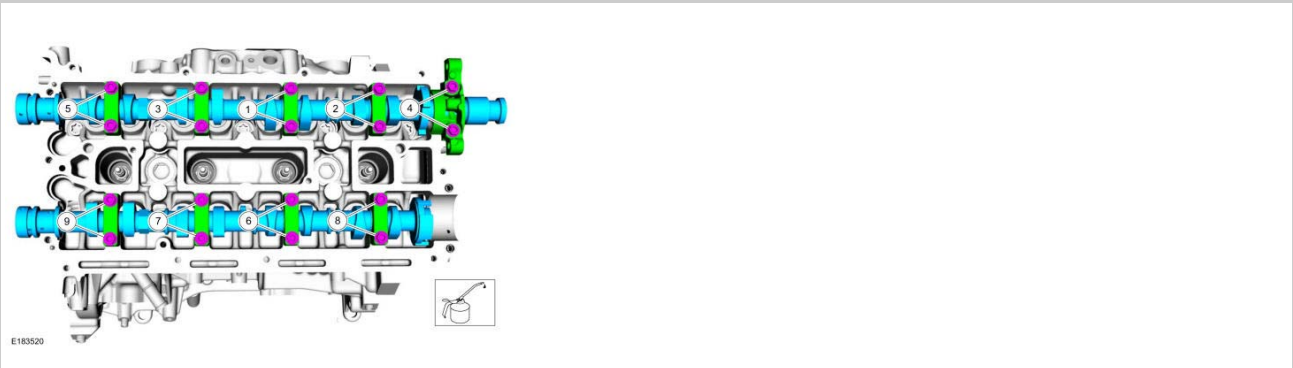
NOTE: Lubricate the camshaft journals and camshaft bearing caps with clean engine oil.

61.

Lubricate with clean engine oil and install the camshafts, caps and bolts.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)



Tighten the camshaft bearing cap bolts one turn at a time, until finger-tight.

Tighten 2 turns at a time in the sequence shown in illustration in 2 stages.

Torque:

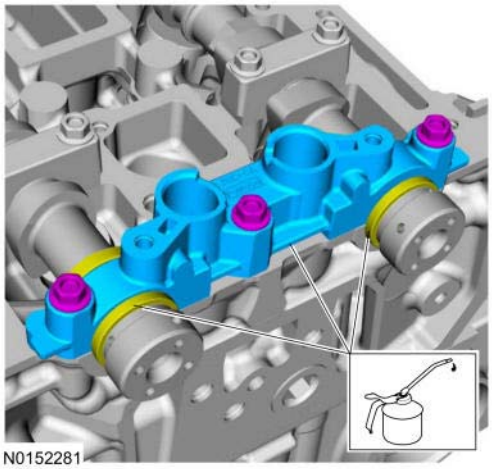
Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)

62.

Lubricate the camshaft journals with clean engine oil.

Material



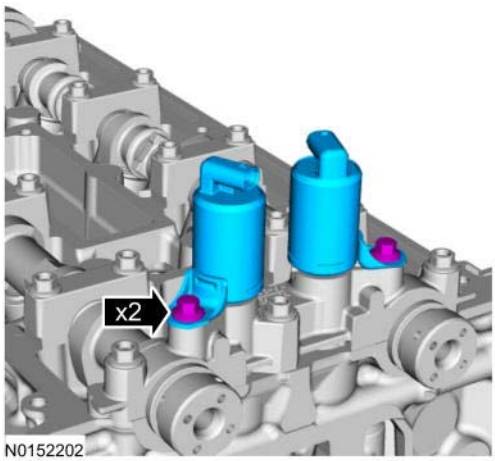
: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Install the front camshaft bearing cap and the bolts and tighten in 2 stages.

Torque:

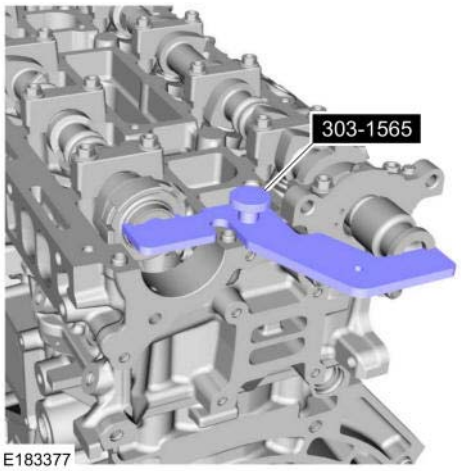
Stage 1: 62 lb.in (7 Nm)

Stage 2: 142 lb.in (16 Nm)



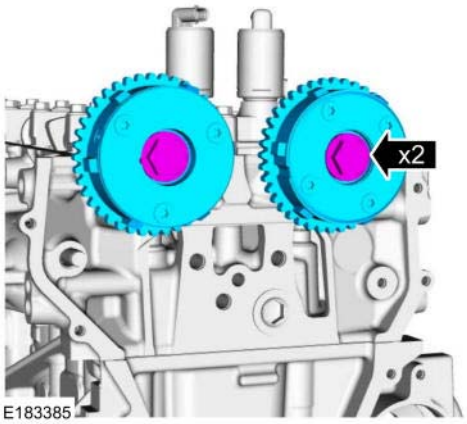
63.

Install the VCT oil control solenoids and the bolts.



Torque

: 89 lb.in (10 Nm)

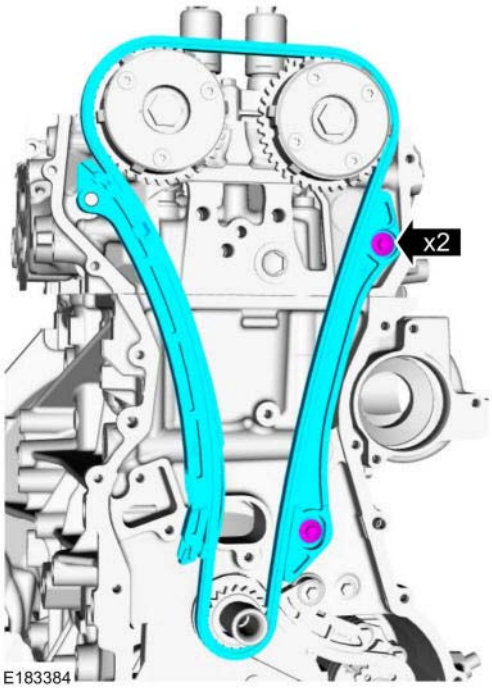


NOTE: The special tool is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.

64.
Install Special Service Tool: 303-1565 Alignment Tool, Camshaft.

NOTE: Do not tighten the VCT unit bolts at this time.

65.
Install the VCT units and the bolts finger-tight.

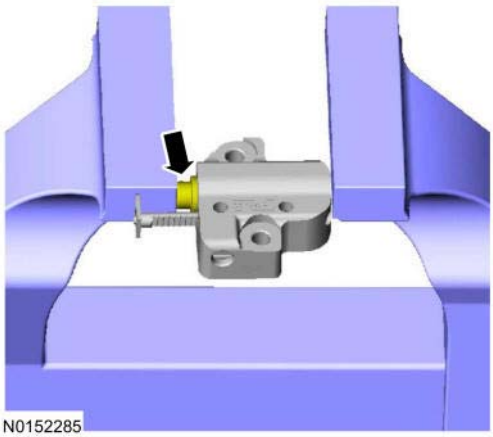


66.

Install the tensioner arm, timing chain, timing chain guide and the bolts.

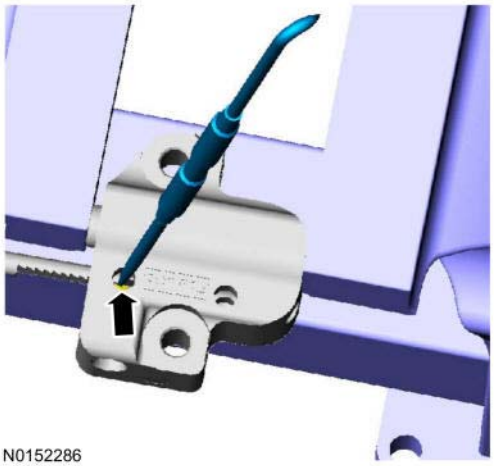
Torque

: 89 lb.in (10 Nm)



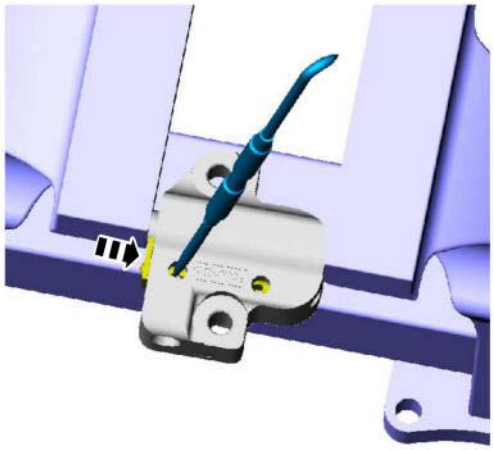
NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.

NOTE: Do not compress the ratchet assembly. This will damage the ratchet assembly.



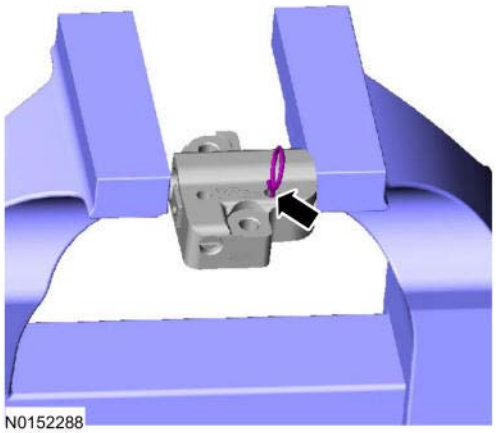
67.
Using the edge of a vise, compress the timing chain tensioner plunger.

Use the General Equipment: Vise



68.

Using a small pick, push back and hold the ratchet mechanism.

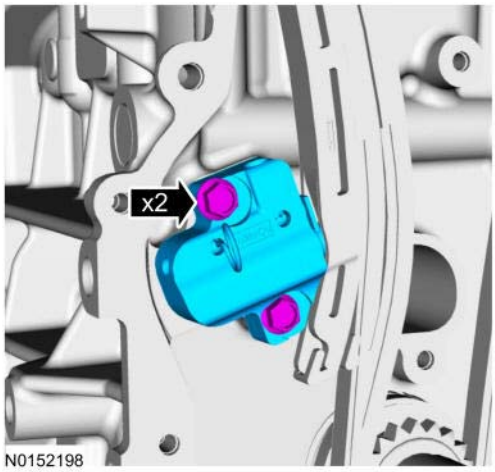


69.

While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

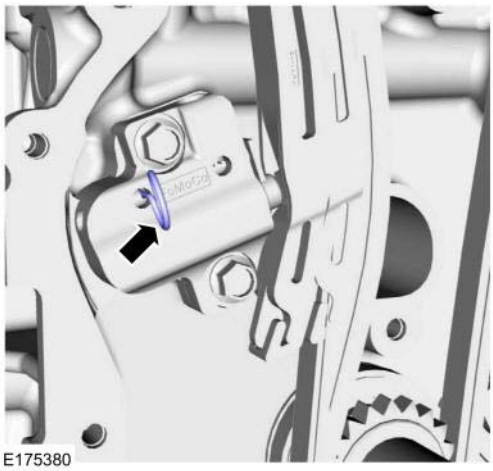
70.

Install a holding pin into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.



NOTE: Do not remove the holding pin until the tensioner bolts are tightened.

71.
Install the timing chain tensioner and the bolts.

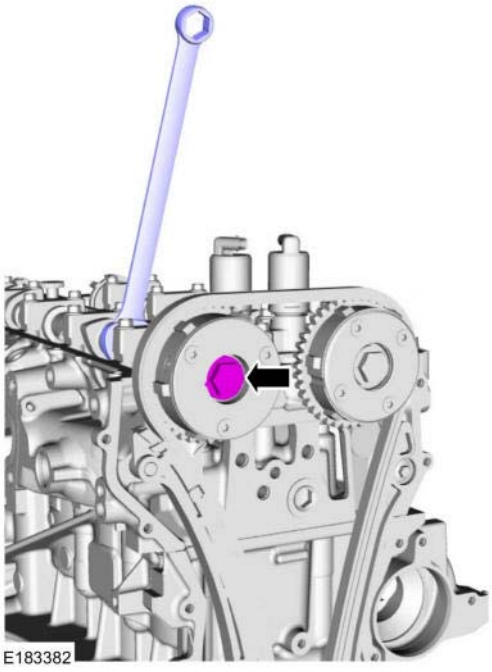


Torque

: 89 lb.in (10 Nm)

72.

Remove the holding pin.



NOTE: Use an open-ended wrench to prevent the component from turning.

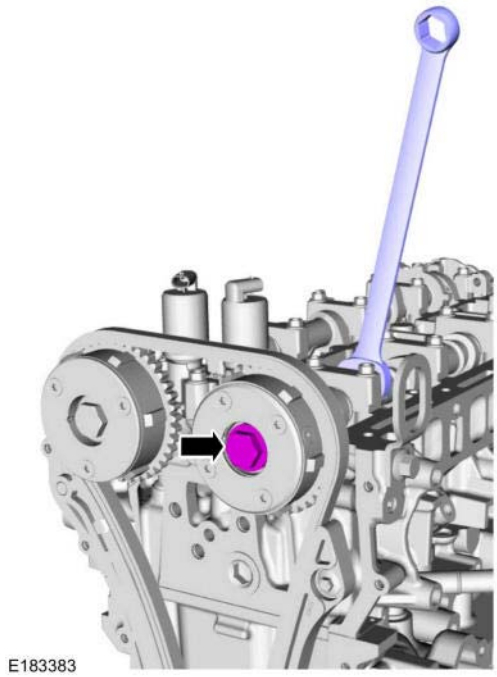
73.
Tighten the exhaust VCT unit bolt in 2 stages.

Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: 60°

NOTE: Use an open-ended wrench to prevent the component from turning.



74.

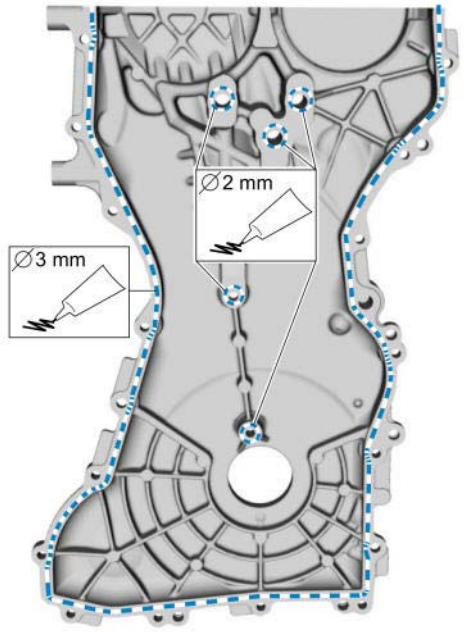
Tighten the intake VCT unit bolt in 2 stages.

Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: 60°

NOTE: The engine front cover must be secured within 10 minutes of Silicone Gasket and Sealant application. If the valve cover is not secured within 10 minutes, the silicone sealant must be removed and the sealing area cleaned.



75.
Apply silicone sealant.

Material

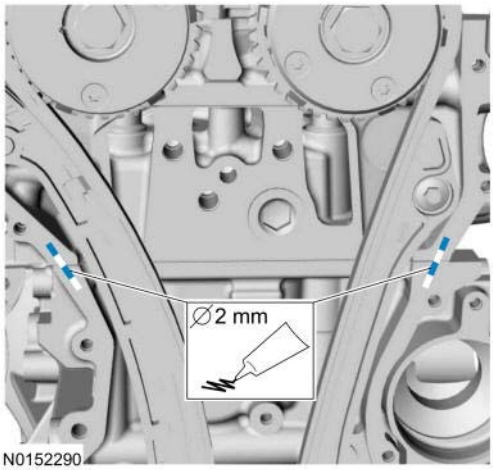
: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

N0152289

NOTE: The engine front cover must be secured within 10 minutes of Silicone Gasket and Sealant application. If the engine front cover is not secured within 10 minutes, the silicone sealant must be removed and the sealing area cleaned.



76.
Apply beads of silicone sealant that are 2 mm (0.078 in) in diameter and 5 mm (0.19 in) in length across the cylinder head and cylinder block joint areas.

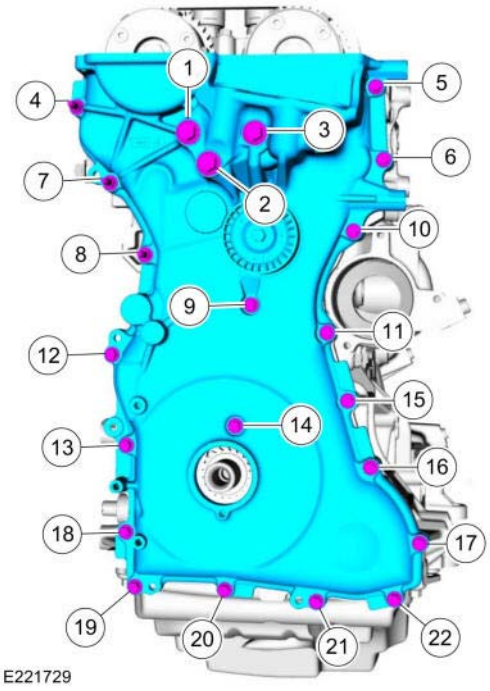
Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

N0152290



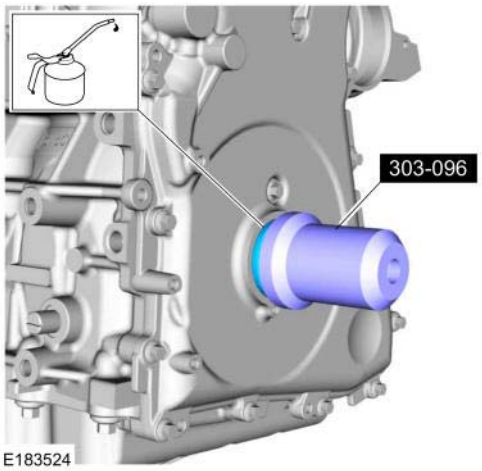
77.

Install the engine front cover and the fasteners and tighten in the sequence shown in illustration.

Torque:

Bolts 1 - 3: 35 lb.ft (48 Nm)

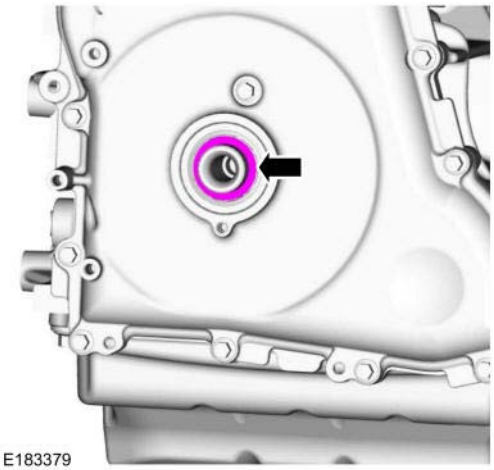
Bolts 4 - 22: 89 lb.in (10 Nm)



NOTE: Remove the through-bolt from the Camshaft Front Oil Seal Installer.

78.
Lubricate with clean engine oil and using the special tool, install the crankshaft front seal.

Use Special Service Tool: 303-096 (T74P-6150-A) Installer, Camshaft Front Oil Seal.



Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

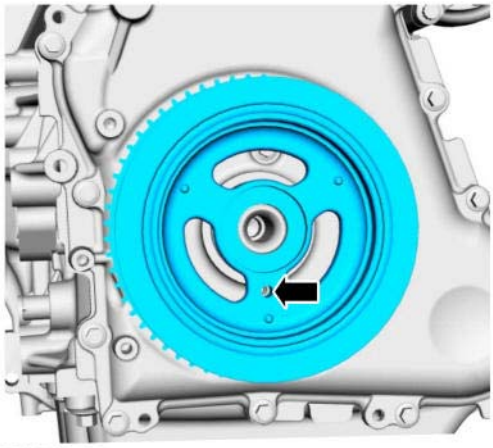
NOTE: Before installation, clean and inspect the diamond washer for any damage. If damaged is evident, replace the diamond washer. If no damage, the diamond washer is to be reused. If the diamond washer is not installed, engine damage may occur.

79.
Install the diamond washer onto the crankshaft.

80.

Lubricate the crankshaft pulley with clean engine oil.

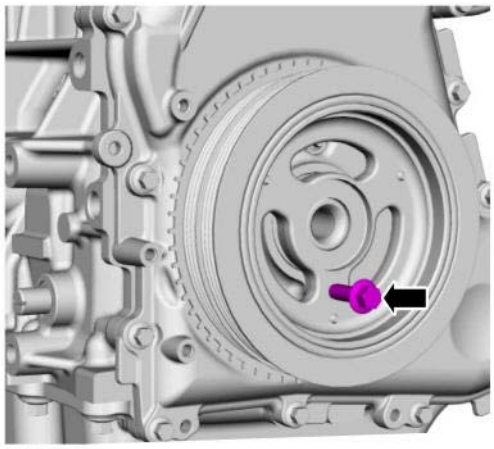
Material



: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

N0152293

81.



Install the crankshaft pulley.

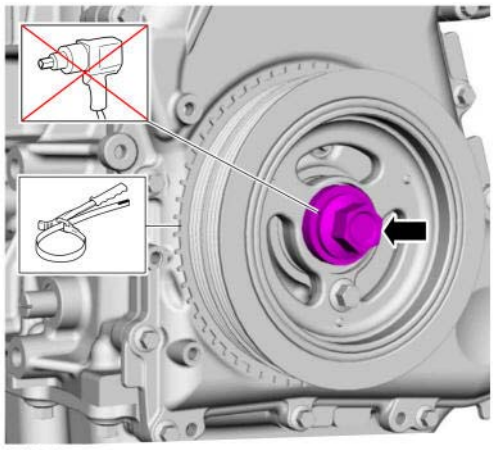
E183525

NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

82.
Install an M6 bolt.

E183526

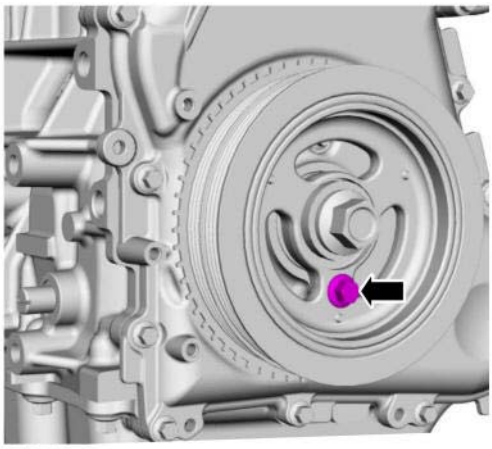
NOTE: The crankshaft must remain in the TDC position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Strap Wrench and the bolt should be installed using hand tools only.



83.
Using a strap wrench, tighten the crankshaft pulley.

Use the General Equipment: Strap Wrench

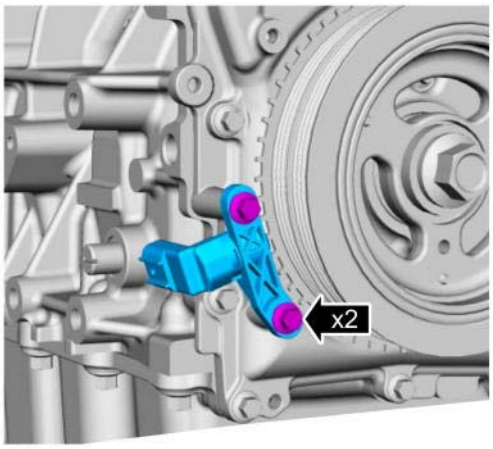
Torque:



Stage 1: 74 lb.ft (100 Nm)

Stage 2: 90°

E183527



84.

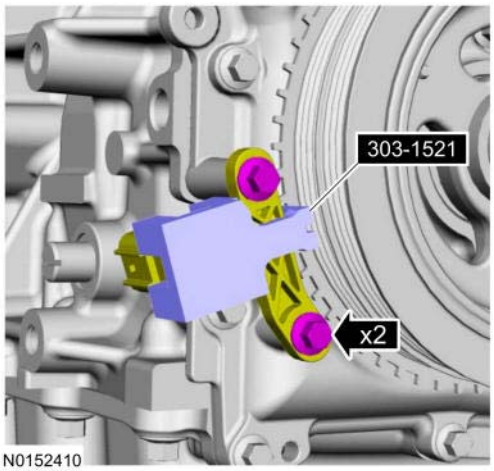
Remove the M6 bolt.

E183528

NOTE: Do not tighten the CKP sensor bolts at this time.

85.
Install the CKP sensor and the bolts finger-tight.

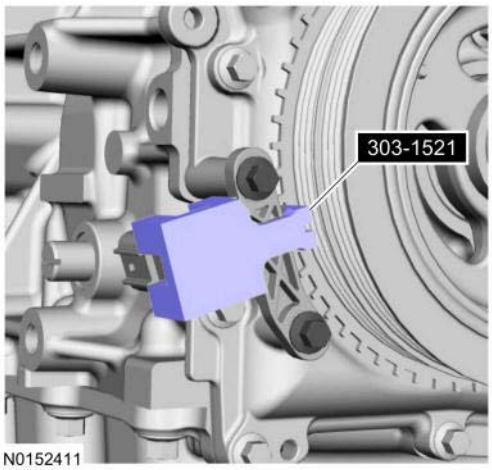
E183529



86.

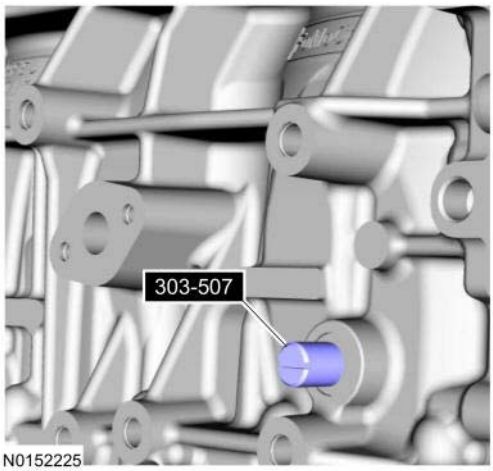
Install the Special Tool onto the CKP sensor and the tooth of the crankshaft pulley trigger wheel.

Use Special Service Tool: 303-1521 Alignment Tool, Crankshaft Position Sensor.



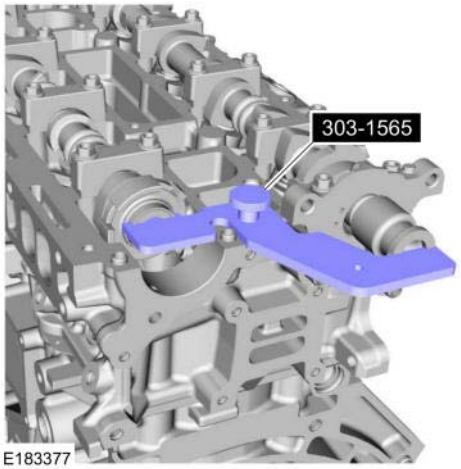
Torque

: 62 lb.in (7 Nm)



87.

Remove Special Service Tool: 303-1521 Alignment Tool, Crankshaft Position Sensor.

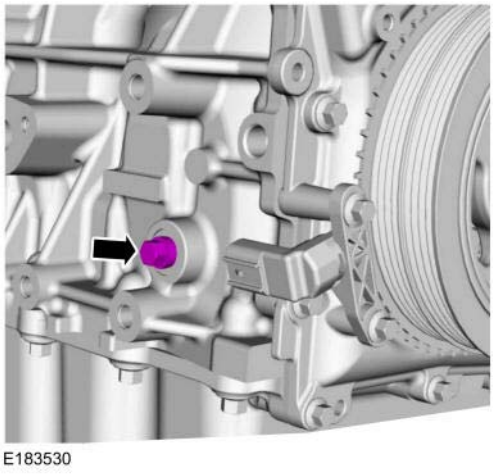


88.

Remove Special Service Tool: 303-507 Timing Peg, Crankshaft TDC.

89.

Remove Special Service Tool: 303-1565 Alignment Tool, Camshaft.

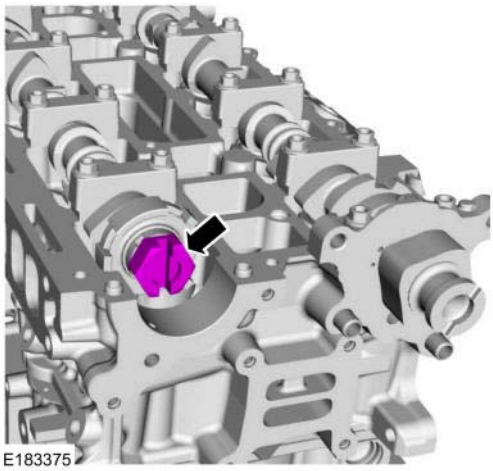


90.

Install the engine plug bolt.

Torque

: 177 lb.in (20 Nm)



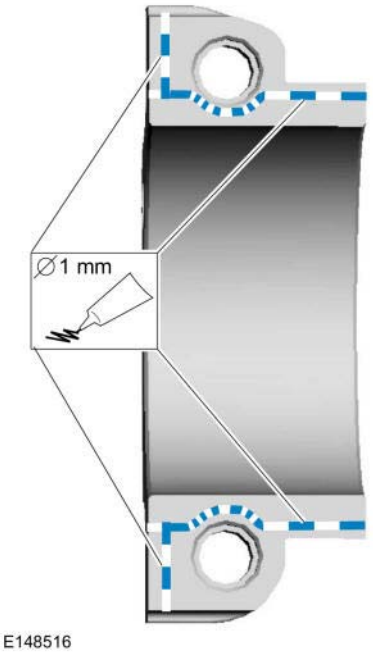
91.

Install the camshaft drive adapter.

Torque

: 46 lb.ft (63 Nm)

NOTE: The intake camshaft rear bearing cap must be secured within 10 minutes of gasket maker application. If the bearing cap is not secured within 10 minutes, the gasket maker must be removed and the sealing area cleaned.



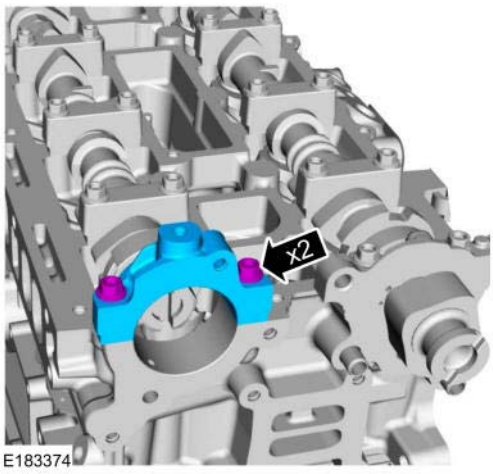
92.
Apply a 1 mm bead of gasket maker.

Material

: Gasket Maker / TA-16 (WSK-M2G348-A5)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

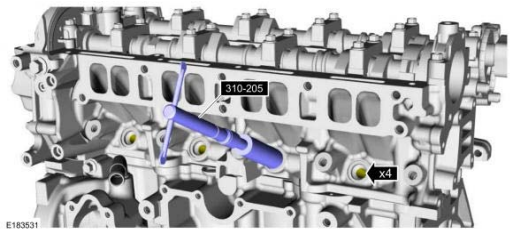


NOTE: Wipe off any excess gasket maker from the vacuum pump sealing surface of the cylinder head and camshaft cap.

93.
Install camshaft rear bearing cap and the bolts.

Torque:

Stage 1: 62 lb.in (7 Nm)



Stage 2: 142 lb.in (16 Nm)

NOTE: Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and the general surrounding area of the fuel rails and injectors.

NOTE: Do not use compressed air or the Fuel Injector Brush to clean the tip of the fuel injectors. Failure to follow this instruction may result in damage to the fuel injectors.

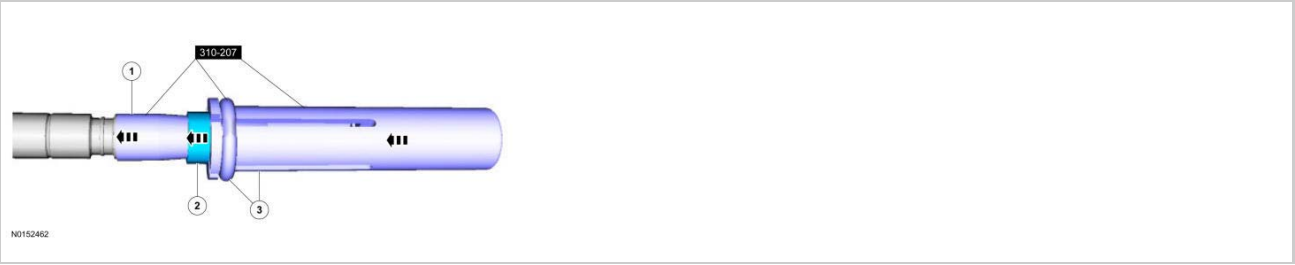
94.
Using the special tool, clean the fuel injector bores. Use Special Service Tool: 310-205 Fuel Injector Brush.

NOTE: Do not lubricate the new lower Teflon® fuel injector seals.

95.

1.

Use Special Service Tool: 310-207 Installer, Fuel Injector Seal Assembly.



NOTE: Once the Teflon® seal is installed on the Teflon® Seal Guide, it should immediately be installed onto the fuel injector to avoid excessive expansion of the Teflon® seal.

2.
Make sure that new lower fuel injector Teflon® seals are installed.

Use Special Service Tool: 310-207 Installer, Fuel Injector Seal Assembly.

3.

Using the special tool, slide the Teflon® seals off of the Teflon® Seal Guide and into the groove on the fuel injectors.

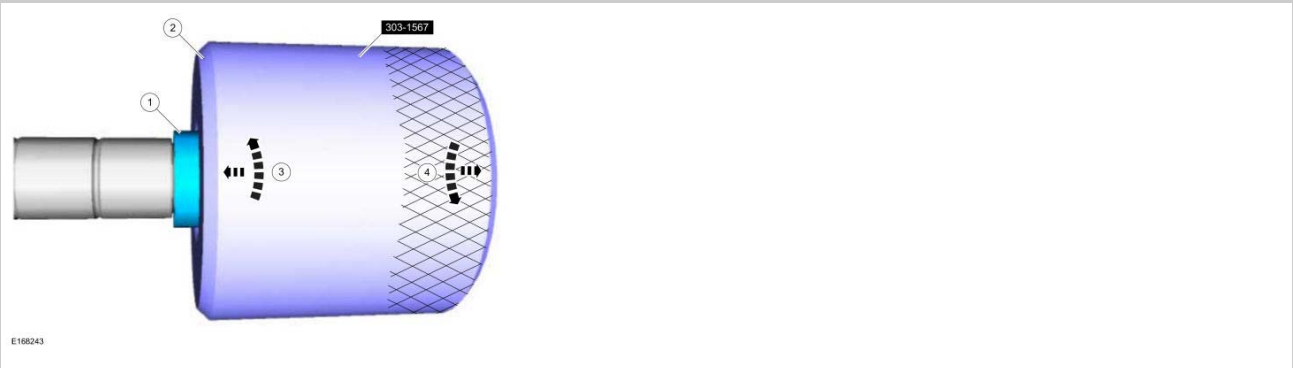
NOTE: Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the Teflon® seal.

NOTE: Install the fuel injectors into the cylinder head within 15 minutes of sizing the seals due to Teflon® seal expansion.

96.

1.

Some massaging of the Teflon® seal with your fingers before the special tool is installed will aid in installing the special tool.



2.

Position the Teflon® seal sizer tool with the larger opening towards the Teflon® seal. Push while turning the Teflon® seal sizer tool 180 degrees.

Use Special Service Tool: 303-1567Sizer, Teflon Seal.

3.

Once the special tool is installed, check and make sure the Teflon® seal is in the sizing portion of the special tool. After one minute, turn the special tool back 180 degrees and remove.

NOTE: Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-ring seals.

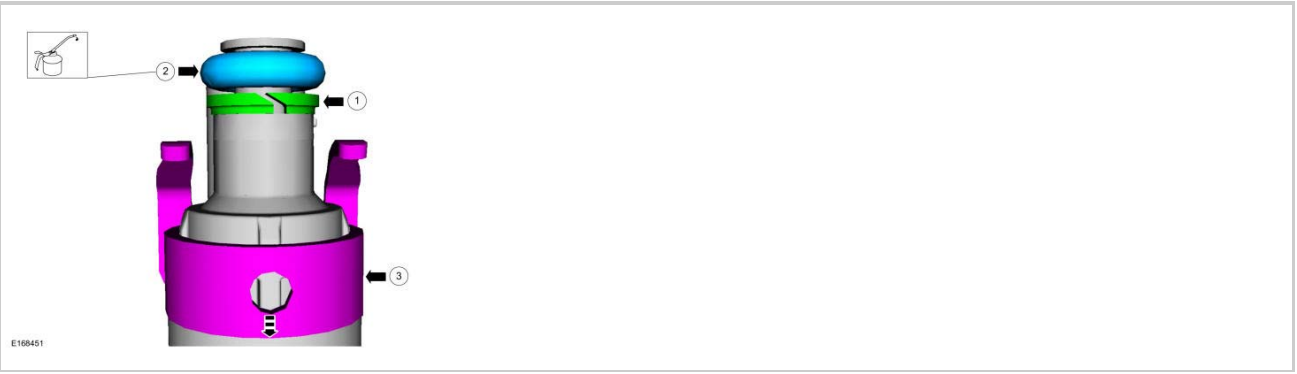
NOTE: Do not lubricate the new lower Teflon® fuel injector seals.

97.

1.

Install the fuel injector seal.

2.



Lubricate with clean engine oil and install the fuel injector O-ring seal.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

3.

Install the fuel injector seal.

NOTE: The FRP sensor must be replaced if it is removed from the fuel rail.

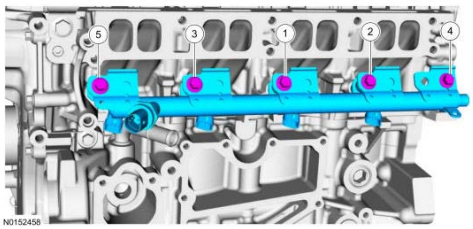
NOTE: The anti-rotation finger of the fuel injector clip must slip into the groove of the fuel rail cup.

98.
Install the fuel injectors in the fuel rail.

NOTE: Make sure that new fuel rail bolts are installed.

NOTE: Do not lubricate the new lower Teflon® fuel injector seals.

99.

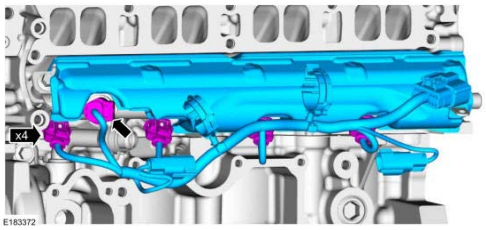


Install the fuel rail by push down on the fuel rail above the injectors.

Install the bolts and tighten in sequence shown in illustration in 2 stages.

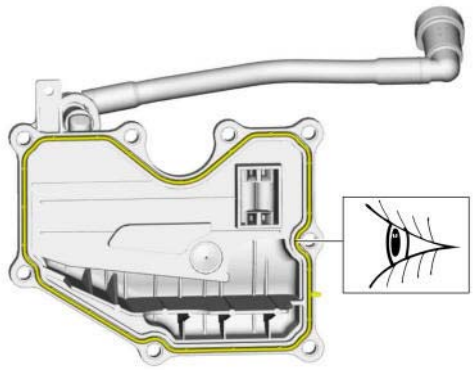
Torque:

Stage 1: 71 lb.in (8 Nm)



Stage 2: 26°

100.

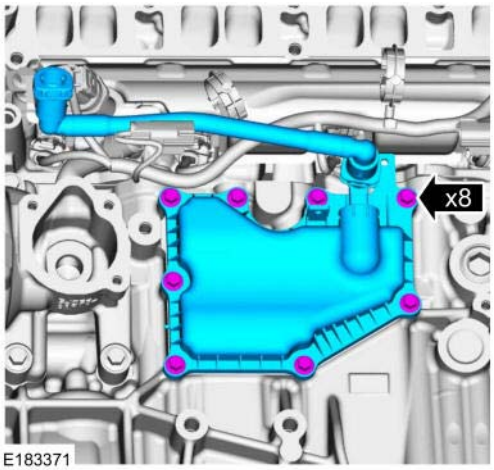


Connect the fuel injectors and FRP sensor electrical connectors.

Install the fuel rail shield.

101.

Inspect and replace the crankcase vent separator gasket, if damaged.



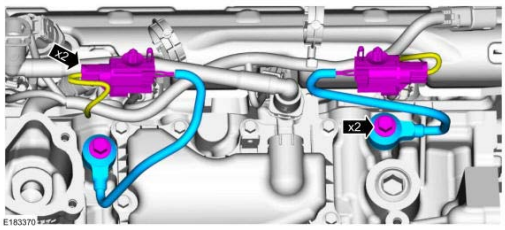
102.

Install the crankcase vent separator and the bolts.

Torque

: 89 lb.in (10 Nm)

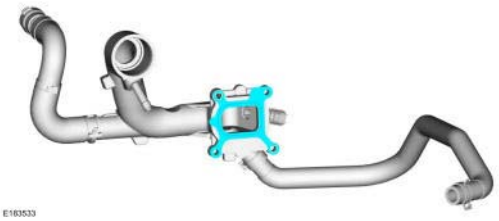
103.



> *NOTE: The forward KS must be installed in the 6 o'clock position and the rearward KS must be installed in the 3 o'clock position as shown in illustration. Failure to follow these instructions may result in damage to the engine.*

Install the KS in their original position and install the bolts.

Torque

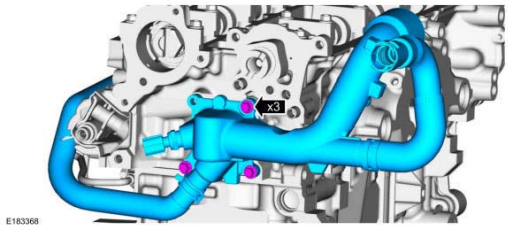


: 177 lb.in (20 Nm)

Connect the KS electrical connectors.

104.

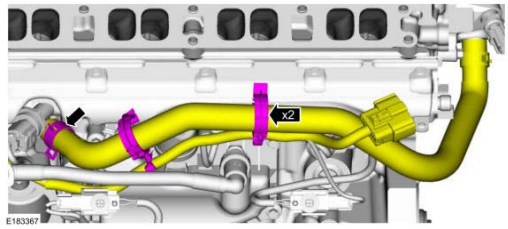
Install a new coolant outlet gasket.



105.

Install the coolant outlet and the bolts.

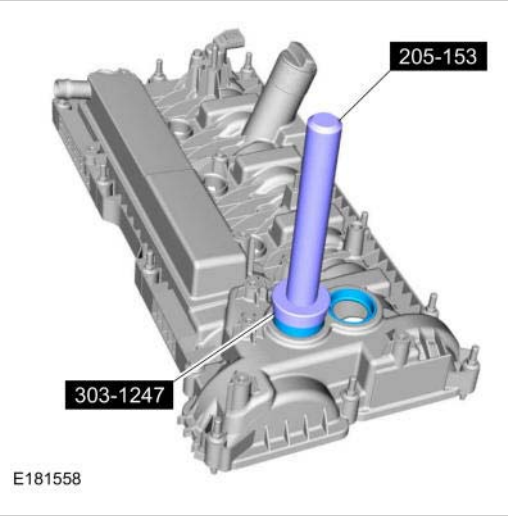
Torque



: 89 lb.in (10 Nm)

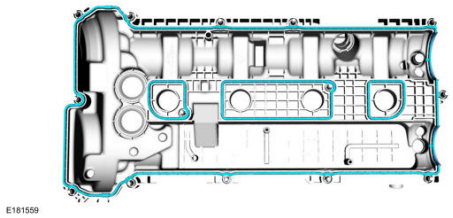
106.

Connect the coolant tube and the retainers.



Use the General Equipment: Hose Clamp Remover/Installer

NOTE: Installation of new seals is only required if damaged seals were removed during valve cover removal.

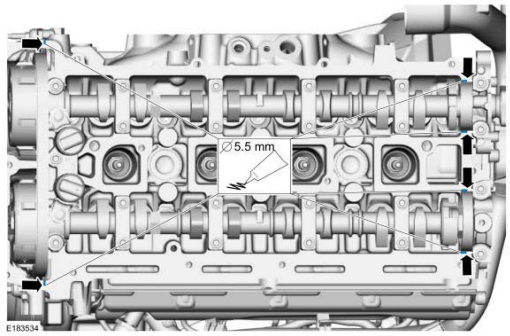


107.
If removed, using the special tools, install the VCT oil control solenoid seals.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

108.

Install a new valve cover gasket.

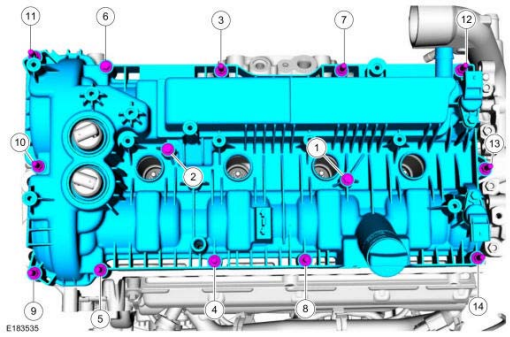


109.

Apply a 5.5 mm bead of silicone sealant.

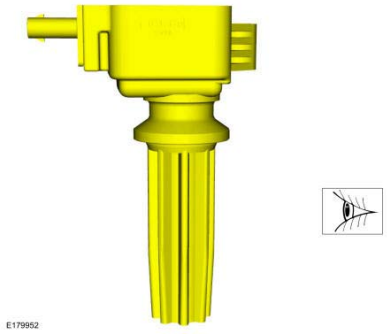
Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



NOTE: The valve cover must be secured within 10 minutes of silicone gasket application. If the valve cover is not secured within 10 minutes, the silicone sealant must be removed and the sealing area cleaned.

110.
Install the valve cover and tighten the fasteners in the sequence shown in illustration.

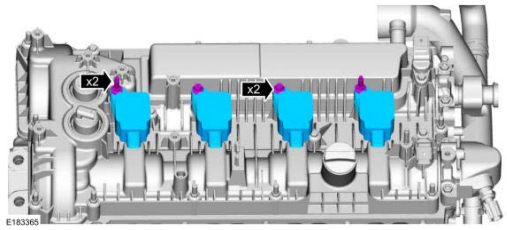


Torque

: 89 lb.in (10 Nm)

111.

Inspect the ignition coil-on-plug assembly for cracks, rips, or tears. Replace any damaged coil-on-plug assemblies.

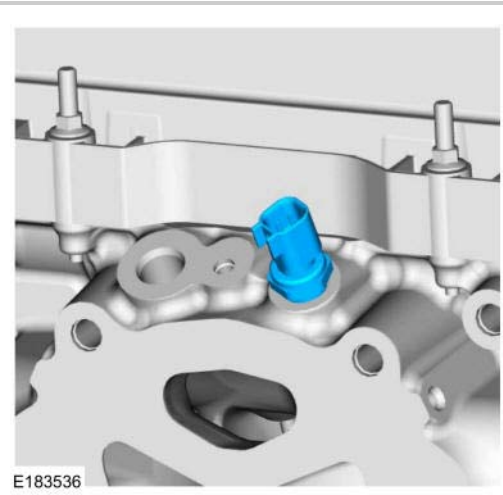


112.

Install the ignition coil-on-plugs and the fasteners.

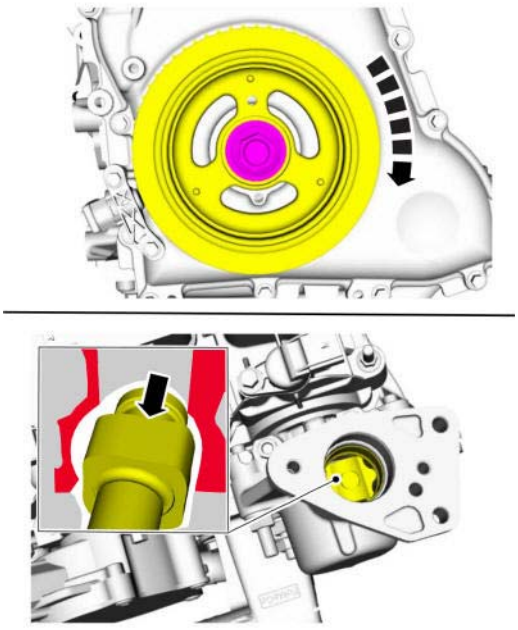
Torque

: 53 lb.in (6 Nm)



113

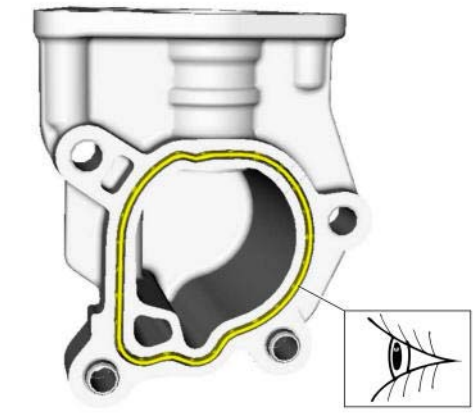
Install a new CHT sensor.



Torque

: 97 lb.in (11 Nm)

NOTE: The fuel injection cam lobe must be positioned at zero lift before installing the high-pressure fuel pump drive unit.



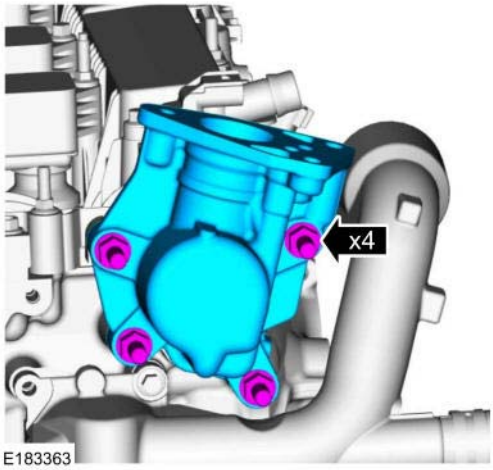
114.
Rotate the crankshaft to position the camshaft at zero lift.

E183361

115.

Inspect and replace the high-pressure fuel pump drive unit gasket, if damaged.

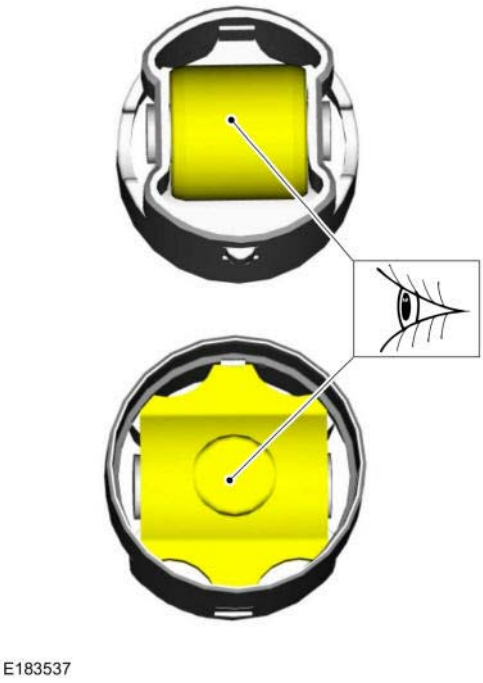
N0152074



116.

Install the high-pressure fuel pump drive unit and the stud bolts and tighten in 2 stages.

Torque



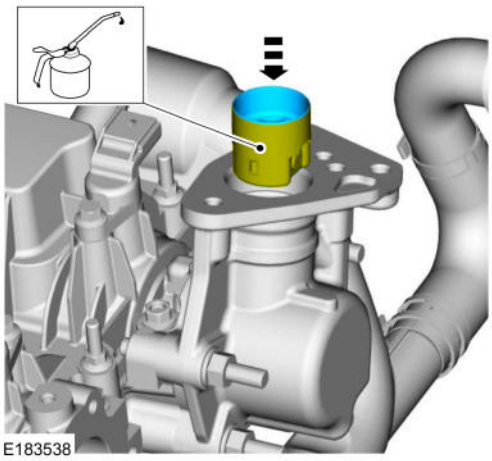
Stage 1: 133 lb.in (15 Nm)

Stage 2: 60°

117.

Inspect the high-pressure fuel pump tappet for flat spots or scoring, especially in the indicated areas. If any damage is found, inspect the high-pressure fuel pump and the high-pressure fuel pump tappet drive lobe. Install a new component as necessary.

118.



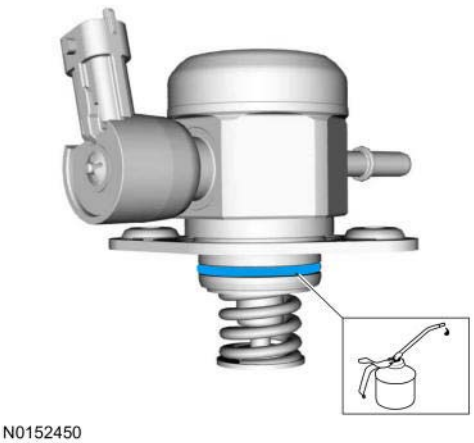
Lubricate the high-pressure fuel pump tappet with clean engine oil.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.)

(WSS-M2C946-A)

Install the high-pressure fuel pump tappet.

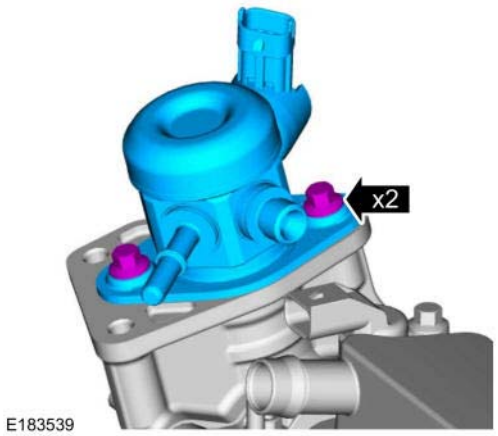


119.

Install a new fuel injection pump O-ring seal.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)



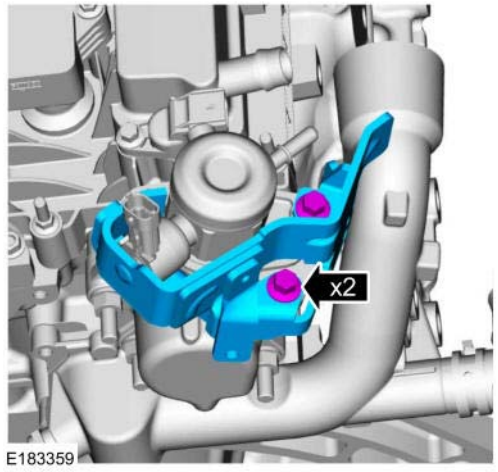
NOTE: Install new bolts.

120.
Install the fuel injection pump and alternately tighten each bolt one complete revolution until seated in 2 stages.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 55°

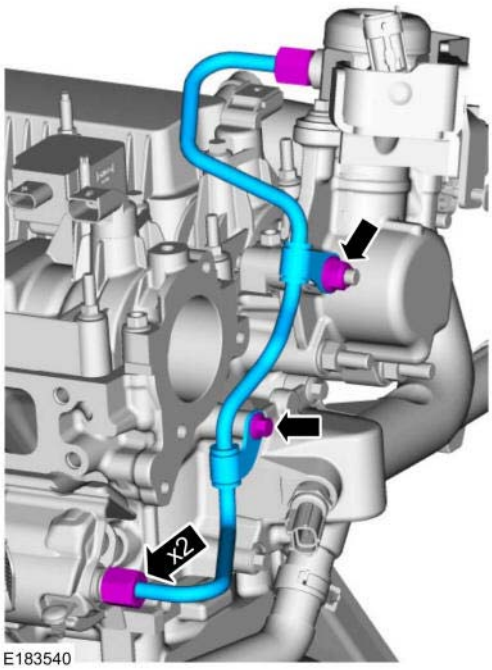


121.

Install the fuel injection pump bracket and the bolts.

Torque

: 150 lb.in (17 Nm)

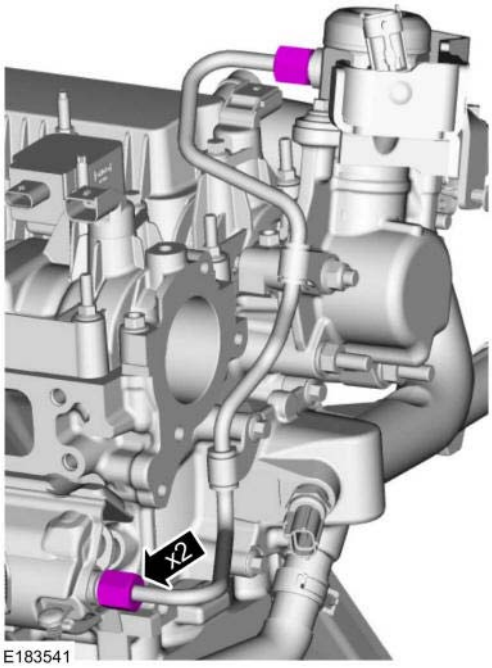


NOTE: Install a new fuel tube.

122.

Install the fuel tube, nut and the bolt finger-tight.

Install the flare nuts finger-tight.



123.

Tighten the flare nuts in 2 stages.

Torque:

Stage 1: 133 lb.in (15 Nm)

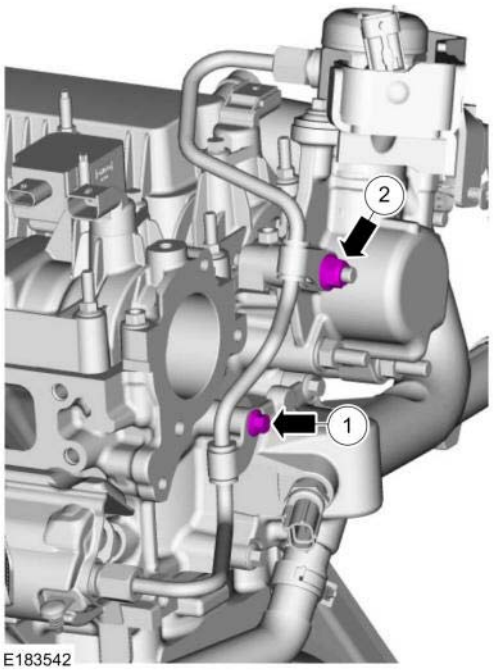
Stage 2: 30°

124.

1.

Tighten the bolt.

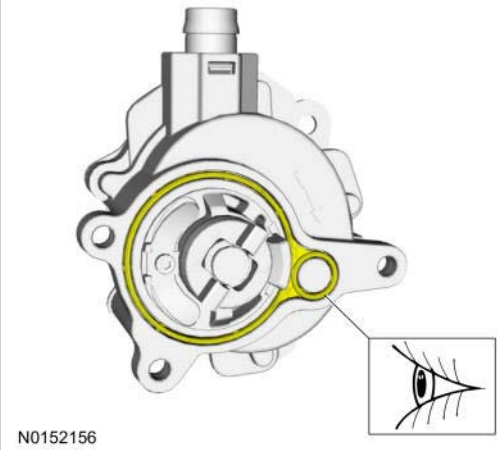
Torque



: 89 lb.in (10 Nm)

2.

Tighten the nut.

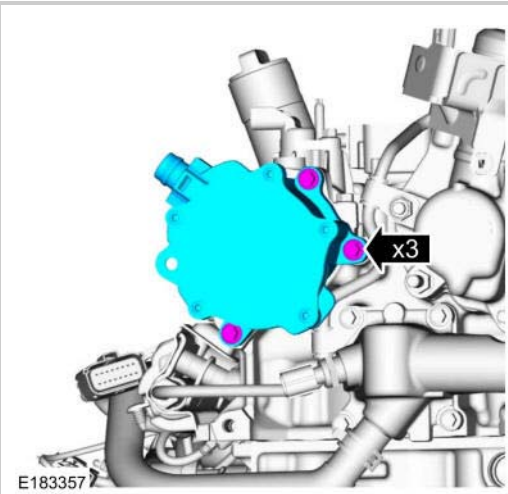


Torque

: 150 lb.in (17 Nm)

125.

Inspect and replace the brake vacuum pump gasket, if damaged.

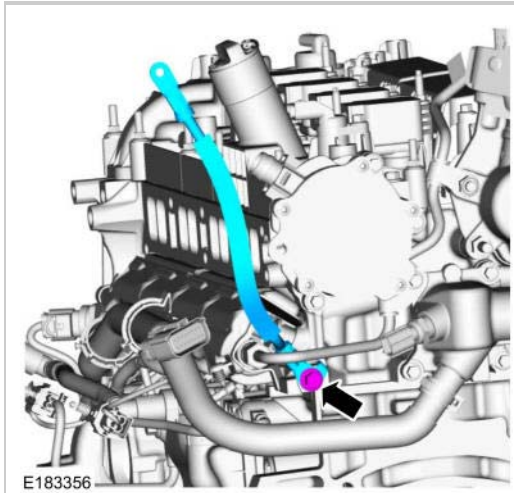


126.

Install the brake vacuum pump and the bolts.

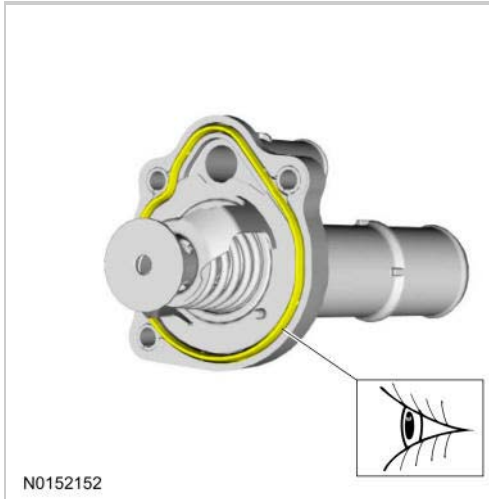
Torque

: 89 lb.in (10 Nm)



127.

Install the ground strap and the bolt.



Torque

: 18 lb.ft (25 Nm)

128.

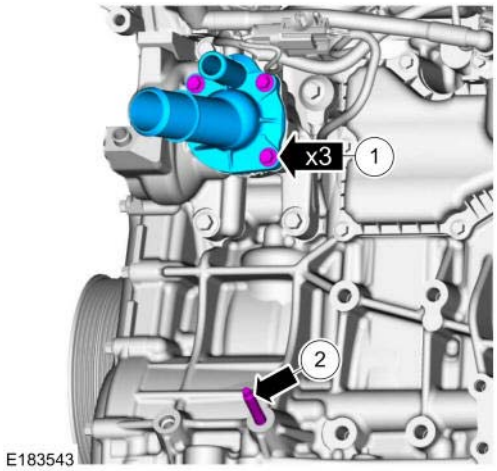
Inspect and replace the thermostat housing gasket, if damaged.

129.

1.

Install the thermostat housing the bolts.

Torque



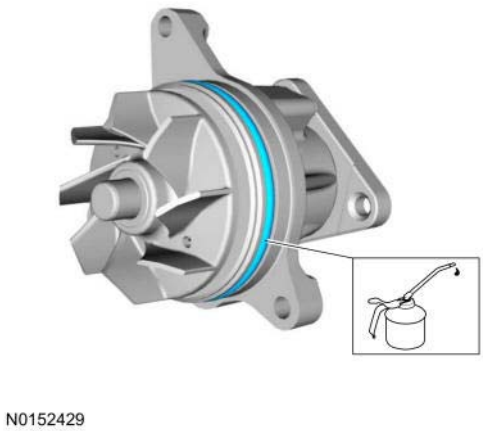
: 89 lb.in (10 Nm)

2.

Install the generator stud.

Torque

: 80 lb.in (9 Nm)

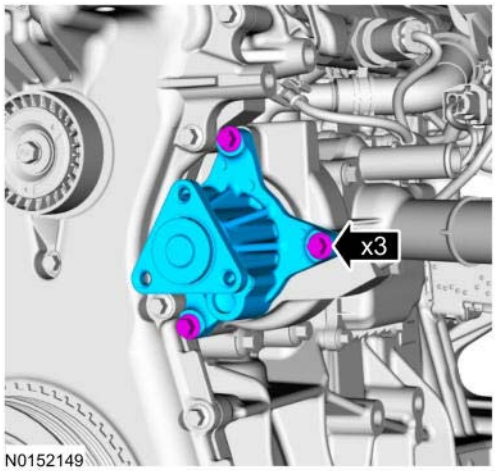


130.

Install and lubricate the coolant pump O-ring seal with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)



131.

Install the coolant pump and the bolts.

Torque

: 89 lb.in (10 Nm)

132.

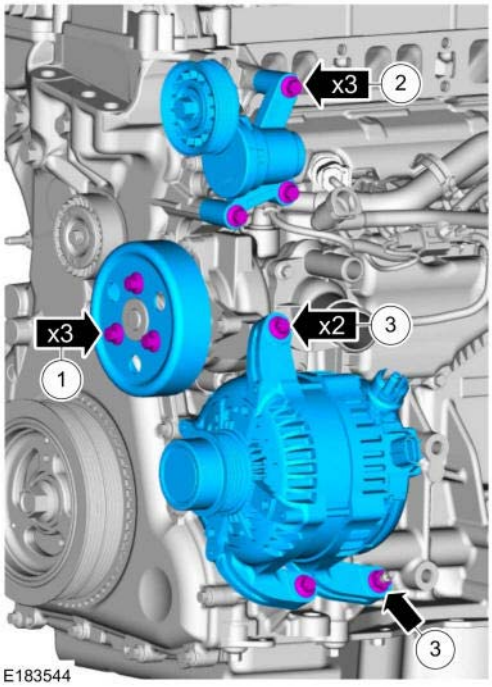
1.

Install the coolant pump pulley and the bolts finger-tight.

2.

Install the accessory drive belt tensioner and the bolts.

Torque



: 18 lb.ft (25 Nm)

3.

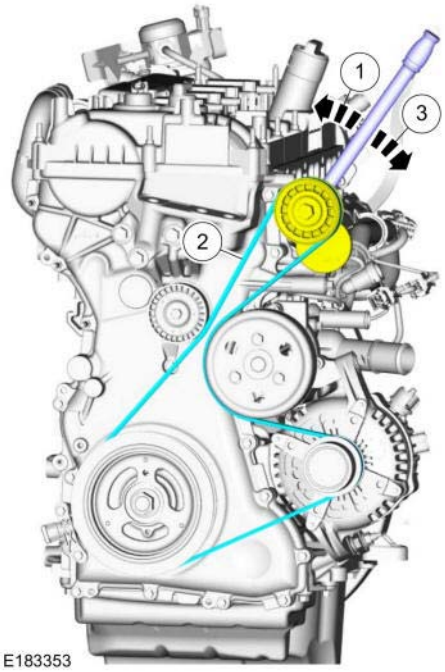
Install the generator, nut and the bolts.

Torque

: 18 lb.ft (25 Nm)

133.

1.



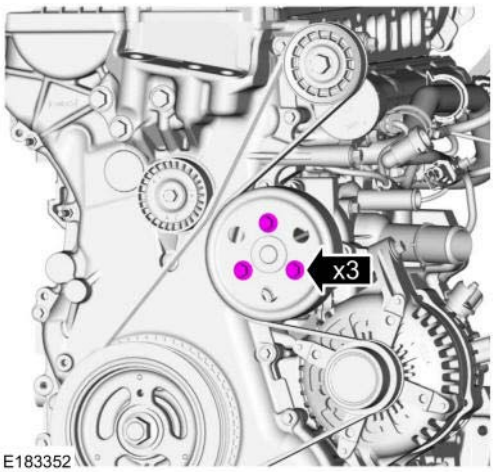
Install the tool and release the tension on the accessory drive belt tensioner.

2.

Install the accessory drive belt.

3.

Release the tool and remove.

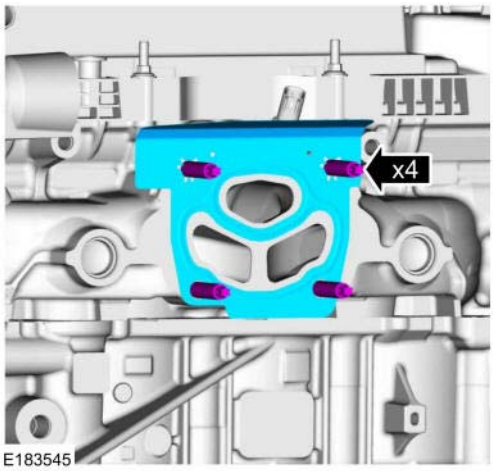


134.

Tighten the coolant pump pulley bolts.

Torque

: 177 lb.in (20 Nm)

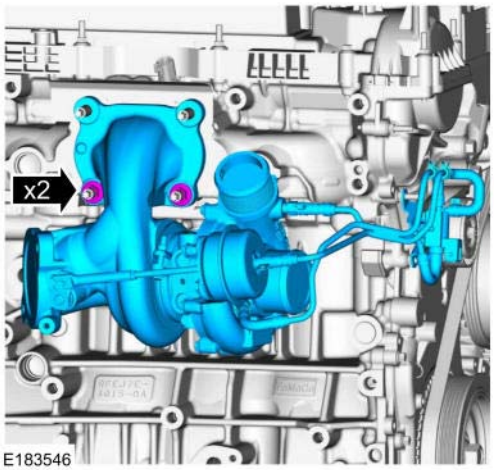


135.

Install the studs and the turbocharger gasket.

Torque

: 150 lb.in (17 Nm)

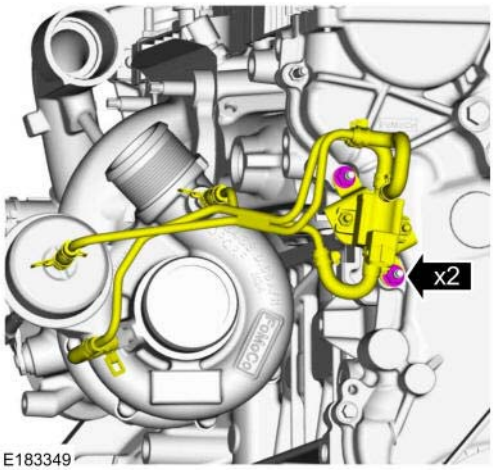


136.

Install the turbocharger and the nuts.

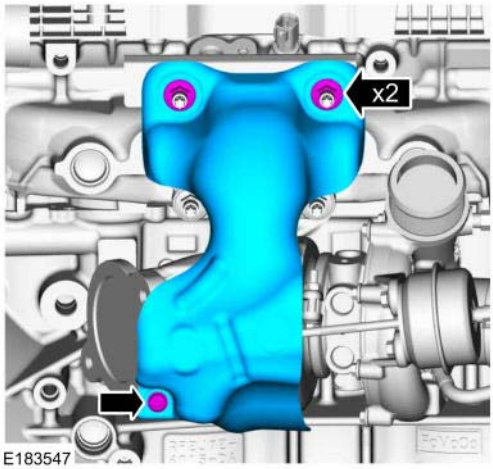
Torque

: 37 lb.ft (50 Nm)



137.

Position the turbocharger vacuum valve and install the nuts.



Torque

: 89 lb.in (10 Nm)

138.

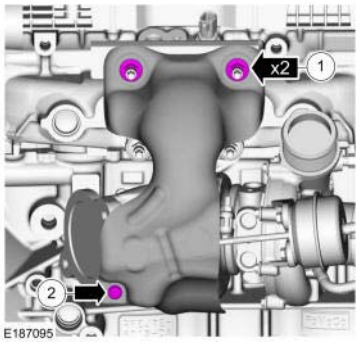
Install the heat shield, nuts and the bolt finger-tight.

139.

1.

Tighten the nuts.

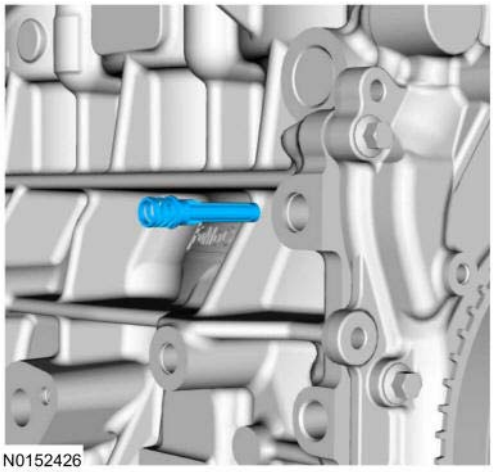
Torque



: 37 lb.ft (50 Nm)

2.

Tighten the bolt.



Torque

: 89 lb.in (10 Nm)

NOTE: Do not reuse the turbocharger oil filter, a new part must be installed.

140.
Install a new turbocharger oil supply filter.

141.

Install new sealing washers.

Lubricate and install the new turbocharger oil supply tube O-ring seal with clean engine oil.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

E183549

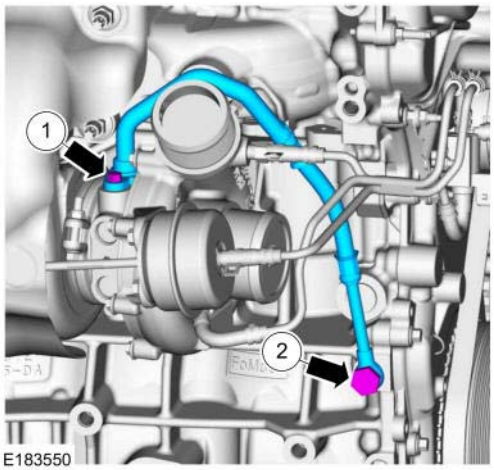
NOTE: The oil feed hose must be fully seated prior to fastener rundown.

142.

1.

Install the turbocharger oil supply tube and the bolt.

Torque



: 89 lb.in (10 Nm)

2.

Tighten the bolt.

Torque

: 18 lb.ft (25 Nm)

E183550

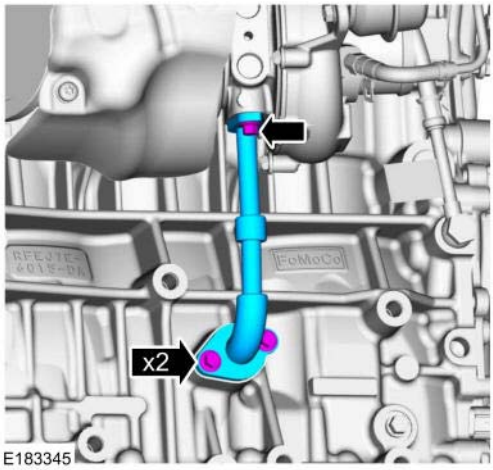
143.

Install a new turbocharger O-ring seal and lubricate with clean engine oil.

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

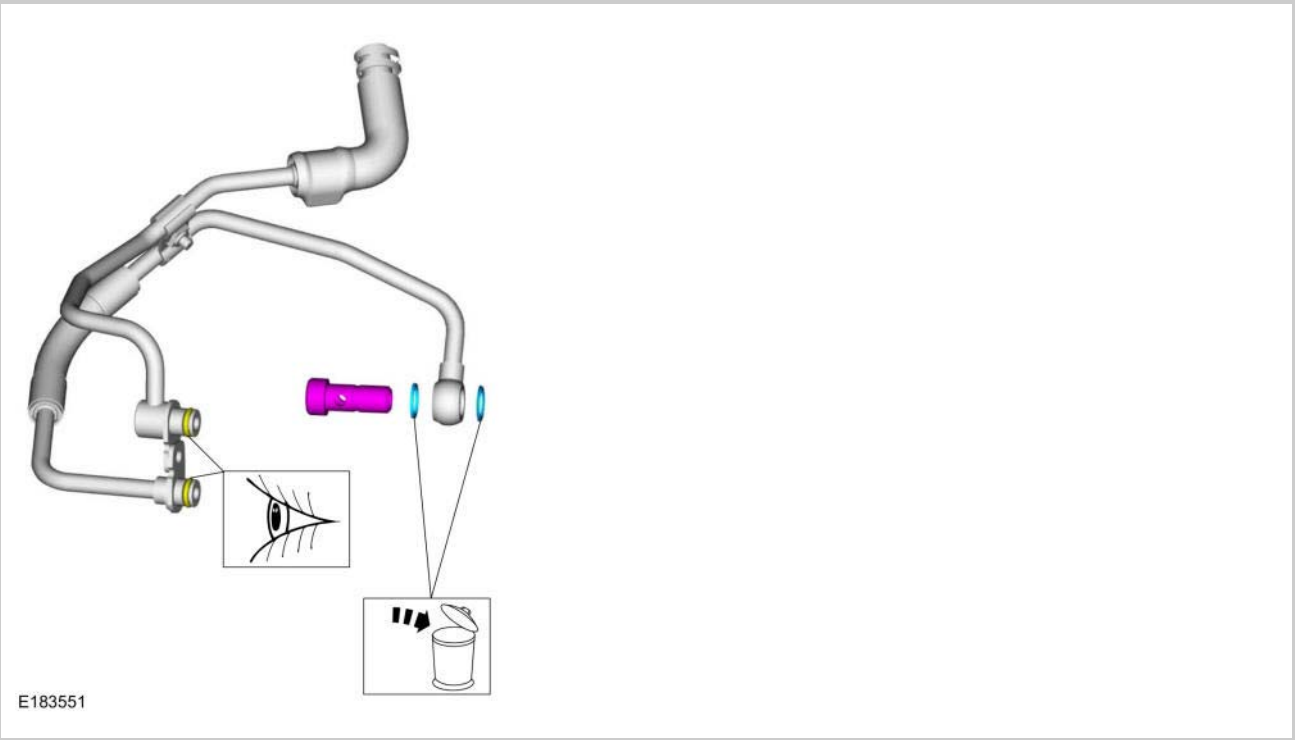
Install a new turbocharger gasket.



NOTE: The oil drain tube must be fully seated prior to fastener rundown.

144.
Install the turbocharger-to-cylinder block oil return tube and the bolts.

Torque

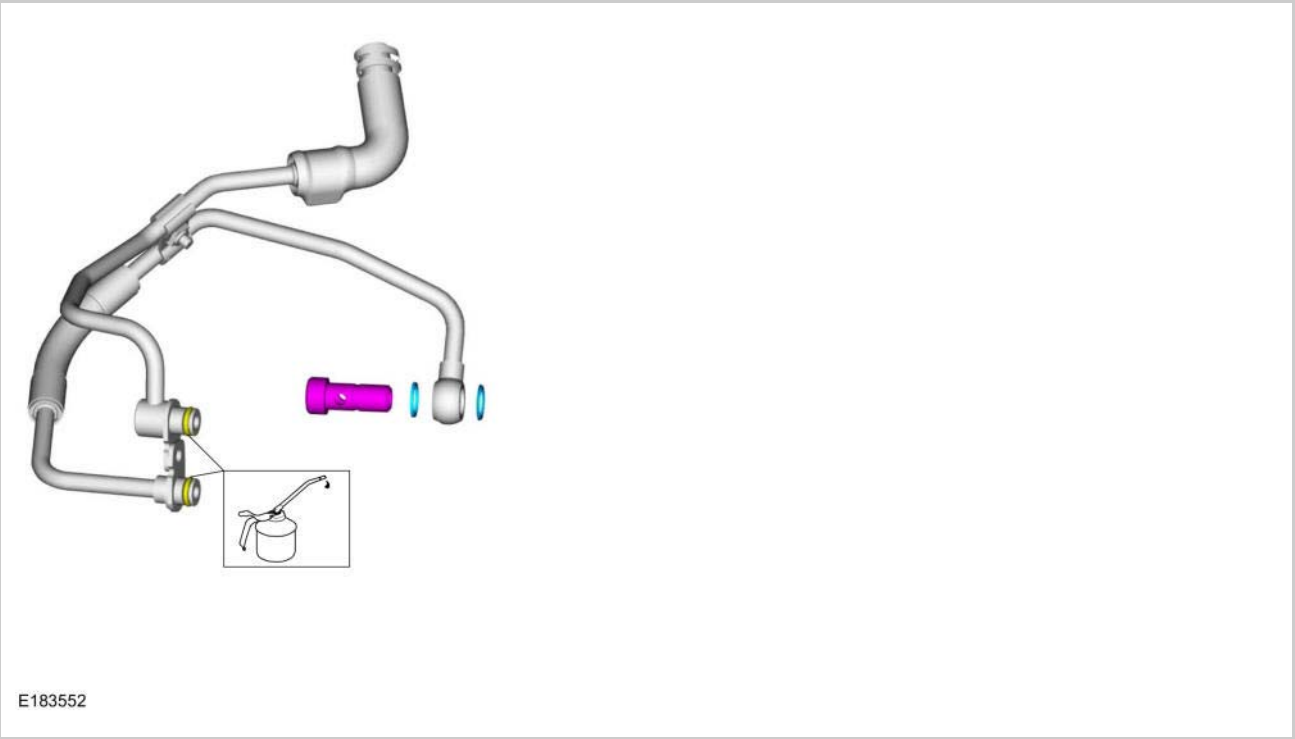


: 89 lb.in (10 Nm)

145.

Inspect a the O-ring seals, replace if damaged.

Discard the washers.



146.

Lubricate the O-ring seals with engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Install new washers.

147.

1.

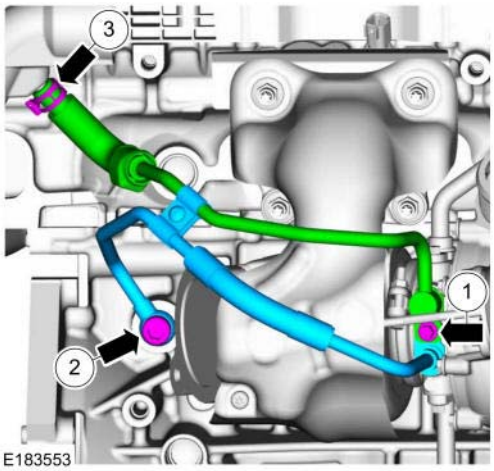
Fit the O-ring end of the turbocharger coolant tubes to the turbocharger. The lower coolant inlet tube goes into the turbocharger first. Install the bolt.

Torque

: 89 lb.in (10 Nm)

2.

Install the bolt for the turbocharger coolant inlet tube.

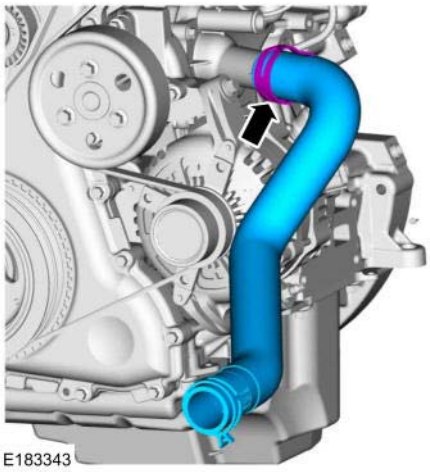


Torque

: 27 lb.ft (37 Nm)

3.

Connect the turbocharger coolant outlet tube to the coolant outlet.



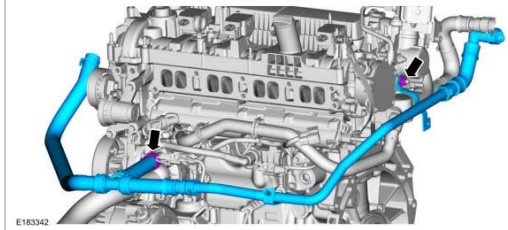
Use the General Equipment: Hose Clamp Remover/Installer

148.

Connect the radiator hose to the thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer

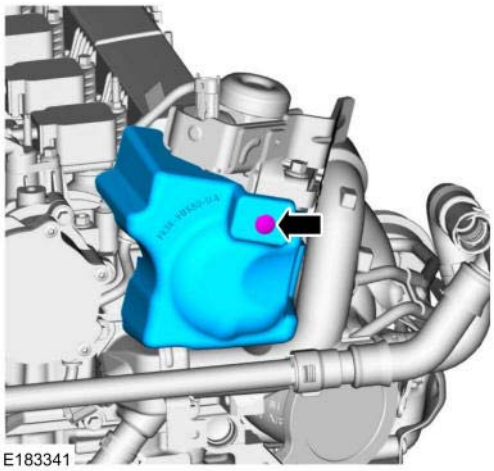
149.



Install the coolant hose and the nut.

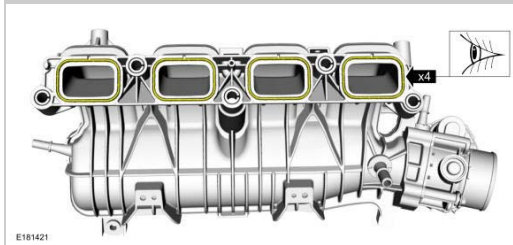
Torque

: 115 lb.in (13 Nm)



Connect the coolant hose to thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer

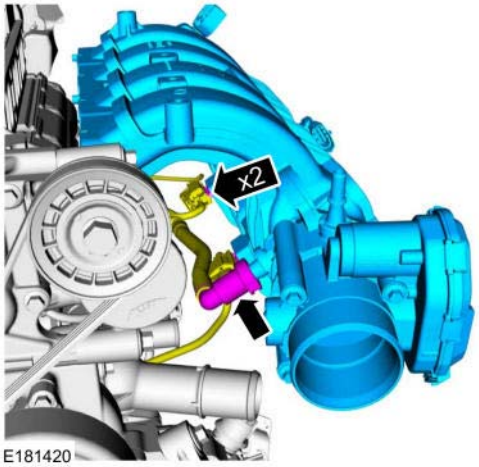


150.

Install the high-pressure fuel pump drive unit cover and the retainer.

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

151.
Visually inspect the intake manifold gaskets for nicks, cuts and abrasions. If these conditions are not present, the gaskets may be reused.

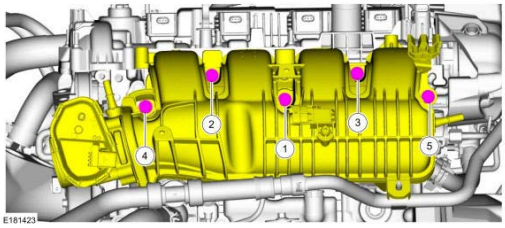


152.

Install the intake manifold.

Attach the KS electrical connector retainers to the intake manifold.

Connect the PCV tube quick release coupling.

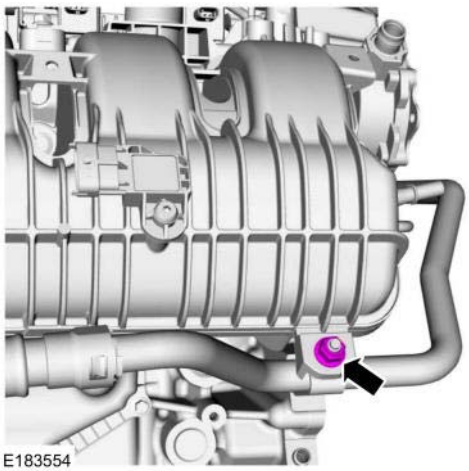


153.

Position the intake manifold and install the bolts.

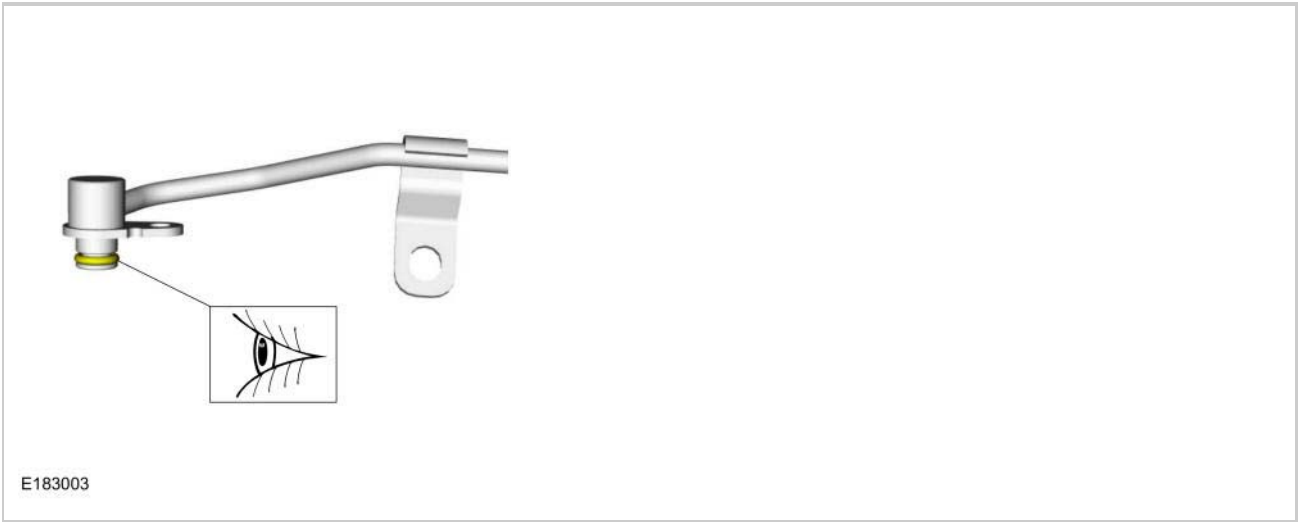
Torque

: 177 lb.in (20 Nm)



154.

Install the nut on the coolant tube stud.

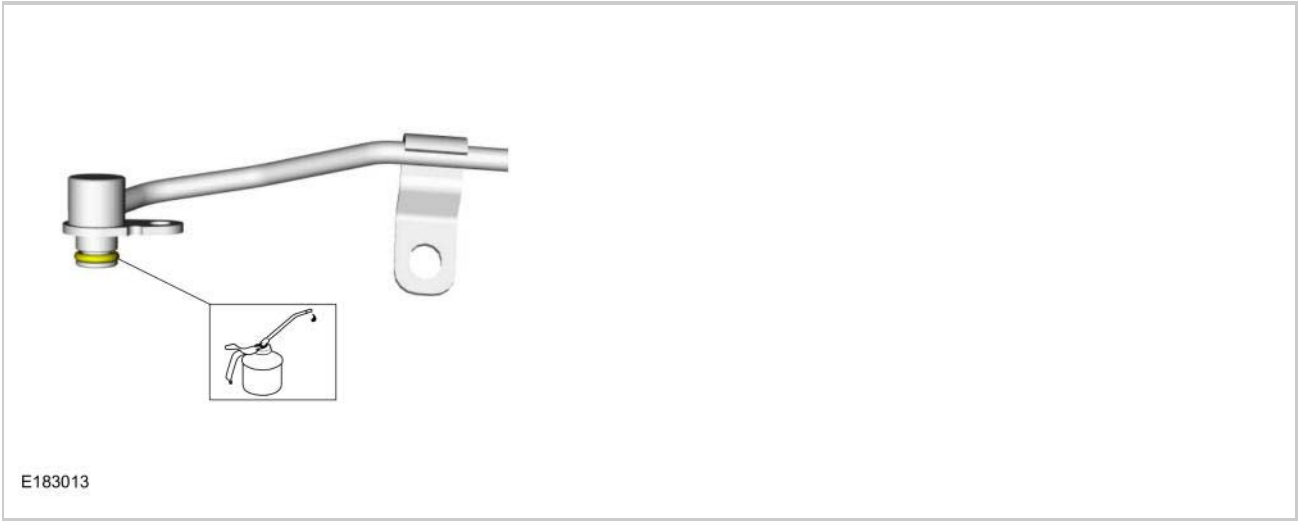


Torque

: 177 lb.in (20 Nm)

155.

Inspect the coolant tube O-ring seal and replace if necessary.



E183003

156.

Lubricate the coolant tube O-ring seal with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

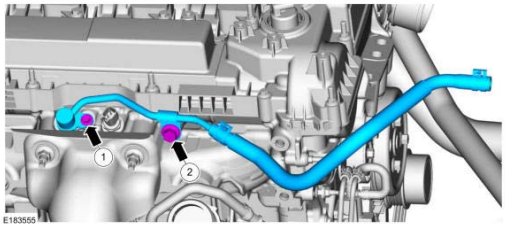
E183013

157.

NOTE: The coolant tube must be fully seated prior to tighten the bolt.

1.
Install the coolant tube and bolt.

Torque



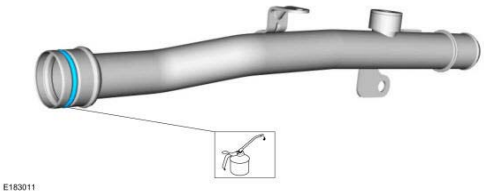
: 97 lb.in (11 Nm)

2.

Install the coolant tube bolt.

Torque

: 22 lb.ft (30 Nm)



158.

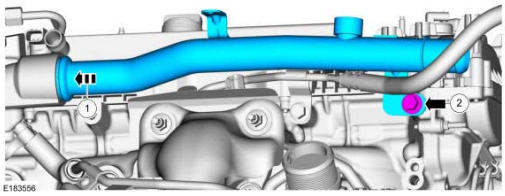
Install a new O-ring seal and lubricate with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

159.

1.

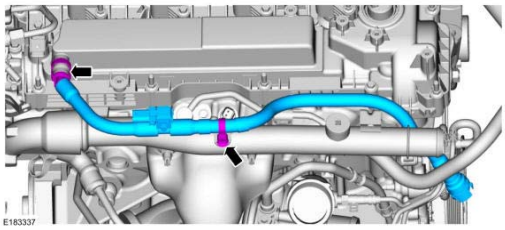


Install the coolant tube.

2.

Install the coolant tube bolt.

Torque



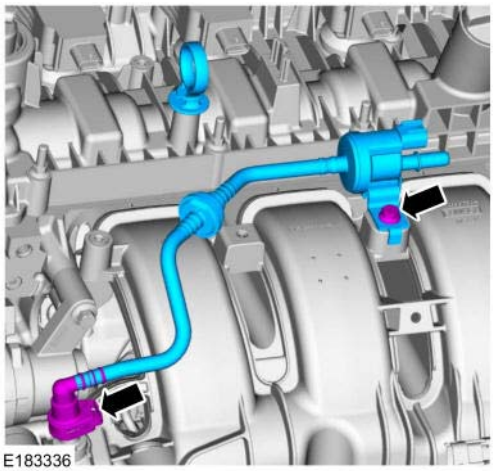
: 89 lb.in (10 Nm)

160.

Connect the crankcase vent tube to the valve cover.

Attach the crankcase vent tube retainer.

161.



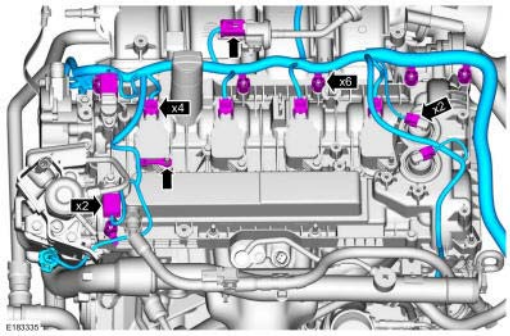
Install the oil level indicator.

Install the EVAP canister purge valve and the bolt.

Torque

: 71 lb.in (8 Nm)

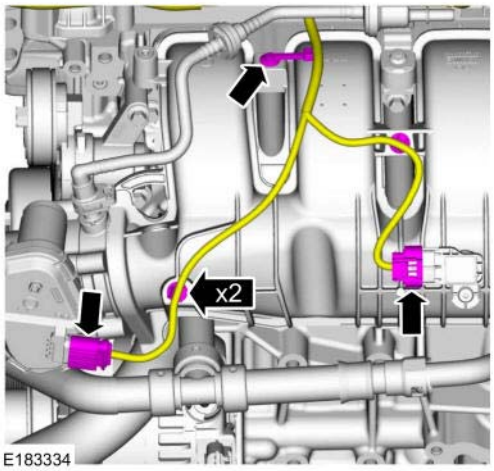
Connect the EVAP canister purge valve quick release coupling.



162.

Install the engine wiring harness and attach the wiring harness retainer.

Connect the ignition coil-on-plugs and VCT oil control solenoid sensor electrical connectors.

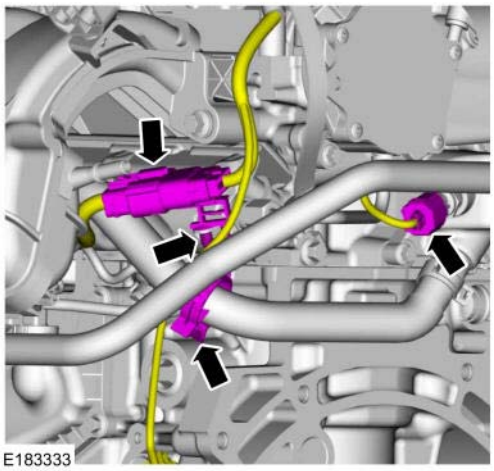


Connect the CMP sensor and EVAP canister purge valve electrical connectors.

163.

Attach the wiring harness retainers.

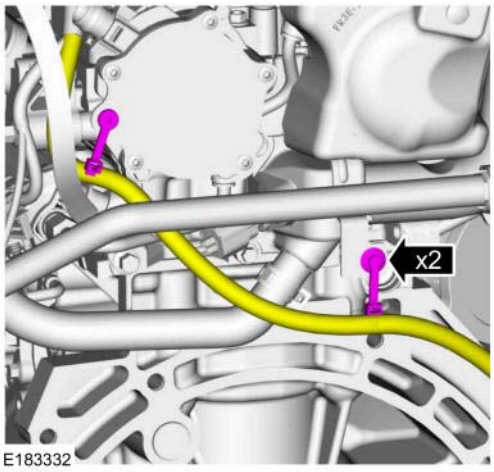
Connect the throttle body and MAPT electrical connectors.



164.

Attach the wiring harness retainer.

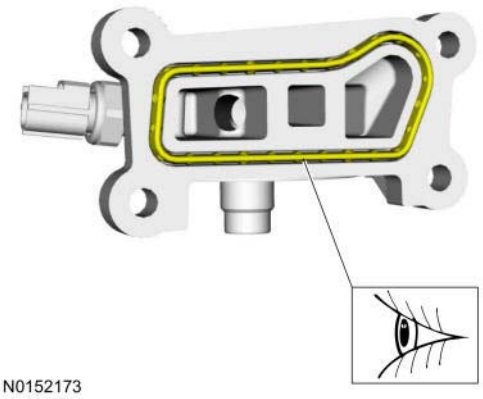
Connect the ECT sensor electrical connector.



Connect and attach the fuel injector harness electrical connector.

6-Speed Automatic Transmission - 6R80

165.

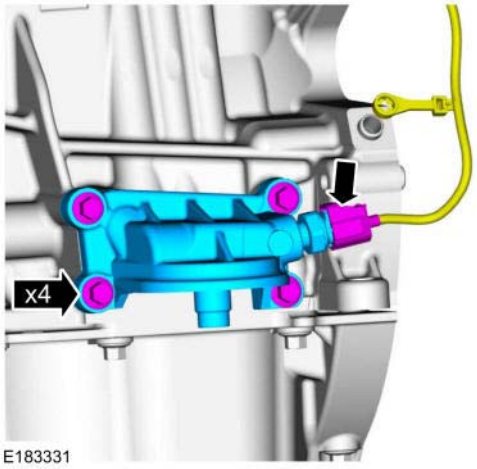


Attach the wiring harness retainers.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

166.

Inspect and replace the oil filter adapter gasket, if damaged.



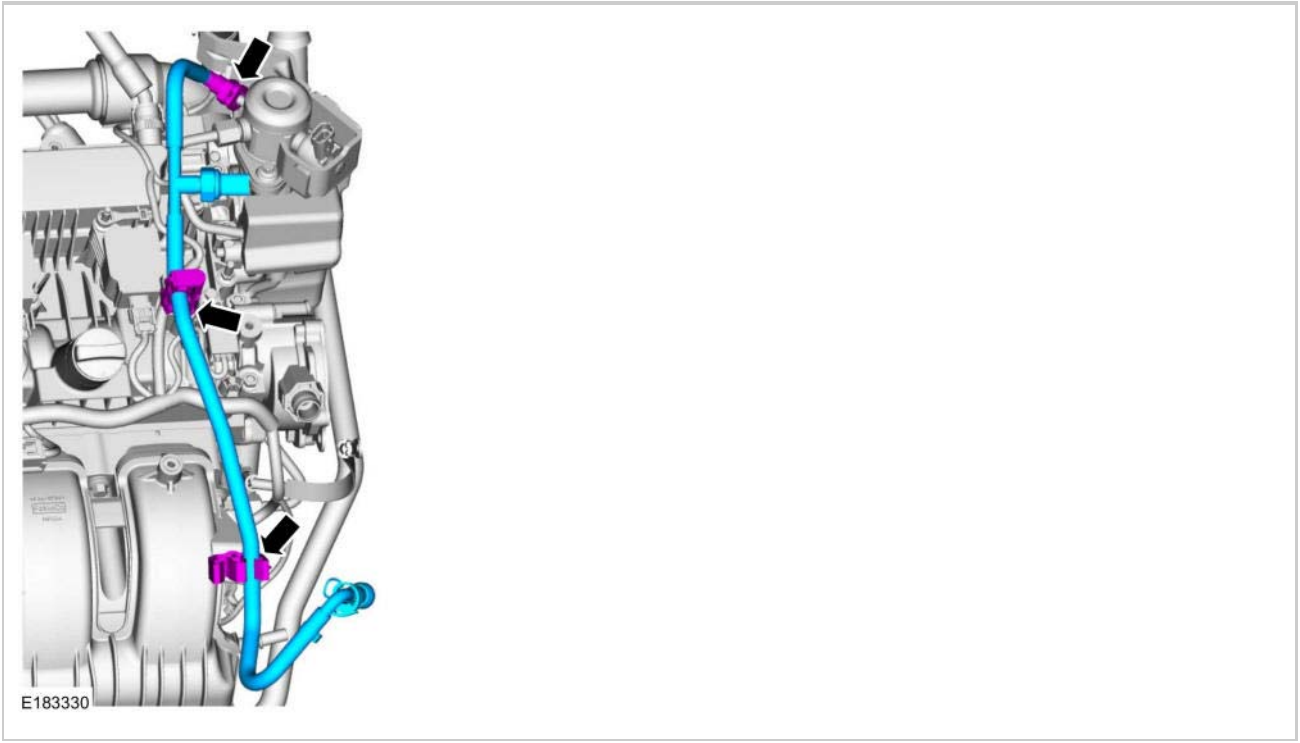
167.

Install the oil filter adapter and the bolts.

Torque

: 18 lb.ft (25 Nm)

Connect the oil pressure switch electrical connector.

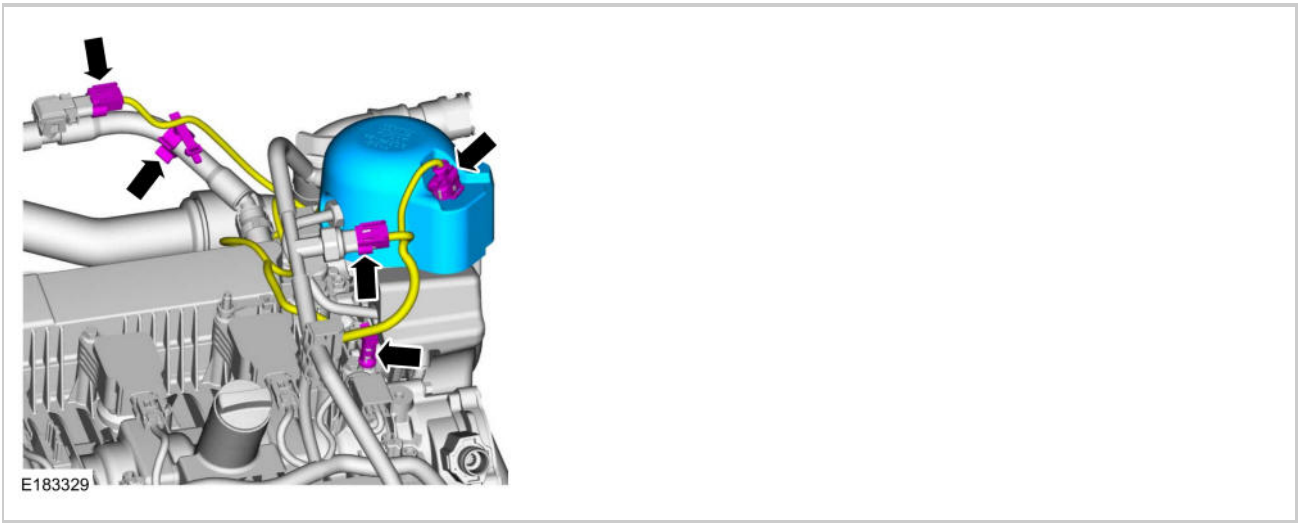


168.

Install the fuel supply tube and attach the retainer.

Connect the fuel supply tube quick release coupling to the high-pressure fuel pump. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

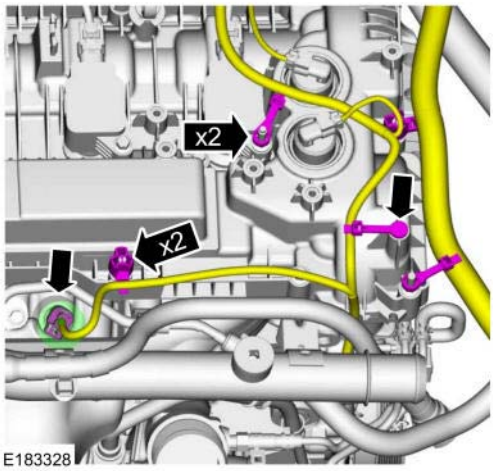
Attach the fuel supply tube to the intake manifold retainer.



169.

Install the high-pressure fuel pump cover.

Attach the wiring harness retainers.

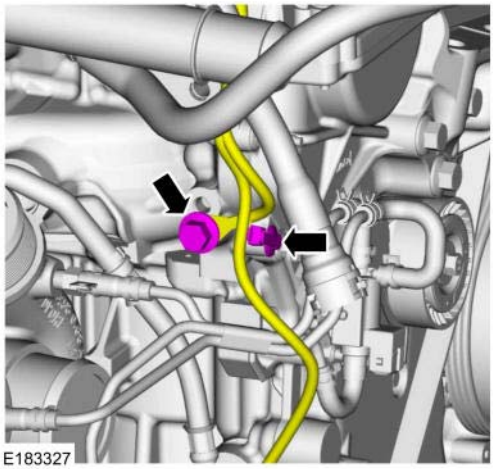


Connect the high-pressure fuel pump, fuel supply tube pressure switch and crankcase vent tube wiring harness electrical connectors.

170.

Attach the wiring harness retainers.

Connect the CHT sensor electrical connector.

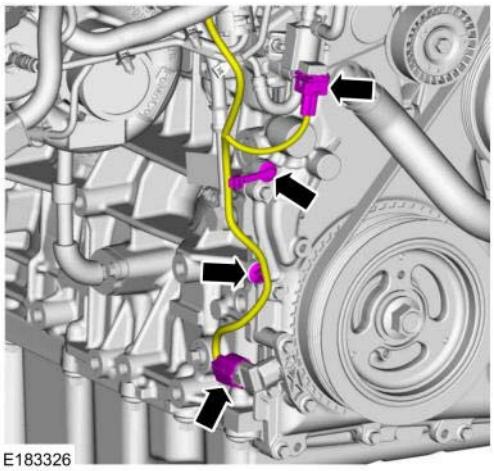


171.

Position the ground wire harness and install the bolt.

Torque

: 177 lb.in (20 Nm)

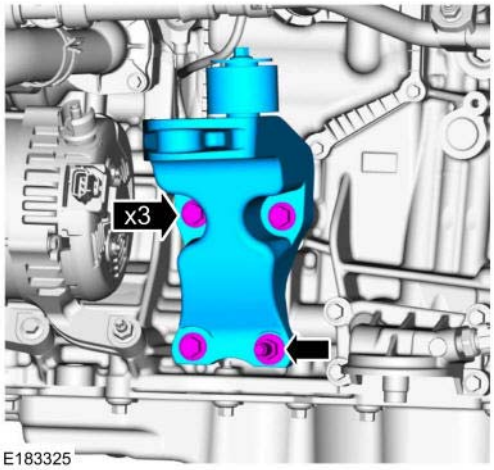


Attach the wiring harness retainer.

172.

Attach the wiring harness retainers.

Connect the CKP and vacuum valve electrical connectors.

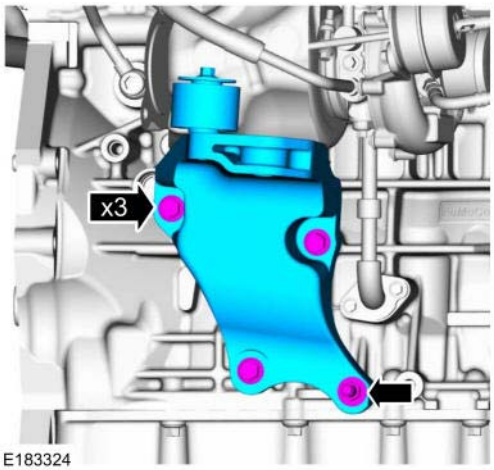


173.

Install the LH engine mount bracket, stud bolt and the bolts.

Torque

: 41 lb.ft (55 Nm)

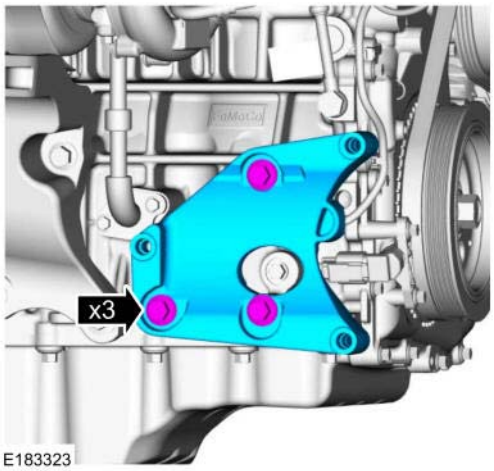


174.

Install the RH engine mount bracket, stud bolt and the bolts.

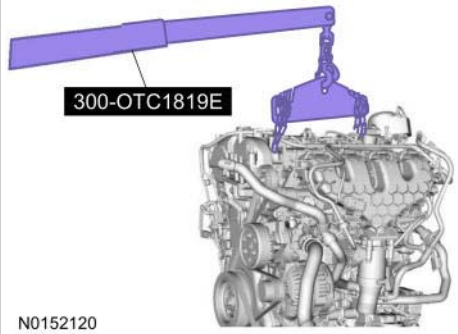
Torque

: 41 lb.ft (55 Nm)



175.

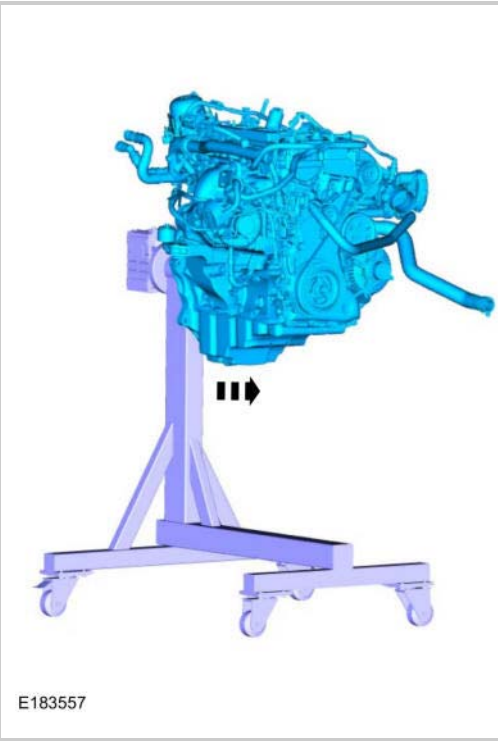
Install the A/C compressor mounting bracket and the bolts.



Torque

: 35 lb.ft (48 Nm)

176.



Install Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.

177.

Remove engine from the mounting stand.

Use the General Equipment: Mounting Stand

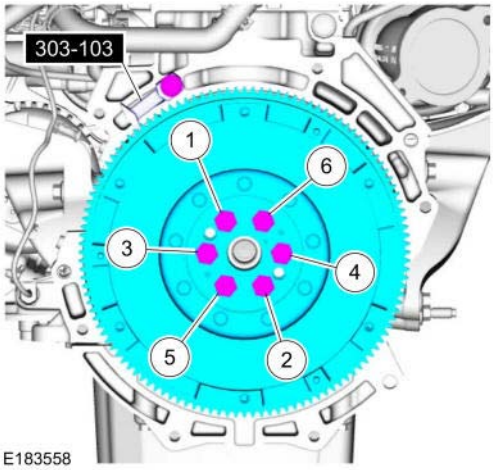
6-Speed Manual Transmission - MT82

NOTE: Special bolts are used for installation. Do not use standard bolts.

178.

Install the flywheel and the new bolts finger-tight.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.

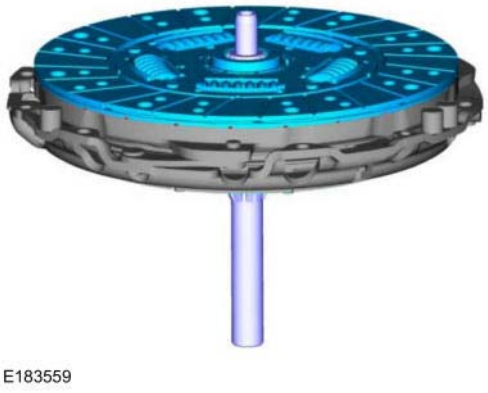


Tighten the bolts in sequence shown in illustration in 3 stages.

Torque:

Stage 1: 37 lb.ft (50 Nm)

Stage 2: 59 lb.ft (80 Nm)

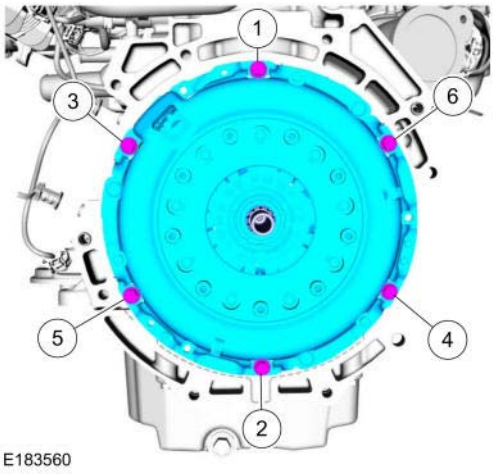


Stage 3: 83 lb.ft (112 Nm)

179.

Using the Clutch Alignment tool, position the clutch disc on the flywheel.

Use the General Equipment: Clutch Alignment Tool



NOTE: Special bolts are used for installation. Do not use standard bolts.

180.
Using the Clutch Alignment tool, position the clutch pressure plate on the flywheel and install the clutch pressure plate bolts.

Use the General Equipment: Clutch Alignment Tool

Torque

: 26 lb.ft (35 Nm)

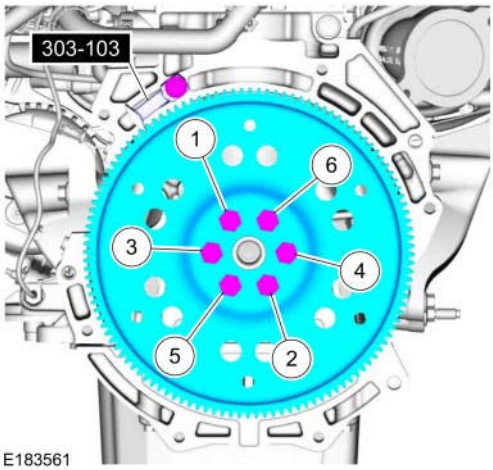
6-Speed Automatic Transmission - 6R80

181.

NOTE: Special bolts are used for installation. Do not use standard bolts.

Install the flexplate and the new bolts finger-tight.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.



Tighten the bolts in sequence shown in illustration in 3 stages.

Torque:

Stage 1: 37 lb.ft (50 Nm)

Stage 2: 59 lb.ft (80 Nm)

Stage 3: 83 lb.ft (112 Nm)

INSTALLATION > ENGINE

Special Tool(s) / General Equipment

 ST1341-A	300-OTC1819E 2, 200# Floor Crane, Fold Away
	303-050 (T70P-6000) Lifting Bracket, Engine
Magnetic Socket

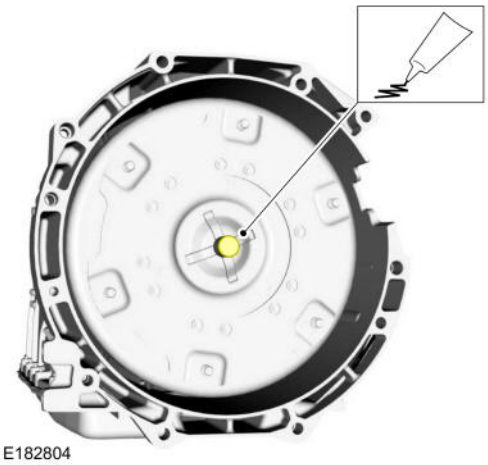
Materials

Name	Specification
Motorcraft® Multi-Purpose Grease Spray XL-5-A	ESB-M1C93-B
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A



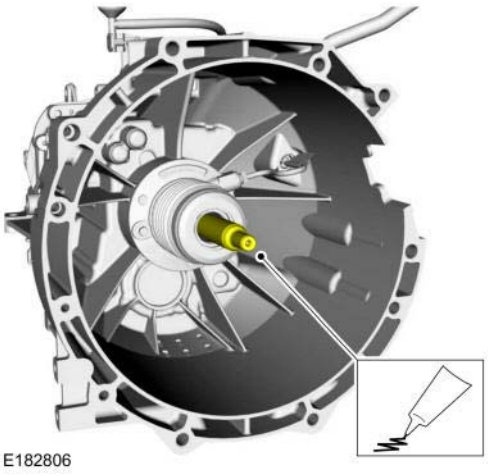
6-Speed Automatic Transmission - 6R80

1.

Lubricate the torque converter pilot hub with multi-purpose grease.

Material

: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

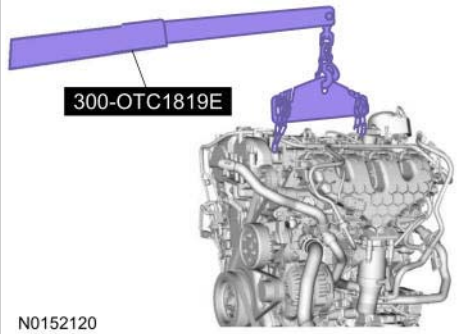


6-Speed Manual Transmission - MT82

2.

Lubricate the input shaft with multi-purpose grease.

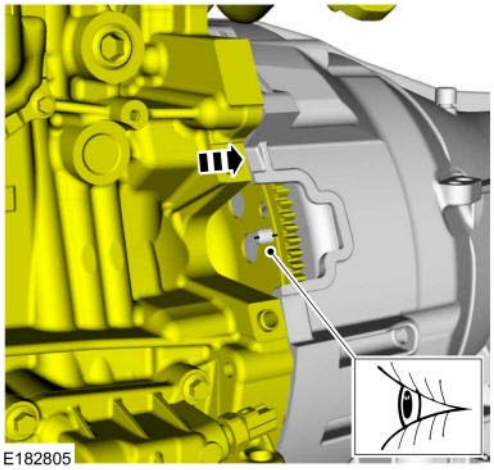
Material



: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

3.

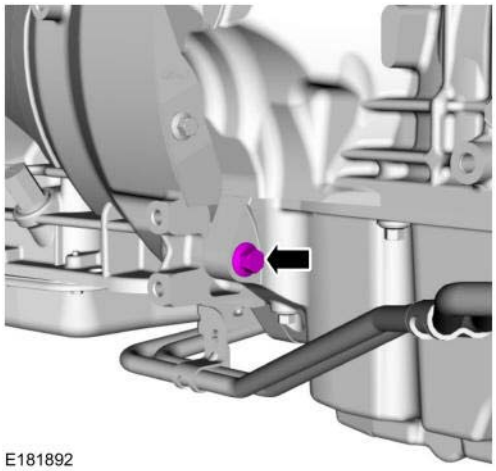


Using the special tool, install the engine. Use Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.

6-Speed Automatic Transmission - 6R80

4.

Align the torque converter stud marked during removal with the flexplate.



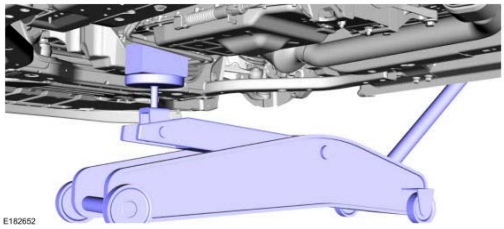
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: Automatic transmission shown in illustration, manual transmission similar.

5.
Install the oil pan bolt.

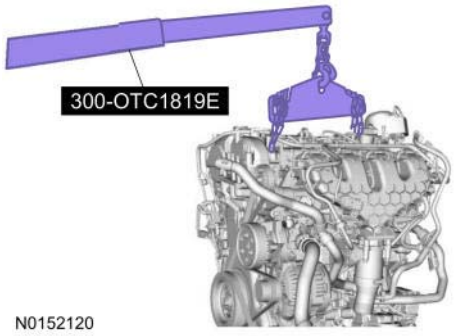
Torque

: 35 lb.ft (48 Nm)



6.

Remove the jack and wooden block.

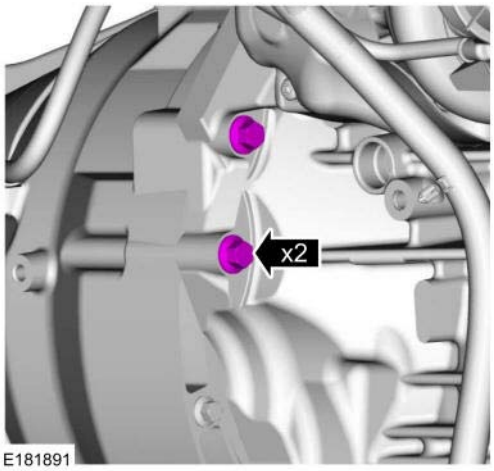


Use the General Equipment: Wooden Block

Use the General Equipment: Trolley Jack

7.

Remove Special Service Tool: 300-OTC1819E 2, 200# Floor Crane, Fold Away.

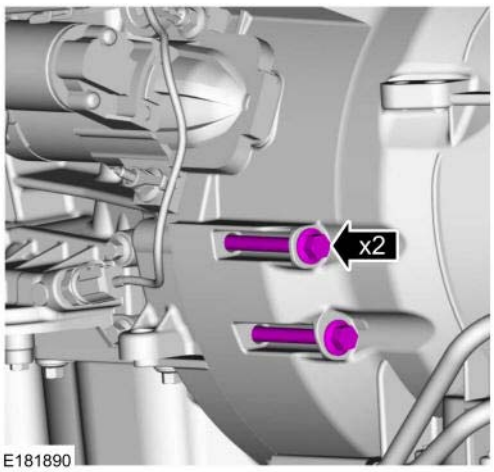


NOTE: Automatic transmission shown in illustration, manual transmission similar.

8.
Install the transmission bolts.

Torque

: 35 lb.ft (48 Nm)

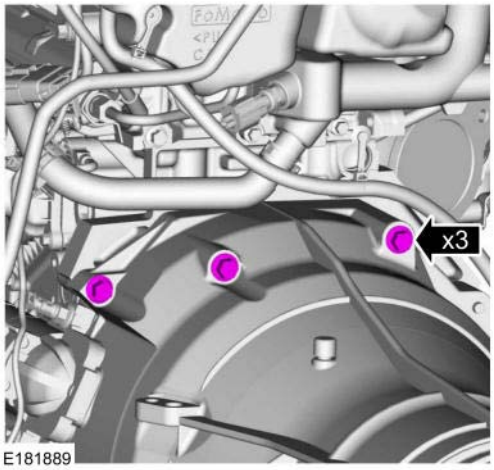


NOTE: Automatic transmission shown in illustration, manual transmission similar.

9.
Install the transmission bolts.

Torque

: 35 lb.ft (48 Nm)

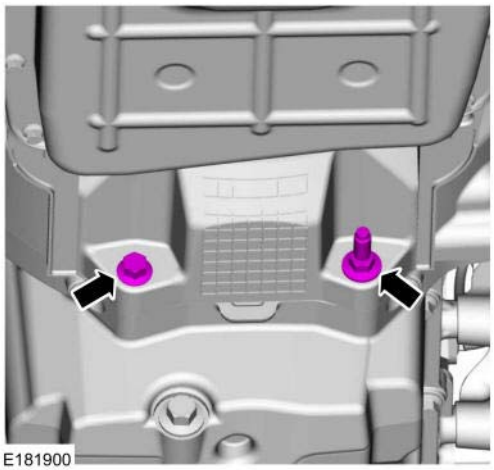


NOTE: Automatic transmission shown in illustration, manual transmission similar.

10.
Install the transmission bolts.

Torque

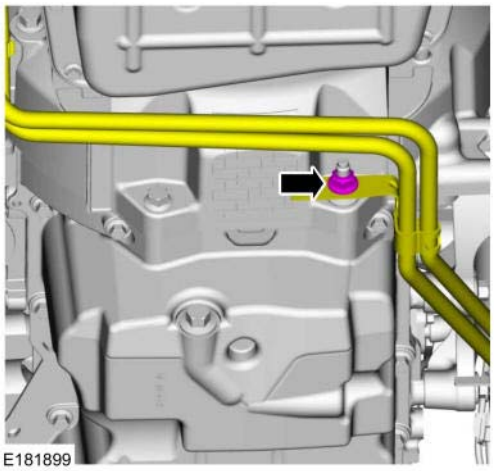
: 35 lb.ft (48 Nm)



NOTE: Automatic transmission shown in illustration, manual transmission similar.

11.
Install the oil pan bolts.

Torque

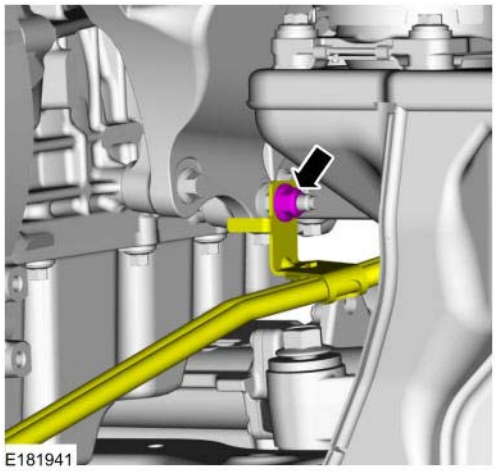


: 35 lb.ft (48 Nm)

6-Speed Automatic Transmission - 6R80

12.

Install the transmission cooling tube bracket and nut.

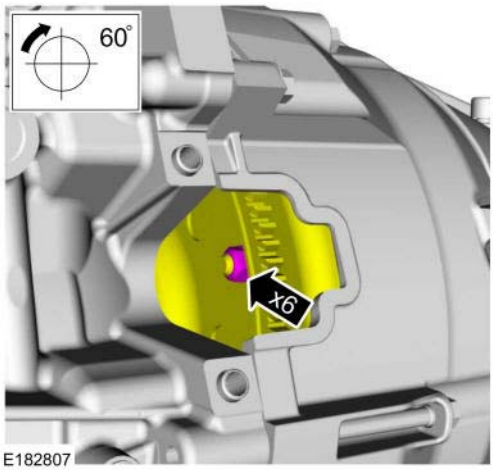


13.

Position the automatic transmission tube bracket and install the nut.

Torque

: 35 lb.ft (48 Nm)



NOTE: Only rotate the crankshaft in a clockwise direction.

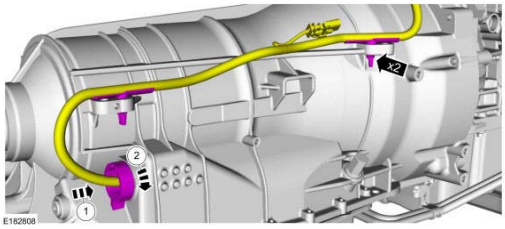
14.
Install the new torque convertor nuts.

Use the General Equipment: Magnetic Socket

Torque

: 30 lb.ft (40 Nm)

15.

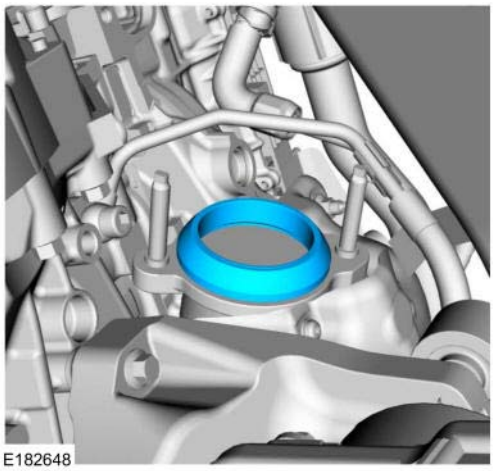


1.

Push the transmission electrical connector in to connect.

2.

Rotate the transmission electrical connector clockwise.

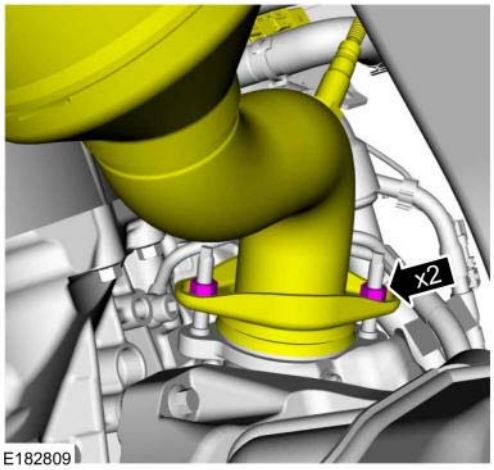


Attach the wiring harness retainers.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

16.

Install a new gasket.

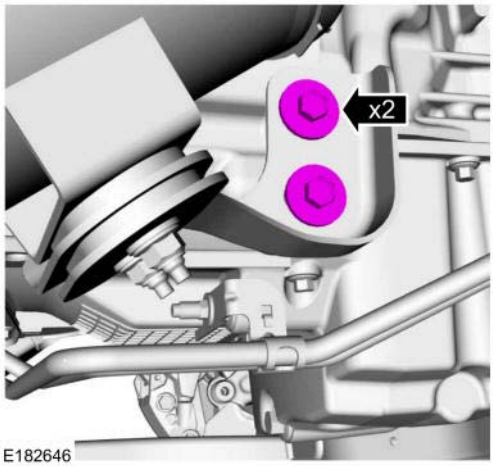


17.

Position the catalytic converter and install the new nuts.

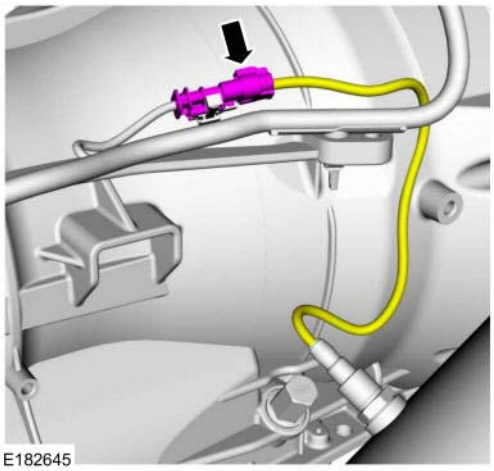
Torque

: 30 lb.ft (40 Nm)



NOTE: Automatic transmission shown in illustration, manual transmission similar.

18.
Install the bolts for the catalytic converter bracket.



Torque

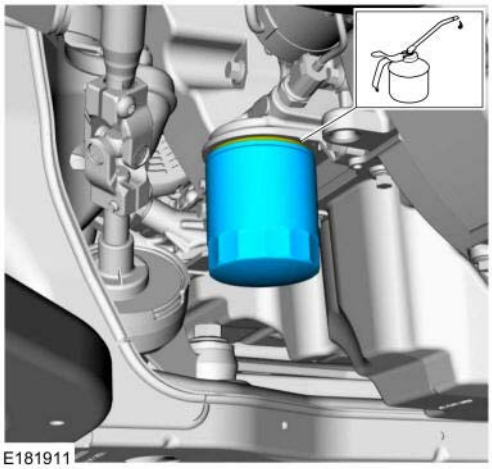
: 18 lb.ft (25 Nm)

NOTE: Automatic transmission shown in illustration, manual transmission similar.

19.
Connect the catalyst monitor sensor (CMS) sensor electrical connector.

NOTE: Lubricate the engine oil filter seal with clean engine oil.

20.
Install a new engine oil filter.



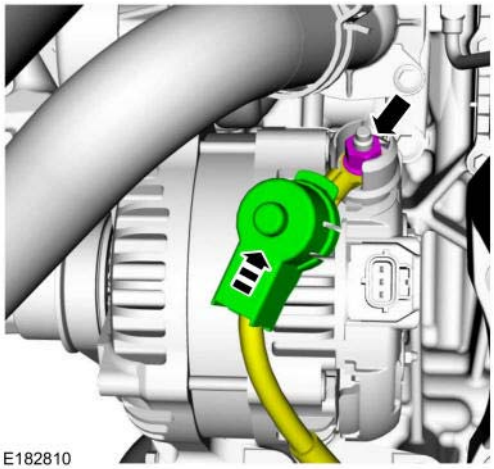
Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 180°



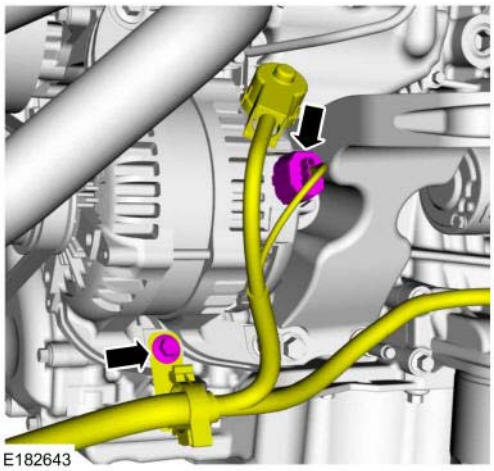
21.

Install the B+ cable and the nut.

Torque

: 150 lb.in (17 Nm)

Position the protective cover.



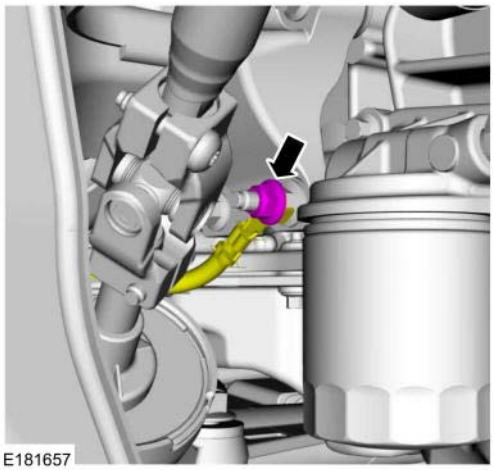
22.

Connect the generator electrical connector.

Position the wire harness retainer and install the bolt.

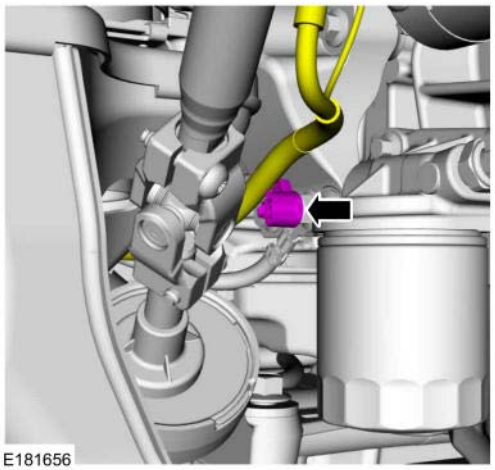
Torque

: 89 lb.in (10 Nm)



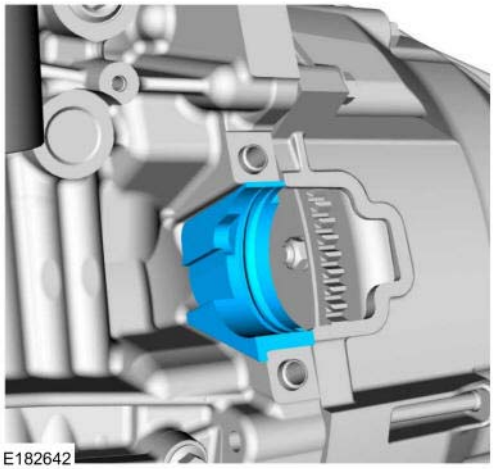
23.

Install the ground wire and nut to the engine mount bracket stud bolt.



Torque

: 35 lb.ft (48 Nm)



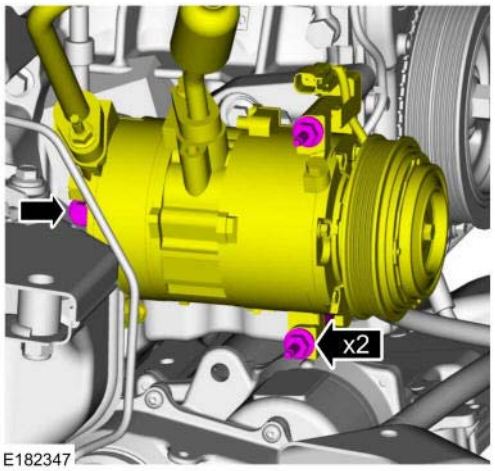
24.

Attach the wire harness retainer to the engine mount bracket stud bolt.

25.

Install the starter motor insulator.

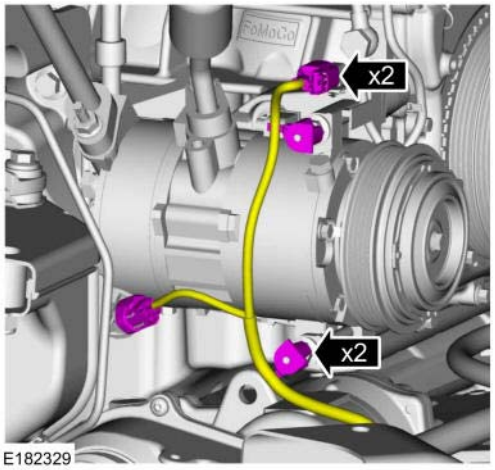
26.



Install the starter motor. Refer to: STARTER MOTOR .

27.

Position the A/C compressor and install the bolts.

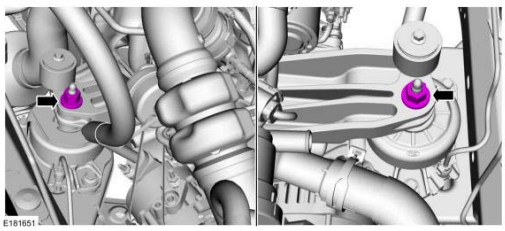


Torque

: 18 lb.ft (25 Nm)

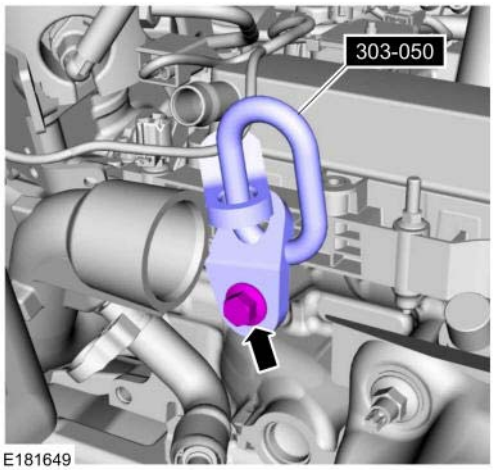
28.

Connect the A/C compressor electrical connectors and the wire harness retainers.



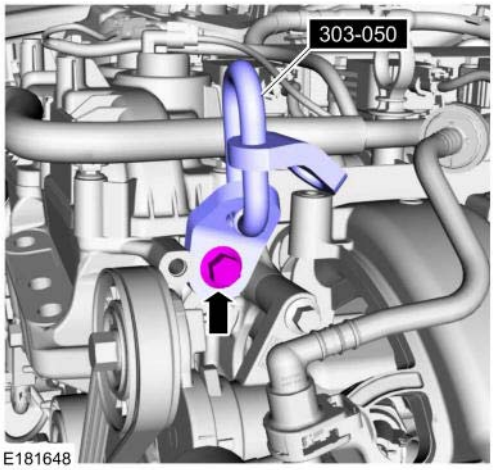
29.

Install the RH and LH engine mount bracket nuts.



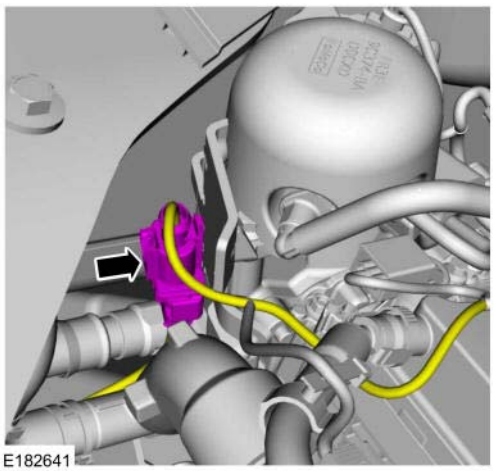
Torque

: 92 lb.ft (125 Nm)



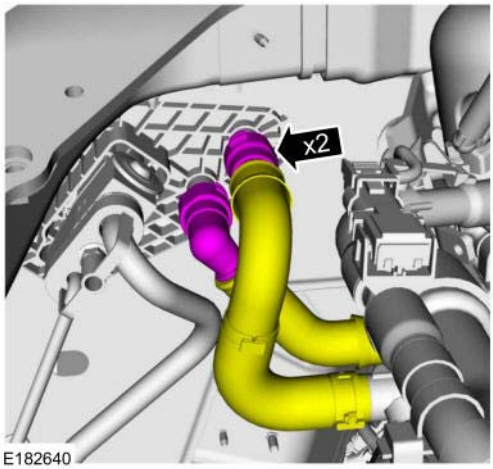
30.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



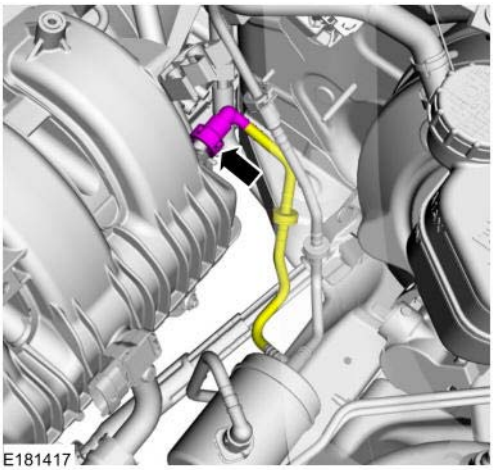
31.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine.



32.

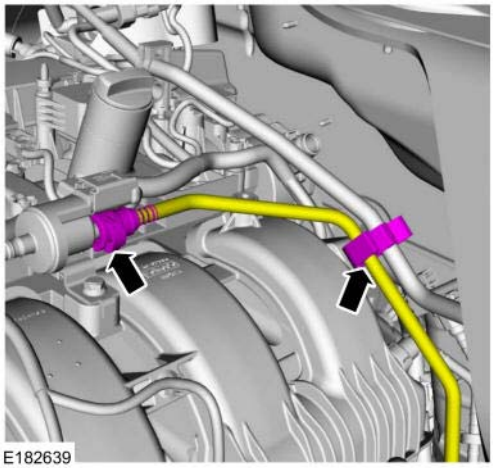
Connect and attach the HO2S electrical connector.



33.

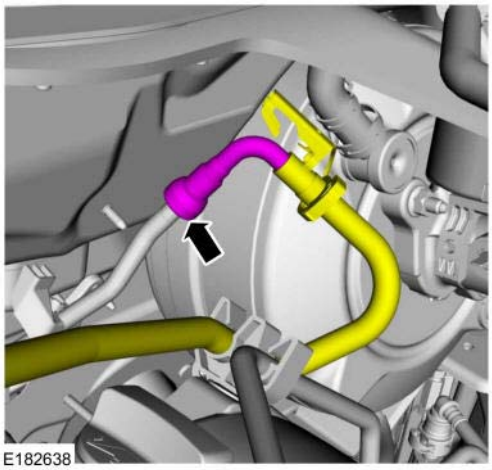
Connect the coolant hoses to the heater core.

34.



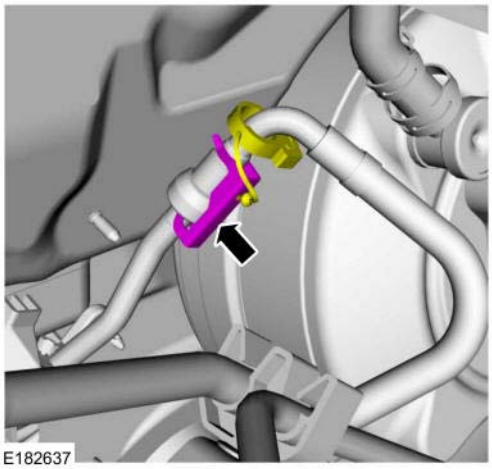
Connect the vacuum tube to the rear of the intake manifold.

35.



Attach the vacuum tube to the intake manifold retainer.

Connect the vacuum tube quick release coupling to the EVAP canister purge valve.

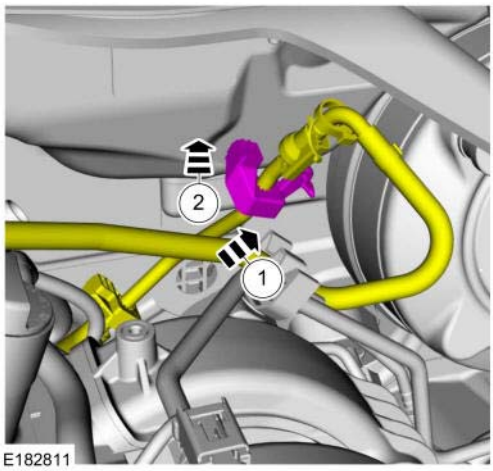


36.

Connect the fuel supply tube. Refer to: SPRING LOCK COUPLINGS - 2.3L EcoBoost (231kW/314PS).

37.

Install the fuel supply tube spring lock coupling retainer.



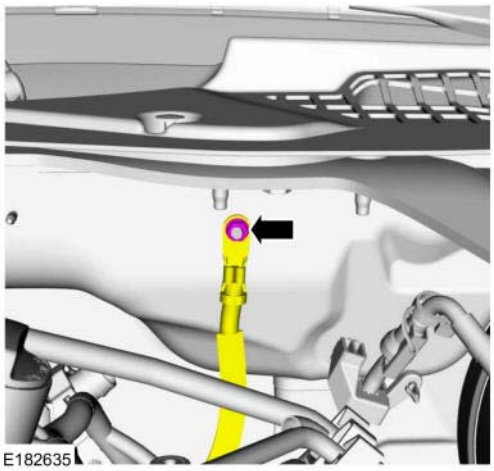
38.

1.

Slide the retainer up the fuel supply tube.

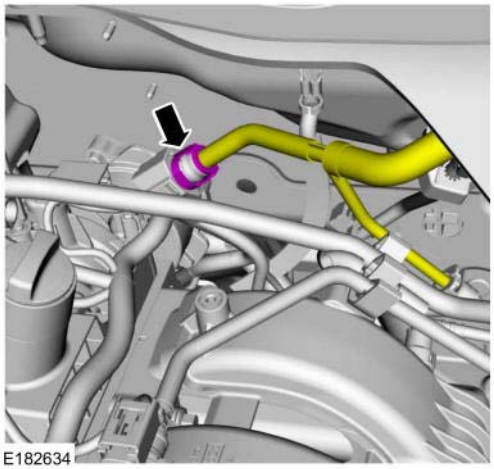
2.

Attach the fuel supply tube retainer to the cowl.



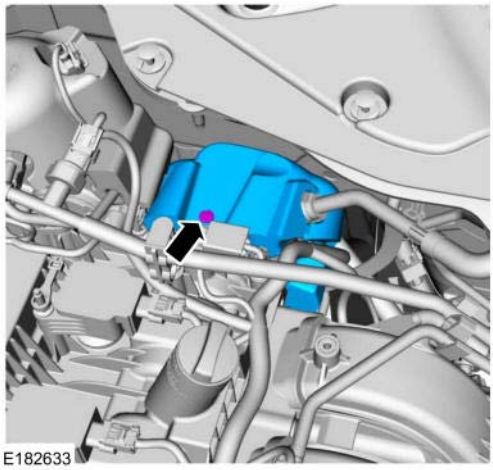
39.

Install the engine ground strap and nut to the cowl.



Torque

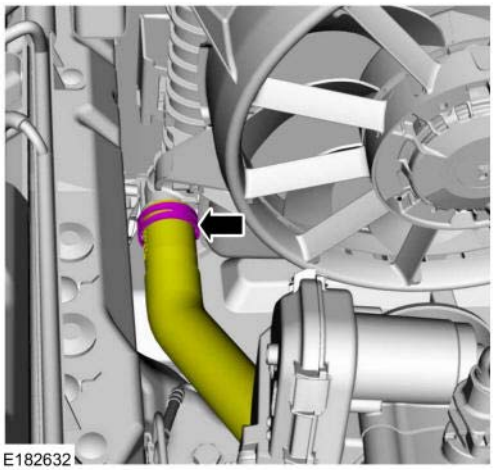
: 80 lb.in (9 Nm)



40.

Connect the vacuum hose to the brake vacuum pump.

41.

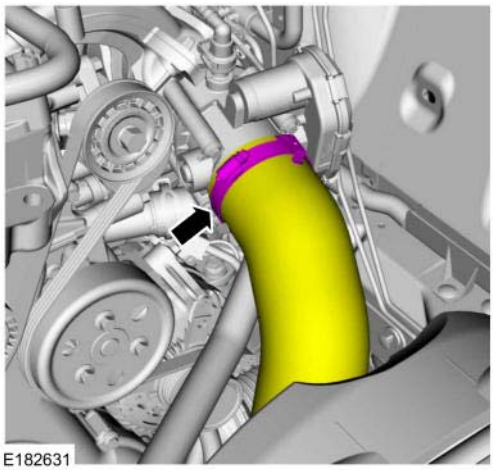


Install the brake vacuum pump insulator cover and the retainer.

42.

Install the lower radiator hose to the radiator.

Use the General Equipment: Hose Clamp Remover/Installer

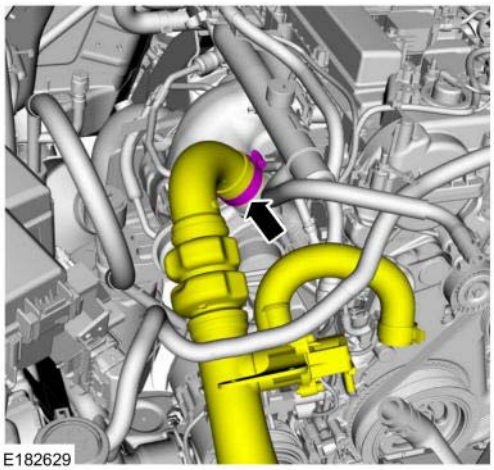


43.

Position the CAC outlet tube and tighten the clamp.

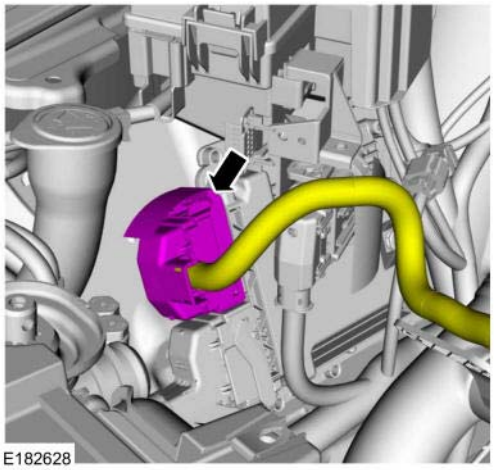
Torque

: 44 lb.in (5 Nm)



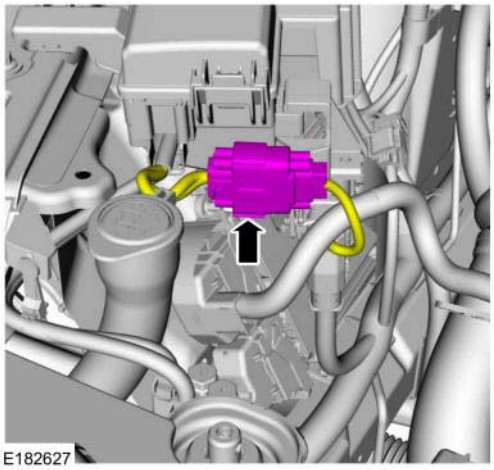
44.

Position the CAC inlet tube and tighten the clamp.



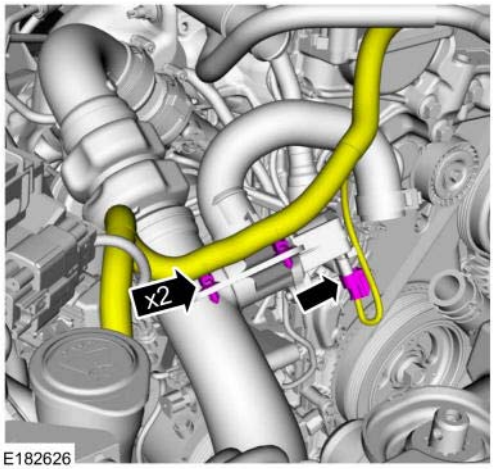
Torque

: 44 lb.in (5 Nm)



45.

Connect the upper PCM electrical connector.



46.

Connect and attach the engine harness electrical connector.

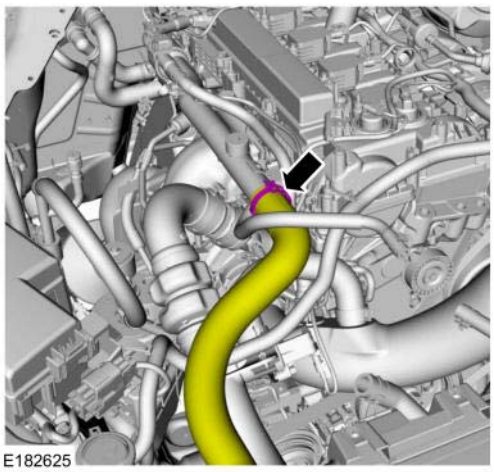
47.

Connect the CAC valve electrical connector and the wire harness retainers.

48.

Install the following items:

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



Refer to: AIR CLEANER - 2.3L EcoBoost (231kW/314PS).

Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

49.

Install the upper radiator hose to the coolant tube.

Use the General Equipment: Hose Clamp Remover/Installer

50.

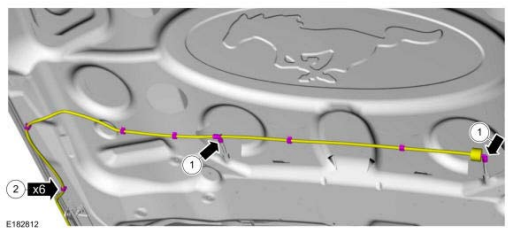
Install the degas bottle. Refer to: DEGAS BOTTLE .

NOTE: Use the index-mark for location to aid in hood installation.

51.
Install the hood and the 4 nuts.

Torque

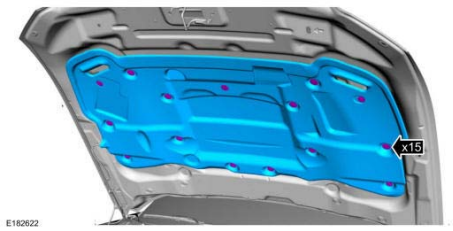
: 17 lb.ft (23 Nm)



52.

1.

Connect the windshield washer hose couplings. Refer to: Washer Hose Coupling .



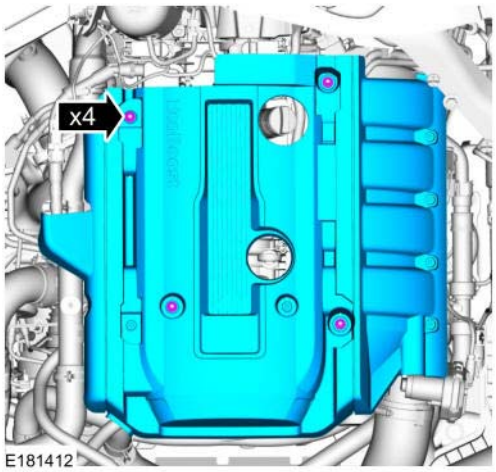
2.

Attach the windshield washer hose retainers.

53.

Install the hood insulation and the pin-type retainers.

54.



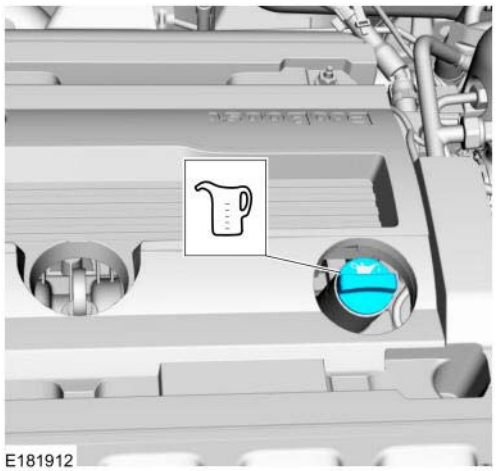
Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

55.

Install the engine appearance cover and the nuts.

Torque

: 80 lb.in (9 Nm)



56.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

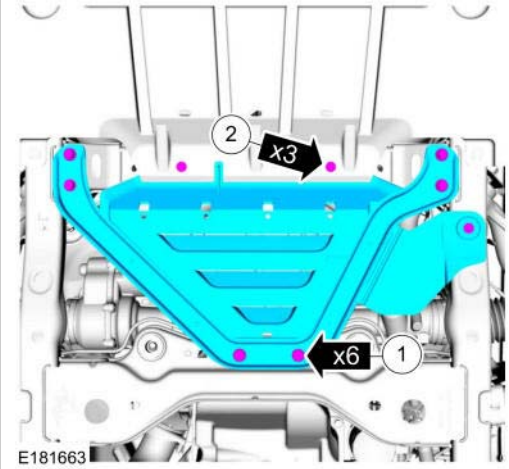
: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

57.

Fill the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

58.

1.



Install the underbody shield and the bolts.

Torque

: 46 lb.ft (63 Nm)

2.

Install the underbody shield screws.

59.

Start and check the exhaust system for leaks.

60.

Use the Powertrain Control Module (PCM) Misfire Monitor Profile Correction routine in the diagnostic scan tool.

Service Manual: ENGINE - 3.7L DURATEC (227KW/301PS)

SPECIFICATIONS > SPECIFICATIONS

ENGINE

Item	Specification
Displacement	3.7L (4V) (226 CID)
No. of cylinders	6
Bore/stroke	95.5/86.7 mm (3.759/3.413 in)
Firing order	1-4-2-5-3-6
Spark plug	12405
Spark plug gap	1.25-1.35 mm (0.049-0.053 in)
Compression ratio	10.5:1
Engine weight (without accessory drive components)	354.9 lb (161 kg)

LUBRICANTS

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada)	XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)

ENGINE OIL CAPACITY

Item	Specification
Service fill including oil filter	6.0 qt (5.7 L)

OIL PRESSURE

Item	Specification
Oil pressure @ 1, 500 rpm with engine at normal operating temperature	30.0 psi (206.8 kPa)

CYLINDER HEAD AND VALVE TRAIN

Item	Specification
Cylinder head gasket surface flatness	Flat within 0.08 mm (0.003 in) length end to end,

	area 150 mm (5.9 in) x 150 mm (5.9 in) (or full width) should be less than 0.05 mm (0.002 in)
Valve tappet clearance - intake	0.006-0.010 in (.15-.25 mm)
Valve tappet clearance - exhaust - Engine must be at room temperature before measuring	0.01-0.02 in (.36-.46 mm)
Valve guide bore inner diameter	0.217-0.218 in (5.519-5.549 mm)
Valve stem diameter - intake	0.2157-0.2164 in (5.479-5.497 mm)
Valve stem diameter - exhaust	0.2152-0.2159 in (5.466-5.484 mm)
Valve stem-to-guide clearance - intake	0.0009-0.0028 in (.022-.07 mm)
Valve stem-to-guide clearance - exhaust	0.0014-0.0033 in (.035-.083 mm)
Valve head diameter - intake	1.46 in (37 mm)
Valve head diameter - exhaust	1.22 in (31 mm)
Valve face runout	0.002 in (.05 mm)
Valve face angle	45.25-45.75°
Valve seat width - intake	0.051-0.059 in (1.3-1.5 mm)
Valve seat width - exhaust	0.067-0.079 in (1.7-2 mm)
Valve seat runout	0.002 in (.04 mm)
Valve seat angle	44.5-45.5°
Valve spring free length (approx.)	1.890 in (48 mm)
Valve spring compression pressure (N @ spec. length)	525 N @ 27.0 mm (114.7 lb @ 1.06 in)
Valve spring installed height	1.457 in (37 mm)
Valve spring installed height pressure (N @ spec. length)	235 N @ 37.0 mm (53 lb @ 1.45 in)
Valve spring installed pressure - service limit	10% force loss @ specified height

CAMSHAFT

Item	Specification
Theoretical valve lift (intake) @ 0 lash	0.394 in (10 mm)
Theoretical valve lift (exhaust) @ 0 lash	0.38 in (9.6798 mm)
Lobe lift - intake	0.394 in (10 mm)
Lobe lift - exhaust	0.38 in (9.6798 mm)
Allowable lobe lift loss	0.0024 in (.062 mm)

Camshaft journal bore inside diameter - 1st journal	1.537-1.538 in (39.0375-39.0625 mm)
Camshaft journal bore inside diameter - intermediate journals	1.023-1.024 in (25.9875-26.0125 mm)
Camshaft bearing outside diameter - 1st journal	1.535-1.536 in (38.99-39.01 mm)
Camshaft bearing outside diameter - intermediate journals	1.021-1.022 in (25.937-25.963 mm)
Camshaft journal-to-bearing clearance, 1st journal - service limit	0.0029 in (.0725 mm)
Camshaft journal-to-bearing clearance, intermediate journals - service limit	0.0030 in (.0755 mm)
Runout	0.0016 in (.04 mm)
End play - standard	0.0013-0.0067 in (.032-.17 mm)
End play - service limit	0.0075 in (.19 mm)

CYLINDER BLOCK

Item	Specification
Cylinder bore diameter	3.760-3.761 in (95.5-95.52 mm)
Cylinder bore roundness	0.0005 in (.013 mm)
Cylinder bore taper	0.0004 in (.01 mm)
Block main bore roundness	0.000 in (.008 mm)
Main bearing bore inside diameter	2.850-2.851 in (72.4-72.424 mm)
Head gasket surface flatness	Flat within 0.150 mm (0.005 in) overall 0.050 mm (0.001 in) per 150 mm (5.905 in) x 150 mm (5.905 in) 0.025 mm (0.0009 in) per 25 mm (0.98 in) x 25 mm (0.98 in)

CRANKSHAFT

Item	Specification
Main bearing journal diameter	2.657 in (67.5 mm)
Main bearing journal maximum taper	0.1575 in (.004 m)
Main bearing journal maximum out-of-round	0.0002 in (.006 mm)
Main bearing journal-to-main bearing clearance	0.0010-0.0016 in (.026-.041 mm)
Connecting rod journal diameter	2.204-2.205 in (55.983-56.003 mm)
Connecting rod journal maximum taper	0.0002 in (.004 mm)

Connecting rod journal maximum out-of-round	0.0002 in (.006 mm)
Crankshaft maximum end play	0.0020-0.0115 in (.051-.291 mm)

PISTON AND CONNECTING ROD

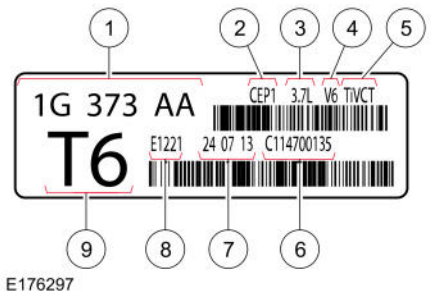
Item	Specification
Piston diameter - single grade	3.7594-3.7589 in (95.49-95.476 mm)
Piston-to-cylinder bore clearance	0.0004-0.0017 in (.01-.044 mm)
Piston ring end gap - compression (top, gauge diameter)	0.0067-0.0106 in (.17-.27 mm)
Piston ring end gap - compression (bottom, gauge diameter)	0.0118-0.0217 in (.3-.55 mm)
Piston ring end gap - oil ring (steel rail, gauge diameter)	0.0059-0.0177 in (.15-.45 mm)
Piston ring groove width - compression (top)	0.0484-0.0492 in (1.23-1.25 mm)
Piston ring groove width - compression (bottom)	0.0602-0.0610 in (1.53-1.55 mm)
Piston ring groove width - oil ring	0.0996-0.1004 in (2.53-2.55 mm)
Piston ring width - upper compression ring	0.0461-0.0469 in (1.17-1.19 mm)
Piston ring width - lower compression ring	0.0579-0.0587 in (1.47-1.49 mm)
Piston ring-to-groove clearance (upper and lower compression rings)	0.0016-0.0031 in (.04-.08 mm)
Piston pin bore diameter	0.9057-0.9058 in (23.004-23.008 mm)
Piston pin diameter	0.9054-0.9055 in (22.997-23 mm)
Piston pin length	2.204 in (55.975 mm)
Piston pin-to-piston fit	0.0002-0.0004 in (.004-.011 mm)
Piston-to-connecting rod clearance	0.1 in (2.7 mm)
Connecting rod-to-pin clearance - standard	0.0003-0.0009 in (.007-.022 mm)
Connecting rod pin bore diameter	0.9058-0.9063 in (23.007-23.019 mm)
Connecting rod length (center-to-center)	6.01 in (152.68 mm)
Connecting rod maximum allowed bend	0.0015 in (.038 mm)
Connecting rod maximum allowed twist	0.0020 in (.05 mm)
Connecting rod bearing bore diameter - grade 1	2.3569-2.3572 in (59.866-59.872 mm)
Connecting rod bearing bore diameter - grade 2	2.3572-2.3574 in (59.873-59.879 mm)
Connecting rod bearing bore diameter - grade 3	2.3575-2.3577 in (59.88-59.886 mm)
Connecting rod bearing-to-crankshaft clearance	0.0008-0.0021 in (.02-.054 mm)

Connecting rod side clearance (assembled to crank) - standard	0.0069-0.0167 in (.175-.425 mm)
Connecting rod side clearance (assembled to crank) - service limit	0.0069-0.0167 in (.175-.425 mm)

DESCRIPTION AND OPERATION > ENGINE - OVERVIEW > OVERVIEW

The 3.7L (4V) is a V-6 engine with the following features:

- Dual overhead camshafts
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- Composite upper and lower intake manifold
- Aluminum cylinder head
- An aluminum, 60-degree V-cylinder block
- Accessory dive belt driven coolant pump
- Twin independent variable cam timing (Ti-VCT)
- An electronic ignition system with 6 ignition coil-on-plugs

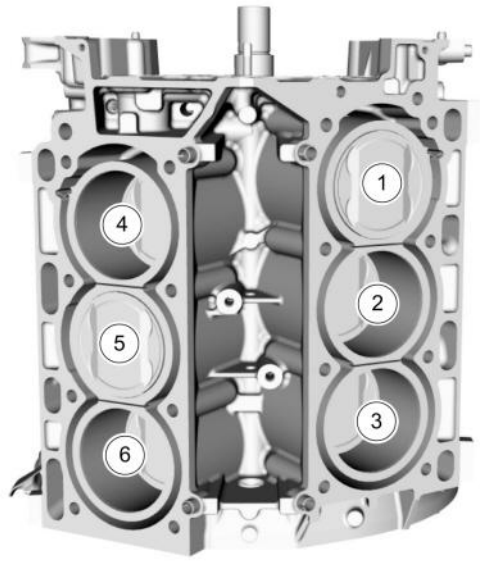


Engine Identification

For quick identification, refer to the safety certification decal.

The decal is located on the LH front door lock face panel.

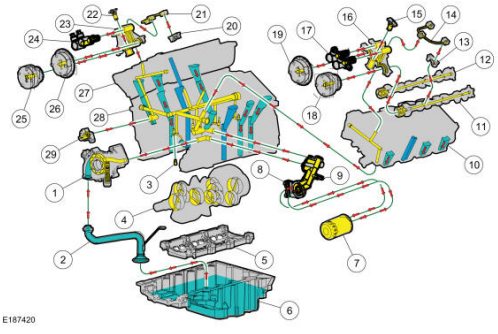
Engine Code Information Label



The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Engine plant (Cleveland)

3	Engine displacement
4	Engine configuration
5	Twin independent VCT
6	Running number
7	Engine build date (DDMMYY)
8	Plant shift line
9	Derivative code



Engine Cylinder Identification

E176298

DESCRIPTION AND OPERATION > ENGINE - OVERVIEW > SYSTEM OPERATION

Lubrication System

E187420

Item	Description
1	Oil pump
2	Oil pump screen and pickup tube
3	Piston oil cool valve
4	Crankshaft
5	Engine main bearing cap support
6	Oil pan
7	Oil filter
8	Oil filter adapter
9	Oil pressure switch
10	LH cylinder head
11	Exhaust camshaft
12	Intake camshaft
13	LH camshaft cap
14	LH valve train oil feed tube
15	LH secondary timing chain tensioner
16	LH camshaft mega cap
17	LH intake and exhaust camshaft Variable Camshaft Timing (VCT) oil control solenoid
18	LH exhaust camshaft VCT
19	LH intake camshaft VCT
20	RH camshaft cap
21	RH valve train oil feed tube
22	RH secondary timing chain tensioner
23	RH camshaft mega cap
24	RH intake and exhaust camshaft VCT oil control solenoid
25	RH exhaust camshaft VCT
26	RH intake camshaft VCT
27	RH cylinder head
28	Cylinder block
29	Primary timing chain tensioner

Oil Pump

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, timing chain tensioners, piston oil cooling jets and VCT solenoids.

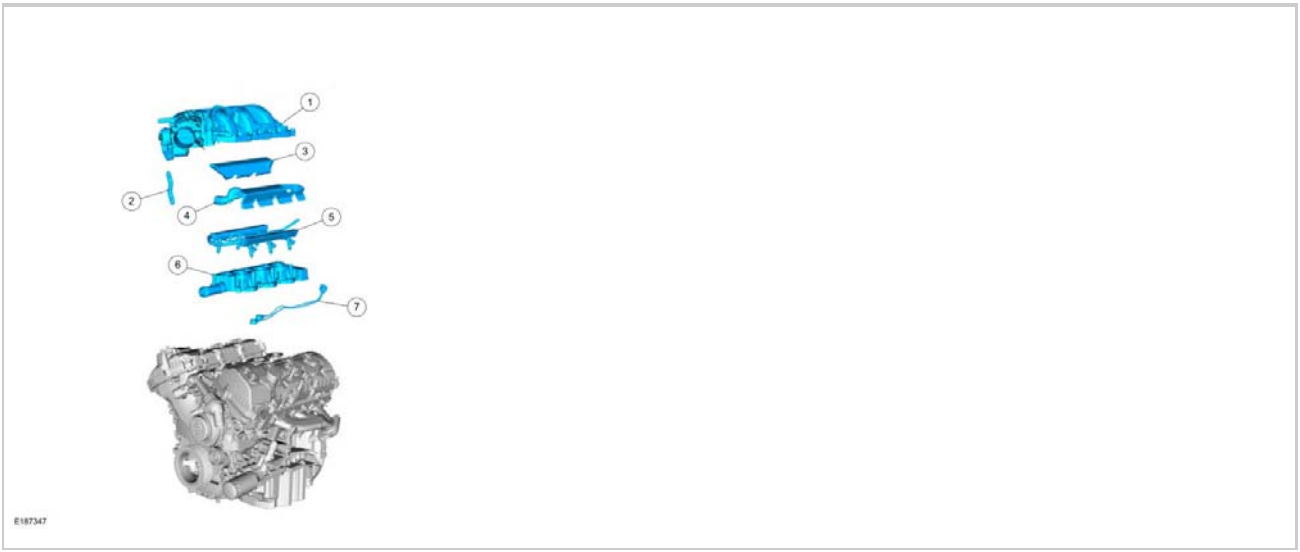
The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the cylinder head, front camshaft cap.

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high temperature and high-speed conditions.



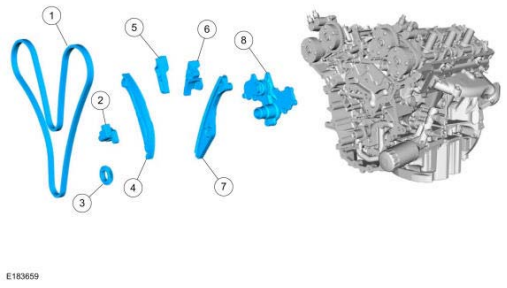
Valve Train

The valve train uses direct acting mechanical buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Twin Independent Variable Cam Timing (Ti-VCT)

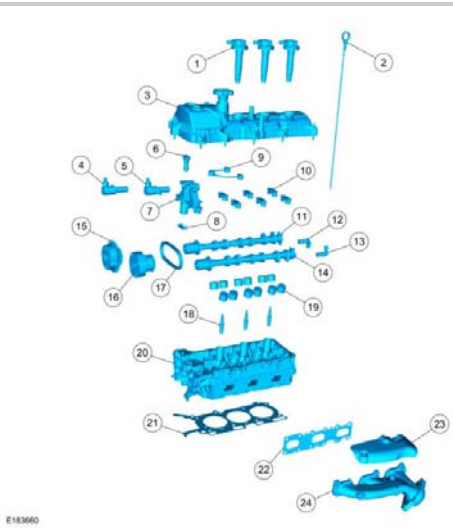
DESCRIPTION AND OPERATION > ENGINE COMPONENT VIEW

Engine Upper



Item	Part Number	Description
1	9424	Upper intake manifold
2	9J444	Upper intake manifold support bracket
3	6P013	RH fuel rail noise shield insulator
4	6P013	LH fuel rail noise shield insulator
5	9F797	Fuel rail
6	9J447	Lower intake manifold
7	12A699	Knock Sensor (KS)

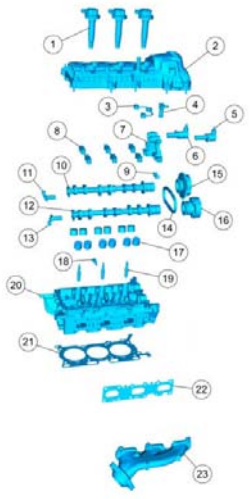
Engine Front



Item	Part Number	Description
1	W701512/N806165/N806165	Crankshaft pulley bolt and washer
2	6316	Crankshaft pulley
3	6700	Crankshaft front seal
4	8A586	Thermostat housing assembly
5	4E856	Thermostat housing assembly O-ring seal
6	8A571	Thermostat housing assembly O-ring seal
7	6B209	Accessory drive belt tensioner
8	8A528	Coolant pump pulley
9	8501	Coolant pump
10	6020	Front cover radial seal
11	6019	Engine front cover

Timing Drive Components

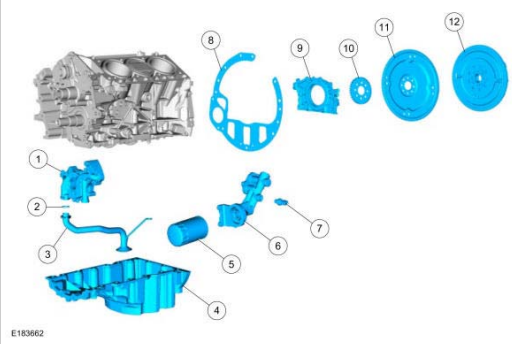
Item	Part Number	Description
1	6268	Timing chain
2	6L266	Primary timing chain tensioner
3	6306	Crankshaft timing sprocket
4	6K255	Primary timing chain tensioner arm
5	6K297	RH primary timing chain guide
6	6K297	LH upper primary timing chain guide
7	6B274	LH lower primary timing chain guide
8	8B593	Channel cover plate



Engine Upper - LH Cylinder Head

Item	Part Number	Description
1	12A375	LH ignition coil-on-plugs (3 required)
2	6750	Oil level indicator
3	6K273	LH valve cover
4	6B297	Intake camshaft variable camshaft timing (VCT) oil control solenoid

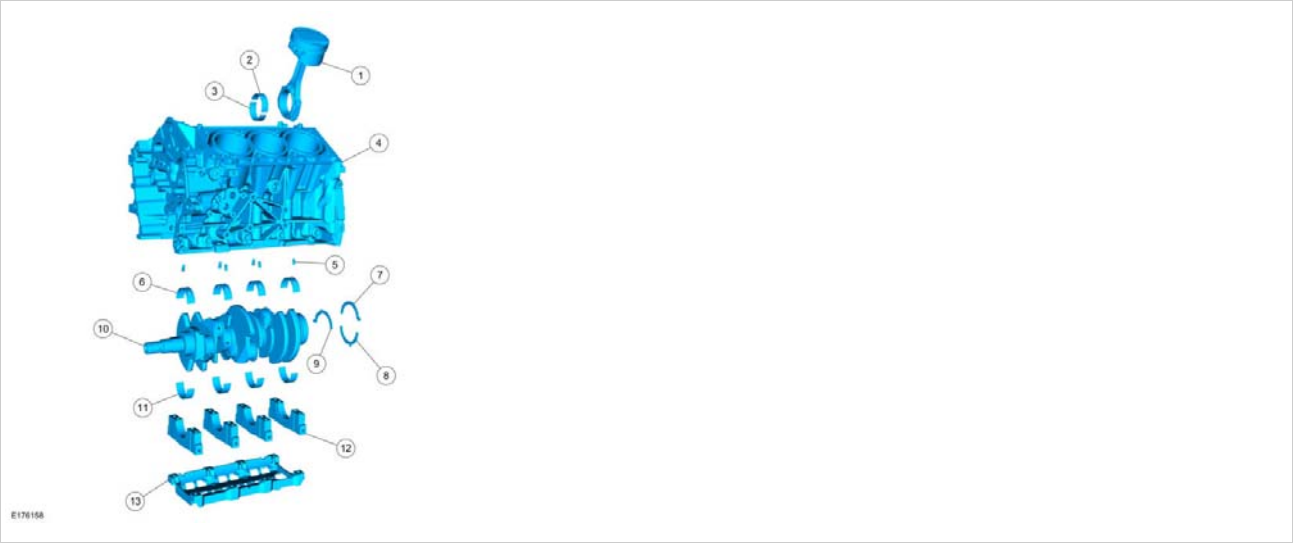
5	6B297	Exhaust camshaft VCT oil control solenoid
6	6C270	LH secondary timing chain tensioner
7	6B280	Camshaft mega cap
8	6K297	LH secondary tensioner shoe
9	6K602	Valve train oil feed tube
10	6A258	LH camshaft cap (6 required)
11	6250	LH intake camshaft
12	6B288	LH intake camshaft position (CMP) sensor
13	6B288	LH exhaust CMP sensor
14	6250	LH exhaust camshaft
15	6C524	Intake camshaft variable valve timing (VVT) unit
16	6C525	Exhaust camshaft VVT Unit
17	6C256	LH secondary timing chain
18	12405	Spark plug (3 required)
19	6500	Valve tappet (12 required)
20	6050	LH cylinder head
21	6083	LH cylinder head gasket
22	9448	LH exhaust manifold gasket
23	9Y427	LH exhaust manifold heat shield
24	9431	LH exhaust manifold



Engine Upper - RH Cylinder Head

Item	Part Number	Description

1	12A375	RH ignition coil-on-plugs (3 required)
2	6K271	RH valve cover
3	6K602	Valve train oil feed tube
4	6C270	RH secondary timing chain tensioner
5	6B297	Exhaust camshaft VCT oil control solenoid
6	6B297	Intake camshaft VCT oil control solenoid
7	6B280	Camshaft mega cap
8	6A258	RH camshaft cap (6 required)
9	6K297	RH secondary tensioner shoe
10	6250	RH intake camshaft
11	6B288	RH intake CMP sensor
12	6250	RH exhaust camshaft
13	6B288	RH exhaust CMP sensor
14	6C256	RH secondary timing chain
15	6C524	Intake camshaft VVT unit
16	6C525	Exhaust camshaft VVT unit
17	6500	Valve tappet (12 required)
18	6G004	Cylinder head temperature (CHT) sensor
19	12405	Spark plug (3 required)
20	6050	RH cylinder head
21	6083	RH cylinder head gasket
22	9448	RH exhaust manifold gasket
23	9430	RH exhaust manifold



Lower Engine Block (View 1)

Item	Part Number	Description

1	6621	Oil pump
2	6625	Oil pump screen and pickup tube O-ring seal
3	6622	Oil pump screen and pickup tube
4	6675	Oil pan
5	6714	Engine oil filter
6	6881	Oil filter adapter
7	9278	Oil pressure switch
8	6A373	Engine-to-transmission spacer plate
9	6D327	Crankshaft rear seal retainer
10	12A227	Crankshaft sensor ring
11	6375	Flexplate
12	6477	Flywheel

Lower Engine Block (View 2)

Item	Part Number	Description
1	6110	Piston and connecting rod assembly (6 required)
2	6211	Connecting rod upper bearing (6 required)
3	6211	Connecting rod lower bearing (6 required)
4	6010	Cylinder block
5	6K868	Piston oil cool valve (6 required)
6	6333	Cylinder block crankshaft main bearing (4 required)
7	6A341	Crankshaft upper thrust outer washer
8	6K302	Crankshaft lower thrust washer

9	6A341	Crankshaft upper thrust inner washer
10	6303	Crankshaft
11	6A338	Lower crankshaft main bearings (4 required)
12	-	Lower crankshaft main bearing caps (4 required) (part of 6010)
13	6C364	Main bearing cap support brace

DIAGNOSIS AND TESTING > ENGINE

1.

For basic mechanical concerns. REFER to: ENGINE SYSTEM - GENERAL INFORMATION . For driveability concerns. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

GENERAL PROCEDURES > VALVE CLEARANCE ADJUSTMENT

Special Tool(s) / General Equipment

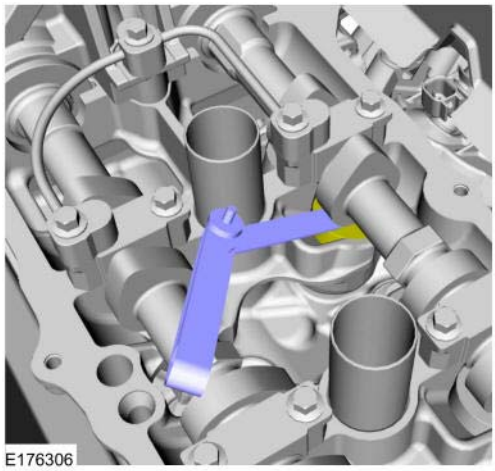
Feeler Gauge

Check

1.

Remove the LH or RH valve cover. Refer to: Valve Cover LH . Refer to: Valve Cover RH .

NOTE: Engine must be at room temperature before measuring. The valve clearance must be measured with the camshaft at base circle. The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.



2.

Measure the clearance of each valve and record its location. A midrange clearance is the most desirable:

Use the General Equipment: Feeler Gauge

Intake: 0.15-0.25 mm (0.006-0.01 in)

Exhaust: 0.360-0.460 mm (0.0142-0.0181 in)

NOTE: The number on the valve tappet reflects the thickness of the valve tappet. For example, a tappet with the number 3.310 has the thickness of 3.31 mm (0.13 in).

3.
If any of the valve clearances are out of specification, select new tappets using this formula: tappet thickness = measured clearance + the base tappet thickness - most desirable thickness. Select the tappets and mark the installation location.

Adjustment

NOTE: The following step is only necessary if adjustment is required.

1.
Remove the camshafts. Refer to: Camshafts .

REMOVAL AND INSTALLATION > CAMSHAFTS

Special Tool(s) / General Equipment

	303-1248 Camshaft holding tools TKIT-2006UF-FLM TKIT-2006UF-ROW

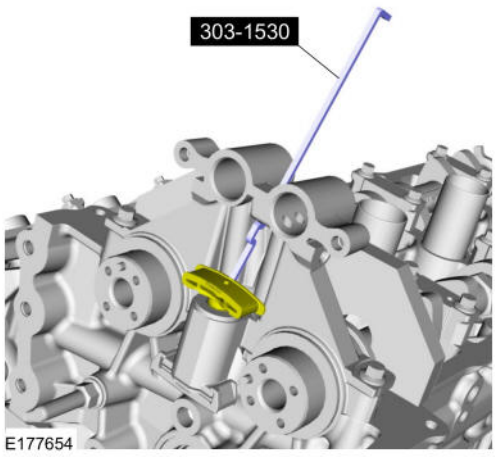
REMOVAL AND INSTALLATION > CAMSHAFTS > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

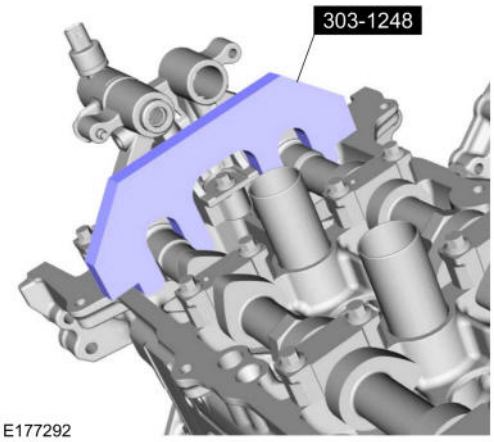
All camshafts



1.

Remove the LH or RH VCT unit. Refer to: Variable Camshaft Timing (VCT) Unit .

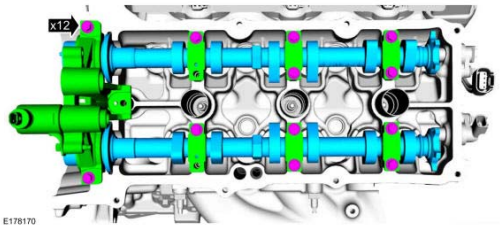
LH camshafts



NOTE: The VCT oil control solenoids are removed for clarity.

2.
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

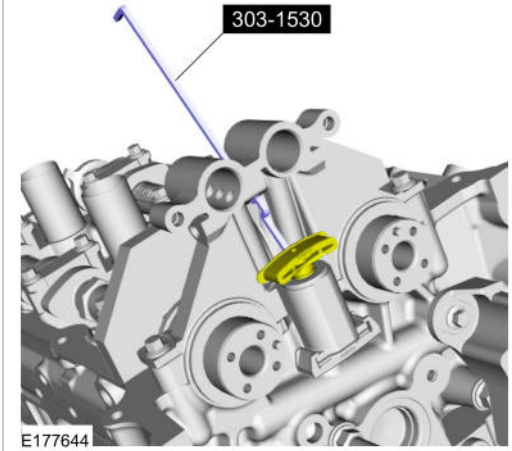
3.



Remove Special Service Tool: 303-1248 Camshaft holding tools.

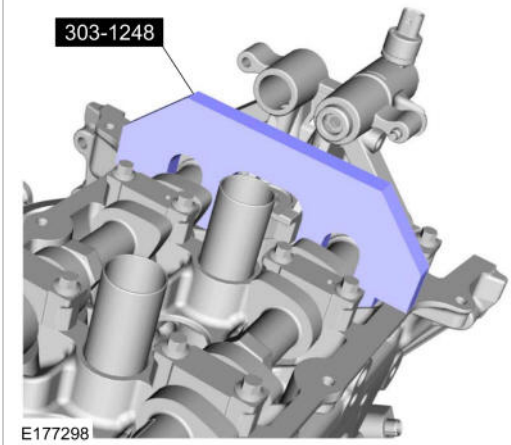
NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

NOTE: Mark the exhaust and intake camshafts for installation into their original locations.



4.
Remove the bolts, camshaft caps and the camshafts.

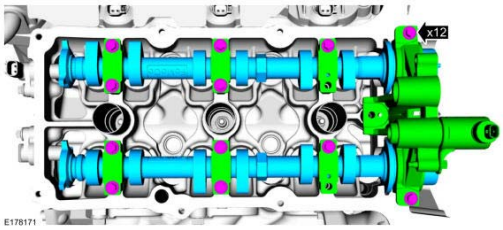
RH camshafts



NOTE: The VCT oil control solenoids are removed for clarity.

5.
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

6.

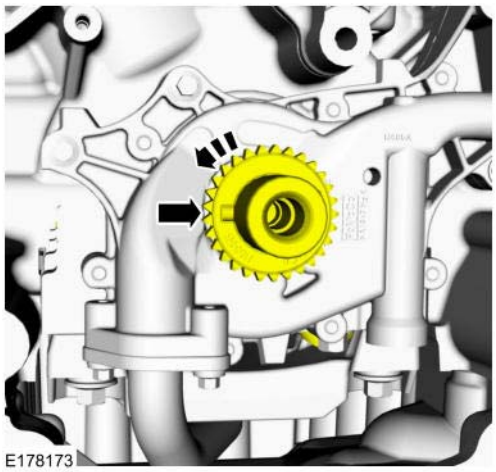


Remove Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

7.
Remove the bolts, camshaft caps and the camshafts.

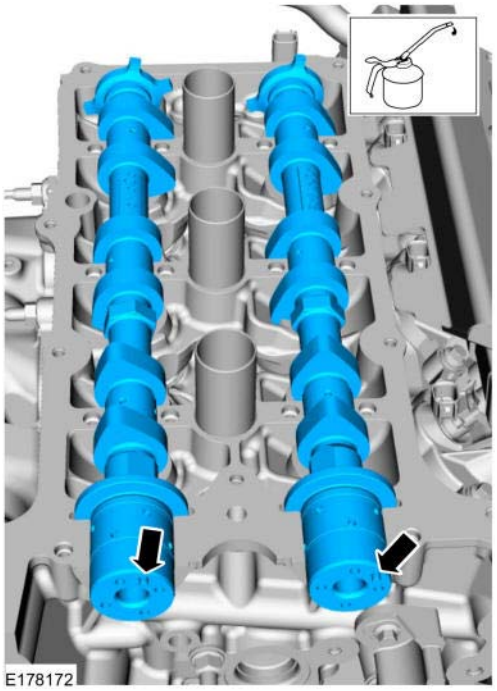


REMOVAL AND INSTALLATION > CAMSHAFTS > INSTALLATION

RH camshafts

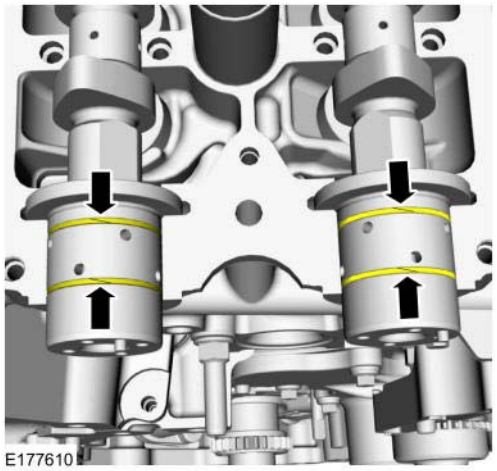
> *NOTE: The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.*

1.
Rotate counterclockwise to the 9 o'clock position.



2.

Lubricate the camshafts with clean engine oil and position the camshafts onto the RH cylinder head in the neutral position as shown in illustration.

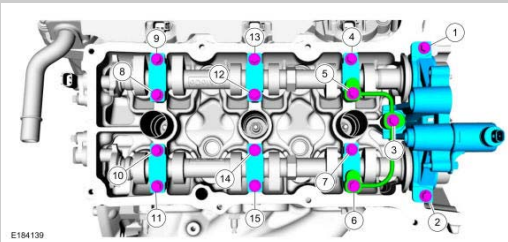


Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.

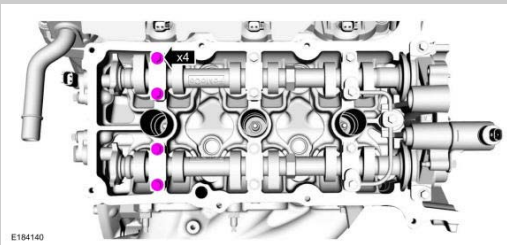
3.
Position the camshaft seals gaps at 12 o'clock.



NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

4.
Install the camshaft caps, oil tube and the bolts.

Torque:

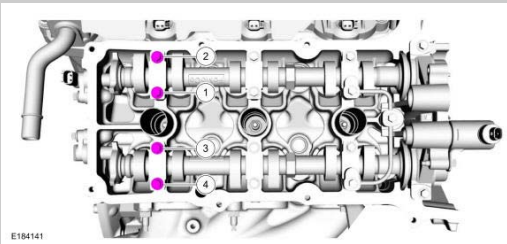


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

5.

Loosen the camshaft cap bolts.



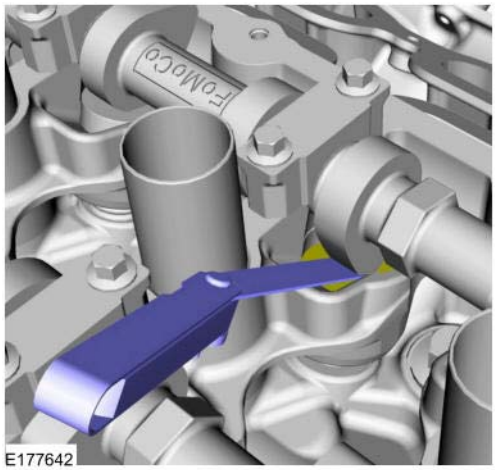
6.

Tighten the camshaft cap bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

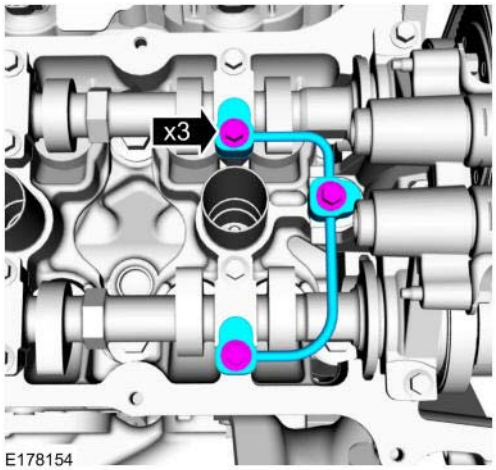
Stage 2: 45°



NOTE: If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.

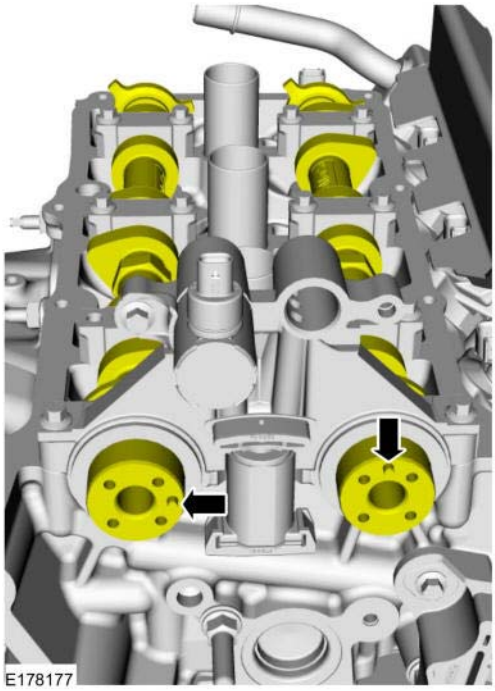
NOTE: Use a camshaft sprocket bolt to turn the camshafts.

7.
Confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the



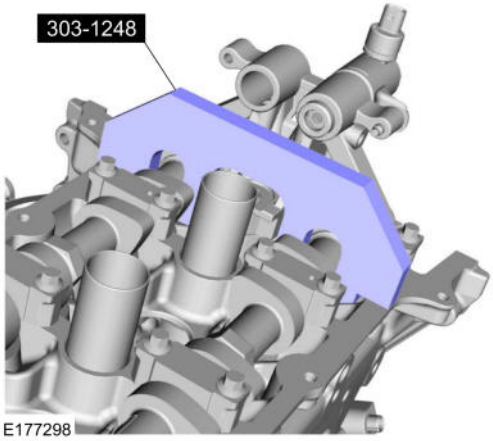
correct size. Refer to: Valve Clearance Adjustment .

Use the General Equipment: Feeler Gauge



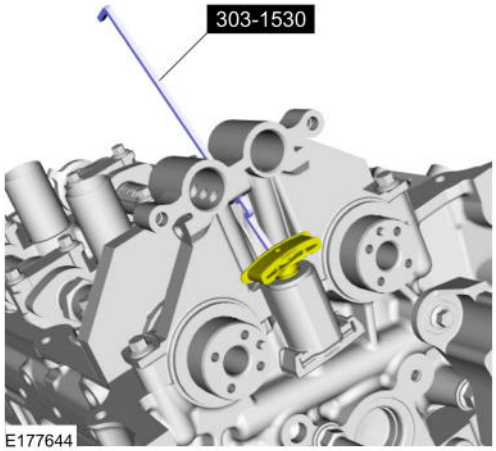
8.

Remove the bolts and the RH oil tube.



9.

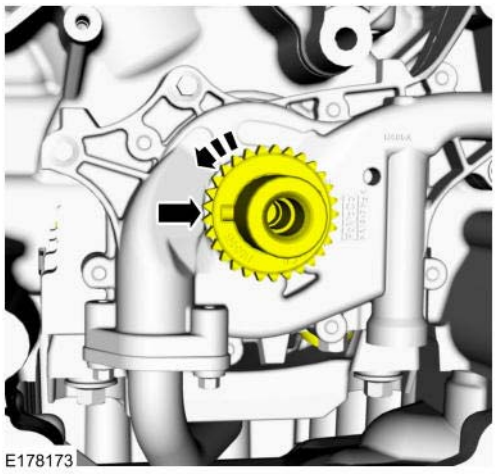
Rotate the RH camshafts to the TDC.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

10.
Install Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: The VCT oil control solenoids are removed for clarity.

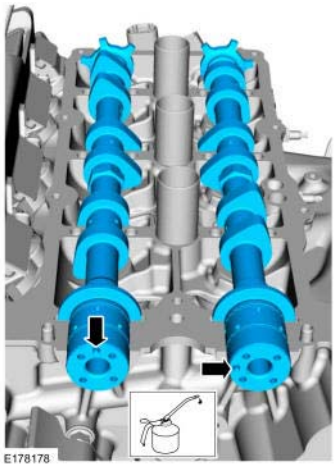


11.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

LH camshafts

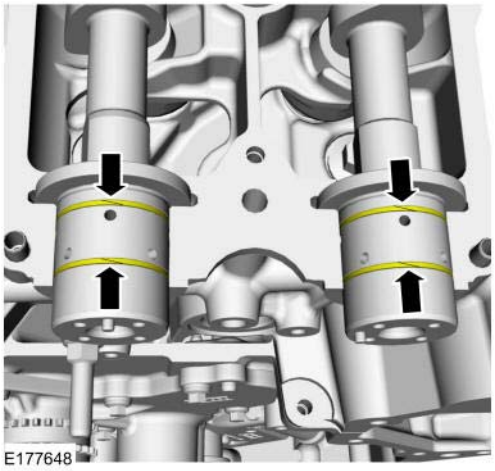
> *NOTE: The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.*

12.
Rotate counterclockwise to the 9 o'clock position.



13.

Lubricate the camshafts with clean engine oil and position the camshafts onto the LH cylinder head in the neutral position as shown in illustration.

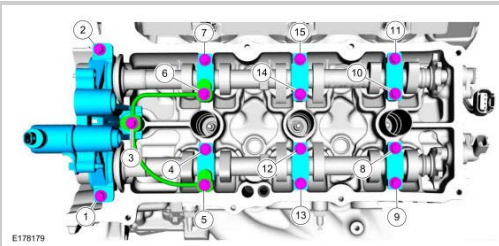


Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.

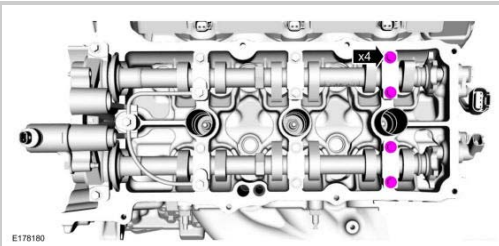
14.
Position the camshaft seals gaps at 12 o'clock.



NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

15.
Install the camshaft caps, oil tube and the bolts.

Torque:

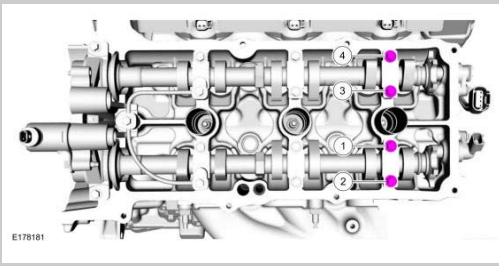


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

16.

Loosen the camshaft cap bolts.



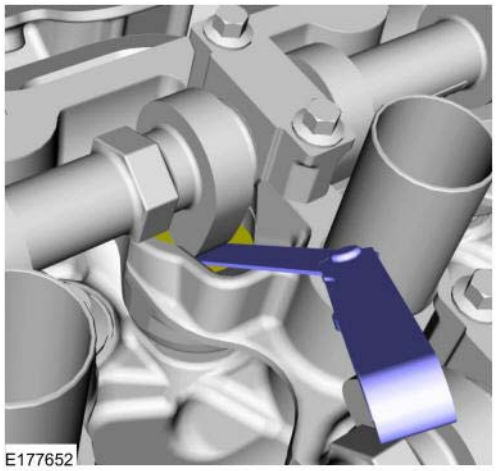
17.

Tighten the camshaft cap bolts.

Torque:

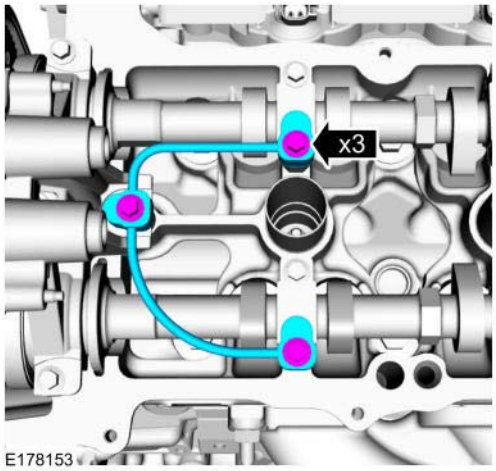
Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°



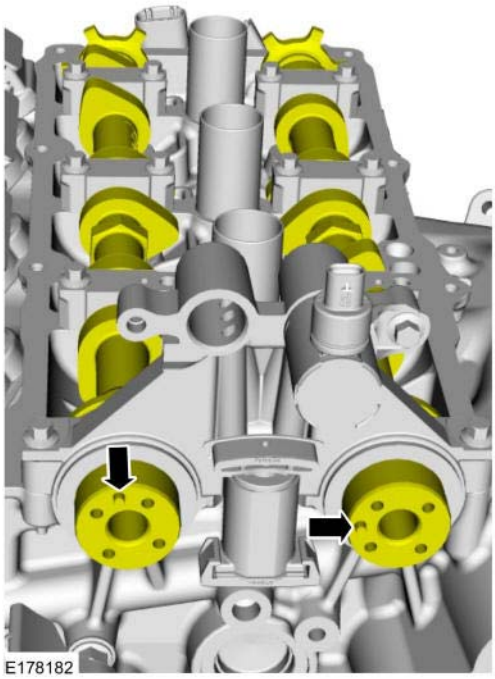
NOTE: If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.

NOTE: Use a camshaft sprocket bolt to turn the camshafts.



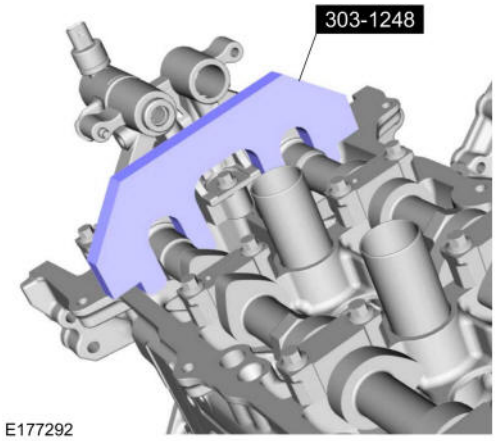
18.
Confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. Refer to: Valve Clearance Adjustment

.Use the General Equipment: Feeler Gauge



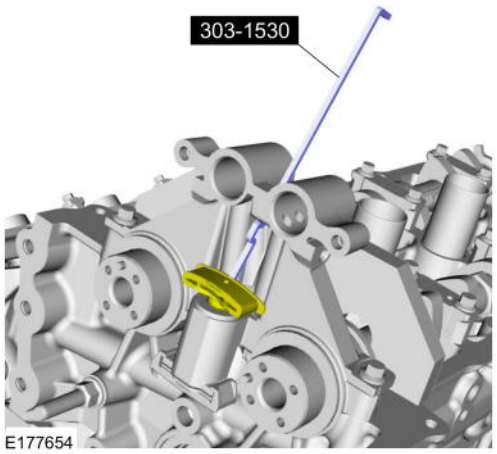
19.

Remove bolts and the LH oil tube.



20.

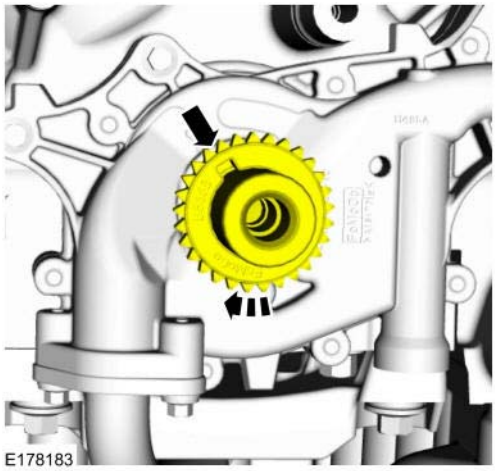
Rotate the LH camshafts to the TDC.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

21.
Install Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: The VCT oil control solenoids are removed for clarity.



22.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

All camshafts

23.

Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

24.

Install the LH or RH VCT unit. Refer to: Variable Camshaft Timing (VCT) Unit .

REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL

Special Tool(s) / General Equipment

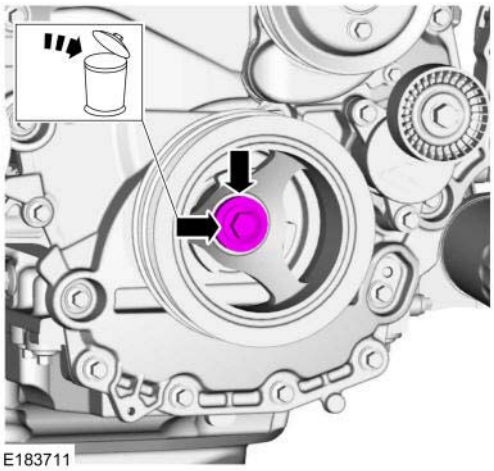
REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.

1.

Remove the degas bottle. Refer to: DEGAS BOTTLE .

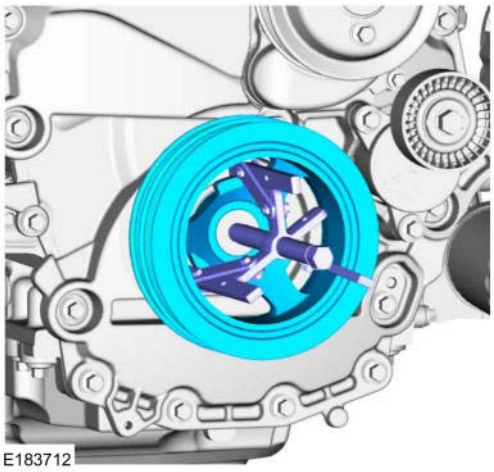


2.

Remove the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

3.

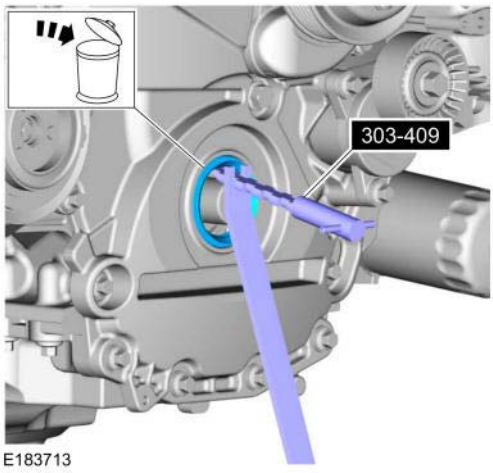
Remove the crankshaft bolt and washer.



Discard the bolt.

4.

Using a three leg puller, remove the crankshaft pulley.

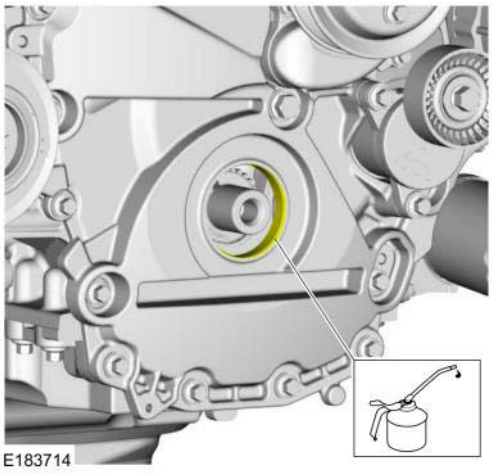


Use the General Equipment: Three Leg Puller

5.

Using the special tool, remove and discard the crankshaft front seal.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.

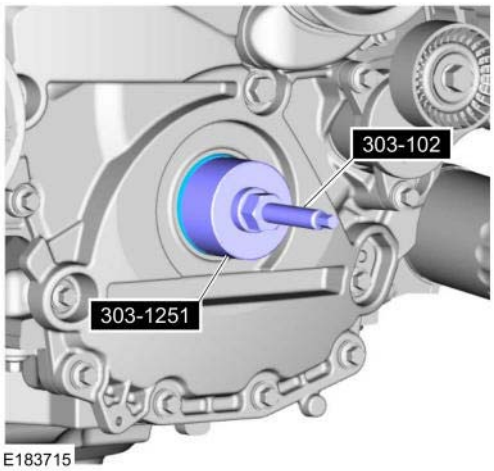


REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > INSTALLATION

1.

Lubricate the crankshaft front seal bore with clean engine oil.

Material

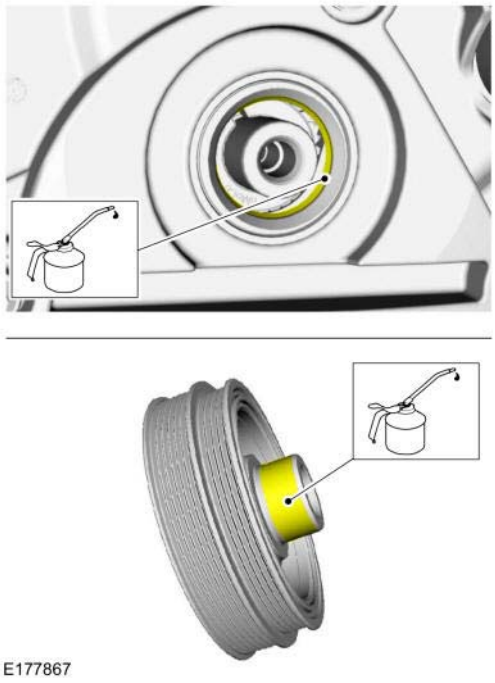


: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

2.

Using the special tools, install the crankshaft front seal.

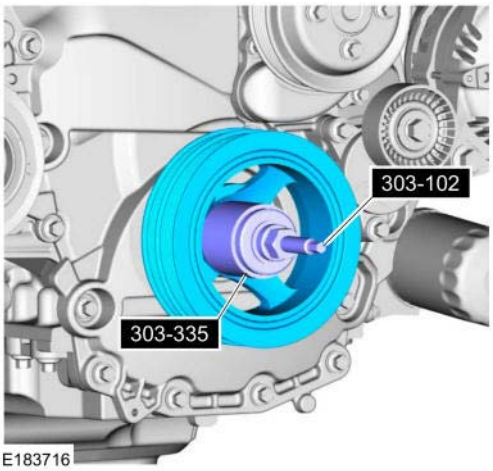
Use Special Service Tool: 303-102 Installer, Crankshaft Pulley, 303-1251 Installer, Front Seal.



3.

Lubricate the crankshaft front seal and the crankshaft pulley with clean engine oil.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

4.

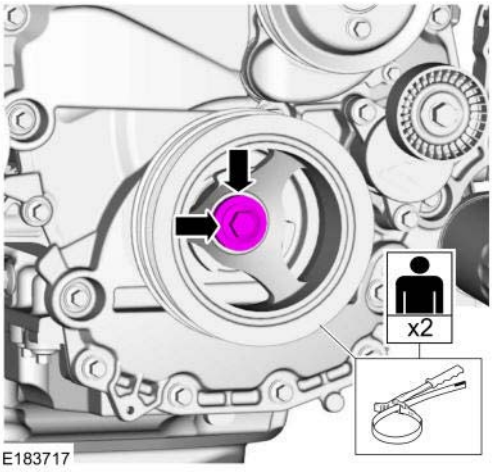
Using the special tools, install the crankshaft pulley.

Use Special Service Tool: 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal, 303-102 Installer, Crankshaft Pulley.

5.

Using the strap wrench, install the new crankshaft bolt and the washer and tighten in 4 stages.

Use the General Equipment: Strap Wrench



Torque:

Stage 1: 89 lb.ft (120 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 37 lb.ft (50 Nm)

Stage 4: 90°

6.

Install the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

7.

Install the degas bottle. Refer to: DEGAS BOTTLE .

8.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL

Special Tool(s) / General Equipment

Plastic Scraper

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6

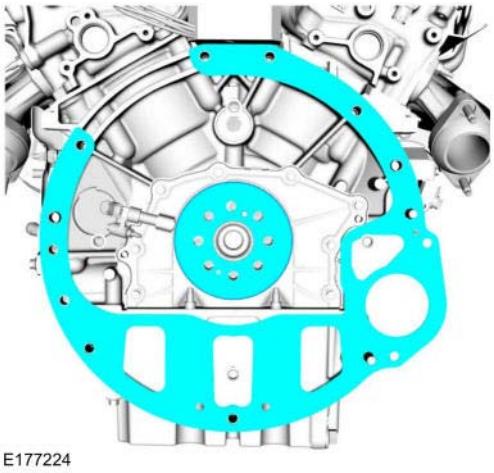
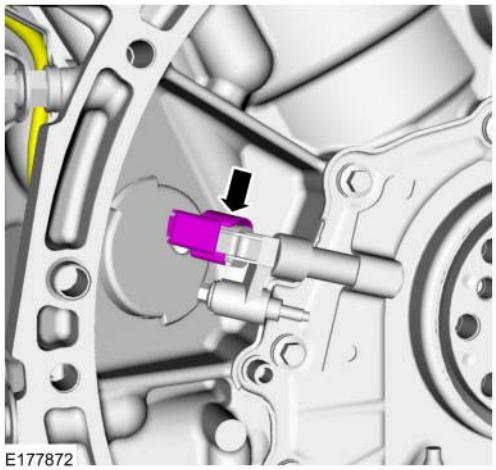
REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > REMOVAL



NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1.

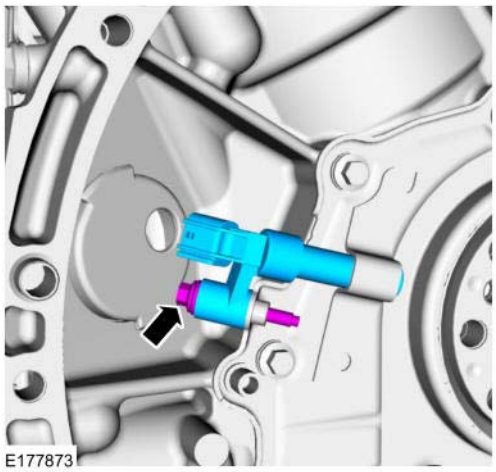
Remove the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .



2.

Remove the crankshaft sensor ring and the engine-to-transmission spacer plate.

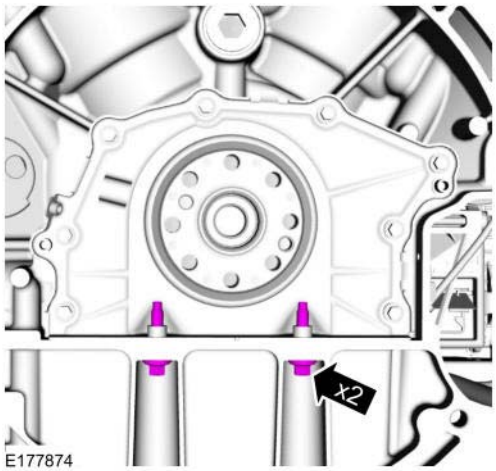
E177224



3.

Disconnect the CKP sensor electrical connector.

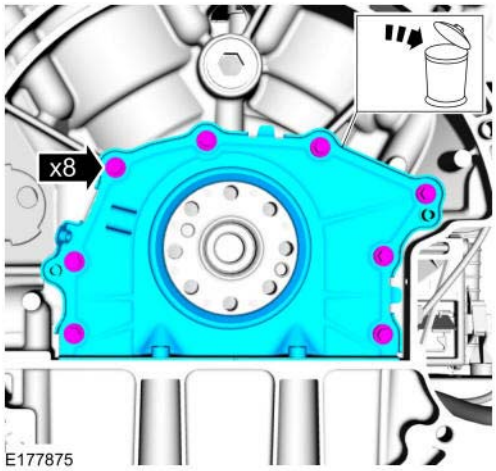
E177872



4.

Remove the bolt and the CKP sensor.

E177873



5.

Remove oil pan-to-crankshaft rear seal bolts.

6.

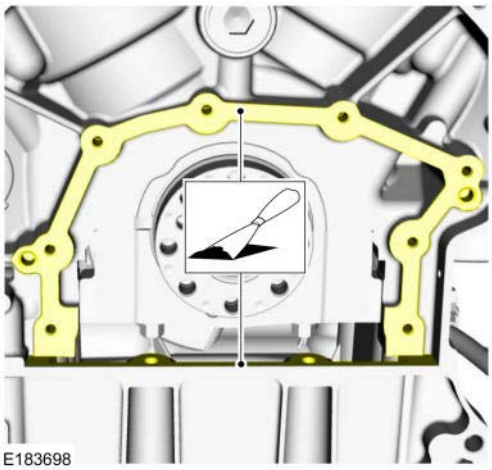
Remove the bolts and the crankshaft rear seal and discard the seal.

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

7.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

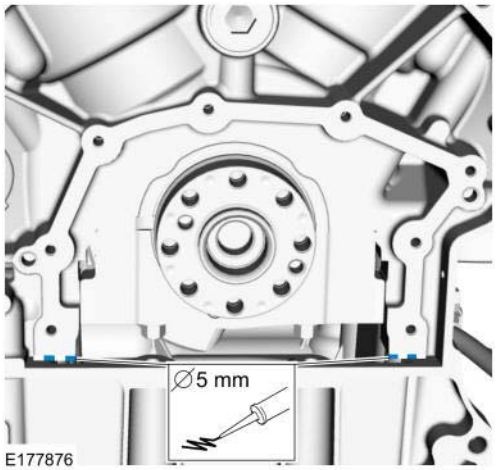
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > INSTALLATION



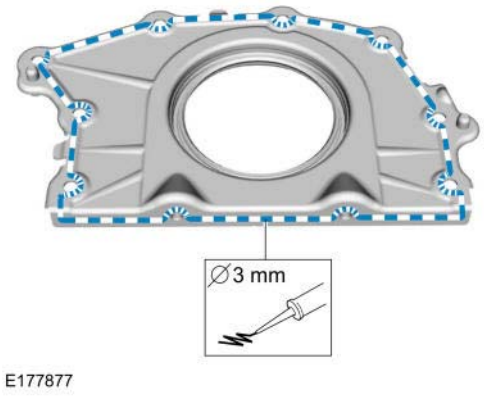
NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

1.
Apply 5 mm (0.196 in) bead of silicone sealant.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



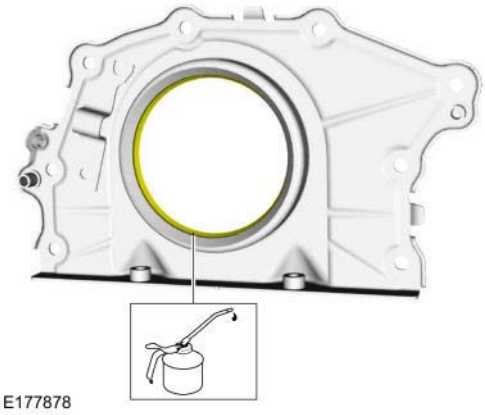
NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

2.
Apply 3 mm (0.11 in) bead of silicone sealant.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



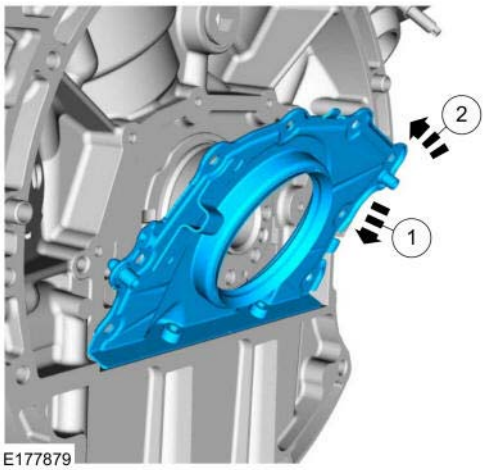
3.

Lubricate the crankshaft rear seal with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.)

(WSS-M2C945-A)



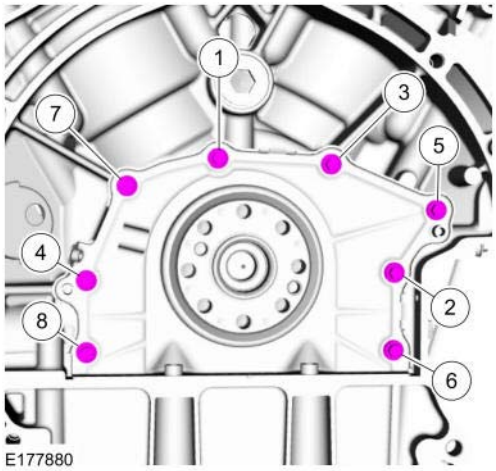
4.

1.

Install the crankshaft rear seal retainer at an angle above the oil pan flange to avoid scraping off the sealer.

2.

Tilt the seal retainer up and onto the rear of the cylinder block.



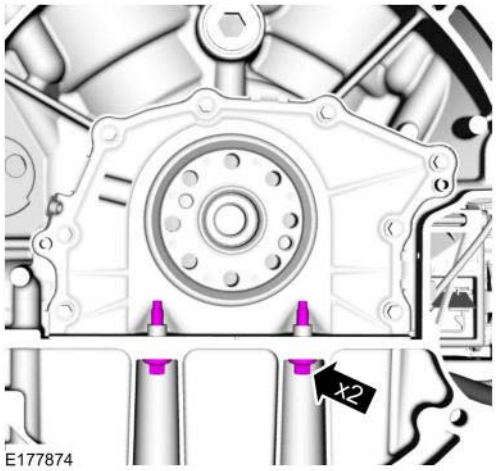
5.

Install the bolts and tighten in sequence shown in illustration.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



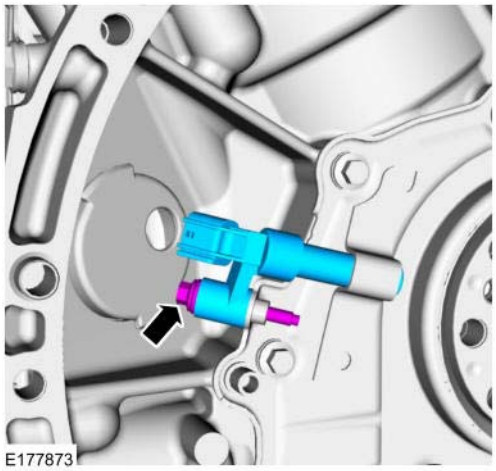
6.

Install oil pan-to-crankshaft rear seal bolts.

Torque:

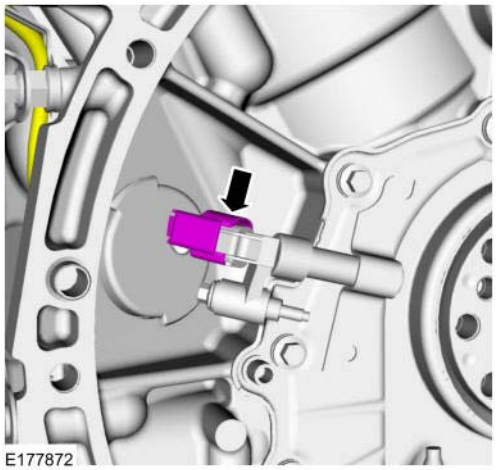
Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



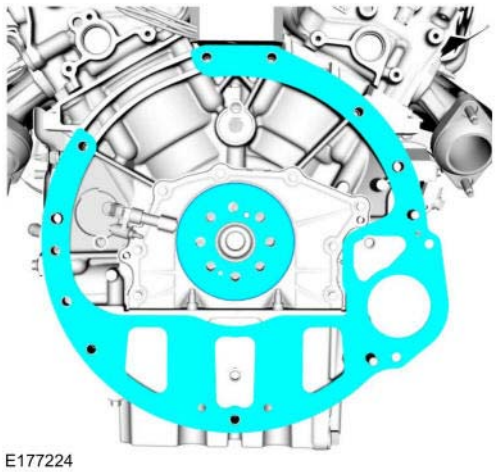
7.

Install the CKP sensor and the bolt.



Torque

: 89 lb.in (10 Nm)



8.

Connect the CKP sensor electrical connector.

9.

Install the engine-to-transmission spacer plate and the crankshaft sensor ring.

10.

Install the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

REMOVAL AND INSTALLATION > CYLINDER HEAD LH

Special Tool(s) / General Equipment

Oil Drain Equipment

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > CYLINDER HEAD LH > REMOVAL

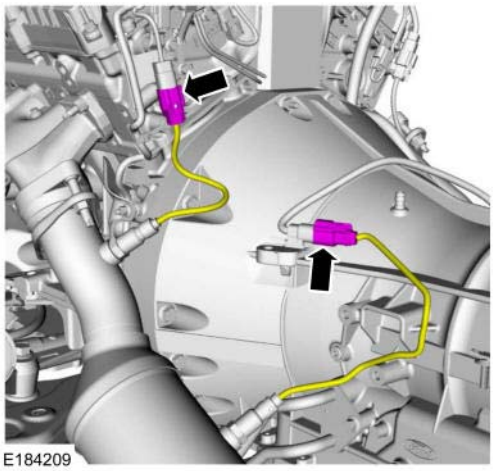
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed. Refer to Variable Camshaft Timing (VCT) Unit .

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

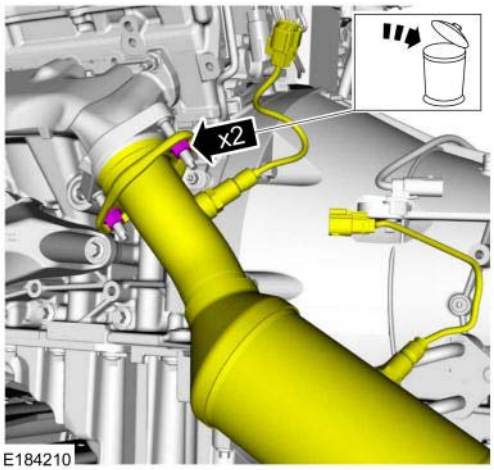
2.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE .

3.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .



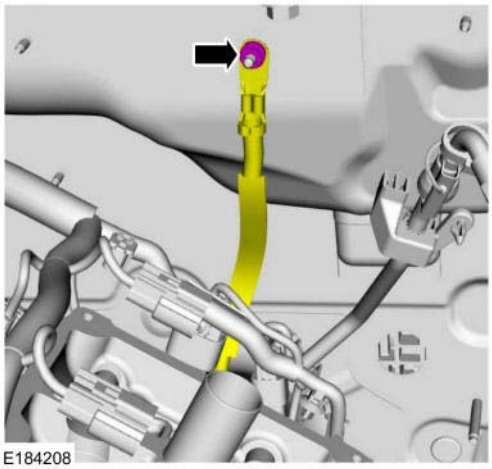
4.

Disconnect the LH HO2S and catalyst monitor sensor electrical connectors.

NOTE: Clean the catalytic converter-to-exhaust manifold sealing surfaces.

5.
Remove and discard the LH catalytic converter flange nuts.

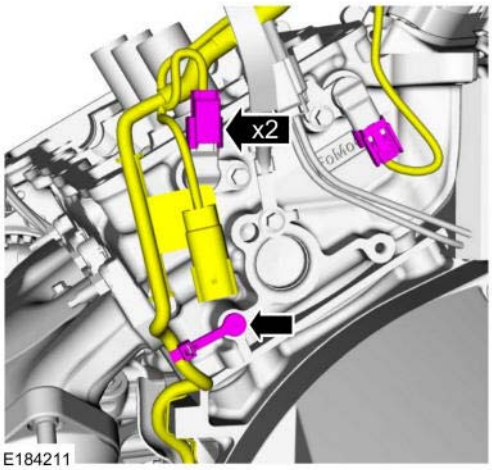
6.



Remove the LH camshafts. Refer to: Camshafts .

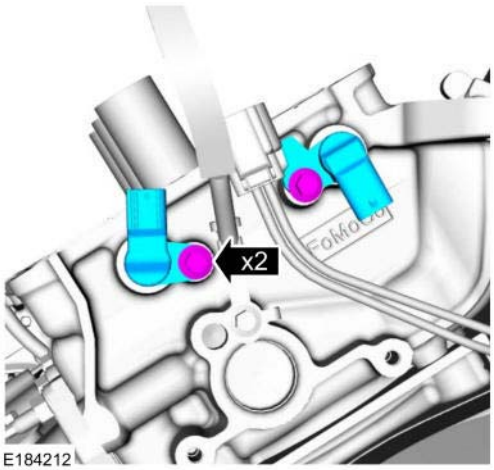
7.

Remove the lower intake manifold. Refer to: Lower Intake Manifold .



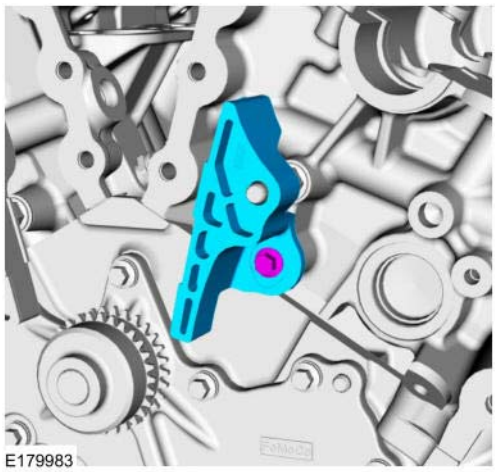
8.

Remove the nut and the ground strap.



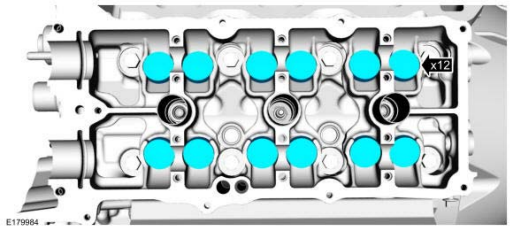
9.

Disconnect the CMP sensor electrical connectors and detach the wiring harness retainer.



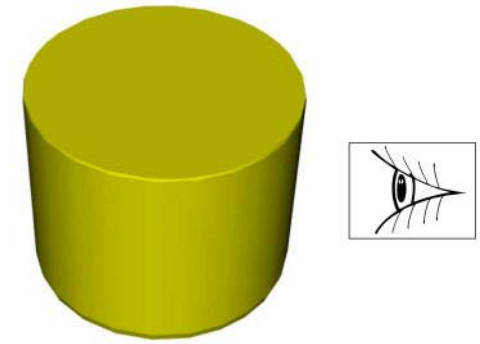
10.

Remove the bolts and the CMP sensors.



NOTE: Do not use power tools to remove the bolt or damage to the upper LH timing chain guide may occur.

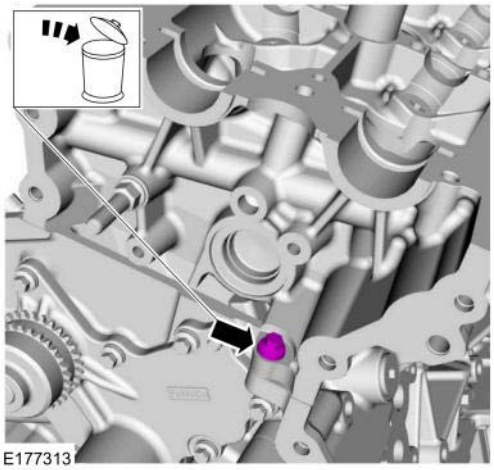
11.
Remove the bolt and the upper LH timing chain guide.



NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

12.
Remove the valve tappets.

13.



Inspect and install new components as necessary.

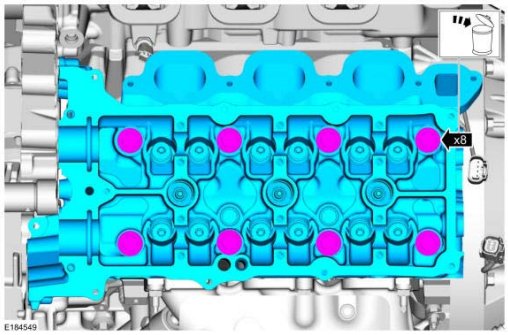
E177302

14.

Remove and discard the M6 bolt.

E177313

NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.



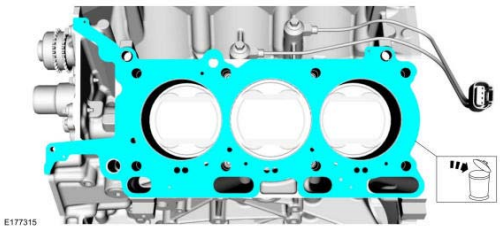
NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

15.

Remove and discard the bolts.

Remove the cylinder head.



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

16.
Make sure that the mating faces are clean and free of foreign material.

17.

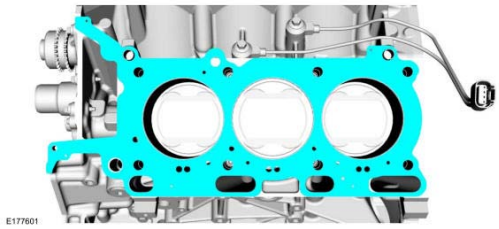
Remove and discard the cylinder head gasket.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and

gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

18.
Make sure that the mating faces are clean and free of foreign material.



19.

Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. Refer to: Cylinder Head Distortion . Refer to: Cylinder Block Distortion .

REMOVAL AND INSTALLATION > CYLINDER HEAD LH > INSTALLATION

1.

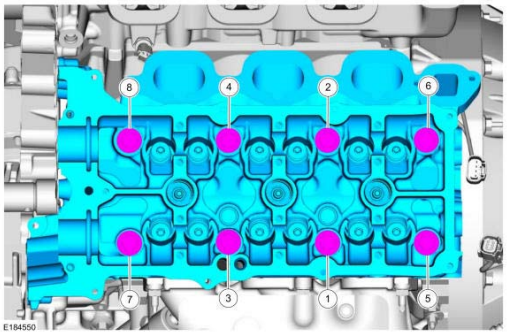
Install the cylinder head gasket.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

NOTE: Install new cylinder head bolts.

2.
Install the cylinder head and the new bolts.

Torque:



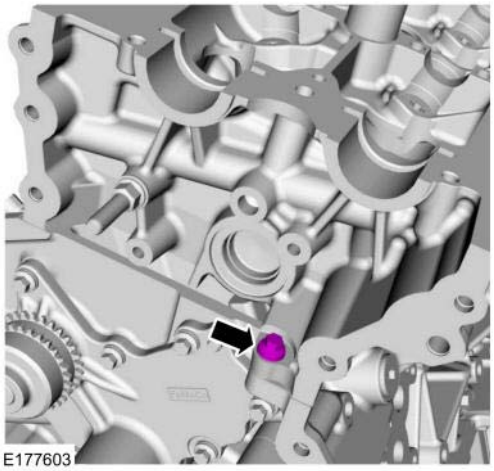
Stage 1: 177 lb.in (20 Nm)

Stage 2: 26 lb.ft (35 Nm)

Stage 3 : 90°

Stage 4: 90°

Stage 5: 45°

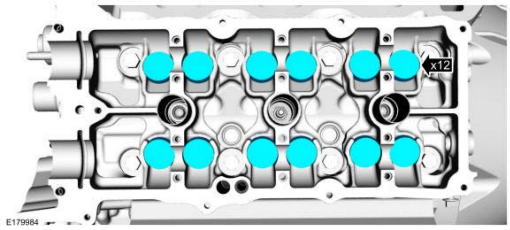


3.

Install the new M6 bolt.

Torque

: 89 lb.in (10 Nm)

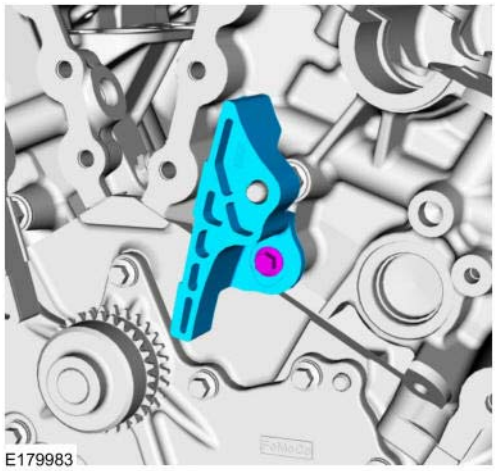


NOTE: The valve tappets must be installed in their original positions.

4.
Lubricate the valve tappets with clean engine oil and install.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



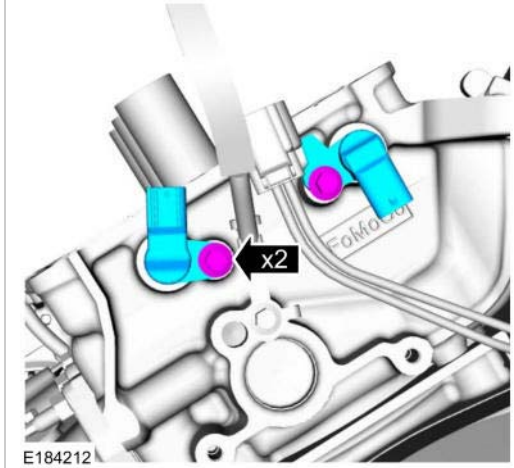
NOTE: Do not use power tools to install the bolt or damage to the upper LH timing chain guide may occur.

5.
Install the upper LH timing chain guide and the bolt.

Torque

: 89 lb.in (10 Nm)

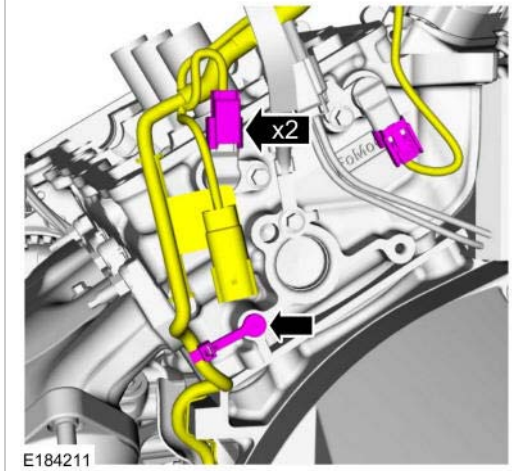
NOTE: Lubricate the O-ring seals with clean engine oil.



6.
Install the CMP sensors and the bolts.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

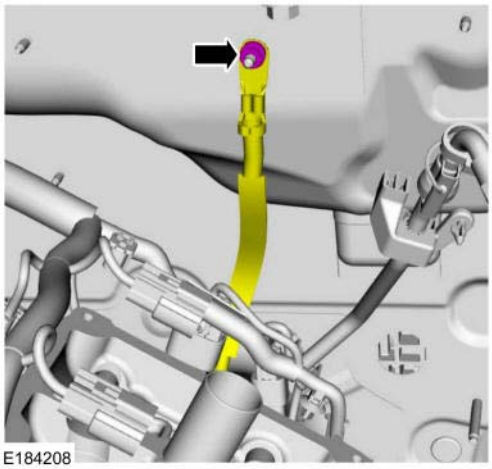


Torque

: 89 lb.in (10 Nm)

7.

Connect the CMP sensors electrical connectors and attach the wiring harness retainer.



8.

Install the ground strap and the nut.

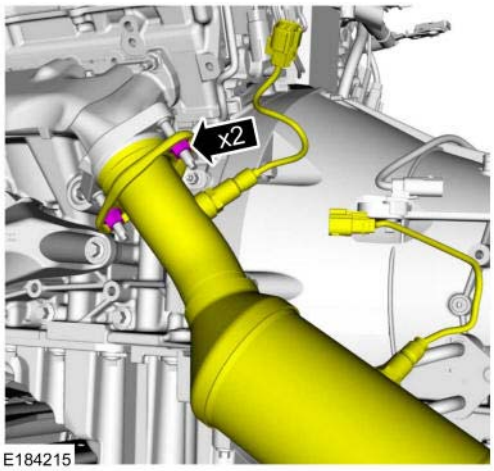
Torque

: 80 lb.in (9 Nm)

9.

Install the lower intake manifold. Refer to: Lower Intake Manifold .

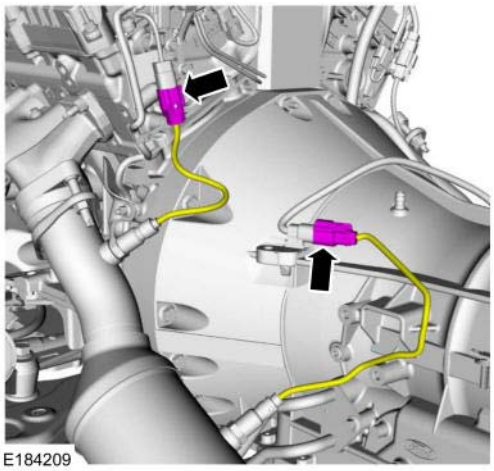
10.



Install the LH camshafts. Refer to: Camshafts .

11.

Position the LH catalytic converter and install new flange nuts.



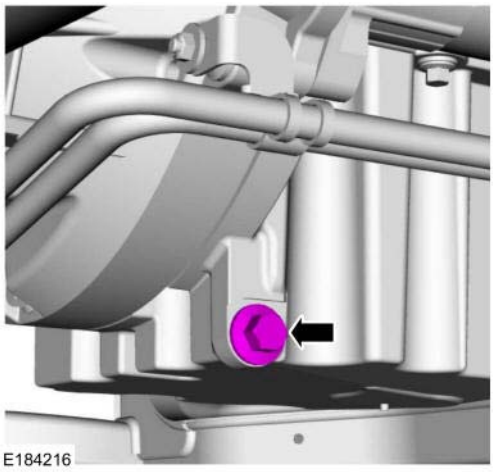
Torque

: 30 lb.ft (40 Nm)

12.

Connect the LH HO2S and catalyst monitor sensor electrical connectors.

13.

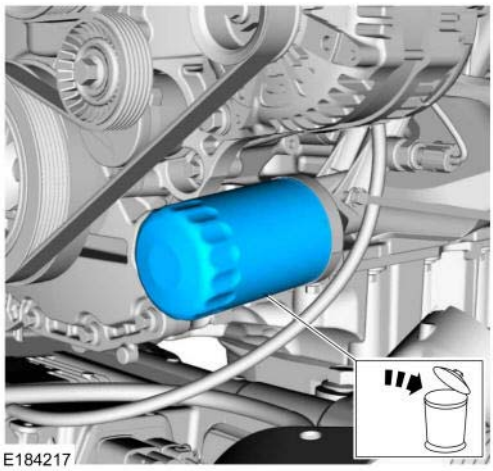


Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

Torque

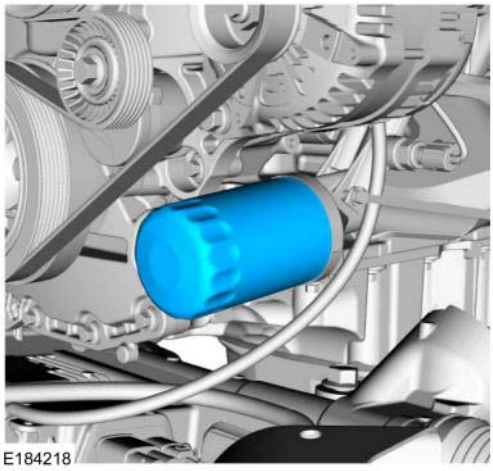


: 20 lb.ft (27 Nm)

14.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment



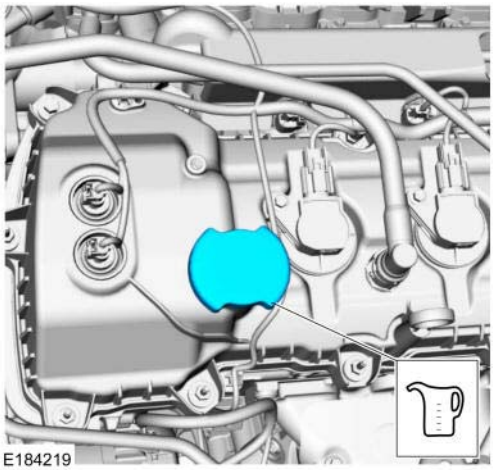
NOTE: Do not lubricate the engine oil filter seal.

15.
Install a new engine oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°



16.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

17.

Connect the battery ground. Refer to: Battery Disconnect and Connect .

18.

Start and check the exhaust system for leaks.

REMOVAL AND INSTALLATION > CYLINDER HEAD RH

Special Tool(s) / General Equipment

Oil Drain Equipment

REMOVAL AND INSTALLATION > CYLINDER HEAD RH > REMOVAL

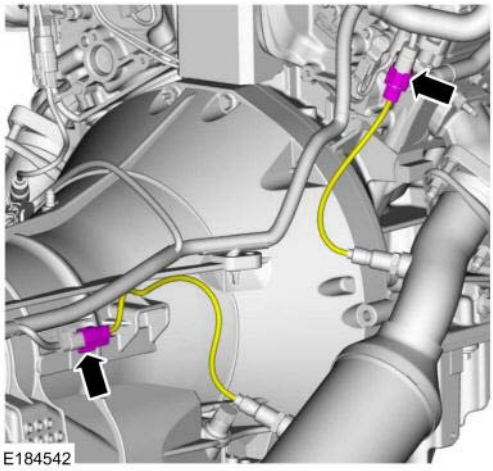
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed. Refer to Variable Camshaft Timing (VCT) Unit .

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

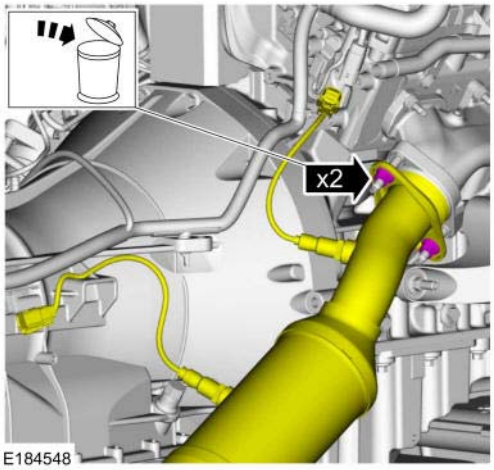
2.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE .

3.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .



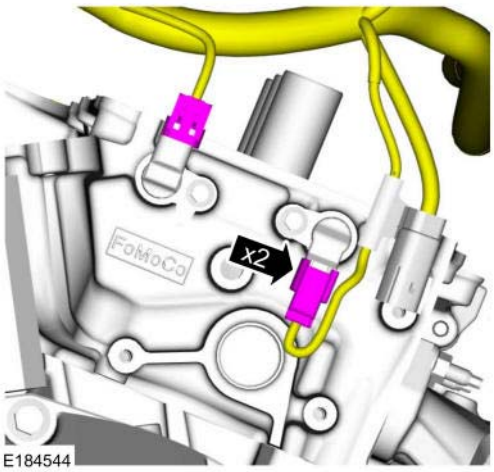
4.

Disconnect the RH HO2S and catalyst monitor sensor electrical connectors.

NOTE: Clean the catalytic converter-to-exhaust manifold sealing surfaces.

5.
Remove and discard the RH catalytic converter flange nuts.

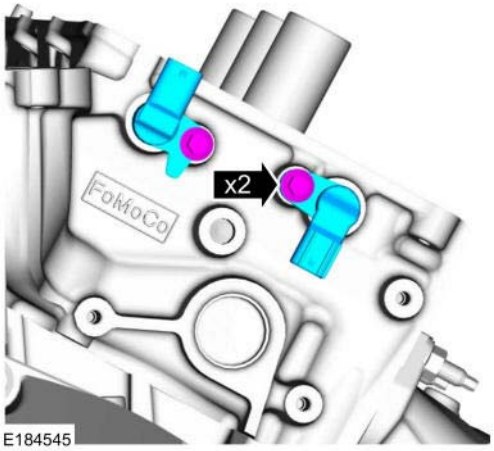
6.



Remove the RH camshafts. Refer to: Camshafts .

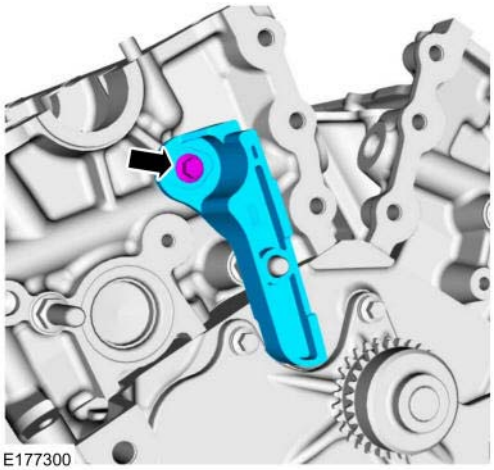
7.

Remove the lower intake manifold. Refer to: Lower Intake Manifold .



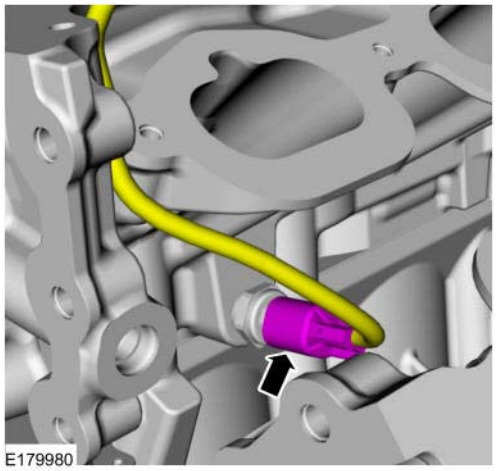
8.

Disconnect the RH CMP sensor electrical connectors.



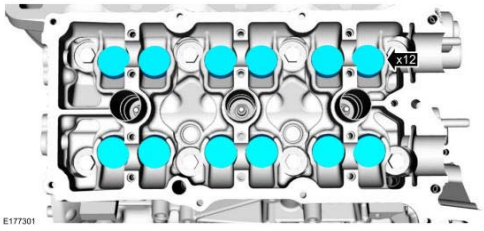
9.

Remove the bolts and the RH CMP sensors.



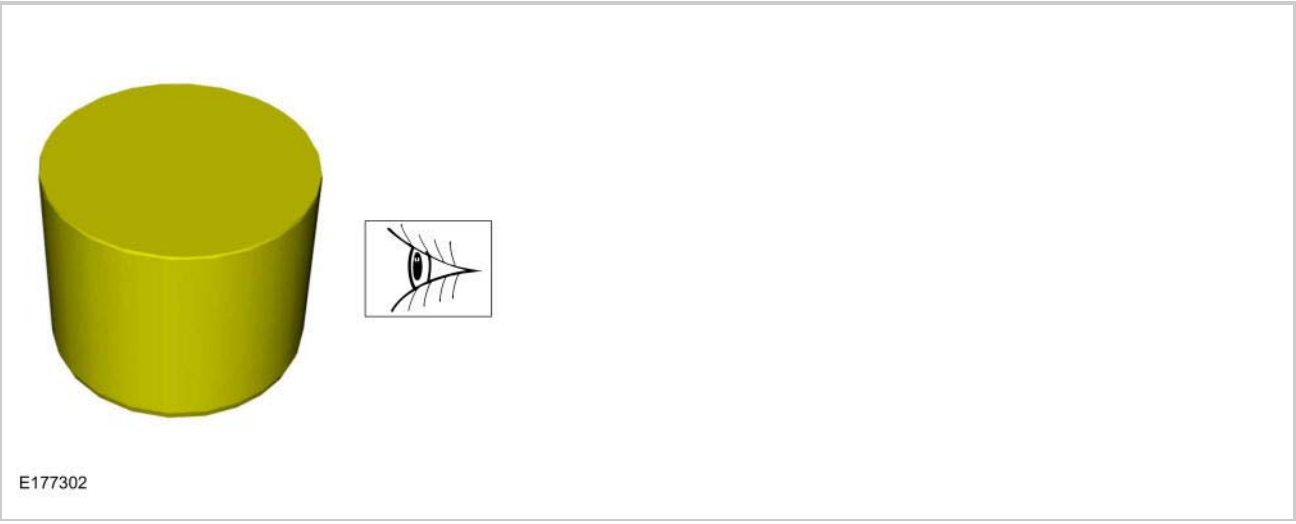
NOTE: Do not use power tools to remove the bolt or damage to the upper RH timing chain guide may occur.

10.
Remove the bolt and the RH timing chain guide.



11.

Disconnect the CHT sensor electrical connector.



NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

12.
Remove the valve tappets.

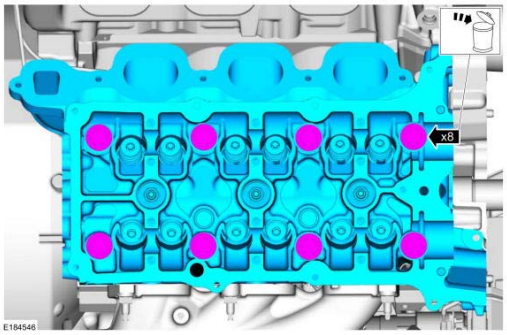
13.

Inspect and install new components as necessary.

14.

Remove and discard the M6 bolt.

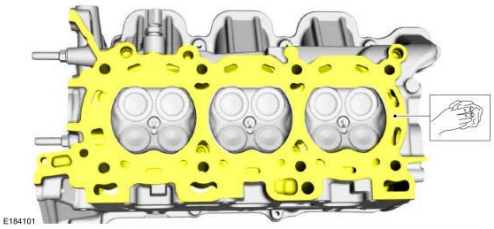
NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.



NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface

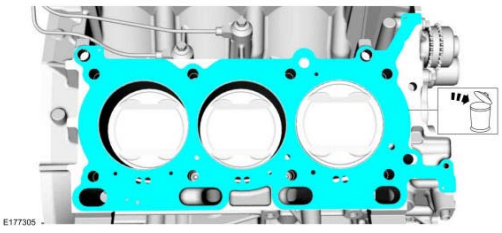
NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

15.



Remove and discard the bolts.

Remove the cylinder head.



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

16.
Make sure that the mating faces of the cylinder head are clean and free of foreign material.

17.

Remove and discard the cylinder head gasket.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and

gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

18.
Make sure that the mating faces of the engine block are clean and free of foreign material.

19.

Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. Refer to: Cylinder Head Distortion . Refer to: Cylinder Block Distortion .

REMOVAL AND INSTALLATION > CYLINDER HEAD RH > INSTALLATION

1.

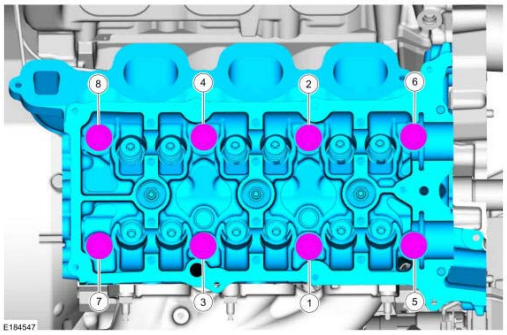
Install the cylinder head gasket.

NOTE: Install new cylinder head bolts.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

2.
Install the cylinder head and the new bolts.

Torque:



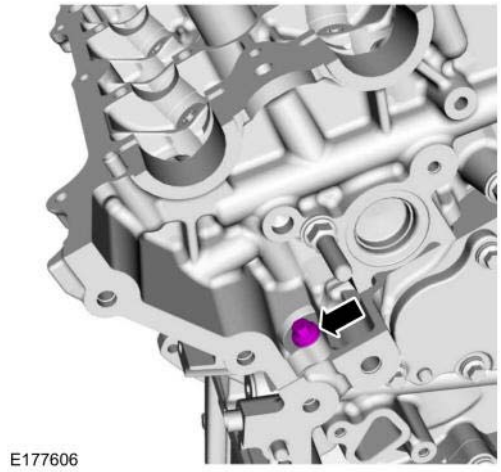
Stage 1: 177 lb.in (20 Nm)

Stage 2: 26 lb.ft (35 Nm)

Stage 3: 90°

Stage 4: 90°

Stage 5: 45°

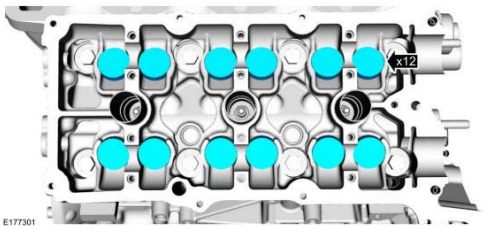


3.

Install the new M6 bolt.

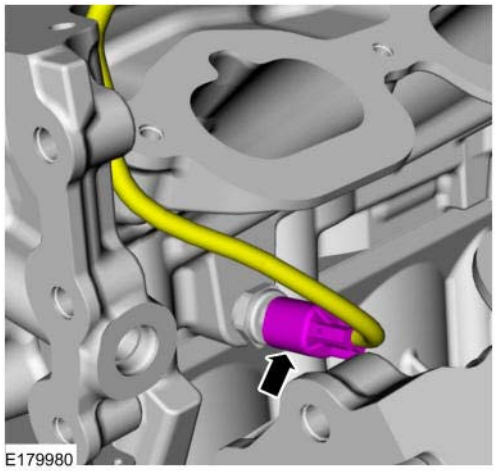
Torque

: 89 lb.in (10 Nm)



NOTE: The valve tappets must be installed in their original positions.

4.
Lubricate the valve tappets with clean engine oil and install.

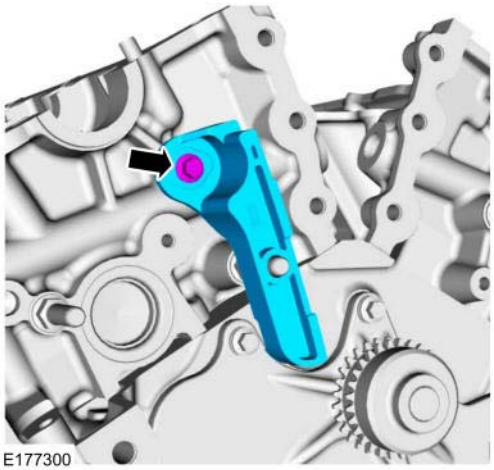


Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

5.

Connect the CHT sensor electrical connector.



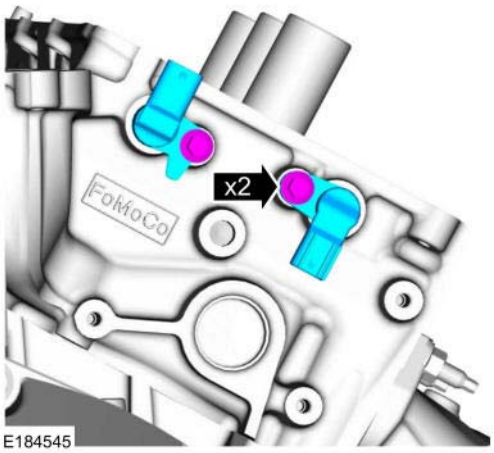
NOTE: Do not use power tools to remove the bolt or damage to the upper RH timing chain guide may occur.

6.
Install the RH timing chain guide and the bolt.

Torque

: 89 lb.in (10 Nm)

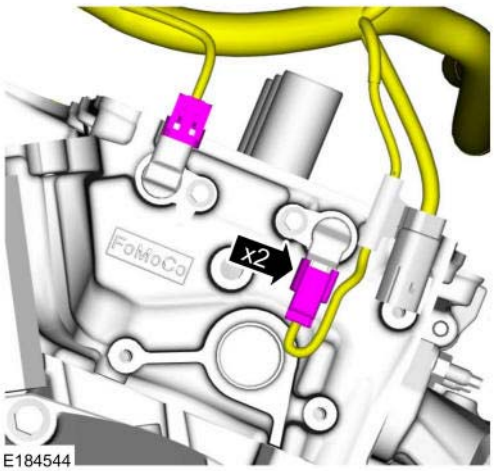
NOTE: Lubricate the O-ring seals with clean engine oil.



7.
Install the CMP sensors and the bolts.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



Torque

: 89 lb.in (10 Nm)

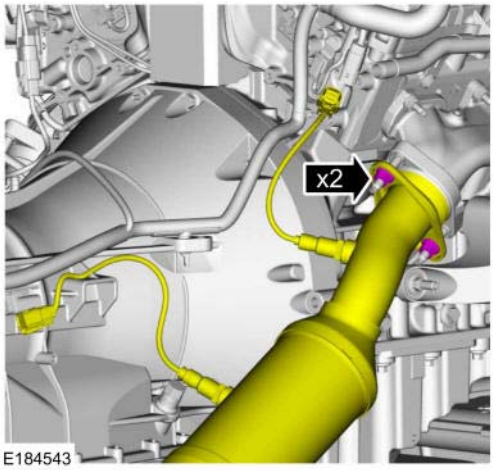
8.

Connect the RH CMP sensor electrical connectors.

9.

Install the lower intake manifold. Refer to: Lower Intake Manifold .

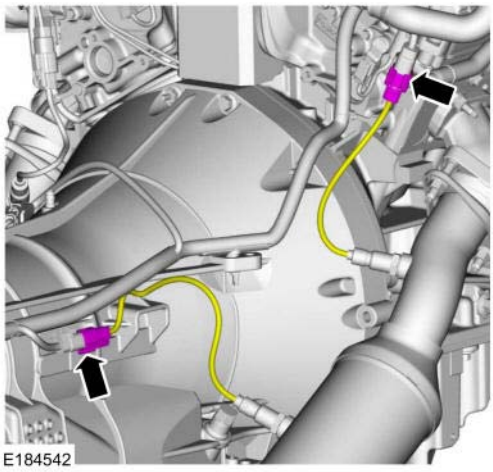
10.



Install the RH camshafts. Refer to: Camshafts .

11.

Position the RH catalytic converter and install new flange nuts.



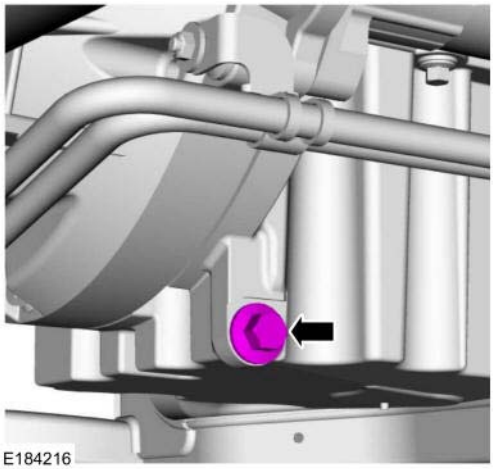
Torque

: 30 lb.ft (40 Nm)

12.

Connect the RH HO2S and catalyst monitor sensor electrical connectors.

13.

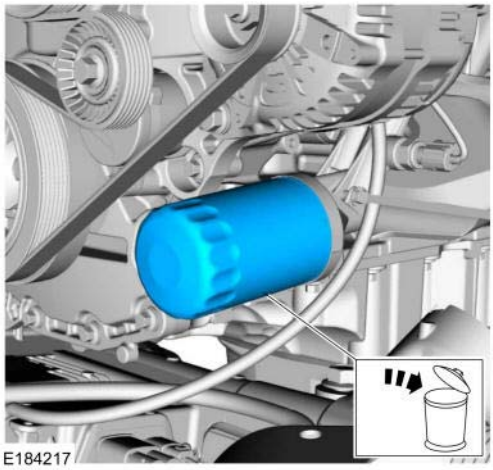


Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

Torque

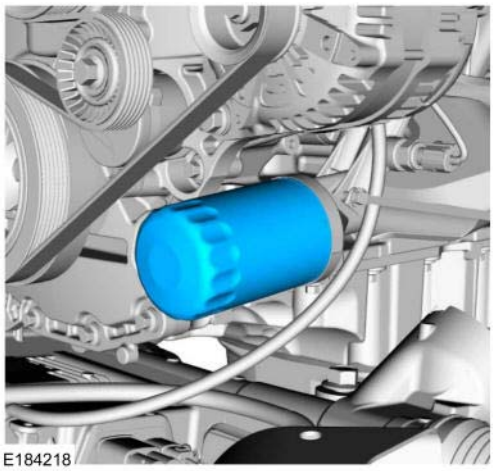


: 20 lb.ft (27 Nm)

14.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment



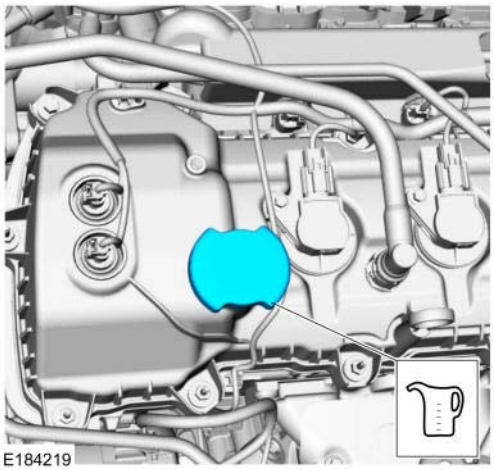
NOTE: Do not lubricate the engine oil filter seal.

15.
Install a new engine oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°



16.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

17.

Connect the battery ground. Refer to: Battery Disconnect and Connect .

18.

Start and check the exhaust system for leaks.

Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

REMOVAL AND INSTALLATION > ENGINE FRONT COVER > REMOVAL

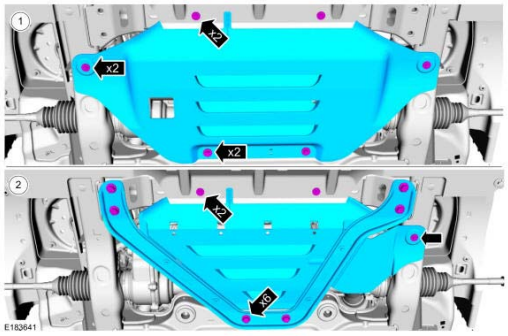
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Vehicles are equipped with either an underbody shield or a subframe

bracket and underbody shield assembly.



2.

1.

Remove the bolts and the underbody shield.

2.

Remove the bolts and the subframe bracket and underbody shield assembly.

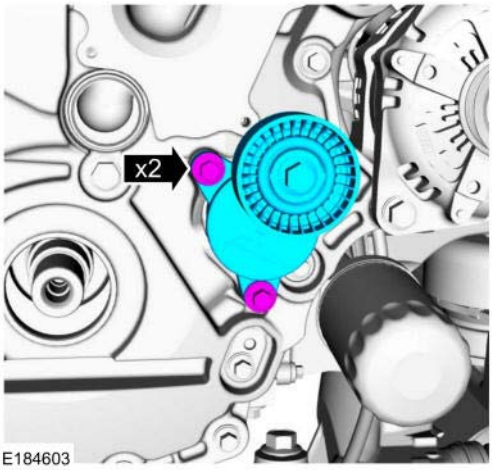
3.

Drain the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

4.

Remove the following items:

Refer to: Valve Cover LH .



Refer to: Valve Cover RH .

Refer to: Crankshaft Front Seal .

Refer to: COOLANT PUMP .

5.

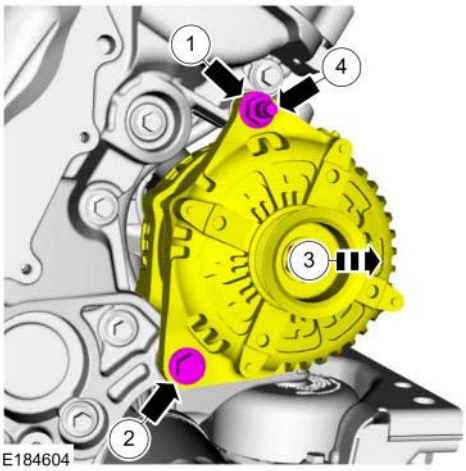
Remove the bolts and the accessory drive belt tensioner.

6.

1.

Remove the nut.

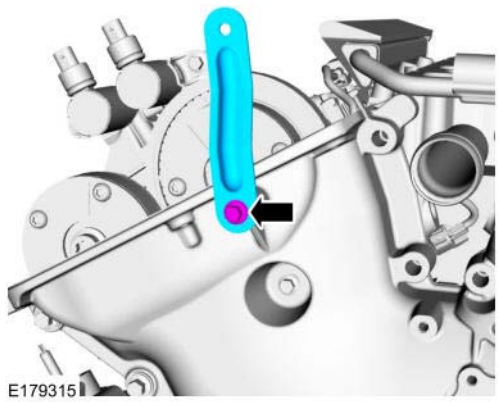
2.



Remove the bolt.

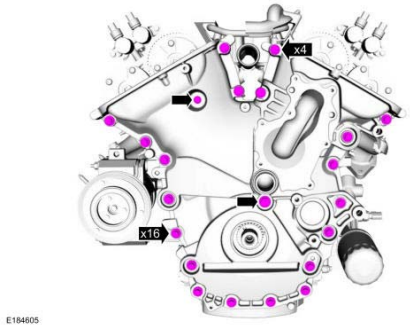
3.

Position the generator aside.



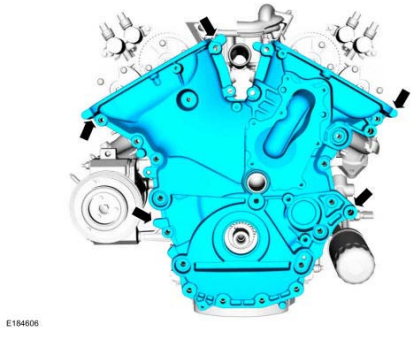
4.

Remove the stud bolt.



7.

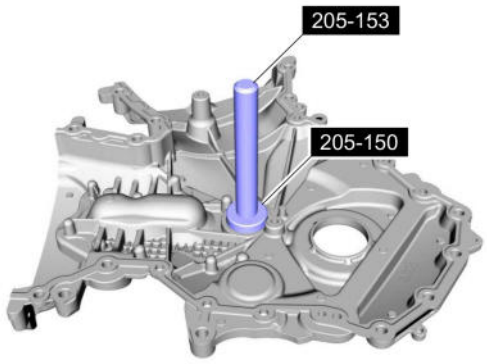
Remove the bolt and the upper intake manifold support bracket.



8.

Remove the engine front cover bolts.

9.



Using a pry tool, locate the pry pads shown in illustration and pry the engine front cover loose and remove.

10.

Using the special tools, remove the engine front cover to coolant pipe seal.

Use Special Service Tool: 205-150 (T80T-4000-S) Installer, Spindle Bearing, 205-153 (T80T-4000-W) Handle.

E177279

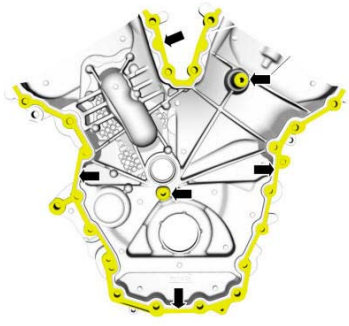
NOTE: Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean front cover.

11.

Clean the engine front cover using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15, 000 rpm. Refer to: RTV Sealing Surface Cleaning and Preparation .

Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

E183886

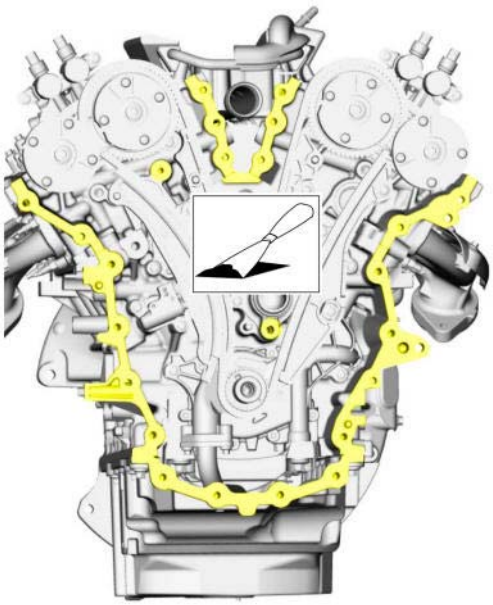
NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully

remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.

12.
Make sure that the mating faces of the engine block and oil pan are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material



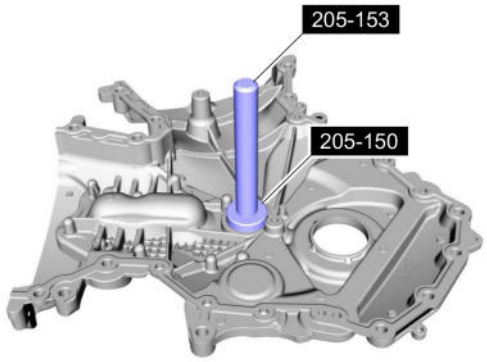
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

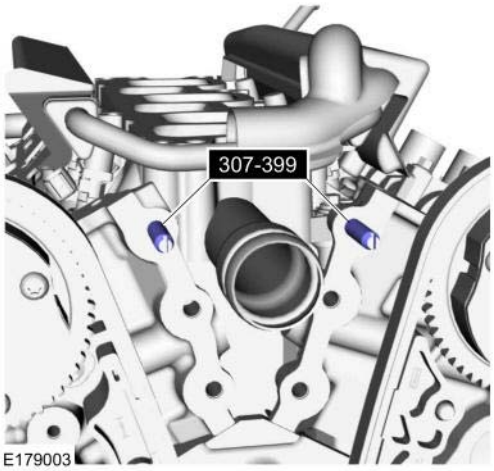


E183887

REMOVAL AND INSTALLATION > ENGINE FRONT COVER > INSTALLATION

1.

Using the special tools, install the engine front cover to coolant pipe seal.



Use Special Service Tool: 205-150 (T80T-4000-S) Installer, Spindle Bearing, 205-153 (T80T-4000-W) Handle.

E177279

2.

Install Special Service Tool: 307-399 Alignment Pins, Transmission Fluid Pump.

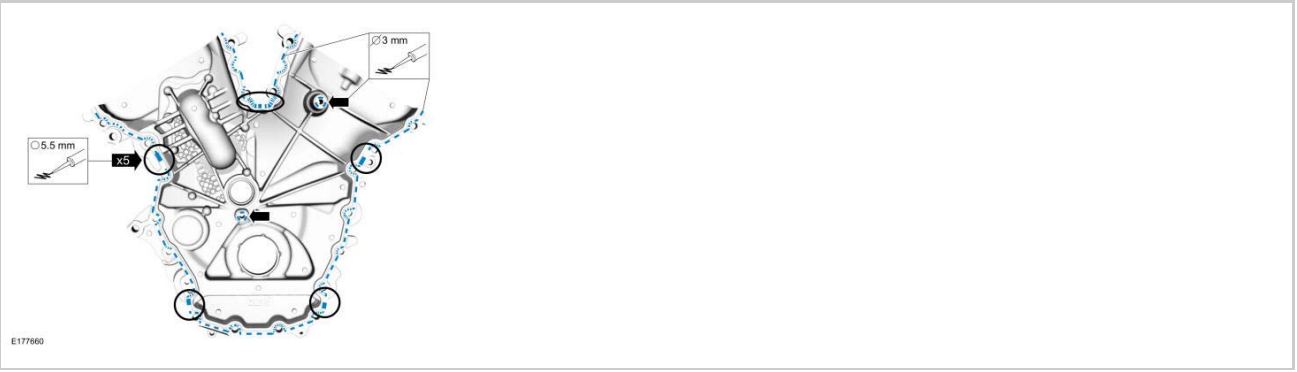
E179003

3.

NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The engine front cover and the bolts must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. Failure to follow this procedure can cause future oil leakage.

Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the inner bolt bosses.



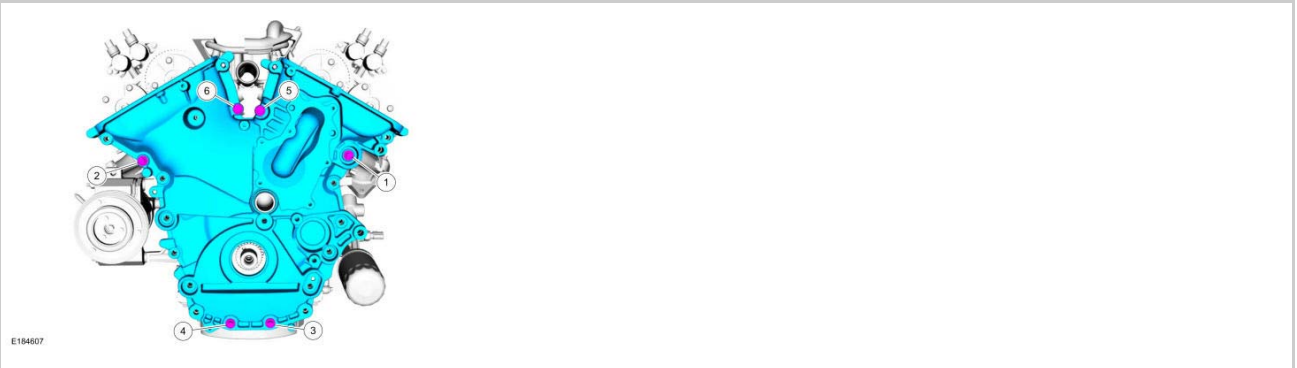
Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in places as indicated.

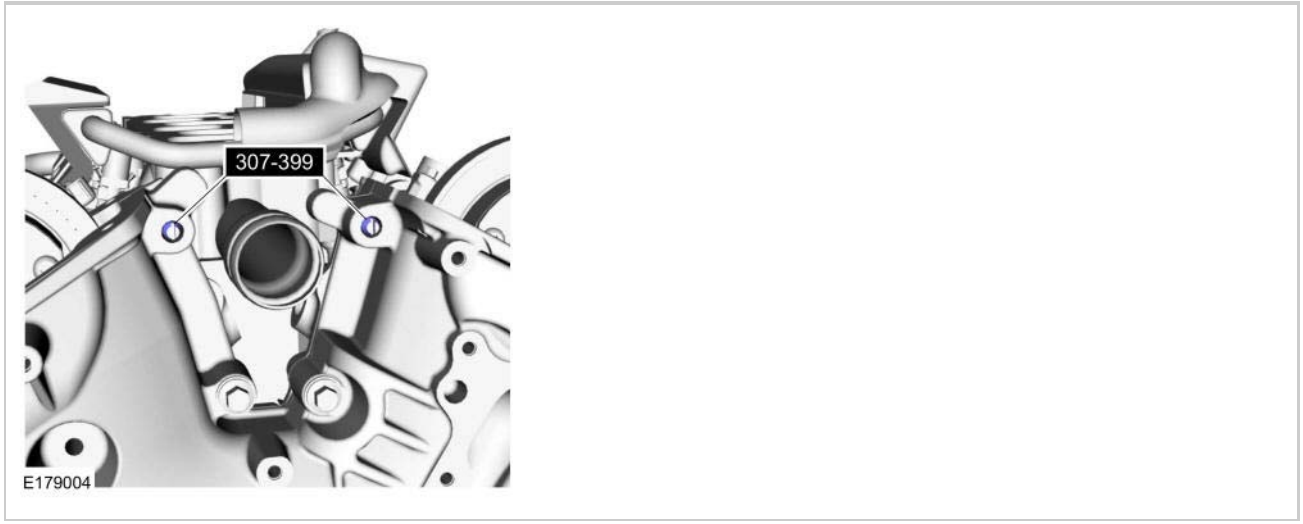
Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



NOTE: Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

4.
Install the engine front cover and the bolts.



Torque

: 27 lb.in (3 Nm)

5.

Remove Special Service Tool: 307-399 Alignment Pins, Transmission Fluid Pump.

6.

Install the remaining engine front cover bolts.

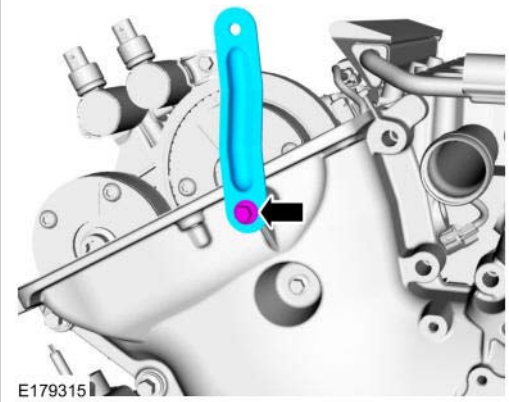
Torque:

Stage 1: Tighten bolts 1 thru 21 to: 89 lb.in (10 Nm)

Stage 2: Tighten bolts 1 thru 20 to: 18 lb.ft (24 Nm)

Stage 3: Tighten bolt 21 to: 177 lb.in (20 Nm)

Stage 4: Tighten bolt 21 an additional: 90°



Stage 5: Tighten bolt 22 to: 89 lb.in (10 Nm)

Stage 6: Tighten bolt 22 an additional: 45°

7.

Install the upper intake manifold support bracket and the bolt finger-tight.

8.

1.

Install the stud bolt.

Torque

: 71 lb.in (8 Nm)

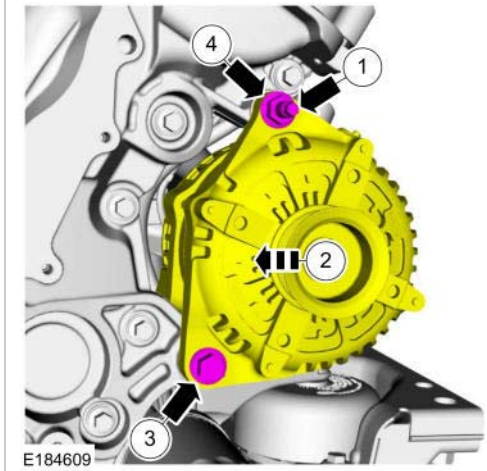
2.

Install the generator.

3.

Install the bolt.

Torque



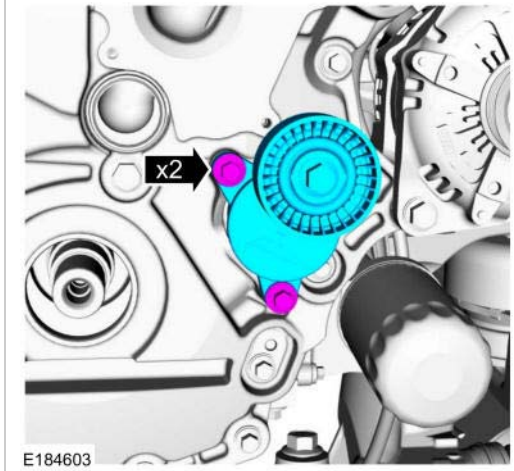
: 35 lb.ft (47 Nm)

4.

Install the nut.

Torque

: 35 lb.ft (47 Nm)



9.

Install the accessory drive belt tensioner and the bolts.

Torque

: 97 lb.in (11 Nm)

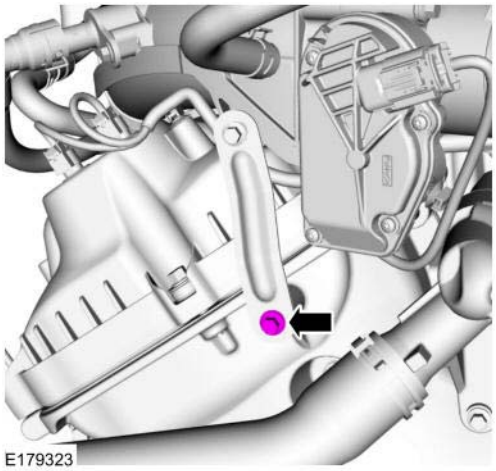
10.

Install the following items:

Refer to: COOLANT PUMP .

Refer to: Crankshaft Front Seal .

Refer to: Valve Cover RH .



Refer to: Valve Cover LH .

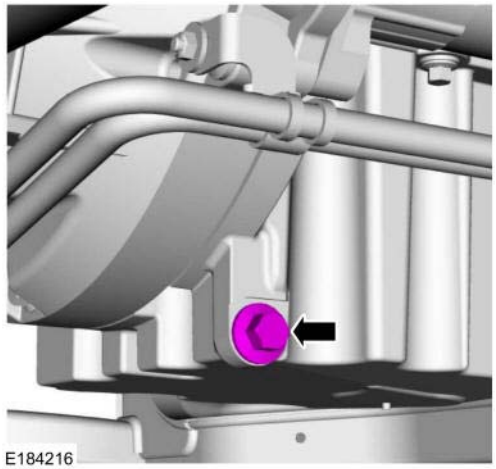
11.

Tighten the bolt for the upper intake manifold support bracket.

Torque

: 89 lb.in (10 Nm)

12.

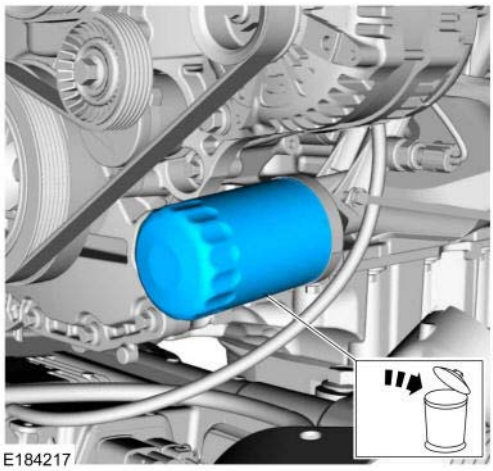


Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

Torque

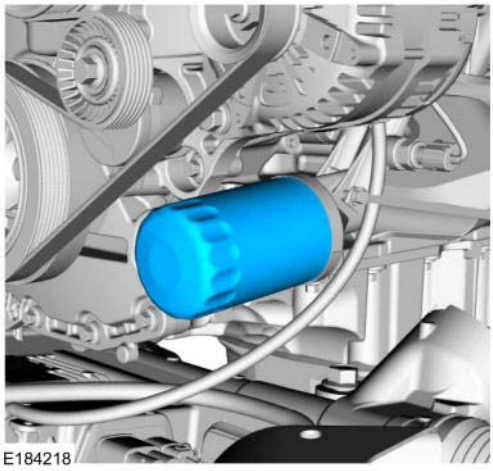


: 20 lb.ft (27 Nm)

13.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment



NOTE: Do not lubricate the engine oil filter seal.

14.
Install a new engine oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

15.

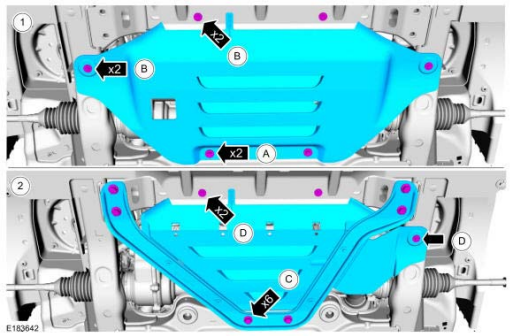
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



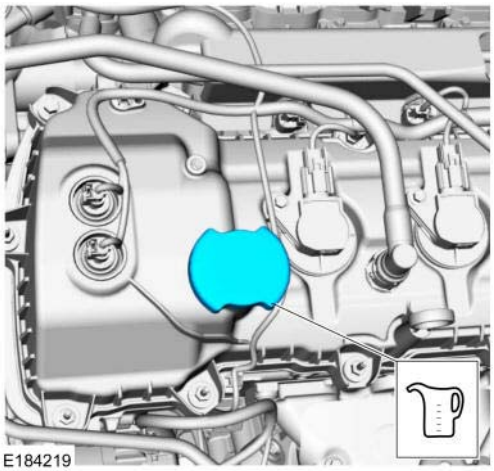
2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)



16.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

17.

Fill the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

18.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > ENGINE MOUNT LH

Special Tool(s) / General Equipment

REMOVAL AND INSTALLATION > ENGINE MOUNT LH > REMOVAL

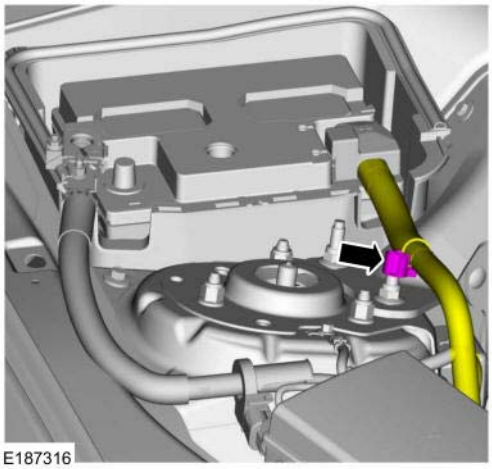
Convertible/Coupe

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the cowl panel grille. Refer to: Cowl Panel Grille .



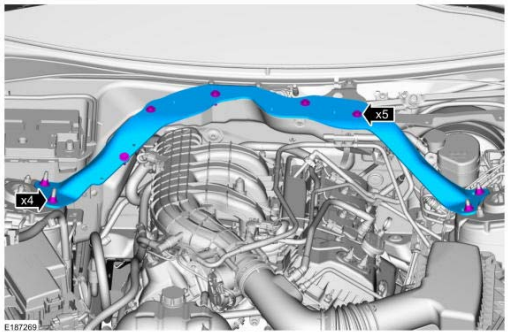
Convertible

3.

Disconnect the negative battery cable. Refer to: Battery Disconnect and Connect .

4.

Detach the battery cable retainer.



5.

Disconnect the positive battery cable. Refer to: Battery Disconnect and Connect .

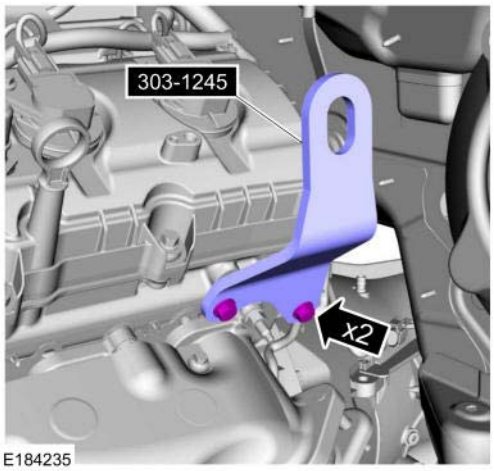
6.

Remove the cowl extension nuts.

Remove the bolts and the cowl extension.

Convertible/Coupe

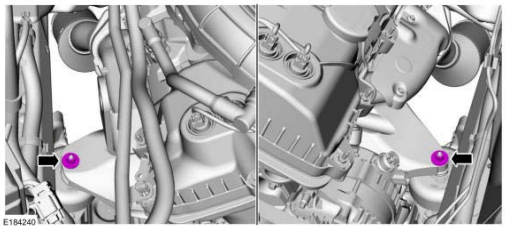
7.



Remove the following items:

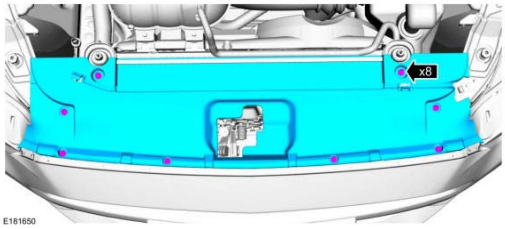
Refer to: AIR CLEANER OUTLET PIPE .

Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).



8.

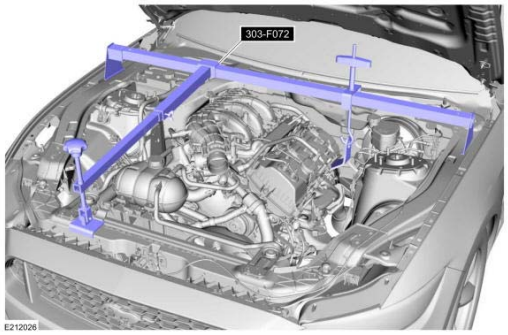
Install Special Service Tool: 303-1245 Engine Lift Eye.



9.

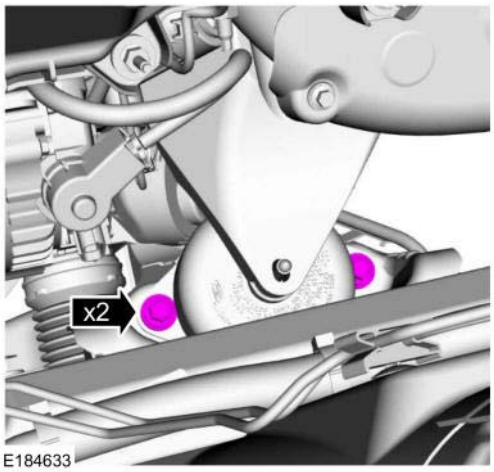
Remove the RH and LH engine mount bracket nuts.

10.



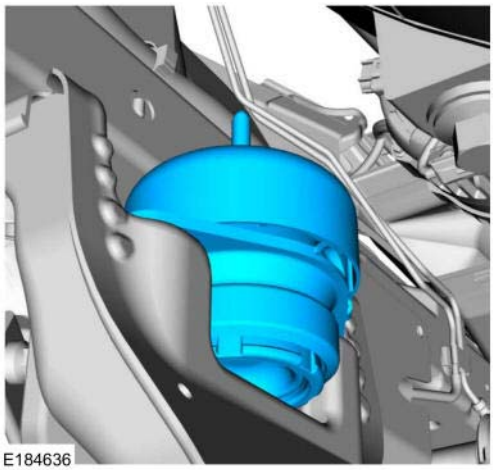
Remove the retainers and the radiator top shield.

11.



Install the special tool and raise the engine.

Install Special Service Tool: 303-F072 Support Bar, Engine.

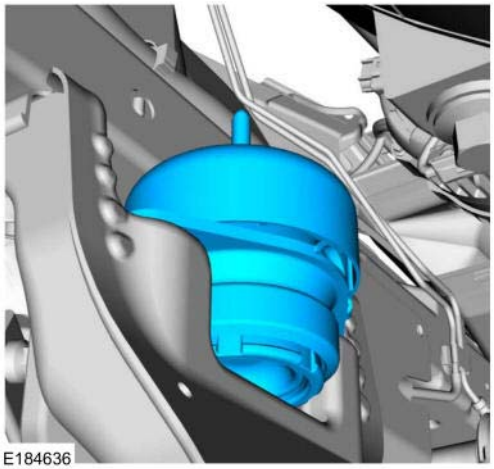


12.

Remove the bolts for the engine mount.

13.

Remove the engine mount.

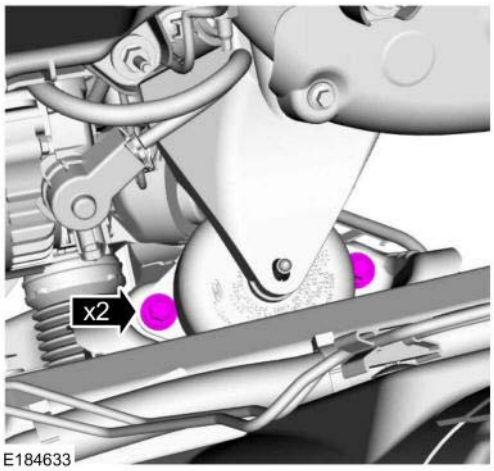


REMOVAL AND INSTALLATION > ENGINE MOUNT LH > INSTALLATION

Convertible/Coupe

NOTE: Do not install the bolts at this time.

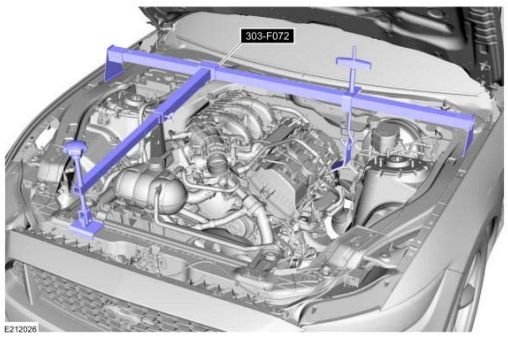
1.
Install the engine mount.



2.

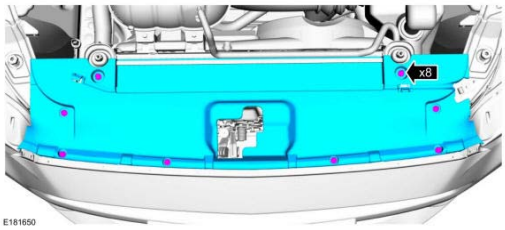
Install the bolts for the engine mount.

Torque



: 52 lb.ft (70 Nm)

3.

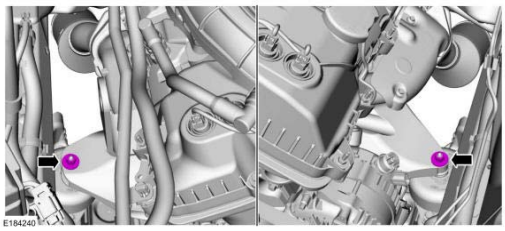


Lower the engine and remove the special tool.

Remove Special Service Tool: 303-F072 Support Bar, Engine.

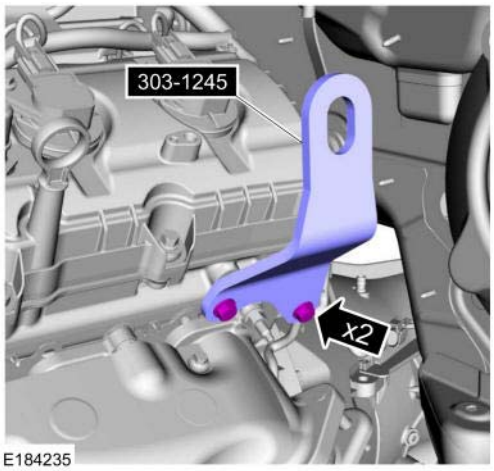
4.

Install the radiator top shield and the retainers.



5.

Install the RH and LH engine mount nuts.



Torque

: 46 lb.ft (63 Nm)

6.

Remove Special Service Tool: 303-1245 Engine Lift Eye.

7.

Install the following items:

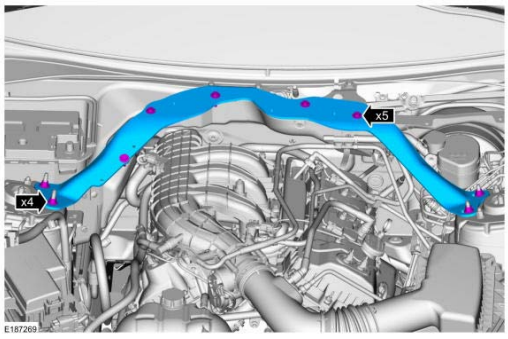
Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

Refer to: AIR CLEANER OUTLET PIPE .

Convertible

8.

Install the cowl extension and the bolts.



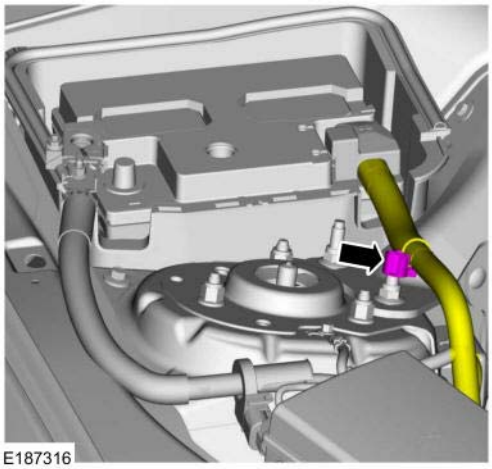
Torque

: 26 lb.ft (35 Nm)

Install the cowl extension nuts.

Torque

: 41 lb.ft (55 Nm)



9.

Connect the positive battery cable. Refer to: Battery Disconnect and Connect .

10.

Attach the battery cable retainer.

11.

Connect the negative battery cable. Refer to: Battery Disconnect and Connect .

Convertible/Coupe

12.

Install the cowl panel grille. Refer to: Cowl Panel Grille .

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

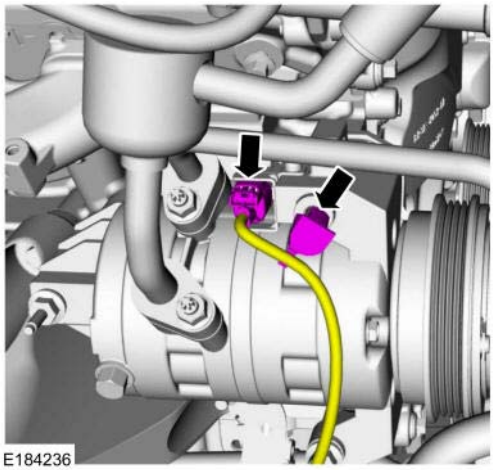
2.

Remove the retainers and the battery cover.

3.

Remove the following items:

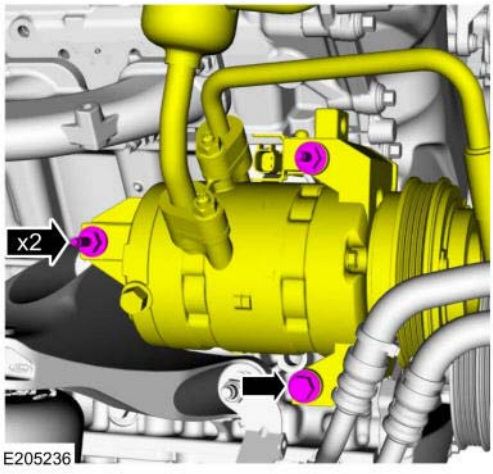
Refer to: AIR CLEANER OUTLET PIPE .



Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

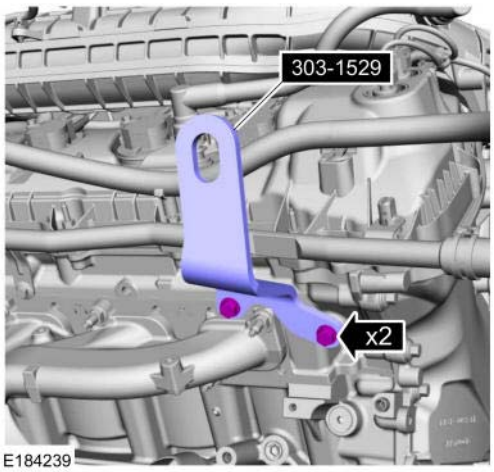
4.

Remove the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



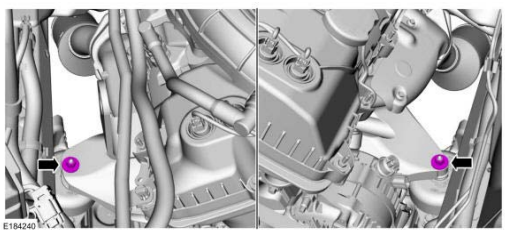
5.

Disconnect the A/C compressor electrical connector and the wire harness retainer.



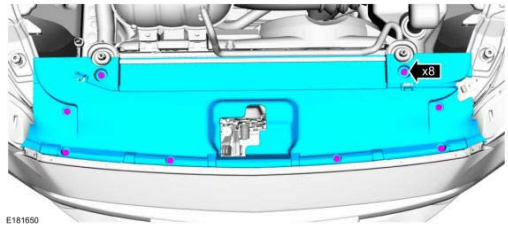
NOTE: The stud bolts and bolt will stay with the A/C compressor.

6.
Loosen the stud bolts, bolt and position the A/C compressor aside.



7.

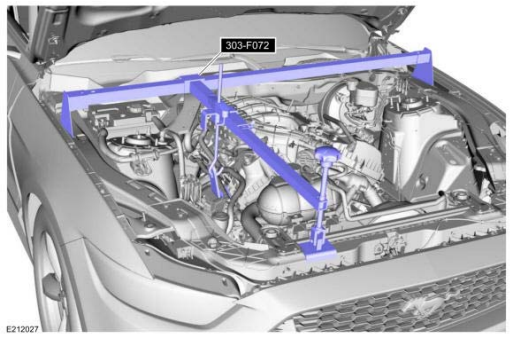
Install Special Service Tool: 303-1529 Lift Eye, Engine.



8.

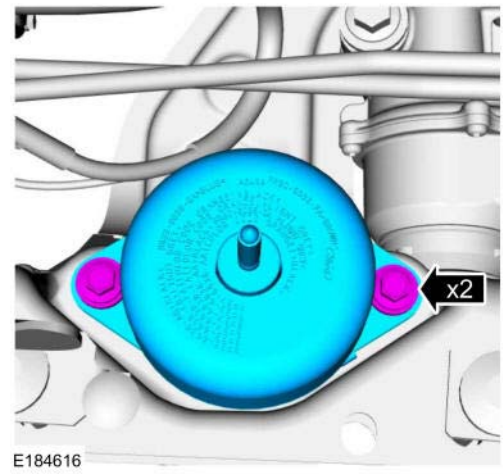
Remove the RH and LH engine mount bracket nuts.

9.



Remove the retainers and the radiator top shield.

10.

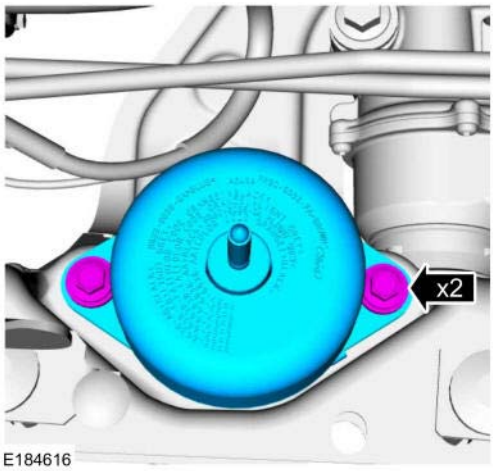


Install the special tool and raise the engine.

Install Special Service Tool: 303-F072 Support Bar, Engine.

11.

Remove the bolts and the engine mount.

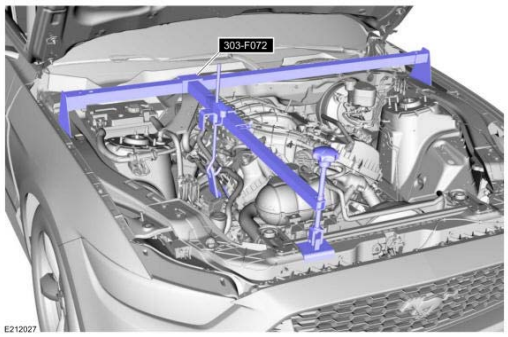


REMOVAL AND INSTALLATION > ENGINE MOUNT RH > INSTALLATION

1.

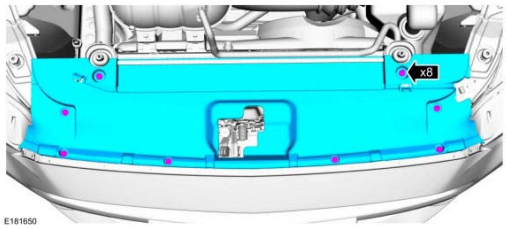
Install the engine mount and the bolts.

Torque



: 52 lb.ft (70 Nm)

2.

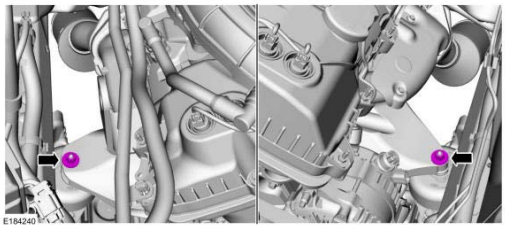


Lower the engine and remove the special tool.

Install Special Service Tool: 303-F072 Support Bar, Engine.

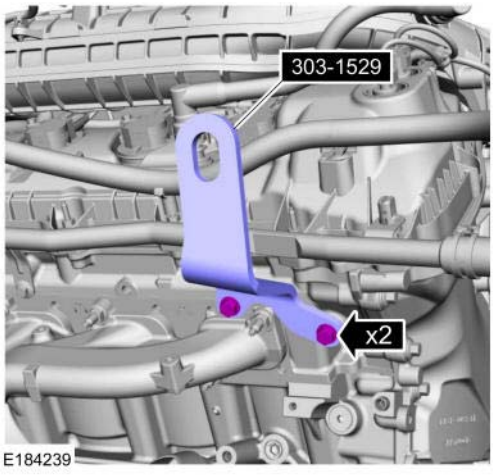
3.

Install the radiator top shield and the retainers.



4.

Install the RH and LH engine mount nuts.

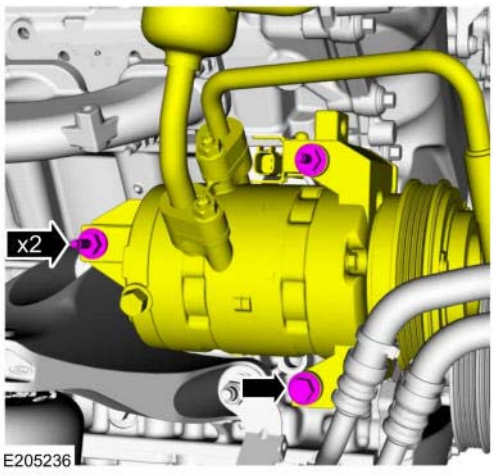


Torque

: 46 lb.ft (63 Nm)

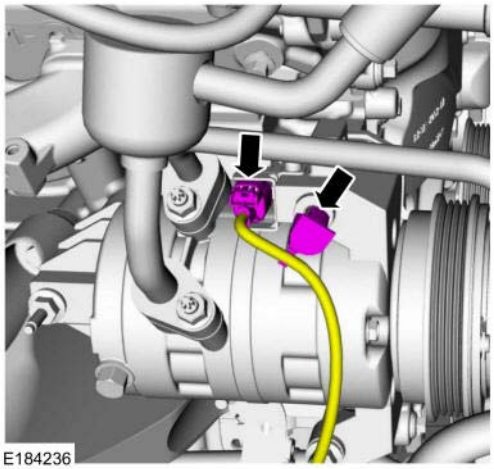
5.

Remove Special Service Tool: 303-1529 Lift Eye, Engine.



6.

Position the A/C compressor and install the stud bolts and bolt.



Torque

: 18 lb.ft (25 Nm)

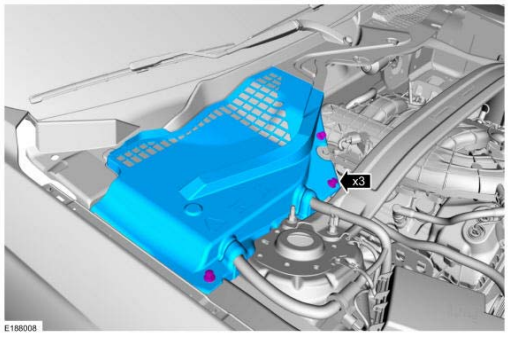
7.

Connect the A/C compressor electrical connector and the wire harness retainer.

8.

Install the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

9.



Install the following items:

Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

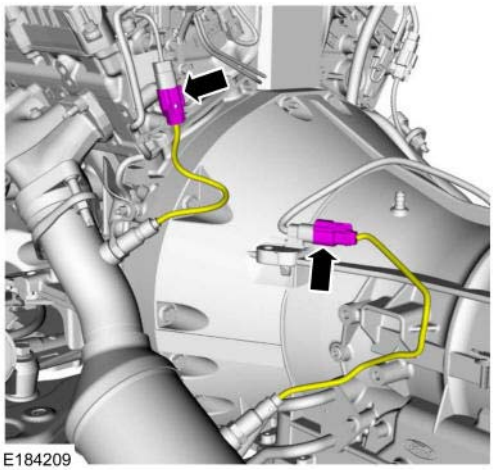
Refer to: AIR CLEANER OUTLET PIPE .

10.

Install the battery cover and the retainers.

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD LH > REMOVAL

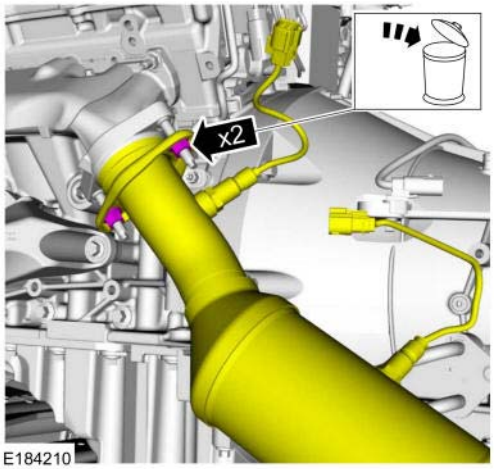
1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

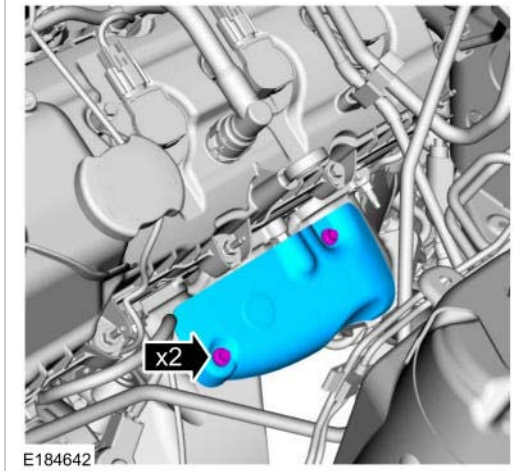
2.

Remove the air cleaner. Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).



3.

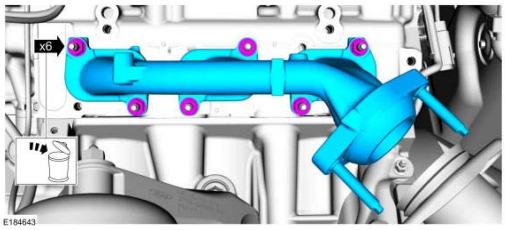
Disconnect the LH HO2S and catalyst monitor sensor electrical connectors.



NOTE: Clean the catalytic converter-to-exhaust manifold sealing surfaces.

4.
Remove and discard the LH catalytic converter flange nuts.

5.



Remove the bolts and the exhaust manifold heat shield.

6.

Remove the nuts and the exhaust manifold.

Discard the nuts.

7.

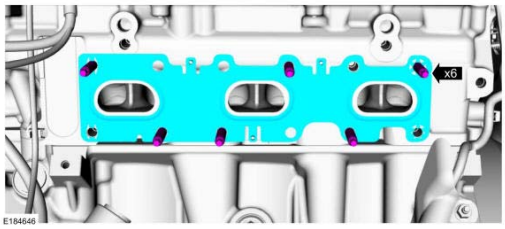
Remove and discard the exhaust manifold gasket.

Remove and discard the exhaust manifold studs.

8.

Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD LH > INSTALLATION



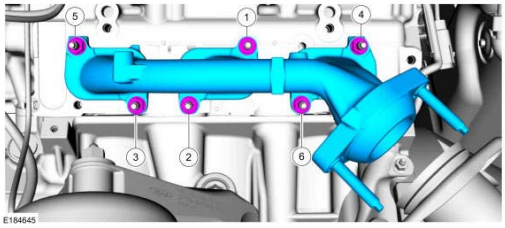
1.

Install the new exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install the new exhaust manifold gasket.



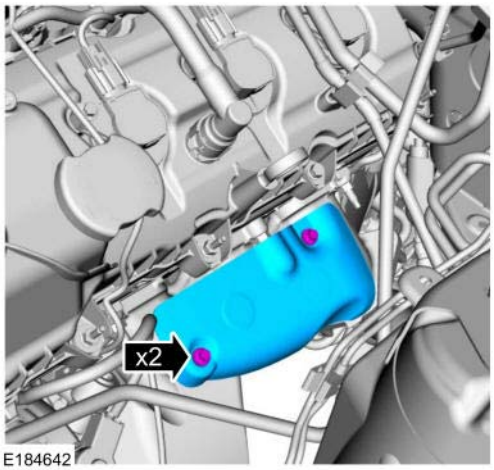
2.

Install the exhaust manifold and the new nuts.

Torque:

Stage 1: 168 lb.in (19 Nm)

Stage 2: 18 lb.ft (25 Nm)

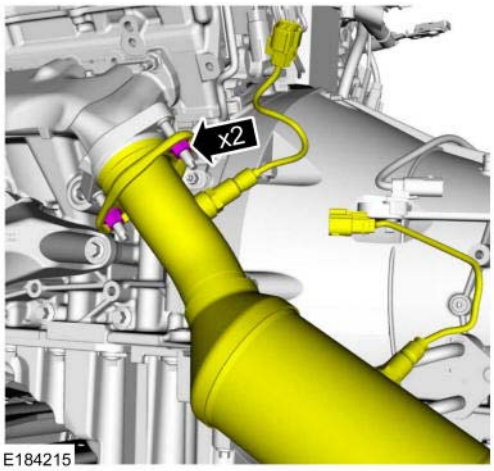


3.

Install the exhaust manifold heat shield and the bolts.

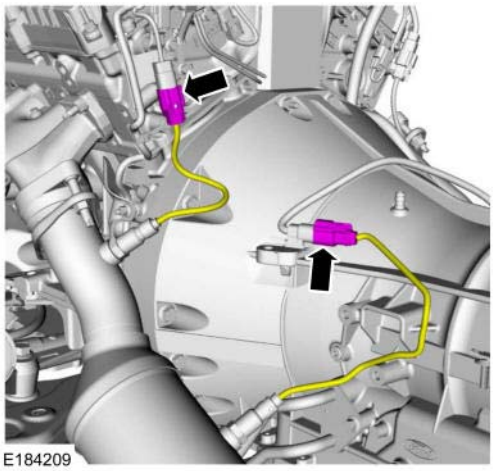
Torque

: 106 lb.in (12 Nm)



4.

Position the LH catalytic converter and install new flange nuts.



Torque

: 30 lb.ft (40 Nm)

5.

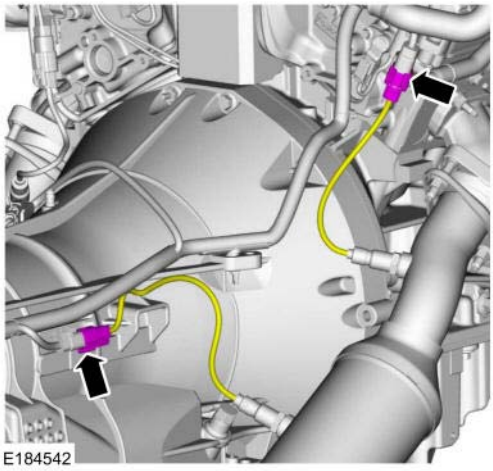
Connect the LH HO2S and catalyst monitor sensor electrical connectors.

6.

Install the air cleaner. Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

7.

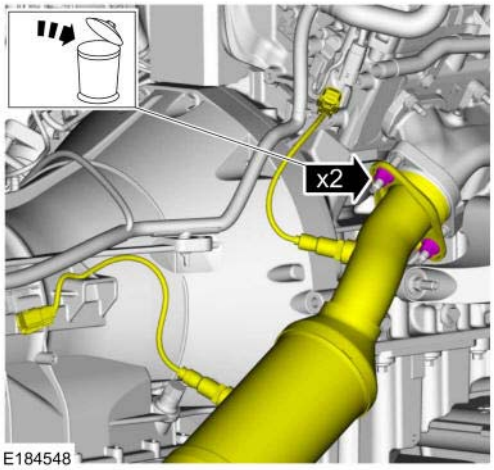
Start and check the exhaust system for leaks.



REMOVAL AND INSTALLATION > EXHAUST MANIFOLD RH > REMOVAL

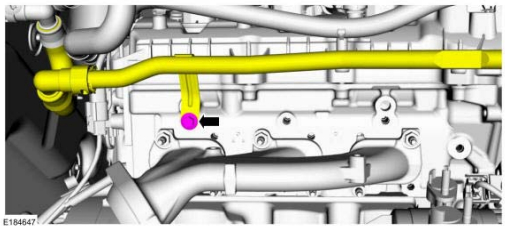
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



2.

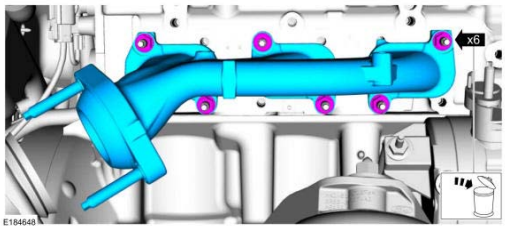
Disconnect the RH HO2S and catalyst monitor sensor electrical connectors.



NOTE: Clean the catalytic converter-to-exhaust manifold sealing surfaces.

3.
Remove and discard the RH catalytic converter flange nuts.

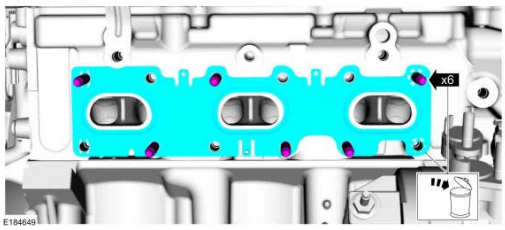
4.



Remove the coolant tube bolt from the cylinder head.

5.

Remove the nuts and the exhaust manifold.



Discard the nuts.

6.

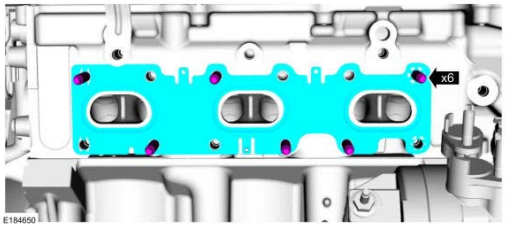
Remove and discard the exhaust manifold gasket.

Remove and discard the exhaust manifold studs.

7.

Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD RH > INSTALLATION



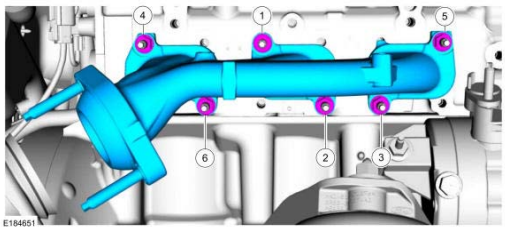
1.

Install the new exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install the new exhaust manifold gasket.



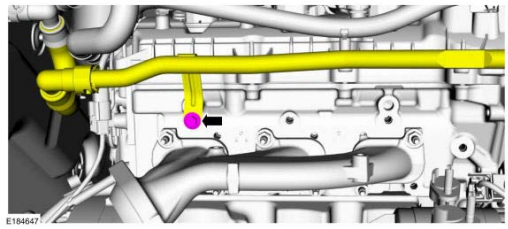
2.

Install the exhaust manifold and the new nuts.

Torque:

Stage 1: 68 lb.in (19 Nm)

Stage 2: 18 lb.ft (25 Nm)

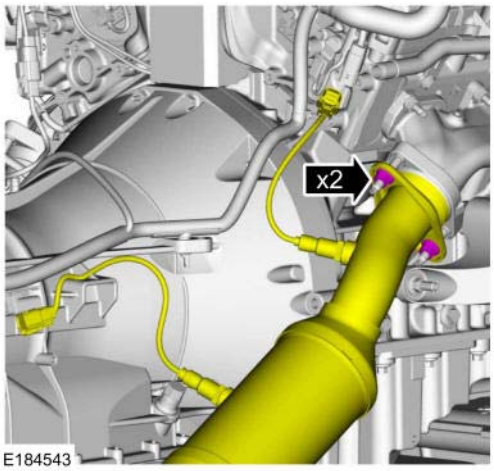


3.

Install the coolant tube bolt.

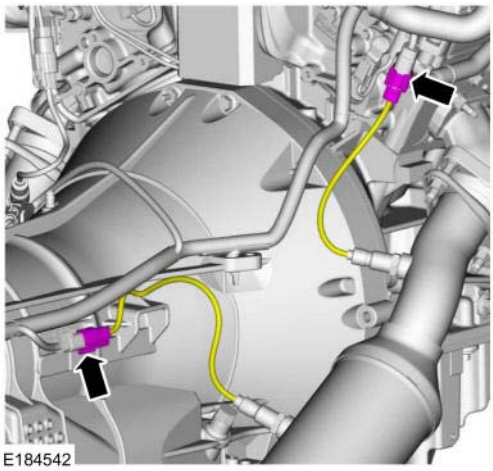
Torque

: 17 lb.ft (23 Nm)



4.

Position the RH catalytic converter and install new flange nuts.



Torque

: 30 lb.ft (40 Nm)

5.

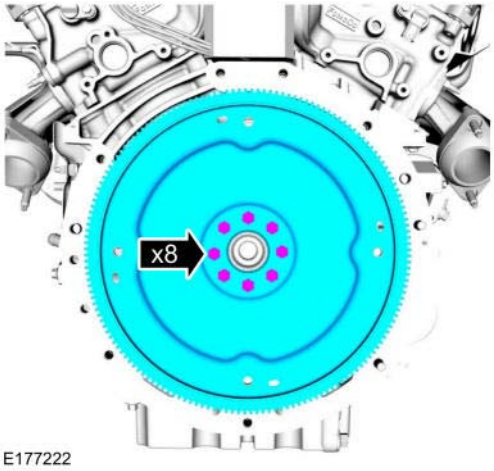
Connect the RH HO2S and catalyst monitor sensor electrical connectors.

6.

Start and check the exhaust system for leaks.

REMOVAL AND INSTALLATION > FLEXPLATE > REMOVAL

1.



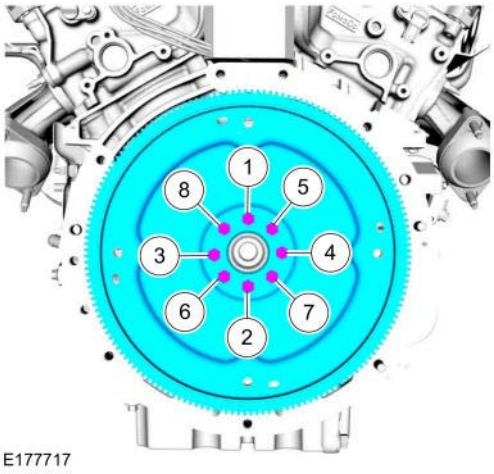
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the automatic transmission. Refer to: Transmission - 3.7L Duratec (227kW/301PS) .

3.

Remove the bolts and the flexplate.



REMOVAL AND INSTALLATION > FLEXPLATE > INSTALLATION

NOTE: One of the flexplate holes are offset so the flexplate can only be installed in one position.

1.
Install the flexplate and the bolts and tighten in sequence shown in illustration.

Torque

: 59 lb.ft (80 Nm)

2.

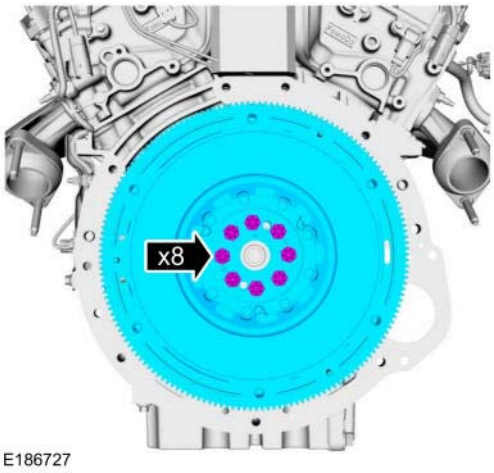
Install the automatic transmission. Refer to: Transmission - 3.7L Duratec (227kW/301PS) .

3.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > FLYWHEEL > REMOVAL

1.



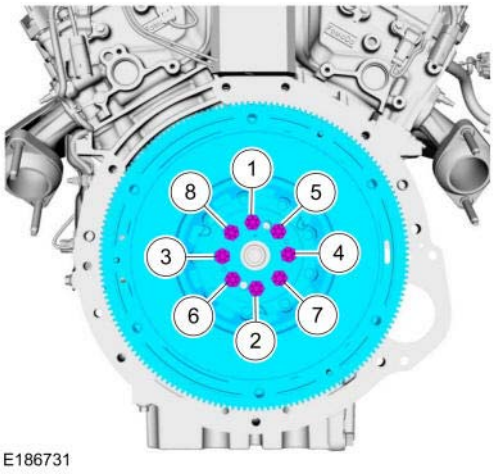
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the clutch. Refer to: Clutch Disc and Pressure Plate - 3.7L Duratec (227kW/301PS) .

3.

Remove the bolts and the flywheel.



REMOVAL AND INSTALLATION > FLYWHEEL > INSTALLATION

NOTE: One of the 8 flywheel holes are offset so the flywheel can only be installed in one position.

1.
Install the flywheel and the bolts.

Torque

: 59 lb.ft (80 Nm)

2.

Install the clutch. Refer to: Clutch Disc and Pressure Plate - 3.7L Duratec (227kW/301PS) .

3.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > FRONT COVER TO COOLANT PIPE SEAL

Special Tool(s) / General Equipment

	303-1528 Remover/Installer, Water Tube Seal

REMOVAL AND INSTALLATION > FRONT COVER TO COOLANT PIPE SEAL > REMOVAL

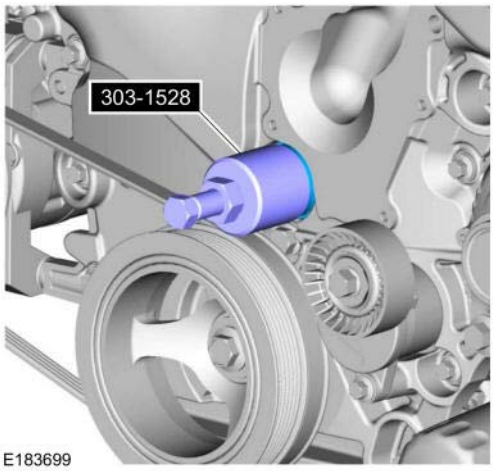
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1.

Remove the coolant pump. Refer to: COOLANT PUMP .

2.

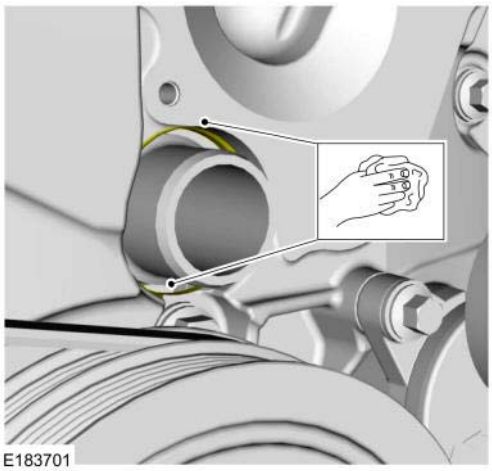
Using the special tool, remove the front cover to coolant pipe seal.



Reset the special tool center bolt to its retracted position.

Use Special Service Tool: 303-1528 Remover/Installer, Water Tube Seal.

Screw the special tool onto the front cover to coolant pipe seal until it bottoms out.



Using a brass hammer, give the special tool a slight tap inward to break front cover radial seal lose.

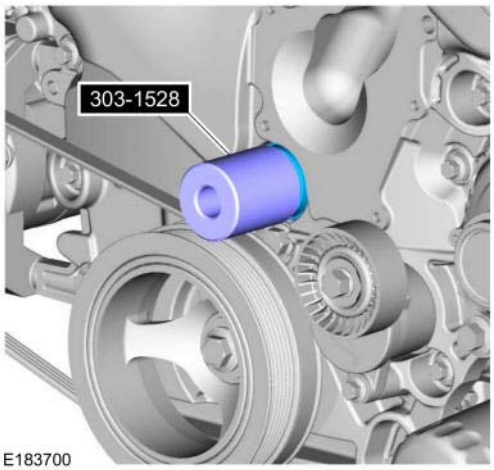
Turn the special tool center bolt clockwise and remove the front cover to coolant pipe seal.

3.

Clean the engine front cover to coolant pipe seal area.

REMOVAL AND INSTALLATION > FRONT COVER TO COOLANT PIPE SEAL > INSTALLATION

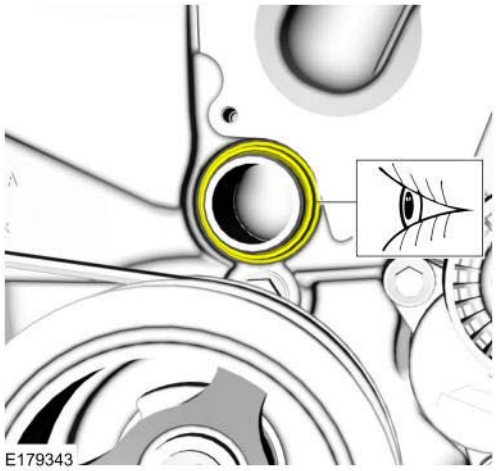
1.



Using the special tool, install the front cover to coolant pipe seal.

Position the front cover to coolant pipe seal on the special tool.

Use Special Service Tool: 303-1528 Remover/Installer, Water Tube Seal.



Position the special tool into the engine front cover.

Using a brass hammer, tap the special tool until the front cover to coolant pipe seal bottoms out.

2.

Inspect the front cover to coolant pipe seal for proper installation or damage.

3.

Install the coolant pump. Refer to: COOLANT PUMP .

REMOVAL AND INSTALLATION > LOWER INTAKE MANIFOLD > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: It is not necessary to remove the fuel rail from the intake manifold assembly.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

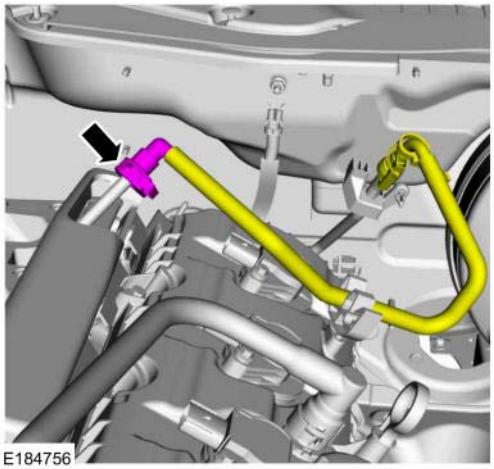
2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE .

3.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

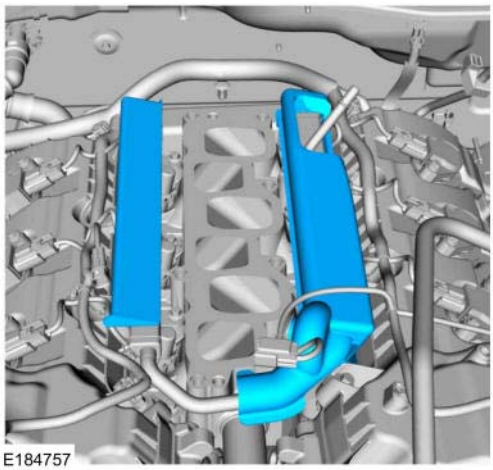
4.



Drain the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

5.

Remove the upper intake manifold. Refer to: Upper Intake Manifold .

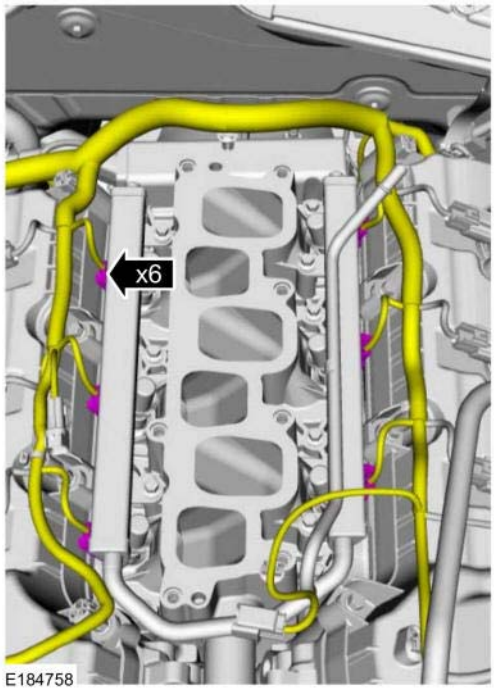


6.

Disconnect the fuel tube quick release coupling. Refer to: QUICK RELEASE COUPLING .

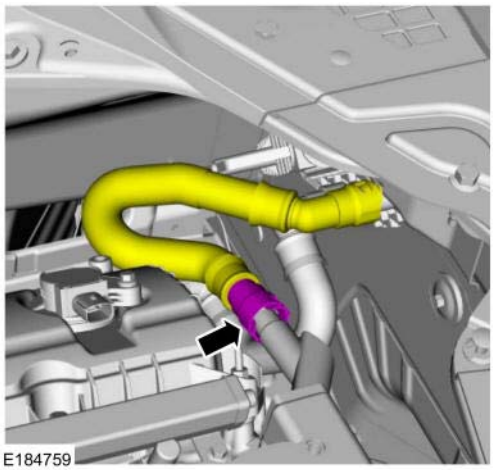
7.

Remove the fuel rail sound insulators.



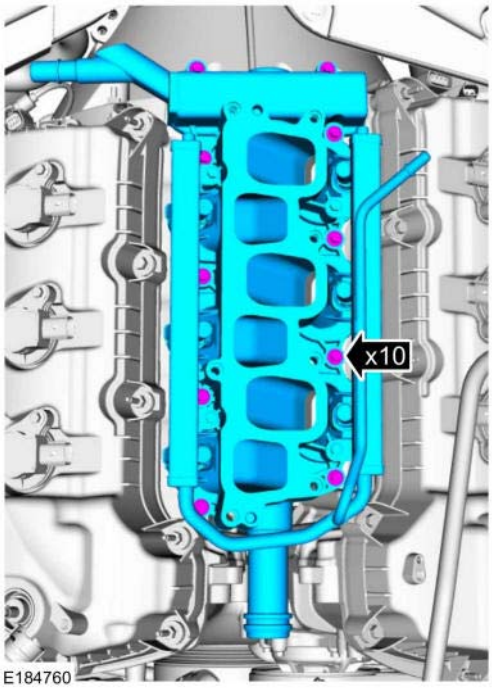
8.

Remove the thermostat housing. Refer to: THERMOSTAT HOUSING .



9.

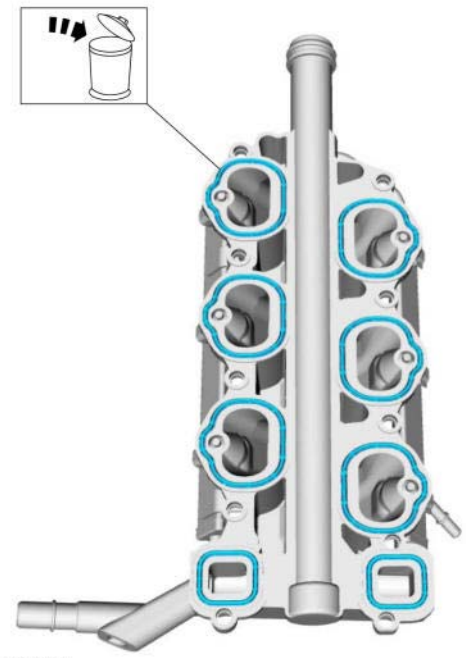
Disconnect the fuel injector electrical connectors.



10.

Disconnect the coolant tube from the back of the lower intake manifold.

11.

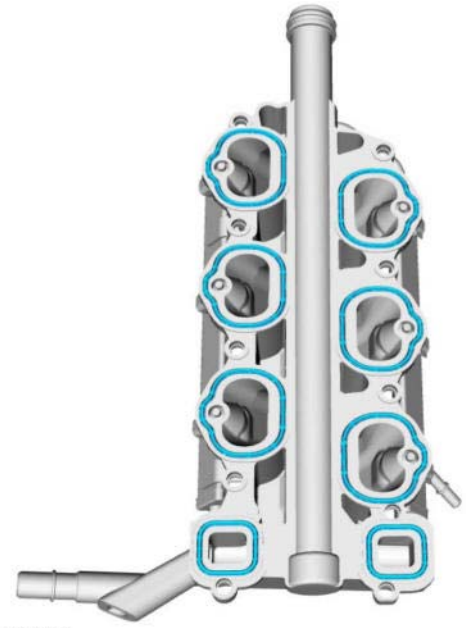


Remove the bolts and the lower intake manifold.

12.

Remove and discard the lower intake manifold gaskets.

Clean and inspect all sealing surfaces.

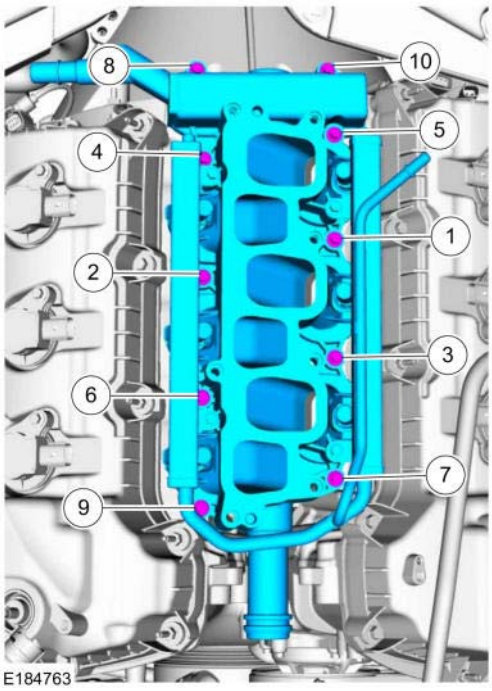


REMOVAL AND INSTALLATION > LOWER INTAKE MANIFOLD > INSTALLATION

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

1.

Install the new lower intake manifold gaskets.

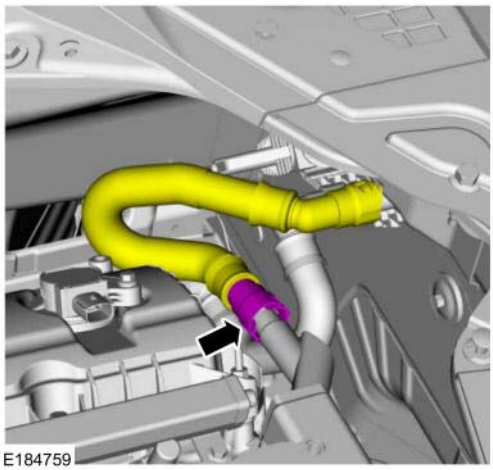


E184762

2.

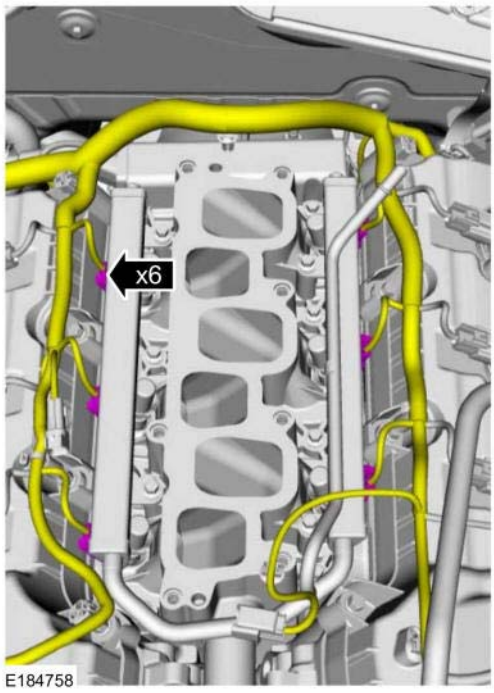
Install the lower intake manifold and the bolts.

Torque



: 89 lb.in (10 Nm)

E184763

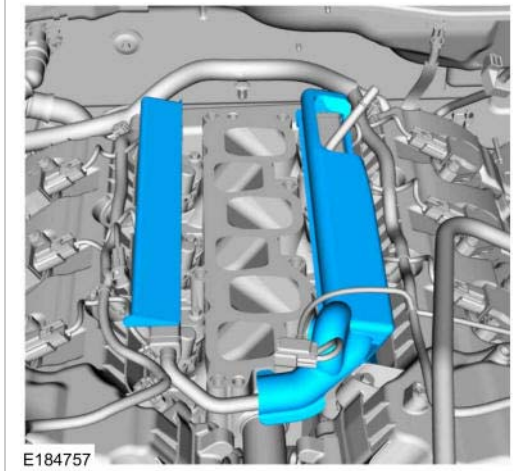


3.

Connect the coolant tube to the back of the lower intake manifold.

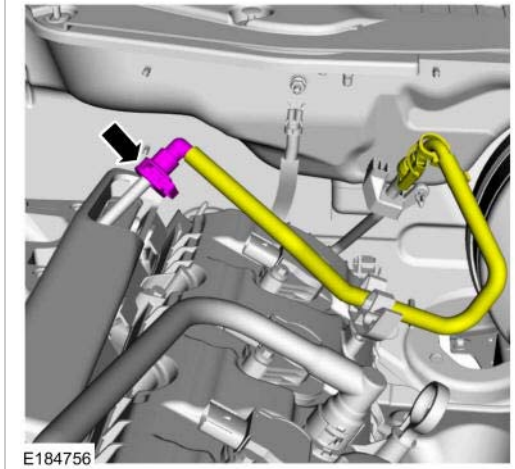
4.

Connect the fuel injector electrical connectors.



5.

Install the thermostat housing. Refer to: THERMOSTAT HOUSING .



6.

Install the fuel rail sound insulators.

7.

Connect the fuel tube quick release coupling. Refer to: QUICK RELEASE COUPLING .

8.

Install the upper intake manifold. Refer to: Upper Intake Manifold .

9.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

10.

Fill the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

REMOVAL AND INSTALLATION > OIL PAN

REMOVAL AND INSTALLATION > OIL PAN > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

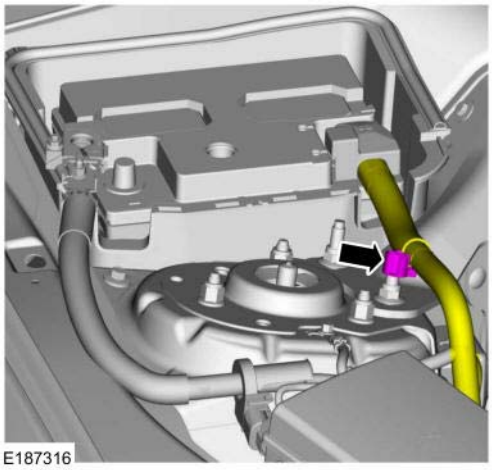
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .



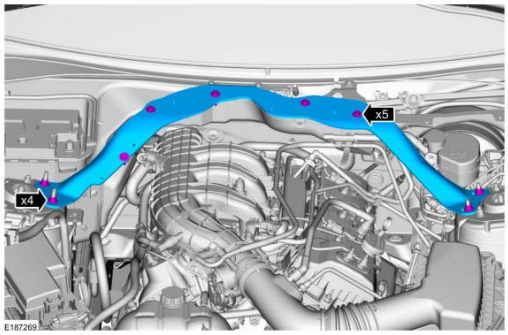
3.

Remove the cowl panel grille. Refer to: Cowl Panel Grille .

Convertible

4.

Detach the battery cable retainer.



5.

Disconnect the positive battery cable. Refer to: Battery Disconnect and Connect .

6.

Remove the cowl extension nuts.

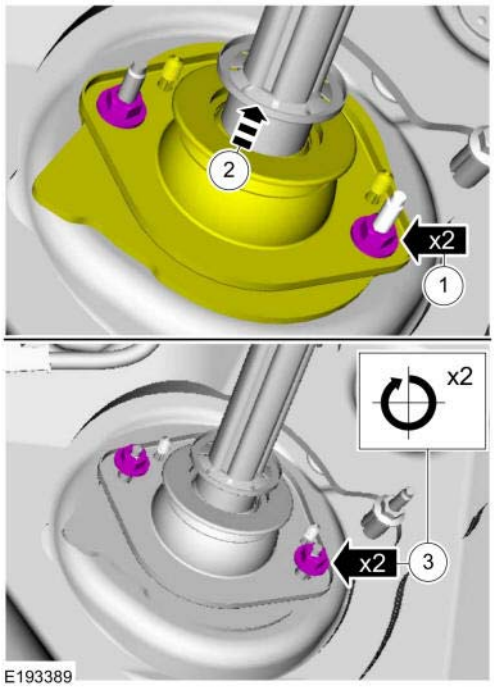
Remove the bolts and the cowl extension.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

7.

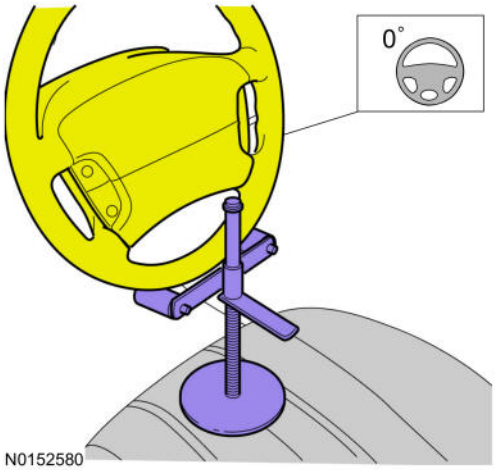
1.



Remove the steering column dash seal nuts.

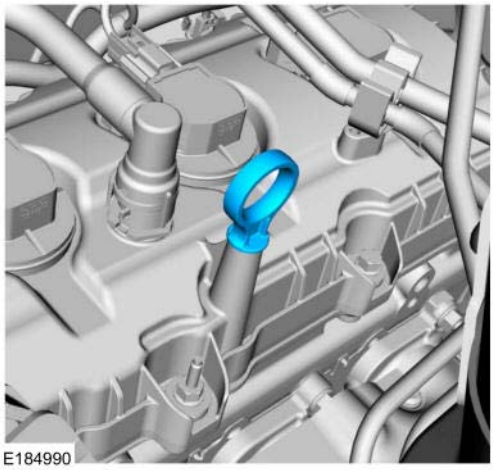
2.

Loosen the dash seal.



3.

Hand start the dash seal nuts.

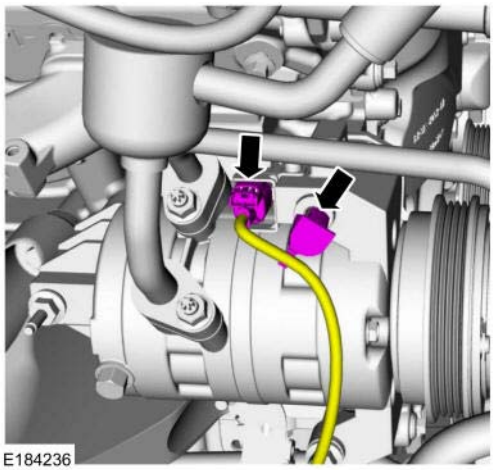


8.

Using a holding device, hold the steering wheel in the straight-ahead position.

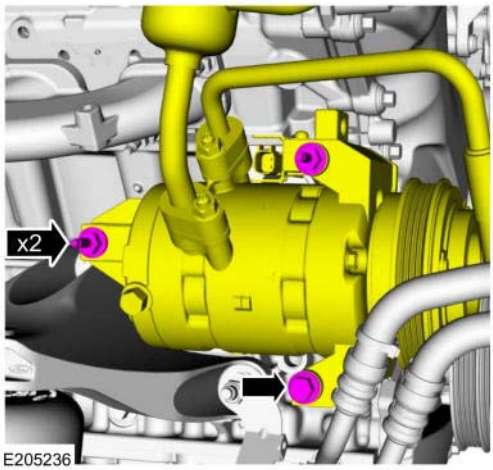
9.

Remove the oil level indicator.



10.

Remove the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



11.
