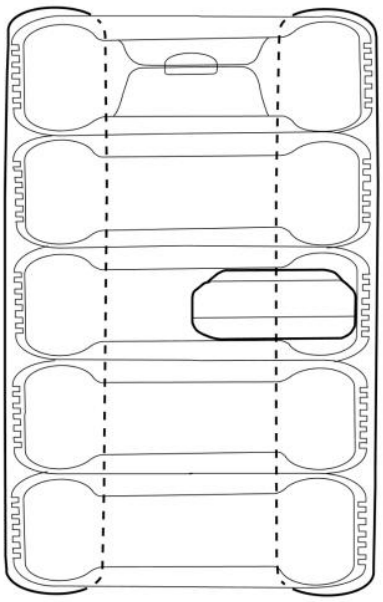
Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the airbag or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure the leads do not make contact with each other.

E144158

NOTE: Make sure the airbag connections are maintained.

25.
For driver airbags, with the stack of tires upright and the wheel on the bottom, carefully place the driver airbag, with the trim cover facing up, on the wheel.

E142969



NOTE: Make sure the airbag connections are maintained.

26.

For passenger, knee and seat side airbags, tip the stack of tires on its side.

Place the airbag inside the center tire, making sure that there are 2 tires beneath the tire containing the airbag and 2 tires (including the tire and wheel assembly) above the tire containing the airbag.

Place the tire stack upright, with the wheel on top.

E142970

27.

Remain at least 9.14 m (30 ft) away from the airbag.

28.

From the end of the jumper harness that is not connected to the airbag, disconnect the 2 wires of the jumper harness from each other.

29.

Deploy the airbag by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

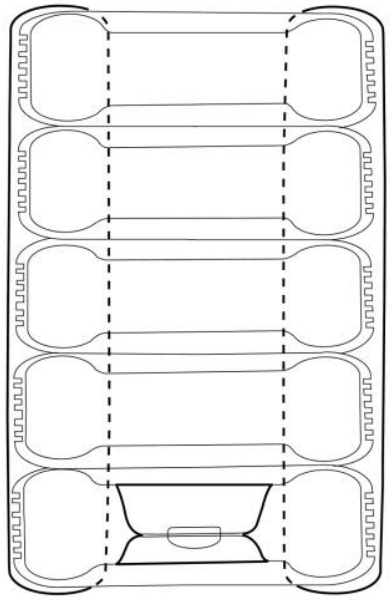
30.

To allow for cooling, wait at least 10 minutes before approaching the deployed airbag.

31.

Dispose of the deployed airbag in the same manner as any other part to be scrapped.

Safety Belt Anchor-Buckle-Retractor Pretensioners, Adaptive Load Limiting Retractors and Safety Belt Inflators - Remote Deployment



32.

NOTE: The tires must be of sufficient size to accommodate the safety belt anchor, buckle, retractor or inflator.

Obtain a tire and wheel assembly and 4 additional tires (without wheels) of the same size.

With the tire and wheel assembly on the bottom, stack the tires.

Securely tie all of the tires together.

E142968

33.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

34.

Remove the safety belt anchor, buckle, retractor or inflator. Refer to the appropriate procedure in the SEATBELT SYSTEMS article.

35.

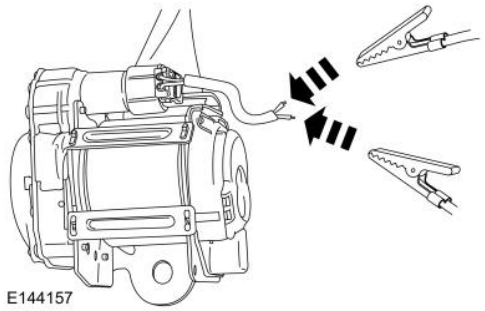
If the safety belt anchor, buckle, retractor or inflator does not have a hard-wired pigtail, cut each of the wires near the electrical connector that connects to the vehicle wire harness.

36.

When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and the same diameter used to retain it to the seat.

37.

Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.



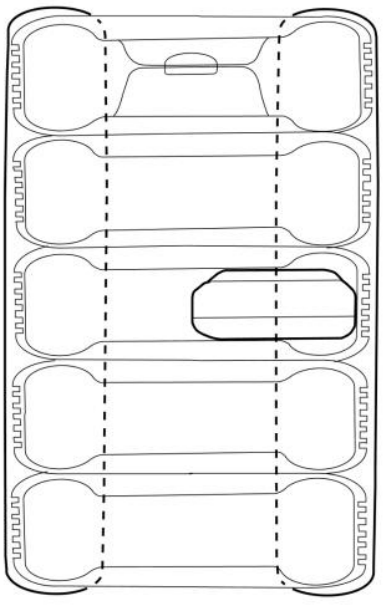
38.

Make a jumper harness to deploy the safety belt anchor, buckle, retractor or inflator by obtaining 2 wires (20 gauge minimum) at least 9.14 m (30 ft).

At one end of the jumper harness, connect the wires together.

NOTE: Typical safety belt retractor pretensioner shown in illustration, other safety belt anchor pretensioners, buckle pretensioners, load-limiting retractors and safety belt inflators similar.

39.
Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt anchor, buckle, retractor or inflator. Use tape or other insulating material to make sure the leads do not make contact with each other.



NOTE: Make sure the airbag connections are maintained.

40.

Tip the stack of tires on its side.

Place the safety belt anchor, buckle, retractor or inflator inside the center tire, making sure that there are 2 tires beneath the tire containing the airbag and 2 tires (including the tire and wheel assembly) above the tire containing the airbag.

Place the tire stack upright, with the wheel on top.

41.

Remain at least 9.14 m (30 ft) away from the safety belt anchor, buckle, retractor or inflator.

42.

From the end of the jumper harness that is not connected to the safety belt anchor, buckle, retractor or inflator, disconnect the 2 wires of the jumper harness from each other.

43.

Deploy the safety belt anchor, buckle, retractor or inflator by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

44.

To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt anchor, buckle, retractor or inflator.

45.

Dispose of the deployed safety belt anchor, buckle, retractor or inflator in the same manner as any other part to be scrapped.

Safety Belt Anchor-Buckle-Retractor Pretensioners, and Adaptive Load Limiting Retractors - In-Vehicle Deployment

46.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

47.

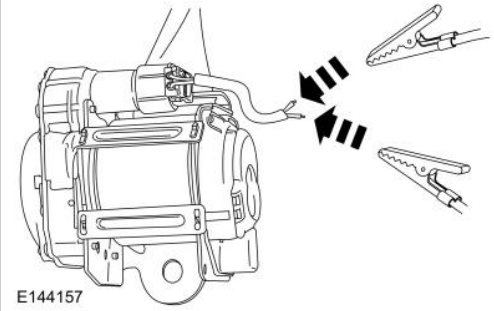
Access the safety belt anchor, buckle or retractor electrical connectors. Refer to the appropriate procedure in the SEATBELT SYSTEMS article procedure(s).

48.

Cut each of the safety belt anchor, buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.

49.

Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.



50.

Make a jumper harness to deploy the safety belt anchor, buckle or retractor by obtaining 2 wires (20 gauge minimum) at least 9.14 m (30 ft).

At one end of the jumper harness, connect the wires together.

NOTE: Typical safety belt retractor pretensioner shown in illustration, other safety belt anchor pretensioners, buckle pretensioners and load-limiting retractors are similar.

51.
Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt anchor, buckle or retractor. Use tape or other insulating material to make sure the leads do not make contact with each other.

52.

Remain at least 9.14 m (30 ft) away from the safety belt anchor, buckle or retractor.

53.

Remain at least 9.14 m (30 ft) away from the safety belt anchor, buckle, retractor or inflator.

54.

From the end of the jumper harness that is not connected to the safety belt anchor, buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

55.

Deploy the safety belt anchor, buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

56.

To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt anchor, buckle or retractor.

57.

Dispose of the deployed safety belt anchor, buckle or retractor in the same manner as any other part to be scrapped.

Safety Canopy® and Side Air Curtains - In-Vehicle Deployment

NOTE: The Safety Canopy® deployment for a scrapped vehicle occurs in its installed position in the vehicle.

NOTE: A typical Safety Canopy® disposal is shown in illustration.

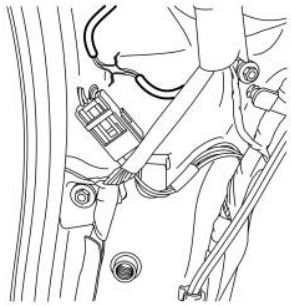
58.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

59.

Access the Safety Canopy® /side air curtain electrical connectors. For additional information, refer to the appropriate procedure in this service information.

60.



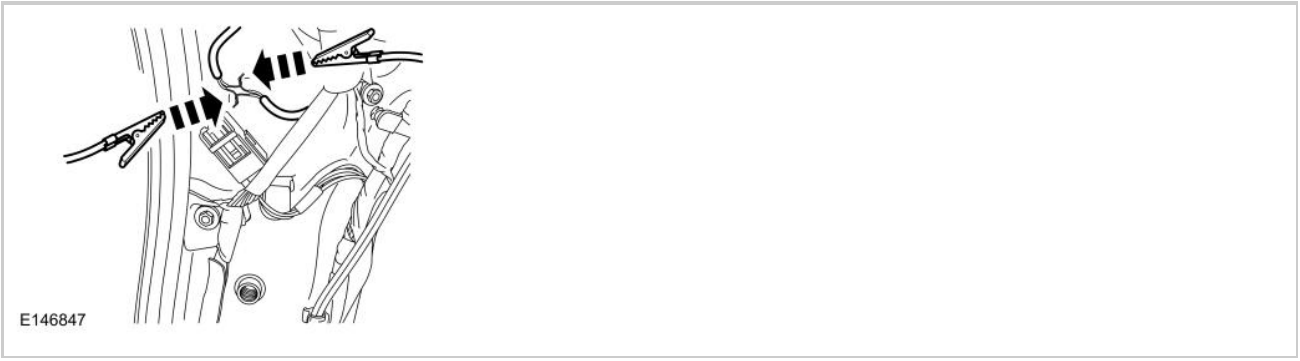
Cut each of the Safety Canopy® /side air curtain wires, leaving at least 101.6 mm (4 in) to work with.

61.

Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

NOTE: Typical Safety Canopy® /side air curtain with 2 loops shown in illustration, other Safety Canopy® /side air curtains with 2 loops are similar.

62.
For Safety Canopy® /side air curtains with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.



63.

Make a jumper harness to deploy the safety belt anchor, buckle or retractor by obtaining 2 wires (20 gauge minimum) at least 9.14 m (30 ft).

At one end of the jumper harness, connect the wires together.

64.

Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the Safety Canopy® /side air curtain or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure the leads do not make contact with each other.

65.

From the end of the jumper harness that is not connected to the Safety Canopy® /side air curtain, disconnect the 2 wires of the jumper harness from each other.

66.

Deploy the Safety Canopy® /side air curtain by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

67.

To allow for cooling, wait at least 10 minutes before approaching the deployed Safety Canopy® /side air curtain.

68.

Dispose of the deployed Safety Canopy® /side air curtain in the same manner as any other part to be scrapped.

Deployable Steering Column - In-Vehicle Deployment

69.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

NOTE: It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.

70.
Access the deployable steering column electrical connector.

NOTE: If the deployable steering column does not have a hard-wired pigtail, cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

71.
Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.

72.

Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

73.

Make a jumper harness to deploy the deployable steering column by obtaining 2 wires (20 gauge minimum) at least 9.14 m (30 ft).

At one end of the jumper harness, connect the wires together.

74.

Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure the leads do not make contact with each other.

75.

Remain at least 9.14 m (30 ft) away from the deployable steering column.

76.

From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.

77.

Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

78.

To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.

79.

Dispose of the deployed steering column in the same manner as any other part to be scrapped.

GENERAL PROCEDURES > SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING

Depower

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental

Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

1.

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

Refer to: Health and Safety Precautions .

2.

Determine if a SRS fault is present. Turn the ignition OFF and wait 10 seconds, then turn the ignition ON and monitor the airbag warning indicator. The airbag warning indicator illuminates continuously for approximately 6 seconds and then turns off. Continue to monitor the airbag warning indicator for approximately 30 seconds as this is the time required for the RCM to complete testing of the SRS.

3.

If a SRS fault is present the airbag warning indicator either fails to light, remains lit continuously or flashes. The flashing may not occur until approximately 30 seconds after the ignition has been turned from OFF to ON. If this occurs, diagnose and repair any SRS faults before proceeding with other repairs.

If after the ignition has been turned ON for 30 seconds the airbag warning indicator remains unlit with no chime or SRS message displayed in the message center, no SRS fault is present.

If the airbag warning indicator is inoperative and a SRS fault exists, a chime sounds in a pattern of 5 sets of 5 beeps or a message displays in the message center. If this occurs, diagnose and repair the airbag warning indicator and any SRS faults before proceeding with other repairs.

No SRS Fault Present (with ignition ON, airbag warning indicator stays off after prove out)

4.

WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Ignition must remain OFF until repair is complete. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

Turn the ignition OFF and wait one minute before continuing vehicle service.

SRS Fault Present

5.

Turn the ignition OFF.

6.

Remove the RCM fuse. Refer to OEM FUSE AND RELAY INFORMATION .

7.

Turn the ignition ON.

8.

Using a diagnostic scan tool, carry out a Network Test. Verify that the RCM does not respond to the Network Test. If the RCM passes the Network Test, remove the correct RCM fuse and repeat the Network Test to verify before proceeding.

9.

Turn the ignition OFF.

10.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

11.

Wait at least one minute before continuing vehicle service.

GENERAL PROCEDURES > SUPPLEMENTAL RESTRAINT SYSTEM (SRS) REPOWERING

Repower

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1.

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

Refer to: Health and Safety Precautions .

No SRS Fault Present At Beginning of Repair

2.

Prove out the SRS. Verify all airbags are installed and connected and the ignition is OFF. Wait 10 seconds then turn the ignition ON and monitor the airbag warning indicator. The airbag warning indicator illuminates continuously for approximately 6 seconds and turns off. Continue to monitor the airbag warning indicator for approximately 30 seconds as this is the time required for the RCM to complete testing of the SRS.

3.

If a SRS fault is present, the airbag warning indicator either fails to light, remains lit continuously or flashes. The flashing may not occur until approximately 30 seconds after the ignition has been turned from OFF to ON. If this occurs, diagnose and repair any SRS faults before proceeding with other repairs.

If, after the ignition has been turned on for 30 seconds, the airbag warning indicator remains unlit with no chime or SRS message displayed in the message center, no SRS fault is present.

If the airbag warning indicator is inoperative and a SRS fault exists, a chime sounds in a pattern of 5 sets of 5 beeps or a message displays in the message center. If this occurs, diagnose and repair the airbag warning indicator and any SRS faults before proceeding with other repairs.

SRS Fault Present At Beginning of Repair

4.

Verify the ignition is OFF.

5.

Install the RCM fuse. Refer to OEM FUSE AND RELAY INFORMATION .

6.

Connect the battery. Refer to: Battery Disconnect and Connect .

7.

Sit in the driver seat in an upright position. Make sure no objects are between you and any pyrotechnic device. Move the driver seat to the rearmost position to maintain the maximum possible distance from the driver airbag.

8.

Turn the ignition from OFF to ON.

9.

Prove out the SRS. Verify all airbags are installed and connected and the ignition is OFF. Wait 10 seconds, then turn the ignition ON and monitor the airbag warning indicator. The airbag warning indicator illuminates continuously for approximately 6 seconds and then turns off. Continue to monitor the airbag warning indicator for approximately 30 seconds, as this is the time required for the RCM to complete testing of the SRS.

10.

If a SRS fault is present, the airbag warning indicator either fails to light, remains lit continuously or flashes. The flashing may not occur until approximately 30 seconds after the ignition has been turned from OFF to ON. If this occurs, diagnose and repair any SRS faults before proceeding with other repairs.

If, after the ignition has been turned on for 30 seconds, the airbag warning indicator remains unlit with no chime or SRS message displayed in the message center, no SRS fault is present.

If the airbag warning indicator is inoperative and a SRS fault exists, a chime sounds in a pattern of 5 sets of 5 beeps or a message displays in the message center. If this occurs, diagnose and repair the airbag warning indicator and any SRS faults before proceeding with other repairs.

11.

Using a scan tool, clear all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

REMOVAL AND INSTALLATION > CLOCKSPRING > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: Removal steps in this procedure may contain installation details.

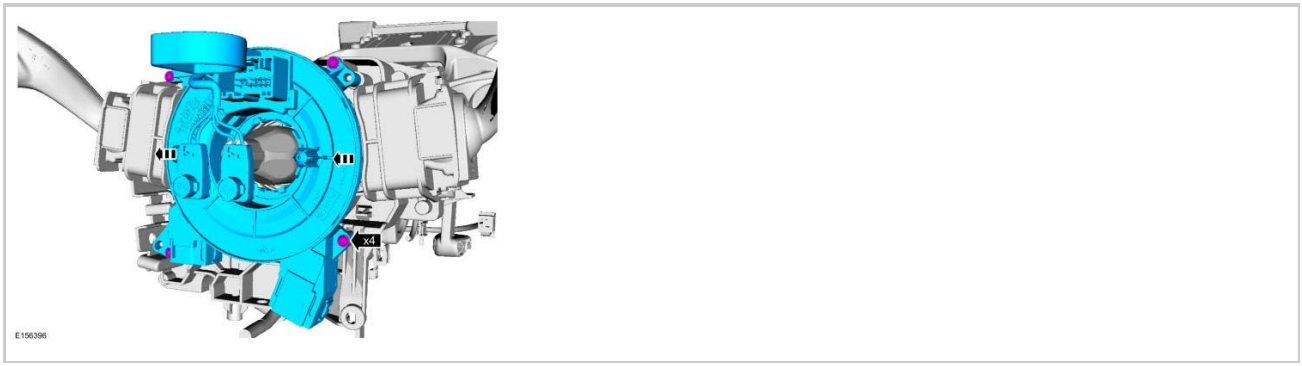
1.

Remove the following items:

NOTE: Follow the unique instructions or graphic for this step in installation.

Refer to: Steering Wheel .

Refer to: Steering Column Shrouds .



2.

Disconnect the electrical connectors.

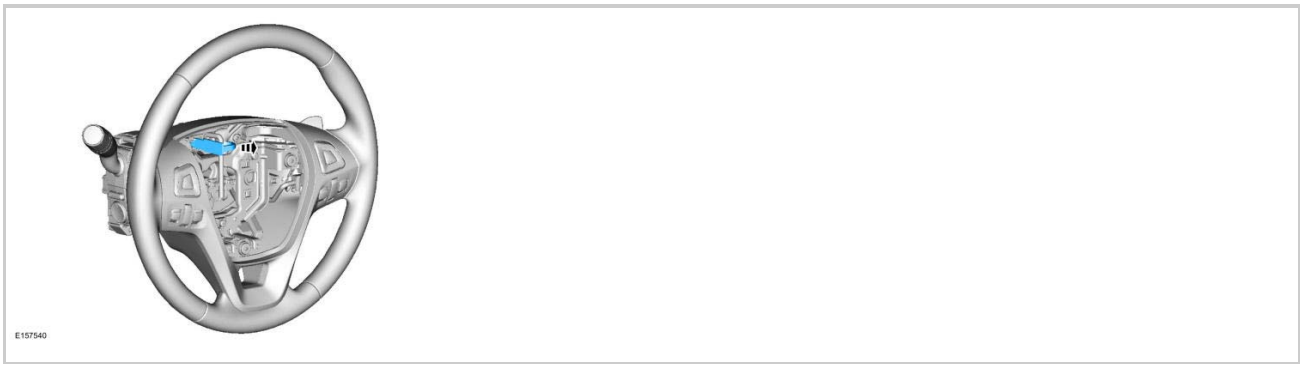
3.

Remove the screws and the clockspring.

REMOVAL AND INSTALLATION > CLOCKSPRING > INSTALLATION

NOTE: If installing a new clockspring, do not remove the clockspring anti-rotation key until the steering wheel is installed. If the anti-rotation key has been removed before installing the steering wheel, the clockspring must be centered. Failure to follow this instruction may result in component damage and/or system failure.

1.



To install, reverse the removal procedure.

NOTE: This step is only necessary if adjustment is required.

2.
Adjust the clockspring. Refer to: Clockspring Adjustment .

NOTE: To install, remove the anti-rotation key from a new clockspring after installing the steering wheel.

3.
Install the steering wheel. Refer to: Steering Wheel .

REMOVAL AND INSTALLATION > B-PILLAR SIDE IMPACT SENSOR > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: Removal steps in this procedure may contain installation details.

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

Remove the load space trim panel.

Refer to: Loadspace Trim Panel - Convertible .

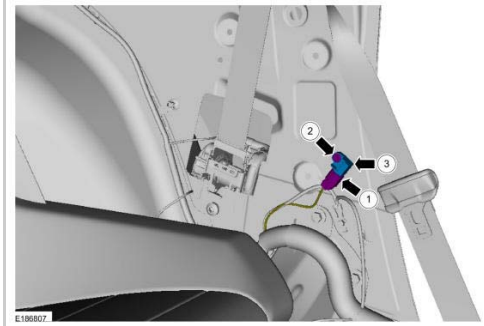
Refer to: Loadspace Trim Panel - Coupe .

3.

1.

Disconnect the electrical connector.

2.



Remove the bolt.

Torque

: 93 lb.in (10.5 Nm)

3.

Remove the side impact sensor.

REMOVAL AND INSTALLATION > B-PILLAR SIDE IMPACT SENSOR > INSTALLATION

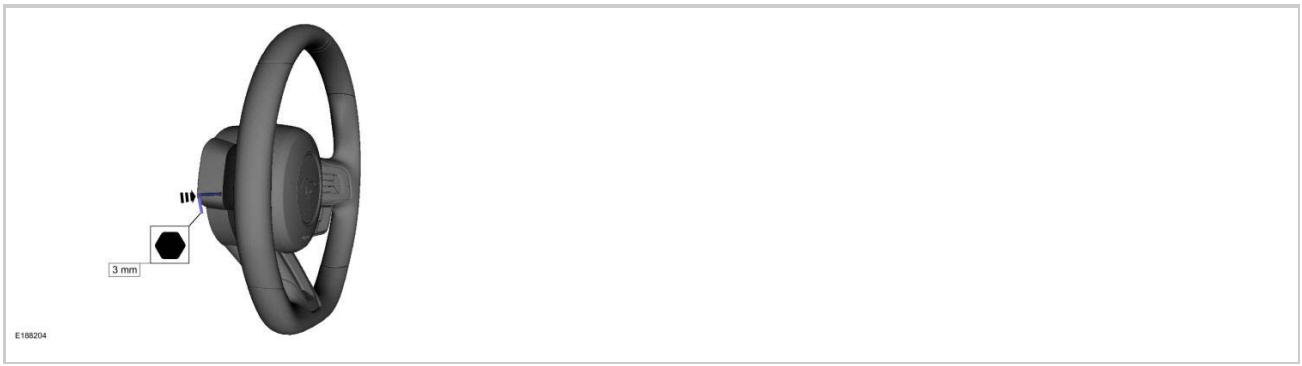
NOTE: The impact sensor mating surfaces must be smooth and allow for a flush attachment to each other.

1.
To install, reverse the removal procedure.

2.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > DRIVER AIRBAG > REMOVAL



WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

1.

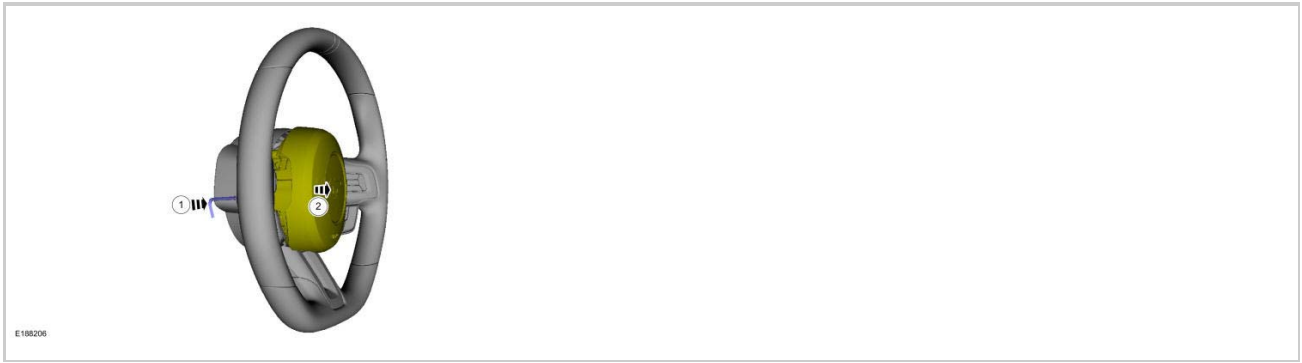
Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

At the side of the steering wheel cover, locate the hole and insert a 3 mm (0.125 inch) Allen key.

NOTE: The driver airbag has been removed for clarity.

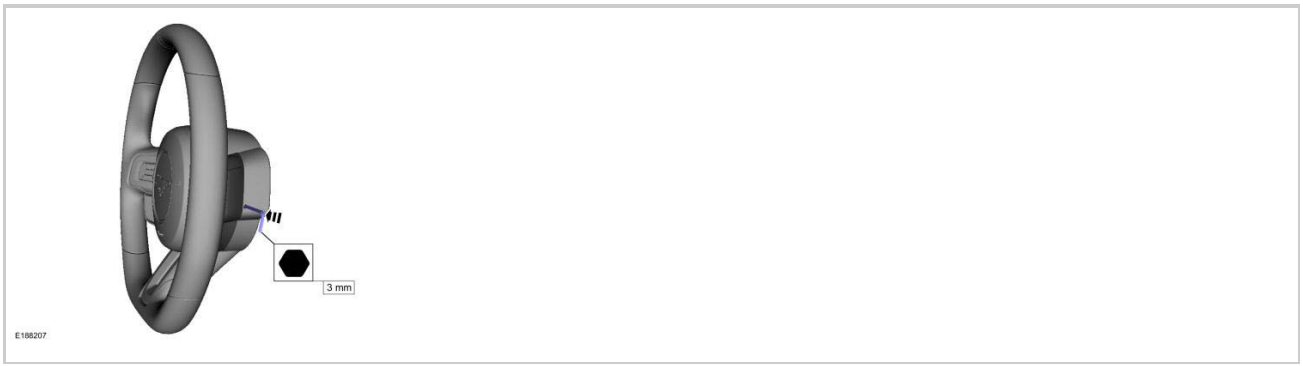
3.
Angle the inserted end of the Allen key up and toward the front of the vehicle for ideal contact with the spring clip.



4.

1.

Push in on the steering wheel spring clip to release the driver airbag retainer.



2.

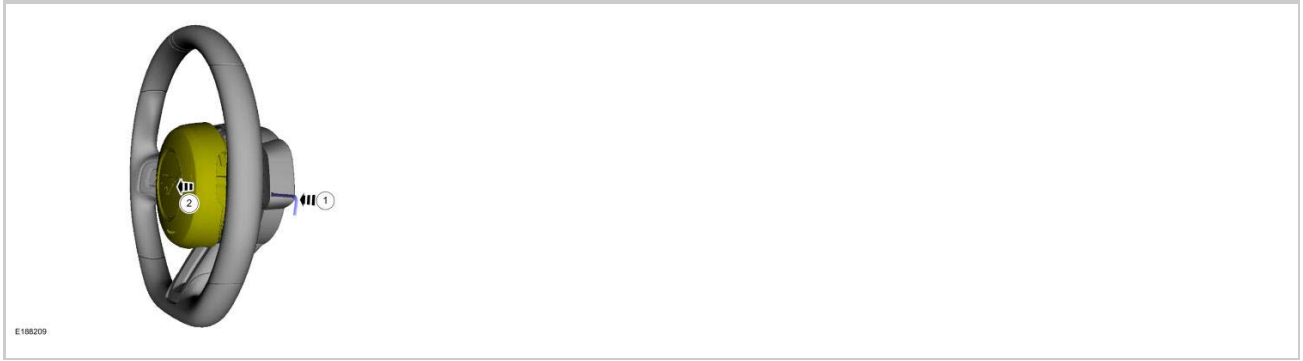
Pull the driver airbag out and separate it from the steering wheel.

5.

At the side of the steering wheel cover, locate the hole and insert a 3 mm (0.125 inch) Allen key.

NOTE: The driver airbag has been removed for clarity.

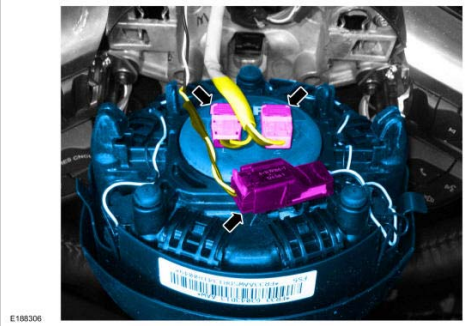
6.
Angle the inserted end of the Allen key up and toward the front of the vehicle for ideal contact with the spring clip.



7.

1.

Push in on the steering wheel spring clip to release the driver airbag retainer.

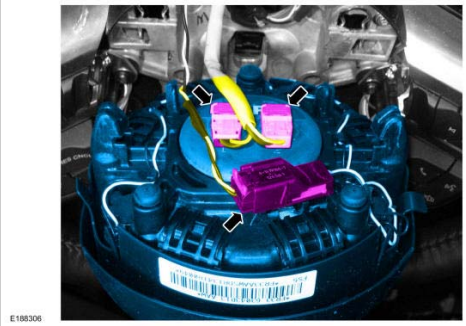


2.

Pull the driver airbag out and separate it from the steering wheel.

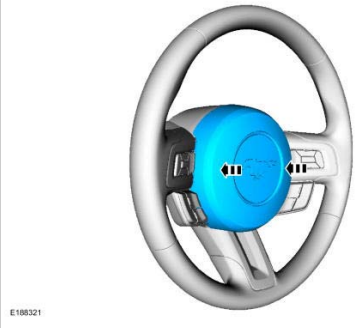
8.

Disconnect the 3 driver airbag electrical connectors.



REMOVAL AND INSTALLATION > DRIVER AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.



1.

Connect the 3 driver airbag electrical connectors.

2.

Align the driver airbag to the steering wheel and push in, engaging the driver airbag retainers to the spring clips.

3.

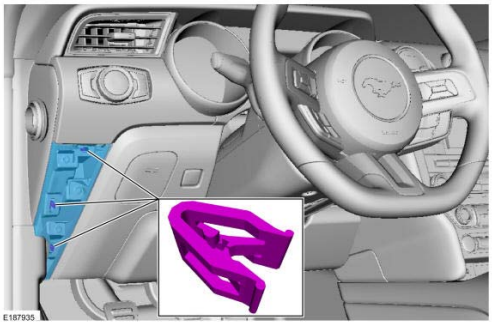
Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > DRIVER KNEE AIRBAG > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: LH drive shown in illustration, RH drive similar except where called out.

NOTE: Removal steps in this procedure may contain installation details.



All vehicles

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

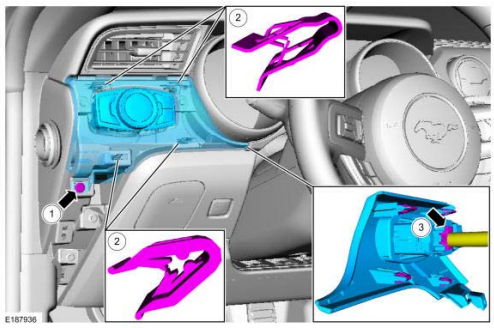
Release the clips and remove LH instrument panel trim panel.

3.

1.

Remove the screw.

Torque



: 22 lb.in (2.5 Nm)

2.

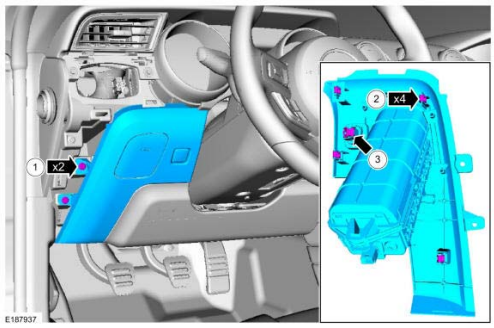
Release the clips and detach the lighting switch trim panel.

3.

Disconnect the electrical connector and remove the lighting switch trim panel.

4.

1.



Remove the screws.

2.

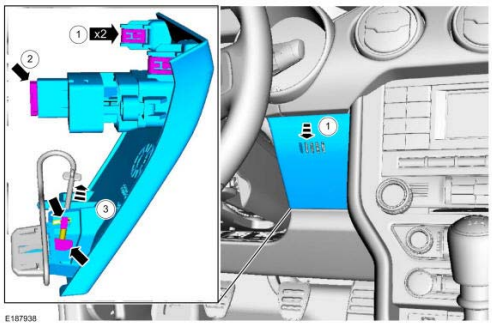
Detach the trim panel.

3.

Disconnect the electrical connector and remove the trim panel.

5.

1.



Detach the ambient air temp grille panel.

2.

Disconnect the electrical connector.

3.

Detach the tether and remove the ambient air temp grille panel.

6.

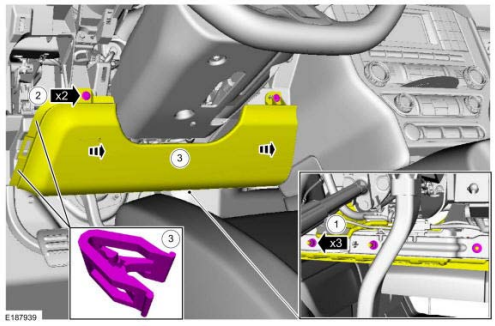
1.

From under the instrument panel, remove the nuts.

Torque

: 71 lb.in (8 Nm)

2.

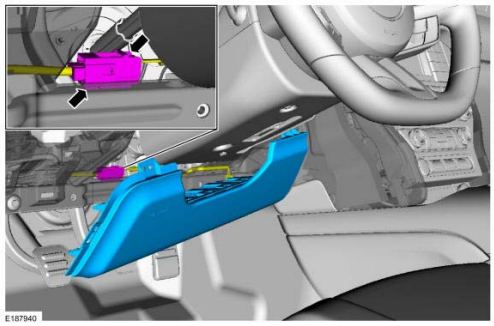


Remove the screws.

Torque

: 22 lb.in (2.5 Nm)

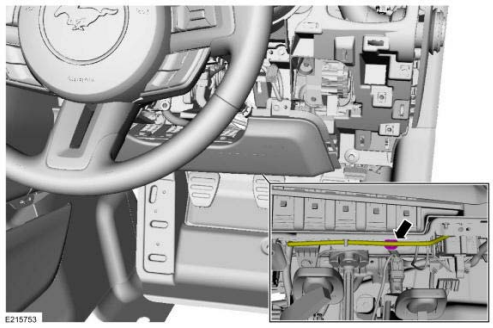
3.



Disengage the clips and separate the driver knee airbag from the instrument panel.

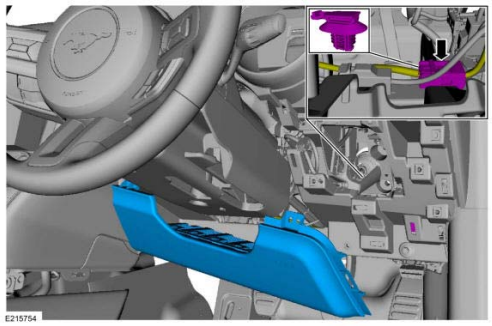
Left hand drive vehicles

7.



Detach and disconnect the electrical connector and remove the driver knee airbag.

Right hand drive vehicles



8.

Detach the driver knee airbag wire harness pin-type retainer.

9.

Detach and disconnect the electrical connector and remove the driver knee airbag.

REMOVAL AND INSTALLATION > DRIVER KNEE AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

1.

To install, reverse the removal procedure.

2.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > FRONT DOOR SIDE IMPACT SENSOR > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: Removal steps in this procedure may contain installation details.

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

Remove the front door trim panel. Refer to: Front Door Trim Panel .

3.

1.

Disconnect the electrical connector.

2.

Remove the bolts.

Torque

: 17 lb.in (1.9 Nm)

3.

Remove the side impact sensor.

REMOVAL AND INSTALLATION > FRONT DOOR SIDE IMPACT SENSOR > INSTALLATION

NOTE: The impact sensor mating surfaces must be smooth and allow for a flush attachment to each other.

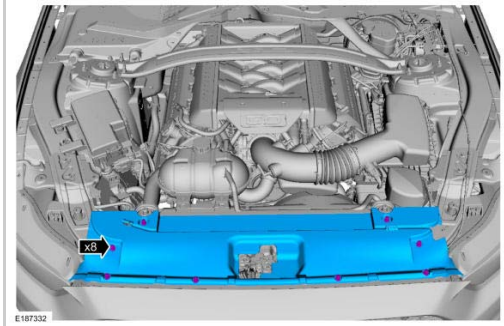
1.
To install, reverse the removal procedure.

2.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > FRONT IMPACT SEVERITY SENSOR > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.



NOTE: Removal steps in this procedure may contain installation details.

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

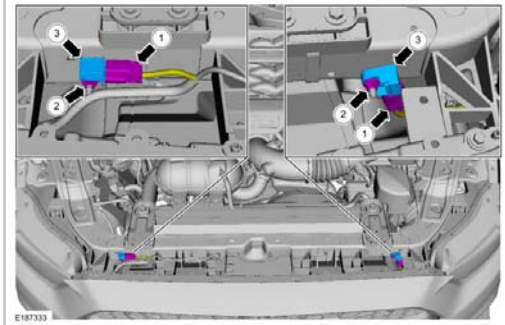
Remove the retainers and the radiator upper air deflector.

3.

1.

Disconnect the electrical connector.

2.



Remove the nut.

Torque

: 93 lb.in (10.5 Nm)

3.

Remove the front impact severity sensor.

REMOVAL AND INSTALLATION > FRONT IMPACT SEVERITY SENSOR > INSTALLATION

NOTE: The impact sensor mating surfaces must be smooth and allow for a flush attachment to each other.

1.
To install, reverse the removal procedure.

2.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > OCCUPANT CLASSIFICATION SYSTEM (OCS) SENSOR > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: To prevent system failure, carry out the OCS reset when a front passenger seat cushion is disassembled, a new trim cover is installed or an OCS service kit is installed. Use a scan tool to carry out the OCS reset command.

NOTE: The cushion heater mat on a front outboard passenger seat is not serviced separately. If a new cushion heater mat is needed on the front passenger seat, install an OCS service kit equipped with a heater mat. Failure to follow this instruction may result in incorrect operation of the OCS.

NOTE: OCS components (seat cushion foam pad, bladder with OCSM) are calibrated to each other and are serviced as an assembly. The OCS components are not to be installed separately. If a new OCS, OCS component or seat cushion foam pad are needed, a new OCS service kit (seat cushion foam pad, bladder with OCSM) must be installed as an assembly.

NOTE: LH drive passenger seat shown in illustration, RH drive passenger seat similar.

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the front passenger seat. Refer to: Front Seat .

2.

Remove the clip and the recline handle.

3.

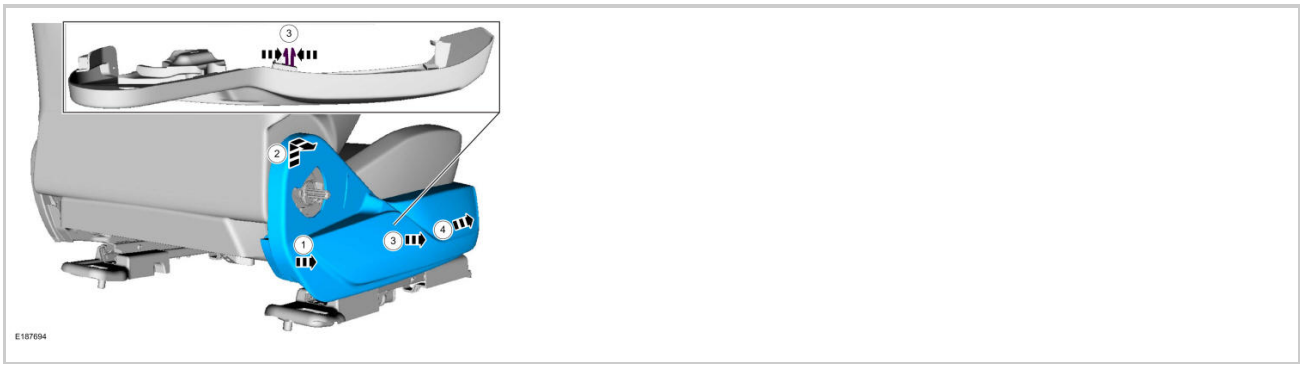
Remove the 2 cushion side shield screws.

4.

1.

Pull the rear of the cushion side shield out.

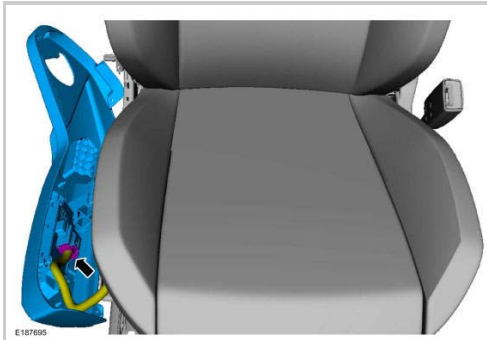
2.



Firmly grasp the cushion side shield, lift up and out, separating the cushion side shield from the recliner bracket.

3.

If equipped with a manual seat track, from underneath, squeeze the retainers together and pull out on the cushion side shield.

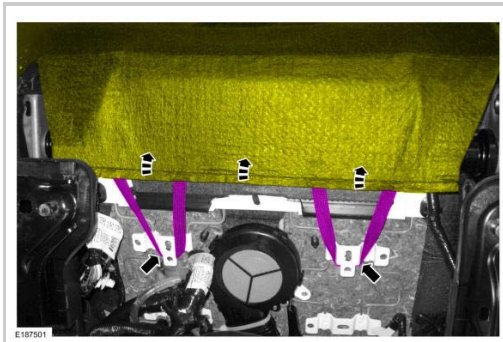


4.

Slide the cushion side shield forward and for a manual seat track, remove the cushion side shield.

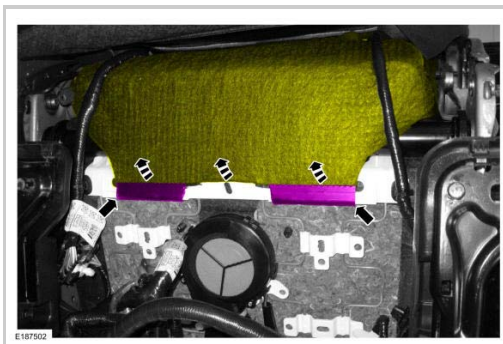
5.

If equipped with a power seat track, disconnect the seat control switch electrical connector and remove the cushion side shield.



6.

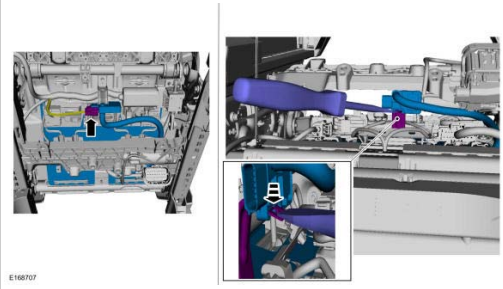
Detach the 2 electrical connector pin-type retainers and position aside.



7.

Detach the 2 backrest cover straps and position the backrest cover aside.

8.

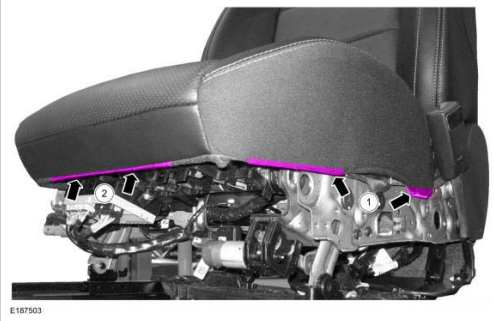


Detach the 2 cushion cover J-clips and position the cushion cover aside.

NOTE: Follow the unique instructions or graphic for this step in the installation.

NOTE: Using excessive force when bending the bracket tab can damage the OCS sensor housing.

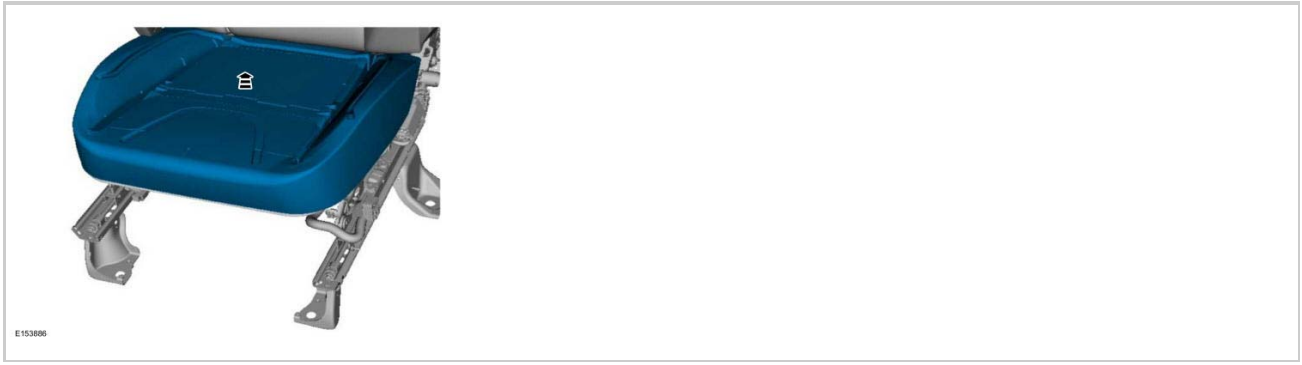
9.
Disconnect the electrical connector, bend the bracket tab away and slide the OCS sensor off the bracket.



10.

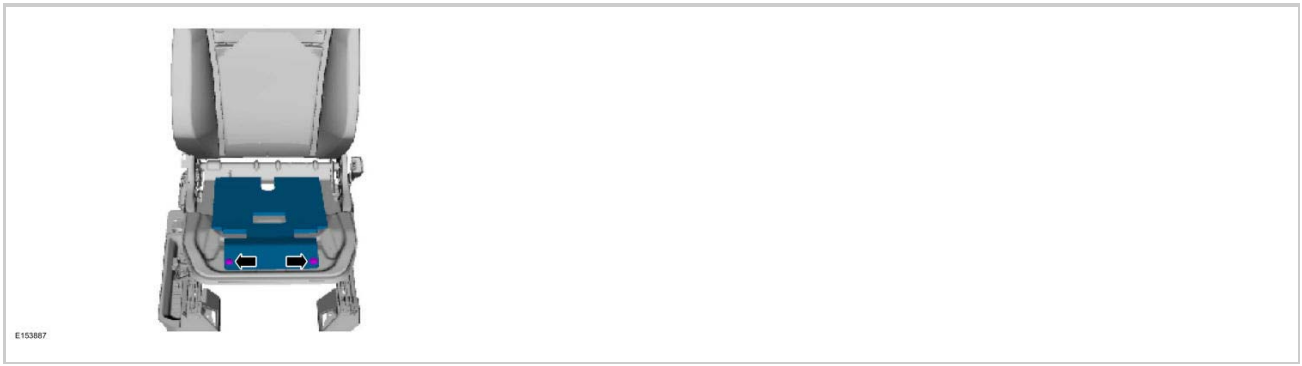
1.

On both sides. Detach the cushion cover J-clips.



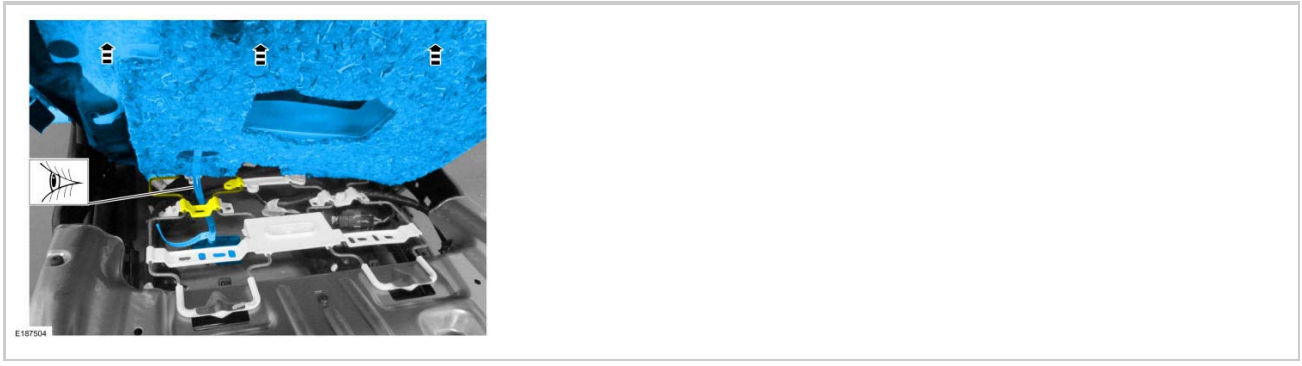
2.

Detach the cushion cover J-clip.



11.

If equipped with OE (original equipment) OCS, remove the cushion foam pad and cover.



NOTE: Typical OE OCS shown in illustration, service kit similar.

12.
Remove the 2 pin-type retainers.

NOTE: Note the location of the OCS hose as it passes through the seat springs for proper installation.

13.
Route out the OCS hose and sensor from between the seat cushion support wires.

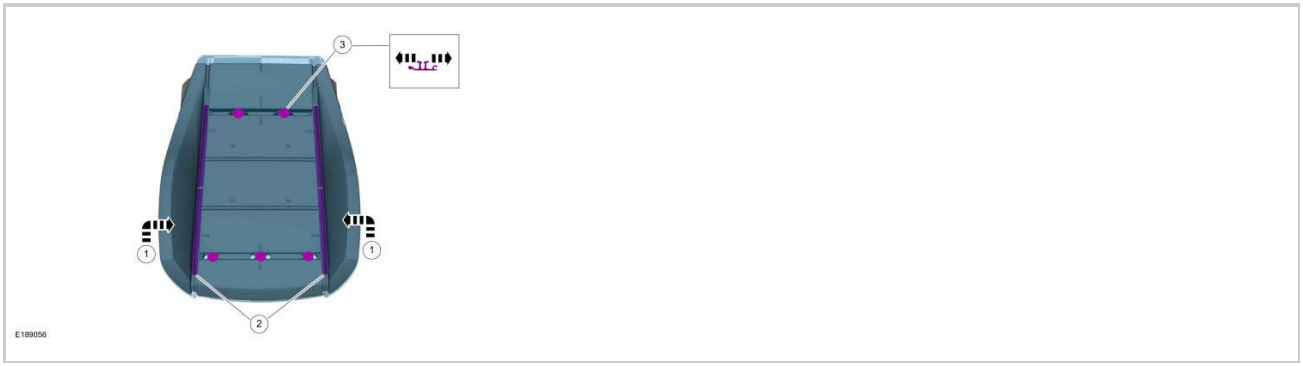
NOTE: Use care when separating the seat cushion trim cover from the hook-and-loop strips or the hook-and-loop strips may be torn from the seat cushion foam pad.

NOTE: Use care when separating the seat cushion from the hook-and-arrow or the

hook may be torn from the seat cushion foam pad.

14.
Remove the seat cushion cover.

1.



Invert the seat cushion cover.

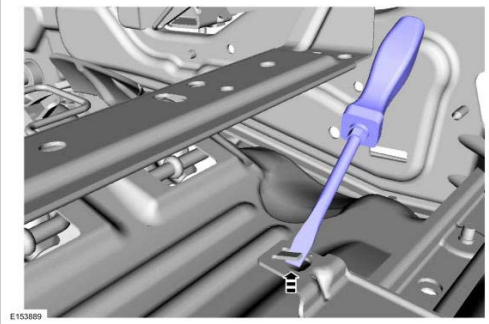
2.

Release hook-and-loop strips.

3.

Release the hook and arrows.

REMOVAL AND INSTALLATION > OCCUPANT CLASSIFICATION SYSTEM (OCS) SENSOR > INSTALLATION



NOTE: Do not trap the pressure sensor hose incorrectly over the seat's suspension or spring. Route the hose so that it lays in a natural bend, and is not twisted due to being forced into an unnatural position. Failure to follow these instructions may result in component damage and/or system failure.

NOTE: Inspect the OCS bladder, seat cushion pan and support assembly for any foreign objects before installing the OCS to the seat cushion pan. Remove any foreign objects. Failure to follow these instructions may result in incorrect operation of the OCS and may cause system failure.

1.
To install, reverse the removal procedure.

2.

Bend the OCS sensor bracket tab back.

3.

Install the front passenger seat. Do not prove out the SRS at this time. Refer to: Front Seat .

NOTE: To prevent system failure, take the following precautions before carrying out the OCS reset.

WARNING: Occupant Classification System (OCS) parts are calibrated as an assembly and must only be replaced in the configuration they are sold. Never separate parts of an assembly. Failure to follow this instruction may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

WARNING: Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before using System Reset to rezero the seat weight. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.

4.

Make sure the voltage to the OCSM is greater than 8 volts and less than 18 volts.

Make sure the OCS is not below 6°C (42.8°F) or above 36°C (96.7°F) when initiating the OCS reset process. If the vehicle has been exposed to extreme cold or hot temperatures, the vehicle must be exposed and kept at a temperature between 6°C (42.8°F) to 36°C (96.7°F) for a minimum of 30 minutes.

Make sure nothing is present on the passenger seat before and during the OCS reset process.

Prior to carrying out the OCS reset, make sure a minimum of 8 seconds has elapsed after cycling the ignition switch on.

Using a diagnostic scan tool, carry out the OCS reset. Cycle the ignition switch after the OCS reset.

5.

If the first system reset attempt was successful, proceed to prove out the SRS.

6.

If the first system reset attempt was not successful, carry out a thorough visual inspection of the OCS connector and wiring for damage, pressure sensor hose for kinks and or damage, and seat-related wiring harness and body wiring harness terminals and connectors for damage. Repair any concerns found and proceed to the next step.

7.

Carry out a second OCS reset. Cycle the ignition switch after the OCS reset. If the second attempt is unsuccessful, install a new OCS service kit.

8.

Prove out the SRS. Verify all airbags are installed and connected and the ignition is OFF. Wait 10 seconds then turn the ignition ON and monitor the airbag warning indicator. The airbag warning indicator illuminates continuously for approximately 6 seconds and turns off. Continue to monitor the airbag warning indicator for approximately 30 seconds, as this is the time required for the RCM to complete testing of the SRS.

If a SRS fault is present, the airbag warning indicator either fails to light, remains lit continuously or flashes. The flashing may not occur until approximately 30 seconds after the ignition has been turned from OFF to ON. If this occurs, diagnose and repair any SRS faults before proceeding with other repairs.

If, after the ignition has been turned on for 30 seconds, the airbag warning indicator remains unlit with no chime or SRS message displayed in the message center, no SRS fault is present.

If the airbag warning indicator is inoperative and a SRS fault exists, a chime sounds in a pattern of 5 sets of 5 beeps or a message displays in the message center. If this occurs, diagnose and repair the airbag warning indicator and any SRS faults before proceeding with other repairs.

9.

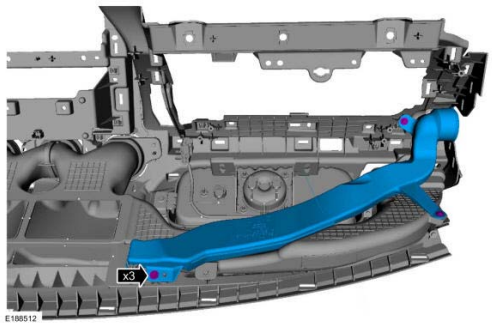
Using a scan tool, clear all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

REMOVAL AND INSTALLATION > PASSENGER AIRBAG > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct supplemental restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the supplemental restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: LH drive shown in illustration, RH drive similar.

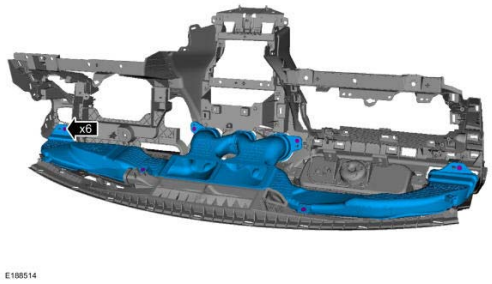
1.



Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

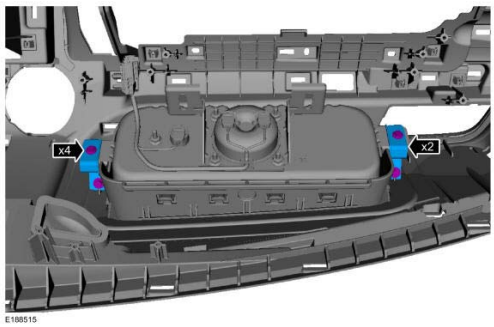
2.

Remove the instrument panel upper section. Refer to: INSTRUMENT PANEL UPPER SECTION .



NOTE: RH side shown in illustration, LH similar.

3.
On both sides. Remove the screws and the demister duct.

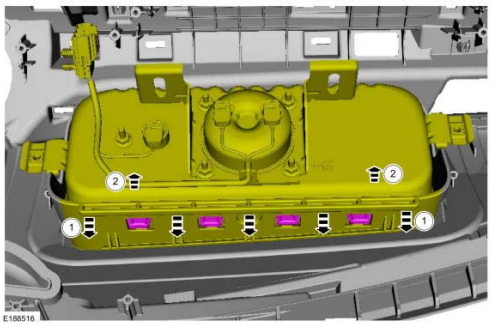


4.

Remove the screws and the air conditioning duct.

5.

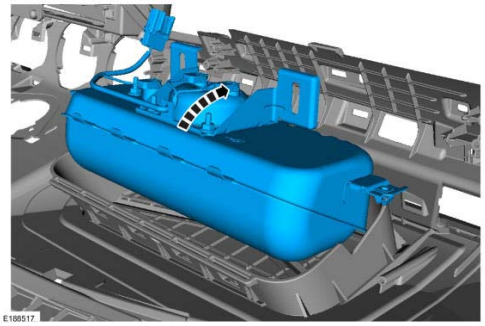
Remove the screws and brackets.



6.

1.

Pull the passenger airbag deployment chute away from the passenger airbag.



2.

Rotate the passenger airbag out of the deployment chute and disengage the 4 passenger airbag retainers.

7.

Continue to rotate the passenger airbag and remove it from the deployment chute.

REMOVAL AND INSTALLATION > PASSENGER AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

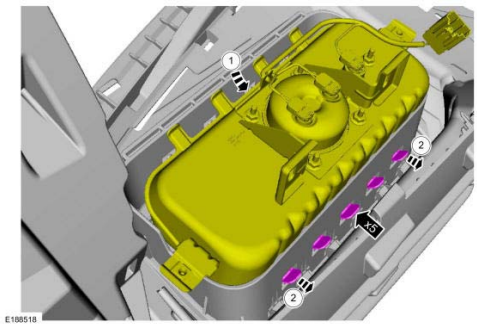
1.

WARNING: Before installing the passenger air bag module assembly:

Inspect the passenger air bag module and instrument panel/deployment chute cavity for any damage or foreign material.

Remove any foreign material from the passenger air bag module and instrument panel/deployment chute cavity.

Install new parts if damaged.



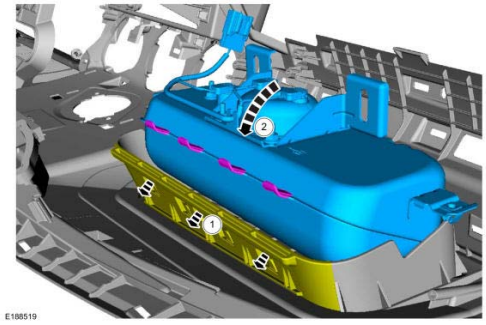
Failure to follow these instructions may result in the passenger air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

1.

Position the passenger airbag to the deployment chute.

2.

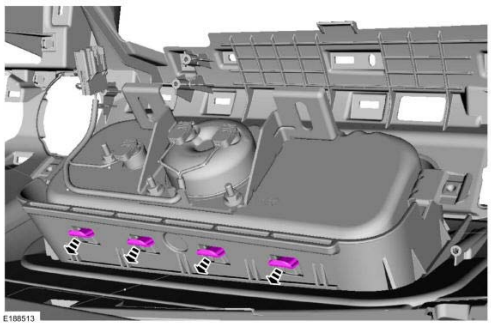
Engage the 5 passenger airbag retainers to the deployment chute.



2.

1.

Pull the passenger airbag deployment chute out, making room for the passenger airbag to pass.

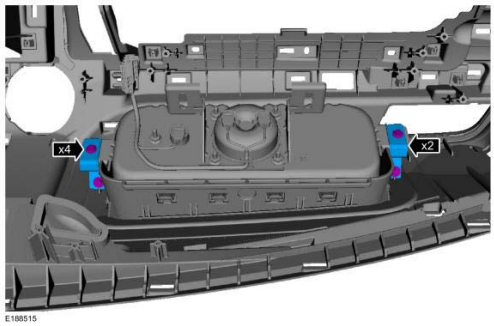


2.

Rotate the passenger airbag down and into the deployment chute.

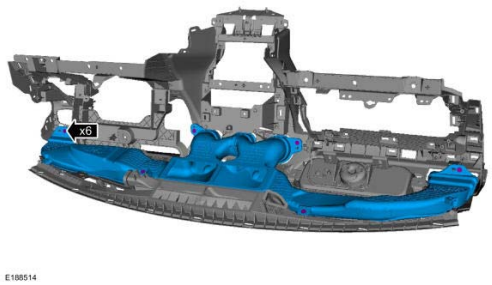
3.

Engage the passenger airbag retainers to the deployment chute.



4.

Install the brackets and screws.



Torque

: 22 lb.in (2.5 Nm)

5.

Install the air conditioning duct and screws.

NOTE: RH side shown in illustration, LH similar.

6.
On both sides. Install the demister duct and screws.

7.

Install the instrument panel upper section. Refer to: INSTRUMENT PANEL UPPER SECTION .

8.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > PASSENGER KNEE AIRBAG

Special Tool(s) / General Equipment

Interior Trim Remover

REMOVAL AND INSTALLATION > PASSENGER KNEE AIRBAG > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

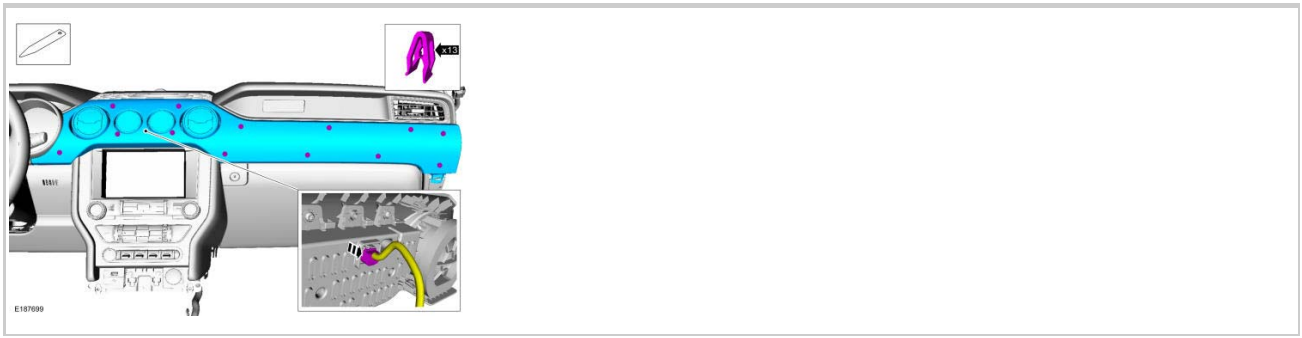
NOTE: LHD shown in illustration, RHD similar.

NOTE: Removal steps in this procedure may contain installation details.

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.



Release the clips and remove the RH instrument panel trim panel. Use the General Equipment: Interior Trim Remover

NOTE: Instrument panel center finish panel with optional ICM shown in illustration.

3.
Release the clips and remove the instrument panel center finish panel.

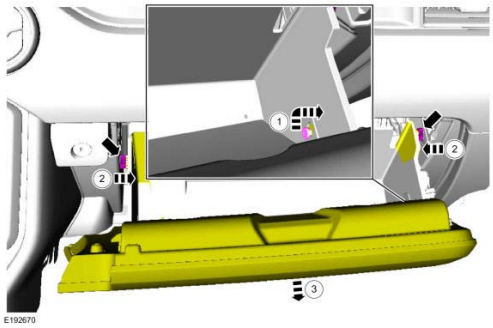
Disconnect the electrical connector. Use the General Equipment: Interior Trim Remover

4.

Open the glove box.

5.

1.



Detach the glove box door damper.

2.

Push each side of the glove box door, disengaging the stops.

3.

Open the glove box door past its stops.

6.

1.

Disconnect and detach the electrical connector and wire harness.

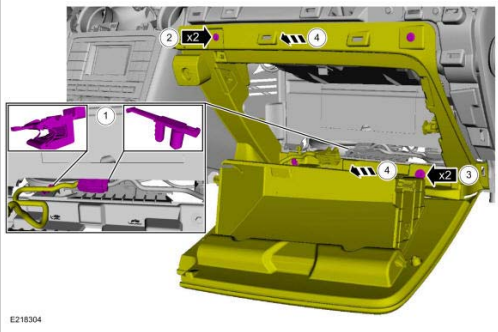
2.

Remove the upper screws.

Torque

: 22 lb.in (2.5 Nm)

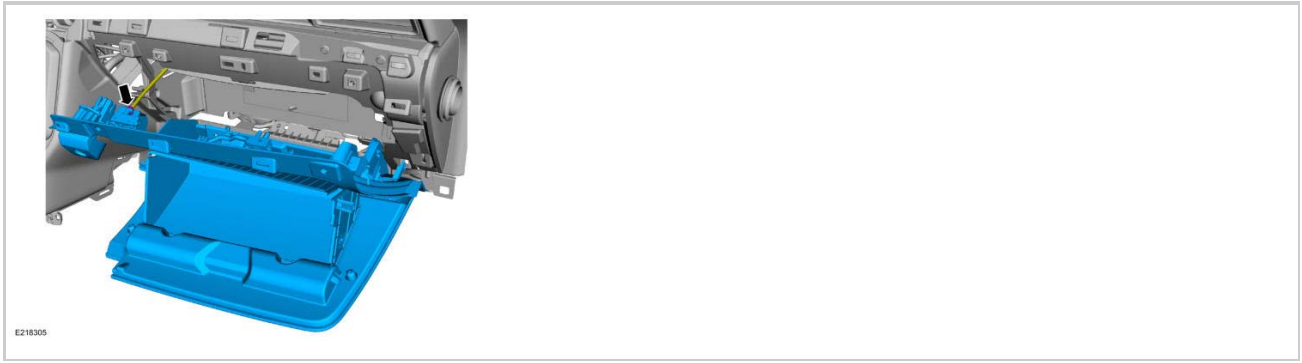
3.



Remove the lower screws.

Torque

: 44 lb.in (5.0 Nm)



4.

Separate the glove box assembly from the instrument panel.

7.

Disconnect the electrical connector and remove the glove box assembly.

REMOVAL AND INSTALLATION > PASSENGER KNEE AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

1.

To install, reverse the removal procedure.

2.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > RESTRAINTS CONTROL MODULE (RCM) > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

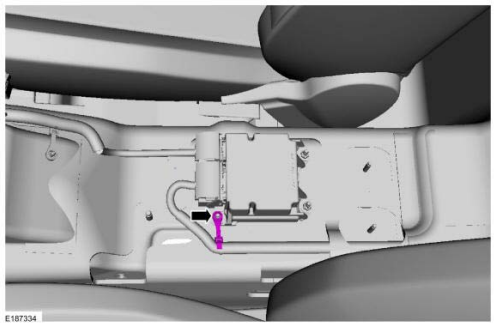
NOTE: Removal steps in this procedure may contain installation details.

NOTE: The PMI process must begin with the current RCM installed. If the current RCM does not respond to the diagnostic scan tool, the tool may prompt for As-Built Data as part of the repair.

NOTE: This step is only necessary when installing a new component.

1.
Using a diagnostic scan tool, begin the PMI process for the RCM following the on-screen instructions.

2.



Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering

3.

Remove the floor console. Refer to: Floor Console .

4.

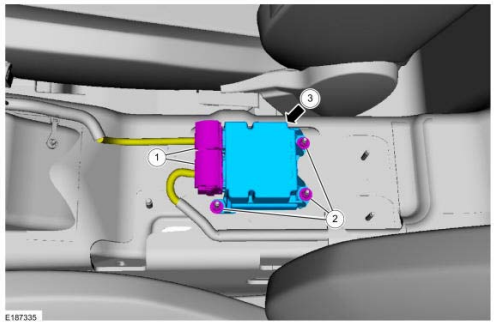
Detach the wire harness retainer.

5.

1.

Disconnect the RCM electrical connectors.

2.



Remove the nuts.

Torque

: 93 lb.in (10.5 Nm)

3.

Remove the RCM.

REMOVAL AND INSTALLATION > RESTRAINTS CONTROL MODULE (RCM) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Repower the SRS. For a new RCM, do not prove out the SRS at this time. Refer to: Supplemental Restraint System (SRS) Repowering .

> *NOTE: This step is only necessary when installing a new component.*

3.
Using a diagnostic scan tool, complete the PMI process for the RCM following the on-screen instructions.

4.

For a new RCM, prove out the SRS. Verify all airbags are installed and connected and the ignition is OFF. Wait 10 seconds then turn the ignition ON and monitor the airbag warning indicator. The airbag warning indicator illuminates continuously for approximately 6 seconds and turns off. Continue to monitor the airbag warning indicator for approximately 30 seconds, as this is the time required for the RCM to complete testing of the SRS.

If a SRS fault is present, the airbag warning indicator either fails to light, remains lit continuously or flashes. The flashing may not occur until approximately 30 seconds after the ignition has been turned from OFF to ON. If this occurs, diagnose and repair any SRS faults before proceeding with other repairs.

If, after the ignition has been turned on for 30 seconds, the airbag warning indicator remains unlit with no chime or SRS message displayed in the message center, no SRS fault is present.

If the airbag warning indicator is inoperative and a SRS fault exists, a chime sounds in a pattern of 5 sets of 5 beeps or a message displays in the message center. If this occurs, diagnose and repair the airbag warning indicator and any SRS faults before proceeding with other repairs.

REMOVAL AND INSTALLATION > SEAT POSITION SENSOR

Seat Position Sensor

REMOVAL AND INSTALLATION > SEAT POSITION SENSOR > REMOVAL

> *NOTE: Removal steps in this procedure may contain installation details.*

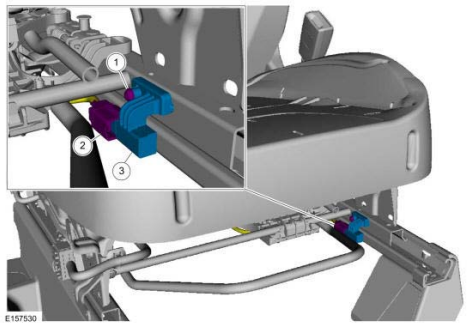
NOTE: RH manual seat shown in illustration, other seats similar.

1.

1.

Remove the screw.

Torque



: 8 lb.in (0.9 Nm)

2.

Disconnect the electrical connector.

3.

Remove the seat position sensor.

REMOVAL AND INSTALLATION > SEAT POSITION SENSOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > SIDE AIRBAG

Special Tool(s) / General Equipment

Hog Ring Plier

REMOVAL AND INSTALLATION > SIDE AIRBAG > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct

restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

WARNING: Front seat backrest trim covers installed on seats equipped with seat side airbags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side airbag deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTE: Removal steps in this procedure may contain installation details.

Side airbag and upper side airbag

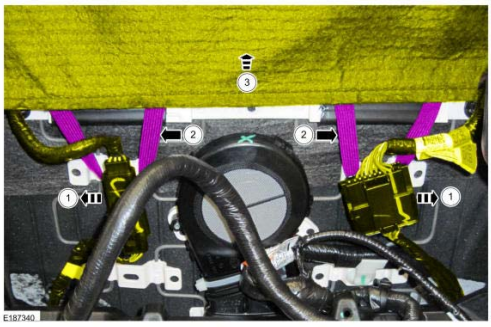
1.

Remove the front seat. Refer to: Front Seat .

2.

Position the front seat backrest cover.

1.



Releases the wire harness electrical connector retainers.

2.

Detach the front seat backrest cover straps from the seat cushion frame.

3.

Position the front seat backrest cover aside.

3.

Remove the backrest cover insert.

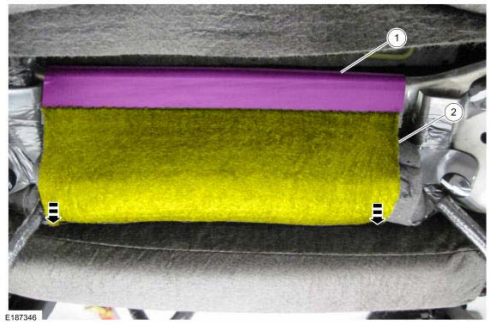
1.

Remove the pin-type retainers.

2.

Position the backrest cover upwards and remove the insert.

4.



Position the front seat backrest cover.

1.

Release the J-clip.

2.

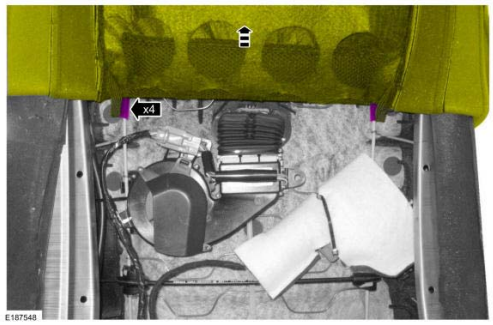
Position the backrest cover from between the seat cushion and backrest.

NOTE: Use care when separating the seat backrest trim cover from the hook-and-loop strips or the hook-and-loop strips may be torn from the seat backrest foam pad.

5.
Partially invert the backrest cover to access the side airbag deployment chute.

6.

Detach the side airbag deployment chute retainers and position aside.



7.

Pull the side airbag deployment chute through the backrest foam.

8.

Release the 4 backrest cover J-clip type retainers and position the backrest cover upward.

Side airbag

9.

Remove the side airbag nuts.

Torque

: 53 lb.in (6 Nm)

10.

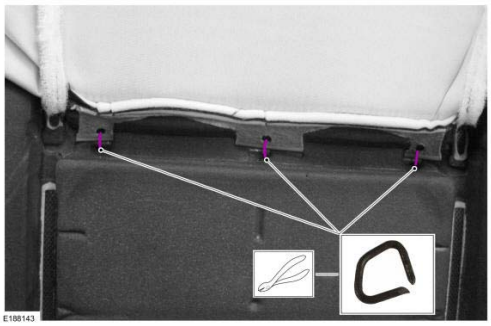
1.

Detach the side airbag from the backrest frame.

2.

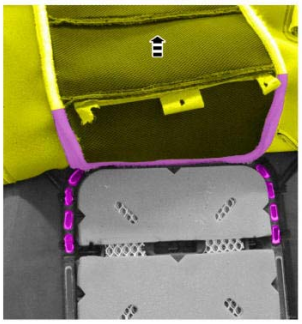
Slide the locking wedge out, disconnect the electrical connector and remove the side airbag.

Upper side airbag



11.

Release the J-clip from the backrest frame.

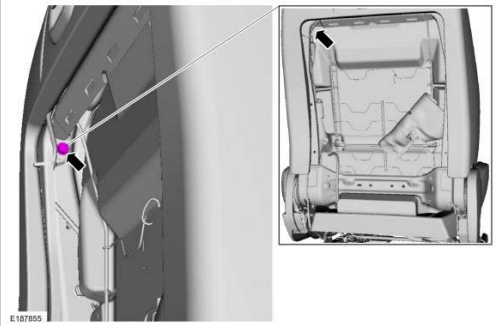


12.

Remove the hog rings.

NOTE: Use care when separating the seat backrest trim cover from the hook-and-loop strips or the hook-and-loop strips may be torn from the seat backrest foam pad.

13.
Detach the hook-and-loop strips.

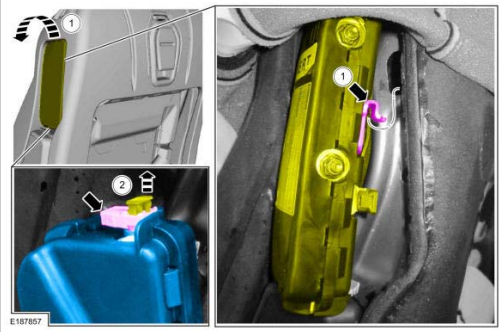


14.

Remove the side airbag bolt.

Torque

: 53 lb.in (6 Nm)



15.

1.

Detach the side airbag from the backrest frame.

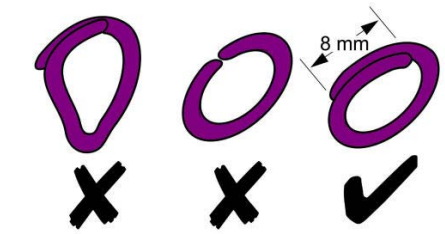
2.

Slide the locking wedge out, disconnect the electrical connector and remove the side airbag.

REMOVAL AND INSTALLATION > SIDE AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

1.



WARNING: Inspect the seat side airbag, airbag cavity, mounting surface and deployment chute for damage or the presence of foreign material. Remove all foreign material. Install a new side airbag if it is damaged. Install a new deployment chute if the deployment chute is damaged. Failure to follow these instructions may result in the seat side airbag deploying incorrectly and increase the risk of serious personal injury or death in a crash.

WARNING: If the seat side airbag cover has been damaged or separated from its mounting, or if the airbag material has been exposed, install a new seat side airbag assembly. Never try to repair the seat side airbag assembly. Failure to follow these instructions may result in the seat side airbag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

To install, reverse the removal procedure.

2.

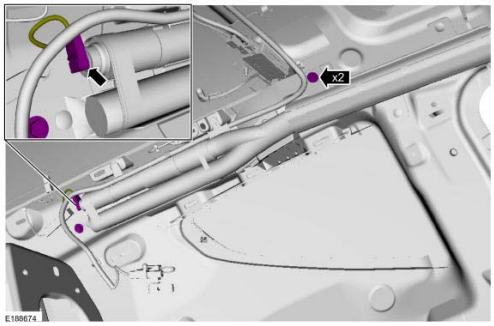
Use the General Equipment: Hog Ring Plier

REMOVAL AND INSTALLATION > SIDE CURTAIN AIRBAG > REMOVAL

WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.

NOTE: Removal steps in this procedure may contain installation details.

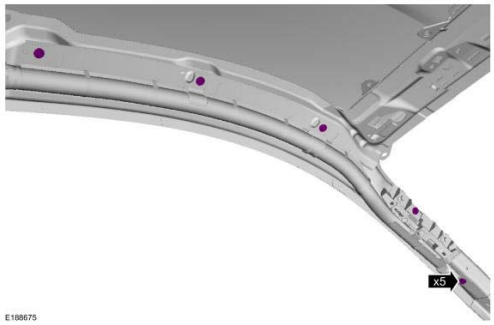
1.



Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

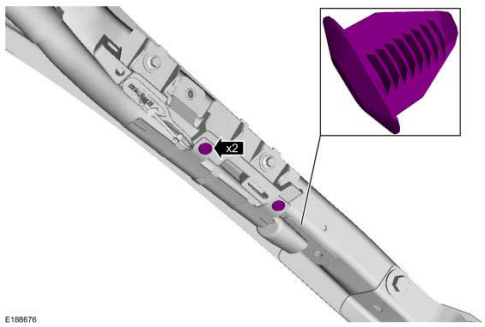
2.

Remove the headliner. Refer to: Headliner .



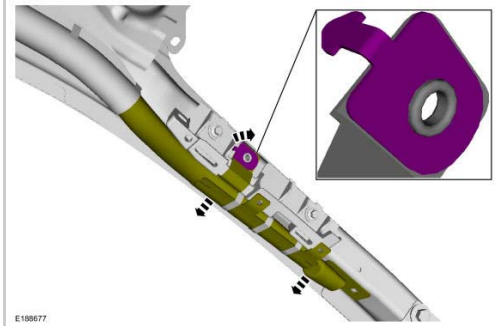
NOTE: Follow the unique instructions or graphic for this step in installation.

3.
Disconnect the electrical connector and remove the screws.



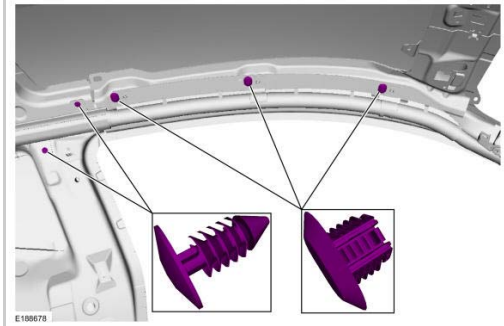
NOTE: Follow the unique instructions or graphic for this step in installation.

4.
Remove the screws.



5.

Remove the pin-type retainers at the A-pillar.

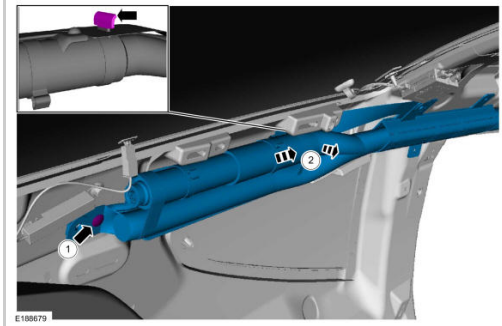


6.

Disengage the retainer and position the side curtain airbag away from the A-pillar.

7.

Disengage the pin-type retainers.



8.

1.

Remove the pin-type retainer.

2.

Slide the side curtain airbag forward and out, disengaging the T-tab from the sheet metal and remove the side curtain airbag.

REMOVAL AND INSTALLATION > SIDE CURTAIN AIRBAG > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental

Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

WARNING: Before installing a Safety Canopy® or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the Safety Canopy® or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

NOTE: During installation, ensure that the side curtain airbag is not twisted 360° between attachment points.

1.

To install, reverse the removal procedure.

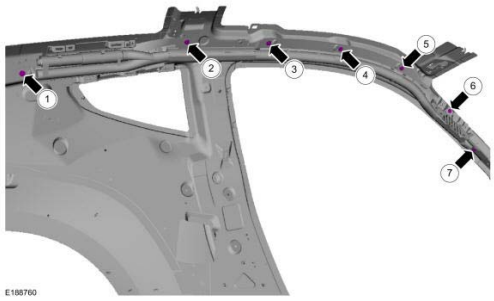
2.

Tighten the screws in the sequence shown in illustration.

1.

Tighten screws 1 and 2.

Torque



: 106 lb.in (12 Nm)

2.

Tighten screws 3 through 7.

Torque

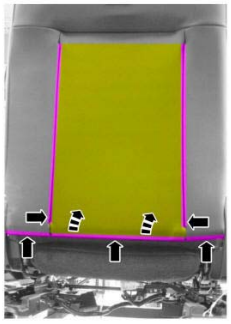
: 80 lb.in (9 Nm)

3.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

REMOVAL AND INSTALLATION > SIDE AIRBAG - VEHICLES WITH: RECARO SEATS > REMOVAL

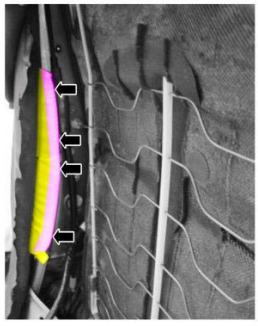
WARNING: The following procedure prescribes critical repair steps required for correct restraint system operation during a crash. Follow all notes and steps carefully. Failure to follow step instructions may result in incorrect operation of the restraint system and increases the risk of serious personal injury or death in a crash.



NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the front seat. Refer to: Front Seat .

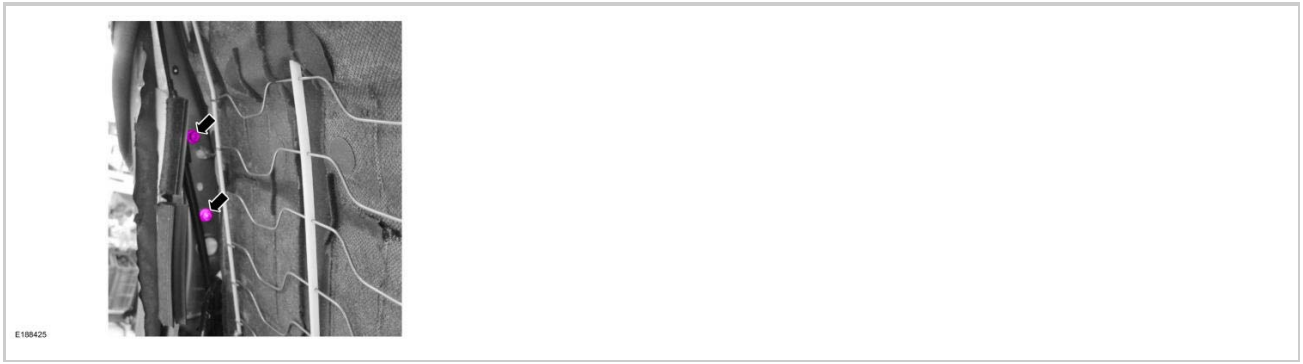


2.

Detach the backrest cover J-clips and position the backrest cover upward.

3.

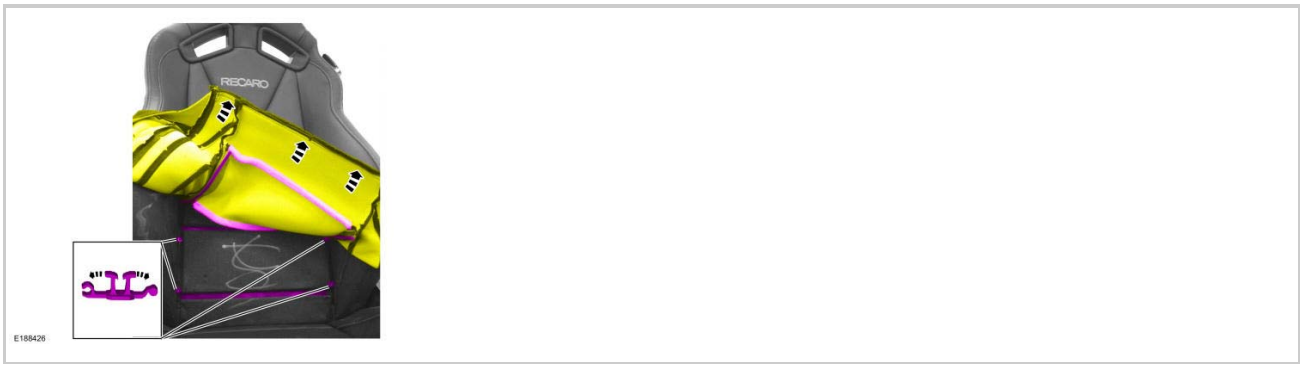
Detach the side airbag deployment chute J-clips from the backrest frame.



4.

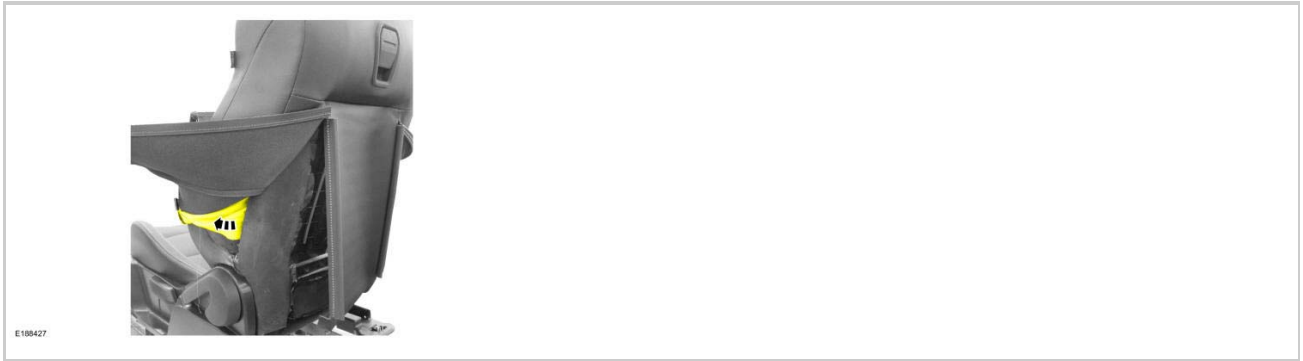
Remove the side airbag nuts.

Torque



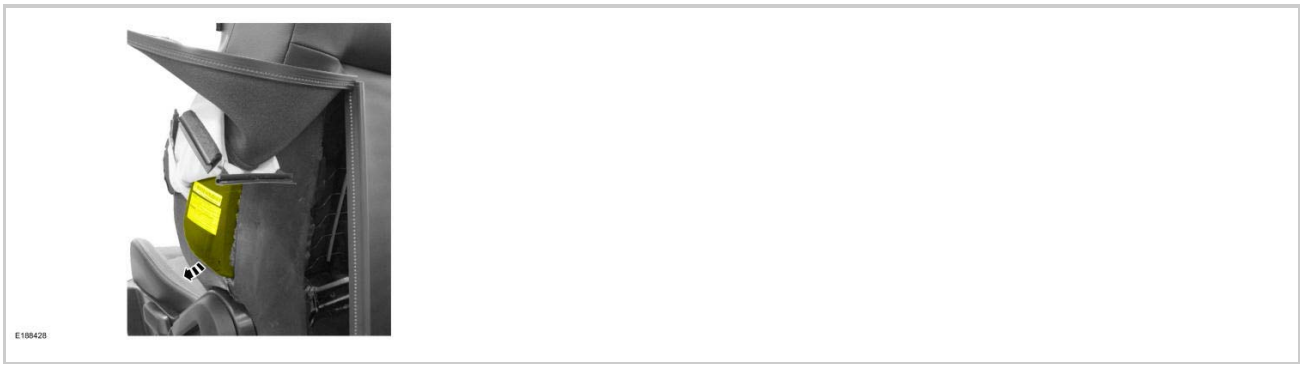
: 53 lb.in (6 Nm)

NOTE: Use care when separating the backrest cover from the hook-and-arrows, or the hooks can be torn from the backrest foam pad.



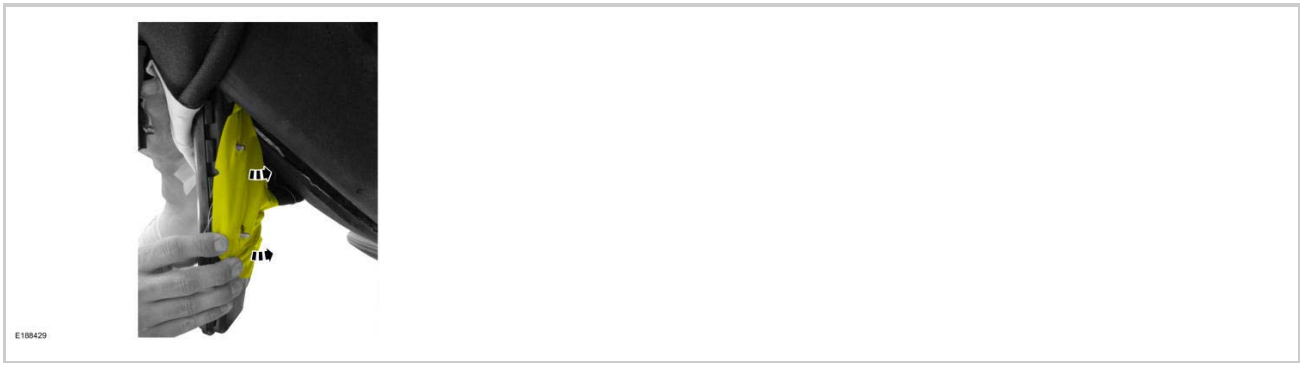
NOTE: Use care when separating the backrest cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

5.
Detach the hook-and-loop strips, the hook-and-arrows and position the backrest cover up.



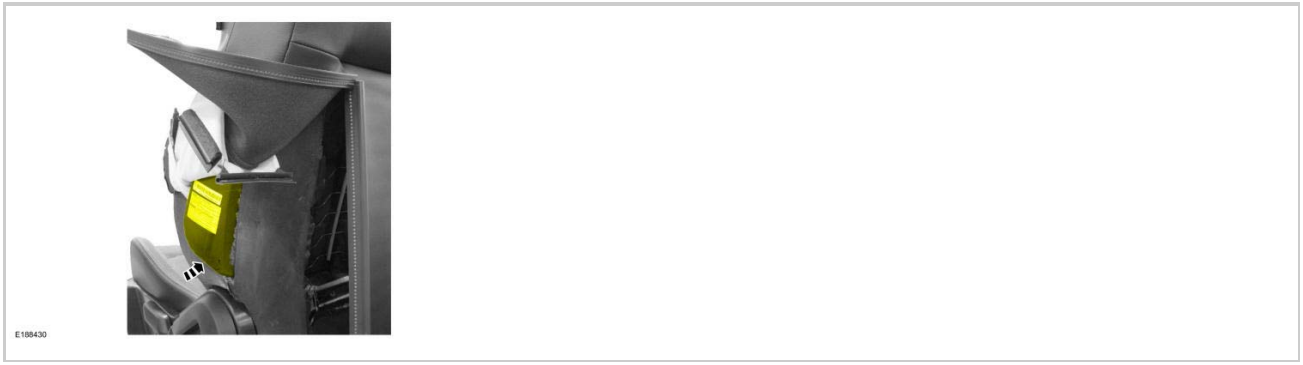
6.

Position the deployment chute through the backrest foam.



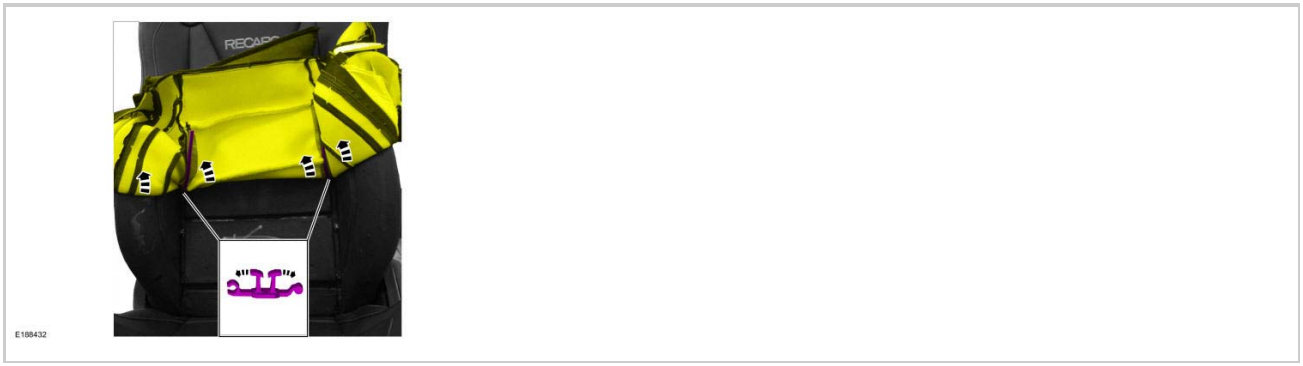
7.

Separate the side airbag from the backrest frame.



8.

Separate the deployment chute from the side airbag studs.

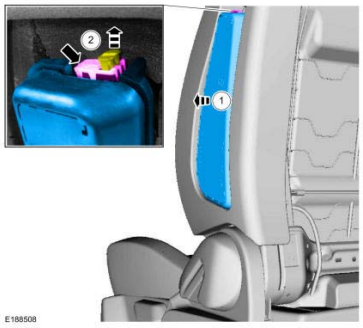


9.

Position the side airbag back into the backrest foam pad.

10.

Detach the hook-and-arrows and position the backrest cover up.



11.

1.

Detach the side airbag from the backrest frame.

2.

Slide the locking wedge out, disconnect the electrical connector and remove the side airbag.

REMOVAL AND INSTALLATION > SIDE AIRBAG - VEHICLES WITH: RECARO SEATS > INSTALLATION

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System deployment. Make sure the restraint system is depowered before reconnecting the component. Refer to the Supplemental Restraint System (SRS) Depowering . Failure to precisely follow depowering instructions could result in serious personal injury from an accidental deployment.

1.

WARNING: Inspect the seat side airbag, airbag cavity, mounting surface and deployment chute for damage or the presence of foreign material. Remove all foreign material. Install a new side airbag if it is damaged. Install a new deployment chute if the deployment chute is damaged. Failure to follow these instructions may result in the seat side airbag deploying incorrectly and increase the risk of serious personal injury or death in a crash.

To install, reverse the removal procedure.

Service Manual: POWER STEERING

DESCRIPTION AND OPERATION > POWER STEERING - OVERVIEW > OVERVIEW

The EPAS system provides steering assist to the driver by replacing the conventional hydraulic valve system with a steering gear equipped with an integrated electrical motor and PSCM. The motor operation and level of steering assist provided is controlled by the PSCM.

DESCRIPTION AND OPERATION > POWER STEERING - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > POWER STEERING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

PSCM Network Input Messages

Broadcast Message	Originating Module	Message Purpose
ABS active	ABS module	Used to confirm the operational state of the ABS.
Ignition status	BCM	This message is first sent to the GWM and then to the PSCM. Used to confirm the ignition status of the vehicle.
Power pack status	PCM	This message is first sent to the GWM and then to the PSCM. Used to confirm the status of the operating mode; off - torque not available, on - torque not available, start in progress - torque not available or on - torque available.
Power system status	BCM	This message is first sent to the GWM and then to the PSCM. Used to confirm the status of the vehicle battery and charging system.
Stability control brake active	ABS module	Used to confirm the operational state of the stability control system.
Steering wheel angle	ABS module	Used to verify the validity of the steering angle sensor.

Traction control brake active	ABS module	Used to confirm the operational state of the traction control system.
Vehicle configuration information	BCM	This message is first sent to the GWM and then to the PSCM. Used to compare the PSCM configuration against the vehicles specific configuration (central car configuration).
Vehicle lateral acceleration	ABS module	Used by the PSCM for steering assist calculations.
Vehicle lateral acceleration	RCM	Used by the PSCM for steering assist calculations.
Vehicle longitudinal acceleration	ABS module	Used by the PSCM for steering assist calculations.
Vehicle speed	PCM	This message is first sent to the GWM and then to the PSCM. Used to determine the level of assist supplied to the steering gear.
Vehicle yaw rate	ABS module	Used by the PSCM for steering assist calculations.
Wheel speed data	ABS module	Used to determine the level of assist supplied to the steering gear and to validate the steering wheel component angle by comparing the rotational speeds of each wheel. The difference in the speed of each wheel is used to derive a steering angle for comparison against the absolute steering angle message from the SCCM.

DESCRIPTION AND OPERATION > POWER STEERING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > EPAS SYSTEM

The PSCM controls the functions of the EPAS system and communicates with other modules over the HS-CAN2.

To activate, the EPAS system requires battery voltage at the hot at all times PSCM input, battery voltage at the PSCM ignition-run input, the PSCM must communicate with other modules over the HS-CAN2 and the PSCM must receive both the power pack status message from the PCM.

The main input for calculating the level of EPAS assist is the steering torque sensor signal (internal to the PSCM). Vehicle speed is also taken into consideration in order to achieve the vehicle speed

dependent steering assist characteristic.

The EPAS gear uses a reversible motor to apply the steering assist by moving the rack inside the steering gear. The motor is connected to the rack of the steering gear by a toothed belt and pulley-bearing assembly.

The PSCM continually monitors and adjusts steering efforts based on the steering torque sensor signal, motor position and HS-CAN2 inputs to enhance the feel of the steering system. As vehicle speed increases, the amount of assist decreases to improve and enhance road feel at the steering wheel. As vehicle speed decreases, the amount of assist increases to ease vehicle maneuvering. Compensation is made to reduce the effect of pull or drift experienced when driving on roads with a high degree of camber. Compensation is also made for the impact of wheel imbalance on steering feel, up to a predetermined threshold.

The steering torque sensor senses the torque at the steering wheel. It is integrated into the PSCM and works by measuring the relative rotation between an input and output shaft which are connected by a torsion bar. The steering torque sensor sends out 2 PWM signals which allows a channel to channel cross-check and an accurate correction of the neutral point.

The PSCM is self-monitoring and is capable of setting and storing Diagnostic Trouble Codes (DTCs). Depending on the DTC set, the PSCM may enter a failure mode. In addition, the PSCM may send a request to the IPC to display a message in the message center, alerting the driver of a potential EPAS concern. The warning message is sent over the HS-CAN2 to the GWM which relays the message to the IPC over the HS-CAN3.

DESCRIPTION AND OPERATION > POWER STEERING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FAILURE MODES

When a DTC is present in the PSCM, the EPAS enters 1 of 2 modes of operation.

The EPAS enters a **reduced steering assist mode** to protect the internal components of the EPAS when a non-critical safety concern is detected by the PSCM, concerns such as low battery voltage, high battery voltage or over-temperature are considered non-critical safety concerns. This reduced steering assist mode gives the steering operation a heavier than normal feel.

The EPAS enters a **manual steering mode** (no electrical steering assistance is provided) when a concern considered to be a critical safety concern is detected. In manual steering mode, the vehicle has mechanical steering only which gives the steering operation a heavy feel.

DESCRIPTION AND OPERATION > POWER STEERING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SELECTABLE STEERING

The selectable steering button on the FCIM allows the driver to select 1 of 3 steering modes. These steering modes alter the feel and response of the EPAS system. After a selection is made, a soft feedback bump may be felt in the steering wheel. Pressing the switch causes the FCIM to send a message to the IPC and the PSCM. The IPC displays the current mode in the message center and the PSCM modifies EPAS operation according to the selected steering mode.

- **Standard**

: Default system setting. The system defaults to standard mode if the battery is disconnected.

- **Sport**

  : Slightly higher effort required for steering with more road feel through the steering wheel.

- **Comfort**

  : Slightly less effort required for steering with less road feel through the steering wheel.

If the vehicle is equipped with the selectable drive mode feature, the steering feel changes when a new drive mode is selected. This automatic selection can be overridden by using the selectable steering button. For additional information on the selectable drive mode feature, Refer to: Anti-Lock Brake System (ABS) and Stability Control - System Operation and Component Description .

Component Description

EPAS Steering Gear

The EPAS gear is an assembly consisting of a PSCM, a motor, and a steering torque sensor, all of which are serviced as an assembly. The inner and outer tie rods and the steering gear bellows boots are available separately for service.

- The steering torque sensor is mounted near the input shaft of the EPAS gear and is used by the PSCM to determine how much force is being used to turn the steering wheel.
- The EPAS gear has one inner tie rod located at each end of the gear assembly and is available separately for service.
- The EPAS gear has one outer tie rod located at each end of the gear assembly and is available separately for service.
- The EPAS gear has one bellows boot located at each side of the EPAS gear assembly. Each boot is held in place with 2 boot clamps. The boots and clamps are available for service.

PSCM

The PSCM is the Electronic Control Unit (ECU) for the EPAS system. The module monitors all sensor inputs and HS-CAN2 messages relating to the EPAS system and directly controls the output of the EPAS motor.

REMOVAL AND INSTALLATION > STEERING GEAR

Boot Clamp Pliers	
Oil Drain Equipment	

Materials

Name	Specification
Premium Long-Life Grease XG-1-E1	ESA-M1C75-B
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) XO-5W30-QSP (U.S.)	WSS-M2C946-A

REMOVAL AND INSTALLATION > STEERING GEAR > REMOVAL

All vehicles

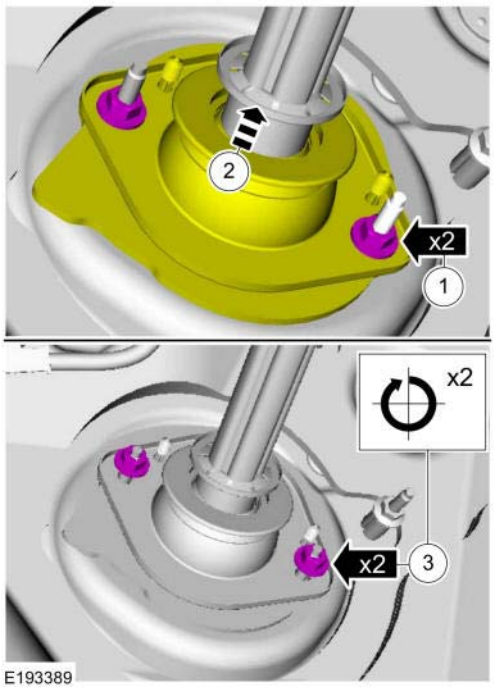
1.

If installing a new steering gear, connect the scan tool and upload the module configuration information from the PSCM. Refer to: MODULE CONFIGURATION .

NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

2.

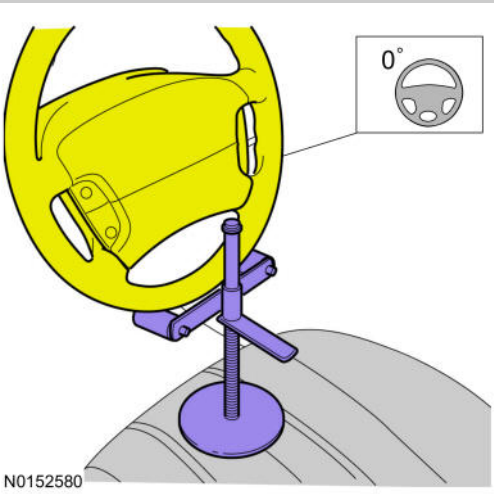
1.



Remove the steering column dash seal nuts.

2.

Loosen the dash seal.

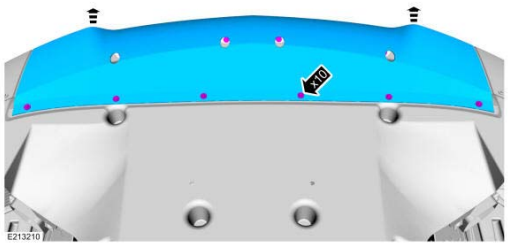


3.

Hand start the dash seal nuts.

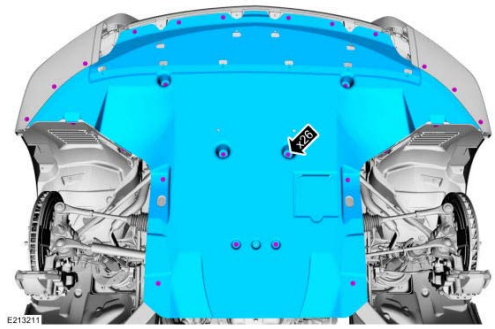
3.

Using a holding device, hold the steering wheel in the straight-ahead position.



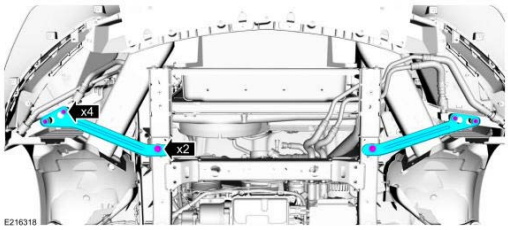
4.

On both sides. Remove the tie rod end. Refer to: Tie Rod End .



NOTE: If equipped.

5.
Remove the bolts and the underbody shield.



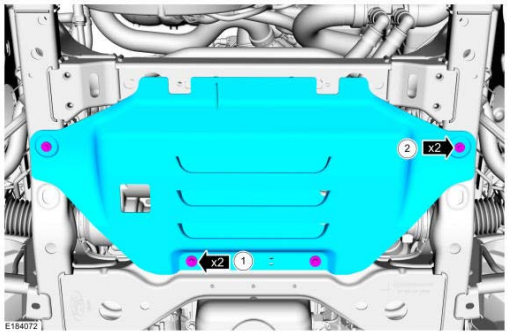
NOTE: If equipped.

6.
Remove the bolts and the underbody shield.

NOTE: If equipped.

7.
Remove the bolts and the support brackets.

NOTE: If equipped.



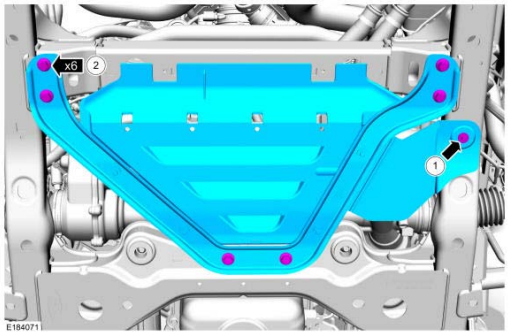
8.

1.

Remove the 2 rearward underbody shield bolts.

2.

Remove the 2 remaining underbody shield bolts and remove the underbody shield.



9.

NOTE: If equipped.

1.
Remove the underbody shield bolt.

NOTE: It is not necessary to separate the underbody shield from the V-brace.

2.
Remove the 6 V-brace bolts and remove the V-brace and underbody shield.

WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

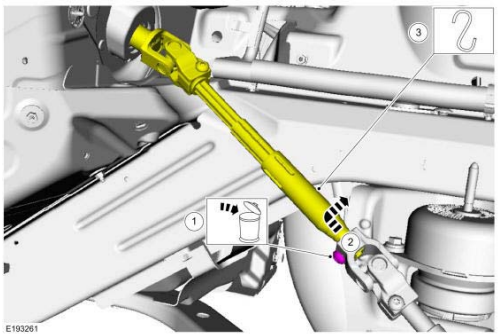
NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering

components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT attempt to remove or install the steering column lower coupler at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

10.
Detach the steering column lower shaft from the lower coupler.

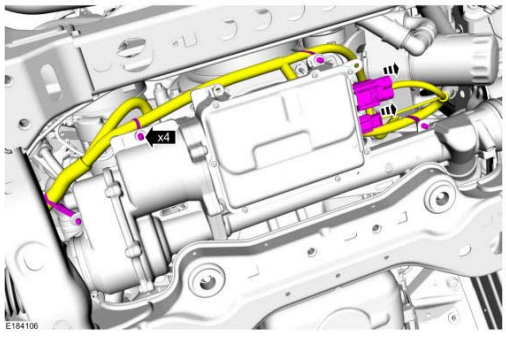
1.



Remove and discard the steering column shaft bolt.

2.

Pull apart the steering column shaft from the coupler.



3.

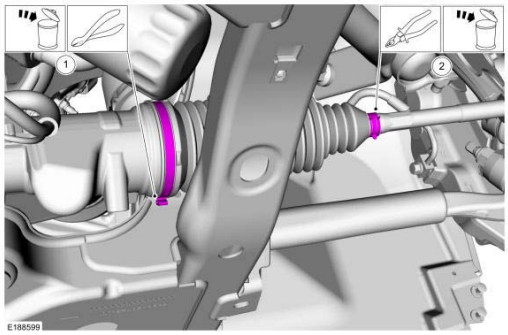
Secure the lower shaft to the frame rail to avoid damaging it during steering gear removal.

11.

Disconnect the 2 EPAS gear electrical connectors and unclip the 4 wiring fasteners and position the wiring harness aside.

NOTE: When servicing inner tie rods, install a new bellows boot and clamps. The boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning will draw water and contamination into the gear, causing failure of the steering gear components. Zip ties must not be used as they do not provide an airtight seal.

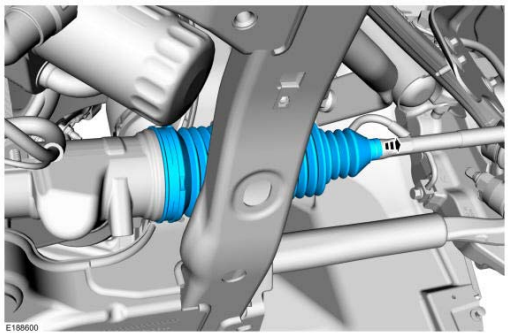
NOTE: The inner ball joint grease is not compatible with water contamination. Do not allow water to become trapped in the grease or degradation and failure of the joint may occur.



12.

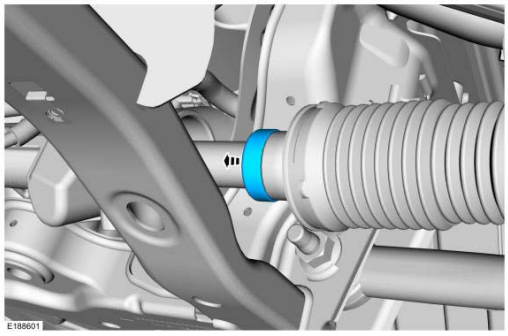
1.

On both sides. Remove and discard the inner bellows boot clamp.



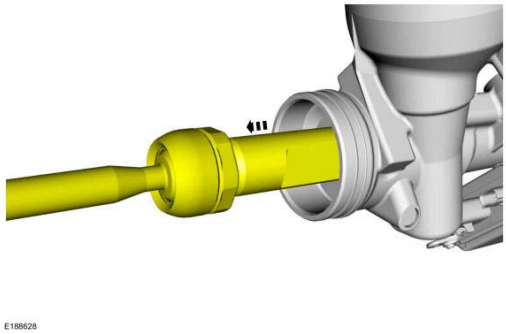
2.

On both sides. Remove and discard the outer bellows boot clamp.



NOTE: Move the bellows boot enough to gain access to the inner tie rod nut.

13.
On both sides.Position aside the bellows boot.



14.

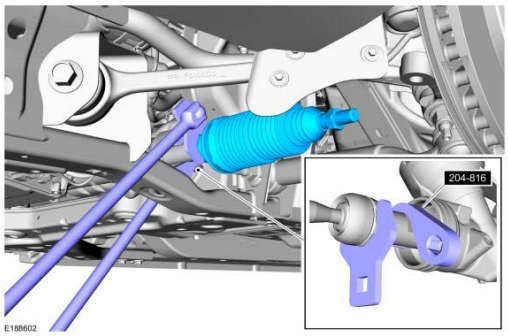
On both sides.Position aside the steering stop.

NOTE: The rack must be positioned completely to the LH side to gain clearance for tools.

15.
Position the steering rack completely to the LH side.

NOTE: Hold the steering gear rack while loosening the inner tie rod. Failure to hold the rack securely could result in steering gear damage.

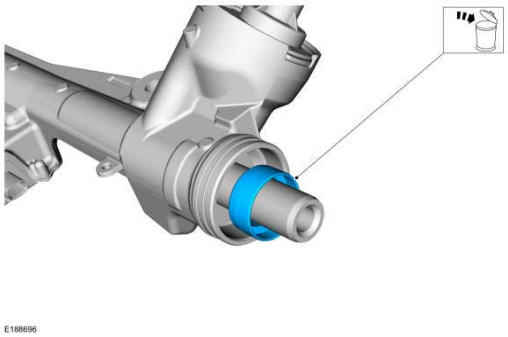
NOTE: The steering gear rack holding tool must be reversed to remove the RH tie rod or damage to the rack and/or special tool may occur.



NOTE: The holding tool can only be used on the LH side of the steering gear.

NOTE: LH side shown in illustration, RH side similar.

16.
On both sides. Using the special tool to hold the rack and an appropriate size crows foot wrench

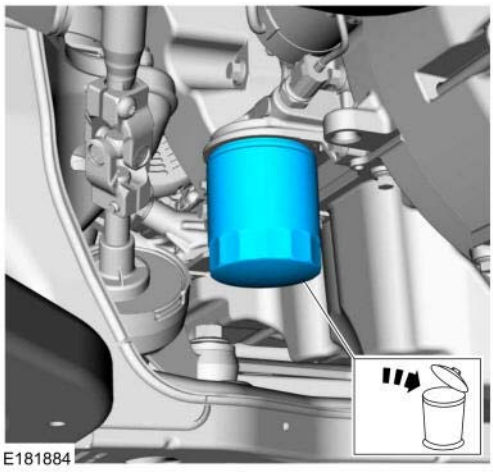


or open end wrench, remove and discard the inner tie rod.

Use Special Service Tool: 204-816 Rack Holding Tool.

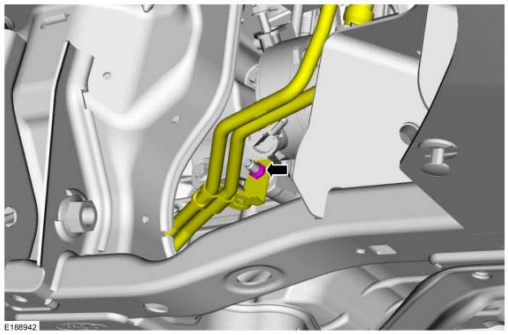
17.

On both sides. Remove and discard the steering stop.



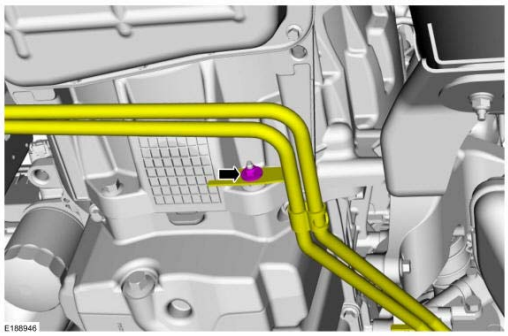
2.3L EcoBoost (231kW/314PS)

18.



Remove and discard the engine oil filter.

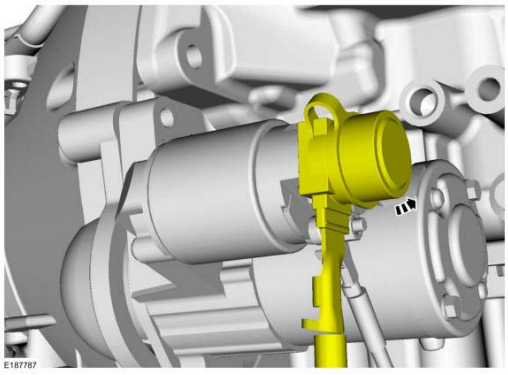
Use the General Equipment: Oil Drain Equipment



NOTE: If equipped with 2.3L EcoBoost and automatic transmission.

19.
Remove the transmission fluid cooler tubes bracket-to-engine mount nut.

NOTE: If equipped with 2.3L EcoBoost and automatic transmission.

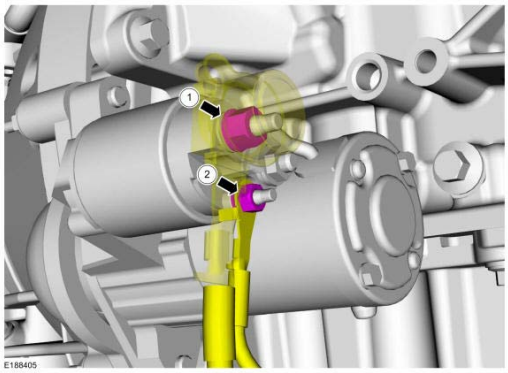


20.
Remove the transmission fluid cooler tubes bracket-to-transmission nut and position the tubes aside.

3.7L Duratec (227kW/301PS)

21.

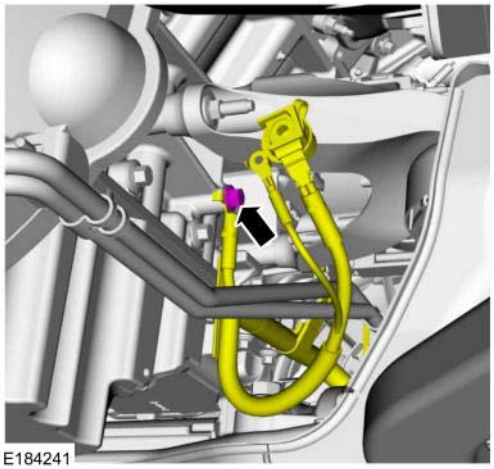
Open the starter motor solenoid battery cable cover.



22.

1.

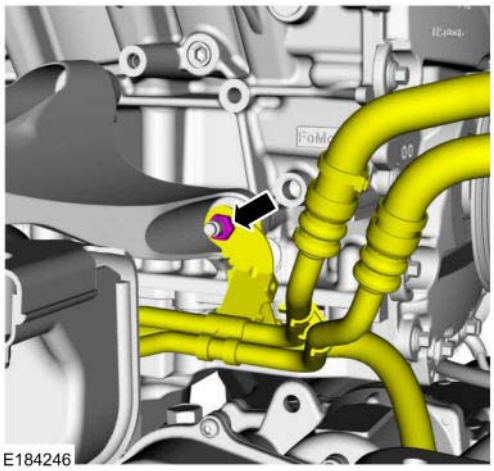
Remove the starter motor solenoid battery cable nut and then disconnect the starter motor solenoid battery cable.



2.

Remove the starter motor solenoid wire nut and then disconnect starter motor solenoid wire.

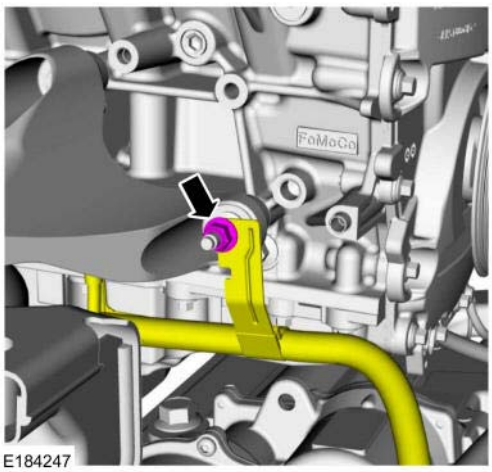
NOTE: Automatic transmission shown in illustration, manual transmission similar.



23.
Remove the bolt and ground wire from the RH side of the engine.

6-Speed Automatic Transmission - 6R80

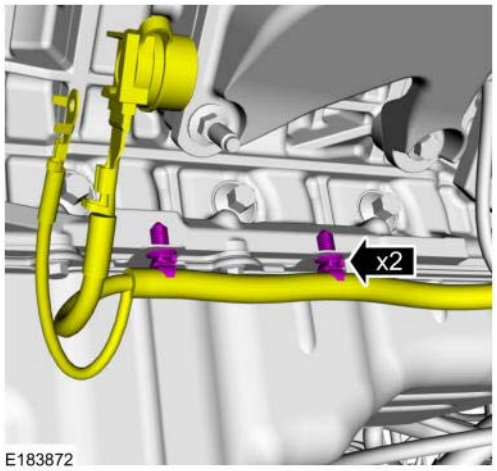
24.



Remove the nut from the front of the RH engine mount bracket stud bolt and position the brackets for the transmission cooling tubes and wire harness aside.

6-Speed Manual Transmission - MT82

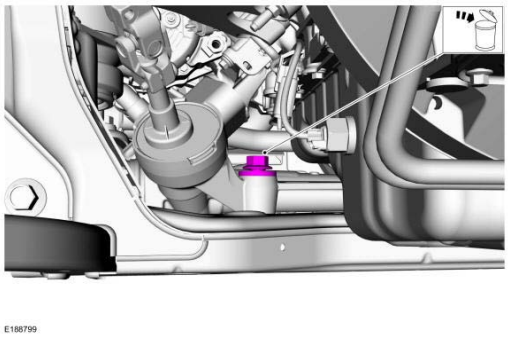
25.



Remove the nut from the front of the RH engine mount bracket stud bolt and position the bracket for the wire harness aside.

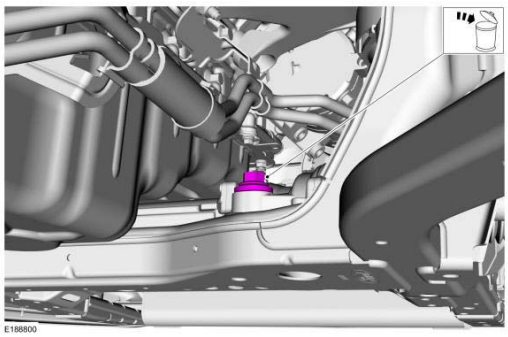
5.0L 32V Ti-VCT/5.2L 32V Ti-VCT

26.



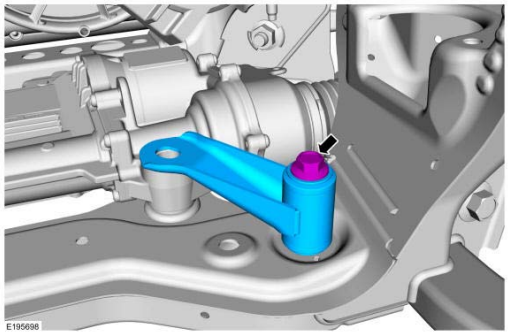
Detach the wire harness retainers from the oil pan.

All vehicles



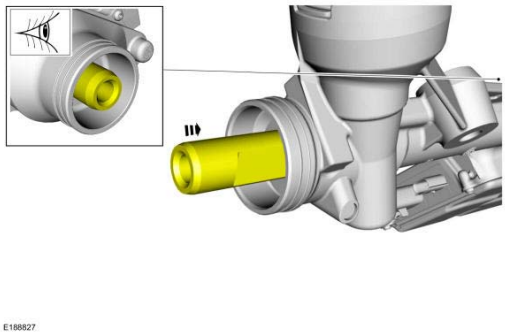
28.

Remove and discard the LH steering gear bolt.



29.

Remove and discard the RH steering gear bolt.



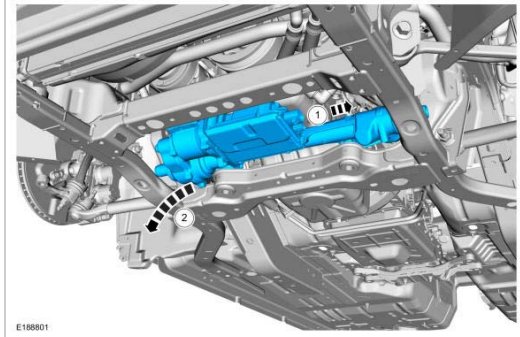
30.

On convertible vehicles. If equipped.Remove the steering gear bracket bolt and the steering gear bracket.

NOTE: The steering gear rack must be positioned so that the end of the rack is flush with the RH side of the steering gear case to gain clearance for removal.

31.
Position the steering gear rack so the end of the rack is flush with the RH side of the steering gear case.

NOTE: It will be necessary to slide the steering gear to the LH side of the vehicle, then rotate and remove by lowering the RH side of the steering gear in order to remove it from the vehicle.



32.
Remove the steering gear.

1.

Slide the steering gear to the LH side of the vehicle.

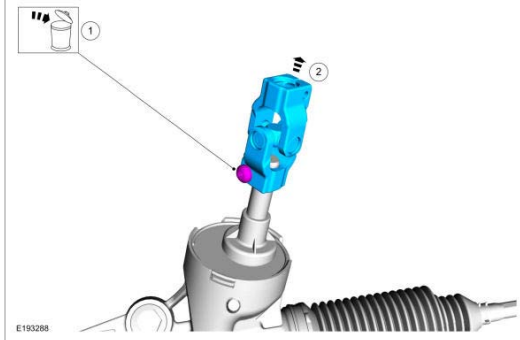
2.

Lower the RH side of the steering gear and remove it from the vehicle.

NOTE: This step is only necessary when installing a new component.

33.

WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).



NOTE: DO NOT attempt to remove or install the steering column lower coupler at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.

Remove and discard the steering coupler bolt.

2.

Remove the steering coupler.

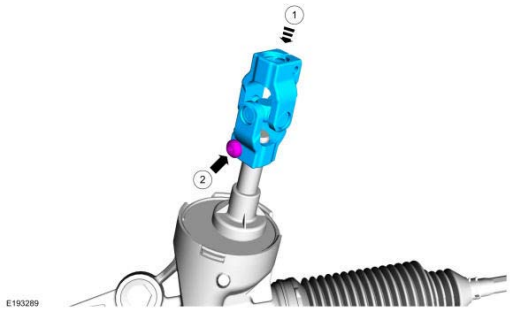
REMOVAL AND INSTALLATION > STEERING GEAR > INSTALLATION

All vehicles

NOTE: This step is only necessary when installing a new component.

1.

1.



Install the steering coupler.

2.

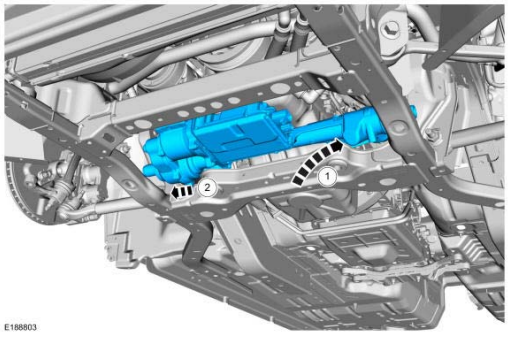
Install the new steering coupler bolt.

Torque

: 22 lb.ft (30 Nm)

NOTE: The steering gear is shipped without the inner tie rods attached. The inner tie rods, bellows boots, bellows boot clamps and tie rod end jamb nuts are supplied in a kit and are to be installed after the steering gear is installed into the vehicle.

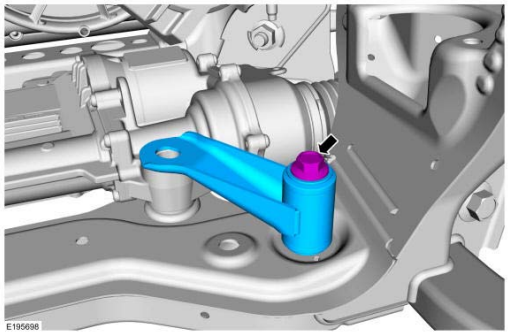
NOTE: It will be necessary to raise the LH side of the steering gear and slide it to the LH side of the vehicle, then rotate and raise the RH side of the steering gear in order to install it into the vehicle.



2.
Install the steering gear.

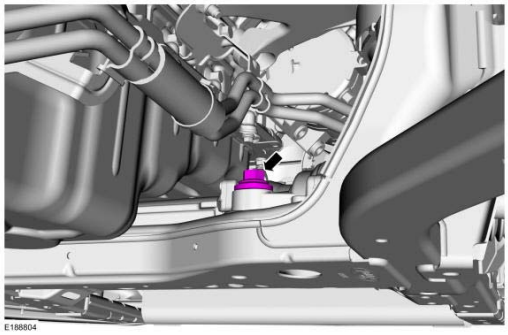
1.

Lift the LH side of the steering gear and slide it to the LH side of the vehicle.



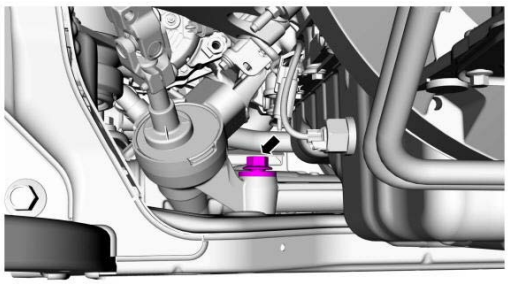
2.

Raise the RH side of the steering gear and slide it to the RH side of the vehicle.



NOTE: Only tighten the bolt finger tight at this stage.

3.
On convertible vehicles. If equipped.Install the steering gear bracket and the steering gear bracket bolt.

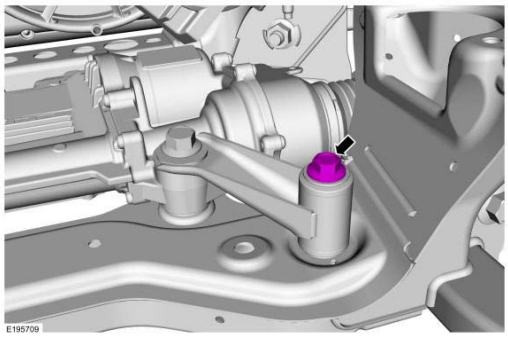


NOTE: Only tighten the bolt finger tight at this stage.

4.
Install the new RH steering gear bolt.

NOTE: Only tighten the bolt finger tight at this stage.

5.
Install the new LH steering gear bolt.

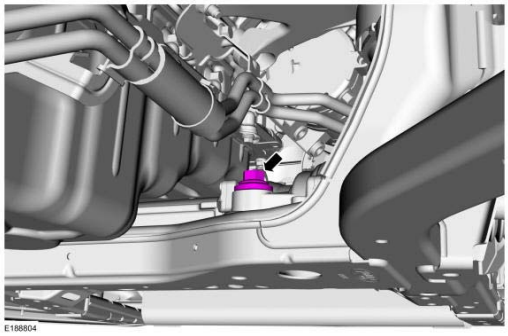


6.

On convertible vehicles. If equipped.Tighten the steering gear bracket bolt.

Torque

: 85 lb.ft (115 Nm)

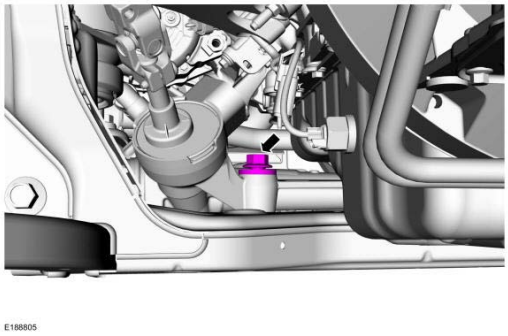


7.

Tighten the new RH steering gear bolt.

Torque

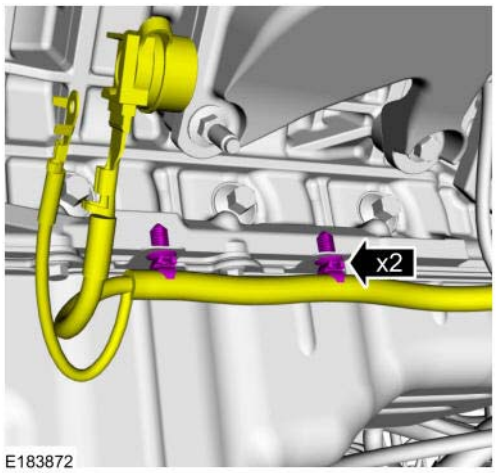
: 148 lb.ft (200 Nm)



8.

Tighten the new LH steering gear bolt.

Torque

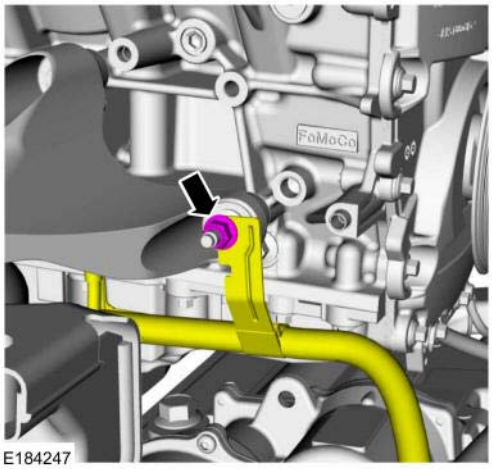


: 148 lb.ft (200 Nm)

5.0L Ti-VCT V8 (308kW/418PS)

9.

Attach the wire harness retainers to the oil pan.



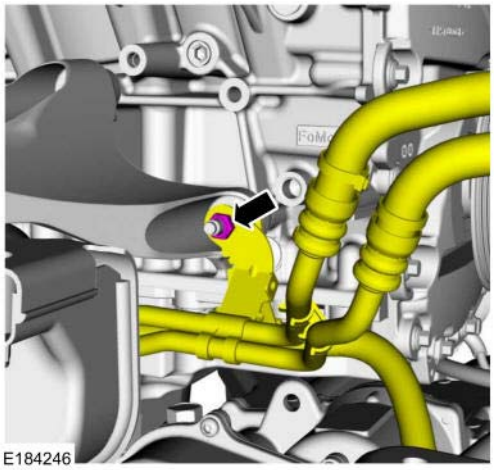
6-Speed Manual Transmission - MT82

10.

Position the bracket for the wire harness and install the nut on the front of the RH engine mount bracket stud bolt.

Torque

: 35 lb.ft (47.5 Nm)



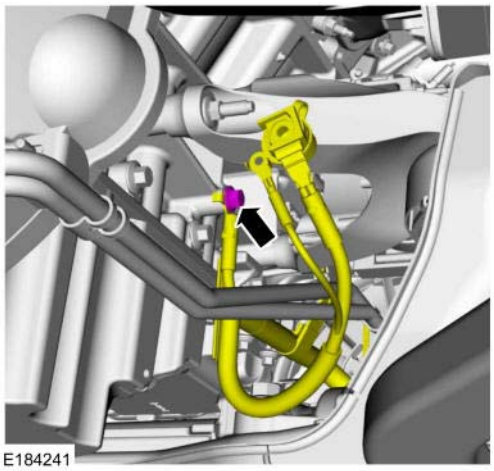
6-Speed Automatic Transmission - 6R80

11.

Position the brackets for the transmission cooling tubes and wire harness and install the nut on the front of the RH engine mount bracket stud bolt.

Torque

: 35 lb.ft (47.5 Nm)



3.7L Duratec (227kW/301PS)

NOTE: Automatic transmission shown in illustration, manual transmission similar.

12.
Position the ground wire and install the bolt to the RH side of the engine.

Torque

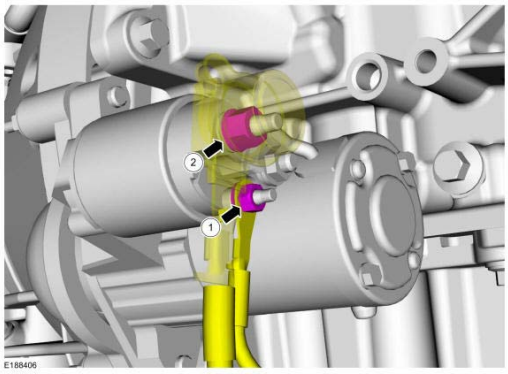
: 35 lb.ft (47.5 Nm)

13.

1.

Connect starter motor solenoid wire and install the starter motor solenoid wire nut.

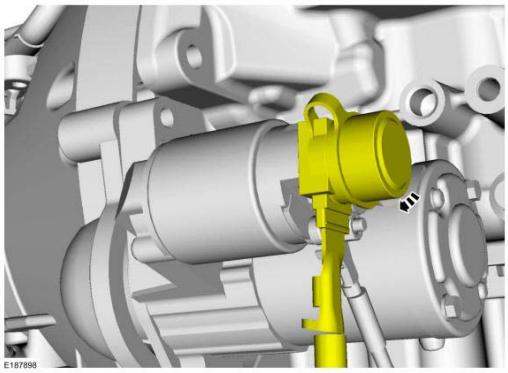
Torque



: 53 lb.in (6 Nm)

2.

Connect the starter motor solenoid battery cable and install the starter motor solenoid battery cable nut.

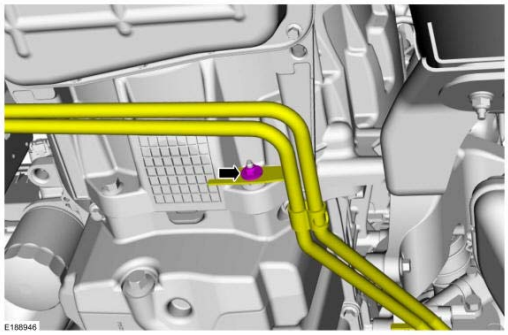


Torque

: 106 lb.in (12 Nm)

14.

Close the starter motor solenoid battery cable cover.



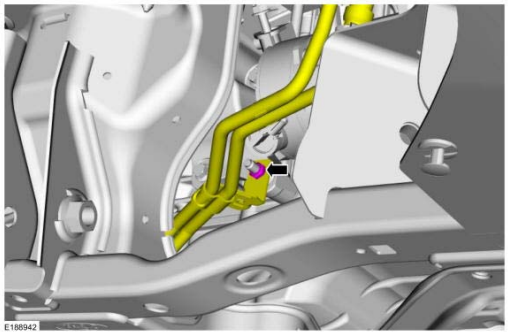
2.3L EcoBoost (231kW/314PS)

> *NOTE: If equipped with 2.3L EcoBoost and automatic transmission.*

15.
Position the tubes and install the transmission fluid cooler tubes bracket-to-transmission nut.

Torque

: 124 lb.in (14 Nm)



> *NOTE: If equipped with 2.3L EcoBoost and automatic transmission.*

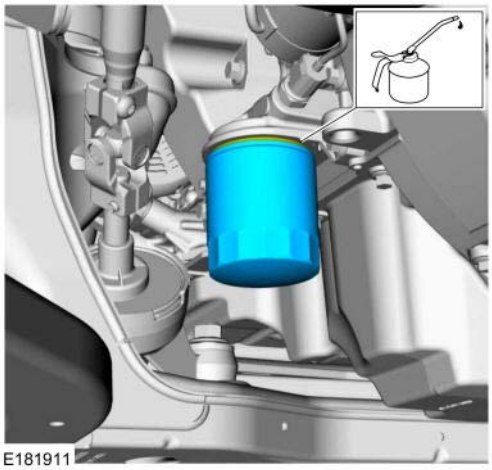
16.
Install the transmission fluid cooler tubes bracket-to-engine mount nut.

Torque

: 35 lb.ft (48 Nm)

17.

Install the new engine oil filter.

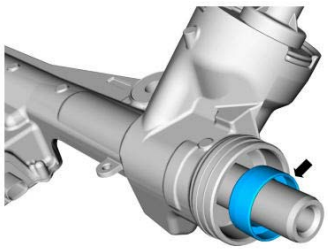


Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

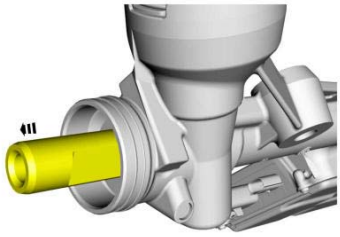
Torque:

Stage 1: 71 lb.in (8 Nm)



Stage 2: 180°

All vehicles



18.

On both sides. Position the new steering stop.

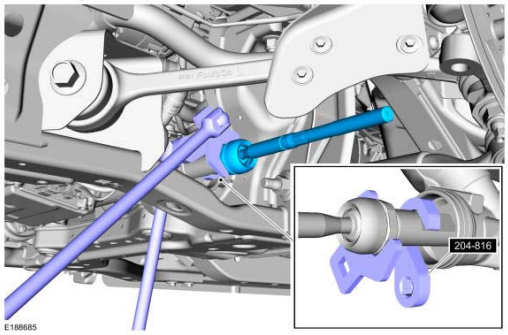
19.

Position the steering rack completely to the LH side.

NOTE: Hold the steering gear rack while tightening the inner tie rod. Failure to hold the rack securely could result in steering gear damage.

NOTE: The steering gear rack holding tool must be reversed to install the RH tie rod or damage to the rack and/or special tool may occur.

NOTE: The holding tool can only be used on the LH side of the steering gear.

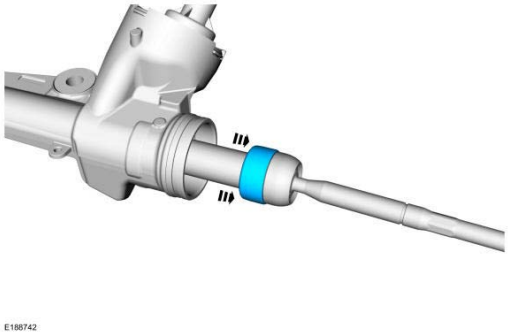


NOTE: LH side shown in illustration, RH side similar.

20.
On both sides.Using the special tool to hold the rack and an appropriate size crows foot wrench or open end wrench, install the inner tie rod and steering stop.

Use Special Service Tool: 204-816 Rack Holding Tool.

Torque

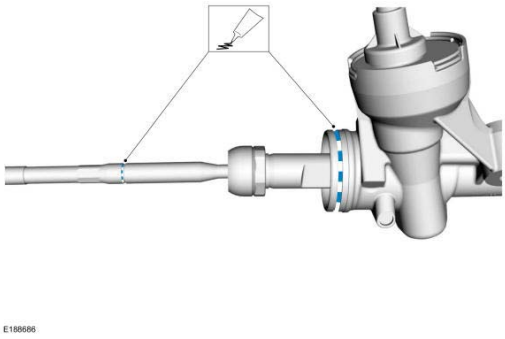


: 89 lb.ft (120 Nm)

NOTE: An audible click will be heard when the steering stop seats onto the inner tie rod. Make sure that the steering stop is fully seated and cannot be separated by hand.

NOTE: Install the steering stop using hand force only. Striking the steering stop may cause damage to the stop.

21.
On both sides.Install the steering stop onto the inner tie rod using hand force only.



22.

On both sides.Apply the specified grease to the steering gear-to-bellows boot mating surface and bellows boot groove on the inner tie-rod.

Material

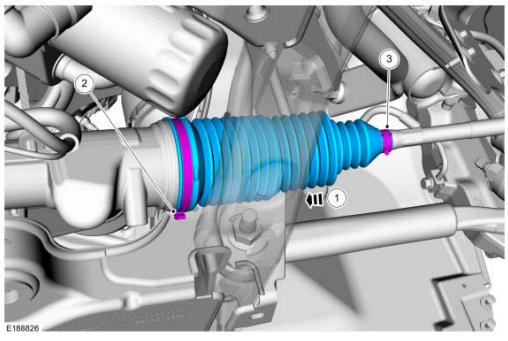
: Premium Long-Life Grease / XG-1-E1 (ESA-M1C75-B)

NOTE: LH side shown in illustration, RH side similar.

23.

NOTE: Make sure the steering gear bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

1.
On both sides. Install the new steering gear bellows boot.



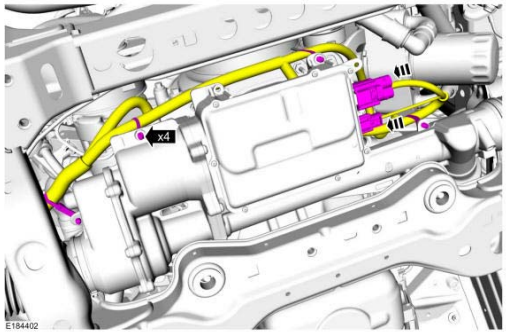
2.

On both sides. Install the new inner bellows boot clamp.

Use the General Equipment: Boot Clamp Pliers

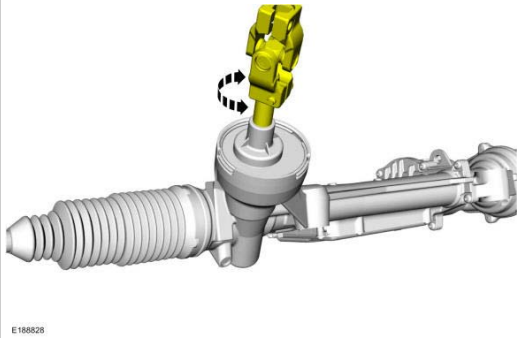
3.

On both sides. Install the new outer bellows boot clamp.



24.

On both sides.Thread the tie-rod end jam nut onto the inner tie rod.



25.

Position the EPAS gear wiring harness, clip the 4 wiring fasteners and connect the 2 electrical connectors.

NOTE: Make sure steering gear is centered before connecting the steering column shaft. Damage to the steering gear and/or clockspring may result.

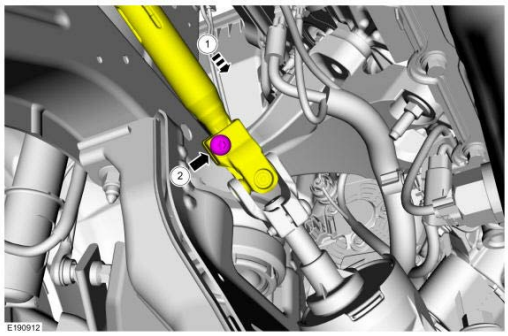
26.
Turn the steering gear input shaft completely to the right then completely to the left and return to the center position.

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT attempt to remove or install the steering column lower coupler at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

27.

1.



Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

Torque

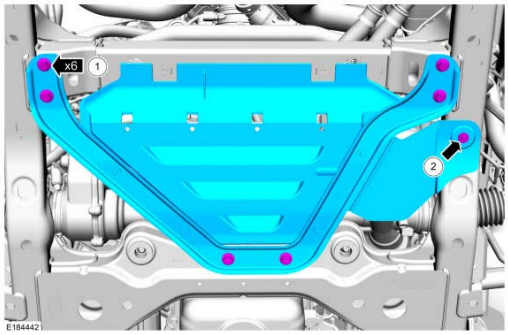
: 22 lb.ft (30 Nm)

28.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

29.

NOTE: If equipped.



1.
Position the V-brace and underbody shield and install the 6 V-brace bolts.

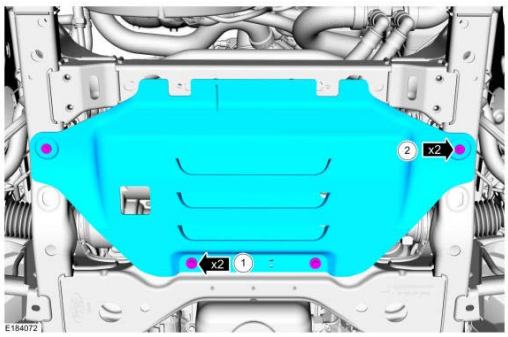
Torque

: 46 lb.ft (63 Nm)

2.

Install the underbody shield bolt.

NOTE: If equipped.



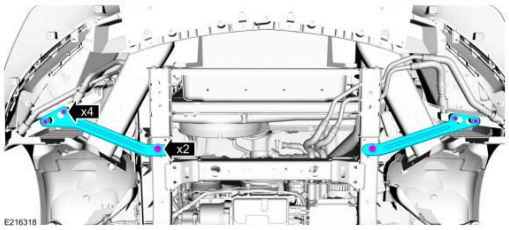
30.

1.

Position the underbody shield and install the 2 rearward underbody shield bolts.

2.

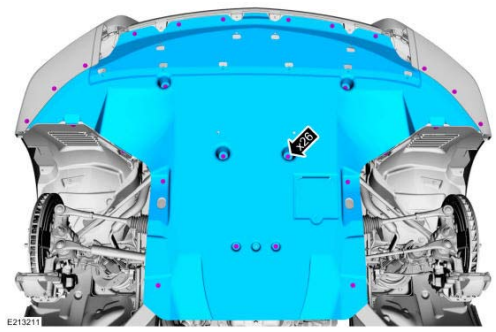
Install the 2 remaining underbody shield bolts.



NOTE: If equipped.

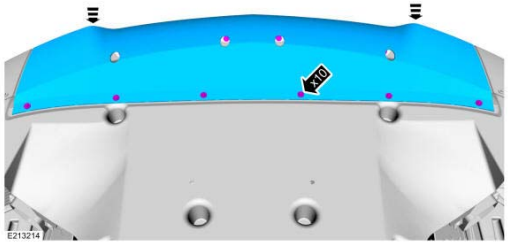
31.
Install the 2 support brackets and the bolts.

Torque:



Bracket to subframe bolts: 22 lb.ft (30 Nm)

Bracket to cooler bolts: 93 lb.in (10.5 Nm)



NOTE: If equipped.

32.
Position the underbody shield and install the bolts.

NOTE: If equipped.

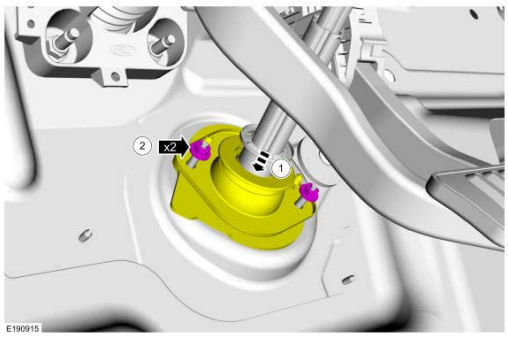
33.
Position the underbody shield and install the bolts.

34.

On both sides.Install the tie rod end. Refer to: Tie Rod End .

35.

1.



Position the steering column dash seal.

2.

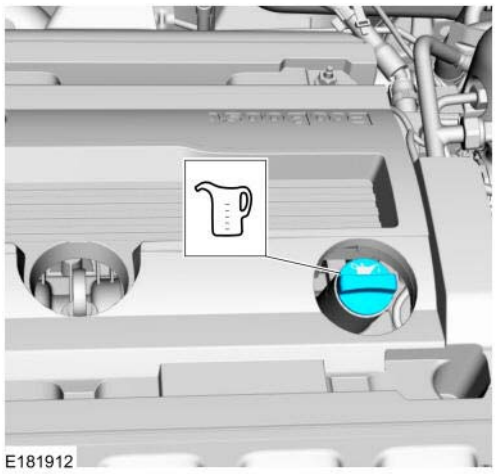
Tighten the steering column dash seal nuts.

Torque

: 80 lb.in (9 Nm)

36.

Turn the steering wheel lock-to-lock to assure the steering stops are fully seated.



2.3L EcoBoost (231kW/314PS)

37.

Fill the engine with clean engine oil. Refer to: SPECIFICATIONS - 2.3L EcoBoost (231kW/314PS).

Material

: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W30-QSP (U.S.) (WSS-M2C946-A)

All vehicles

38.

When installing a new steering gear, it must be configured (using vehicle as-built data or module

configuration information retrieved earlier in this procedure). Connect a scan tool and follow the scan tool instructions. Refer to: MODULE CONFIGURATION .

39.

Check and if necessary adjust front toe. Refer to: Front Toe Adjustment .

REMOVAL AND INSTALLATION > TIE ROD

Special Tool(s) / General Equipment

 E188617	204-816 Rack Holding Tool TKIT-2014D-FL_ROW TKIT-2014D-ROW2
Boot Clamp Pliers	

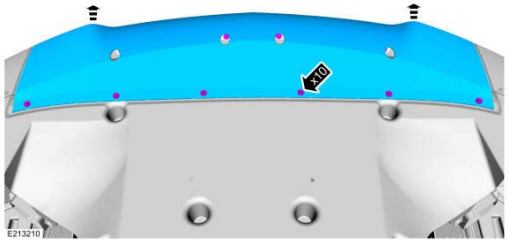
Materials

Name	Specification
Premium Long-Life GreaseXG-1-E1	ESA-M1C75-B

REMOVAL AND INSTALLATION > TIE ROD > REMOVAL

NOTE: When servicing inner tie rods, install a new bellows boot and clamps. The boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning will draw water and contamination into the gear, causing failure of the steering gear components. Zip ties must not be used as they do not provide an airtight seal.

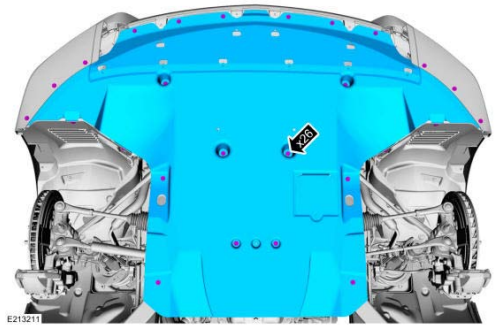
NOTE: The inner ball joint grease is not compatible with water contamination. Do not allow water to become trapped in the grease or degradation and failure of the joint may occur.



NOTE: If the RH inner tie rod is being serviced, remove the LH outer tie rod end and bellows boot to access and hold the steering rack when loosening and tightening the inner tie rod.

1.

Remove the tie rod end. Refer to: Tie Rod End .



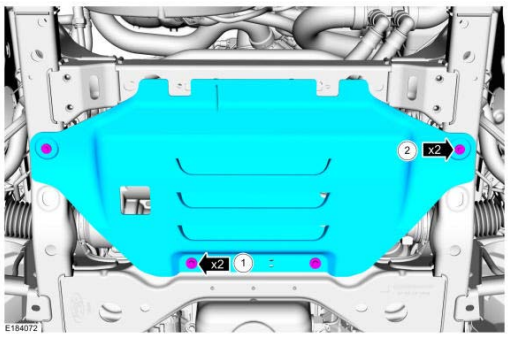
NOTE: If equipped.

2.
Remove the bolts and the underbody shield.

NOTE: If equipped.

3.
Remove the bolts and the underbody shield.

NOTE: If equipped.



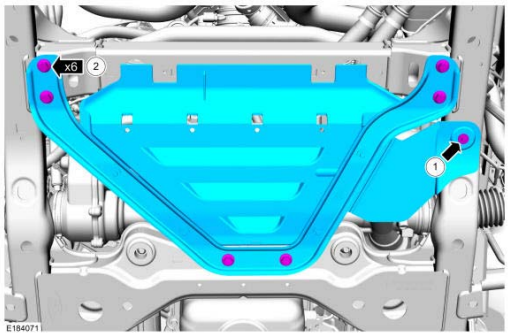
4.

1.

Remove the 2 rearward underbody shield bolts.

2.

Remove the 2 remaining underbody shield bolts and remove the underbody shield.



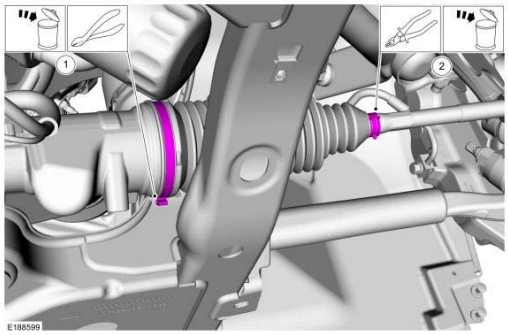
5.

NOTE: If equipped.

1.
Remove the underbody shield bolt.

NOTE: It is not necessary to separate the underbody shield from the V-brace.

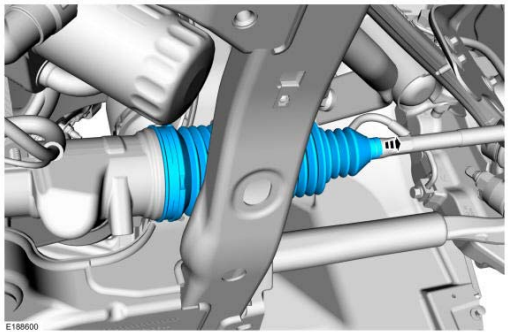
2.
Remove the 6 V-brace bolts and remove the V-brace and underbody shield.



6.

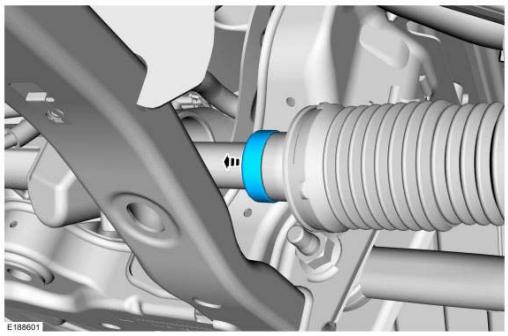
1.

Remove and discard the inner bellows boot clamp.



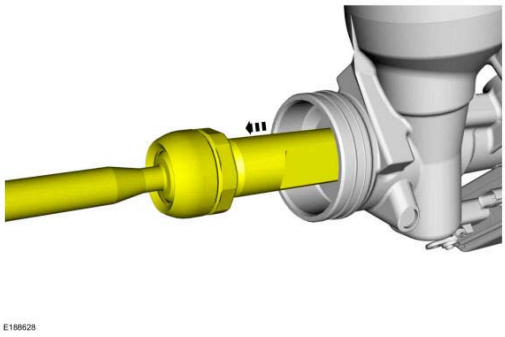
2.

Remove and discard the outer bellows boot clamp.



NOTE: Move the bellows boot enough to gain access to the inner tie rod nut.

7.
Position aside the bellows boot.

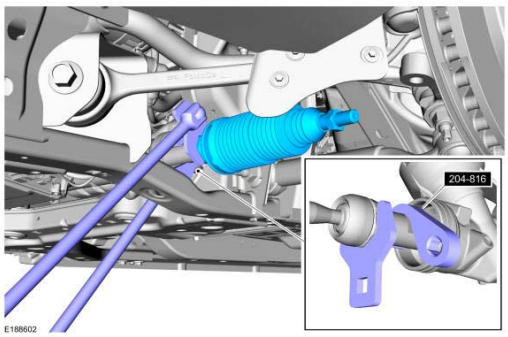


8.

Position aside the steering stop.

9.

Position the steering rack completely to the left.



NOTE: The holding tool can only be used on the LH side of the steering gear.

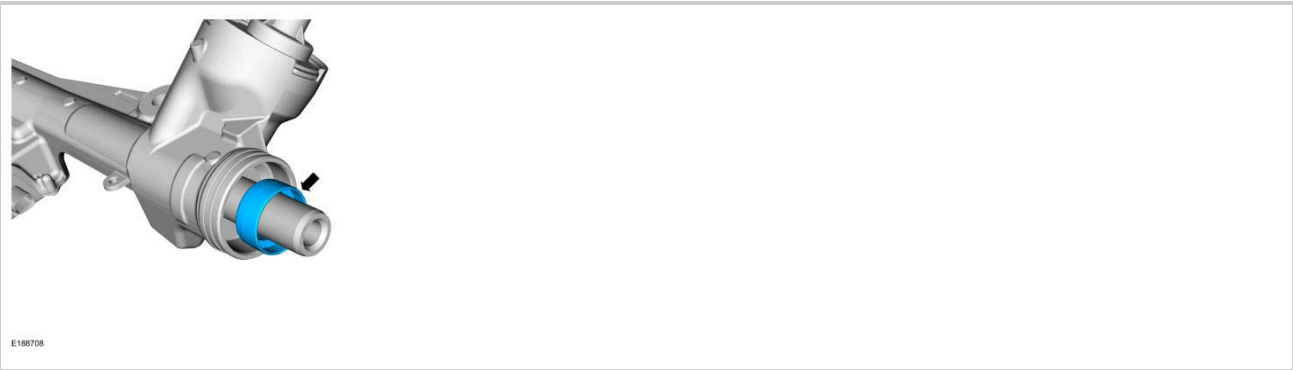
NOTE: The steering gear rack holding tool must be reversed to remove the RH tie rod or damage to the rack and/or special tool may occur.

NOTE: Hold the steering gear rack while loosening the inner tie rod. Failure to hold the rack securely could result in steering gear damage.

10.
Using the special tool to hold the rack and an appropriate size crows foot wrench or open end wrench, remove and discard the inner tie rod.

Use Special Service Tool: 204-816 Rack Holding Tool.

11.



Remove and discard the steering stop.

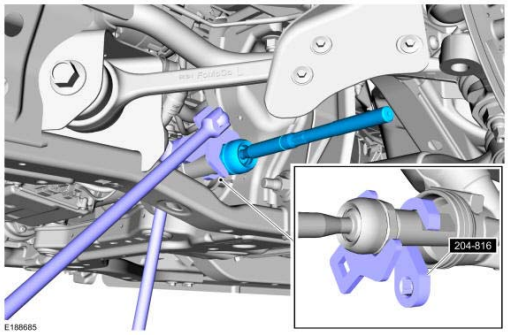
REMOVAL AND INSTALLATION > TIE ROD > INSTALLATION

1.

Position the new steering stop.

NOTE: Hold the steering gear rack while loosening the inner tie rod. Failure to hold the rack securely could result in steering gear damage.

NOTE: The steering gear rack holding tool must be reversed to install the RH tie rod or damage to the rack and/or special tool may occur.

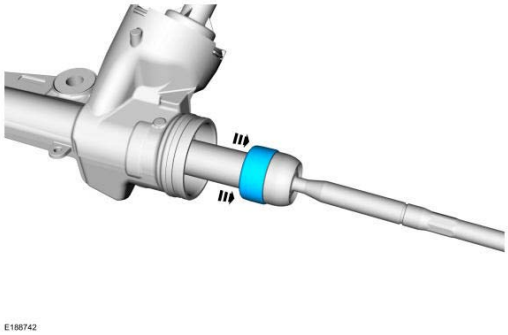


NOTE: The holding tool can only be used on the LH side of the steering gear.

2.
Using the special tool to hold the rack and an appropriate size crows foot wrench or open end wrench, install the inner tie rod and steering stop.

Use Special Service Tool: 204-816 Rack Holding Tool.

Torque

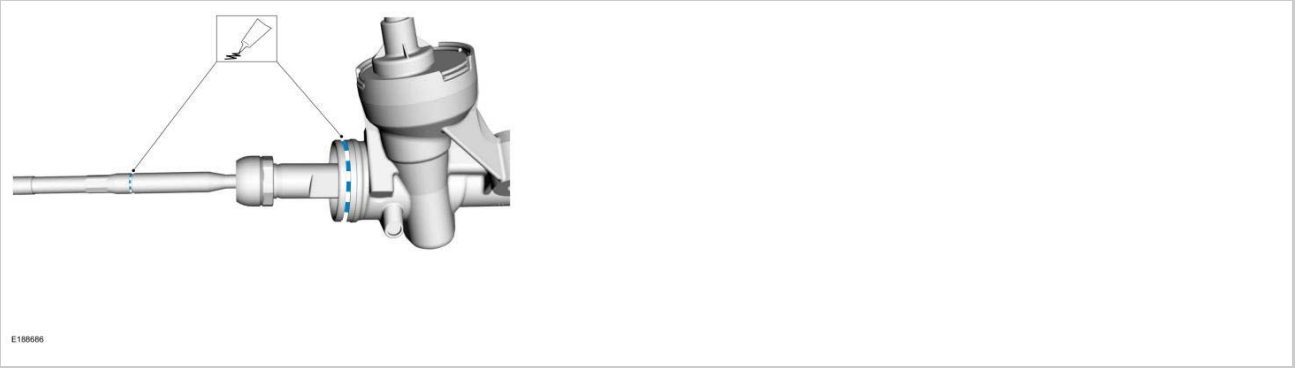


: 89 lb.ft (120 Nm)

NOTE: Install the steering stop using hand force only. Striking the steering stop may cause damage to the stop.

NOTE: An audible click will be heard when the steering stop seats onto the inner tie rod. Make sure that the steering stop is fully seated and cannot be separated by hand.

3.
Install the steering stop onto the inner tie rod using hand force only.



4.

Apply the specified grease to the steering gear-to-bellows boot mating surface and bellows boot groove on the inner tie-rod.

Material

: Premium Long-Life Grease / XG-1-E1 (ESA-M1C75-B)

NOTE: LH side shown in illustration, RH side similar.

5.

NOTE: Make sure the steering gear bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

1.
Install the new steering gear bellows boot.

2.

Install the new inner bellows boot clamp.

Use the General Equipment: Boot Clamp Pliers

3.

Install the new outer bellows boot clamp.

6.

Thread the tie-rod end jam nut onto the inner tie rod.

7.

NOTE: If equipped.

1.
Position the V-brace and underbody shield and install the 6 V-brace bolts.

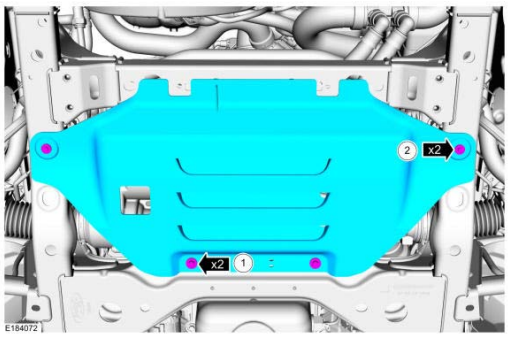
Torque

: 46 lb.ft (63 Nm)

2.

Install the underbody shield bolt.

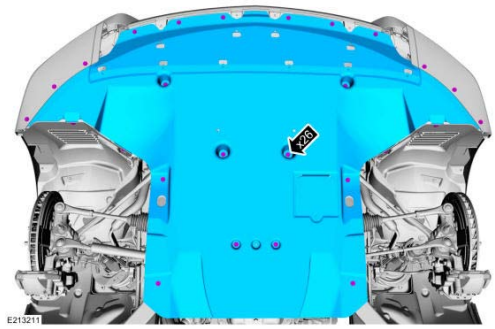
NOTE: If equipped.



8.

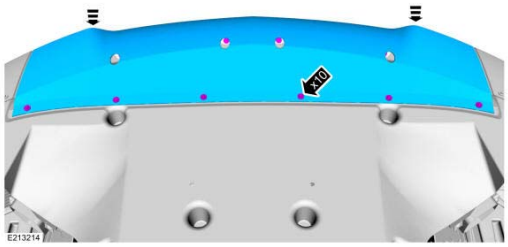
1.

Position the underbody shield and install the 2 rearward underbody shield bolts.



2.

Install the 2 remaining underbody shield bolts.



NOTE: If equipped.

9.
Position the underbody shield and install the bolts.

NOTE: If equipped.

10.
Position the underbody shield and install the bolts.

11.

Install the tie rod end.Refer to: Tie Rod End .

12.

Turn the steering wheel lock-to-lock to assure the steering stops are fully seated.

REMOVAL AND INSTALLATION > TIE ROD END

Special Tool(s) / General Equipment

Tie Rod End Remover

REMOVAL AND INSTALLATION > TIE ROD END > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Disconnect the battery ground cable anytime the steering linkage is being serviced or damage to the steering gear may occur resulting in steering gear replacement.

1.
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

2.

Remove the wheel and tire. Refer to: Wheel and Tire .

3.

1.

Loosen the tie rod end jam nut.

Torque

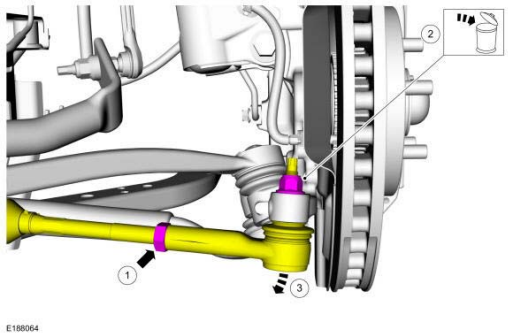
: 76 lb.ft (103 Nm)

2.

Remove and discard the outer tie rod end nut.

Torque:

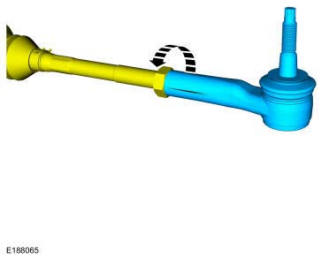
Non SVT: 59 lb.ft (80 Nm)



SVT: 30 lb.ft (40 Nm)

NOTE: Do not use a hammer to separate the outer tie-rod end from the wheel spindle or damage to the wheel spindle may result.

NOTE: Use care when installing the tie rod separator or damage to the outer tie-rod end boot may occur.



3.
Separate the outer tie rod end from the wheel spindle.

Use the General Equipment: Tie Rod End Remover

NOTE: Count and record the number of turns required to remove the outer tie-rod end for reference during installation.

4.
Remove the tie-rod end.

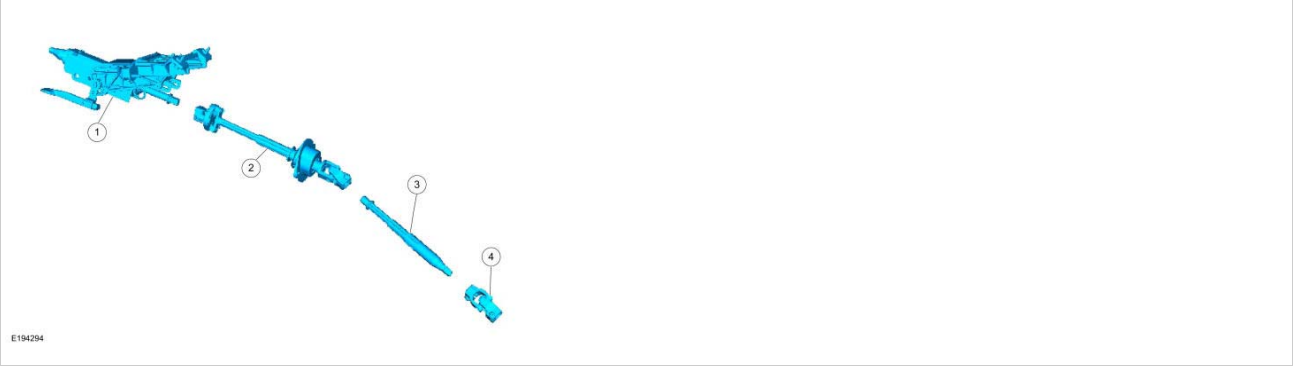
REMOVAL AND INSTALLATION > TIE ROD END > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check and if necessary, adjust front toe. Refer to: Front Toe Adjustment .



Service Manual: STEERING COLUMN

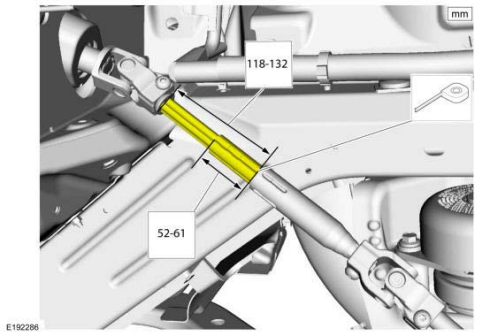
DESCRIPTION AND OPERATION > STEERING COLUMN - OVERVIEW

Authoring Template

DESCRIPTION AND OPERATION > STEERING COLUMN - OVERVIEW > STEERING COLUMN OVERVIEW

The steering column is the mechanical linkage between the steering wheel and the steering gear. The steering wheel is mounted to a shaft, which passes through the center of the steering column. The shaft is centered by bearings within the steering column. The upper and lower steering column shafts then connect the steering column to the steering gear. The lower steering column shaft is a collapsible shaft and needs to be measured any time the shaft has been disconnected from the upper shaft or the coupling.

Item	Description
1	Steering column
2	Steering column upper shaft
3	Steering column lower shaft
4	Steering column coupling

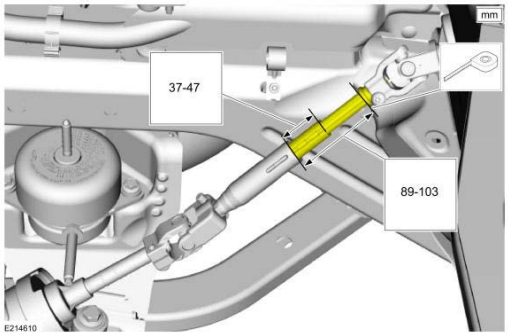


GENERAL PROCEDURES > STEERING COLUMN COLLAPSED CHECK

Inspection

Left hand drive

1.



With the steering system fully assembled, measure the lengths of the lower shaft. If either length is out of range, discard the lower shaft and install a new one. Do not attempt to repair the shaft.

Right hand drive

2.

With the steering system fully assembled, measure the lengths of the lower shaft. If either length is out of range, discard the lower shaft and install a new one. Do not attempt to repair the shaft.

GENERAL PROCEDURES > STEERING WHEEL COVER REPAIR

Materials

Name	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

Activation

NOTE: If re-adhering leather to the front side of the steering wheel only, it will not be necessary to remove the steering wheel. Steering wheel removal is necessary only when repairing loose leather on the backside of the steering wheel.

1.
If necessary, remove the steering wheel. Refer to: Steering Wheel .

2.

Position the loose leather out of the way.

3.

Apply the specified adhesive evenly over the wheel spoke.

Material

: Instant Gel Adhesive / TA-19 (WSK-M2G402-A4)

4.

Position the loose leather back into the original position.

> *NOTE: The adhesive should be completely set after 5 minutes. Do not pull on the repair area.*

5.
Smooth the leather and tuck in for neat appearance.

6.

Apply pressure (for at least 30 seconds) until the leather is bonded to the wheel spoke.

7.

If removed, install the steering wheel. Refer to: Steering Wheel .

REMOVAL AND INSTALLATION > STEERING COLUMN > REMOVAL

All vehicles

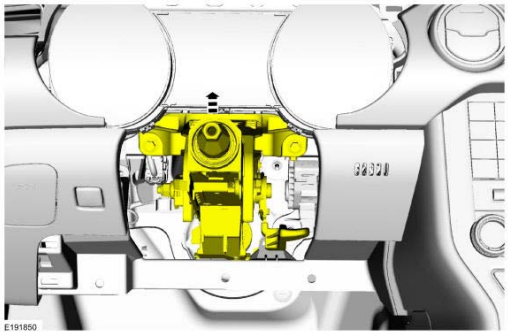
> *NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.*

> *NOTE: Do not allow the steering column to rotate while the steering column shaft system is disconnected or damage to the steering column electrical components may result.*

> *NOTE: LHD shown in illustration below, RHD similar.*

> *NOTE: Removal steps in this procedure may contain installation details.*

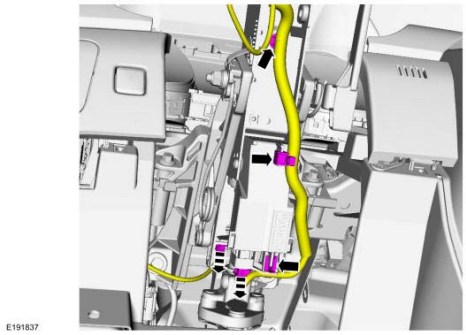
NOTE: This step is only necessary when installing a new component.



1.
Remove the SCCM. Refer to: Steering Column Control Module (SCCM) .

2.

Remove the driver knee airbag. Refer to: Driver Knee Airbag .

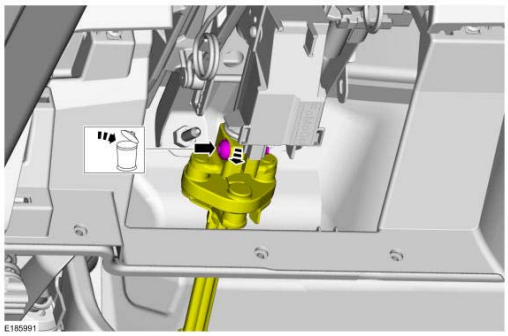


3.

Position the steering column in the full up/rearward position.

NOTE: Vehicles equipped with electronic steering column lock shown in illustration below, vehicles without similar.

4.
Remove the retainers and disconnect the steering column electrical connectors.



NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

5.
Remove and discard the bolt and pull apart the upper steering column shaft from the steering column.

Torque

: 22 lb.ft (30 Nm)

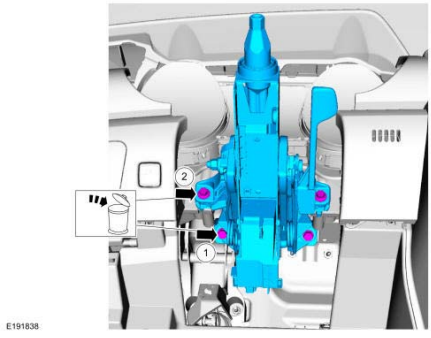
NOTE: The front and rear fasteners are not the same. DO NOT install in place of one another.

6.
Remove the steering column.

1.

Remove and discard the bolts.

Torque



: 18 lb.ft (25 Nm)

2.

Remove and discard the bolts. Remove the steering column.

Torque

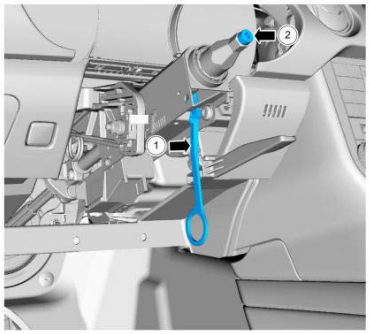
: 18 lb.ft (25 Nm)

With security pack

NOTE: This step is only necessary when installing a new component.

7.
Remove the steering column lock module. Refer to: Steering Column Lock Module .

REMOVAL AND INSTALLATION > STEERING COLUMN > INSTALLATION



NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.

To install, reverse the removal procedure.

NOTE: This step is only necessary when installing a new component.

2.
With the steering system fully assembled, remove the anti-rotation pin and the spindle bolt.

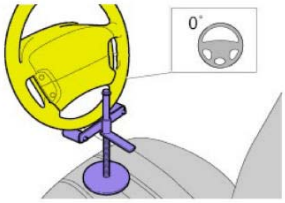
REMOVAL AND INSTALLATION > STEERING COLUMN LOWER SHAFT > REMOVAL

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: Do not allow the steering column to rotate while the steering column shaft system is disconnected or damage to the steering column electrical components may result.

NOTE: LHD shown in illustration below, RHD similar.



NOTE: Removal steps in this procedure may contain installation details.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

2.
Keep the steering wheel in the straight-ahead position.

E190302

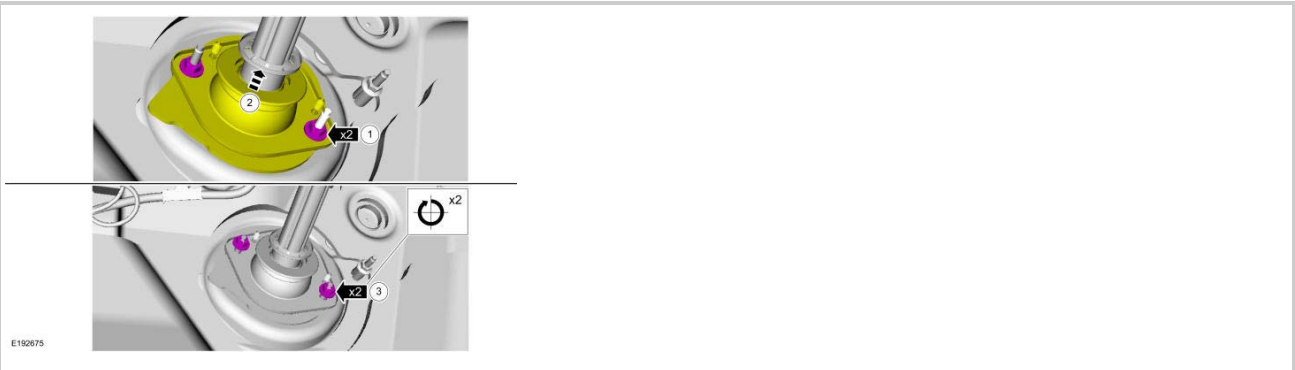
NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

3.
Loosen the dash seal.

1.

Remove the nuts.

Torque



: 80 lb.in (9 Nm)

2.

Loosen the dash seal.

3.

Hand start the nuts.

NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

4.
Remove the steering column lower shaft.

1.

Remove and discard the bolt.

Torque

: 22 lb.ft (30 Nm)

NOTE: Vehicles equipped with LHD.

2.
Remove and discard the bolt.

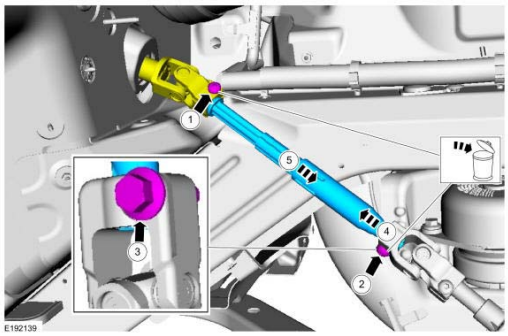
Torque

: 22 lb.ft (30 Nm)

NOTE: Vehicles equipped with RHD.

3.
Remove and discard the bolt.

Torque



: 35 lb.ft (47.5 Nm)

4.

Pull apart the steering column lower shaft from the coupling.

5.

Pull apart the steering column lower shaft from the steering column upper shaft.

REMOVAL AND INSTALLATION > STEERING COLUMN LOWER SHAFT > INSTALLATION

NOTE: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.

To install, reverse the removal procedure.

2.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

REMOVAL AND INSTALLATION > STEERING COLUMN UPPER SHAFT

Special Tool(s) / General Equipment

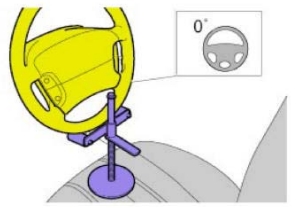
Steering Wheel Holder

REMOVAL AND INSTALLATION > STEERING COLUMN UPPER SHAFT > REMOVAL

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: Do not allow the steering column to rotate while the steering column shaft system is disconnected or damage to the steering column electrical components may result.

NOTE: LHD shown in illustration below, RHD similar.

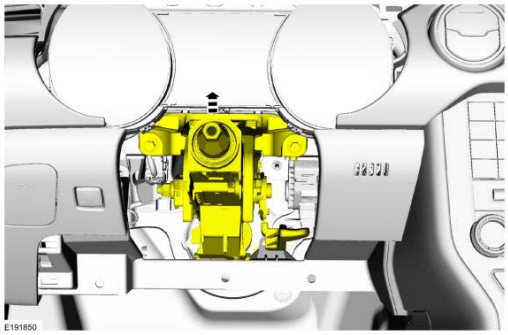


1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

2.
Keep the steering wheel in straight ahead-position.



Use the General Equipment: Steering Wheel Holder

E190302

3.

Position the steering column in the full up/rearward position.

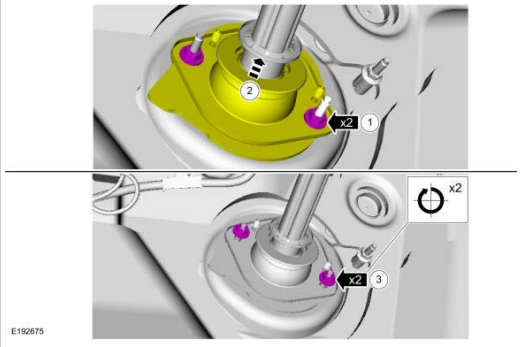
NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

4.
Loosen the dash seal.

1.

Remove the nuts.

Torque

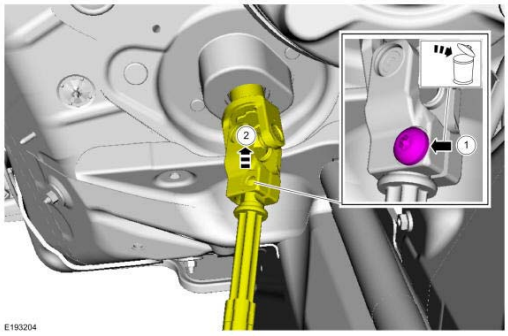


: 80 lb.in (9 Nm)

2.

Loosen the dash seal.

3.



Hand start the nuts.

NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

5.

Remove and discard the bolt and loosen the upper shaft from the lower shaft by partially pulling them apart from each other.

6.

Remove the driver knee airbag. Refer to: Driver Knee Airbag .

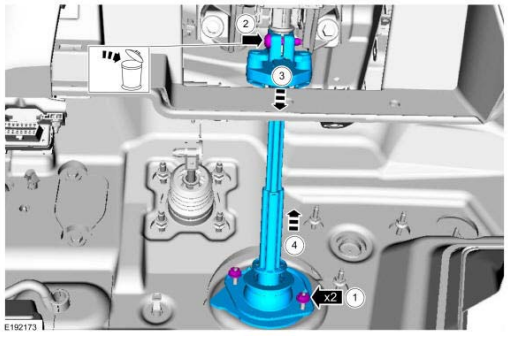
NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

7.
Remove the steering column upper shaft.

1.

Remove the nuts.

2.



Remove and discard the bolt.

3.

Pull apart the upper shaft from the steering column.

4.

Pull apart and remove the upper shaft from the lower shaft.

REMOVAL AND INSTALLATION > STEERING COLUMN UPPER SHAFT > INSTALLATION

1.

Install the steering column upper shaft.

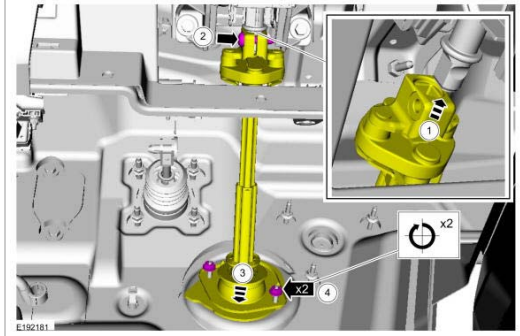
> *NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).*

1.
Connect the upper shaft to the steering column.

2.

Install the bolt.

Torque



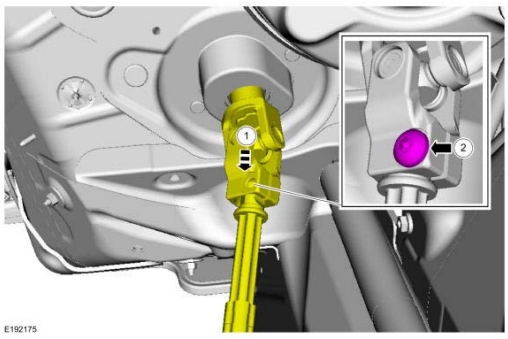
: 22 lb.ft (30 Nm)

3.

Seat the dash seal.

4.

Hand start the nuts.

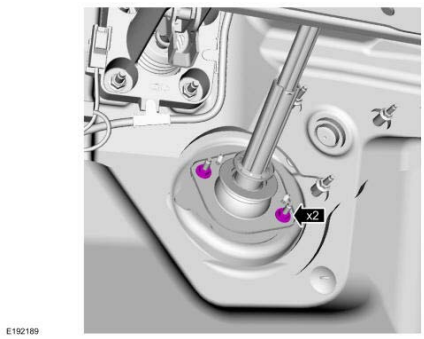


2.

Connect the upper shaft to the lower shaft and install the bolt.

Torque

: 22 lb.ft (30 Nm)



3.

Tighten the dash seal nuts.

Torque

: 80 lb.in (9 Nm)

4.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

REMOVAL AND INSTALLATION > STEERING WHEEL > REMOVAL

NOTE: To prevent damage to the clockspring, make sure the front wheels are in the straight-ahead position.

NOTE: Removal steps in this procedure may contain installation details.

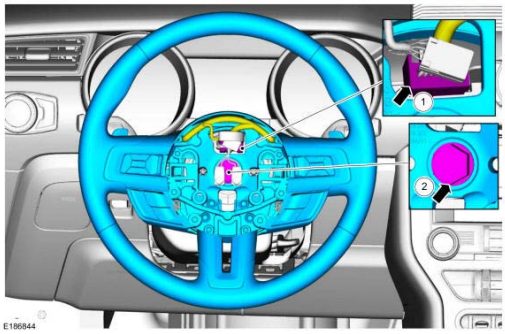
NOTE: LHD shown in illustration below, RHD similar.

1.

Remove the driver airbag module. Refer to: Driver Airbag .

2.

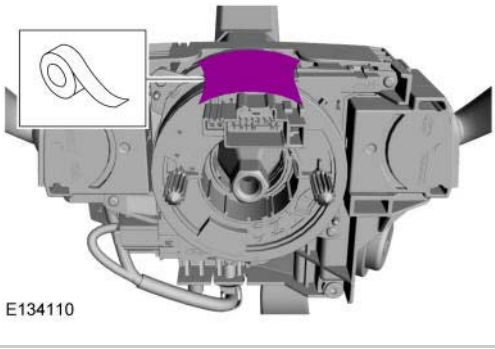
1.



Disconnect the steering wheel switches electrical connector.

2.

Remove the steering wheel bolt and the steering wheel.



Torque

: 35 lb.ft (47.5 Nm)

3.

Tape the clockspring rotor to the outer housing to keep it from rotating.

REMOVAL AND INSTALLATION > STEERING WHEEL > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > STEERING COLUMN COUPLING

Special Tool(s) / General Equipment

Steering Wheel Holder

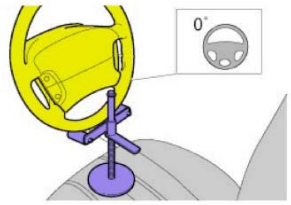
REMOVAL AND INSTALLATION > STEERING COLUMN COUPLING > REMOVAL

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: Do not allow the steering column to rotate while the steering column shaft system is disconnected or damage to the steering column electrical components may result.

NOTE: LHD shown in illustration below, RHD similar.



1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

2.
Keep the steering wheel in the straight-ahead position.

Use the General Equipment: Steering Wheel Holder

E190302

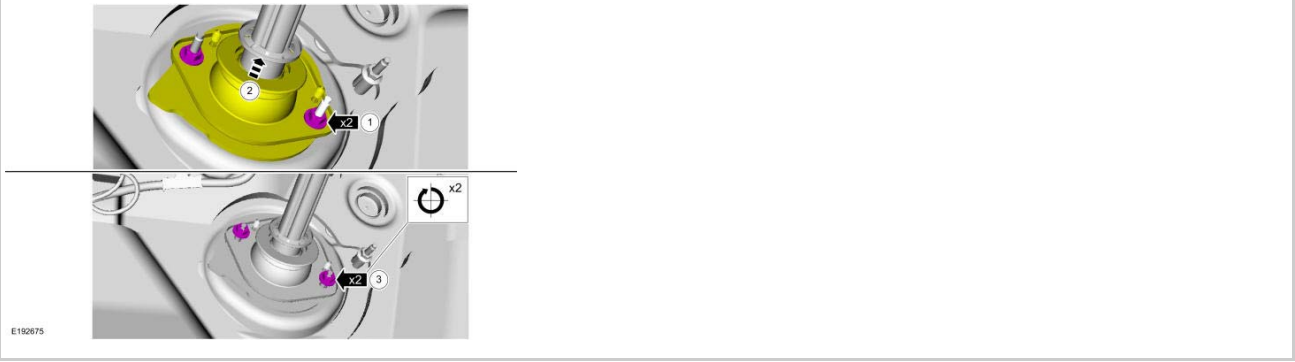
NOTE: Make sure to minimize damage to the sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

3.
Loosen the dash seal.

1.

Remove the nuts.

Torque



: 80 lb.in (9 Nm)

2.

Loosen the dash seal.

3.

Hand start the nuts.

4.

Detach the steering column lower shaft from the coupling.

NOTE: Vehicles equipped with LHD.

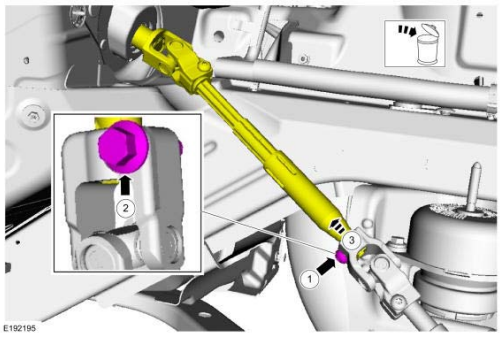
NOTE: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

1.
Remove and discard the bolt.

Torque

: 22 lb.ft (30 Nm)

NOTE: Vehicles equipped with RHD.



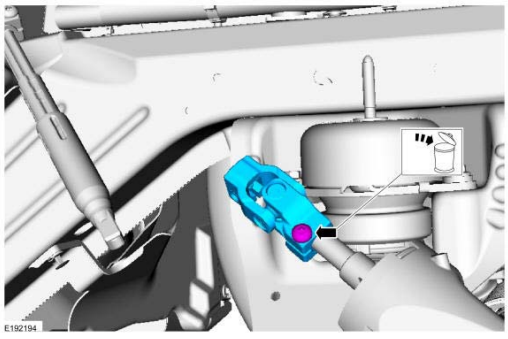
2.
Remove and discard the bolt.

Torque

: 35 lb.ft (47.5 Nm)

3.

Pull apart the steering column lower shaft from the coupling.



5.

Remove and discard the bolt. Pull apart the coupling from the steering gear.

Torque

: 22 lb.ft (30 Nm)

REMOVAL AND INSTALLATION > STEERING COLUMN COUPLING > INSTALLATION

NOTE: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to

follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

NOTE: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.

To install, reverse the removal procedure.

2.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

Service Manual: FRONT SUSPENSION

DESCRIPTION AND OPERATION > FRONT SUSPENSION > THE FRONT SUSPENSION CONSISTS OF THE FOLLOWING COMPONENTS:

- Front and rear lower arms
- Stabilizer bar and links
- Strut and spring assembly
- Wheel bearing and wheel hub
- Wheel spindle

The front suspension system incorporates a strut assembly that takes the place of the upper arm and ball joint. The strut carries out the function of a shock absorber and is encompassed by a coil spring. The strut and spring assembly supports the weight of the vehicle and is also the pivot point for the steering spindle. This system uses front and rear lower control arms and ball joints for the lower (unloaded) pivot points of the steering spindle and/or knuckle.

DIAGNOSIS AND TESTING > FRONT SUSPENSION

REFER to: Suspension System

REMOVAL AND INSTALLATION > FRONT LOWER ARM

Special Tool(s) / General Equipment

	204-592 Separator, Lower Arm Ball Joint TKIT-2006C-FFMFLM TKIT-2006C-LM TKIT-2006C-ROW
Vehicle/Axle Stands	

REMOVAL AND INSTALLATION > FRONT LOWER ARM > REMOVAL

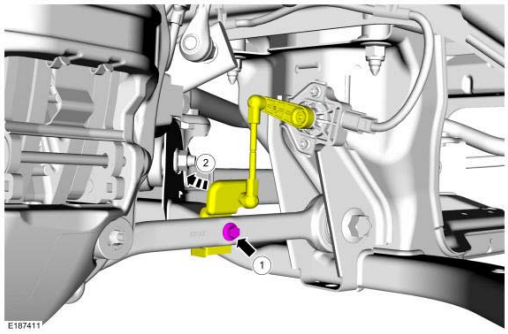
NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .

NOTE: If equipped with dynamic suspension.

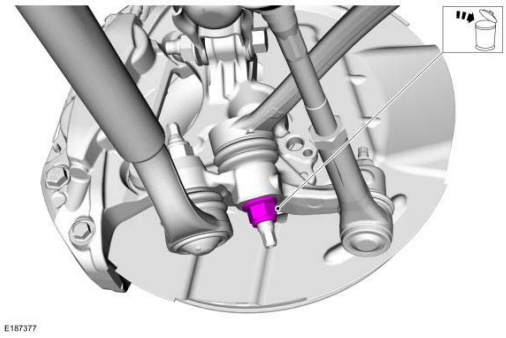
NOTE: The front suspension height sensor must be disconnected from the lower control arm prior to servicing suspension components or damage to the suspension height sensor and/or the vehicle dynamic suspension system may occur. The sensor will need to be recalibrated after reassembly.



2.

1.

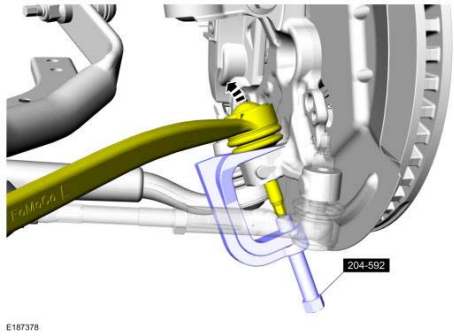
Remove the ride height sensor arm bracket bolt.



2.

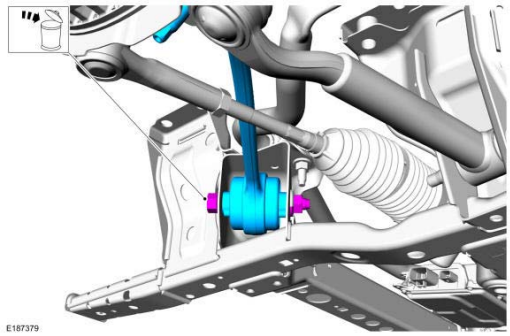
Position the ride height sensor arm bracket aside.

3.



Remove and discard the front lower arm outboard nut.

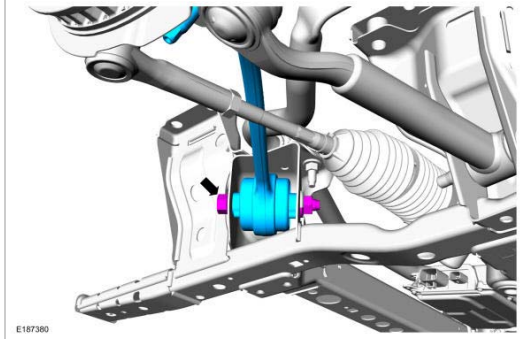
NOTE: Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.



NOTE: Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower arm body opening.

4.
Separate the front lower arm from the wheel spindle. Use Special Service Tool: 204-592 Separator, Lower Arm Ball Joint.

5.



Remove and discard the front lower arm-to-frame bolt and remove the front lower arm.

REMOVAL AND INSTALLATION > FRONT LOWER ARM > INSTALLATION

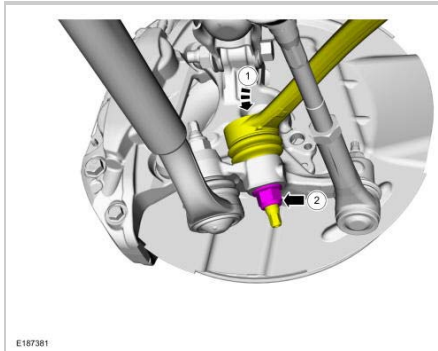
NOTE: Only tighten the bolt finger tight at this stage.

1.
Position the front lower arm and install the new front lower arm-to-frame bolt.

2.

1.

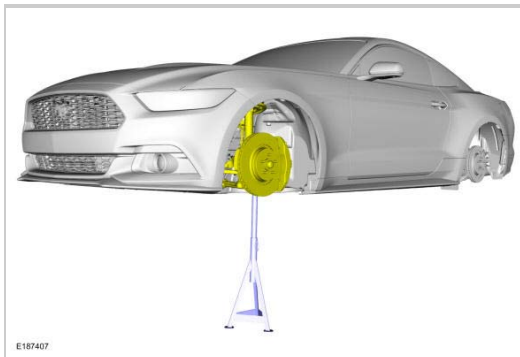
Attach the front lower arm to the wheel spindle.



2.

Install the new front lower arm outboard nut.

Torque:

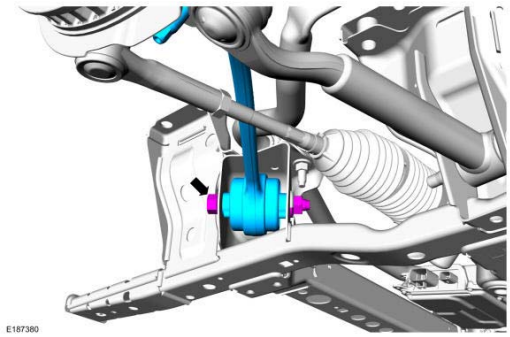


Non SVT: 85 lb.ft (115 Nm)

SVT: 76 lb.ft (103 Nm)

3.

Support the suspension at curb height. Use the General Equipment: Vehicle/Axle Stands



NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

4.
Tighten the front lower arm-to-frame bolt.

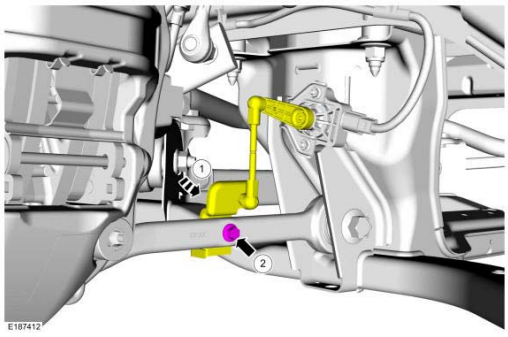
Torque

: 184 lb.ft (250 Nm)

NOTE: If equipped with dynamic suspension.

5.

1.



Position the ride height sensor arm bracket.

2.

Install the ride height sensor arm bracket bolt.

Torque

: 177 lb.in (20 Nm)

6.

Install the wheel and tire. Refer to: Wheel and Tire .

7.

Check and if necessary adjust front toe. Refer to: Front Toe Adjustment .

8.

If equipped with dynamic suspension, calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

REMOVAL AND INSTALLATION > FRONT STABILIZER BAR

Front Stabilizer Bar

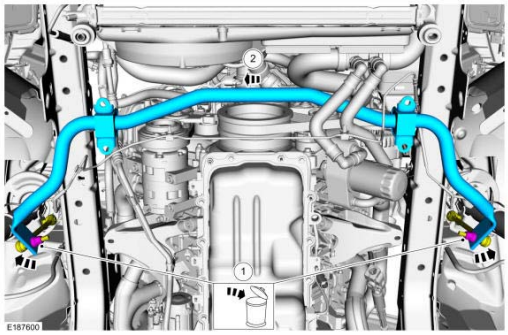
REMOVAL AND INSTALLATION > FRONT STABILIZER BAR > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the front subframe. Refer to: Front Subframe - 2.3L EcoBoost (201kW/273PS) . Refer to: Front Subframe - 3.7L Duratec (227kW/301PS)/5.0L 32V Ti-VCT/5.2L 32V Ti-VCT .

2.



NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing the stabilizer bar link nut.

NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

1.
Remove and discard the 2 front stabilizer bar link lower nuts and position aside the front stabilizer bar links.

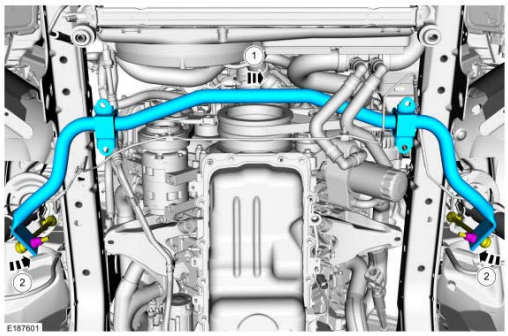
2.

Remove the front stabilizer bar.

REMOVAL AND INSTALLATION > FRONT STABILIZER BAR > INSTALLATION

1.

> *NOTE: Use the hex-holding feature to prevent the ball stud from turning while installing the stabilizer bar link nut.*



1.
Position the front stabilizer bar.

2.

Position the front stabilizer bar links and install the 2 new front stabilizer bar link lower nuts.

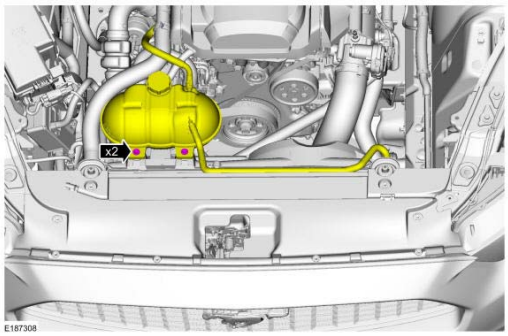
Torque

: 85 lb.ft (115 Nm)

2.

Install the front subframe. Refer to: Front Subframe - 2.3L EcoBoost (201kW/273PS) . Refer to: Front Subframe - 3.7L Duratec (227kW/301PS)/5.0L 32V Ti-VCT/5.2L 32V Ti-VCT .

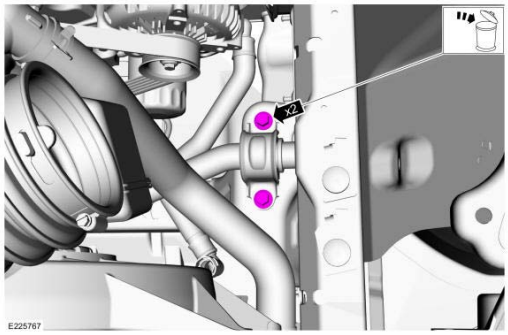
REMOVAL AND INSTALLATION > FRONT STABILIZER BAR BUSHING > REMOVAL



NOTE: Vehicles equipped with performance package, front stabilizer bushings are not serviceable separately. Replace the front stabilizer bar.

1.

Remove the air cleaner. Refer to: AIR CLEANER - 2.3L EcoBoost (231kW/314PS) . Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS) . Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS) .



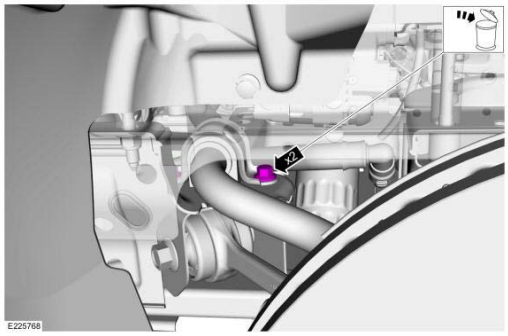
2.

Remove the bolts and position the degas bottle aside.

NOTE: All vehicles except vehicles equipped with 5.0L engine.

3.
On both sides. Remove and discard the front stabilizer bar bushing bracket bolts.

NOTE: Vehicles equipped with 5.0L engine.



4.
Remove the LH wheel and tire. Refer to: Wheel and Tire .

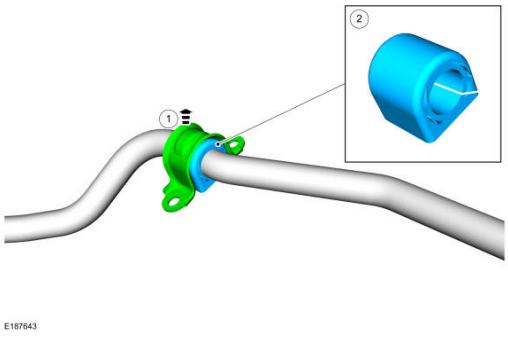
NOTE: On vehicles equipped with 5.0L engine, the reward front stabilizer bar

bushing bracket bolt is under the alternator and must be removed through the wheel opening.

NOTE: Vehicles equipped with 5.0L engine.

5.
On both sides. Remove and discard the front stabilizer bar bushing bracket bolts.

NOTE: Non performance package vehicle front stabilizer bushing shown in illustration below.



6.

1.

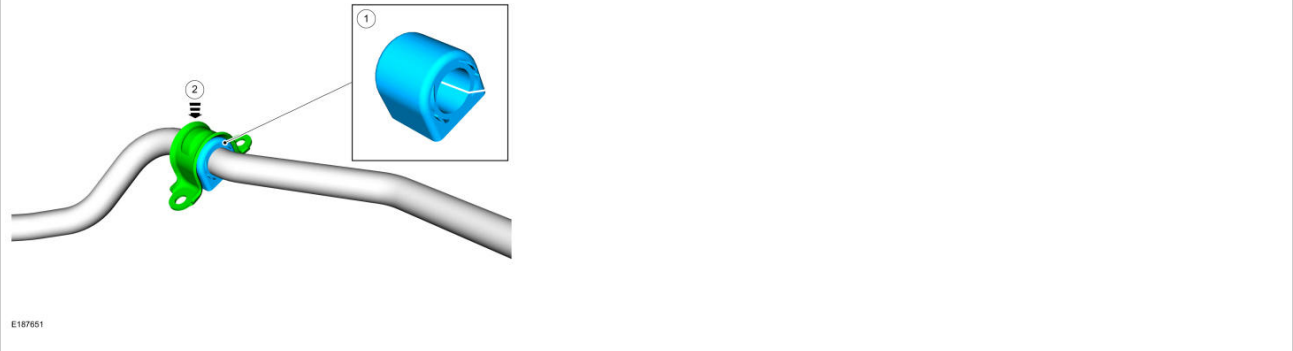
Remove the front stabilizer bar bushing bracket.

2.

Remove the front stabilizer bar bushing.

REMOVAL AND INSTALLATION > FRONT STABILIZER BAR BUSHING > INSTALLATION

NOTE: Do not use any lubrication on the stabilizer bar or the bushings or damage to the bushings may occur.



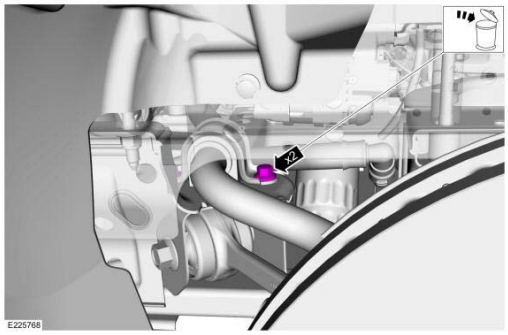
1.

NOTE: Stabilizer bar bushings must be installed with slits facing the rear of the vehicle.

1.
Install the front stabilizer bar bushing.

2.

Install the front stabilizer bar bushing bracket.



NOTE: On vehicles equipped with 5.0L engine, the reward front stabilizer bar bushing bracket bolt is under the alternator and must be installed through the wheel opening.

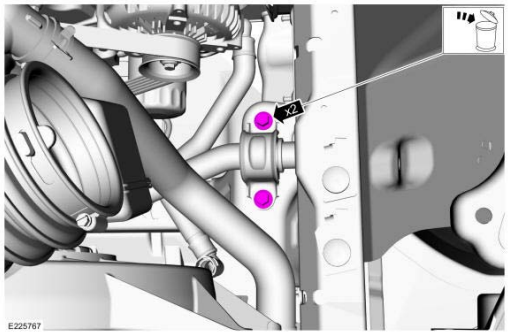
NOTE: Vehicles equipped with 5.0L engine.

2.
On both sides. Install the new front stabilizer bar bushing bracket bolts.

Torque

: 76 lb.ft (103 Nm)

NOTE: Vehicles equipped with 5.0L engine.



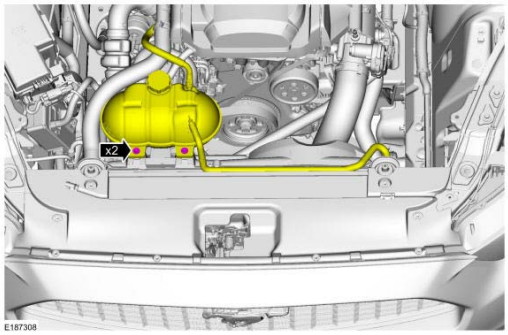
3.
Install the LH wheel and tire. Refer to: Wheel and Tire .

NOTE: All vehicles except vehicles equipped with 5.0L engine.

4.
On both sides. Install the new front stabilizer bar bushing bracket bolts.

Torque

: 76 lb.ft (103 Nm)



5.

Position the degas bottle and install the bolts.

Torque

: 80 lb.in (9 Nm)

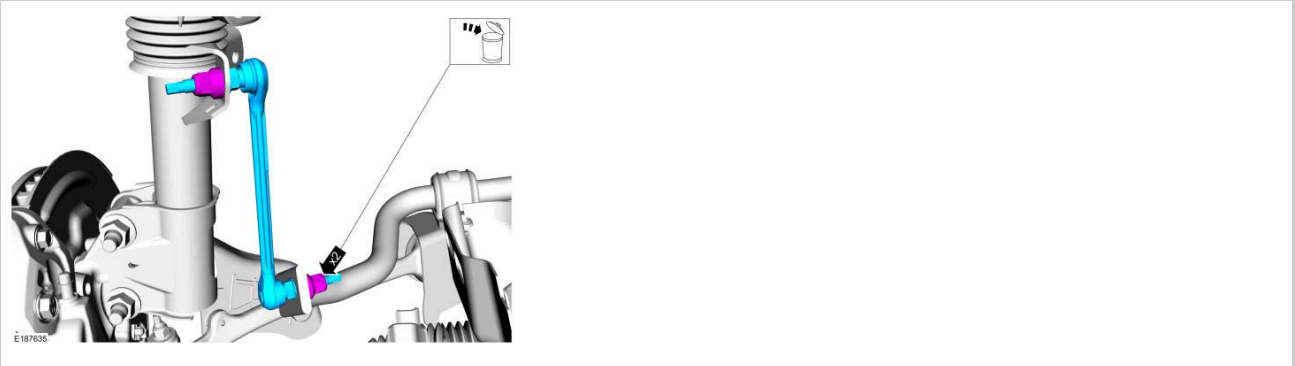
6.

Install the air cleaner. Refer to: AIR CLEANER - 2.3L EcoBoost (231kW/314PS). Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS). Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

REMOVAL AND INSTALLATION > FRONT STABILIZER BAR LINK > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

NOTE: Removal steps in this procedure may contain installation details.



NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

1.
Remove and discard the 2 front stabilizer bar link nuts and remove the front stabilizer bar link.

Torque

: 85 lb.ft (115 Nm)

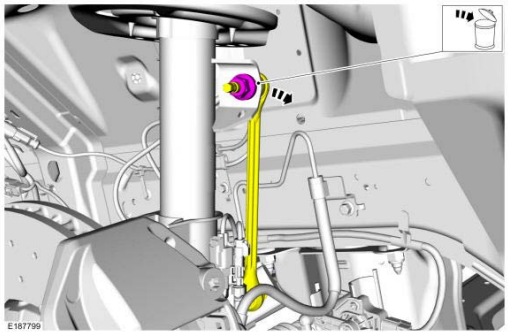
REMOVAL AND INSTALLATION > FRONT STABILIZER BAR LINK > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FRONT STRUT AND SPRING ASSEMBLY > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.



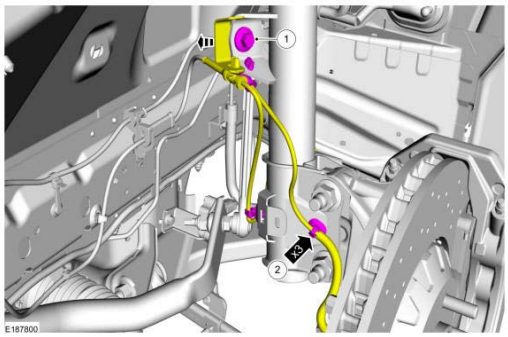
1.

Remove the wheel and tire. Refer to: Wheel and Tire .

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

2.
Remove and discard the front stabilizer bar link upper nut and separate the front stabilizer bar link from the strut and spring assembly.



3.

1.

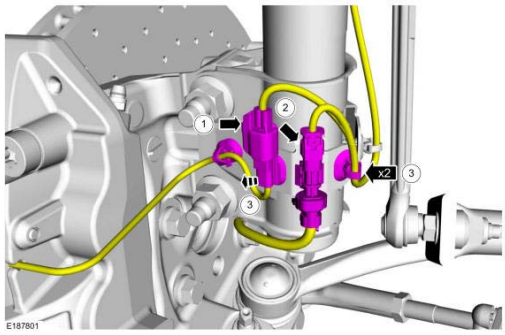
If equipped with dynamic suspension. Remove the dynamic suspension strut wire harness bracket bolt and position the bracket and wire harness aside.

2.

Disconnect the 2 wheel speed sensor retainers and the 1 dynamic suspension strut wire harness retainer.

4.

1.



If equipped. Disconnect the brake sensor electrical connector.

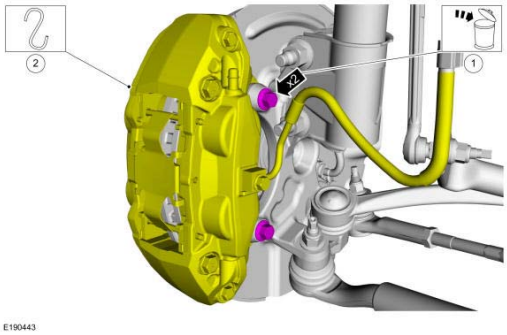
2.

If equipped with dynamic suspension. Disconnect the dynamic suspension strut wire harness connector.

3.

If equipped. Unclip the brake sensor electrical connector and the 2 wire retainers from the strut.

NOTE: Base brakes shown in illustration below, other applications similar.



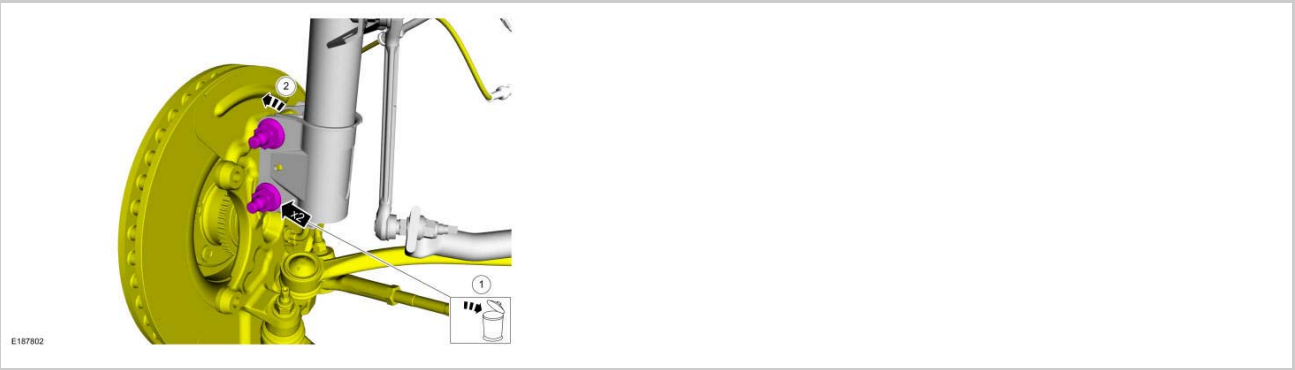
5.
Position aside the brake caliper assembly.

1.

Remove and discard the 2 brake caliper anchor plate bolts.

2.

Position aside the brake caliper assembly.



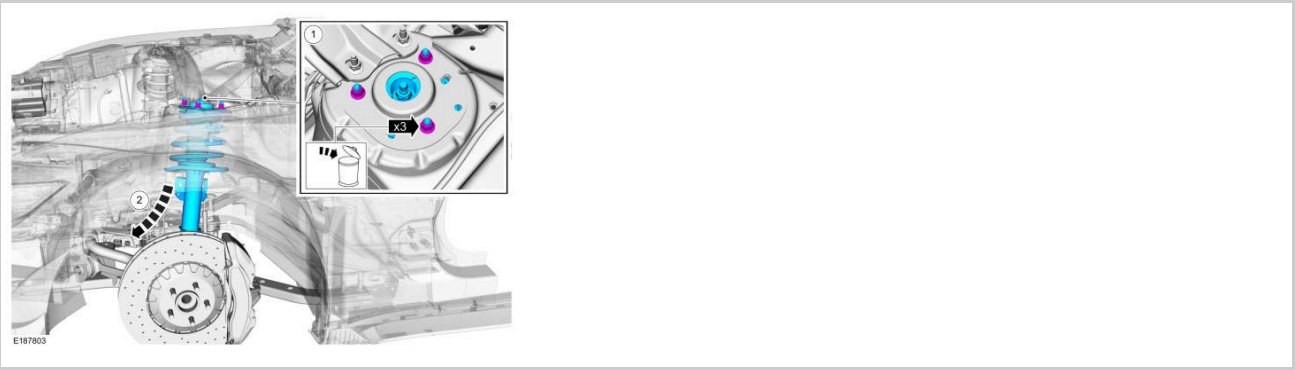
6.

NOTE: Original strut-to-wheel spindle bolts are splined and may need to be driven out.

1.
Remove and discard the 2 strut-to-wheel spindle bolts and nuts.

2.

Separate the wheel spindle from the front strut and spring assembly.



7.

1.

Remove and discard the 3 upper strut mount nuts.

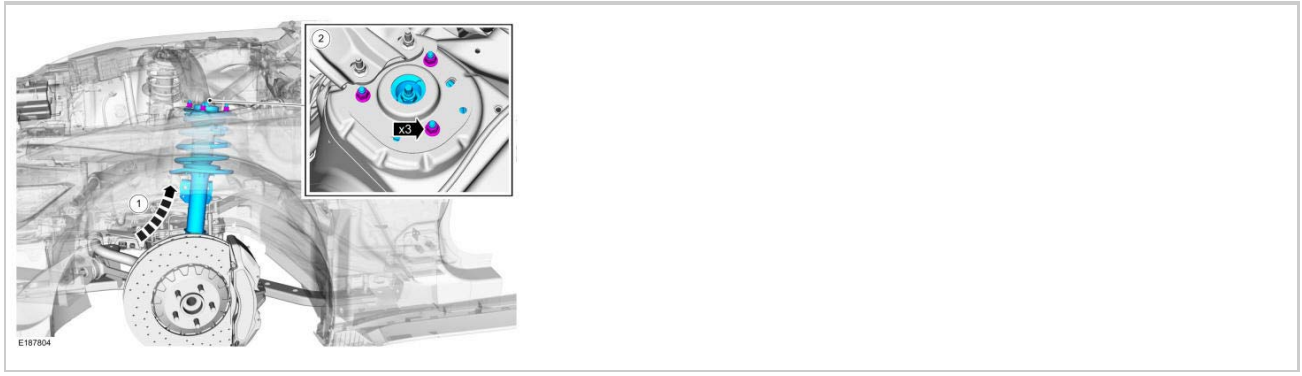
2.

Remove the front strut and spring assembly.

REMOVAL AND INSTALLATION > FRONT STRUT AND SPRING ASSEMBLY > INSTALLATION

1.

1.



Install the front strut and spring assembly.

2.

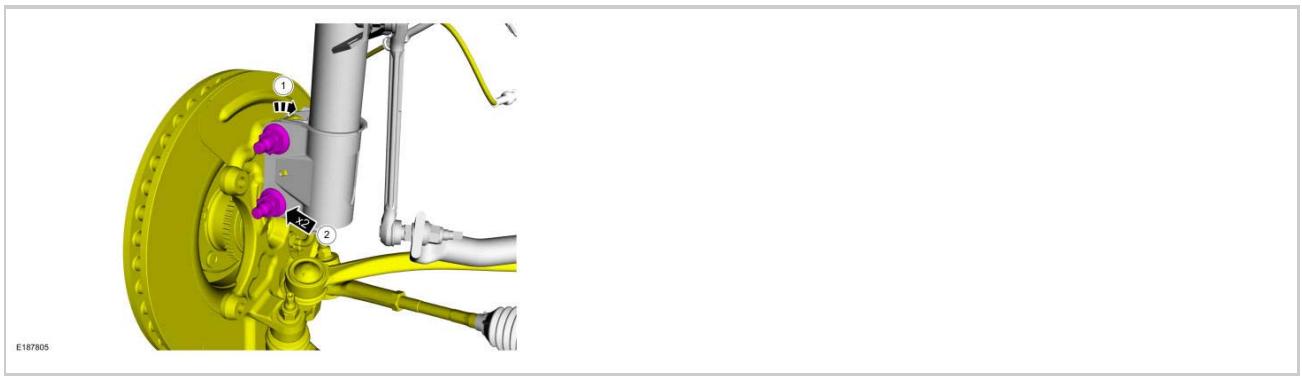
Install the 3 new upper strut mount nuts.

Torque

: 46 lb.ft (63 Nm)

2.

1.



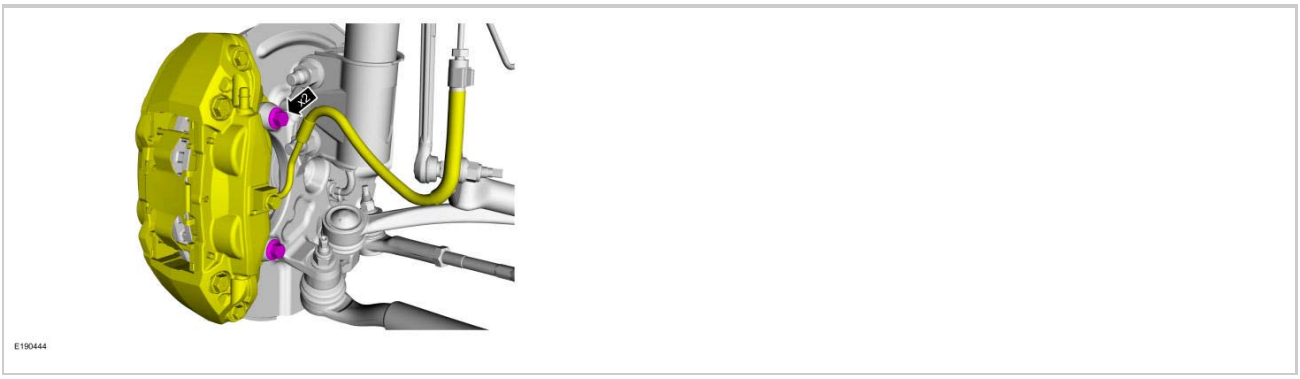
Attach the wheel spindle to the front strut and spring assembly.

2.

Install the 2 new strut-to-wheel spindle bolts and nuts.

Torque

: 184 lb.ft (250 Nm)



3.

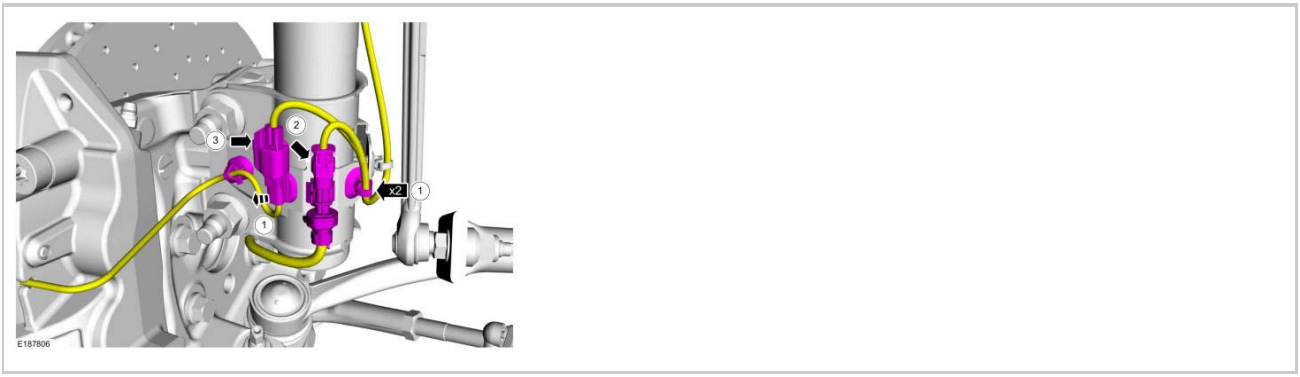
Position the brake caliper assembly and install the 2 new brake caliper anchor plate bolts.

Torque

: 85 lb.ft (115 Nm)

4.

1.



If equipped. Clip the brake sensor electrical connector and the 2 wire retainers to the strut.

2.

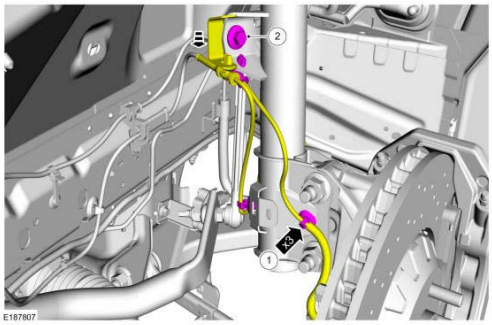
If equipped with dynamic suspension. Connect the dynamic suspension strut wire harness connector.

3.

If equipped. Connect the brake sensor electrical connector.

5.

1.



Connect the 2 wheel speed sensor retainers and the 1 dynamic suspension strut wire harness retainer.

2.

If equipped with dynamic suspension. Position the dynamic suspension strut wire harness bracket install the bolt.

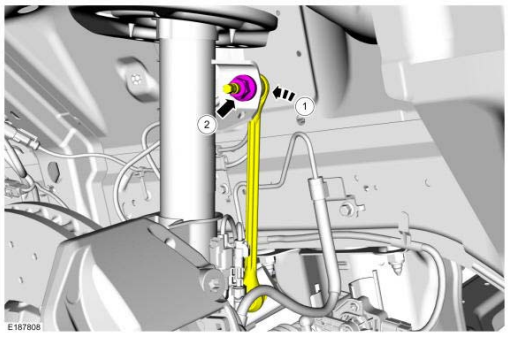
Torque

: 46 lb.ft (63 Nm)

6.

1.

Position the front stabilizer bar link.



> *NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.*

> *NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.*

2.
Install the front stabilizer bar link upper nut.

Torque

: 85 lb.ft (115 Nm)

7.

Install the wheel and tire. Refer to: Wheel and Tire .

8.

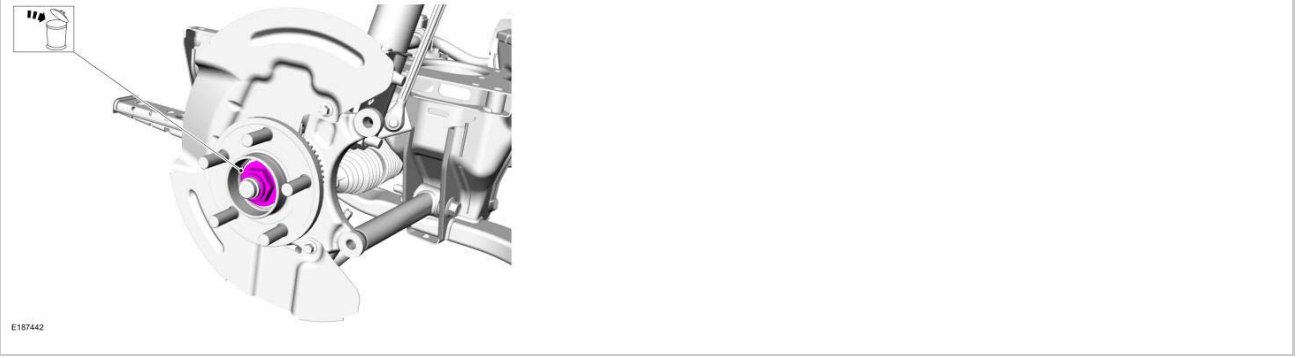
Check and if necessary adjust front camber. Refer to: Front Camber Adjustment .

REMOVAL AND INSTALLATION > FRONT WHEEL BEARING AND WHEEL HUB > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

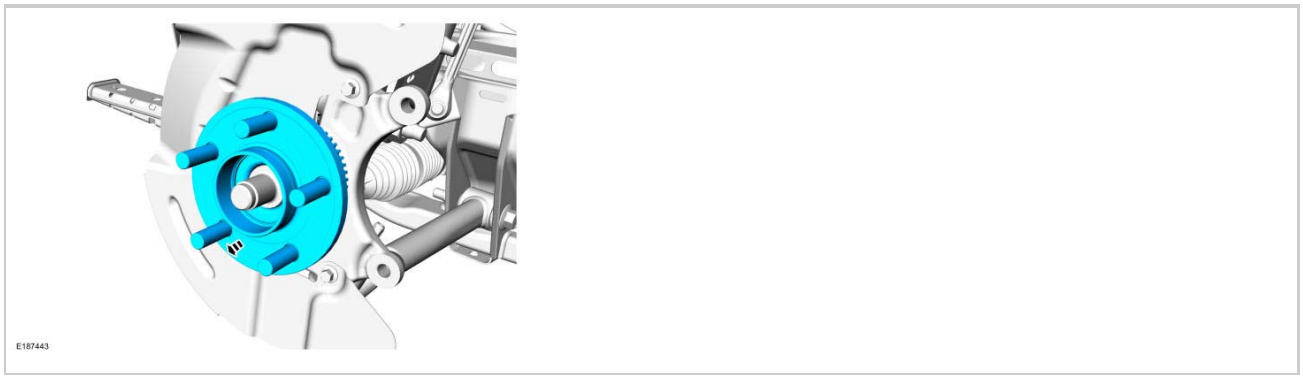
1.

Remove the brake disc. Refer to: Brake Disc .



2.

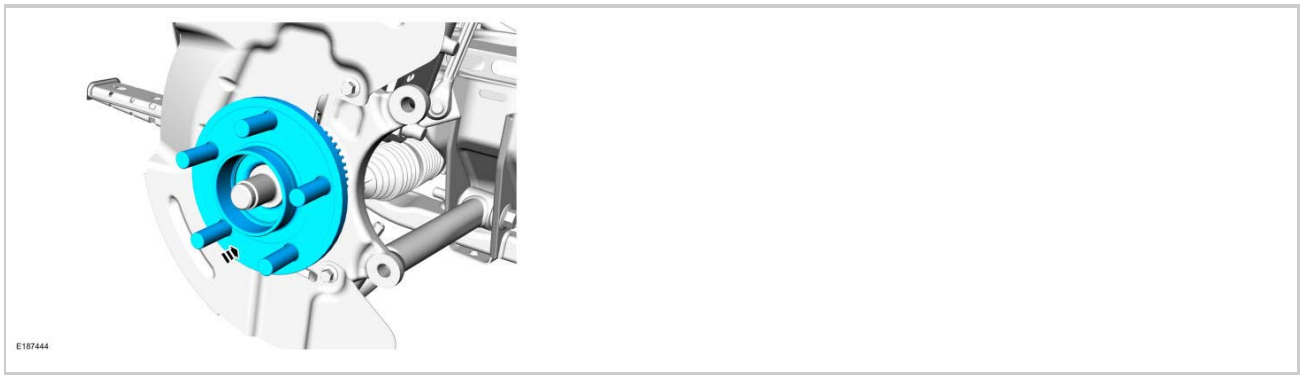
Remove and discard the wheel hub grease cap.



3.

Remove and discard the wheel hub nut.

4.

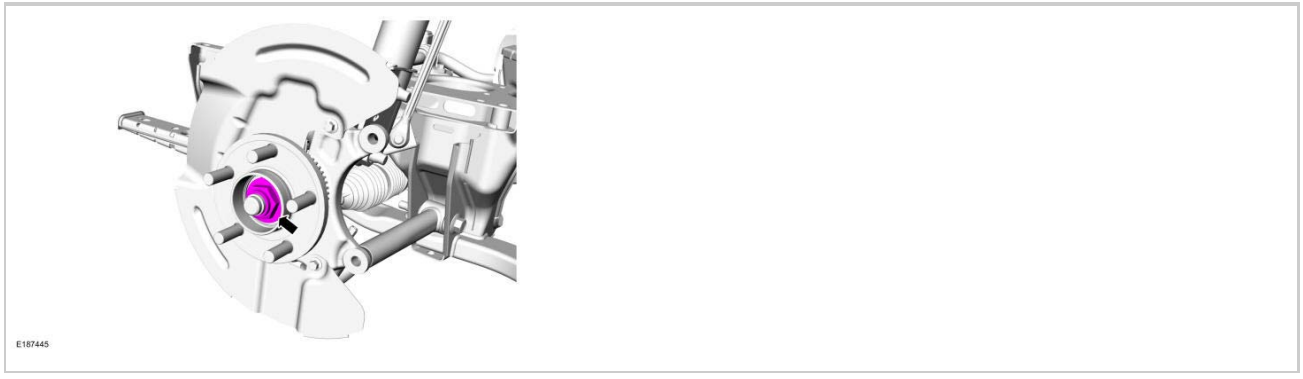


Remove the front wheel bearing and wheel hub.

REMOVAL AND INSTALLATION > FRONT WHEEL BEARING AND WHEEL HUB > INSTALLATION

1.

Install the front wheel bearing and wheel hub.



2.

Install the new the wheel hub nut.

Torque

: 251 lb.ft (340 Nm)

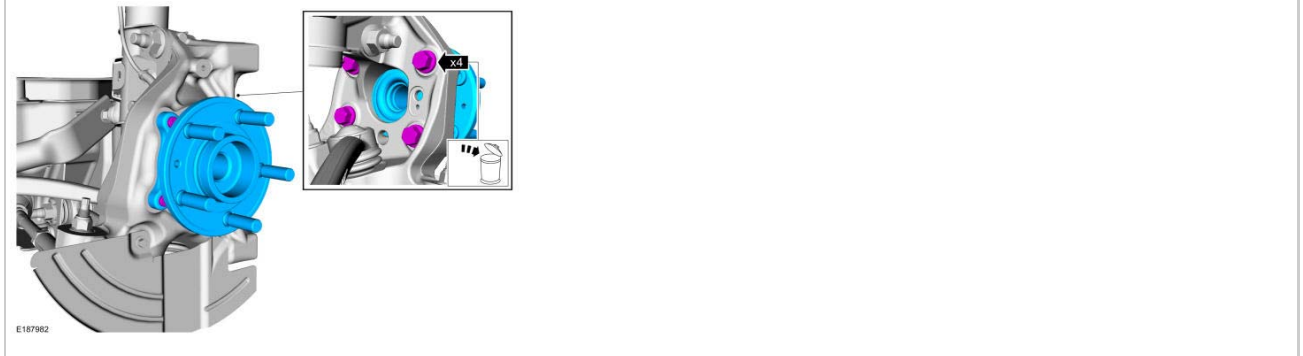
3.

Install the new wheel hub grease cap.

4.

Install the brake disc. Refer to: Brake Disc .

REMOVAL AND INSTALLATION > FRONT WHEEL BEARING AND WHEEL HUB - VEHICLES WITH: SVT PERFORMANCE PACKAGE > REMOVAL



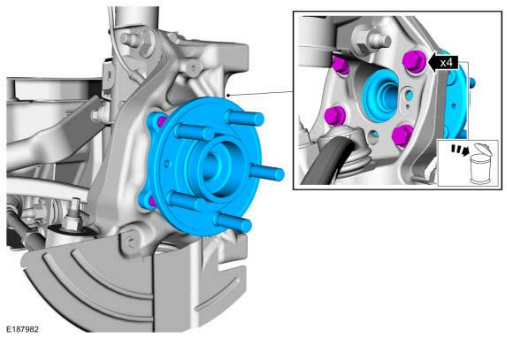
NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the brake disc. Refer to: Brake Disc .

2.

Remove and discard the 4 front wheel bearing and wheel hub bolts and remove the front wheel bearing and wheel hub.



REMOVAL AND INSTALLATION > FRONT WHEEL BEARING AND WHEEL HUB - VEHICLES WITH: SVT PERFORMANCE PACKAGE > INSTALLATION

NOTE: Tighten the front wheel bearing and wheel hub bolts in a cross pattern.

1.
Install the front wheel bearing and wheel hub and install the 4 new front wheel bearing and wheel hub bolts.

Torque

: 98 lb.ft (133 Nm)

2.

Install the brake disc. Refer to: Brake Disc .

REMOVAL AND INSTALLATION > REAR LOWER ARM

Special Tool(s) / General Equipment

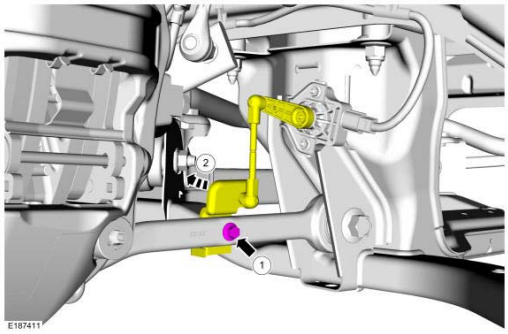
1.

Remove the wheel and tire. Refer to: Wheel and Tire .

NOTE: If equipped with dynamic suspension.

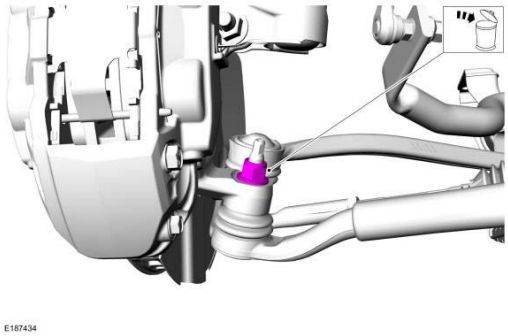
NOTE: The front suspension height sensor must be disconnected from the lower control arm prior to servicing suspension components or damage to the suspension height sensor and/or the vehicle dynamic suspension system may occur. The sensor will need to be recalibrated after reassembly.



2.

1.

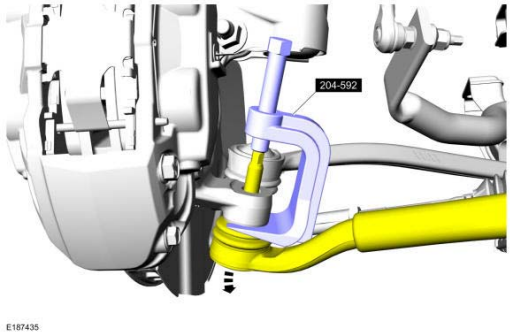
Remove the ride height sensor arm bracket bolt.



2.

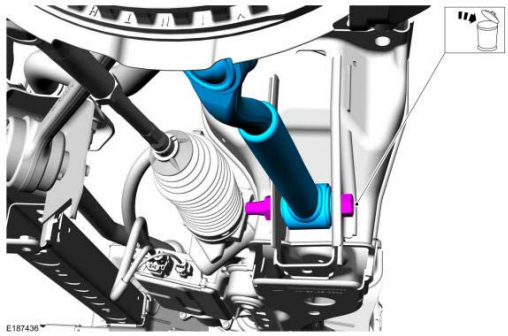
Position the ride height sensor arm bracket aside.

3.



Remove and discard the rear lower arm outboard nut.

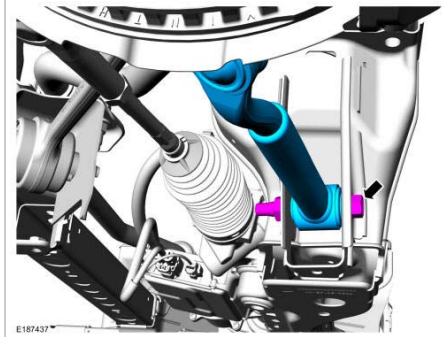
NOTE: Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.



NOTE: Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower arm body opening.

4.
Separate the rear lower arm from the wheel spindle. Use Special Service Tool: 204-592 Separator, Lower Arm Ball Joint.

5.



Remove and discard the rear lower arm-to-frame bolt and remove the rear lower arm.

REMOVAL AND INSTALLATION > REAR LOWER ARM > INSTALLATION

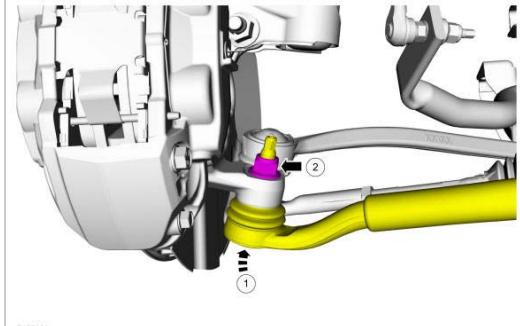
NOTE: Only tighten the bolt finger tight at this stage.

1.
Position the rear lower arm and install the new rear lower arm-to-frame bolt.

2.

1.

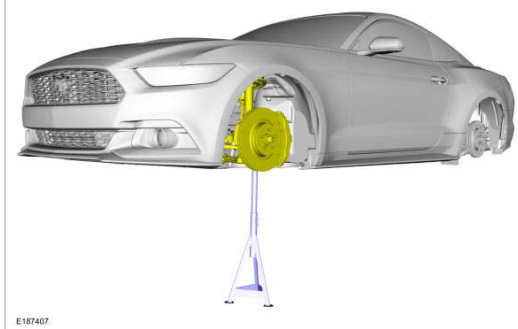
Attach the rear lower arm to the wheel spindle.



2.

Install the new rear lower arm outboard nut.

Torque:

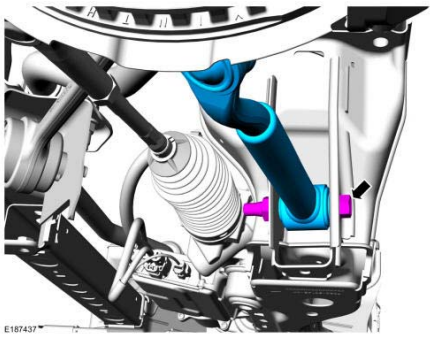


Non SVT: 85 lb.ft (115 Nm)

SVT: 76 lb.ft (103 Nm)

3.

Support the suspension at curb height. Use the General Equipment: Vehicle/Axle Stands



NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

4.
Tighten the rear lower arm-to-frame bolt.

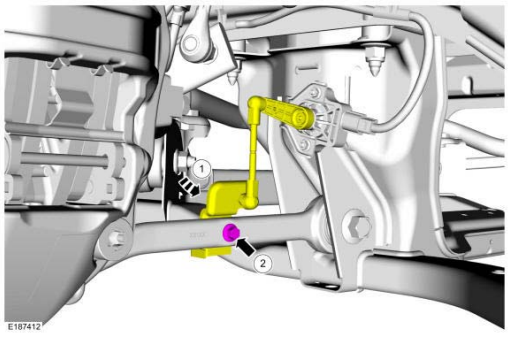
Torque

: 184 lb.ft (250 Nm)

NOTE: If equipped with dynamic suspension.

5.

1.



Position the ride height sensor arm bracket.

2.

Install the ride height sensor arm bracket bolt.

Torque

: 177 lb.in (20 Nm)

6.

Install the wheel and tire. Refer to: Wheel and Tire .

7.

Check and if necessary adjust front toe. Refer to: Front Toe Adjustment .

8.

If equipped with dynamic suspension, calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

REMOVAL AND INSTALLATION > WHEEL KNUCKLE - VEHICLES WITH: SVT PERFORMANCE PACKAGE

Vehicle/Axle Stands	

REMOVAL AND INSTALLATION > WHEEL KNUCKLE - VEHICLES WITH: SVT PERFORMANCE PACKAGE > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

NOTE: Disconnect the battery ground cable anytime the steering gear is being serviced or damage to the steering gear internal power relay may occur resulting in steering gear replacement.

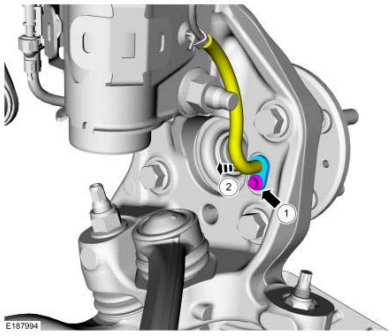
1.
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

2.

Remove the front wheel bearing and hub assembly. Refer to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .

3.

Remove the brake disc shield. Refer to: Brake Disc Shield .



4.

1.

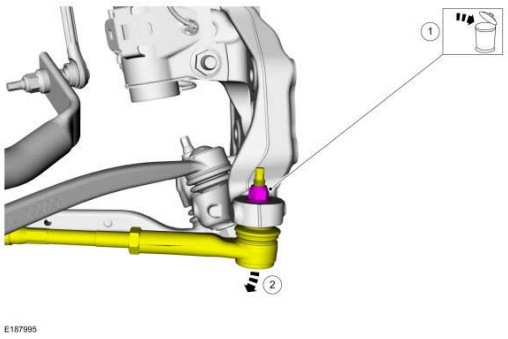
Remove the front wheel speed sensor bolt.

2.

Position the front wheel speed sensor aside.

NOTE: Use care when installing the tie rod separator or damage to the outer tie-rod end boot may occur.

NOTE: Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.



5.

1.

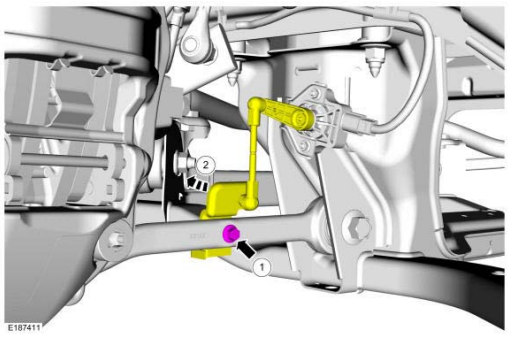
Remove and discard the tie rod end nut.

2.

Disconnect the tie rod end from the wheel knuckle. Use the General Equipment: Tie Rod End Remover

NOTE: If equipped with dynamic suspension.

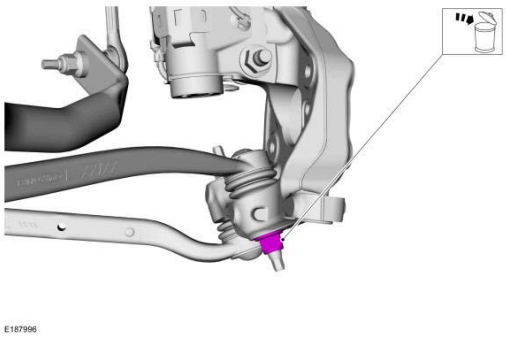
NOTE: The front suspension height sensor must be disconnected from the lower control arm prior to servicing suspension components or damage to the suspension height sensor and/or the vehicle dynamic suspension system may occur. The sensor will need to be recalibrated after reassembly.



6.

1.

Remove the ride height sensor arm bracket bolt.

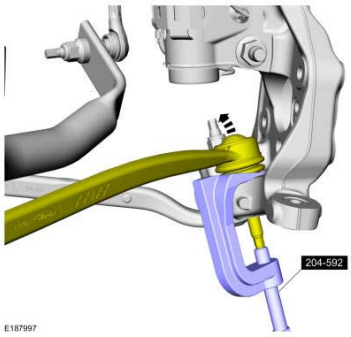


2.

Position the ride height sensor arm bracket aside.

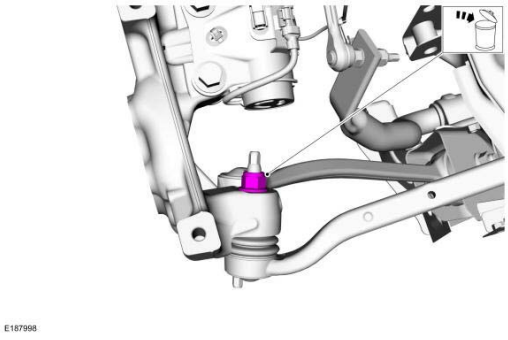
7.

Remove and discard the front lower arm outboard nut.



NOTE: Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.

NOTE: Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower arm body opening.



8.
Separate the front lower arm from the wheel knuckle.

Use Special Service Tool: 204-592 Separator, Lower Arm Ball Joint.

9.

Remove and discard the rear lower arm outboard nut.

NOTE: Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.

NOTE: Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result. Only use the pry bar by inserting it into the lower arm body opening.

10.
Separate the rear lower arm from the wheel knuckle.

Use Special Service Tool: 204-592 Separator, Lower Arm Ball Joint.

11.

1.

Remove and discard the 2 strut-to-wheel knuckle bolts and nuts.

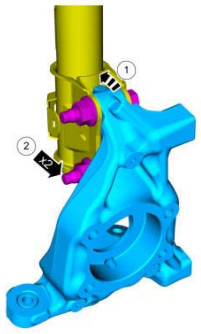
2.

Remove the wheel knuckle.

REMOVAL AND INSTALLATION > WHEEL KNUCKLE - VEHICLES WITH: SVT PERFORMANCE PACKAGE > INSTALLATION

1.

1.



Position the wheel knuckle.

2.

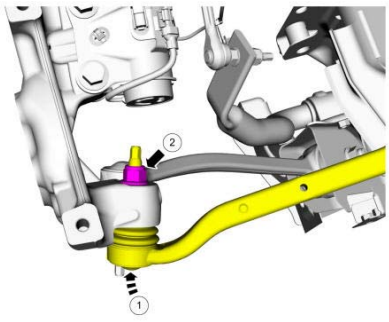
Install the 2 new strut-to-wheel knuckle bolts and nuts.

Torque

: 184 lb.ft (250 Nm)

2.

1.



Attach the rear lower arm to the wheel knuckle.

2.

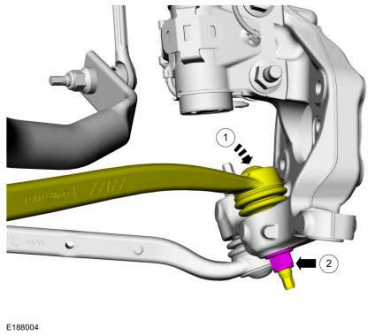
Install the new rear lower arm outboard nut.

Torque

: 76 lb.ft (103 Nm)

3.

1.



Attach the front lower arm to the wheel knuckle.

2.

Install the new front lower arm outboard nut.

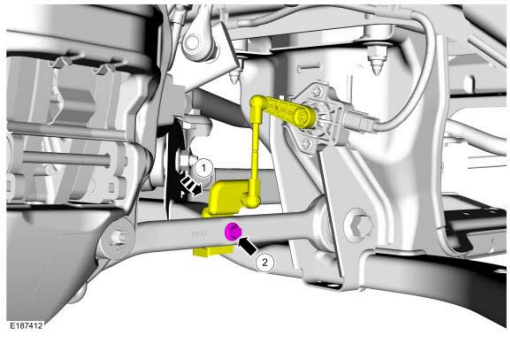
Torque

: 76 lb.ft (103 Nm)

NOTE: If equipped with dynamic suspension.

4.

1.



Position the ride height sensor arm bracket.

2.

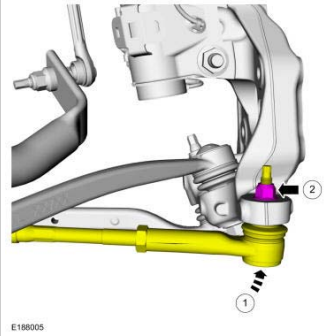
Install the ride height sensor arm bracket bolt.

Torque

: 177 lb.in (20 Nm)

5.

1.



Attach the tie rod end to the wheel knuckle.

2.

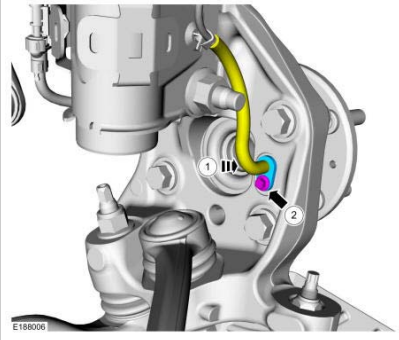
Install the new tie rod end nut.

Torque

: 30 lb.ft (40 Nm)

6.

1.



Position the front wheel speed sensor.

2.

Install the front wheel speed sensor bolt.

Torque

: 133 lb.in (15 Nm)

7.

Install the brake disc shield. Refer to: Brake Disc Shield .

8.

Install the front wheel bearing and hub assembly. Refer to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .

9.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

10.

Check and if necessary adjust front camber. Refer to: Front Camber Adjustment .

11.

If equipped with dynamic suspension, calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

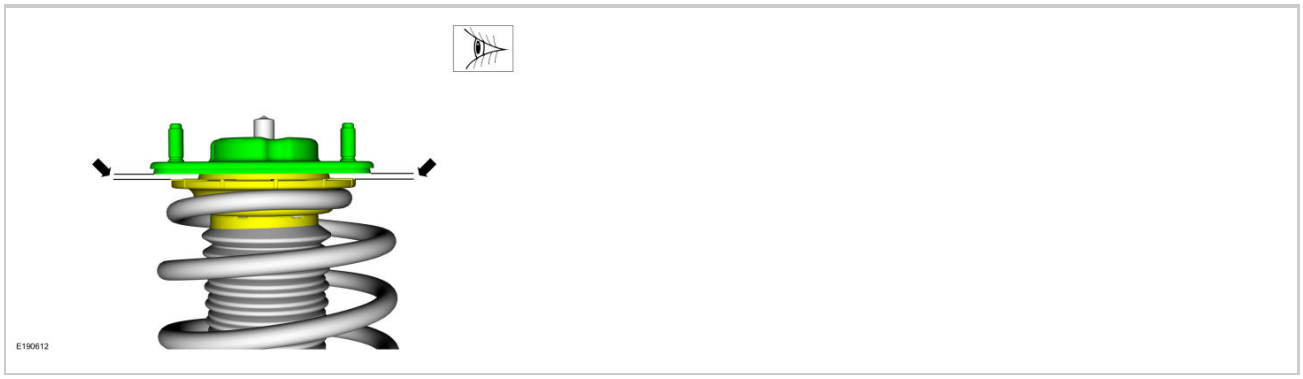
DISASSEMBLY AND ASSEMBLY > FRONT STRUT AND SPRING ASSEMBLY > ASSEMBLY

NOTE: Make sure that the components are installed to the position noted before removal.

1.
To assemble, reverse the disassembly procedure.



NOTE: Make sure that the spring is centered in the lower spring seat.

2.
Make sure that the lower spring seat is properly installed.

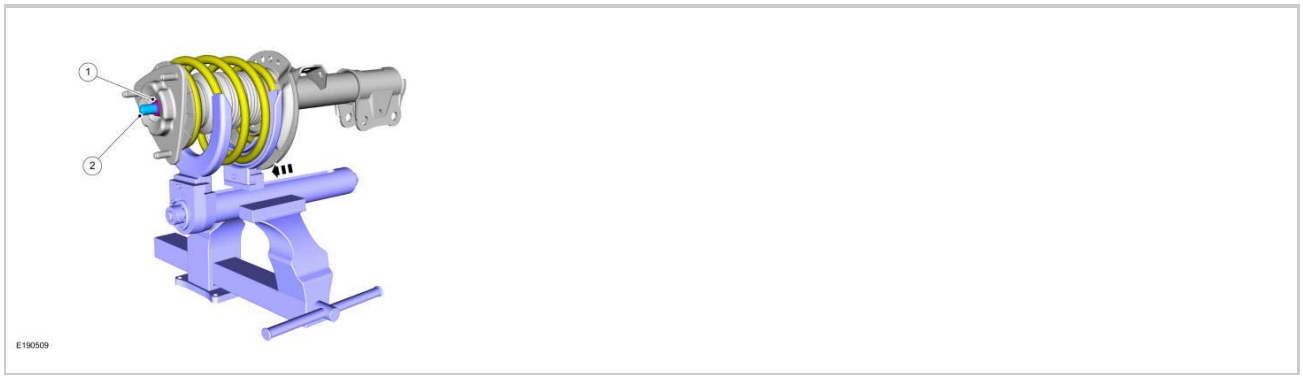
NOTE: If bearing is properly seated, there should be equal spacing on all sides.

3.
Make sure that the bearing is properly seated in the mount.

NOTE: Typical strut and spring assembly shown in illustration below.

4.

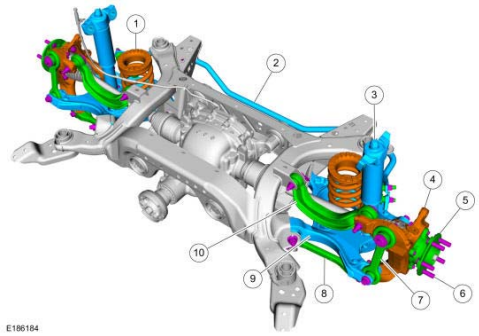
NOTE: Utilize the hex holding feature to prevent the strut rod from turning while installing the strut rod nut.



1.
Install the new strut rod nut. Use the General Equipment: Spring Compressor Use the General Equipment: Vise

Torque

: 76 lb.ft (103 Nm)



2.

Install the cap.

Service Manual: REAR SUSPENSION

DESCRIPTION AND OPERATION > REAR SUSPENSION - COMPONENT LOCATION

Item	Description
1	Coil spring
2	Stabilizer and links
3	Shock absorber
4	Wheel knuckle
5	Wheel bearing and wheel hub assembly
6	Wheel studs
7	Lower arm vertical link
8	Toe link
9	Lower arm and bushing assembly
10	Upper arm

DESCRIPTION AND OPERATION > REAR SUSPENSION - OVERVIEW > OVERVIEW

The rear suspension consists of the following components:

- Coil springs
- Lower arm and bushing assemblies
- Shock absorbers
- Stabilizer bar and links
- Toe links
- Upper arms
- Lower arm vertical links

- Wheel bearing and wheel hub assemblies
- Wheel knuckles
- Wheel studs

The rear suspension uses 2 parallel arms (1 upper and 1 lower). Each arm has a mounting position to the chassis and an attachment at the wheel knuckle. This suspension allows the wheels to react to road imperfections independent of each other. The shock absorber mounts to the lower arm and along with the spring, controls vertical movement. The stabilizer bar and links control suspension lean/sway.

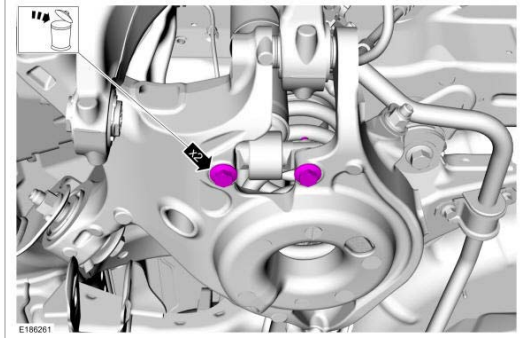
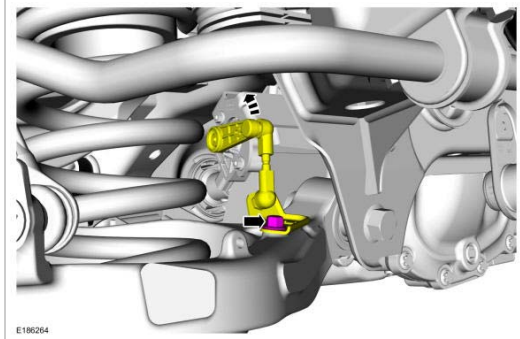
1.

Remove the wheel and tire. Refer to: Wheel and Tire .



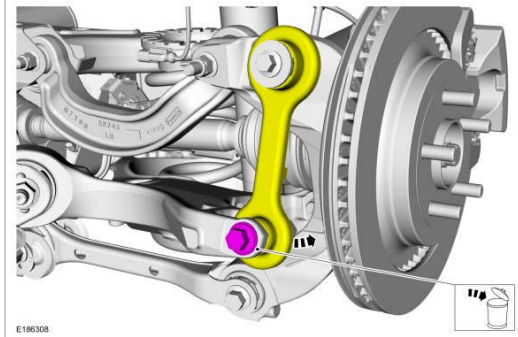
2.

Support the suspension at curb height. Use the General Equipment: Vehicle/Axle Stands



3.

Remove and discard the 2 lower shock absorber bolts.



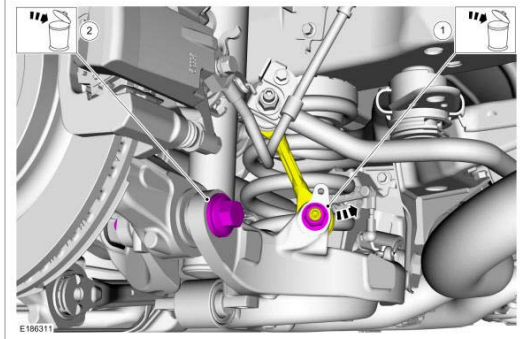
NOTE: If equipped with dynamic suspension.

4.
Remove the ride height sensor arm bracket bolt and position the bracket aside.

5.

Remove and discard the lower arm vertical link lower bolt and position the lower arm vertical link aside.

6.



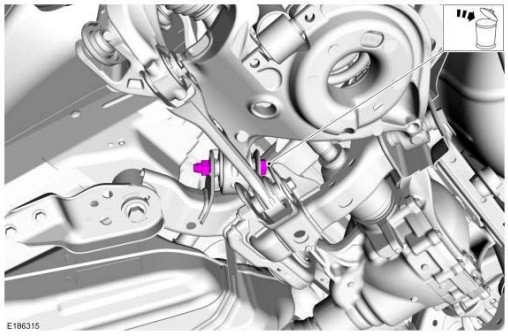
NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing the stabilizer bar link nut.

1.
Remove and discard the stabilizer bar link lower nut and position the stabilizer bar link aside.

2.

Remove and discard the lower control arm-to-wheel knuckle bolt.



NOTE: The muffler and tailpipe must be removed for clearance for the lower control arm rearward bolts.

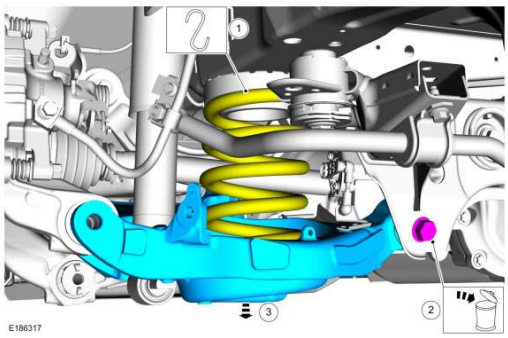
7.
Remove the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 2.3L EcoBoost (231kW/314PS). Refer to: MUFFLER AND TAILPIPE - 3.7L Duratec (227kW/301PS). Refer to: MUFFLER AND TAILPIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

8.

Remove and discard the forward lower control arm-to-frame bolt.

9.

1.

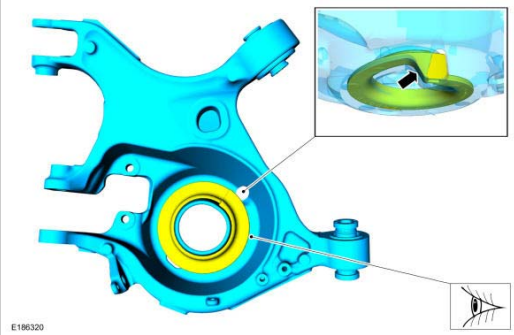


Support the coil spring.

2.

Remove and discard the rearward lower control arm-to-frame bolt.

3.

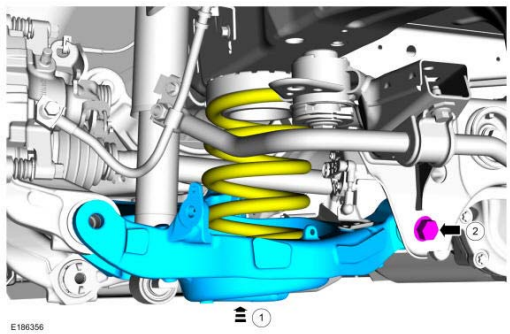


Remove the lower control arm.

REMOVAL AND INSTALLATION > LOWER ARM > INSTALLATION

1.

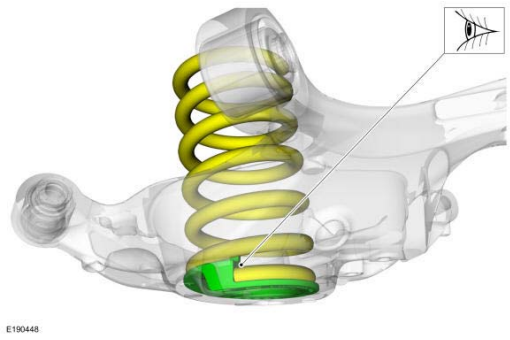
Inspect the lower coil spring seat. Make sure it is properly aligned in the lower control arm.



2.

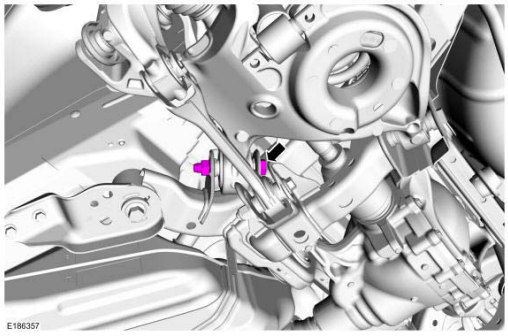
1.

Position the lower control arm.



> *NOTE: Only tighten the bolt finger tight at this stage.*

2.
Install the new rearward lower control arm-to-frame bolt.



3.

Make sure that the coil spring is properly positioned in the lower coil spring seat.

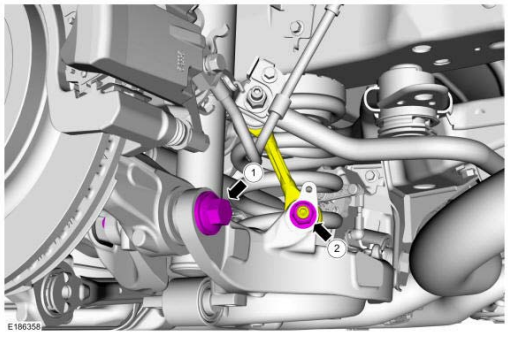
> *NOTE: Only tighten the bolt finger tight at this stage.*

4.
Install the new forward lower control arm-to-frame bolt.

NOTE: The muffler and tailpipe were removed for clearance for the lower control arm rearward bolts.

5.
Install the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 2.3L EcoBoost (231kW/314PS). Refer to: MUFFLER AND TAILPIPE - 3.7L Duratec (227kW/301PS). Refer to: MUFFLER AND TAILPIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

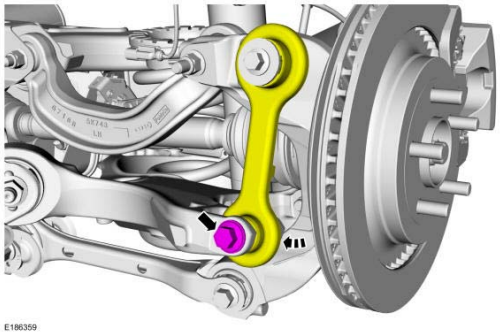
6.



NOTE: Only tighten the bolt finger tight at this stage.

1.
Install the new lower control arm-to-wheel knuckle bolt.

NOTE: Use the hex-holding feature to prevent the ball stud from turning while installing the stabilizer bar link nut.

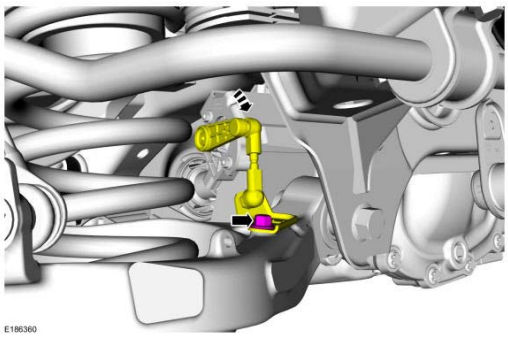


NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

2.
Position the stabilizer bar link and install the new stabilizer bar link lower nut.

NOTE: Only tighten the bolt finger tight at this stage.

7.
Position the lower arm vertical link and install the new lower arm vertical link lower bolt.

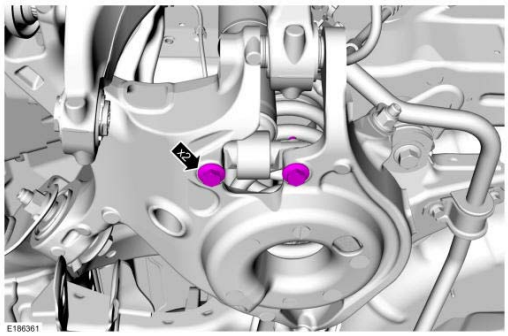


NOTE: If equipped with dynamic suspension.

8.
Position the ride height sensor arm bracket and install the ride height sensor arm bracket bolt.

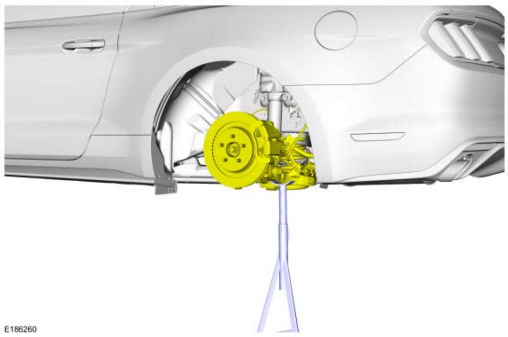
Torque

: 177 lb.in (20 Nm)



9.

Install the 2 new lower shock absorber bolts.



Torque

: 35 lb.ft (48 Nm)

10.

Support the suspension at curb height. Use the General Equipment: Vehicle/Axle Stands

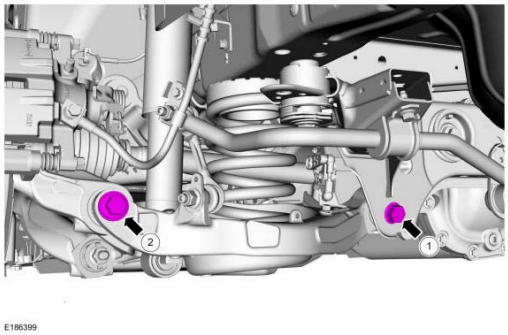
NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

11.

1.

Tighten the rearward lower control arm-to-frame bolt.

Torque



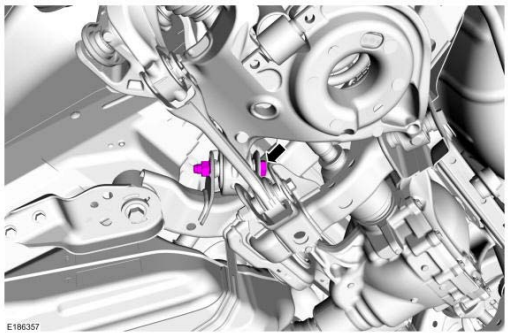
: 184 lb.ft (250 Nm)

2.

Tighten the lower control arm-to-wheel knuckle bolt.

Torque

: 203 lb.ft (275 Nm)

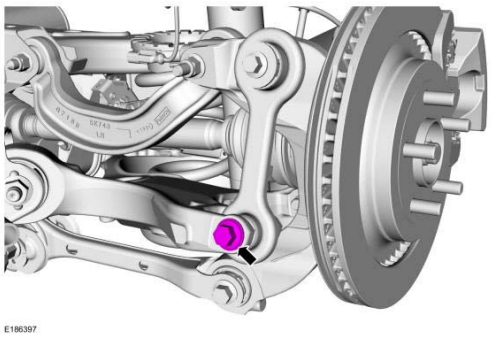


NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

12.
Tighten the forward lower control arm-to-frame bolt.

Torque

: 166 lb.ft (225 Nm)



NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

13.
Tighten lower arm vertical link lower bolt.

Torque

: 129 lb.ft (175 Nm)

14.

Install the wheel and tire. Refer to: Wheel and Tire .

15.

Check and if necessary, adjust rear camber. Refer to: Rear Camber Adjustment .

16.

If equipped with dynamic suspension, calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

REMOVAL AND INSTALLATION > LOWER ARM VERTICAL LINK

Special Tool(s) / General Equipment

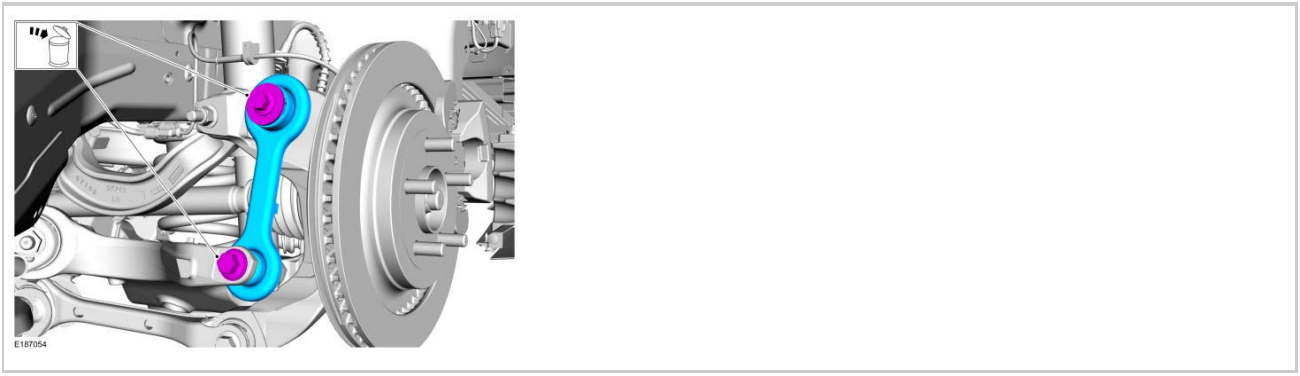
Vehicle/Axle Stands

REMOVAL AND INSTALLATION > LOWER ARM VERTICAL LINK > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .



2.

Support the suspension at curb height. Use the General Equipment: Vehicle/Axle Stands

3.

Remove and discard the 2 lower arm vertical link bolts and remove the lower arm vertical link.

REMOVAL AND INSTALLATION > LOWER ARM VERTICAL LINK > INSTALLATION

NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

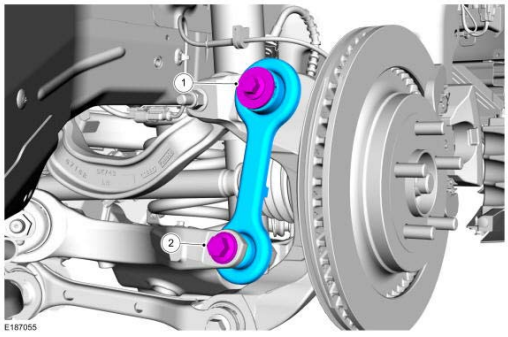
1.

Position the lower arm vertical link and install the 2 new lower arm vertical link bolts.

1.

Tighten the lower arm vertical link upper bolt.

Torque



: 76 lb.ft (103 Nm)

2.

Tighten the lower arm vertical link lower bolt.

Torque

: 129 lb.ft (175 Nm)

2.

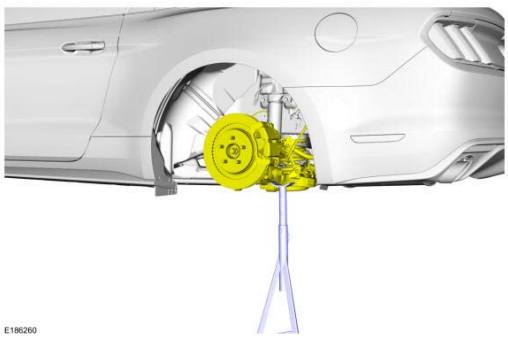
Install the wheel and tire. Refer to: Wheel and Tire .

REMOVAL AND INSTALLATION > REAR SHOCK ABSORBER

Special Tool(s) / General Equipment

Vehicle/Axle Stands

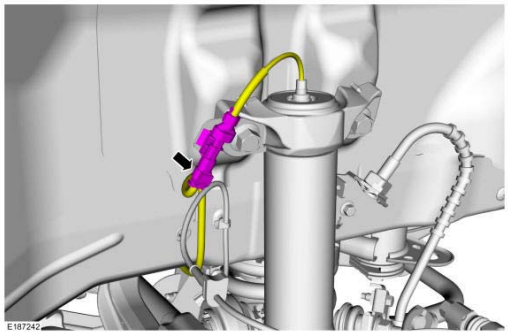
REMOVAL AND INSTALLATION > REAR SHOCK ABSORBER > REMOVAL



NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

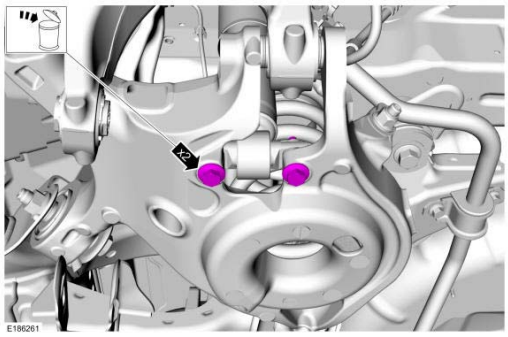
1.

Remove the wheel and tire. Refer to: Wheel and Tire .



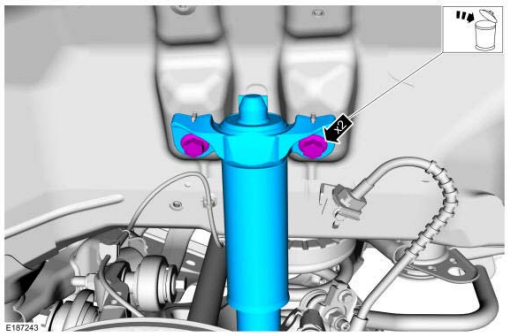
2.

Support the rear suspension. Use the General Equipment: Vehicle/Axle Stands



NOTE: If equipped with dynamic suspension.

3.
Disconnect the rear shock absorber electrical connector.



4.

Remove and discard the 2 rear shock absorber lower bolts.

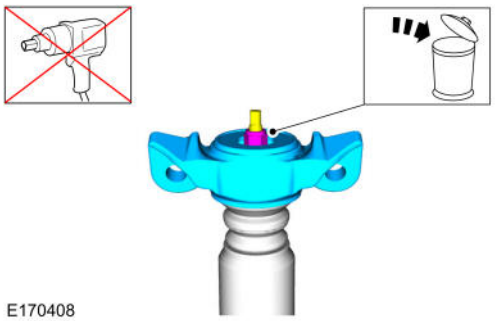
5.

Remove and discard the 2 rear shock absorber upper bolts and remove the rear shock absorber.

NOTE: This step is only necessary when installing a new component.

NOTE: If equipped.

6.
Remove the rear shock absorber rod nut cap.



NOTE: Do not use power tools to remove the nut.

NOTE: This step is only necessary when installing a new component.

NOTE: Use the hex-holding feature to prevent the shock absorber rod from turning while removing the shock absorber rod nut.

7.
Remove and discard the rear shock absorber rod nut.

REMOVAL AND INSTALLATION > REAR SHOCK ABSORBER > INSTALLATION

NOTE: This step is only necessary when installing a new component.

NOTE: Use the hex-holding feature to prevent the shock absorber rod from turning while installing the shock absorber rod nut.

1.
Install the new rear shock absorber rod nut.

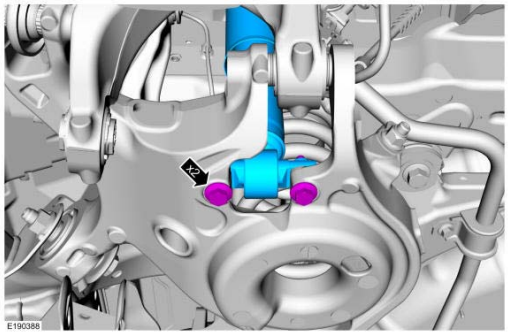
Torque

: 22 lb.ft (30 Nm)

NOTE: This step is only necessary when installing a new component.

NOTE: If equipped.

2.
Install the rear shock absorber rod nut cap.



3.

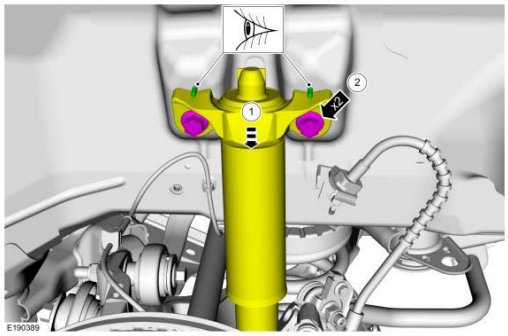
Install the rear shock absorber and install the 2 new rear shock absorber lower bolts.

Torque

: 35 lb.ft (48 Nm)

4.

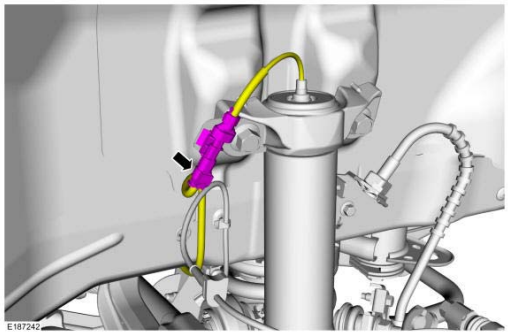
1.



Compress the rear shock absorber and align the rear shock absorber upper mount under the body alignment pins.

2.

Install the 2 new rear shock absorber upper bolts.



Torque

: 66 lb.ft (90 Nm)

NOTE: If equipped with dynamic suspension.

5.
Connect the rear shock absorber electrical connector.

6.

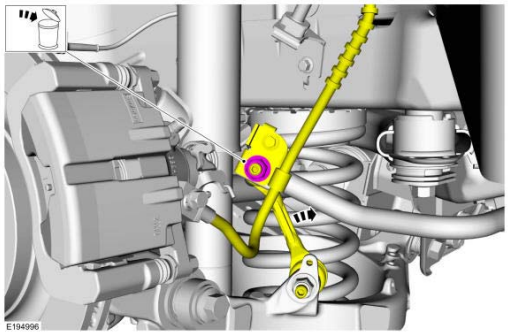
Install the wheel and tire. Refer to: Wheel and Tire .

REMOVAL AND INSTALLATION > REAR STABILIZER BAR > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

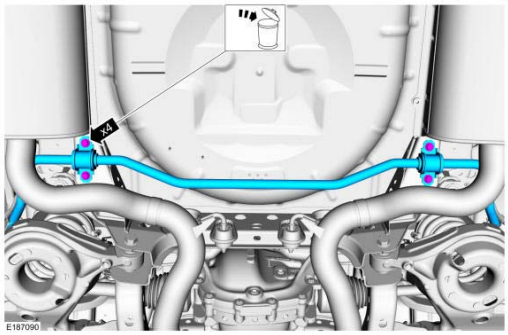
Remove the RH rear wheel and tire. Refer to: Wheel and Tire .



NOTE: Do not use power tools to remove or install the stabilizer bar link nuts. Damage to the stabilizer bar link ball joints and boots may occur.

NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing the stabilizer bar link nut.

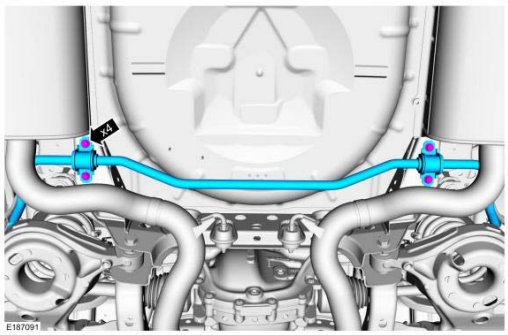


2.
On both sides.

Remove and discard the stabilizer bar link upper nut and position the stabilizer bar link aside.

3.

Remove and discard the 4 stabilizer bar bracket bolts, remove the stabilizer bar brackets and remove the stabilizer bar.



REMOVAL AND INSTALLATION > REAR STABILIZER BAR > INSTALLATION

1.

Position the stabilizer bar, the stabilizer bar brackets and install the 4 new stabilizer bar bracket bolts.

Torque

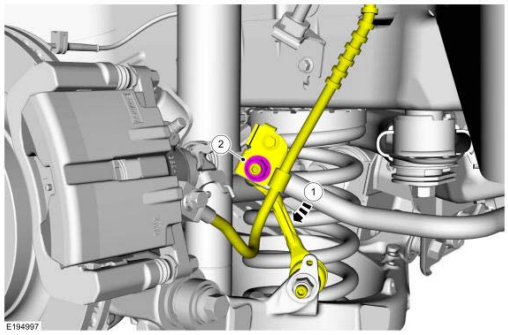
: 52 lb.ft (70 Nm)

2.

1.

On both sides.

Position the stabilizer bar link.



> *NOTE: Use the hex-holding feature to prevent the ball stud from turning while installing the stabilizer bar link nut.*

2.
On both sides.

Install the new stabilizer bar link upper nut.

Torque

: 85 lb.ft (115 Nm)

3.

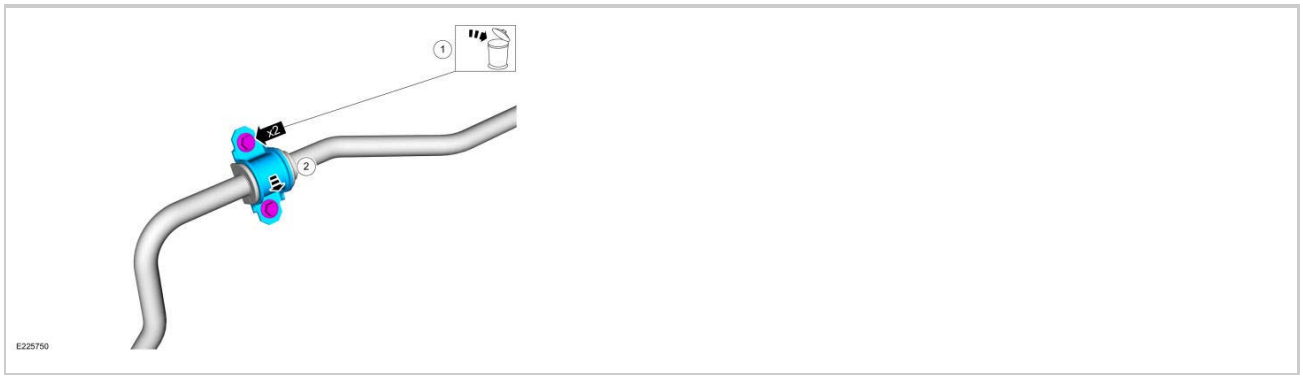
Install the RH rear wheel and tire. Refer to: Wheel and Tire .

REMOVAL AND INSTALLATION > REAR STABILIZER BAR BUSHING > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

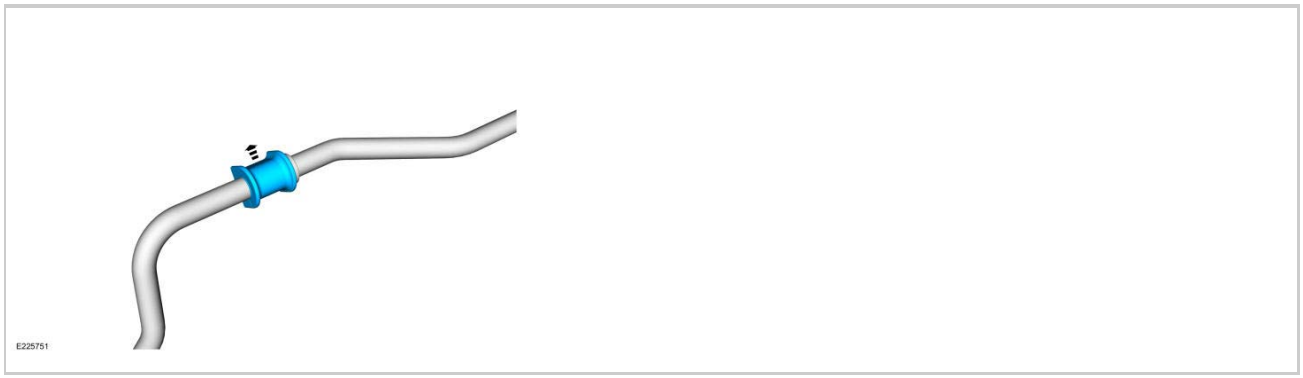
2.



On both sides.

1.

Remove and discard the rear stabilizer bar bushing bracket bolts.

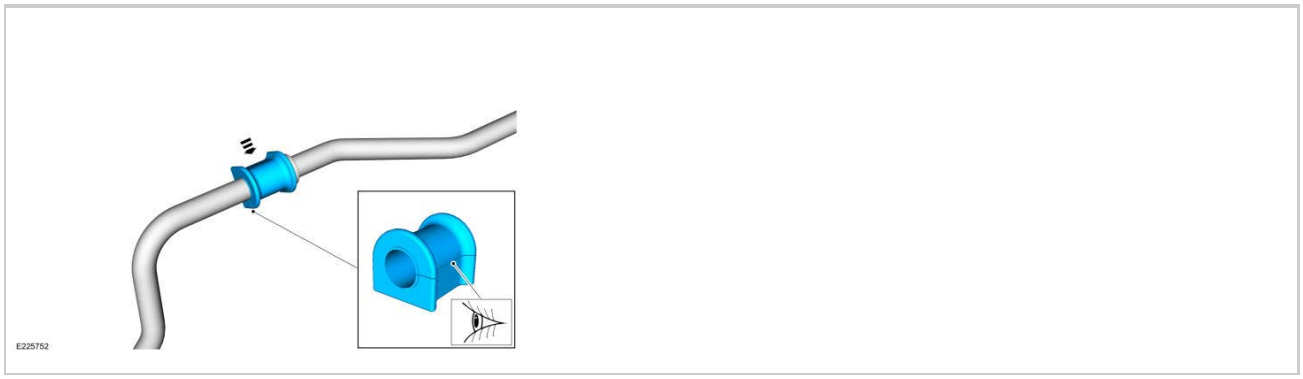


2.

Remove the rear stabilizer bar bushing bracket.

3.

On both sides. Remove the rear stabilizer bar bushing.



REMOVAL AND INSTALLATION > REAR STABILIZER BAR BUSHING > INSTALLATION

NOTE: Do not use any lubrication on the stabilizer bar or the bushings or damage to the bushings may occur.

NOTE: Stabilizer bar bushings must be installed with slits facing the front of the vehicle.

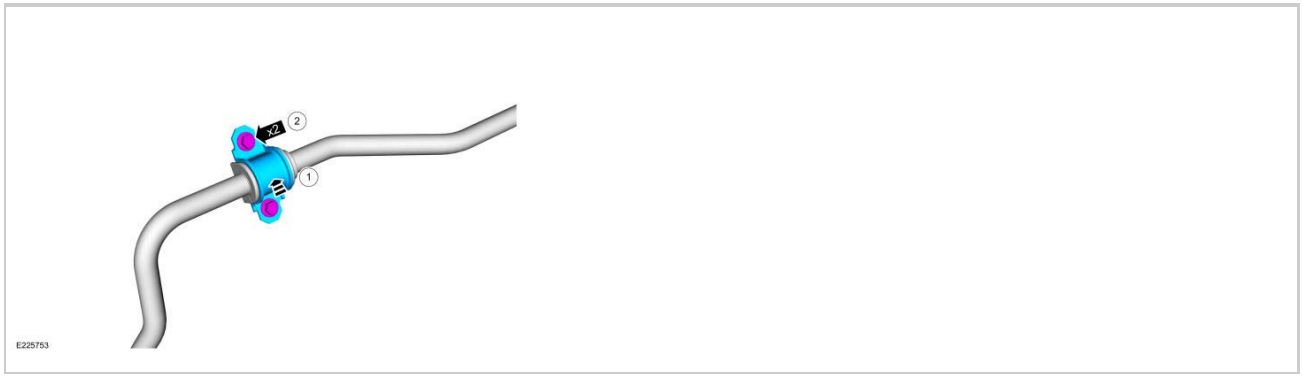
1.
On both sides. Install the rear stabilizer bar bushing.

NOTE: Water may be applied to the bracket to aid in installation.

2.

On both sides.

1.



Install the rear stabilizer bar bushing bracket.

2.

Install the new rear stabilizer bar bushing bracket bolts.

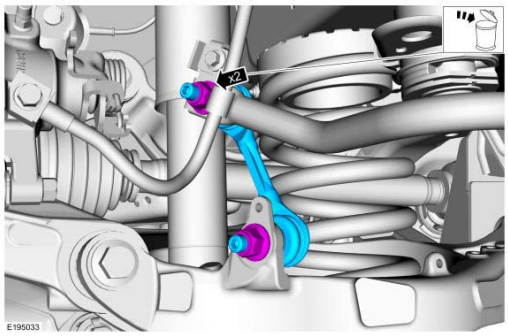
Torque

: 52 lb.ft (70 Nm)

REMOVAL AND INSTALLATION > REAR STABILIZER BAR LINK > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Do not use power tools to remove or install the stabilizer bar link nuts. Damage to the stabilizer bar link ball joints and boots may occur.



NOTE: The stabilizer bar links are designed with low friction ball joints that have a low breakaway torque.

NOTE: Use the hex-holding feature to prevent the ball stud from turning while removing the stabilizer bar link nut.

1.
Remove and discard the 2 rear stabilizer bar link nuts and remove the rear stabilizer bar link.

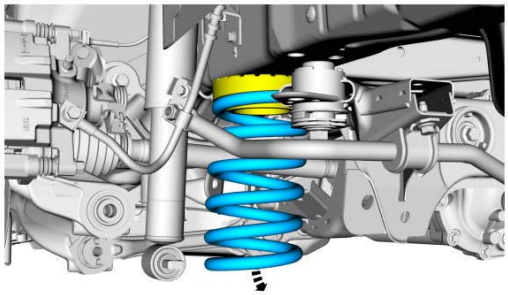
Torque

: 85 lb.ft (115 Nm)

REMOVAL AND INSTALLATION > REAR STABILIZER BAR LINK > INSTALLATION

1.

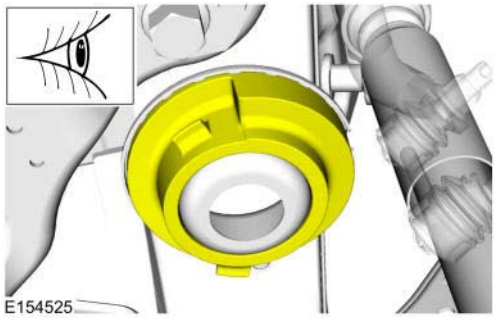
To install, reverse the removal procedure.



REMOVAL AND INSTALLATION > SPRING > REMOVAL

1.

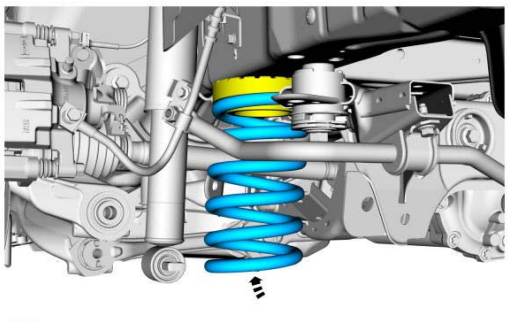
Remove the lower arm. Refer to: Lower Arm .



2.

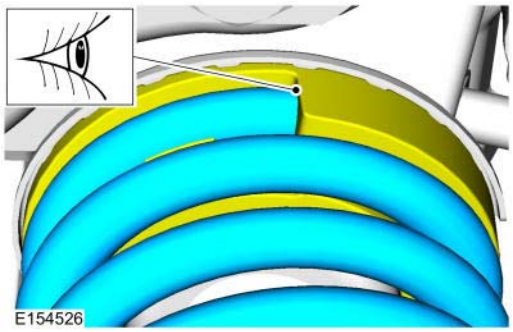
Remove the spring.

3.



Inspect the upper spring seat for damage. Replace as necessary.

REMOVAL AND INSTALLATION > SPRING > INSTALLATION



1.

Install the spring.

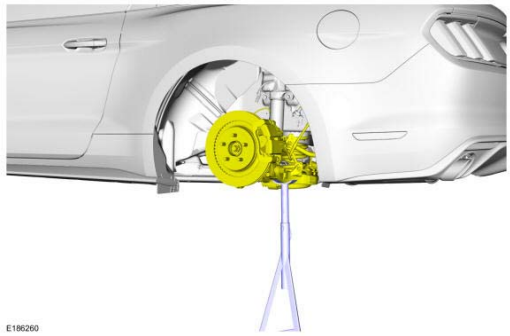
2.

Make sure that the spring is correctly located in the upper spring seat.

3.

Install the lower arm. Refer to: Lower Arm .

REMOVAL AND INSTALLATION > TOE LINK > REMOVAL



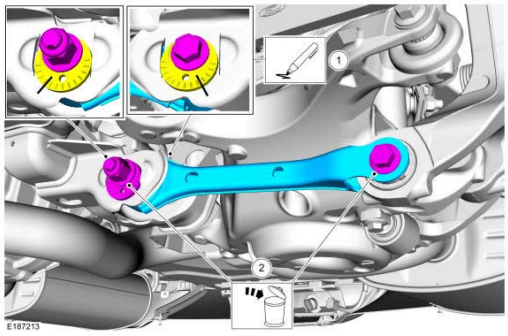
NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .

2.

Support the suspension at curb height.



3.

1.

Index mark both the inner and outer cam wheels for use during assembly.

2.

Remove and discard the toe link-to-knuckle bolt and nut, the toe link-to-frame bolt and nut and remove the toe link.

REMOVAL AND INSTALLATION > TOE LINK > INSTALLATION

NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

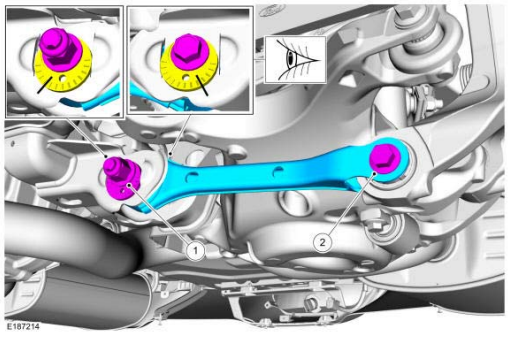
NOTE: Align reference marks made during removal.

1.
Position the toe link.

1.

Install the new toe link-to-frame bolt and nut.

Torque



: 129 lb.ft (175 Nm)

2.

Install the new toe link-to-knuckle bolt and nut.

Torque

: 129 lb.ft (175 Nm)

2.

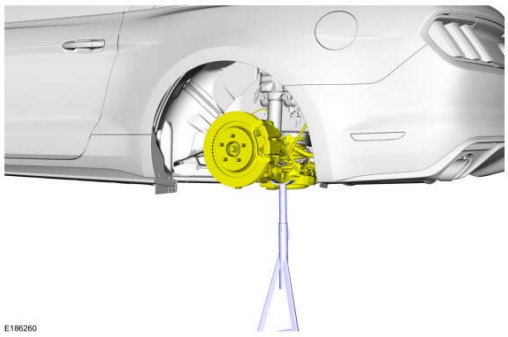
Install the wheel and tire. Refer to: Wheel and Tire .

3.

Recheck rear toe and adjust as necessary. Refer to: Rear Toe Adjustment .

REMOVAL AND INSTALLATION > UPPER ARM > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.



NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .

2.

Support the suspension at curb height.

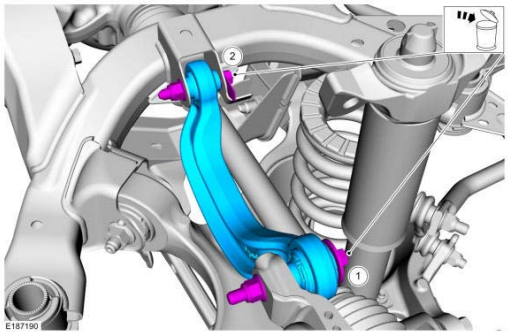
NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

3.

1.

Remove and discard the upper arm-to-wheel knuckle bolt and nut.

Torque



: 76 lb.ft (103 Nm)

2.

Remove and discard the upper arm-to-frame flag-bolt and nut and remove the upper arm.

Torque

: 85 lb.ft (115 Nm)

REMOVAL AND INSTALLATION > UPPER ARM > INSTALLATION

1.

To install, reverse the removal procedure.

2.

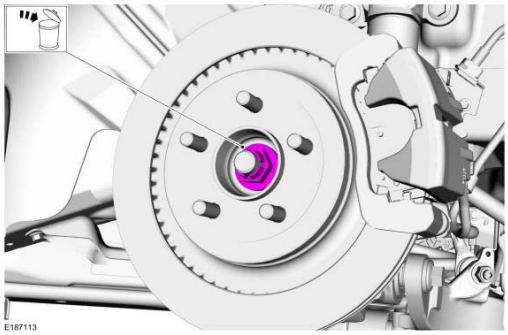
Check and if necessary adjust rear camber. Refer to: Rear Camber Adjustment .

REMOVAL AND INSTALLATION > WHEEL BEARING AND WHEEL HUB

Special Tool(s) / General Equipment

	205-D070 (D93P-1175-B) Remover, Front Wheel Hub

REMOVAL AND INSTALLATION > WHEEL BEARING AND WHEEL HUB > REMOVAL

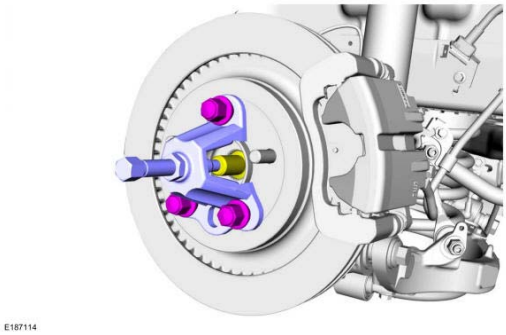


NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .

2.

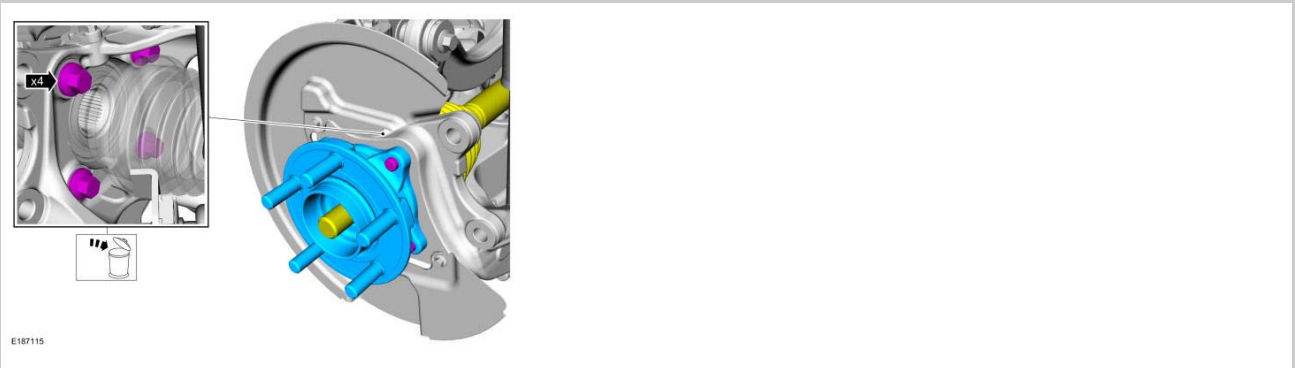


Remove and discard the spindle nut.

3.

Press the halfshaft from the hub.

Use Special Service Tool: 205-D070 (D93P-1175-B) Remover, Front Wheel Hub.

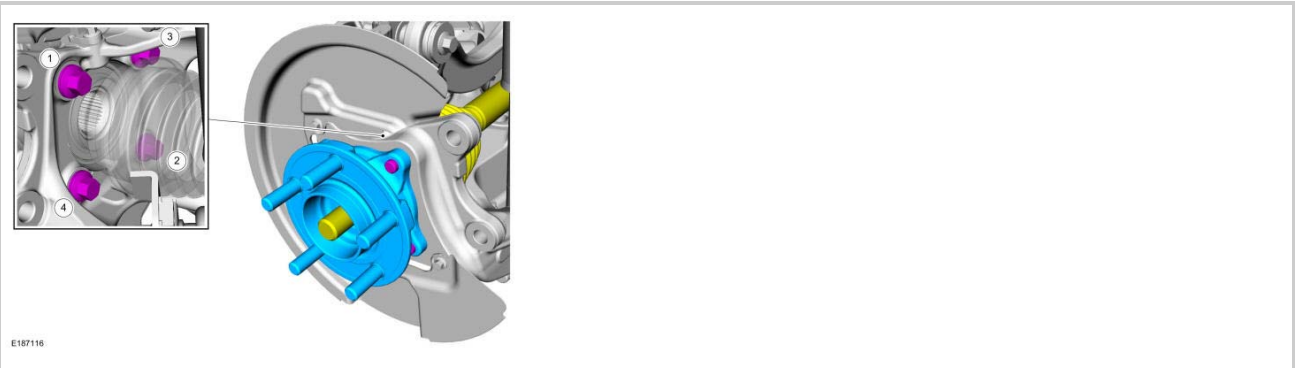


4.

Remove the brake disc. Refer to: Brake Disc .

5.

Remove and discard the 4 wheel bearing and wheel hub bolts and remove the wheel bearing and wheel hub.



REMOVAL AND INSTALLATION > WHEEL BEARING AND WHEEL HUB > INSTALLATION

NOTE: Tighten the wheel bearing and wheel hub bolts in a cross pattern.

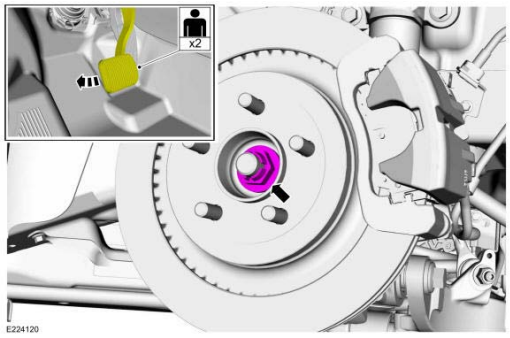
1.
Position the wheel bearing and wheel hub and install the 4 new wheel bearing and wheel hub bolts.

Torque

: 98 lb.ft (133 Nm)

2.

Install the brake disc. Refer to: Brake Disc .



NOTE: Apply the brake to keep the halfshaft from rotating.

3.
Install the new spindle nut.

Torque:

Stage 1: 98 lb.ft (133 Nm)

Stage 2: 45°

4.

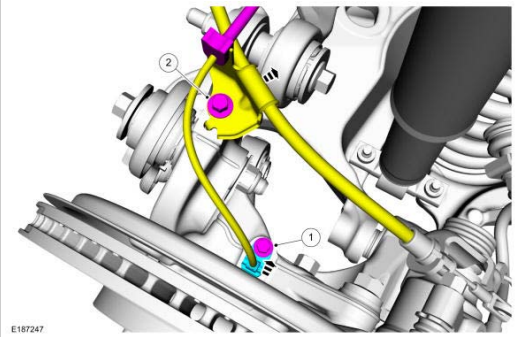
Install the wheel and tire. Refer to: Wheel and Tire .

REMOVAL AND INSTALLATION > WHEEL KNUCKLE > REMOVAL

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.

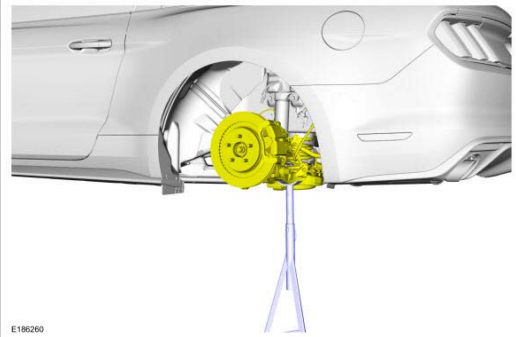
Remove the wheel bearing and wheel hub. Refer to: Wheel Bearing and Wheel Hub .



2.

1.

Remove the wheel speed sensor bolt and position aside the wheel speed sensor.



2.

Remove the parking brake cable bracket bolt and position the parking brake cable bracket aside.

3.

Support the suspension at curb height.

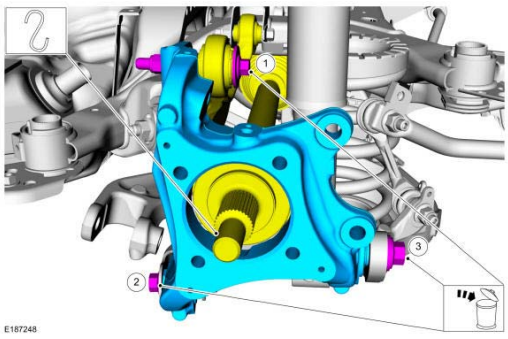
4.

Remove the lower arm vertical link. Refer to: Lower Arm Vertical Link .

NOTE: Support the halfshaft.

5.

1.



Remove and discard the wheel knuckle-to-upper arm bolt and nut.

2.

Remove and discard the wheel knuckle-to-toe link bolt and nut.

3.

Remove and discard the wheel knuckle-to-lower arm bolt. Remove the knuckle.

REMOVAL AND INSTALLATION > WHEEL KNUCKLE > INSTALLATION

NOTE: Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.

1.

1.

Position the wheel knuckle and install the new wheel knuckle-to-lower arm bolt.

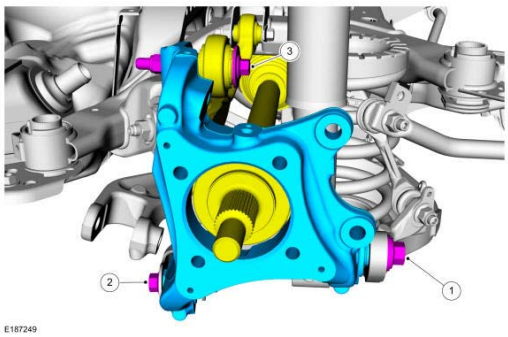
Torque

: 203 lb.ft (275 Nm)

2.

Install the new wheel knuckle-to-toe link bolt and nut.

Torque



: 129 lb.ft (175 Nm)

3.

Install the new wheel knuckle-to-upper arm bolt and nut.

Torque

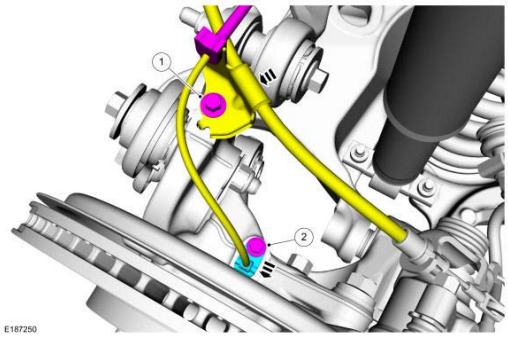
: 76 lb.ft (103 Nm)

2.

1.

Position the parking brake cable bracket and install the parking brake cable bracket bolt.

Torque



: 21 lb.ft (28 Nm)

2.

Position the wheel speed sensor and install the wheel speed sensor bolt.

Torque

: 80 lb.in (9 Nm)

3.

Install the lower arm vertical link. Refer to: Lower Arm Vertical Link .

4.

Install the wheel bearing and wheel hub. Refer to: Wheel Bearing and Wheel Hub .

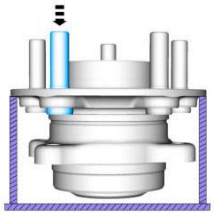
5.

Check and if necessary adjust rear toe. Refer to: Rear Toe Adjustment .

REMOVAL AND INSTALLATION > WHEEL STUDS

Special Tool(s) / General Equipment

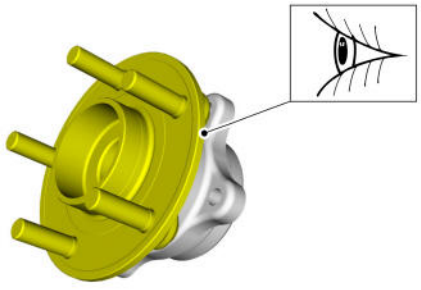
Hydraulic Press



REMOVAL AND INSTALLATION > WHEEL STUDS > REMOVAL

1.

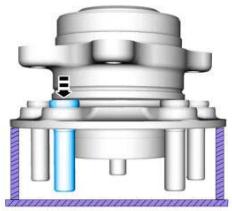
Remove the wheel bearing and wheel hub. Refer to: Wheel Bearing and Wheel Hub .



2.

Press the wheel stud from the wheel bearing and wheel hub. Use the General Equipment: Hydraulic Press

3.



Inspect the wheel bearing and wheel hub for damage. Replace as necessary.

REMOVAL AND INSTALLATION > WHEEL STUDS > INSTALLATION

1.

Press the wheel stud into the wheel bearing and wheel hub. Use the General Equipment: Hydraulic Press

E153907

2.

Install the wheel bearing and wheel hub. Refer to: Wheel Bearing and Wheel Hub .

SPECIFICATIONS > SPECIFICATIONS

Alignment Specifications

NOTE: Measurements listed at curb load. Curb load is defined as "full service fluids, full fuel tank(s), no passengers and no cargo".

Item	LH	RH	Total/Split
Front			
Camber - (Base Coupe, Base Convertible, Performance Package Convertible, Track Package Convertible)	-0.72° ± 0.75°	-0.72° ± 0.75°	0.0° ± 0.75°
Camber - (Performance Package Coupe, Track Package Coupe)	-1.03° ± 0.75°	-1.03° ± 0.75°	0.0° ± 0.75°
Caster - (Base Coupe, Base Convertible, Performance Package Convertible, Track Package Convertible)	7.12° ± 0.75°	7.12° ± 0.75°	0.0° ± 0.75°
Caster - (Performance Package Coupe, Track Package Coupe)	6.91° ± 0.75°	6.91° ± 0.75°	0.0° ± 0.75°

Ride Height

NOTE: Measurements listed at curb load. Curb load is defined as "full service fluids, full fuel tank(s), no passengers and no cargo".

Item	Specification
Front Ride Height	
All Models	48.8 mm (1.921 in) ± 12 mm (0.472 in)

Rear Ride Height	
All Models	32.1 mm (1.264) ± 10 mm (0.394 in)

Vehicle Lean Side-To-Side Differences

Front - Maximum	7.5 mm (0.295 in)
Rear - Maximum	6.3 mm (0.248 in)

General Specifications

Item	Specification
Thrust Angle - Rear	
All Models	0.0° ± 0.5°

DIAGNOSIS AND TESTING > SUSPENSION SYSTEM > PRELIMINARY INSPECTION

1.

Road test the vehicle:

If any suspension alignment or ride height concerns are present, REFER to Symptom Chart: Suspension System .

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, REFER to Symptom Chart: NVH .

2.

Inspect the tires:

Check the tire pressures with all normal loads in the vehicle and the tires cold. REFER to the VC label.

Verify that all tires are sized to specification. REFER to the VC label.

Inspect the tires for incorrect wear and damage. INSTALL new tires as necessary.

3.

Inspect the chassis and underbody:

Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.

Front or rear suspension components.

Suspension fastener(s).

Incorrect spring usage Spring(s).

Shock absorber(s).

Strut(s).

Suspension bushing(s).

Steering system components.

Wheel bearing and wheel hub(s).

4.

Inspect for aftermarket equipment:

Check for aftermarket changes to the steering, suspension, and wheel and tire components (such as competition or heavy duty). The specifications shown in this service information do not apply to vehicles equipped with aftermarket equipment.

DIAGNOSIS AND TESTING > SUSPENSION SYSTEM > SYMPTOM CHART: SUSPENSION SYSTEM

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Condition	Possible Sources	Actions
Vehicle drifts/pulls	Refer to the Diagnostic Routine.	GO to Pinpoint Test A
Wander	Overloaded, unevenly or incorrectly loaded vehicle	NOTIFY the customer of incorrect vehicle loading.
	Ball joint(s)	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
	Damaged or missing front strut mount bearing(s)	INSTALL a new front strut mount bearing(s) as necessary. REFER to: Front Strut and Spring Assembly .
	Loose, worn or damaged front wheel bearing(s)	INSPECT the wheel bearings. INSTALL new wheel bearings as necessary. REFER to: Front Wheel Bearing and Wheel Hub .
	Loose, worn or damaged suspension component(s)	INSTALL new suspension component(s) as necessary.
	Loose suspension fasteners	INSPECT the suspension fasteners. TIGHTEN to specifications.

	Steering components	INSPECT the steering system. INSTALL new components as necessary.
	Wheel alignment (excessive total front toe out)	ADJUST as necessary. REFER to: Front Toe Adjustment .
Front bottoming or riding low	Worn, damaged or incorrect springs	MEASURE the ride height. REFER to: Ride Height Measurement . INSTALL new springs as necessary. REFER to: Front Strut and Spring Assembly .
	Worn front strut(s)	INSTALL new struts as necessary. REFER to: Front Strut and Spring Assembly .
Abnormal/incorrect tire wear	Incorrect tire pressure (rapid center rib or inner and outer edge wear)	ADJUST the tire pressure. REFER to VC label.
	Incorrect tire rotation intervals	REFER to Owners Literature for correct tire rotation intervals.
	High-speed cornering Excessive front or rear toe (inner or outer edge wear) Excessive negative or positive camber (inner or outer edge wear)	REFER to: Wheels and Tires .
	Front or rear suspension components	INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary.
Sticky steering, poor returnability	Damaged or worn front strut mount bearing(s)	INSTALL a new front strut mount bearing(s) as necessary. REFER to: Front Strut and Spring Assembly .
	Binding ball joints	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
	Steering components	INSPECT the steering system. INSTALL new components as necessary.
Steering wheel off-center	Unequal front or rear toe setting (side-to-side)	CHECK the wheel alignment. REFER to: Front Toe Adjustment or REFER to: Rear Toe Adjustment .
	Steering components	INSPECT the steering system. INSTALL new components as

		necessary.
Sway or roll	Overloaded, unevenly or incorrectly loaded vehicle	NOTIFY the customer of incorrect vehicle loading.
	Loose wheel nut(s)	TIGHTEN the wheel nut(s) to specification. REFER to: Wheel and Tire .
	Strut(s) or shock absorber(s)	INSTALL new struts or shock absorbers as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Rear Shock Absorber .
	Loose stabilizer bracket-to-frame bolts	TIGHTEN the bolts to specification. REFER to: Front Stabilizer Bar .
	Worn stabilizer bar bushings or links	INSTALL new stabilizer bar bushings, stabilizer bar links or stabilizer bar assembly as necessary. REFER to: Front Stabilizer Bar Bushing or REFER to: Front Stabilizer Bar Link or REFER to: Front Stabilizer Bar .
	Damaged or broken stabilizer bar	INSTALL a new stabilizer bar or stabilizer bar assembly as necessary. REFER to: Front Stabilizer Bar .
	Worn spring(s)	INSTALL new springs as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Spring .
Vehicle leans to one side	Unevenly loaded or overloaded vehicle	NOTIFY the customer of incorrect vehicle loading.
	Front or rear suspension components	INSPECT the front and rear suspension systems. INSTALL new suspension components as necessary.
	Incorrect drive axle(s) ride height. Side-to-side lean out of specification	MEASURE the ride height..3to: Ride Height Measurement . INSPECT the front and rear suspension systems. REPAIR or INSTALL new components as necessary.

- If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
- If the fault is not visually evident, REFER to Symptom Chart or REFER to Symptom Chart: NVH .

DIAGNOSIS AND TESTING > SUSPENSION SYSTEM > SYMPTOM CHART: NVH

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, Glossary of Terms REFER to: Noise, Vibration and Harshness (NVH) . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, REFER to: Noise, Vibration and Harshness (NVH) . for the next likely system and continue diagnosis.

Additional diagnostics may be necessary to further isolate the concern. An electronic listening tool such as Chassis Ear® may be used. Follow the tool manufacturer's instructions and the Possible Sources found in the following NVH chart to determine the connection points.

Condition	Possible Sources	Actions
Front suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads due to the suspension moving in an up/down motion.	Strut top nut	INSPECT and TIGHTEN to specification. REFER to: Front Strut and Spring Assembly .
	Jounce bumper	INSPECT, LUBRICATE or INSTALL new components as necessary.
	Stabilizer bar insulators and/or Stabilizer bar links	INSPECT for out-of-position bushings, isolators or locating pins. INSTALL new components as necessary. REFER to: Front Stabilizer Bar or REFER to: Front Stabilizer Bar Bushing or REFER to: Front Stabilizer Bar Link .
	Steering gear and/or Tie rod ends	INSPECT the steering gear and tie rod ends. INSTALL new components as necessary. REFER to: POWER STEERING .
	Front brake caliper	INSPECT the front brake caliper(s). REFER to: Brake System .
	Lower control arm / ball joint	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
	Hub	INSPECT hub(s). REPAIR or REPLACE as necessary. REFER to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package (204-01

		Front Suspension, Removal and Installation).
	Exhaust system	INSPECT the exhaust system. REFER to: EXHAUST SYSTEM - 2.3L EcoBoost (231kW/314PS) or REFER to: EXHAUST SYSTEM - 3.7L Duratec (227kW/301PS) or REFER to: EXHAUST SYSTEM - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
	Powertrain mounts	INSPECT the powertrain mounts. REFER to: ENGINE MOUNT LH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT RH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT LH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT RH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT LH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS) or REFER to: ENGINE MOUNT RH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
	Subframe welds or insulators	INSPECT subframe. REPAIR or REPLACE as necessary. REFER to: Front Subframe - 2.3L EcoBoost (201kW/273PS) .
Rear suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads due to the suspension moving in an up/down motion.	Loose or damaged rear shock absorber(s) or shock absorber bushing(s)	INSPECT the rear shock absorber(s) or shock absorber bushing(s). INSTALL new components as necessary. REFER to: Rear Shock Absorber .
	Damaged spring(s) or spring mount(s)	INSPECT the rear spring(s) and spring mount(s). REPLACE damaged components as necessary. REFER to: Spring .
	Worn or damaged stabilizer bar bushing(s) or link(s)	INSPECT the stabilizer bar bushing(s) or link(s). REPLACE damaged or worn components as necessary. REFER to: Rear Stabilizer Bar Bushing or REFER to: Rear Stabilizer Bar Link .
	Worn or damaged lower control arms, toe link ball joints or cross-axis joints	INSPECT for worn or damaged lower control arms, toe link ball joints or cross-axis joints.

		REPLACE damaged or worn components as necessary.
Noise from front suspension when turning - crunch or ratcheting noise. Occurs as a result of the suspension twisting and flexing.	Strut top nut	INSPECT and TIGHTEN to specification. REFER to: Front Strut and Spring Assembly .
	Worn or damaged front strut bearing(s)	INSPECT for worn or damaged strut bearing. INSTALL new components as necessary. REFER to: Front Strut and Spring Assembly .
	Coil Spring	INSPECT springs. REPLACE as necessary. REFER to: Front Strut and Spring Assembly .
	Strut brackets or seat(s)	INSPECT strut brackets or seat(s). REPAIR as necessary.
	Stabilizer bar	INSPECT the stabilizer bar. REPAIR or REPLACE as necessary. REFER to: Front Stabilizer Bar .
	Steering gear	INSPECT the steering gear. REFER to: POWER STEERING .
	Tie rod ends	INSPECT tie rod ends. INSTALL new components as necessary. REFER to: Tie Rod End .
	Hub	INSPECT hub(s). REPAIR or REPLACE as necessary. REFER to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .
	Lower control arm / ball joint	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
Noise from front suspension when turning - Crunch clunk or grunt noise from the front suspension occurring when turning to full left or right stop.	Steering stops	Normal condition. No action required.
Noise while braking - Noises occurring during this condition result from rearward and downward force applied to the suspension and subframe such as rearward force applied to the lower control arm.	Front brake caliper	INSPECT the front brake caliper(s). REFER to: Brake System .
	Hub	INSPECT hub(s). REPAIR or REPLACE as necessary. REFER to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .

	Lower control arm / ball joint	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
	Powertrain mounts	INSPECT the powertrain mounts. REFER to: ENGINE MOUNT LH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT RH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT LH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT RH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT LH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS) or REFER to: ENGINE MOUNT RH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
Noise while accelerating - Noises occurring during this condition result from powertrain torque and flex, such as torque on the powertrain mounts during acceleration.	Body (inner fender, bulkhead, seams and pinch welds)	INSPECT and REPAIR as necessary.
	Hub	INSPECT hub(s). REPAIR or REPLACE as necessary. REFER to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package (204-01 Front Suspension, Removal and Installation).
	Powertrain mounts	INSPECT the powertrain mounts. REFER to: ENGINE MOUNT LH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT RH - 2.3L EcoBoost (231kW/314PS). REFER to: ENGINE MOUNT LH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT RH - 3.7L Duratec (227kW/301PS). REFER to: ENGINE MOUNT LH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS) or REFER to: ENGINE MOUNT RH - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
	Exhaust system	INSPECT the exhaust system. REFER to: EXHAUST SYSTEM - 2.3L EcoBoost (231kW/314PS) or REFER to: EXHAUST SYSTEM - 3.7L Duratec (227kW/301PS) or REFER to: EXHAUST SYSTEM -

		5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
	Subframe welds or insulators	INSPECT subframe. REPAIR or REPLACE as necessary. REFER to: Front Subframe - 2.3L EcoBoost (201kW/273PS) .
Noise while entering driveways or driving over dips or depressions - Noises occurring during this condition result from the body, subframe or suspension twisting or flexing such as the tension on body structure welds.	Body (inner fender, bulkhead, seams and pinch welds)	INSPECT and REPAIR as necessary.
	Stabilizer bar links	INSPECT the stabilizer bar links. INSTALL new stabilizer bar links as necessary. REFER to: Front Stabilizer Bar Link or REFER to: Rear Stabilizer Bar Link .
	Subframe welds or insulators	INSPECT subframe. REPAIR or REPLACE as necessary. REFER to: Front Subframe - 2.3L EcoBoost (201kW/273PS) .
Clunk or pop or thump/thud - noise may be thought of as a loose part striking an adjacent part or a secure part coming loose when force is applied. A clunk is often rhythmic, repeatable and metallic in nature.	Loose fasteners	INSPECT for loose nuts or bolts.
	Worn or damaged bushings	INSPECT for out-of-position or damaged components.
	Struts & shocks	INSPECT for worn or damaged struts or shocks. REPLACE as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Rear Shock Absorber .
	Coil spring or spring seat out of position	INSPECT for out-of-position or damaged components. ADJUST or REPLACE as necessary.
	Worn or damaged ball joint(s)	INSPECT ball joints. INSTALL new control arm(s) as necessary. REFER to: Front Lower Arm or REFER to: Rear Lower Arm .
Rattle - noise occurs mostly over bumps, rough roads or uneven surfaces at low speeds (i.e. parking lot). A rattle is often a rapid, repetitive noise that can be metallic or non-metallic in nature.	Loose fasteners or brackets Loose or damaged front struts, shock absorber(s) or shock absorber bushing(s), dust boot(s), jounce bumper(s) Damaged spring or spring mount(s) Damaged or worn control/radius arm bushing(s) Worn or damaged stabilizer bar bushings or link(s)	INSPECT for loose nuts or bolts. TIGHTEN to specification. INSPECT for out-of-position or damaged components. ADJUST or INSTALL new components as necessary.
Whine, roar or groan - noise generally occurs over 30 mph and is often more noticeable with	Loose or damaged wheel bearings	INSPECT the front or rear wheel bearing(s). INSTALL new bearing(s) as necessary. REFER

steering input.		to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .
Shimmy	Loose wheel nut(s)	TIGHTEN the nut(s) to specification. REFER to: Wheel and Tire .
	Loose front suspension fastener(s)	TIGHTEN the fastener(s) to specifications.
	Loose front wheel bearing(s)	INSPECT the front wheel bearing(s). INSTALL new bearing(s) as necessary. REFER to: Front Wheel Bearing and Wheel Hub - Vehicles With: SVT Performance Package .
	Strut(s) or shock absorber(s)	INSTALL new struts or shock absorbers as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Rear Shock Absorber .
Shimmy - most noticeable on coast/deceleration. Also hard steering condition	Excessive positive caster	INSPECT the front suspension. REPAIR or INSTALL new suspension components as necessary.
Rough/harsh ride	Incorrect tire pressure	ADJUST the tire pressure. REFER to VC label.
	Strut(s) or shock absorber(s)	INSTALL new struts or shock absorbers as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Rear Shock Absorber .
	Spring(s)	MEASURE the ride height. REFER to: Ride Height Measurement . INSTALL new springs as necessary. REFER to: Front Strut and Spring Assembly or REFER to: Spring .
	Damaged suspension component(s)	INSTALL new suspension component(s) as necessary.

DIAGNOSIS AND TESTING > SUSPENSION SYSTEM > PINPOINT TESTS

Vehicle Drifts, Pulls

Diagnostic Overview

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific

diagnostic practices. REFER to: Diagnostic Methods .

Possible Causes

- Unevenly loaded vehicle
- Tire pressure
- Tire forces
- Brake drag
- Incorrect vehicle alignment
- Bent/damaged vehicle components
- Steering system

DIAGNOSIS AND TESTING > SUSPENSION SYSTEM > PINPOINT TESTS > PINPOINT TEST A : VEHICLE DRIFTS, PULLS > PINPOINT TEST A : VEHICLE DRIFTS, PULLS

A1 CHECK FOR UNEVENLY LOADED VEHICLE

Visually check the vehicle for an uneven loading condition.

Is the vehicle unevenly loaded?

Yes	ADVISE the customer of uneven loading condition.

No	GO to A2

A2 CHECK THE TIRE PRESSURES AND TIRE CONDITIONS

Check the tire pressures: REFER to VC label. REFER to: Identification Codes . Check the tires for uneven/abnormal wear: REFER to: Wheels and Tires .

Are the tire pressures and tire conditions OK?

Yes	GO to A3

No	ADJUST the tire pressures to the specified pressure or INSTALL new tires as necessary.

A3 ISOLATE TIRE DRIFT/PULL CONDITION

Cross the front wheel and tire assemblies from left-to-right.

Does the vehicle drift/pull?

Yes	If the vehicle drifts/pulls in the opposite direction, tire forces are causing the drift/pull. ROTATE the wheel and tire assemblies front-to-rear. If the vehicle drifts/pulls in the same direction, GO to A4

No	Tire forces were causing the drift/pull and the concern has been corrected.

A4 CHECK FOR BRAKE DRAG

Spin all four wheel and tire assemblies by hand and check for brake drag.

Do the wheels spin freely?

Yes	GO to A5

No	REFER to: Brake System to diagnose brake drag condition.

A5 CHECK THE WHEEL ALIGNMENT

Using alignment equipment and the manufacturer's instructions, check the wheel alignment.

Is the wheel alignment out of specification?

Yes	ADJUST the alignment as necessary. REFER to: Front Toe Adjustment .

No	REFER to: POWER STEERING to diagnose steering system drift/pull/wander condition.

GENERAL PROCEDURES > FRONT CAMBER ADJUSTMENT

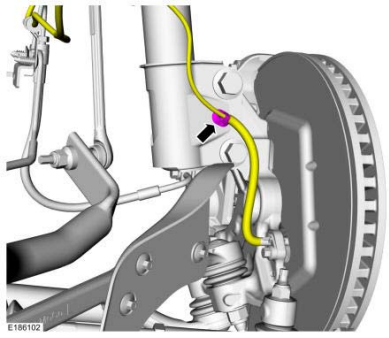
Special Tool(s) / General Equipment

Wheel Alignment System

Adjustment

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

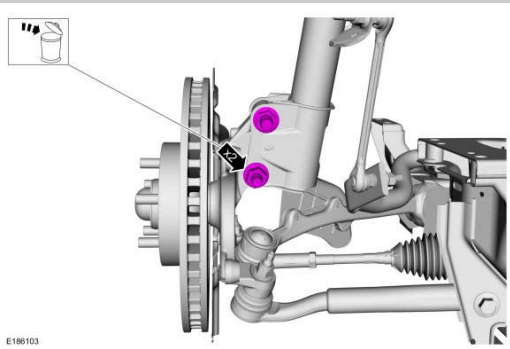
1.



Using alignment equipment and the manufacturer's instructions, measure the front camber. Use the General Equipment: Wheel Alignment System

2.

Remove the wheels and tires. Refer to: Wheel and Tire .



3.

On both sides. Unclip and position aside the wheel speed sensor harness.

4.

On both sides. Remove and discard the strut-to-spindle bolts and nuts.

NOTE: Do not fully tighten the strut-to-spindle bolts and nuts until the alignment has been corrected.

NOTE: Original equipment bolts are splined, service bolts are smooth and smaller in diameter which allows for camber adjustment.

5.
On both sides. Position the wheel spindle and install the 2 new service strut-to-spindle bolts and nuts and tighten until snug.

6.

On both sides. Position the wheel speed sensor harness.

7.

Install the wheels and tires. Refer to: Wheel and Tire .

8.

Using alignment equipment and the manufacturer's instructions, measure the front camber. Use the General Equipment: Wheel Alignment System

9.

On both sides. Tighten the strut-to-spindle bolts and nuts.

Torque

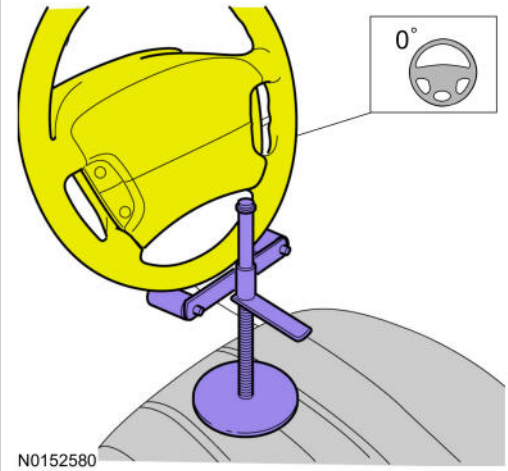
: 184 lb.ft (250 Nm)

10.

Recheck alignment to verify camber change and adjust front toe if necessary. Refer to: Front Toe Adjustment .

GENERAL PROCEDURES > FRONT TOE ADJUSTMENT

Special Tool(s) / General Equipment



Wheel Alignment System

Adjustment

NOTE: Make sure that the vehicle is standing on a level surface.

1.

Steering wheel in straight ahead position.

2.

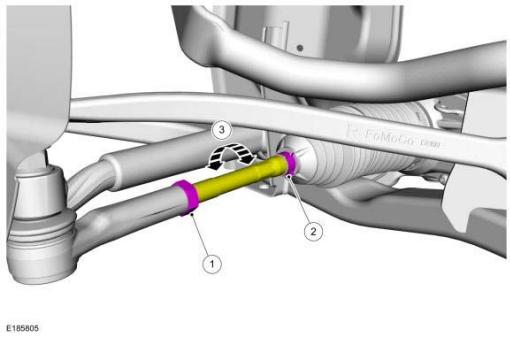
Using alignment equipment and the manufacturer's instructions, check the front toe setting on both sides. Use the General Equipment: Wheel Alignment System

3.

1.

On both sides. Loosen the outer tie rod end jamb nut.

Torque



: 76 lb.ft (103 Nm)

2.

On both sides. Position aside the steering gear boot clamp.

NOTE: Do not allow the steering gear bellows to twist when the inner tie rod is rotated.

3.
On both sides. Rotate the inner tie rods until the toe reading is within specifications.

4.

Recheck the toe settings and adjust as necessary.

GENERAL PROCEDURES > REAR CAMBER ADJUSTMENT

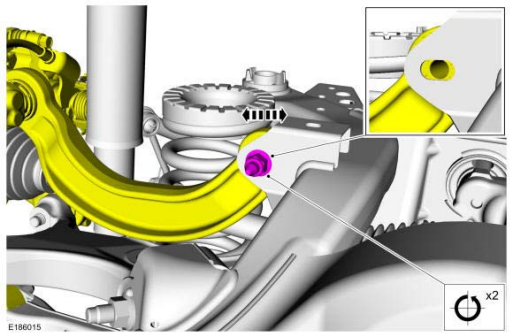
Special Tool(s) / General Equipment

Wheel Alignment System

Adjustment

NOTE: Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.

1.



Using alignment equipment and the manufacturer's instructions, measure the rear camber. Use the General Equipment: Wheel Alignment System

2.

Loosen the upper control arm inboard nut approximately 2 turns, and slide the upper control arm inboard or outboard to adjust the rear camber.

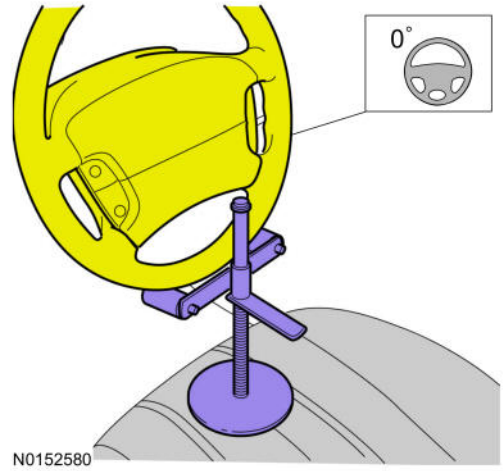
Torque

: 85 lb.ft (115 Nm)

3.

Recheck alignment to verify camber change and adjust rear toe if necessary. Refer to: Rear Toe Adjustment .

GENERAL PROCEDURES > REAR TOE ADJUSTMENT



Special Tool(s) / General Equipment

Wheel Alignment System

Adjustment

1.

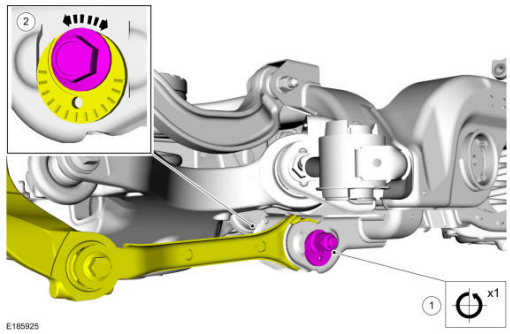
Using a holding device, hold the steering wheel in the straight-ahead position.

2.

Using alignment equipment and the manufacturer's instructions, check the rear toe setting on both sides. Use the General Equipment: Wheel Alignment System

3.

NOTE: Make sure that the toe settings are not disturbed while tightening the nuts.



1.
Loosen the toe link nut approximately one full turn.

Torque

: 129 lb.ft (175 Nm)

2.

Rotate the toe link bolt to achieve the specified toe setting.

4.

Recheck the rear toe settings and adjust as necessary.

GENERAL PROCEDURES > RIDE HEIGHT MEASUREMENT

Special Tool(s) / General Equipment

Surface Gauge

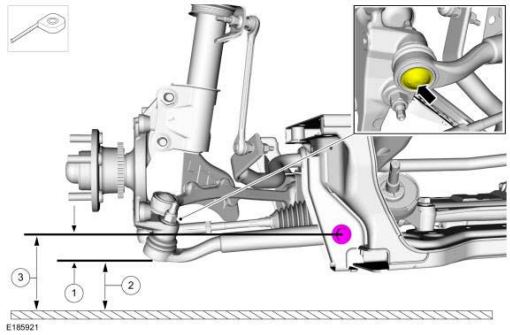
Check

Ride Height Measurement - Front

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1.

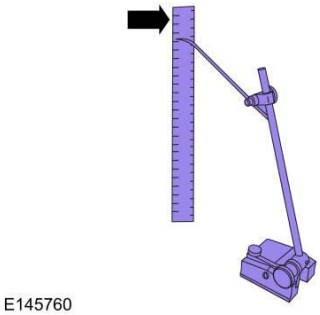
1.



Ride height = 3-2

2.

Measure the distance between the flat level surface and the center of the rear control arm ball joint cap (measurement 2)



3.

Measure the distance between the flat level surface and the center of the rear control arm inboard bolt (measurement 3) Use the General Equipment: Surface Gauge

2.

With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 2) and (measurement 3).

3.

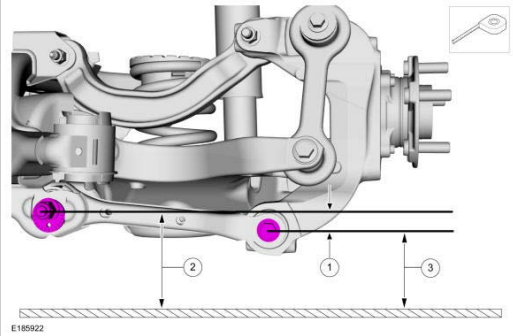
Subtract measurement 2 from measurement 3 to obtain the front ride height.

Ride Height Measurement - Rear

4.

1.

Ride height = 2-3



2.

Measurement 2

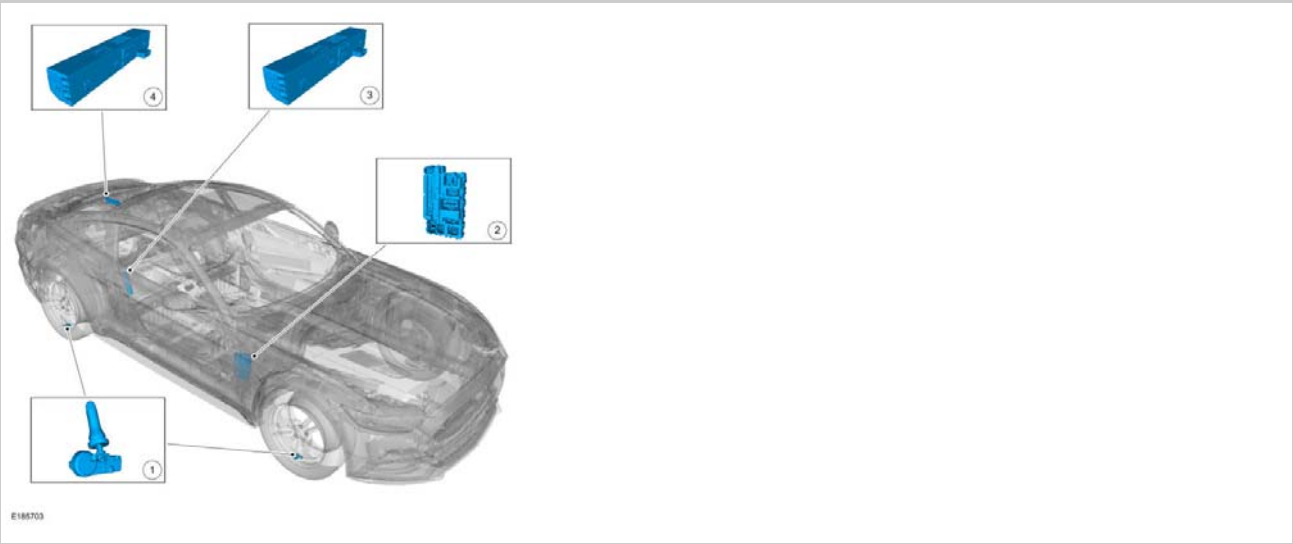
3.

Measurement 3

Use the General Equipment: Surface Gauge

5.

Measure the distance between the flat level surface and the center of the toe link inboard cam bolt (measurement 2).



6.

Measure the distance between the flat level surface and the center of the toe link outboard bolt (measurement 3).

7.

Subtract measurement 3 from measurement 2 to obtain the rear ride height.

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - COMPONENT LOCATION

Item	Description
1	TPMS sensor (4 required)
2	BCM
3	RTM, convertible (1 required)
4	RTM, coupe (1 required)

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - OVERVIEW > OVERVIEW

The BCM uses tire pressure sensors to monitor tire pressure. The sensors use radio signals to transmit the tire pressure to the RTM. The RTM sends the information to the BCM over a LIN. The tire pressure sensors are battery operated and mounted to the valve stems. The IPC illuminates the TPMS warning indicator and the message center displays a message when a fault is present or when the tire pressure falls below the low pressure limit.

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

RTM TPMS Network Input Messages

Broadcast Message	Originating Module	Message Purpose
TPMS data	RTM	Communicates tire pressure information to the BCM

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > TPMS FUNCTION

*NOTE: When directed to train any TPMS sensors, use **only** the sensor training procedure outlined in this service information. Do not use the TPMS reset procedure outlined in the Owner's Literature as this procedure **does not** program new sensors to the module.*

The TPMS uses 4 valve stem mounted sensors to monitor tire pressure. These sensors wirelessly transmit tire pressure data to the RTM. The RTM is a radio signal receiver which collects the tire pressure data and sends the information to the BCM along a LIN. All TPMS functions are controlled by the BCM. The BCM compares the tire pressure data sent by the RTM with a programmed tire pressure. This programmed pressure is specified on the VC label and cannot be changed. If the actual tire pressure is less than the programmed tire pressure, the BCM sends a low tire pressure message to the IPC along the MS-CAN. The IPC responds by illuminating the TPMS warning indicator and displaying a low tire pressure message in the message center. The TPMS sensors are trained (calibrated) to the BCM which records the unique identifier for each TPMS sensor and records the location of each sensor based on the training (calibration) order. The BCM sends messages to the RTM by first sending the information along the HS-CAN1 to the GWM which then sends the information to the RTM along the MS-CAN.

The diagnostic scan tool is useful in diagnosing TPMS concerns and may be used to verify the accuracy of the tire pressure data transmitted by the TPMS sensors. This is accomplished by comparing the BCM tire pressure PID data to the actual tire pressure using a digital tire pressure gauge.

It is not necessary to train the sensors after a tire rotation on vehicles with the same front and rear tire pressures however, the BCM cannot recognize the sensor identifiers have been moved to different positions and retains the original position information for each sensor.

Wheel Rotation and Sensor Training Techniques

Training known good sensors from another vehicle can help determine whether the concern is with a sensor or the RTM. This technique cannot help determine whether the concern is due to RFI as some RFI source could be preventing the RTM from receiving the tire pressure status from the known good sensors as well as the original sensors.

If the RTM in the suspect vehicle cannot train any of the original sensors and, likewise, cannot train known good sensors from another vehicle, then the concern is with the module or RFI and not with the

original sensors. The original sensors should not be replaced. If a sensor in a certain location has caused several events, yet the sensor trains and seems to operate normally, moving that particular wheel to a different location on the vehicle is a good way to isolate the concern to a certain sensor/wheel location. Rotate the wheels and road test the vehicle. This can be done in an attempt to replicate the concern and help determine if the concern followed the sensor or remained in the original sensor location.

If the vehicle has been stationary for more than 30 minutes, the sensors go into a "sleep mode" to conserve battery power and need to be "woken up" so they transmit the latest tire pressure information to the RTM. Refer to: Tire Pressure Monitoring System (TPMS) Sensor Activation .

Training Sensors in a Different Order

If the first sensor fails the TPMS training procedure, the BCM aborts the entire procedure. Starting the training procedure at a different wheel is a technique which can be used to determine if the remaining sensors can train to the module. This can help save time determining if one sensor is damaged, other sensors are having concerns or the BCM is experiencing training difficulties with a certain TPMS sensor location.

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > TPMS WARNING INDICATOR

The TPMS warning indicator is used to indicate both a low tire pressure event and a possible system fault condition. The message center displays additional information associated with the low tire pressure event or the system fault condition. Occasionally, the warning indicator and message center indicate faults that cannot be resolved by the customer. Treat these as TPMS faults that must be serviced.

TPMS Warning Indicator Illuminates Continuously

The TPMS warning indicator remains on continuously and the message center displays LOW TIRE PRESSURE when any of the tire pressures fall below the low pressure limit. When this condition exists, adjust the tire pressure to the recommended cold tire pressure indicated on the VC label.

Tire Pressure Monitoring System (TPMS) Warning Indicator Flashes

The TPMS warning indicator flashes for 70 seconds and then remains on continuously when the ignition is set to ON and the TPMS is malfunctioning. The TPMS status (TPMS_STATUS) PID can be used to determine why the TPMS warning indicator is flashing.

- Tire Pressure Sensor Fault - The message center displays TIRE PRESSURE SENSOR FAULT when a TPMS sensor is malfunctioning.
- No communication with the BCM - The TPMS warning indicator illuminates when the IPC has not received any signals from the BCM for more than 5 seconds. The message center displays TIRE PRESSURE MONITOR FAULT.
- Tire Pressure Monitor Fault - The message center displays TIRE PRESSURE MONITOR FAULT when the TPMS is malfunctioning.

DESCRIPTION AND OPERATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > TPMS PID DEFINITIONS

The BCM monitors the TPMS status. Use the diagnostic scan tool to view the current status of the TPMS status (TPMS_STATUS) PID. This helps identify the current system status and may aid in diagnosing the system. The PID has 4 valid states:

- TPMS_STATUS PID displays SENSOR FAULT if the BCM has not received the tire pressure data from 1 to 3 TPMS sensors for 20 minutes when vehicle speed is above 32.2 km/h (20 mph).
- TPMS_STATUS PID displays SYSTEM FAULT if the BCM has not received the tire pressure data from all 4 TPMS sensors for 20 minutes when vehicle speed is above 32.2 km/h (20 mph).
- TPMS_STATUS PID displays LOW if the BCM has detected that at least 1 TPMS sensor is reporting low tire pressure.
- TPMS_STATUS PID displays SYSTEM ACTIVE if the TPMS is functioning normally.

Last Warning Event PID Definitions

The TPMS uses the TPMS last warning event Parameter Identifications (PIDs) to store detailed information about the last 5 times the TPMS warning indicator was activated. These Parameter Identifications (PIDs) can be used to acquire more information about a particular TPMS event, but must be used carefully.

PID	Definition
EVT1_AGE_IGN through EVT5_AGE_IGN	The number of key cycles since the TPMS was activated. This PID cycles from zero to 255 and then starts over from zero again. This can be used to determine how long ago a TPMS event occurred and the time (in key cycles) between events.
EVT1_TR_LOC through EVT5_TR_LOC	This is the last programmed location for the TPMS sensor identifier causing each TPMS event. Due to tire rotation, the sensor may no longer be at the original location. It is suggested that all the Parameter Identifications (PIDs) be recorded, the system retrained, and then the sensor identifier Parameter Identifications (PIDs) be used to pinpoint the actual location of each sensor.
EVT1_PRES_BP through EVT5_PRES_BP	This is the tire pressure associated with each TPMS indicator event. This can be used along with the function code to clearly identify the TPMS events that were strictly due to low pressure. It can also be used to determine when a sensor is transmitting inaccurate tire pressure.
EVT1_SNSR_ST through EVT5_SNSR_ST	Describes the warning status of each TPMS event by using the information received from the TPMS_STATUS PID. If there is a communication concern, the status could be NORMAL. UNKNOWN

	NORMAL (normal operation) LOW (low pressure event) FAULT (sensor fault or system fault)
EVT1_SNSR_ID through EVT5_SNSR_ID	This is the identifier of the sensor involved in each TPMS event. EVT1 is the most recent event that triggered the TPMS warning indicator.

Radio Frequency Interference (RFI)

RFI can be caused by:

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS.
- Anti-theft alarms (even those installed by the dealership) have been found to create enough RFI to cause the TPMS to malfunction or lose considerable range. These anti-theft alarms can be difficult to locate, as they are usually hidden somewhere out of the way for reduced accessibility.
- Many in-vehicle cell phone chargers have been found to cause considerable RFI. The vehicles with the power point closest to the RTM are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all the time. This depends on the state of charge of the cell phone battery. The phone battery must be almost completely discharged in some cases.
- Power supplies and DC/ AC inverters typically create a lot of RFI. Most consumer grade equipment has very little filtering or shielding.

Using Hit Rate Parameter Identifiers (PIDs) to Determine the Presence of Radio Frequency Interference (RFI)

If an intermittent RFI issue is suspected, the information contained in the last 5 TPMS warning event Parameter Identifiers (PIDs) can be combined with specific Parameter Identifiers (PIDs) from the BCM to determine which TPMS sensors are being affected and if a RFI source is currently present in the vehicle.

The BCM module contains Parameter Identifiers (PIDs) that keep track of the number of TPMS messages received from the 4 trained TPMS sensors. These Parameter Identifiers (PIDs) can provide insight on the performance of the TPMS, and can help establish the presence of an Frequency Interference (RFI) source.

- TPM_HITS_LF (Tire Pressure Monitor Hit Rate Left Front) - The number of TPMS messages received by the BCM module from the LH front sensor
- TPM_HITS_RF (Tire Pressure Monitor Hit Rate Right Front) - The number of TPMS messages received by the BCM module from the RH front sensor.
- TPM_HITS_LRO (Tire Pressure Monitor Hit Rate Left Rear Outer) - The number of TPMS messages received by the BCM module from the LH rear sensor
- TPM_HITS_RRO (Tire Pressure Monitor Hit Rate Right Rear Outer) - The number of TPMS messages received by the BCM module from the RH rear sensor.

Method for determining if a RFI issue has been affecting the TPMS:

- Collect the last 5 TPMS events and determine if they were due to system faults or low tire air pressure.

- Collect the TPMS Hit Rate PID counters and compare them to the last 5 TPMS events.
- If the TPMS Hit Rate PID counters are significantly different from each other or if the locations with lower hit rate values show up as fault locations in last 5 TPMS events and BCM DTC B124D:02 (Tire Pressure Sensor: General Signal Failure) is present, an intermittent RFI source is most likely preventing the signals from these TPMS sensors from reaching the RTM.
- An intermittent RFI source can also be the case when all 4 TPMS sensors show up in the last 5 fault events and BCM DTC B1182:00 (Tire Pressure Monitoring System (TPMS): No Sub Type Information) is present. The possible cause would a strong source of RFI noise.

Original Equipment Manufacturer (OEM) Modules

In some cases the RFI may actually be caused by a module or ground on the vehicle. Depending on the severity of the concern, a dirty ground, improperly built ground shield or module can disable the system. Modules which have microcontrollers using clock circuits to create timing pulses for the microprocessor may radiate RFI.

Using Customer Electronics to Pinpoint Radio Frequency Interference (RFI)

This method can be a way to determine the cause of a concern before the sensors and module are replaced with little or no effect on system performance. Discuss with the customer what types of devices were being used when the event occurred. Determine which power points were being used and, if necessary, ask the devices be activated to determine their affect on the TPMS.

Options for Eliminating Intermittent TPMS Operation Caused by Radio Frequency Interference (RFI)

RFI can be caused by:

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS.
- Anti-theft alarms (even those installed by the dealership) have been found to create enough RFI to cause the TPMS to malfunction or lose considerable range. These anti-theft alarms can be difficult to locate, as they are usually hidden somewhere out of the way for reduced accessibility.
- Many in-vehicle cell phone chargers have been found to cause considerable RFI. The vehicles with the power point closest to the RTM are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all the time. This depends on the state of charge of the cell phone battery. The phone battery must be almost completely discharged in some cases.
- Power supplies and DC/ AC inverters typically create a lot of RFI. Most consumer grade equipment has very little filtering or shielding.

Using Hit Rate Parameter Identifiers (PIDs) to Determine the Presence of Radio Frequency Interference (RFI)

If an intermittent RFI issue is suspected, the information contained in the last 5 TPMS warning event Parameter Identifiers (PIDs) can be combined with specific Parameter Identifiers (PIDs) from the BCM to determine which TPMS sensors are being affected and if a RFI source is currently present in the vehicle.

The BCM module contains Parameter Identifiers (PIDs) that keep track of the number of TPMS messages received from the 4 trained TPMS sensors. These Parameter Identifiers (PIDs) can provide insight on the performance of the TPMS, and can help establish the presence of an Frequency

Interference (RFI) source.

- TPM_HITS_LF (Tire Pressure Monitor Hit Rate Left Front) - The number of TPMS messages received by the BCM module from the LH front sensor
- TPM_HITS_RF (Tire Pressure Monitor Hit Rate Right Front) - The number of TPMS messages received by the BCM module from the RH front sensor.
- TPM_HITS_LRO (Tire Pressure Monitor Hit Rate Left Rear Outer) - The number of TPMS messages received by the BCM module from the LH rear sensor
- TPM_HITS_RRO (Tire Pressure Monitor Hit Rate Right Rear Outer) - The number of TPMS messages received by the BCM module from the RH rear sensor.

Method for determining if a RFI issue has been affecting the TPMS:

- Collect the last 5 TPMS events and determine if they were due to system faults or low tire air pressure.
- Collect the TPMS Hit Rate PID counters and compare them to the last 5 TPMS events.
- If the TPMS Hit Rate PID counters are significantly different from each other or if the locations with lower hit rate values show up as fault locations in last 5 TPMS events and BCM DTC B124D:02 (Tire Pressure Sensor: General Signal Failure) is present, an intermittent RFI source is most likely preventing the signals from these TPMS sensors from reaching the RTM.
- An intermittent RFI source can also be the case when all 4 TPMS sensors show up in the last 5 fault events and BCM DTC B1182:00 (Tire Pressure Monitoring System (TPMS): No Sub Type Information) is present. The possible cause would a strong source of RFI noise.

Original Equipment Manufacturer (OEM) Modules

In some cases the RFI may actually be caused by a module or ground on the vehicle. Depending on the severity of the concern, a dirty ground, improperly built ground shield or module can disable the system. Modules which have microcontrollers using clock circuits to create timing pulses for the microprocessor may radiate RFI.

Using Customer Electronics to Pinpoint Radio Frequency Interference (RFI)

This method can be a way to determine the cause of a concern before the sensors and module are replaced with little or no effect on system performance. Discuss with the customer what types of devices were being used when the event occurred. Determine which power points were being used and, if necessary, ask the devices be activated to determine their affect on the TPMS.

Options for Eliminating Intermittent TPMS Operation Caused by Radio Frequency Interference (RFI)

- If an Original Equipment Manufacturer (OEM) component or customer device is causing a RFI concern, replace the device.
- If a phone charger is causing a RFI concern, the customer should consult with their cell phone provider to acquire a different battery charger.
- If a device such as a dealer installed anti-theft alarm is causing a RFI concern, move the device to another location in the vehicle. In the case of a portable device move the power cord to another power point location.

In summary, if the RFI source is present and cannot be moved or replaced, the intermittent concern remains. The TPMS must accept the unwanted system operation the RFI can cause.

Ambient Temperature Change and Tire Pressure

Tire pressures fluctuate with temperature changes. For this reason, tire pressures must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and illuminate the TPMS warning indicator.

As the ambient temperature decreases by -12.2°C (10°F), tire pressure decreases 6.9 kPa (1 psi). Adjust the tire pressure by 6.9 kPa (1 psi) for each -12.2° C (10° F) of ambient temperature drop as necessary to keep the tire at the specified VC label pressure. To adjust the tire pressure indoors for colder outside temperatures, refer to the following chart.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]
** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.																		
Outside Temperature (˚F)	Tire Placard Pressure (PSI) →

-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

E142982

Component Description

BCM

The BCM is a multifunction module which monitors all sensor inputs and all CAN messages relating to the TPMS. The BCM records and retains the unique sensor identifier of each TPMS sensor.

The BCM retains the previous sensor location information following a tire rotation. For the BCM to learn the new sensor location, the sensors must be trained (calibrated) to the BCM. Refer to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration . Additionally, the sensors must be trained when a new BCM is installed.

When installing a new BCM, there are several procedures that must be carried out in order for the module to function correctly. These procedures include, but are not limited to; PMI, anti-theft parameter reset, programming keyless entry remote and setting customer preferences. Refer to: Body Control Module (BCM) .

RTM

The RTM is a radio signal receiver which collects the tire pressure data from the TPMS sensors.

TPMS Sensor

Each of the 4 TPMS sensors contain a battery, a tire pressure sensor and a radio transmitter. The TPMS sensor radio transmissions are sent approximately once every 60 seconds when the vehicle speed exceeds 32.2 km/h (20 mph).

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > DTC CHARTS

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > DTC CHARTS > RTM DTC CHART

DTC	Description	Action
U0146:00	Lost Communication with Gateway "A": No Sub Type Information	GO to Pinpoint Test H
U0401:00	Invalid Data Received from ECM / PCM "A": No Sub Type Information	GO to Pinpoint Test J
U0401:82	Invalid Data Received from ECM / PCM "A": Alive / Sequence Counter Incorrect / Not Updated	GO to Pinpoint Test J
U1A00:00	Private Communication Network: No Sub Type Information	GO to Pinpoint Test I
U2100:00	Initial Configuration Not Complete: No Sub Type Information	This DTC is present when a new RTM is installed, or when the RTM is incorrectly flashed or reconfigured. This DTC clears when the RTM is correctly configured. Using a diagnostic scan tool, CONFIGURE the RTM. FOLLOW all diagnostic scan tool instructions.
U3000:04	Control Module: System Internal Failure	CHECK vehicle service history for recent service actions related to this module. This DTC sets due to incomplete or improper PMI procedures. If there have been recent service actions with this module, REPEAT the PMI procedure as directed by the diagnostic scan tool.

		If there have been no recent service actions, INSTALL a new RTM to correct the failure to retain configuration data. REFER to: Radio Transceiver Module (RTM) .

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > DTC CHARTS > BCM DTC CHART

DTC	Description	Action
B1182:00	Tire Pressure Monitoring System: No Sub Type Information	GO to Pinpoint Test A
B1182:55	Tire Pressure Monitoring System: Not Configured	This DTC is only present when a new BCM is installed, or the BCM is flashed or reconfigured. This DTC clears when the BCM is correctly configured, all 4 TPMS sensors are trained to the BCM and the BCM self-test completes successfully. Using a diagnostic scan tool, CONFIGURE the BCM. FOLLOW all diagnostic scan tool instructions. TRAIN the TPMS sensors, REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration . CARRY OUT a BCM self-test to clear the DTC.
B124D:02	Tire Pressure Sensor: General Signal Failure	GO to Pinpoint Test E
B1251:00	Tire Pressure Sensor Low Battery: No Sub Type Information	GO to Pinpoint Test C
B1254:51	Right Rear (Outside on Dual Wheel) Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, or the BCM is flashed or reconfigured. This DTC is cleared after the TPMS senors locations are trained to the BCM. TRAIN the TPMS sensors, REFER to: Tire Pressure Monitoring

		System (TPMS) Sensor Location Calibration .
B1255:51	Left Rear (Outside On Dual Wheel) Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, or the BCM is flashed or reconfigured. This DTC is cleared after the TPMS senors locations are trained to the BCM. TRAIN the TPMS sensors, REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .
C1A56:51	Left Front Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, or the BCM is flashed or reconfigured. This DTC is cleared after the TPMS senors locations are trained to the BCM. TRAIN the TPMS sensors, REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .
C1A58:51	Right Front Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, or the BCM is flashed or reconfigured. This DTC is cleared after the TPMS senors locations are trained to the BCM. TRAIN the TPMS sensors, REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .
U0559:56	Invalid Data Received from Radio Transceiver: Invalid / Incomplete Configuration	CHECK the service history for recent service actions related to the RTM. This DTC sets due to incomplete or improper PMI procedures. If there have been recent service actions with the RTM, REPEAT the PMI procedure as directed by the diagnostic scan tool. If there have been no recent service actions with the RTM, INSTALL a new RTM to correct the failure to retain the configuration data. REFER to: Radio Transceiver Module (RTM) .
-	All Other BCM Diagnostic Trouble Codes (DTCs)	REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > SYMPTOM CHART

Symptom Chart: Tire Pressure Monitoring System

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
A module does not respond to the diagnostic scan tool	Fuse Wiring, terminals or connectors Communication network concern BCM	REFER to: MODULE COMMUNICATIONS NETWORK .
TPMS warning indicator is on continuously and the message center displays LOW TIRE PRESSURE	Refer to the Pinpoint Test	GO to Pinpoint Test E
TPMS warning indicator is on continuously and the message center **does not** display LOW TIRE PRESSURE	Diagnostic Trouble Codes (DTCs) present in the BCM or RTM	Using a diagnostic scan tool, RETRIEVE all Diagnostic Trouble Codes (DTCs) from the BCM and the RTM. For any BCM Diagnostic Trouble Codes (DTCs), GO to the BCM DTC Chart . For any RTM Diagnostic Trouble Codes (DTCs), GO to the RTM DTC Chart .
The BCM does not enter TPMS sensor training mode	Refer to the Pinpoint Test	GO to Pinpoint Test F
The TPMS warning indicator is never or always on	Communication network concern IPC	REFER to: Instrumentation, Message Center and Warning Chimes .
One or more TPMS sensors do not train and no Diagnostic Trouble Codes (DTCs) are present	Refer to the Pinpoint Test	GO to Pinpoint Test G

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS

B1182:00

Normal Operations and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

Communication between the RTM and the TPMS sensors can be interrupted by Radio Frequency Interference (RFI), which causes intermittent issues that are not vehicle concerns. Radio Frequency Interference (RFI) is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1182:00	Tire Pressure Monitoring System (TPMS): No Sub Type Information	Set by the BCM in continuous memory when **all 4** of the tire pressure sensors are faulted, not communicating with the RTM or when sensor data is not received by the BCM from the RTM.

Possible Sources

- Radio Frequency Interference (RFI)
- RTM communication concern
- TPMS sensor(s)
- GWM
- BCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for cell phone chargers or GPS units.
- Inspect for Non-Original Equipment Manufacturer (OEM) wheels or run-flat tires.
- Verify horn operation.
- Verify spare tire is not in use.

NOTE: Make sure all aftermarket electronic equipment has been disconnected (if possible) and the customer has been questioned about the electronic equipment they may have been using in the vehicle when this concern was identified.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST A : B1182:00 > PINPOINT TEST A : B1182:00

A1 CHECK FOR COMMUNICATION WITH THE GWM (GATEWAY MODULE A), THE RTM (RADIO TRANSCEIVER MODULE) AND THE BCM (BODY CONTROL MODULE)

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the GWM, the RTM and the BCM all pass the Network Test?

Yes	GO to A2

No	DIAGNOSE the GWM, RTM or BCM does not respond to the scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK FOR RTM (RADIO TRANSCEIVER MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the RTM self-test.

Are any Diagnostic Trouble Codes (DTCs) present in the RTM?

Yes	DIAGNOSE all RTM Diagnostic Trouble Codes (DTCs). GO to the RTM DTC Chart .

No	GO to A3

A3 CHECK THE BCM (BODY CONTROL MODULE) TPMS (TIRE PRESSURE MONITORING SYSTEM) STATUS (TPMS_STATUS) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the BCM TPMS_STATUS PID.

Does the TPMS_STATUS PID display SYSTEM FAULT?

Yes	GO to A4

No	GO to A6

A4 CARRY OUT THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING PROCEDURE

Train all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	The system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	GO to A5

A5 REPEAT THE TPMS (TIRE PRESSURE MONITORING SYSTEM) TRAINING

NOTE: A spare tire cannot be programmed to the vehicle. If a damaged road wheel is located in the vehicle and the RTM cannot communicate with it, or if the damaged wheel has been dropped off at a repair facility, the BCM sets a TPMS sensor fault. Repair and remount the road wheel as necessary to restore system operation.

If the spare tire is in use, repair and remount the road wheel as necessary to restore system operation. REFER to: Wheel and Tire .

Move the vehicle to rotate the wheels at least one-fourth of a turn. Leave the vehicle doors open. Start the sensor training procedure at a different wheel. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did any of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	If only some of the sensors trained, INSTALL a new TPMS sensor for each sensor that failed to train. REFER to: Tire Pressure Monitoring System (TPMS) Sensor . If all the sensors trained, the concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	GO to A6

A6 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals or pins

pushed-out pins - replace pins as necessary

Connect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	The sensors may not be present. DISMOUNT the tires and VERIFY the sensors are present and mounted to the wheels. REFER to: Wheel and Tire . If a sensor is missing, INSTALL a new sensor. REFER to: Tire Pressure Monitoring System (TPMS) Sensor . If all the sensors are present, CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST B : B124D:02

B124D:02

Normal Operation and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

Communication between the RTM and the TPMS sensors can be interrupted by Radio Frequency Interference (RFI), which causes intermittent issues that are not vehicle concerns. Radio Frequency Interference (RFI) is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B124D:02	Tire Pressure Sensor: General Signal Failure	Set by the BCM in continuous memory when 1, 2 or 3 of the tire pressure sensors are faulted, not communicating with the RTM or when sensor data is not received by the BCM from the RTM.

Possible Sources

- Radio Frequency Interference (RFI)
- One or more TPMS sensors not trained
- TPMS sensor(s)

Visual Inspection and Diagnostic Pre-checks

- Inspect for customer electronic devices, such as cell phone chargers or GPS units.
- Inspect for Non-Original Equipment Manufacturer (OEM) wheels or run-flat tires.
- Verify horn operation.
- Verify spare tire is not in use.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST B : B124D:02 > PINPOINT TEST B : B124D:02

B1 CHECK THE BCM (BODY CONTROL MODULE) TPMS (TIRE PRESSURE MONITORING SYSTEM) STATUS (TPMS_STATUS) PID (PARAMETER IDENTIFICATION) AND SENSOR IDENTIFIERS

Ignition ON.

Using a diagnostic scan tool, view and **record** the following BCM Parameter Identifications (PIDs):

Left Front Tire Transmitter Identifier (TPM_S_ID_LF)

Right Front Tire Transmitter Identifier (TPM_S_ID_RF)

Left Rear Tire Transmitter Identifier (TPM_S_ID_LRO)

Right Rear Tire Transmitter Identifier (TPM_S_ID_RRO)

View the BCM TPMS_STATUS PID.

Does the BCM TPMS_STATUS PID display SENSOR FAULT?

Yes	GO to B2

No	If the TPMS_STATUS PID displays SYSTEM FAULT, GO to Pinpoint Test A

B2 CARRY OUT THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING PROCEDURE

Train all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	Using a diagnostic scan tool, LOCATE the updated TPMS sensor identifiers trained to the BCM. COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers not matching those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete. DOCUMENT all TPMS sensor identifiers on the applicable warranty claim.

No	GO to B3

B3 ATTEMPT TO TRAIN THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS AGAIN

Move the vehicle to rotate the wheels at least one-fourth of a turn. Starting at a different wheel, train all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did any of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	If only some of the sensors trained, INSTALL a new TPMS sensor for each sensor that failed to train. REFER to: Tire Pressure Monitoring System (TPMS) Sensor . If all the sensors trained, the concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	GO to B4

B4 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals or pins

pushed-out pins - replace pins as necessary

Connect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	The sensors may not be present. DISMOUNT the tires and VERIFY the sensors are present and mounted to the wheels. REFER to: Wheel and Tire . If the sensors are missing, INSTALL new sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor . CLEAR the Diagnostic Trouble Codes (DTCs). If all the sensors are present, CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues. CLEAR the Diagnostic Trouble Codes (DTCs).

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST C : B1251:00

Normal Operation and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

When one or more of the TPMS sensors have a low battery, the TPMS warning indicator flashes for 70 seconds and then remains on continuously when the ignition is turned to the ON position, and the

message center displays TIRE PRESSURE SENSOR FAULT.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1251:00	Tire Pressure Sensor Low Battery: No Sub Type Information	Sets in continuous memory when attempting to train a TPMS sensor with a low battery.

Possible Sources

- Radio Frequency Interference (RFI)
- One or more TPMS sensors not trained
- TPMS sensor

Visual Inspection and Diagnostic Pre-checks

- Inspect for Non-Original Equipment Manufacturer (OEM) wheels or run-flat tires.
- Verify horn operation.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST C : B1251:00 > PINPOINT TEST C : B1251:00

C1 TRAIN THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS TO DETERMINE THE INOPERATIVE SENSOR

Train all 4 tire pressure sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	The system is operating correctly at this time.

No	**Before installing a new sensor(s):** If a sensor does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still does not respond, ATTEMPT to activate the same sensor again. If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open. If the sensor(s) fails to train a second time, INSTALL a new TPMS sensor(s). REFER to: Tire Pressure Monitoring System (TPMS) Sensor .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST D : DIAGNOSING RADIO FREQUENCY INTERFERENCE FAULTS

Normal Operation and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

One or more TPMS sensors not being trained or missing, RTM wiring and BCM wiring, or an internal failure of the RTM, GWM or BCM can all present symptoms similar to Radio Frequency Interference (RFI).

Possible Sources

- Wiring, terminals or connectors
- Not all TPMS sensors are installed
- TPMS sensor(s) not trained
- TPMS sensor(s)
- Intermittent TPMS operation due to Radio Frequency Interference (RFI)
- RTM
- GWM
- BCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for customer electronic devices, such as a cell phone charger or GPS unit.
- Inspect for aftermarket wheels or run-flat tires (tires with steel body cord plies in the tire sidewall).
- Verify horn operation

NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and the customer has been questioned about the electronic equipment they may have been using in the vehicle when this concern was identified.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST D : DIAGNOSING RADIO FREQUENCY INTERFERENCE FAULTS > PINPOINT TEST D : DIAGNOSING RADIO FREQUENCY INTERFERENCE FAULTS

D1 CHECK FOR COMMUNICATION WITH THE GWM (GATEWAY MODULE A) AND THE RTM (RADIO TRANSCEIVER MODULE)

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Do the GWM and the RTM pass the Network Test?

Yes	GO to D2

No	DIAGNOSE the GWM or RTM does not respond to the scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

D2 CHECK FOR RTM (RADIO TRANSCEIVER MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the RTM self-test.

Are there any Diagnostic Trouble Codes (DTCs) present in the RTM?

Yes	DIAGNOSE all RTM Diagnostic Trouble Codes (DTCs). REFER to the RTM DTC Chart .

No	GO to D3

D3 VIEW THE BCM (BODY CONTROL MODULE) TPMS (TIRE PRESSURE MONITORING SYSTEM) STATUS (TPMS_STATUS) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view the BCM TPMS_STATUS PID.

Does the TPMS_STATUS PID display SYSTEM FAULT?

Yes	GO to D4

No	GO to D6

D4 CARRY OUT THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING PROCEDURE

NOTE: Before beginning TPMS sensor training, make sure the vehicle is away from other vehicles or devices which may cause Radio Frequency Interference (RFI) such as electric motors or radio transmitters.

Train all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	The system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	GO to D5

D5 ATTEMPT TO CARRY OUT THE SENSOR TRAINING PROCEDURE AGAIN USING KNOWN GOOD SENSORS

Move the vehicle to rotate the wheels at least one-fourth of a turn. Leave the vehicle doors open.

Attempt to train known good TPMS sensors from another vehicle. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the known good TPMS sensors train and did the horn sound when each known good sensor was trained?

Yes	If some of the sensors trained, INSTALL a new TPMS sensor for each sensor that failed to train. REFER to: Tire Pressure Monitoring System (TPMS) Sensor . If all the known good sensors trained, INSTALL new TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor .

No	INSTALL a new RTM. REFER to: Radio Transceiver Module (RTM) . If the concern is still present, GO to D6

D6 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins).

damaged or bent pins - install new terminals or pins.

pushed-out pins - install new pins as necessary.

Connect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST E : TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS ON CONTINUOUSLY AND THE MESSAGE CENTER DISPLAYS LOW TIRE PRESSURE

Normal Operations and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B124D:02	Tire Pressure Sensor: General Signal Failure	This DTC sets in continuous memory if any of the TPMS sensors fail to transmit any tire pressure data.

Possible Sources

- Tire pressure not set to specifications listed on the VC label
- Spare tire currently in use
- TPMS sensor

Visual Inspection and Diagnostic Pre-checks

- Verify the spare tire is **not** in use.
- Verify the air pressure in all 4 tires matches the pressure indicated on the VC label.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST E : TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS ON CONTINUOUSLY AND THE MESSAGE CENTER DISPLAYS LOW TIRE PRESSURE > PINPOINT TEST E : TPMS (TIRE PRESSURE MONITORING SYSTEM) WARNING INDICATOR IS ON CONTINUOUSLY AND THE MESSAGE CENTER DISPLAYS LOW TIRE PRESSURE

E1 CHECK FOR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, carry out the BCM Diagnostic Trouble Codes (DTCs).

Is DTC B124D:02 present?

Yes	GO to E2

No	For other BCM Diagnostic Trouble Codes (DTCs), GO to the BCM DTC Chart . If there are no Diagnostic Trouble Codes (DTCs) present in the BCM, GO to E3

E2 VERIFY BCM (BODY CONTROL MODULE) DTC (DIAGNOSTIC TROUBLE CODE) B124D:02

Using a diagnostic scan tool, clear the BCM Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Activate each TPMS sensor. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Activation .

Using a diagnostic scan tool, carry out the BCM Diagnostic Trouble Codes (DTCs).

Is DTC B124D:02 present?

Yes	GO to E3

No	If the TPMS warning indicator is on continuously and the message center is displaying low tire pressure, GO to E3 If the TPMS warning indicator is **not** illuminated and the message center does **not** display low tire pressure, the system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - Component Location .

E3 CHECK FOR SPARE TIRE IN USE

NOTE: A spare tire cannot be programmed to the vehicle. If a damaged road wheel is located in the vehicle and the RTM cannot communicate with it, or if the damaged wheel has been dropped off at a repair facility, the BCM sets a TPMS sensor fault. Repair and remount the road wheel as necessary to restore system operation.

Check the spare tire location.

Is the spare tire in use?

Yes	REPAIR and REMOUNT the wheel to the vehicle. REFER to: Wheel and Tire . ADJUST tire pressures to the required pressure as defined on the VC label.

No	GO to E4

E4 CHECK FOR LOW TIRE PRESSURE

Measure and record the pressure in all 4 tires using a digital tire pressure gauge.

Adjust the pressure for those found to be below the specification listed on the VC label.

To clear the low pressure warning indicator, drive the vehicle for at least 2 minutes above 32.2 km/h (20 mph) or activate each sensor at least twice. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Activation . Do not train the sensors at this time.

Has the TPMS warning indicator gone out?

Yes	The system is operating correctly at this time. The cause was low tire pressure.

No	GO to E5

E5 TRAIN ALL 4 TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS

Train all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	GO to E6

No	GO to Pinpoint Test G

E6 CHECK THE TIRE PRESSURES USING THE BCM (BODY CONTROL MODULE) TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR PARAMETER IDENTIFICATIONS (PIDS)

Using a diagnostic scan tool, view the following BCM Parameter Identifications (PIDs):

Left Front Tire Pressure (TPM_PRES_LF)

Right Front Tire Pressure (TPM_PRES_RF)

Left Rear Tire Pressure (TPM_PRES_LRO)

Right Rear Tire Pressure (TPM_PRES_RRO)

Do the tire pressures indicated by the Parameter Identifications (PIDs) match the tire pressures measured previously, ±20.7 kPa (3 psi)?

Yes	The system is operating normally at this time. The concern may have been caused by an incomplete or incorrectly performed sensor calibration or low tire pressure.

No	INSTALL a new TPMS sensor(s) for the sensor(s) displaying inaccurate tire pressure. REFER to: Tire Pressure Monitoring System (TPMS) Sensor .

PINPOINT TESTS > PINPOINT TEST F : THE BCM (BODY CONTROL MODULE) DOES NOT ENTER TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING MODE

The BCM Does Not Enter TPMS Sensor Training Mode

Normal Operation and Fault Conditions

The training (calibration) can be carried out manually or by using a diagnostic scan tool, REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

When one or more new TPMS sensors are installed or a new BCM is installed, the sensors must be trained (calibrated) to the BCM. For the manual training procedure, the BCM must receive a valid ignition signal, a valid brake pedal position signal and a valid vehicle speed signal. The start-stop switch signal and the brake pedal position signal are both direct inputs to the BCM, the vehicle speed signal is sent to the BCM from the PCM over the HS-CAN1.

If the vehicle has been stationary for more than 30 minutes, the TPMS sensors enter a "sleep mode" to conserve battery power. It becomes necessary to wake them up so they transmit the latest tire pressure information to the RTM. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Activation .

Possible Sources

- Network communication concern
- Stoplamp switch concern
- Start-stop switch concern
- PCM concern
- BCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for customer electronic devices, such as a cell phone charger or GPS unit.
- Inspect for non-Original Equipment Manufacturer (OEM) wheel or run-flat tires.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST F : THE BCM (BODY CONTROL MODULE) DOES NOT ENTER TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING MODE > PINPOINT TEST F : THE BCM (BODY CONTROL MODULE) DOES NOT ENTER TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSOR TRAINING MODE

F1 CHECK FOR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, carry out the BCM self-test.

Are there any "Lost Communication" or "Invalid Data" Diagnostic Trouble Codes (DTCs) present in the BCM?

Yes	DIAGNOSE all BCM Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	GO to F2

F2 CHECK THE IGNITION SWITCH INPUT

Ignition ON.

Observe the start-stop switch LED indicator after entering RUN mode.

Is the start-stop switch LED indicator flashing?

Yes	GO to F3

No	DIAGNOSE the start-stop switch. REFER to: Steering Wheel and Column Electrical Components .

F3 CHECK FOR VEHICLE SPEED-RELATED DIAGNOSTIC TROUBLE CODES (DTCS) IN THE PCM (POWERTRAIN CONTROL MODULE)

Ignition ON.

Using a diagnostic scan tool, carry out the PCM KOEO self-test.

Are there any Diagnostic Trouble Codes (DTCs) present in the PCM?

Yes	DIAGNOSE the PCM DTC. REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS) . REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS) . REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

No	GO to F4

F4 CHECK THE STOPLAMP OPERATION

Press and release the brake pedal while monitoring the stoplamps.

Do the stoplamps operate correctly?

Yes	GO to F5

No	DIAGNOSE the stoplamp switch and stoplamps. REFER to: Stoplamps .

F5 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins).

damaged or bent pins - install new terminals or pins.

pushed-out pins - install new pins as necessary.

Connect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST G : ONE OR MORE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS DO NOT TRAIN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) ARE PRESENT

One or More TPMS Sensors Do Not Train and No Diagnostic Trouble Codes (DTCs) are Present

Normal Operation and Fault Conditions

REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

If the vehicle has been stationary for more than 30 minutes, the TPMS sensors enter a "sleep mode" to conserve battery power. It becomes necessary to wake them up so they transmit the latest tire pressure information to the RTM. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Activation .

Possible Sources

- TPMS sensors
- Radio Frequency Interference (RFI)

Visual Inspection and Diagnostic Pre-checks

- Inspect for customer electronic devices, such as a cell phone charger or GPS unit.
- Inspect for non-Original Equipment Manufacturer (OEM) wheel or run-flat tires.

- Verify horn operation.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST G : ONE OR MORE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS DO NOT TRAIN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) ARE PRESENT > PINPOINT TEST G : ONE OR MORE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS DO NOT TRAIN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) ARE PRESENT

NOTE: The BCM has a 2-minute time limit between sensor responses. If the BCM does not recognize any of the 4 TPMS sensors during this time limit, the horn sounds twice and the message center displays TIRE NOT TRAINED REPEAT. The entire procedure must be repeated.

G1 ATTEMPT TO TRAIN THE TPMS (TIRE PRESSURE MONITORING SYSTEM) SENSORS

TRAIN all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	The system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	If one or more TPMS sensors trained, GO to G2 If none of the TPMS sensors trained, GO to Pinpoint Test D

G2 CHECK FOR RADIO FREQUENCY INTERFERENCE

Ignition ON.

Move the vehicle to rotate the wheels at least one-fourth turn.

TRAIN all 4 TPMS sensors. REFER to: Tire Pressure Monitoring System (TPMS) Sensor Location Calibration .

Did all of the TPMS sensors train and did the horn sound when each sensor was trained?

Yes	The system is operating correctly at this time. The concern may have been caused by Radio Frequency Interference (RFI). For information on locating sources of Radio Frequency Interference (RFI), REFER to: Tire Pressure Monitoring System (TPMS) - System Operation and Component Description .

No	For each sensor that did not train, INSTALL a new TPMS sensor. REFER to: Tire

	Pressure Monitoring System (TPMS) Sensor .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST H : U0146:00

Normal Operation and Fault Conditions

With the ignition ON, the GWM sends messages to the RTM using the MS-CAN 1. If the RTM does not receive these messages within a predetermined time frame, the RTM sets a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0146:00	Lost Communication with Gateway "A": No Sub Type Information	This DTC sets in continuous memory if any of the following messages is missing from the GWM or contain invalid information; ignition status, TPMS status or vehicle configuration data.

Possible Sources

- Network communication concern
- GWM
- RTM

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST H : U0146:00 > PINPOINT TEST H : U0146:00

H1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the GWM pass the Network Test?

Yes	GO to H2

No	DIAGNOSE the GWM does not respond to the scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

H2 RECHECK THE RTM (RADIO TRANSCEIVER MODULE) DIAGNOSTIC TROUBLE CODES

(DTCS)

Using a diagnostic scan tool, clear the RTM Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the RTM self-test.

Is DTC U0146:00 retrieved again?

Yes	GO to H3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

H3 RETRIEVE ALL DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE GWM (GATEWAY MODULE A)

Using a diagnostic scan tool, carry out the GWM self-test.

Are any Diagnostic Trouble Codes (DTCS) present in the GWM?

Yes	DIAGNOSE the GWM Diagnostic Trouble Codes (DTCS). REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to H4

H4 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0146:00 SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test to retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC set in 1 or more modules in addition to the RTM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new GWM. REFER to: Gateway Module A (GWM) .

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RTM. REFER to: Radio Transceiver Module (RTM) .

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) >

PINPOINT TESTS > PINPOINT TEST I : U1A00:00

Normal Operation and Fault Conditions

With the ignition ON, the BCM and the RTM communicate using a LIN. If the RTM is unable to communicate with the BCM using this LIN, the RTM sets a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U1A00:00	Private Communication Network: No Sub Type Information	This DTC sets in continuous memory if the RTM communication bus reset counter reaches zero. This is most likely due to a circuit failure in the LIN, an internal failure of the BCM or an internal failure of the RTM.

Possible Sources

- Wiring, terminals or connectors
- BCM
- RTM

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST I : U1A00:00 > PINPOINT TEST I : U1A00:00

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

I1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Do the RTM and the BCM pass the Network Test?

Yes	GO to I2

No	DIAGNOSE the RTM or BCM does not respond to the scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

I2 CHECK FOR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the BCM self-test.

Are any Diagnostic Trouble Codes (DTCs) present in the BCM?

Yes	DIAGNOSE the Diagnostic Trouble Codes (DTCs). REFER to: Body Control Module (BCM) .

No	GO to I6

I3 CHECK THE RTM (RADIO TRANSCEIVER MODULE) BATTERY VOLTAGE INPUT FOR AN OPEN

Ignition OFF.

Disconnect BCM C2280C .

Disconnect RTM C4458 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280C-22	Ω	C4458-6

Is the resistance less than 3 ohms?

Yes	GO to I4

No	REPAIR the circuit.

I4 CHECK THE RTM (RADIO TRANSCEIVER MODULE) BATTERY VOLTAGE INPUT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4458-6	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I5

No	REPAIR the circuit. VERIFY BCM fuse 32 (10A) is OK. INSTALL a new fuse as necessary.

I5 CHECK THE RTM (RADIO TRANSCEIVER MODULE) GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4458-1	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to I6

No	REPAIR the circuit.

I6 CHECK THE LIN (LOCAL INTERCONNECT NETWORK) CIRCUIT FOR A SHORT TO GROUND

Disconnect BCM C2280B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280B-26	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to I7

No	REPAIR the circuit.

I7 CHECK THE LIN (LOCAL INTERCONNECT NETWORK) CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280B-26	Ω	C4458-2

Is the resistance less than 3 ohms?

Yes	GO to I8

No	REPAIR the circuit.

I8 CHECK THE LIN (LOCAL INTERCONNECT NETWORK) CIRCUIT FOR A SHORT TO VOLTAGE

Connect BCM C2280B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4458-2		Ground

Is a steady voltage greater than 3 volts present?

Yes	REPAIR the circuit.

No	GO to I9

I9 CHECK FOR CORRECT RTM (RADIO TRANSCEIVER MODULE) OPERATION

Ignition OFF.

Inspect the RTM electrical connector.

Repair:

corrosion (install new connector or terminal - clean module pins)

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

Connect RTM C4458 , make sure the connector seats and latches correctly.

Connect all previously disconnected BCM electrical connectors, make sure the connectors seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RTM. REFER to: Radio Transceiver Module (RTM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST J : U0401:00, U0401:82

Normal Operation and Fault Conditions

With the ignition ON, the PCM sends vehicle speed data messages to the GWM along the HS-CAN1. The GWM relays the messages to the RTM using the MS-CAN 1. If the vehicle speed data messages are invalid or faulted, the RTM sets a DTC and the TPMS warning indicator is illuminated.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0401:00	Invalid Data Received from ECM / PCM "A": No Sub Type Information	This DTC sets in continuous memory if the vehicle speed message from the PCM is "invalid" or "faulted" instead of the actual vehicle speed data.
U0401:82	Invalid Data Received from ECM / PCM "A": Alive / Sequence Counter Incorrect / Not Updated	This DTC sets in continuous memory if the vehicle speed message from the PCM does not refresh.

Possible Sources

- Network communication concern
- GWM
- PCM
- RTM

DIAGNOSIS AND TESTING > TIRE PRESSURE MONITORING SYSTEM (TPMS) > PINPOINT TESTS > PINPOINT TEST J : U0401:00, U0401:82 > PINPOINT TEST J : U0401:00, U0401:82

J1 CHECK THE RTM (RADIO TRANSCEIVER MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the RTM self-test.

Is DTC U0146:00 also present?

Yes	DIAGNOSE DTC U0146:00 before diagnosing DTC U0401:00 or U0401:82, GO to Pinpoint Test H

No	GO to J2

J2 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the GWM and the PCM pass the Network Test?

Yes	GO to J3

No	DIAGNOSE the GWM or the PCM does not respond to the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

J3 RECHECK THE RTM (RADIO TRANSCEIVER MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the RTM Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Test drive the vehicle for a minimum of 2 minutes at a speed greater than 24 km/h (15 mph).

Using a diagnostic scan tool, carry out the RTM self-test.

Is DTC U0401:00 or U0401:82 present?

Yes	GO to J4

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

J4 RETRIEVE ANY DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE GWM (GATEWAY MODULE A)

Using a diagnostic scan tool, carry out the GWM self-test.

Are there any Diagnostic Trouble Codes (DTCs) present in the GWM?

Yes	DIAGNOSE the GWM Diagnostic Trouble Codes (DTCs). REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to J5

J5 RETRIEVE ANY DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE PCM (POWERTRAIN CONTROL MODULE)

Using a diagnostic scan tool, carry out the PCM KOEO self-test.

Are there any Diagnostic Trouble Codes (DTCs) present in the PCM?

Yes	DIAGNOSE the PCM DTC. REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS). REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS). REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS.

No	GO to J6

J6 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0146:XX OR U0447:XX SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test for all modules.

Retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC U0146:xx or U0447:xx set in 2 or more modules?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new GWM. REFER to: Gateway Module A (GWM) .

No	GO to J7

J7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0401 OR U0401:XX SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test for all modules.

Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules.

Is DTC U0401 or U0401:xx set in 1 or more modules in addition to the RTM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS). REFER to: POWERTRAIN CONTROL MODULE (PCM) - 3.7L Duratec (227kW/301PS). REFER to: POWERTRAIN CONTROL MODULE (PCM) - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

GENERAL PROCEDURES > TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR ACTIVATION

Special Tool(s) / General Equipment

 E170534	204-D081 TPM Activation Tool

Activation

> *NOTE: The tire pressure sensors will go into a "sleep mode" when a vehicle is stationary to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.*

1.
Turn the ignition switch to the ON position.

2.

Position the special tool against the Left Front (LF) tire sidewall at the tire valve stem. Use Special Service Tool: 204-D081 TPM Activation Tool.

> *NOTE: If a sensor does not respond to the special tool move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.*

> *NOTE: The special tool should provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. This feedback may not always be present, do not rely on it as a confirmation that the module heard a particular sensor.*

3.
Press the test button on the special tool to activate the sensor. Activate the sensor at least 2 times. Use Special Service Tool: 204-D081 TPM Activation Tool.

4.

Repeat Steps 2 and 3 for the remaining tires.

5.

If the TPMS indicator remains illuminated after adjusting and activating each sensor, Refer to: Tire Pressure Monitoring System (TPMS) .

GENERAL PROCEDURES > TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR LOCATION CALIBRATION

Tire Pressure Monitoring System (TPMS) Sensor Location Calibration

Special Tool(s) / General Equipment

 E170534	204-D081 TPM Activation Tool

Programming

NOTE: The TPMS can be placed into learn mode using a diagnostic scan tool or manually where a diagnostic scan tool is not available.

NOTE: ***Enter Training Mode With Scan Tool***

NOTE: The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN Left Front (LF) TIRE.

1.

1.

Select Chassis.

2.

Select TPMS.

3.

Select Training Mode. Use the General Equipment: Ford Diagnostic Equipment

Programming

NOTE: ***Enter Training Mode Without Scan Tool***

NOTE: The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display

TRAIN Left Front (LF) TIRE.

1.
With the ignition OFF, press and release the brake pedal.

2.

Using the start/stop switch, position the ignition from OFF to RUN 3 times, ending in the RUN position.

3.

Press and release the brake pedal.

4.

Position the ignition to OFF position.

5.

Using the start/stop switch, position the ignition from OFF to RUN 3 times, ending in the RUN position.

Programming

NOTE: ***TPMS Sensor Training Procedure***

NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the special tool must remain in place at the valve stem.

1.
Place the special tool on the Left Front (LF) tire sidewall at the valve stem. Press and release the test button on the special tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the BCM. Use Special Service Tool: 204-D081 TPM Activation Tool.

2.

Within 2 minutes of the horn sounding, place the special tool on the Right Front (RF) tire sidewall at the valve stem and press and release the test button to train the Right Front (RF) tire pressure sensor. Use Special Service Tool: 204-D081 TPM Activation Tool.

3.

Repeat Step 1 for the Right Rear (RR) and Left Rear (LR) tires. The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE. For vehicles not equipped with a message center, successful completion of the training procedure will be verified by positioning the ignition to OFF without the horn sounding. If the horn sounds twice when the ignition is positioned to OFF, the training procedure was not successful.

4.

Using the scan tool, locate the updated TPMS sensor identifiers trained to the BCM and document them on the applicable warranty claim. Use Special Service Tool: 204-D081 TPM Activation Tool.

5.

This step is required to clear DTC B1182:55, cause the BCM to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed BCM.

6.

If the sensors are being trained due to the installation of a new BCM, clear any DTC and carry out the BCM On-Demand Self Test.

REMOVAL AND INSTALLATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR > REMOVAL

1.

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

Refer to: Health and Safety Precautions .

2.

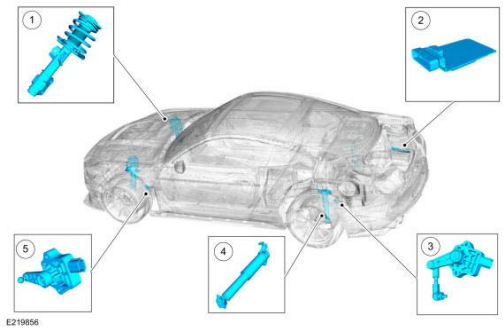
WARNING: The Tire Pressure Monitoring System (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of Tire Pressure Monitoring System (TPMS) sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: The Tire Pressure Monitoring System (TPMS) sensor cannot be removed without disassembly of the wheel and tire.

NOTE: The maximum shelf life of a TPMS snap in valve stems before being mounted to a wheel is 1 year. The production date / week / year is marked on the TPMS sensor / valve stem itself. Snap in valve stems which are older than 1 year are to be scrapped. TPMS snap in sensors with valve stems older than one year should

not be mounted but the valve stem should be replaced.

Refer to: Wheel and Tire .



REMOVAL AND INSTALLATION > TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR > INSTALLATION

NOTE: The Tire Pressure Monitoring System (TPMS) sensor cannot be installed without disassembly of the wheel and tire.

1.
Refer to: Wheel and Tire .

Service Manual: VEHICLE DYNAMIC SUSPENSION

DESCRIPTION AND OPERATION > VEHICLE DYNAMIC SUSPENSION - COMPONENT LOCATION

Item	Description
1	Strut (2 required)
2	VDM
3	Rear height sensor (2 required)
4	Shock (2 required)
5	Front height sensor (2 required)

DESCRIPTION AND OPERATION > VEHICLE DYNAMIC SUSPENSION - OVERVIEW > OVERVIEW

The semi-active, computer-controlled suspension damping system utilizes vehicle sensors and magneto-rheological fluid-filled dampers to offer improved handling, comfort and stability by continuously adjusting the adaptive shock absorber force to the current road and driving conditions.

DESCRIPTION AND OPERATION > VEHICLE DYNAMIC SUSPENSION - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > VEHICLE DYNAMIC SUSPENSION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages - VDM

Broadcast Message	Originating Module	Message Purpose
ABS active	ABS module	Indicates the current ABS activity, on or off.
Ambient air temperature	PCM	This message is sent to the GWM and then to the VDM. Indicates the current ambient air temperature.
Brake pedal applied	PCM	This message is sent to the GWM and then to the VDM. Indicates whether or not the driver is applying the brake pedal.
Brake torque request	ABS module	This message indicates the current amount of braking requested by the ABS module. The VDM adjusts the suspension to prevent nose-diving during hard braking maneuvers.
Driven wheel torque actual	PCM	This message is sent to the GWM and then to the VDM. Indicates the current amount of torque being applied to the rear wheels in Newton meters.
Driven wheel torque request	PCM	This message is sent to the GWM and then to the VDM. Indicates the current amount of torque being requested by the driver through the launch control system.
Engine coolant temperature	PCM	This message is sent to the GWM and then to the VDM. Indicates the current engine coolant temperature in degrees Celsius.
Ignition status	BCM	This message is sent to the GWM and then to the VDM. Indicates the current ignition status; off, accessory, run, start, invalid or unknown.
Odometer master value	IPC	This message is sent to the GWM and then to the VDM. Indicates the current odometer reading in kilometers.
Stability control brake active	ABS module	Indicates the current ESC activity, on or off.
Steering wheel angle	ABS module	Indicates the current steering wheel angle relative to the

		straight ahead position. Used to determine the amount of dampening required during vehicle operation.
Traction control mode	ABS module	Indicates the current traction control activity, on or off.
Vehicle configuration data	BCM	This message is sent to the GWM and then to the VDM. Indicates the current vehicle configuration and optional equipment.
Vehicle lateral acceleration	RCM	Indicates the current lateral acceleration as measured by the sensors in the RCM. Used to determine the amount of dampening required during vehicle operation.
Vehicle longitudinal acceleration	RCM	Indicates the current longitudinal acceleration as measured by the sensors in the RCM. Used to determine the amount of dampening required during vehicle operation.
Vehicle roll rate	RCM	Indicates the current roll rate as measured by the sensors in the RCM. Used to determine the amount of dampening required during vehicle operation.
Vehicle speed	PCM	This message is sent to the GWM and then to the VDM. Indicates the current vehicle speed in kilometers per hour.
Vehicle yaw rate	RCM	Indicates the current yaw rate as measured by the sensors in the RCM. Used to determine the amount of dampening required during vehicle operation.

DESCRIPTION AND OPERATION > VEHICLE DYNAMIC SUSPENSION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > VEHICLE DYNAMIC SUSPENSION

The VDM is connected to the HS-CAN to communicate with the ABS module, the RCM, the BCM and the PCM to monitor vehicle roll, pitch, cornering, braking and acceleration. Using the information received from other modules and the information from the 4 vehicle height sensors, the VDM calculates the best action for each of the 4 suspension dampers.

The driver is also able to select 1 of 4 preset system modes (Tour, Sport, Track or Drag) using the

message center. When a mode is selected, the VDM regulates the magnetic field of the damper piston to keep the suspension "feel" relational to the selected mode.

When the VDM is initialized (ignition ON), it carries out a preliminary electrical check of the height sensors, height sensor circuits, damper piston electromagnetic coils and damper piston electromagnetic coil circuits. Any malfunction detected in the system causes the VDM to set a DTC and send a message over the HS-CAN2 to the GWM. The GWM relays this message to the IPC over the HS-CAN3 and the IPC responds by displaying a message in the message center.

Depending on the DTC present, the VDM may deactivate the dynamic suspension resulting in a firm suspension feel.

Component Description

Vehicle Dynamics Control Module (VDM)

The VDM monitors all sensor inputs and all HS-CAN messages relating to the vehicle dynamic suspension and directly controls the damper piston electromagnetic coils. The VDM sends an individual electrical current to each damper piston to control the amount of damping required.

When a new VDM is installed, it must be programmed with the correct vehicle information for proper dynamic suspension operation. New module programming is carried out using a diagnostic scan tool, follow all diagnostic scan tool instructions. Refer to: MODULE CONFIGURATION .

When one of the following components is installed new, disassembled, disconnected or removed the VDM must be calibrated.

- VDM
- Suspension height sensor
- Front lower control arm
- Front strut assembly
- Rear lower control arm
- Rear shock

The calibration routine is required for the system to learn the zero-position of the vehicle which means the vehicle must be on a level surface, must not be moving and cannot contain any passengers or cargo. The calibration routine is carried out using a diagnostic scan tool. The calibration routine should not be performed with the vehicle raised off the ground or immediately after lowering the vehicle as the suspension will not be in a neutral position. The suspension must be neutralized before performing the calibration routine by driving the vehicle for a short distance such as around a parking lot.

Height Sensor

The height sensor is an electronic device which behaves like a potentiometer to send a variable amount of voltage back to the VDM. The sensor has 3 circuits, one circuit is for the 5 volt sensor supply, one circuit is for sensor ground and one circuit is for the sensor output.

Damper Piston Electromagnetic Coils

Each damper piston contains 2 sets of electromagnetic coils wound around the damper piston. The coils produce a magnetic field restricting flow of fluid in the damper. The VDM uses a PWM output to increase or decrease the magnetic field of the damper piston coils. The higher the PWM, the stronger the

magnetic field, resulting in a "firm" suspension feel.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > DTC CHART: VEHICLE DYNAMICS CONTROL MODULE (VDM)

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

VDM DTC Chart

DTC	Description	Action
B14C1:64	Damper Temperature: Signal Plausibility Failure	GO to Pinpoint Test C
C103E:00	Suspension System Shipping Blocks Not Removed: No Sub Type Information	The vehicle is fitted with spacers designed to maintain a very high vehicle trim height in order to protect against front splitter or rear diffuser damage. If all 4 height sensors have been correctly configured and there are no height sensor Diagnostic Trouble Codes (DTCs) present, the VDM sets this DTC if there is no change in ride height information. REMOVE the shipping blocks from the front struts and rear shock absorbers.
C110C:11	Left Front Damper Solenoid: Circuit Shorted to Ground	GO to Pinpoint Test C
C110C:12	Left Front Damper Solenoid: Circuit Shorted to Battery	GO to Pinpoint Test C
C110C:13	Left Front Damper Solenoid: Circuit Open	GO to Pinpoint Test C

U0151:00	Lost Communication with Restraints Control Module: No Sub Type Information	GO to Pinpoint Test G
U0300:57	Internal Control Module Software Incompatibility: Invalid / Incompatible Software Component	CHECK the service history for recent service actions related to the VDM. This DTC sets due to incomplete or improper PMI procedures. If there have been recent service actions with the VDM, REPEAT the PMI procedure, FOLLOW all diagnostic scan tool instructions. CARRY OUT the ride height sensor calibration routine, FOLLOW all diagnostic scan tool directions. If there have been no recent service actions, INSTALL a new VDM to correct the failure to retain the configuration data. REFER to: Vehicle Dynamics Control Module (VDM) .
U0415:68	Invalid Data Received from Anti-Lock Brake System (ABS) Control Module: Event Information	This DTC sets if the VDM receives invalid or faulted steering wheel angle information or total brake torque information from the ABS module. Using a diagnostic scan tool, RETRIEVE and DIAGNOSE all ABS

		module Diagnostic Trouble Codes (DTCs). REFER to: Anti-Lock Brake System (ABS) and Stability Control . If the diagnostic scan tool cannot communicate with the ABS module, REFER to: MODULE COMMUNICATIONS NETWORK . If there are no Diagnostic Trouble Codes (DTCs) in the ABS module, the DTC may be caused by an intermittent concern. SET the ignition to OFF. DISCONNECT and INSPECT all VDM and ABS module electrical connectors and related in-line connectors for corrosion, bent pins, pushed-out pins and spread terminals. REPAIR as necessary.
U0447:68	Invalid Data Received From Gateway "A": Event Information	This DTC sets if the VDM receives invalid or faulted engine, body or instrument cluster information from the GWM. For additional information on PCM, BCM and IPC messages received by the VDM, REFER to the VDM Network Message Input Chart. REFER to: Vehicle Dynamic Suspension - System Operation and Component Description . Using a diagnostic scan tool, RETRIEVE and DIAGNOSE all GWM Diagnostic Trouble Codes (DTCs). REFER to: MODULE COMMUNICATIONS NETWORK . If the diagnostic scan tool cannot communicate with the GWM, REFER to: MODULE COMMUNICATIONS NETWORK . If there are no Diagnostic Trouble Codes (DTCs) in the GWM, the DTC may be caused by an intermittent concern. SET the ignition to OFF. DISCONNECT and INSPECT all VDM, GWM, PCM, BCM and IPC electrical connectors and related in-line connectors for corrosion, bent pins, pushed-out pins and spread terminals. REPAIR as necessary.
U0452:68	Invalid Data Received from Restraints Control Module: Event Information	This DTC sets if the VDM receives invalid or faulted vehicle yaw rate, lateral acceleration, longitudinal

		acceleration or roll rate information from the RCM. Using a diagnostic scan tool, RETRIEVE and DIAGNOSE all RCM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) . If the diagnostic scan tool cannot communicate with the RCM, REFER to: MODULE COMMUNICATIONS NETWORK . If there are no Diagnostic Trouble Codes (DTCs) in the RCM, the DTC may be caused by an intermittent concern. SET the ignition to OFF and WAIT one minute. DISCONNECT and INSPECT all VDM and RCM electrical connectors and related in-line connectors for corrosion, bent pins, pushed-out pins and spread terminals. REPAIR as necessary.
U3000:47	Control Module: Watchdog / Safety µC Failure	CLEAR the Diagnostic Trouble Codes (DTCs). CARRY OUT the VDM self-test. RETRIEVE and RECORD all Diagnostic Trouble Codes (DTCs). If the DTC returns INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .
U3000:48	Control Module: Supervision Software Failure	CLEAR the Diagnostic Trouble Codes (DTCs). CARRY OUT the VDM self-test. RETRIEVE and RECORD all Diagnostic Trouble Codes (DTCs). If the DTC returns INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .
U3000:49	Control Module: Internal Electronic Failure	CLEAR the Diagnostic Trouble Codes (DTCs). CARRY OUT the VDM self-test. RETRIEVE and RECORD all Diagnostic Trouble Codes (DTCs). If the DTC returns INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .
U3000:4B	Control Module: Over Temperature	This DTC sets when the calculated temperature of the VDM exceeds 115°C (239°F). This can be due to ambient temperature issues or internal circuit current. SET the ignition to OFF and ALLOW the vehicle to cool down for at least

		30 minutes. CLEAR the Diagnostic Trouble Codes (DTCs). CARRY OUT the VDM self-test. RETRIEVE and RECORD all Diagnostic Trouble Codes (DTCs). DIAGNOSE all other VDM Diagnostic Trouble Codes (DTCs) before diagnosing U3000:4B. If the DTC returns INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .
U3000:98	Control Module: Component or System Over Temperature	This DTC sets when the calculated temperature of the VDM exceeds 120°C (248°F). This can be due to ambient temperature issues or internal circuit current. SET the ignition to OFF and ALLOW the vehicle to cool down for at least 30 minutes. CLEAR the Diagnostic Trouble Codes (DTCs). CARRY OUT the VDM self-test. RETRIEVE and RECORD all Diagnostic Trouble Codes (DTCs). DIAGNOSE all other VDM Diagnostic Trouble Codes (DTCs) before diagnosing U3000:4B. If the DTC returns INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .
U3006:2F	Control Module Input Power "A": Signal Erratic	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > SYMPTOM CHART

Symptom Chart: Vehicle Dynamic Suspension

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Condition	Possible Sources	Actions
A module does not respond to the diagnostic scan tool	Fuse Wiring, terminals or connectors VDM concern	REFER to: MODULE COMMUNICATIONS NETWORK .
Message center displays, DRIVE CONTROL MALFUNCTION SERVICE REQUIRED	Diagnostic Trouble Codes (DTCs) present in the VDM	RETRIEVE and DIAGNOSE all VDM Diagnostic Trouble Codes (DTCs).

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS

P0562:16, P1794:18, U3006:2F

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

The VDM requires an operating voltage between 9 and 16 volts. The VDM receives this voltage from the BCM and has a single ground circuit. Excessive resistance or an open in one or more of these circuits, a discharged battery or a inoperative charging system results in the VDM setting a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0562:16	Battery Voltage Low: Circuit Voltage Below Threshold	This DTC sets in continuous memory if the voltage supplied to the VDM falls below 9 volts for more than 3 seconds.
P1794:18	Battery Voltage Circuit: Circuit Current Below Threshold	This DTC sets in continuous memory if the voltage supplied to the VDM falls below 9 volts for more than 60 seconds.
U3006:2F	Control Module Input Power "A": Signal Erratic	This DTC sets in continuous memory if the power reset indicates an irregular shutdown and power up has been detected. This is usually caused by a sudden loss of vehicle battery voltage due to an open circuit, a disconnected electrical connector or disconnected battery terminal.

Possible Sources

- Fuses
- Wiring, terminals or connectors
- VDM

Visual Inspection and Diagnostic Pre-checks

- Make sure the vehicle battery terminals and cables are free of any corrosion and other

contaminants.

- Make sure the vehicle battery terminals are tightened to their correct torque specifications.
- Make sure BJB fuse 66 (5A) is OK.
- Make sure BCM fuse 25 (30A) is OK.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST A : P0562:16, P1794:18, U3006:2F > PINPOINT TEST A : P0562:16, P1794:18, U3006:2F

A1 RECHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the VDM Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Is DTC P0562:16, P1794:18 or U3006:2F still present?

Yes	GO to A2

No	The system is operating correctly at this time. The DTC may have set due to a previous low battery voltage condition.

A2 CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTCS) IN THE PCM (POWERTRAIN CONTROL MODULE)

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Is DTC B1317, B1318, B1676, U3003:16 or U3003:17 present in one or more modules AND are any charging system Diagnostic Trouble Codes (DTCs) present in the PCM?

Yes	DIAGNOSE the vehicle charging concern. REFER to: CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) , CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) or CHARGING SYSTEM - 5.0L 32V TI-VCT .

No	GO to A3

A3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE

Carry out the Battery Condition Test. REFER to: BATTERY .

Did the battery pass the condition test?

Yes	GO to A4

No	INSTALL a new battery. REFER to: Battery .

A4 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) VOLTAGE (VDM_SUPPLY_V) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Measure and record the voltage at the battery.

Using a diagnostic scan tool, monitor the VDM_Supply_V PID.

Is the PID) display within 0.2 volt of the recorded battery voltage?

Yes	GO to A7

No	GO to A5

A5 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) VOLTAGE SUPPLY

Ignition OFF.

Disconnect VDM.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-16		Ground
C4585A-32		Ground

Is the voltage within 1 volt of the recorded battery voltage?

Yes	GO to A6

No	VERIFY BJB fuse 66 (5A) and BCM fuse 25 (30A) are OK. If OK, REPAIR the affected circuit for high resistance or an open. If not OK, REFER to the OEM WIRING DIAGRAMS to identify the cause of the circuit short.

A6 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-47	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A8

No	REPAIR the circuit.

A7 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect all VDM related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to A8

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

A8 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect VDM and all related in-line electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM.REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST B : P0563:17, P1794:17

P0563:17, P1794:17

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

The VDM requires an operating voltage that is between 9 and 16 volts. The VDM receives this voltage from the BCM and has a single ground circuit. Excessive resistance or an open in one or more of these circuits, a discharged battery or a inoperative charging system results in the VDM setting a DTC.

An overcharging condition in the charging system results in the VDM setting a DTC. This DTC may also set in the VDM due to battery charging or vehicle jump starting events.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0563:17	System Voltage High: Circuit Voltage Above Threshold	This DTC sets in continuous memory and on-demand if the voltage supplied to the VDM is above 16 volts for more than 3 seconds.
P1794:17	Battery Voltage Circuit: Circuit Voltage Above Threshold	This DTC sets in continuous memory and on-demand if the voltage supplied to the VDM is above 16 volts for more than 60 seconds.

Possible Sources

- Charging system concern
- VDM

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST B : P0563:17, P1794:17 > PINPOINT TEST B : P0563:17, P1794:17

B1 CHECK FOR HIGH VOLTAGE DIAGNOSTIC TROUBLE CODES (DTCS) SET IN OTHER MODULES

Using a diagnostic scan tool, retrieve all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Is DTC B1317, B1318, B1676, U3003:16 or U3003:17 present in one or more modules AND are any charging system Diagnostic Trouble Codes (DTCs) present in the PCM?

Yes	DIAGNOSE the vehicle charging concern. REFER to: CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) , CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) or CHARGING SYSTEM - 5.0L 32V TI-VCT .

No	GO to B2

B2 CHECK THE BATTERY VOLTAGE

Turn off all interior lights, exterior lights and accessories.

NOTE: Do not allow the engine speed to increase above 2, 000 RPM while performing this step or the generator may self-excite and result in default charging system output voltage. If engine speed goes above 2, 000 RPM, turn the engine off and restart the engine before performing this step.

Start and run the engine at approximately 1, 500 RPM for 3 minutes while monitoring the battery voltage.

Is the battery voltage between 13 and 15.2 volts?

Yes	GO to B3

No	DIAGNOSE the overcharging condition. REFER to: CHARGING SYSTEM - 2.3L ECOBOOST (201KW 273PS) , CHARGING SYSTEM - 3.7L DURATEC (227KW 301PS) or CHARGING SYSTEM - 5.0L 32V TI-VCT .

B3 RECHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) FOR DTC (DIAGNOSTIC TROUBLE CODE) U3003:17

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, clear the VDM Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Is DTC P0563:17 or P1794:17 still present?

Yes	GO to B4

No	The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

B4 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect and inspect VDM and related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to B5

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

B5 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect VDM and all related in-line electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST C : DAMPER SOLENOID ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS)

Damper Solenoid Electrical Fault Diagnostic Trouble Codes (DTCs)

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

The VDM sends a PWM voltage to the shock absorber solenoids based on sensor input and HS-CAN messages. The VDM continually monitors the shock absorber solenoid circuits and sets a DTC when a circuit fault is detected. A shorted or open shock absorber solenoid also causes the VDM to set a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C110C:11 C110D:11 C110E:11 C110F:11	Left Front Damper Solenoid: Circuit Short to Ground Right Front Damper Solenoid: Circuit Short to Ground Left Rear Damper Solenoid: Circuit Short to Ground Right Rear Damper Solenoid: Circuit Short to Ground	This DTC sets in continuous memory when the VDM detects a short to ground on one or both of the shock absorber solenoid circuits for longer than 3 seconds.
C110C:12 C110D:12 C110E:12 C110F:12	Left Front Damper Solenoid: Circuit Short to Battery Right Front Damper Solenoid: Circuit Short to Battery Left Rear Damper Solenoid: Circuit Short to Battery Right Rear Damper Solenoid: Circuit Short to Battery	This DTC sets in continuous memory when the VDM detects a short to battery voltage on one or both of the shock absorber solenoid circuits for longer than 3 seconds.
C110C:13 C110D:13 C110E:13 C110F:13	Left Front Damper Solenoid: Circuit Open Right Front Damper Solenoid: Circuit Open Left Rear Damper Solenoid: Circuit Open Right Rear Damper Solenoid: Circuit Open	This DTC sets in continuous memory when the VDM detects an open circuit on one or both of the shock absorber solenoid circuits for longer than 3 seconds.
C110C:19 C110D:19 C110E:19 C110F:19	Left Front Damper Solenoid: Circuit Current Above Threshold Right Front Damper Solenoid: Circuit Current Above Threshold Left Rear Damper Solenoid: Circuit Current Above Threshold Right Rear Damper Solenoid: Circuit Current Above Threshold	This DTC sets in continuous memory when the VDM detects the shock absorber commanded current is higher than the calibrated threshold.
C110C:1A C110D:1A C110E:1A C110F:1A	Left Front Damper Solenoid: Circuit Resistance Below Threshold Right Front Damper Solenoid: Circuit Resistance Below Threshold Left Rear Damper Solenoid: Circuit Resistance Below	This DTC sets in continuous memory when the estimated shock absorber solenoid resistance is less than 0.4 ohms.

	Threshold Right Rear Damper Solenoid: Circuit Resistance Below Threshold	
C110C:1B C110D:1B C110E:1B C110F:1B	Left Front Damper Solenoid: Circuit Resistance Above Threshold Right Front Damper Solenoid: Circuit Resistance Above Threshold Left Rear Damper Solenoid: Circuit Resistance Above Threshold Right Rear Damper Solenoid: Circuit Resistance Above Threshold	This DTC sets in continuous memory when the estimated shock absorber solenoid resistance is greater than 4 ohms.

Possible Sources

- Wiring, terminals or connectors
- Shock or Strut (solenoid is serviced as an assembly with the shock or strut)
- VDM

Visual Inspection and Diagnostic Pre-checks

- Make sure the solenoid harness is routed correctly and is undamaged.
- Make sure the solenoid electrical connector is free from any corrosion or other contaminants.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST C : DAMPER SOLENOID ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS) > PINPOINT TEST C : DAMPER SOLENOID ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS)

C1 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Is DTC C110X:11 or C110X:1A present?

Yes	GO to C2

No	If DTC C110X:12 is present, GO to C3If DTC C110X:13, C110X:19 or C110X:1B is present, GO to C4

	For all other VDM Diagnostic Trouble Codes (DTCs), GO to the DTC Chart: Vehicle Dynamics Control Module (VDM) .

C2 CHECK THE SHOCK ABSORBER SOLENOID CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Disconnect VDM.

Disconnect the suspect shock absorber solenoid electrical connector.

For the LH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-30	Ω	Ground
C4585A-31	Ω	Ground

For the RH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-27	Ω	Ground
C4585A-28	Ω	Ground

For the LH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-42	Ω	Ground
C4585A-43	Ω	Ground

For the RH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-45	Ω	Ground
C4585A-46	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to C5

No	REPAIR the circuit.

C3 CHECK THE DAMPER SOLENOID CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect VDM.

Disconnect the suspect shock absorber solenoid electrical connector.

Ignition ON.

For the LH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-30		Ground
C4585A-31		Ground

For the RH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-27		Ground
C4585A-28		Ground

For the LH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-42		Ground
C4585A-43		Ground

For the RH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-45		Ground
C4585A-46		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to C5

C4 CHECK THE SHOCK ABSORBER SOLENOID CIRCUITS FOR AN OPEN

Ignition OFF.

Disconnect VDM.

Disconnect the suspect shock absorber solenoid electrical connector.

For the LH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-30	Ω	C1668-2
C4585A-31	Ω	C1668-1

For the RH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-27	Ω	C1669-2
C4585A-28	Ω	C1669-1

For the LH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-42	Ω	C4044-2
C4585A-43	Ω	C4044-1

For the RH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-45	Ω	C4045-2
C4585A-46	Ω	C4045-1

Are the resistances less than 3 ohms?

Yes	GO to C5

No	REPAIR the circuit.

C5 CHECK THE SHOCK ABSORBER SOLENOID CIRCUITS FOR A SHORT TOGETHER

Ignition OFF.

For the LH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-30	Ω	C4585A-31

For the RH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead

C4585A-27	Ω	C4585A-28

For the LH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-42	Ω	C4585A-43

For the RH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4585A-45	Ω	C4585A-46

Are the resistances greater than 10, 000 ohms?

Yes	GO to C6

No	REPAIR the circuit.

C6 CHECK THE SHOCK ABSORBER SOLENOID RESISTANCE

Ignition OFF.

For the LH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C1668-1 **Component Side**	Ω	C1668-2 **Component Side**

For the RH front shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C1669-2 **Component Side**	Ω	C1669-1 **Component Side**

For the LH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4044-2 **Component Side**	Ω	C4044-1 **Component Side**

For the RH rear shock absorber solenoid, measure:

Positive Lead	Measurement / Action	Negative Lead
C4045-1	Ω	C4045-2

Component Side		**Component Side**

Is the resistance between 2.8 and 4.5 ohms?

Yes	GO to C7

No	INSTALL a new front strut or rear shock absorber. REFER to: Front Strut and Spring Assembly . REFER to: Rear Shock Absorber .

C7 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect all VDM and shock absorber solenoid related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to C8

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

C8 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect VDM. Make sure it seats and latches correctly.

Connect all VDM and shock absorber solenoid related in-line electrical connectors. Make sure they seat and latch correctly.

Connect the suspect damper solenoid electrical connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST D : HEIGHT SENSOR ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS)

Height Sensor Electrical Fault Diagnostic Trouble Codes (DTCs)

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

The VDM continually monitors the height sensor circuits and sets a DTC when a circuit fault is detected. A shorted height sensor also causes the VDM to set a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C1A03:12 C1A04:12 C1A05:12 C1A06:12	Left Front Height Sensor: Circuit Short to Battery Right Front Height Sensor: Circuit Short to Battery Left Rear Height Sensor: Circuit Short to Battery Right Rear Height Sensor: Circuit Short to Battery	This DTC sets in continuous memory when the VDM detects a short to battery on one or more of the height sensor circuits.
C1A03:14 C1A04:14 C1A05:14 C1A06:14	Left Front Height Sensor: Circuit Short to Ground or Open Right Front Height Sensor: Circuit Short to Ground or Open Left Rear Height Sensor: Circuit Short to Ground or Open Right Rear Height Sensor: Circuit Short to Ground or Open	This DTC sets in continuous memory when the VDM detects a short to ground or an open on one or more of the height sensor circuits.
C1A03:2A C1A04:2A C1A05:2A C1A06:2A	Left Front Damper Solenoid: Signal Stuck In Range Right Front Damper Solenoid: Signal Stuck In Range Left Rear Damper Solenoid: Signal Stuck In Range Right Rear Damper Solenoid: Signal Stuck In Range	This DTC sets in continuous memory when the VDM does not detect sufficient movement in the height sensor. This could be due to a mechanical failure or excessive resistance in the circuit.
C1A03:64 C1A04:64 C1A05:64 C1A06:64	Left Front Damper Solenoid: Signal Plausibility Failure Right Front Damper Solenoid: Signal Plausibility Failure	This DTC sets in continuous memory when one of the height sensors does not agree with the other sensors.

	Left Rear Damper Solenoid: Signal Plausibility Failure Right Rear Damper Solenoid: Signal Plausibility Failure	

Possible Sources

- Wiring, terminals or connectors
- Height sensor
- VDM

Visual Inspection and Diagnostic Pre-checks

- Make sure the height sensor harness is routed correctly and is undamaged.
- Make sure the height sensor electrical connector is free from any corrosion or other contaminants.
- Make sure the height sensor and linkage are installed and connected correctly.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST D : HEIGHT SENSOR ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS) > PINPOINT TEST D : HEIGHT SENSOR ELECTRICAL FAULT DIAGNOSTIC TROUBLE CODES (DTCS)

D1 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Is DTC C1A0X:14, C1A0X:2A or C1A0X:64 present?

Yes	GO to D2

No	If DTC C1A03:12, C1A04:12, C1A05:12 or C1A06:12 is present, GO to D4 For all other VDM Diagnostic Trouble Codes (DTCs), GO to the DTC Chart: Vehicle Dynamics Control Module (VDM)

D2 CHECK THE HEIGHT SENSOR CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Disconnect VDM.

Disconnect the suspect height sensor electrical connector(s).

For the LH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1733-1	Ω	Ground
C1733-2	Ω	Ground
C1733-3	Ω	Ground

For the RH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1151-1	Ω	Ground
C1151-2	Ω	Ground
C1151-3	Ω	Ground

For the LH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4092-1	Ω	Ground
C4092-2	Ω	Ground
C4092-3	Ω	Ground

For the RH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4093-1	Ω	Ground
C4093-2	Ω	Ground
C4093-3	Ω	Ground

Are the resistance greater than 10, 000 ohms?

Yes	GO to D3

No	For front height sensor concerns, INSPECT connectors C1733 and C1153 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s). For rear height sensor concerns, INSPECT connectors C4092 and C4093 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s).

D3 CHECK THE HEIGHT SENSOR CIRCUITS FOR AN OPEN

For the LH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1733-1	Ω	C4585A-6
C1733-2	Ω	C4585A-21
C1733-3	Ω	C4585A-36

For the RH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1151-1	Ω	C4585A-3
C1151-2	Ω	C4585A-18
C1151-3	Ω	C4585A-34

For the LH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4092-1	Ω	C4585A-17
C4092-2	Ω	C4585A-2
C4092-3	Ω	C4585A-33

For the RH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4093-1	Ω	C4585A-20
C4093-2	Ω	C4585A-5
C4093-3	Ω	C4585A-35

Are the resistance less than 3 ohms?

Yes	If DTC C1A0X:64 is present, GO to D4 If DTC C1A0X:14 or C1A0X:2A is present, GO to D5

No	For front height sensor concerns, INSPECT connectors C1733 and C1153 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s). For rear height sensor concerns, INSPECT connectors C4092 and C4093 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary.If the connectors are OK, REPAIR the affected circuit(s).

D4 CHECK THE HEIGHT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect VDM (if not previously disconnected).

Disconnect the suspect height sensor electrical connector(s) (if not previously disconnected).

Ignition ON.

For the LH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1733-1		Ground
C1733-2		Ground
C1733-3		Ground

For the RH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1151-1		Ground
C1151-2		Ground
C1151-3		Ground

For the LH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4092-1		Ground
C4092-2		Ground
C4092-3		Ground

For the RH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4093-1		Ground
C4093-2		Ground
C4093-3		Ground

Is any voltage present?

Yes	For front height sensor concerns, INSPECT connectors C1733 and C1153 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s). For rear height sensor concerns, INSPECT connectors C4092 and 4093 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s).

No	GO to D5

D5 CHECK THE HEIGHT SENSOR CIRCUITS FOR A SHORT TOGETHER

Ignition OFF.

For the LH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1733-1	Ω	C1733-2
C1733-1	Ω	C1733-3
C1733-2	Ω	C1733-3

For the RH front height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C1151-1	Ω	C1151-2
C1151-1	Ω	C1151-3
C1151-2	Ω	C1151-3

For the LH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4092-1	Ω	C4092-2
C4092-1	Ω	C4092-3
C4092-2	Ω	C4092-3

For the RH rear height sensor, measure:

Positive Lead	Measurement / Action	Negative Lead
C4093-1	Ω	C4093-2
C4093-1	Ω	C4093-3
C4093-2	Ω	C4093-3

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new height sensor. REFER to: Front Suspension Height Sensor . REFER to: Rear Suspension Height Sensor .

No	For front height sensor concerns, INSPECT connectors C1733 and C1153 for corrosion,

	pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s). For rear height sensor concerns, INSPECT connectors C4092 and C4093 for corrosion, pushed out pins, bent pins and spread terminals. REPAIR as necessary. If the connectors are OK, REPAIR the affected circuit(s).

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST E : U0146:00

U0146:00

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

With the ignition ON, the GWM sends messages to the VDM over the HS-CAN2. If the VDM does not receive these messages within a certain time frame, the module sets Diagnostic Trouble Codes (DTCs). For information on the messages sent to the VDM by the GWM, go to the Module Network Input Messages - VDM. REFER to: Vehicle Dynamic Suspension - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0146:00	Lost Communication With Gateway "A": No Sub Type Information	This DTC sets in continuous memory if any one of the BCM, IPC or PCM messages are missing.

Possible Sources

- Wiring, terminals or connectors
- Network communication concern
- GWM

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST E : U0146:00 > PINPOINT TEST E : U0146:00

E1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the GWM pass the Network Test?

Yes	GO to E2

No	DIAGNOSE the GWM does not respond to the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

E2 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the VDM self-test.

Clear the Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Record the VDM Diagnostic Trouble Codes (DTCs).

Is DTC U0146:00 retrieved again?

Yes	GO to E3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

E3 REVIEW THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE VDM (VEHICLE DYNAMICS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the VDM self-test.

Is DTC P0562:16, P0563:17, P1794:17 or P1794:18 present in the VDM?

Yes	If DTC P0562:16 or P1794:18 is present, GO to Pinpoint Test A If DTC P0563:17 or P1794:17 is present, GO to Pinpoint Test B

No	GO to E4

E4 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS) IN THE GWM (GATEWAY MODULE A)

Using a diagnostic scan tool, carry out the GWM self-test.

Are any Diagnostic Trouble Codes (DTCs) present in the GWM?

Yes	GO to the DTC Chart: GWM. REFER to: MODULE COMMUNICATIONS NETWORK .

No	GO to E5

NOTE: If new modules were installed prior to the DTC being set, the module configuration can be incorrectly set during the PMI or the PMI may not have been carried out.

E5 CHECK FOR OTHER CAUSES OF COMMUNICATION NETWORK CONCERN

Check the vehicle service history for recent service actions related to the VDM or GWM. If recent service history is found:

verify the correct replacement module was installed.

HVBOM may be used to verify correct part fitment.

verify the configuration of replacement module was correct.

re-configure the module using as-built data if prior configuration is suspect.

verify the module was not obtained from a like vehicle and installed into customer vehicle.

return the swapped module to source vehicle and obtain new replacement module.

Operate the system and determine if the observable symptom is still present.

Is the observable symptom still present?

Yes	GO to E6

No	The system is operating correctly at this time. The concern may have been due to incorrect parts replacement procedures or incorrect module configuration.

E6 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0146:XX SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test for all modules.

Is DTC U0146:xx set in 1 or more modules in addition to the VDM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new GWM. REFER to: Gateway Module A (GWM) .

No	GO to E7

E7 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect all VDM electrical connectors and related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to E8

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

E8 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect all VDM electrical connectors and all related in-line electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST F : U0121:00

U0121:00

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

With the ignition ON, the ABS module sends messages to the VDM over the HS-CAN2. If the VDM does not receive these messages within a certain time frame, the module sets Diagnostic Trouble Codes (DTCs). For information on the messages sent to the VDM by the ABS module, go to the Module Network Input Messages - VDM. REFER to: Vehicle Dynamic Suspension - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0121:00	Lost Communication With Anti-Lock Brake System (ABS) Control Module: No Sub Type Information	This DTC sets in continuous memory if any of the following ABS module messages is missing.

Possible Sources

- Wiring, terminals or connectors
- Network communication concern
- ABS module

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST F : U0121:00 > PINPOINT TEST F : U0121:00

F1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the ABS module pass the Network Test?

Yes	GO to F2

No	DIAGNOSE the ABS module does not respond to the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

F2 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the VDM self-test.

Clear the Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Record the VDM Diagnostic Trouble Codes (DTCs).

Is DTC U0121:00 retrieved again?

Yes	GO to F3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

F3 REVIEW THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE VDM (VEHICLE DYNAMICS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the VDM self-test.

Is DTC P0562:16, P0563:17, P1794:17 or P1794:18 present in the VDM?

Yes	If DTC P0562:16 or P1794:18 is present, GO to Pinpoint Test A If DTC P0563:17 or P1794:17 is present, GO to Pinpoint Test B

No	GO to F4

F4 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS) IN THE ABS (ANTI-LOCK BRAKE SYSTEM) MODULE

Using a diagnostic scan tool, carry out the ABS module self-test.

Are any Diagnostic Trouble Codes (DTCs) present in the ABS module?

Yes	DIAGNOSE the ABS module Diagnostic Trouble Codes (DTCs). REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	GO to F5

NOTE: If new modules were installed prior to the DTC being set, the module configuration can be incorrectly set during the PMI or the PMI may not have been carried out.

F5 CHECK FOR OTHER CAUSES OF COMMUNICATION NETWORK CONCERN

Check the vehicle service history for recent service actions related to the VDM or ABS module. If recent service history is found:

verify the correct replacement module was installed.

HVBOM may be used to verify correct part fitment.

verify the configuration of replacement module was correct.

re-configure the module using as-built data if prior configuration is suspect.

verify the module was not obtained from a like vehicle and installed into customer vehicle.

return the swapped module to source vehicle and obtain new replacement module.

Operate the system and determine if the observable symptom is still present.

Is the observable symptom still present?

Yes	GO to F6

No	The system is operating correctly at this time. The concern may have been due to incorrect parts replacement procedures or incorrect module configuration.

F6 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0121:XX SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test for all modules.

Is DTC U0121:xx set in 1 or more modules in addition to the VDM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new ABS module. REFER to: Anti-Lock Brake System (ABS) Module .

No	GO to F7

F7 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect all VDM electrical connectors and related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to F8

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

F8 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect all VDM electrical connectors and all related in-line electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST G : U0151:00

U0151:00

Refer to VEHICLE DYNAMIC SYSTEMS for schematic and connector information.

Normal Operation and Fault Conditions

With the ignition ON, the RCM sends messages to the VDM over the HS-CAN2. If the VDM does not receive these messages within a certain time frame, the module sets Diagnostic Trouble Codes (DTCs). For information on the messages sent to the VDM by the RCM, go to the Module Network Input Messages - VDM. REFER to: Vehicle Dynamic Suspension - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0151:00	Lost Communication With RCM: No Sub Type Information	This DTC sets in continuous memory if any of the RCM messages is missing.

Possible Sources

- Wiring, terminals or connectors
- Network communication concern
- RCM

DIAGNOSIS AND TESTING > VEHICLE DYNAMIC SUSPENSION > PINPOINT TESTS > PINPOINT TEST G : U0151:00 > PINPOINT TEST G : U0151:00

G1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the Network Test.

Does the RCM pass the Network Test?

Yes	GO to G2

No	DIAGNOSE the RCM does not respond to the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

G2 CHECK THE VDM (VEHICLE DYNAMICS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, carry out the VDM self-test.

Clear the Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Using a diagnostic scan tool, carry out the VDM self-test.

Record the VDM Diagnostic Trouble Codes (DTCs).

Is DTC U0151:00 retrieved again?

Yes	GO to G3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

G3 REVIEW THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE VDM (VEHICLE DYNAMICS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the VDM self-test.

Is DTC P0562:16, P0563:17, P1794:17 or P1794:18 present in the VDM?

Yes	If DTC P0562:16 or P1794:18 is present, GO to Pinpoint Test A If DTC P0563:17 or P1794:17 is present, GO to Pinpoint Test B

No	GO to G4

G4 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS) IN THE RCM (RESTRAINTS CONTROL MODULE)

Using a diagnostic scan tool, carry out the RCM self-test.

Are any Diagnostic Trouble Codes (DTCs) present in the RCM?

Yes	DIAGNOSE the RCM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	GO to G5

NOTE: If new modules were installed prior to the DTC being set, the module configuration can be incorrectly set during the PMI or the PMI may not have been carried out.

G5 CHECK FOR OTHER CAUSES OF COMMUNICATION NETWORK CONCERN

Check the vehicle service history for recent service actions related to the VDM or RCM. If recent service history is found:

verify the correct replacement module was installed.

HVBOM may be used to verify correct part fitment.

verify the configuration of replacement module was correct.

re-configure the module using as-built data if prior configuration is suspect.

verify the module was not obtained from a like vehicle and installed into customer vehicle.

return the swapped module to source vehicle and obtain new replacement module.

Operate the system and determine if the observable symptom is still present.

Is the observable symptom still present?

Yes	GO to G6

No	The system is operating correctly at this time. The concern may have been due to incorrect parts replacement procedures or incorrect module configuration.

G6 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0151:XX SET IN OTHER MODULES

Using a diagnostic scan tool, carry out the self-test for all modules.

Is DTC U0151:xx set in 1 or more modules in addition to the VDM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints

	Control Module (RCM) .

No	GO to G7

G7 VERIFY ALL WIRING CONNECTIONS

Ignition OFF.

Disconnect all VDM electrical connectors and related in-line electrical connectors.

Using a good light source, inspect **all** disconnected electrical connectors for the following:

corrosion - install new connector or terminal and clean the module pins

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

spread terminals - install new terminals as necessary

Are the connectors free of corrosion, damaged pins, bent pins, pushed-out pins and spread terminals?

Yes	GO to G8

No	REPAIR the connector or terminals. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

G8 CHECK FOR CORRECT VDM (VEHICLE DYNAMICS CONTROL MODULE) OPERATION

Connect all VDM electrical connectors and all related in-line electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new VDM. REFER to: Vehicle Dynamics Control Module (VDM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

REMOVAL AND INSTALLATION > FRONT SUSPENSION HEIGHT SENSOR > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Position the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: LH height sensor assembly shown in illustration below, RH similar.

NOTE: Note the position of the components before removal.

2.

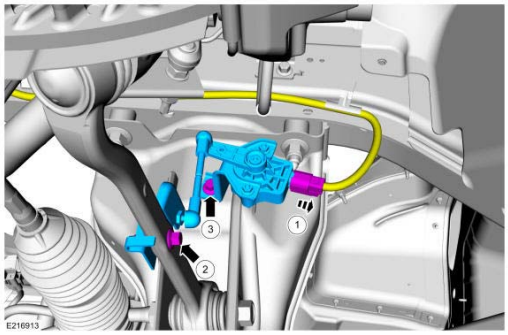
1.

Disconnect the front suspension height sensor electrical connector.

2.

Remove the front suspension height sensor arm bracket-to-lower arm bolt.

Torque



: 177 lb.in (20 Nm)

3.

Remove the front suspension height sensor bracket mounting bolt and remove the sensor.

Torque

: 177 lb.in (20 Nm)

REMOVAL AND INSTALLATION > FRONT SUSPENSION HEIGHT SENSOR > INSTALLATION

*NOTE: The RH and LH height sensor assemblies **cannot** be used on opposite sides of the vehicle.*

NOTE: The linkage must be in a vertical position after installation. Failure to follow these instructions may result in component damage and/or failure.

1.
To install, reverse the removal procedure.

2.

Calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

REMOVAL AND INSTALLATION > REAR SUSPENSION HEIGHT SENSOR > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Position the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

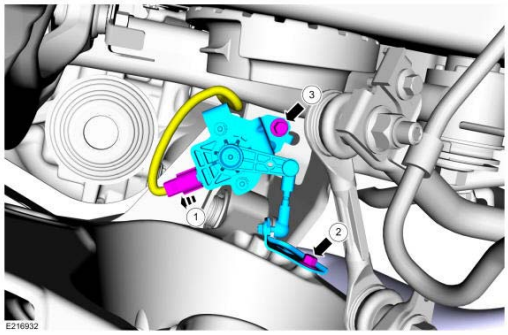
NOTE: LH height sensor assembly shown in illustration below, RH similar.

NOTE: Note the position of the components before removal.

2.

Disconnect the rear suspension height sensor electrical connector.

Remove the rear suspension height sensor arm bracket-to-lower arm bolt.



Torque

: 177 lb.in (20 Nm)

Remove the rear suspension height sensor bracket bolt and remove the sensor.

Torque

: 177 lb.in (20 Nm)

REMOVAL AND INSTALLATION > REAR SUSPENSION HEIGHT SENSOR > INSTALLATION

*NOTE: The RH and LH height sensor assemblies **cannot** be used on opposite sides of the vehicle.*

NOTE: The linkage must be in a vertical position after installation. Failure to follow these instructions may result in component damage and/or failure.

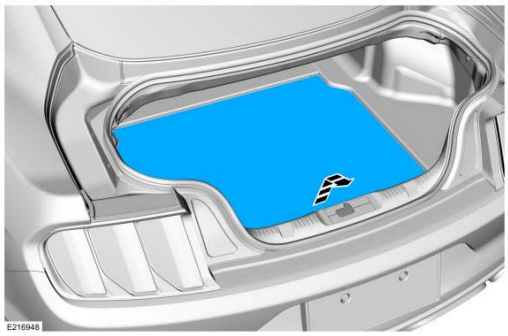
1.
To install, reverse the removal procedure.

2.

Calibrate the suspension system. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

REMOVAL AND INSTALLATION > VEHICLE DYNAMICS CONTROL MODULE (VDM) > REMOVAL

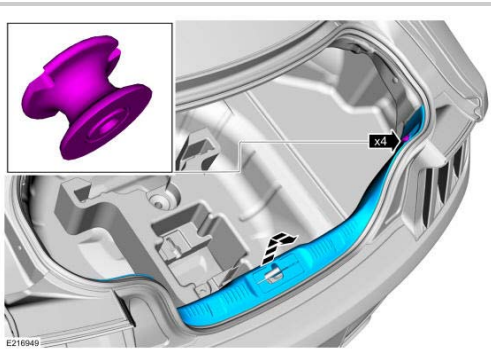
NOTE: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.



NOTE: Removal steps in this procedure may contain installation details.

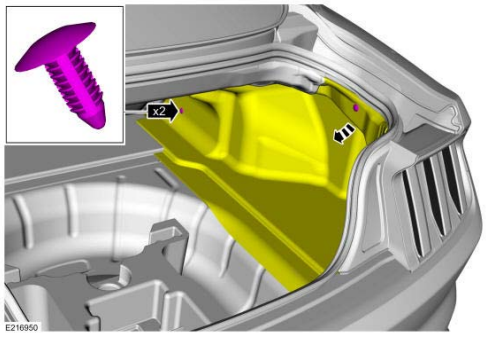
NOTE: The current PMI process must begin with the current VDM installed. If the current VDM does not respond to the diagnostic scan tool, the tool may prompt for As-Built Data as part of the repair.

1.
Using a diagnostic scan tool, begin the PMI process for the VDM following the on-screen instructions.



2.

Remove the load space floor panel.



3.

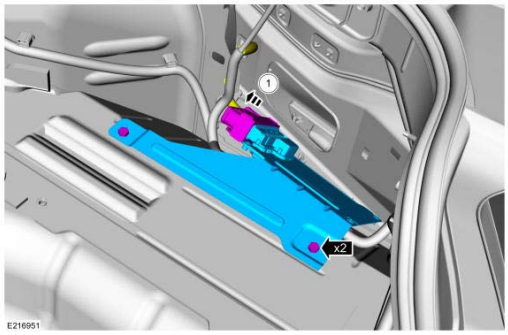
Remove the load space rear trim panel.

4.

Position aside the RH load space trim panel.

5.

1.



Disconnect the VDM electrical connector.

2.

Remove the VDM retainers and remove the VDM.

Torque

: 93 lb.in (10.5 Nm)

REMOVAL AND INSTALLATION > VEHICLE DYNAMICS CONTROL MODULE (VDM) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Using a diagnostic scan tool, complete the PMI process for the VDM following the on-screen instructions.

3.

Calibrate the VDM. Connect the scan tool and carry out the Ride Height Calibration routine. Follow the scan tool directions.

Service Manual: WHEELS AND TIRES

DESCRIPTION AND OPERATION > SAFETY PRECAUTIONS - OVERVIEW > OVERVIEW

WARNING: Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.

NOTE: NOTICE

Ford Recommends The Following For Vehicles With Carbon Fiber And Alloy Wheels:

- **Tire Changer:**
  - Ford requires center clamp style tire changers such as Hunter® Auto 34, Revolution, TC3900 or equivalent. Anything else, especially table top style machines, are highly likely to damage the wheel which is not warrantable. Do not use table top design machines that grab onto the inside of the wheel and that ride on the front wheel flange to remove the tire. Wheel damage will occur.
- **Tire Balancer:**
  - Ford requires the use of wheel balancers that do not contact the wheel face such as, Hunter® Road Force Touch GSP9700. Do not use machines that contact the wheel face. Wheel damage will occur.
- **Alignment Machine:**
  - Ford requires non-spade style alignment machines such as Hunter® Hawkeye Elite, or equivalent. Anything else is highly likely to damage the wheel which is not warrantable. Do not use machines that grab onto or contact the outside edge of the wheel. Wheel damage will occur.

NOTE: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PRELIMINARY INSPECTION

1.

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, Refer to the Symptom Chart: NVH in Symptom Chart(s) .

2.

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

3.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

Inspect the tires for signs of uneven wear. the following descriptions to identify the type of wear.

Check the tires for:

- cuts.
- stone bruises.
- abrasions.
- blisters.
- embedded objects.

Check the valve stems for:

- cracks.
- cuts.

Install a new valve stem when damage is found or anytime a new tire or wheel is installed.

Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than measurement 2/32 inch.

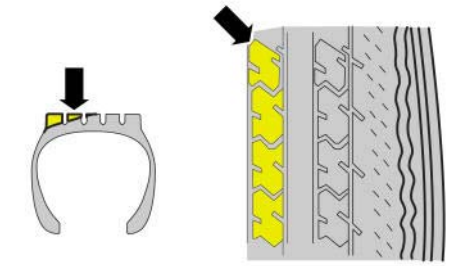
Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

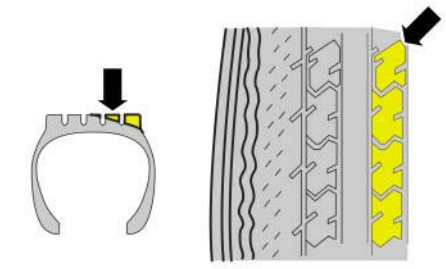


Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

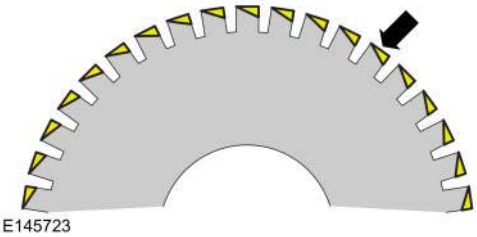
Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than and the tire is not causing a vehicle performance (noise/vibration) concern.

Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.



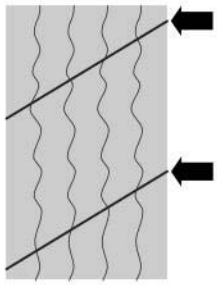
NOTE: Right Front tire shown in illustration below, others similar.



E145721

Outer Edge/Shoulder Wear

Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.



NOTE: Right Front tire shown in illustration below, others similar.

E145722

E145723

Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, it may be necessary to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

DIAGNOSIS AND TESTING > WHEELS AND TIRES > SYMPTOM CHART(S)

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

Symptom Chart: Tire Wear

Condition	Possible Sources	Actions
Inner edge/shoulder wear	Excessive toe out and/or negative camber Incorrect wheel and tire assembly rotation intervals High-speed cornering	GO to Pinpoint Test A
Outer edge/shoulder wear	Excessive toe in and/or positive camber Incorrect wheel and tire assembly rotation intervals High-speed cornering	GO to Pinpoint Test B

Heel/toe wear	Excessive toe in/out Incorrect wheel and tire assembly rotation intervals	ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.
Diagonal wear	Excessive toe in/out Incorrect tire rotation intervals	GO to Pinpoint Test C
	Loose, worn or damaged suspension components	REFER to: Suspension System .

Symptom Chart: NVH

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, REFER to: Noise, Vibration and Harshness (NVH) . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, REFER to: Noise, Vibration and Harshness (NVH) . for the next likely system and continue diagnosis.

Condition	Possible Sources	Actions
Wobble or shimmy	Bent wheel	INSTALL a new wheel as necessary.
	Damaged tire	INSTALL a new tire as necessary.
	Loose wheel nuts	TIGHTEN to specification.
High-speed shake	Tires/wheels	REFER to Radial Runout Measurement - Loaded Hunter Road Force® Method in Component Test- Radial Runout or Radial Runout Measurement - Dial Indicator Method .
Vehicle vibration	Tires/wheels	REFER to Component Test- Radial Runout or Radial Runout Measurement - Dial Indicator Method .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS

Inner Edge, Shoulder Wear

Diagnostic Overview

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS > PINPOINT TEST A : INNER EDGE, SHOULDER WEAR > PINPOINT TEST A : INNER EDGE, SHOULDER WEAR

A1 MEASURE THE TREAD DEPTH

Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth.

Is the tread depth greater than 1.588 mm (0.0625 in) ?

Yes	ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to: Front Camber Adjustment .

No	INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to: Front Camber Adjustment .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS > PINPOINT TEST B : OUTER EDGE, SHOULDER WEAR

Outer Edge, Shoulder Wear

Diagnostic Overview

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS > PINPOINT TEST B : OUTER EDGE, SHOULDER WEAR > PINPOINT TEST B : OUTER EDGE, SHOULDER WEAR

B1 MEASURE THE TREAD DEPTH

Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth.

Is the tread depth greater than 1.588 mm (0.0625 in) ?

Yes	ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal -0.15 degrees (toe out). CHECK and ADJUST caster and camber to nominal. REFER to: Front Camber Adjustment .

No	INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to: Front Camber Adjustment .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS > PINPOINT TEST C : DIAGONAL WEAR

Diagonal Wear

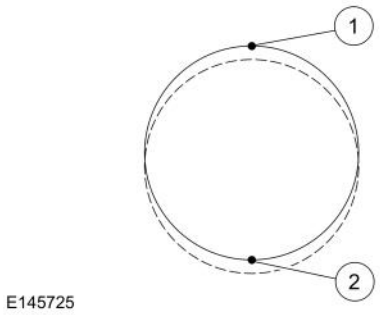
Diagnostic Overview

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DIAGNOSIS AND TESTING > WHEELS AND TIRES > PINPOINT TESTS > PINPOINT TEST C : DIAGONAL WEAR > PINPOINT TEST C : DIAGONAL WEAR

C1 MEASURE THE TREAD DEPTH

Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern.



Is the tread depth greater than 1.588 mm (0.0625 in) ?

Yes	If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary.

No	INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary.

DIAGNOSIS AND TESTING > WHEELS AND TIRES > COMPONENT TEST- RADIAL RUNOUT

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular to the circumference. On a wheel and tire assembly, this means measuring the center tire tread rib. The center rib is indicative of the condition of the tire as a whole. Total runout is the difference between the maximum-to-minimum gauge reading. The high spot is the location of maximum runout.

Item	Description
1	High spot
2	Low spot

Radial Runout Measurement - Loaded Hunter Road Force® Method

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 198.8 mi (320 km). Some initial tire/wheel vibration issues (such as flat spotting) may correct themselves after the tires have been in service for 198.8 mi (320 km). This procedure is intended to assist with the diagnosis of wheel and tire assembly runout and/or force variation issues. The Hunter Road Force® 9700 Series Wheel Balancer measures the wheel and tire assembly's loaded runout and the tire's radial spring rate. The balancer then converts the runout into pounds of force (termed as Road Force). Measuring loaded runout (Road Force) is more effective than measuring unloaded runout using a dial indicator.

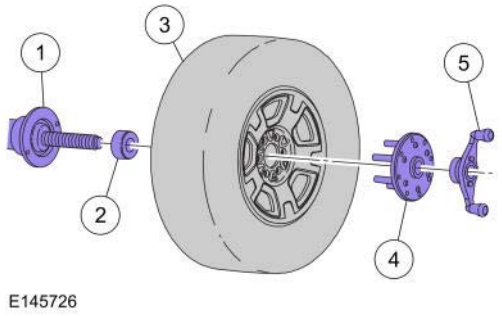
1.

Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

2.

Remove the wheel and tire assemblies. REFER to: Wheel and Tire .

NOTE: Use only a digital tire pressure gauge any time tire pressures are measured to be sure that accurate values are obtained.



3.
Make sure that the tire pressures are set to the correct pressure as indicated on the VC label.

NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 60.0 psi (414 kPa) or above.

NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

NOTE: Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.

4.
Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown in illustration below.

Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5.

Measure the Road Force®.

- Temporarily mark the high spot and the Road Force® value on the sidewall of the tire. If the wheel and tire assembly Road Force® value is greater than 9 kg (20 lb), carry out the Match Mounting procedure to optimize the wheel and tire assembly.
- If the wheel and tire assembly Road Force® value is 9 kg (20 lb) or less, permanently mark the high spot and the Road Force® value on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

DIAGNOSIS AND TESTING > WHEELS AND TIRES > RADIAL RUNOUT MEASUREMENT - DIAL INDICATOR METHOD

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) will correct themselves after the tires have been in service for 320 km (200 mi).

NOTE: Loaded run-out measurements are the preferred method for verifying tire serviceability. While a dial indicator can be used to optimize the position of the tire on the wheel, the unloaded run-out measurement cannot accurately determine if the tire should be removed from service.

NOTE: The following procedures should be used if normal diagnostics leads to a potential runout issue.

NOTE: Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Radial runout measurements can be taken using a dial indicator and should be measured with the wheel and tire assembly mounted on a suitable wheel balancer. The dial indicator should be mounted securely to eliminate gauge movement when measuring runout.

NOTE: Use only a digital tire pressure gauge any time tire pressures are measured to be sure that accurate values are obtained.

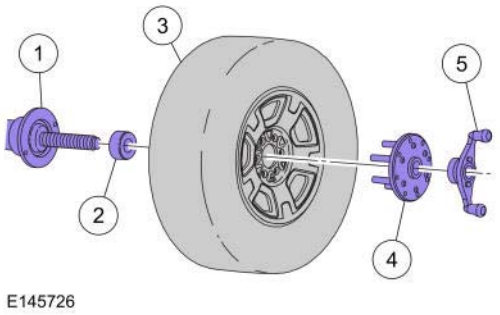
1.

Make sure that the tire pressures are set to the correct pressure as indicated on the VC label.

2.

Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

3.



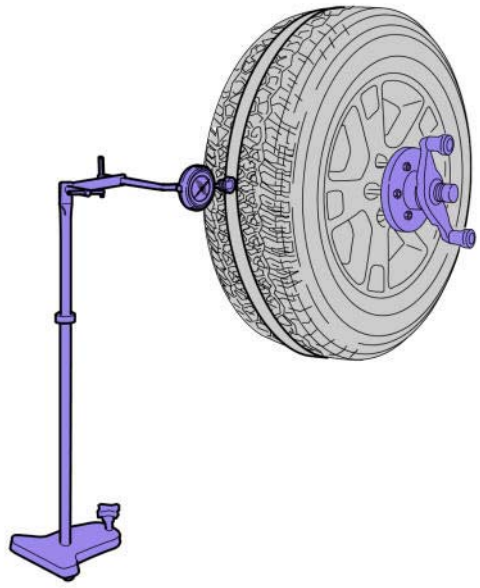
Remove the wheel and tire assemblies. REFER to: Wheel and Tire .

NOTE: Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.

NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 60.0 psi (414 kPa) or above.

4.
Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown in illustration below.

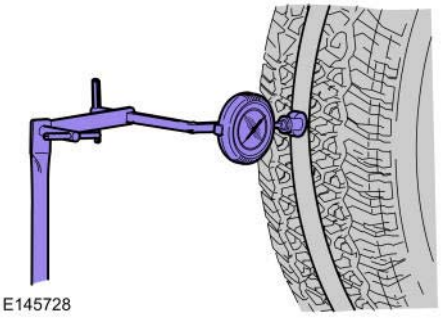


Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

NOTE: Masking tape can be applied on the center tread rib to allow for a smoother measuring surface. Some fluctuation of the gauge reading is expected. Observe the overall sweep of the gauge from the highest to the lowest spot on the tire.

5.
Position a suitable dial indicator and stand with the dial indicator on the center tread rib.

- Rotate the wheel and tire assembly (or wheel) to locate the low spot.
- Adjust the runout gauge to read 0.
- Rotate the wheel and tire assembly one complete revolution to make sure that the low spot has been found and that the dial indicator returns to a 0 reading.



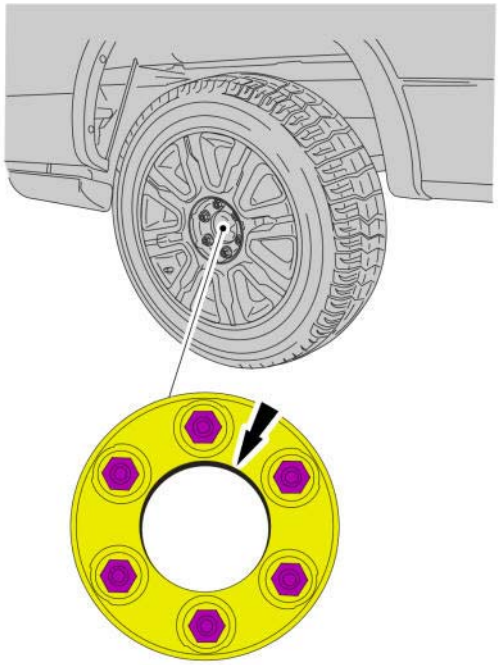
E145727

6.

While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.

- Note the variance (runout) from 0 on the dial of the gauge.
- If the runout reading of a wheel and tire assembly is greater than 1.14 mm (0.045 in), locate and temporarily mark the high spot and runout reading on the sidewall of the tire and carry out the Match Mounting procedure to optimize the wheel and tire assembly.
- If the runout reading of a wheel and tire assembly is 1.14 mm (0.045 in) or less, permanently mark the high spot and the runout reading on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

E145728



GENERAL PROCEDURES > WHEEL TO HUB RUNOUT MINIMIZATION

Check

NOTE: Wheel-to-hub optimization is important. Clearance between the wheel and hub can be used to offset or neutralize the Road Force® or run-out of the wheel and tire assembly. For every 0.001 inch of wheel-to-hub clearance, the Road Force® can be affected between 1 and 3 pounds depending on the tire stiffness.

NOTE: The example below illustrates how the clearance between the wheel and the hub can be used to offset the high spot of radial run-out or Road Force®. Following the procedure will make sure of the best optimization.

1.
Position the wheel and tire assembly on the vehicle so that the high spot location of radial run-out or Road Force® is at the 6 o'clock position and install the wheel nuts by hand until snug.

NOTE: Do not allow the full weight of the vehicle to rest on the tires while tightening the wheel nuts.

2.
Lower the vehicle until the tires make contact with the ground, slightly loading the suspension. Tighten the wheel nuts. Refer to: Wheel and Tire .

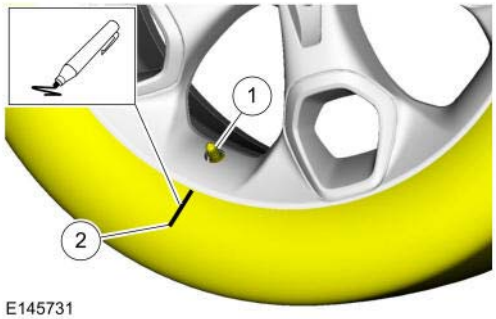
GENERAL PROCEDURES > WHEEL TO TIRE RUNOUT MINIMIZATION

Check

NOTE: Road Force® values in illustrations are shown in pounds.

NOTE: Match mounting is a technique used to reduce radial runout or road force on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel.

NOTE: Position the wheel and tire assembly on a tire machine and put a reference mark on the tire sidewall at the valve stem position.



1.

1.

Valve stem

2.

Reference mark

NOTE: For vehicles equipped with a TPMS, the sensor may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the procedure. Failure to follow these instructions may result in TPMS component damage.

NOTE: Always make sure that the final high spot and measurement values are permanently marked on the inward sidewall of the tire for reference during future wheel and tire service.

2.
Marker. Using a suitable tire machine, separate the tire beads from the wheel.

3.

Lubricate the tire beads using a suitable fast drying, corrosion inhibiting tire bead lubricant. Position the tire 180 degrees (half-way around) on the rim so the valve stem reference mark is now opposite the valve stem.

4.

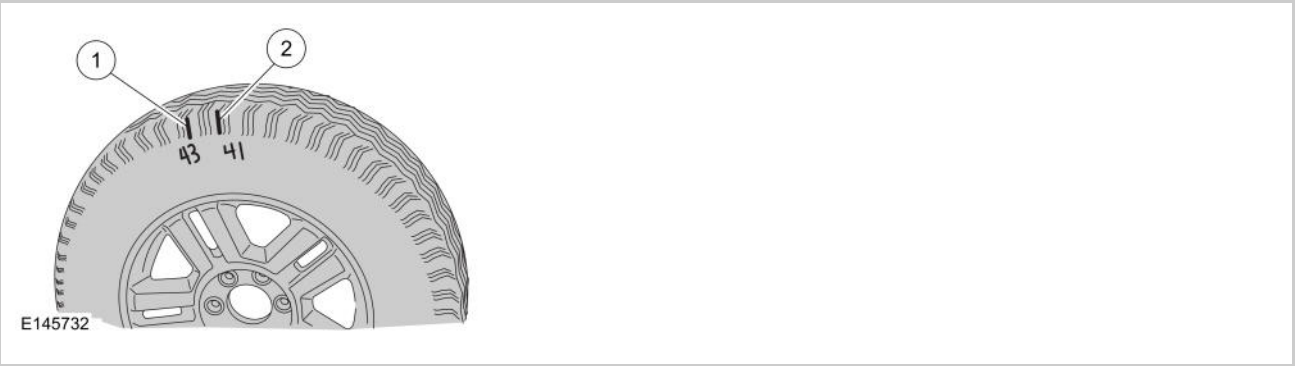
Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly again using a suitable dial indicator or Hunter Road Force® 9700 Series Wheel Balancer. Mark the second high spot on the tire.

5.

If the runout or Road Force is reduced to within specifications, the concern has been resolved. Balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

6.

If the second runout or Road Force® measurement is still not within specification and both high spots are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire (the high spot followed the tire).



7.

1.

First high spot on the tire

2.

Second high spot on the tire

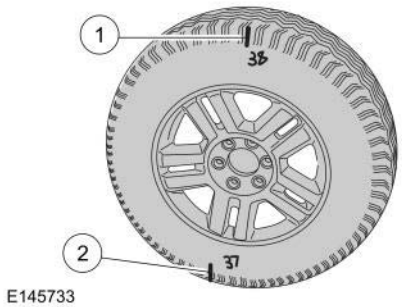
8.

To be SURE that the tire is causing the high runout, it is necessary to have 2 runout or Road Force® measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. If the tire is the cause, install a new tire, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure. If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

9.

If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite

the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. If the wheel runout exceeds 1.14 mm (0.0449 in), install a new wheel, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure. Refer to: Wheel to Hub Runout Minimization .



10.

1.

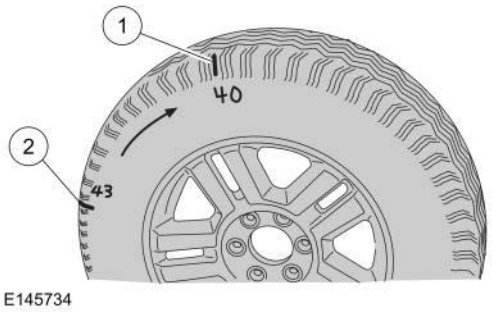
First high spot on the tire

2.

Second high spot on the tire

NOTE: If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

11.
Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).



12.

1.

First high spot on the tire

2.

Second high spot on the tire

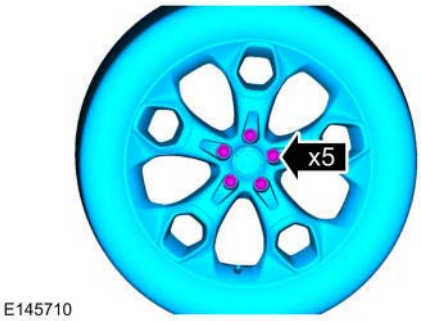
13.

Separate the tire beads from the wheel and rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.

REMOVAL AND INSTALLATION > WHEEL AND TIRE

Materials

Name	Specification
High Temperature Nickel Anti-Seize LubricantXL-2	-



REMOVAL AND INSTALLATION > WHEEL AND TIRE > REMOVAL

1.

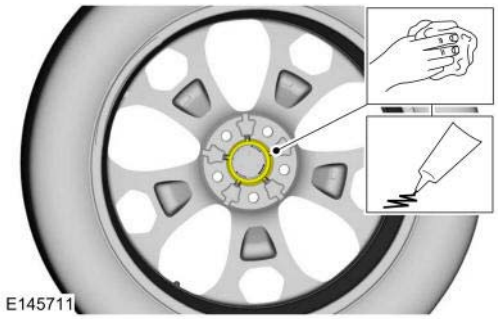
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.

2.
Remove the wheel nuts.

REMOVAL AND INSTALLATION > WHEEL AND TIRE > INSTALLATION

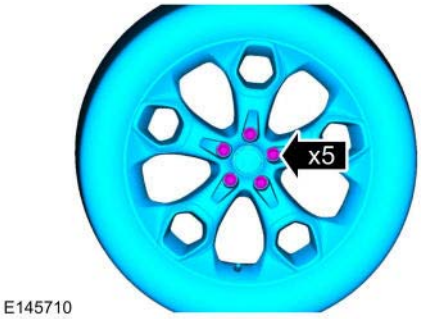
WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).



NOTE: Make sure to apply a thin coat of anti-seize lubricant only to the interface between the wheel pilot bore and the hub pilot. Do not allow the anti-seize to make contact with the wheel-to-brake disc/drum mounting surface, wheel studs, wheel nuts, brake pads or brake disc friction surfaces or damage to components may occur.

1.

Clean the mounting surface of the wheel. Apply the substance from the specified tube.



Material

: High Temperature Nickel Anti-Seize Lubricant / XL-2

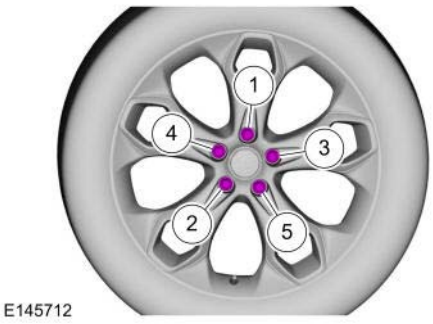
NOTE: Only tighten the nuts finger tight at this stage.

2.
Position the wheel and install the wheel nuts.

3.

WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Failure to tighten the wheel nuts in a star/cross pattern can result in high brake disc runout, which accelerates the development of brake roughness, shudder and vibration.



NOTE: The wheel nut torque specification is for clean, dry wheel stud and wheel nut threads.

NOTE: Final tightening to be performed with vehicle resting on tires.

Tighten the wheel nuts in a star pattern.

Torque

: 148 lb.ft (200 Nm)

DISASSEMBLY AND ASSEMBLY > WHEEL AND TIRE

Special Tool(s) / General Equipment

Wooden Block

DISASSEMBLY AND ASSEMBLY > WHEEL AND TIRE > DISASSEMBLY

NOTE: Failure to follow the instructions below may result in damage to the TPMS.

NOTE: The TPMS sensor is mounted to the valve stem. Removal of the valve stem requires dismounting the tire from the wheel and removal of the TPMS sensor.

NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

1.

Remove the wheel and tire. Refer to: Wheel and Tire .

NOTE: The valve stem is connected to the TPMS sensor. Do not pull the valve stem from the wheel, or damage to the sensor will occur.

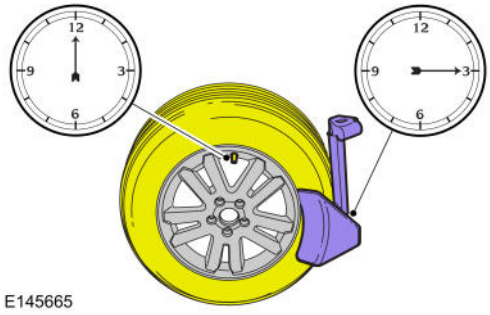
NOTE: If a new TPMS sensor is being installed, remove and discard the valve stem-to-sensor screw and the sensor.

2.
Remove the valve stem core and fully deflate all air from the tire.

NOTE: Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the TPMS sensor may occur.

NOTE: Tire and valve stem position is critical to prevent damage to the TPMS sensor when using a paddle-type bead separator.

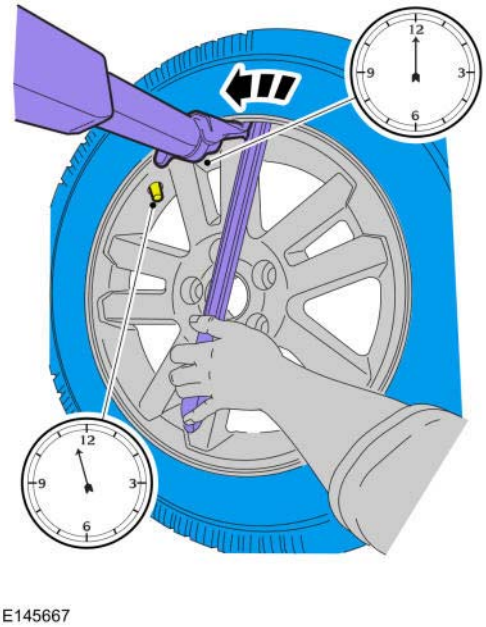
NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.



For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6

o'clock position and the paddle at the 3 o'clock position.

For a roller-type tire machine, align the valve stem with the roller at any position.



NOTE: Paddle type shown in illustration below, roller type similar.

3.

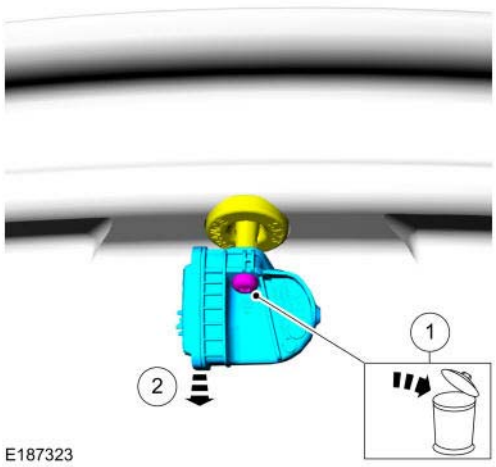
NOTE: Index-mark the valve stem and wheel weight positions on the tire.

4.
Place the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.

5.

Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

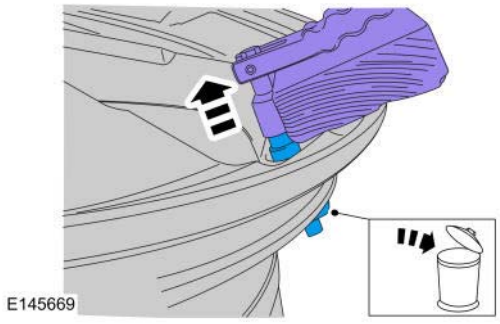
NOTE: A new valve stem must be installed whenever a new tire or wheel is installed.



6.

1.

Remove and discard the TPMS sensor-to-valve stem screw.



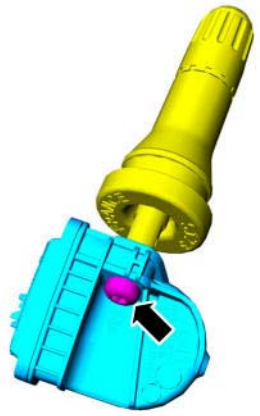
2.

Separate the TPMS sensor from the valve stem.

NOTE: Use care not to damage the wheel surface when removing the valve stem.

7.
Using a suitable valve stem remover/installer, remove and discard the valve stem. Use the General Equipment: Wooden Block

NOTE: When installing a new wheel, always install a new valve stem and sensor screw. Reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused.



NOTE: If the TPMS sensor is being reused, inspect the TPMS sensor for damage and install a new sensor as necessary.

NOTE: To prevent TPMS sensor and valve stem damage, the valve stem must be installed onto the TPMS sensor and then installed into the wheel as an assembly.

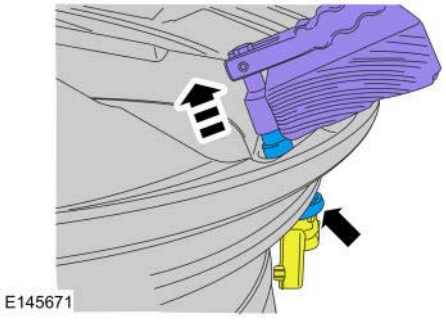
8.
Position the new valve stem onto the TPMS sensor and install the new screw.

Torque

: 13 lb.in (1.5 Nm)

E187324

DISASSEMBLY AND ASSEMBLY > WHEEL AND TIRE > ASSEMBLY



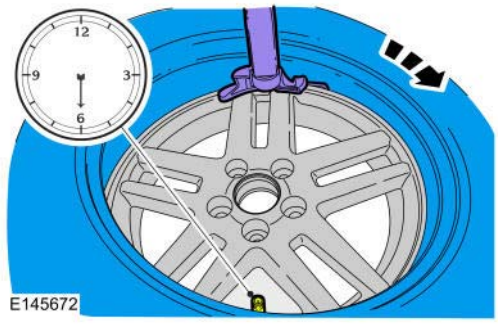
NOTE: Damage to the TPMS sensor may result if the tire mounting is not carried out as instructed.

NOTE: It is important to pull the valve stem and TPMS sensor assembly through the wheel rim hole in a direction parallel to the valve stem hole axis. If the assembly is pulled through at an angle, damage to the valve stem and sensor assembly may occur.

NOTE: Use care not to damage the wheel surface when installing the valve stem and TPMS sensor assembly.

NOTE: Lubricate the valve stem with soapy water and install the valve stem and TPMS sensor assembly into the wheel using a block of wood and a suitable valve stem installer.

1.
Using a suitable valve stem installer, install the new valve stem and TPMS sensor assembly. Use the General Equipment: Wooden Block



NOTE: Lubricate the tire beads using a suitable fast-drying, corrosion-inhibiting tire bead lubricant.

NOTE: Do not mount the tire at this time.

2.
Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.

3.

Position the wheel to align the valve stem with the machine arm, at the 6 o'clock position, and mount the bottom bead of the tire.

4.

Reposition the wheel to align the valve stem with the machine arm at the 6 o'clock position, and mount the top bead of the tire.

> *NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.*

5.
Inflate the tire to the pressure specified on the VC label located on the driver door or door pillar.

> *NOTE: Proceed to the next step if the tire beads do not seat at the specified inflation pressure.*

> *WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire in order to seat the beads, follow all steps listed below. Failure to follow these steps may result in serious personal injury.*

> *NOTE: The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.*

6.

1.

Relubricate the tire bead and wheel bead seat area.

2.

Install a remote valve and pressure gauge.

3.

Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.

4.

Inflate the tire using the remote valve and tire gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.

5.

Place the wheel and tire assembly in an OSHA-approved tire safety cage.

6.

Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall.

Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.

7.

Install the wheel and tire. Refer to: Wheel and Tire .

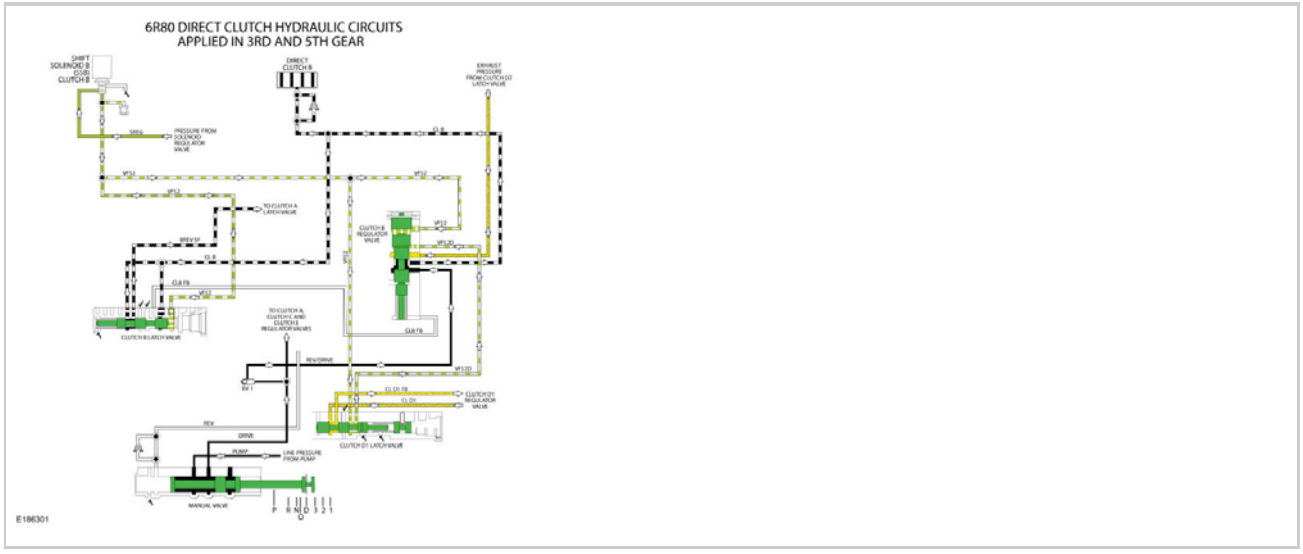
Direct Clutch (B) Hydraulic Circuits

To apply the direct clutch (B), the manual valve can be in the REVERSE, DRIVE, 3, 2 or 1 position to provide line pressure to the clutch B regulator valve through the REV/DRIVE circuit.

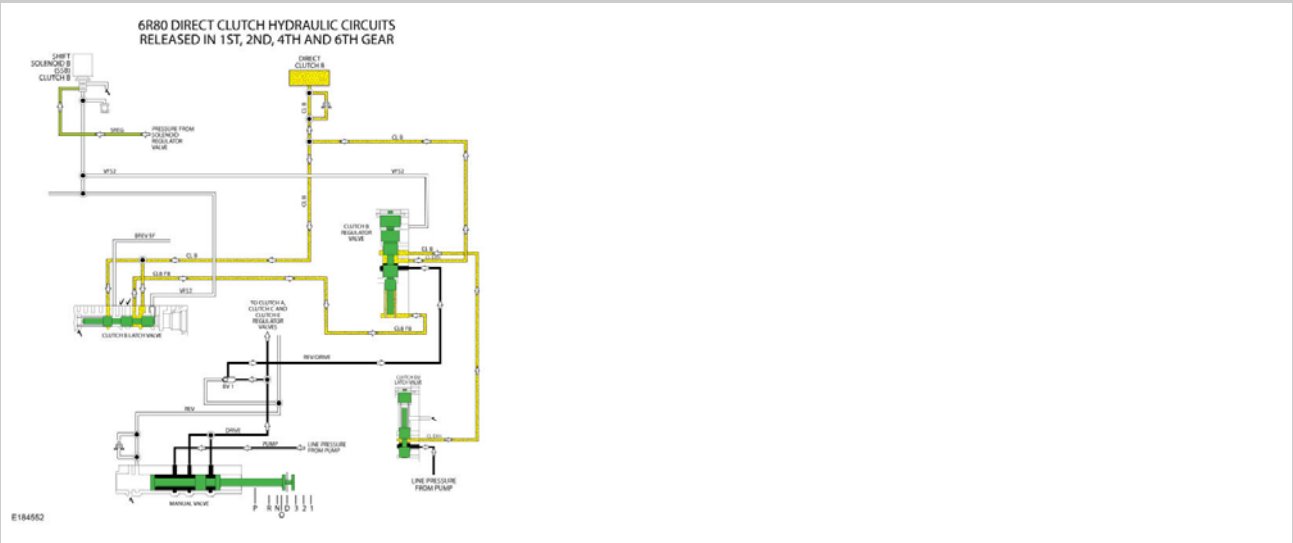
For the direct clutch (B) to apply in reverse, SSB provides regulated solenoid pressure from the SREG circuit to the clutch B regulator and latch valves through the VFS2 circuit.



The clutch B regulator valve provides regulated line pressure to the CL B circuit to apply the direct clutch (B).

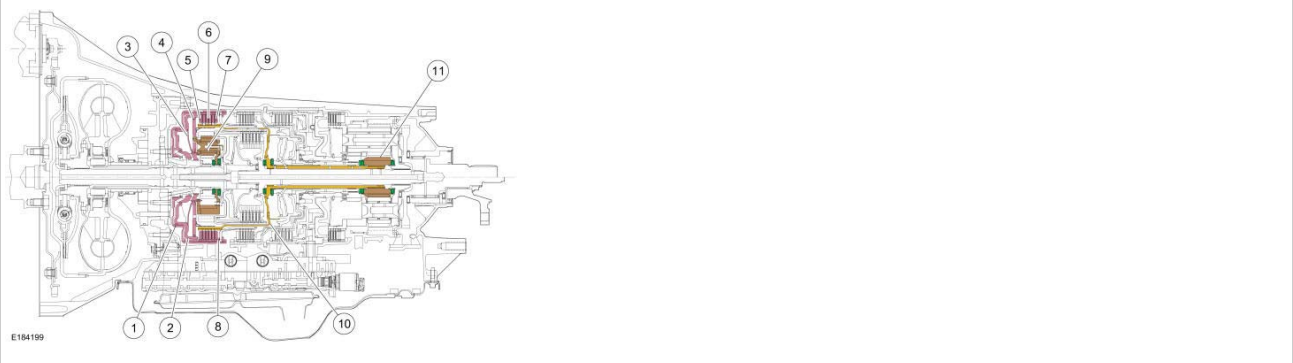
Direct (3, 5, R) Clutch Hydraulic Circuits (Applied in reverse)

The direct clutch is applied the same way in 3rd and 5th gear with one exception. VFS2 pressure is routed through the Clutch D1 Latch valve into the VFS2D circuit. VFS2D is routed to the clutch B regulator valve where it opposes VFS2 pressure. This action effectively reduces the amount of VFS2 force acting on the regulator valve and results in a smooth shift.

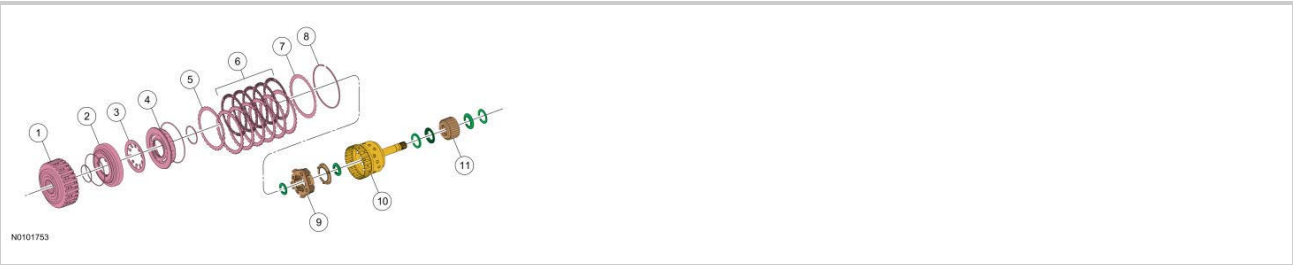


Direct (3, 5, R) Clutch Hydraulic Circuits (Applied in 3rd and 5th gear)

To release the direct clutch (B), In 1st, 2nd, 4th or 6th gear, the manual valve supplies line pressure to the clutch B regulator valve. The SSB lowers pressure to the clutch B regulator and clutch B latch valve to position the valves to lower the regulated line pressure in the CL B circuit to release the clutch.



In 2nd, 3rd, 4th, 5th and 6th gear, the D2 Latch valve directs exhaust circuit pressure from the CL EXH circuit to the CL B circuit to fill the circuit and the direct clutch (B) with fluid at low pressure, approximately 21 kPa (3 psi). This keeps air out of the Clutch B circuits resulting in smooth shifts when the clutch is applied in 3rd or 5th gear.



Direct Clutch (B) Released in 1st, 2nd, 4th and 6th Gear

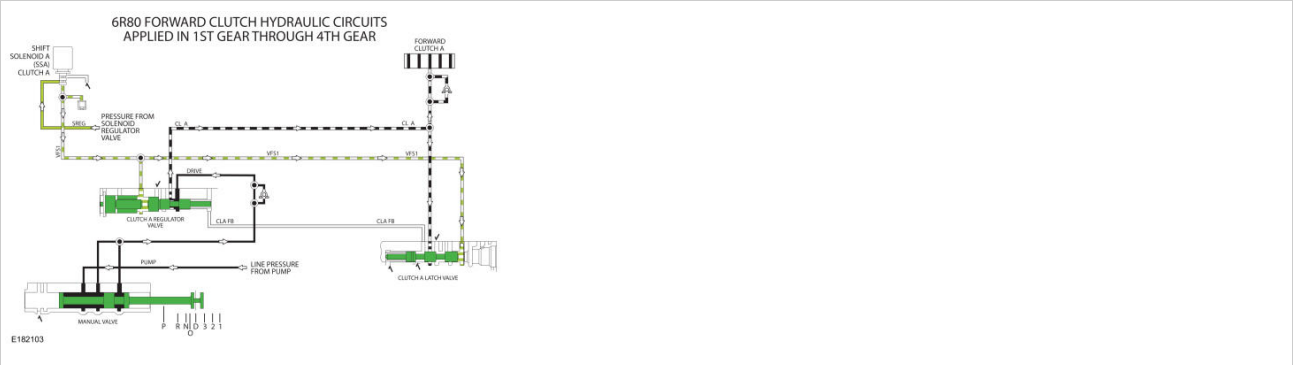
11	Rear planetary No. 3 sun gear

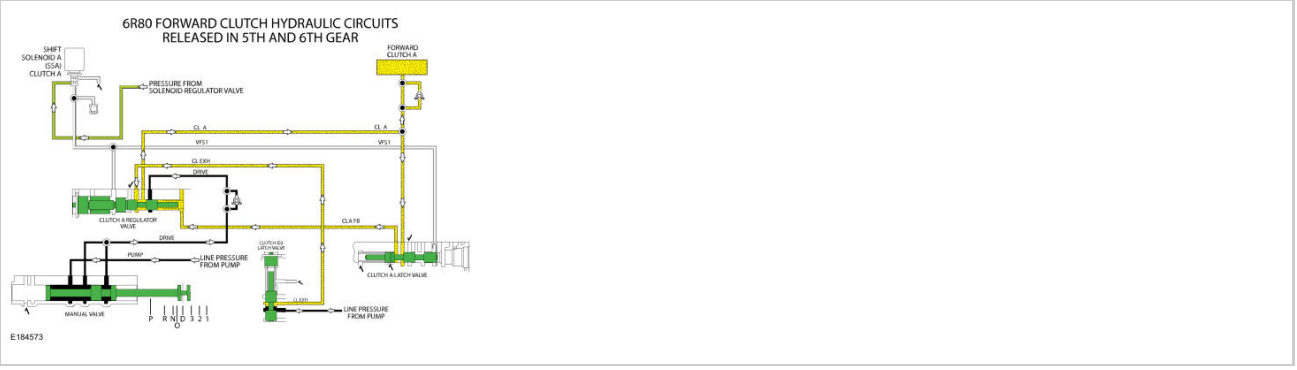


Forward Clutch Hydraulic Circuits

To apply the forward clutch, the manual valve must be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch A regulator valve through the DRIVE circuit.

For the forward clutch to apply, SSA provides regulated solenoid pressure from the SREG circuit to the clutch A regulator and latch valves through the VFS1 circuit to position the valves.

The clutch A regulator valve provides regulated line pressure to the CL A circuit to apply the forward clutch.



Forward (1, 2, 3, 4) Clutch Hydraulic Circuits (Applied in 1st, 2nd, 3rd and 4th gear)

The forward clutch is released when the manual valve is in the NEUTRAL, REVERSE or PARK position or the when the manual valve is in the DRIVE position with the transmission in 5th or 6th gear.

To release the forward clutch, the SSA lowers pressure to the clutch A regulator and the clutch A latch valve. This blocks the regulated line pressure in the CL A circuit to release the forward clutch.

In 2nd, 3rd, 4th, 5th and 6th gear, the D2 Latch valve directs exhaust circuit pressure from the CL EXH circuit to the CL A circuit to fill the circuit and the forward clutch with fluid at low pressure, approximately 21 kPa (3 psi). This keeps air out of the Clutch A circuits resulting in smooth shifts when the clutch is applied during a downshift into 4th gear.

DESCRIPTION AND OPERATION > INTERMEDIATE CLUTCH ASSEMBLY

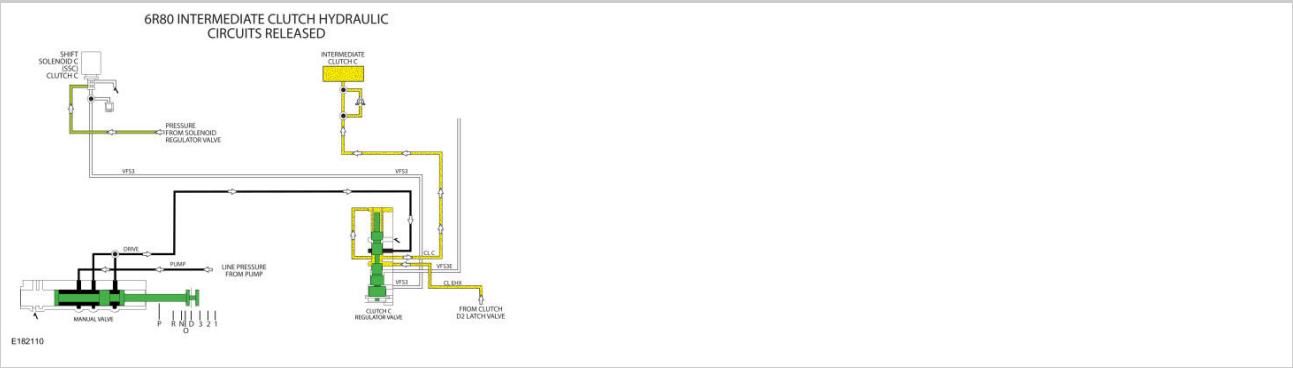
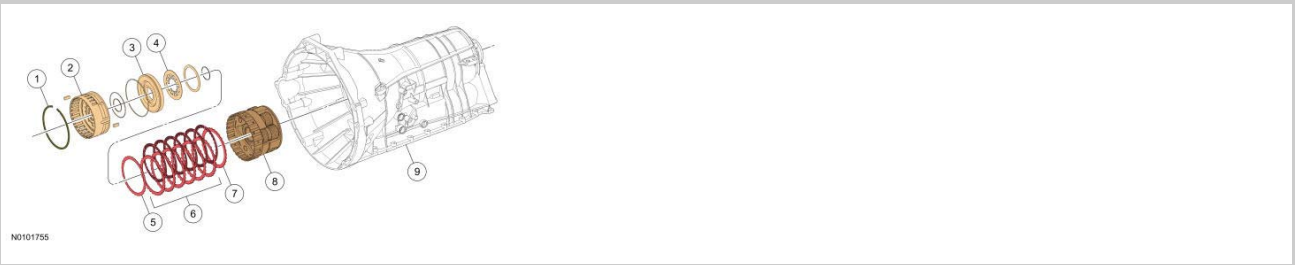
10	Rear planetary sun gear No. 2
11	Transmission case assembly



Intermediate Clutch (C) Hydraulic Circuits

To apply the intermediate clutch, the manual valve can be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch C regulator valve through the DRIVE circuit. SSC provides regulated solenoid pressure from the SREG circuit to the clutch C regulator valve through the VFS3 circuit to position the valve to apply the intermediate clutch). As the intermediate clutch is applied, SSC increases pressure to the clutch C regulator valve. The clutch C regulator valve provides regulated line pressure to the CL C circuit to apply the intermediate clutch. In 6th gear, regulated solenoid pressure from the clutch E latch valve is supplied to the clutch C regulator valve through the VFS3E circuit. VFS3E opposes VFS3 pressure. This action effectively reduces the amount of VFS3 force acting on the regulator valve and results in a smooth shift into 6th gear.

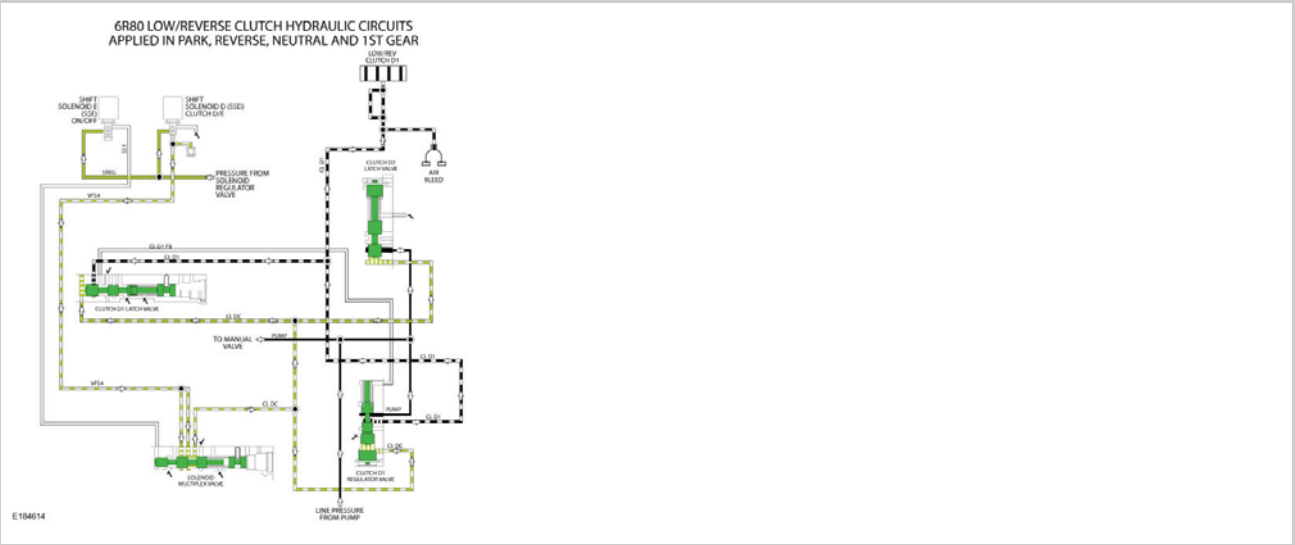
Intermediate (2, 6) Clutch Hydraulic Circuits (Released)



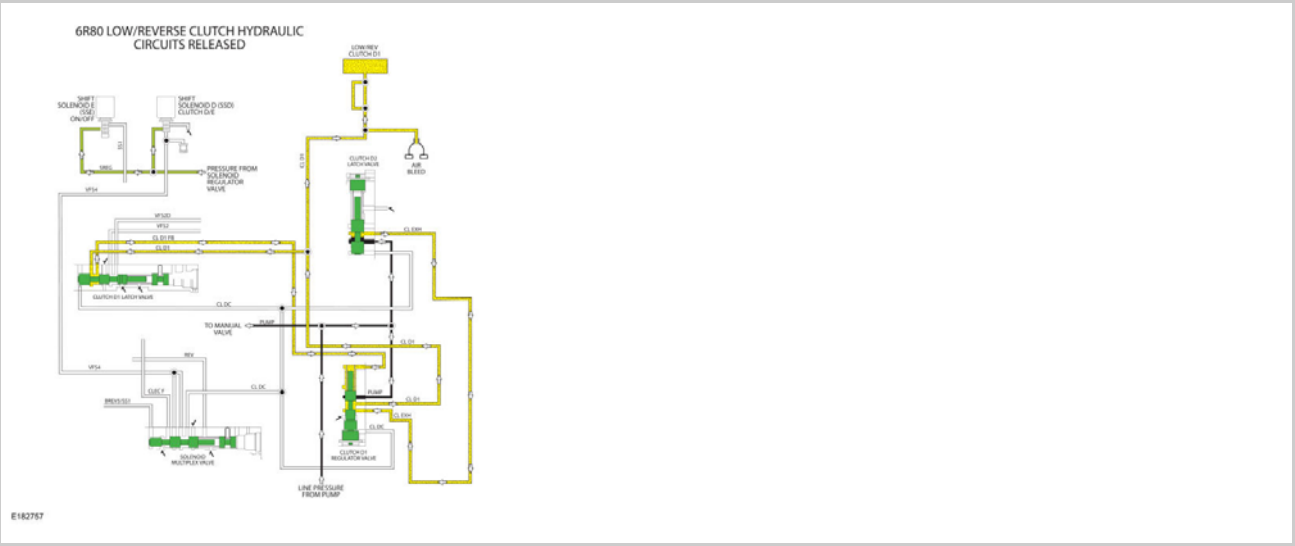
In 2nd, 3rd, 4th, 5th and 6th gear, the D2 Latch valve directs a small amount of fluid from the PUMP circuit the CL EXH circuit. When SSC is hydraulically off and the Manual Valve is in DRIVE, the Clutch C circuits are filled with fluid from the CL EXH circuit under low pressure, (21kPa/ 3 PSI). This keeps air out of the Clutch C circuits resulting in smooth shifts when the clutch is applied in 2nd and 6th gear.

DESCRIPTION AND OPERATION > LOW REVERSE CLUTCH ASSEMBLY

Low/Reverse Clutch Cutaway View



Low/Reverse Clutch Exploded View



Item	Description

5	Low/reverse clutch disc cushion plate
6	Low/reverse clutch assembly
7	Low/reverse clutch pressure plate
8	Rear planetary carrier assembly
9	Transmission case assembly

Low/Reverse Clutch Hydraulic Circuits

To apply the low/reverse clutch, the manual valve can be in any position. Line pressure is supplied to the D1 regulator and latch valves through the PUMP circuit. SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit where it is directed to the D1 regulator and latch valves through the CL DC circuit to position the valves. The clutch D1 regulator valve provide regulated line pressure from the PUMP circuit to the CL D1 circuit to apply the low/reverse clutch.

In 2nd, 3rd, 4th, 5th and 6th gear, the D2 Latch valve directs a small amount of fluid from the PUMP circuit the CL EXH circuit. When SSD is hydraulically off and the Manual Valve is in DRIVE, CLD1 circuits are filled with fluid from the CL EXH circuit under low pressure, (21kPa/ 3 PSI). This keeps air out of the CLD1 circuit resulting in a smooth downshift into 1st gear.

DESCRIPTION AND OPERATION > LOW ONE-WAY CLUTCH ASSEMBLY

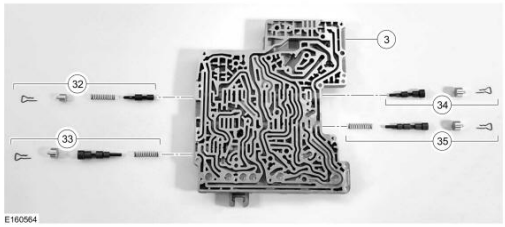
Low One-way Clutch



The low One-Way Clutch (OWC) is a brake clutch that holds the rear planetary carrier in one direction and allows it to freewheel in the opposite direction which eliminates engine braking in 1st gear when the transmission is in DRIVE. The low One-Way Clutch (OWC) is also the pressure plate for the low/reverse clutch.

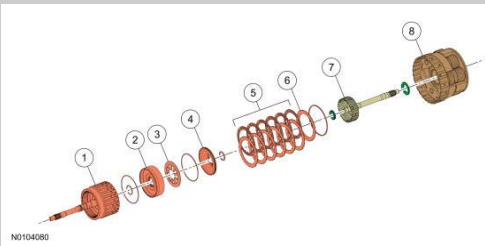
NL = Normally low



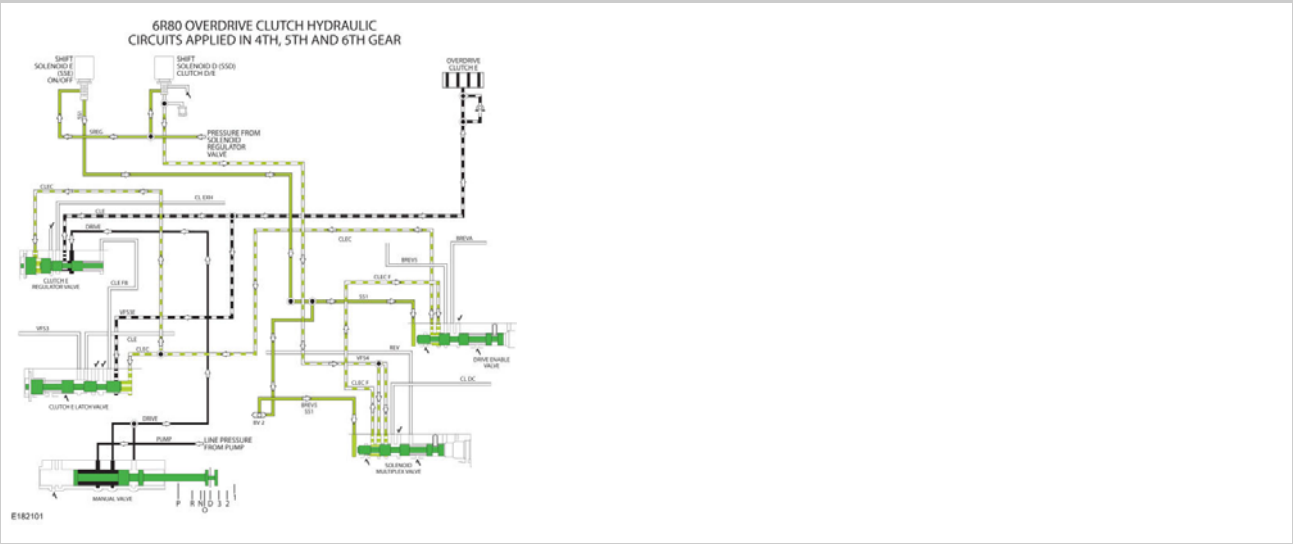
Main Control Valve Body Mechanical Operation

The main control consists of a valve body assembly with solenoids that are controlled by the PCM. The PCM operates the electrical components to provide refined engagement feel, shift feel, and shift scheduling.

DESCRIPTION AND OPERATION > OVERDRIVE CLUTCH ASSEMBLY

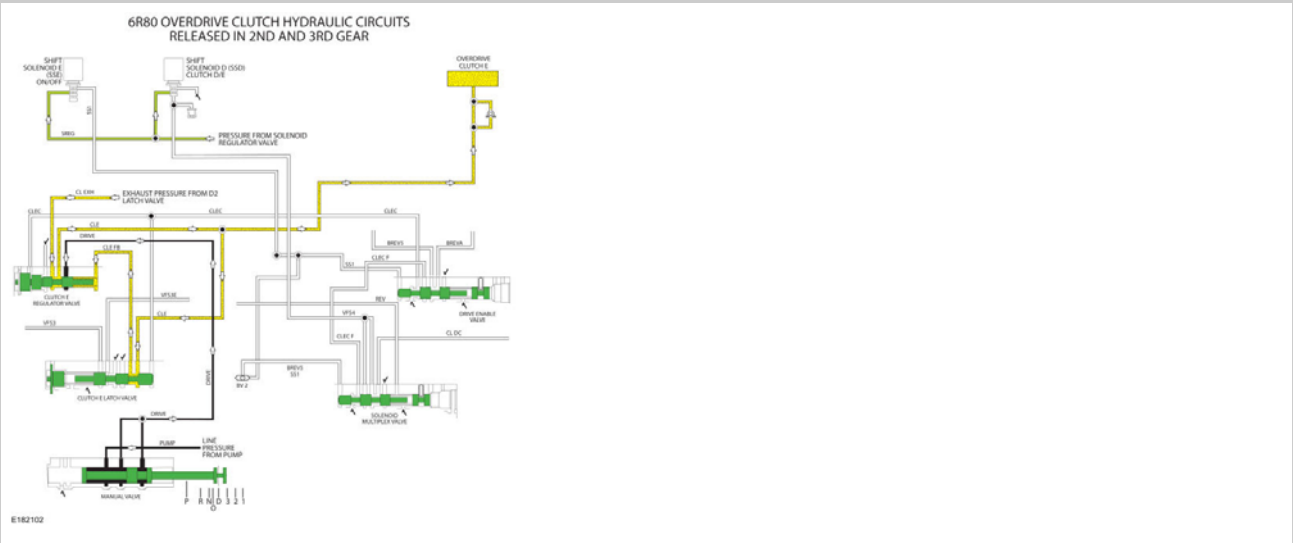
Overdrive (O/D) Clutch Cutaway View

Overdrive (O/D) Clutch Exploded View



Item	Description
1	Input shaft assembly
2	Overdrive clutch piston
3	Overdrive clutch piston return spring
4	Overdrive clutch balance piston
5	Overdrive clutch friction and steel plates
6	Overdrive clutch pressure plate
7	Intermediate shaft
8	Rear planetary carrier assembly

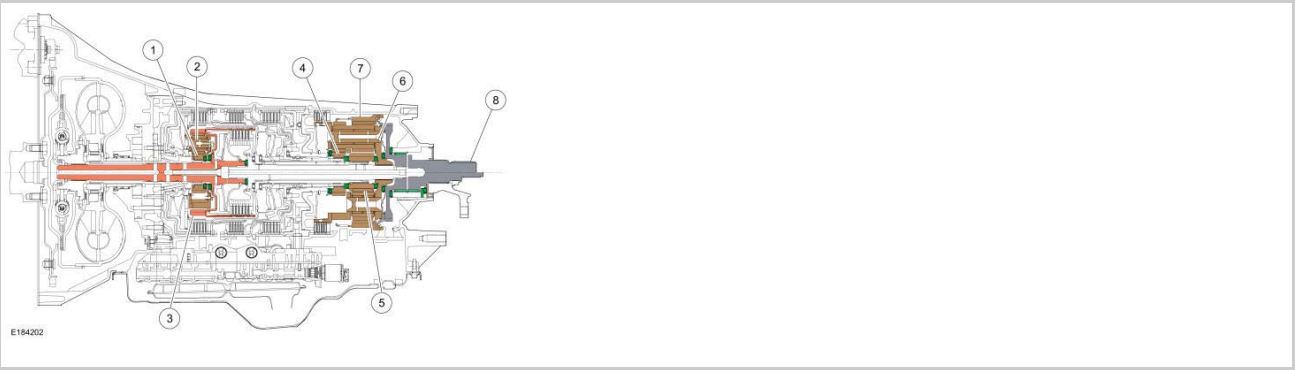
To apply the overdrive clutch, the manual valve must be in the DRIVE position. Line pressure is supplied to the clutch E regulator valve.



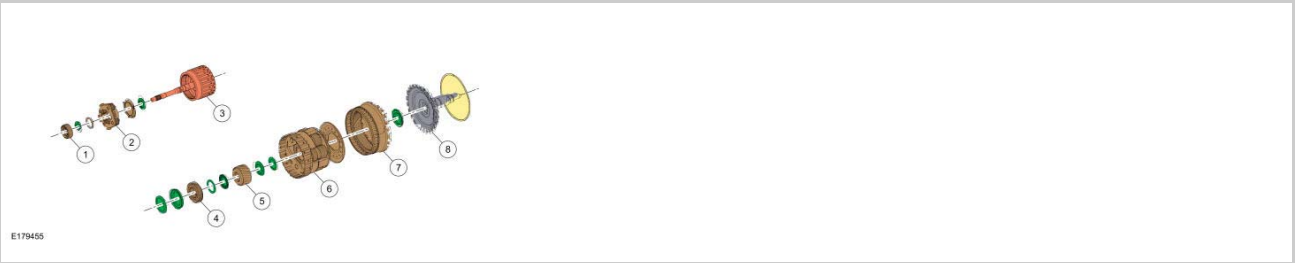
SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit. SSE supplies pressure to the solenoid multiplex valve and the drive enable valve to

position the valves to direct pressure from the VFS4 circuit to the CLEC F and CLEC circuits to position the clutch E regulator and latch valves to apply the overdrive clutch.

The clutch E regulator valve provides regulated line pressure from the DRIVE circuit to the CLE circuit to apply the overdrive clutch.



In 2nd, 3rd, 4th, 5th and 6th gear, the D2 Latch valve directs a small amount of fluid from the PUMP circuit the CL EXH circuit. When SSD is hydraulically off and the Manual Valve is in DRIVE, CLE circuits are filled with fluid from the CL EXH circuit under low pressure, (21kPa/ 3 PSI). This keeps air out of the CLE circuit resulting in a smooth shift into 4th gear.



DESCRIPTION AND OPERATION > PLANETARY ASSEMBLY

Mechanical Components and Functions

Planetary Gearset

This transmission has 2 planetary gearsets (front and rear) to provide operation in reverse and 6 forward speeds.

The front planetary gearset is a single planetary gearset and has the following components:

- Front planetary No. 1 sun gear
- Front planetary carrier
- Front planetary ring gear (part of the input shaft assembly)

The input shaft rotates the front ring gear as a driving member. The front sun gear is connected to the fluid pump and is held stationary. The front ring gear rotates the front planetary carrier assembly with a

reduction ratio of 1.52:1

The front planetary carrier assembly is the only output member of the front planetary gearset in reverse, 1st gear, 2nd gear and 3rd gear. The front planetary gearset provides a 1.52:1 gear ratio to the rear planetary gearset.

In 4th gear and 5th gear, both the front ring gear and front planetary carrier assembly are output members of the front planetary gearset. The front planetary gearset provides both a 1:1 and 1.52:1 gear ratio to different members of the rear planetary gearset.

In 6th gear, the front ring gear is the only output member of the front planetary gearset. The front planetary gearset provides a 1:1 gear ratio to the rear planetary gearset.

The rear planetary gearset is a ravigneaux planetary gearset and has the following components:

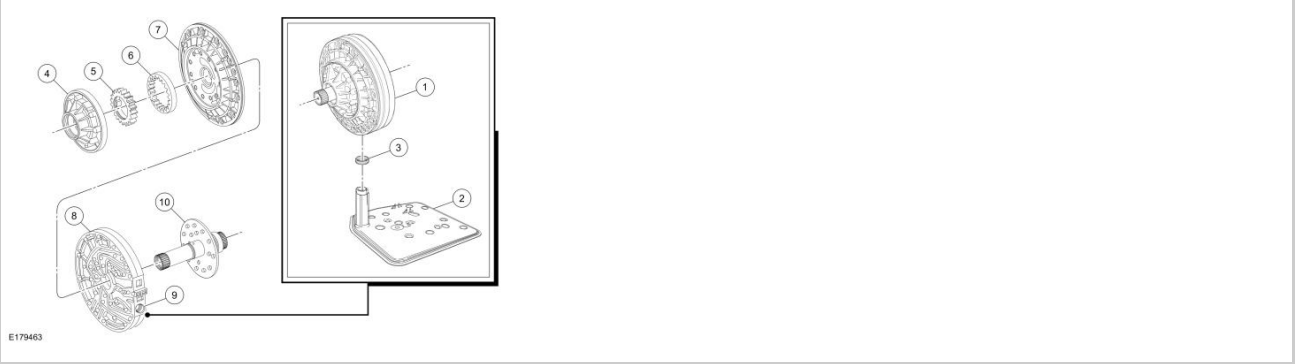
- Rear planetary No. 2 sun gear
- Rear planetary No. 3 sun gear
- Rear planetary carrier assembly (2 sets of pinion gears)
- Rear planetary ring gear assembly

Power flow through the rear planetary gearset is as follows:

- In reverse, rear sun gear No. 2 is driven, the rear planetary carrier is held and the ring gear is the output (2.24:1 with reverse direction)
- In 1st gear, sun gear No. 3 is driven, the rear planetary carrier is held and the ring gear is the output (2.74:1)
- In 2nd gear, sun gear No. 3 is driven, sun gear No. 2 is held and the ring gear is the output (1.54:1)
- In 3rd gear, sun gear No. 3 and sun gear No. 2 are driven and the ring gear is the output (1:1)
- In 4th gear, sun gear No. 3 and the rear planetary carrier are driven and the ring gear is the output (1.14:1)
- In 5th gear, sun gear No. 2 and the rear planetary carrier are driven and the ring gear is the output (0.87:1)
- In 6th gear, the rear planetary carrier is driven, sun gear No. 2 is held and the ring gear is the output (0.69:1)

DESCRIPTION AND OPERATION > PUMP ASSEMBLY

Pump Assembly and Transmission Fluid Filter



This transmission has a gear type pump that supplies transmission fluid pressure to the hydraulic system. The inner (drive) gear is turned by the torque converter hub. The transmission fluid pump has the following parts:

- Pump body, with inner (drive) and outer (driven) gears
- Centering plate

- Intermediate plate
- Stator shaft

The transmission fluid pump draws transmission fluid from the sump area, formed by the transmission fluid pan, through the transmission fluid filter, which is installed into the intermediate plate portion of the pump assembly and sealed by a rubber seal. A magnet attached to the transmission fluid pan collects any metallic material in the transmission fluid.

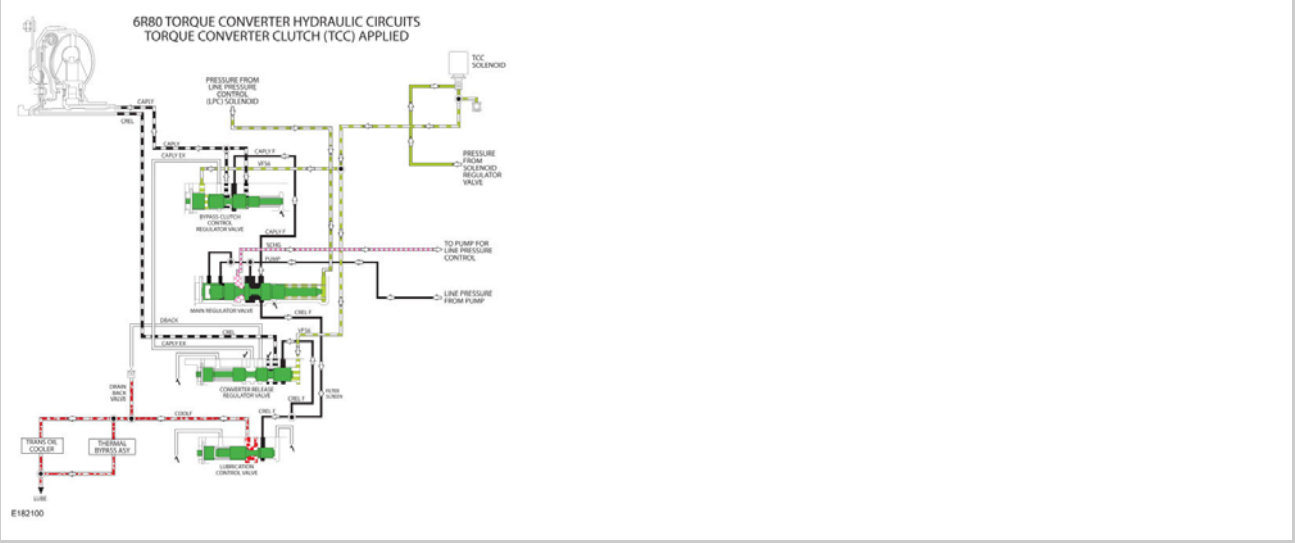
DESCRIPTION AND OPERATION > TORQUE CONVERTER



When the TCC is released, line pressure is supplied to the converter release regulator valve from the lubrication control valve through the CREL F circuit. The converter release regulator valve supplies fluid to the torque converter through the CREL circuit. Fluid exits the torque converter through the CAPLY circuit and goes to the bypass clutch control regulator valve. The bypass clutch control regulator valve directs the fluid back to the converter release regulator valve through the CAPLY EX circuit. The converter release regulator valve directs the fluid to the DBACK circuit where it supplies lubrication in the LUBE circuit.

When the TCC is applied, the TCC solenoid applies hydraulic pressure to the bypass clutch control regulator valve and the converter release regulator valve through the VFS6 circuit to position the valves.

Line pressure is supplied to the bypass clutch control regulator valve from the main regulator valve. The bypass clutch control regulator valve directs regulated line pressure to the TCC through the CAPLY circuit to apply the TCC.

Fluid exits the torque converter through the CREL circuit and goes to the converter release regulator valve.

DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > OVERVIEW

This transmission uses planetary gears with hydraulic electronic controls.

This transmission has the following features:

- Six forward speeds
- Torque converter with an integral converter clutch
- Electronic shift and pressure controls
- Single planetary gear set
- Double planetary gear set
- Two fixed multi-disc clutches
- Three multi-plate clutches

All hydraulic functions are directed by electronic solenoids to control the following:

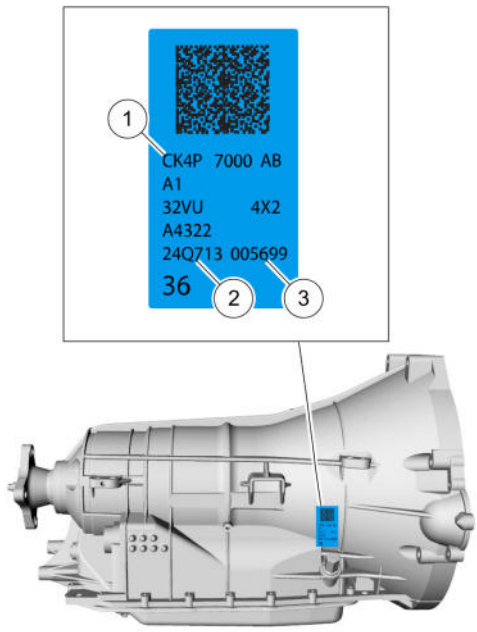
- Engagement feel
- Shift feel
- Shift scheduling
- Modulated TCC applications

This transmission has a main control unit which contains:

- TSS sensor
- OSS sensor
- An integral transmission range sensor
- TFT sensor

Engine power reaches the transmission by a torque converter with an integral clutch. The 6 forward gears and one reverse gear are obtained from 2 planetary gearsets.

Gear selection is achieved by the control of automatic transmission fluid flow to operate various internal clutches. The PCM operates the electrical components and provides for the control of gear selection shift pressure, which increases refinement and torque converter slip.

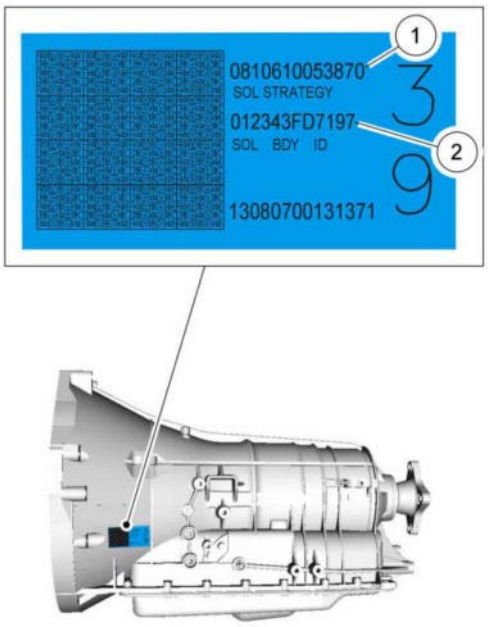


In the event of a system fault, the PCM also provides for Failure Mode Effect Management to maintain

maximum functional operation of the transmission with a minimum reduction in driver, passenger or vehicle safety. In the event of a total loss of control or electrical power, the basic transmission functions P, R, N and D are retained. Also 3rd or 5th gear is retained by the hydraulic system. The gear retained is dependent upon the gear selected at the time of the failure.

This transmission has an internal thermal bypass valve contained within the case.

DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > IDENTIFICATION TAGS



All vehicles come equipped with a Vehicle Certification Label. The location on the label marked TR is reserved for the transmission code. Refer to: IDENTIFICATION_CODES . All transmissions are equipped with an identification tag located on the transmission case. For transmission part number, serial number and build date, see the transmission identification tag located on the transmission case.

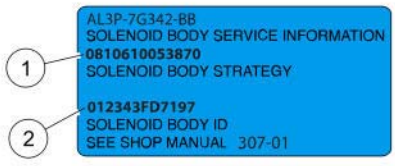
DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > ORIGINAL SOLENOID BODY TAG



E160542

Item	Description
1	13 Digit Solenoid Strategy
2	12 Digit Solenoid body identification

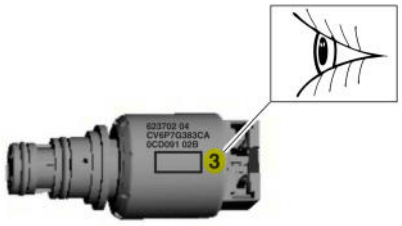
The solenoid body strategy is programmed into the PCM to control the shift, Line Pressure Control (LPC) and TCC solenoids to prevent harsh shifts. The solenoid body tag on the transmission case contains the 13-digit solenoid body strategy and the 12-digit solenoid body identification. Letters are not used in the 13 digit solenoid body strategy. The characters consist of all numbers.

DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > REPLACEMENT SOLENOID BODY TAG

E181713

Item	Description
1	13 Digit Solenoid Strategy
2	12 Digit Solenoid body identification

When a new solenoid body is installed, a new solenoid body strategy file is downloaded into the PCM. A replacement solenoid body tag is supplied with the new solenoid body which contains the 13-digit solenoid body strategy and the 12-digit solenoid body identification. The new tag is placed over the original solenoid body tag.

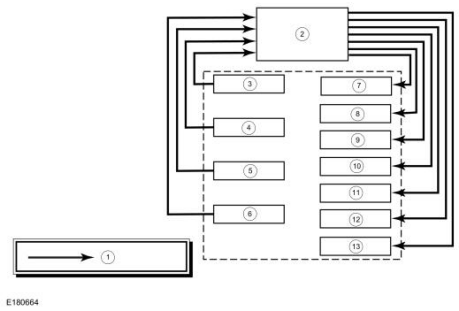


DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > MAIN CONTROL SOLENOID BODY STRATEGY IDENTIFICATION

E184453

If the solenoid body strategy etched on the main control does not match what the scan tool displays, the solenoid body strategy must be downloaded into the PCM or harsh shifts will result.

DESCRIPTION AND OPERATION > TRANSMISSION DESCRIPTION - OVERVIEW > SOLENOID BAND NUMBER



E150961

The solenoids are calibrated from the factory and are not all the same. The solenoids can be replaced separately, but only with a replacement solenoid with a injector nozzle and band number that matches the solenoid being replaced. When solenoid(s) are replaced, the new solenoid band number must match the old solenoid band number. The band number is next to the two-dimensional matrix barcode on the side of the solenoid and will be a 1, 2, 3, 4 or 5.

System Operation

The PCM and its input/output network controls the following operations:

Shift timing

Line pressure (shift feel)

The transmission control strategy is separate from the engine control strategy in the PCM, although some of the input signals are shared. When determining the best operating strategy for transmission operation, the PCM uses input information from engine and driver related sensors and switches.

In addition, the PCM receives input signals from transmission related sensors and switches. The PCM uses these signals when determining transmission operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift or when to apply or release the TCC. It also determines the best line pressure to optimize shift engagement feel. To accomplish this, the PCM uses output solenoids to control transmission operation.

The transmission control strategy is separate from the engine control strategy in the PCM, although some of the input signals are shared. When determining the best operating strategy for transmission operation, the PCM uses input information from engine and driver related sensors and switches. In addition, the PCM receives input signals from transmission related sensors and switches. The PCM uses these signals when determining transmission operating strategy. Component Description

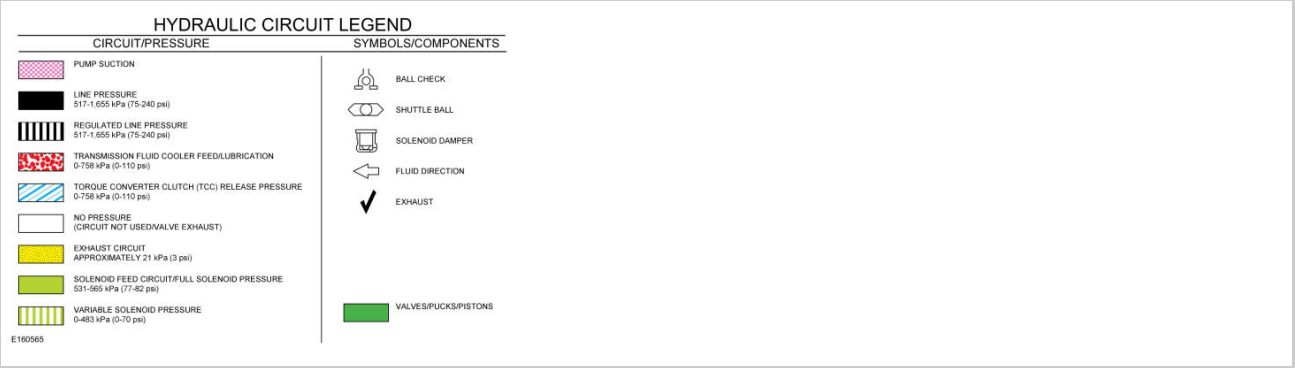
Sensors and Switches



The PCM controls the electronic functions of this transmission. The PCM receives input signals from engine and transmission sensors and uses these inputs to control line pressure, shift time, TCC and shift solenoids.

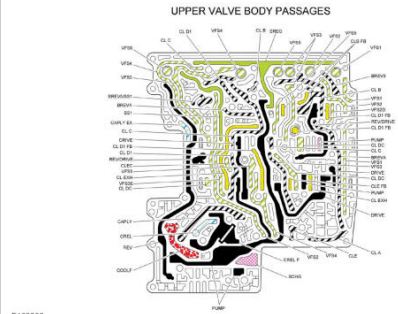
Item	Description
TFT Sensor	This sensor is located in the transmission solenoid body. It is a temperature-sensitive device called a thermistor. The resistance value of the TFT sensor will vary with temperature change. The PCM monitors the voltage across the TFT sensor to determine the temperature of the transmission fluid. The PCM uses this initial signal to determine whether a cold start shift schedule is necessary. The cold start shift schedule allows delayed shifts when the transmission fluid is cold to help warm the transmission fluid. The PCM also inhibits TCC operation at low transmission fluid temperatures and

	adjusts line pressure for temperature.
TR Sensor	The TR sensor has a 6-pin electrical connector. The TR sensor is located on the inside of the transmission at the manual control lever. The TR sensor sends a signal to the PCM to start the vehicle in PARK and NEUTRAL. The TR sensor opens/closes a set of 4 switches that are monitored by the PCM to determine the position of the manual control lever.
TSS Sensor	This TSS sensor is a Hall-effect pickup that sends a signal to the PCM that indicates transmission turbine shaft input speed. The TSS information is compared to engine RPM to determine TSS performance. TSS is also compared to OSS to determine shift quality and clutch performance.
OSS Sensor	The OSS sensor is a Hall-effect pickup, located on the transfer shaft drive gear, that sends a signal to the PCM to indicate transmission output speed. The OSS is used for shift scheduling. OSS is also compared to TSS to determine shift quality and clutch performance.

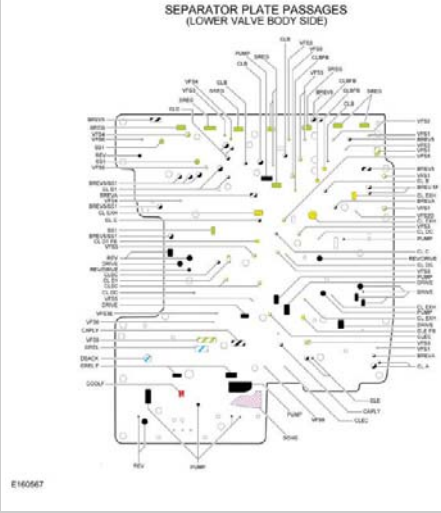
Hydraulic System Diagram

Hydraulic Circuit Identification Chart

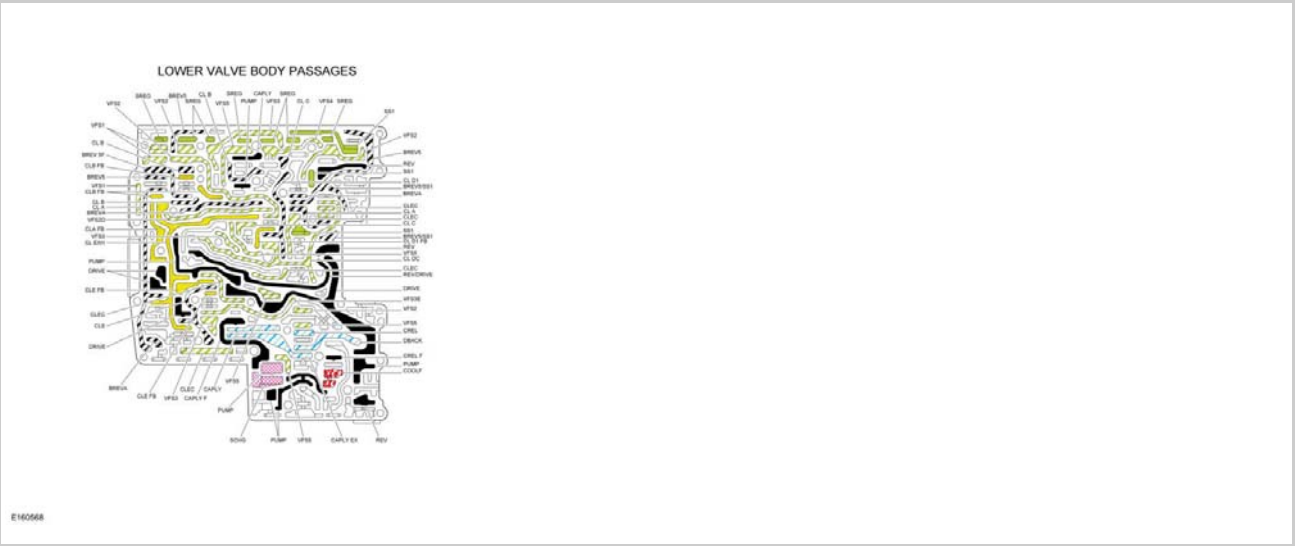
Circuit Name	Description
BREVA	BREV5 pressure from the drive enable valve to the clutch A regulator valve.
BREV5	BREV 5F pressure from the clutch A latch valve to the drive enable valve and the No. 2 shuttle ball.
BREV 5F	Regulated line pressure from the CL B circuit directed to the A clutch latch valve by the B clutch latch valve.
BREV5/SS1	BREV5 or SS1 pressure from the No. 2 shuttle ball to the solenoid multiplex valve.
CAPLY	Apply circuit to the torque converter, also the return circuit during TCC release.
CAPLY EX	TCC releases pressure from the bypass clutch control regulator valve to the converter release regulator valve.
CAPLY F	Line pressure from the PUMP circuit directed to the bypass clutch control regulator valve by the main regulator valve.
CL A	Regulated line pressure from the clutch A regulator valve to the clutch A latch valve and the forward (A) clutch to apply the clutch.
CLA FB	Regulated line pressure from the clutch A latch valve that feeds back to the clutch A regulator valve.
CL B	Regulated line pressure from the clutch B regulator valve to the clutch B latch valve and the direct (B) clutch to apply the clutch.
CLB FB	Regulated line pressure from the clutch B latch valve that feeds back to the clutch B regulator valve.



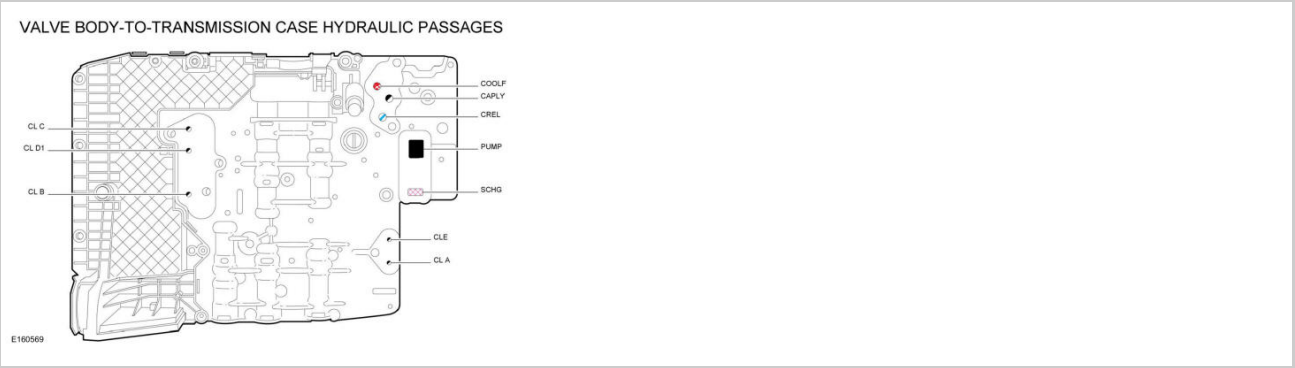
CL C	Regulated line pressure from the clutch C regulator valve to the intermediate (C) clutch to apply the clutch.
CL D1	Regulated line pressure from the clutch D1 regulator valve to the clutch D1 latch valve and the low/reverse (D) clutch to apply the clutch.
CL D1 FB	Regulated line pressure from the clutch D1 latch valve that feeds back to the clutch D1 regulator valve.
CL D2	Regulated line pressure from the clutch D2 regulator valve to the low/reverse (D) clutch to apply the clutch.
CL DC	Regulated solenoid output pressure from SSD directed by the solenoid multiplex valve to the D1 and D2 regulator and latch valves to apply the low/reverse (D) clutch.
CLE	Regulated line pressure from the clutch E regulator valve to the clutch E latch valve and the Overdrive (O/D) (E) clutch to apply the clutch.
CLEC	Regulated solenoid output pressure from the CLEC F circuit directed by the drive enable valve to the clutch E regulator and latch valves to apply the clutch.
CLEC F	Regulated solenoid output pressure from the VFS4 circuit directed to the drive enable valve by the solenoid multiplex valve to move the clutch E regulator and latch valves to apply the O/D (E) clutch.
CLE FB	Regulated line pressure from the clutch E latch valve that feeds back to the clutch E regulator valve.
CL EXH	Line pressure regulated to approximately 21 kPa (3 psi) by the D2 latch valve that supplies exhaust pressure to the A, B, C, D1 and E clutch when the clutches are released.
COOLF	Pressure from the lubrication control valve to the oil cooler or the thermal bypass valve that feeds the lubrication circuit.
CREL	Pressure supplied to the torque converter by the converter release regulator valve to release the TCC.
CREL F	Line pressure from the main regulator valve that supplies the converter release regulator valve and the lubrication control valve.



DBACK	CAPLY EX pressure directed to the drain back valve by the converter release regulator valve.
DRIVE	Line pressure directed by the manual valve to the A, C and E clutch regulator valves and the No. 1 shuttle ball.
LUBE	Transmission lubrication circuit supplied by the COOLF circuit after the fluid circulates the transmission fluid cooler or is returned by the cooler bypass valve.
PUMP	Line pressure supplied by the pump to the manual valve, solenoid pressure regulator valve, main regulator valve, clutch D1 regulator valve, clutch D2 regulator valve and clutch D2 latch valve.
REV	Line pressure from the manual valve to the No. 1 shuttle ball and the solenoid multiplex valve.
REV/DRIVE	REV or DRIVE pressure from the No. 1 shuttle ball to the clutch B regulator valve.
SCHG	Line pressure from the main regulator valve to the pump suction port.
SREG	Line pressure from the solenoid regulator valve that supplies pressure to the 7 solenoids, SSA, SSB, SSC, SSD, SSE, TCC solenoid and LPC solenoid.
SS1	Solenoid output pressure from SSE to the drive enable valve and to shuttle ball No. 2 to direct SSD output pressure to clutch E regulator and latch valves to apply the O/D (E) clutch.
VFS1	Solenoid output pressure from SSA to the A clutch regulator and latch valve to apply the forward (A) clutch.
VFS2	Solenoid output pressure from SSB to the B clutch regulator and latch valve to apply the direct (B) clutch and is also routed to the D1 latch valve.
VFS2D	SSB output pressure from the VFS2 circuit directed to the clutch B regulator valve by the D1 latch valve.
VFS3	Solenoid output pressure from SSC to the C clutch regulator valve to apply the intermediate (C) clutch and is also routed to the clutch E latch valve.
VFS3E	SSC output pressure from the VFS3 circuit directed to the clutch C regulator valve by the clutch E latch valve.
VFS4	Solenoid output pressure from SSD to the solenoid multiplex valve to apply either the D or E clutch.

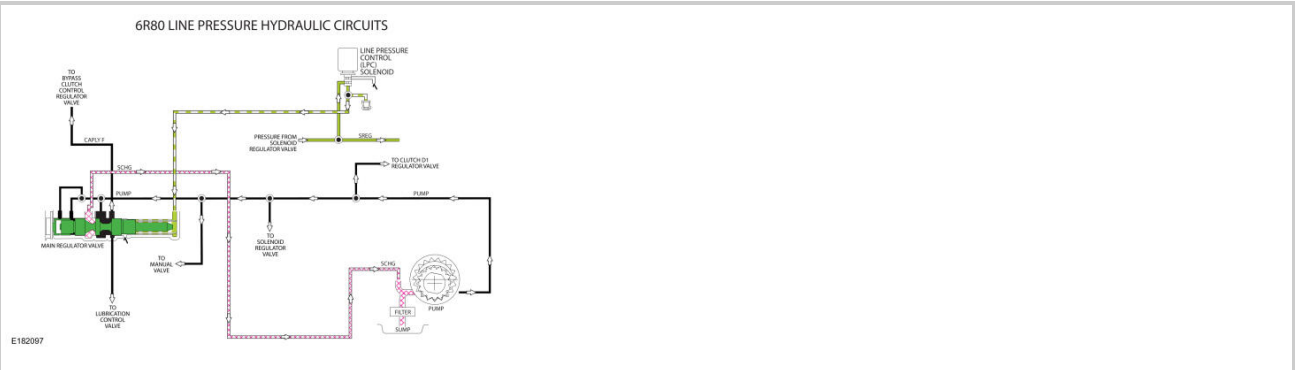


VFS5	Solenoid output pressure from the LPC solenoid to the main regulator valve to control line pressure.
VFS6	Solenoid output pressure from the TCC solenoid to the bypass clutch control regulator valve and the converter release regulator valve to control the TCC.



Valve Body Maps for Solenoid and Line Pressure

Solenoid Body Hydraulic Passages



Line Pressure Hydraulic Circuits

The PCM controls line pressure with the LPC solenoid. Varying pressure from the LPC solenoid effects shift feel while allowing sufficient pressure for clutch application.

When the engine is running, the pump supplies pressure to the main regulator valve through the PUMP circuit. The position of the main regulator valve controls line pressure (in the PUMP circuit). Pressure from the LPC solenoid through the VFS5 circuit controls the position of the main regulator valve.

The main regulator valve varies pressure in the SCHG circuit. The higher the pressure in the SCHG circuit, the lower the line pressure (PUMP circuit) is. As SCHG pressure decreases, line pressure (PUMP circuit) increases.

Lubrication Hydraulic Circuits

The main regulator valve supplies pressure to the lubrication control valve through the CREL F circuit.

When the TCC is applied, the lubrication control valve supplies the transmission lubrication through the COOLF circuit to the LUBE circuit.

When the TCC is released, return fluid from the torque converter is supplied to the LUBE circuit through the CAPLY, CAPLY EX and DBACK circuits.

Pressure in the LUBE circuit either circulates through the thermal bypass valve when TFT is below operating temperature or through the transmission fluid cooler when the transmission fluid is at or above operating temperature. Return fluid from the thermal bypass valve or the transmission fluid cooler enters the input shaft through the pump assembly and flows through passages in the input shaft, intermediate shaft and output shaft to provide lubrication for the transmission.

Transmission Electronic Control System

The PCM control the electronic functions of this transmission. A plastic molded leadframe is bolted to the main control assembly. The leadframe contains the TSS, OSS, TFT and TR sensors.

The PCM receives input signals from engine and transmission sensors and uses these inputs to control line pressure, shift time, TCC, and shift solenoids. The PCM also provides power and ground for the reverse lamp relay coil and provides a PARK/NEUTRAL start enable signal.

The following is a list of direct engine and driver inputs to the PCM along with module information from the vehicle CAN:

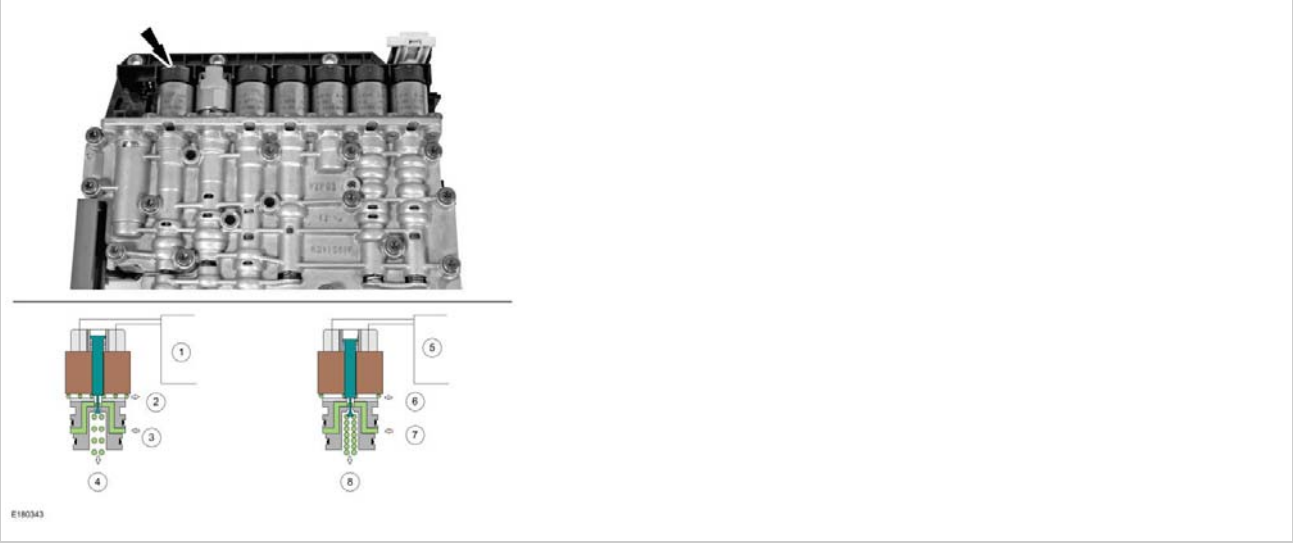
- Engine speed
- Engine torque
- ECT
- Engine Oil Temperature (EOT)
- TP
- APP
- BPP
- ABS wheel speed
- Traction Control (ATC) status

The PCM also:

- Monitors inputs and outputs for the presence of faults.

- Stores DTCs related to detected faults.
- Provides outputs on the CAN for TR, OSS, TSS, TFT, current gear and A/C inhibit.
- Provides OBD information using the CAN to illuminate the MIL or Transmission Control Indicator Lamp (TCIL).
- Provides diagnostic information to a scan tool through the DLC.

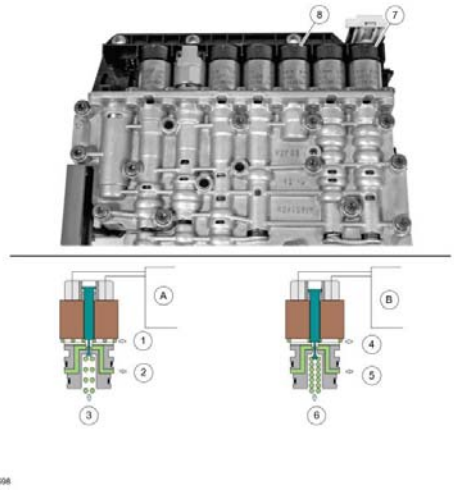
If the PCM detects a system or component fault, it substitutes a default value or signal using Failure Mode and Effect Management strategies.



The PCM also uses Failure Mode and Effect Management strategies to compensate for electrical or mechanical shift solenoid and apply component faults that result in alternate shift patterns.

If the transmission loses complete electronic control, it operates in a fail-safe mode with:

- Maximum line pressure in all transmission ranges
- Functional PARK, REVERSE and NEUTRAL positions
- Operation in 3rd or 5th gear (depending on the failure conditions) when the selector lever is in the DRIVE, 3, 2 or 1 position
- TCC is released in all transmission ranges and gears



Torque Converter Clutch (TCC) Proportional (VFS)

The TCC solenoid is a VFS that varies hydraulic pressure by actuating a hydraulic valve. The PCM applies variable current to the TCC solenoid which varies pressure in the VFS6 hydraulic circuit to the Converter Release Regulator Valve and the Bypass Clutch Control Regulator Valve. The TCC solenoid uses proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. The TCC solenoid is supplied hydraulic pressure from the SREG circuit. With zero current, the TCC solenoid fully closes the hydraulic valve which applies the minimum amount of hydraulic pressure to the Converter Release Regulator Valve and the Bypass Clutch Control Regulator Valve through the VFS6 hydraulic circuit and releases the TCC. With maximum current to the solenoid, the hydraulic valve fully opens the outlet port for maximum pressure to the VFS6 hydraulic circuit to apply the TCC.

Item	Description

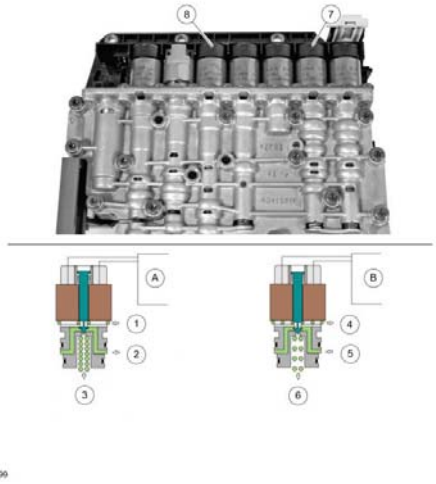
4	Low Exhaust
5	SREG Circuit Fluid (Supply)
6	High Pressure To Clutch Regulator And Latch Valves
7	SSA) Variable Force Solenoid (VFS)
8	SSC VFS

SSB and SSD use inverse proportional operation. As the current from the PCM decreases, the pressure from the solenoid increases. As the current from the PCM increases, the pressure from the solenoid decreases. SSB and SSD are supplied hydraulic pressure from the SREG circuit.

With zero current, SSB and SSD fully open the hydraulic valves which applies maximum hydraulic pressure to the regulator and latch valves to apply the clutch that it controls. With maximum current to the solenoids, the hydraulic valve fully closes to apply zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch.



Shift solenoids A through D are VFS that vary hydraulic pressure by actuating a hydraulic valve.

The PCM applies variable current to the shift solenoids which varies pressure in the hydraulic circuit to the regulator and latch valves of the clutch that it controls.

SSA and SSC use proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. SSA and SSC are supplied hydraulic pressure from the SREG circuit.

With zero current, SSA and SSC fully close the hydraulic valves which applies zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch. With maximum current to the solenoids, the hydraulic valves fully open for maximum pressure to the regulator and latch valves to apply the clutch.

Turbine Shaft Speed (TSS) Sensor

The TSS is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the forward (1, 2, 3, 4) clutch cylinder varies.

The PCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter.

The PCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The PCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the TSS sensor signal for transmission fault detection and diagnostics.

Output Shaft Speed (OSS) Sensor

The OSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the output shaft ring gear varies.

The PCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The PCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the OSS sensor signal for transmission fault detection and diagnostics.

Transmission Fluid Temperature (TFT) Sensor

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area.

The PCM monitors the voltage across the TFT sensor, which changes as transmission fluid temperature varies.

The PCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TFT sensor signal for transmission fault detection and diagnostics.

Transmission Range (TR) Sensor

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependent on the PARK, REVERSE, NEUTRAL, DRIVE, 3,

2 or 1 position of the manual valve.

The TR sensor also provides signals for the starting system and the reverse lights.

The PCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TR sensor signal for transmission fault detection and diagnostics.

Transmission Operation Overview

Transmission operation is controlled by the PCM.

Torque Converter

This transmission uses a torque converter with the following elements:

- Impeller
- Turbine
- Reactor
- TCC

For diagnostic information, Refer to: Torque Converter Clutch (TCC) .

Planetary Gearsets

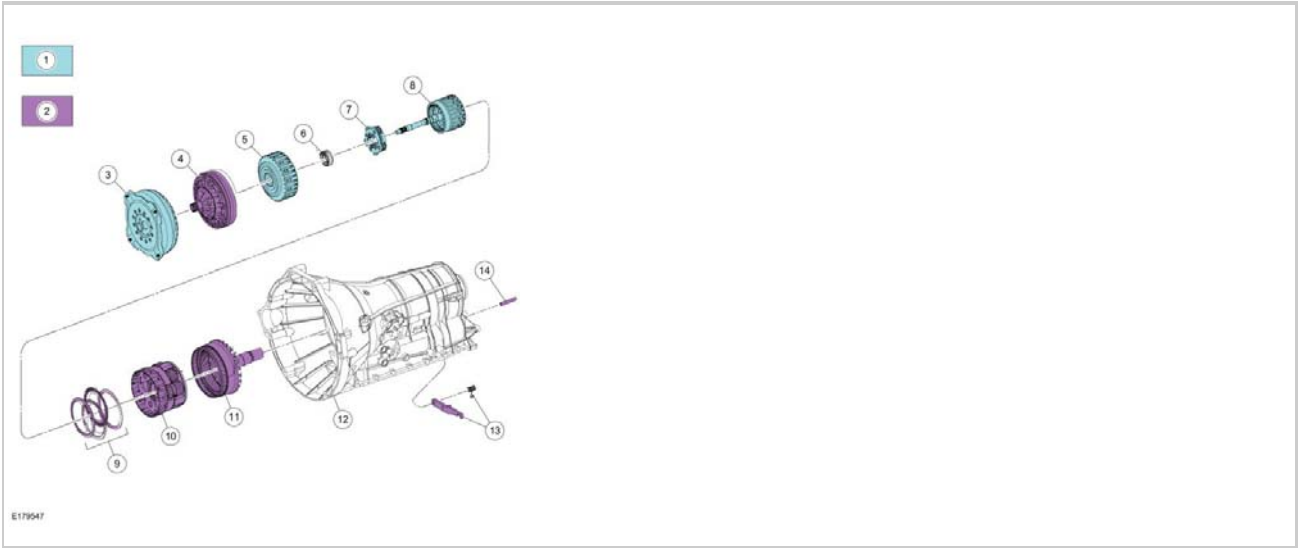
Operation of this transmission involves the use of 2 planetary gearsets that have the following components:

- Front (single planetary gearset)
    - One sun gear
    - One planetary carrier with 4 gears

    - One ring gear
- Rear (ravigneaux planetary gearset)
    - Two sun gears of different sizes
    - Three short planetary gear pinions meshing with the sun gears
    - Three long planetary gear pinions meshing with the sun gears
    - One planetary carrier
    - One ring gear

Hydraulic System

The hydraulic operation of this transmission includes the following components:



- Main control assembly
- Pump assembly with filter
- Torque converter
- Apply components (clutches)

Transmission Operation Overview

The PCM controls the operation of this transmission with the following solenoids:

- LPC solenoid
- SSA
- SSB
- SSC
- SSD
- SSE
- TCC solenoid

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
    - manual valve.
    - lubrication control valve.
    - converter release regulator valve.
    - bypass clutch control regulator valve.
    - solenoid pressure regulator valve.
    - D1 latch and regulator valves.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC.
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit.

Solenoid hydraulic circuits:

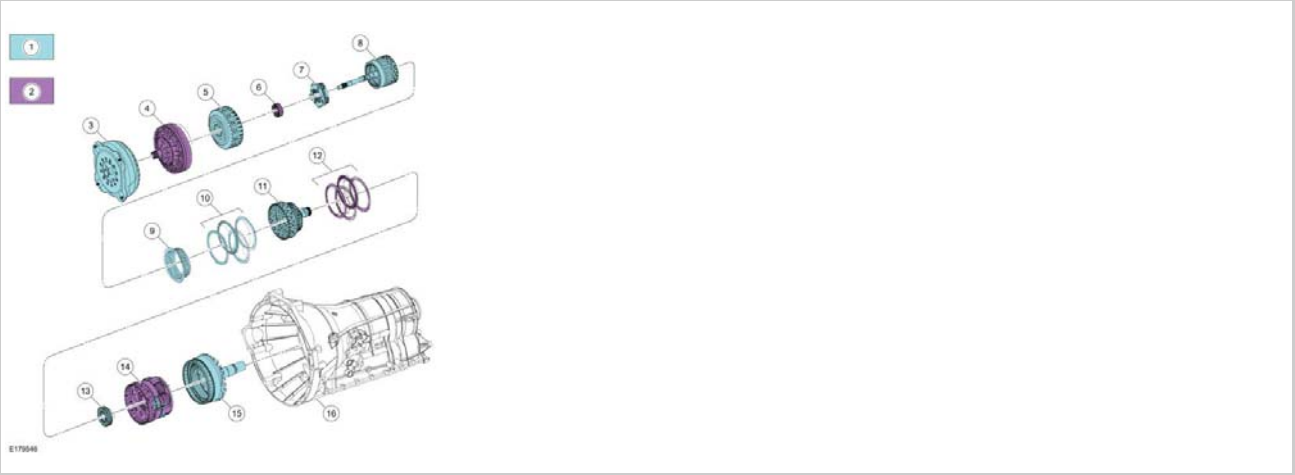
- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.

- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CL DC circuit to position the valves for low/reverse clutch (D) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 latch and regulator valves.
- Regulated line pressure from the D1 regulator valve is supplied to the low/reverse clutch (D) to apply the clutch.

Electrical Operation



Solenoid operation:

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In reverse, the manual valve directs line pressure to the No. 1 shuttle valve and the solenoid multiplex valve through the REV circuit.

- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC.
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSB supplies pressure to the clutch B regulator and latch valves to position the valves for direct clutch (B) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 latch and regulator valves.
- Regulated line pressure from the D1 regulator valve is supplied to the low/reverse clutch (D) to apply the clutch.
- Line pressure is supplied by the manual valve to the clutch B latch and regulator valves.
- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to apply the clutch.

- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - Manual valve.
  - Lubrication control valve
  - Converter release regulator valve.

    - Bypass clutch control regulator valve.
    - Solenoid pressure regulator valve.
    - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC.
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoid through the SREG hydraulic circuit.
- The LPC applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for overdrive clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.

- Regulated line pressure from the clutch E regulator valve is supplied to the overdrive clutch (E) to apply the clutch.

The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.

- Line pressure is supplied to the:
  - Manual valve.
  - Lubrication control valve.
  - Converter release regulator valve.
  - Bypass clutch control regulator valve.
  - Solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E

regulator valves.

- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC.
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoid through the SREG hydraulic circuit.
- The PCA applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. LPC solenoid regulates line pressure by controlling
- The position of the main regulator valve.
- SSB supplies pressure to the clutch B regulator valve to position the valve for direct clutch (B) application.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for overdrive clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to apply the clutch.
- Regulated line pressure from the clutch E regulator valve is supplied to the overdrive clutch (E) to apply the clutch.

Electrical Operation

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - Manual valve.
  - Lubrication control valve.
  - Converter release regulator valve.
  - Bypass clutch control regulator valve.
  - Solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is applied, the bypass clutch control regulator valve applies pressure to the torque converter through the CAPLY circuit to apply the TCC.
- CAPLY pressure exits the torque converter through the CREL circuit to the converter release regulator valve.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- The TCC solenoid supplies pressure to the converter release regulator valve and the bypass clutch control regulator valve to move the position of the valves for TCC application.
- SSC supplies pressure to the clutch C regulator valve to position the valve for intermediate clutch (C) application.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for overdrive clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch C regulator valve is supplied to the intermediate clutch (C) to apply the clutch.
- Regulated line pressure from the clutch E regulator valve is supplied to the overdrive clutch (E) to apply the clutch.

DIAGNOSIS AND TESTING > DIAGNOSIS BY SYMPTOM > SYMPTOM CHART(S)

Symptom Chart: Automatic Transmission

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

In most circumstances the PCM sets a DTC to help guide with diagnostics. Refer to the DTC Chart before using the Symptom Chart. The Condition column lists the vehicle condition. The Possible Sources column lists a detailed vehicle condition. The Action column lists the action to be performed to determine the cause of the condition. Each action lists the components that can cause the symptom and the individual components in that system. The components are listed in order of disassembly. Use the list of components and the required action to focus on disassembly inspections for the root cause of the concern.

Symptom	Possible Sources	Action

Engagement concerns	No forward	REFER to: Forward Clutch Assembly .
No reverse		REFER to: Direct Clutch Assembly .
Harsh reverse		REFER to: Direct Clutch Assembly .
Harsh forward		REFER to: Forward Clutch Assembly .
Delayed/soft reverse		REFER to: Direct Clutch Assembly .
Delayed soft/forward		CHECK the transmission fluid level. REFER to: Transmission Fluid Level Check . INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to: Forward Clutch Assembly .
No forward and no reverse		CHECK the transmission fluid level. REFER to: Transmission Fluid Level Check . INSPECT the filter and pump assembly. REFER to: Transmission Fluid Pan, Gasket and Filter .
Delayed/soft forward and reverse		Forward clutch damaged or worn. REFER to: Forward Clutch Assembly .
Neutral after launch		REFER to: Low One-Way Clutch Assembly .
Shift concerns	No 1-2 shift/harsh/soft/slipping	REFER to: Intermediate Clutch Assembly . REFER to: Forward Clutch Assembly . REFER to: Low One-Way Clutch Assembly .
No 2-3 shift/harsh/soft/slipping		REFER to: Direct Clutch Assembly . REFER to: Forward Clutch Assembly . REFER to: Intermediate Clutch Assembly .
No 3-4 shift/harsh/soft/slipping		REFER to: Overdrive Clutch Assembly . REFER to: Forward Clutch Assembly .

		REFER to: Direct Clutch Assembly .
No 4-5 shift/harsh/soft/slipping		REFER to: Direct Clutch Assembly . REFER to: Overdrive Clutch Assembly . REFER to: Forward Clutch Assembly .
No 5-6 shift/harsh/soft/slipping		REFER to: Intermediate Clutch Assembly . REFER to: Direct Clutch Assembly .
Only gears 1, 2, 3, 4 available		REFER to: Forward Clutch Assembly .
Only gears 3 and 5 available		REFER to: Direct Clutch Assembly .
Only gears 2 and 6 available		REFER to: Intermediate Clutch Assembly .
Only gears 4, 5, 6 available		REFER to: Overdrive Clutch Assembly .
Only gears 1 and R available		REFER to: Low/Reverse Clutch Assembly . REFER to: Low One-Way Clutch Assembly .
No engine braking in low		REFER to: Low/Reverse Clutch Assembly .
Torque converter operation concerns	No apply	CHECK for DTCs related to torque converter concerns. INSPECT the torque converter hydraulic circuits and regulator valve for damage or wear. REFER to: Main Control Valve Body and REFER to: Torque Converter Clutch (TCC) .
Always applied (engine stalls)		CHECK for DTCs related to torque converter concerns. INSPECT the torque converter hydraulic circuits and regulator valve for damage or wear. REFER to: Main Control Valve Body and REFER to: Torque Converter Clutch (TCC) .
Cycling/shutter/chatter		CHECK for DTCs related to torque converter concerns. CHECK the transmission fluid level. REFER to: Transmission

		Fluid Level Check . INSPECT the torque converter hydraulic circuits and regulator valve for damage or wear. REFER to: Torque Converter Clutch (TCC) .
Other concerns	Selector lever high effort	Selector lever cable routed wrong, binding or damaged. REFER to: External Controls .
External leaks		Damaged or worn seals. REFER to: Leakage Inspection .
Noise		Engine drive accessories, suspension, CV joints, REFER to: Noise, Vibration and Harshness (NVH) .
Vibration		Engine drive accessories, suspension, CV joints, transmission fluid cooler tubes, REFER to: Noise, Vibration and Harshness (NVH) .
No park range		INSPECT the selector lever cable for correct adjustment. REFER to: Selector Lever Cable Adjustment .
INSPECT the manual control lever for damage, wear or correct installation. REFER to: Shift Solenoids (SS) .		
INSPECT the park pawl, park pawl actuator, for damage or wear. REFER to: Shift Solenoids (SS) .		
Overheating		Transmission fluid cooling system damaged. REFER to: Transmission Cooling .

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > OVERVIEW

The diagnostic process for each transmission concern will vary depending on the symptoms and condition of the vehicle. The diagnostic process below is an efficient method to collect as much data as possible about the concern before performing a repair or removing the transmission from the vehicle for teardown and further inspection. Intermittent concerns and concerns that result in default or fail-safe operations can be difficult to diagnose.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > AUTOMATIC TRANSMISSION DIAGNOSIS

Many transmission faults will set one or more DTCs in the PCM/ TCM. In some instances a group of

DTCs may indicate a particular fault. The transmission may only operate in default or failsafe modes while certain DTCs are set.

Begin diagnosis by performing the PCM Quick Test. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) . Record all DTCs and related freeze frame data. Clear DTCs after recording the information.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > PRELIMINARY INSPECTION

The preliminary inspection will:

1.

* Find obvious causes for a concern.

2.

* Adjust the selector lever linkage.

3.

* Collect a fluid sample.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > PID MONITOR/RECORD ON ROAD TEST

Using the DTCs and freeze frame data as a guide, prepare the scan tool to make a recording of the event. Select the transmission PIDs that are related to the concern as well as PIDs for general automatic transmission operation. Since you may only get one or two chances to duplicate the concern, it is better to have more data on the recording. If possible, set datalogger to automatically start recording when a PID reaches a certain value. For example, you might want the recording to start 6 seconds before a fault PID changes from No Fault to Fault.

The PCM/ TCM may set a DTC after the first occurrence of the fault. Some DTCs may require up to 5 consecutive occurrences before setting. Drive the vehicle in a manner similar to the freeze frame data conditions if possible. If no freeze frame data is available, then perform this road test:

- Drive vehicle normally for 1-3 minutes to warm up the fluid.
- From a stop, accelerate the vehicle to 6th gear with the shifts occurring at approximately 2000 RPM. Stay in 6th gear for 30 seconds or until the TCC applies. Repeat this two times.
- From a stop, accelerate the vehicle to 6th gear with the shifts occurring at approximately 3000 RPM. Stay in 6th gear for 30 seconds or until the TCC applies. Repeat this two times.

After the road test, review the recording and recheck for newly set DTCs. Electrical fault DTCs are diagnosed in pinpoint tests. Hydraulic, mechanical, and performance fault DTCs are diagnosed in component tests. REFER to DTC chart for detailed diagnosis.

If no DTCs are set, use the data collected, the clutch application chart, and the solenoid application chart to determine suspect transmission systems for the concern. Use the component test to diagnose

each suspect system.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > PINPOINT TESTS

The pinpoint tests are divided by component or system. Each test is a series of circuit checks to verify the integrity of the wiring harness between the PCM/ TCM and the solenoid or sensor.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > COMPONENT TESTS

The component tests are divided by system. Each test lists the possible symptoms the system can exhibit. For each symptom is a list of components that could cause the symptom. The components are listed in least intrusive to most intrusive order.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > PERFORM REPAIR

There are over 400 individual components in an automatic transmission. All of these parts must be in good working order. Many repairs are fairly straight forward. In these repairs you will:

- Clean and inspect all parts removed
- Attempt to determine root cause of the failure
- Identify and repair/replace any related damaged parts
- Carefully document findings on the repair order

In the case of clutch failure where the transmission fluid is heavily contaminated with friction material, the transmission needs to be overhauled. The repair will require complete disassembly and cleaning of the transmission. All seals and gaskets (except the reusable pan gasket) should be replaced.

DIAGNOSIS AND TESTING > DIAGNOSTIC STRATEGY > COMPLETE REPAIR

After reassembling the transmission, several steps are required to properly restore the vehicle before returning it to the customer.

- Initial transmission fluid fill - this may be completed before the transmission is installed in the vehicle
- Clear adaptive tables - required for overhaul and when the solenoid body has been replaced
- Reset misfire monitor - required whenever the transmission has been removed
- Road Test until the transmission fluid is up to operating temperature, this is required to make sure transmission fluid cooler is full of transmission fluid
- Perform adaptive drive cycle - required if the adaptive tables were cleared
- Set transmission fluid level - transmission fluid is now at the correct temperature and that the

transmission fluid cooler has been purged of air.

- Verify the repair resolved the concern - this is also known as the "post repair road test"

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PRINCIPLES OF OPERATION

Inspection and Verification

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical or electrical damage.

3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4.

If the cause is not visually evident, verify the symptom. REFER to: Diagnosis By Symptom .

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. Check for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set.

Shift Solenoid Pre-Diagnosis

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > DTC CHART: PCM

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DTC Chart

DTC	Description	Component	Action
P0657	Actuator Supply Voltage A Circuit Open	Actuator Supply Voltage A Circuit Open	Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically off. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay also disables power to the transmission solenoids when certain transmission

			DTCs are set. REPAIR as required. CLEAR the DTC. GO to Pinpoint Test A
P0701	Transmission Control System Range/Performance	Transmission hydraulic and clutch systems (including non-electrical shift solenoid faults, main control valve body and clutch(s)).	Intermittent clutch on fault and may set with DTCs P2700, P2701, P2702, P2703 and/or P2704. CLEAR the DTC. If DTC P0701 returns, REFER to: Diagnosis By Symptom .
P0702	Transmission Control System Electrical	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RERUN the KOEO and (KOER self-test). If DTC P0702 returns, REFER to: Charging System - 2.3L EcoBoost (201kW/273PS) .
P0705	Transmission Range Sensor "A" Circuit (PRNDL Input)	TR sensor	GO to Pinpoint Test C
P0706	Transmission Range Sensor "A" Circuit Range/Performance	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is greater or less than the expected duty cycle by 50Hz or more. Engine may not crank. CLEAR the DTC. If DTC P0706 returns, GO to Pinpoint Test C
P0707	Transmission Range Sensor "A" Circuit Low	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0707 returns, GO to Pinpoint Test C
P0708	Transmission Range Sensor "A" Circuit High	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0708 returns, GO to Pinpoint Test C
P0709	Transmission Range Sensor "A" Circuit Intermittent	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is within range but is in the dead band between the design position, and a in-range but invalid duty

			cycle. GO to Pinpoint Test C
P0710	Transmission Fluid Temperature Sensor "A" Circuit	TFT sensor	CLEAR the DTC. If DTC P0710 returns, GO to Pinpoint Test B
P0711	Transmission Fluid Temperature Sensor "A" Circuit Range/Performance	TFT sensor	CLEAR the DTC. If DTC P0711 returns, GO to Pinpoint Test B
P0712	Transmission Fluid Temperature Sensor "A" Circuit Low	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0712 returns, GO to Pinpoint Test B
P0713	Transmission Fluid Temperature Sensor "A" Circuit High	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0713 returns, GO to Pinpoint Test B
P0715	Turbine/Input Shaft Speed Sensor "A" Circuit	TSS sensor	DTC P0717 may set. CLEAR the DTC. If DTC P0715 returns, GO to Pinpoint Test D
P0717	Turbine/Input Shaft Speed Sensor "A" Circuit No Signal	TSS sensor	This DTC sets when DTC P0715 is set. REFER to DTC P0715.
P0718	Turbine/Input Shaft Speed Sensor "A" Circuit Intermittent	TSS sensor	CLEAR the DTC. If DTC P0718 returns, GO to Pinpoint Test D
P0720	Output Shaft Speed Sensor Circuit	OSS sensor	DTC P0722 may set. CLEAR the DTC. If DTC P0720 returns, GO to Pinpoint Test E
P0721	Output Shaft Speed Sensor Circuit Range/Performance	OSS sensor	CLEAR the DTC. If DTC P0721 returns, GO to Pinpoint Test E
P0722	Output Shaft Speed Sensor Circuit No Signal	OSS sensor	This DTC sets when DTC P0720 is set. REFER to DTC P0720.
P0729	Gear 6 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0729 returns, REFER to: Diagnosis By Symptom .
P0731	Gear 1 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0731 returns, REFER to: Diagnosis By Symptom .
P0732	Gear 2 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0732 returns, REFER to: Diagnosis By Symptom .

P0733	Gear 3 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0733 returns, REFER to: Diagnosis By Symptom .
P0734	Gear 4 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0734 returns, REFER to: Diagnosis By Symptom .
P0735	Gear 5 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0735 returns, REFER to: Diagnosis By Symptom .
P0740	Torque Converter Clutch Solenoid Circuit/Open	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0740 returns, GO to Pinpoint Test A
P0741	Torque Converter Clutch Solenoid Circuit Performance/Stuck Off	TCC solenoid	DTC P0741 is a non-electrical DTC. CLEAR the DTC. If DTC P0741 returns, REFER to: Diagnosis By Symptom .
P0742	Torque Converter Clutch Solenoid Circuit Stuck On	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0742 returns, GO to Pinpoint Test A
P0743	Torque Converter Clutch Solenoid Circuit Electrical	TCC solenoid	DTC P0740, P0742 and/or P0744 may set, CLEAR the DTC. If DTC P0743 returns, GO to Pinpoint Test A
P0744	Torque Converter Clutch Solenoid Circuit Intermittent	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0744 returns, GO to Pinpoint Test A
P0748	Pressure Control Solenoid "A" Electrical	LPC	DTC P0960, P0962 and/or P0963 may set, CLEAR the DTC. If DTC P0748 returns, GO to Pinpoint Test A
P0750	Shift Solenoid "A"	SSA	DTC P0751 may set, CLEAR the DTC. If DTC P0750 returns, GO to Pinpoint Test A
P0751	Shift Solenoid "A" Performance/Stuck Off	SSA	DTC P2700 may set, CLEAR the DTC. If DTC P0751 returns, REFER to: Diagnosis By Symptom .
P0752	Shift Solenoid "A" Stuck On	SSA	CLEAR the DTC. If DTC P0752 returns, REFER to: Diagnosis By Symptom .

P0753	Shift Solenoid "A" Electrical	SSA	DTC P0750, P0973 and/or P0974 may set, CLEAR the DTC. If DTC P0753 returns, GO to Pinpoint Test A
P0754	Shift Solenoid "A" Intermittent	SSA	CLEAR the DTC. If DTC P0754 returns, GO to Pinpoint Test A
P0755	Shift Solenoid "B"	SSB	DTC P0756 may set, CLEAR the DTC. If DTC P0755 returns, GO to Pinpoint Test A
P0756	Shift Solenoid "B" Performance/Stuck Off	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0756 returns, REFER to: Diagnosis By Symptom .
P0757	Shift Solenoid "B" Stuck On	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0757 returns, REFER to: Diagnosis By Symptom .
P0758	Shift Solenoid "B" Electrical	SSB	DTC P0755, P0976 and/or P0977 may set, CLEAR the DTC. If DTC P0758 returns, GO to Pinpoint Test A
P0759	Shift Solenoid "B" Intermittent	SSB	CLEAR the DTC. If DTC P0759 returns, GO to Pinpoint Test A
P0760	Shift Solenoid "C"	SSC	DTC P0761 may set, CLEAR the DTC. If DTC P0760 returns, GO to Pinpoint Test A
P0761	Shift Solenoid "C" Performance/Stuck Off	SSC	DTC P2702 may set, CLEAR the DTC. If DTC P0761 returns, REFER to: Diagnosis By Symptom .
P0762	Shift Solenoid "C" Stuck On	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0762 returns, REFER to: Diagnosis By Symptom .
P0763	Shift Solenoid "C" Electrical	SSC	DTC P0760, P0979 and/or P0980 may set, CLEAR the DTC. If DTC P0763 returns, GO to Pinpoint Test A
P0764	Shift Solenoid "C" Intermittent	SSC	CLEAR the DTC. If DTC P0764 returns, GO to Pinpoint Test A

P0765	Shift Solenoid "D"	SSD	DTC P0766 may set, CLEAR the DTC. If DTC P0765 returns, GO to Pinpoint Test A
P0766	Shift Solenoid "D" Performance/Stuck Off	SSD	DTC P2704 may set, CLEAR the DTC. If DTC P0766 returns, REFER to: Diagnosis By Symptom .
P0767	Shift Solenoid "D" Stuck On	SSD	DTC P07A9 and/or P2704 may set, CLEAR the DTC. If DTC P0767 returns, REFER to: Diagnosis By Symptom .
P0768	Shift Solenoid "D" Electrical	SSD	DTC P0765, P0982 and/or P0983 may set, CLEAR the DTC. If DTC P0768 returns, GO to Pinpoint Test A
P0769	Shift Solenoid "D" Intermittent	SSD	CLEAR the DTC. If DTC P0769 returns, GO to Pinpoint Test A
P0770	Shift Solenoid "E"	SSE	DTC P0773 may set, CLEAR the DTC. If DTC P0770 returns, GO to Pinpoint Test A
P0771	Shift Solenoid "E" Performance/Stuck Off	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0771 returns, REFER to: Diagnosis By Symptom .
P0772	Shift Solenoid "E" Stuck On	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0772 returns, REFER to: Diagnosis By Symptom .
P0773	Shift Solenoid "E" Electrical	SSE	REFER to DTC P0770.
P0774	Shift Solenoid "E" Intermittent	SSE	CLEAR the DTC. If DTC P0774 returns, GO to Pinpoint Test A
P07A8	Transmission Friction Element "D" Stuck Off	Transmission	CLEAR the DTC. If DTC P07A8 returns, REFER to: Diagnosis By Symptom .
P07A9	Transmission Friction Element "D" Stuck On	Transmission	DTC P0767 may set, CLEAR the DTC. If DTC P07A9 returns, REFER to: Diagnosis By Symptom .
P07AA	Transmission Friction Element "E" Stuck Off	Transmission	CLEAR the DTC. If DTC P07AA returns, REFER to: Diagnosis By Symptom .

P0815	Upshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0815 returns, REFER to: External Controls .
P0816	Downshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0816 returns, REFER to: External Controls .
P0826	Up and Down switch circuit	SelectShift™ switch	REFER to: External Controls .
P0882	PCM Power Input Signal Low	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. If DTC P0882 returns, REFER to: Charging System - 2.3L EcoBoost (201kW/273PS) .
P0883	PCM Power Input Signal High	Battery	CLEAR the DTC. If DTC P0883 returns, REFER to: Charging System - 2.3L EcoBoost (201kW/273PS) .
P0960	Pressure Control Solenoid "A" Control Circuit/Open	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0960 returns, GO to Pinpoint Test A
P0961	Pressure Control Solenoid "A" Control Circuit Range/Performance	LPC	CLEAR the DTC. If DTC P0961 returns, GO to Pinpoint Test A
P0962	Pressure Control Solenoid "A" Control Circuit Low	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0962 returns, GO to Pinpoint Test A
P0963	Pressure Control Solenoid "A" Control Circuit High	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0963 returns, GO to Pinpoint Test A
P0973	Shift Solenoid "A" Control Circuit Low	SSA	DTC P0753 may set, CLEAR the DTC. If DTC P0973 returns, GO to Pinpoint Test A
P0974	Shift Solenoid "A" Control Circuit High	SSA	DTC P0748 may set, CLEAR the DTC. If DTC P0974 returns, GO to Pinpoint Test A

P0976	Shift Solenoid "B" Control Circuit Low	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0976 returns, GO to Pinpoint Test A
P0977	Shift Solenoid "B" Control Circuit High	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0977 returns, GO to Pinpoint Test A
P0979	Shift Solenoid "C" Control Circuit Low	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0979 returns, GO to Pinpoint Test A
P0980	Shift Solenoid "C" Control Circuit High	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0980 returns, GO to Pinpoint Test A
P0982	Shift Solenoid "D" Control Circuit Low	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0982 returns, GO to Pinpoint Test A
P0983	Shift Solenoid "D" Control Circuit High	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0983 returns, GO to Pinpoint Test A
P0984	Shift Solenoid "E" Range/Performance	SSE	DTC P0771 and/or P0772 may set, CLEAR the DTC. If DTC P0984 returns, REFER to: Diagnosis By Symptom .
P1001	The KOER Not Able to Complete, KOER Aborted	PCM	RETRIEVE and RECORD all DTCs. REPAIR any self-test or CMDTCs first. CLEAR the DTC. RERUN the KOER self-test. If the DTC returns, REPROGRAM the PCM to the latest software. RERUN the KOER self-test. If the DTC returns, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . After installing the new PCM PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

P1397	System Voltage Out Of Self Test Range	PCM	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RUN the KOEO self-test. If DTC P1397 returns, REFER to: Charging System - 2.3L EcoBoost (201kW/273PS) .
P1501	Vehicle Speed Sensor Out Of Self Test Range	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1502	Vehicle Speed Sensor Intermittent	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1635	Tire/Axle Out Of Acceptable Range	PCM	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1636	Inductive Signature Chip Communication Error	PCM	CLEAR the DTC. If DTC P1636 returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P163E	Transmission Control Module Programming Error	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163E returns, INSTALL a new PCM. REFER to: Powertrain Control Module

			(PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P163F	Transmission ID Block Corrupted, Not Programmed	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163F returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P1700	Drivers Door Status Correlation	Transmission	OPEN then CLOSE the drivers door and cycle the door locks. If the door ajar icon is illuminated on the IPC and the door lock and unlock are not working correctly, REFER to: Locks, Latches and Entry Systems . If the door ajar and locks are working correctly, REFER to: External Controls .
P1702	Transmission Range Sensor Circuit Intermittent	TR sensor	DTC P0706, P0707 and/or P0708 may set, CLEAR the DTC. If DTC P1702 returns, GO to Pinpoint Test C
P1705	Transmission Range Circuit Not Indicating Park/Neutral During Self Test	TR sensor	CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1705 returns, GO to Pinpoint Test C
P1711	Transmission Fluid Temperature Sensor Out Of Self Test Range	TFT sensor	CLEAR the DTC and RERUN the KOEO and KOER self-test.
P1744	Torque Converter Clutch Solenoid Circuit Performance	TCC	DTC P1744 is a non-electrical DTC. CLEAR the DTC. If DTC P1744 returns, REFER to: Diagnosis By Symptom .

P177F	Unable To Fully Engage Neutral	Direct or forward clutch pack	This DTC may set when there is a mechanical/hydraulic concern with the direct or forward clutch pack, possibly deformed clutch plates or a rolled clutch seal allowing the direct clutch or the forward clutch to mechanically or hydraulically apply in neutral. PLACE the transmission in neutral with the engine running to see if there is any creep torque, this fault causes the transmission to partially engage forward gear in neutral. This DTC may set with P0752, P0757, P0762, and/or P0767. CLEAR the DTC. If the DTC returns, check the transmission for internal failure. REFER to: Transmission .
P1780	Transmission Control Switch (O/D Cancel) Circuit Out of Self-Test Range	TCS	CLEAR the DTC. If DTC P1780 returns, REFER to: External Controls .
P1783	Transmission Over Temperature Condition	Transmission	CLEAR the DTC. If DTC P1783 returns, determine if this DTC was set in conjunction with any transmission fluid temperature sensor circuit DTCs and RESOLVE them first, otherwise REFER to: Transmission Cooling .
P1910	Reverse Lamp Control Circuit/Open	Reverse lamps	CLEAR the DTC. TEST system for normal operation. If DTC P1910 returns, REFER to: Reversing Lamps .
P1921	Transmission Range Signal	TR sensor	The engine may not crank. DTC P0706, P0707 and/or P0708 may set. CLEAR the DTC. If DTC P1921 returns, CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1921 returns, GO to Pinpoint Test C
P2700	Transmission Friction Element "A" Apply Time	Transmission	DTC P2700 is a non-electrical DTC. DTC

	Range/Performance		P0751 and/or P0752 may set. CLEAR the DTC. If DTC P2700 returns, REFER to: Diagnosis By Symptom .
P2701	Transmission Friction Element "B" Apply Time Range/Performance	Transmission	DTC P2701 is a non-electrical DTC. DTC P0756 and/or P0757 may set. CLEAR the DTC. If DTC P2701 returns, REFER to: Diagnosis By Symptom .
P2702	Transmission Friction Element "C" Apply Time Range/Performance	Transmission	DTC P2702 is a non-electrical DTC. DTC P0761 and/or P0762 may set. CLEAR the DTC. If DTC P2702 returns, REFER to: Diagnosis By Symptom .
P2703	Transmission Friction Element "D" Apply Time Range/Performance	Transmission	DTC P2703 is a non-electrical DTC. DTC P0766 and/or P0768 may set. CLEAR the DTC. If DTC P2703 returns, REFER to: Diagnosis By Symptom .
P2704	Transmission Friction Element "E" Apply Time Range/Performance	Transmission	DTC P2704 is a non-electrical DTC. DTC P0771 and/or P0772 may set. CLEAR the DTC. If DTC P2704 returns, REFER to: Diagnosis By Symptom .
P2705	Transmission Friction Element "F" Apply Time Range/Performance	Mechanical one-way clutch	DTC P2705 is a non-electrical DTC. CLEAR the DTC. If DTC P2705 returns, REFER to: Diagnosis By Symptom .
P2758	Torque Converter Clutch Pressure Control Solenoid Stuck On	TCC	CLEAR the DTC. If DTC P2758 returns, REFER to: Diagnosis By Symptom .
P2760	Torque Converter Clutch Pressure Control Solenoid Intermittent	TCC	CLEAR the DTC. If DTC P2760 returns, GO to Pinpoint Test A

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS

Power is routed through the transmission solenoid power control relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the transmission solenoid power control relay fails open, all solenoids are failed electrically off. Check for open, short to ground or

the transmission connector disconnected. The transmission solenoid power control relay disables power to the transmission solenoids when certain transmission DTCs are set.

- Carry out KOEO and KOER procedures.
- Retrieve and record all DTCs.
- Repair all non-transmission DTCs first.
- Repair all transmission DTCs second.
- Clear all CMDTCs and attempt to repeat them.
- Repair all CMDTCs.
- If only pass codes are obtained, REFER to: Diagnosis By Symptom .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required. Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

NOTE: Without a voltage signal return to the PCM, the Transmission Solenoid Power Control (TSPC) relay is commanded OFF. By using a fused jumper wire between a transmission solenoid control circuit and the signal return circuit, the TSPC relay circuit supplies power to the transmission solenoids when the ignition is cycled from OFF to ON. Do not use a solenoid control circuit that may be at fault.

NOTE: Read and record all DTCs.

A1 CHECK THE SOLENOID POWER CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect: Transmission vehicle harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Using the chart, connect a fused jumper wire between one of the 7 solenoid control circuit pins on transmission vehicle harness C1575 and C1575-5 .

Ignition ON.

> *NOTE: Do not use a solenoid control circuit that may be at fault. Failure to jump pin 5 to a known good solenoid control circuit can cause incorrect diagnostic results.*

Using the chart, connect a fused jumper wire between one of the 7 solenoid control circuit pins on transmission vehicle harness C1575 and C1575-5

Transmission Vehicle Harness C1575	Solenoid Control Circuit
C1575-9	SSA
C1575-14	SSB
C1575-13	SSC
C1575-10	SSD
C1575-8	SSE
C1575-16	LPC solenoid
C1575-3	TCC solenoid

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-7		Ground

Is the voltage greater than 11 volts?

Yes	GO to A4

No	GO to A2

A2 CHECK THE SOLENOID POWER CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: C1551E . Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551E-80	Ω	C1575-7

Is the resistance less than 3 ohms?

Yes	GO to A3

No	REPAIR transmission vehicle harness circuit for an open. CLEAR the DTCs. TEST the system for normal operation. If DTC P0657 returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

A3 CHECK THE SOLENOID POWER CIRCUIT FOR A SHORT TO GROUND

Positive Lead	Measurement / Action	Negative Lead
C1551E-80	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR transmission vehicle harness circuit short to ground. CLEAR the DTCs. If DTC P0657 returns, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

A4 CHECK SOLENOID CONTROL CIRCUITS FOR AN OPEN

Ignition OFF.

Disconnect: TCM C1551E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure the resistance of the solenoid control circuits using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C1551E-60	Ω	C1575-9
C1551E-45	Ω	C1575-14

C1551E-75	Ω	C1575-13
C1551E-30	Ω	C1575-10
C1551E-2	Ω	C1575-8
C1551E-59	Ω	C1575-16
C1551E-44	Ω	C1575-3

Is the resistance less than 3 ohms on each circuit?

Yes	GO to A5

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A5 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between the transmission vehicle harness C1575 , harness side and ground using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C1575-7	Ω	Ground
C1575-9	Ω	Ground
C1575-14	Ω	Ground
C1575-13	Ω	Ground
C1575-10	Ω	Ground
C1575-8	Ω	Ground
C1575-16	Ω	Ground
C1575-3	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A6

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A6 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO POWER

Connect: PCM C1551E

Measure for voltage between the transmission vehicle harness C1575 , harness side and ground using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C1575-9		Ground
C1575-14		Ground
C1575-13		Ground
C1575-10		Ground
C1575-8		Ground
C1575-16		Ground
C1575-3		Ground

Is voltage greater than 3 volts on each circuit?

Yes	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

No	GO to A7

A7 CHECK COMPONENT RESISTANCE

Measure resistance of the solenoid between the transmission molded leadframe C1551E , component side using the following chart.

Transmission	Solenoid	Transmission	Ohms
C1575-7	SSA	C1575-9	4.8 to 5.6
C1575-7	SSB	C1575-14	4.8 to 5.6
C1575-7	SSC	C1575-13	4.8 to 5.6
C1575-7	SSD	C1575-10	4.8 to 5.6
C1575-7	SSE	C1575-8	17.5 to 18.6
C1575-7	LPC solenoid	C1575-16	4.8 to 5.6
C1575-7	TCC solenoid	C1575-3	4.8 to 5.6

Are the solenoid resistances within specifications?

Yes	Inspect for stuck valves or debris, REFER to: Main Control Valve Body . REFER to: Shift Solenoids (SS) . CLEAR the transmission adaptive tables and perform the adaptive drive cycle. REFER to: Adaptive Learning Drive Cycle .

No	GO to A8

A8 CHECK SOLENOID RESISTANCE

Remove the molded leadframe from the main control. REFER to: Shift Solenoids (SS) . Inspect for metallic contamination and clean the solenoid and molded leadframe terminals.

Measure and record the resistance of the suspected solenoid. REFER to: Shift Solenoids (SS) . Compare the recorded value with the chart below.

Solenoid	Ohms
SSA	4.8 to 5.6
SSB	4.8 to 5.6
SSC	4.8 to 5.6
SSD	4.8 to 5.6
SSE	17.5 to 18.6
LPC solenoid	4.8 to 5.6
TCC solenoid	4.8 to 5.6

Is the solenoid resistance within specification?

Yes	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) . CLEAR the DTCs.

No	INSTALL a new solenoid for the solenoid that failed the resistance check. REFER to: Shift Solenoids (SS) . CLEAR the transmission adaptive tables and perform the adaptive drive cycle. REFER to: Adaptive Learning Drive Cycle .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area. The PCM monitors the voltage across the TFT sensor, which changes as transmission fluid temperature varies. The PCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TFT sensor signal for transmission fault detection and diagnostics.

PCM Non-MIL sister code to TFT circuit fault codes P0712 and P0713. This code is used to illuminate the wrench lamp. When the PCM detects a TFT circuit fault that could result in a driveability symptom. The DTC is set to illuminate the wrench lamp. Connectors damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals TFT sensor Transmission internal wiring harness frame PCM

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT

TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

B1 CHECK TFT INPUT SIGNAL

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Connect the diagnostic tool.

Ignition ON.

Enter the following mode on the diagnostic scan tool: TFT PIDs TFT and TFTV.

Does the TFT PID display -40 °C (-40 °F) and the TFTV PID display 4.96 to 5.10 volts? ?

Yes	GO to B2

No	REPAIR the circuit.

B2 CHECK TFT SIGNAL INPUT CIRCUIT FOR VOLTAGE

Measure.

Positive Lead	Measurement / Action	Negative Lead
C1575-6		Ground

Is the voltage between 4.8 and 5.1 volts?

Yes	GO to B3

No	INSPECT and REPAIR the transmission open circuit. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B3 CHECK TFT SIGNAL RETURN CIRCUIT

Connect a fused jumper wire between the transmission vehicle harness C1575-5 and C1575-6 , harness side

Positive Lead	Measurement / Action	Negative Lead
C1575-5		C1575-6

Does the TFT PID display 190 °-195 °C (374 °-383 °F) and the TFTV PID display 0 volts?

Yes	GO to B4

No	INSPECT and REPAIR the transmission vehicle harness signal return circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B4 CHECK TFT SENSOR RESISTANCE

Remove the transmission molded leadframe. REFER to: Shift Solenoids (SS) . Inspect for metal shavings on the exposed metal contacts or other components and clean the solenoid and transmission internal wiring harness frame terminals.

Measure the resistance between the transmission molded leadframe C1575-5 and C1575-6 , component side using the following chart.

C1575-5	Ω	C1575-6
°C	°F	Resistance
-40 to -20	-40 to -4	967K-284K
-19 to -1	-3 to 31	284K-100K
0-20	32-68	100K-37K
21-40	69-104	37K-16K
41-70	105-158	16K-5K
71-90	159-194	5K-2.7K
91-110	195-230	2.7K-1.5K
111-130	231-266	1.5K-0.8K
131-150	267-302	0.8K-0.54K

Does the temperature to resistance specification match?

Yes	To diagnose an overheating concern REFER to: Diagnosis By Symptom .

No	INSPECT and CLEAN the TFT sensor on the molded leadframe for metallic contamination. INSTALL a new molded leadframe if no debris was found, REFER to: Transmission Strategy Download . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT

TEST C : TR SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependent on the PARK, REVERSE, NEUTRAL, DRIVE, 3, 2 or 1 position of the manual valve. The TR sensor has digital sensor (hall effect) that converts the shifter position into a bit pattern, and a micro controller that converts the 4 bit signal into a 125 Hz pulse width modulated signal. The TR sensor also provides signals for the starting system and the reverse lights. The PCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TR sensor signal for transmission fault detection and diagnostics. The TR sensor is integral to the leadframe. DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and P1921 cannot be set by an incorrectly adjusted selector lever cable.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST C : TR SENSOR > PINPOINT TEST C : TR SENSOR

NOTE: Read and record all DTCs.

C1 VERIFY DTCS

Ignition OFF.

Select PARK.

Connect the diagnostic tool.

Carry out the KOEO then the KOER test.

Are TR sensor DTCs present?

Yes	GO to C2

No	If no DTCs are present, and to diagnose any symptoms that may be present REFER to: Diagnosis By Symptom .

C2 CHECK TR SENSOR ELECTRICAL OPERATION

Ignition ON.

Enter the following diagnostic mode on the scan tool: TR PID: TR_DC and TR_FREQ.

Move the selector lever into each range and stop.

Observe the PIDs: TR_DC and TR_FREQ while wiggling the harness or driving the vehicle.

Compare the PID TR_DC to the selector lever position duty cycle, using the following chart.

Selector Lever Position	Range (% Duty Cycle)
P	8.0 - 25.8
R	30.50 - 39.31
N	40.54 - 52.49
D	54.35 - 71.15

Is the TR_FREQ between 100 to 150 Hz?

Is the TR_DC within range?

Does the TR_DC and TR_FREQ remain steady when the harness is wiggled or the vehicle driven?

Yes	The problem is not in the TR sensor system. REFER to: Diagnosis By Symptom .

No	GO to C3

C3 CHECK TR SENSOR VPWR CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-12		Ground

Is the voltage greater than 11 volts?

Yes	INSPECT and REPAIR the transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to C4

C4 CHECK TR SENSOR SIGNAL CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		Ground

Is the voltage greater than 4.8 volts?

Yes	GO to C5

No	INSPECT and REPAIR the transmission vehicle harness for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C5 CHECK TR SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		C1575-11

Is the voltage greater than 4.8 volts?

Yes	GO to C6

No	INSPECT and REPAIR transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C6 CHECK TR SENSOR TO MANUAL VALVE

Drain the transmission fluid and remove the transmission fluid pan. REFER to: Transmission Fluid Pan, Gasket and Filter .

Check the connection between the TR sensor and the manual control valve. REFER to: Transmission .

Inspect the molded leadframe for metallic contamination, REFER to: Shift Solenoids (SS) .

Is the TR sensor connected to the manual control valve shaft?

Is the TR sensor connected to the manual control valve shaft?

Yes	INSTALL a new TR sensor. REFER to: Shift Solenoids (SS) .

No	CONNECT the TR sensor to the manual control valve, REFER to: Shift Solenoids (SS) . CLEAN any debris from the molded leadframe. RUN the KOEO self-test. If DTCs return,

	INSTALL a new TR sensor. REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the forward (1, 2, 3, 4) clutch cylinder varies. The PCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter. The PCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the TSS sensor signal for transmission fault detection and diagnostics. REFER to: Transmission Description - System Operation and Component Description .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

D1 DRIVE CYCLE TEST

Connect the diagnostic tool.

Enter the following diagnostic mode: PID TSS_SRC..

Monitor the PID TSS_SRC while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears.

Does the TSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to D2

D2 CHECK TSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		Ground

Is the voltage less than 4.8 volts?

Yes	GO to D3

No	GO to D6

D3 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C1551E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	Ω	C1551E-27

Is the resistance less than 3 ohms?

Yes	GO to D4

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

D4 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1575-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to D5

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to ground. If a short to ground is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

D5 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C1551E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to power. If a short to power is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to D6

D6 CHECK THE TSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The OSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the output shaft ring gear varies. The PCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the OSS sensor signal for transmission fault detection and diagnostics.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 2.3L ECOBOOST (201KW 273PS) > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

E1 DRIVE CYCLE TEST

Using the diagnostic scan tool, monitor the OSS sensor PID OSS_SRC while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears.

Does the OSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to E2

E2 CHECK OSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: PCM C1551E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		Ground

Is the voltage less than 4.8 volts?

Yes	GO to E3

No	GO to E6

E3 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C1551E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	C1551E-12

Is the resistance less than 3 ohms?

Yes	GO to E4

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E4 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E5

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short

	to ground. If a short to ground is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E5 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C1551E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short to power. If a short to power is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to E6

E6 CHECK THE OSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PRINCIPLES OF OPERATION

Inspection and Verification

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical or electrical damage.

3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4.

If the cause is not visually evident, verify the symptom. REFER to: Diagnosis By Symptom .

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. Check for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set.

Shift Solenoid Pre-Diagnosis

Selector Lever Position	PCM Commanded Gear	Shift Solenoid	TCC NL				
SSA NL TCC NL (1, 2, 3, 4)	SSB NH (3, 5, R)	SSC NL (CB 2, 6)	SSD NH (CB L, R/C 4, 5, 6)	SSE NC			
P	P	Off	On	Off	Off	Off	Off
R	R	Off	Off	Off	Off	Off	Off
N	N	Off	On	Off	Offa	Off	Off
D	1	On	On	Off	Offb	Off	Off
2		On	On	On	On	Off	Off
3		On	Off	Off	On	On	On/Off
4		On	On	Off	Off	On	On/Off

M c	--	--	--	--	--	--	--

2	2	On	On	On	On	Off	Off
1	1	On	On	Off	Off	On	Off

a Solenoid state changes if vehicle is moving forward with the selector lever in the NEUTRAL position. b Solenoid is On when vehicle is above 5 km/h (3 mph). c All gears available upon driver request.

CB = Clutch brake

NC = Normally closed

NH = Normally high

NL = Normally low

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > DTC CHART: PCM

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DTC Chart

DTC	Description	Component	Action
P0657	Actuator Supply Voltage A Circuit Open	Actuator Supply Voltage A Circuit Open	Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically off. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay also disables power to the transmission solenoids when certain transmission DTCs are set. REPAIR as required. CLEAR the DTC. GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS .
P0701	Transmission Control System Range/Performance	Transmission hydraulic and clutch systems (including non-electrical shift solenoid faults, main control valve body and clutch(s)).	Intermittent clutch on fault and may set with DTCs P2700, P2701, P2702, P2703 and/or P2704. CLEAR the DTC. If DTC P0701 returns, REFER to: Diagnosis By Symptom .

P0702	Transmission Control System Electrical	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RERUN the KOEO and (KOER self-test. If DTC P0702 returns, REFER to: Charging System - 3.7L Duratec (227kW/301PS) .
P0705	Transmission Range Sensor "A" Circuit (PRNDL Input)	TR sensor	GO to PINPOINT TEST C : TR SENSOR
P0706	Transmission Range Sensor "A" Circuit Range/Performance	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is greater or less than the expected duty cycle by 50Hz or more. Engine may not crank. CLEAR the DTC. If DTC P0706 returns, GO to PINPOINT TEST C : TR SENSOR
P0707	Transmission Range Sensor "A" Circuit Low	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0707 returns, GO to PINPOINT TEST C : TR SENSOR
P0708	Transmission Range Sensor "A" Circuit High	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0708 returns, GO to PINPOINT TEST C : TR SENSOR
P0709	Transmission Range Sensor "A" Circuit Intermittent	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is within range but is in the dead band between the design position, and a in-range but invalid duty cycle. GO to PINPOINT TEST C : TR SENSOR
P0710	Transmission Fluid Temperature Sensor "A" Circuit	TFT sensor	CLEAR the DTC. If DTC P0710 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

P0711	Transmission Fluid Temperature Sensor "A" Circuit Range/Performance	TFT sensor	CLEAR the DTC. If DTC P0711 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0712	Transmission Fluid Temperature Sensor "A" Circuit Low	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0712 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0713	Transmission Fluid Temperature Sensor "A" Circuit High	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0713 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0715	Turbine/Input Shaft Speed Sensor "A" Circuit	TSS sensor	DTC P0717 may set. CLEAR the DTC. If DTC P0715 returns, GO to PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR .
P0717	Turbine/Input Shaft Speed Sensor "A" Circuit No Signal	TSS sensor	This DTC sets when DTC P0715 is set. REFER to DTC P0715.
P0718	Turbine/Input Shaft Speed Sensor "A" Circuit Intermittent	TSS sensor	CLEAR the DTC. If DTC P0718 returns, GO to PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR
P0720	Output Shaft Speed Sensor Circuit	OSS sensor	DTC P0722 may set. CLEAR the DTC. If DTC P0720 returns, GO to PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR
P0721	Output Shaft Speed Sensor Circuit Range/Performance	OSS sensor	CLEAR the DTC. If DTC P0721 returns, GO to PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR
P0722	Output Shaft Speed Sensor Circuit No Signal	OSS sensor	This DTC sets when DTC P0720 is set. REFER to DTC P0720.
P0729	Gear 6 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0729 returns, REFER to: Diagnosis By Symptom .

P0731	Gear 1 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0731 returns, REFER to: Diagnosis By Symptom .
P0732	Gear 2 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0732 returns, REFER to: Diagnosis By Symptom .
P0733	Gear 3 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0733 returns, REFER to: Diagnosis By Symptom .
P0734	Gear 4 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0734 returns, REFER to: Diagnosis By Symptom .
P0735	Gear 5 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0735 returns, REFER to: Diagnosis By Symptom .
P0740	Torque Converter Clutch Solenoid Circuit/Open	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0740 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0741	Torque Converter Clutch Solenoid Circuit Performance/Stuck Off	TCC solenoid	DTC P0741 is a non-electrical DTC. CLEAR the DTC. If DTC P0741 returns, REFER to: Diagnosis By Symptom .
P0742	Torque Converter Clutch Solenoid Circuit Stuck On	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0742 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0743	Torque Converter Clutch Solenoid Circuit Electrical	TCC solenoid	DTC P0740, P0742 and/or P0744 may set, CLEAR the DTC. If DTC P0743 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0744	Torque Converter Clutch Solenoid Circuit Intermittent	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0744 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0748	Pressure Control Solenoid "A" Electrical	LPC	DTC P0960, P0962 and/or P0963 may set, CLEAR the DTC. If DTC P0748 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL

			SOLENOIDS
P0750	Shift Solenoid "A"	SSA	DTC P0751 may set, CLEAR the DTC. If DTC P0750 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0751	Shift Solenoid "A" Performance/Stuck Off	SSA	DTC P2700 may set, CLEAR the DTC. If DTC P0751 returns, REFER to: Diagnosis By Symptom .
P0752	Shift Solenoid "A" Stuck On	SSA	CLEAR the DTC. If DTC P0752 returns, REFER to: Diagnosis By Symptom .
P0753	Shift Solenoid "A" Electrical	SSA	DTC P0750, P0973 and/or P0974 may set, CLEAR the DTC. If DTC P0753 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0754	Shift Solenoid "A" Intermittent	SSA	CLEAR the DTC. If DTC P0754 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0755	Shift Solenoid "B"	SSB	DTC P0756 may set, CLEAR the DTC. If DTC P0755 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0756	Shift Solenoid "B" Performance/Stuck Off	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0756 returns, REFER to: Diagnosis By Symptom .
P0757	Shift Solenoid "B" Stuck On	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0757 returns, REFER to: Diagnosis By Symptom .
P0758	Shift Solenoid "B" Electrical	SSB	DTC P0755, P0976 and/or P0977 may set, CLEAR the DTC. If DTC P0758 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0759	Shift Solenoid "B" Intermittent	SSB	CLEAR the DTC. If DTC P0759 returns, GO to PINPOINT TEST A :

			TRANSMISSION CONTROL SOLENOIDS
P0760	Shift Solenoid "C"	SSC	DTC P0761 may set, CLEAR the DTC. If DTC P0760 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0761	Shift Solenoid "C" Performance/Stuck Off	SSC	DTC P2702 may set, CLEAR the DTC. If DTC P0761 returns, REFER to: Diagnosis By Symptom .
P0762	Shift Solenoid "C" Stuck On	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0762 returns, REFER to: Diagnosis By Symptom .
P0763	Shift Solenoid "C" Electrical	SSC	DTC P0760, P0979 and/or P0980 may set, CLEAR the DTC. If DTC P0763 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0764	Shift Solenoid "C" Intermittent	SSC	CLEAR the DTC. If DTC P0764 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0765	Shift Solenoid "D"	SSD	DTC P0766 may set, CLEAR the DTC. If DTC P0765 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0766	Shift Solenoid "D" Performance/Stuck Off	SSD	DTC P2704 may set, CLEAR the DTC. If DTC P0766 returns, REFER to: Diagnosis By Symptom .
P0767	Shift Solenoid "D" Stuck On	SSD	DTC P07A9 and/or P2704 may set, CLEAR the DTC. If DTC P0767 returns, REFER to: Diagnosis By Symptom .
P0768	Shift Solenoid "D" Electrical	SSD	DTC P0765, P0982 and/or P0983 may set, CLEAR the DTC. If DTC P0768 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

P0769	Shift Solenoid "D" Intermittent	SSD	CLEAR the DTC. If DTC P0769 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0770	Shift Solenoid "E"	SSE	DTC P0773 may set, CLEAR the DTC. If DTC P0770 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0771	Shift Solenoid "E" Performance/Stuck Off	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0771 returns, REFER to: Diagnosis By Symptom .
P0772	Shift Solenoid "E" Stuck On	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0772 returns, REFER to: Diagnosis By Symptom .
P0773	Shift Solenoid "E" Electrical	SSE	REFER to DTC P0770.
P0774	Shift Solenoid "E" Intermittent	SSE	CLEAR the DTC. If DTC P0774 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P07A8	Transmission Friction Element "D" Stuck Off	Transmission	CLEAR the DTC. If DTC P07A8 returns, REFER to: Diagnosis By Symptom .
P07A9	Transmission Friction Element "D" Stuck On	Transmission	DTC P0767 may set, CLEAR the DTC. If DTC P07A9 returns, REFER to: Diagnosis By Symptom .
P07AA	Transmission Friction Element "E" Stuck Off	Transmission	CLEAR the DTC. If DTC P07AA returns, REFER to: Diagnosis By Symptom .
P0815	Upshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0815 returns, REFER to: External Controls .
P0816	Downshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0816 returns, REFER to: External Controls .
P0826	Up and Down switch circuit	SelectShift™ switch	REFER to: External Controls .
P0882	PCM Power Input Signal Low	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged

			or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. If DTC P0882 returns, REFER to: Charging System - 3.7L Duratec (227kW/301PS) .
P0883	PCM Power Input Signal High	Battery	CLEAR the DTC. If DTC P0883 returns, REFER to: Charging System - 3.7L Duratec (227kW/301PS) .
P0960	Pressure Control Solenoid "A" Control Circuit/Open	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0960 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0961	Pressure Control Solenoid "A" Control Circuit Range/Performance	LPC	CLEAR the DTC. If DTC P0961 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0962	Pressure Control Solenoid "A" Control Circuit Low	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0962 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0963	Pressure Control Solenoid "A" Control Circuit High	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0963 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0973	Shift Solenoid "A" Control Circuit Low	SSA	DTC P0753 may set, CLEAR the DTC. If DTC P0973 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0974	Shift Solenoid "A" Control Circuit High	SSA	DTC P0748 may set, CLEAR the DTC. If DTC P0974 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0976	Shift Solenoid "B" Control Circuit Low	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0976 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

P0977	Shift Solenoid "B" Control Circuit High	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0977 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0979	Shift Solenoid "C" Control Circuit Low	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0979 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0980	Shift Solenoid "C" Control Circuit High	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0980 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0982	Shift Solenoid "D" Control Circuit Low	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0982 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0983	Shift Solenoid "D" Control Circuit High	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0983 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0984	Shift Solenoid "E" Range/Performance	SSE	DTC P0771 and/or P0772 may set, CLEAR the DTC. If DTC P0984 returns, REFER to: Diagnosis By Symptom .
P1001	The KOER Not Able to Complete, KOER Aborted	PCM	RETRIEVE and RECORD all DTCs. REPAIR any self-test or CMDTCs first. CLEAR the DTC. RERUN the KOER self-test. If the DTC returns, REPROGRAM the PCM to the latest software. RERUN the KOER self-test. If the DTC returns, INSTALL a new PCM REFER to: Powertrain Control Module (PCM) . After installing the new PCM PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

P1397	System Voltage Out Of Self Test Range	PCM	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RUN the KOEO self-test. If DTC P1397 returns, REFER to: Charging System - 3.7L Duratec (227kW/301PS) .
P1501	Vehicle Speed Sensor Out Of Self Test Range	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1502	Vehicle Speed Sensor Intermittent	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1635	Tire/Axle Out Of Acceptable Range	PCM	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1636	Inductive Signature Chip Communication Error	PCM	CLEAR the DTC. If DTC P1636 returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P163E	Transmission Control Module Programming Error	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163E returns, INSTALL a new PCM. REFER to: Powertrain Control Module

			(PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P163F	Transmission ID Block Corrupted, Not Programmed	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163F returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P1700	Transmission Intermittent Failure (failed to neutral)	Transmission	DTC P1700 is a non-electrical DTC. CLEAR the DTC. If the DTC returns, REFER to: Diagnosis By Symptom .
P1702	Transmission Range Sensor Circuit Intermittent	TR sensor	DTC P0706, P0707 and/or P0708 may set, CLEAR the DTC. If DTC P1702 returns, GO to PINPOINT TEST C : TR SENSOR
P1705	Transmission Range Circuit Not Indicating Park/Neutral During Self Test	TR sensor	CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1705 returns, GO to PINPOINT TEST C : TR SENSOR
P1711	Transmission Fluid Temperature Sensor Out Of Self Test Range	TFT sensor	CLEAR the DTC and RERUN the KOEO and KOER self-test.
P1744	Torque Converter Clutch Solenoid Circuit Performance	TCC	DTC P1744 is a non-electrical DTC. CLEAR the DTC. If DTC P1744 returns, REFER to: Diagnosis By Symptom .
P177F	Unable To Fully Engage Neutral	Direct or forward clutch pack	This DTC may set when there is a mechanical/hydraulic concern with the direct or forward clutch pack, possibly deformed clutch plates or a

			rolled clutch seal allowing the direct clutch or the forward clutch to mechanically or hydraulically apply in neutral. PLACE the transmission in neutral with the engine running to see if there is any creep torque, this fault causes the transmission to partially engage forward gear in neutral. This DTC may set with P0752, P0757, P0762, and/or P0767. CLEAR the DTC. If the DTC returns, check the transmission for internal failure. REFER to: Transmission .
P1780	Transmission Control Switch (O/D Cancel) Circuit Out of Self-Test Range	TCS	CLEAR the DTC. If DTC P1780 returns, REFER to: External Controls .
P1783	Transmission Over Temperature Condition	Transmission	CLEAR the DTC. If DTC P1783 returns, determine if this DTC was set in conjunction with any transmission fluid temperature sensor circuit DTCs and RESOLVE them first, otherwise REFER to: Transmission Cooling .
P1910	Reverse Lamp Control Circuit/Open	Reverse lamps	CLEAR the DTC. TEST system for normal operation. If DTC P1910 returns, REFER to: Reversing Lamps .
P1921	Transmission Range Signal	TR sensor	The engine may not crank. DTC P0706, P0707 and/or P0708 may set. CLEAR the DTC. If DTC P1921 returns, CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1921 returns, GO to PINPOINT TEST C : TR SENSOR .
P2700	Transmission Friction Element "A" Apply Time Range/Performance	Transmission	DTC P2700 is a non-electrical DTC. DTC P0751 and/or P0752 may set. CLEAR the DTC. If DTC P2700 returns, REFER to: Diagnosis By Symptom .

P2701	Transmission Friction Element "B" Apply Time Range/Performance	Transmission	DTC P2701 is a non-electrical DTC. DTC P0756 and/or P0757 may set. CLEAR the DTC. If DTC P2701 returns, REFER to: Diagnosis By Symptom .
P2702	Transmission Friction Element "C" Apply Time Range/Performance	Transmission	DTC P2702 is a non-electrical DTC. DTC P0761 and/or P0762 may set. CLEAR the DTC. If DTC P2702 returns, REFER to: Diagnosis By Symptom .
P2703	Transmission Friction Element "D" Apply Time Range/Performance	Transmission	DTC P2703 is a non-electrical DTC. DTC P0766 and/or P0768 may set. CLEAR the DTC. If DTC P2703 returns, REFER to: Diagnosis By Symptom .
P2704	Transmission Friction Element "E" Apply Time Range/Performance	Transmission	DTC P2704 is a non-electrical DTC. DTC P0771 and/or P0772 may set. CLEAR the DTC. If DTC P2704 returns, REFER to: Diagnosis By Symptom .
P2705	Transmission Friction Element "F" Apply Time Range/Performance	Mechanical one-way clutch	DTC P2705 is a non-electrical DTC. CLEAR the DTC. If DTC P2705 returns, REFER to: Diagnosis By Symptom .
P2758	Torque Converter Clutch Pressure Control Solenoid Stuck On	TCC	CLEAR the DTC. If DTC P2758 returns, REFER to: Diagnosis By Symptom .
P2760	Torque Converter Clutch Pressure Control Solenoid Intermittent	TCC	CLEAR the DTC. If DTC P2760 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS

Power is routed through the transmission solenoid power control relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the transmission solenoid power control relay fails open, all solenoids are failed electrically off. Check for open, short to ground or the transmission connector disconnected. The transmission solenoid power control relay disables power to the transmission solenoids when certain transmission DTCs are set.

- Carry out KOEO and KOER procedures.
- Retrieve and record all DTCs.
- Repair all non-transmission DTCs first.
- Repair all transmission DTCs second.
- Clear all CMDTCs and attempt to repeat them.
- Repair all CMDTCs.
- If only pass codes are obtained, REFER to: Diagnosis By Symptom .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required. Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

> *NOTE: The PCM removes power from the Transmission Solenoid Power Control (TSPC) circuit when the key is on and the transmission harness is disconnected. Use the meter's min/max function to record the voltage before the PCM removes power.*

A1 CHECK THE SOLENOID POWER CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect: C1575 .

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

NOTE: Use a meter with a min/max feature and/or recording capabilities to obtain accurate measurements.

Set the meter to measure DC voltage.

Set the meter range to greater than 15 volts.

Enable the min/max or recording feature.

NOTE: Make sure all test connections are made at the transmission harness connector before the ignition key is turned to the ON position.

Connect the meter leads to C1575-7 and ground.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-7	V	Ground

Is the maximum recorded voltage greater than 11 volts?

Yes	GO to A4

No	GO to A2

A2 CHECK THE SOLENOID POWER CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: C1381E Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381E-91	Ω	C1575-7

Is the resistance less than 3 ohms?

Yes	GO to A3

No	REPAIR transmission vehicle harness circuit for an open.

A3 CHECK THE SOLENOID POWER CIRCUIT FOR A SHORT TO GROUND

Positive Lead	Measurement / Action	Negative Lead
C1381E-91	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	REPAIR transmission vehicle harness circuit short to ground.

A4 CHECK SOLENOID CONTROL CIRCUITS FOR AN OPEN

Ignition OFF.

Disconnect: PCM C1381E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure the resistance of the solenoid control circuits using the following chart:

Positive Lead	Measurement / Action	Negative Lead
C1381E-75	Ω	C1575-9
C1381E-74	Ω	C1575-14
C1381E-73	Ω	C1575-13
C1381E-72	Ω	C1575-10
C1381E-77	Ω	C1575-8
C1381E-15	Ω	C1575-16
C1381E-14	Ω	C1575-3

Is the resistance less than 3 ohms on the suspect circuit?

Yes	GO to A5

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A5 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between the transmission vehicle harness C1575 , harness side and ground using the following chart:

Positive Lead	Measurement / Action	Negative Lead
C1575-7	Ω	Ground
C1575-9	Ω	Ground
C1575-14	Ω	Ground
C1575-13	Ω	Ground
C1575-10	Ω	Ground
C1575-8	Ω	Ground
C1575-16	Ω	Ground
C1575-3	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A6

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A6 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO POWER

Connect: PCM C1381E

Measure the voltage between the transmission vehicle harness C1575 , harness side and ground using the following chart:

Positive Lead	Measurement / Action	Negative Lead
C1575-9	V	Ground
C1575-14	V	Ground
C1575-13	V	Ground
C1575-10	V	Ground
C1575-8	V	Ground
C1575-16	V	Ground
C1575-3	V	Ground

Is the voltage greater than 3 volts on the suspect circuit?

Yes	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

No	GO to A7

A7 CHECK FOR FLUID CONTAMINATION

REMOVE the transmission fluid pan. REFER to: Transmission Fluid Pan, Gasket and Filter .

Inspect for fine metallic contamination at the molded leadframe to solenoid connections.

Is visible metallic contamination present?

Yes	REMOVE and discard the foam strip if equipped. REMOVE and CLEAN the molded lead frame and solenoid terminals with clean transmission fluid. REFER to: Shift Solenoids (SS) .GO to A8

No	GO to A8

A8 CHECK MOLDED LEADFRAME RESISTANCE

Measure resistance of the suspect solenoid circuit between the transmission harness connector C1575 (component side), and the transmission molded leadframe using the table below:

Positive Lead	Measurement / Action	Negative Lead
Transmission Harness Component Side (see table below)	Ω	Lead Frame

Transmission	**Solenoid**	**Solenoid Terminal**
C1575-9	SSA	9
C1575-14	SSB	14
C1575-13	SSC	13
C1575-10	SSD	10
C1575-8	SSE	8
C1575-16	LPC solenoid	16
C1575-3	TCC solenoid	3

Is the resistance less than 3 ohms on the suspect circuit?

Yes	GO to A9

No	INSTALL a new molded leadframe. INSTALL new foam strip (Service Part Number FL3Z-14B167-A) between molded leadframe and the solenoids. REFER to: Shift Solenoids (SS) .

A9 CHECK SOLENOID RESISTANCE

Remove the molded leadframe from the main control. REFER to: Shift Solenoids (SS) . Inspect for metallic contamination and clean the solenoid and molded leadframe terminals.

Measure and record the resistance of the suspected solenoid. REFER to: Shift Solenoids (SS) . Compare the recorded value with the chart below:

Solenoid	Ohms
SSA	4.8 to 5.6
SSB	4.8 to 5.6
SSC	4.8 to 5.6
SSD	4.8 to 5.6
SSE	17.5 to 18.6
LPC solenoid	4.8 to 5.6
TCC solenoid	4.8 to 5.6

Is the solenoid resistance within specification?

Yes	The system is operating correctly at this time. INSTALL new foam strip (Service Part Number FL3Z-14B167-A) between molded leadframe and the solenoids. REFER to: Shift Solenoids (SS) .

No	INSTALL a new solenoid for the solenoid that failed the resistance check. INSTALL new foam strip (Service Part Number FL3Z-14B167-A) between molded leadframe and the solenoids. REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area. The PCM monitors the voltage across the TFT sensor, which changes as transmission fluid temperature varies. The PCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TFT sensor signal for transmission fault detection and diagnostics.

Possible Sources

- Connectors damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals
- TFT sensor

- Transmission internal wiring harness frame
- PCM

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

B1 CHECK TFT INPUT SIGNAL

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Connect the diagnostic tool.

Ignition ON.

Enter the following mode on the diagnostic scan tool: TFT PIDs TFT and TFTV.

Does the TFT PID display -40 °C (-40 °F) and the TFTV PID display 4.96 to 5.10 volts?

Yes	GO to B2

No	REPAIR the circuit.

B2 CHECK TFT SIGNAL INPUT CIRCUIT FOR VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-6		Ground

Is the voltage between 4.8 and 5.1 volts?

Yes	GO to B3

No	INSPECT and REPAIR the transmission open circuit. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B3 CHECK TFT SIGNAL RETURN CIRCUIT

Connect a fused jumper wire between the transmission vehicle harness C1575-5 and C1575-6 , harness side:

Positive Lead	Measurement / Action	Negative Lead
C1575-5		C1575-6

Does the TFT PID display 190 °-195 °C (374 °-383 °F) and the TFTV PID display 0 volts?

Yes	GO to B4

No	INSPECT and REPAIR the transmission vehicle harness signal return circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B4 CHECK TFT SENSOR RESISTANCE

Remove the transmission molded leadframe. REFER to: Shift Solenoids (SS) . Inspect for metal shavings on the exposed metal contacts or other components and clean the solenoid and transmission internal wiring harness frame terminals.

Measure the resistance between the transmission molded leadframe C1575-5 and C1575-6 , component side using the following chart:

C1575-5	Ω	C1575-6
°C	°F	Resistance
-40 to -20	-40 to -4	967K-284K
-19 to -1	-3 to 31	284K-100K
0-20	32-68	100K-37K
21-40	69-104	37K-16K
41-70	105-158	16K-5K
71-90	159-194	5K-2.7K
91-110	195-230	2.7K-1.5K
111-130	231-266	1.5K-0.8K
131-150	267-302	0.8K-0.54K

Does the temperature to resistance specification match?

Yes	To diagnose an overheating concern REFER to: Diagnosis By Symptom .

No	INSPECT and CLEAN the TFT sensor on the molded leadframe for metallic contamination. INSTALL a new molded leadframe if no debris was found, REFER to: Transmission Strategy Download . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST C : TR SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependent on the PARK, REVERSE, NEUTRAL, DRIVE, 3, 2 or 1 position of the manual valve. The TR sensor has digital sensor (hall effect) that converts the shifter position into a bit pattern, and a micro controller that converts the 4 bit signal into a 125 Hz pulse width modulated signal. The TR sensor also provides signals for the starting system and the reverse lights. The PCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TR sensor signal for transmission fault detection and diagnostics. The TR sensor is integral to the leadframe. DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and P1921 cannot be set by an incorrectly adjusted selector lever cable.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST C : TR SENSOR > PINPOINT TEST C : TR SENSOR

NOTE: Read and record all DTCs.

C1 VERIFY DTCS

Ignition OFF.

Select PARK.

Connect the diagnostic tool.

Carry out the KOEO then the KOER test.

Are Transmission Range (TR) sensor DTCs present?

Yes	GO to C2

No	If no DTCs are present, and to diagnose any symptoms that may be present REFER to: Diagnosis By Symptom .

C2 CHECK TR SENSOR ELECTRICAL OPERATION

Ignition ON.

Enter the following diagnostic mode on the scan tool: TR PID: TR_DC and TR_FREQ.

Move the selector lever into each range and stop.

Observe the PIDs: TR_DC and TR_FREQ while wiggling the harness or driving the vehicle.

Compare the PID TR_DC to the selector lever position duty cycle, using the following chart.

Selector Lever Position	Range (% Duty Cycle)
P	8.0 - 25.8
R	30.50 - 39.31
N	40.54 - 52.49
D	54.35 - 71.15

Is the TR_FREQ between 100 to 150 Hz?

Is the TR_DC within range?

Does the TR_DC and TR_FREQ remain steady when the harness is wiggled or the vehicle driven?

Yes	The problem is not in the TR sensor system. REFER to: Diagnosis By Symptom .

No	GO to C3

C3 CHECK TR SENSOR VPWR CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-12		Ground

Is the voltage greater than 11 volts?

Yes	GO to C4

No	INSPECT and REPAIR the transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C4 CHECK TR SENSOR SIGNAL CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		Ground

Is the voltage greater than 4.8 volts?

Yes	GO to C5

No	INSPECT and REPAIR the transmission vehicle harness for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C5 CHECK TR SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		C1575-11

Is the voltage greater than 4.8 volts?

Yes	GO to C6

No	INSPECT and REPAIR transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C6 CHECK TR SENSOR TO MANUAL VALVE

Drain the transmission fluid and remove the transmission fluid pan. REFER to: Transmission Fluid Pan, Gasket and Filter .

Check the connection between the TR sensor and the manual control valve. REFER to: Shift Solenoids (SS) .

Inspect the molded leadframe for metallic contamination, REFER to: Shift Solenoids (SS) .

Is the TR sensor connected to the manual control valve shaft?

Is the TR sensor connected to the manual control valve shaft?

Yes	INSTALL a new TR sensor. REFER to: Shift Solenoids (SS) .

No	CONNECT the TR sensor to the manual control valve, REFER to: Shift Solenoids (SS) . CLEAN any debris from the molded leadframe. RUN the KOEO self-test. If DTCs return, INSTALL a new TR sensor.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the forward (1, 2, 3, 4) clutch cylinder varies. The PCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter. The PCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the TSS sensor signal for transmission fault detection and diagnostics. REFER to: Transmission Description - System Operation and Component Description .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

D1 DRIVE CYCLE TEST

Connect the diagnostic tool.

Enter the following diagnostic mode: PID TSS_SRC..

Monitor the PID TSS_SRC while road testing the vehicle. Drive the vehicle so the

transmission upshifts and downshifts through all the gears.

Does the TSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to D2

D2 CHECK TSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		Ground

Is the voltage less than 4.8 volts?

Yes	GO to D3

No	GO to D6

D3 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C1381E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	Ω	C1381E-25

Is the resistance less than 3 ohms?

Yes	GO to D4

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for an open.

D4 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to D5

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to ground.

D5 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C1381E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	V	Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to power.

No	GO to D6

D6 CHECK THE TSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	V	C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The OSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the output shaft ring gear varies. The PCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the OSS sensor signal for transmission fault detection and diagnostics. DTC s are set.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 3.7L DURATEC (227KW 301PS) > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

E1 DRIVE CYCLE TEST

Using the diagnostic scan tool, monitor the OSS sensor PID OSS_SRC while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears.

Does the OSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to E2

E2 CHECK OSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: PCM C1575

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		Ground

Is the voltage less than 4.8 volts?

Yes	GO to E3

No	GO to E6

E3 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C1381E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	C1381E-26

Is the resistance less than 3 ohms?

Yes	GO to E4

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E4 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E5

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short to ground. If a short to ground is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E5 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C1381E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short to power. If a short to power is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to E6

E6 CHECK THE OSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND

PINPOINT TESTS - 5.0L 32V TI-VCT > PRINCIPLES OF OPERATION

Inspection and Verification

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical or electrical damage.

3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4.

If the cause is not visually evident, verify the symptom. REFER to: Diagnosis By Symptom .

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. Check for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set.

Shift Solenoid Pre-Diagnosis

Selector Lever Position	PCM Commanded Gear	Shift Solenoid	TCC NL				
SSA NL TCC NL (1, 2, 3, 4)	SSB NH (3, 5, R)	SSC NL (CB 2, 6)	SSD NH (CB L, R/C 4, 5, 6)	SSE NC			
P	P	Off	On	Off	Off	Off	Off
R	R	Off	Off	Off	Off	Off	Off
N	N	Off	On	Off	Offa	Off	Off
D	1	On	On	Off	Offb	Off	Off
2		On	On	On	On	Off	Off
3		On	Off	Off	On	On	On/Off
4		On	On	Off	Off	On	On/Off
5		Off	Off	Off	Off	On	On/Off

6		Off	On	On	Off	On	On/Off
M c	--	--	--	--	--	--	--
2	2	On	On	On	On	Off	Off
1	1	On	On	Off	Off	On	Off

a Solenoid state changes if vehicle is moving forward with the selector lever in the NEUTRAL position. b Solenoid is On when vehicle is above 5 km/h (3 mph). c All gears available upon driver request.

CB = Clutch brake

NC = Normally closed

NH = Normally high

NL = Normally low

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > DTC CHART: PCM

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

DTC Chart

DTC	Description	Component	Action
P0657	Actuator supply voltage A circuit open	Actuator Supply Voltage A Circuit Open	Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically off. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay also disables power to the transmission solenoids when certain transmission DTCs are set. REPAIR as required. CLEAR the DTC. GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0701	Transmission Control System Range/Performance	Transmission hydraulic and clutch systems	Intermittent clutch on fault and may set with DTCs P2700,

		(including non-electrical shift solenoid faults, main control valve body and clutch(s)).	P2701, P2702, P2703 and/or P2704. CLEAR the DTC. If DTC P0701 returns, REFER to: Diagnosis By Symptom .
P0702	Transmission Control System Electrical	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P0702 returns, REFER to: Charging System - 5.0L 32V Ti-VCT .
P0705	Transmission Range Sensor "A" Circuit (PRNDL Input)	TR sensor	GO to PINPOINT TEST C : TR SENSOR
P0706	Transmission Range Sensor "A" Circuit Range/Performance	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is greater or less than the expected duty cycle by 50Hz or more. Engine may not crank. CLEAR the DTC. If DTC P0706 returns, GO to PINPOINT TEST C : TR SENSOR
P0707	Transmission Range Sensor "A" Circuit Low	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0707 returns, GO to PINPOINT TEST C : TR SENSOR
P0708	Transmission Range Sensor "A" Circuit High	TR sensor	Engine may not crank, CLEAR the DTC. If DTC P0708 returns, GO to PINPOINT TEST C : TR SENSOR
P0709	Transmission Range Sensor "A" Circuit Intermittent	TR sensor	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is within range but is in the dead band between the design position, and an in-range but invalid duty cycle. GO to PINPOINT TEST C : TR SENSOR

P0710	Transmission Fluid Temperature Sensor "A" Circuit	TFT sensor	CLEAR the DTC. If DTC P0710 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0711	Transmission Fluid Temperature Sensor "A" Circuit Range/Performance	TFT sensor	CLEAR the DTC. If DTC P0711 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0712	Transmission Fluid Temperature Sensor "A" Circuit Low	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0712 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0713	Transmission Fluid Temperature Sensor "A" Circuit High	TFT sensor	DTC P0710 may set. CLEAR the DTC. If DTC P0713 returns, GO to PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR
P0715	Turbine/Input Shaft Speed Sensor "A" Circuit	TSS sensor	DTC P0717 may set. CLEAR the DTC. If DTC P0715 returns, GO to PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR
P0717	Turbine/Input Shaft Speed Sensor "A" Circuit No Signal	TSS sensor	This DTC sets when DTC P0715 is set. REFER to DTC P0715.
P0718	Turbine/Input Shaft Speed Sensor "A" Circuit Intermittent	TSS sensor	CLEAR the DTC. If DTC P0718 returns, GO to PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR
P0720	Output Shaft Speed Sensor Circuit	OSS sensor	DTC P0722 may set. CLEAR the DTC. If DTC P0720 returns, GO to PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR
P0721	Output Shaft Speed Sensor Circuit Range/Performance	OSS sensor	CLEAR the DTC. If DTC P0721 returns, GO to PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

P0722	Output Shaft Speed Sensor Circuit No Signal	OSS sensor	This DTC sets when DTC P0720 is set. REFER to DTC P0720.
P0729	Gear 6 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0729 returns, REFER to: Diagnosis By Symptom .
P0731	Gear 1 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0731 returns, REFER to: Diagnosis By Symptom .
P0732	Gear 2 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0732 returns, REFER to: Diagnosis By Symptom .
P0733	Gear 3 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0733 returns, REFER to: Diagnosis By Symptom .
P0734	Gear 4 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0734 returns, REFER to: Diagnosis By Symptom .
P0735	Gear 5 Incorrect Ratio	Transmission	CLEAR the DTC. If DTC P0735 returns, REFER to: Diagnosis By Symptom .
P0740	Torque Converter Clutch Solenoid Circuit/Open	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0740 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0741	Torque Converter Clutch Solenoid Circuit Performance/Stuck Off	TCC solenoid	DTC P0741 is a non-electrical DTC. CLEAR the DTC. If DTC P0741 returns, REFER to: Diagnosis By Symptom .
P0742	Torque Converter Clutch Solenoid Circuit Stuck On	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0742 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0743	Torque Converter Clutch Solenoid Circuit Electrical	TCC solenoid	DTC P0740, P0742 and/or P0744 may set, CLEAR the DTC. If DTC P0743 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0744	Torque Converter Clutch Solenoid Circuit Intermittent	TCC solenoid	DTC P0743 may set, CLEAR the DTC. If DTC P0744 returns, GO to PINPOINT

			TEST A : TRANSMISSION CONTROL SOLENOIDS
P0748	Pressure Control Solenoid "A" Electrical	LPC	DTC P0960, P0962 and/or P0963 may set, CLEAR the DTC. If DTC P0748 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0750	Shift Solenoid "A"	SSA	DTC P0751 may set, CLEAR the DTC. If DTC P0750 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0751	Shift Solenoid "A" Performance/Stuck Off	SSA	DTC P2700 may set, CLEAR the DTC. If DTC P0751 returns, REFER to: Diagnosis By Symptom .
P0752	Shift Solenoid "A" Stuck On	SSA	CLEAR the DTC. If DTC P0752 returns, REFER to: Diagnosis By Symptom .
P0753	Shift Solenoid "A" Electrical	SSA	DTC P0750, P0973 and/or P0974 may set, CLEAR the DTC. If DTC P0753 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0754	Shift Solenoid "A" Intermittent	SSA	CLEAR the DTC. If DTC P0754 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0755	Shift Solenoid "B"	SSB	DTC P0756 may set, CLEAR the DTC. If DTC P0755 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0756	Shift Solenoid "B" Performance/Stuck Off	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0756 returns, REFER to: Diagnosis By Symptom .
P0757	Shift Solenoid "B" Stuck On	SSB	DTC P2701 may set, CLEAR the DTC. If DTC P0757 returns, REFER to: Diagnosis By Symptom .
P0758	Shift Solenoid "B" Electrical	SSB	DTC P0755, P0976 and/or P0977 may set, CLEAR the

			DTC. If DTC P0758 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0759	Shift Solenoid "B" Intermittent	SSB	CLEAR the DTC. If DTC P0759 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0760	Shift Solenoid "C"	SSC	DTC P0761 may set, CLEAR the DTC. If DTC P0760 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0761	Shift Solenoid "C" Performance/Stuck Off	SSC	DTC P2702 may set, CLEAR the DTC. If DTC P0761 returns, REFER to: Diagnosis By Symptom .
P0762	Shift Solenoid "C" Stuck On	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0762 returns, REFER to: Diagnosis By Symptom .
P0763	Shift Solenoid "C" Electrical	SSC	DTC P0760, P0979 and/or P0980 may set, CLEAR the DTC. If DTC P0763 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0764	Shift Solenoid "C" Intermittent	SSC	CLEAR the DTC. If DTC P0764 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0765	Shift Solenoid "D"	SSD	DTC P0766 may set, CLEAR the DTC. If DTC P0765 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0766	Shift Solenoid "D" Performance/Stuck Off	SSD	DTC P2704 may set, CLEAR the DTC. If DTC P0766 returns, REFER to: Diagnosis By Symptom .
P0767	Shift Solenoid "D" Stuck On	SSD	DTC P07A9 and/or P2704 may set, CLEAR the DTC. If DTC P0767 returns, REFER to: Diagnosis By Symptom .

P0768	Shift Solenoid "D" Electrical	SSD	DTC P0765, P0982 and/or P0983 may set, CLEAR the DTC. If DTC P0768 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0769	Shift Solenoid "D" Intermittent	SSD	CLEAR the DTC. If DTC P0769 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0770	Shift Solenoid "E"	SSE	DTC P0773 may set, CLEAR the DTC. If DTC P0770 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0771	Shift Solenoid "E" Performance/Stuck Off	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0771 returns, REFER to: Diagnosis By Symptom .
P0772	Shift Solenoid "E" Stuck On	SSE	DTC P0984 may set, CLEAR the DTC. If DTC P0772 returns, REFER to: Diagnosis By Symptom .
P0773	Shift Solenoid "E" Electrical	SSE	REFER to DTC P0770.
P0774	Shift Solenoid "E" Intermittent	SSE	CLEAR the DTC. If DTC P0774 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P07A8	Transmission Friction Element "D" Stuck Off	Transmission	CLEAR the DTC. If DTC P07A8 returns, REFER to: Diagnosis By Symptom .
P07A9	Transmission Friction Element "D" Stuck On	Transmission	DTC P0767 may set, CLEAR the DTC. If DTC P07A9 returns, REFER to: Diagnosis By Symptom .
P07AA	Transmission Friction Element "E" Stuck Off	Transmission	CLEAR the DTC. If DTC P07AA returns, REFER to: Diagnosis By Symptom .
P0815	Upshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0815 returns, REFER to: External Controls .
P0816	Downshift Switch Circuit	SelectShift™ switch	CLEAR the DTC. If DTC P0816 returns, REFER to:

			External Controls .
P0826	Up and Down switch circuit	SelectShift™ switch	REFER to: External Controls .
P0882	PCM Power Input Signal Low	Battery	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. If DTC P0882 returns, REFER to: Charging System - 5.0L 32V Ti-VCT .
P0883	PCM Power Input Signal High	Battery	CLEAR the DTC. If DTC P0883 returns, REFER to: Charging System - 5.0L 32V Ti-VCT .
P0960	Pressure Control Solenoid "A" Control Circuit/Open	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0960 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0961	Pressure Control Solenoid "A" Control Circuit Range/Performance	LPC	CLEAR the DTC. If DTC P0961 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0962	Pressure Control Solenoid "A" Control Circuit Low	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0962 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0963	Pressure Control Solenoid "A" Control Circuit High	LPC	DTC P0748 may set, CLEAR the DTC. If DTC P0963 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0973	Shift Solenoid "A" Control Circuit Low	SSA	DTC P0753 may set, CLEAR the DTC. If DTC P0973 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0974	Shift Solenoid "A" Control Circuit High	SSA	DTC P0748 may set, CLEAR the DTC. If DTC P0974 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

P0976	Shift Solenoid "B" Control Circuit Low	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0976 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0977	Shift Solenoid "B" Control Circuit High	SSB	DTC P0758 may set, CLEAR the DTC. If DTC P0977 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0979	Shift Solenoid "C" Control Circuit Low	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0979 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0980	Shift Solenoid "C" Control Circuit High	SSC	DTC P0763 may set, CLEAR the DTC. If DTC P0980 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0982	Shift Solenoid "D" Control Circuit Low	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0982 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0983	Shift Solenoid "D" Control Circuit High	SSD	DTC P0768 may set, CLEAR the DTC. If DTC P0983 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS
P0984	Shift Solenoid "E" Range/Performance	SSE	DTC P0771 and/or P0772 may set, CLEAR the DTC. If DTC P0984 returns, REFER to: Diagnosis By Symptom .
P1001	The KOER Not Able to Complete, KOER Aborted	PCM	RETRIEVE and RECORD all DTCs. REPAIR any self-test or CMDTCs first. CLEAR the DTC. RERUN the KOER self-test. If the DTC returns, REPROGRAM the PCM to the latest software. RERUN the KOER self-test. If the DTC returns, INSTALL a new PCM REFER to: Powertrain Control Module (PCM) . After installing the new PCM PROGRAM it with the latest software and PERFORM the

			Transmission Strategy Download, REFER to: Transmission Strategy Download .
P1397	System Voltage Out Of Self Test Range	PCM	INSPECT the PCM power and ground circuits for opens or short to ground. INSPECT the PCM connector for damaged or pushed-out terminals, corrosion or loose wires. CLEAR the DTC. RUN the KOEO self-test. If DTC P1397 returns, REFER to: Charging System - 5.0L 32V Ti-VCT .
P1501	Vehicle Speed Sensor Out Of Self Test Range	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1502	Vehicle Speed Sensor Intermittent	PCM	Vehicle speed not at 0.0 mph (km/h) during the KOEO and/or KOER self-test. CLEAR the DTC and RERUN the KOEO and KOER self-test. If DTC P1501 returns, REFER to: Anti-Lock Brake System (ABS) and Stability Control .
P1635	Tire/Axle Out Of Acceptable Range	PCM	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1636	Inductive Signature Chip Communication Error	PCM	CLEAR the DTC. If DTC P1636 returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

P163E	Transmission Control Module Programming Error	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163E returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P163F	Transmission ID Block Corrupted, Not Programmed	PCM	CLEAR the DTC. REPROGRAM the original PCM with the latest software. If DTC P163F returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . After installing the new PCM, PROGRAM it with the latest software and PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
P1700	Drivers Door Status Correlation	Transmission	OPEN then CLOSE the drivers door and cycle the door locks. If the door ajar icon is illuminated on the IPC and the door lock and unlock are not working correctly, REFER to: Locks, Latches and Entry Systems . If the door ajar and locks are working correctly, REFER to: External Controls .
P1702	Transmission Range Sensor Circuit Intermittent	TR sensor	DTC P0706, P0707 and/or P0708 may set, CLEAR the DTC. If DTC P1702 returns, GO to PINPOINT TEST C : TR SENSOR
P1705	Transmission Range Circuit Not Indicating Park/Neutral During Self Test	TR sensor	CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1705 returns, GO to PINPOINT TEST C : TR SENSOR
P1711	Transmission Fluid Temperature Sensor Out Of	TFT sensor	CLEAR the DTC and RERUN the KOEO and KOER

	Self Test Range		self-test.
P1744	Torque Converter Clutch Solenoid Circuit Performance	TCC	DTC P1744 is a non-electrical DTC. CLEAR the DTC. If DTC P1744 returns, REFER to: Diagnosis By Symptom .
P177F	Unable To Fully Engage Neutral	Direct or forward clutch pack	This DTC may set when there is a mechanical/hydraulic concern with the direct or forward clutch pack, possibly deformed clutch plates or a rolled clutch seal allowing the direct clutch or the forward clutch to mechanically or hydraulically apply in neutral. PLACE the transmission in neutral with the engine running to see if there is any creep torque, this fault causes the transmission to partially engage forward gear in neutral. This DTC may set with P0752, P0757, P0762, and/or P0767. CLEAR the DTC. If the DTC returns, check the transmission for internal failure. REFER to: Transmission .
P1780	Transmission Control Switch (O/D Cancel) Circuit Out of Self-Test Range	TCS	CLEAR the DTC. If DTC P1780 returns, REFER to: External Controls .
P1783	Transmission Over Temperature Condition	Transmission	CLEAR the DTC. If DTC P1783 returns, determine if this DTC was set in conjunction with any transmission fluid temperature sensor circuit DTCs and RESOLVE them first, otherwise REFER to: Transmission Cooling .
P1910	Reverse Lamp Control Circuit/Open	Reverse lamps	CLEAR the DTC. TEST system for normal operation. If DTC P1910 returns, REFER to: Reversing Lamps .
P1921	Transmission Range Signal	TR sensor	The engine may not crank. DTC P0706, P0707 and/or P0708 may set. CLEAR the DTC. If DTC P1921 returns,

			CLEAR the DTC. RERUN the KOEO and KOER self-test. If DTC P1921 returns, GO to PINPOINT TEST C : TR SENSOR
P2700	Transmission Friction Element "A" Apply Time Range/Performance	Transmission	DTC P2700 is a non-electrical DTC. DTC P0751 and/or P0752 may set. CLEAR the DTC. If DTC P2700 returns, REFER to: Diagnosis By Symptom .
P2701	Transmission Friction Element "B" Apply Time Range/Performance	Transmission	DTC P2701 is a non-electrical DTC. DTC P0756 and/or P0757 may set. CLEAR the DTC. If DTC P2701 returns, REFER to: Diagnosis By Symptom .
P2702	Transmission Friction Element "C" Apply Time Range/Performance	Transmission	DTC P2702 is a non-electrical DTC. DTC P0761 and/or P0762 may set. CLEAR the DTC. If DTC P2702 returns, REFER to: Diagnosis By Symptom .
P2703	Transmission Friction Element "D" Apply Time Range/Performance	Transmission	DTC P2703 is a non-electrical DTC. DTC P0766 and/or P0768 may set. CLEAR the DTC. If DTC P2703 returns, REFER to: Diagnosis By Symptom .
P2704	Transmission Friction Element "E" Apply Time Range/Performance	Transmission	DTC P2704 is a non-electrical DTC. DTC P0771 and/or P0772 may set. CLEAR the DTC. If DTC P2704 returns, REFER to: Diagnosis By Symptom .
P2705	Transmission Friction Element "F" Apply Time Range/Performance	Transmission	DTC P2705 is a non-electrical DTC. CLEAR the DTC. If DTC P2705 returns, REFER to: Diagnosis By Symptom .

P2760	Torque Converter Clutch Pressure Control Solenoid Intermittent	TCC	CLEAR the DTC. If DTC P2760 returns, GO to PINPOINT TEST A : TRANSMISSION CONTROL

			SOLENOIDS .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS

Power is routed through the transmission solenoid power control relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the transmission solenoid power control relay fails open, all solenoids are failed electrically off. Check for open, short to ground or the transmission connector disconnected. The transmission solenoid power control relay disables power to the transmission solenoids when certain transmission DTCs are set.

- Carry out KOEO and KOER procedures.
- Retrieve and record all DTCs.
- Repair all non-transmission DTCs first.
- Repair all transmission DTCs second.
- Clear all CMDTCs and attempt to repeat them.
- Repair all CMDTCs.
- If only pass codes are obtained, REFER to: Diagnosis By Symptom .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required. Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay disables power to the transmission solenoids when certain transmission DTCs are set

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS > PINPOINT TEST A : TRANSMISSION CONTROL SOLENOIDS

NOTE: Without a voltage signal return to the PCM, the Transmission Solenoid Power Control (TSPC) relay is commanded OFF. By using a fused jumper wire between a transmission solenoid control circuit and the signal return circuit, the TSPC relay circuit supplies power to the transmission solenoids when the ignition is cycled from OFF to ON. Do not use a solenoid control circuit that may be at fault.

NOTE: Read and record all DTCs.

A1 CHECK THE SOLENOID POWER CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect: Transmission vehicle harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Using the chart, connect a fused jumper wire between one of the 7 solenoid control circuit pins on transmission vehicle harness C1575 and C1575-5 .

Ignition ON.

NOTE: Do not use a solenoid control circuit that may be at fault. Failure to jump pin 5 to a known good solenoid control circuit can cause incorrect diagnostic results.

Using the chart, connect a fused jumper wire between one of the 7 solenoid control circuit pins on transmission vehicle harness C1575 and C1575-5

Transmission Vehicle Harness C1575	Solenoid Control Circuit
C1575-9	SSA
C1575-14	SSB
C1575-13	SSC
C1575-10	SSD
C1575-8	SSE
C1575-16	LPC solenoid
C1575-3	TCC solenoid

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-7		Ground

Is the voltage greater than 11 volts?

Yes	GO to A4

No	GO to A2

A2 CHECK THE SOLENOID POWER CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: C175E . Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C175E-91	Ω	C1575-7

Is the resistance less than 3 ohms?

Yes	GO to A3

No	REPAIR transmission vehicle harness circuit for an open. CLEAR the DTCs. If DTC P0657 returns, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

A3 CHECK THE SOLENOID POWER CIRCUIT FOR A SHORT TO GROUND

Positive Lead	Measurement / Action	Negative Lead
C175E-91	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR transmission vehicle harness circuit short to ground. CLEAR the DTCs. If DTC P0657 returns, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

A4 CHECK SOLENOID CONTROL CIRCUITS FOR AN OPEN

Ignition OFF.

Disconnect: TCM C175E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure the resistance of the solenoid control circuits using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C175E-75	Ω	C1575-9
C175E-74	Ω	C1575-14
C175E-73	Ω	C1575-13
C175E-72	Ω	C1575-10
C175E-77	Ω	C1575-8
C175E-15	Ω	C1575-16
C175E-14	Ω	C1575-3

Is the resistance less than 3 ohms on each circuit?

Yes	GO to A5

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A5 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between the transmission vehicle harness C1575 , harness side and ground using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C1575-7	Ω	Ground
C1575-9	Ω	Ground
C1575-14	Ω	Ground
C1575-13	Ω	Ground
C1575-10	Ω	Ground
C1575-8	Ω	Ground
C1575-16	Ω	Ground
C1575-3	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A6

No	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

A6 CHECK SOLENOID CONTROL CIRCUITS FOR A SHORT TO POWER

Connect: PCM C175E

Measure for voltage between the transmission vehicle harness C1575 , harness side and ground using the following chart.

Positive Lead	Measurement / Action	Negative Lead
C1575-9		Ground
C1575-14		Ground
C1575-13		Ground
C1575-10		Ground
C1575-8		Ground
C1575-16		Ground
C1575-3		Ground

Is voltage greater than 3 volts on each circuit?

Yes	REPAIR the transmission vehicle harness circuit. CLEAR the DTCs.

No	GO to A7

A7 CHECK COMPONENT RESISTANCE

Measure resistance of the solenoid between the transmission molded leadframe C175E , component side using the following chart.

Transmission	Solenoid	Transmission	Ohms
C1575-7	SSA	C1575-9	4.8 to 5.6
C1575-7	SSB	C1575-14	4.8 to 5.6
C1575-7	SSC	C1575-13	4.8 to 5.6
C1575-7	SSD	C1575-10	4.8 to 5.6
C1575-7	SSE	C1575-8	17.5 to 18.6
C1575-7	LPC solenoid	C1575-16	4.8 to 5.6
C1575-7	TCC solenoid	C1575-3	4.8 to 5.6

Are the solenoid resistances within specifications?

Yes	Inspect for stuck valves or debris, REFER to: Main Control Valve Body . REFER to: Shift Solenoids (SS) . CLEAR the transmission adaptive tables and perform the adaptive drive cycle. REFER to: Adaptive Learning Drive Cycle .

No	GO to A8

A8 CHECK SOLENOID RESISTANCE

Remove the molded leadframe from the main control. REFER to: Shift Solenoids (SS) . Inspect for metallic contamination and clean the solenoid and molded leadframe terminals.

Measure and record the resistance of the suspected solenoid. REFER to: Shift Solenoids (SS) . Compare the recorded value with the chart below.

Solenoid	Ohms
SSA	4.8 to 5.6
SSB	4.8 to 5.6
SSC	4.8 to 5.6
SSD	4.8 to 5.6
SSE	17.5 to 18.6
LPC solenoid	4.8 to 5.6
TCC solenoid	4.8 to 5.6

Is the solenoid resistance within specification?

Yes	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) . CLEAR the DTCs.

No	INSTALL a new suspected solenoid which failed the resistance check. REFER to: Shift Solenoids (SS) . CLEAR the transmission adaptive tables and perform the adaptive drive cycle. REFER to: Adaptive Learning Drive Cycle .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area. The PCM monitors the voltage across the TFT sensor, which changes as transmission fluid temperature varies. The PCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TFT sensor signal for transmission fault

detection and diagnostics.

Possible Sources

- Connectors damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals
- TFT sensor
- Transmission internal wiring harness frame
- PCM

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR > PINPOINT TEST B : TFT (TRANSMISSION FLUID TEMPERATURE) SENSOR

B1 CHECK TFT INPUT SIGNAL

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575 .

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Connect the diagnostic tool.

Ignition ON.

Enter the following mode on the diagnostic scan tool: TFT PIDs TFT and TFTV.

Does the TFT PID display -40 °C (-40 °F) and the TFTV PID display 4.96 to 5.10 volts? ?

Yes	GO to B2

No	REPAIR the circuit.

B2 CHECK TFT SIGNAL INPUT CIRCUIT FOR VOLTAGE

Measure.

Positive Lead	Measurement / Action	Negative Lead
C1575-6		Ground

Is the voltage between 4.8 and 5.1 volts?

Yes	GO to B3

No	INSPECT and REPAIR the transmission open circuit. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B3 CHECK TFT SIGNAL RETURN CIRCUIT

Connect a fused jumper wire between the transmission vehicle harness C1575-5 and C1575-6 , harness side

Positive Lead	Measurement / Action	Negative Lead
C1575-5		C1575-6

Does the TFT PID display 190 °-195 °C (374 °-383 °F) and the TFTV PID display 0 volts?

Yes	GO to B4

No	INSPECT and REPAIR the transmission vehicle harness signal return circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

B4 CHECK TFT SENSOR RESISTANCE

Remove the transmission molded leadframe. REFER to: Shift Solenoids (SS) . Inspect for metal shavings on the exposed metal contacts or other components and clean the solenoid and transmission internal wiring harness frame terminals.

Measure the resistance between the transmission molded leadframe C1575-5 and C1575-6 , component side using the following chart.

C1575-5	Ω	C1575-6
°C	°F	Resistance
-40 to -20	-40 to -4	967K-284K
-19 to -1	-3 to 31	284K-100K
0-20	32-68	100K-37K
21-40	69-104	37K-16K
41-70	105-158	16K-5K
71-90	159-194	5K-2.7K
91-110	195-230	2.7K-1.5K

111-130	231-266	1.5K-0.8K
131-150	267-302	0.8K-0.54K

Does the temperature to resistance specification match?

Yes	To diagnose an overheating concern REFER to: Diagnosis By Symptom .

No	INSPECT and CLEAN the TFT sensor on the molded leadframe for metallic contamination. INSTALL a new molded leadframe if no debris was found, REFER to: Transmission Strategy Download . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST C : TR SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependent on the PARK, REVERSE, NEUTRAL, DRIVE, 3, 2 or 1 position of the manual valve. The TR sensor has digital sensor (hall effect) that converts the shifter position into a bit pattern, and a micro controller that converts the 4 bit signal into a 125 Hz pulse width modulated signal. The TR sensor also provides signals for the starting system and the reverse lights. The PCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TR sensor signal for transmission fault detection and diagnostics. The TR sensor is integral to the leadframe. DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and P1921 cannot be set by an incorrectly adjusted selector lever cable.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST C : TR SENSOR > PINPOINT TEST C : TR SENSOR

NOTE: Read and record all DTCs.

C1 VERIFY DTCS

Ignition OFF.

Select PARK.

Connect the diagnostic tool.

Carry out the KOEO then the KOER test. DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and P1921 cannot be set by an incorrectly adjusted selector lever cable.

Are TR sensor DTCs present?

Yes	GO to C2

No	If no DTC s are present, and to diagnose any symptoms that may be present REFER to: Diagnosis By Symptom .

C2 CHECK TR SENSOR ELECTRICAL OPERATION

Ignition ON.

Enter the following diagnostic mode on the scan tool: TR PID: TR_DC and TR_FREQ.

Move the selector lever into each range and stop.

Observe the PIDs: TR_DC and TR_FREQ while wiggling the harness or driving the vehicle.

Compare the PID TR_DC to the selector lever position duty cycle, using the following chart.

Selector Lever Position	Range (% Duty Cycle)
P	8.0 - 25.8
R	30.50 - 39.31
N	40.54 - 52.49
D	54.35 - 71.15

Is the TR_FREQ between 100 to 150 Hz?

Is the TR_DC within range?

Does the TR_DC and TR_FREQ remain steady when the harness is wiggled or the vehicle driven?

Yes	The problem is not in the TR sensor system. REFER to: Diagnosis By Symptom .

No	GO to C3

C3 CHECK TR SENSOR VPWR CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-12		Ground

Is the voltage greater than 11 volts?

Yes	GO to C4

No	INSPECT and REPAIR the transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C4 CHECK TR SENSOR SIGNAL CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		Ground

Is the voltage greater than 4.8 volts?

Yes	GO to C5

No	INSPECT and REPAIR the transmission vehicle harness for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C5 CHECK TR SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-4		C1575-11

Is the voltage greater than 4.8 volts?

Yes	GO to C6

No	INSPECT and REPAIR transmission vehicle harness circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

C6 CHECK TR SENSOR TO MANUAL VALVE

Drain the transmission fluid and remove the transmission fluid pan. REFER to: Transmission Fluid Pan, Gasket and Filter .

Check the connection between the TR sensor and the manual control valve. REFER to: Transmission .

Inspect the molded leadframe for metallic contamination, REFER to: Shift Solenoids (SS) .

Is the TR sensor connected to the manual control valve shaft?

Is the TR sensor connected to the manual control valve shaft?

Yes	INSTALL a new TR sensor. REFER to: Shift Solenoids (SS) .

No	CONNECT the TR sensor to the manual control valve, REFER to: Shift Solenoids (SS) . CLEAN any debris from the molded leadframe. RUN the KOEO self-test. If DTCs return, INSTALL a new TR sensor. REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The TSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the forward (1, 2, 3, 4) clutch cylinder varies. The PCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter. The PCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the TSS sensor signal for transmission fault detection and diagnostics. REFER to: Transmission Description - System Operation and Component Description .

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR > PINPOINT TEST D : TSS (TURBINE SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

D1 DRIVE CYCLE TEST

Connect the diagnostic tool.

Enter the following diagnostic mode: PID TSS_SRC..

Monitor the PID TSS_SRC while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears.

Does the TSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to D2

D2 CHECK TSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: Transmission Vehicle Harness C1575 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		Ground

Is the voltage less than 4.8 volts?

Yes	GO to D3

No	GO to D6

D3 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C175E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1575-1	Ω	C175E-25

Is the resistance less than 3 ohms?

Yes	GO to D4

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

D4 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to D5

No	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to ground. If a short to ground is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

D5 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C175E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1	V	Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness TSS sensor signal circuit for a short to power. If a short to power is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to D6

D6 CHECK THE TSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-1		C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) . CLEAR the DTCs.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation

The OSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the output shaft ring gear varies. The PCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset. The PCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the OSS sensor signal for transmission fault detection and diagnostics. DTC s are set.

DIAGNOSIS AND TESTING > DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND PINPOINT TESTS - 5.0L 32V TI-VCT > PINPOINT TESTS > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR > PINPOINT TEST E : OSS (OUTPUT SHAFT SPEED) SENSOR

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

NOTE: Read and record all DTCs.

E1 DRIVE CYCLE TEST

Using the diagnostic scan tool, monitor the OSS sensor PID OSS_SRC while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears.

Does the OSS sensor RPM increase and decrease with engine RPM and vehicle speed?

Yes	REFER to: Road Testing Vehicle .

No	GO to E2

E2 CHECK OSS SENSOR SIGNAL CIRCUIT FOR POWER

Ignition OFF.

Disconnect: PCM C1575

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		Ground

Is the voltage less than 4.8 volts?

Yes	GO to E3

No	GO to E6

E3 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect: PCM C175E

Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	C175E-26

Is the resistance less than 3 ohms?

Yes	GO to E4

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for an open. If an open circuit is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E4 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to E5

No	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short to ground. If a short to ground is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

E5 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER

Connect: PCM C175E

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15	V	Ground

Is voltage greater than 5.1 volts?

Yes	INSPECT and REPAIR transmission vehicle harness OSS sensor signal circuit for a short to power. If a short to power is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	GO to E6

E6 CHECK THE OSS SENSOR GROUND CIRCUIT

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1575-15		C1575-5

Is voltage less than 4.8 volts?

Yes	REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, INSTALL a new PCM, REFER to: Powertrain Control Module (PCM) . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new molded leadframe, REFER to: Shift Solenoids (SS) .

DIAGNOSIS AND TESTING > DIRECT CLUTCH ASSEMBLY

Direct Clutch

For direct (3, 5, R) clutch operation, REFER to: Direct Clutch Assembly .**Direct Clutch**

Condition	Possible Sources	Action
Direct (3, 5, R) clutch does not apply	SSB is mechanically stuck OFF	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch B regulator valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the clutch B regulator valve. REFER to: Main Control Valve Body . If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
-	CLB, DRIVE, REV/DRIVE, VFS2 hydraulic circuits blocked/leaking	DISASSEMBLE, CLEAN and INSPECT the main control valve body. REFER to: Main Control Valve Body . If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Ball valve 1 check ball missing/damaged	REMOVE the main control valve body, and INSPECT the check ball missing/damage. REFER to: Main Control Valve Body .
	Center support, direct clutch drum, direct clutch drum Teflon™ seals, direct clutch friction plates, direct clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components as necessary. REFER to: Transmission .

Direct (3, 5, R) clutch always applied	SSB is mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch B regulator valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the clutch B regulator valve. REFER to:Main Control Valve Body . If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLB, DRIVE, REV/DRIVE, VFS2 hydraulic circuits blocked/leaking	REMOVE the main control valve body, and INSPECT the check ball missing/damage. missing/damage. REFER to: Main Control Valve Body .
	Center support, direct clutch drum, direct clutch drum Teflon™ seals, direct clutch friction plates, direct clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components as necessary. REFER to: Transmission .
Direct (3, 5, R) clutch delayed/soft/slipping apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSB is mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch B regulator valve sticking, Clutch B latch valve sticking	DISASSEMBLE, CLEAN and INSPECT the clutch B regulator valve. REFER to: Main Control Valve Body . If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLB, DRIVE, REV/DRIVE, VFS2 hydraulic circuits blocked/leaking	REMOVE the main control valve body, and separator plate passages for debris/blockage. CLEAN as necessary. missing/damage. REFER to: Main Control Valve Body .
	BV 1 check ball missing/damaged	REMOVE the main control valve body, and INSPECT the check ball missing/damage. missing/damage. REFER to: Main Control Valve Body .
	Center support, direct clutch drum, direct clutch drum Teflon™ seals, direct clutch friction plates, direct clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components as necessary. REFER to: Transmission .

Direct (3, 5, R) clutch harsh apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSB is mechanically stuck OFF	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch B regulator valve sticking, Clutch B latch valve sticking	DISASSEMBLE, CLEAN and INSPECT the clutch B regulator valve. REFER to: Main Control Valve Body . If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLB, DRIVE, REV/DRIVE, VFS2 hydraulic circuits blocked/leaking	REMOVE the main control valve body, and separator plate passages for debris/blockage. CLEAN as necessary. missing/damage. REFER to: Main Control Valve Body .
	Ball valve 1 check ball missing/damaged	REMOVE the main control valve body, and INSPECT the check ball missing/damage. missing/damage. REFER to: Main Control Valve Body .
	Center support, direct clutch drum, direct clutch drum Teflon™ seals, direct clutch friction plates, direct clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components as necessary. REFER to: Transmission .
	Direct (3, 5, R) clutch piston return spring	INSPECT the return spring for proper installation and damage. INSTALL new components as necessary. REFER to: Transmission .

DIAGNOSIS AND TESTING > FORWARD CLUTCH ASSEMBLY > SYMPTOM CHART

Forward Clutch

For forward clutch operation, REFER to: Forward Clutch Assembly .

Condition	Possible Sources	Action
Forward clutch does not apply	SSA is mechanically stuck OFF	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

	Clutch B regulator valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLA, DRIVE, VFS1 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Input shaft, input shaft Teflon™ seals, forward clutch drum	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Forward clutch friction plates, piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
Forward clutch always applied	SSA mechanically stuck ON	INSTALL a new solenoid. PERFORM the Transmission Strategy Download, REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch A regulator valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLA, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary.
	Forward clutch friction plates	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Forward clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .

forward clutch delayed/soft /slipping apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSA mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch A regulator or latch valve sticking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLA, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Center support, forward clutch hub/direct clutch drum	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
	Forward clutch friction plates	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
	Forward clutch piston seals	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
forward clutch harsh apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSA mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch C regulator valve sticking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .

	CLC, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary.
	Input shaft, input shaft Teflon™ seals, forward clutch drum	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
-	Forward clutch friction plates or piston seals	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
-	Forward clutch piston return spring	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .

DIAGNOSIS AND TESTING > INTERMEDIATE CLUTCH ASSEMBLY

Intermediate Clutch

For intermediate clutch operation, REFER to: Intermediate Clutch Assembly .**Intermediate Clutch**

Condition	Possible Sources	Action
Intermediate clutch does not apply	Main control to case seal blocked, damaged, or missing	INSTALL a new seal. REFER to: Main Control Valve Body .
	SSC is mechanically stuck OFF	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch C regulator valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLC, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main

		Control Valve Body .
	Center support, intermediate clutch hub/direct clutch drum	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Intermediate clutch friction plates	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Intermediate clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
Intermediate clutch always applied	Main control to case seal blocked, damaged, or missing	INSTALL a new seal. REFER to: Main Control Valve Body .
	Shift Solenoid C (SSC) mechanically stuck ON	INSTALL a new solenoid. PERFORM the Transmission Strategy Download, REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch C regulator valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLC, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Center support, intermediate clutch hub/direct clutch drum	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Intermediate clutch friction plates	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .
	Intermediate clutch piston seals	INSPECT components wear and damage. CLEAN and/or INSTALL new components necessary. REFER to: Transmission .

Intermediate clutch delayed/soft /slipping apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Main control to case seal blocked	INSTALL a new seal. REFER to: Main Control Valve Body .
	SSC mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Clutch C regulator valve sticking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLC, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Center support, intermediate clutch hub/direct clutch drum	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
	Intermediate clutch friction plates	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
	Intermediate clutch piston seals	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
Intermediate clutch harsh apply	Incorrect transmission strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Main control to case seal blocked	INSTALL a new seal. REFER to: Main Control Valve Body .
	SSC mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

	Clutch C regulator valve sticking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CLC, DRIVE, VFS3 hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Center support, intermediate clutch hub/direct clutch drum	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
-	Intermediate clutch friction plates	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
-	Intermediate clutch piston seals	DISASSEMBLE and INSPECT the transmission passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .

DIAGNOSIS AND TESTING > LEAKAGE INSPECTION

Leak Check Test

1.

With the vehicle in NEUTRAL, position the vehicle on a hoist. REFER to: Jacking and Lifting - Overview .

2.

Inspect the gasket and sealing areas for evidence of leakage.

3.

Trace the transmission fluid leak to the highest point.

4.

Clean area of suspected leak.

5.

Lower vehicle.

6.

Remove the transmission fluid fill plug or fluid level indicator.

7.

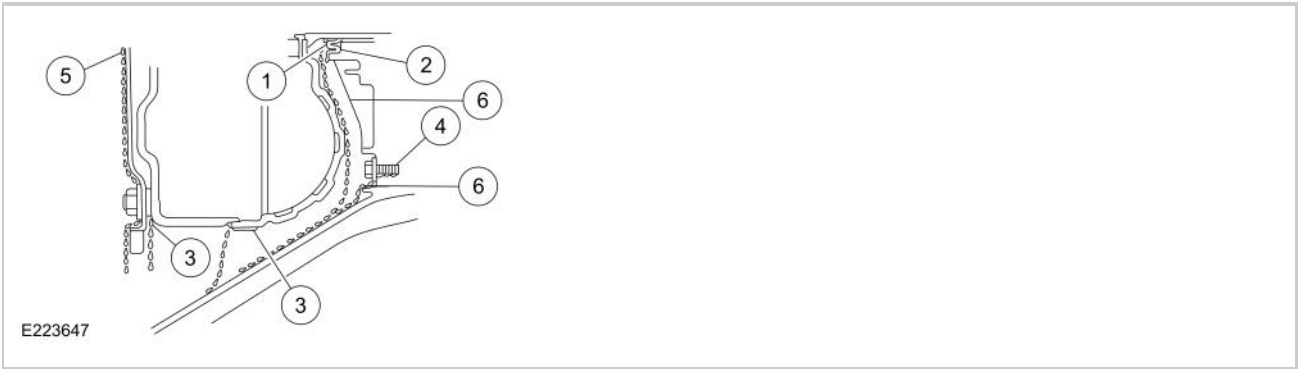
Add leak detection dye to the transmission fluid. Use 1 fl. oz. (30 ml) of dye solution for every 4 qt (3.8 L) of transmission fluid.

8.

Road test the vehicle for at least 1 mile with at least 1 application of the TCC.

9.

With the vehicle in NEUTRAL, position the vehicle on a hoist. REFER to: Jacking and Lifting - Overview .



10.

If the source of the leak is obvious, repair as required.

11.

After the repair, clean the affected area.

Leakage From Torque Converter Housing

12.

Leaks from the torque converter housing can originate from several locations. The paths which the transmission fluid takes to reach the bottom of the torque converter housing is shown in the illustration. The following 6 steps correspond with the numbers in the illustration.

1.

Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure, transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.

2.

Transmission fluid leakage by the outside diameter of the torque converter impeller hub seal and the case will follow the same path that leaks by the inside diameter of the converter hub seal follow.

3.

Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.

4.

Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.

5.

Engine oil leaks from the rear main oil.

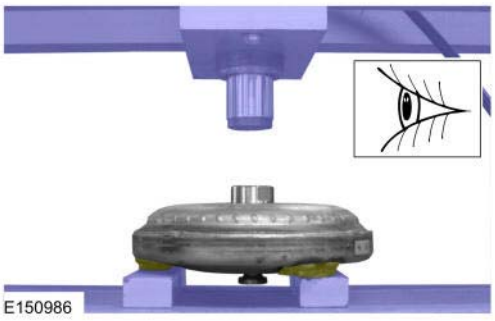
6.

Transmission fluid leak from pump to case seal.

13.

Remove the torque converter.

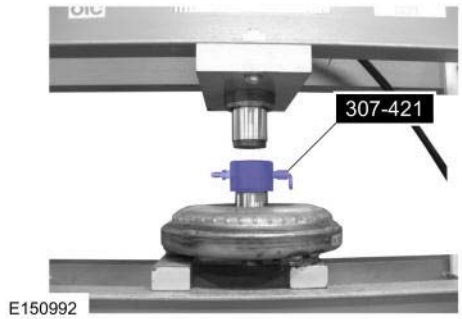
14.



Using a black light, observe the torque converter housing. Inspect for evidence of dye from the pump bolts, pump seal, and torque converter hub seal. Repair as required.

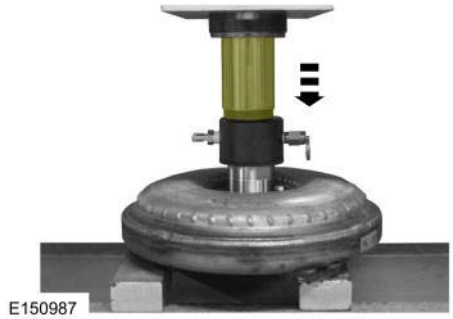
15.

If the source of the leak is not evident, continue with this procedure to leak test the torque converter.



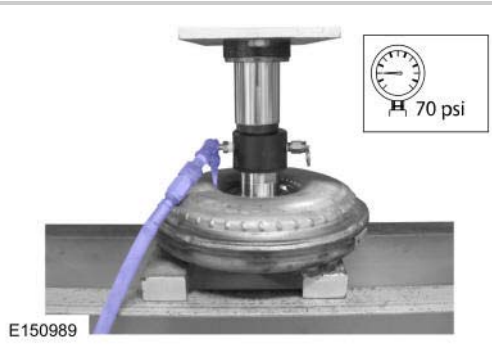
16.

Place the torque converter in an arbor press. Support the torque converter on the mounting pads.



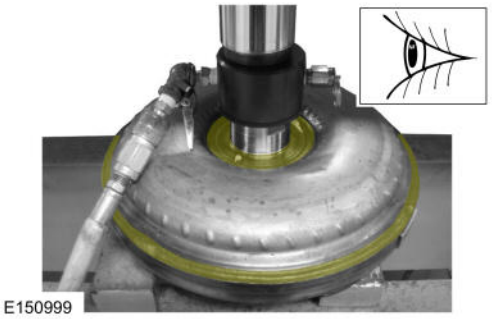
17.

Install the torque converter leak tester (307-421) into the torque converter hub.



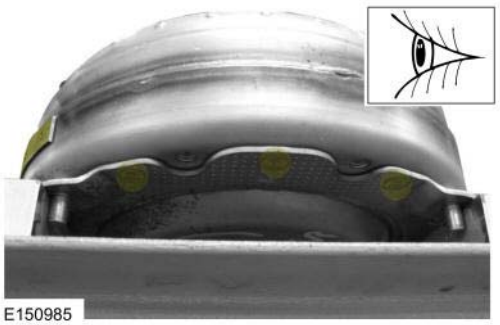
18.

Secure the press. Apply enough force from the press to seal the torque converter leak tester (307-421) into the torque converter hub.



19.

Connect a compressed air supply to the torque converter leak tester (307-421).



20.

Inspect for leaks at the torque converter hub weld and seams with air pressure applied to the valve. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

21.

Inspect for leaks at the stud or mounting pad and balance weight welds. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

22.

After leaks are repaired, clean the remaining transmission fluid dye from serviced areas.

DIAGNOSIS AND TESTING > LOW REVERSE CLUTCH ASSEMBLY

Low/Reverse Clutch

For low/reverse clutch operation, REFER to: Low/Reverse Clutch Assembly .**Low/Reverse Clutch**

Condition	Possible Sources	Action
Low/Reverse clutch does not apply	SSD solenoid filter blocked to	CLEAN or INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	SSD is mechanically stuck OFF	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

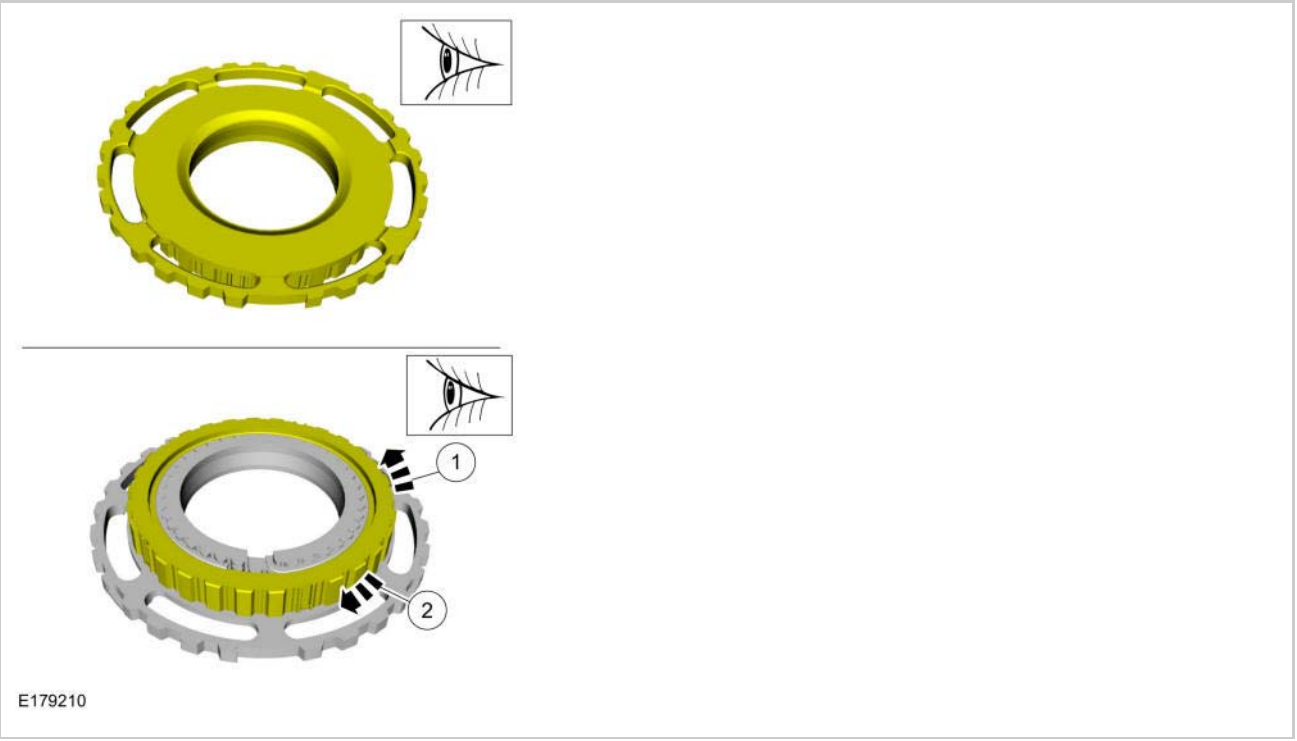
	Low/Reverse clutch (CBLR/C456) regulator valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch regulator valve. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body .
	SSD SIG, CBLR/C456 SUPPLY, CBLR SUPPLY hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	REV/SSE SIG to multiplex shift valve shuttle ball missing/damaged	REMOVE the main control valve body and INSPECT the check ball missing/damage. REFER to: Main Control Valve Body .
	Multiplex shift valve stuck in default position	DISASSEMBLE, CLEAN and INSPECT the multiplex shift valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CBLR supply hydraulic circuit blocked or leaking	DISASSEMBLE and INSPECT the transmission cover passages for debris/blockage. CLEAN as necessary. REFER to: Transmission .
	Rear planetary carrier/center ring gear	INSPECT the planetary carrier/center ring gear for wear and damage that would prevent the gear from being held. INSTALL new components necessary. REFER to: Transmission .
	Low/Reverse clutch friction plates	DISASSEMBLE and INSPECT the low/reverse clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission .
	Low/Reverse clutch piston seal leakage	INSTALL a new low/reverse clutch piston and seals. REFER to: Transmission .
Low/Reverse clutch always applied	SSD solenoid filter seal damaged	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	SSD mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to:

		Transmission Strategy Download .
	Low/Reverse clutch (CBLR/C456) regulator valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch regulator valve and spring. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	SSD SIG, CBLR/C456 SUPPLY, CBLR SUPPLY hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for leakage. CLEAN as necessary. REFER to: Transmission Description - System Operation and Component Description .
	Low One-Way Clutch (OWC)	INSPECT the Low One-Way Clutch (OWC) for free rotation in over-run direction. INSTALL new components as necessary. REFER to: Transmission .
	Low/Reverse clutch friction plates	DISASSEMBLE and INSPECT the low/reverse clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission .
	Low/Reverse clutch piston return spring	INSPECT the return spring for damage. INSTALL new components as necessary. REFER to: Transmission .
Low/Reverse clutch delayed/soft/slipping apply	Incorrect Transmission Strategy programmed into PCM	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSD filter seal damaged	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	SSD mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Low/Reverse clutch (CBLR/C456) regulator valve sticking	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Low/Reverse clutch (CBLR/C456) boost valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch boost valve. If bore or valve is damaged, INSTALL a new main

		control valve body. REFER to: Main Control Valve Body .
	SSD SIG, CBLR/C456 SUPPLY, CBLR SUPPLY hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	REV/SSE SIG to multiplex shift valve shuttle ball missing/damaged	REMOVE the main control valve body and INSPECT the check ball missing/damage. REFER to: Main Control Valve Body .
	CBLR supply hydraulic circuit blocked or leaking	DISASSEMBLE and INSPECT the transmission cover passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Low/Reverse clutch friction plates	DISASSEMBLE and INSPECT the low/reverse clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission .
	Low/Reverse clutch piston seal leakage	INSTALL a new low/reverse clutch piston and seals. REFER to: Transmission .
Low/Reverse clutch harsh apply	Incorrect Transmission Strategy programmed into PCM	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	SSD mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	Low/Reverse clutch regulator valve sticking	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch regulator valve and spring. If bore, valve or spring is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Low/Reverse clutch (CBLR/C456) boost valve sticking	DISASSEMBLE, CLEAN and INSPECT the low/reverse clutch boost valve and spring. If bore, valve or spring is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .

	SSD SIG, CBLR/C456 SUPPLY, CBLR SUPPLY hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body .
	Low/Reverse clutch friction plates	DISASSEMBLE and INSPECT the low/reverse clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission .
	Low/Reverse clutch piston return spring	INSPECT the return spring for proper installation and damage. INSTALL new components as necessary. REFER to: Transmission .

DIAGNOSIS AND TESTING > LOW ONE-WAY CLUTCH ASSEMBLY



Low One Way Clutch

For low one way clutch operation, REFER to: Low One-Way Clutch Assembly .

NOTE: Do not clean with water or with water-based solvents. Damage to the component may occur.

NOTE: The low one way clutch cannot be disassembled.

Clean and inspect the low one way clutch for cracks and damaged splines. The splined section should rotate in the direction of the number 1 arrow and lock when rotated in the direction of the number 2 arrow. Check for burned or excessively worn surfaces. If any damage is found or the clutch does not rotate or lock, install a new low one-way clutch.

DIAGNOSIS AND TESTING > OVERDRIVE CLUTCH ASSEMBLY

Overdrive Clutch

For overdrive clutch operation, REFER to: Overdrive Clutch Assembly .

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Condition	Possible Sources	Action
Overdrive clutch does not apply	SSD is mechanically stuck OFF, SSE is mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch E regulator valve is stuck OFF	DISASSEMBLE, CLEAN and INSPECT the overdrive clutch regulator valve. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	CLE, Drive, VFS4, SS1, CLECF, CLEC hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .

	Solenoid multiplex or drive enable valves stuck in applied position or springs broken	DISASSEMBLE, CLEAN and INSPECT the multiplex shift valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Ball valve 2 missing	INSPECT for presence of Ball valve 2, REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Input shaft, input shaft Teflon™ seals, or intermediate shaft, Overdrive clutch piston seal leakage	REFER to: Transmission . REFER to: Symbols Glossary .
	Overdrive clutch friction plates	DISASSEMBLE and INSPECT the overdrive clutch friction and steel plates. INSTALL new components as necessary. REFER to: Overdrive Clutch Assembly .
Overdrive clutch always applied	SSD is mechanically stuck OFF, SSE is mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch E regulator valve is stuck OFF	DISASSEMBLE, CLEAN and INSPECT the overdrive clutch regulator valve. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	CLE, Drive, VFS4, SS1, CLECF, CLEC hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Solenoid multiplex or drive enable valves stuck in applied position or springs broken	DISASSEMBLE, CLEAN and INSPECT the multiplex shift valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Ball valve 2 missing	REFER to: Main Control Valve Body . REFER to: Main Control Valve Body .

-	Input shaft, input shaft Teflon™ seals, or intermediate shaft, Overdrive clutch piston seal leakage	REFER to: Transmission . REFER to: Symbols Glossary .
-	Overdrive clutch friction plates	DISASSEMBLE and INSPECT the overdrive clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission . REFER to: Symbols Glossary .
Overdrive clutch delayed/soft /slipping apply	SSD is mechanically stuck OFF, SSE is mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch E regulator valve is stuck OFF	DISASSEMBLE, CLEAN and INSPECT the overdrive clutch regulator valve. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	CLE, Drive, VFS4, SS1, CLECF, CLEC hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Solenoid multiplex or drive enable valves stuck in applied position or springs broken	DISASSEMBLE, CLEAN and INSPECT the multiplex shift valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Ball valve 2 missing	INSPECT for missing ball valve, REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Input shaft, input shaft Teflon™ seals, or intermediate shaft, Overdrive clutch piston seal leakage	INSPECT for damaged Teflon™ seal, REFER to: Transmission . REFER to: Symbols Glossary .
	Overdrive clutch friction plates	DISASSEMBLE and INSPECT the overdrive clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission . REFER to: Symbols Glossary .

Overdrive clutch harsh apply	SSD is mechanically stuck OFF, SSE is mechanically stuck ON	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) .
	Clutch E regulator valve is stuck OFF	DISASSEMBLE, CLEAN and INSPECT the overdrive clutch regulator valve. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	CLE, Drive, VFS4, SS1, CLECF, CLEC hydraulic circuits blocked/leaking	DISASSEMBLE and INSPECT the main control valve body and separator plate passages for debris/blockage. CLEAN as necessary. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Solenoid multiplex or drive enable valves stuck in applied position or springs broken	DISASSEMBLE, CLEAN and INSPECT the multiplex shift valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Ball valve 2 missing	INSPECT for missing ball valve, REFER to: Main Control Valve Body . REFER to: Symbols Glossary .
	Input shaft, input shaft Teflon™ seals, or intermediate shaft, Overdrive clutch piston seal leakage	INSPECT for damaged Teflon™ seal, REFER to: Transmission . REFER to: Symbols Glossary .
-	Overdrive clutch friction plates	DISASSEMBLE and INSPECT the overdrive clutch friction and steel plates. INSTALL new components as necessary. REFER to: Transmission . REFER to: Symbols Glossary .

DIAGNOSIS AND TESTING > PARAMETER IDENTIFICATION (PID) CHART

2.3L, 3.7L and 5.0L Diagnostic PID Chart

PID Acronym	PID Name	Description
APP1	APP sensor 1	APP

AST	Time Since Start	Time (in seconds) since the vehicle was started
CLRDIST	Distance since DTC cleared	Distance driven since PCM Diagnostic Trouble Codes (DTCs) were cleared
DTC PCM	Continuous Codes	Number of PCM Diagnostic Trouble Codes (DTCs) present
ECT PCM	ECTPCM	Engine coolant temperature data provided to the PCM
ENGLOAD	Engine Load	Engine load calculated by PCM
GEAR	Gear Commanded by Module	PCM commanded transmission gear
GEAR_OSC	Gear Commanded by Output State Control	Output state control commanded gear
GEAR_RAT	Gear Ratio Commanded	Theoretical transmission gear ratio commanded
HRSH_SHFT	Firm Shift	Output state control commanded firm shift
LINEDSD	Line Pressure Control Desired	Commanded line pressure
LPC	Line Pressure Control	Commanded pressure for the Line Pressure Control (LPC) Variable Force Solenoid (VFS)
LPC_AMP	Line Pressure Control in Amps	Commanded current for the Line Pressure Control (LPC) Variable Force Solenoid (VFS)
LPC_F	Line Pressure Control Status	Fault status for the Line Pressure Control (LPC) Variable Force Solenoid (VFS)
MIL_DIS	The distance travelled since the (MIL) was activated	The distance travelled since the MIL was activated
OSS_F	Output Shaft Speed Reliable	Fault status for the OSS sensor
OSS_SRC	Unfiltered Output Shaft Speed A	Actual speed of the OSS sensor (RPM)
RPM_PCM	Engine Revolutions Per Minute	Engine RPM input to PCM
SHFT_DROP	Shift RPM Drop in Input Shaft Speed Below Expected	Shift RPM drop in input shaft speed below expected
SHFT_FLRE	Shift RPM Rise in Input Shaft Speed Above Expected	Shift RPM rise in input shaft speed above expected
SHFT_ID	Shift Identification of Shift (PID)s Lag, Time, Flare and Drop	Shift identification of shift Parameter Identifications (PIDs) lag, time, flare and drop

SHFT_LAG	Shift Time Elapsed From 10% to 90% of Complete	Actual time during shift between 10% and 90% complete
SHFT_TIME	Shift Time Elapsed From Commanded to 10% Complete	Shift time 0% to 10% complete
SHFT_TYP	Shift Type	Shift Type
SSPCA	Shift Solenoid Pressure Control A	Commanded pressure for the Shift Solenoid Pressure Control A (SSPCA)/CB1234
SSA_AMP	Shift Solenoid Pressure Control A	Commanded current for the Shift Solenoid Pressure Control A (SSPCA)/CB1234
SSPCA_F	(SSPCA) Status	Fault status for the Shift Solenoid Pressure Control A (SSPCA)/CB1234
SSPCB	Shift Solenoid Pressure Control B	Commanded pressure for the Shift Solenoid Pressure Control B (SSPCB)/C35R
SSB_AMP	Shift Solenoid Pressure Control B	Commanded current for the Shift Solenoid Pressure Control B (SSPCB)/C35R
SSPCB_F	(SSPCB) Status	Fault status for the Shift Solenoid Pressure Control B (SSPCB)/C35R
SSPCC	Shift Solenoid Pressure Control C	Commanded pressure for the Shift Solenoid Pressure Control C (SSPCC)/CB26
SSC_AMP	Shift Solenoid Pressure Control C	Commanded current for the Shift Solenoid Pressure Control C (SSPCC)/CB26
SSPCC_F	(SSPCC) Status	Fault status for the Shift Solenoid Pressure Control C (SSPCC)/CB26
SSPCD	Shift Solenoid Pressure Control D	Commanded pressure for the Shift Solenoid Pressure Control D (SSPCD)/CBLR, C456
SSD_AMP	Shift Solenoid Pressure Control D	Commanded current for the Shift Solenoid Pressure Control D (SSPCD)/CBLR, C456
SSPCD_F	(SSPCD) Status	Fault status for the Shift Solenoid Pressure Control D (SSPCD)/CBLR, C456
SSPCE	Shift Solenoid Pressure Control E	Commanded pressure for the Shift Solenoid Pressure Control E (SSPCE)/CBLR, C456

SSE_AMP	Shift Solenoid Pressure Control E	Commanded current for the Shift Solenoid Pressure Control E (SSPCE)/CBLR, C456
SSPCE_F	(SSPCE) Status	Fault status for the Shift Solenoid Pressure Control E (SSPCE)/CBLR, C456
SST_D	SelectShift™ Transmission - Down Switch Input	SelectShift™ transmission-down switch input
SST_U	SelectShift™ Transmission - Up Switch Input	SelectShift™ transmission-up switch input
TCC AMP	Converter Pressure Control	Commanded current for the TCC
TC_SLIPACT	Torque Converter Slip Actual	Actual difference between engine speed and turbine speed, measured in RPM
TC_SLIPDSD	Torque Converter Slip Desired	PCM commanded difference between engine speed and turbine speed, measured in RPM
TCC	Torque Converter Clutch Solenoid	Commanded pressure for the TCC
TCC_F	Torque Converter Clutch Pressure Control Fault	Fault status for the TCC
TCC_OSC	Output State Control of Torque Converter	Output state control commanded pressure to the TCC
TCC_RAT	Torque Slip Ratio	Actual speed ratio of torque converter (1.0 = fully engaged)
TCS_DEPRES	Transmission Control Switch Pressed	TCS status
TCS_STATE	Transmission Control Switch Requested State	TCS status
TFT	Transmission Fluid Temperature	TFT
TFT_F	Transmission Fluid Temperature Status	Fault status for TFT sensor
TFTV	Transmission Fluid Temperature	TFT voltage
TR	Transmission Range	TR
TR_CRANK	Transmission Range Input Allowing Engine Start	TR
TR_F	Transmission Range Status	Fault status for TR sensor
TRAN_RAT	Gear Ratio Measured	Actual transmission gear ratio

TRANS_VOLT_A	Transmission Supply Voltage Control State	Transmission supply voltage
TRO_N_F	Neutral Output Status	Transmission neutral output status
TRO_P_F	Park Output Status	Transmission park output status
TSS_F	Turbine Shaft Speed Reliable	Fault status of the TSS sensor (RPM)
TSS_SRC	Unfiltered Turbine Shaft Speed	Actual speed of the TSS sensor (RPM)
VPWR_PCM	Module supply voltage	PCM supply voltage
VSS	Vehicle Speed	Vehicle Speed

DIAGNOSIS AND TESTING > PRELIMINARY INSPECTION > OVERVIEW

The preliminary inspection is part of Automatic Transmission Diagnosis. The preliminary inspection is used to find obvious causes for transmission concern.

DIAGNOSIS AND TESTING > PRELIMINARY INSPECTION > UNDERHOOD INSPECTION

To correctly diagnose a concern, first understand the customer concern or condition. Customer contact may be required to understand the conditions, including when the concern occurs. For example:

1.

Look for missing or damaged air induction components.

2.

Inspect the wire harness for proper routing, especially near the rear of the cylinder heads. Make sure the harness is not chafed or pinched.

3.

Inspect transmission fluid cooler for proper mounting and check for any missing air deflectors.

DIAGNOSIS AND TESTING > PRELIMINARY INSPECTION > UNDER VEHICLE INSPECTION

1.

Place the selector lever in D.

2.

With the vehicle in NEUTRAL, position it on a hoist. REFER to: Jacking and Lifting - Overview .

3.

Inspect transmission case for evidence of leaks.

4.

Inspect transmission fluid cooler lines for proper routing, pinches, or kinks.

5.

Inspect transmission fluid cooler mounting and check for any missing air deflectors.

6.

Adjust the selector lever cable. REFER to: Selector Lever Cable Adjustment .

DIAGNOSIS AND TESTING > PRELIMINARY INSPECTION > TRANSMISSION FLUID INSPECTION

Transmission fluid condition can provide many clues to the nature of the transmission concern. Proper transmission fluid level can only be determined with the transmission fluid at a specified temperature range. It is not necessary to verify exact transmission fluid level at this time. If the transmission fluid is below operating temperature, it is expected to be low on the transmission fluid level indicator. Transmission fluid temperatures below 30.2 °F (-1 °C) may not show up on a transmission fluid level indicator.

1.

With the vehicle in NEUTRAL, position it on a hoist. REFER to: Jacking and Lifting - Overview . Remove the transmission fluid fill plug and transmission fluid level indicator.

2.

Allow the transmission fluid to drip onto a facial tissue or white sheet of paper.

3.

Examine the stain.

4.

Small black particles are typically burnt friction material.

5.

Small shiny metallic particles indicate excessive hard part wear.

6.

Foamy pink color indicates either water or engine coolant in the transmission.

DIAGNOSIS AND TESTING > PRELIMINARY INSPECTION > WATER IN TRANSMISSION FLUID

To correctly repair an automatic transmission that has had water or coolant introduced into the system, completely disassemble, clean, and replace the following parts:

- All internal and external seals
- All friction material
- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

Prior to installing the transmission, flush and clean the transmission fluid cooler(s) and the transmission fluid cooler tubes and hoses.

DIAGNOSIS AND TESTING > ROAD TESTING VEHICLE > SHIFT POINT ROAD TEST

> *NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.*

Most performance based automatic transmission DTCs require the fault to be detected multiple times before setting a DTC. In many instances the faults musts be detected consecutively a predetermined number of times (up to five). Performing the shift point road test as detailed below increases the likelihood that a DTC sets if a fault is present in the system.

1. Bring engine and transmission up to normal operating temperature.
2. Operate the vehicle with the selector lever in the D position.
3. Apply minimum throttle and observe speeds when an upshift occurs. Refer to the Shift Speeds chart.
4. With the selector lever in the D position and speed above 80 km/h (50 mph) and less than half throttle, move the selector lever from the D position to manual 2 position and release the accelerator pedal. The transmission should downshift into 2nd gear. With the transmission

remaining in the manual 2 position, move the selector lever into the manual 1 position and release the accelerator pedal. The transmission should downshift into 1st gear at speeds below approximately 45-56 km/h (28-35 mph).

5.

If the transmission fails to upshift/downshift, REFER to: Diagnosis By Symptom .

Shift Speed

Throttle Position	Shift	Km/h	MPH
Light Throttle	1-2	13-21	8-13
Throttle Position (TP) Sensor	2-3	26-34	16-21
Voltage @ 1.25 Volts	3-4	35-43	22-27
4-5		56-64	35-40
5-6		71-79	44-49
Closed Throttle	6-5	56-64	35-40
5-4		40-48	25-30
4-3		13-21	8-13
3-2		3-11	2-7
2-1		2-6	1-4
Wide Open Throttle (WOT)	1-2	45-53	28-33
2-3		87-95	54-59
3-4		140-148	87-92

DIAGNOSIS AND TESTING > SPECIAL TESTING PROCEDURES > FRONT PUMP OUTPUT TEST

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission. The front pump output test can also be used to detect a stuck or inoperative main control torque converter regulator valve. The datalogger is used to measure the amount of time it takes the vehicle to reach approximately 5 Km/h (3 MPH) at engine idle speed without pressing the accelerator pedal, verifying transmission pump operation.

1.

Verify transmission fluid temperature is at 77 °C (170 °F) or above.

2.

Park the vehicle for a minimum of 6 hours or overnight on a level spot where it can be driven

forward uninhibited for up to 5 Km/h (3 MPH).

3.

Using a diagnostic scan tool, with Ignition On and Engine Off, select the following PIDs:

VSS Vehicle speed

TRS Transmission Range selector

BOO1 Brake On

APP% Accelerator Pedal Position

Gear_Mode Transmission gear

TFT Transmission Fluid Temperature

TSS_SRC Turbine Speed Sensor

RPM Engine Revolutions

Gear_Rat Transmission Gear ratio

NOTE: Read and review the following steps before performing them as they need to happen consecutively.

4.
Make sure the parking brake is released prior to the next step.

NOTE: Do not apply the accelerator pedal for this test.

5.
Press the record function and perform the following steps.

Press the brake pedal.

Start the engine.

Immediately place the transmission selector lever in the D position.

Immediately release the brake pedal and allow the vehicle to move at idle speed only. Do not accelerate.

6.

After recording for 15 seconds, stop the vehicle.

7.

Using the scroll feature, slide the time bar to the point when the brake was released as indicated by PID BOO1, and note the time at the bottom.

8.

Move the slide until the VSS shows 5 Km/h (3 MPH), or the maximum speed attained.

9.

Did the vehicle reach 5 Km/h (3 MPH) within 5 seconds?

Yes - vehicle is operating normally. This procedure does not apply.

No - replace the transmission pump assembly. REFER to: Transmission .

DIAGNOSIS AND TESTING > SPECIAL TESTING PROCEDURES > FRONT PUMP OUTPUT TEST- TORQUE CONVERTER PRESSURE REGULATOR VALVE

1.

Using a diagnostic scan tool, perform a self-test and check for DTCs.

2.

RECORD the RPM and TSS data while raising the engine RPM.

3.

If the TSS stays at 0 RPM the torque converter is malfunctioning.

4.

INSPECT the main control torque converter regulator valve.

DIAGNOSIS AND TESTING > TORQUE CONVERTER CLUTCH (TCC)

For torque converter operation, REFER to: Torque Converter .

Condition	Possible Sources	Action
TCC does not apply	TCC solenoid mechanically stuck OFF	INSTALL a new TCC solenoid. REFER to: Shift Solenoids (SS) .
	Bypass Clutch Control Regulator Valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Converter Release Regulator Valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body.

		REFER to: Main Control Valve Body .
	CAPLY, CREL, CAPLY F, VFS6 hydraulic circuit blocked or leaking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body .
	TCC friction material worn or damaged	INSTALL a new TCC. REFER to: Transmission - 2.3L EcoBoost (231kW/314PS) . REFER to: Transmission - 3.7L Duratec (227kW/301PS) . REFER to: Transmission - 5.0L 32V Ti-VCT .
TCC always applied/stalls vehicle	TCC solenoid mechanically stuck ON	INSTALL a new TCC solenoid. REFER to: Shift Solenoids (SS) .
	Bypass Clutch Control Regulator Valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Converter Release Regulator Valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CAPLY, CREL, CAPLY F, VFS6 hydraulic circuit blocked or leaking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body .
	TCC friction material worn or damaged	INSTALL a new TCC. REFER to: Transmission - 2.3L EcoBoost (231kW/314PS) . REFER to: Transmission - 3.7L Duratec (227kW/301PS) . REFER to: Transmission - 5.0L 32V Ti-VCT .
TCC cycles, shudders or chatters	Incorrect Transmission Strategy programmed into PCM.	PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .
	TCC solenoid mechanically sticking	INSTALL a new solenoid. REFER to: Shift Solenoids (SS) . PERFORM the Transmission Strategy Download, REFER to: Transmission Strategy Download .

	Bypass Clutch Control Regulator Valve stuck ON	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	Converter Release Regulator Valve stuck OFF	DISASSEMBLE, CLEAN and INSPECT the regulator valve. If bore or valve is damaged, INSTALL a new main control valve body. REFER to: Main Control Valve Body .
	CAPLY, CREL, CAPLY F, VFS6 hydraulic circuit blocked or leaking	DISASSEMBLE, CLEAN and INSPECT the valves. If bore or valve is damaged, INSTALL a new main control. REFER to: Main Control Valve Body .
	TCC friction material worn or damaged	INSTALL a new TCC. REFER to: Transmission - 2.3L EcoBoost (231kW/314PS) . REFER to: Transmission - 3.7L Duratec (227kW/301PS) . REFER to: Transmission - 5.0L 32V Ti-VCT .

GENERAL PROCEDURES > ADAPTIVE LEARNING DRIVE CYCLE

Configuration

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for shift error DTC to set, and 5 times consecutively for continuous TCC DTC to set.

NOTE: Use the Transmission Drive Cycle Test for checking codes after performing a self-test.

1.

Record then clear the DTCs (Diagnostic Trouble Codes).

2.

Warm the engine to normal operating temperature.

3.

Make sure the transmission fluid level is correct.

4.

With the selector lever in (D), moderately accelerate from stop to 80 km/h (50 mph) allowing the transmission to shift into 6th gear. Keep vehicle speed and throttle steady for a minimum of 15 seconds.

5.

With the transmission in 6th gear and maintaining steady speed and throttle, lightly apply and release the brake to operate stoplamps. Maintain the speed and throttle for a minimum of 5 seconds.

6.

Brake to a stop and remain stopped for a minimum of 20 seconds.

7.

Repeat Steps 4 through 6 five times.

8.

Perform a self-test and record DTCs.

If DTCs are present, repair all non-transmission DTCs first as they can directly affect the transmission operation. Repeat the self-test and road test the vehicle to verify the repair. Clear the DTCs. Perform the drive cycle test and repeat the self-test after completing the repair. Refer to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 2.3L EcoBoost (201kW/273PS) . Refer to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 3.7L Duratec (227kW/301PS) . Refer to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 5.0L 32V Ti-VCT .

If the tests pass and a concern is still present, refer to Diagnosis By Symptom, OASIS messages and TSB regarding concern. Refer to: Diagnosis By Symptom .

NOTE: The vehicle wiring harness, PCM and non-transmission sensors may affect transmission operations. Repair these concerns first.

9.

Repair all DTCs after the OBD test procedures are completed. Begin with non-transmission related DTCs, then repair any transmission related DTCs. Use the DTC Chart for information on condition and symptoms. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure the vehicle wiring harness and the PCM are diagnosed as well. The Engine Controls article aids in diagnosing non-transmission electronic components. Refer to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 2.3L EcoBoost (201kW/273PS) . Refer to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 3.7L Duratec (227kW/301PS) . Refer

to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 5.0L 32V Ti-VCT .

GENERAL PROCEDURES > TRANSMISSION AND TORQUE CONVERTER FLUID DRAIN AND REFILL

Special Tool(s) / General Equipment

Fluid Exchanger

Materials

Name	Specification
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

Flushing

NOTE: Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Connect the Fluid Exchanger to the transmission fluid cooler tube after the transmission fluid cooler on the return tube. This helps remove any foreign material trapped in the transmission fluid coolers. Use the General Equipment: Fluid Exchanger

3.

Perform the transmission fluid exchange using the Fluid Exchanger.

Follow the manufacturer's instructions included with the machine. Use the General Equipment: Fluid Exchanger

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

4.

Once the transmission fluid exchange is completed, disconnect the Fluid Exchanger. Reconnect any disconnected transmission fluid cooler tubes. Use the General Equipment: Fluid Exchanger

5.

Check the transmission fluid level. Refer to: Transmission Fluid Level Check .

GENERAL PROCEDURES > TRANSMISSION FLUID DRAIN AND REFILL

Special Tool(s) / General Equipment

	307-570 Tube, Transmission Fill TKIT-2006U-F/FM TKIT-2006U-FLM/LM TKIT-2006U-ROW1 TKIT-2006U-ROW2
	307-D465 Transporter Fluid Evacuator/Injector
 416-D002	416-D002 Vacuum Pump Kit

Materials

Name	Specification
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

Draining

NOTE: The transmission fluid pan must be removed to drain the transmission fluid. Follow the steps in the Transmission Fluid Pan, Gasket and Filter procedure to remove and install the transmission fluid pan. It is not necessary to remove the transmission fluid filter to drain the transmission fluid.

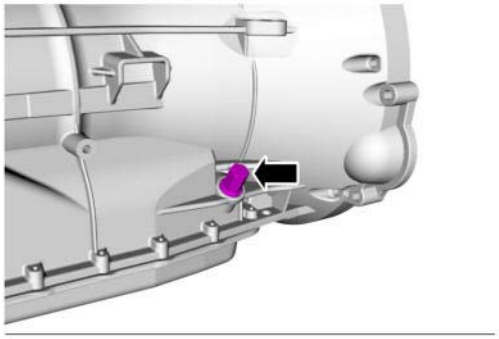
1.
Remove the transmission fluid pan to drain the transmission fluid. Refer to: Transmission Fluid Pan, Gasket and Filter .

Filling

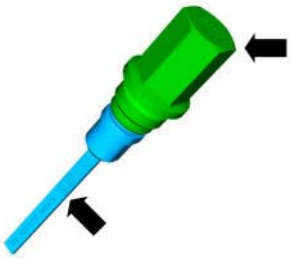
NOTE: This procedure contains the air purge steps required to purge air from the transmission fluid cooling system. This procedure is NOT intended for use with the Transmission Fluid Level Check.

NOTE: The vehicle should not be driven if the transmission fluid level is low or internal failure could result.

NOTE: The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.



NOTE: Check the transmission fluid level if the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking.



NOTE: Here is an overview of the Transmission Fluid Refill procedure.

- Adding 3.3L (3.5 qt) of transmission fluid is an initial fill enabling the engine to be started.
- Filling the transmission to the transmission fluid level indicator area below the crosshatch mark allows the vehicle to be driven.
- The vehicle should be driven to allow the transmission fluid temperature to reach 96.7 °C - 102 °C (206 °F - 215 °F) in order to purge the air from the transmission fluid cooling system.
- Fill the transmission fluid to the fill range on the transmission fluid level indicator at the normal operating range 96.7 °C - 102 °C (206 °F - 215 °F).

1.

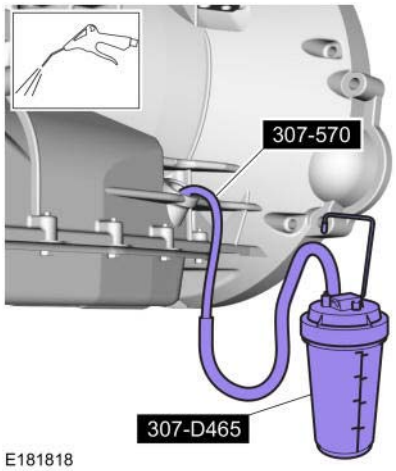
Remove the transmission fluid fill plug and remove the transmission fluid level indicator from the plug.

E181797

NOTE: The transmission will need 11.35L (12 qt) of transmission fluid added to the transmission as an initial fill if the transmission has been overhauled.

NOTE: The transmission will need 3.3L (3.5 qt) of transmission fluid added to the transmission as an initial fill if:

2.



a new main control has been installed.

the transmission fluid pan or transmission fluid filter have been removed.

Using the special tools, add transmission fluid to the transmission through the transmission fluid fill hole. Use Special Service Tool: 307-570 Tube, Transmission Fill., 307-D465 Transporter Fluid Evacuator/Injector.

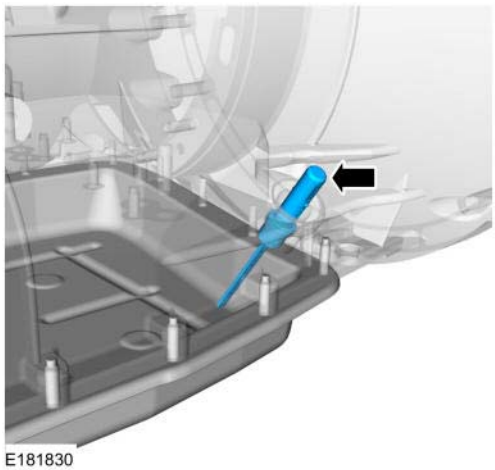
Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

3.

1.

Connect the diagnostic scan tool and monitor the transmission fluid temperature.



2.

Start the engine.

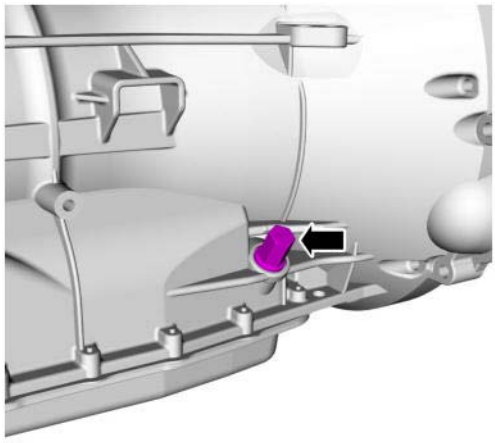
3.

Place the selector lever in each gear position, holding approximately 5 seconds in each position. Place the selector lever in PARK, with the engine at idle (600-750 RPM).

Check the transmission fluid level using the transmission fluid level indicator.

NOTE: The vehicle is safe to drive with a cold transmission fluid temperature if the transmission fluid level is in the transmission fluid level indicator area below the crosshatch mark as shown. Failure to add transmission fluid to this level can result in damage to the transmission.

4.
Add transmission fluid to the area on the transmission fluid level indicator below the crosshatch mark.



E181869

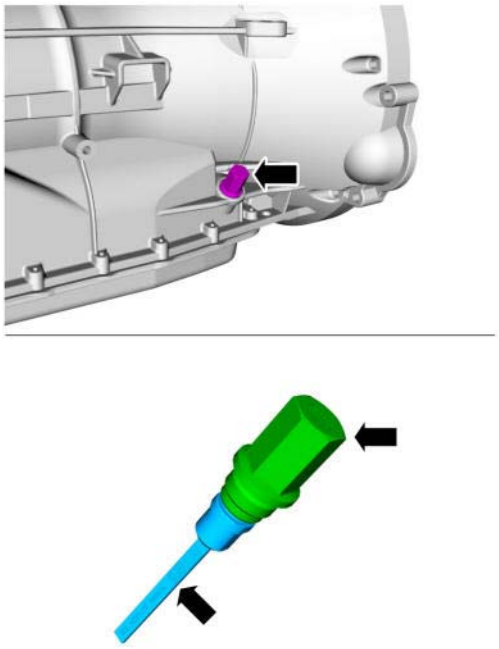
5.

Install the transmission fluid fill plug.

Torque

: 26 lb.ft (35 Nm)

E181871

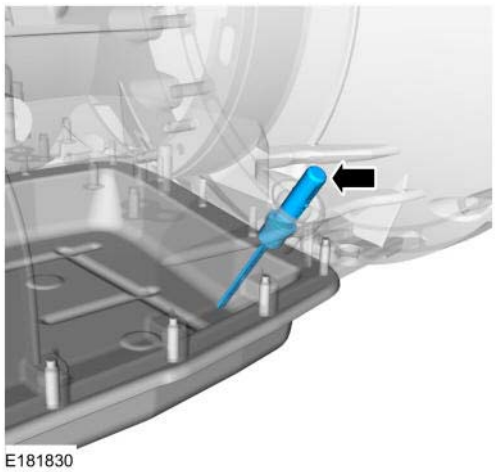


NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

6.
Drive the vehicle. While driving the vehicle, use the scan tool to verify the transmission fluid has reached a temperature of 96.7 °C - 102 °C (206 °F - 215 °F). This circulates the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system. With the engine idling (600-750 RPM) in PARK, verify the transmission fluid temperature is between 96.7 °C - 102 °C (206 °F - 215 °F) and lift the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

7.

Remove the transmission fluid fill plug and remove the transmission fluid level indicator from the



plug.

E181797

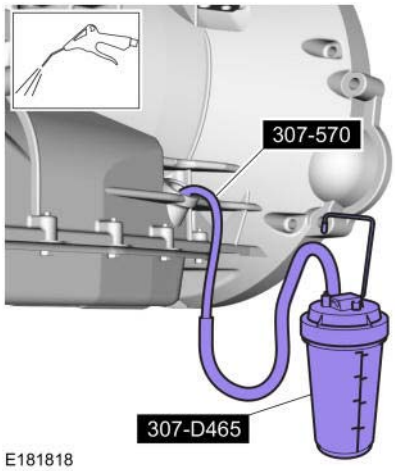
8.

Check the transmission fluid level using the transmission fluid level indicator.

E181830

NOTE: The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (A) area and a dotted (B) area. Use the dotted (B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted (B) area marks on the transmission fluid level indicator.

9.
Using the scan tool verify the transmission fluid temperature is between 96.7 °C - 102 °C (206 °F - 215 °F). The transmission fluid level must be at the upper level of the dotted (B) area.



E193861

10.

If the transmission fluid level is low, add transmission fluid using the special tools.Use Special Service Tool: 307-570 Tube, Transmission Fill., 307-D465 Transporter Fluid Evacuator/Injector.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

E181818

11.

If the transmission fluid is overfilled, remove transmission fluid using the special tools. Use Special Service Tool: 307-570 Tube, Transmission Fill., 307-D465 Transporter Fluid Evacuator/Injector., 416-D002 Vacuum Pump Kit.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

12.

Install the transmission fluid fill plug.

Torque

: 26 lb.ft (35 Nm)

GENERAL PROCEDURES > TRANSMISSION FLUID LEVEL CHECK

Inspection

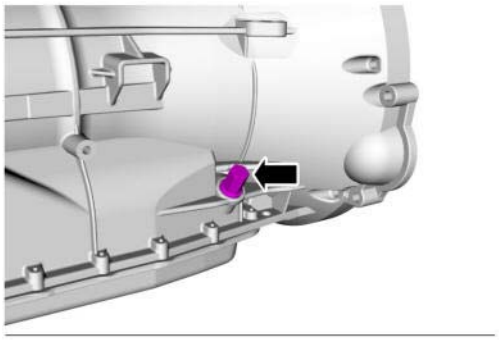
NOTE: The vehicle should not be driven if the transmission fluid level is low. Internal failure could result.

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the transmission fluid must cool down to obtain an accurate reading.

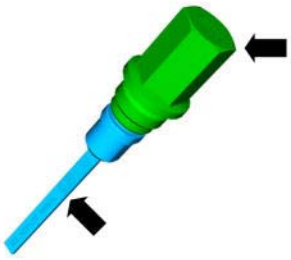
NOTE: Do not overfill the transmission. The transmission fluid level must be at the upper level of the dotted (B) area marks on the transmission fluid level indicator.

NOTE: If a new transmission fluid cooler or new fluid cooler tubes have been installed, drive the vehicle to warm the transmission fluid to 96.7 °C-102 °C (206 °F-215 °F) in order to purge the air from the transmission fluid cooling system.

1.



Connect the diagnostic scan tool and position the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

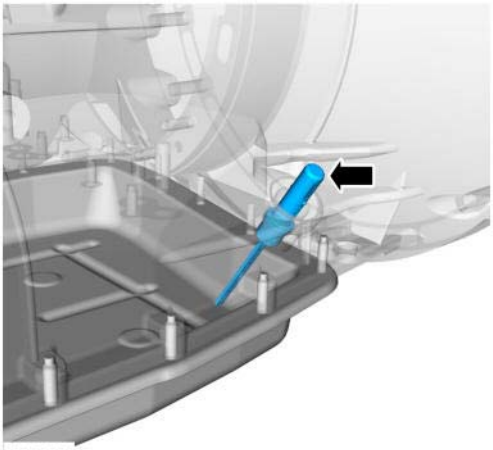


2.

With the engine running, place the transmission selector lever in each gear position, holding approximately 5 seconds in each position. Place the transmission selector lever in PARK.

3.

Remove the transmission fluid fill plug and remove the transmission fluid level indicator from the plug.



E181797

4.

Check the transmission fluid level using the transmission fluid level indicator.

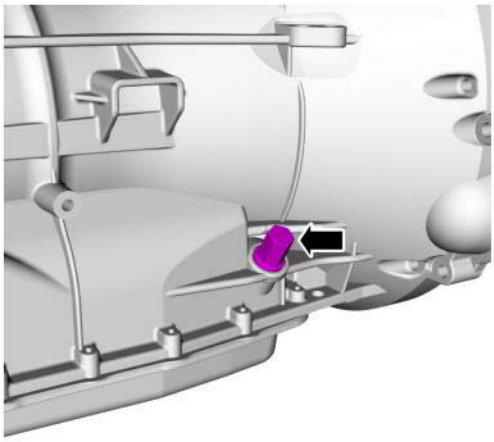
E181830

NOTE: The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (A) area and a dotted (B) area. Use the dotted (B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted (B) area marks on the transmission fluid level indicator.

5.
Using the scan tool verify the transmission fluid temperature is between 96.7 °C - 102 °C (206 °F - 215 °F). The transmission fluid level must be at the upper level of the dotted (B) area.

E193861

6.



If the transmission fluid is not at the correct level, follow the steps for adding or removing transmission fluid. Refer to: Transmission Fluid Drain and Refill .

7.

Install the transmission fluid fill plug.

Torque

: 26 lb.ft (35 Nm)

E181871

GENERAL PROCEDURES > TRANSMISSION IDENTIFICATION

Check

1.

Using the scan tool, select Powertrain, Transmission and Transmission Characterization / Solenoid IDN from the toolbox icon and follow the instructions displayed on the scan tool. The Transmission Characterization / Solenoid IDN screen displays solenoid body identification information:

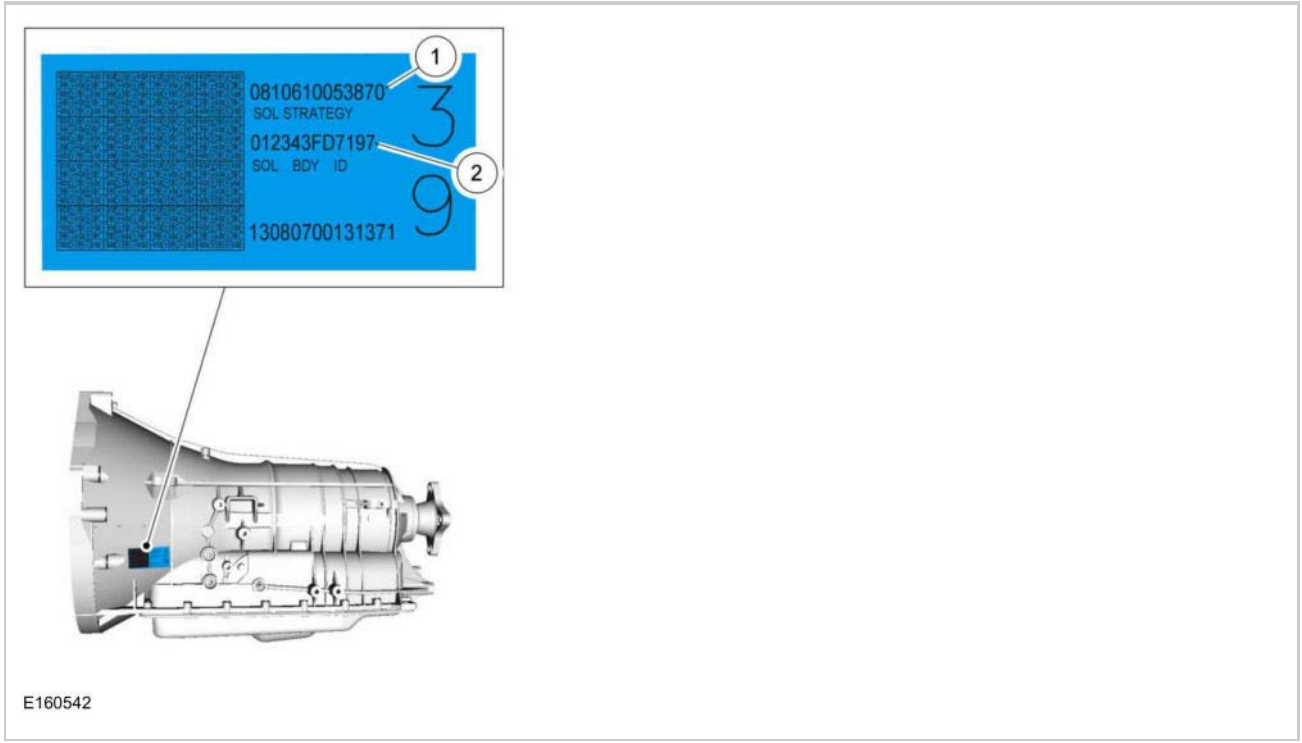
Solenoid body identification is a 12-digit number

Solenoid body strategy is a 13-digit number. If the solenoid body strategy field is blank, the module contains a partial transmission solenoid body strategy. This is due to a corrupt or missing file at the time the programmable parameters were completed.

NOTE: The 13-digit solenoid body strategy number consists of only numbers. Letters are not used.

2.
Compare the solenoid body identification and strategy to the solenoid body identification tag located on the left side of the transmission case.

- **Original Solenoid Body Service Tag**



3.

1.

13 - digit solenoid body strategy

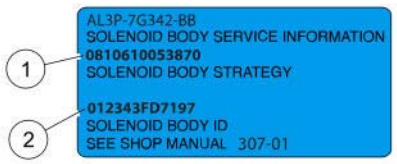
2.

12 - digit solenoid body identification

4.

If the solenoid body identification and strategy displayed on the scan tool match the solenoid body identification tag or replacement tag, then the solenoid body identification and strategy are correct for this transmission and a solenoid body strategy data download is not required. If the solenoid body identification tag or replacement tag is missing or damaged so it is not readable or does not match the identification or strategy displayed on the scan tool, remove the transmission fluid pan and filter and locate the 13-digit solenoid body strategy etched on the main control casting. Refer to: Transmission Fluid Pan, Gasket and Filter .

- **Replacement Solenoid Body Service Tag**



5.

1.

13 - digit solenoid body strategy

2.

12 - digit solenoid body identification

E181713

- **Main Control Solenoid Body Strategy**

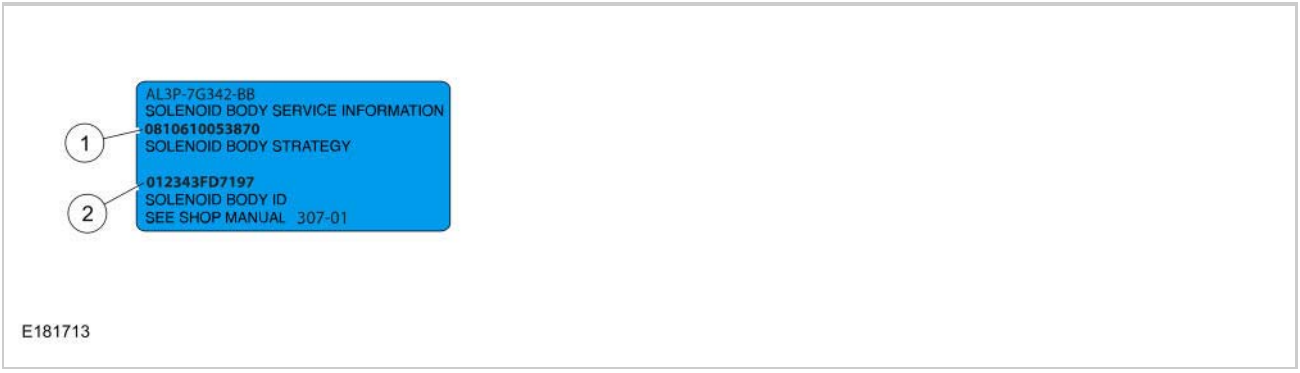
> *NOTE: If the new main control was not supplied with a replacement solenoid strategy identification tag, DO NOT INSTALL the main control as all required programming information is missing.*

> *NOTE: The 13-digit solenoid body strategy number displayed on the scan tool must match the solenoid body strategy number etched on the main control. If the numbers do not match, damage to the transmission or driveability concerns can occur.*

6.
Compare the solenoid body strategy identification etched on the main control to the solenoid strategy identification tag on the transmission case. If the solenoid body strategy identification etched on the main control does not match the solenoid strategy identification tag then a solenoid body strategy data download is required. If the solenoid body strategy etched on the main control does match the solenoid strategy identification tag on the transmission case but does not match the solenoid body identification and strategy displayed on the scan tool, then a solenoid body strategy data download is also required.

E184453

GENERAL PROCEDURES > TRANSMISSION STRATEGY DOWNLOAD



Programming

1.

If a new main control was installed, record the 12-digit solenoid body identification and 13-digit solenoid body strategy from the replacement solenoid body tag provided with the main control service kit. Place the replacement tag over the existing identification tag.

13 - digit solenoid body strategy

12 - digit solenoid body identification

2.

Using the scan tool, select module Programming and Programmable Parameters under the toolbox icon and select transmission. Follow the instructions displayed on the scan tool. There are fields to enter the solenoid body 12-digit identification and 13-digit strategy recorded from the solenoid body.

NOTE: If the solenoid body information is not correct, transmission damage or driveability concerns can occur.

3.
Enter the solenoid body 13-digit strategy. The scan tool verifies the numbers entered are valid and display a message if the information is not valid. The scan tool will check to verify the file is present on the scan tool. If the file is present, the technician may proceed with downloading the file to the module. If the file is not present, the scan tool will need to be connected to the Professional Technician Society (PTS) server to download the file onto the scan tool.

4.

Verify the file is present on the scan tool. If the file is present, go to Step 8. If the file is not present, continue with this procedure.

5.

Connect the scan tool to the Professional Technician Society (PTS) server.

6.

Follow the instructions on the network to download the strategy file to the scan tool.

7.

If the scan tool cannot connect to the Professional Technician Society (PTS) server, download the file from Professional Technician Society (PTS) using the OASIS tab and select the transmission strategy. If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

8.

Reconnect the scan tool to the vehicle.

9.

Follow the instructions displayed on the scan tool.

10.

The scan tool automatically downloads the strategy file or partial strategy file to the module. The scan tool displays a message when it is finished downloading the data that states that the file was downloaded successfully.

NOTE: If a drive cycle is not completed, erratic shifts and driveability concerns may occur.

11.
Road test the vehicle following the Adaptive Learning Drive Cycle. Refer to: Adaptive Learning Drive Cycle .

REMOVAL AND INSTALLATION > TRANSMISSION - 2.3L ECOBOOST (231KW 314PS)

Special Tool(s) / General Equipment

	307-346 (T97T-7902-A) Retainer, Torque Converter TKIT-1997-F/FLM/LT TKIT-1998-LM (NavigatoR)
Magnetic Socket	
Transmission Jack	

Materials

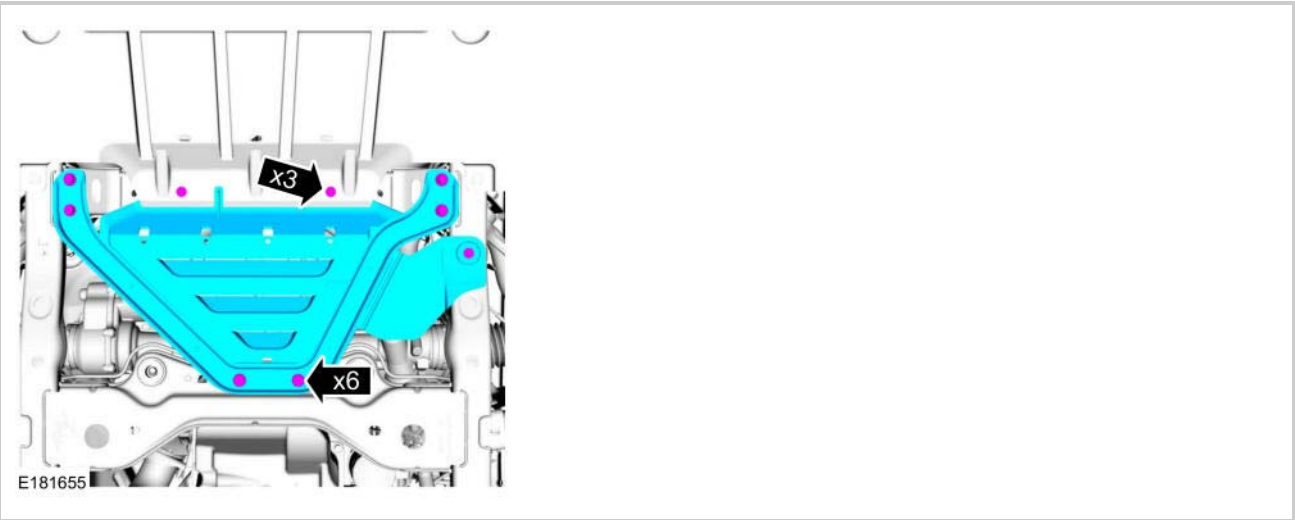
Name	Specification
Motorcraft ® Multi-Purpose Grease Spray XL-5-A	ESB-M1C93-B
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

REMOVAL AND INSTALLATION > TRANSMISSION - 2.3L ECOBOOST (231KW 314PS) > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

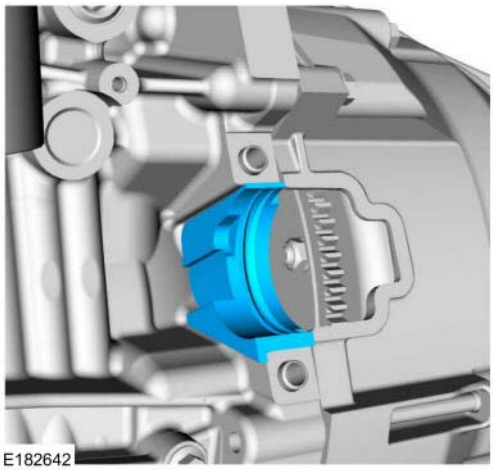
2.



Remove the following items:

Refer to: Starter Motor .

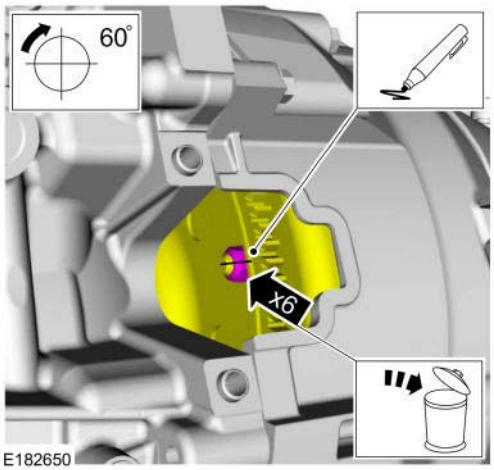
Refer to: Driveshaft .



3.

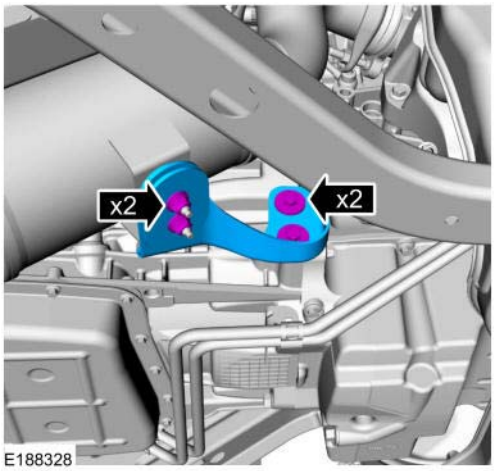
Remove the screws, bolts and the underbody shield.

4.



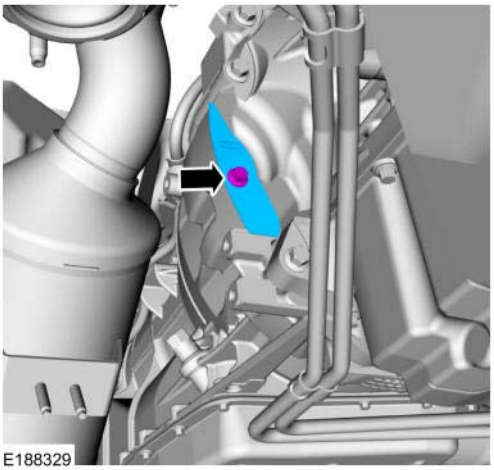
Remove the starter motor insulator.

NOTE: Index mark one stud and the flexplate for assembly reference.



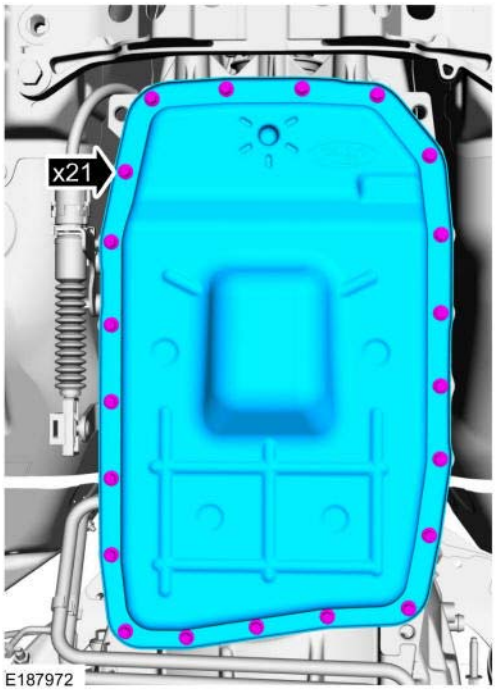
NOTE: Only rotate the crankshaft in a clockwise direction.

5.
Remove and discard the torque converter nuts. Use the General Equipment: Magnetic Socket



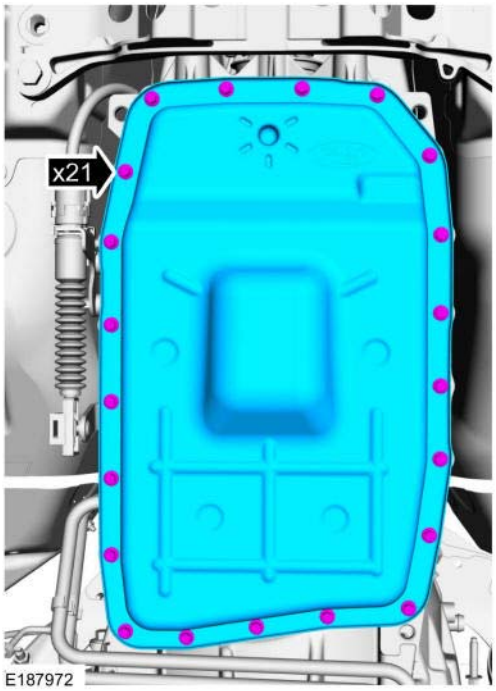
6.

Remove the nuts, bolts and the catalytic converter bracket.



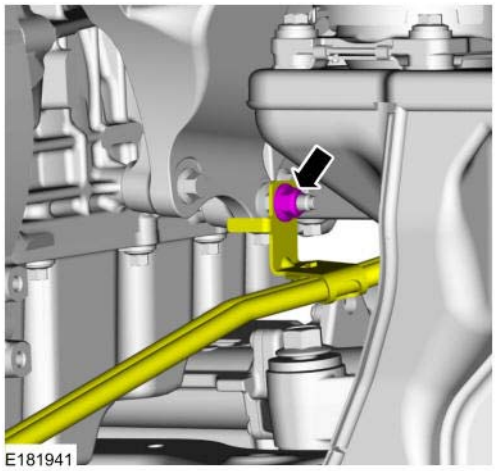
7.

Remove the bolt and the dust shield.



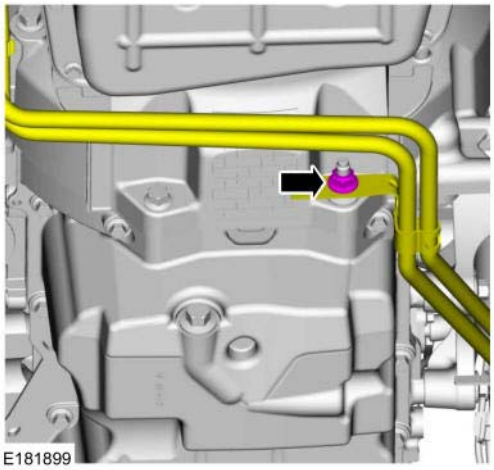
NOTE: If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.

8.
Remove the transmission fluid pan bolts and the transmission fluid pan and allow the transmission fluid to drain.



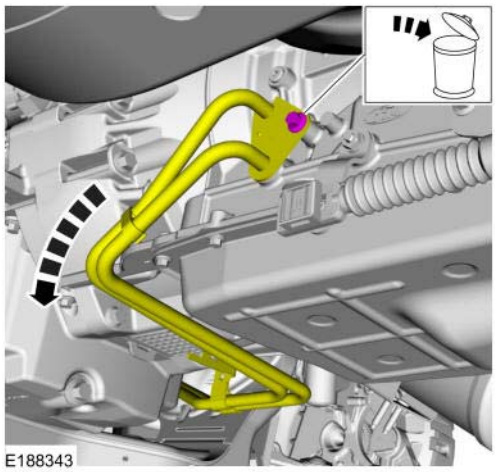
NOTE: It is not necessary to torque transmission fluid pan bolts at this time.

9.
Install the transmission fluid pan and the bolts.



10.

Remove the transmission fluid cooler tube nut from the RH engine mount bracket.



11.

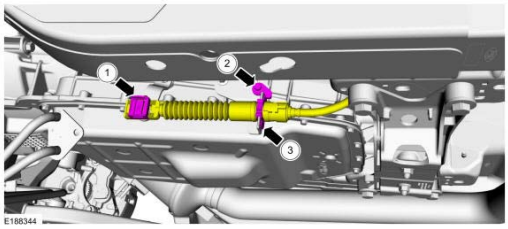
Remove the transmission fluid cooler tube nut.

12.

Remove and discard the bolt and position the transmission fluid cooler tubes aside.

13.

1.



Disconnect the selector lever cable from the selector lever.

2.

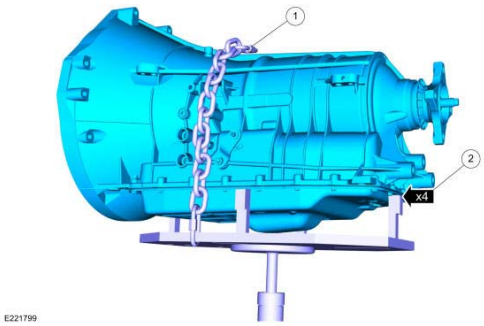
Remove the bolt from the bracket.

3.

Disconnect the selector lever cable from the bracket.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap or chain.



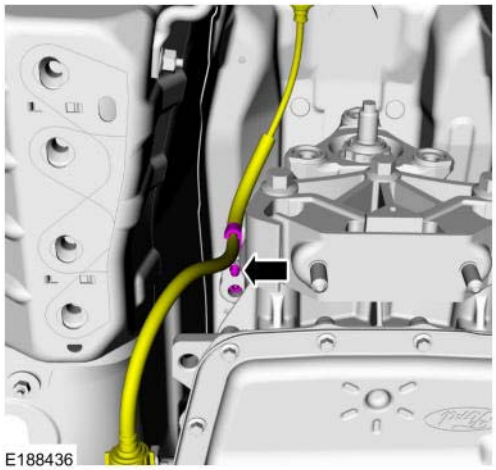
14.
Using a high-lift transmission jack, support the transmission.

1.

Safety chain

2.

Outer ribs of the transmission fluid pan Use the General Equipment: Transmission Jack



15.

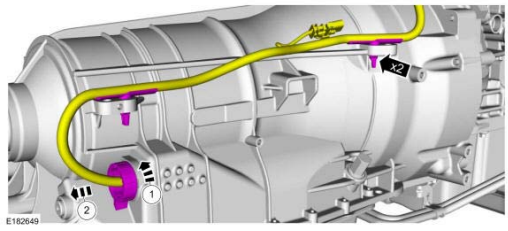
Remove the transmission support crossmember. Refer to: Transmission Support Crossmember .

16.

Disconnect the selector lever cable retainer from the transmission case.

NOTE: Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.

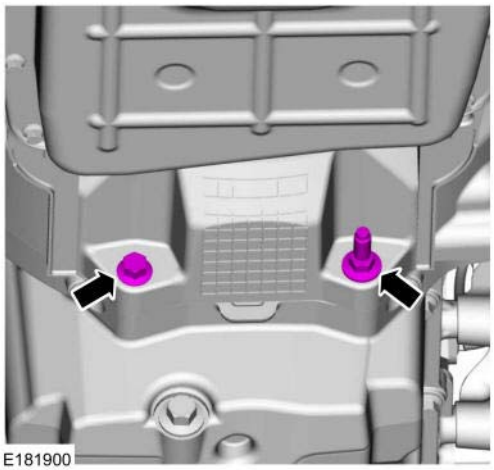
17.



1.

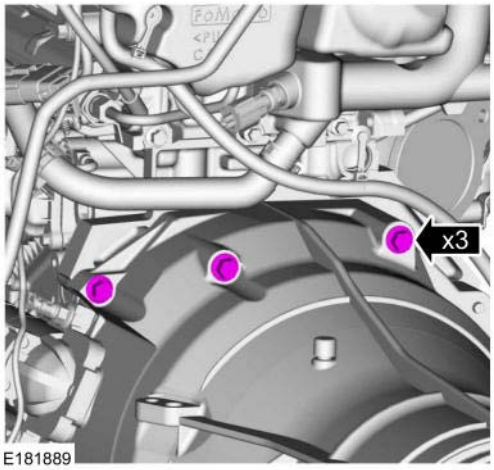
Rotate the transmission electrical connector counterclockwise.

2.



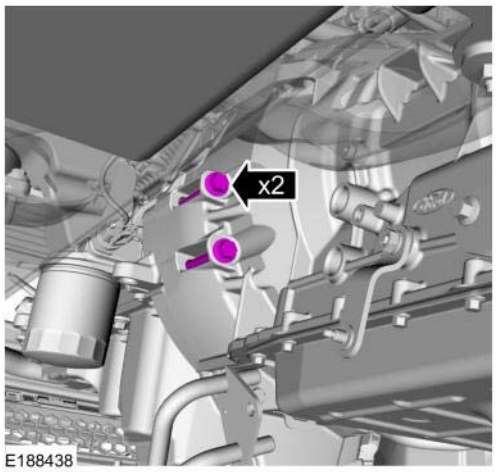
Pull the transmission electrical connector out to disconnect.

Detach the retainers and position the wiring harness aside.



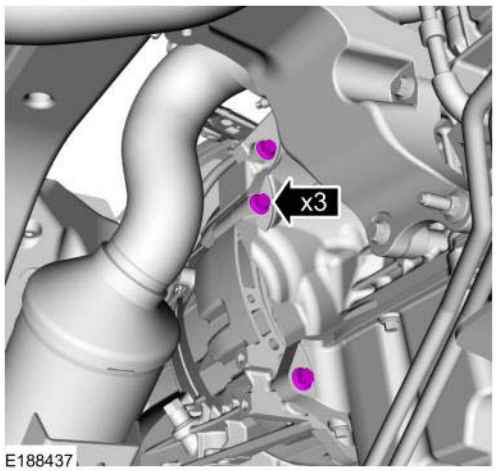
18.

Remove the lower bellhousing bolt and stud bolt.



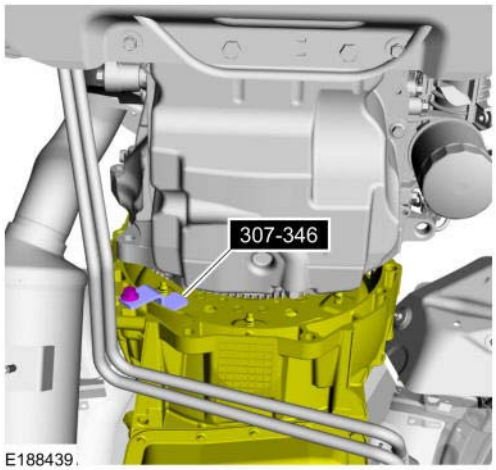
19.

Remove the upper bellhousing bolts.



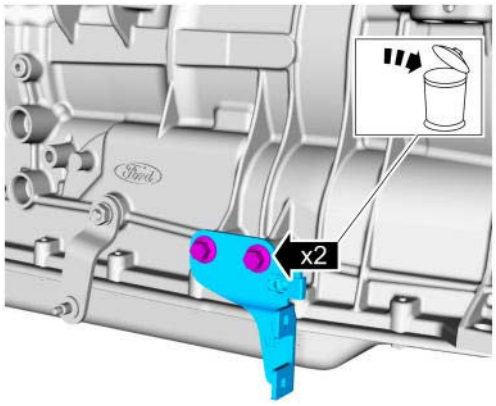
20.

Remove the LH side bellhousing bolts.



21.

Remove the RH side bellhousing bolts.



22.

Slide the transmission back enough to install the special tool and remove the transmission from the vehicle. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

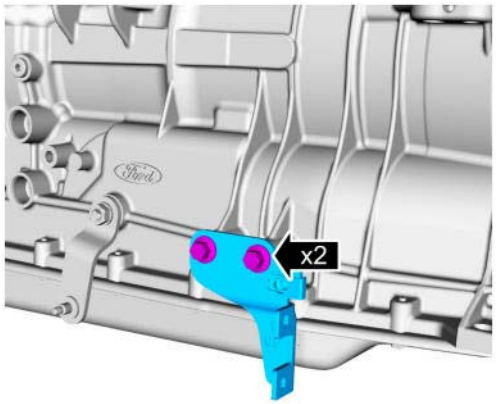
23.

If installing a new or re-manufactured transmission, remove and discard the bolts.

E221622

NOTE: Failure to clean the transmission fluid cooler tubes can result in transmission failure.

24.
If the transmission is to be overhauled or if installing a new or re-manufactured transmission, carryout the transmission fluid cooler backflushing and cleaning. Refer to: Transmission Fluid Cooler - Backflushing and Cleaning .



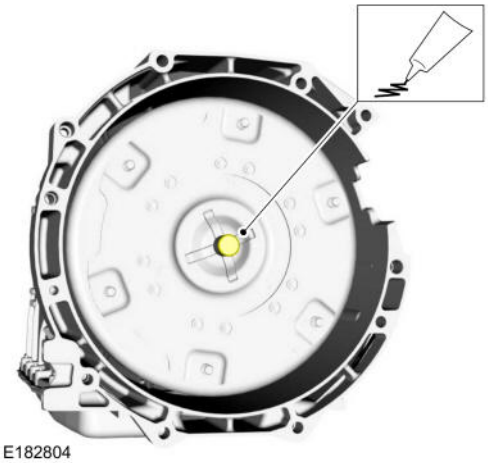
REMOVAL AND INSTALLATION > TRANSMISSION - 2.3L ECOBOOST (231KW 314PS) > INSTALLATION

1.

If removed, install the bracket and the new bolts.

Torque

: 18 lb.ft (25 Nm)



E221623

2.

Lubricate the torque converter pilot hub with multi-purpose grease.

Material

: Motorcraft ® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

E182804

3.

Install the special tool. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

E188616

NOTE: If transmission was disassembled, add transmission fluid to the transmission.

NOTE: If transmission is being replaced, remove the transmission fluid fill plug and verify that the transmission is filled with transmission fluid.

4.

1.

Remove the transmission fluid fill plug transmission fluid level indicator assembly.

Torque

: 19 lb.ft (26 Nm)

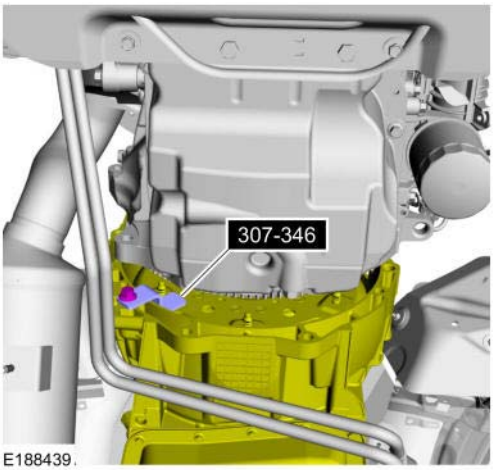
2.

Verify transmission is filled with transmission fluid.

3.

Slightly tilt the transmission rearward.

4.

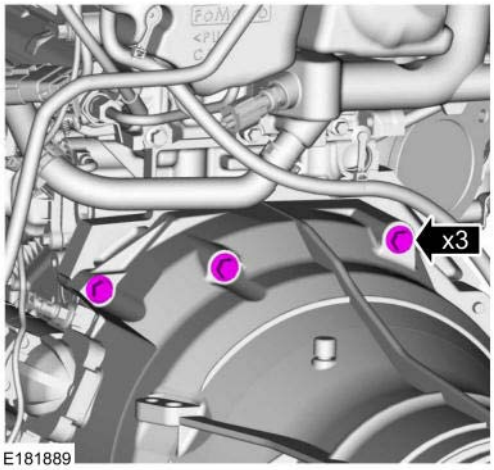


If the transmission was disassembled, add 11.35L (12 qt) of transmission fluid to the transmission through the transmission fluid fill hole.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap.

5.
Using a high-lift transmission jack, position the transmission into the vehicle behind the engine and remove the special tool. Use Special Service Tool: 307-346 (T97T-7902-A)Retainer, Torque Converter. Use the General Equipment: Transmission Jack



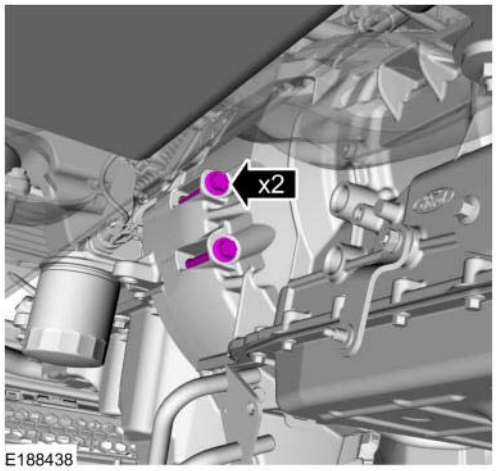
NOTE: With the transmission in a horizontal position, move it toward the engine and position it on the dowel pins.

NOTE: Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

6.
Install the upper bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

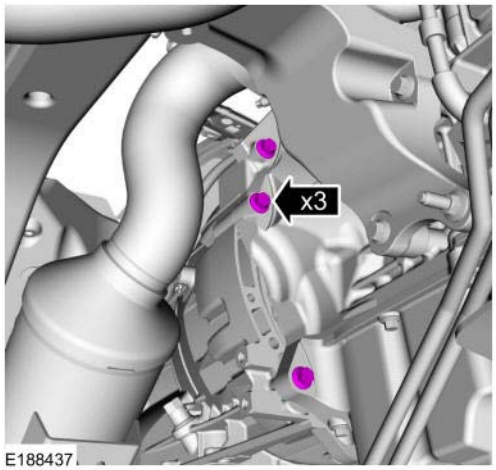


7.

Install the LH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

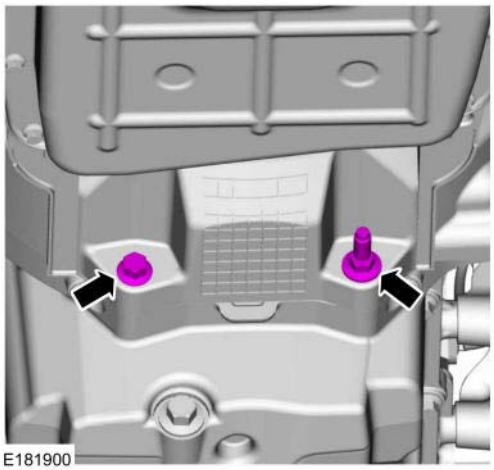


8.

Install the RH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

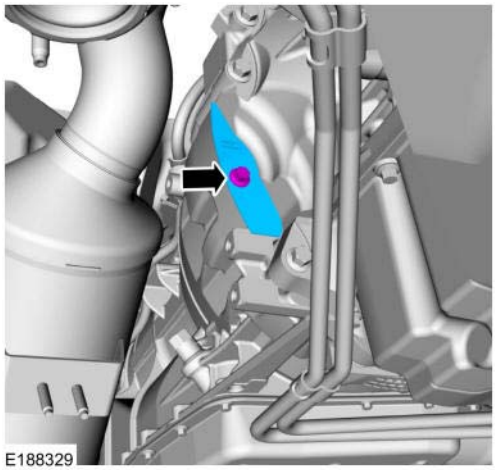


9.

Install the lower bellhousing bolt and stud bolt.

Torque

: 35 lb.ft (48 Nm)

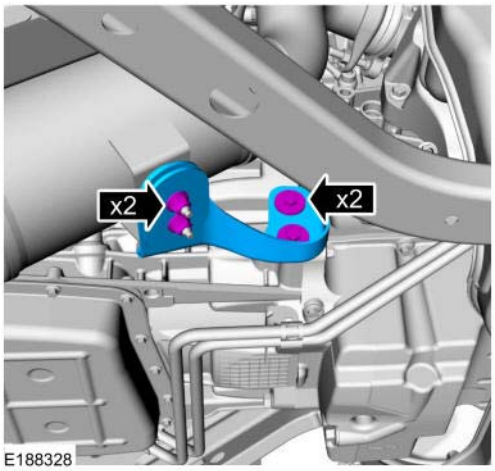


10.

Install the dust shield and the bolt.

Torque

: 18 lb.ft (25 Nm)

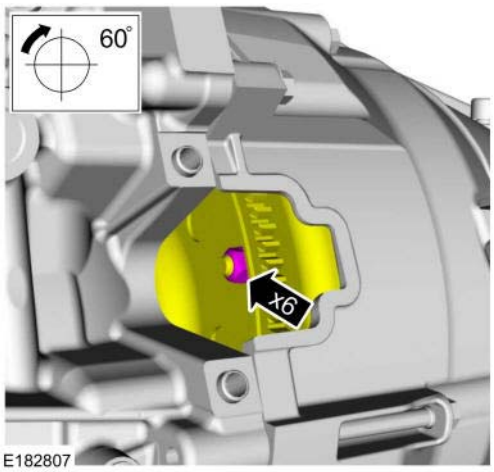


11.

Install the catalytic converter bracket, the nuts and the bolts.

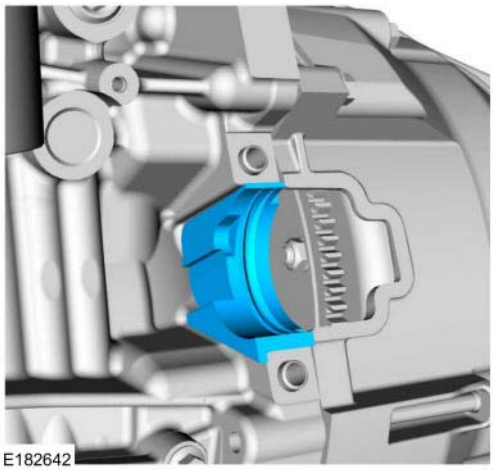
Torque

: 18 lb.ft (25 Nm)



NOTE: Only rotate the crankshaft in a clockwise direction.

12.
Install the new torque converter nuts.



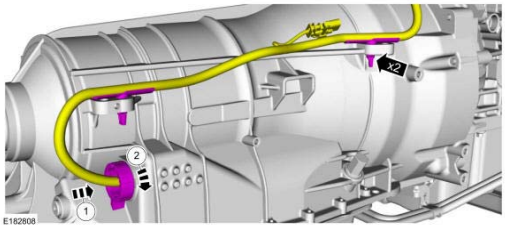
Torque

: 35 lb.ft (48 Nm)

13.

Install the starter motor insulator.

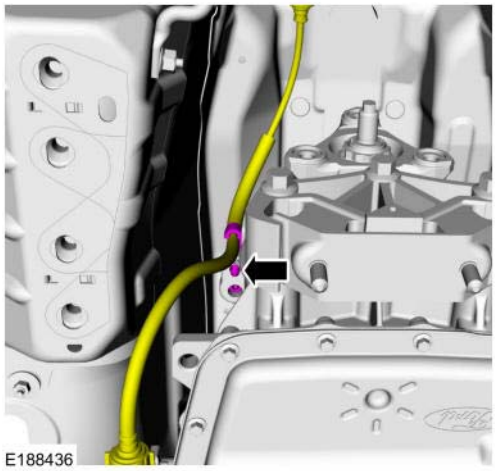
14.



1.

Push the transmission electrical connector in to connect.

2.



Rotate the transmission electrical connector clockwise.

Attach the wiring harness retainers.

15.

Connect the selector lever cable retainer to the transmission case.

16.

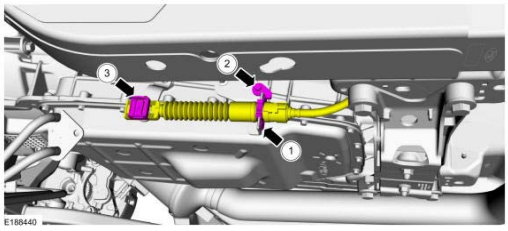
Install the transmission support crossmember. Refer to: Transmission Support Crossmember .

17.

1.

Connect the selector lever cable to the bracket.

2.



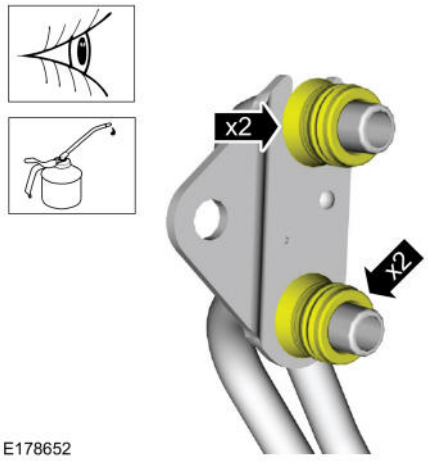
Install the bolt.

Torque

: 62 lb.in (7 Nm)

3.

Connect the selector lever cable to the selector lever.

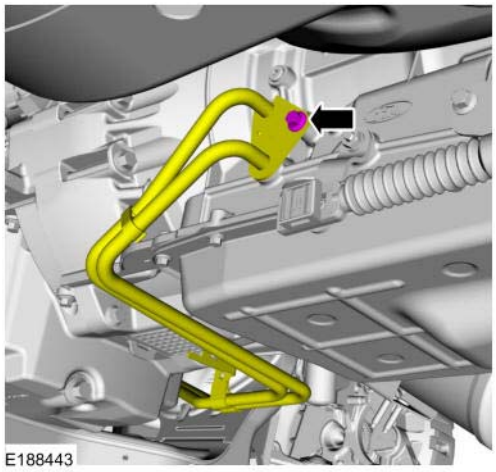


NOTE: Lubricate with clean transmission fluid.

18.
Inspect the transmission fluid cooler tube band seals and backing rings for damage, replace if necessary.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

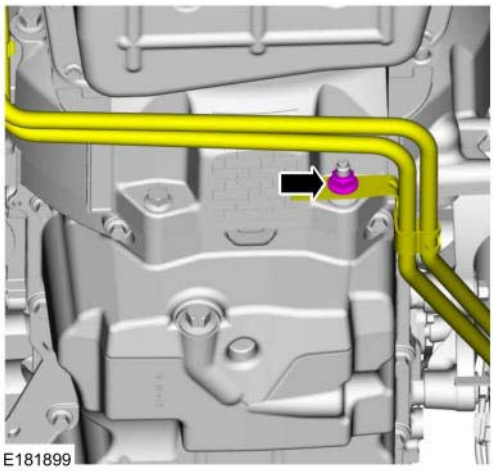


19.

Install the transmission fluid cooler tubes and the new bolt.

Torque

: 18 lb.ft (25 Nm)

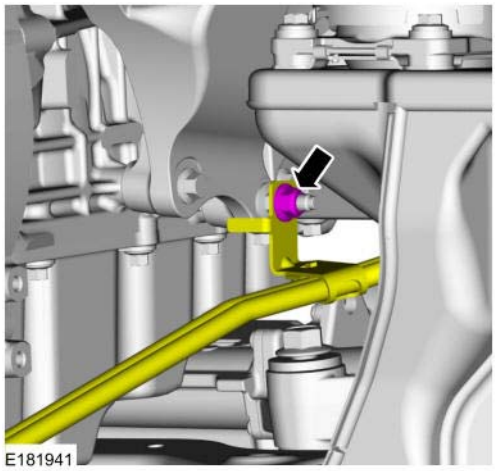


20.

Install the transmission fluid cooler tube bracket nut.

Torque

: 124 lb.in (14 Nm)



21.

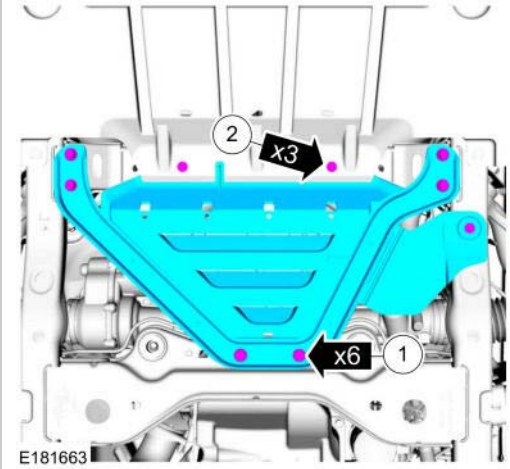
Install the transmission fluid cooler tube nut on the RH engine mount bracket.

Torque

: 35 lb.ft (48 Nm)

22.

1.



Install the underbody shield and the bolts.

Torque

: 46 lb.ft (63 Nm)

2.

Install the underbody shield screws.

23.

Install the following items:

Refer to: Driveshaft .

Refer to: Starter Motor .

24.

Verify the selector lever cable is correctly adjusted. Refer to: Selector Lever Cable Adjustment .

25.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

26.

If a new transmission or a new main control was installed, the solenoid body strategy must be updated. Refer to: Transmission Strategy Download .

27.

If the transmission was overhauled, the adaptive learning drive cycle must be updated. Refer to: Adaptive Learning Drive Cycle .

28.

While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 96.7 °C-102 °C (206 °F-215 °F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.

29.

Check the transmission fluid level. Refer to: Transmission Fluid Level Check .

REMOVAL AND INSTALLATION > TRANSMISSION - 3.7L DURATEC (227KW 301PS)

Special Tool(s) / General Equipment

	307-346 (T97T-7902-A) Retainer, Torque Converter TKIT-1997-F/FLM/LT TKIT-1998-LM (NavigatoR)

Materials

Name	Specification
Motorcraft ® Multi-Purpose Grease Spray XL-5-A	ESB-M1C93-B
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

REMOVAL AND INSTALLATION > TRANSMISSION - 3.7L DURATEC (227KW 301PS) > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

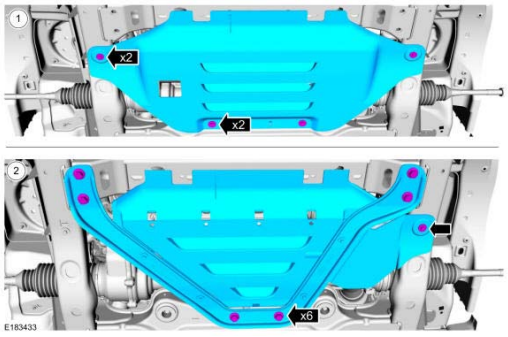
2.

Remove the following items:

Refer to: Starter Motor .

Refer to: Driveshaft .

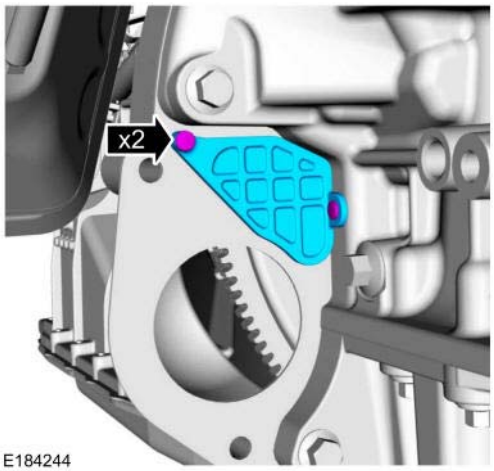
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



3.

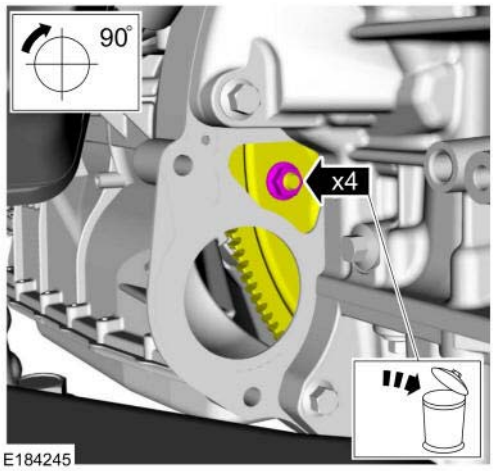
1.

Remove the bolts and the underbody shield.



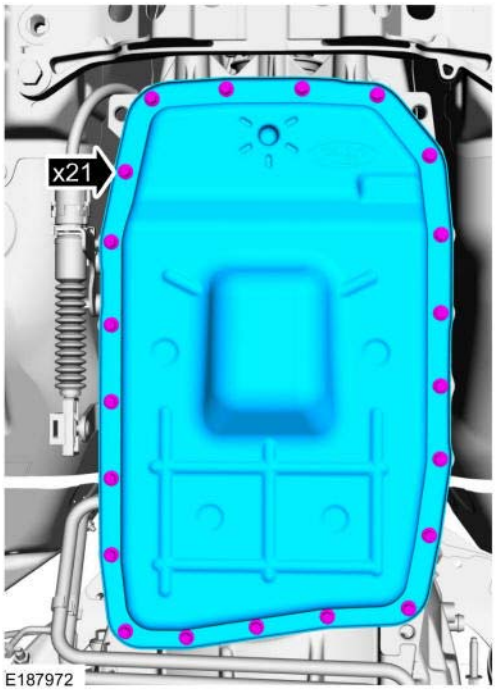
2.

Remove the bolts and the subframe bracket and underbody shield assembly.



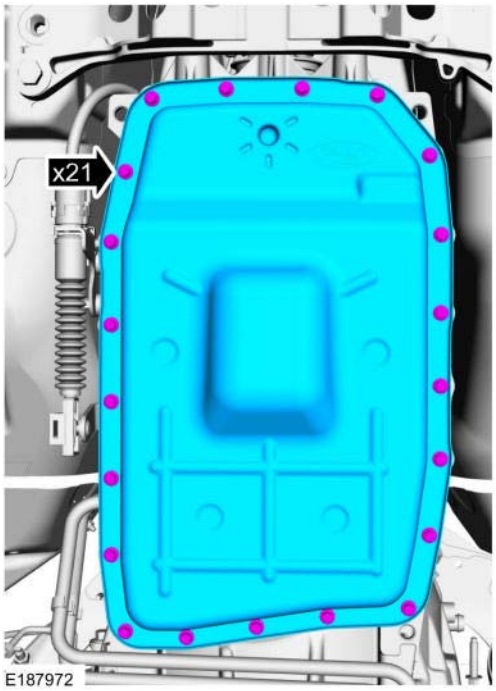
4.

Remove the retainers and the access cover.



NOTE: Using the crankshaft pulley bolt, turn the engine clockwise.

5.
Remove and discard the torque converter nuts.

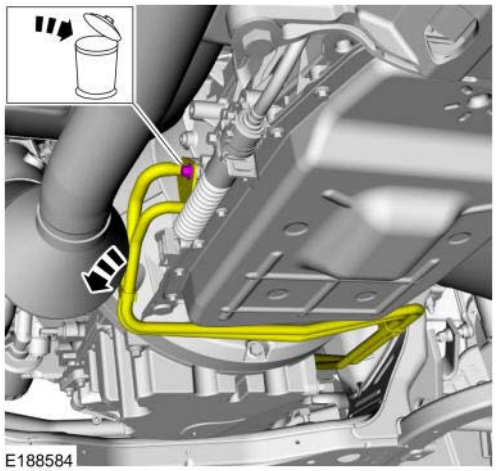


NOTE: If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.

6.
Remove the transmission fluid pan bolts and the transmission fluid pan and allow the transmission fluid to drain.

NOTE: It is not necessary to torque transmission fluid pan bolts at this time.

7.
Install the transmission fluid pan and the bolts.



8.

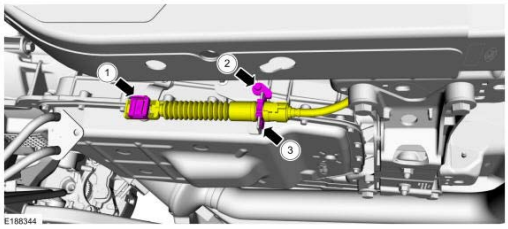
Remove the LH catalyst monitor sensor. Refer to: Catalyst Monitor Sensor .

9.

Remove and discard the bolt and position the transmission fluid cooler tubes aside.

10.

1.



Disconnect the selector lever cable from the selector lever.

2.

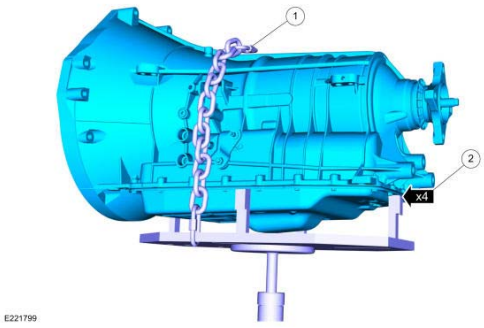
Remove the bolt from the bracket.

3.

Disconnect the selector lever cable from the bracket.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap or chain.



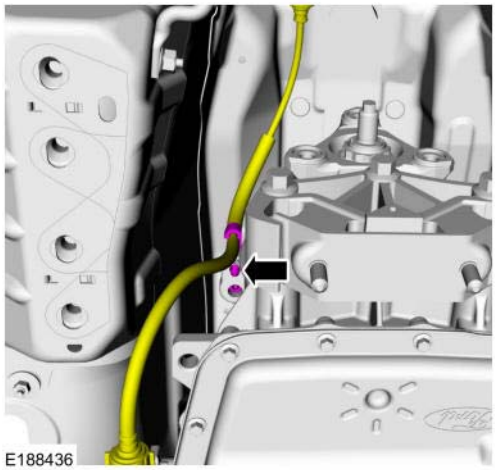
11.
Using a high-lift transmission jack, support the transmission.

1.

Safety chain

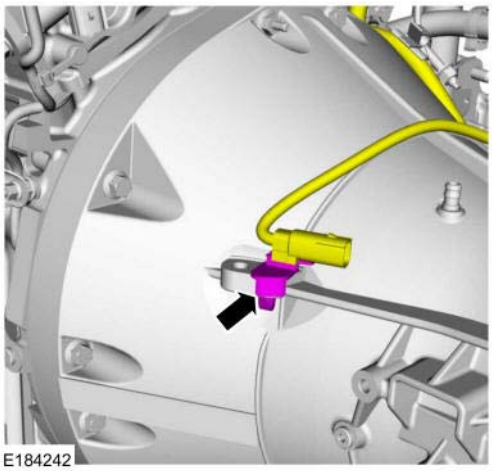
2.

Outer ribs of the transmission fluid pan Use the General Equipment: Transmission Jack



12.

Remove the transmission support crossmember. Refer to: Transmission Support Crossmember .



13.

Disconnect the selector lever cable retainer from the transmission case.

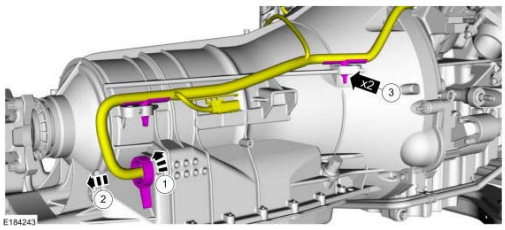
14.

Detach the wiring harness retainer from the LH side of the transmission.

NOTE: Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.

15.

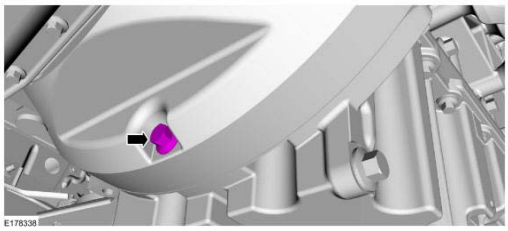
1.



Rotate the transmission electrical connector counterclockwise.

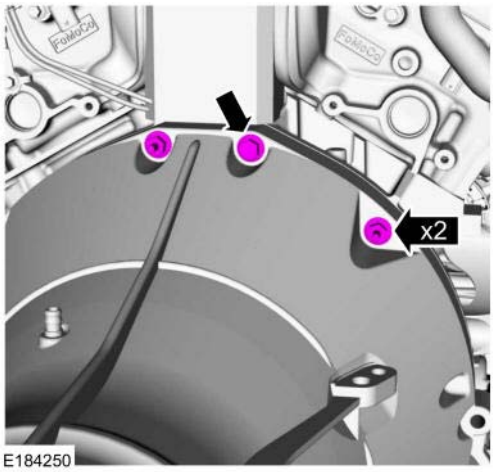
2.

Pull the transmission electrical connector out to disconnect.



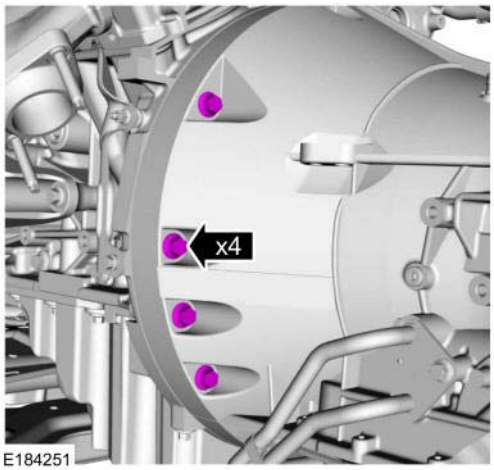
3.

Detach the retainers and position the wiring harness aside.



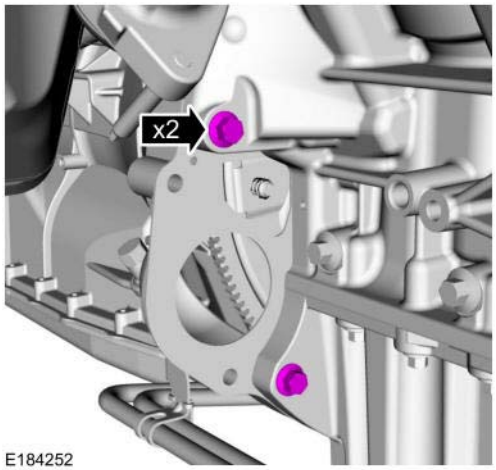
16.

Remove the lower bellhousing bolts.



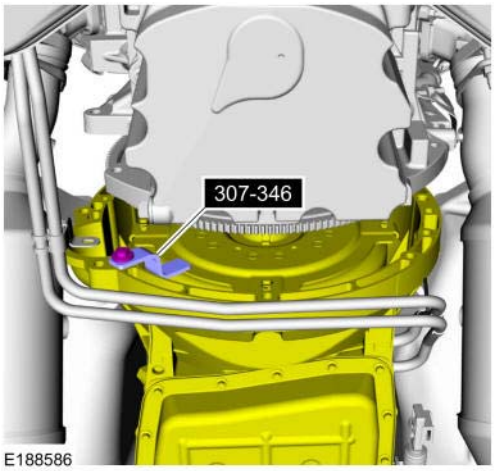
17.

Remove the upper bellhousing bolts.



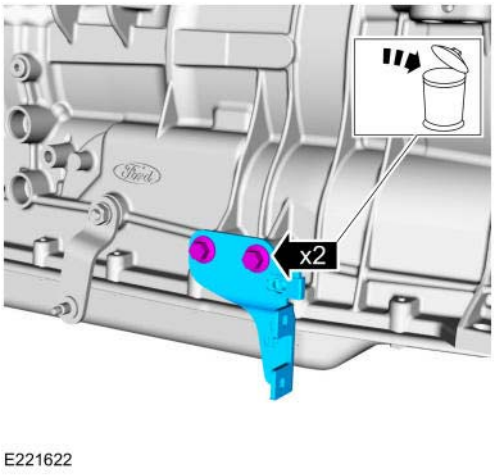
18.

Remove the LH side bellhousing bolts.



19.

Remove the RH side bellhousing bolts.



20.

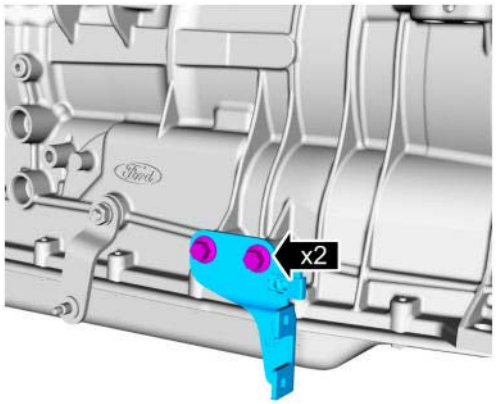
Slide the transmission back enough to install the special tool and remove the transmission from the vehicle. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

21.

If installing a new or re-manufactured transmission, remove and discard the bolts.

NOTE: Failure to clean the transmission fluid cooler tubes can result in transmission failure.

22.
If the transmission is to be overhauled or if installing a new or re-manufactured transmission, carryout the transmission fluid cooler backflushing and cleaning. Refer to: Transmission Fluid Cooler - Backflushing and Cleaning .



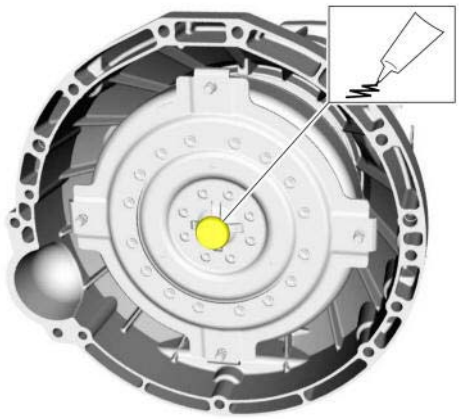
REMOVAL AND INSTALLATION > TRANSMISSION - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

If removed, install the bracket and the new bolts.

Torque

: 18 lb.ft (25 Nm)



E221623

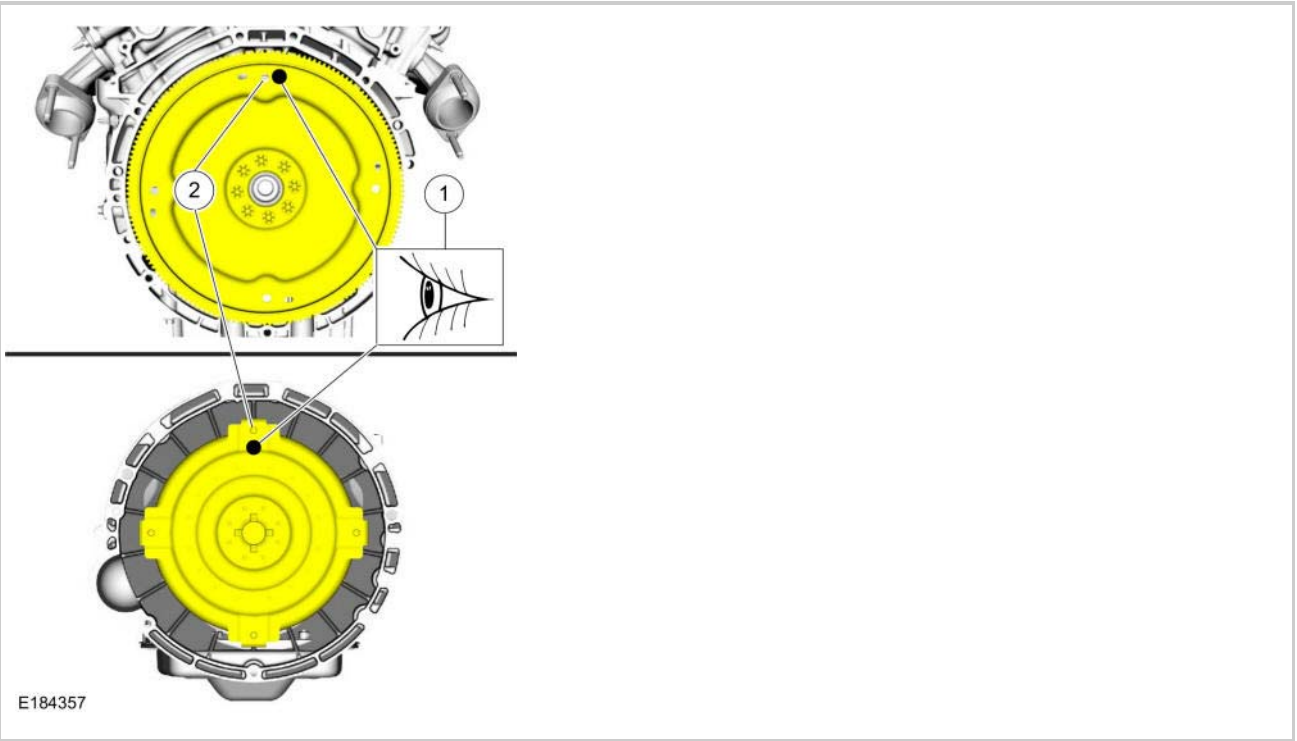
2.

Lubricate the torque converter pilot hub with multi-purpose grease.

Material

: Motorcraft ® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

E178649



3.

1.

Inspect the torque converter stud and flexplate for paint marks.

2.

Align the torque converter stud and flexplate hole near the paint marks to the 12 o'clock position.

4.

Install the special tool.Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

NOTE: If transmission was disassembled, add transmission fluid to the transmission.

NOTE: If transmission is being replaced, remove the transmission fluid fill plug and verify that the transmission is filled with transmission fluid.

5.

1.

Remove the transmission fluid fill plug transmission fluid level indicator assembly.

Torque

: 19 lb.ft (26 Nm)

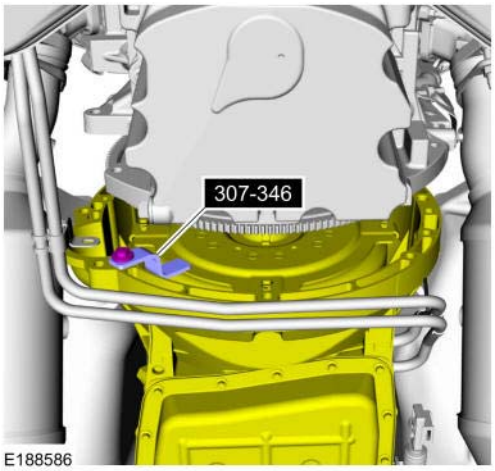
2.

Verify transmission is filled with transmission fluid.

3.

Slightly tilt the transmission rearward.

4.

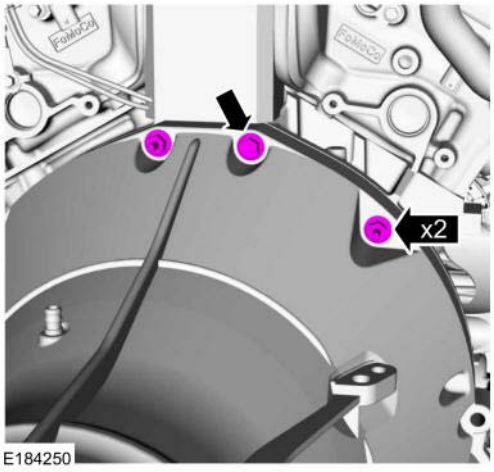


If the transmission was disassembled, add 11.35L (12 qt) of transmission fluid to the transmission through the transmission fluid fill hole.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap.

6.
Using a high-lift transmission jack, position the transmission into the vehicle behind the engine and remove the special tool. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter. Use the General Equipment: Transmission Jack



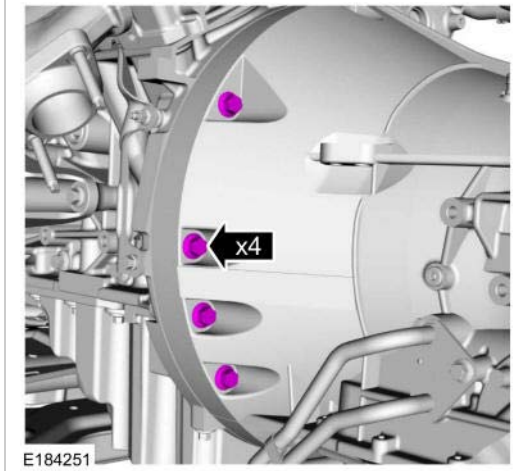
NOTE: With the transmission in a horizontal position, move it toward the engine and position it on the dowel pins.

NOTE: Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

7.
Install the upper bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

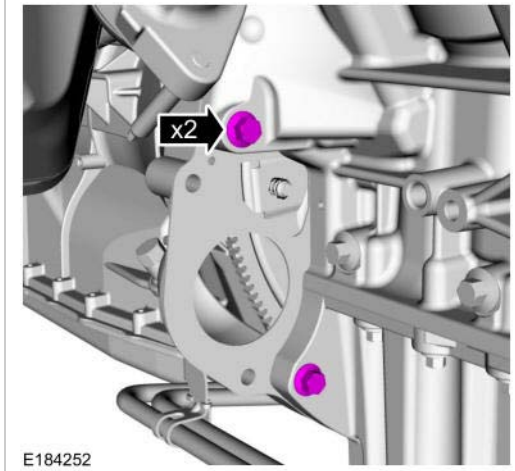


8.

Install the LH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

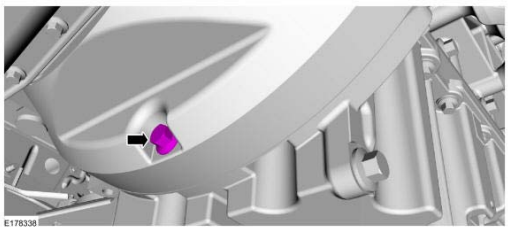


9.

Install the RH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

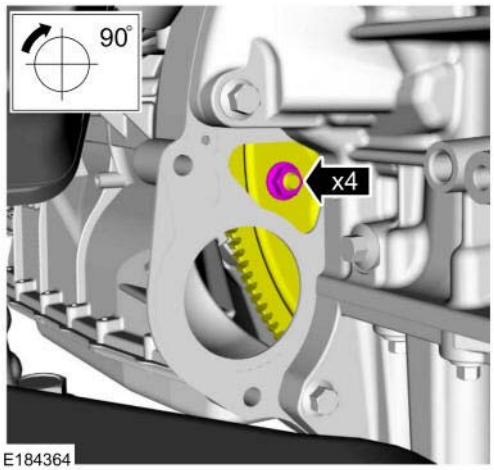


10.

Install the lower bellhousing bolt.

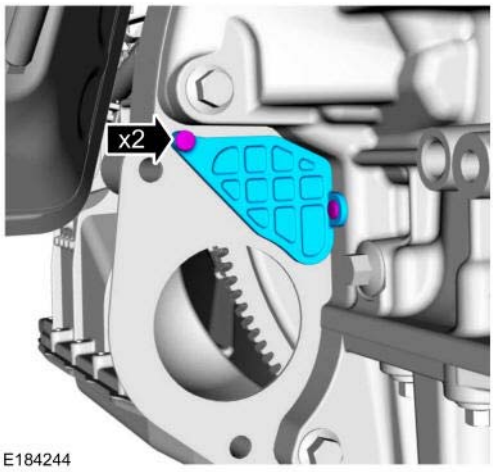
Torque

: 35 lb.ft (48 Nm)



NOTE: Using the crankshaft pulley bolt, turn the engine clockwise.

11.
Install the new torque converter nuts.



Torque

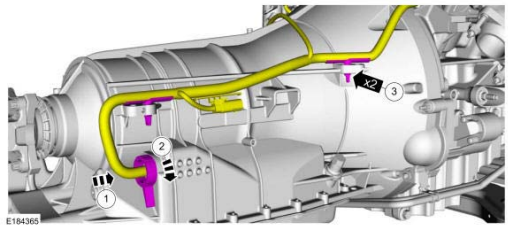
: 35 lb.ft (48 Nm)

12.

Install the access cover and the retainers.

13.

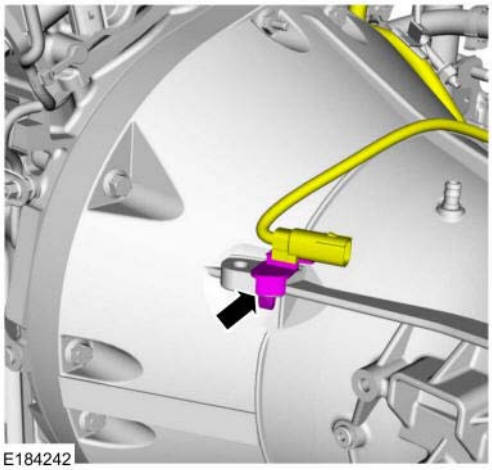
1.



Push the transmission electrical connector in to connect.

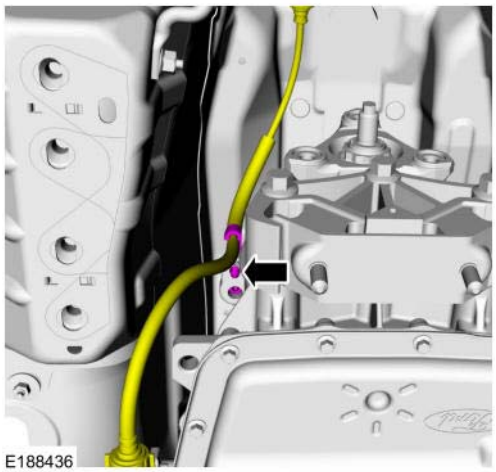
2.

Rotate the transmission electrical connector clockwise.



3.

Attach the wiring harness retainers.



14.

Attach the wiring harness retainer to the LH of the transmission.

15.

Connect the selector lever cable retainer to the transmission case.

16.

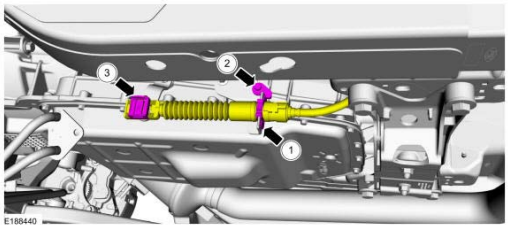
Install the transmission support crossmember. Refer to: Transmission Support Crossmember .

17.

1.

Connect the selector lever cable to the bracket.

2.



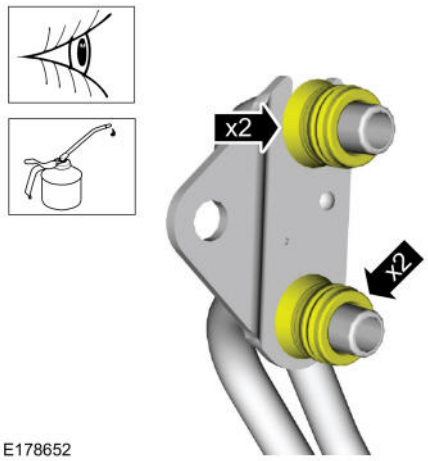
Install the bolt.

Torque

: 62 lb.in (7 Nm)

3.

Connect the selector lever cable to the selector lever.

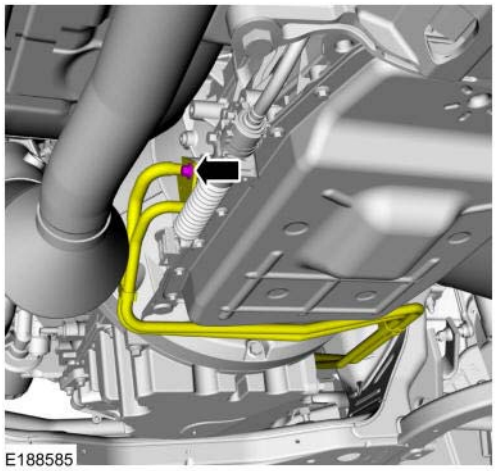


NOTE: Lubricate with clean transmission fluid.

18.
Inspect the transmission fluid cooler tube band seals and backing rings for damage, replace if necessary.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



19.

Install the transmission fluid cooler tubes and the new bolt.

Torque

: 18 lb.ft (25 Nm)

20.

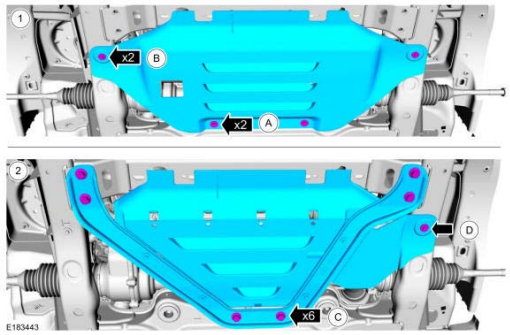
Install the LH catalyst monitor sensor. Refer to: Catalyst Monitor Sensor .

21.

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

1.
Install the underbody shield and the bolts.

Torque



: A: 97 lb.in (11 Nm) B: 18 lb.in (2 Nm)

2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque

: C: 46 lb.ft (63 Nm) D: 18 lb.in (2 Nm)

22.

Install the following items:

Refer to: Driveshaft .

Refer to: Starter Motor .

23.

Verify the selector lever cable is correctly adjusted. Refer to: Selector Lever Cable Adjustment .

24.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

25.

If a new transmission or a new main control was installed, the solenoid body strategy must be updated. Refer to: Transmission Strategy Download .

26.

If the transmission was overhauled, the adaptive learning drive cycle must be updated. Refer to: Adaptive Learning Drive Cycle .

27.

While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 96.7 °C-102 °C (206 °F-215 °F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.

28.

Check the transmission fluid level. Refer to: Transmission Fluid Level Check .

REMOVAL AND INSTALLATION > TRANSMISSION - 5.0L 32V TI-VCT > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the following items:

Refer to: Starter Motor .

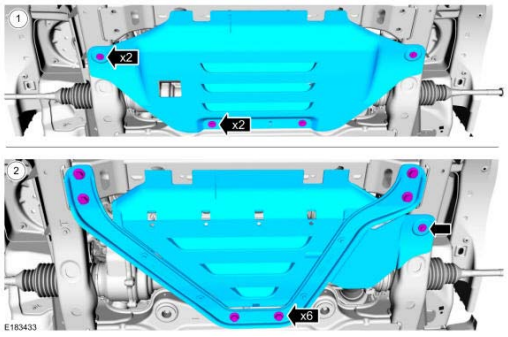
Refer to: Driveshaft .

Refer to: Catalytic Converter RH .

3.

Remove the LH HO2S and the LH catalyst monitor sensor. Refer to: Heated Oxygen Sensor (HO2S) . Refer to: Catalyst Monitor Sensor .

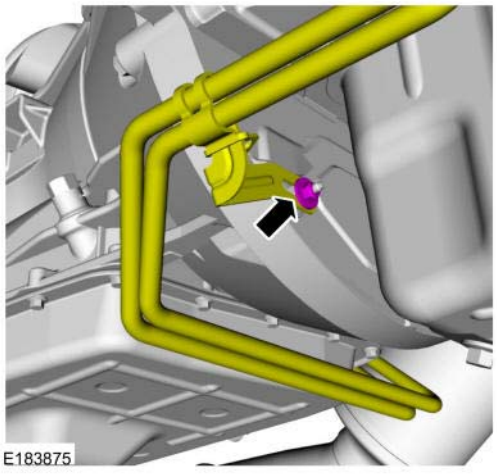
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



4.

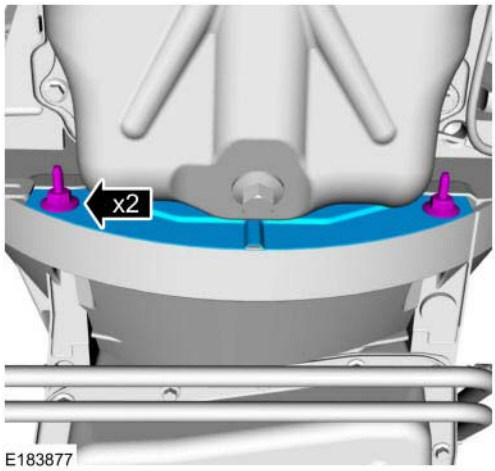
1.

Remove the bolts and the underbody shield.



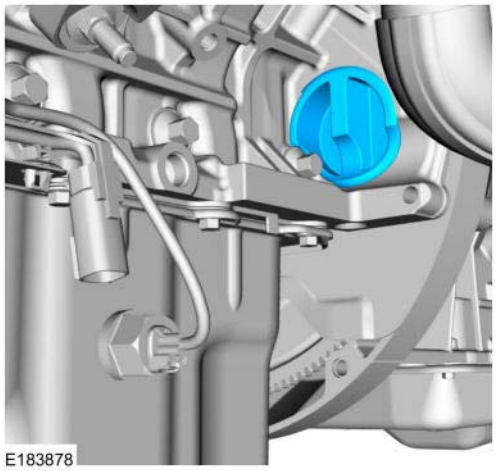
2.

Remove the bolts and the subframe bracket and underbody shield assembly.



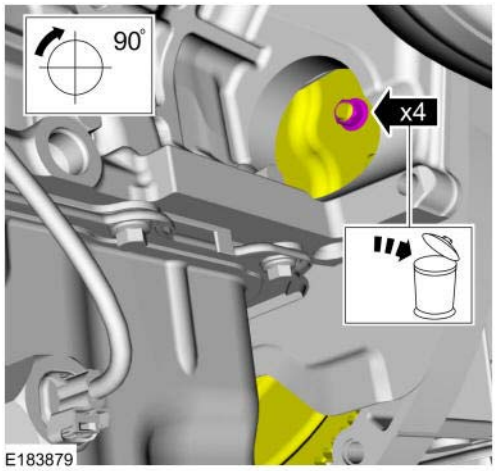
5.

Remove the transmission cooling tube nut and bracket from the flexplate inspection cover stud bolt.



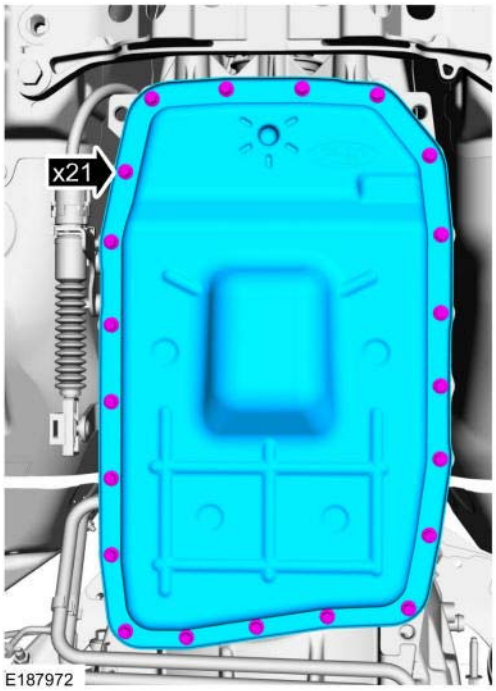
6.

Remove the stud bolts and the flexplate inspection cover.



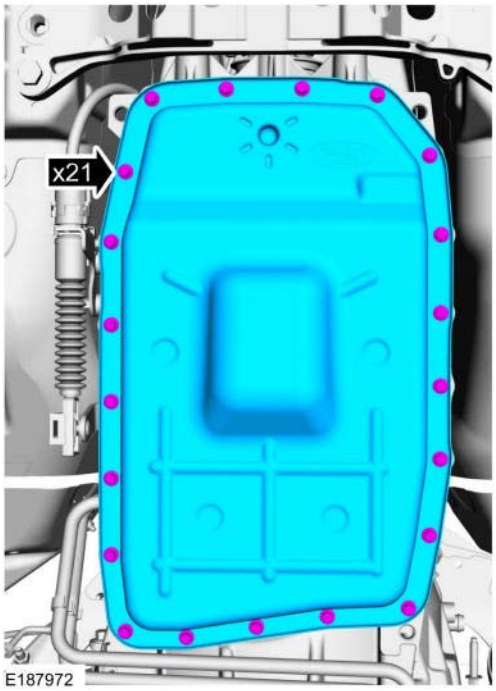
7.

Remove the rubber access plug.



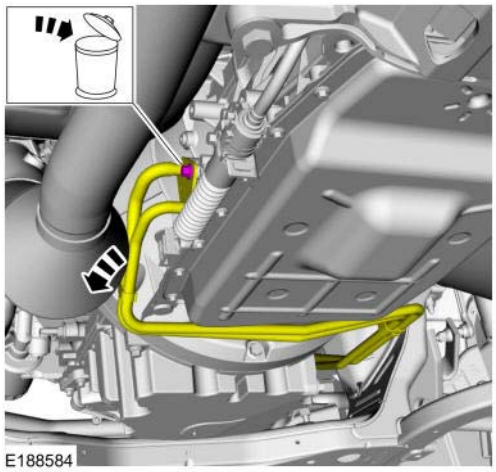
NOTE: Only rotate the crankshaft in a clockwise direction.

8.
Remove and discard the torque converter nuts. Use the General Equipment: Magnetic Socket



NOTE: If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.

9.
Remove the transmission fluid pan bolts and the transmission fluid pan and allow the transmission fluid to drain.



NOTE: It is not necessary to torque transmission fluid pan bolts at this time.

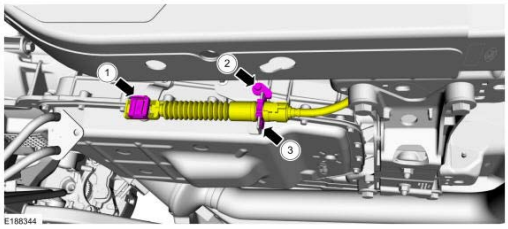
10.
Install the transmission fluid pan and the bolts.

11.

Remove and discard the bolt and position the transmission fluid cooler tubes aside.

12.

1.



Disconnect the selector lever cable from the selector lever.

2.

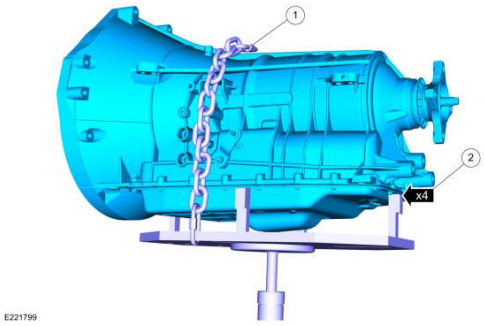
Remove the bolt from the bracket.

3.

Disconnect the selector lever cable from the bracket.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap or chain.



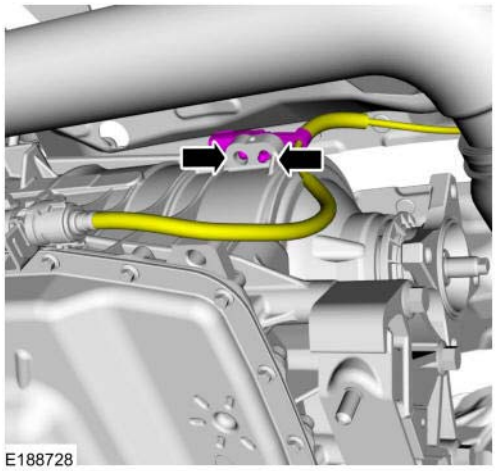
13.
Using a high-lift transmission jack, support the transmission.

1.

Safety chain

2.

Outer ribs of the transmission fluid pan Use the General Equipment: Transmission Jack



14.

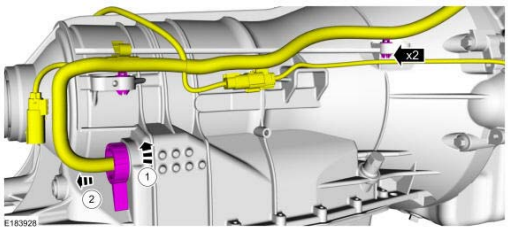
Remove the transmission support crossmember. Refer to: Transmission Support Crossmember .

15.

Disconnect the selector lever cable and wiring harness retainers from the transmission case.

NOTE: Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.

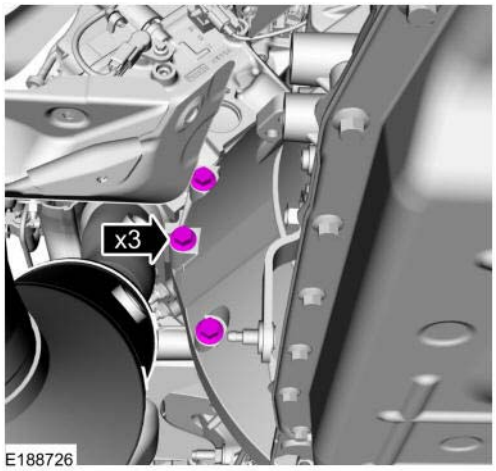
16.



1.

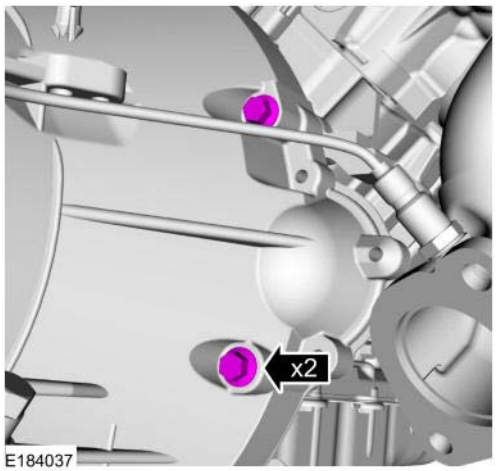
Rotate the transmission electrical connector counterclockwise.

2.



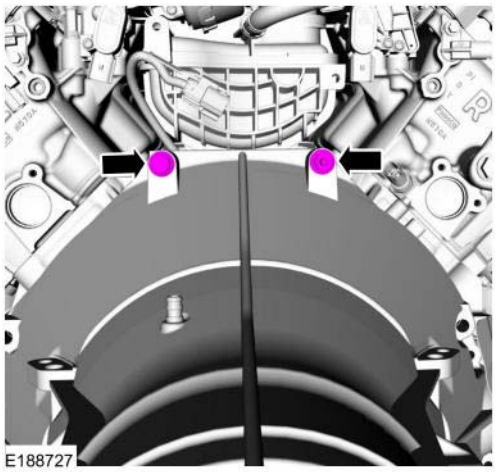
Pull the transmission electrical connector out to disconnect.

Detach the retainers and position the wiring harness aside.



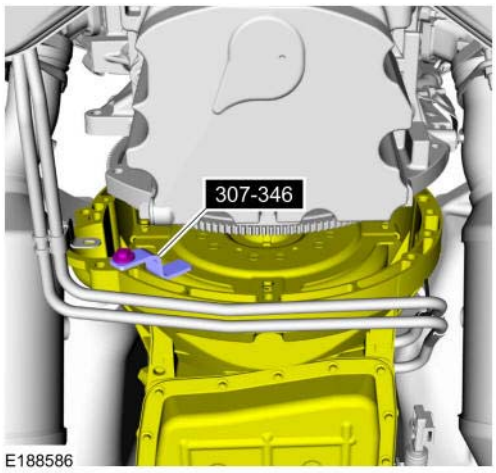
17.

Remove the LH side bellhousing bolts.



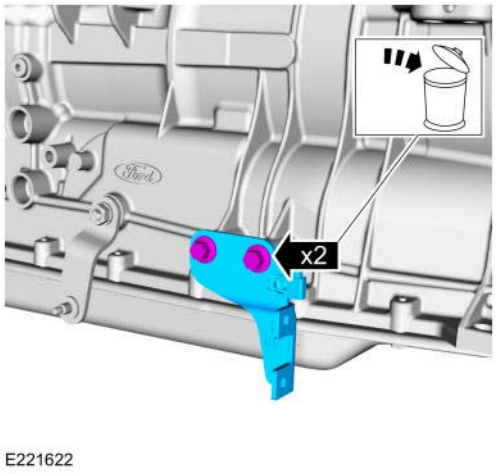
18.

Remove the RH side bellhousing bolts.



19.

Remove the upper bellhousing bolt and stud bolt.



20.

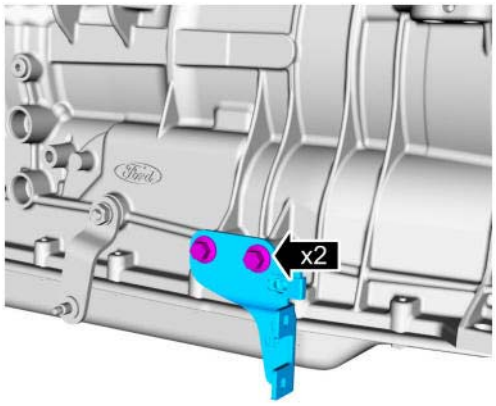
Slide the transmission back enough to install the special tool and remove the transmission from the vehicle. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

21.

If installing a new or re-manufactured transmission, remove and discard the bolts.

NOTE: Failure to clean the transmission fluid cooler tubes can result in transmission failure.

22.
If the transmission is to be overhauled or if installing a new or re-manufactured transmission, carryout the transmission fluid cooler backflushing and cleaning. Refer to: Transmission Fluid Cooler - Backflushing and Cleaning .



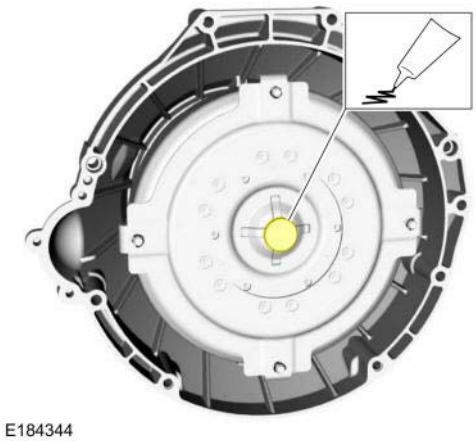
REMOVAL AND INSTALLATION > TRANSMISSION - 5.0L 32V TI-VCT > INSTALLATION

1.

If removed, install the bracket and the new bolts.

Torque

: 18 lb.ft (25 Nm)



E221623

2.

Lubricate the torque converter pilot hub with multi-purpose grease.

Material

: Motorcraft ® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

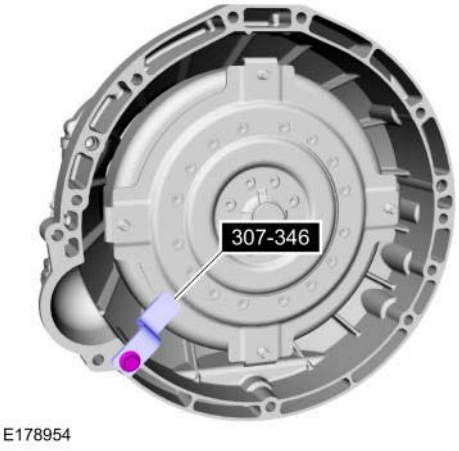
3.

1.

Inspect the torque converter stud and flexplate for paint marks.



2.

Align the torque converter stud and flexplate hole near the paint marks to the 12 o'clock position.

4.

Install the special tool. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter.

NOTE: If transmission was disassembled, add transmission fluid to the transmission.

NOTE: If transmission is being replaced, remove the transmission fluid fill plug

and verify that the transmission is filled with transmission fluid.

5.

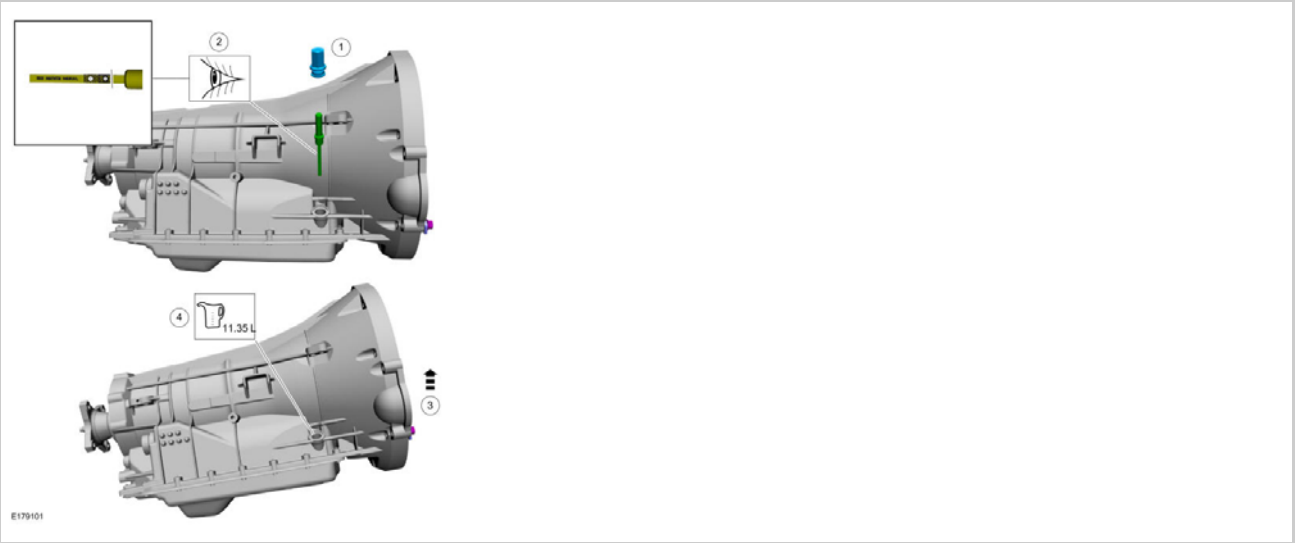
1.

Remove the transmission fluid fill plug transmission fluid level indicator assembly.

Torque

: 19 lb.ft (26 Nm)

2.

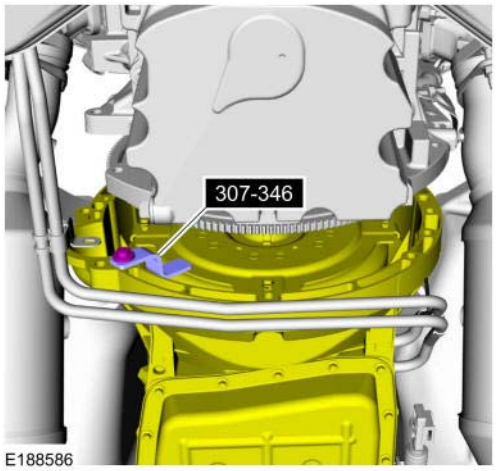


Verify transmission is filled with transmission fluid.

3.

Slightly tilt the transmission rearward.

4.

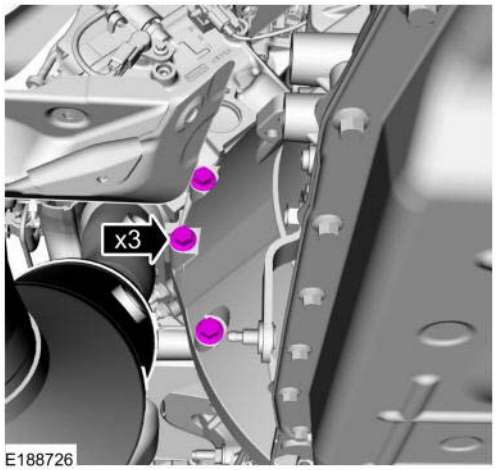


If the transmission was disassembled, add 11.35L (12 qt) of transmission fluid to the transmission through the transmission fluid fill hole.

NOTE: Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

NOTE: Secure the transmission to the transmission jack with a safety strap.

6.
Using a high-lift transmission jack, position the transmission into the vehicle behind the engine and remove the special tool. Use Special Service Tool: 307-346 (T97T-7902-A) Retainer, Torque Converter. Use the General Equipment: Transmission Jack



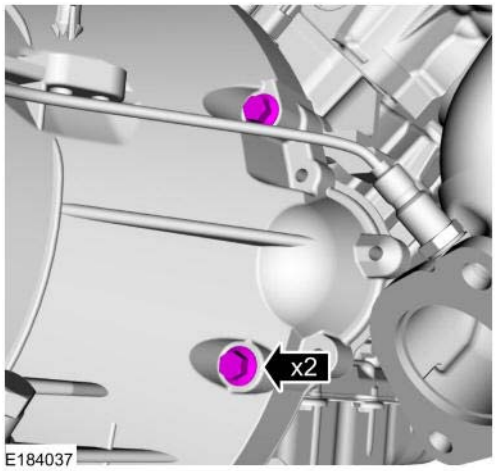
NOTE: With the transmission in a horizontal position, move it toward the engine and position it on the dowel pins.

NOTE: Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

7.
Install the LH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

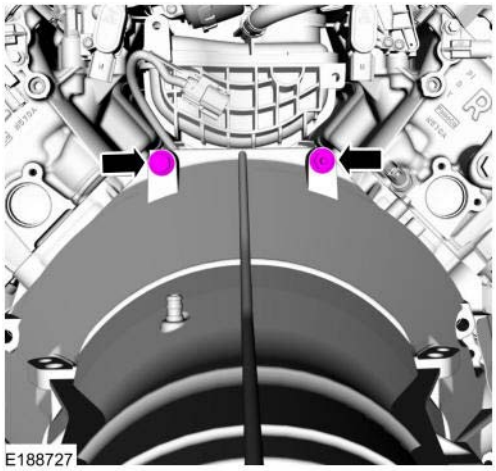


8.

Install the RH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

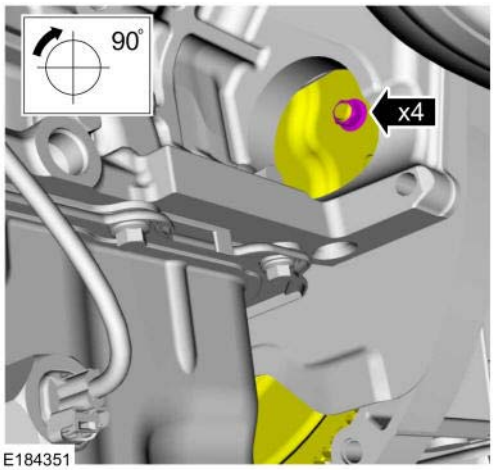


9.

Install the upper bellhousing bolt and stud bolt.

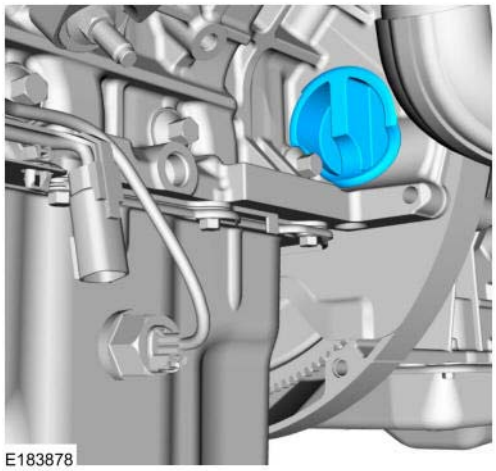
Torque

: 35 lb.ft (48 Nm)



NOTE: Only rotate the crankshaft in a clockwise direction.

10.
Install the new torque converter nuts.

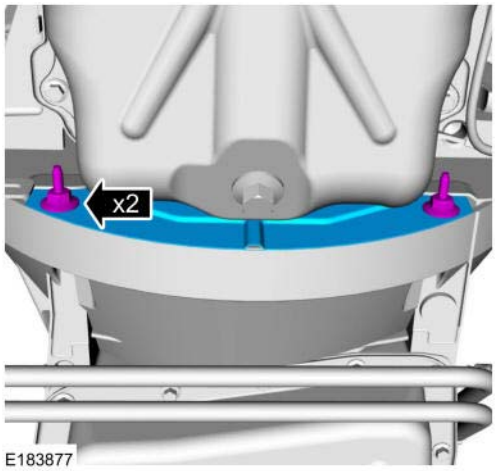


Torque

: 35 lb.ft (48 Nm)

11.

Install the rubber access plug.



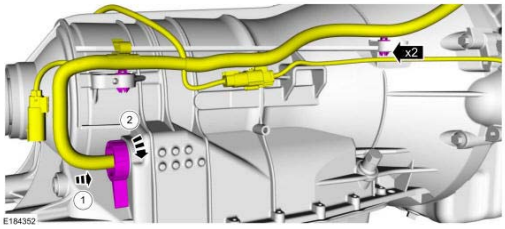
12.

Install the flexplate inspection cover and the stud bolts.

Torque

: 35 lb.ft (48 Nm)

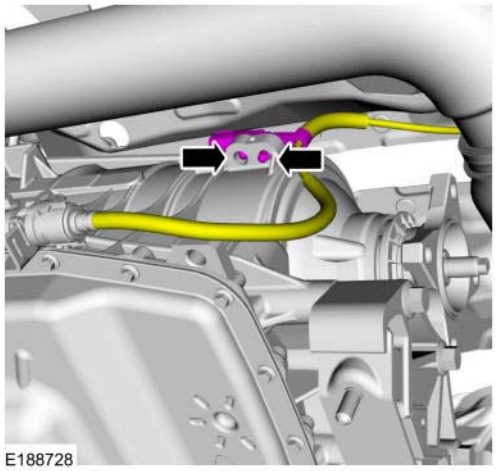
13.



1.

Push the transmission electrical connector in to connect.

2.



Rotate the transmission electrical connector clockwise.

Attach the wiring harness retainers.

14.

Connect the selector lever cable and wiring harness retainers to the transmission case.

15.

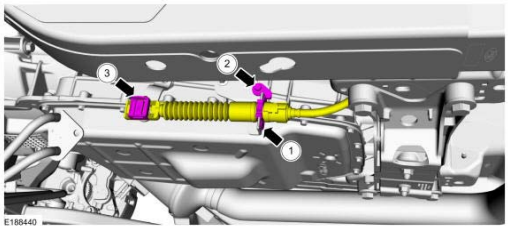
Install the transmission support crossmember. Refer to: Transmission Support Crossmember .

16.

1.

Connect the selector lever cable to the bracket.

2.



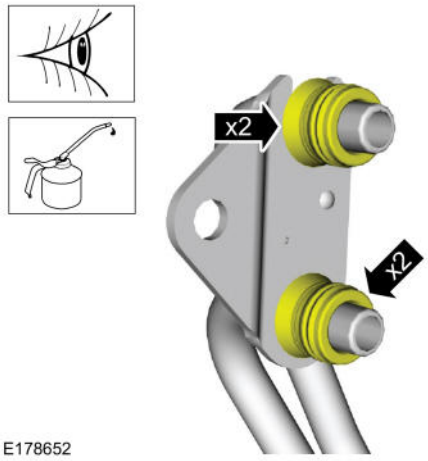
Install the bolt.

Torque

: 62 lb.in (7 Nm)

3.

Connect the selector lever cable to the selector lever.

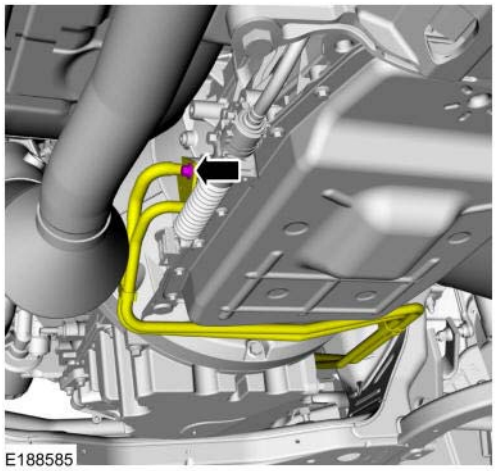


NOTE: Lubricate with clean transmission fluid.

17.
Inspect the transmission fluid cooler tube band seals and backing rings for damage, replace if necessary.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

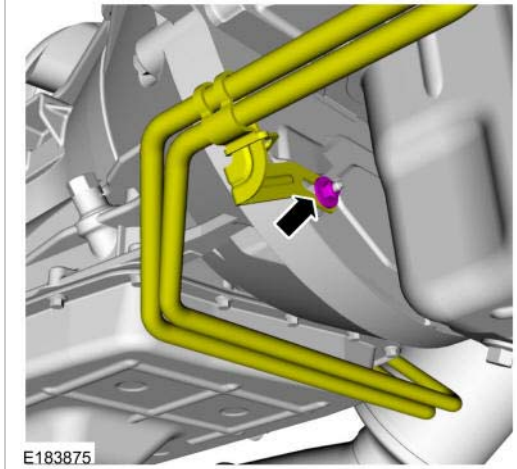


18.

Install the transmission fluid cooler tubes and the new bolt.

Torque

: 18 lb.ft (25 Nm)



19.

Install the transmission cooling tube bracket and nut.

Torque

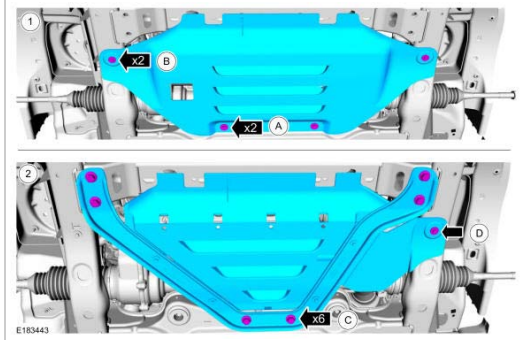
: 124 lb.in (14 Nm)

20.

> *NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.*

1.
Install the underbody shield and the bolts.

Torque



: A: 97 lb.in (11 Nm) B: 18 lb.in (2 Nm)

2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque

: C: 46 lb.ft (63 Nm) D: 18 lb.in (2 Nm)

21.

Install the LH HO2S and the LH catalyst monitor sensor. Refer to: Heated Oxygen Sensor (HO2S) . Refer to: Catalyst Monitor Sensor .

22.

Install the following items:

Refer to: Catalytic Converter RH .

Refer to: Driveshaft .

Refer to: Starter Motor .

23.

Verify the selector lever cable is correctly adjusted. Refer to: Selector Lever Cable Adjustment .

24.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

25.

If a new transmission or a new main control was installed, the solenoid body strategy must be updated. Refer to: Transmission Strategy Download .

26.

If the transmission was overhauled, the adaptive learning drive cycle must be updated. Refer to: Adaptive Learning Drive Cycle .

27.

While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 96.7 °C-102 °C (206 °F-215 °F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.

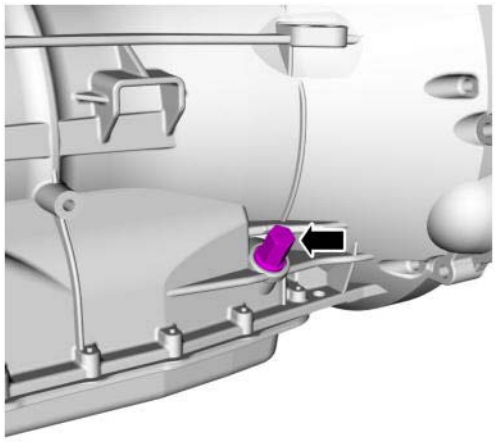
28.

Check the transmission fluid level. Refer to: Transmission Fluid Level Check .

REMOVAL AND INSTALLATION > TRANSMISSION FLUID PAN, GASKET AND FILTER

Materials

Name	Specification
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

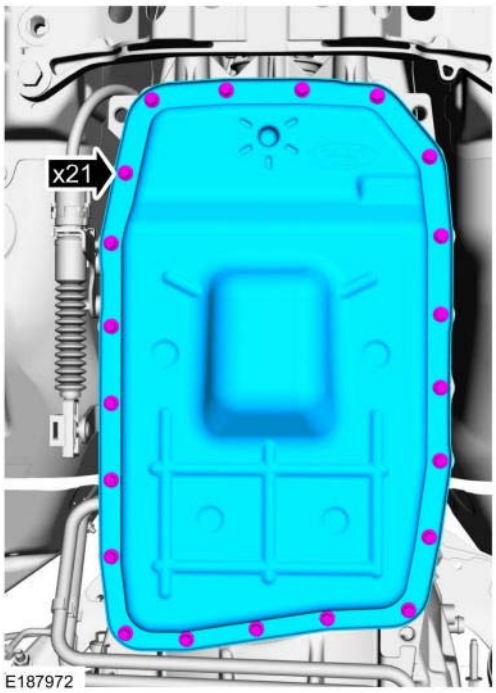


REMOVAL AND INSTALLATION > TRANSMISSION FLUID PAN, GASKET AND FILTER > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

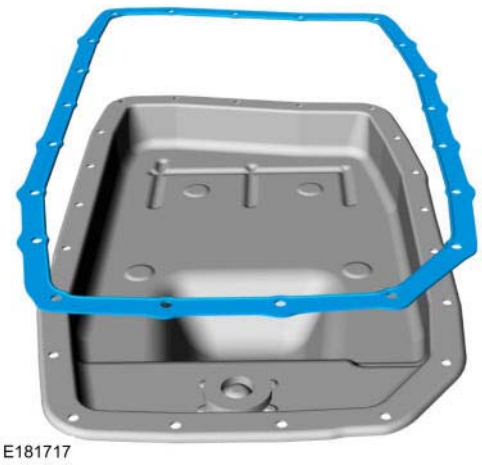
2.



Remove the transmission fluid fill plug transmission fluid level indicator assembly.

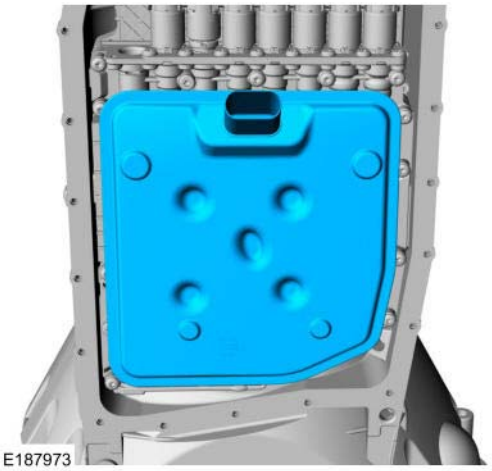
E181871

3.



Remove the transmission fluid pan bolts and the transmission fluid pan and allow the transmission fluid to drain.

E187972



4.

Remove the transmission fluid pan gasket.

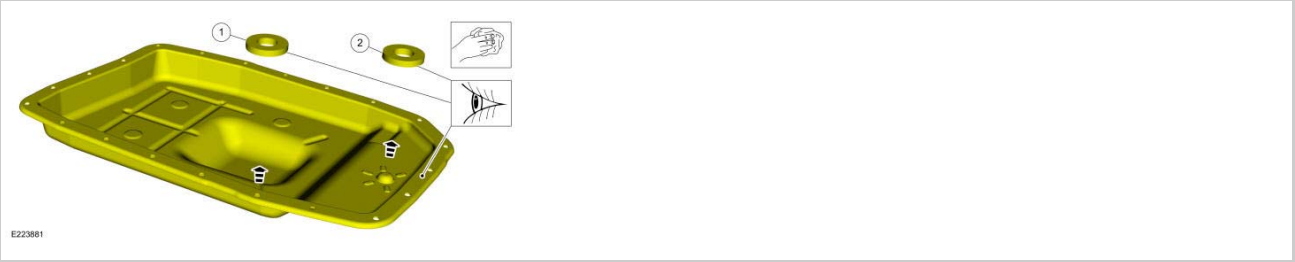
E181717

NOTE: The transmission fluid filter may be reused if no excessive contamination is indicated.

5.
Remove the transmission fluid filter.

E187973

6.



Clean and inspect the transmission fluid pan and magnet(s).

1.

Late build transmissions

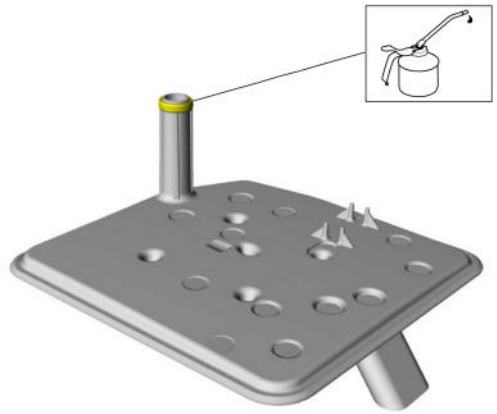
2.

All transmissions

REMOVAL AND INSTALLATION > TRANSMISSION FLUID PAN, GASKET AND FILTER > INSTALLATION

1.

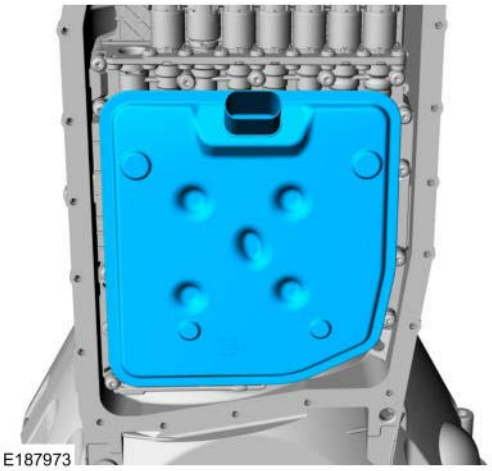
Inspect the transmission pump bore for the transmission fluid filter seal. If the seal is in the pump, carefully remove the seal without scratching the transmission pump bore.



2.

Make sure that the seal is on the transmission fluid filter and lubricate the seal with automatic transmission fluid.

Material



: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

E181721

NOTE: The transmission fluid filter may be reused if no excessive contamination is indicated.

3.
If required, install a new transmission fluid filter.

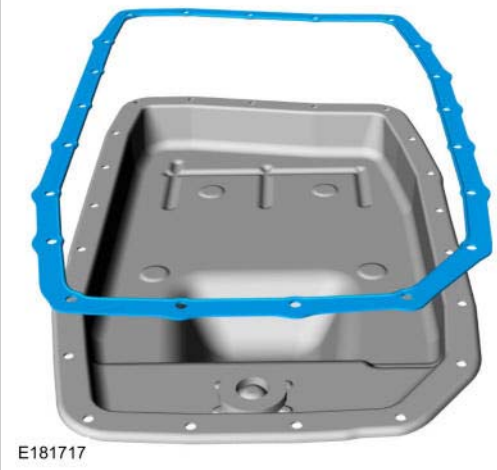
E187973

4.

Position the magnet(s) in the transmission fluid pan.

1.

Late build transmissions

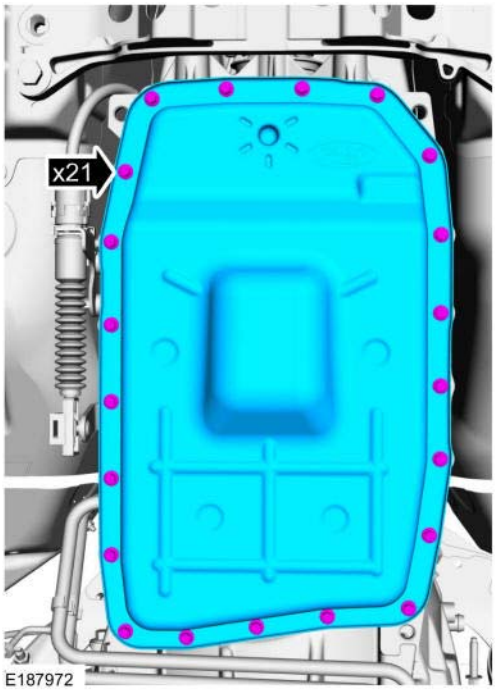


2.

All transmissions

NOTE: The transmission fluid pan gasket can be reused if not damaged.

5.
Install a new transmission fluid pan gasket if required.



NOTE: Tighten the transmission fluid pan bolts in a crisscross pattern.

6.
Install the transmission fluid pan and tighten the bolts in a crisscross pattern.

Torque

: 80 lb.in (9 Nm)

7.

Fill and check the transmission fluid. Refer to: Transmission Fluid Drain and Refill .

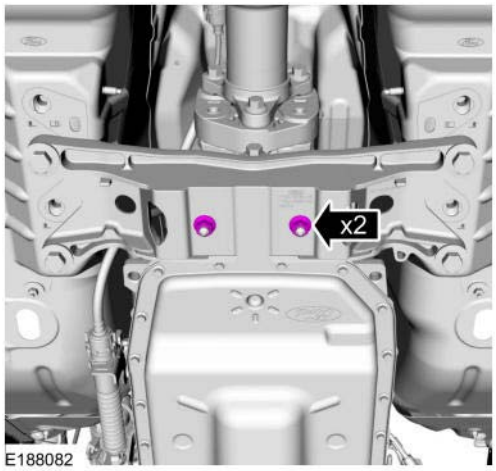
REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR

Special Tool(s) / General Equipment

Vehicle/Axle Stands
Wooden Block

REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR > REMOVAL

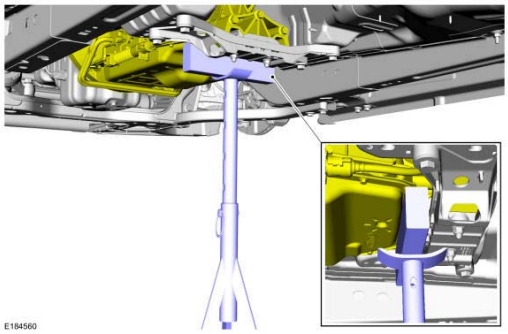
1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the transmission support insulator nuts.

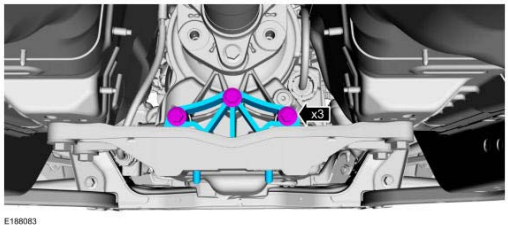


Torque

: 59 lb.ft (80 Nm)

NOTE: Make sure the jackstand and wooden block makes contact on the outer rib of the transmission fluid pan.

3.
Using a jackstand and a wooden block, support the transmission.Use the General Equipment: Vehicle/Axle Stands Use the General Equipment: Wooden Block



4.

Remove the bolts and the transmission support insulator.

Torque

: 76 lb.ft (103 Nm)

REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > MAIN CONTROL VALVE BODY

Special Tool(s) / General Equipment

 E173280	307-717 Remover, Kostal Sleeve TKIT-2013B-FL TKIT-2013B-ROW

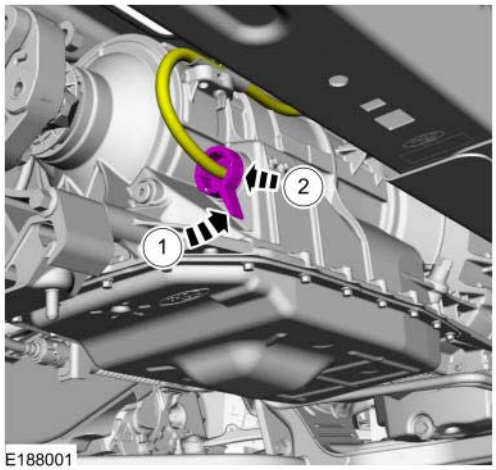
REMOVAL AND INSTALLATION > MAIN CONTROL VALVE BODY > REMOVAL

NOTE: The Solenoid Body Strategy Data Download procedure must be performed if a new main control assembly is installed.

1.

Remove the transmission fluid pan and filter. Refer to: Transmission Fluid Pan, Gasket and Filter .

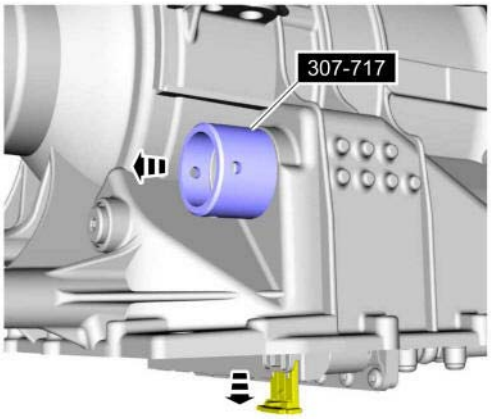
NOTE: Do not pull on the wiring harness to disconnect the electrical connector or damage to the electrical connector will occur.



2.

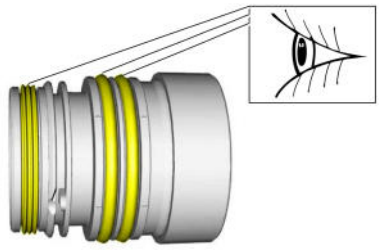
1.

Rotate the transmission electrical connector counterclockwise.



2.

Pull the transmission electrical connector out to disconnect.



3.

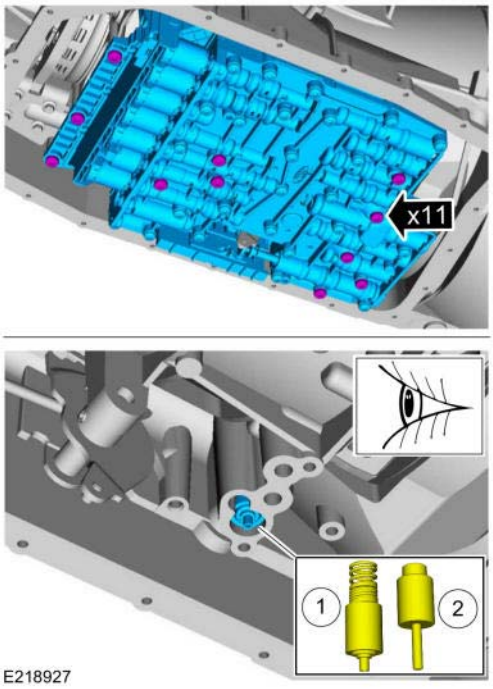
Pull the transmission bulkhead connector sleeve retainer down to release it. Using the special tool, pull the outer shell of the bulkhead connector sleeve out of the transmission. Use Special Service Tool: 307-717 Remover, Kostal Sleeve.

4.

Inspect the bulkhead connector sleeve seals and install new seals if damage is found.

NOTE: During removal of the main control assembly, the thermal bypass valve or

blank plug can fall out of the transmission case. Damage to the valve or plug can occur if the valve or plug falls out.

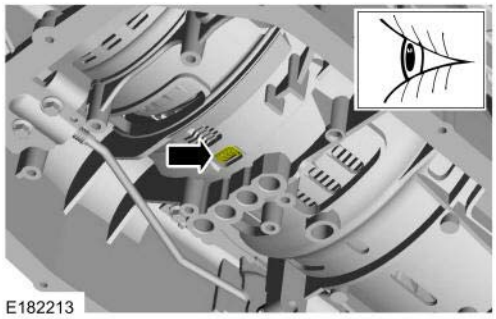


5.
Remove the bolts from the main control assembly and remove the main control assembly and the thermal bypass valve or blank plug. Inspect the thermal bypass valve for damage and discard the valve if damage is found.

NOTE: Vehicles without transmission fluid warmer.

1.
Thermal bypass valve

NOTE: Vehicles equipped with transmission fluid warmer.



2.
Blank plug

REMOVAL AND INSTALLATION > MAIN CONTROL VALVE BODY > INSTALLATION

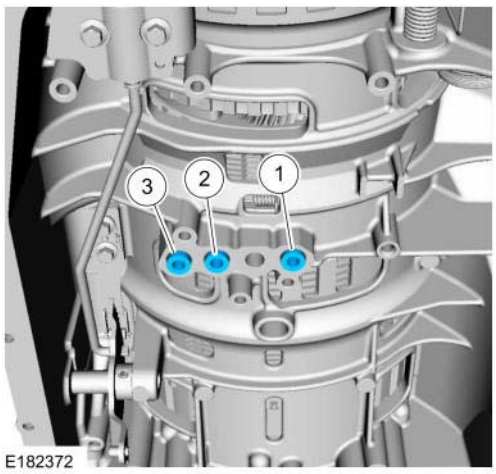
1.

Inspect the bias spring to make sure it is positioned correctly in the transmission case.

NOTE: Before installing the main control assembly into the transmission case, verify the presence and orientation of the center support feed tube seals. Also note that one or more of the center support feed tube seals may have remained in the main control assembly during removal and should be installed into the transmission case at this time.

2.

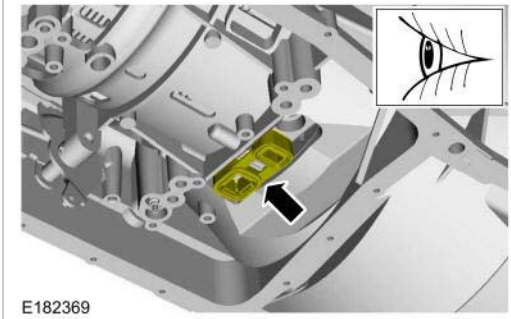
1.



Center support feed tube seal (7G199 Black)

2.

Center support feed tube seal (7G087 Green or Orange)



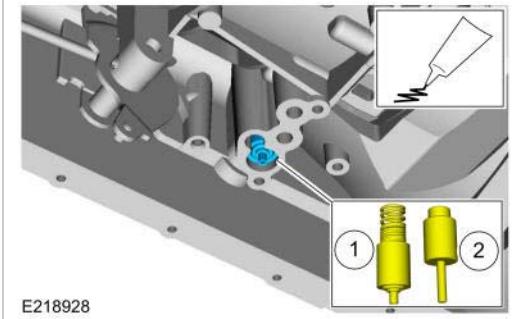
3.

Center support feed tube seal (7G084 Blue)

3.

Verify the rubber adapter is in place.

4.



Material: Petroleum JellyCoat the thermal bypass valve or plug with petroleum jelly to hold it in place and install the thermal bypass valve or plug into the transmission case.

NOTE: Vehicles without transmission fluid warmer.

1.
Thermal bypass valve

NOTE: Vehicles equipped with transmission fluid warmer.

2.
Blank plug

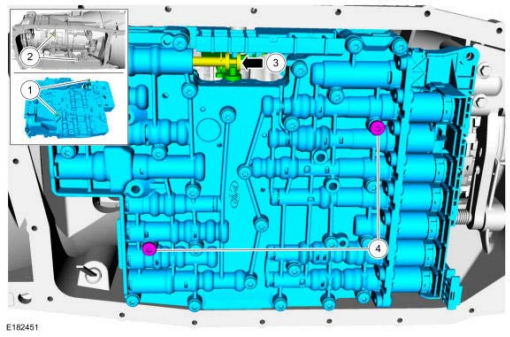
NOTE: The main control will not rest flush on the on the transmission case, this is a normal condition with the rubber feed tubes, the bolts will pull the main control assembly to the case.

5.

1.

Align the guide pins on the main control with the alignment holes in the transmission case.

2.



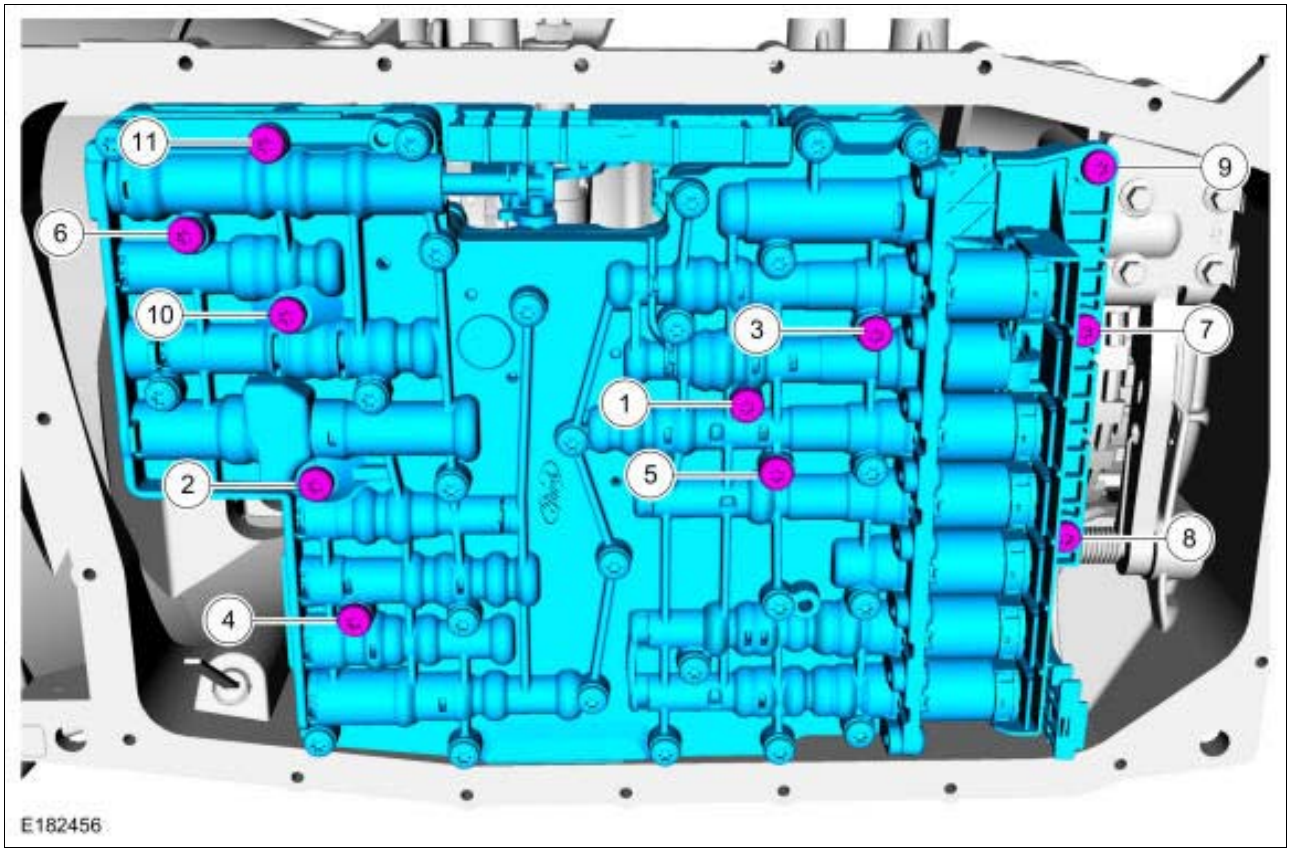
Alignment holes.

3.

Align the manual valve with the manual valve pin.

4.

Loosely install the 2 bolts.



6.

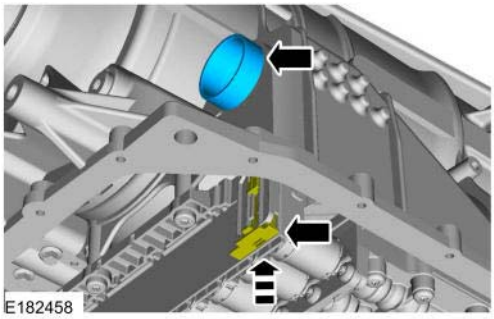
Install the main control valve body bolts and tighten in the sequence shown.

Torque

: 71 lb.in (8 Nm)

Fig 1: Main Control Valve Body Bolts Tightening Sequence

Courtesy of FORD MOTOR CO.

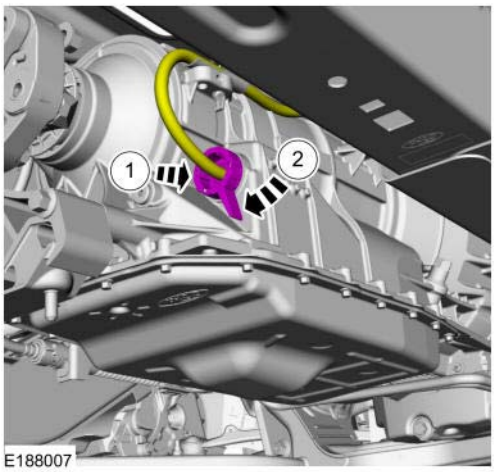


7.

If removed, install the bulkhead connector sleeve seals.

8.

With the release tab down and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure the bulkhead connector is fully seated into the molded leadframe. Push up on the tab and lock the outer shell of the bulkhead electrical connector in place. Make sure the locking tab is securely locked.



9.

1.

Connect the transmission electrical connector.

2.

Rotate the transmission electrical connector clockwise to lock it.

10.

Install the transmission fluid pan and filter. Refer to: Transmission Fluid Pan, Gasket and Filter .

NOTE: If an individual solenoid was replaced clear the adaptive strategy.

11.
If any of the solenoids were replaced, Perform a Road Test - Adaptive Drive Cycle after the adaptive strategy is cleared. Refer to: Adaptive Learning Drive Cycle .

NOTE: The solenoid body strategy data file and solenoid body identification must be updated anytime a new solenoid body is installed. A new solenoid body service tag must be installed over the current solenoid body service tag on top of the transmission

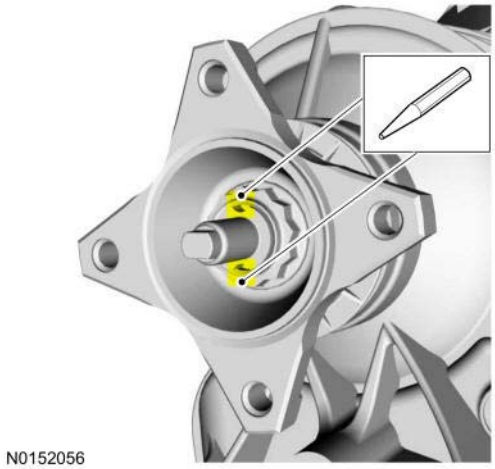
case.

12.
If a new main control was installed, download a new transmission strategy. Refer to: Transmission Strategy Download .

REMOVAL AND INSTALLATION > OUTPUT SHAFT SEAL

Special Tool(s) / General Equipment

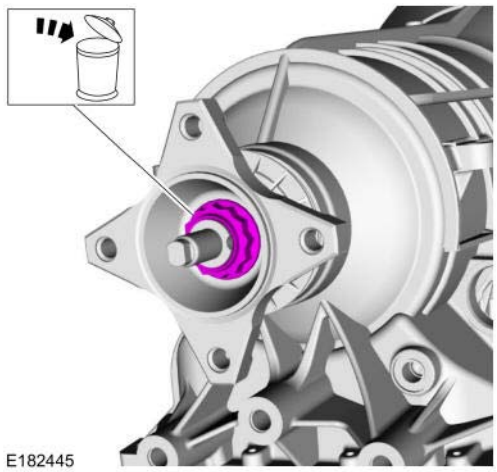
 E216593	205-199 (T83T-3132-A1) Installer, Spindle/Axle Shaft T83-4000-AT KIT-1983-F TKIT-1983-FLM TKIT-1983-FX
 E181073	307-715Installer, Output Seal (4X2) TKIT-2013B-FL TKIT-2013B-ROW
Punch	



REMOVAL AND INSTALLATION > OUTPUT SHAFT SEAL > REMOVAL

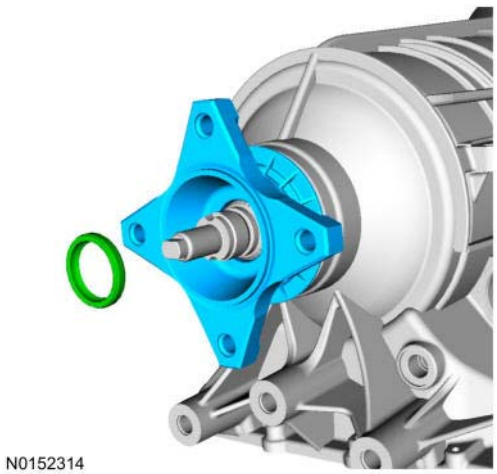
1.

Remove the driveshaft. Refer to: Driveshaft .



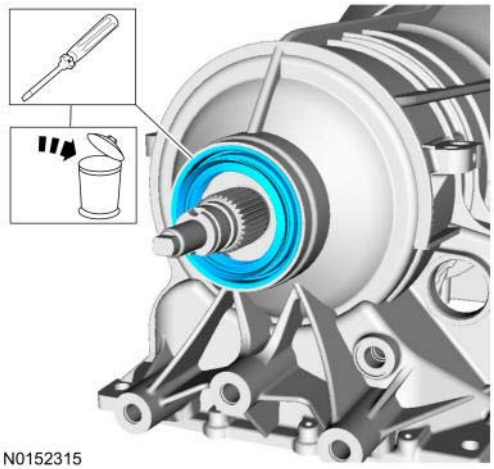
NOTE: The output shaft flange retaining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.

2.
Remove the stakes from the output shaft flange retaining nut. Use the General Equipment: Punch



3.

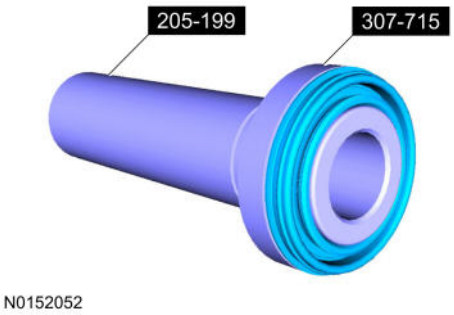
Remove and discard the output shaft flange retaining nut.



4.

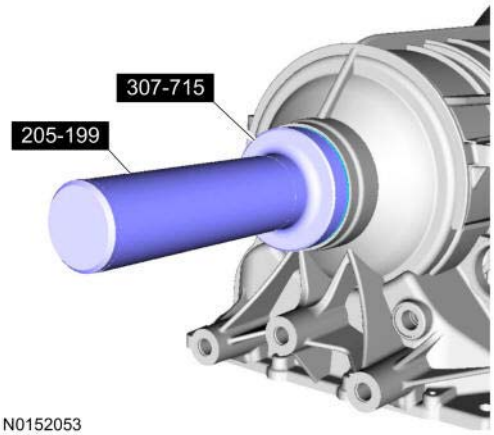
Remove the output shaft flange seal and the output shaft flange.

5.



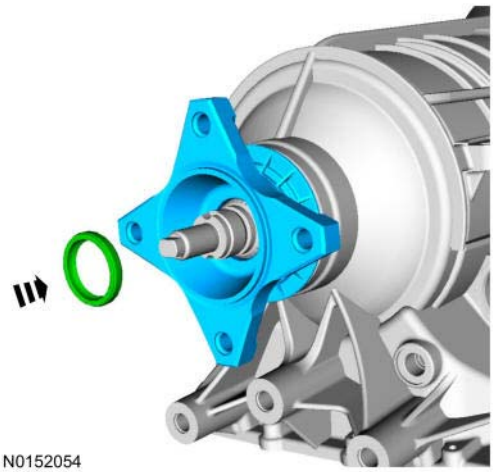
Remove and discard the output shaft seal.

REMOVAL AND INSTALLATION > OUTPUT SHAFT SEAL > INSTALLATION



1.

Position a new output shaft seal on the special tool. Use Special Service Tool: 205-199 (T83T-3132-A1)Installer, Spindle/Axle Shaft., 307-715Installer, Output Seal (4X2).

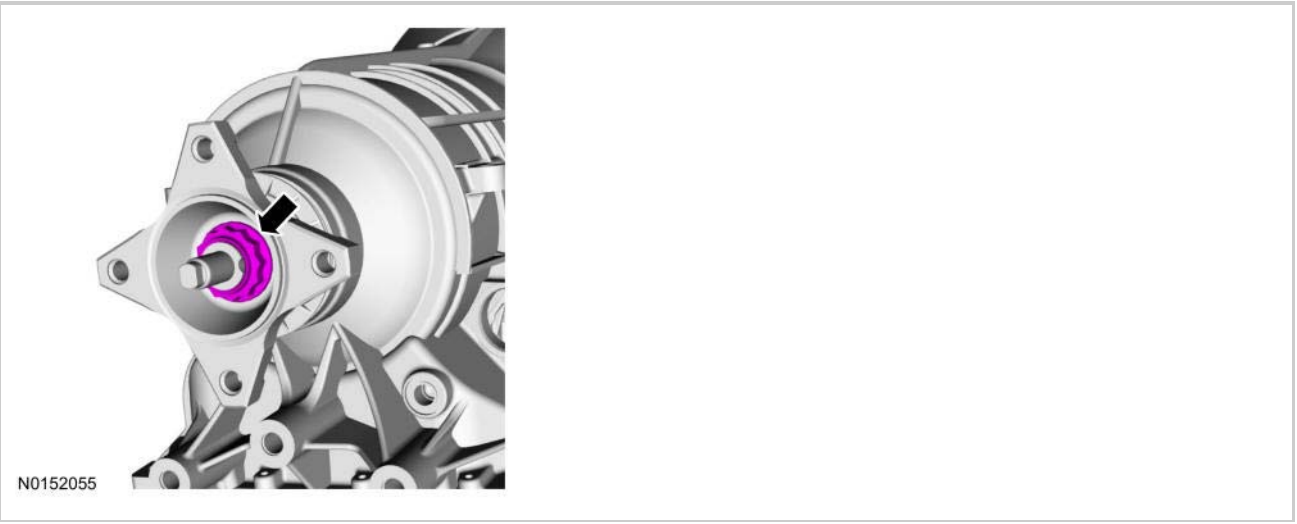


2.

Using the special tool, install the output shaft seal.Use Special Service Tool: 205-199 (T83T-3132-A1) Installer, Spindle/Axle Shaft., 307-715 Installer, Output Seal (4X2).

3.

Install the output shaft flange and the output shaft flange seal.



4.

Install the new output shaft flange retaining nut.

Torque

: 59 lb.ft (80 Nm)

5.

After installing the output shaft flange retaining nut, stake the slots to prevent it from coming loose. Use the General Equipment: Punch

6.

Install the driveshaft. Refer to: Driveshaft .

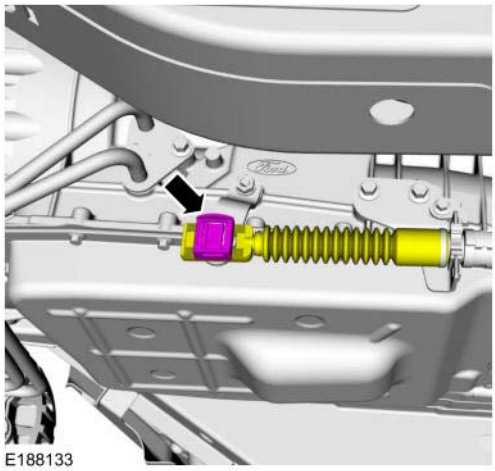
7.

Check the transmission fluid level. Refer to: Transmission Fluid Level Check .

REMOVAL AND INSTALLATION > SELECTOR SHAFT SEAL

Special Tool(s) / General Equipment

 E142021	307-559 Installer, Shifter Fluid Seal TKIT-2005U-FLM TKIT-2005U-LM TKIT-2006U-FLM/LM TKIT-2006UF/FM



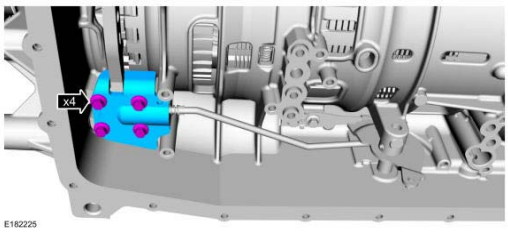
REMOVAL AND INSTALLATION > SELECTOR SHAFT SEAL > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: To prevent selector lever cable damage, do not apply force to the selector lever cable between the selector lever and the selector lever cable bracket.

2.
Disconnect the transmission selector lever cable end from the selector lever.



E188133

3.

Remove the main control valve body. Refer to: Main Control Valve Body .

4.

Remove the bolts and the park rod actuating plate.

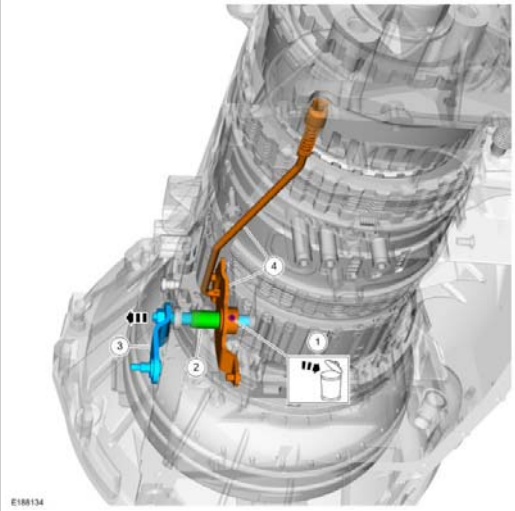
E182225

5.

1.

Remove and discard the roll pin.

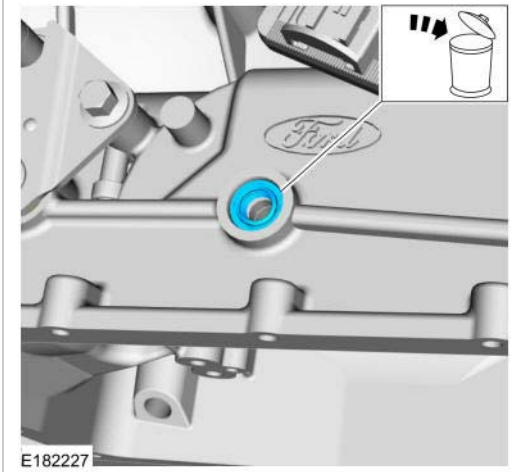
2.



Hold the selector lever spacer to keep it from falling.

3.

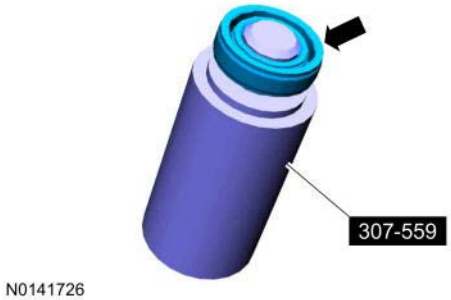
Slide the selector lever shaft out of the case.



4.

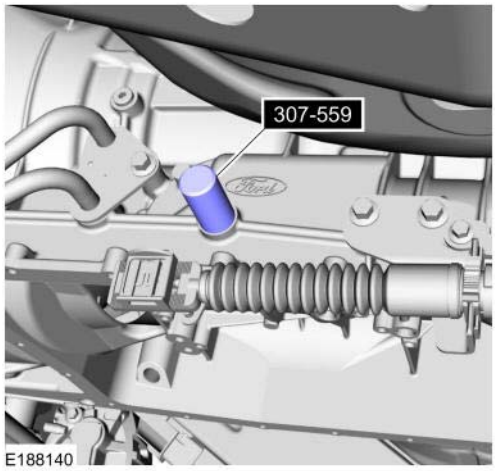
Remove the manual valve detent lever and park pawl actuator rod as an assembly.

6.



Remove and discard the selector shaft seal.

REMOVAL AND INSTALLATION > SELECTOR SHAFT SEAL > INSTALLATION



1.

Install a new selector shaft seal on the special tool. Use Special Service Tool: 307-559 Installer, Shifter Fluid Seal.

2.

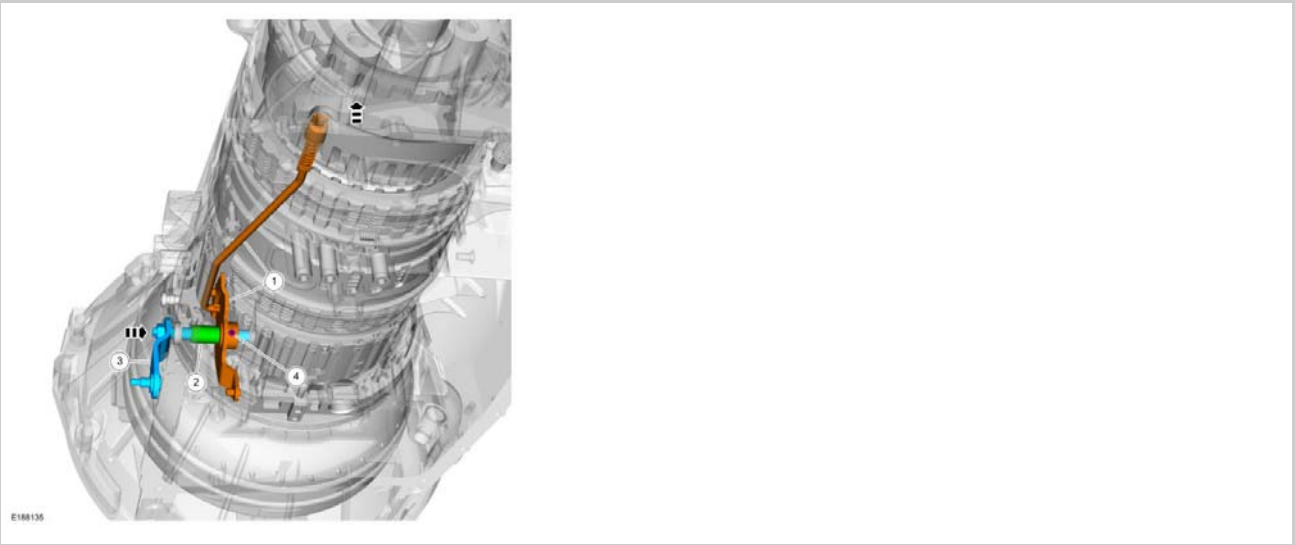
Using the special tool, install the selector shaft seal. Use Special Service Tool: 307-559 Installer, Shifter Fluid Seal.

3.

NOTE: Push on the park pawl to position the park pawl actuator rod in place.

1.
Install the manual valve detent lever and park pawl actuator rod as an assembly.

2.



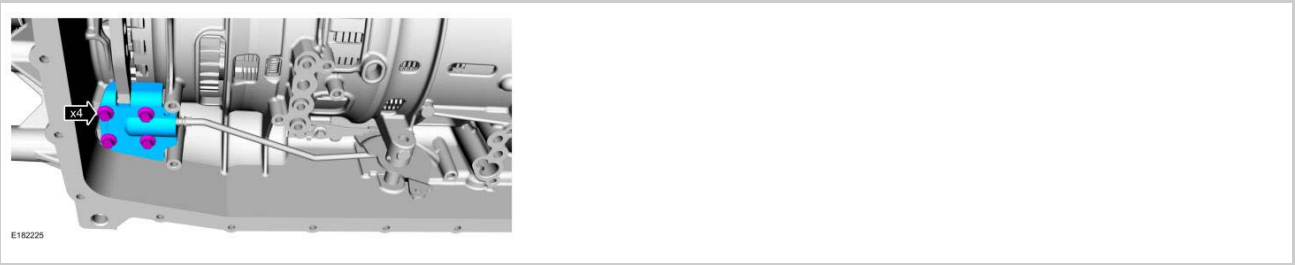
Position the selector lever spacer in place.

3.

Slide the selector lever shaft into the case and line up the roll pin hole.

4.

Install the new roll pin.

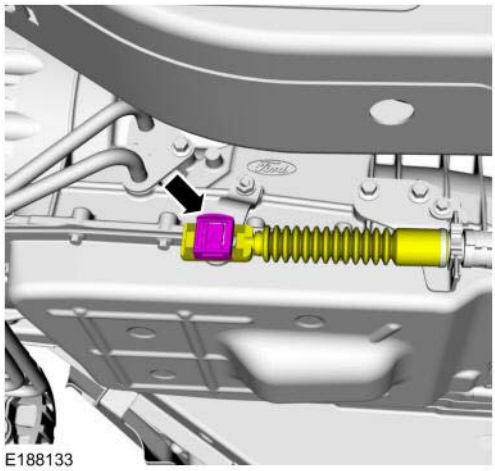


4.

While holding the park rod down, install the park rod actuating plate and bolts.

Torque

: 106 lb.in (12 Nm)



5.

Install the main control valve body. Refer to: Main Control Valve Body .

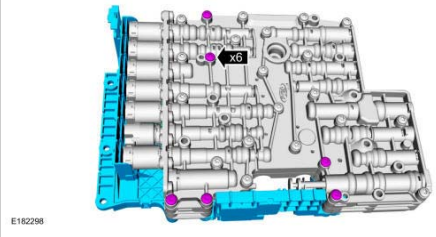
NOTE: To prevent selector lever cable damage, do not apply force to the selector lever cable between the selector lever and the selector lever cable bracket.

6.
Install the selector lever cable end on the selector lever.

REMOVAL AND INSTALLATION > SHIFT SOLENOIDS (SS)

Materials

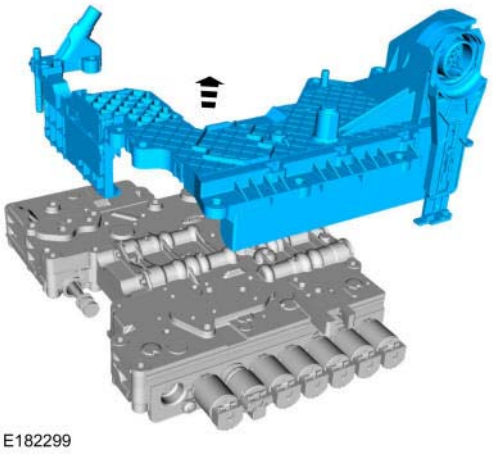
Name	Specification
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A



REMOVAL AND INSTALLATION > SHIFT SOLENOIDS (SS) > REMOVAL

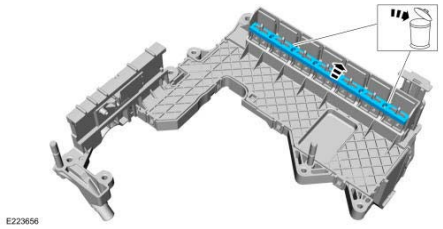
1.

Remove the main control valve body. Refer to: Main Control Valve Body .



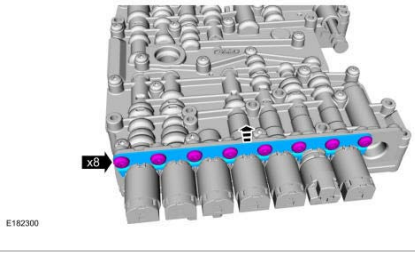
2.

Remove the long bolts from the molded leadframe.



3.

Carefully separate the molded leadframe from the main control valve body assembly.



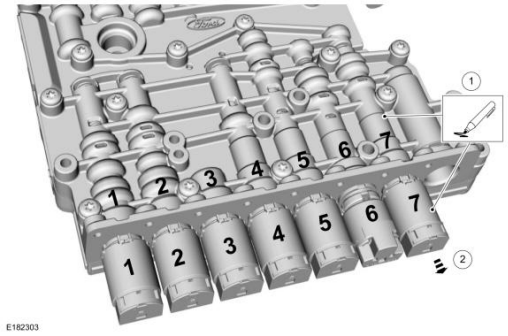
4.

If equipped, remove and discard the foam strip seal.

5.

Remove the solenoid bracket bolts and the solenoid bracket.

NOTE: A Variable Force Solenoid (VFS) is calibrated from the factory and are not all the same. To replace a Variable Force Solenoid (VFS), match the replacement solenoid nozzle color and the band number with the original solenoid or harsh/erratic shifts, harsh/soft engagement or damage to the transmission can occur.



6.

1.

If replacing more then one solenoid, number the solenoids and number the main control valve body solenoid ports to correspond to the solenoid.

2.

Pull the solenoid(s) out of the main control valve body.

REMOVAL AND INSTALLATION > SHIFT SOLENOIDS (SS) > INSTALLATION

NOTE: A Variable Force Solenoid (VFS) is calibrated from the factory and are not all the same. To replace a Variable Force Solenoid (VFS), match the replacement solenoid nozzle color and the band number with the original solenoid or harsh/erratic shifts, harsh/soft engagement or damage to the transmission can occur.

NOTE: Identify what type of solenoid is being replaced. The solenoid can be a normally high Variable Force Solenoid (VFS) with a black nozzle, normally low Variable Force Solenoid (VFS) with a brown nozzle or an ON/OFF solenoid.

1.

1.

7G383, SSA, Forward (1, 2, 3, 4) clutch, normally low solenoid (brown nozzle).

2.

7G383, SSB, Direct (3, 5, R) clutch, normally high solenoid (black nozzle).

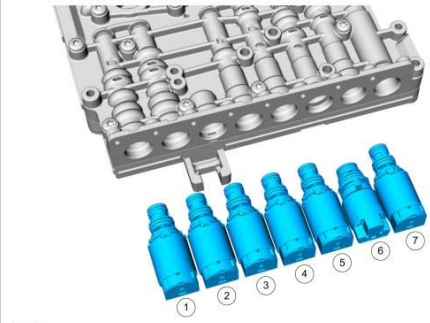
3.

7G383, SSC, Intermediate (2, 6) clutch, normally low solenoid (brown nozzle).

4.

7G383, LPC solenoid, normally high solenoid (black nozzle).

5.



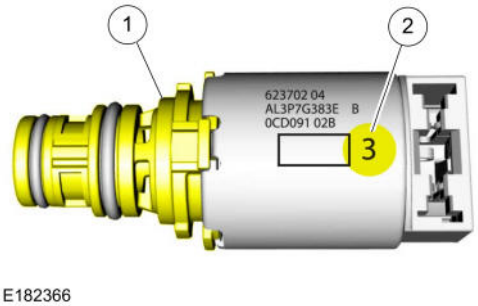
7G383, SSD, low/reverse/overdrive clutch, normally high solenoid (black nozzle).

6.

7G484, SSE, normally off ON/OFF solenoid.

7.

7G383, TCC solenoid, normally low solenoid (brown nozzle).



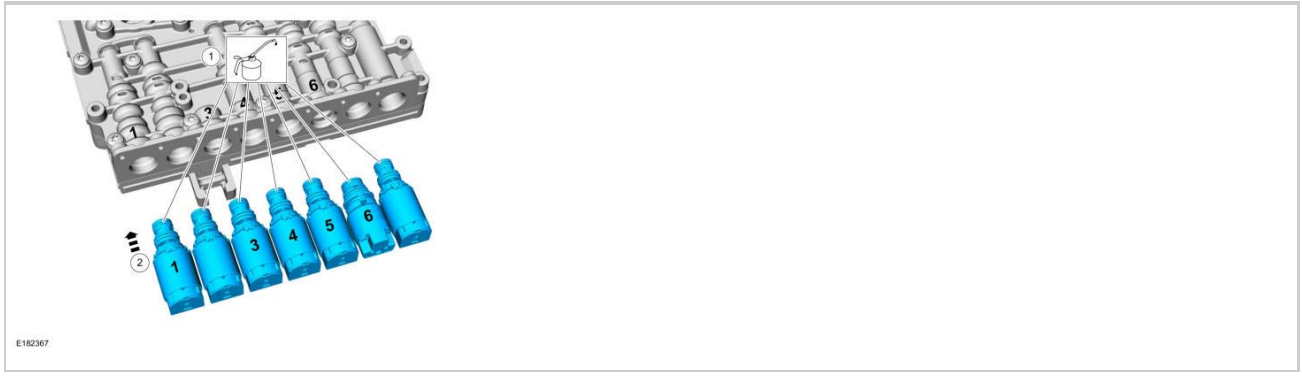
2.

1.

If replacing a Variable Force Solenoid (VFS), record the solenoid nozzle color to get the correct part number for the solenoid.

2.

If replacing a Variable Force Solenoid (VFS), record the band number to get the correct part number for the solenoid.



3.

Lubricate the solenoid O-rings and position the solenoid(s) in the main control valve body in the correct port(s) as marked during removal.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

4.

Position the solenoid bracket in place and install the bolts.

Torque

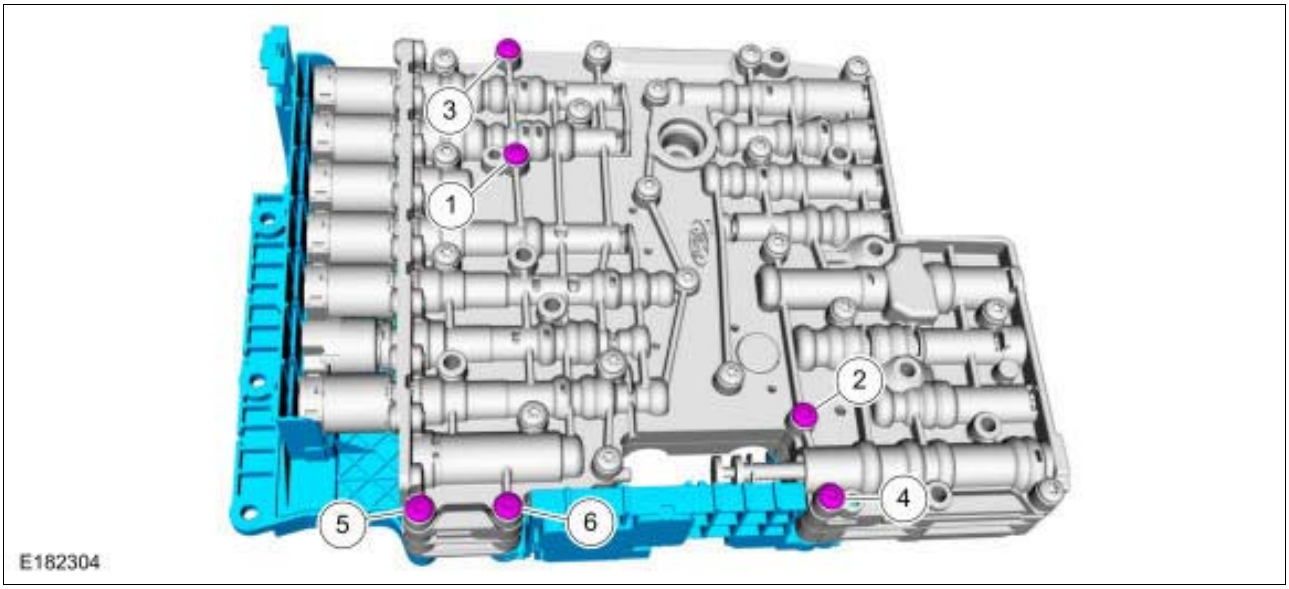
: 53 lb.in (6 Nm)

NOTE: Some vehicles may not have been built with a foam strip seal. A new foam strip seal should be installed on all molded leadframes.

5.
Install a new foam strip seal on the molded leadframe.

NOTE: The TR sensor pin must be aligned with the manual control valve during installation.

6.
Position the molded leadframe on the main control valve body and align the TR sensor pin with the manual control valve.



7.

Install the long bolts into the molded leadframe. Tighten the bolts in the sequence shown.

Torque

: 53 lb.in (6 Nm)

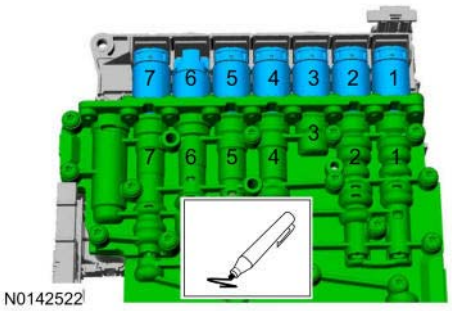
Fig 1: Molded Leadframe Bolts Tightening Sequence

Courtesy of FORD MOTOR CO.

8.

Install the main control valve body. Refer to: Main Control Valve Body .

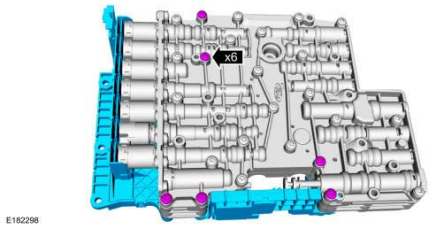
OVERHAUL > MAIN CONTROL VALVE BODY



NOTE: Solenoids may visually appear the same but their designs/functions are different. Use care not to assemble the main control assembly incorrectly. Incorrect solenoid installation results in poor transmission shift quality.

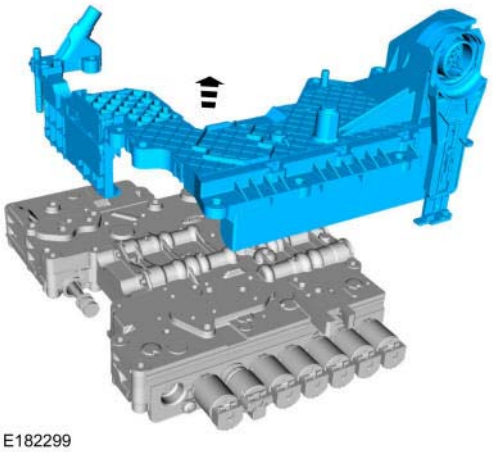
NOTE: Note the location of the 8 check balls, 6 solenoid dampers, 2 internal valves and springs and 2 filter screens for reassembly.

1.



Make an identifying mark on each solenoid and the corresponding bore for correct assembly.

For solenoid and valve identification. Refer to: Main Control Valve Body .

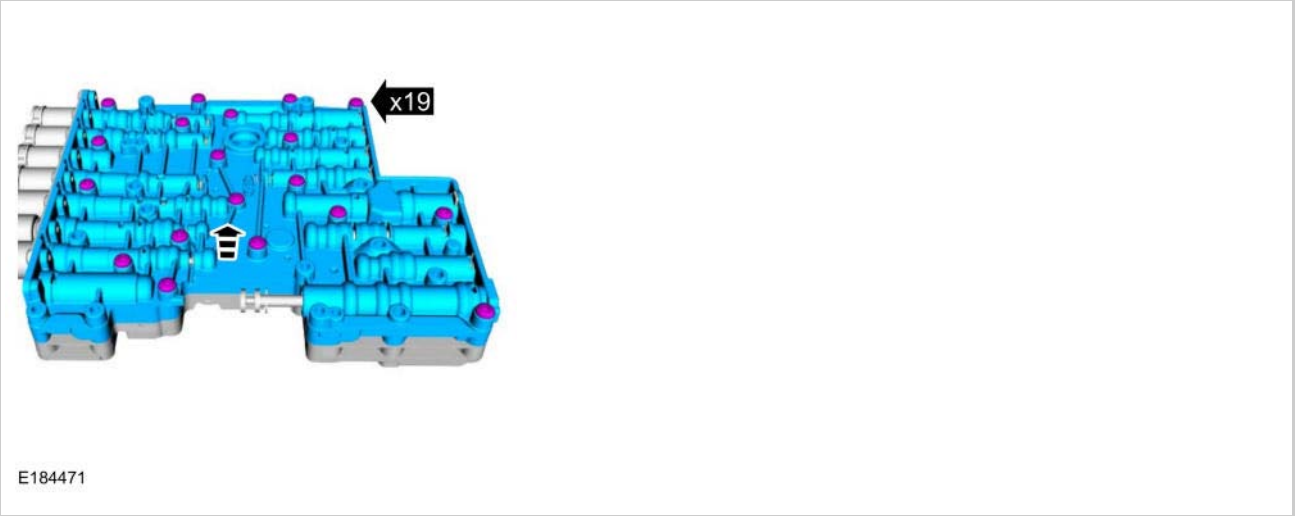


2.

Remove the long bolts from the molded leadframe.

3.

Carefully separate the molded leadframe from the main control valve body assembly.



4.

If equipped, remove and discard the foam strip seal.

5.

Remove the short main control bolts from the main control assembly. Separate the lower half of the main control assembly from the upper half of the main control assembly.

6.

Remove and discard the main control valve body separator plate.

7.

Remove the solenoid dampers, check balls, converter drain back valves and filter screens from the main control assembly. Note the location for assembly.

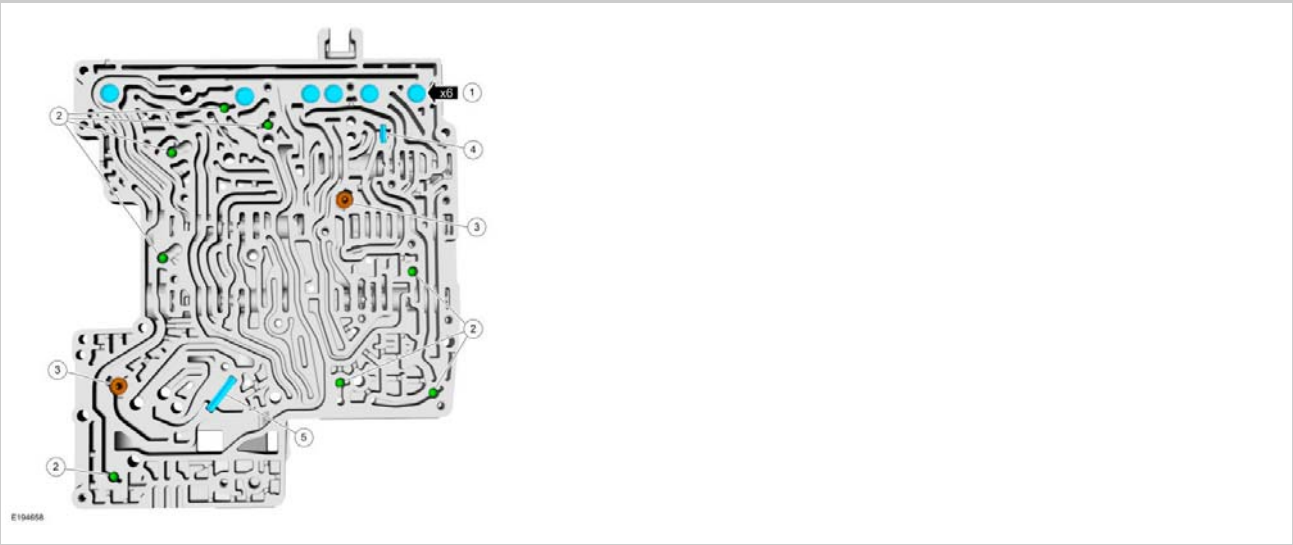
1.

Solenoid dampers

2.

Check balls

3.

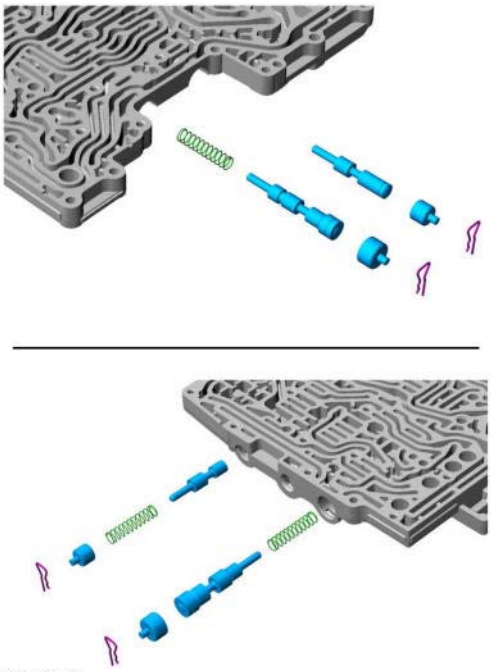


Converter drain back valves and springs

4.

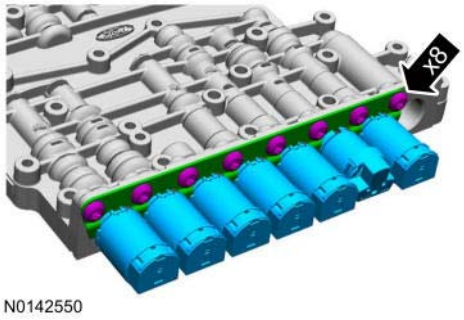
Small filter screen

5.



Large filter screen

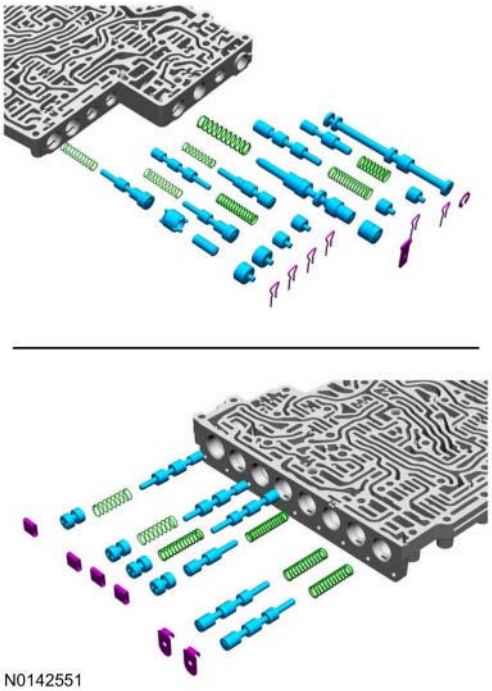
NOTE: Note the location and order of the clips, caps, valves and valve springs for assembly.



NOTE: Many components and surfaces in the main control valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly prevents unnecessary damage to machined surfaces.

8.
Remove the retaining clips, caps, valves and valve springs from each bore of the main control assembly. Clean the main control assembly and install the clips, caps, valves and valve springs in the same order as noted during removal.

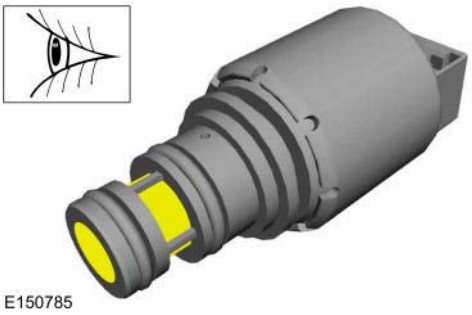
9.



Remove the solenoids.

NOTE: Note the location and order of the clips, caps, valves and valve springs for assembly.

NOTE: Many components and surfaces in the main control valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly prevents unnecessary damage to machined surfaces.



10.
Remove the retaining clips, caps, valves and valve springs from each bore of the main control assembly. Clean the main control assembly and install the clips, caps, valves and valve springs in the same order as noted during removal.

N0142551

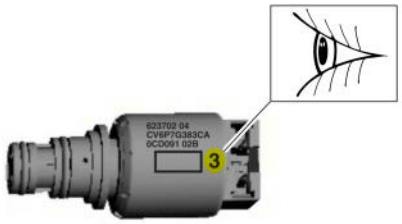
11.

Inspect the solenoid screens for debris that may restrict fluid flow.

E150785

12.

If installing new solenoids, note the color of the plastic nozzle and the large O-ring. High pressure solenoids, such as the LPC solenoid, SSB and SSD, have black plastic nozzles and orange O-rings. Low pressure solenoids, such as the TCC solenoid, SSA and SSC, have brown plastic nozzles and green O-rings. The solenoids can only be replaced with the same color solenoid.

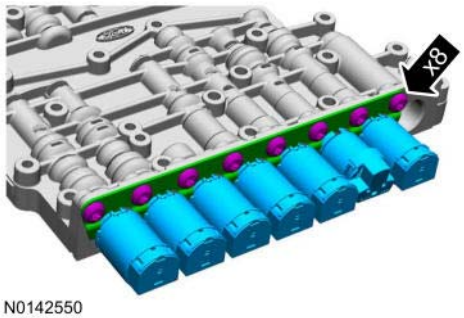


E150962

13.

Determine the part number suffix by checking the solenoid service band number etched on the side of the solenoid. The band number is next to the two-dimensional matrix barcode on the side of the solenoid and will be a 1, 2, 3, 4 or 5. Determine the part number suffix and match the new solenoid base part number and suffix with the old solenoid.

Solenoid Number	Solenoid Part Number Suffix
1	B
2	C
3	D
4	E
5	F



E150961

14.

Install the solenoids into their correct bores as marked during disassembly.

Torque

: 53 lb.in (6 Nm)

N0142550

NOTE: Toward the back of the upper valve body there is a hydraulic passage that is shaped as though it receives a check ball. This passage does not require a check ball. Be sure not to mistake this hydraulic passage for a passage that does require a check ball or damage to the transmission can occur.

15.
Install the solenoid dampers, check balls, converter drain back valves and springs and filter screens in the main control assembly.

1.

Solenoid dampers

2.

Check balls

3.

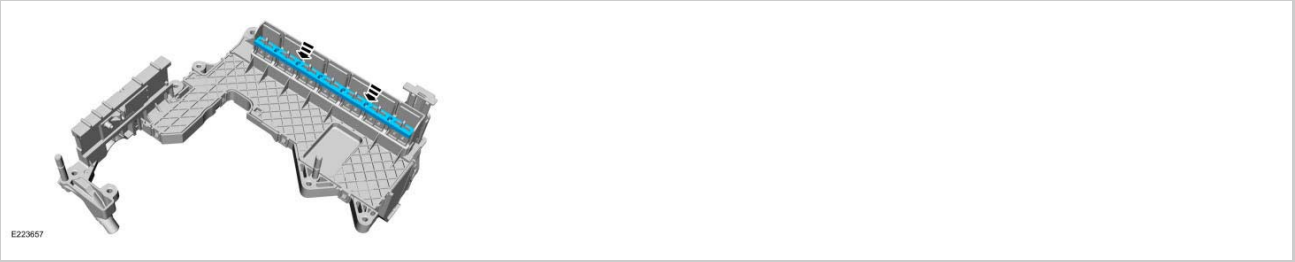
Converter drain back valves and springs

4.

Small filter screen

5.

Large filter screen



6.

Empty hydraulic passage (no check ball)

NOTE: Some vehicles may not have been built with a foam strip seal. A new foam strip seal should be installed on all molded leadframes.

16.
Install a new foam strip seal on the molded leadframe.

17.

Align the guide pins on the molded leadframe with the holes in the main control upper valve body and install the valve body onto the molded leadframe.

1.

Molded leadframe

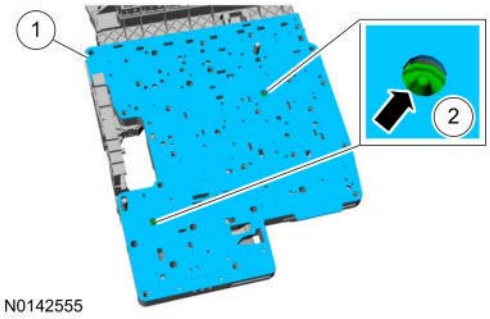
2.

Upper main control valve body

3.

Guide pins

NOTE: If the drain back valves are not installed correctly in the separator plate, damage to the transmission can occur.



18.
Position the new main control separator plate on the main control upper valve body. Check the 2 drain back valves to be sure they are correctly positioned in the separator plate when the separator plate is pressed flush against the main control upper valve body.

1.

Main control separator plate

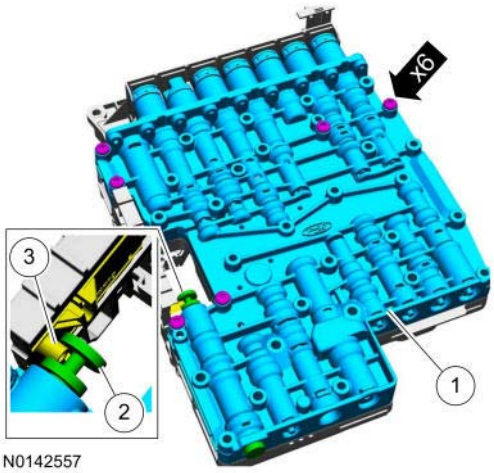
2.

Drain back valves

NOTE: If the drain back valves are not installed correctly in the separator plate, damage to the transmission can occur.

19.
Position the main control lower valve body on the 2 molded leadframe alignment studs, align the manual valve with the TR sensor on the molded leadframe and install the main control lower valve body. Install the long molded leadframe-to-valve body bolts hand-tight.

1.



Main control lower valve body

2.

Manual valve

3.

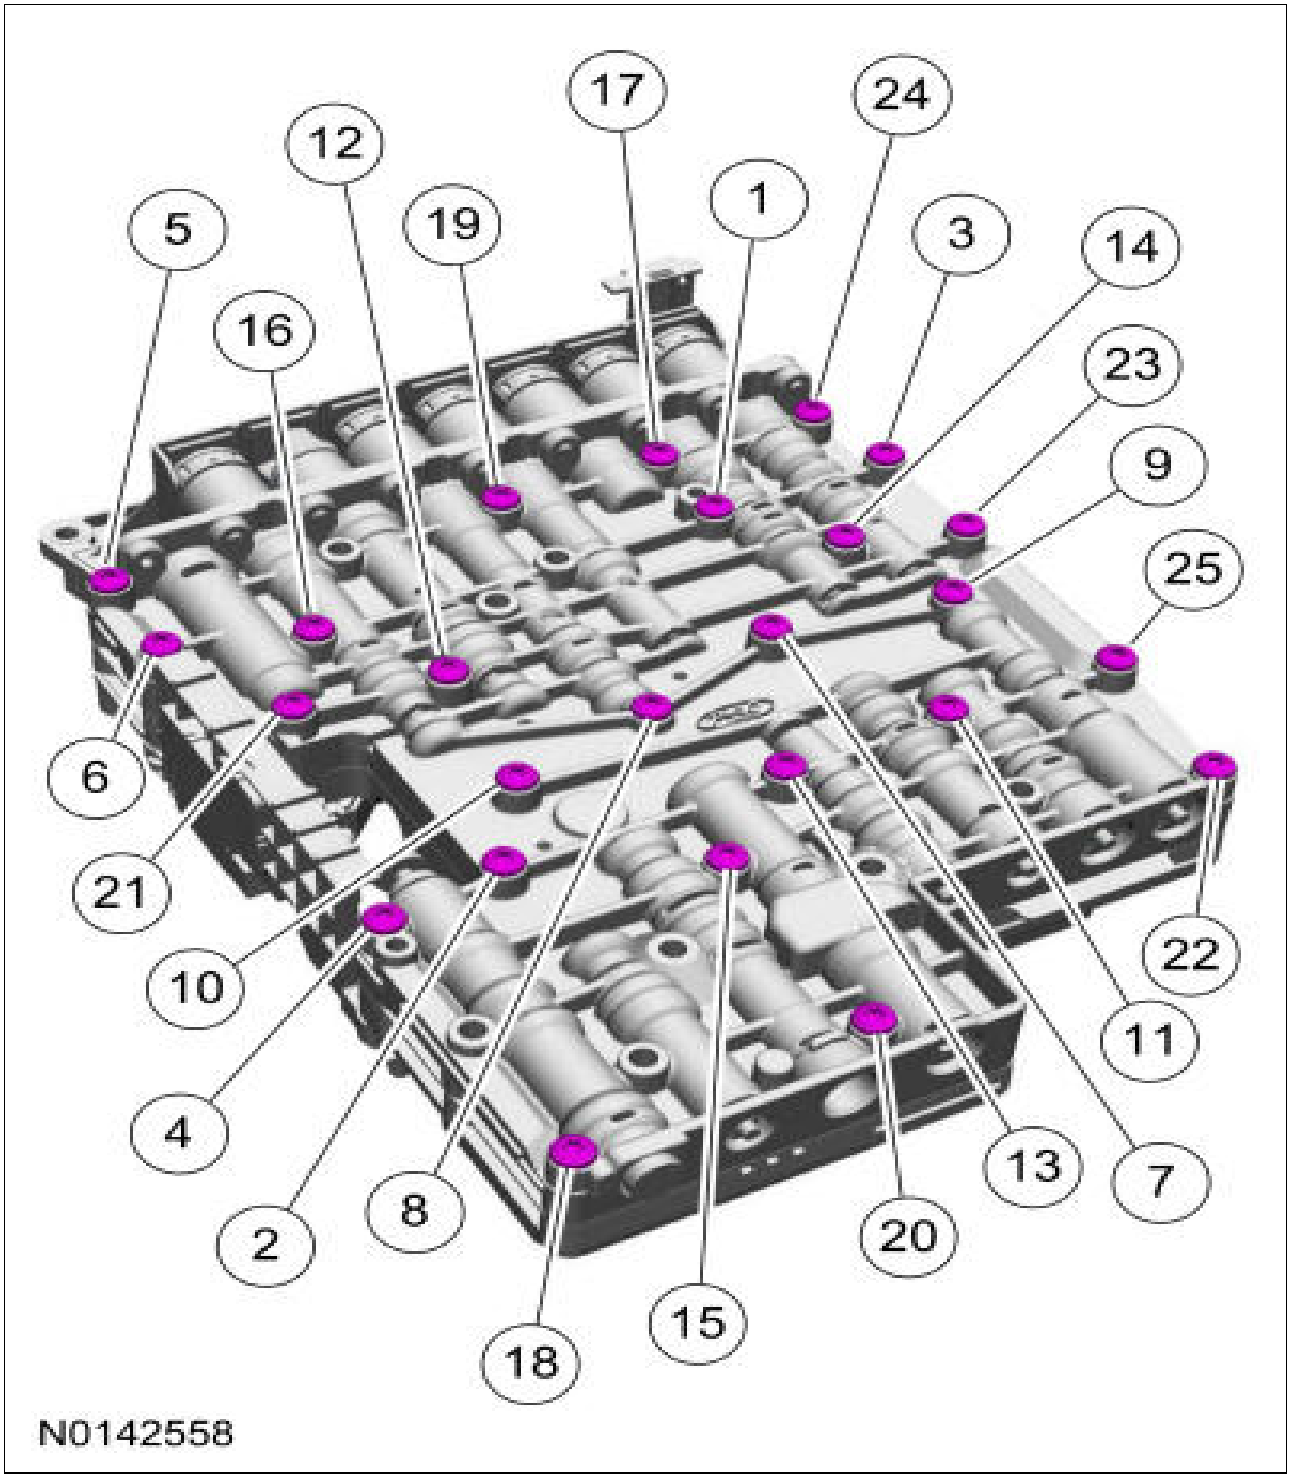
TR sensor

20.

Install the short main control assembly lower-to-upper valve body bolts. Tighten all the bolts in the sequence shown below.

Tighten bolts 1 through 6

Torque



: 53 lb.in (6 Nm)

Tighten bolts 7 through 25

Torque

: 62 lb.in (7 Nm)

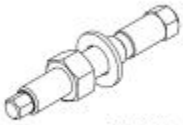


Fig 1: Main Control Assembly Valve Body Bolts Tightening Sequence

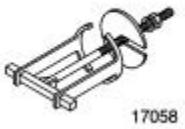

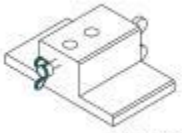

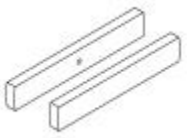

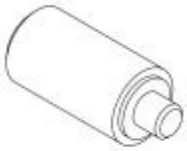

Courtesy of FORD MOTOR CO.

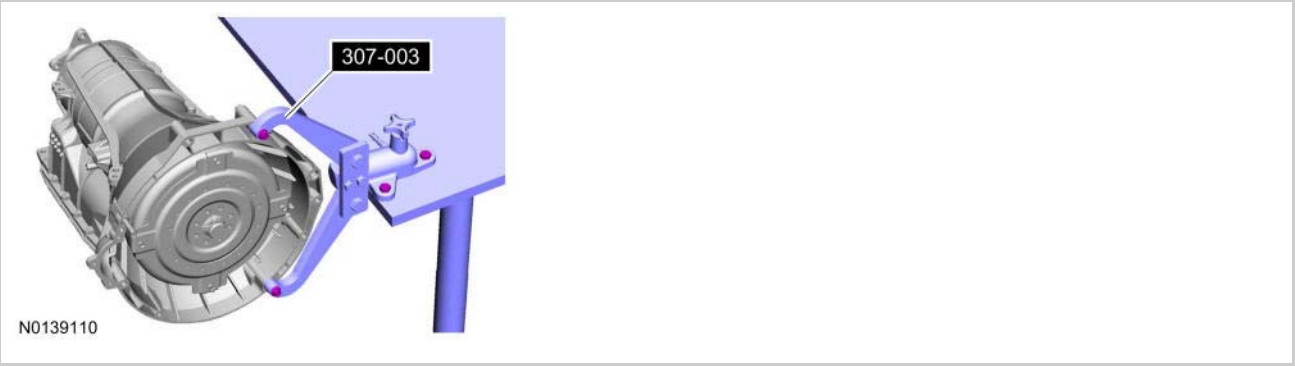
Materials

Name	Specification
Motorcraft ® 6R ATF Additive Kit XL-16	-
Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON ® LVWSS-M2C938-A

1.

The following components are discarded during disassembly and must be replaced:

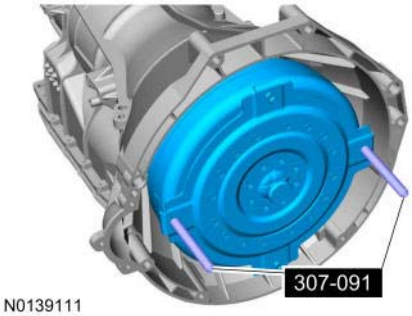
Description	Part Number
Gasket and Oil Seal Kit	7153
Transmission fluid filter	7A098
Front pump adapter seal	7F401
Direct clutch feed tube (Black)	7G199



Low/reverse clutch feed tube (Green or Orange)	7G087
Intermediate clutch feed tube (Blue)	7G084
Output shaft retaining nut	7045
TR sensor roll pin	7G100
Park pawl abutment retaining screw and washer	W711235-S300
TR detent spring retaining screw and washer	W711235-S300
Direct clutch hub retaining ring	7D483
Direct clutch hub	7F236
Overdrive clutch balance piston retaining ring	7C122
Intermediate clutch piston retaining ring	7A577
Low/reverse clutch piston return spring retainer	7H318

2.

For information on component views and base part numbers. Refer to: Transmission Description .



3.

Install the special tool on the torque converter housing and install the transmission on a bench. Use Special Service Tool: 307-003 (T57L-500-B) Holding Fixture, Transmission.

4.

Using the special tool, remove the torque converter.Use Special Service Tool: 307-091 Handle, Torque Converter.

5.

1.

Inspect the sealing surface for a groove worn from the seal. Install a new torque converter if necessary.

2.

A new or remanufactured torque converter must be installed if one or more of the following statements are true:

A torque converter malfunction has been determined based on complete diagnostic procedures.

The torque converter stud or studs, impeller hub or bushing are damaged.

The torque converter exhibits external discoloration (due to overheating).

There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:

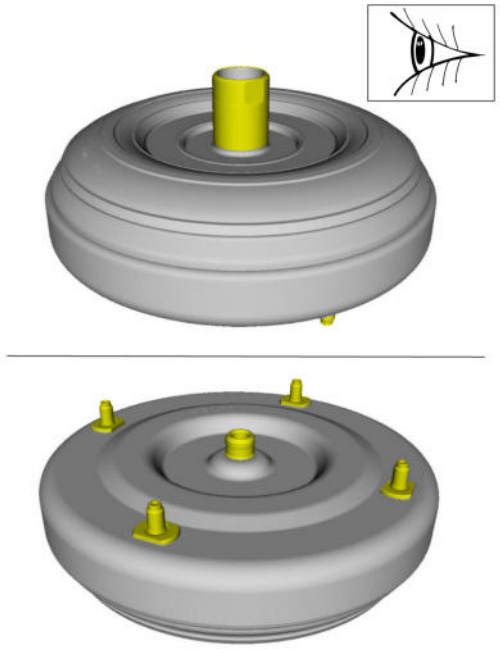
Major metallic failure

Multiple clutch plates or band failures

Sufficient component wear which results in metallic contamination

Water or antifreeze contamination

3.



If none of the above conditions are present, continue with the following fluid inspection.

4.

Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.

5.

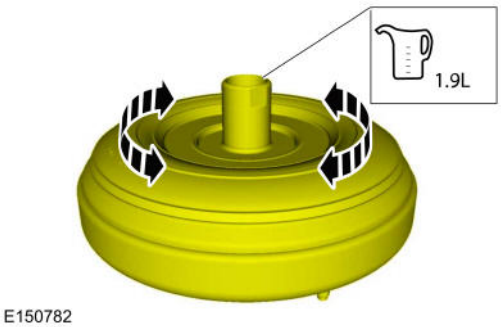
Examine the fluid for contaminants. The fluid must be free of metallic contaminants.

E150775

NOTE: Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur. Use only clean transmission fluid designated for the transmission and torque converter being serviced.

6.

1.

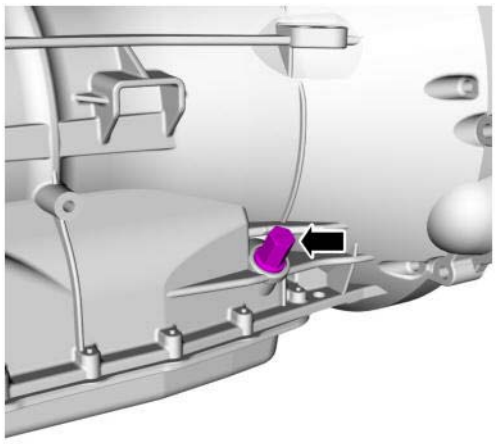


Drain the remaining fluid from the torque converter. Apply the specified amount of fluid.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

Agitate by hand.



Thoroughly drain the fluid.

E150782

7.

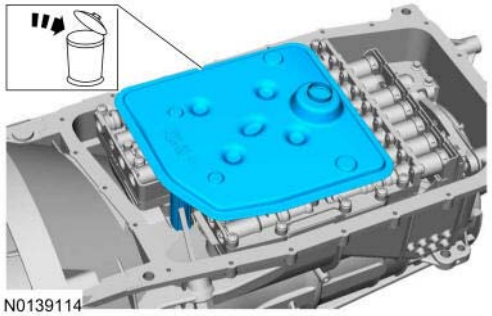
Remove the transmission fluid fill plug.

E181871

8.

Remove the transmission fluid pan bolts and the transmission fluid pan.

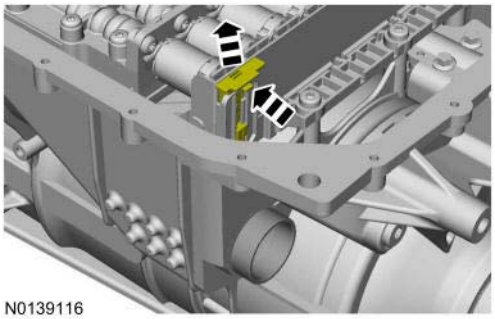
E195080



9.

Remove the transmission fluid pan gasket.

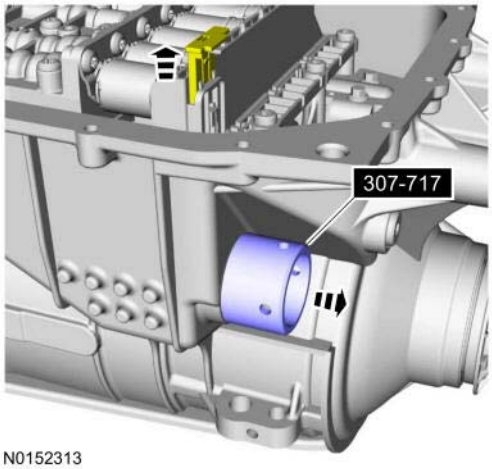
N0139113



10.

Remove and discard the transmission fluid filter.

N0139114

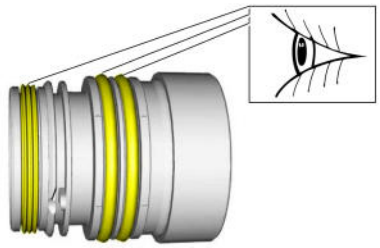


11.

Press the release tab and lift up on the bulkhead electrical connector retainer to release the bulkhead electrical connector shell.

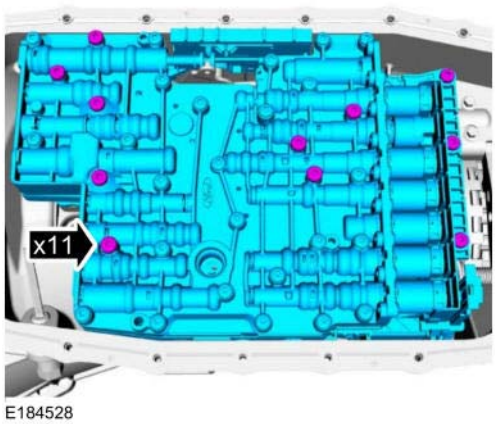
N0139116

12.



With the transmission bulkhead connector sleeve retainer released, use the special tool to pull the outer shell of the bulkhead connector sleeve out of the transmission. Use Special Service Tool: 307-717 Remover, Kostal Sleeve.

N0152313

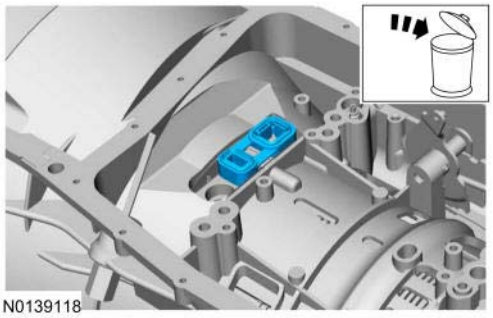


13.

Inspect the bulkhead connector sleeve seals. If necessary, replace the seals.

N0152364

14.



Remove the bolts from the main control assembly and remove the main control assembly.

E184528

15.

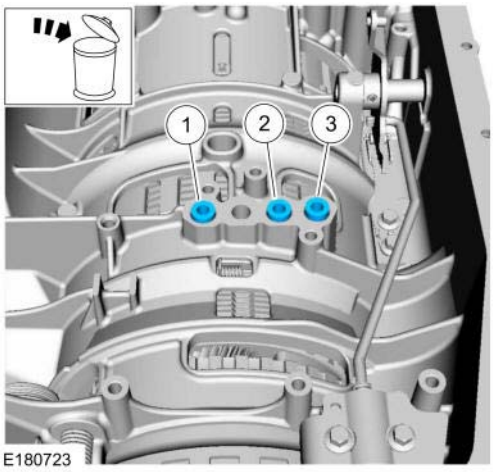
Remove and discard the front pump adapter seal.

NOTE: The green (7G087) center support feed tube seal may be replaced with an orange (7G087) center support feed tube seal.

16.

1.

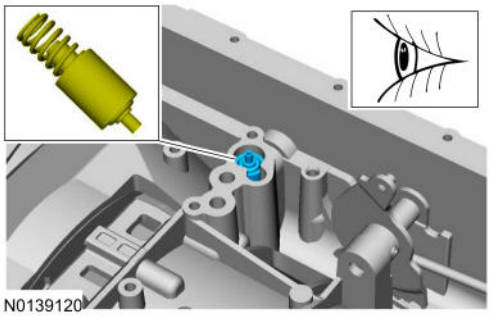
Center support feed tube seal (7G199 Black)



2.

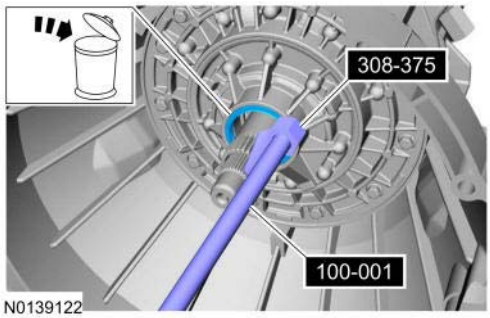
Center support feed tube seal (7G087 Green or Orange)

3.



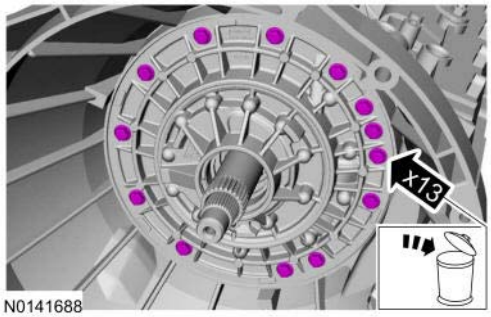
Center support feed tube seal (7G084 Blue)

Remove and discard the feed tubes.



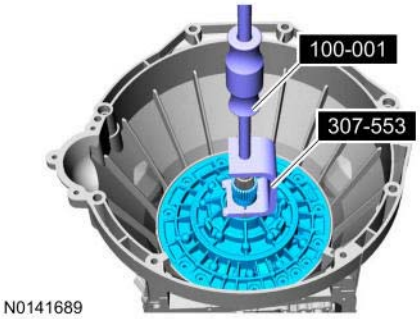
17.

Remove the thermal bypass valve from the case. Inspect the thermal bypass valve for damage and discard the valve if damaged.



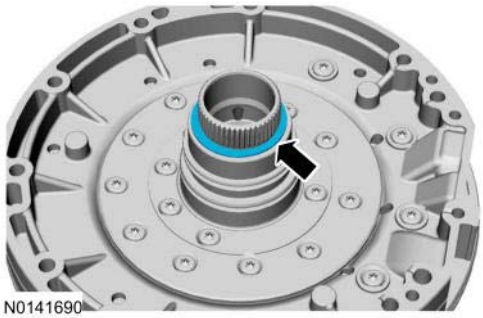
18.

Using the special tools, remove and discard the front pump seal. Use Special Service Tool: 100-001 (T50T-100-A) Slide Hammer., 308-375 Remover, Input Shaft Seal.



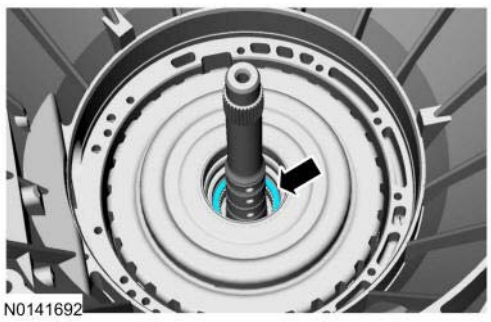
19.

Remove and discard the front pump-to-case bolts and washers.



20.

Using the special tools, remove the pump. Use Special Service Tool: 100-001 (T50T-100-A) Slide Hammer., 307-553 Remover, Transmission Fluid Pump.

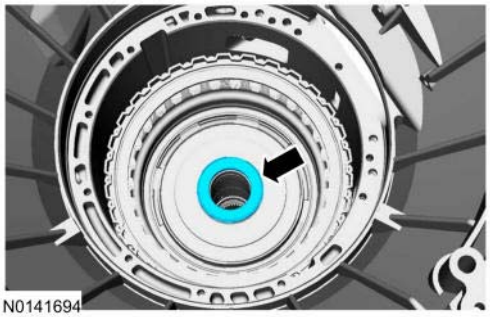


NOTE: The selective shim may come out while removing the front pump.

21.
Inspect the back of the front pump for the selective shim and remove if necessary.

22.

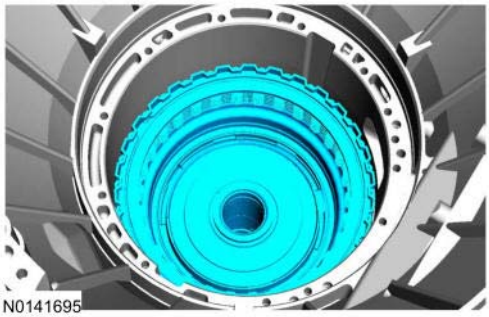
If the selective shim is not on the pump, using a magnet, remove it from the forward (A)/overdrive (E) clutch assembly.



23.

Remove the forward (A)/overdrive (E) clutch assembly.

N0141693



24.

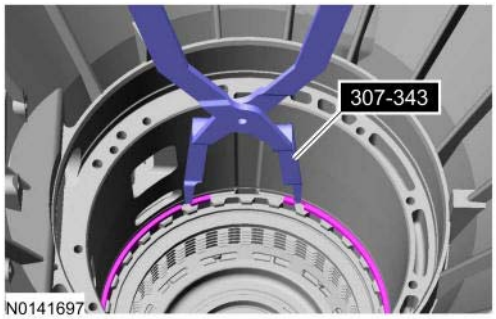
Remove the caged T5 roller bearing from the direct (B) clutch assembly.

N0141694

25.

Remove the direct (B) clutch assembly.

N0141695

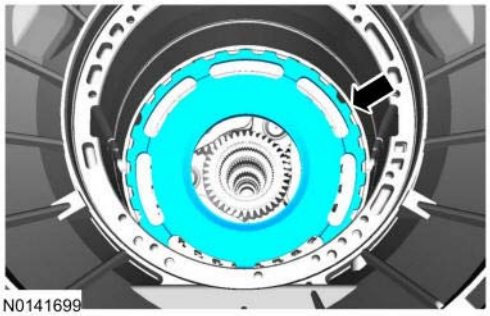


26.

Remove the bias spring.

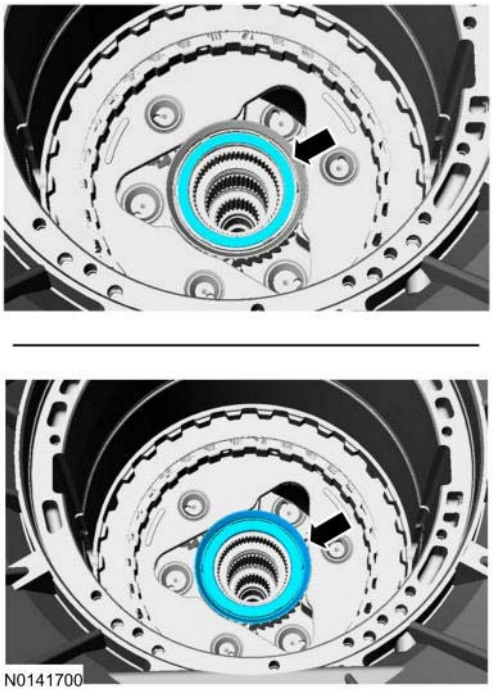
27.

Using the special tools, remove the center support snap ring.Use Special Service Tool: 307-343 Retaining Ring Pliers.



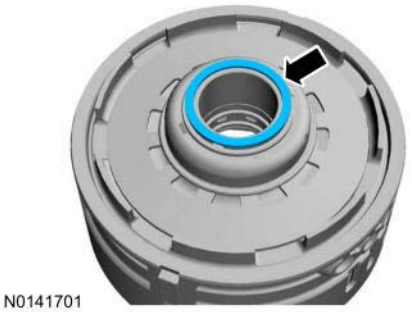
28.

Remove the center support and T6 bearing.



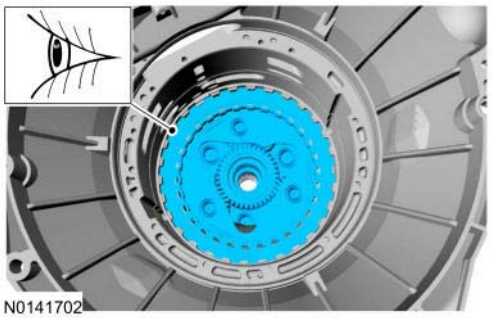
NOTE: When removing the one-way clutch, note the position for assembly.

29.
Remove the one-way clutch.



NOTE: The selective shim might stick to the T7 thrust bearing during removal of the center support.

30.
Remove the selective shim and the T7 thrust bearing.



NOTE: The selective shim might stick to the back of the center support assembly during removal.

31.
Remove the selective shim from the center support assembly.

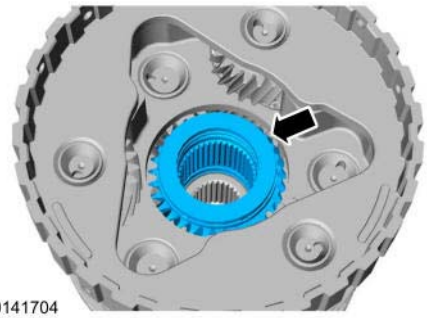
N0141701

NOTE: Some of the clutch plates may stay in the case when removing the planetary carrier and the low/reverse clutch pack. Remove any clutch plates from the transmission that were not removed with the carrier and keep the clutch plates together.

32.
Remove the planetary carrier and the low/reverse clutch pack as an assembly. Inspect the clutch plates for excessive wear or damage. If the clutch plates are excessively worn or damaged replace as necessary. If the clutch plates are not excessively worn or damaged, they can be reused.

N0141702

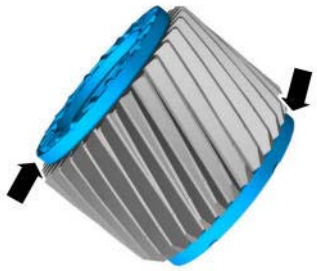
33.



Remove the No. 2 sun gear and race.

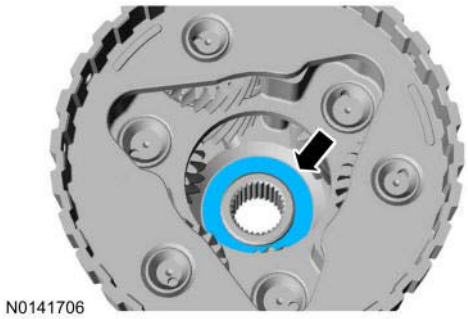
N0141703

NOTE: When removing the sun gear, note that the tapered edge is facing up toward the torque converter housing.



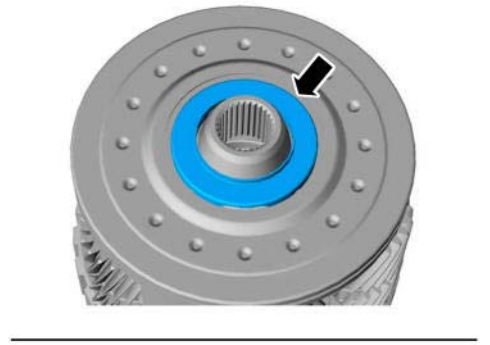
NOTE: Remove the bearings with the sun gear.

34.
Remove the No. 3 sun gear.



35.

Remove the top T8 and the bottom T9 roller bearings from the sun gear.

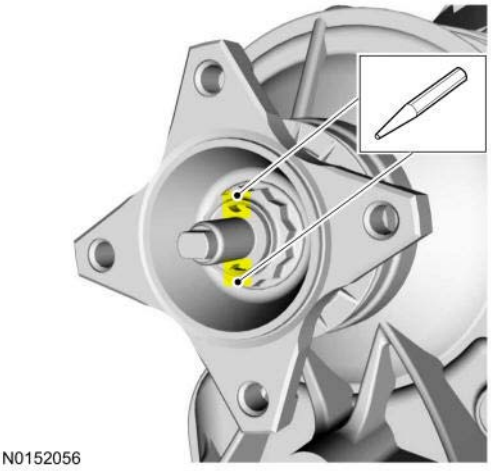


36.

Remove the T9 roller bearing race from the bottom of the carrier.

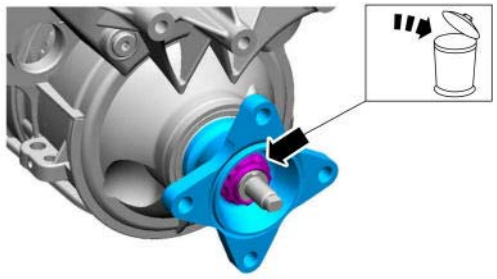
NOTE: The T10 thrust bearing can stick to the planetary carrier.

37.
Remove the T10 thrust bearing.



N0141707

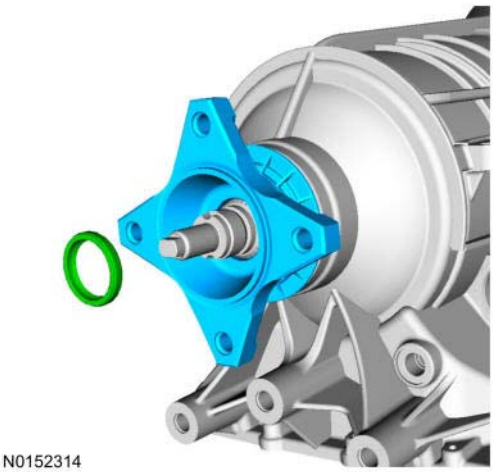
NOTE: The output shaft flange retaining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.



38.
Remove the stakes from the output shaft flange retaining nut. Use the General Equipment: Punch

N0152056

39.



Place the manual control lever in the PARK position and remove and discard the output shaft flange retaining nut.

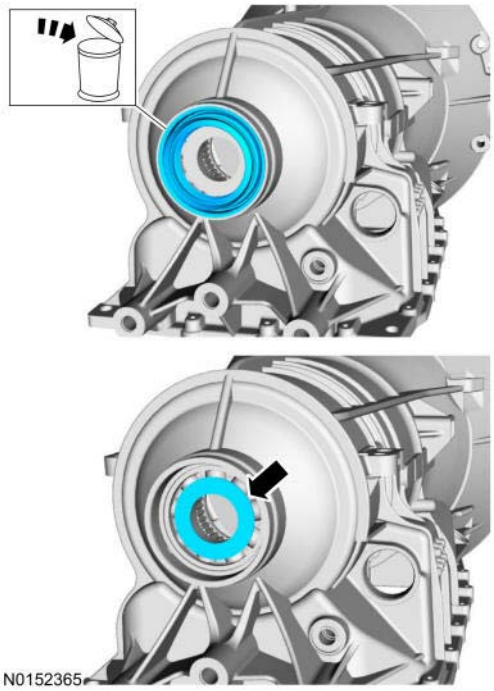
N0141709

40.

Remove the output shaft flange seal and flange.

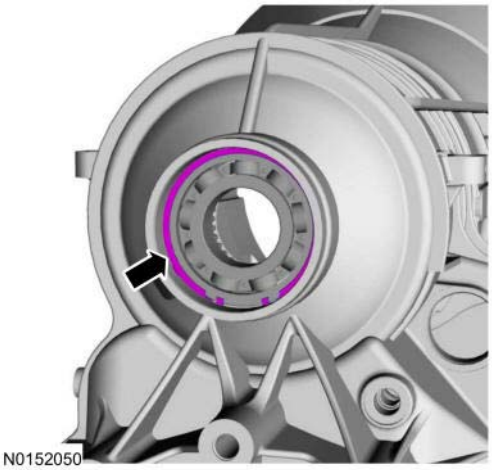
N0152314

41.



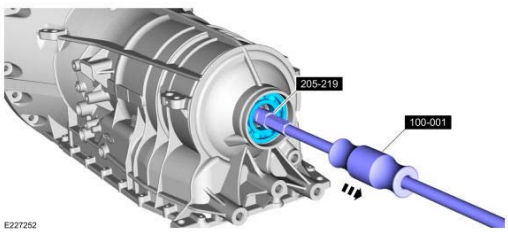
Remove the planetary carrier hub, output shaft assembly and T11 bearing.

N0141710



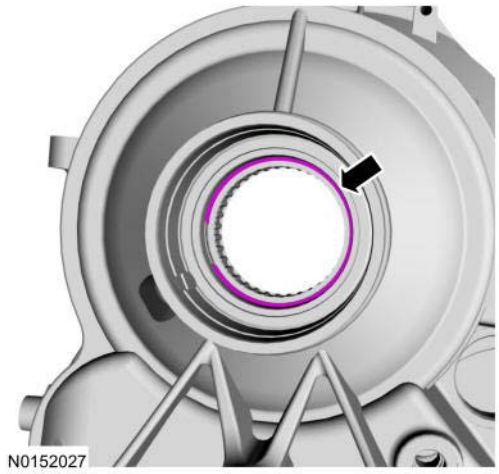
42.

Remove and discard the output shaft seal and remove the slip plane washer.



43.

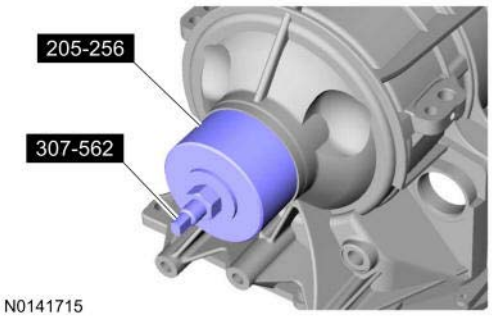
Remove the output shaft ball bearing snap ring.



44.

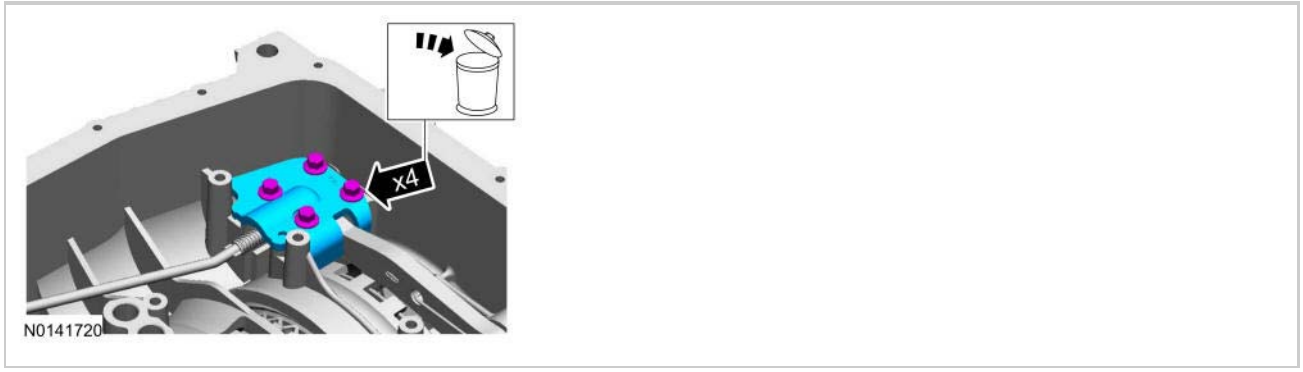
Using the special tools, remove the output shaft ball bearing. Use Special Service Tool: 100-001 (T50T-100-A) Slide Hammer., 205-219 (T85L-1225-AH) Remover, Axle Bearing.

45.



Remove the snap ring.

NOTE: Use care when installing the Needle Bearing Remover. Look inside the transmission case to make sure that the Needle Bearing Remover contacts the bearing only and not the lip of the case, or damage to the case will occur.



46.
Install the special tools on the bearing and remove the bearing. Use Special Service Tool: 205-256 Installer, Front Wheel Hub Seal., 307-562 Remover, Needle Bearing.

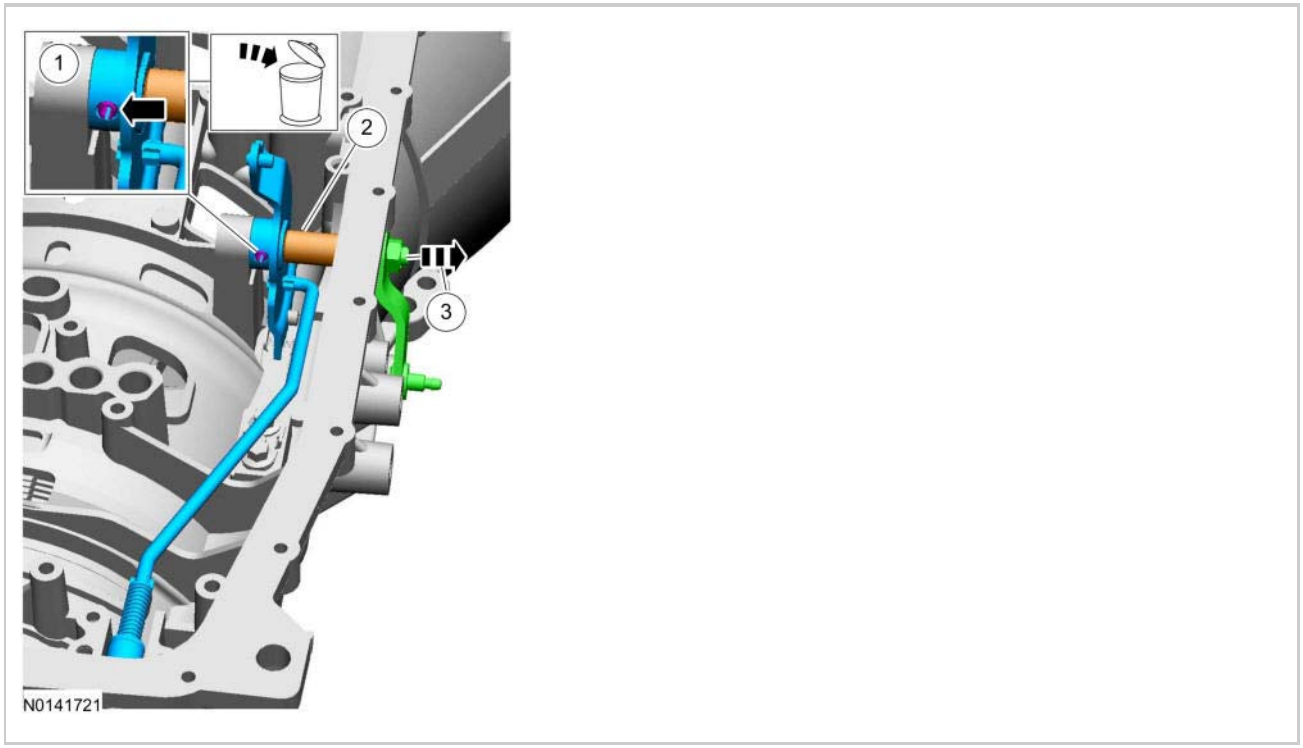
47.

Remove and discard the 4 park rod actuating plate bolts and remove the park rod actuating plate.

48.

1.

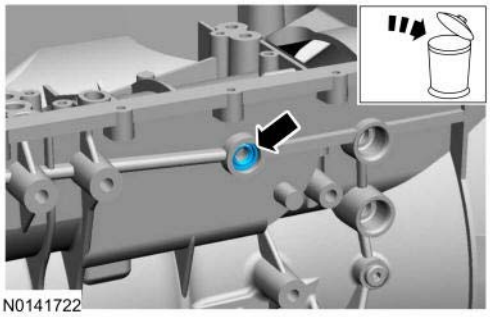
Remove and discard the roll pin.



2.

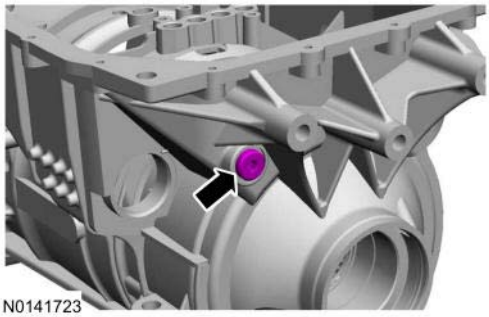
Hold the manual control lever spacer to keep it from falling into the case.

3.



Slide the manual control lever shaft out of the case.

Remove the manual valve detent lever and park pawl actuator rod as an assembly.



49.

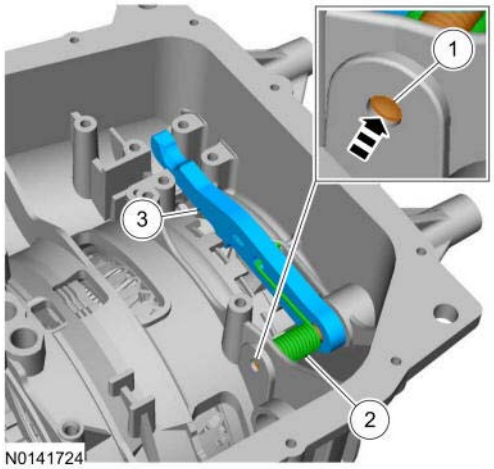
Remove and discard the manual control lever shaft seal.

50.

Remove the bolt from the back of the case to access to the park pawl pin.

51.

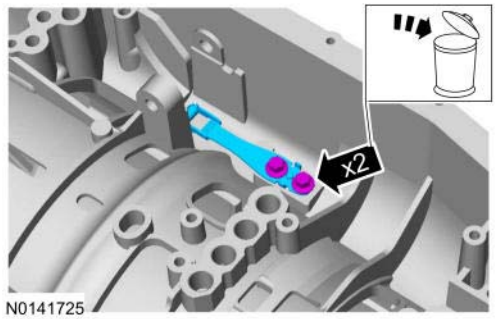
1.



Push the park pawl pin out toward the back side of the case and remove the pin.

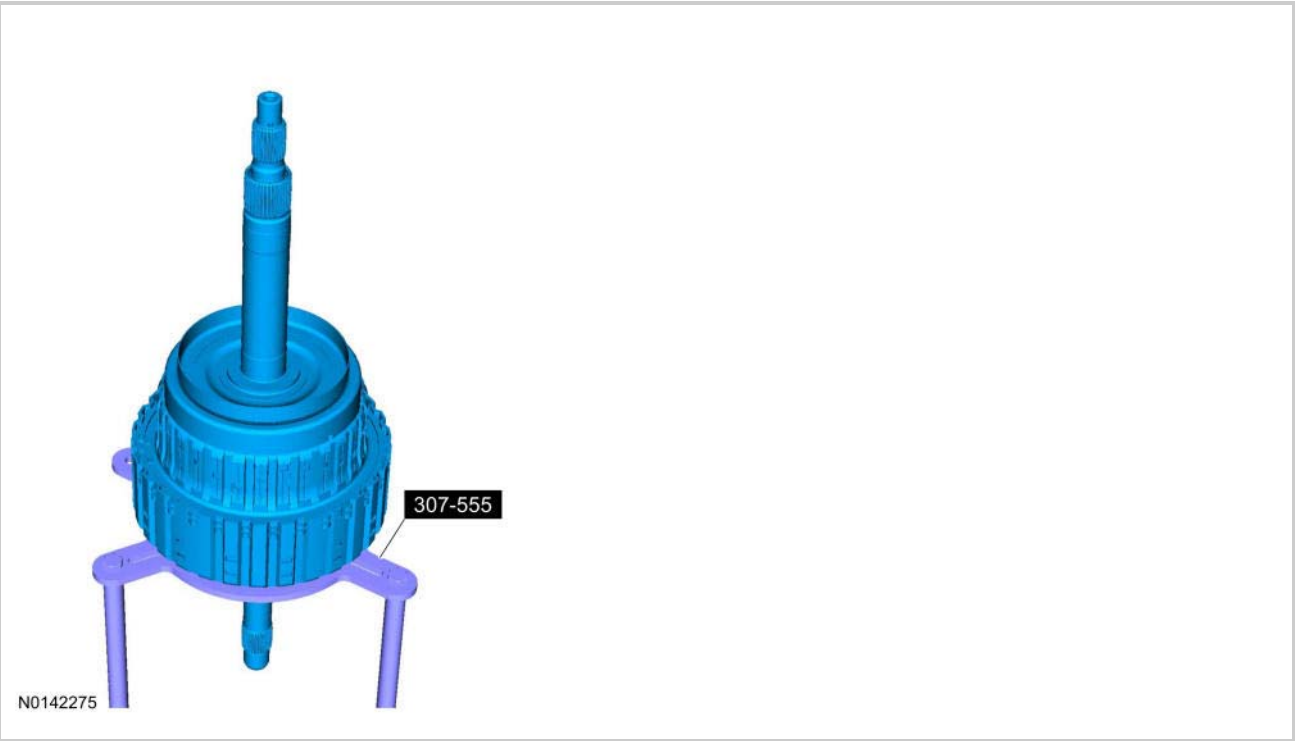
2.

Remove the park pawl return spring.



3.

Remove the park pawl.

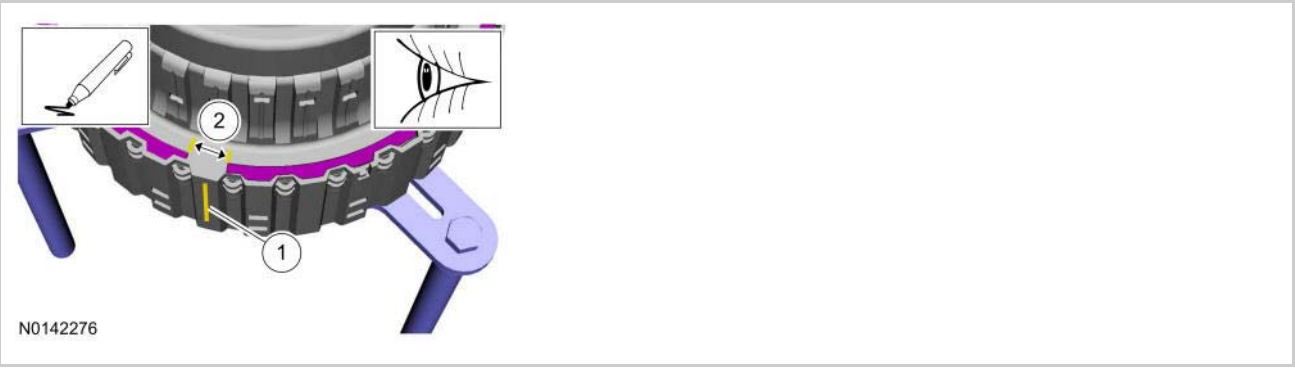


52.

Remove and discard the 2 bolts and remove the park detent spring.

53.

Position the forward/overdrive clutch assembly in the special tool.Use Special Service Tool: 307-555 End Play Gauge, Clutch.



54.

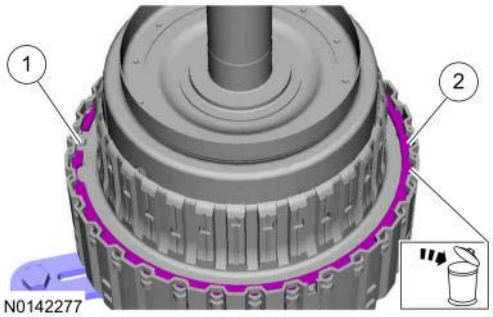
1.

Locate the snap ring gap.

2.

Index-mark the direct clutch outer shell snap ring gap location to the side of the forward clutch hub using a paint marker.

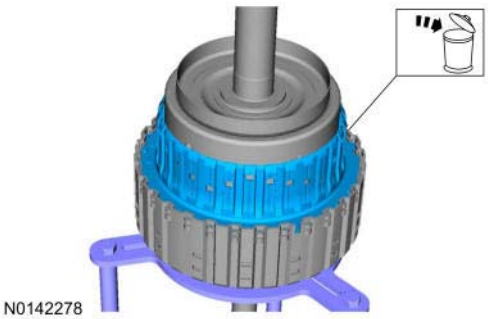
55.



1.

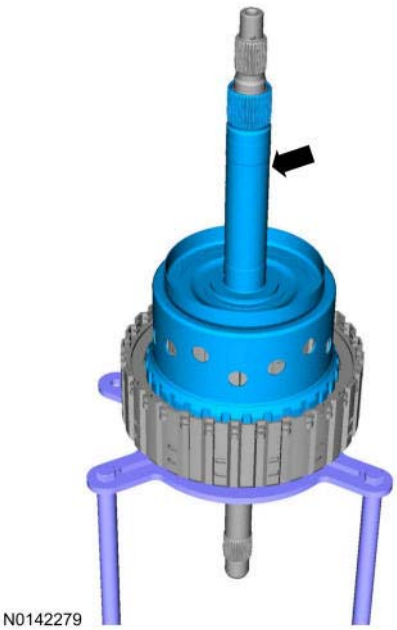
Locate the snap ring gap.

2.



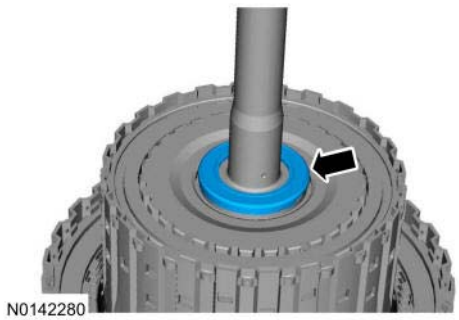
Pry the snap ring out of the groove 180 ° from the snap ring gap and remove and discard

the snap ring.



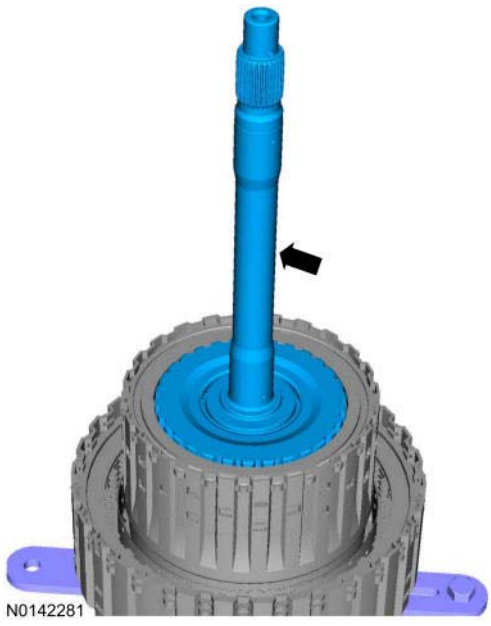
56.

Remove and discard the direct clutch hub.



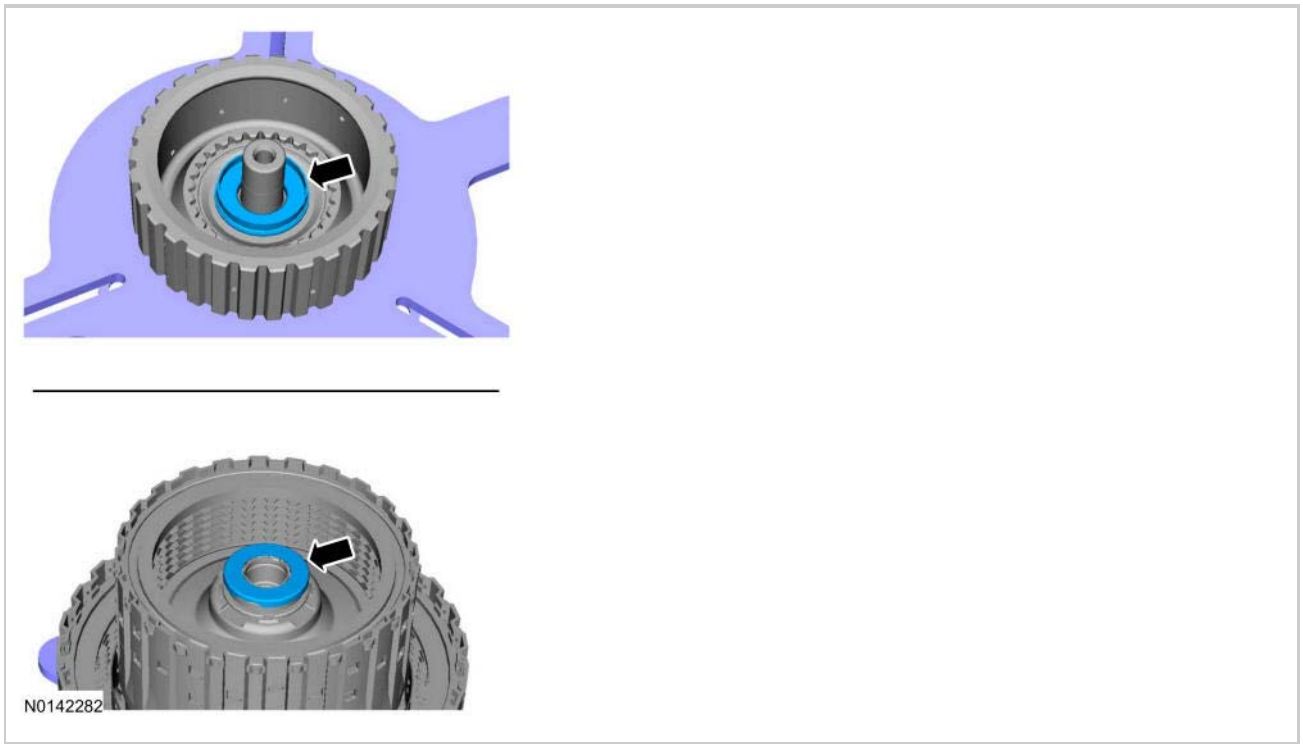
57.

Remove the forward clutch and sun shaft assembly.



NOTE: The bearing may stick in the forward clutch drum.

58.
Remove the intermediate shaft T4 thrust bearing.



59.

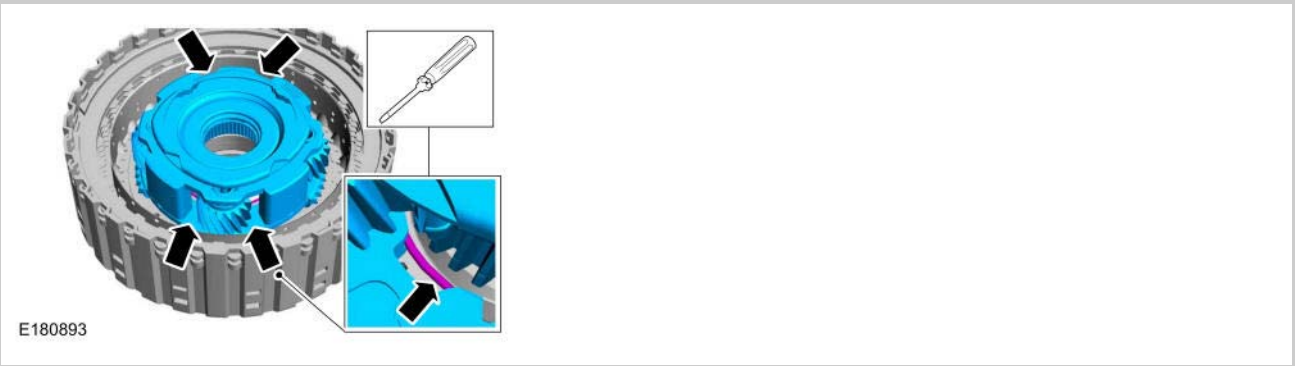
Remove the intermediate shaft assembly.

60.

If the T3 thrust bearing stuck to the intermediate shaft assembly, remove it from the intermediate shaft assembly. If the T3 thrust bearing is on the overdrive clutch, remove it from the overdrive clutch assembly.

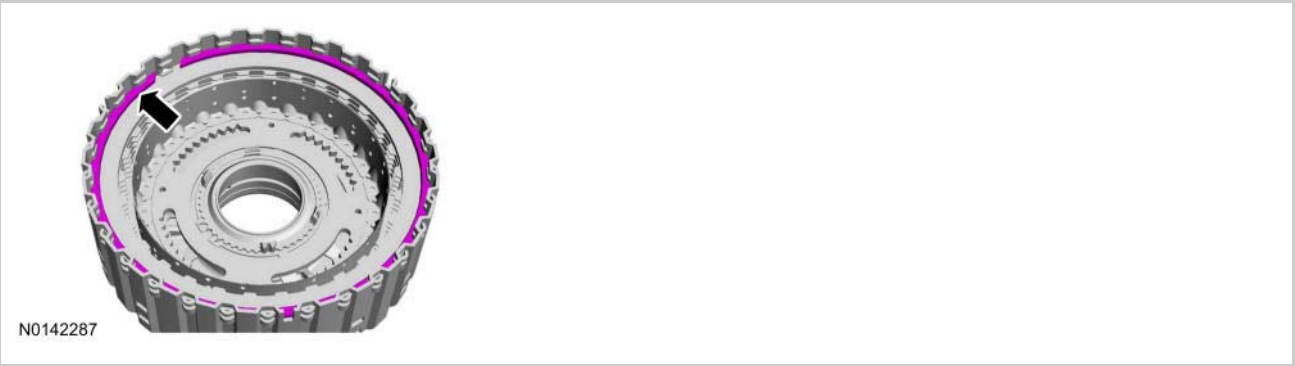
61.

Remove the overdrive clutch pack from the forward clutch pack.



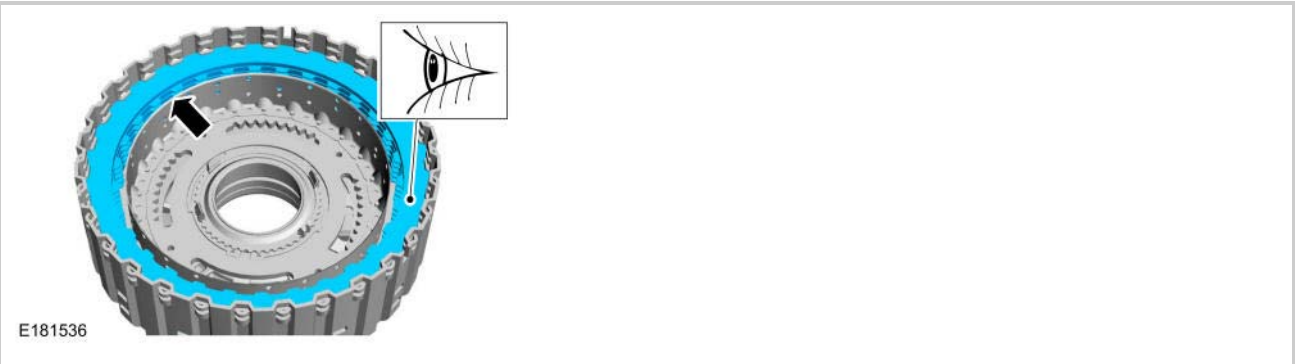
62.

If the T2 thrust bearing is on the forward clutch assembly, remove it from the forward clutch assembly.



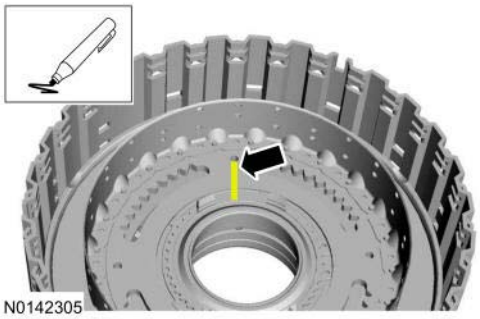
63.

Remove the front planetary carrier and sun gear from the forward clutch assembly. Use a small screwdriver or a pick inserted into the front planetary assembly, push on the retaining ring in 4 places while lifting up on the front planetary assembly.Use the General Equipment: Flat Headed Screw Driver



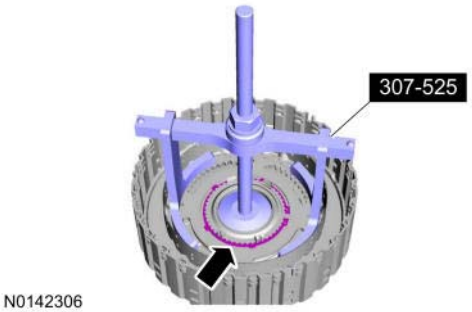
64.

Remove the forward clutch pack snap ring.



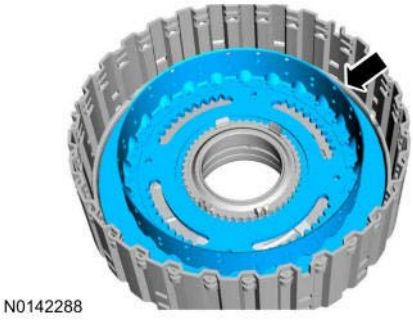
65.

Remove the forward clutch steel and friction plates. Inspect the clutch plates for excessive wear or damage. If the clutch plates are excessively worn or damaged replace as necessary. If the clutch plates are not excessively worn or damaged, they can be reused.



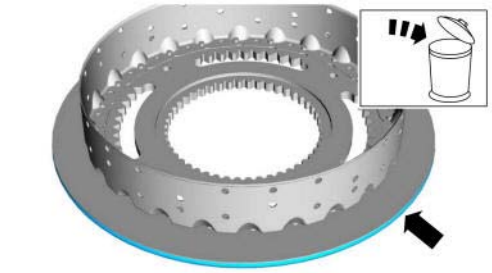
66.

For correct alignment during assembly, make an identifying mark on the balance dam and the center part of the housing.



67.

Using the special tool, slightly collapse the balance dam to access to the retaining ring and remove the retaining ring. Use Special Service Tool: 307-525 Compressor, Clutch Spring.



68.

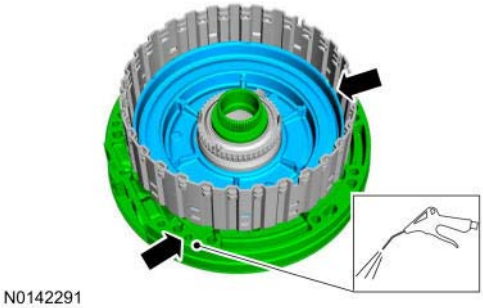
Remove the balance dam.

69.

Remove and discard the O-ring seal from the balance dam.

N0142289

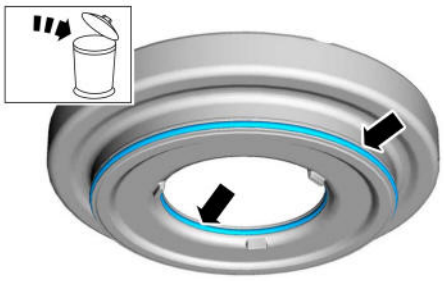
70.



Remove the forward clutch return spring.

N0142290

71.



Install the forward clutch on the front pump to remove the forward clutch piston. Apply a small amount of shop air to remove the piston.

N0142291

72.

Remove and discard the inner and outer piston O-ring seals.

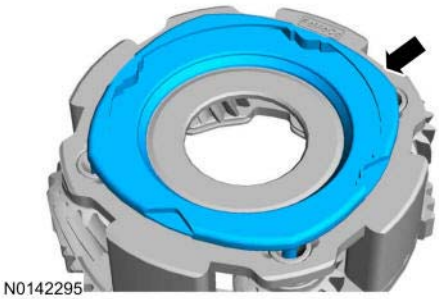
N0142292

73.

Remove the sun gear from the planetary carrier.

N0142293

NOTE: The T1 thrust bearing may have stuck to the sun gear when it was removed.

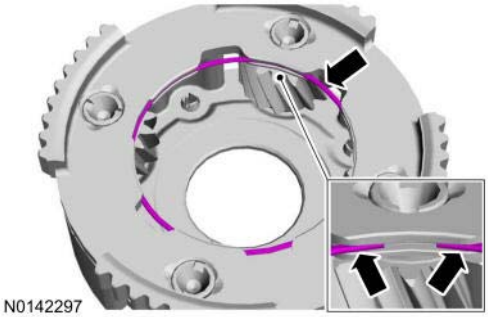


74.
Remove the T1 bearing from the planetary carrier.

N0142294

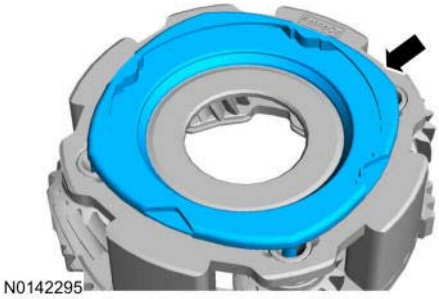
75.

Remove the transmission fluid collector plate from the front planetary carrier.



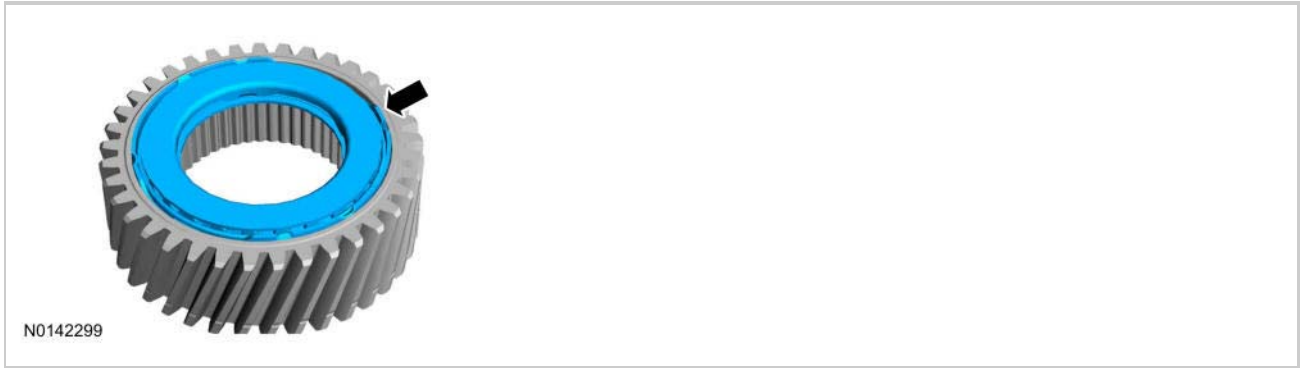
76.

Clean and inspect the components of the forward clutch assembly for damage and install new components as necessary.



NOTE: If a new planetary assembly is being installed, the new planetary assembly may not come with the snap ring installed.

77.
Install the planetary assembly snap ring, if necessary. Make sure the planetary snap ring is oriented correctly.



78.

Install the transmission fluid collector plate on the front planetary carrier.

79.

Install the T1 bearing onto the sun gear.

80.

Install the sun gear into the planet assembly with the T1 bearing facing down and the recessed part of the gear up.

81.

Install new O-ring seals onto the forward clutch piston. Lightly coat the O-ring seal with clean transmission fluid.

Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

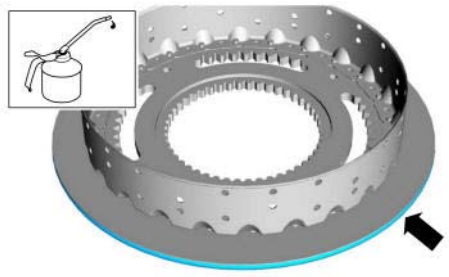
82.

Install the forward clutch piston into the forward clutch drum.

N0142301

83.

Install the forward clutch return spring.

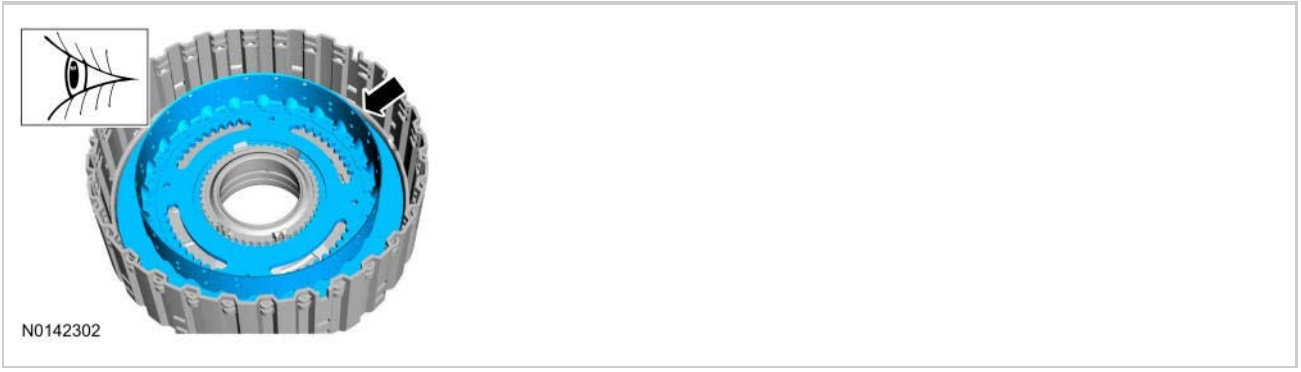


N0142290

84.

Install a new O-ring seal onto the forward clutch balance dam. Lightly coat the O-ring seal with clean transmission fluid.

Material



: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

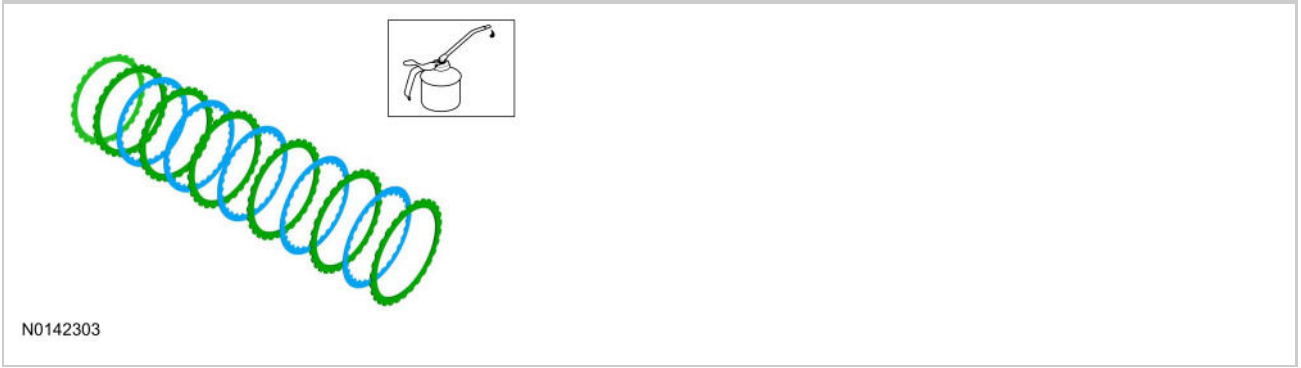
N0142307

85.

Align the marks made during disassembly and install the balance dam into the forward clutch drum.

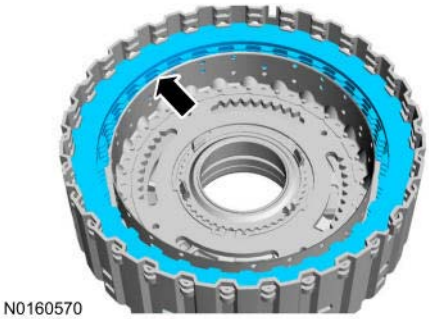
NOTE: Prior to releasing the special tool, make sure that the snap ring is fully seated.

86.
Using the special tool, slightly collapse the balance dam and install the retaining ring. Use Special Service Tool: 307-525 Compressor, Clutch Spring.



NOTE: Friction and steel plate quantity will vary based on engine displacement.

87.
Soak the forward clutch plates in clean transmission fluid. For friction and steel plate quantity, refer to the Clutch Plate Quantity Chart. Refer to: Specifications .

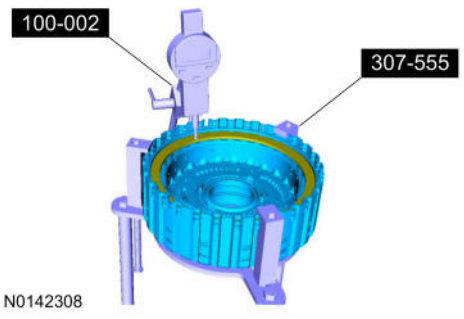


Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

88.

Install the forward clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates and install the pressure plate.



89.

Install the forward clutch plate snap ring.

NOTE: All forward clutch plates, friction and steel are of a wave-type design.

90.
Install the forward clutch assembly on the Clutch End Play Gauge and install the dial indicator gauge. Position the plunger so it fits into the snap ring gap. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

91.

With the dial indicator gauge set at zero, lift up on the steel pressure plate so it is against the

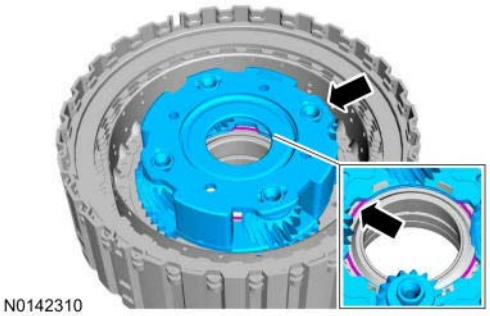
select fit snap ring. Record this reading as reading A. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

92.

Rotate the forward clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Average reading A and B for a total end clearance	

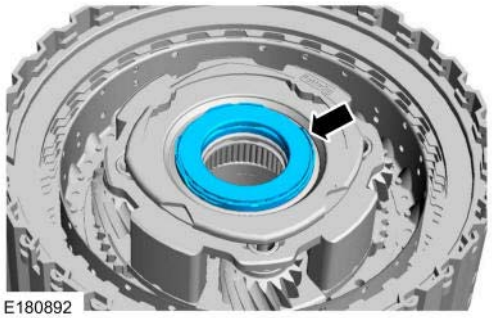
NOTE: If the end clearance is not within specification, install a new snap ring until the correct specification is achieved.



93.

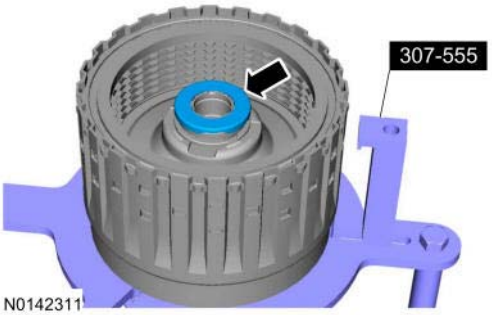
0.71-1.10 mm (0.028-0.043 in)

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, re-measure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, re-measure using a thinner select fit snap ring.



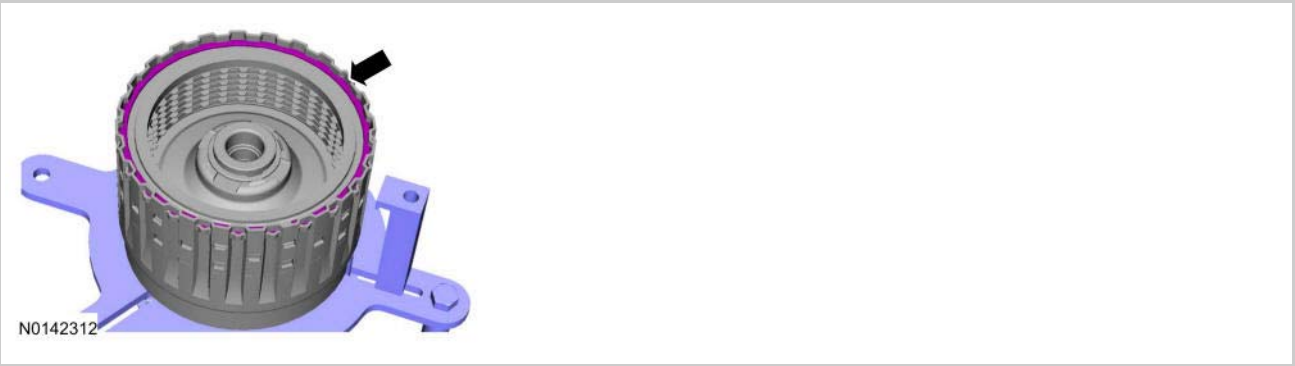
94.

Install the sun gear and planetary gearset into the forward clutch drum. Make sure it snaps and locks in place.



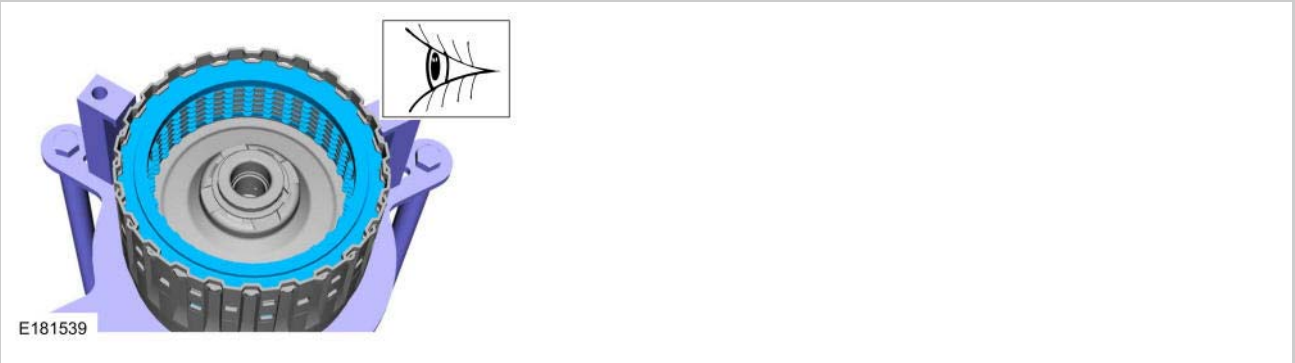
95.

Install the T2 thrust bearing.



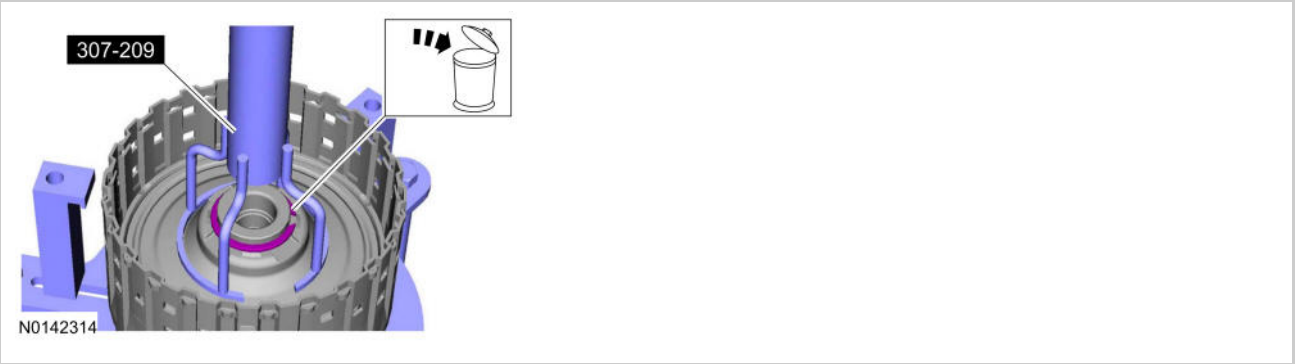
96.

Position the overdrive clutch assembly into the special tool and remove the T3 thrust bearing. Use Special Service Tool: 307-555 End Play Gauge, Clutch.



97.

Remove the overdrive clutch pack snap ring.

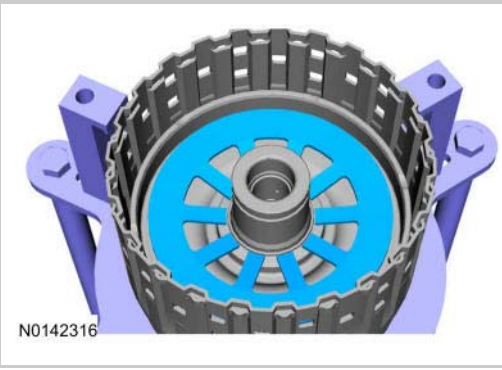


98.

Remove the overdrive clutch pack. Inspect the clutch plates for excessive wear or damage. If the clutch plates are excessively worn or damaged replace as necessary. If the clutch plates are not excessively worn or damaged, they can be reused.

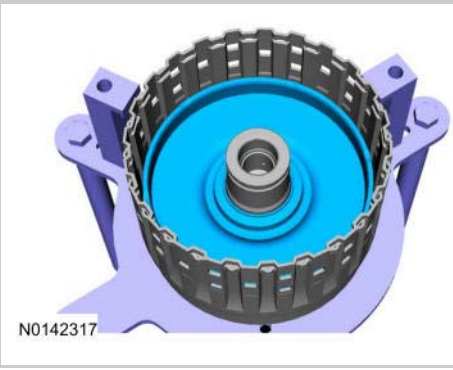
99.

Using the special tool and a press, remove and discard the overdrive clutch balance piston retaining ring. Use Special Service Tool: 307-209 Compressor, Spring Washer.



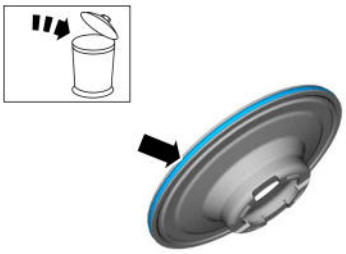
100.

Remove the overdrive clutch balance piston.



101.

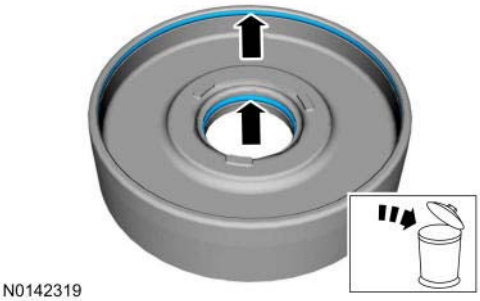
Remove the overdrive clutch return spring.



102.

Remove the overdrive clutch apply piston.

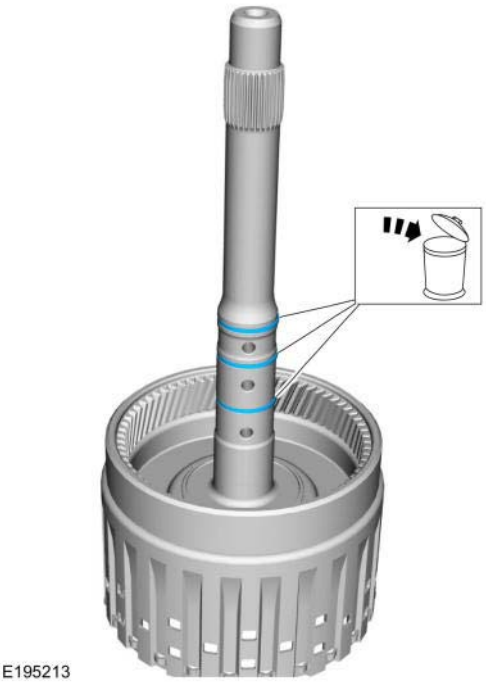
103.



Remove and discard the overdrive clutch balance piston O-ring seal.

N0142318

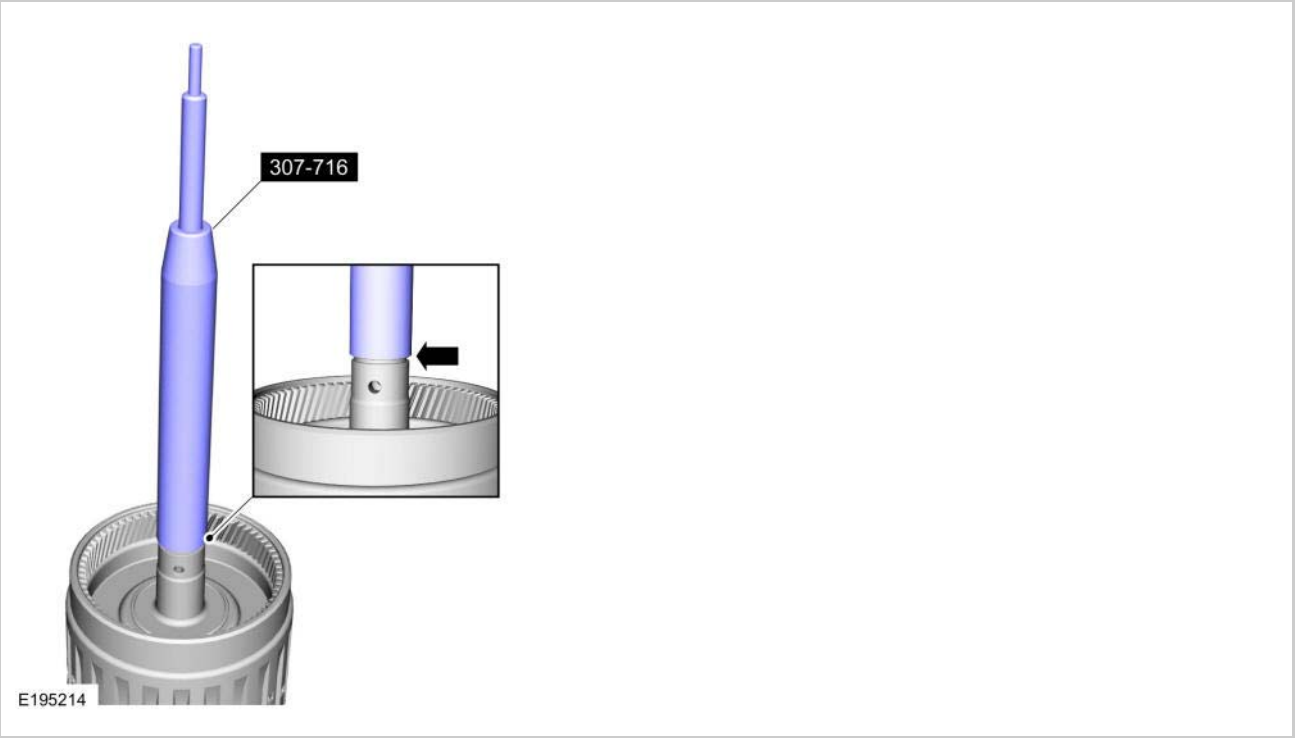
104.



Remove and discard the O-ring seals from the clutch apply piston.

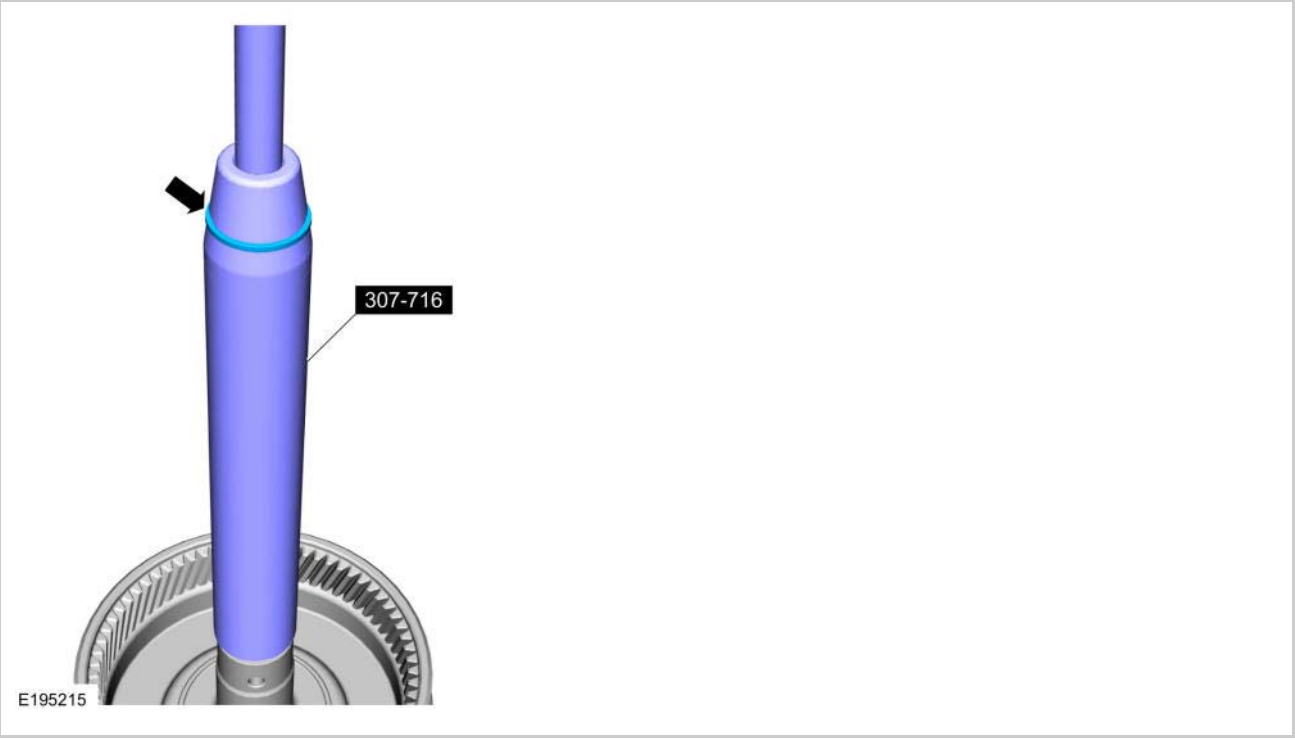
N0142319

105.



Remove and discard the Teflon ® seals.

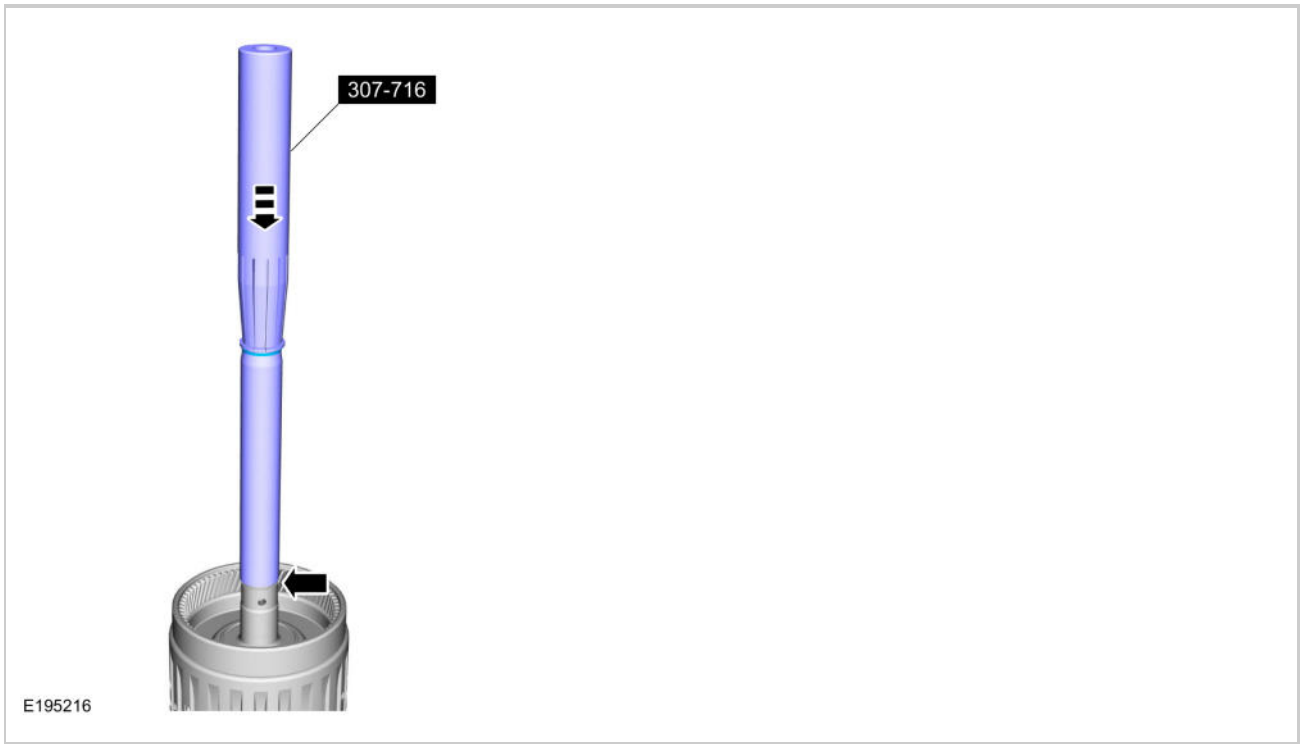
E195213



106.

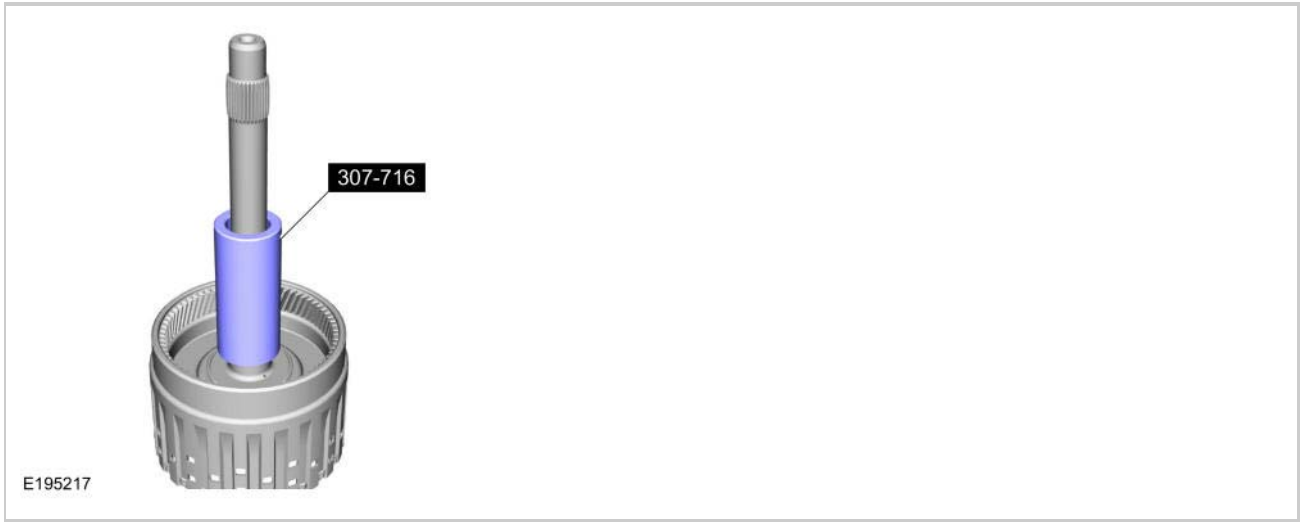
Install the special tool and adjust the special tool to align the bottom edge of the tool with the top edge of the bottom Teflon ® seal groove. Use Special Service Tool: 307-716 Installer, Teflon Seal.

107.



Install a new Teflon ® seal on the special tool.Use Special Service Tool: 307-716 Installer, Teflon Seal.

108.

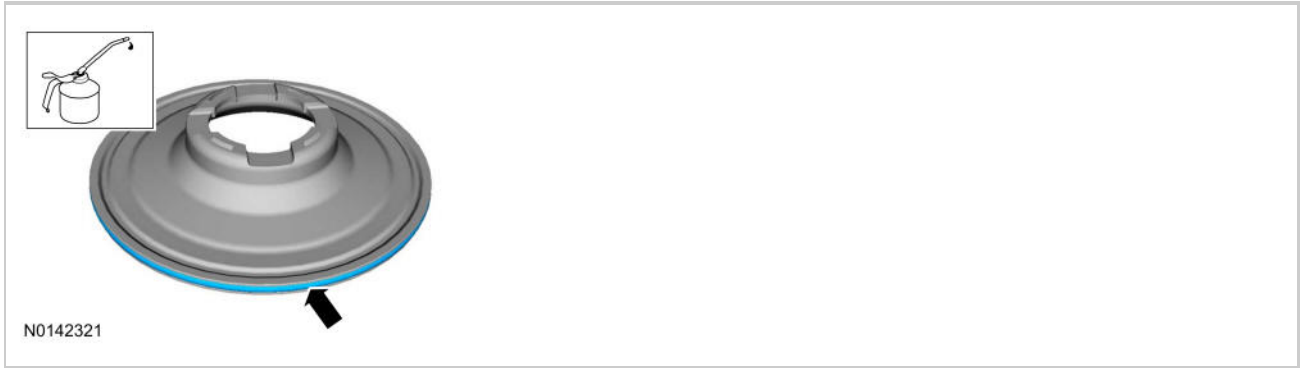


Using the top half of the special tool, slide the Teflon ® seal into the groove. Remove the special

tools and repeat the steps for the other 2 Teflon ® seals. Use Special Service Tool: 307-716 Installer, Teflon Seal.

109.

Install the special tool to size the 3 Teflon ® seals. Use Special Service Tool: 307-716 Installer, Teflon Seal.

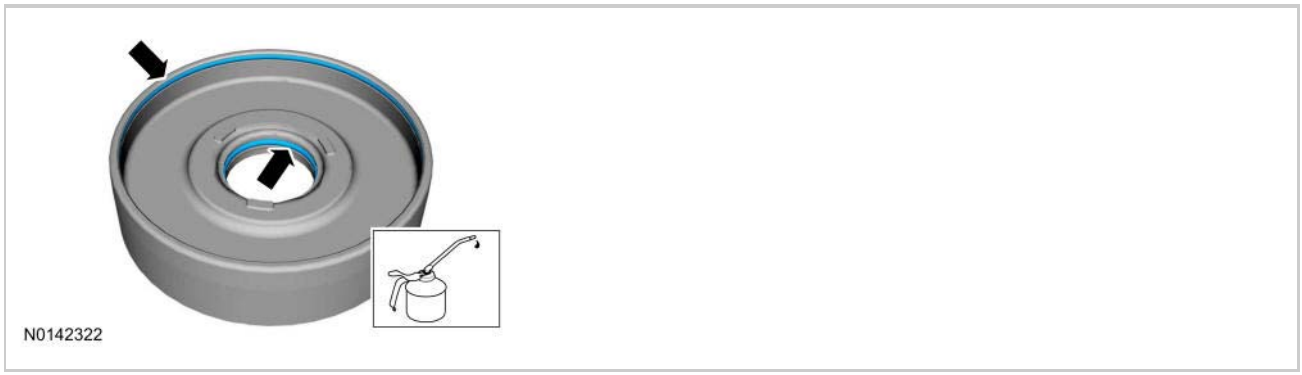


110.

Install a new outer O-ring seal on the overdrive clutch balance piston. Lightly coat the O-ring seal with clean transmission fluid.

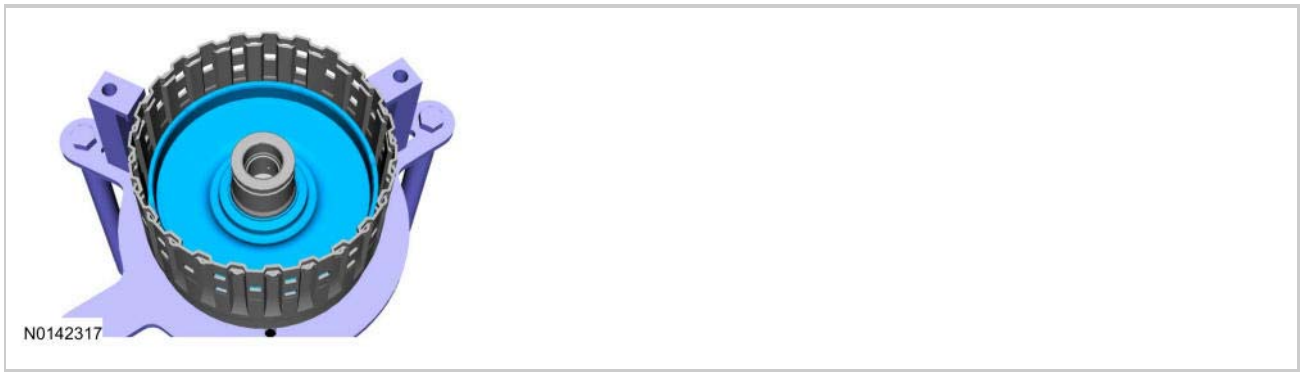
Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



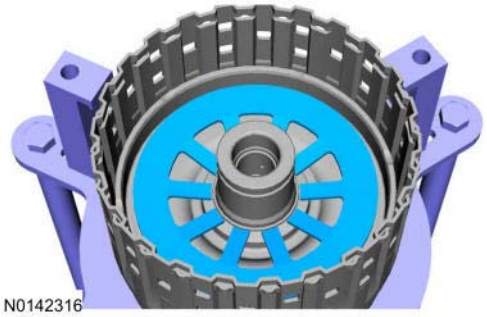
111.

Install a new outer O-ring seal on the overdrive clutch balance piston. Lightly coat the O-ring seals with clean transmission fluid.



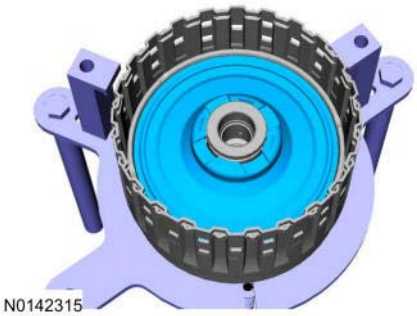
Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



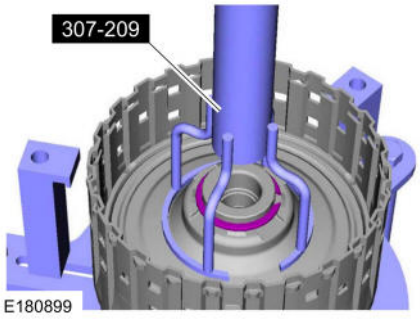
112.

Install the overdrive clutch apply piston into the drum with the O-ring seals and the 3 pads facing down.



NOTE: The fingers on the return spring are facing down toward the piston.

113.
Install the overdrive clutch return spring.

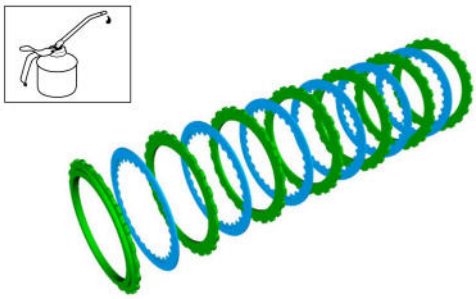


NOTE: The cone shape of the balance piston must face up when installed correctly.

114.
Install the overdrive clutch balance piston.

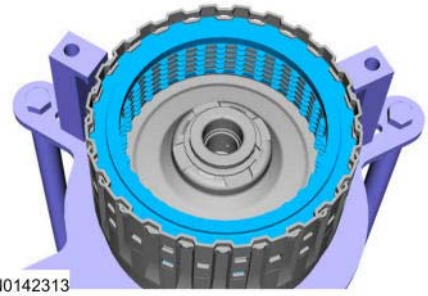
115.

Using the special tool and a press, install the balance piston retaining ring. Use Special Service Tool: 307-209 Compressor, Spring Washer.



NOTE: Friction and steel plate quantity will vary based on engine displacement.

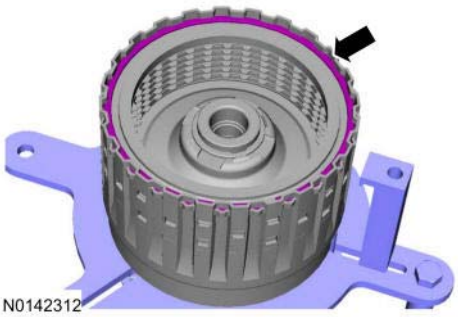
116.
Soak the overdrive clutch in clean transmission fluid. For friction and steel plate quantity, refer to the Clutch Plate Quantity Chart. Refer to: Specifications .



Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

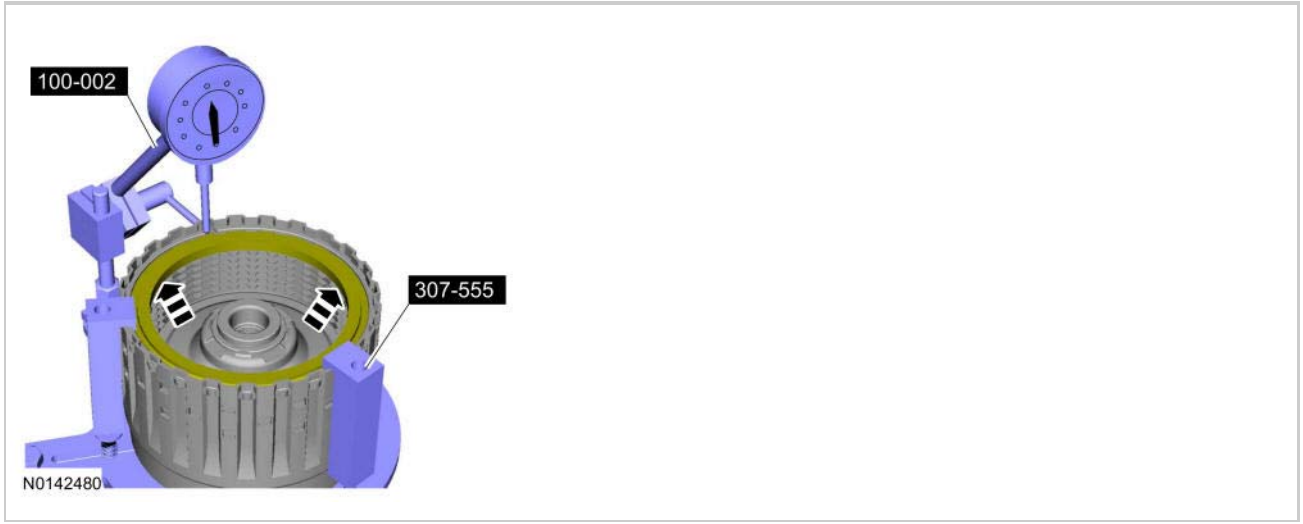
N0142323



117.

Install the overdrive clutch plates, starting with a steel plate and alternating between friction and steel plates and ending with the pressure plate on the top.

N0142313



118.

Install the overdrive clutch pack snap ring.

N0142312

119.

Install the overdrive assembly on the Clutch End Play Gauge and install the dial indicator gauge. Position the plunger so it fits into the opening of the snap ring. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

120.

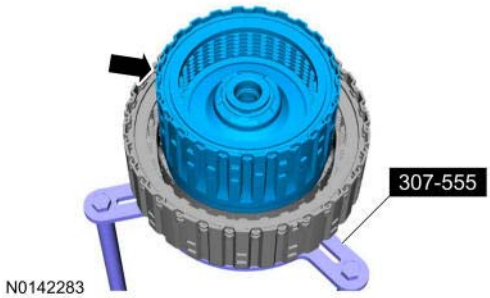
Rotate the overdrive clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Average reading A and B for a total end clearance	

121.

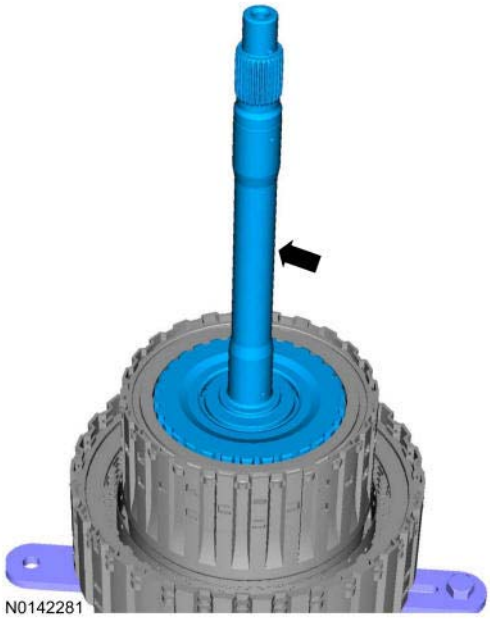
0.5-0.9 mm (0.019-0.035 in)

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, re-measure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, re-measure using a thinner select fit snap ring.



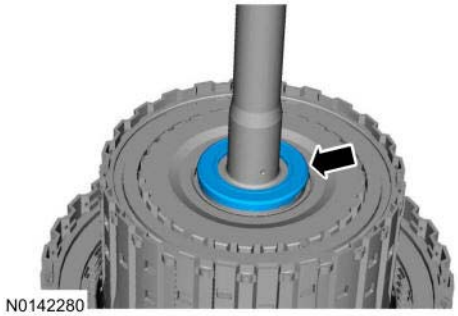
122.

Install the T3 thrust bearing.



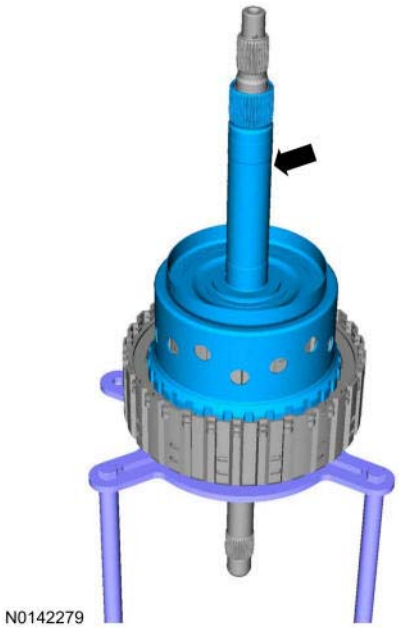
123.

Position the forward clutch assembly in the special tool and install the overdrive clutch pack onto the forward clutch and planetary gear set.Use Special Service Tool: 307-555 End Play Gauge, Clutch.



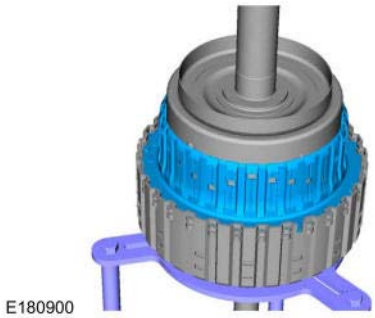
124.

Install the intermediate shaft assembly.



NOTE: Inspect and install new thrust bearings as required.

125.
Install the T4 intermediate shaft bearing.



126.

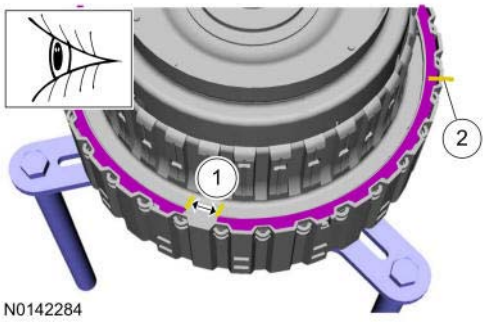
Install the forward clutch hub and sun shaft assembly.

127.

Install a new direct clutch hub.

NOTE: Do not install the snap ring on the forward clutch hub with the snap ring

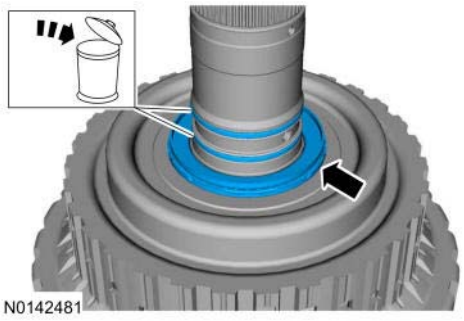
gap in the same position as the original snap ring or damage to the transmission can occur.



128.

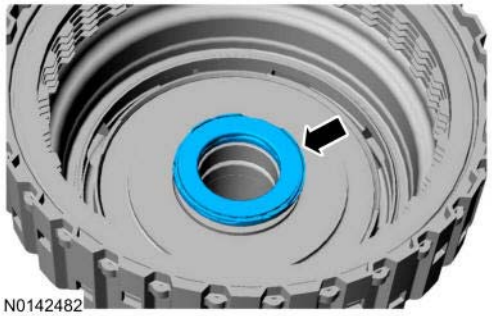
1.

Install the snap ring with the snap ring gap approximately 120 ° away from the mark made on the forward clutch hub during disassembly.



2.

Index mark from original snap ring gap location.



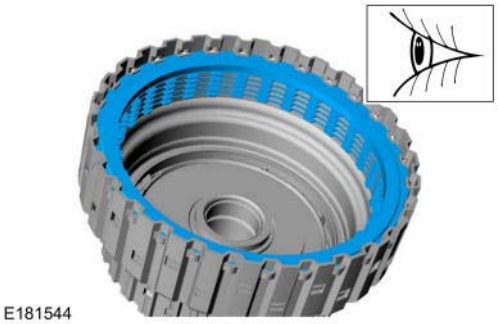
129.

Remove and discard the 2 scarf cut seals and remove the roller bearing.

130.

Remove the T5 thrust bearing.

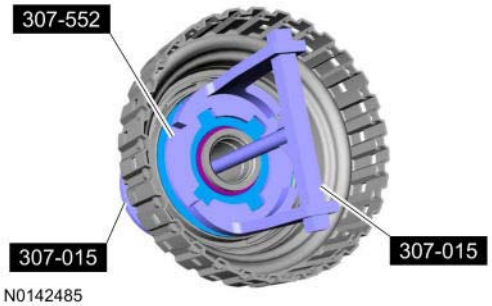
N0142482



131.

Remove the direct clutch snap ring.

N0142483

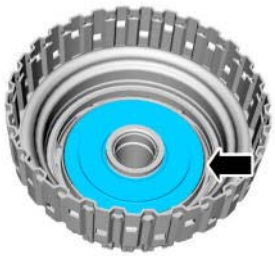


132.

Remove the direct clutch steel and friction plates. Inspect the clutch plates for excessive wear or damage. If the clutch plates are excessively worn or damaged replace as necessary. If the clutch plates are not excessively worn or damaged, they can be reused.

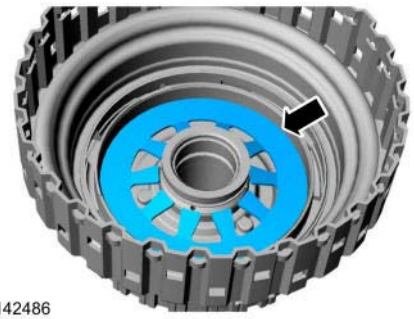
E181544

133.



Install the special tools and remove the direct clutch balance piston snap ring. Use Special Service Tool: 307-015 Compressor, Clutch Spring., 307-552 Compressor, Clutch Spring.

N0142485



134.

Remove the balance piston.

E180912

135.

Remove the direct clutch return spring.

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

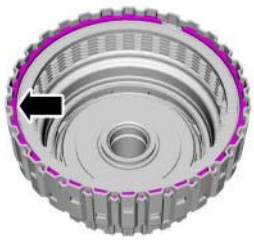
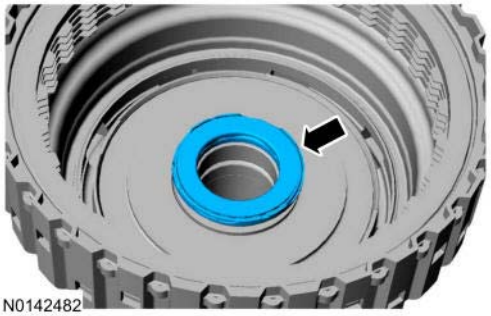
N0142492



147.

Install the direct clutch plates, starting with the wave spring then a steel plate and alternating between steel and friction plates, and ending with the pressure plate on the top.

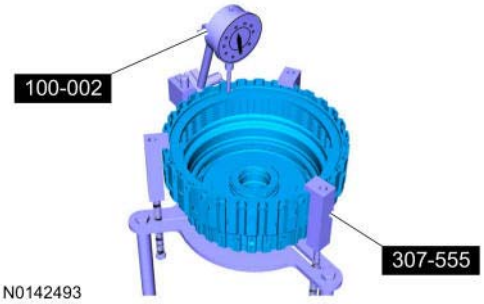
N0142484



148.

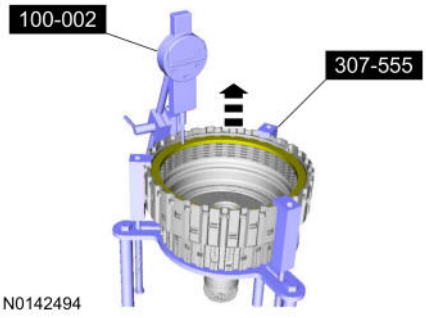
Install the direct clutch snap ring.

N0142483



NOTE: Inspect the thrust bearing for damage and install a new thrust bearing if damage is found.

149.
Install the T5 thrust bearing.



NOTE: All direct clutch plates, friction and steel are of a wave-type design.

150.
Install the direct clutch assembly on the Clutch End Play Gauge and install the dial indicator gauge. Position the plunger so it fits into the opening of the snap ring. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

151.

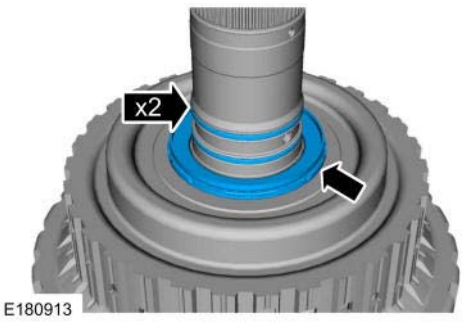
With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

152.

Rotate the direct clutch assembly 180 ° from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Average reading A and B for a total end clearance	

NOTE: If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.



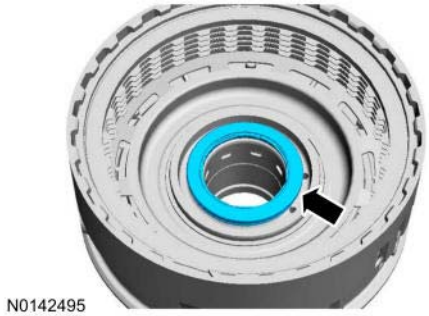
153.

0.5-1.3 mm (0.019-0.051 in)

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, re-measure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, re-measure using a thinner select fit snap ring.

154.

Install 2 new scarf cut seals and the roller bearing.



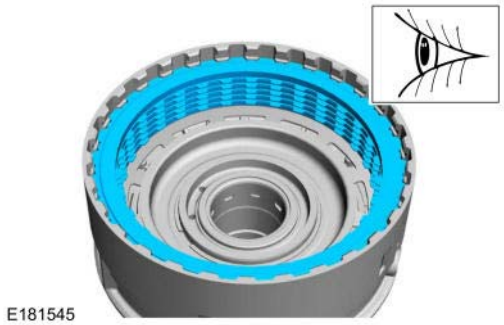
NOTE: The intermediate clutch plate quantity is model dependent on engine size. Failure to install the correct clutch plate quantity will result in transmission failure.

NOTE: The intermediate clutch piston is model dependent on engine size due to the different quantity of intermediate clutch plates. If installing a new intermediate clutch piston, check to make sure the height of the new piston is the same as the original piston. Failure to install the correct piston will result in transmission failure.

155.

Remove the T6 thrust bearing.

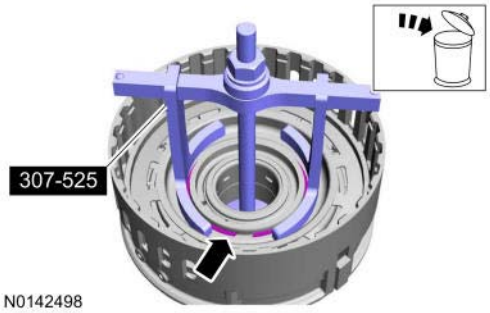
N0142495



156.

Remove the intermediate clutch plate snap ring.

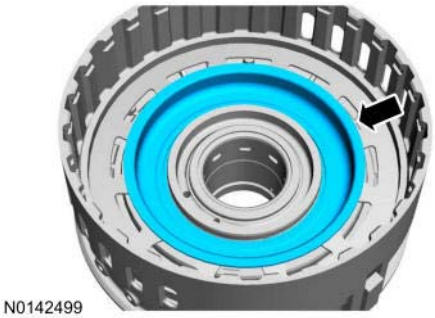
N0142496



157.

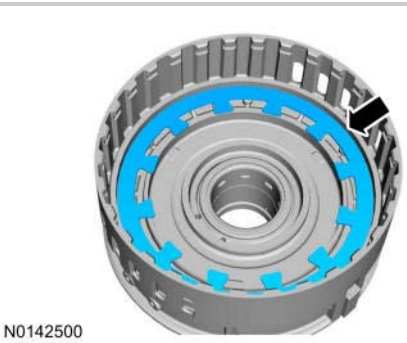
Remove the intermediate clutch plates. Inspect the clutch plates for excessive wear or damage. If the clutch plates are excessively worn or damaged replace as necessary. If the clutch plates are not excessively worn or damaged, they can be reused.

E181545



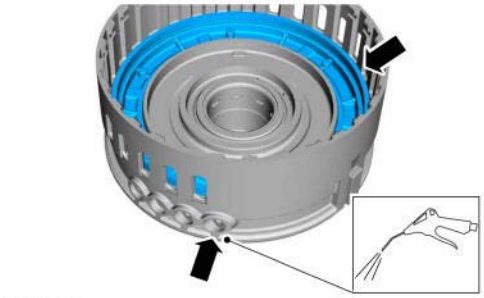
158.

Using the special tool, remove and discard the intermediate clutch return spring retainer. Use Special Service Tool: 307-525 Compressor, Clutch Spring.



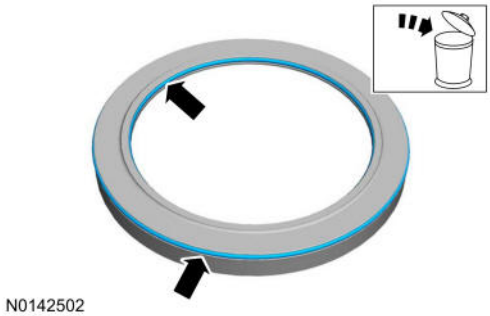
159.

Remove the intermediate clutch return spring top plate.



160.

Remove the intermediate clutch return spring.

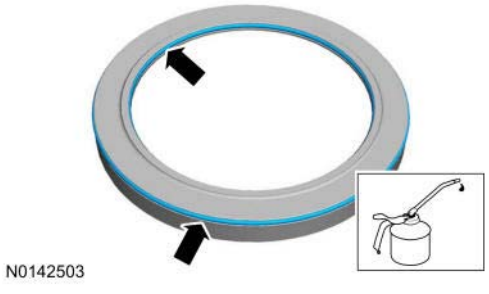


161.

Applying a slight amount of air to the port, remove the intermediate clutch piston.

162.

Remove and discard the inner and outer intermediate clutch piston O-ring seals.

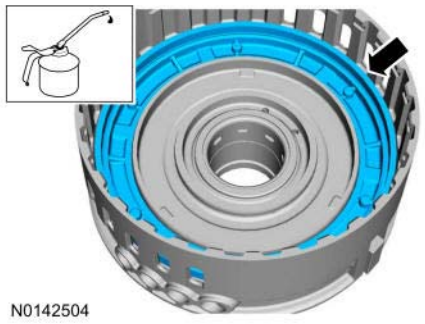


163.

Install the inner and outer intermediate clutch piston O-ring seals.

Material

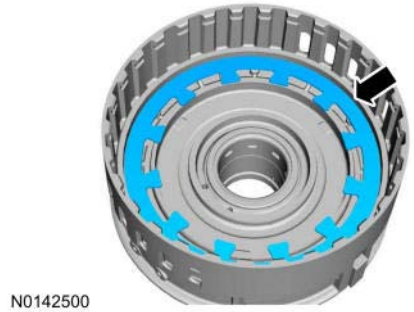
: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



164.

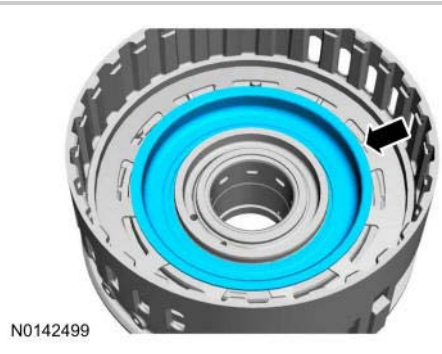
Lightly coat the O-ring seals in clean automatic transmission fluid and install the intermediate clutch piston.

Material



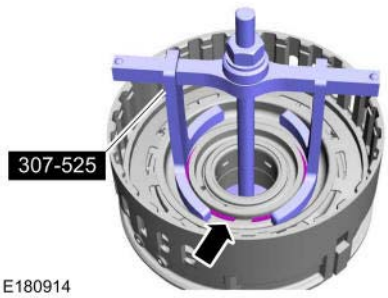
: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.)

(MERCON ® LV) (WSS-M2C938-A)



165.

Install the intermediate clutch return spring.

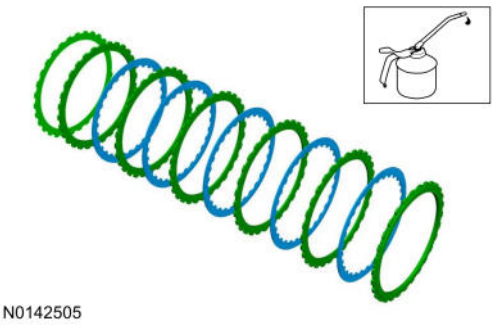


166.

Install the intermediate clutch return spring top plate.

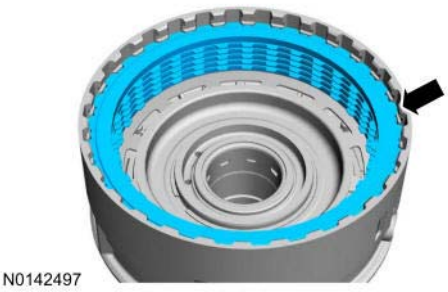
167.

Using the special tool, install a new intermediate clutch return spring retainer. Use Special Service Tool: 307-525 Compressor, Clutch Spring.



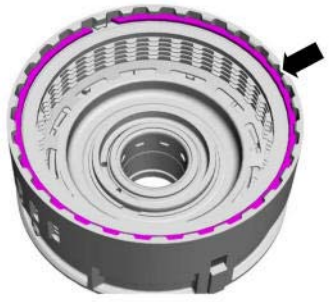
NOTE: Friction and steel plate quantity will vary based on engine displacement.

168.
Soak the intermediate clutch plates in clean automatic transmission fluid. For friction and steel plate quantity, refer to the Clutch Plate Quantity Chart. Refer to: Specifications .



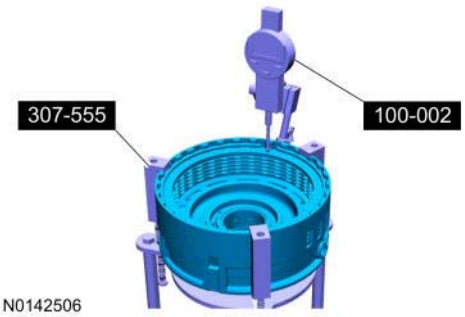
Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



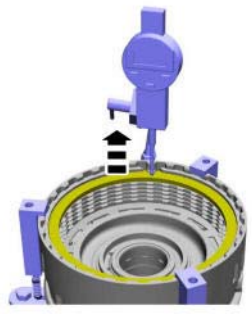
169.

Install the intermediate clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate.



170.

Install the intermediate clutch plate snap ring.



NOTE: All intermediate clutch plates, friction and steel are of a wave-type design.

171.
Install the intermediate clutch assembly on the Clutch End Play Gauge and install the dial indicator gauge. Position the plunger so it fits into the opening of the snap ring.Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.

172.

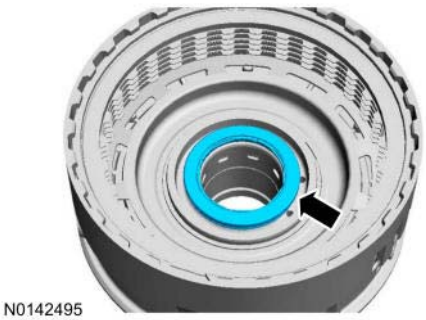
With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

173.

Rotate the intermediate clutch assembly 180 ° from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Average reading A and B for a total end clearance	

NOTE: If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.



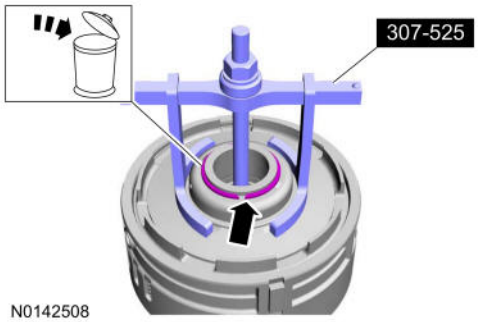
174.

0.7-1.1 mm (0.027-0.043 in)

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, re-measure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, re-measure using a thinner select fit snap ring.

175.

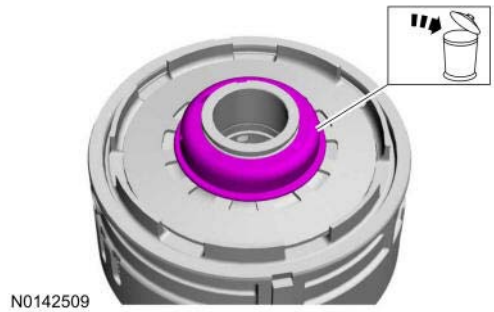
Install the T6 thrust bearing.



N0142495

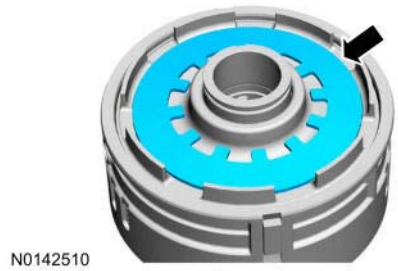
NOTE: The low/reverse clutch plate quantity is model dependent on engine size. Failure to install the correct clutch plate quantity will result in transmission failure.

NOTE: The low/reverse clutch plates are installed in the case during the transmission assembly procedure.



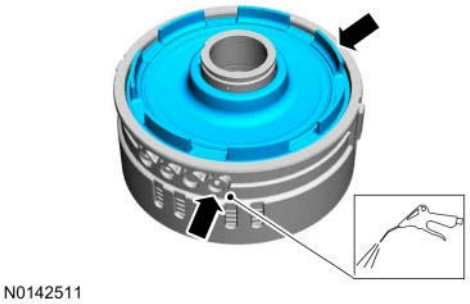
176.

Using the special tool, remove and discard the low/reverse clutch return spring retainer. Use Special Service Tool: 307-525 Compressor, Clutch Spring.



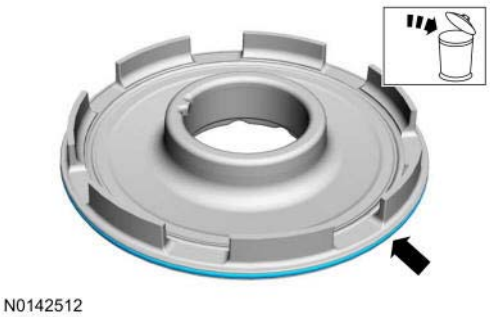
177.

Remove and discard the low/reverse clutch return spring retainer.



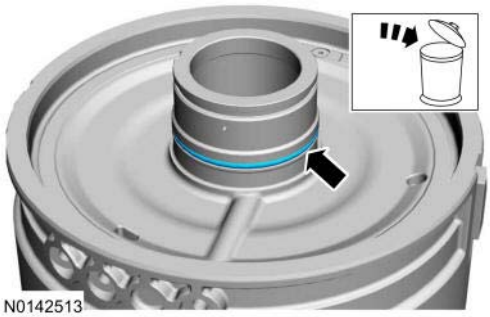
178.

Remove the low/reverse clutch return spring.



179.

Apply a slight amount of air to the port, remove the low/reverse clutch piston from the low/reverse clutch drum.

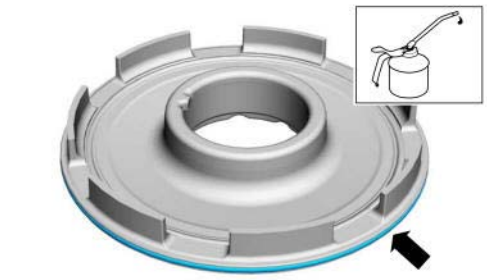


180.

Remove and discard the low/reverse outer piston O-ring seal.

181.

Remove and discard the low/reverse drum O-ring seal.

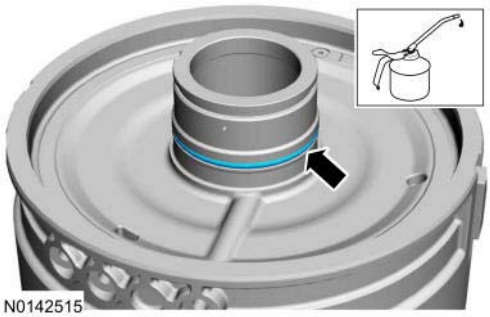


182.

Install new low/reverse outer piston O-ring seal.

Material

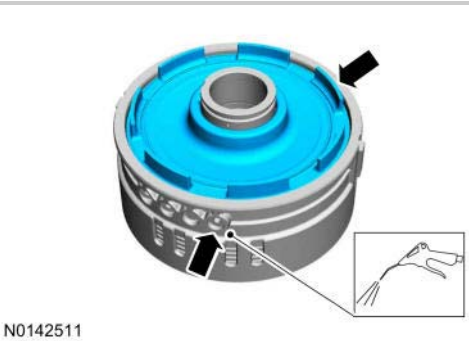
: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)



N0142514

183.

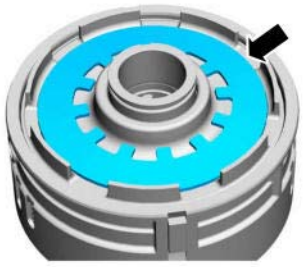
Install a new low/reverse drum inner O-ring seal.



Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

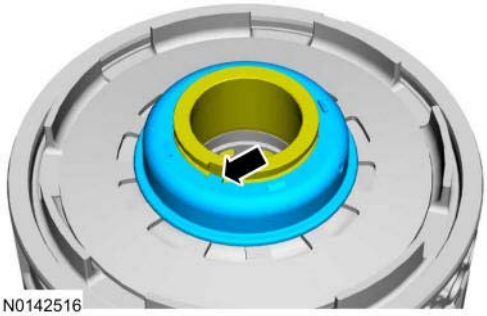
N0142515



184.

Align the alignment tab on the piston with the groove in the center support and install the low/reverse piston.

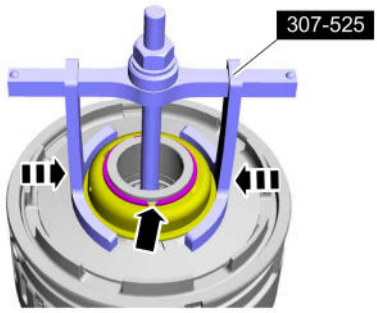
N0142511



185.

Install the low/reverse clutch return spring.

N0142510

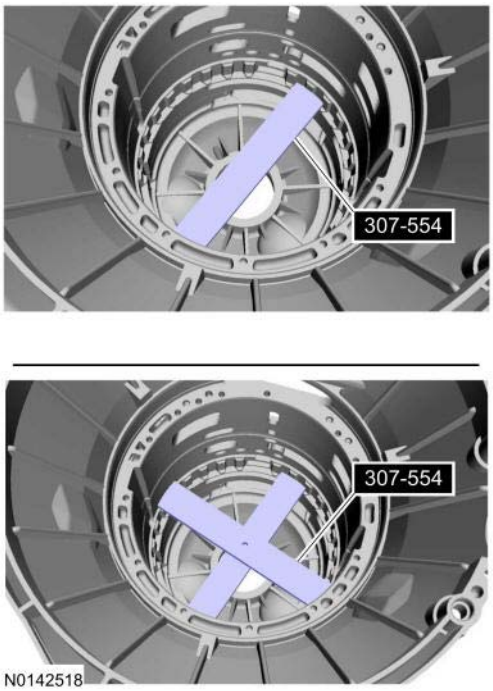


186.

Install a new low/reverse clutch return spring retainer. Align the alignment tab on the retainer with the groove in the center support and install the low/reverse piston return spring retainer.

N0142516

187.

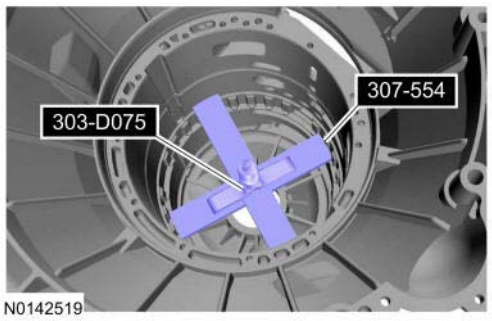


Using the special tool, compress the low/reverse clutch return spring and install the retaining ring.Use Special Service Tool: 307-525 Compressor, Clutch Spring.

N0142517

NOTE: All low/reverse clutch plates, friction and steel are of a wave-type design.

188.
Install the special tool into the case. Use Special Service Tool: 307-554 Gauge, D-Clutch Measurement.

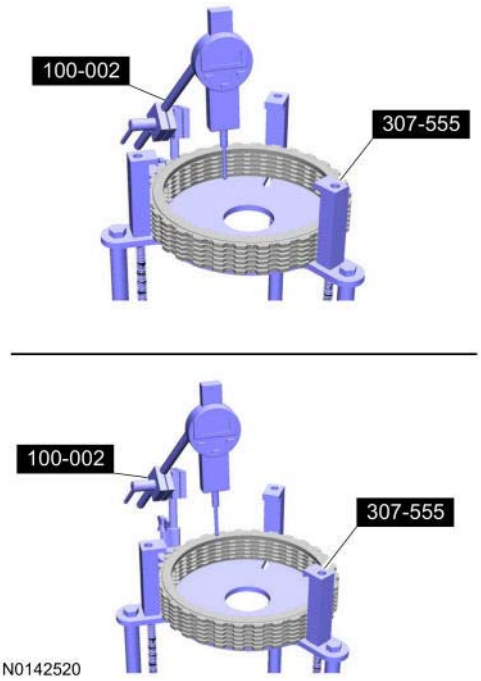


189.

With the special tool positioned in the case, use the depth gauge to measure the case stop depth.

Description	Reading
Measure the distance from the top of the upper gauge bar to the top of the lower gauge bar. Record this reading as the case measurement. Record as reading A.	

Use Special Service Tool: 307-554 Gauge, D-Clutch Measurement. Use the General Equipment: Depth Gauge



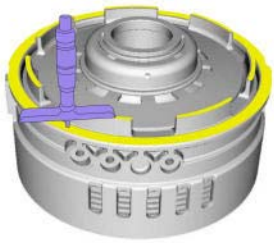
190.

Measure the clutch pack height.

Description	Reading
Place the low/reverse clutch pack on the Clutch	

End Play Gauge with the wave spring down and the pressure plate on top. Place the plunger of the dial indicator on the pressure plate. Slide the clutch to the side so the plunger of the dial indicator is touching the gauge plate of Clutch End Play Gauge. Zero out the dial indicator. Carefully lift the plunger enough to slide the clutch pack under the plunger to take a reading. Record this reading. Rotate the clutch pack 180 degrees and take a second reading. Average the readings. Record this as B.	

Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-555 End Play Gauge, Clutch.



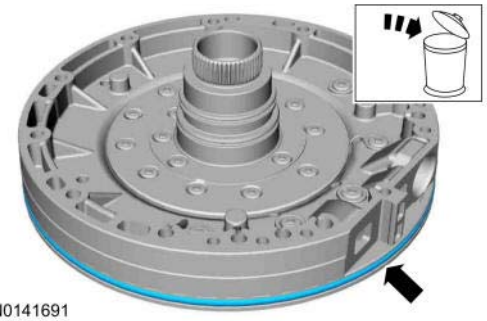
191.

Using a depth gauge, measure the piston to center support shoulder height.

Description	Reading
Measure the piston to center support shoulder height. Record this measurement. Rotate the center support 180 degrees and record this measurement. Average the 2 measurements. Record this as C.	

Use the General Equipment: Depth Gauge

N0142521

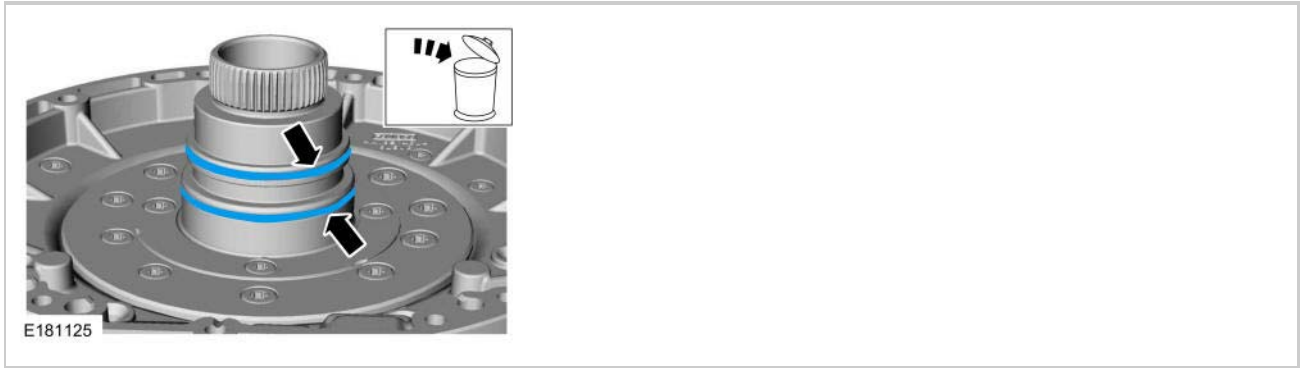


192.

Calculate the end clearance. Compare the end clearance to the specification. If the end clearance is out of specification, select the next thinner or thicker plate as required and repeat the steps to measure the clutch height.

Description	Reading
Subtract B and C from A to determine end clearance	
Total C measurement	
End clearance specification	1.0-1.6 mm (0.039-0.062 in)

193.



Remove and discard the front pump O-ring seal.

N0141691

194.

Remove and discard the front pump seal rings.

195.

1.

Pump body

2.

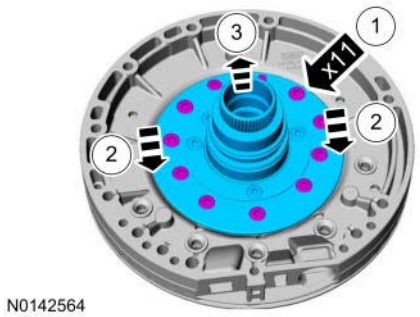
Pump plate assembly

3.

Index-mark the pump body to the pump plate assembly.

196.

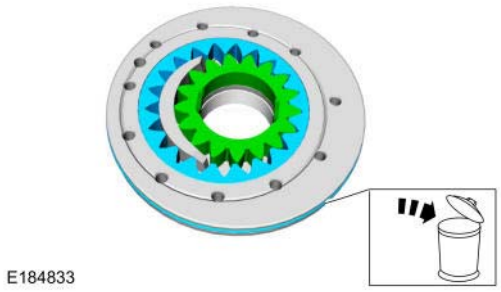
1.



Loosen the pump plate assembly-to-pump body bolts.

2.

Push down on the loose pump plate assembly-to-pump body bolts to remove the pump body from the pump plate assembly.



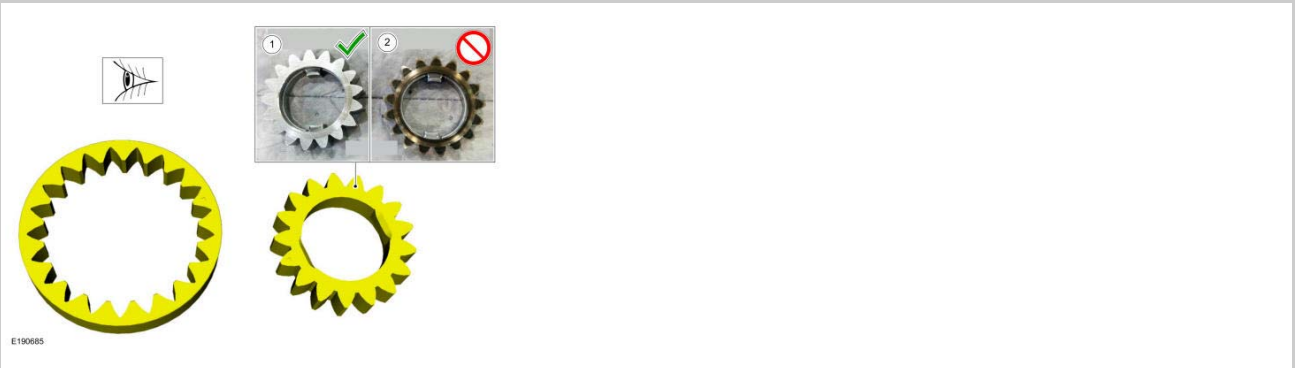
3.

Remove the bolts and the pump body.

197.

Remove and discard the pump body outer seal and remove the fluid pump gears.

NOTE: Clean all pump components in solvent and dry the parts with compressed air. Inspect the pump gears, faces, gear teeth and mating surfaces for damage or scoring. Install a new pump if necessary.



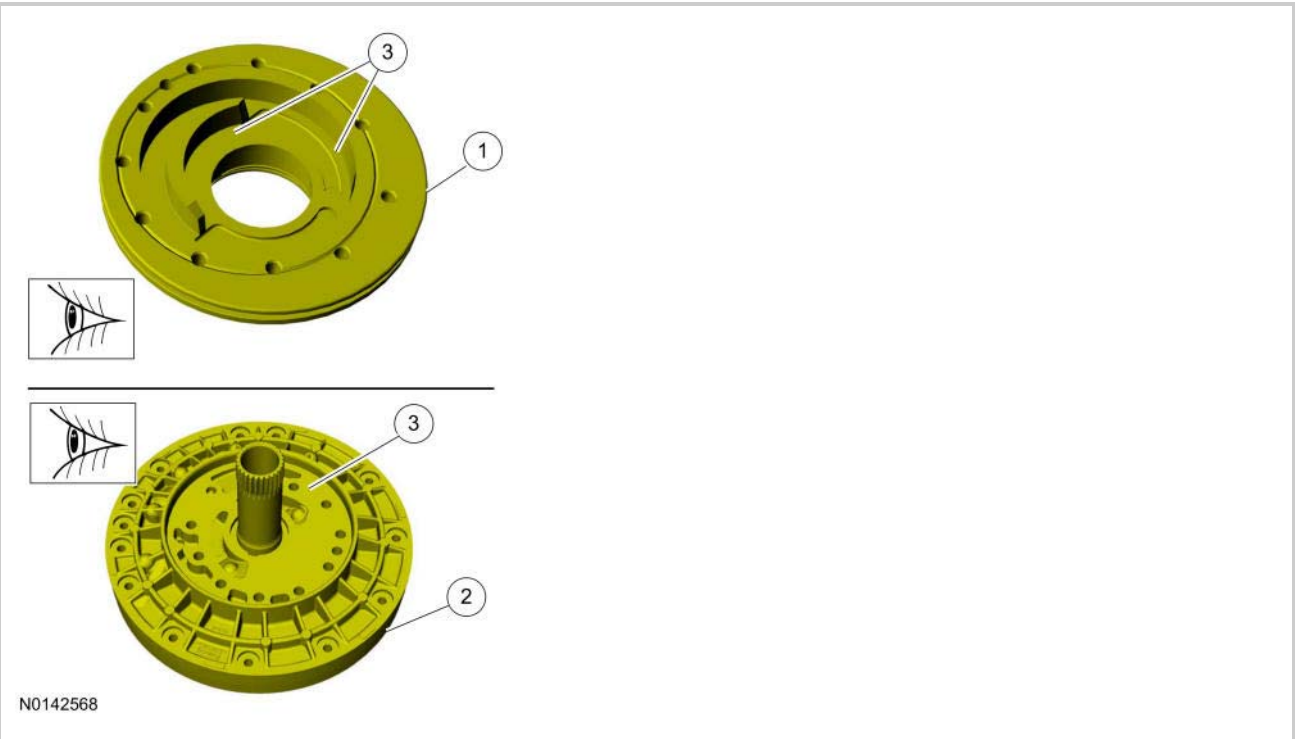
198.

NOTE: Some pump internal wear mark or light scratches is normal.

1.
Acceptable wear.

2.

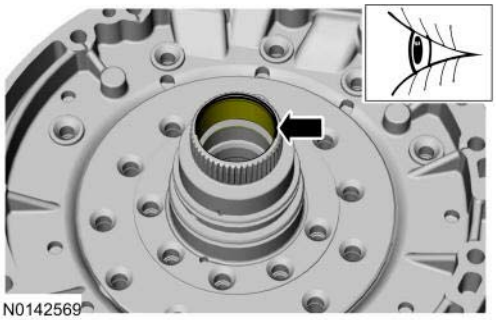
If the gears are burned, discolored or scored or if the teeth are damaged, install a new pump.



199.

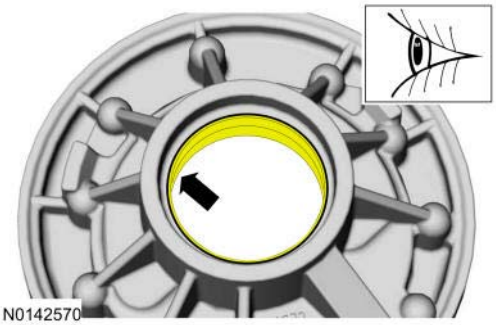
Inspect the pump body for damage or scoring.

Inspect the pump plate assembly for damage or scoring.



Inspect the pump gear thrust surfaces for damage or scoring.

Install a new pump if necessary.

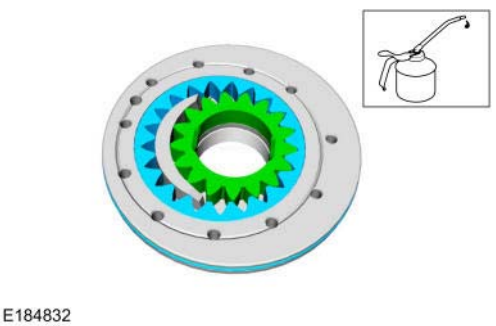


200.

Inspect the input shaft bushing for damage or scoring. If the bushing is damaged, install a new pump.

201.

Inspect the torque converter hub bushing for damage or scoring. If the bushing is damaged, install a new pump.



NOTE: Prior to installation, lightly lubricate the pump gears with clean automatic transmission fluid.

202.
Install the pump gears with the dot facing the pump plate assembly and install a new pump body outer seal. Lubricate the pump gears and the seal with clean automatic transmission fluid.

Material

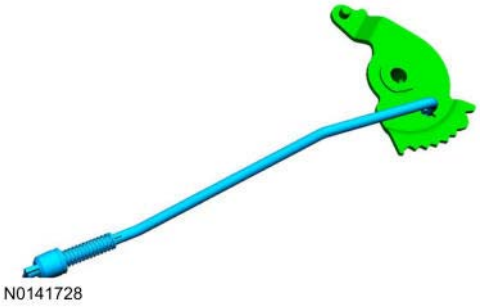
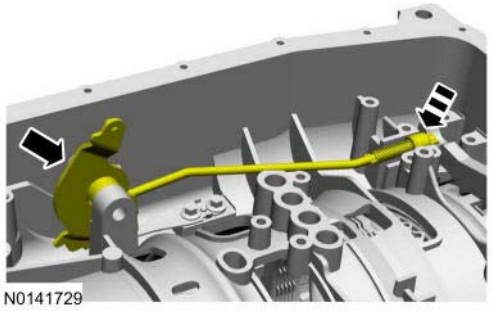
212.

Install a new manual control lever shaft seal on the special tool. Use Special Service Tool: 307-559 Installer, Shifter Fluid Seal.



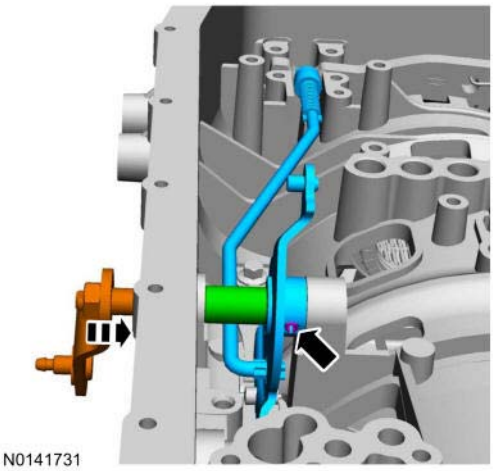
213.

Using the special tool, install the manual control lever shaft seal. Use Special Service Tool: 307-559 Installer, Shifter Fluid Seal.



214.

Assemble the manual control lever detent plate assembly and park pawl actuator rod.

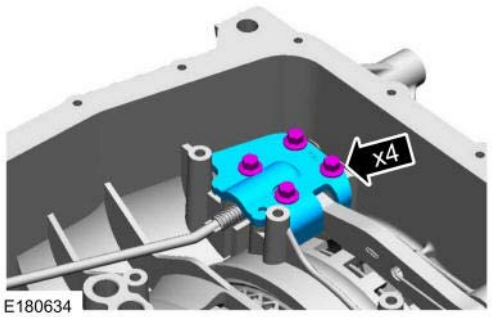


215.

Position the manual valve detent lever and park pawl actuator rod assembly in the transmission case.

216.

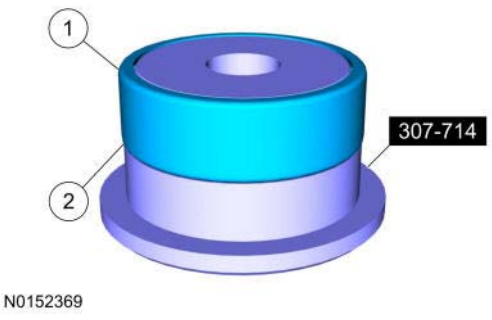
Position the manual control lever spacer in place and slide the manual control lever shaft into the case and the manual lever detent plate. Align the roll pin hole in the manual control lever detent plate with the roll pin hole in the manual control lever shaft and install a new roll pin.



217.

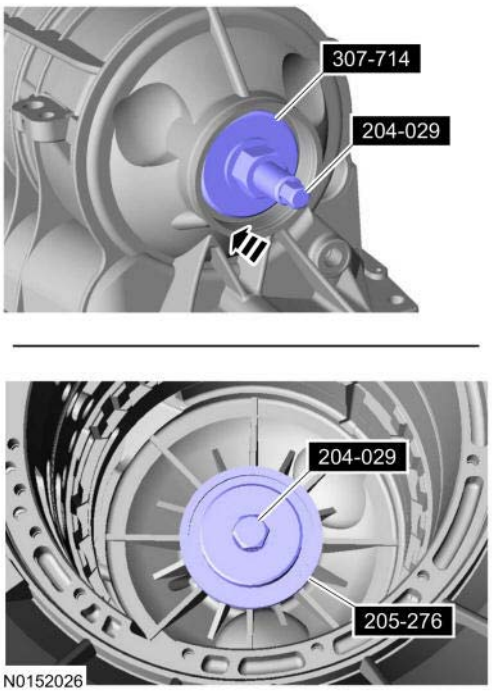
Install the park rod actuating plate and the bolts.

Torque



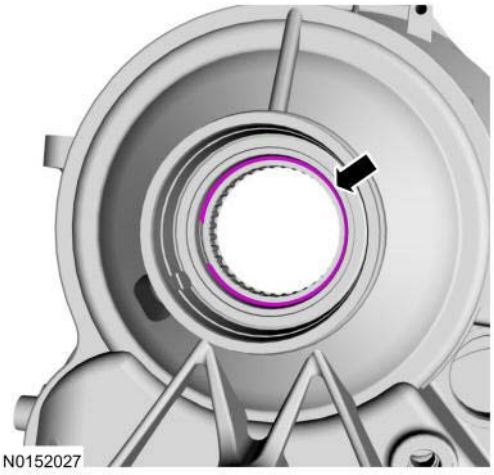
: 106 lb.in (12 Nm)

218.



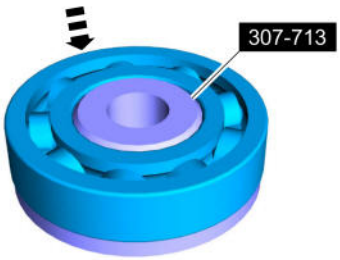
Install the needle bearing on the special tool so that the rounded end faces up.

Flat bearing surface (snap ring side) facing down. Use Special Service Tool: 307-714 Installer, Needle Bearing.



219.

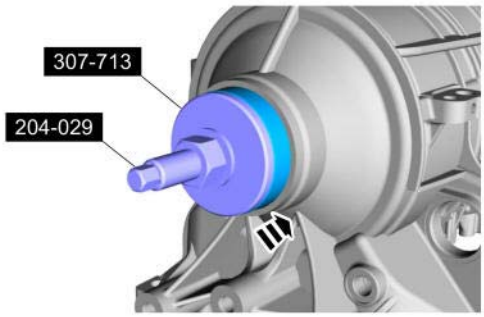
Assemble the special tools and install the bearing in the transmission case.Use Special Service Tool: 204-029 Drawbar., 205-276 Installer, Front Wheel Hub Seal., 307-714 Installer, Needle Bearing.



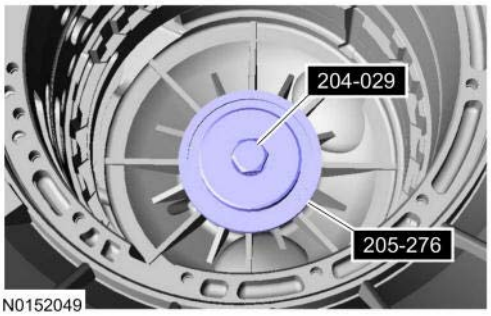
220.

Install the snap ring.

221.



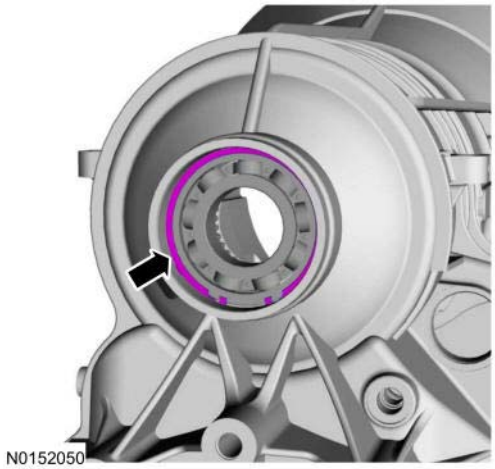
Install the bearing on the special tool.Use Special Service Tool: 307-713 Installer, Roller Bearing.



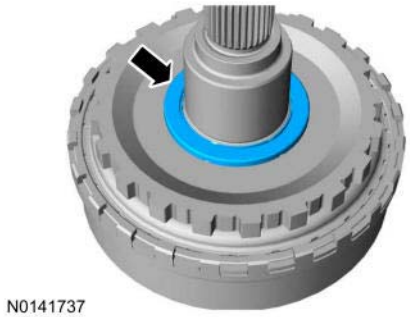
N0152047

222.

Assemble the special tools and install the bearing in the transmission case. Use Special Service Tool: 204-029 Drawbar., 205-276 Installer, Front Wheel Hub Seal., 307-713 Installer, Roller Bearing.



N0152049



223.

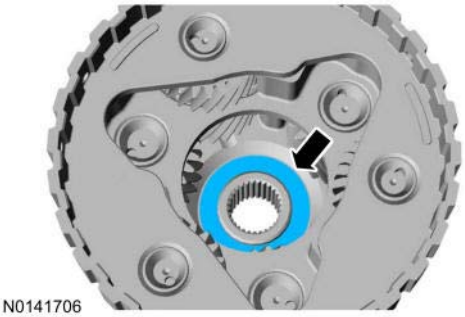
Install the snap ring.

224.

Install the T11 bearing, on the planetary ring gear and output shaft assembly.

225.

Install the rear planetary ring gear and output shaft assembly.



226.

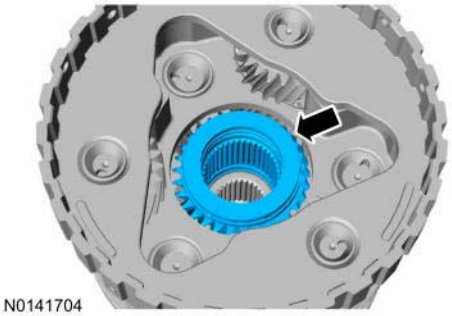
Install the T10 thrust bearing on the output shaft assembly.

N0141738

227.

Install the T9 roller bearing race into the bottom of the carrier.

N0141706



228.

Install the top T8 and the bottom T9 roller bearings onto the sun gear.

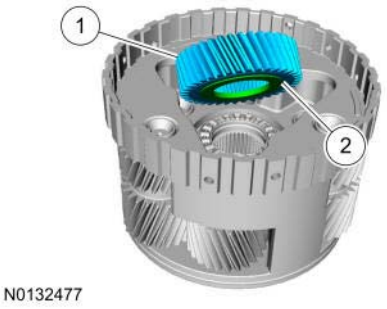
N0141705

NOTE: When installing the sun gear, make sure that the TAPERED EDGE is facing UP toward the torque converter housing.

229.
Install the sun gear into the planetary assembly.

NOTE: Be sure the bearing race is installed in the sun gear.

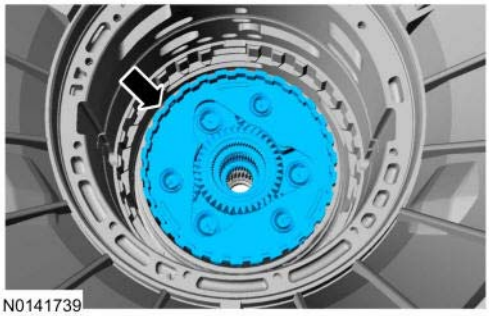
230.



1.

low/reverse sun gear

2.

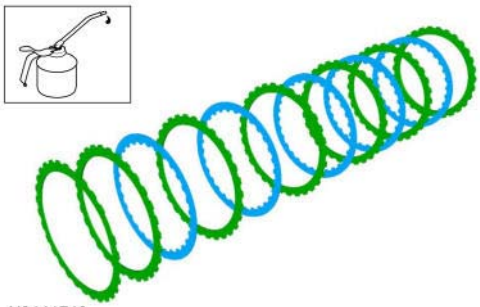


bearing race

Install the low/reverse sun gear and bearing race into the planetary carrier with the race side facing down.

NOTE: Place the manual control lever in PARK when installing the rear planetary gearset to hold the rear ring gear stationary.

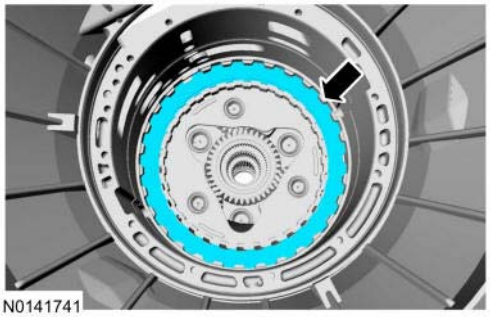
231.
Install the planetary carrier.



N0141739

NOTE: Friction and steel plate quantity are model dependent and vary based on engine displacement.

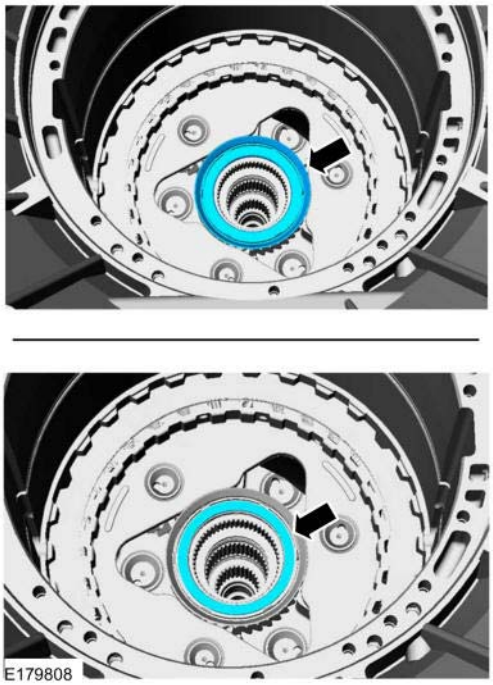
232.
Soak the low/reverse clutch plates in clean automatic transmission fluid. For friction and steel plate quantity, refer to the Clutch Plate Quantity Chart. Refer to: Specifications .



Material

: Motorcraft ® MERCON ® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON ® LV) (WSS-M2C938-A)

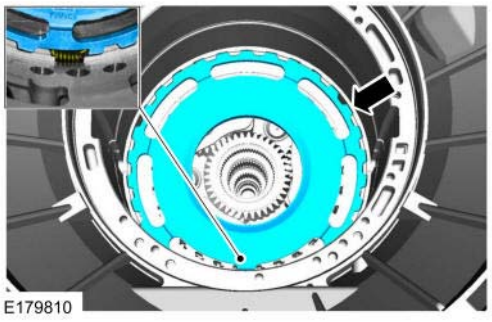
N0141740



233.

Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates and ending with the wave spring plate on the top.

N0141741



NOTE: Inspect the T7 thrust bearing and selective shim for damage or scoring.

234.
Install the T7 thrust bearing and the selective shim.

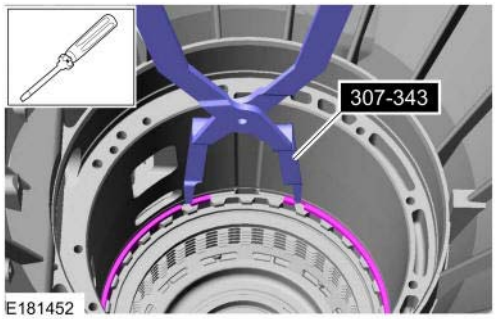
NOTE: Align the one-way clutch in the transmission case so the bias spring fits into the transmission case.

235.
Install the one-way clutch clocked so that the bias spring can engage the one-way clutch and the case.

236.

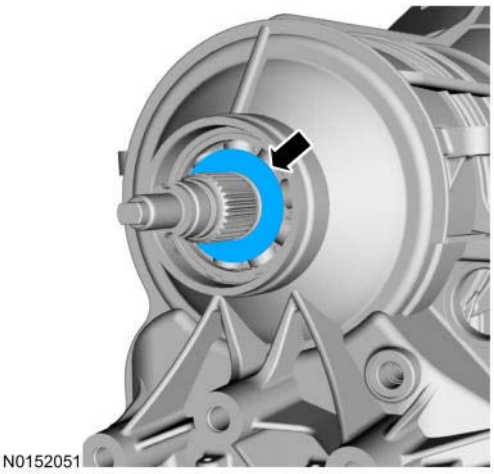
Install the bias spring.

NOTE: Make sure the center support feed holes are lined up with the feed holes in the case.



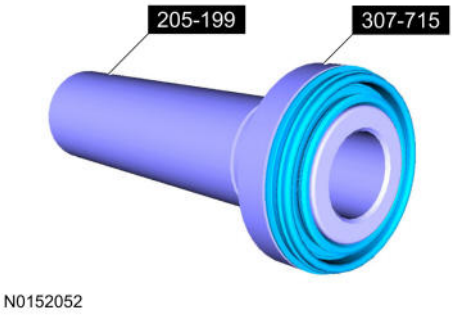
237.
Install the center support into the case.

NOTE: Rotate the case to a horizontal position.



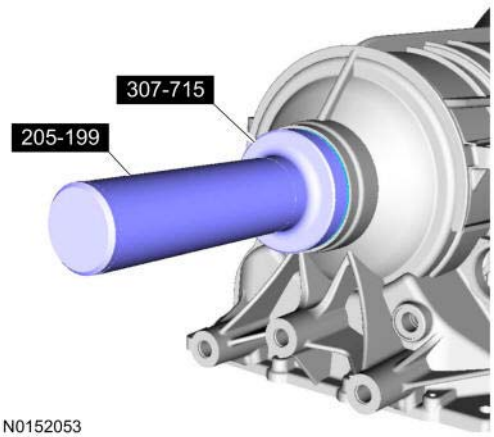
NOTE: Install the snap ring with the beveled surface facing up and the snap ring gap in the 3 o'clock or the 9 o'clock position.

238.
Using the special tool, install the center support snap ring. Using a tool, make sure the snap ring is fully seated. Use Special Service Tool: 307-343 Retaining Ring Pliers.Use the General Equipment: Flat Headed Screw Driver



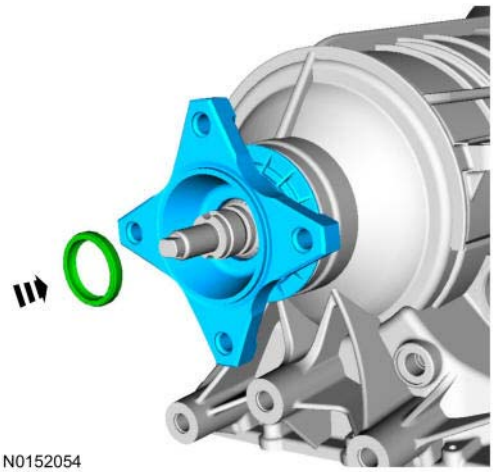
NOTE: Rotate the case to a vertical position.

239.
Install the slip plane washer.



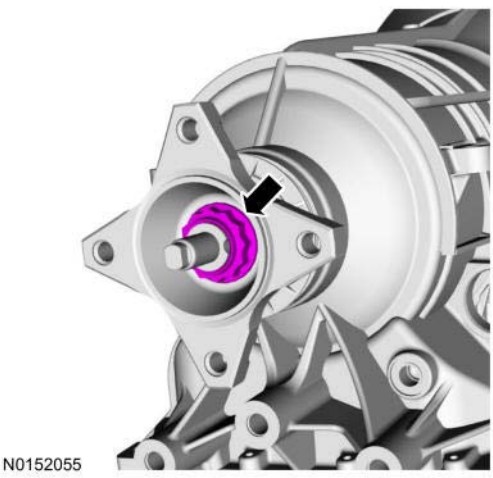
240.

Position a new output shaft seal on the special tool.Use Special Service Tool: 205-199 (T83T-3132-A1) Installer, Spindle/Axle Shaft., 307-715 Installer, Output Seal (4X2).



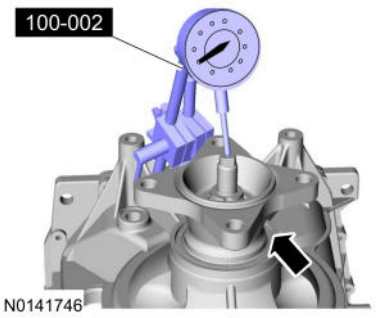
241.

Using the special tools, install the output shaft seal.Use Special Service Tool: 205-199 (T83T-3132-A1) Installer, Spindle/Axle Shaft., 307-715 Installer, Output Seal (4X2).



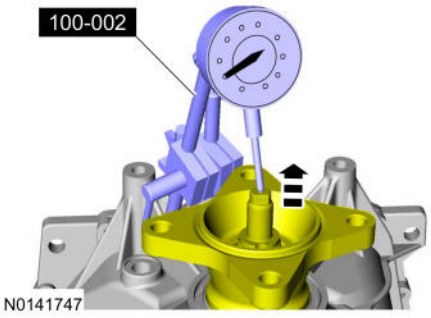
242.

Install the output shaft flange and the output shaft flange seal.



243.

Loosely install a new output shaft flange retaining nut.

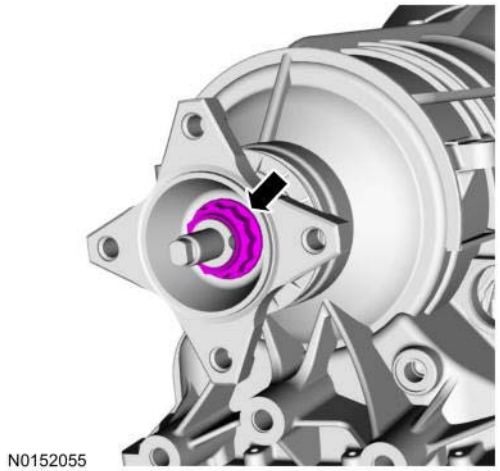


NOTE: Loosely install the flange nut or an inaccurate reading may be recorded.

244.
Install the special tool on the transmission case and position the plunger on the output shaft flange. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

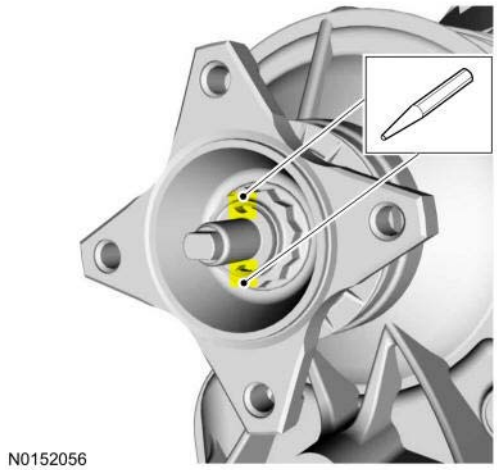
NOTE: Loosely install the flange nut or an inaccurate reading may be recorded.

245.
Lift up on the output shaft flange and record the reading. The reading should be within 0.6-0.9 mm (0.024-0.035 in). If the reading is not within specification, install a different (either thinner or thicker) rear planetary gearset selective shim.Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.



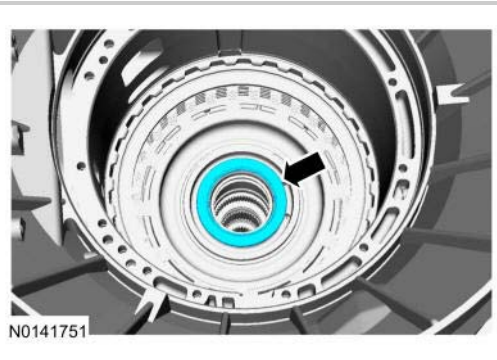
246.

Tighten the output shaft flange nut.



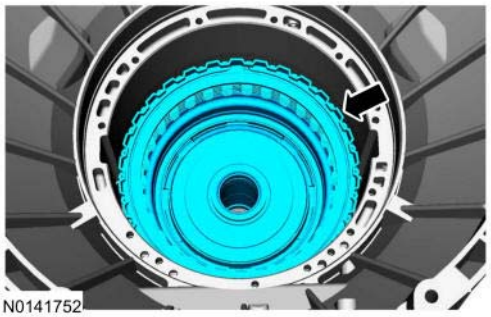
Torque

: 59 lb.ft (80 Nm)



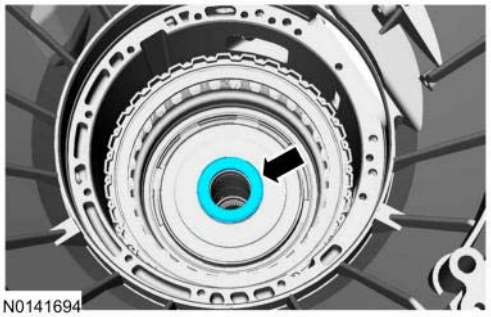
247.

After installing the new output shaft flange retaining nut, stake the slots to prevent it from coming loose.Use the General Equipment: Punch



NOTE: Rotate the transmission in the vertical position with the torque converter housing facing up.

248.
Install the T6 bearing.

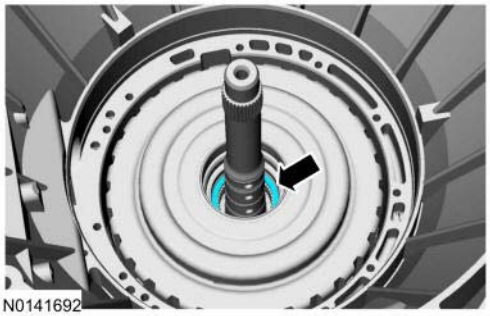


249.

Install the direct clutch assembly.

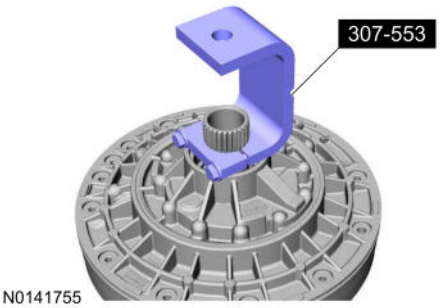
250.

Install the T5 roller bearing on the direct clutch assembly.



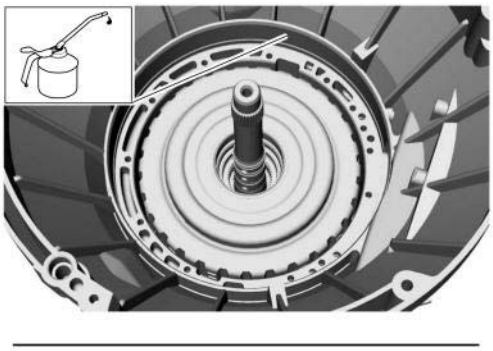
251.

Install the forward/overdrive clutch assembly.



252.

Install the selective shim.

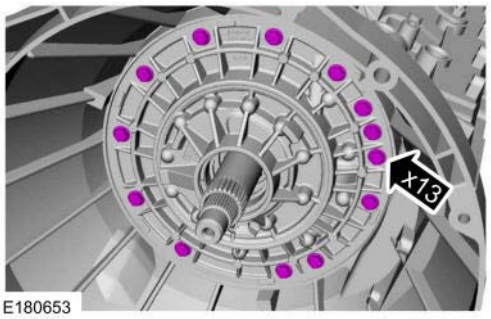


253.

Install the special tool on the front pump.Use Special Service Tool: 307-553 Remover, Transmission Fluid Pump.

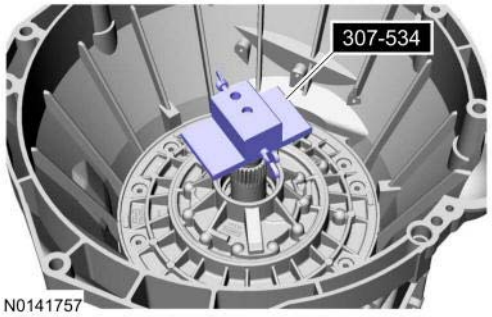
254.

Lubricate the transmission case pump bore with petroleum jelly. Using the special tool, position the pump assembly in the case and rotate the pump to insert the pump splines into the front planetary sun gear. Rotate the pump to align the pump-to-case bolts and push the pump into the case. Use Special Service Tool: 307-553 Remover, Transmission Fluid Pump.



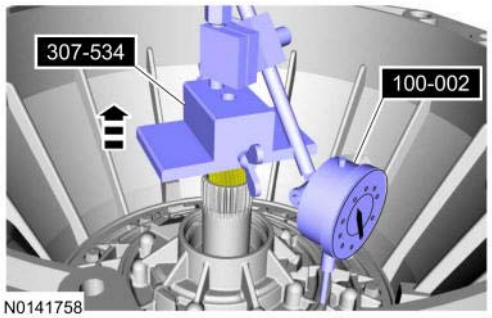
NOTE: Failure to replace the fasteners will result in transmission fluid leakage.

255.
Install new front pump-to-case bolts and washers. Tighten in a crisscross pattern.



Torque

: 89 lb.in (10 Nm)



256.

Install the special tool on the input shaft.Use Special Service Tool: 307-534 End Play Gauge, Transmission.

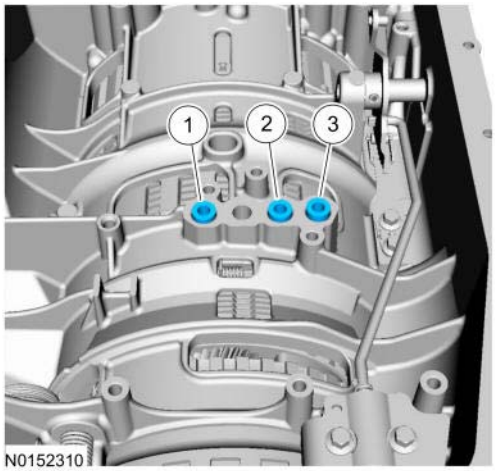
257.

Install the special tools. Push down on the Transmission End Play Gauge and zero the dial indicator. Lift up on the Transmission End Play Gauge and record the measurement on the dial indicator. The specification should be between 0.2-0.4 mm. If the Measurement is not within specification, remove the pump and install a new selective shim. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge., 307-534 End Play Gauge, Transmission.

NOTE: The green (7G087) center support feed tube seal may be replaced with an orange (7G087) center support feed tube seal.

258.

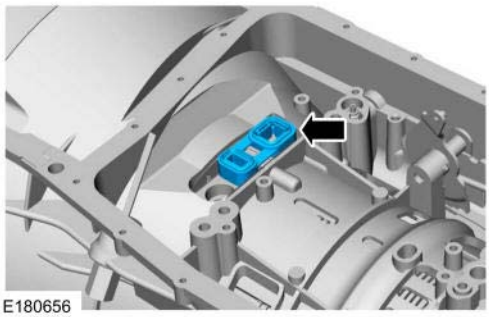
1.



Install a new center support feed tube seal (7G199 Black).

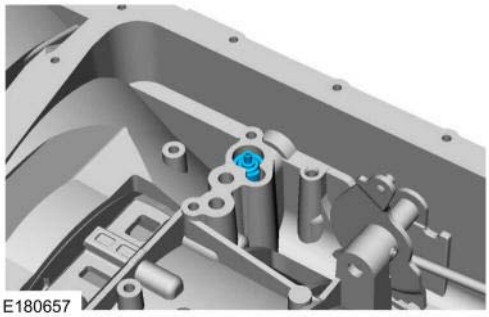
2.

Install a new center support feed tube seal (7G087 Green or Orange).



3.

Install a new center support feed tube seal (7G084 Blue).

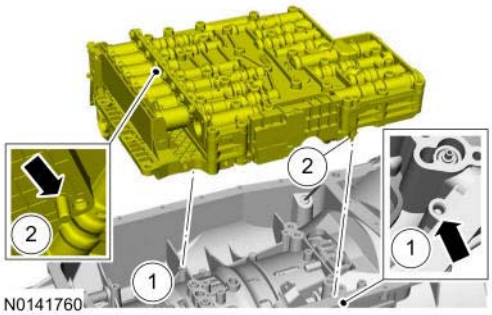


259.

Install a new front pump adapter seal.

260.

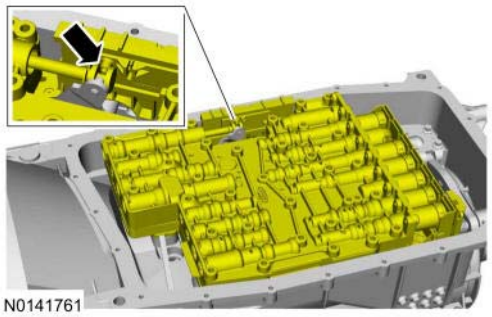
Install the thermal bypass valve into the case.



261.

1.

Alignment holes

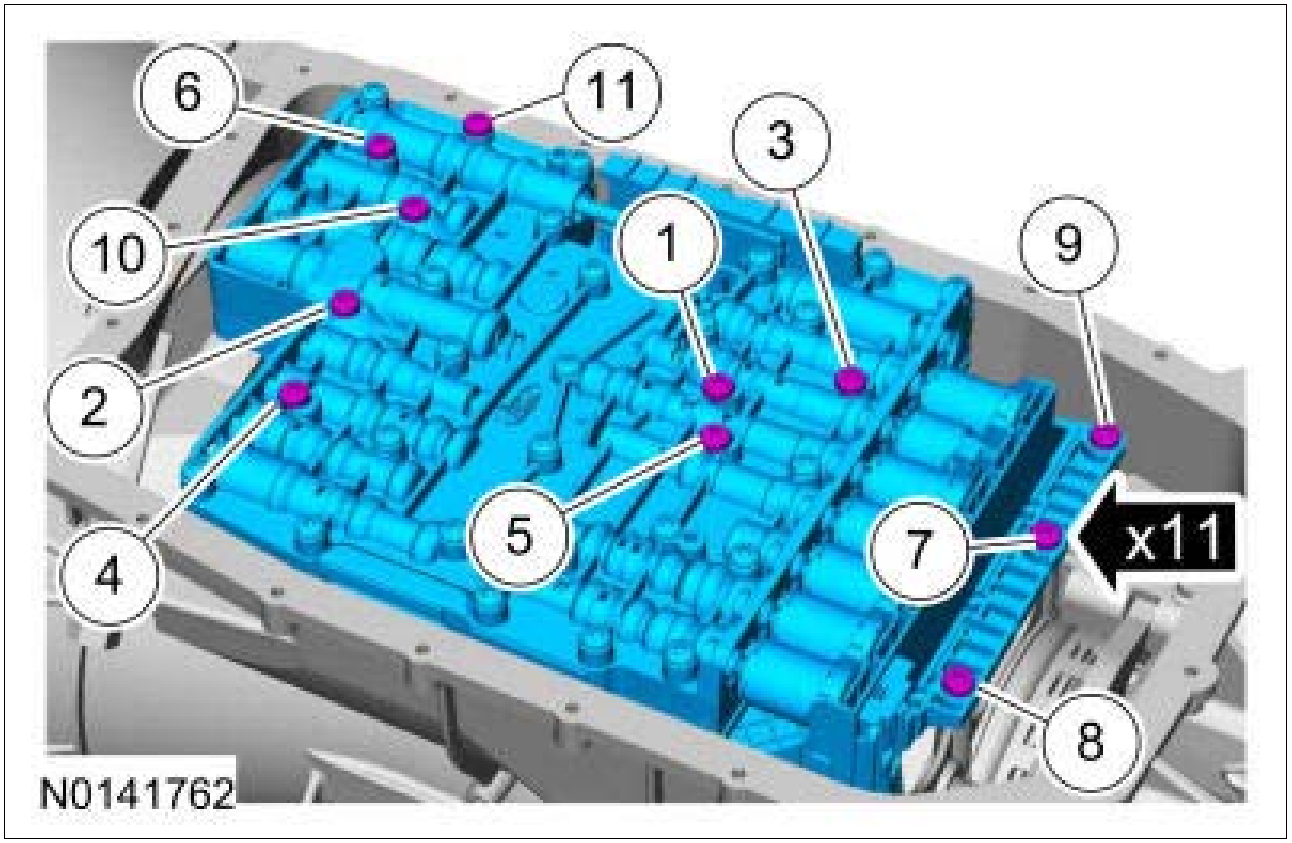


2.

Guide pins

NOTE: The main control assembly will not lay flush on the case, this is a normal condition with the rubber feed tubes, the bolts will pull the main control assembly down.

262.
Slightly lift the main control assembly and align the manual valve in the manual valve linkage and position the main control in place.



263.

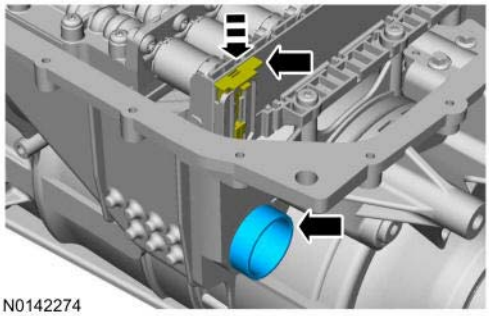
Install the main control assembly bolts and tighten in the sequence shown below.

Torque

: 71 lb.in (8 Nm)

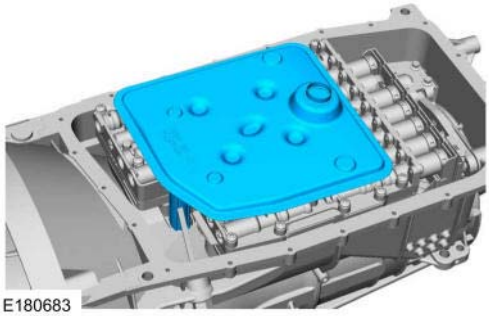
Fig 1: Main Control Assembly Bolts Tightening Sequence

Courtesy of FORD MOTOR CO.



264.

If removed, install the bulkhead connector sleeve seals.



265.

With the release tab up and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure the bulkhead connector is fully seated into the molded leadframe. Press down on the tab and lock the outer shell of the bulkhead electrical connector in place. Make sure the locking tab is securely locked.

N0142274

266.

Install a new transmission fluid filter.

E180683

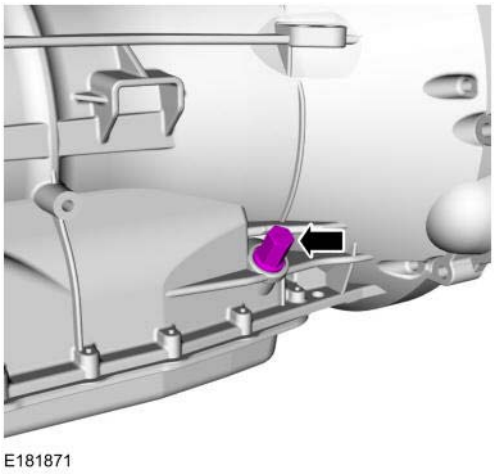
NOTE: The fluid pan gasket can be reused if not damaged.

267.
Install the transmission fluid pan gasket.

N0139113

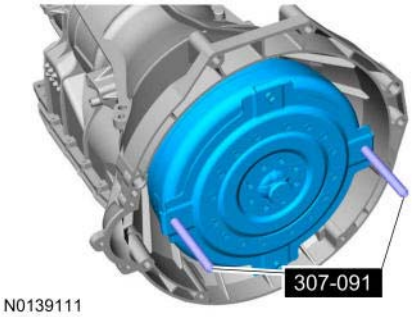
268.

Install the transmission fluid pan and transmission fluid pan bolts. Tighten in a crisscross pattern.



Torque

: 80 lb.in (9 Nm)



269.

Install the transmission fluid fill plug.

270.

Using the special tool, install the torque converter. Use Special Service Tool: 307-091 Handle, Torque Converter.

NOTE: The 6R ATF Additive Kit XL-16 kit contains two syringes. The syringe with additive "F" is to be used after all of the fluid has been replaced in the transmission or if the overdrive frictions are replaced. The syringe with additive "T" is a tracer that is part of the kit and is not used.

NOTE: Only 9-10 ml of the 6R ATF Additive Kit XL-16 kit should be used after all of the fluid has been replaced in the transmission or if the overdrive frictions are replaced. Too much additive in the fluid can result in converter clutch slip issues.

271.
If the Overdrive clutch FRICTIONS were replaced, add 9-10 ml of Motorcraft ® 6R ATF Additive Kit XL-16 syringe with additive "F" to the transmission.

Material

: Motorcraft ® 6R ATF Additive Kit / XL-16

DISASSEMBLY > TRANSMISSION

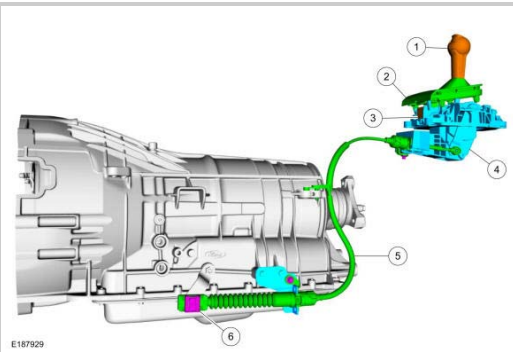
1.

To disassemble the transmission, refer to transmission overhaul. Refer to: Transmission .

ASSEMBLY > TRANSMISSION

1.

To assemble the transmission, refer to transmission overhaul. Refer to: Transmission .



INSTALLATION > TRANSMISSION

1.

To install the transmission assembly. Refer to: Transmission - 2.3L EcoBoost (231kW/314PS) . Refer to: Transmission - 3.7L Duratec (227kW/301PS) . Refer to: Transmission - 5.0L 32V Ti-VCT .

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - COMPONENT LOCATION

Transmission Selector Lever and Cable

Item	Description
1	Transmission selector lever knob
2	Transmission selector lever bezel
3	Brake shift interlock actuator
4	Transmission selector lever assembly
5	Transmission selector lever cable
6	Transmission selector lever cable adjuster

Transmission Paddle Switches

Item	Description
1	Downshift paddle switch
2	Upshift paddle switch

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - OVERVIEW > OVERVIEW

The transmission selector lever linkage consists of:

- a selector lever cable that connects the transmission manual control lever to the selector lever assembly.
- a brake shift interlock actuator that is integral to the selector lever assembly.

The selector lever assembly:

- locks the transmission selector lever in the P position when the ignition switch is in the LOCK position.
- requires the transmission selector lever to be in the P position to turn the ignition switch to the LOCK position.

The steering wheel:

- has SelectShift™ paddle switches mounted to it that allow the driver to manually shift the transmission.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

The transmission has 5 range positions P, R, N, D and S with SelectShift™ paddle switches mounted on the steering wheel.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PARK

In the PARK position:

- there is no powerflow through the transmission.
- the parking pawl locks the output shaft
- the engine may be started.
- the ignition key may be removed.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REVERSE

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- engine braking will occur.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NEUTRAL

In the NEUTRAL position:

- there is no powerflow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > DRIVE

DRIVE is the normal position for most forward driving.

DRIVE provides:

- automatic shifts - 1st through 6th gears.
- maximum fuel economy during normal operation.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MANUAL S POSITION

In manual S position:

- the transmission provides maximum engine braking.
- gears 1 through 6 are available.
- the driver can manually shift the transmission to gears 1 through 6 using the SelectShift™ paddle switches located on the steering wheel.
- grade assist is activated.
- the transmission will select gears that will provide the engine braking desired, based on the vehicle inputs, which will increase engine rpm during engine braking.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BRAKE SHIFT INTERLOCK OPERATION

The brake shift interlock actuator inhibits the selector lever movement from the PARK position by mechanically blocking the detent pawl of the selector lever mechanism. When the brake pedal is pressed (BPP switch closed) with the ignition key in the RUN position and the transmission in PARK, the brake shift interlock actuator is energized by the BCM, allowing the selector lever to be moved out of the PARK

position.

The brake shift interlock system consists of:

- a brake shift interlock actuator that is integral to the selector lever assembly.
- an ignition switch.
- a BPP switch.
- a BCM.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SELECTOR LEVER CABLE

The selector lever cable consists of:

- a cable that connect the transmission manual control lever to the selector lever assembly.
- a cable grommet that is fastened to the floor pan.
- an adjuster locking tab at the transmission manual control lever.

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SELECTOR LEVER

Selector Lever Cable

The selector lever cable consists of:

- a cable that connect the transmission manual control lever to the selector lever assembly.
- a cable grommet that is fastened to the floor pan.
- an adjuster locking tab at the transmission manual control lever.

Selector Lever

The selector lever consists of:

- a selector lever knob.
- a brake shift interlock actuator that is integral to the selector lever assembly.

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > INSPECTION AND VERIFICATION

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical or electrical damage.

3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

4.

If the cause is not visually evident, verify the symptom and refer to the Symptom Chart .

Mechanical	Electrical
Transmission selector lever cable	Brake Shift Interlock Actuator (BSIA)
Manual control lever	Wiring harness
Selector lever	Terminals
Selector lever knob	Connectors
	SelectShift™ paddle switches

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > DTC CHART - BCM

DTC	Description	Action
B1319:11	Brake Shift Interlock (BSI) Output Circuit Short To Ground	GO to Pinpoint Test A
B1319:15	Brake Shift Interlock (BSI) Output Circuit Short To Battery or Open	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > SYMPTOM CHART

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

In most circumstances the PCM sets a DTC to help guide diagnostics. Refer to the DTC Chart - BCM before using the Symptom Chart. The Symptom column lists the vehicle condition. The Possible Sources column lists a detailed vehicle condition. The Action column lists the action to be performed to determine the cause of the condition. Each action lists the components that can cause the symptom and the individual components in that system. The components are listed in order of disassembly. Use the list of components and the required action to focus on disassembly inspections for the root cause of the concern.

Symptom	Possible Sources	Action
Brake shift interlock system	Circuitry open, shorted to	GO to Pinpoint Test A

does not release/lock correctly	ground or shorted to power	
Brake Shift Interlock Actuator (BSIA) solenoid		INSTALL a new selector lever assembly. REFER to: Selector Lever Assembly .
Paddle shift does not operate correctly	Wiring, terminals or connectors Selector lever or knob Paddle shift switches Clockspring SCCM PCM	GO to Pinpoint Test B
Selector lever linkage is out of correct gear relationship	Selector lever linkage out of adjustment	REFER to: Selector Lever Cable Adjustment .
Loose selector lever cable bracket		CHECK the selector lever cable bracket. TIGHTEN as necessary.
Loose or out of alignment selector lever bezel		CHECK the selector lever bezel alignment. ALIGN or INSTALL a new selector lever bezel if necessary. REFER to: Selector Lever Assembly .
Selector lever binding	Selector lever bezel damaged	CHECK the selector lever bezel for damage. If necessary, INSTALL a new selector lever bezel. REFER to: Selector Lever Assembly .
Selector lever damaged		CHECK the selector lever for damage. If necessary, INSTALL a new selector lever assembly. REFER to: Selector Lever Assembly .
Selector lever cable damaged		CHECK the selector lever cable for damage. If necessary, INSTALL a new selector lever cable. REFER to: Selector Lever Cable Adjustment).
Internal transmission components damaged		CHECK the manual control lever and internal transmission components for damage. REFER to: Main Control Valve Body .
Brake shift interlock override does not release the selector lever	Brake shift interlock override damaged	INSPECT the selector lever for damage. If necessary, INSTALL a new selector lever. REFER to: Selector Lever Assembly .
Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	Selector lever cable incorrectly routed, grounded out or loose	CHECK the selector lever cable. REFER to: Selector Lever Cable Adjustment .

The ignition key cannot be returned to the OFF position or the ignition key can be turned to the OFF position when the selector lever is not in P	Wiring, terminals or connectors Ignition lock cylinder Key removal inhibit solenoid (part of the ignition switch) Park detect switch (part of the selector lever) Selector lever cable Mechanical damage to the selector lever, selector lever cable or selector lever knob	REFER to: Steering Wheel and Column Electrical Components .
The PRNDL indicator does not illuminate P	Wiring, terminals or connectors PCM concern IPC Park detect switch (part of the selector lever assembly)	REFER to: INSTRUMENTATION, MESSAGE CENTER AND WARNING CHIMES .

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > PINPOINT TESTS

DTCs B1319:11, B1319:15

Refer to Shift Interlock for schematic and connector information.

Normal Operation and Fault Conditions

The BCM provides power to the Brake Shift Interlock Actuator (BSIA). When the BCM receives a brake pedal applied input, voltage is applied to the brake shift interlock actuator. When the actuator is energized, the plunger is pulled inward allowing the selector lever to move from the park position.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1319:11	Brake Shift Interlock Output Circuit Short To Ground	Short to ground in the Brake Shift Interlock Actuator (BSIA) circuitry.
B1319:15	Brake Shift Interlock Output Circuit Short To Battery or Open	Short to power or open in the Brake Shift Interlock Actuator (BSIA) circuitry.

Possible Sources

- Connectors damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals
- Brake Shift Interlock Actuator (BSIA)
- BCM

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > PINPOINT TESTS > PINPOINT

TEST A : DTCS B1319:11, B1319:15 > PINPOINT TEST A : DTCS B1319:11, B1319:15

A1 CHECK THE STOPLAMPS

Apply the brake pedal and observe the stoplamps.

Do the stoplamps illuminate?

Yes	GO to A2

No	REFER to: Stoplamps .

A2 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR POWER CIRCUIT FOR VOLTAGE

Disconnect Floor Shifter C3245 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-4		Ground

Is the voltage greater than 11 volts with the brake pedal applied and 0 volts with the brake pedal not applied?

Yes	GO to A5

No	If the voltage was greater than 11 volts with the brake pedal applied or not applied, GO to A3 Otherwise, GO to A5

A3 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR POWER CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-4		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to A7

A4 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR POWER CIRCUIT FOR AN OPEN

Disconnect BCM C2280B .

Inspect for damaged or pushed-out terminals.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-4	Ω	C2280B-46

Is the resistance less than 3 ohms?

Yes	GO to A6

No	REPAIR the circuit.

A5 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-5	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A6

No	REPAIR the circuit.

A6 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR POWER CIRCUIT FOR SHORT TO GROUND

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3245-4		Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A7

No	REPAIR the circuit.

A7 CHECK FOR CORRECT BCM OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Check for the following:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect all BCM connectors. Make sure they seat and latch correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > PINPOINT TESTS > PINPOINT TEST B : PADDLE SHIFT DOES NOT OPERATE CORRECTLY

Paddle Shift Does Not Operate Correctly

Refer to Transmission Controls - 6R80 for schematic and connector information.

Normal Operation and Fault Conditions

Each paddle shift switch is a momentary contact switch integral to the steering wheel. When the selector lever is placed in the sport shift position, the upshift/downshift feature becomes activated and allows the operator to upshift or downshift without removing their hands from the steering wheel.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0815	Upshift Switch Circuit	The PCM detects a voltage high signal when an upshift is requested.
P0816	Downshift Switch Circuit	The PCM detects a voltage high signal when a downshift is requested.

P0819	Up and Down Shift Switch to Transmission Range Correlation	The PCM detects a voltage high signal when an upshift or downshift is requested.

Possible Sources

- Circuitry open/shorted
- Clockspring
- Selector lever assembly
- Selector lever knob
- SCCM
- PCM

DIAGNOSIS AND TESTING > EXTERNAL CONTROLS > PINPOINT TESTS > PINPOINT TEST B : PADDLE SHIFT DOES NOT OPERATE CORRECTLY > PINPOINT TEST B : PADDLE SHIFT DOES NOT OPERATE CORRECTLY

B1 MONITOR SHIFT SELECT PIDS

Ignition ON.

Enter the following diagnostic mode: Datalogger.

Monitor the PCM PIDs, SST_D and SST_U while depressing the upshift and downshift switches.

Do both the upshift and downshift PIDs show low when their respective switch is depressed and high when the switch is not depressed?

Yes	The system is operating correctly at this time. The concern may have been caused by a loose connector.

No	If the Upshift switch PID reads high when the switch is pressed, or if the Upshift PID reads low when the switch is not pressed, GO to B2. If the Downshift switch PID reads high when the switch is pressed, or if the Downshift PID reads low when the switch is not pressed, GO to B9. If the PIDs for both switches show no change when both of the switches are pressed, GO to B12

B2 CHECK THE UPSHIFT PADDLE SWITCH

Remove the driver air bag module. REFER to: Driver Airbag .

Disconnect Upshift Paddle Switch Connector C2428 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Component side resistance pin 1.	Ω	Component side resistance pin 2.

Is the resistance less than 1.5 ohms with upshift switch pressed and greater than 10, 000 ohms when released?

Yes	GO to B3

No	INSTALL a new upshift paddle switch. REFER to: Upshift Paddle Switch .

B3 CHECK THE UPSHIFT SIGNAL CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect Right Paddle Shifter, C2428 .

Inspect the connector for damaged or pushed-out terminals.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2428-4	V	Ground

Is the voltage greater than 11 volts?

Yes	GO to B12

No	GO to B4

B4 CHECK THE UPSHIFT SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect PCM.

Inspect the connectors for damaged or pushed-out terminals.

For the 2.3L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-10	Ω	C1551B-89

For the 3.5L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-10	Ω	C1381B-23

For the 5.0L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-10	Ω	C175B-23

Is the resistance less than 3 ohms?

Yes	GO to B5

No	REPAIR the circuit.

B5 CHECK THE UPSHIFT SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-10	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to B6

No	REPAIR the circuit.

B6 CHECK THE CLOCKSPRING CIRCUIT FOR AN OPEN

Connect PCM.

Disconnect SCCM C226A .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
Component Side C226A-10	Ω	C218B-12

Is the resistance less than 3 ohms?

Yes	INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS). REFER to: POWERTRAIN CONTROL MODULE (PCM) - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS). PERFORM the Transmission Strategy

	Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new clockspring. If concern still exists, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

B7 CHECK THE DOWNSHIFT PADDLE SWITCH

Remove the driver air bag module. REFER to: Driver Airbag .

Disconnect Downshift Paddle Switch Connector C2429 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Component side resistance pin 3	Ω	Component side resistance pin 4

Is the resistance less than 1.5 ohms with upshift switch pressed and greater than 10, 000 ohms when released?

Yes	GO to B9

No	INSTALL a new upshift paddle switch. REFER to: Downshift Paddle Switch .

B8 CHECK THE DOWNSHIFT SIGNAL CIRCUIT FOR VOLTAGE

Ignition OFF.

Disconnect Left Paddle Shifter, C2429 .

Inspect the connector for damaged or pushed-out terminals.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2429-4	V	Ground

Is the voltage greater than 11 volts?

Yes	GO to B12

No	GO to B9

B9 CHECK THE DOWNSHIFT SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect PCM.

Inspect the connector for damaged or pushed-out terminals.

For the 2.3L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-9	Ω	C1551B-88

For the 3.5L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-9	Ω	C1381B-24

For the 5.0L engine, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-9	Ω	C175B-24

Is the resistance less than 3 ohms?

Yes	GO to B10

No	REPAIR the circuit.

B10 CHECK THE DOWNSHIFT SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-9	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to B11

No	REPAIR the circuit.

B11 CHECK THE CLOCKSPRING CIRCUIT FOR AN OPEN

Connect PCM.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
Component Side C226A-9	Ω	C218B-5

Is the resistance less than 3 ohms?

Yes	INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS). REFER to: POWERTRAIN CONTROL MODULE (PCM) - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS). PERFORM the Transmission Strategy Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new clockspring. If concern still exists, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

B12 CHECK THE SIGNAL RETURN CIRCUIT FOR A SHORT TO GROUND

Disconnect PCM.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-11	Ω	Ground

Is the voltage greater than 10, 000 ohms?

Yes	GO to B13

No	REPAIR the circuit.

B13 CHECK THE SIGNAL RETURN CIRCUIT FOR AN OPEN

Connect PCM.

Ignition ON.

For the 2.3L, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-11	Ω	C1551B-88

For the 3.5L, measure:

Positive Lead	Measurement / Action	Negative Lead

C226A-11	Ω	C1381B-24

For the 5.0L, measure:

Positive Lead	Measurement / Action	Negative Lead
C226A-11	Ω	C175B-24

Is the resistance less than 3 ohms

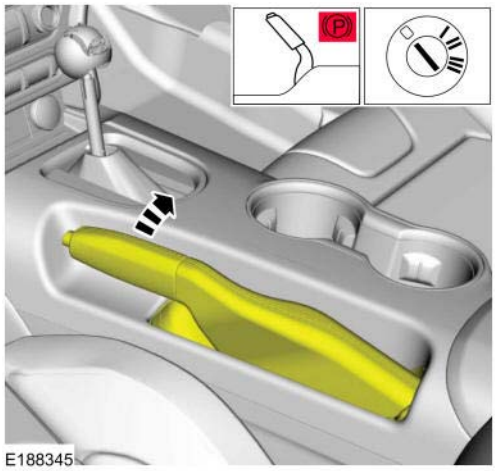
Is the resistance less than 3 ohms?

Yes	INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS). REFER to: POWERTRAIN CONTROL MODULE (PCM) - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS). PERFORM the Transmission Strategy Download procedure. REFER to: Transmission Strategy Download .

No	INSTALL a new clockspring. If concern still exists, INSTALL a new SCCM. REFER to: Steering Column Control Module (SCCM) .

GENERAL PROCEDURES > BRAKE SHIFT INTERLOCK ACTUATOR MANUAL OVERRIDE

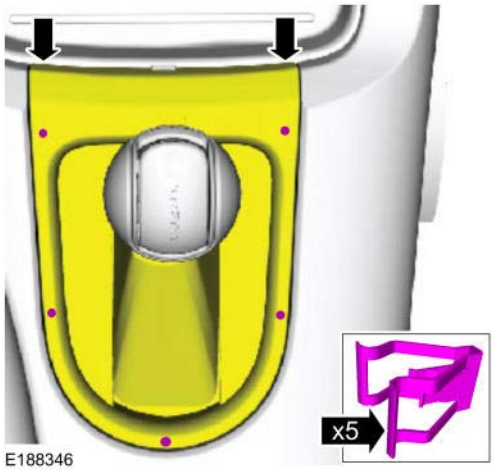
Activation



NOTE: If it is necessary to use the brake shift interlock actuator override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the

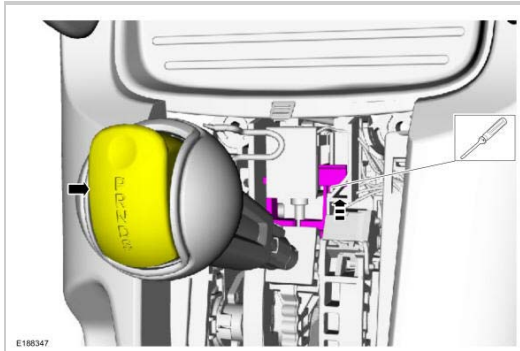
brake lights are not operational. Before driving the vehicle, verify the brake lights are working.

This vehicle is equipped with a brake shift interlock actuator feature that prevents the selector lever from being moved out of the PARK position when the ignition is in the ON position until the brake pedal is applied. If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is applied:



1.

Fully apply the parking brake. Set the ignition switch to the 0 position (ignition off).



2.

Starting from the front corners, carefully pry up the bezel and position it out of the way.

3.

Using a small screwdriver, push forward on the brake shift interlock actuator on the selector lever assembly, apply the brake pedal, press the button on the selector lever knob and move the selector lever into NEUTRAL.

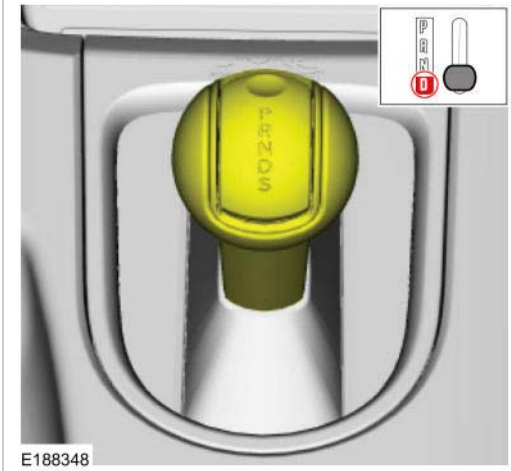
4.

Start the engine.

5.

Snap the bezel into place.

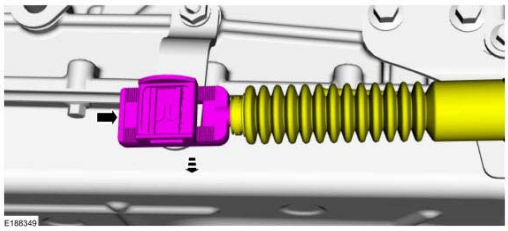
GENERAL PROCEDURES > SELECTOR LEVER CABLE ADJUSTMENT



Adjustment

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

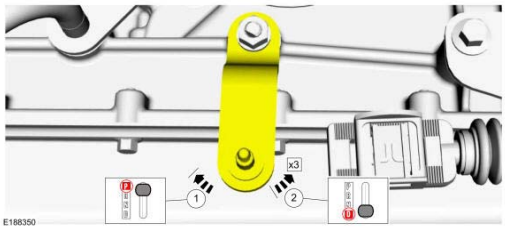


2.

Position the shifter lever in DRIVE.

3.

Disconnect the selector lever cable from the manual lever.



4.

Position the manual lever in DRIVE.

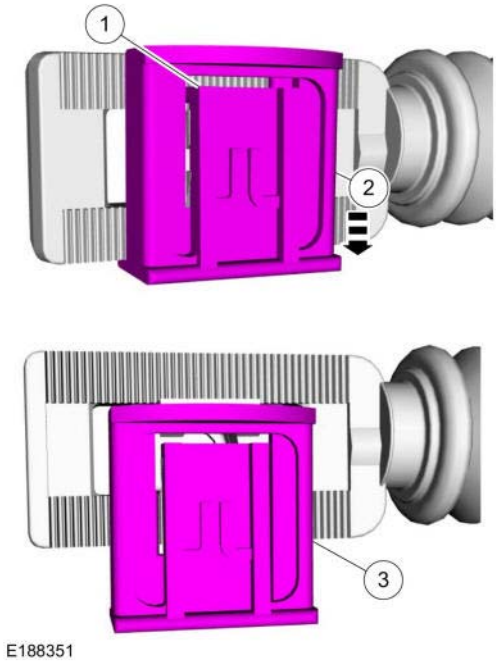
Rotate the manual lever clockwise until it stops.

Rotate the manual lever counterclockwise 3 detents.

5.

Unlock the adjuster.

1.



Gently pry the latch up.

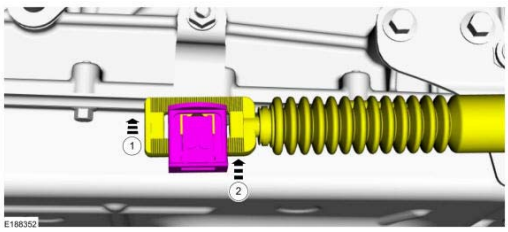
2.

Push the lock tab to slide it down.

3.

Lock tab shown open in illustration.

NOTE: After locking the adjuster, pull back on the adjuster to make sure it is securely installed.



6.
Connect and lock the adjuster.

1.

With the adjuster lock tab released, connect the selector lever cable end to the manual control lever.

2.

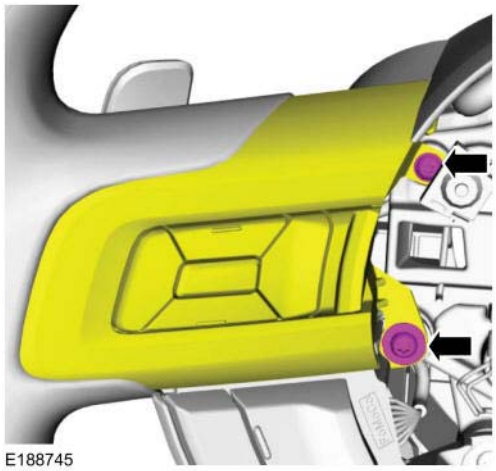
Push the lock tab upward to lock the transmission selector lever cable adjustment lock.

7.

Verify the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in

REVERSE.

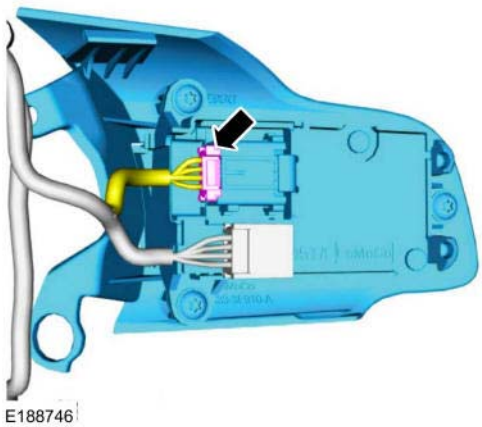
REMOVAL AND INSTALLATION > DOWNSHIFT PADDLE SWITCH > REMOVAL



NOTE: Removal steps in this procedure may contain installation details.

1.

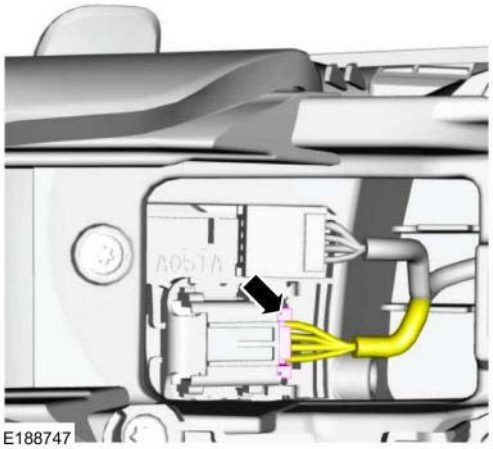
Remove the driver air bag. Refer to: Driver Airbag .



2.

Remove the screws and position the LH speed control switch to access the electrical connector.

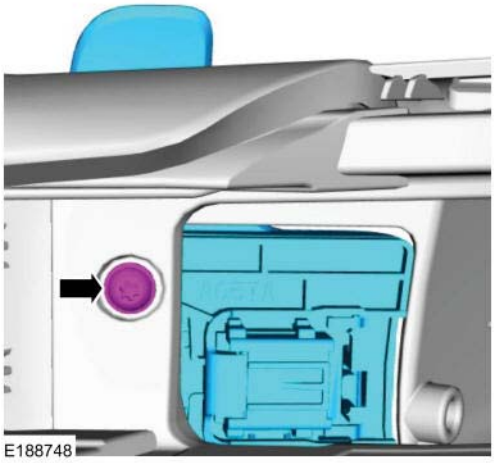
E188745



3.

Disconnect the LH speed control switch electrical connector and remove the switch.

E188746



4.

Disconnect the downshift paddle switch electrical connector.

5.

Remove the screw and the downshift paddle switch.

REMOVAL AND INSTALLATION > DOWNSHIFT PADDLE SWITCH > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > SELECTOR LEVER ASSEMBLY

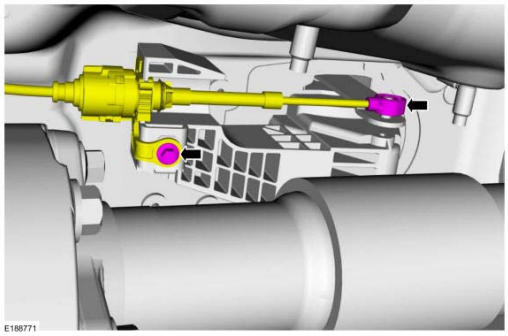
Special Tool(s) / General Equipment

Interior Trim Remover

REMOVAL AND INSTALLATION > SELECTOR LEVER ASSEMBLY > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

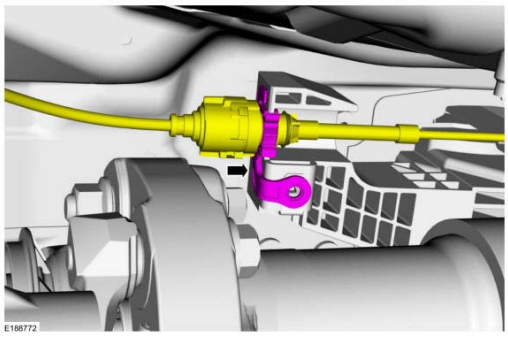
1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the selector lever cable from the selector lever and remove the selector lever cable retainer bolt.

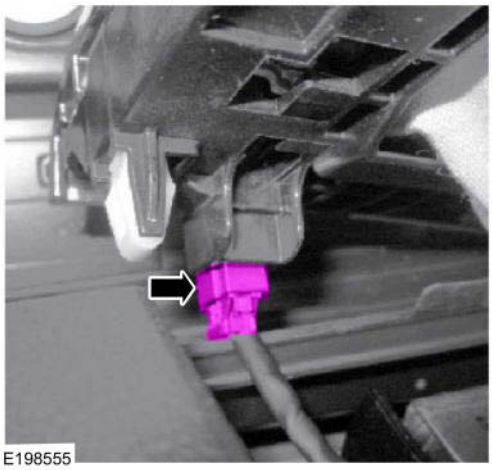


Torque

: 62 lb.in (7 Nm)

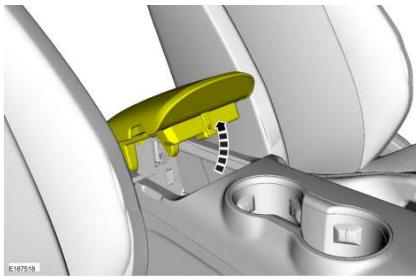
3.

Disconnect the selector lever cable from the selector lever assembly.



4.

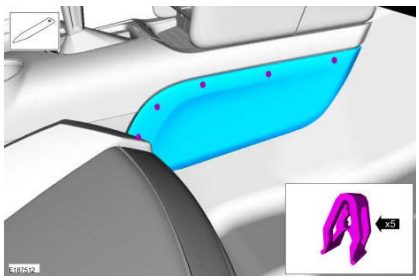
Starting from the front corners, carefully pry up the bezel and position it out of the way.



5.

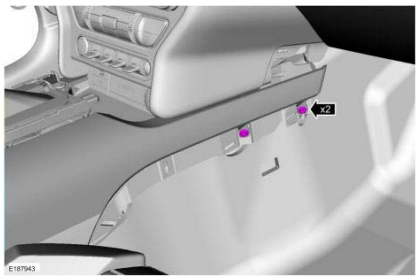
Disconnect the electrical connector.

6.



Open the floor console lid.

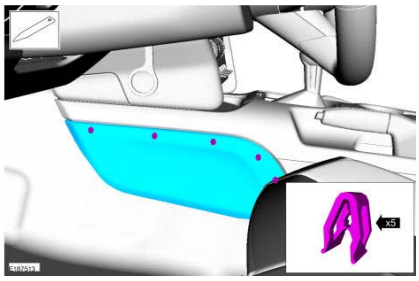
NOTE: If necessary, position the seat rearward.



7.
Release the clips and remove the floor console RH side trim panel.

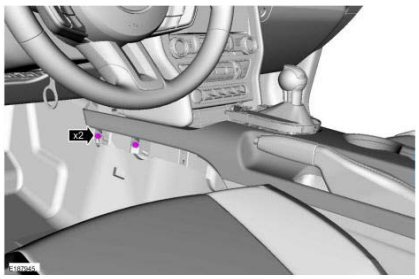
Use the General Equipment: Interior Trim Remover

8.



Remove the RH side front screws.

NOTE: If necessary, position the seat rearward.

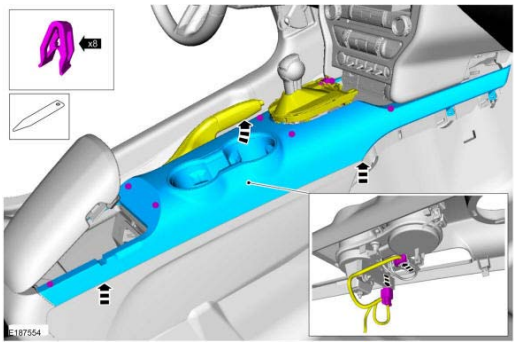


9.
Release the clips and remove the LH side trim panel.

Use the General Equipment: Interior Trim Remover

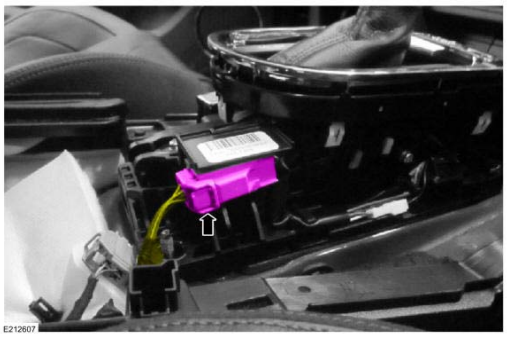
10.

Remove the LH side front screws.



11.

Release the clips, position the selector lever bezel and boot aside and remove the floor console upper trim panel.

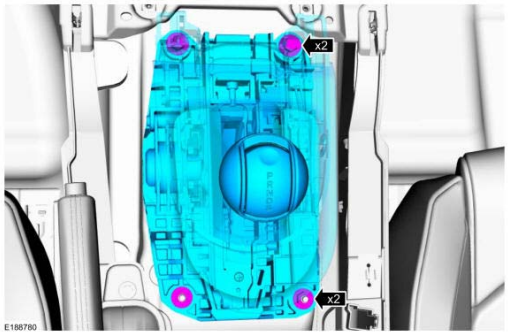


Disconnect the electrical connectors.

Use the General Equipment: Interior Trim Remover

12.

Disconnect the selector lever assembly electrical connector.



13.

Remove the bolts, the nuts and the selector lever assembly.

Torque

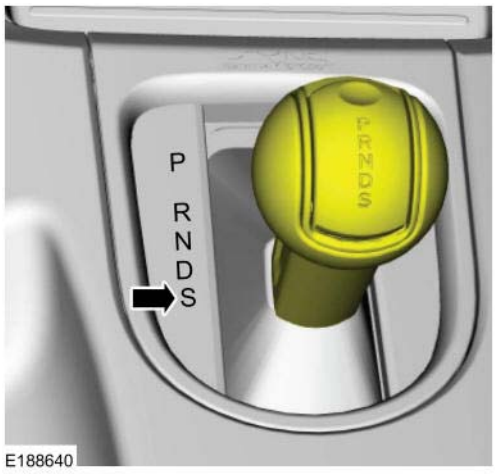
: 80 lb.in (9 Nm)

REMOVAL AND INSTALLATION > SELECTOR LEVER ASSEMBLY > INSTALLATION

1.

To install, reverse the removal procedure.

2.



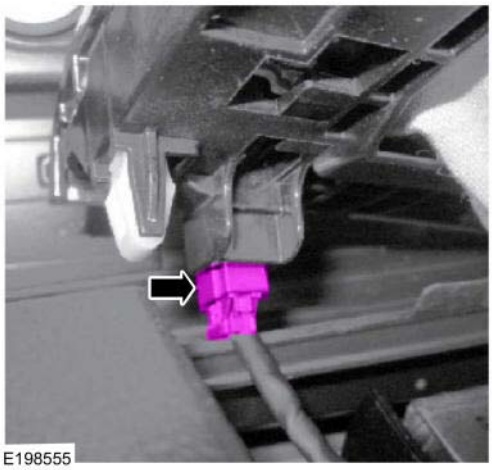
Adjust the selector lever cable. Refer to: Selector Lever Cable Adjustment .

REMOVAL AND INSTALLATION > SELECTOR LEVER BEZEL > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

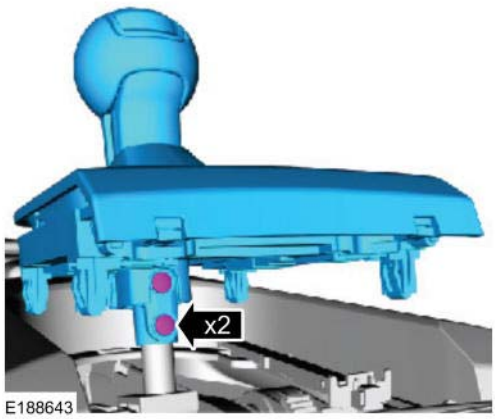
1.

Position the shifter in the S position.



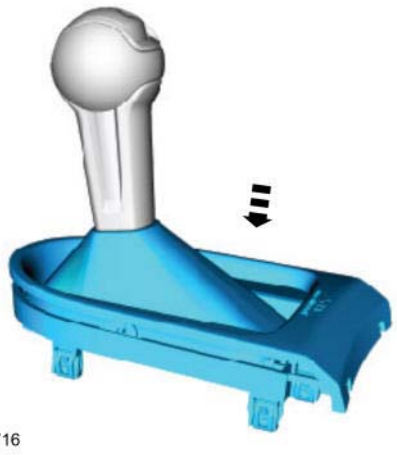
2.

Starting from the front corners, carefully pry up the bezel and position it out of the way.



3.

Disconnect the electrical connector.



4.

Remove the screws and the shifter knob, boot and bezel as an assembly.

5.

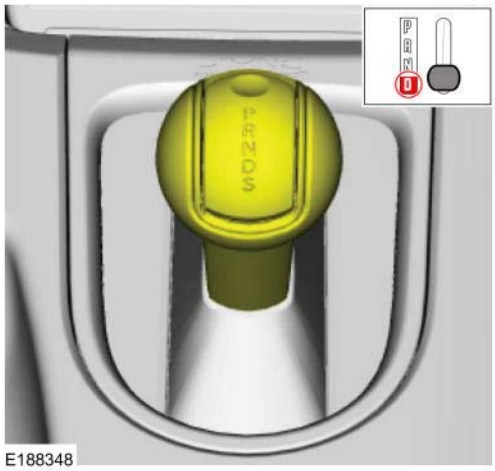
Remove the boot and bezel from the shifter knob.

E188716

REMOVAL AND INSTALLATION > SELECTOR LEVER BEZEL > INSTALLATION

1.

To install, reverse the removal procedure.

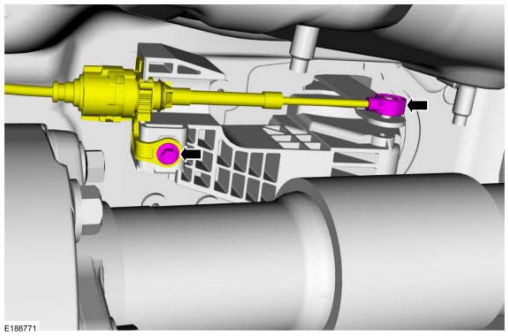


REMOVAL AND INSTALLATION > SELECTOR LEVER CABLE > REMOVAL

1.

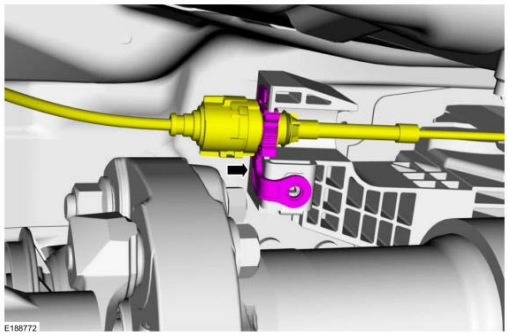
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.



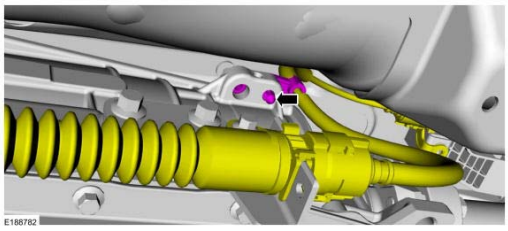
Position the selector lever in DRIVE.

E188348



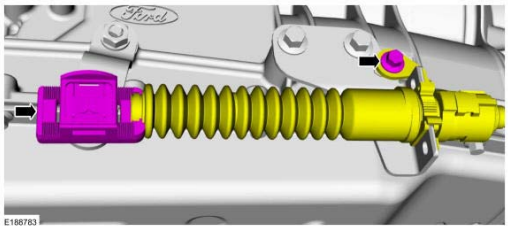
3.

Disconnect the selector lever cable from the selector lever and remove the selector lever cable retainer bolt.



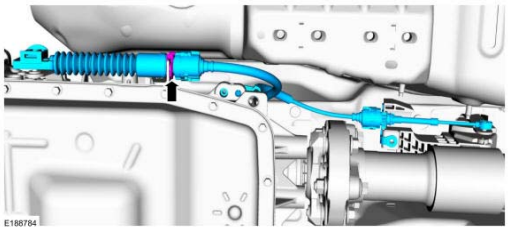
4.

Disconnect the selector lever cable from the selector lever assembly.



5.

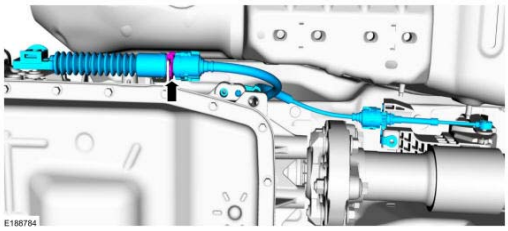
Disconnect the selector lever cable retainer from the transmission.



6.

Disconnect the selector lever cable from the manual lever and remove the selector lever cable bolt.

7.

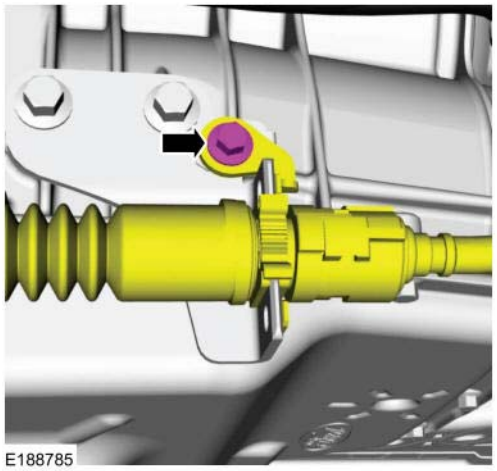


Disconnect the selector cable retainer and remove the selector lever cable.

REMOVAL AND INSTALLATION > SELECTOR LEVER CABLE > INSTALLATION

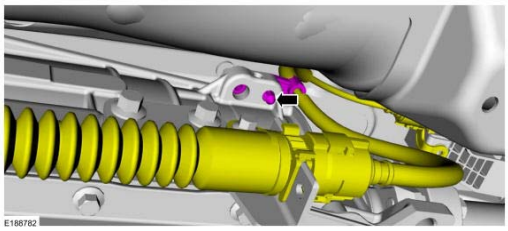
1.

Position the selector lever cable and connect the selector lever cable retainer.



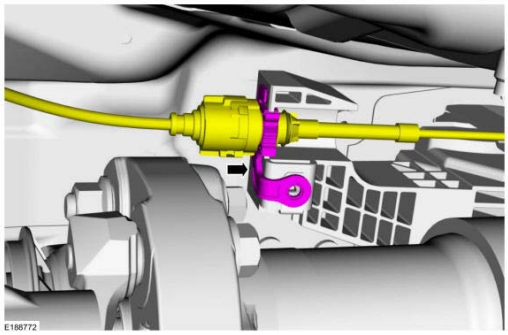
2.

Install the selector lever cable retainer bolt.



Torque

: 62 lb.in (7 Nm)

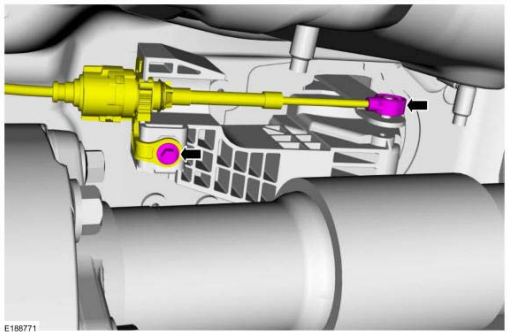


3.

Connect the selector lever cable retainer to the transmission.

4.

Connect the selector lever cable to the selector lever assembly.



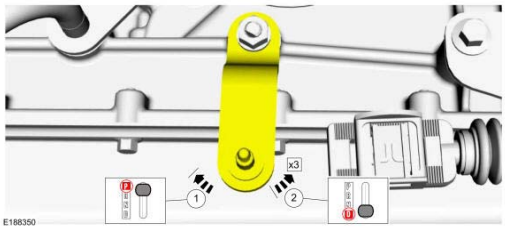
5.

With the selector lever in DRIVE, install the selector lever cable retainer bolt and connect the selector lever cable to the selector lever.

Torque

: 62 lb.in (7 Nm)

6.



Position the manual lever in DRIVE.

1.

Rotate the manual lever clockwise until it stops.

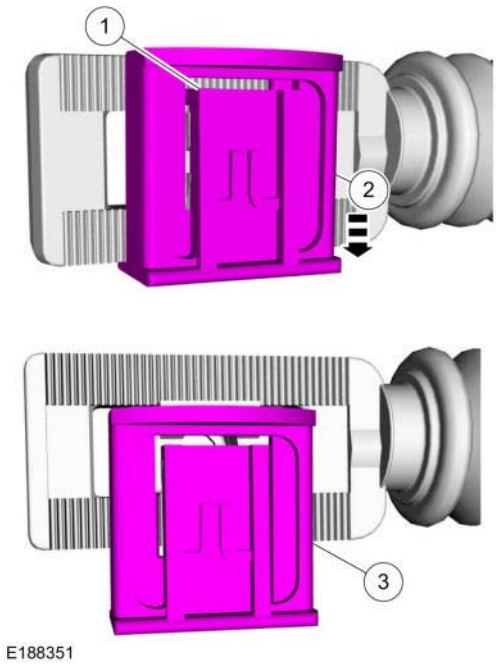
2.

Rotate the manual lever counterclockwise 3 detents.

7.

Unlock the adjuster.

1.



Gently pry the latch up.

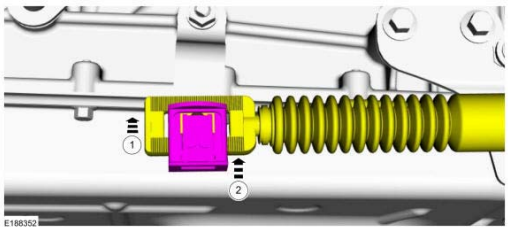
2.

Push the lock tab to slide it down.

3.

Lock tab shown open in illustration.

NOTE: After locking the adjuster, pull back on the adjuster to make sure it is securely installed.



8.
Connect and lock the adjuster.

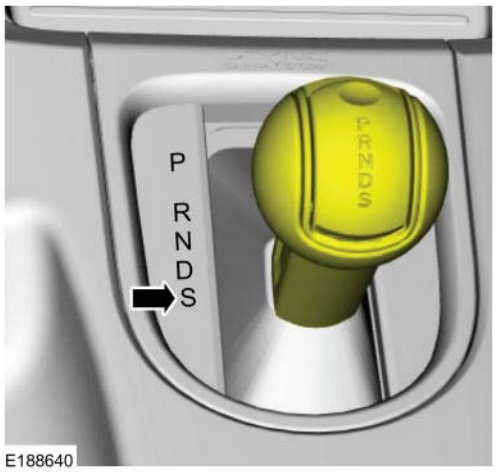
1.

With the adjuster lock tab released, connect the selector lever cable end to the manual control lever.

2.

Push the lock tab upward to lock the transmission selector lever cable adjustment lock.

9.



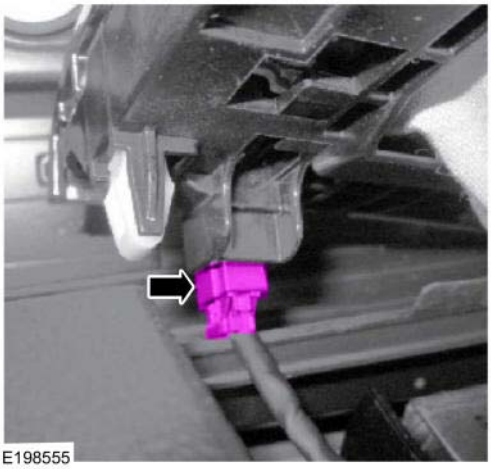
Verify the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

REMOVAL AND INSTALLATION > SELECTOR LEVER KNOB > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

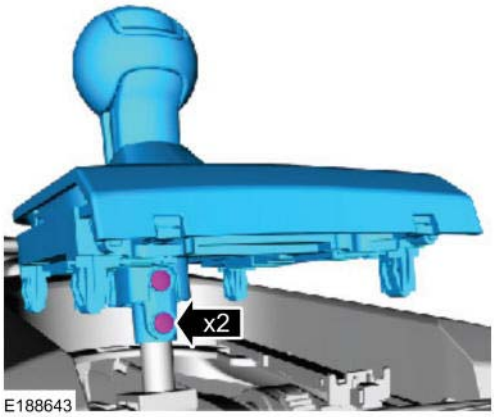
1.

Position the shifter in the S position.



2.

Starting from the front corners, carefully pry up the bezel and position it out of the way.



3.

Disconnect the electrical connector.

4.

Remove the screws and the shifter knob, boot and bezel as an assembly.

5.

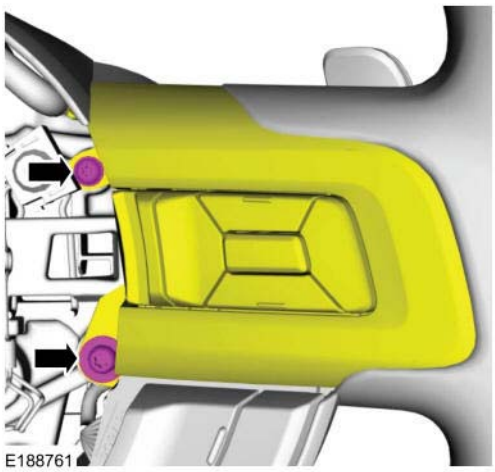
Remove the shifter knob from the boot and bezel.

REMOVAL AND INSTALLATION > SELECTOR LEVER KNOB > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > UPSHIFT PADDLE SWITCH > REMOVAL



NOTE: Removal steps in this procedure may contain installation details.

1.

Service Manual: CLUTCH CONTROLS

DESCRIPTION AND OPERATION > CLUTCH CONTROLS - COMPONENT LOCATION

Item	Description
1	Clutch pedal
2	Clutch master cylinder
3	Clutch slave cylinder
4	Clutch hydraulic fluid tubes

GENERAL PROCEDURES > CLUTCH SYSTEM BLEEDING

Special Tool(s) / General Equipment

Brake/Clutch System Pressure Bleeder/Filler

Materials

Name	Specification
Motorcraft® DOT 4 LV High Performance Motor Vehicle Brake Fluid PM-20	WSS-M6C65-A2

Bleeding

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call the Poison Control Center at: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface

may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

1.

Make sure all hydraulic tubes are correctly seated.

2.

Make sure the clutch pedal is in the most upward position.

3.

Check the fluid level of the brake/clutch reservoir. Fill the reservoir with the specified fluid to the MAX mark.

Material

: Motorcraft® DOT 4 LV High Performance Motor Vehicle Brake Fluid / PM-20 (WSS-M6C65-A2)

4.

Using a suitable bleeder kit and a Vacuum Pump Kit, install the rubber stopper in the reservoir opening. Make sure the rubber stopper has a tight fit. Alternate method: use a 50 mm (1.96 in) rubber stopper with an 8 mm (0.31 in) pipe inserted through the rubber stopper. Use the General Equipment: Brake/Clutch System Pressure Bleeder/Filler

5.

Holding the rubber stopper in place, operate the vacuum pump to 15-20 inches of vacuum. Hold the vacuum for one minute, then quickly relieve the vacuum. Remove the special tools.

6.

Check the fluid level of the reservoir. Fill the reservoir with the specified fluid to the MAX mark. Install the reservoir cap.

7.

Press and release the clutch pedal 10 to 12 times or until clutch pedal effort is consistent and positive at top of clutch pedal travel.

8.

Repeat Steps 4 through 7 two additional times or until clutch pedal effort is consistent and positive at top of clutch pedal travel.

9.

Install the reservoir cap.

10.

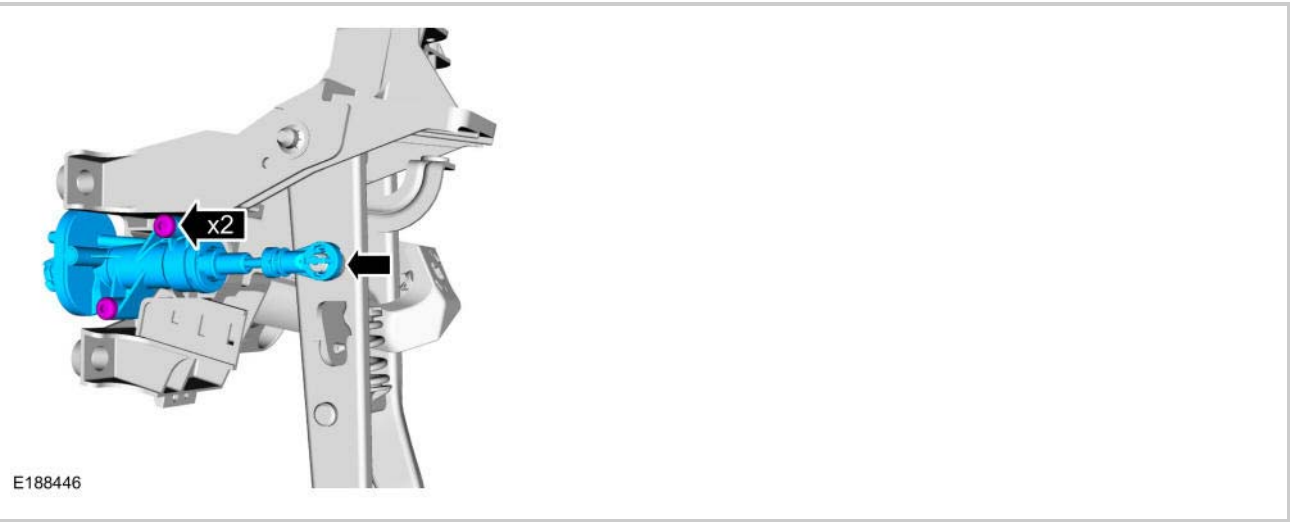
Check the clutch pedal reserve. Test the clutch system for normal operation.

REMOVAL AND INSTALLATION > CLUTCH MASTER CYLINDER - LHD > REMOVAL

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call the Poison Control Center at: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

1.



Remove the brake pedal and bracket assembly. Refer to: Brake Pedal and Bracket - 6-Speed Manual Transmission - 3160/6-Speed Manual Transmission - MT82 .

2.

Remove the clutch master cylinder bolts, then disconnect the clutch master cylinder from the clutch pedal and remove the master cylinder.

Torque

: 89 lb.in (10 Nm)

REMOVAL AND INSTALLATION > CLUTCH MASTER CYLINDER - LHD > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Bleed the clutch hydraulic system. Refer to: Clutch System Bleeding .

REMOVAL AND INSTALLATION > CLUTCH PEDAL - LHD > REMOVAL

1.

The clutch pedal is serviced as part of the brake pedal assembly. Remove the brake pedal assembly. Refer to: Brake Pedal and Bracket - 6-Speed Manual Transmission - 3160/6-Speed Manual Transmission - MT82 .

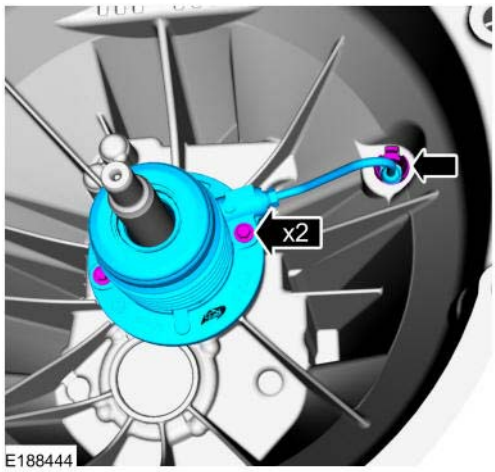
REMOVAL AND INSTALLATION > CLUTCH PEDAL - LHD > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CLUTCH SLAVE CYLINDER > REMOVAL

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.



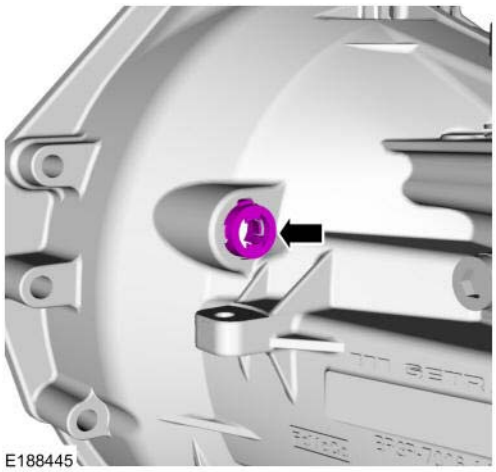
WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call the Poison Control Center at: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

1.

Remove the transmission. Refer to: Transmission - 2.3L EcoBoost (201kW/273PS) . Refer to: Transmission - 3.7L Duratec (227kW/301PS) . Refer to: Transmission - 5.0L 32V Ti-VCT .

2.

Remove the clutch slave cylinder bolts. Pull the clutch slave cylinder outward and release the tube from the retaining clip.



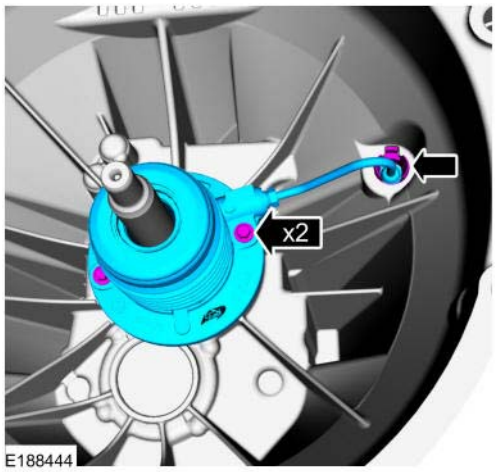
3.

Inspect the clutch slave cylinder for a damaged boot, leaking brake fluid or a worn or damaged release bearing. Rotate the release bearing while applying pressure. If the bearing rotation is rough, install a new clutch slave cylinder.

REMOVAL AND INSTALLATION > CLUTCH SLAVE CYLINDER > INSTALLATION

1.

Install a new retaining clip.



2.

Position the clutch slave cylinder in the transmission, inserting the tube through the retaining clip. Install the clutch slave cylinder bolts.

Torque

: 97 lb.in (11 Nm)

3.

Install the transmission. Refer to: Transmission - 2.3L EcoBoost (201kW/273PS) . Refer to: Transmission - 3.7L Duratec (227kW/301PS) . Refer to: Transmission - 5.0L 32V Ti-VCT .

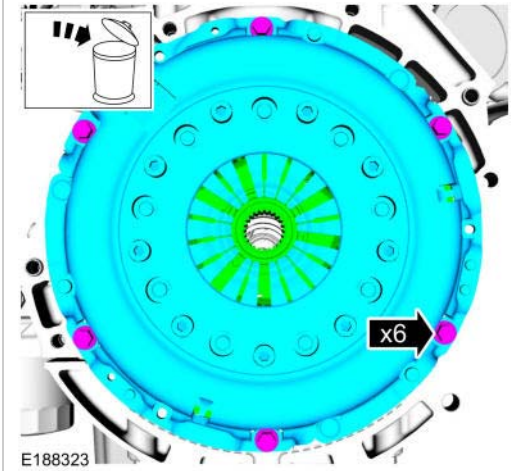
REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 2.3L ECOBOOST (201KW 273PS)

Special Tool(s) / General Equipment

Clutch Alignment Tool

REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

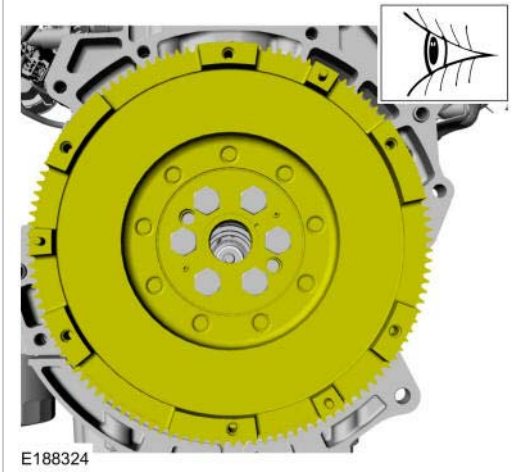


1.

Remove the transmission. Refer to: Transmission - 2.3L EcoBoost (201kW/273PS) .

NOTE: If the parts are to be reused, index-mark the pressure plate to the flywheel. Failure to install the pressure plate to the flywheel in the original position may result in a clutch system vibration.

NOTE: Loosen the bolts evenly to prevent clutch pressure plate damage.



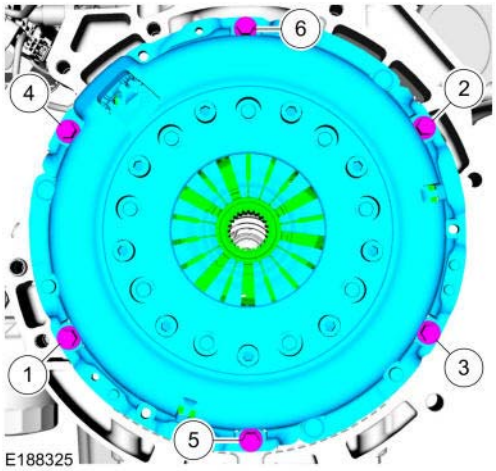
2.
Remove the pressure plate bolts by turning them 1 turn at a time in a star pattern until the clutch is fully released. Remove the pressure plate and the clutch disc. Discard the pressure plate bolts.

REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

Inspect the flywheel for damage, burn marks or wear and install a new flywheel if necessary.

NOTE: If installing a new pressure plate and/or flywheel, align the paint dot on the pressure plate as close as possible to the paint dot on the flywheel or a clutch system vibration can occur.



NOTE: If installing the original pressure plate, align it using the index-marks made during removal or a clutch system vibration can occur.

2.
Using a clutch aligner, position the clutch disc on the flywheel. If installing the original pressure plate, align the pressure plate to the flywheel using the index-marks made during removal. If

installing a new pressure plate, align the pressure plate to the flywheel using the paint dots. Install new pressure plate bolts by turning the bolts 1 turn at a time in a star pattern until the clutch is fully secured. Use the General Equipment: Clutch Alignment Tool

Torque

: 26 lb.ft (35 Nm)

3.

Install the transmission. Refer to: Transmission - 2.3L EcoBoost (201kW/273PS) .

4.

After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 3.7L DURATEC (227KW 301PS)

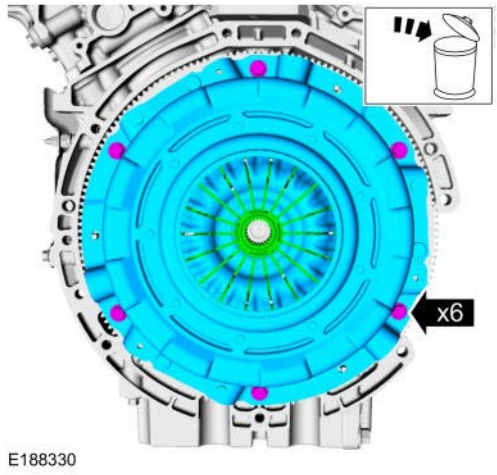
Special Tool(s) / General Equipment

Clutch Alignment Tool

REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 3.7L DURATEC (227KW 301PS) > REMOVAL

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and

respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

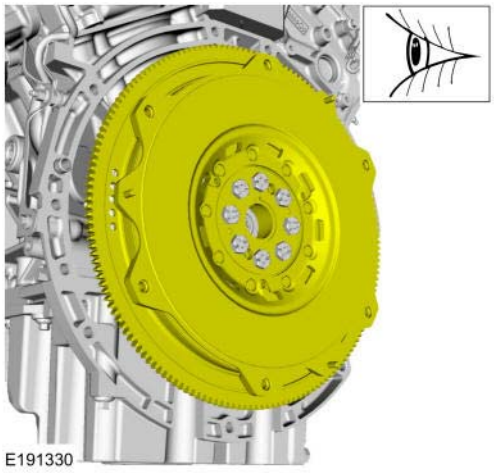


1.

Remove the transmission. Refer to: Transmission - 3.7L Duratec (227kW/301PS) .

NOTE: Loosen the bolts evenly to prevent clutch pressure plate damage.

NOTE: If the parts are to be reused, index-mark the pressure plate to the flywheel. Failure to install the pressure plate to the flywheel in the original position may result in a clutch system vibration.



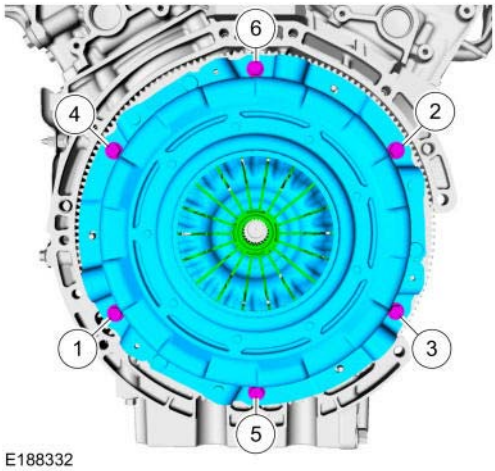
2.
Remove the pressure plate bolts by turning them 1 turn at a time in a star pattern until the clutch is fully released. Remove the pressure plate and the clutch disc. Discard the pressure plate bolts.

REMOVAL AND INSTALLATION > CLUTCH DISC AND PRESSURE PLATE - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

Inspect the flywheel for damage. Refer to: Flywheel Inspection - 3.7L Duratec (227kW/301PS) .

NOTE: If installing a new pressure plate and/or flywheel, align the paint dot on the pressure plate as close as possible to the paint dot on the flywheel or a clutch system vibration can occur.



NOTE: If installing the original pressure plate, align it using the index-marks made during removal or a clutch system vibration can occur.

2.
Using a clutch aligner, position the clutch disc on the flywheel. If installing the original pressure plate, align the pressure plate to the flywheel using the index-marks made during removal. If installing a new pressure plate, align the pressure plate to the flywheel using the paint dots. Install new pressure plate bolts by turning the bolts 1 turn at a time in a star pattern until the clutch is fully secured. Use the General Equipment: Clutch Alignment Tool

Torque:

Stage 1: 46 lb.ft (63 Nm)

Stage 2: 60°

3.

Install the transmission. Refer to: Transmission - 3.7L Duratec (227kW/301PS) .

4.

After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

DESCRIPTION AND OPERATION > MANUAL TRANSMISSION - OVERVIEW > OVERVIEW

The MT82 is a fully synchronized 6-speed manual transmission with reverse gear. The name of the MT82 is derived from the distance between the two shafts in the transmission:

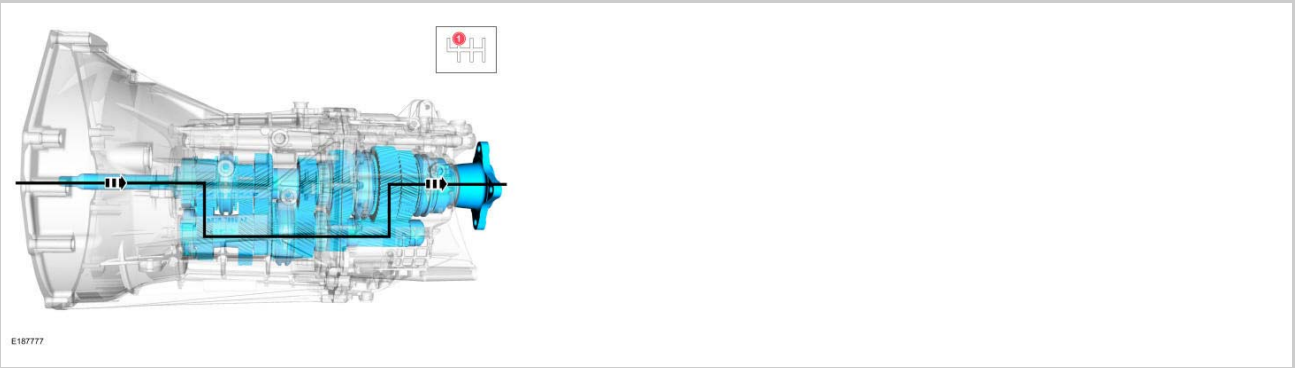
- **M** Manual.

- **T** Transmission.
- **82** The distance between the main shaft and the counter shaft in millimeters.

This transmission is a coaxial transmission with three shafts. The input shaft as well as the output shaft lie on a single axis. All gear wheels have helical teeth and are constantly engaged. The transmission is designed for a maximum torque of 480 Nm. In order to ensure secure mounting of the selector rods, they are passed through a centre bearing mounting plate. The center bearing mounting plate is bolted to the housing. All gear selector forks and shift forks are made of forged steel. The main selector shaft is mounted in the center bearing mounting plate. The bearing of the transmission does not require preloading and therefore does not require shims. In order to compensate for the heat expansion of the shafts, they run in one bearing which can slide in its seat and one bearing which is pressed home in its seat. To improve gearshifting, 1st and 2nd gear have triple synchronizers and 3rd and 4th gear have double synchronizers. Only the 5th and 6th gears and the reverse gear have single synchronizers. The transmission fluid is designed to last the entire service life of the transmission and does not need to be changed during servicing.

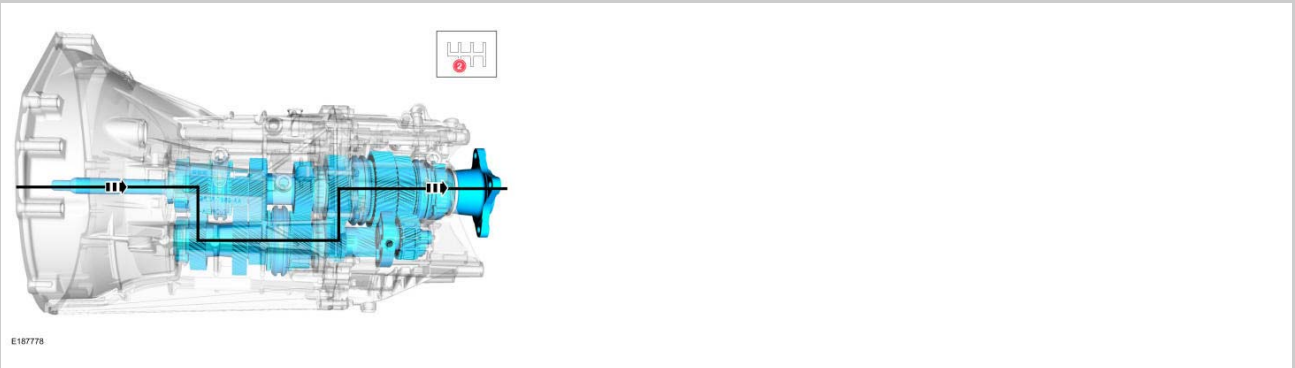
DESCRIPTION AND OPERATION > MANUAL TRANSMISSION - OVERVIEW > IDENTIFICATION TAGS

The transmission identification tag is located on the RH side of the transmission, near the driveshaft flange.



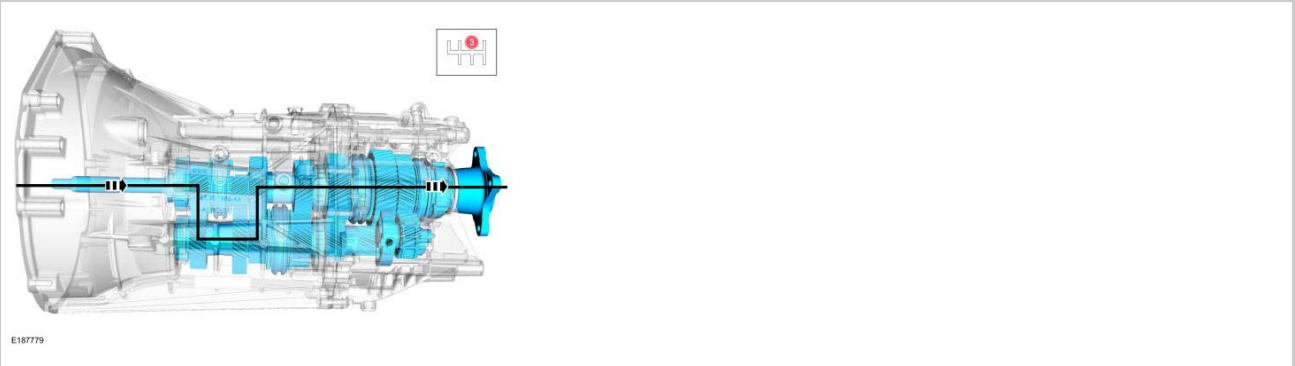
Item	Description
1	Replacement part number
2	Place of manufacture
3	Transmission build date

4	Build time



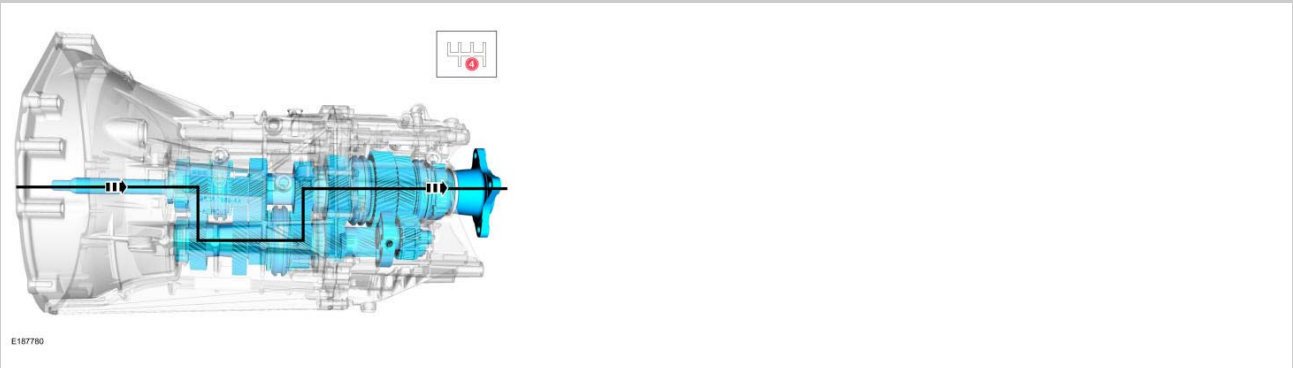
DESCRIPTION AND OPERATION > MANUAL TRANSMISSION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

First Gear Powerflow



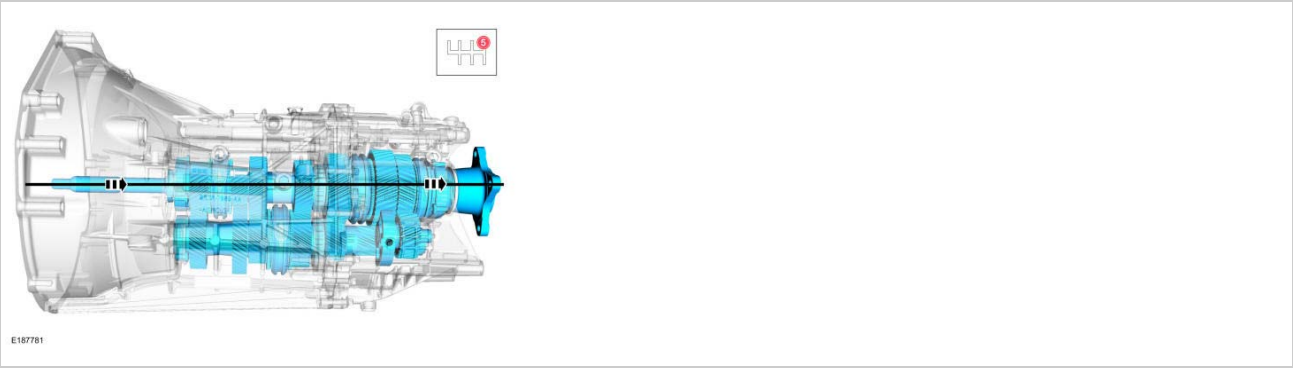
In first gear, the shift shaft assembly pulls the 1st/2nd shift rail and fork back to slide the 1st/2nd synchronizer sleeve onto 1st gear to lock it to the output shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through 1st gear.

Second Gear Powerflow



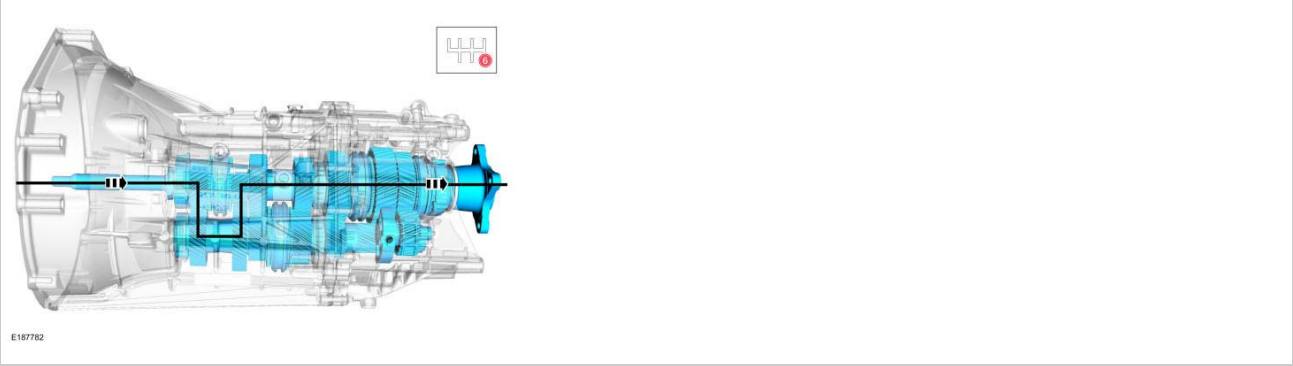
In second gear, the shift shaft assembly pushes the 1st/2nd shift rail and fork forward to slide the 1st/2nd synchronizer sleeve onto 2nd gear to lock it to the output shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through 2nd gear.

Third Gear Powerflow



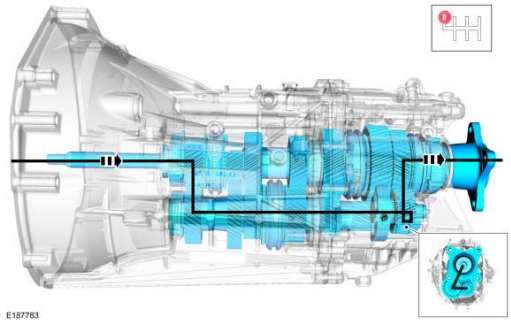
In third gear, the shift shaft assembly pulls the 3rd/4th shift rail back which pivots the 3rd/4th shift fork to slide the 3rd/4th synchronizer sleeve forward onto 3rd gear to lock it to the counter shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through 3rd gear.

Fourth Gear Powerflow



In forth gear, the shift shaft assembly pushes the 3rd/4th shift rail forward which pivots the 3rd/4th shift fork to slide the 3rd/4th synchronizer sleeve back onto 4th gear to lock it to the counter shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through 4th gear.

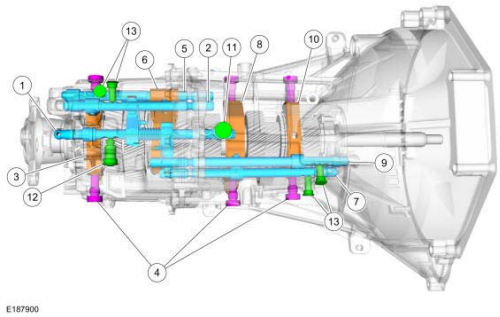
Fifth Gear Powerflow



In fifth gear, the shift shaft assembly pulls the 5th/6th shift rail back which pivots the 5th/6th shift fork to slide the 5th/6th synchronizer sleeve forward onto the input shaft to lock it to the output shaft. Torque is transferred from the input shaft to the output shaft through the 5th/6th synchronizer sleeve and provides direct drive through the transmission.

Sixth Gear Powerflow

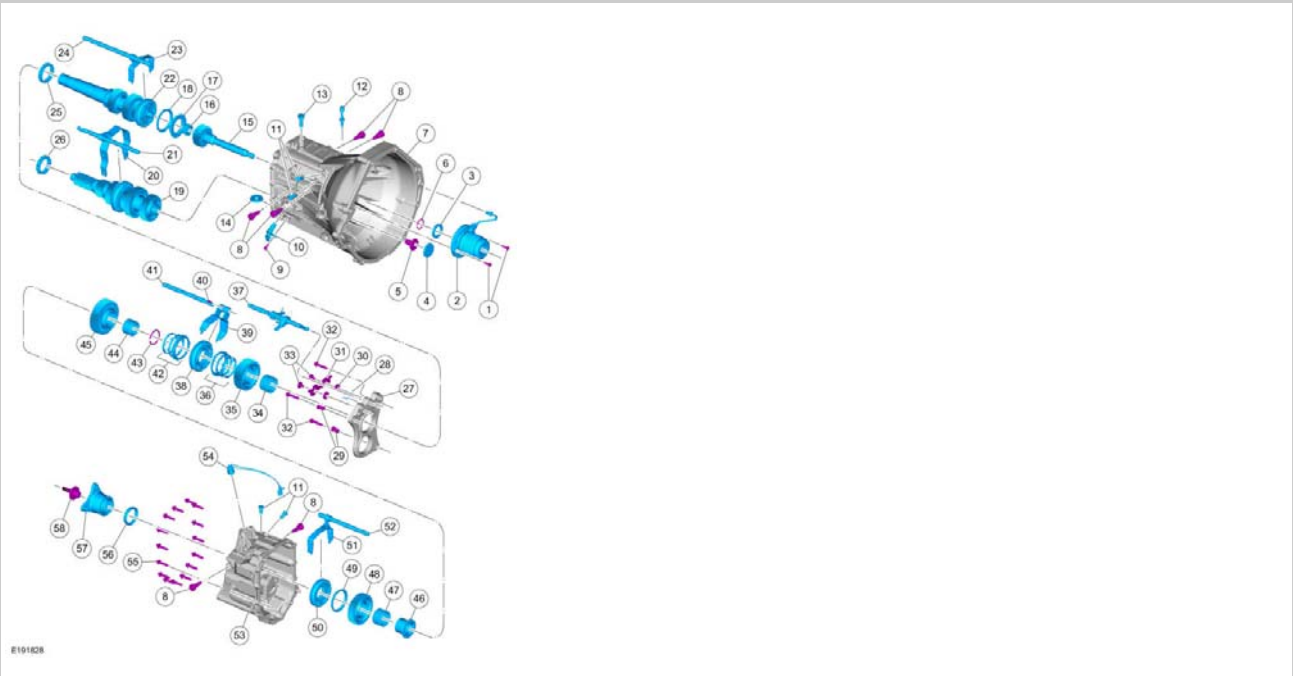
In sixth gear, the shift shaft assembly pushes the 5th/6th shift rail forward which pivots the 5th/6th shift fork to slide the 5th/6th synchronizer sleeve back onto 6th gear to lock it to the output shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through 6th gear.



Reverse Powerflow

In reverse, the shift shaft assembly pulls the reverse shift rail back which pivots the reverse shift fork to slide the reverse synchronizer sleeve forward onto reverse gear to lock it to the output shaft. Torque is transferred from the input shaft to the counter shaft through 5th gear and from the counter shaft to the output shaft through the reverse gear and reverse idler gear to rotate the output shaft in the opposite direction.

Component Description

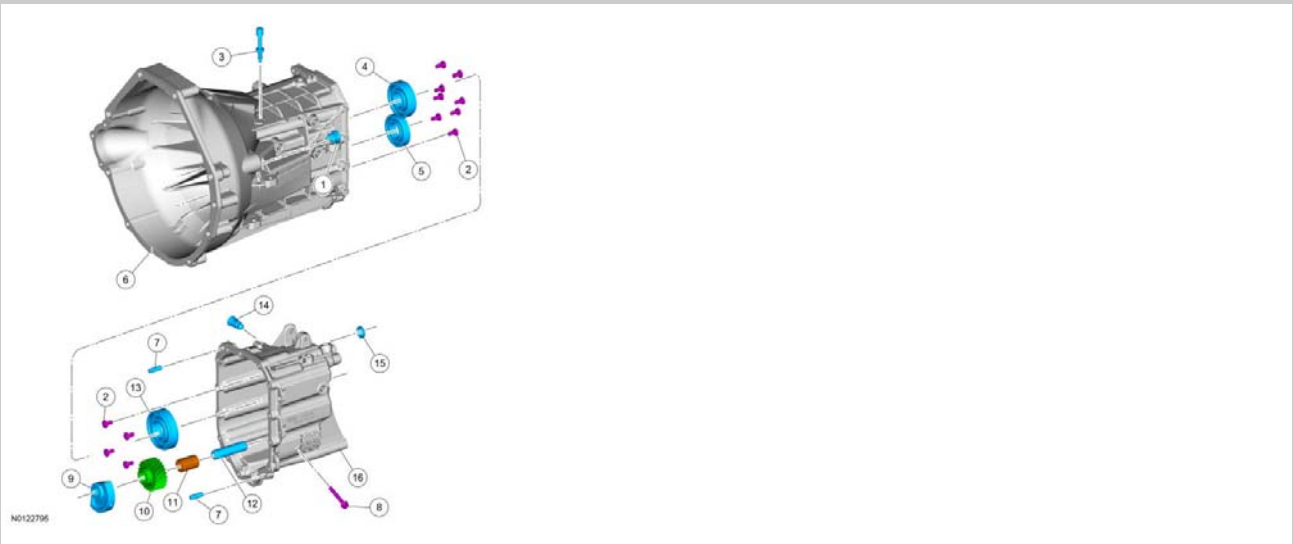


Internal Gearshift Mechanism

Item	Description
1	Shift shaft assembly
2	Reverse shift rail
3	Reverse shift fork
4	Shift fork pivot bolts
5	1st/2nd shift rail
6	1st/2nd shift fork
7	3rd/4th shift rail
8	3rd/4th shift fork

9	5th/6th shift rail
10	5th/6th shift fork
11	Shift shaft stop pin
12	Shift shaft d©tente
13	Shift rail detents

Transmission Exploded View



Item	Description
1	Clutch slave cylinder bolt (2 required)
2	Clutch slave cylinder
3	Input shaft seal
4	Countershaft bolt cover
5	Countershaft bolt
6	Input shaft snap ring
7	Front transmission case assembly
8	Shift fork pivot bolts (6 required)

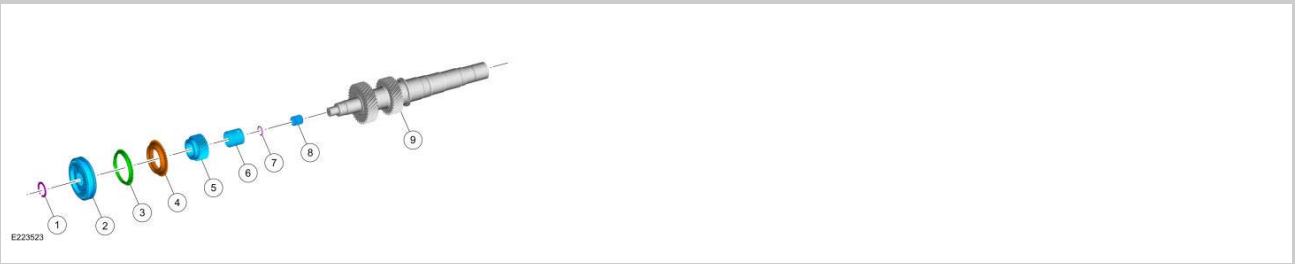
10	OSS sensor
11	Shift rail detents (4 required)
12	Transmission case vent tube
13	Shift shaft stop pin

14	Magnet
15	Input shaft
16	Output shaft roller bearing
17	5th gear synchronizer cone
18	5th gear synchronizer ring
19	Countershaft assembly
20	3rd/4th shift fork
21	3rd/4th shift rail
22	Output shaft assembly
23	5th/6th shift fork
24	5th/6th shift rail
25	Center support bearing (output shaft)
26	Center support bearing (countershaft)
27	Center support
28	Spring
29	Dowels (2 required)
30	Spacers (2 required)
31	Interlock plate
32	Center support bolts (3 required)
33	Interlock plate bolts (2 required)
34	2nd gear needle bearing
35	2nd gear
36	2nd gear synchronizer ring assembly
37	Shift shaft assembly
38	1st/2nd gear synchronizer assembly
39	1st/2nd shift fork
40	Roll pin
41	1st/2nd shift rail
42	1st gear synchronizer ring assembly
43	1st/2nd gear synchronizer assembly snap ring
44	1st gear needle bearing
45	1st gear
46	Reverse gear needle bearing race

47	Reverse gear needle bearing
48	Reverse gear
49	Reverse gear synchronizer ring
50	Reverse gear synchronizer assembly
51	Reverse shift fork
52	Reverse shift rail
53	Rear transmission case assembly
54	Reverse lamp switch
55	Transmission case bolts
56	Output shaft seal
57	Output shaft flange
58	Output shaft flange bolt

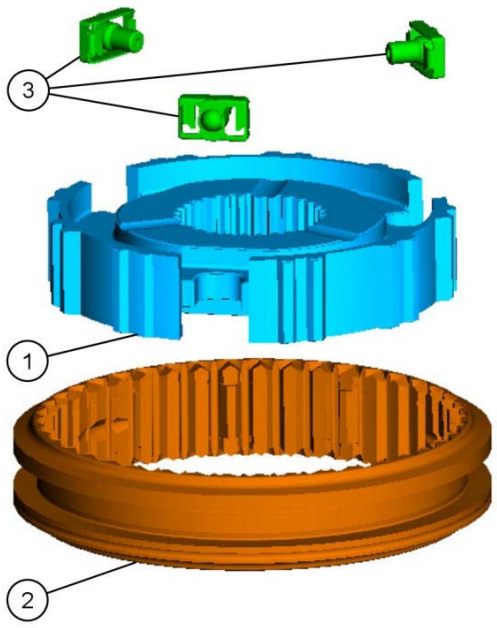
Transmission Case

Item	Description
1	Clutch slave cylinder tube retaining clip
2	Bearing retaining bolts
3	Transmission case vent tube
4	Input shaft bearing
5	Countershaft bearing
6	Front transmission case
7	Dowel pin
8	Reverse idler gear bracket bolt



9	Reverse idler gear bracket
10	Reverse idler gear
11	Reverse idler gear needle bearing
12	Reverse idler gear shaft
13	Output shaft bearing
14	Shift shaft detent
15	Shift shaft seal
16	Rear transmission case

Counter Shaft



Item	Description
1	5th gear
2	6th gear
3	3rd gear
4	3rd gear needle bearing
5	3rd gear synchronizer ring assembly
6	3rd/4th gear synchronizer assembly snap ring
7	3rd/4th gear synchronizer assembly
8	4th gear synchronizer ring assembly
9	4th gear
10	4th gear needle bearing
11	Countershaft

Output Shaft

Item	Description
1	5th/6th gear synchronizer assembly snap ring
2	5th/6th gear synchronizer assembly
3	6th gear synchronizer ring
4	6th gear synchronizer cone
5	6th gear
6	6th gear needle bearing
7	Pocket bearing inner bearing race retainer
8	Pocket bearing inner bearing race
9	Output shaft

Synchronizer Assembly

E92188

Item	Description
1	Synchronizer hub
2	Synchronizer sleeve
3	Pressure pieces

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > INSPECTION AND VERIFICATION

NOTE: If transmission noise is reported, first check the transmission fluid level. The vehicle should not be driven if the transmission fluid level is low. A low transmission fluid level will damage the transmission.

NOTE: If an observed or reported concern is found, correct the cause before proceeding.

Gear driven units produce a certain level of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Many conditions, such as road and weather can amplify normal vehicle noise.

The following overview is a guide to diagnose a transmission or clutch concern:

- Verify and document the customer concern.
    - During the customer interview, if a leak was noticed or if a leak is the concern, check the transmission fluid level. The vehicle should not be driven if the transmission fluid level is low.
- Check fluid level and condition.
- Evaluate the clutch hydraulic system.
- Evaluate the clutch.
- Inspect gearshift mechanism.
- Evaluate the transmission.

Check Fluid Level and Condition

An incorrect transmission fluid level may affect the transmission operation and can result in transmission damage. REFER to: Transmission Fluid Level Check .

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > CHECK FLUID LEVEL AND CONDITION

NOTE: Excessive temperatures may break down the transmission lubricant. If there is reason to believe the transmission has been subjected to temperatures exceeding 135°C (275°F) for an extended period (greater than 20 minutes), change the lubricant immediately.

A low transmission fluid level can result in poor transmission shifting, engagement or damage. It also indicates a leak in the transmission seals or gaskets.

1.

Check the transmission fluid condition.

Allow the transmission fluid to drip onto a white cloth and examine the stain. Check the transmission fluid for contamination or metal particles.

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > EVALUATE CLUTCH HYDRAULIC SYSTEM

1.

Verify the clutch hydraulic fluid reservoir is filled to the correct level.

If the clutch hydraulic fluid level is low, add fluid as necessary. Check the clutch hydraulic system for leaks.

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > EVALUATE THE CLUTCH

1.

Apply and release the clutch pedal slowly to check pedal binding. Make sure the clutch pedal can be fully applied and is not restricted by the floor mat.

2.

With the engine idling and the park brake applied, move the gearshift lever into 4th gear. Increase engine speed to 2, 000 rpm and slowly release the clutch pedal.

If the engine stalls, the clutch is not slipping.

If the engine does not stall, the clutch is slipping.

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > INSPECT GEARSHIFT MECHANISM

1.

Inspect the gearshift mechanism for:

signs of damage.

missing or loose fasteners.

binding.

2.

Repair as necessary.

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > EVALUATE TRANSMISSION

NOTE: The vehicle should not be driven if the transmission fluid level is low or damage may occur.

NOTE: Before attempting to repair any concerns, road test the vehicle to determine which system the concern is in.

1.

Road test the vehicle. Use the following methods to diagnose the concern.

Start the engine.

Evaluate the noise in NEUTRAL while vehicle is parked.

Check whether the noise is present with the clutch fully disengaged (clutch pedal applied). Check to see if the pedal pulsates abnormally (clutch diaphragm finger runout).

Check whether the noise is present with the gearshift in the NEUTRAL position and the clutch fully engaged (clutch pedal released). Apply the park brake and move the gearshift towards the 1st gear position.

With the clutch fully engaged (clutch pedal released) check whether the noise is present as the engine speed is raised. If the noise reduces, note the engine speed at which this occurs.

Listen for any change in noise while applying and releasing the clutch pedal.

Listen for any change in noise while changing the engine rpm.

Drive the vehicle and shift through all the gears including REVERSE. Listen for any changes in noise.

Drive the vehicle in the gear in which the noise is most noticeable. Apply the clutch pedal and leave the gear engaged. Listen for any change in noise.

Drive the vehicle in the gear in which the noise is most noticeable. Apply the clutch pedal and shift the transmission into NEUTRAL. Release the clutch pedal and allow the vehicle to coast.

2.

The following list of conditions are typical clutch concerns.

Clutch slippage

Clutch chatter or shudder

Clutch pedal feels spongy or has excessive travel. Clutch will not disengage

Clutch drag, also hard to shift

Clutch pedal pulsation

Clutch-related vibrations

Excessive noise

3.

The following list of conditions are typical clutch hydraulic system concerns.

Clutch pedal feels spongy or has excessive travel. Clutch will not disengage

Clutch drag, also hard to shift

Clutch pedal pulsation

Clutch system leakage

4.

Compare the road test results with the following symptom charts. The following list of conditions are typical transmission concerns:

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > SYMPTOM CHART: MANUAL TRANSMISSION

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom	Possible Sources	Action
Transmission difficult to shift when cold	Normal Condition	Excessive force to select gears when the transmission is cold is a normal condition. Test drive the vehicle to see if the condition is still present when it warms up.
Transmission difficult to shift	Lubricant	ADD or DRAIN and FILL with specified lubricant. REFER to: Transmission Draining and Filling .
Internal shift mechanism		CHECK the internal shift mechanism for smooth operation. REPAIR or INSTALL a new mechanism as necessary.
Sliding gears, synchronizers		CHECK for free movement of gears and synchronizers. REPAIR or INSTALL new components as necessary.

Housings, shaft		CHECK for binding condition between the input shaft and the engine crankshaft pilot bearing or bushing. REPAIR or INSTALL new components as necessary. REFER to: Pilot Bearing .
Loose pressure plate to flywheel bolts		CHECK for loose bolts at the pressure plate. INSTALL new components as necessary. REFER to: Clutch Disc and Pressure Plate - 2.3L EcoBoost (201kW/273PS) . REFER to: Clutch Disc and Pressure Plate - 3.7L Duratec (227kW/301PS) . REFER to: Clutch Disc and Pressure Plate - 5.0L 32V Ti-VCT .
Transmission will not shift - gearshift lever moves	Gearshift lever damaged	INSTALL a new gearshift lever. REFER to: Gearshift Lever .
Damaged or worn selector arm. Loose shift rail bushings		CHECK the internal shift components. INSTALL new component as necessary.
Damaged or offset lever plate		CHECK the internal shift components. INSTALL new component as necessary.
NOTE: While verifying the condition, determine whether the noise is gear rollover noise, release bearing rub or some other transmission-related noise. Gear rollover noise, inherent in manual transmissions, is caused by the constant mesh of gears turning at the engine idle speed while the clutch is engaged and the transmission is in NEUTRAL. Release bearing rub is sometimes mistaken for mainshaft bearing noise. Gear rollover noise will disappear when the clutch is disengaged or when the transmission is engaged in gear. Release bearing rub will disappear when the clutch is	Lubricant	ADD or DRAIN and FILL with specified lubricant. REFER to: Transmission Draining and Filling .

engaged. In the event that a bearing is damaged, the noise is more pronounced while engaged in gear under load or coast than in NEUTRAL.		
Noisy in forward gears		
Components grounding out on the transmission		CHECK for screws and bolts of body or other components grounding out. CORRECT as necessary.
Components housing bolts		CHECK the torque on the transmission-to-flywheel housing bolts and the flywheel housing-to-engine block bolts. TIGHTEN the bolts to specification.
Bearings or gears		INSPECT the bearings. INSPECT the gears and gear teeth for wear or damage. INSTALL new components as necessary.
Axle howl or whine		The MT82 transmission may be suspect of a gear whine noise, which seems to be emanating from the rear of the vehicle at or in excess of 80 km/h (50 mph) at full operating temperature. Drive the vehicle at customer complaint speeds in 5th gear (this is the direct gear) to eliminate manual transmission as noise source, reach full operating temperature and confirm if noise is still present. REFER to: Suspension System .
Gears clash when shifting from one forward gear to another	Pilot bearing	CHECK for a binding condition between the input shaft and the engine crankshaft pilot bearing. INSTALL new components as necessary. REFER to: Pilot Bearing .
Gear teeth and/or synchronizer		REPAIR or INSTALL new components as necessary.
Damaged shift forks or worn shift fork inserts		INSPECT for wear or damage. INSTALL new components as

		necessary.
Transmission jumps out of gear	Transmission-to-engine mounting bolts	TIGHTEN the bolts to specification.
Crankshaft pilot bearing		INSTALL a new pilot bearing. REFER to: Pilot Bearing .
Internal Damage		INSPECT the synchronizer sleeves for free movement on their hubs. INSPECT the synchronizer blocking rings for widened index slots, rounded clutch teeth and smooth internal surface. CHECK shift forks for worn or loose mounting on shift rails. INSPECT the synchronizer sliding sleeve and the gear clutch teeth for wear or damage. REPAIR or INSTALL a new component as necessary.
Gear teeth		If worn or damaged, INSTALL new gears.
Transmission will not shift into one gear - all others OK	Manual shift linkage	REPAIR or INSTALL new components as necessary.
Backup switch ball		If REVERSE is the problem, CHECK reverse lamp switch for ball frozen in extended position.
Internal components		INSPECT the shift rail and fork system, synchronizer system and the gear clutch teeth for restricted travel. REPAIR or INSTALL new components as necessary.
Transmission is locked in one gear and cannot be shifted out of that gear	Internal components	INSPECT the problem gears, shift rails, forks and the synchronizer for wear or damage. REPAIR as necessary.
Fork on rail or shift rail		CHECK the shift rail interlock system. REPAIR as necessary.
Transmission leaks	Lubricant	CHECK the level and type.
Other component leaking		IDENTIFY leaking fluid as engine, power steering or transmission fluid. REPAIR as necessary.
False report		REMOVE all traces of lube on the exposed transmission surfaces. CHECK the vent for

		free breathing. OPERATE the transmission and INSPECT for new leakage. REPAIR as necessary.
Internal components		INSPECT for leaks at the input shaft seal. INSPECT the case for sand holes or cracks. REPAIR or INSTALL a new case as necessary.
Fill and drain plugs		CHECK fill and drain plugs and bore threads. REPAIR as necessary. TIGHTEN plugs to specified torque value.
Bearing failure	Other part failure Raceways or rollers Lubricant Towing vehicle further than 80 km (50 mi) with driveshaft installed.	REMOVE, DISASSEMBLE and CLEAN the transmission. Inspect for damaged parts and install new components as necessary. (Note: RESET the bearing preload if any new tapered bearings are installed.)
Vibration break-up of retainer and brinelling of races Bearing(s) Shafts or bore Incorrect preload		DETERMINE the cause of vibration and CORRECT. Otherwise, PROCEED as above.
Input shaft oil dam		INSTALL new components as necessary and VERIFY the oil dam installation is correct. CHECK for correct installation of the snap ring on the mainshaft next to the oil dam.
Oil baffle in the input bearing shim pack		INSTALL a new oil baffle, making sure it is not damaged during assembly.

DIAGNOSIS AND TESTING > MANUAL TRANSMISSION > SYMPTOM CHART: NVH

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom	Possible Sources	Action
NOTE: NVH symptoms should be identified using the diagnostic tools that are	Gear engagement	Acceptable operating condition. Caused by the contact pattern of these gears.

available. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, check for the next likely system and continue diagnosis.		
Transmission rattle noise - noise occurs at 1st and 2nd gear on light acceleration.		
Transmission rattling/clattering noise - occurs in NEUTRAL or in gear, at idle	Incorrect fluid level or fluid quality	COMPARE with other like vehicles. CHECK that the transmission is filled to the correct level and with the specified fluid. REFER to: Transmission Fluid Level Check .
Transmission rattling/clattering noise - noise at idle in NEUTRAL	Worn or rough reverse idler gear	CHECK the reverse idler gear. REPAIR as necessary.
Excessive backlash in gears		CHECK the gear backlash. ADJUST as necessary.
Worn countershaft gears		REPAIR as necessary.
Transmission whine - a mild whine at extreme speeds or high rpm	Rotating gears/geartrain	Acceptable noise.
Transmission whine - a high pitched whine, also described as a squeal	Transmission gears are worn (high mileage vehicle)	Result of normal gear wear. REPAIR as necessary.
Mismatched gear sets		INSPECT the gear sets for an uneven wear pattern on the face of the gear teeth. REPAIR as necessary.
Damaged or worn transmission bearing		INSPECT the transmission bearings. INSTALL new bearings as necessary.
Transmission growling/humming - noise occurs in the forward gears. The noise is more prominent when the gear is loaded. The problem gear can be located as the noise occurs in a specific gear position	Gear is cracked, chipped or rough	INSPECT the transmission gears for damage or wear. INSTALL new gears as necessary.

Axle howl or whine		The MT82 transmission may be suspect of a gear whine noise, which seems to be emanating from the rear of the vehicle at or in excess of 80 km/h (50 mph) at full operating temperature. Drive the vehicle at customer complaint speeds in 5th gear (this is the direct gear) to eliminate manual transmission as noise source, reach full operating temperature and confirm if noise is still present. REFER to: Suspension System . If noise is not present, proceed with gear noise analysis.
Transmission hissing - noise in NEUTRAL or in forward gears. As bearings wear or break up, the noise changes to a thumping noise	Damaged or worn bearings	INSPECT the transmission bearings. INSTALL new bearings as necessary.
Transmission knocking/thudding - noise at low speeds in forward gears	Bearings with damaged balls or rollers or with pitted and spalled races	INSPECT the transmission bearings. INSTALL new bearings as necessary.
Transmission growling/humming - noise occurs in the forward gears. The noise is more prominent when the gear is loaded. The problem gear can be located as the noise occurs in a specific gear position *Transmission rumble/growl - noise at higher speeds in forward gears, more pronounced in a coast/deceleration condition	Incorrect driveline angle	CHECK the driveline angle. REPAIR as necessary. REFER to: Driveshaft .
Driveshaft out of balance or damaged		CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to the driveshaft runout and balance test. REFER to: Driveshaft .
Axle howl or whine		The MT82 transmission may be suspect of a gear whine noise, which seems to be emanating from the rear of the vehicle at or in excess of 80 km/h (50 mph) at full operating temperature. Drive the vehicle at customer complaint speeds in 5th gear (this is the direct

		gear) to eliminate manual transmission as noise source, reach full operating temperature and confirm if noise is still present. REFER to: Suspension System . If noise is not present, proceed with gear noise analysis.
Transmission rumble/growl - noise at all speeds in forward gears, more pronounced in a heavy acceleration condition	Damaged or worn transmission bearing or gears (high mileage vehicles)	CHECK transmission fluid for excessive metal particles. REPAIR as necessary.

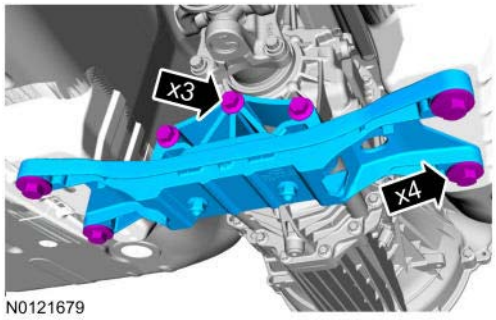
Threadlock 262 TA-26	WSK-M2G351-A6

REMOVAL AND INSTALLATION > OUTPUT SHAFT SEAL > REMOVAL

1.

Remove the driveshaft. Refer to: Driveshaft .

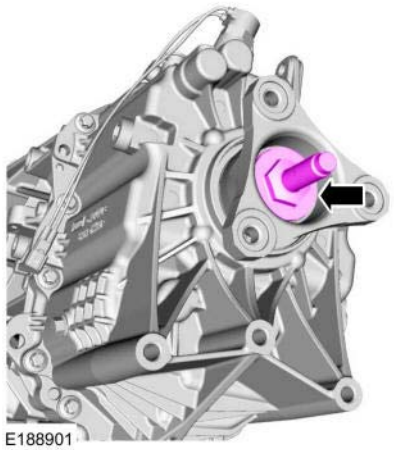
2.



Support the transmission with a transmission jack and secure it with a safety strap.

Use the General Equipment: Transmission Jack

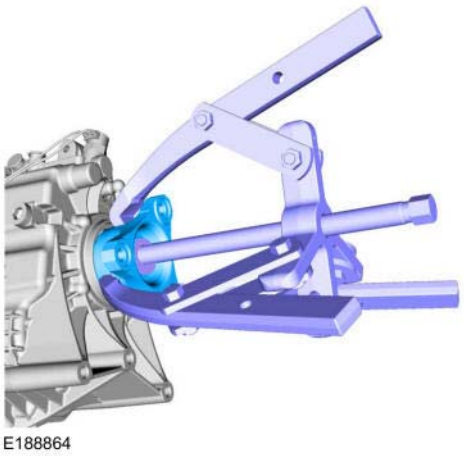
3.



Remove the bolts and remove transmission support insulator and crossmember.

Use the General Equipment: Transmission Jack

4.



Remove the output shaft flange bolt.

5.

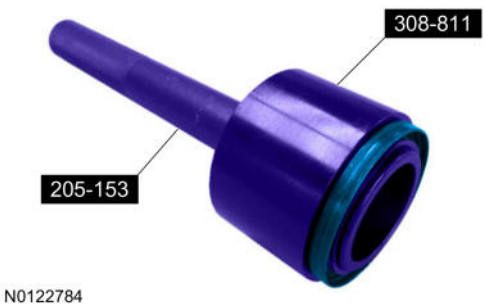
Remove the output shaft flange.

Use the General Equipment: Two Leg Puller

E188864

6.

Remove and discard the output shaft seal.



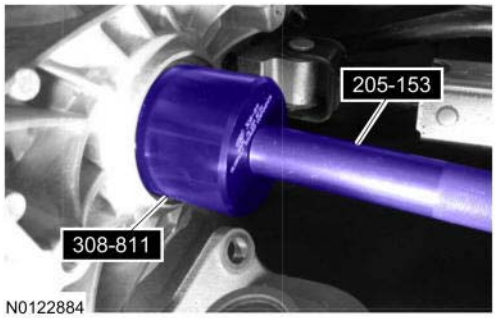
N0122881

REMOVAL AND INSTALLATION > OUTPUT SHAFT SEAL > INSTALLATION

1.

Install a new seal on the special tools.

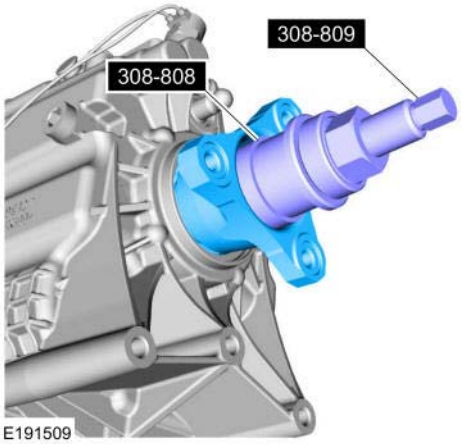
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 308-811 Installer, Rear Seal.



N0122784

2.

Using the special tools, install a new seal.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 308-811 Installer, Rear Seal.

3.

Using the special tools, install the output shaft flange.

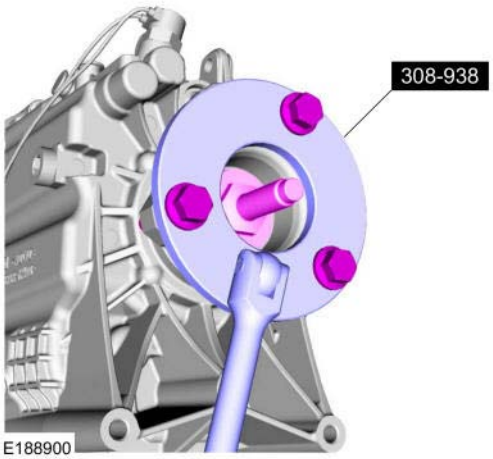
Use Special Service Tool: 308-808 Installer, Rear Flange, 308-809 Installer, Syncro Gear Pack.

4.

Install the special tools. Clean the threads on the output shaft bolt and apply one dot of thread locking adhesive to the lower end of the output shaft bolt threads. Using the special tools, install the output shaft flange bolt.

Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

Material



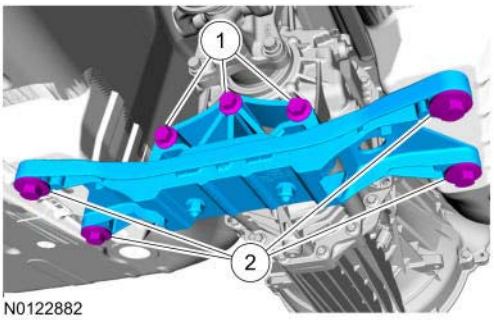
: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque:

Stage 1: 148 lb.ft (200 Nm)

Stage 2: Loosen: 5 turn(s)

Stage 3: 133 lb.ft (180 Nm)



5.

Install the transmission support insulator and crossmember and install the bolts.

Torque:

1: 76 lb.ft (103 Nm)

2: 46 lb.ft (63 Nm)

6.

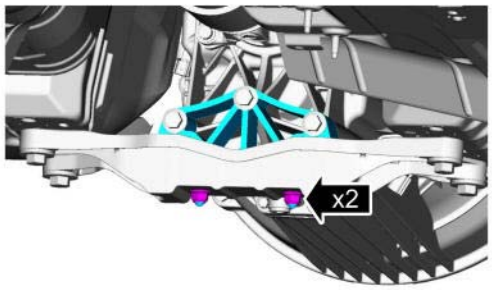
Install the driveshaft. Refer to: Driveshaft .

REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR

Special Tool(s) / General Equipment

Transmission Jack
Retaining Strap

REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR >



REMOVAL

1.

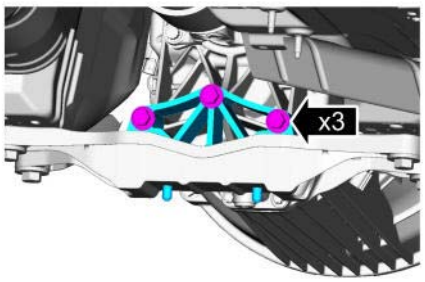
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the transmission support insulator nuts.

E187195

3.



Support the transmission with a transmission jack. Secure the transmission to the transmission jack.

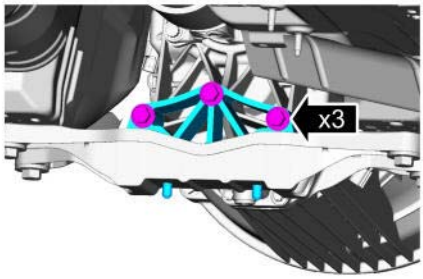
Use the General Equipment: Transmission Jack

Use the General Equipment: Retaining Strap

4.

Remove the transmission support insulator bolts and the transmission support insulator.

E187196



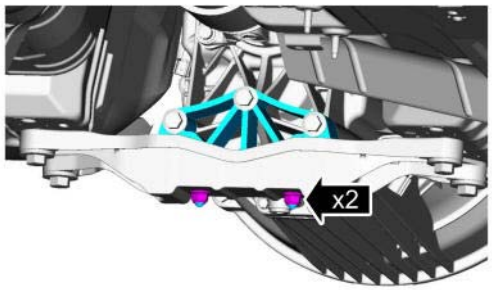
REMOVAL AND INSTALLATION > TRANSMISSION SUPPORT INSULATOR > INSTALLATION

1.

Install the transmission support insulator and the bolts.

Torque

: 76 lb.ft (103 Nm)



E187196

2.

Install the transmission support insulator nuts.

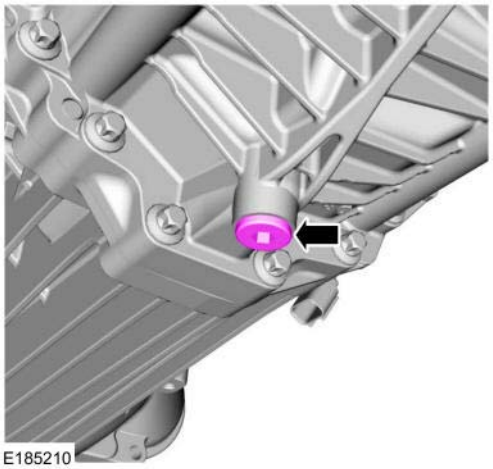
Torque

: 52 lb.ft (70 Nm)

E187195

REMOVAL AND INSTALLATION > VEHICLE SPEED SENSOR (VSS) > REMOVAL

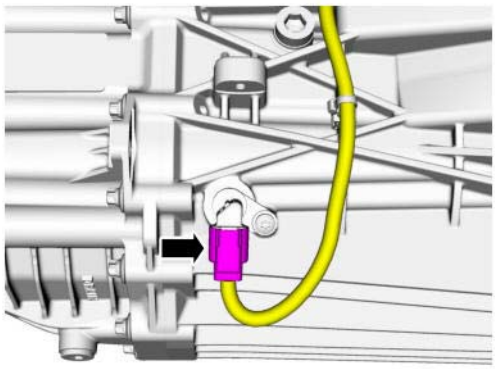
1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

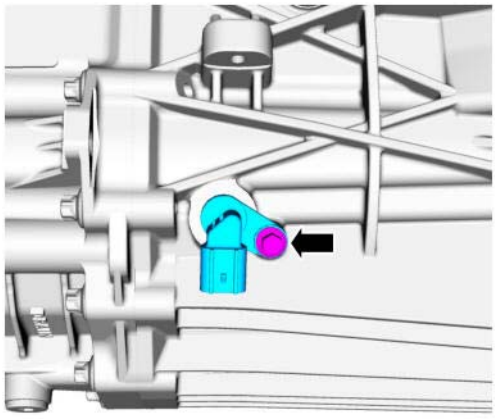
Remove the drain plug and drain the transmission fluid.



Torque

: 26 lb.ft (35 Nm)

E185210



3.

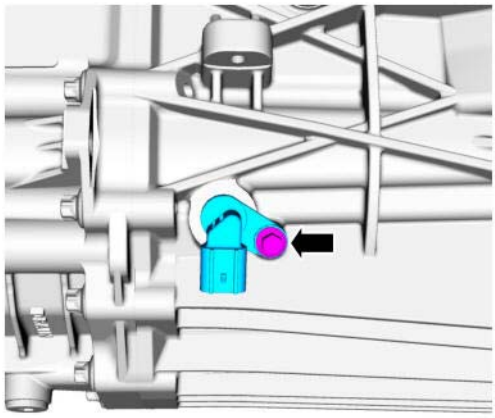
Disconnect the VSS electrical connector.

E187192

4.

Remove the VSS bolt and the VSS.

E187193

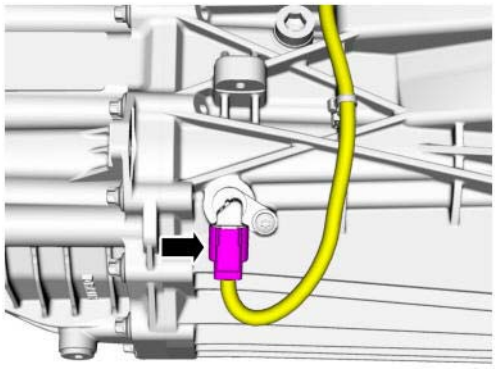


REMOVAL AND INSTALLATION > VEHICLE SPEED SENSOR (VSS) > INSTALLATION

1.

Install the VSS and the VSS bolt.

Torque



: 89 lb.in (10 Nm)

E187193

2.

Connect the VSS electrical connector.

E187192

3.

Fill the transmission. Refer to: Transmission Fluid Drain and Refill .

REMOVAL > TRANSMISSION - 2.3L ECOBOOST (201KW 273PS)

Special Tool(s) / General Equipment

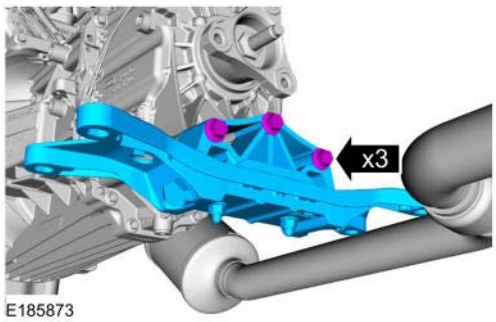
WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

1.

Disconnect the battery. Refer to: Battery Disconnect and Connect .



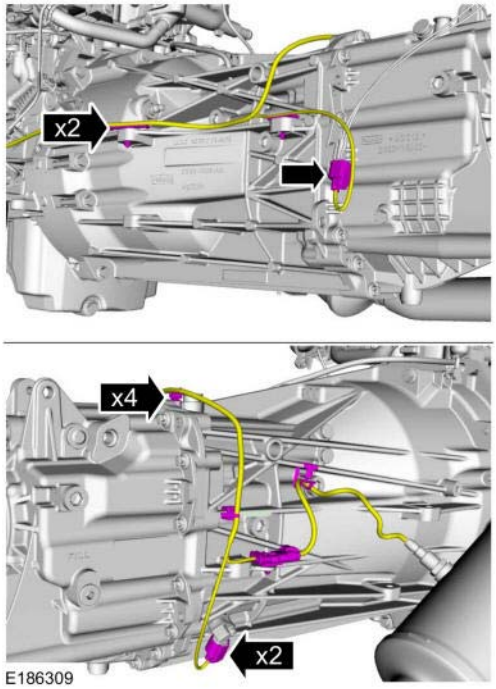
NOTE: Support the transmission with a transmission jack for gearshift lever removal.

2.
Remove the gearshift lever. Refer to: Gearshift Lever .

Use the General Equipment: Transmission Jack

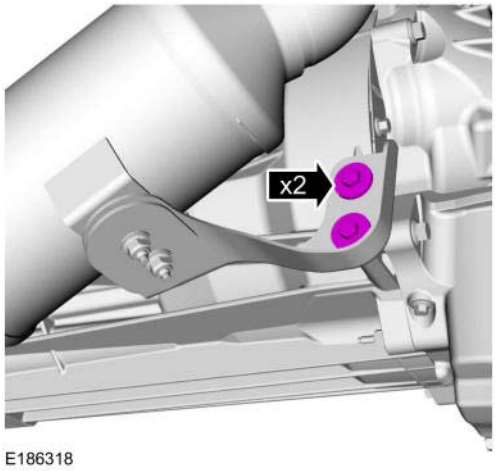
3.

Remove the bolts and remove the transmission support insulator and crossmember from the back of the transmission.



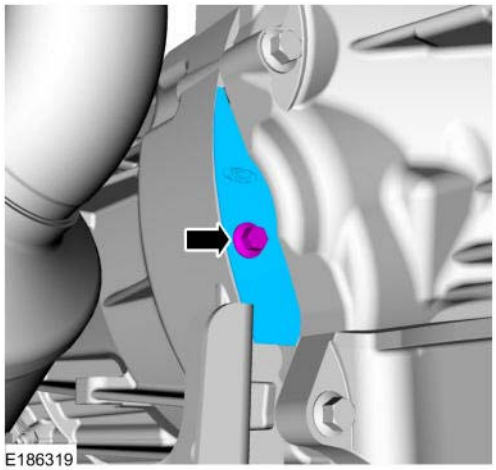
4.

Remove the starter motor. Refer to: STARTER MOTOR .



5.

Disconnect the electrical connectors and the wiring retainers and position the vehicle wiring harness aside.

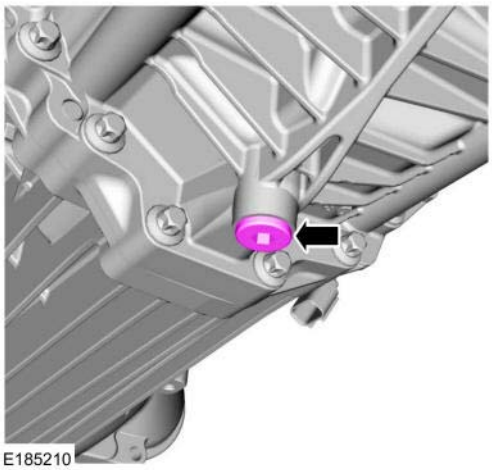


6.

Remove the catalytic converter support bracket bolts.

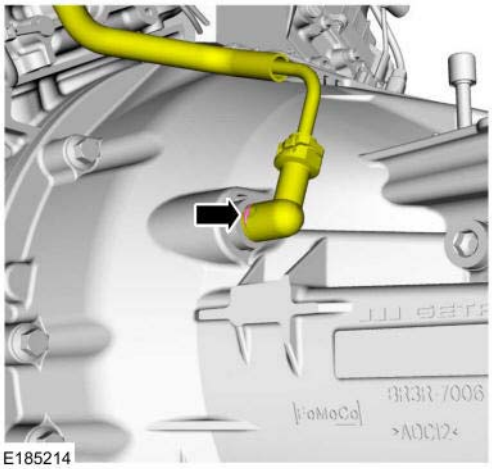
7.

Remove the bolt and the inspection cover.



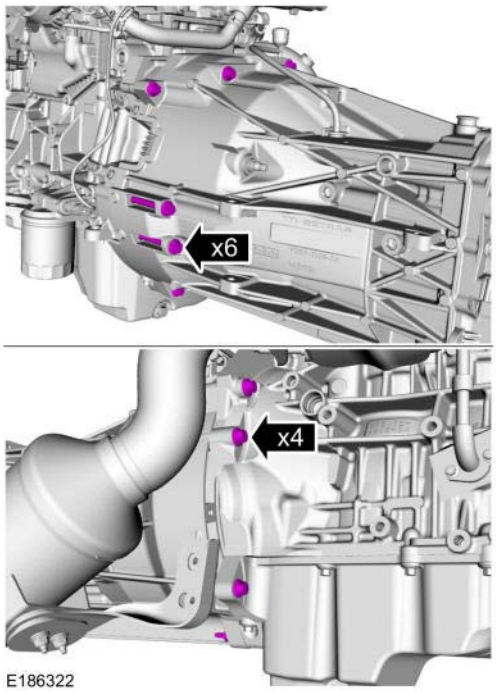
NOTE: If disassembly of the transmission is required, drain the transmission fluid.

8.
Remove the drain plug and drain the transmission fluid.



Torque

: 26 lb.ft (35 Nm)



9.

Remove the retainer and disconnect the hydraulic tube from the clutch master cylinder.

NOTE: Secure the transmission with a safety strap to the transmission jack.

10.
Remove the bellhousing bolts, pull the transmission back to remove the input shaft from the clutch, lower the transmission and remove it from the vehicle.

REMOVAL > TRANSMISSION - 3.7L DURATEC (227KW 301PS)

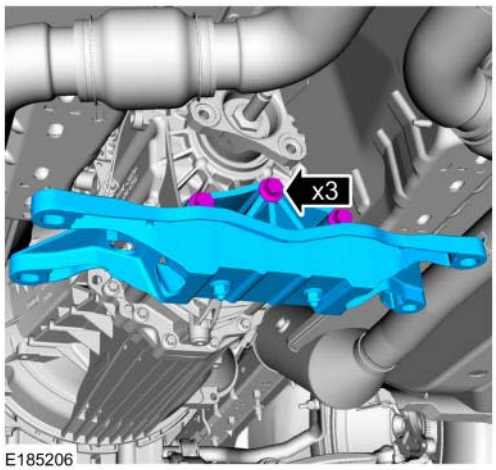
Special Tool(s) / General Equipment

Transmission Jack

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

1.

Disconnect the battery. Refer to: Battery Disconnect and Connect .



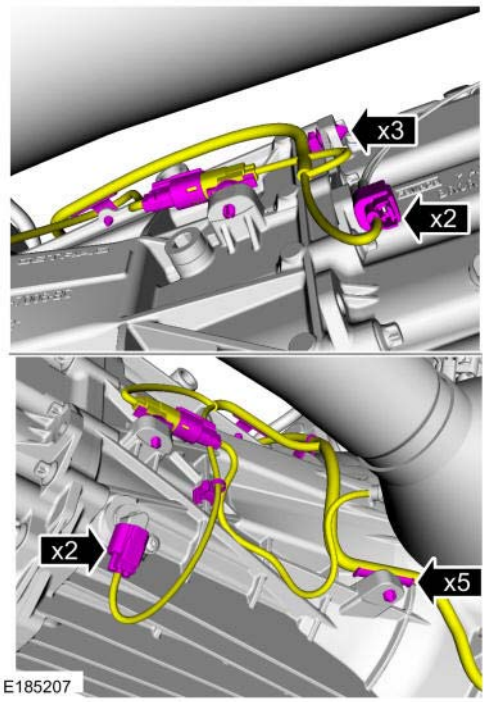
NOTE: Support the transmission with a transmission jack for gearshift lever removal.

2.
Remove the gearshift lever. Refer to: Gearshift Lever .

Use the General Equipment: Transmission Jack

3.

Remove the bolts and remove the transmission support insulator and crossmember from the back of the transmission.

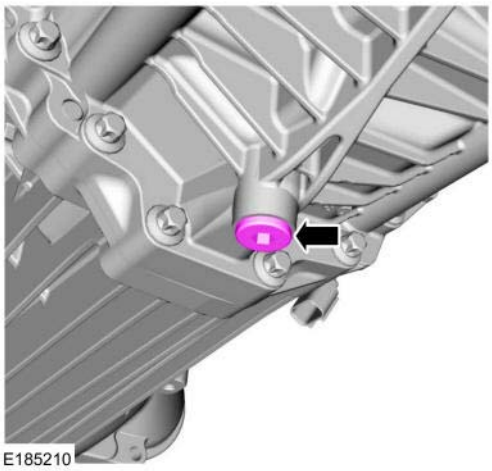


4.

Remove the starter motor. Refer to: STARTER MOTOR .

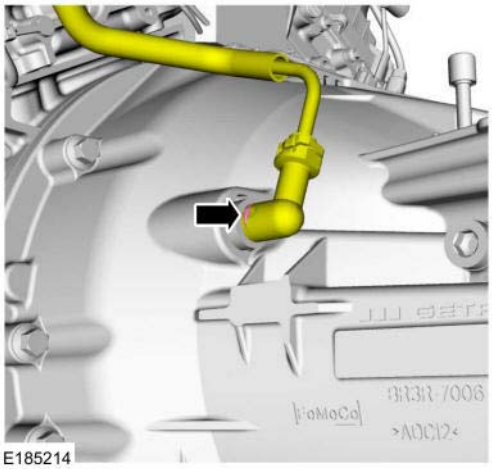
5.

Disconnect the electrical connectors and the wiring retainers and position the vehicle wiring harness aside.



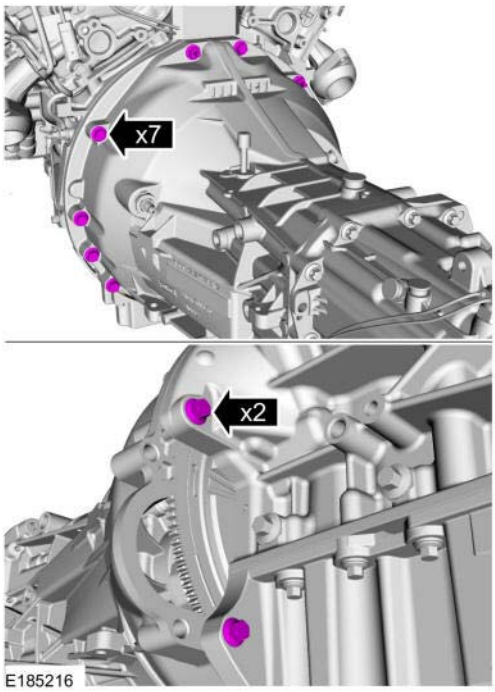
NOTE: If disassembly of the transmission is required, drain the transmission fluid.

6.
Remove the drain plug and drain the transmission fluid.



Torque

: 26 lb.ft (35 Nm)



7.

Remove the retainer and disconnect the hydraulic tube from the clutch master cylinder.

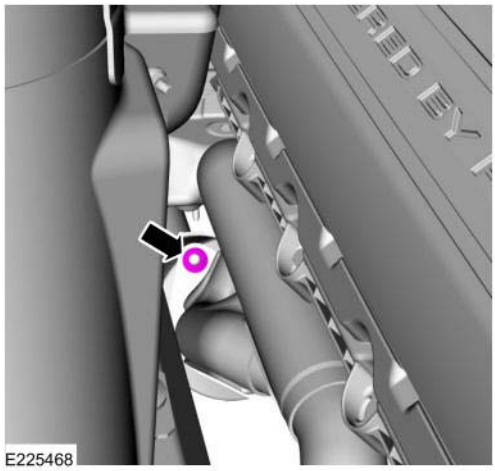
NOTE: Secure the transmission with a safety strap to the transmission jack.

8.
Remove the bellhousing bolts, pull the transmission back to remove the input shaft from the clutch, lower the transmission and remove it from the vehicle.

REMOVAL > TRANSMISSION - 5.0L 32V TI-VCT

Special Tool(s) / General Equipment

Transmission Jack



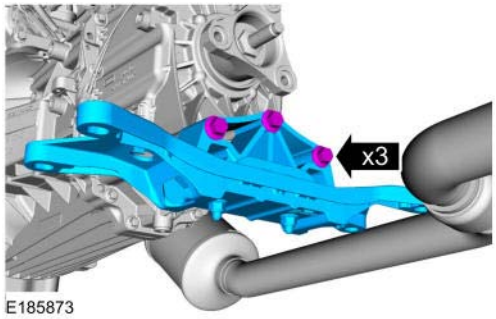
WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

1.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

2.

Remove the upper RH catalytic converter nut.



NOTE: Support the transmission with a transmission jack for gearshift lever removal.

3.
Remove the gearshift lever. Refer to: Gearshift Lever .

Use the General Equipment: Transmission Jack

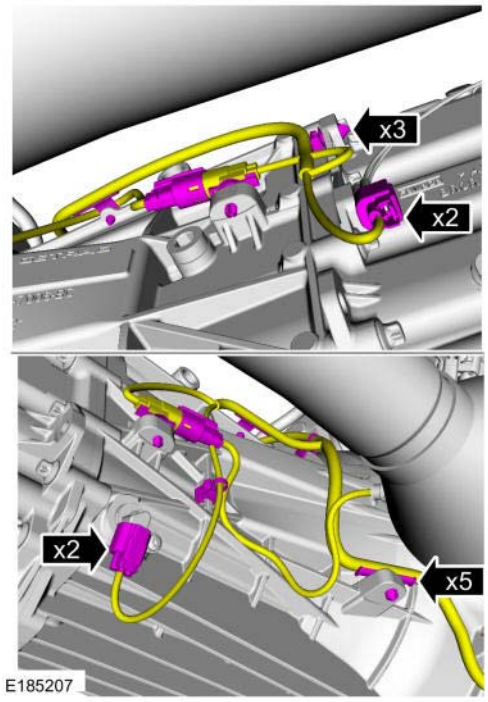
4.

Remove the bolts and remove the transmission support insulator and crossmember from the back of the transmission.

5.

Remove the starter motor. Refer to: STARTER MOTOR .

6.



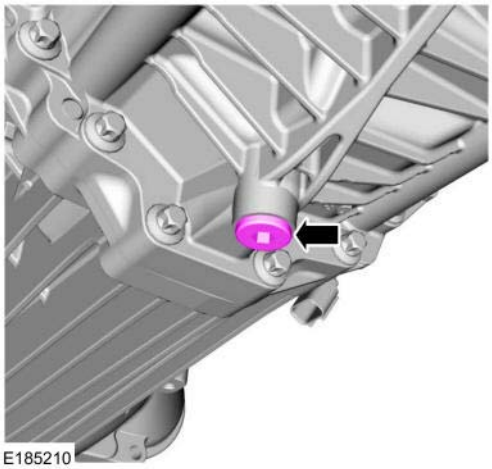
Remove the RH catalytic converter. Refer to: CATALYTIC CONVERTER RH .

7.

Remove the LH HO2S and the catalyst monitor. Refer to: HEATED OXYGEN SENSOR (HO2S) . Refer to: CATALYST MONITOR SENSOR .

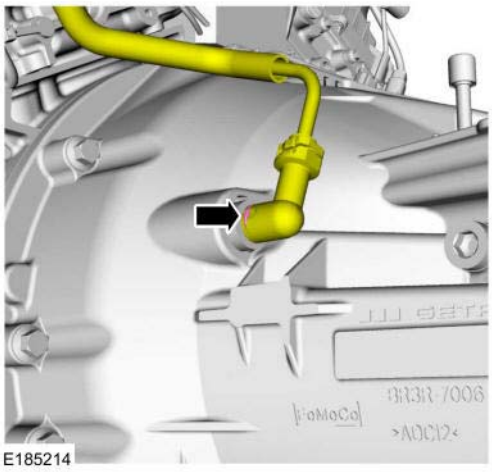
8.

Disconnect the electrical connectors and the wiring retainers and position the vehicle wiring harness aside.



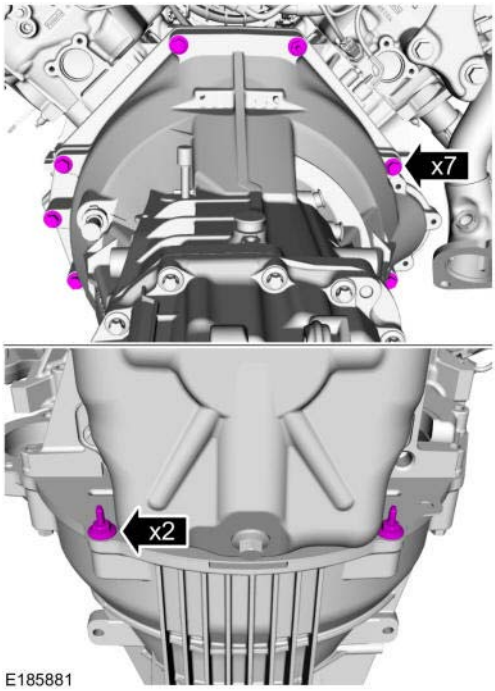
NOTE: If disassembly of the transmission is required, drain the transmission fluid.

9.
Remove the drain plug and drain the transmission fluid.



Torque

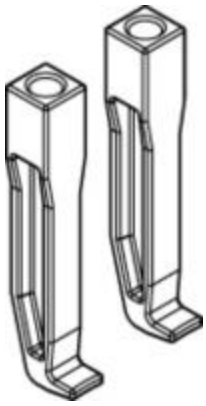
: 26 lb.ft (35 Nm)



10.

Remove the retainer and disconnect the hydraulic tube from the clutch master cylinder.

NOTE: Secure the transmission with a safety strap to the transmission jack.



11.
Remove the bellhousing bolts, pull the transmission back to remove the input shaft from the clutch, lower the transmission and remove it from the vehicle.

Locking Pliers	

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

1.

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips then type, "A00680083" into the "Search Channel" box.**

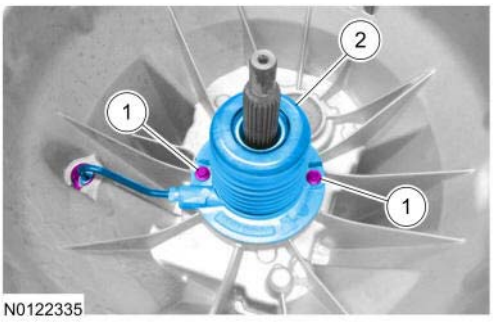
2.

Clean the transmission exterior with solvent and dry with compressed air. During disassembly, clean all components with solvent and dry with compressed air.

3.

Attach the transmission to the special tool.

Use Special Service Tool: 307-003 (T57L-500-B) Holding Fixture, Transmission.



4.

1.

Remove the slave cylinder bolts.

2.

Pull the clutch slave cylinder outward and release the tube from the retaining clip and if equipped, remove the clutch slave cylinder spacer.

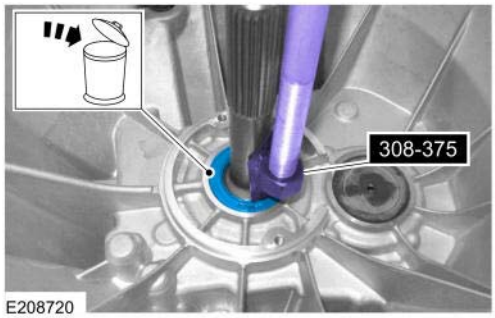
5.

Inspect the clutch slave cylinder for the following:

Damaged boot

Leaking brake fluid

Worn or damaged release bearing

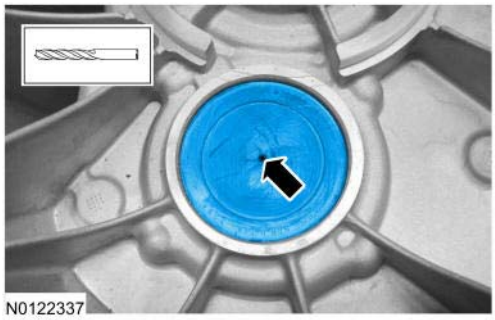


Rotate the release bearing while applying pressure. If the bearing rotation is rough, install a new clutch slave cylinder.

6.

Using the special tools, remove and discard the input shaft seal.

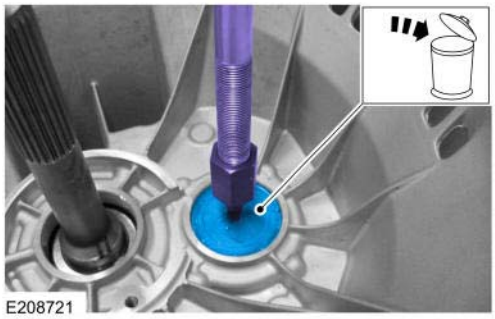
Use Special Service Tool: 308-375 Remover, Input Shaft Seal.



Use the General Equipment: Slide Hammer

7.

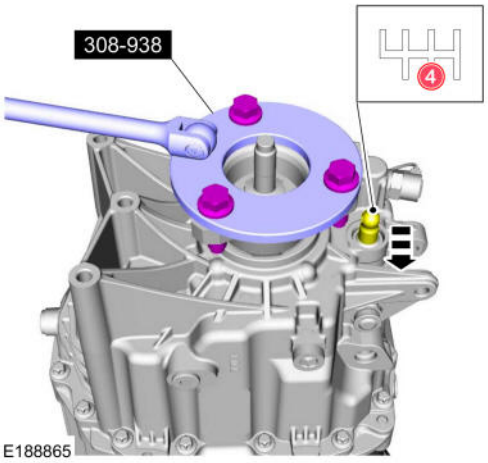
Using a center punch, mark a location in the center of the countershaft bolt cover. Using a drill bit of the appropriate size for the dent puller, drill a hole in the center of the countershaft bolt cover. Drill the hole to pierce the countershaft bolt cover approximately 2 mm (0.078 in) in depth.



Use the General Equipment: Center Punch

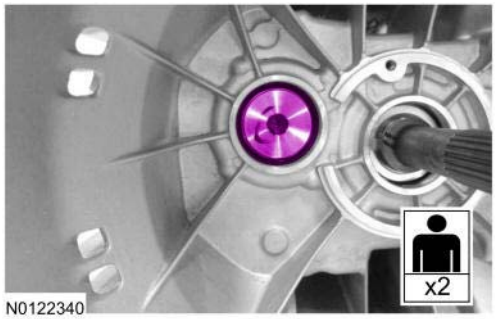
8.

Using the special tool, remove and discard the countershaft bolt cover.



Use the General Equipment: Slide Hammer Dent Puller

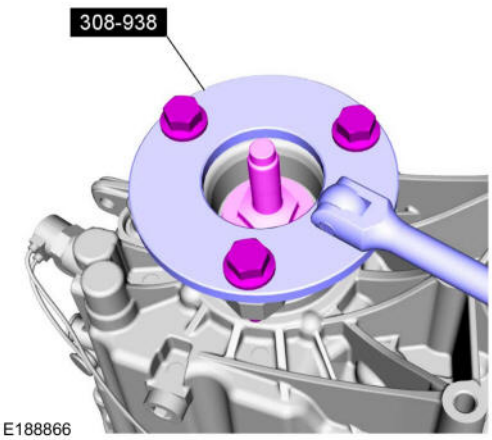
9.



Install the special tools, position the shift shaft into 4th gear.

Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

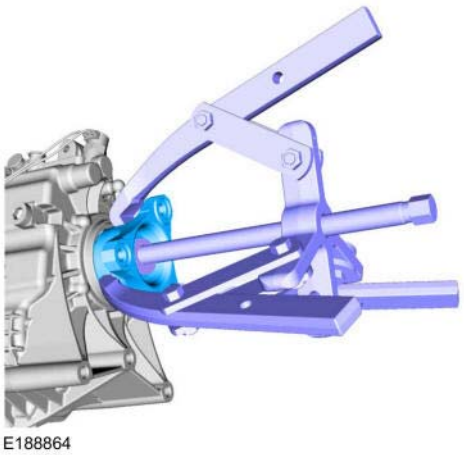
10.



With the help of an assistant, hold the special tools and remove the countershaft bolt.

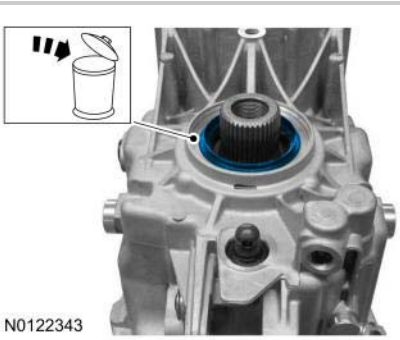
11.

Using the special tools, hold the output shaft flange and remove the bolt.



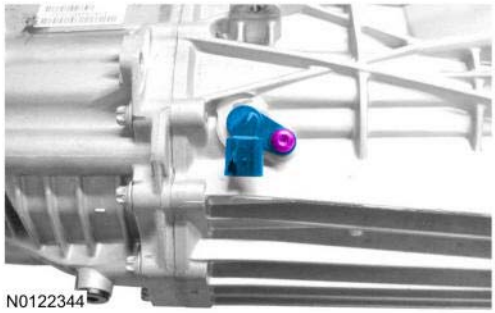
Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

12.



Using the three leg puller and the step plate, remove the output shaft flange.

Use the General Equipment: Three Leg Puller

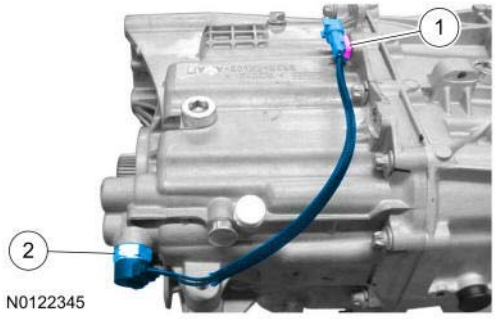


13.

Remove and discard the output shaft seal.

14.

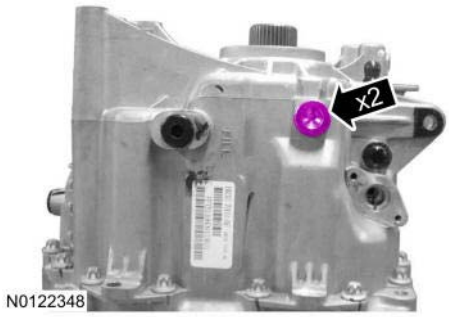
Remove the bolt and the OSS sensor.



15.

1.

Detach the electrical connector retainer.

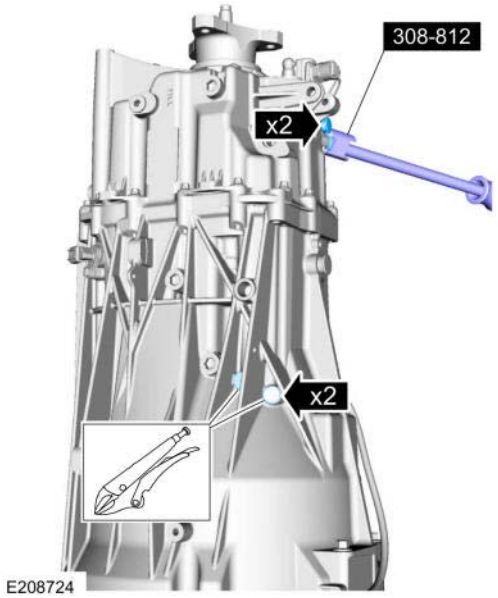


2.

Remove the reverse lamp switch.

16.

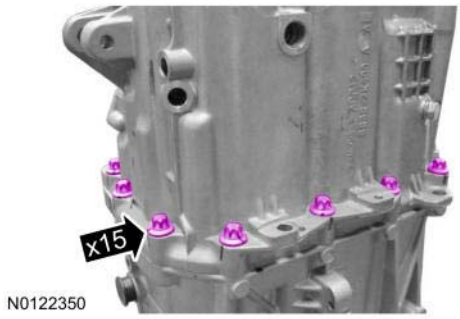
Remove the LH and RH reverse gear shift fork pivot bolts.



17.

Using the special tools, remove the shift rail detents. Use locking pliers with a slide hammer to access the 2 front shift rail detents.

Use Special Service Tool: 308-812 Remover, Detent.



Use the General Equipment: Locking Pliers

Use the General Equipment: Slide Hammer

18.

Remove the transmission case bolts.

19.

Using the two leg puller and the step plate, remove the rear transmission case.

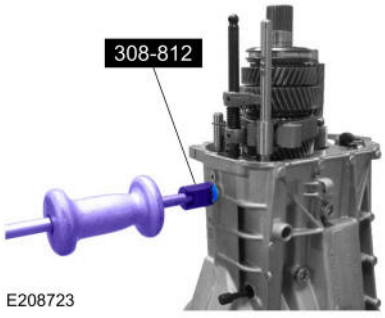
Use the General Equipment: Two Leg Puller

N0122791

NOTE: To remove the reverse shift fork and the reverse shift rail assembly, the transmission must be in neutral and the groves on the shift rail must be aligned with the interlock plate.

20.
Remove the reverse shift fork and the reverse shift rail assembly.

Inspect the reverse shift fork and reverse shift rail assembly for wear or damage. Install new components as necessary.



N0122352

21.

Using the special tools, remove the shift shaft stop pin.

Use Special Service Tool: 308-812 Remover, Detent.

Use the General Equipment: Slide Hammer

E208723

22.

Remove the shift shaft.

N0124189

23.

Using the push/puller set, step plate and special tool, remove the 1st gear, the reverse gear and the reverse gear synchronizer assembly.

Inspect the 1st and reverse gears for wear or damage. Install new gears as necessary.

Inspect the reverse gear needle bearing and the reverse gear needle bearing race for wear or damage. Install new components as necessary.

Inspect the reverse gear synchronizer assembly and the reverse gear synchronizer ring for wear or damage. Install new components as necessary.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

N0124190

24.

Remove the 1st gear needle bearing.

Inspect the 1st gear needle bearing for wear or damage. Install a new 1st gear needle bearing as necessary.

N0124191

NOTE: Note the position of each synchronizer ring component before removal.

25.
Remove the 1st gear synchronizer ring assembly.

Inspect all synchronizer ring components for wear or damage. Install new components as necessary.

N0124192

NOTE: Slide the synchronizer sleeve up while removing the pressure pieces.

26.

1.

Remove the 3 pressure pieces.

N0124193

NOTE: Index-mark the synchronizer sleeve to the synchronizer hub before removal.

27.
Remove the 1st/2nd shift fork, the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

Inspect the 1st/2nd shift fork and the 1st/2nd shift rail for wear or damage. Install new components as necessary.

Inspect the 1st/2nd synchronizer sleeve for wear or damage. Install a new 1st/2nd synchronizer assembly as necessary.

N0124202

28.

Remove the magnet.

N0122374

29.

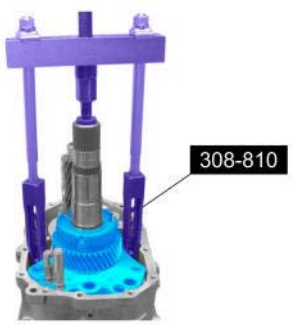
Remove the bolts, spacers, spring and the interlock plate.

N0124194

30.

Remove the center support bolts.

31.



Remove the 1st/2nd synchronizer hub snap ring.

NOTE: The center support must be pulled up evenly or damaged to the center support or transmission case can occur.

32.
Using the push/puller set, step plate and special tool, under the center support pull off the center support, 2nd gear and the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

NOTE: Note the position of each synchronizer ring component before removal.

33.
Remove the 1st/2nd synchronizer hub, the 2nd gear synchronizer ring assembly and the 2nd gear.

Inspect all the components for wear or damage. Install new components as necessary.

N0124198

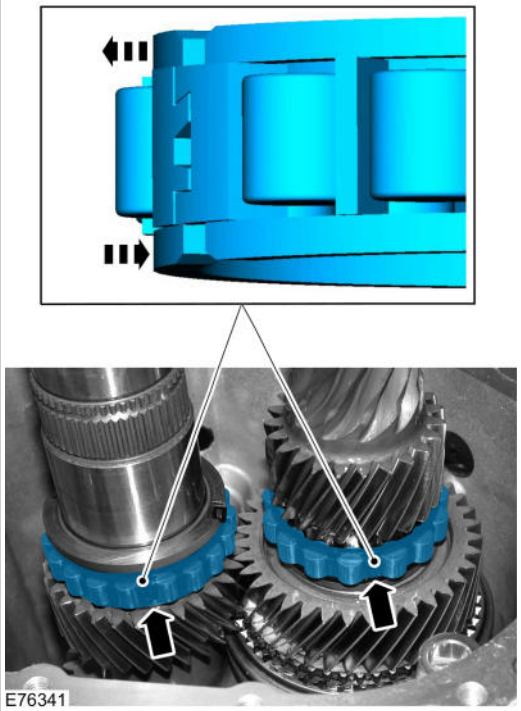
34.

Remove the 2nd gear needle bearing.

Inspect the 2nd gear needle bearing for wear or damage. Install a new needle bearing as necessary.

N0122365

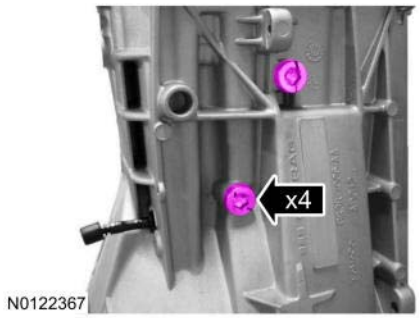
35.



Remove the center support.

Inspect the center support for wear or damage. Install a new center support as necessary.

N0122366



NOTE: When removing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.

36.
Unlock the bearing cage tabs and slightly expand the bearing cages. Remove the center support bearings by sliding them up the shaft assemblies.

37.

Remove the 2 LH and the 2 RH shift fork pivot bolts.

38.

Remove the 3rd/4th shift rail and the 3rd/4th shift fork.

N0122368

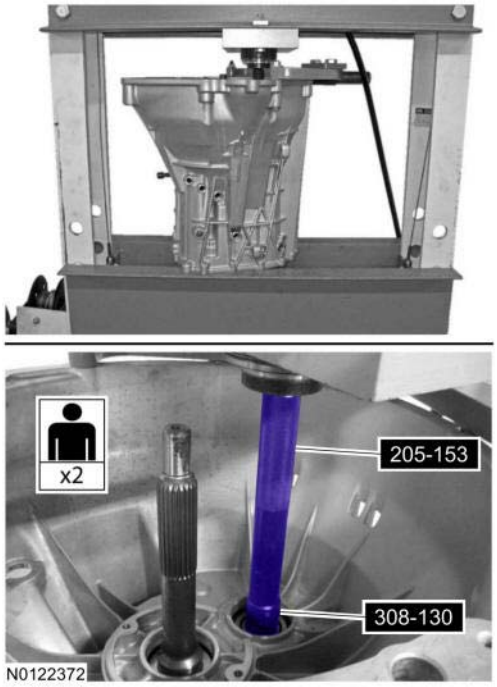
39.

Remove the 5th/6th shift rail and the 5th/6th shift fork.

N0122369

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

NOTE: Use an assistant when pressing out the countershaft and output shaft, do not allow the shafts to bind during removal.



NOTE: The countershaft bolt must be removed prior to pressing out the countershaft or damage to the transmission case will occur.

40.

With an assistant, support the transmission case on flat surface of a hydraulic press. Using the special tools, press the countershaft out of the bearing and remove the countershaft and output shaft.

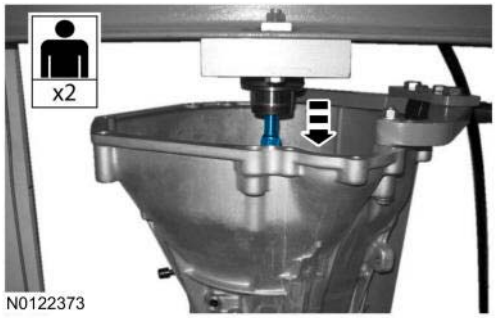
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing.

Use the General Equipment: Hydraulic Press

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

41.
Remove the input shaft snap ring.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

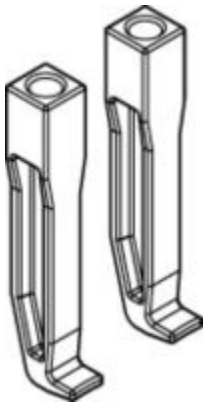


NOTE: Use an assistant when pressing out the input shaft, do not allow the input shaft to drop during removal.

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

42.

With an assistant, support the transmission case on flat surfaces of a hydraulic press. Using the hydraulic press, remove the input shaft.



Use the General Equipment: Hydraulic Press

22.

Remove the shift shaft.

N0124189

23.

Using the push/puller set, step plate and special tool, remove the 1st gear, the reverse gear and the reverse gear synchronizer assembly.

Inspect the 1st and reverse gears for wear or damage. Install new gears as necessary.

Inspect the reverse gear needle bearing and the reverse gear needle bearing race for wear or damage. Install new components as necessary.

Inspect the reverse gear synchronizer assembly and the reverse gear synchronizer ring for wear or damage. Install new components as necessary.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

24.

Remove the 1st gear needle bearing.

Inspect the 1st gear needle bearing for wear or damage. Install a new 1st gear needle bearing as necessary.

NOTE: Note the position of each synchronizer ring component before removal.

25.
Remove the 1st gear synchronizer ring assembly.

Inspect all synchronizer ring components for wear or damage. Install new components as necessary.

N0124192

NOTE: Slide the synchronizer sleeve up while removing the pressure pieces.

26.

1.

Remove the 3 pressure pieces.

N0124193

NOTE: Index-mark the synchronizer sleeve to the synchronizer hub before removal.

27.
Remove the 1st/2nd shift fork, the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

Inspect the 1st/2nd shift fork and the 1st/2nd shift rail for wear or damage. Install new components as necessary.

Inspect the 1st/2nd synchronizer sleeve for wear or damage. Install a new 1st/2nd synchronizer assembly as necessary.

N0124202

28.

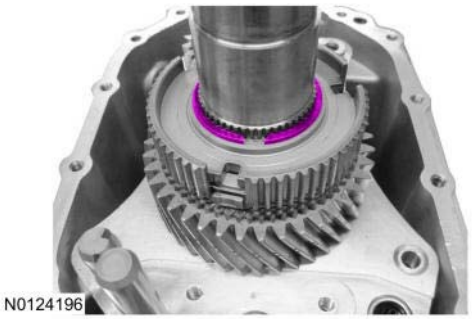
Remove the magnet.

N0122374

29.

Remove the bolts, spacers, spring and the interlock plate.

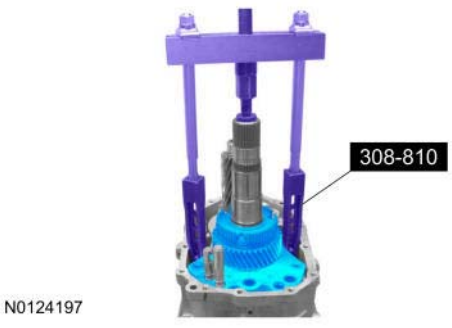
N0124194



30.

Remove the center support bolts.

31.



Remove the 1st/2nd synchronizer hub snap ring.

NOTE: The center support must be pulled up evenly or damaged to the center support or transmission case can occur.

32.
Using the push/puller set, step plate and special tool, under the center support pull off the center support, 2nd gear and the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

NOTE: Note the position of each synchronizer ring component before removal.

33.
Remove the 1st/2nd synchronizer hub, the 2nd gear synchronizer ring assembly and the 2nd gear.

Inspect all the components for wear or damage. Install new components as necessary.

N0124198

34.

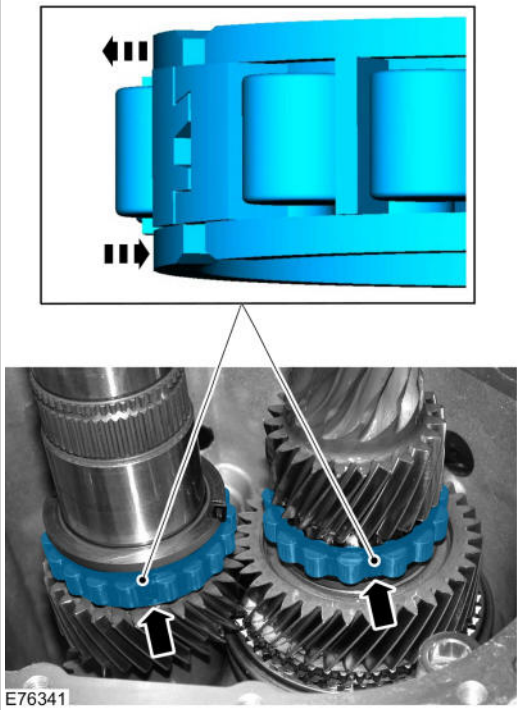
Remove the 2nd gear needle bearing.

Inspect the 2nd gear needle bearing for wear or damage. Install a new needle bearing as necessary.

N0122365

35.

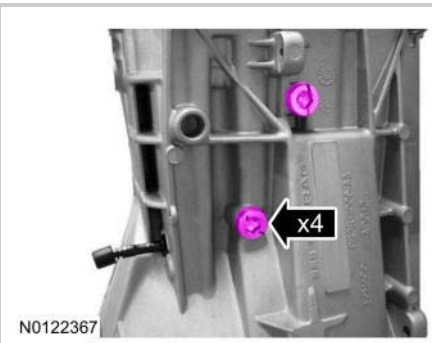
Remove the center support.



Inspect the center support for wear or damage. Install a new center support as necessary.

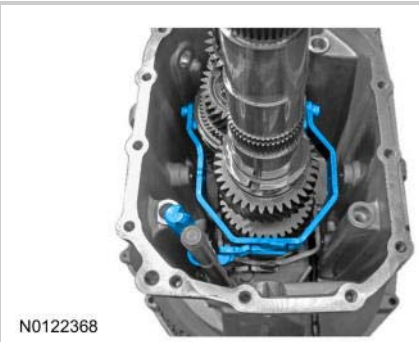
N0122366

NOTE: When removing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.



36.

Unlock the bearing cage tabs and slightly expand the bearing cages. Remove the center support bearings by sliding them up the shaft assemblies.



37.

Remove the 2 LH and the 2 RH shift fork pivot bolts.

38.

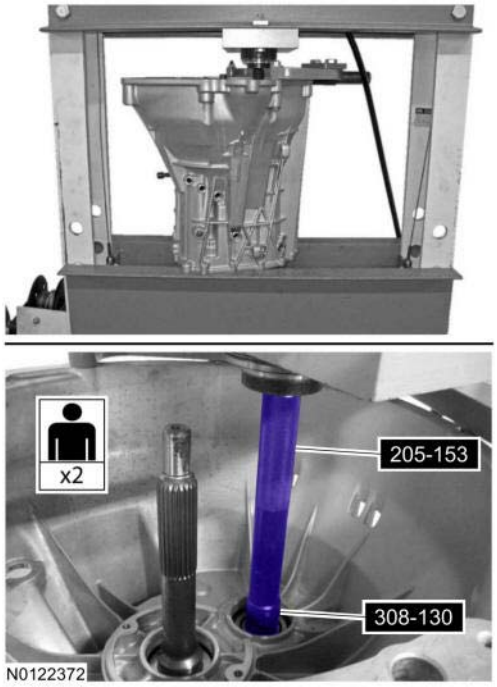
Remove the 3rd/4th shift rail and the 3rd/4th shift fork.

39.

Remove the 5th/6th shift rail and the 5th/6th shift fork.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

NOTE: Use an assistant when pressing out the countershaft and output shaft, do not allow the shafts to bind during removal.



NOTE: The countershaft bolt must be removed prior to pressing out the countershaft or damage to the transmission case will occur.

40.

With an assistant, support the transmission case on flat surface of a hydraulic press. Using the special tools, press the countershaft out of the bearing and remove the countershaft and output shaft.

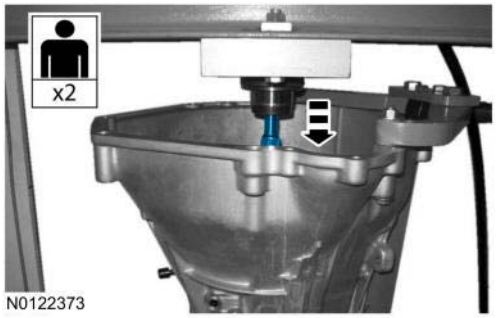
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing.

Use the General Equipment: Hydraulic Press

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

41.
Remove the input shaft snap ring.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

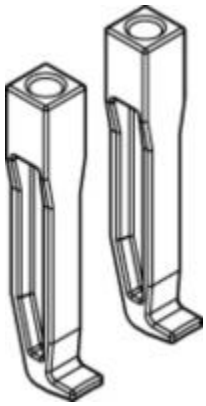


NOTE: Use an assistant when pressing out the input shaft, do not allow the input shaft to drop during removal.

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

42.

With an assistant, support the transmission case on flat surfaces of a hydraulic press. Using the hydraulic press, remove the input shaft.



Use the General Equipment: Hydraulic Press

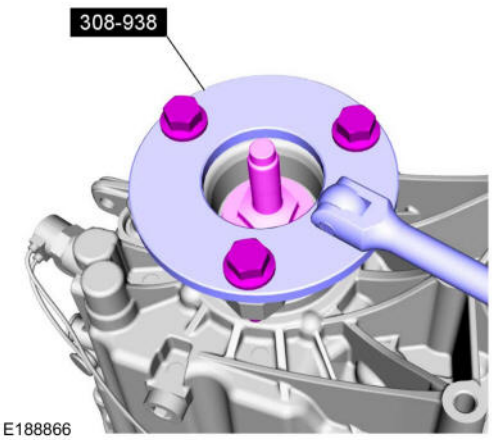
Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

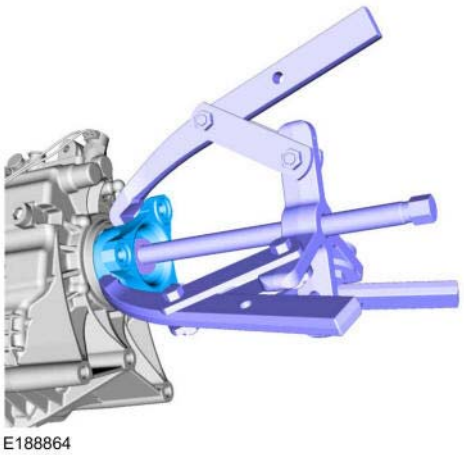
10.



With the help of an assistant, hold the special tools and remove the countershaft bolt.

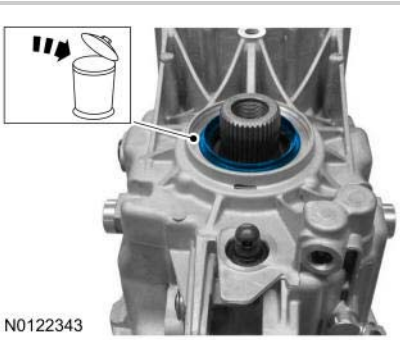
11.

Using the special tools, hold the output shaft flange and remove the bolt.



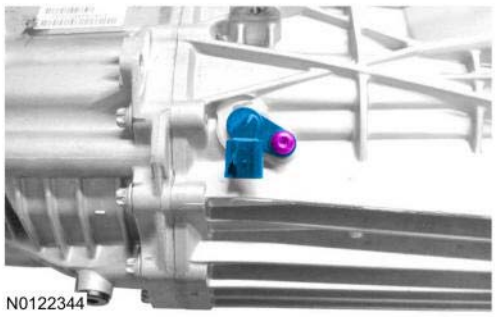
Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

12.



Using the three leg puller and the step plate, remove the output shaft flange.

Use the General Equipment: Three Leg Puller



13.

Remove and discard the output shaft seal.

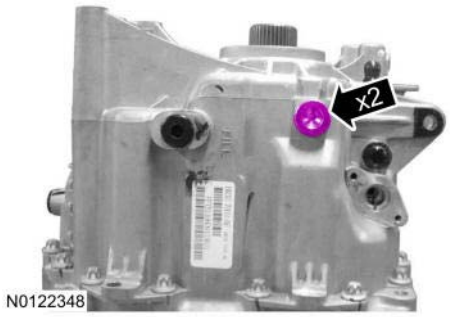
14.

Remove the bolt and the OSS sensor.

15.

1.

Detach the electrical connector retainer.

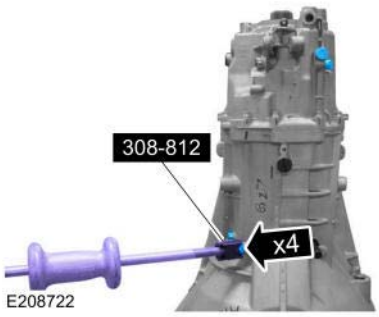


2.

Remove the reverse lamp switch.

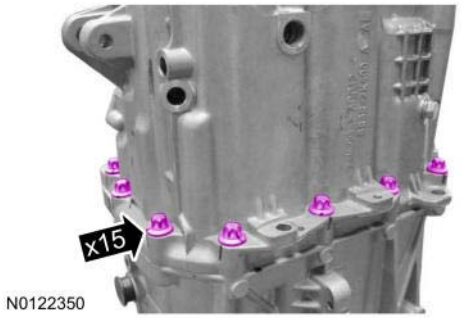
16.

Remove the LH and RH reverse gear shift fork pivot bolts.



17.

Using the special tools, remove the shift rail detents.



Use Special Service Tool: 308-812 Remover, Detent.

Use the General Equipment: Slide Hammer

18.

Remove the transmission case bolts.

19.

Using the two leg puller and the step plate, remove the rear transmission case.

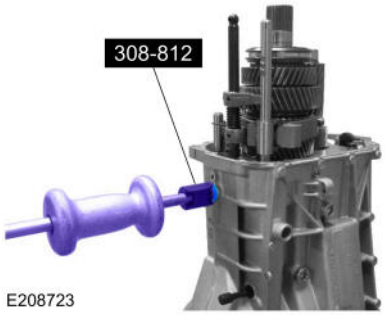
Use the General Equipment: Two Leg Puller

NOTE: To remove the reverse shift fork and the reverse shift rail assembly, the transmission must be in neutral and the groves on the shift rail must be aligned with the interlock plate.

20.

Remove the reverse shift fork and the reverse shift rail assembly.

Inspect the reverse shift fork and reverse shift rail assembly for wear or damage. Install new components as necessary.



N0122352

21.

Using the special tools, remove the shift shaft stop pin.

Use Special Service Tool: 308-812 Remover, Detent.

Use the General Equipment: Slide Hammer

E208723

22.

Remove the shift shaft.

N0124189

23.

Using the push/puller set, step plate and special tool, remove the 1st gear, the reverse gear and the reverse gear synchronizer assembly.

Inspect the 1st and reverse gears for wear or damage. Install new gears as necessary.

Inspect the reverse gear needle bearing and the reverse gear needle bearing race for wear or damage. Install new components as necessary.

Inspect the reverse gear synchronizer assembly and the reverse gear synchronizer ring for wear or damage. Install new components as necessary.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

24.

Remove the 1st gear needle bearing.

Inspect the 1st gear needle bearing for wear or damage. Install a new 1st gear needle bearing as necessary.

NOTE: Note the position of each synchronizer ring component before removal.

25.
Remove the 1st gear synchronizer ring assembly.

Inspect all synchronizer ring components for wear or damage. Install new components as necessary.

N0124192

NOTE: Slide the synchronizer sleeve up while removing the pressure pieces.

26.

1.

Remove the 3 pressure pieces.

N0124193

NOTE: Index-mark the synchronizer sleeve to the synchronizer hub before removal.

27.
Remove the 1st/2nd shift fork, the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

Inspect the 1st/2nd shift fork and the 1st/2nd shift rail for wear or damage. Install new components as necessary.

Inspect the 1st/2nd synchronizer sleeve for wear or damage. Install a new 1st/2nd synchronizer assembly as necessary.

N0124202

28.

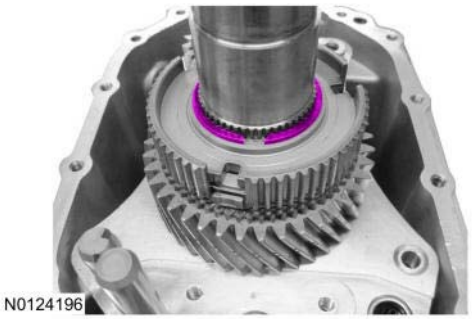
Remove the magnet.

N0122374

29.

Remove the bolts, spacers, spring and the interlock plate.

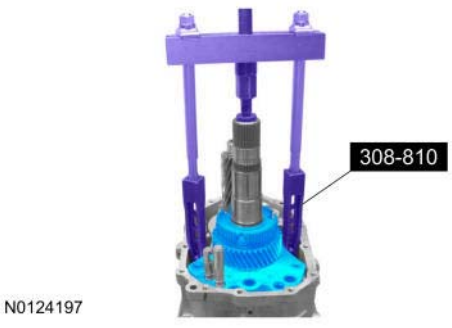
N0124194



30.

Remove the center support bolts.

31.



Remove the 1st/2nd synchronizer hub snap ring.

NOTE: The center support must be pulled up evenly or damaged to the center support or transmission case can occur.

32.
Using the push/puller set, step plate and special tool, under the center support pull off the center support, 2nd gear and the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-810 Remover, Syncro Gear Pack.

NOTE: Note the position of each synchronizer ring component before removal.

33.
Remove the 1st/2nd synchronizer hub, the 2nd gear synchronizer ring assembly and the 2nd gear.

Inspect all the components for wear or damage. Install new components as necessary.

N0124198

34.

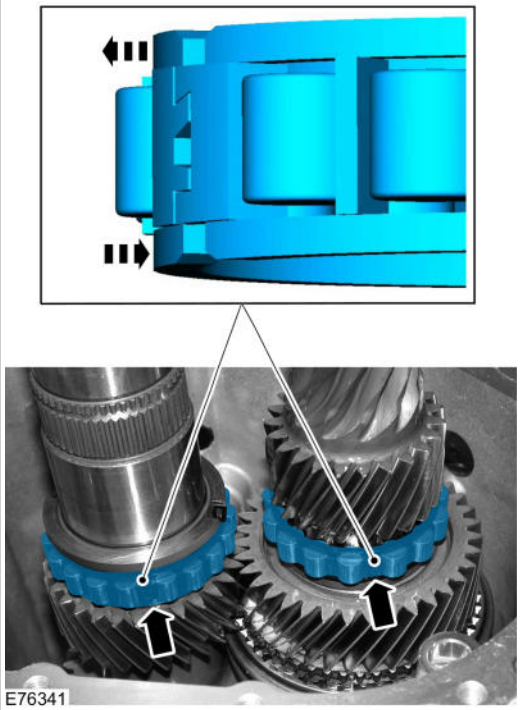
Remove the 2nd gear needle bearing.

Inspect the 2nd gear needle bearing for wear or damage. Install a new needle bearing as necessary.

N0122365

35.

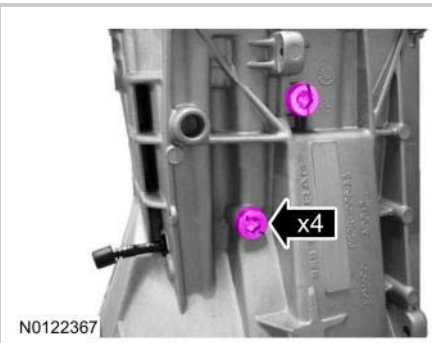
Remove the center support.



Inspect the center support for wear or damage. Install a new center support as necessary.

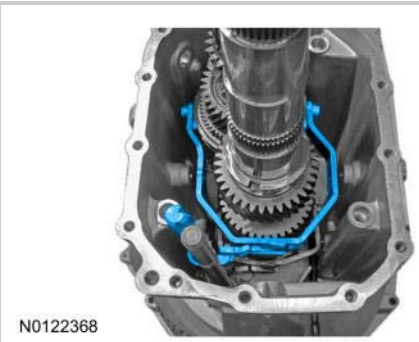
N0122366

NOTE: When removing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.



36.

Unlock the bearing cage tabs and slightly expand the bearing cages. Remove the center support bearings by sliding them up the shaft assemblies.



37.

Remove the 2 LH and the 2 RH shift fork pivot bolts.

38.

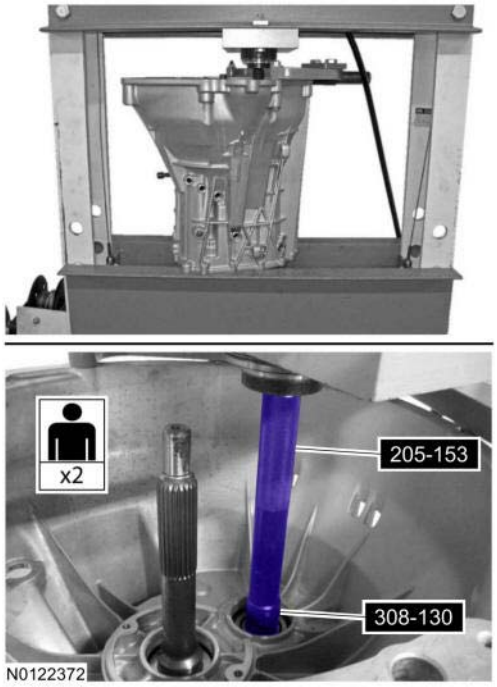
Remove the 3rd/4th shift rail and the 3rd/4th shift fork.

39.

Remove the 5th/6th shift rail and the 5th/6th shift fork.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

NOTE: Use an assistant when pressing out the countershaft and output shaft, do not allow the shafts to bind during removal.



NOTE: The countershaft bolt must be removed prior to pressing out the countershaft or damage to the transmission case will occur.

40.

With an assistant, support the transmission case on flat surface of a hydraulic press. Using the special tools, press the countershaft out of the bearing and remove the countershaft and output shaft.

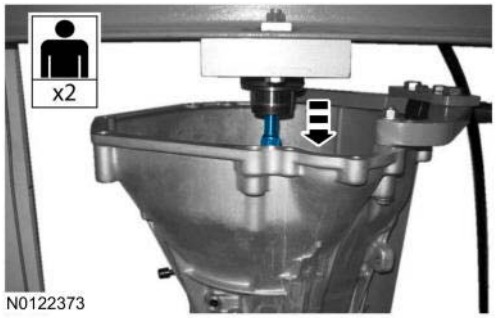
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing.

Use the General Equipment: Hydraulic Press

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

41.
Remove the input shaft snap ring.

WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.



NOTE: Use an assistant when pressing out the input shaft, do not allow the input shaft to drop during removal.

NOTE: Removal of the input shaft is only required if damage is found to the input shaft, input shaft seal or input shaft bearing. If damage is not found, no not remove the input shaft.

42.

With an assistant, support the transmission case on flat surfaces of a hydraulic press. Using the hydraulic press, remove the input shaft.

Use the General Equipment: Hydraulic Press

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > COUNTERSHAFT > DISASSEMBLY

NOTE: Hand-tighten the Bearing Puller to prevent gear damage.

NOTE: Support the countershaft while using the hydraulic press to prevent damage to the shaft or gears.

NOTE: Removing the Fifth and Sixth gears may take up to 18, 000 pounds of force. Do not heat the gear.

1.

Using the special tools, bearing separator and a hydraulic press, remove the 5th gear.

Inspect the 5th gear for wear or damage. Install a new gear as necessary.

Use Special Service Tool: 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing,205-153 (T80T-4000-W) Handle.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

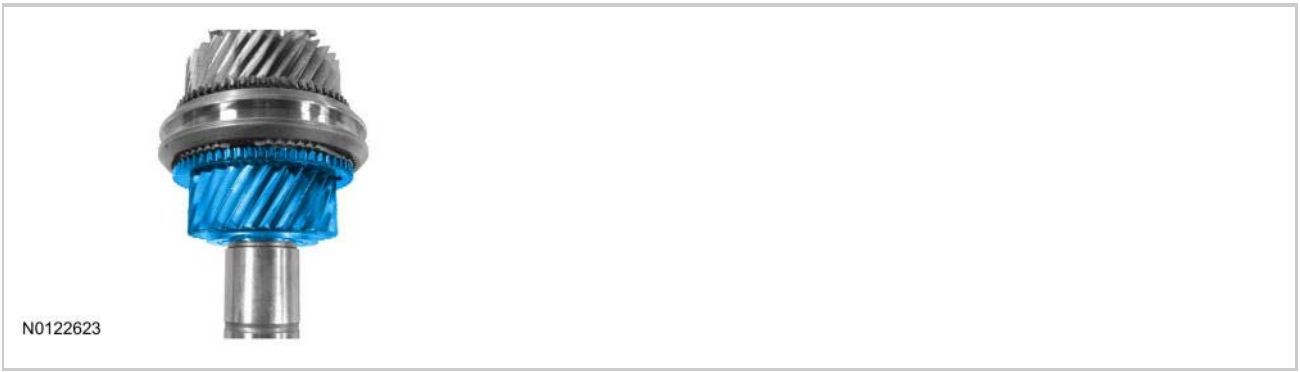
2.

Using the special tool, bearing separator and a hydraulic press, remove the 6th gear.

Inspect the 6th gear for wear or damage. Install a new gear as necessary.

Use Special Service Tool: 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing.

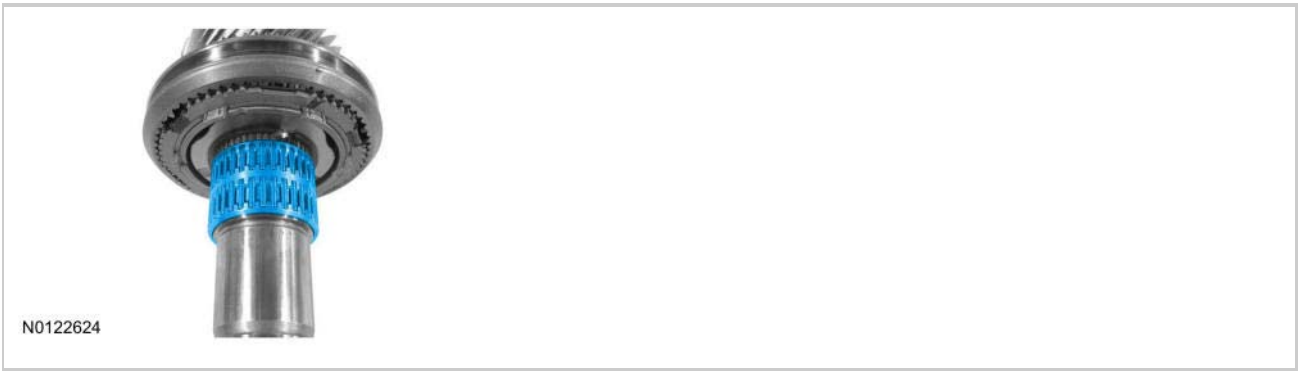
Use the General Equipment: Bearing Separator



Use the General Equipment: Hydraulic Press

3.

Remove the 3rd gear.



Inspect the 3rd gear for wear or damage. Install a new gear as necessary.

4.

Remove the 3rd gear needle bearing.

Inspect the 3rd gear needle bearing for wear or damage. Install a new needle bearing as necessary.

NOTE: Prior to removing the synchronizer rings, note the position of each synchronizer ring.

5.
Remove the 3rd gear synchronizer ring assembly.

Inspect all synchronizer ring components for wear or damage. Install new components as necessary.

N0122625

6.

Remove the 3rd/4th gear synchronizer assembly snap ring.

E76347

7.

Using the special tool, the bearing separator and a hydraulic press, remove the 4th gear and the 3rd/4th gear synchronizer assembly.

Use Special Service Tool: 308-130 (T87T-7025-DH) Installer, Shift Rail Needle Bearing.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

N0122626

NOTE: Prior to removing the synchronizer rings, note the position of each

synchronizer ring.

8.
Remove the 4th gear from the 4th gear synchronizer ring assembly. Remove the 4th gear synchronizer ring assembly from the 3rd/4th gear synchronizer assembly.

Inspect the 4th gear for wear or damage. Install a new gear as necessary.

Inspect the 3rd/4th gear synchronizer assembly for wear or damage. Install a new 3rd/4th gear synchronizer assembly as necessary.

Inspect the synchronizer ring components for wear or damage. Install new components as necessary.

E184723

NOTE: When removing the bearing, do not over expand the bearing cage or damage to the bearing cage can occur.

9.
Remove the 4th gear needle bearing.

Inspect the 4th gear needle bearing for wear or damage. Install a new needle bearing as necessary.

N0122628

10.

Inspect the countershaft for scoring or worn or damaged splines. Install a new countershaft as necessary.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > COUNTERSHAFT > ASSEMBLY

NOTE: Lubricate all components with the recommended transmission fluid before assembling.

NOTE: When installing the bearing, do not over expand the bearing cage or damage to the bearing cage can occur.

1.
Install the 4th gear needle bearing.

Material

: Motorcraft® Dual Clutch Transmission Fluid / XT-11-QDC (WSS-M2C200-D2)

N0122628

NOTE: The 4th gear synchronizer ring assembly outer ring has one identification notch.

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slot and the 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

NOTE: The groove on the 3rd/4th gear synchronizer assembly must be facing away from 4th gear or damage to the synchronizer assembly can occur.

2.
With the groove on the 3rd/4th gear synchronizer assembly sleeve facing away from the 4th gear install the 4th gear synchronizer ring assembly and the 4th gear.

Align the 6 synchronizer ring tabs with the 6 gear slots and the 3 synchronizer ring tabs with the 3 synchronizer assembly slots.

N0124483

3.

Using the bearing separator and a hydraulic press, install the 4th gear and the 3rd/4th gear synchronizer assembly.

Use the General Equipment: Bearing Separator

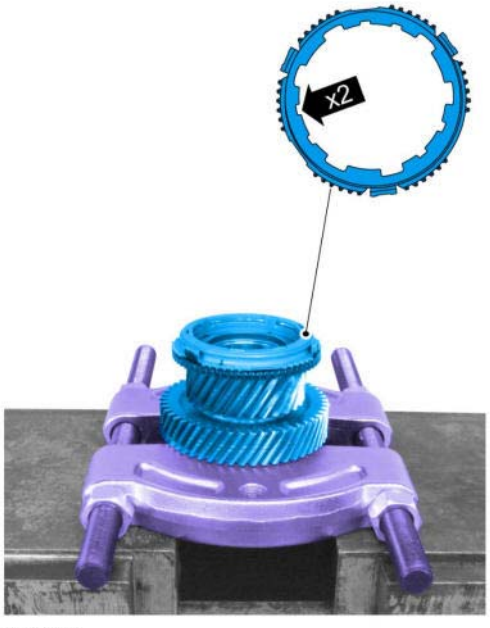
Use the General Equipment: Hydraulic Press

N0122629

4.

Install the 3rd/4th gear synchronizer assembly snap ring.

E76347



NOTE: The 3rd gear synchronizer ring assembly outer ring has 2 identification notches.

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

5.
Position the 6th gear and the 3rd gear and the 3rd gear synchronizer ring assembly onto the bearing separator.

Align the 6 synchronizer ring tabs with the 6 gear slots.

Use the General Equipment: Bearing Separator

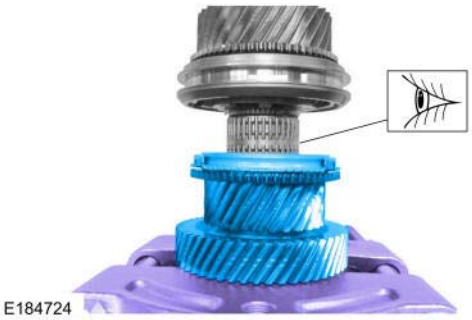
N0124484

NOTE: Lubricate the needle bearing with petroleum jelly to hold it in place during assembly.

6.
Install the 3rd gear needle bearing.

N0121675

NOTE: Do not allow the 3rd gear needle bearing to slide down the countershaft while pressing the components or damage to the needle bearing can occur.



NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

7.
While keeping the 3rd gear needle bearing from sliding down the countershaft, use the bearing separator and a hydraulic press to install the 6th gear the 3rd gear and the 3rd gear synchronizer ring assembly.

Align the 3 synchronizer ring tabs with the 3 synchronizer assembly slots.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

E184724

8.

Using the bearing separator and a hydraulic press, install the 5th gear.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > OUTPUT SHAFT

Bearing Separator

Materials

Name	Specification
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > OUTPUT SHAFT > DISASSEMBLY

NOTE: Hand-tighten the Bearing Separator to prevent gear damage.

NOTE: Support the output shaft while using the press to prevent damage to the shaft or gears.

1.

Remove the 5th/6th gear synchronizer assembly snap ring.

E76500

2.

Using the bearing separator and a hydraulic press, remove the 5th/6th gear synchronizer assembly.

Inspect the 5th/6th gear synchronizer assembly and the 6th gear synchronizer ring and cone for wear or damage. Install new components as necessary.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

N0122554

3.

Remove the 6th gear.

Inspect the 6th gear for wear or damage. Install a new gear as necessary.

N0122555

4.

Remove the 6th gear needle bearing.

Inspect the 6th gear needle bearing for wear or damage. Install a new needle bearing as necessary.

5.

Inspect the output shaft for scoring or worn or damaged splines. Install a new output shaft as necessary.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > OUTPUT SHAFT > ASSEMBLY

NOTE: Lubricate all components with the recommended transmission fluid before reassembling.

1.

Position the 5th/6th gear synchronizer assembly on the bearing separator and a hydraulic press.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

Material

: Motorcraft® Dual Clutch Transmission Fluid / XT-11-QDC (WSS-M2C200-D2)

NOTE: The 3 synchronizer ring tabs must engage into 3 synchronizer assembly

slots or damage to the synchronizer assembly and synchronizer ring can occur.

2.
Install the 6th gear synchronizer ring and cone.

Align the 3 synchronizer ring tabs with the 3 synchronizer assembly slots.

N0122557

3.

Install the 6th gear needle bearing.

N0122794

4.

Install the 6th gear.

N0122558

5.

Using the bearing separator and a hydraulic press, install the 5th/6th gear synchronizer assembly and the 6th gear.

Use the General Equipment: Bearing Separator

Use the General Equipment: Hydraulic Press

6.

Install the 5th/6th gear synchronizer assembly snap ring.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > SYNCHRONIZERS

Materials

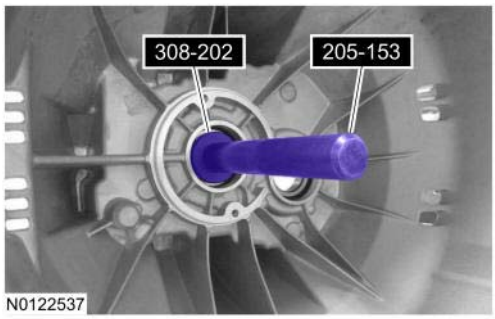
Motorcraft® Dual Clutch Transmission Fluid XT-11-QDC	WSS-M2C200-D2

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > TRANSMISSION CASE > DISASSEMBLY

1.

Remove the bolts.

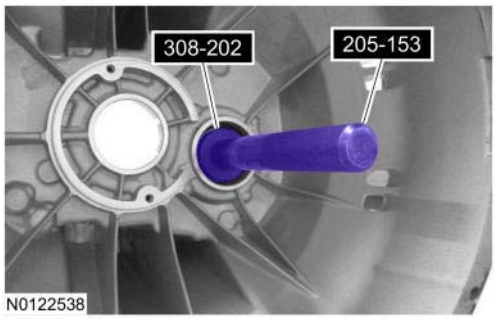


2.

Using the special tools, remove the input shaft bearing.

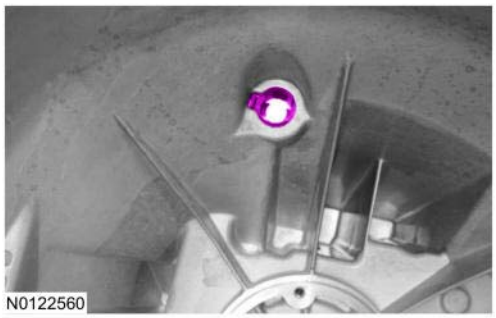
Inspect the input shaft bearing for wear or damage. Install a new bearing as necessary.

Use Special Service Tool: 308-202 (T91T-7127-B) Installer, Input Shaft Bearing, 205-153 (T80T-4000-W) Handle.



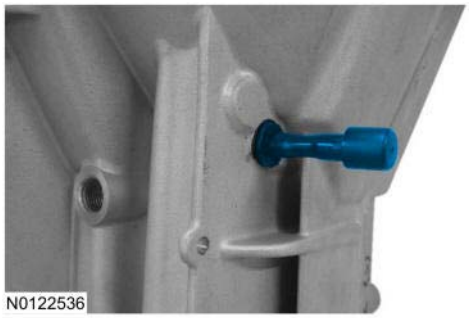
3.

Using the special tools, remove the countershaft bearing.



Inspect the countershaft bearing for wear or damage. Install a new bearing as necessary.

Use Special Service Tool: 308-202 (T91T-7127-B) Installer, Input Shaft Bearing, 205-153 (T80T-4000-W) Handle.



4.

If replacing the transmission case, remove the clutch slave cylinder tube retaining clip.

5.

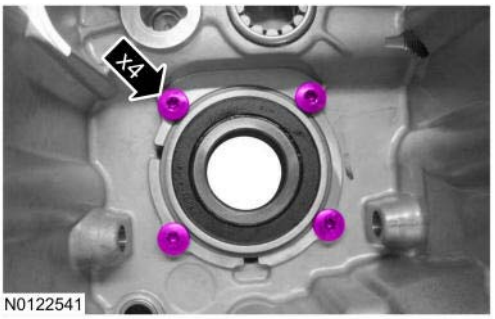
If replacing the transmission case, remove the transmission case vent tube.

6.

Using a brass drift, tap the dowel pins flush with the transmission case.

7.

Remove the bolt and the reverse idler gear assembly.



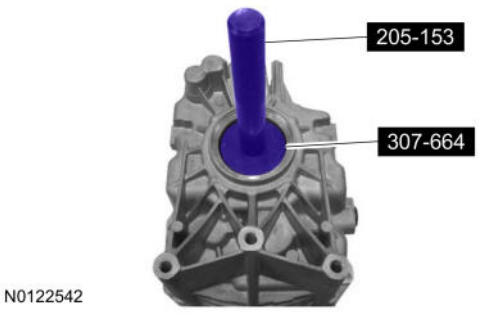
Inspect the reverse idler gear for wear or damage. Install a new gear as necessary.

Inspect the reverse idler gear needle bearing and shaft for wear or damage. Install new components as necessary.

N0122540

8.

Remove the bolts.



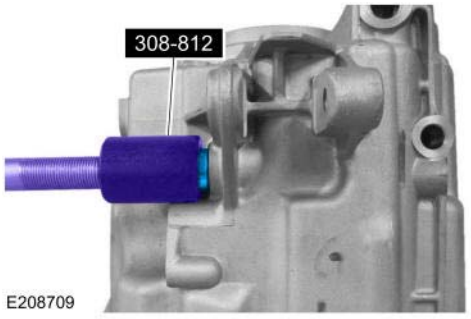
N0122541

9.

Using the special tools, remove the output shaft bearing.

Inspect the output shaft bearing for wear or damage. Install a new bearing as necessary.

Use Special Service Tool: 307-664 Case Bushing Installer, 205-153 (T80T-4000-W) Handle.



N0122542

10.

If replacing the transmission case, use the special tools to remove the shift shaft detent.

Use Special Service Tool: 308-812 Remover, Detent.

Use the General Equipment: Slide Hammer

11.

If leakage is present, remove the shift shaft seal.

12.

Clean and inspect the front and rear transmission cases.

Inspect the shift shaft and shift rail bearing for wear or damage. Install new components as necessary.

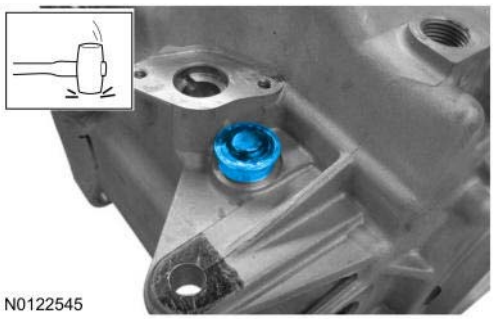
Inspect the rear countershaft for wear or damage. Install a new rear transmission case as necessary.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > TRANSMISSION CASE > ASSEMBLY

NOTE: Lubricate all components with the recommended transmission fluid before reassembling.

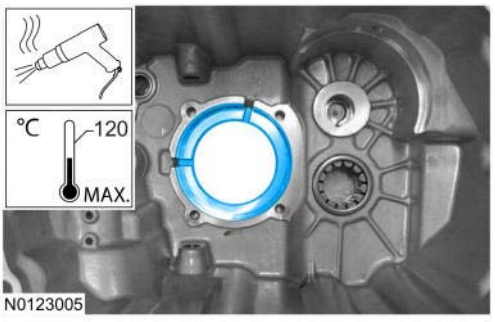
1.

If removed, install the shift shaft seal.



Material

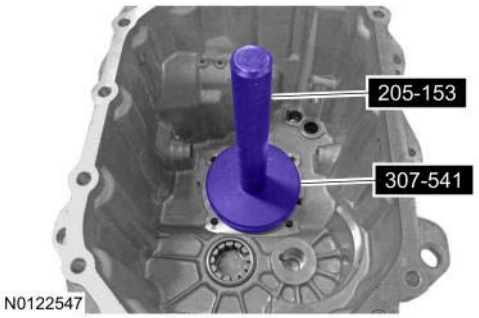
: Motorcraft® Dual Clutch Transmission Fluid / XT-11-QDC (WSS-M2C200-D2)



2.

If removed, use a soft-faced hammer to install the shift shaft detent.

NOTE: Do not heat the transmission case higher the 120°C (248°F) maximum or damage to the transmission case can occur.



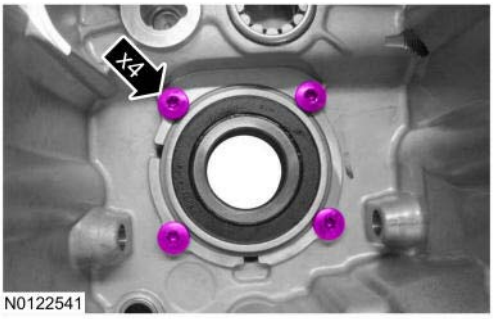
3.
Using a heat gun, heat the transmission case to maximum of 120°C (248°F).

NOTE: Install the output shaft bearing with the grooved side of the outer output shaft bearing race facing the inside of the transmission case or damage to the transmission case can occur.

4.
Using the special tools, install the output shaft bearing.

Use Special Service Tool: 307-541 Installer, Transfer Gear Bearing, 205-153 (T80T-4000-W) Handle.

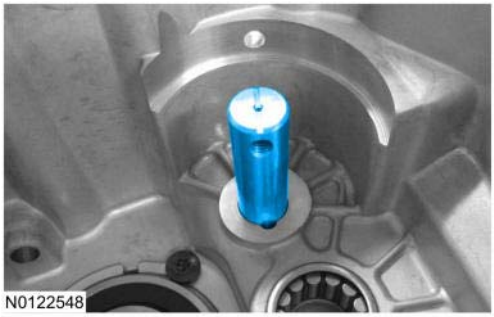
5.



Apply threadlock and install the bearing retaining bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



Torque

: 27 lb.ft (36 Nm)

6.

Install the reverse idler gear shaft.

7.

Install the reverse idler gear and the reverse idler gear needle bearing.

N0122549

8.

Install the reverse idler gear bracket.

N0122550

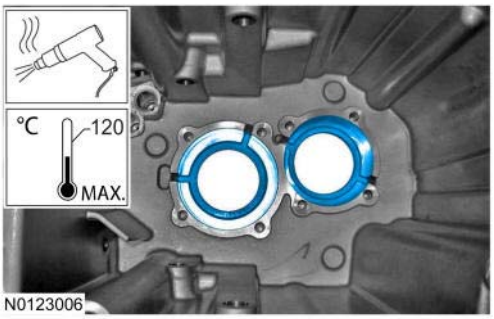
9.

Apply threadlock and install the reverse idler gear bracket bolt.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

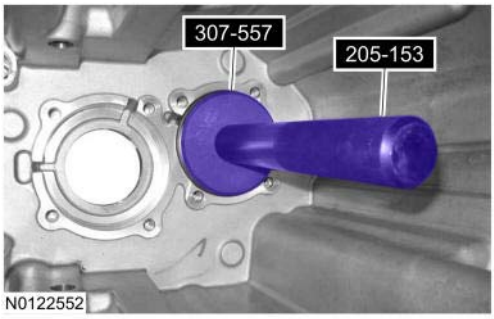


: 20 lb.ft (27 Nm)

N0122540

NOTE: Do not heat the transmission case higher the 120°C (248°F) maximum or

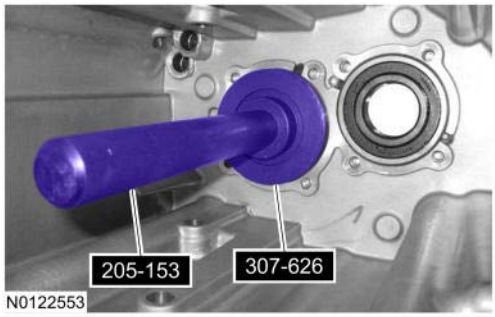
damage to the transmission case can occur.



10.
Using a heat gun, heat the transmission case to maximum of 120°C (248°F).

11.

Using the special tools, install the countershaft bearing.



Use Special Service Tool: 307-557 Installer, Ball Bearing, 205-153 (T80T-4000-W) Handle.

NOTE: Install the input shaft bearing with the grooved side of the outer input shaft bearing race facing the inside of the transmission case or damage to the transmission case can occur.

12.
Using the special tools, install the input shaft bearing.

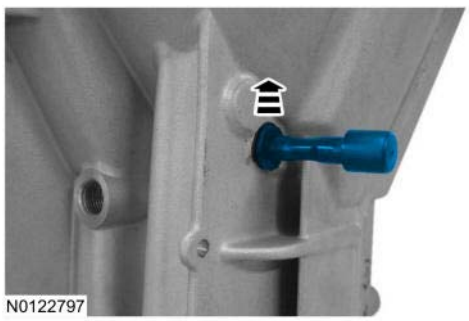
Use Special Service Tool: 307-626 Installer, Differential Seal, 205-153 (T80T-4000-W) Handle.

13.

Apply threadlock and install the bearing retaining bolts.

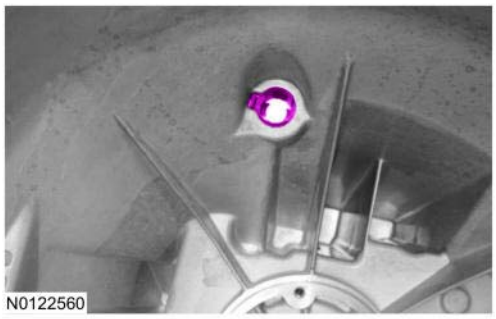
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



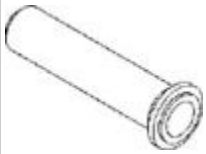
Torque

: 27 lb.ft (36 Nm)



NOTE: Before installing the vent tube, lightly coat the vent tube "O" ring with recommended transmission fluid.

14.
If removed, install the transmission case vent tube with the notch pointing to the front of the transmission case.



15.

If removed, install the clutch slave cylinder tube retaining clip.

ASSEMBLY > TRANSMISSION - 2.3L ECOBOOST (201KW 273PS)

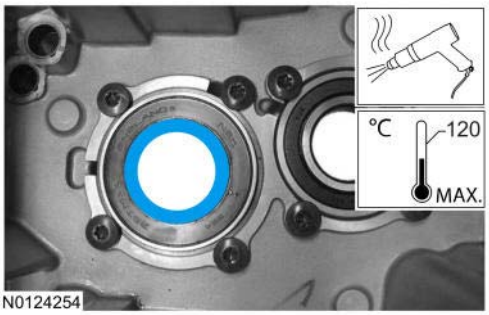
Materials

Name	Specification
Threadlock 262 TA-26	WSK-M2G351-A6
Motorcraft® MT82 Transmission Additive XL-18	-
Gasket Maker TA-16	WSK-M2G348-A5

NOTE: Lubricate all components with the recommended transmission fluid before assembling.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.



1.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

E184964

NOTE: Do not heat the input shaft bearing higher than 120°C (248°F) maximum or

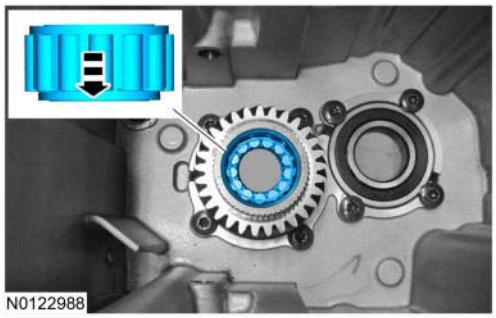
damage to the input shaft bearing can occur.

2.
Using a heat gun, heat the input shaft bearing inner race to a maximum of 120°C (248°F).

3.

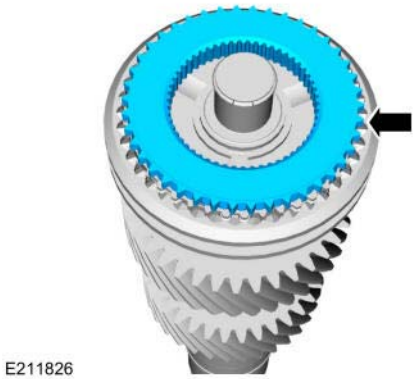
Install the input shaft.

4.



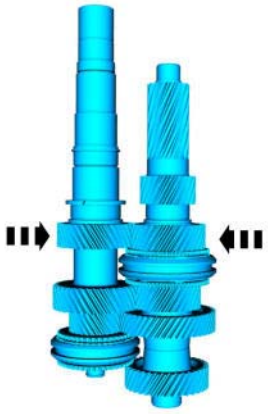
Install the input shaft snap ring.

NOTE: Make sure the small diameter side of the output shaft roller bearing cage is facing the input shaft or damage to the output shaft bearing can occur.



5.
With the small diameter side of the output shaft roller bearing cage facing the input shaft, install

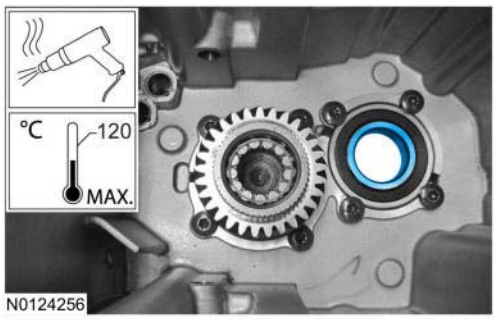
the output shaft roller bearing.



NOTE: Apply petroleum jelly to hold the 5th gear synchronizer ring and the 5th gear synchronizer cone in place during assembly.

6.
Install the 5th gear synchronizer ring and the 5th gear synchronizer cone.

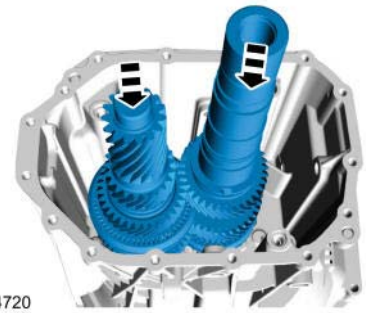
7.



Assemble the output shaft and countershaft assemblies.

E211828

NOTE: Do not heat the countershaft bearing higher than 120°C (248°F) maximum or damage to the countershaft bearing can occur.

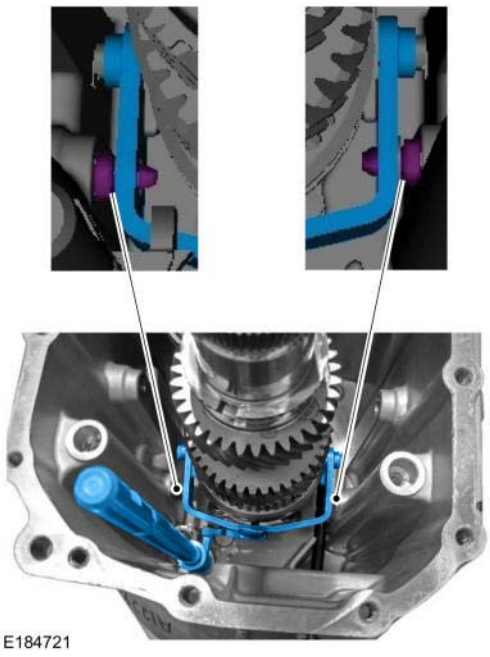


8.
Using a heat gun, heat the countershaft bearing inner race to a maximum of 120°C (248°F).

N0124256

9.

Install the output shaft and countershaft assembly.



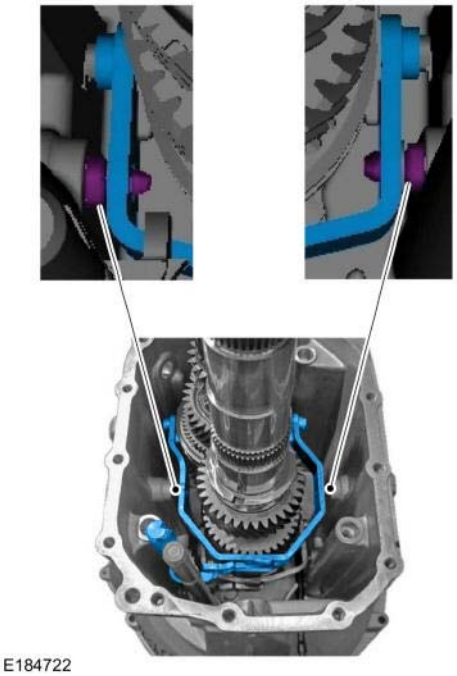
E184720

NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

10.
Install the 5th/6th shift fork, the 5th/6th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

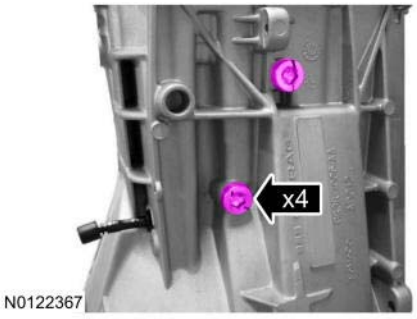


NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

11.
Install the 3rd/4th shift fork, the 3rd/4th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

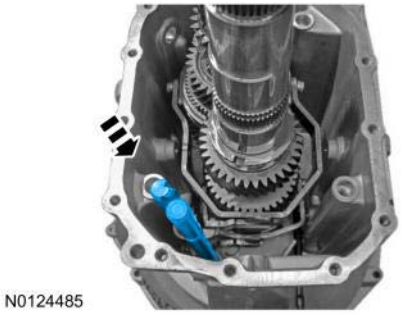
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



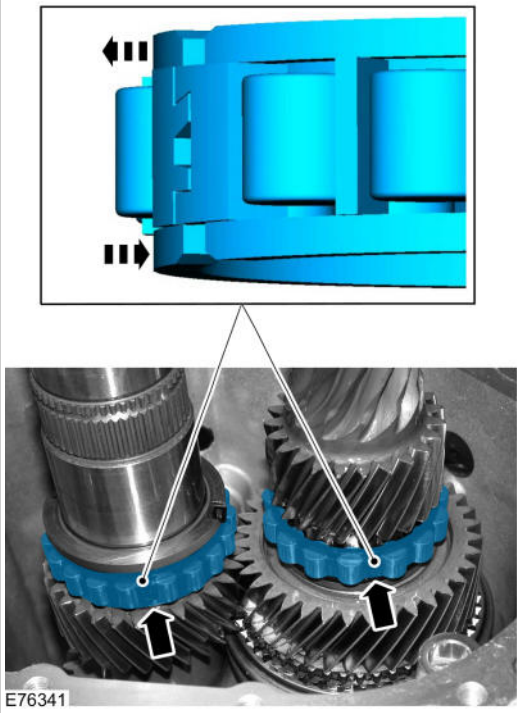
12.

Tighten the 2 LH and the 2 RH shift fork pivot bolts.



Torque

: 27 lb.ft (37 Nm)



13.

Push down the 3rd/4th shift rail and the 5th/6th shift rail to lock the transmission into 2 gears.

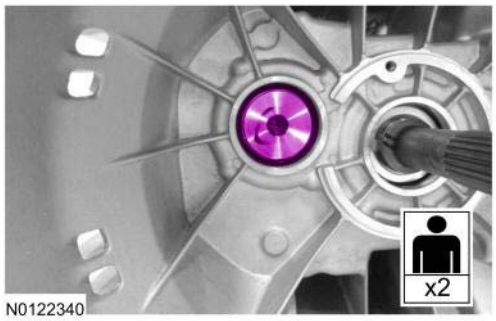
NOTE: When installing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.

14.
Slightly expand the center support bearing cages and slide the center support bearings down the shaft assemblies. Lock the bearing cage tabs.

15.

Loosely install the center support and finger tighten the bolts.

NOTE: Install the countershaft bolt with the transmission in the vertical position with the input shaft facing down.



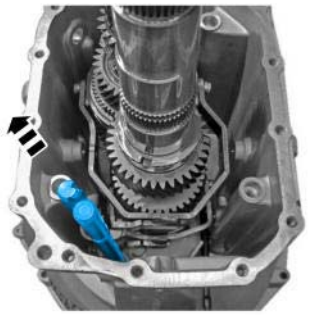
16.
Apply threadlock and install the countershaft bolt.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 70 lb.ft (95 Nm)



17.

Remove the center support and the bolts.

18.

Pull up on the 3rd/4th shift rail and 5th/6th shift rail to unlock the transmission from 2 gears.

N0124531

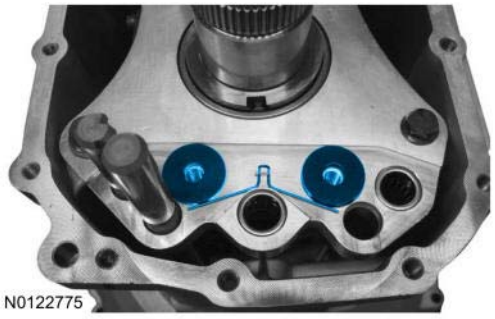
NOTE: The center support must be tightened evenly or damage to the center support or transmission case can occur.

19.
Install the center support, apply threadlock and evenly tighten the center support bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque



: 18 lb.ft (24 Nm)

N0123038

20.

Install the spring and spacers.

NOTE: Make sure the interlock plate moves freely.

21.
Install the interlock plate, apply threadlock and install the interlock plate bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 18 lb.ft (24 Nm)

22.

Install the 2nd gear needle bearing.

23.

Install the 2nd gear.

N0123034

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer ring assembly can occur.

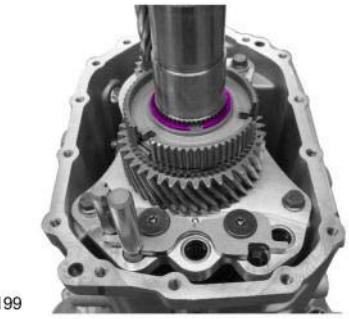
NOTE: The 2nd gear synchronizer ring assembly outer ring has 2 identification notches.

24.
Install the 2nd gear synchronizer ring assembly.

N0124481

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer hub slots or damage to the synchronizer hub and the synchronizer ring assembly can occur.

NOTE: The long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear or damage to the synchronizer hub can occur.



25.
With the long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear, use the special tool and install the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

26.

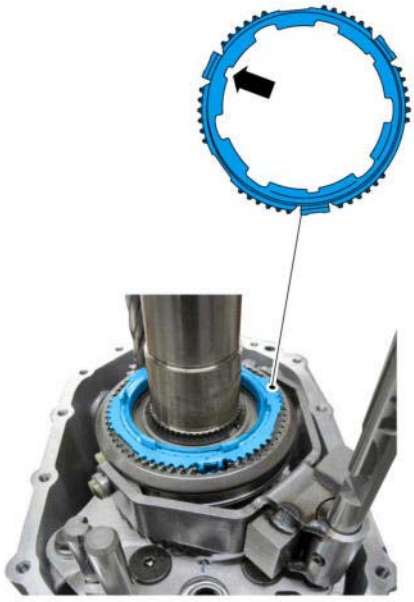
Install the 1st/2nd synchronizer hub snap ring.

NOTE: Align the index marks made during removal on the synchronizer sleeve and the synchronizer hub.

27.
With the groove on the 1st/2nd synchronizer sleeve facing 2nd gear, install the 1st/2nd shift fork the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

N0124202

NOTE: Slide the synchronizer sleeve up to install the pressure pieces.



28.
Install the 3 pressure pieces.

N0124193

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring assembly can occur.

NOTE: The 1st gear synchronizer ring assembly outer ring has one identification notch.

29.
Install the 1st gear synchronizer ring assembly.

N0124482

30.

Install the 1st gear needle bearing.

N0123022

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

31.
Install the 1st gear.

N0123021

32.

Using the special tool, install the reverse gear needle bearing race.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

N0122778

33.

Install the reverse gear needle bearing.

N0123019

34.

Install the reverse gear.

N0123020

NOTE: The shift shaft must be installed in the neutral position prior to installing the shift shaft stop pin or damage to the shift shaft pin can occur.

35.
Install the shift shaft in the neutral position, using a soft-faced hammer install the shift shaft stop pin.

N0123037

36.

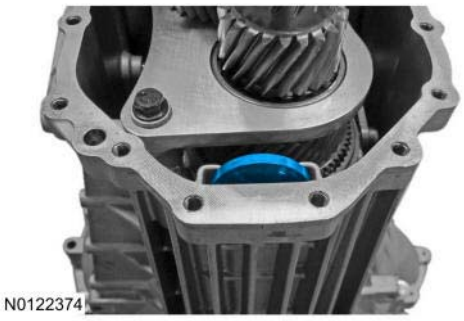
Install the reverse gear synchronizer ring.

N0123018

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring can occur.

37.
Using the special tool, install the reverse gear synchronizer assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.



NOTE: To install the reverse shift fork and the reverse shift rail assembly, the transmission must be in neutral and the grooves on the shift rails must be aligned with the interlock plate.

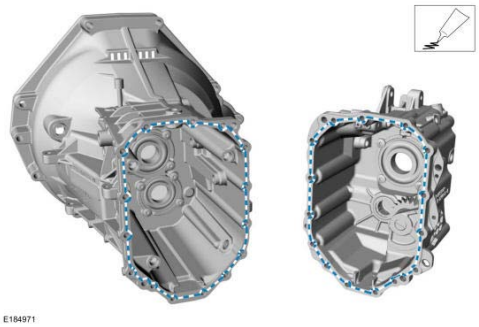
38.
Install the reverse shift fork and the reverse shift rail assembly.

39.

Install the magnet.

40.

Shift the transmission into 4th gear.



NOTE: Art shown in illustration with internal components removed for clarity.

NOTE: Do not wait longer than 10 minutes to install the rear transmission case assembly due to rapid cure of the sealant.

41.
Clean the sealing surfaces of the front transmission case and the sealing surfaces of the rear transmission case. Thinly coat the sealing surface of the front transmission case assembly and the sealing surface of the rear transmission case assembly with gasket maker.

Material

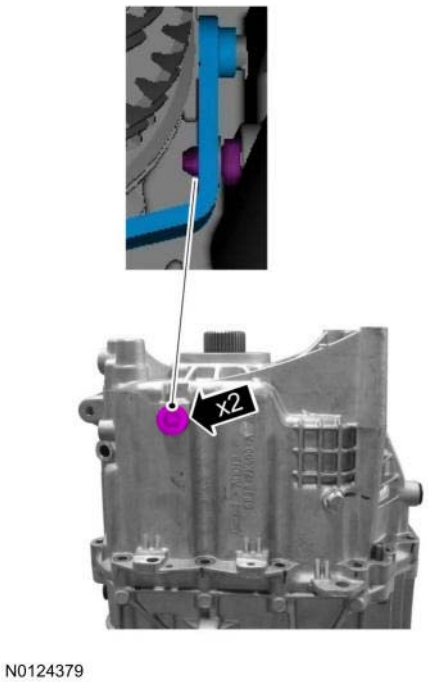
: Gasket Maker / TA-16 (WSK-M2G348-A5)

NOTE: The rear transmission case assembly must be installed evenly with the transmission shifted into 4th gear, do not allow the shift rails to bind during installation or damage to the transmission case assembly can occur.

42.
Using the special tools, install the rear transmission case assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

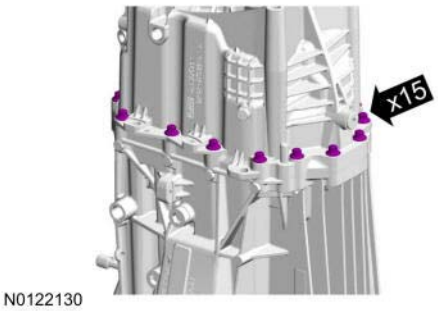
NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.



43.
Apply threadlock and sealer and install the shift fork pivot bolts.

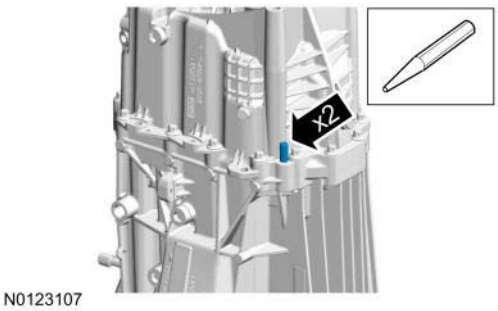
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



Torque

: 27 lb.ft (37 Nm)

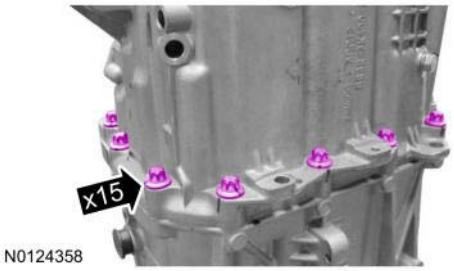


44.

Loosely install the bolts.

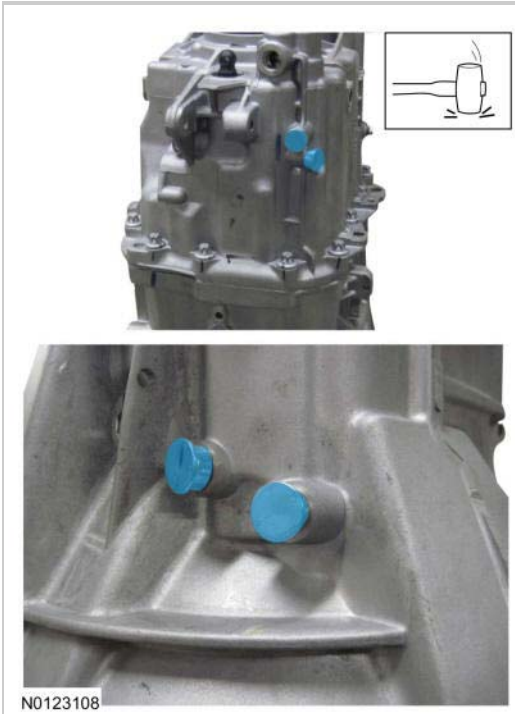
45.

Using a brass drift, tap the dowel pins flush with the transmission case.



46.

Tighten the bolts.



Torque

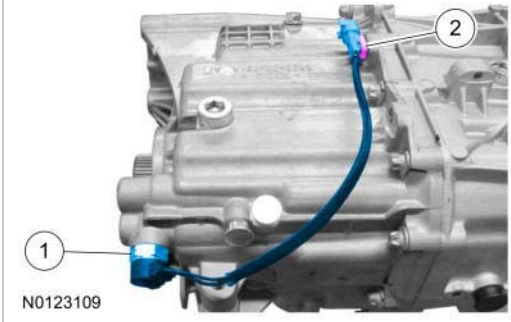
: 18 lb.ft (24 Nm)

47.

Using a soft-faced hammer install the 4 shift rail detents.

48.

1.



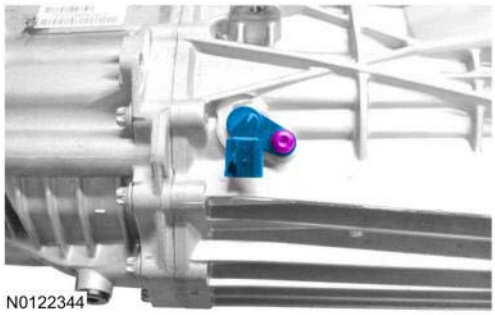
Install the reverse lamp switch.

Torque

: 177 lb.in (20 Nm)

2.

Attach the electrical connector retainer.



49.

Install the OSS sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

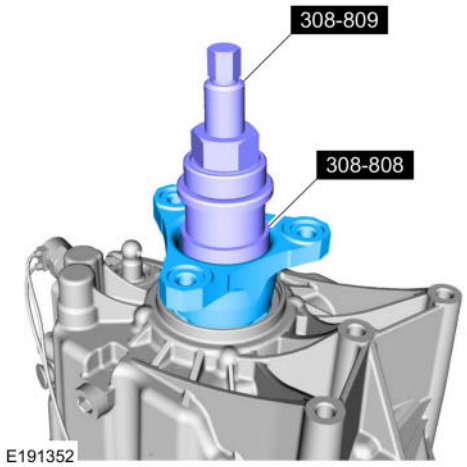
50.

Install a new output shaft seal on the special tools.

Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

51.

Using the special tools, install the output shaft seal.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

52.

Using the special tools, install the output shaft flange.

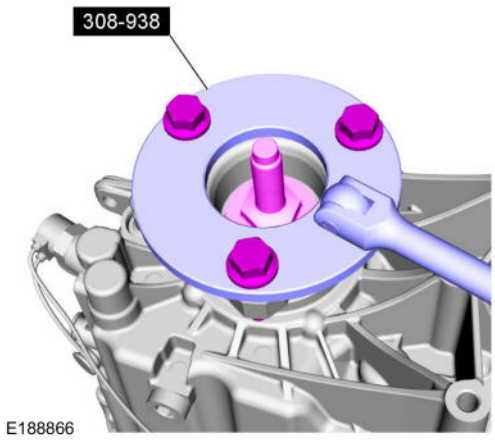
Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

53.

Clean the threads on the output shaft bolt and apply one dot of threadlock to the lower end of the output shaft bolt threads. Using the special tools, install the output shaft flange bolt and tighten in 3 stages.

Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

Material

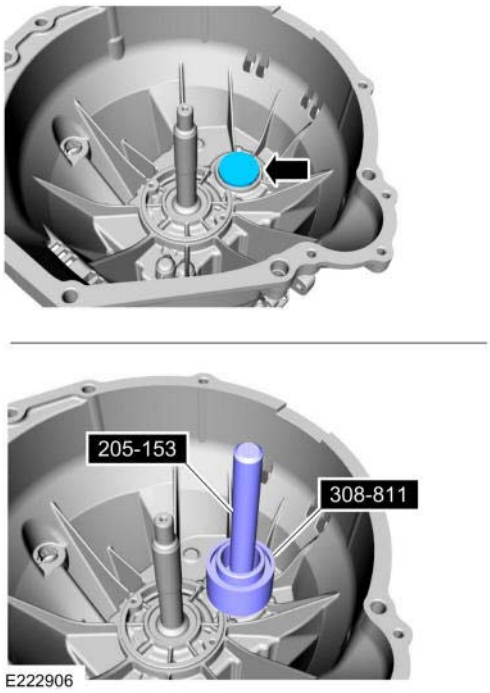


: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque:

Stage 1: 148 lb.ft (200 Nm)

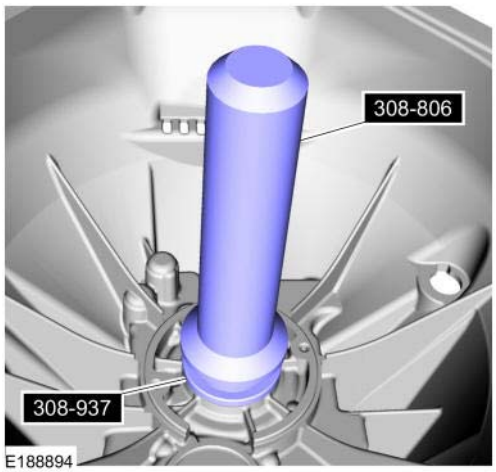
Stage 2: Loosen: 5 turn(s)



Stage 3: 133 lb.ft (180 Nm)

54.

Install the countershaft bolt cover in the clutch housing. Using the special tools, drive the countershaft bolt cover into the clutch housing.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

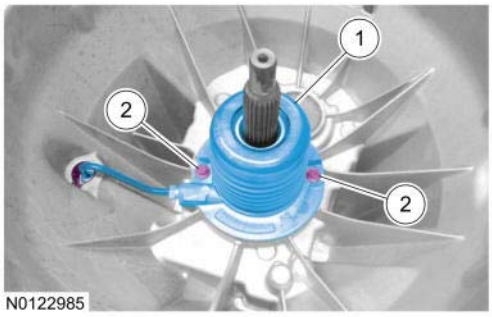
55.

Using the special tool, install the new input shaft seal.

Use Special Service Tool: 308-806 Installer, Front Seal, 308-937 Installer, Input Shaft Seal.

56.

1.



Position the clutch slave cylinder and if equipped, the clutch slave cylinder spacer and connect the tube in the retaining clip.

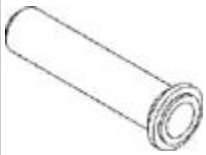
2.

Install the 2 bolts.

Torque

: 97 lb.in (11 Nm)

57.



Add 1 bottle (.91 fl oz (27 ml)) of XL-18 to the transmission if a new synchronizer was installed.

Material

: Motorcraft® MT82 Transmission Additive / XL-18

ASSEMBLY > TRANSMISSION - 3.7L DURATEC (227KW 301PS)

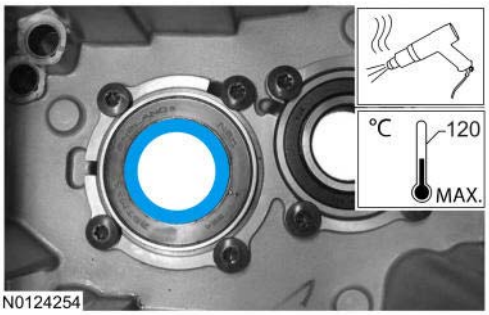
Name	Specification
Threadlock 262 TA-26	WSK-M2G351-A6
Motorcraft® MT82 Transmission Additive XL-18	-
Gasket Maker TA-16	WSK-M2G348-A5

NOTE: Lubricate all components with the recommended transmission fluid before assembling.



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.

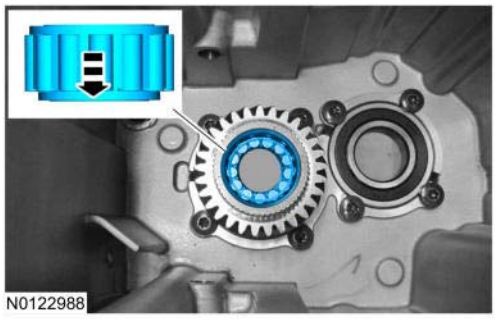
1.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

NOTE: Do not heat the input shaft bearing higher than 120°C (248°F) maximum or damage to the input shaft bearing can occur.

2.
Using a heat gun, heat the input shaft bearing inner race to a maximum of 120°C (248°F).

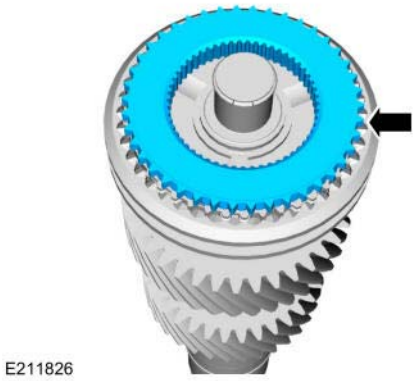
3.

Install the input shaft.



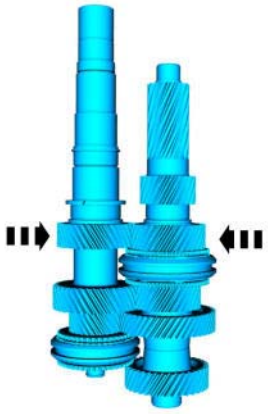
4.

Install the input shaft snap ring.



NOTE: Make sure the small diameter side of the output shaft roller bearing cage is facing the input shaft or damage to the output shaft bearing can occur.

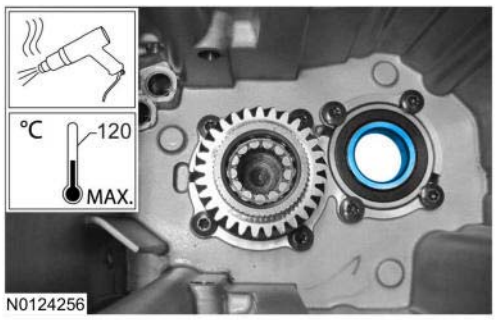
5.
With the small diameter side of the output shaft roller bearing cage facing the input shaft, install the output shaft roller bearing.



NOTE: Apply petroleum jelly to hold the 5th gear synchronizer ring and the 5th gear synchronizer cone in place during assembly.

6.
Install the 5th gear synchronizer ring and the 5th gear synchronizer cone.

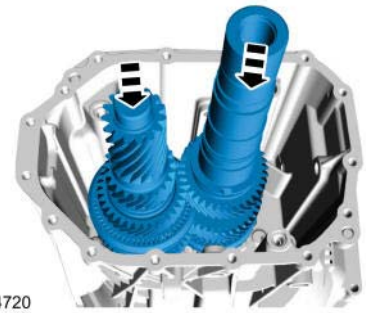
7.



Assemble the output shaft and countershaft assemblies.

E211828

NOTE: Do not heat the countershaft bearing higher than 120°C (248°F) maximum or damage to the countershaft bearing can occur.

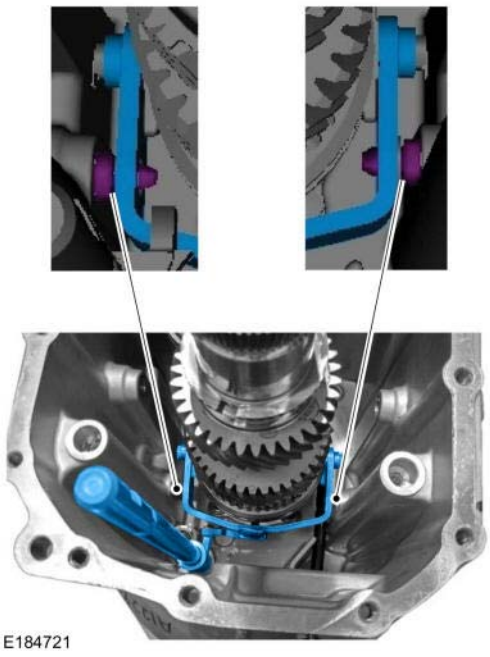


8.
Using a heat gun, heat the countershaft bearing inner race to a maximum of 120°C (248°F).

N0124256

9.

Install the output shaft and countershaft assembly.



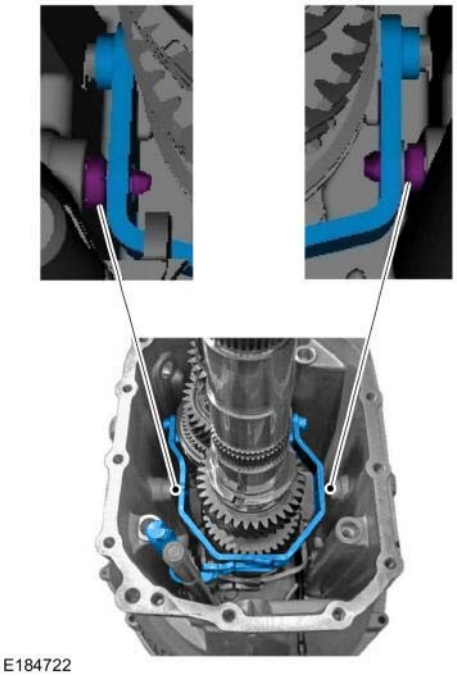
E184720

NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

10.
Install the 5th/6th shift fork, the 5th/6th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

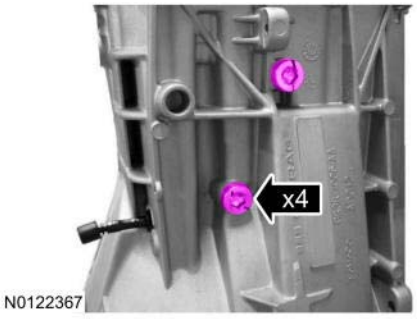


NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

11.
Install the 3rd/4th shift fork, the 3rd/4th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

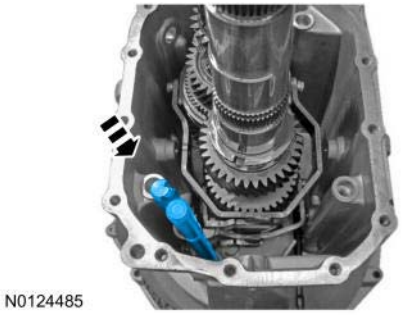
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



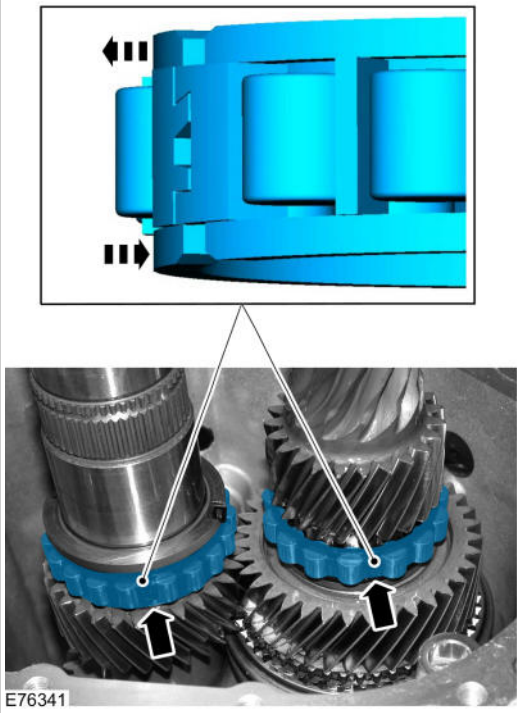
12.

Tighten the 2 LH and the 2 RH shift fork pivot bolts.



Torque

: 27 lb.ft (37 Nm)



13.

Push down the 3rd/4th shift rail and the 5th/6th shift rail to lock the transmission into 2 gears.

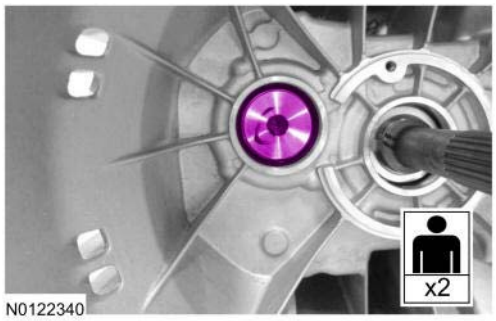
NOTE: When installing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.

14.
Slightly expand the center support bearing cages and slide the center support bearings down the shaft assemblies. Lock the bearing cage tabs.

15.

Loosely install the center support and finger tighten the bolts.

NOTE: Install the countershaft bolt with the transmission in the vertical position with the input shaft facing down.



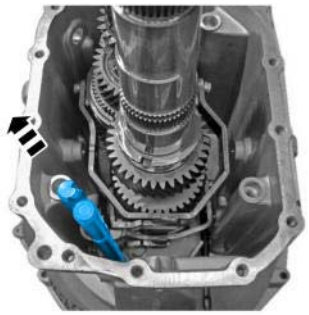
16.
Apply threadlock and install the countershaft bolt.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 70 lb.ft (95 Nm)



17.

Remove the center support and the bolts.

18.

Pull up on the 3rd/4th shift rail and 5th/6th shift rail to unlock the transmission from 2 gears.

N0124531

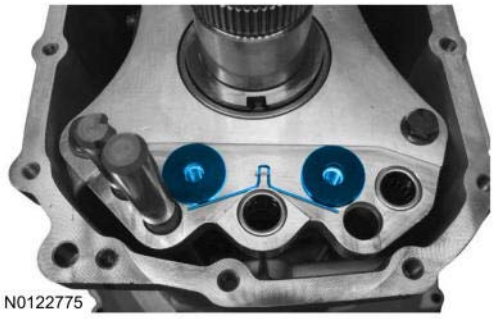
NOTE: The center support must be tightened evenly or damage to the center support or transmission case can occur.

19.
Install the center support, apply threadlock and evenly tighten the center support bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque



: 18 lb.ft (24 Nm)

N0123038

20.

Install the spring and spacers.

NOTE: Make sure the interlock plate moves freely.

21.
Install the interlock plate, apply threadlock and install the interlock plate bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 18 lb.ft (24 Nm)

22.

Install the 2nd gear needle bearing.

23.

Install the 2nd gear.

N0123034

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer ring assembly can occur.

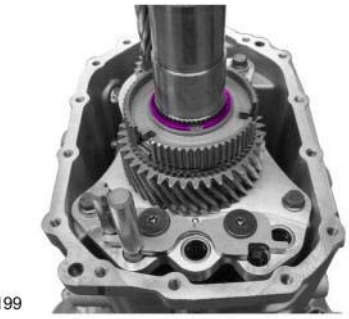
NOTE: The 2nd gear synchronizer ring assembly outer ring has 2 identification notches.

24.
Install the 2nd gear synchronizer ring assembly.

N0124481

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer hub slots or damage to the synchronizer hub and the synchronizer ring assembly can occur.

NOTE: The long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear or damage to the synchronizer hub can occur.



25.
With the long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear, use the special tool and install the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

26.

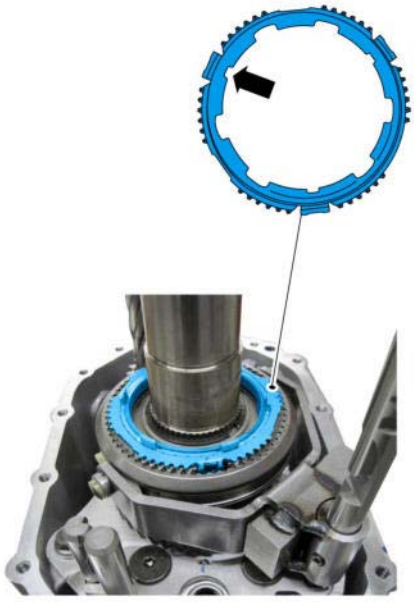
Install the 1st/2nd synchronizer hub snap ring.

NOTE: Align the index marks made during removal on the synchronizer sleeve and the synchronizer hub.

27.
With the groove on the 1st/2nd synchronizer sleeve facing 2nd gear, install the 1st/2nd shift fork the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

N0124202

NOTE: Slide the synchronizer sleeve up to install the pressure pieces.



28.
Install the 3 pressure pieces.

N0124193

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring assembly can occur.

NOTE: The 1st gear synchronizer ring assembly outer ring has one identification notch.

29.
Install the 1st gear synchronizer ring assembly.

N0124482

30.

Install the 1st gear needle bearing.

N0123022

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

31.
Install the 1st gear.

N0123021

32.

Using the special tool, install the reverse gear needle bearing race.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

N0122778

33.

Install the reverse gear needle bearing.

N0123019

34.

Install the reverse gear.

N0123020

NOTE: The shift shaft must be installed in the neutral position prior to installing the shift shaft stop pin or damage to the shift shaft pin can occur.

35.
Install the shift shaft in the neutral position, using a soft-faced hammer install the shift shaft stop pin.

N0123037

36.

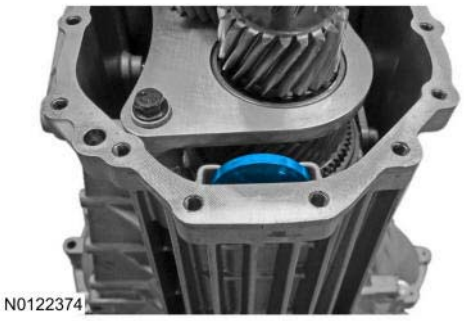
Install the reverse gear synchronizer ring.

N0123018

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring can occur.

37.
Using the special tool, install the reverse gear synchronizer assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.



NOTE: To install the reverse shift fork and the reverse shift rail assembly, the transmission must be in neutral and the grooves on the shift rails must be aligned with the interlock plate.

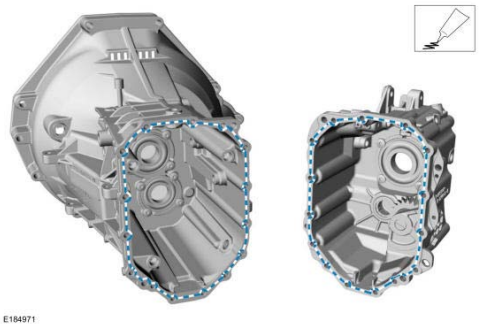
38.
Install the reverse shift fork and the reverse shift rail assembly.

39.

Install the magnet.

40.

Shift the transmission into 4th gear.



NOTE: Art shown in illustration with internal components removed for clarity.

NOTE: Do not wait longer than 10 minutes to install the rear transmission case assembly due to rapid cure of the sealant.

41.
Clean the sealing surfaces of the front transmission case and the sealing surfaces of the rear transmission case. Thinly coat the sealing surface of the front transmission case assembly and the sealing surface of the rear transmission case assembly with gasket maker.

Material

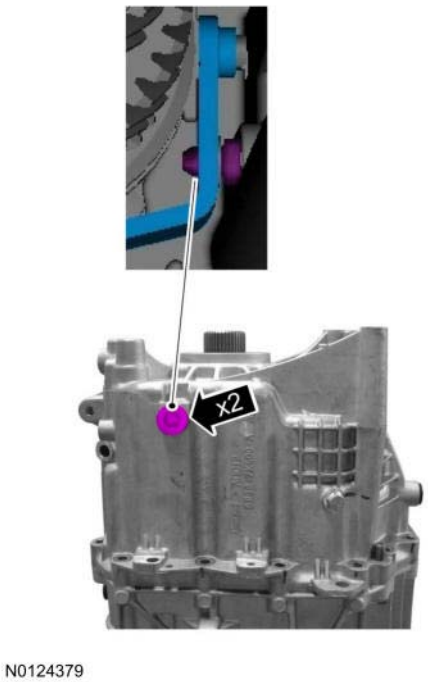
: Gasket Maker / TA-16 (WSK-M2G348-A5)

NOTE: The rear transmission case assembly must be installed evenly with the transmission shifted into 4th gear, do not allow the shift rails to bind during installation or damage to the transmission case assembly can occur.

42.
Using the special tools, install the rear transmission case assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

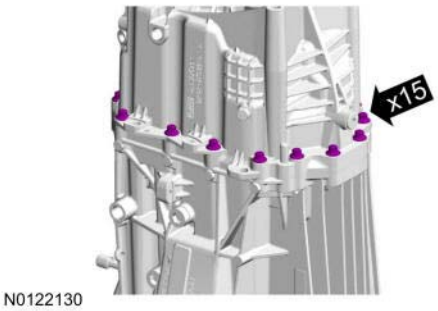
NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.



43.
Apply threadlock and sealer and install the shift fork pivot bolts.

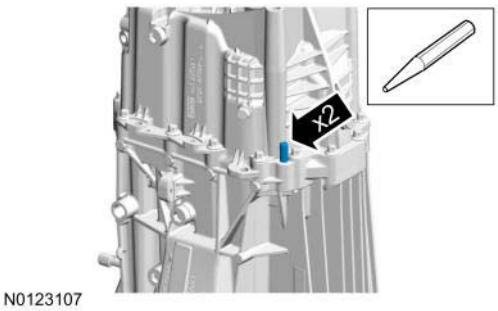
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



Torque

: 27 lb.ft (37 Nm)

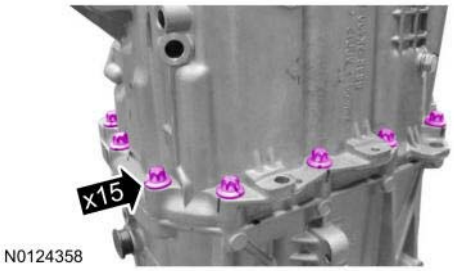


44.

Loosely install the bolts.

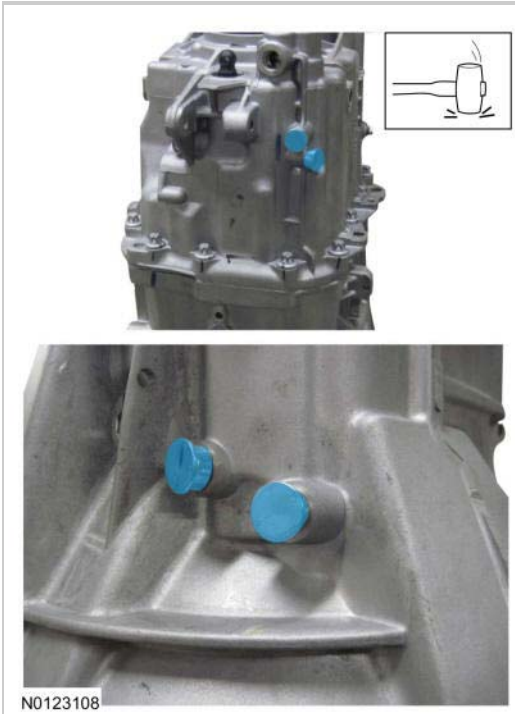
45.

Using a brass drift, tap the dowel pins flush with the transmission case.



46.

Tighten the bolts.



Torque

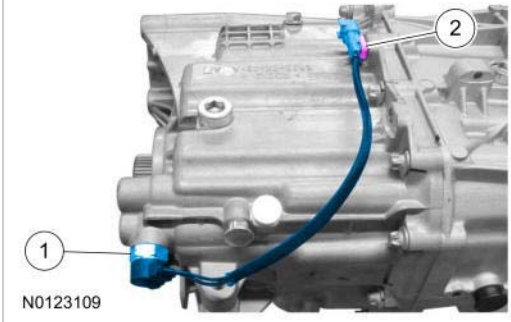
: 18 lb.ft (24 Nm)

47.

Using a soft-faced hammer install the 4 shift rail detents.

48.

1.



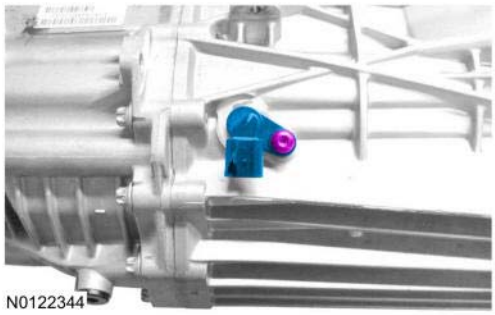
Install the reverse lamp switch.

Torque

: 177 lb.in (20 Nm)

2.

Attach the electrical connector retainer.



49.

Install the OSS sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

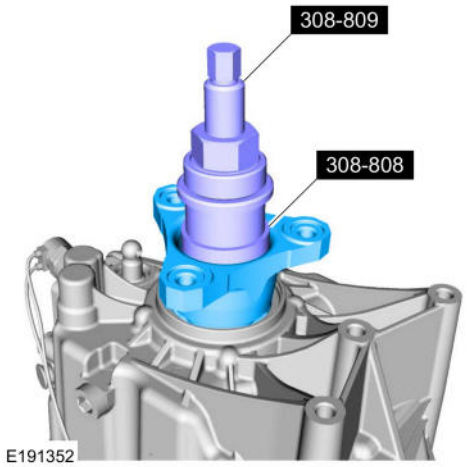
50.

Install a new output shaft seal on the special tools.

Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

51.

Using the special tools, install the output shaft seal.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

52.

Using the special tools, install the output shaft flange.

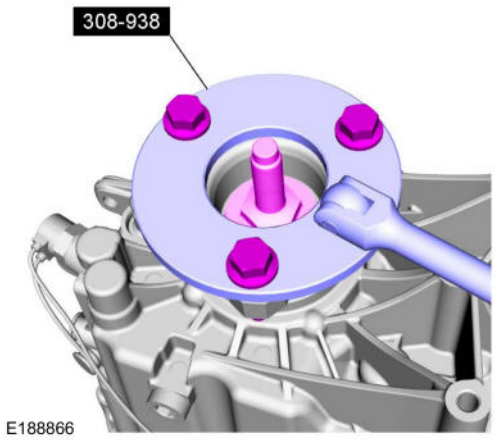
Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

53.

Clean the threads on the output shaft bolt and apply one dot of threadlock to the lower end of the output shaft bolt threads. Using the special tools, install the output shaft flange bolt and tighten in 3 stages.

Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

Material

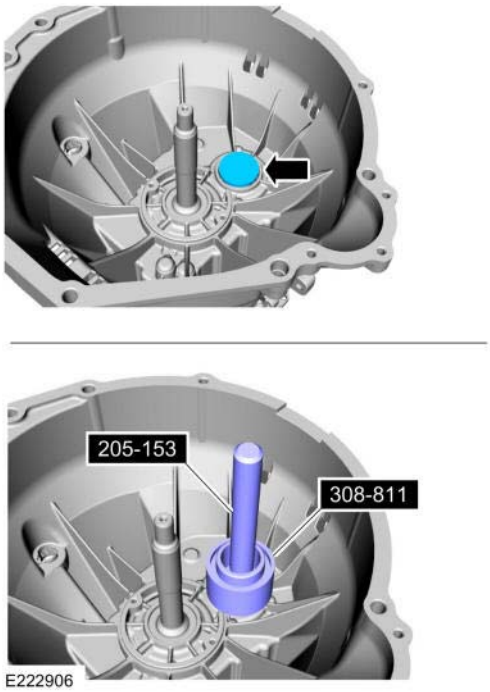


: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque:

Stage 1: 148 lb.ft (200 Nm)

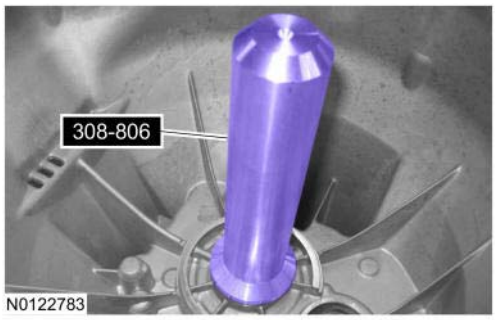
Stage 2: Loosen: 5 turn(s)



Stage 3: 133 lb.ft (180 Nm)

54.

Install the countershaft bolt cover in the clutch housing. Using the special tools, drive the countershaft bolt cover into the clutch housing.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

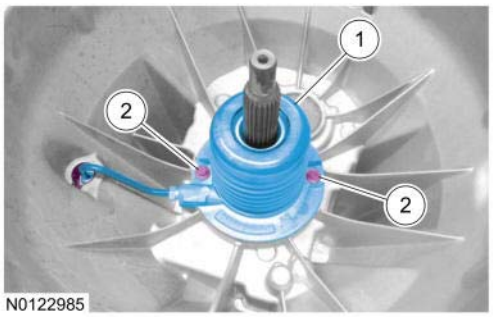
55.

Using the special tool, install the new input shaft seal.

Use Special Service Tool: 308-806 Installer, Front Seal.

56.

1.



Position the clutch slave cylinder and if equipped, the clutch slave cylinder spacer and connect the tube in the retaining clip.

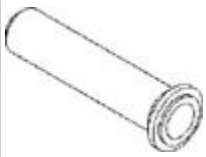
2.

Install the 2 bolts.

Torque

: 97 lb.in (11 Nm)

57.



Add 1 bottle (.91 fl oz (27 ml)) of XL-18 to the transmission if a new synchronizer was installed.

Material

: Motorcraft® MT82 Transmission Additive / XL-18

1.
Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

NOTE: Do not heat the input shaft bearing higher than 120°C (248°F) maximum or

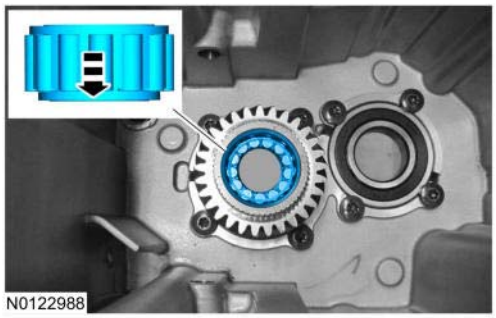
damage to the input shaft bearing can occur.

2.
Using a heat gun, heat the input shaft bearing inner race to a maximum of 120°C (248°F).

3.

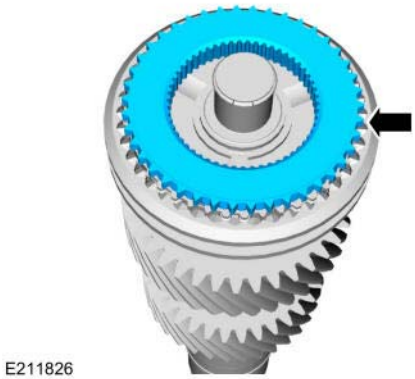
Install the input shaft.

4.



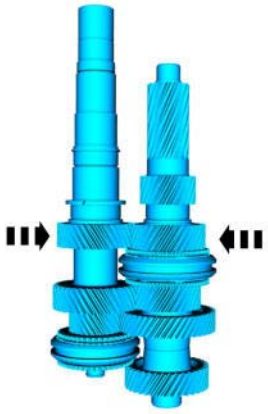
Install the input shaft snap ring.

NOTE: Make sure the small diameter side of the output shaft roller bearing cage is facing the input shaft or damage to the output shaft bearing can occur.



5.
With the small diameter side of the output shaft roller bearing cage facing the input shaft, install

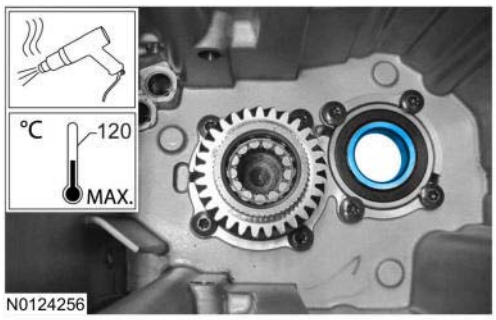
the output shaft roller bearing.



NOTE: Apply petroleum jelly to hold the 5th gear synchronizer ring and the 5th gear synchronizer cone in place during assembly.

6.
Install the 5th gear synchronizer ring and the 5th gear synchronizer cone.

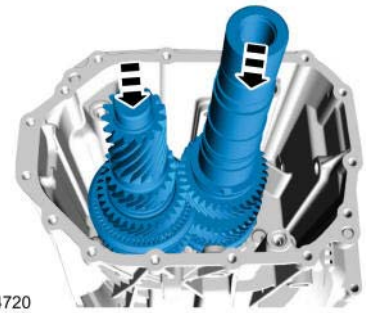
7.



Assemble the output shaft and countershaft assemblies.

E211828

NOTE: Do not heat the countershaft bearing higher than 120°C (248°F) maximum or damage to the countershaft bearing can occur.

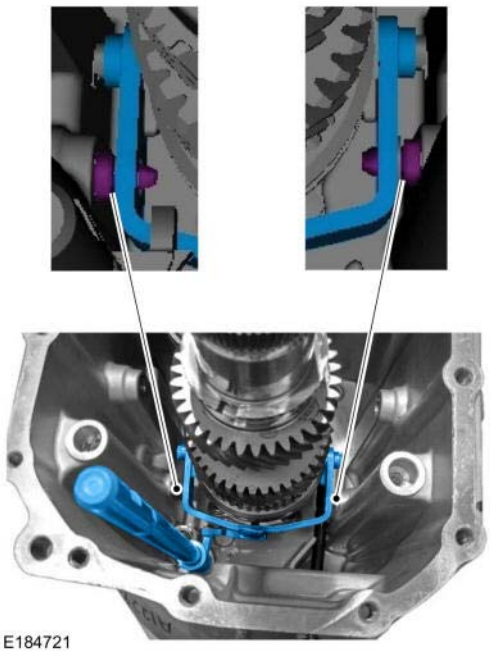


8.
Using a heat gun, heat the countershaft bearing inner race to a maximum of 120°C (248°F).

N0124256

9.

Install the output shaft and countershaft assembly.



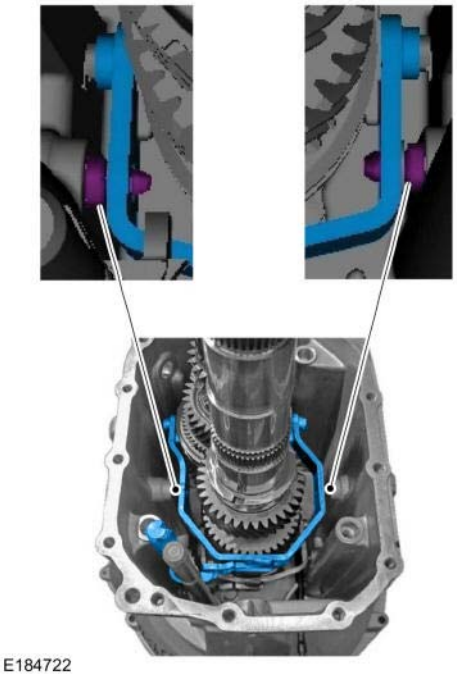
E184720

NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

10.
Install the 5th/6th shift fork, the 5th/6th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

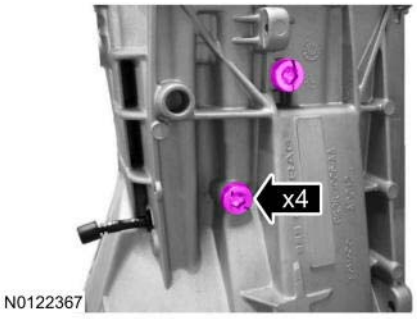


NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.

11.
Install the 3rd/4th shift fork, the 3rd/4th shift rail. Apply threadlock and sealer and loosely install the shift fork pivot bolts.

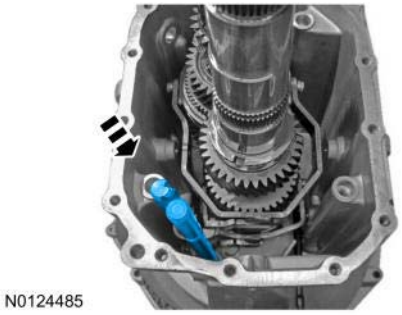
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



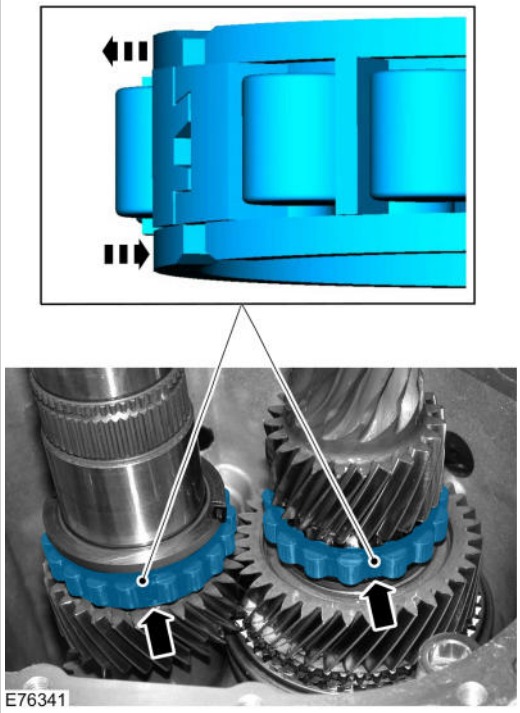
12.

Tighten the 2 LH and the 2 RH shift fork pivot bolts.



Torque

: 27 lb.ft (37 Nm)



13.

Push down the 3rd/4th shift rail and the 5th/6th shift rail to lock the transmission into 2 gears.

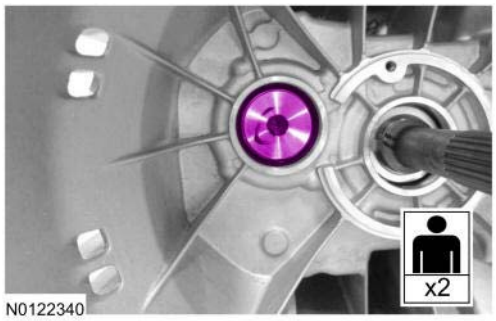
NOTE: When installing the bearings, do not over expand the bearing cages or damage to the bearing cages can occur.

14.
Slightly expand the center support bearing cages and slide the center support bearings down the shaft assemblies. Lock the bearing cage tabs.

15.

Loosely install the center support and finger tighten the bolts.

NOTE: Install the countershaft bolt with the transmission in the vertical position with the input shaft facing down.



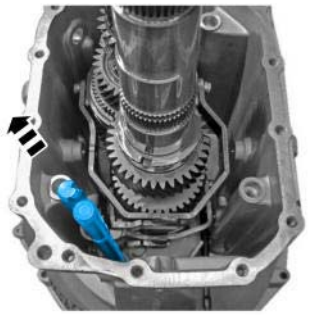
16.
Apply threadlock and install the countershaft bolt.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 70 lb.ft (95 Nm)



17.

Remove the center support and the bolts.

18.

Pull up on the 3rd/4th shift rail and 5th/6th shift rail to unlock the transmission from 2 gears.

N0124531

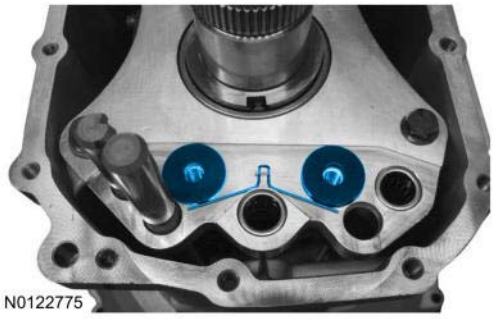
NOTE: The center support must be tightened evenly or damage to the center support or transmission case can occur.

19.
Install the center support, apply threadlock and evenly tighten the center support bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque



: 18 lb.ft (24 Nm)

N0123038

20.

Install the spring and spacers.

NOTE: Make sure the interlock plate moves freely.

21.
Install the interlock plate, apply threadlock and install the interlock plate bolts.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque

: 18 lb.ft (24 Nm)

22.

Install the 2nd gear needle bearing.

23.

Install the 2nd gear.

N0123034

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer ring assembly can occur.

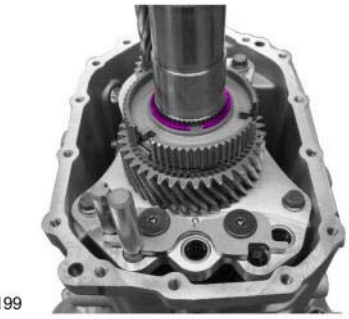
NOTE: The 2nd gear synchronizer ring assembly outer ring has 2 identification notches.

24.
Install the 2nd gear synchronizer ring assembly.

N0124481

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer hub slots or damage to the synchronizer hub and the synchronizer ring assembly can occur.

NOTE: The long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear or damage to the synchronizer hub can occur.



25.
With the long shoulder of the 1st/2nd synchronizer hub must be facing 2nd gear, use the special tool and install the 1st/2nd synchronizer hub.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

26.

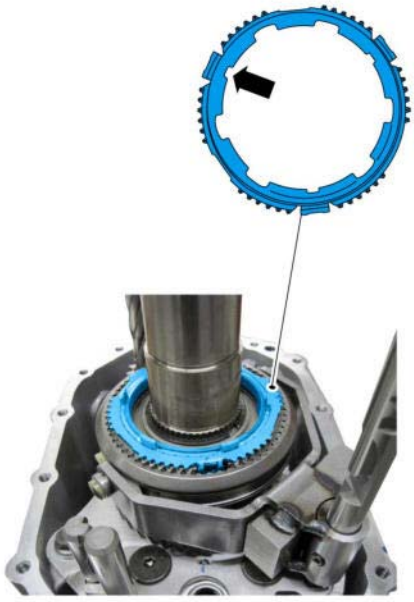
Install the 1st/2nd synchronizer hub snap ring.

NOTE: Align the index marks made during removal on the synchronizer sleeve and the synchronizer hub.

27.
With the groove on the 1st/2nd synchronizer sleeve facing 2nd gear, install the 1st/2nd shift fork the 1st/2nd shift rail and the 1st/2nd synchronizer sleeve.

N0124202

NOTE: Slide the synchronizer sleeve up to install the pressure pieces.



28.
Install the 3 pressure pieces.

N0124193

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring assembly can occur.

NOTE: The 1st gear synchronizer ring assembly outer ring has one identification notch.

29.
Install the 1st gear synchronizer ring assembly.

N0124482

30.

Install the 1st gear needle bearing.

N0123022

NOTE: The 6 synchronizer ring tabs must engage into the 6 gear slots or damage to the synchronizer assembly and synchronizer ring assembly can occur.

31.
Install the 1st gear.

N0123021

32.

Using the special tool, install the reverse gear needle bearing race.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.

N0122778

33.

Install the reverse gear needle bearing.

N0123019

34.

Install the reverse gear.

N0123020

NOTE: The shift shaft must be installed in the neutral position prior to installing the shift shaft stop pin or damage to the shift shaft pin can occur.

35.
Install the shift shaft in the neutral position, using a soft-faced hammer install the shift shaft stop pin.

N0123037

36.

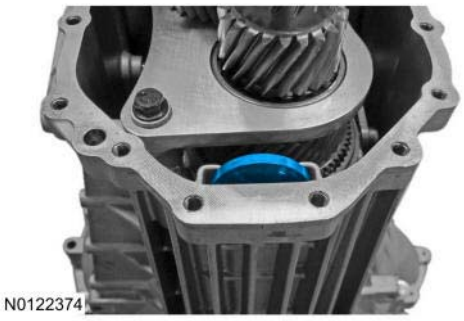
Install the reverse gear synchronizer ring.

N0123018

NOTE: The 3 synchronizer ring tabs must engage into the 3 synchronizer assembly slots or damage to the synchronizer assembly and the synchronizer ring can occur.

37.
Using the special tool, install the reverse gear synchronizer assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack.



NOTE: To install the reverse shift fork and the reverse shift rail assembly, the transmission must be in neutral and the grooves on the shift rails must be aligned with the interlock plate.

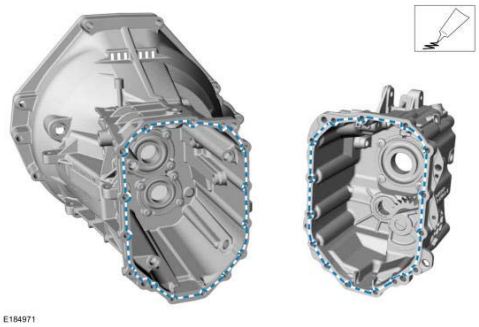
38.
Install the reverse shift fork and the reverse shift rail assembly.

39.

Install the magnet.

40.

Shift the transmission into 4th gear.



NOTE: Art shown in illustration with internal components removed for clarity.

NOTE: Do not wait longer than 10 minutes to install the rear transmission case assembly due to rapid cure of the sealant.

41.
Clean the sealing surfaces of the front transmission case and the sealing surfaces of the rear transmission case. Thinly coat the sealing surface of the front transmission case assembly and the sealing surface of the rear transmission case assembly with gasket maker.

Material

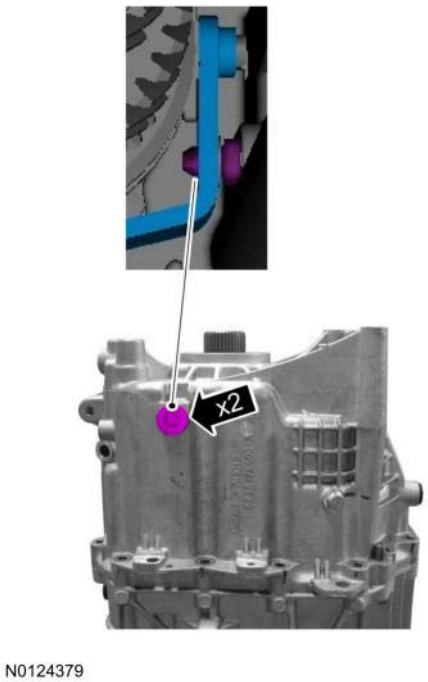
: Gasket Maker / TA-16 (WSK-M2G348-A5)

NOTE: The rear transmission case assembly must be installed evenly with the transmission shifted into 4th gear, do not allow the shift rails to bind during installation or damage to the transmission case assembly can occur.

42.
Using the special tools, install the rear transmission case assembly.

Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

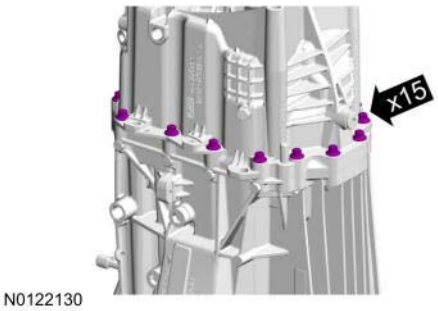
NOTE: Make sure the shift fork pivot bolts engage into the shift fork or damage to the shift fork can occur.



43.
Apply threadlock and sealer and install the shift fork pivot bolts.

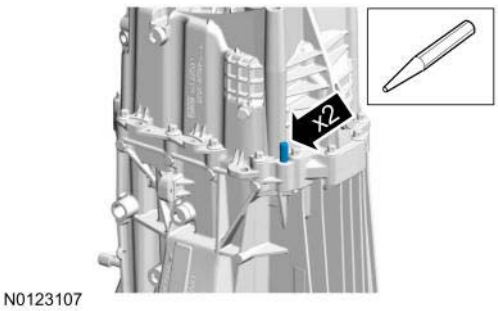
Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



Torque

: 27 lb.ft (37 Nm)

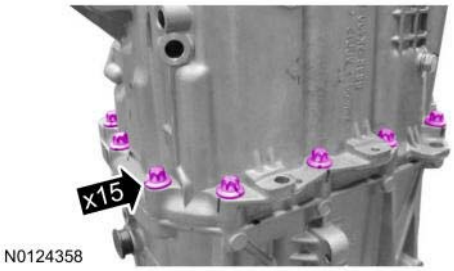


44.

Loosely install the bolts.

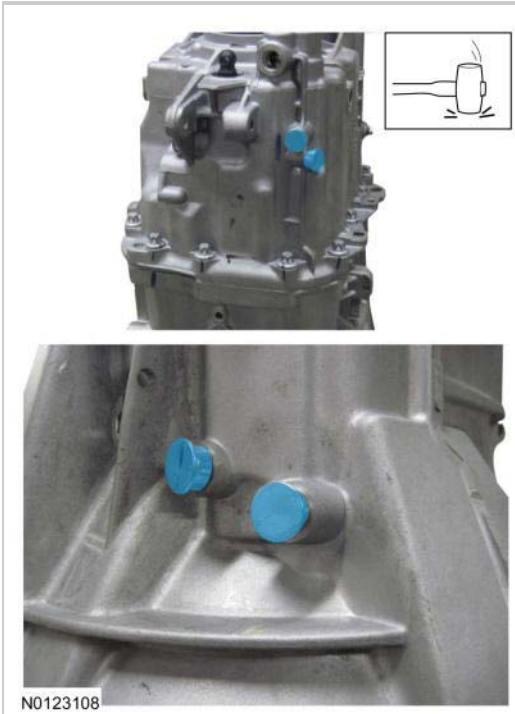
45.

Using a brass drift, tap the dowel pins flush with the transmission case.



46.

Tighten the bolts.



Torque

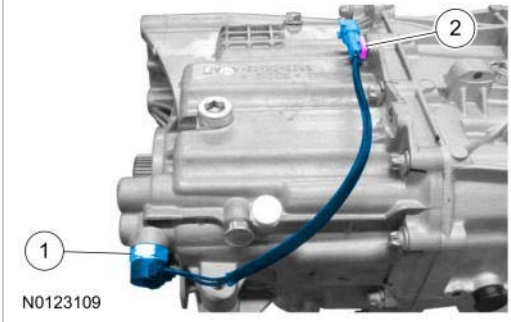
: 18 lb.ft (24 Nm)

47.

Using a soft-faced hammer install the 4 shift rail detents.

48.

1.



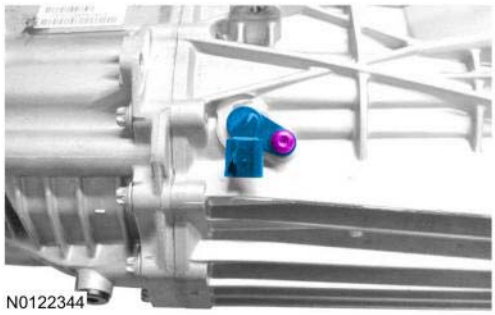
Install the reverse lamp switch.

Torque

: 177 lb.in (20 Nm)

2.

Attach the electrical connector retainer.



49.

Install the OSS sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

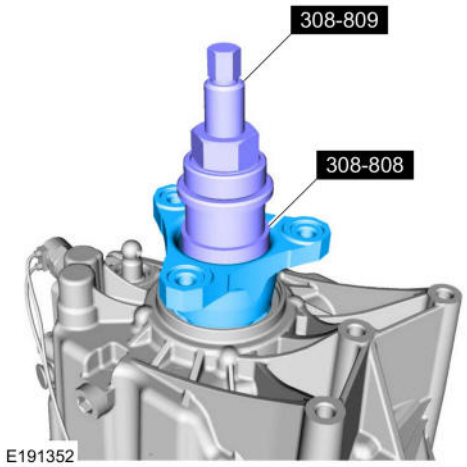
50.

Install a new output shaft seal on the special tools.

Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

51.

Using the special tools, install the output shaft seal.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

52.

Using the special tools, install the output shaft flange.

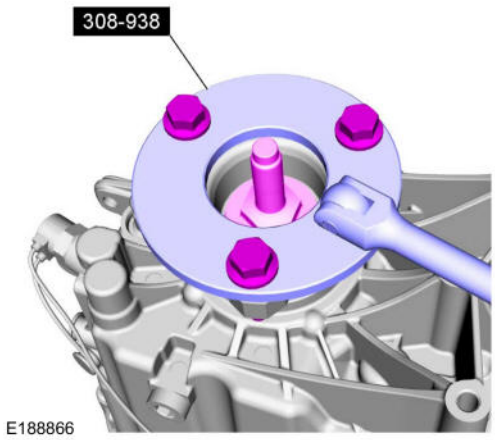
Use Special Service Tool: 308-809 Installer, Syncro Gear Pack, 308-808 Installer, Rear Flange.

53.

Clean the threads on the output shaft bolt and apply one dot of threadlock to the lower end of the output shaft bolt threads. Using the special tools, install the output shaft flange bolt and tighten in 3 stages.

Use Special Service Tool: 308-938 Remover/Installer, Companion Flange Nut.

Material

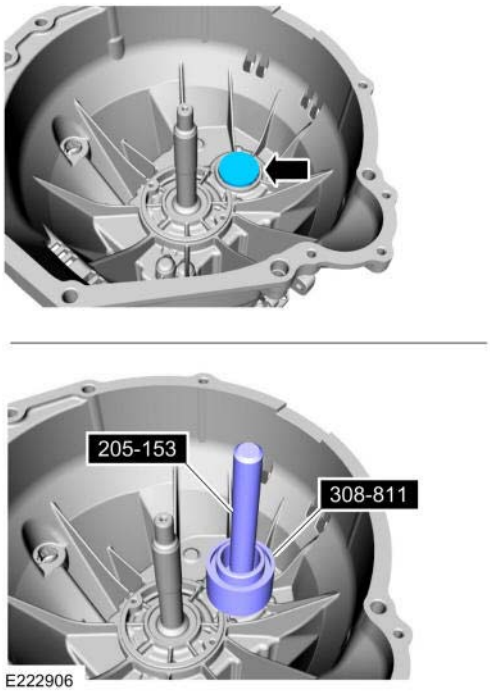


: Threadlock 262 / TA-26 (WSK-M2G351-A6)

Torque:

Stage 1: 148 lb.ft (200 Nm)

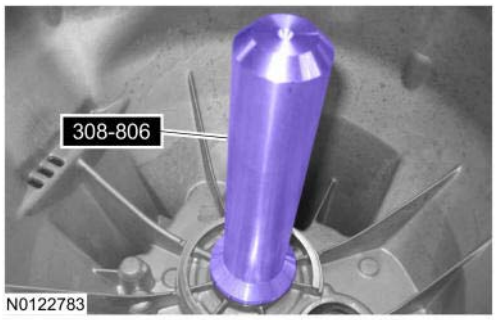
Stage 2: Loosen: 5 turn(s)



Stage 3: 133 lb.ft (180 Nm)

54.

Install the countershaft bolt cover in the clutch housing. Using the special tools, drive the countershaft bolt cover into the clutch housing.



Use Special Service Tool: 308-811 Installer, Rear Seal, 205-153 (T80T-4000-W) Handle.

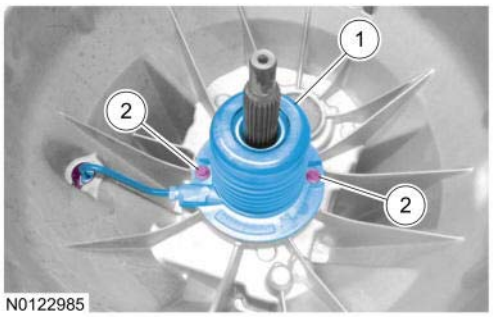
55.

Using the special tool, install the new input shaft seal.

Use Special Service Tool: 308-806 Installer, Front Seal.

56.

1.



Position the clutch slave cylinder and if equipped, the clutch slave cylinder spacer and connect the tube in the retaining clip.

2.

Install the 2 bolts.

Torque

: 97 lb.in (11 Nm)

57.

Add 1 bottle (.91 fl oz (27 ml)) of XL-18 to the transmission if a new synchronizer was installed.

Material

: Motorcraft® MT82 Transmission Additive / XL-18

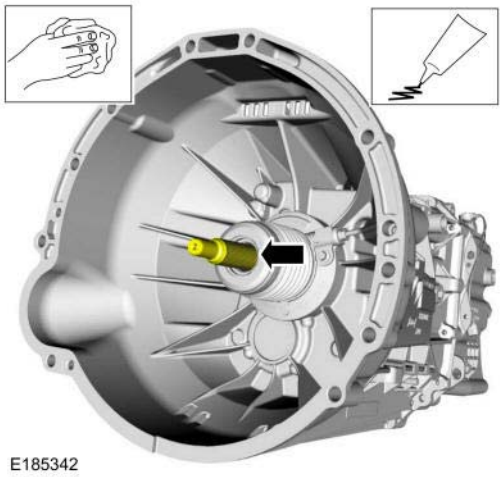
INSTALLATION > TRANSMISSION - 2.3L ECOBOOST (201KW 273PS)

Special Tool(s) / General Equipment

Transmission Jack

Materials

Name	Specification
Premium Long-Life Grease XG-1-E1	ESA-M1C75-B



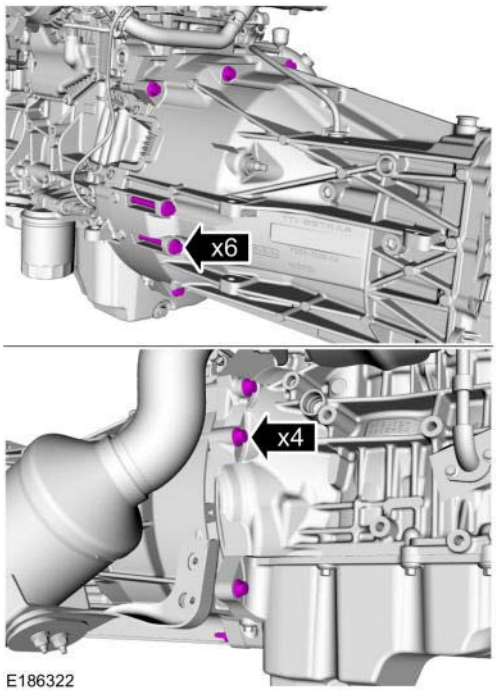
WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

1.

Clean the input shaft and apply a small amount of grease to the splined surface and the pilot bearing surface.

Material

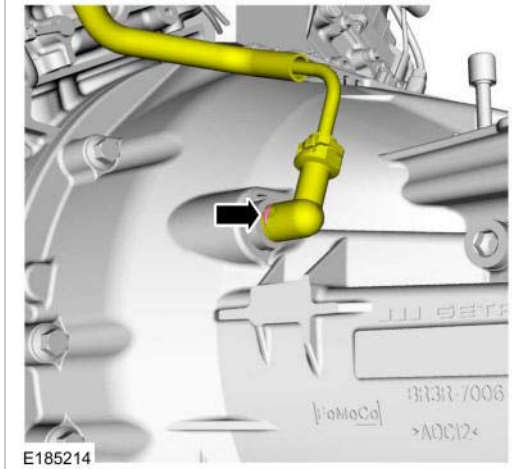
: Premium Long-Life Grease / XG-1-E1 (ESA-M1C75-B)



2.

Install the bellhousing bolts.

Use the General Equipment: Transmission Jack

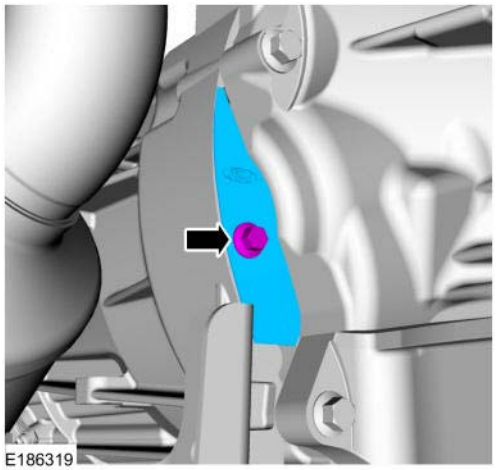


Torque

: 35 lb.ft (48 Nm)

3.

Connect the clutch master cylinder tube and install the retainer.

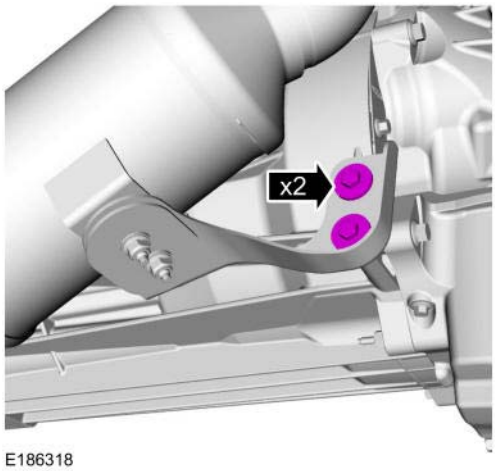


4.

Install the inspection cover and the bolt.

Torque

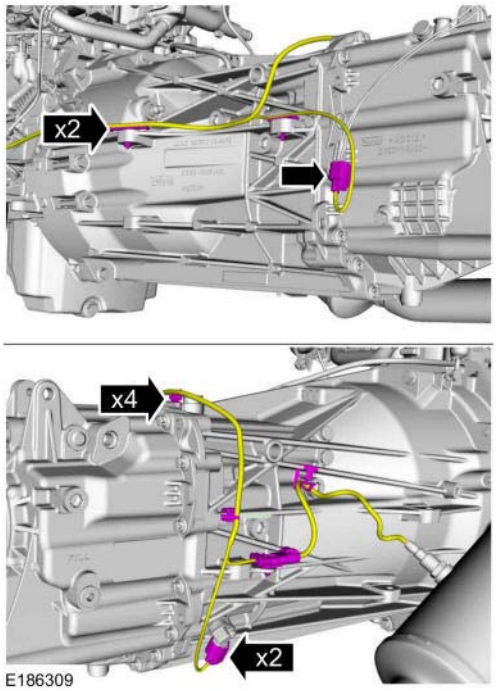
: 35 lb.ft (48 Nm)



5.

Install the catalytic converter support bracket bolts.

Torque



: 18 lb.ft (25 Nm)

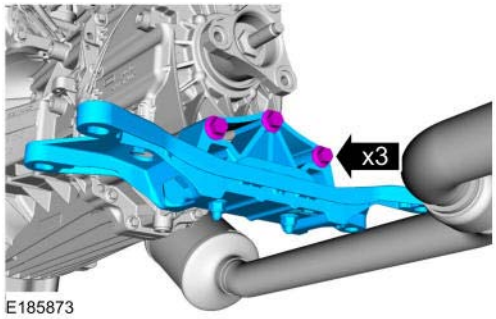
E186318

6.

Connect the electrical connectors and the wiring retainers.

E186309

7.



Install the starter motor. Refer to: STARTER MOTOR .

8.

Install the transmission support insulator and crossmember and the bolts.

Torque

: 76 lb.ft (103 Nm)

9.

Install the gearshift lever. Refer to: Gearshift Lever .

10.

Fill the transmission. Refer to: Transmission Draining and Filling .

11.

Connect the battery. Refer to: Battery Disconnect and Connect .

12.

Fill and bleed the clutch hydraulic system. Refer to: Clutch System Bleeding .

INSTALLATION > TRANSMISSION - 3.7L DURATEC (227KW 301PS)

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - COMPONENT LOCATION > EXTERNAL CONTROLS

Item	Part Number	Description
1	-	Gearshift lever knob
2	-	Gearshift lever boot
3	-	Gearshift lever

DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - OVERVIEW > OVERVIEW

The manual transmission external controls consists of the following:

- Gearshift lever assembly
    - A service kit which includes (roll pin, spring, plastic blocker, shoulder bolt and anti-rattle washer)
    - A rear isolator
    - A front hub bushing
    - A tunnel seal, foam gasket and boot
- Gearshift lever knob
- Gearshift lever boot

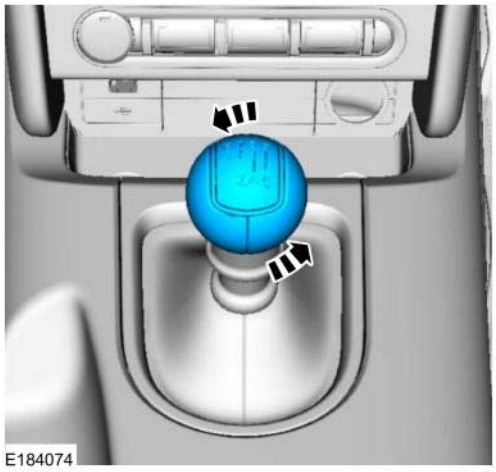
DESCRIPTION AND OPERATION > EXTERNAL CONTROLS - OVERVIEW > SYSTEM OPERATION

The manual transmission is controlled by a floor-mounted gearshift lever located in the floor console. When the operator moves the floor mounted gearshift lever, that movement is transmitted through a lever that is attached to the transmission.

REMOVAL AND INSTALLATION > GEARSHIFT LEVER

Special Tool(s) / General Equipment

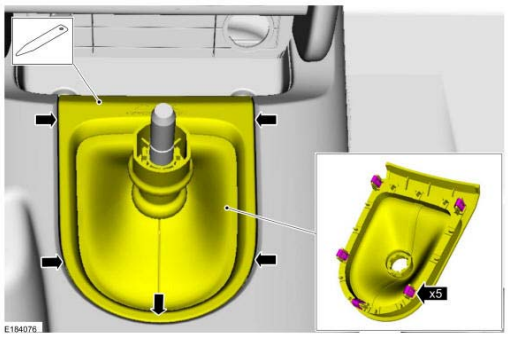
Transmission Jack
Interior Trim Remover



REMOVAL AND INSTALLATION > GEARSHIFT LEVER > REMOVAL

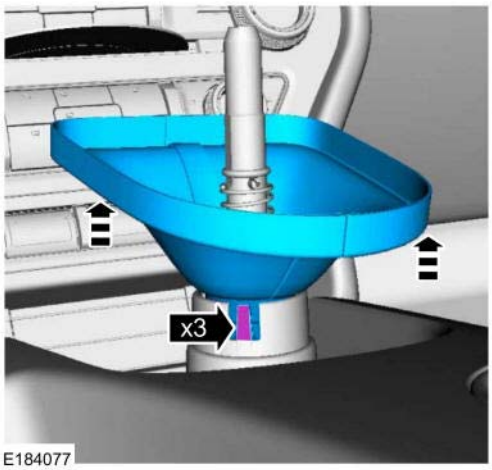
1.

With the vehicle in N, position it on a hoist. Refer to: Jacking and Lifting - Overview .



2.

Rotate the gearshift knob counterclockwise and remove the gearshift knob.

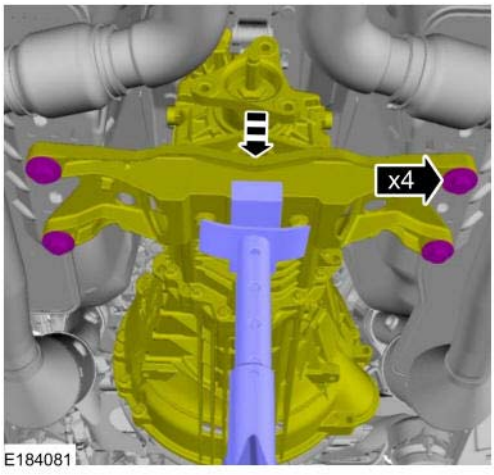


3.

Using an interior trim remover, release the gearshift lever boot from the floor console starting at the front sides and moving rearward. Use the General Equipment: Interior Trim Remover

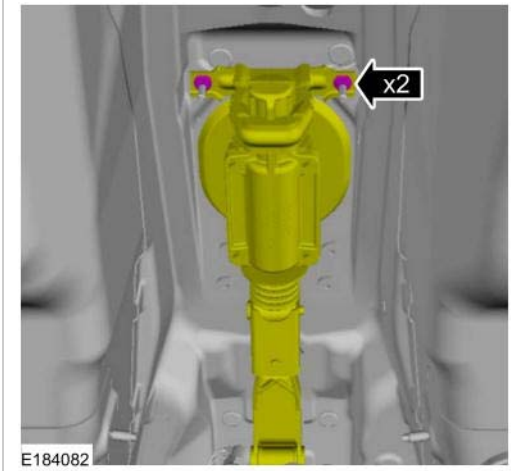
4.

Release the retainers and remove the gearshift lever boot.



5.

Remove the driveshaft. Refer to: Driveshaft .



6.

Support the crossmember with a transmission jack, remove the crossmember bolts and lower the transmission. Use the General Equipment: Transmission Jack

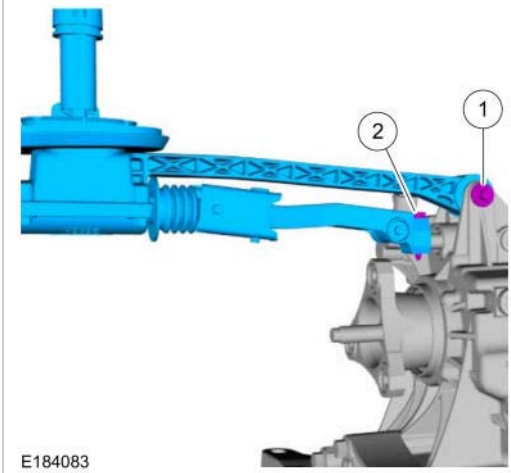
7.

Remove the gearshift lever nuts.

8.

Remove the gearshift lever assembly.

1.



Remove the gearshift lever-to-transmission bolt.

2.

Remove the gearshift lever bolt.

3.

Remove the gearshift lever assembly from the transmission by pulling towards the rear of the vehicle.

9.

Inspect the following components for damage. If damage is found, replace the components as necessary.

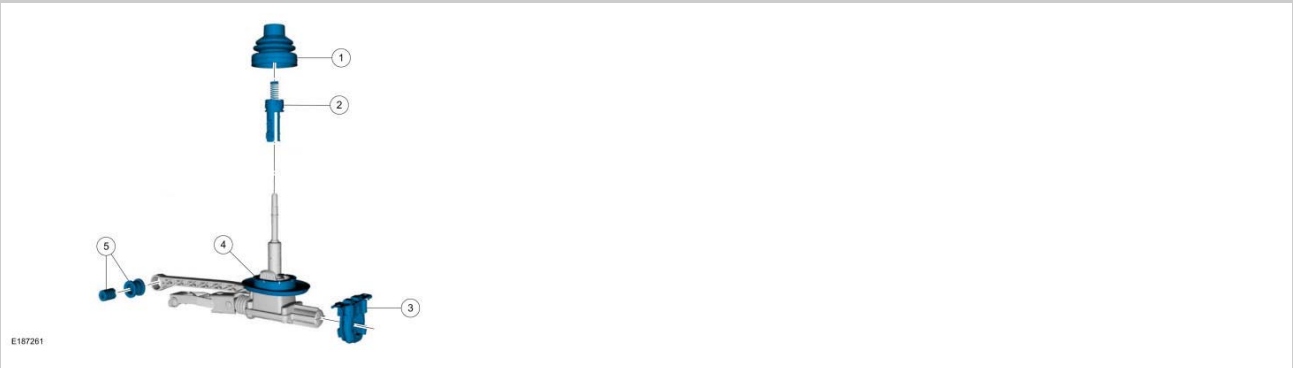
1.

Rubber Boot

2.

Service kit (roll pin, spring, plastic blocker, shoulder bolt and anti-rattle washer)

3.



Rear isolator

4.

Tunnel seal and foam gasket

5.

Front hub bushing

REMOVAL AND INSTALLATION > GEARSHIFT LEVER > INSTALLATION

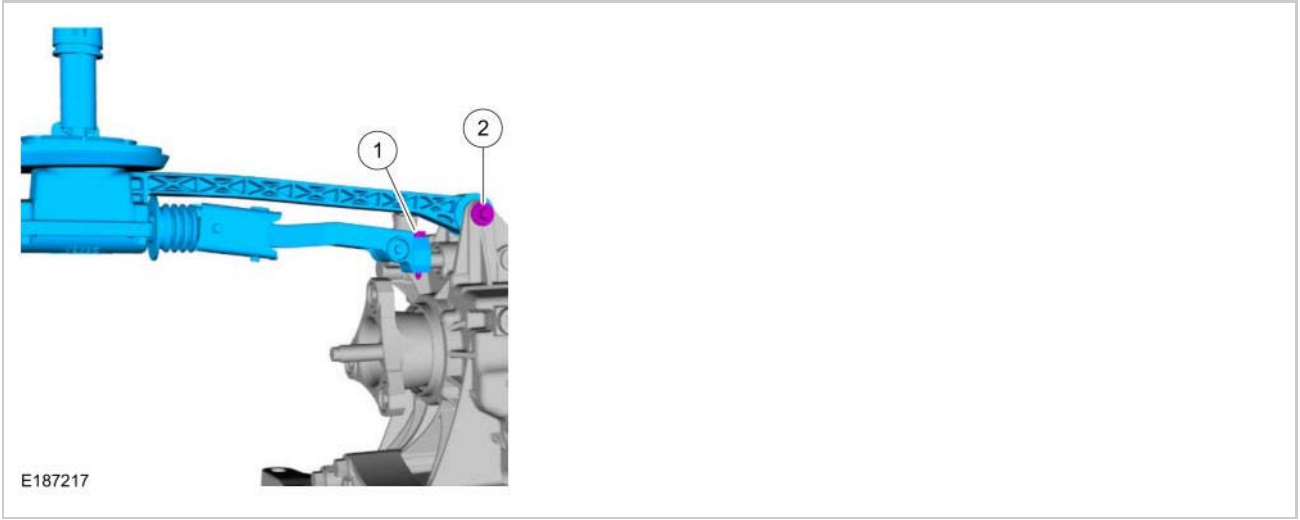
1.

Install the gearshift lever assembly.

1.

Install the gearshift lever bolt.

Torque



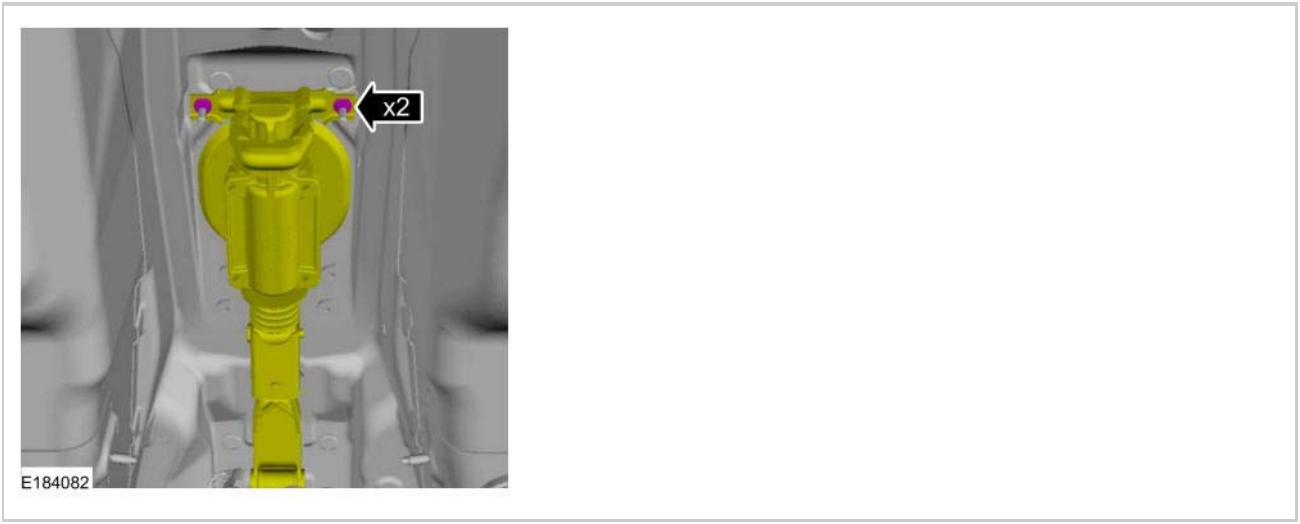
: 133 lb.in (15 Nm)

2.

Install the gearshift lever-to-transmission bolt.

Torque

: 30 lb.ft (40 Nm)

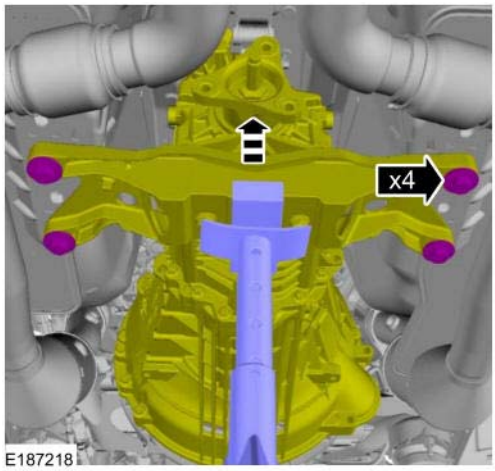


2.

Install the gearshift lever nuts.

Torque

: 97 lb.in (11 Nm)

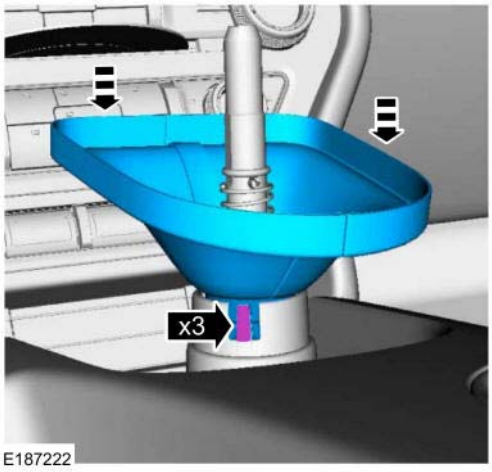


3.

Support the crossmember with a transmission jack, raise the transmission and install the crossmember bolts. Use the General Equipment: Transmission Jack

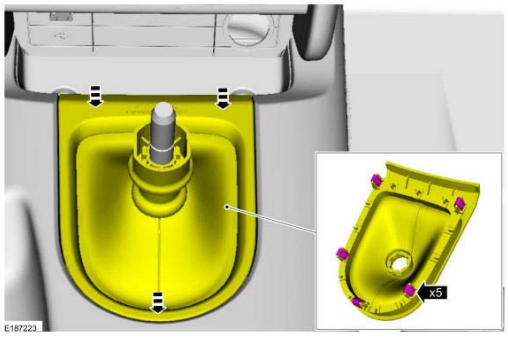
Torque

: 46 lb.ft (63 Nm)



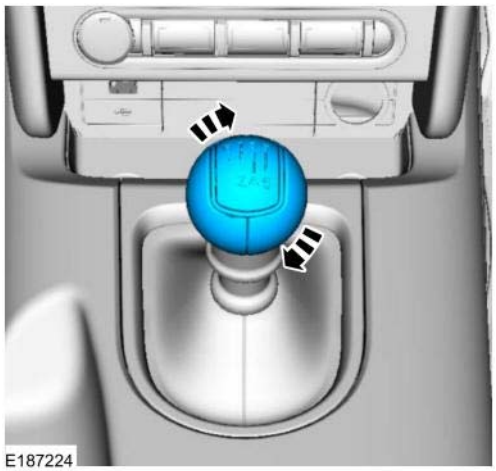
4.

Install the driveshaft. Refer to: Driveshaft .



5.

Install the gearshift lever boot and attach the retainers.



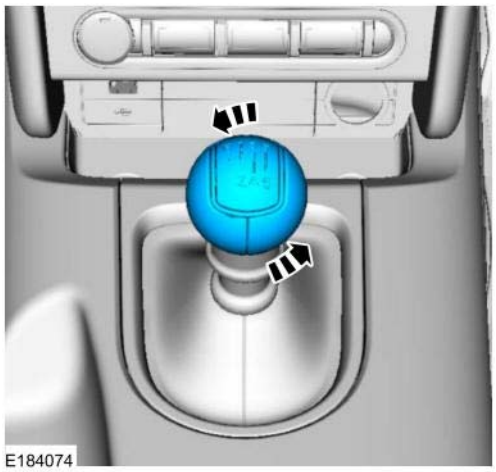
6.

Install the gearshift lever boot to the floor console.

7.

Install the gearshift knob.

REMOVAL AND INSTALLATION > GEARSHIFT LEVER BOOT

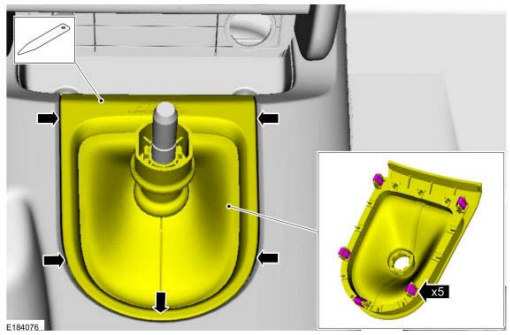


Special Tool(s) / General Equipment

Interior Trim Remover

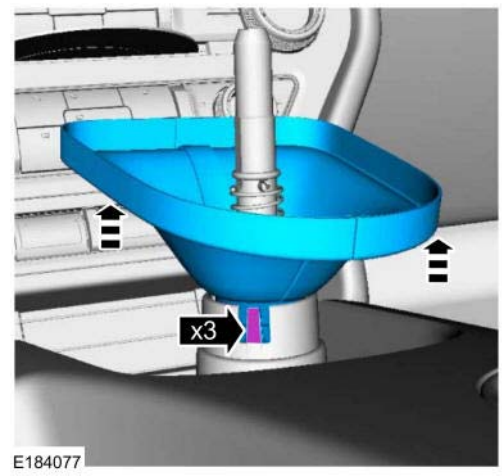
REMOVAL AND INSTALLATION > GEARSHIFT LEVER BOOT > REMOVAL

1.



Rotate the gearshift knob counterclockwise and remove the gearshift knob.

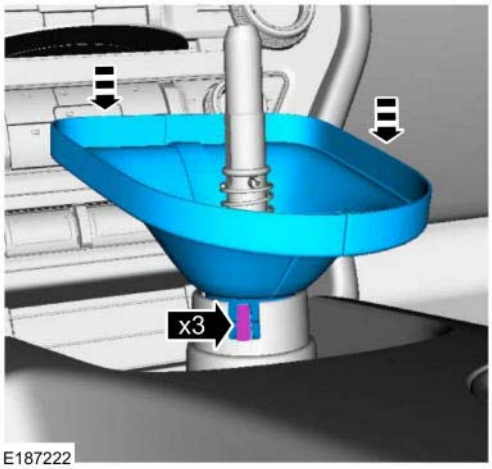
2.



Using an interior trim remover, release the gearshift lever boot from the floor console starting at

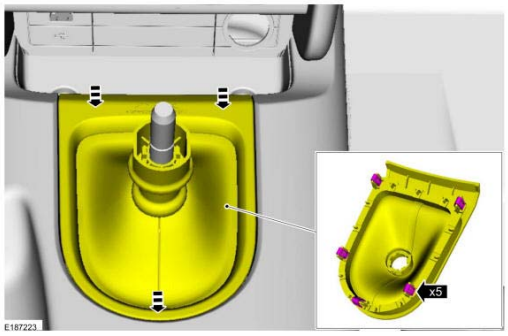
the front sides and moving rearward. Use the General Equipment: Interior Trim Remover

3.



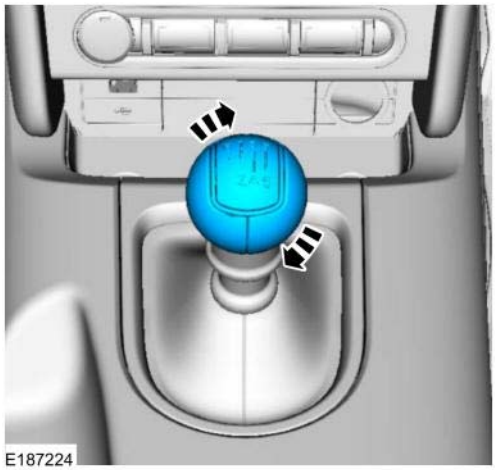
Release the retainers and remove the gearshift lever boot.

REMOVAL AND INSTALLATION > GEARSHIFT LEVER BOOT > INSTALLATION



1.

Install the gearshift lever boot and attach the retainers.



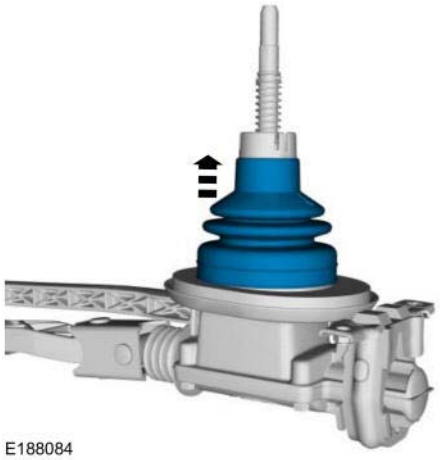
2.

Install the gearshift lever boot to the floor console.

3.

Install the gearshift knob.

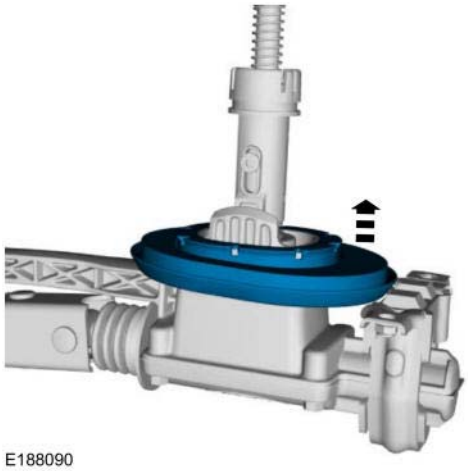
DISASSEMBLY AND ASSEMBLY > GEARSHIFT LEVER



Special Tool(s) / General Equipment

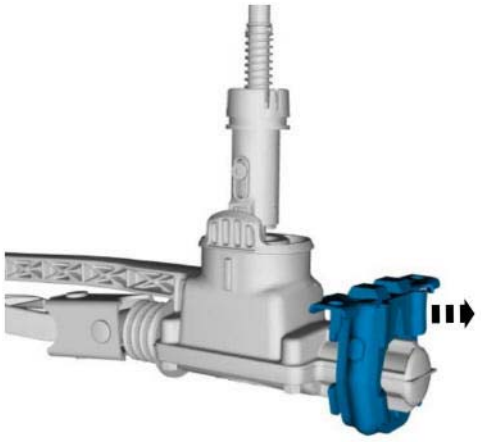
Punch

DISASSEMBLY AND ASSEMBLY > GEARSHIFT LEVER > DISASSEMBLY



1.

Remove the boot.



2.

Remove the tunnel seal.

3.

Remove the isolator.

E188086

4.

Remove the steel sleeve.

E188089

5.

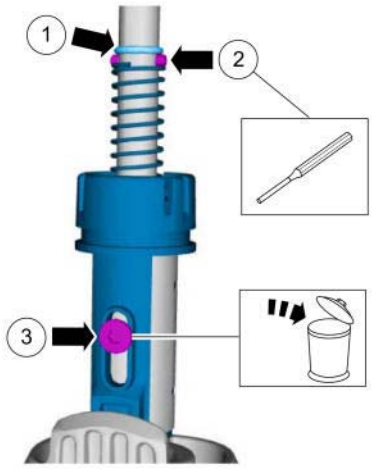
Remove the polymer bushing.

E188087

NOTE: The anti-rattle washer is installed above the roll pin.

6.

1.



Remove the anti-rattle washer.

2.

Using a punch, remove the roll pin. Use the General Equipment: Punch

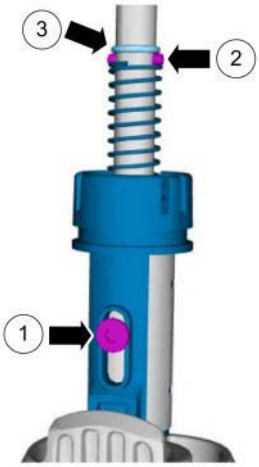
3.

Remove and discard the bolt.

DISASSEMBLY AND ASSEMBLY > GEARSHIFT LEVER > ASSEMBLY

1.

1.



Install a new bolt.

2.

Install the roll pin.

3.

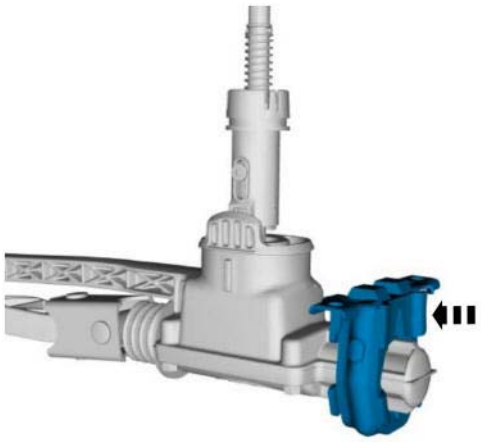
Install the anti-rattle washer.

E188129

2.

Install the polymer bushing.

E188128

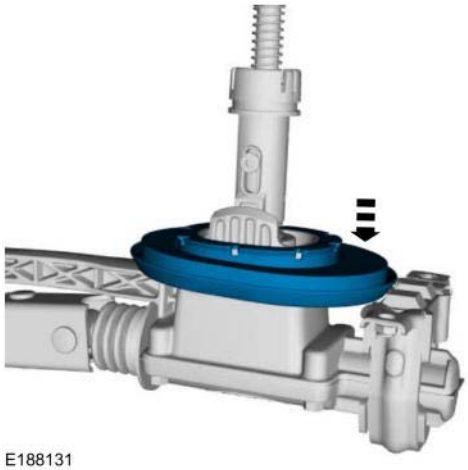


3.

Install the steel sleeve.

E188130

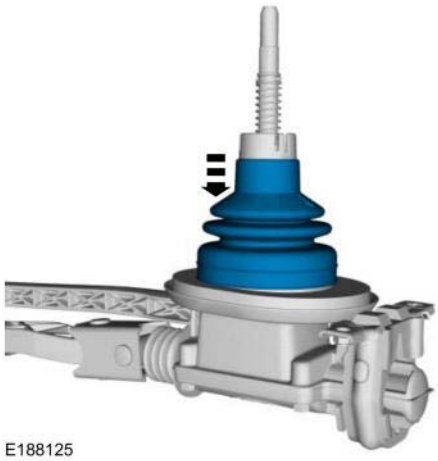
4.



Install the isolator.

E188127

5.

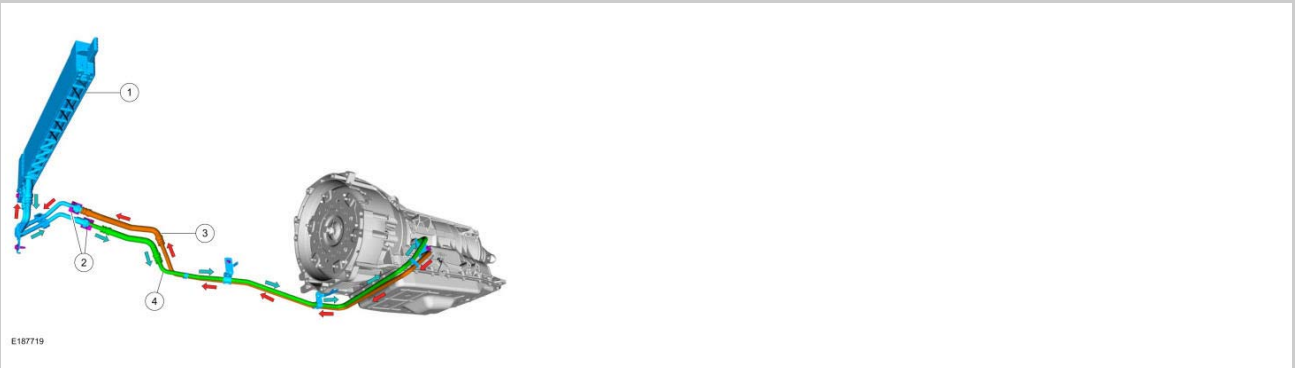


Install the tunnel seal.

E188131

6.

Install the boot.

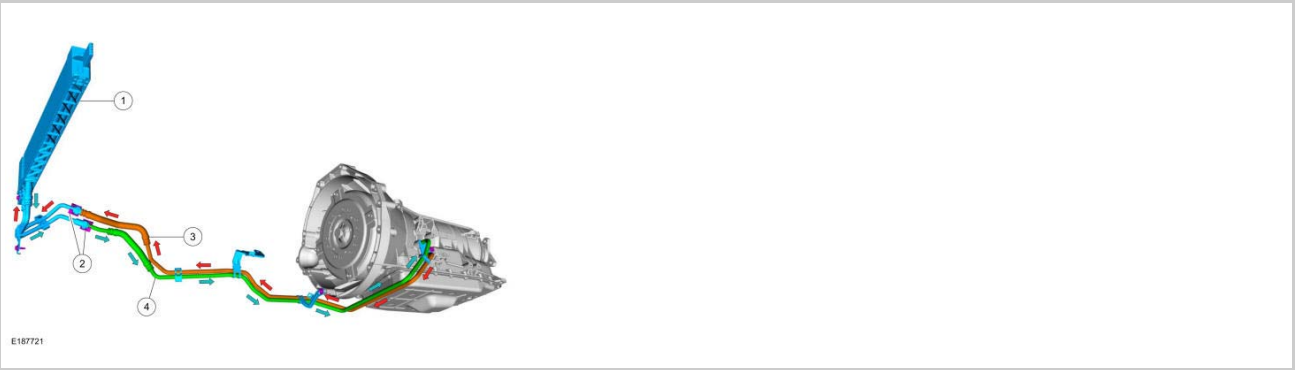


E188125

Service Manual: TRANSMISSION COOLING

DESCRIPTION AND OPERATION > TRANSMISSION COOLING - COMPONENT LOCATION

2.3L Engine



Item	Description
1	Transmission fluid cooler and hose assembly
2	Transmission fluid cooler tube fitting latches
3	Transmission fluid cooler inlet tube
4	Transmission fluid cooler outlet tube

3.7L Engine

Item	Description
1	Transmission fluid cooler and hose assembly
2	Transmission fluid cooler tube fitting latches
3	Transmission fluid cooler inlet tube
4	Transmission fluid cooler outlet tube

5.0L Engine

Item	Description
1	Transmission fluid cooler and hose assembly
2	Transmission fluid cooler tube fitting latches
3	Transmission fluid cooler inlet tube
4	Transmission fluid cooler outlet tube

DESCRIPTION AND OPERATION > TRANSMISSION COOLING - OVERVIEW

Vehicles equipped with an automatic transmission are equipped with an external transmission fluid cooler. The transmission fluid cooler is an oil to air fluid cooler which is mounted in front of the radiator. The transmission fluid travels from the transmission through the cooler and back to the transmission via transmission fluid cooler tubes. The transmission fluid cooler transfers heat from the transmission fluid to the ambient air passing over the cooler.

DIAGNOSIS AND TESTING > TRANSMISSION COOLING > INSPECTION AND VERIFICATION

1.

Verify the customer concern by operating the vehicle to duplicate the condition.

2.

If the inspection reveals obvious concern(s) that can be readily identified, repair as necessary.

3.

Install new components if a transmission fluid leak is found in any of the transmission cooling components.

4.

If the cause is not visually evident, check for DTC. REFER to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 3.7L Duratec (227kW/301PS) . REFER to: Diagnostic Trouble

Code (DTC) Charts and Pinpoint Tests - 5.0L 32V Ti-VCT .

DIAGNOSIS AND TESTING > TRANSMISSION COOLING > SYMPTOM CHART - TRANSMISSION COOLING

Symptom	Possible Sources	Action
Transmission overheating	Clogged transmission fluid cooler or transmission fluid cooler tubes Bent or crushed transmission fluid cooler tubes	INSPECT the transmission fluid cooler and the transmission fluid cooler tubes for damage or plugging. INSTALL new components as necessary.
System leaks		INSPECT transmission fluid cooler and transmission fluid cooler tubes for leaks. SERVICE as required.
Transmission fluid level is too high		REFER to: Transmission Fluid Level Check .
Vibration - a high frequency (20-80 Hz) that is felt through the seat or gear shifter. Changes with engine speed	Transmission fluid cooler tubes grounded	CHECK the transmission fluid cooler tubes. REPAIR as necessary.

DIAGNOSIS AND TESTING > TRANSMISSION COOLING > CHECK TRANSMISSION FLUID LEVEL AND CONDITION

Transmission Fluid Level Check

To check the transmission fluid level, REFER to: Transmission Fluid Level Check .

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transmission malfunction and/or damage.

Low Transmission Fluid Level

A low transmission fluid level could result in poor transmission engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transmission seals or gaskets.

Transmission Fluid Condition Check

1.

Check the transmission fluid level, REFER to: Transmission Fluid Level Check .

2.

Place a drop of transmission fluid on a facial tissue and examine the stain.

3.

If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

4.

If transmission fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, repair the transmission and clean the transmission fluid cooler tubes and the transmission fluid cooler.

5.

If the transmission is to be overhauled or if installing a new transmission, the transmission fluid cooler must be backflushed. REFER to: Transmission Fluid Cooler - Backflushing and Cleaning .

GENERAL PROCEDURES > TRANSMISSION FLUID COOLER - BACKFLUSHING AND CLEANING

Special Tool(s) / General Equipment

Transmission Cooling System Heated Flusher

Materials

Name	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid (U.S.) XT-10-QLVC (U.S.)	MERCON® LVWSS-M2C938-A

Flushing

NOTE: Use transmission fluid specified for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail, which will affect the operation of the transmission.

1.
The transmission cooling system (cooler and lines) MUST be flushed every time the transmission is overhauled or replaced in order to minimize the likelihood of repeat repairs. It is mandatory that proper equipment and procedures be followed when flushing coolers/lines. The flushing equipment used MUST:

maintain fluid at 140°F or above

pulsate fluid during cleaning

have a GPM flow meter

have twin magnetic filters

and have air purge capability before and after flushing

2.

If equipment meeting the specifications above is not available, the transmission fluid cooler(s) should be replaced and the lines cleaned by hand.

3.

Check and top off fluid level of the transmission cooling system heated flusher with transmission fluid.

Use the General Equipment: Transmission Cooling System Heated Flusher

Material

: Motorcraft® MERCON® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.) (MERCON® LV) (WSS-M2C938-A)

4.

Turn on the heater and allow the fluid in the cooler line flusher 15-30 minutes to heat up to 60°C (140°F) before using.

5.

Install the line adapters onto the transmission fluid cooler tubes.

6.

Attach the Transmission Cooling System Heated Flusher red line to the transmission fluid cooler inlet tube. Refer to: Transmission Cooling - Component Location .

7.

Attach the Transmission Cooling System Heated Flusher blue line to the transmission fluid cooler outlet tube.

8.

Follow the Transmission Cooling System Heated Flusher manufacturer's instructions to purge the transmission fluid cooler tubes and the transmission fluid cooler prior to starting the flushing procedure.

9.

Allow the Transmission Cooling System Heated Flusher to backflush for 10-15 minutes, then flush the transmission fluid cooler in a normal flow direction for an additional 10-15 minutes.

10.

If the transmission fluid cooling system heated flusher is equipped with an inspection micron filter:

1.

Remove and clean the Oberg 28 micron filter.

2.

Install the filter.

3.

Backflush the system for 5 minutes.

4.

Remove and inspect the filter.

5.

If debris/contamination is present on the filter, repeat step 9.

11.

Follow the equipment instructions to purge the transmission fluid cooler tubes and transmission fluid cooler.

REMOVAL AND INSTALLATION > TRANSMISSION FLUID COOLER - 2.3L ECOBOOST (231KW/314PS)

Special Tool(s) / General Equipment

Material

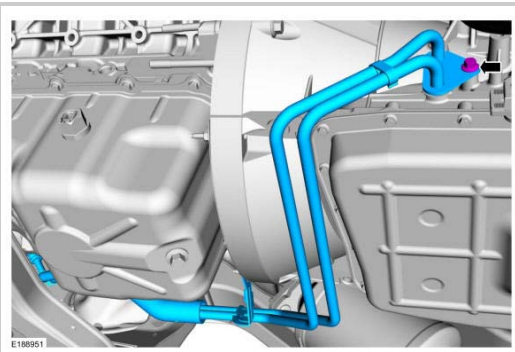
: Motorcraft® MERCON® LV Automatic Transmission Fluid (U.S.) / XT-10-QLVC (U.S.)

(MERCON® LV) (WSS-M2C938-A)



3.

Position the transmission fluid cooler tubes in the vehicle, attach the transmission fluid cooler tubes to the transmission and install the bolt.

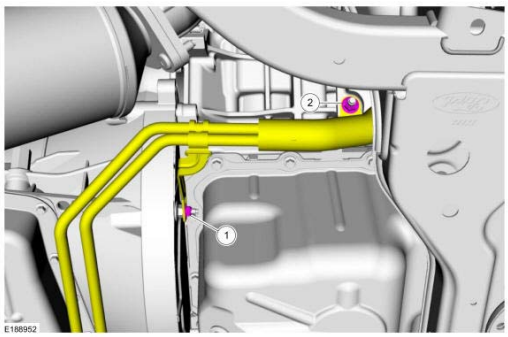
Torque

: 18 lb.ft (25 Nm)

4.

Install the nuts.

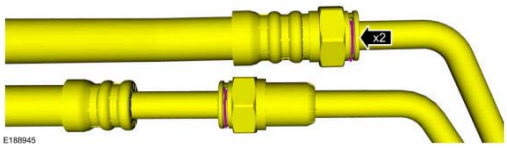
Install the transmission fluid cooler tubes bracket-to-transmission nut.



Torque

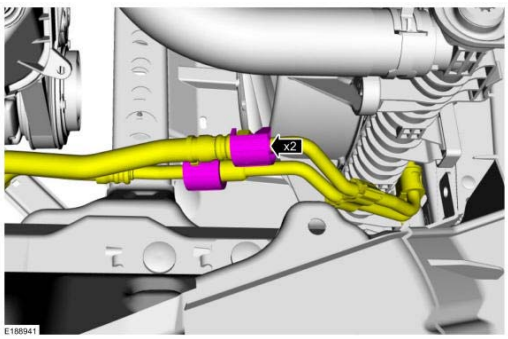
: 124 lb.in (14 Nm)

Install the transmission fluid cooler tubes bracket-to-engine mount nut.



Torque

: 35 lb.ft (48 Nm)



5.

Connect the transmission fluid cooler tube fittings.

6.

Install the transmission fluid cooler tube fittings secondary latches.

Service Manual: SYSTEM WIRING DIAGRAMS

AIR CONDITIONING
