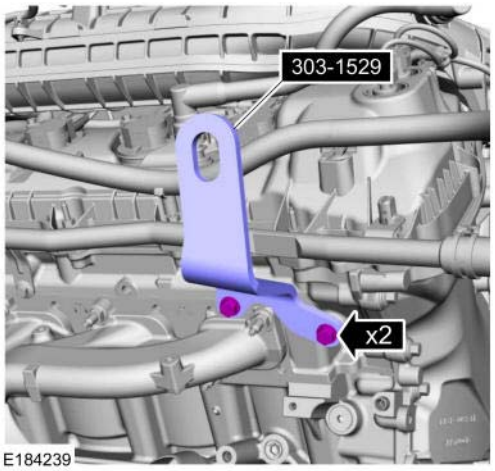
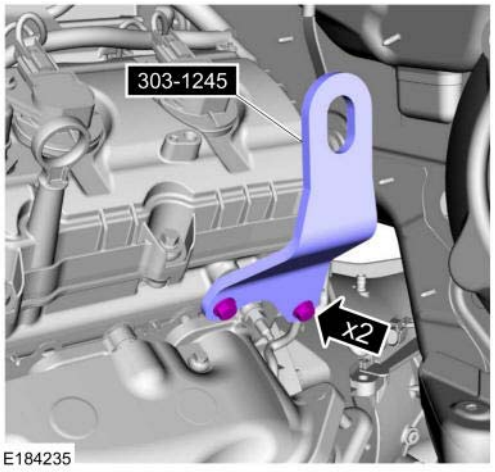
Disconnect the A/C compressor electrical connector and the wire harness retainer.



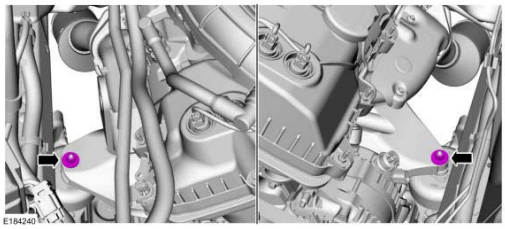
NOTE: The stud bolts and bolt will stay with the A/C compressor.

12.
Loosen the stud bolts, bolt and position the A/C compressor aside.



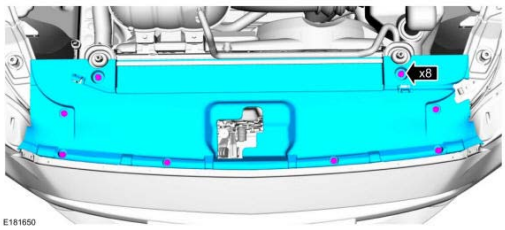
13.

Install Special Service Tool: 303-1529 Lift Eye, Engine.



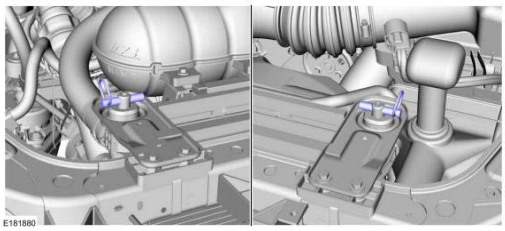
14.

Install Special Service Tool: 303-1245 Engine Lift Eye.



15.

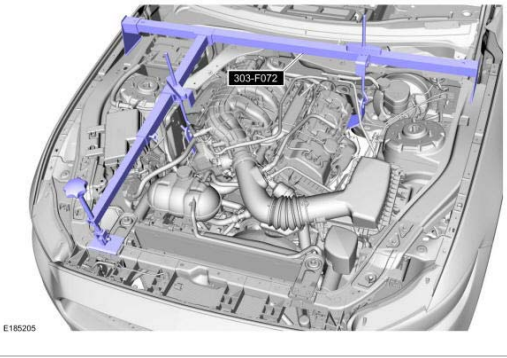
Remove the RH and LH engine mount bracket nuts.



16.

Remove the retainers and the radiator top shield.

17.



Install retaining pins to support cooling module.

18.

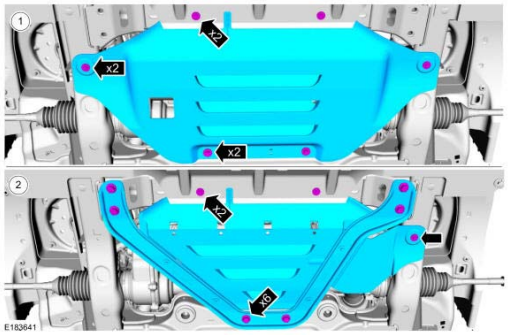
Install the special tool to support the engine.

Install Special Service Tool: 303-F072 Support Bar, Engine.

19.

Remove the front wheels and tires. Refer to: Wheel and Tire .

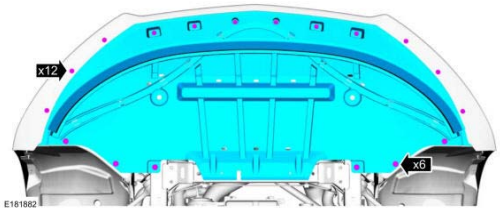
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



20.

1.

Remove the bolts and the underbody shield.



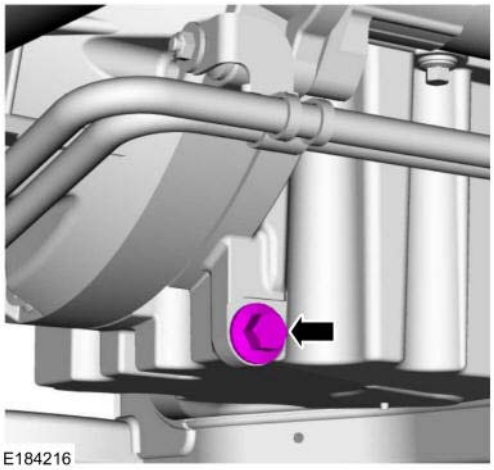
2.

Remove the bolts and the subframe bracket and underbody shield assembly.

21.

Remove the pin-type retainers, bolts and the underbody shield.

22.

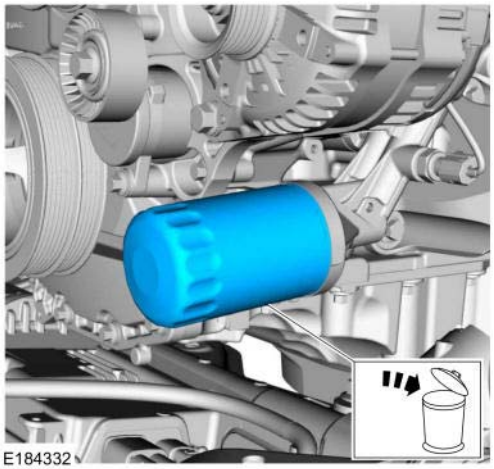


Remove the oil pan plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

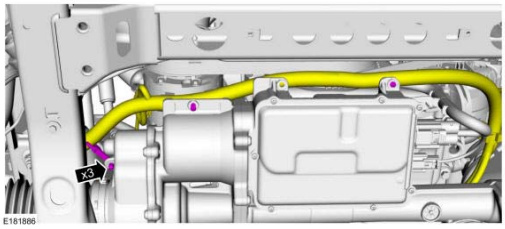
Install the oil pan drain plug.

Torque



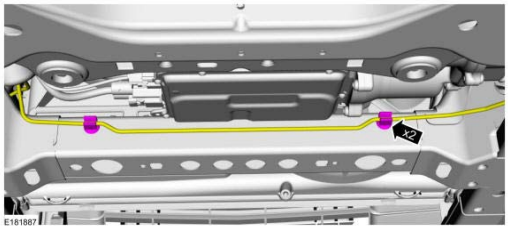
: 20 lb.ft (27 Nm)

23.



Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment



24.

Detach the EPAS wiring harness pin-type retainers.

25.

Detach the brake line retainers from the subframe.

26.

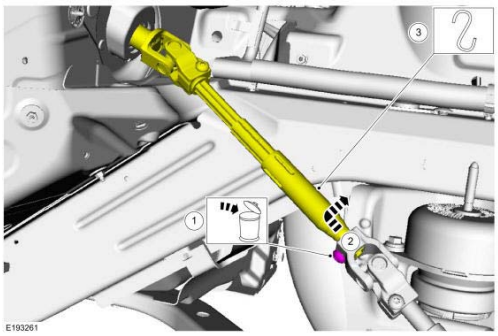
WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

Detach the steering column lower shaft from the lower coupling.

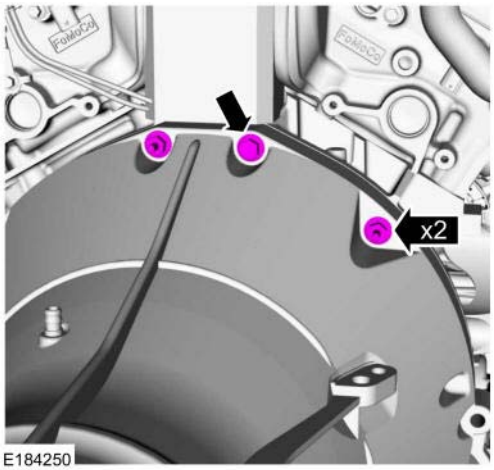
1.



Remove and discard the steering column shaft bolt.

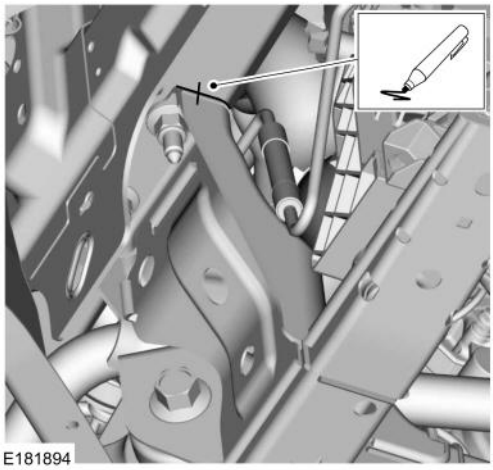
2.

Pull apart the steering column shaft from the coupling.



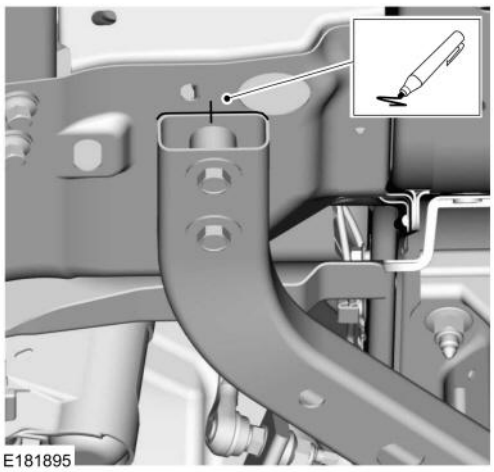
3.

Secure the lower shaft to the frame rail to avoid damaging it during subframe removal.



NOTE: To prevent damage to the transmission, do not loosen the transmission-to-engine fasteners more than 5 mm (0.19 in).

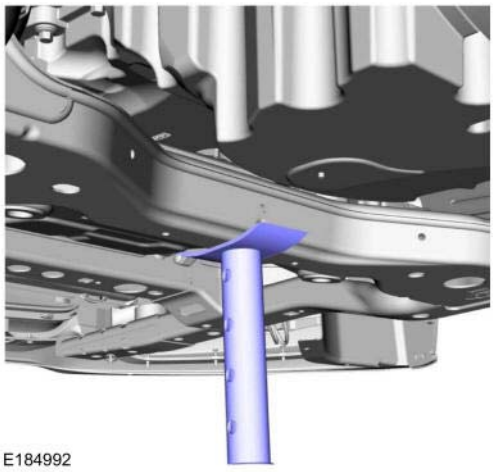
27.
Loosen the bellhousing bolts 5 mm (0.19 in).



28.

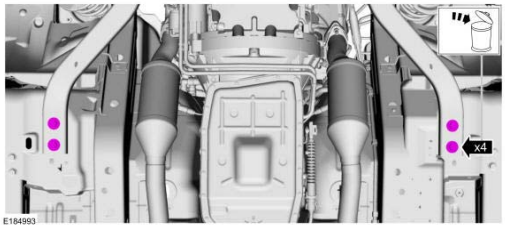
Mark the position of the front subframe for reference during installation.

29.



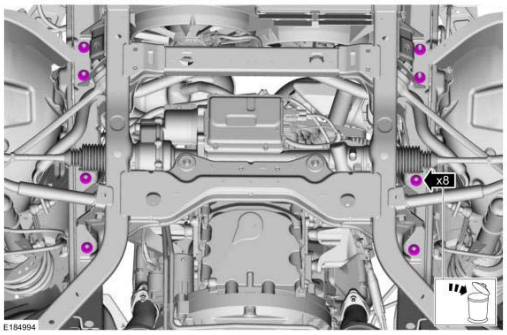
Mark the position of the rear subframe for reference during installation.

30.



Using an adjustable stand, support the subframe.

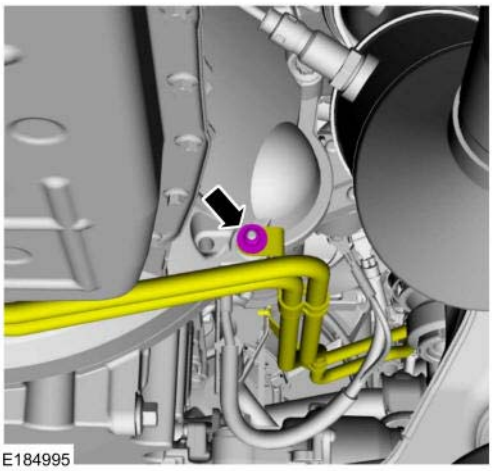
Use the General Equipment: Vehicle/Axle Stands



31.

Remove and discard the rear subframe bolts.

32.

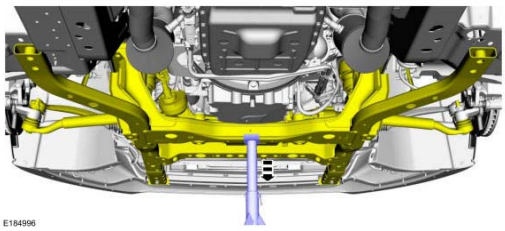


Remove and discard the front subframe nuts.

6-Speed Automatic Transmission - 6R80

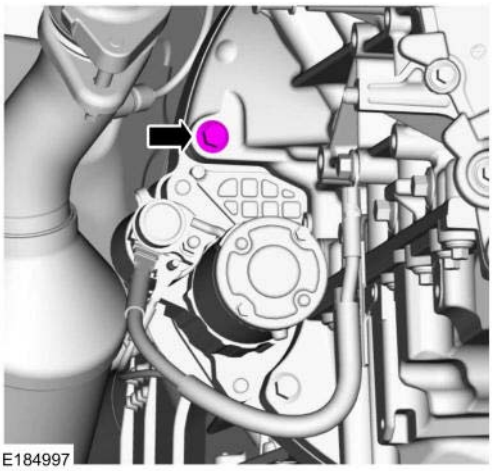
33.

Remove the nut and position the transmission cooling tube bracket aside.



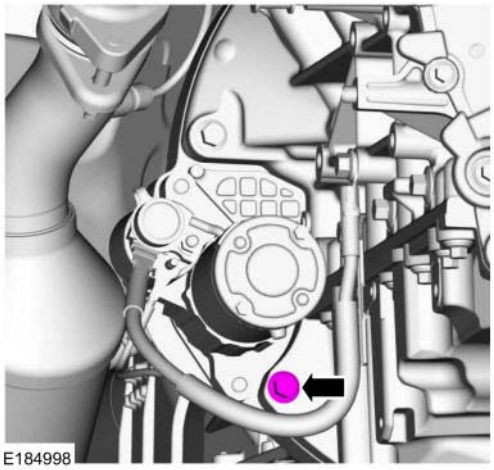
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

34.



Using an adjustable stand, lower the subframe 102 mm (4.0 in).

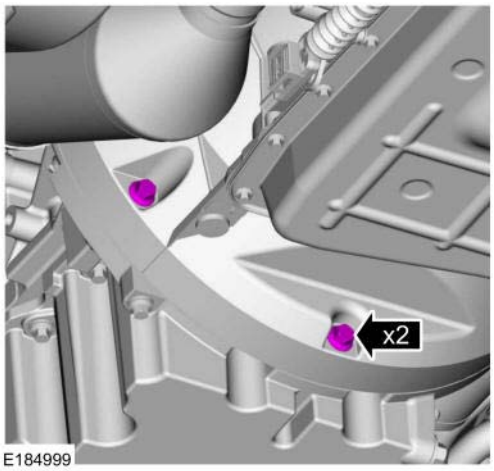
Use the General Equipment: Vehicle/Axle Stands



NOTE: To prevent damage to the transmission, do not loosen the transmission-to-engine fasteners more than 5 mm (0.19 in).

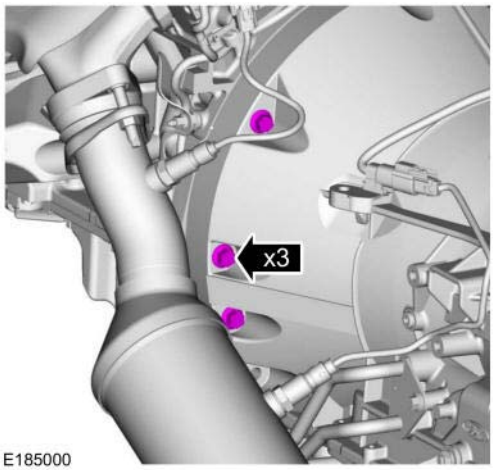
35.
Loosen the bellhousing bolt 5 mm (0.19 in).

36.



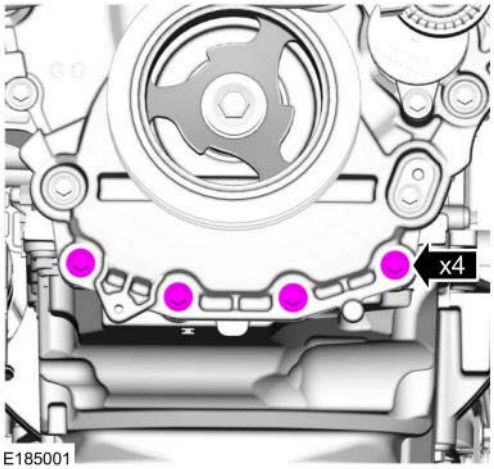
Remove the oil pan bolt.

NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan bolt than the manual transmission.



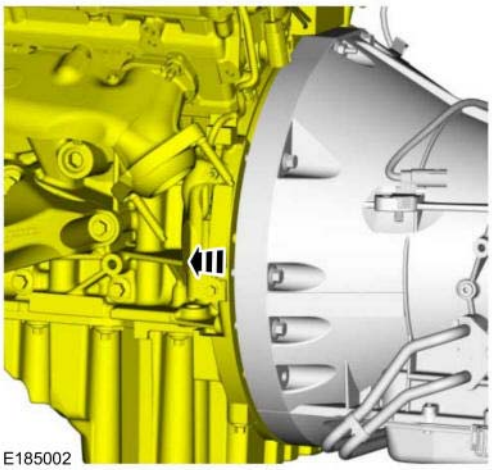
NOTE: Automatic transmission shown in illustration, manual transmission similar.

37.
Remove the oil pan bolts.



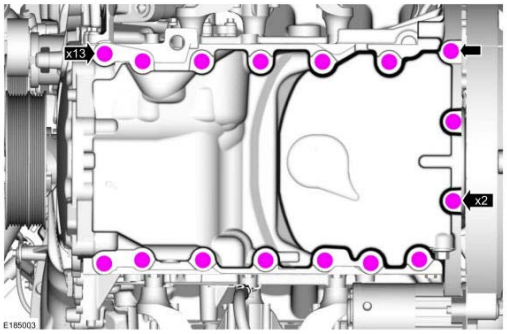
NOTE: To prevent damage to the transmission, do not loosen the transmission-to-engine fasteners more than 5 mm (0.19 in).

38.
Loosen the bellhousing bolts 5 mm (0.19 in).



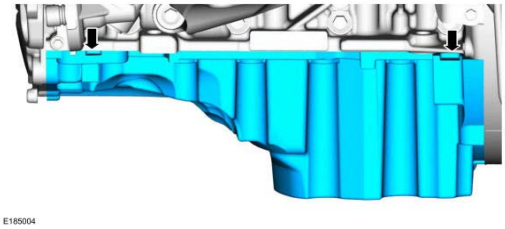
39.

Remove the engine front cover bolts.



40.

Separate the engine and transmission 5 mm (0.19 in).



41.

Remove the oil pan bolts.

42.

Using a pry tool on the pry pads shown in illustration, remove the oil pan.

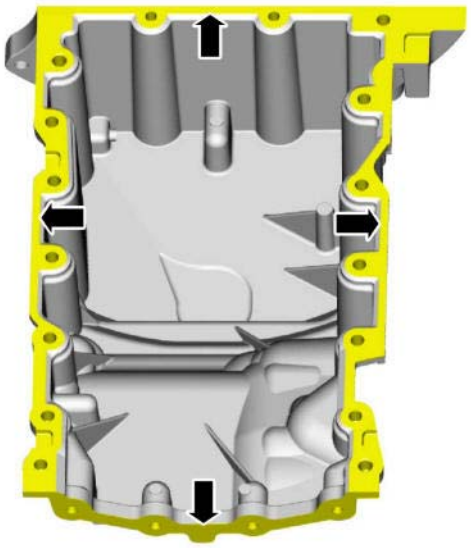
NOTE: Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15, 000 rpm, to clean the oil pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.

43.

Make sure that the mating faces of the oil pan are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A



Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

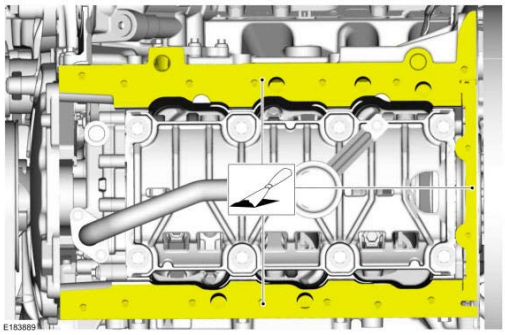
E183888

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

44.
Make sure that the mating faces of the engine block are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

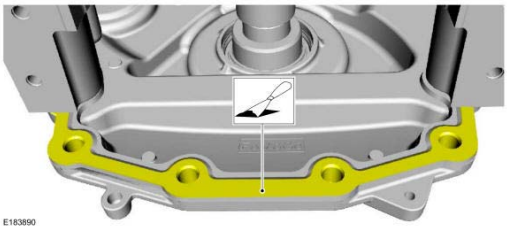
: Motorcraft® Metal Surface Prep / ZC-31-B

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

45.
Make sure that the mating faces of the engine front cover are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

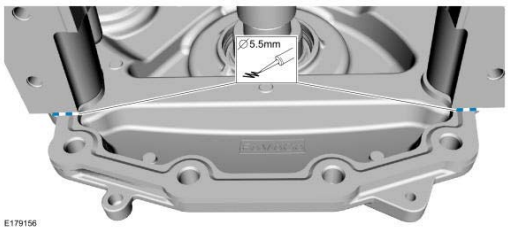
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

REMOVAL AND INSTALLATION > OIL PAN > INSTALLATION



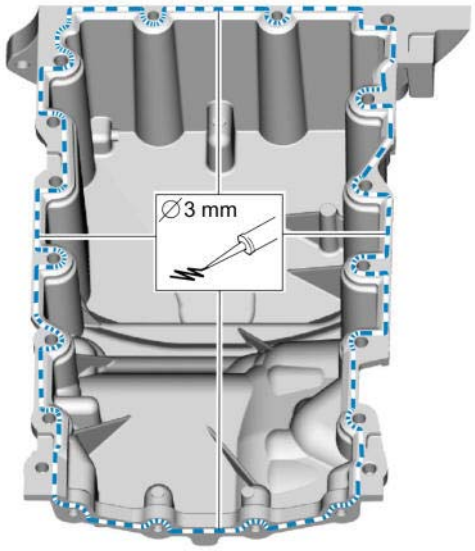
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft engine front cover-to-cylinder block joint areas.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

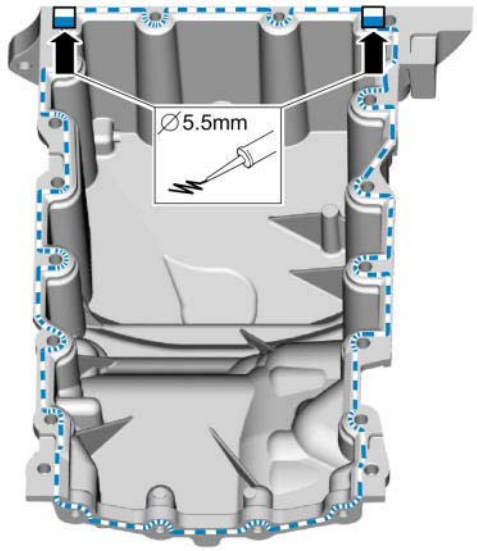


NOTE: The oil pan and the specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

2.
Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the oil pan.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

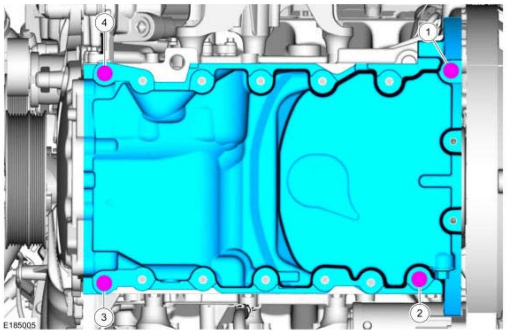


3.

Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

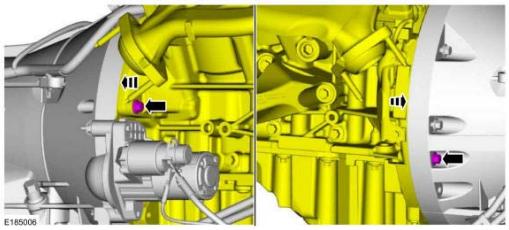
Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



E179155

NOTE: The oil pan and the specified bolts must be installed within 4 minutes of the start of sealant application.

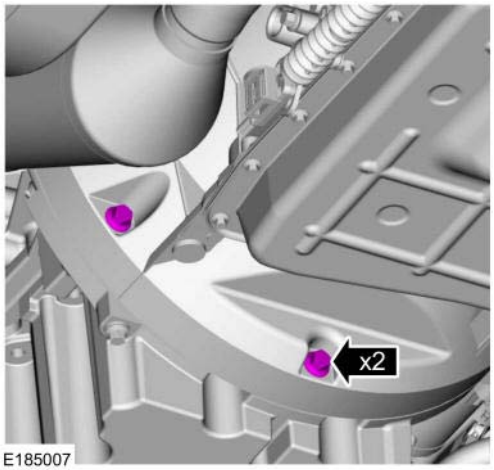


NOTE: Keep the oil pan as close as possible to the transmission while installing, then slide forward towards the engine front cover to prevent wiping off of the sealant.

4.
Install the bolts finger tight.

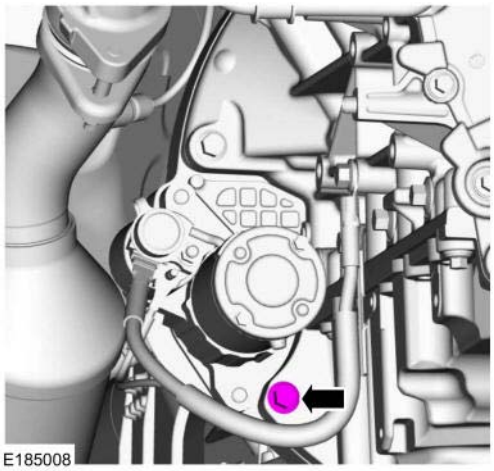
NOTE: Do not torque at this time.

5.
Draw the transmission and engine together using the bolts.



NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan bolt than the manual transmission.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

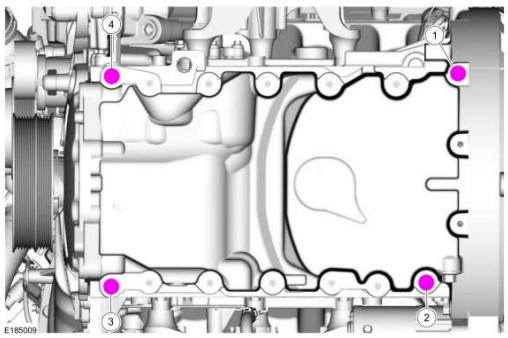


NOTE: Do not torque at this time.

6.
Install the oil pan bolts.

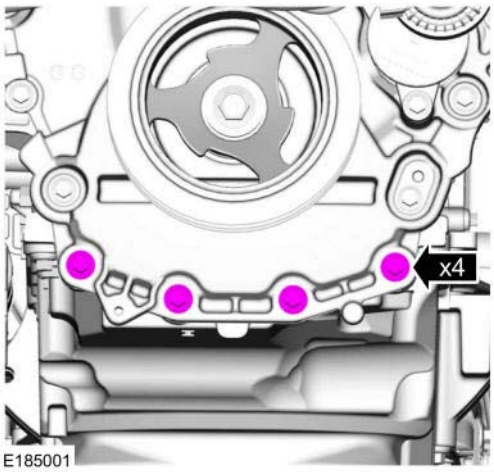
NOTE: Do not torque at this time.

7.
Install the oil pan bolt.



8.

Tighten the oil pan bolts in sequence.



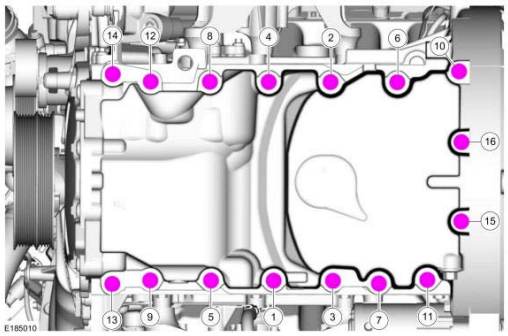
Torque

: 27 lb.in (3 Nm)

9.

Install the engine front cover bolts finger tight.

10.



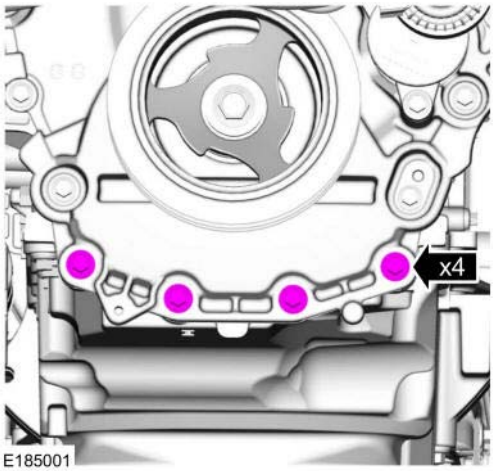
Install the remaining oil pan bolts and tighten in sequence shown in illustration.

Torque:

Stage 1: Tighten bolts 1 through 14 to: 18 lb.ft (24 Nm)

Stage 2: Tighten bolt 10 an additional: 90°

Stage 3: Tighten bolts 15 and 16 to: 89 lb.in (10 Nm)

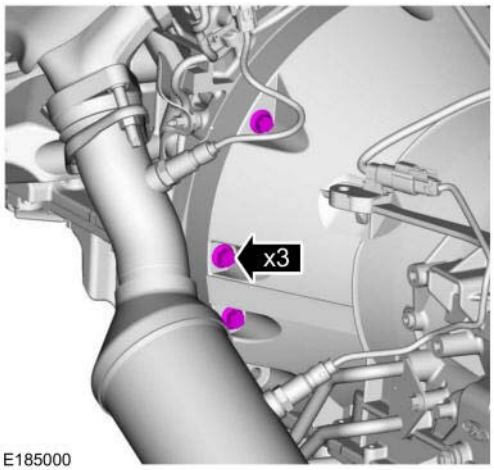


11.

Tighten the engine front cover bolts.

Torque

: 18 lb.ft (24 Nm)

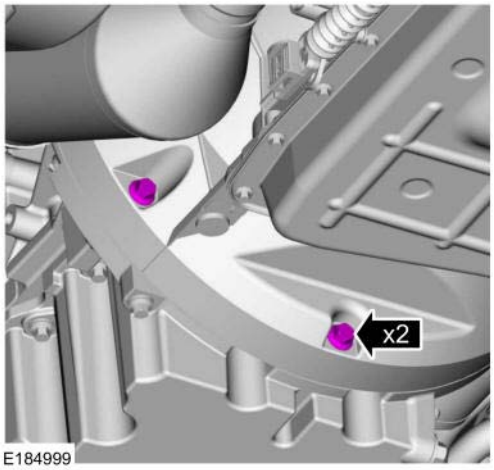


12.

Tighten the bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)



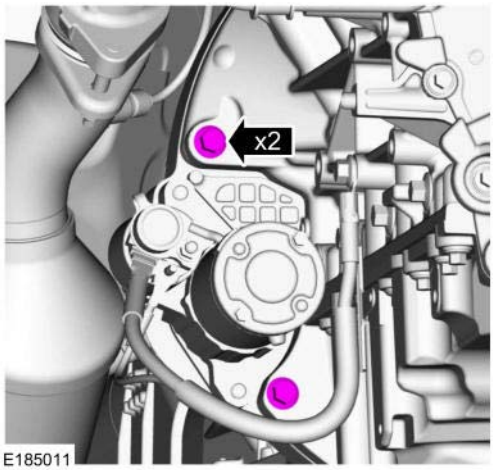
NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan bolt than the manual transmission.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

13.
Tighten the oil pan bolts.

Torque

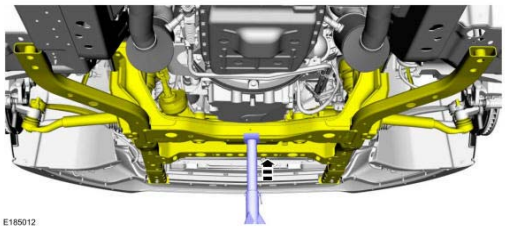
: 35 lb.ft (48 Nm)



14.

Tighten the oil pan and bellhousing bolts.

Torque

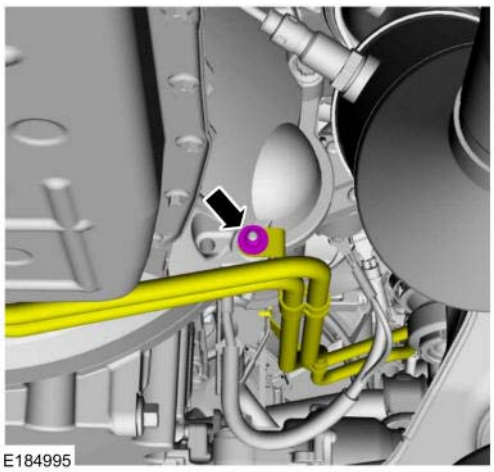


: 35 lb.ft (48 Nm)

15.

Using an adjustable stand, raise the subframe.

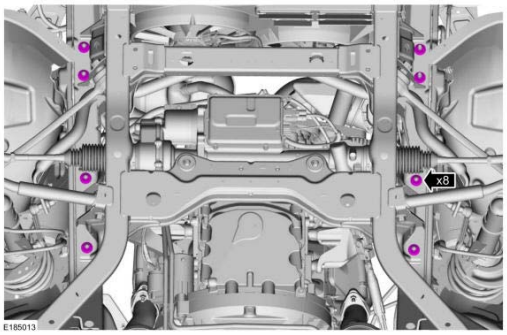
Use the General Equipment: Vehicle/Axle Stands



6-Speed Automatic Transmission - 6R80

16.

Position the transmission cooling tube bracket and install the nut.

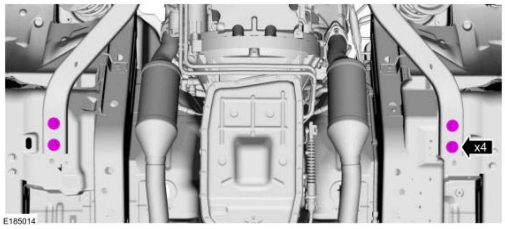


Torque

: 124 lb.in (14 Nm)

17.

Install the new front subframe nuts loosely.

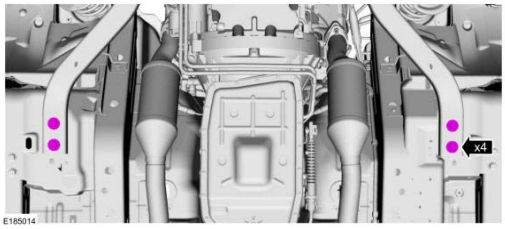


18.

Use a suitable alignment tool with a 15 mm (0.59 in) OD shaft that is long enough to go through the subframe and body.

Align the subframe to the alignment marks made during removal.

Install the new rear subframe bolts loosely.

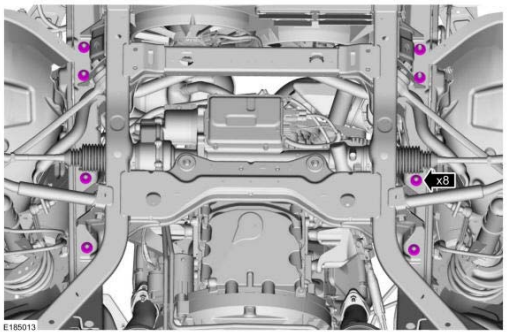


19.

Tighten the rear subframe bolts in a cross pattern.

Torque

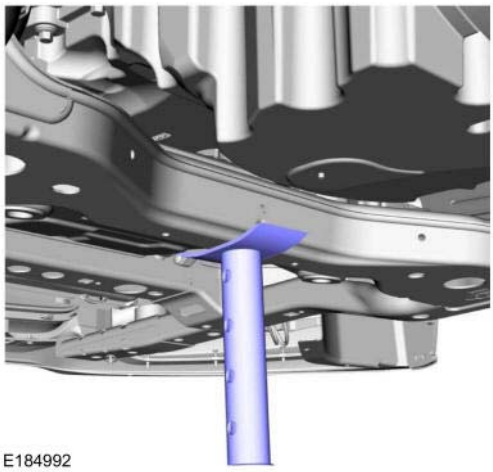
: 85 lb.ft (115 Nm)



20.

Tighten the front subframe nuts in a cross pattern.

Torque

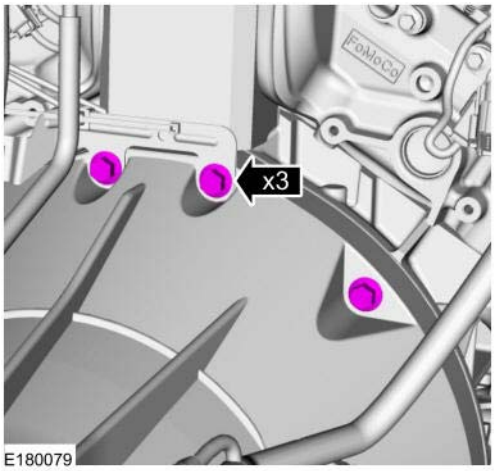


: 85 lb.ft (115 Nm)

21.

Remove the adjustable stand.

Use the General Equipment: Vehicle/Axle Stands



22.

Tighten the bellhousing bolts.

Torque

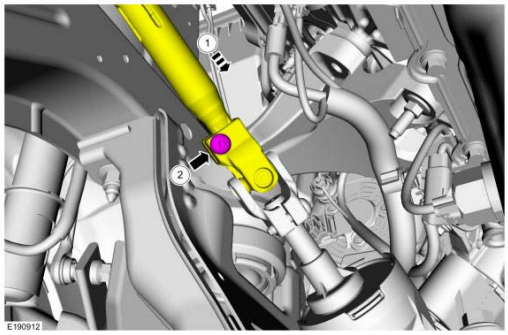
: 35 lb.ft (48 Nm)

23.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.



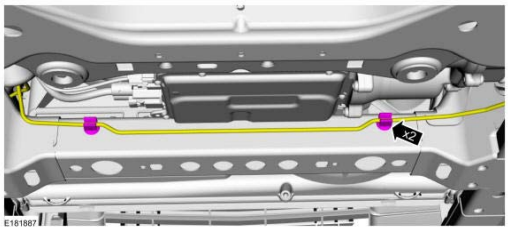
Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

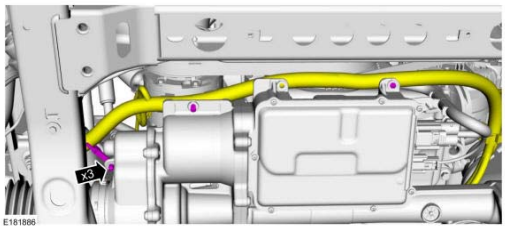
Torque

: 22 lb.ft (30 Nm)



24.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

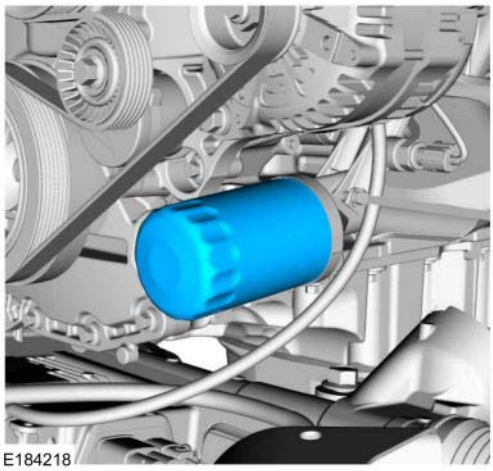


25.

Attach the brake line retainers to the subframe.

26.

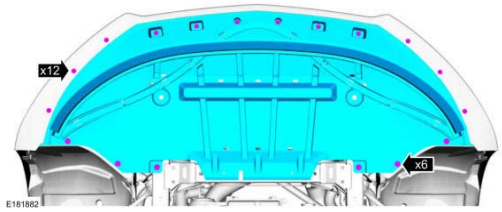
Attach the EPAS wiring harness pin-type retainers.



NOTE: Do not lubricate the engine oil filter gasket.

27.
Install a new engine oil filter.

Torque:



Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

28.

Install the underbody shield, bolts and the pin-type retainers.

29.

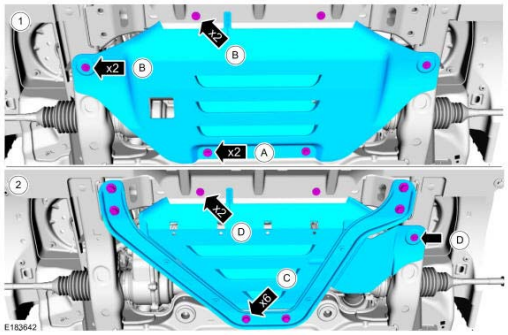
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



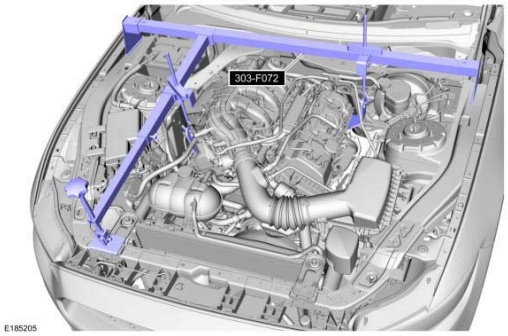
2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

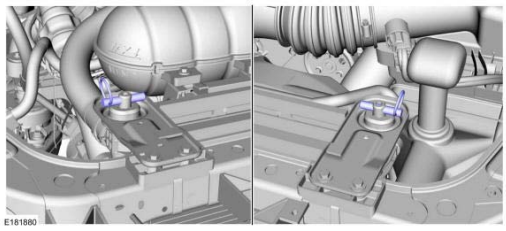
C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)



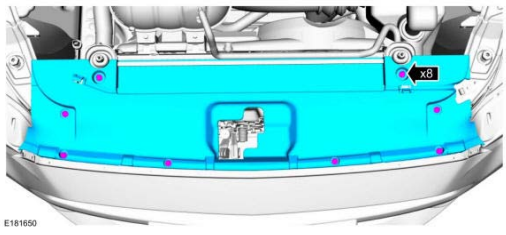
30.

Install the front wheels and tires. Refer to: Wheel and Tire .



31.

Remove Special Service Tool: 303-F072 Support Bar, Engine.

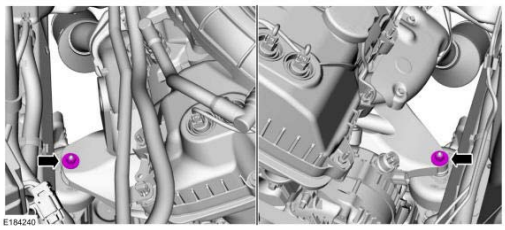


32.

Remove the retaining pins.

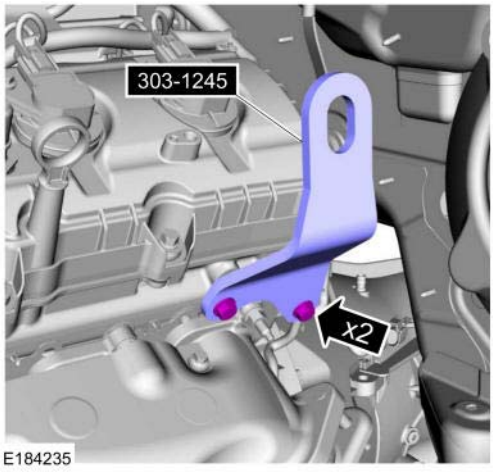
33.

Install the radiator top shield and the retainers.



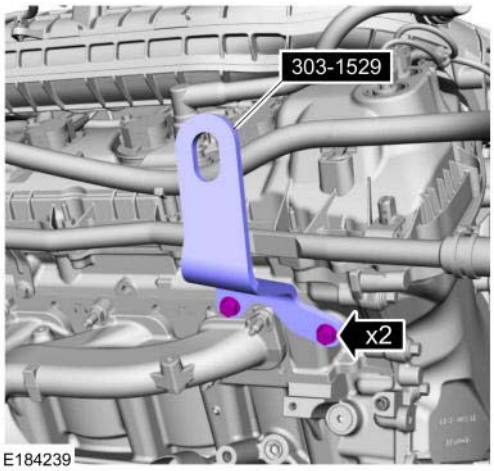
34.

Install the RH and LH engine mount nuts.



Torque

: 46 lb.ft (63 Nm)

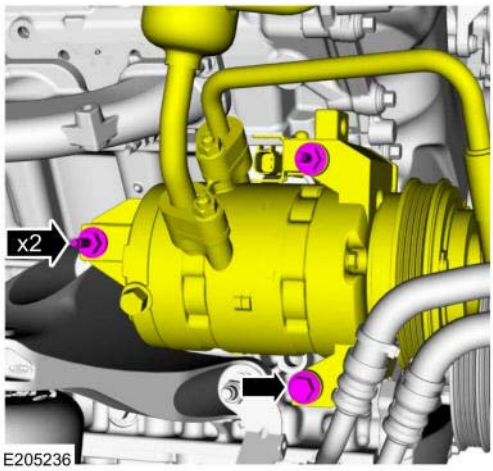


35.

Remove Special Service Tool: 303-1245 Engine Lift Eye.

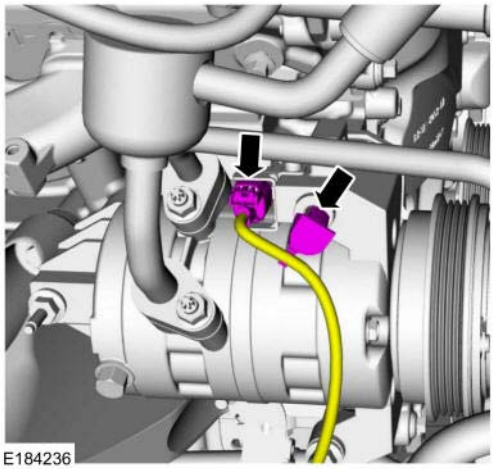
36.

Remove Special Service Tool: 303-1529 Lift Eye, Engine.



37.

Position the A/C compressor and install the stud bolts and bolt.

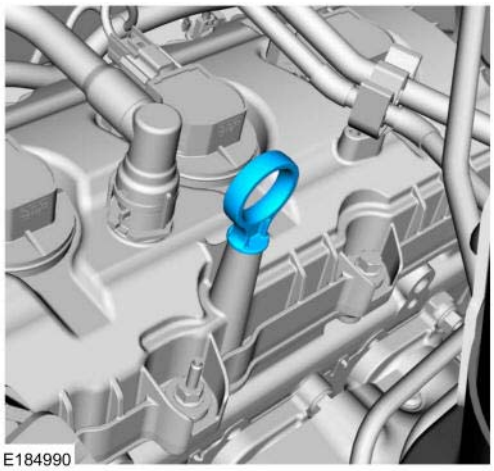


Torque

: 18 lb.ft (25 Nm)

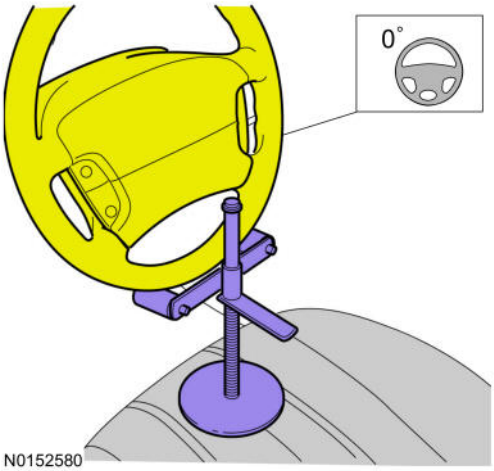
38.

Connect the A/C compressor electrical connector and the wire harness retainer.



39.

Install the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



40.

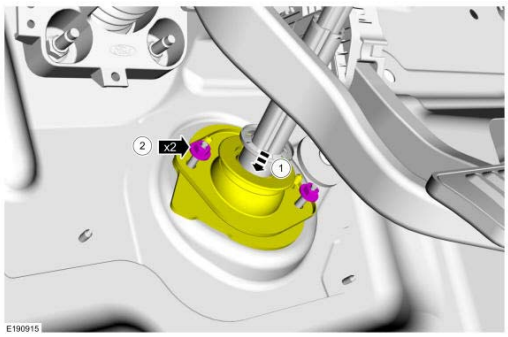
Install the oil level indicator.

41.

Remove the holding device.

42.

1.



Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

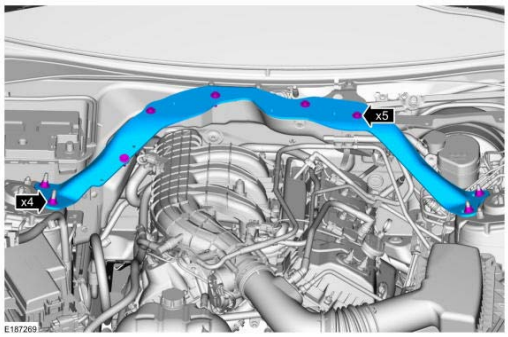
Torque

: 80 lb.in (9 Nm)

Convertible

43.

Install the cowl extension and the bolts.



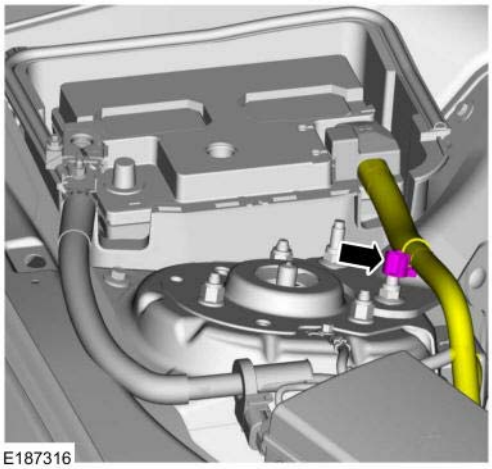
Torque

: 26 lb.ft (35 Nm)

Install the cowl extension nuts.

Torque

: 41 lb.ft (55 Nm)



44.

Connect the positive battery cable. Refer to: Battery Disconnect and Connect .

45.

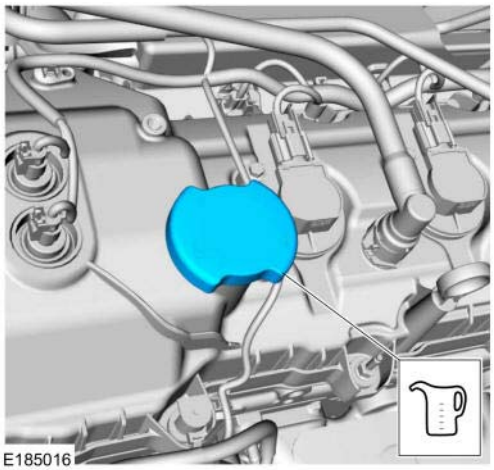
Attach the battery cable retainer.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

46.

Install the cowl panel grille. Refer to: Cowl Panel Grille .

47.



Connect the negative battery cable. Refer to: Battery Disconnect and Connect .

48.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH

Materials

Name	Specification
Thread Sealant with PTFETA-24-B	WSK-M2G350-A2

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

2.

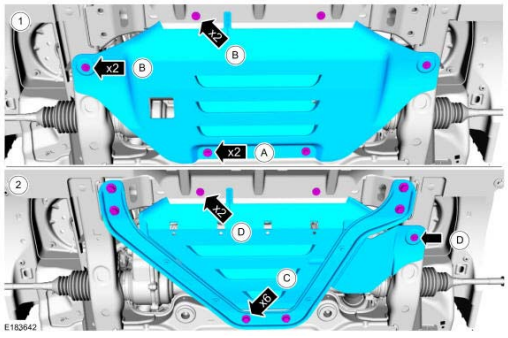
1.

Loosen the 2 front bolts, remove the remaining bolts and the underbody shield.

Torque:

A: 97 lb.in (11 Nm)

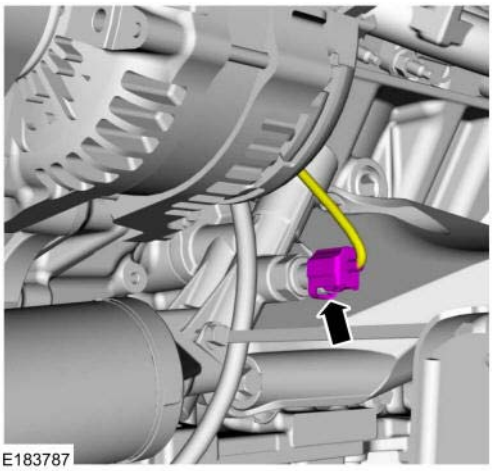
B: 18 lb.in (2 Nm)



2.

Loosen the 2 front bolts, remove the remaining bolts and the subframe bracket and underbody shield assembly.

Torque:



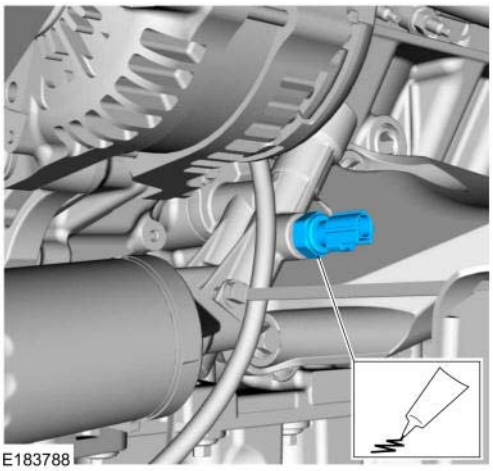
C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)

3.

Disconnect oil pressure switch electrical connector.

NOTE: If the oil pressure switch is to be reused, apply thread sealant.



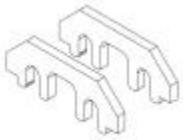
4.
Remove the oil pressure switch.

Material

: Thread Sealant with PTFE / TA-24-B (WSK-M2G350-A2)

Torque

: 159 lb.in (18 Nm)



REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > OIL PUMP

REMOVAL AND INSTALLATION > OIL PUMP > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.

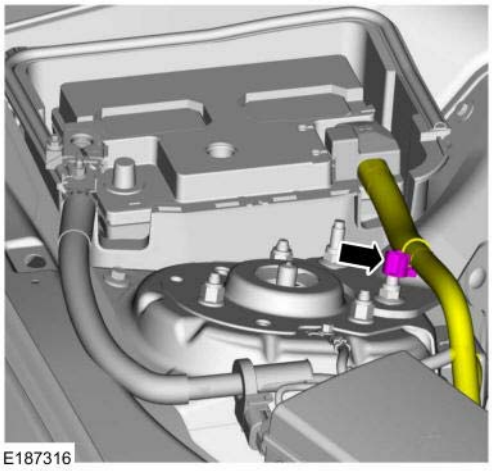
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .



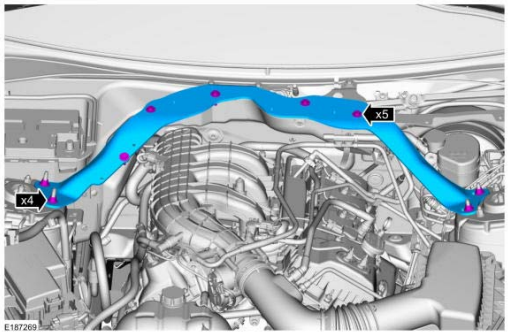
3.

Remove the cowl panel grille. Refer to: Cowl Panel Grille .

Convertible

4.

Detach the battery cable retainer.



5.

Disconnect the positive battery cable. Refer to: Battery Disconnect and Connect .

6.

Remove the cowl extension nuts.

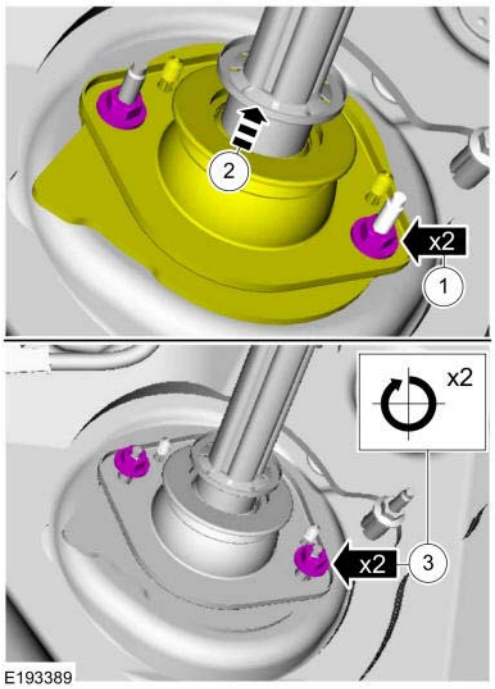
Remove the bolts and the cowl extension.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

7.

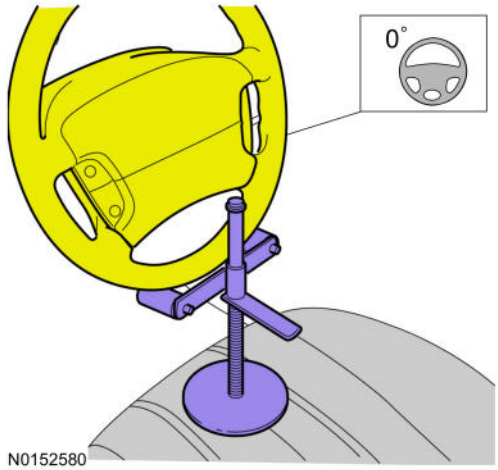
1.



Remove the steering column dash seal nuts.

2.

Loosen the dash seal.

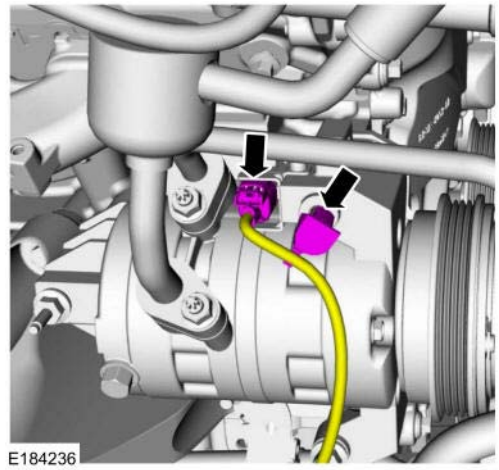


3.

Hand start the dash seal nuts.

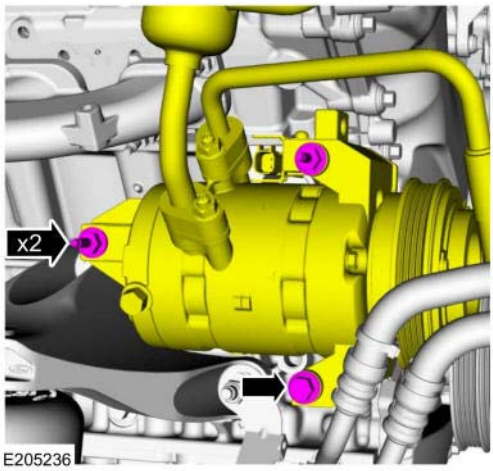
8.

Using a holding device, hold the steering wheel in the straight-ahead position.



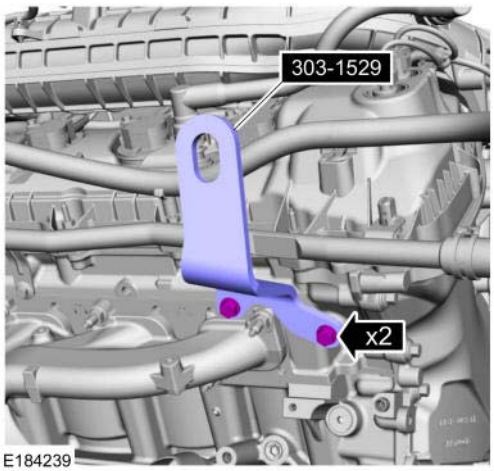
9.

Remove the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .



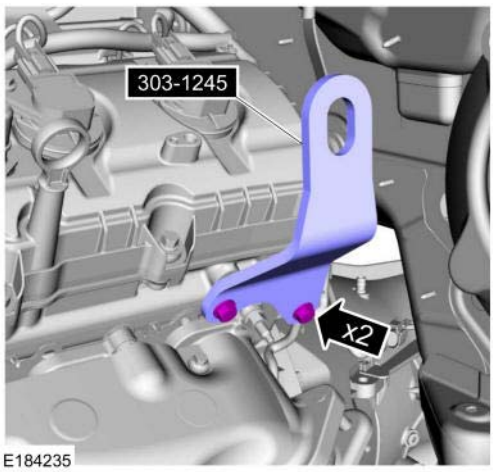
10.

Disconnect the A/C compressor electrical connector and the wire harness retainer.



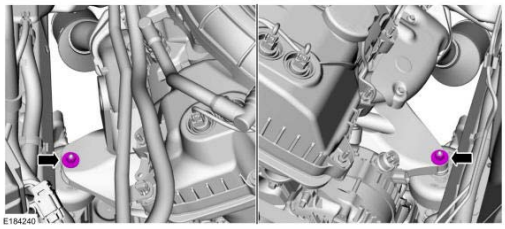
NOTE: The stud bolts and bolt will stay with the A/C compressor.

11.
Loosen the stud bolts, bolt and position the A/C compressor aside.



12.

Install Special Service Tool: 303-1529 Lift Eye, Engine.

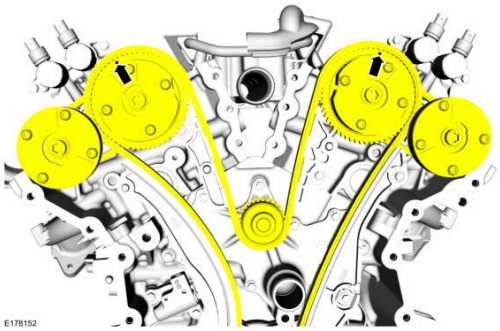


13.

Install Special Service Tool: 303-1245 Engine Lift Eye.

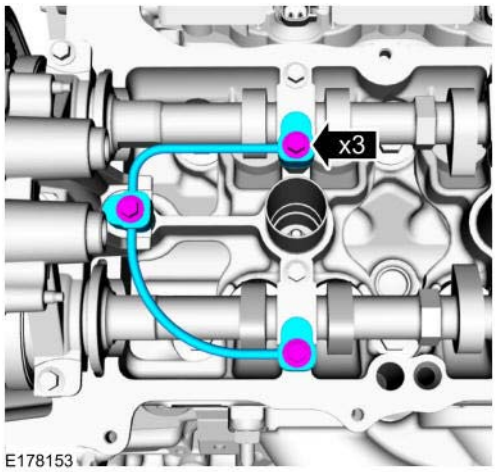
14.

Remove the RH and LH engine mount bracket nuts.



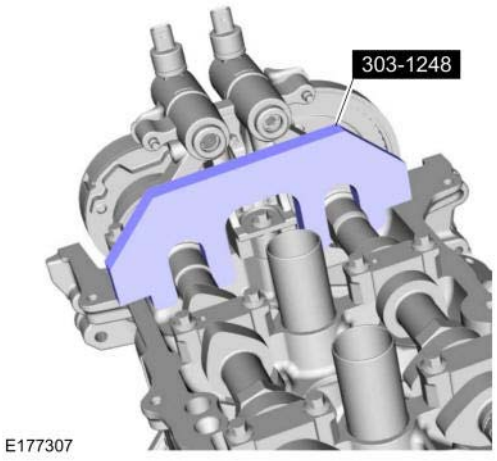
15.

Remove the engine front cover. Refer to: Engine Front Cover .



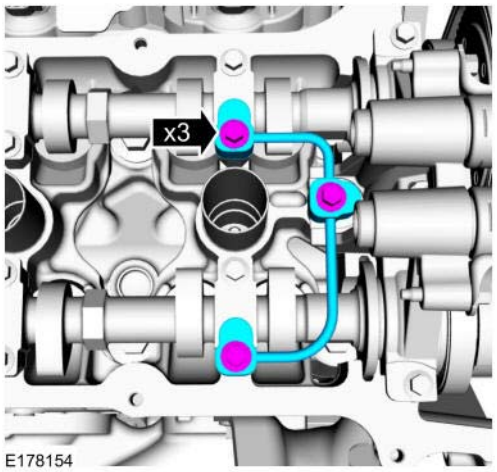
NOTE: Rotate the crankshaft in a clockwise direction only.

16.
Align the timing marks.



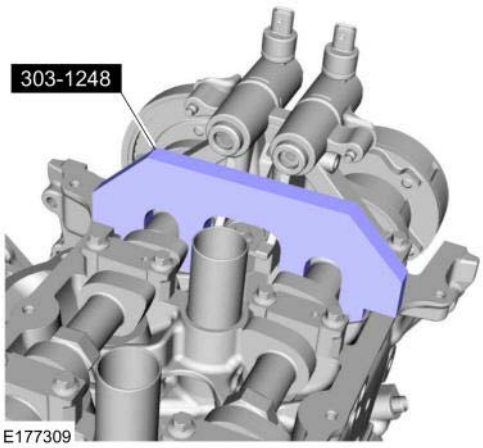
17.

Remove the bolts and the LH oil tube.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

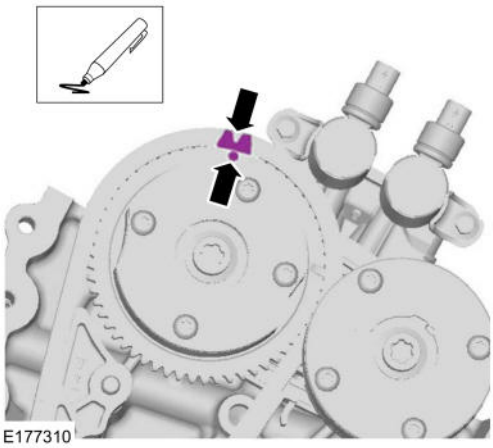
18.
Install Special Service Tool: 303-1248 Camshaft holding tools.



19.

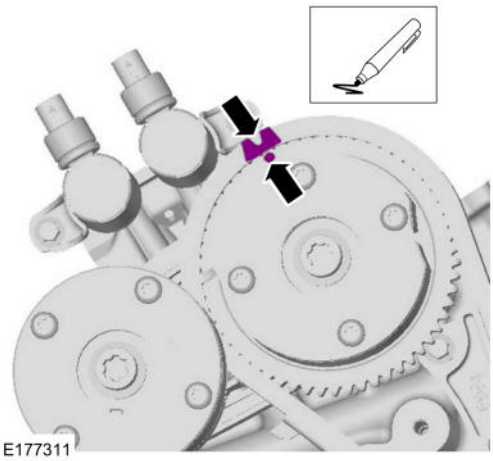
Remove the bolts and the RH oil tube.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.



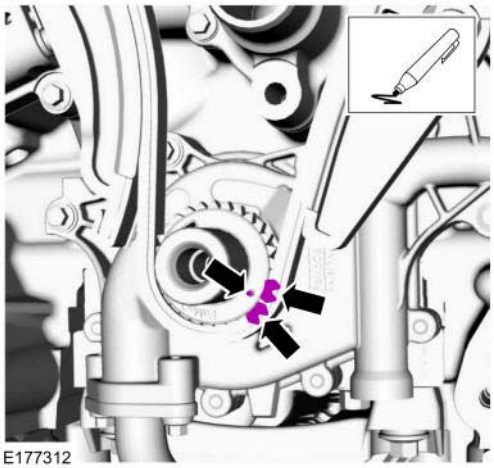
20.
Install Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: ***The following 3 steps are for primary timing chains that the colored links are not visible.***



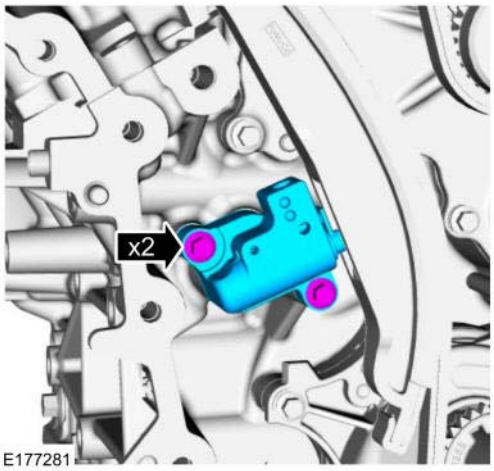
21.

Mark the timing chain link that aligns with the timing mark on the LH intake VCT unit as shown in illustration.



22.

Mark the timing chain link that aligns with the timing mark on the RH intake VCT unit as shown in illustration.

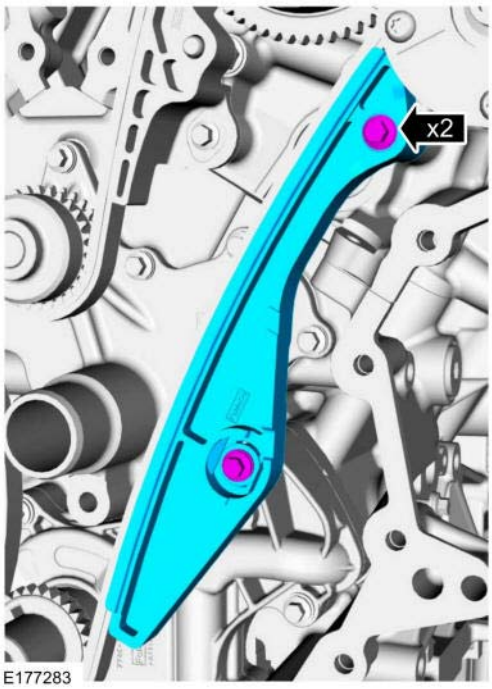


NOTE: The crankshaft sprocket timing mark should be between the 2 colored links.

23.
Mark the timing chain links that aligns with the timing mark on the crankshaft sprocket as shown in illustration.

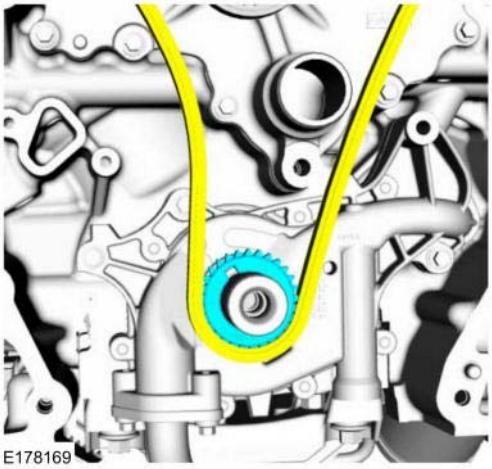
24.

Remove the bolts and the timing chain tensioner.



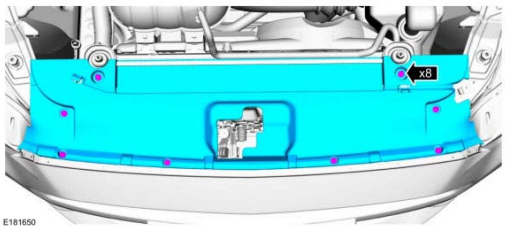
25.

Remove the timing chain tensioner arm.



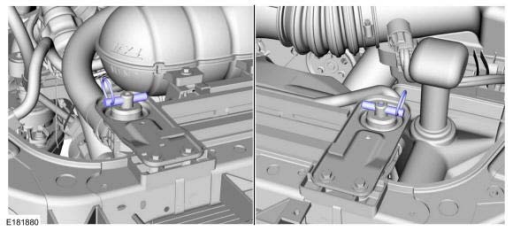
26.

Remove the bolts and the lower LH timing chain guide.



27.

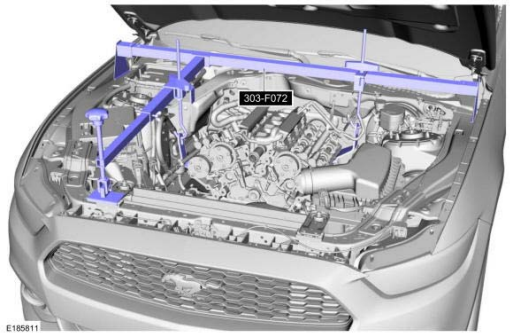
Position the timing chain aside and remove the crankshaft sprocket.



28.

Remove the retainers and the radiator top shield.

29.



Install retaining pins to support cooling module.

30.

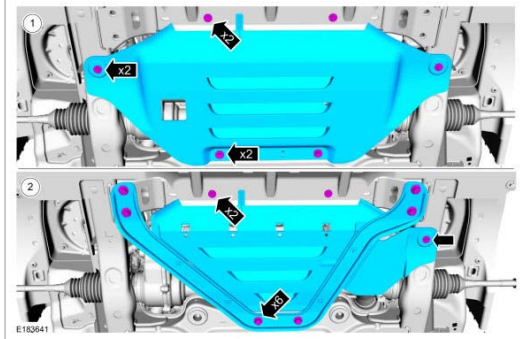
Install the special tool to support the engine.

Install Special Service Tool: 303-F072 Support Bar, Engine.

31.

Remove the front wheels and tires. Refer to: Wheel and Tire .

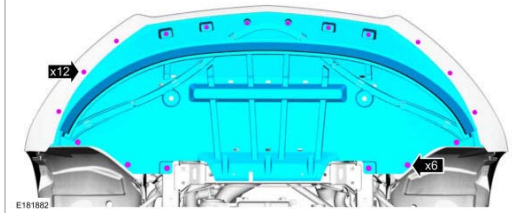
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



32.

1.

Remove the bolts and the underbody shield.



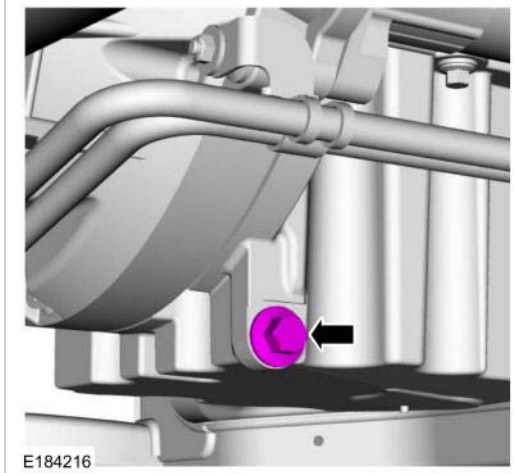
2.

Remove the bolts and the subframe bracket and underbody shield assembly.

33.

Remove the pin-type retainers, bolts and the underbody shield.

34.

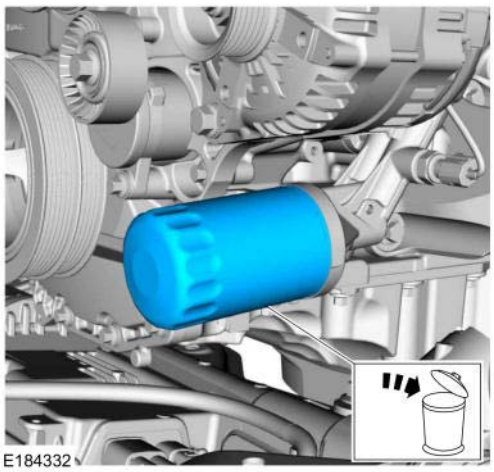


Remove the oil pan plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

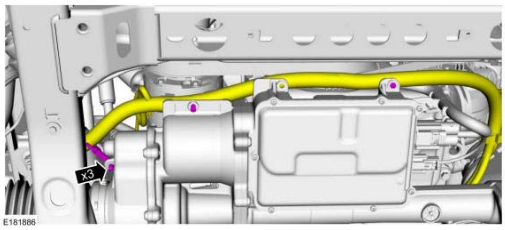
Install the oil pan drain plug.

Torque



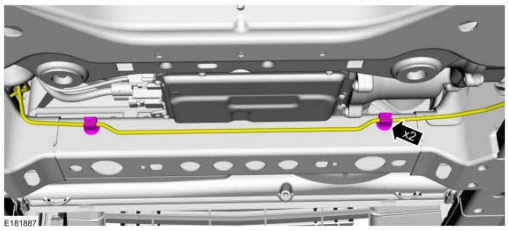
: 20 lb.ft (27 Nm)

35.



Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment



36.

Detach the EPAS wiring harness pin-type retainers.

37.

Detach the brake line retainers from the subframe.

38.

WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

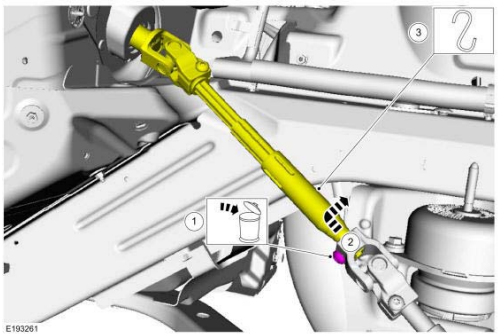
WARNING: DO NOT hammer, pry or force steering column and column shafts

during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

Detach the steering column lower shaft from the lower coupling.

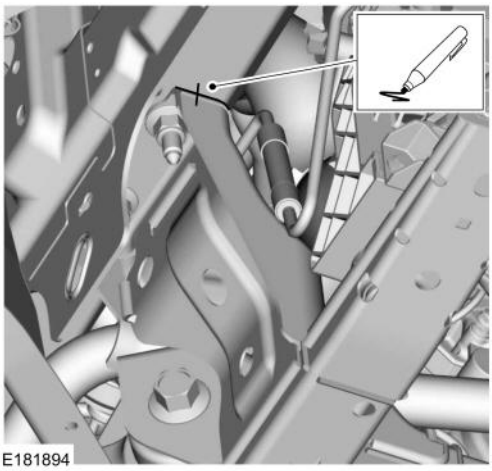
1.



Remove and discard the steering column shaft bolt.

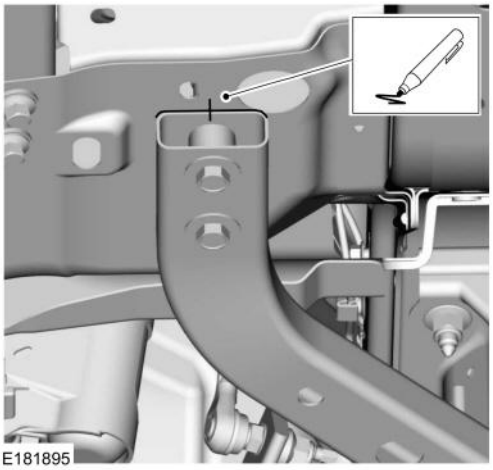
2.

Pull apart the steering column shaft from the coupling.



3.

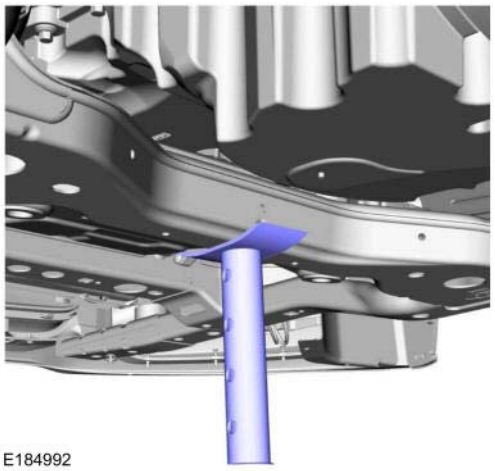
Secure the lower shaft to the frame rail to avoid damaging it during subframe removal.



39.

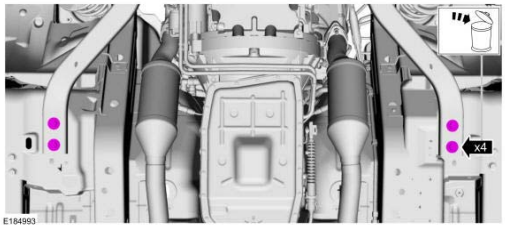
Mark the position of the front subframe for reference during installation.

40.



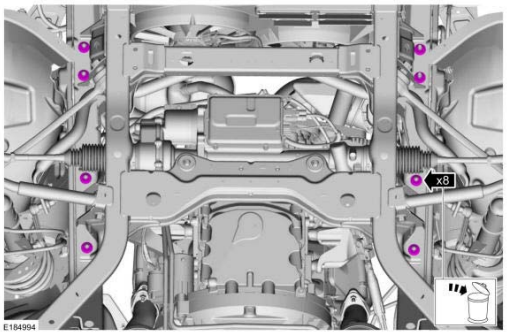
Mark the position of the rear subframe for reference during installation.

41.



Using an adjustable stand, support the subframe.

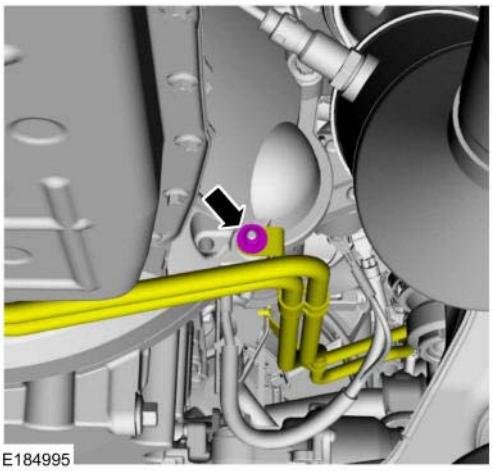
Use the General Equipment: Vehicle/Axle Stands



42.

Remove and discard the rear subframe bolts.

43.

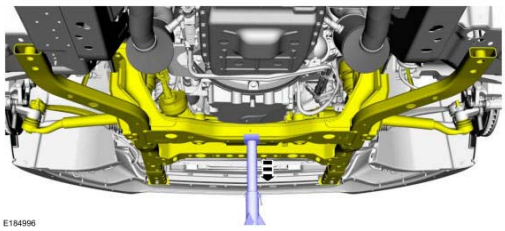


Remove and discard the front subframe nuts.

6-Speed Automatic Transmission - 6R80

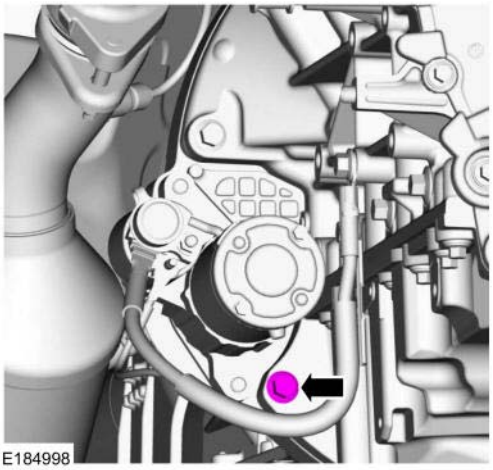
44.

Remove the nut and position the transmission cooling tube bracket aside.



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

45.

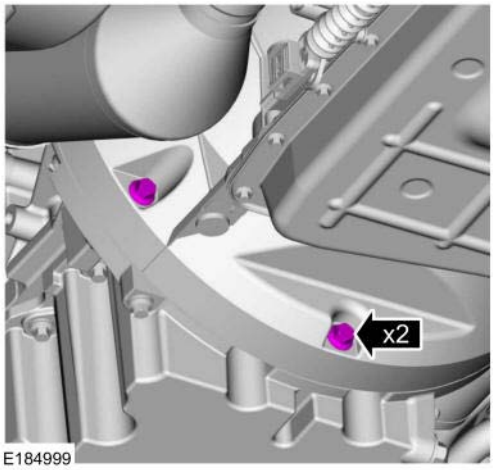


Using an adjustable stand, lower the subframe 102 mm (4.0 in).

Use the General Equipment: Vehicle/Axle Stands

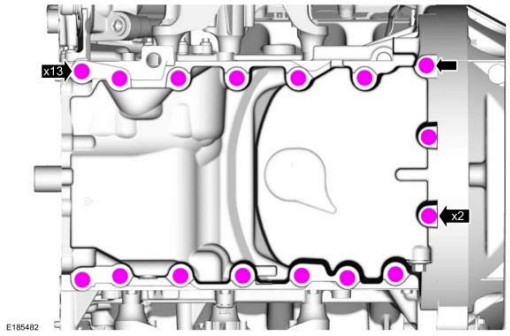
46.

Remove the oil pan bolt.



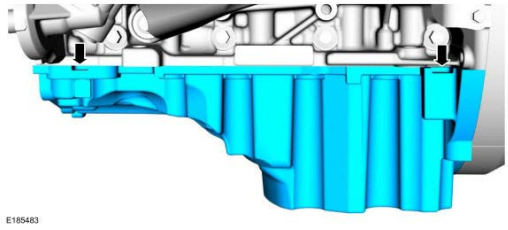
NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan

bolt than the manual transmission.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

47.
Remove the oil pan bolts.



48.

Remove the oil pan bolts.

49.

Using a pry tool on the pry pads shown, remove the oil pan.

NOTE: Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a

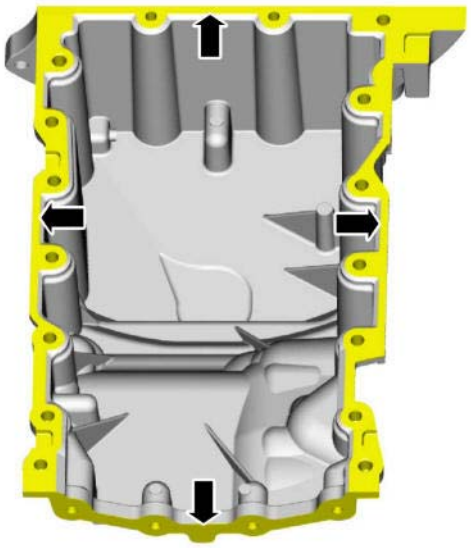
suitable tool turning at the recommended speed of 15, 000 rpm, to clean the oil pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.

50.

Make sure that the mating faces of the oil pan are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A



Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

E183888

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

51.

Make sure that the mating faces of the engine block are clean and free of foreign material. Refer

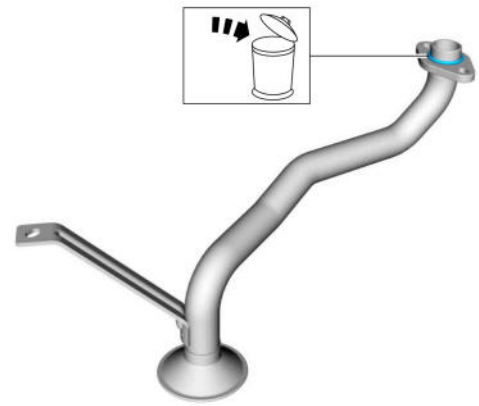
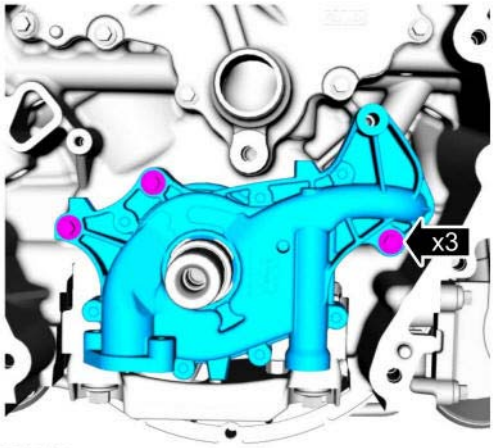
: Motorcraft® Metal Surface Prep / ZC-31-B



52.

Remove the bolts and oil pump screen and pickup tube.

53.



Remove and discard the oil pump screen and pickup tube O-ring seal.

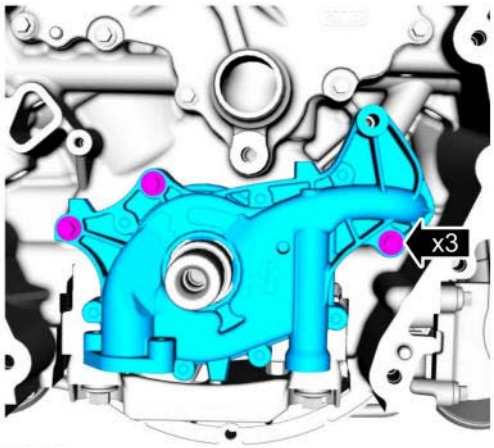
E177322

54.

Remove the bolts and oil pump.

E185485

REMOVAL AND INSTALLATION > OIL PUMP > INSTALLATION



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

Install the oil pump and the bolts.

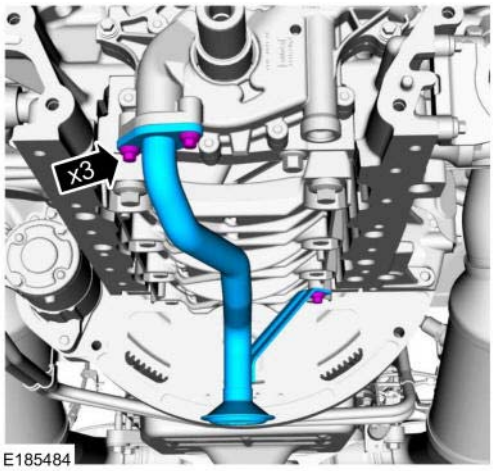
Torque

: 89 lb.in (10 Nm)

E185485

2.

Install a new oil pump screen and pickup tube O-ring seal.



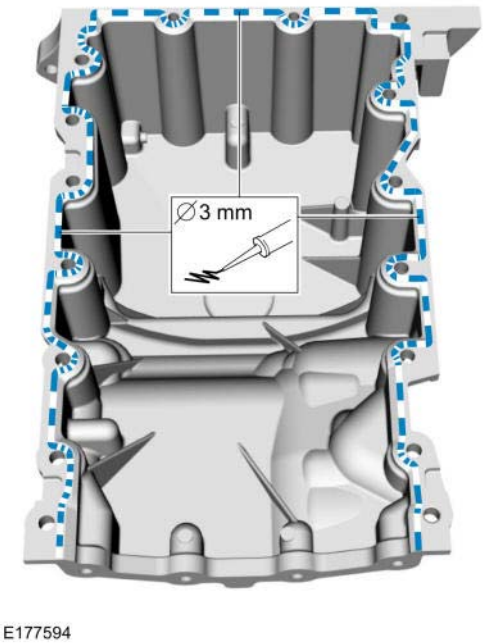
E177221

3.

Install the oil pump screen and pickup tube and the bolts.

Torque

: 89 lb.in (10 Nm)

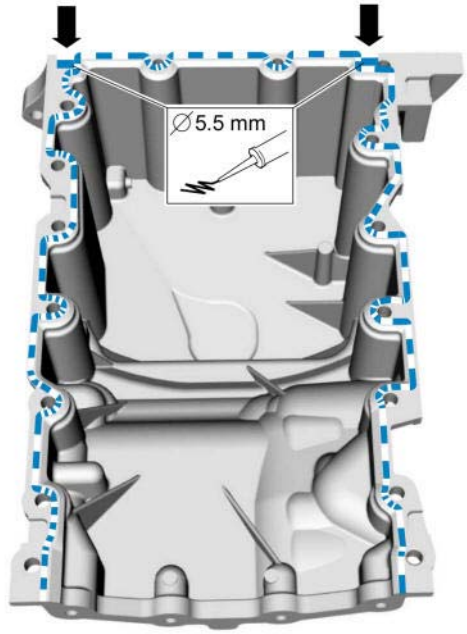


NOTE: The oil pan and the specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

4.
Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the oil pan.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



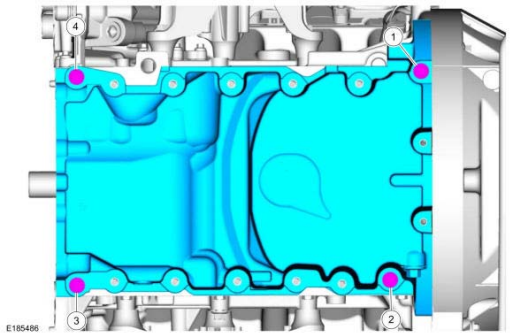
5.

Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2

crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



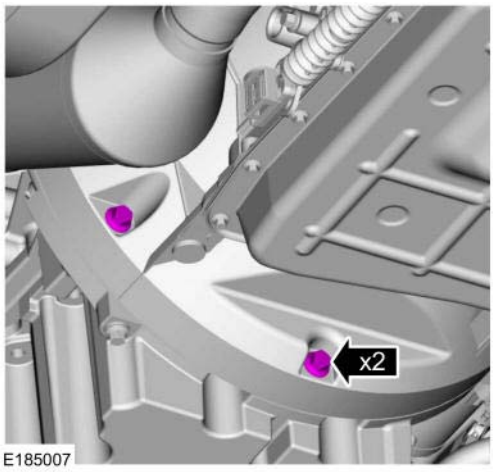
E177595

NOTE: The oil pan and the specified bolts must be installed within 4 minutes of the start of sealant application.

NOTE: Keep the oil pan as close as possible to the transmission while installing, then slide forward towards the engine front cover to prevent wiping off of the sealant.

6.
Install the bolts finger tight.

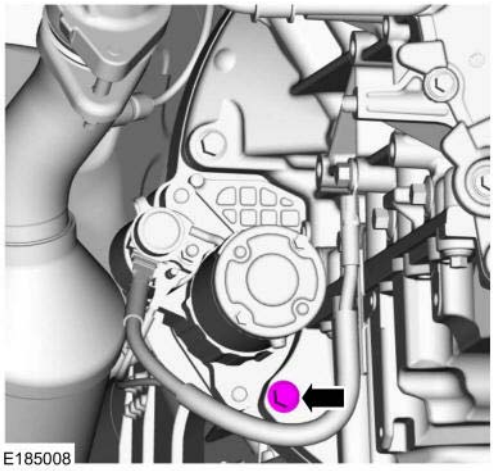
E185486



NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan

bolt than the manual transmission.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

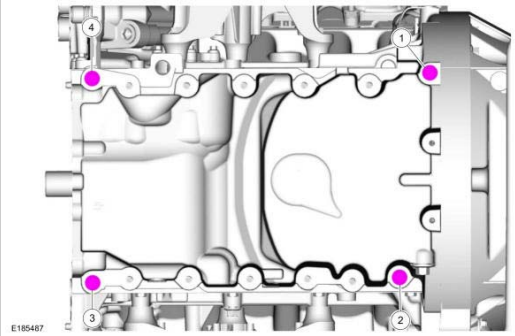


NOTE: Do not torque at this time.

7.
Install the oil pan bolts.

NOTE: Do not torque at this time.

8.
Install the oil pan bolt.



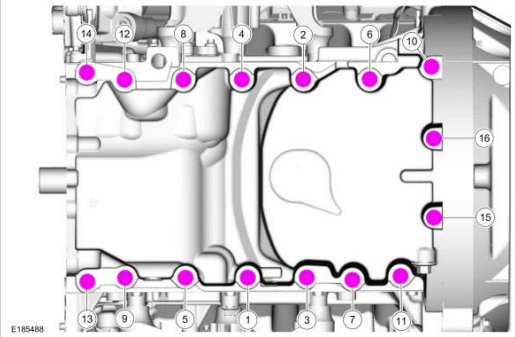
9.

Tighten the oil pan bolts in sequence.

Torque

: 27 lb.in (3 Nm)

10.



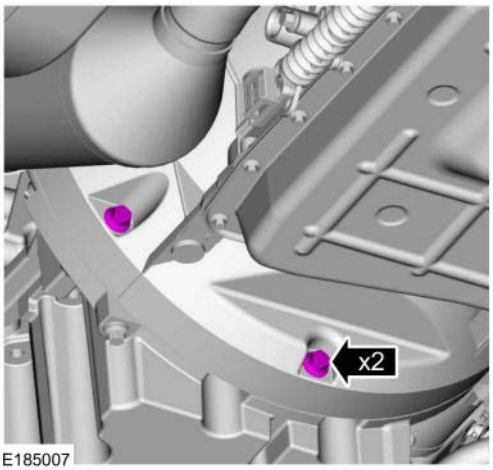
Install the remaining oil pan bolts and tighten in sequence shown in illustration.

Torque:

Stage 1: Tighten bolts 1 through 14 to: 18 lb.ft (24 Nm)

Stage 2: Tighten bolt 10 an additional: 90°

Stage 3: Tighten bolts 15 and 16 to: 89 lb.in (10 Nm)



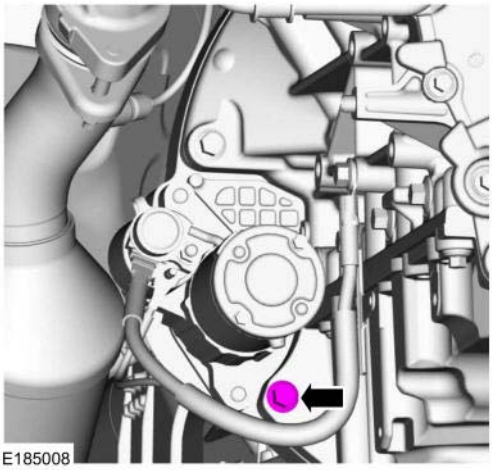
NOTE: The automatic transmission has one more bottom bellhousing-to-oil pan bolt than the manual transmission.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

11.
Tighten the oil pan bolts.

Torque

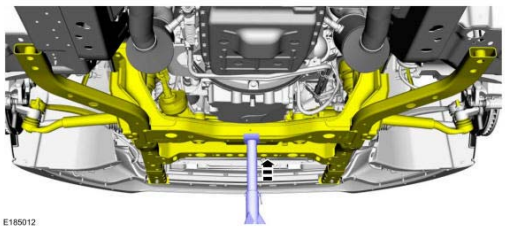
: 35 lb.ft (48 Nm)



12.

Tighten the oil pan bolt.

Torque

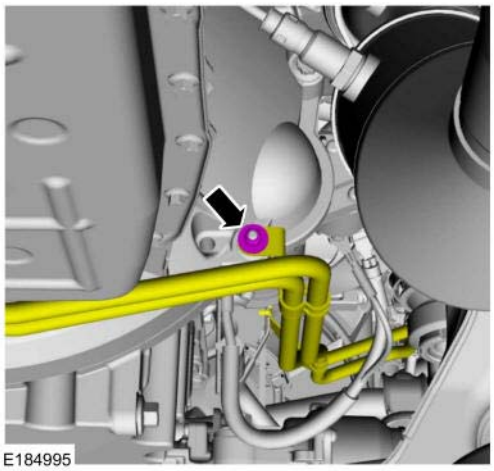


: 35 lb.ft (48 Nm)

13.

Using an adjustable stand, raise the subframe.

Use the General Equipment: Vehicle/Axle Stands

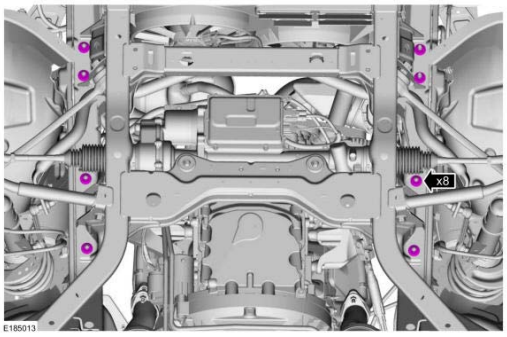


6-Speed Automatic Transmission - 6R80

14.

Position the transmission cooling tube bracket and install the nut.

Torque

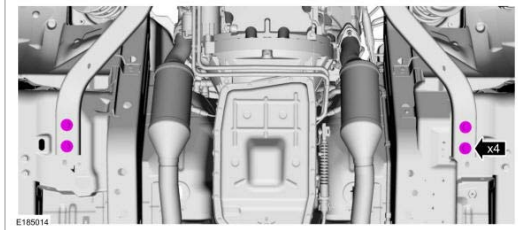


: 124 lb.in (14 Nm)

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

15.

Install the new front subframe nuts loosely.

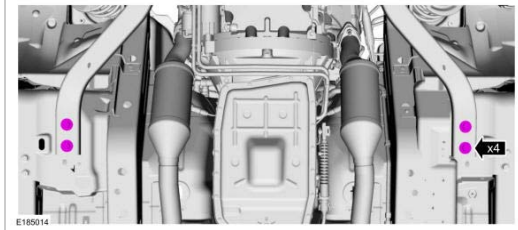


16.

Use a suitable alignment tool with a 15 mm (0.59 in) OD shaft that is long enough to go through the subframe and body.

Align the subframe to the alignment marks made during removal.

Install the new rear subframe bolts loosely.

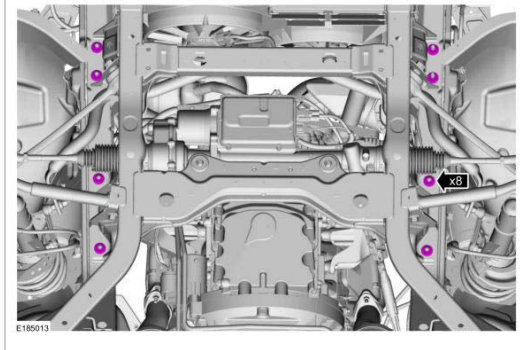


17.

Tighten the rear subframe bolts in a cross pattern.

Torque

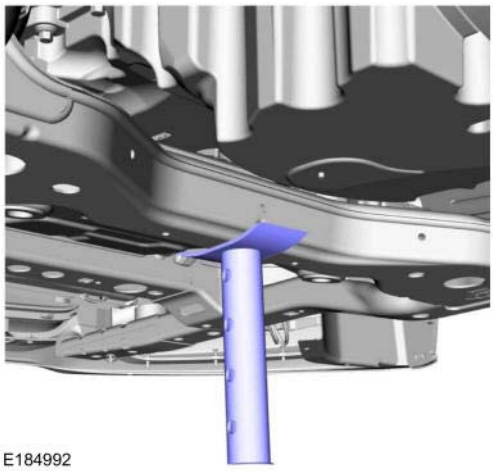
: 85 lb.ft (115 Nm)



18.

Tighten the front subframe nuts in a cross pattern.

Torque



: 85 lb.ft (115 Nm)

19.

Remove the adjustable stand.

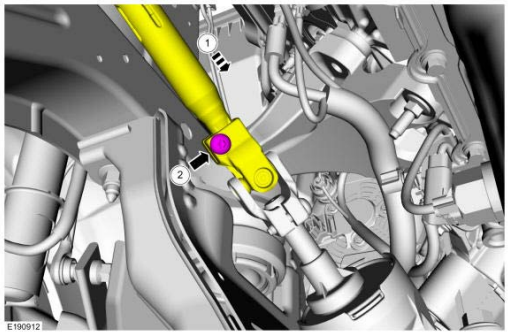
Use the General Equipment: Vehicle/Axle Stands

20.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.



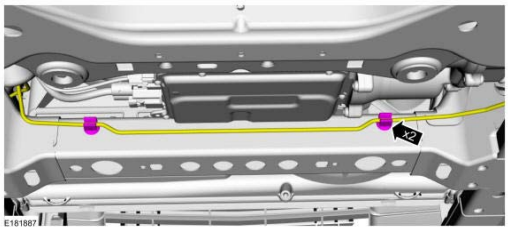
Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

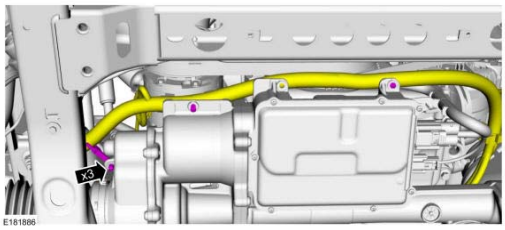
Torque

: 22 lb.ft (30 Nm)



21.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

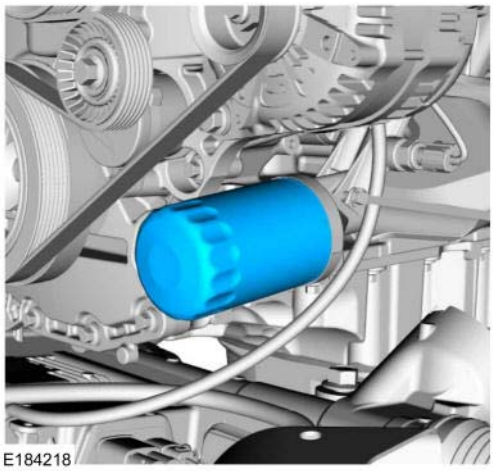


22.

Attach the brake line retainers to the subframe.

23.

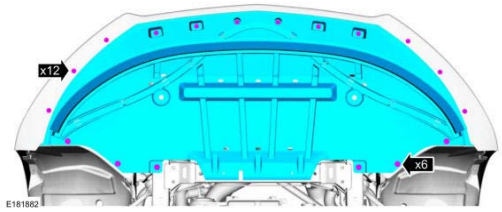
Attach the EPAS wiring harness pin-type retainers.



NOTE: Do not lubricate the engine oil filter gasket.

24.
Install a new oil filter.

Torque:



Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

25.

Install the underbody shield, bolts and the pin-type retainers.

26.

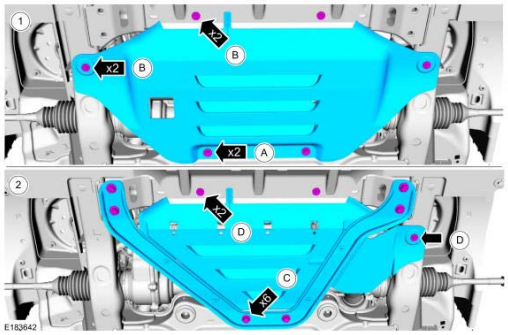
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



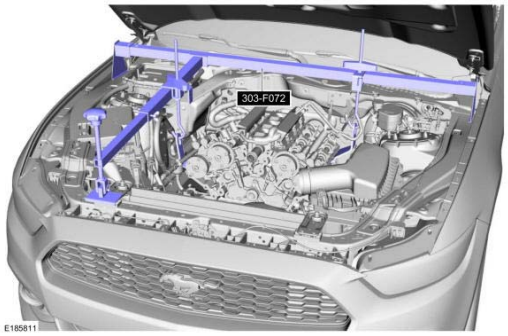
2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

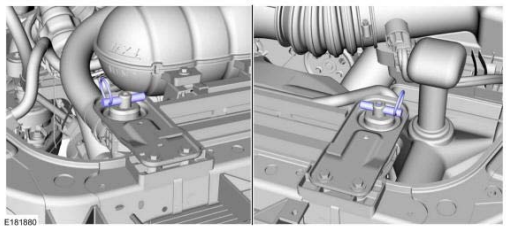
C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)



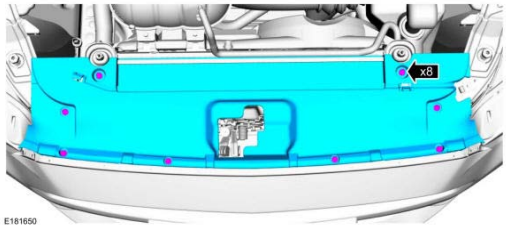
27.

Install the front wheels and tires. Refer to: Wheel and Tire .



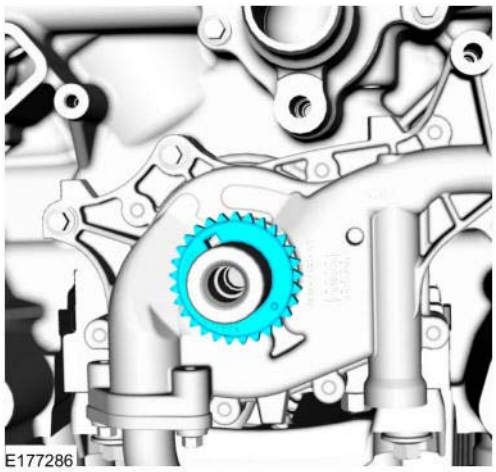
28.

Remove Special Service Tool: 303-F072 Support Bar, Engine.



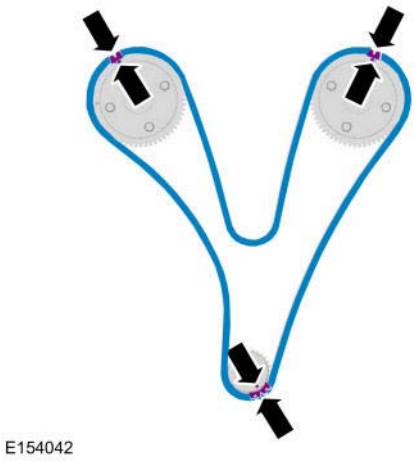
29.

Remove the retaining pins.



30.

Install the radiator top shield and the retainers.

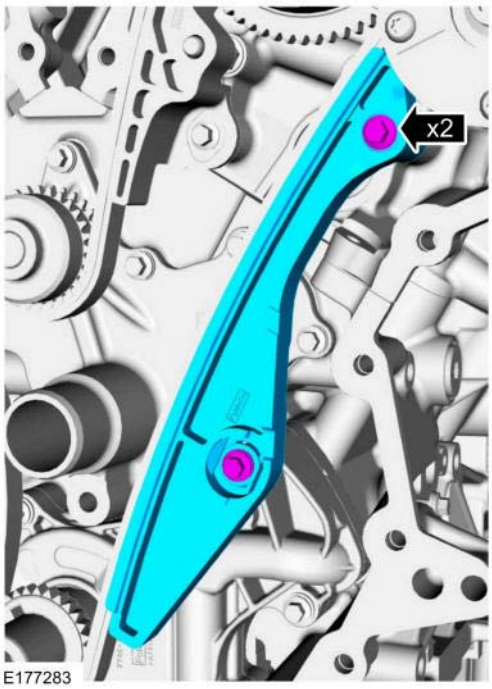


31.

Install the crankshaft sprocket with the timing dot mark out.

NOTE: It may be necessary to rotate the camshafts slightly, to align the timing marks.

32.
Install the timing chain with the colored links aligned with the timing marks on the VCT units and the crankshaft sprocket.



33.

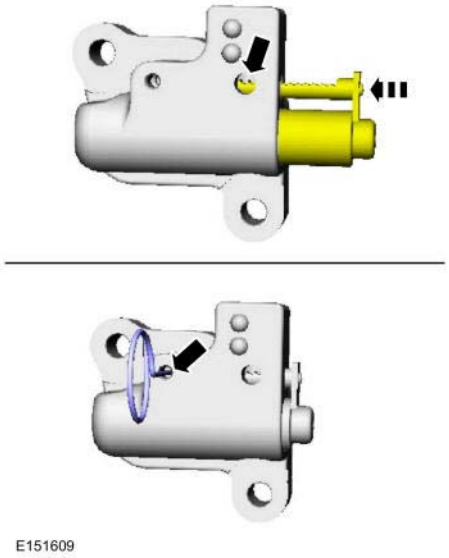
Install the lower LH timing chain guide and the bolts.

Torque

: 89 lb.in (10 Nm)

34.

Install the timing chain tensioner arm.



35.

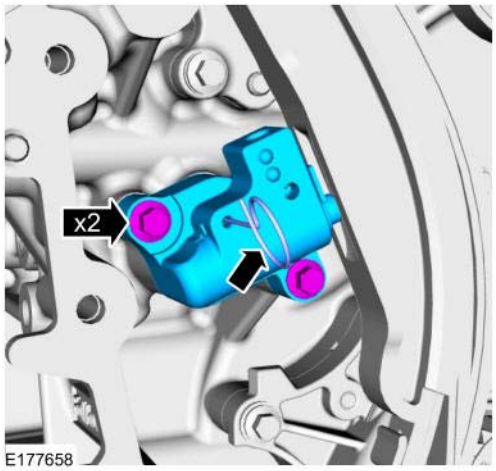
Release the ratchet detent.

Using a soft-jawed vise, compress the ratchet plunger.

Align the hole in the ratchet plunger with the hole in the tensioner housing.

Install a lockpin.

NOTE: It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.



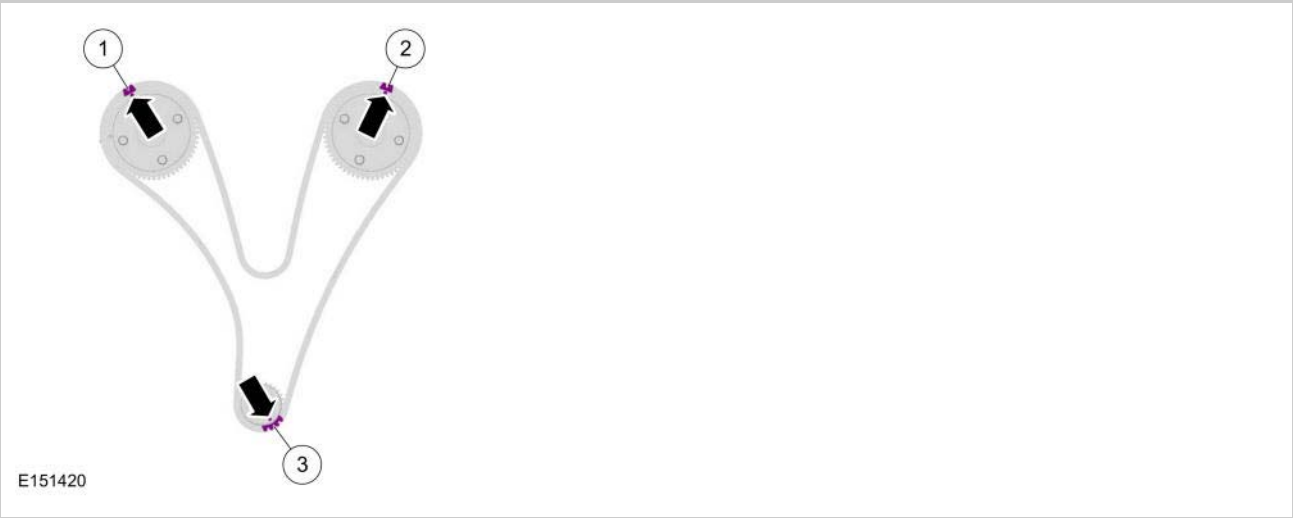
36.

Install the timing chain tensioner and the bolts.

Torque

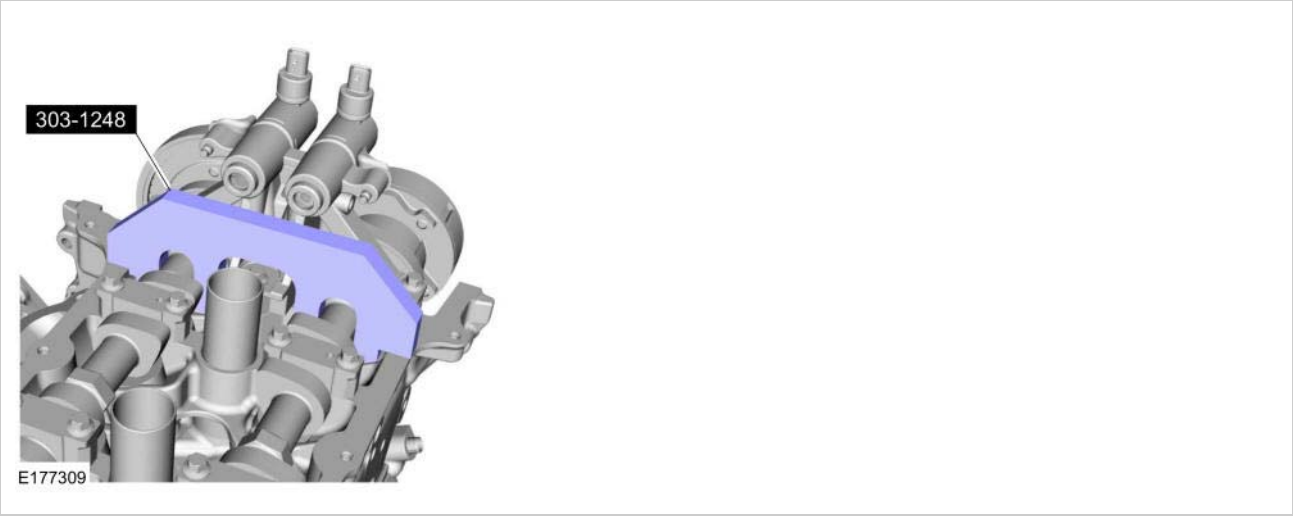
: 89 lb.in (10 Nm)

Remove the lockpin.



37.

As a post-check, verify correct alignment of all timing marks.

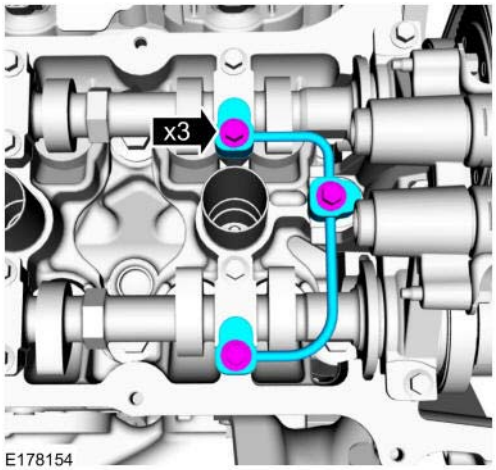


There are 48 links in between the RH intake VVT unit colored link (1) and the LH intake VVT unit colored link (2).

There are 35 links in between LH intake VVT unit colored link (2) and the crankshaft sprocket links (3).

38.

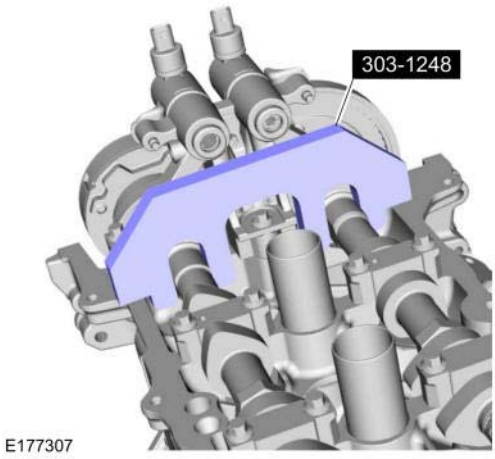
Remove Special Service Tool: 303-1248 Camshaft holding tools.



39.

Install the RH oil tube and the bolts.

Torque:

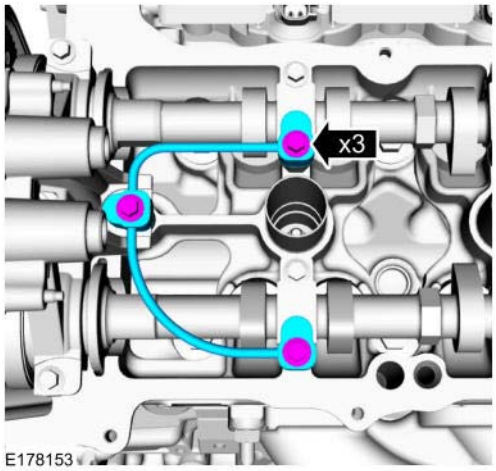


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

40.

Remove Special Service Tool: 303-1248 Camshaft holding tools.



41.

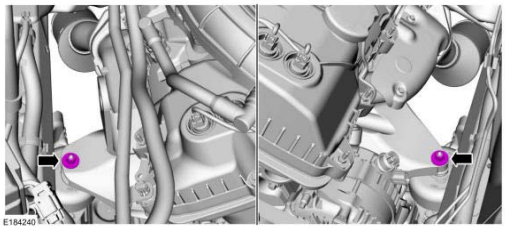
Install the LH oil tube and the bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

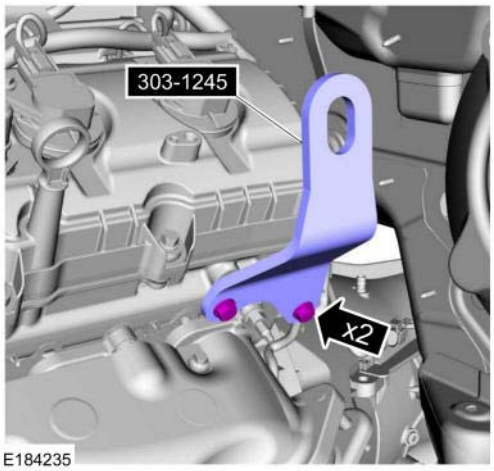
42.



Install the engine front cover. Refer to: Engine Front Cover .

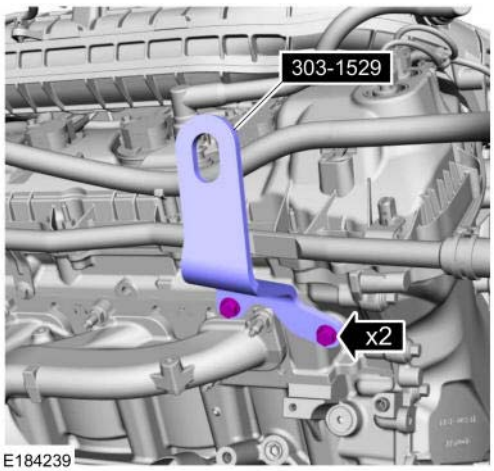
43.

Install the RH and LH engine mount nuts.



Torque

: 46 lb.ft (63 Nm)

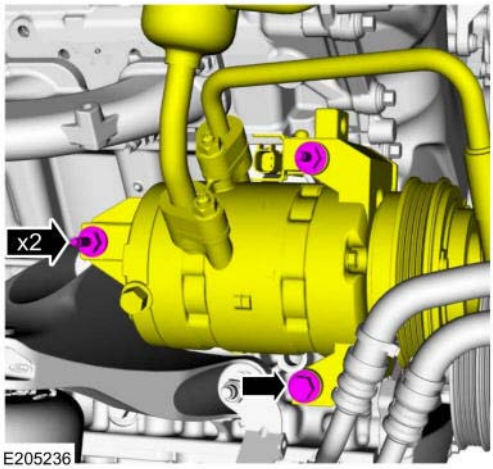


44.

Remove Special Service Tool: 303-1245 Engine Lift Eye.

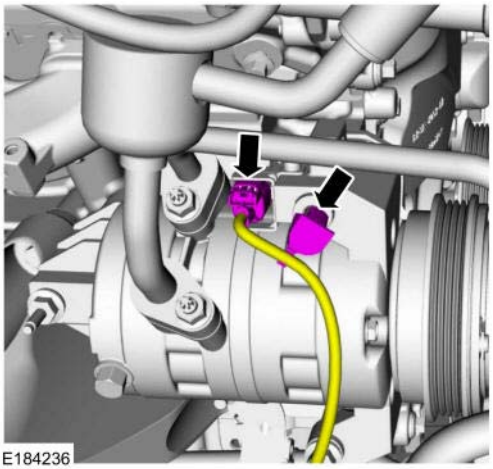
45.

Remove Special Service Tool: 303-1529 Lift Eye, Engine.



46.

Position the A/C compressor and install the stud bolts and bolt.

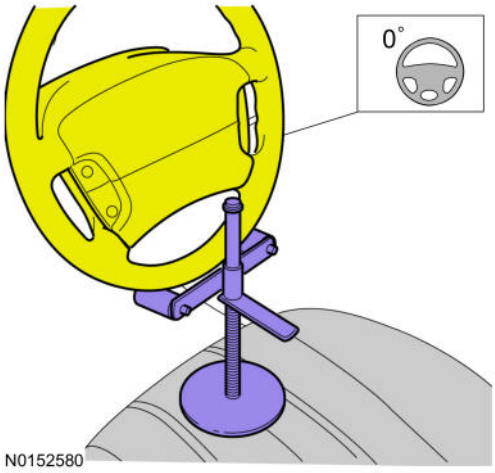


Torque

: 18 lb.ft (25 Nm)

47.

Connect the A/C compressor electrical connector and the wire harness retainer.



48.

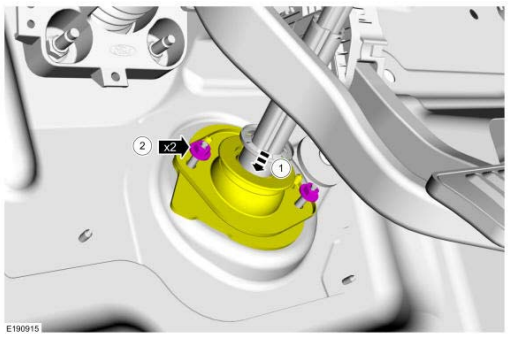
Install the A/C compressor belt. Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

49.

Remove the holding device.

50.

1.



Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

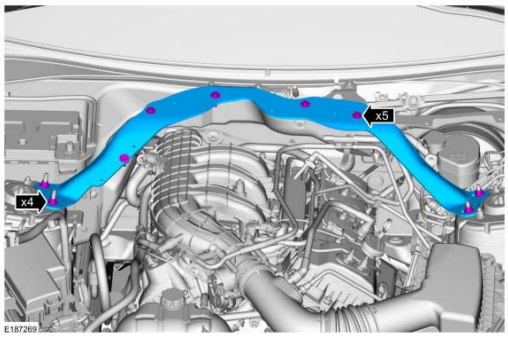
Torque

: 80 lb.in (9 Nm)

Convertible

51.

Install the cowl extension and the bolts.



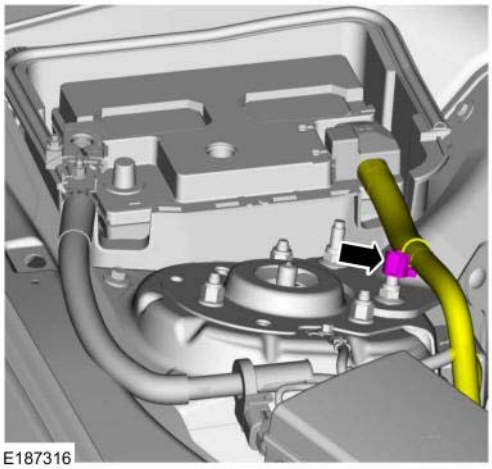
Torque

: 26 lb.ft (35 Nm)

Install the cowl extension nuts.

Torque

: 41 lb.ft (55 Nm)



52.

Connect the positive battery cable. Refer to: Battery Disconnect and Connect .

53.

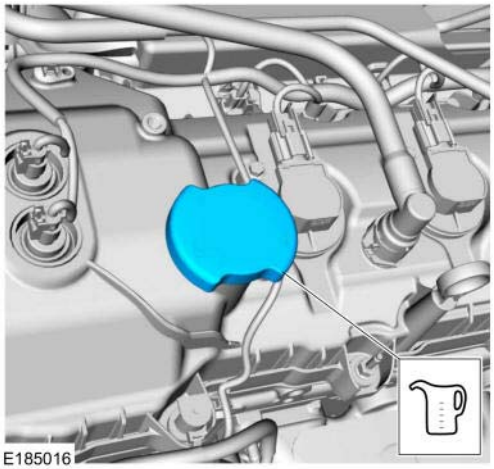
Attach the battery cable retainer.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

54.

Install the cowl panel grille. Refer to: Cowl Panel Grille .

55.



Connect the negative battery cable. Refer to: Battery Disconnect and Connect .

56.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

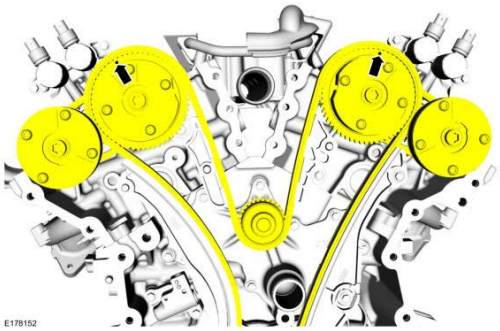
: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

REMOVAL AND INSTALLATION > TIMING CHAIN

Special Tool(s) / General Equipment

 E216421	303-1248 Camshaft holding tools TKIT-2006UF-FLM TKIT-2006UF-ROW

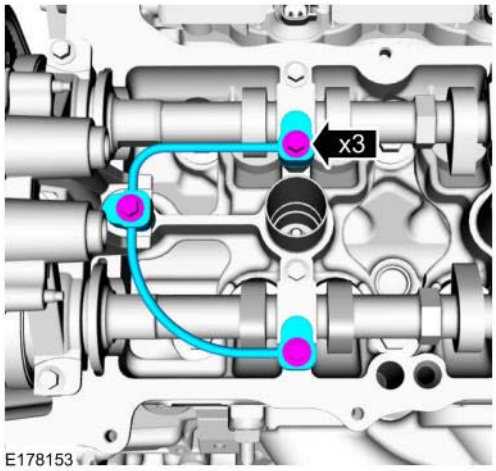
REMOVAL AND INSTALLATION > TIMING CHAIN > REMOVAL



NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.

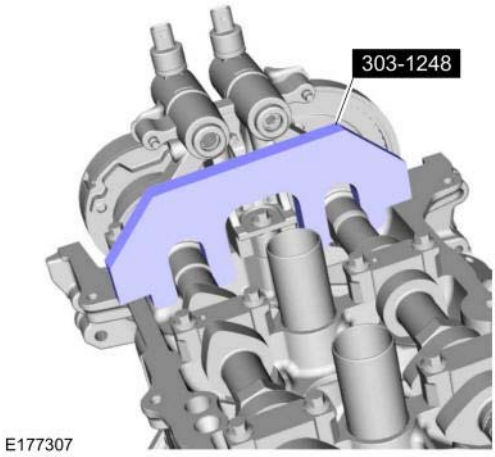
1.

Remove the engine front cover. Refer to: Engine Front Cover .



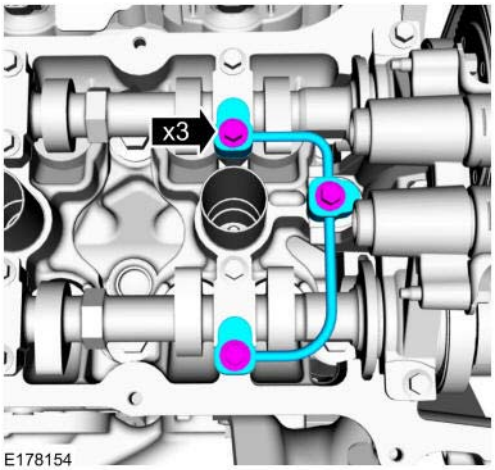
NOTE: Rotate the crankshaft in a clockwise direction only.

2.
Rotate the crankshaft clockwise and align the timing marks on the intake VCT units as shown in illustration.



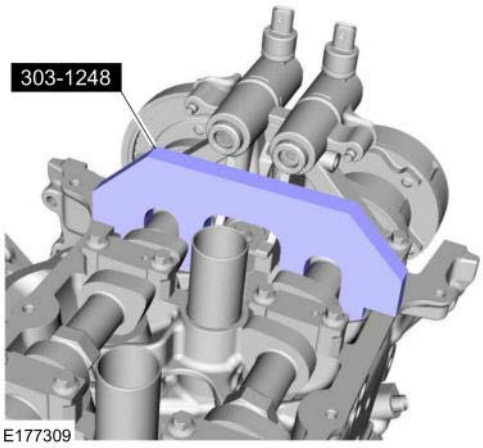
3.

Remove the bolts and the LH oil tube.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

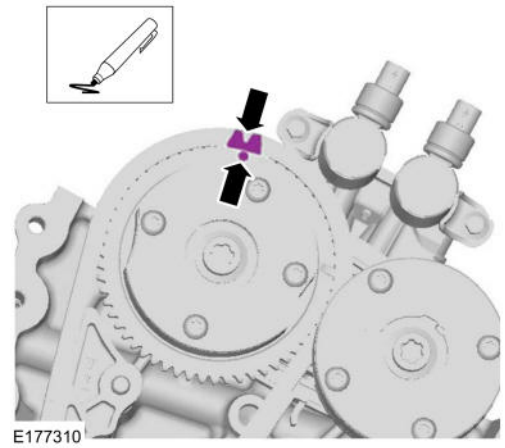
4.
Install Special Service Tool: 303-1248 Camshaft holding tools.



5.

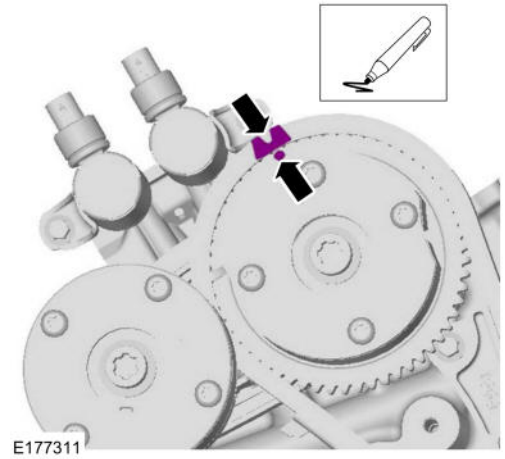
Remove the bolts and the RH oil tube.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.



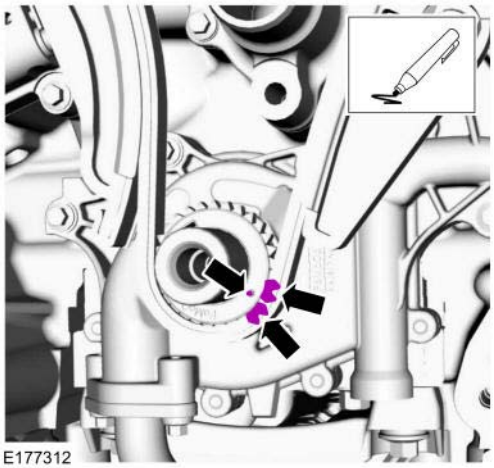
6.
Install Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: ***The following 3 steps are for timing chains that the colored links are not visible.***



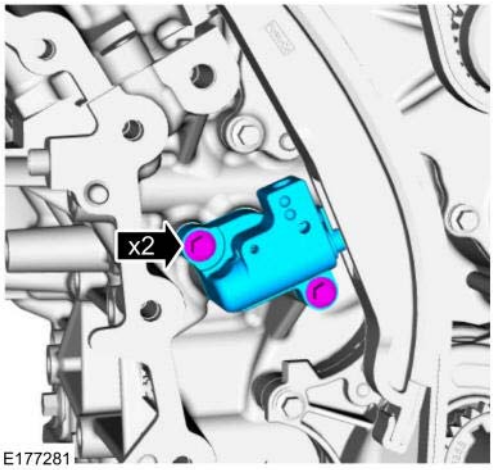
7.

Mark the timing chain link that aligns with the timing mark on the LH intake VCT unit as shown in illustration.



8.

Mark the timing chain link that aligns with the timing mark on the RH intake VCT unit as shown in illustration.

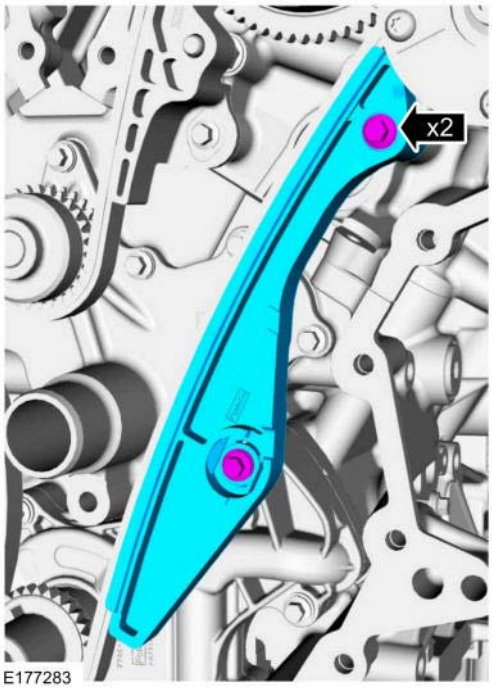


NOTE: The crankshaft sprocket timing mark should be between the colored links.

9.
Mark the timing chain links that aligns with the timing mark on the crankshaft sprocket as shown in illustration.

10.

Remove the bolts and the timing chain tensioner.



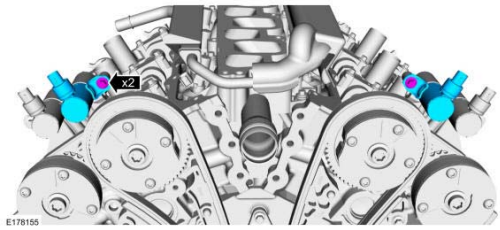
11.

Remove the timing chain tensioner arm.

E177282

12.

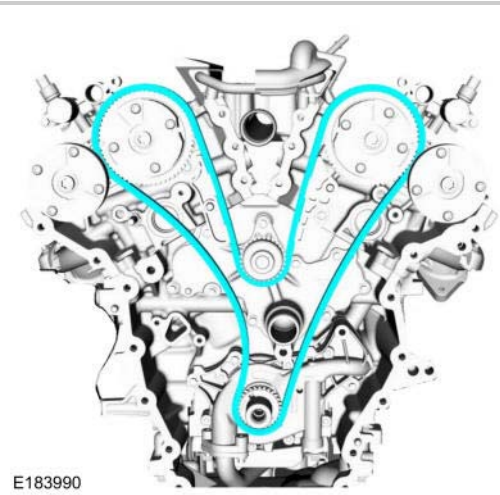
Remove the bolts and the lower LH timing chain guide.



E177283

NOTE: Removal of the VCT oil control solenoid will aid in the removal of the timing chain.

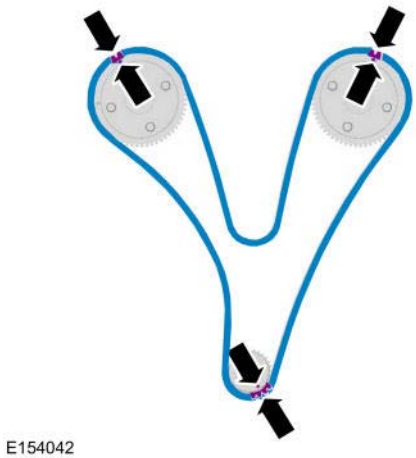
NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoids.



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

13.
Remove the bolts and the VCT oil control solenoids.

14.

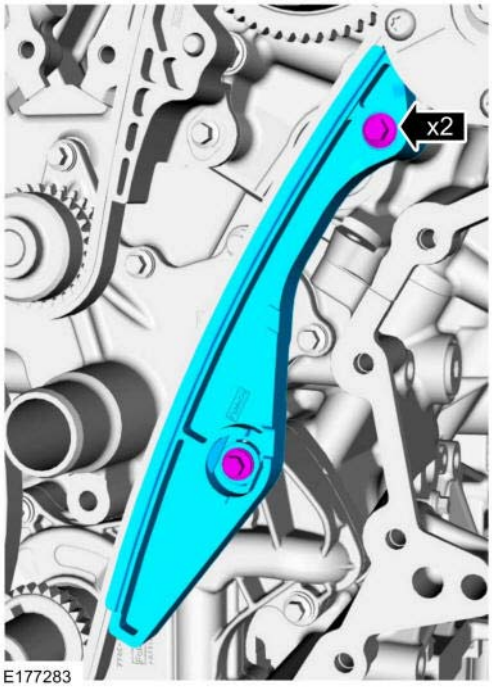


Remove the timing chain.

REMOVAL AND INSTALLATION > TIMING CHAIN > INSTALLATION

NOTE: It may be necessary to rotate the camshafts slightly, to align the timing marks.

1.
Install the timing chain with the colored links aligned with the timing marks on the VCT units and the crankshaft sprocket.



2.

Install the lower LH timing chain guide and the bolts.

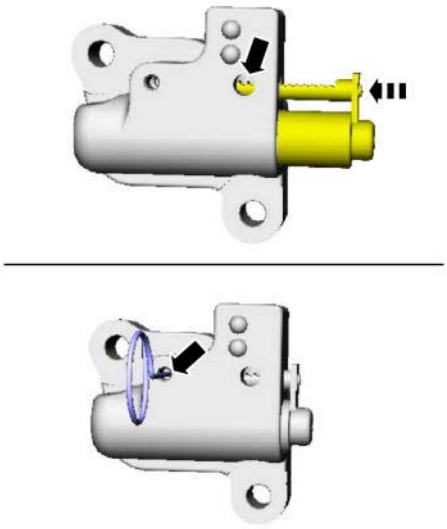
Torque

: 89 lb.in (10 Nm)

3.

Install the timing chain tensioner arm.

E177282



4.

Release the ratchet detent.

Using a soft-jawed vise, compress the ratchet plunger.

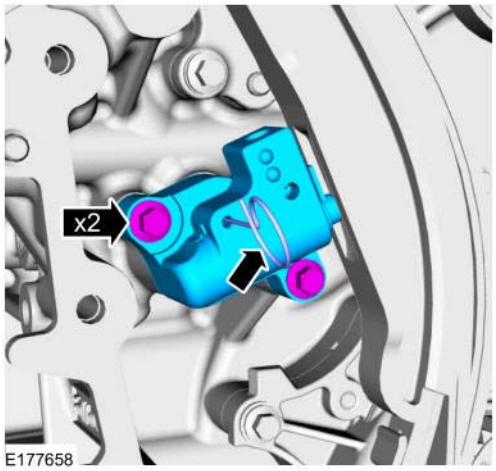
Align the hole in the ratchet plunger with the hole in the tensioner housing.

Install a lockpin.

E151609

NOTE: It may be necessary to rotate the camshafts slightly to remove slack from

the timing chain to install the tensioner.



5.

Install the timing chain tensioner and the bolts.

Torque

: 89 lb.in (10 Nm)

Remove the lockpin.

6.

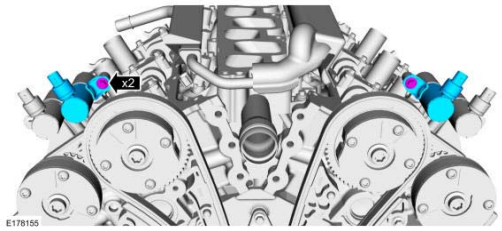
As a post-check, verify correct alignment of all timing marks.

There are 48 links in between the RH intake VCT unit colored link (1) and the LH intake VCT unit colored link (2).

There are 35 links in between LH intake VCT unit colored link (2) and the 2 crankshaft sprocket links (3).

NOTE: Do not use excessive force when installing the VCT oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.

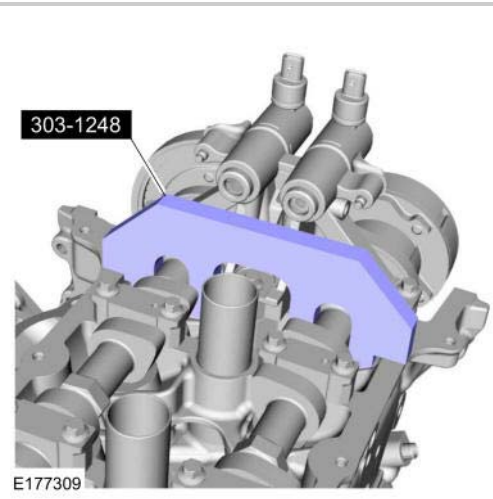
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

7.
Install the VCT oil control solenoids and the bolts.

Torque:

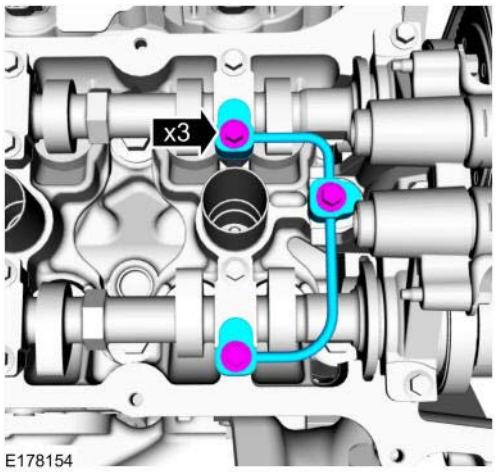


Stage 1: 71 lb.in (8 Nm)

Stage 2: 20°

8.

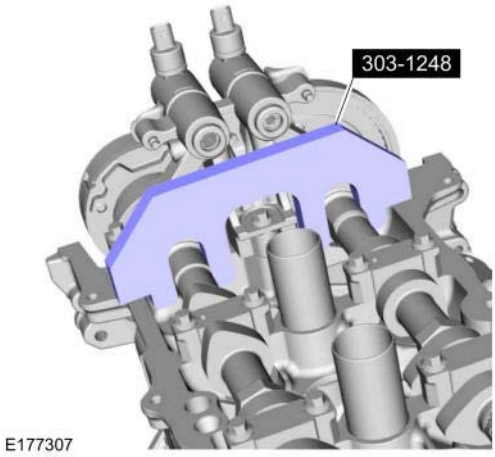
Remove Special Service Tool: 303-1248 Camshaft holding tools.



9.

Install the RH oil tube and the bolts.

Torque:

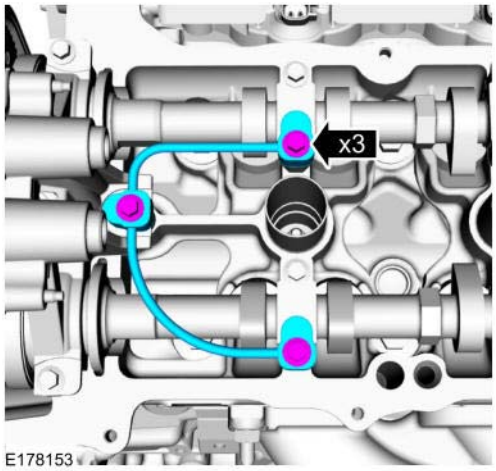


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

10.

Remove Special Service Tool: 303-1248 Camshaft holding tools.



11.

Install the LH oil tube and the bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

12.

Install the engine front cover. Refer to: Engine Front Cover .

REMOVAL AND INSTALLATION > UPPER INTAKE MANIFOLD

Special Tool(s) / General Equipment

Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > UPPER INTAKE MANIFOLD > REMOVAL

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

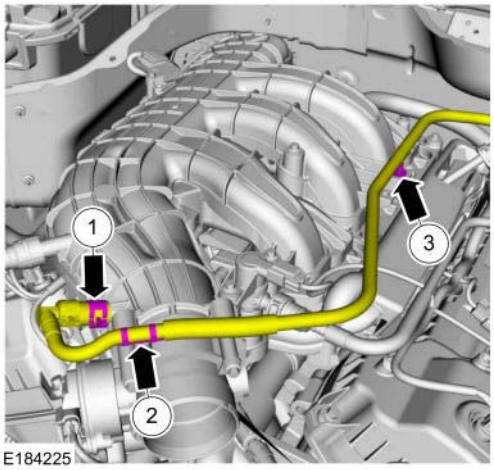
1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

2.

1.

Disconnect the vacuum hose from the upper intake manifold.



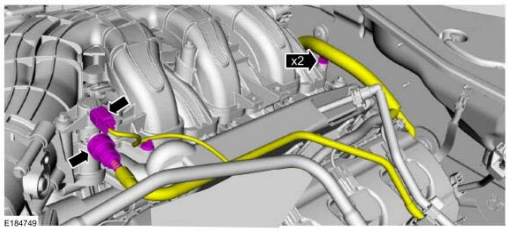
Use the General Equipment: Hose Clamp Remover/Installer

2.

Detach the vacuum hose retainer from the throttle body.

3.

Detach the vacuum hose retainer from the upper intake manifold.

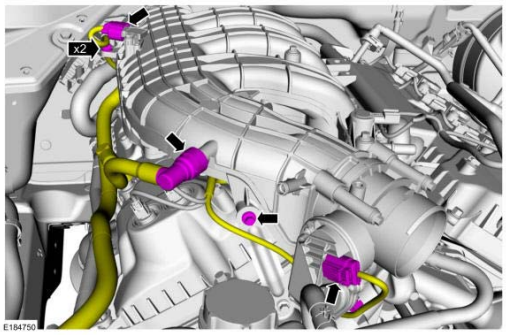


3.

Disconnect the EVAP purge valve electrical connector.

Detach the wiring harness retainers.

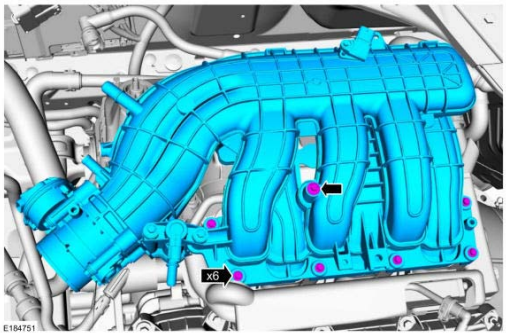
Disconnect the EVAP purge valve quick release coupling. Refer to: QUICK RELEASE COUPLING .



4.

Disconnect the PCV tube from the upper intake manifold and position aside.

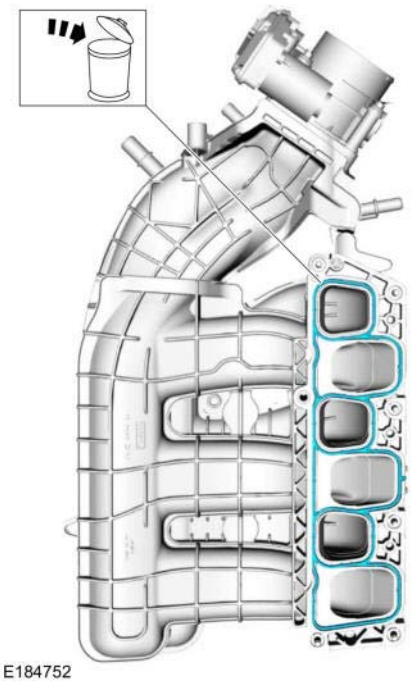
Disconnect the throttle body and MAP sensor electrical connectors.



Disconnect the wiring harness retainers.

Remove the upper intake manifold support bolt.

5.

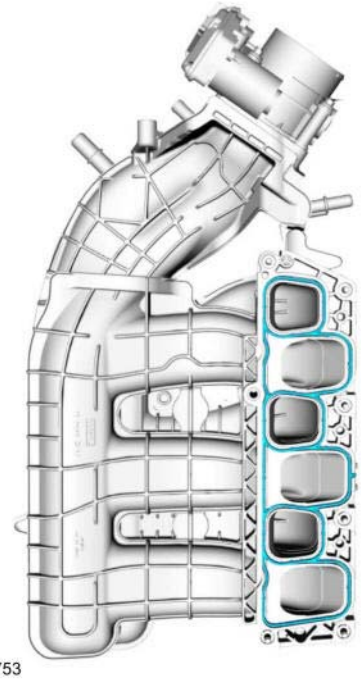


Remove the bolts and the upper intake manifold.

6.

Remove and discard the upper intake manifold gaskets.

Clean and inspect all of the sealing surfaces of the upper and lower intake manifold.

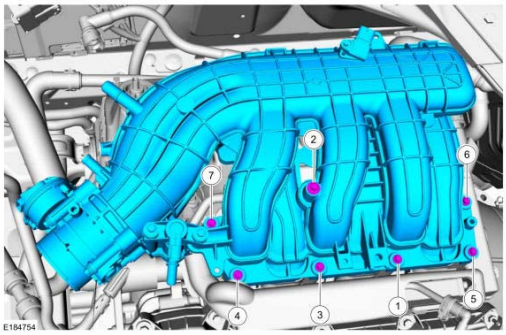


REMOVAL AND INSTALLATION > UPPER INTAKE MANIFOLD > INSTALLATION

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

1.

Install the new upper intake manifold gaskets.



2.

Install the upper intake manifold and the bolts.

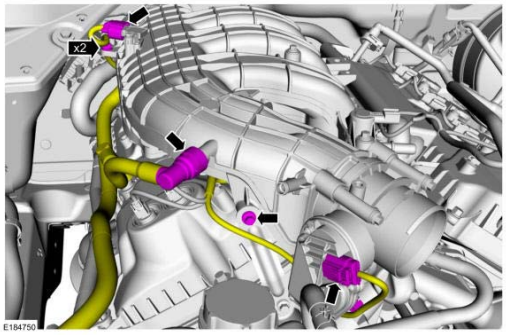
Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°

3.

Install the upper intake manifold support bolt.



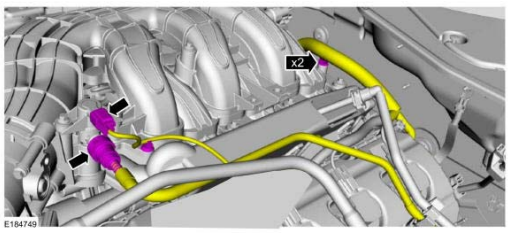
Torque

: 89 lb.in (10 Nm)

Connect the wiring harness retainers.

Connect the throttle body and MAP sensor electrical connectors.

Connect the PCV tube to the upper intake manifold.



4.

Connect the EVAP purge valve quick release coupling. Refer to: QUICK RELEASE COUPLING .

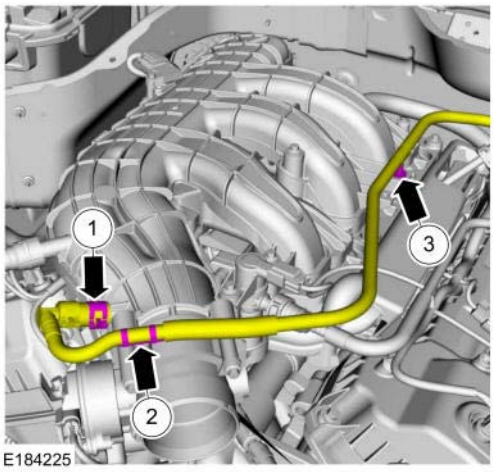
Attach the wiring harness retainers.

Connect the EVAP purge valve electrical connector.

5.

1.

Connect the vacuum hose to the upper intake manifold.



Use the General Equipment: Hose Clamp Remover/Installer

2.

Attach the vacuum hose retainer to the throttle body.

3.

Attach the vacuum hose retainer to the upper intake manifold.

6.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

REMOVAL AND INSTALLATION > VALVE COVER LH

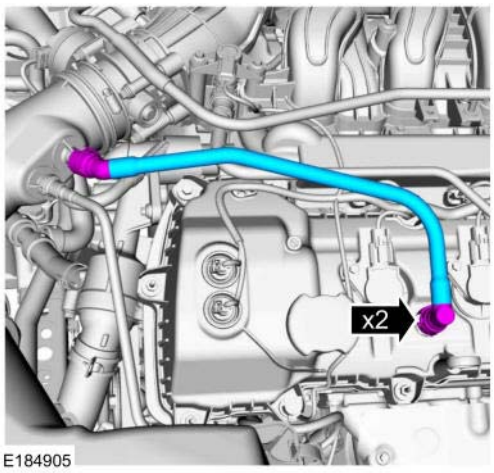
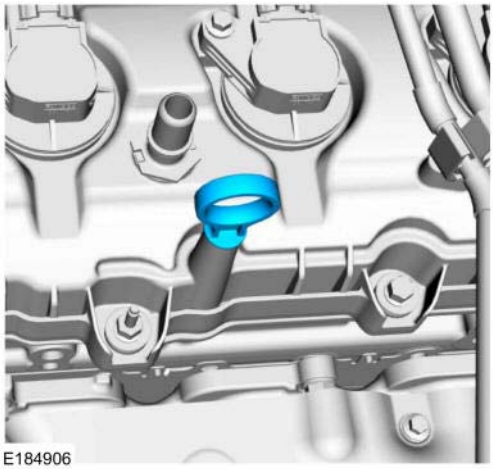
Motorcraft® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.)PM-4-A, PM-4-B (U.S.)	-



REMOVAL AND INSTALLATION > VALVE COVER LH > REMOVAL

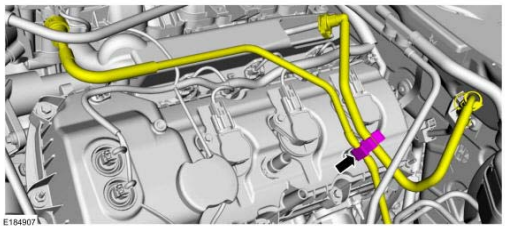
NOTE: Installation of new spark plug seals or VCT seals is only required if seals are damaged.

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



1.

Remove the crankcase vent tube.

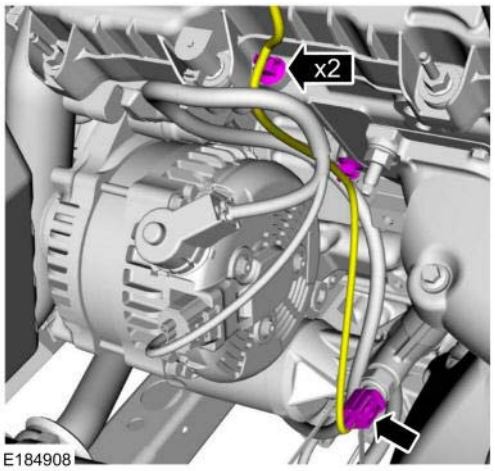


2.

Remove the oil level indicator.

3.

Detach the fuel supply tube and EVAP tube retainer from the LH valve cover.

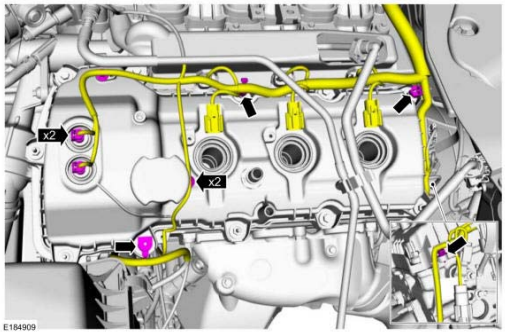


4.

Remove the LH ignition coil-on-plugs. Refer to: IGNITION COIL-ON-PLUG .

5.

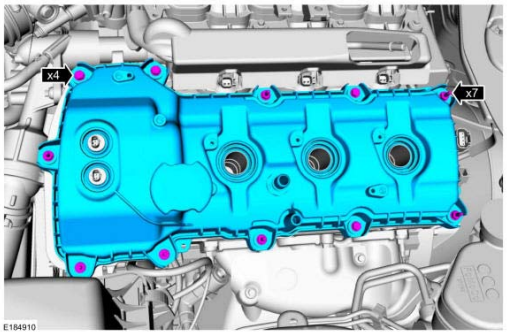
Disconnect the oil pressure switch electrical connector.



Detach the wiring harness retainers.

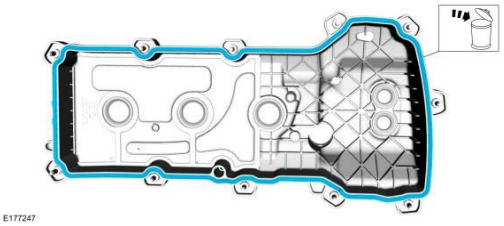
6.

Disconnect the VCT oil control solenoid electrical connectors.



Detach the wiring harness retainers.

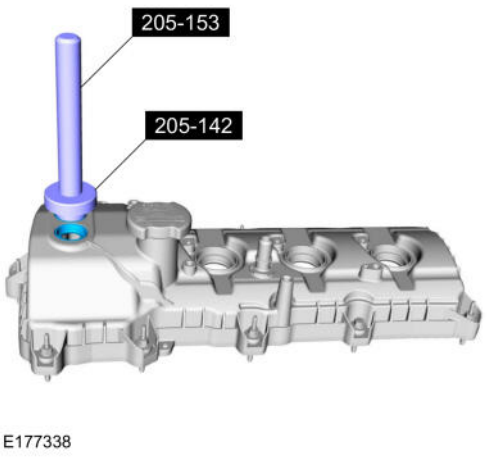
NOTE: While removing the valve cover do not apply excessive force to the VCT oil control solenoid or damage may occur.



NOTE: If the VCT oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.

7.
Loosen the bolts and remove the valve cover.

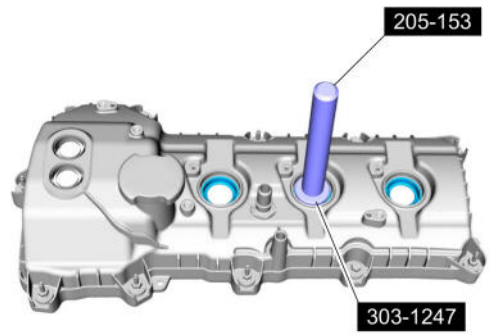
8.



Remove and discard the valve cover gasket.

NOTE: Inspect the VCT oil control solenoid seals. Remove any damaged seals.

9.
If necessary, using the special tools, remove the VCT oil control solenoid seals.



Use Special Service Tool: 205-142 (T80T-4000-J) Installer, Differential Bearing Cone, 205-153 (T80T-4000-W) Handle.

NOTE: Inspect the spark plug tube seals. Remove any damaged seals.

10.
If necessary, using the special tools, remove the spark plug tube seals.

Use Special Service Tool: 303-1247 VCT Spark Plug Tube Seal Remover and Installer, 205-153 (T80T-4000-W) Handle.

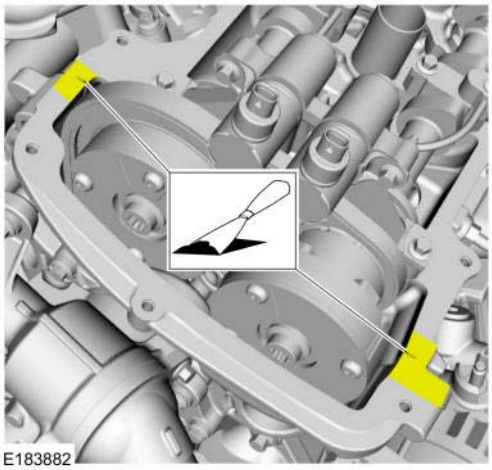
E177339

11.

Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



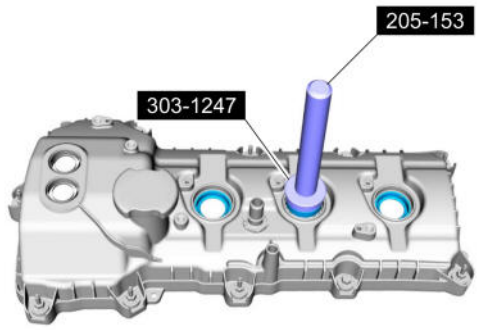
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B



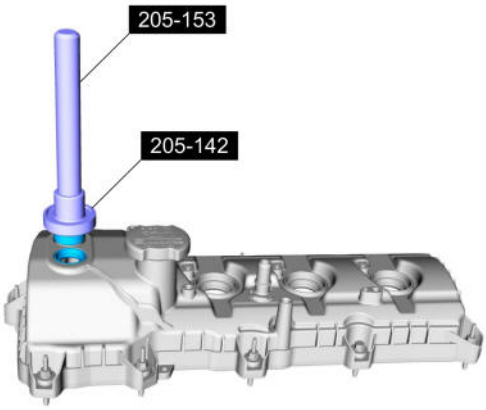
E183882

REMOVAL AND INSTALLATION > VALVE COVER LH > INSTALLATION

NOTE: Installation of new seals is only required if damaged seals were removed.

1.
If removed, using the special tools, install the spark plug tube seals.

Use Special Service Tool: 303-1247 VCT Spark Plug Tube Seal Remover and Installer, 205-153 (T80T-4000-W) Handle.

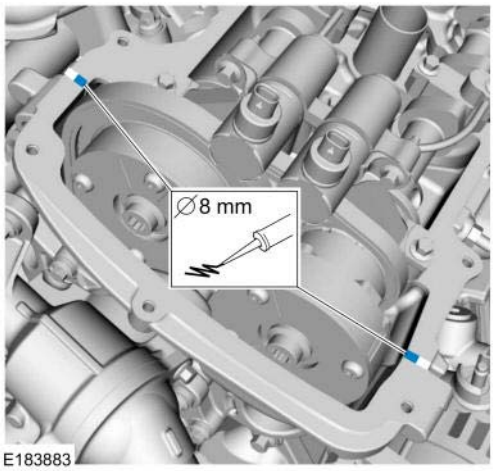


E177702

NOTE: Installation of new seals is only required if damaged seals were removed.

2.
If removed, using the special tools, install the VCT oil control solenoid seals.

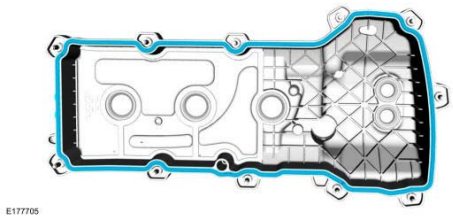
Use Special Service Tool: 205-142 (T80T-4000-J) Installer, Differential Bearing Cone, 205-153 (T80T-4000-W) Handle.



E177703

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned.

3.
Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-cylinder head joints.

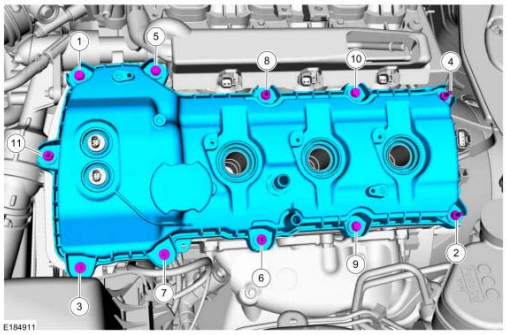


Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

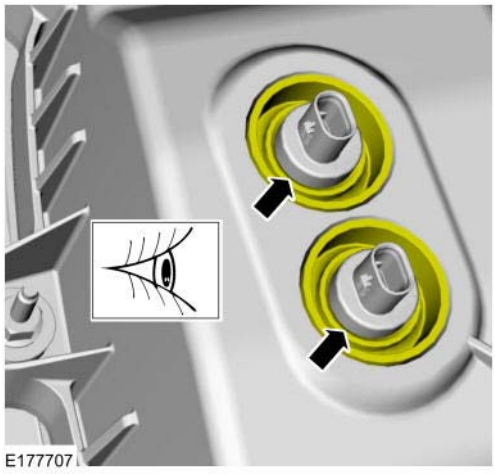
4.

Install a new valve cover gasket.



5.

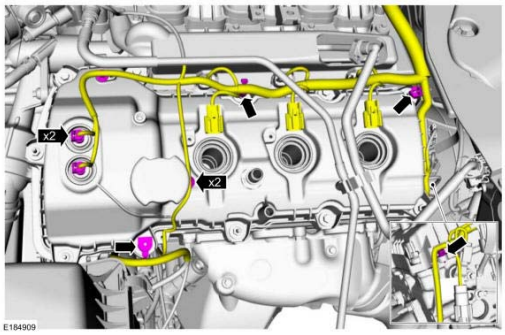
Install the valve cover and tighten the bolts.



Torque

: 89 lb.in (10 Nm)

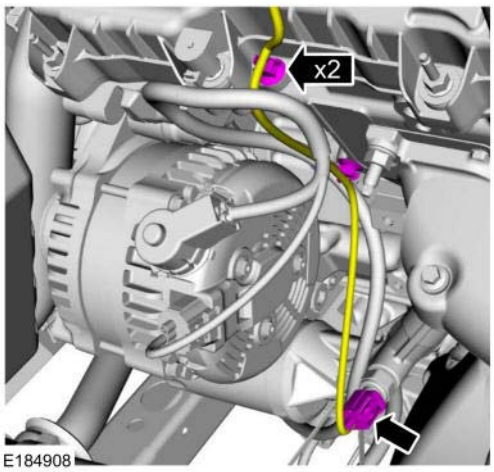
6.



Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

7.

Attach the wiring harness retainers.

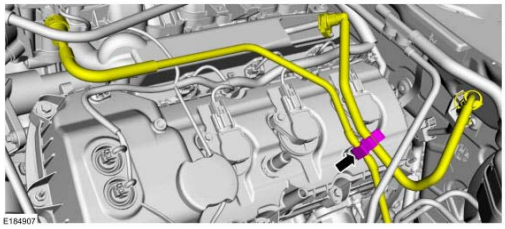


Connect the VCT oil control solenoid electrical connectors.

8.

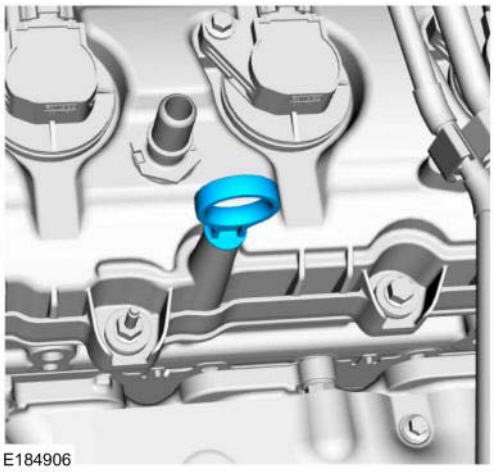
Attach the wiring harness retainers.

Connect the oil pressure switch electrical connector.



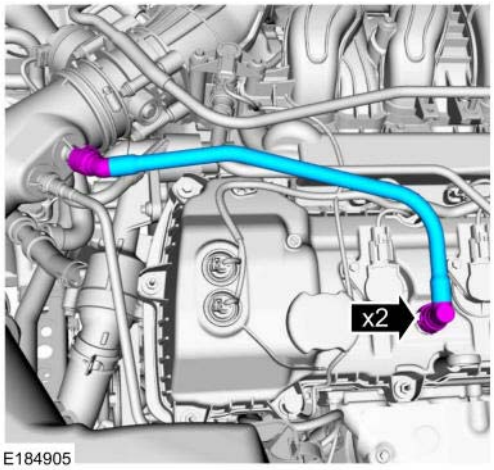
9.

Install the LH ignition coil-on-plugs. Refer to: IGNITION COIL-ON-PLUG .



10.

Attach the fuel supply tube and EVAP tube retainer to the LH valve cover.



11.

Install the oil level indicator.

12.

Install the crankcase vent tube.

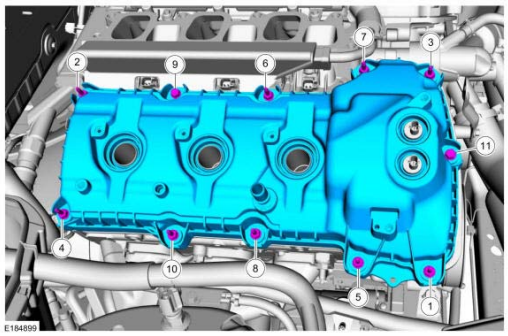
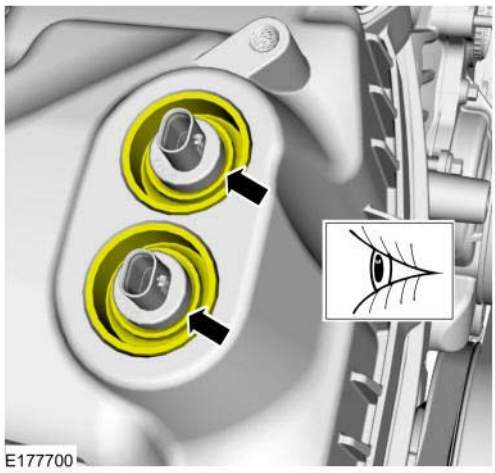
Install a new valve cover gasket.



5.

Install the valve cover and tighten the bolts.

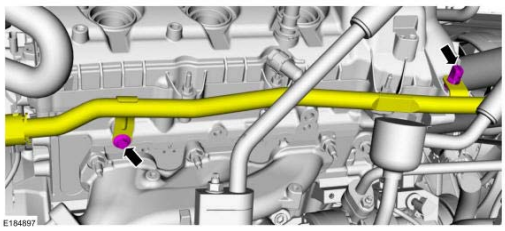


Torque

: 89 lb.in (10 Nm)

6.

Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

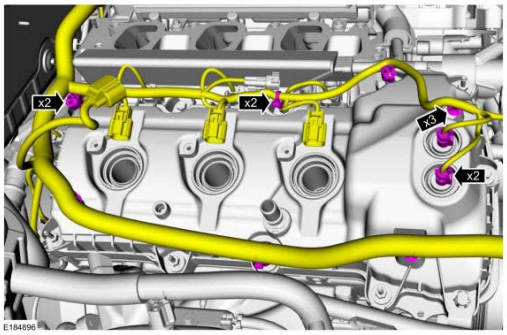


7.

Attach the heater tube retainer to the RH valve cover stud bolt.

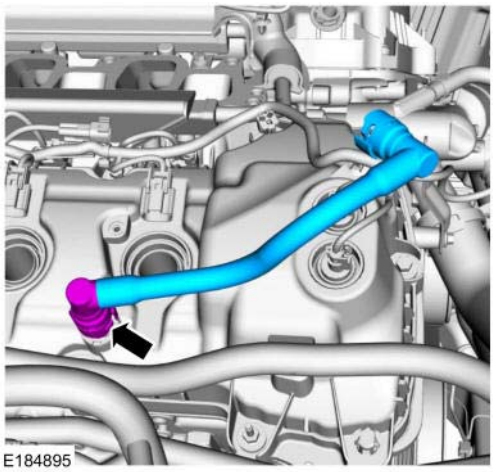
Install the heater tube bolt.

Torque



: 17 lb.ft (23 Nm)

8.



Attach the wiring harness retainers.

Connect the VCT oil control solenoid electrical connectors.

9.

Install the PCV tube.

10.

Install the RH ignition coil-on-plugs. Refer to: IGNITION COIL-ON-PLUG .

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT

Special Tool(s) / General Equipment

	303-1530 Tool, Chain Tensioner Hold Down TKIT-2010A-F TKIT-2010A-LM TKIT-2010A-ROW

Materials

Name	Specification

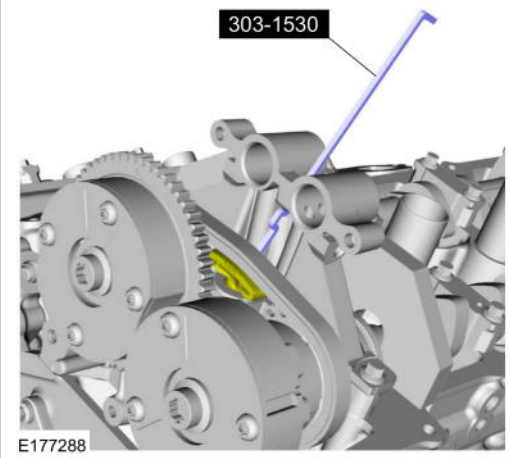
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.

All variable camshaft timing (VCT) unit

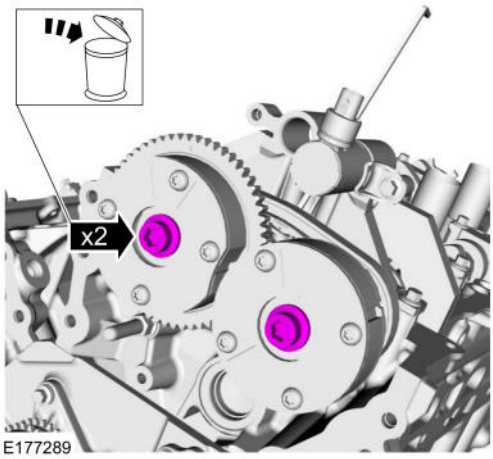
1.



Remove the timing chain. Refer to: Timing Chain .

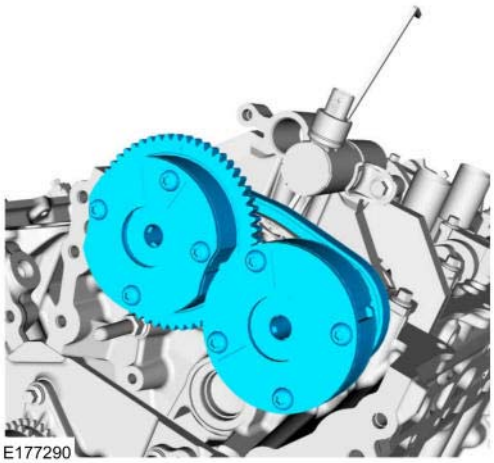
LH variable camshaft timing (VCT) unit

NOTE: The VCT oil control solenoids are removed for clarity.



2.
Compress the LH secondary timing chain tensioner and install the special tool in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

Use Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

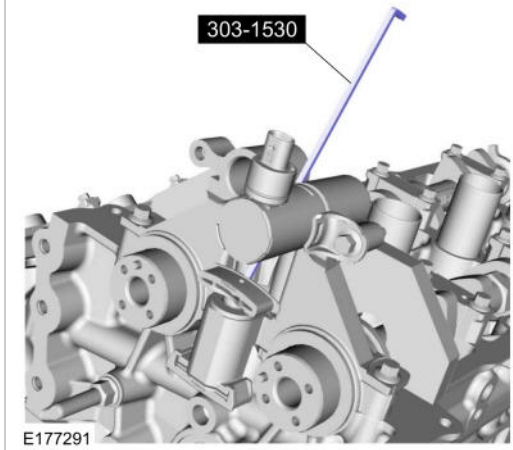


3.

Remove and discard the LH VCT unit bolts.

4.

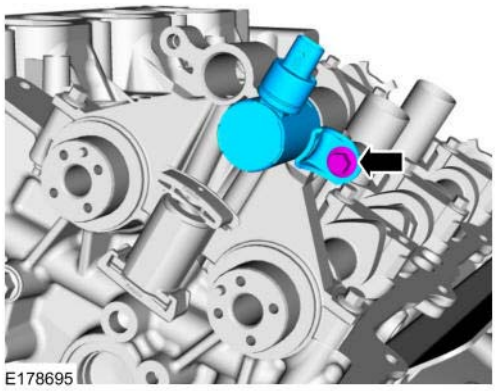
Remove the LH VCT units.



Replacement of the LH secondary timing chain tensioner

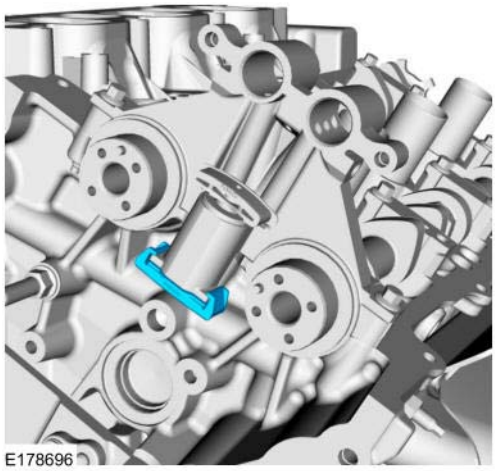
NOTE: The following 4 steps are only for the replacement of the secondary timing chain tensioner. Do not reuse the secondary timing chain tensioner if removed, or damage to the engine may occur.

5.



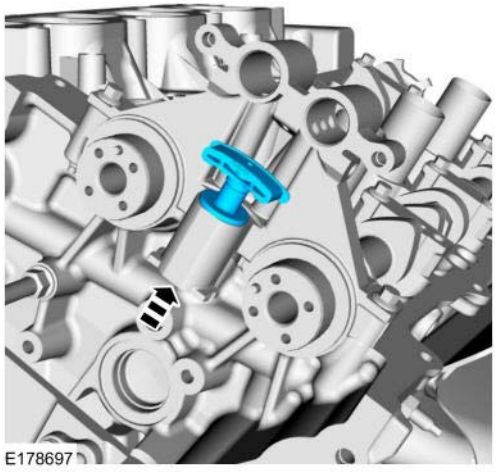
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

6.
Remove the bolt and the exhaust VCT oil control solenoid.

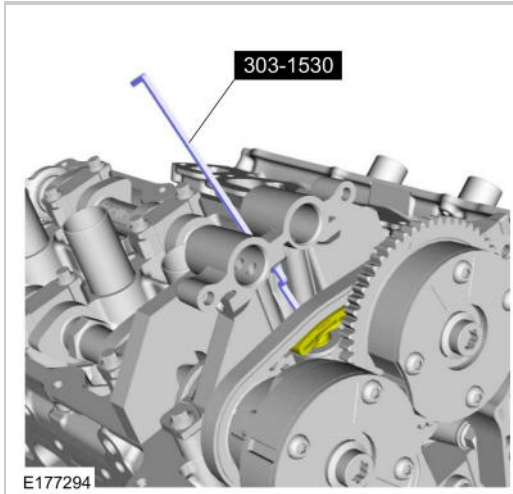


7.

Remove the LH secondary timing chain tensioner shoe.

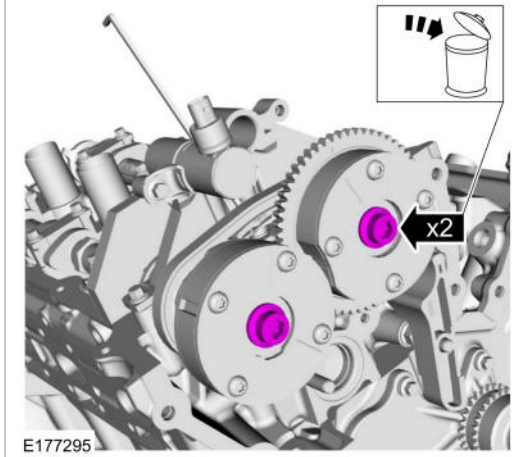
8.

Remove the LH secondary timing chain tensioner by pushing up from the bottom.



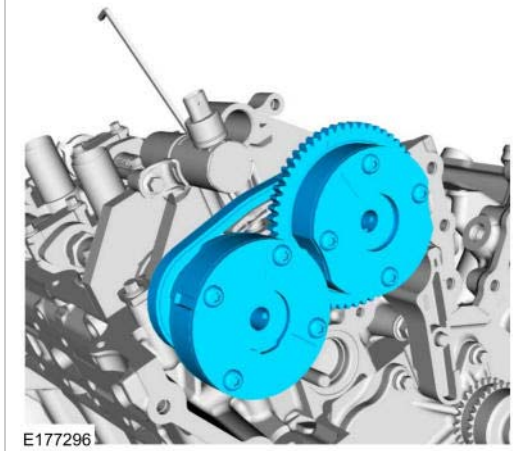
RH variable camshaft timing (VCT) unit

NOTE: The VCT oil control solenoids are removed for clarity.



9.
Compress the RH secondary timing chain tensioner and install the special tool in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

Use Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

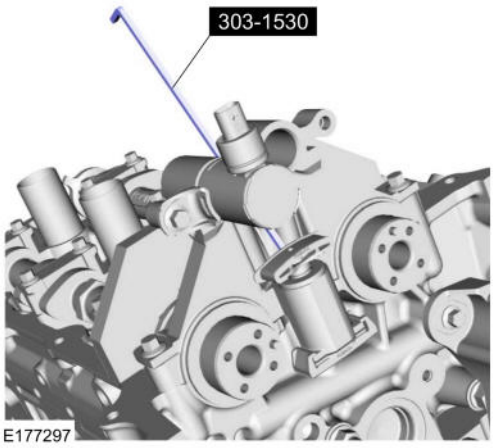


10.

Remove and discard the RH VCT unit bolts.

11.

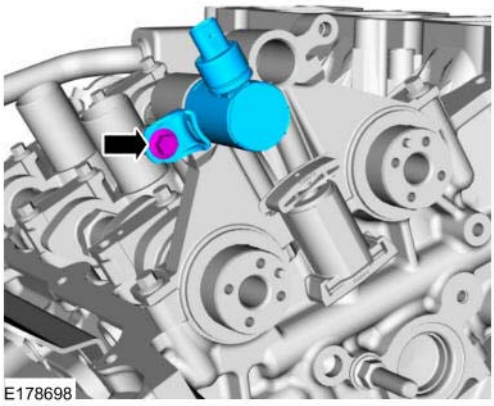
Remove the RH VCT units.



Replacement of the RH secondary timing chain tensioner

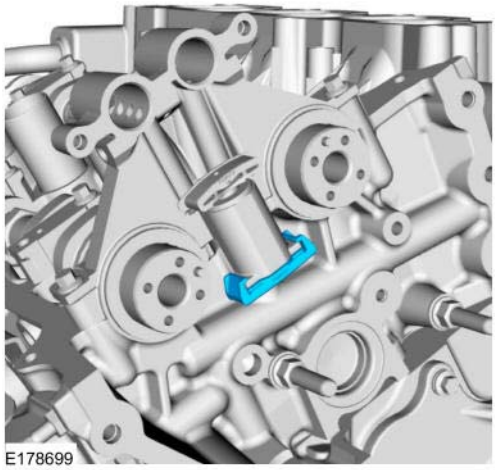
NOTE: The following 4 steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.

12.



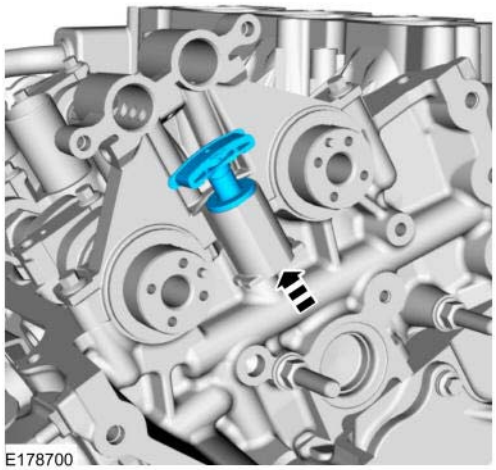
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

13.
Remove the bolt and the exhaust VCT oil control solenoid.



14.

Remove the RH secondary timing chain tensioner shoe.

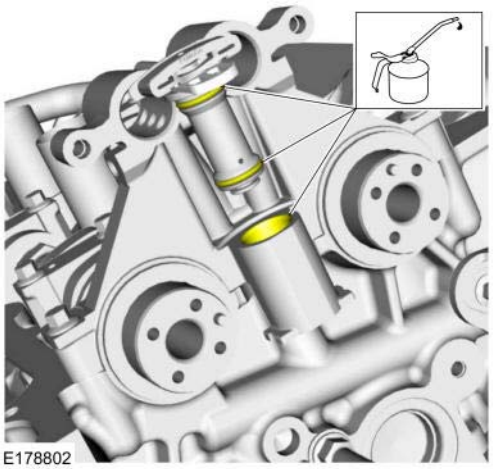
15.

Remove the RH secondary timing chain tensioner by pushing up from the bottom.

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT > INSTALLATION

Installation of the RH secondary timing chain tensioner

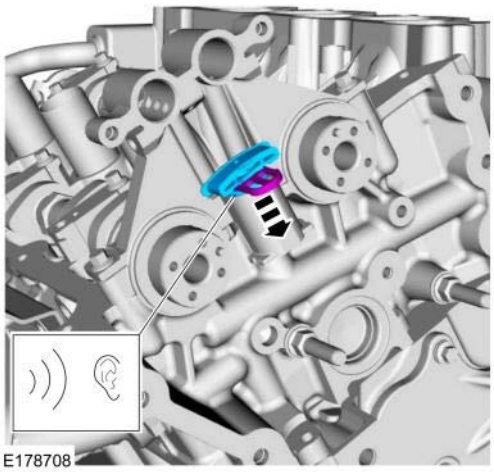
NOTE: The following 10 steps are only for the installation of the RH secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.



NOTE: Do not remove the secondary timing chain tensioner shipping clip, until

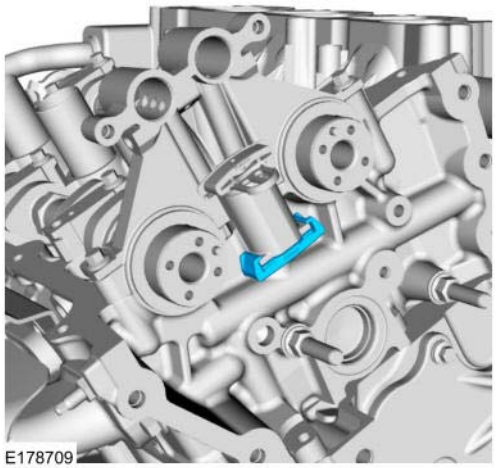
instructed to do so.

1.
Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.



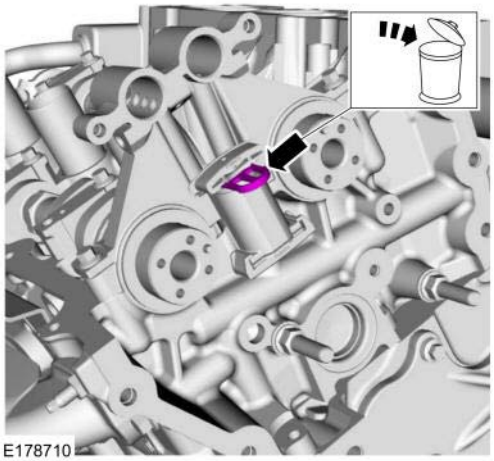
Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



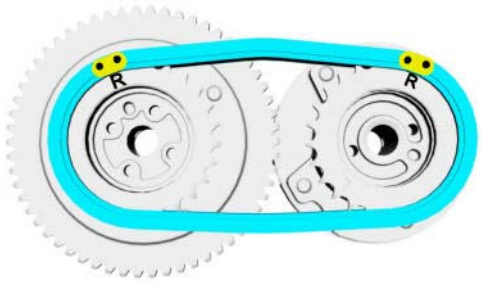
NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

2.
Install the RH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.



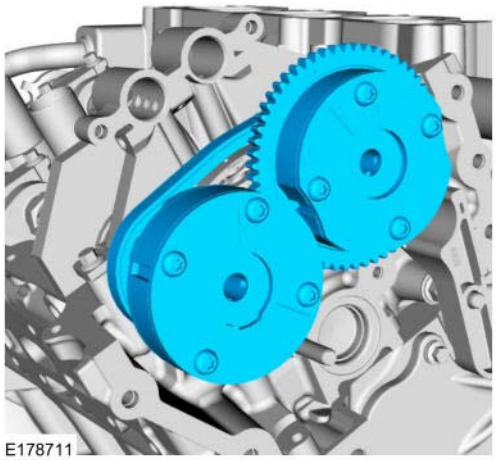
3.

Install the RH secondary timing chain tensioner shoe.



4.

Remove and discard the RH secondary timing chain tensioner shipping clip.



5.

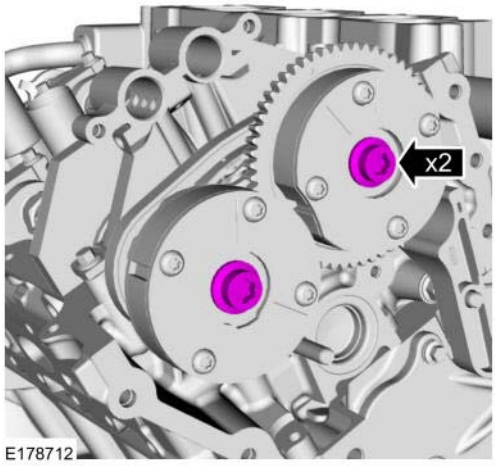
Align the colored links with the timing marks and assemble the RH VCT units.

NOTE: It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

6.
Position the RH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

7.

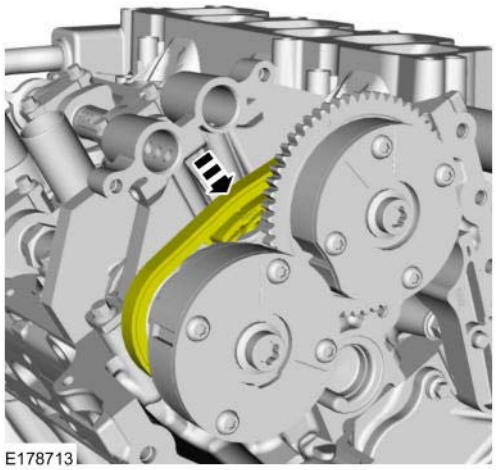
Install the new RH VCT unit bolts and tighten in 4 stages.



Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)



Stage 3: 18 lb.ft (25 Nm)

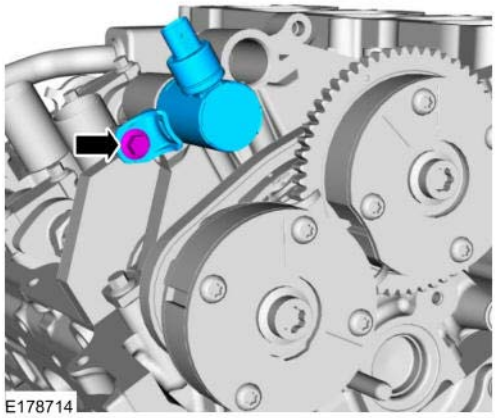
Stage 4: 180°

8.

Activate the RH secondary timing chain tensioner by pressing down on the secondary timing chain and tensioner top shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

NOTE: Do not use excessive force when installing the VCT oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.

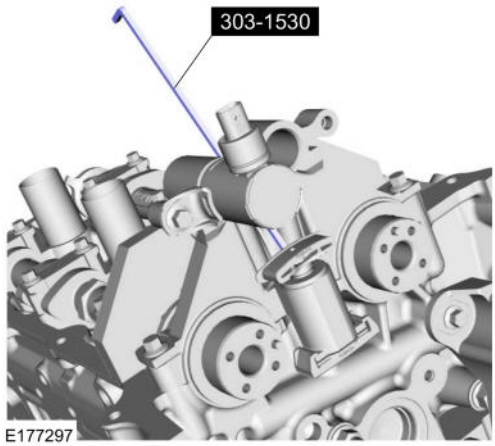
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

9.
Install the RH exhaust VCT oil control solenoid and the bolt.

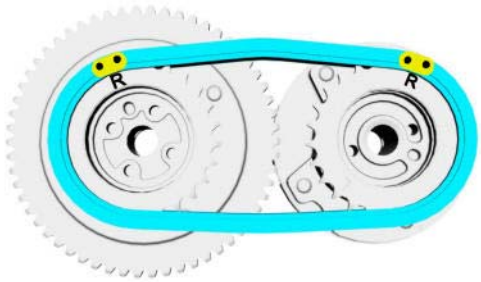
Torque:



Stage 1: 71 lb.in (8 Nm)

Stage 2: 20°

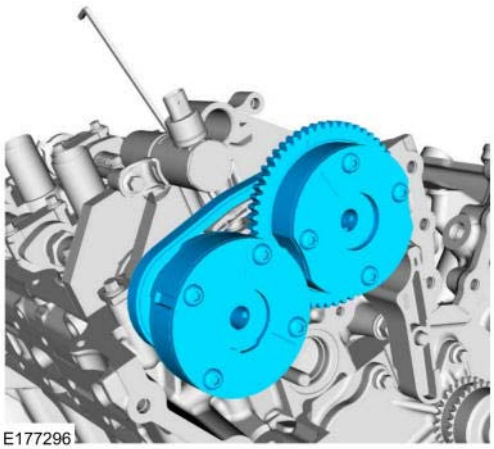
10.



Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

RH variable camshaft timing (VCT) unit

11.



Align the colored links with the timing marks and assemble the RH VCT units.

E177645

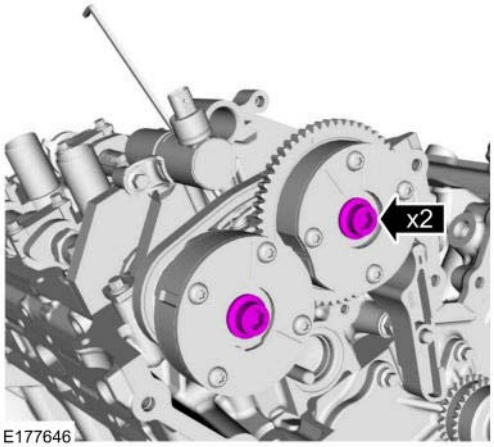
NOTE: It may be necessary to rotate the camshafts slightly, to install the RH VCT units.

12.
Position the RH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

E177296

13.

Install the new RH VCT unit bolts and tighten in 4 stages.

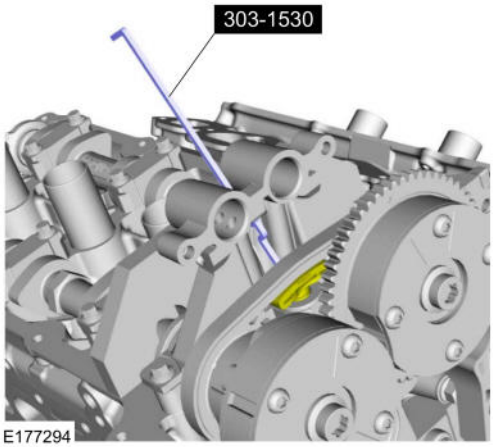


Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 18 lb.ft (25 Nm)



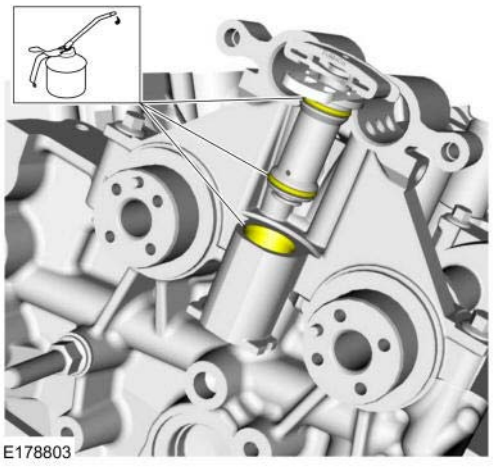
Stage 4: 180°

NOTE: Make sure the secondary timing chain is centered on the timing chain tensioner guides.

NOTE: The VCT oil control solenoids are removed for clarity.

14.
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

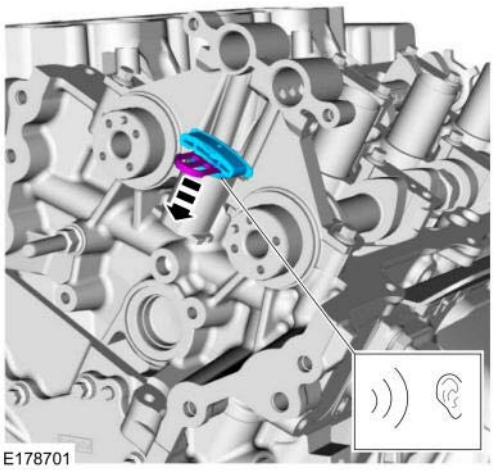
Installation of the LH secondary timing chain tensioner



NOTE: The following 10 steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.

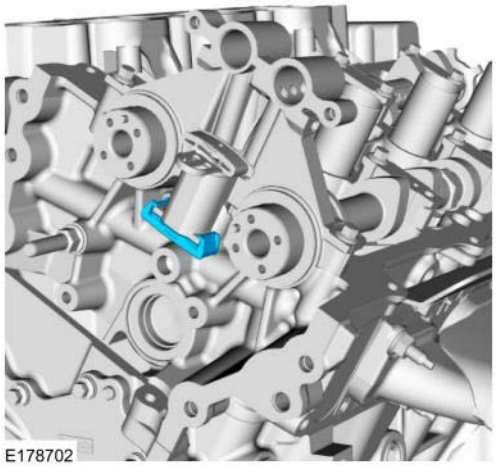
NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

15.
Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.



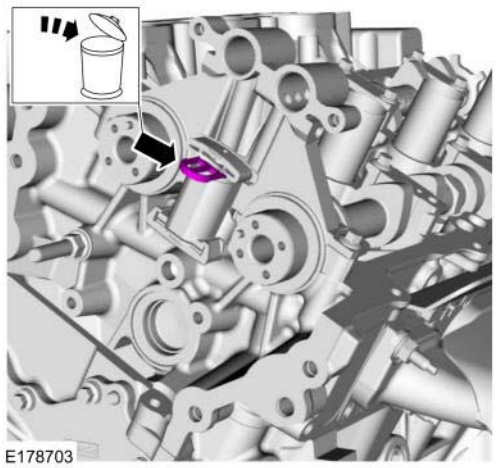
Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



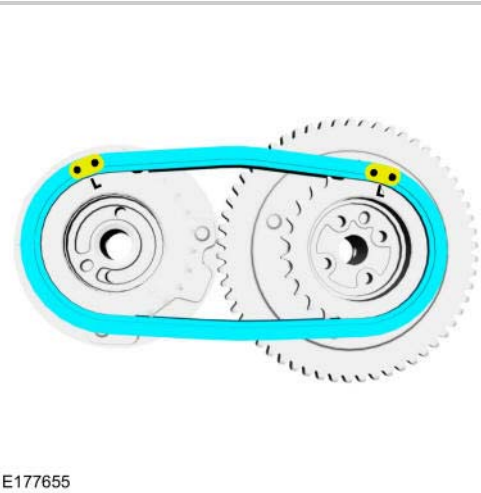
NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

16.
Install the LH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.



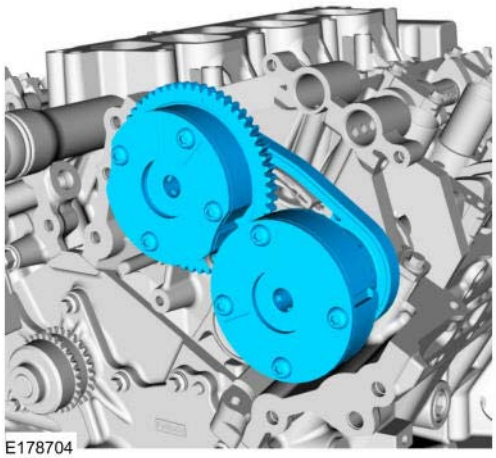
17.

Install the LH secondary timing chain tensioner shoe.



18.

Remove and discard the LH secondary timing chain tensioner shipping clip.



19.

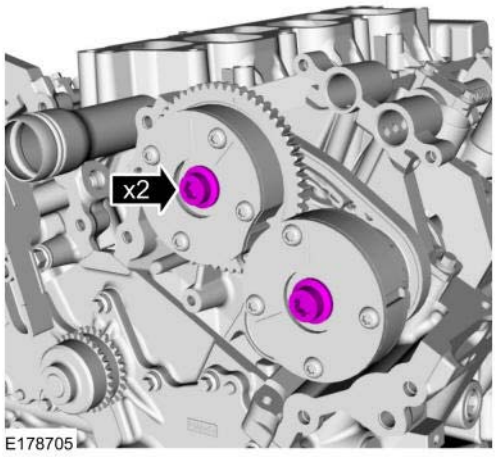
Align the colored links with the timing marks and assemble the LH VCT units.

20.

Position the LH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

21.

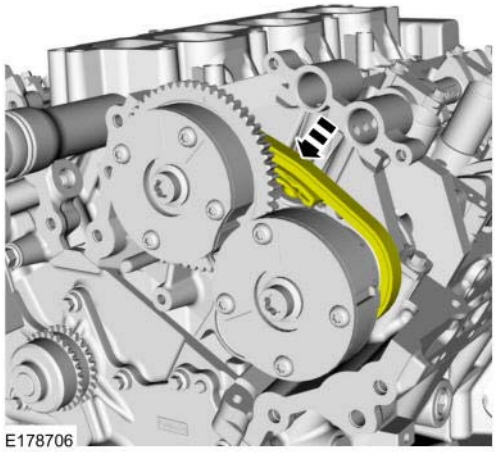
Install the new LH VCT unit bolts and tighten in 4 stages.



Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)

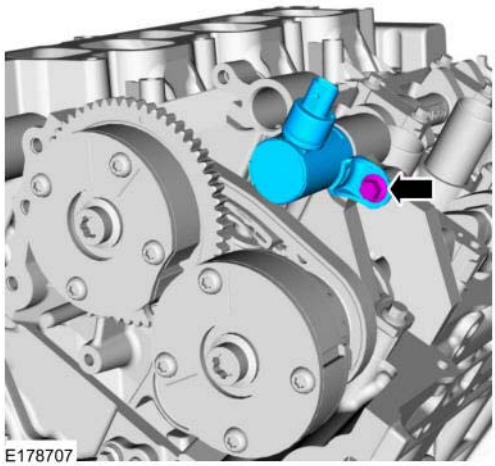


Stage 3: 18 lb.ft (25 Nm)

Stage 4: 180°

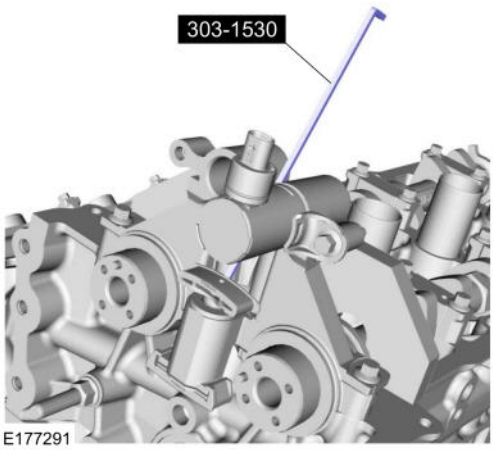
22.

Activate the LH secondary timing chain tensioner by pressing down on the secondary timing chain and tensioner top shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.



NOTE: Do not use excessive force when installing the VCT oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.

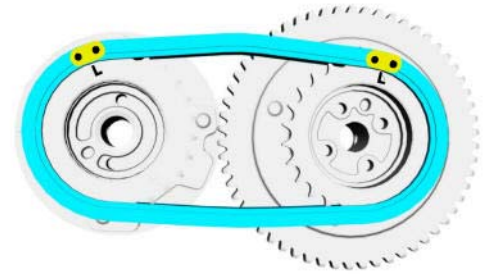
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid



NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

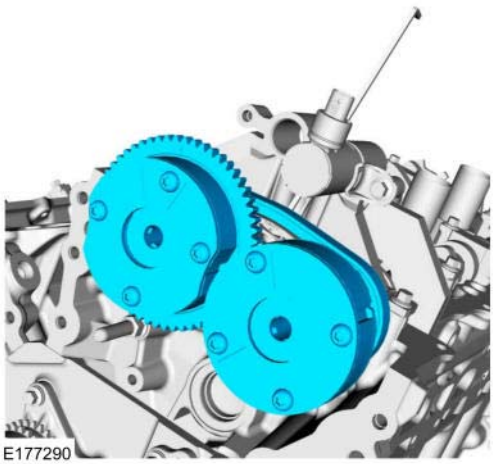
23.
Install the LH exhaust VCT oil control solenoid and the bolt.

24.



Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

LH variable camshaft timing (VCT) unit



25.

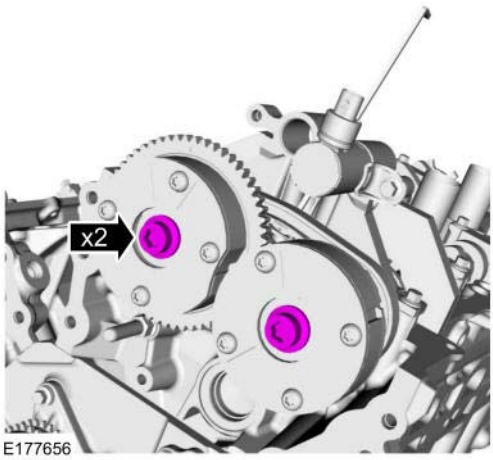
Align the colored links with the timing marks on the LH VCT units.

NOTE: It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

26.
Position the LH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

27.

Install the new LH VCT unit bolts and tighten in 4 stages.



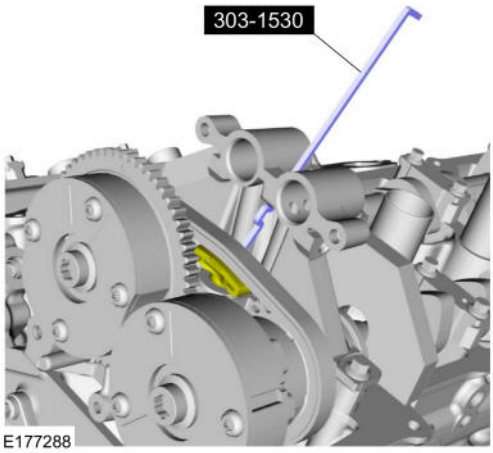
Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 18 lb.ft (25 Nm)

Stage 4: 180°



NOTE: Make sure the secondary timing chain is centered on the timing chain tensioner guides.

NOTE: The VCT oil control solenoids are removed for clarity.

28.

Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

All variable camshaft timing (VCT) unit

29.

Install the timing chain. Refer to: Timing Chain .

REMOVAL > ENGINE

Special Tool(s) / General Equipment

	303-1245 Engine Lift Eye TKIT-2006UF-FLM TKIT-2006UF-ROW
	303-1529 Lift Eye, Engine TKIT-2010A-F TKIT-2010A-LM TKIT-2010A-ROW
Floor Crane	
Oil Drain Equipment	
Trolley Jack

Wooden Block	

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

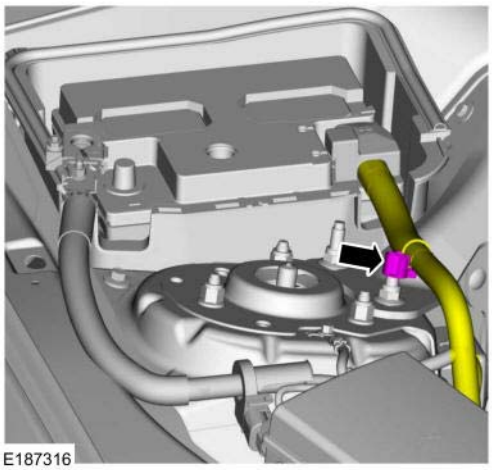
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE .

3.

Disconnect the battery ground. Refer to: Battery Disconnect and Connect .



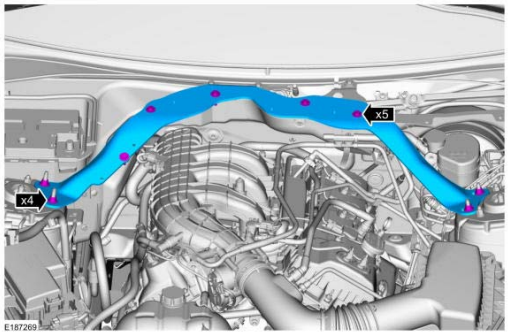
Convertible

4.

Remove the cowl panel grille. Refer to: Cowl Panel Grille .

5.

Detach the battery cable retainer.



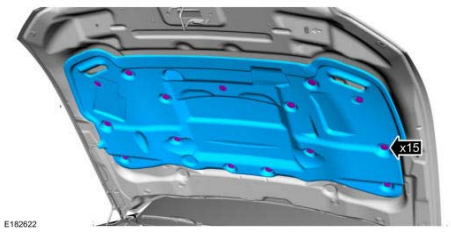
6.

Disconnect the positive battery cable. Refer to: Battery Disconnect and Connect .

7.

Remove the cowl extension nuts.

Remove the bolts and the cowl extension.



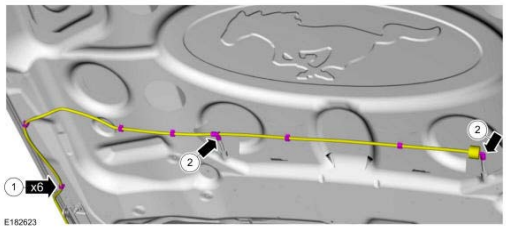
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

8.

Drain the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

9.

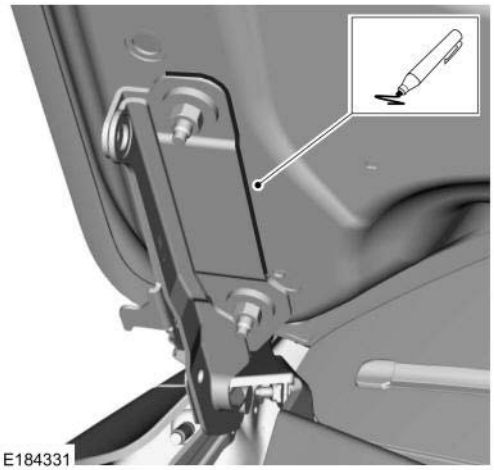
Remove the pin-type retainers and the hood insulation.



10.

1.

Detach the windshield washer hose retainers.



2.

Disconnect the windshield washer hose couplings. Refer to: Washer Hose Coupling .

NOTE: RH side shown in illustration, LH similar.

11.
Index-mark the hood hinges location to aid in hood installation.

12.

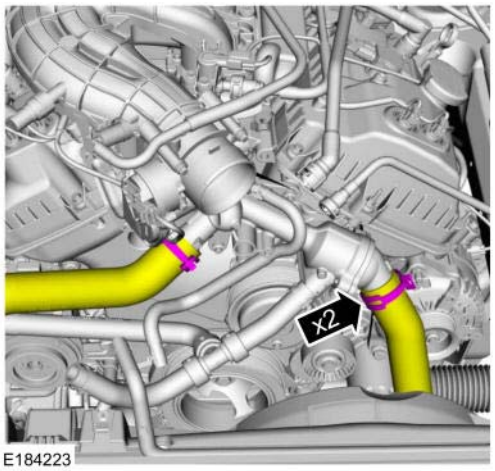
Remove the nuts and the hood.

13.

Remove the following items:

Refer to: DEGAS BOTTLE .

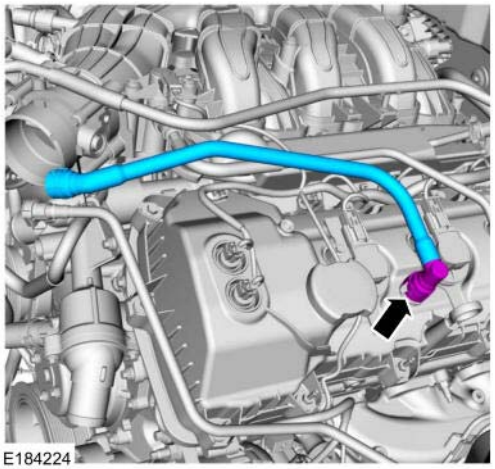
Refer to: AIR CLEANER OUTLET PIPE .



Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

14.



Disconnect the upper and lower radiator hoses from the thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer

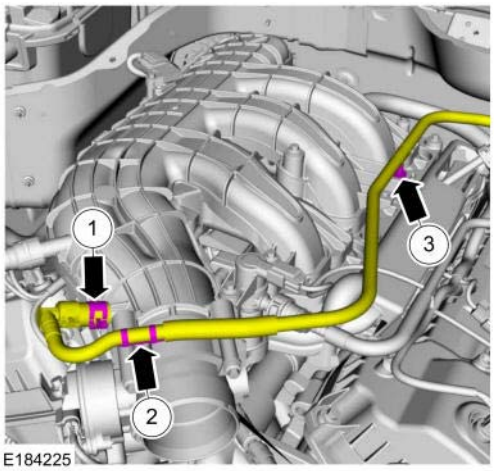
15.

Remove the crankcase vent tube.

16.

1.

Disconnect the vacuum hose from the upper intake manifold.

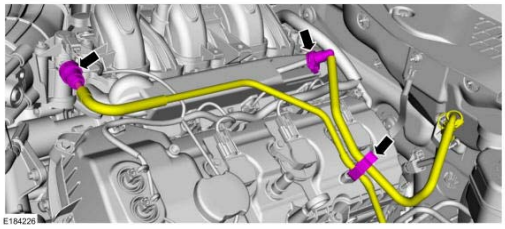


Use the General Equipment: Hose Clamp Remover/Installer

2.

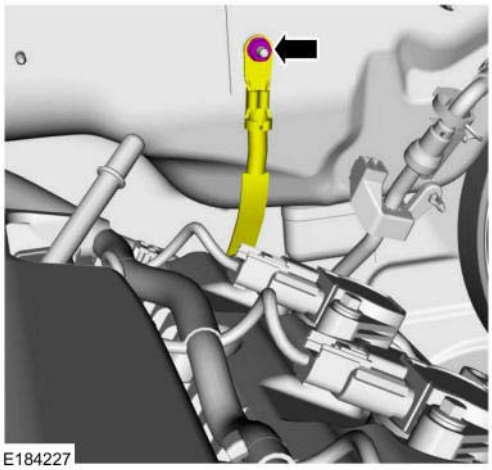
Detach the vacuum hose retainer from the throttle body.

3.



Detach the vacuum hose retainer from the intake manifold.

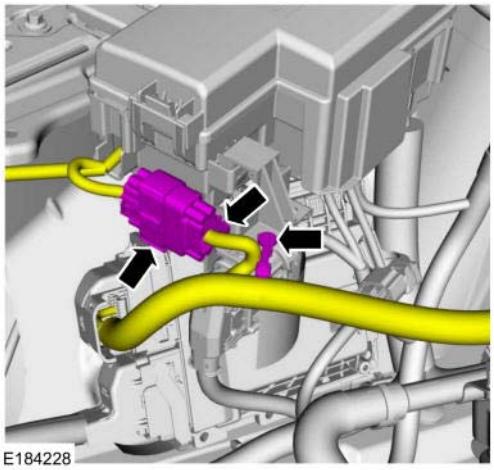
17.



Disconnect the fuel tube and EVAP purge valve quick release coupling. Refer to: QUICK RELEASE COUPLING .

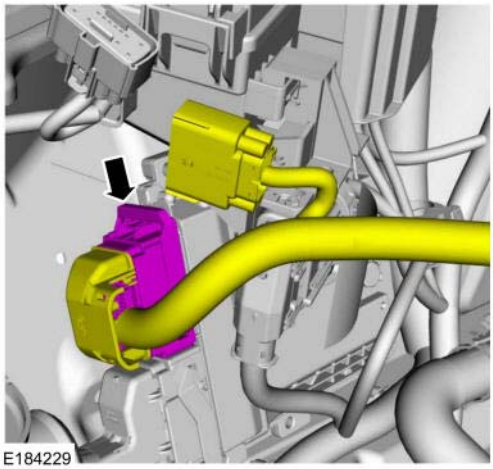
Remove the retainer from the LH valve cover.

18.



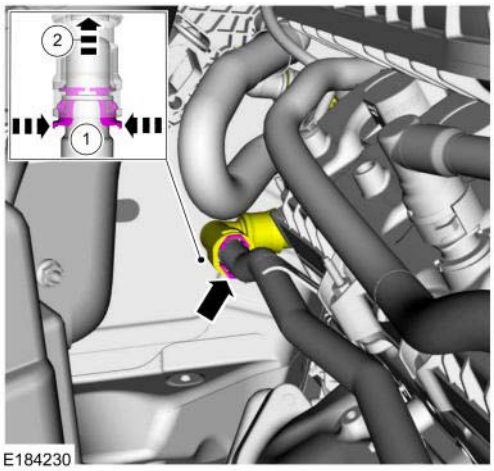
Remove the nut and the ground strap from the cowl.

19.



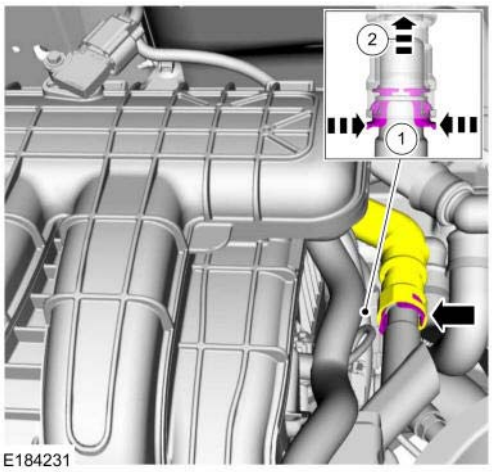
Detach and disconnect the engine harness electrical connector.

Detach the wiring harness retainer.



20.

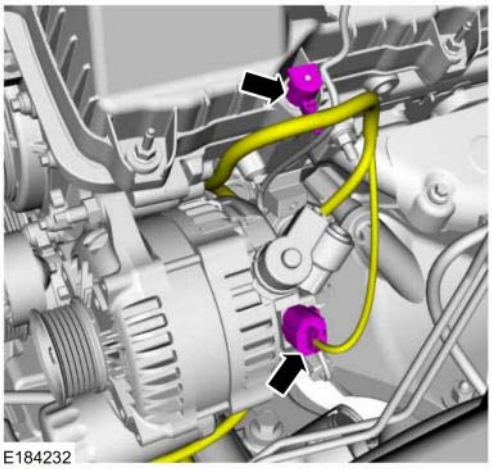
Disconnect the upper PCM electrical connector.



21.

Pinch the tabs and disconnect the heater hose from the coolant tube.

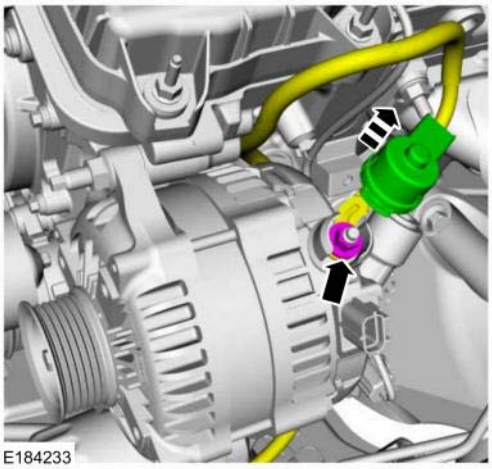
22.



Pinch the tabs and disconnect the heater hose from the back of the lower intake manifold.

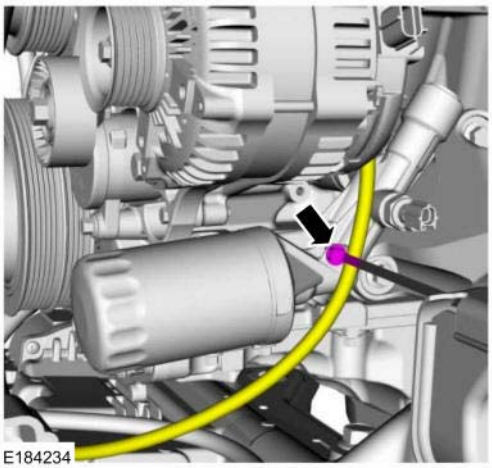
23.

Detach the wire harness retainer from the valve cover stud bolt.



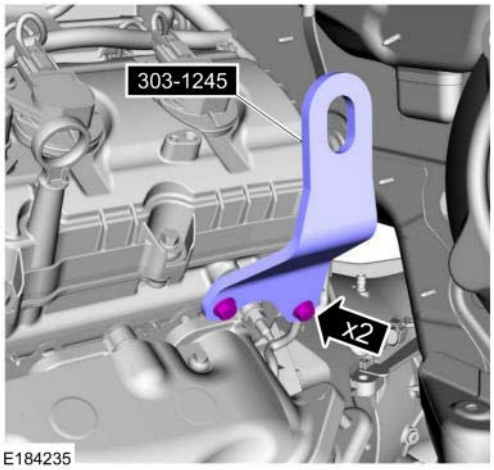
Disconnect the generator electrical connector.

24.



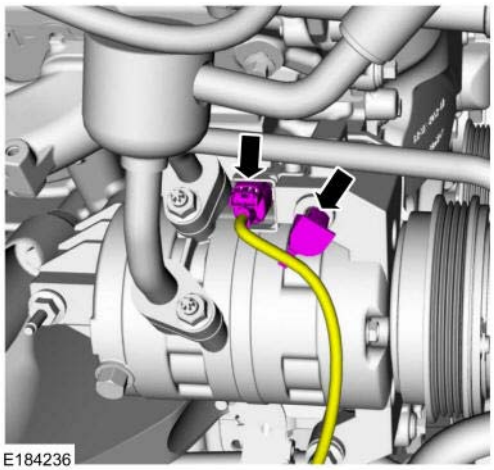
Position the protective cover aside.

Remove the nut and the generator B+ cable.



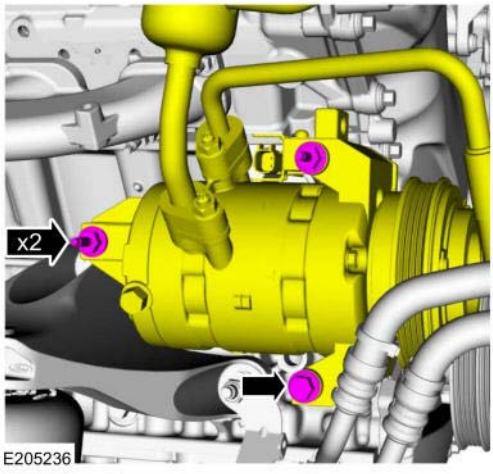
25.

Detach the generator wiring harness retainer from the oil filter adapter.



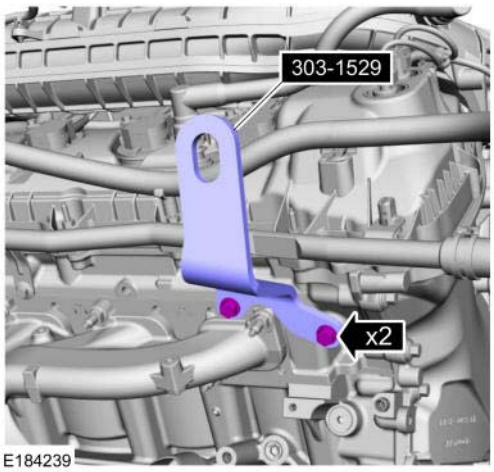
26.

Install Special Service Tool: 303-1245 Engine Lift Eye.



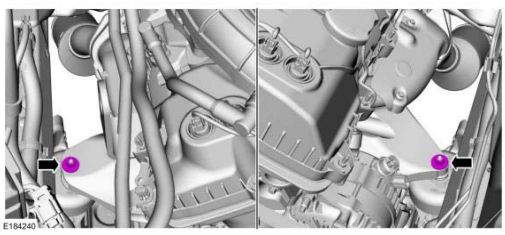
27.

Disconnect the A/C compressor electrical connector and the wire harness retainer.



NOTE: The stud bolts and bolt will stay with the A/C compressor.

28.
Loosen the stud bolts, bolt and position the A/C compressor aside.



29.

Install Special Service Tool: 303-1529 Lift Eye, Engine.

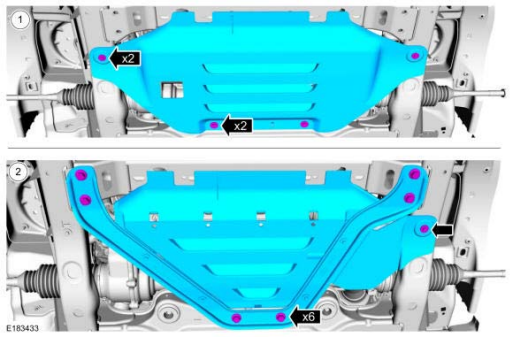
30.

Remove the RH and LH engine mount bracket nuts.

31.

Remove the front wheels and tires. Refer to: Wheel and Tire .

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



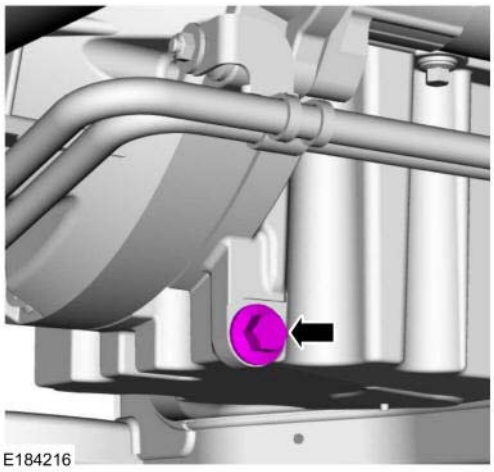
32.

1.

Remove the bolts and the underbody shield.

2.

Remove the bolts and the subframe bracket and underbody shield assembly.

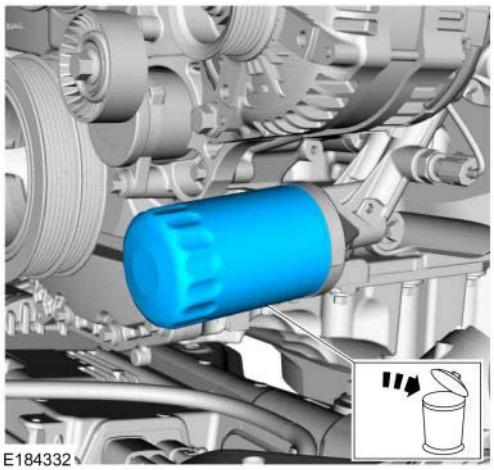


33.

Drain the engine oil and install drain plug.

Use the General Equipment: Oil Drain Equipment

Torque

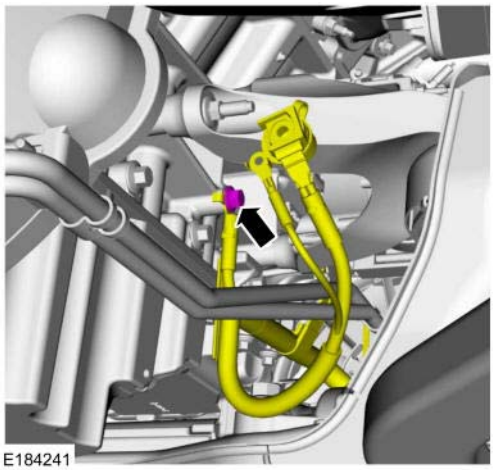


: 20 lb.ft (27 Nm)

34.

Remove and discard the engine oil filter.

Use the General Equipment: Oil Drain Equipment

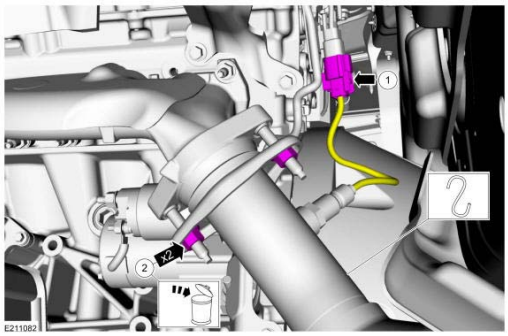


35.

Remove the starter motor. Refer to: STARTER MOTOR .

NOTE: Automatic transmission shown in illustration, manual transmission similar.

36.
Remove the bolt and ground wire from the RH side of the engine.



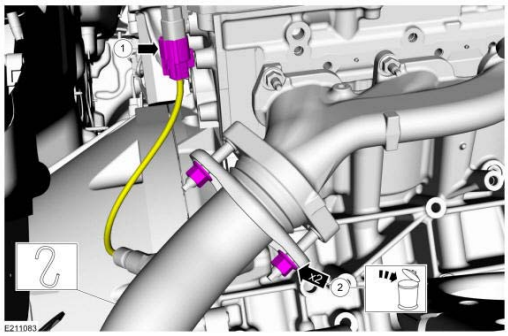
37.

NOTE: Make sure that the mating faces are clean and free of foreign material.

1.
Disconnect the LH HO2S electrical connector.

2.

Support the catalytic converter and remove and discard the nuts.

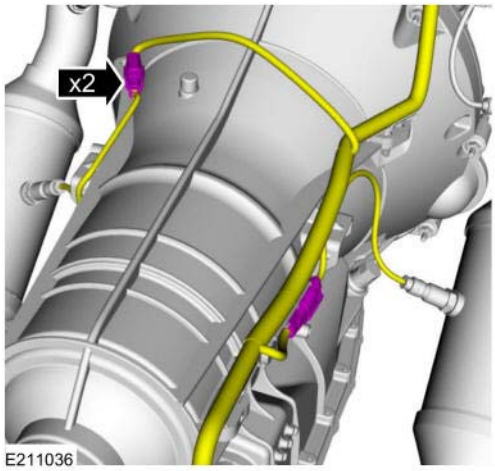


38.

NOTE: Make sure that the mating faces are clean and free of foreign material.

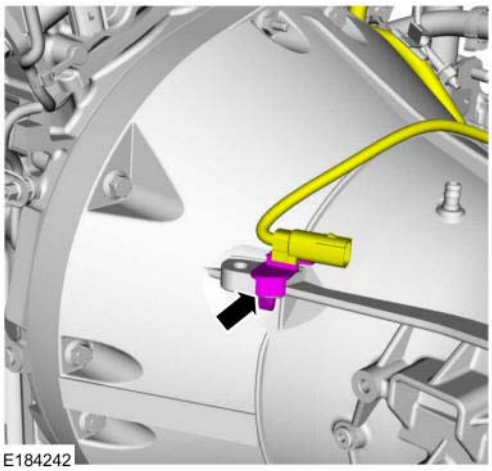
1.
Disconnect the RH HO2S electrical connector.

2.



Support the catalytic converter and remove and discard the nuts.

6-Speed Automatic Transmission - 6R80



39.

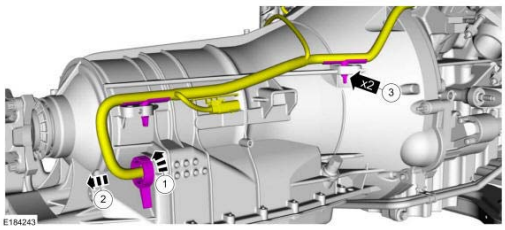
Disconnect the catalyst monitor sensors.

40.

Detach the wiring harness retainer from the LH side of the transmission.

41.

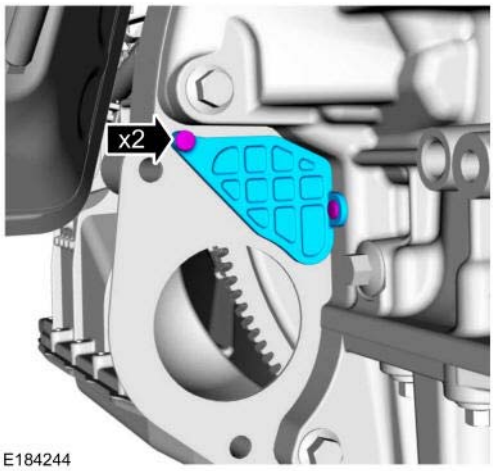
1.



Rotate the transmission electrical connector.

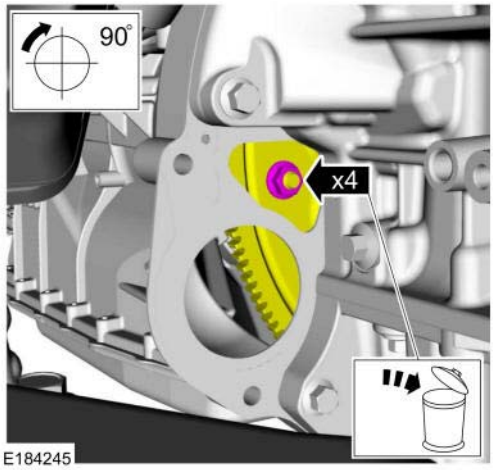
2.

Pull the transmission electrical connector out to disconnect.



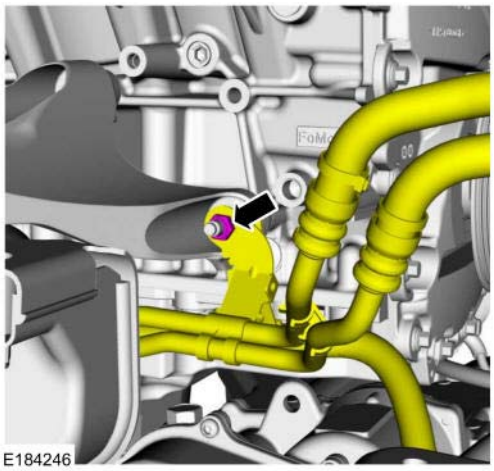
3.

Detach the wiring harness retainers and position the aside.



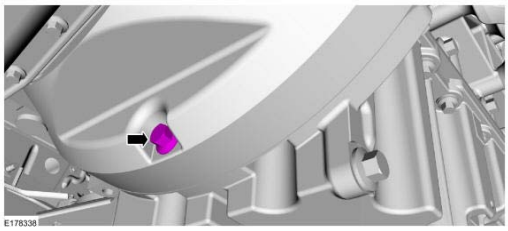
42.

Remove the retainers and the access cover.



NOTE: Using the crankshaft pulley bolt, turn the engine clockwise.

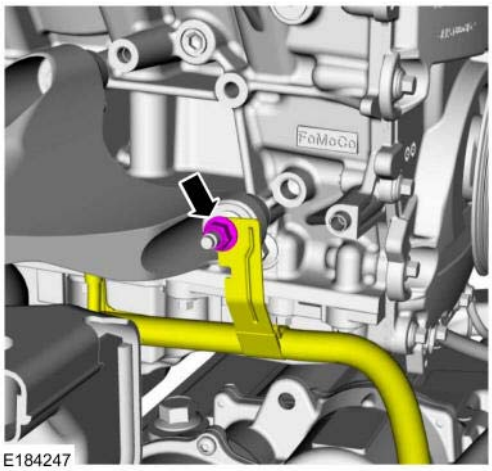
43.
Remove and discard the torque converter nuts.



44.

Remove the nut from the front of the RH engine mount bracket stud bolt and position the brackets for the transmission cooling tubes and wiring harness aside.

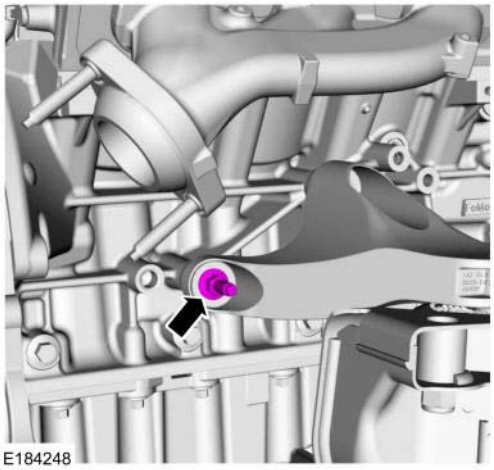
45.



Remove the lower bellhousing bolt.

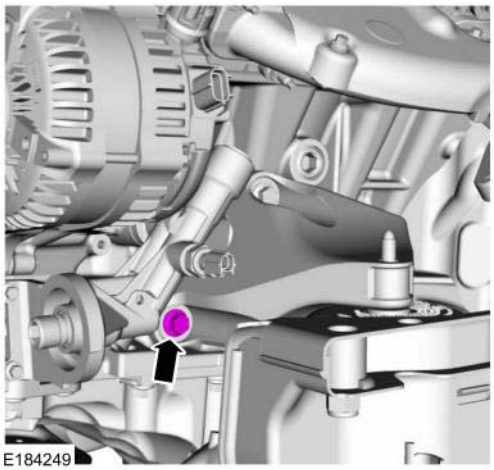
6-Speed Manual Transmission - MT82

46.



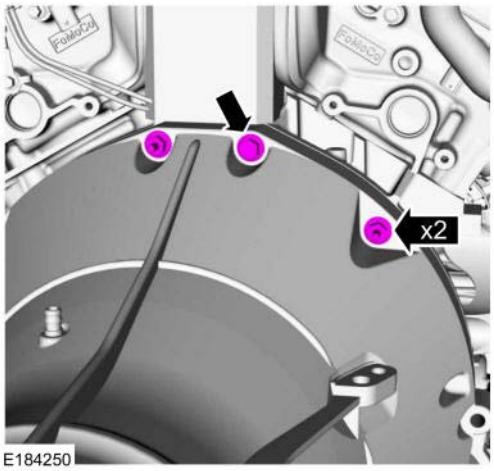
Remove the nut from the front of the RH engine mount bracket stud bolt and position the bracket for the wiring harness aside.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



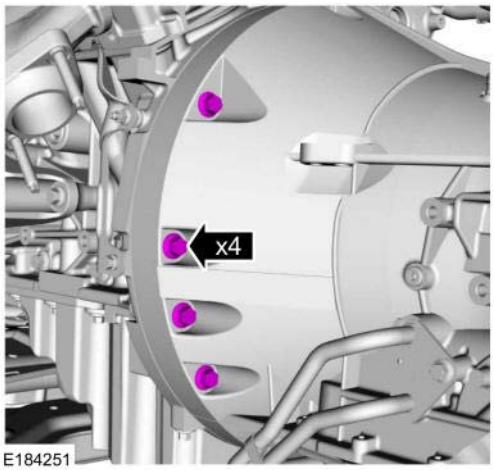
47.

Remove the rear stud bolt from the RH engine mount bracket.



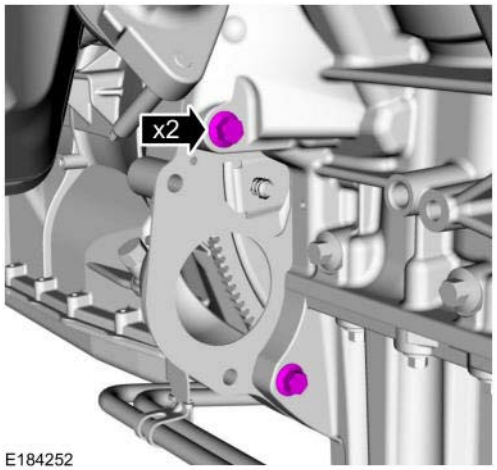
48.

Remove the front bolt from the LH engine mount bracket.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

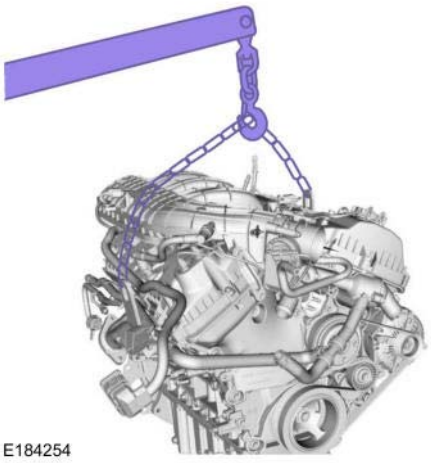
49.
Remove the upper bellhousing bolts.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

50.
Remove the LH side bellhousing bolts.

NOTE: Automatic transmission shown in illustration, manual transmission similar.



51.
Remove the RH side bellhousing bolts.

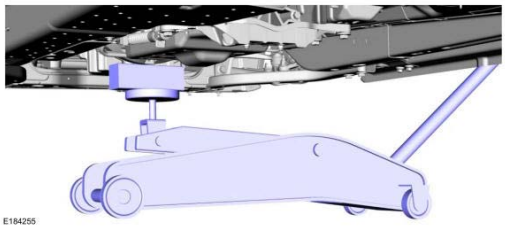
52.

Install the engine floor crane.

Use the General Equipment: Floor Crane

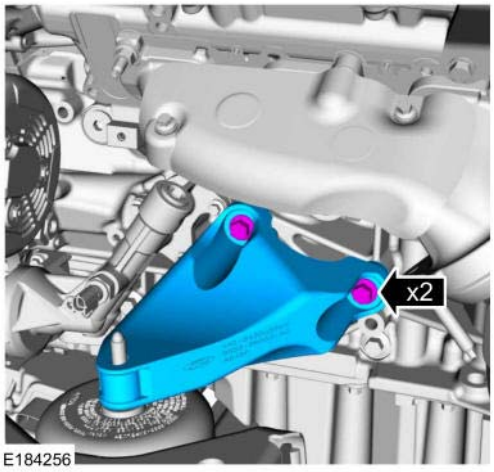
53.

Install a ratchet strap from the front of engine to the chain to keep the engine level.



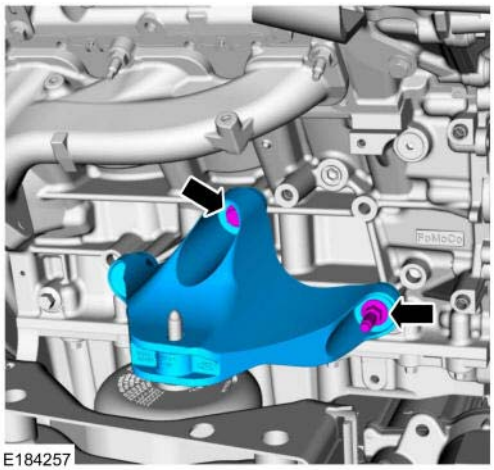
54.

Install a jack and wooden block under the transmission bellhousing to support the transmission.



Use the General Equipment: Wooden Block

Use the General Equipment: Trolley Jack



55.

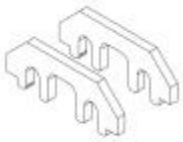
Remove the bolts and the LH engine mount bracket.

56.

Remove the bolts and the RH engine mount bracket.

57.

Using the floor crane, remove the engine.



Use the General Equipment: Floor Crane

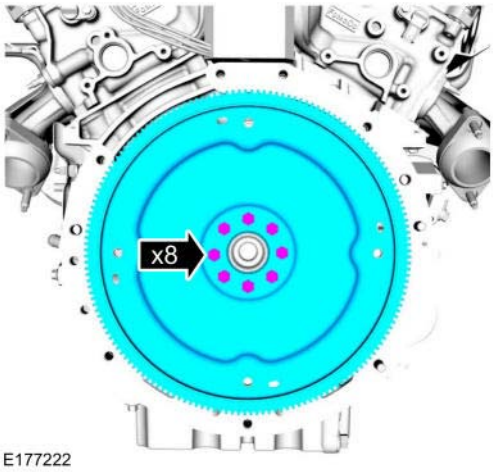
Materials

Name	Specification
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



NOTE: If the cylinder head(s) is replaced, a new secondary timing chain tensioner will need to be installed.

NOTE: Refer to the exploded view under the Engine Component View .

6-Speed Automatic Transmission - 6R80

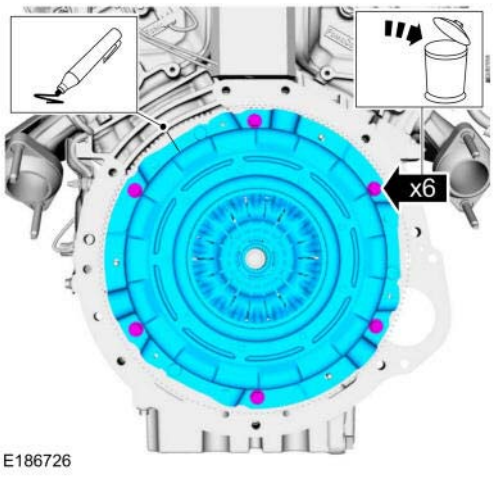
1.

Remove the bolts and the flexplate.

6-Speed Manual Transmission - MT82

NOTE: Loosen the bolts evenly to prevent clutch pressure plate damage.

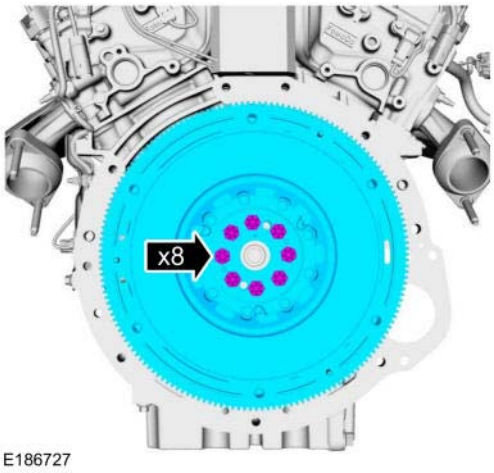
NOTE: If the parts are to be reused, index-mark the pressure plate to the flywheel. Failure to install the pressure plate to the flywheel in the original position may result in a clutch system vibration.



WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

2.

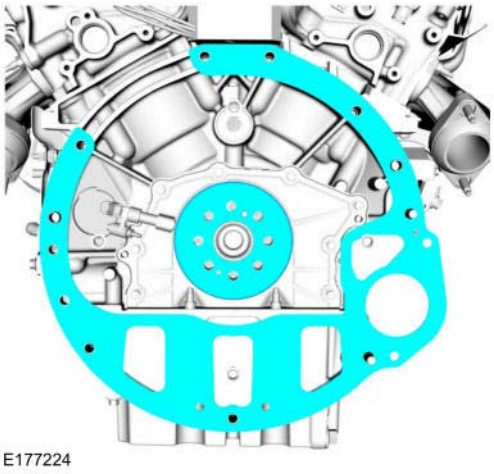
Remove the 6 pressure plate bolts by turning them 1 turn at a time in a star pattern until the clutch is fully released.



Remove the pressure plate and the clutch disc.

Discard the pressure plate bolts.

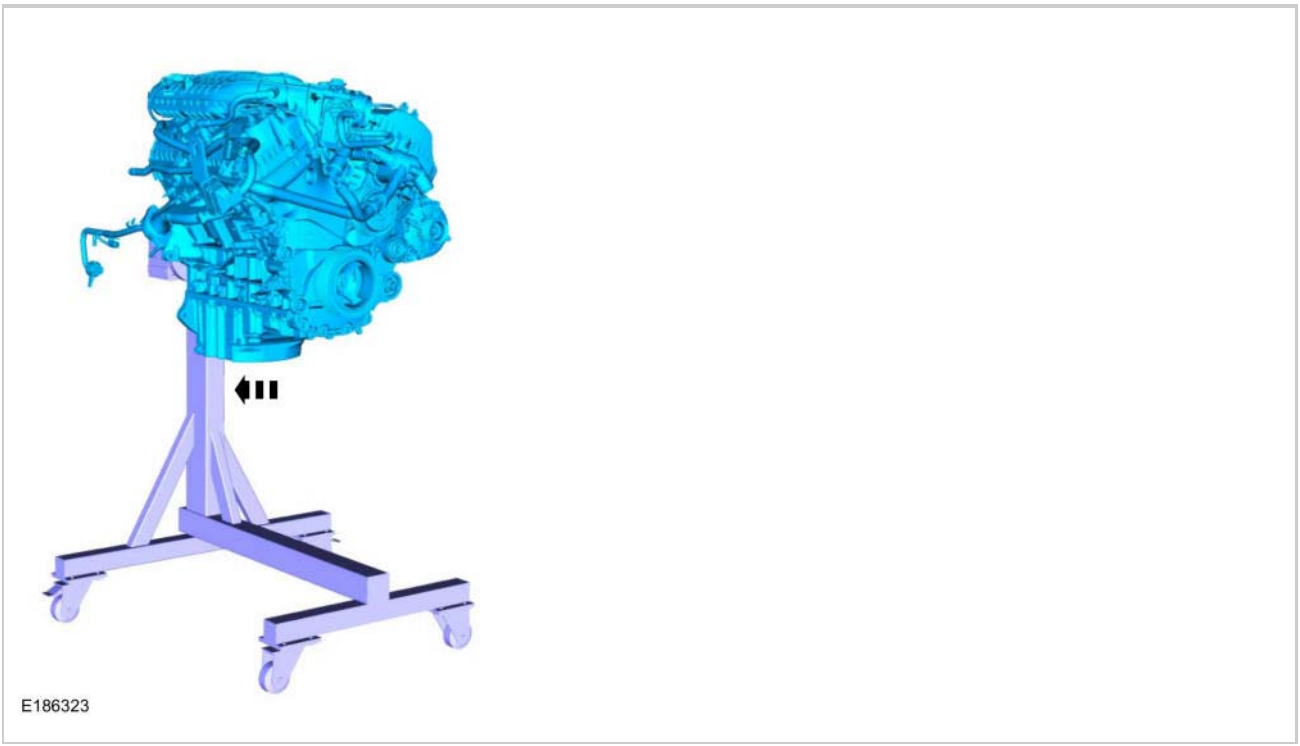
3.



Remove the bolts and the flywheel.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

4.



Remove the crankshaft sensor ring and the engine-to-transmission spacer plate.

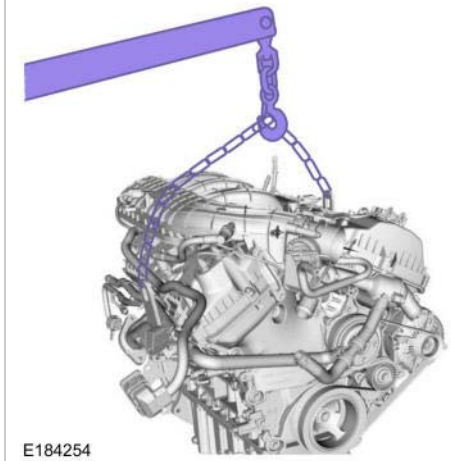
NOTE: Install the engine stand bolts into the cylinder block only. Do not install the bolts into the oil pan.

5.
Mount the engine to the mounting stand.

Use the General Equipment: Mounting Stand

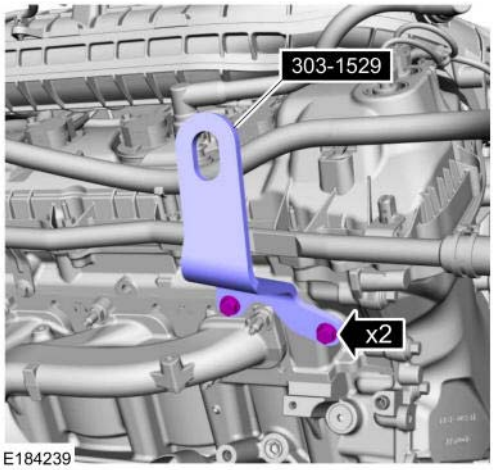
6.

Remove the ratchet strap.



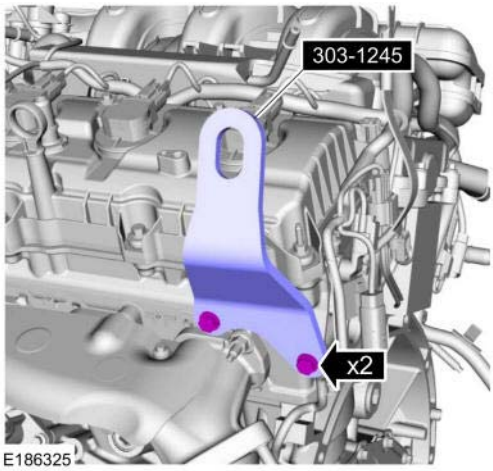
Use the General Equipment: Floor Crane

7.



Remove the floor crane and chain.

Use the General Equipment: Floor Crane

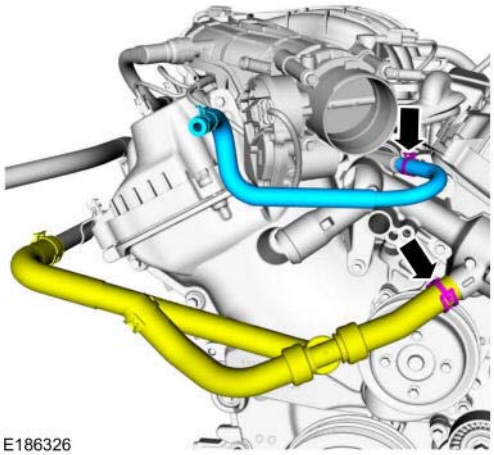


8.

Remove Special Service Tool: 303-1529 Lift Eye, Engine.

9.

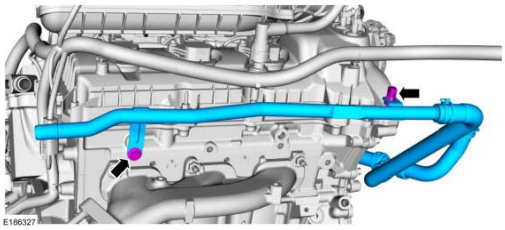
Remove Special Service Tool: 303-1245 Engine Lift Eye.



10.

Release the clamp and remove the coolant return hose.

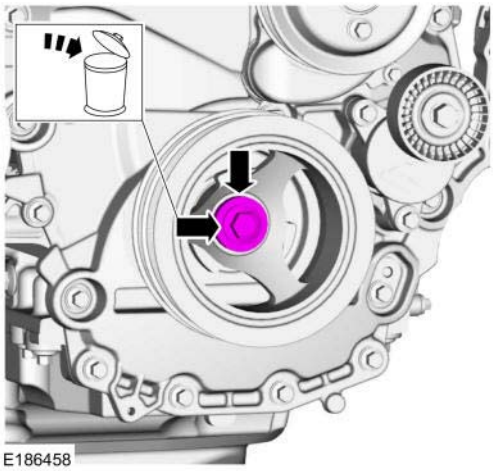
Use the General Equipment: Hose Clamp Remover/Installer



Release the clamp and position the coolant hose aside.

Use the General Equipment: Hose Clamp Remover/Installer

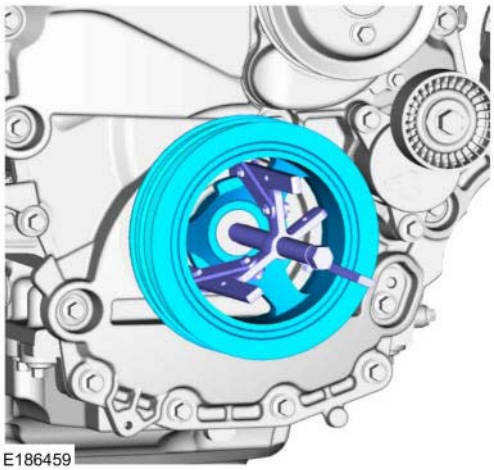
11.



Remove the bolt, detach the coolant tube retainer and remove the coolant tube.

12.

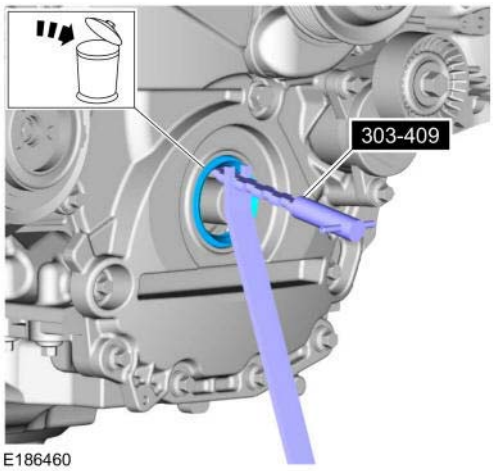
Remove the crankshaft pulley bolt and washer.



Discard the bolt.

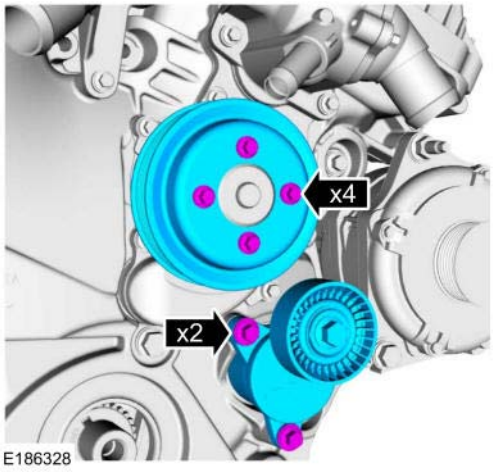
13.

Using a three leg puller, remove the crankshaft pulley.



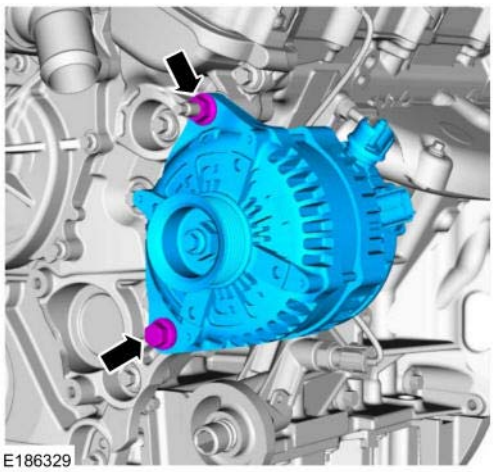
Use the General Equipment: Three Leg Puller

14.



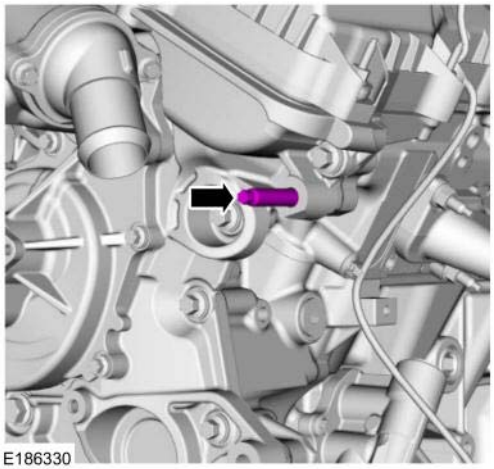
Using the special tool, remove and discard the crankshaft front seal.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.



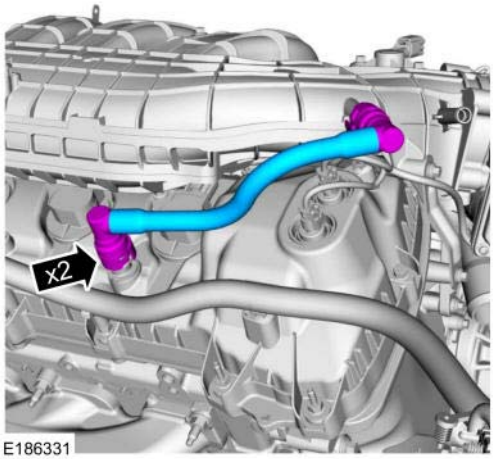
15.

Remove the bolts, coolant pump pulley and the accessory drive belt tensioner.



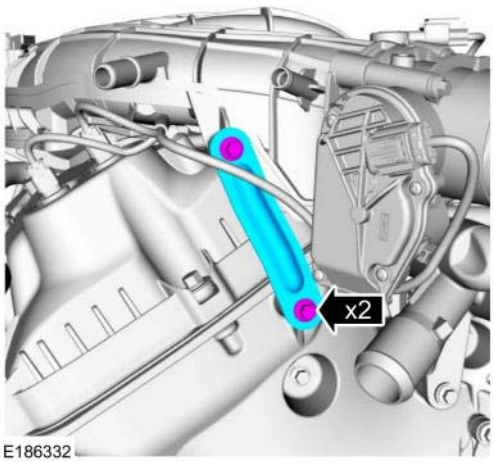
16.

Remove the nut, bolt and the generator.



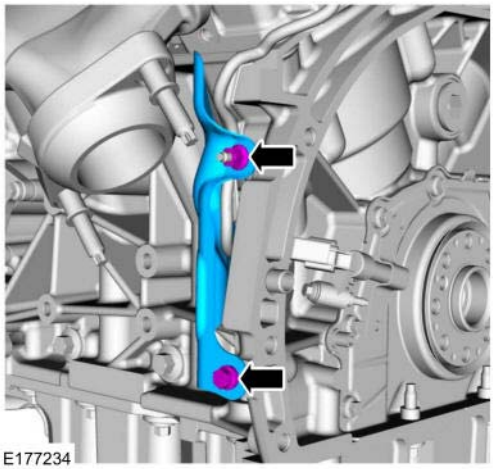
17.

Remove the generator stud.



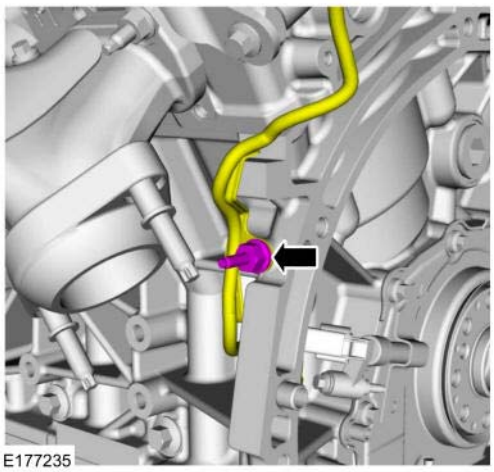
18.

Remove the PCV tube.



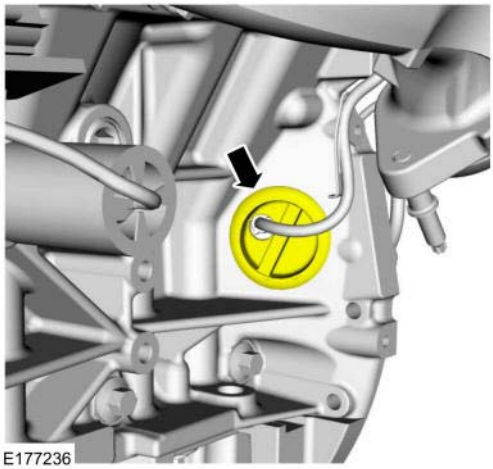
19.

Remove the bolts and the upper intake manifold support bracket.



20.

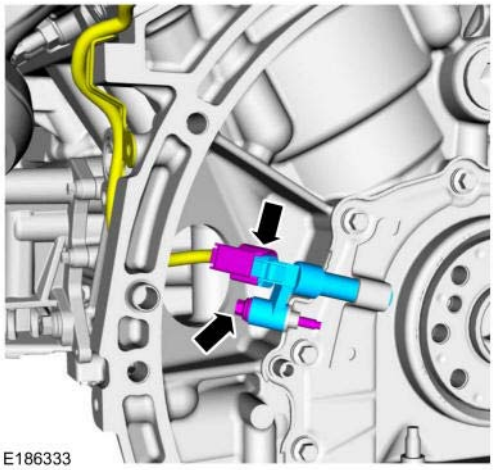
Remove the nut, bolt and the heat shield.



21.

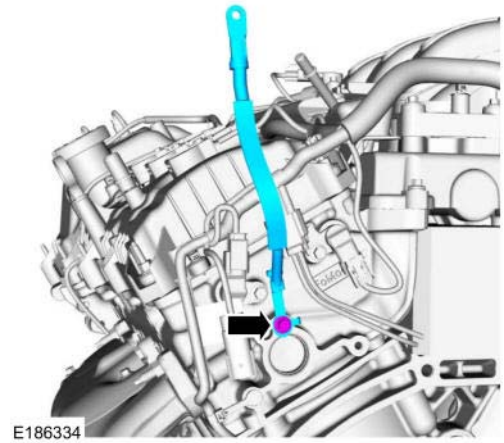
Remove the wiring harness retainer stud bolt.

22.



Remove the wiring harness grommet.

23.

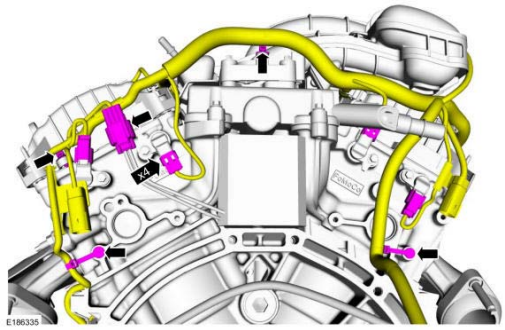


Disconnect the CKP sensor electrical connector.

Remove the bolt and the CKP sensor.

24.

Remove the bolt and the ground strap.



25.

Disconnect the KS sensor electrical connector.

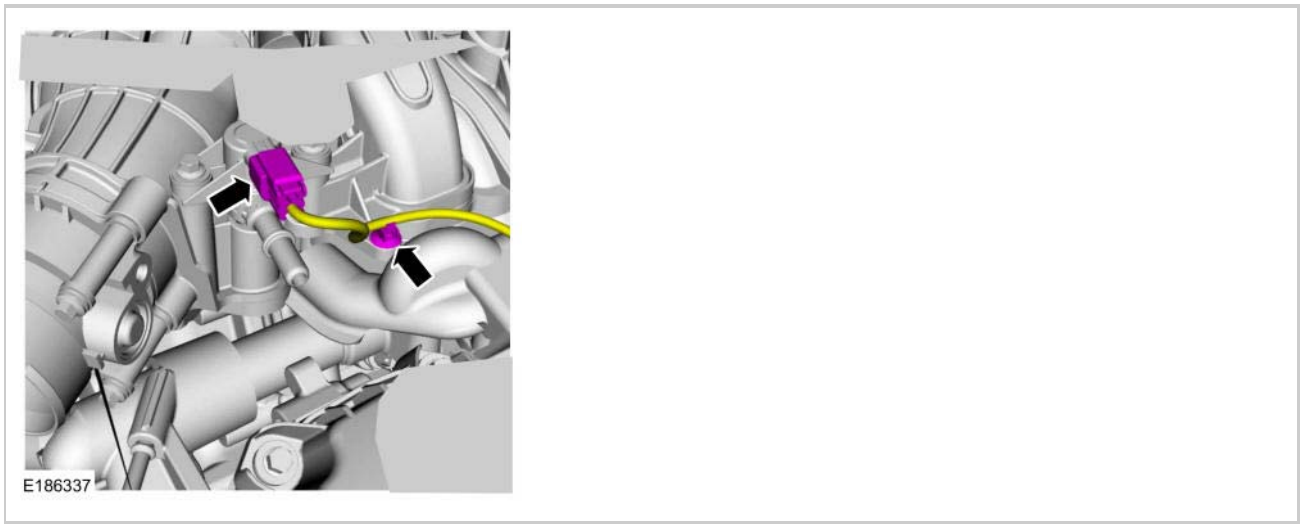
Disconnect the CMP sensor electrical connectors.

Detach the wiring harness retainers.

26.

Disconnect the VCT oil control solenoids electrical connectors.

Disconnect the ignition coil-on-plug electrical connectors.

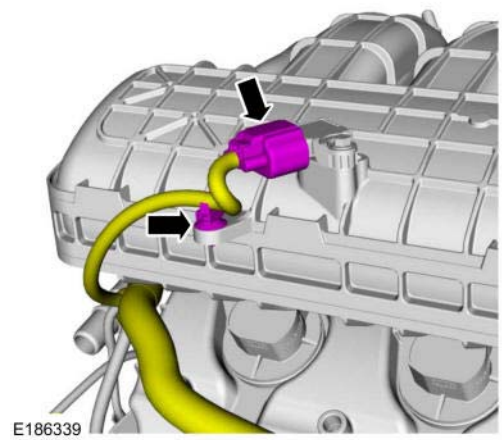


Disconnect the oil pressure switch electrical connector.

Detach the wiring harness retainers.

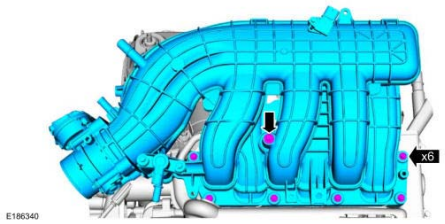
27.

Disconnect the EVAP canister purge valve electrical connector and wire retainer.



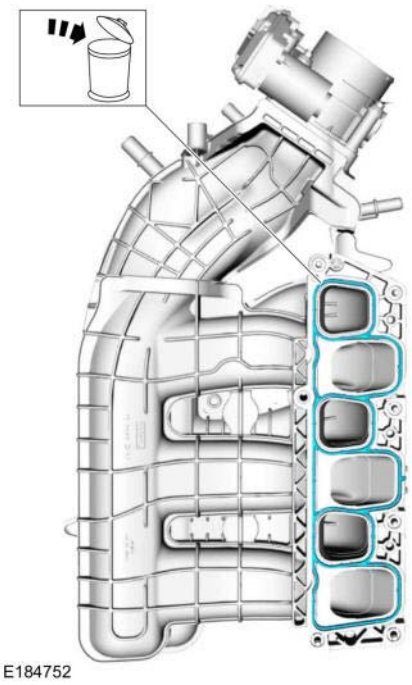
28.

Disconnect the throttle body electrical connector and wire retainer.



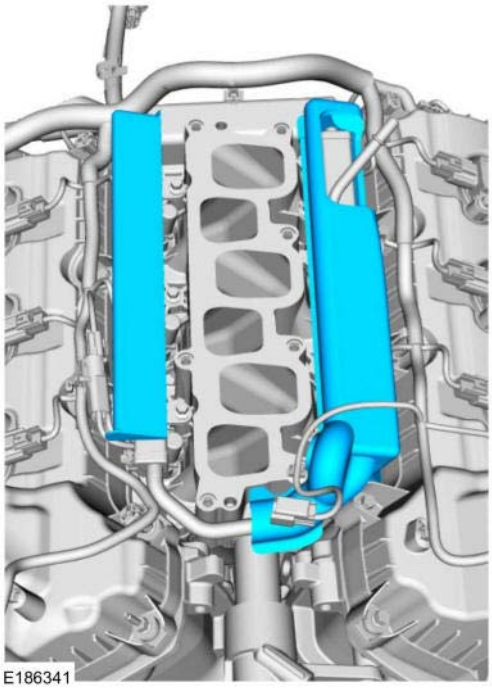
29.

Disconnect the MAPT sensor and wire retainer.



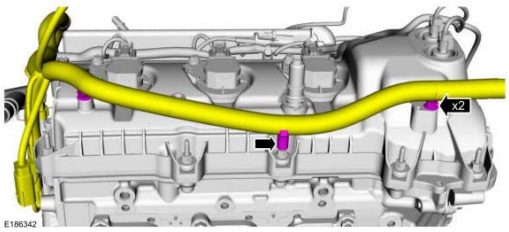
NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

30.
Remove the bolts and the upper intake manifold.



31.

Remove and discard the upper intake manifold gasket.

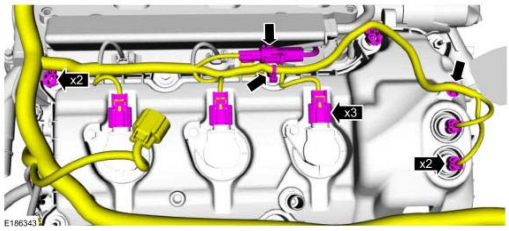


32.

Remove the fuel rail insulators.

33.

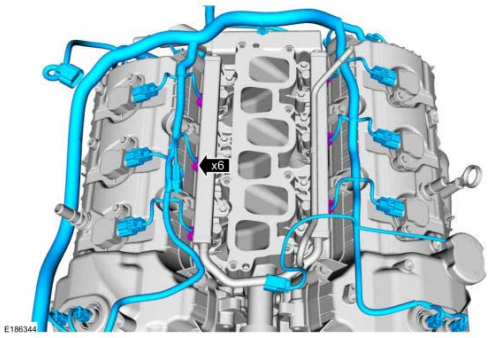
Detach the wiring harness retainers.



34.

Disconnect the VCT oil control solenoids electrical connectors.

Disconnect the ignition coil-on-plug electrical connectors.

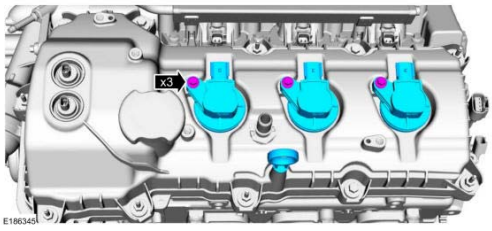


Disconnect the CHT sensor electrical connector.

Detach the wiring harness retainers.

35.

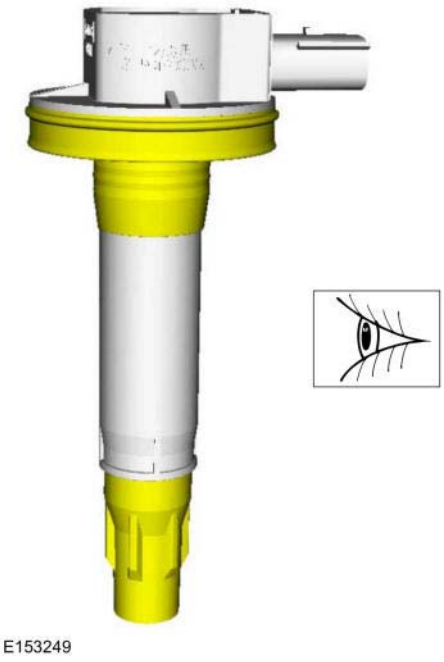
Disconnect the fuel injector electrical connectors and remove the engine wiring harness.



36.

NOTE: Use compressed air to remove any foreign material from the ignition coil-on-plugs and surrounding area before removing the ignition coil-on-plugs.

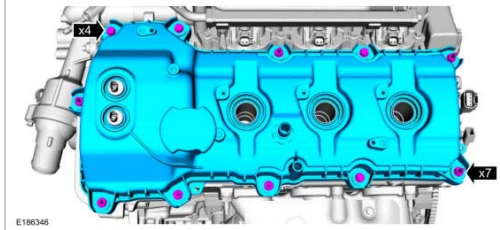
NOTE: When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.



Remove the bolts and the ignition coil-on-plugs.

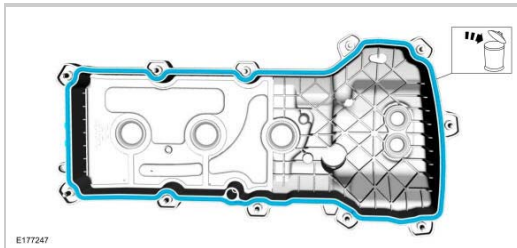
Remove the oil level indicator.

37.



Inspect the coil seals for rips, nicks or tears and replace if necessary.

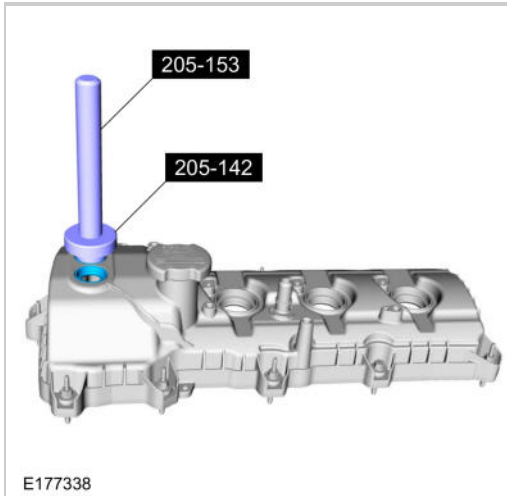
NOTE: If the VCT oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.



NOTE: While removing the valve cover do not apply excessive force to the VCT oil control solenoid or damage may occur.

38.
Loosen the bolts and the LH valve cover.

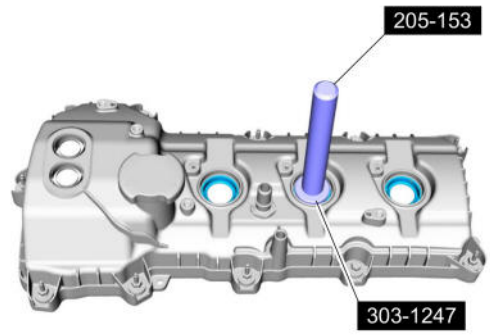
39.



Discard the gasket.

NOTE: Inspect the VCT solenoid seals. Remove any damaged seals.

40.
Using the special tools, remove and discard the seal(s).



Use Special Service Tool: 205-142 (T80T-4000-J) Installer, Differential Bearing Cone, 205-153 (T80T-4000-W) Handle.

NOTE: Inspect the spark plug tube seals. Remove any damaged seals.

41.
Using the special tools, remove and discard the seal(s).

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

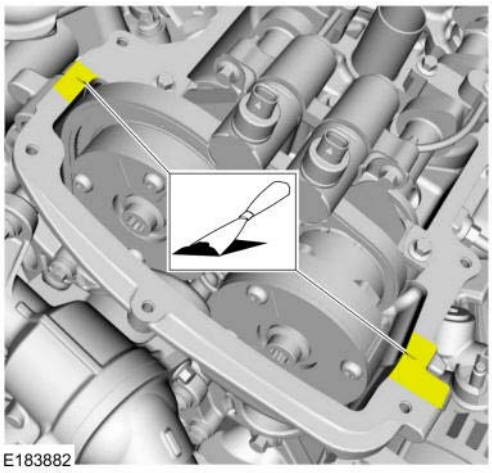
E177339

42.

Make sure that the mating faces are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

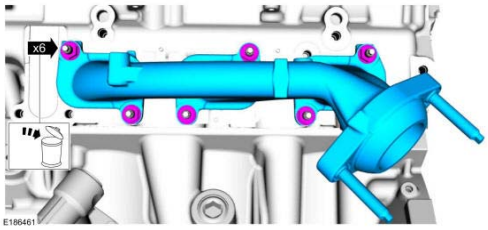
E183884

50.

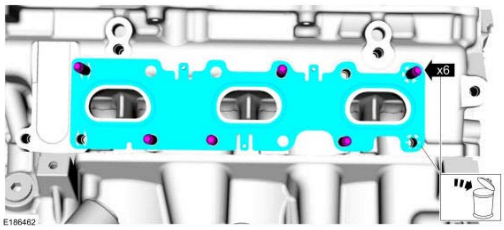


Remove the bolts and the LH exhaust manifold heat shield.

51.

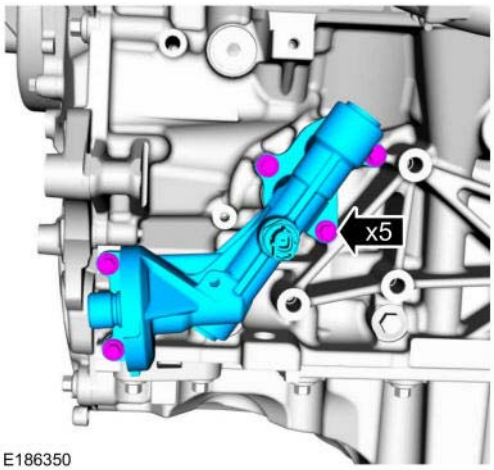
Remove the nuts and the LH exhaust manifold.

Discard the nuts.



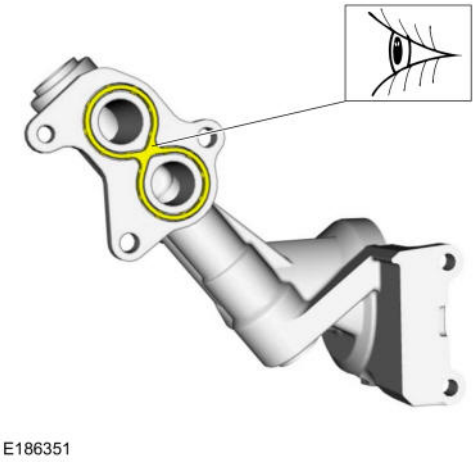
52.

Clean and inspect the catalytic converter flange. Refer to: Exhaust Manifold Cleaning and Inspection .



53.

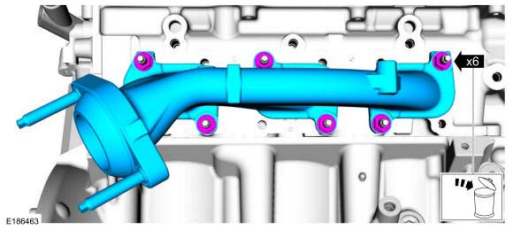
Remove and discard the LH exhaust manifold gasket and studs.



54.

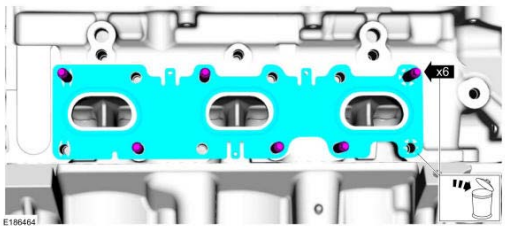
Remove the bolts and the oil filter adapter.

55.



Inspect and replace if necessary.

56.

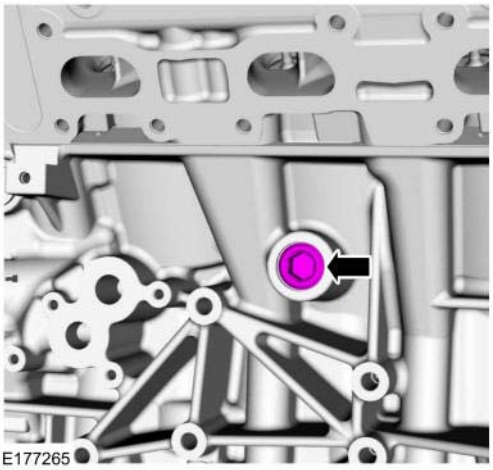


Remove the nuts and the RH exhaust manifold.

Discard the nuts.

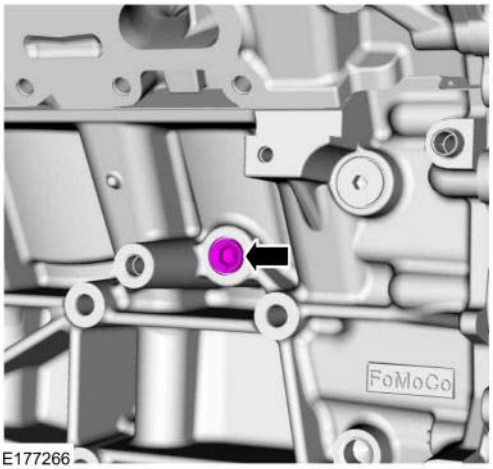
57.

Remove and discard the RH exhaust manifold gasket and studs.



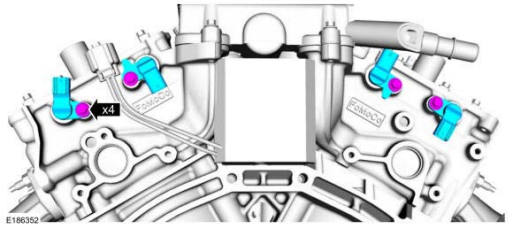
58.

Clean and inspect the catalytic converter flange. Refer to: Exhaust Manifold Cleaning and Inspection .



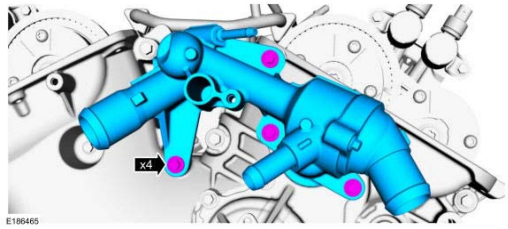
59.

Remove the LH block coolant drain plug and allow coolant to drain from the cylinder block.



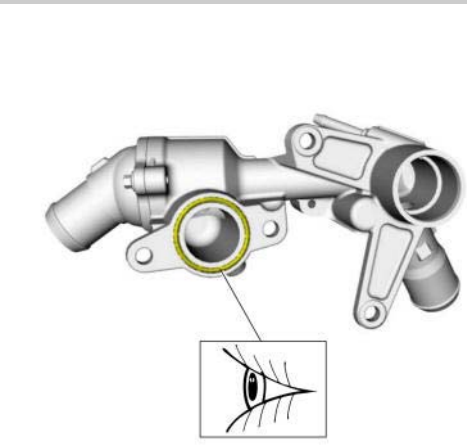
60.

Remove the RH block coolant drain plug and allow coolant to drain from the cylinder block.



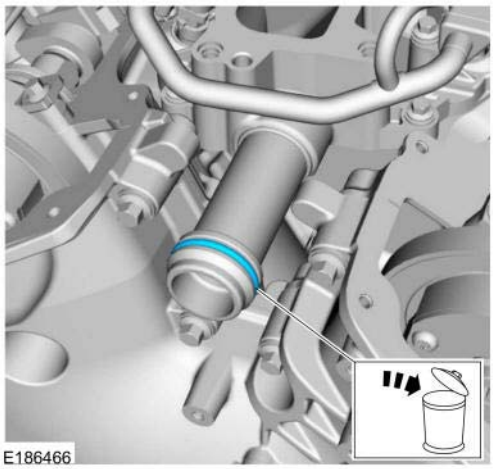
61.

Remove the bolts and the CMP sensors.



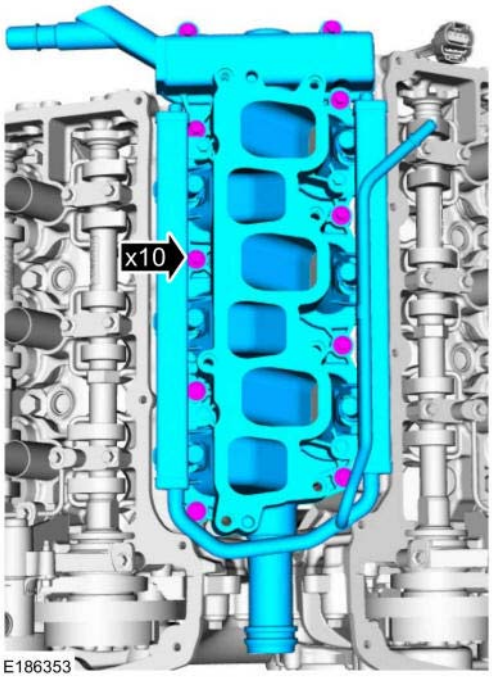
62.

Remove the bolts and the thermostat housing.



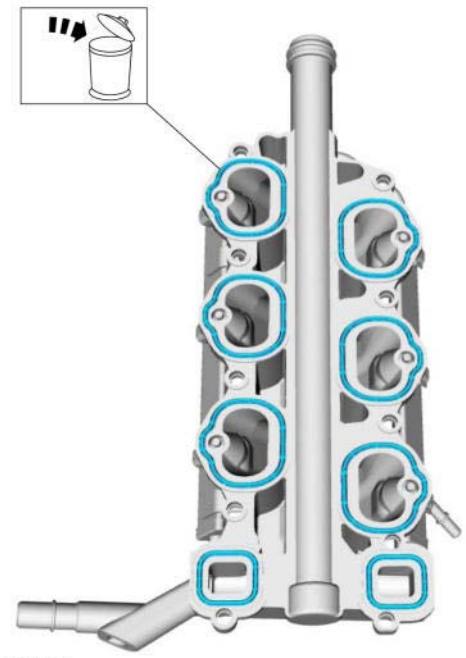
63.

Inspect and replace if necessary.



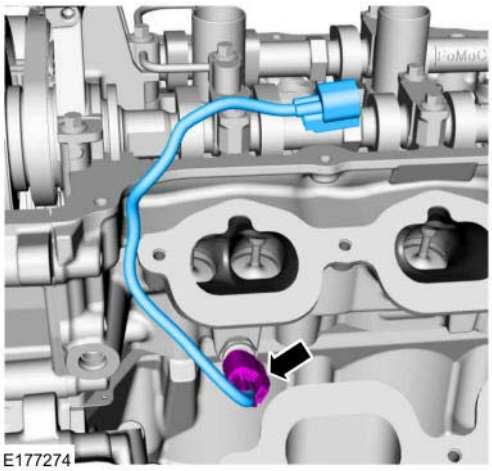
64.

Remove and discard the thermostat housing O-ring seal.



65.

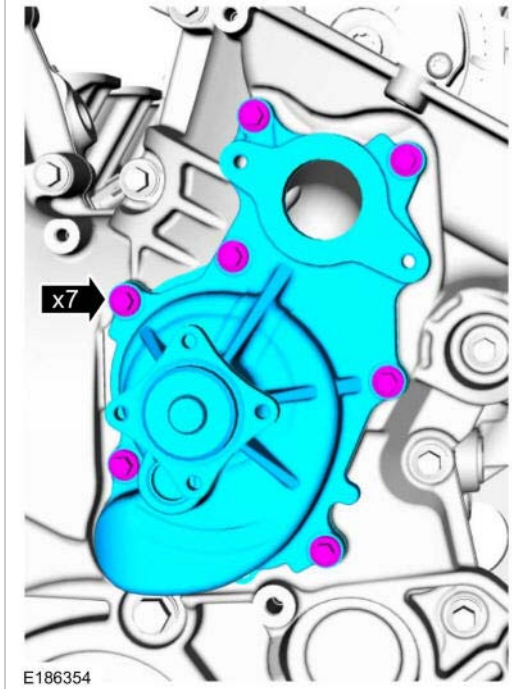
Remove the bolts and the lower intake manifold.



66.

Remove and discard the lower intake manifold gaskets.

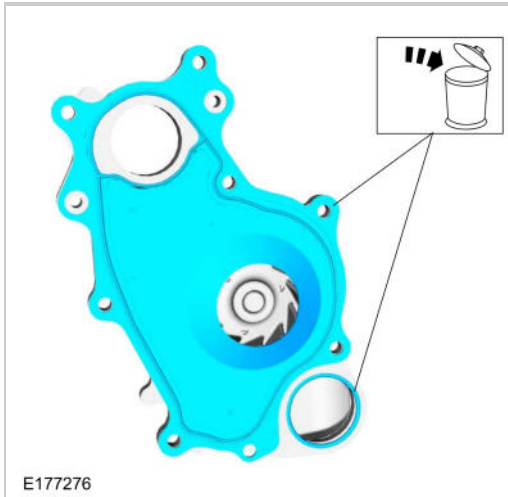
E184761



67.

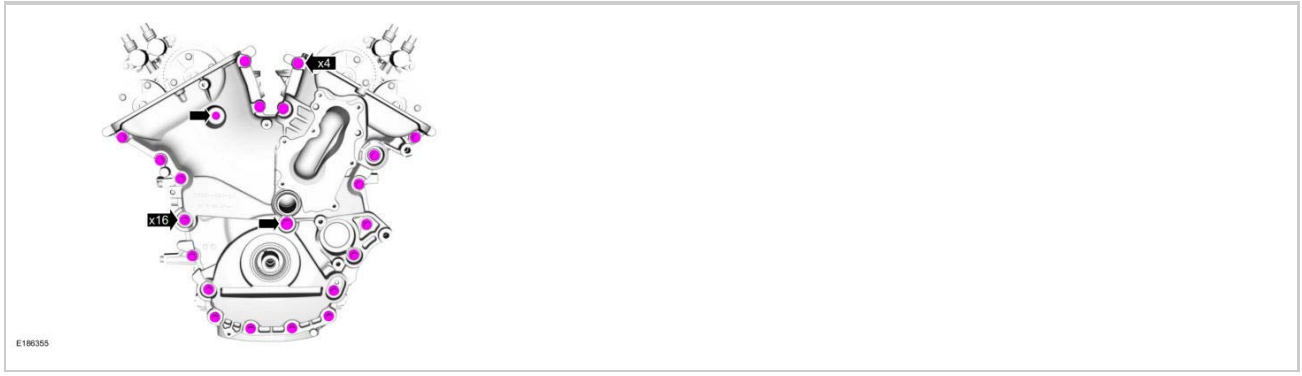
Disconnect the CHT sensor electrical connector.

E177274



68.

Remove the bolts and the coolant pump.



69.

Remove and discard the coolant pump gasket and O-ring seal.

70.

Remove the engine front cover bolts.

71.

Using a pry tool, locate the 5 pry pads shown in illustration and pry the engine front cover loose and remove.

72.

Using the special tools, remove the engine front cover to coolant pipe seal.

Use Special Service Tool: 205-150 (T80T-4000-S) Installer, Spindle Bearing, 205-153 (T80T-4000-W) Handle.

NOTE: Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15, 000 rpm, to clean the engine

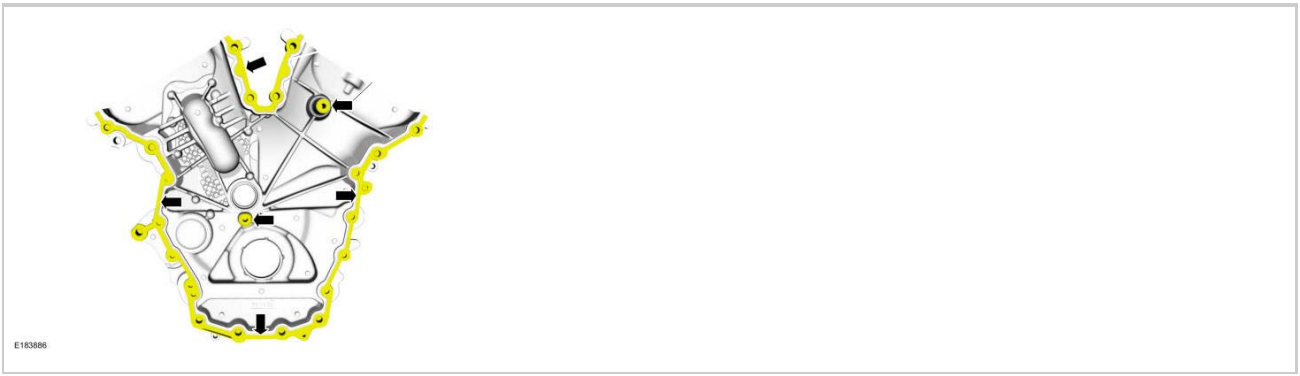
front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean front cover.

73.

Make sure that the mating faces of the front cover are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A



Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.

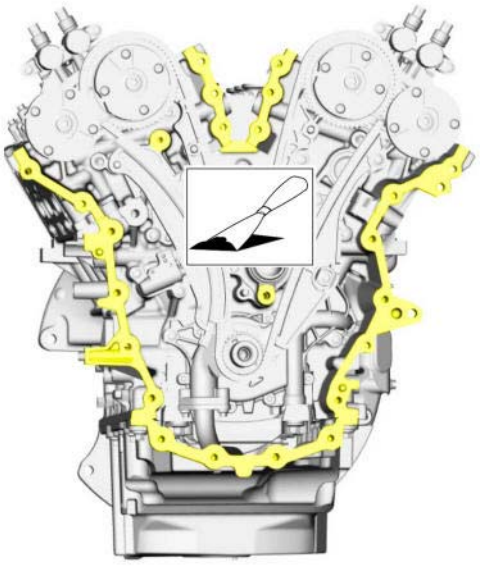
NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

74.
Make sure that the mating faces of the engine block and oil pan are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material

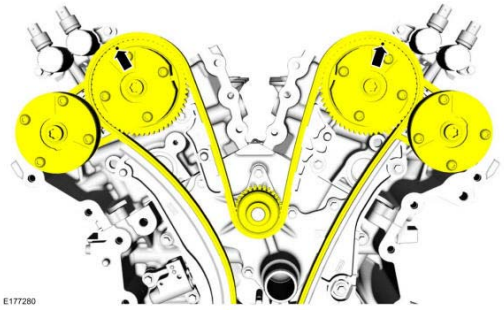


: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

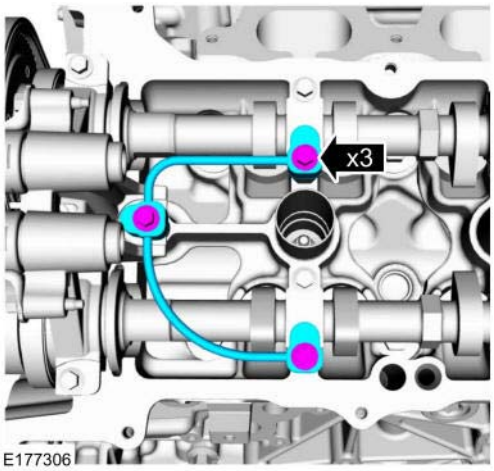
Material



: Motorcraft® Metal Surface Prep / ZC-31-B

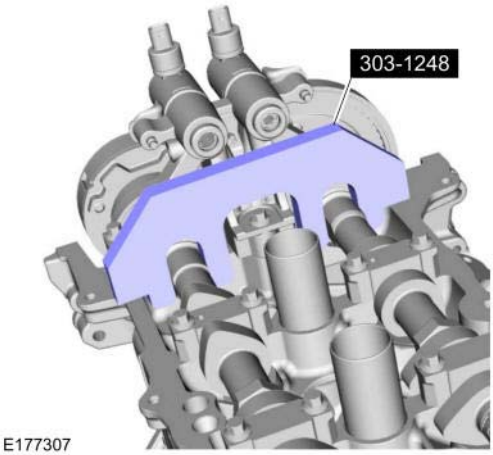
E184099

NOTE: Rotate the crankshaft in a clockwise direction only.



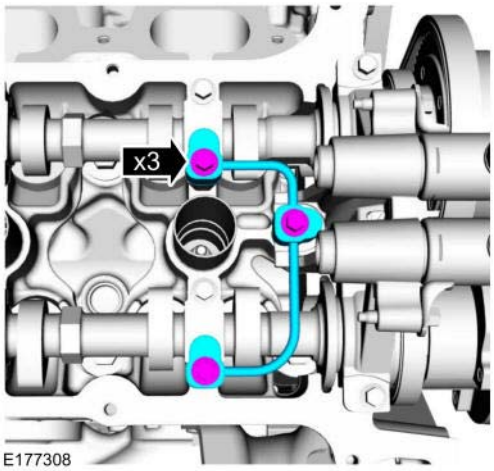
75.
Rotate the crankshaft clockwise and align the timing marks on the intake VCT units as shown in illustration.

E177280



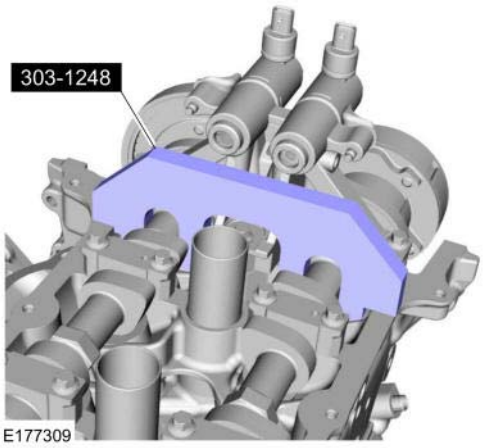
76.

Remove the bolts and the LH oil tube.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

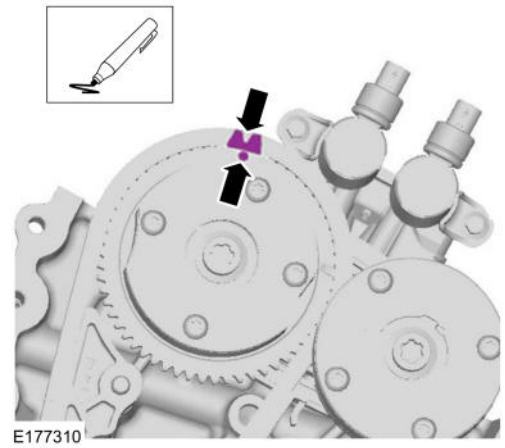
77.
Install Special Service Tool: 303-1248 Camshaft holding tools.



78.

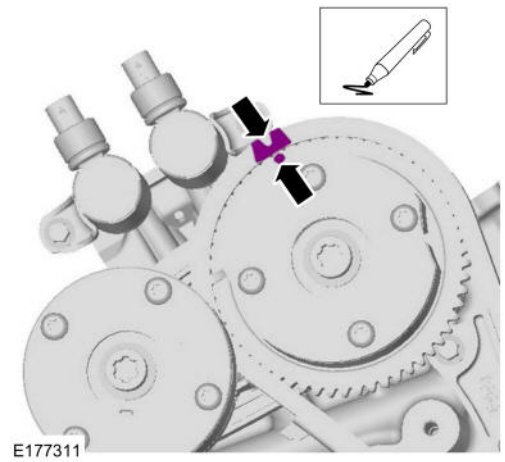
Remove the bolts and the RH oil tube.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.



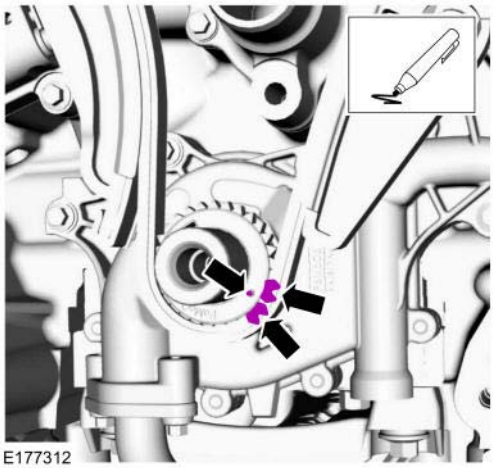
79.
Install Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: ***The following 3 steps are for primary timing chains that the colored links are not visible.***



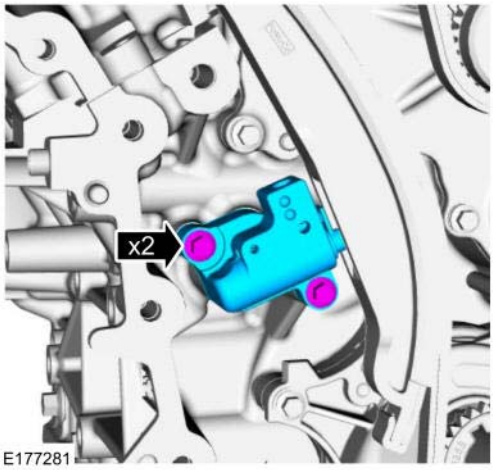
80.

Mark the timing chain link that aligns with the timing mark on the LH intake VCT unit as shown in illustration.



81.

Mark the timing chain link that aligns with the timing mark on the RH intake VCT unit as shown in illustration.

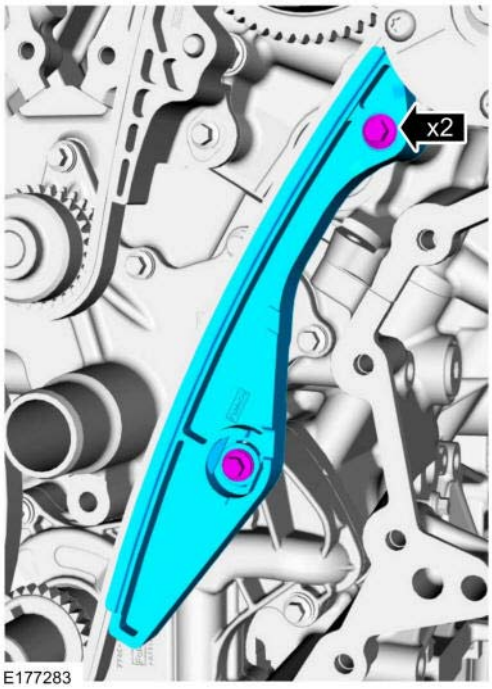


NOTE: The crankshaft sprocket timing mark should be between the colored links.

82.
Mark the timing chain links that aligns with the timing mark on the crankshaft sprocket as shown in illustration.

83.

Remove the bolts and the timing chain tensioner.

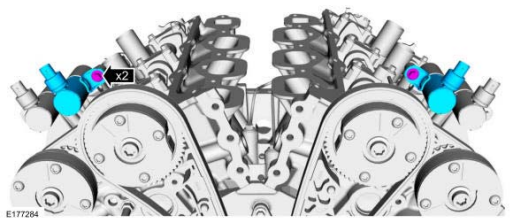


84.

Remove the timing chain tensioner arm.

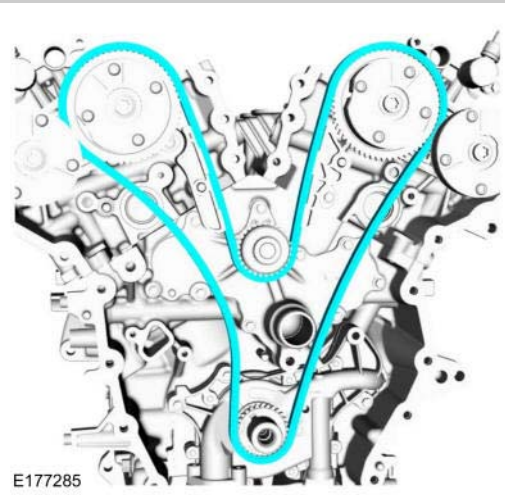
85.

Remove the bolts and the lower LH timing chain guide.



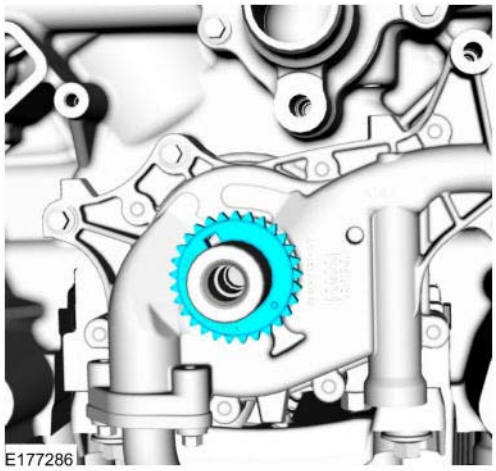
NOTE: Removal of the VCT oil control solenoid will aid in the removal of the timing chain.

NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoids.



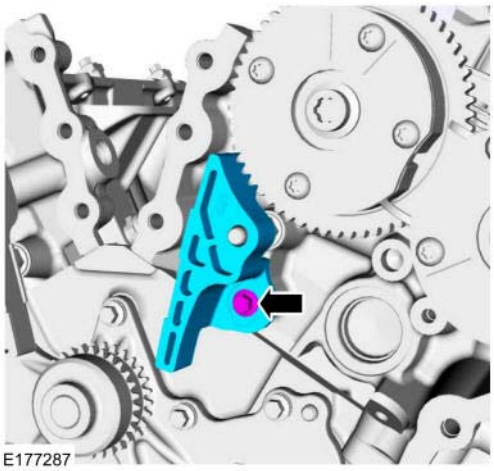
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

86.
Remove the bolts and the VCT oil control solenoids.



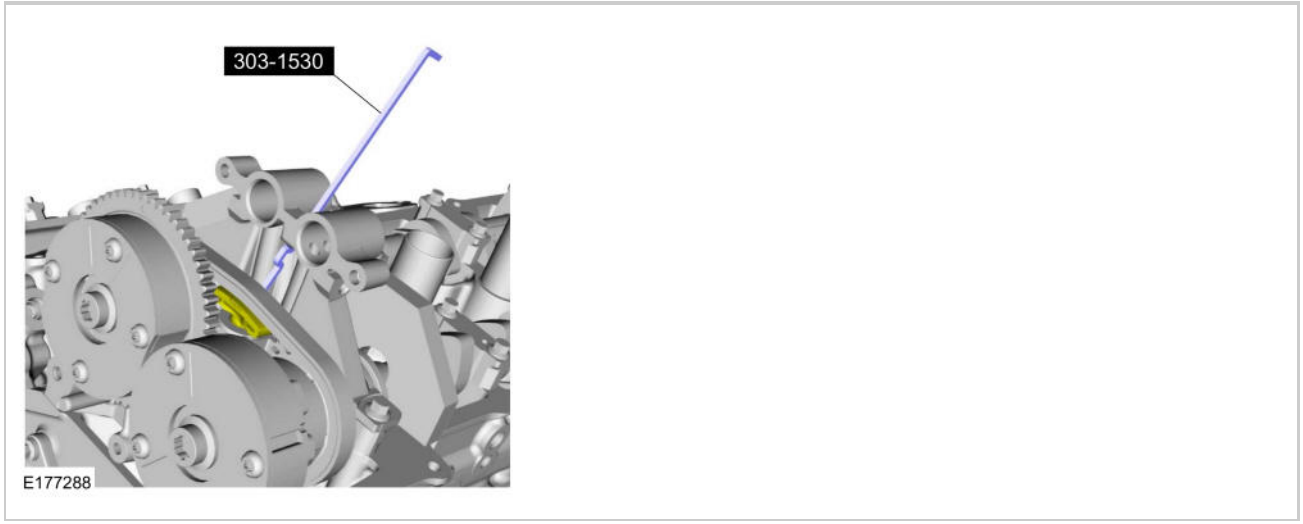
87.

Remove the timing chain.



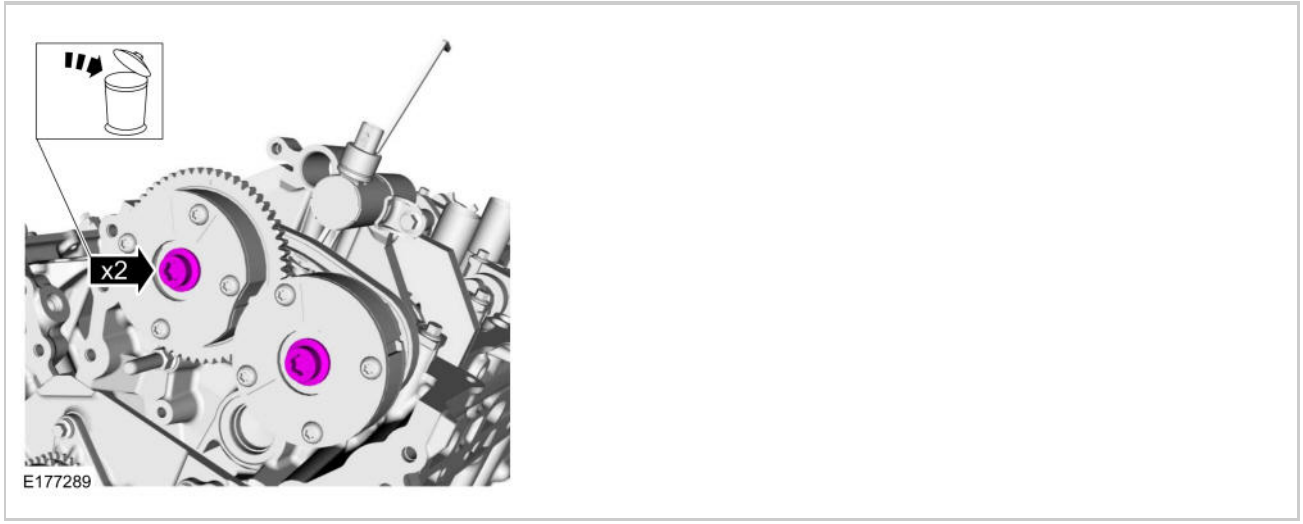
88.

Remove the crankshaft sprocket.



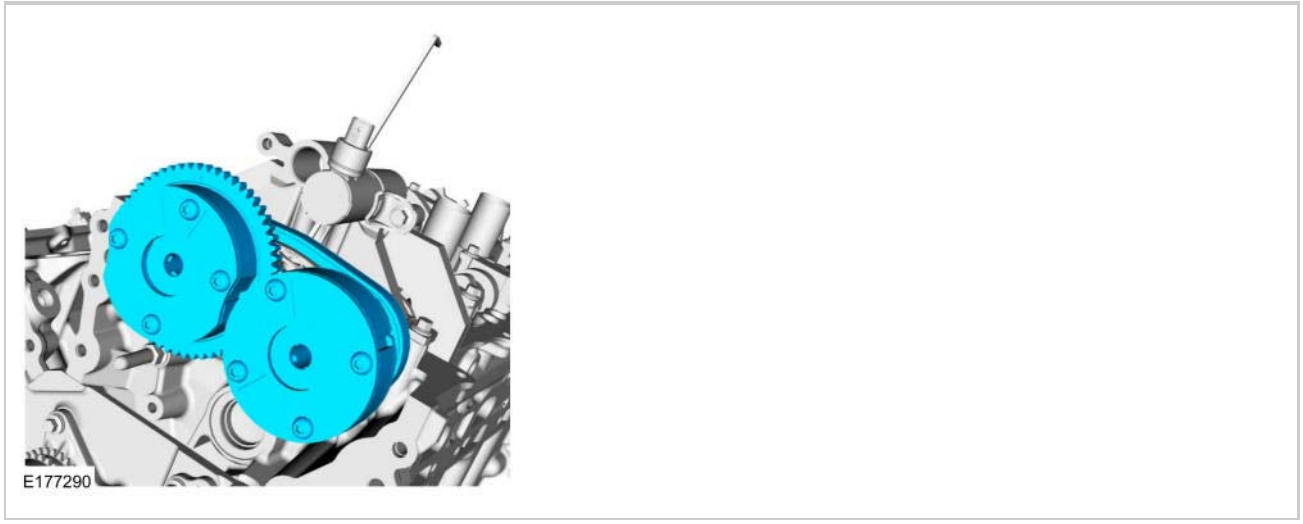
NOTE: Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.

89.
Remove the bolt and the upper LH timing chain guide.



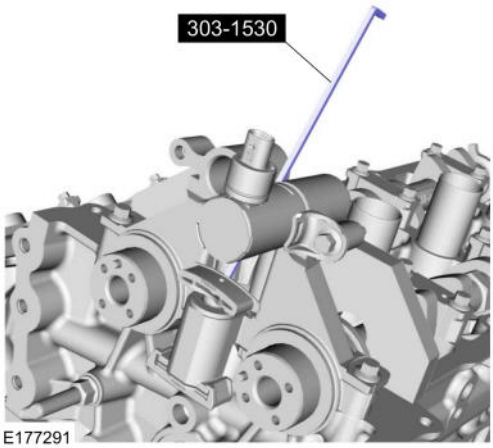
NOTE: The VCT oil control solenoids are removed for clarity.

90.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.



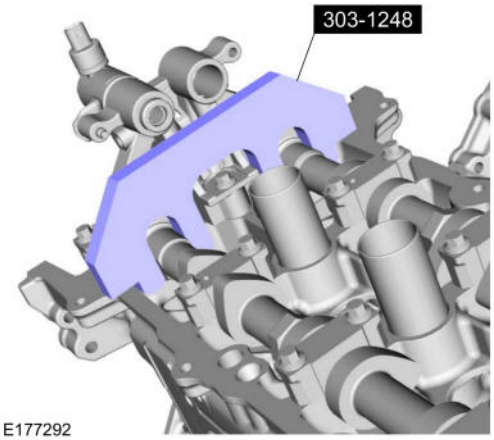
91.

Remove and discard the LH VCT unit bolts.



92.

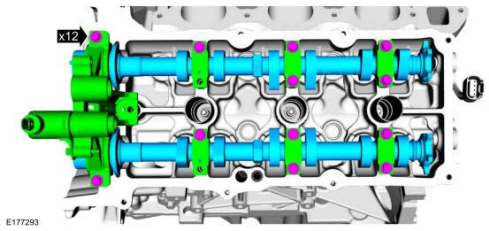
Remove the LH VCT units and secondary timing chain.



93.

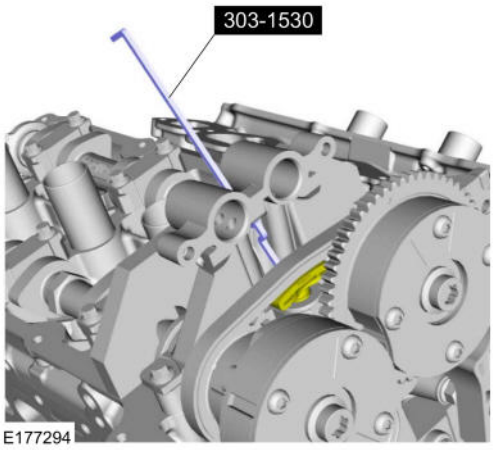
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

94.



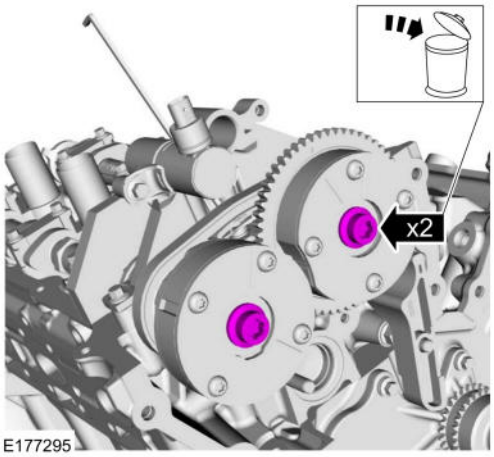
Remove Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.



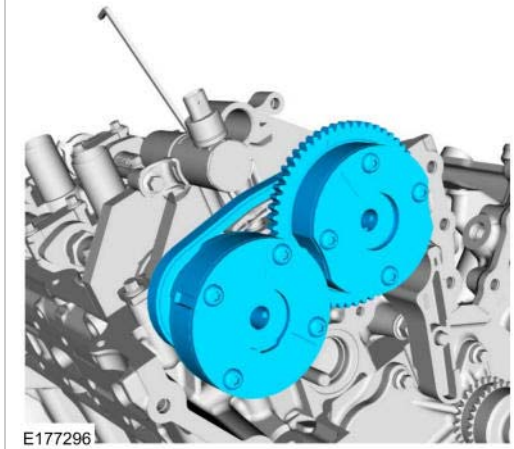
NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

95.
Remove the bolts, camshaft caps and the camshafts.



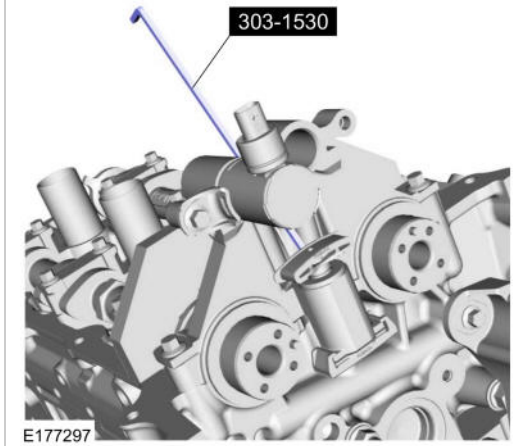
NOTE: The VCT oil control solenoids are removed for clarity.

96.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.



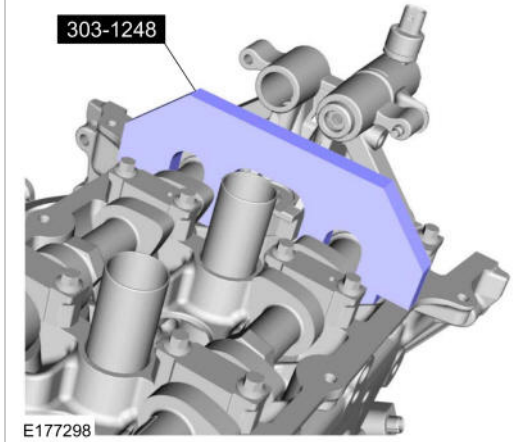
97.

Remove and discard the RH VCT unit bolts.



98.

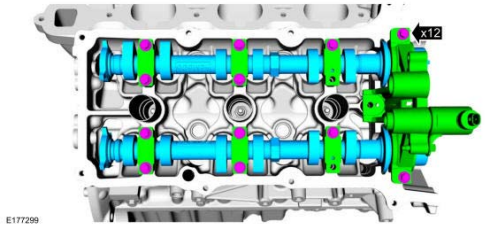
Remove the RH VCT units and secondary timing chain.



99.

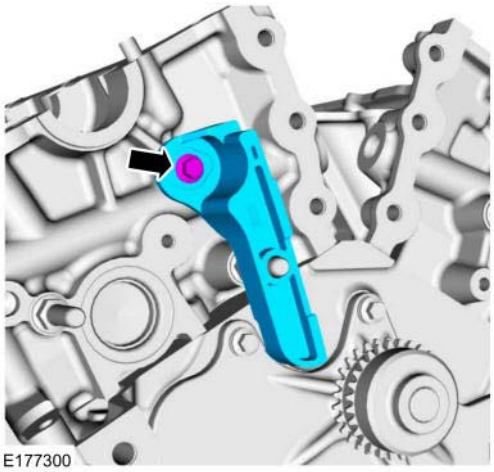
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

100.



Remove Special Service Tool: 303-1248 Camshaft holding tools.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

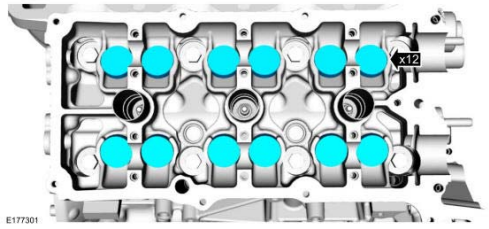


NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

101.
Remove the bolts, camshaft caps and the camshafts.

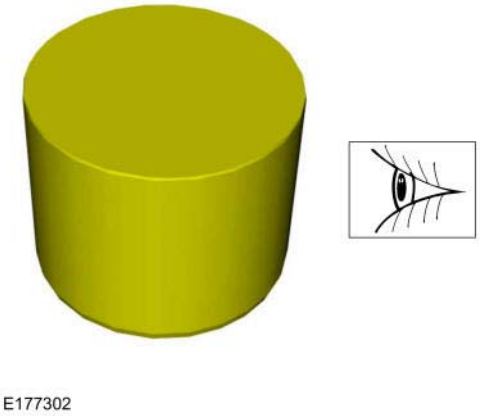
NOTE: Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.

102.
Remove the bolt and the RH timing chain guide.



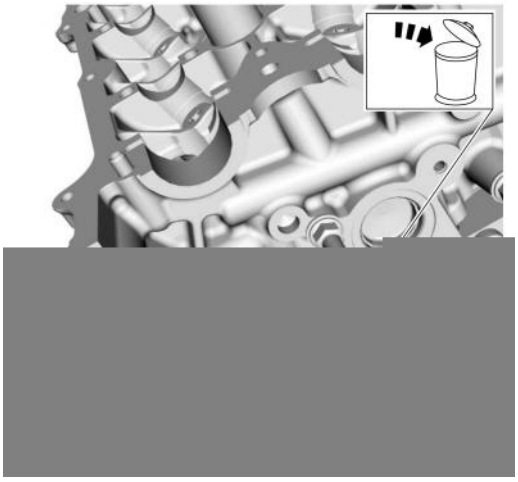
NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

NOTE: RH shown in illustration, LH similar.



103.

Remove the valve tappets from the cylinder heads.



104.

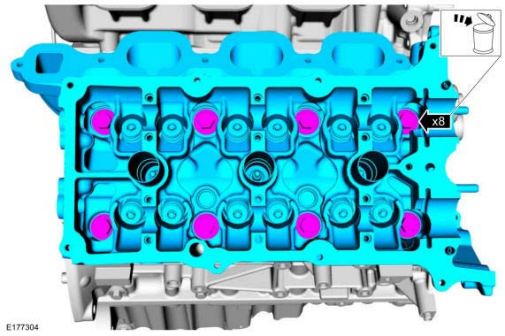
Inspect and install new components as necessary.

105.

Remove and discard the M6 bolt.

NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil

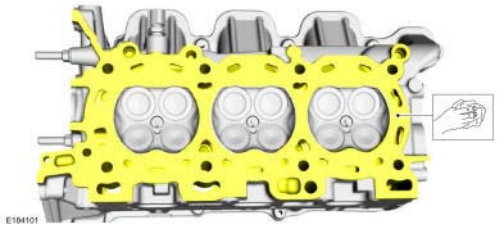
passages or the oil pan, may cause engine failure.



NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

106.



Remove and discard the bolts from the cylinder head.

Remove the cylinder head.

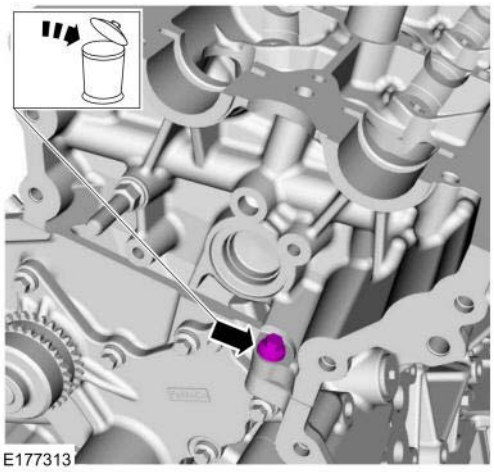
NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

107.
Make sure that the mating faces of the cylinder head are clean and free of foreign material.

108.

Remove and discard the cylinder head gasket.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

109.
Make sure that the mating faces of the engine block are clean and free of foreign material.

110.

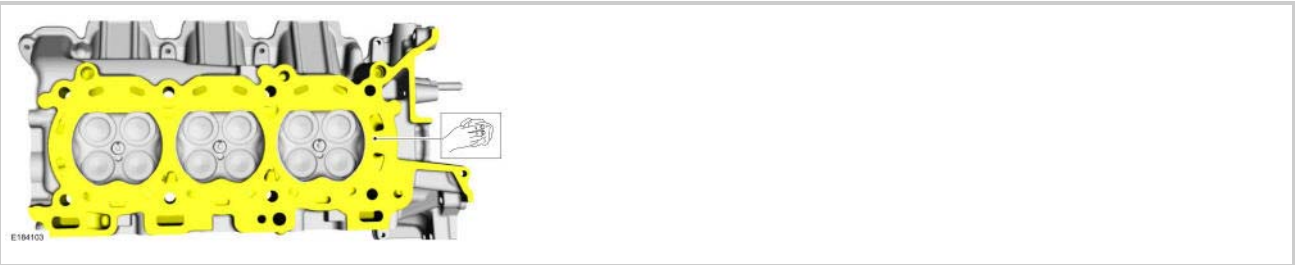
Remove and discard the M6 bolt.

NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface

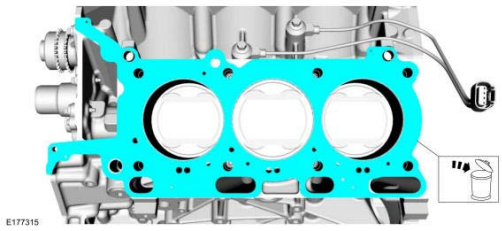
NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield designed and cannot be reused.

111.



Remove and discard the bolts from the cylinder head.

Remove the cylinder head.



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

112.
Make sure that the mating faces of the cylinder head are clean and free of foreign material.

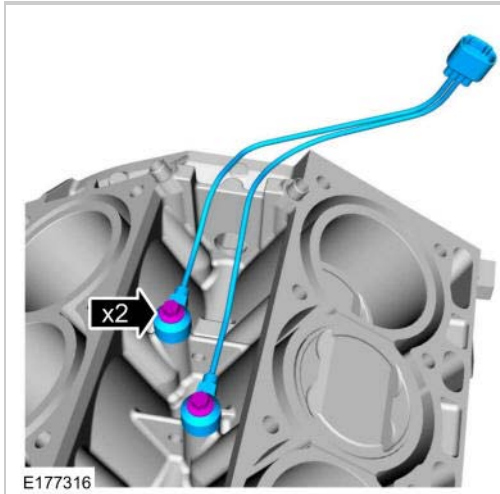
113.

Remove and discard the cylinder head gasket.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

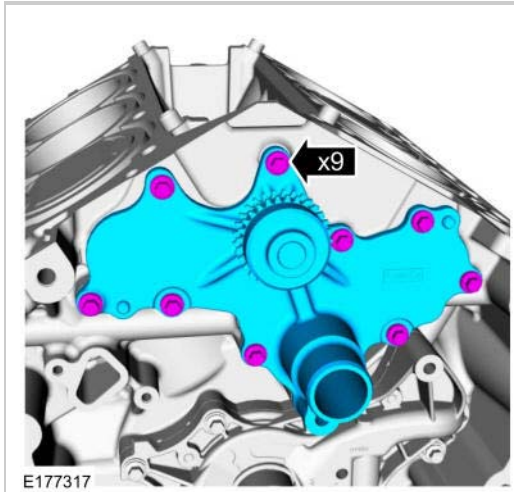
NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

114.
Make sure that the mating faces of the engine block are clean and free of foreign material.



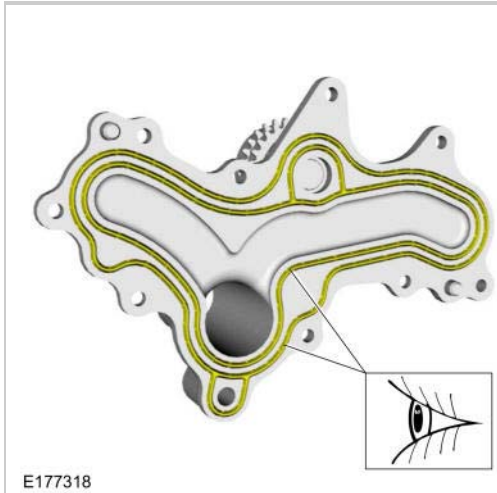
115.

Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion. Refer to: Cylinder Head Distortion .



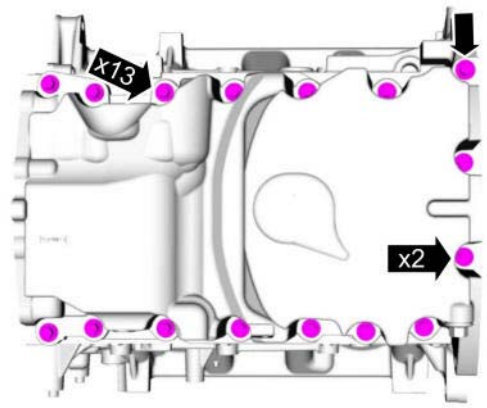
116.

Remove the bolts and the KS.



117.

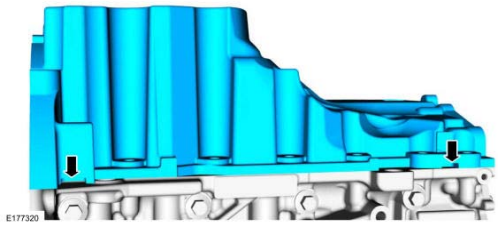
Remove the bolts and the channel cover plate.



118.

Inspect and replace if necessary.

119.



Remove the oil pan bolts.

E177319

120.

Using a pry tool, locate the pry pads at the LH and RH side of the oil pan and pry the oil pan loose and remove.

E177320

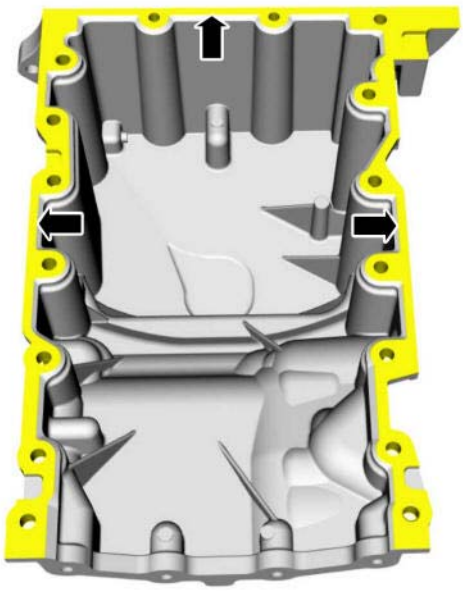
NOTE: Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the oil pan and engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.

121.

Make sure that the mating faces of the oil pan are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A



Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

E183911

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

122.
Make sure that the mating faces of the engine block are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

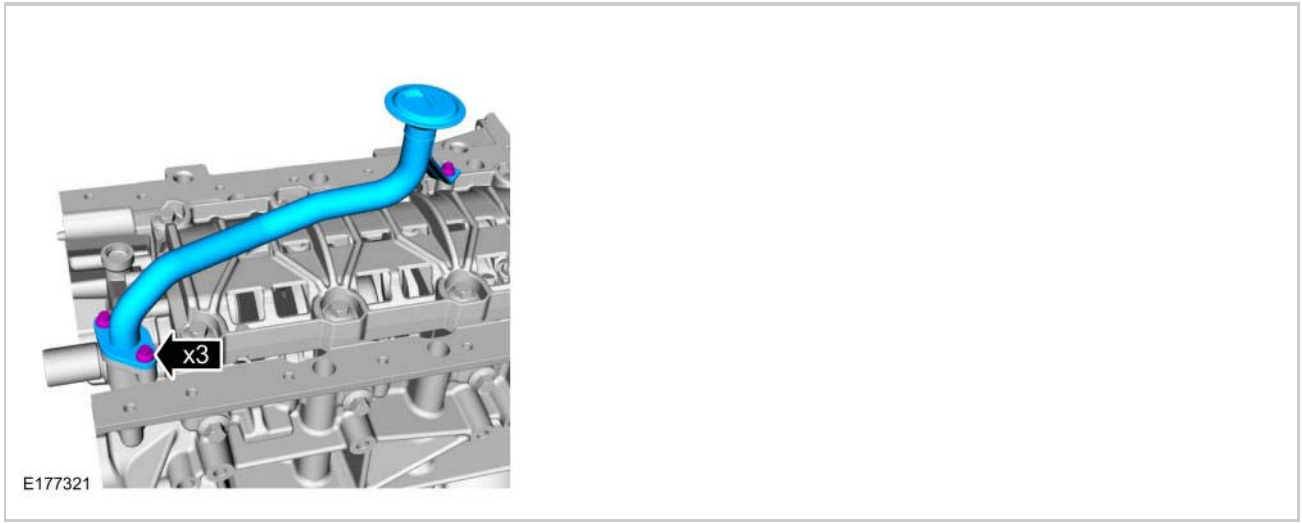
Use the General Equipment: Plastic Scraper

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A

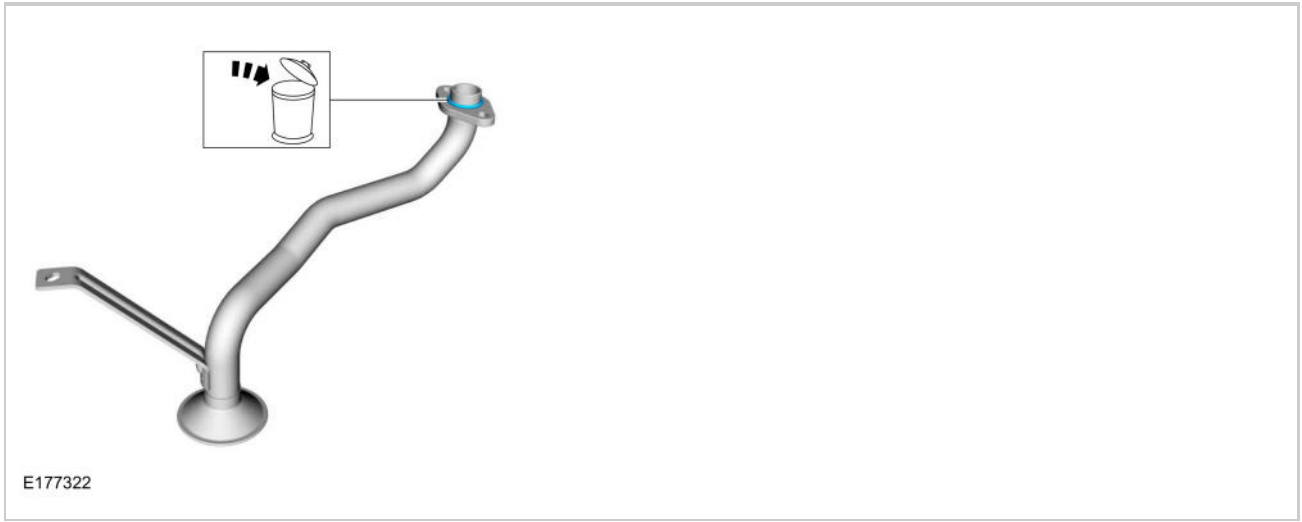
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



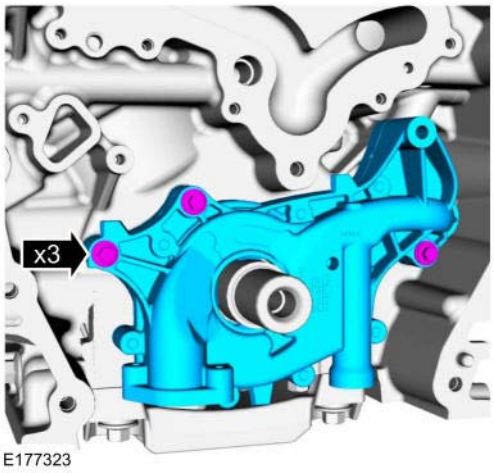
Material

: Motorcraft® Metal Surface Prep / ZC-31-B



123.

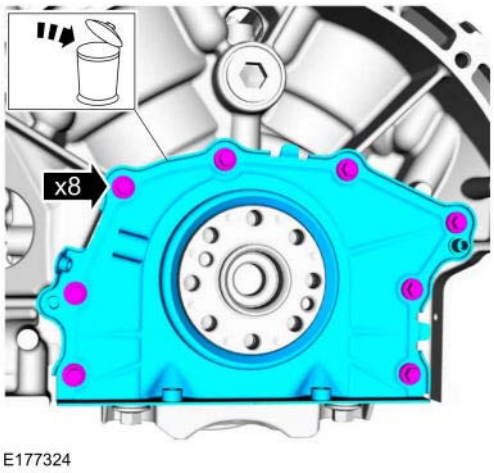
Remove the bolts and the oil pump screen and pickup tube.



124.

Remove and discard the oil pump screen and pickup tube O-ring seal.

125.



Remove the bolts and the oil pump.

126.

Remove the bolts and the crankshaft rear seal.

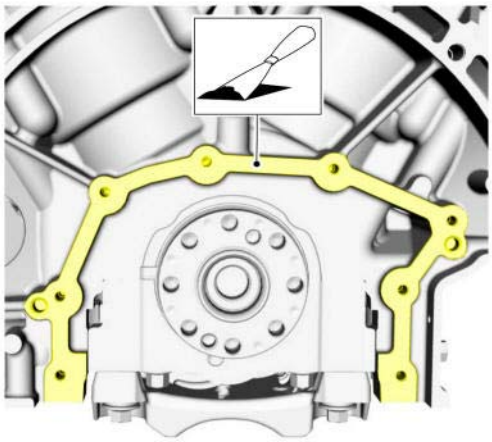
Discard the crankshaft rear seal.

NOTE: Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.

127.
Make sure that the mating faces is clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

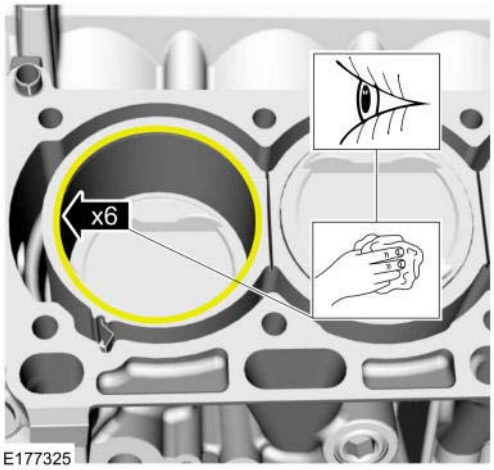
Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

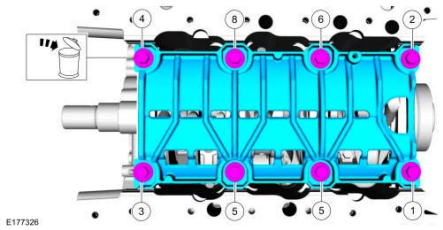
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



Material

: Motorcraft® Metal Surface Prep / ZC-31-B

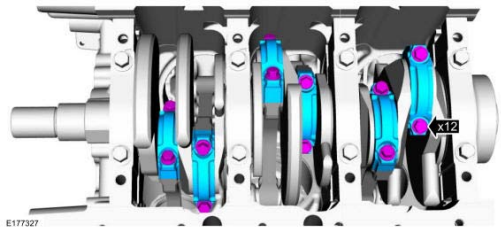
128.



Inspect and clean the specified component with a abrasive pad.

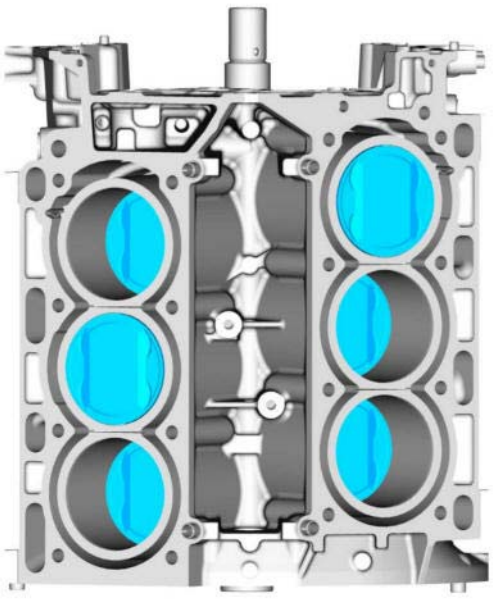
129.

Remove and discard the bolts in the sequence shown in illustration.



Remove the main bearing cap support brace.

NOTE: The connecting rod cap bolts are a torque-to-yield design. The original connecting rod cap bolts will be used when measuring the connecting rod large end bore during assembly. The connecting rod cap bolts will be discarded after measurement.

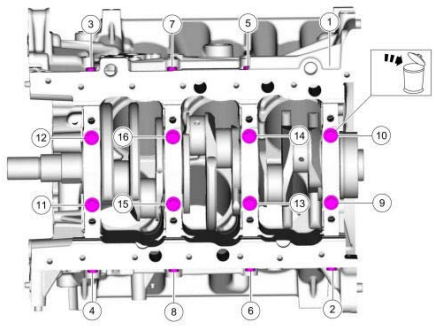


NOTE: Clearly mark the position and orientation of the connecting rods, connecting rod caps and connecting rod bearings for reassembly.

130.
Remove the connecting rod cap bolts and caps.

NOTE: Do not scratch the cylinder walls or crankshaft journals with the connecting rod while removing the pistons.

131.
Remove the piston/rod assembly from the engine block.



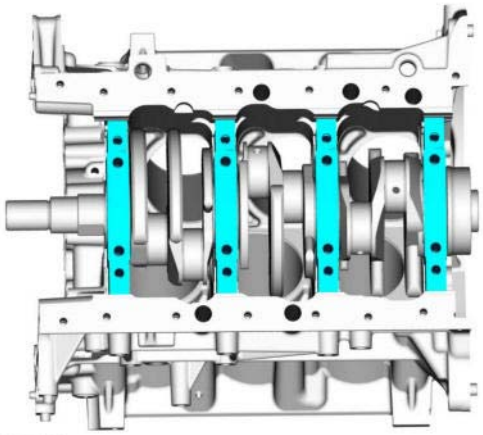
E177328

132.

Inspect the pistons. Refer to: Piston Inspection .

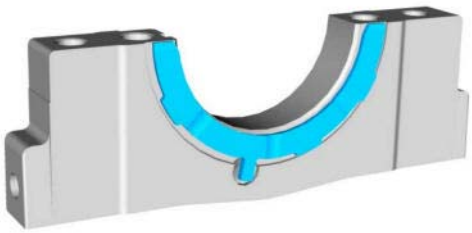
NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.

133.
Remove and discard the main bearing caps bolts in the sequence shown in illustration.



E177329

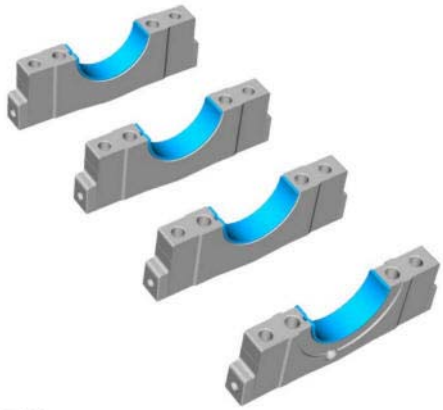
NOTE: If the main bearings are being reused, mark them for correct position and orientation for reassembly.



NOTE: Note the position of the thrust washer on the outside of the No. 4 rear main bearing cap.

134.
Remove the main bearing caps.

E177330

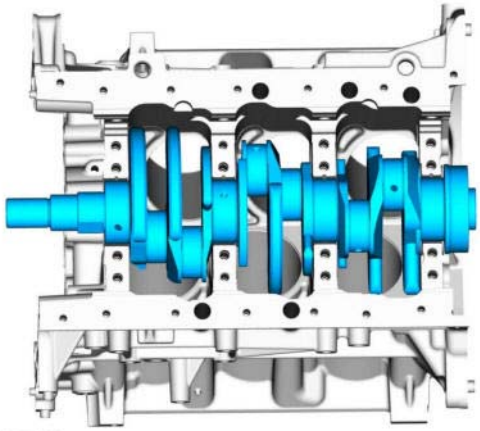


135.

Remove the lower crankshaft thrust washer from the back side of the No. 4 rear main bearing cap.

E177331

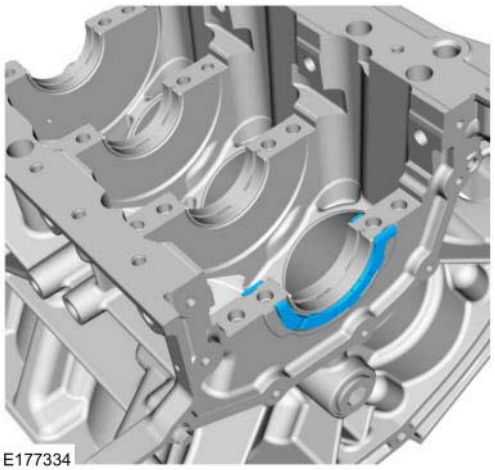
NOTE: If the main bearings are being reused, mark them for correct position and orientation for reassembly.



136.
Remove the crankshaft main bearings from the main bearing caps.

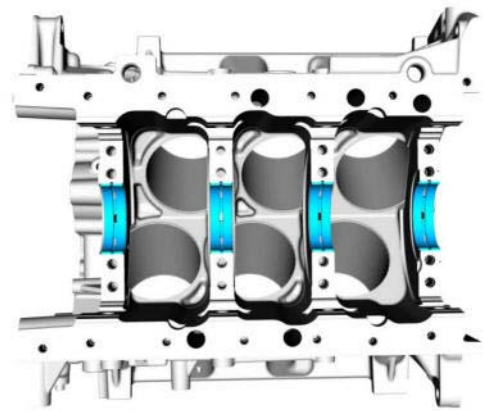
E177332

NOTE: Note the position of the 2 thrust washers on the inside and outside of the rear main bearing bulkhead.



137.
Remove the crankshaft.

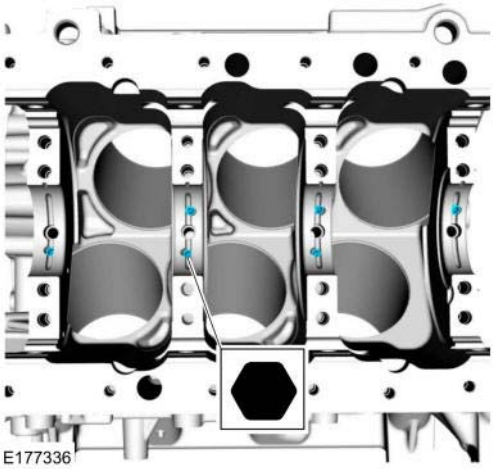
E177333



138.

Remove the crankshaft thrust bearings from the rear main bearing bulkhead.

E177334



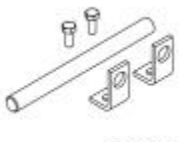
NOTE: If the main bearings are being reused, mark them for correct position and orientation for reassembly.

139.
Remove the crankshaft main bearings from the cylinder block.

E177335

140.

Using a hex bit, remove the piston oil cool valves.



141.

Inspect the cylinder block distortion. Refer to: Cylinder Block Distortion .

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD

Special Tool(s) / General Equipment

	303-1249 Valve Spring Compressor TKIT-2006UF-FLM TKIT-2006UF-ROW
	303-300 (T87C-6565-A) Set, Valve Spring Compressor T88C-1000-ST TKIT-1988-FESTIVA TKIT-1988-TRACER TKIT-2009TC-F
	303-350 (T89P-6565-A) Compressor, Valve Spring TKIT-1989-F TKIT-1989-FLM TKIT-1989-FM TKIT-1990-LMH

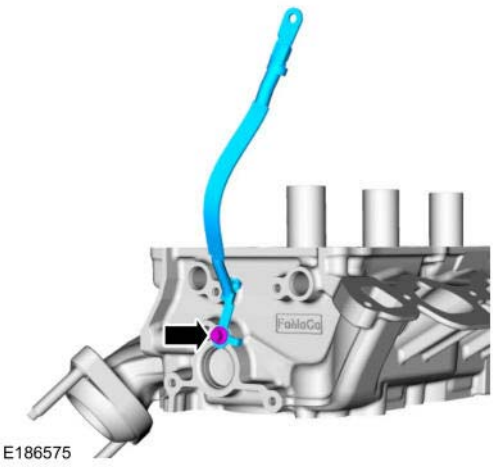
Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A



DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > DISASSEMBLY

NOTE: If replacing the cylinder head, do not reuse the secondary timing chain tensioners, they must be replaced or damage to the engine may occur. Refer to Variable Camshaft Timing (VCT) Unit .

LH cylinder head

1.

Remove the bolt and ground strap.

E186575

2.

Remove the bolts and the exhaust manifold heat shield.

3.

Remove the nuts and the exhaust manifold.

Discard the nuts.

4.

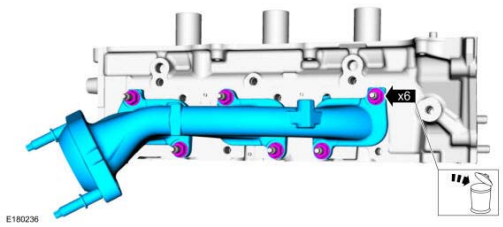
Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .

5.

Remove and discard the studs and the exhaust manifold gasket.

6.

Remove the timing chain guide pin.

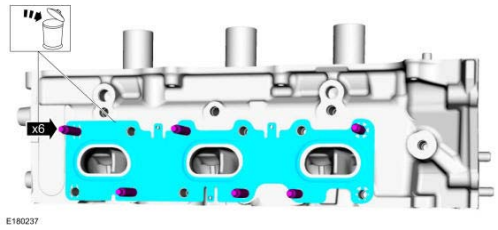


RH cylinder head

7.

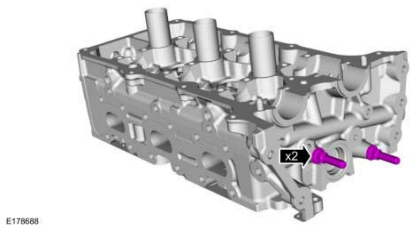
Remove the nuts and the exhaust manifold.

Discard the nuts.



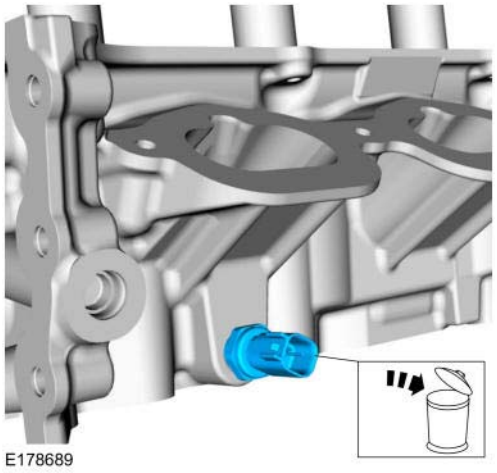
8.

Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .



9.

Remove and discard the studs and the exhaust manifold gasket.



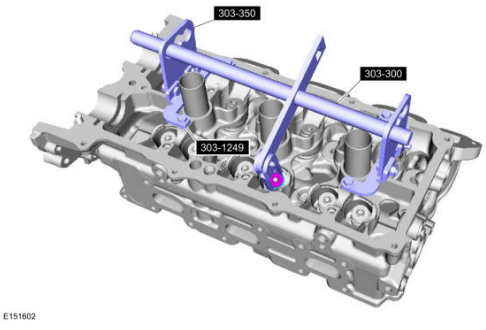
10.

Remove the timing chain tensioner arm and timing chain guide pins.

11.

Remove and discard the CHT sensor.

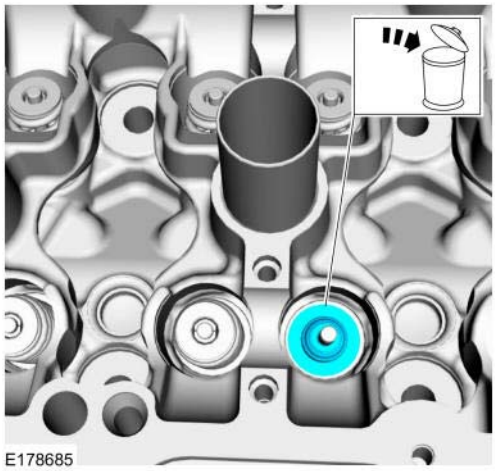
All cylinder heads



12.

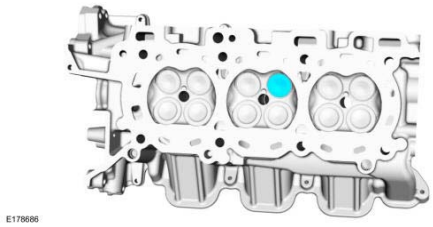
Remove the spark plugs. Refer to: SPARK PLUGS .

NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.



13.
Using the special tools, remove the valve collet, valve spring retainer and the valve spring.

Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350 (T89P-6565-A) Compressor, Valve Spring, 303-1249 Valve Spring Compressor.



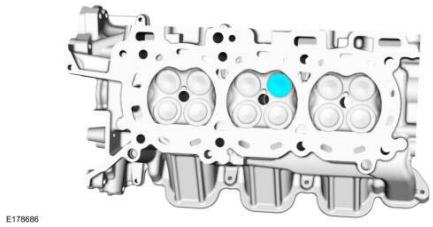
14.

Remove the valve stem seal.

15.

Remove the valve.

16.



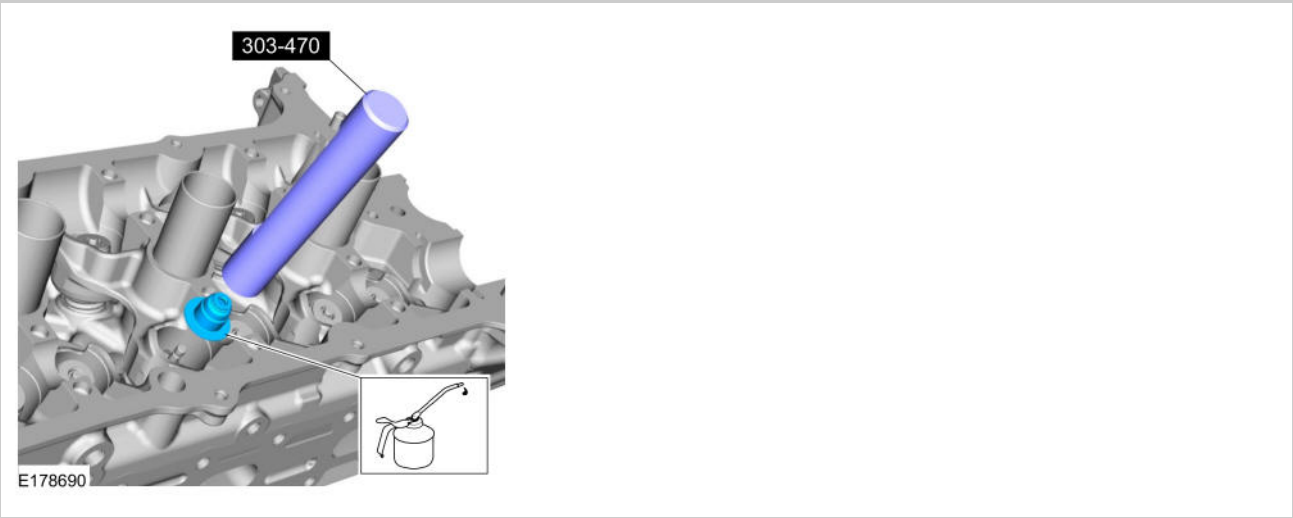
Repeat the previous 3 steps for each valve.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > ASSEMBLY

All cylinder heads

1.

Install the valve.

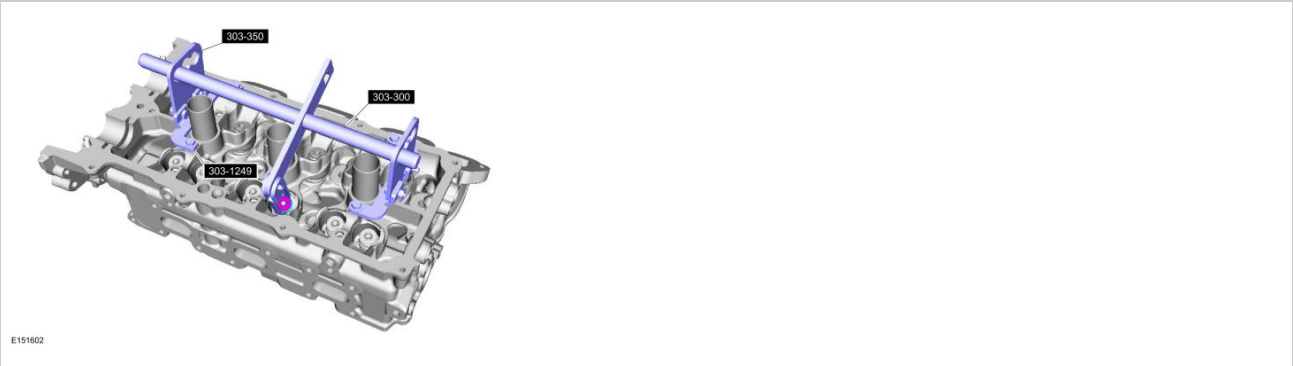


2.

Lubricate with clean engine oil and using the special tool, install the valve stem seal.

Use Special Service Tool: 303-470 (T94P-6510-CH) Installer, Valve Stem Oil Seal.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

3.

Using the special tools, install the valve spring, valve spring retainer and the valve collet.

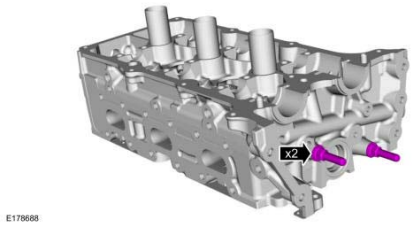
Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350 (T89P-6565-A) Compressor, Valve Spring, 303-1249 Valve Spring Compressor.

4.

Repeat the previous 3 steps for each valve.

5.

Install the spark plugs. Refer to: SPARK PLUGS .



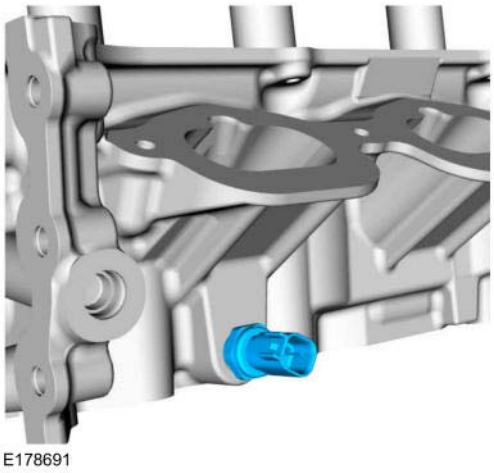
RH cylinder head

6.

Install the timing chain tensioner arm and timing chain guide pins.

Torque

: 89 lb.in (10 Nm)

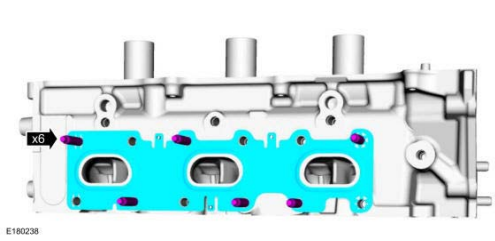


7.

Install a new CHT sensor.

Torque

: 89 lb.in (10 Nm)



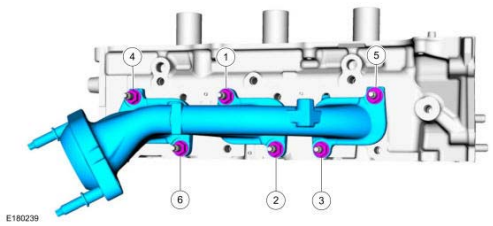
8.

Install the new the exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install a new exhaust manifold gasket.



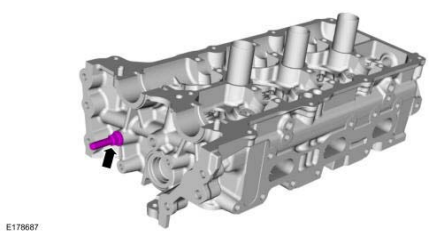
9.

Install the exhaust manifold and the new nuts.

Torque:

Stage 1: 168 lb.in (19 Nm)

Stage 2: 18 lb.ft (25 Nm)



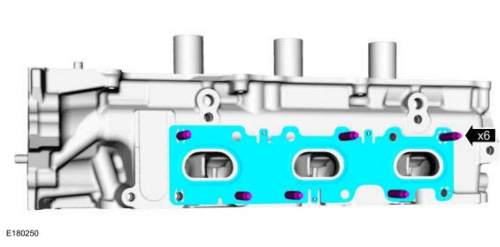
LH cylinder head

10.

Install the timing chain guide pin.

Torque

: 89 lb.in (10 Nm)



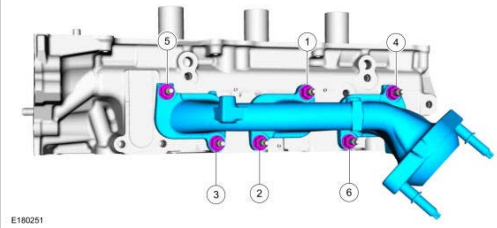
11.

Install the new the exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install a new exhaust manifold gasket.



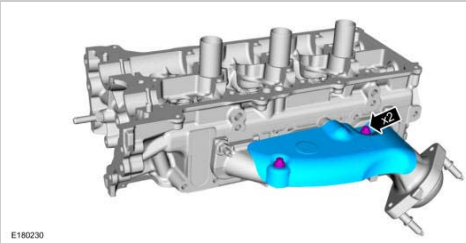
12.

Install the exhaust manifold and the new nuts.

Torque:

Stage 1: 168 lb.in (19 Nm)

Stage 2: 18 lb.ft (25 Nm)

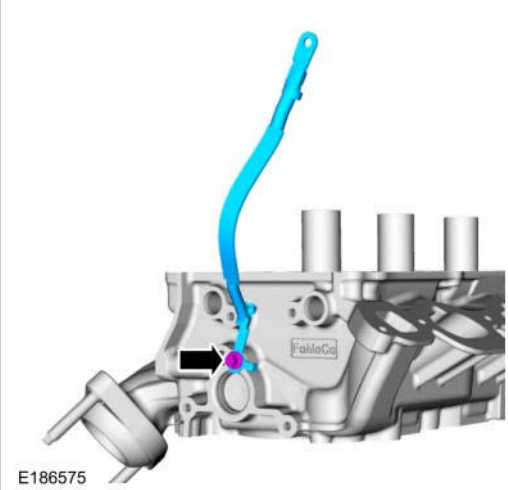


13.

Install the exhaust manifold heat shield and the bolts.

Torque

: 106 lb.in (12 Nm)



14.

Install ground strap and the bolt.

Torque

: 106 lb.in (12 Nm)

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > DISASSEMBLY

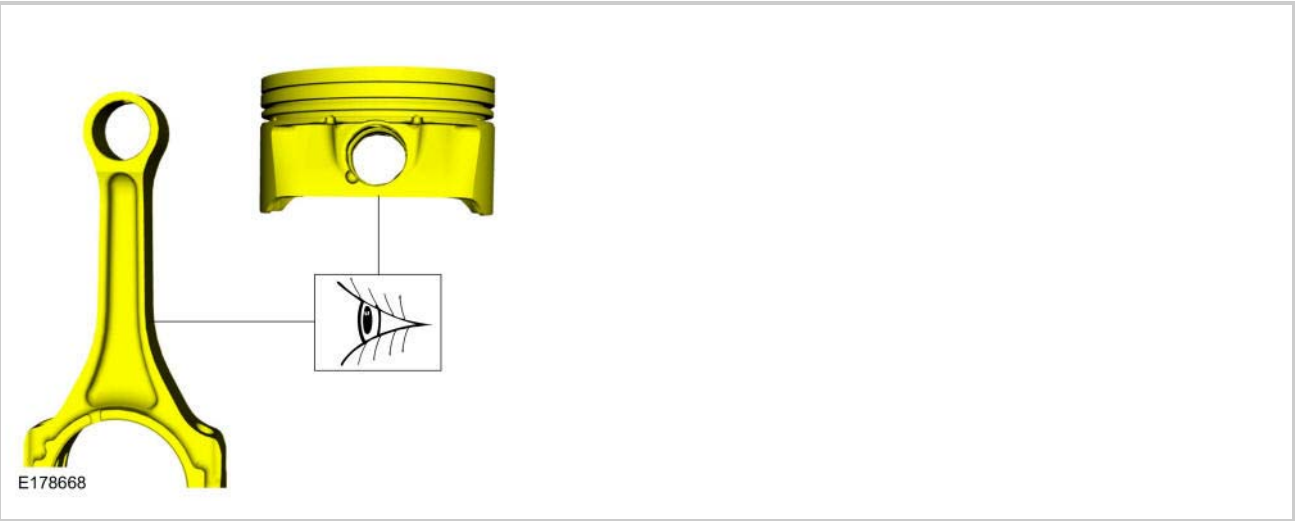
1.

Remove the piston rings and discard.

2.

Remove the piston pin retainers and discard.

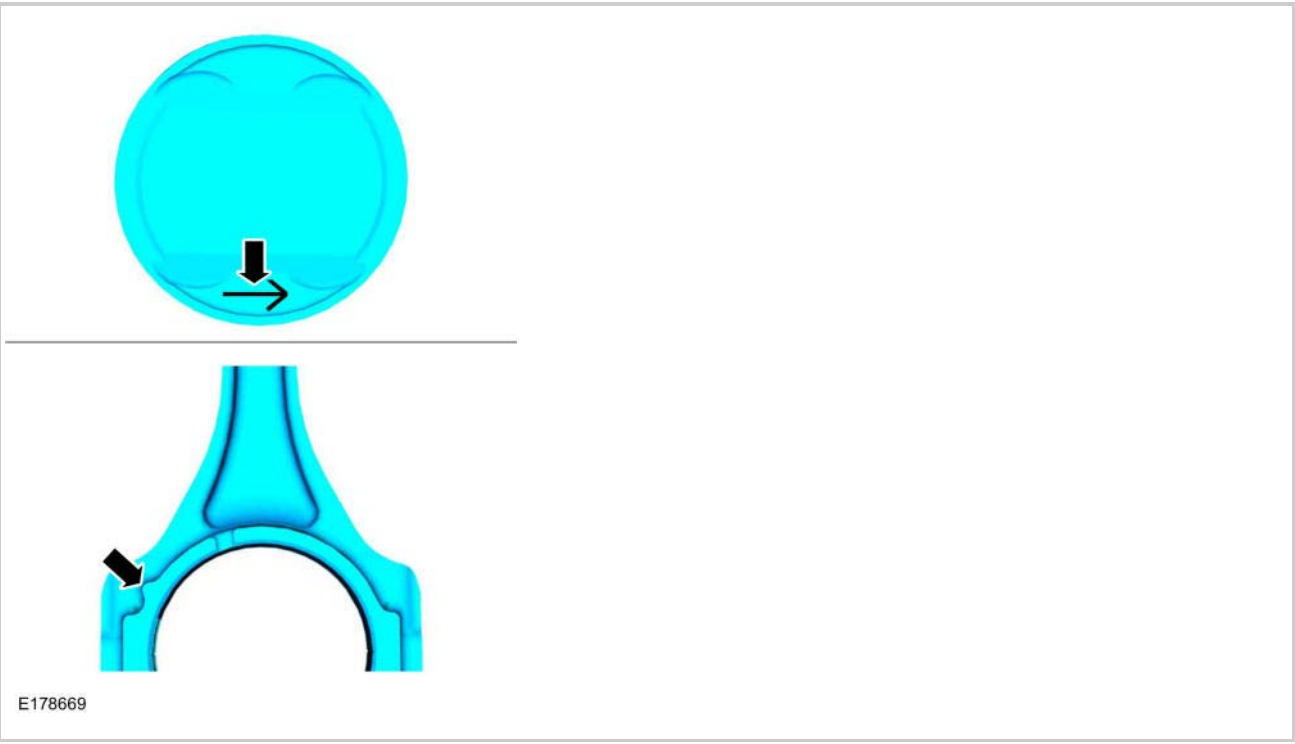
Remove the piston pin.



NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

3.
Remove the piston from the connecting rod.

4.



Inspect the piston and connecting rod. Refer to: Piston Inspection .

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > ASSEMBLY

1.

If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

2.

Install the piston to the connecting rod.

3.

Lubricate with clean engine oil and install the piston pin.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The piston pin retaining clip gap orientation must be toward the top or dome of piston.

4.
Install the piston pin retainers.

5.

Lubricate with clean engine oil and install the piston rings.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The arrow on the top of the piston indicates the front of the engine.

NOTE: The piston compression upper and lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

6.

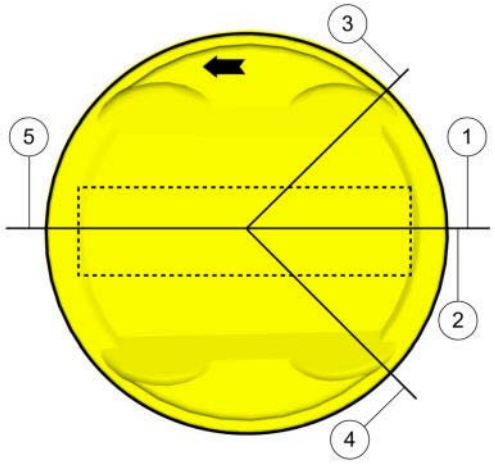
1.

Center line of the piston parallel to the wrist pin bore.

2.

Upper compression ring gap location.

3.



Upper oil control segment ring gap location.

4.

Lower oil control segment ring gap location.

5.

Expander ring and lower compression ring gap location.

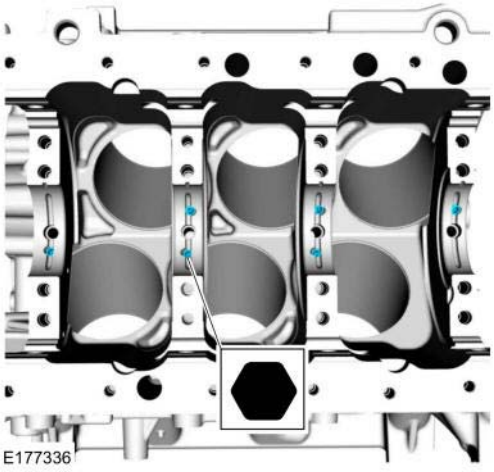
Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

NOTE: Assembly of the engine requires various inspections/measurements of the engine components. These inspections/measurements will aid in determining if the engine components will require replacement. Refer to ENGINE SYSTEM - GENERAL INFORMATION .

NOTE: If the cylinder head(s) is replaced, a new secondary timing chain tensioner will need to be installed. Refer to Variable Camshaft Timing (VCT) Unit .



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

Using a hex bit, install the piston oil cool valves.

Torque

: 35 lb.in (4 Nm)

NOTE: This step is for selecting the correct main bearings.

NOTE: The #1 main bearing is at the front of the engine block.

2.

Select the crankshaft main bearings for each crankshaft journal.

Record the code that is on the cylinder block face.

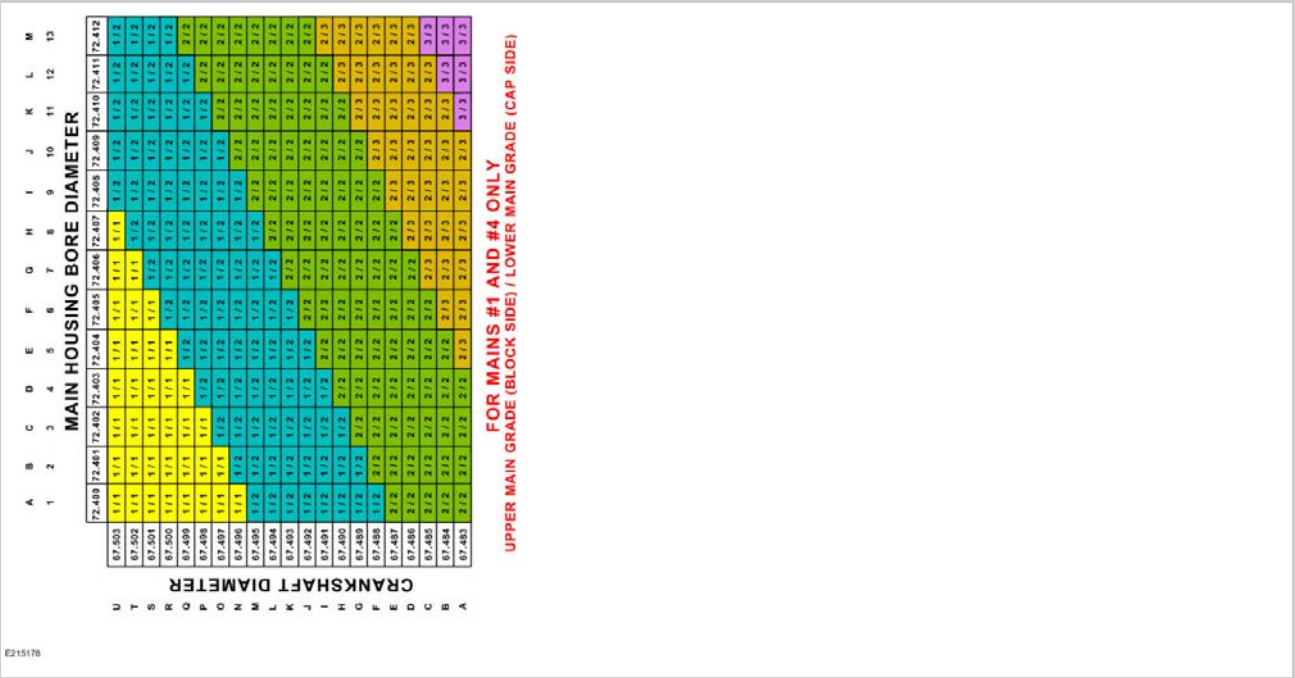
Record the code that is on the crankshaft flange.

The first letter is for main No. 1 and the next letters are for mains 2, 3 and 4.

NOTE: This chart is for selecting main bearings 1 and 4 only.

NOTE: This chart is continued in the next step.

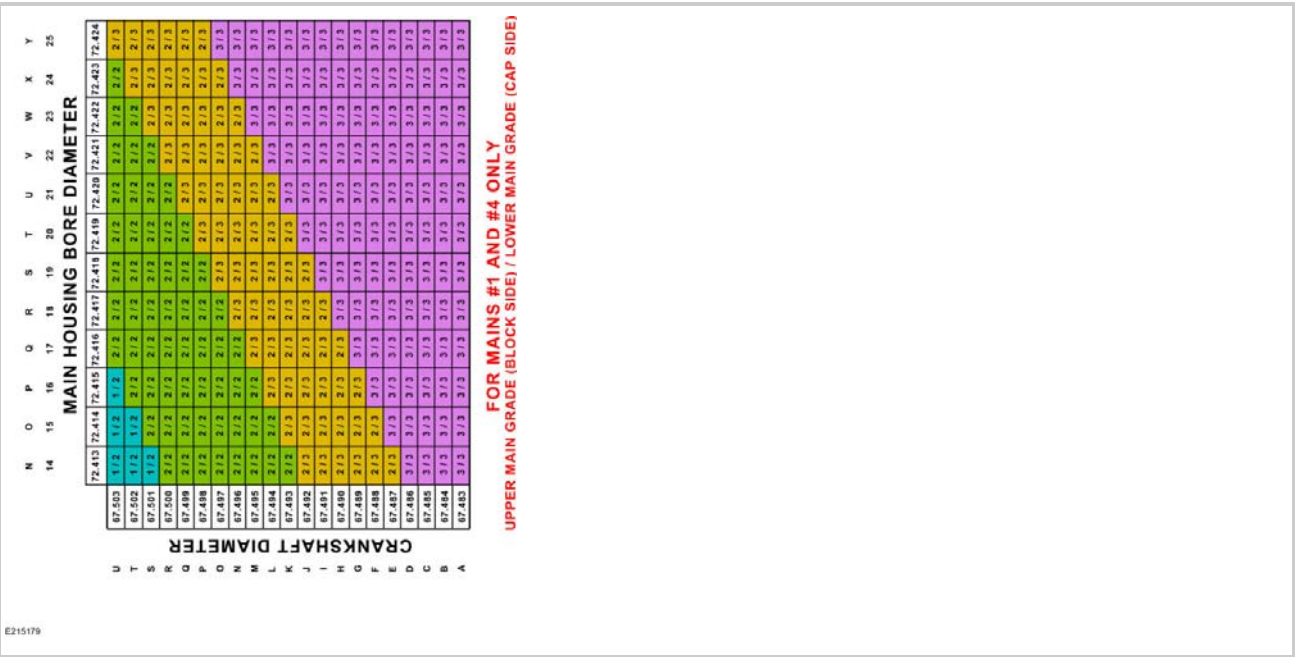
3.



Using the data recorded earlier and the Bearing Select Fit Chart in the illustration below, Standard Bearings, determine the required bearing grade for main bearings 1 and 4.

Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.

Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.



As an example, if the engine block code letter is "M" and the crankshaft code letter is "M", the correct bearing grade for this main bearing is a "2" for the upper bearing and a "2" for the lower bearing.

Repeat the above steps using the fourth letter of the block and crankshaft codes to select the No. 4 bearing.

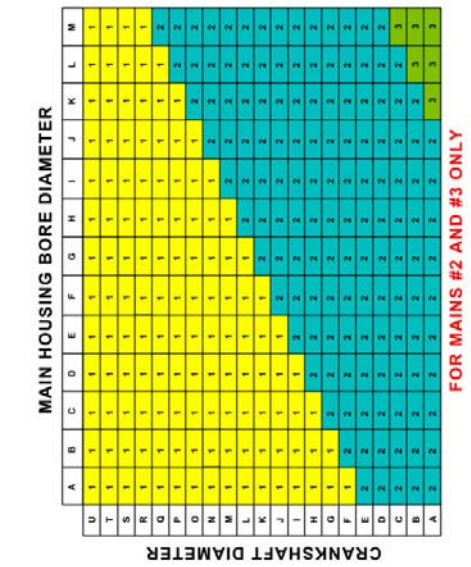
NOTE: This chart in the illustration is for selecting main bearings 1 and 4 only.

4.

NOTE: This chart is continued in the next step.

NOTE: This chart is for selecting main bearings 2 and 3 only.

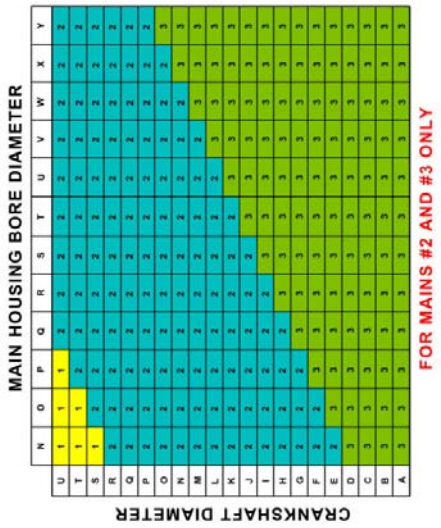
5.



Using the data recorded earlier and the Bearing Select Fit Chart in the illustration below, Standard Bearings, determine the required bearing grade for main bearings 2 and 3.

Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.

Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the No. 2 crankshaft main bearing.



As an example, if the engine block code letter is "N" and the crankshaft code letter is "H", the correct bearing grade for this main bearing is "2".

Repeat the above steps using the third letter of the block and crankshaft codes to select the No. 3.

NOTE: This chart in the illustration is for selecting main bearings 2 and 3 only.

6.

E215181

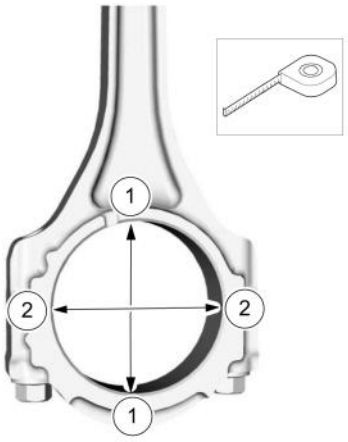
NOTE: The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

7.
Using the original connecting rod cap bolts, install the connecting rod caps and bolts.

Torque:

Stage 1: 17 lb.ft (23 Nm)

Stage 2: 32 lb.ft (43 Nm)

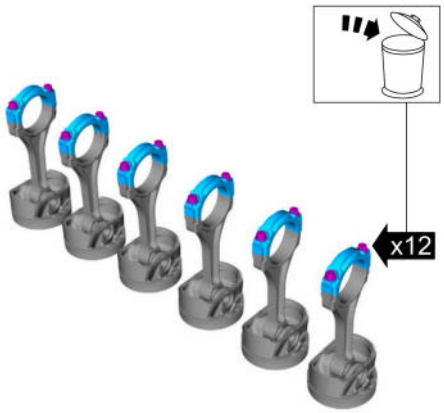


Stage 3: 90°

E177202

8.

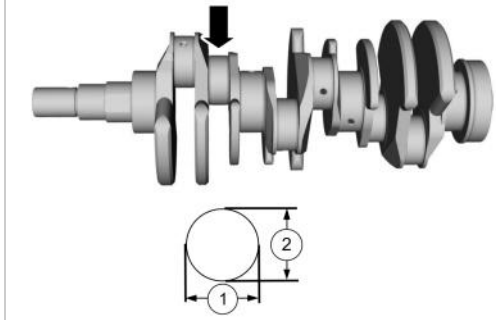
Measure the connecting rod large end bore in 2 directions.



E177203

9.

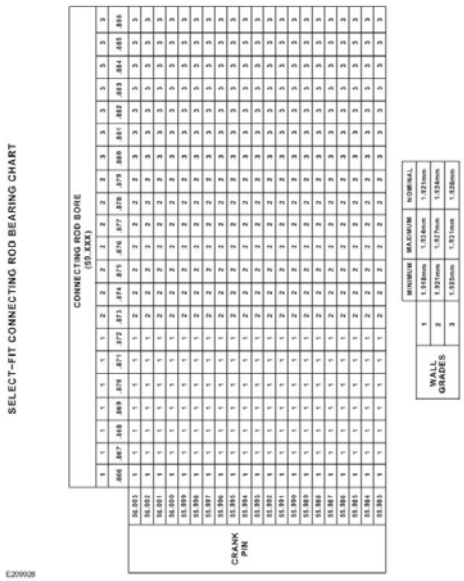
Remove the bolts and the rod cap.



Discard the bolts.

E177204

10.

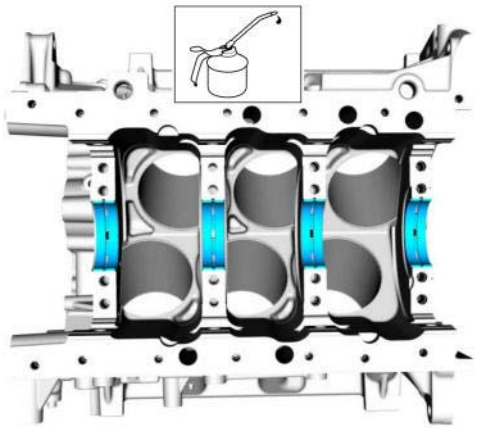


Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions.

E177205

11.

Using the chart in illustration, select the correct connecting rod bearings for each crankshaft connecting rod journal.



E209928

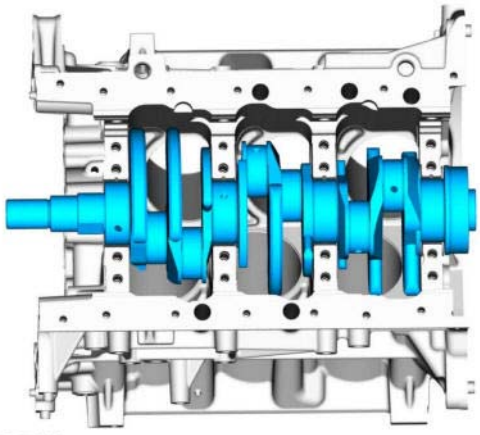
NOTE: Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

12.
Lubricate the upper crankshaft main bearings with clean engine oil and install in the cylinder block.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E177206

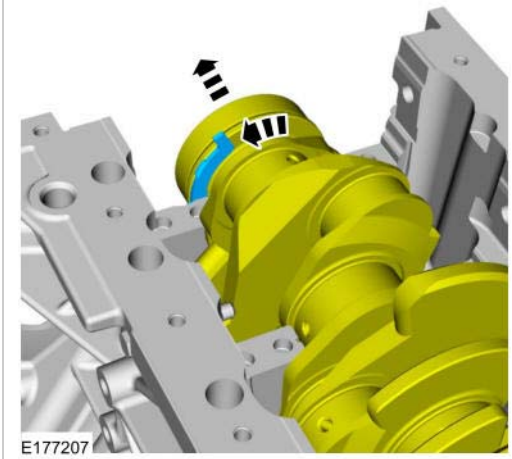


NOTE: Do not install the upper thrust bearings until the crankshaft is installed.

NOTE: Lubricate the thrust surfaces of the crankshaft with clean engine oil.

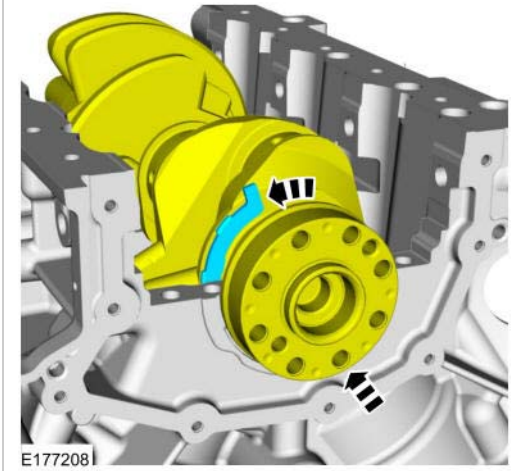
13.
Install the crankshaft.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E177333

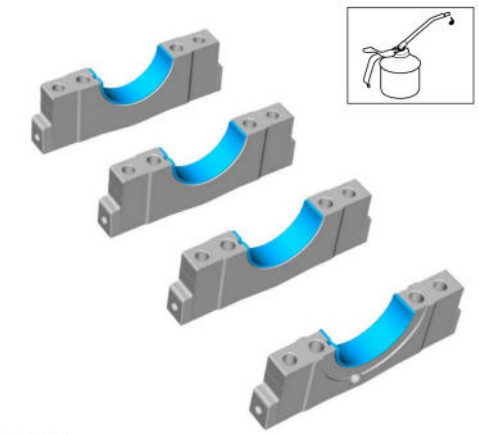


NOTE: Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

14.
Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 4 rear bulkhead.

NOTE: Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

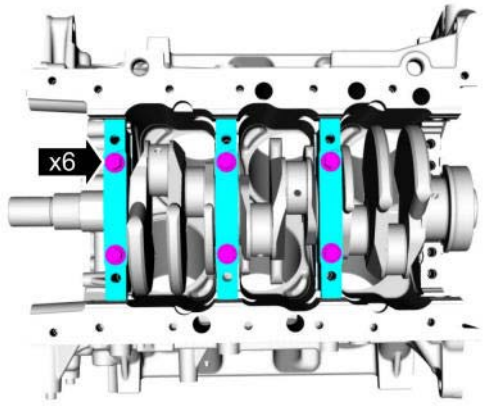
15.
Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 4 rear bulkhead.



16.

Lubricate the crankshaft lower main bearings with clean engine oil and install them into the main bearing caps. Check seating and squareness of the bearings to make sure of proper seating in caps.

Material

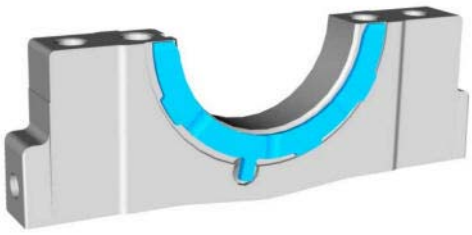


: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E177209

17.

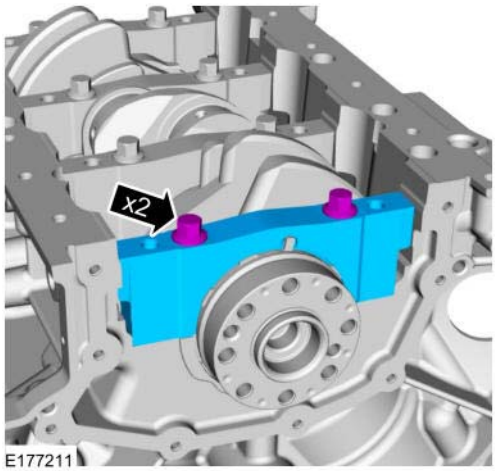
Position the No. 1, No. 2 and No. 3 main bearing caps on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the new bolts until the main bearing caps are seated.



E177210

NOTE: Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

NOTE: To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.



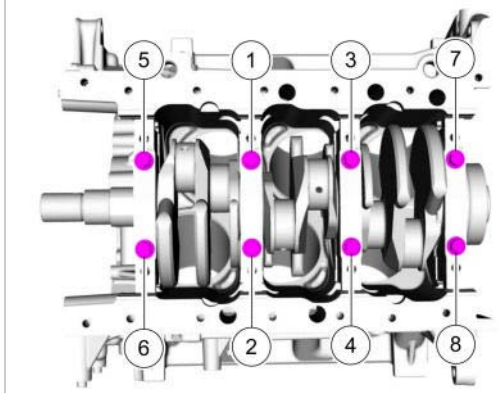
18.
Install the lower crankshaft thrust washer to the back side of the No. 4 rear main bearing cap, with the tab aligned with the cutout in the main bearing cap.

E177331

19.

Position main bearing cap No. 4 on the cylinder block and keeping the cap as square as possible, alternately draw the cap down evenly using the new bolts until the main bearing cap is seated.

E177211



NOTE: While tightening the main bearing vertical bolts, push the crankshaft forward and the No. 4 main bearing cap rearward to seat the crankshaft thrust washers.

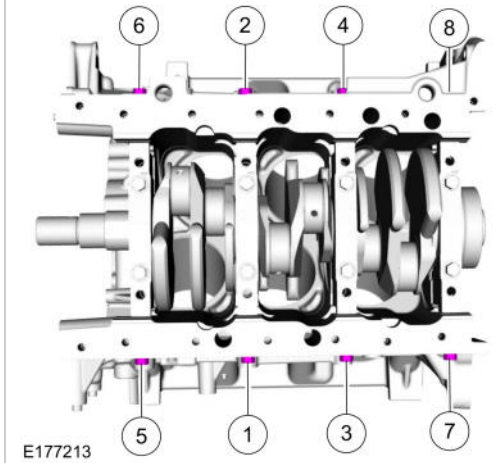
20.
Tighten the main bearing bolts.

Torque:

Stage 1: 24 lb.ft (33 Nm)

Stage 2: 135°

E177212



21.

Install the new main bearing cap side bolts.

Torque:

Stage 1: 33 lb.ft (45 Nm)

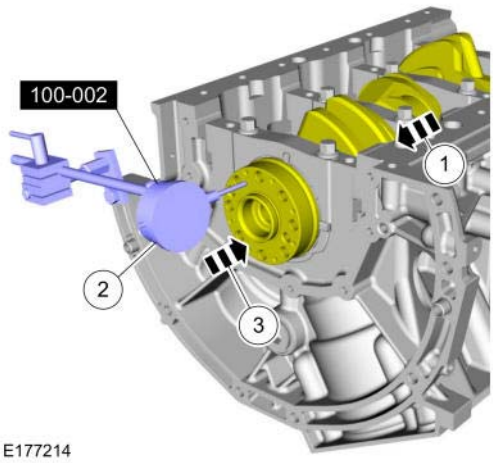
Stage 2: 90°

E177213

22.

1.

Position the crankshaft to the rear of the cylinder block.



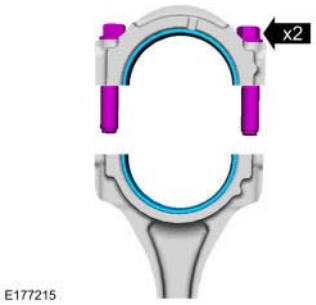
Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

2.

Zero the Dial Indicator Gauge.

3.

Move the crankshaft to the front of the cylinder block. Measure and record the crankshaft end play.



NOTE: The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

23.

Prepare the connecting rod and cap.

Insert the new bolts in the rod cap.

Insert the upper and lower rod bearings into the rod and cap.

NOTE: The arrow on the top of the piston indicates the front of the engine.

NOTE: The piston compression upper and lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

24.

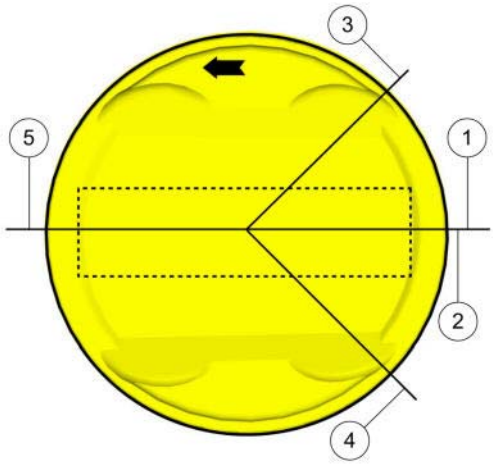
1.

Center line of the piston parallel to the wrist pin bore.

2.

Upper compression ring gap location.

3.



Upper oil control segment ring gap location.

4.

Lower oil control segment ring gap location.

5.

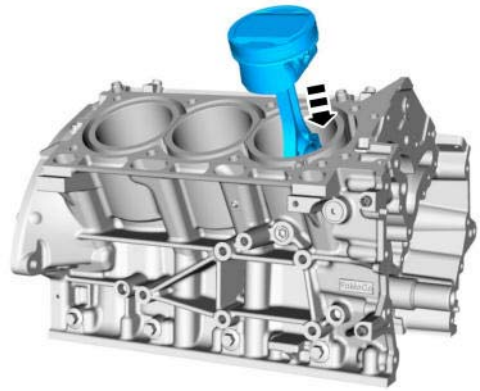
Expander ring and lower compression ring gap location.

E176334

NOTE: Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.

NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

NOTE: Make sure the piston rings are positioned to specifications for installation.



Refer to Piston .

NOTE: If the piston and or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

NOTE: If the piston and connecting rod are to be reinstalled, they must be installed in the same orientation as disassembled.

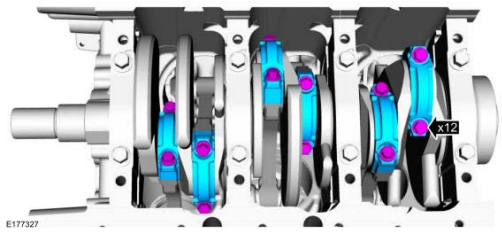
25.
Using the Piston Ring Compressor, install the piston and connecting rod assemblies. Repeat until all 6 piston assemblies are installed.

Use the General Equipment: Piston Ring Compressor

E177217

NOTE: The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

NOTE: After installation of each piston, connecting rod, rod cap and bolts, rotate the crankshaft to verify smooth operation.



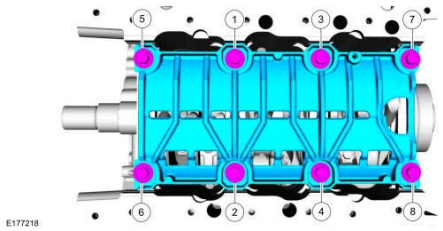
26.
Install the connecting rod cap and the new bolts.

Torque:

Stage 1: 17 lb.ft (23 Nm)

Stage 2: 32 lb.ft (43 Nm)

Stage 3: 90°

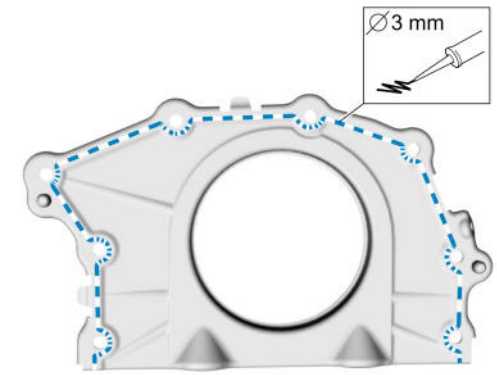


27.

Install the main bearing cap support brace and the new bolts.

Torque:

Stage 1: 18 lb.ft (24 Nm)

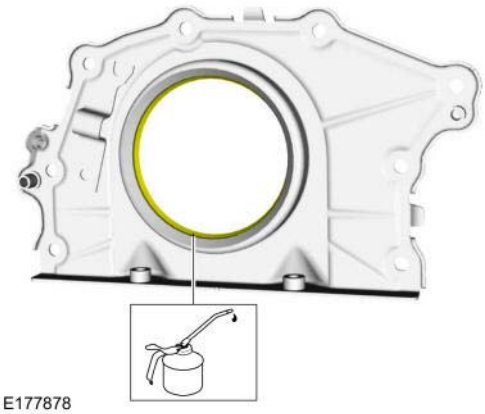


Stage 2: 180°

NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 4 minutes of sealant application.

NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

28.
Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

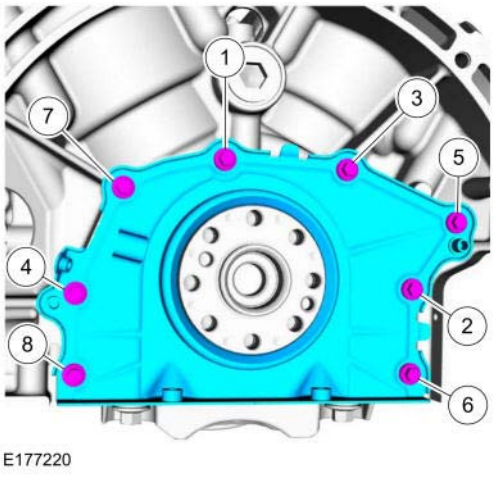


29.

Lubricate the crankshaft rear seal with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

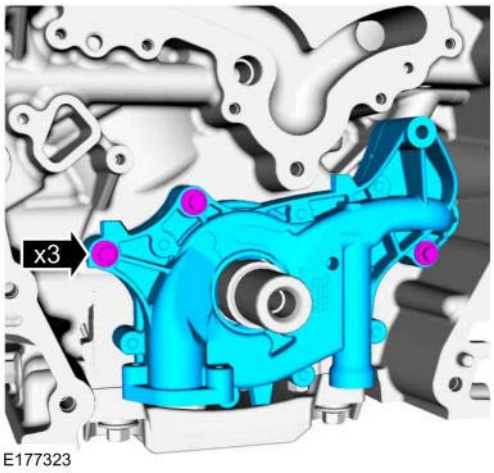


30.

Install the crankshaft rear seal and the bolts.

Torque

: 89 lb.in (10 Nm)



31.

Install the oil pump and the bolts.

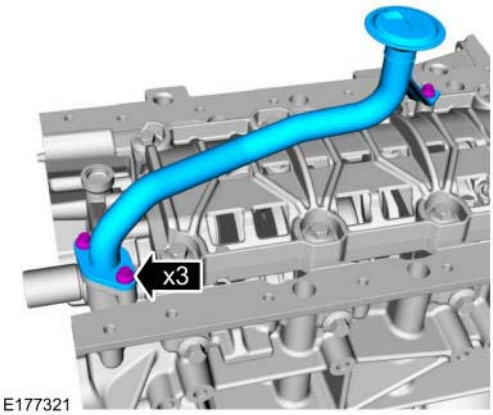
Torque

: 89 lb.in (10 Nm)

E177323

32.

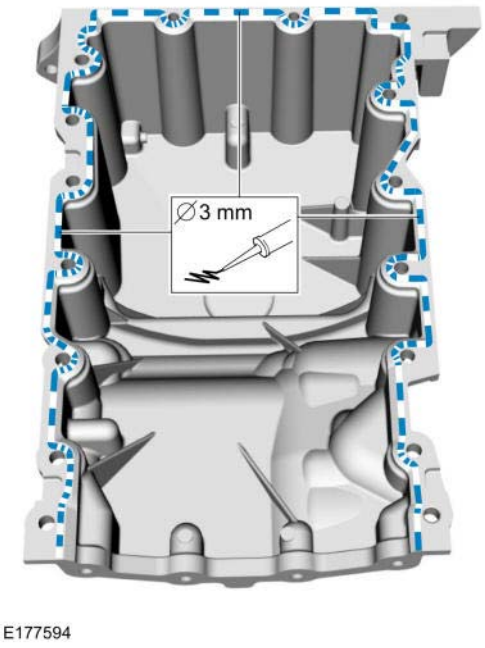
Install a new oil pump screen and pickup tube O-ring seal.



E177221

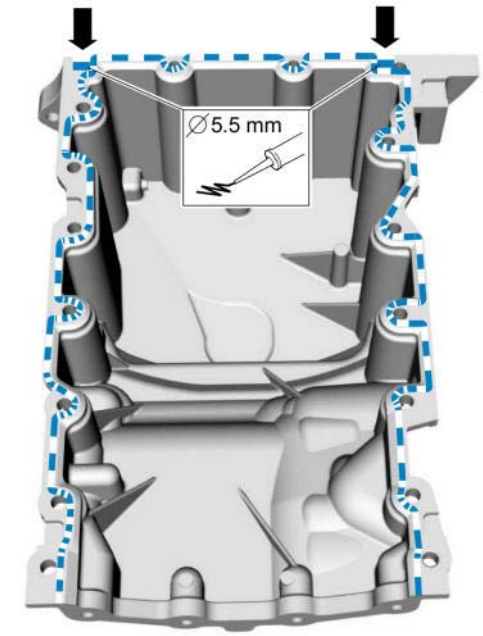
33.

Install the oil pump screen and pickup tube and the bolts.



Torque

: 89 lb.in (10 Nm)



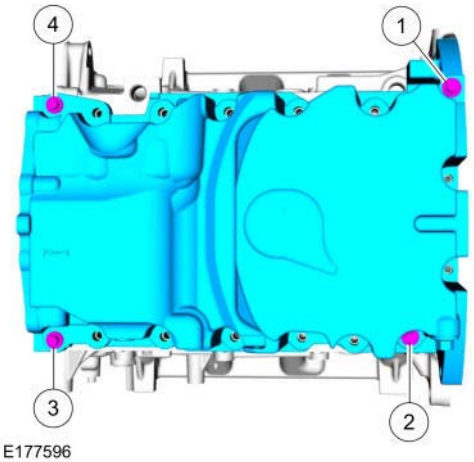
NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

34.
Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the oil pan.

NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

35.
Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

E177595



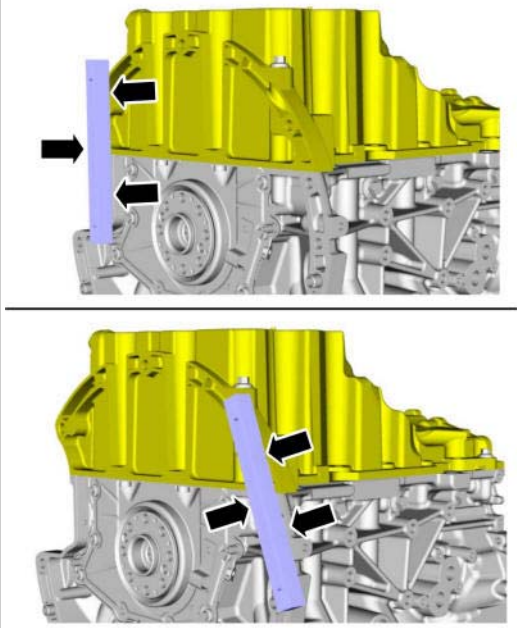
36.

Install the oil pan and bolts.

Torque:

Stage 1: 27 lb.in (3 Nm)

Stage 2: Loosen: 180°

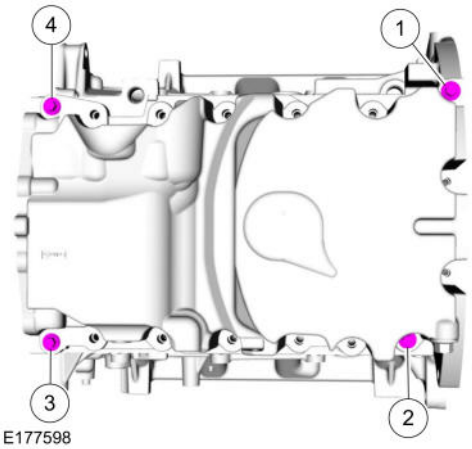


E177596

37.

Using a straight edge, align the oil pan flush with the rear of the cylinder block at the 2 areas shown in illustration.

Use the General Equipment: Round-Ended Steel Rule



E177597

38.

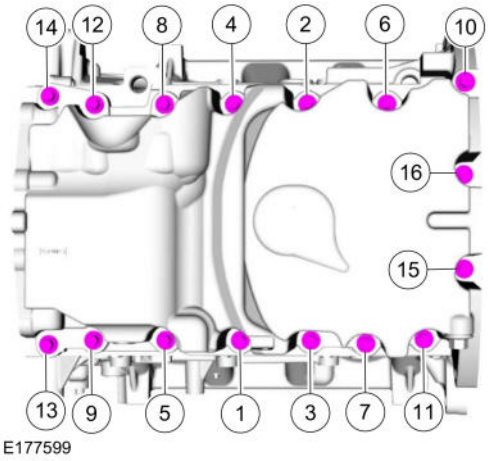
Tighten the bolts in the sequence.

Torque

: 27 lb.in (3 Nm)

E177598

39.



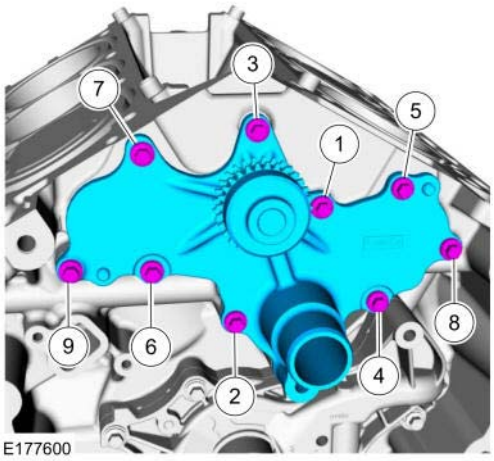
Install the remaining oil pan bolts.

Torque:

Stage 1: Tighten bolts 1 through 14 to: 18 lb.ft (24 Nm)

Stage 2: Tighten bolt 10 an additional: 90°

Stage 3: Tighten bolts 15 and 16 to: 89 lb.in (10 Nm)



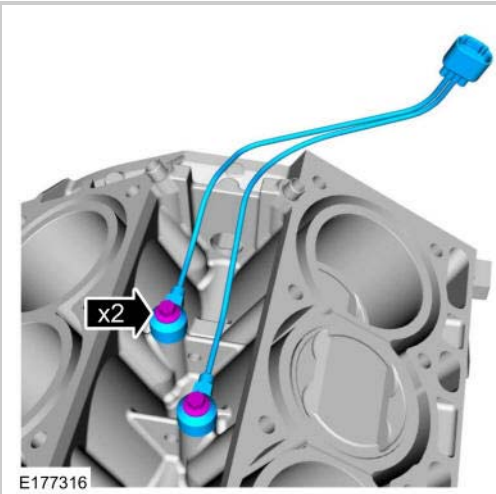
40.

Install the channel cover plate and the bolts.

Torque:

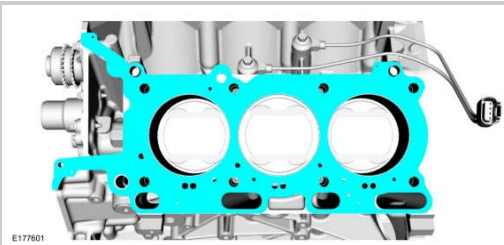
Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



41.

Install the KS and the bolts.



Torque

: 177 lb.in (20 Nm)

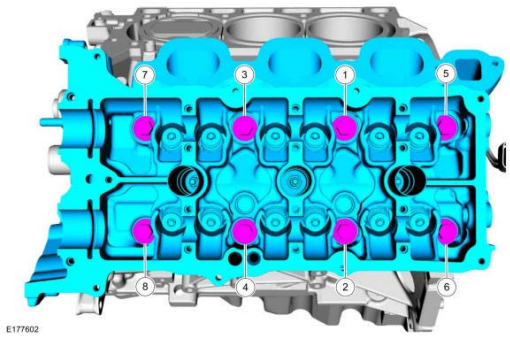
42.

Install the LH cylinder head gasket.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

43.
Install the cylinder head and the new bolts.

Torque:



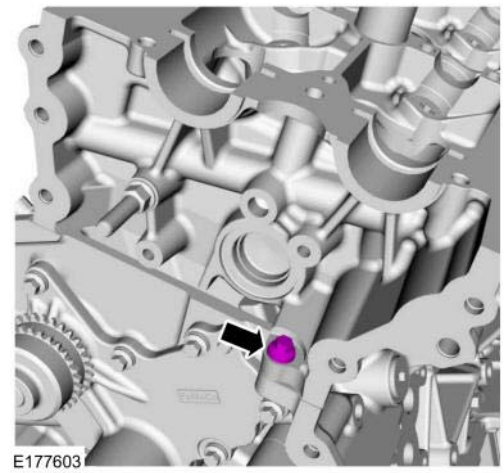
Stage 1: 177 lb.in (20 Nm)

Stage 2: 26 lb.ft (35 Nm)

Stage 3: 90°

Stage 4: 90°

Stage 5: 45°



44.

Install the M6 bolt.

Torque

: 89 lb.in (10 Nm)

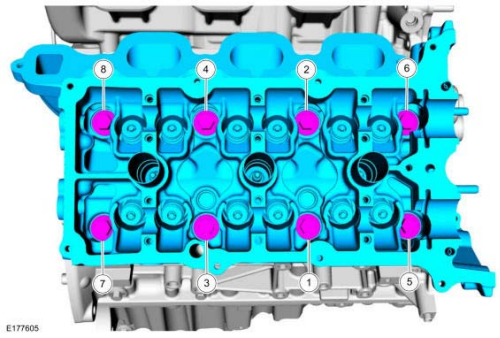
45.

Install the RH cylinder head gasket.

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

46.
Install the cylinder head and the new bolts.

Torque:



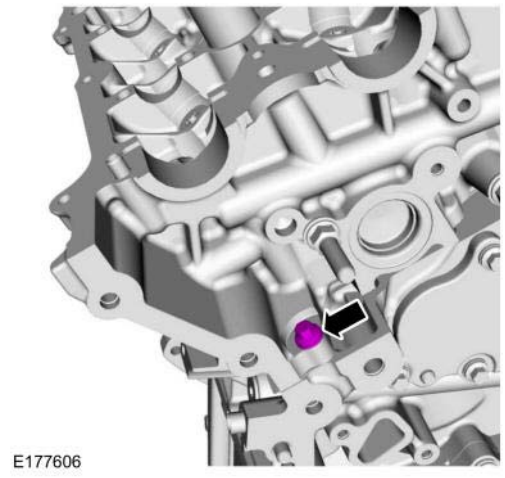
Stage 1: 177 lb.in (20 Nm)

Stage 2: 26 lb.ft (35 Nm)

Stage 3: 90°

Stage 4: 90°

Stage 5: 45°



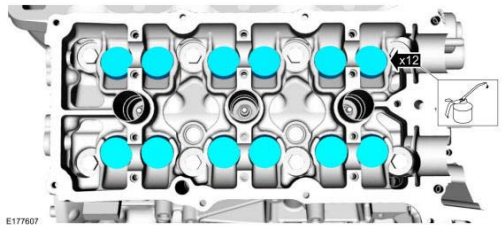
47.

Install the M6 bolt.

Torque

: 89 lb.in (10 Nm)

NOTE: The valve tappets must be installed in their original positions.



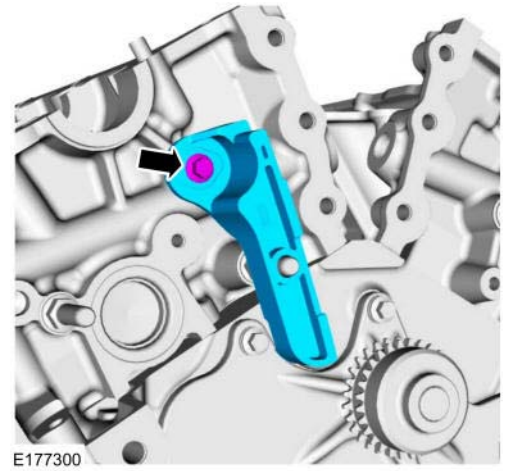
NOTE: Coat the valve tappets with clean engine oil prior to installation.

NOTE: RH shown in illustration, LH similar.

48.
Install the valve tappets.

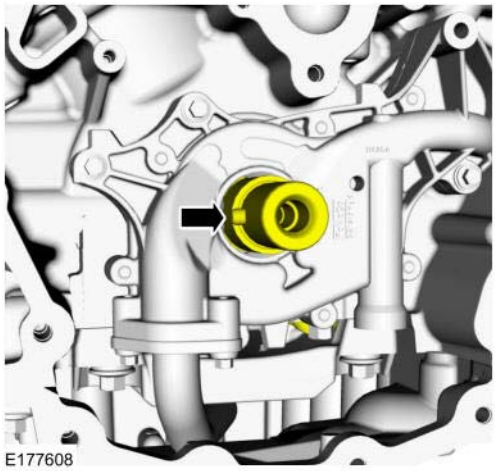
Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



49.

Install the RH primary timing chain guide and the bolt.

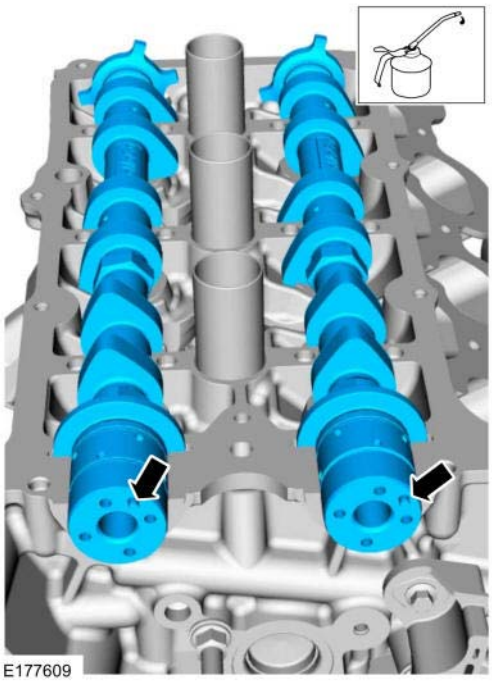


Torque

: 89 lb.in (10 Nm)

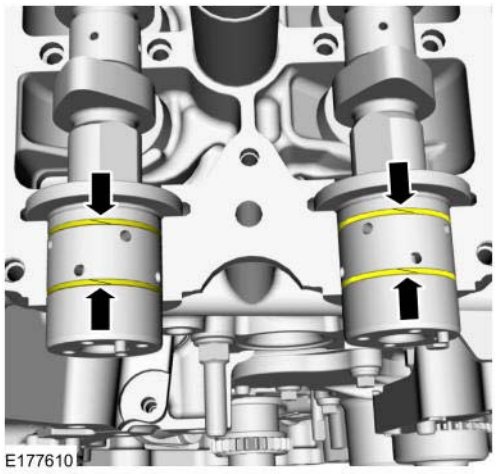
NOTE: The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.

50.
Position the crankshaft dowel pin in the 9 o'clock position.



NOTE: Coat the camshafts with clean engine oil prior to installation.

51.
Lubricate the camshafts with clean engine oil and position the camshafts onto the RH cylinder head in the neutral position as shown in illustration.

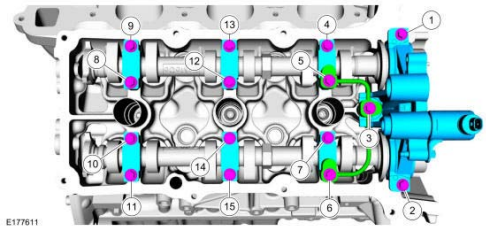


Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.

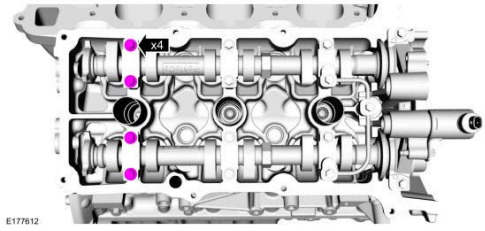
52.
Position the RH camshaft seals gaps as shown in illustration.



NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

53.
Install the camshaft caps, oil tube and the bolts.

Torque:

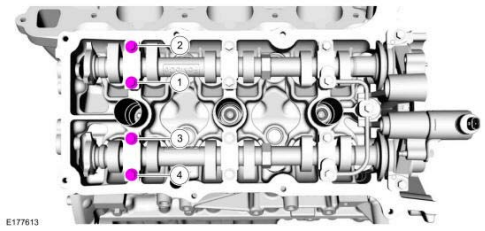


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

54.

Loosen the camshaft cap bolts.



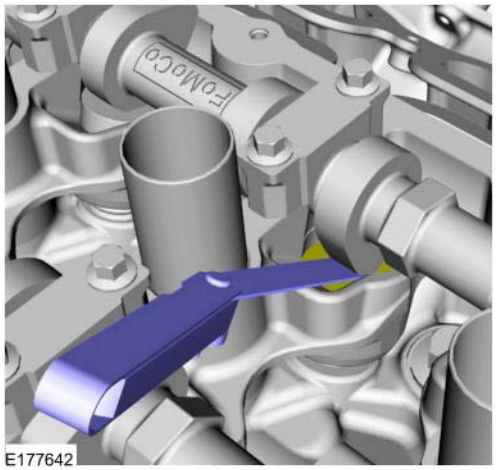
55.

Tighten the camshaft cap bolts.

Torque:

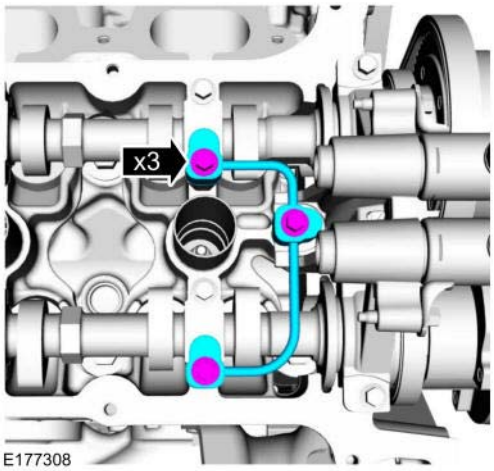
Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°



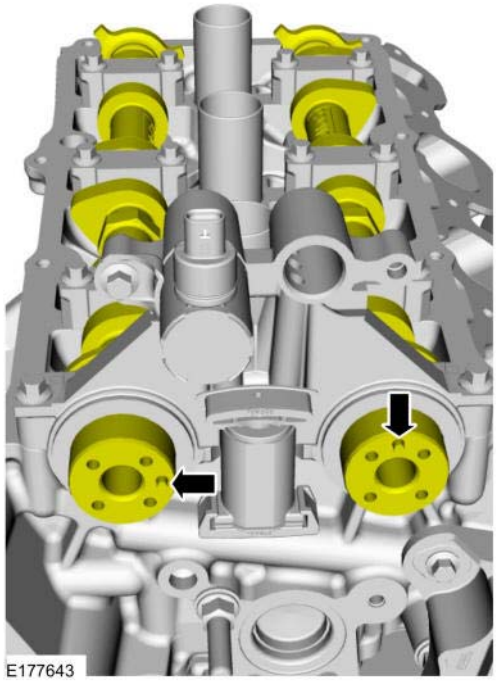
NOTE: If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.

NOTE: Use a camshaft sprocket bolt to turn the camshafts.



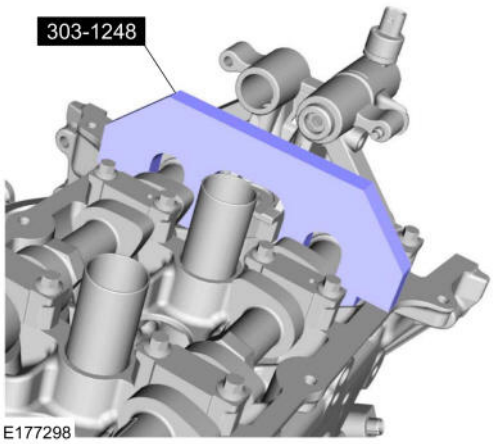
56.
Confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. Refer to: Valve Clearance Adjustment .

Use the General Equipment: Feeler Gauge



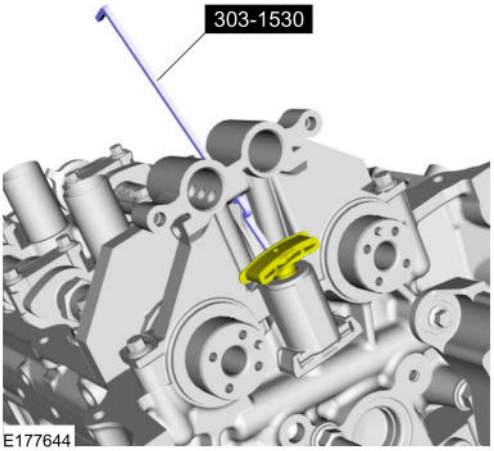
57.

Remove the bolts and the oil tube.



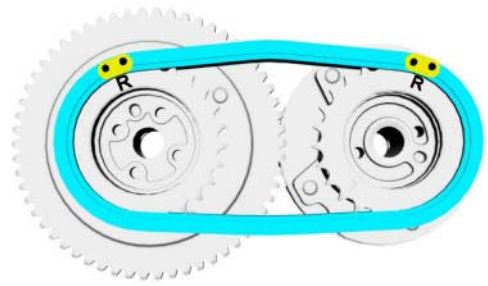
58.

Rotate the RH camshafts to TDC.



NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

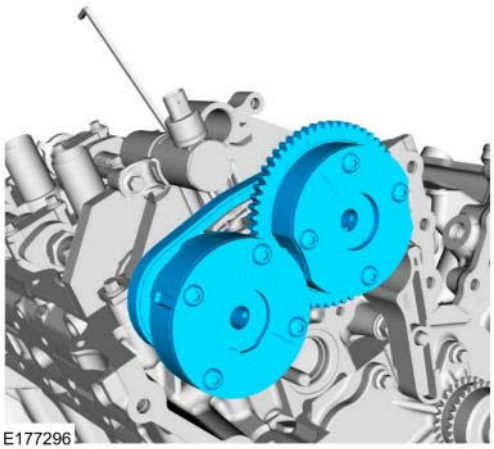
59.
Install Special Service Tool: 303-1248 Camshaft holding tools.



NOTE: The VCT oil control solenoids are removed for clarity.

60.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.

61.



Align the colored links with the timing marks and assemble the RH VCT units.

E177645

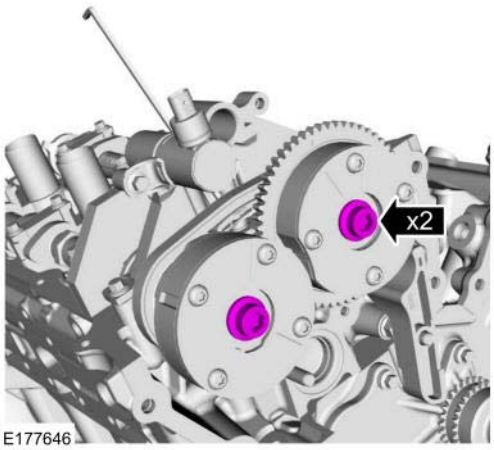
NOTE: It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

62.
Position the RH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

E177296

63.

Install the new RH VCT unit bolts.

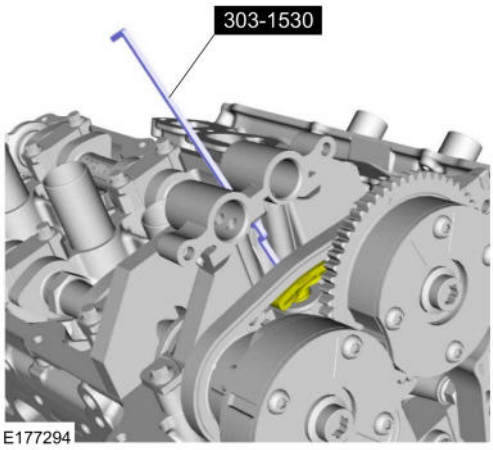


Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 18 lb.ft (25 Nm)

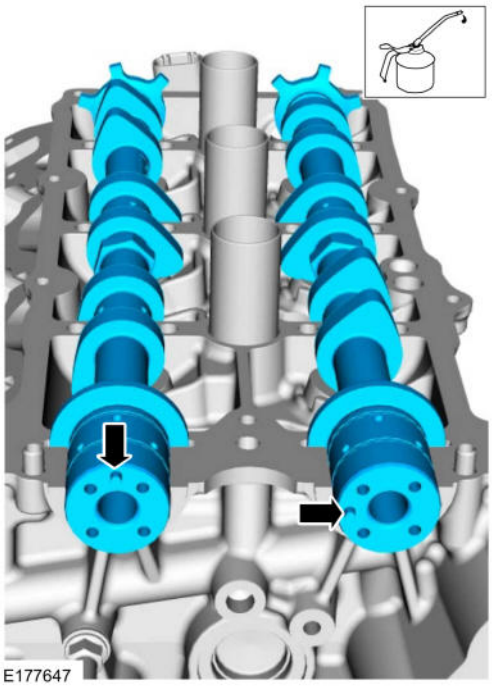


Stage 4: 180°

NOTE: Make sure the secondary timing chain is centered on the timing chain tensioner guides.

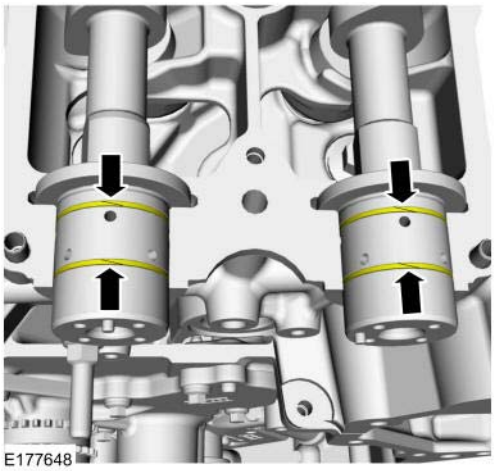
NOTE: The VCT oil control solenoids are removed for clarity.

64.
Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.



NOTE: Coat the camshafts with clean engine oil prior to installation.

65.
Lubricate the camshafts with clean engine oil and position the camshafts onto the LH cylinder head in the neutral position as shown in illustration.

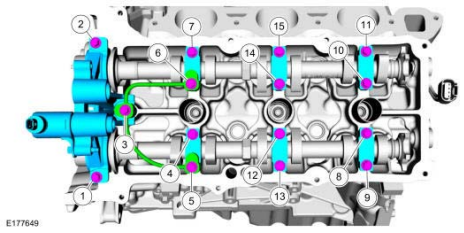


Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.

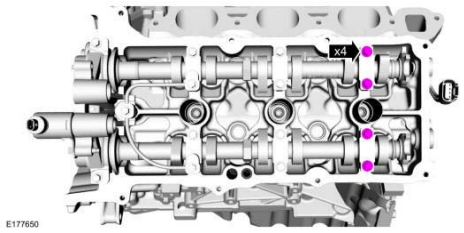
66.
Position the LH camshaft seals gaps as shown in illustration.



NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

67.
Install the camshaft caps, oil tube and the bolts.

Torque:

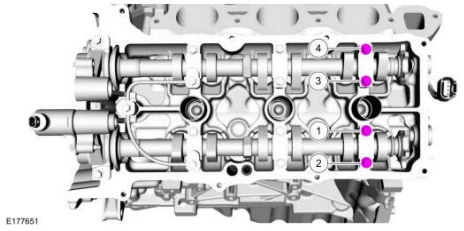


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

68.

Loosen the camshaft cap bolts.



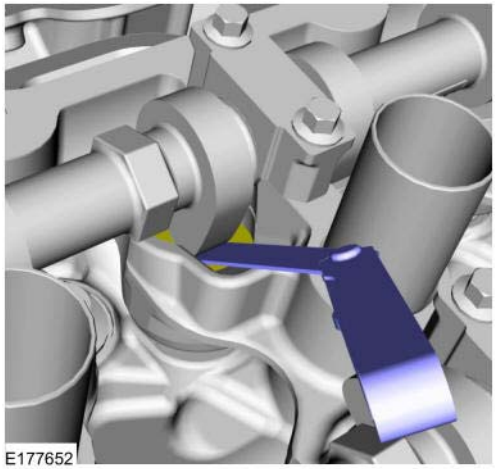
69.

Tighten the camshaft cap bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

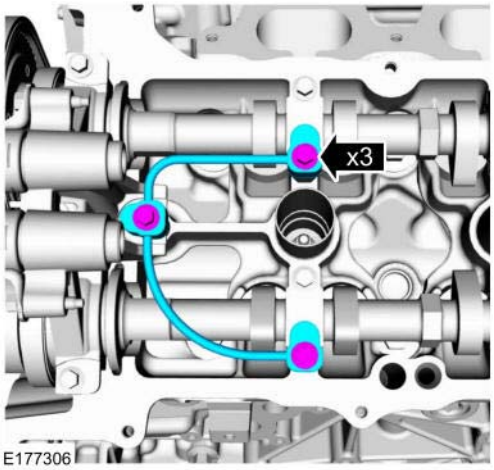
Stage 2: 45°



NOTE: If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.

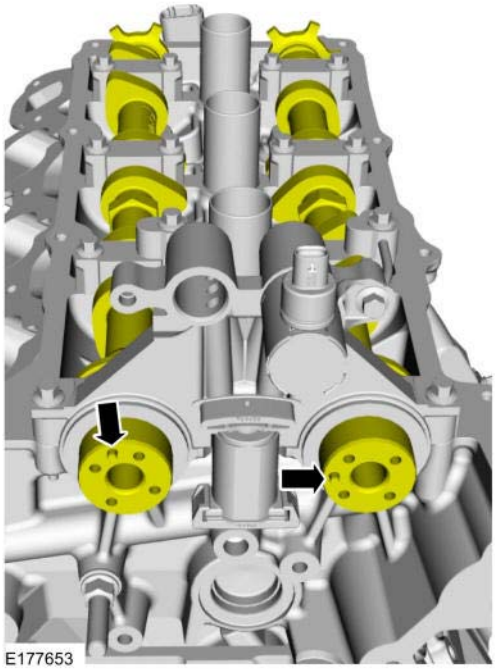
NOTE: Use a camshaft sprocket bolt to turn the camshafts.

70.
Confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the



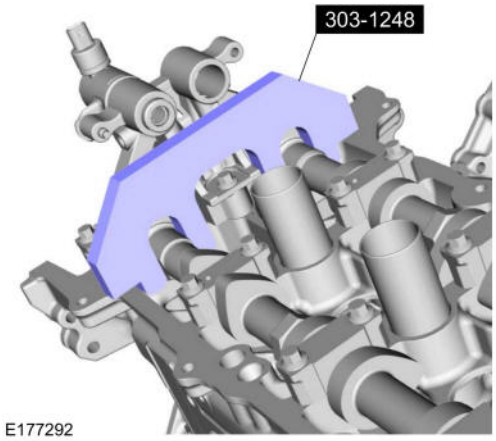
correct size. Refer to: Valve Clearance Adjustment .

Use the General Equipment: Feeler Gauge



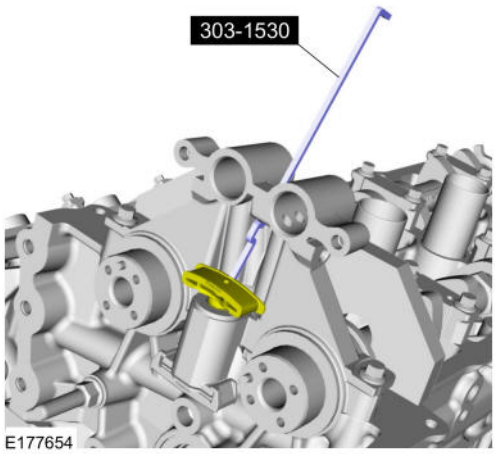
71.

Remove bolts and the oil tube.



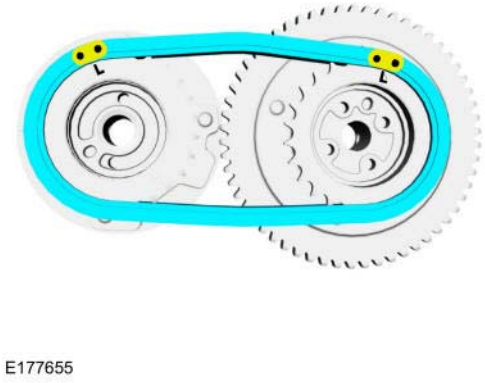
72.

Rotate the LH camshafts to TDC.



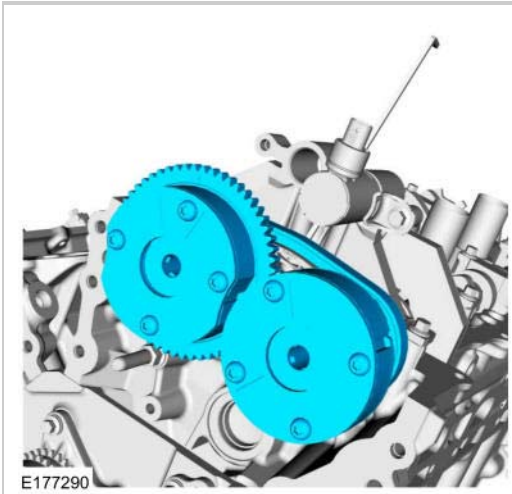
NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

73.
Install Special Service Tool: 303-1248 Camshaft holding tools.



NOTE: The VCT oil control solenoids are removed for clarity.

74.
Install Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.



75.

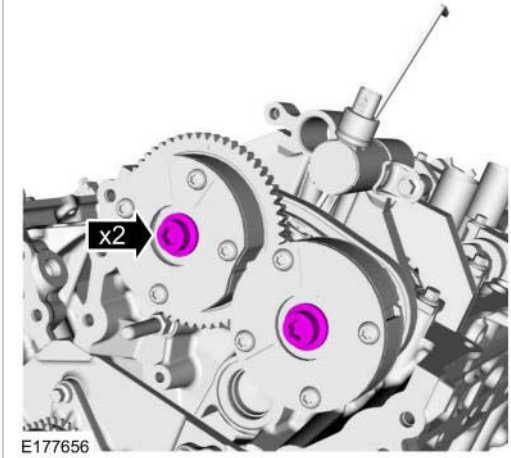
Align the colored links with the timing marks and assemble the LH VCT units.

NOTE: It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

76.
Position the LH VCT units and secondary timing chain onto the camshafts by aligning the holes in the VCT units with the dowel pins in the camshafts.

77.

Install the new LH VCT unit bolts.



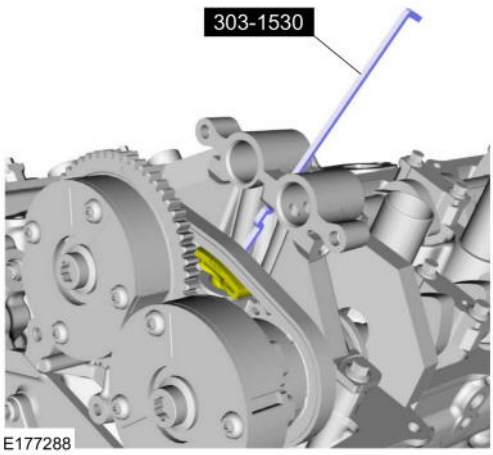
Torque:

Stage 1: 30 lb.ft (40 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 18 lb.ft (25 Nm)

Stage 4: 180°

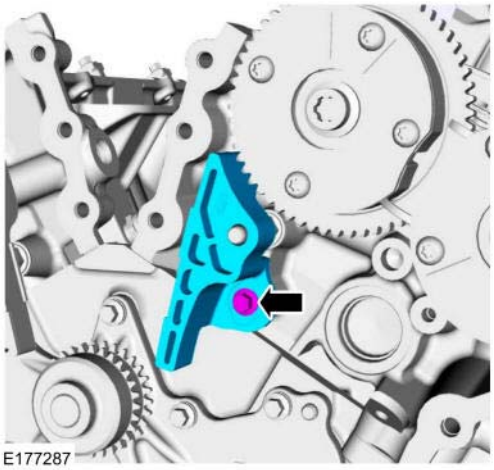


NOTE: Make sure the secondary timing chain is centered on the timing chain tensioner guides.

NOTE: The VCT oil control solenoids are removed for clarity.

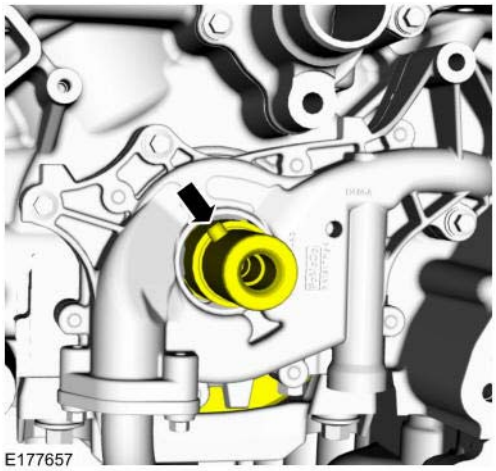
78.

Remove Special Service Tool: 303-1530 Tool, Chain Tensioner Hold Down.



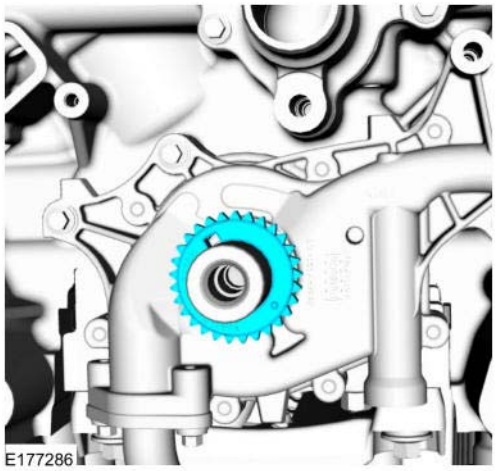
79.

Install the LH upper primary timing chain guide and the bolt.



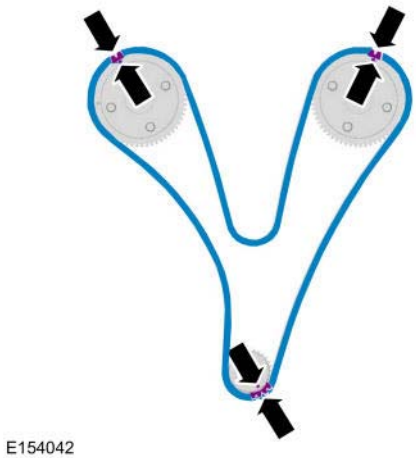
Torque

: 89 lb.in (10 Nm)



80.

Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

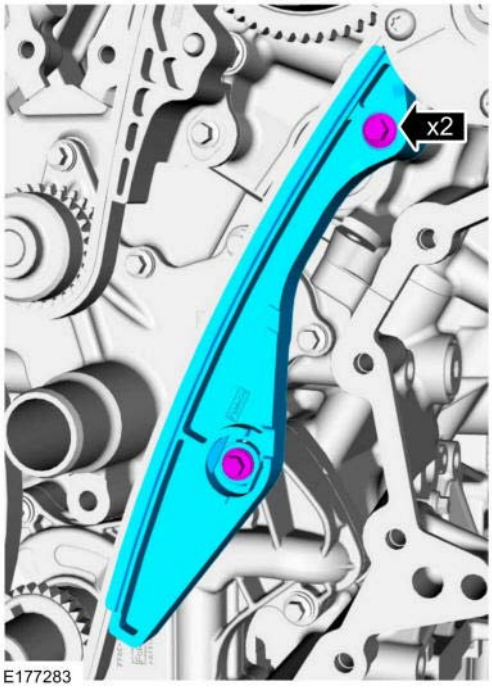


81.

Install the crankshaft sprocket.

NOTE: It may be necessary to rotate the camshafts slightly, to align the timing marks.

82.
Install the timing chain with the colored links aligned with the timing marks on the VCT units and the crankshaft sprocket.



83.

Install the lower LH timing chain guide and the bolts.

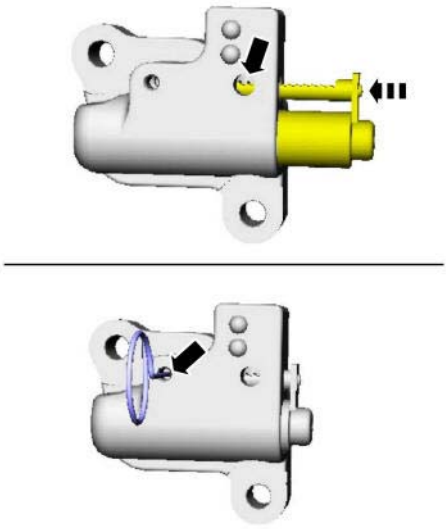
Torque

: 89 lb.in (10 Nm)

84.

Install the timing chain tensioner arm.

E177282



85.

Release the ratchet detent.

Using a soft-jawed vise, compress the ratchet plunger.

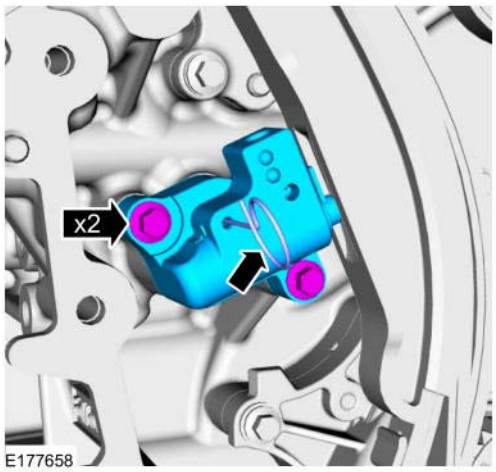
Align the hole in the ratchet plunger with the hole in the tensioner housing.

Install a lockpin.

E151609

NOTE: It may be necessary to rotate the camshafts slightly to remove slack from

the timing chain to install the tensioner.



86.

Install the timing chain tensioner and the bolts.

Torque

: 89 lb.in (10 Nm)

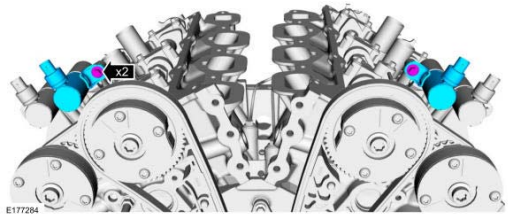
Remove the lockpin.

87.

As a post-check, verify correct alignment of all timing marks.

There are 48 links in between the RH intake VCT unit colored link (1) and the LH intake VCT unit colored link (2).

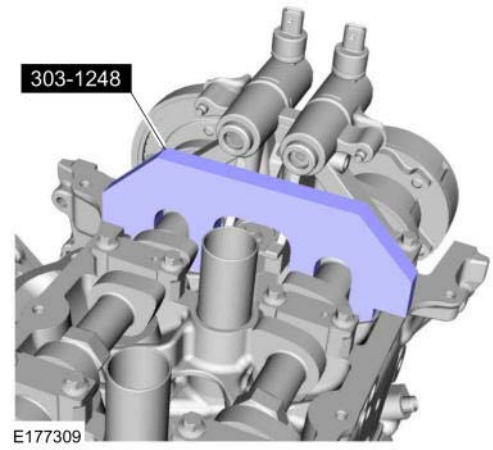
There are 35 links in between LH intake VCT unit colored link (2) and the 2 crankshaft sprocket links (3).



NOTE: Do not use excessive force when installing the VCT oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.

88.
Install the VCT oil control solenoids and the bolts.

Torque:

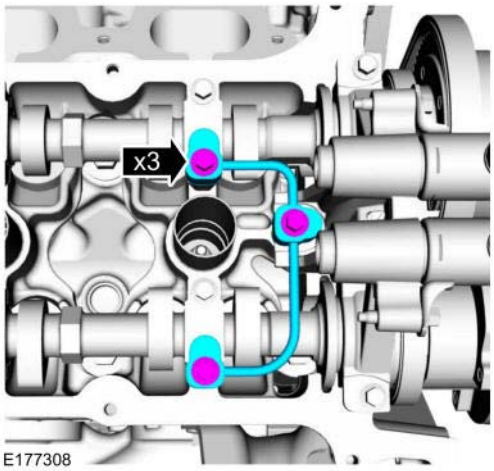


Stage 1: 71 lb.in (8 Nm)

Stage 2: 20°

89.

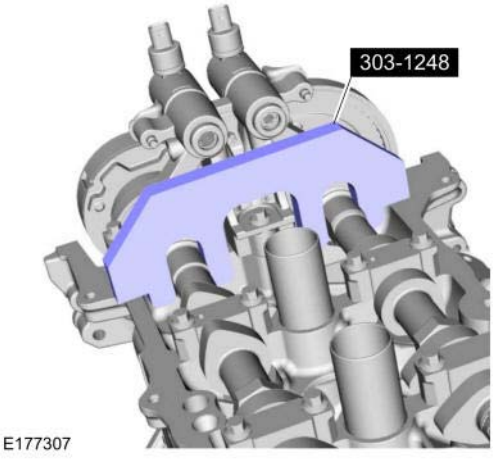
Remove Special Service Tool: 303-1248 Camshaft holding tools.



90.

Install the RH oil tube and the bolts.

Torque:

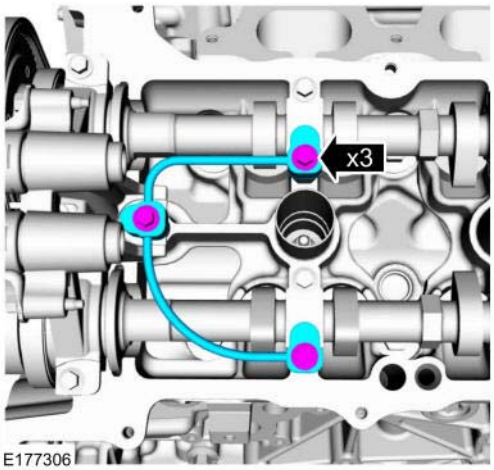


Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

91.

Remove Special Service Tool: 303-1248 Camshaft holding tools.

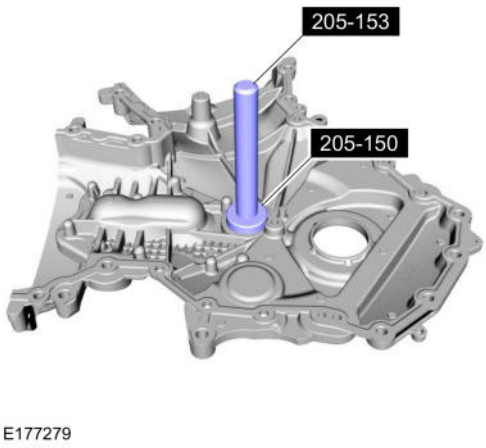


92.

Install the LH oil tube and the bolts.

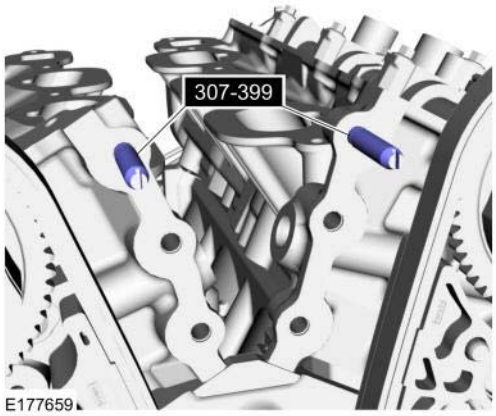
Torque:

Stage 1: 71 lb.in (8 Nm)



Stage 2: 45°

93.



Using the special tools, install the front cover to coolant pipe seal.

Use Special Service Tool: 205-150 (T80T-4000-S) Installer, Spindle Bearing, 205-153 (T80T-4000-W) Handle.

94.

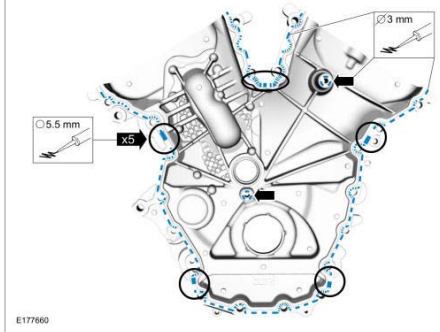
Install Special Service Tool: 307-399 Alignment Pins, Transmission Fluid Pump.

NOTE: Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: The engine front cover and 6 bolts must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

95.

Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the inner bolt bosses.



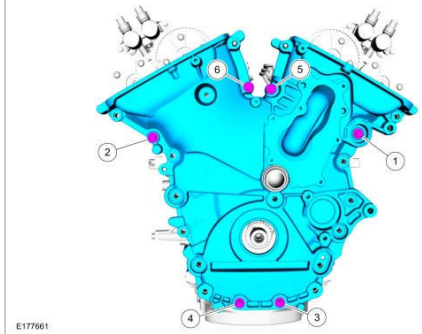
Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in places as indicated.

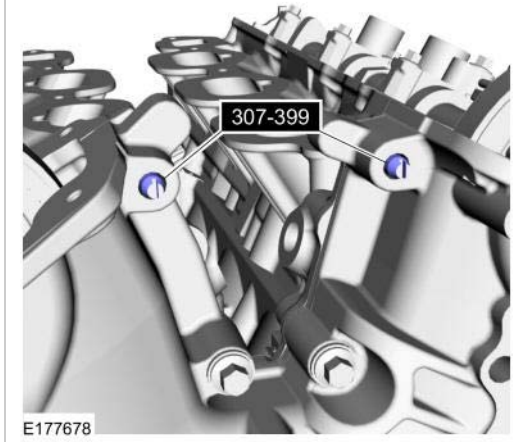
Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)



NOTE: Make sure the locating dowel pins are seated correctly in the cylinder block.

96.
Install the engine front cover and the bolts.



Torque

: 27 lb.in (3 Nm)

97.

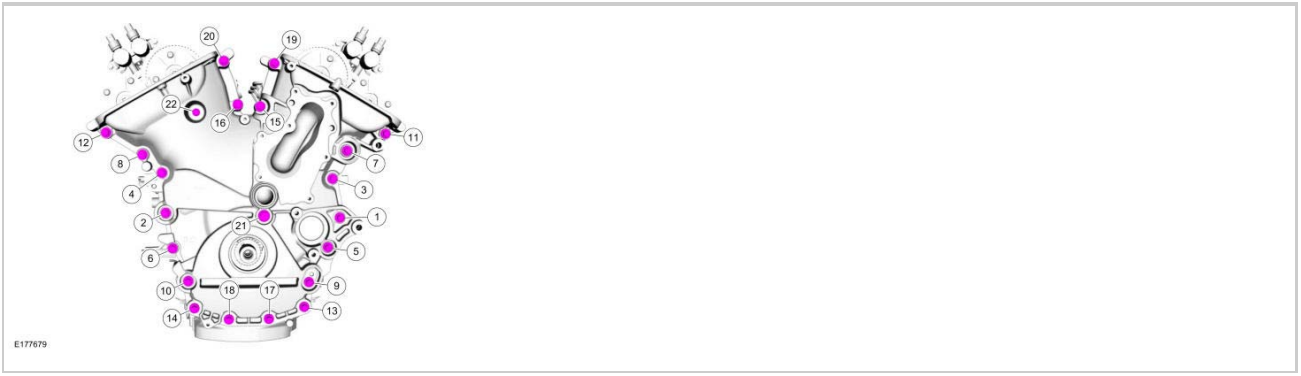
Remove Special Service Tool: 307-399 Alignment Pins, Transmission Fluid Pump.

98.

Install the remaining engine front cover bolts.

Torque:

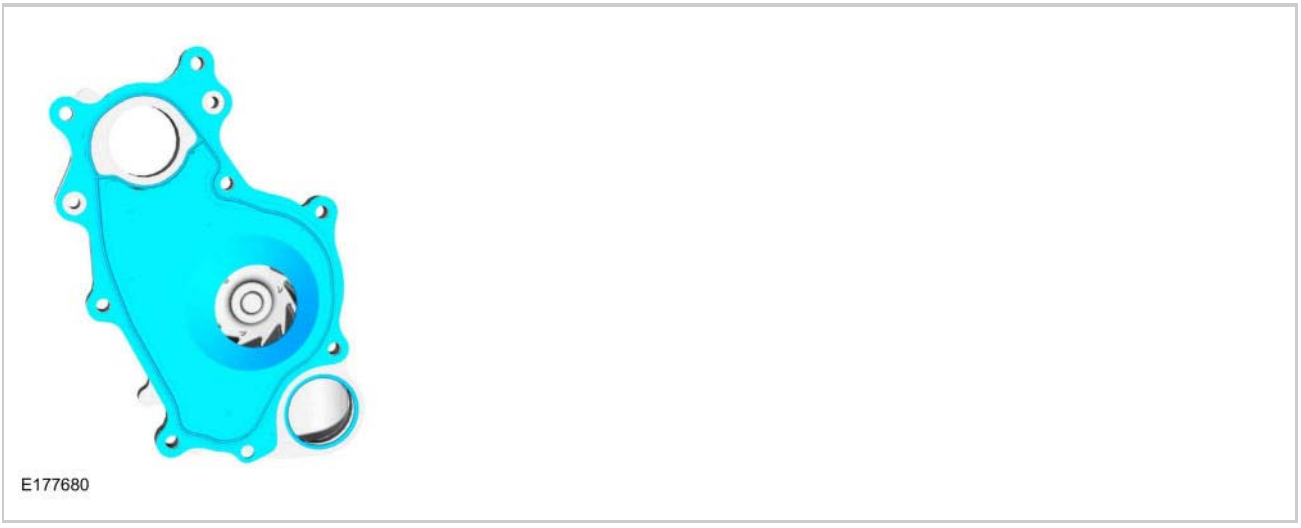
Stage 1: Tighten bolts 1 thru 21 to: 89 lb.in (10 Nm)



Stage 2: Tighten bolts 1 thru 20 to: 18 lb.ft (24 Nm)

Stage 3: Tighten bolt 21 to: 177 lb.in (20 Nm)

Stage 4: Tighten bolt 21 an additional: 90°

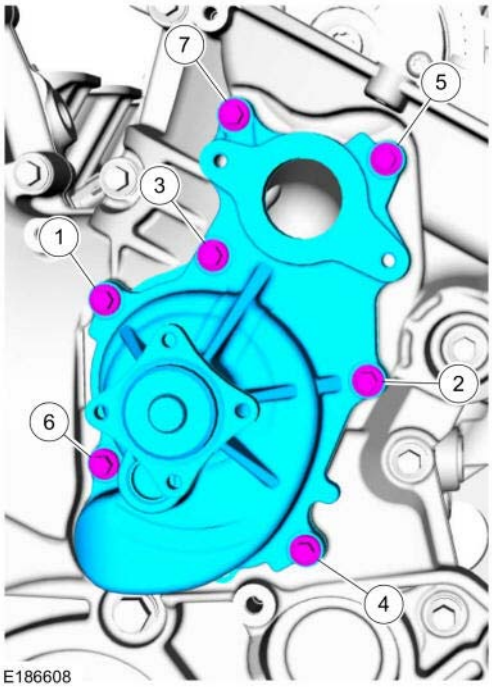


Stage 5: Tighten bolt 22 to: 89 lb.in (10 Nm)

Stage 6: Tighten bolt 22 an additional: 45°

99.

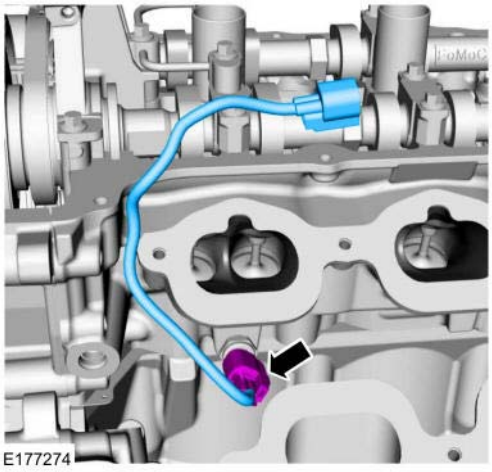
Install a new coolant pump gasket and O-ring seal.



100.

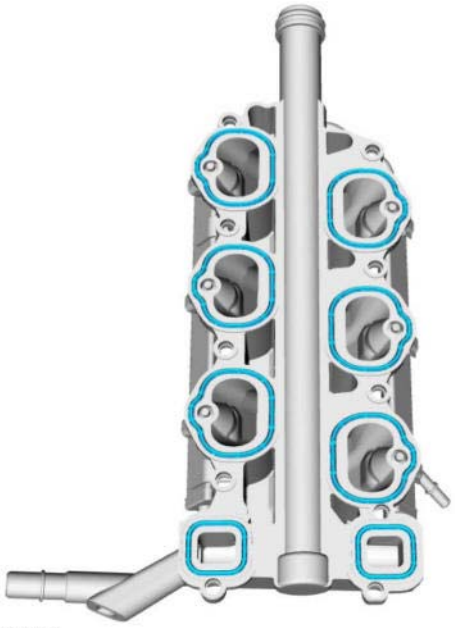
Install the coolant pump and the bolts.

Torque:



Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°

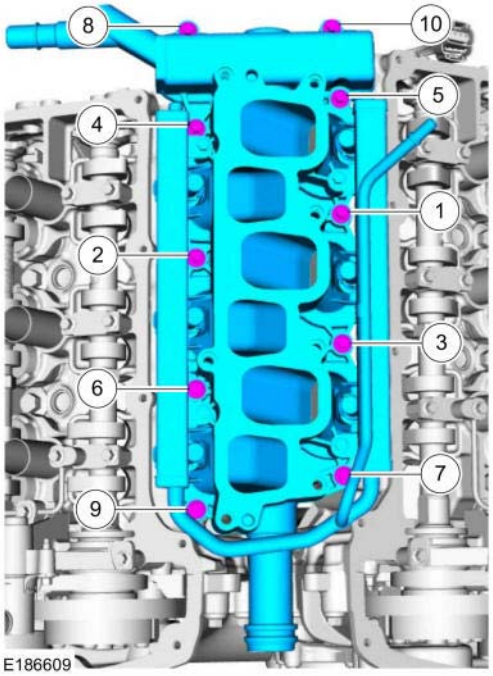


101.

Connect the CHT sensor electrical connector.

102.

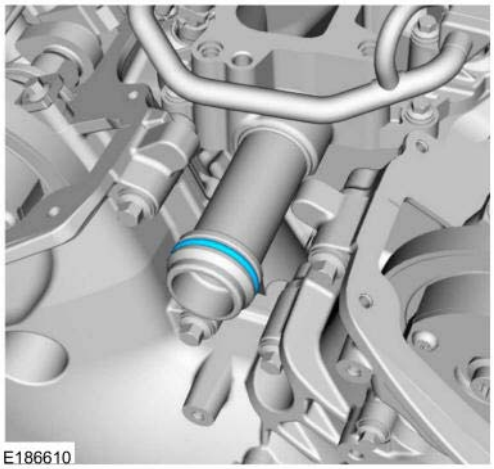
Install the new lower intake manifold gaskets.



E184762

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

103.
Install the lower intake manifold and the bolts.

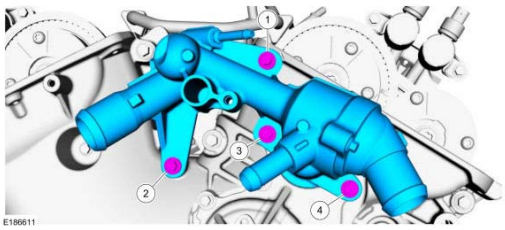


Torque

: 89 lb.in (10 Nm)

104.

Install a new thermostat housing O-ring seal.



105.

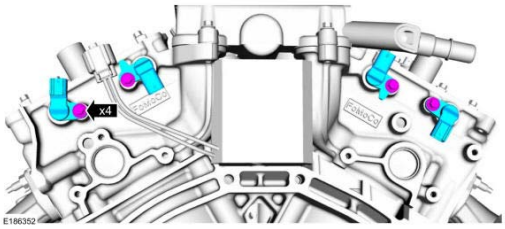
Install the thermostat housing and the bolts.

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 45°

NOTE: Apply clean engine oil to the CMP sensor O-ring seals.



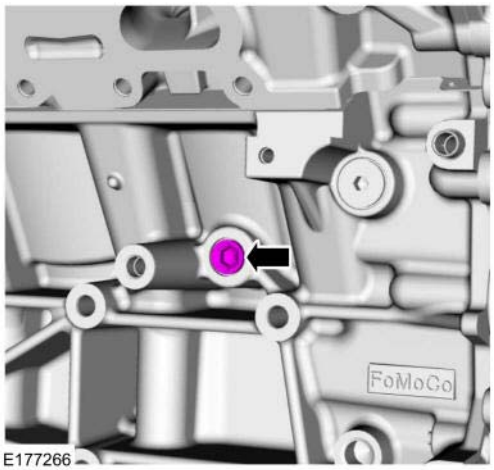
106.
Install the CMP sensors and the bolts.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

Torque

: 89 lb.in (10 Nm)



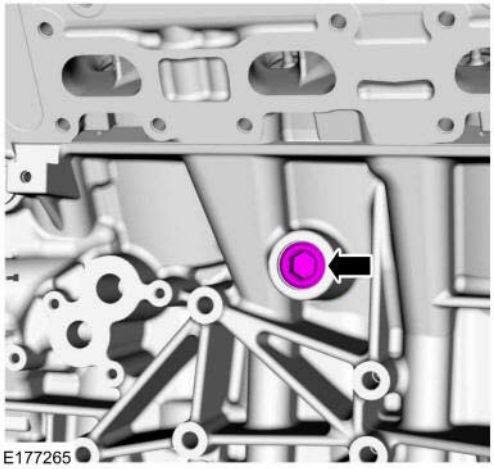
107.

Install the RH block coolant drain plug.

Torque:

Stage 1: 142 lb.in (16 Nm)

Stage 2: 180°

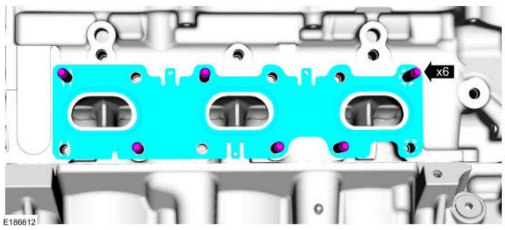


108.

Install the LH block coolant drain plug.

Torque

: 30 lb.ft (40 Nm)



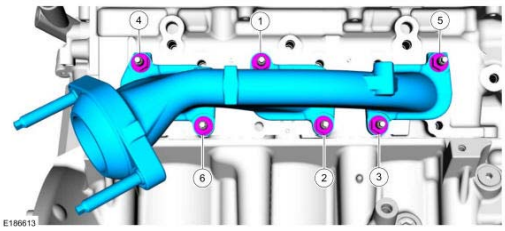
109.

Install the exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install the exhaust manifold gasket.



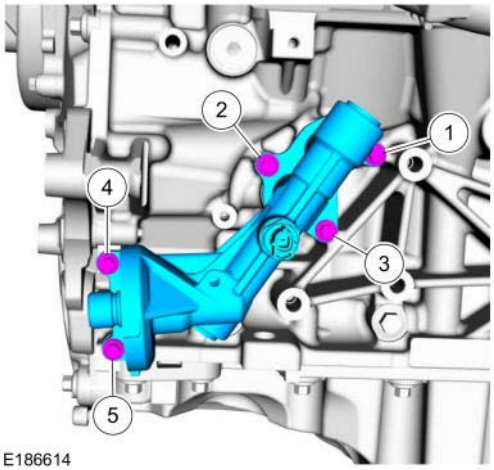
110.

Install the exhaust manifold and the new nuts.

Torque:

Stage 1: 168 lb.in (19 Nm)

Stage 2: 18 lb.ft (25 Nm)



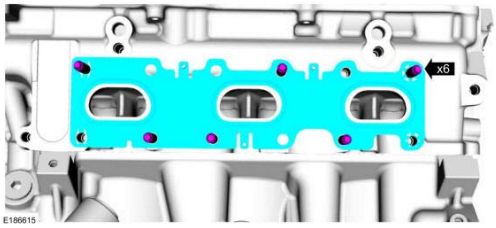
111.

Install the oil filter adapter and the bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



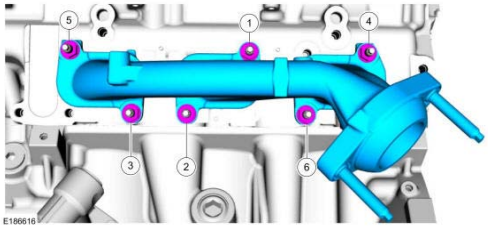
112.

Install the exhaust manifold studs.

Torque

: 106 lb.in (12 Nm)

Install the exhaust manifold gasket.

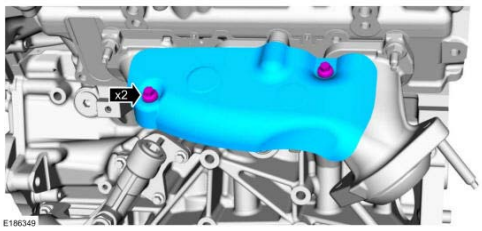


113.

Install the exhaust manifold and the new nuts.

Torque:

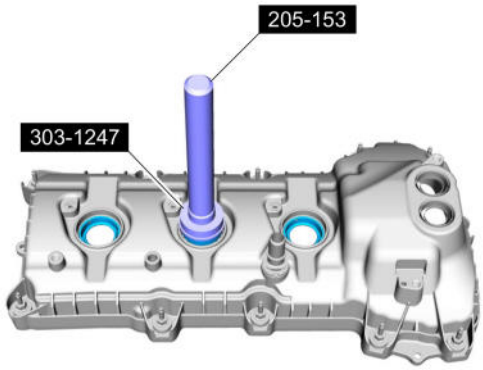
Stage 1: 168 lb.in (19 Nm)



114.

Install the exhaust manifold heat shield and the bolts.

Torque

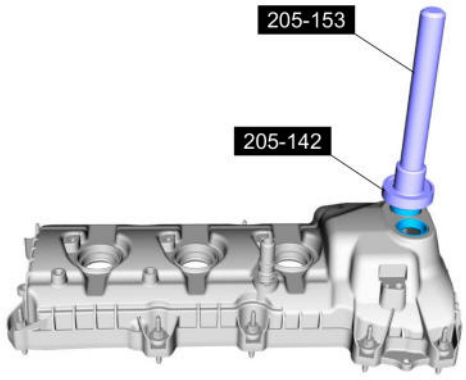


: 106 lb.in (12 Nm)

NOTE: Installation of new seals is only required if damaged seals were removed.

115.
If removed, using the special tools, install the spark plug tube seals.

Use Special Service Tool: 303-1247 VCT Spark Plug Tube Seal Remover and Installer, 205-153 (T80T-4000-W) Handle.



E177694

NOTE: Installation of new seals is only required if damaged seals were removed.

116.
If removed, using the special tools, install the VCT oil control solenoid seals.

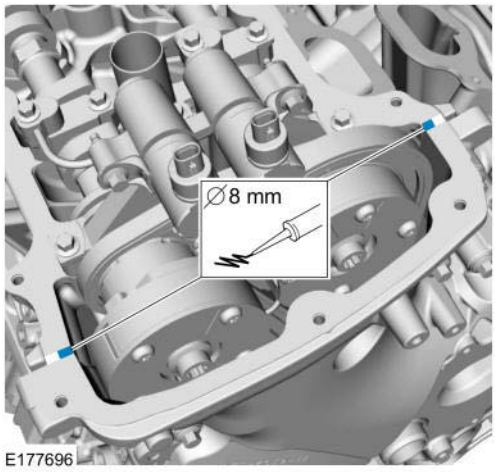
Use Special Service Tool: 205-142 (T80T-4000-J) Installer, Differential Bearing Cone, 205-153 (T80T-4000-W) Handle.

E177695

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

117.
Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-cylinder head joints.

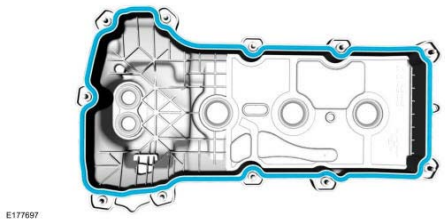
Material



: Motorcraft® Metal Surface Prep / ZC-31-B

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A

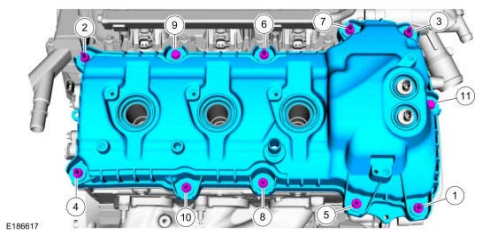


Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

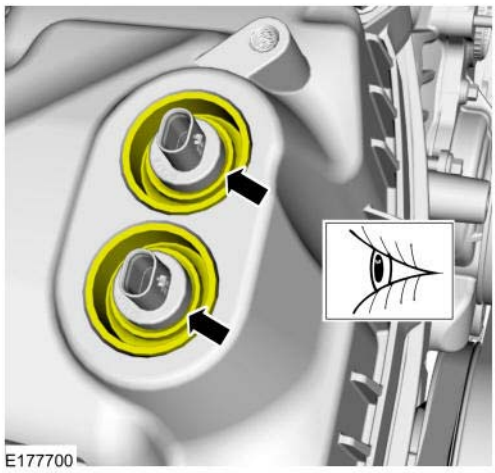
118.

Install a new valve cover gasket.



119.

Install the valve cover and tighten the bolts.

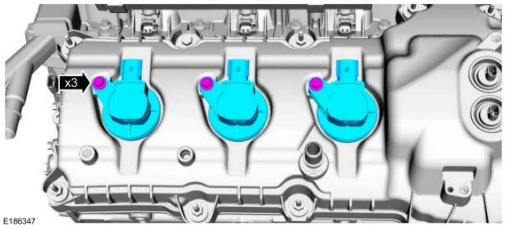


Torque

: 89 lb.in (10 Nm)

120.

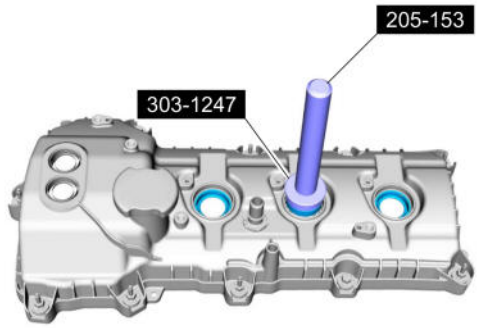
Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.



121.

Install the RH coil-on-plugs and the bolts.

Torque

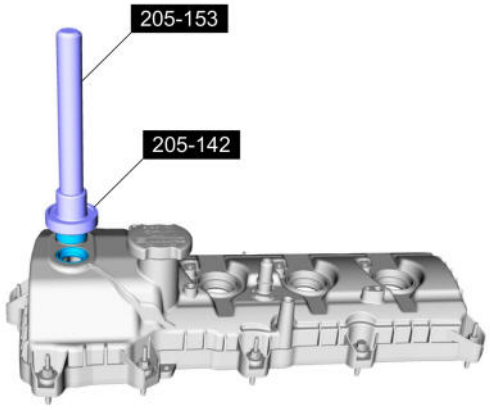


: 62 lb.in (7 Nm)

NOTE: Installation of new seals is only required if damaged seals were removed.

122.
If removed, using the special tools, install the spark plug tube seals.

Use Special Service Tool: 303-1247 VCT Spark Plug Tube Seal Remover and Installer, 205-153 (T80T-4000-W) Handle.



E177702

NOTE: Installation of new seals is only required if damaged seals were removed.

123.
If removed, using the special tools, install the VCT oil control solenoid seals.

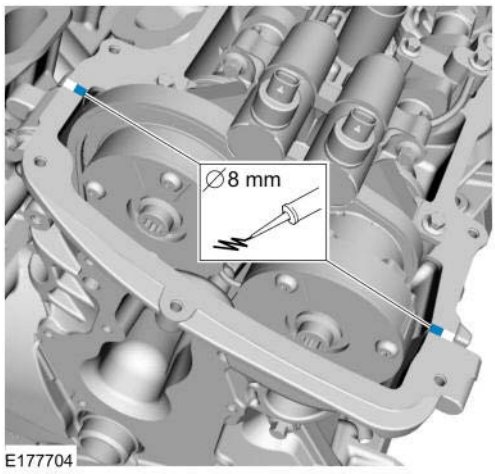
Use Special Service Tool: 205-142 (T80T-4000-J) Installer, Differential Bearing Cone, 205-153 (T80T-4000-W) Handle.

E177703

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

124.
Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-cylinder head joints.

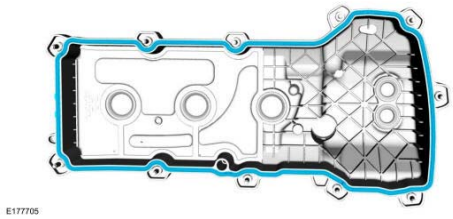
Material



: Motorcraft® Metal Surface Prep / ZC-31-B

Material

: Motorcraft® Silicone Gasket Remover / ZC-30-A

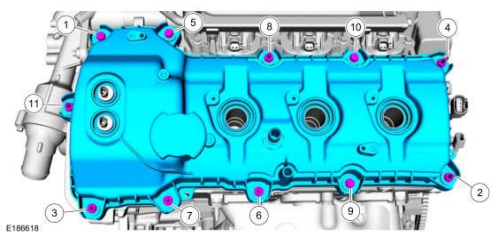


Material

: Motorcraft® High Performance Engine RTV Silicone / TA-357 (WSE-M4G323-A6)

125.

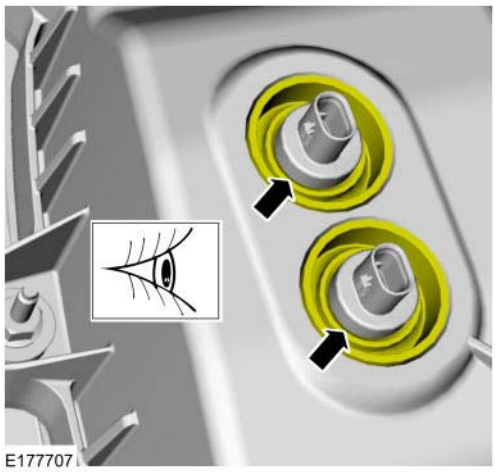
Install a new valve cover gasket.



126.

Install the valve cover and tighten the bolts.

Torque

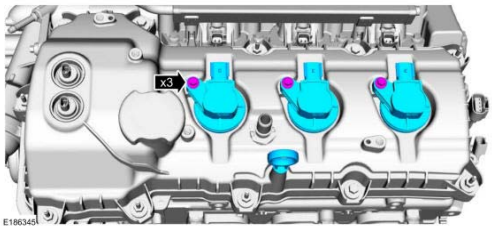


: 89 lb.in (10 Nm)

127.

Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid

electrical connector or the VCT seal may leak oil.

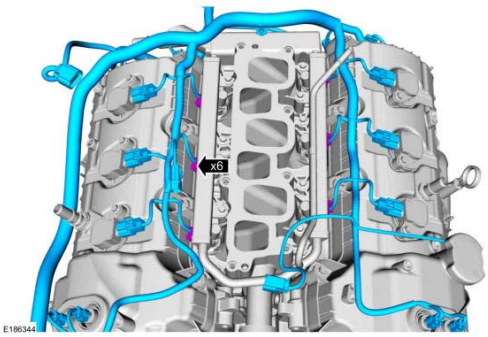


128.

Install the LH coil-on-plugs and the bolts.

Torque

: 62 lb.in (7 Nm)

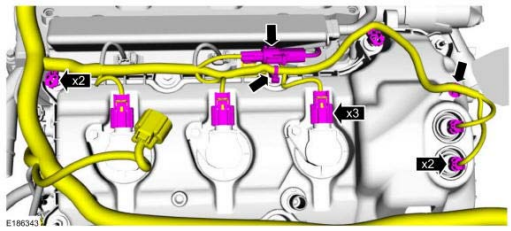


Install the oil level indicator.

129.

Install the engine wiring harness.

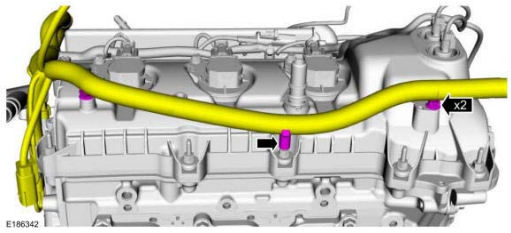
Connect the fuel injector electrical connectors.



130.

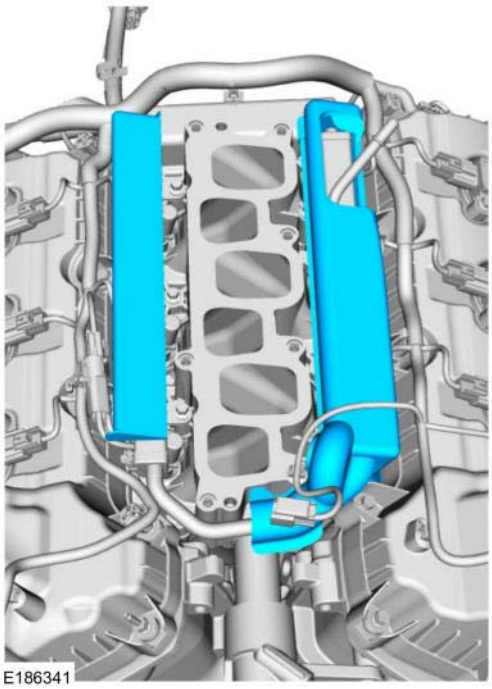
Attach the wiring harness retainers.

Connect the CHT sensor electrical connector.



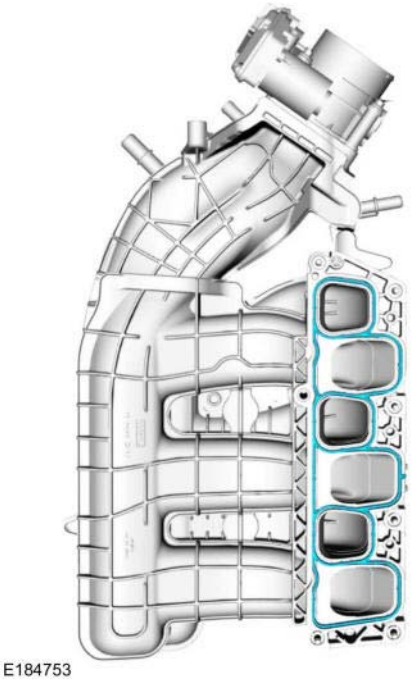
Connect the ignition coil-on-plug electrical connectors.

Connect the VCT oil control solenoids electrical connectors.



131.

Attach the wiring harness retainers.



132.

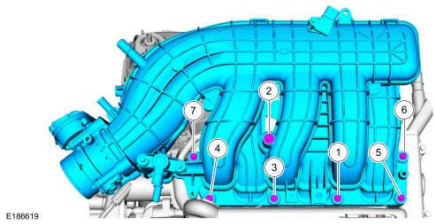
Install the fuel rail sound insulators.

E186341

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

133.
Install the new upper intake manifold gasket.

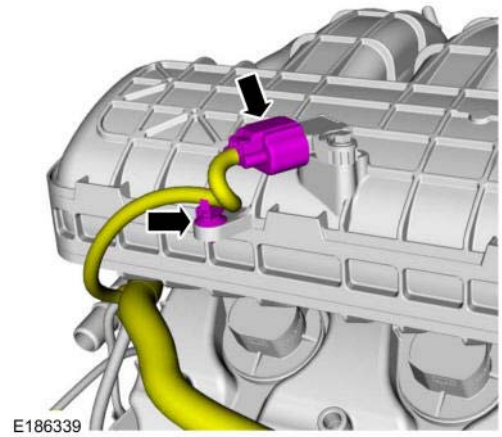
E184753



134.

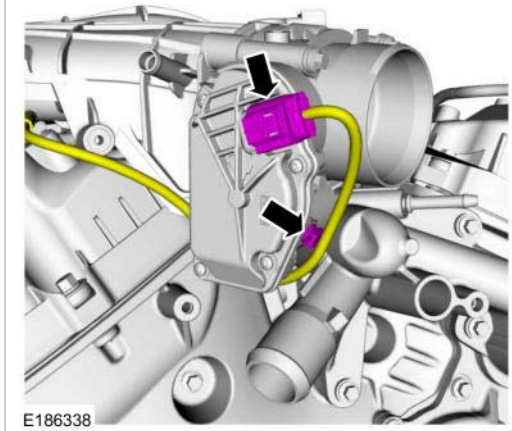
Install the upper intake manifold and the bolts.

Torque:



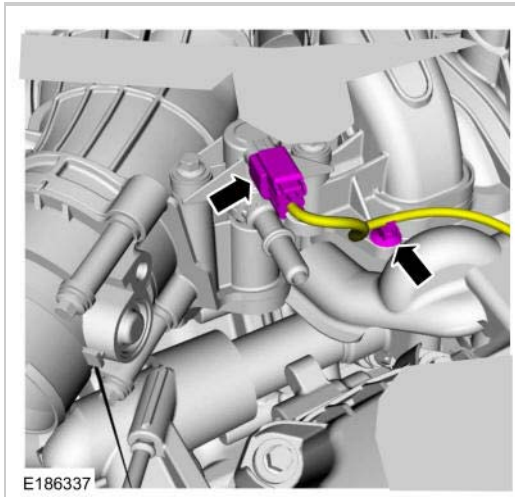
Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



135.

Connect the MAPT sensor electrical connector and the wiring harness retainer.



136.

Connect the throttle body electrical connector and the wiring harness retainer.

137.

Connect the EVAP canister purge valve electrical connector and the wiring harness retainer.

138.

Attach the wiring harness retainers.

Connect the oil pressure switch electrical connector.

Connect the ignition coil-on-plug electrical connectors.

Disconnect the VCT oil control solenoids electrical connectors.

139.

Attach the wiring harness retainers.

Connect the CMP sensor electrical connectors.

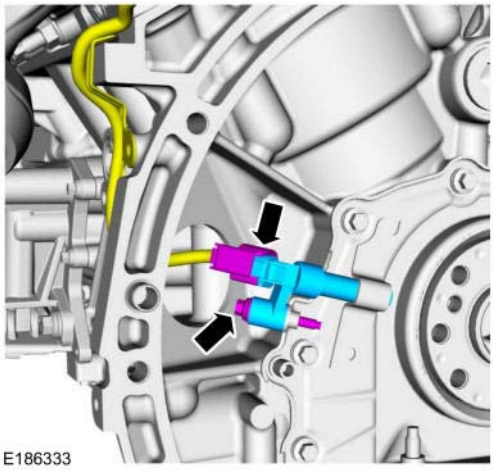
Connect the KS sensor electrical connector.

140.

Install the ground strap and the bolt.

Torque

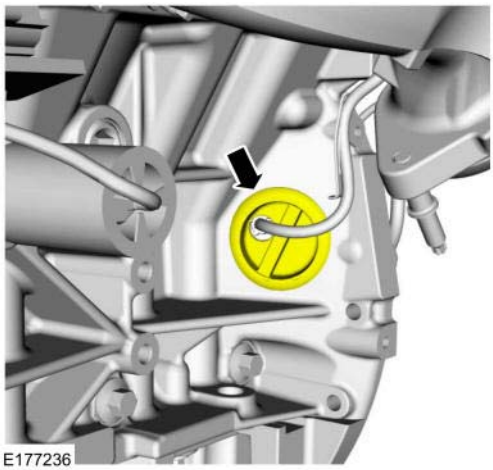
: 106 lb.in (12 Nm)



141.

Install the CKP sensor and the bolt.

Torque

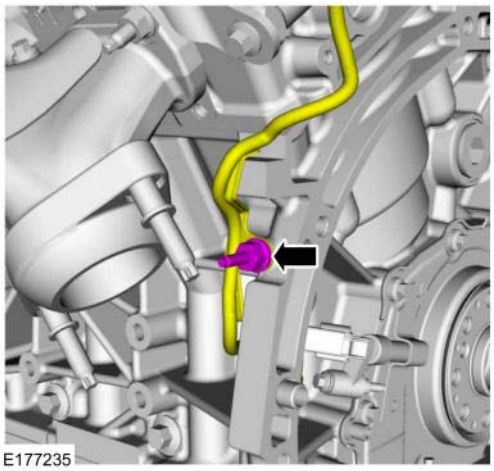


: 89 lb.in (10 Nm)

Connect the CKP sensor electrical connector.

142.

Install the wiring harness grommet.

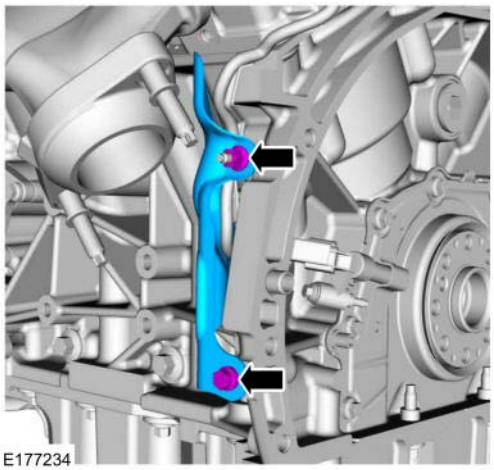


143.

Install the wiring harness retainer stud bolt.

Torque

: 89 lb.in (10 Nm)

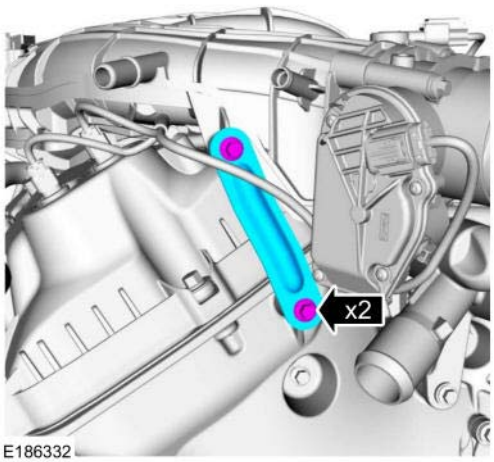


144.

Install the heat shield, nut and bolt.

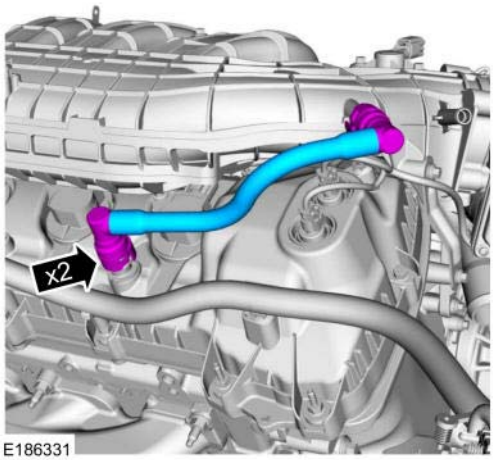
Torque

: 89 lb.in (10 Nm)



145.

Install the upper intake manifold support bracket and the bolt.

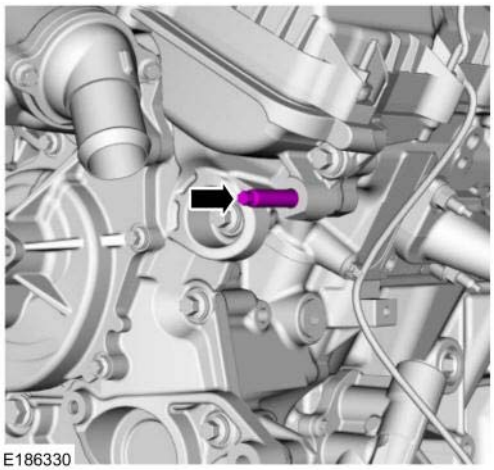


Torque

: 89 lb.in (10 Nm)

146.

Install the PCV tube.

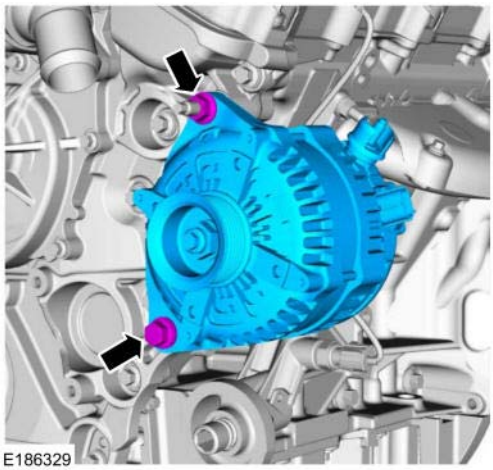


147.

Install the generator stud bolt.

Torque

: 71 lb.in (8 Nm)



148.

Install the generator, nut and bolt.

Torque

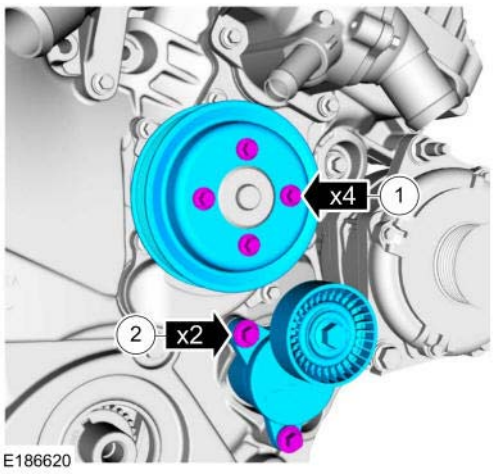
: 35 lb.ft (47 Nm)

149.

1.

Install the coolant pump pulley and the bolts.

Torque



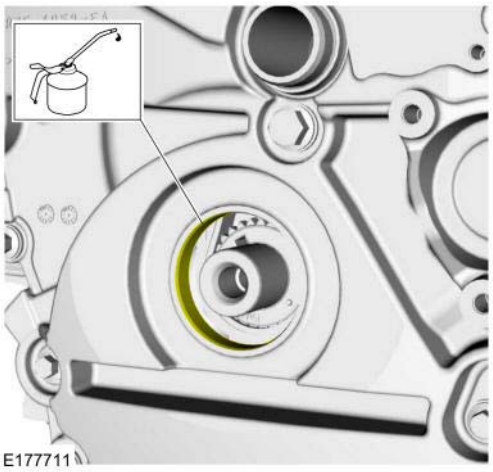
: 18 lb.ft (24 Nm)

2.

Install the accessory drive belt tensioner and the bolts.

Torque

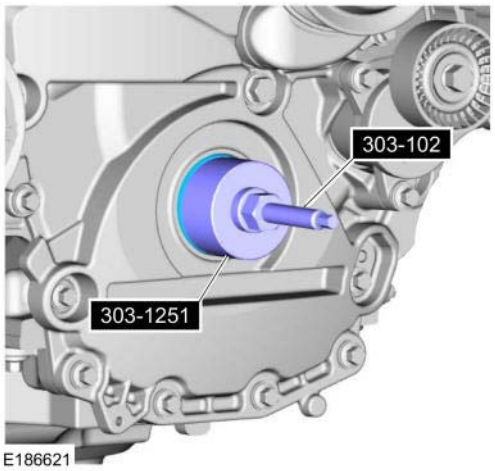
: 18 lb.ft (25 Nm)



150.

Lubricate the crankshaft front seal bore with clean engine oil.

Material

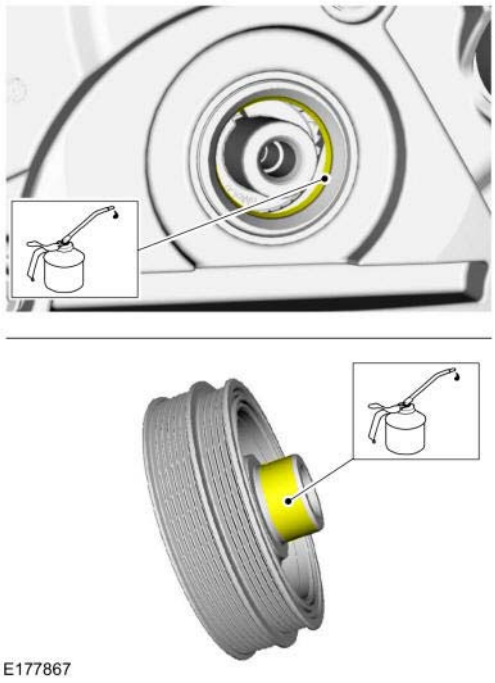


: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

151.

Using the special tools, install the crankshaft front seal.

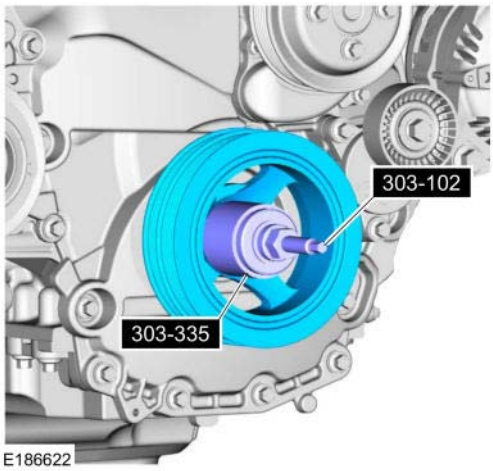
Use Special Service Tool: 303-102 Installer, Crankshaft Pulley, 303-1251 Installer, Front Seal.



152.

Lubricate the crankshaft front seal and the crankshaft pulley with clean engine oil.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

153.

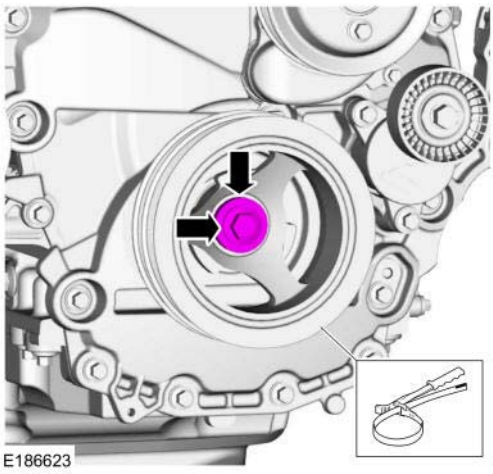
Using the special tools, install the crankshaft pulley.

Use Special Service Tool: 303-102 Installer, Crankshaft Pulley, 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal.

154.

Install the new crankshaft bolt and the washer.

Use the General Equipment: Strap Wrench



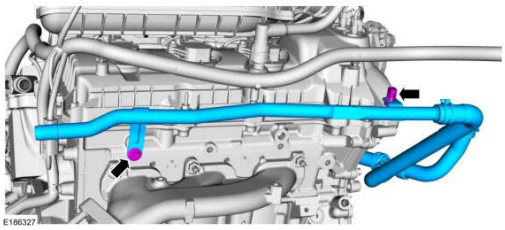
Torque:

Stage 1: 89 lb.ft (120 Nm)

Stage 2: Loosen: 1 turn(s)

Stage 3: 37 lb.ft (50 Nm)

Stage 4: 90°

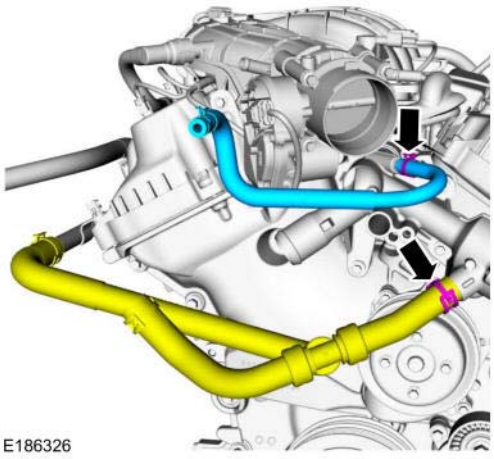


155.

Install the coolant tube, attach the retainer and install the bolt.

Torque

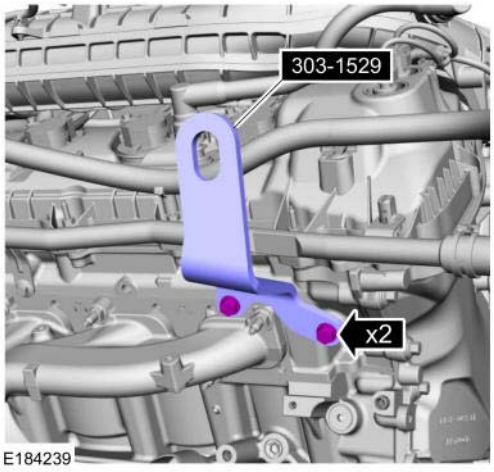
: 17 lb.ft (23 Nm)



156.

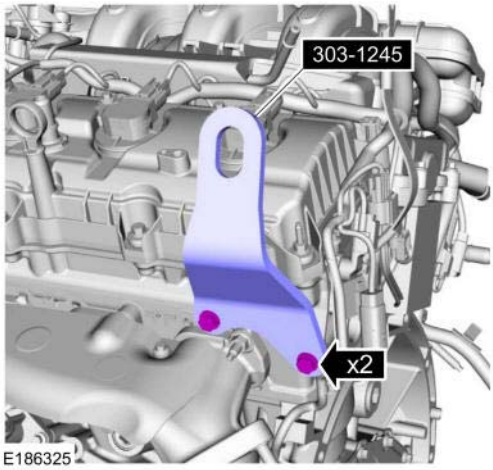
Position the coolant hose and install clamp.

Use the General Equipment: Hose Clamp Remover/Installer



Install the coolant return hose and the clamp.

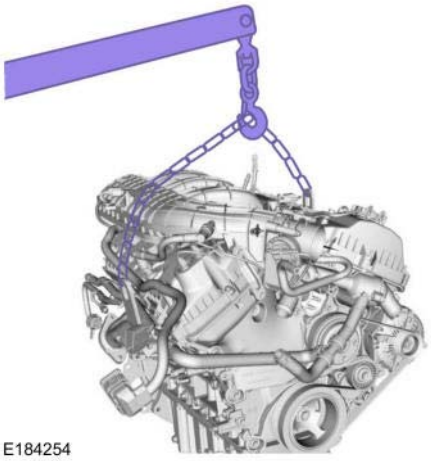
Use the General Equipment: Hose Clamp Remover/Installer



157.

Install Special Service Tool: 303-1529 Lift Eye, Engine.

158.



Install Special Service Tool: 303-1245 Engine Lift Eye.

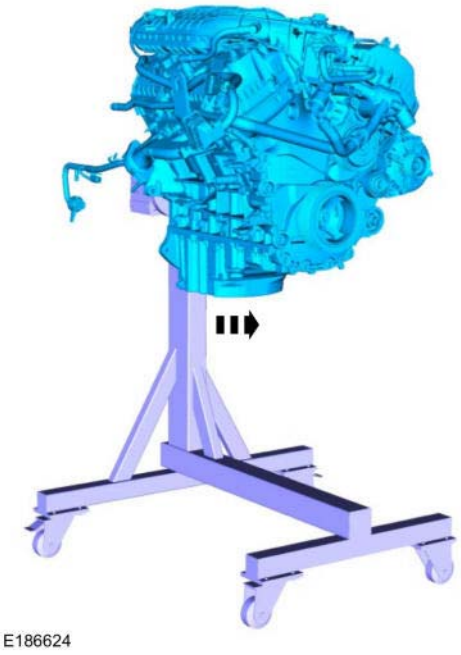
159.

Install the floor crane.

Use the General Equipment: Floor Crane

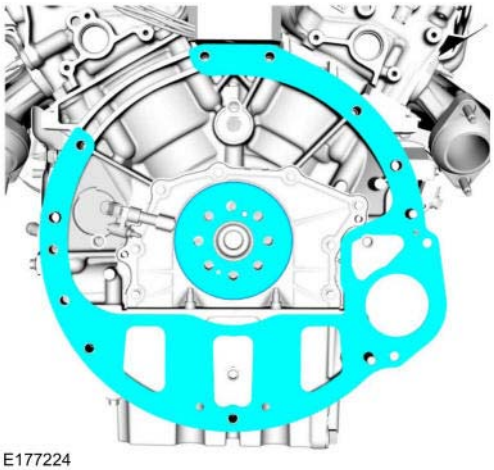
160.

Install a ratchet strap from the front of engine to the chain to keep the engine level.



Use the General Equipment: Floor Crane

161.



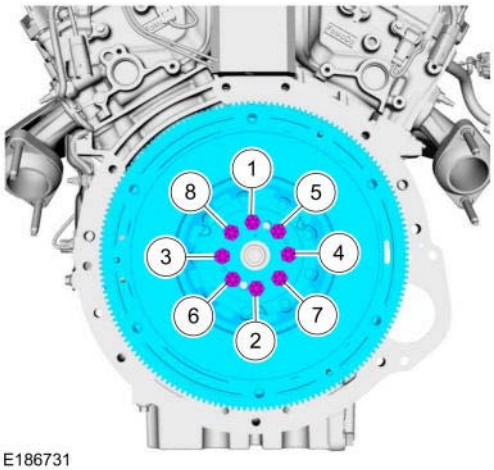
Remove the engine from the mounting stand.

Use the General Equipment: Mounting Stand

162.

Install the crankshaft sensor ring and the engine-to-transmission spacer plate.

E177224



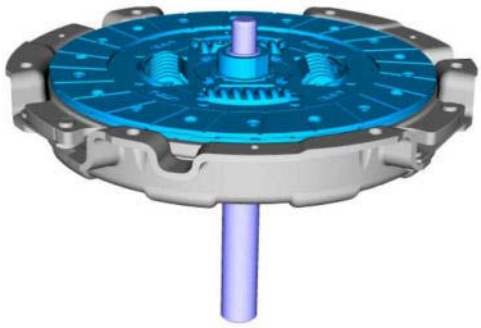
6-Speed Manual Transmission - MT82

> *NOTE: The dual mass flywheel has 7 degrees (3.25 ring gear teeth) of freeplay in the clockwise and counter clockwise direction, this is normal between the primary part of the flywheel (bolts-to-crankshaft) and the secondary part of the flywheel (clutch-to-ring gear).*

163.
Install the flywheel and the bolts.

Torque

: 59 lb.ft (80 Nm)



E186731

164.

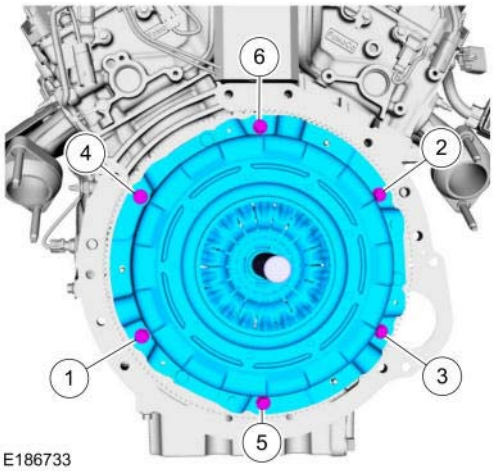
Using the Clutch Alignment tool, position the clutch disc on the flywheel.

Use the General Equipment: Clutch Alignment Tool

E186732

NOTE: If installing the original pressure plate, align it using the index-marks made during removal or a clutch system vibration can occur.

NOTE: Special bolts are used for installation. Do not use standard bolts. Always install new pressure plate bolts.



165.
Align the clutch pressure plate on the flywheel and install the clutch pressure plate bolts.

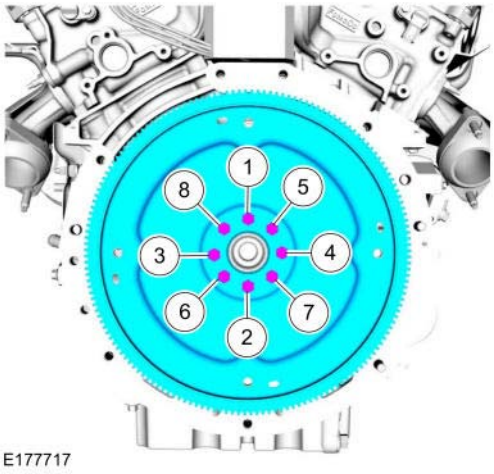
Use the General Equipment: Clutch Alignment Tool

Torque

Stage 1: 46 lb.ft (63 Nm)

Stage 2: 60°

E186733



6-Speed Automatic Transmission - 6R80

NOTE: One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.

166.
Install the flexplate and the bolts.

Torque

: 59 lb.ft (80 Nm)

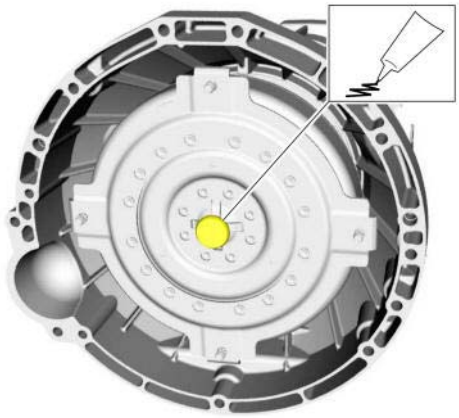
Materials

Name	Specification
Motorcraft® Multi-Purpose Grease Spray XL-5-A	ESB-M1C93-B
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

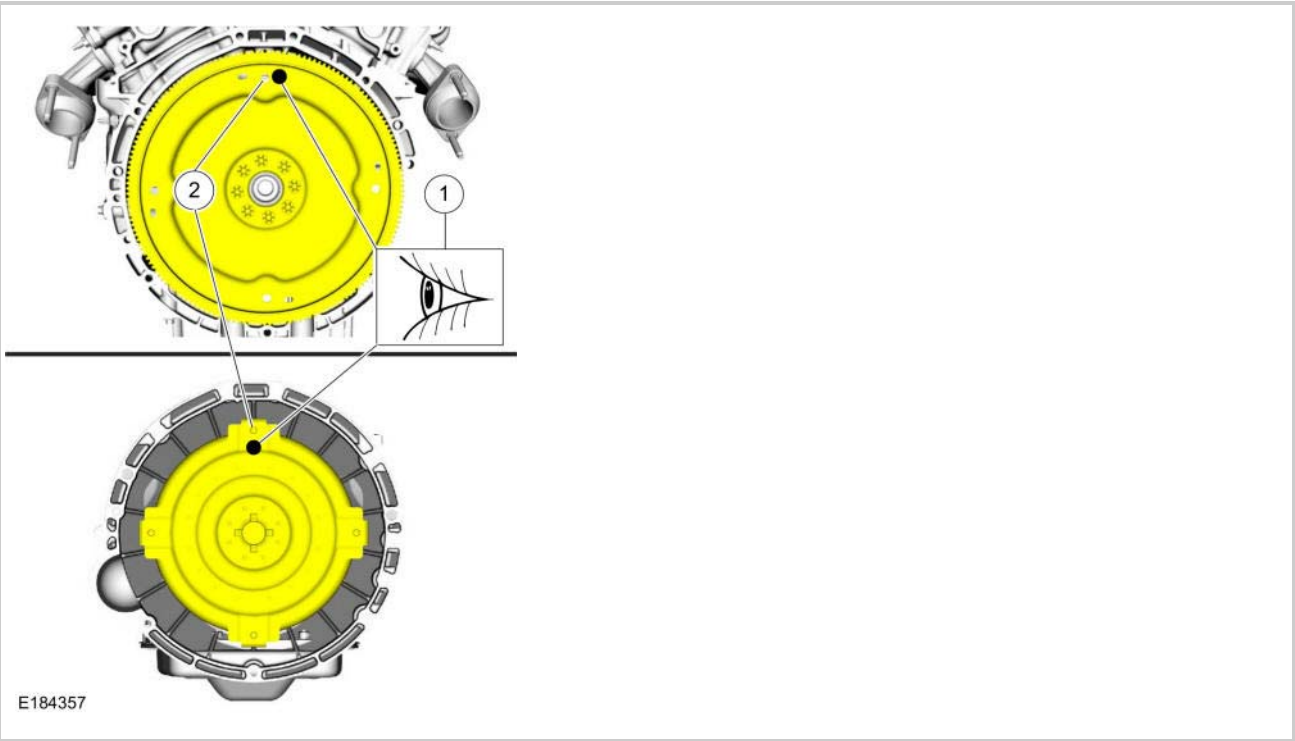


6-Speed Automatic Transmission - 6R80

1.

Lubricate the torque converter pilot hub with multi-purpose grease.

Material



: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

2.

Inspect the torque converter stud and flexplate for paint marks.

Align the torque converter stud and flexplate hole near the paint marks to the 12 o'clock position.

6-Speed Manual Transmission - MT82

3.

Lubricate the input shaft with multi-purpose grease.

Material

: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

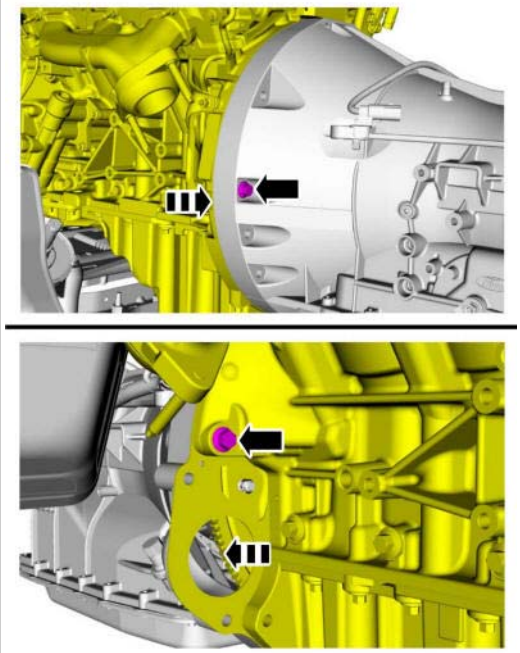
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

4.

Using the floor crane, install the engine.

Use the General Equipment: Floor Crane

E184258



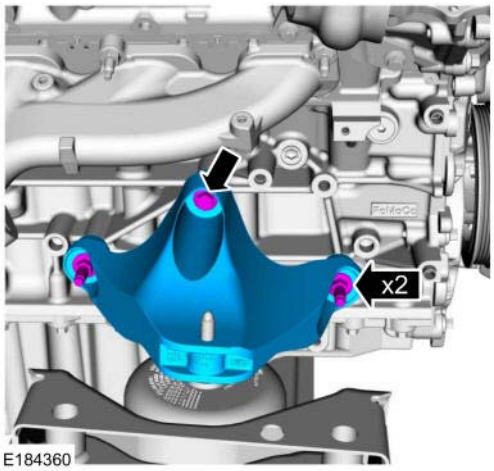
NOTE: When mating engine-to-transmission, make sure RH catalytic converter clears the exhaust manifold studs.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

5.
Draw the engine to the transmission together using the bolts.

Torque

: 35 lb.ft (48 Nm)



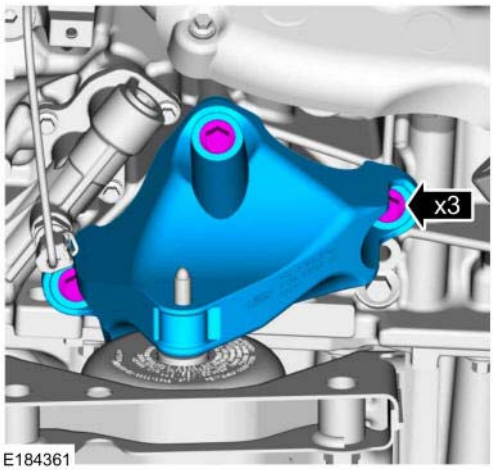
E184359

6.

Install the RH engine mount bracket and the bolts.

Torque

: 41 lb.ft (55 Nm)



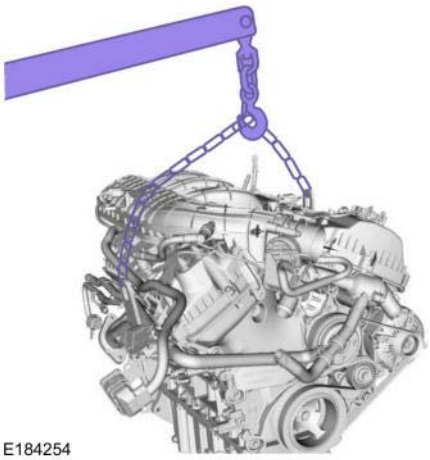
7.

Install the LH engine mount bracket and the bolts.

Torque

: 41 lb.ft (55 Nm)

8.

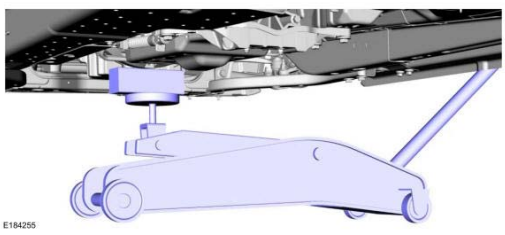


Remove the ratchet strap.

9.

Remove the floor crane.

Use the General Equipment: Floor Crane

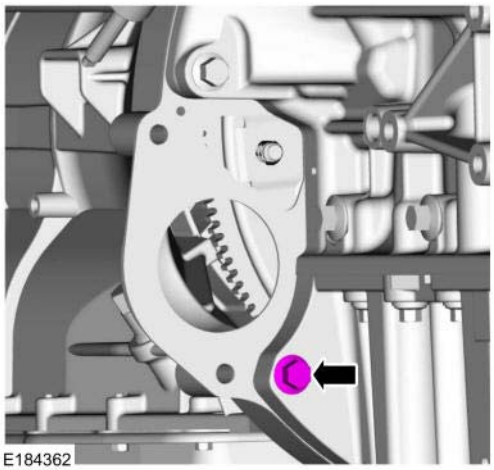


10.

Remove the jack and wooden block.

Use the General Equipment: Wooden Block

Use the General Equipment: Trolley Jack

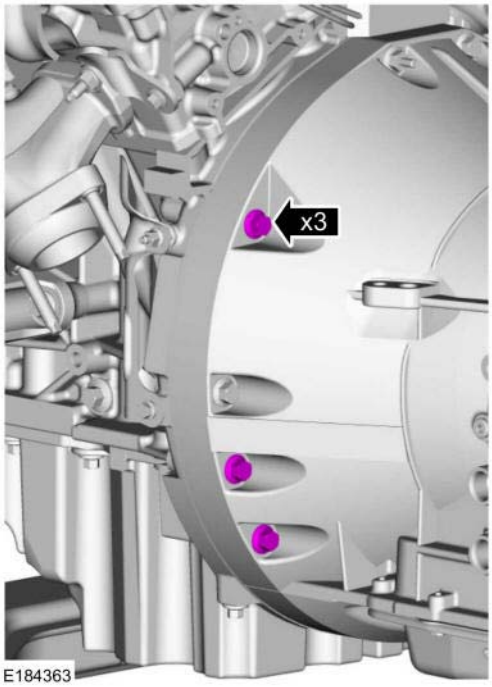


NOTE: Automatic transmission shown in illustration, manual transmission similar.

11.
Install the RH side bellhousing bolt.

Torque

: 35 lb.ft (48 Nm)

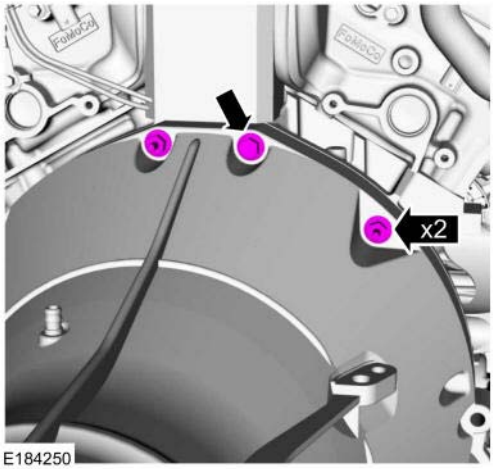


NOTE: Automatic transmission shown in illustration, manual transmission similar.

12.
Install the LH side bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)

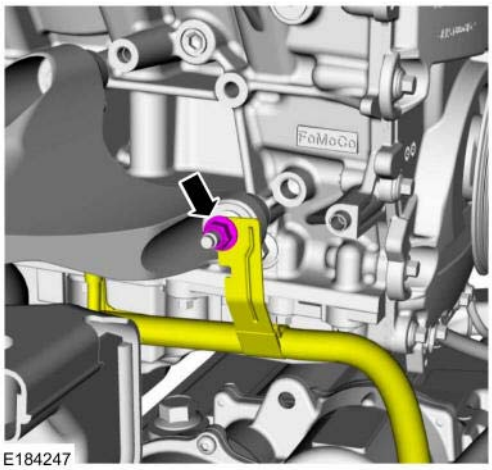


NOTE: Automatic transmission shown in illustration, manual transmission similar.

13.
Install the upper bellhousing bolts.

Torque

: 35 lb.ft (48 Nm)



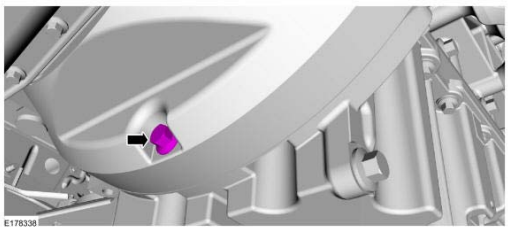
6-Speed Manual Transmission - MT82

14.

Position the bracket for the wiring harness on the RH engine mount bracket stud bolt and install the nut.

Torque

: 35 lb.ft (48 Nm)



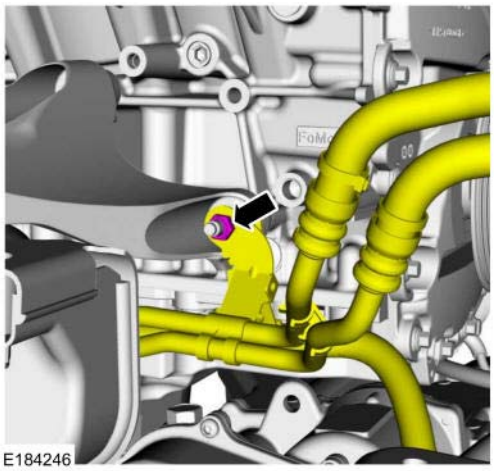
6-Speed Automatic Transmission - 6R80

15.

Install the lower bellhousing bolt.

Torque

: 35 lb.ft (48 Nm)

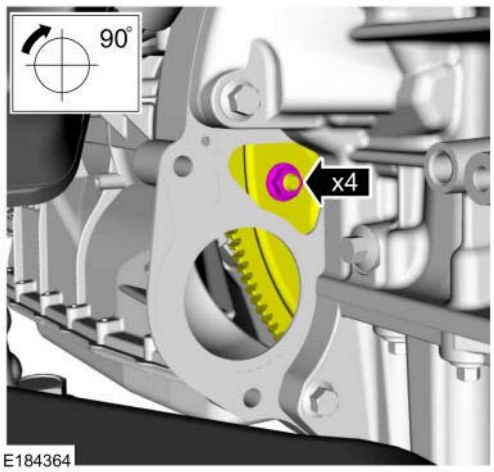


16.

Position the brackets for the transmission cooling tubes and wiring harness on the RH engine mount bracket and install the nut.

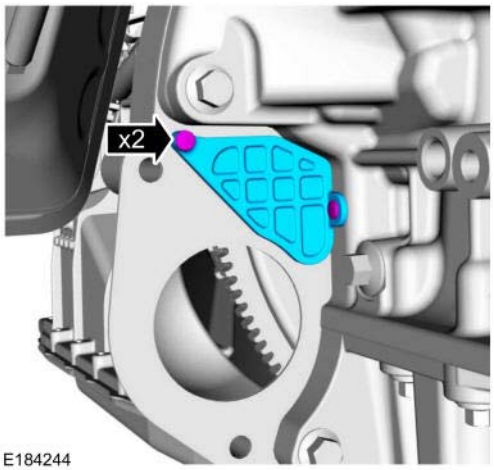
Torque

: 35 lb.ft (48 Nm)



NOTE: Using the crankshaft pulley bolt, turn the engine clockwise.

17.
Install new torque converter nuts.



Torque

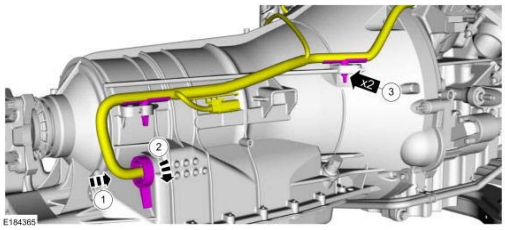
: 35 lb.ft (48 Nm)

18.

Install the access cover and the retainers.

19.

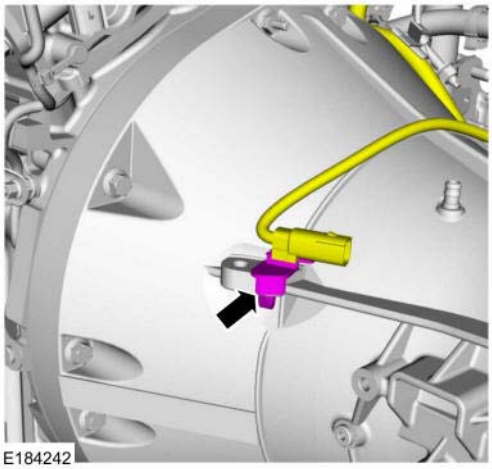
1.



Push the transmission electrical connector in to connect.

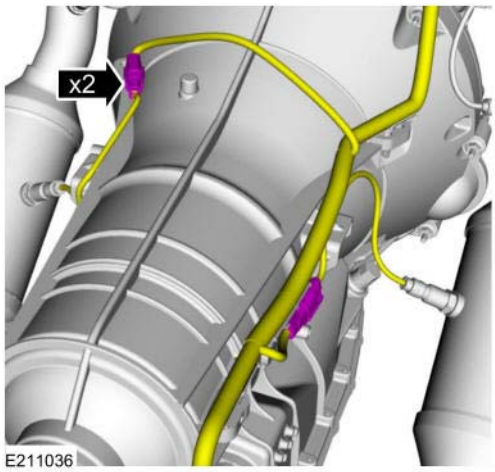
2.

Rotate the transmission electrical connector clockwise.



3.

Attach the wiring harness retainers.



20.

Attach the wiring harness retainer to the LH of the transmission.

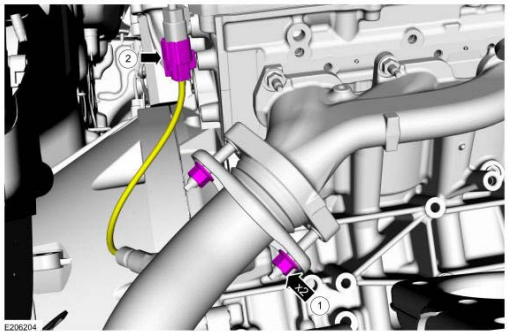
21.

Connect the catalyst monitor sensors.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

22.

1.



Install the new nuts and remove the support.

Torque

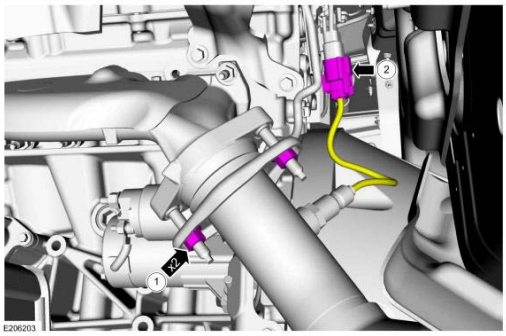
: 30 lb.ft (40 Nm)

2.

Connect the RH HO2S electrical connector.

23.

1.



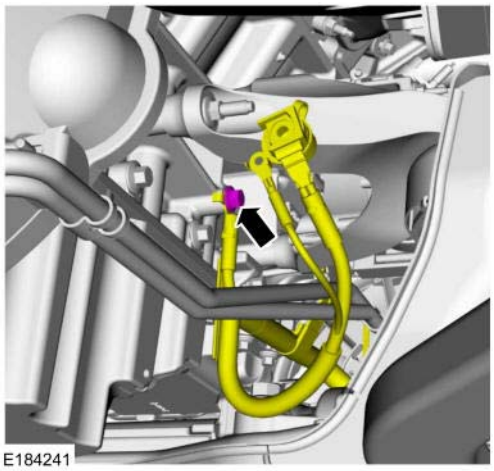
Install the new nuts and remove the support.

Torque

: 30 lb.ft (40 Nm)

2.

Connect the LH HO2S electrical connector.



NOTE: Automatic transmission shown in illustration, manual transmission similar.

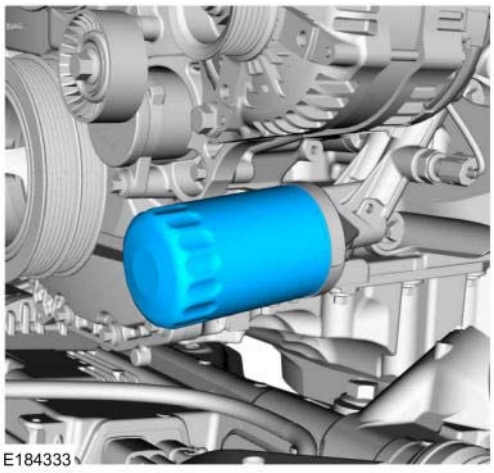
24.
Install ground wire to the RH side of the engine and install the bolt.

Torque

: 35 lb.ft (48 Nm)

25.

Install the starter motor. Refer to: STARTER MOTOR .



NOTE: Do not lubricate the engine oil filter gasket.

26.
Install a new engine oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

27.

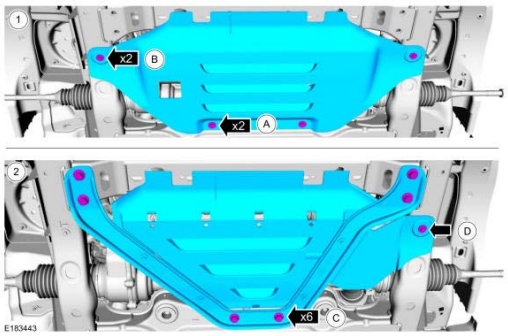
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



2.

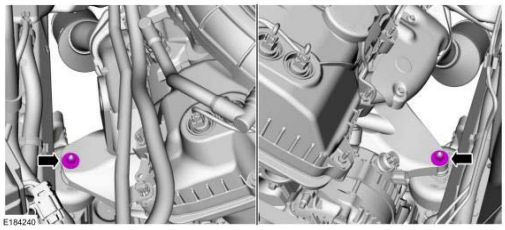
Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)

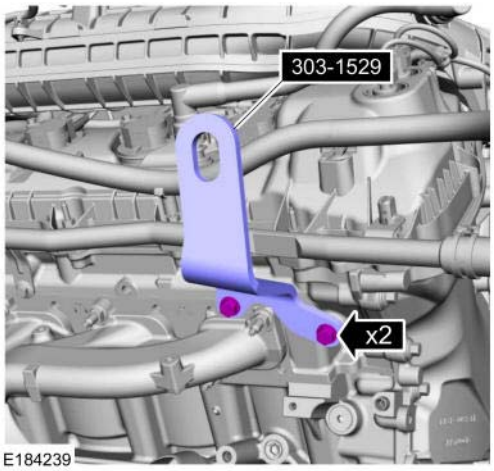
28.



Install the front wheels and tires. Refer to: Wheel and Tire .

29.

Install the RH and LH engine mount bracket nuts.

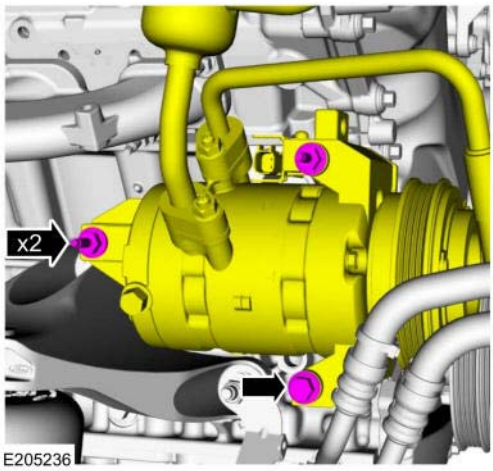


Torque

: 46 lb.ft (63 Nm)

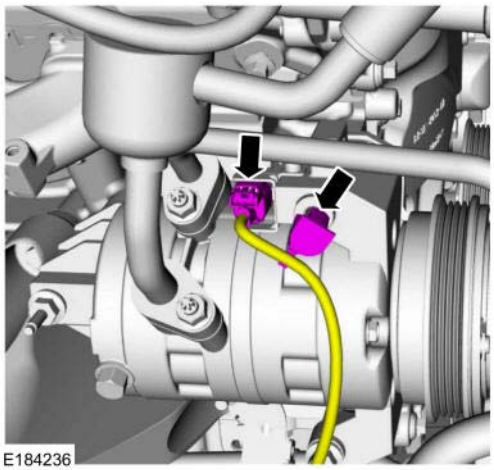
30.

Remove Special Service Tool: 303-1529 Lift Eye, Engine.



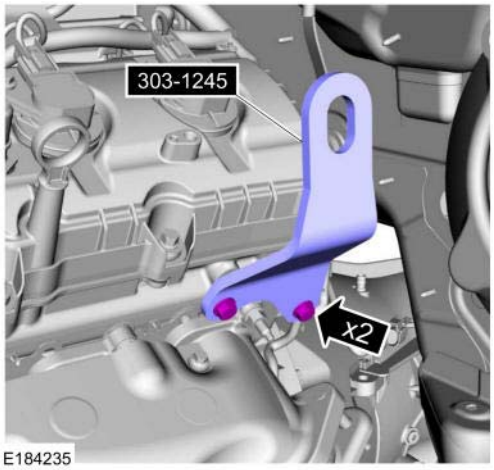
31.

Position the A/C compressor and install the stud bolts and bolt.



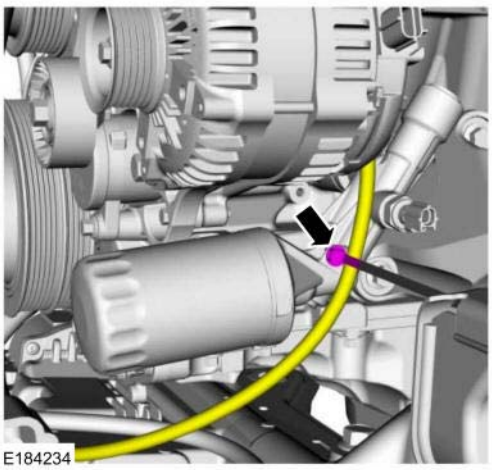
Torque

: 18 lb.ft (25 Nm)



32.

Connect the A/C compressor electrical connector and the wire harness retainer.

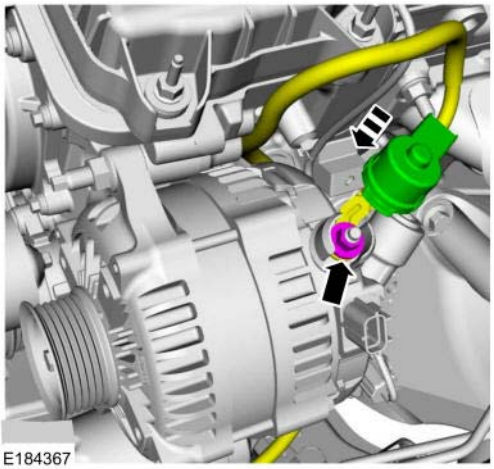


33.

Remove Special Service Tool: 303-1245 Engine Lift Eye.

34.

Attach the generator wiring harness retainer to the oil filter adapter.

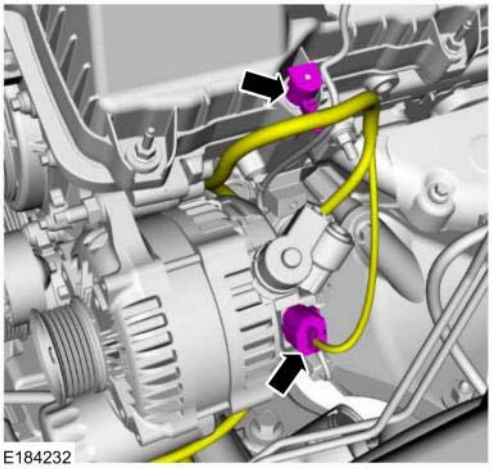


35.

Install the generator B+ cable and the nut.

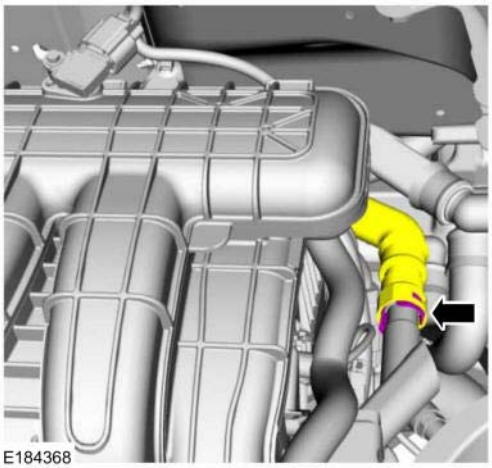
Torque

: 142 lb.in (16 Nm)



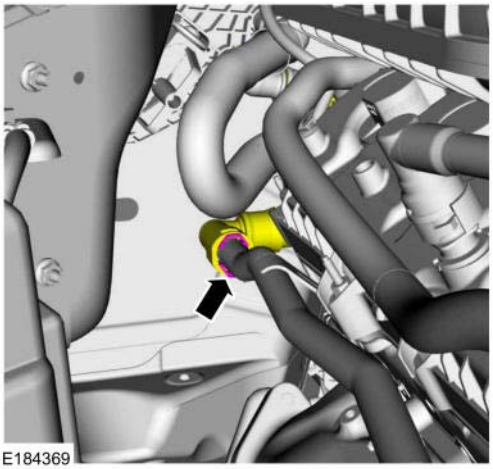
Position the protective cover.

36.



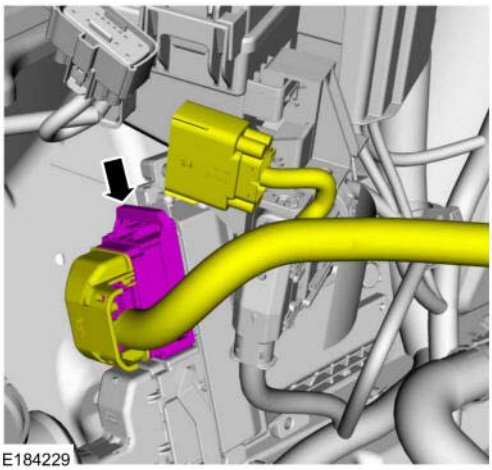
Connect the generator electrical connector.

Attach the wire harness retainer to the valve cover stud bolt.



37.

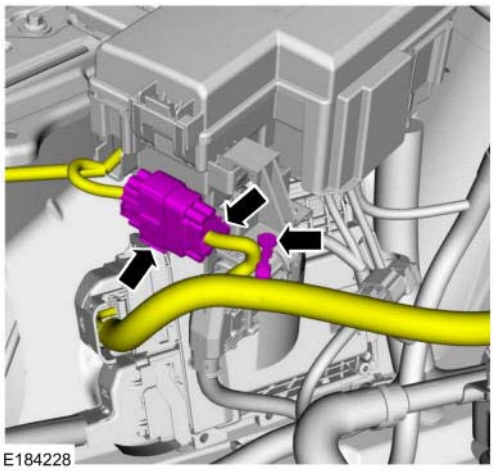
Connect the heater hose to the back of the lower intake manifold.



38.

Connect the heater hose to the coolant tube.

39.

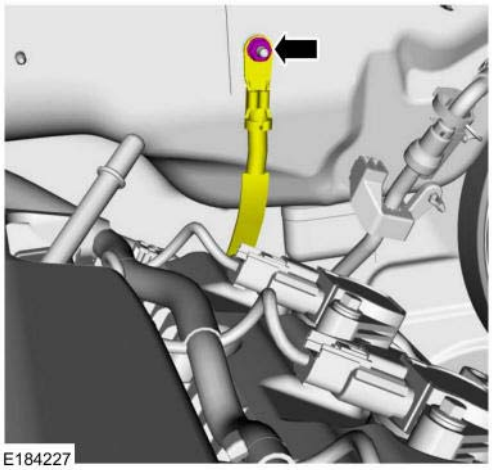


Connect the upper PCM electrical connector.

40.

Attach the wiring harness retainer.

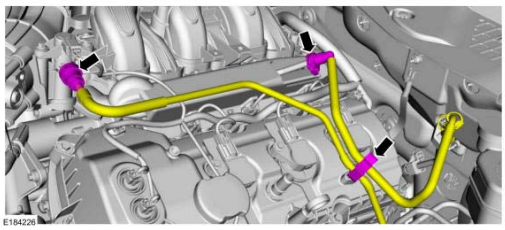
Connect and attach the engine harness electrical connector.



41.

Install the ground strap and the nut to the cowl.

Torque



: 80 lb.in (9 Nm)

42.

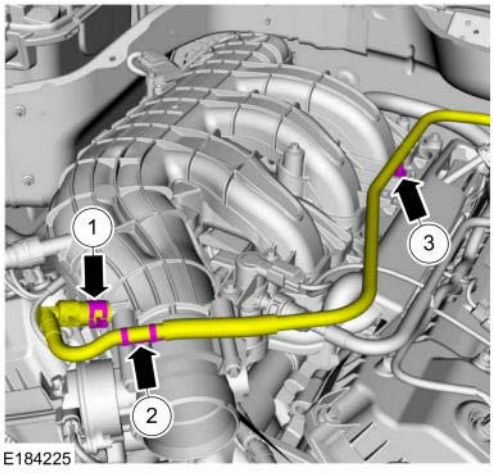
Position and install the retainer to the LH valve cover.

Connect the fuel tube and EVAP purge valve quick release coupling. Refer to: QUICK RELEASE COUPLING .

43.

1.

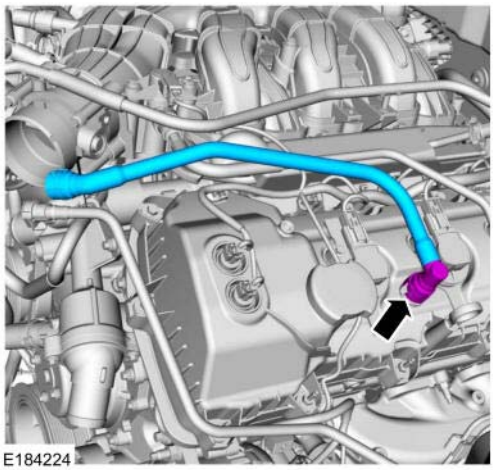
Connect the vacuum hose to the upper intake manifold.



Use the General Equipment: Hose Clamp Remover/Installer

2.

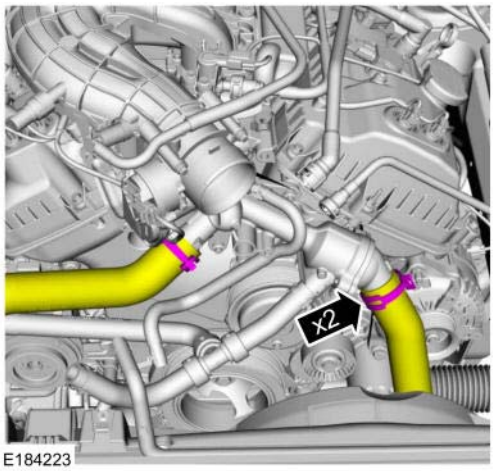
Attach the vacuum hose retainer to the throttle body.



3.

Attach the vacuum hose retainer to the intake manifold.

44.



Install the crankcase vent tube.

45.

Connect the upper and lower radiator hoses to the thermostat housing.

Use the General Equipment: Hose Clamp Remover/Installer

46.

Install the following items:

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

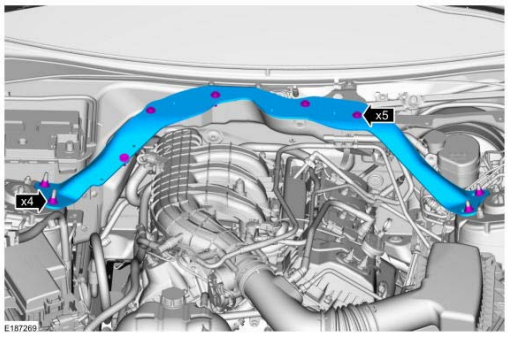
Refer to: AIR CLEANER OUTLET PIPE .

Refer to: DEGAS BOTTLE .

Convertible

47.

Install the cowl extension and the bolts.



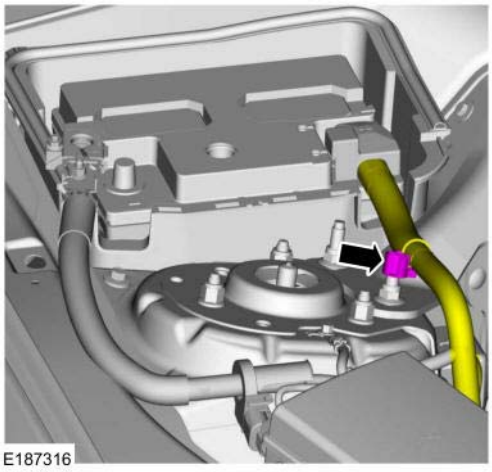
Torque

: 26 lb.ft (35 Nm)

Install the cowl extension nuts.

Torque

: 41 lb.ft (55 Nm)



48.

Connect the positive battery cable. Refer to: Battery Disconnect and Connect .

49.

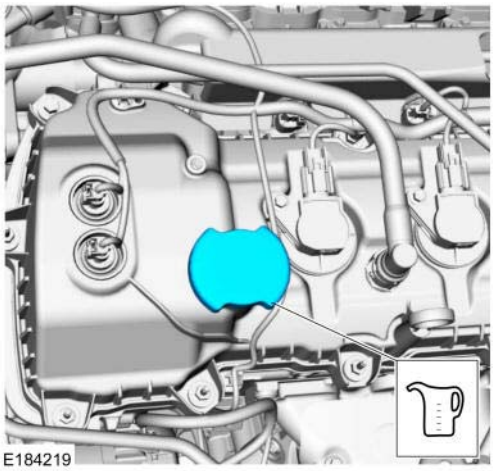
Attach the battery cable retainer.

50.

Install the cowl panel grille. Refer to: Cowl Panel Grille .

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

51.



Connect the battery ground. Refer to: Battery Disconnect and Connect .

52.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

53.

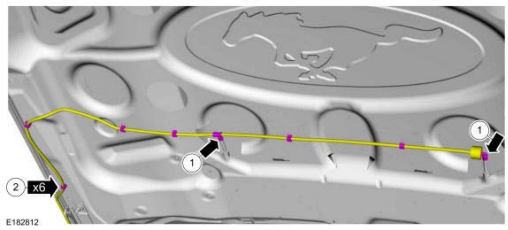
Fill the cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

NOTE: Use the index-mark for location to aid in hood installation.

54.
Install the hood and the 4 nuts.

Torque

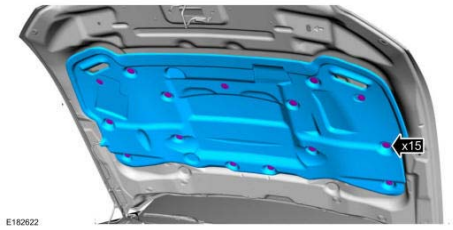
: 17 lb.ft (23 Nm)



55.

1.

Connect the windshield washer hose C-Lock Couplers. Refer to: Washer Hose Coupling .



2.

Attach the windshield washer hose retainers.

56.

Install the hood insulation and the pin-type retainers.

57.

Start and check the exhaust system for leaks.

58.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

SPECIFICATIONS > SPECIFICATIONS

ENGINE

Item	Specification
Displacement	4.957 L (302 CID)
No. of cylinders	8
Bore	92.2 mm (3.629 in)
Stroke	92.7 mm (3.649 in)
Firing order	1-5-4-8-6-3-7-2
Spark plug	12405
Spark plug gap	1.25-1.35 mm (0.049-0.053 in)
Compression ratio	11.0:1
Engine weight (without accessory drive components)	431.0lb (195.5kg)

LUBRICANTS

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada)	XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)

ENGINE OIL CAPACITY

Item	Specification
Service fill including oil filter	8.0qt (7.6L)

OIL PRESSURE

Item	Specification
Oil pressure @ idle with engine at normal operating temperature	10-15psi (69-103kPa)
Oil pressure @ 2, 000 rpm with engine at normal operating temperature	30-40psi (207-276kPa)

CYLINDER HEAD AND VALVE TRAIN

Item	Specification
Combustion chamber volume	3.33-3.51in^3 (54.5-57.5cm^3)
Valve stem diameter - intake	0.2368-0.2380in (6.015-6.044mm)
Valve stem diameter - exhaust	0.2368-0.2380in (6.015-6.044mm)
Valve stem-to-guide clearance - intake	0.0008-0.0027in (.02-.069mm)
Valve stem-to-guide clearance - exhaust	0.0018-0.0037in (.045-.094mm)
Valve head diameter - intake	1.46in (37mm)
Valve head diameter - exhaust	1.22in (31mm)
Valve face runout	0.0020in (.05mm)
Valve face angle	3 angle
Valve seat width - intake	0.051-0.059in (1.3-1.5mm)
Valve seat width - exhaust	0.055-0.063in (1.4-1.6mm)
Valve seat runout	0.0016in (.04mm)
Valve seat angle	121/91/61 degrees
Valve spring free length - intake	2.020in (51.32mm)
Valve spring free length - exhaust	2.020in (51.32mm)
Valve spring perpendicularity - intake	0.118in (3mm)
Valve spring perpendicularity - exhaust	0.118in (3mm)
Valve spring compression force - intake	650 N
Valve spring compression force - exhaust	650 N
Valve spring installed height - intake	1.5748in (40mm)
Valve spring installed height - exhaust	1.5748in (40mm)
Valve spring installed force - intake	265 N
Valve spring installed force - exhaust	265 N
Roller follower ratio	2:1
Cylinder head gasket surface flatness	0.025 mm (0.001 in) in any 25 mm (1 in) x 25 mm (1 in) area; 0.050 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.1 mm (0.004 in) overall

HYDRAULIC LASH ADJUSTER

Item	Specification
Diameter - intake	0.472in (12mm)

Diameter - exhaust	0.472in (12mm)
Clearance-to-bore	0.0007-0.0020in (.018-.05mm)
Hydraulic leakdown rate - intake	0.45-3 seconds a
Hydraulic leakdown rate - exhaust	0.45-3 seconds a
Collapsed lash adjuster gap	0.0138-0.0335in (.35-.85mm)

CAMSHAFT

Item	Specification
Lobe lift - intake	0.2348in (5.963mm)
Lobe lift - exhaust	0.2161in (5.488mm)
Journal diameter	1.1268in (28.62mm)
Journal bore inside diameter	1.1292-1.1282in (28.682-28.657mm)
Journal-to-bearing clearance	0.0010-0.0030in (.025-.075mm)
Runout	0.0016in (.04mm)
End play	0.0059in (.15mm)

CYLINDER BLOCK

Item	Specification
Cylinder bore diameter	3.6299-3.6307in (92.2-92.22mm)
Cylinder bore maximum taper	0.0005in (.013mm)
Cylinder bore maximum out-of-round	0.0004in (.01mm)
Main bearing bore inside diameter	2.850-2.851in (72.4-72.424mm)
Head gasket surface flatness	0.0254 mm (0.001 in) across any 38.1 mm (1.5 in) square

CRANKSHAFT

Item	Specification
Main bearing journal diameter	2.657-2.658in (67.481-67.505mm)
Main bearing journal maximum taper	0.0002in (.004mm)
Main bearing journal maximum out-of-round	0.0002in (.006mm)
Main bearing journal-to-main bearing clearance	0.0010-0.0018in (.025-.045mm)
Connecting rod journal diameter	2.086-2.087in (52.983-53.003mm)

Connecting rod journal maximum taper	0.0002in (.004mm)
Connecting rod journal maximum out-of-round	0.0002in (.006mm)
Crankshaft maximum end play	0.0110in (.28mm)

PISTON AND CONNECTING ROD

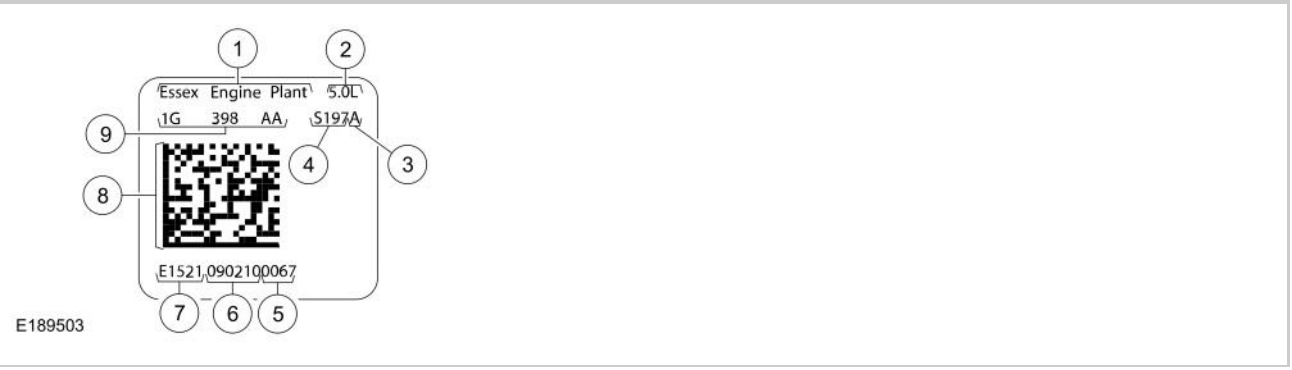
Item	Specification
Piston diameter - single grade	3.6284-3.6289in (92.161-92.175mm)
Piston-to-cylinder bore clearance (at grade size) b	0.0010-0.0023in (.025-.059mm)
Piston ring end gap - top	0.0059-0.0098in (.15-.25mm)
Piston ring end gap - intermediate	0.0118-0.0217in (.3-.55mm)
Piston ring end gap - oil control	0.0059-0.0177in (.15-.45mm)
Piston ring groove width - top	0.0480-0.0492in (1.22-1.25mm)
Piston ring groove width - intermediate	0.0480-0.0488in (1.22-1.24mm)
Piston ring groove width- oil control	0.0996-0.1004in (2.53-2.55mm)
Piston ring width - top	0.0461-0.0469in (1.17-1.19mm)
Piston ring width - intermediate	0.0461-0.0469in (1.17-1.19mm)
Piston ring-to-groove clearance - top	0.0012-0.0031in (.03-.08mm)
Piston ring-to-groove clearance - intermediate	0.0012-0.0028in (.03-.07mm)
Piston pin bore diameter	0.8663-0.8665in (22.004-22.01mm)
Piston pin diameter	0.8660-0.8661in (21.997-22mm)
Piston pin length	2.390-2.402in (60.7-61mm)
Piston pin-to-piston fit (clearance)	0.0002-0.0005in (.004-.013mm)
Connecting rod-to-pin clearance	0.0001-0.0007in (.003-.018mm)
Connecting rod pin bore diameter	0.8663-0.8667in (22.003-22.015mm)
Connecting rod length (center-to-center)	5.93in (150.7mm)
Connecting rod maximum allowed bend	0.0015in (.038mm)
Connecting rod maximum allowed twist	0.0020in (.05mm)
Connecting rod bearing-to-crankshaft clearance	0.0011-0.0027in (.028-.069mm)
Connecting rod side clearance (as assembled to crank) - standard play	0.0128in (.325mm)
Connecting rod side clearance (as assembled to crank) - max. play	0.0197in (.5mm)

a. Time required for the plunger to leak down 1.6 mm of travel with 222 N force and leakdown fluid

in the lash adjuster

b. Before Grafal coating.

DESCRIPTION AND OPERATION > ENGINE - OVERVIEW > OVERVIEW

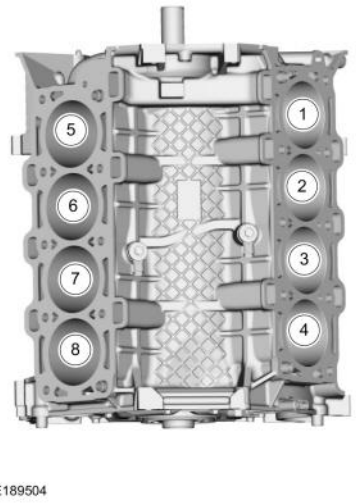


The 5.0L (302 CID) is a V-8 engine with the following features:

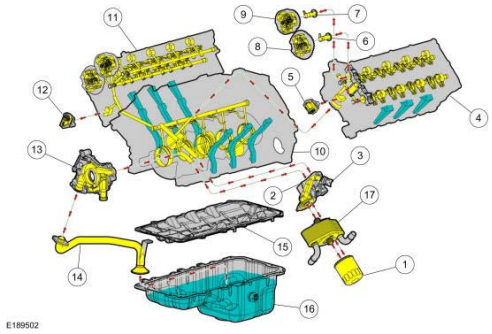
- Dual overhead camshafts
- Four valves per cylinder
- SFI
- Aluminum cylinder heads
- Aluminum, 90-degree V-cylinder block
- Twin independent VCT system
- Individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- Electronic ignition system with 8 ignition coils

Engine Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure the correct parts are obtained. The codes contain all the pertinent information relating to the dates, optional equipment and revisions.



Engine Code Information Label



Item	Description
1	Essex engine plant
2	Engine displacement
3	Transmission
4	Vehicle line
5	Sequential number

6	Engine build date (DDMMYY)
7	Essex engine plant
8	Bar code
9	Engine part number

Engine Cylinder Identification

Engine Oil Flow Illustration

Item	Description
1	Oil filter
2	Oil filter adapter
3	EOP switch
4	Cylinder head - LH
5	Timing chain tensioner - LH
6	Exhaust camshaft
7	Intake camshaft

8	Exhaust VCT unit
9	Intake VCT unit
10	Cylinder block
11	Cylinder head - RH
12	Timing chain tensioner - RH
13	Oil pump
14	Oil pump screen and pickup tube
15	Oil pan baffle and gasket
16	Oil pan
17	Oil Cooler

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the:

- crankshaft main bearings.
- crankshaft thrust main bearing.
- connecting rod bearings.
- oil galleries.

All other parts are lubricated by splash of the oil.

The lubrication system of the 5.0L (4V) engine is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors.

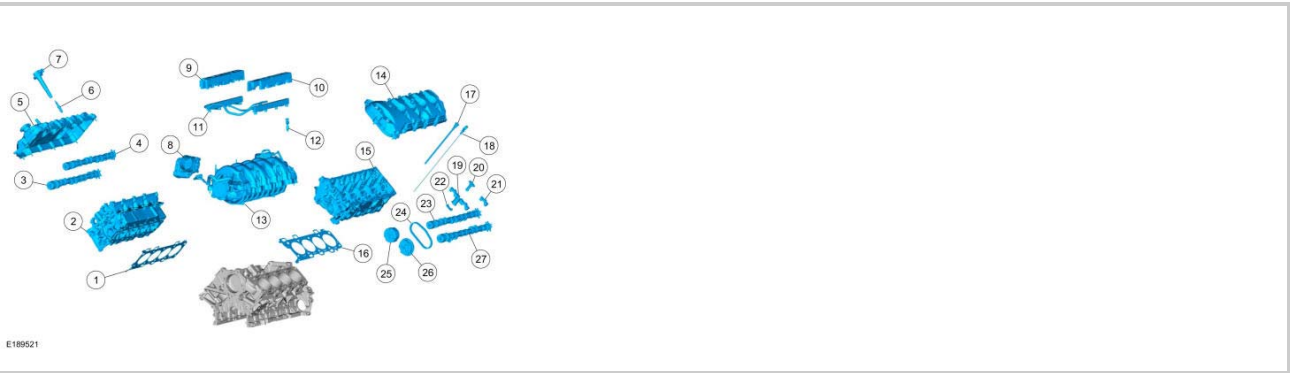
The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Valve Train

The valves are actuated by a hydraulic lash adjuster and roller follower. The hydraulic lash adjusters and roller followers:

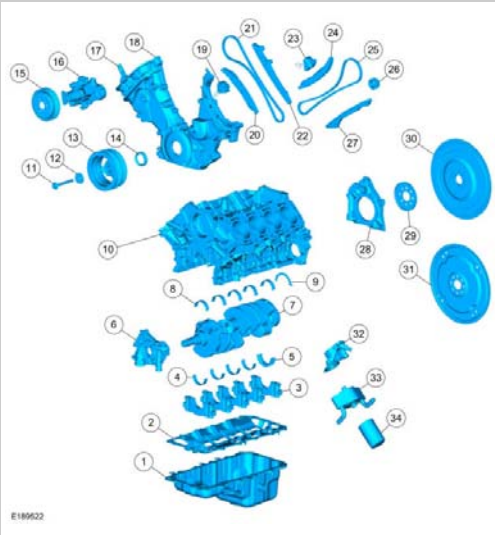


- provide hydraulic lash adjustment.
- ride on the camshaft lobes.

Twin Independent VCT System

The twin independent VCT system allows variable control of the valves which optimizes combustion at full load providing improved power and low speed torque (broadening the torque curve) which enables variable valve overlap which provides better fuel economy and emissions and provides optimized cold start operation with improved exhaust emissions.

DESCRIPTION AND OPERATION > ENGINE COMPONENT VIEW



Engine - Upper Components

Item	Part Number	Description
1	6051	RH cylinder head gasket
2	6049	RH cylinder head
3	6250	RH exhaust camshaft
4	6250	RH intake camshaft
5	6582	RH valve cover
6	12405	Spark plug (8 required)
7	12029	Ignition coil on plug (8 required)
8	9F991	Throttle body
9	6P013	RH fuel injector insulator shield
10	6P013	LH fuel injector insulator shield
11	9F792	Fuel rail
12	9F593	Fuel injector (8 required)
13	9424	Intake manifold

24	6K255	LH timing chain tensioner arm
25	6268	LH primary timing chain
26	6306	Crankshaft sprocket
27	6B274	LH timing chain guide
28	6K318	Crankshaft rear seal retainer plate
29	12A227	Crankshaft sensor ring

30	6375	Flywheel (manual transmission)
31	6375	Flexplate (automatic transmission)
32	6881	Oil filter adapter
33	6A642	Oil cooler
34	6731	Oil filter

DIAGNOSIS AND TESTING > ENGINE

1.

For basic mechanical concerns. REFER to: ENGINE SYSTEM - GENERAL INFORMATION . For driveability concerns. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

REMOVAL AND INSTALLATION > CAMSHAFT LH

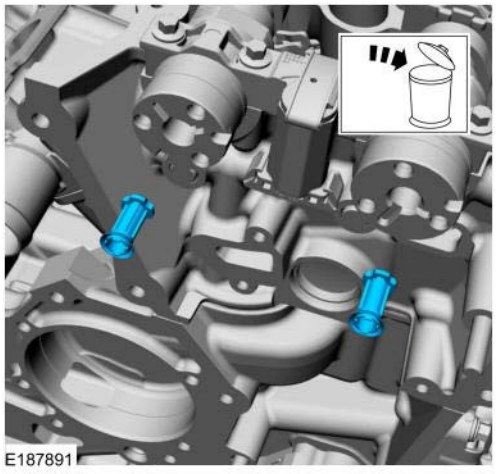
Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > CAMSHAFT LH > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

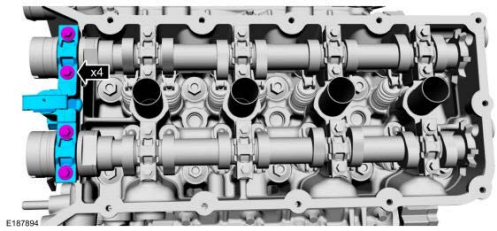
NOTE: If the RH camshafts are being serviced at the same time as the LH camshafts, remove the RH camshafts first. Refer to the appropriate procedure in this service information.



NOTE: If the components are to be reinstalled, they must be installed in their original locations.

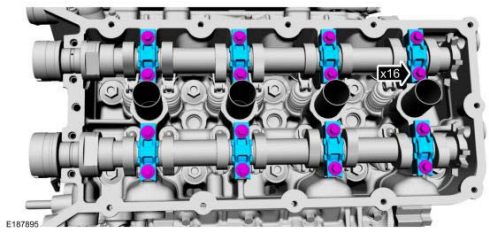
1.

Remove the LHVCT units. Refer to: Variable Camshaft Timing (VCT) Unit .



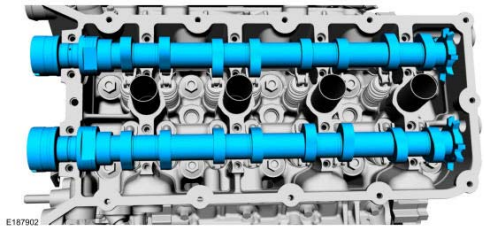
2.

Remove and discard the VCT system oil filters.



NOTE: The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.

3.
Remove the bolts and the front camshaft bearing mega cap.



4.

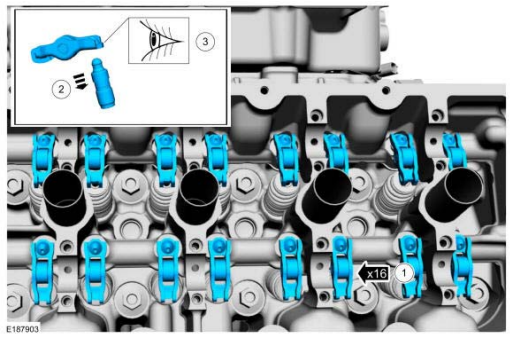
Remove the bolts and the camshaft bearing caps.

5.

Remove the intake and exhaust camshafts.

6.

1.



Remove the camshaft roller follower and hydraulic lash adjuster assemblies.

2.

Separate the hydraulic lash adjusters from the spring clips on the camshaft roller followers.

3.

Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage. Replace damaged components as necessary.

REMOVAL AND INSTALLATION > CAMSHAFT LH > INSTALLATION

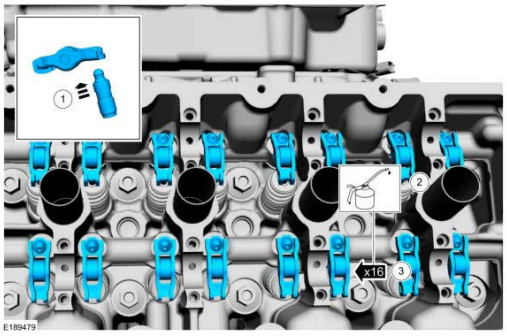
NOTE: If the components are to be reinstalled, they must be installed in their original locations.

1.

1.

Assemble the hydraulic lash adjusters onto the spring clips on the camshaft roller followers.

2.



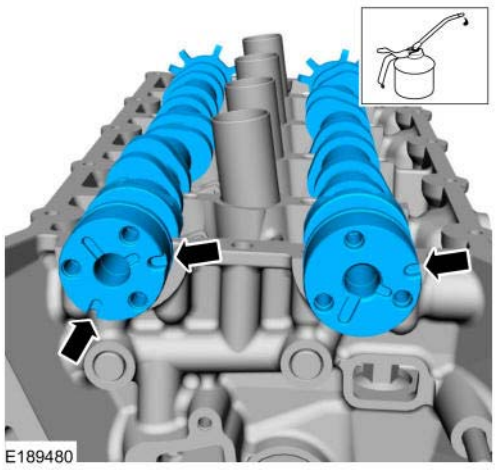
Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

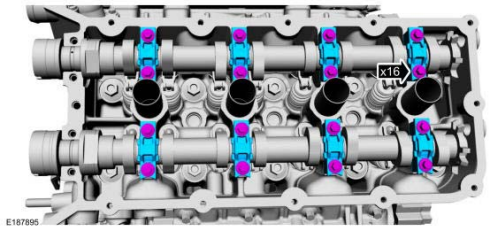
3.

Install the camshaft roller follower and hydraulic lash adjuster assemblies.



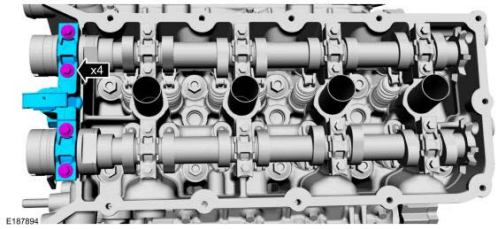
NOTE: Lubricate the camshafts with clean engine oil prior to installation.

2.
Install the intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.



Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

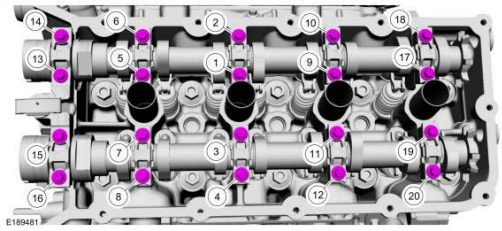


NOTE: Do not tighten at this time.

3.
Install the camshaft bearing caps and the bolts.

NOTE: Do not tighten at this time.

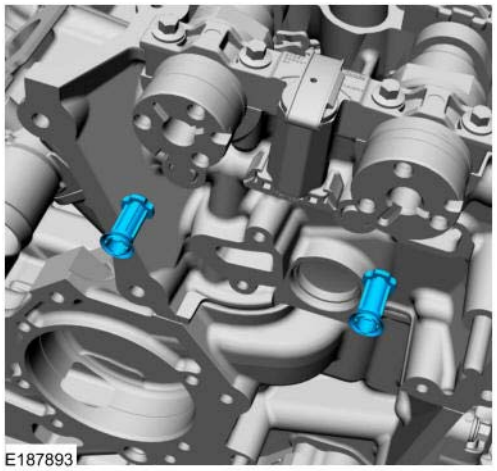
4.
Install the front camshaft bearing mega cap and the bolts.



5.

Tighten the bolts.

Torque:



Stage 1: 53 lb.in (6 Nm)

Stage 2: 45°

6.

Install new VCT system oil filters into the camshafts.

7.

Install the LH VCT units. Refer to: Variable Camshaft Timing (VCT) Unit .

REMOVAL AND INSTALLATION > CAMSHAFT RH

Strap Wrench	
Three Leg Puller	

Materials

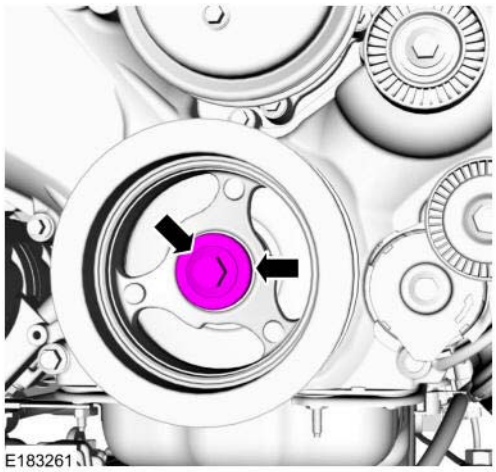
Name	Specification

Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > REMOVAL

1.

Remove the following items:



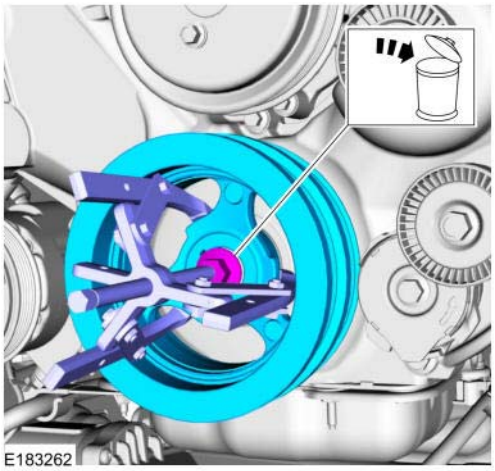
Refer to: COOLING FAN MOTOR AND SHROUD .

Refer to: ACCESSORY DRIVE BELT .

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

2.

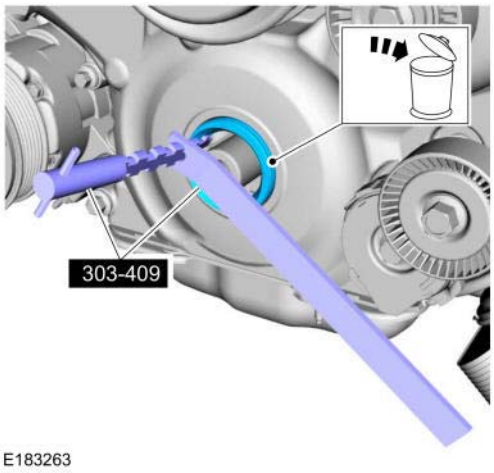
Remove the crankshaft pulley bolt and washer.



3.

Using the 3 Leg Puller and the crankshaft pulley bolt, remove the crankshaft pulley.

Use the General Equipment: Three Leg Puller



Discard the crankshaft pulley bolt.

NOTE: Use care not to damage the engine front cover or the crankshaft when removing the seal.

4.
Using the special tool, remove and discard the crankshaft front oil seal.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.

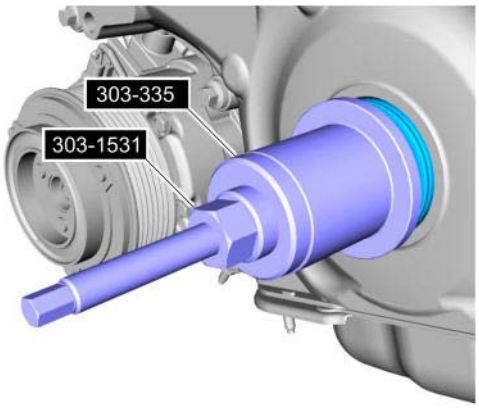
REMOVAL AND INSTALLATION > CRANKSHAFT FRONT SEAL > INSTALLATION

1.

Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

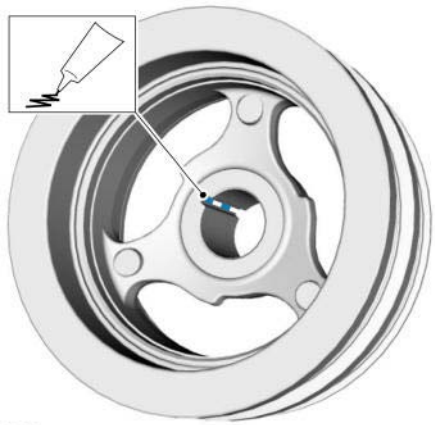


E183264

2.

Using the special tools, install the new crankshaft front oil seal.

Use Special Service Tool: 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal, 303-1531 Installer, Front Crank Seal and Damper.



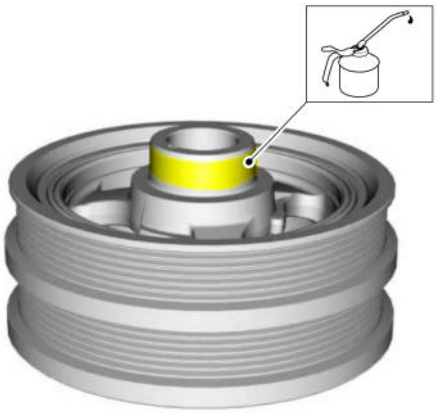
E183265

NOTE: If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

3.
Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

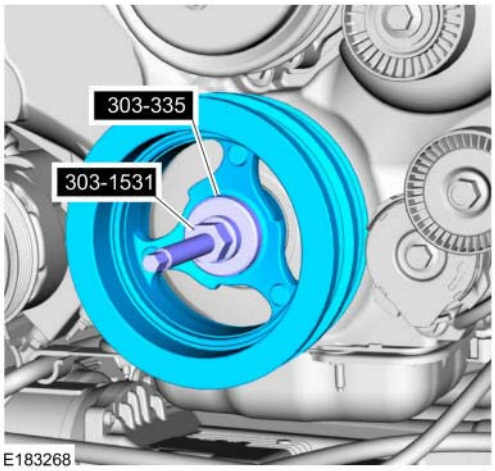


E183266

4.

Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E183267

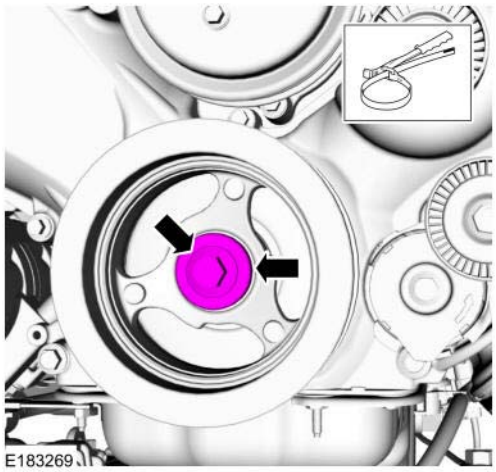
5.

Using the special tools, install the crankshaft pulley. Use Special Service Tool: 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal, 303-1531Installer, Front Crank Seal and Damper.

6.

Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer.

Use the General Equipment: Strap Wrench



Torque:

Stage 1: 103 lb.ft (140 Nm)

Stage 2: Loosen: 360°

Stage 3: 74 lb.ft (100 Nm)

Stage 4: 90°

7.

Install the following items:

Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

Refer to: ACCESSORY DRIVE BELT .

Refer to: COOLING FAN MOTOR AND SHROUD .

8.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

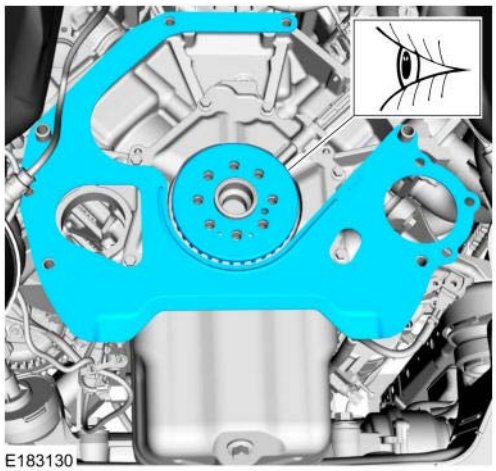
	303-519 (T95P-6701-EH) Remover, Crankshaft Rear Oil Seal TKIT-1995-FH/FLMH TKIT-1995-LMH/MH

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > REMOVAL

1.

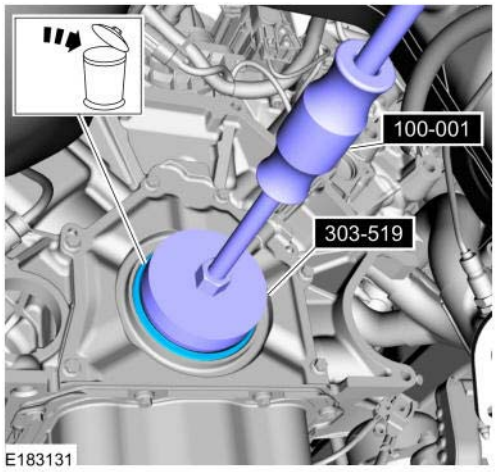


Remove the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

NOTE: Automatic transmission spacer plate shown in illustration, manual transmission similar.

2.

Remove the crankshaft sensor ring and the engine-to-transmission spacer plate.

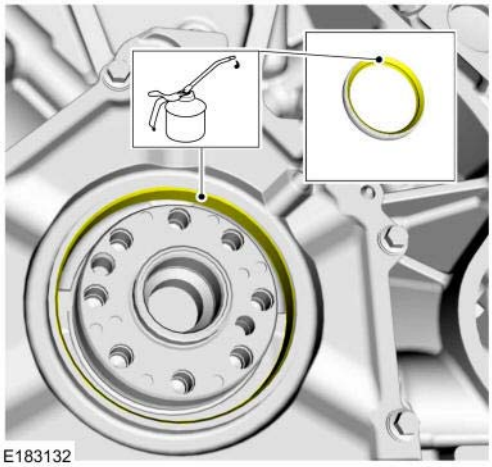


Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be discarded.

3.

Using the special tools, remove and discard the crankshaft rear seal.

Use Special Service Tool: 303-519 (T95P-6701-EH) Remover, Crankshaft Rear Oil Seal, 100-001 (T50T-100-A)Slide Hammer.



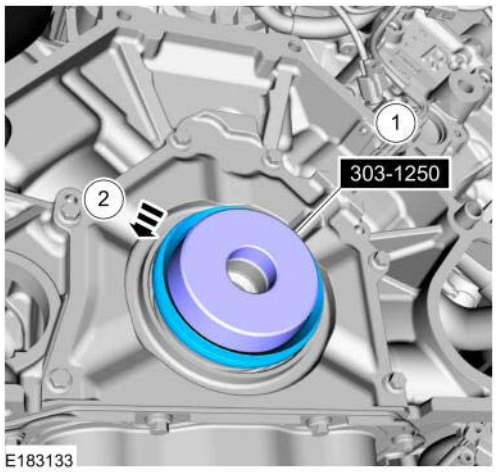
REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL > INSTALLATION

1.

Lubricate the seal bore and the seal lips with clean engine oil.

Material

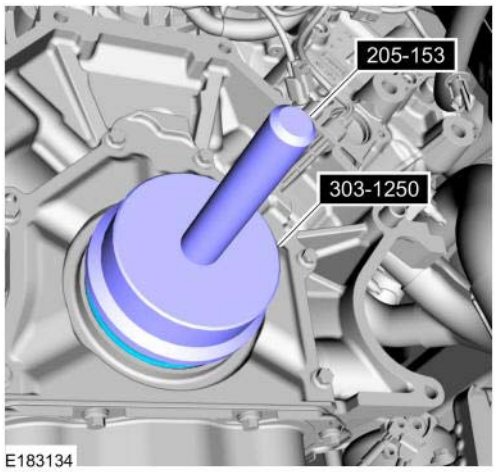
: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



2.

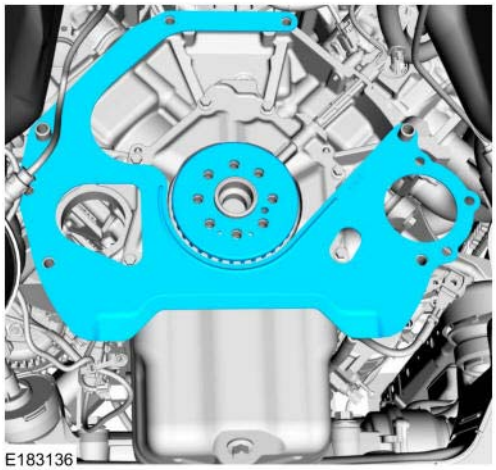
Position the special tool onto the end of the crankshaft.

Use Special Service Tool: 303-1250 Seal Installer, Rear Main.



Slide the new crankshaft rear seal onto the tool.

3.



Using the special tools, install the crankshaft rear seal.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1250 Seal Installer, Rear Main.

NOTE: Automatic transmission spacer plate shown in illustration, manual transmission similar.

4.
Install the crankshaft sensor ring and the engine-to-transmission spacer plate.

5.

Install the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL WITH RETAINER PLATE

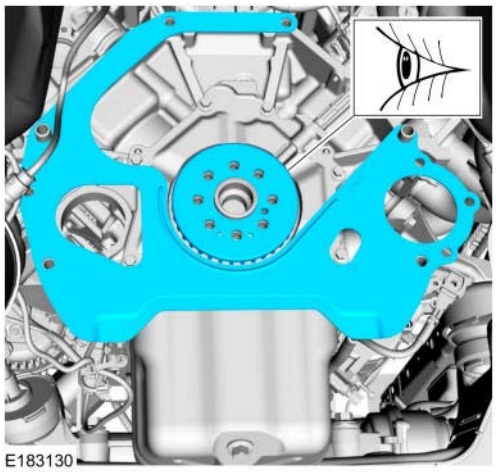
Plastic Scraper	

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL WITH RETAINER PLATE > REMOVAL

1.

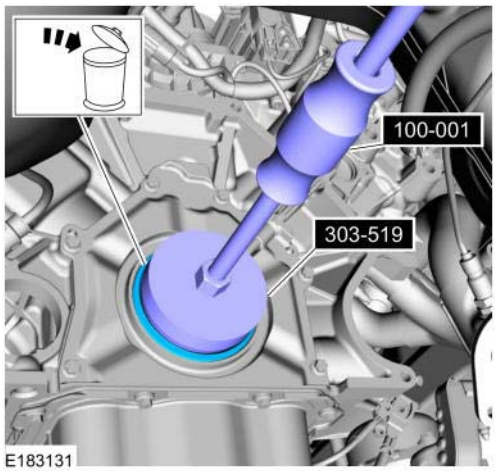


Remove the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

NOTE: Automatic transmission spacer plate shown in illustration, manual transmission similar.

2.

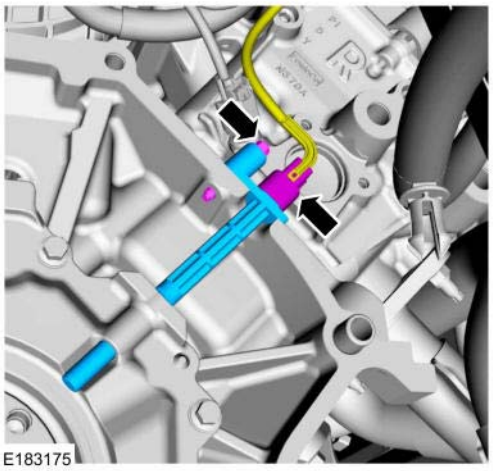
Remove the crankshaft sensor ring and the engine-to-transmission spacer plate.



Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be discarded.

3.

Using the special tools, remove and discard the crankshaft rear seal.

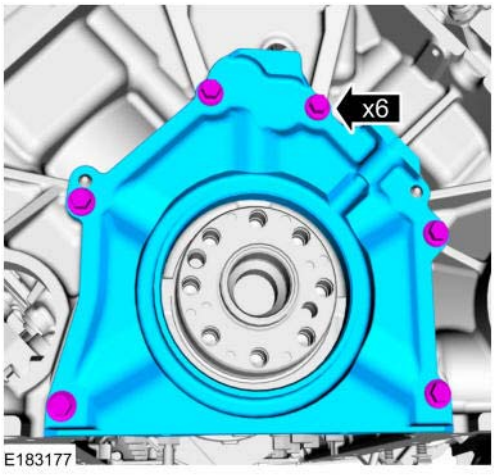


Use Special Service Tool: 303-519 (T95P-6701-EH) Remover, Crankshaft Rear Oil Seal, 100-001 (T50T-100-A) Slide Hammer.

4.

Disconnect the CKP sensor electrical connector.

Remove the bolt and the CKP sensor.



5.

Remove the oil pan. Refer to: Oil Pan .

6.

Remove the bolts and the crankshaft rear seal retainer plate.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

7.
Clean and inspect the mating surface. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material

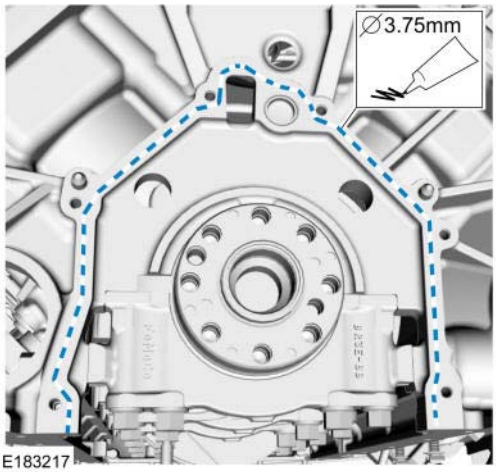
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B



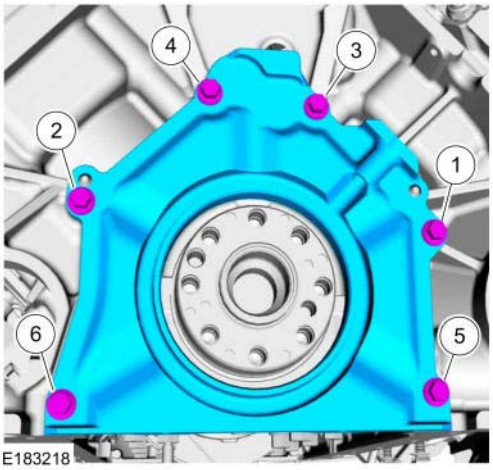
REMOVAL AND INSTALLATION > CRANKSHAFT REAR SEAL WITH RETAINER PLATE > INSTALLATION

NOTE: If the rear crankshaft seal retaining plate is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure may cause future oil leaks.

1.
Apply a 3.75 mm (0.147 in) bead of silicone gasket and sealant to the rear crankshaft seal retainer mating surface on the engine block.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



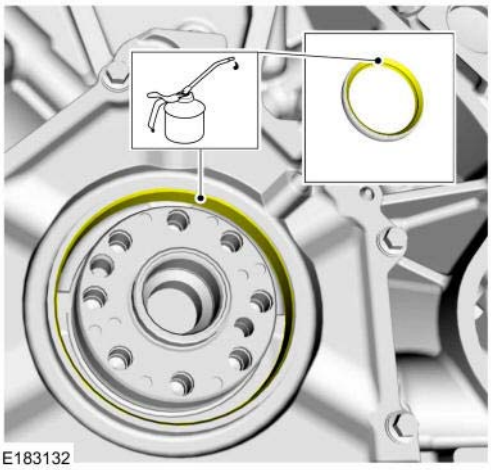
2.

Install the crankshaft rear seal retainer plate and the bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°

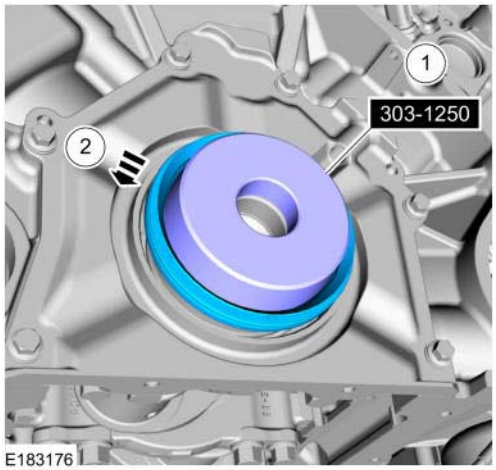


3.

Lubricate the crankshaft rear seal bore and the seal lips with clean engine oil.

Material

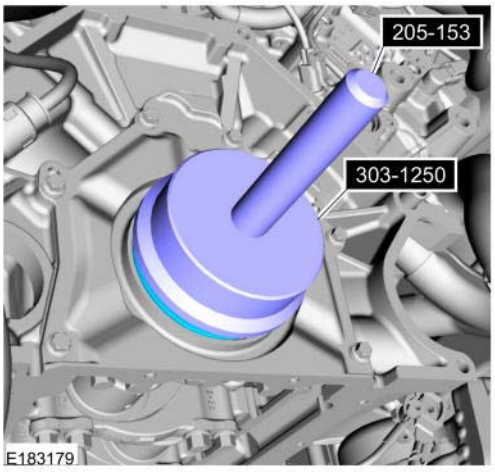
: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



4.

Position the special tool onto the end of the crankshaft.

Use Special Service Tool: 303-1250 Seal Installer, Rear Main.

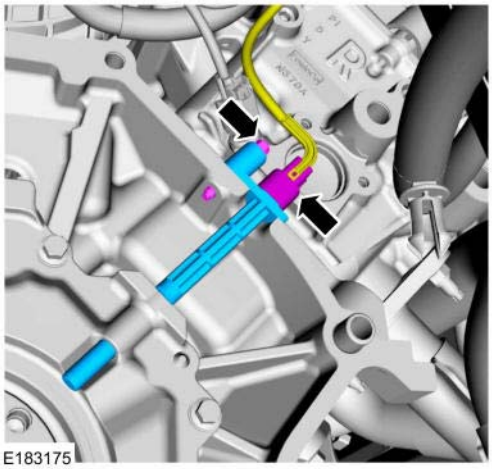


Slide the new crankshaft rear seal onto the tool.

5.

Using the special tools, install the crankshaft rear seal.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1250 Seal Installer, Rear Main.



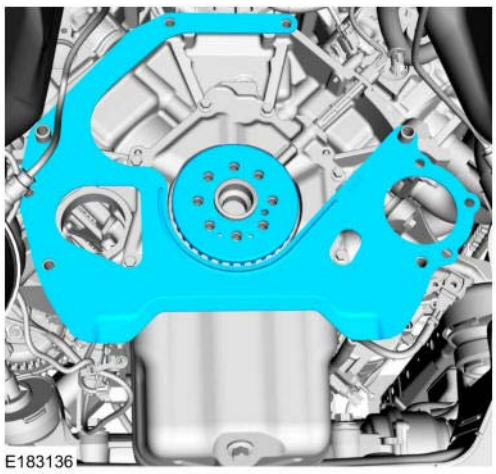
6.

Install the CKP sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

Connect the CKP sensor electrical connector.



7.

Install the oil pan. Refer to: Oil Pan .

NOTE: Automatic transmission spacer plate shown in illustration, manual transmission similar.

8.
Install the crankshaft sensor ring and the engine-to-transmission spacer plate.

9.

Install the flexplate or flywheel. Refer to: Flexplate . Refer to: Flywheel .

REMOVAL AND INSTALLATION > CYLINDER HEAD LH

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine
Oil Drain Equipment	

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

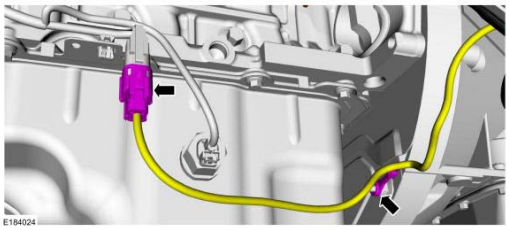
REMOVAL AND INSTALLATION > CYLINDER HEAD LH > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

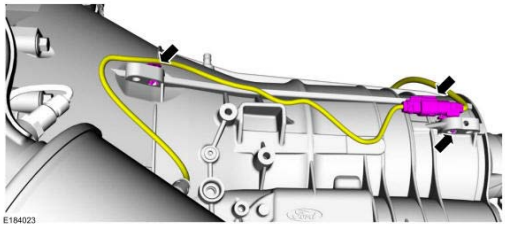
2.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

3.

Drain the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .



4.

Disconnect the LH HO2S electrical connector and detach the harness retainer.

NOTE: Automatic transmission shown in illustration, manual transmission similar.

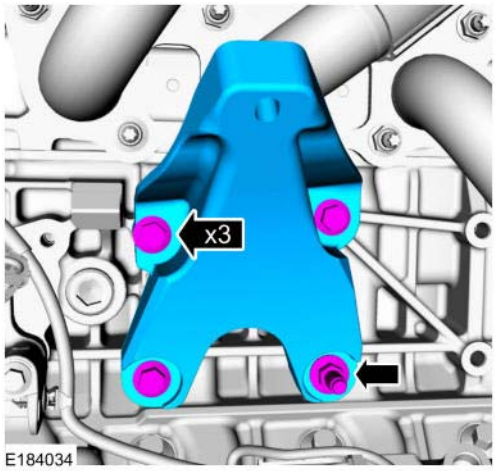
5.
Disconnect the LH catalyst monitor sensor electrical connector and detach the harness retainers.

6.

Remove the following items:

Refer to: Intake Manifold .

Refer to: Camshaft LH .

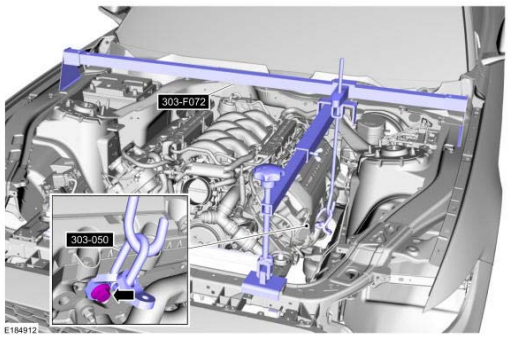


Refer to: CATALYTIC CONVERTER LH .

7.

Install the LH engine mount bracket, bolts and stud bolt.

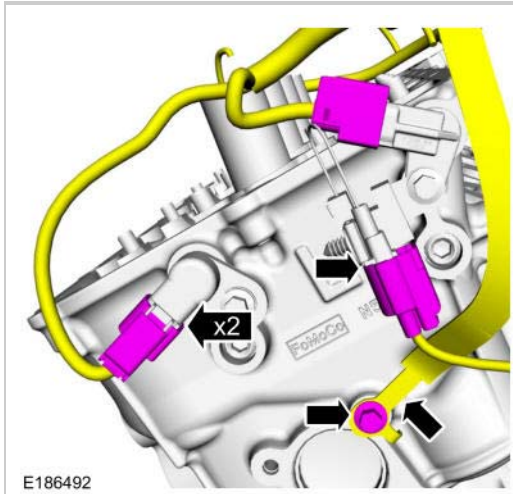
Torque



: 41 lb.ft (55 Nm)

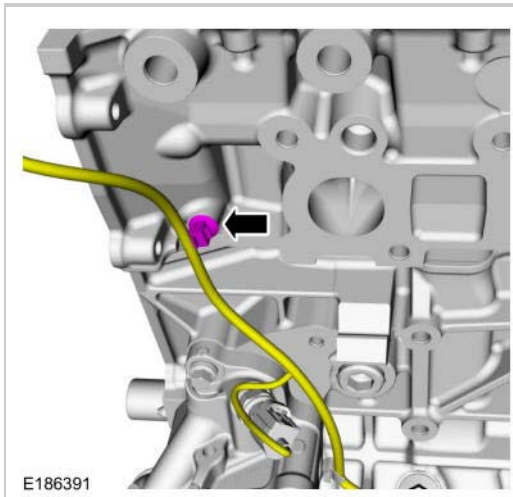
8.

Using the special tools, lower the engine onto the LH engine mount.



Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine, 303-F072 Support Bar, Engine.

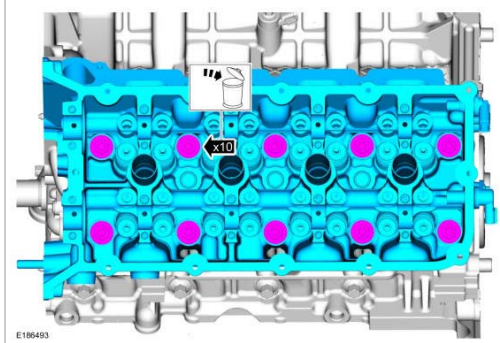
9.



Disconnect the Camshaft Position (CMP) sensors and the ignition interference capacitor electrical connectors.

Remove the bolt and position the ground wire aside.

10.



Detach the wiring harness retainer from the cylinder head.

11.

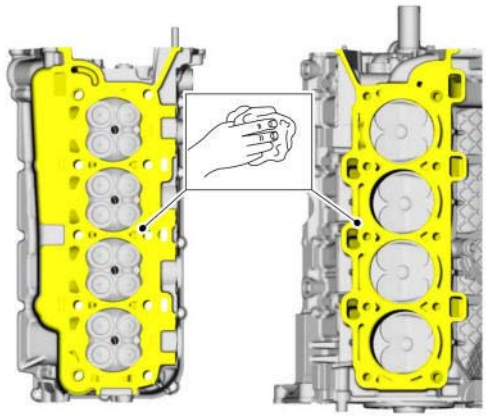
Remove and discard the bolts.

Remove the cylinder head.

12.

Discard the cylinder head gasket.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

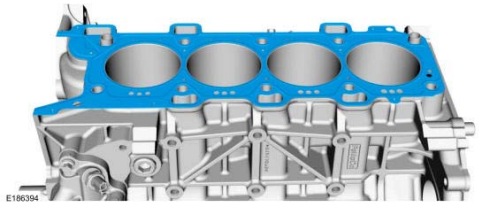


NOTE: Clean the cylinder head bolt holes in the cylinder block using compressed air. Make sure all coolant, oil or other foreign material is removed.

13.

Clean and inspect the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block

Refer to: Cylinder Head Distortion .



Refer to: Cylinder Block Distortion .

REMOVAL AND INSTALLATION > CYLINDER HEAD LH > INSTALLATION

1.

Install the cylinder head gasket.

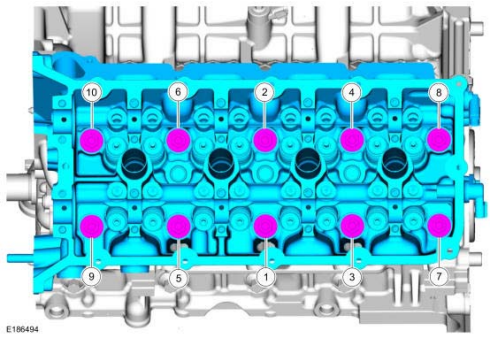
NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

2.
Install the cylinder head and the new bolts.

Torque:

Stage 1: 18 lb.ft (25 Nm)

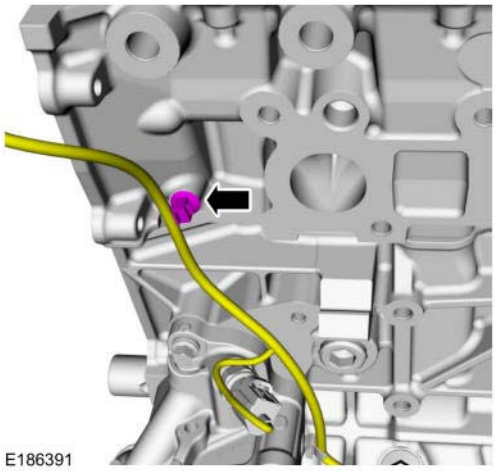
Stage 2: 55 lb.ft (75 Nm)



Stage 3: Loosen: 180°

Stage 4: 18 lb.ft (25 Nm)

Stage 5: 26 lb.ft (35 Nm)

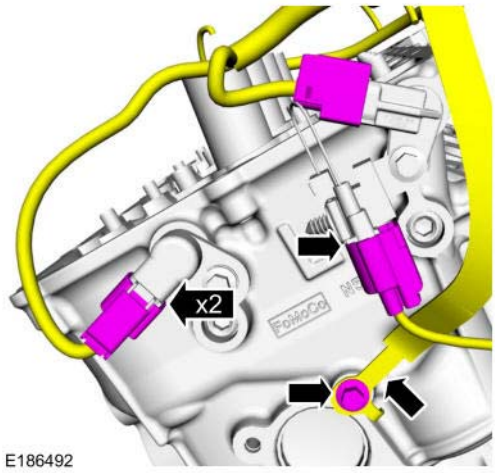


Stage 6: 90°

Stage 7: 90°

3.

Attach the wiring harness retainer to the cylinder head.



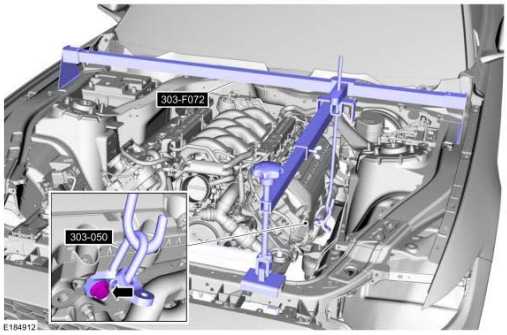
4.

Install the ground wire and bolt.

Torque

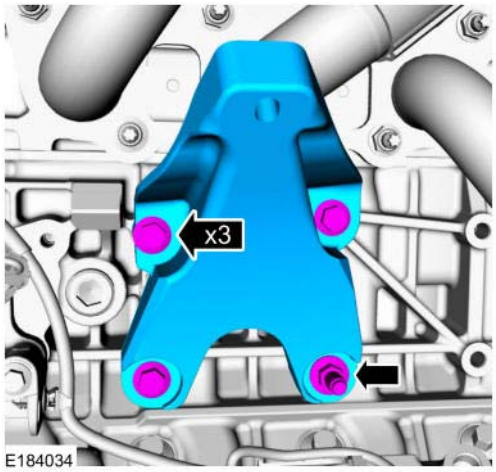
: 106 lb.in (12 Nm)

Connect the Camshaft Position (CMP) sensors and the ignition interference capacitor electrical connectors.



NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

5.



Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine, 303-F072 Support Bar, Engine.

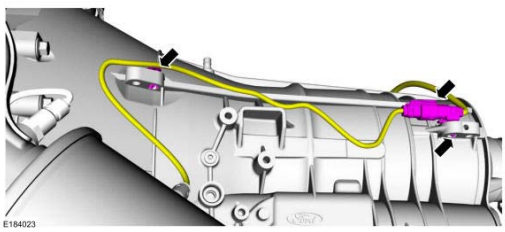
Using the special tools raise the LH side of the engine 25 mm (1 inch).

6.

Remove the bolts, stud bolt and the LH engine mount bracket.

7.

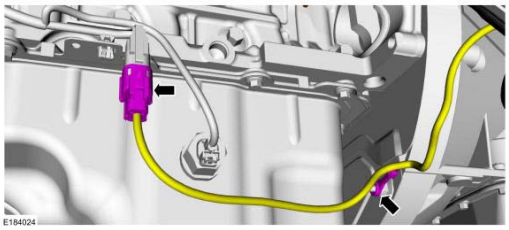
Install the following items:



Refer to: CATALYTIC CONVERTER LH .

Refer to: Camshaft LH .

Refer to: Intake Manifold .



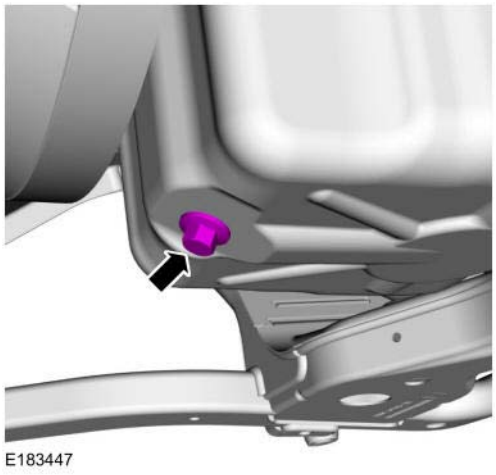
NOTE: Automatic transmission shown in illustration, manual transmission similar.

8.
Connect the LH catalyst monitor sensor electrical connector and attach the harness retainers.

9.

Connect the LH HO2S electrical connector and attach the harness retainer.

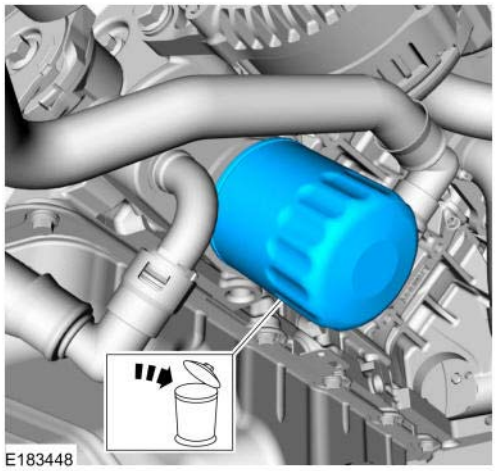
10.



Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

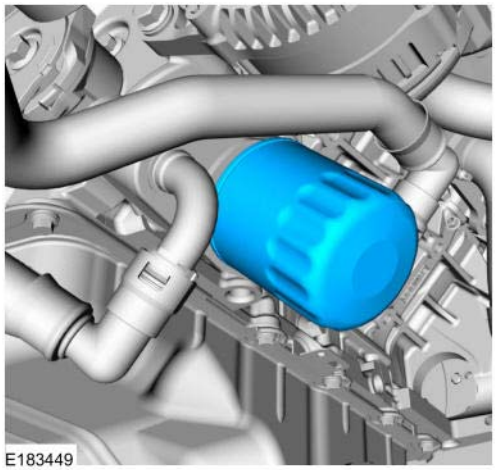


Torque

: 19 lb.ft (26 Nm)

11.

Remove and discard the engine oil filter.



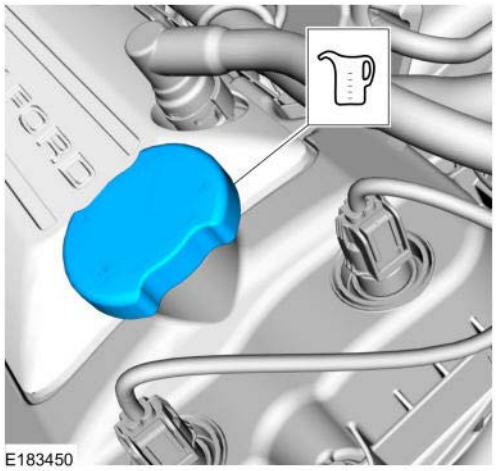
NOTE: Do not lubricate the O-ring seal.

12.
Install a new oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°



13.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

14.

Fill and bleed the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

REMOVAL AND INSTALLATION > CYLINDER HEAD RH

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine
Oil Drain Equipment	

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > CYLINDER HEAD RH > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign

material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

3.

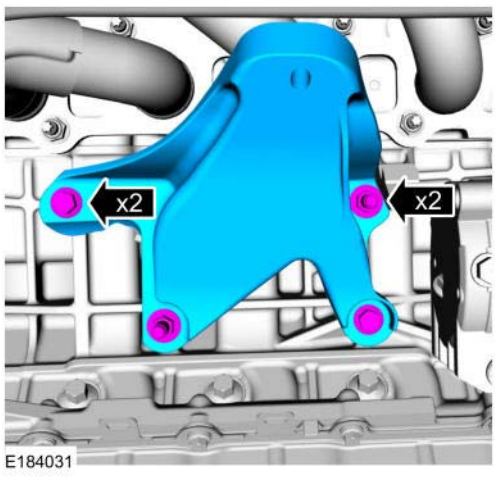
Drain the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

4.

Remove the following items:

Refer to: Intake Manifold .

Refer to: Camshaft RH .

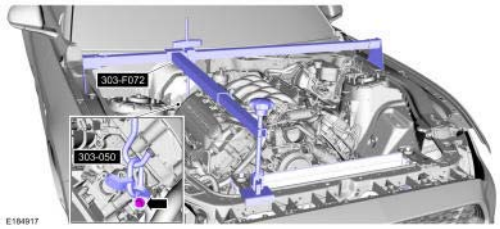


Refer to: Exhaust Manifold RH .

5.

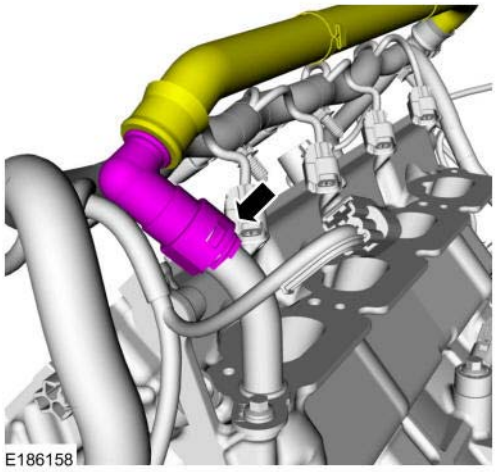
Install the RH engine mount bracket, bolts and stud bolts.

Torque



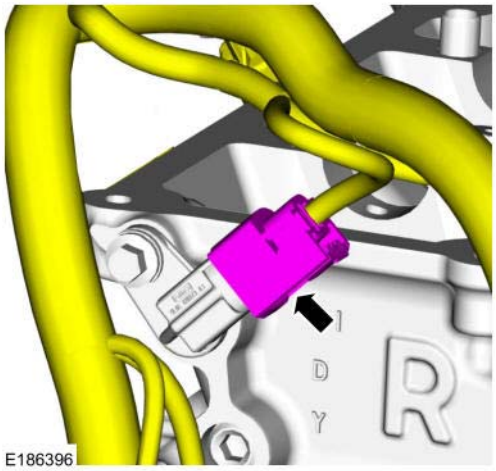
: 41 lb.ft (55 Nm)

6.



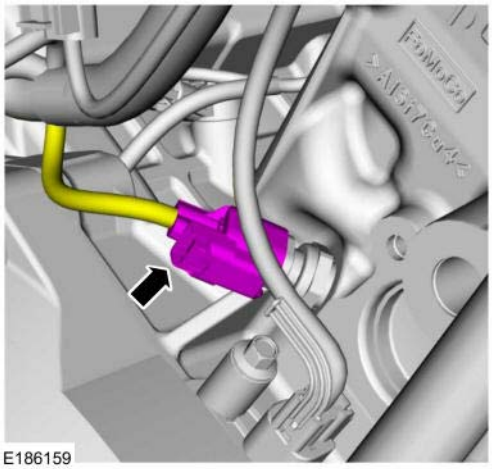
Using the special tools, lower the engine onto the RH engine mount.

Remove Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine, 303-F072 Support Bar, Engine.



7.

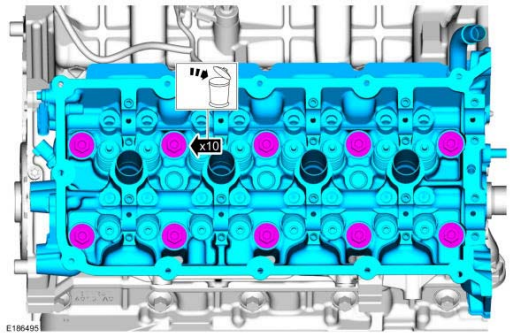
Disconnect the heater hose.



8.

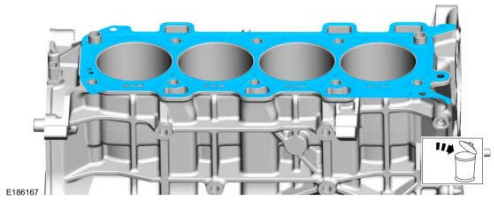
Disconnect the camshaft position sensor electrical connector.

9.



Disconnect the CHT electrical connector.

10.



Remove and discard the bolts.

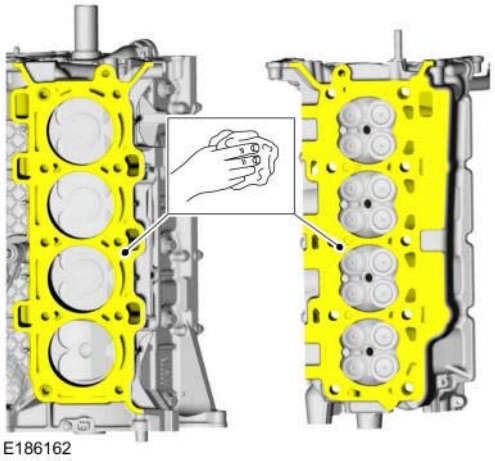
Remove the cylinder head.

11.

Remove and discard the cylinder head gasket.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

NOTE: Clean the cylinder head bolt holes in the cylinder block using compressed

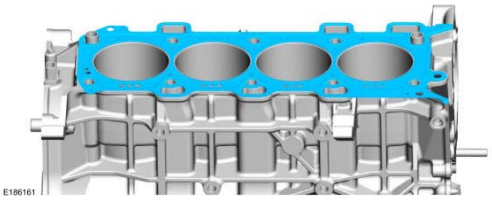


air. Make sure all coolant, oil or other foreign material is removed.

12.

Clean and inspect the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block

Refer to: Cylinder Head Distortion .



Refer to: Cylinder Block Distortion .

E186162

REMOVAL AND INSTALLATION > CYLINDER HEAD RH > INSTALLATION

1.

Install the new cylinder head gasket.

E186161

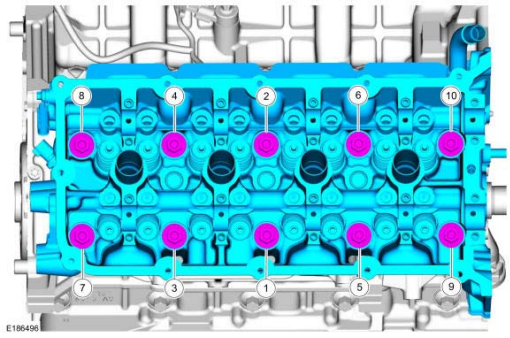
NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

2.
Install the cylinder head and the new bolts.

Torque:

Stage 1: 18 lb.ft (25 Nm)

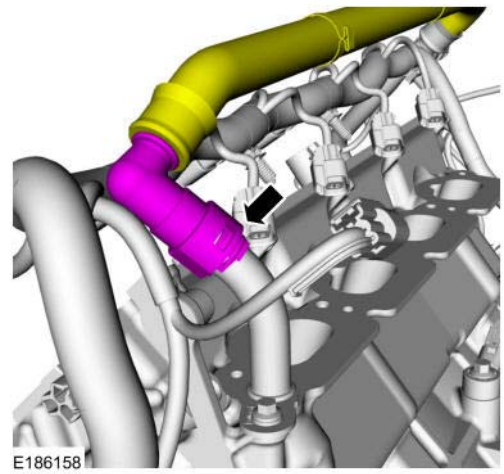
Stage 2: 55 lb.ft (75 Nm)



Stage 3: Loosen: 180°

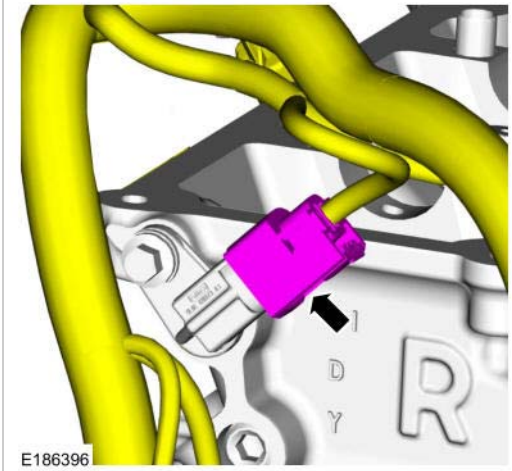
Stage 4: 18 lb.ft (25 Nm)

Stage 5: 26 lb.ft (35 Nm)



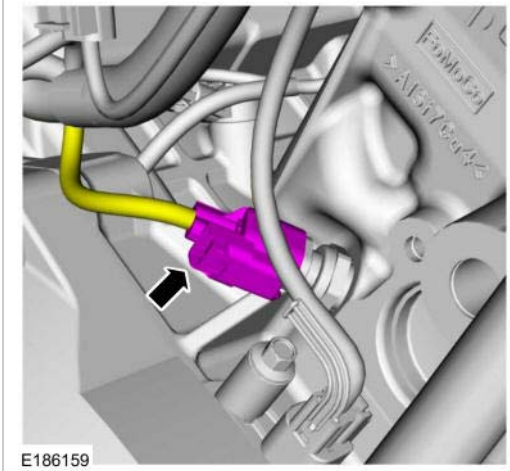
Stage 6: 90°

Stage 7: 90°



3.

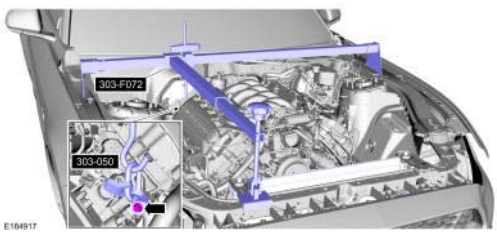
Connect the heater hose.



4.

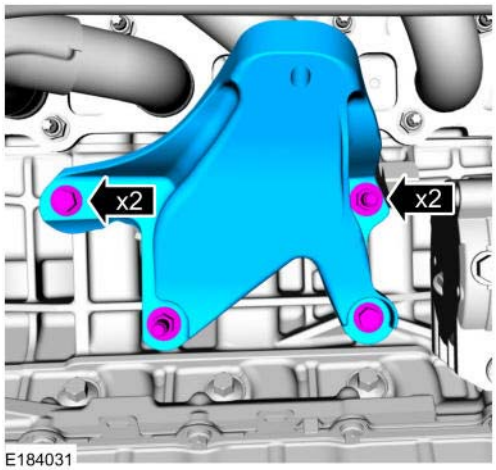
Connect the camshaft position sensor electrical connector.

5.



Connect the CHT electrical connector.

6.



Install Special Service Tool: 303-050 (T70P-6000) Lifting Bracket, Engine, 303-F072 Support Bar, Engine.

Using the special tools raise the RH side of the engine 25 mm (1 inch).

7.

Remove the bolts, stud bolts and the RH engine mount bracket.

8.

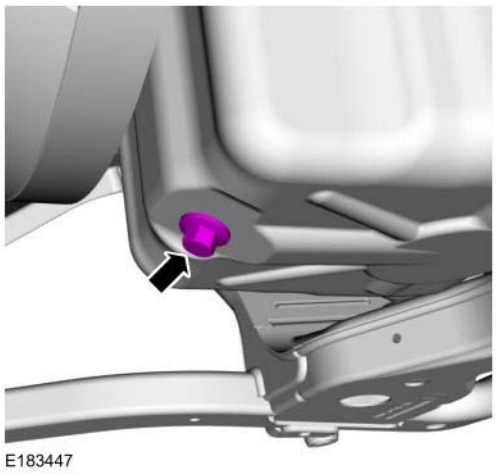
Install the following items:

Refer to: Exhaust Manifold RH .

Refer to: Camshaft RH .

Refer to: Intake Manifold .

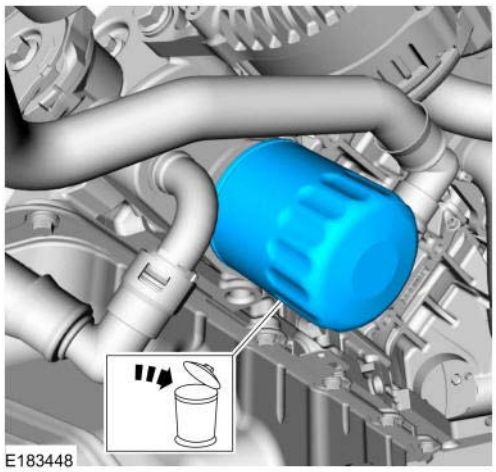
9.



Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

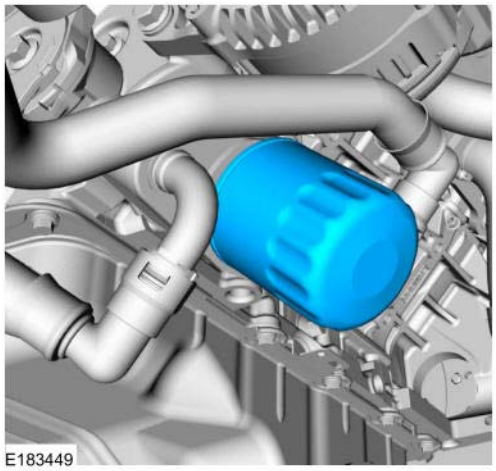


Torque

: 19 lb.ft (26 Nm)

10.

Remove and discard the engine oil filter.



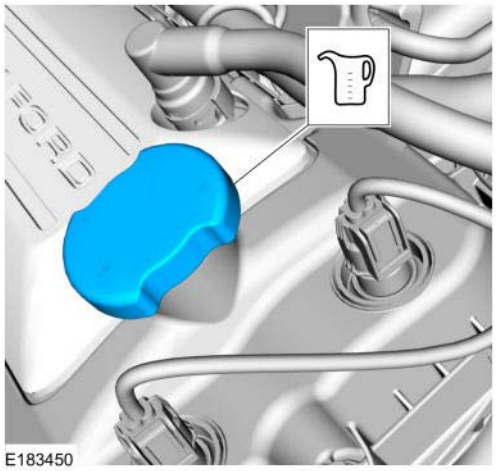
NOTE: Do not lubricate the O-ring seal.

11.
Install a new oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°



12.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

13.

Fill and bleed the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

REMOVAL AND INSTALLATION > ENGINE FRONT COVER

Special Tool(s) / General Equipment

Plastic Scraper
Oil Drain Equipment

Materials

Name	Specification

REMOVAL AND INSTALLATION > ENGINE FRONT COVER > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign

material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

3.

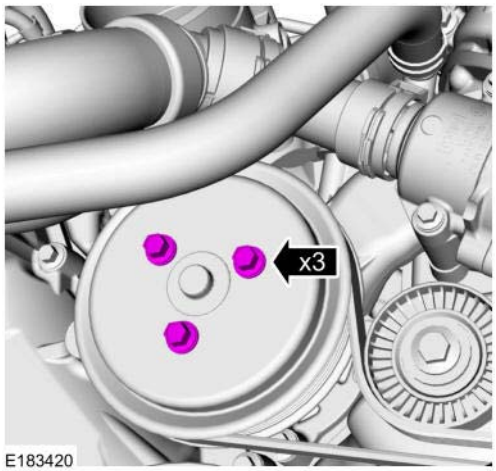
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

4.

Drain the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

5.

Remove the following items:



Refer to: DEGAS BOTTLE .

Refer to: AIR CLEANER OUTLET PIPE .

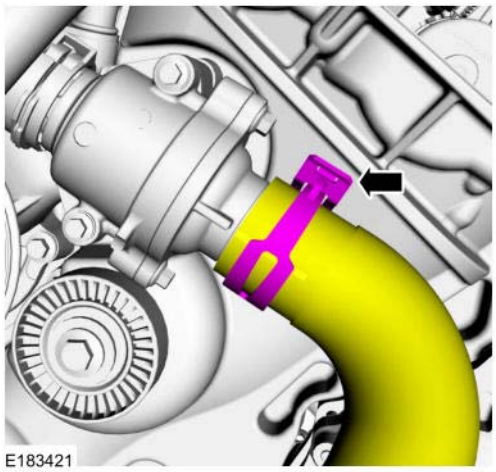
Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS)

6.

Loosen the coolant pump pulley bolts.

7.

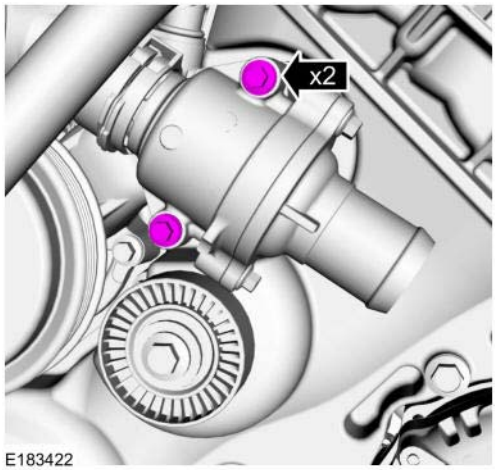
Remove the following items:



Refer to: Crankshaft Front Seal .

Refer to: Valve Cover RH .

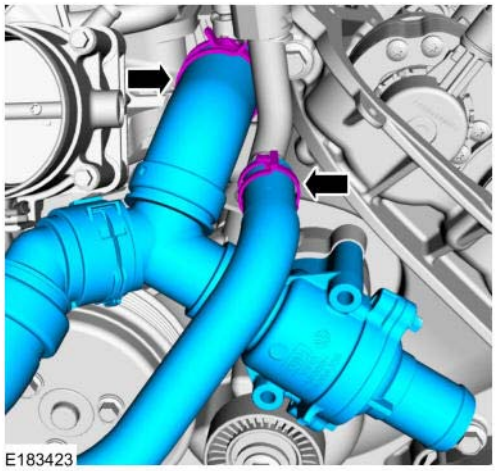
Refer to: Valve Cover LH .



8.

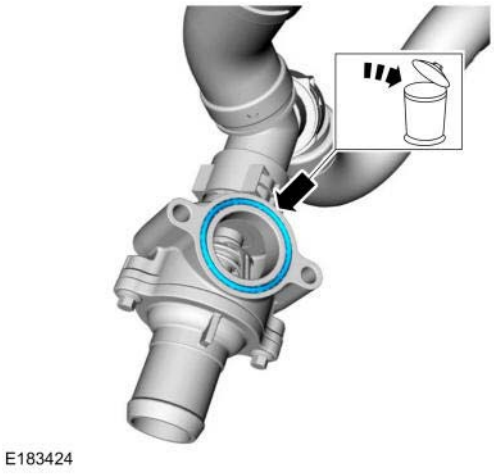
Disconnect the lower radiator hose from the thermostat housing assembly.

9.



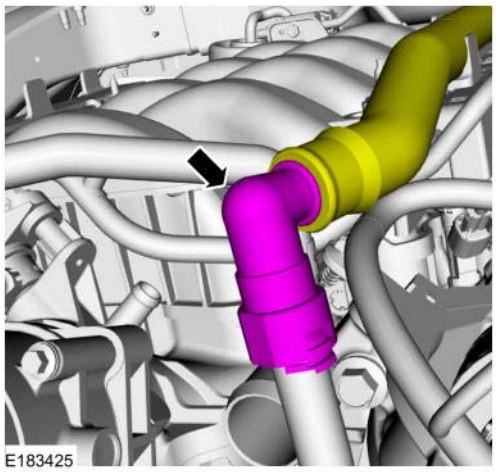
Remove the thermostat housing bolts.

10.



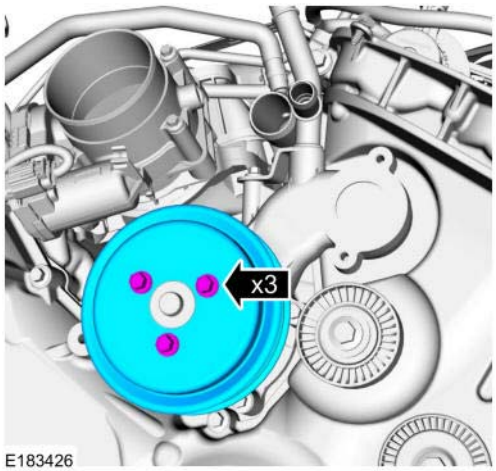
Release the clamp and remove the upper radiator hose T-connector/thermostat housing assembly.

Release the clamp and remove the degas bottle coolant hose.



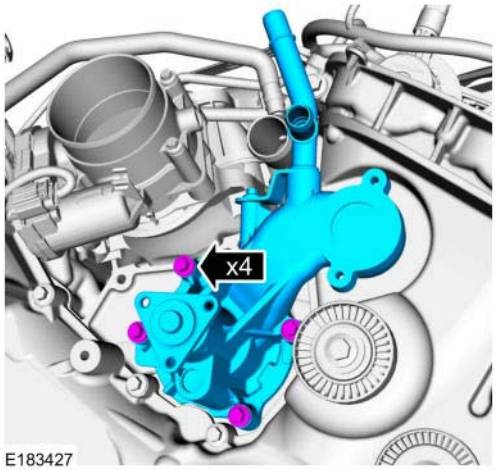
11.

Remove and discard the thermostat housing O-ring seal.



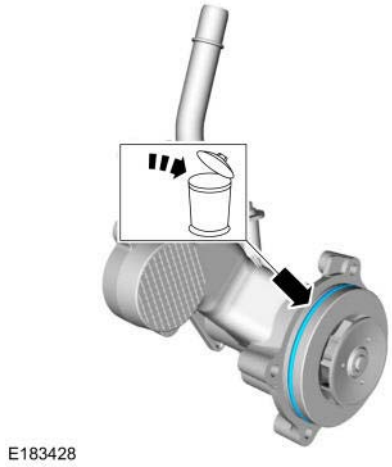
12.

Disconnect the heater hose.



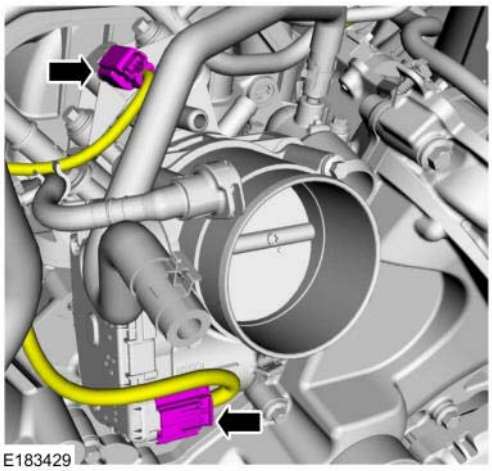
13.

Remove the bolts and the coolant pump pulley.



14.

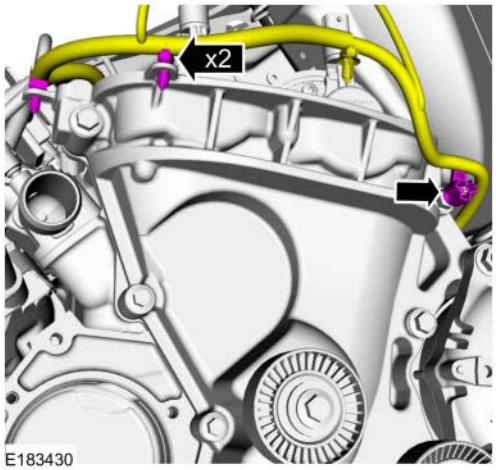
Remove the bolts and the coolant pump.



15.

Remove and discard the coolant pump O-ring seal.

E183428



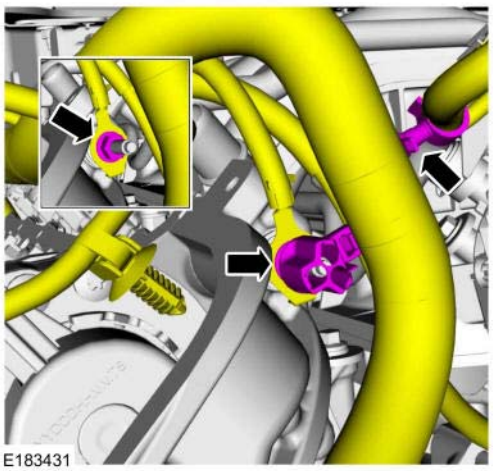
16.

Disconnect the throttle body and EVAP purge valve electrical connectors.

E183429

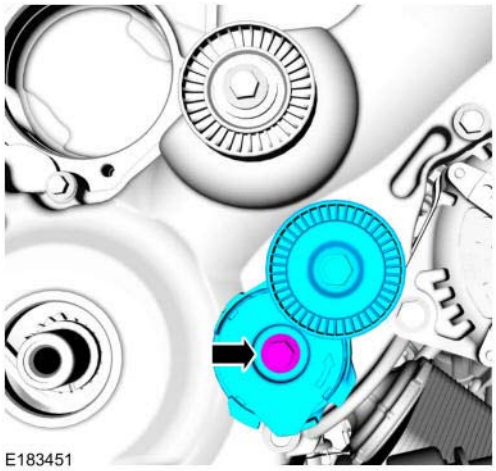
17.

Detach the wiring harness retainers from the engine front cover and stud bolt.



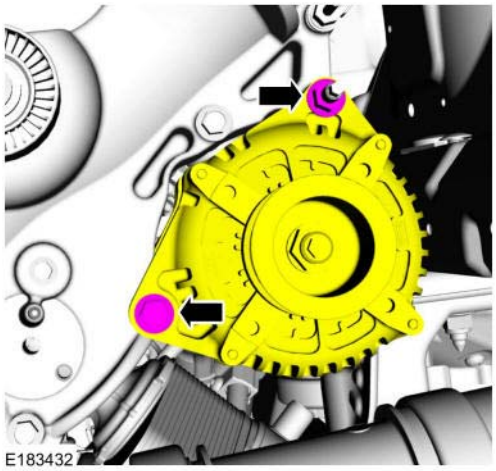
E183430

18.



Remove the wiring harness retainers.

Remove the nut and ground wire.



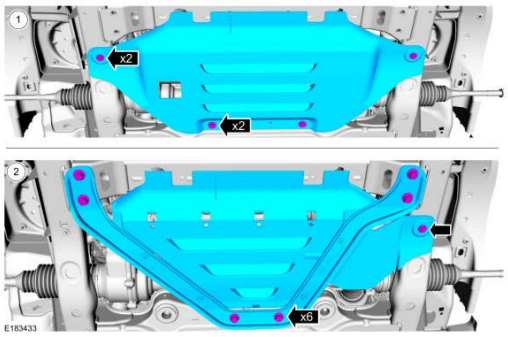
19.

Remove the bolt and the accessory drive belt tensioner.

20.

Remove the nut, the bolt and position the generator aside.

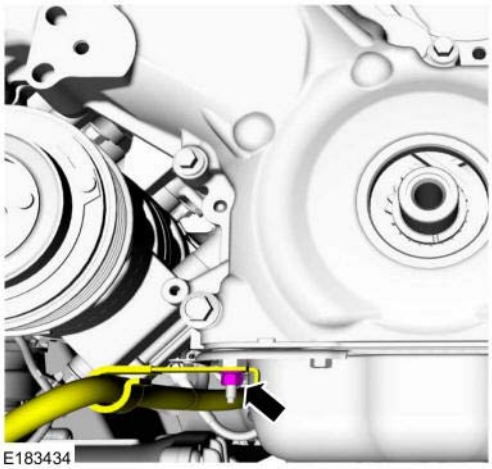
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



21.

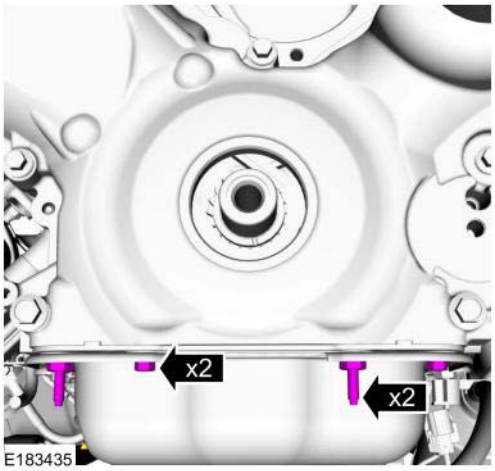
1.

Remove the bolts and the underbody shield.



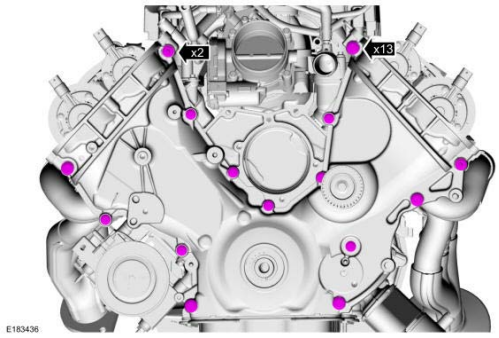
2.

Remove the bolts and the subframe bracket and underbody shield assembly.



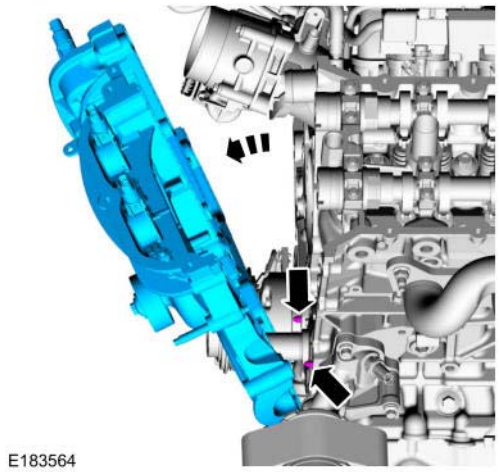
22.

Remove the nut and the wiring harness retainer.



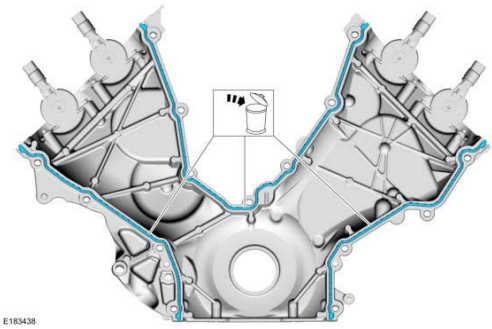
23.

Remove the bolts and stud bolts.



24.

Remove the bolts and stud bolts.



NOTE: Timing drive components removed from view for clarity.

25.
Remove the engine front cover from the front cover to cylinder block dowels.

26.

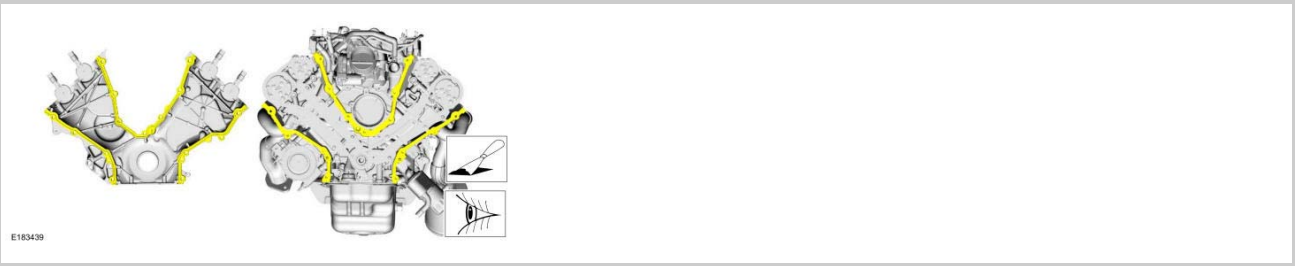
Remove and discard the gaskets.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

27.
Clean and inspect the mating surface. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material

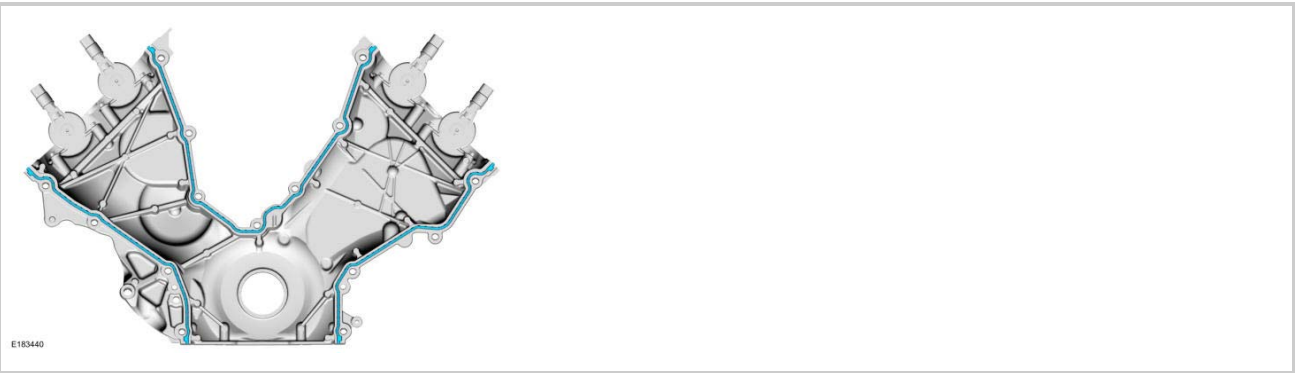


: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

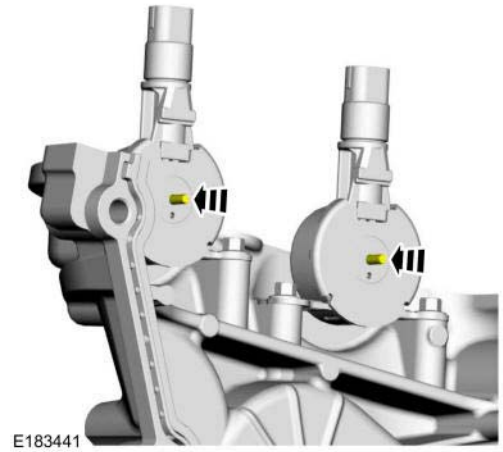
Material



: Motorcraft® Metal Surface Prep / ZC-31-B

REMOVAL AND INSTALLATION > ENGINE FRONT COVER > INSTALLATION

1.

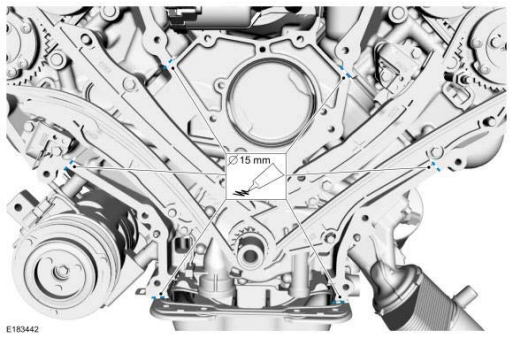


Install new gaskets on the engine front cover.

NOTE: RH shown in illustration, LH similar.

NOTE: The VCT variable force solenoid pins must be fully depressed to avoid interference with the VCT valve tips when installing the engine front cover. Failure to follow these instructions can result in damage to the engine.

2.
Fully depress the VCT variable force solenoid pins.

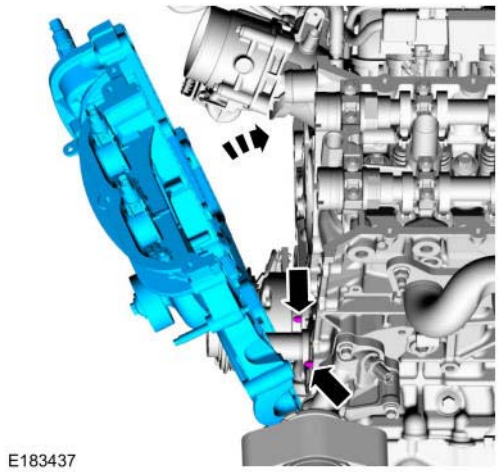


NOTE: The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

3.
Apply a 15 mm (0.59 in) diameter drop of silicone gasket and sealant to the cylinder head-to-cylinder block joints and the oil pan-to-cylinder block joints.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



NOTE: Make sure that the engine front cover gaskets are in place on the engine front cover before installation.

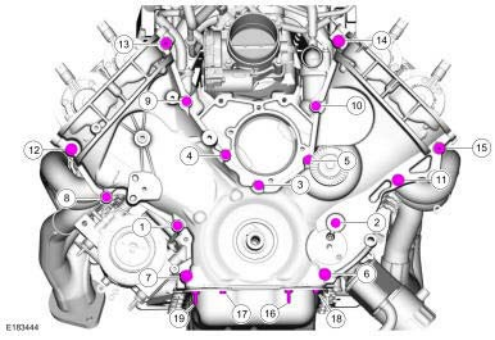
NOTE: Timing drive components removed from view for clarity.

4.

Position the engine front cover onto the dowels.

NOTE: The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

5.
Install the bolts and stud bolts.



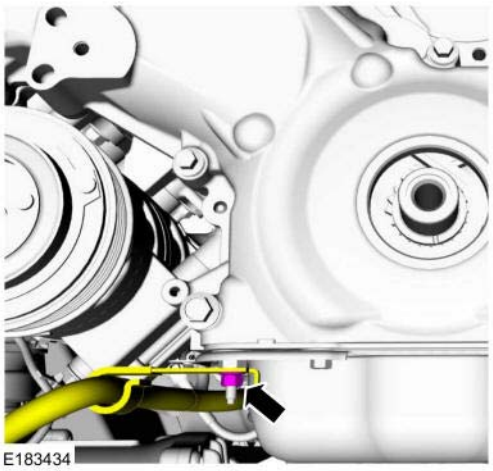
Torque:

Stage 1: Fasteners 1-15 : 18 lb.ft (25 Nm)

Stage 2: Fasteners 16-19 : 89 lb.in (10 Nm)

Stage 3: Fasteners 1-15 : 60°

Stage 4: Fasteners 16-19 : 45°

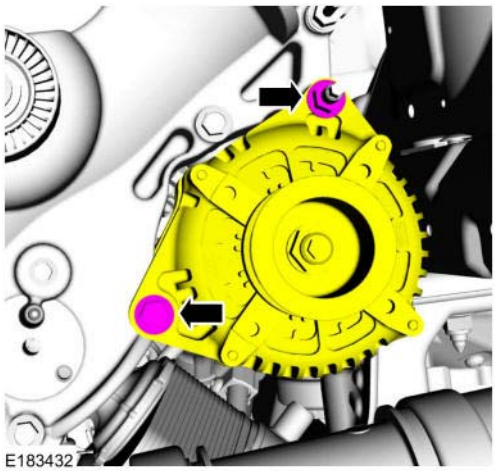


6.

Install the wiring harness retainer and the nut.

Torque

: 71 lb.in (8 Nm)

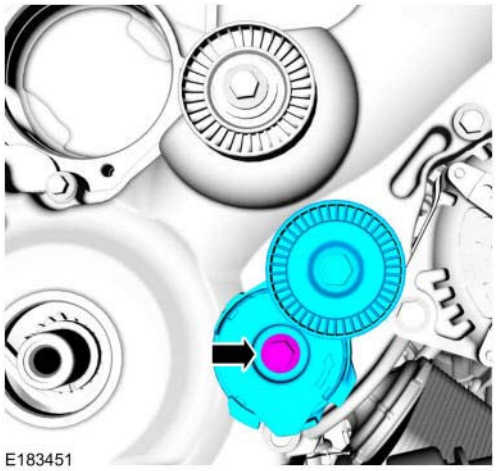


7.

Install the generator, the bolt and the nut.

Torque

: 35 lb.ft (48 Nm)

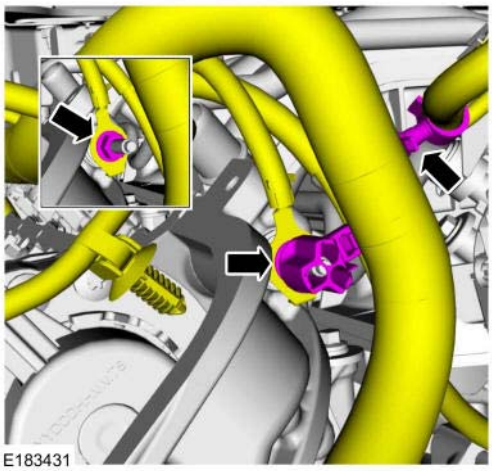


8.

Install the accessory drive belt tensioner and bolt.

Torque

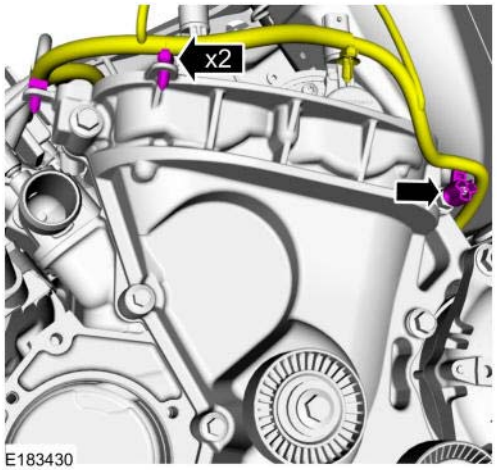
: 35 lb.ft (48 Nm)



9.

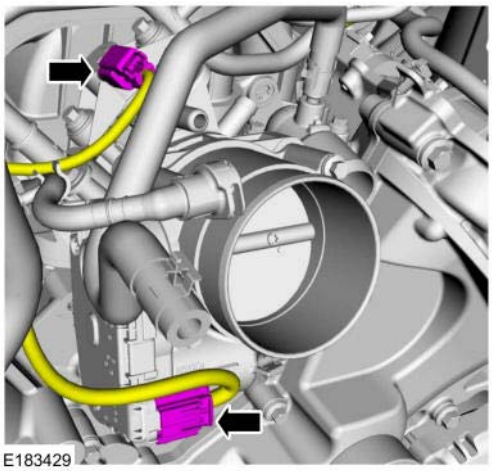
Install the ground wire and nut.

Torque



: 89 lb.in (10 Nm)

Install the wiring harness retainers.

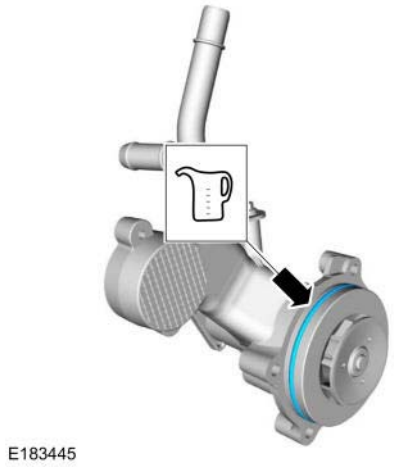


10.

Attach the wiring harness retainers to the engine front cover and stud bolt.

11.

Connect the throttle body and EVAP purge valve electrical connectors.

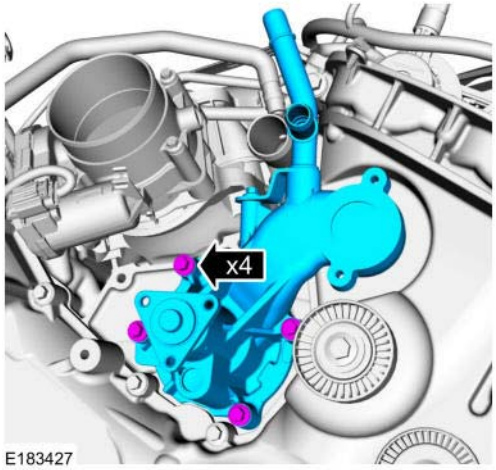


12.

Install a new coolant pump O-ring seal and lubricate with clean engine coolant.

Material

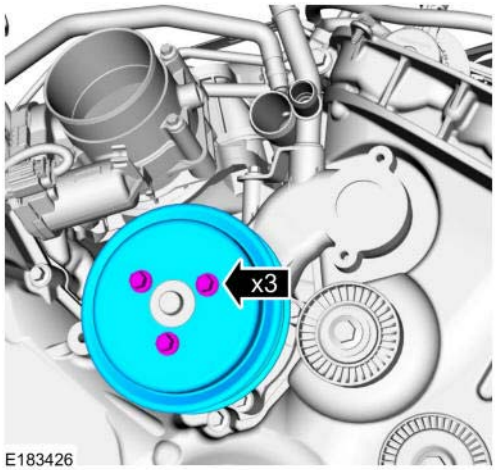
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)



13.

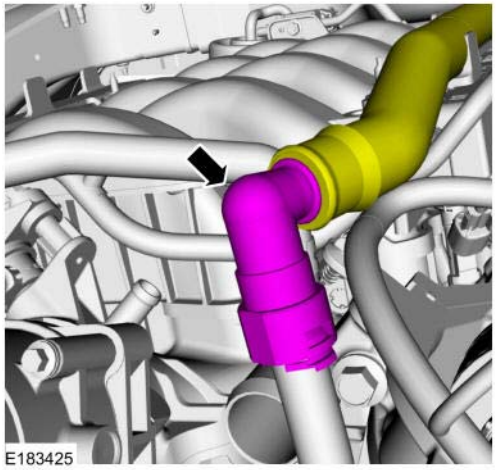
Install the coolant pump and bolts.

Torque:



Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°

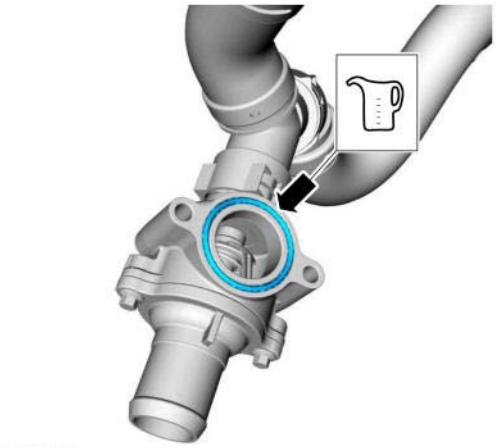


14.

Install the coolant pump pulley and the bolts.

15.

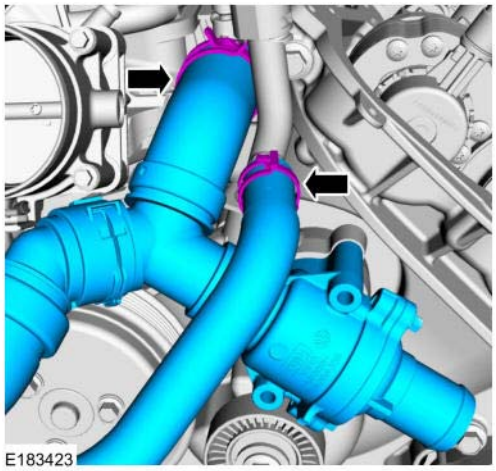
Connect the heater hose.



16.

Install a new thermostat housing O-ring seal and lubricate with clean engine coolant.

Material



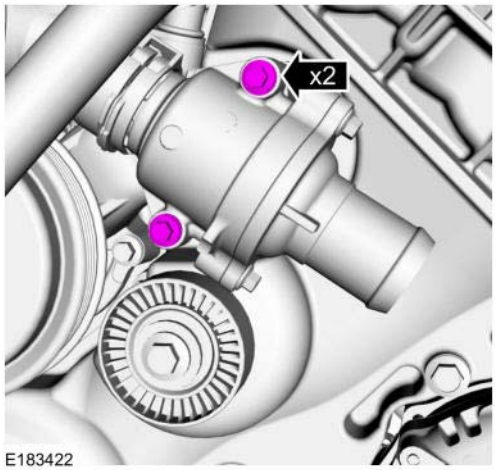
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

E183446

17.

Install the upper radiator hose T-connector/thermostat housing assembly and clamp.

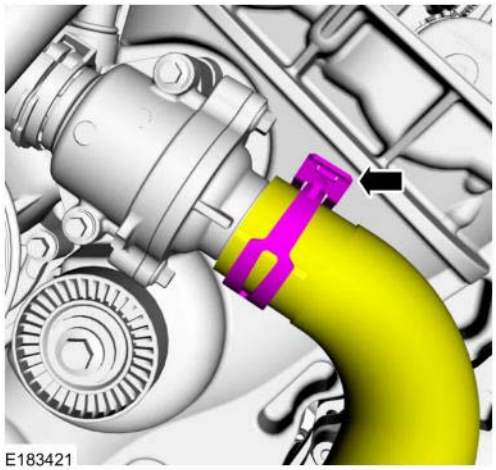
Install the degas bottle coolant hose and clamp.



E183423

18.

Install the thermostat housing bolts.



Torque

: 89 lb.in (10 Nm)

19.

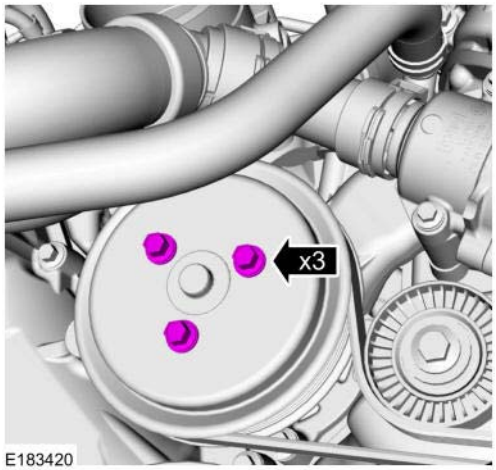
Connect the lower radiator hose to the thermostat housing assembly.

20.

Install the following items:

Refer to: Valve Cover LH .

Refer to: Valve Cover RH .



Refer to: Crankshaft Front Seal .

21.

Tighten.

Torque

: 18 lb.ft (25 Nm)

22.

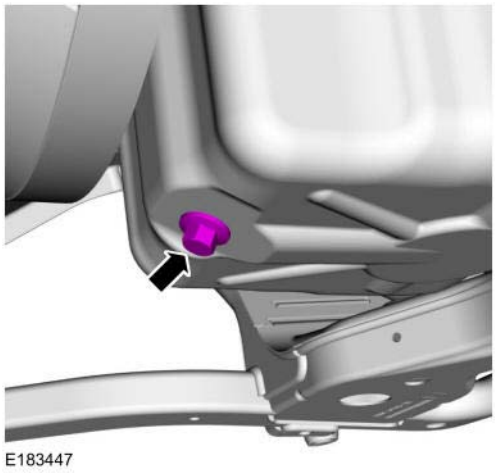
Install the following items:

Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

Refer to: AIR CLEANER OUTLET PIPE .

Refer to: DEGAS BOTTLE).

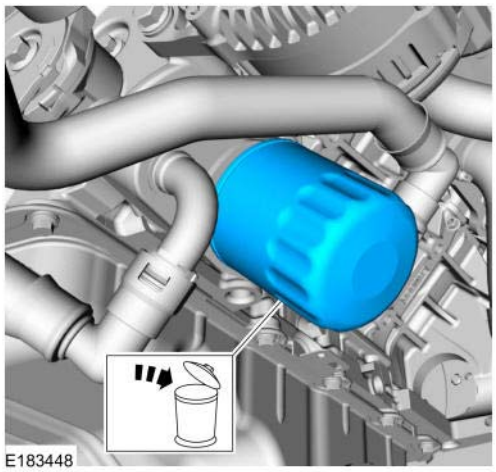
23.



Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.

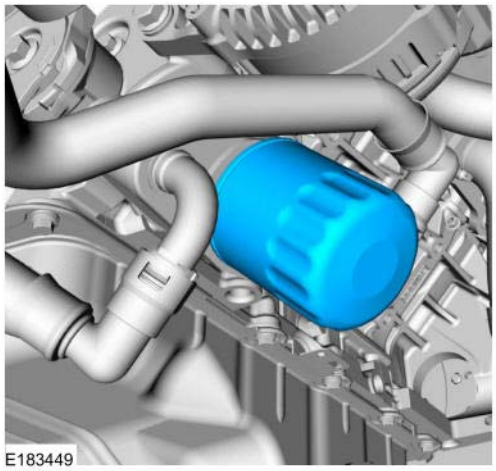


Torque

: 19 lb.ft (26 Nm)

24.

Remove and discard the engine oil filter.



NOTE: Do not lubricate the O-ring seal.

25.
Install a new oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

26.

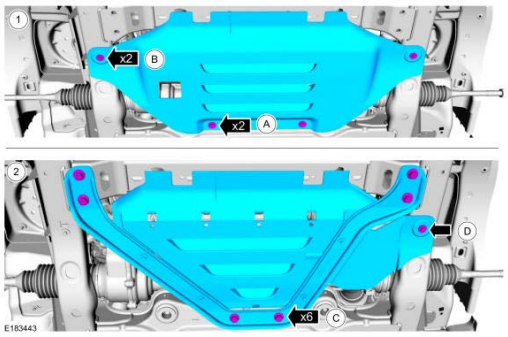
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



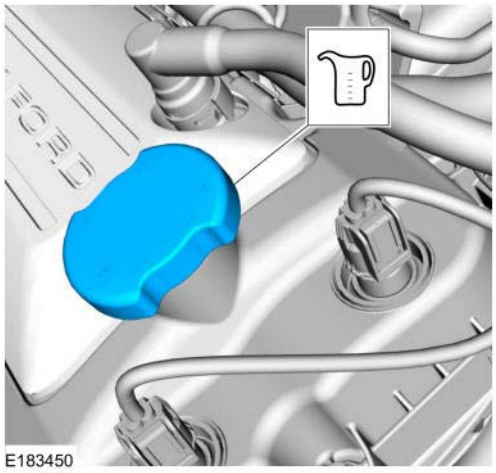
2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque

C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)



27.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

28.

Connect the battery positive and ground cables. Refer to: Battery Disconnect and Connect .

29.

Fill and bleed the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

30.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > ENGINE MOUNT LH

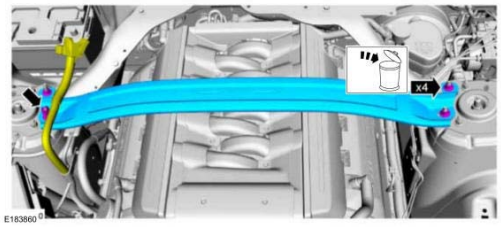
Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine

REMOVAL AND INSTALLATION > ENGINE MOUNT LH > REMOVAL

1.

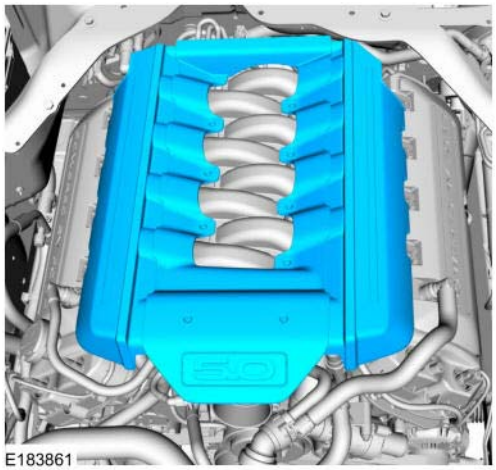
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



2.

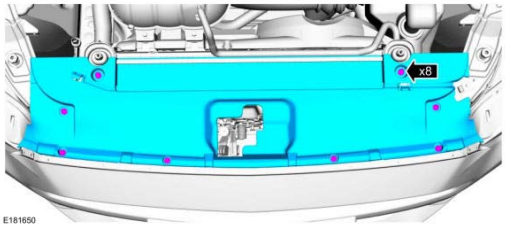
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

3.



If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



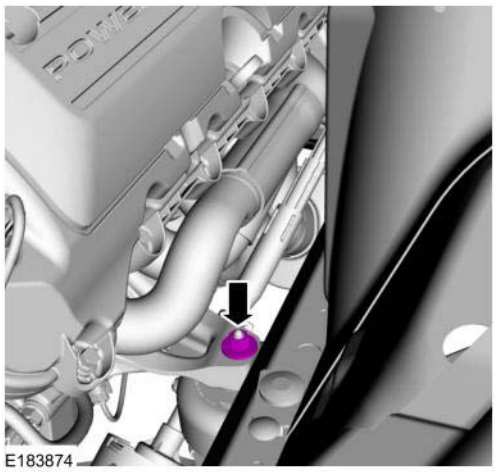
NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

4.
Remove the engine appearance cover.

5.

Remove the retainers and the radiator top shield.

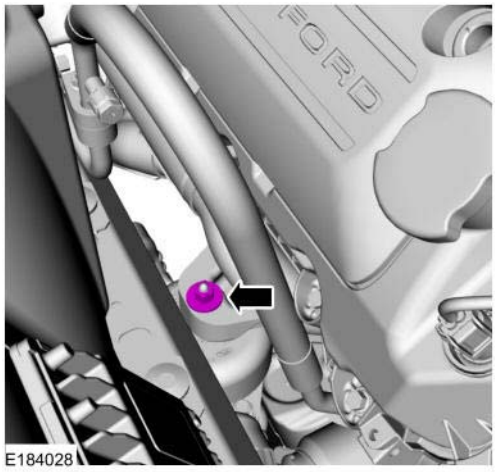
6.



Remove the following items:

Refer to: AIR CLEANER OUTLET PIPE .

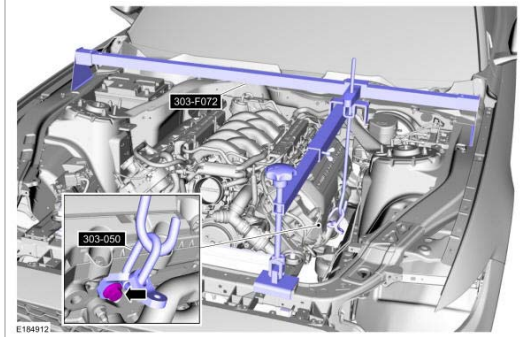
Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



7.

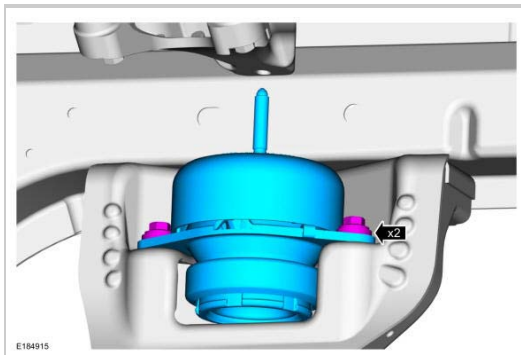
Remove the LH engine mount nut.

8.



Remove the RH engine mount nut.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

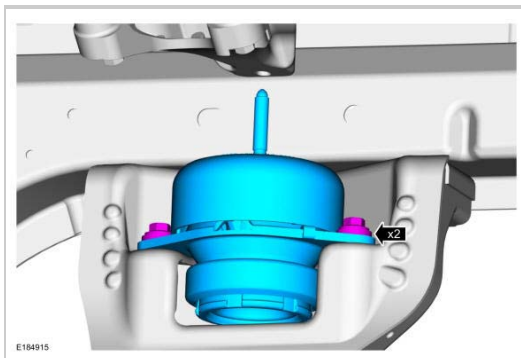


9.
Install the special tools and raise the engine 50 mm (2 inch).

Use Special Service Tool: 303-F072Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

10.

Remove the bolts and the engine mount.



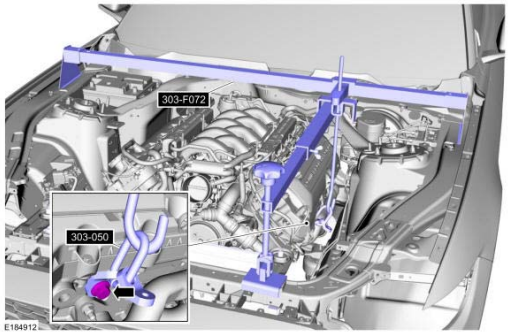
REMOVAL AND INSTALLATION > ENGINE MOUNT LH > INSTALLATION

1.

Install the engine mount and the bolts.

Torque

: 52 lb.ft (70 Nm)

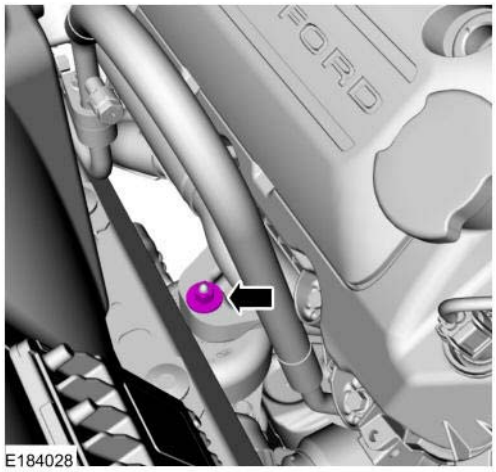


2.

Lower the engine onto the engine mounts and remove the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket,

Engine.

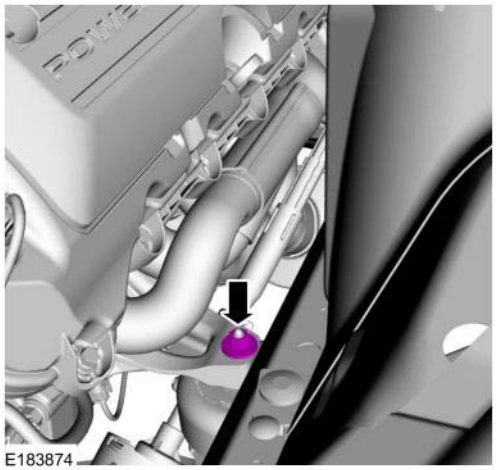


3.

Install the RH engine mount nut.

Torque

: 46 lb.ft (63 Nm)



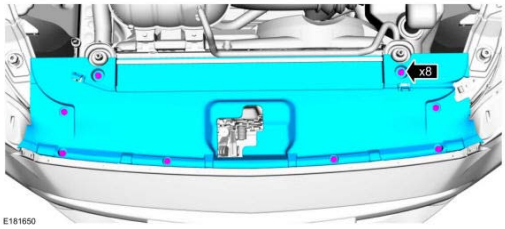
4.

Install the LH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

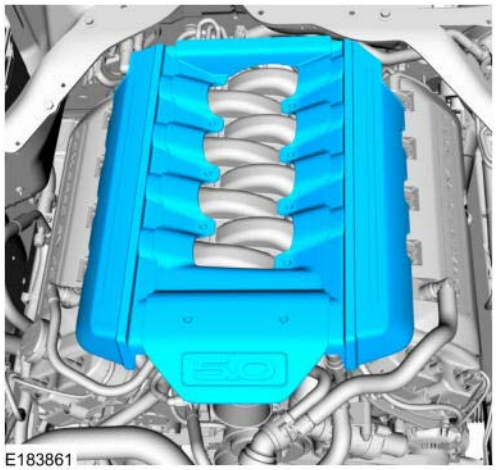
5.



Install the following items:

Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

Refer to: AIR CLEANER OUTLET PIPE .

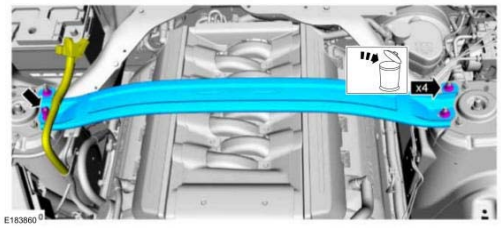


6.

Install the radiator top shield and the retainers.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

7.
Install the engine appearance cover.



8.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

9.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > ENGINE MOUNT RH

Special Tool(s) / General Equipment

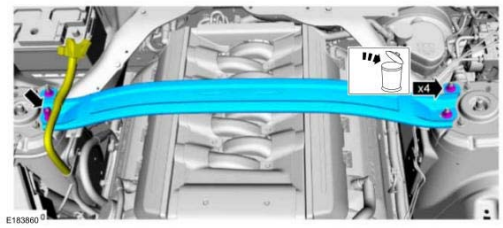
	303-050 (T70P-6000) Lifting Bracket, Engine

	303-F072 Support Bar, Engine

REMOVAL AND INSTALLATION > ENGINE MOUNT RH > REMOVAL

1.

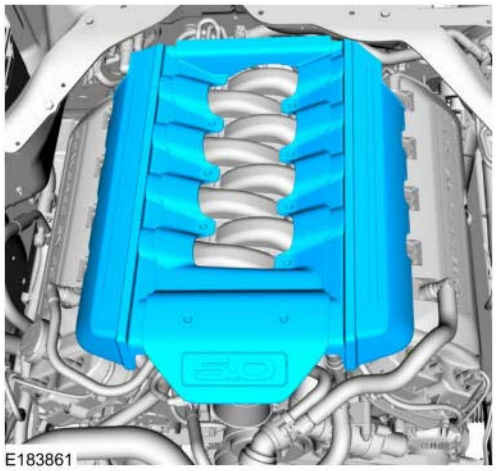
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



2.

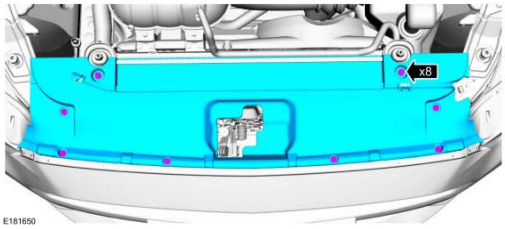
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

3.



If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

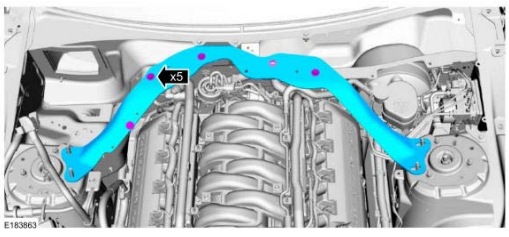
4.
Remove the engine appearance cover.

5.

Remove the retainers and the radiator top shield.

6.

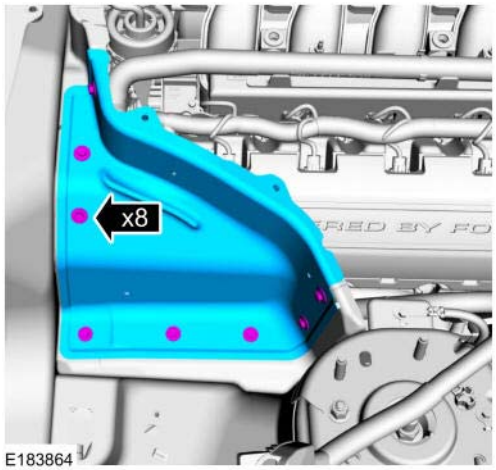
Remove the following items:



AIR CLEANER OUTLET PIPE .

Refer to: Cowl Panel Grille .

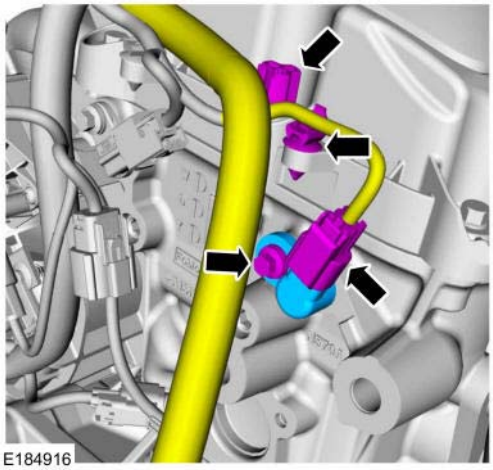
Refer to: Battery Tray .



7.

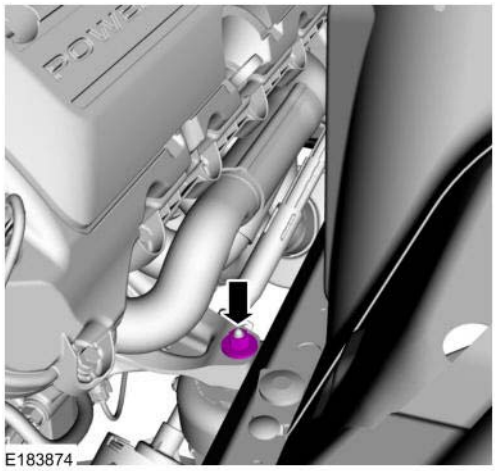
Remove the fasteners and the cowl extension.

8.



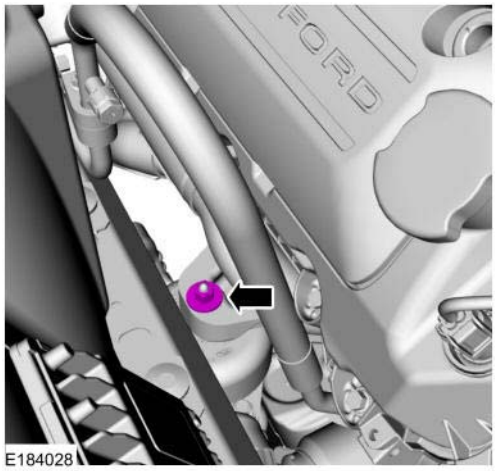
Remove the fasteners and the battery heat shield.

9.



Disconnect the CMP sensor electrical connector, the wiring harness retainers and position the harness aside.

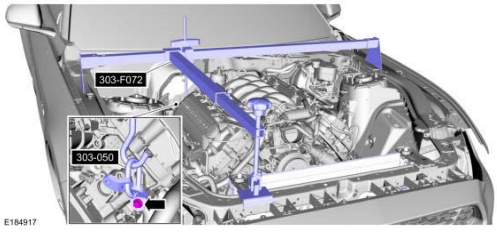
Remove the bolt and the CMP sensor.



10.

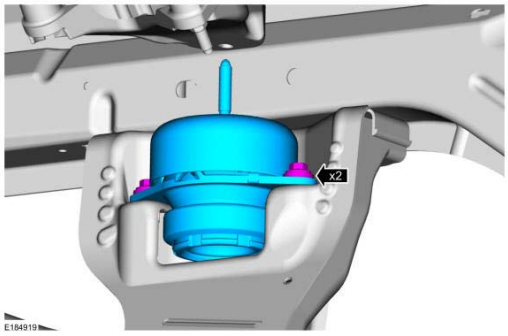
Remove the LH engine mount nut.

11.



Remove the RH engine mount nut.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

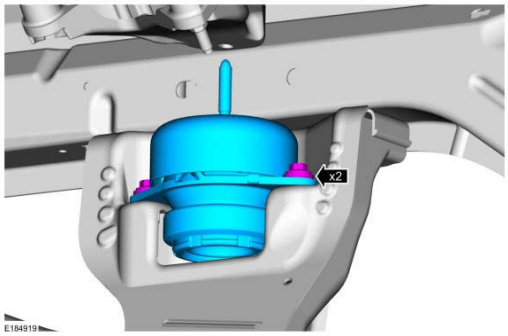


12.
Install the special tools and raise the engine 50 mm (2 inch).

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

13.

Remove the bolts and the engine mount.

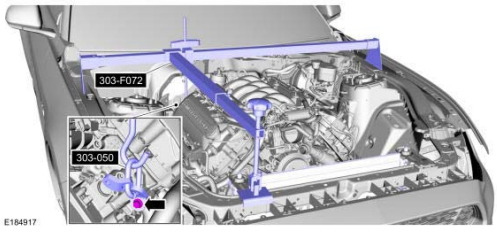


REMOVAL AND INSTALLATION > ENGINE MOUNT RH > INSTALLATION

1.

Install the engine mount and bolts.

Torque

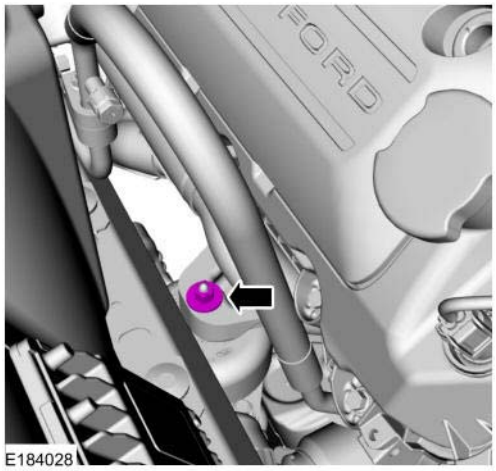


: 52 lb.ft (70 Nm)

2.

Lower the engine onto the engine mounts and remove the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

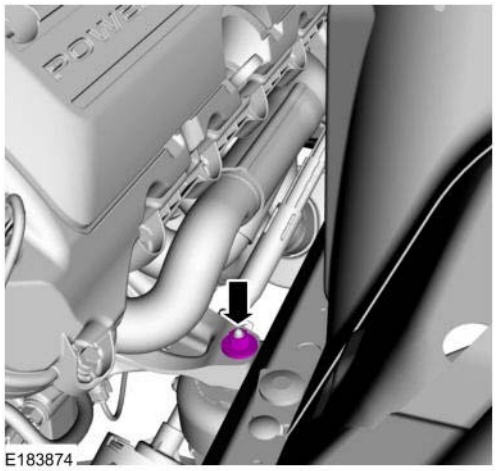


3.

Install the RH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

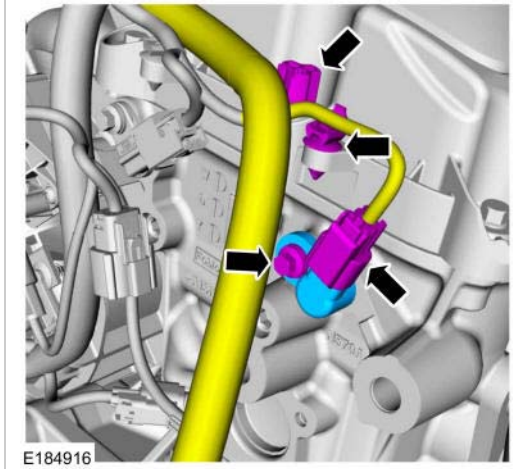


4.

Install the LH engine mount nut.

Torque

: 46 lb.ft (63 Nm)



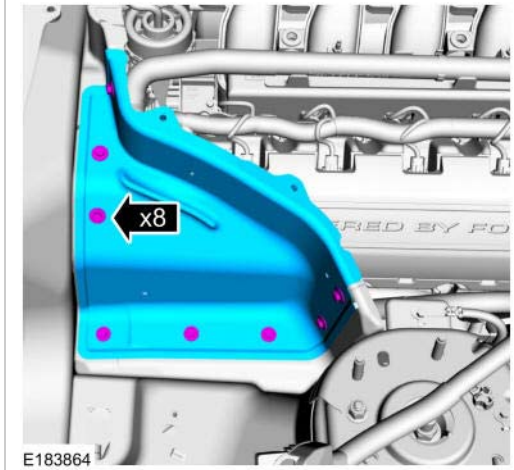
5.

Install the CMP sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

Connect the CMP sensor electrical connector and the wiring harness retainers.

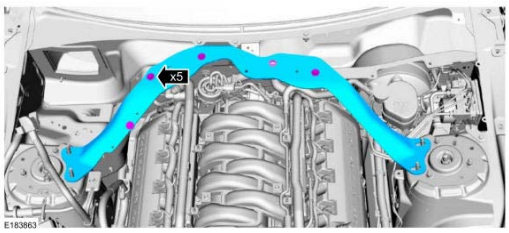


6.

Install the battery heat shield and fasteners.

Torque

: 80 lb.in (9 Nm)



7.

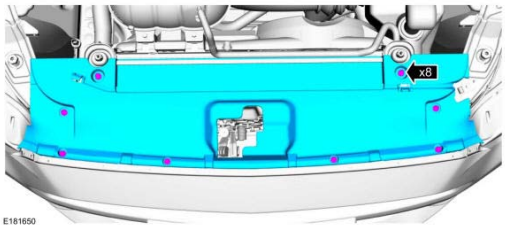
Install the cowl extension and fasteners.

Torque

: 26 lb.ft (35 Nm)

8.

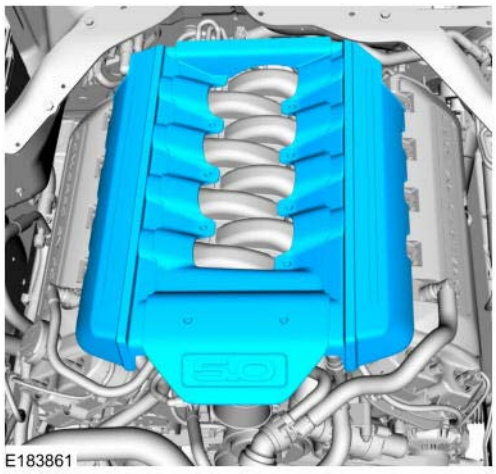
Install the following items:



Refer to: Battery Tray .

Refer to: Cowl Panel Grille .

Refer to: AIR CLEANER OUTLET PIPE .

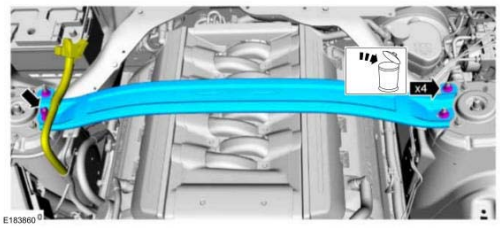


9.

Install the radiator top shield and the retainers.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

10.
Install the engine appearance cover.



11.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

12.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD RH

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD RH > REMOVAL

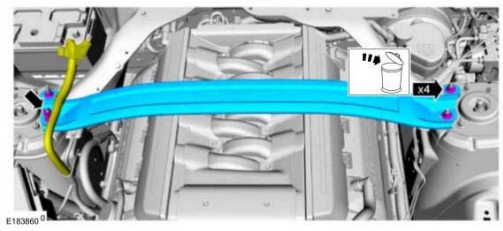
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

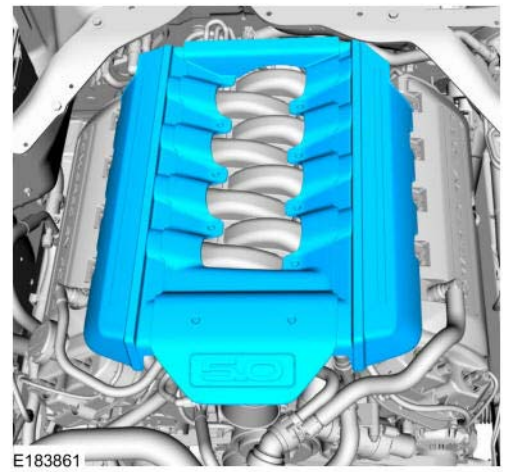
Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .



3.

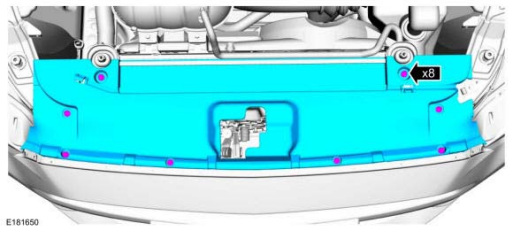
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

4.



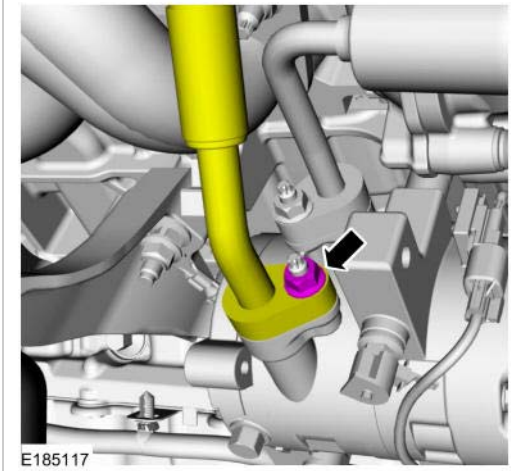
If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

5.
Remove the engine appearance cover.



6.

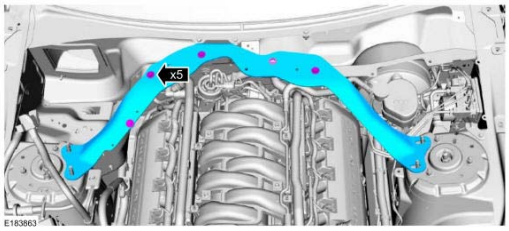
Remove the retainers and the radiator top shield.

NOTE: Discard the O-ring seal and gasket.

7.
Remove the nut and disconnect the A/C compressor fitting.

8.

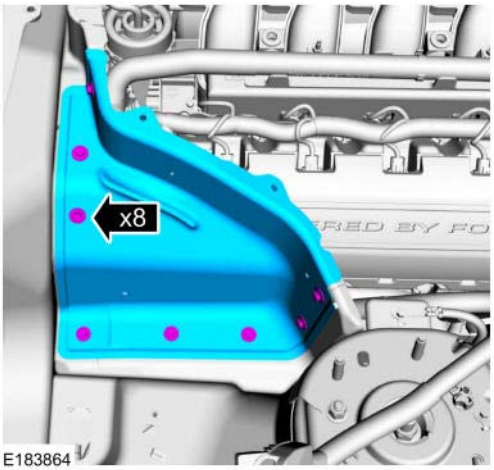
Remove the following items:



Refer to: AIR CLEANER OUTLET PIPE .

Refer to: Cowl Panel Grille .

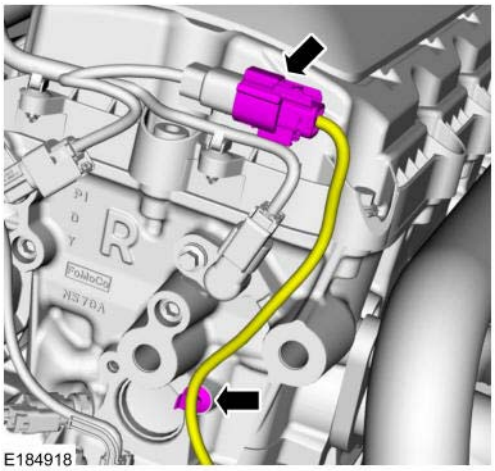
Refer to: Battery Tray .



9.

Remove the fasteners and the cowl extension.

10.

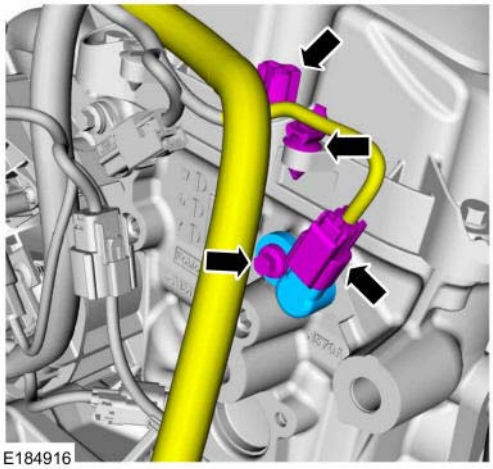


Remove the fasteners and the battery heat shield.

6-Speed Manual Transmission - MT82

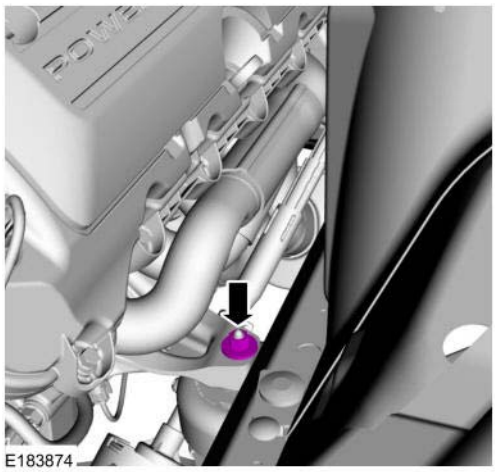
11.

Disconnect the HO2S electrical connector and wiring harness retainer.



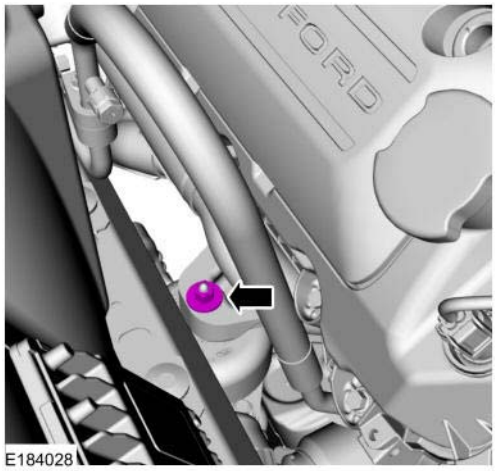
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

12.



Disconnect the CMP sensor electrical connector, the wiring harness retainers and position the harness aside.

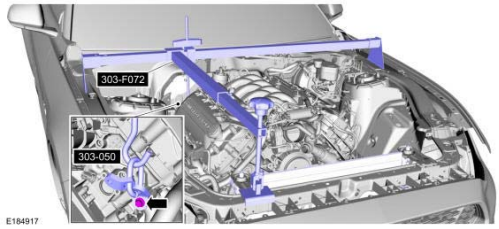
Remove the bolt and the CMP sensor.



13.

Remove the LH engine mount nut.

14.



Remove the RH engine mount nut.

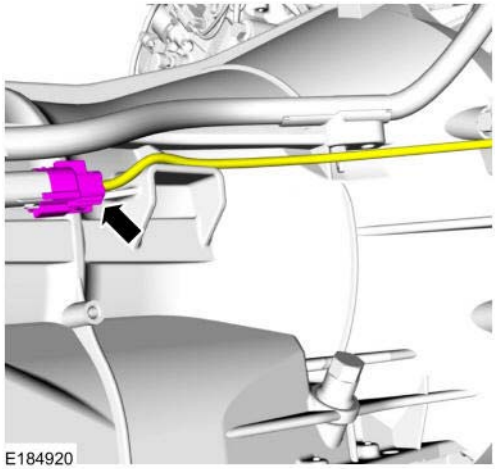
NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

15.
Install the special tools and raise the engine 50 mm (2 inch).

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

16.

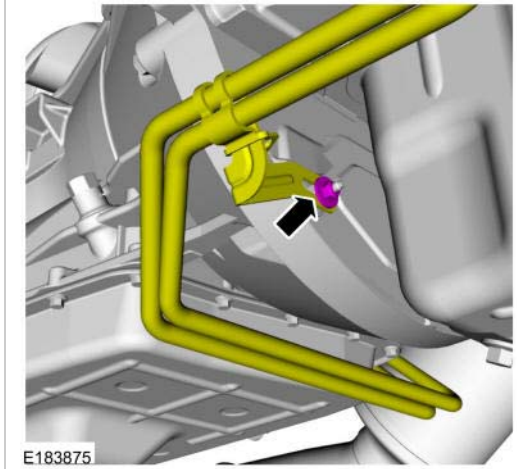
Remove the following items:



Refer to: CATALYTIC CONVERTER RH .

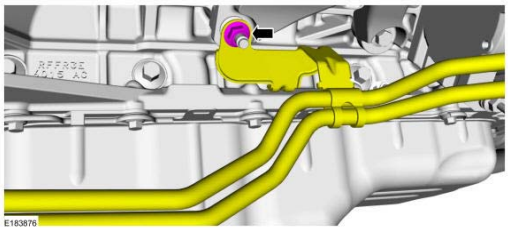
Refer to: STARTER MOTOR .

6-Speed Automatic Transmission - 6R80



17.

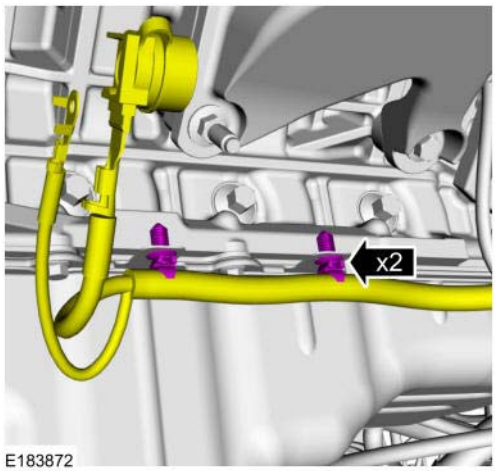
Disconnect the HO2S electrical connector.



18.

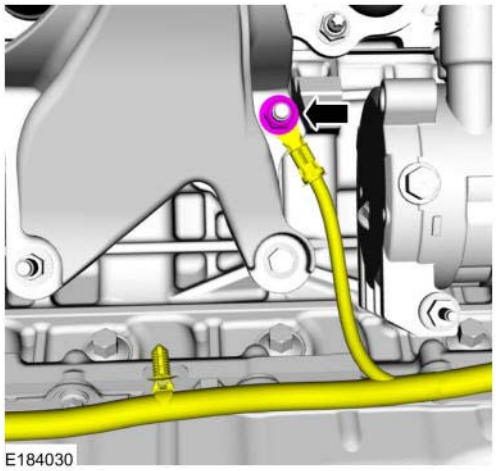
Remove the transmission cooling tube nut and bracket from the flexplate inspection cover stud bolt.

19.



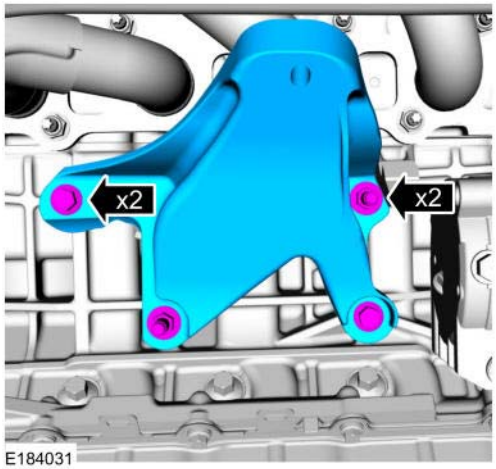
Remove the transmission cooling tube bracket nut and position the bracket and tubes aside.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



20.

Detach the wiring harness retainers from the oil pan.

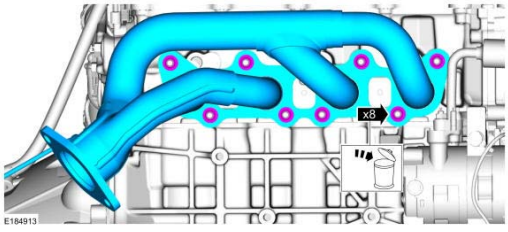


21.

Remove the nut and ground strap from the RH engine mount bracket stud bolt.

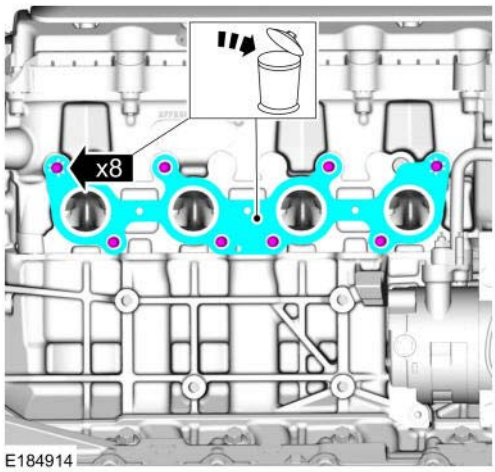
22.

Remove the bolts, the stud bolts and the RH engine mount bracket.



23.

Remove and discard the nuts.



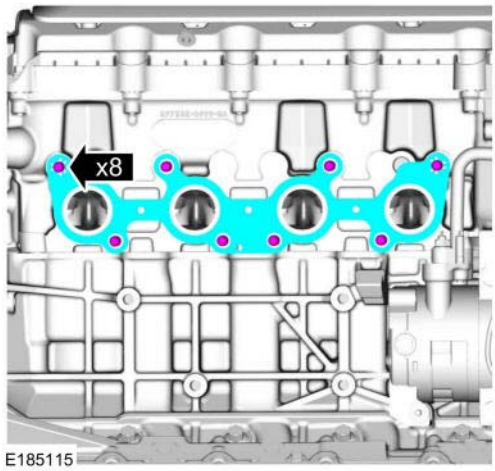
Remove the exhaust manifold.

Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .

24.

Remove and discard the gasket and studs.

REMOVAL AND INSTALLATION > EXHAUST MANIFOLD RH > INSTALLATION



6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

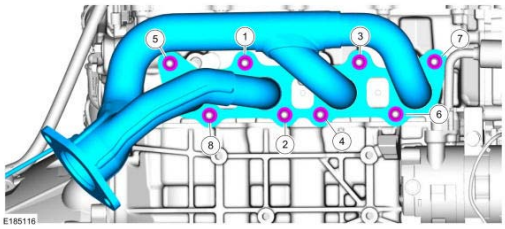
1.

Install new studs and new gasket.

Torque

: 18 lb.ft (25 Nm)

2.



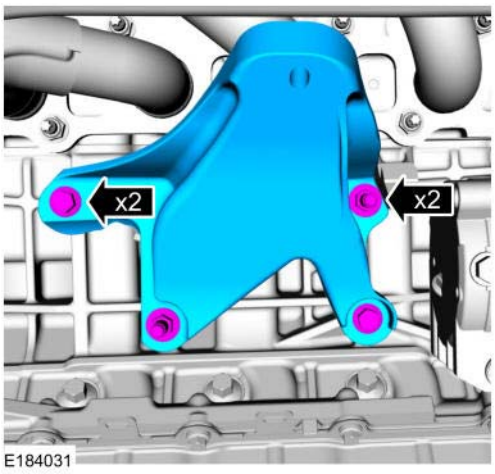
Install the exhaust manifold.

Install the new nuts.

Torque:

Stage 1: 18 lb.ft (24 Nm)

Stage 2: 24 lb.ft (32 Nm)

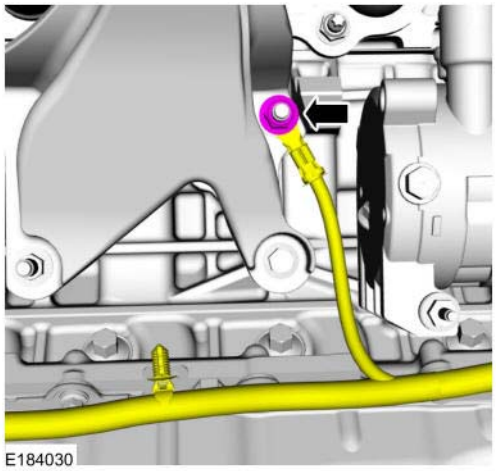


3.

Install the RH engine mount bracket, bolts and stud bolts.

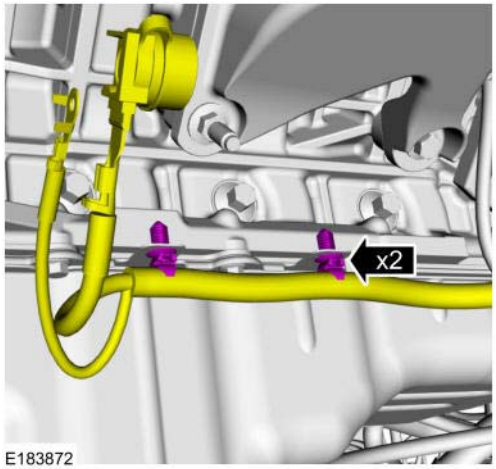
Torque

: 41 lb.ft (55 Nm)



4.

Install the ground strap and nut onto the RH engine mount bracket stud bolt.

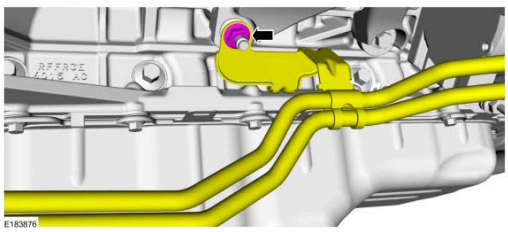


Torque

: 35 lb.ft (48 Nm)

5.

Attach the wiring harness retainers to the oil pan.



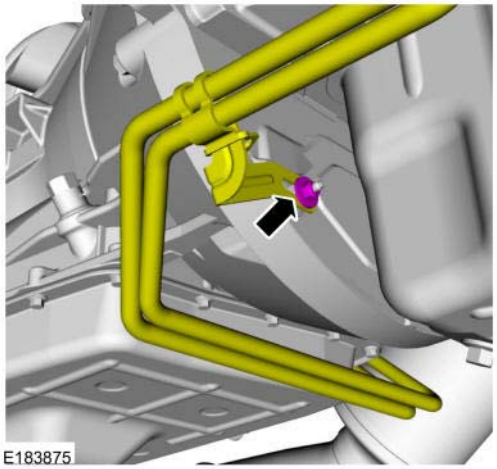
6-Speed Automatic Transmission - 6R80

6.

Install the transmission cooling tube bracket and nut.

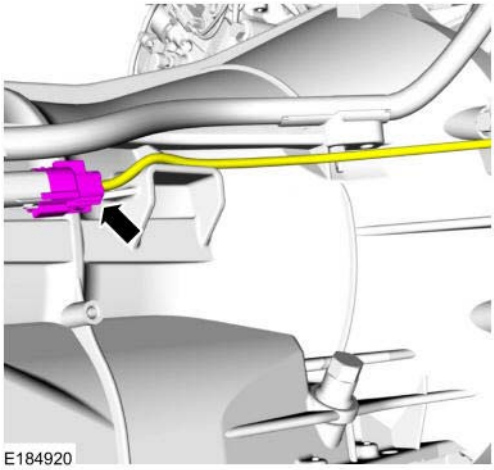
Torque

: 35 lb.ft (48 Nm)



7.

Install the transmission cooling tube bracket and nut.



Torque

: 124 lb.in (14 Nm)

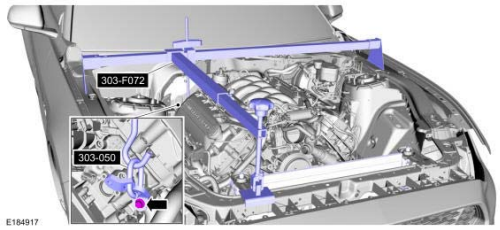
8.

Connect the HO2S electrical connector.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

9.

Install the following items:



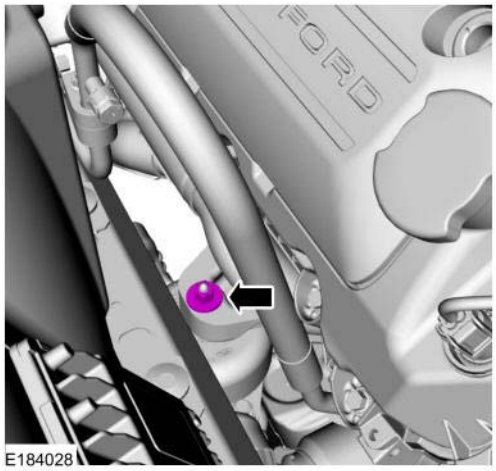
Refer to: STARTER MOTOR .

Refer to: CATALYTIC CONVERTER RH .

10.

Lower the engine onto the engine mounts and remove the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

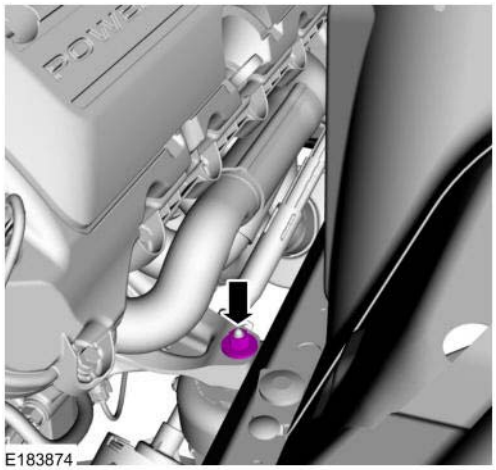


11.

Install the RH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

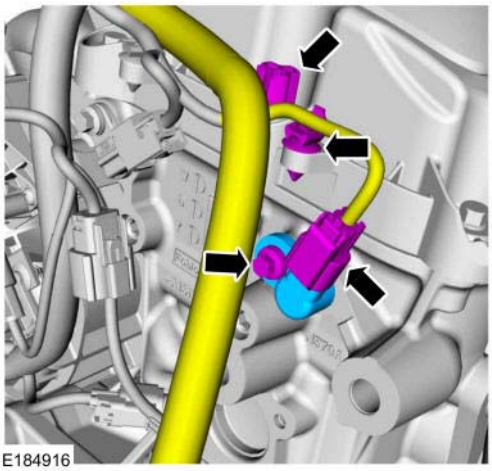


12.

Install the LH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

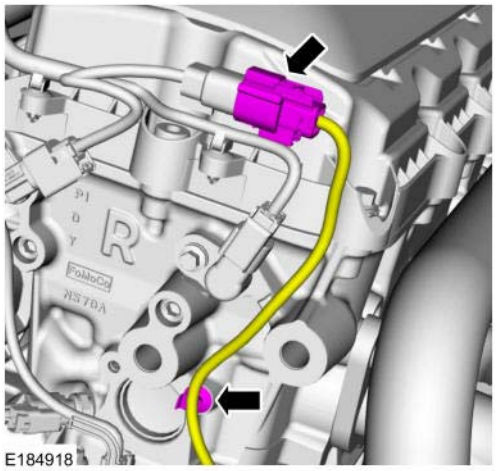


13.

Install the CMP sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

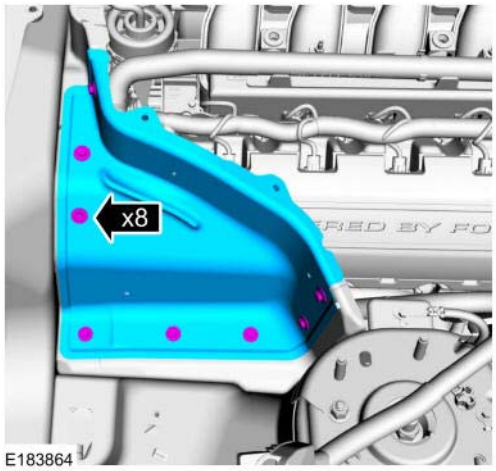


Connect the CMP sensor electrical connector and the wiring harness retainers.

6-Speed Manual Transmission - MT82

14.

Connect the HO2S electrical connector and wiring harness retainer.



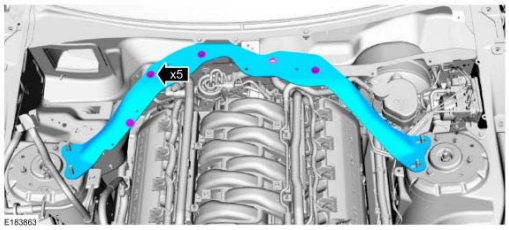
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

15.

Install the battery heat shield and fasteners.

Torque

: 80 lb.in (9 Nm)



16.

Install the cowl extension and fasteners.

Torque

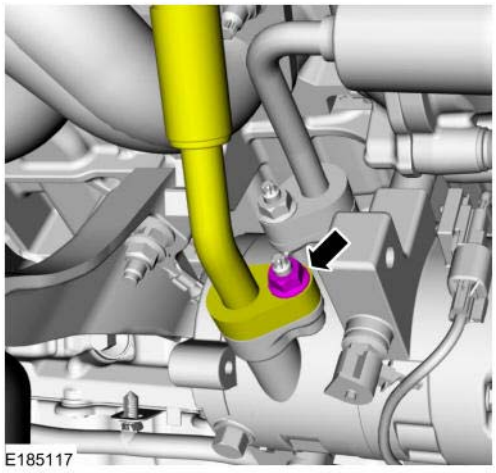
: 26 lb.ft (35 Nm)

17.

Install the following items:

Refer to: Battery Tray .

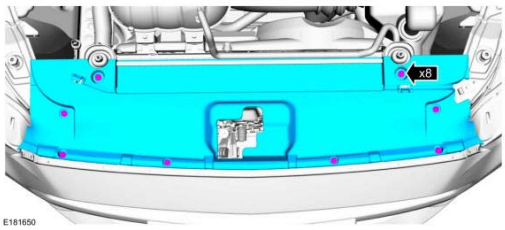
Refer to: Cowl Panel Grille .



Refer to: AIR CLEANER OUTLET PIPE .

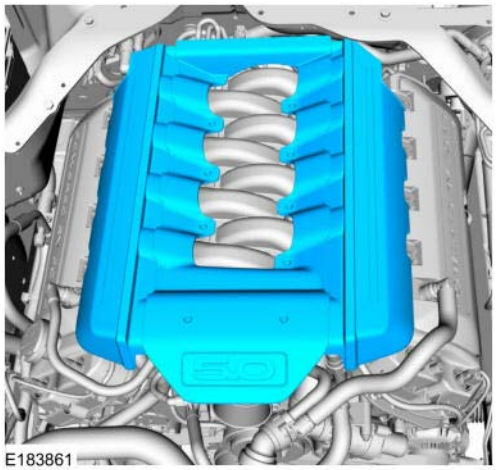
NOTE: Install a new O-ring seal and gasket.

18.
Connect the A/C compressor fitting and install the nut.



Torque

: 133 lb.in (15 Nm)

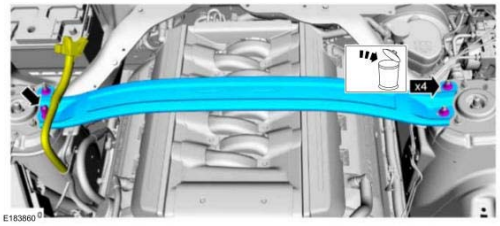


19.

Install the radiator top shield and the retainers.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

20.
Install the engine appearance cover.



21.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

22.

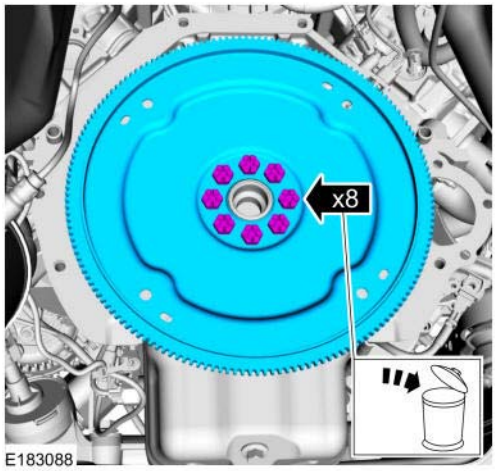
Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

23.

Recharge the A/C system. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

REMOVAL AND INSTALLATION > FLEXPLATE > REMOVAL

1.



Remove the transmission. Refer to: Transmission - 5.0L 32V Ti-VCT .

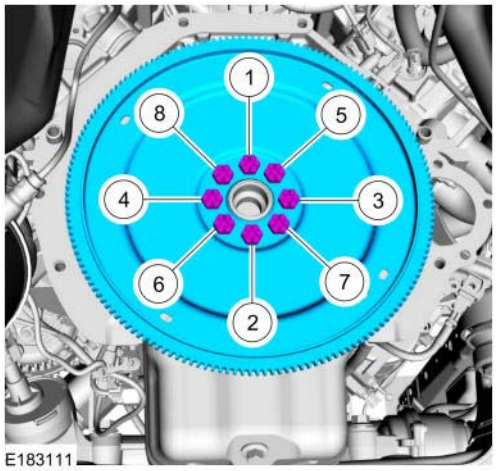
NOTE: The flexplate bolts are torque-to-yield design and are not reusable.

2.

Remove and discard the bolts. Remove and discard the bolts.

Remove the flexplate.

REMOVAL AND INSTALLATION > FLEXPLATE > INSTALLATION



1.

Install the flexplate and the bolts.

Torque:

Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°

2.

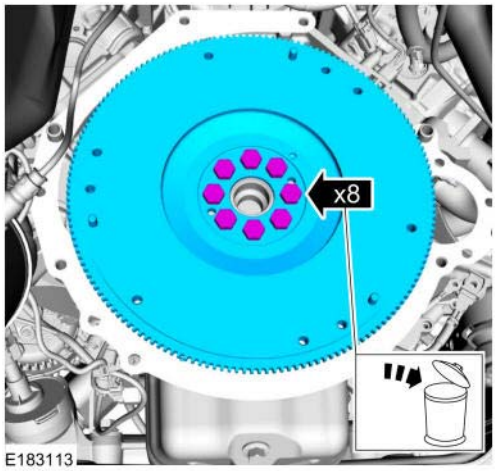
Install the transmission. Refer to: Transmission - 5.0L 32V Ti-VCT .

3.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > FLYWHEEL > REMOVAL

1.



Remove the clutch disc. Refer to: Clutch Disc and Pressure Plate - 5.0L 32V Ti-VCT .

NOTE: The flywheel bolts are torque-to-yield design and are not reusable.

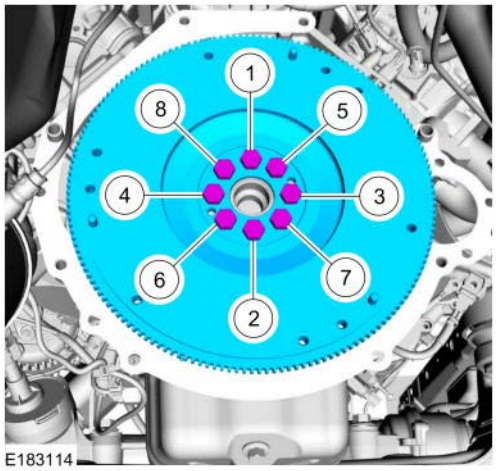
2.

Remove and discard the bolts.

Remove the flywheel.

REMOVAL AND INSTALLATION > FLYWHEEL > INSTALLATION

1.



Install the flywheel and the bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 177 lb.in (20 Nm)

Stage 3: 60°

2.

Install the clutch disc. Refer to: Clutch Disc and Pressure Plate - 5.0L 32V Ti-VCT .

3.

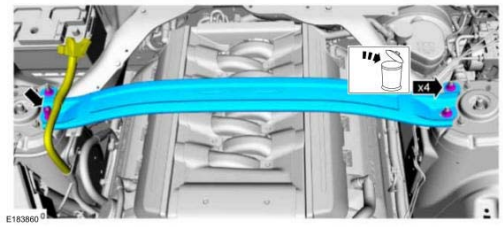
After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

REMOVAL AND INSTALLATION > INTAKE MANIFOLD > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

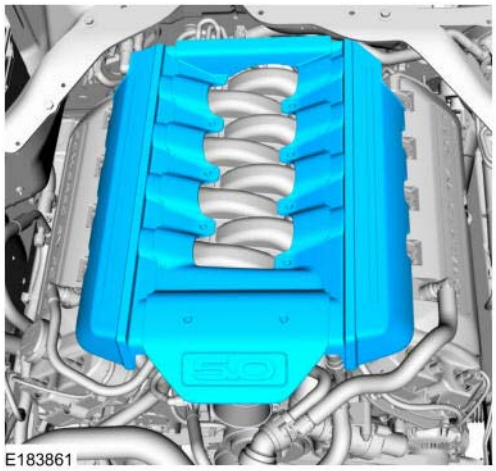
Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



2.

Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

3.



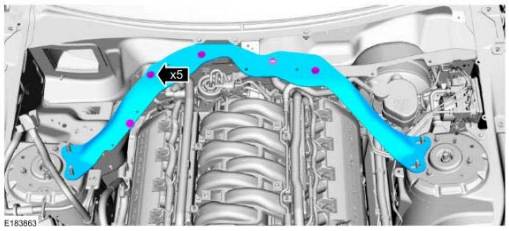
If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

4.
Remove the engine appearance cover.

5.



Remove the following items:

Refer to: AIR CLEANER OUTLET PIPE .

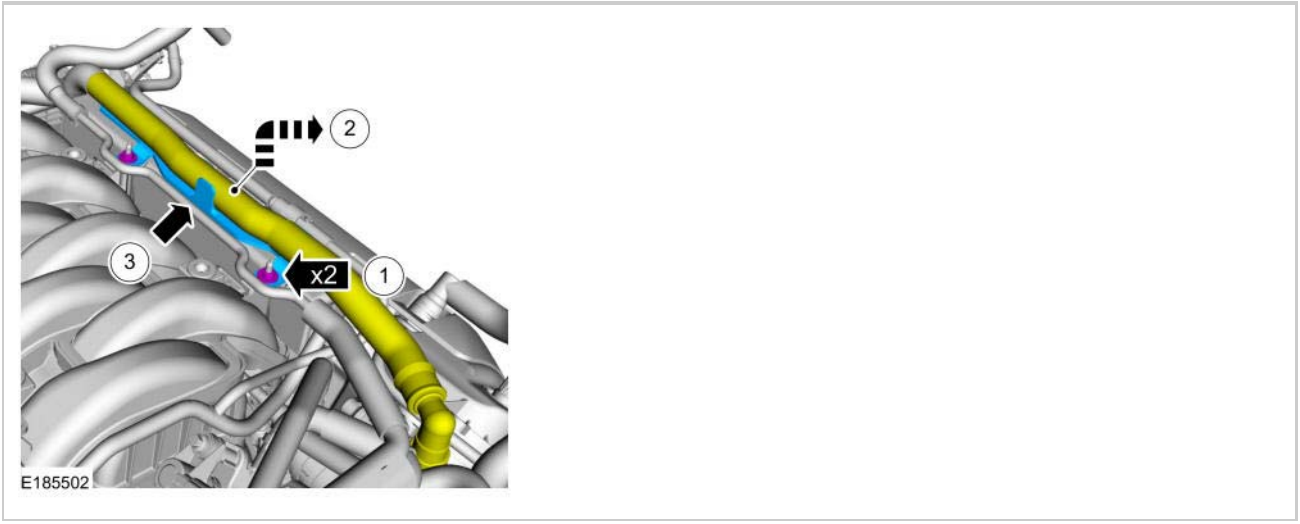
Refer to: Cowl Panel Grille .

6.

Remove the fasteners and the cowl extension.

7.

1.



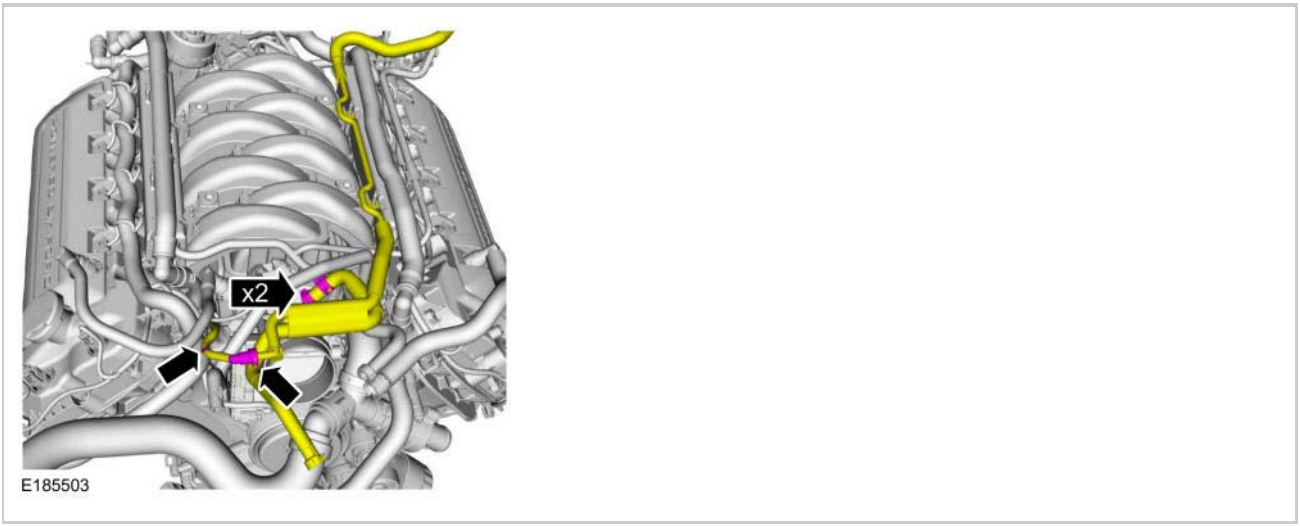
Remove the nuts.

2.

Position the heater hose aside.

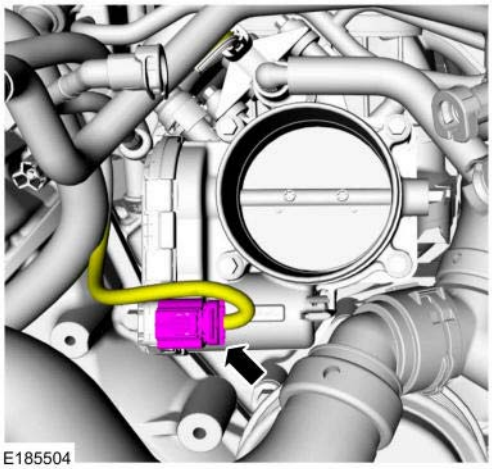
3.

Remove the heater hose support.



8.

Detach the vacuum tube retainer.



Disconnect the vacuum tube. Refer to: QUICK RELEASE COUPLING .

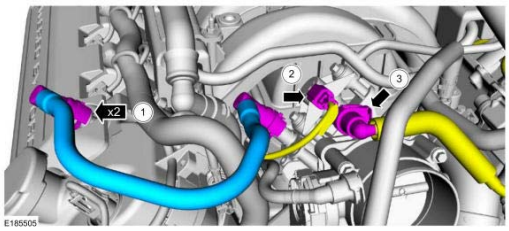
Release the clamps and position the vacuum tube aside.

9.

Disconnect the throttle body electrical connector.

10.

1.



Disconnect the couplings and remove the crankcase vent tube. Refer to: QUICK RELEASE COUPLING .

2.

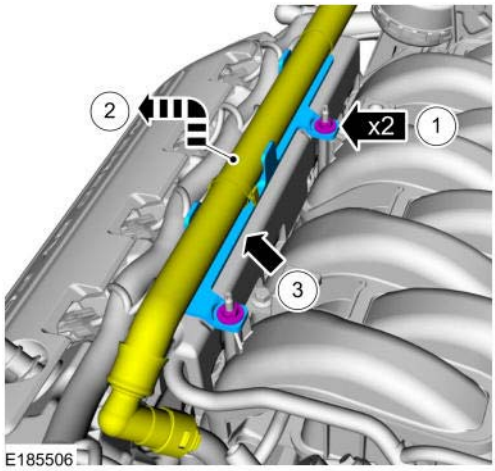
Disconnect the EVAP purge valve electrical connector.

3.

Disconnect the EVAP tube and position aside. Refer to: QUICK RELEASE COUPLING .

11.

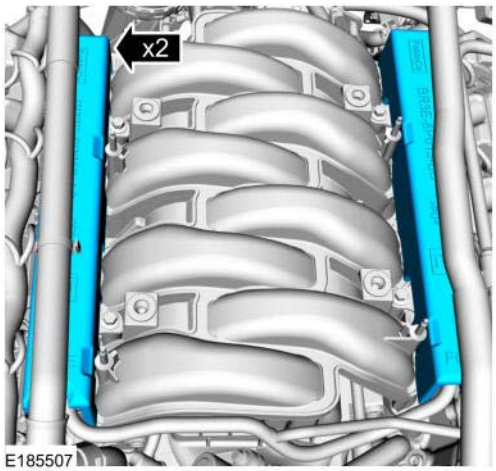
1.



Remove the nuts.

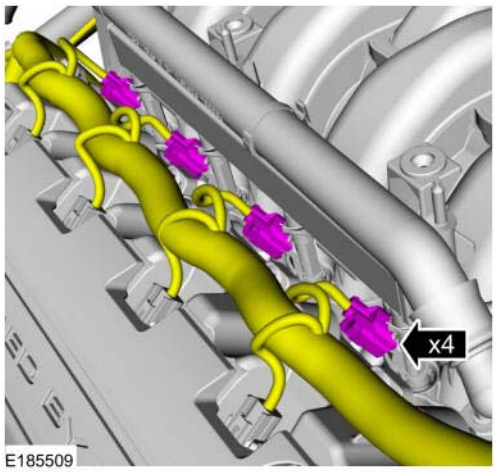
2.

Position the heater hose aside.



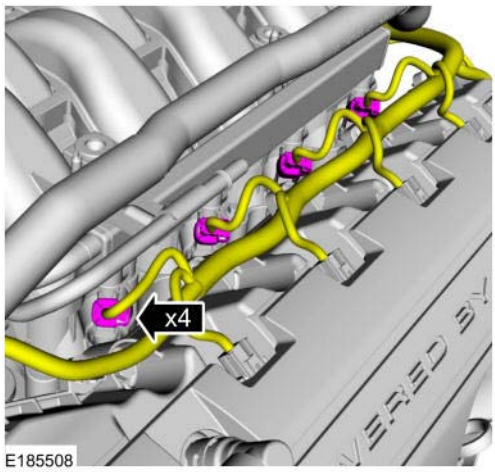
3.

Remove the heater hose support.



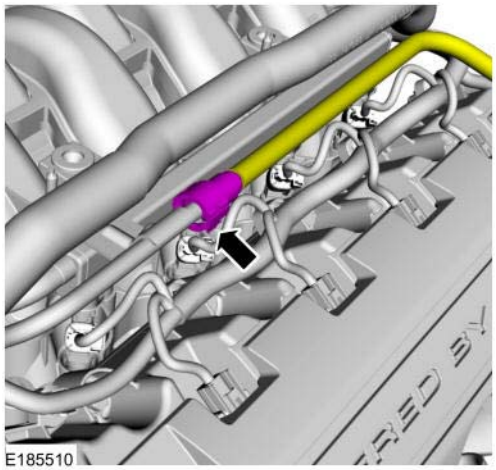
12.

Remove the fuel rail insulators.



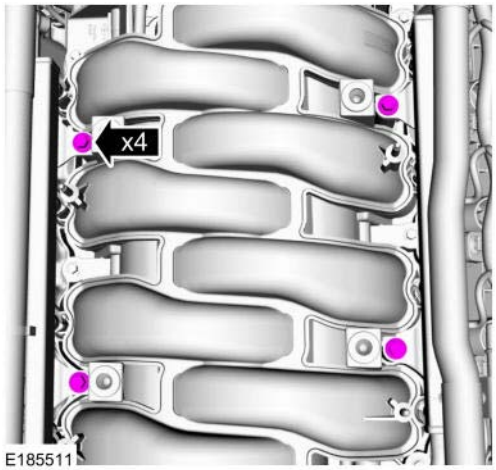
13.

Disconnect the RH fuel injector electrical connectors.



14.

Disconnect the LH fuel injector electrical connectors.

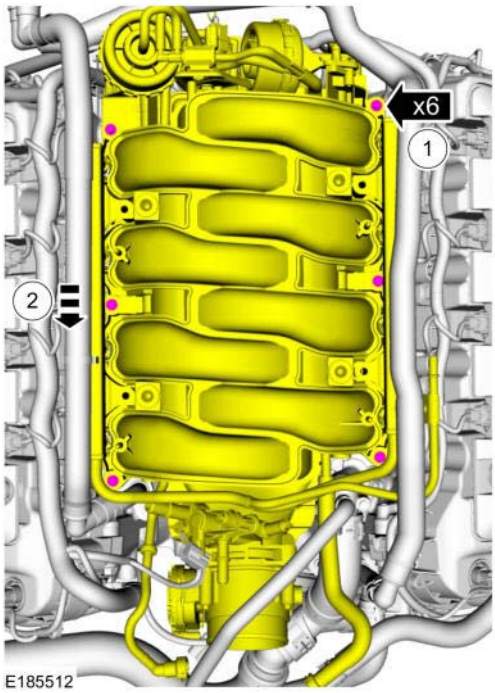


15.

Disconnect the fuel supply tube. Refer to: QUICK RELEASE COUPLING .

NOTE: It is not necessary to remove the fuel rail from the intake manifold assembly.

16.
Remove the fuel rail bolts.



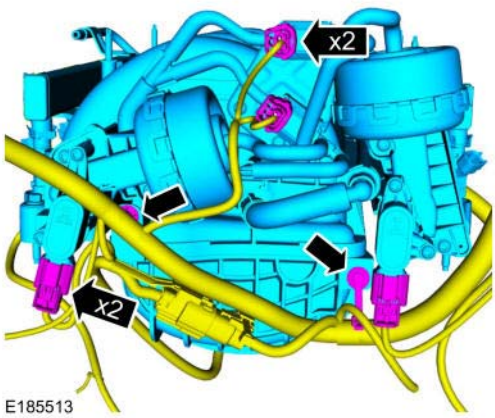
17.

1.

Loosen the intake manifold bolts.

2.

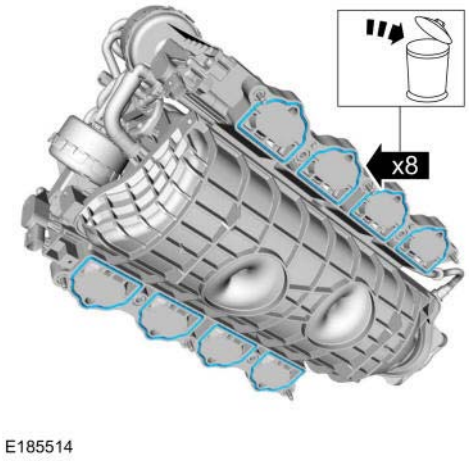
Position the manifold up and towards the front of the engine to access the rear of the manifold.



18.

Disconnect the wiring harness electrical connectors.

Detach the wiring harness retainers.

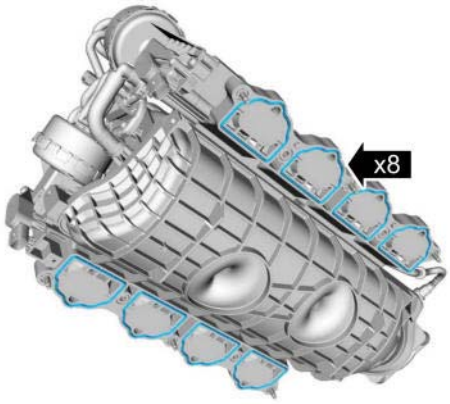


Remove the intake manifold.

19.

Remove and discard the gaskets.

Clean and inspect all sealing surfaces.

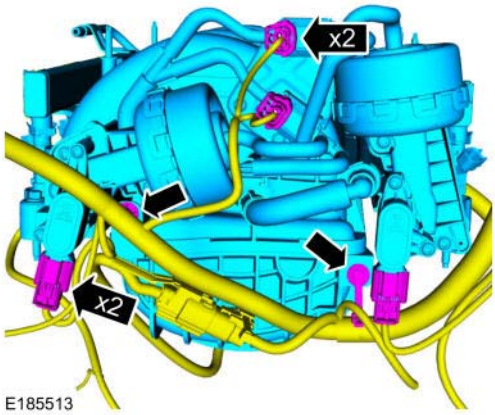


REMOVAL AND INSTALLATION > INTAKE MANIFOLD > INSTALLATION

NOTE: If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris if found, install a new intake manifold. Failure to follow these instructions can result in engine damage.

1.

Install new gaskets.



E185653

2.

Position the intake manifold onto the engine.

Attach the wiring harness retainers.

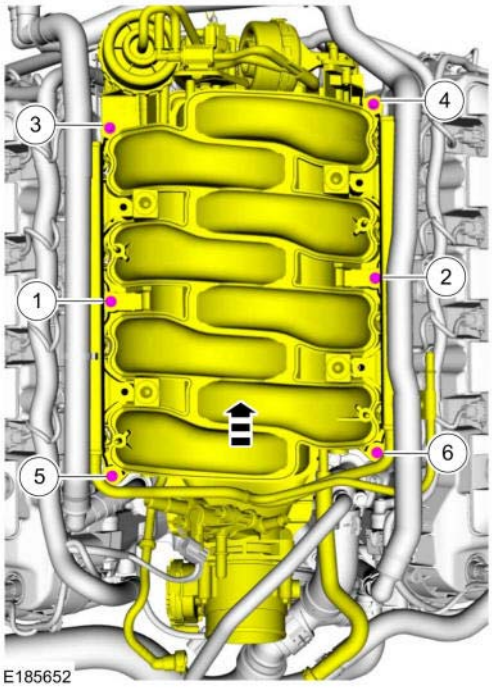
Connect the wiring harness electrical connectors.

E185513

3.

1.

Position the manifold to the installed position.



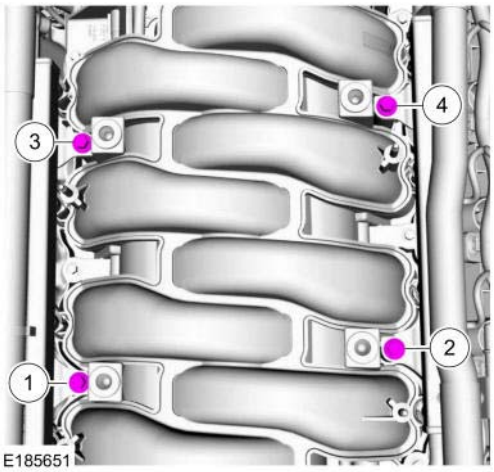
2.

Tighten the intake manifold bolts.

Torque:

Stage 1: 106 lb.in (12 Nm)

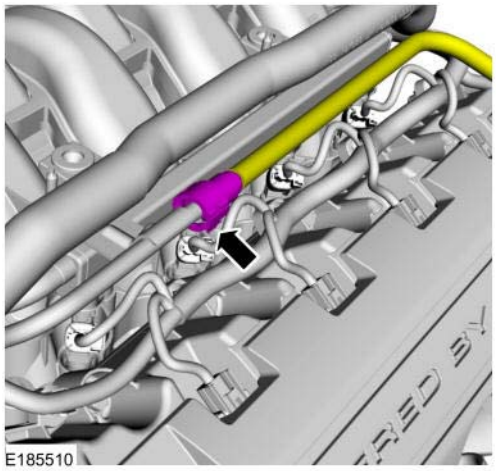
Stage 2: 35°



4.

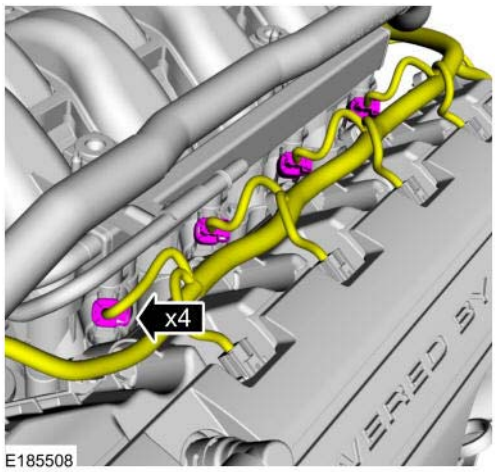
Install the fuel rail bolts.

Torque



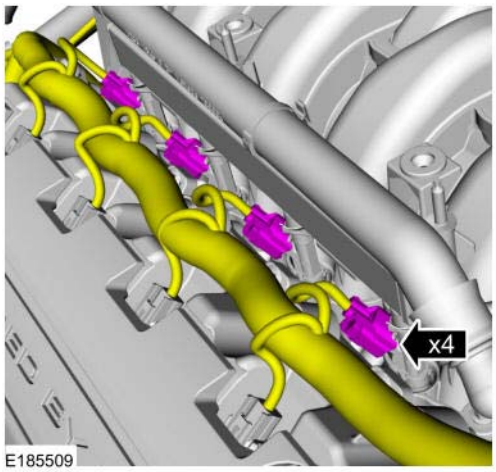
Stage 1: 89 lb.in (10 Nm)

Stage 2: 90°



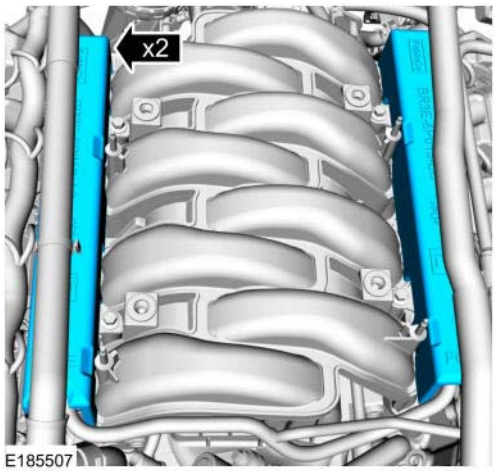
5.

Connect the fuel supply tube. Refer to: QUICK RELEASE COUPLING .



6.

Connect the LH fuel injector electrical connectors.



7.

Connect the RH fuel injector electrical connectors.

8.

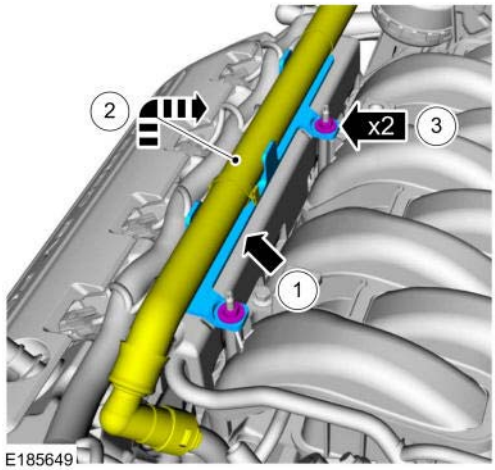
Install the fuel rail insulators.

9.

1.

Install the heater hose support.

2.



Position the heater hose.

3.

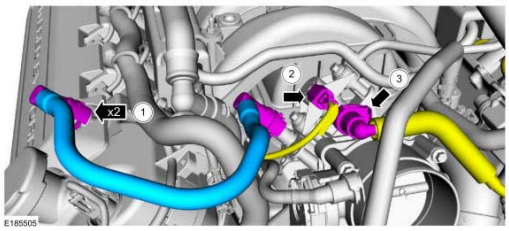
Install the nuts.

Torque

: 62 lb.in (7 Nm)

10.

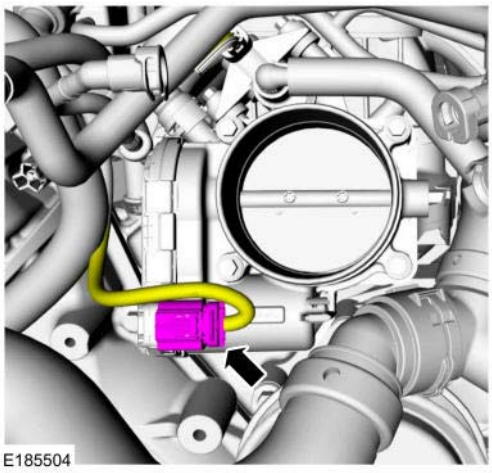
1.



Install the crankcase vent tube and connect the couplings. Refer to: QUICK RELEASE COUPLING .

2.

Connect the EVAP purge valve electrical connector.

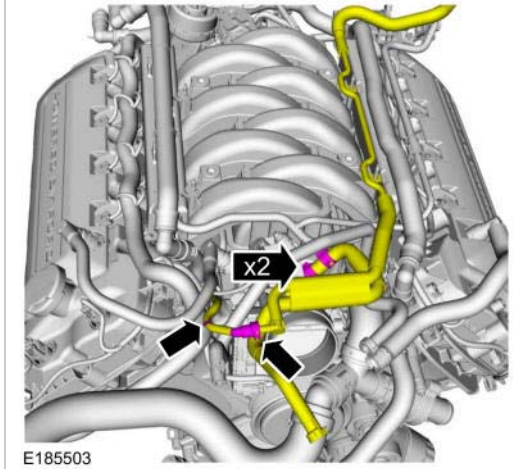


3.

Connect the EVAP tube. Refer to: QUICK RELEASE COUPLING .

11.

Connect the throttle body electrical connector.



12.

Install the vacuum tube and clamps.

Connect the vacuum tube. Refer to: QUICK RELEASE COUPLING .

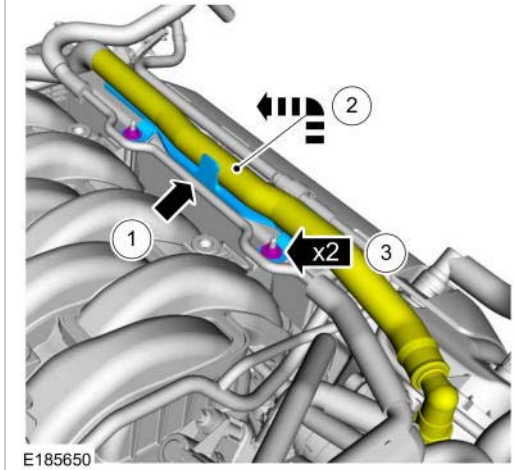
Attach the vacuum tube retainer.

13.

1.

Install the heater hose support.

2.



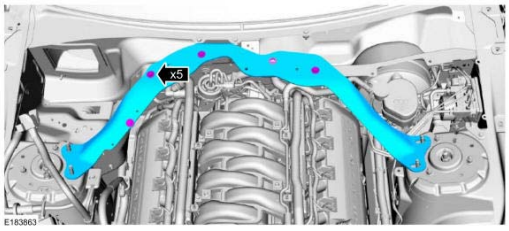
Position the heater hose.

3.

Install the nuts.

Torque

: 62 lb.in (7 Nm)



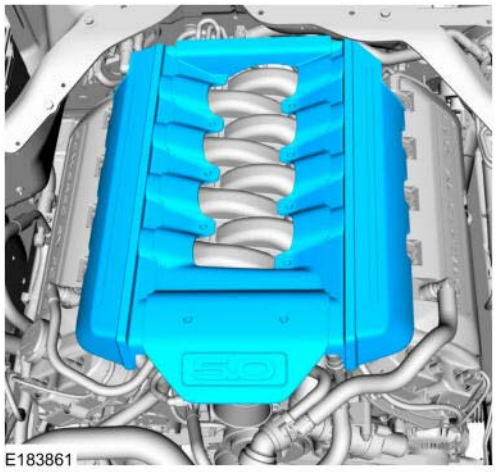
14.

Install the cowl extension and fasteners.

Torque

: 26 lb.ft (35 Nm)

15.



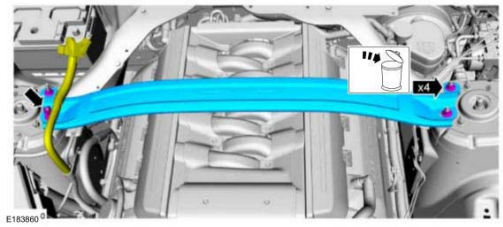
Install the following items:

Refer to: Cowl Panel Grille .

AIR CLEANER OUTLET PIPE .

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

16.
Install the engine appearance cover.



17.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

18.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > OIL COOLER

Special Tool(s) / General Equipment

Locking Pliers

Materials

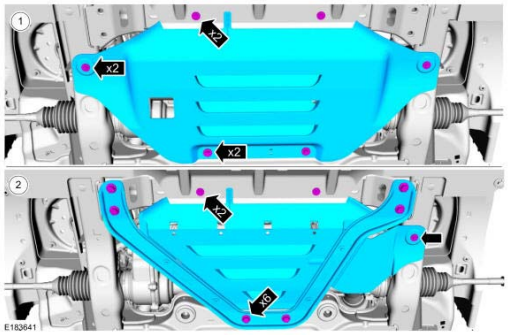
Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.)VC-3-B (U.S.)	WSS-M97B44-D

REMOVAL AND INSTALLATION > OIL COOLER > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

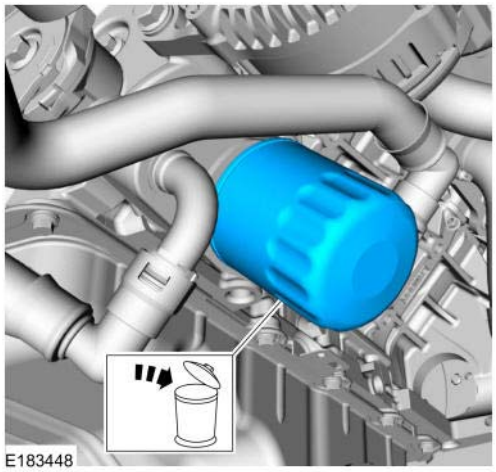
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



2.

1.

Loosen the 2 front bolts, remove the remaining bolts and the underbody shield.

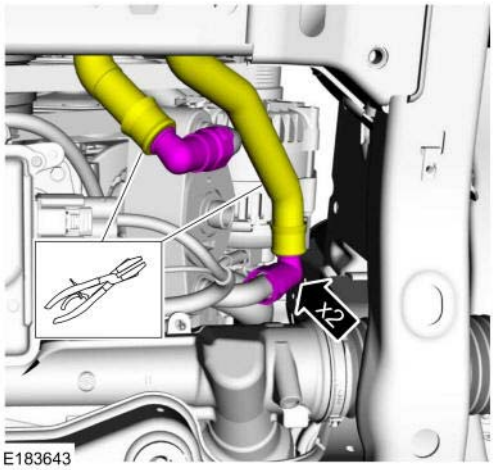


2.

Loosen the 2 front bolts, remove the remaining bolts and the subframe bracket and underbody shield assembly.

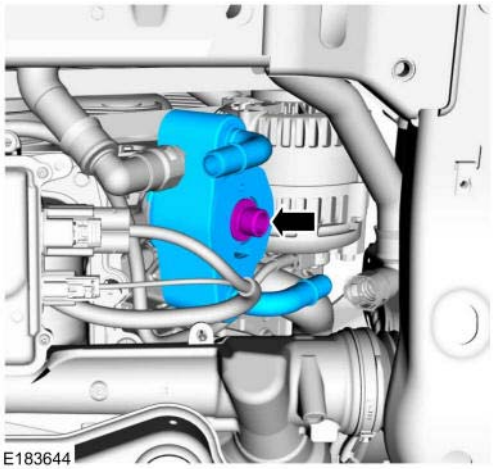
3.

Remove and discard the engine oil filter.



4.

Using hose locking pliers, clamp the oil cooler coolant hoses.

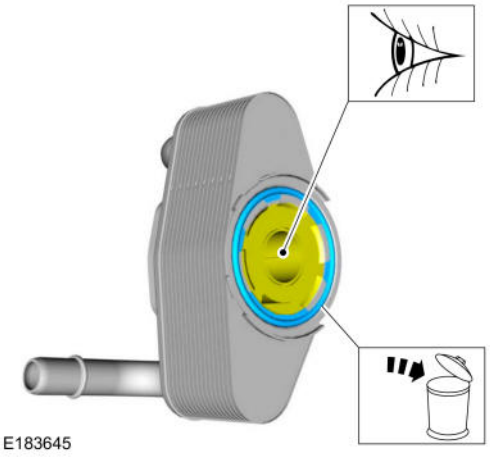


Use the General Equipment: Locking Pliers

Disconnect the coolant hoses.

5.

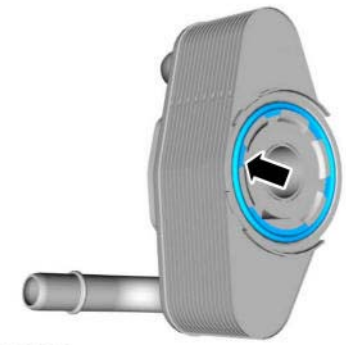
Remove the retainer and the oil cooler.



NOTE: If metal or aluminum material is present in the oil cooler, mechanical concerns exist. Failure to correct these concerns may cause engine failure. To diagnose mechanical concerns, refer to appropriate Engine article.

6.

Remove and discard the gasket.

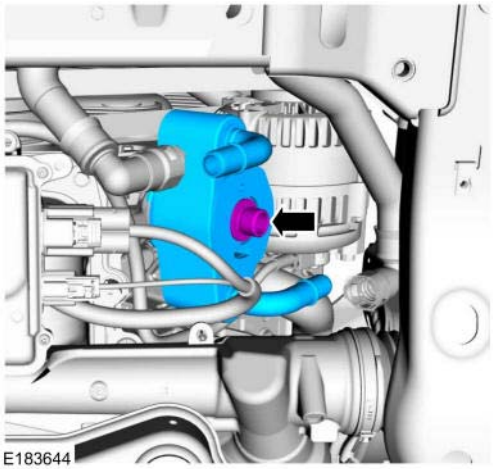


Inspect the oil cooler.

REMOVAL AND INSTALLATION > OIL COOLER > INSTALLATION

1.

Install a new gasket.



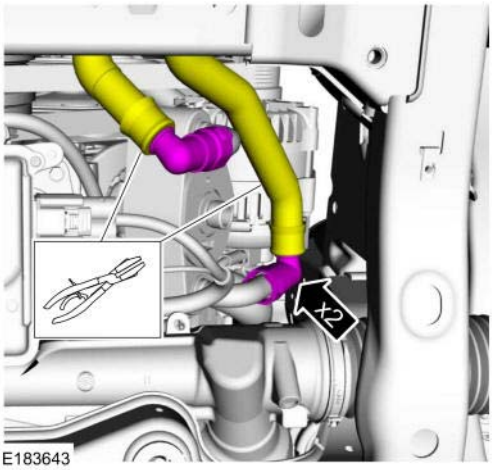
E183646

2.

Install the oil cooler and the retainer.

Torque

: 43 lb.ft (58 Nm)



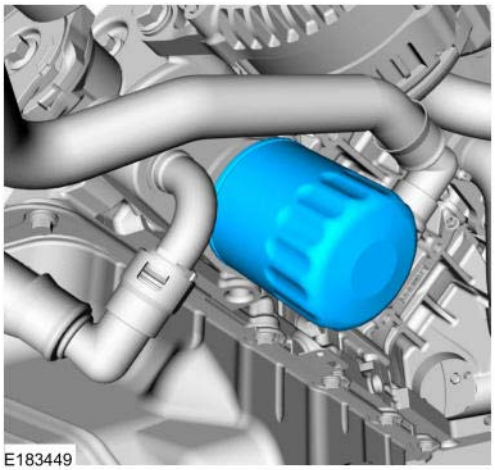
E183644

3.

Connect the coolant hoses.

Remove the hose locking pliers.

Use the General Equipment: Locking Pliers



NOTE: Do not lubricate the O-ring seal.

4.
Install a new oil filter.

Torque

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

5.

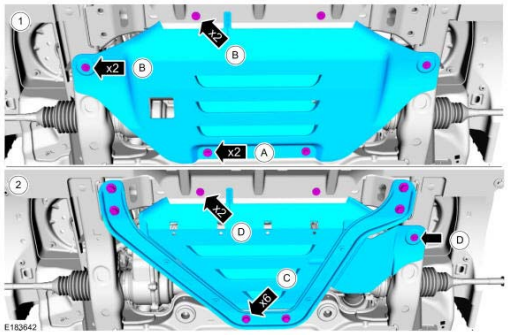
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)

6.

Inspect and adjust the coolant level in the degas bottle

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

7.

Inspect and adjust the engine oil level.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

REMOVAL AND INSTALLATION > OIL PAN

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine

	303-F072 Support Bar, Engine
Plastic Scraper	
Oil Drain Equipment	
Vehicle/Axle Stands	

Materials

Name	Specification
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Engine Oil - 5W20	WSS-M2C948-B
Motorcraft® Metal Surface Prep ZC-31-B	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

REMOVAL AND INSTALLATION > OIL PAN > REMOVAL

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

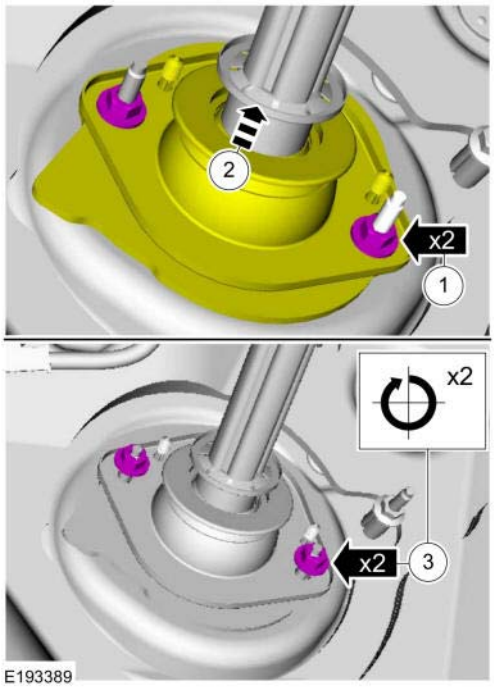
2.

Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

3.

1.



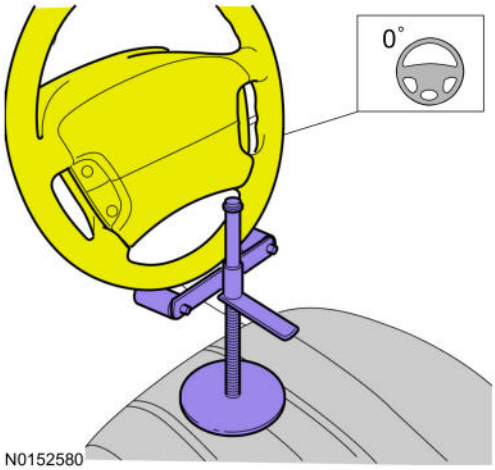
Remove the steering column dash seal nuts.

2.

Loosen the dash seal.

3.

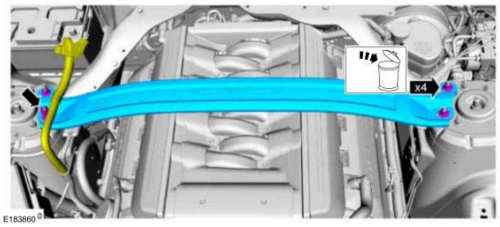
Hand start the dash seal nuts.



4.

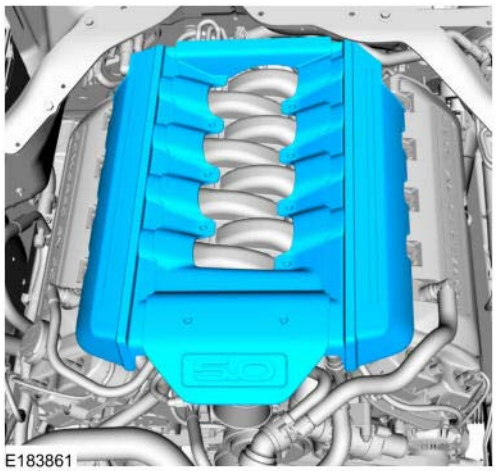
Using a holding device, hold the steering wheel in the straight-ahead position.

Material



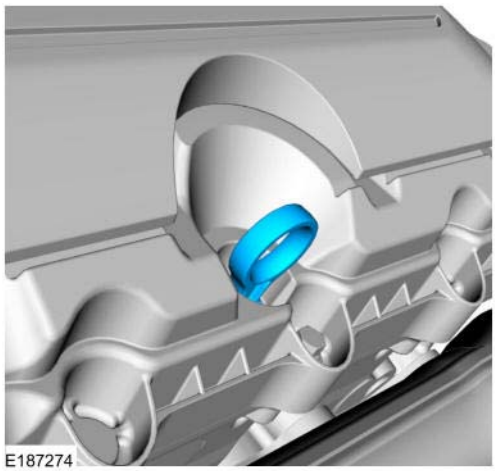
: Motorcraft® Silicone Gasket Remover / ZC-30-A

5.



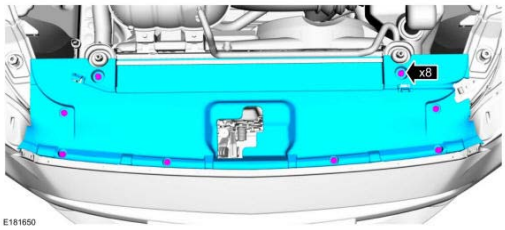
If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



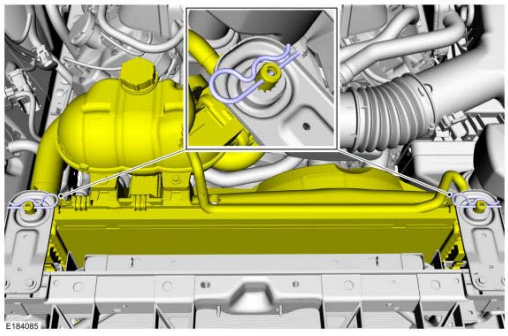
NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

6.
Remove the engine appearance cover.



7.

Remove the oil level indicator.



8.

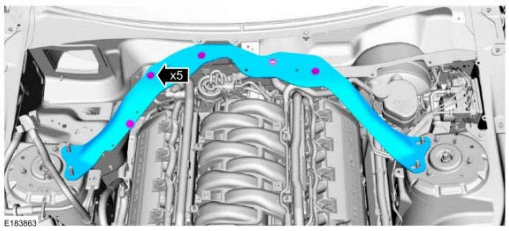
Remove the retainers and the radiator top shield.

9.

Install clips to support the cooling module.

10.

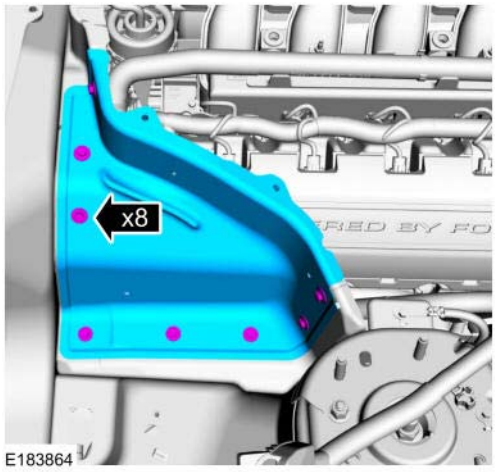
Remove the following items:



Refer to: AIR CLEANER OUTLET PIPE .

Refer to: Cowl Panel Grille .

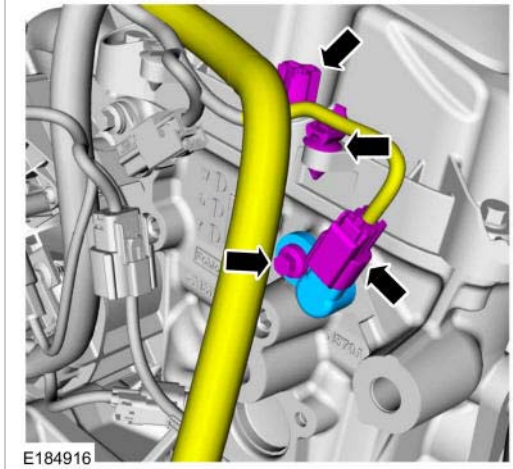
Refer to: Battery Tray .



11.

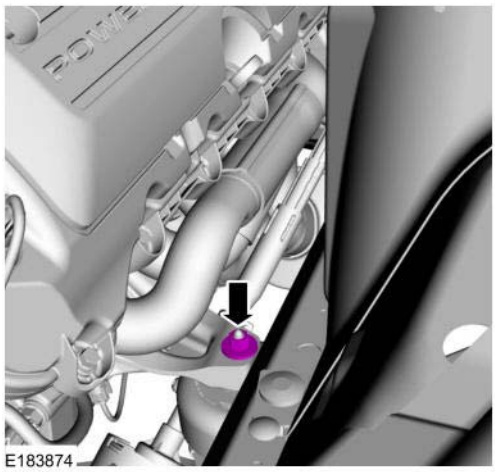
Remove the fasteners and the cowl extension.

12.



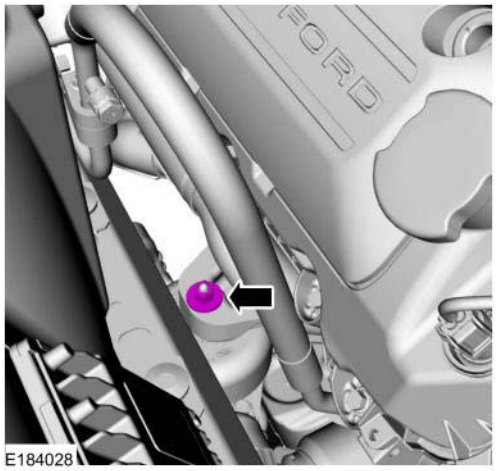
Remove the fasteners and the battery heat shield.

13.



Disconnect the CMP sensor electrical connector, the wiring harness retainers and position the harness aside.

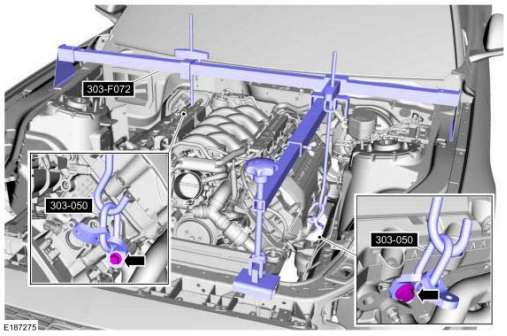
Remove the bolt and the CMP sensor.



14.

Remove the LH engine mount nut.

15.



Remove the RH engine mount nut.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

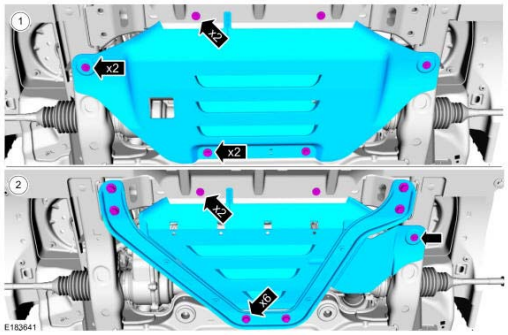
16.
Install the special tools and raise the engine 50 mm (2 inch).

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

17.

Remove the front wheels and tires. Refer to: Wheel and Tire .

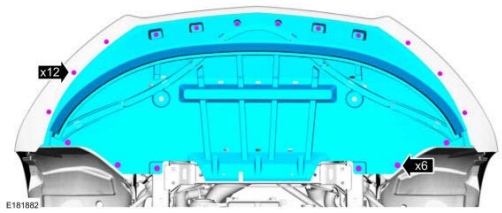
NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



18.

1.

Remove the bolts and the underbody shield.



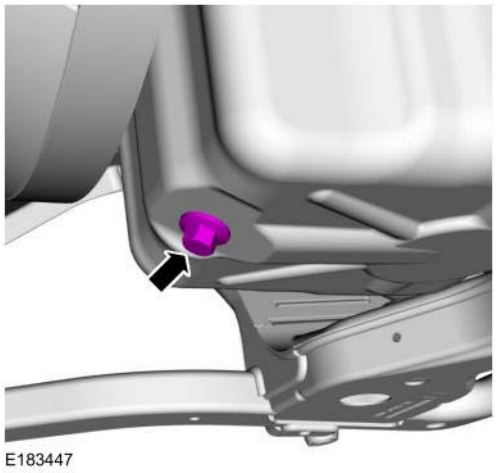
2.

Remove the bolts and the subframe bracket and underbody shield assembly.

19.

Remove the pin-type retainers, bolts and the underbody shield.

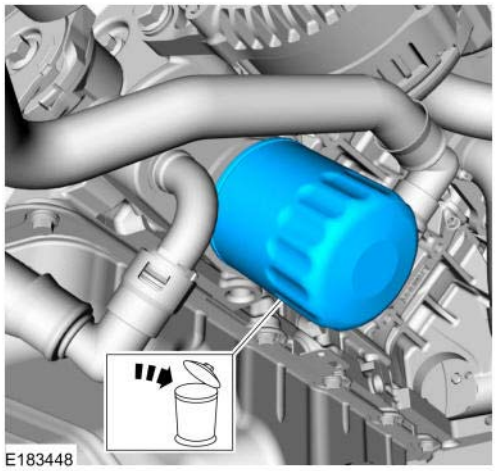
20.



Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

Install the oil pan drain plug.



Torque

: 19 lb.ft (26 Nm)

21.

Remove and discard the engine oil filter.

22.

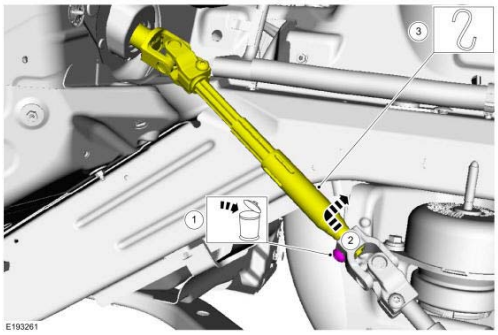
WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

Detach the steering column lower shaft from the lower coupling.

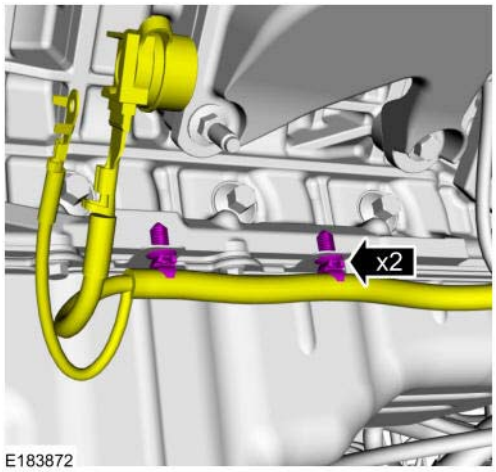
1.



Remove and discard the steering column shaft bolt.

2.

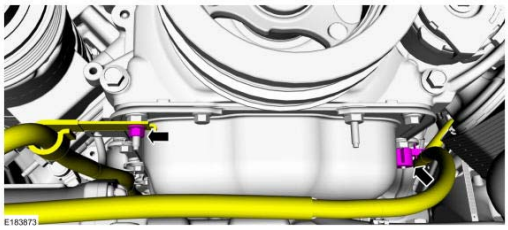
Pull apart the steering column shaft from the coupling.



3.

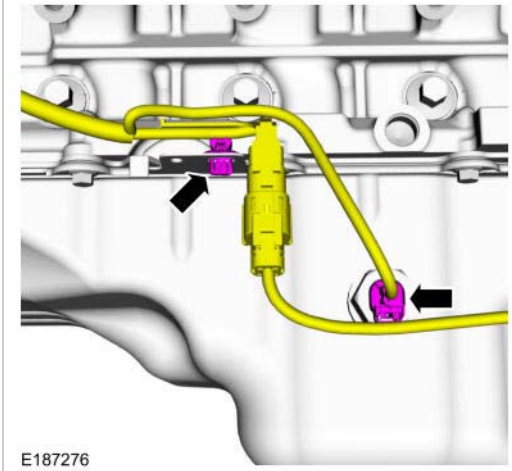
Secure the lower shaft to the frame rail to avoid damage to the shaft.

23.



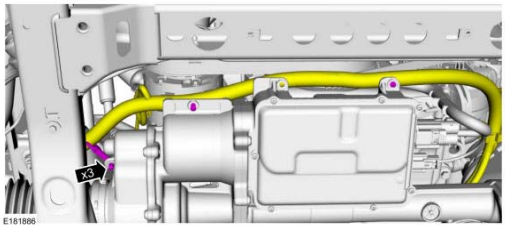
Detach the wiring harness retainers from the oil pan.

24.



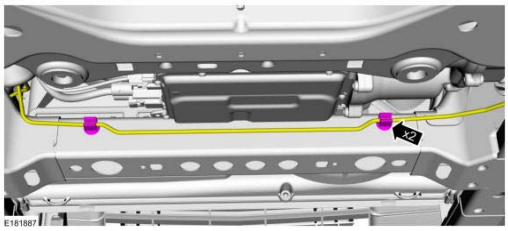
Remove the nut and the wiring harness retainer.

Detach the wiring harness retainer from the oil pan stud bolt.



25.

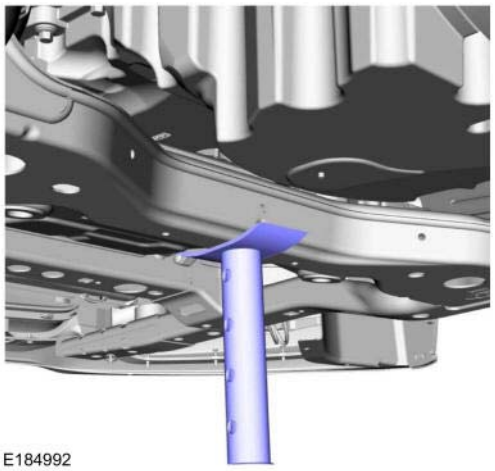
Disconnect the oil level sensor electrical connector and wiring harness retainer.



26.

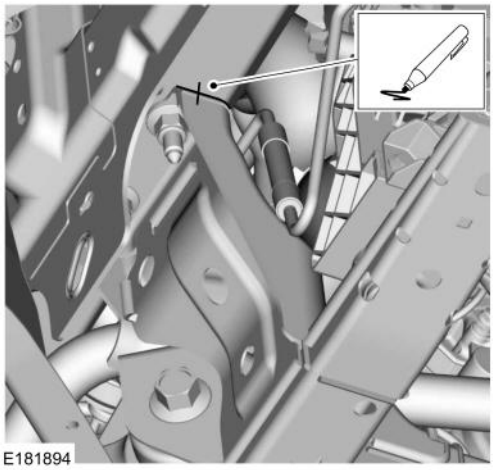
Detach the wiring harness pin-type retainers.

27.



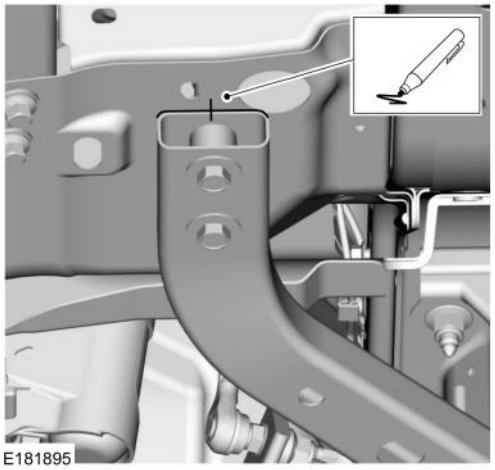
Detach the brake tube retainers from the subframe.

28.



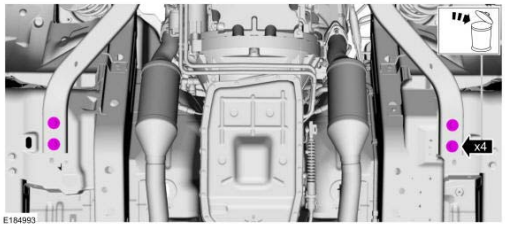
Using an adjustable stand, support the subframe.

Use the General Equipment: Vehicle/Axle Stands



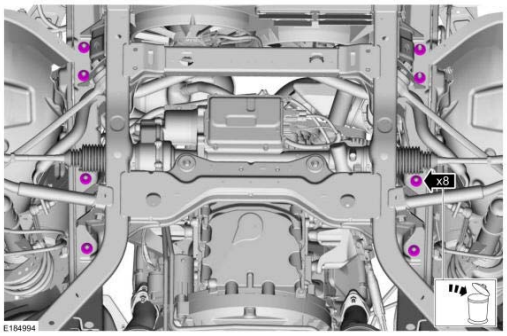
29.

Mark the position of the front subframe for reference during installation.



30.

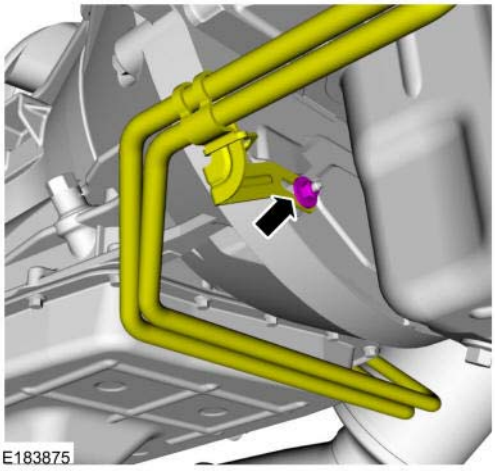
Mark the position of the rear subframe for reference during installation.



31.

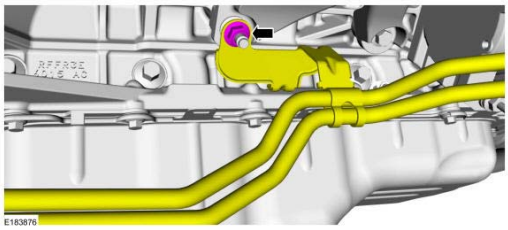
Remove and discard the rear subframe bolts.

32.



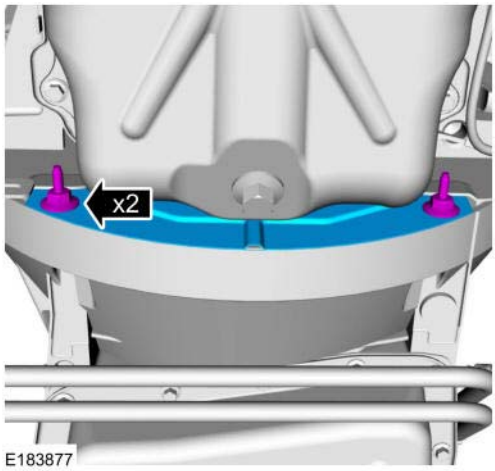
Remove and discard the front subframe nuts.

6-Speed Automatic Transmission - 6R80



33.

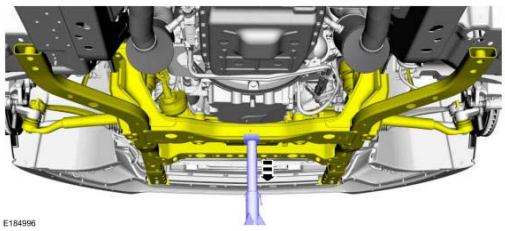
Remove the transmission cooling tube nut and bracket from the flexplate inspection cover stud bolt.



34.

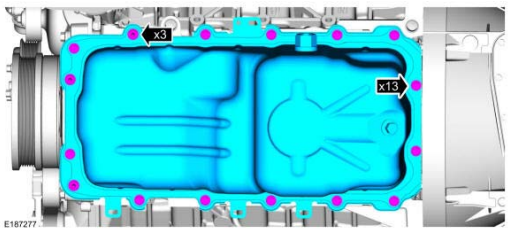
Remove the transmission cooling tube bracket nut and position the bracket and tubes aside.

35.



Remove the stud bolts and the flexplate inspection cover.

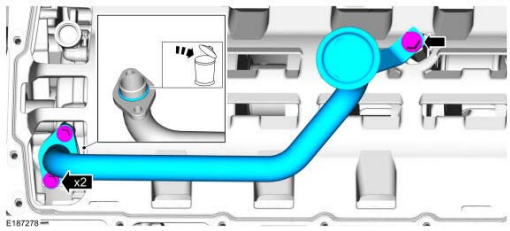
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



36.

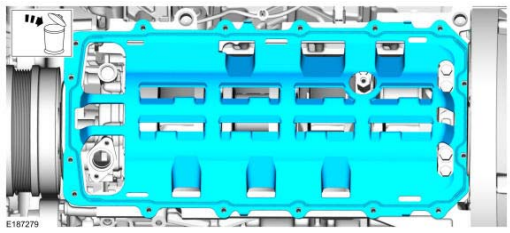
Using an adjustable stand, lower the subframe 102 mm (4.0 in). Use the General Equipment: Vehicle/Axle Stands

37.



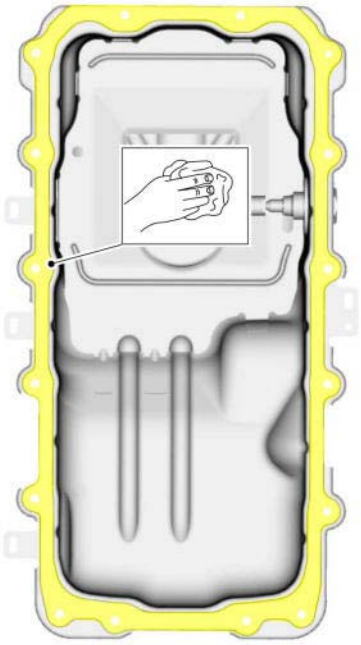
Remove the bolts, stud bolts and the oil pan.

38.



Remove the bolts and the oil pump screen and pickup tube.

Remove and discard the O-ring seal.



39.

Remove and discard the oil pan baffle and gasket.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths.

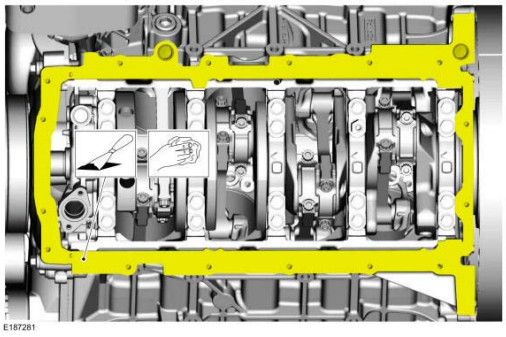
40.
Make sure that the mating faces are clean and free of foreign material.

E187280

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.

41.
Make sure that the oil pan mating faces of the cylinder block, engine front cover and real seal retaining plate are clean and free of foreign material. Refer to: RTV Sealing Surface Cleaning and Preparation .

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

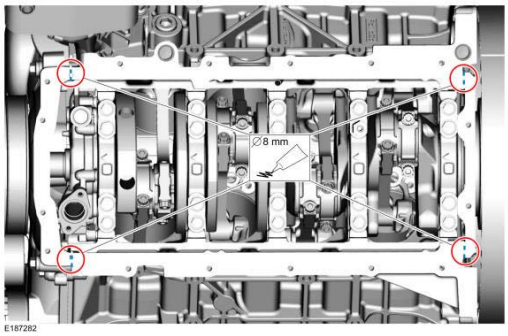
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

REMOVAL AND INSTALLATION > OIL PAN > INSTALLATION

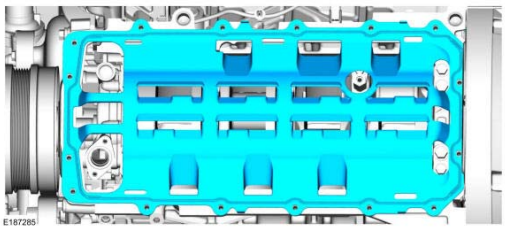
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



NOTE: If the oil pan is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage. If this timing cannot be met, tighten fasteners 7, 8, 9 and 10 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer and final torque all of the fasteners within 1 hour of applying the sealer.

NOTE: If the engine front cover has been removed, it is only necessary to apply sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces.

1.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces and the engine front cover-to-cylinder block sealing surfaces.



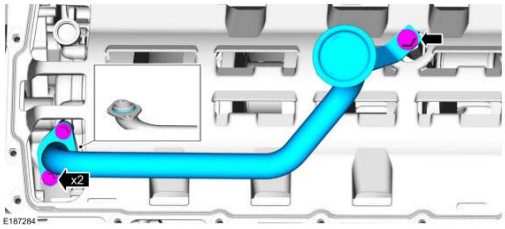
Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

2.

Install the new oil pan baffle and gasket.

3.



Using a new O-ring seal, install the oil pump screen and pickup tube and the bolts.

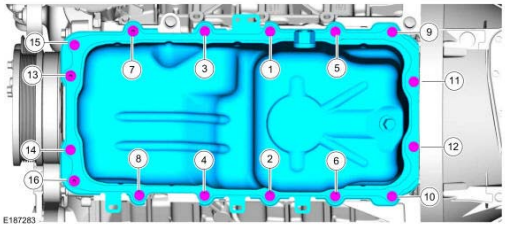
Torque

Oil pump screen and pickup tube-to-oil pump bolts:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45° Oil pump screen and pickup tube-to-spacer bolt : 18 lb.ft (25 Nm)

NOTE: Fastener locations 7, 13 and 16 are stud bolts.

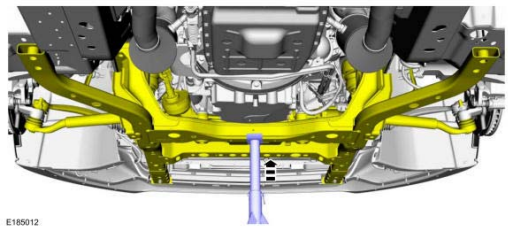


4.
Install the oil pan and the bolts.

Torque:

Stage 1: 18 lb.in (2 Nm)

Stage 2: 89 lb.in (10 Nm)

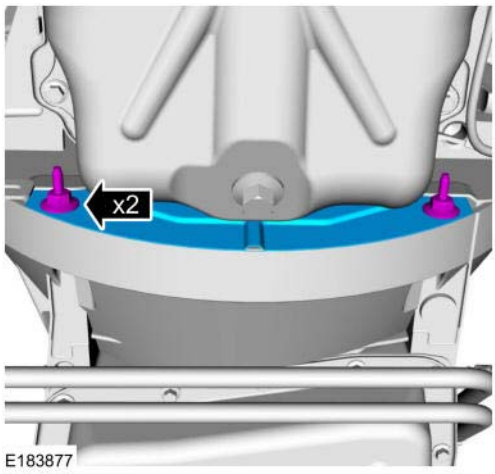


Stage 3: 45°

5.

Using an adjustable stand, raise the subframe.

Use the General Equipment: Vehicle/Axle Stands



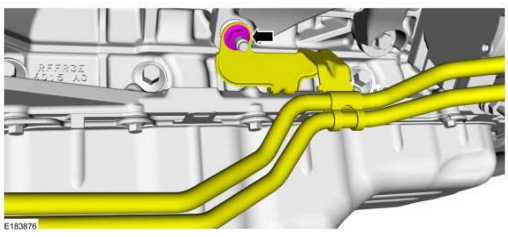
6-Speed Automatic Transmission - 6R80

6.

Install the flexplate inspection cover and the stud bolts.

Torque

: 35 lb.ft (48 Nm)

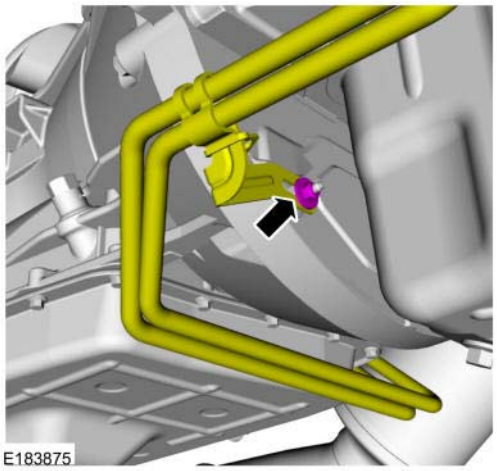


7.

Install the transmission cooling tube bracket and nut.

Torque

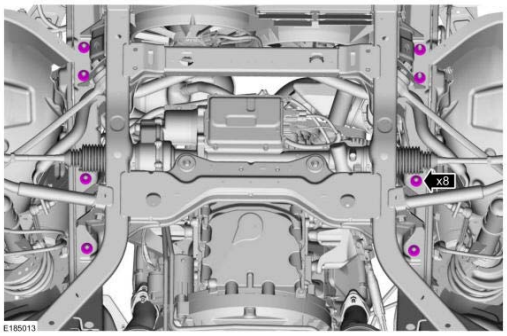
: 35 lb.ft (48 Nm)



8.

Install the transmission cooling tube bracket and nut.

Torque

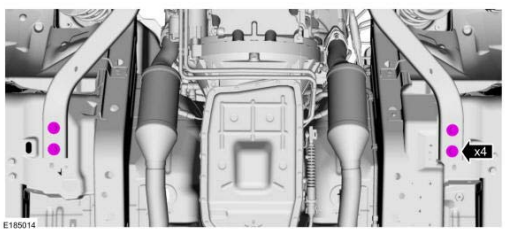


: 124 lb.in (14 Nm)

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

9.

Install the new front subframe nuts loosely.

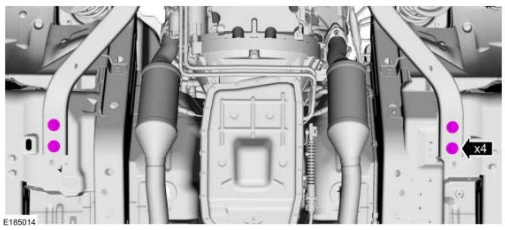


10.

Use a suitable alignment tool with a 15 mm (0.59 in) OD shaft that is long enough to go through the subframe and body.

Align the subframe to the alignment marks made during removal.

Install the new rear subframe bolts loosely.

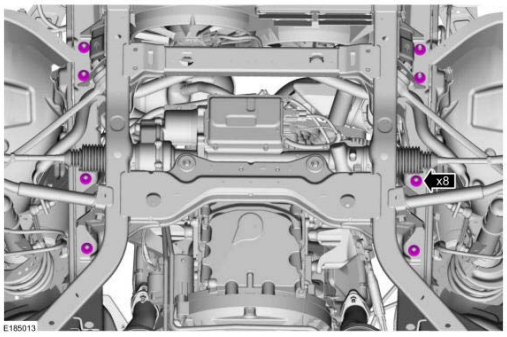


11.

Tighten the rear subframe bolts in a cross pattern.

Torque

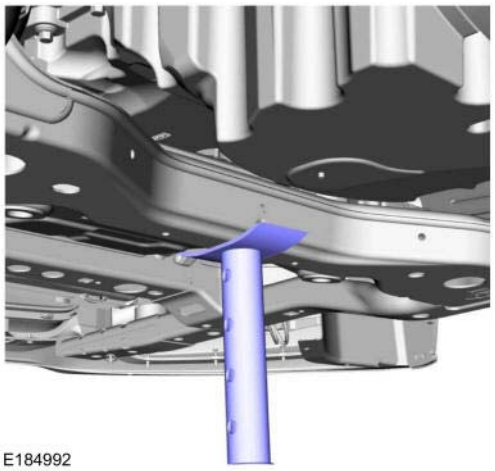
: 85 lb.ft (115 Nm)



12.

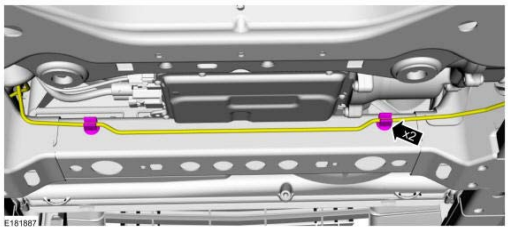
Tighten the front subframe nuts in a cross pattern.

Torque



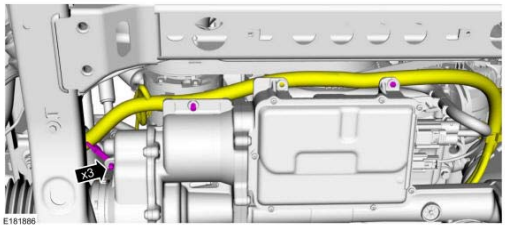
: 85 lb.ft (115 Nm)

13.



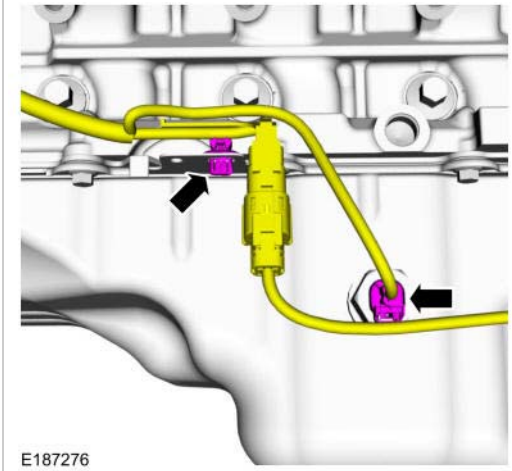
Remove the adjustable stand.

Use the General Equipment: Vehicle/Axle Stands



14.

Attach the brake line retainers to the subframe.

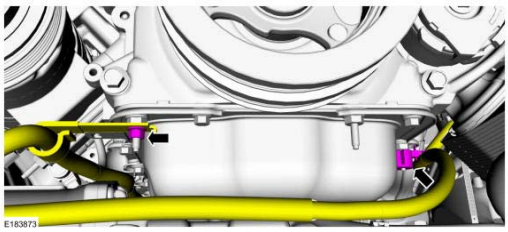


15.

Attach the EPAS wiring harness pin-type retainers.

16.

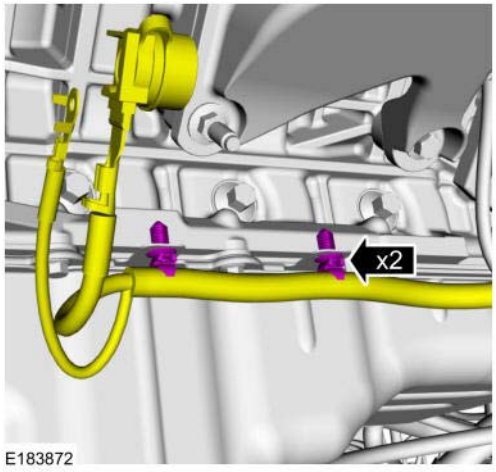
Connect the oil level sensor electrical connector and wiring harness retainer.



17.

Attach the wiring harness retainer to the oil pan stud bolt.

Install the wiring harness retainer and the nut.



Torque

: 124 lb.in (14 Nm)

18.

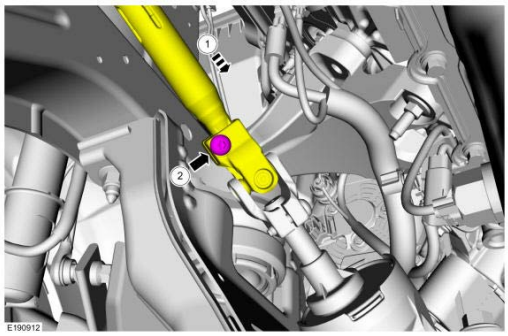
Attach the wiring harness retainers to the oil pan.

19.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.



Connect the steering column shaft to the steering gear universal joint.

2.

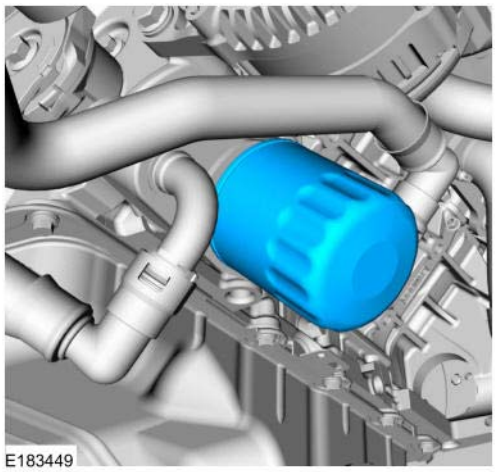
Install the new steering column shaft bolt.

Torque

: 22 lb.ft (30 Nm)

20.

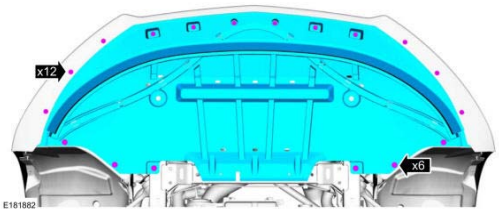
Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .



NOTE: Do not lubricate the O-ring seal.

21.
Install a new oil filter.

Torque:



Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

22.

Install the underbody shield, bolts and the pin-type retainers.

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

23.

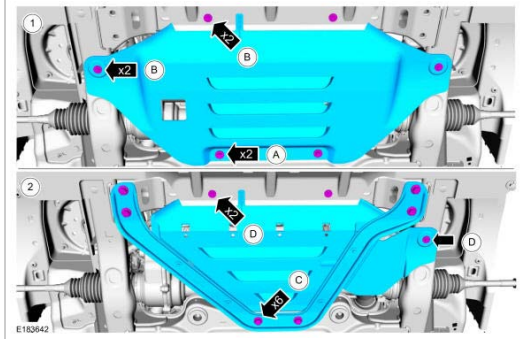
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

B: 18 lb.in (2 Nm)



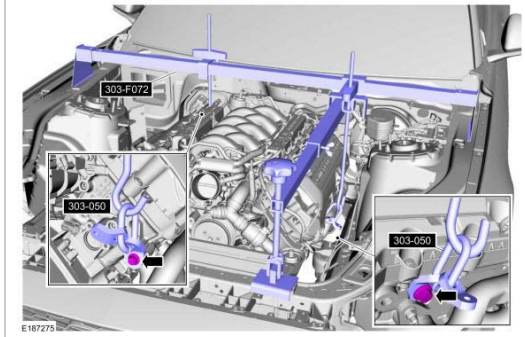
2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:

C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)



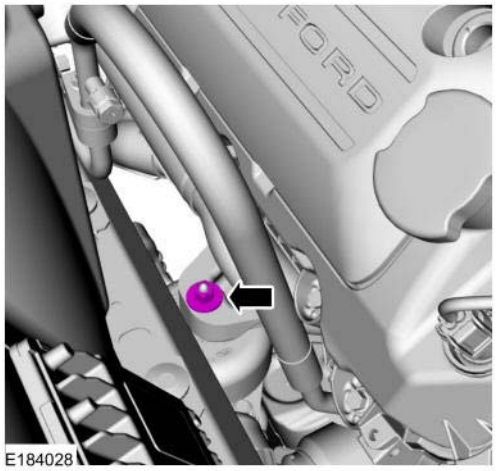
24.

Install the front wheels and tires. Refer to: Wheel and Tire .

25.

Lower the engine onto the engine mounts and remove the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

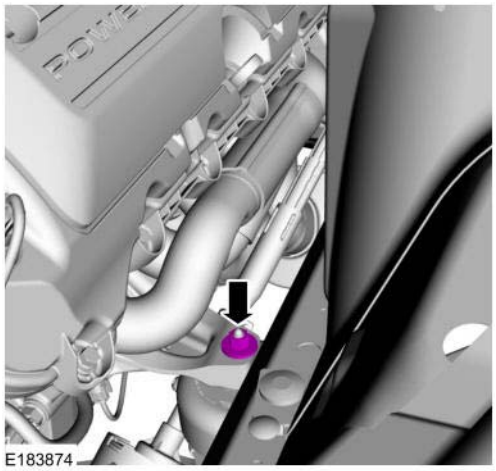


26.

Install the RH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

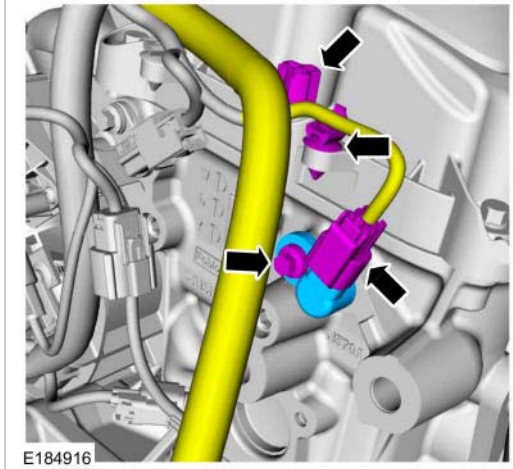


27.

Install the LH engine mount nut.

Torque

: 46 lb.ft (63 Nm)



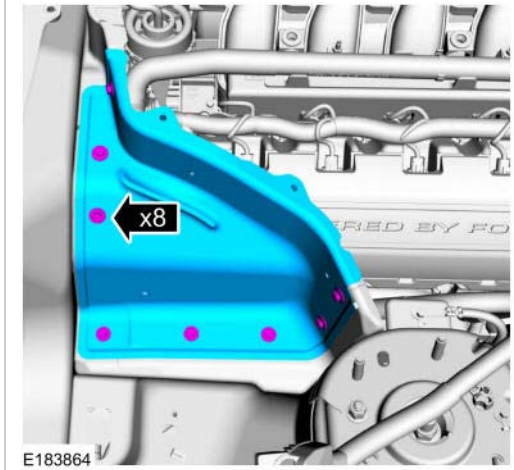
28.

Install the CMP sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

Connect the CMP sensor electrical connector and the wiring harness retainers.

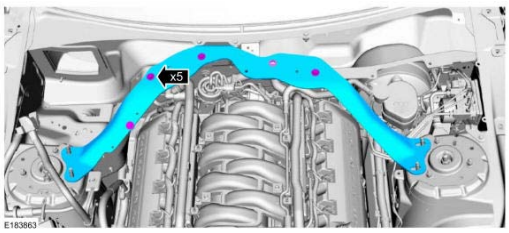


29.

Install the battery heat shield and fasteners.

Torque

: 80 lb.in (9 Nm)



30.

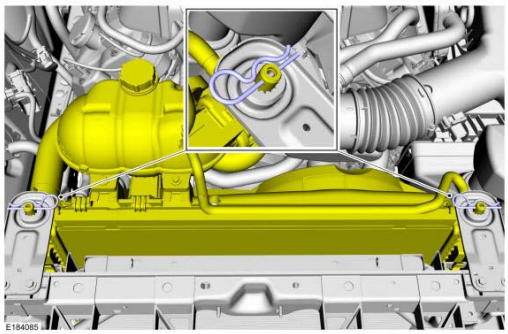
Install the cowl extension and the fasteners.

Torque

: 26 lb.ft (35 Nm)

31.

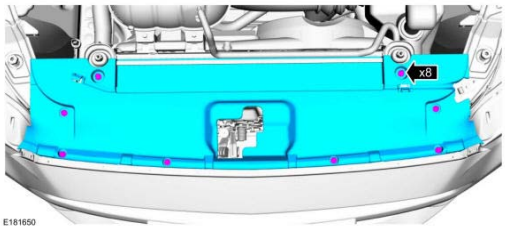
Install the following items:



Refer to: Battery Tray .

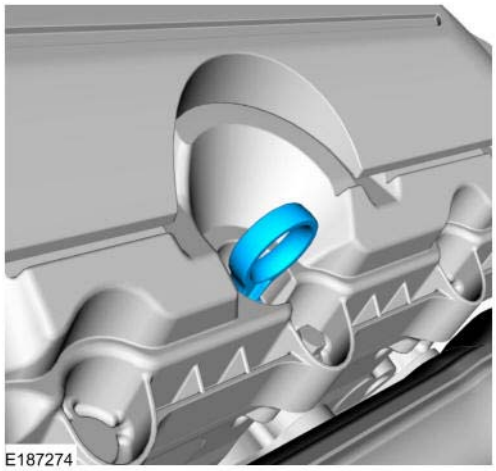
Refer to: Cowl Panel Grille .

Refer to: AIR CLEANER OUTLET PIPE .



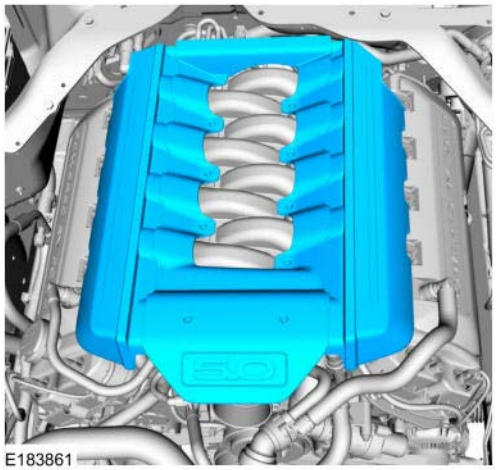
32.

Remove the clips.



33.

Install the radiator top shield and the retainers.

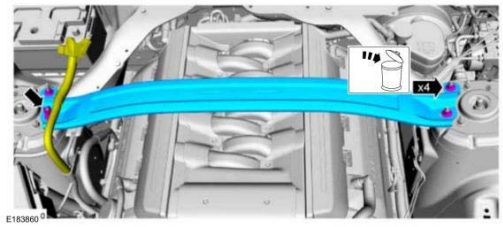


34.

Install the oil level indicator.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

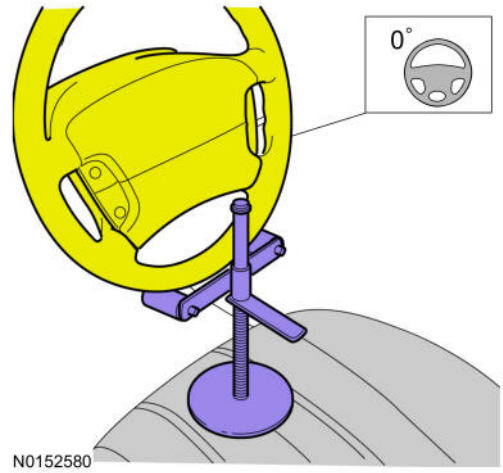
35.
Install the engine appearance cover.



36.

If equipped, install the strut tower cross brace and nuts.

Torque



: 41 lb.ft (55 Nm)

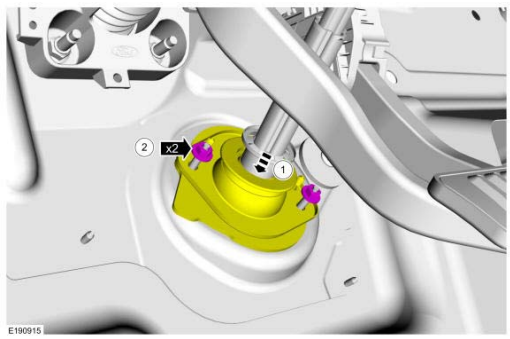
Attach the wiring harness retainer.

37.

Remove the holding device.

38.

1.



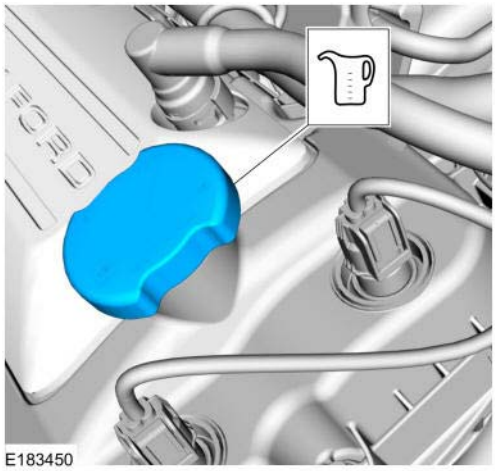
Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

Torque

: 80 lb.in (9 Nm)



39.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Engine Oil - 5W20 (WSS-M2C948-B)

40.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH

Materials

Name	Specification
Thread Sealant with PTFETA-24-B	WSK-M2G350-A2

REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

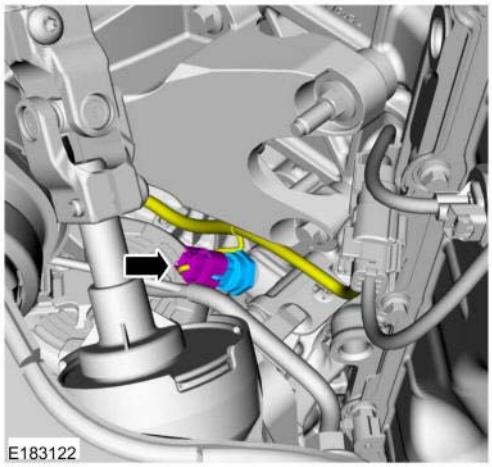
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the EOP switch electrical connector.

NOTE: If the oil pressure switch is to be reused, apply thread sealant.

Remove the EOP switch.



Material

: Thread Sealant with PTFE / TA-24-B (WSK-M2G350-A2)

Torque:

Stage 1: 124 lb.in (14 Nm)

Stage 2: 180°

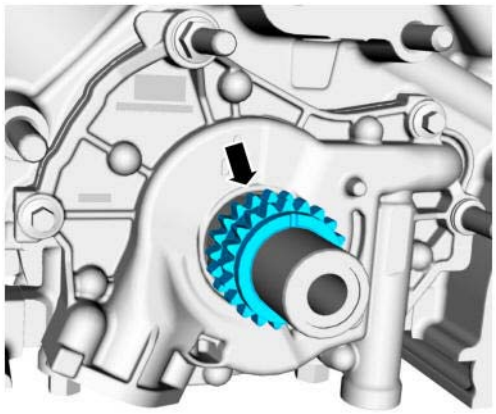
REMOVAL AND INSTALLATION > OIL PRESSURE SWITCH > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > OIL PUMP > REMOVAL

1.



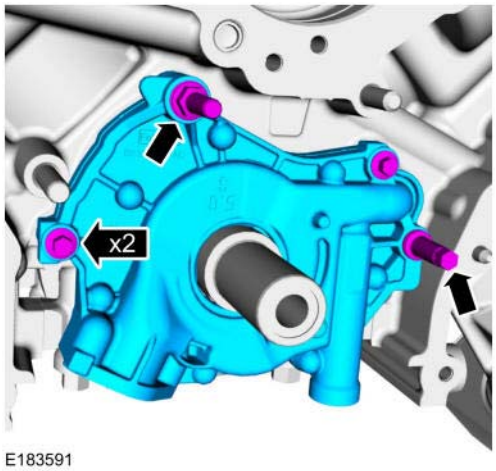
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the timing chains. Refer to: Timing Chain .

3.

Remove the crankshaft sprocket.



E183590

4.

Remove the oil pan. Refer to: Oil Pan .

5.

Remove the bolts, stud bolts and the oil pump.

E183591

REMOVAL AND INSTALLATION > OIL PUMP > INSTALLATION

NOTE: Oil pump must be held against the cylinder block until all bolts are tightened.

1.

Rotate the inner rotor of the oil pump assembly to align the flats on the crankshaft and slip the oil pump over the crankshaft until seated against the block.

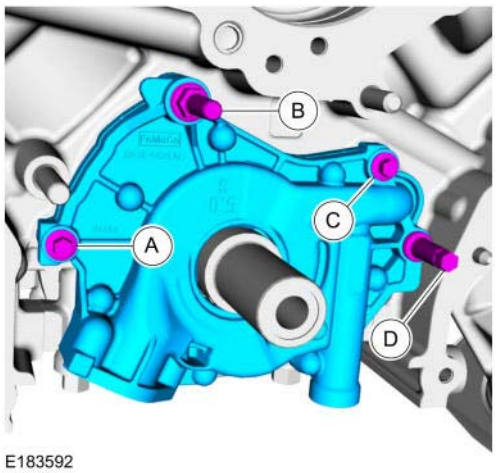
Rotate the oil pump until the bolt holes are aligned to the block and install the fasteners hand tight.

Torque:

Stage 1: A: 89 lb.in (10 Nm)

Stage 2: B: 18 lb.ft (25 Nm)

Stage 3: C: 89 lb.in (10 Nm)



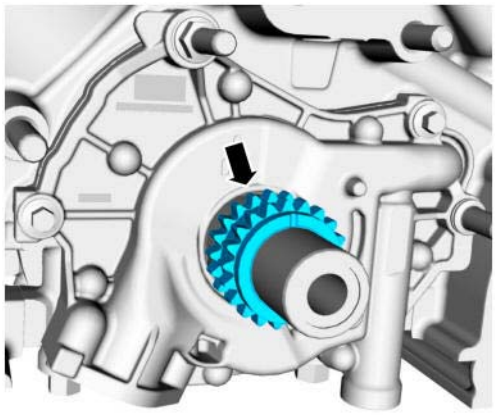
Stage 4: D: 177 lb.in (20 Nm)

Stage 5: A: 45°

Stage 6: B: 75°

Stage 7: C: 45°

Stage 8: D: 60°



E183592

2.

Install the oil pan. Refer to: Oil Pan .

3.

Install the crankshaft sprocket.

E183590

4.

Install the timing chains. Refer to: Timing Chain .

REMOVAL AND INSTALLATION > TIMING CHAIN

Special Tool(s) / General Equipment

	303-448 (T93P-6303-A) Holding Tool, Crankshaft TKIT-1993-FLM TKIT-1993-LM

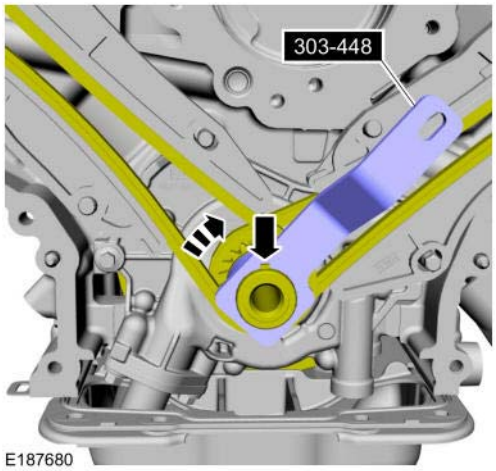
REMOVAL AND INSTALLATION > TIMING CHAIN > REMOVAL

NOTE: The timing chain procedure has changed from prior model year engines and must be followed exactly or damage to the engine will result.

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: In order to remove the LH timing chain, the RH timing chain must be removed first.

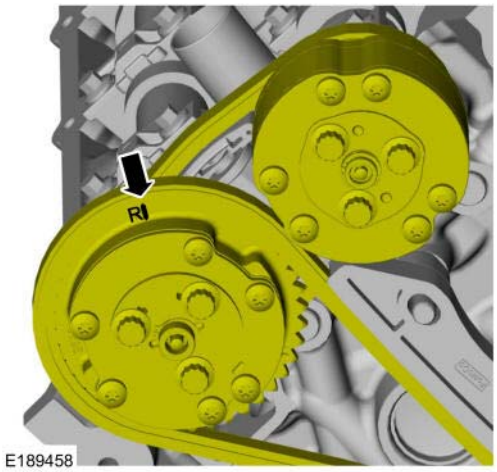
RH and LH timing chains



1.

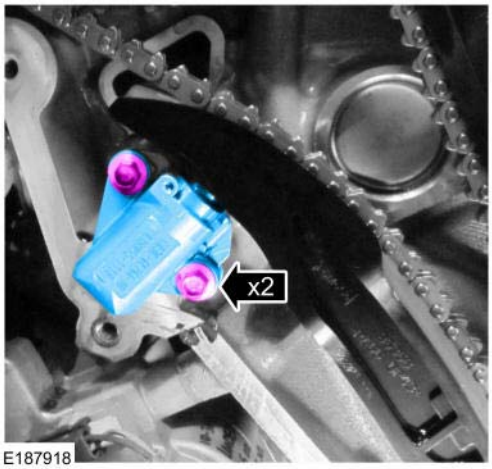
Remove the engine front cover. Refer to: Engine Front Cover .

2.



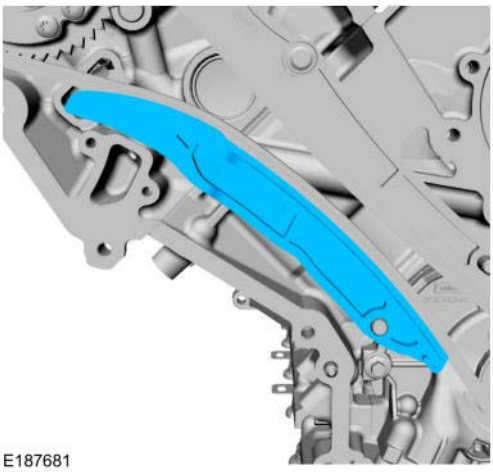
Using the special tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.



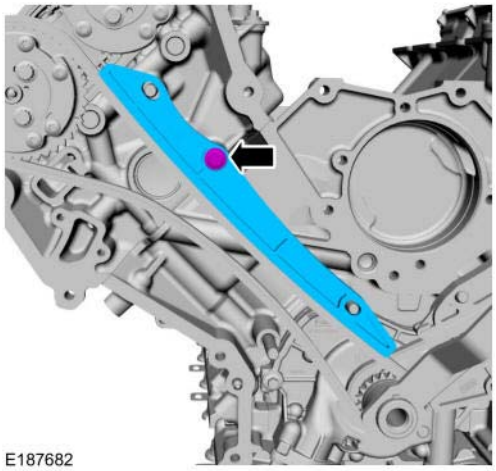
3.

Verify the timing mark on the RH VCT unit is on top, if not, rotate the crankshaft clockwise one complete revolution so the keyway is at the 12 o'clock position.



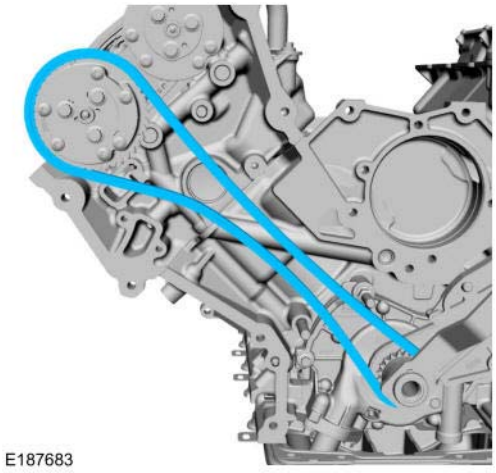
4.

Remove the bolts and the RH primary timing chain tensioner.



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

5.
Remove the RH timing chain tensioner arm.

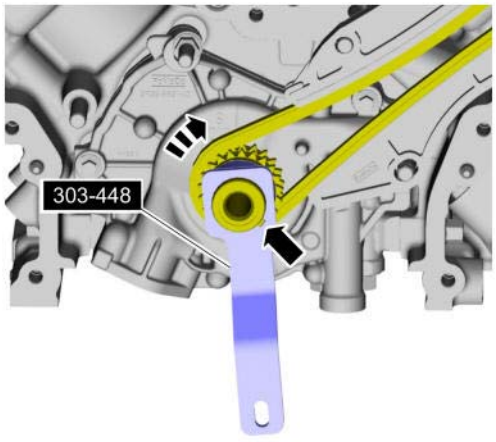


NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

6.
Remove the bolt and the RH timing chain guide.

7.

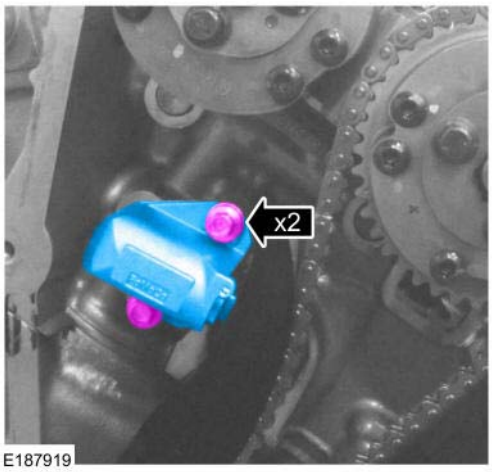
Remove the RH timing chain.



LH timing chain

8.

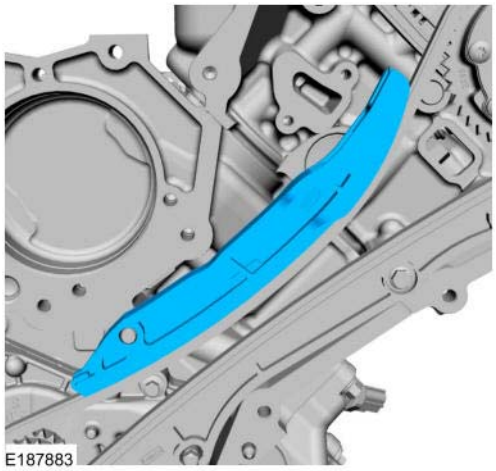
Using the special tool, rotate the crankshaft clockwise until the keyway is at the 5 o'clock position.



Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

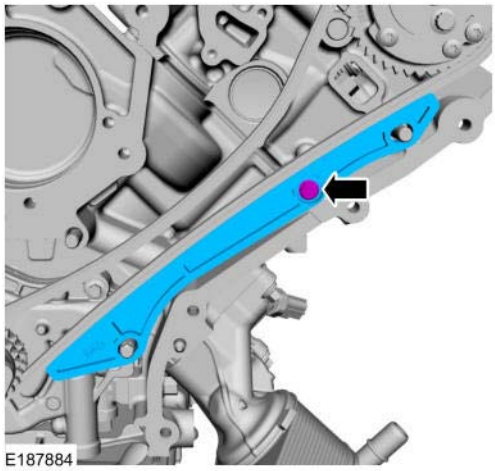
E187882

9.



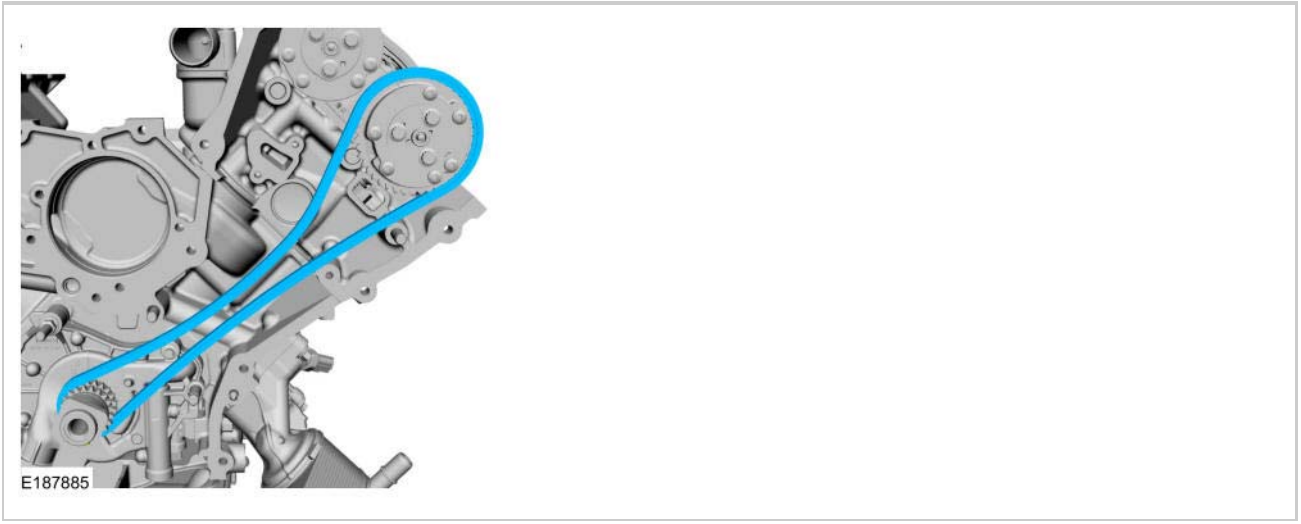
Remove the bolts and the LH primary timing chain tensioner.

E187919



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 5 o'clock position after removing the LH timing chain tensioner arm.

10.
Remove the LH timing chain tensioner arm.



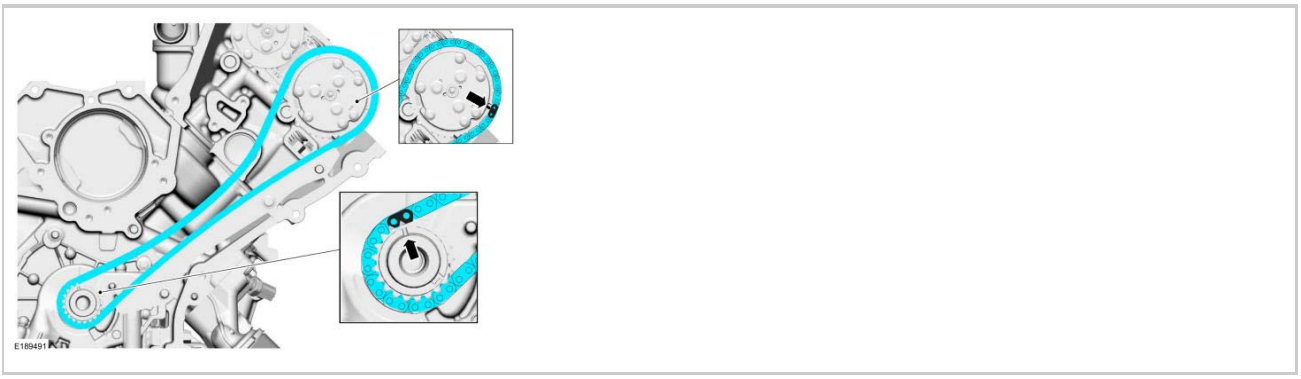
NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 5 o'clock position after removing the LH timing chain guide.

11.
Remove the bolt and the LH timing chain guide.

12.

Remove the LH timing chain.

REMOVAL AND INSTALLATION > TIMING CHAIN > INSTALLATION



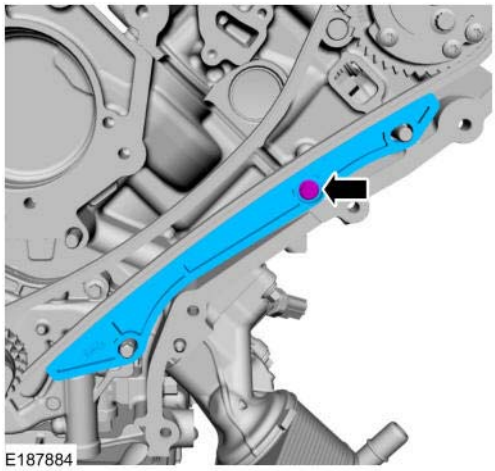
LH timing chain

1.

Install the LH timing chain.

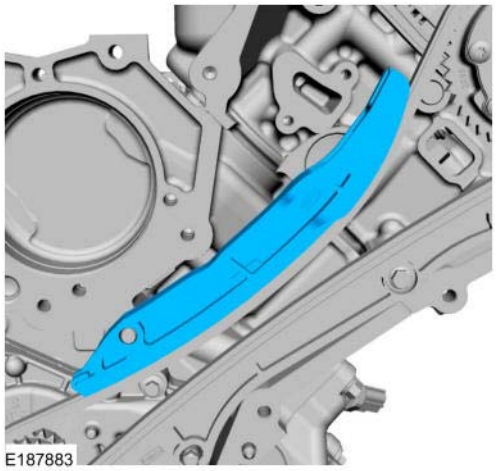
Align the colored link on the timing chain with the timing mark on the LH VCT assembly.

Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 5 o'clock position after installing the LH timing chain guide.

2.
Install the LH timing chain guide and bolt.

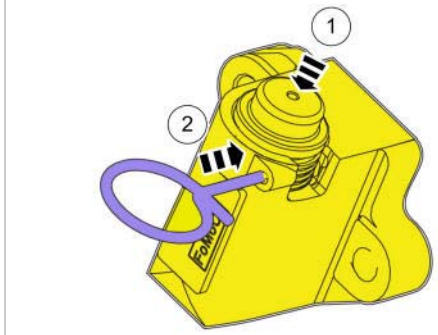


Torque

: 89 lb.in (10 Nm)

NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain arm. Return the crankshaft keyway to the 5 o'clock position after installing the LH timing chain arm.

3.
Install the LH timing chain tensioner arm.



4.

1.

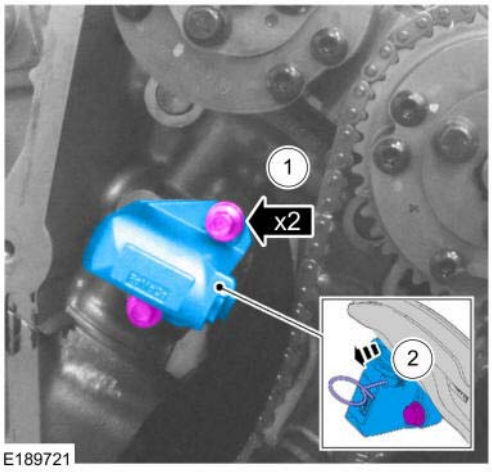
Compress the primary timing chain tensioner plunger, using an edge of a vise.

2.

Install a suitable pin into the hole of the tensioner housing to hold the plunger in place during installation.

5.

1.

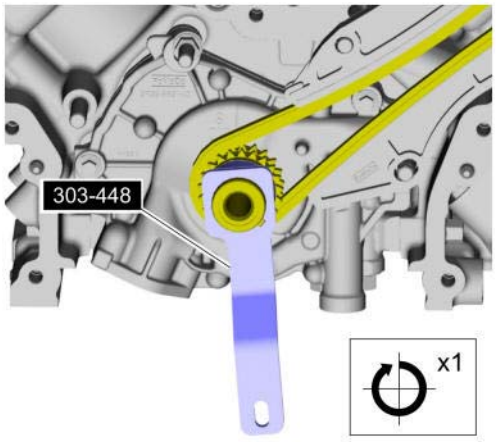


Install the LH primary timing chain tensioner and bolts.

Torque

: 89 lb.in (10 Nm)

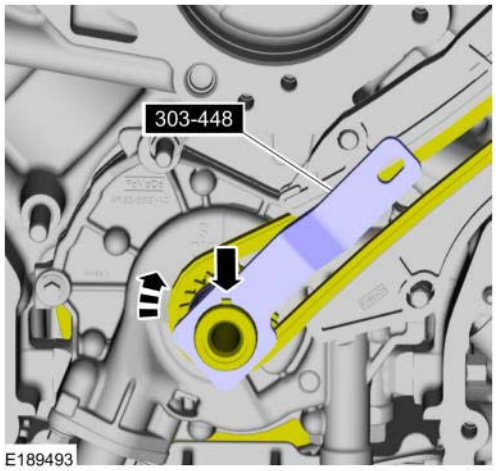
2.



Remove the holding pin from the tensioner.

6.

Using the special tool, rotate the crankshaft clockwise one complete revolution.

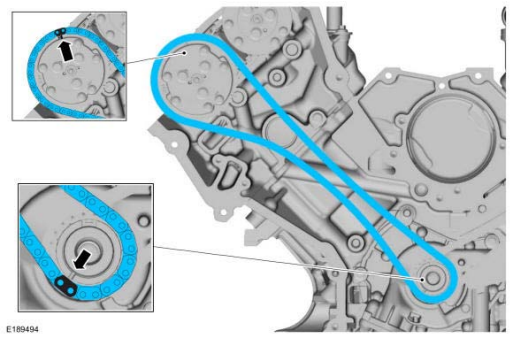


Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

7.

Using the special tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.



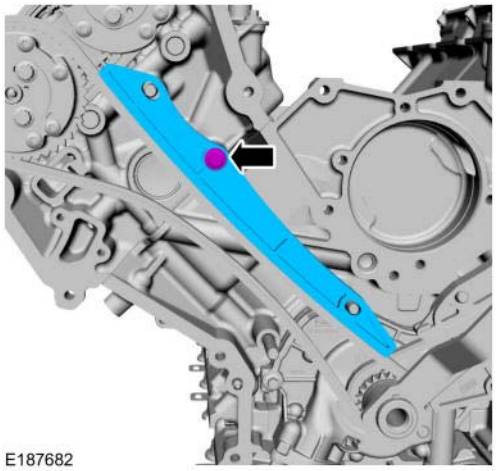
RH and LH timing chains

8.

Install the RH timing chain.

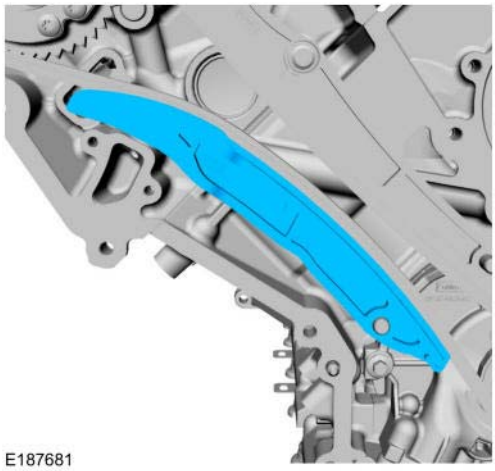
Align the colored link on the timing chain with the timing mark on the RH VCT assembly.

Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

9.
Install the RH timing chain guide and bolt.



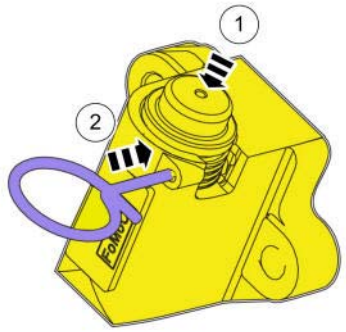
Torque

: 89 lb.in (10 Nm)

NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain arm.

10.
Install the RH timing chain tensioner arm.

E187681



11.

1.

Compress the primary timing chain tensioner plunger, using an edge of a vise.

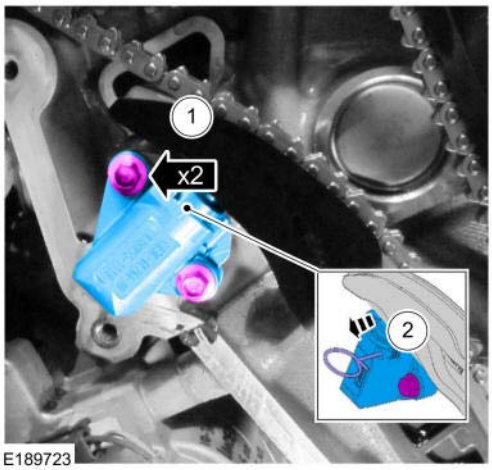
2.

Install a suitable pin into the hole of the tensioner housing to hold the plunger in place during installation.

E189722

12.

1.



Install the RH primary timing chain tensioner and bolts.

Torque

: 89 lb.in (10 Nm)

2.

Remove the holding pin from the tensioner.

13.

Install the engine front cover. Refer to: Engine Front Cover .

REMOVAL AND INSTALLATION > VALVE COVER LH

Special Tool(s) / General Equipment

	205-142 (T80T-4000-J) Installer, Differential Bearing Cone
	205-153 (T80T-4000-W) Handle
	303-1247 VCT Spark Plug Tube Seal Remover and Installer TKIT-2006UF-FLM TKIT-2006UF-ROW
Plastic Scraper	

Materials

Name	Specification

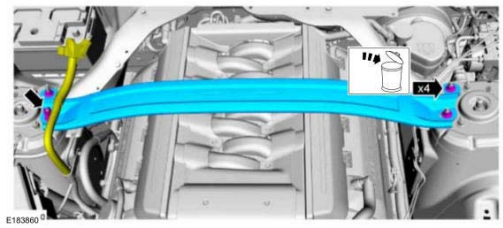
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

REMOVAL AND INSTALLATION > VALVE COVER LH > REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1.

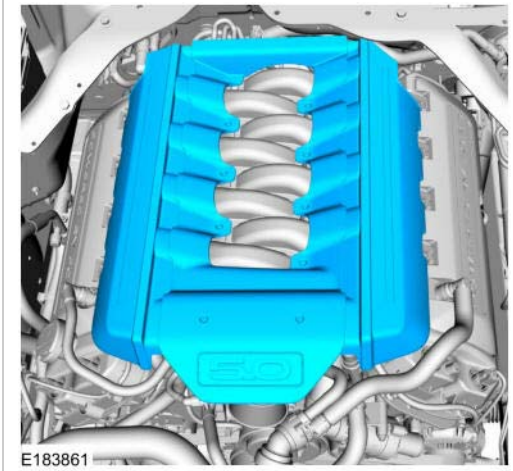
Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS)



2.

Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

3.



If equipped with a strut tower cross brace, detach the wiring harness retainer.

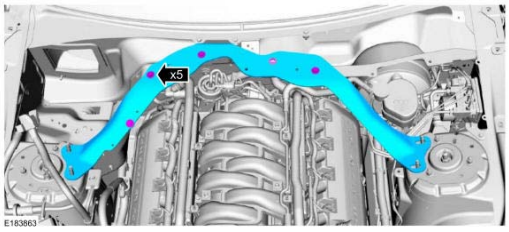
Remove the nuts and the strut tower cross brace.

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

4.
Remove the engine appearance cover.

5.

Remove the following items:



Refer to: AIR CLEANER OUTLET PIPE .

Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

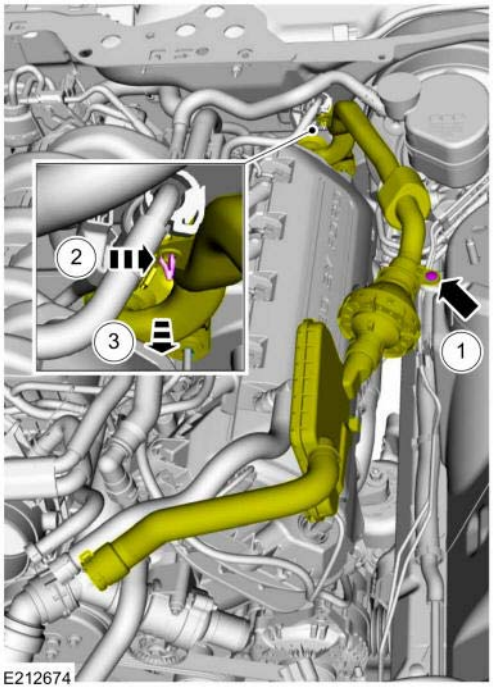
Refer to: Cowl Panel Grille .

6.

Remove the fasteners and the cowl extension.

7.

1.



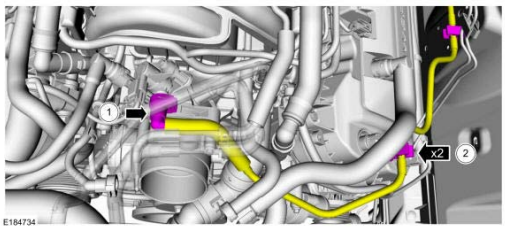
Remove the pin-type retainer.

2.

Depress the retainer.

3.

Position the sound enhancement pipe aside.



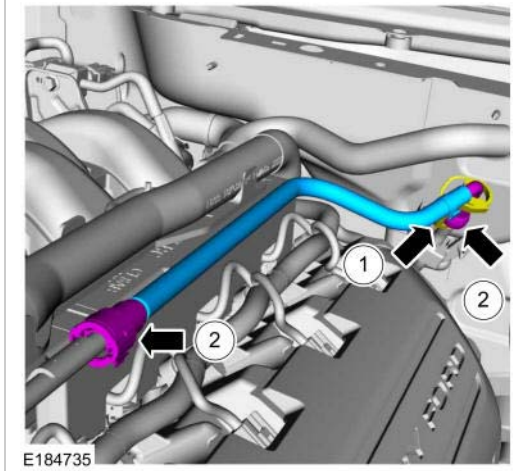
8.

1.

Disconnect the EVAP tube quick release coupling. Refer to: QUICK RELEASE COUPLING .

2.

Detach the EVAP tube from the retainers.



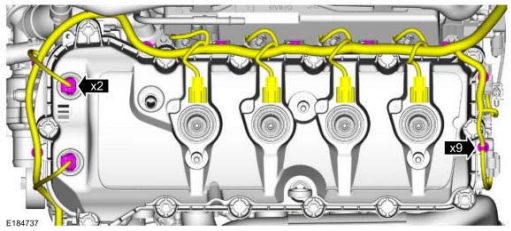
9.

1.

Position the safety clip aside.

2.

Disconnect the quick release couplings and remove the fuel tube. Refer to: QUICK RELEASE COUPLING .



10.

Remove the LH ignition coils. Refer to: IGNITION COIL-ON-PLUG .

11.

Disconnect the VCT variable force solenoid electrical connectors.

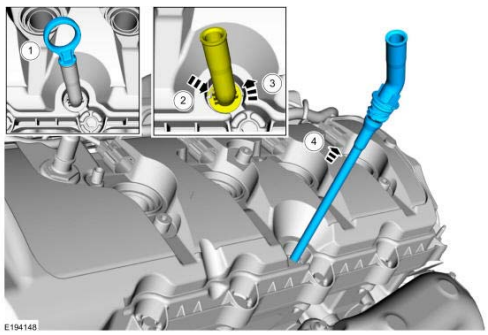
Detach the wiring harness retainers.

12.

1.

Remove the oil level indicator.

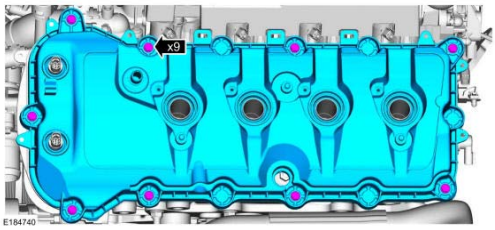
2.



Depress the tab.

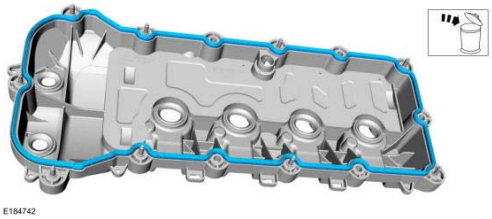
3.

Rotate the oil level indicator tube counterclockwise.



4.

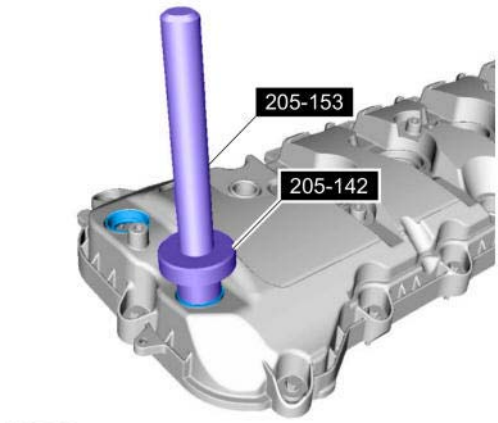
Pull the oil level indicator tube from the engine.



13.

Loosen the bolts and remove the valve cover.

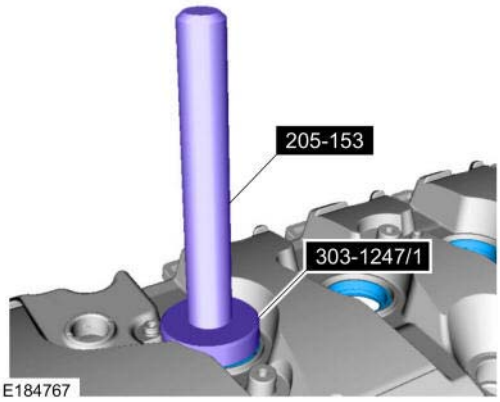
NOTE: Clean the valve cover gasket groove with soap and water or a suitable solvent.



14.
Remove and discard the gasket.

15.

Inspect the VCT variable force solenoid seals. Remove and discard any damaged seals using the special tools.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle,205-142 (T80T-4000-J)Installer, Differential Bearing Cone.

16.

Inspect the spark plug seals. Remove and discard any damaged seals using the special tools.

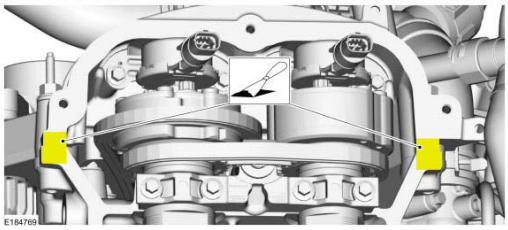
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

17.
Clean the valve cover mating surface of the cylinder head and engine front cover. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



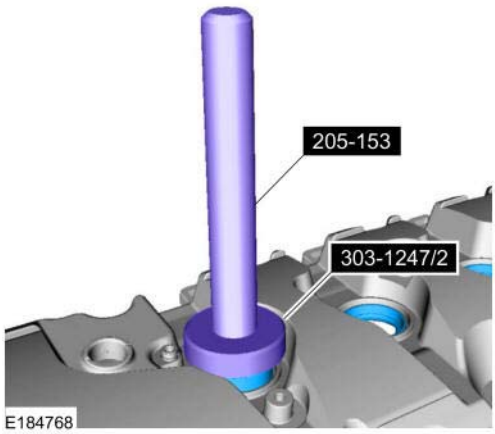
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Material

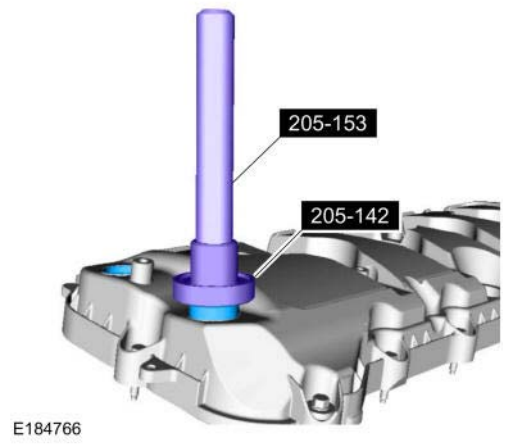
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



REMOVAL AND INSTALLATION > VALVE COVER LH > INSTALLATION

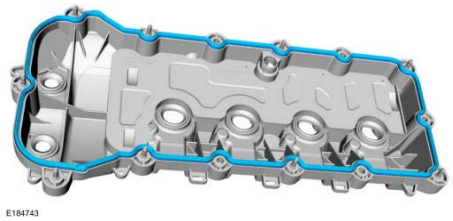
NOTE: Installation of new seals is only required if damaged seals were removed.

1.
Using the special tools, install new spark plug tube seals.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Installation of new seals is only required if damaged seals were removed.

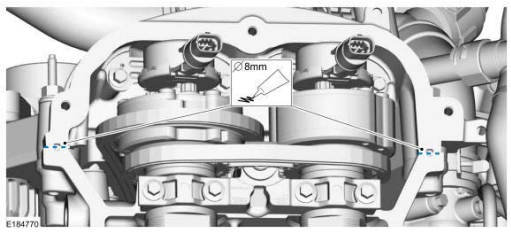


2.
Using the special tools, install new VCT variable force solenoid seals.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J) Installer, Differential Bearing Cone.

3.

Install a new gasket.

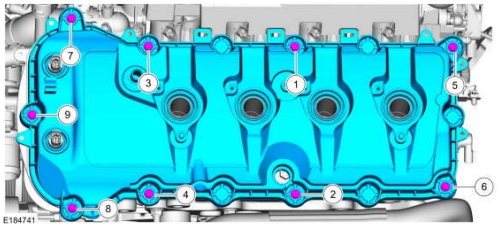


NOTE: If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned.

4.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-cylinder head joints.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



5.

Install the valve cover and tighten the bolts.

Torque

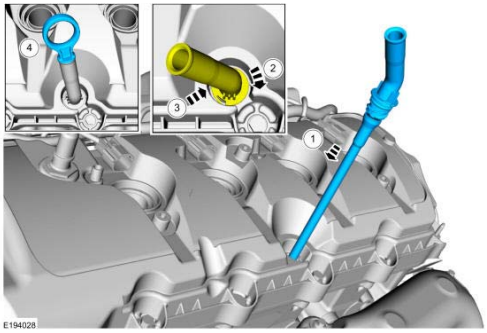
: 89 lb.in (10 Nm)

6.

1.

Push the oil level indicator tube into the engine.

2.

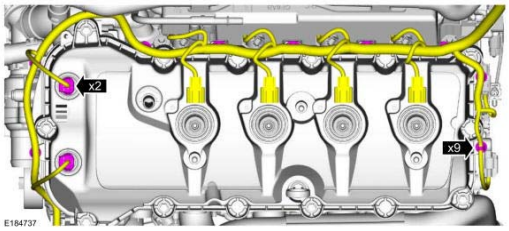


Rotate the oil level indicator tube clockwise.

3.

Verify the tab is locked in place.

4.



Install the oil level indicator.

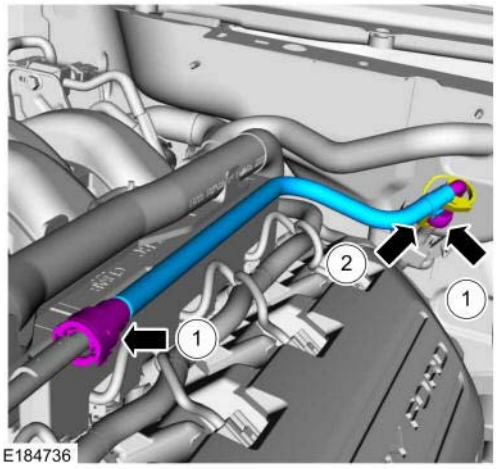
7.

Attach the wiring harness retainers.

Connect the VCT variable force solenoid electrical connectors.

8.

Install the LH ignition coils. Refer to: IGNITION COIL-ON-PLUG .



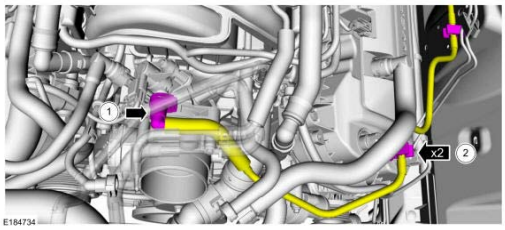
9.

1.

Position the fuel tube and connect the quick release couplings. Refer to: QUICK RELEASE COUPLING .

2.

Install the safety clip.



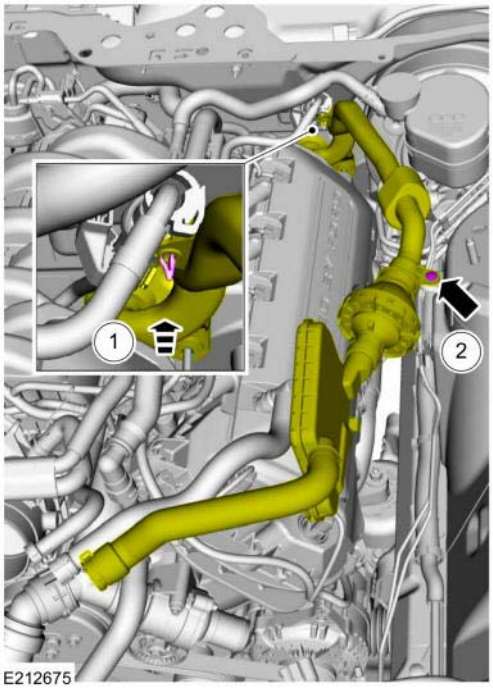
10.

1.

Connect the EVAP tube coupling. Refer to: QUICK RELEASE COUPLING .

2.

Attach the EVAP tube to the retainers.



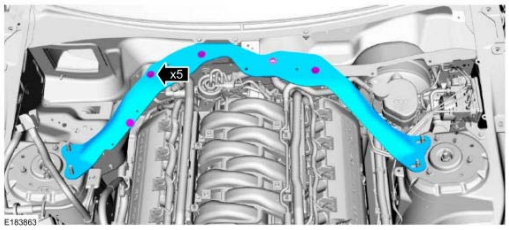
11.

1.

Position the sound enhancement pipe onto the retainer.

2.

Install the pin-type retainer.



12.

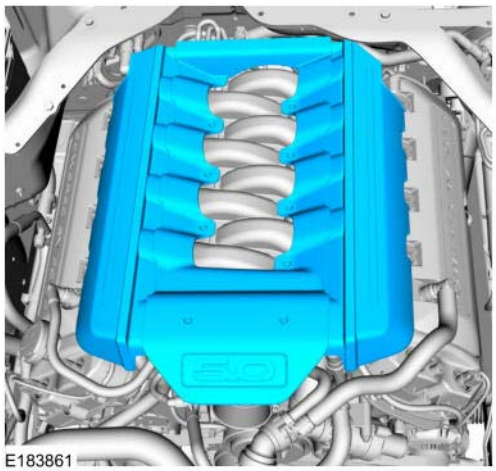
Install the cowl extension and fasteners.

Torque

: 26 lb.ft (35 Nm)

13.

Install the following items:



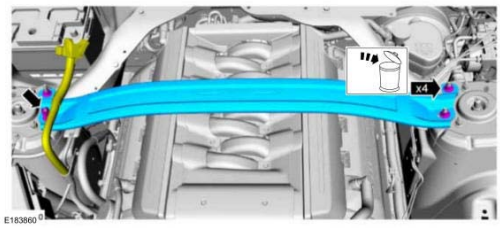
Refer to: Cowl Panel Grille .

Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

Refer to: AIR CLEANER OUTLET PIPE .

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

14.
Install the engine appearance cover.



15.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

16.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

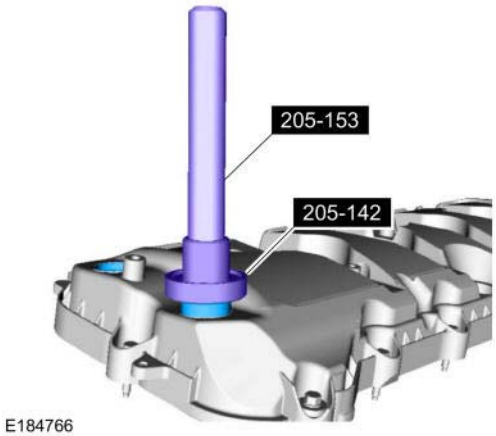
REMOVAL AND INSTALLATION > VALVE COVER RH > INSTALLATION

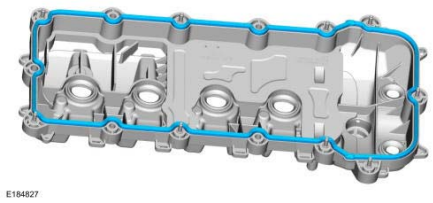
NOTE: Installation of new seals is only required if damaged seals were removed.

1.
Using the special tools, install new spark plug tube seals.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Installation of new seals is only required if damaged seals were removed.

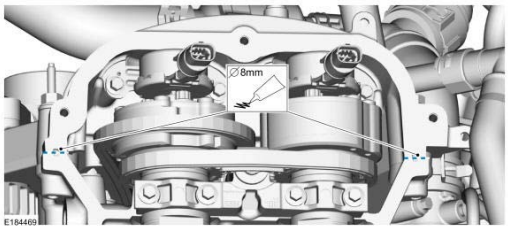


2.
Using the special tools, install new VCT variable force solenoid seals.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J) Installer, Differential Bearing Cone.

3.

Install a new gasket.

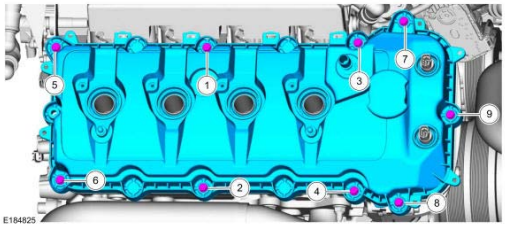


NOTE: If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned.

4.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-cylinder head joints.

Material

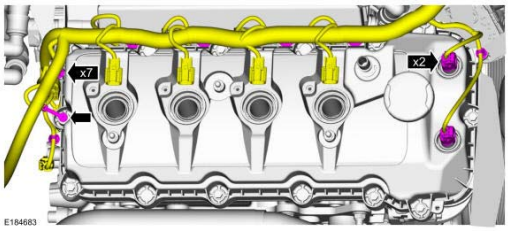
: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



5.

Install the valve cover and tighten the bolts.

Torque



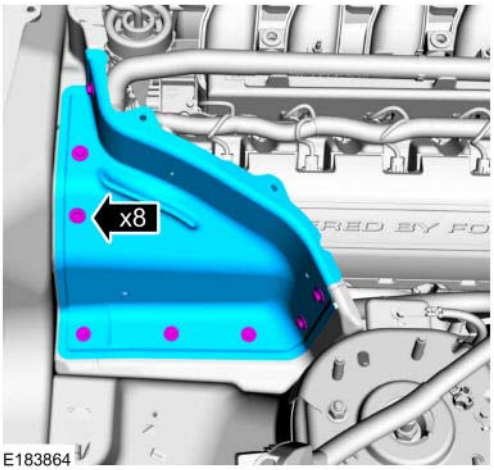
: 89 lb.in (10 Nm)

6.

Attach the wiring harness retainers.

Connect the VCT variable force solenoid electrical connectors.

7.



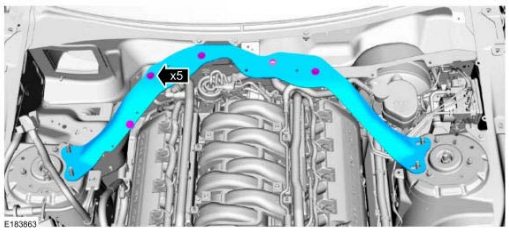
Install the RH ignition coils. Refer to: IGNITION COIL-ON-PLUG .

8.

Install the battery heat shield and fasteners.

Torque

: 80 lb.in (9 Nm)



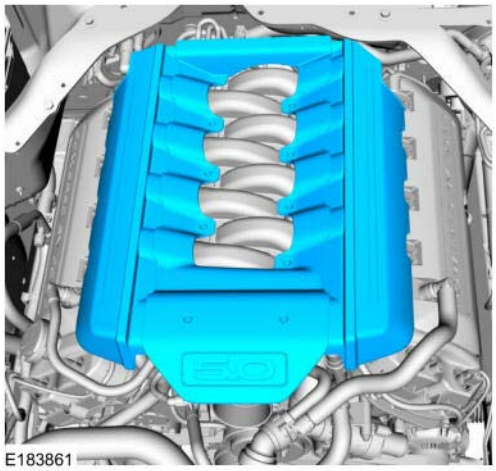
9.

Install the cowl extension and fasteners.

Torque

: 26 lb.ft (35 Nm)

10.



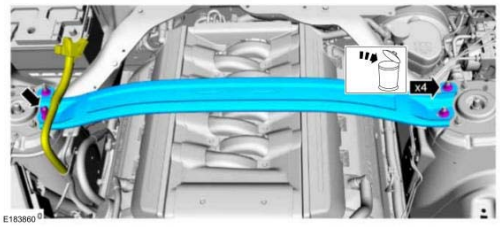
Install the following items:

Refer to: Battery Tray .

Refer to: Cowl Panel Grille .

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

11.
Install the engine appearance cover.



12.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

13.

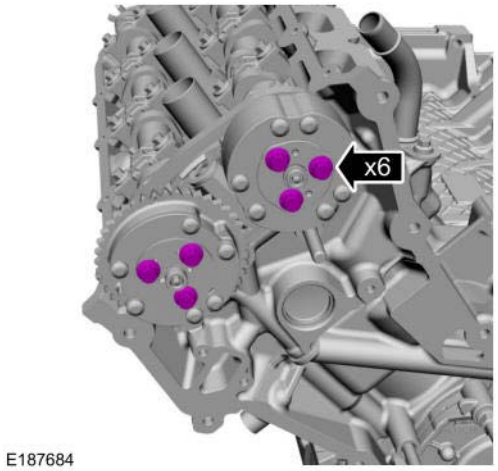
Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT >

REMOVAL

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

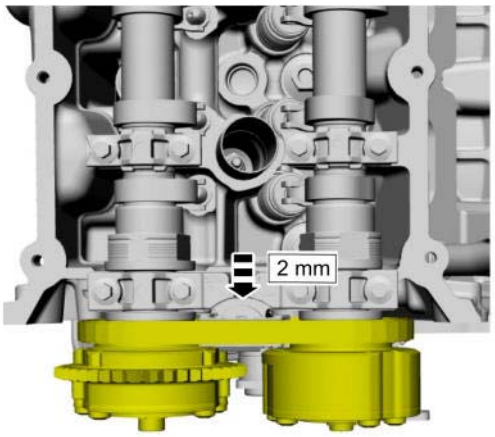
NOTE: If the RH VCT units are being serviced at the same time as the LH VCT units, remove the RH VCT units first.



Right hand units

1.

Remove the RH timing chain. Refer to: Timing Chain .



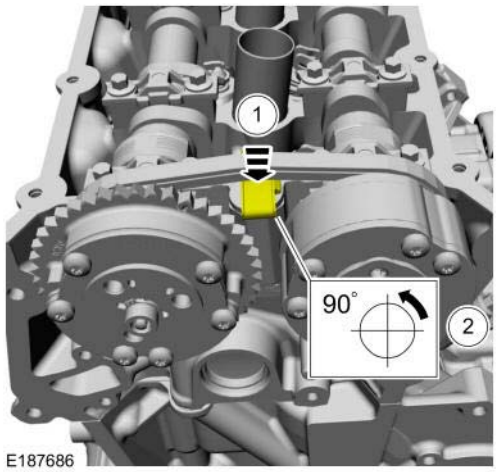
2.

Remove the intake and exhaust VCT assembly bolts.

3.

Slide the VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

E187685

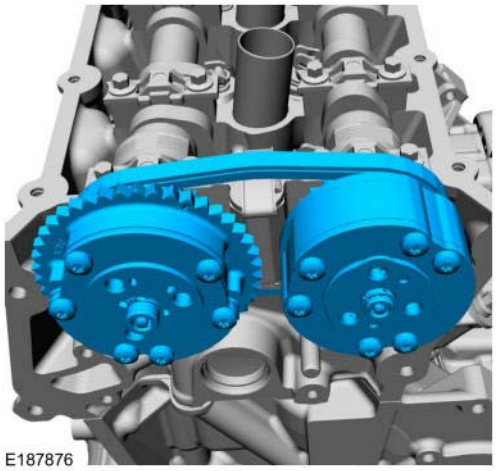


4.

1.

Depress the secondary timing chain tensioner.

2.

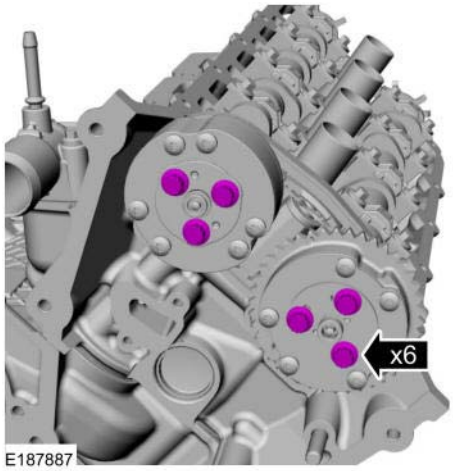


Turn the tensioner counterclockwise 90 degrees.

E187686

5.

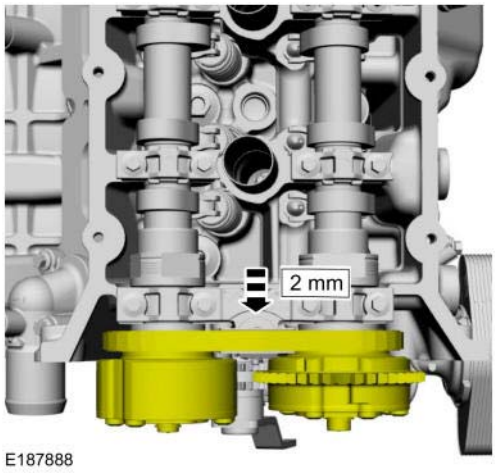
Remove the VCT assemblies and the secondary timing chain.



Left hand units

6.

Remove the LH timing chain. Refer to: Timing Chain .

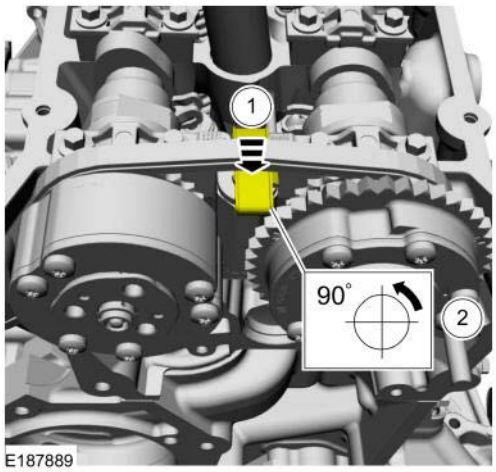


7.

Remove the intake and exhaust VCT assembly bolts.

8.

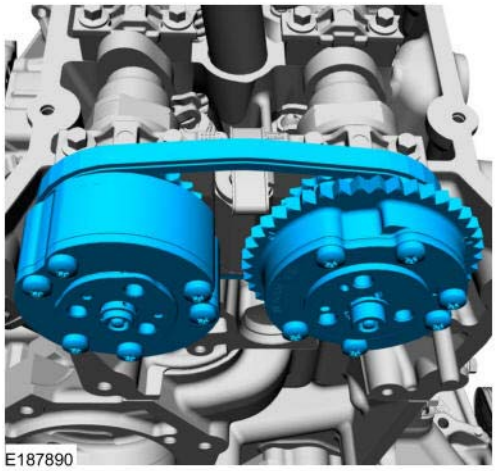
Slide the Variable Camshaft Timing VCT assemblies and secondary timing chain forward 2 mm (0.078 in).



9.

1.

Depress the secondary timing chain tensioner.



2.

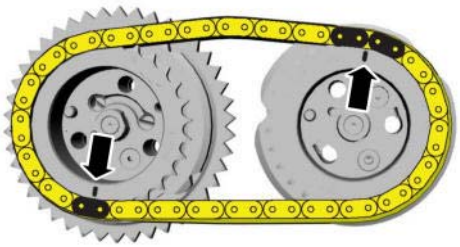
Turn the tensioner counterclockwise 90 degrees.

10.

Remove the VCT assemblies and the secondary timing chain.

E187890

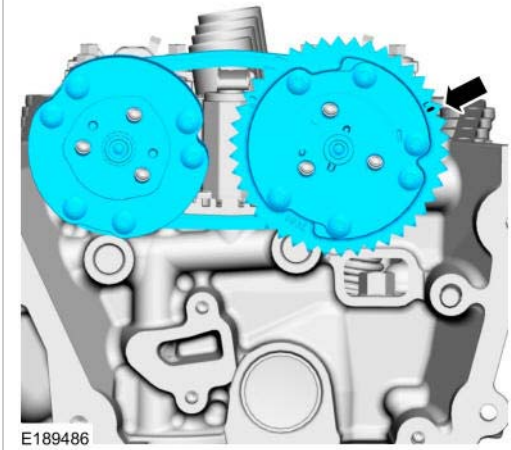
REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) UNIT > INSTALLATION



Left hand units

1.

Position the secondary timing chain onto the VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.

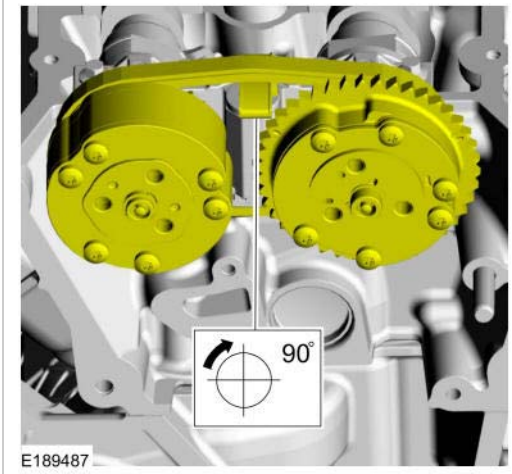


The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.

The timing mark on the exhaust VCT assembly should align with the single colored link.

E189485

2.

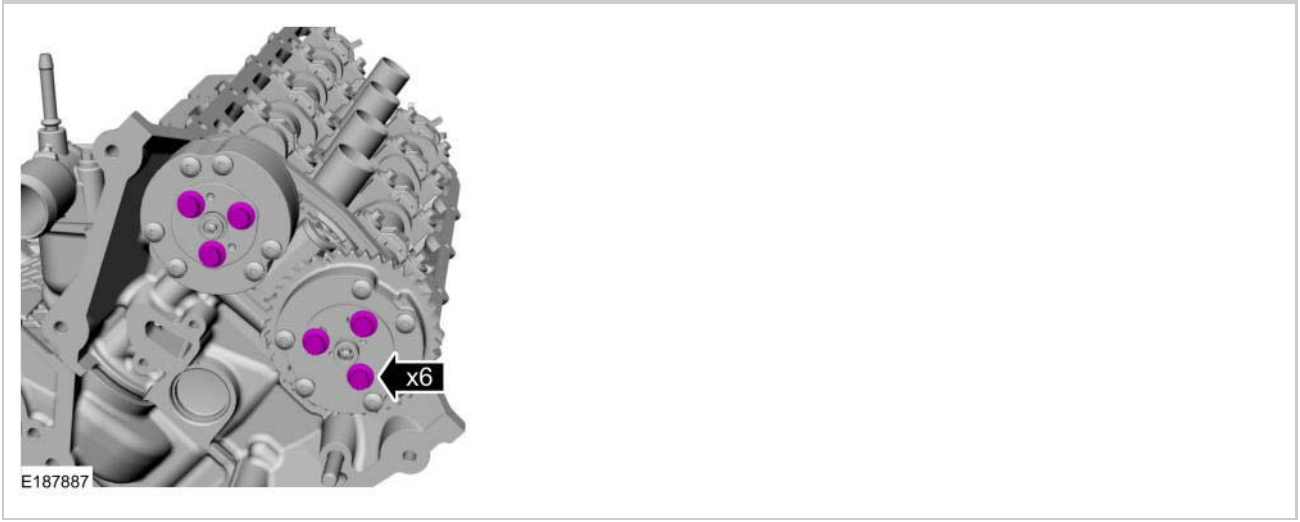


Install the VCT assemblies and the secondary timing chain onto the camshafts. The timing mark on the exhaust VCT assembly should be approximately in the 2 o'clock position.

NOTE: It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

3.
Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.

If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



NOTE: Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

4.
Install the intake and the exhaust VCT assembly bolts.

Torque:

Stage 1: 133 lb.in (15 Nm)

Stage 2: 90°

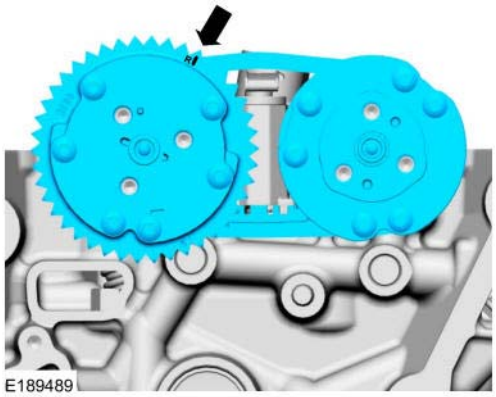
5.

Install the LH timing chain. Refer to: Timing Chain .

Right hand units

6.

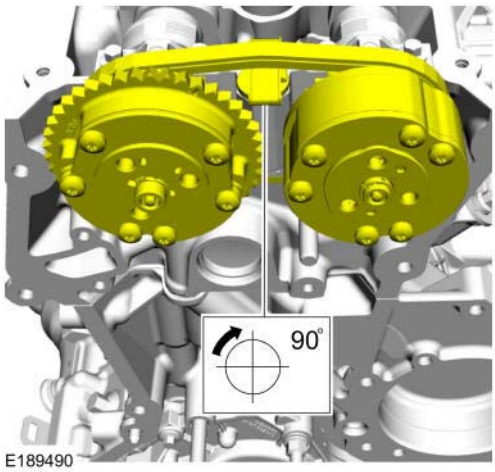
Position the secondary timing chain onto the VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.



The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.

The timing mark on the exhaust VCT assembly should align with the single colored link.

7.

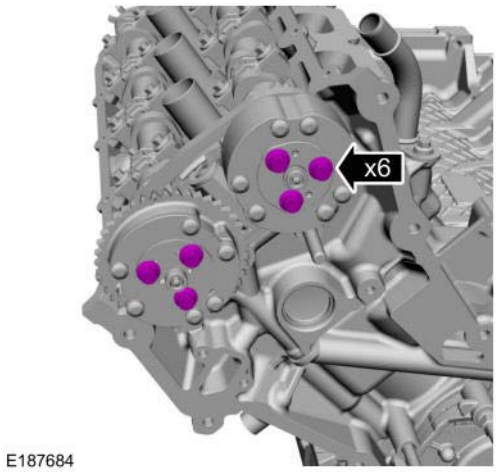


Install the VCT assemblies and the secondary timing chain onto the camshafts. The timing mark on the exhaust VCT assembly should be approximately in the 1 o'clock position.

NOTE: It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

8.
Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.

If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



NOTE: Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

9.
Install the intake and the exhaust VCT assembly bolts.

Torque:

Stage 1: 133 lb.in (15 Nm)

Stage 2: 90°

10.

Install the RH timing chain. Refer to: Timing Chain .

REMOVAL > ENGINE

Special Tool(s) / General Equipment

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

3.

Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

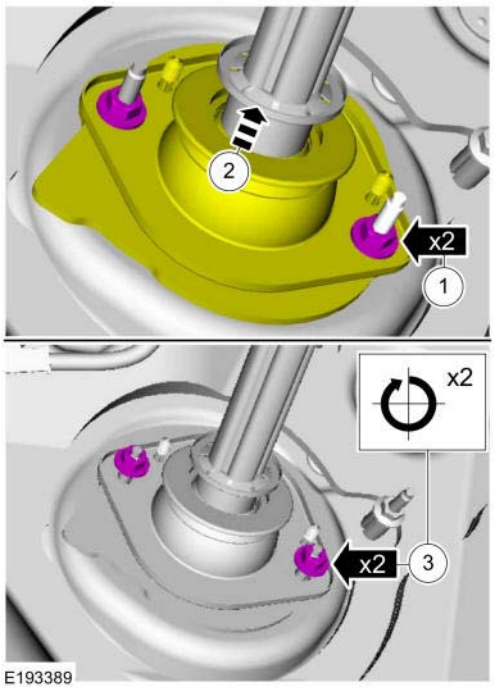
4.

Drain the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

> *NOTE: Make sure to minimize damage to sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.*

5.

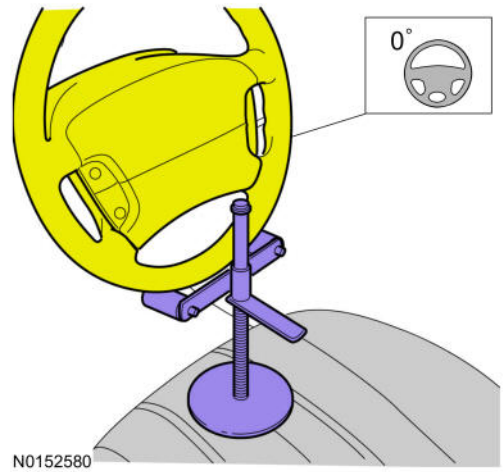
1.



Remove the steering column dash seal nuts.

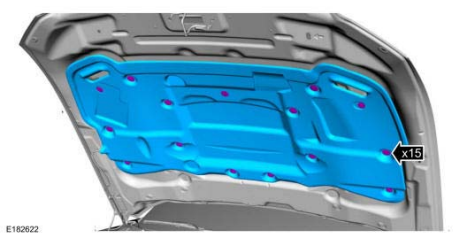
2.

Loosen the dash seal.



3.

Hand start the dash seal nuts.

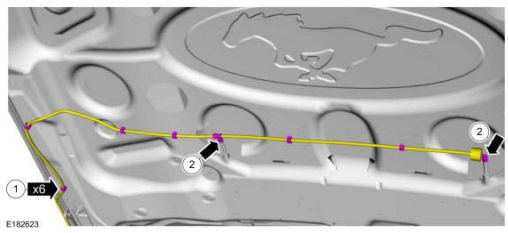


6.

Using a holding device, hold the steering wheel in the straight-ahead position.

7.

Remove the pin-type retainers and the hood insulation.



8.

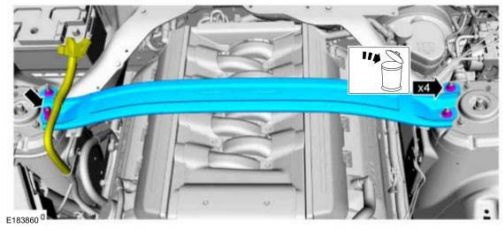
1.

Detach the windshield washer hose retainers.

2.

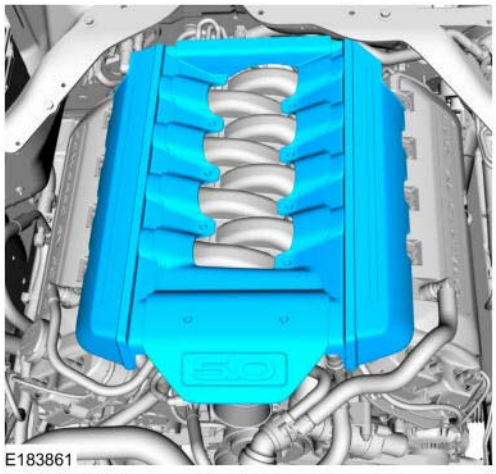
Disconnect the windshield washer hose C-Lock Couplers.

NOTE: Index-mark the hood hinge location to aid in hood installation.



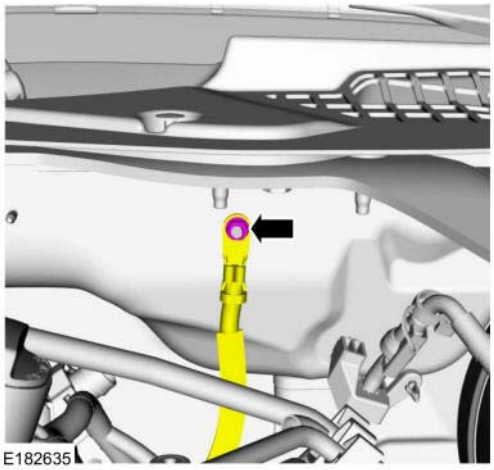
9.
Remove the nuts and the hood.

10.



If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



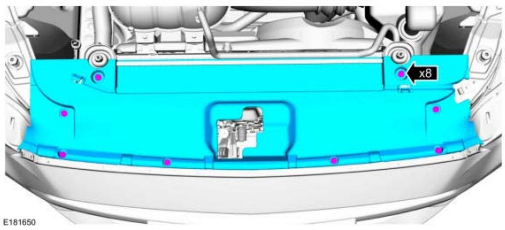
NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

11.
Remove the engine appearance cover.

12.

Remove the nut and the engine ground wire from the cowl.

NOTE: It is not necessary to separate the air cleaner outlet pipe and the air cleaner, the 2 components can be removed as an assembly.



13.
Remove the following items:

Refer to: AIR CLEANER OUTLET PIPE .

Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS)

14.

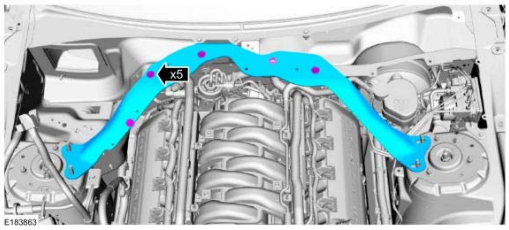
Remove the retainers and the radiator top shield.

15.

Remove the following items:

Refer to: DEGAS BOTTLE .

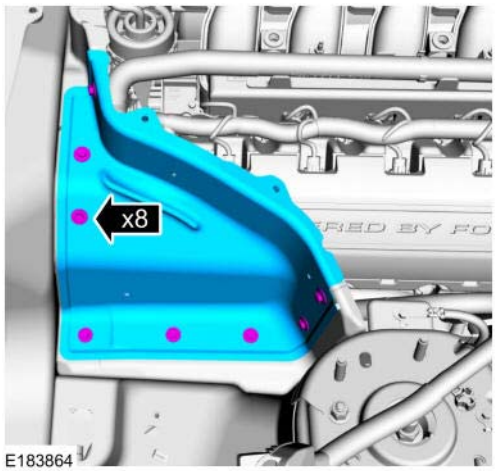
Refer to: COOLING FAN MOTOR AND SHROUD .



Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

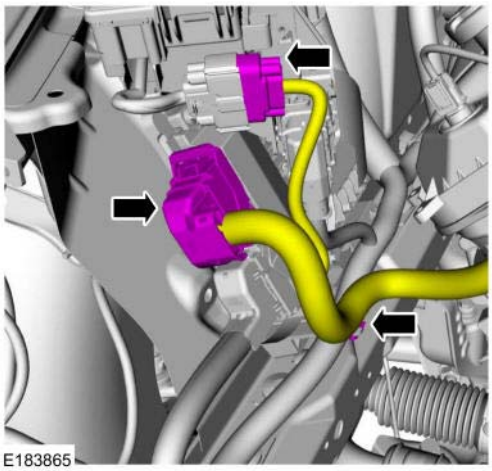
Refer to: Battery Tray .

Refer to: Cowl Panel Grille .



16.

Remove the fasteners and the cowl extension.



17.

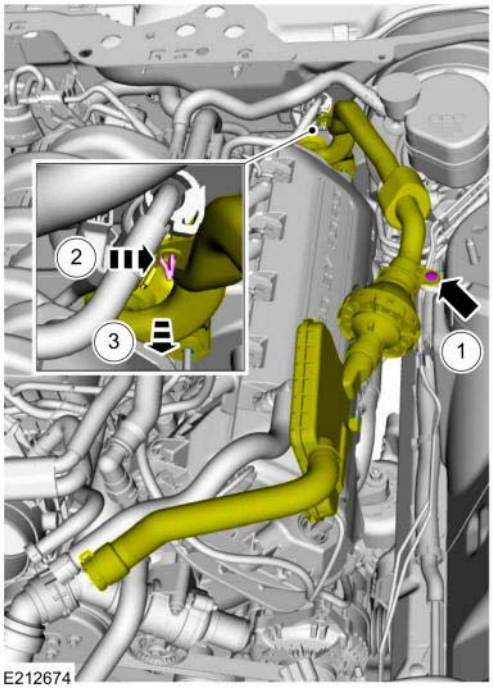
Remove the fasteners and the battery heat shield.

18.

Disconnect the top PCM electrical connector, the 16 pin electrical connector and detach the wiring harness retainers from the PCM bracket.

19.

1.



Remove the pin-type retainer.

2.

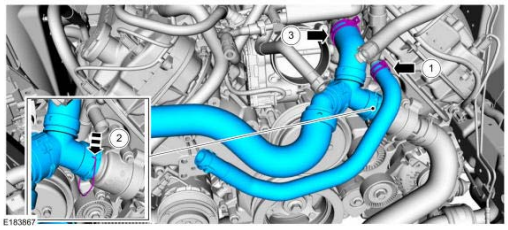
Depress the retainer.

3.

Position the sound enhancement pipe aside.

20.

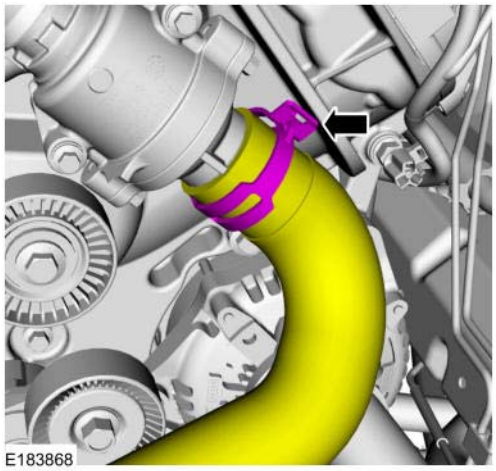
1.



Release the clamp and remove the degas bottle hose.

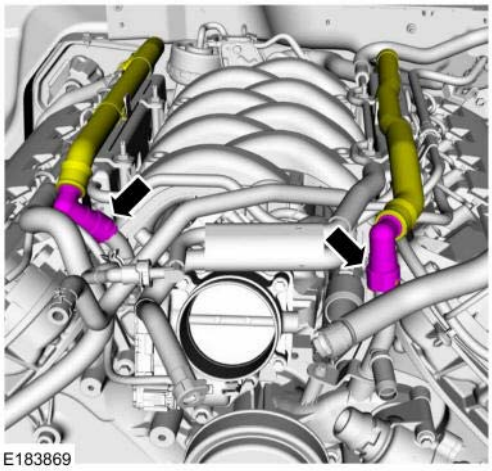
2.

Slide the spring clip until it hits the stop on the hose fitting.



3.

Release the clamp and remove the coolant bypass T assembly from the engine.

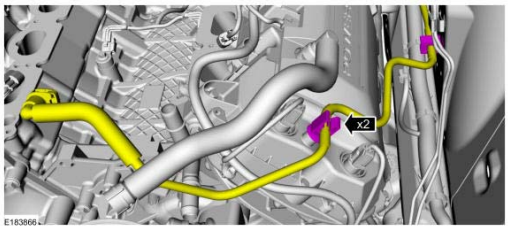


21.

Disconnect the lower radiator hose from the thermostat housing assembly.

22.

Disconnect the heater hose quick connect couplings.

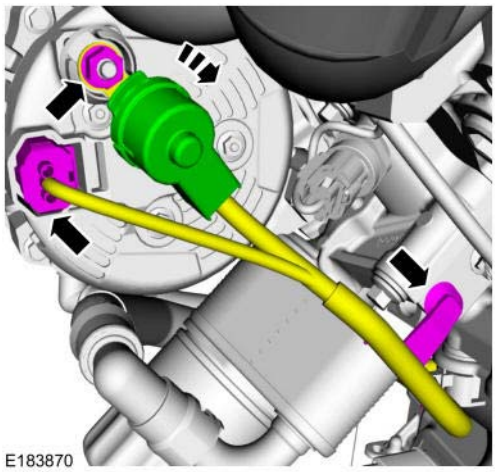


23.

Remove the intake manifold. Refer to: Intake Manifold .

24.

Detach the EVAP tube from the LH valve cover and the LH inner fender.



25.

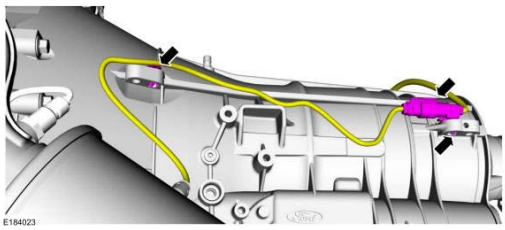
Position the cover aside.

Remove the nut and disconnect the B+ cable.

Disconnect the wiring harness electrical connector.

Detach the harness retainer.

26.



Remove the following items:

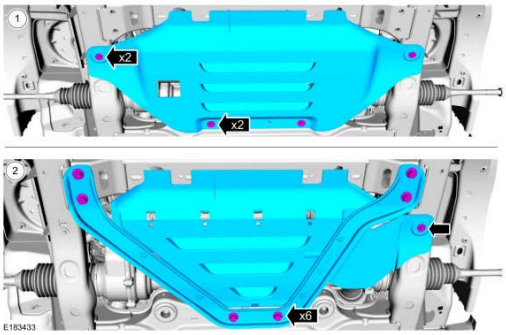
Refer to: CATALYTIC CONVERTER RH .

Refer to: STARTER MOTOR .

NOTE: Automatic transmission shown in illustration, manual transmission similar.

27.
Disconnect the LH catalyst monitor sensor electrical connector and detach the harness retainers.

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.



28.

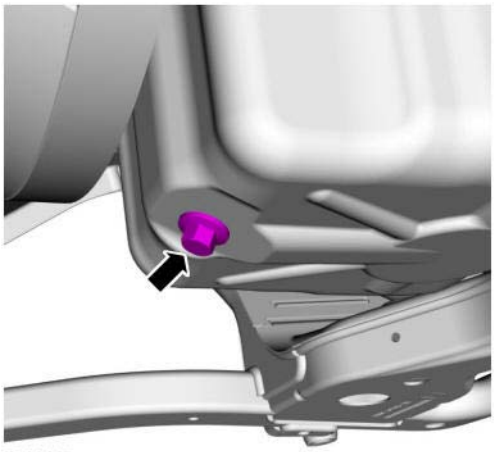
1.

Remove the bolts and the underbody shield.

2.

Remove the bolts and the subframe bracket and underbody shield assembly.

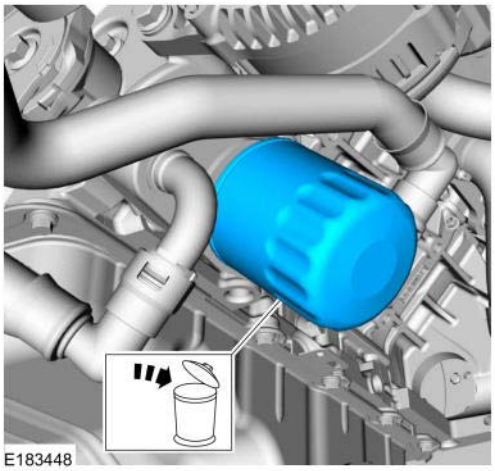
29.



Remove the oil pan drain plug and drain the engine oil.

Use the General Equipment: Oil Drain Equipment

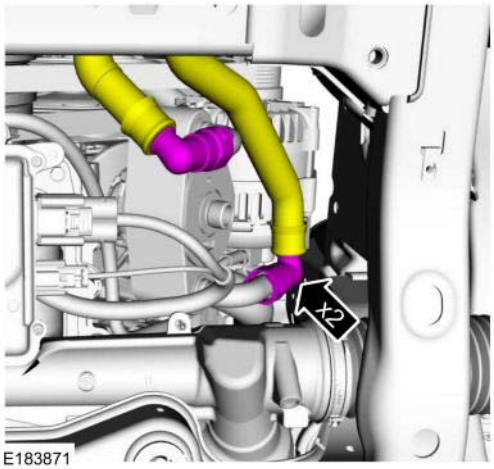
Install the oil pan drain plug.



Torque

: 19 lb.ft (26 Nm)

E183447

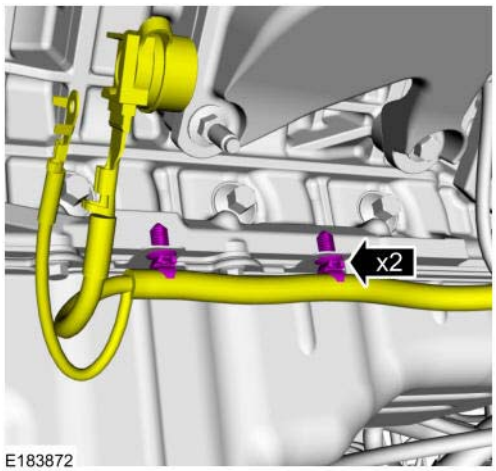


30.

Remove and discard the engine oil filter.

E183448

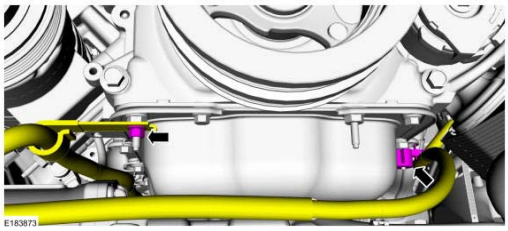
31.



Disconnect the oil cooler hoses.

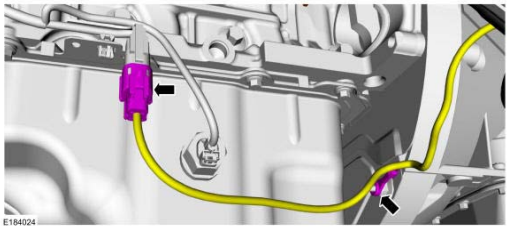
E183871

32.



Detach the wiring harness retainers from the oil pan.

33.



Remove the nut and the wiring harness retainer.

Detach the wiring harness retainer from the oil pan stud bolt.

34.

Disconnect the LH HO2S electrical connector and wiring harness retainer.

35.

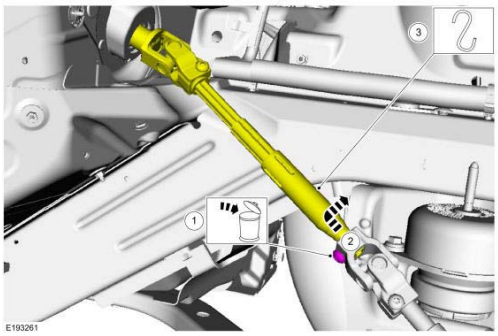
WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

Detach the steering column lower shaft from the lower coupling.

1.



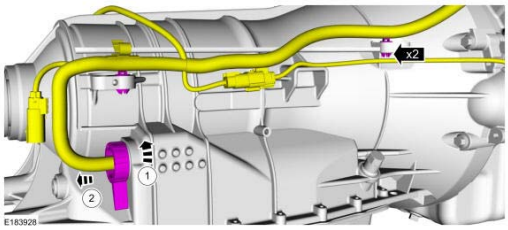
Remove and discard the steering column shaft bolt.

2.

Pull apart the steering column shaft from the coupling.

3.

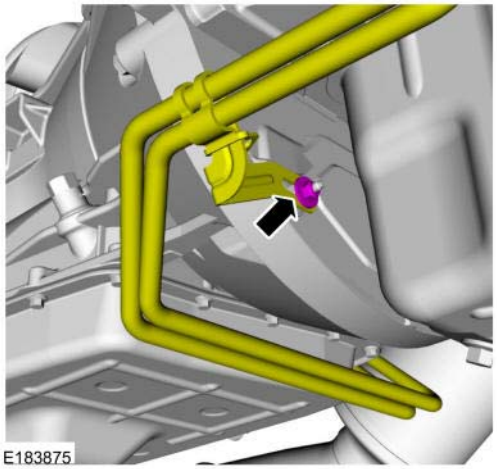
Secure the lower shaft to the frame rail to avoid damage to the shaft.



6-Speed Automatic Transmission - 6R80

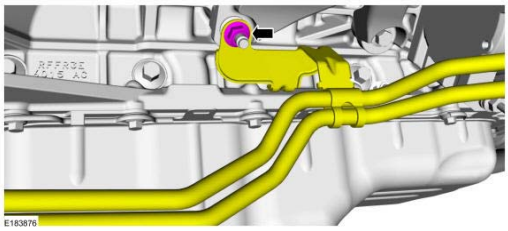
36.

Rotate the transmission electrical connector.



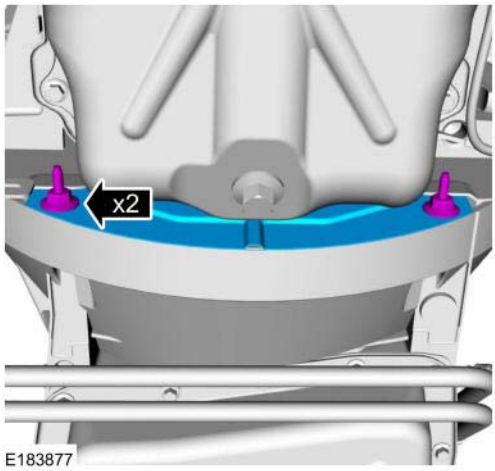
Pull the transmission electrical connector out to disconnect.

Detach the retainers and position the wiring harness aside.



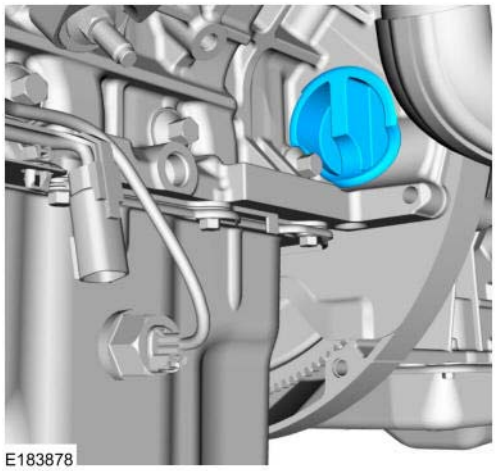
37.

Remove the transmission cooling tube nut and bracket from the flexplate inspection cover stud bolt.



38.

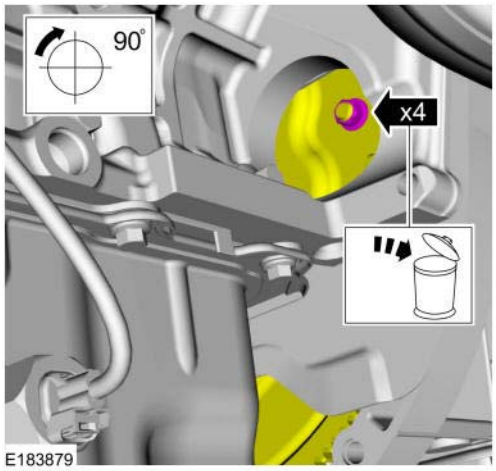
Remove the transmission cooling tube bracket nut and position the bracket and tubes aside.



39.

Remove the stud bolts and the flexplate inspection cover.

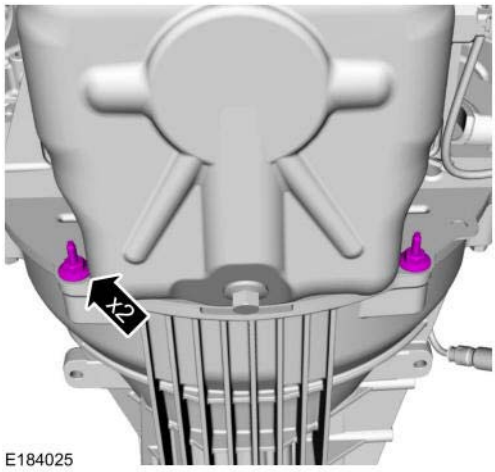
40.



Remove the rubber access plug.

NOTE: Only rotate the crankshaft in a clockwise direction.

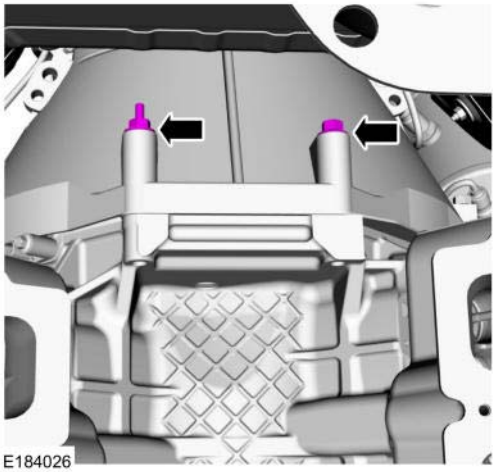
41.
Remove and discard the torque converter nuts.



Use the General Equipment: Magnetic Socket

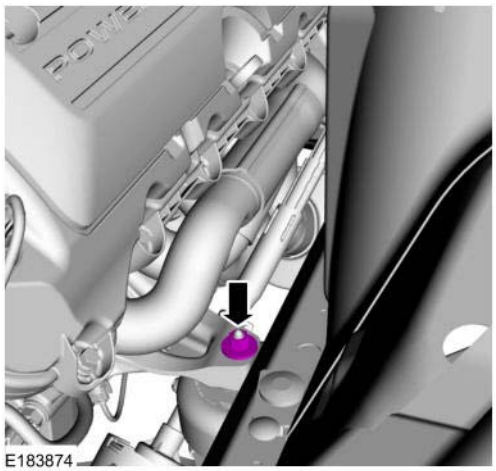
6-Speed Manual Transmission - MT82

42.



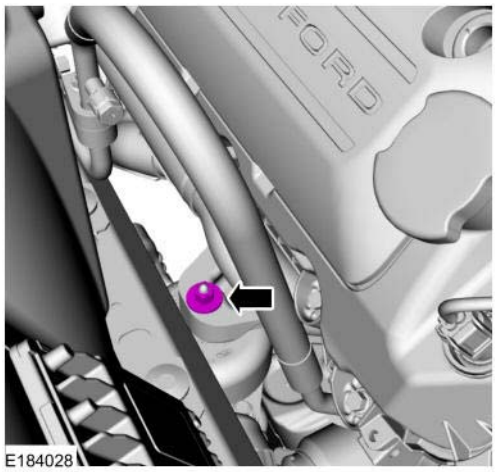
Remove the engine rear cover plate stud bolts.

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



43.

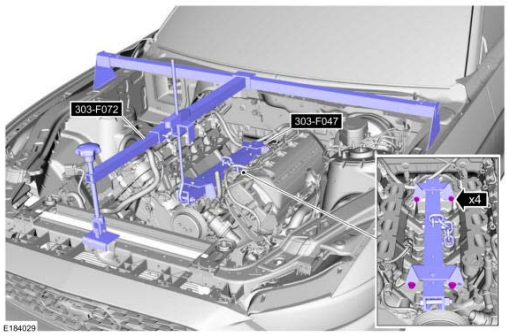
Remove the top transmission-to-engine bolt and stud bolt.



44.

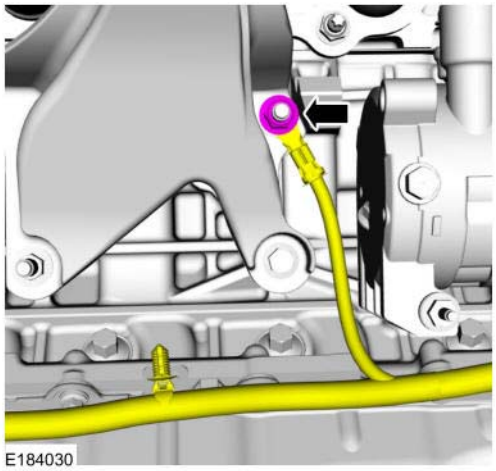
Remove the LH engine mount nut.

45.



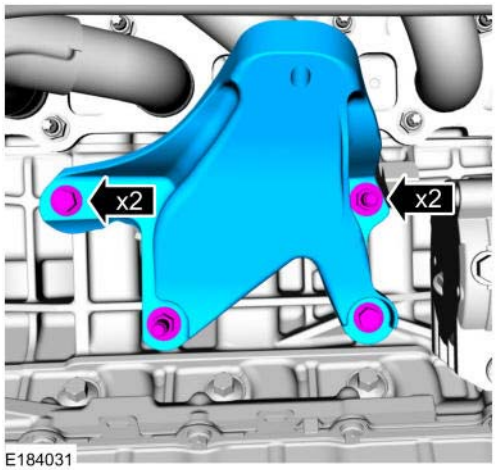
Remove the RH engine mount nut.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.



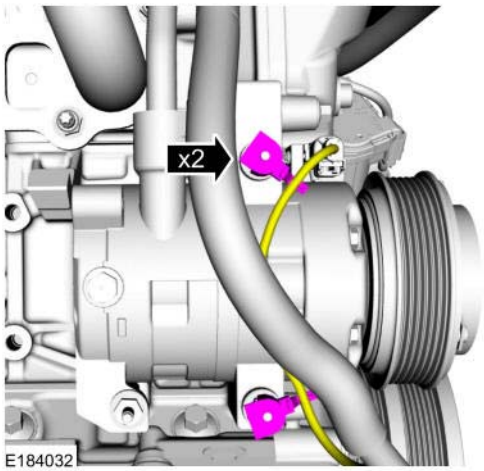
46.
Install the special tools and raise the engine 25 mm (1 inch).

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-F047 Lifting Bracket, Engine.



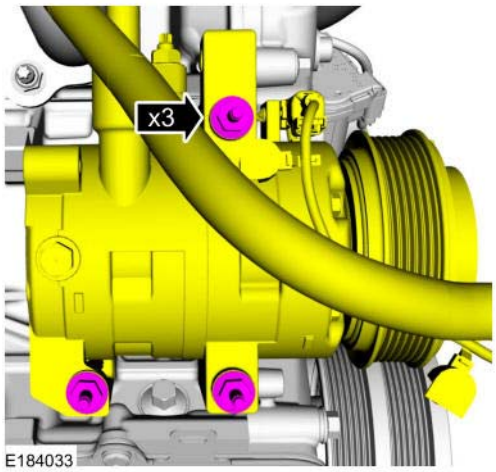
47.

Remove the nut and ground strap from the RH engine mount bracket stud bolt.



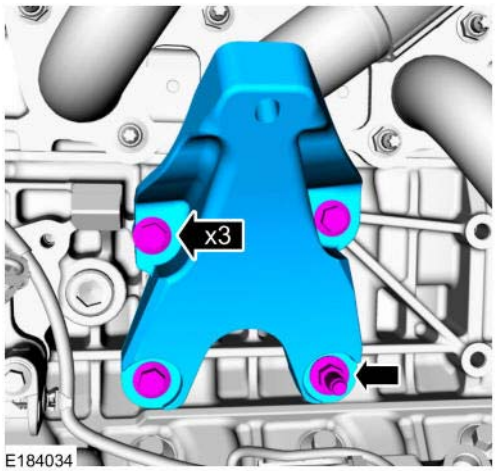
48.

Remove the bolts, the stud bolts and the RH engine mount bracket.



49.

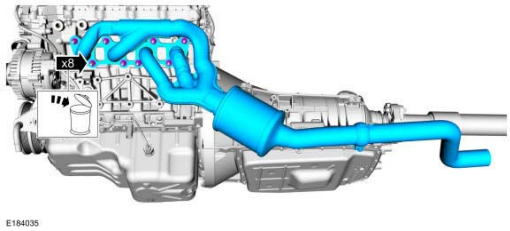
Detach the wiring harness retainers from the A/C compressor stud bolts.



50.

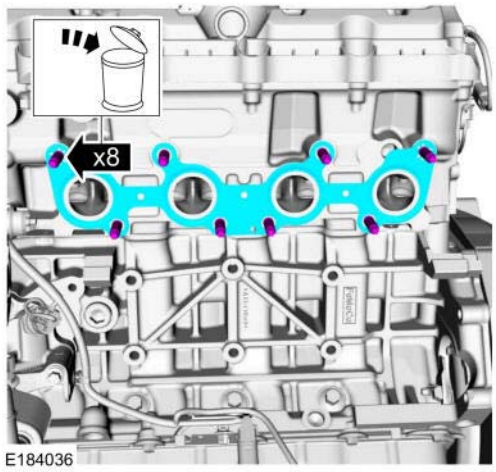
Remove the stud bolts and position the A/C compressor aside.

51.



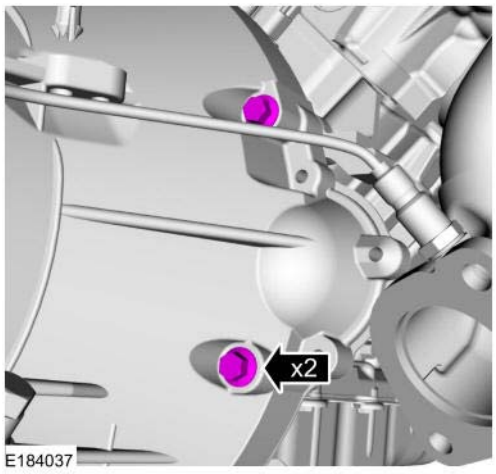
Remove the bolts, the stud bolt and the LH engine mount bracket.

52.



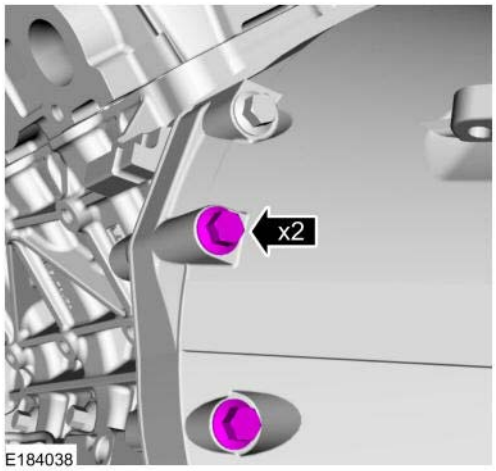
Remove and discard the nuts.

Remove the LH catalytic converter.



53.

Remove and discard the gasket and studs.



54.

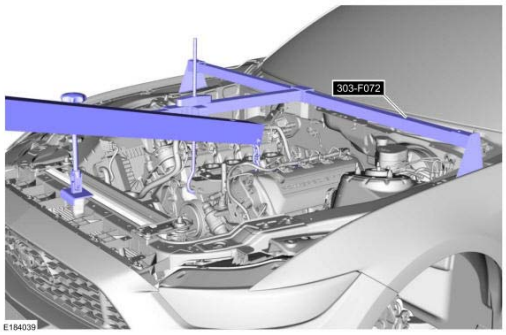
Remove RH transmission-to-engine bolts.

55.

Remove LH transmission-to-engine bolts.

56.

1.



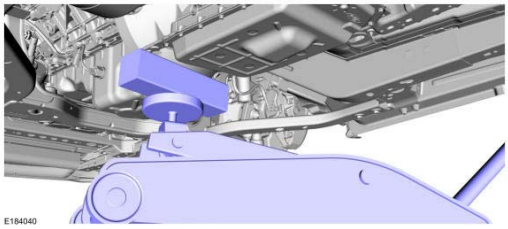
Attach the Floor Crane to the Engine Lifting Bracket

Use the General Equipment: Floor Crane

2.

Once the engine is supported by the Floor Crane, remove the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine.

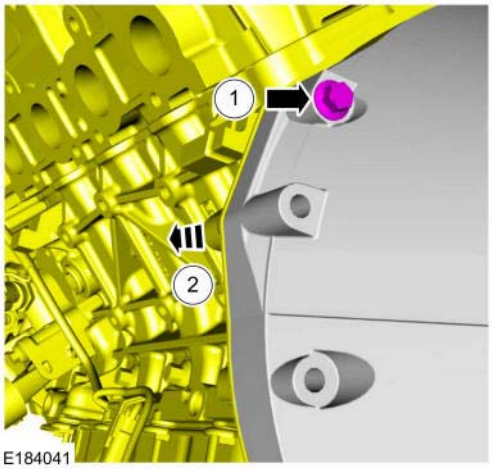


NOTE: Do not support the transmission by the fluid pan, failure to follow this instruction may result in serious damage to the transmission.

57.
Install a jack and wooden block under the transmission bell housing to support the transmission.

Use the General Equipment: Wooden Block

Use the General Equipment: Trolley Jack

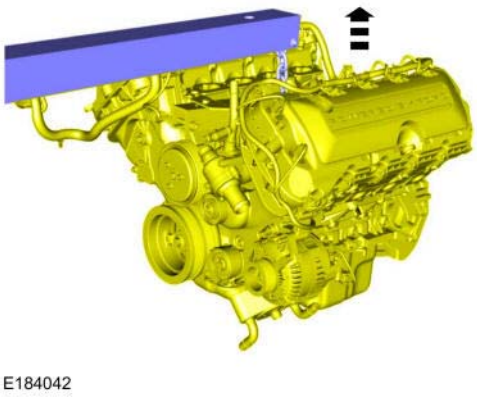


58.

1.

Remove the remaining transmission-to-engine bolt.

2.



Separate the engine from the transmission.

59.

Using the Floor Crane lift the engine from the vehicle.

Use the General Equipment: Floor Crane

DISASSEMBLY > ENGINE

Materials

Name	Specification
Motorcraft® Silicone Gasket Remover ZC-30-A	-
Motorcraft® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: Remove the cylinder heads before removing the crankshaft. Failure to do so can result in engine damage.

NOTE: If the components are to be reinstalled, they must be installed in their original location. Mark the components for installation into their original location.

NOTE: Refer to the exploded view under the Engine Component View .

6-Speed Automatic Transmission - 6R80

NOTE: The flexplate bolts are torque-to-yield design and are not reusable

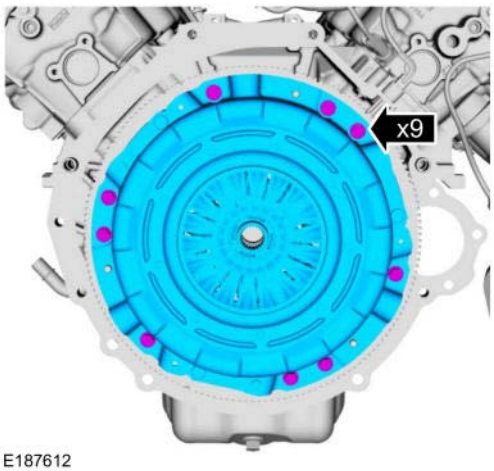
1.
Remove and discard the flexplate bolts.

Remove the flexplate.

6-Speed Manual Transmission - MT82

2.

WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved

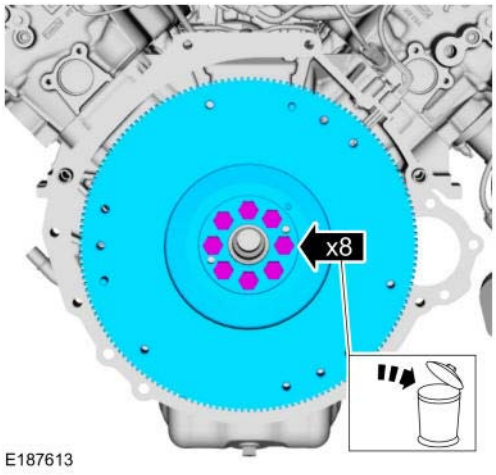


techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

NOTE: Loosen the bolts evenly to prevent clutch pressure plate damage.

NOTE: If the parts are to be reused, index-mark the pressure plate to the flywheel.

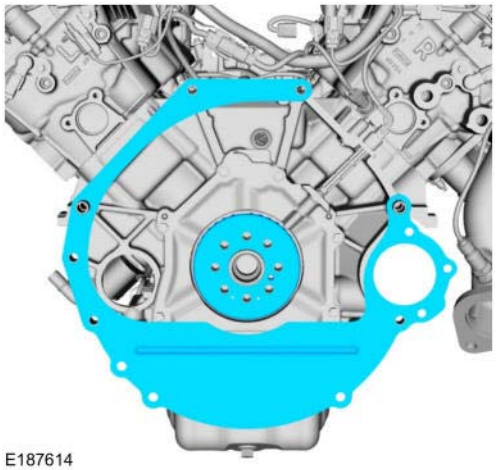
Remove and discard the pressure plate bolts.



Remove the pressure plate and the clutch disc.

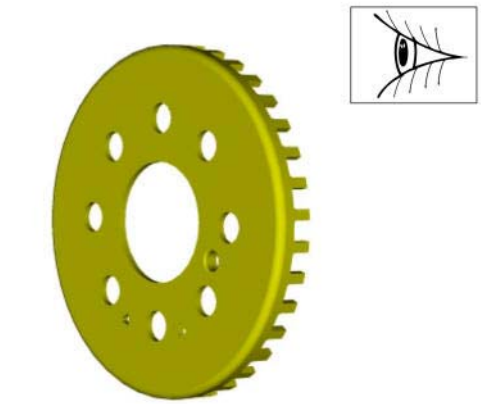
NOTE: The flywheel bolts are torque-to-yield design and are not reusable

3.
Remove and discard the flywheel bolts.



Remove the flywheel.

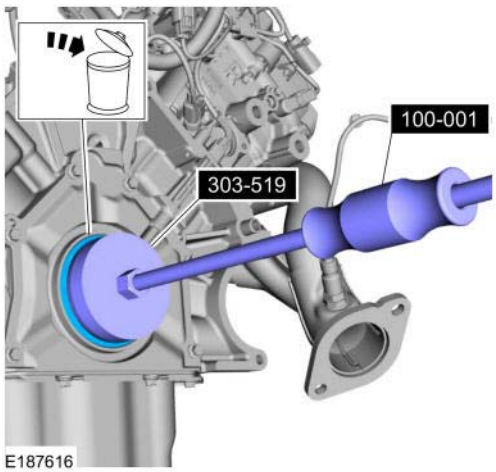
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82



> *NOTE: Engine equipped with manual transmission shown in illustration, automatic transmission engine similar.*

4.
Remove the crankshaft sensor ring and the engine-to-transmission spacer plate.

5.



Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be replaced.

E187615

6.

Using the special tools, remove and discard the crankshaft rear seal.

Use Special Service Tool: 100-001 (T50T-100-A) Slide Hammer, 303-519 (T95P-6701-EH) Remover, Crankshaft Rear Oil Seal.

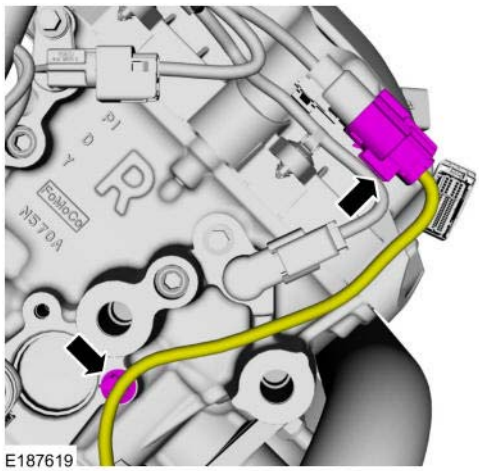
E187616

7.

Using a floor crane, install the engine on a mounting stand and remove the special tool.

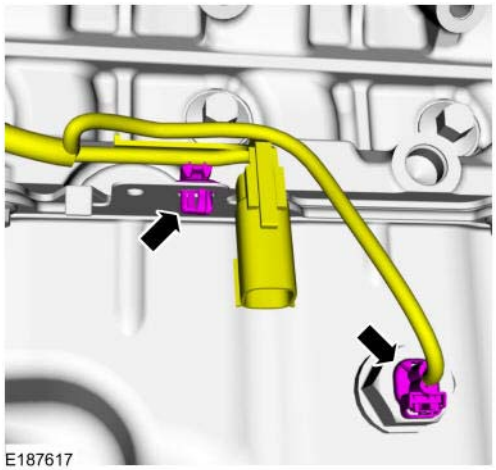
Remove Special Service Tool: 303-F047 Lifting Bracket, Engine.

Use the General Equipment: Floor Crane



Use the General Equipment: Mounting Stand

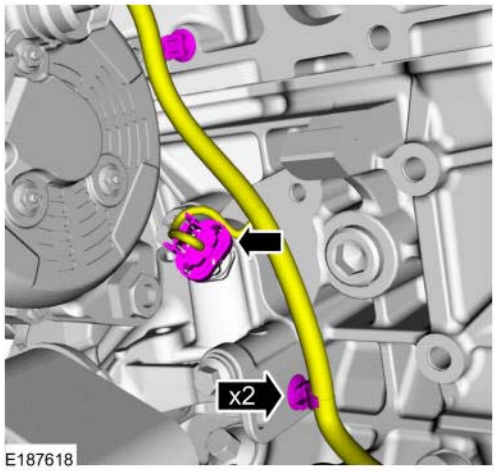
E189975



NOTE: Manual transmission engine shown in illustration, automatic transmission engine similar.

8.
Disconnect the RH HO2S electrical connector and wiring harness retainer.

E187619

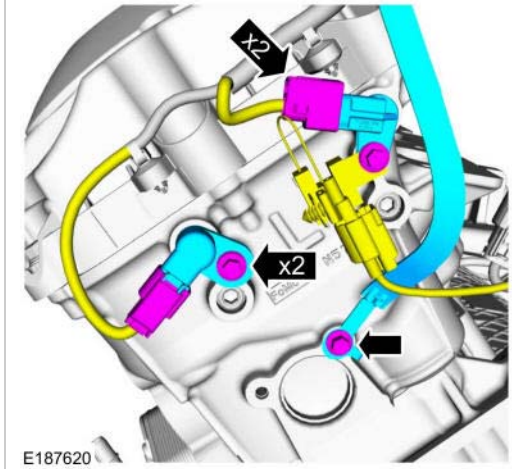


9.

Disconnect the engine oil level sensor electrical connector and the wiring harness retainer.

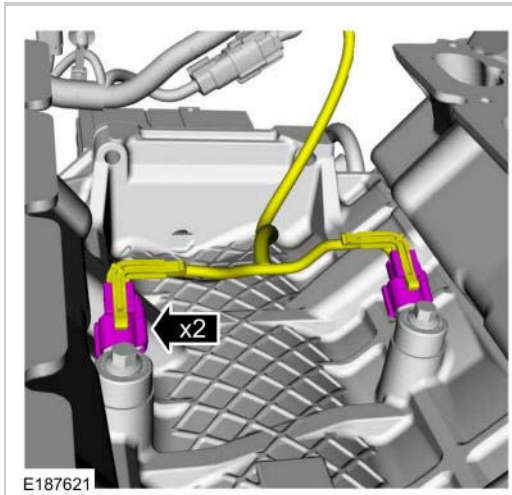
10.

Disconnect the EOP) switch electrical connector and the wiring harness retainers.



11.

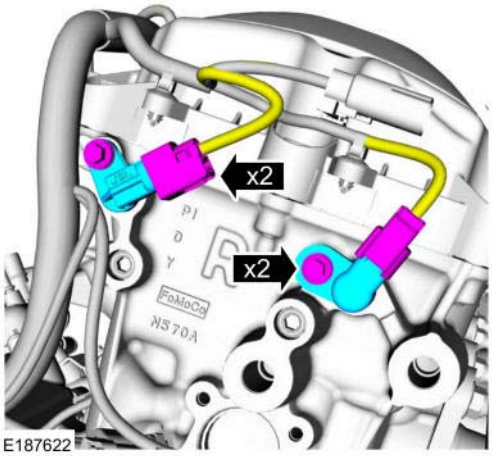
Disconnect the LH camshaft position sensor electrical connectors.



Remove the bolt and the ground wire.

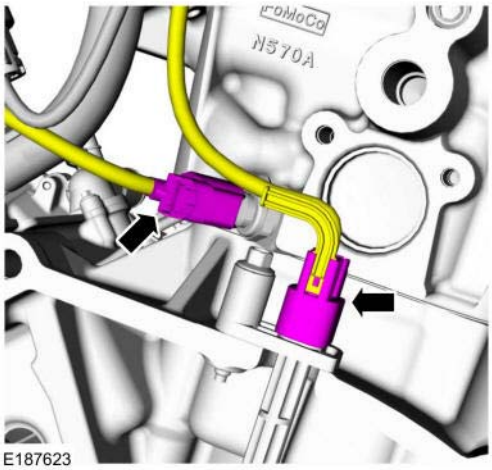
Remove the bolts and the LH camshaft position sensors.

12.



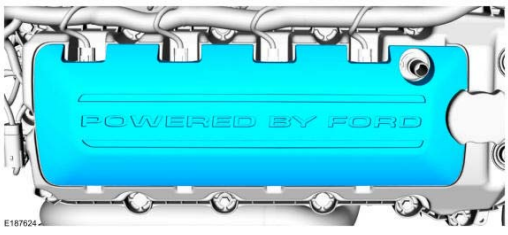
Disconnect the KS electrical connectors.

13.



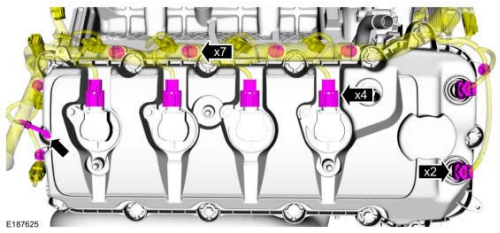
Disconnect the RH camshaft position sensor electrical connectors.

Remove the bolts and the RH camshaft position sensors.



14.

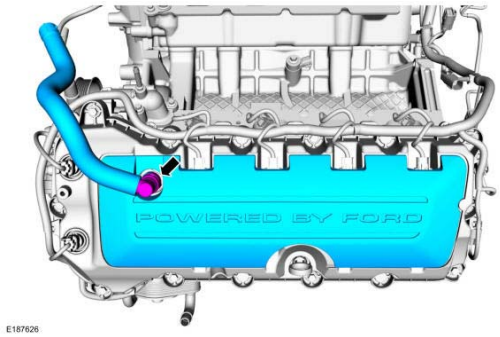
Disconnect the CHT sensor and the CKP sensor electrical connectors.



15.

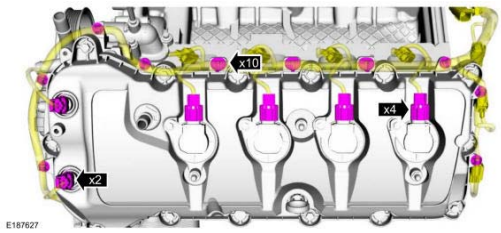
Remove the RH spark plug cover.

NOTE: Engine equipped with automatic transmission shown in illustration, manual transmission engine similar.



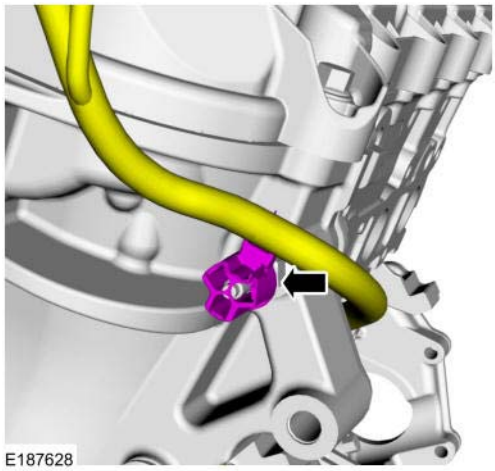
16.
Disconnect the wiring harness electrical connectors and retainers.

17.



Remove the crankcase ventilation tube. Refer to: QUICK RELEASE COUPLING .

Remove the LH spark plug cover.



18.

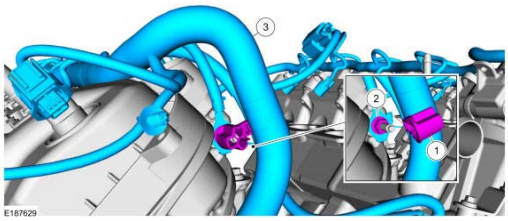
Disconnect the wiring harness electrical connectors and retainers.

19.

Detach the wiring harness retainer from the engine front cover stud bolt.

20.

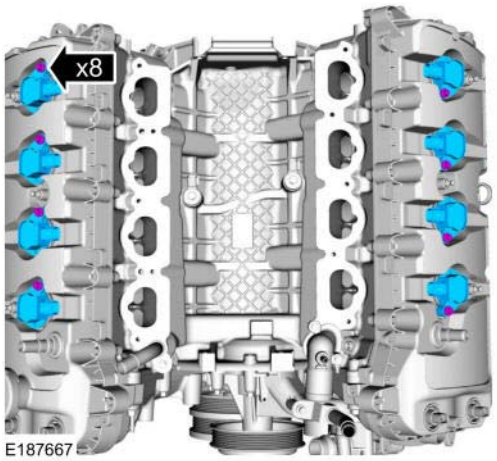
1.



Detach the wiring harness retainer from the engine front cover stud bolt.

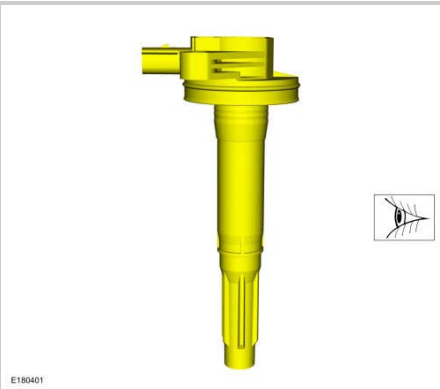
2.

Remove the nut and the ground wire.



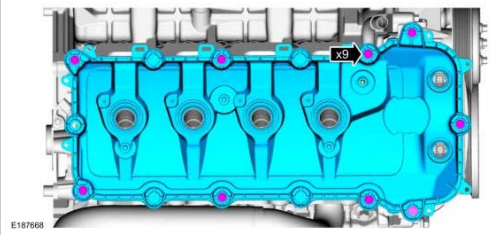
3.

Remove the wiring harness from the engine.



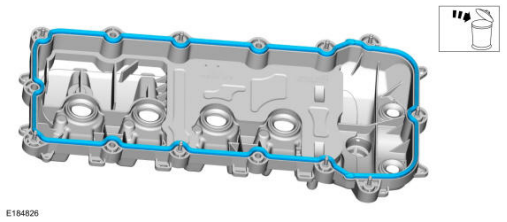
NOTE: When removing the ignition coils, a slight twisting motion will break the seal and ease removal.

21.
Remove the bolts and the ignition coils.



22.

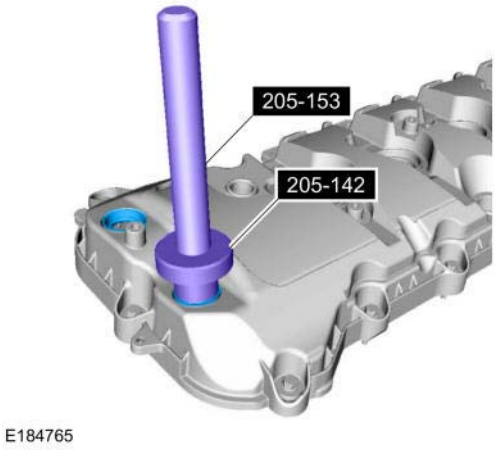
Inspect the ignition coil-on-plug assembly for cracks, rips, or tears. Replace any damaged coil-on-plug assemblies.



23.

Loosen the bolts and remove the RH valve cover.

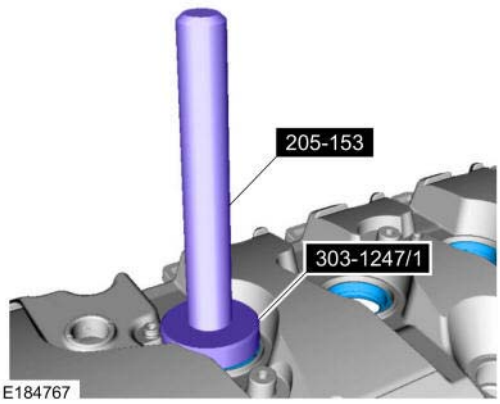
NOTE: Clean the valve cover gasket groove with soap and water or a suitable solvent.



24.
Remove and discard the gasket.

25.

Inspect the VCT variable force solenoid seals. Remove any damaged seals using the special tools.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J) Installer, Differential Bearing Cone.

26.

Inspect the spark plug seals. Remove any damaged seals using the special tools.

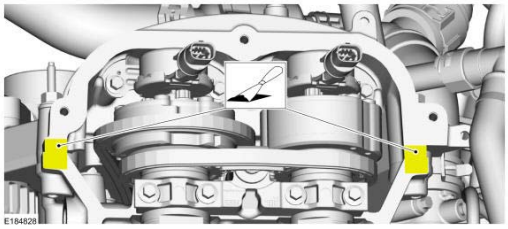
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

27.
Clean the valve cover mating surface of the RH cylinder head and engine front cover. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

Material

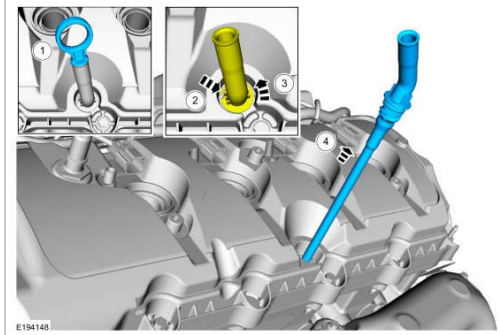
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

28.

1.

Remove the oil level indicator.

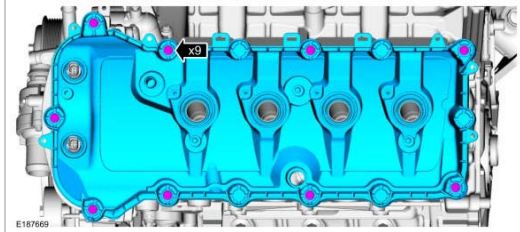
2.



Depress the tab.

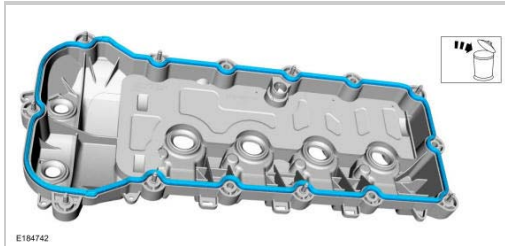
3.

Rotate the oil level indicator tube counterclockwise.



4.

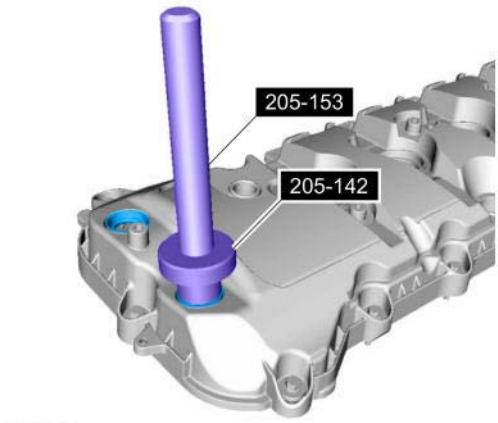
Pull the oil level indicator tube from the engine.



29.

Loosen the bolts and remove the LH valve cover.

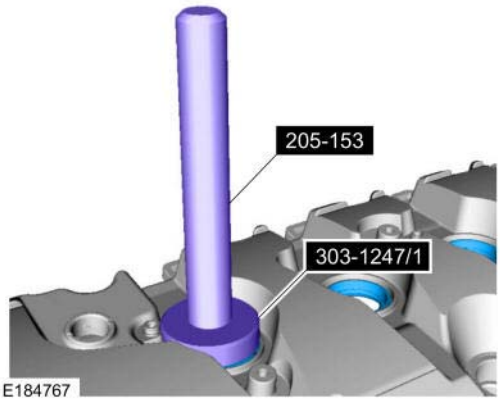
NOTE: Clean the valve cover gasket groove with soap and water or a suitable solvent.



30.
Remove and discard the gasket.

31.

Inspect the VCT variable force solenoid seals. Remove any damaged seals using the special tools.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J) Installer, Differential Bearing Cone.

32.

Inspect the spark plug seals. Remove any damaged seals using the special tools.

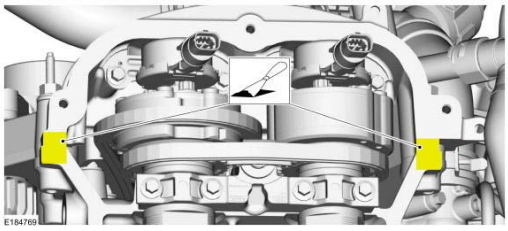
Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

33.
Clean the valve cover mating surface of the LH cylinder head and engine front cover. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material



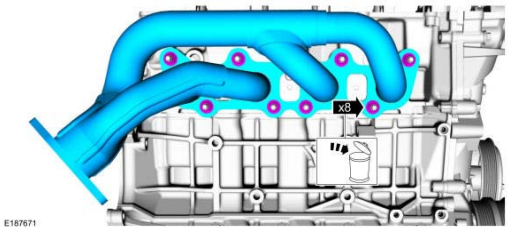
: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

: Motorcraft® Metal Surface Prep / ZC-31-B

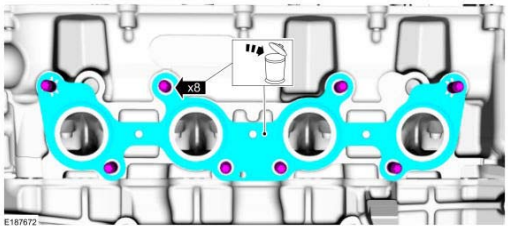
Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



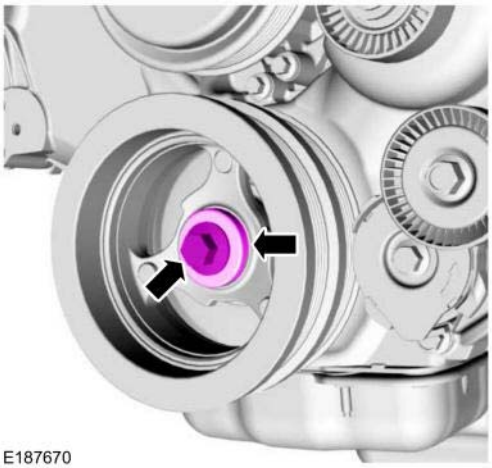
34.

Remove and discard the nuts.



Remove the exhaust manifold.

Clean and inspect the exhaust manifold. Refer to: Exhaust Manifold Cleaning and Inspection .

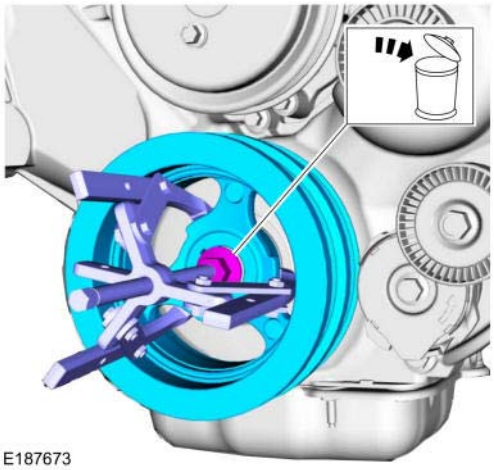


35.

Remove and discard the gasket and studs.

36.

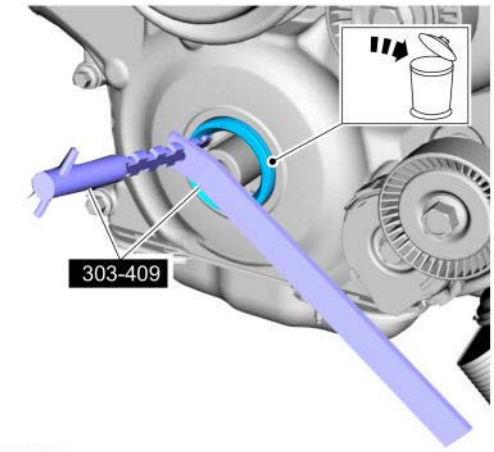
Remove the crankshaft pulley bolt and washer.



37.

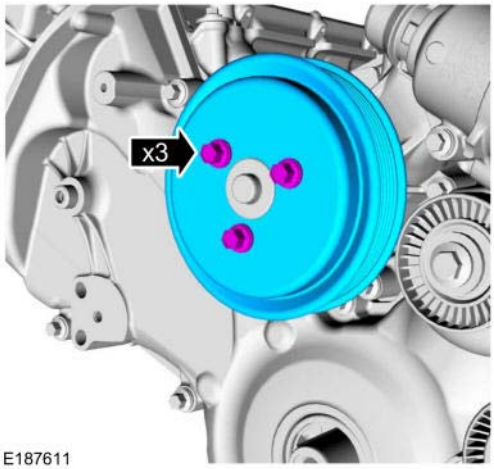
Using the 3 Leg Puller and the crankshaft pulley bolt, remove the crankshaft pulley.

Use the General Equipment: Three Leg Puller



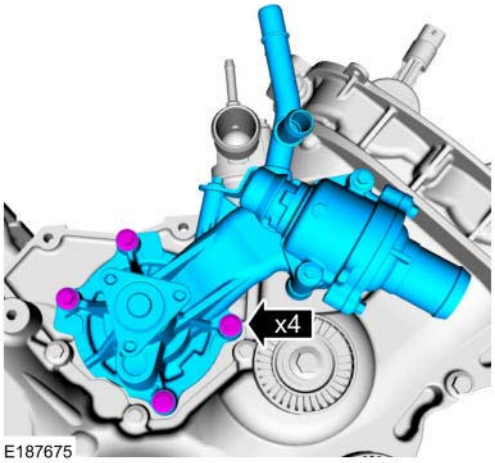
Discard the crankshaft pulley bolt.

NOTE: Use care not to damage the engine front cover or the crankshaft when removing the seal.



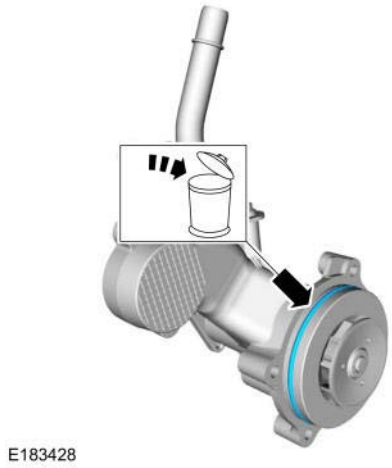
38.
Using the special tool, remove and discard the crankshaft front oil seal.

Use Special Service Tool: 303-409 (T92C-6700-CH) Remover, Crankshaft Seal.



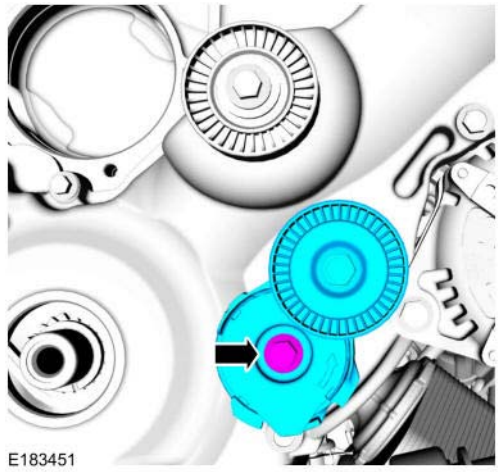
39.

Remove the bolts and the coolant pump pulley.



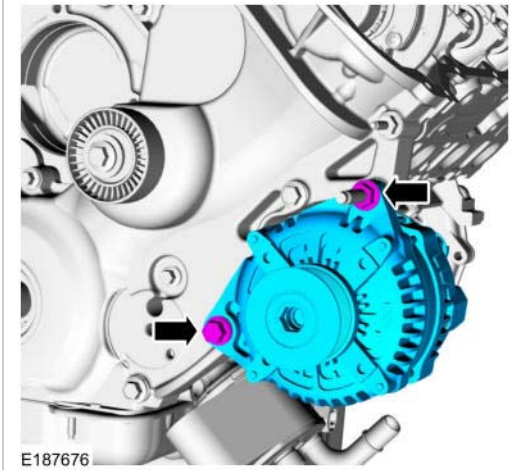
40.

Remove the bolts and the coolant pump.



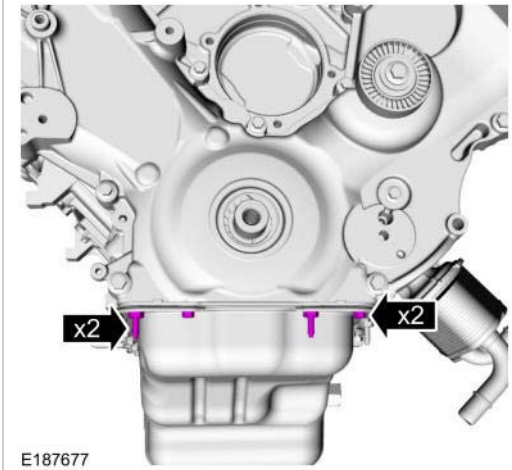
41.

Remove and discard the coolant pump O-ring seal.



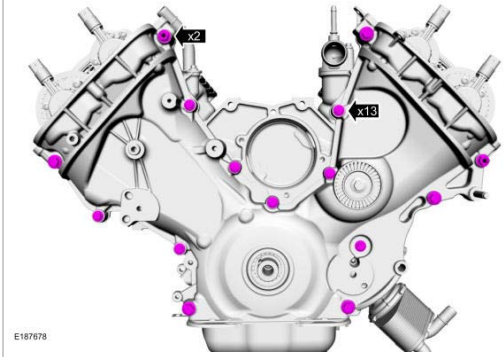
42.

Remove the bolt and the accessory drive belt tensioner.



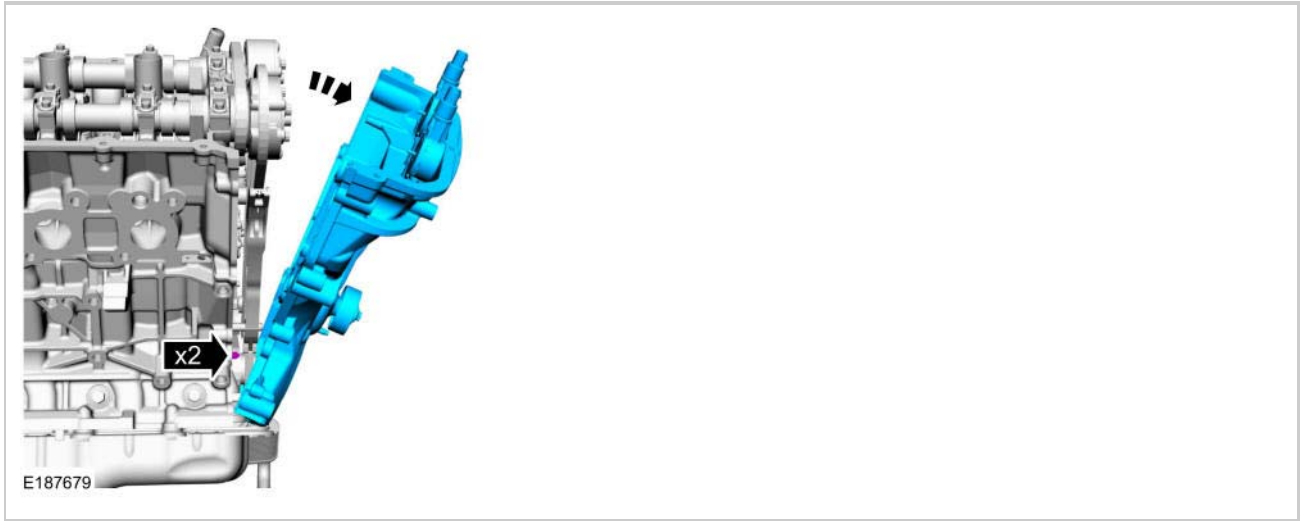
43.

Remove the nut, the bolt and the generator.



44.

Remove the bolts and stud bolts.



45.

Remove the bolts and stud bolts.

46.

Remove the engine front cover from the front cover to cylinder block dowels.

47.

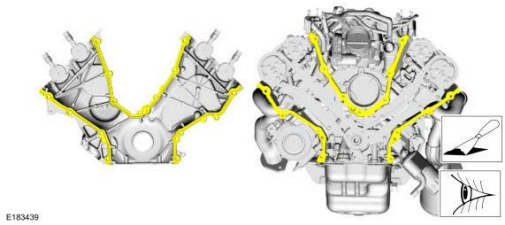
Remove and discard the gaskets.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

48.
Clean and inspect the mating surface. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

Material

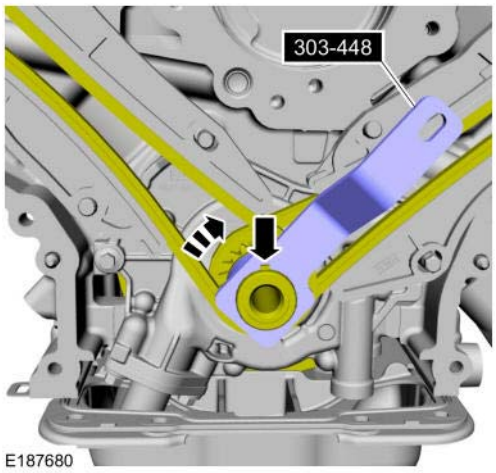


: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

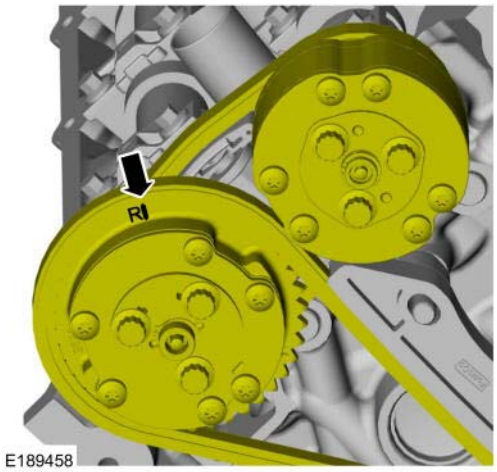
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

Material



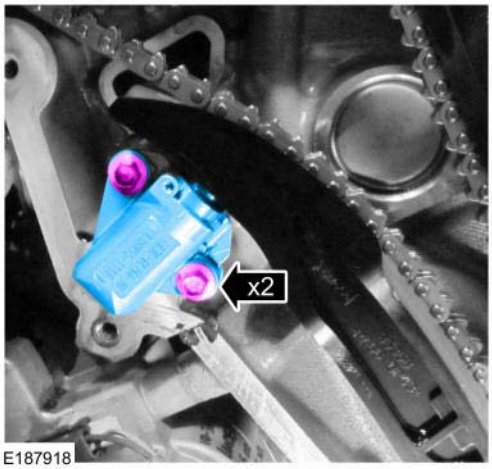
: Motorcraft® Metal Surface Prep / ZC-31-B

49.



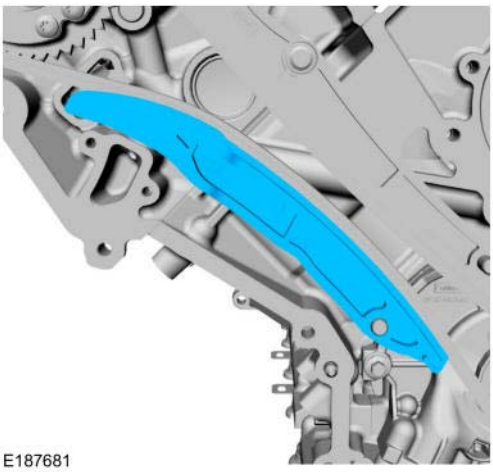
Using the special tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.



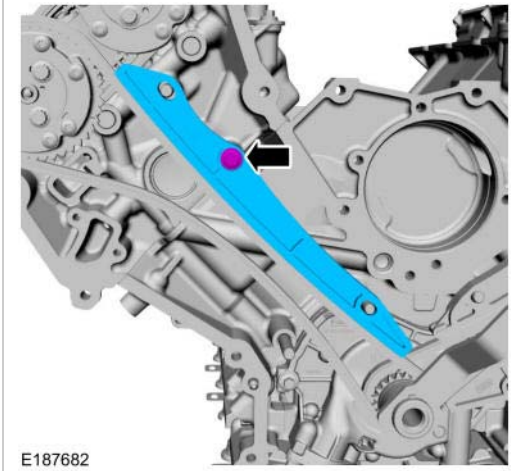
50.

Verify the timing mark on the RH VCT unit is on top, if not, rotate the crankshaft clockwise one complete revolution so the keyway is at the 12 o'clock position.



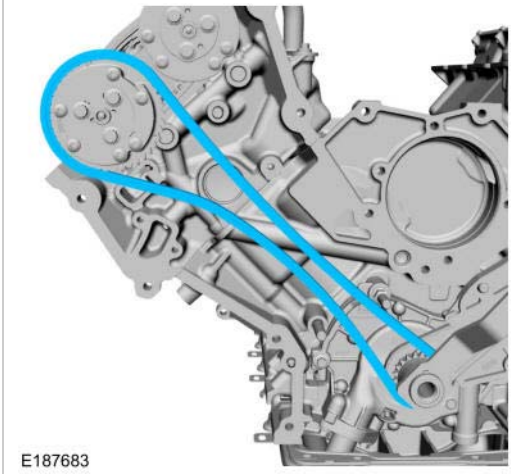
51.

Remove the bolts and the RH primary timing chain tensioner.



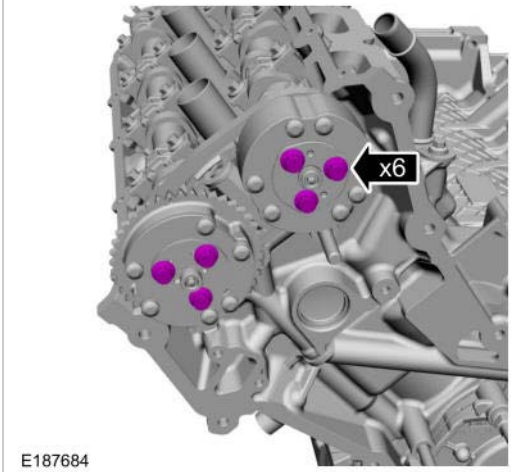
NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

52.
Remove the RH timing chain tensioner arm.



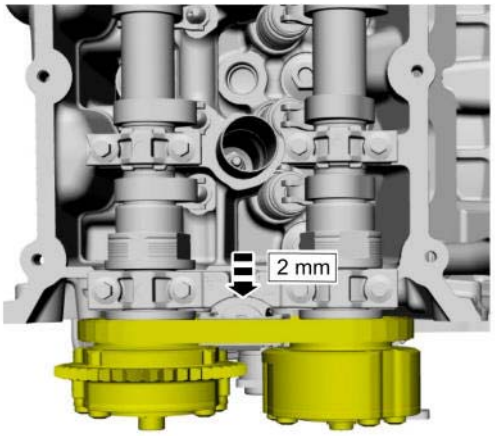
NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

53.
Remove the bolt and the RH timing chain guide.



54.

Remove the RH timing chain.



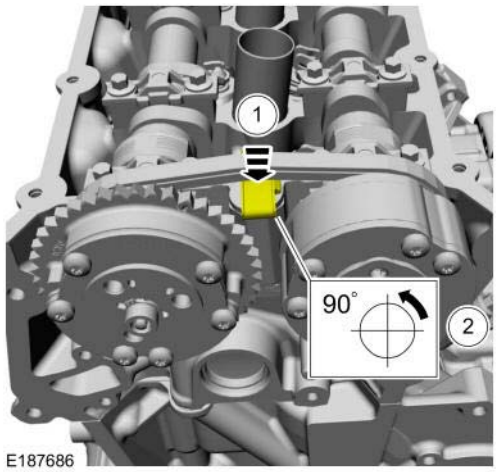
55.

Remove the intake and exhaust VCT assembly bolts.

56.

Slide the VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

E187685

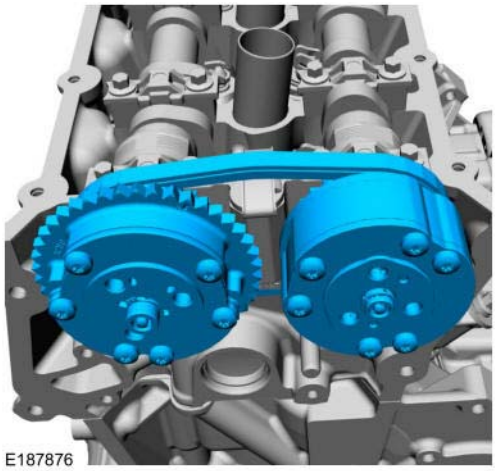


57.

1.

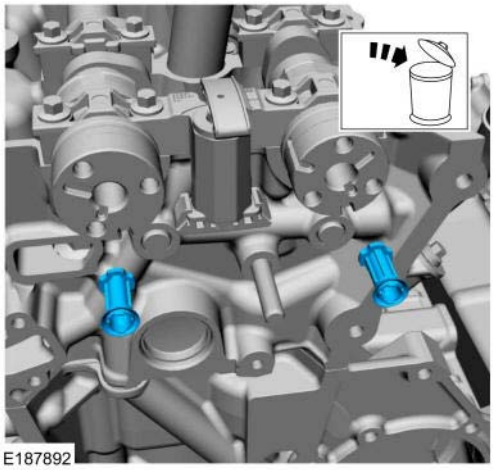
Depress the secondary timing chain tensioner.

2.



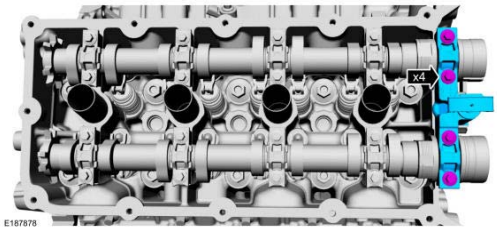
Turn the tensioner counterclockwise 90 degrees.

E187686



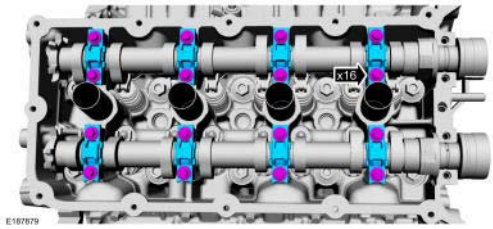
58.

Remove the VCT assemblies and the secondary timing chain.



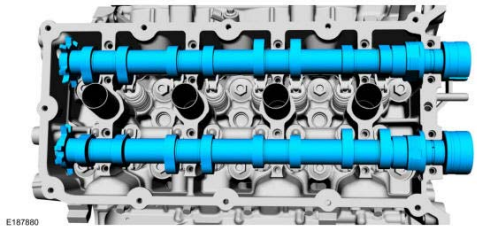
59.

Remove and discard the VCT system oil filters.



NOTE: The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.

60.
Remove the bolts and the front camshaft bearing mega cap.

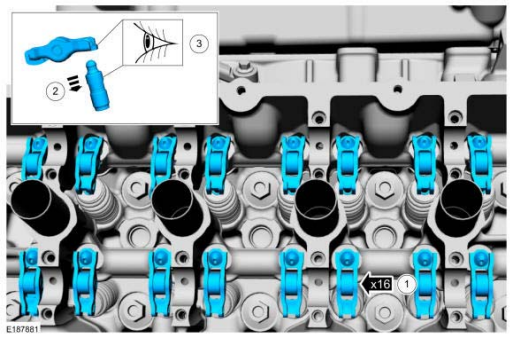


61.

Remove the bolts and the camshaft bearing caps.

62.

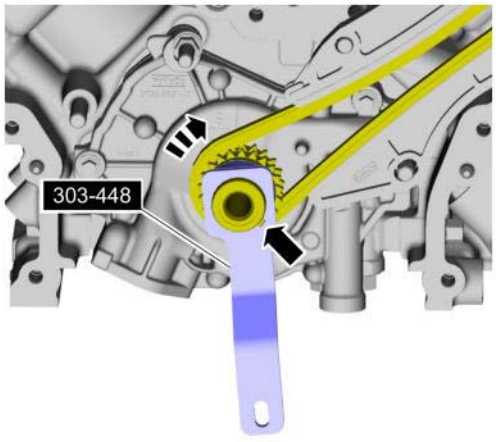
Remove the intake and exhaust camshafts.



63.

Remove the camshaft roller follower and hydraulic lash adjuster assemblies.

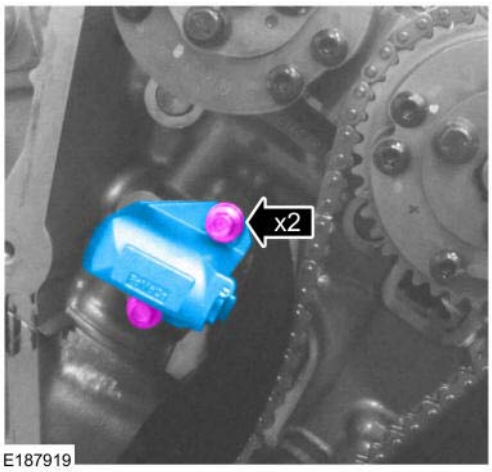
Separate the hydraulic lash adjusters from the spring clips on the camshaft roller followers.



Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage. Replace damaged components as necessary.

64.

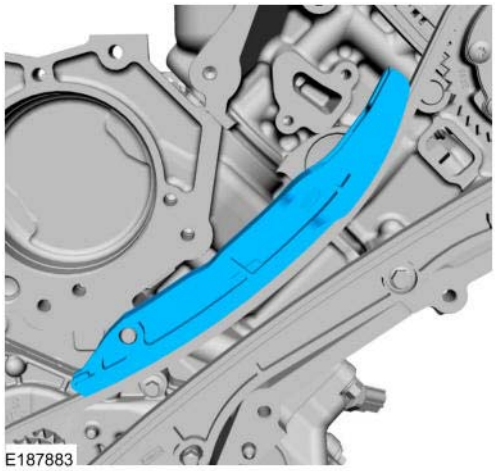
Using the special tool, rotate the crankshaft clockwise until the keyway is at the 5 o'clock position.



Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

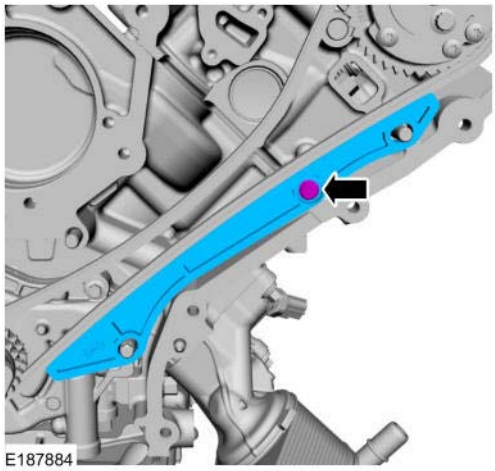
E187882

65.



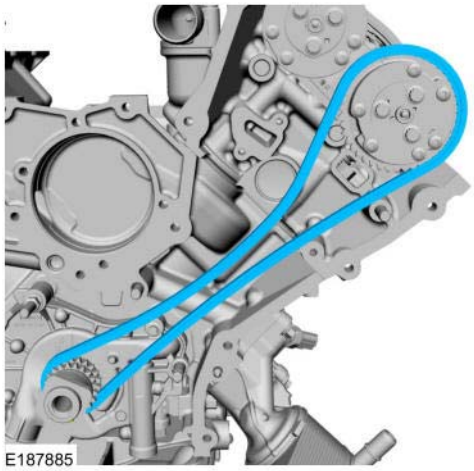
Remove the bolts and the LH primary timing chain tensioner.

E187919



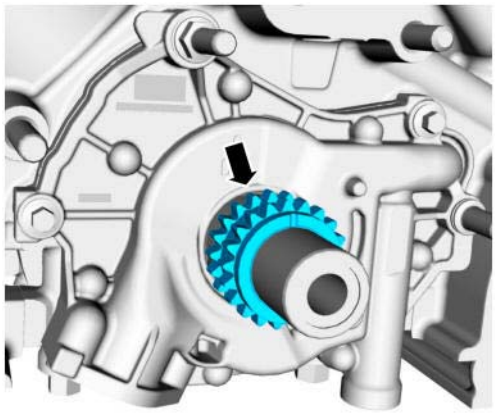
NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 5 o'clock position after removing the LH timing chain tensioner arm.

66.
Remove the LH timing chain tensioner arm.



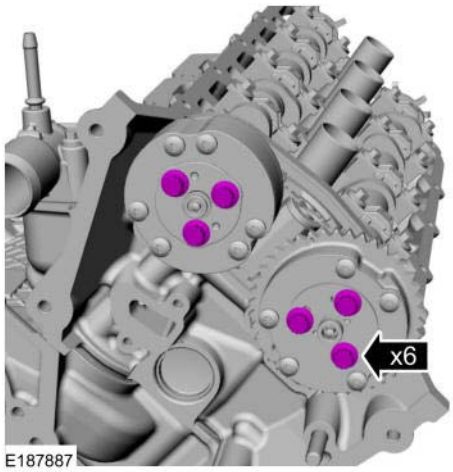
NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 5 o'clock position after removing the LH timing chain guide.

67.
Remove the bolt and the LH timing chain guide.



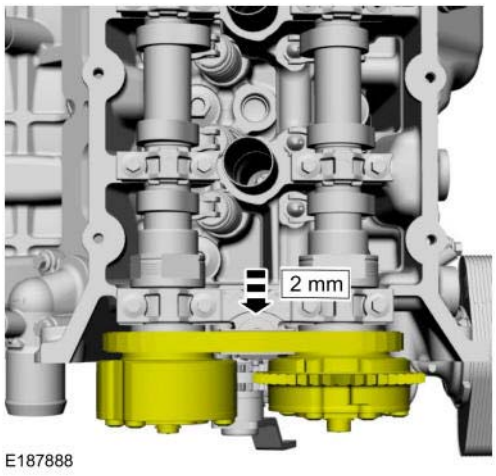
68.

Remove the LH timing chain.



69.

Remove the crankshaft sprocket.

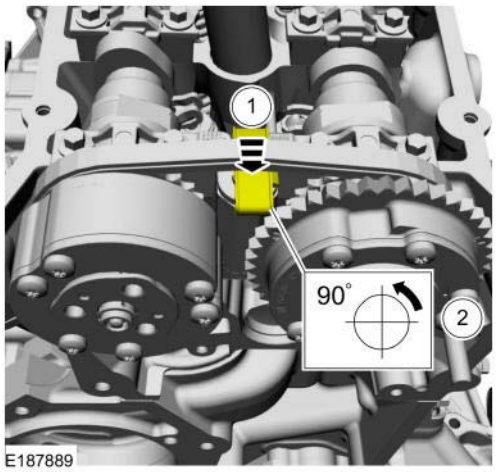


70.

Remove the intake and exhaust VCT assembly bolts.

71.

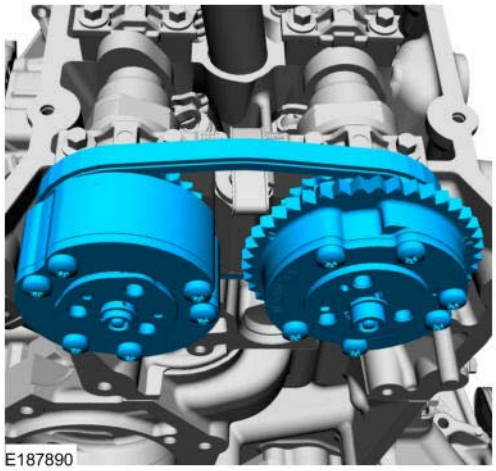
Slide the Variable Camshaft Timing VCT assemblies and secondary timing chain forward 2 mm (0.078 in).



72.

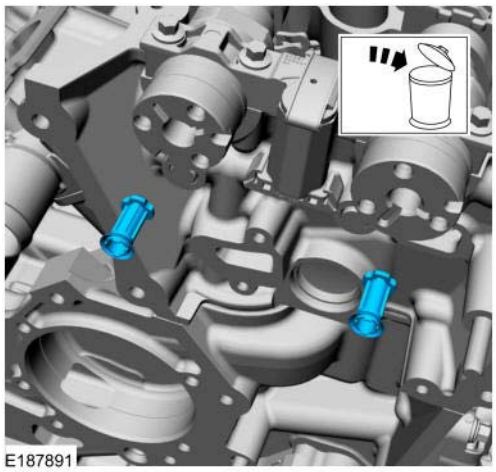
1.

Depress the secondary timing chain tensioner.



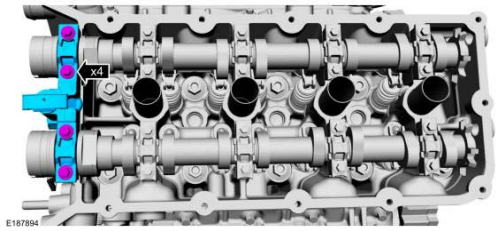
2.

Turn the tensioner counterclockwise 90 degrees.



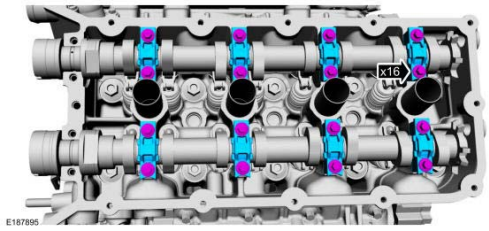
73.

Remove the VCT assemblies and the secondary timing chain.



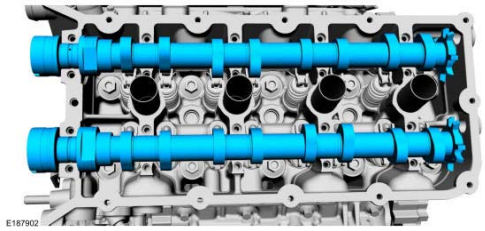
74.

Remove and discard the VCT system oil filters.



NOTE: The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.

75.
Remove the bolts and the front camshaft bearing mega cap.

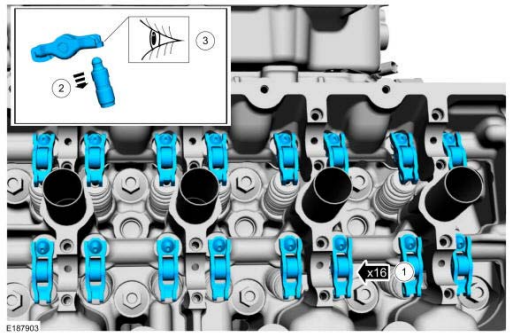


76.

Remove the bolts and the camshaft bearing caps.

77.

Remove the intake and exhaust camshafts.



78.

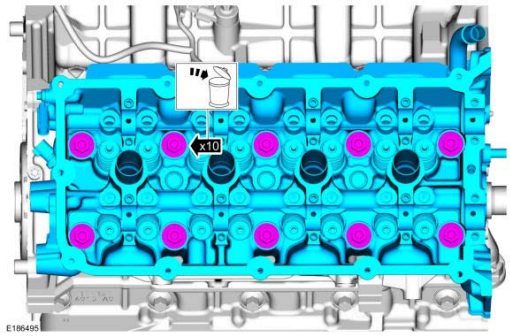
Remove the camshaft roller follower and hydraulic lash adjuster assemblies.

Separate the hydraulic lash adjusters from the spring clips on the camshaft roller followers.

Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage. Replace damaged components as necessary.

NOTE: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.

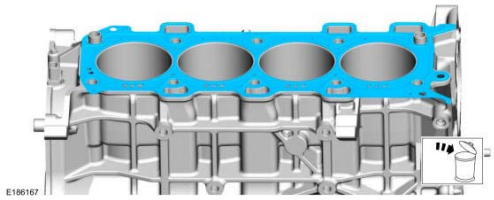
NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.



NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

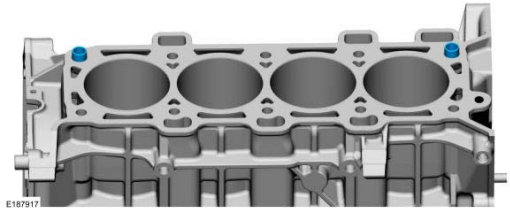
NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

79.



Remove and discard the bolts.

Remove the cylinder head.



80.

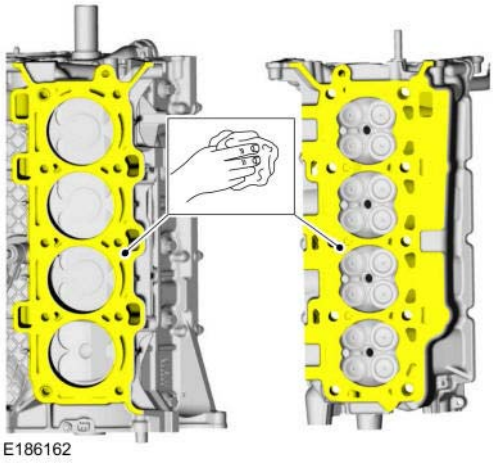
Remove and discard the cylinder head gasket.

81.

Remove the dowels.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other

abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.



NOTE: Clean the cylinder head bolt holes in the cylinder block using compressed air. Make sure all coolant, oil or other foreign material is removed.

82.

Clean and inspect the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block.

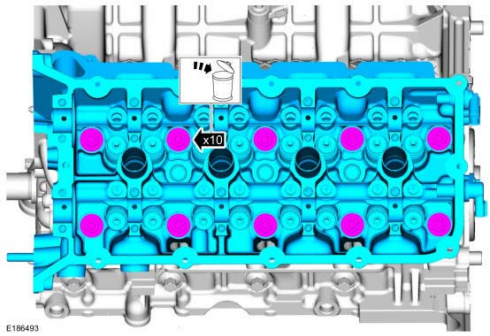
Refer to: Cylinder Head Distortion .

Refer to: Cylinder Block Distortion .

E186162

NOTE: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.

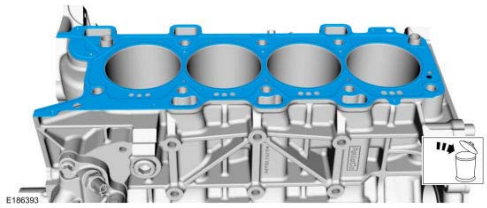
NOTE: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.



NOTE: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

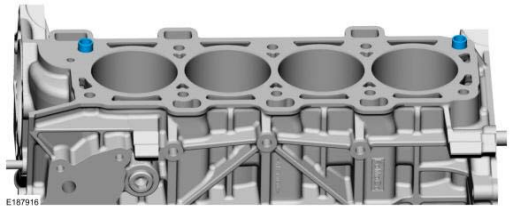
NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

83.



Remove and discard the bolts.

Remove the cylinder head.



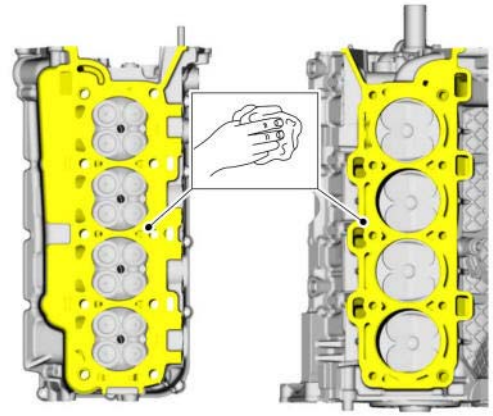
84.

Discard the cylinder head gasket.

85.

Remove the dowels.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

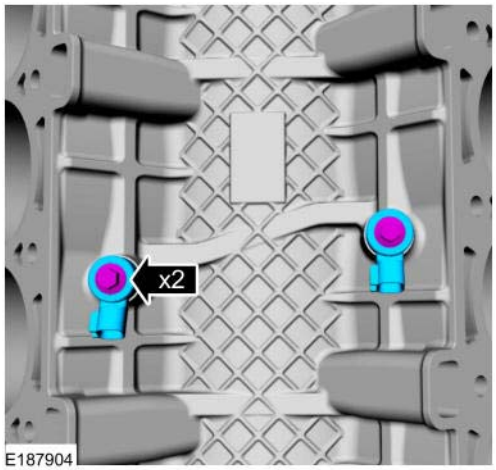


NOTE: Clean the cylinder head bolt holes in the cylinder block using compressed air. Make sure all coolant, oil or other foreign material is removed.

86.

Clean and inspect the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block.

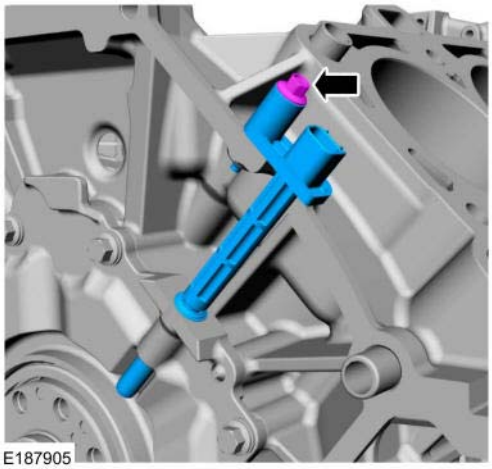
Refer to: Cylinder Head Distortion .



Refer to: Cylinder Block Distortion .

E186395

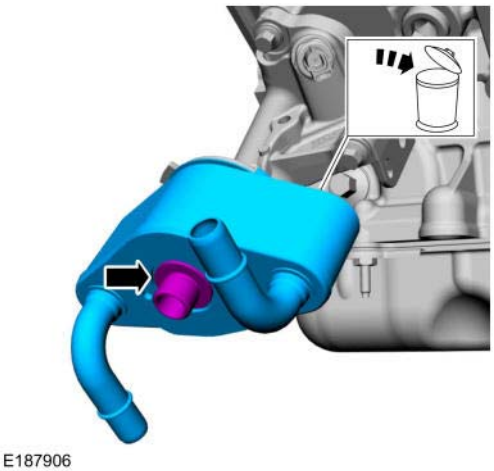
87.



Remove the bolts and the KSs.

E187904

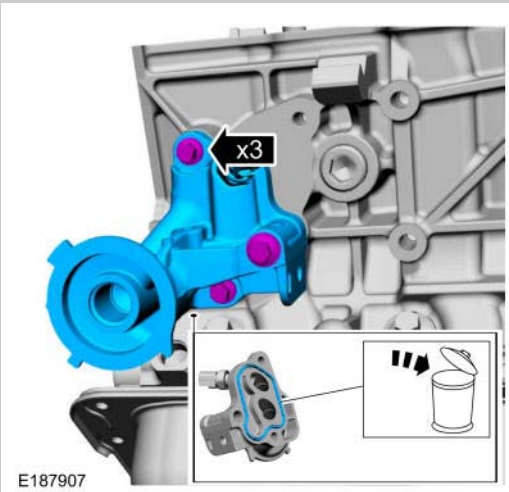
88.



Remove the bolt and the CKP sensor.

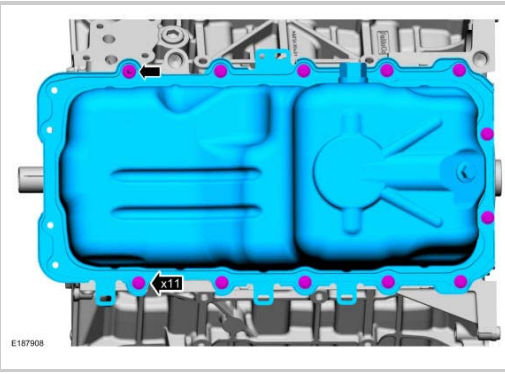
NOTE: A new oil cooler must be installed or severe damage to the engine can occur.

89.
Remove the threaded fitting and the oil cooler.



Discard the oil cooler.

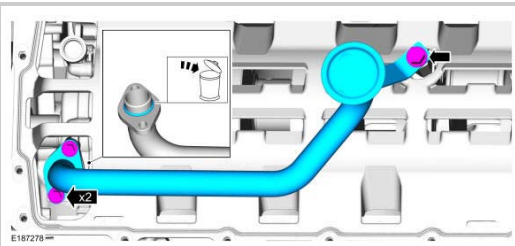
90.



Remove the bolts and the oil filter adapter.

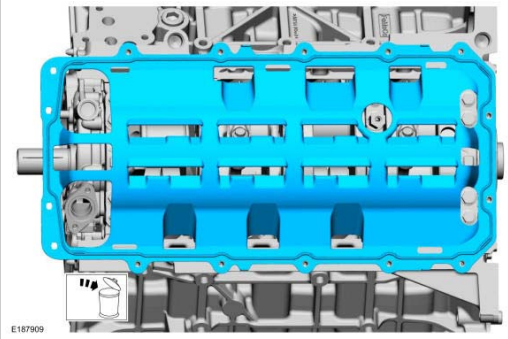
Discard the gasket.

91.



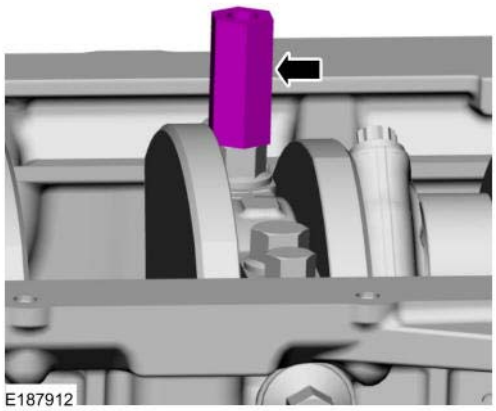
Remove the bolts and the oil pan.

92.



Remove the bolts and the oil pump screen and pickup tube.

Discard the O-ring seal.



93.

Remove and discard the oil pan baffle and gasket.

94.

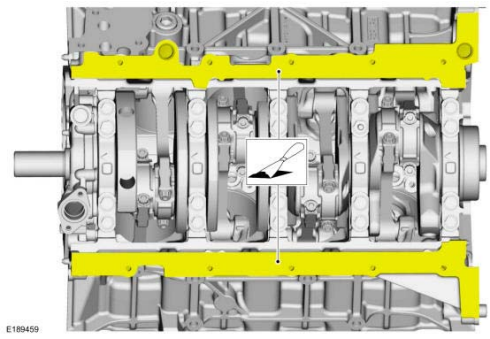
Remove the oil pump screen and pickup tube spacer.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

95.
Clean the mating surface of the cylinder block. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

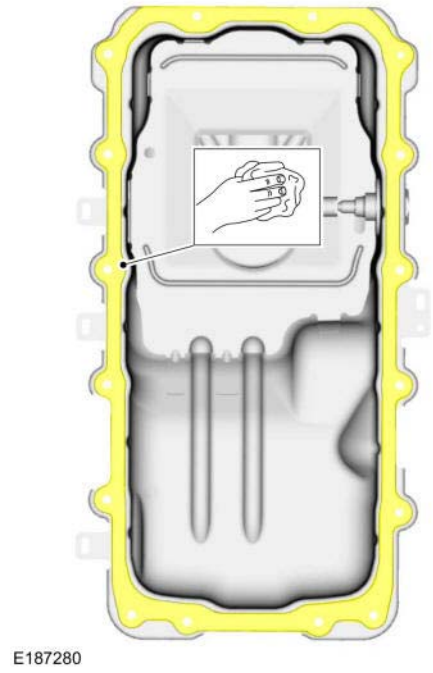
Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

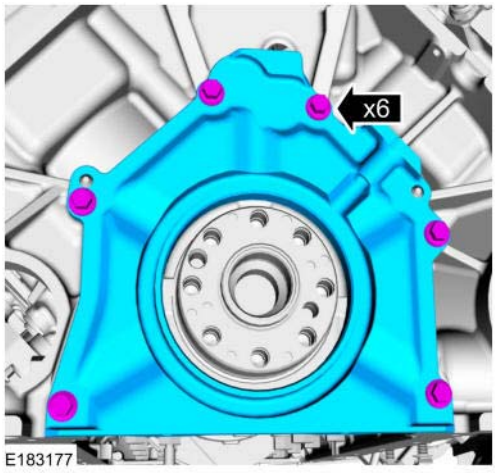
Material

: Motorcraft® Metal Surface Prep / ZC-31-B



Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.

96.
Make sure that the mating faces are clean and free of foreign material.

97.

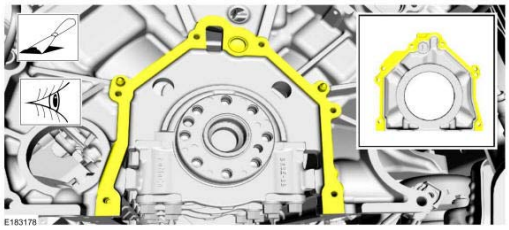
Remove the bolts and the crankshaft rear seal retainer plate.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

98.
Clean and inspect the mating surface. Refer to: RTV Sealing Surface Cleaning and Preparation .

Use the General Equipment: Plastic Scraper

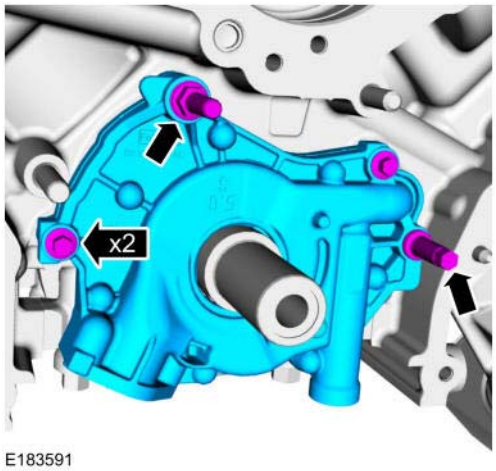
Material



: Motorcraft® Silicone Gasket Remover / ZC-30-A

Material

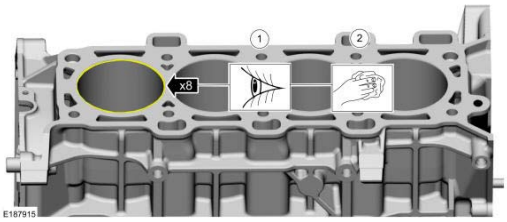
: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)



Material

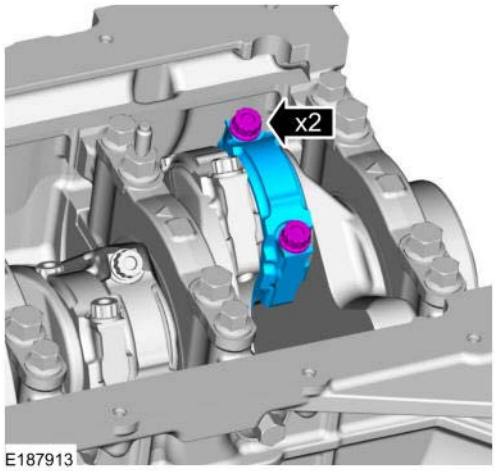
: Motorcraft® Metal Surface Prep / ZC-31-B

99.



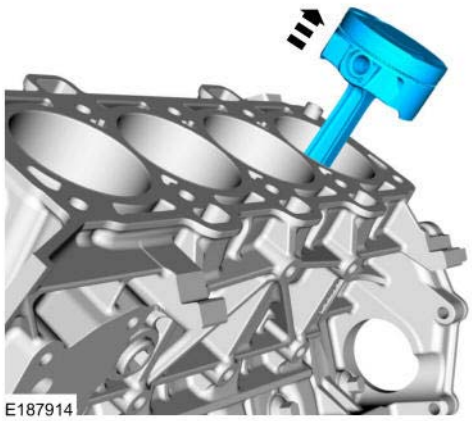
Remove the bolts, the stud bolts and the oil pump.

100.



Before removing the pistons, inspect the top of the cylinder bores.

If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad.



NOTE: Verify that the connecting rod and rod cap have orientation numbers cast into them. If not, number the connecting rod and rod cap for correct orientation. Failure to do so can result in engine damage.

101.
Remove the bolts and the connecting rod cap.

NOTE: Do not scratch the cylinder walls or crankshaft journals with the connecting rod or engine damage may occur.

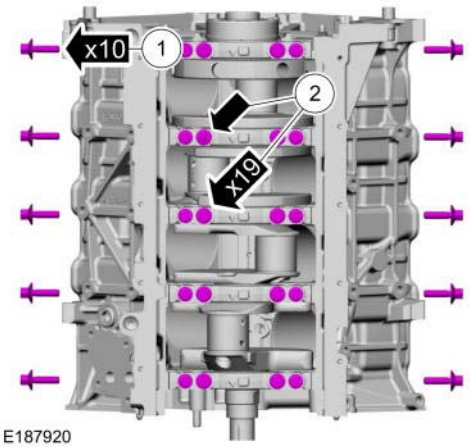
102.
Remove the piston through the top of the cylinder block.

103.

Repeat the previous 2 steps for each of the remaining pistons.

104.

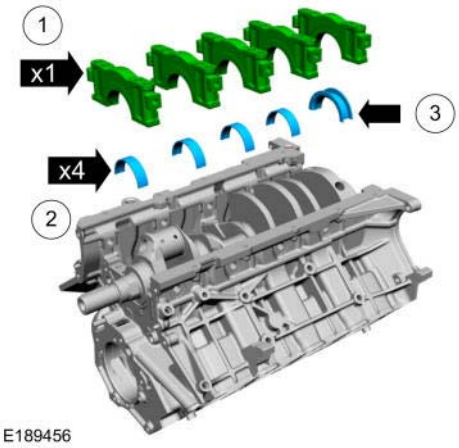
Disassemble the 8 pistons. Refer to: Piston .



105.

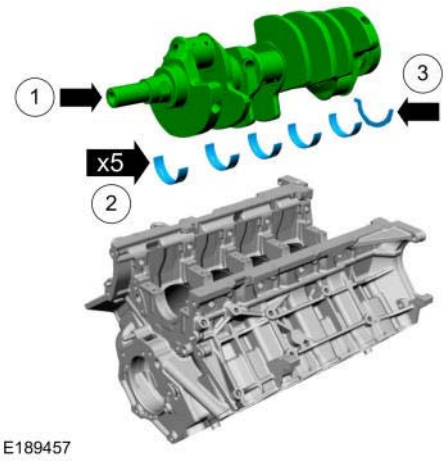
1.

Remove and discard the cross-mounted main cap bolts.



2.

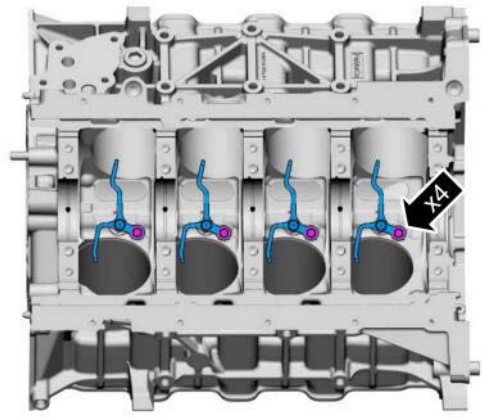
Remove and discard the main bearing cap bolts and stud bolt.



106.

Remove the main bearing caps (1), the lower crankshaft main bearings (2) and the lower thrust bearing (3).

107.

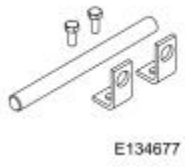


Remove the crankshaft (1), the upper crankshaft main bearings (2) and the upper thrust washer (3) from the cylinder block.

E189457

108.

Remove the bolts and the piston cooling jets from the cylinder block.



E187921

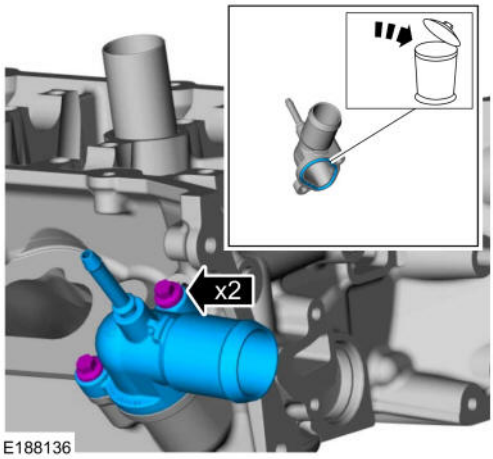
DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > DISASSEMBLY

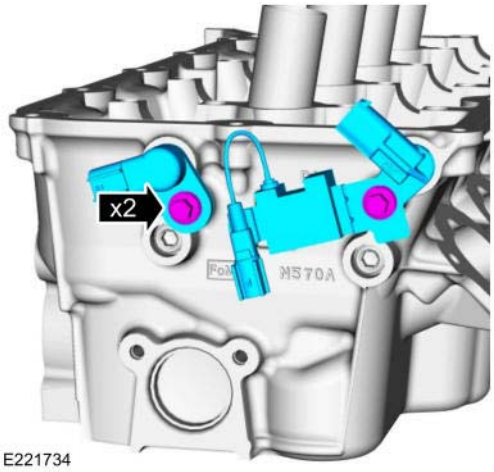
NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

LH cylinder heads

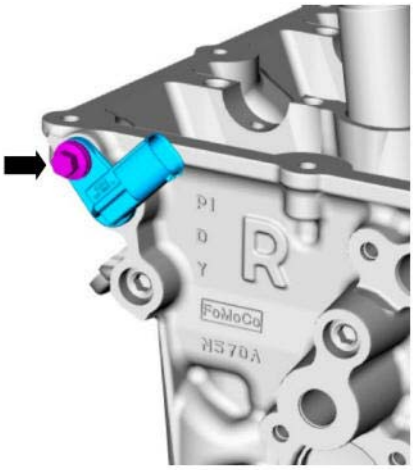
1.



Remove the bolts and the coolant outlet.

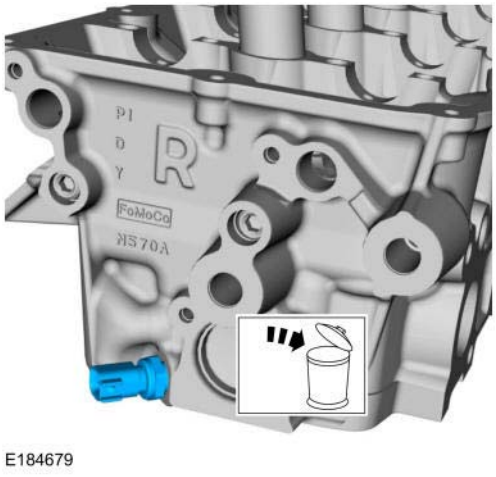
Discard the gasket.

2.



Remove the bolts, the CMP sensors and the radio interference capacitor.

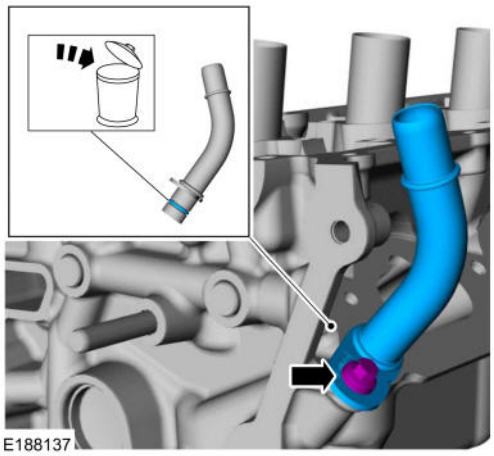
RH cylinder heads



3.

Remove the bolt and the CMP sensor.

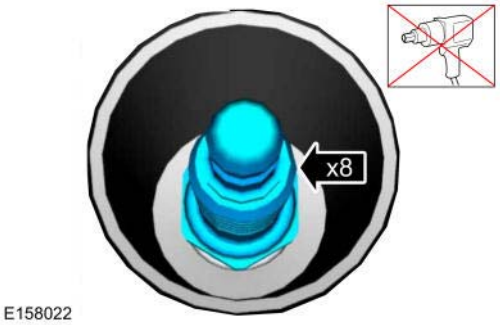
4.



Remove and discard the CHT sensor.

5.

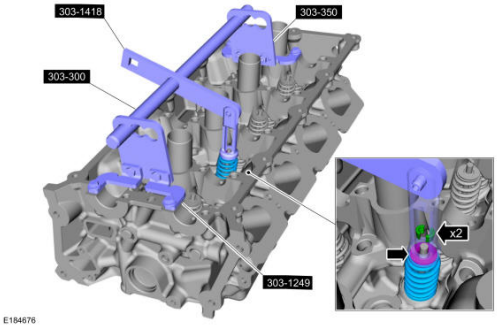
Remove the bolt and the coolant outlet.



Discard the O-ring seal.

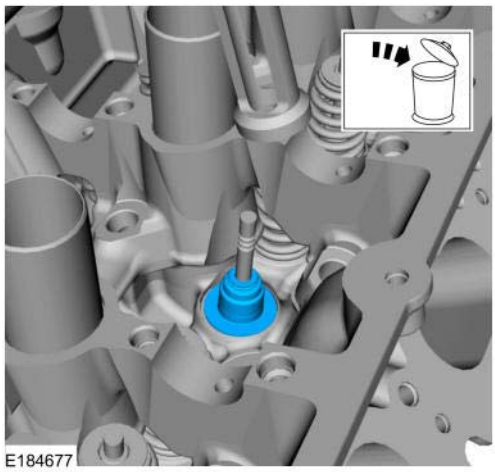
All cylinder heads

6.



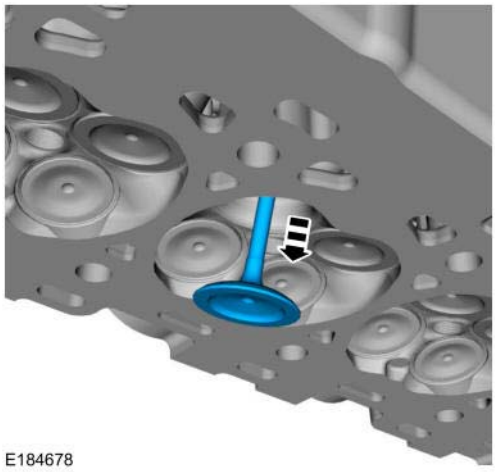
Remove the spark plugs.

7.



Using the special tools, remove the keys, retainer and spring.

Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350 (T89P-6565-A) Compressor, Valve Spring, 303-1249 Valve Spring Compressor, 303-1418 Compressor, Valve Spring.



8.

Remove and discard the valve stem seal.

9.

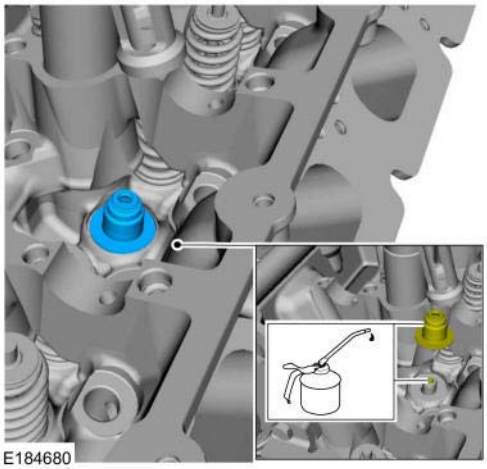
Remove the valve from the cylinder head.

10.

Repeat the previous steps for each of the remaining valves.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > CYLINDER HEAD > ASSEMBLY

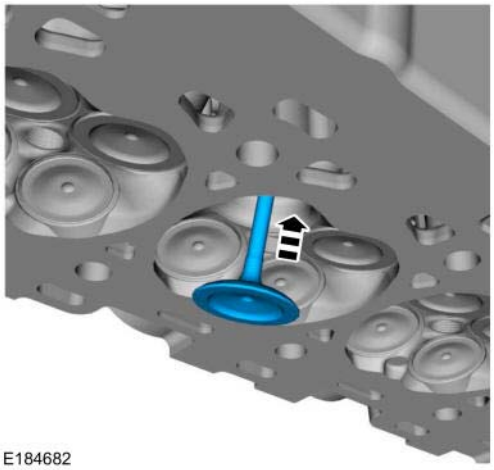
All cylinder heads



NOTE: Lubricate the new valve stem seal and valve guide bore with clean engine oil.

1.

Install the new valve stem seal.



Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

2.

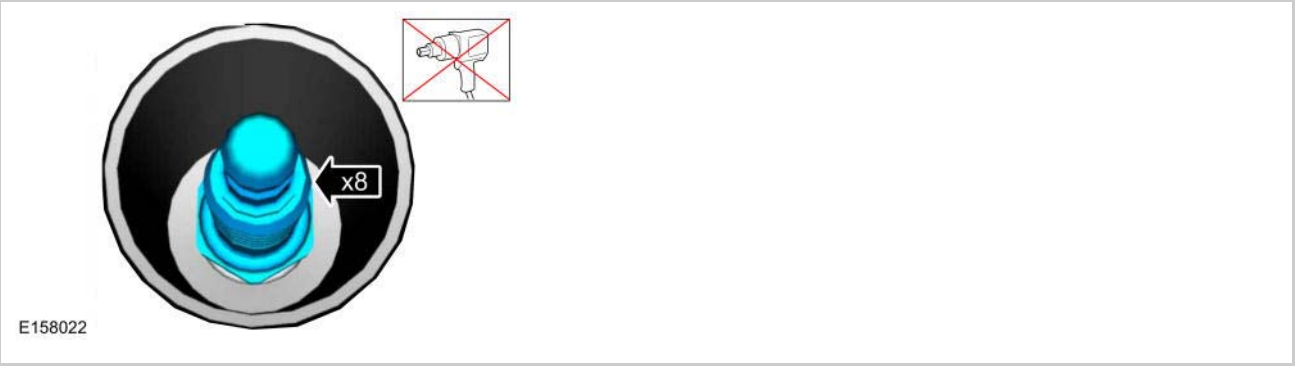
Install the valve into the cylinder head.

3.

Using the special tools, install the spring, retainer and keys.

Use Special Service Tool: 303-300 (T87C-6565-A) Set, Valve Spring Compressor, 303-350 (T89P-6565-A) Compressor, Valve Spring, 303-1249 Valve Spring Compressor, 303-1418 Compressor, Valve Spring.

4.



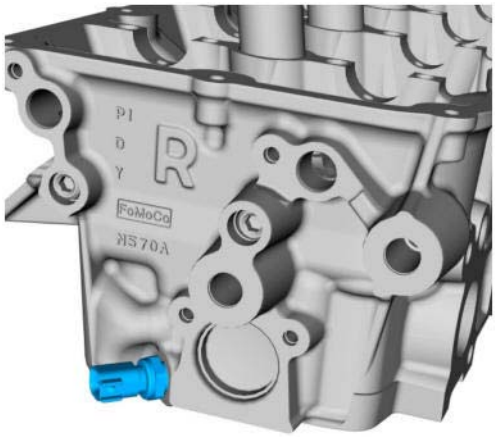
Repeat the previous steps for each of the remaining valves.

5.

Install the spark plugs.

Torque

: 133 lb.in (15 Nm)



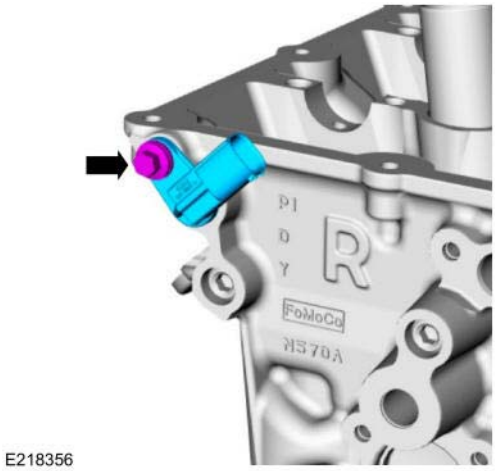
RH cylinder heads

6.

Install a new CHT sensor.

Torque

: 97 lb.in (11 Nm)



E184681

7.

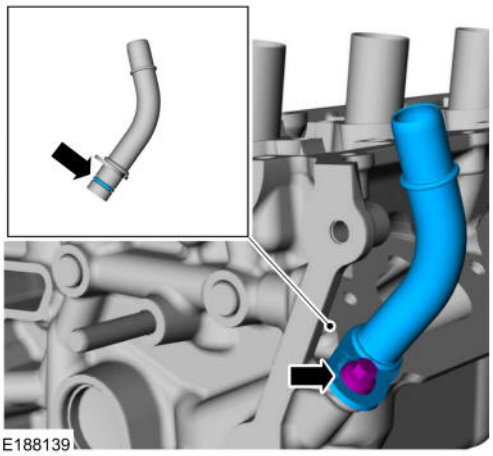
Install the CMP sensor and bolt.

Torque

: 89 lb.in (10 Nm)

E218356

NOTE: Lubricate the O-ring seal with clean engine coolant prior to installing.



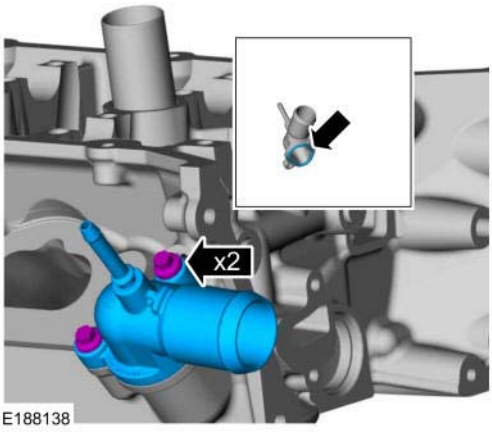
8.
Using a new O-ring seal, install the coolant outlet pipe.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Torque

: 89 lb.in (10 Nm)



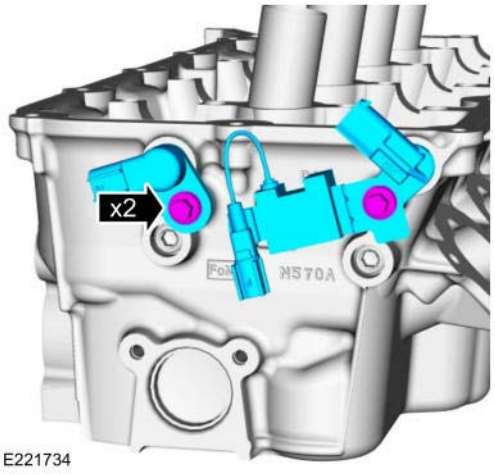
LH cylinder heads

9.

Using a new gasket, install the coolant outlet and the bolts.

Torque

: 89 lb.in (10 Nm)



10.

Install the CMP sensors, the radio interference capacitor and the bolts.

Torque

: 89 lb.in (10 Nm)

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > DISASSEMBLY

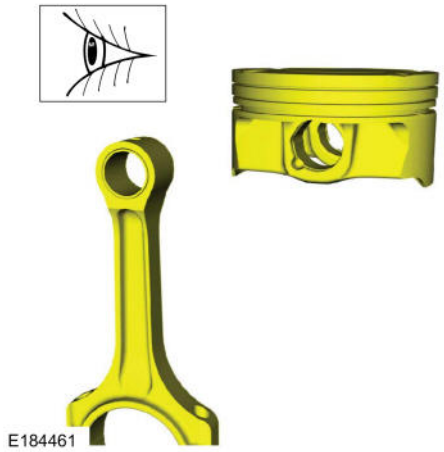
1.

Remove and discard the piston rings.

2.

Remove and discard the piston pin retainers.

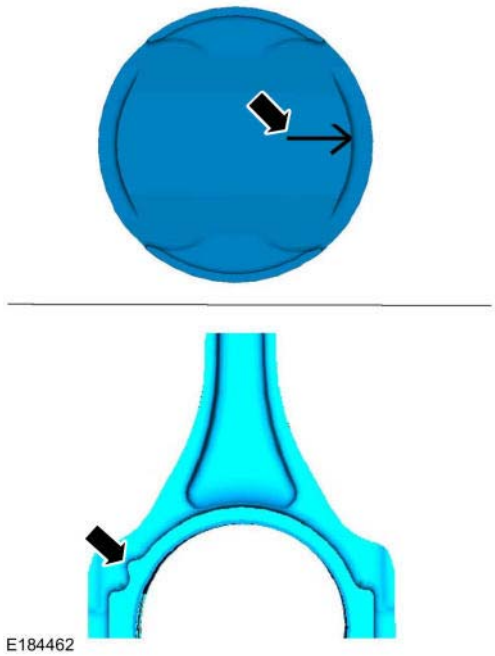
Remove the piston pin.



NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

3.
Separate the piston from the connecting rod.

4.



Clean and inspect the piston and connecting rod. Refer to: Piston Inspection .

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES > PISTON > ASSEMBLY

1.

If the piston and/or connecting rod are being installed new, the connecting rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

2.

Position the piston on the connecting rod.

3.

Lubricate and install the piston pin.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

NOTE: The piston pin retainer gap orientation must be toward the top of the piston.

4.
Install the piston pin retainers.

5.

Lubricate and install the oil control rings.

1.

Upper oil control ring.

2.

Oil control expander ring.

3.

Lower oil control ring.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

6.

Install the lower compression ring.

1.

The "O" mark on the ring pointing up toward the top of the piston.

2.

Hook feature will point down toward the bottom of piston.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

7.

Install the upper compression ring.

1.

The "O" mark on the ring pointing up toward the top of the piston.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

8.

Position the piston ring gaps.

1.

Center line of the piston parallel to the wrist pin bore.

2.

Upper compression ring gap.

3.

Upper oil control ring gap.

4.

Lower oil control ring gap.

5.

Oil control expander ring and lower compression ring gap.

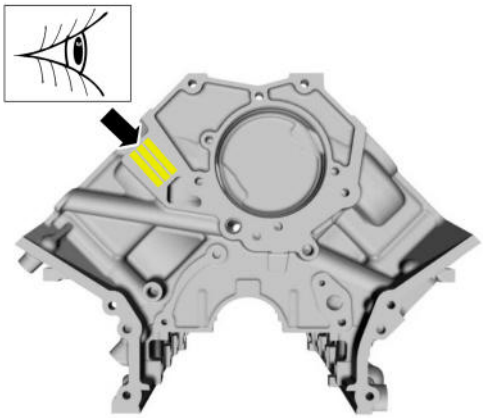
Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

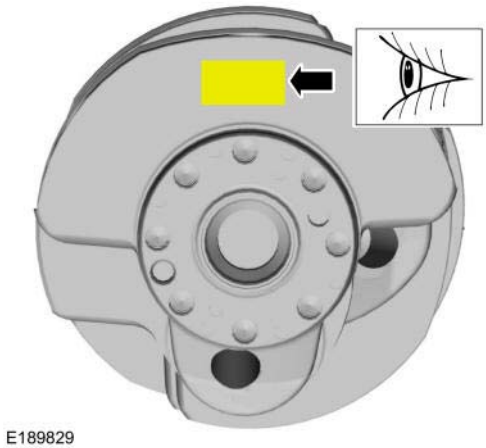


NOTE: The timing chain alignment procedure has changed from prior model year engines and must be followed exactly or damage to the engine will result.

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

NOTE: During engine assembly it may become necessary to check bearing clearances and end play. Refer to appropriate Engine article.

1.



Record the main bearing code found on the front of the engine block.

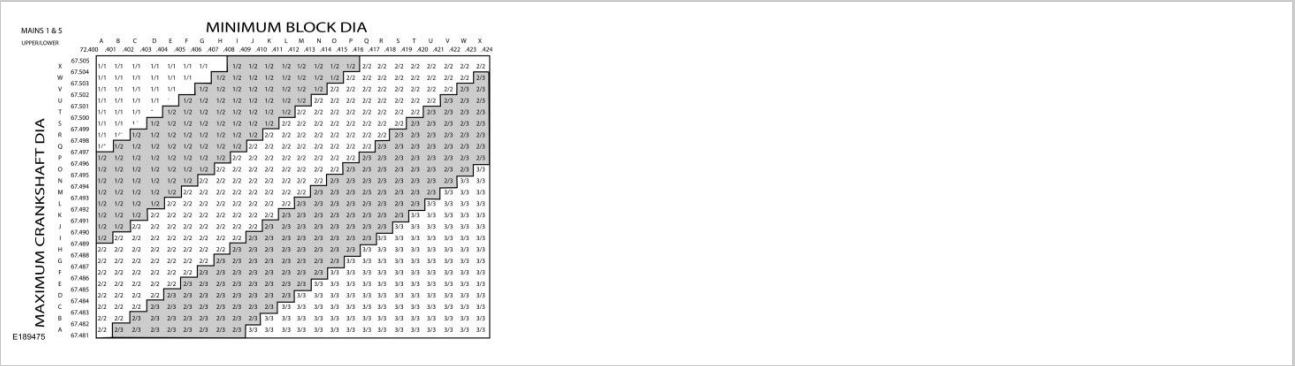
E189828

2.

Record the main bearing code found on the rear of the crankshaft.

E189829

NOTE: This chart in the illustration is for selecting main bearings 1 and 5 only, the remaining bearings will be selected using a different chart in the next step.



3.
Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 1 and 5.

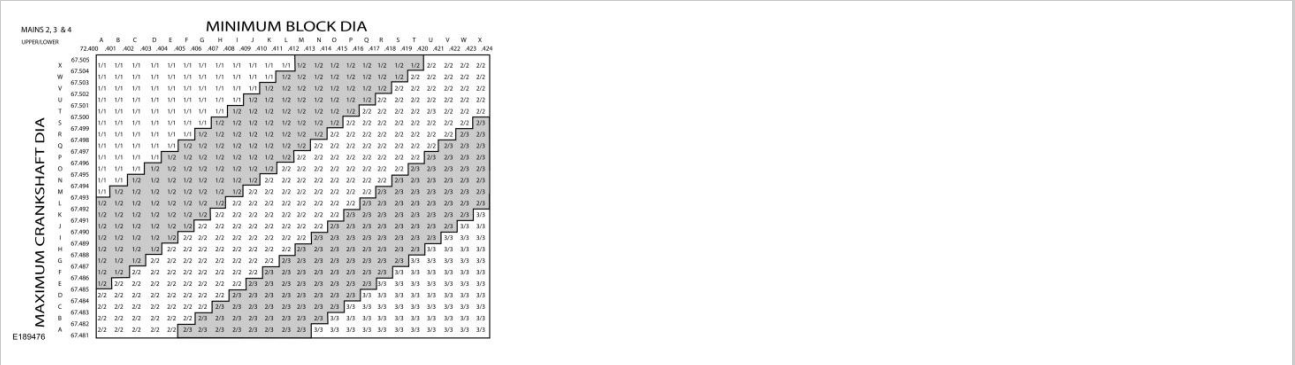
Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.

Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.

As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.

Repeat the above steps using the fifth letter of the block and crankshaft codes to select the No. 5 bearing.

NOTE: This chart in the illustration is for selecting main bearings 2, 3 and 4 only.



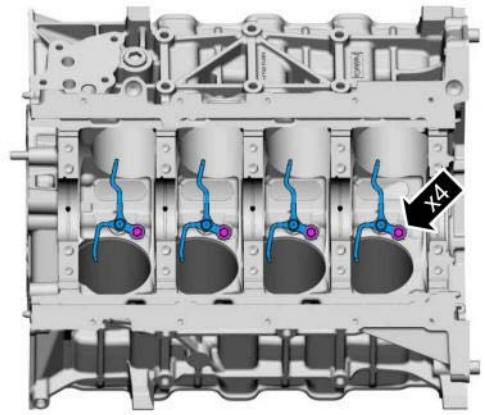
4.
Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 2, 3 and 4.

Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.

Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 2 crankshaft main bearing

As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.

Repeat the above steps using the third and fourth letters of the block and crankshaft codes to select the No. 3 and No. 4 bearings.



5.

Install the piston cooling jets and bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

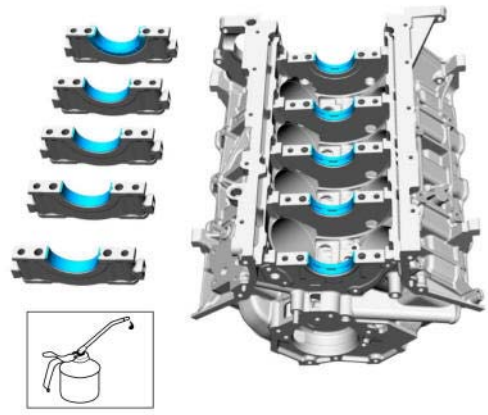
Stage 2: 45°

E187921

6.

Install the crankshaft main bearings.

Install the crankshaft upper main bearings into the cylinder block.



Install the crankshaft lower main bearings and thrust bearing into the bearing caps.

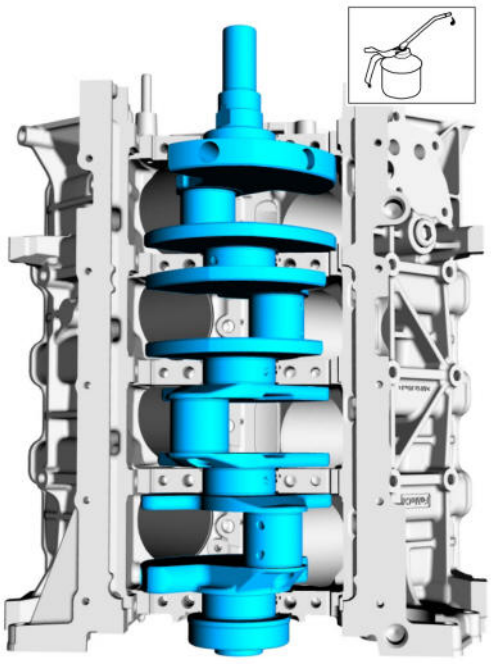
Make sure all oil passages are aligned.

Lubricate all main bearings with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E189831



NOTE: Lubricate the crankshaft bearing journals with clean engine oil.

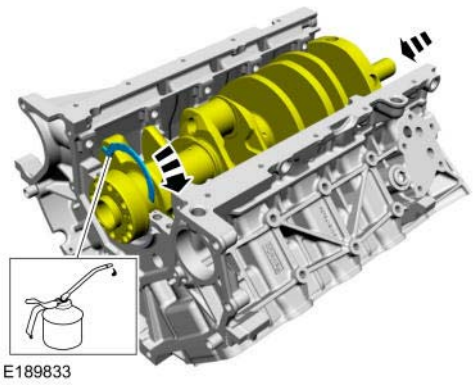
7.

Install the crankshaft into the cylinder block.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E189832



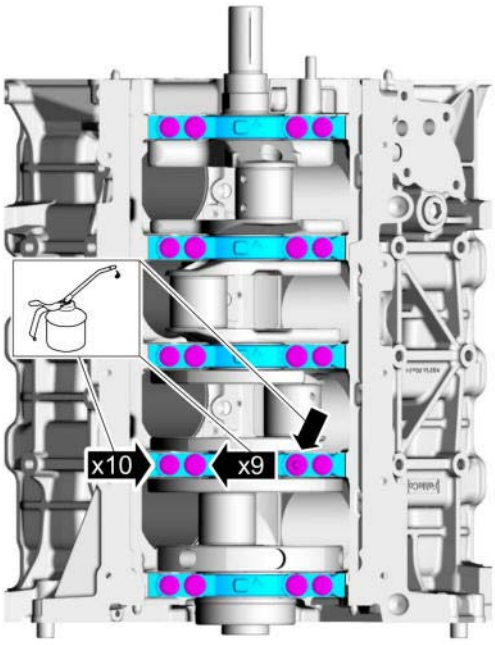
NOTE: The oil groove on the thrust washer must face toward the rear of the engine (against the crankshaft thrust surface).

NOTE: Lubricate the thrust washer with clean engine oil.

8.
Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 5 main boss.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

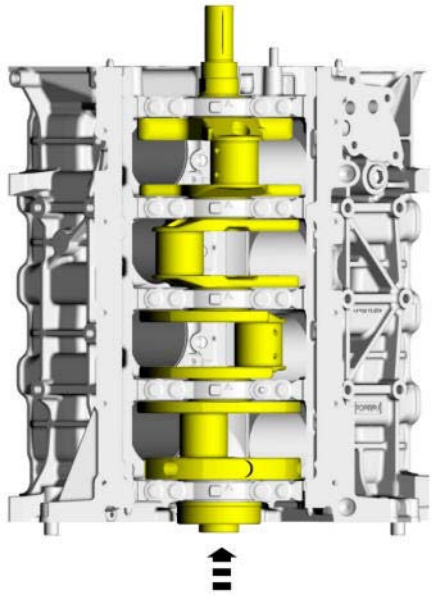


E189833

NOTE: Lubricate the fastener threads with clean engine oil.

9.
Install the main bearing caps and fasteners on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the cap fasteners.

Material



: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

E189834

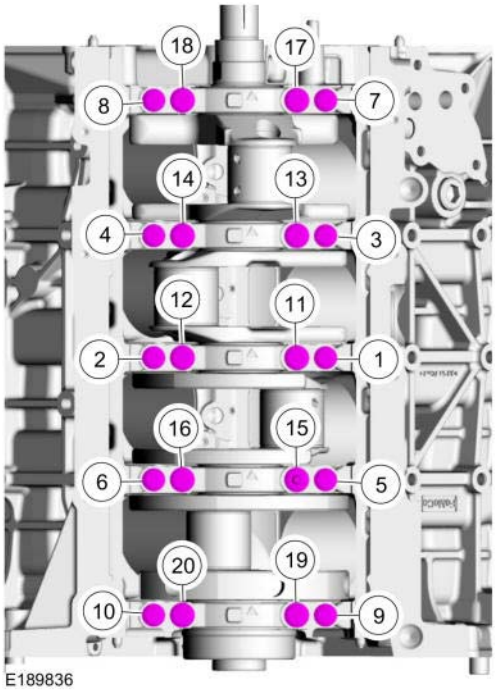
10.

Push the crankshaft forward to seat the crankshaft thrust washer.

E189835

11.

Tighten the vertical main bearing cap fasteners.



Torque:

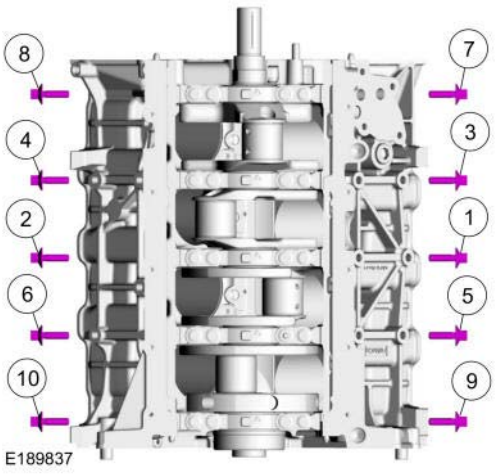
Stage 1: 1 through 20: 177 lb.in (20 Nm)

Stage 2: 1 through 10: 30 lb.ft (40 Nm)

Stage 3: 11 through 20 : 48 lb.ft (65 Nm)

Stage 4: 1 through 20: 90°

12.



Install the cross-mounted main bearing cap fasteners.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 22 lb.ft (30 Nm)

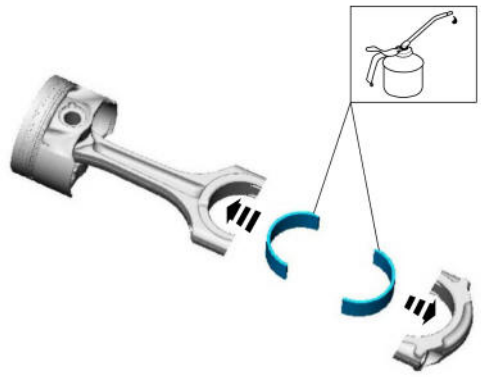
Stage 3: 60°

13.

Check the crankshaft end play. Refer to: Specifications .

Check that crankshaft torque-to-turn does not exceed 6 Nm (53 lb-in).

Check the piston-to-cylinder block and piston ring clearances. Refer to: Specifications .



Assemble the pistons and position the piston ring gaps. Refer to: Piston .

14.

Lubricate with clean engine oil and install the connecting rod bearings.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

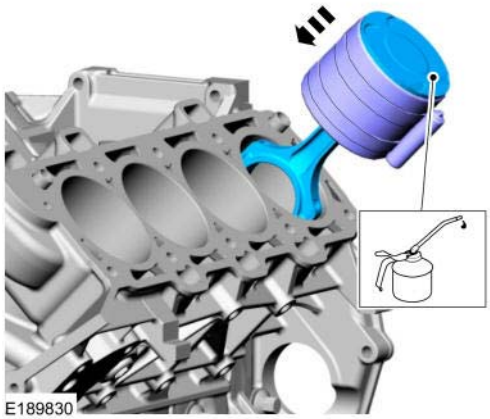
N0152264

NOTE: Do not allow the piston connecting rods to come in contact with the piston cooling jets or engine damage may occur.

NOTE: Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.

NOTE: Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.

NOTE: Lubricate the piston with clean engine oil.



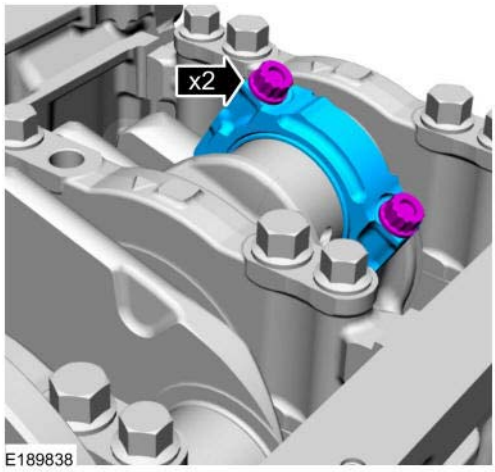
15.

Using a piston ring compressor, install the piston.

Use the General Equipment: Piston Ring Compressor

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



NOTE: The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.

NOTE: The connecting rod caps are of the "cracked" design and must mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

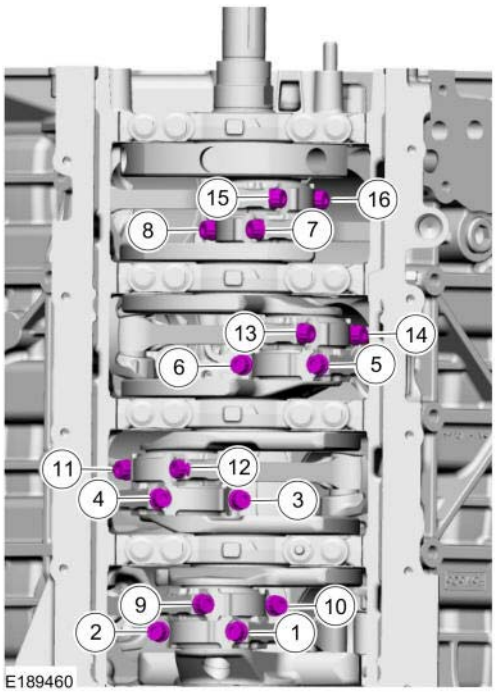
16.
Install the connecting rod cap and bearing.

Install the new bolts hand tight.

17.

Repeat the previous 2 steps for each of the remaining pistons.

18.



Tighten the connecting rod bolts.

Torque

Stage 1: 177 lb.in (20 Nm)

Stage 2: 28 lb.ft (38 Nm)

Stage 3: 105°

NOTE: Oil pump must be held against the cylinder block until all bolts are tightened.

19.

Rotate the inner rotor of the oil pump assembly to align the flats on the crankshaft and slip the oil pump over the crankshaft until seated against the block.

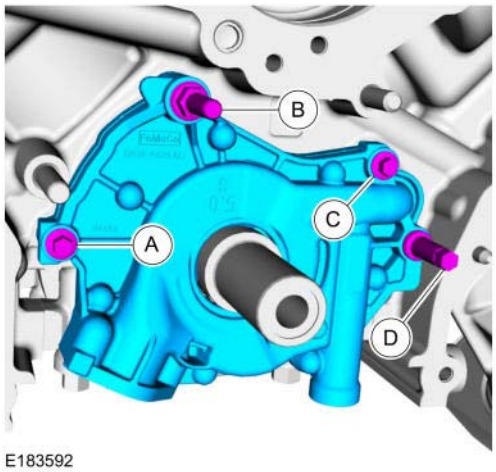
Rotate the oil pump until the bolt holes are aligned to the block and install the fasteners hand tight.

Torque

Stage 1: A: 89 lb.in (10 Nm)

Stage 2: B: 18 lb.ft (25 Nm)

Stage 3: C: 89 lb.in (10 Nm)



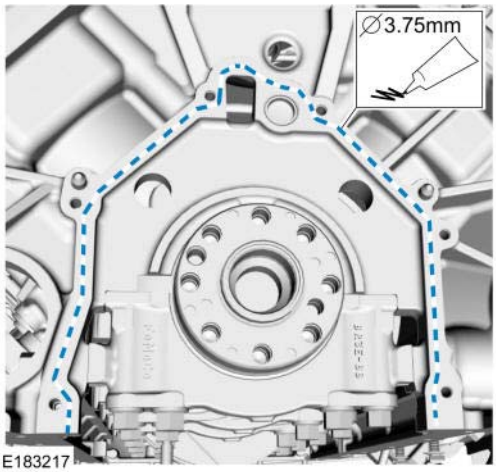
Stage 4: D: 177 lb.in (20 Nm)

Stage 5: A: 45°

Stage 6: B: 75°

Stage 7: C: 45°

Stage 8: D: 60°



E183592

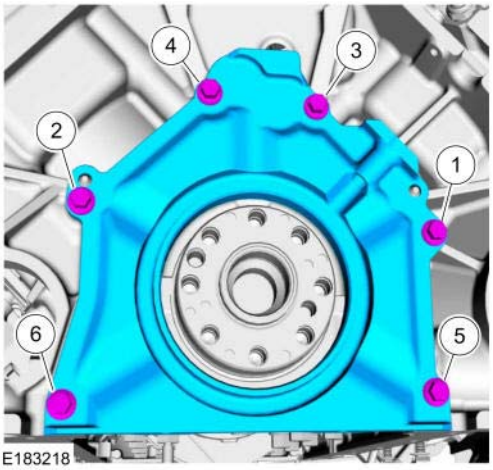
NOTE: If the rear crankshaft seal retaining plate is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure may cause future oil leaks.

20.
Apply a 3.75 mm (0.147 in) bead of silicone gasket and sealant to the rear crankshaft seal retainer mating surface on the engine block.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

E183217



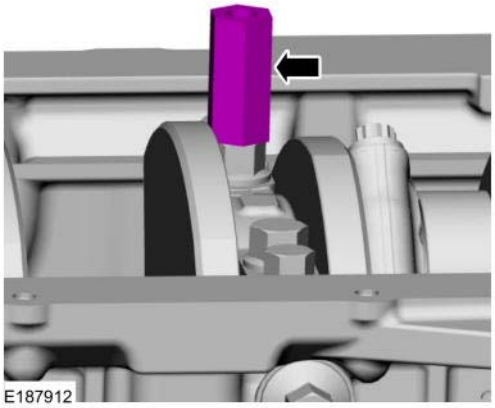
21.

Install the crankshaft rear seal retainer plate and the bolts.

Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°



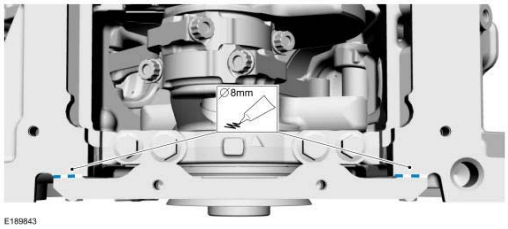
22.

Install the oil pump screen and pickup tube spacer.

Torque

: 18 lb.ft (25 Nm)

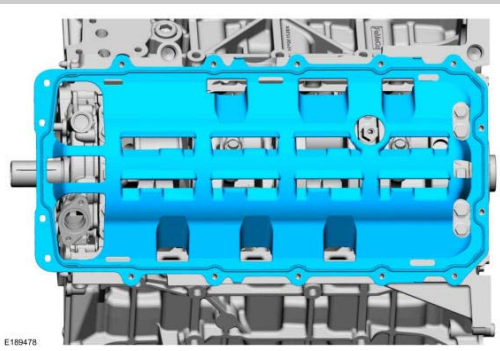
NOTE: If the oil pan is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage. If this timing cannot be met, tighten fasteners 7, 8, 9 and 10 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer and final torque all of the fasteners within 1 hour of applying the sealer.



23.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



Torque

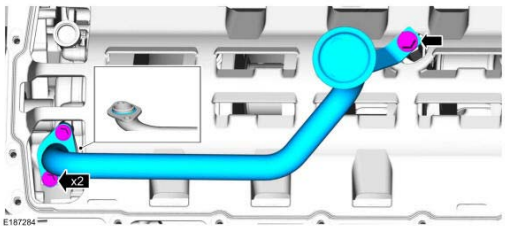
: 18 lb.ft (25 Nm)

24.

Install the oil pan baffle and gasket.

25.

Using a new O-ring seal, install the oil pump screen and pickup tube and the bolts.



Torque:

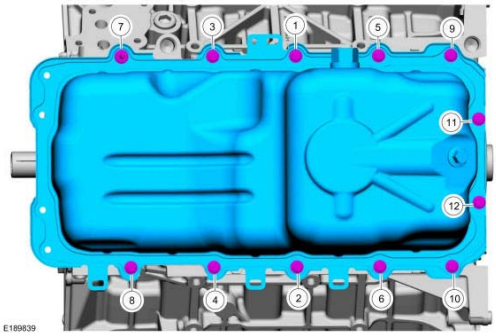
Oil pump screen and pickup tube-to-oil pump bolts:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°

Oil pump screen and pickup tube-to-spacer bolt : 18 lb.ft (25 Nm)

26.



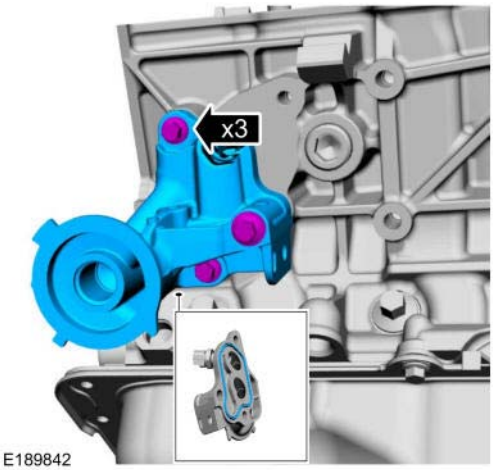
Install the oil pan and the fasteners.

Torque:

Stage 1: 18 lb.in (2 Nm)

Stage 2: 89 lb.in (10 Nm)

Stage 3: 45°



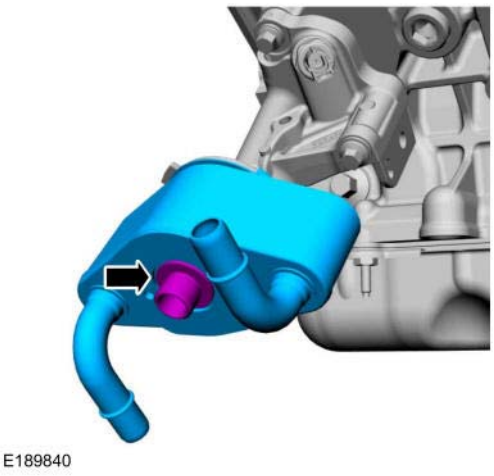
27.

Using a new gasket, install the oil filter adapter and the bolts.

Torque:

Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°



NOTE: A new oil cooler must be installed or severe damage to the engine can occur.

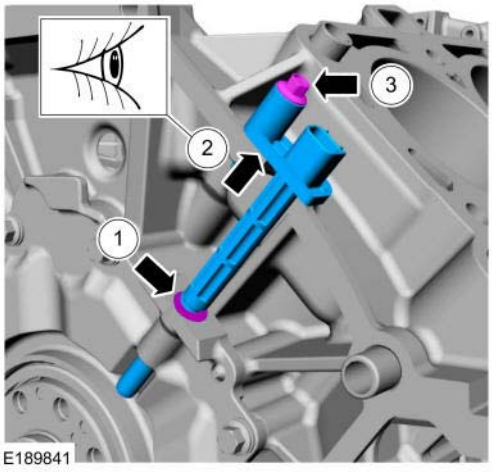
28.
Install a new oil cooler and the threaded fitting.

Torque

: 43 lb.ft (58 Nm)

NOTE: The CKP sensor must be positioned into the fitting on the crankshaft rear seal retainer plate and be flush against the boss on the engine block before the bolt is installed. If the CKP sensor is installed incorrectly, the CKP sensor can be damaged.

29.



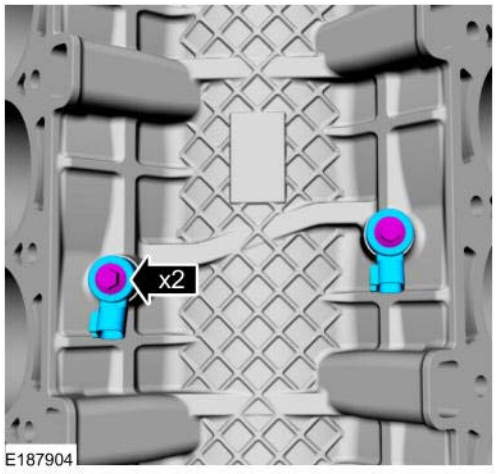
Install the CKP sensor must be positioned into the fitting on the crankshaft rear seal retainer plate.

Make sure the CKP sensor is flush with the engine block boss.

Install the bolt.

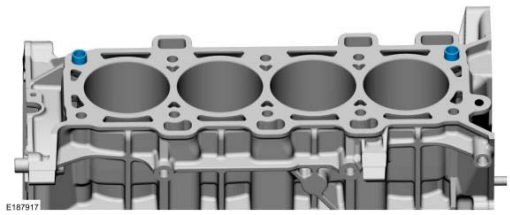
Torque

: 89 lb.in (10 Nm)



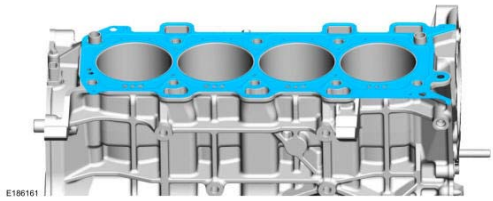
30.

Install the KSs and the bolts.



Torque

: 177 lb.in (20 Nm)



31.

Install the dowels on theRH bank of the cylinder block.

32.

Install a new RH cylinder head gasket.

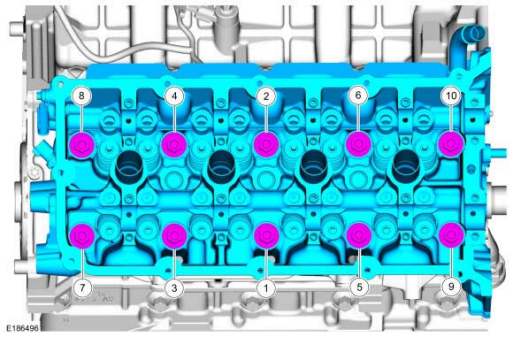
NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

33.
Install the RH cylinder head and the new bolts.

Torque:

Stage 1: 18 lb.ft (25 Nm)

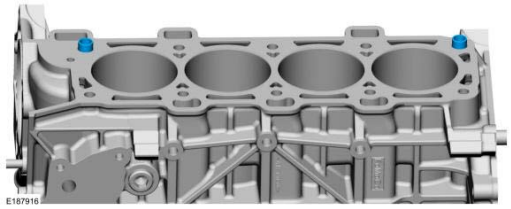
Stage 2: 55 lb.ft (75 Nm)



Stage 3 Loosen: 180°

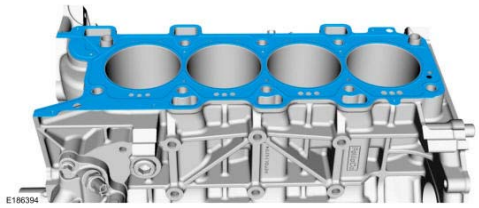
Stage 4: 18 lb.ft (25 Nm)

Stage 5: 26 lb.ft (35 Nm)



Stage 6: 90°

Stage 7: 90°



34.

Install the dowels on the LH bank of the cylinder block.

35.

Install a new LH cylinder head gasket.

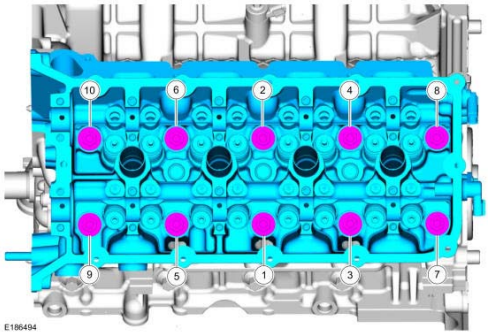
NOTE: The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

36.
Install the LH cylinder head and the new bolts.

Torque:

Stage 1: 18 lb.ft (25 Nm)

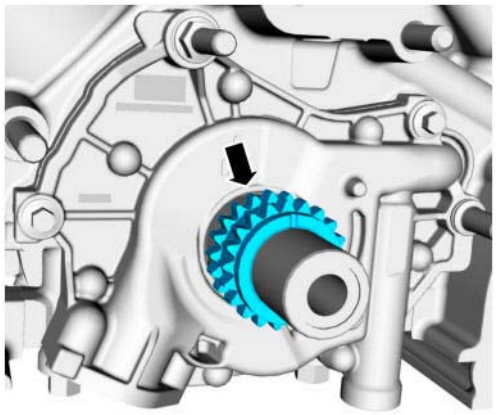
Stage 2: 55 lb.ft (75 Nm)



Stage 3: Loosen: 180°

Stage 4: 18 lb.ft (25 Nm)

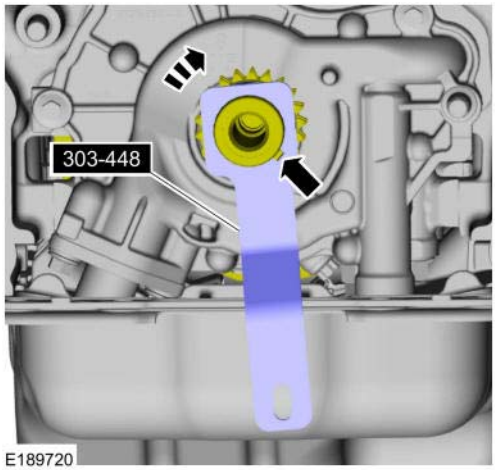
Stage 5: 26 lb.ft (35 Nm)



Stage 6: 90°

Stage 7: 90°

37.



Install the crankshaft sprocket.

38.

Using the special tool, rotate the crankshaft clockwise until the keyway is at the 5 o'clock position.

Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

NOTE: The LH camshafts, VCT units and timing chains must be installed first. Only turn

the crankshaft as instructed. Failure to do so may result in the camshafts installed out of phase and serious damage to the engine will result.

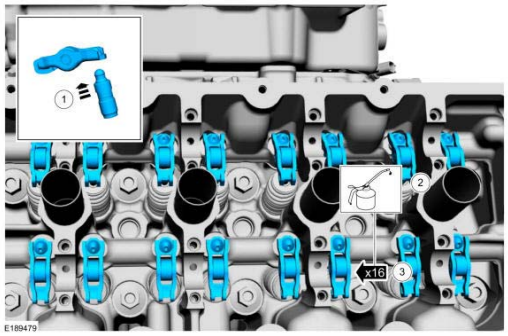
NOTE: If the components are to be reinstalled, they must be installed in their original locations.

39.

1.

Assemble the hydraulic lash adjusters onto the spring clips on the camshaft roller followers.

2.



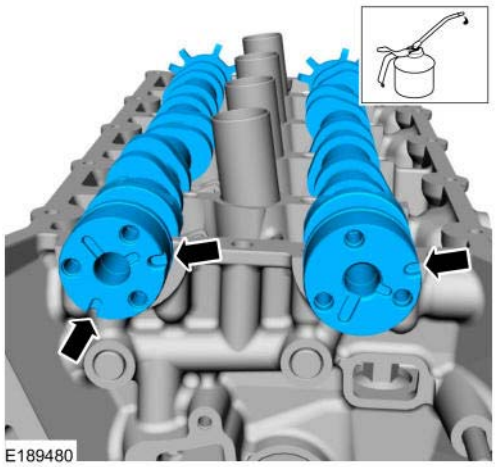
Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

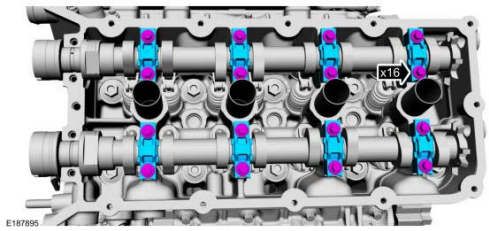
3.

Install the camshaft roller follower and hydraulic lash adjuster assemblies.



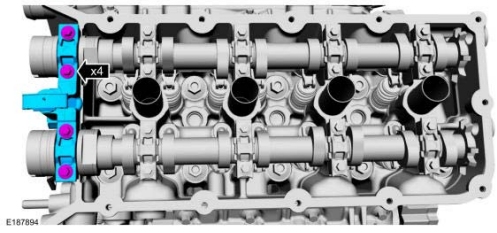
NOTE: Lubricate the camshafts with clean engine oil prior to installation.

40.
Install the LH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.



Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

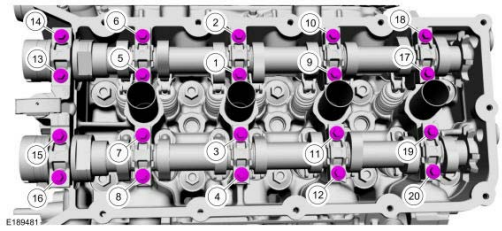


NOTE: Do not tighten at this time.

41.
Install the camshaft bearing caps and the bolts.

NOTE: Do not tighten at this time.

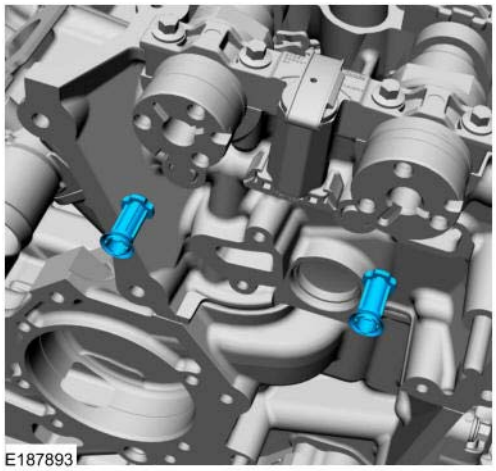
42.
Install the front camshaft bearing mega cap and the bolts.



43.

Tighten the bolts.

Torque:

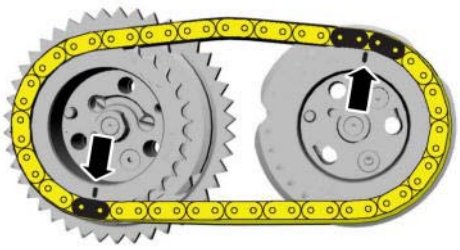


Stage 1: 53 lb.in (6 Nm)

Stage 2: 45°

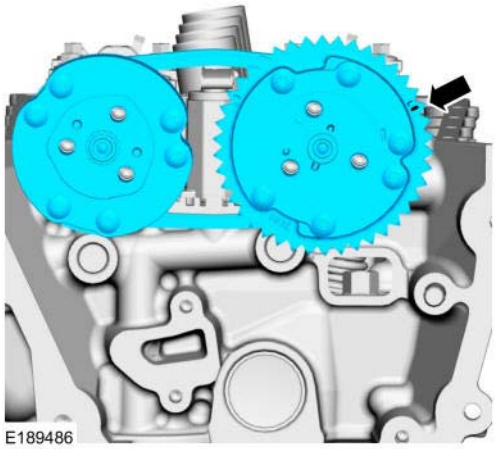
44.

Install new VCT system oil filters into the camshafts.



45.

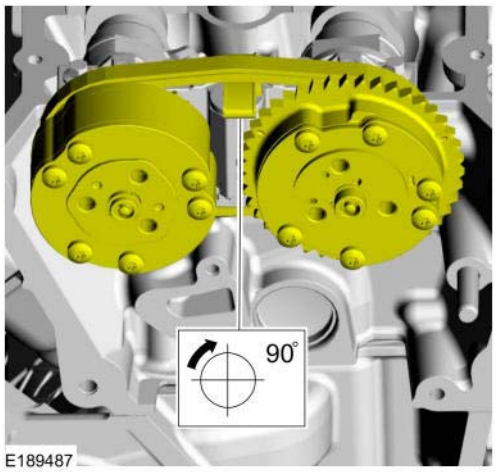
Position the secondary timing chain onto the VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.



The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.

The timing mark on the exhaust VCT assembly should align with the single colored link.

46.

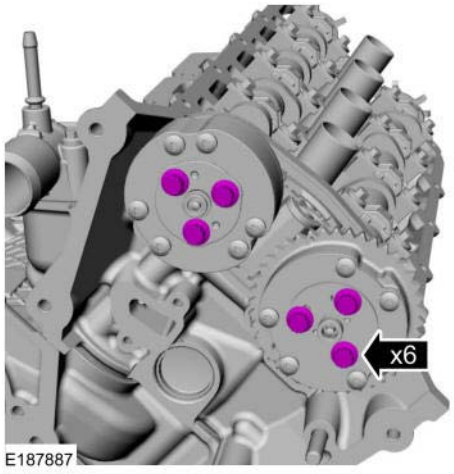


Install the VCT assemblies and the secondary timing chain onto the camshafts. The timing mark on the exhaust VCT assembly should be approximately in the 2 o'clock position.

NOTE: It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

47.
Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.

If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



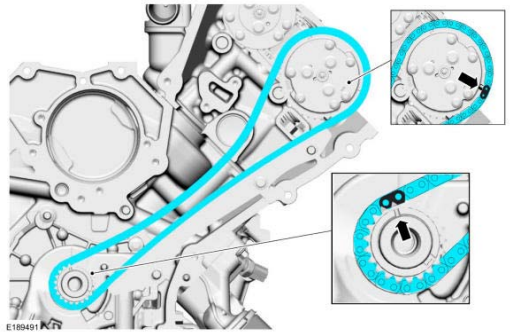
NOTE: Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

48.
Install the intake and the exhaust VCT assembly bolts.

Torque:

Stage 1: 133 lb.in (15 Nm)

Stage 2: 90°

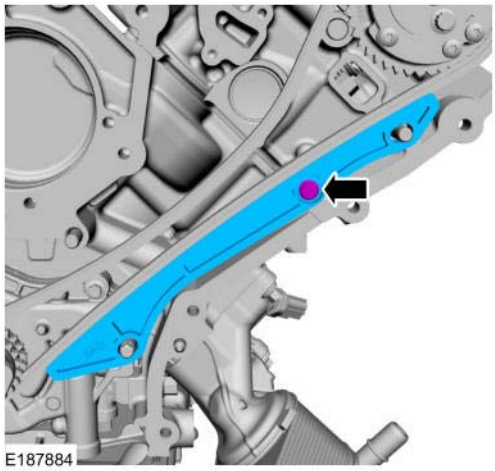


49.

Install the LH timing chain.

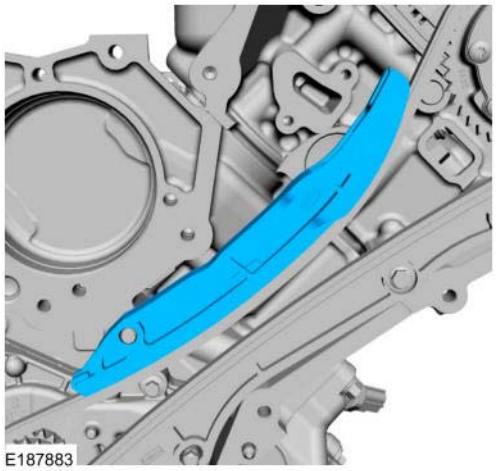
Align the colored link on the timing chain with the timing mark on the LH VCT assembly.

Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 5 o'clock position after installing the LH timing chain guide.

50.
Install the LH timing chain guide and bolt.

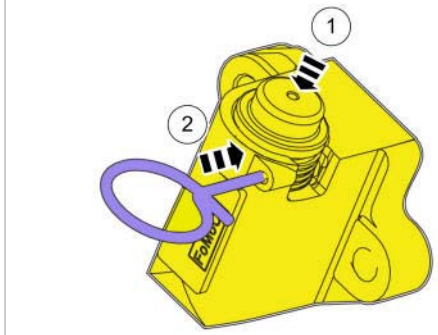


Torque

: 89 lb.in (10 Nm)

NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain arm. Return the crankshaft keyway to the 5 o'clock position after installing the LH timing chain arm.

51.
Install the LH timing chain tensioner arm.



52.

1.

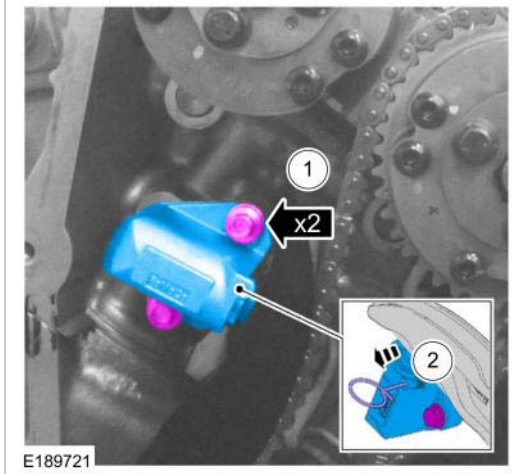
Compress the primary timing chain tensioner plunger, using an edge of a vise.

2.

Install a suitable pin into the hole of the tensioner housing to hold the plunger in place during installation.

53.

1.

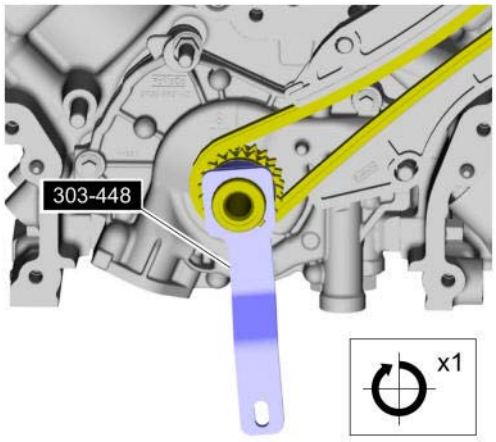


Install the LH primary timing chain tensioner and bolts.

Torque

: 89 lb.in (10 Nm)

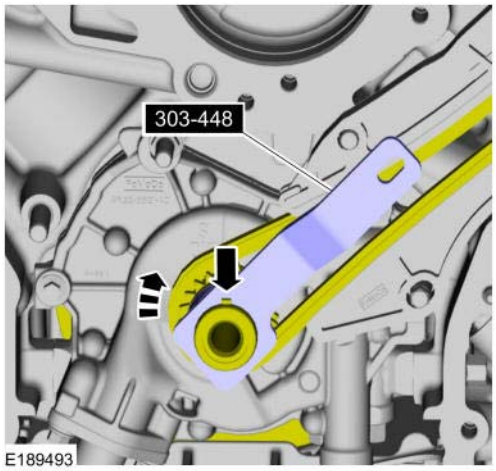
2.



Remove the holding pin from the tensioner.

54.

Using the special tool, rotate the crankshaft clockwise one complete revolution.



Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

55.

Using the special tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

Use Special Service Tool: 303-448 (T93P-6303-A) Holding Tool, Crankshaft.

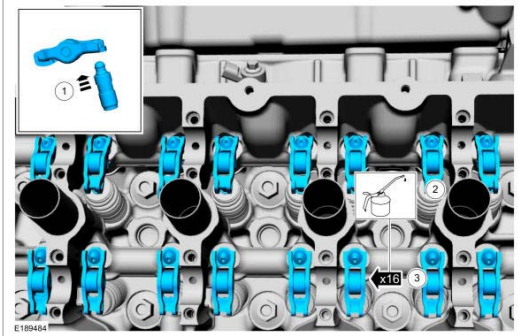
NOTE: If the components are to be reinstalled, they must be installed in their original locations.

56.

1.

Assemble the hydraulic lash adjusters onto the spring clips on the camshaft roller followers.

2.



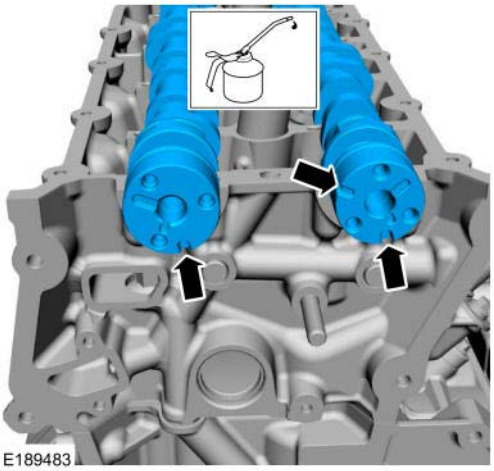
Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

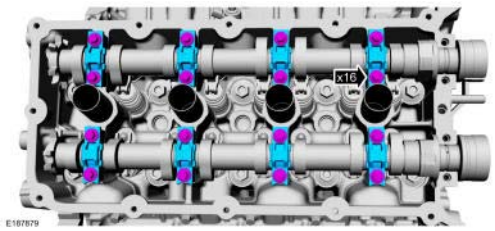
3.

Install the camshaft roller follower and hydraulic lash adjuster assemblies.



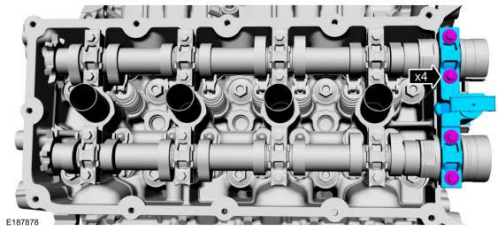
NOTE: Lubricate the camshafts with clean engine oil prior to installation.

57.
Install the RH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.



Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

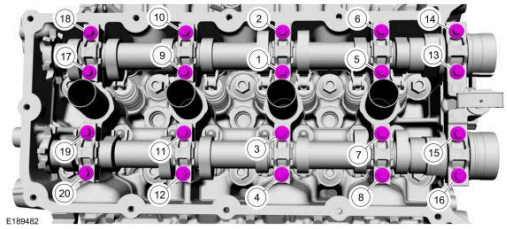


NOTE: Do not tighten at this time.

58.
Install the camshaft bearing caps and the bolts.

NOTE: Do not tighten at this time.

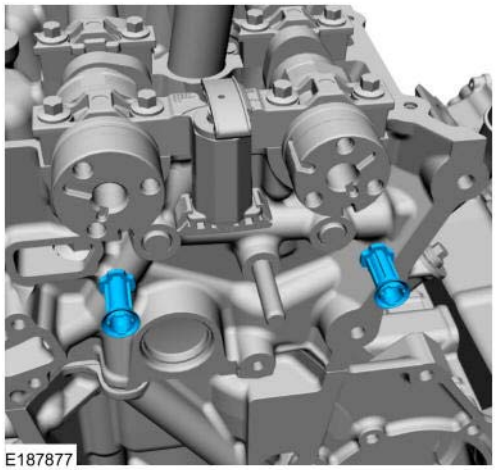
59.
Install the front camshaft bearing mega cap and the bolts.



60.

Tighten the bolts.

Torque:

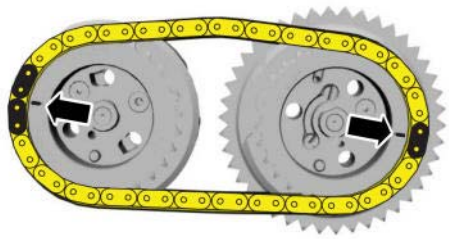


Stage 1: 53 lb.in (6 Nm)

Stage 2: 45°

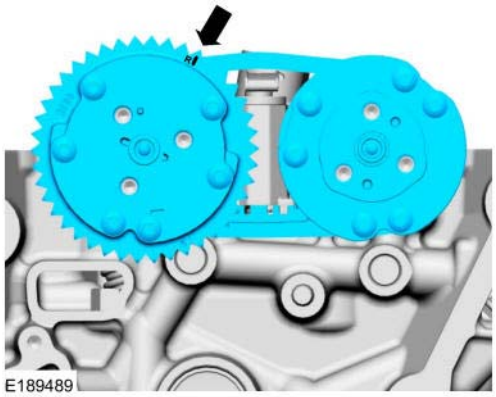
61.

Install the VCT system oil filters into the camshafts.



62.

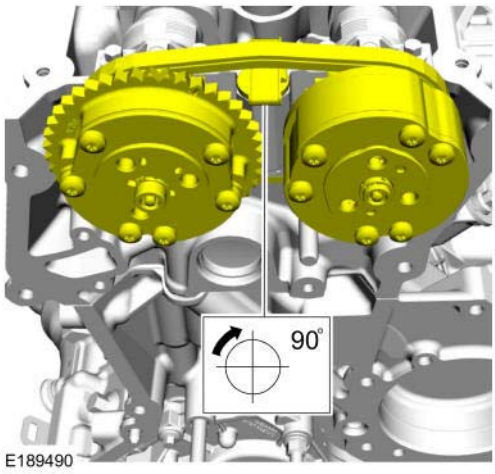
Position the secondary timing chain onto the VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.



The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.

The timing mark on the exhaust VCT assembly should align with the single colored link.

63.

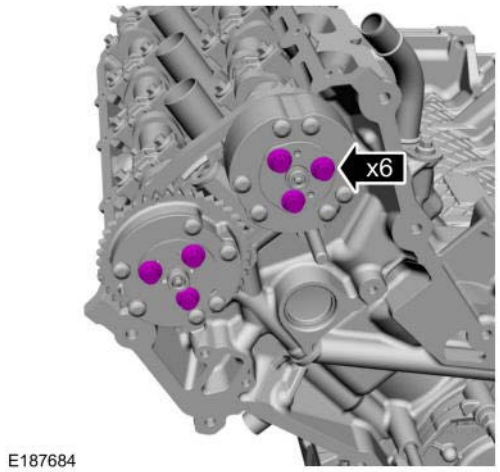


Install the VCT assemblies and the secondary timing chain onto the camshafts. The timing mark on the exhaust VCT assembly should be approximately in the 1 o'clock position.

NOTE: It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

64.
Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.

If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



NOTE: Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

65.
Install the intake and the exhaust VCT assembly bolts.

Torque:

Stage 1: 133 lb.in (15 Nm)

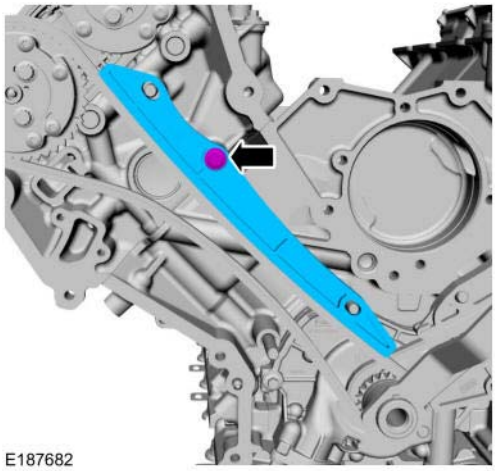
Stage 2: 90°

66.

Install the RH timing chain.

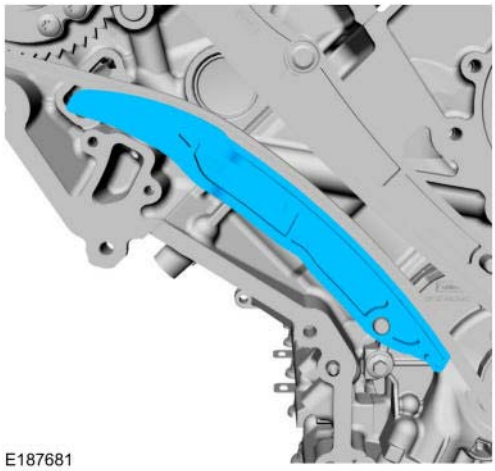
Align the colored link on the timing chain with the timing mark on the RH VCT assembly.

Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

67.
Install the RH timing chain guide and bolt.

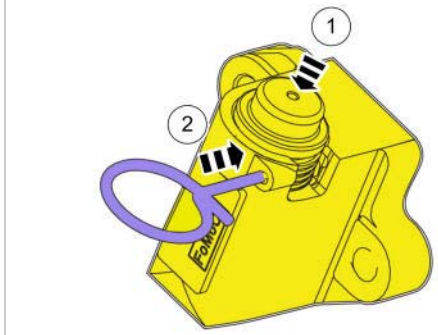


Torque

: 89 lb.in (10 Nm)

NOTE: It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain arm.

68.
Install the RH timing chain tensioner arm.



69.

1.

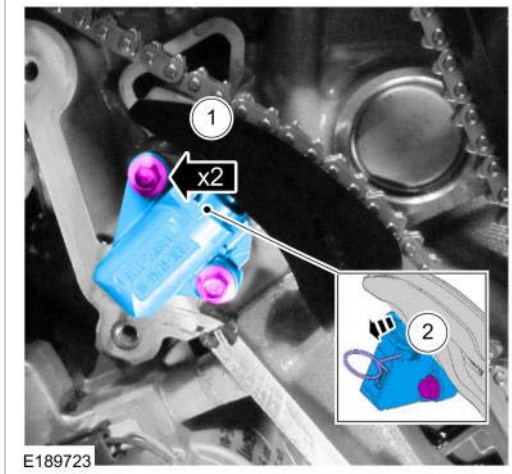
Compress the primary timing chain tensioner plunger, using an edge of a vise.

2.

Install a suitable pin into the hole of the tensioner housing to hold the plunger in place during installation.

70.

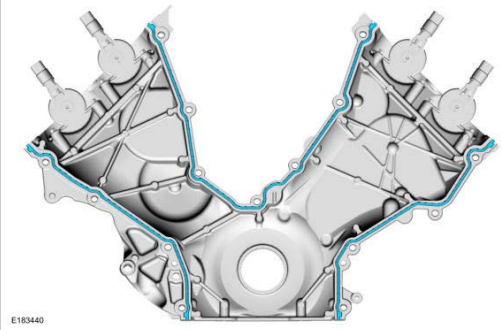
1.



Install the RH primary timing chain tensioner and bolts.

Torque

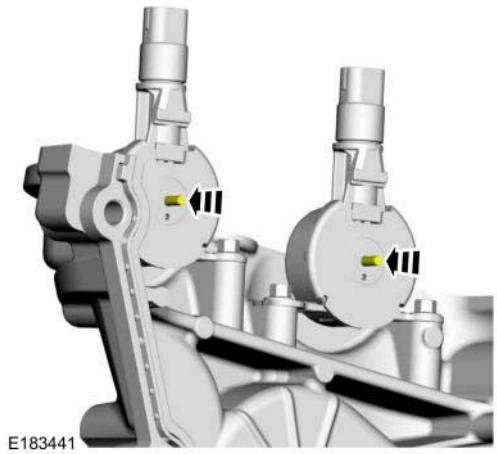
: 89 lb.in (10 Nm)



2.

Remove the holding pin from the tensioner.

71.

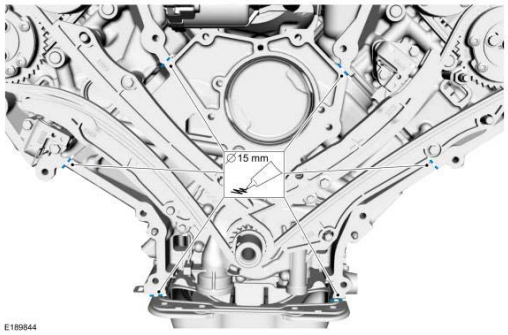


Install new gaskets on the engine front cover.

NOTE: The VCT variable force solenoid pins must be fully depressed to avoid interference with the VCT valve tips when installing the engine front cover. Failure to follow these instructions can result in damage to the engine.

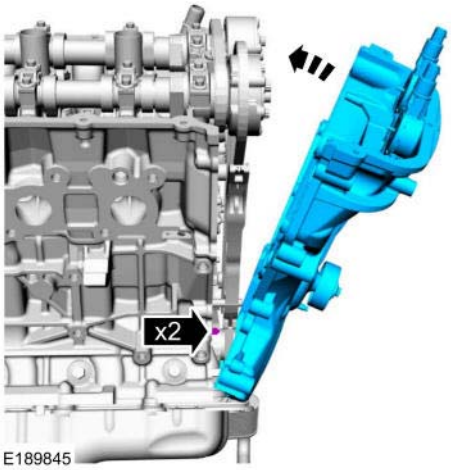
NOTE: RH shown in illustration, LH similar.

72.
Fully depress the VCT variable force solenoid pins.



NOTE: The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

73.
Apply a 15 mm (0.59 in) diameter drop of silicone gasket and sealant to the cylinder head-to-cylinder block joints and the oil pan-to-cylinder block joints.



Material

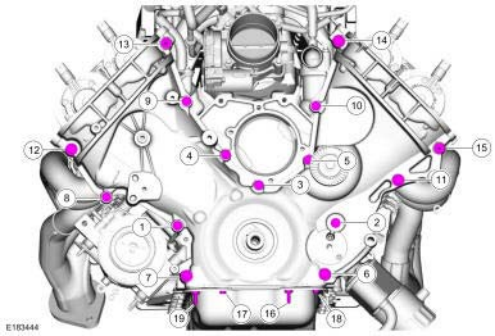
: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)

NOTE: Make sure that the engine front cover gaskets are in place on the engine front cover before installation.

74.
Position the engine front cover onto the dowels.

NOTE: The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

75.
Install the bolts and stud bolts.



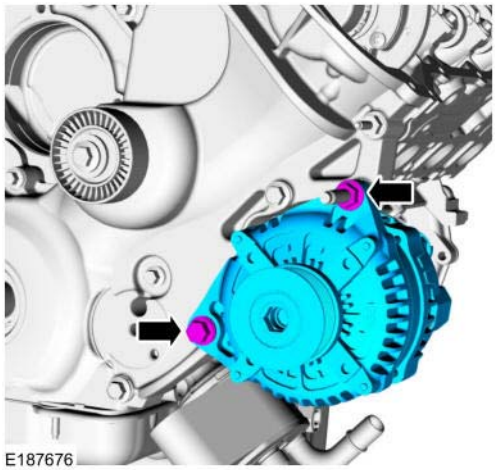
Torque:

Stage 1: Fasteners 1-15 : 18 lb.ft (25 Nm)

Stage 2: Fasteners 16-19 : 89 lb.in (10 Nm)

Stage 3: Fasteners 1-15 : 60°

Stage 4: Fasteners 16-19 : 45°

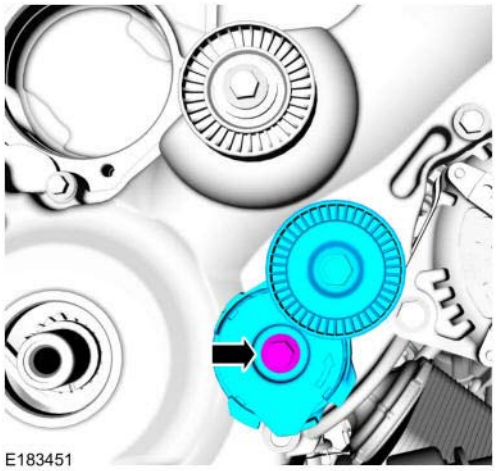


76.

Install the generator, the bolt and the nut.

Torque

: 35 lb.ft (48 Nm)

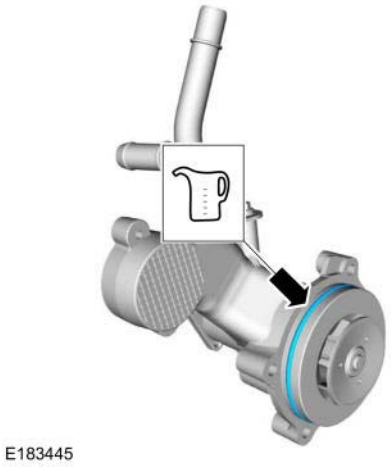


77.

Install the accessory drive belt tensioner and bolt.

Torque

: 35 lb.ft (48 Nm)



78.

Install a new coolant pump O-ring seal and lubricate with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

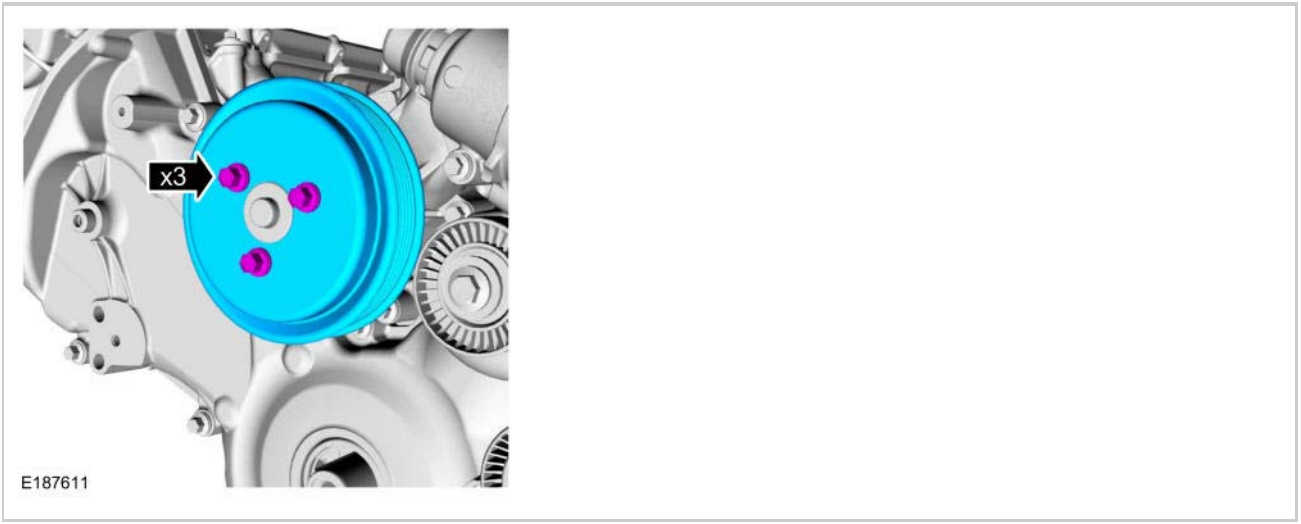
79.

Install the coolant pump and bolts.

Torque:

Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°



80.

Install the coolant pump pulley and the bolts.

Torque

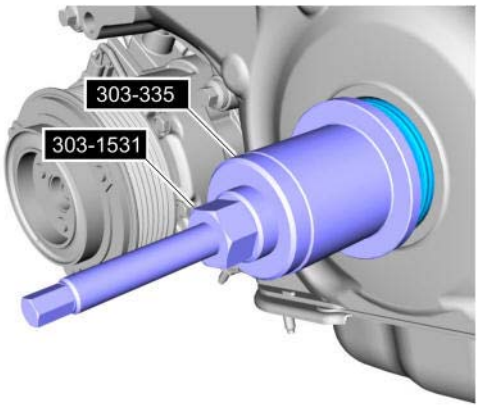
: 18 lb.ft (25 Nm)

81.

Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

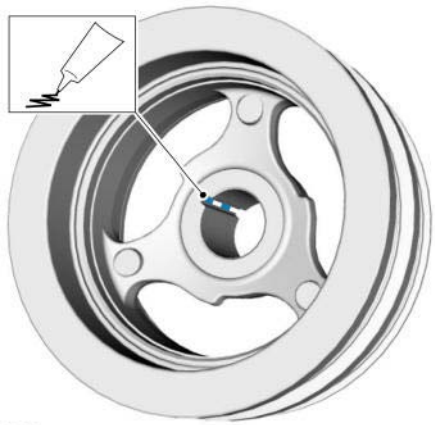


E183264

82.

Using the special tools, install the new crankshaft front oil seal.

Use Special Service Tool: 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal, 303-1531 Installer, Front Crank Seal and Damper.



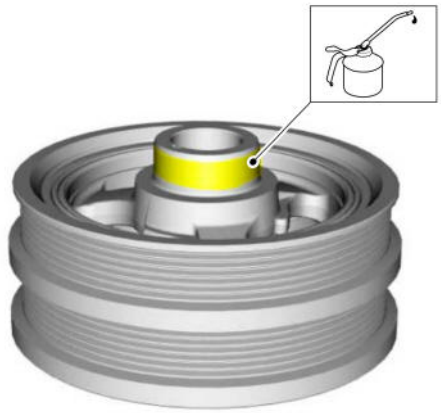
E183265

NOTE: If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned. Failure to follow this procedure can cause future oil leakage.

83.
Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



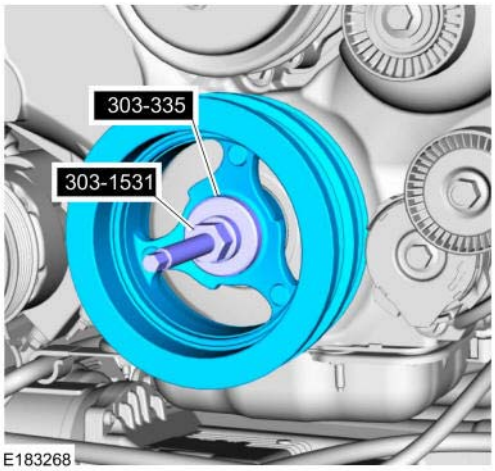
E183266

84.

Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



E183267

85.

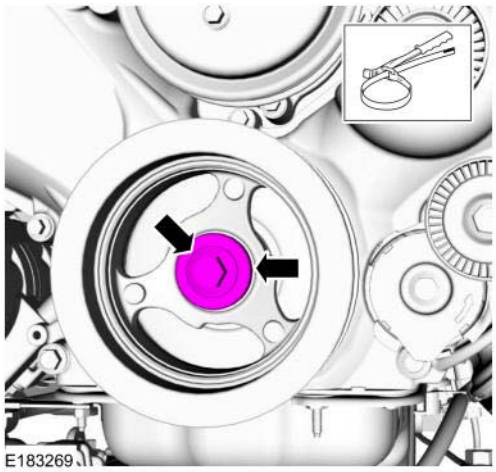
Using the special tools, install the crankshaft pulley.

Use Special Service Tool: 303-335 (T88T-6701-A) Installer, Front Cover Oil Seal, 303-1531 Installer, Front Crank Seal and Damper.

86.

Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer.

Use the General Equipment: Strap Wrench



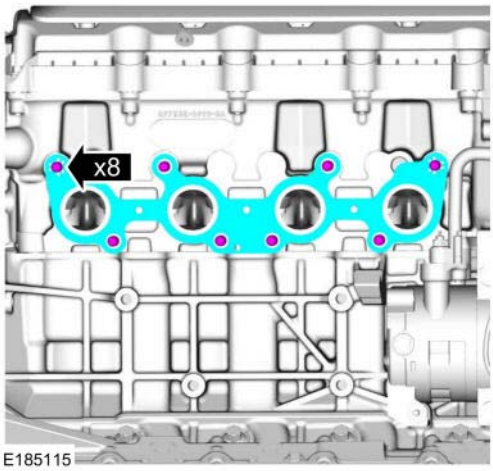
Torque:

Stage 1: 103 lb.ft (140 Nm)

Stage 2: Loosen: 360°

Stage 3: 74 lb.ft (100 Nm)

Stage 4: 90°



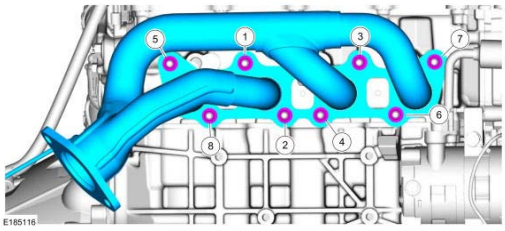
87.

Install new studs and new gasket.

Torque

: 159 lb.in (18 Nm)

88.

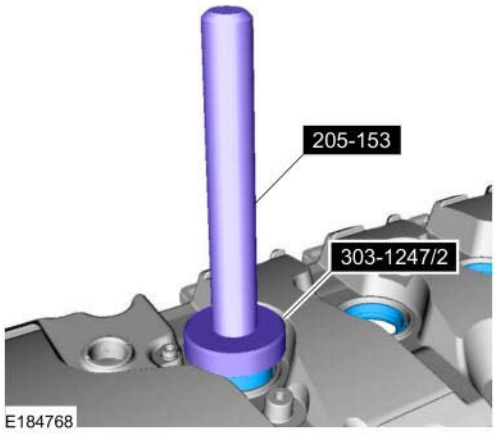


Install the exhaust manifold.

Install the new nuts.

Torque:

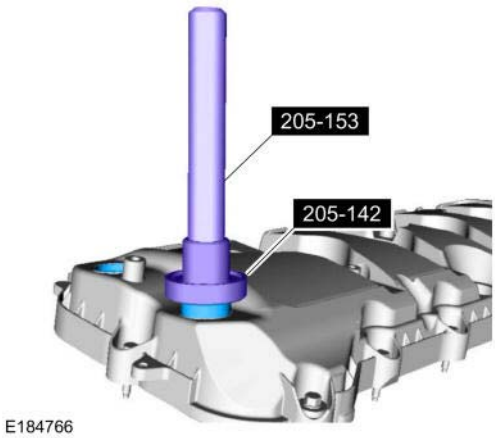
Stage 1: 159 lb.in (18 Nm)



Stage 2: 18 lb.ft (24 Nm)

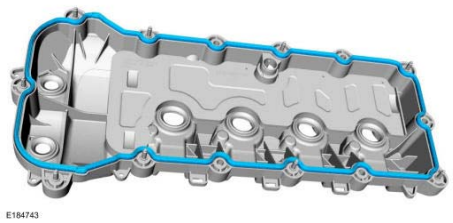
NOTE: Installation of new seals is only required if damaged seals were removed.

89.
Using the special tools, install new spark plug tube seals into the LH valve cover.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Installation of new seals is only required if damaged seals were removed.

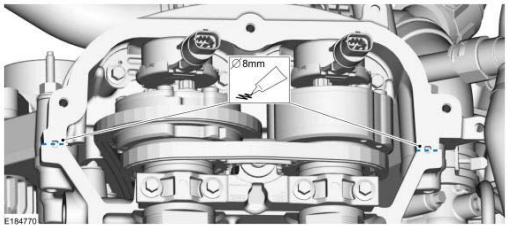


90.
Using the special tools, install new VCT variable force solenoid seals into the LH valve cover.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J) Installer, Differential Bearing Cone.

91.

Install a new gasket onto the LH valve cover.

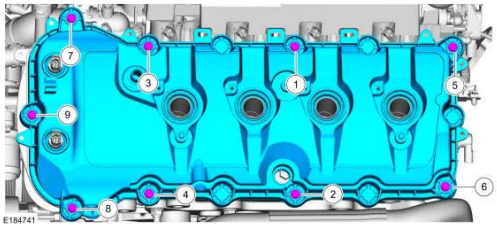


NOTE: If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned.

92.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-LH cylinder head joints.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



93.

Install the LH valve cover and tighten the bolts.

Torque

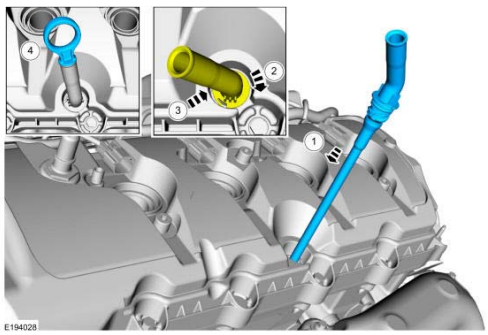
: 89 lb.in (10 Nm)

94.

1.

Push the oil level indicator tube into the engine.

2.

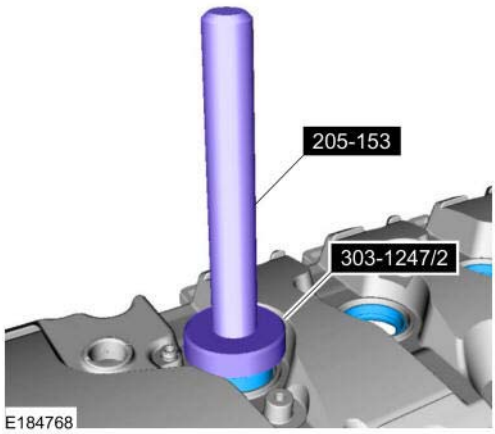


Rotate the oil level indicator tube clockwise.

3.

Verify the tab is locked in place.

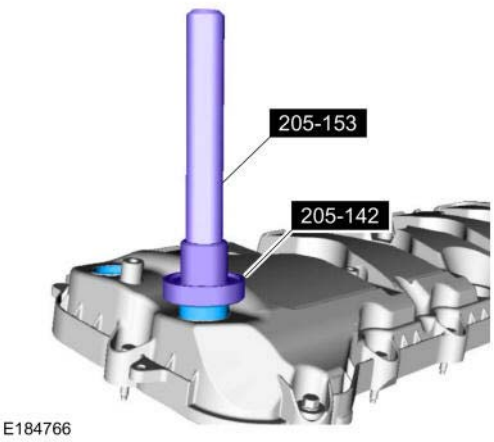
4.



Install the oil level indicator.

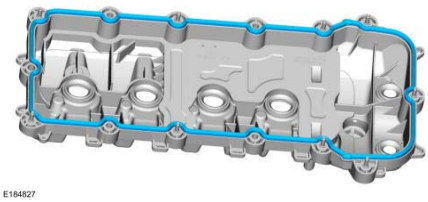
NOTE: Installation of new seals is only required if damaged seals were removed.

95.
Using the special tools, install new spark plug tube seals into the RH valve cover.



Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1247 VCT Spark Plug Tube Seal Remover and Installer.

NOTE: Installation of new seals is only required if damaged seals were removed.

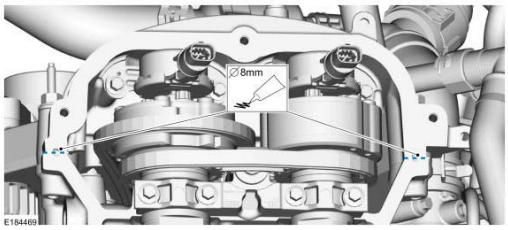


96.
Using the special tools, install new VCT variable force solenoid seals into the RH valve cover.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 205-142 (T80T-4000-J)Installer, Differential Bearing Cone.

97.

Install a new gasket onto the RH valve cover.

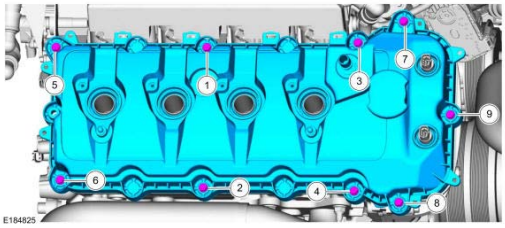


NOTE: If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned.

98.
Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-RH cylinder head joints.

Material

: Silicone Gasket and Sealant / TA-30 (WSE-M4G323-A4)



99.

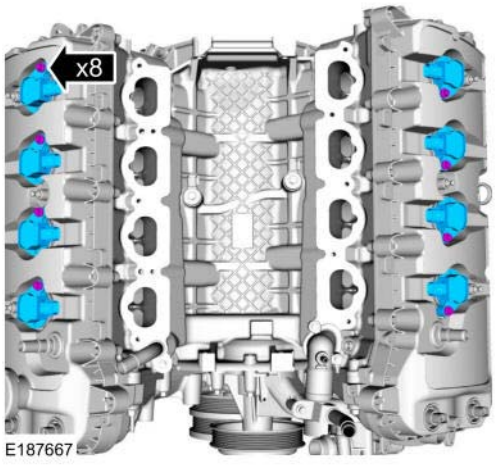
Install the RH valve cover and tighten the bolts.

Torque

: 89 lb.in (10 Nm)

NOTE: When installing ignition coils, apply a small amount of silicone brake caliper grease and dielectric compound to the inside of the ignition coil boots before installation.

100.
Install the ignition coils and the bolts. Install the ignition coils and the bolts.



Material

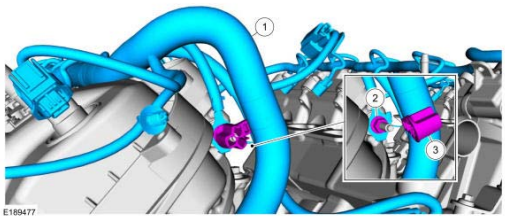
: Silicone Brake Caliper Grease and Dielectric Compound / XG-3-A (ESE-M1C171-A)

Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 50°

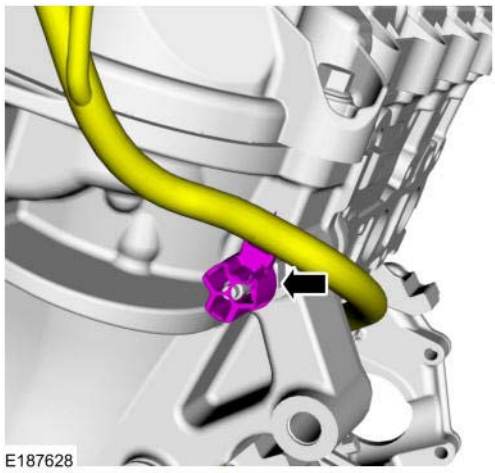
101.



Position the wiring harness on the engine.

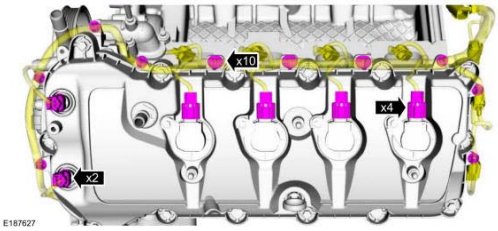
Install the ground wire and the nut.

Torque



: 89 lb.in (10 Nm)

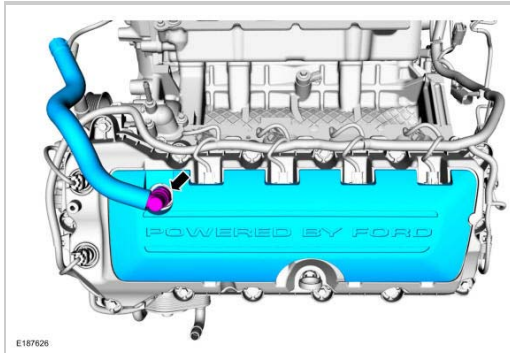
Attach the wiring harness retainer to the engine front cover stud bolt.



102.

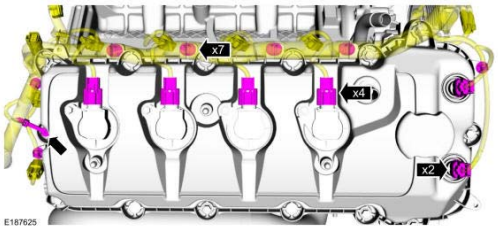
Attach the wiring harness retainer to the engine front cover stud bolt.

103.



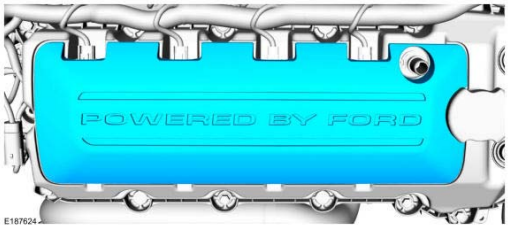
Connect the wiring harness electrical connectors and retainers.

104.



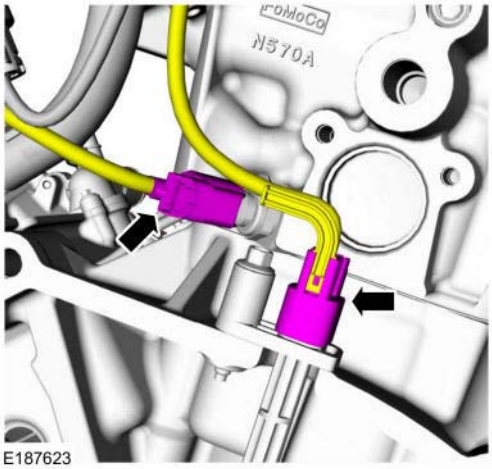
Install the LH spark plug cover.

Install the crankcase ventilation tube. Refer to: QUICK RELEASE COUPLING .



NOTE: Engine equipped with automatic transmission shown in illustration, manual transmission engine similar.

105.
Connect the wiring harness electrical connectors and retainers.

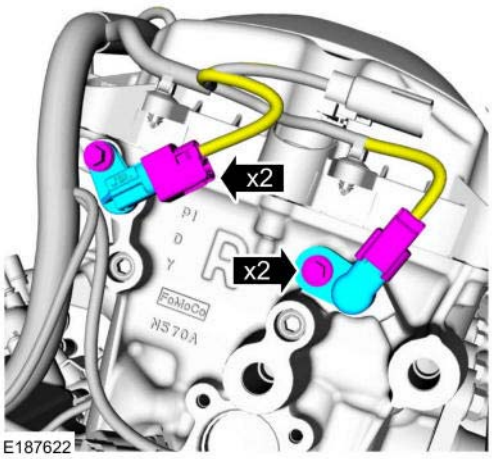


106.

Install the spark plug cover.

107.

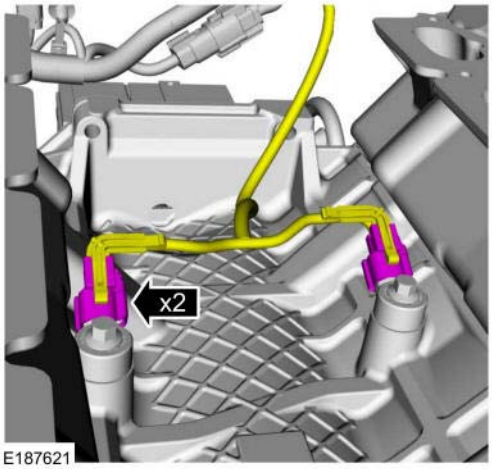
Connect the CHT sensor and the CKP sensor electrical connectors.



108.

Install the RH camshaft position sensors and the bolts.

Torque



: 89 lb.in (10 Nm)

Connect the RH camshaft position sensor electrical connectors.

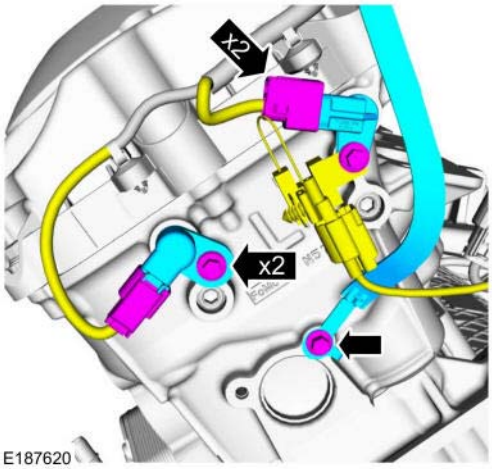
109.

Connect the KS electrical connectors.

110.

Install the LH camshaft position sensors and the bolts.

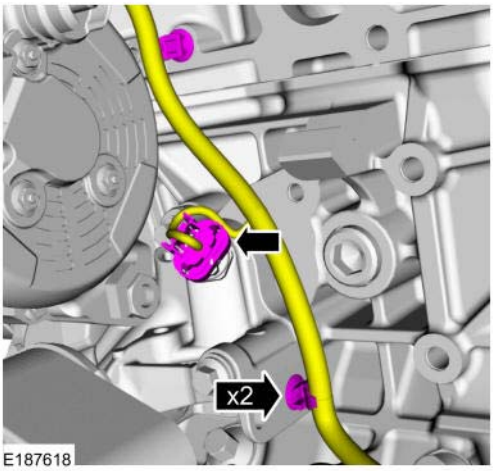
Torque



: 89 lb.in (10 Nm)

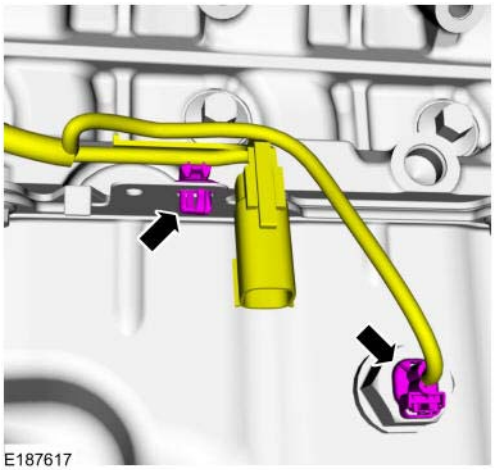
Position the ground wire and install the bolt.

Torque



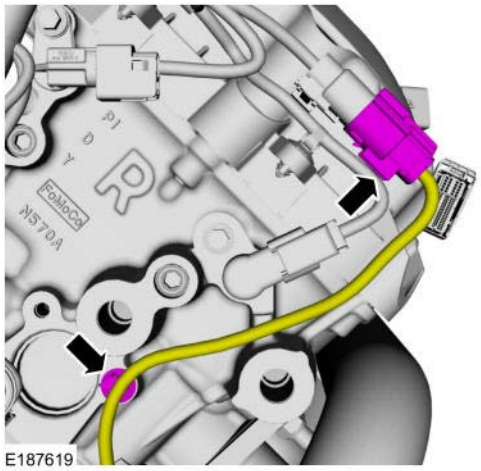
: 106 lb.in (12 Nm)

Connect the LH camshaft position sensor electrical connectors.



111.

Connect the EOP) switch electrical connector and the wiring harness retainers.



112.

Connect the engine oil level sensor electrical connector and the wiring harness retainer.

NOTE: Manual transmission engine shown in illustration, automatic transmission engine similar.

113.
Connect the RH HO2S electrical connector and wiring harness retainer.

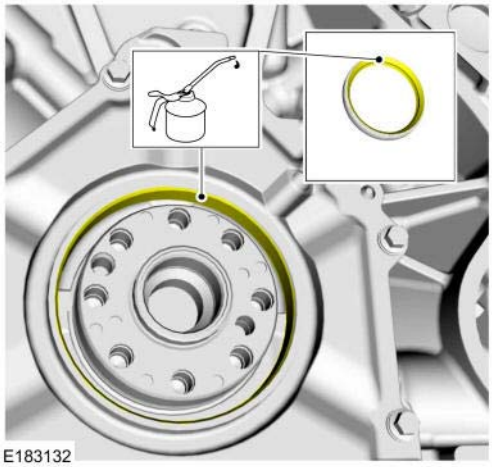
114.

Install the special tool and remove the engine from the engine stand using a floor crane.

Install Special Service Tool: 303-F047 Lifting Bracket, Engine.

Use the General Equipment: Floor Crane

Use the General Equipment: Mounting Stand

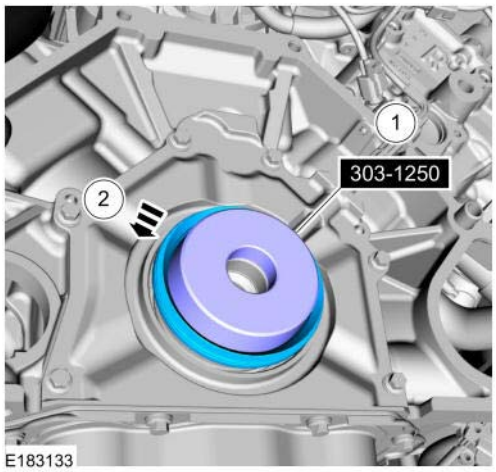


115.

Lubricate the seal bore and the seal lips with clean engine oil.

Material

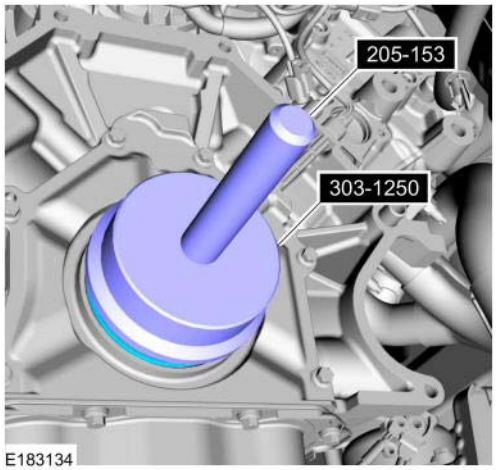
: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)



116.

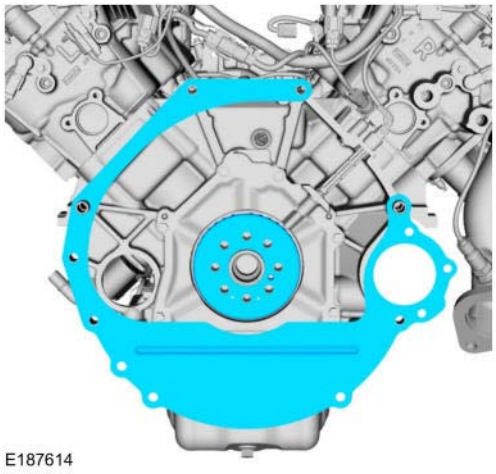
Position the special tool onto the end of the crankshaft.

Use Special Service Tool: 303-1250 Seal Installer, Rear Main.



Slide the new crankshaft rear seal onto the tool.

117.



Using the special tools, install the crankshaft rear seal.

Use Special Service Tool: 205-153 (T80T-4000-W) Handle, 303-1250 Seal Installer, Rear Main.

NOTE: Engine equipped with manual transmission shown in illustration, automatic transmission engine similar.

118.
Install the engine-to-transmission spacer plate and the crankshaft sensor ring.

6-Speed Manual Transmission - MT82

119.

Install the flywheel and the bolts.

Torque:

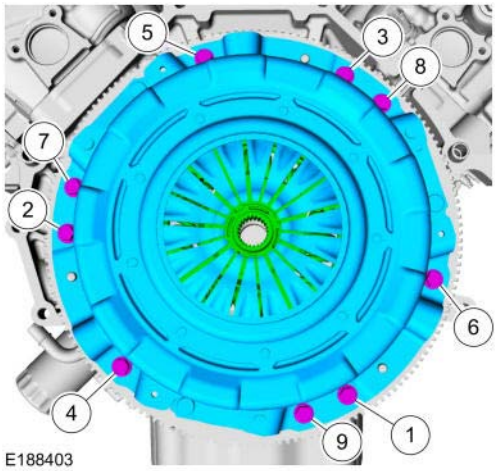
Stage 1: 89 lb.in (10 Nm)

Stage 2: 177 lb.in (20 Nm)

Stage 3: 60°

NOTE: If installing a new pressure plate and/or flywheel, align the paint dot on the pressure plate as close as possible to the paint dot on the flywheel or a clutch system vibration can occur.

NOTE: If installing the original pressure plate, align it using the index-marks made during removal or a clutch system vibration can occur.



120.
Using a clutch aligner, position the clutch disc on the flywheel. If installing the original pressure plate, align the pressure plate to the flywheel using the index-marks made during removal. If installing a new pressure plate, align the pressure plate to the flywheel using the paint dots. Install new pressure plate bolts by turning the bolts 1 turn at a time in a star pattern until the clutch is fully secured.

Use the General Equipment: Clutch Alignment Tool

Torque:

Stage 1: 34 lb.ft (46 Nm)

Stage 2: 60°

6-Speed Automatic Transmission - 6R80

121.

Install the flexplate and the bolts.

Torque:

Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°

INSTALLATION > ENGINE

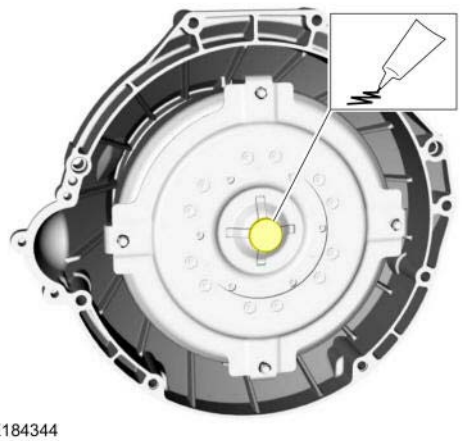
Materials

Name	Specification
Motorcraft® Multi-Purpose Grease Spray XL-5-A	ESB-M1C93-B
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

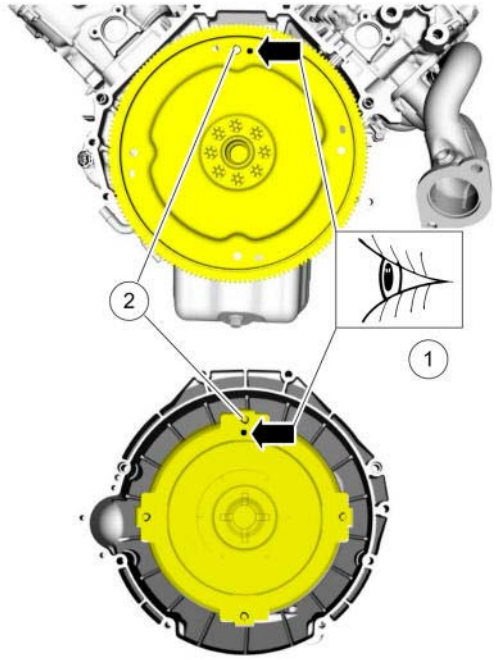


6-Speed Automatic Transmission - 6R80

NOTE: Prior to installation of the engine, the torque converter pilot hub must be lubricated with multi-purpose grease or damage to the torque converter or the engine crankshaft can occur.

1.
Lubricate the torque converter pilot hub with multi-purpose grease.

Material

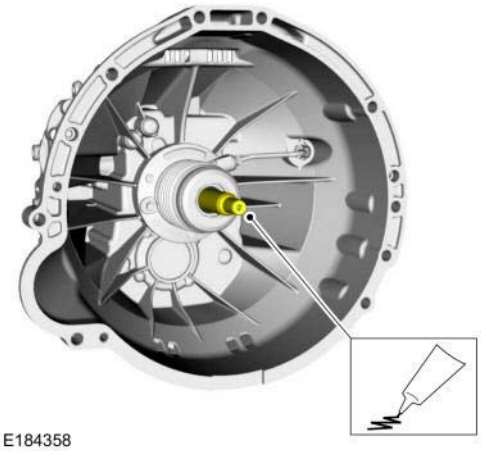


: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

2.

Inspect the torque converter stud and flexplate for paint marks.

Align the torque converter stud and flexplate hole near the paint marks to the 12 o'clock position.

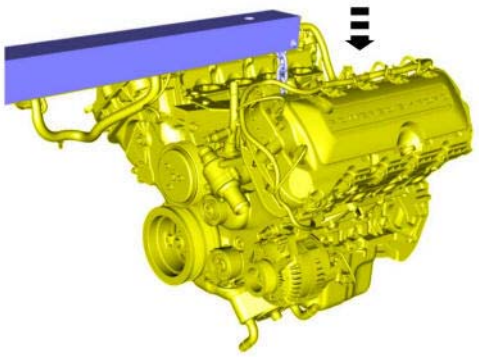


6-Speed Manual Transmission - MT82

3.

Lubricate the input shaft with multi-purpose grease.

Material



: Motorcraft® Multi-Purpose Grease Spray / XL-5-A (ESB-M1C93-B)

4.

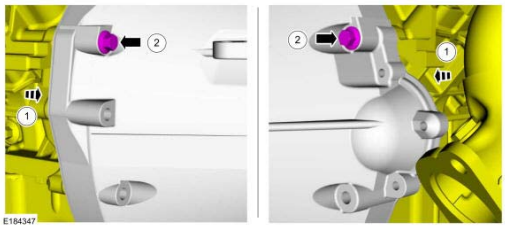
With the aid of an assistant, use the Floor Crane to install the engine into the vehicle.

Use the General Equipment: Floor Crane

E184346

5.

1.



Align the engine to the transmission.

2.

Draw the engine and transmission together using the bolts.

Torque

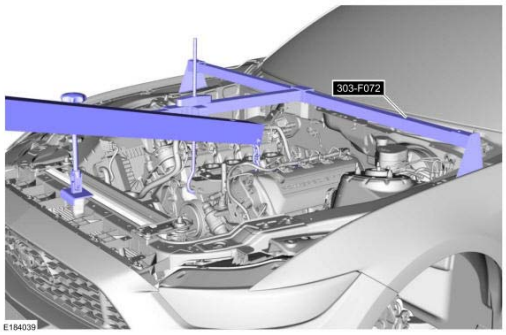
: 35 lb.ft (48 Nm)

E184347

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

6.

1.



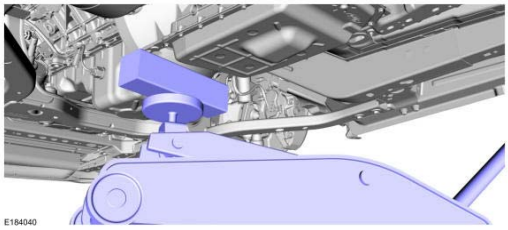
Install the special tools.

Use Special Service Tool: 303-F072 Support Bar, Engine.

2.

Once the engine is supported by the Engine Support Bar, remove the Floor Crane.

Use the General Equipment: Floor Crane

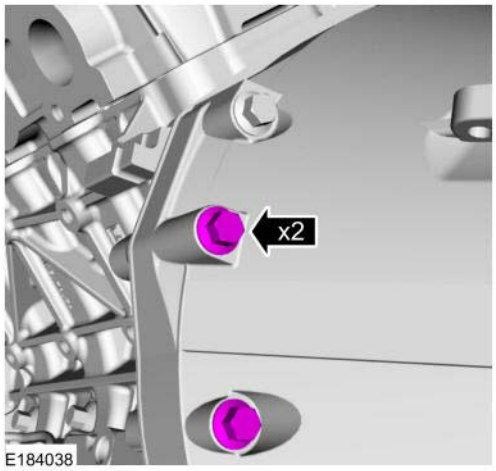


7.

Remove the jack and wooden block.

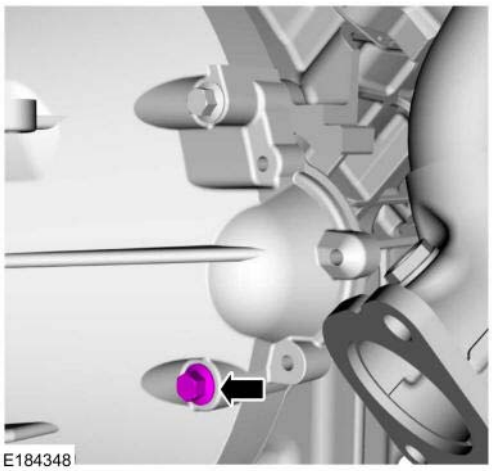
Use the General Equipment: Wooden Block

Use the General Equipment: Trolley Jack



8.

Install LH transmission-to-engine bolts.

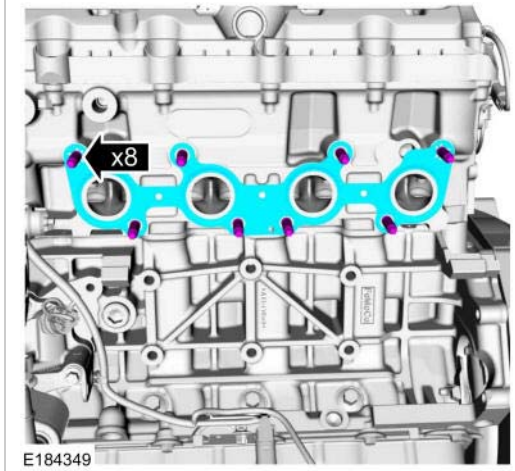


Torque

: 35 lb.ft (48 Nm)

9.

Install the RH transmission-to-engine bolt.



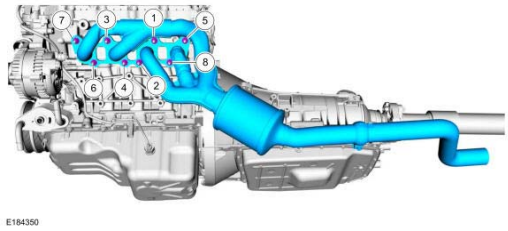
10.

Install new studs and new gasket.

Torque

: 18 lb.ft (25 Nm)

11.



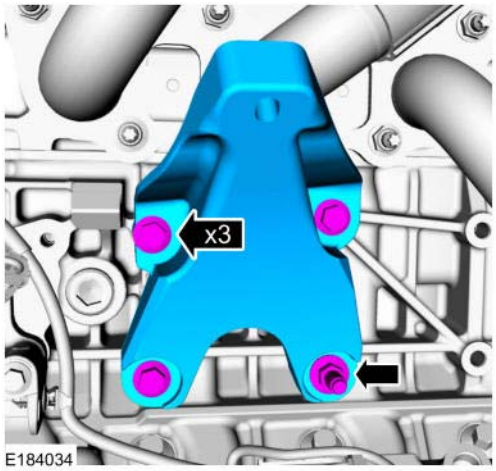
Install the LH catalytic converter.

Install the new nuts.

Torque:

Stage 1: 18 lb.ft (24 Nm)

Stage 2: 24 lb.ft (32 Nm)

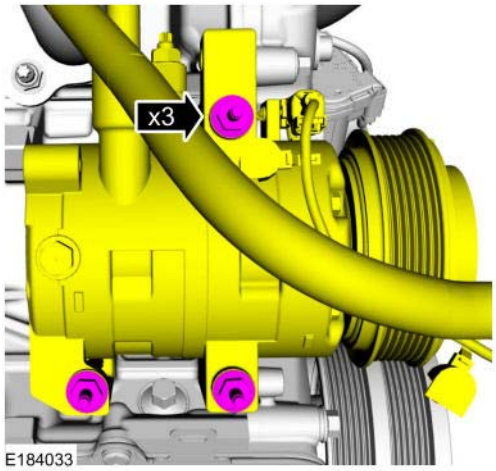


12.

Install the LH engine mount bracket, bolts and stud bolt.

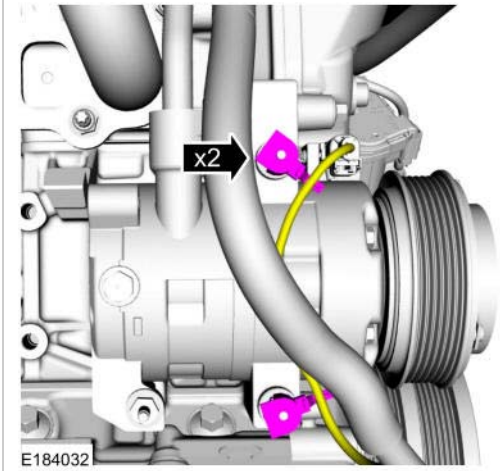
Torque

: 41 lb.ft (55 Nm)



13.

Install the A/C compressor and the stud bolts.

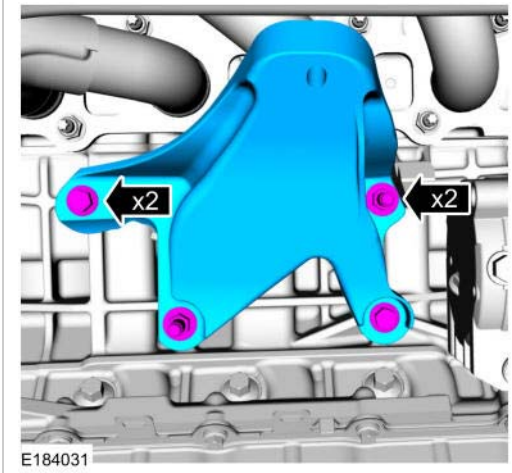


Torque

: 18 lb.ft (25 Nm)

14.

Attach the wiring harness retainers to the A/C compressor stud bolts.

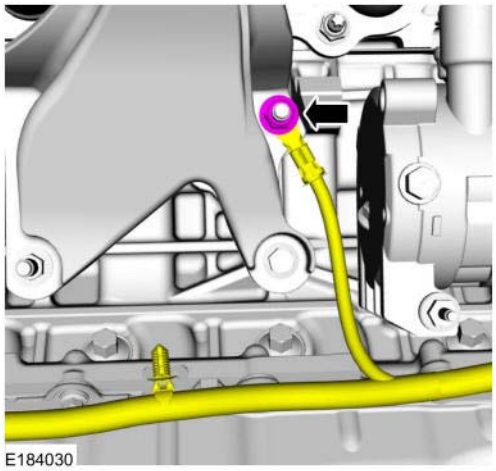


15.

Install the RH engine mount bracket, bolts and stud bolts.

Torque

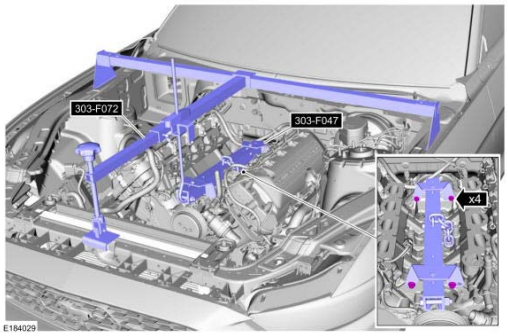
: 41 lb.ft (55 Nm)



16.

Install the ground strap and nut onto the RH engine mount bracket stud bolt.

Torque

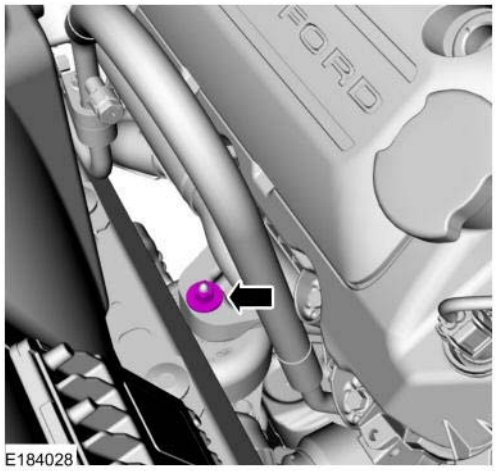


: 35 lb.ft (48 Nm)

17.

Lower the engine onto the engine mounts and remove the special tools

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-F047 Lifting Bracket, Engine.

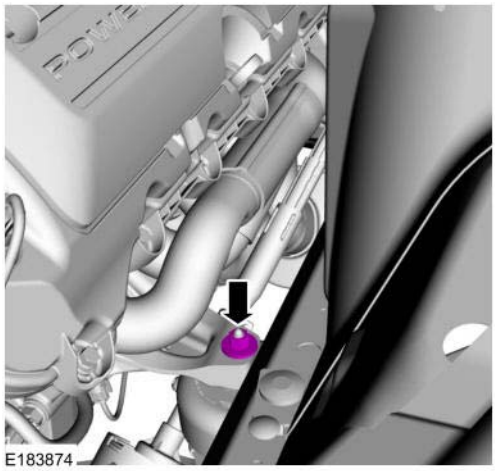


18.

Install the RH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

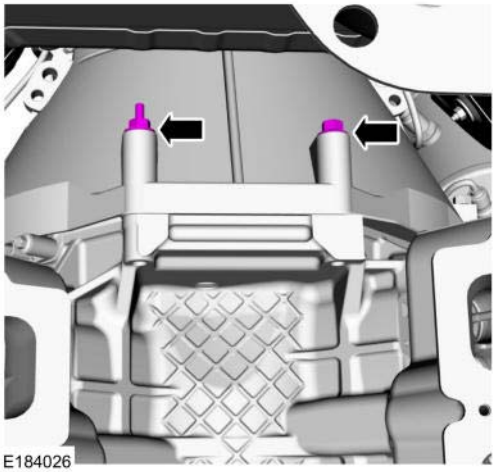


19.

Install the LH engine mount nut.

Torque

: 46 lb.ft (63 Nm)

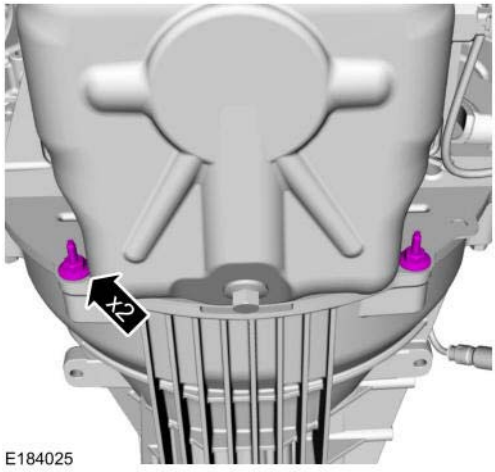


20.

Install the top transmission-to-engine bolt and stud bolt.

Torque

: 35 lb.ft (48 Nm)



6-Speed Manual Transmission - MT82

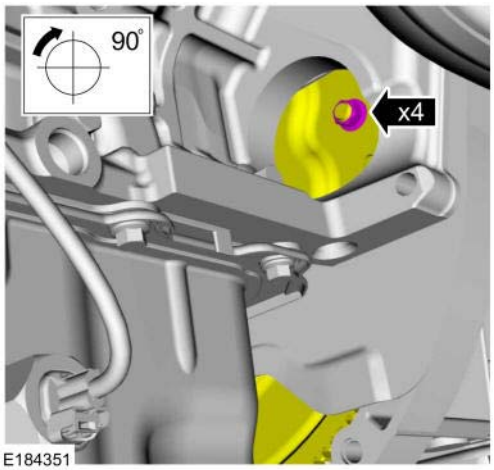
21.

Install the engine rear cover plate stud bolts.

Torque

: 35 lb.ft (48 Nm)

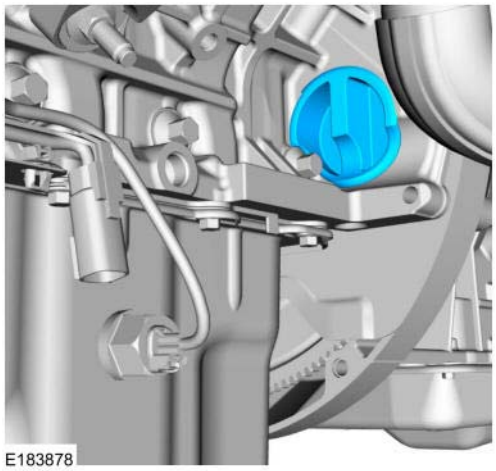
6-Speed Automatic Transmission - 6R80



NOTE: Only rotate the crankshaft in a clockwise direction.

22.
Install the new torque converter nuts.

Use the General Equipment: Magnetic Socket

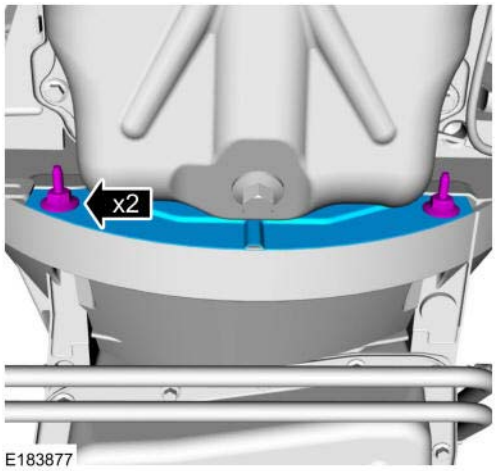


Torque

: 35 lb.ft (48 Nm)

23.

Install the rubber access plug.

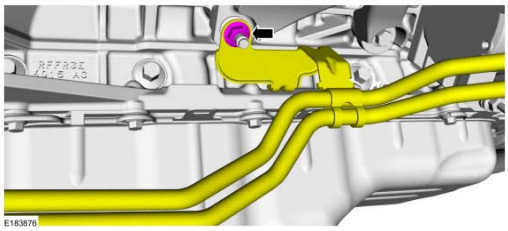


24.

Install the flexplate inspection cover and the stud bolts.

Torque

: 35 lb.ft (48 Nm)

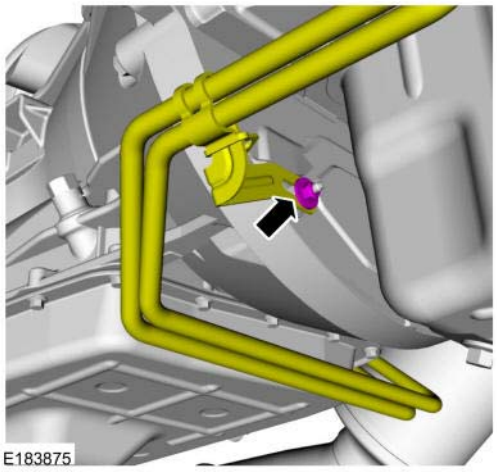


25.

Install the transmission cooling tube bracket and nut.

Torque

: 35 lb.ft (48 Nm)

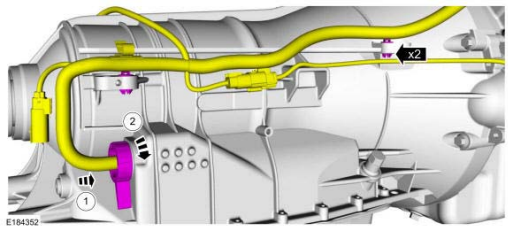


26.

Install the transmission cooling tube bracket and nut.

Torque

: 124 lb.in (14 Nm)



27.

Push the transmission electrical connector in to connect.

Rotate the transmission electrical connector.

Position the wiring harness and attach the retainers.

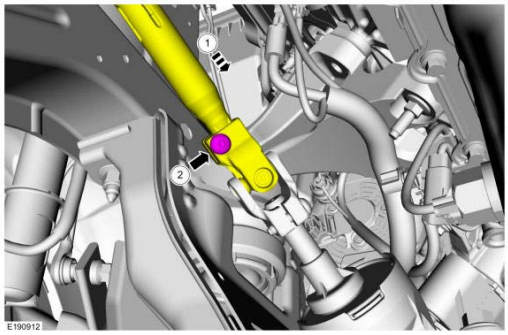
6-Speed Automatic Transmission - 6R80/6-Speed Manual Transmission - MT82

28.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: DO NOT attempt to remove or install the steering column lower u-joint at the steering gear without first loosening the steering column dash seal and fasteners. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

1.



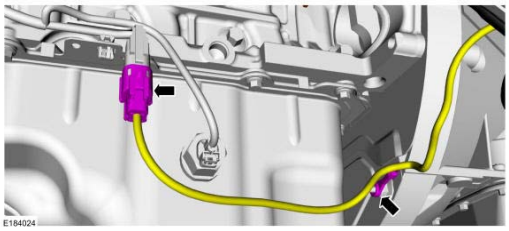
Connect the steering column shaft to the steering gear universal joint.

2.

Install the new steering column shaft bolt.

Torque

: 22 lb.ft (30 Nm)

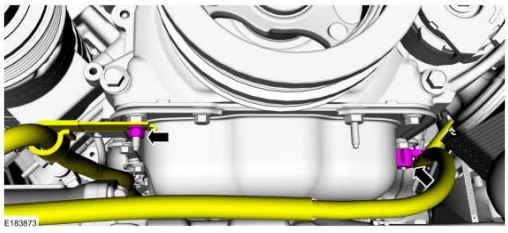


29.

Inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

30.

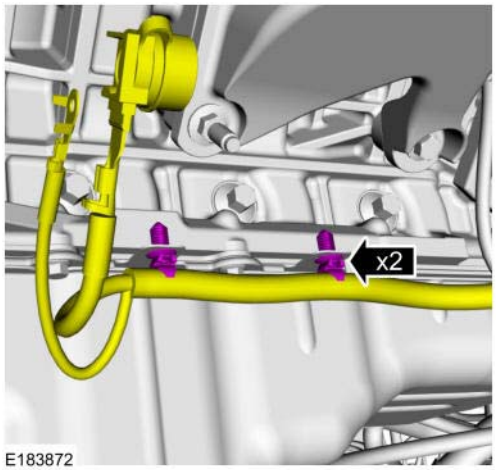
Connect the LH HO2S electrical connector and wiring harness retainer.



31.

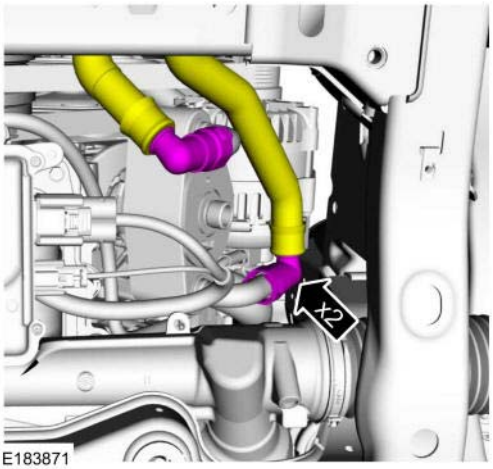
Attach the wiring harness retainer to the oil pan stud bolt.

Install the wiring harness retainer and the nut.



Torque

: 124 lb.in (14 Nm)

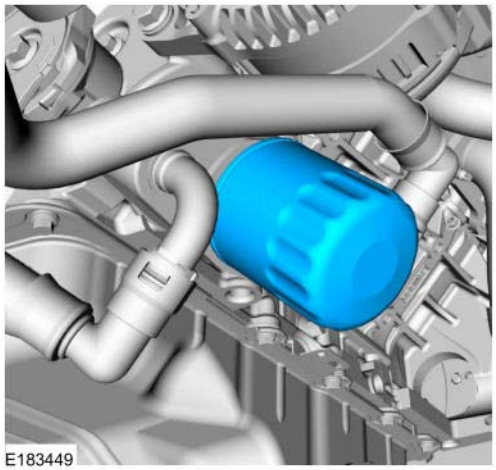


32.

Attach the wiring harness retainers to the oil pan.

33.

Connect the oil cooler hoses.



NOTE: Do not lubricate the O-ring seal.

34.
Install a new oil filter.

Torque:

Stage 1: 44 lb.in (5 Nm)

Stage 2: 180°

NOTE: Vehicles are equipped with either an underbody shield or a subframe bracket and underbody shield assembly.

35.

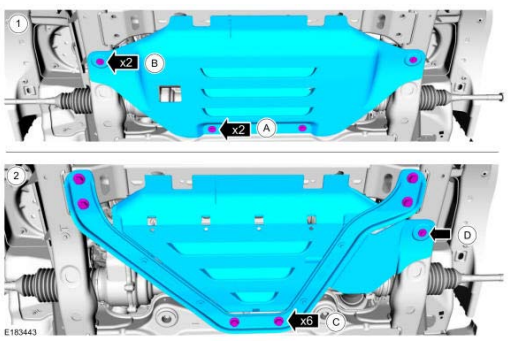
1.

Install the underbody shield and the bolts.

Torque:

A: 97 lb.in (11 Nm)

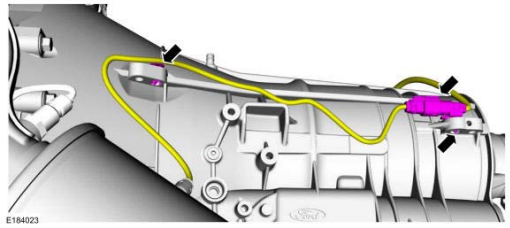
B: 18 lb.in (2 Nm)



2.

Install the subframe bracket and underbody shield assembly and the bolts.

Torque:



C: 46 lb.ft (63 Nm)

D: 18 lb.in (2 Nm)

NOTE: Automatic transmission shown in illustration, manual transmission similar.

36.
Connect the LH catalyst monitor sensor electrical connector and attach the wiring harness retainers.

37.

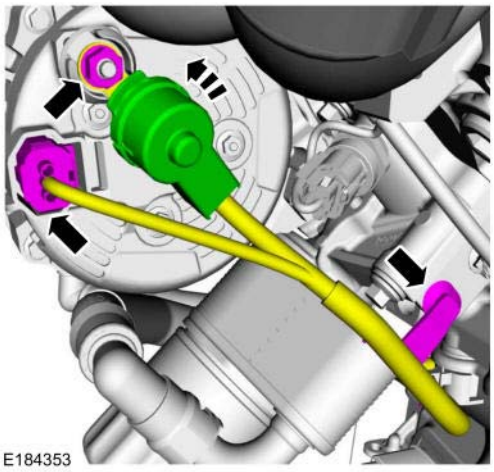
Install the following items:

Refer to: STARTER MOTOR .

Refer to: CATALYTIC CONVERTER RH .

38.

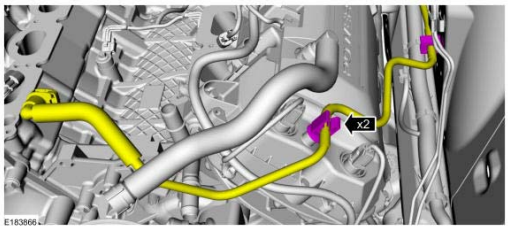
Attach the wiring harness retainer.



Connect the wiring harness electrical connector.

Connect the B+ cable and install the nut.

Torque

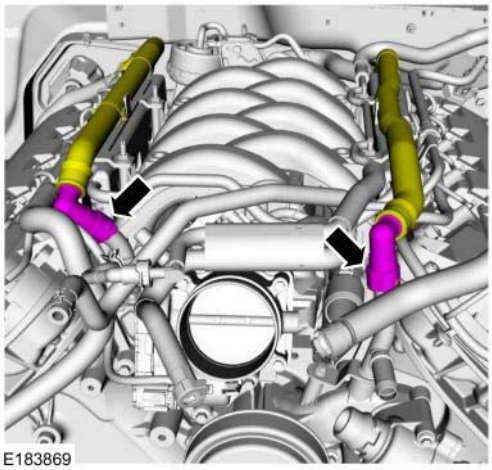


: 159 lb.in (18 Nm)

Position the cover.

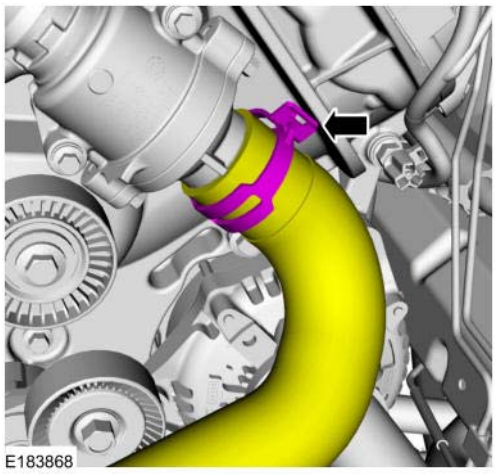
39.

Attach the EVAP tube to the LH valve cover and the LH inner fender.



40.

Install the intake manifold. Refer to: Intake Manifold .



41.

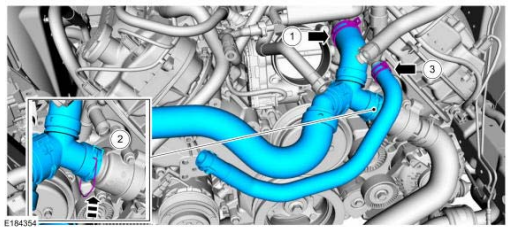
Connect the heater hose quick connect couplings.

42.

Connect the lower radiator hose to the thermostat housing assembly.

43.

1.



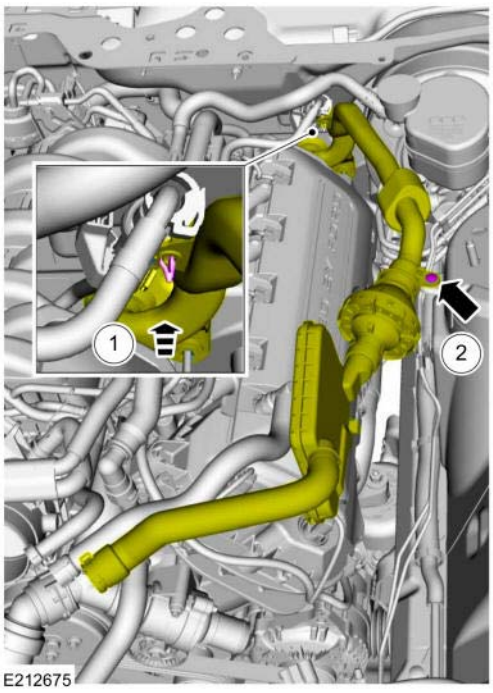
Install the coolant bypass T assembly and clamp onto the engine.

2.

Slide the spring clip until it hits the stop on the hose fitting.

3.

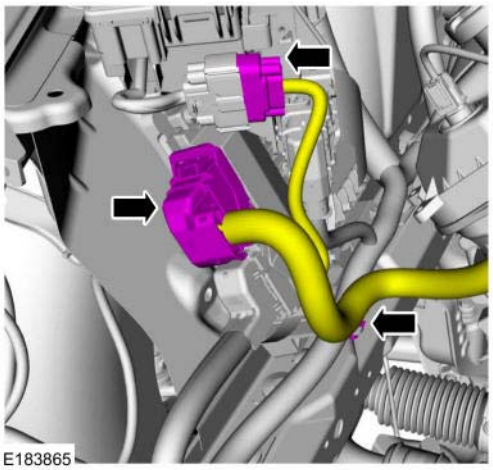
Install the degas bottle hose and clamp.



44.

1.

Position the sound enhancement pipe onto the retainer.

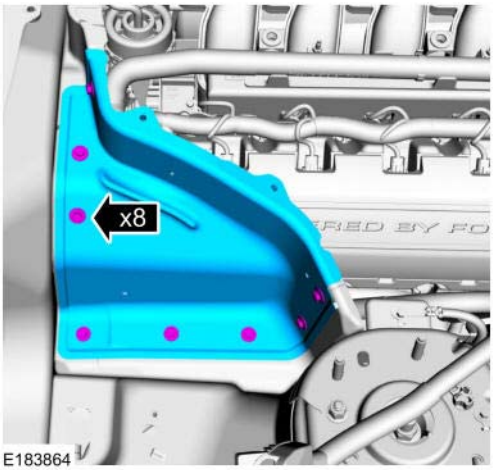


2.

Install the pin-type retainer.

45.

Connect the top PCM electrical connector, the 16 pin electrical connector and attach the wiring harness retainers to the PCM bracket.

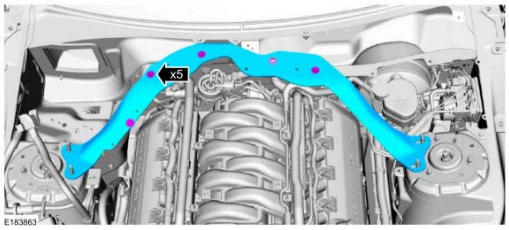


46.

Install the battery heat shield and fasteners.

Torque

: 80 lb.in (9 Nm)



47.

Install the cowl extension and fasteners.

Torque

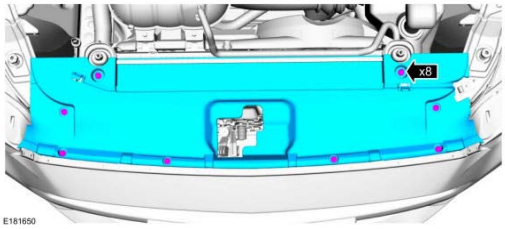
: 26 lb.ft (35 Nm)

48.

Install the following items:

Refer to: Cowl Panel Grille .

Refer to: Battery Tray .



Refer to: AIR CONDITIONING (A C) COMPRESSOR BELT .

Refer to: COOLING FAN MOTOR AND SHROUD .

Refer to: DEGAS BOTTLE .

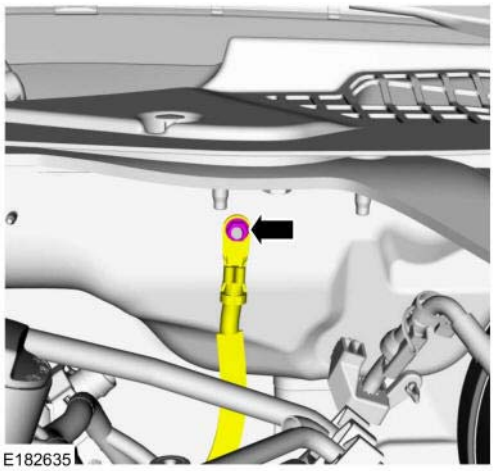
49.

Install the radiator top shield and the retainers.

50.

Install the following items:

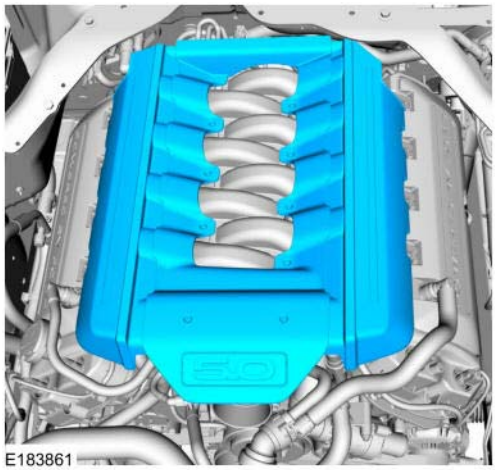
Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



Refer to: AIR CLEANER OUTLET PIPE .

51.

Install the engine ground wire and nut.

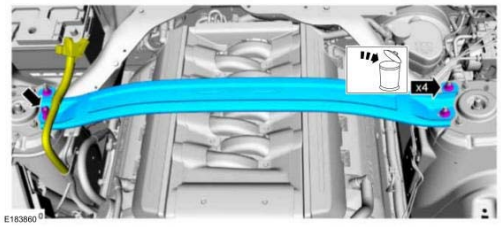


Torque

: 80 lb.in (9 Nm)

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

52.
Install the engine appearance cover.



53.

If equipped, install the strut tower cross brace and nuts.

Torque

: 41 lb.ft (55 Nm)

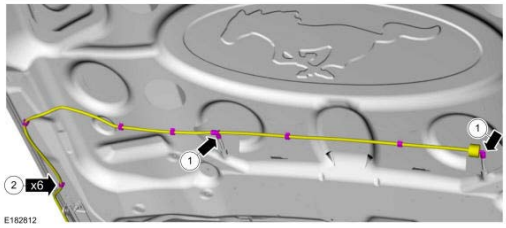
Attach the wiring harness retainer.

NOTE: Use the index-mark for location to aid in hood installation.

54.
Install the hood and the nuts.

Torque

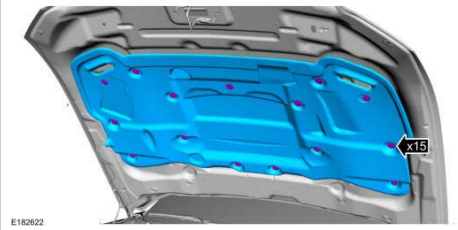
: 62 lb.in (7 Nm)



55.

1.

Connect the windshield washer hose C-Lock Couplers.



2.

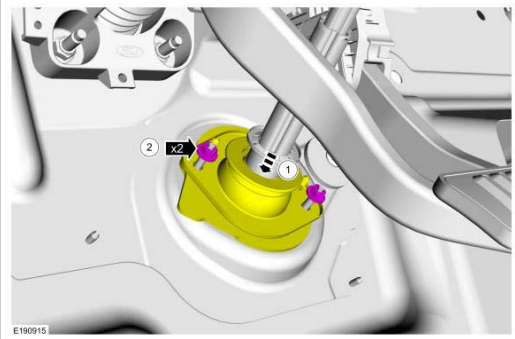
Attach the windshield washer hose retainers.

56.

Install the hood insulation and the pin-type retainers.

57.

1.



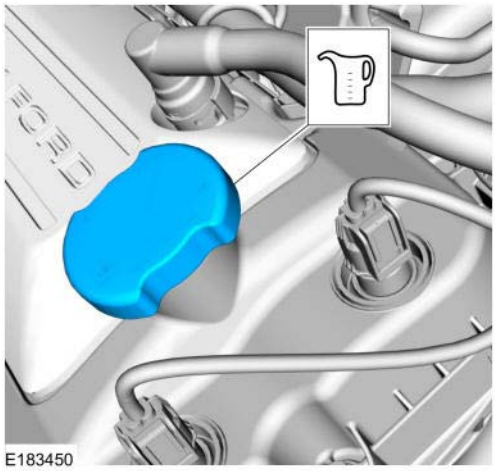
Position the steering column dash seal.

2.

Tighten the steering column dash seal nuts.

Torque

: 80 lb.in (9 Nm)



58.

Fill the engine with clean engine oil. Refer to: Specifications .

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

59.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

60.

Fill and bleed the engine cooling system. Refer to: COOLING SYSTEM DRAINING AND VACUUM FILLING .

61.

After completing the repairs, perform the Misfire Monitor Neutral Profile Correction procedure using a diagnostic scan tool.

DESCRIPTION AND OPERATION > ENGINE COOLING - SYSTEM OPERATION AND COMPONENT DESCRIPTION

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core and turbocharger with coolant. The coolant pump, operated by engine rotation through the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

The engine uses a cold side thermostat. This means the thermostat is located at the lower radiator hose connection to the engine, where coolant enters the engine after being cooled by the radiator. During initial warm-up, the cooler coolant from the radiator quickly closes the thermostat after the warm coolant in the engine opens the thermostat slightly. The thermostat opens and closes several times before the coolant coming from the radiator is warm enough to allow the thermostat to remain open. The engine must run much longer than a vehicle with a hot side thermostat before the thermostat remains fully opened.

The degas bottle holds surplus coolant and removes air from the cooling system. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 sets, and the MIL illuminates.

Fail Safe Cooling

A strategy called Fail Safe Cooling is built into the PCM that will control the engine if it starts to overheat.

Fail Safe Cooling has two modes: A 'Closed Loop' mode that relies on CHT sensor and an 'Open Loop' mode that relies on ECT sensor. When the engine starts to overheat, the decision to go into closed loop or open loop mode is made based on sensor availability and sensor failures. Closed loop mode takes priority over open loop. The reason is that a good CHT sensor is able to reliably track engine block temperature at all times, while the ECT sensor will fail to do so when the engine coolant is dumped.

Closed Loop Mode

Stage 1 of the strategy commences if the engine starts to overheat. The CHT sensor transmits a signal to the PCM, which moves the temperature gauge pointer into the red zone.

If the engine is not switched off and the temperature continues to rise, the Powertrain Check Lamp is illuminated. This indicates to the driver that the engine is approaching critical limits and should be stopped. At this point DTC P1285 is set in the PCM which can be retrieved using a scan tool.

Stage 2 of the strategy commences if the lamp and temperature gauge are ignored by the driver. The

PCM will start to control the engine by cutting out 2 cylinders and restricting load. The RPM will be limited below 3, 000 RPM initially then will slowly be ramped down with time to as low as 800 RPM. Simultaneously the MIL illuminates. This indicates that long term engine damage can occur and vehicle emissions will be affected. At this point DTC P1299 is set in the PCM which can be retrieved using a scan tool.

Air is drawn into the deactivated cylinders. This helps to control the temperature of the engine internal components. The deactivated cylinders are alternated to allow even cooling of all the cylinders.

> *NOTE: If the driver is using a high percentage of throttle travel (for example, an overtaking maneuver) when the PCM starts engine deactivation (Stage 2), the deactivation will be delayed for 10 seconds.*

> *NOTE: After 2-cylinder operation has begun, the engine will not revert to 4-cylinder operation, even if the temperature should fall, until the ignition is switched off and then on again.*

> *NOTE: The MIL can only be extinguished by using a scan tool after the fault has been rectified and the DTC cleared.*

Stage 3 of the strategy will commence if the engine temperature continues to rise. This results in the engine being totally disabled before major engine damage or seizure occurs. The Powertrain Check Lamp will begin to flash, indicating to the driver that the engine will be switched off after 30 seconds. This allows the driver time to choose a suitable parking place.

Open Loop Mode

This mode is entered when the ECT sensor indicates a high engine temperature that is rising at a dangerously high rate, much faster than expected based on current engine running conditions. This mode can also be entered when all sensors used in Fail Safe Cooling determination are failed.

When this mode is activated, the PCM will restrict load, and restrict engine speed to below 3000 RPM, then start ramping engine speed down slowly to as low as 800 RPM and hold the speed there.

At the same time, the PCM will also move the temperature gauge pointer into the red zone and the P1285 code is set.

If the engine is not switched off after a short period of time, the engine will be totally disabled before major engine damage or seizure occurs, The Powertrain Check Lamp will begin the flash, indicating to the driver that the engine will be switched off. The P1299 Code is set.

If the driver decides to restart the vehicle, it will be restarted but with the P1299 still set the engine speed is limited to 800 RPM. This mode can only be reset by clearing the DTC using a diagnostic scan tool.

DIAGNOSIS AND TESTING > ENGINE COOLING

Material : Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

DIAGNOSIS AND TESTING > ENGINE COOLING > DTC CHART

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in

serious personal injury.

REFER to: Engine Cooling System Health and Safety Precautions .

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

PCM DTC Chart

DTC	Description	Action
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	GO to Pinpoint Test C
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	GO to Pinpoint Test C
P0217	Engine Coolant Overtemperature Condition	GO to Pinpoint Test B
P0480	Fan 1 Control Circuit	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P0481	Fan 2 Control Circuit	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1285	Cylinder Head Overtemperature Condition	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1299	Cylinder Head Overtemperature Protection Active	GO to Pinpoint Test B
All Other PCM Diagnostic Trouble Codes (DTCs)	-	REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS).

DIAGNOSIS AND TESTING > ENGINE COOLING > INSPECTION AND VERIFICATION

NOTE: The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor

does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

1.

Verify the customer concern.

2.

Visually check the engine coolant level at the degas bottle when the system is cold.

3.

Make sure the pressure relief cap is installed correctly.

4.

Record any cooling system Diagnostic Trouble Codes (DTCs) retrieved. Refer to the PCM DTC chart in DTC Chart for DTC descriptions.

NOTE: Take note of any coolant odor or steam coming from cooling system components.

5.
If the system coolant is filled correctly and no Diagnostic Trouble Codes (DTCs) associated with fail-safe cooling are retrieved, verify the customer concern by operating the engine to duplicate the condition.

6.

Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
Leaks or weeps at: Hoses Tubes Clamp joints Gaskets O-rings Thermostat housing Radiator Pressure relief cap Coolant pump Heater core (wet floor or coolant odor in vehicle) Degas bottle Cylinder block core plugs Cylinder head core plugs Block heater (if equipped)	Inoperative or damaged: Electric cooling fan Wiring, connectors, relays or modules CHT sensor ECT sensor

Cracked or damaged: Hoses Tubes Hose clamps Thermostat housing Radiator Pressure relief cap Cooling fan Coolant pump Degas bottle Cylinder block core plugs Cylinder head core plugs Block heater (if equipped) Restricted airflow through the A/C condenser/radiator Drive belt loose, worn or installed incorrectly Broken or weak drive belt tensioner Excessive white or light gray exhaust smoke (may have burnt coolant odor) Coolant in engine oil Engine oil in coolant	

7.

If the inspection reveals an obvious concern that can be readily identified, repair it as necessary.

8.

Inspect the coolant condition.

1.

Inspect the coolant color.

Discoloration may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow in color) coolant degrades the corrosion protection of Motorcraft® Orange Antifreeze/Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Gold Antifreeze/Coolant, however, may not change the color or appearance of the orange-colored coolant. Detection of contamination with Motorcraft® Gold Antifreeze/Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Gold Antifreeze/Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the nitrite testing directions in the kit to determine if nitrite is present in the system. If nitrite is present, flush the system and refill with the correct mixture of distilled water and Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A darker orange with the presence of debris could indicate a commercially available stop leak may have been used and could result in loss of coolant flow to critical parts of the engine. If sediment is present, flush the system and refill with the correct mixture of distilled water and Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A light or reddish brown color indicates that rust may be present in the cooling system.

Flush the system and refill with the correct mixture of distilled water and Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For engine diagnosis, REFER to: appropriate Engine article. Flush the system and refill with the correct mixture of distilled water and Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests . If engine oil is suspected, the cause of the leak may be internal to the engine. For engine diagnosis, REFER to: appropriate Engine article. Flush the system and refill with the correct mixture of distilled water and Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

2.

If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. Maintain the coolant concentration within 48% to 50%, which equates to a freeze point between -34°C and -37°C (-30°F and -34°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) engine coolant to distilled water.

Maximum coolant concentration is 60/40 for cold weather areas.

Minimum coolant concentration is 40/60 for warm weather areas.

3.

Adjust coolant range and level if necessary:

If coolant is low, add specified coolant mixture only.

If the engine coolant tests too weak, remove some of the engine coolant and add Motorcraft® Orange Antifreeze/Coolant Concentrated until the readings are within acceptable levels.

If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9.

If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

DIAGNOSIS AND TESTING > ENGINE COOLING > SYMPTOM CHART

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Condition	Possible Sources	Actions
Loss of coolant	Refer to the Pinpoint Test	GO to Pinpoint Test A
The engine overheats.	Refer to the Pinpoint Test	GO to Pinpoint Test B
The engine does not reach normal operating temperature.	Refer to the Pinpoint Test	GO to Pinpoint Test C
The block heater does not operate correctly.	Block heater power cable Block heater	CHECK continuity in all 3 power cable circuits. If any circuit measures more than 5 ohms, INSTALL a new power cable. CHECK the resistance of the block heater. If the resistance does not measure between 30 and 40 ohms, INSTALL a new block heater. REFER to: Block Heater .
The electric cooling fan is inoperative in one or more speeds or does not operate correctly.	Wiring Relays Fuses Cooling fan motor Cooling fan resistor	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
The electric cooling fan stays on all the time.	Wiring Relays	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Noisy electric cooling fan operation.	Foreign material contamination Fan motor	REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly. REFER to: Cooling Fan Motor and Shroud .
	Fan blade detached from fan motor	INSTALL a new cooling fan assembly. REFER to: Cooling Fan Motor and Shroud , Removal and Installation).

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS

Loss of Coolant

Normal operation and Fault Conditions

The engine cooling system is a closed system providing for coolant expansion and contraction as well as changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Possible Sources

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Radiator
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Engine gaskets (may leak internally or externally)
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST A : PINPOINT TEST > PINPOINT TEST A : PINPOINT TEST

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

A1 CARRY OUT INSPECTION AND VERIFICATION

Carry out Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to A2

NOTE: Allow the engine to cool before checking the engine coolant level.

A2 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE ENGINE COOLING SYSTEM

Ignition OFF

Visually inspect the engine coolant level at the degas bottle and adjust as necessary. Pressure test the engine cooling system. Refer to Component Tests , Cooling System Pressure Test.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to A3

A3 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the degas bottle for signs of engine oil.

Is engine oil evident in the engine coolant?

Yes	REFER to: appropriate Engine article.

No	GO to A4

A4 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: appropriate Engine article.

No	GO to A5

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

A5 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

Are combustion gases present?

Yes	REFER to: appropriate Engine article.

No	The cooling system is operational.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST

The Engine Overheats

Normal operation and Fault Conditions

The engine cooling system maintains the engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

Possible Sources

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through A/C condenser/radiator
- Active grill shutter stuck closed
- Internal engine coolant leak
- Turbocharger
- Coolant condition/concentration
- Non-OEM engine enhancement components
- Electric cooling fan
- CHT sensor
- ECT sensor
- Radiator

- Thermostat housing
- Coolant pump
- Coolant flow restriction

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0217	Engine Coolant Overtemperature Condition	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor or the ECT sensor.
P1299	Cylinder Head Overtemperature Protection Active	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor or the ECT sensor. A failure mode effects strategy called fail-safe cooling was activated to cool the engine.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST > PINPOINT TEST B : PINPOINT TEST

B1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to B2

B2 CHECK FOR PCM (POWERTRAIN CONTROL MODULE) DTCS

Ignition ON.

Using a scan tool, perform PCM self-test.

Is DTC P0217 and/or P1299 present?

Yes	GO to B4

No	Actual engine overheating has not been verified. CHECK the engine coolant temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If any other PCM DTCs are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS).

B3 CHECK FOR ACTIVE GRILL SHUDDER DTCS

Review the PCM DTCs.

Are any active grill shudder DTCs present?

Yes	REFER to: Active Grille Shutter .

No	GO to B4

NOTE: Verify no vehicle front end damage is present.

Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard and verify all air deflectors are present.

B4 CHECK FOR AN AIRFLOW OBSTRUCTION AND MISSING AIR DEFLECTORS

Is an airflow obstruction present or air deflectors missing?

Yes	REPAIR as necessary.

No	GO to B5

B5 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE COOLING SYSTEM

Ignition OFF.

Visually check the engine coolant level in the coolant expansion tank and adjust as necessary. Pressure test the cooling system.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to B6

B6 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the coolant expansion tank for signs of engine oil.

Is engine oil evident in the coolant?

Yes	REFER to: appropriate Engine article.

No	GO to B7

B7 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: appropriate Engine article.

No	GO to B8

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Are combustion gases present?

Yes	REFER to: appropriate Engine article.

No	GO to B9

B9 CHECK COOLANT CONDITION

Check the coolant for dirt, rust or contamination and check the coolant concentration.

Is the coolant condition OK?

Yes	GO to B10

No	FLUSH the engine cooling system. REFER to: Cooling System Flushing .

B10 CHECK THE ELECTRIC COOLING FAN OPERATION

Start the engine.

Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.

Did the electric cooling fan operate?

Yes	GO to B11

No	DIAGNOSE the electric cooling fan operation. Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

B11 CHECK THE COOLANT PUMP OPERATION

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.

Is the heater outlet hose hot?

Yes	GO to B12

No	INSTALL a new coolant pump. REFER to: Coolant Pump .

NOTE: This cooling system uses a cold side thermostat. The coolant in the radiator must reach full operating temperature for the thermostat to remain in an open state.

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the lower radiator hose.

B12 CHECK THE THERMOSTAT OPERATION

Is the lower radiator hose hot?

Yes	CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes .

No	GO to B13

B13 VISUALLY INSPECT THE THERMOSTAT

Carry out the Thermostat Visual Inspection in the Component Tests .

Is the thermostat damaged?

Yes	INSTALL a new thermostat housing. REFER to: Thermostat Housing .

No	INSTALL a new thermostat housing. REFER to: Thermostat Housing . If the engine still overheats, INSTALL a new radiator. REFER to: Radiator .

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST

The Engine Does Not Reach Normal Operating Temperature

Normal operation and Fault Conditions

The engine cooling system maintains engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

Possible Sources

- Low coolant level
- Thermostat housing
- Temperature gauge
- ECT
- CHT

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0125	Insufficient Coolant Temp for Closed Loop Fuel Control	Sets in the PCM when the CHT sensor or the ECT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Sets in the PCM when the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST > PINPOINT TEST C : PINPOINT TEST

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

C1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Were any concerns found?

Yes	REPAIR as needed.

No	GO to C2

C2 CHECK FOR DTC P0125 OR P0128

Using a scan tool, perform the PCM self-test.

Is DTC P0125 or P0128 present?

Yes	GO to C3

No	The cooling system is operational. If an inoperative temperature gauge is suspected, CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If an inoperative climate control system is suspected, CHECK the climate control system operation. For Dual Automatic Temperature Control (DATC), REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) . For Electronic Manual Temperature contro (EMTC), REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) . If any other Diagnostic Trouble Codes (DTCs) are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS).

NOTE: Allow the engine to cool before checking the coolant expansion tank.

Visually check the engine coolant level in the coolant expansion tank

C3 CHECK THE COOLANT LEVEL

Is the engine coolant level within specification?

Yes	INSTALL a new thermostat housing. REFER to: Thermostat Housing . CLEAR Diagnostic

	Trouble Codes (DTCs). If the DTC returns check for correct CHT sensor and ECT sensor operation.

No	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > ENGINE COOLING > COMPONENT TESTS

Cooling System Pressure Test

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles have a pressure relief cap on the degas bottle and no radiator cap.

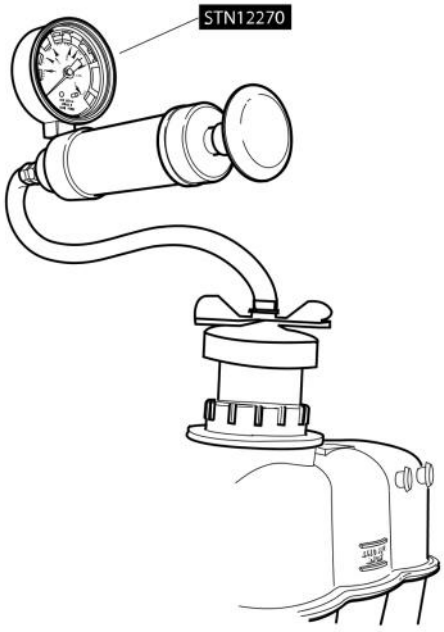
1.

Turn the engine OFF.

2.

Check the engine coolant level and adjust as necessary.

3.



Remove the degas bottle cap. Inspect the degas bottle cap and degas bottle for any issues that would cause improper sealing, such as for cross-threading, burrs, damaged o-ring, etc. If any issues are found, INSTALL a new cap and/or degas bottle.

4.

Attach the Pressure Tester and adaptor (Snap-On TA53 or equivalent), to the degas bottle cap. The cap must hold pressure of 145 kPa +/- 21 kPa (21 PSI +/- 3 PSI). If any issues are found, INSTALL a new cap.

5.

Attach the Pressure Tester and adaptor (Snap-On TA52, AST ASSFZ-47, Redline RDL95-0750 or equivalent) to the degas bottle.

E164137

NOTE: Do not pressurize the cooling system beyond the maximum pressure listed in the SPECIFICATIONS , or cooling system components can be damaged.

NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading will result.

6.

To pressurize the engine cooling system, slowly press the plunger of the pressure test pump and increase the pressure to between 124 - 138 kPa (18 - 20 PSI). Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7.

If no leaks are found and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. REFER to: appropriate Engine article.

8.

If the pressure does not drop remove the cooling system Pressure Tester and adaptor from degas bottle.

9.

Install the degas bottle cap until it contacts the hard stop.

Thermostat

Install a new thermostat only after at least one of the following tests and checks have been carried out:

- Pinpoint Test B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1.

Remove the thermostat housing.

2.

Examine the thermostat for signs of damage including:

- Valve not fully seated (light visible through the valve)
- Foreign material lodged in the main valve
- Bent or broken frame or flange
- Bent or broken spring
- Wax leaking from wax reservoir or a bulge in the reservoir
- Any other damage or distortion

> *NOTE: If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.*

3.
If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat housing.

Radiator Leak Test, Removed From Vehicle

> *NOTE: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.*

> *NOTE: Clean the radiator before leak testing to avoid contamination of tank.*

1.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the SPECIFICATIONS .

GENERAL PROCEDURES > COOLING SYSTEM DRAINING AND VACUUM FILLING

Special Tool(s) / General Equipment

 ST1720-A	ROB75240Coolant/Battery Refractometer (Fahrenheit)
Fluid Container	
Cooling System Vacuum Tester and Refiller	

Materials

Name	Specification
Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) VC-3DIL-B (U.S.)	WSS-M97B44-D2
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

Draining

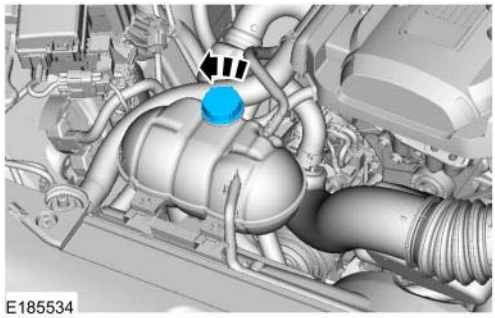
NOTE: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.

NOTE: The vehicle cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing . Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft® Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

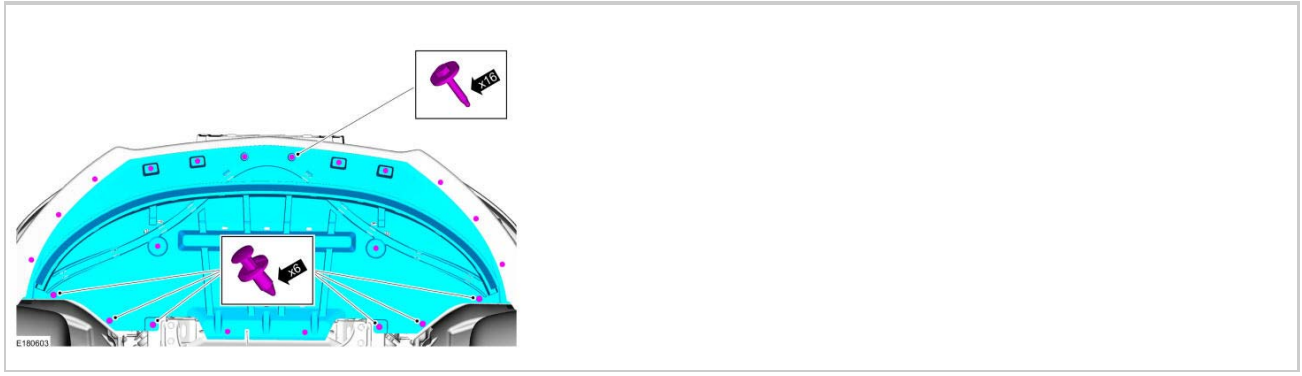
NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.



1.

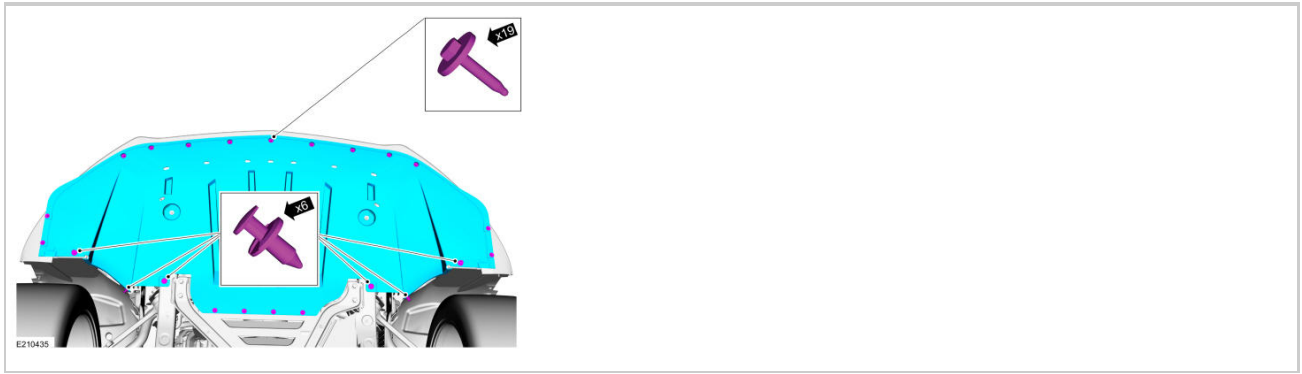
WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

Remove the pressure relief cap.



2.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



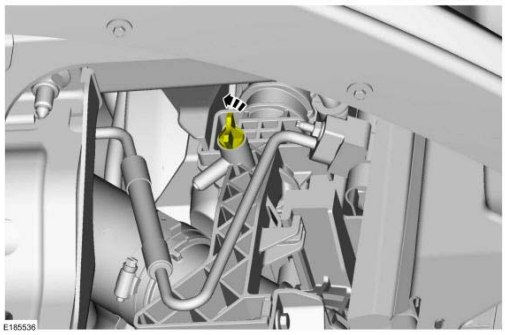
NOTE: If equipped.

3.
Remove the underbody shield.

NOTE: If equipped.

4.
Remove the underbody shield.

5.



WARNING: Be prepared to collect escaping fluid.

Use a hose to drain the coolant.

Open the radiator drain valve and drain the engine coolant in a suitable, clean container.

Use the General Equipment: Fluid Container

Filling

Filling and Bleeding with a Vacuum Cooling System Filler

1.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240 Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

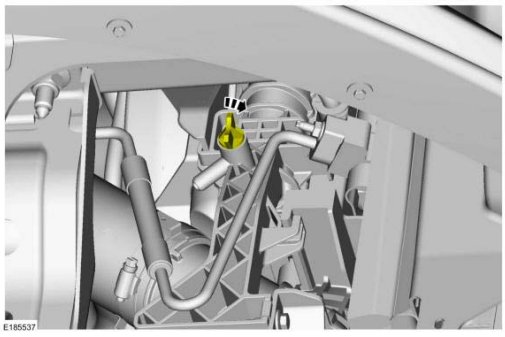
Add, top-off or adjust the coolant as follows:

For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

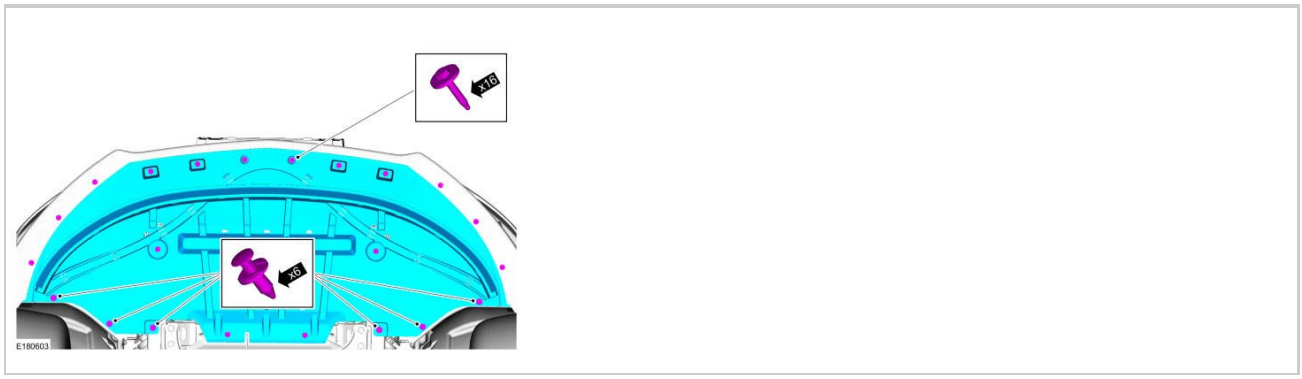
For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.



Material

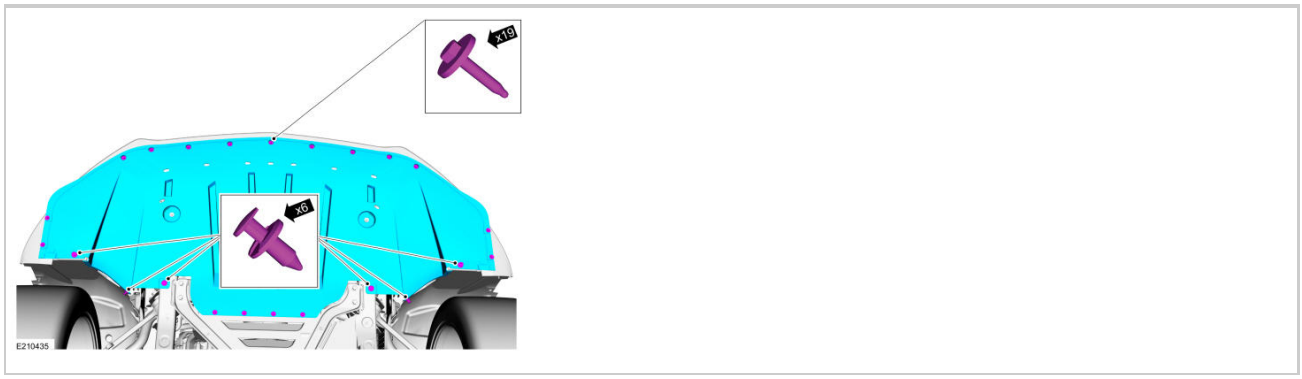
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



2.

Close the radiator drain valve.



NOTE: If equipped.

3.
Install the underbody shield.

NOTE: If equipped.

4.
Install the underbody shield.

5.

Install the Airlift Cooling System Tester UVU550000 or equivalent and follow the manufacturer's instructions to fill and bleed the system.

Use the General Equipment: Cooling System Vacuum Tester and Refiller

6.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -34°C to -37°C [-30°F to -34°F]).

7.

For extremely cold climates (less than -37°C [-34°F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

A coolant concentration of 60% provides freeze protection down to -50°C (-58°F)

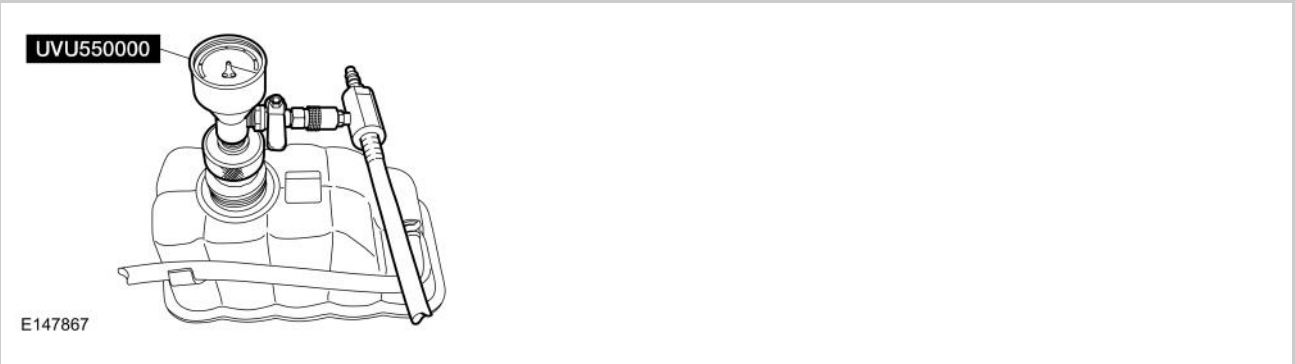
Engine coolant concentrations above 60% will decrease the overheat protection

characteristics of the engine coolant and may damage the engine.

8.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.



NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the corrosion/freeze protection characteristics of the engine coolant and may damage the engine.

9.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler

10.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240 Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

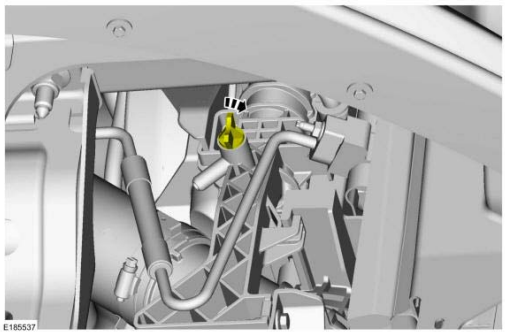
Add, top-off or adjust the coolant as follows:

For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

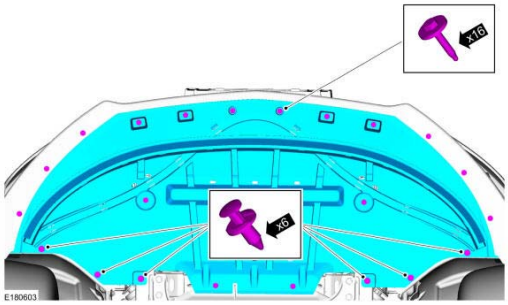
For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.



Material

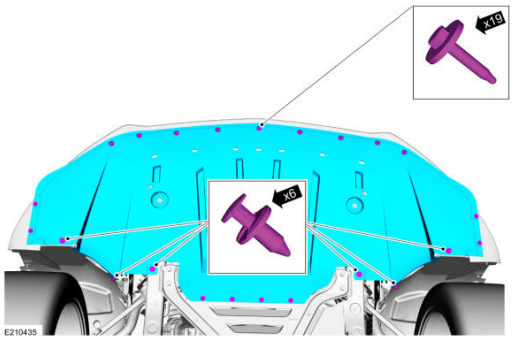
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



11.

Close the radiator drain valve.



NOTE: If equipped.

12.
Install the underbody shield.

NOTE: If equipped.

13.
Install the underbody shield.

14.

Fill the degas bottle to the MAX FILL line.

15.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze

protection -34°C to -37°C [-30°F to -34°F]).

16.

For extremely cold climates (less than -37°C [-34°F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

A coolant concentration of 60% provides freeze protection down to -50°C (-58°F)

Engine coolant concentrations above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.

17.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.

NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the corrosion/freeze protection characteristics of the engine coolant and may damage the engine.

18.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

19.

Install the degas bottle cap until it contacts the hard stop.

20.

Turn the climate control system off.

21.

Start the engine and increase the engine speed to 3, 500 rpm and hold for 30 seconds.

22.

Turn the engine off for and wait for 1 minute to purge any large air pockets from the cooling system.

23.

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle if the engine is warm or to the top of the MIN FILL LEVEL if the engine is cold.

24.

Start the engine and let it idle until the engine reaches normal operating temperature and the thermostat is fully open. A fully open thermostat is verified by the cooling fan cycling on at least once.

25.

Increase the engine speed to 3, 500 rpm and hold for 30 seconds.

26.

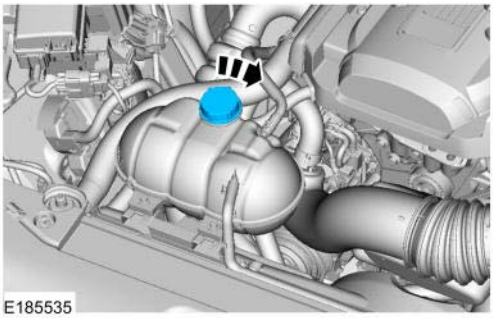
Allow the engine to idle for 30 seconds.

27.

Turn the engine off for 1 minute.

28.

Repeat steps 25 through 27 a total of 5 times to remove any remaining air trapped in the system.



29.

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle.

30.

Install the pressure relief cap.

GENERAL PROCEDURES > COOLING SYSTEM FLUSHING

Materials

Name	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state, provincial, or federal laws.

1.

Add Premium Cooling System Flush to the cooling system and follow the directions on the package.

Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

2.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

3.

Remove the radiator. Refer to: Radiator .

NOTE: Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.

4.
Backflush the radiator with radiator turned so the upper radiator hose is at the top and with a high-pressure hose in the upper hose location.

NOTE: The thermostat and housing are serviced as an assembly.

5.
Remove the thermostat housing. Refer to: Thermostat Housing .

6.

Backflush the engine. Position the high-pressure water hose into the engine through the lower radiator hose and backflush the engine.

NOTE: The thermostat and housing are serviced as an assembly.

7.
Install the thermostat housing. Refer to: Thermostat Housing .

8.

Install the radiator. Refer to: Radiator .

9.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

GENERAL PROCEDURES > HEATER CORE BACKFLUSHING

Motorcraft® Premium Cooling System FlushVC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not

unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

1.

Partially drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Add Premium Cooling System Flush to backflush the heater core and follow the directions on the package. Flush with water thoroughly after using Premium Cooling System Flush prior to refilling the cooling system.

Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

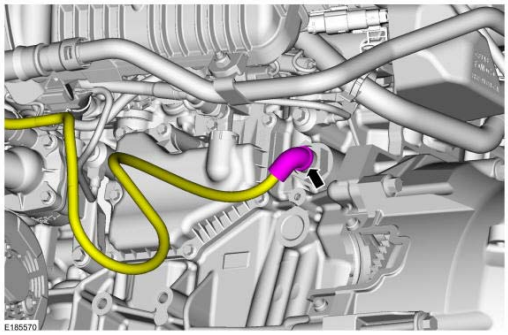
3.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > BLOCK HEATER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



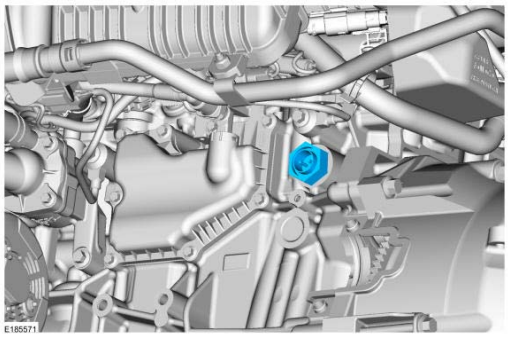
Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the starter motor. Refer to: STARTER MOTOR - 2.3L EcoBoost (231kW/314PS).

NOTE: Make sure the block heater wiring is routed and secured away from rotating or hot components.

3.
Disconnect the block heater electrical connector.



4.

Remove the block heater.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > BLOCK HEATER > INSTALLATION

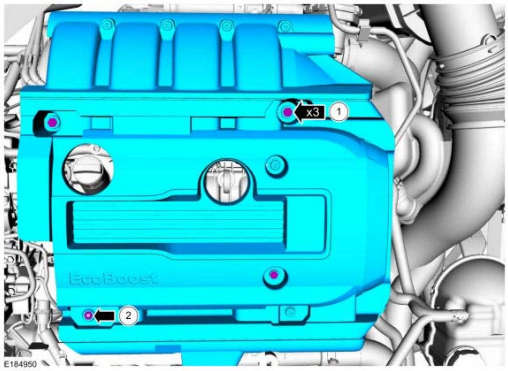
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D



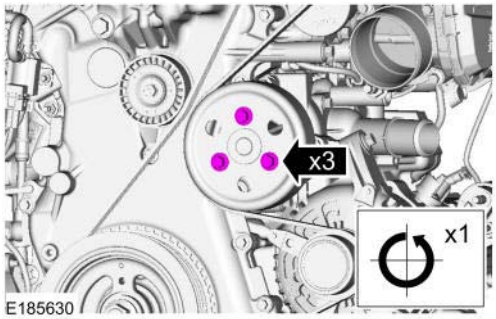
REMOVAL AND INSTALLATION > COOLANT PUMP > REMOVAL

1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

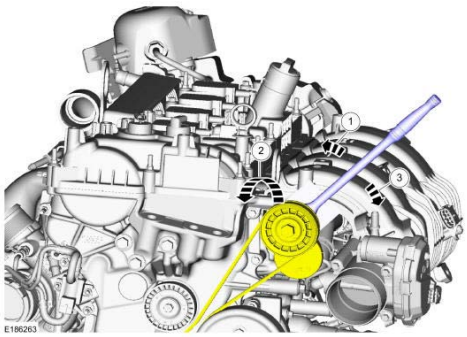
2.

Remove the retainers and the engine appearance cover.



3.

Remove the air cleaner outlet pipe. Refer to: Air Cleaner Outlet Pipe .

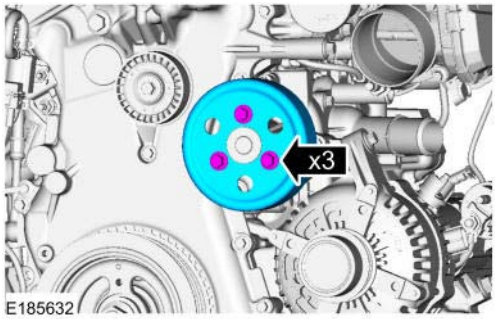


4.

Loosen the coolant pump pulley bolts.

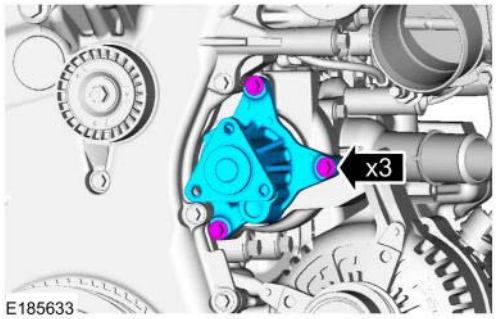
NOTE: Make sure the accessory drive belt is positioned so coolant can not contaminate the belt.

5.
Rotate the accessory drive belt tensioner counter clockwise and position aside the accessory drive belt.



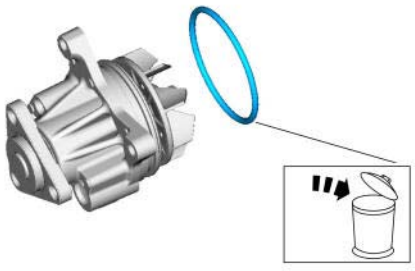
NOTE: Cover the accessory drive and A/C belts to prevent coolant contamination of the belts.

6.
Completely cover the accessory drive and A/C belts with waterproof plastic.



7.

Remove the bolts and the coolant pump pulley.

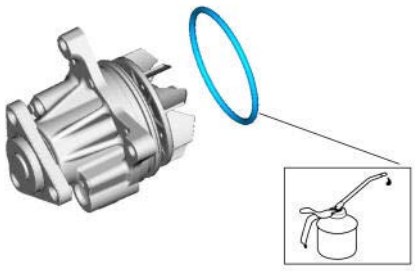


8.

Remove the bolts and the coolant pump.

9.

Remove and discard the coolant pump O-ring seal.



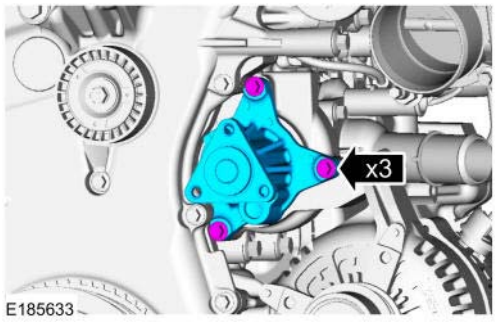
REMOVAL AND INSTALLATION > COOLANT PUMP > INSTALLATION

1.

Install a new coolant pump O-ring seal and lubricate it with clean engine coolant.

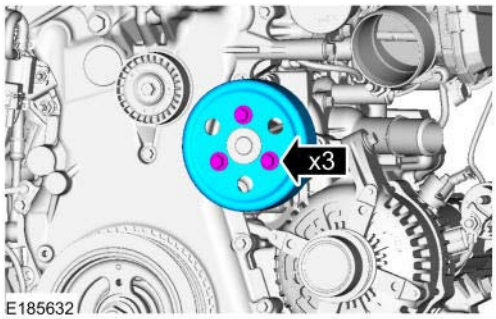
Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)



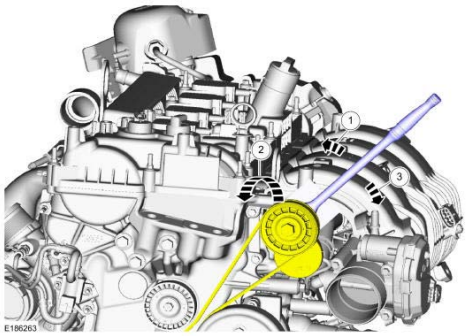
2.

Install the coolant pump and the bolts.



Torque

: 89 lb.in (10 Nm)

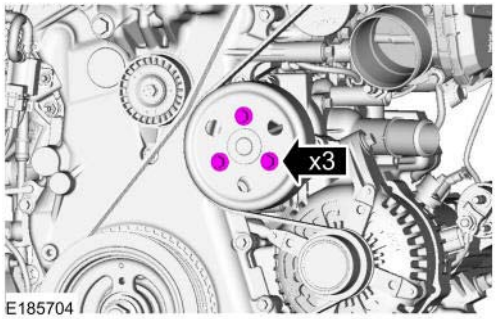


3.

Position the coolant pump pulley and install the bolts finger tight.

4.

Rotate the accessory drive belt tensioner counter clockwise and position back the accessory drive belt.



5.

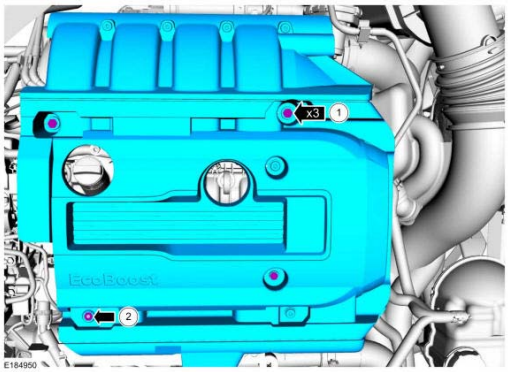
Tighten the coolant pump pulley bolts.

Torque

: 177 lb.in (20 Nm)

6.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).



7.

Install the engine appearance cover and the retainers.

Torque:

1: 53 lb.in (6 Nm)

2: 89 lb.in (10 Nm)

8.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD

Special Tool(s) / General Equipment

Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

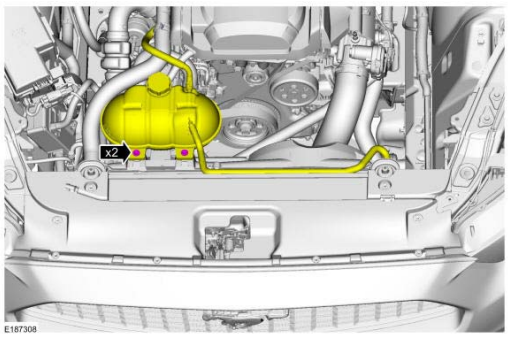
1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the air cleaner. Refer to: AIR CLEANER - 2.3L EcoBoost (231kW/314PS).

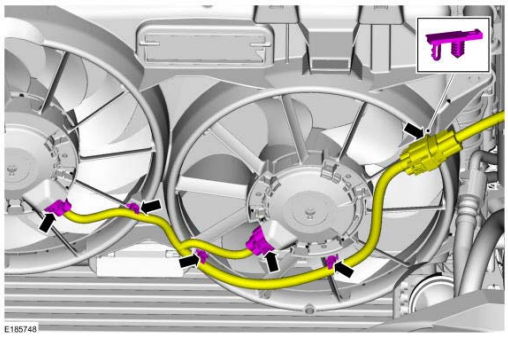
3.



Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 2.3L EcoBoost (231kW/314PS).

4.

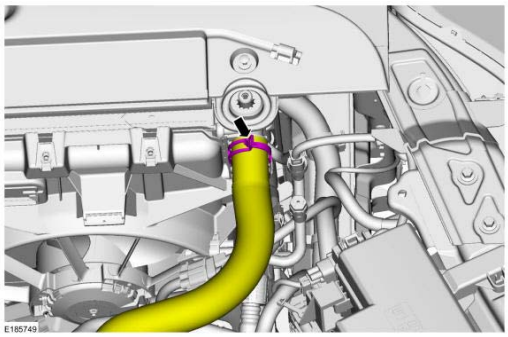
Remove the bolts and position the degas bottle aside.



Torque

: 80 lb.in (9 Nm)

5.

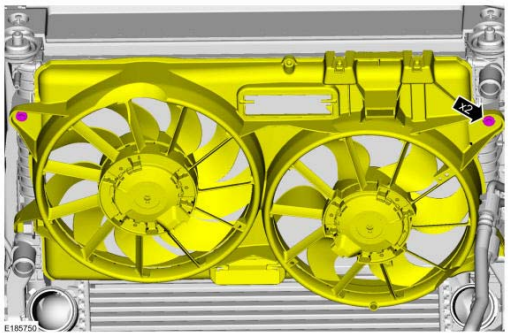


Disconnect the cooling fan electrical connectors and detach the wiring harness retainers.

6.

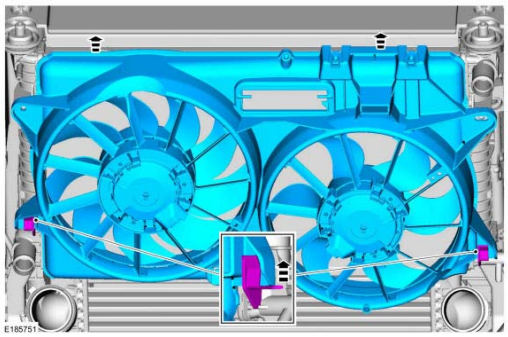
Release the clamp and disconnect the upper radiator hose.

Use the General Equipment: Hose Clamp Remover/Installer



7.

Remove the bolts.



Torque

: 53 lb.in (6 Nm)

8.

Remove the cooling fan motor and shroud.

REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

DESCRIPTION AND OPERATION > ENGINE COOLING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

On 3.7L engines, a channel cover plate is located behind the front cover. It contains a timing chain idler and press in place gaskets separating engine coolant and engine oil. A weep hole is provided on the front left side of the engine behind the generator. If oil or coolant is leaking from the weep hole, then a gasket has failed and the channel cover plate must be replaced. Refer to the appropriate Engine article.

The engine uses a cold side thermostat. This means the thermostat is located at the lower radiator hose connection to the engine, where coolant enters the engine after being cooled by the radiator. During initial warm-up, the cooler coolant from the radiator quickly closes the thermostat after the warm coolant in the engine opens the thermostat slightly. The thermostat opens and closes several times before the coolant coming from the radiator is warm enough to allow the thermostat to remain open. The engine must run much longer than a vehicle with a hot side thermostat before the thermostat remains fully opened.

The degas bottle holds surplus coolant and removes air from the cooling system. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 sets, and the MIL illuminates.

DESCRIPTION AND OPERATION > ENGINE COOLING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION > FAIL SAFE COOLING

A strategy called Fail Safe Cooling is built into the PCM that will control the engine if it starts to overheat.

Stage 1 of the strategy commences if the engine starts to overheat. The CHT sensor transmits a signal to the PCM, which moves the temperature gauge pointer into the red zone.

If the engine is not switched off and the temperature continues to rise, the Powertrain Check Lamp is illuminated. This indicates to the driver that the engine is approaching critical limits and should be stopped. At this point DTC P1285 is set in the PCM which can be retrieved using a scan tool.

Stage 2 of the strategy commences if the lamp and temperature gauge are ignored by the driver. The PCM will start to control the engine by cutting out 3 cylinders and restricting engine speed below 3, 000 RPM. Simultaneously the MIL illuminates. This indicates that long term engine damage can occur and vehicle emissions will be affected. At this point DTC P1299 is set in the PCM which can be retrieved using a scan tool.

Air is drawn into the deactivated cylinders. This helps to control the temperature of the engine internal components. The deactivated cylinders are alternated to allow even cooling of all the cylinders.

> *NOTE: If the driver is using a high percentage of throttle travel (for example, an overtaking maneuver) when the PCM starts engine deactivation (Stage 2), the deactivation will be delayed for 10 seconds.*

> *NOTE: After 3-cylinder operation has begun, the engine will not revert to 6-cylinder operation, even if the temperature should fall, until the ignition is switched off and then on again.*

NOTE: The MIL can only be extinguished by using a scan tool after the fault has been rectified and the DTC cleared.

Stage 3 of the strategy will commence if the engine temperature continues to rise. This results in the engine being totally disabled before major engine damage or seizure occurs. The Powertrain Check Lamp will begin to flash, indicating to the driver that the engine will be switched off after 30 seconds. This allows the driver time to choose a suitable parking place.

P0481	Fan 2 Control Circuit	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1285	Cylinder Head Overtemperature Condition	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1299	Cylinder Head Overtemperature Protection Active	GO to Pinpoint Test B
All Other PCM Diagnostic Trouble Codes (DTCs)	-	REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).

DIAGNOSIS AND TESTING > ENGINE COOLING > INSPECTION AND VERIFICATION

NOTE: The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

1.

Verify the customer concern.

2.

Visually check the engine coolant level at the degas bottle when the system is cold.

3.

Make sure the pressure relief cap is installed correctly.

4.

Record any cooling system Diagnostic Trouble Codes (DTCs) retrieved. Refer to the PCM DTC chart in DTC Chart for DTC descriptions.

NOTE: Take note of any coolant odor or steam coming from cooling system components.

5.
If the system coolant is filled correctly and no Diagnostic Trouble Codes (DTCs) associated with fail-safe cooling are retrieved, verify the customer concern by operating the engine to duplicate the condition.

6.

Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
Leaks or weeps at: • Hoses	Inoperative or damaged: • Electric cooling fan

- Tubes
- Clamp joints
- Gaskets
- O-rings
- Thermostat housing
- Transmission fluid cooler
- Radiator
- Pressure relief cap
- Coolant pump
- Heater core (wet floor or coolant odor in vehicle)
- Lower intake manifold
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

Cracked or damaged:

- Hoses
- Tubes
- Hose clamps
- Thermostat housing
- Lower intake manifold
- Radiator
- Pressure relief cap
- Cooling fan
- Coolant pump
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs

- Wiring, connectors, relays or modules
- CHT sensor

• Block heater (if equipped) Restricted airflow through the A/C condenser/radiator Drive belt loose, worn or installed incorrectly Broken or weak drive belt tensioner Excessive white or light gray exhaust smoke (may have burnt coolant odor) Coolant in engine oil Engine oil in coolant	

7.

If the inspection reveals an obvious concern that can be readily identified, repair it as necessary.

8.

Inspect the coolant condition.

1.

Inspect the coolant color.

Discoloration may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow in color) coolant degrades the corrosion protection of Motorcraft® Orange Antifreeze/Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Gold Antifreeze/Coolant, however, may not change the color or appearance of the orange-colored coolant. Detection of contamination with Motorcraft® Gold Antifreeze/Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Gold Antifreeze/Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the nitrite testing directions in the kit to determine if nitrite is present in the system. If nitrite is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A darker orange with the presence of debris could indicate a commercially available stop leak may have been used and could result in loss of coolant flow to critical parts of the engine. If sediment is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For engine diagnosis, REFER to: appropriate Engine article. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests . If engine oil is suspected, the cause of the leak may be internal to the engine. For engine diagnosis, REFER to: appropriate Engine article. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

2.

If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. Maintain the coolant concentration within 48% to 50%, which equates to a freeze point between -34°C and - °C (-30°F and -34°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) engine coolant to distilled water.

Maximum coolant concentration is 60/40 for cold weather areas.

Minimum coolant concentration is 40/60 for warm weather areas.

3.

Adjust coolant range and level if necessary:

If coolant is low, add specified coolant mixture only.

If the engine coolant tests too weak, remove some of the engine coolant and add Motorcraft® Orange Antifreeze/Coolant Concentrated until the readings are within acceptable levels.

If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9.

If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

DIAGNOSIS AND TESTING > ENGINE COOLING > SYMPTOM CHART

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Condition	Possible Sources	Actions
Loss of coolant	Refer to the Pinpoint Test	GO to Pinpoint Test A
The engine overheats.	Refer to the Pinpoint Test	GO to Pinpoint Test B
The engine does not reach normal operating temperature.	Refer to the Pinpoint Test	GO to Pinpoint Test C

The block heater does not operate correctly.	Block heater power cable Block heater	CHECK continuity in all 3 power cable circuits. If any circuit measures more than 5 ohms, INSTALL a new power cable. CHECK the resistance of the block heater. If the resistance does not measure between 30 and 40 ohms, INSTALL a new block heater. REFER to: Block Heater .
The electric cooling fan is inoperative in one or more speeds or does not operate correctly.	Wiring Relays Fuses Cooling fan motor Cooling fan resistor	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
The electric cooling fan stays on all the time.	Wiring Relays	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Noisy electric cooling fan operation.	Foreign material contamination Fan motor	REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal operation. If still noisy, INSTALL a new cooling fan assembly. REFER to: Cooling Fan Motor and Shroud .
	Fan blade detached from fan motor	INSTALL a new cooling fan assembly. REFER to: Cooling Fan Motor and Shroud .

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS

Loss of Coolant

Normal operation and Fault Conditions

The engine cooling system is a closed system providing for coolant expansion and contraction as well as changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Possible Sources

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing

- Radiator
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Lower intake manifold
- Engine gaskets (may leak internally or externally)
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST A : PINPOINT TEST > PINPOINT TEST A : PINPOINT TEST

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

A1 CARRY OUT INSPECTION AND VERIFICATION

Carry out Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to A2

NOTE: Allow the engine to cool before checking the engine coolant level.

A2 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE ENGINE COOLING SYSTEM

Ignition OFF

Visually inspect the engine coolant level at the degas bottle and adjust as necessary. Pressure test the engine cooling system. Refer to Component Tests , Cooling System

Pressure Test.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to A3

A3 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the degas bottle for signs of engine oil or transmission fluid.

Is engine oil evident in the coolant?

Yes	REFER to: appropriate Engine article.

No	GO to A4

A4 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: appropriate Engine article.

No	GO to A5

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

A5 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

Are combustion gases present?

Yes	REFER to: appropriate Engine article.

No	The cooling system is operational.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST

The Engine Overheats

Normal operation and Fault Conditions

The engine cooling system maintains the engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

Possible Sources

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Non-OEM engine enhancement components
- Electric cooling fan
- CHT sensor
- Radiator
- Thermostat
- Coolant pump
- Coolant flow restriction

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0217	Engine Coolant Overtemperature Condition	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor.

P1299	Cylinder Head Overtemperature Protection Active	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST > PINPOINT TEST B : PINPOINT TEST

B1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to B2

B2 CHECK FOR PCM (POWERTRAIN CONTROL MODULE) DTCS

Ignition ON.

Using a scan tool, perform PCM self-test.

Is DTC P0217 and/or P1299 present?

Yes	GO to B4

No	Actual engine overheating has not been verified. CHECK the engine coolant temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If any other PCM DTCs are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).

B3 CHECK FOR ACTIVE GRILL SHUDDER DTCS

Review the PCM DTCs.

Are any active grill shudder DTCs present?

Yes	REFER to: Active Grille Shutter .

No	GO to B4

NOTE: Verify no vehicle front end damage is present.

B4 CHECK FOR AN AIRFLOW OBSTRUCTION AND MISSING AIR DEFLECTORS

Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard and verify all air deflectors are present.

Is an airflow obstruction present or air deflectors missing?

Yes	REPAIR as necessary.

No	GO to B5

B5 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE COOLING SYSTEM

Ignition OFF.

Visually check the engine coolant level in the coolant expansion tank and adjust as necessary. Pressure test the cooling system.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to B6

B6 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the coolant expansion tank for signs of engine oil.

Is engine oil evident in the coolant?

Yes	REFER to: appropriate Engine article.

No	GO to B7

B7 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: appropriate Engine article.

No	GO to B8

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

Are combustion gases present?

Yes	REFER to: appropriate Engine article.

No	GO to B9

B9 CHECK COOLANT CONDITION

Check the coolant for dirt, rust or contamination and check the coolant concentration.

Is the coolant condition OK?

Yes	GO to B10

No	FLUSH the engine cooling system. REFER to: Cooling System Flushing .

B10 CHECK THE ELECTRIC COOLING FAN OPERATION

Start the engine.

Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.

Did the electric cooling fan operate?

Yes	GO to B11

No	DIAGNOSE the electric cooling fan operation. Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

B11 CHECK THE COOLANT PUMP OPERATION

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.

Is the heater outlet hose hot?

Yes	GO to B12

No	INSTALL a new coolant pump. REFER to: Coolant Pump .

NOTE: This cooling system uses a cold side thermostat. The coolant in the radiator must reach full operating temperature for the thermostat to remain in an open state.

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the lower radiator hose.

B12 CHECK THE THERMOSTAT OPERATION

Is the lower radiator hose hot?

Yes	CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes .

No	GO to B13

B13 VISUALLY INSPECT THE THERMOSTAT

Carry out the Thermostat Visual Inspection in the Component Tests .

Is the thermostat damaged?

Yes	INSTALL a new thermostat. REFER to: Thermostat .

No	INSTALL a new thermostat. REFER to: Thermostat . If the engine still overheats, INSTALL a new radiator. REFER to: Radiator .

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST

The Engine Does Not Reach Normal Operating Temperature

Normal operation and Fault Conditions

The engine cooling system maintains engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

Possible Sources

- Low coolant level
- Thermostat
- Temperature gauge
- CHT

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0125	Insufficient Coolant Temp for Closed Loop Fuel Control	Sets in the PCM when the CHT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Sets in the PCM when the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST > PINPOINT TEST C : PINPOINT TEST

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

C1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Were any concerns found?

Yes	REPAIR as needed.

No	GO to C2

C2 CHECK FOR DTC P0125 OR P0128

Using a scan tool, perform the PCM self-test.

Is DTC P0125 or P0128 present?

Yes	GO to C3

No	The cooling system is operational. If an inoperative temperature gauge is suspected, CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If an inoperative climate control system is suspected, CHECK the climate control system operation. For Dual Automatic Temperature Control (DATC), REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) . For Electronic Manual Temperature contro (EMTC), REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) . If any other Diagnostic Trouble Codes (DTCs) are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).

NOTE: Allow the engine to cool before checking the coolant expansion tank.

Visually check the engine coolant level in the coolant expansion tank

C3 CHECK THE COOLANT LEVEL

Is the engine coolant level within specification?

Yes	INSTALL a new thermostat. REFER to: Thermostat . CLEAR Diagnostic Trouble Codes (DTCs). If the DTC returns check for correct CHT sensor operation.

No	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > ENGINE COOLING > COMPONENT TESTS

Cooling System Pressure Test

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles have a pressure relief cap on the degas bottle and no radiator cap.

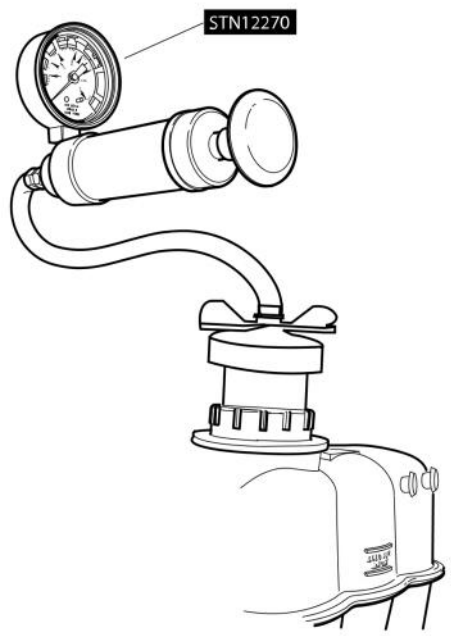
1.

Turn the engine OFF.

2.

Check the engine coolant level and adjust as necessary.

3.



Remove the degas bottle cap. Inspect the degas bottle cap and degas bottle for any issues that would cause improper sealing, such as for cross-threading, burrs, damaged o-ring, etc. If any issues are found, INSTALL a new cap and/or degas bottle.

4.

Attach the Pressure Tester and adaptor (Snap-On TA53 or equivalent), to the degas bottle cap. The cap must hold pressure of 145 kPa +/- 21 kPa (21 PSI +/- 3 PSI). If any issues are found, INSTALL a new cap.

5.

Attach the Pressure Tester and adaptor (Snap-On TA52, AST ASSFZ-47, Redline RDL95-0750 or equivalent) to the degas bottle.

E164137

NOTE: Do not pressurize the cooling system beyond the maximum pressure listed in the SPECIFICATIONS , or cooling system components can be damaged.

NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading will result.

6.

To pressurize the engine cooling system, slowly press the plunger of the pressure test pump and increase the pressure to between 124 - 138 kPa (18 - 20 PSI). Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7.

If no leaks are found and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. REFER to: appropriate Engine article.

8.

If the pressure does not drop remove the cooling system Pressure Tester and adaptor from degas bottle.

9.

Install the degas bottle cap until it contacts the hard stop.

Thermostat

Install a new thermostat only after at least one of the following tests and checks have been carried out:

- Pinpoint Test B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1.

Remove the thermostat.

2.

Examine the thermostat for signs of damage including:

- Valve not fully seated (light visible through the valve)
- Foreign material lodged in the main valve
- Bent or broken frame or flange
- Bent or broken spring
- Wax leaking from wax reservoir or a bulge in the reservoir
- Any other damage or distortion

NOTE: If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

3.
If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

Radiator Leak Test, Removed From Vehicle

NOTE: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the SPECIFICATIONS .

GENERAL PROCEDURES > COOLING SYSTEM DRAINING AND VACUUM FILLING

Special Tool(s) / General Equipment

 ST1720-A	ROB75240 Coolant/Battery Refractometer (Fahrenheit)
Fluid Container	
Cooling System Vacuum Tester and Refiller	

Materials

Name	Specification
Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) VC-3DIL-B (U.S.)	WSS-M97B44-D2
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

Draining

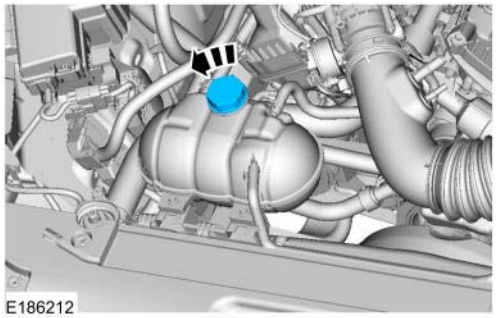
NOTE: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.

NOTE: The vehicle cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing . Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft® Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

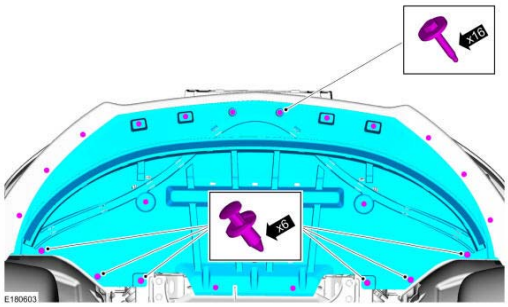
NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.



1.

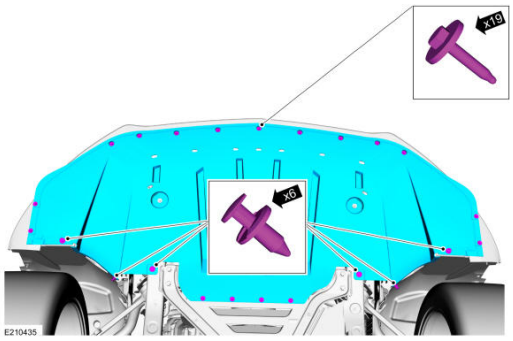
WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

Remove the pressure relief cap.



2.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



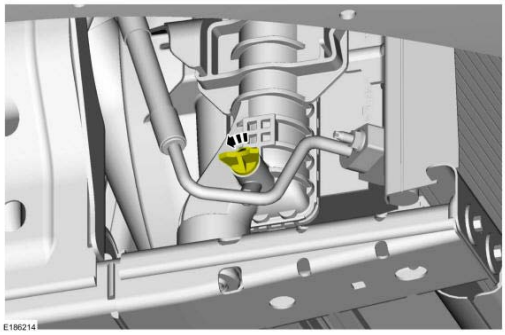
NOTE: If equipped.

3.
Remove the underbody shield.

NOTE: If equipped.

4.
Remove the underbody shield.

5.



WARNING: Be prepared to collect escaping fluid.

Use a hose to drain the coolant.

Open the radiator drain valve and drain the engine coolant in a suitable, clean container.

Use the General Equipment: Fluid Container

Filling

Filling and Bleeding with a Vacuum Cooling System Filler

1.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240 Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

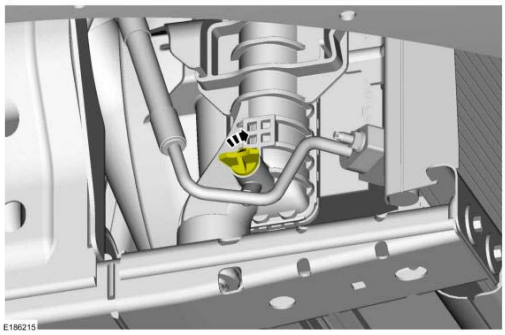
Add, top-off or adjust the coolant as follows:

For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

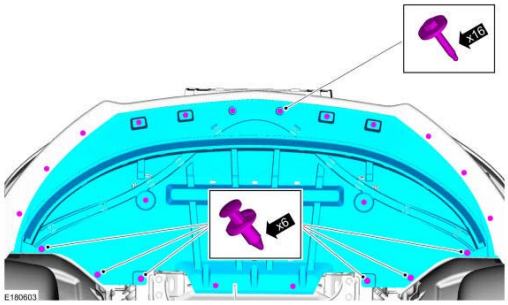
For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.



Material

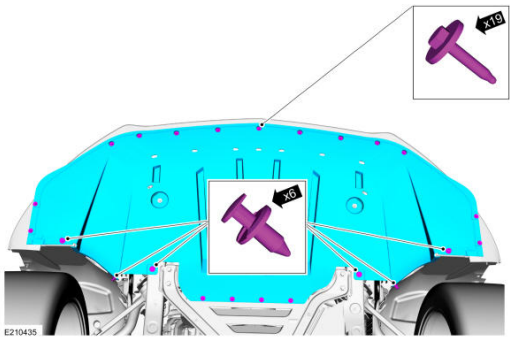
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



2.

Close the radiator drain valve.



NOTE: If equipped.

3.
Install the underbody shield.

NOTE: If equipped.

4.
Install the underbody shield.

5.

Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the system.

Use the General Equipment: Cooling System Vacuum Tester and Refiller

6.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -34°C to -37°C [-30°F to -34°F]).

7.

For extremely cold climates (less than -37?C [-34?F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

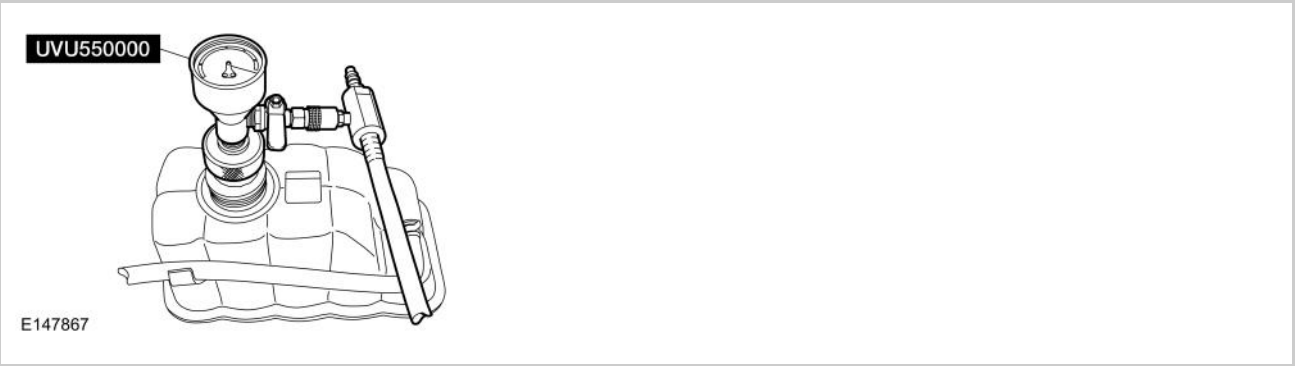
A coolant concentration of 60% provides freeze protection down to -50?C (-58?F)

Engine coolant concentrations above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.

8.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.



NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the freeze and corrosion protection characteristics of the engine coolant and may damage the engine.

9.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler

10.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240 Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

Add, top-off or adjust the coolant as follows:

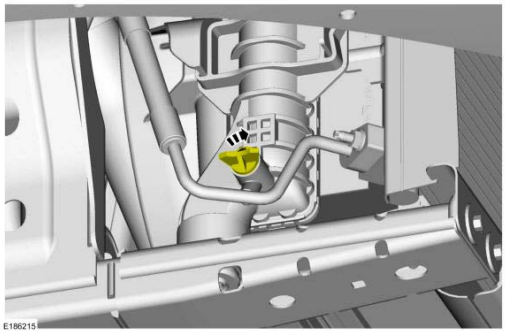
For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated

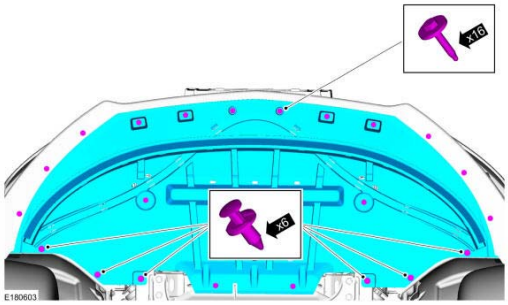
and/or distilled water to get to the desired concentration.



Material

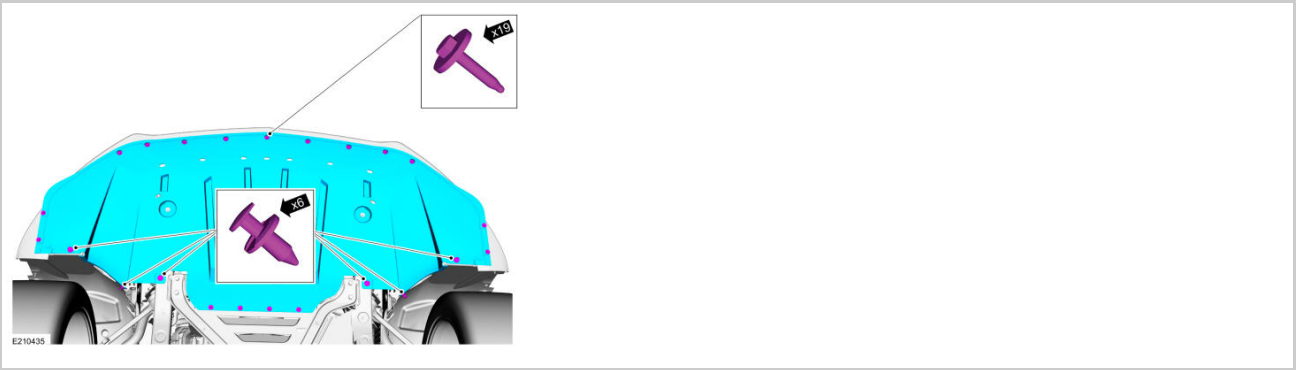
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



11.

Close the radiator drain valve.



NOTE: If equipped.

12.
Install the underbody shield.

NOTE: If equipped.

13.
Install the underbody shield.

14.

Fill the degas bottle to the MAX FILL line.

15.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -34°C to -37?C [-30°F to -34°F]).

16.

For extremely cold climates (less than -37°C [-34°F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

A coolant concentration of 60% provides freeze protection down to -50°C (-58°F)

Engine coolant concentrations above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.

17.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.

NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the freeze and corrosion protection characteristics of the engine coolant and may damage the engine.

18.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

19.

Install the degas bottle cap until it contacts the hard stop.

20.

Turn the climate control system off.

21.

Start the engine and increase the engine speed to 3, 500 rpm and hold for 30 seconds.

22.

Turn the engine off for and wait for 1 minute to purge any large air pockets from the cooling system.

23.

> *WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.*

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle if the engine is warm or to the top of the MIN FILL LEVEL if the engine is cold.

24.

Start the engine and let it idle until the engine reaches normal operating temperature and the thermostat is fully open. A fully open thermostat is verified by the cooling fan cycling on at least once.

25.

Increase the engine speed to 3, 500 rpm and hold for 30 seconds.

26.

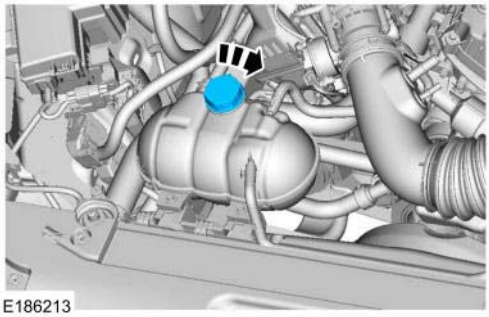
Allow the engine to idle for 30 seconds.

27.

Turn the engine off for 1 minute.

28.

Repeat steps 25 through 27 a total of 5 times to remove any remaining air trapped in the system.



29.

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle.

30.

Install the pressure relief cap.

GENERAL PROCEDURES > COOLING SYSTEM FLUSHING

Materials

Name	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system

flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.

1.

Add Motorcraft® Premium Cooling System Flush to the cooling system and follow the directions on the package.

Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

2.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

3.

Remove the radiator. Refer to: Radiator .

NOTE: Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.

4.
Backflush the radiator with radiator turned so the upper radiator hose is at the top and with a high-pressure hose in the upper hose location.

5.

Remove the thermostat. Refer to: Thermostat .

6.

Install the coolant inlet connection without the thermostat.

Torque

: 89 lb.in (10 Nm)

7.

Backflush the engine. Position the high-pressure water hose into the engine through the upper radiator hose and backflush the engine.

8.

Install the thermostat. Refer to: Thermostat .

9.

Install the radiator. Refer to: Radiator .

10.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

GENERAL PROCEDURES > HEATER CORE BACKFLUSHING

Materials

Name	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

1.

Partially drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Add Premium Cooling System Flush to backflush the heater core and follow the directions on the package. Flush with water thoroughly after using Premium Cooling System Flush prior to refilling the cooling system.

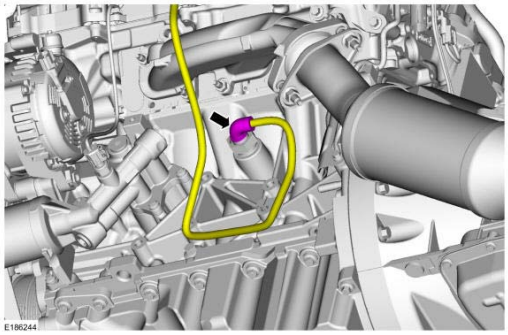
Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

3.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling

REMOVAL AND INSTALLATION > BLOCK HEATER > REMOVAL



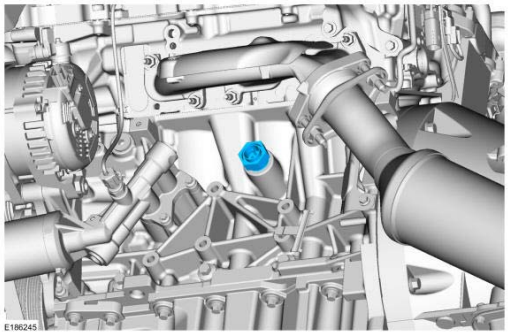
NOTE: Removal steps in this procedure may contain installation details.

1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

NOTE: Make sure the block heater wiring is routed and secured away from rotating or hot components.

2.
Disconnect the block heater electrical connector.



3.

Remove the block heater.

Torque

: 30 lb.ft (40 Nm)

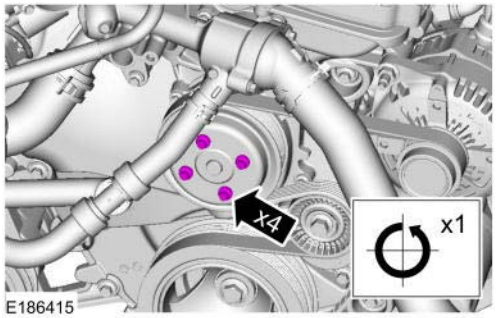
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

REMOVAL AND INSTALLATION > COOLANT PUMP > REMOVAL

1.



Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

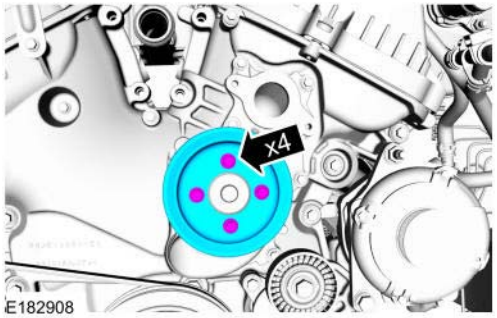
3.

Loosen the coolant pump pulley bolts.

4.

Remove the accessory drive belt. Refer to: ACCESSORY DRIVE BELT - 3.7L Duratec (227kW/301PS).

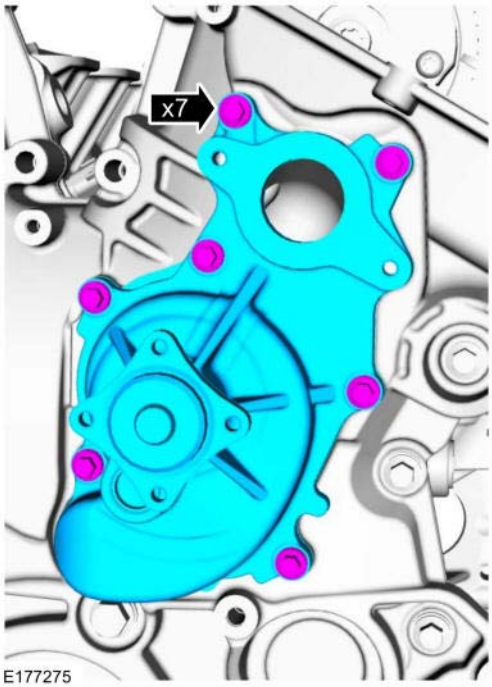
NOTE: Cover the A/C compressor belt to prevent coolant contamination of the belt.



5.
Completely cover the A/C compressor belt with waterproof plastic.

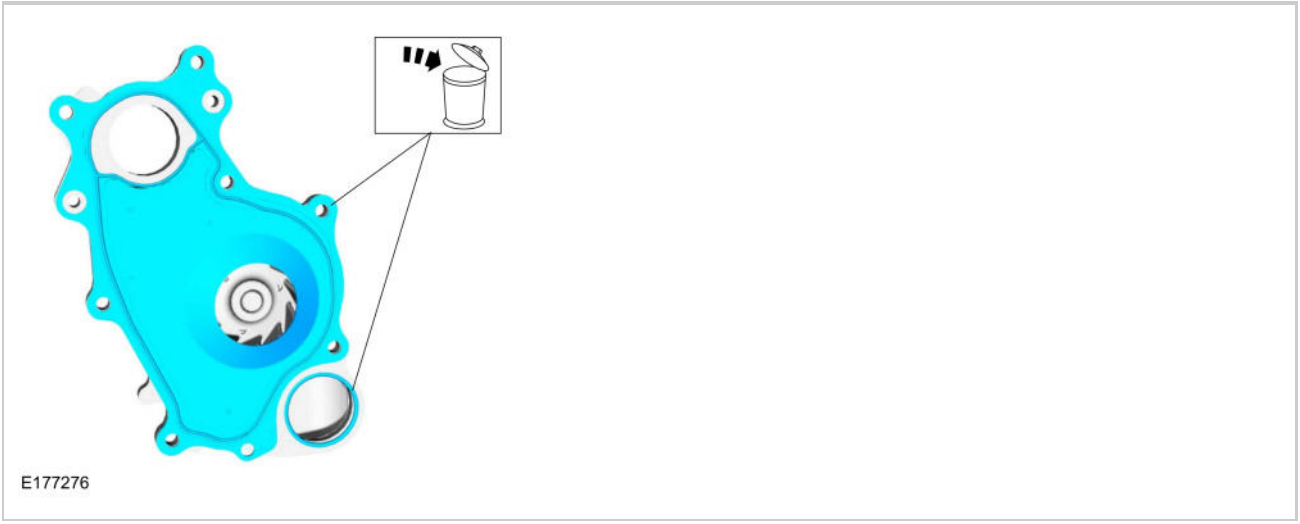
6.

Remove the thermostat housing. Refer to: Thermostat Housing .



7.

Remove the bolts and the coolant pump pulley.

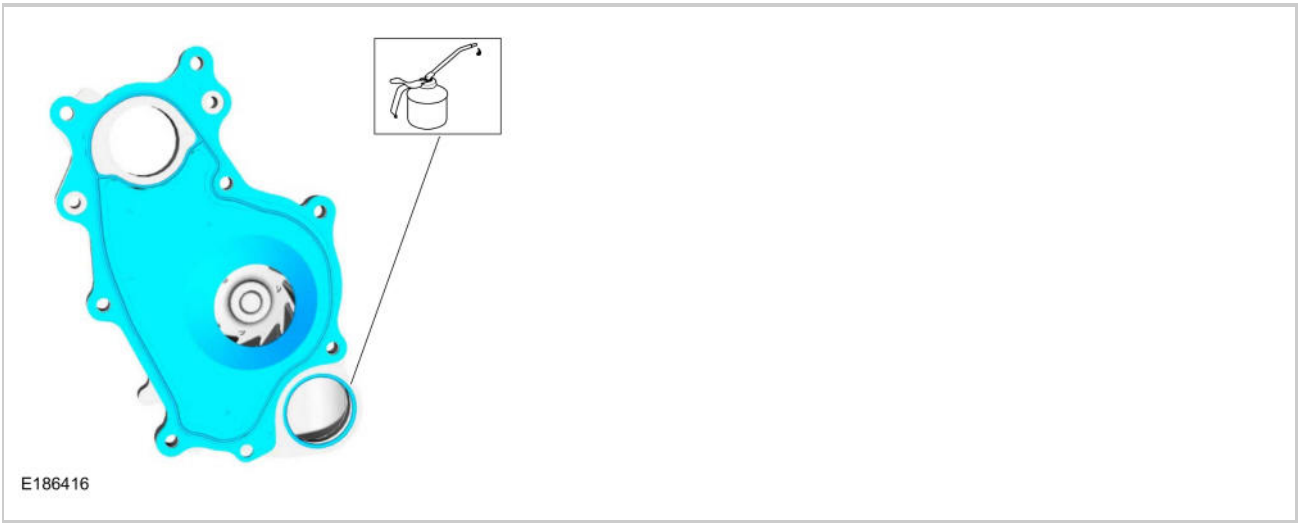


8.

Remove the bolts and the coolant pump.

9.

Remove and discard the coolant pump gasket and O-ring seal.



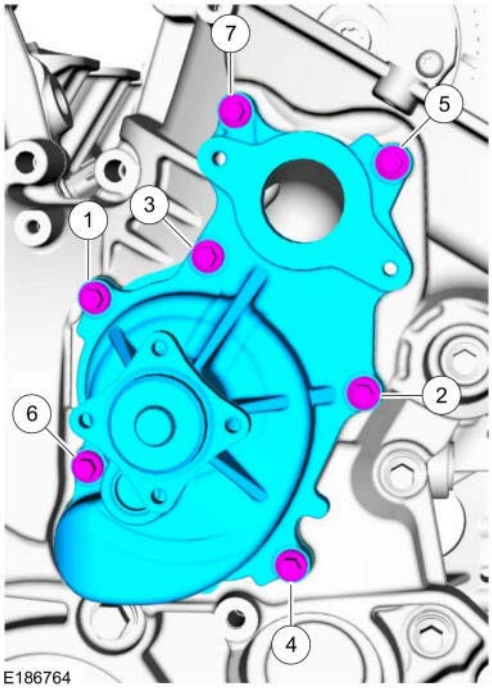
REMOVAL AND INSTALLATION > COOLANT PUMP > INSTALLATION

1.

Install a new coolant pump gasket and O-ring seal and lubricate the O-ring seal with clean engine coolant.

Material

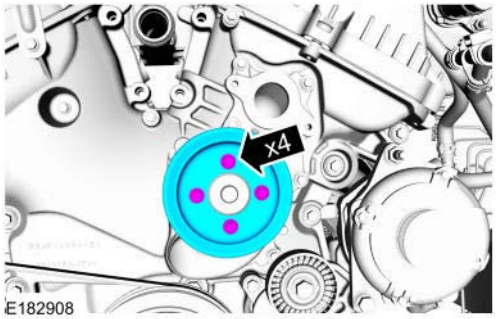
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)



2.

Install the coolant pump, the 7 bolts and tighten in the sequence shown in 2 stages.

Torque:



Stage 1: 89 lb.in (10 Nm)

Stage 2: 45°

NOTE: Only tighten the bolts finger tight at this stage.

3.
Position the coolant pump pulley and install the bolts finger tight.

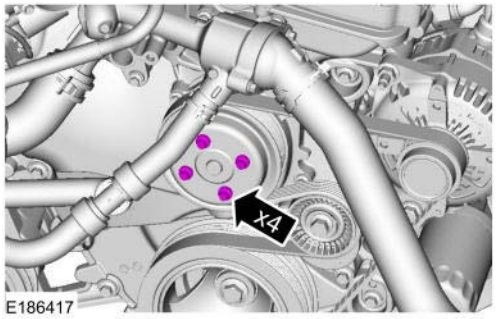
4.

Install the thermostat housing. Refer to: Thermostat Housing .

5.

Remove the plastic from the A/C compressor belt.

6.



Install the accessory drive belt. Refer to: ACCESSORY DRIVE BELT - 3.7L Duratec (227kW/301PS).

7.

Tighten the coolant pump pulley bolts.

Torque

: 18 lb.ft (24 Nm)

8.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

9.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

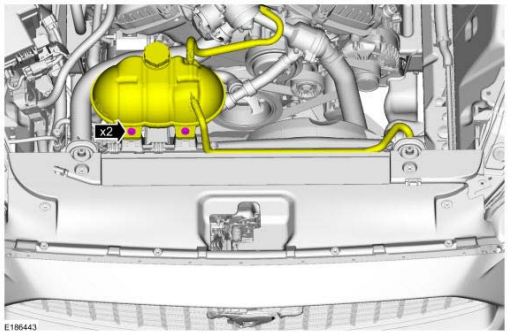
REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the air cleaner. Refer to: AIR CLEANER - 3.7L Duratec (227kW/301PS).

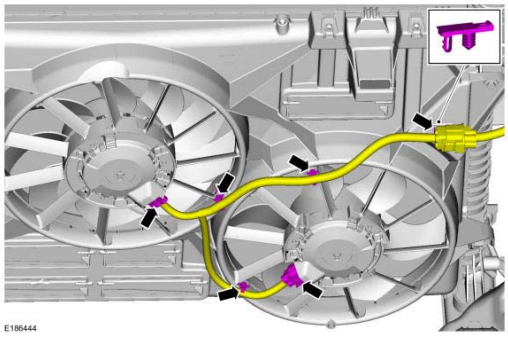
2.



Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

3.

Remove the bolts and position the degas bottle aside.

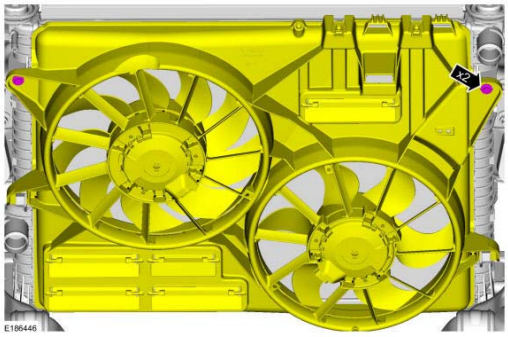


Torque

: 80 lb.in (9 Nm)

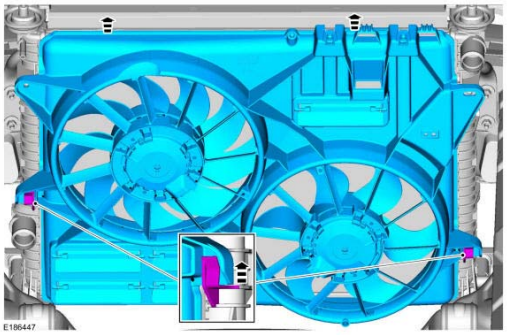
4.

Disconnect the cooling fan electrical connectors and detach the wiring harness retainers.



5.

Remove the bolts.



Torque

: 53 lb.in (6 Nm)

6.

Remove the cooling fan motor and shroud.

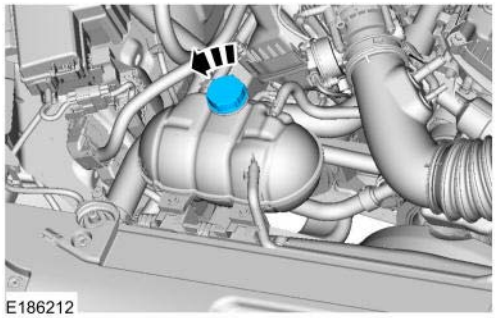
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

REMOVAL AND INSTALLATION > DEGAS BOTTLE > REMOVAL

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

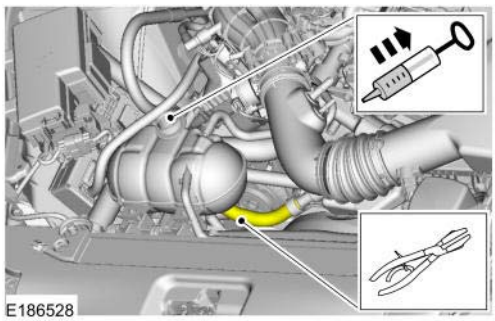
NOTE: Removal steps in this procedure may contain installation details.



1.

WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

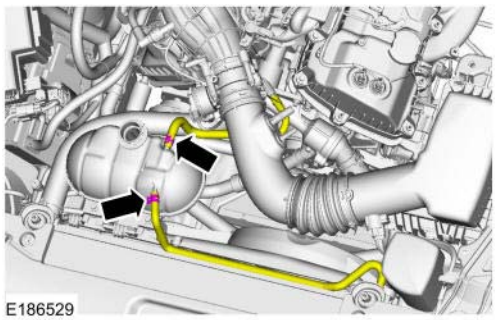
Remove the pressure relief cap.



2.

Using general tools clamp the lower degas bottle hose and syphon the coolant from the degas bottle.

Use the General Equipment: Fluid Suction Gun

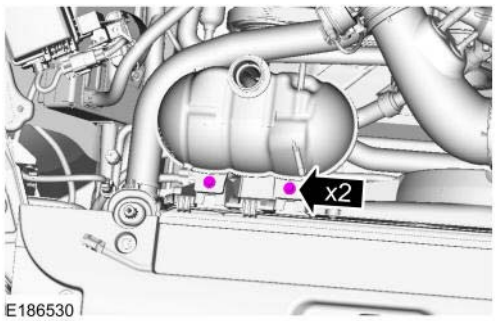


Use the General Equipment: Locking Pliers

3.

Release the clamps, disconnect the upper degas bottle hoses.

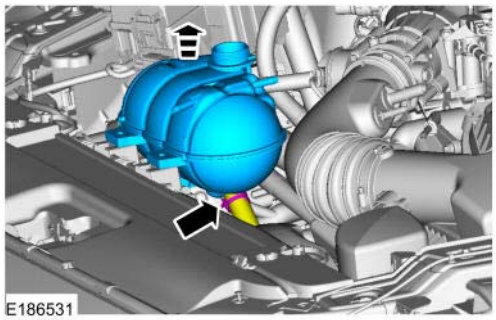
Use the General Equipment: Hose Clamp Remover/Installer



4.

Remove the bolts.

Torque



: 80 lb.in (9 Nm)

5.

Position the degas bottle and disconnect the lower coolant hose.

Use the General Equipment: Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > DEGAS BOTTLE > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Fill the degas bottle with the recommended coolant mixture and fill level.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Material

DESCRIPTION AND OPERATION > ENGINE COOLING - SYSTEM OPERATION AND COMPONENT DESCRIPTION

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

The engine uses a cold side thermostat. This means the thermostat is located at the lower radiator hose connection to the engine, where coolant enters the engine after being cooled by the radiator. During initial warm-up, the cooler coolant from the radiator quickly closes the thermostat after the warm coolant in the engine opens the thermostat slightly. The thermostat opens and closes several times before the coolant coming from the radiator is warm enough to allow the thermostat to remain open. The engine must run much longer than a vehicle with a hot side thermostat before the thermostat remains fully opened.

The degas bottle holds surplus coolant and removes air from the cooling system. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 sets, and the MIL illuminates.

DESCRIPTION AND OPERATION > ENGINE COOLING - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FAIL SAFE COOLING

A strategy called Fail Safe Cooling is built into the PCM that will control the engine if it starts to overheat.

Stage 1 of the strategy commences if the engine starts to overheat. The CHT sensor transmits a signal to the PCM, which moves the temperature gauge pointer into the red zone.

If the engine is not switched off and the temperature continues to rise, the Powertrain Check Lamp is illuminated. This indicates to the driver that the engine is approaching critical limits and should be stopped. At this point DTC P1285 is set in the PCM which can be retrieved using a scan tool.

Stage 2 of the strategy commences if the lamp and temperature gauge are ignored by the driver. The PCM will start to control the engine by cutting out 4 cylinders and restricting engine speed below 3, 000 RPM. Simultaneously the MIL illuminates. This indicates that long term engine damage can occur and vehicle emissions will be affected. At this point DTC P1299 is set in the PCM which can be retrieved using a scan tool.

Air is drawn into the deactivated cylinders. This helps to control the temperature of the engine internal components. The deactivated cylinders are alternated to allow even cooling of all the cylinders.

NOTE: If the driver is using a high percentage of throttle travel (for example, an

overtaking maneuver) when the PCM starts engine deactivation (Stage 2), the deactivation will be delayed for 10 seconds.

NOTE: After 4-cylinder operation has begun, the engine will not revert to 8-cylinder operation, even if the temperature should fall, until the ignition is switched off and then on again.

NOTE: The MIL can only be extinguished by using a scan tool after the fault has been rectified and the DTC cleared.

Stage 3 of the strategy will commence if the engine temperature continues to rise. This results in the engine being totally disabled before major engine damage or seizure occurs. The Powertrain Check Lamp will begin to flash, indicating to the driver that the engine will be switched off after 30 seconds. This allows the driver time to choose a suitable parking place.

DIAGNOSIS AND TESTING > ENGINE COOLING

		DIESEL & HYBRID) .
P1285	Cylinder Head Overtemperature Condition	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
P1299	Cylinder Head Overtemperature Protection Active	GO to Pinpoint Test B
All Other PCM Diagnostic Trouble Codes (DTCs)	-	REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

DIAGNOSIS AND TESTING > ENGINE COOLING > INSPECTION AND VERIFICATION

NOTE: The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

1.

Verify the customer concern.

2.

Visually check the engine coolant level at the degas bottle when the system is cold.

3.

Make sure the pressure relief cap is installed correctly.

4.

Record any cooling system Diagnostic Trouble Codes (DTCs) retrieved. Refer to the PCM DTC chart in DTC Chart for DTC descriptions.

NOTE: Take note of any coolant odor or steam coming from cooling system components.

5.
If the system coolant is filled correctly and no Diagnostic Trouble Codes (DTCs) associated with fail-safe cooling are retrieved, verify the customer concern by operating the engine to duplicate the condition.

6.

Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
Leaks or weeps at: • Hoses • Tubes • Clamp joints • • Gaskets • O-rings • Thermostat housing • Oil Cooler • Radiator • Pressure relief cap • Coolant pump • Heater core (wet floor or coolant odor in vehicle) • Lower intake manifold • Degas bottle • Cylinder block core plugs • Cylinder head core plugs • Block heater (if equipped) Cracked or damaged: • Hoses • Tubes • Hose clamps	Inoperative or damaged: Electric cooling fan Wiring, connectors, relays or modules CHT sensor

• Thermostat housing • Lower intake manifold • Oil cooler • Radiator • Pressure relief cap • Cooling fan • Coolant pump • Degas bottle • Cylinder block core plugs • Cylinder head core plugs • Block heater (if equipped)	
Restricted airflow through the A/C condenser/radiator Drive belt loose, worn or installed incorrectly Broken or weak drive belt tensioner Excessive white or light gray exhaust smoke (may have burnt coolant odor) Coolant in engine oil Engine oil in coolant	

7.

If the inspection reveals an obvious concern that can be readily identified, repair it as necessary.

8.

Inspect the coolant condition.

1.

Inspect the coolant color.

Discoloration may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow in color) coolant degrades the corrosion protection of Motorcraft® Orange Antifreeze/Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Gold Antifreeze/Coolant, however, may not change the color or appearance of the orange-colored coolant. Detection of contamination with Motorcraft® Gold Antifreeze/Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Gold Antifreeze/Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the nitrite testing directions in the kit to determine if nitrite is present in the system. If nitrite is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A darker orange with the presence of debris could indicate a commercially available stop leak may have been used and could result in loss of coolant flow to critical parts of the engine. If sediment is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For engine diagnosis, REFER to: ENGINE SYSTEM - GENERAL INFORMATION . Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests . If engine oil is suspected, the cause of the leak may be internal to the engine. For engine diagnosis, REFER to: ENGINE SYSTEM - GENERAL INFORMATION . Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant Concentrated. REFER to: Cooling System Draining and Vacuum Filling .

2.

If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. Maintain the coolant concentration within 48% to 50%, which equates to a freeze point between -34°C and -37°C (-30°F and -34°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) engine coolant to distilled water.

Maximum coolant concentration is 60/40 for cold weather areas.

Minimum coolant concentration is 40/60 for warm weather areas.

3.

Adjust coolant range and level if necessary:

If coolant is low, add specified coolant mixture only.

If the engine coolant tests too weak, remove some of the engine coolant and add Motorcraft® Orange Antifreeze/Coolant Concentrated until the readings are within acceptable levels.

If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9.

If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

DIAGNOSIS AND TESTING > ENGINE COOLING > SYMPTOM CHART

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS

Loss of Coolant

Normal operation and Fault Conditions

The engine cooling system is a closed system providing for coolant expansion and contraction as well

as changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Possible Sources

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Oil cooler (may leak internally or externally)
- Radiator
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Lower intake manifold
- Engine gaskets (may leak internally or externally)
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST A : PINPOINT TEST > PINPOINT TEST A : PINPOINT TEST

> ⛔ *WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.*

A1 CARRY OUT INSPECTION AND VERIFICATION

Carry out Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to A2

NOTE: Allow the engine to cool before checking the engine coolant level.

A2 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE ENGINE COOLING SYSTEM

Ignition OFF

Visually inspect the engine coolant level at the degas bottle and adjust as necessary. Pressure test the engine cooling system. Refer to Component Tests , Cooling System Pressure Test.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to A3

A3 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the degas bottle for signs of engine oil or transmission fluid.

Is engine oil evident in the coolant?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	GO to A4

A4 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	GO to A5

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

A5 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

Are combustion gases present?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	The cooling system is operational.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST

The Engine Overheats

Normal operation and Fault Conditions

The engine cooling system maintains the engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

Possible Sources

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Non-OEM engine enhancement components
- Electric cooling fan
- CHT sensor

- Radiator
- Thermostat
- Coolant pump
- Coolant flow restriction

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0217	Engine Coolant Overtemperature Condition	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor.
P1299	Cylinder Head Overtemperature Protection Active	Sets in the PCM when an engine overheat condition was sensed by the CHT sensor.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST B : PINPOINT TEST > PINPOINT TEST B : PINPOINT TEST

B1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Are any concerns present?

Yes	REPAIR as needed.

No	GO to B2

B2 CHECK FOR PCM (POWERTRAIN CONTROL MODULE) DTCS

Ignition ON.

Using a scan tool, perform PCM self-test.

Is DTC P0217 and/or P1299 present?

Yes	GO to B4

No	Actual engine overheating has not been verified. CHECK the engine coolant temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If any other PCM DTCs are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

B3 CHECK FOR ACTIVE GRILL SHUDDER DTCS

Review the PCM DTCs.

Are any active grill shudder DTCs present?

Yes	REFER to: Active Grille Shutter .

No	GO to B4

NOTE: Verify no vehicle front end damage is present.

B4 CHECK FOR AN AIRFLOW OBSTRUCTION AND MISSING AIR DEFLECTORS

Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard and verify all air deflectors are present.

Is an airflow obstruction present or air deflectors missing?

Yes	REPAIR as necessary.

No	GO to B5

B5 CHECK THE ENGINE COOLANT LEVEL AND PRESSURE TEST THE COOLING SYSTEM

Ignition OFF.

Visually check the engine coolant level in the coolant expansion tank and adjust as necessary. Pressure test the cooling system.

Does the engine cooling system leak externally?

Yes	REPAIR or INSTALL new components.

No	GO to B6

B6 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK

Inspect the engine coolant in the coolant expansion tank for signs of engine oil.

Is engine oil evident in the coolant?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	GO to B7

B7 CHECK THE ENGINE OIL FOR COOLANT

Remove the oil level indicator from the engine.

Is coolant evident in the oil?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	GO to B8

NOTE: Use UView® Combustion Leak Tester part number UVU560000-R or equivalent.

B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES

Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.

Are combustion gases present?

Yes	REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

No	GO to B9

B9 CHECK COOLANT CONDITION

Check the coolant for dirt, rust or contamination and check the coolant concentration.

Is the coolant condition OK?

Yes	GO to B10

No	FLUSH the engine cooling system. REFER to: Cooling System Flushing .

B10 CHECK THE ELECTRIC COOLING FAN OPERATION

Start the engine.

Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.

Did the electric cooling fan operate?

Yes	GO to B11

No	DIAGNOSE the electric cooling fan operation. Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

B11 CHECK THE COOLANT PUMP OPERATION

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose.

Is the heater outlet hose hot?

Yes	GO to B12

No	INSTALL a new coolant pump. REFER to: Coolant Pump .

NOTE: This cooling system uses a cold side thermostat. The coolant in the radiator must reach full operating temperature for the thermostat to remain in an open state.

B12 CHECK THE THERMOSTAT OPERATION

Start the engine.

Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the lower radiator hose.

Is the lower radiator hose hot?

Yes	CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes .

No	GO to B13

B13 VISUALLY INSPECT THE THERMOSTAT

Carry out the Thermostat Visual Inspection in Component Tests .

Is the thermostat damaged?

Yes	INSTALL a new thermostat. REFER to: Thermostat .

No	INSTALL a new thermostat. REFER to: Thermostat . If the engine still overheats, INSTALL a new radiator. REFER to: Radiator .

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST

The Engine Does Not Reach Normal Operating Temperature

Normal operation and Fault Conditions

The engine cooling system maintains engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder head. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

Possible Sources

- Low coolant level
- Thermostat
- Temperature gauge
- CHT

Diagnostic Trouble Code (DTC) Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0125	Insufficient Coolant Temp for Closed Loop Fuel Control	Sets in the PCM when the CHT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Sets in the PCM when the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

DIAGNOSIS AND TESTING > ENGINE COOLING > PINPOINT TESTS > PINPOINT TEST C : PINPOINT TEST > PINPOINT TEST C : PINPOINT TEST

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

C1 CARRY OUT INSPECTION AND VERIFICATION

Carry out the Inspection and Verification .

Were any concerns found?

Yes	REPAIR as needed.

No	GO to C2

C2 CHECK FOR DTC P0125 OR P0128

Using a scan tool, perform the PCM self-test.

Is DTC P0125 or P0128 present?

Yes	GO to C3

No	The cooling system is operational. If an inoperative temperature gauge is suspected, CHECK the temperature gauge operation. REFER to: Instrumentation, Message Center and Warning Chimes . If an inoperative climate control system is suspected, CHECK the climate control system operation. For Dual Automatic Temperature Control (DATC), REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) . For Electronic Manual Temperature control (EMTC), REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) . If any other Diagnostic Trouble Codes (DTCs) are retrieved, REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

NOTE: Allow the engine to cool before checking the coolant expansion tank.

C3 CHECK THE COOLANT LEVEL

Visually check the engine coolant level in the coolant expansion tank

Is the engine coolant level within specification?

Yes	INSTALL a new thermostat. REFER to: Thermostat . CLEAR Diagnostic Trouble Codes (DTCs). If the DTC returns check for correct CHT sensor operation.

No	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > ENGINE COOLING > COMPONENT TESTS

Cooling System Pressure Test

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles have a pressure relief cap on the degas bottle and no radiator cap.

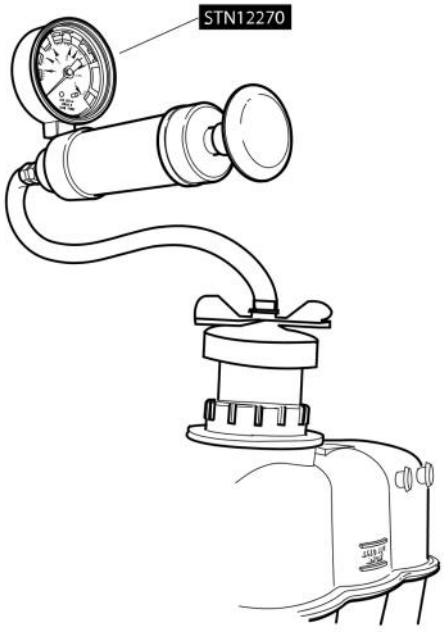
1.

Turn the engine OFF.

2.

Check the engine coolant level and adjust as necessary.

3.



Remove the degas bottle cap. Inspect the degas bottle cap and degas bottle for any issues that would cause improper sealing, such as for cross-threading, burrs, damaged o-ring, etc. If any issues are found, INSTALL a new cap and/or degas bottle.

4.

Attach the Pressure Tester and adaptor (Snap-On TA53 or equivalent), to the degas bottle cap. The cap must hold pressure of 145 kPa +/- 21 kPa (21 PSI +/- 3 PSI). If any issues are found, INSTALL a new cap.

5.

Attach the Pressure Tester and adaptor (Snap-On TA52, AST ASSFZ-47, Redline RDL95-0750 or equivalent) to the degas bottle.

E164137

NOTE: Do not pressurize the cooling system beyond the maximum pressure listed in the SPECIFICATIONS , or cooling system components can be damaged.

NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading will result.

6.

To pressurize the engine cooling system, slowly press the plunger of the pressure test pump and increase the pressure to between 124 - 138 kPa (18 - 20 PSI). Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7.

If no leaks are found and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. REFER to: ENGINE SYSTEM - GENERAL INFORMATION .

8.

If the pressure does not drop remove the cooling system Pressure Tester and adaptor from degas bottle.

9.

Install the degas bottle cap until it contacts the hard stop.

Thermostat

Install a new thermostat only after at least one of the following tests and checks have been carried out:

- Pinpoint Test B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1.

Remove the thermostat.

2.

Examine the thermostat for signs of damage including:

- Valve not fully seated (light visible through the valve)
- Foreign material lodged in the main valve
- Bent or broken frame or flange
- Bent or broken spring
- Wax leaking from wax reservoir or a bulge in the reservoir
- Any other damage or distortion

> *NOTE: If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.*

3.
If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

Radiator Leak Test, Removed From Vehicle

> *NOTE: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.*

> *NOTE: Clean the radiator before leak testing to avoid contamination of tank.*

1.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the Specifications table.

GENERAL PROCEDURES > COOLING SYSTEM DRAINING AND VACUUM FILLING

Special Tool(s) / General Equipment

 ST1720-A	ROB75240Coolant/Battery Refractometer (Fahrenheit)
Fluid Container	
Cooling System Vacuum Tester and Refiller	

Materials

Name	Specification
Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) VC-3DIL-B (U.S.)	WSS-M97B44-D2
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

Draining

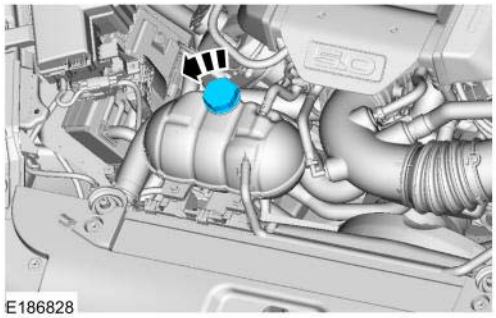
NOTE: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.

NOTE: The vehicle cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing . Failure to follow these instructions may damage the engine or cooling system.

NOTE: During normal vehicle operation, Motorcraft® Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

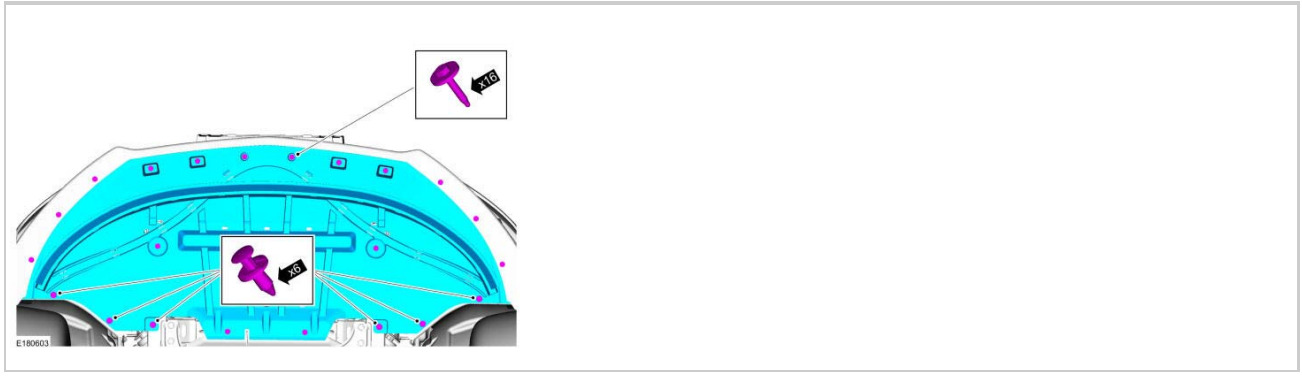
NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.



1.

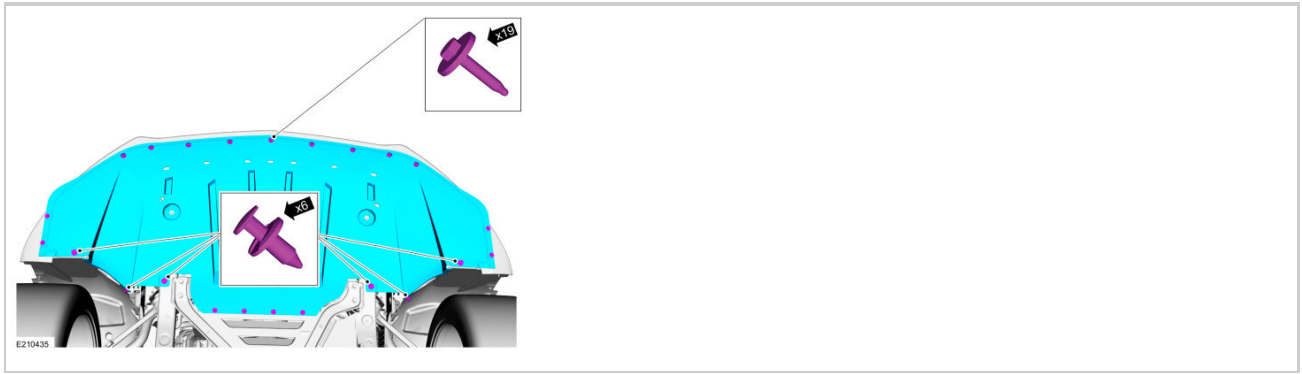
WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

Remove the pressure relief cap.



2.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .



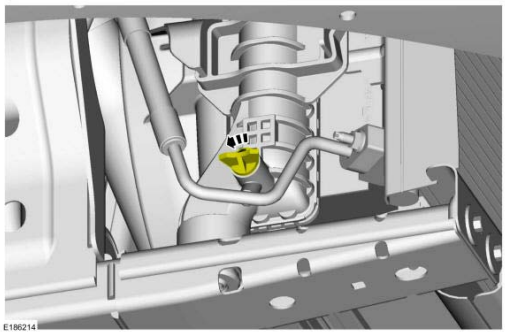
NOTE: If equipped.

3.
Remove the underbody shield.

NOTE: If equipped.

4.
Remove the underbody shield.

5.



WARNING: Be prepared to collect escaping fluid.

Use a hose to drain the coolant.

Open the radiator drain valve and drain the engine coolant in a suitable, clean container.

Use the General Equipment: Fluid Container

Filling

Filling and Bleeding with a Vacuum Cooling System Filler

1.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

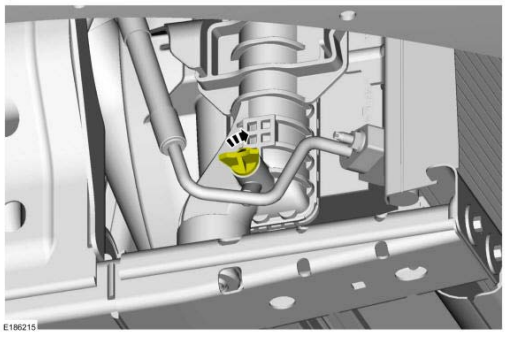
Add, top-off or adjust the coolant as follows:

For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

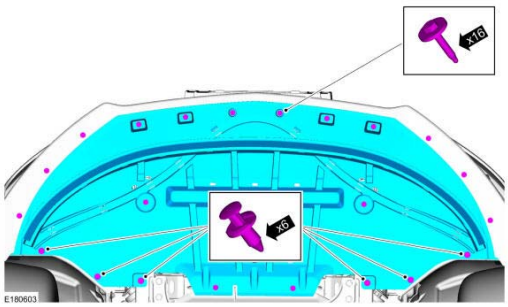
For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.



Material

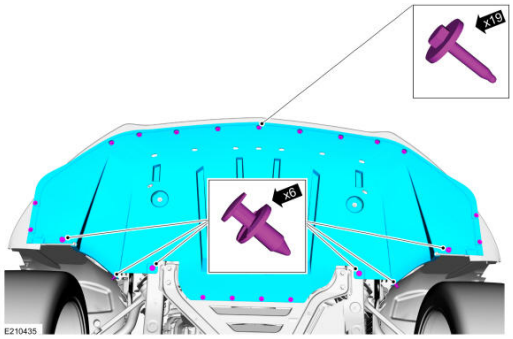
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



2.

Close the radiator drain valve.



NOTE: If equipped.

3.
Install the underbody shield.

NOTE: If equipped.

4.
Install the underbody shield.

5.

Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the system.

Use the General Equipment: Cooling System Vacuum Tester and Refiller

6.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -34°C to -37°C [-30°F to -34°F]).

7.

For extremely cold climates (less than -37°C [-34°F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

A coolant concentration of 60% provides freeze protection down to -50°C (-58°F)

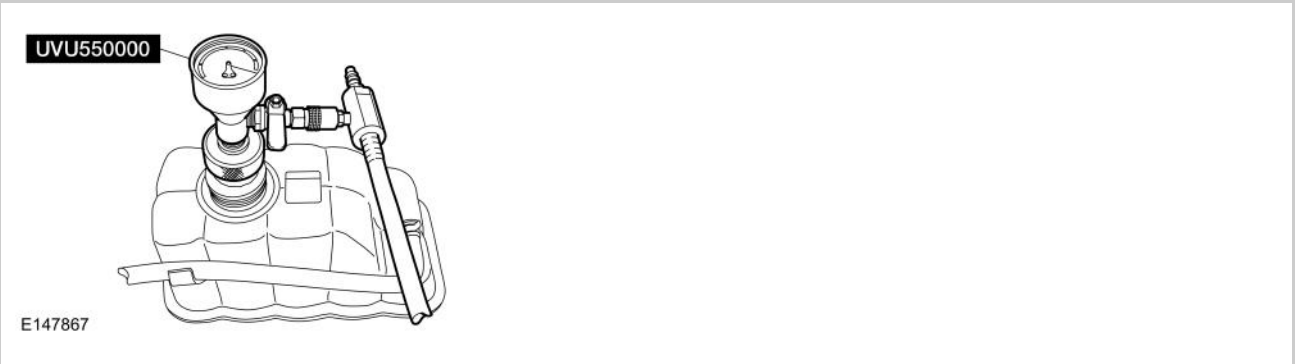
Engine coolant concentrations above 60% will decrease the overheat protection

characteristics of the engine coolant and may damage the engine.

8.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.



NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the freeze and corrosion protection characteristics of the engine coolant and may damage the engine.

9.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler

10.

NOTE: The cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may damage the engine or cooling system.

NOTE: Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

NOTE: Add Motorcraft® Orange Antifreeze/Coolant or equivalent.

NOTE: Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

NOTE: Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.

NOTE: Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.

When adding or topping off the engine coolant:

Measure the coolant concentration in the vehicle.

Use Special Service Tool: ROB75240 Coolant/Battery Refractometer (Fahrenheit).

Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.

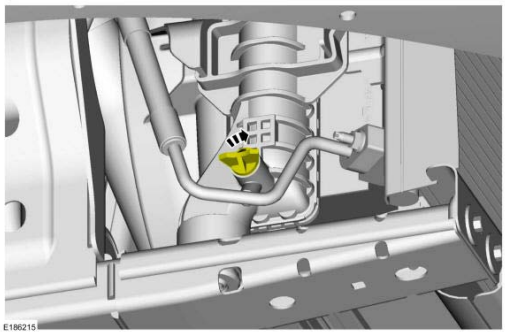
Add, top-off or adjust the coolant as follows:

For concentrations measured 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

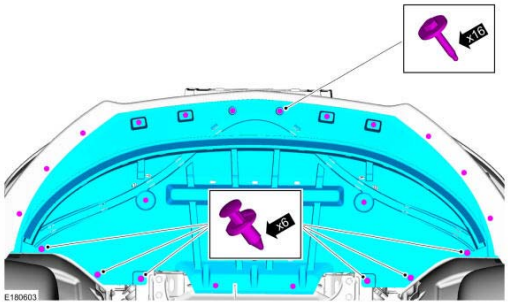
For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.



Material

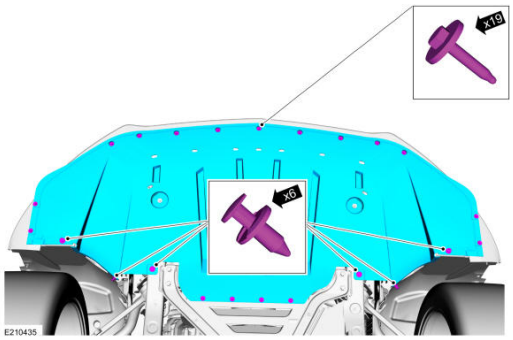
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.



11.

Close the radiator drain valve.



NOTE: If equipped.

12.
Install the underbody shield.

NOTE: If equipped.

13.
Remove the underbody shield.

14.

Fill the degas bottle to the MAX FILL line.

15.

Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze

protection -34°C to -37°C [-30°F to -34°F]).

16.

For extremely cold climates (less than -37°C [-34°F]):

It may be necessary to increase the coolant concentration above 50%.

NEVER increase the coolant concentration above 60%.

Maximum coolant concentration is 60/40 for cold weather areas.

A coolant concentration of 60% provides freeze protection down to -50°C (-58°F)

Engine coolant concentrations above 60% will decrease the overheat protection characteristics of the engine coolant and may damage the engine.

17.

For extremely hot climates:

It is still necessary to maintain the coolant concentration above 40%.

NEVER decrease the coolant concentration below 40%.

Minimum coolant concentration is 40/60 for warm weather areas.

Engine coolant concentrations below 40% will decrease the freeze and corrosion protection characteristics of the engine coolant and may damage the engine.

18.

Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 (freeze protection -34°C to -37°C [-30°F to -34°F]) mixture of engine coolant and distilled water for optimum cooling system and engine protection.

19.

Install the degas bottle cap until it contacts the hard stop.

20.

Turn the climate control system off.

21.

Start the engine and increase the engine speed to 3, 500 rpm and hold for 30 seconds.

22.

Turn the engine off for and wait for 1 minute to purge any large air pockets from the cooling system.

23.

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle if the engine is warm or to the top of the MIN FILL LEVEL if the engine is cold.

24.

Start the engine and let it idle until the engine reaches normal operating temperature and the thermostat is fully open. A fully open thermostat is verified by the cooling fan cycling on at least once.

25.

Increase the engine speed to 3, 500 rpm and hold for 30 seconds.

26.

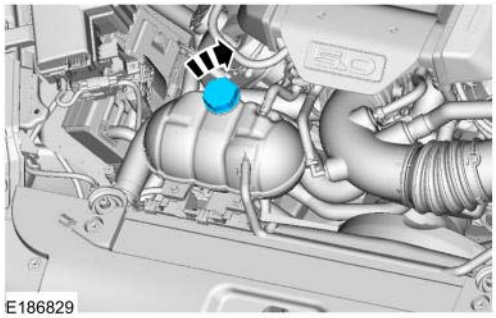
Allow the engine to idle for 30 seconds.

27.

Turn the engine off for 1 minute.

28.

Repeat steps 25 through 27 a total of 5 times to remove any remaining air trapped in the system.



29.

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Check the engine coolant level in degas bottle and if necessary fill to the top of the MAX FILL line on the degas bottle.

30.

Install the pressure relief cap.

GENERAL PROCEDURES > COOLING SYSTEM FLUSHING

Materials

Name	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.

1.

Add Motorcraft® Premium Cooling System Flush to the cooling system and follow the directions on the package.

Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

2.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

3.

Remove the radiator. Refer to: Radiator .

NOTE: Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.

4.
Position the radiator upside down and with a high pressure hose in the lower radiator hose opening, backflush the radiator.

5.

Remove the thermostat. Refer to: Thermostat .

6.

Install the coolant inlet connection without the thermostat.

Torque

: 89 lb.in (10 Nm)

7.

Backflush the engine. Position the high-pressure water hose into the engine through the upper radiator hose and backflush the engine.

8.

Install the thermostat. Refer to: Thermostat .

9.

Install the radiator. Refer to: Radiator .

10.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

GENERAL PROCEDURES > HEATER CORE BACKFLUSHING

Materials

Name	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

Flushing

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

1.

Partially drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Add Premium Cooling System Flush to backflush the heater core and follow the directions on the package. Flush with water thoroughly after using Premium Cooling System Flush prior to refilling the cooling system.

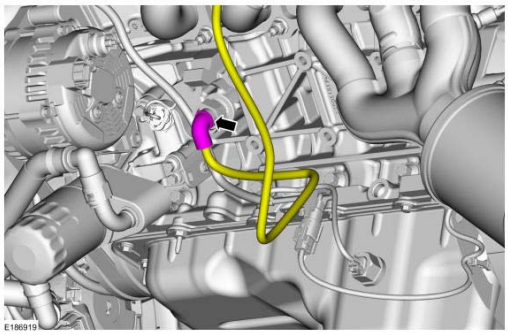
Material

: Motorcraft® Premium Cooling System Flush / VC-1 (ESR-M14P7-A)

3.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > BLOCK HEATER > REMOVAL



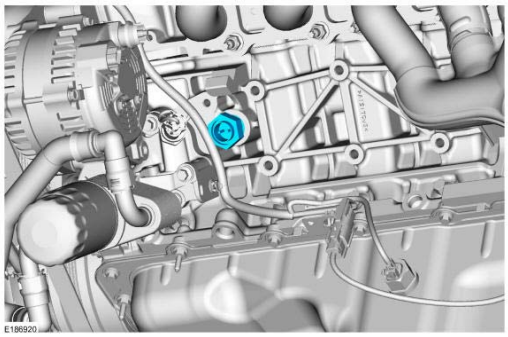
NOTE: Removal steps in this procedure may contain installation details.

1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

NOTE: Make sure the block heater wiring is routed and secured away from rotating or hot components.

2.
Disconnect the block heater electrical connector.



3.

Remove the block heater.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > BLOCK HEATER > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > COOLANT PUMP

Special Tool(s) / General Equipment

Hose Clamp Remover/Installer

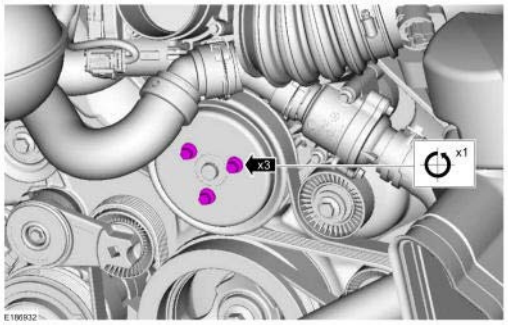
Materials

Name	Specification

Motorcraft® Metal Surface PrepZC-31-B	-
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

REMOVAL AND INSTALLATION > COOLANT PUMP > REMOVAL

1.



Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

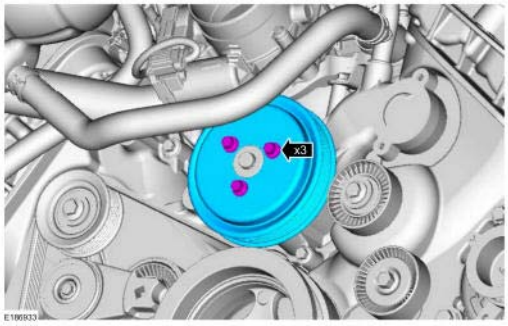
3.

Loosen the coolant pump pulley bolts.

4.

Remove the accessory drive belt. Refer to: ACCESSORY DRIVE BELT - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

NOTE: Cover the A/C compressor belt to prevent coolant contamination of the belt.



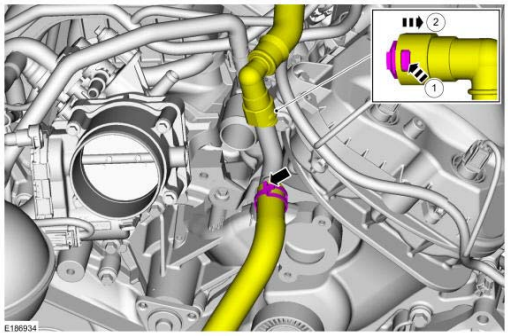
5.
Completely cover the A/C compressor belt with waterproof plastic.

6.

Remove the thermostat housing. Refer to: Thermostat Housing .

7.

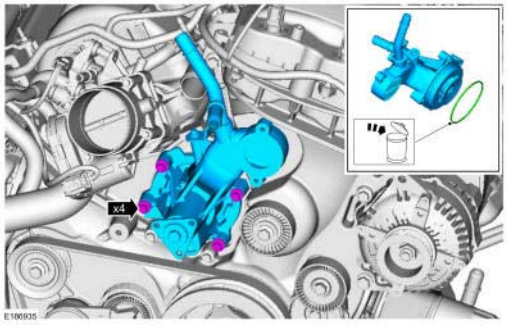
Remove the bolts and the coolant pump pulley.



8.

Disconnect the heater outlet hose from the heater outlet tube.

Release the clamp and disconnect the lower degas bottle hose from the heater outlet tube.

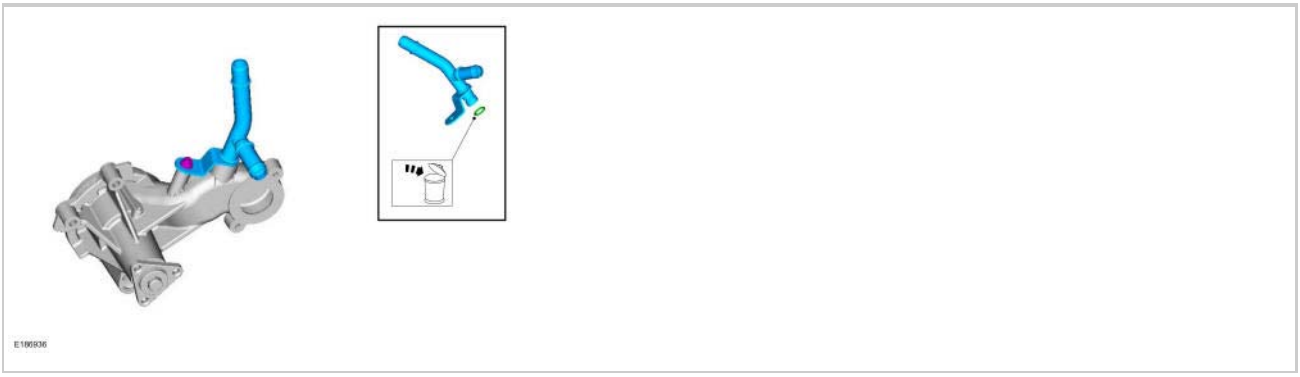


Use the General Equipment: Hose Clamp Remover/Installer

9.

Remove the bolts and the coolant pump.

Remove and discard the O-ring seal.



NOTE: This step is only necessary when installing a new component.

10.

Remove the bolt and the heater outlet tube.

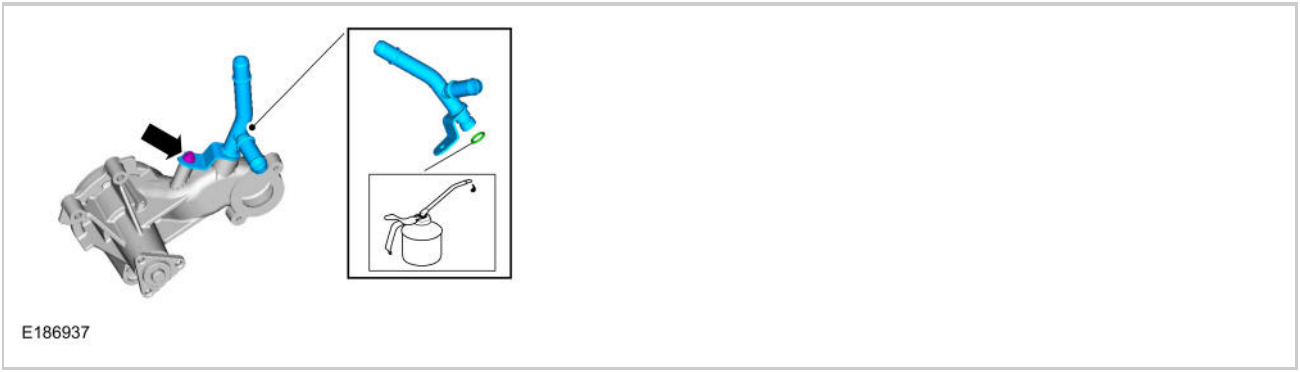
Remove and discard the O-ring seal.

REMOVAL AND INSTALLATION > COOLANT PUMP > INSTALLATION

NOTE: This step is only necessary when installing a new component.

1.

Install a new O-ring seal on the heater outlet tube and lubricate it with clean engine coolant.



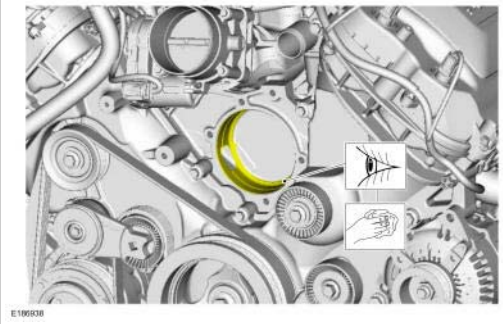
Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Install the heater outlet tube and the bolt.

Torque

: 89 lb.in (10 Nm)



2.

Inspect the sealing surfaces and clean with metal surface prep wipes.

Material

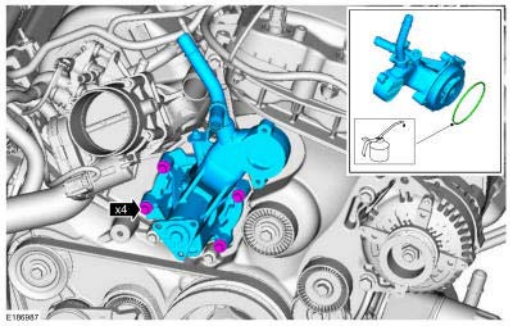
: Motorcraft® Metal Surface Prep / ZC-31-B

NOTE: Align the bolt holes with the bosses prior to insertion of the coolant pump and insert the pump straight into the coolant pump cavity. Do not rotate the coolant pump once installed into the coolant pump cavity or the O-ring seal can be damaged, causing the coolant pump to leak.

3.

Install a new O-ring seal and lubricate it with clean engine coolant.

Material



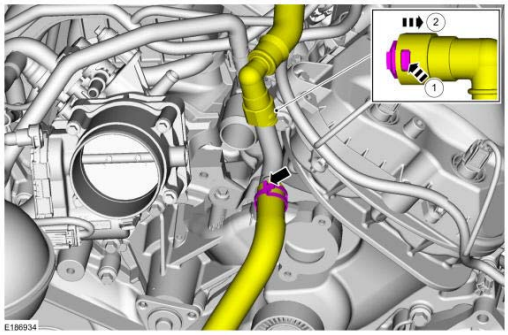
: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Install the coolant pump and tighten the bolts in 2 stages.

Torque:

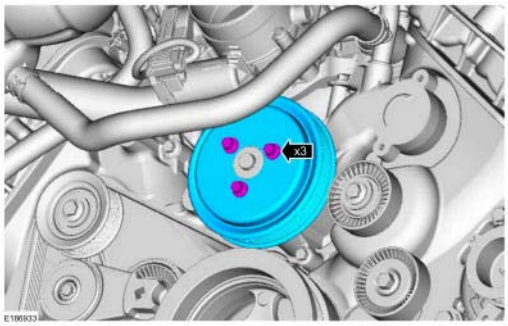
Stage 1: 177 lb.in (20 Nm)

Stage 2: 60°



4.

Connect the lower degas bottle hose to the heater outlet tube and position the clamp.



Use the General Equipment: Hose Clamp Remover/Installer

Connect the heater outlet hose to the heater outlet tube.

NOTE: Only tighten the bolts finger tight at this stage.

5.
Position the coolant pump pulley and install the bolts finger tight.

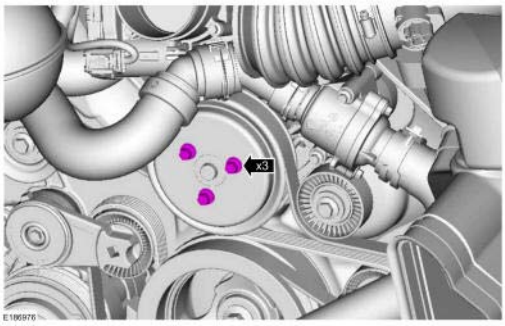
6.

Install the thermostat housing. Refer to: Thermostat Housing .

7.

Remove the plastic from the A/C compressor belt.

8.



Install the accessory drive belt. Refer to: ACCESSORY DRIVE BELT - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

9.

Tighten the coolant pump pulley bolts.

Torque

: 18 lb.ft (25 Nm)

10.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

11.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

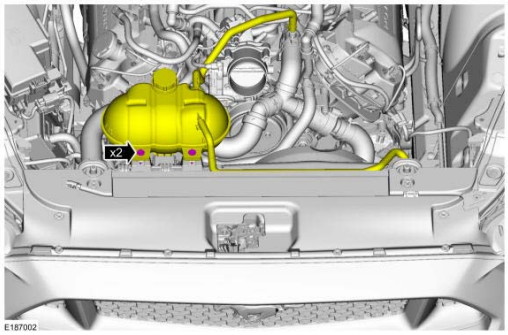
REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the air cleaner. Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

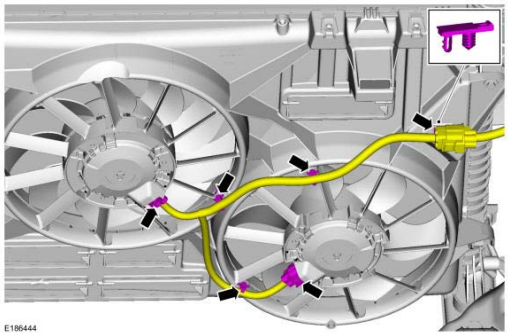
2.



Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

3.

Remove the bolts and position the degas bottle aside.

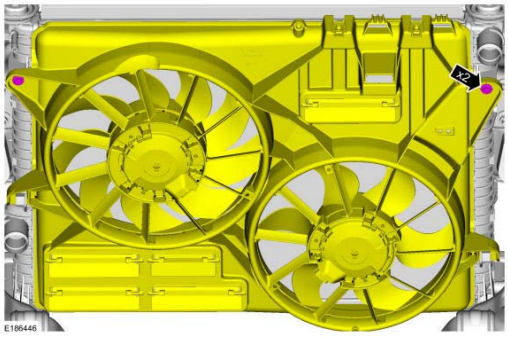


Torque

: 80 lb.in (9 Nm)

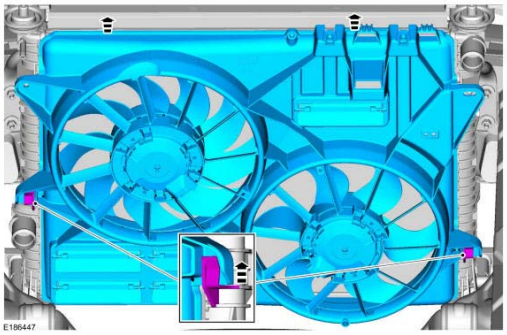
4.

Disconnect the cooling fan electrical connectors and detach the wiring harness retainers.



5.

Remove the bolts.



Torque

: 53 lb.in (6 Nm)

6.

Remove the cooling fan motor and shroud.

REMOVAL AND INSTALLATION > COOLING FAN MOTOR AND SHROUD > INSTALLATION

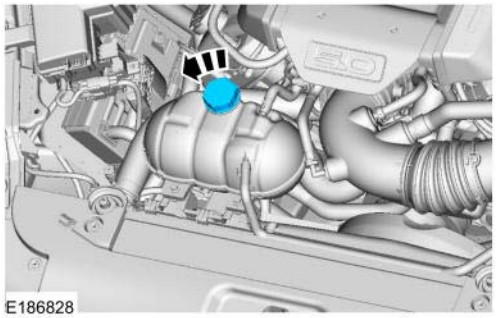
REMOVAL AND INSTALLATION > DEGAS BOTTLE > REMOVAL

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

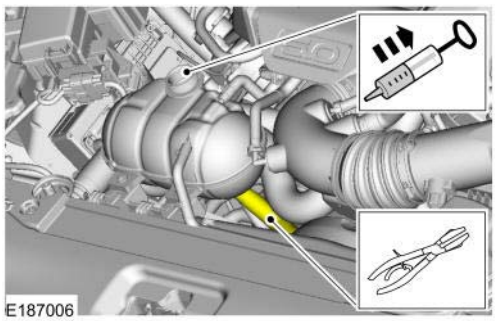
NOTE: Removal steps in this procedure may contain installation details.



1.

WARNING: When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

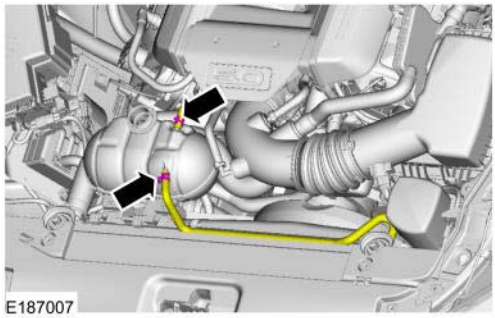
Remove the pressure relief cap.



2.

Using general tools clamp the lower degas bottle hose and syphon the coolant from the degas bottle.

Use the General Equipment: Fluid Suction Gun

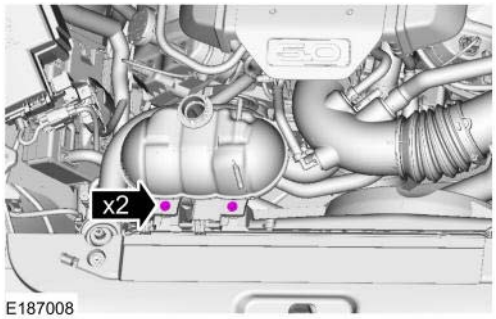


Use the General Equipment: Locking Pliers

3.

Release the clamps, disconnect the upper degas bottle coolant hoses.

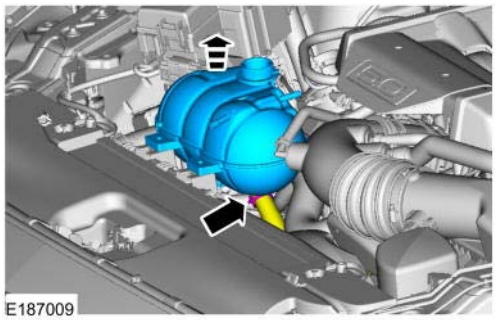
Use the General Equipment: Hose Clamp Remover/Installer



4.

Remove the bolts.

Torque



: 80 lb.in (9 Nm)

5.

Position the degas bottle and disconnect the lower coolant hose.

Use the General Equipment: Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > DEGAS BOTTLE > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Fill the degas bottle with the recommended coolant mixture and fill level.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

Material

: Motorcraft® Orange Antifreeze/Coolant Prediluted (U.S.) / VC-3DIL-B (U.S.) (WSS-M97B44-D2)

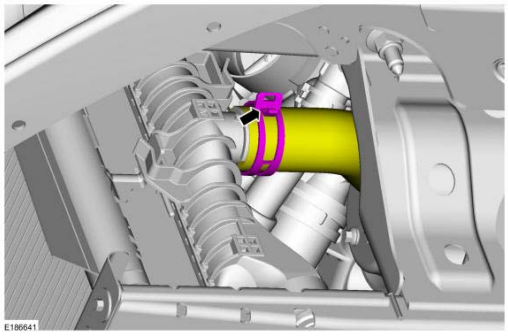
REMOVAL AND INSTALLATION > RADIATOR

Special Tool(s) / General Equipment

Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > RADIATOR > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.



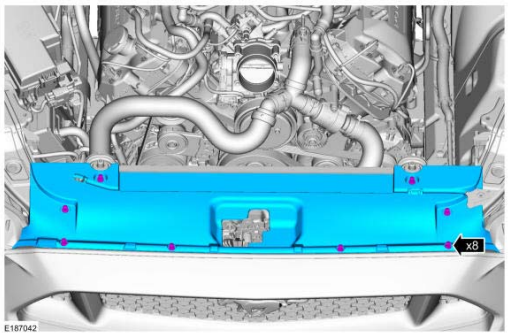
1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Release the clamp and disconnect the lower radiator hose.

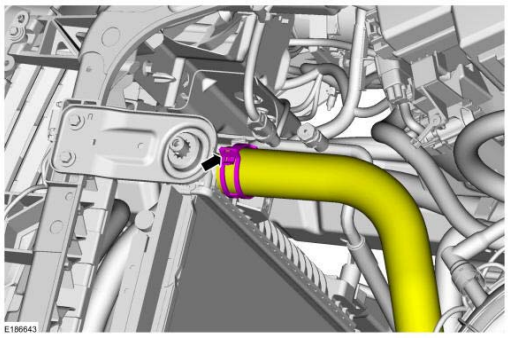
Use the General Equipment: Hose Clamp Remover/Installer



3.

Remove the cooling fan motor and shroud. Refer to: Cooling Fan Motor and Shroud .

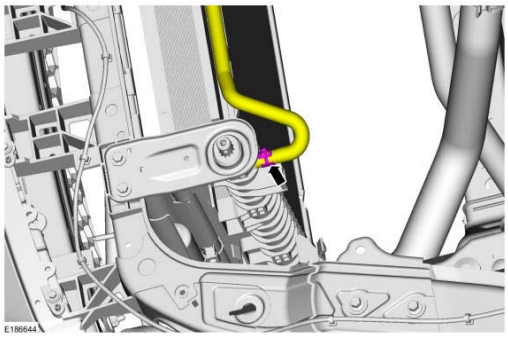
4.



Remove the retainers and the radiator sight shield.

5.

Release the clamp and disconnect the upper radiator hose.

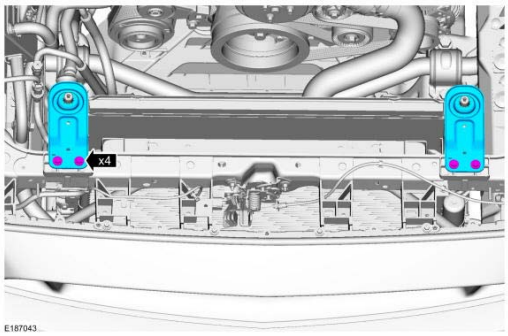


Use the General Equipment: Hose Clamp Remover/Installer

6.

Release the clamp and disconnect the upper coolant hose.

Use the General Equipment: Hose Clamp Remover/Installer



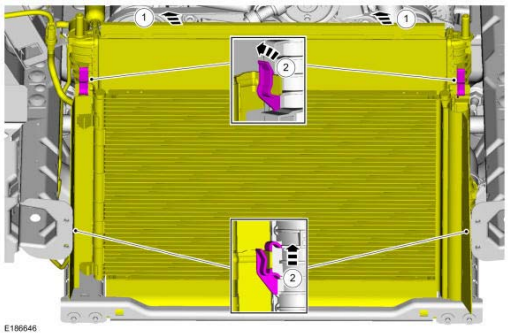
7.

Remove the bolts and the upper radiator support brackets.

Torque

: 97 lb.in (11 Nm)

NOTE: Front bumper removed for clarity.



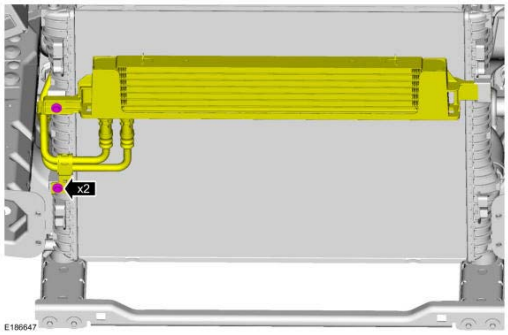
8.

1.

Position the radiator towards the engine.

2.

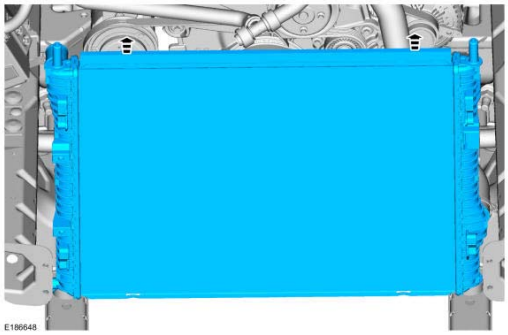
Release the upper tabs and position the A/C condenser aside.



NOTE: If equipped.

NOTE: Front bumper removed for clarity.

9.
Remove the bolts and position aside the transmission fluid cooler.



Torque

: 53 lb.in (6 Nm)

NOTE: Front bumper removed for clarity.

10.
Remove the radiator.

REMOVAL AND INSTALLATION > RADIATOR > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > THERMOSTAT

Materials

Name	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) VC-3-B (U.S.)	WSS-M97B44-D

REMOVAL AND INSTALLATION > THERMOSTAT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

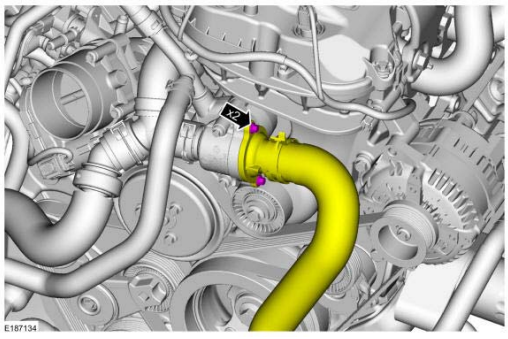
1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

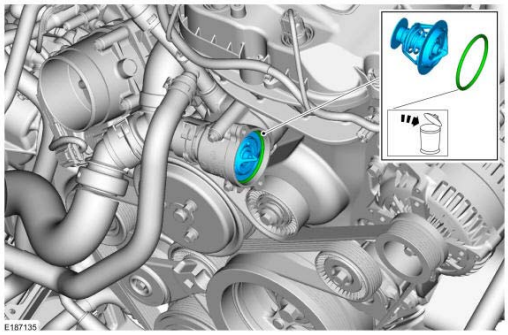
NOTE: Cover the accessory drive belts to prevent coolant contamination of the belts.



3.
Completely cover the accessory drive belts with waterproof plastic.

NOTE: During installation, make sure the coolant outlet connection is fully seated on the thermostat housing before tightening the bolts.

4.
Remove the bolts and detach the coolant inlet connector.



Torque

: 89 lb.in (10 Nm)

5.

Remove the thermostat and discard the O-ring seal.

REMOVAL AND INSTALLATION > THERMOSTAT > INSTALLATION

1.

1.

Install a new O-ring seal and lubricate it with clean engine coolant.

Material

: Motorcraft® Orange Antifreeze/Coolant Concentrated (U.S.) / VC-3-B (U.S.) (WSS-M97B44-D)

2.

To install, reverse the removal procedure.

2.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

REMOVAL AND INSTALLATION > THERMOSTAT HOUSING

Special Tool(s) / General Equipment

Hose Clamp Remover/Installer

REMOVAL AND INSTALLATION > THERMOSTAT HOUSING > REMOVAL

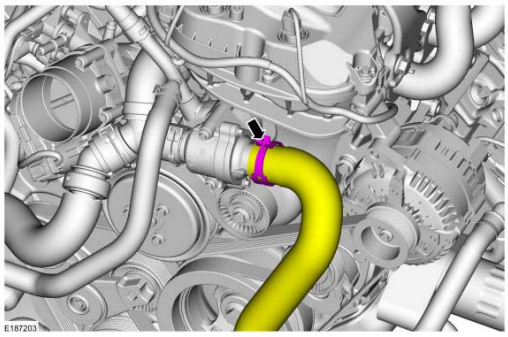
NOTE: Removal steps in this procedure may contain installation details.

1.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



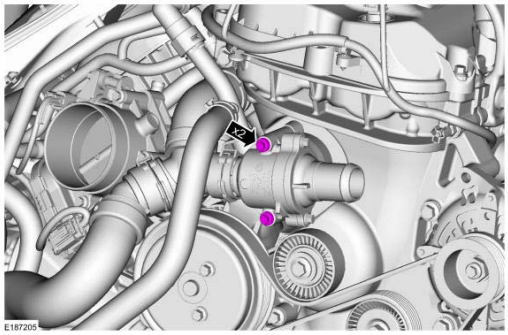
NOTE: Cover the accessory drive belts to prevent coolant contamination of the belts.

3.
Completely cover the accessory drive belts with waterproof plastic.

4.

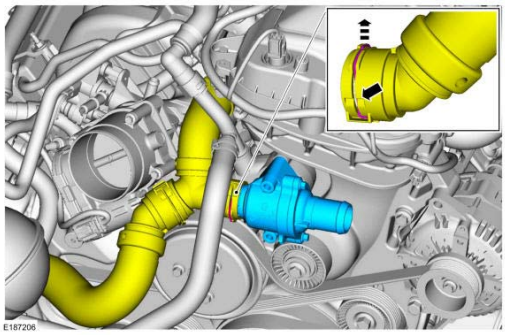
Release the clamp and disconnect the lower radiator hose from the coolant inlet connection.

Use the General Equipment: Hose Clamp Remover/Installer



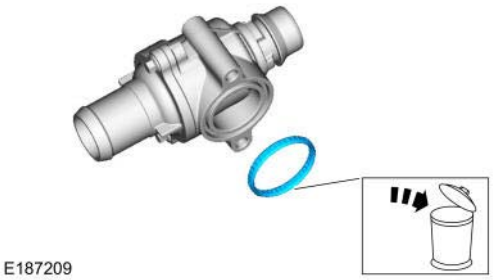
5.

Remove the thermostat housing bolts.



Torque

: 89 lb.in (10 Nm)



6.

Pull the upper radiator hose T-connector spring clip up until the end of the clip is in the detent on the quick connect coupling and remove the thermostat housing from the upper radiator hose T-connector.

7.

Remove and discard the thermostat housing gasket.

REMOVAL AND INSTALLATION > THERMOSTAT HOUSING > INSTALLATION

1.

Install a new thermostat housing gasket.

To install, reverse the removal procedure.

2.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

SPECIFICATIONS > SPECIFICATIONS

Materials

Item	Specification
Dye-Lite ® Gasoline Engine Oil Leak Detection Dye 164-R3700 (Rotunda)	-

DESCRIPTION AND OPERATION > ENGINE - OVERVIEW > ENGINE INFORMATION

NOTE: When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure may occur.

NOTE: Specifications show the expected minimum or maximum condition. Refer to the appropriate article for the specifications.

NOTE: If a component fails to meet the specifications, it is necessary to refinish it or install a new component. Wear limits are provided as an aid to determine if the component can be refinished. A new component must be installed when any component fails to meet specifications and cannot be refinished.

NOTE: This article contains information, steps and procedures that may not be specific to this engine.

This article covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Engine Controls article.

The engine incorporates the following features: Refer to the appropriate article for the procedure.

- Crankcase ventilation or breather system
- Exhaust emission control system
- EVAP

Some engines incorporate a fail-safe cooling system. Refer to the appropriate article for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the Scheduled

Maintenance Guide.

Correct engine identification is required to order parts. Refer to the appropriate article for the procedure.

For complete vehicle and engine identification codes, Refer to: Identification Codes .

DIAGNOSIS AND TESTING > ENGINE > INSPECTION AND VERIFICATION - ENGINE PERFORMANCE

NOTE: There are 2 diagnostic paths that can be followed depending on the type of engine concern. Carry out Inspection and Verification - Engine Performance or Inspection and Verification - NVH.

1.

Verify the customer concern.

2.

Visually inspect for obvious signs of mechanical or electrical damage.

3.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4.
If the cause is not visually evident, connect the scan tool to the DLC.

NOTE: The VCM LED prove out confirms power and ground from the DLC are provided to the VCM.

5.
If the scan tool does not communicate with the VCM:

check the VCM connection to the vehicle.

check the scan tool connection to the VCM.

check for No Power To The Scan Tool, to diagnose no power to the scan tool, REFER to: MODULE COMMUNICATIONS NETWORK .

6.

If the scan tool does not communicate with the vehicle:

verify the ignition key is in the ON position.

verify the scan tool operation with a known good vehicle.

to diagnose no response from the PCM, REFER to: MODULE COMMUNICATIONS NETWORK .

7.

Carry out the network test.

If the scan tool responds with no communication for one or more modules, REFER to: MODULE COMMUNICATIONS NETWORK .

If the network test passes, retrieve and record continuous memory DTCs.

8.

Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

9.

If the DTCs retrieved are related to the concern, refer to the appropriate article.

10.

If no DTCs related to the concern are retrieved, GO to Symptom Chart - Engine Performance .

DIAGNOSIS AND TESTING > ENGINE > INSPECTION AND VERIFICATION - NVH

1.

NVH symptoms should be identified using the diagnostic tools and techniques that are available. For a list of these techniques, tools, an explanation of their uses and a glossary of common terms, REFER to: Noise, Vibration and Harshness (NVH) . Since it is possible that any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system.

2.

Verify the customer concern by operating the engine to duplicate the condition.

3.

Check the engine oil level and check the oil for contamination. Low engine oil level or contaminated oil are a common cause of engine noise. If the oil is contaminated, the source of the contamination must be identified and repaired as necessary.

4.

Visually inspect for obvious signs of mechanical damage.

5.

If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

> *NOTE: Make sure to use the latest scan tool software release.*

6.
If the cause is not visually evident, connect the scan tool to the DLC.

> *NOTE: The VCM LED prove out confirms power and ground from the DLC are provided to the VCM.*

7.
If the scan tool does not communicate with the VCM:

check the VCM connection to the vehicle.

check the scan tool connection to the VCM.

check for No Power To The Scan Tool, to diagnose no power to the scan tool, REFER to: MODULE COMMUNICATIONS NETWORK .

8.

If the scan tool does not communicate with the vehicle:

verify the ignition key is in the ON position.

verify the scan tool operation with a known good vehicle.

to diagnose no response from the PCM, REFER to: MODULE COMMUNICATIONS NETWORK .

9.

Carry out the network test.

If the scan tool responds with no communication for one or more modules, REFER to: MODULE COMMUNICATIONS NETWORK .

If the network test passes, retrieve and record continuous memory DTCs.

10.

Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

11.

If the DTCs retrieved are related to the concern, go to the appropriate article.

12.

If no DTCs related to the concern are retrieved, continue the inspection and verification if a noise concern is related to the engine. For vibration concerns and noise concerns such as powertrain mounts, air intake system and starter GO to Symptom Chart - NVH .

In some cases, a noise may be a normal characteristic of that engine type. In other cases the noise may require further investigation. Comparing the noise to a similar year/model vehicle equipped with the same engine will aid in determining if the noise is normal or abnormal.

Once a customer concern has been identified as an abnormal engine noise, it is critical to determine the location of the specific noise. Use the EngineEAR/ChassisEAR or stethoscope (the noise will always be louder closer to the noise source) to isolate the location of the noise to one of the following areas.

- Fuel injector(s)
- Upper end of engine
- Lower end of engine
- Front of engine
- Rear of engine

Fuel injector noise

A common source of an engine ticking noise can be related to the fuel injection pump Gasoline Turbocharged Direct Injection (GTDI) engine or fuel injector(s). This is normal engine noise that can be verified by listening to another vehicle. If the injector noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to a specific fuel injector.

Upper end engine noise

A common source of upper end engine noise (ticking, knocking or rattle) include the camshaft(s) and valve train. Upper end engine noise can be determined using the EngineEAR/ChassisEAR or stethoscope on the valve cover bolts. If the noise is loudest from the valve cover bolts, then the noise is upper end. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder. Removal of the valve covers will be required to pinpoint the source of the noise.

Lower end engine noise

A common source of lower end engine noise (ticking or knocking) include the crankshaft, connecting rod(s) and bearings. Lower end noises can be determined by using the oil pan or lower cylinder block. If the noise is loudest from these areas, then the noise is lower end. If an engine noise is isolated to the lower end, some disassembly of the engine may be required to inspect for damage or wear.

Front of engine noise

A common source of noise from the front of the engine (squeal, chirp, whine or hoot) is the FEAD components. To isolate FEAD noise, carry out the Engine Accessory Test, REFER to: Noise, Vibration and Harshness (NVH) .

Some other noises from the front of the engine (ticking, tapping or rattle) may be internal to the engine. Use the EngineEAR/ChassisEAR or stethoscope on the engine front cover to determine if the noise is internal to the engine. Removal of the engine front cover may be necessary to inspect internal engine components.

Rear of engine noise

A common source of noise from the rear of the engine (knocking) is the flywheel/flexplate. Inspection of the flywheel/flexplate will be necessary.

Some engines have timing drive components at the rear of the engine and may be the source of noise (ticking, knocking or rattle). Use the EngineEAR/ChassisEAR or stethoscope on the rear of the engine if the noise is suspected to be internal to the engine. Some disassembly of the engine may be required to inspect for damage or wear.

Turbocharger noise (Gasoline Turbocharged Direct Injection (GTDI) engine)

A common source of noise is the turbocharger. Some whine or air rush noise is an acceptable condition.

13.

After the noise is localized, note the characteristics of the noise, including type of noise, frequency and conditions when the noise occurs and GO to Symptom Chart - NVH .

DIAGNOSIS AND TESTING > ENGINE > SYMPTOM CHART - ENGINE PERFORMANCE

Symptom	Possible Sources	Action
Difficult starting	Inoperative or damaged ignition system Air or vacuum leak Inoperative or damaged fuel system Inoperative or damaged starting system	Refer to the appropriate article for the procedure. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Damaged charging system/battery		REFER to: Charging System - 2.3L EcoBoost (201kW/273PS) or REFER to: Charging System - 3.7L Duratec (227kW/301PS) or REFER to: Charging System - 5.0L 32V Ti-VCT .
Burnt valve		INSTALL a new cylinder head. TEST the system for normal operation after the repair.
Worn piston		INSTALL a new piston. TEST the system for normal operation after the repair.
Worn piston rings		INSTALL new piston rings. TEST the system for normal operation after the repair.
Worn cylinder		INSTALL a new cylinder block. TEST the system for normal operation after the repair.
Damaged head gasket		INSTALL a new cylinder head gasket. TEST the system for normal operation after the repair.

Inoperative or damaged cooling system		Refer to the appropriate article for the procedure.
Fail-safe cooling invoked (if equipped)		Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Poor idling	Vacuum leaks Inoperative or damaged EGR system	Refer to the appropriate article for the procedure. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Inoperative or damaged ignition system		Refer to the appropriate article for the procedure.
Inoperative or damaged cooling system Inoperative or damaged fuel system		Refer to the appropriate article for the procedure.
Fail-safe cooling invoked (if equipped)		Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Incorrect valve clearance		ADJUST valve clearance. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Incorrect valve-to-valve seat contact		INSTALL a new cylinder head. TEST the system for normal operation after the repair.
Damaged head gasket		INSTALL a new cylinder head gasket. TEST the system for normal operation after the repair.
Engine runs rough	Inoperative or damaged fuel system Air or vacuum leaks EGR system fault Inoperative or damaged cooling system Inoperative or damaged ignition system	Refer to the appropriate article for the procedure.
Fail-safe cooling invoked (if equipped)		Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Burnt or sticking valve		INSTALL a new valve. TEST the system for normal operation after the repair.
Weak or broken valve spring		INSTALL a new valve spring. TEST the system for normal operation after the repair.

Carbon accumulation in combustion chamber		ELIMINATE carbon buildup. TEST the system for normal operation after the repair.
Excessive oil consumption	Leaking oil	REPAIR oil leakage. TEST the system for normal operation after the repair.
Blocked or restricted turbocharger oil drain pipe		INSPECT the turbocharger drain pipe. REPAIR as necessary. TEST the system for normal operation after the repair.
Damaged or collapsed air intake hoses and tubes		Tighten hoses clamps. INSPECT for damage and REPAIR as necessary. TEST the system for normal operation after the repair.
Damaged exhaust or exhaust leaks at turbocharger housing or exhaust manifold.		INSPECT for leaks. Leaks can be detected audibility or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as necessary. TEST the system for normal operation after the repair.
Turbocharger oil seals leaking		REFER to Turbocharger Internal Oil Leak Test. REFER to: Turbocharger . TEST the system for normal operation after the repair.
Inoperative PCV system		REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.
Incorrect oil		CHANGE oil to correct specification. TEST the system for normal operation after the repair.
Worn valve stem seal		INSTALL a new valve stem seal. TEST the system for normal operation after the repair.
Worn valve stem or valve guide		INSTALL a new cylinder head. TEST the system for normal operation after the repair.
Sticking piston rings		INSTALL new piston rings. TEST the system for normal operation after the repair.
Worn piston ring groove		INSTALL a new piston and piston pin. TEST the system for normal operation after the repair.

Worn piston or cylinder		INSTALL a new piston or cylinder block. TEST the system for normal operation after the repair.
Oil in coolant	Leaking head gasket Damaged cylinder block Damaged cylinder head	INSPECT the engine components. INSTALL new engine components as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Leaking oil cooler		INSPECT the oil cooler and seal for damage. INSTALL new components as necessary. Refer to the appropriate article for the procedure.
Coolant in oil	Leaking head gasket Damaged cylinder block Damaged cylinder head	INSPECT the engine components. INSTALL new engine components as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Insufficient power	Inoperative or damaged ignition system Air intake system blockage Lubrication system blockage Inoperative or damaged fuel system	Refer to the appropriate article for the procedure. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Turbocharger turbine or compressor wheel damage		INSPECT the turbocharger. REFER to the Check for Free Rotation- Off Vehicle. REFER to: Turbocharger . TEST the system for normal operation after the repair.
Damaged exhaust or exhaust leaks at turbocharger housing or exhaust manifold		INSPECT for leaks. Leaks can be detected audibility or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as necessary. TEST the system for normal operation after the repair.
Malfunctioning turbocharger bypass valve		Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Oil level too high		DRAIN oil to correct level.
Incorrect engine oil		INSTALL correct specification engine oil. TEST the system for normal operation after the repair.

Excessive accessory drive belt loading Inoperative or damaged cooling system	Refer to the appropriate article for the procedure.
Fail-safe cooling invoked (if equipped)	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Damaged or plugged exhaust system	INSPECT exhaust system. TEST the system for normal operation after the repair.
Incorrect tire size	REFER to: Suspension System .
Dragging brakes	REFER to: Brake System .
Slipping transmission	Refer to the appropriate article for the procedure.
Slipping clutch	Refer to the appropriate article for the procedure.
Incorrect valve clearance	ADJUST valve clearance. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Worn or damaged valve tappet	INSTALL a new valve tappet. TEST the system for normal operation after the repair.
Damaged valve guide Compression leakage at valve seat Seized valve stem	INSTALL a new cylinder head assembly. TEST the system for normal operation after the repair.
Weak or broken valve spring	INSTALL a new valve spring. TEST the system for normal operation after the repair.
Worn or damaged cam	INSTALL a new camshaft. TEST the system for normal operation after the repair.
Damaged head gasket	INSTALL a new head gasket. TEST the system for normal operation after the repair.
Cracked or distorted cylinder head	INSTALL a new cylinder head assembly. TEST the system for normal operation after the repair.
Damaged, worn or sticking piston ring(s)	INSTALL a new piston ring(s). TEST the system for normal operation after the repair.
Worn or damaged piston	INSTALL a new piston and piston pin. TEST the system for normal operation after the repair.

Engine emits excessive black smoke (black/blue/white)	Clogged Air Cleaner (ACL) element	INSTALL a new ACL element. TEST the system for normal operation after the repair.
Incorrect type or grade of oil		DRAIN and FILL with specified oil.
Blocked or restricted turbocharger oil drain pipe		INSPECT the turbocharger oil drain pipe. REPAIR as necessary. TEST the system for normal operation after the repair.
Damaged/restricted or leaking turbocharger intake tube assembly		REPAIR or INSTALL a new tube as necessary. TEST the system for normal operation after the repair.
Engine wear (piston rings, valve guides)		REPAIR as necessary. TEST the system for normal operation after the repair.
Plugged crankcase ventilation system		Visually INSPECT the crankcase ventilation system.
Turbocharger oil seals leaking		REFER to Turbocharger Internal Oil Leak Test. REFER to: Turbocharger . TEST the system for normal operation after the repair.

DIAGNOSIS AND TESTING > ENGINE > SYMPTOM CHART - NVH

Symptom	Possible Sources	Action
Drone type noise	Powertrain mount(s)	CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure. REFER to: Powertrain/Drivetrain Mount Neutralizing . TEST the system for normal operation after the repair.
Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very RPM dependent	Engine vibration excites the body resonances inducing interior noise	CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure. REFER to: Powertrain/Drivetrain Mount Neutralizing . TEST the system for normal operation after the repair.
Engine drumming noise - accompanied by vibration	Powertrain mount(s)	CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure. REFER to: Powertrain/Drivetrain Mount Neutralizing . TEST the system for normal operation after the repair.

Rattle - occurs at idle or at light acceleration from a stop	Powertrain mount(s)	CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate article for the procedure. For transaxle, Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Whine/moan type noise - pitch increases or changes with vehicle speed	Powertrain mount(s)	CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate article for the procedure. For transaxle, Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Clunk - occurs when shifting from PARK or between REVERSE and DRIVE	Powertrain mounts	CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate article for the procedure. For transaxle, Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Idle speed is too high		CHECK for the correct idle speed. TEST the system for normal operation after the repair.
Accessory drive bearing hoot - occurs at idle or high idle in cold temperatures of approximately 4 °C (40 °F) or colder at the first start of the day	Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and the bearing race	CARRY OUT the Engine Cold Soak procedure. REFER to: Noise, Vibration and Harshness (NVH) . PLACE the EngineEAR probe directly on the idler/ tensioner center post or bolt to verify which bearing is making the noise. INSTALL new parts as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Accessory drive belt noise, squeal or chirping	Defective/worn or incorrect accessory drive belt Misaligned pulley(s) Pulley runout Damaged or worn accessory drive component or idler Fluid contamination of the accessory drive belt or pulleys Damaged or worn accessory drive belt tensioner Damaged pulley grooves	CARRY OUT the Engine Accessory Test. REFER to: Noise, Vibration and Harshness (NVH) . INSPECT components and INSTALL new parts as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.

Clunking noise	Coolant pump has excessive end play or imbalance	CHECK the coolant pump for excessive end play. INSPECT the coolant pump for imbalance with the drive belt off. INSTALL a new coolant pump as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Whine/hum - occurs when unlocking the vehicle or opening the door with the engine off Gasoline Turbocharged Direct Injection (GTDI) only	Fuel pump module	Acceptable condition. Fuel pump module turns on before engine starts to prime the fuel system.
Whine or moaning noise	Air intake system	CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
Whistling noise - normally accompanied with poor idle condition	Air intake system	CHECK the air intake ducts, air cleaner, throttle body and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary. TEST the system for normal operation after the repair.
Turbocharger intake tube assembly leaking		REPAIR or INSTALL a new tube as necessary. TEST the system for normal operation after the repair.
Loose connections or damage to air intake hoses and tubes		TIGHTEN hose clamps. INSPECT for damage and REPAIR as necessary. TEST the system for normal operation after the repair.
Air leaks at turbine housing, blown joints or damaged exhaust		INSPECT for leaks. Leaks can usually be detected audibility or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as necessary. TEST the system for normal operation after the repair.
Carbon build up in the turbine housing		INSPECT the turbocharger. REFER to the Check for Free Rotation - Off Vehicle. REFER to: Turbocharger . TEST the system for normal operation after the repair.

Turbocharger imbalance due to foreign object/damage		REPAIR as necessary. TEST the system for normal operation after the repair.
Turbine bearing failure		INSPECT the turbocharger. REFER to the Check for Free Rotation - Off Vehicle. REFER to: Turbocharger . TEST the system for normal operation after the repair.
Inoperative turbocharger bypass valve		Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Whine or air rush type noise	Turbocharger	Acceptable condition. Some whine or air noise is common.
Chrip or whoosh sound	Turbocharger bypass valve	CHECK the turbocharger bypass valve. REPAIR as necessary. TEST the system for normal operation after the repair.
Hissing noise - occurs during idle or high idle that is apparent with the hood open	Vacuum leak	Use the Ultrasonic Leak Detector/EngineEAR to locate the source. Scan the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component. TEST the system for normal operation after the repair.
Vehicles with a plastic intake manifold		Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
Grinding noise - occurs during engine cranking	Incorrect starter motor mounting	INSPECT the starter motor for correct mounting. REPAIR as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Starter motor		CHECK the starter motor. INSTALL a new starter motor as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Incorrect starter motor drive engagement		INSPECT the starter motor drive for wear or damage. INSTALL a new starter motor as necessary. Refer to the appropriate article for the procedure. TEST the

		system for normal operation after the repair. INSPECT the flywheel/flexplate for wear or damage. INSTALL a new flywheel/flexplate as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine noise, front of engine - knocking noise from lower front of engine	Damaged or separated crankshaft pulley/damper	CHECK for obvious signs of damage or wobble during operation. INSTALL new as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine noise, front of engine - ticking, tapping or rattling noise from the front of the engine	Timing drive components	REMOVE the accessory drive belt. Refer to the appropriate article for the procedure. USE the EngineEAR to isolate the noise to the engine front cover. REMOVE the engine front cover and INSPECT the timing drive components. INSTALL new parts as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine noise, upper end - ticking noise near the fuel rail and intake manifold	Fuel rail clip Fuel injector	CHECK for loose or damaged fuel rail clip(s). REPAIR as necessary. USE the EngineEAR to isolate the noisy injector(s). INSTALL a new injector(s) as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Fuel injection pump (GTDI only)		This is a normal engine noise that can be verified by listening to another vehicle. If noise is excessive, REPAIR as necessary. TEST the system for normal operation after the repair.
Engine noise, upper end - ticking, knocking or rattle noise that occurs during idle or high idle during the first cold start of the day and may disappear as the engine warms	Valve train noise (bled down lifter/lash adjuster)	CARRY OUT the Valve Train Analysis Component Test in this article. INSTALL new parts as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.

Engine noise, upper end - occurs mostly with a warm engine at light/medium acceleration	Worn or damaged spark plugs	REMOVE the spark plugs. INSPECT and INSTALL new as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine noise, upper end - rattling noise from the valve train. Worse when the engine is cold	Low oil level	CHECK the oil level. FILL as necessary.
Thin or diluted oil		INSPECT the oil for contamination. If the oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter. TEST the system for normal operation after the repair.
Low oil pressure		CARRY OUT the Oil Pressure Test in this article. If not within specifications, REMOVE the engine oil pan. Refer to the appropriate article for the procedure. INSPECT for a blocked oil pick up tube. TEST the system for normal operation after the repair.
Worn valve train components		CARRY OUT the Valve Train Analysis Component Test in this article. INSTALL new parts as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Worn valve guides		CARRY OUT the Valve Guide Inner Diameter procedure. REFER to: Valve Guide Inner Diameter .
Excessive runout of the valve seats or the valve face		INSPECT for abnormalities on the valve face and valve seat. INSTALL a new cylinder head assembly if abnormalities are found.
Engine noise, upper end - pinging noise	Gasoline octane too low	VERIFY with customer the type of gasoline used. CORRECT as necessary. TEST the system for normal operation after the repair.
KS operation		CHECK the KS operation. INSTALL a new KS. Refer to the

		appropriate article for the procedure. TEST the system for normal operation after the repair.
Incorrect spark timing		CHECK the spark timing. REPAIR as necessary. TEST the system for normal operation after the repair.
High operating temperature		INSPECT the cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. VERIFY the engine operating temperature is within specifications. REPAIR as necessary. TEST the system for normal operation after the repair.
Spark plug		CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary. TEST the system for normal operation after the repair.
Catalytic converter		Compare with a similar vehicle for what is acceptable noise.
Engine noise, lower end - ticking or knocking noise near the oil filter adapter	Oil pump	USE the EngineEAR to verify the oil pump as the source of the noise at low RPM. REPAIR as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine noise, lower end - light knocking noise, also described as piston slap. Noise is most noticeable when the engine is cold with light to medium acceleration. The noise disappears as the engine warms	Excessive clearance between the piston and the cylinder wall	CARRY OUT the Piston Diameter procedure. REFER to: Piston Diameter . Measure the cylinder bore diameter. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance. REFER to the appropriate article for specifications.
Engine noise, lower end - light double knock or sharp rap sound. Occurs mostly with a warm engine at idle or low speeds in drive. Increases in relation to engine load. Associated with a poor lubrication history	Excessive clearance between the piston and the piston pin	MEASURE the piston pin bore and the piston pin in 2 directions on each side. REFER to the appropriate article for specifications.

Engine noise, lower end - light knocking noise. The noise is most noticeable when the engine is warm. The noise tends to decrease when the vehicle is coasting or in neutral	Excessive clearance between the connecting rod bearings and the crankshaft	CARRY OUT the Connecting Rod Bearing Journal Clearance procedure. REFER to: Connecting Rod Bearing Journal Clearance .
Engine noise, lower end - deep knocking noise. The noise is most noticeable when the engine is warm, at lower RPM and under a light load and then at float	Worn or damaged crankshaft main bearings	CARRY OUT the Crankshaft Main Bearing Journal Clearance procedure. REFER to: Crankshaft Main Bearing Journal Clearance .
Engine noise, rear of engine - knocking noise at rear of engine	Damaged flywheel/flexplate	INSPECT the flywheel/flexplate for wear or damage. INSTALL a new flywheel/flexplate as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine vibration - vibration felt at all times	Excessive engine pulley runout	CARRY OUT the Engine Accessory Test. REFER to: Noise, Vibration and Harshness (NVH) . INSTALL a new engine pulley as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Damaged or worn accessory component		CARRY OUT the Engine Accessory Test. REFER to: Noise, Vibration and Harshness (NVH) . REPAIR or INSTALL a new component as necessary. TEST the system for normal operation after the repair.
Engine vibration - at idle, a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/ floorpan	Cylinder misfire	Using the scan tool, CARRY OUT the cylinder power balance and the relative compression test. REPAIR as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine or torque converter out of balance		VERIFY the torque converter to crankshaft pilot clearance is correct. REPAIR as necessary. RE-INDEX the torque converter on the flex plate by 120 degrees for a 3- bolt converter or 180 degrees for a 4-bolt converter. Refer to the appropriate article for the procedure. TEST the system for normal operation after

		the repair.
Engine vibration - is felt with increases and decreases in engine RPM	Powertrain mount(s)	CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate article for the procedure. For transaxle, Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine or transmission grounded to chassis		INSPECT the powertrain/ drivetrain for correct clearances. REPAIR as necessary. TEST the system for normal operation after the repair.
Engine vibration - increases intensity as the engine RPM is increased	Engine out-of-balance	CARRY OUT the NERU Test. REFER to: Noise, Vibration and Harshness (NVH) . ROTATE the torque converter, 120 degrees for 3-bolt or 180 degrees for 4- bolt. INSPECT the torque converter pilot outer diameter-to-crankshaft pilot inner diameter. REPAIR as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine vibration - mostly at coast/neutral coast. Condition improves with vehicle acceleration	Combustion instability	CHECK the ignition system. INSTALL new components as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Engine vibration or shudder - occurs with light to medium acceleration above 56 km/h (35 mph)	Worn or damaged spark plugs	INSPECT the spark plugs for cracks, high resistance or broken insulators. INSTALL a new spark plug(s) as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Plugged fuel injector		REPAIR or INSTALL a new injector as necessary. Refer to the appropriate article for the procedure. TEST the system for normal operation after the repair.
Contaminated fuel		INSPECT the fuel for contamination. DRAIN the fuel system and refill. TEST the system for normal operation after

	the repair.

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS

The following component tests are used to diagnose engine concerns.

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS > ENGINE OIL LEAKS

NOTE: If an overnight drive is done, the fan air or road air blast can cause erroneous readings.

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel/flexplate with a suitable solvent to remove all traces of oil.

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS > ENGINE OIL LEAKS - FLUORESCENT OIL ADDITIVE METHOD

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1.

Add 29.6 ml (1 oz.) of Dye-Lite ® Gasoline Engine Oil Leak Detection Dye to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. Thoroughly premix the gasoline engine oil leak detection dye or it will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The additive must be mixed well with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).

2.

Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Leak Detector Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.

3.

At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS > LEAKAGE POINTS - UNDERHOOD

Examine the following areas for oil leakage:

- Valve cover gaskets
- Cylinder head gaskets
- Oil cooler, if equipped
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Oil pressure switch or EOP sensor
- Turbocharger oil tubes

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS > LEAKAGE POINTS - UNDER ENGINE, WITH VEHICLE ON HOIST

Examine the following areas for oil leakage:

- Oil pan gaskets
- Oil pan sealer
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear oil seal
- Oil filter adapter and filter body
- Oil cooler, if equipped
- Turbocharger oil tubes

DIAGNOSIS AND TESTING > ENGINE > COMPONENT TESTS > LEAKAGE POINTS - WITH TRANSMISSION AND FLYWHEEL/FLEXPLATE REMOVED

Examine the following areas for oil leakage:

- Crankshaft rear oil seal

- Rear main bearing cap parting line
- Flexplate mounting bolt holes (with flexplate installed)
- Pipe plugs at the end of oil passages

DIAGNOSIS AND TESTING > ENGINE > COMPRESSION TEST

1.

Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2.

Set the throttle plates in the wide-open position.

3.

Install a compression gauge in the No. 1 cylinder.

4.

Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes necessary to obtain the highest reading.

5.

Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1,131 kPa (164 psi)	848 kPa (123 psi)	1,338 kPa (194 psi)	1,000 kPa (145 psi)	1,544 kPa (224 psi)	1,158 kPa (168 psi)
938 kPa (136 psi)	703 kPa (102 psi)	1,145 kPa (166 psi)	855 kPa (124 psi)	1,351 kPa (196 psi)	1,014 kPa (147 psi)	1,558 kPa (226 psi)	1,165 kPa (169 psi)
952 kPa (138 psi)	717 kPa (104 psi)	1,158 kPa (168 psi)	869 kPa (126 psi)	1,365 kPa (198 psi)	1,020 kPa (148 psi)	1,572 kPa (228 psi)	1,179 kPa (171 psi)
965 kPa (140 psi)	724 kPa (105 psi)	1,172 kPa (170 psi)	876 kPa (127 psi)	1,379 kPa (200 psi)	1,034 kPa (150 psi)	1,586 kPa (230 psi)	1,186 kPa (172 psi)
979 kPa (142 psi)	738 kPa (107 psi)	1,186 kPa (172 psi)	889 kPa (129 psi)	1,303 kPa (189 psi)	1,041 kPa (151 psi)	1,600 kPa (232 psi)	1,200 kPa (174 psi)
993 kPa (135 psi)	745 kPa (108 psi)	1,200 kPa (174 psi)	903 kPa (131 psi)	1,407 kPa (204 psi)	1,055 kPa (153 psi)	1,055 kPa (153 psi)	1,207 kPa (175 psi)
1,007 kPa (146 psi)	758 kPa (110 psi)	1,214 kPa (176 psi)	910 kPa (132 psi)	1,420 kPa (206 psi)	1,062 kPa (154 psi)	1,627 kPa (236 psi)	1,220 kPa (177 psi)
1,020 kPa (148 psi)	765 kPa (111 psi)	1,227 kPa (178 psi)	917 kPa (133 psi)	1,434 kPa (208 psi)	1,075 kPa (156 psi)	1,641 kPa (238 psi)	1,227 kPa (178 psi)

1,110 kPa (161 psi)	834 kPa (121 psi)	1,324 kPa (192 psi)	993 kPa (144 psi)	1,631 kPa (237 psi)	1,145 kPa (166 psi)	–	–

E151691

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil meeting Ford specification on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1.

If compression improves considerably, piston rings are worn or damaged.

2.

If compression does not improve, valves are sticking or not seating correctly.

3.

If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition. Use the Compression Pressure Limit Chart when checking cylinder compression so the lowest reading is within 75% of the highest reading.

DIAGNOSIS AND TESTING > ENGINE > CYLINDER LEAKAGE DETECTION

When a cylinder produces a low reading, use of a cylinder leakage tester will be helpful in pinpointing the exact cause.

The leakage tester is inserted in the spark plug hole, the piston is brought up to TDC on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, the leakage tester gauge will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the Throttle Body (TB). A leak at the exhaust valve can be heard at the tailpipe. Leakage past the piston rings will be audible at the PCV connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be

detected by a stream of bubbles in the radiator.

DIAGNOSIS AND TESTING > ENGINE > EXCESSIVE ENGINE OIL CONSUMPTION

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner's Literature. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

Basic Pre-checks

1.

For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is past the first recommended drain interval, the OEM (Original Equipment Manufacturer) production filter should have been changed.

2.

Ask how the most current mileage was accumulated. That is, determine whether the vehicle was driven under the following conditions:

Extended idling or curbside engine operation

Stop-and-go traffic or taxi operation

Towing a trailer or vehicle loaded heavily

Frequent short trips (engine not up to normal operating temperature)

Excessive throttling or high engine-rpm driving

3.

Verify that there are no external leaks. If necessary, review the diagnostic procedure under Engine Oil Leaks in the Diagnosis and Testing portion of this article.

4.

Inspect the crankcase ventilation system for:

disconnected hoses at the valve cover or TB.

loose or missing valve cover fill cap.

missing or incorrectly seated engine oil level indicator.

incorrect or dirty PCV valve.

a PCV valve grommet unseated in the valve cover (if so equipped).

5.

Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings. Sludge can result from either excessive water ingestion in the crankcase or operation at extremely high crankcase temperatures.

6.

Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.

7.

If the engine is hot or was recently shut down, wait at least 10-minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.

8.

Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.

Detailed Pre-checks

1.

Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.

2.

Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

Oil Consumption Test

NOTE: Once all of the previous conditions are met, carry out an oil consumption test.

1.
Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure the vehicle is positioned on a level surface. Refill the oil pan to a level one liter (quart) less than the specified fill level, using manufacturer-specified oil.

2.

Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 10-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.

3.

Add the final one liter (quart) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.

4.

After a 10-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location.

NOTE: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one quart differential between the new marks.

Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.

5.

Record the vehicle mileage.

6.

Advise the customer that oil level indicator readings must be taken every 320 km (200 mi) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 10-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.

7.

When the subsequent indicator readings demonstrate a full liter (quart) has been used, record the vehicle mileage. The mileage driven should not be less than 4, 800 km (3, 000 mi). The drive cycle the vehicle has been operated under must be considered when making this calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

Post Checks, Evaluation and Corrective Action

1.

If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the Compression Test Chart in this article for pressure range limits.

2.

Compression should be consistent across all cylinders. Refer to the Compression Testing portion of this article. If compression tested within the specifications found in this article, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.

3.

A cylinder leak detection test can be carried out using a cylinder leakage detector. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

> *NOTE: An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.*

4.
If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.

5.

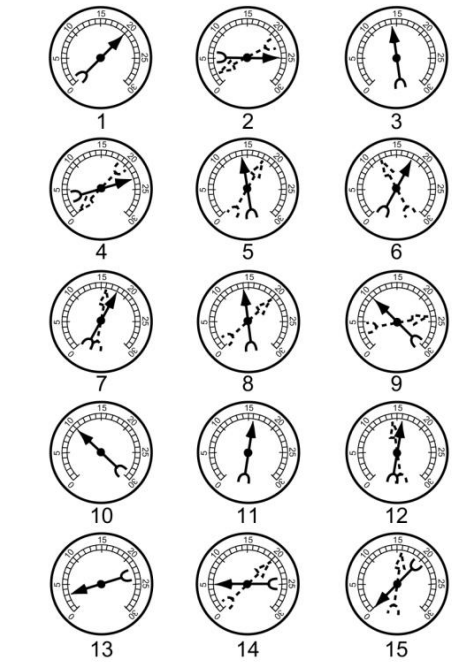
Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption results.

DIAGNOSIS AND TESTING > ENGINE > INTAKE MANIFOLD VACUUM TEST

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is conducted. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1, 000 feet) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.



Intake Manifold Vacuum Test - Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge

readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face. The following are potential gauge readings. Some are normal; others should be investigated further.

The following are potential gauge readings. Some are normal; others should be investigated further.

E147860

1.

NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2.

NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3.

NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.

4.

WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5.

STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6.

BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient valve clearance will also cause this reaction.

7.

POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8.

WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9.

WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine RPM is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10.

LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11.

IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady but somewhat low reading.

12.

INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13.

INTAKE LEAK: A low, steady reading can be caused by an intake manifold or TB (Throttle Body) gasket leak.

14.

BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.

15.

RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine RPM is increased, the back pressure caused by a clogged muffler, kinked tailpipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system

will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

DIAGNOSIS AND TESTING > ENGINE > OIL PRESSURE TEST

1.

Disconnect and remove the oil pressure switch (refer to the appropriate article) or EOP sensor (refer to the appropriate article).

2.

Connect a commercially available oil pressure gauge to the oil pressure sender oil galley port.

3.

Run the engine until normal operating temperature is reached.

4.

Run the engine at the specified RPM and record the gauge reading.

5.

The oil pressure should be within specifications, refer to the specification chart in the appropriate article.

6.

If the pressure is not within specification, check the following possible sources:

- Insufficient oil
- Oil leakage
- Worn or damaged oil pump
- Oil pump screen cover and tube
- Excessive main bearing clearance
- Excessive connecting rod bearing clearance
- Chain tensioner leak

7.

Remove the commercially available oil pressure gauge.

8.

Install and connect the oil pressure switch (refer to the appropriate article) or EOP sensor (refer to the appropriate article).

DIAGNOSIS AND TESTING > ENGINE > VALVE TRAIN ANALYSIS 2.3L ECOBOOST / 3.7L DURATEC

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis - Engine Off, Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis - Camshafts and Valve Tappets

- Check for broken or damaged parts.
- Check for loose mounting bolts on camshaft caps.
- Check for worn or damaged valve tappets.

Valve Train Analysis - Valve Springs, Valve Tappets Removed

- Check for broken or damaged parts.

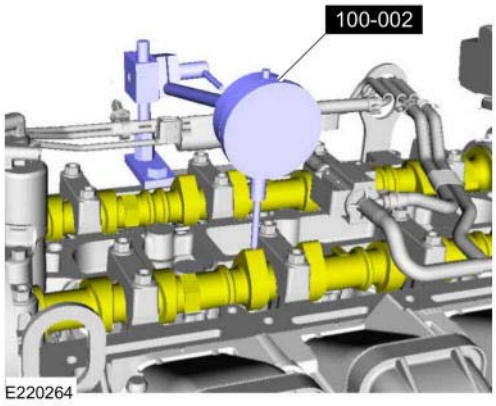
Valve Train Analysis - Valve Spring Retainer and Valve Spring Retainer Keys, Valve Tappets Removed

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis - Valves and Cylinder Head, Valve Tappets Removed

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.

Valve Train Analysis - Camshaft Lobe Lift



Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1.

Remove the spark plugs. Refer to the appropriate article.

2.

Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of the dial indicator is on top of the camshaft lobe and on the same plane as the valve tappet.

NOTE: Only rotate the crankshaft clockwise. If the engine is rotated counterclockwise the valve train timing may slip resulting in the engine having to be retimed.

3.
Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

4.

Zero the dial indicator. Continue to rotate the crankshaft until the high-lift point of the camshaft lobe is in the fully raised position (highest indicator reading).

5.

To check the accuracy of the original dial indicator reading, continue to rotate crankshaft until the base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 2 through 5.

6.

If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers or valve tappets.

7.

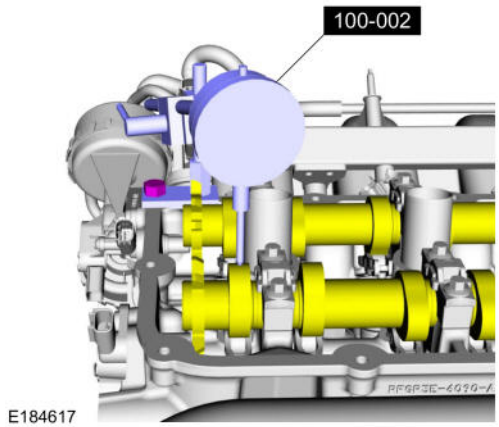
Install the spark plugs. Refer to the appropriate article.

DIAGNOSIS AND TESTING > ENGINE > VALVE TRAIN ANALYSIS 5.0L 32V TI-VCT / 5.2L 32V TI-VCT

Valve Train Analysis - Engine Off, Valve Cover Removed

Check for damaged or severely worn parts and correct assembly.

Valve Train Analysis - Camshaft Lobe Lift



Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1.

Remove the spark plugs. Refer to the appropriate article.

2.

Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of the dial indicator is on top of the camshaft lobe and on the same plane as the valve tappet.

NOTE: Only rotate the crankshaft clockwise. If the engine is rotated counterclockwise the valve train timing may slip resulting in the engine having to be retimed.

3.
Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

4.

Zero the dial indicator. Continue to rotate the crankshaft until the high-lift point of the camshaft lobe is in the fully raised position (highest indicator reading).

5.

To check the accuracy of the original dial indicator reading, continue to rotate crankshaft until the base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 2 through 5.

6.

If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers or valve tappets.

7.

Install the spark plugs. Refer to the appropriate article.

GENERAL PROCEDURES > BEARING INSPECTION

Inspection

1.

Cratering - fatigue failure

Spot glazing - incorrect seating

Scratching - dirty engine oil

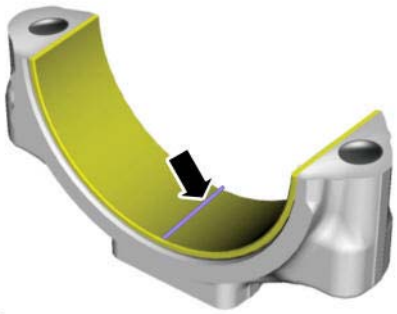
Base exposed - poor lubrication

Both edges worn - journal damaged

One edge worn - journal tapered or bearing not seated

GENERAL PROCEDURES > CONNECTING ROD BEARING JOURNAL CLEARANCE

Check



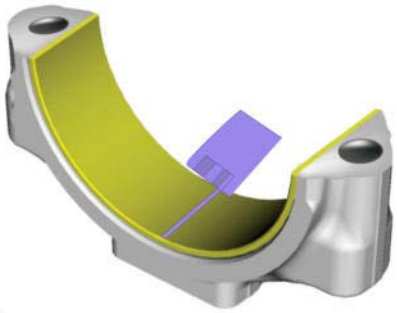
NOTE: Refer to the appropriate article for the specification.

NOTE: The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

1.
Remove the connecting rod bearing cap and connecting rod bearing.

2.

Position a piece of Plastigage across the bearing surface.



E148402

NOTE: Do not turn the crankshaft during this step.

3.
Install and tighten to specifications, then remove the connecting rod bearing cap.

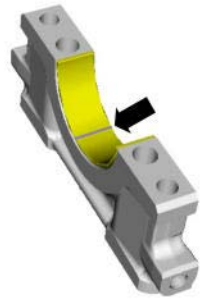
4.

Measure the Plastigage to get the connecting rod bearing journal clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged connecting rod or connecting rod bearing.

E148403

GENERAL PROCEDURES > CRANKSHAFT MAIN BEARING JOURNAL CLEARANCE

Check



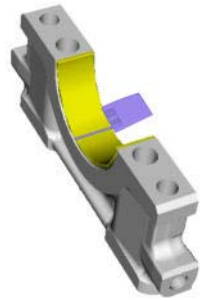
NOTE: Refer to the appropriate article for the specification.

NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.

1.
Remove the crankshaft main bearing cap and crankshaft main bearing.

2.

Position a piece of Plastigage across the crankshaft main bearing surface.



E148405

NOTE: Do not turn the crankshaft while carrying out this procedure.

3.
Install and tighten to specifications, then remove the crankshaft main bearing cap.

4.

Measure the Plastigage to get the crankshaft main bearing clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged crankshaft or crankshaft bearing.

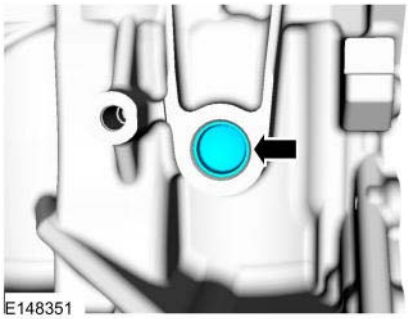
E148406

GENERAL PROCEDURES > CYLINDER BLOCK CORE PLUG REPLACEMENT

Special Tool(s) / General Equipment

 E129694	100-001 (T50T-100-A)Slide Hammer

Materials



Name	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

Repair

All core plugs

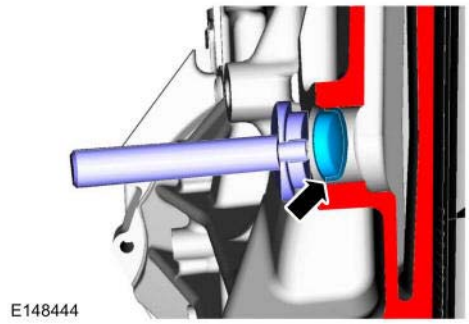
NOTE: Cylinder block core plug shown, cylinder head core plug similar.

1.
Using the Slide Hammer and a commercially available body dent puller attachment or commercially available freeze plug puller remove the core plug. Use Special Service Tool: 100-001 (T50T-100-A) Slide Hammer.

NOTE: Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

2.
Inspect the core plug bore for any damage that would interfere with the correct sealing of the plug. If the core plug bore is damaged, bore for the next oversize plug.

Cup-type



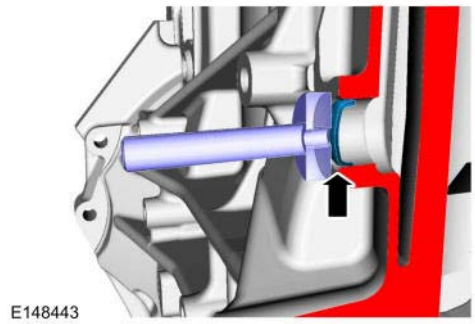
NOTE: When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

NOTE: Use care during this procedure so as not to disturb or distort the cup sealing surface.

3.
Coat the cup-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer. Remove the excess sealant after installation.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)



Expansion-type

NOTE: Do not contact the crown when installing an expansion-type core plug. This could expand the plug before seating and result in leakage.

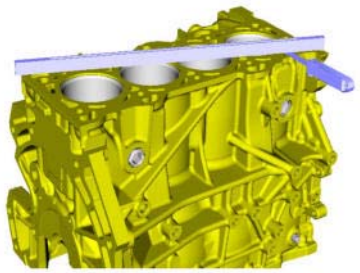
4.
Coat the expansion-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer. Remove the excess sealant after installation.

Material

: Threadlock 262 / TA-26 (WSK-M2G351-A6)

GENERAL PROCEDURES > CYLINDER BLOCK DISTORTION

Special Tool(s) / General Equipment



Feeler Gauge

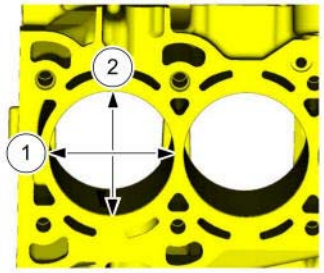
Check

NOTE: Refer to the appropriate article for the specification.

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On ® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

1.
Use a Straightedge and a Feeler Gauge Set to inspect the cylinder block for flatness. Use the General Equipment: Feeler Gauge

E148368



GENERAL PROCEDURES > CYLINDER BORE TAPER

Check

NOTE: Refer to the appropriate article for the specification.

1.

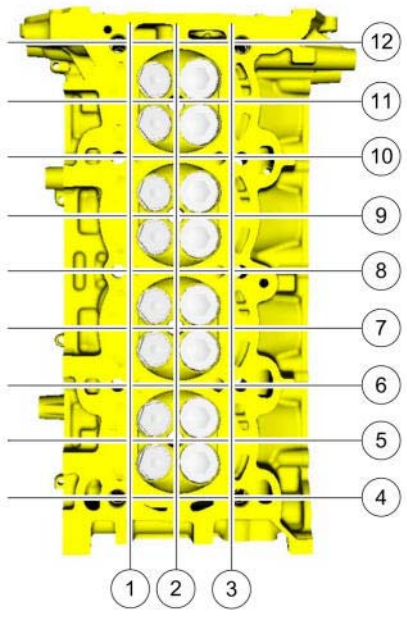
Measure the cylinder bore at the top, middle and bottom of piston ring travel in 2 directions as indicated. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. If the cylinder bore taper does not meet specification, bore the cylinder to the next oversize limit.

E148355

GENERAL PROCEDURES > CYLINDER HEAD DISTORTION

Special Tool(s) / General Equipment

Feeler Gauge



Check

NOTE: Refer to the appropriate article for the specification.

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On ® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

NOTE: Make sure all cylinder head surfaces are clear of any gasket material, silicone sealant, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

1.
Using a Straightedge and a Feeler Gauge Set, inspect the cylinder head for flatness in the sequence shown below. Use the General Equipment: Feeler Gauge

E148404

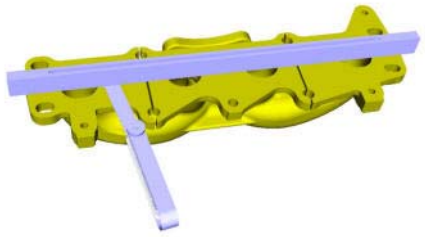
GENERAL PROCEDURES > EXHAUST MANIFOLD CLEANING AND INSPECTION

Special Tool(s) / General Equipment

Feeler Gauge

Cleaning

1.



Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

Inspection

NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On ® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

NOTE: New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

1.
Using the Straightedge and a Feeler Gauge Set, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold. Use the General Equipment: Feeler Gauge

GENERAL PROCEDURES > FLYWHEEL INSPECTION - 3.7L DURATEC (227KW 301PS)

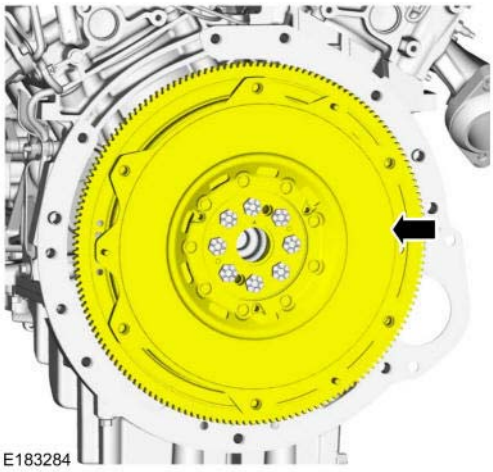
Special Tool(s) / General Equipment

	100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge

 E222983	303-103 (T74P-6375-A) Holding Tool, Flywheel T74P-77000-A TKIT-2009TC-F

Inspection

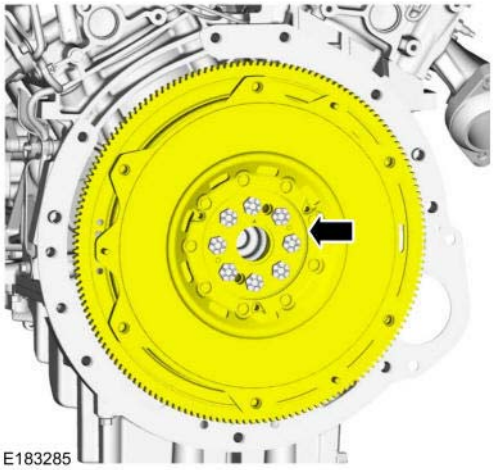
NOTE: Do not clean the dual mass flywheel with compressed air.



NOTE: Do not clean the dual mass flywheel with any kind of fluid, use a dry cloth only or damage to the dual mass flywheel may occur.

NOTE: Do not clean the gap between the primary and secondary mass. Only clean the bolt connection surface and the clutch surface or damage to the dual mass flywheel may occur.

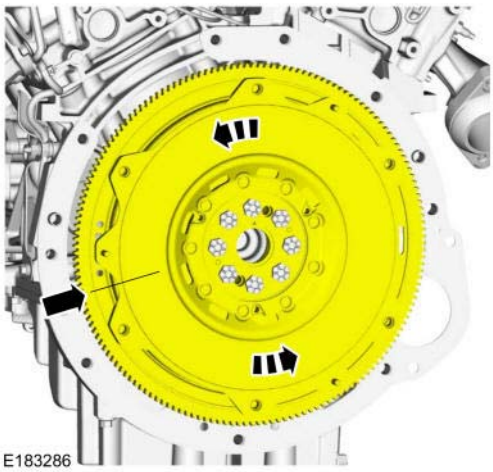
NOTE: The dual mass flywheel normally has up to a total of 14 degrees (6.5 ring gear teeth) maximum rotational freeplay between the primary (bolted to crankshaft) and the secondary mass (clutch disc face).



NOTE: The dual mass flywheel cannot be machined.

1.
With the dual mass flywheel installed on the engine, inspect the dual mass flywheel surface for scoring, cracks, discoloration or damage. Check for contamination from grease, oil or fuel. If any of these conditions exist, install a new dual mass flywheel.

E183284



2.

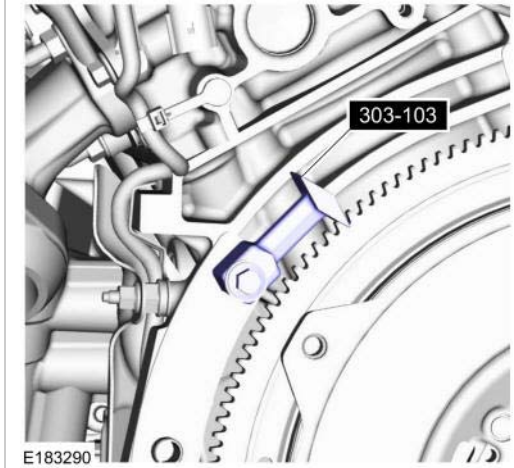
Inspect the dual mass flywheel friction control plate plastic piece between the primary and secondary mass for damage or melting and install a new dual mass flywheel if necessary. Inspect the dual mass flywheel hub bushing for wear and install a new dual mass flywheel if necessary.

NOTE: The dual mass flywheel rotational freeplay inspection cannot be carried out if the friction control plate is damaged.

3.
Rotate the secondary mass counterclockwise and place a reference mark on the primary and secondary mass of the dual mass flywheel.

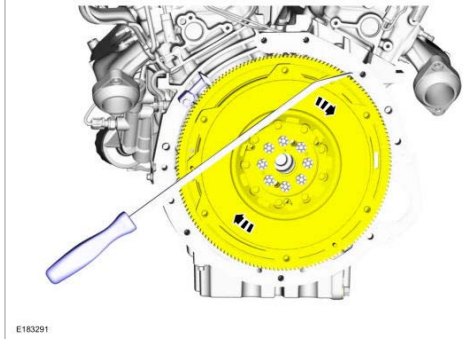
4.

Using light hand pressure, rotate the secondary mass clockwise to the end of the freeplay. Place a 2nd reference mark on the primary mass of the dual mass flywheel, in line with the reference mark on the secondary mass.



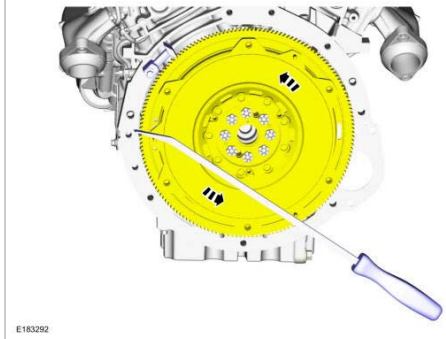
5.

Measure the rotational freeplay between the 2 reference marks on the primary mass of the dual mass flywheel. If the rotational freeplay exceeds 14 degrees (6.5 ring gear teeth), install a new dual mass flywheel.



6.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.



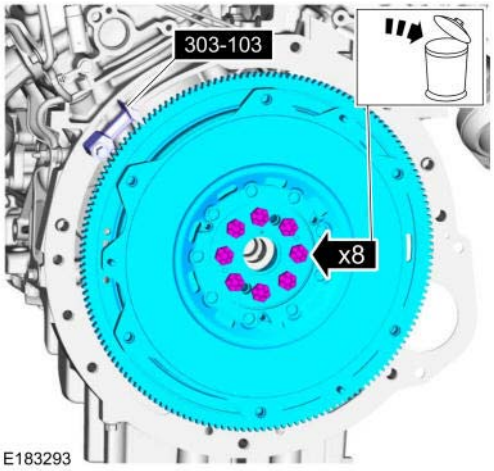
7.

Using a suitable long screwdriver or bar, firmly rotate the secondary mass clockwise. The secondary mass should begin to engage the internal spring past the freeplay movement of 14 degrees (6.5 ring gear teeth) maximum. The secondary mass should continue to rotate and engage the internal spring with increasing spring pressure. If the secondary mass does not rotate, install a new dual mass flywheel.

8.

Using a suitable long screwdriver or bar, firmly rotate the secondary mass counterclockwise. The secondary mass should begin to engage the internal spring past the freeplay movement of 14 degrees (6.5 ring gear teeth) maximum. The secondary mass should continue to rotate and engage the internal spring with increasing spring pressure. If the secondary mass does not rotate, install a new dual mass flywheel.

9.



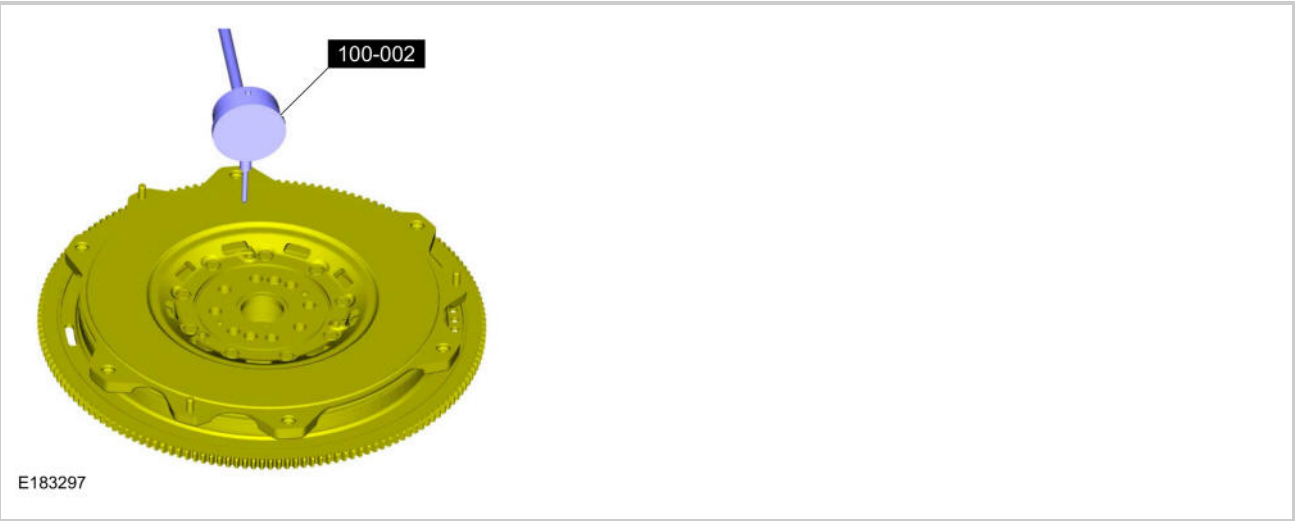
Remove the bolts and the dual mass flywheel. Discard the flywheel bolts.

Inspect the dual mass flywheel crankshaft mounting flange for residual thread locking compound or rust and clean as necessary.

NOTE: Blocks must be placed under the dual mass flywheel to make sure it is level and stable.

Place the flywheel on a firm and level surface.

Remove Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.



10.

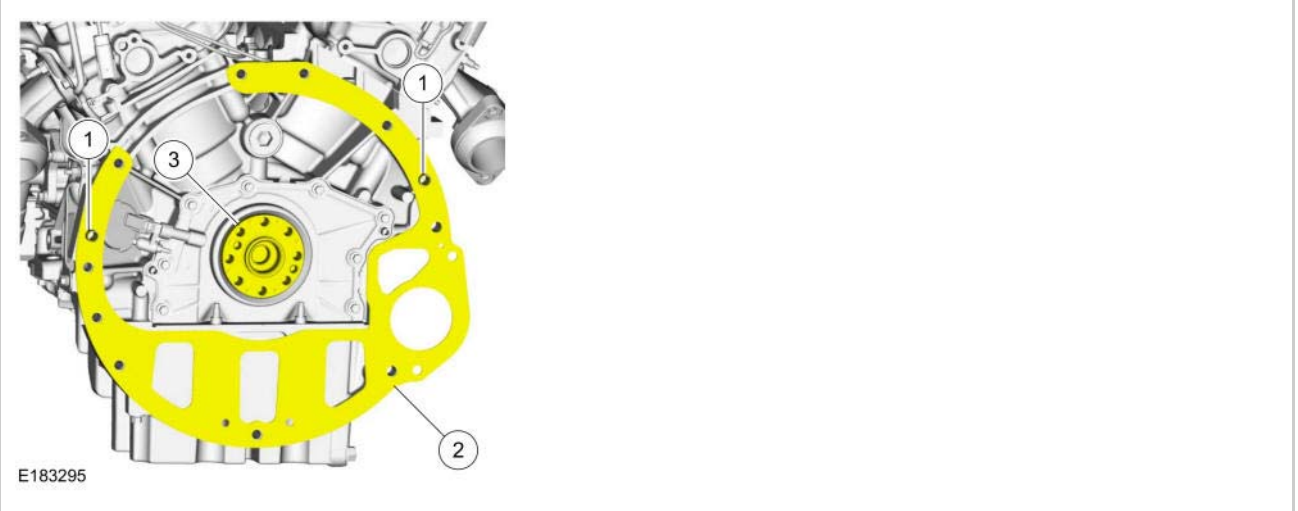
Using the special tool, place a dial indicator gauge at a point on the outer upper surface of the secondary mass. Use Special Service Tool: 100-002 (TOOL-4201-C) Holding Fixture with Dial Indicator Gauge.

Using light hand pressure, press downward at the opposite point on the outer upper surface of the secondary mass and note the deflection on the dial indicator gauge.

Repeat this measurement at 45 degree intervals around the dual mass flywheel and note any deflection. Some axial movement of the secondary mass flywheel is normal, if the deflection exceeds 1.1 mm (0.043 in) at any point, install a new dual mass flywheel.

11.

1.



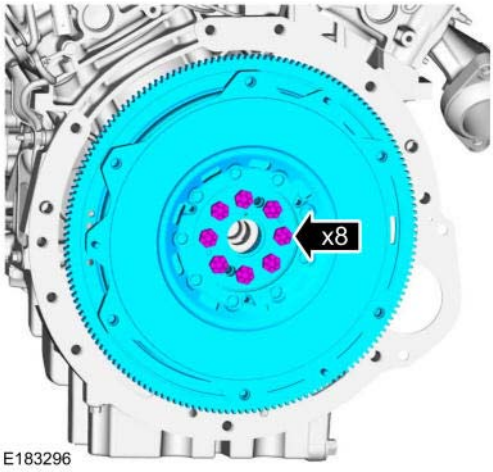
Inspect the rear face of the engine block. Make sure that the 2 engine dowel pins are correctly installed and are not damaged, install new dowel pins as necessary.

2.

Inspect the engine block rear spacer plate for damage or warping and install a new plate as necessary.

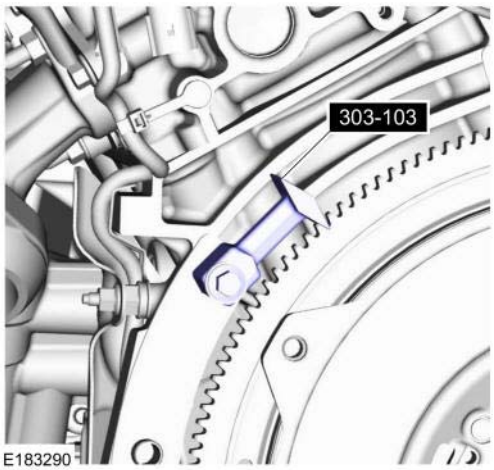
3.

Inspect the crankshaft flange for residual thread lock compound or rust, and clean as necessary.



12.

Inspect the transmission mounting face. Inspect the 2 dowel pin holes so that they are not elongated or damaged.

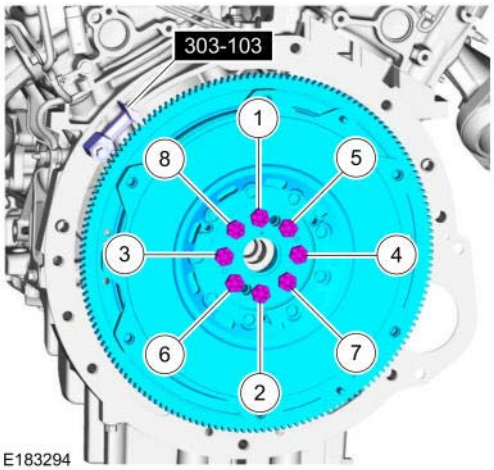


13.

Install the dual mass flywheel and new bolts finger tight.

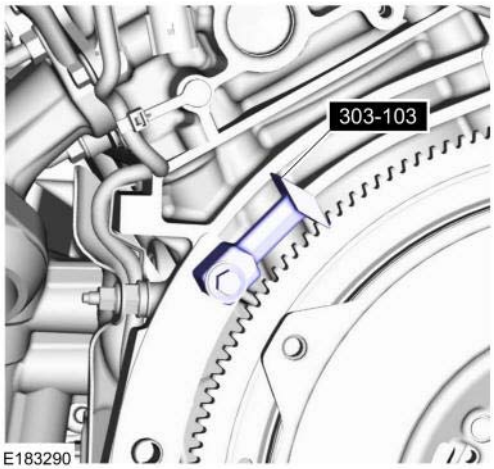
14.

Install Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.



15.

Tighten the bolts in the sequence shown below.

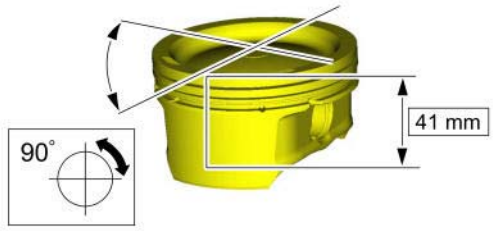


Torque

: 59 lb.ft (80 Nm)

16.

Remove Special Service Tool: 303-103 (T74P-6375-A) Holding Tool, Flywheel.



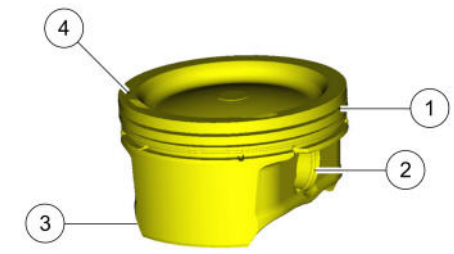
GENERAL PROCEDURES > PISTON DIAMETER

Check

NOTE: Refer to the appropriate article for the specification.

1.

Measure the piston diameter 90 degrees from the piston pin and 41 mm (1.61 in) down from the top of the piston at the point indicated.

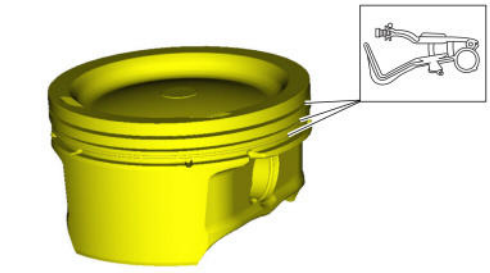


E148432

GENERAL PROCEDURES > PISTON INSPECTION

Inspection

NOTE: Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.



1.
Clean and inspect the (1) ring lands, (2) pin bosses, (3) skirts and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.

E148354

NOTE: Make sure the oil ring holes are clean.

2.
Using a Piston Ring Groove Scraper, clean the piston ring grooves.

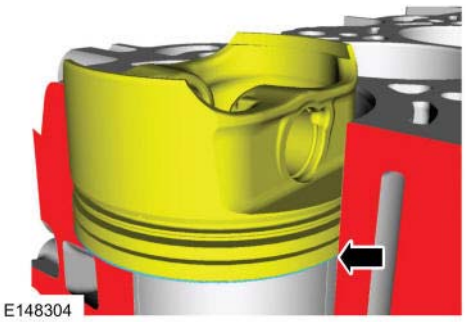
E148332

GENERAL PROCEDURES > PISTON RING END GAP

Special Tool(s) / General Equipment

Feeler Gauge

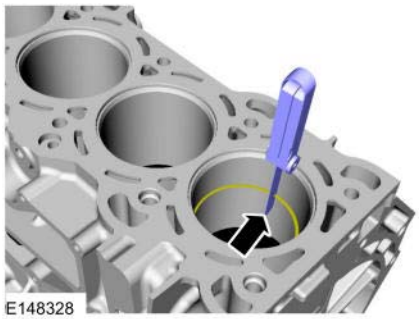
Check



NOTE: Refer to the appropriate article for the specification.

NOTE: The cylinder bore must be within specification for taper and out-of-round.

NOTE: Piston rings should not be transferred from one piston to another.



NOTE: Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.

1.
Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.

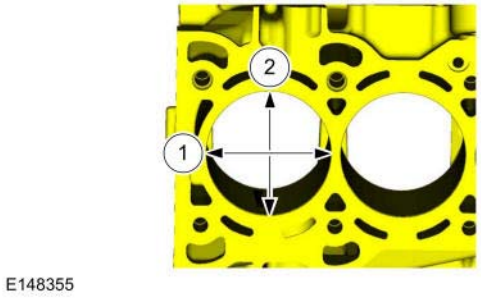
E148304

2.

Using the Feeler Gauge Set measure the top piston ring end gap and the second piston ring end gap Use the General Equipment: Feeler Gauge

GENERAL PROCEDURES > PISTON SELECTION

Check



NOTE: Refer to the appropriate article for the specifications.

NOTE: The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.

1.

Measure the cylinder bore in 2 directions.

Select a piston size based on the cylinder bore.

NOTE: For precision fit, new pistons are divided into 3 categories within each size range based on their relative position within the range. A paint spot or specific size grade on a new piston indicates the position within the size range.

2.
Choose the piston with the correct paint color or specific size grade.

GENERAL PROCEDURES > POWERTRAIN DRIVETRAIN MOUNT NEUTRALIZING

Adjustment

NOTE: Refer to the appropriate article and procedure for special instructions on loosening and tightening mount fasteners.

1.

Loosen, but do not remove, the powertrain/drivetrain mount fasteners.

NOTE: Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.

2.
Start the vehicle and move it in forward 0.6 m (1.97 ft) - 1.2 m (3.94 ft). Then move the vehicle in reverse the same distance.

3.

Tighten the powertrain/drivetrain mount fasteners.

4.

Test the system for normal operation.

GENERAL PROCEDURES > RTV SEALING SURFACE CLEANING AND PREPARATION

Special Tool(s) / General Equipment

Plastic Scraper

Materials

Name	Specification
Motorcraft ® Silicone Gasket Remover ZC-30-A	-
Motorcraft ® Metal Surface Prep ZC-31-B	-
Metal Brake Parts Cleaner (U.S.) PM-4-A, PM-4-B (U.S.)	-

Cleaning

NOTE: Place clean, lint-free towels over exposed cavities. Carefully remove the towels

so foreign material is not dropped into the cavities. Any foreign material (including any material created while cleaning surfaces) that enters the fluid passages, may cause failure.

NOTE: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.

1.

Remove loose sealant by hand or with the aid of a plastic scraper. Use the General Equipment: Plastic Scraper

2.

Apply Motorcraft ® Silicone Gasket Remover to surface. Allow to set for several minutes.

Material

: Motorcraft ® Silicone Gasket Remover / ZC-30-A

3.

Use a lint-free towel and plastic scraper to remove any remaining sealant. A second application of Silicone Gasket Remover may be required. Use the General Equipment: Plastic Scraper

Material

: Motorcraft ® Silicone Gasket Remover / ZC-30-A

4.

Clean the surface with Motorcraft ® Metal Brake Parts Cleaner to remove all residual sealant and oil.

Material

: Metal Brake Parts Cleaner (U.S.) / PM-4-A, PM-4-B (U.S.)

NOTE: Discard wipe after a single use.

NOTE: Motorcraft ® Metal Surface Prep Wipes is a pre-saturated disposable wipe to be used as a final step in surface preparation. It creates a conversion coating providing an improved base for RTV sealing. The wipe is a dry-in-place application and does not require rinsing.

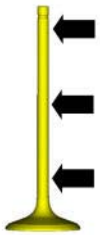
5.
Prep the surface with Motorcraft ® Metal Surface Prep Wipes. All surfaces that are to be sealed with RTV are to be wiped. Make sure the surface is moistened with the fluid.

Material

: Motorcraft ® Metal Surface Prep / ZC-31-B

NOTE: Drying the surface with a towel will contaminate the surface and may cause oil leaks.

6.
Allow the surface to air dry. (Approximately 2 minutes.)



GENERAL PROCEDURES > VALVE STEM DIAMETER

Check

NOTE: Refer to the appropriate article for the specification.

1.

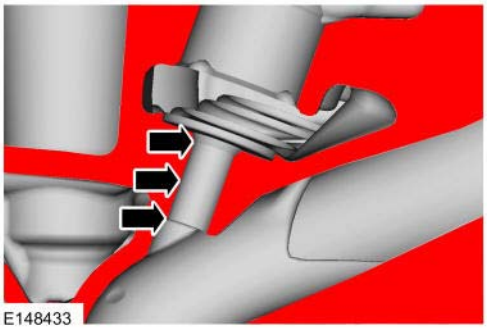
Measure the diameter of each intake and exhaust valve stem at the points shown below. Verify the diameter is within specification.

E148356

GENERAL PROCEDURES > VALVE GUIDE INNER DIAMETER

Check

NOTE: Refer to the appropriate article for the specification.



NOTE: Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide, if necessary.

1.

Use a ball gauge to determine the inside diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

Measure the ball gauge with a micrometer.

If the valve guide is not within specifications, install a new cylinder head assembly.

E148433

DESCRIPTION AND OPERATION > EXHAUST SYSTEM > OVERVIEW

NOTE: Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless. The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.

NOTE: Extremely high temperatures of 1,100°C (2,012°F) or above due to misfiring or an over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring.

NOTE: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters and a muffler assembly. The catalytic converters also play a major role in reducing air pollutants.

- a one-piece catalytic converter with exhaust flexible pipe that is mounted to the turbocharger outlet flange.
- a muffler and tailpipe assembly.
- isolators installed on the body and muffler hangers.

The catalytic converter plays a major role in the emission control system by operating as a gas reactor. Its function is to speed the heat-producing chemical reaction of components in the exhaust gases to reduce air pollutants.

The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary.

Sound insulators and shields, attached to the underbody, protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, install a new insulator and shield. The sound insulators and shields for the muffler, muffler pipe and catalytic converter pipe are installed separately.

Some exhaust fasteners must be discarded and new ones installed as indicated in the procedures. Discard any damaged or heavily corroded fasteners and install new ones as necessary. Some exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Tighten the fasteners to the specified torque during reassembly to make sure of correct retention of exhaust components.

DIAGNOSIS AND TESTING > EXHAUST SYSTEM > SYMPTOM CHART(S)

Symptom Chart: Symptom Chart - Exhaust System

Verify the customer concern. Inspect the components of the exhaust system for obvious signs of damage or other mechanical concerns using the following chart.

Visual Inspection Chart - Mechanical

Mechanical
Exhaust pipe pinched or crushed Damaged muffler Broken or damaged exhaust hanger brackets Damaged catalytic converter Loose or damaged heat shields

Verify the exhaust system is installed correctly, with clamps correctly located and tightened to specifications. If the fault is not visually evident, determine the symptom. GO to Symptom Chart below.

Symptom Chart

Condition	Possible Sources	Actions
Vehicle has low or no power - vehicle performance complaint	Exhaust pipe pinched or crushed Damaged catalytic converter Loose obstruction in exhaust	REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
	Restricted exhaust (possible frozen condensate in muffler)	CHECK drain holes for foreign material. PARK the vehicle inside to thaw. TEST the vehicle for normal operation. If the concern is still present, REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Burning smell - usually occurs at idle, with possible traces of smoke	Foreign material caught in exhaust system Missing heat shields	INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary.
Odor - described as a sulfur or rotten egg smell	Catalytic converter Excessive sulfur content in fuel	At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE

		the customer no repair is required.
	Rich fuel conditions Misfire conditions	REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Visible rust on surface of exhaust pipes	Catalytic converter/exhaust system	Surface rust is a characteristic of materials used on exhaust systems. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, the condition is normal.

Symptom Chart: Symptom Chart - NVH

Symptom Chart

Condition	Possible Sources	Actions
Rattle, squeaks or buzz type noise - from the bottom of the vehicle	Loose or damaged heat shield	INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm. If the heat shields are missing or a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary.
	Loose or damaged exhaust isolators	VERIFY the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Damaged exhaust isolator hanger bracket	INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN the bolts to specification or INSTALL new components as necessary.
	Loose or damaged catalytic converter or muffler	MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber

		mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Drone or clunk type noise - from the bottom of the vehicle	Loose or damaged exhaust isolators	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Whistles, boom, hum or ticking type noise - noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	Exhaust system leak	INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a shop towel over the tail pipe outlet while listening for a leak. REPAIR or INSTALL new components as necessary.
	Catalytic converter	MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as

		necessary.
	Exhaust muffler/resonator drain hole enlarged due to corrosion	CONFIRM the drain holes are the noise source. INSTALL new components as necessary.
Hissing or rushing noise - high frequency sound and the vehicle performance is unaffected	Exhaust system Exhaust flow through pipes	CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
Pinging noise - occurs when exhaust system is hot, engine turned off	Catalytic converter/exhaust system	Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
Vibration - occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise	Loose or damaged exhaust isolator	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Loose or damaged exhaust isolator hanger brackets	INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary.
	Exhaust system grounded to chassis	REPAIR or INSTALL new components as necessary.
Engine drumming noise - normally accompanied by vibration	Damaged or misaligned exhaust system	INSPECT the exhaust system for loose or damaged fasteners or isolators. REPAIR or INSTALL new components as necessary.
Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature	Damaged or worn exhaust system	INSPECT the exhaust system for leaks or damage. REPAIR as necessary.
Thumping noise - from the bottom of the vehicle, worse during acceleration	Misaligned exhaust system	CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary.
Engine vibration - is felt with increases and decreases in engine rpm	Strain on exhaust system isolators	REPAIR or INSTALL new components as necessary.
Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very	Exhaust system vibration excites the body resonances inducing interior noise	REPAIR or INSTALL new components as necessary.

low-frequency drumming is very rpm dependent		

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER > REMOVAL

NOTE: If the catalytic converter is not being replaced, the HO2S and the catalyst monitor sensor do not need to be removed from the catalytic converter. Disconnecting the electrical connectors is still necessary.

NOTE: Removal steps in this procedure may contain installation details.

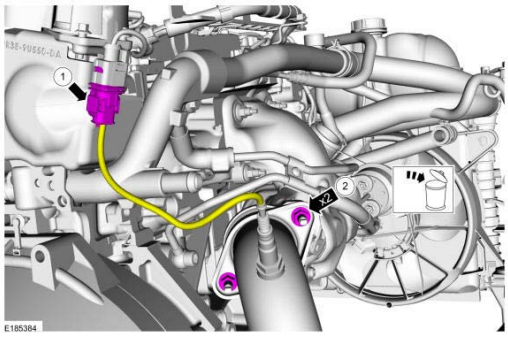
NOTE: Clean all exhaust connections before reassembly.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

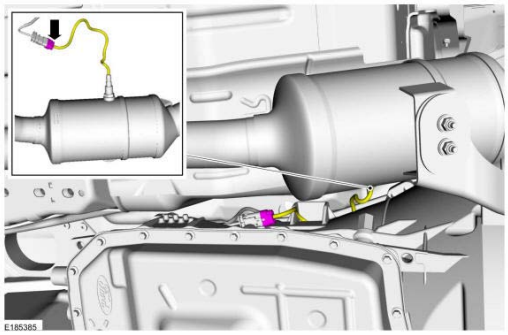
1.



Disconnect the HO2S electrical connector.

2.

Remove and discard the nuts.



Torque

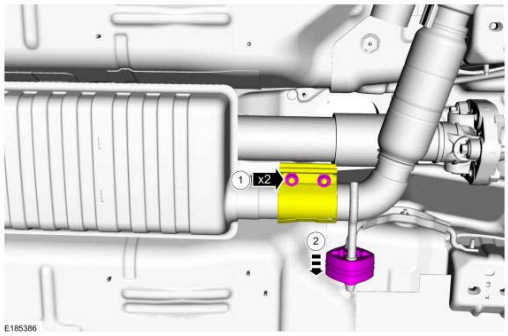
: 30 lb.ft (40 Nm)

3.

Disconnect the catalyst monitor sensor electrical connector.

4.

1.



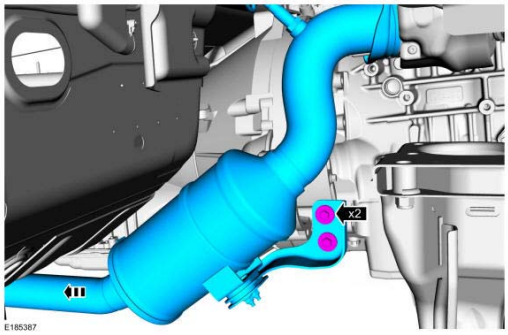
Loosen the clamp and release the tab and slide the clamp back on the muffler. Separate the muffler and tailpipe from the catalytic converter.

Torque

: 35 lb.ft (48 Nm)

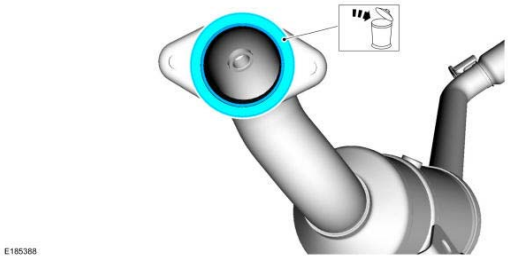
2.

Detach the exhaust isolator.



5.

Remove the bolts and the catalytic converter.



Torque

: 18 lb.ft (25 Nm)

6.

Remove and discard the gasket.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE

Materials

Name	Specification
Threadlock and Sealer TA-25-B	-

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE > REMOVAL

NOTE: Do not excessively bend, twist or allow the exhaust to hang from the flexible joint or damage to the exhaust system may occur.

NOTE: Do not use oil or grease-based lubricants on the isolators. They may cause deterioration of the rubber.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Clean all exhaust connections before reassembly.

1.

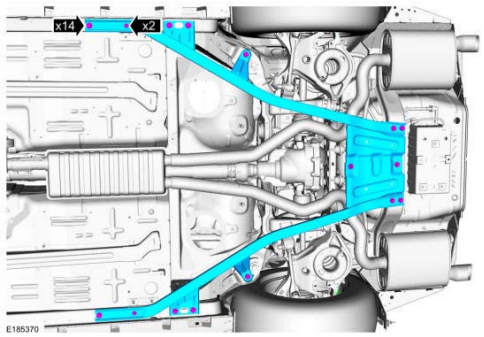
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

1.

Convertible top vehicles only, remove the retainers and the brace.

Torque



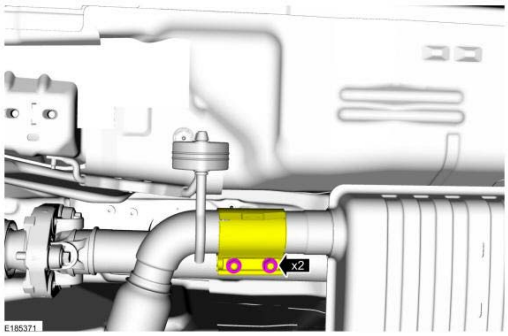
: 46 lb.ft (63 Nm)

2.

During assembly, clean the retainers and apply the thread lock.

Material

: Threadlock and Sealer / TA-25-B



3.

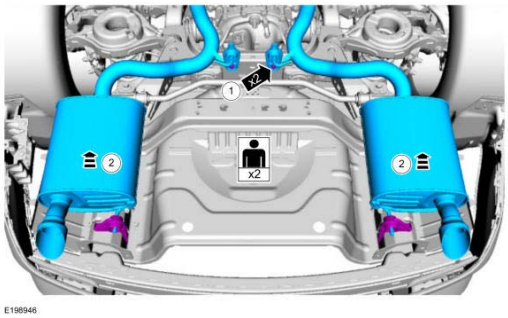
Loosen the clamp and separate the muffler and tailpipe from the catalytic converter.

Torque

: 35 lb.ft (48 Nm)

4.

1.



Remove the LH and RH rear exhaust hanger isolator bracket bolts from the rear subframe.

Torque

: 18 lb.ft (25 Nm)

2.

Unhook the rear exhaust hanger isolators and remove the muffler and tailpipe.

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

DESCRIPTION AND OPERATION > EXHAUST SYSTEM > OVERVIEW

NOTE: Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless. The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.

NOTE: Extremely high temperatures of 1, 100°C (2, 012°F) or above due to misfiring or an over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring.

NOTE: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters and a muffler assembly. The catalytic converters also play a major role in reducing air pollutants.

The exhaust system consists of:

- a LH one-piece catalytic converter manifold that is mounted to the LH exhaust manifold.
- a RH one-piece catalytic converter manifold that is mounted to the RH exhaust manifold.
- a underbody resonator which is part of the muffler and tailpipe assembly.
- a muffler and tailpipe assembly with isolators.

The catalytic converter plays a major role in the emission control system by operating as a gas reactor. Its function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants.

The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary.

Sound insulators and shields, attached to the underbody and exhaust system to protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, install a new insulator and shield. The sound insulators and shields for the muffler, muffler pipe, resonator and

catalytic converter pipe are installed separately.

Condition	Possible Sources	Actions
Rattle, squeaks or buzz type noise - from the bottom of the vehicle	Loose or damaged heat shield	INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm. If the heat shields are missing or a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary.
	Loose or damaged exhaust isolators	VERIFY the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Damaged exhaust isolator hanger bracket	INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN the bolts to specification or INSTALL new components as necessary.
	Loose or damaged catalytic converters or muffler	MOVE the exhaust system to simulate the bouncing action of

		the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Drone or clunk type noise - from the bottom of the vehicle	Loose or damaged exhaust isolators	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Whistles, boom, hum or ticking type noise - noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	Exhaust system leak	INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a shop towel over the tail pipe outlet while listening for a leak. REPAIR or INSTALL new components as necessary.
	Catalytic converters	MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converters. DETERMINE if there are loose or broken baffles in the

		muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	Exhaust muffler/resonator drain hole enlarged due to corrosion	CONFIRM the drain holes are the noise source. INSTALL new components as necessary.
Hissing or rushing noise - high frequency sound and the vehicle performance is unaffected	Exhaust system Exhaust flow through pipes	CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
Pinging noise - occurs when exhaust system is hot, engine turned off	Catalytic converters/exhaust system	Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
Vibration - occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise	Loose or damaged exhaust isolator	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Loose or damaged exhaust isolator hanger brackets	INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary.
	Exhaust system grounded to chassis	REPAIR or INSTALL new components as necessary.
Engine drumming noise - normally accompanied by vibration	Damaged or misaligned exhaust system	INSPECT the exhaust system for loose or damaged fasteners or isolators. REPAIR or INSTALL new components as necessary.
Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature	Damaged or worn exhaust system	INSPECT the exhaust system for leaks or damage. REPAIR as necessary.
Thumping noise - from the bottom of the vehicle, worse during acceleration	Misaligned exhaust system	CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary.
Engine vibration - is felt with increases and decreases in engine rpm	Strain on exhaust system isolators	REPAIR or INSTALL new components as necessary.

Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	Exhaust system vibration excites the body resonances inducing interior noise	REPAIR or INSTALL new components as necessary.

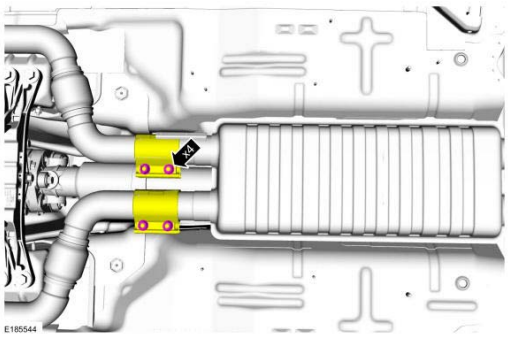
REMOVAL AND INSTALLATION > CATALYTIC CONVERTER LH > REMOVAL

NOTE: Clean all exhaust connections before reassembly.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: If the catalytic converter is not being replaced, the HO2S and the catalyst monitor sensor do not need to be removed from the catalytic converter. Disconnecting the electrical connectors is still necessary.

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

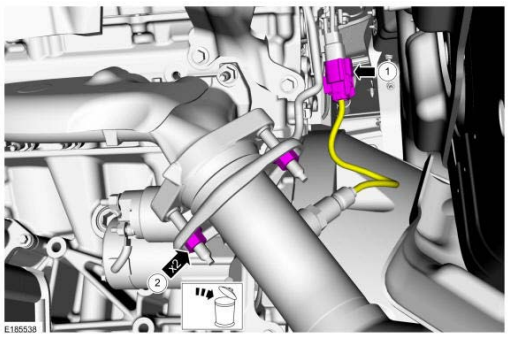
Loosen the clamps, release the tab and slide the clamps back on the muffler. Separate the muffler and tailpipe from the catalytic converters.

Torque

: 35 lb.ft (48 Nm)

3.

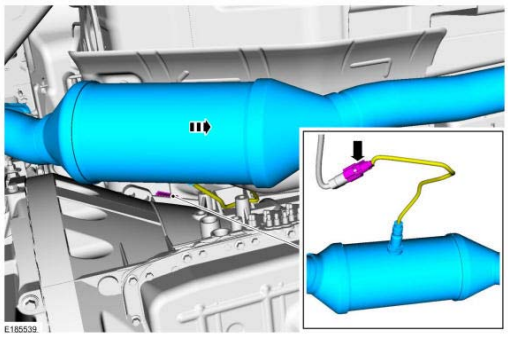
1.



Disconnect the HO2S electrical connector.

2.

Remove and discard the nuts.



Torque

: 30 lb.ft (40 Nm)

4.

Disconnect the catalyst monitor sensor electrical connector and remove the catalytic convertor.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER LH > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER RH > REMOVAL

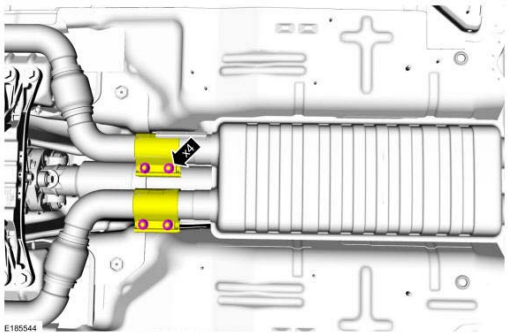
NOTE: If the catalytic converter is not being replaced, the HO2S and the catalyst monitor sensor do not need to be removed from the catalytic converter. Disconnecting the electrical

connectors is still necessary.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Clean all exhaust connections before reassembly.

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

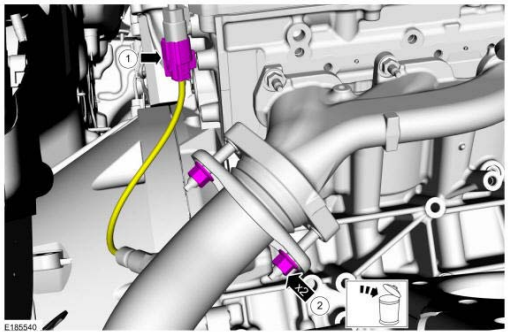
Loosen the clamps, release the tab and slide the clamps back on the muffler. Separate the muffler and tailpipe from the catalytic converters.

Torque

: 35 lb.ft (48 Nm)

3.

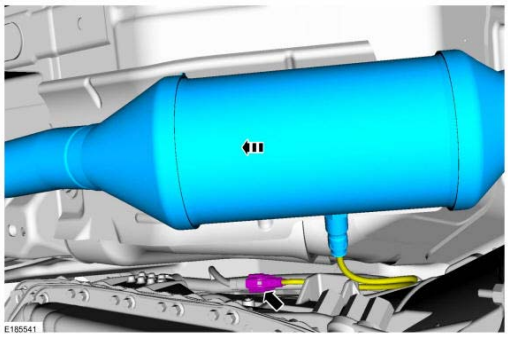
1.



Disconnect the HO2S electrical connector.

2.

Remove and discard the nuts.



Torque

: 30 lb.ft (40 Nm)

4.

Disconnect the catalyst monitor sensor electrical connector and remove the catalytic convertor.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER RH > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE

Materials

Name	Specification
Threadlock and Sealer TA-25-B	-

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE > REMOVAL

NOTE: Do not excessively bend, twist or allow the exhaust to hang from the flexible joint or damage to the exhaust system may occur.

NOTE: Do not use oil or grease-based lubricants on the isolators. They may cause deterioration of the rubber.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Clean all exhaust connections before reassembly.

1.

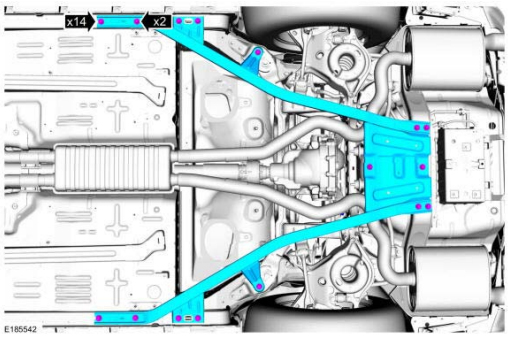
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

1.

Convertible top vehicles only, remove the retainers and the brace.

Torque



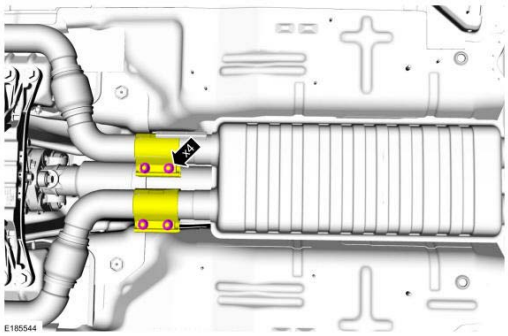
: 46 lb.ft (63 Nm)

2.

During assembly, clean the retainers and apply the thread lock.

Material

: Threadlock and Sealer / TA-25-B



3.

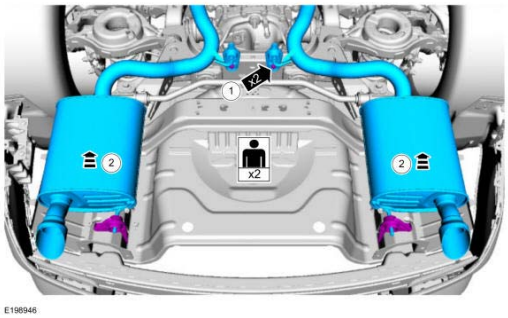
Loosen the clamps and separate the muffler and tailpipe from the catalytic converters.

Torque

: 35 lb.ft (48 Nm)

4.

1.



Remove the LH and RH rear exhaust hanger isolator bracket bolts from the rear subframe.

Torque

: 18 lb.ft (25 Nm)

2.

Unhook the rear exhaust hanger isolators and remove the muffler and tailpipe.

REMOVAL AND INSTALLATION > MUFFLER AND TAILPIPE > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

DESCRIPTION AND OPERATION > EXHAUST SYSTEM > OVERVIEW

NOTE: Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless. The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.

NOTE: Extremely high temperatures of 1, 100°C (2, 012°F) or above due to misfiring or an over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring.

NOTE: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters and a muffler assembly. The catalytic converters also play a major role in reducing air pollutants.

The exhaust system consists of:

- a LH one-piece catalytic converter manifold that is mounted to the LH cylinder head.
- a RH one-piece catalytic converter manifold that is mounted to the RH exhaust manifold.
- a muffler inlet pipe that is mounted to the LH catalytic converter to the muffler and tailpipe assembly.
- a underbody resonator which is part of the muffler and tailpipe assembly.
- a muffler and tailpipe assembly with isolators.

The catalytic converter plays a major role in the emission control system by operating as a gas reactor. Its function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants.

The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary.

Sound insulators and shields, attached to the underbody and exhaust system to protect the vehicle from

exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, install a new insulator and shield. The sound insulators and shields for the muffler, muffler pipe, resonator and catalytic converter pipe are installed separately.

Some exhaust fasteners must be discarded and new ones installed as indicated in the procedures. Discard any damaged or heavily corroded fasteners and install new ones as necessary. Some exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Tighten the fasteners to the specified torque during reassembly to make sure of correct retention of exhaust components.

DIAGNOSIS AND TESTING > EXHAUST SYSTEM > SYMPTOM CHART(S)

Symptom Chart: Symptom Chart - Exhaust System

Verify the customer concern. Inspect the components of the exhaust system for obvious signs of damage or other mechanical concerns using the following chart.

Visual Inspection Chart - Mechanical

Mechanical
Exhaust pipe pinched or crushed Damaged muffler and tailpipe Broken or damaged exhaust hanger brackets Damaged catalytic converters Loose or damaged heat shields

Verify the exhaust system is installed correctly, with clamps correctly located and tightened to specifications. If the fault is not visually evident, determine the symptom. GO to Symptom Chart below.

Symptom Chart

Condition	Possible Sources	Actions
Vehicle has low or no power - vehicle performance complaint	Exhaust pipe pinched or crushed Damaged catalytic converters Loose obstruction in exhaust	REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
	Restricted exhaust (possible frozen condensate in muffler)	CHECK drain holes for foreign material. PARK the vehicle inside to thaw. TEST the vehicle for normal operation. If the concern is still present, REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Burning smell - usually occurs at idle, with possible traces of smoke	Foreign material caught in exhaust system Missing heat shields	INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary.

Odor - described as a sulfur or rotten egg smell	Catalytic converters Excessive sulfur content in fuel	At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE the customer no repair is required.
	Rich fuel conditions Misfire conditions	REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .
Visible rust on surface of exhaust pipes	Catalytic converters/exhaust system	Surface rust is a characteristic of materials used on exhaust systems. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, the condition is normal.

Symptom Chart: Symptom Chart - NVH

Symptom Chart

Condition	Possible Sources	Actions
Rattle, squeaks or buzz type noise - from the bottom of the vehicle	Loose or damaged heat shield	INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm. If the heat shields are missing or a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary.
	Loose or damaged exhaust isolators	VERIFY the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Damaged exhaust isolator hanger bracket	INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN the bolts to specification or INSTALL new components as necessary.

	Loose or damaged catalytic converters or muffler	MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Drone or clunk type noise - from the bottom of the vehicle	Loose or damaged exhaust isolators	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Exhaust grounded to chassis	INSPECT for signs of exhaust components-to-body contact. REPAIR or INSTALL new components as necessary.
Whistles, boom, hum or ticking type noise - noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	Exhaust system leak	INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a shop towel over the tail pipe outlet while listening for a leak. REPAIR or INSTALL new components as necessary.
	Catalytic converters	MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic

		converters. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	Exhaust muffler/resonator drain hole enlarged due to corrosion	CONFIRM the drain holes are the noise source. INSTALL new components as necessary.
Hissing or rushing noise - high frequency sound and the vehicle performance is unaffected	Exhaust system Exhaust flow through pipes	CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
Pinging noise - occurs when exhaust system is hot, engine turned off	Catalytic converters/exhaust system	Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
Vibration - occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise	Loose or damaged exhaust isolator	INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	Loose or damaged exhaust isolator hanger brackets	INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary.
	Exhaust system grounded to chassis	REPAIR or INSTALL new components as necessary.
Engine drumming noise - normally accompanied by vibration	Damaged or misaligned exhaust system	INSPECT the exhaust system for loose or damaged fasteners or isolators. REPAIR or INSTALL new components as necessary.
Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature	Damaged or worn exhaust system	INSPECT the exhaust system for leaks or damage. REPAIR as necessary.
Thumping noise - from the bottom of the vehicle, worse during acceleration	Misaligned exhaust system	CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary.

Engine vibration - is felt with increases and decreases in engine rpm	Strain on exhaust system isolators	REPAIR or INSTALL new components as necessary.
Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	Exhaust system vibration excites the body resonances inducing interior noise	REPAIR or INSTALL new components as necessary.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER LH

Special Tool(s) / General Equipment

	303-050 (T70P-6000) Lifting Bracket, Engine
	303-F072 Support Bar, Engine

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER LH > REMOVAL

NOTE: If the catalytic converter is not being replaced, the HO2S and the catalyst monitor sensor do not need to be removed from the catalytic converter. Disconnecting the electrical connectors is still necessary.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Clean all exhaust connections before reassembly.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery negative and positive cable. Refer to: Battery Disconnect and Connect .

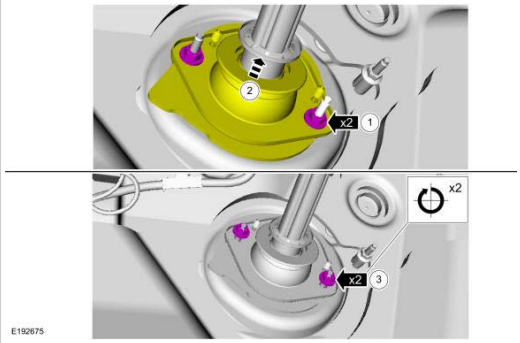
NOTE: Make sure to minimize damage to the sealer foam and avoid pulling apart dash seal brackets from retainer pins. Excessive damage may allow engine noise, fumes, air or water to enter the passenger compartment.

3.
Loosen the dash seal.

1.

Remove the nuts.

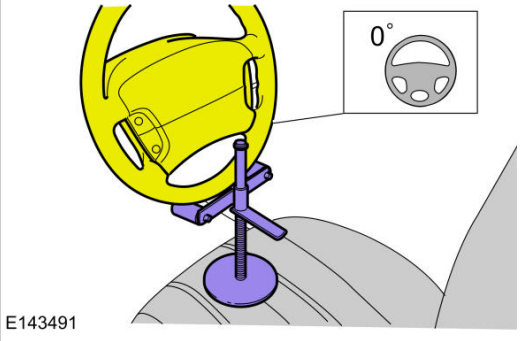
Torque



: 80 lb.in (9 Nm)

2.

Loosen the dash seal.

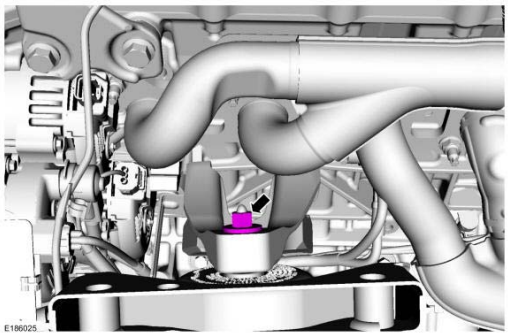


3.

Hand start the nuts.

4.

Steering wheel in straight ahead position.

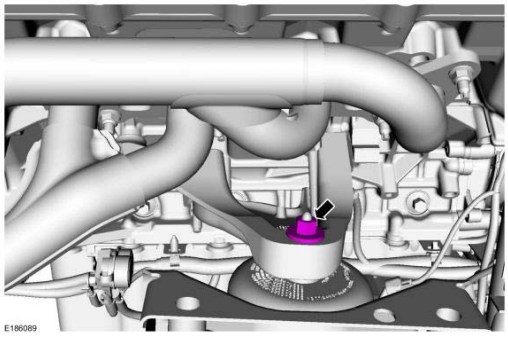


5.

Remove the LH motor mount nut.

Torque

: 46 lb.ft (63 Nm)

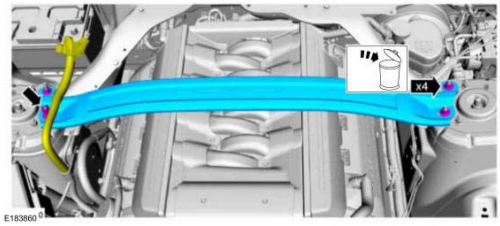


6.

Remove the RH motor mount nut.

Torque

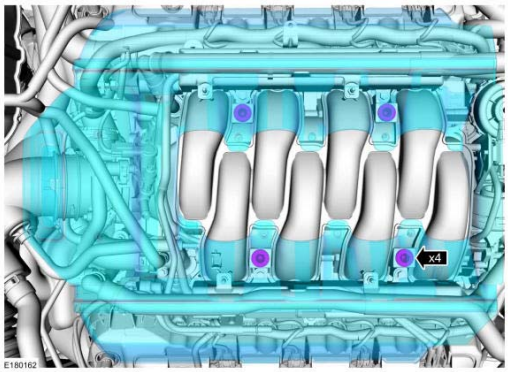
: 46 lb.ft (63 Nm)



7.

If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove and discard the nuts, remove the strut tower cross brace.



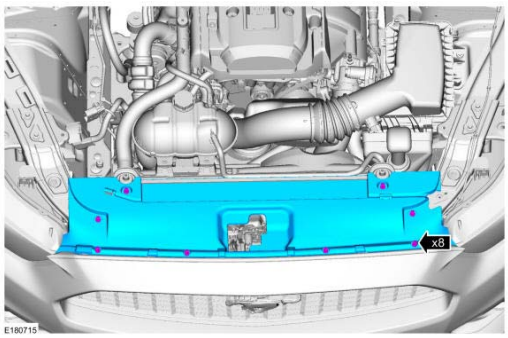
Torque

: 41 lb.ft (55 Nm)

8.

Remove the engine appearance cover.

9.

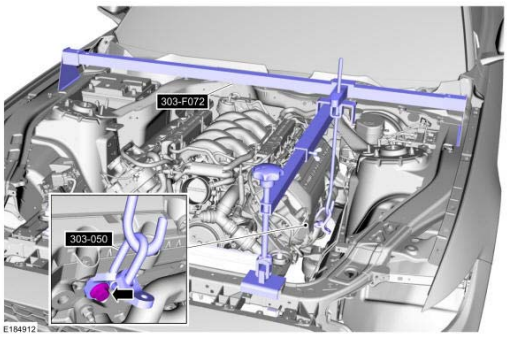


Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

10.

Remove the air cleaner. Refer to: AIR CLEANER - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

11.



Remove the retainers and the radiator sight shield.

NOTE: Do not position the legs of the Engine Support Bar on the fenders. Instead, the legs should be positioned on the body structure. Failure to follow these instructions may result in body damage.

12.
Install the special tools and raise the engine 50 mm (2 inch).

Use Special Service Tool: 303-F072 Support Bar, Engine, 303-050 (T70P-6000) Lifting Bracket, Engine.

13.

Detach the steering column lower shaft from the coupling.

NOTE: Vehicles equipped with LHD.

WARNING: DO NOT hammer, pry or force steering column and column shafts during installation or removal. Failure to follow this instruction may cause damage to steering components that could lead to loss of steering control during vehicle operation and could result in serious personal injury or death.

WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

1.

Remove and discard the bolt.

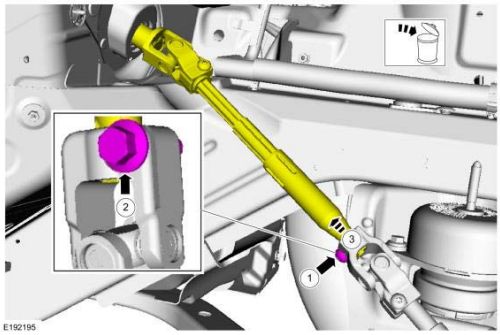
Torque

: 22 lb.ft (30 Nm)

NOTE: Vehicles equipped with RHD.

2.
Remove and discard the bolt.

Torque



: 35 lb.ft (47.5 Nm)

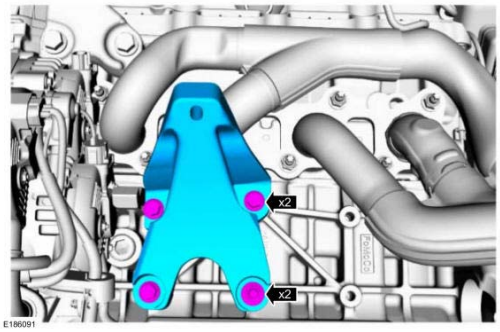
3.

Pull apart the steering column lower shaft from the coupling.

4.

After reassembly, inspect the steering column lower shaft. Refer to: Steering Column Collapsed Check .

14.



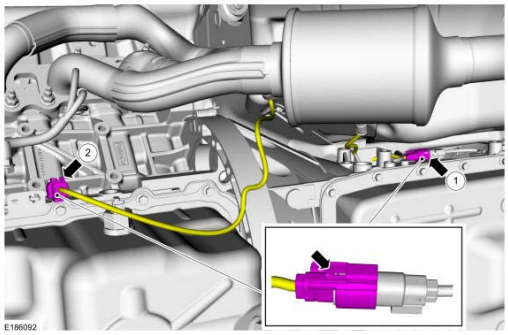
Remove the muffler inlet pipe. Refer to: Muffler Inlet Pipe .

15.

Remove the bolts and stud bolts and remove the LH motor mount bracket.

Torque

: 46 lb.ft (63 Nm)



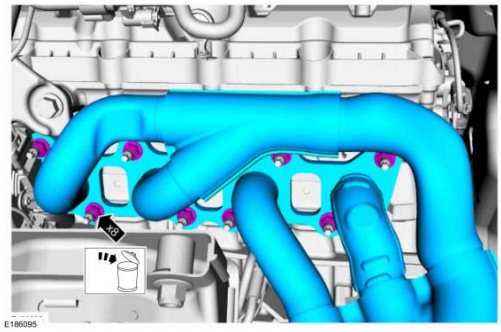
16.

1.

Disconnect the HO2S electrical connector.

2.

Disconnect the catalyst monitor sensor electrical connector.

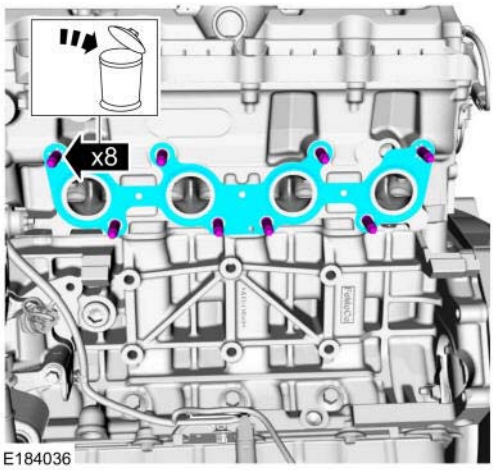


17.

Remove and discard the nuts, remove the LH catalytic converter.

Torque

: 24 lb.ft (32 Nm)



18.

Remove and discard the gasket and studs.

Torque

: 159 lb.in (18 Nm)

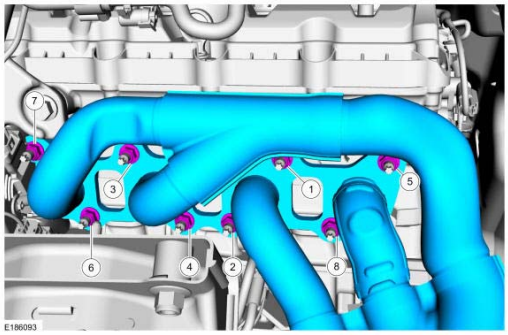
REMOVAL AND INSTALLATION > CATALYTIC CONVERTER LH > INSTALLATION

1.

To install, reverse the removal procedure.

2.

1.



Position the catalytic converter onto the engine and finger-tight the nuts.

2.

Tighten the nuts in the sequence shown in illustration below.

Torque

: 24 lb.ft (32 Nm)

3.

Check the exhaust system for leaks.

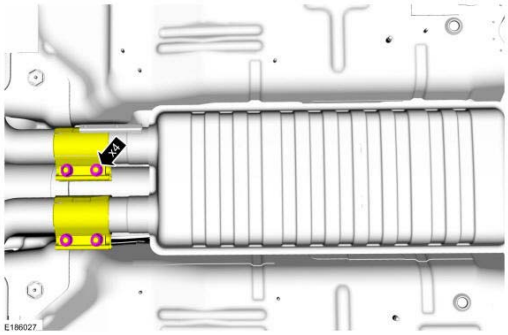
REMOVAL AND INSTALLATION > CATALYTIC CONVERTER RH > REMOVAL

NOTE: If the catalytic converter is not being replaced, the HO2S and the catalyst monitor sensor do not need to be removed from the catalytic converter. Disconnecting the electrical connectors is still necessary.

NOTE: Removal steps in this procedure may contain installation details.

NOTE: Clean all exhaust connections before reassembly.

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

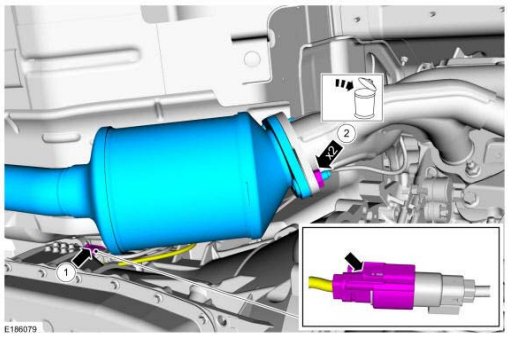
Loosen the clamps, release the tabs and slide the clamps back on the muffler. Separate the muffler and tailpipe from the RH catalytic converter and LH muffler inlet pipe.

Torque

: 35 lb.ft (48 Nm)

3.

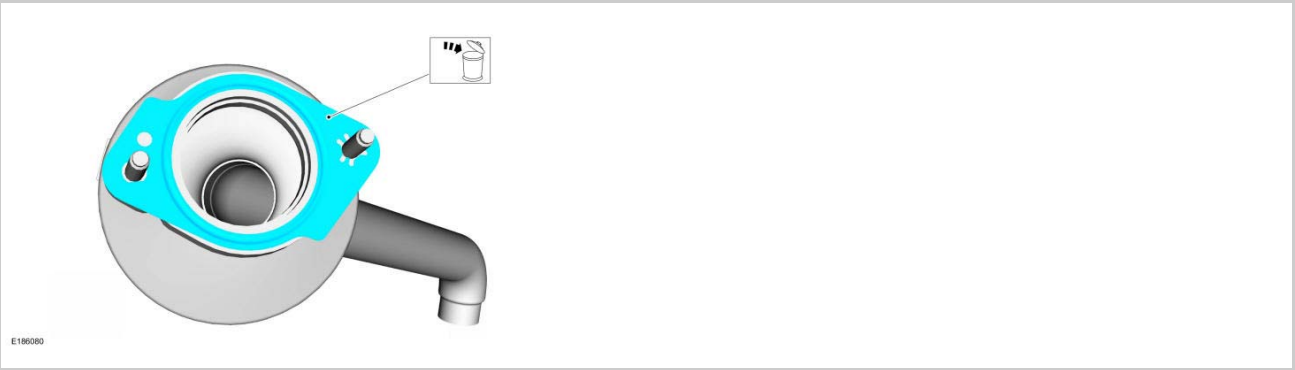
1.



Disconnect the catalyst monitor sensor electrical connector.

2.

Remove and discard the nuts and remove the catalytic convertor.



Torque

: 30 lb.ft (40 Nm)

4.

Remove and discard the gasket.

REMOVAL AND INSTALLATION > CATALYTIC CONVERTER RH > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Check the exhaust system for leaks.

Check the exhaust system for leaks.

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Pressure	
Engine running - 2.3L GTDi (Low pressure side)	50.8-75.4 psi (350-520 kPa)
Fuel Tank Capacity	
Fuel Tank Capacity - 2.3L GTDi	15.5 gal (58.67 L)

DESCRIPTION AND OPERATION > FUEL SYSTEM - OVERVIEW > OVERVIEW

The fuel system:

- is a Closed Loop Pressure Control Fuel System (CLPC)
- saddle-type fuel tank.
- has a Fuel Pump that operates on 6-12 volts depending on load, that supplies fuel under pressure to the high pressure Fuel Pump.
- has a lifetime fuel filter (serviced as part of the Fuel Pump and Sender Unit).
- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- has a supplemental refueling adapter located in the luggage compartment.
- has a high pressure Fuel Pump that supplies high pressure, low volume fuel pressure to the fuel rails.
- has a Fuel Pump Control Module located under the rear seat cushion LH side of the vehicle.
- has fuel tubes (liquid and vapor) mounted on the underside of the vehicle.
- uses separately controlled fuel injectors for each cylinder. The fuel injectors are mounted directly into the head.
- fuel injectors are supplied with pressurized fuel from the high pressure Fuel Pump to the fuel rail.
- has a Fuel Level Sensor
- has a serviceable Fuel Level Sender mounted on the Fuel Pump and Sender Unit.
- Fuel Pump and Sender Unit containing:
    - The electric Fuel Pump which provides pressurized fuel to the high pressure Fuel Pump (FP).

- The fuel level sender.
- A check valve which maintains system pressure after the pump is shut off.
- A pressure relief for overpressure protection in the event of restricted fluid flow.
- A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

Fuel Pump Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Unit Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the Fuel Pump Control Module. Signal communication between the RCM and the Fuel Pump Control Module allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART: FUEL SYSTEM

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods . for information regarding Ford-specific diagnostic practices.

> *NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns, Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .*

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART

Condition	Possible Sources	Actions
Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe vent tube, if equipped • EVAP system • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve (part of the fuel tank)	GO to Pinpoint Test A

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > NORMAL OPERATION AND FAULT CONDITIONS

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank air is vented through the filler pipe or the ORVR system.

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > PINPOINT TEST A: SLOW TO FILL

A1 CHECK COMPONENTS FOR SIGNS OF DAMAGE

Visually inspect the following components for signs of damage:

Fuel tank filler pipe

Fuel tank filler pipe vent tube, if equipped

EVAP system

Fuel level vent valve (part of the fuel tank)

Was the cause of the concern found?

Yes: REPAIR or INSTALL new components to correct the concern.

No: GO to A2

A2 CHECK THE SYSTEM FOR ANY EVAP (EVAPORATIVE EMISSION) DTC'S

Connect the scan tool.

Check the system for any EVAP DTC's.

Are any DTC's present?

Yes: Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

No: GO to A3

A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase .3 to .7 of a volt from its starting point.

Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank.

Is FTP within specification?

Yes: GO to A5

No: GO to A4

A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED

Disconnect the fuel tank-to-EVAP canister quick connect coupling at the EVAP canister.

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase .3 to .7 of a volt from its starting point.

Monitor the FTP reference value while filling the fuel tank. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

Is FTP within specification?

Yes: INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL new EVAP system components.

No: GO to A5

A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION

Remove the fuel tank filler pipe assembly. REFER to: FUEL TANK FILLER PIPE .

Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction.

Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?

Yes: If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube.

No: GO to A6

A6 CHECK THE FUEL TANK INLET CHECK VALVE

Inspect the fuel tank inlet check valve for restriction or sticking.

Is the fuel tank inlet check valve restricted or sticking?

Yes: If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to: FUEL TANK .

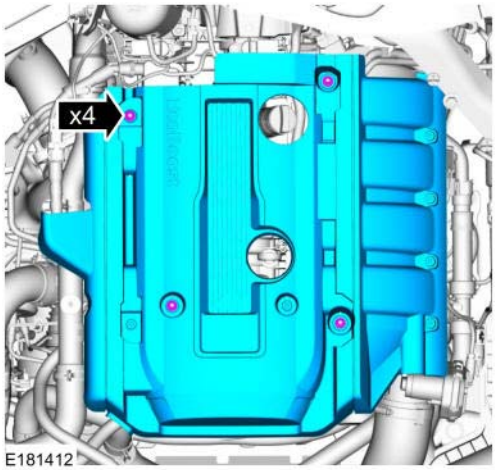
No: INSTALL a new fuel tank.

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE CHECK

Special Tool(s) / General Equipment

	310-D009 (D95L-7211-A) Fuel Pressure Test Kit

Check



NOTE: This Fuel System Pressure Check is for the low pressure side of the system.

1.

Remove the nuts and the engine appearance cover.

Torque

: 80 lb.in (9 Nm)

2.

Release the fuel system pressure. Refer to: Fuel System Pressure Release .

3.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

4.

Disconnect the fuel jumper tube-to-high pressure pump quick release coupling. Refer to: Quick Release Coupling .

5.

Install the Fuel Pressure Test Kit between the fuel jumper tube and the high pressure fuel pump.

Use Special Service Tool: 310-D009 (D95L-7211-A) Fuel Pressure Test Kit.

NOTE: The FPDM electrical connector was previously disconnected to release the fuel system pressure and must be reconnected to test the fuel system pressure.

6.
Reconnect the FPDM electrical connector.

7.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to completing the fuel system pressure test.

8.
Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to SPECIFICATIONS .

9.

After completion of the fuel system pressure test, disconnect the battery ground cable, open the drain valve on the Fuel Pressure Test Kit and release any residual fluid into an appropriate container. Refer to: Battery Disconnect and Connect .

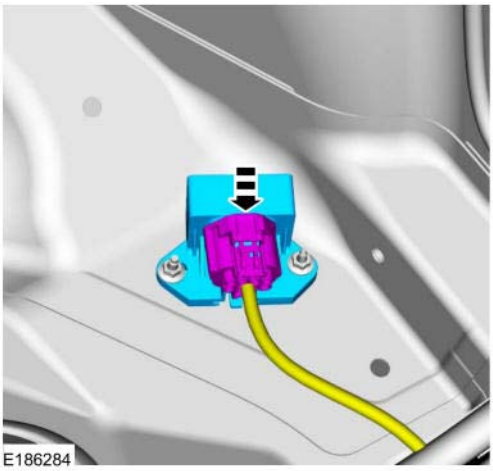
10.

Remove the Fuel Pressure Test Kit by reversing the installation steps.

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE RELEASE

Fuel System Pressure Release

Pressure release



NOTE: The FPDM is located on the LH side, beneath the rear seat cushion.

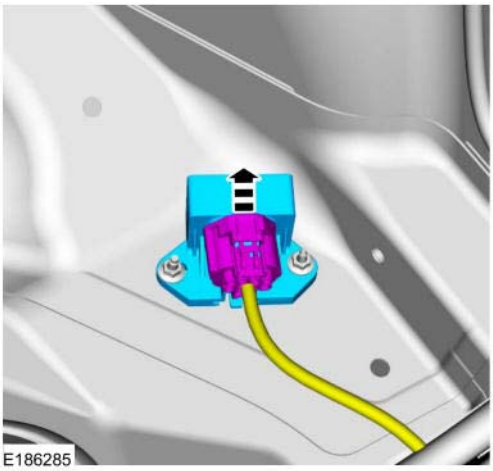
1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

NOTE: On vehicles equipped with Gasoline Turbocharged Direct Injection (GTDI), running the engine with the FPDM disconnected will remove most of the pressure from both the low and high pressure sides of the system.

2.
Disconnect the FPDM electrical connector.

3.



Start the engine and allow it to idle until the engine stalls.

4.

Turn the ignition switch to the off position.

5.

When the fuel system service is complete, reconnect the FPDM electrical connector.

6.

Install the rear seat cushion. Refer to: Rear Seat Cushion .

7.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

8.

When service on the fuel system is complete, start the engine and check for leaks.

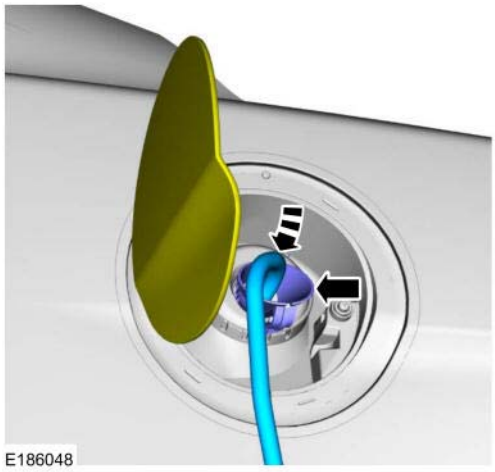
GENERAL PROCEDURES > FUEL TANK DRAINING

Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM
	310-123 Locking Ring, Fuel Tank TKIT-2004J-F TKIT-2005U-LM

Draining

1.



Release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

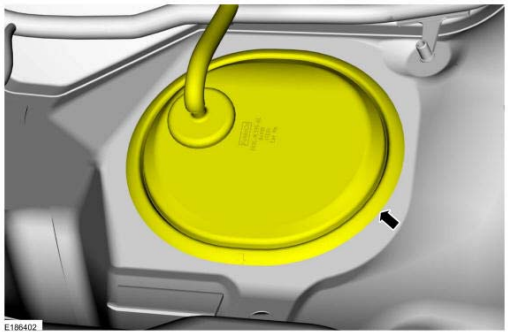
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

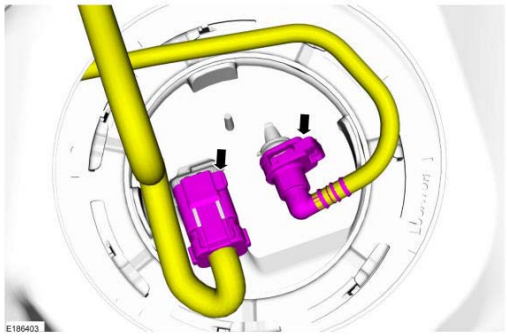
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

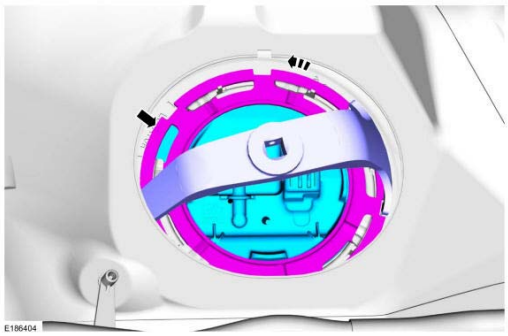
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

Remove the access cover and position aside.

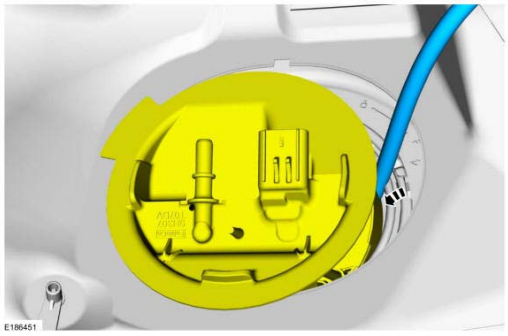
7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling .

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.

8.
Using the lock ring wrench remove the Fuel Pump and Sender Unit lock ring.



Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

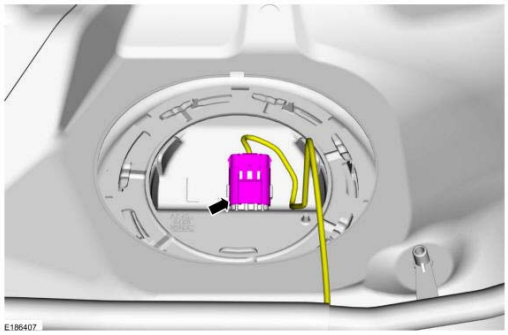
NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.

Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

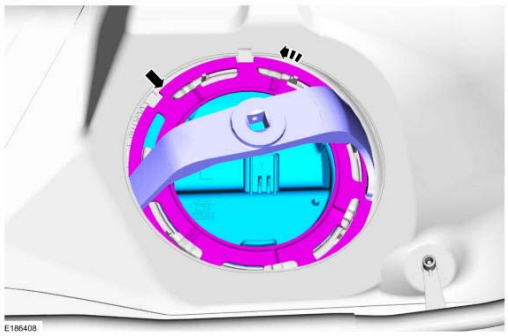
10.
Remove and discard the Fuel Pump and Sender Unit O-ring seal.



11.

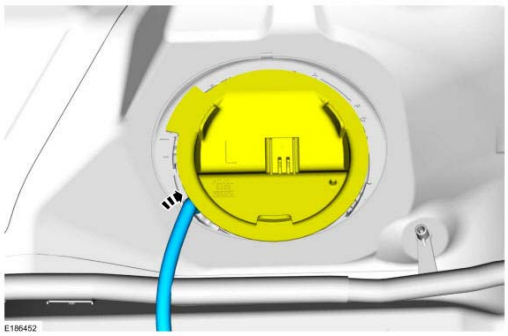
Remove the access cover and position aside.

NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.



12.
Disconnect the electrical connector.

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the fuel level sensor when removing the lock ring.



13.
Using the special tool remove the fuel level sensor lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

NOTE: The fuel level sensor must be handled carefully to avoid damage to the float arm.

14.
Position the fuel level sensor aside. Using the Fuel Storage Tanker, completely drain the RH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Level Sensor flange and fuel tank O-ring

seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Level Sensor or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

15.
Remove and discard the O-ring seal.

GENERAL PROCEDURES > QUICK RELEASE COUPLING

Disconnect

NOTE: When reusing liquid or vapor tube connections, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.

NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

NOTE: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

*NOTE: **Type 1***

1.

If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

4.

Connect

1.

Inspect and clean both quick coupling ends.

NOTE: Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

2.
Press the retainer clip into the quick connect coupling body until flush and the tabs are locked in place.

3.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

Disconnect

NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

NOTE: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

*NOTE: **Type 8***

1.

If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

1.

Release the secondary locking tab.

2.

Depress the primary locking tab.

3.

Separate the quick release coupling from the tube.

Connect

1.

1.

Push the quick release coupling onto the tube.

> *NOTE: Pull on the quick release coupling and the fitting to make sure it is securely fastened.*

2.
Lock the secondary locking tab.

2.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

GENERAL PROCEDURES > SPRING LOCK COUPLINGS

Special Tool(s) / General Equipment

	310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling TKIT-1990-LMH

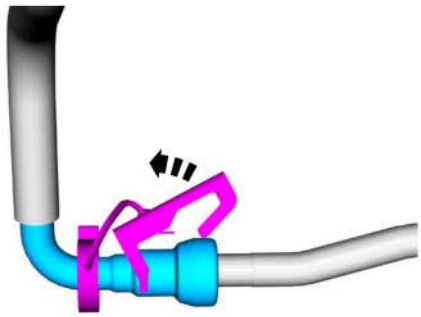
Disconnect

> *NOTE: When reusing liquid or vapor tube connectors, make sure to use compressed air*

to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.

1.



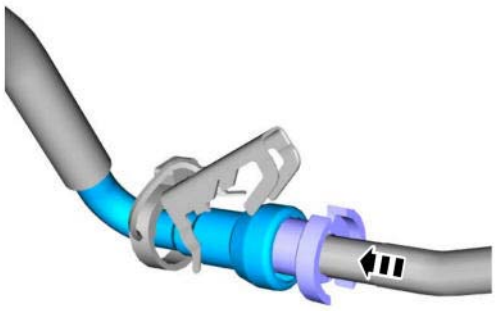
If servicing a liquid fuel tube spring lock coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

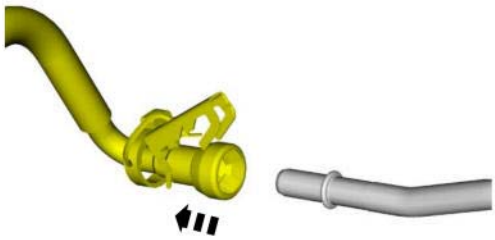
If equipped, remove the fuel tube safety clip.



E186838

4.

Install the Spring Lock Coupling Disconnect Tool on the tube and push into the spring lock coupling to release.

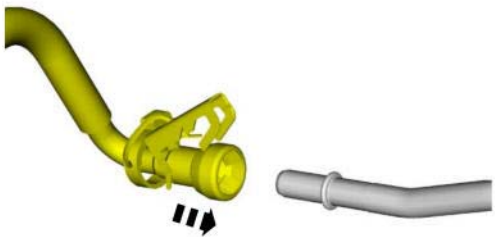


Use Special Service Tool: 310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling.

E186839

5.

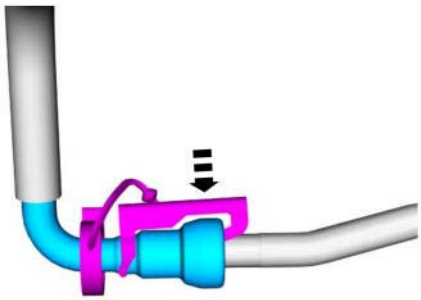
Separate the spring lock coupling from the tube.



E186840

Connect

1.



Align and push the spring lock coupling onto the tube until fully seated.

E186841

2.

If equipped, install the fuel tube safety clip.

E186842

3.

Pull on the coupling to make sure it is fully engaged.

4.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Pressure	
Engine running - 3.7L Duratec, 5.0L Ti-VCT	53.1-63.1 psi (366-435 kPa)
Fuel Tank Capacity	
Fuel Tank Capacity - 3.7L Duratec, 5.0L Ti-VCT	16.0 gal (60.55 L)

DESCRIPTION AND OPERATION > FUEL SYSTEM - OVERVIEW > OVERVIEW

The fuel system consists of the :

- saddle-type fuel tank.
- quick connect fuel and vapor tube couplings.
- has a supplemental refueling adapter located in the luggage compartment.
- fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- has a Fuel Pump Control Module located under the rear seat cushion LH side of the vehicle.
- fuel rail.
- fuel injectors.
- Fuel Tank Pressure (FTP) sensor (part of the fuel vapor tube assembly).
- Mechanical Returnless Fuel System (MRFS).
- Fuel Level Sensor
- Fuel Pump and Sender Unit containing:
    - The electric FP module which provides pressurized fuel to the high pressure Fuel Pump (FP).
    - The Fuel Level Sender.
    - A check valve which maintains system pressure after the pump is shut off.
    - A pressure relief for overpressure protection in the event of restricted fluid flow.
    - A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

Fuel Pump Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Unit Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the Fuel Pump Control Module. Signal communication between the RCM and the Fuel Pump Control Module allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART: FUEL SYSTEM

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods for information regarding Ford-specific diagnostic practices.

> *NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns, refer to Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .*

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART

Condition	Possible Sources	Actions
Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe vent tube, if equipped • EVAP system • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve (part of the fuel tank)	Refer to GO to Pinpoint Test A
All other fuel system concerns	Fuel system components	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > NORMAL OPERATION AND FAULT CONDITIONS

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank air is vented through the filler pipe or the ORVR system.

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > PINPOINT TEST A : SLOW TO FILL

A1 CHECK COMPONENTS FOR SIGNS OF DAMAGE

Visually inspect the following components for signs of damage:

Fuel tank filler pipe

Fuel tank filler pipe Fuel tank filler pipe vent tube, if equipped

EVAP system

Fuel tank inlet check valve (part of the fuel tank)

Fuel level vent valve (part of the fuel tank)

Was the cause of the concern found?

Yes: REPAIR or INSTALL new components to correct the concern.

No: GO to A2

A2 CHECK THE SYSTEM FOR ANY EVAP (EVAPORATIVE EMISSION) DTC'S

Connect the scan tool.

Check the system for any EVAP DTC's.

Are any DTC's present?

Yes: Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

No: GO to A3

A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase.3 to.7 of a volt from its starting point.

Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank. Refer to the ENGINE CONTROLS - REFERENCE VALUES (EXCEPT DIESEL & HYBRID) .

Is FTP within specification?

Yes: GO to A5

No: GO to A4

A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED

Disconnect the fuel tank-to-EVAP canister quick connect coupling at the EVAP canister.

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase.3 to.7 of a volt from its starting point.

Monitor the FTP reference value while filling the fuel tank. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

Is FTP within specification?

Yes: INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL new EVAP system components.

No: GO to A5

A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION

Remove the fuel tank filler pipe assembly. REFER to: FUEL TANK FILLER PIPE - 3.7L Duratec (227kW/301PS).

Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction.

Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?

Yes: If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube.

No: GO to A6

A6 CHECK THE FUEL TANK INLET CHECK VALVE

Inspect the fuel tank inlet check valve for restriction or sticking.

Is the fuel tank inlet check valve restricted or sticking?

Yes: If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to: FUEL TANK .

No: INSTALL a new fuel tank.

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE CHECK

Special Tool(s) / General Equipment

	310-D009 (D95L-7211-A) Fuel Pressure Test Kit

Check

NOTE: This Fuel System Pressure Check is for the low pressure side of the system.

1.

Release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

Disconnect the fuel jumper tube-to-fuel rail quick release coupling. Refer to: Quick Release Coupling .

4.

Install the Fuel Pressure Test Kit between the fuel jumper tube and the fuel rail.

Use Special Service Tool: 310-D009 (D95L-7211-A) Fuel Pressure Test Kit.

E185940

NOTE: The FPDM electrical connector was previously disconnected to release the fuel system pressure and must be reconnected to test the fuel system pressure.

5.
Reconnect the FPDM electrical connector.

6.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

> *NOTE: Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to completing the fuel system pressure test.*

7.
Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to SPECIFICATIONS .

8.

After completion of the fuel system pressure test, disconnect the battery ground cable, open the drain valve on the Fuel Pressure Test Kit and release any residual fluid into an appropriate container. Refer to: Battery Disconnect and Connect .

9.

Remove the Fuel Pressure Test Kit by reversing the installation steps.

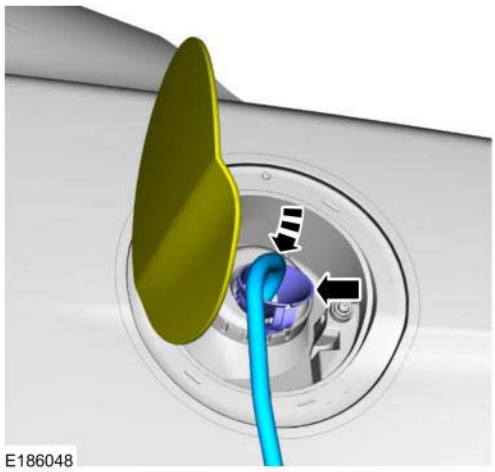
GENERAL PROCEDURES > FUEL TANK DRAINING

Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM
 E80148	310-123 Locking Ring, Fuel Tank TKIT-2004J-F TKIT-2005U-LM

Draining

1.



Release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

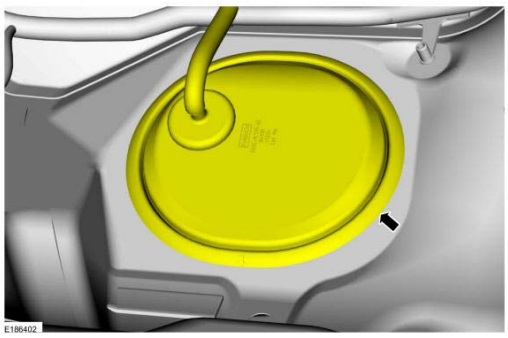
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

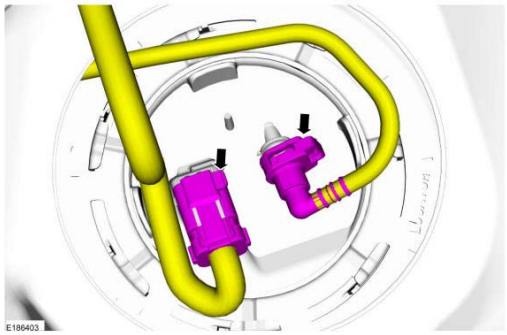
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

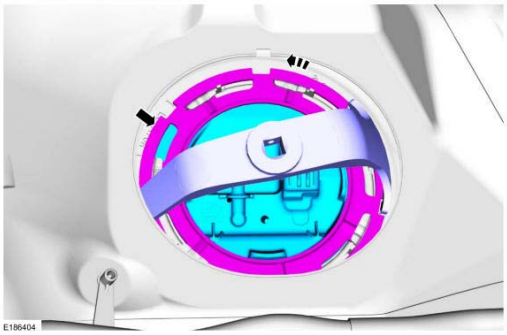
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

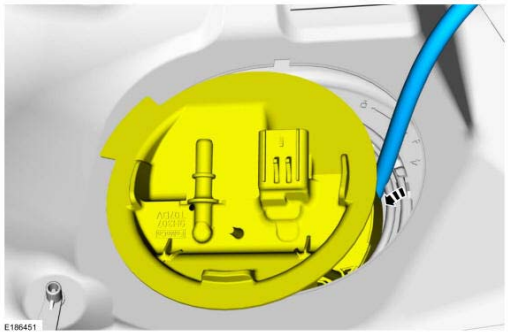
Remove the Fuel Pump and Sender Unit access cover and position aside.

7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling .

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.



8.
Using the lock ring wrench remove the Fuel Pump and Sender Unit lock ring.

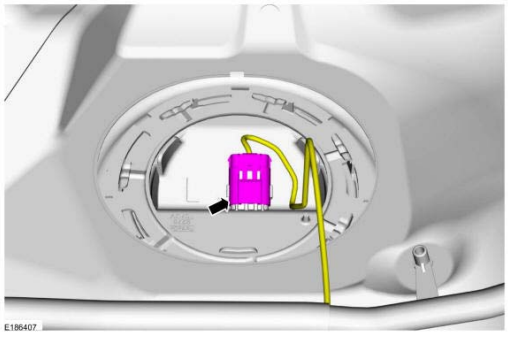
Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.
Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

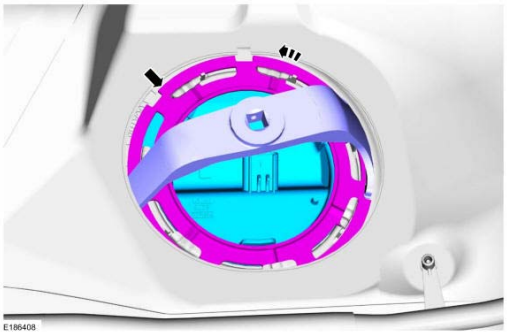
NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

10.
Remove and discard the Fuel Pump and Sender Unit O-ring seal.



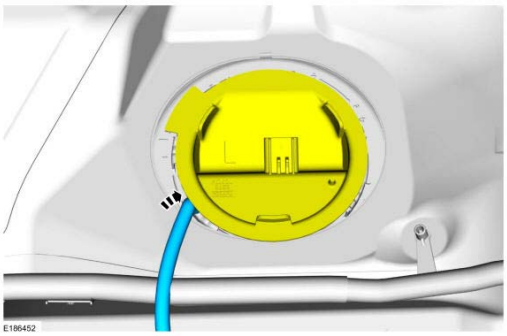
11.

Remove the Fuel Level Sensor access cover and position aside.



NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.

12.
Disconnect the electrical connector.



NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the fuel level sensor when removing the lock ring.

13.
Using the lock ring wrench remove the fuel level sensor lock ring.

NOTE: The fuel level sensor must be handled carefully to avoid damage to the float arm.

14.
Position the fuel level sensor aside. Using the Fuel Storage Tanker, completely drain the RH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Level Sensor flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Level Sensor or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

15.
Remove and discard the Fuel Level Sensor O-ring seal.

GENERAL PROCEDURES > QUICK RELEASE COUPLING

Disconnect

NOTE: When reusing liquid or vapor tube connections, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.

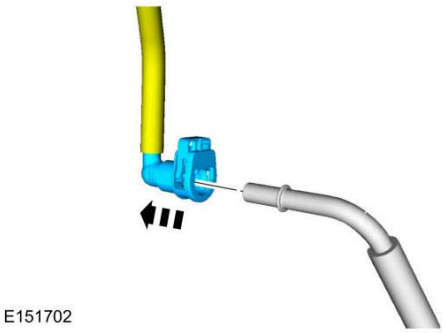
NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

NOTE: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

NOTE: ***Type 1***

1.

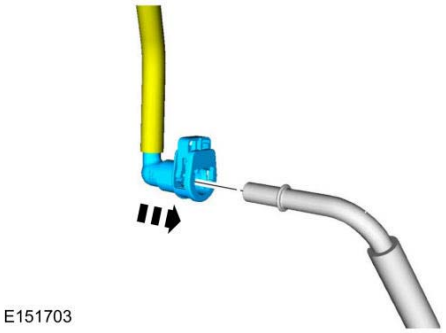
If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .



2.

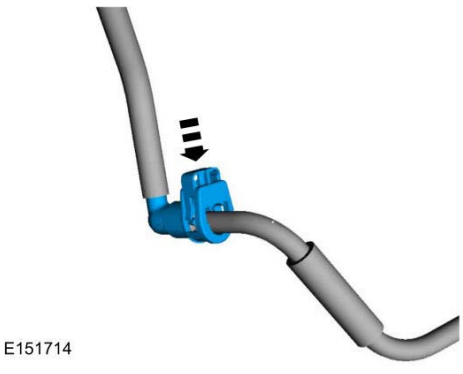
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.



4.

Connect



1.

Inspect and clean both quick coupling ends.

NOTE: Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

2.
Press the retainer clip into the quick connect coupling body until flush and the tabs are locked in place.

3.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

Disconnect

Separate the quick release coupling from the tube.

Connect

1.

1.

Push the quick release coupling onto the tube.

NOTE: Pull on the quick release coupling and the fitting to make sure it is securely fastened.

2.
Lock the secondary locking tab.

2.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

GENERAL PROCEDURES > SPRING LOCK COUPLINGS

Special Tool(s) / General Equipment

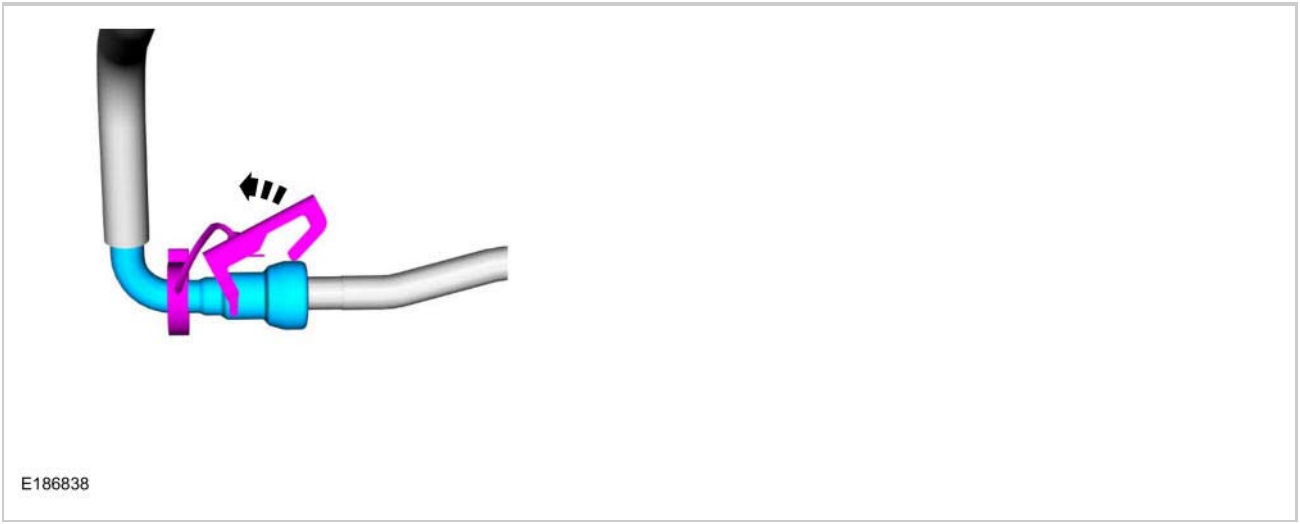
	310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling TKIT-1990-LMH

Disconnect

NOTE: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.

1.



If servicing a liquid fuel tube spring lock coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .

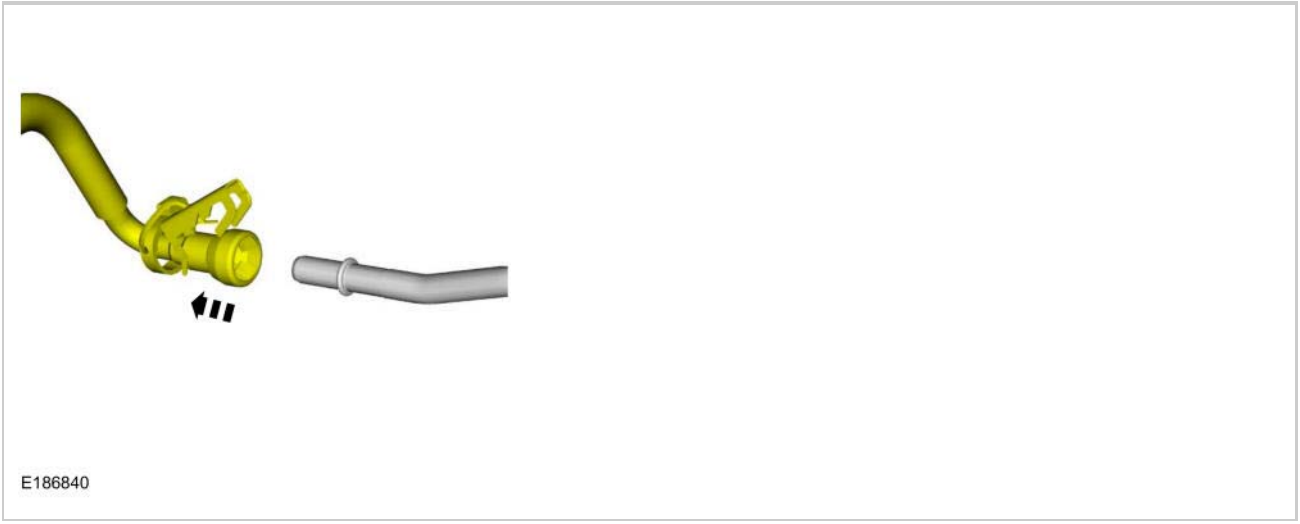
2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

If equipped, remove the fuel tube safety clip.

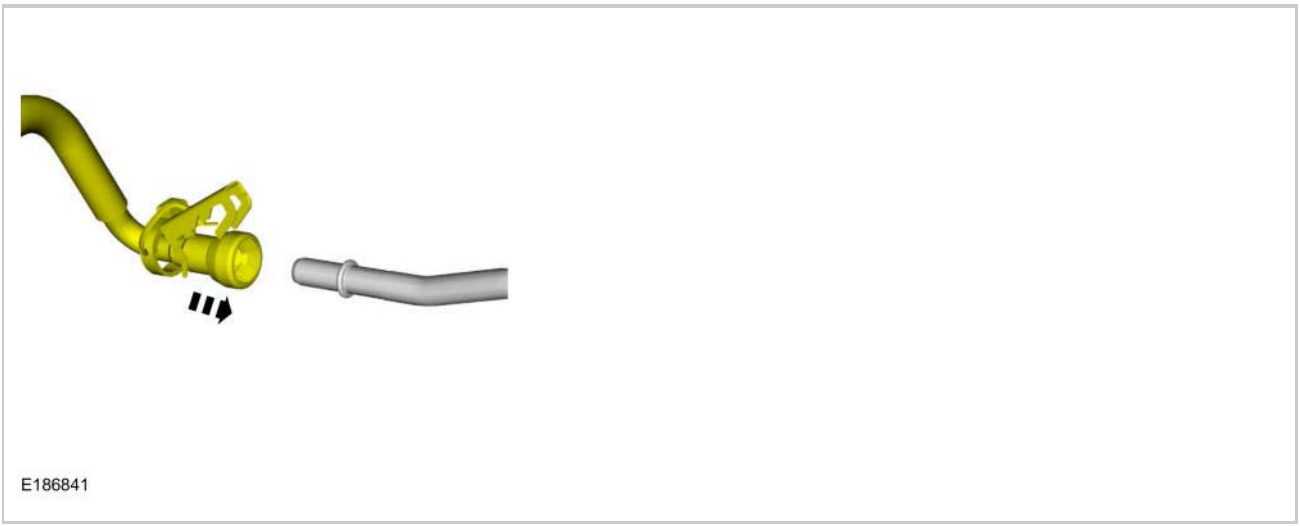
4.



Install the Spring Lock Coupling Disconnect Tool on the tube and push into the spring lock coupling to release.

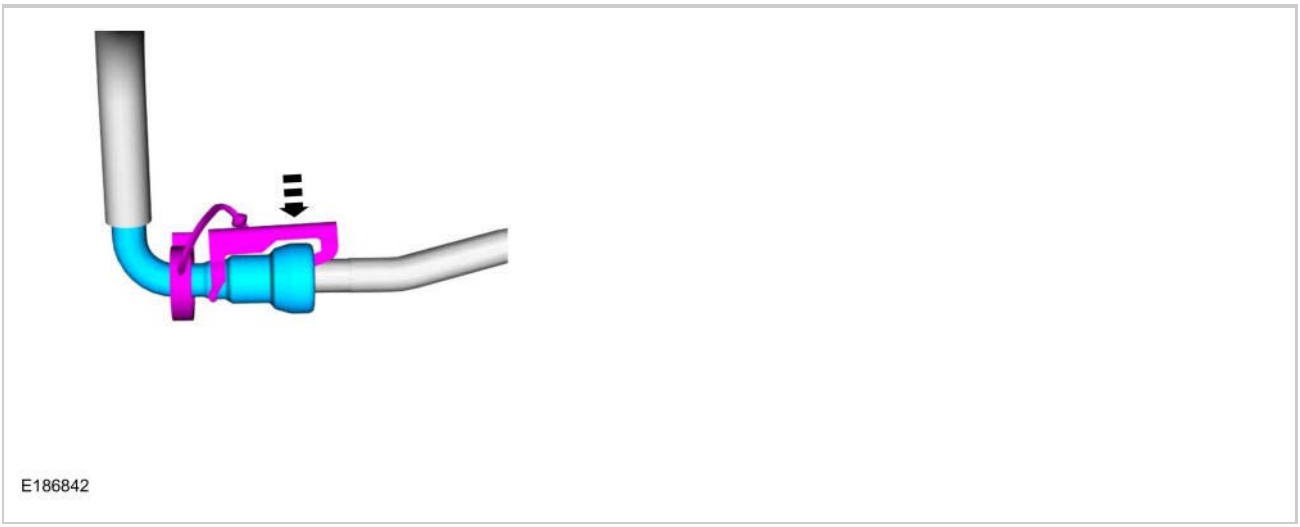
Use Special Service Tool: 310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling.

5.



Separate the spring lock coupling from the tube.

Connect



1.

Align and push the spring lock coupling onto the tube until fully seated.

2.

If equipped, install the fuel tube safety clip.

3.

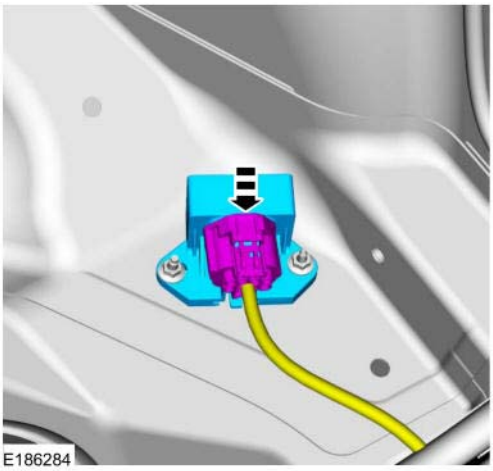
Pull on the coupling to make sure it is fully engaged.

4.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE RELEASE

Pressure release



NOTE: The FPDM is located on the LH side, beneath the rear seat cushion.

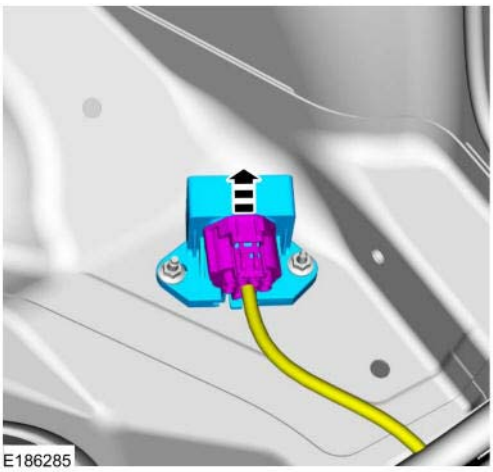
1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

NOTE: On vehicles equipped with Gasoline Turbocharged Direct Injection (GTDI), running the engine with the FPDM disconnected will remove most of the pressure from both the low and high pressure sides of the system.

2.
Disconnect the FPDM electrical connector.

3.



Start the engine and allow it to idle until the engine stalls.

4.

Turn the ignition switch to the off position.

5.

When the fuel system service is complete, reconnect the FPDM electrical connector.

6.

Install the rear seat cushion. Refer to: Rear Seat Cushion .

7.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

8.

When service on the fuel system is complete, start the engine and check for leaks.

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Pressure	
Engine running - 3.7L Duratec, 5.0L Ti-VCT	53.1-63.1 psi (366-435 kPa)
Fuel Tank Capacity	
Fuel Tank Capacity - 3.7L Duratec, 5.0L Ti-VCT	16.0 gal (60.55 L)

DESCRIPTION AND OPERATION > FUEL SYSTEM - OVERVIEW > OVERVIEW

The fuel system consists of the :

- saddle-type fuel tank.
- quick connect fuel and vapor tube couplings.
- has a supplemental refueling adapter located in the luggage compartment.
- fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- has a Fuel Pump Control Module located under the rear seat cushion LH side of the vehicle.
- fuel rail.
- fuel injectors.
- Fuel Tank Pressure (FTP) sensor (part of the fuel vapor tube assembly).
- Mechanical Returnless Fuel System (MRFS).
- Fuel Level Sensor
- Fuel Pump (FP) module containing:
    - The electric FP module which provides pressurized fuel to the high pressure Fuel Pump (FP).
    - The Fuel Level Sender.
    - A check valve which maintains system pressure after the pump is shut off.
    - A pressure relief for overpressure protection in the event of restricted fluid flow.
    - A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

Fuel Pump Shut-off Feature

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Unit Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the Fuel Pump Control Module. Signal communication between the RCM and the Fuel Pump Control Module allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART: FUEL SYSTEM

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods . for information regarding Ford-specific diagnostic practices.

> *NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns, refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .*

DIAGNOSIS AND TESTING > FUEL SYSTEM > SYMPTOM CHART(S) > SYMPTOM CHART

Condition	Possible Sources	Actions
Slow to fill	• Fuel tank filler pipe • Fuel tank filler pipe vent tube, if equipped • EVAPsystem • Fuel tank inlet check valve (part of the fuel tank) • Fuel level vent valve (part of the fuel tank)	GO to Pinpoint Test A
All other fuel system concerns	Fuel system components	Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > NORMAL OPERATION AND FAULT CONDITIONS

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank air is vented through the filler pipe or the ORVR system.

DIAGNOSIS AND TESTING > FUEL SYSTEM > PINPOINT TEST > PINPOINT TEST A: SLOW TO FILL > PINPOINT TEST A : SLOW TO FILL

A1 CHECK COMPONENTS FOR SIGNS OF DAMAGE

Visually inspect the following components for signs of damage:

Fuel tank filler pipe

Fuel tank filler pipe vent tube, if equipped

EVAP system

Fuel tank inlet check valve (part of the fuel tank)

Fuel level vent valve (part of the fuel tank)

Was the cause of the concern found?

Yes: REPAIR or INSTALL new components to correct the concern.

No: GO to A2

A2 CHECK THE SYSTEM FOR ANY EVAP (EVAPORATIVE EMISSION) DTC'S

Connect the scan tool.

Check the system for any EVAP DTC's.

Are any DTC's present?

Yes: Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

No: GO to A3

A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase .3 to .7 of a volt from its starting point. Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank. Refer to the ENGINE CONTROLS - REFERENCE VALUES (EXCEPT DIESEL & HYBRID) .

Is FTP within specification?

Yes: GO to A5

No: GO to A4

A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED

Disconnect the fuel tank-to-EVAP canister quick connect coupling at the EVAP canister.

NOTE: During normal fuel fill the Fuel Tank Pressure (FTP) Sensor value starts at 2.6 volts and will increase .3 to .7 of a volt from its starting point.

Monitor the FTP reference value while filling the fuel tank. Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

Is FTP within specification?

Yes: INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL new EVAP system components.

No: GO to A5

A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION

Remove the fuel tank filler pipe assembly. REFER to: FUEL TANK FILLER PIPE .

Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction.

Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?

Yes: If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube.

No: GO to A6

A6 CHECK THE FUEL TANK INLET CHECK VALVE

Inspect the fuel tank inlet check valve for restriction or sticking.

Is the fuel tank inlet check valve restricted or sticking?

Yes: If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to: FUEL TANK .

No: INSTALL a new fuel tank.

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE CHECK

Special Tool(s) / General Equipment

	310-D009 (D95L-7211-A) Fuel Pressure Test Kit

Check

NOTE: This Fuel System Pressure Check is for the low pressure side of the system.

1.

Release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

Disconnect the fuel jumper tube-to-fuel rail quick release coupling. Refer to: Quick Release Coupling .

4.

Install the Fuel Pressure Test Kit between the fuel jumper tube and the fuel rail.

Use Special Service Tool: 310-D009 (D95L-7211-A) Fuel Pressure Test Kit.

NOTE: The FPDM electrical connector was previously disconnected to release the fuel system pressure and must be reconnected to test the fuel system pressure.

5.
Reconnect the FPDM electrical connector.

6.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to completing the fuel system pressure test.

7.
Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to SPECIFICATIONS .

8.

After completion of the fuel system pressure test, disconnect the battery ground cable, open the drain valve on the Fuel Pressure Test Kit and release any residual fluid into an appropriate container. Refer to: Battery Disconnect and Connect .

9.

Remove the Fuel Pressure Test Kit by reversing the installation steps.

GENERAL PROCEDURES > FUEL TANK DRAINING

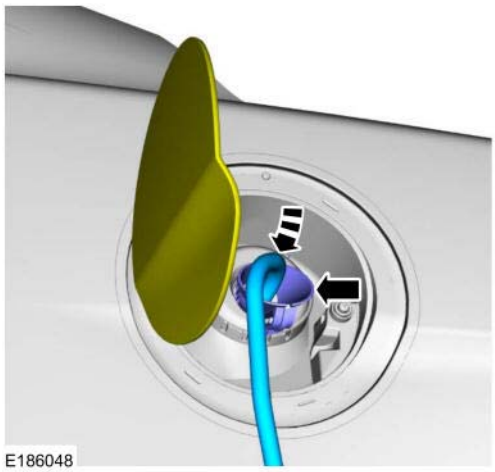
Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM
 E80148	310-123 Locking Ring, Fuel Tank TKIT-2004J-F TKIT-2005U-LM

Draining

1.

Release the fuel system pressure. Refer to: Fuel System Pressure Release .



2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

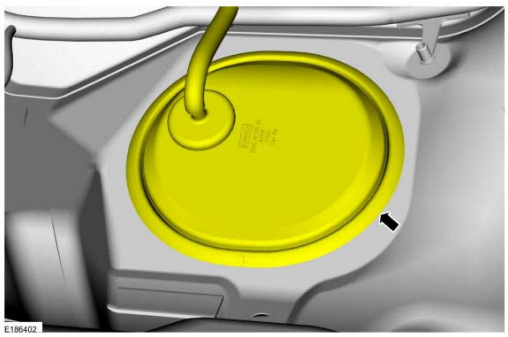
NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into

the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

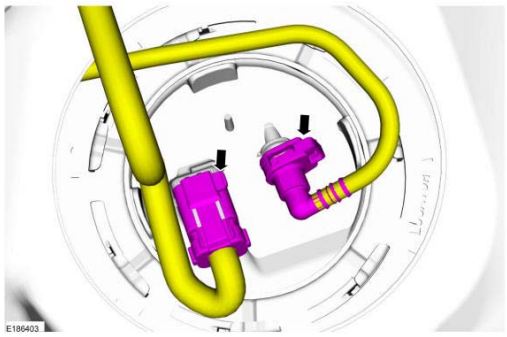
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

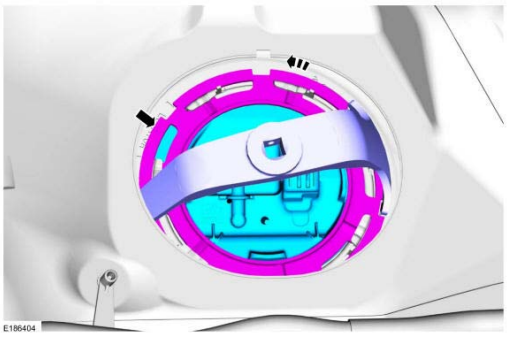
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

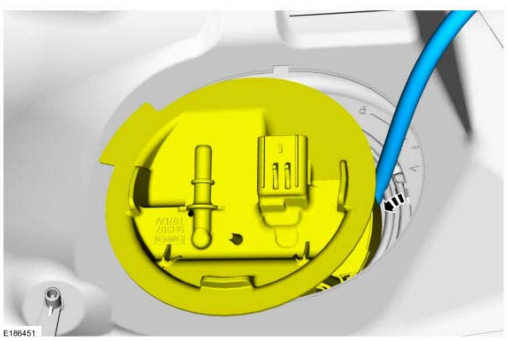
Remove the access cover and position aside.

7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling .

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.



8.
Using the special tool remove the Fuel Pump and Sender Unit lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

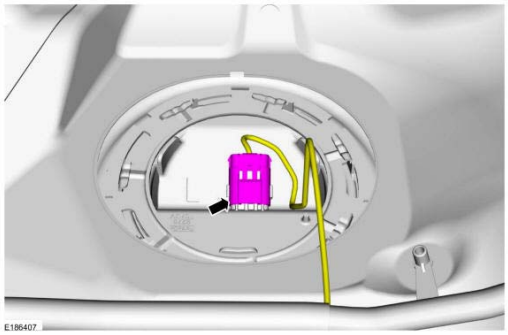
NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.
Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel

tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

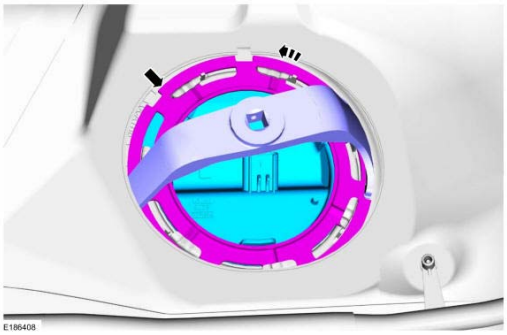
10.
Remove and discard the O-ring seal.



11.

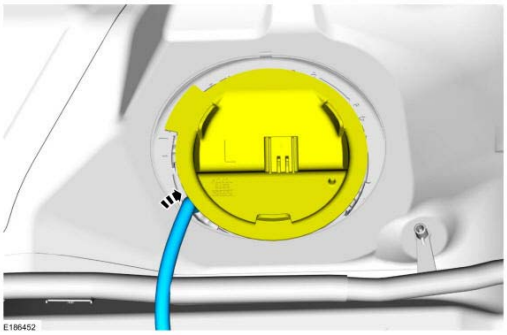
Remove the access cover and position aside.

NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.



12.
Disconnect the electrical connector.

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the fuel level sensor when removing the lock ring.



13.
Using the special tool remove the fuel level sensor lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

NOTE: The fuel level sensor must be handled carefully to avoid damage to the float arm.

14.
Position the fuel level sensor aside. Using the Fuel Storage Tanker, completely drain the RH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Level Sensor flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Level Sensor or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

15.
Remove and discard the Fuel Level Sensor O-ring seal.

GENERAL PROCEDURES > QUICK RELEASE COUPLING

Disconnect

NOTE: When reusing liquid or vapor tube connections, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur.

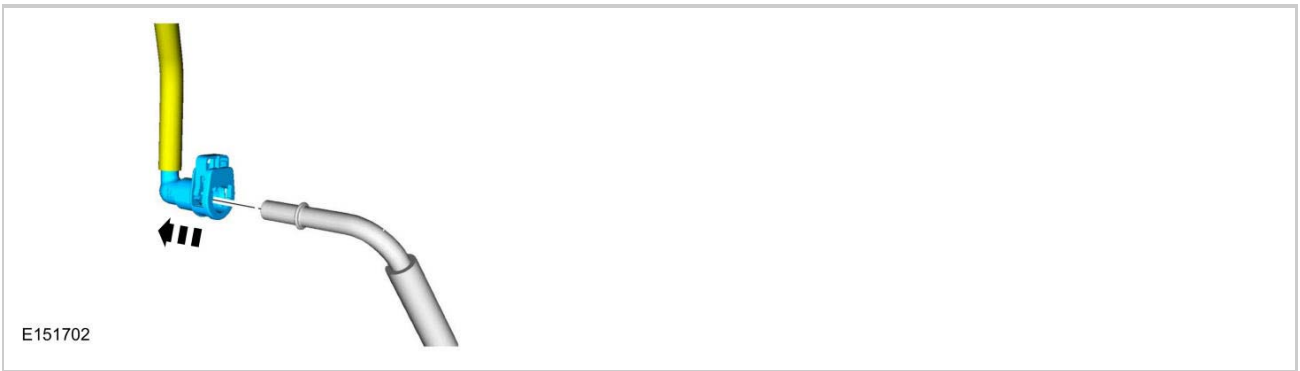
NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install blanking plugs to any open orifices or tubes.

NOTE: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

NOTE: ***Type 1***

1.

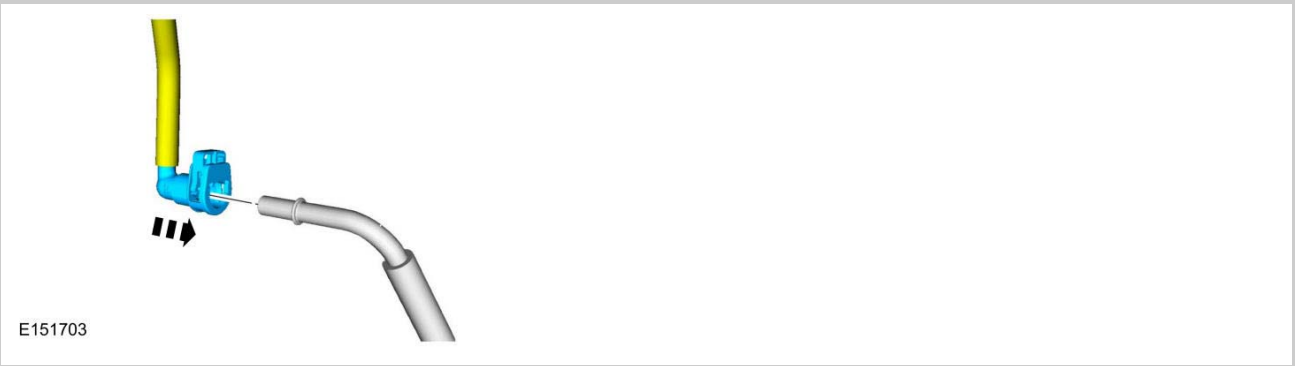
If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .



2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.



4.

Connect

1.

Inspect and clean both quick coupling ends.

NOTE: Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

2.
Press the retainer clip into the quick connect coupling body until flush and the tabs are locked in place.

3.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

Disconnect

Release the secondary locking tab.

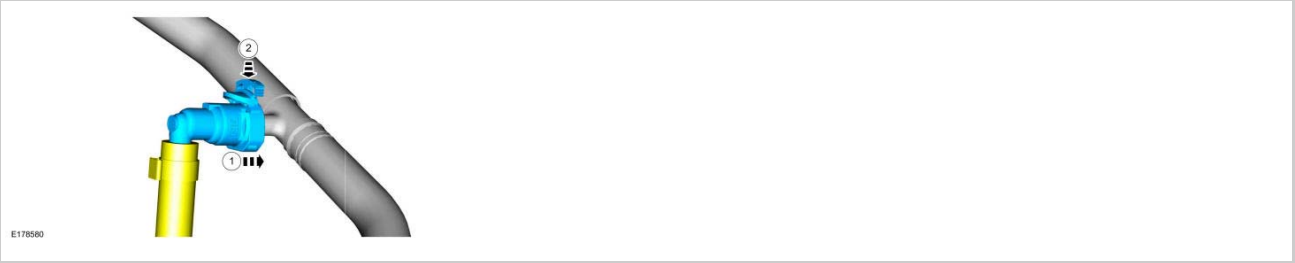
2.

Depress the primary locking tab.

3.

Separate the quick release coupling from the tube.

Connect



1.

1.

Push the quick release coupling onto the tube.

> *NOTE: Pull on the quick release coupling and the fitting to make sure it is securely fastened.*

2.
Lock the secondary locking tab.

2.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

GENERAL PROCEDURES > SPRING LOCK COUPLINGS

Special Tool(s) / General Equipment

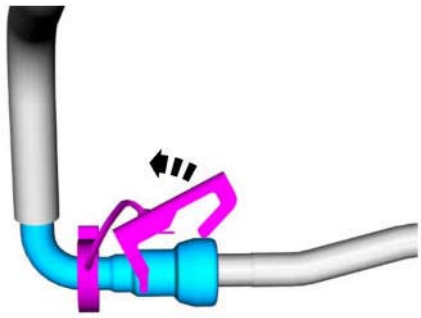
	310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling TKIT-1990-LMH

Disconnect

NOTE: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

NOTE: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.

1.



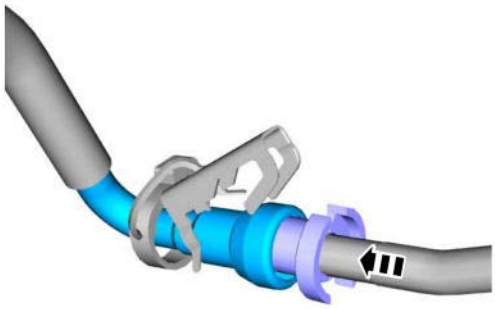
If servicing a liquid fuel tube spring lock coupling, release the fuel system pressure. Refer to: Fuel System Pressure Release .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

If equipped, remove the fuel tube safety clip.

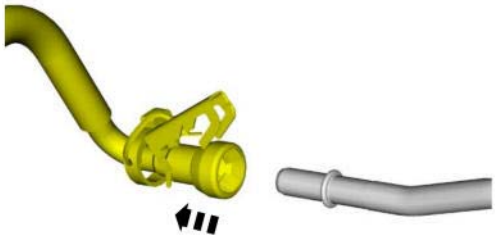


E186838

4.

Install the Spring Lock Coupling Disconnect Tool on the tube and push into the spring lock coupling

to release.

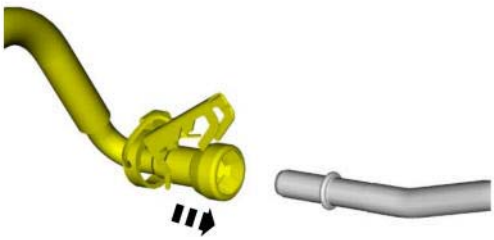


Use Special Service Tool: 310-S039 (T90T-9550-S) Disconnect Tool, Spring Lock Coupling.

E186839

5.

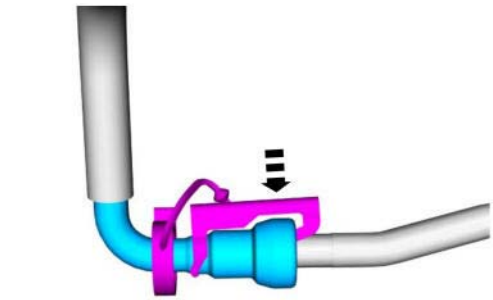
Separate the spring lock coupling from the tube.



E186840

Connect

1.



Align and push the spring lock coupling onto the tube until fully seated.

E186841

2.

If equipped, install the fuel tube safety clip.

E186842

3.

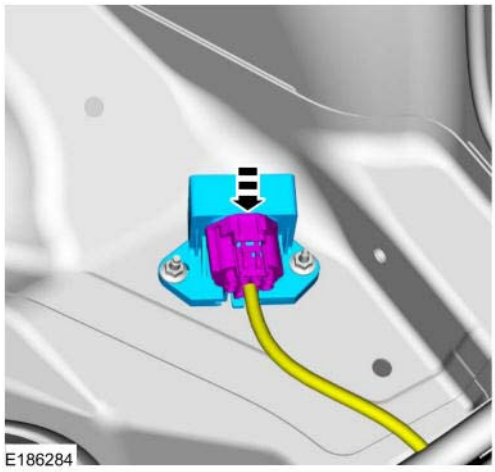
Pull on the coupling to make sure it is fully engaged.

4.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

GENERAL PROCEDURES > FUEL SYSTEM PRESSURE RELEASE

Pressure release



NOTE: The FPDM is located on the LH side, beneath the rear seat cushion.

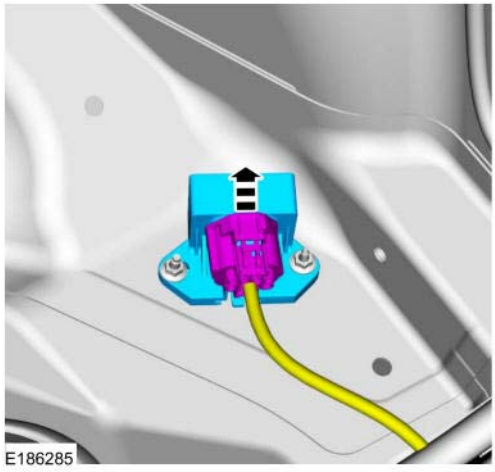
1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

NOTE: On vehicles equipped with Gasoline Turbocharged Direct Injection (GTDI), running the engine with the FPDM disconnected will remove most of the pressure from both the low and high pressure sides of the system.

2.
Disconnect the FPDM electrical connector.

3.



Start the engine and allow it to idle until the engine stalls.

4.

Turn the ignition switch to the off position.

5.

When the fuel system service is complete, reconnect the FPDM electrical connector.

6.

Install the rear seat cushion. Refer to: Rear Seat Cushion .

7.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

8.

When service on the fuel system is complete, start the engine and check for leaks.

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Tank Capacity	
Fuel Tank Capacity - 2.3L GTDi	15.5 gal (58.67 L)

DESCRIPTION AND OPERATION > FUEL TANK AND LINES - OVERVIEW

The fuel system consists of the :

- saddle-type fuel tank.
- quick connect fuel and vapor tube couplings.
- fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- Fuel Pump Control Module (FPCM).
- fuel rail.
- fuel injectors.
- Fuel Tank Pressure (FTP) sensor (part of the fuel vapor tube assembly).
- is a Closed Loop Pressure Control (CLPC) system.
- Fuel Level Sensor
- Fuel Pump (FP) module containing:
    - The electric FP module which provides pressurized fuel to the high pressure Fuel Pump (FP).
    - The Fuel Level Sender.
    - A check valve which maintains system pressure after the pump is shut off.
    - A pressure relief for overpressure protection in the event of restricted fluid flow.
    - A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

The vehicle:

- has a serviceable fuel level sender mounted on the fuel pump module.

- has a fuel tank filler pipe which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank.
- has an Easy Fuel (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- has a supplemental refueling adapter located in the luggage compartment.
- has a lifetime in tank fuel filter serviced as part of the fuel pump.
- has fuel tubes (liquid and vapor) combined in a bundle along with the brake tubes mounted on the underside of the floorpan and covered with a protective cover shield.
- has quick connect and spring lock fuel tube couplings.
- has a FPDM that shuts off fuel in the event of a collision.

DESCRIPTION AND OPERATION > FUEL TANK AND LINES - OVERVIEW > FUEL PUMP SHUT-OFF FEATURE

> *NOTE: Refer to the DESCRIPTION AND OPERATION to review the procedures for achieving the various ignition states (ignition OFF, ignition in ACCESSORY, ignition ON and ignition START) on vehicles with this feature.*

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the FPDM. Signal communication between the RCM and the FPDM allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL TANK AND LINES

Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

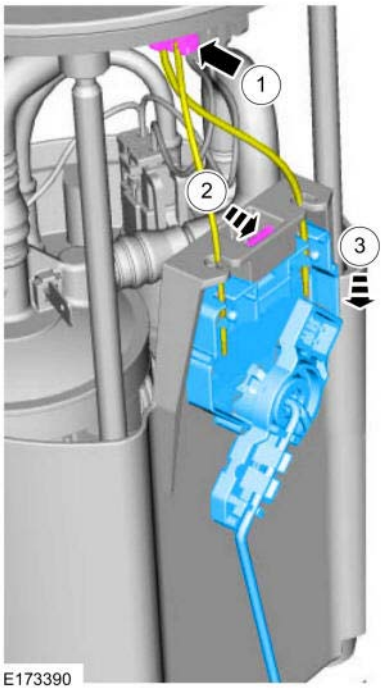
REMOVAL AND INSTALLATION > FUEL LEVEL SENDER

Fuel Level Sender

REMOVAL AND INSTALLATION > FUEL LEVEL SENDER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



Remove the Fuel Pump and Sender Unit. Refer to: Fuel Pump and Sender Unit .

2.

Disconnect the electrical connector.

Release the locking tab.

Remove the fuel level sender.

REMOVAL AND INSTALLATION > FUEL LEVEL SENDER > INSTALLATION

1.

To install, reverse the removal procedure.

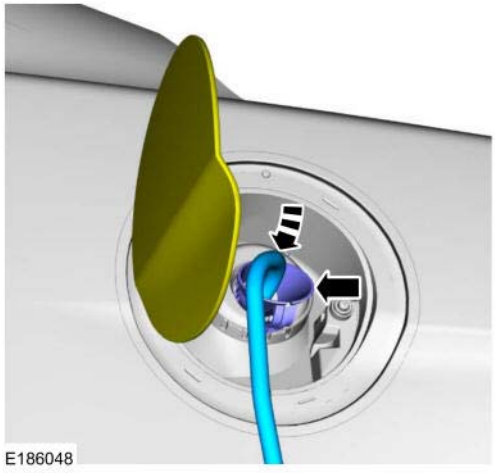
REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > REMOVAL

1.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 2.3L EcoBoost (231kW/314PS).

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

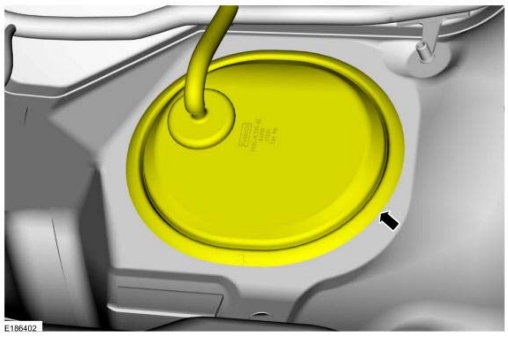
3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

E186048

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler

pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

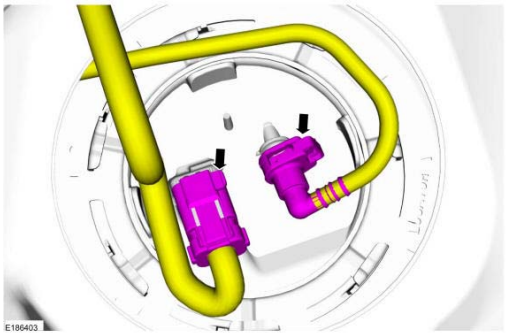
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

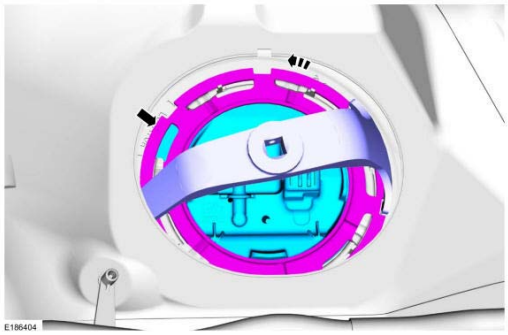
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

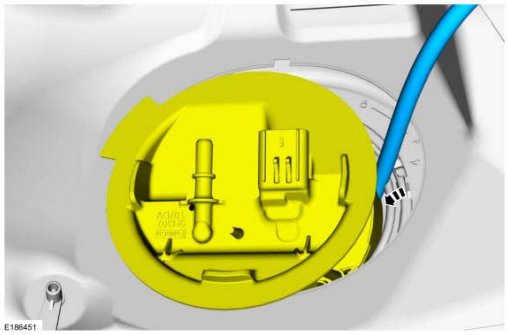
Remove the access cover and position aside.

7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.



8.
Using the special tool remove the Fuel Pump and Sender Unit lock ring.

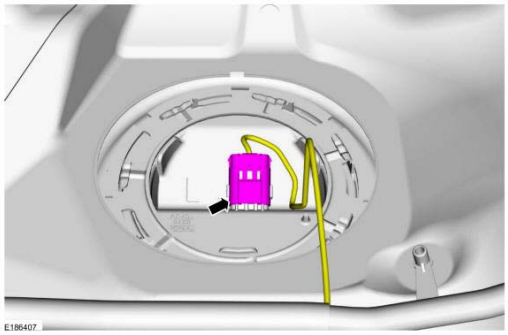
Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.
Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

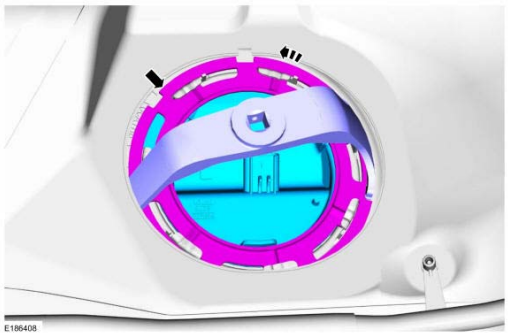
10.
Remove and discard the O-ring seal.



11.

Remove the Fuel Level Sensor access cover and position aside.

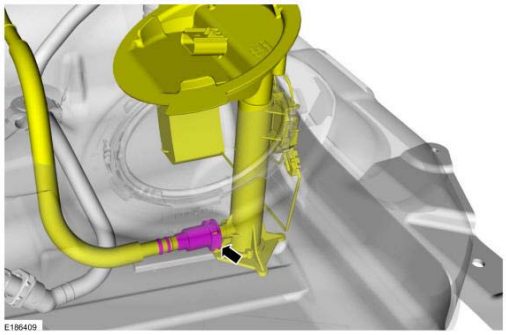
NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.



12.
Disconnect the electrical connector.

NOTE: Carefully install the Fuel Tank Sender Unit Socket to avoid damage to the fuel level sensor when removing the lock ring.

13.
Using the special tool remove the Fuel Level Sensor lock ring.



Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

14.

Disconnect the internal fuel tube-to-Fuel Level Sensor quick connect coupling. Refer to: QUICK

RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > INSTALLATION

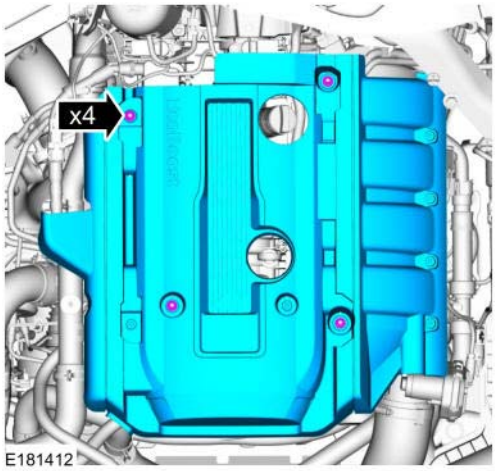
NOTE: Make sure the alignment tabs on the Fuel Level Sensor and the fuel tank meet prior to tightening the Fuel Level Sensor lock ring.

NOTE: Make sure to install a new Fuel Level Sensor O-ring seal.

1.
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FUEL LINES > REMOVAL

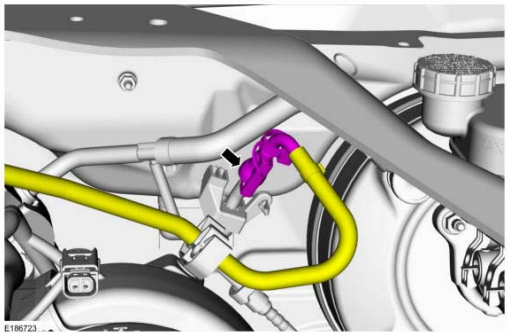
1.



Remove the fuel tank. Refer to: Fuel Tank .

2.

Remove the nuts and the engine appearance cover.

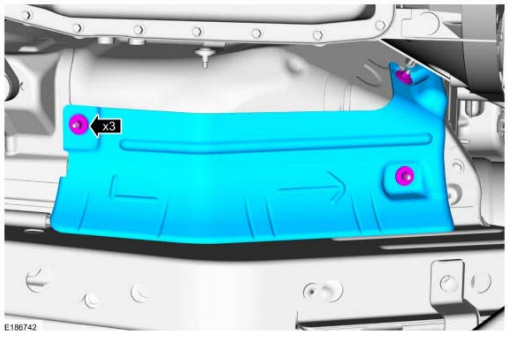


Torque

: 80 lb.in (9 Nm)

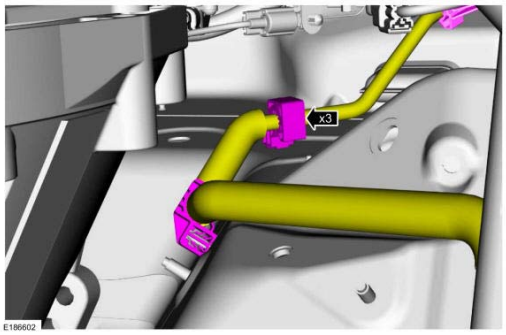
3.

Disconnect the fuel line-to-fuel rail spring lock coupling. Refer to: SPRING LOCK COUPLINGS - 2.3L EcoBoost (231kW/314PS).



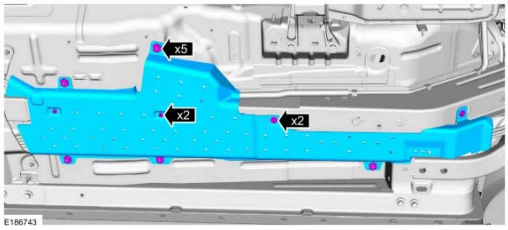
4.

Remove the nuts and the heat shield.



Torque

: 71 lb.in (8 Nm)

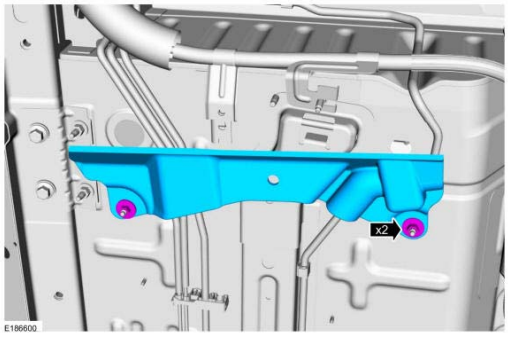


5.

Release the fuel line from the retainers.

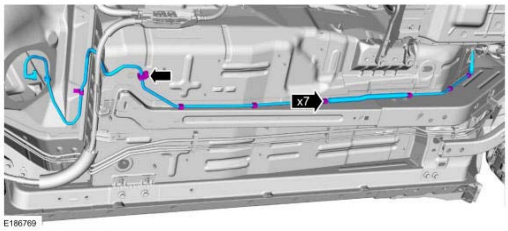
6.

Remove the nuts, bolts, push-pins and splash shield.



7.

Remove the nuts and the fuel tank deflector.



Torque

: 18 lb.ft (25 Nm)

8.

Release the retainers and remove the fuel line.

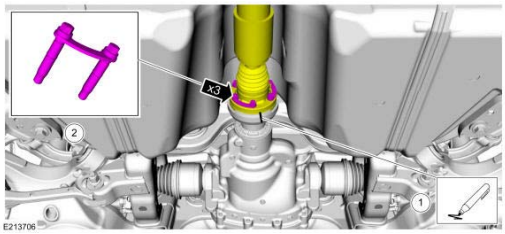
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

3.

Drain the fuel tank. Refer to: FUEL TANK DRAINING - 2.3L EcoBoost (231kW/314PS).



4.

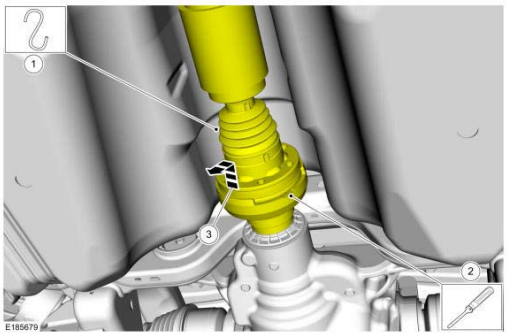
Remove the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 2.3L EcoBoost (231kW/314PS).

5.

Index mark the driveshaft and pinion flange for reference during installation.

Remove the driveshaft to pinion flange bolts.

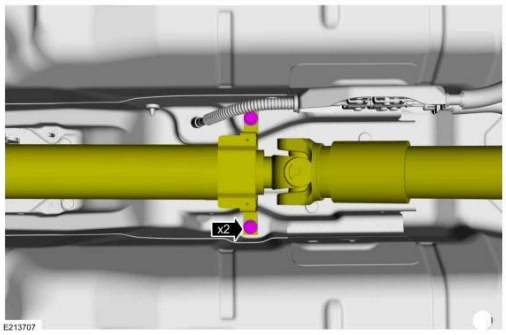
NOTE: Do not over articulate the driveshaft or damage may occur.



6.

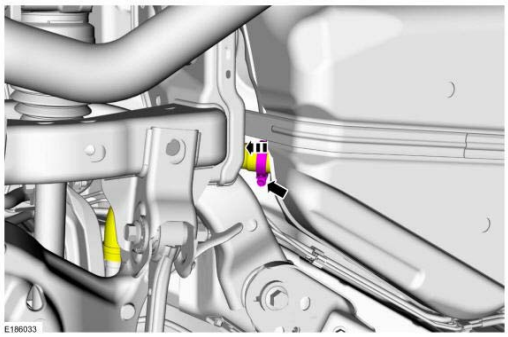
Support the driveshaft.

Using a screwdriver inserted into the slot on the pinion flange, pry the driveshaft from the pinion flange.



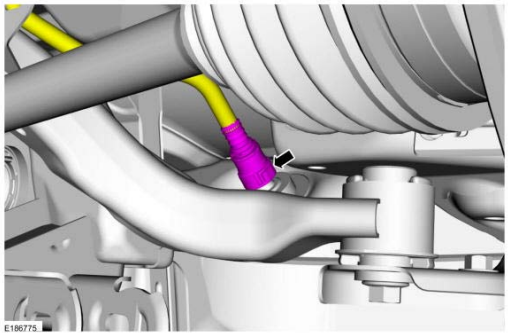
Use the General Equipment: Flat Headed Screw Driver

Separate the driveshaft from the pinion flange.



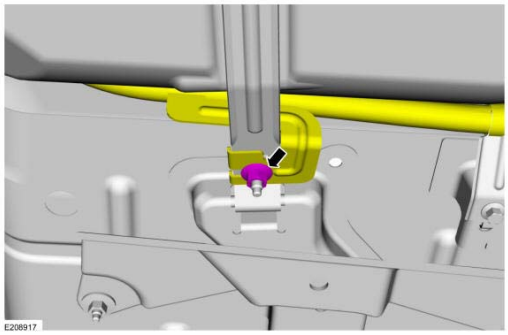
NOTE: Do not over articulate the driveshaft or damage may occur.

7.
Remove the driveshaft center support bearing bolts and lower the driveshaft away from the rear axle flange.



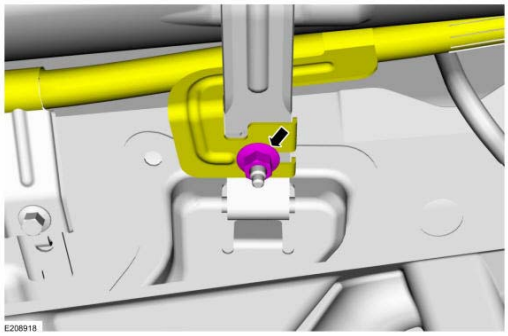
8.

Release the clamp and disconnect the fuel tank filler pipe from the fuel tank.



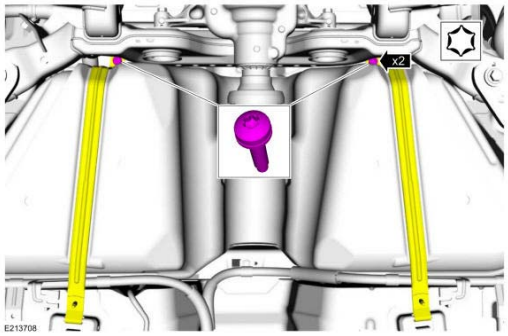
9.

Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).



10.

Remove the nut and position the LH emergency brake cable bracket aside.



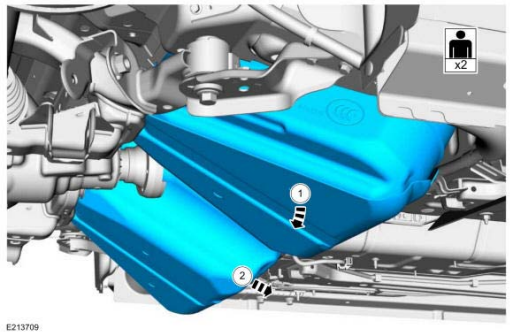
11.

Remove the nut and position the RH emergency brake cable bracket aside.

12.

Using an appropriate impact tool and a TP50 "Torx Plus" Socket Driver, remove the fuel tank strap bolts.

NOTE: Once the fuel tank is removed from the vehicle, reinstall the driveshaft center support bearing bolts by hand and support the rear of the driveshaft with a jackstand or mechanics wire.



13.

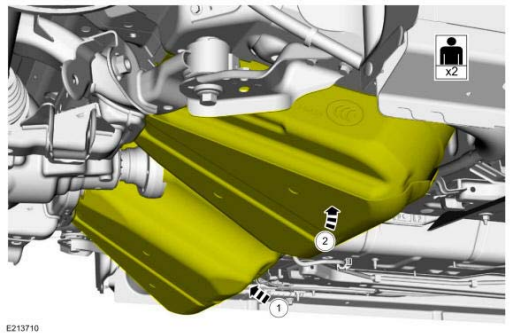
1.

Lower the front of the fuel tank.

2.

Remove the fuel tank.

REMOVAL AND INSTALLATION > FUEL TANK > INSTALLATION



1.

1.

Position the fuel tank above the rear differential.

2.

Raise the fuel tank into position.

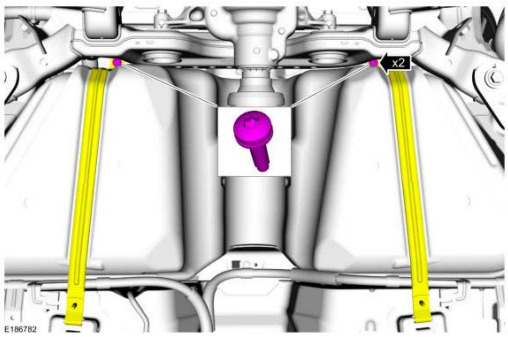
2.

Clean the bolts and weld nuts lightly with a wire brush.

Apply the thread locking sealant to the bolt threads.

Material

: Threadlock and Sealer / TA-25-B



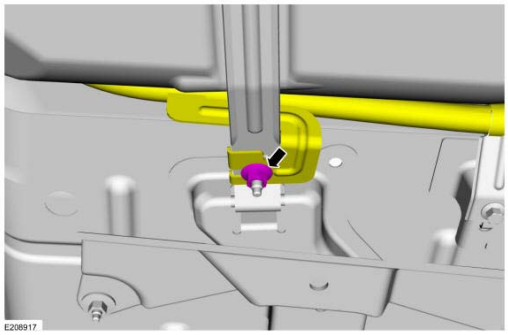
NOTE: To insure that the bolts are threaded in straight, start the bolts by hand

and turn several threads before tightening.

Position the fuel tank straps and install the bolts.

Torque

: 38 lb.ft (52 Nm)

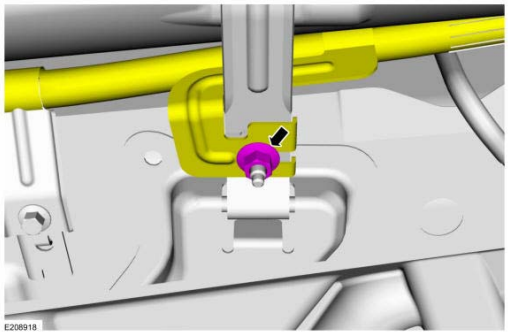


3.

Reposition the LH emergency brake cable bracket and install the nut.

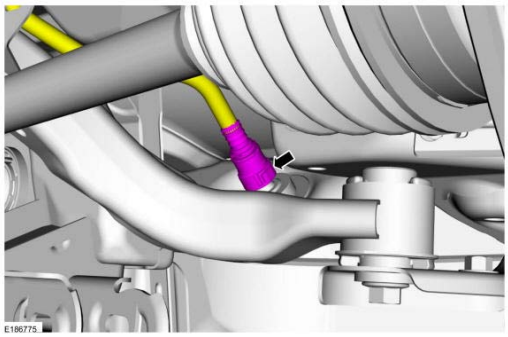
Torque

: 18 lb.ft (25 Nm)



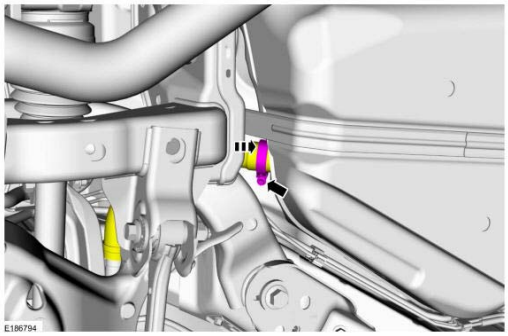
4.

Reposition the RH emergency brake cable bracket and install the nut.



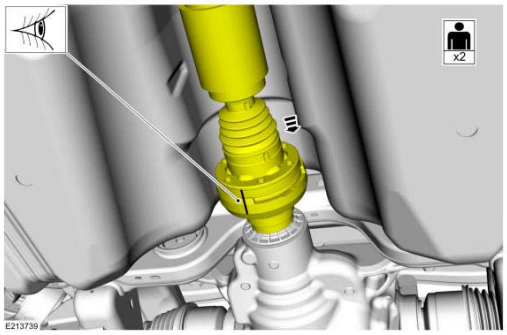
Torque

: 18 lb.ft (25 Nm)



5.

Connect the fuel vapor tube assembly-to-fuel tank quick connect coupling. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).



6.

Connect the hose to the fuel tank and tighten the clamp.

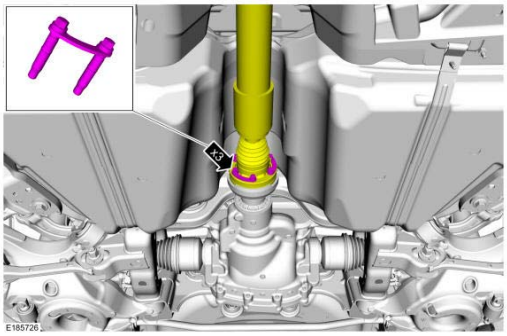
NOTE: The help of a assistant will be needed. Do not over articulate the driveshaft or damage may occur.

7.
Align the index marks on the driveshaft to the rear axle pinion flange.

8.

Clean the bolts.

Apply the thread locking sealant to the bolt threads.



Material

: Threadlock and Sealer / TA-25-B

Install the bolts.

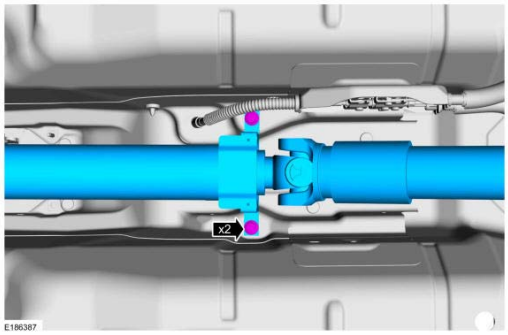
Torque

: 41 lb.ft (55 Nm)

9.

Clean the bolts.

Apply thread locking sealant to the bolt threads.



Material

: Threadlock and Sealer / TA-25-B

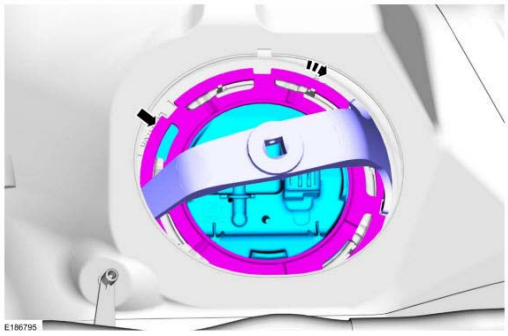
Install the bolts.

Torque

: 35 lb.ft (48 Nm)

10.

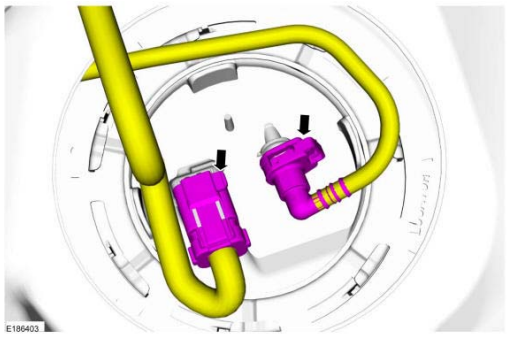
Install the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 2.3L EcoBoost (231kW/314PS).



NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

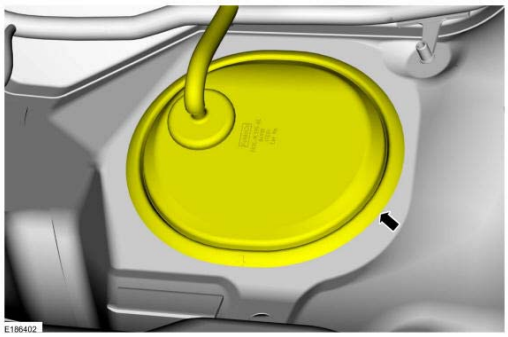
11.
Install a new Fuel Pump and Sender Unit O-ring seal.

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.



12.
Using the special tool install the Fuel Pump and Sender Unit lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

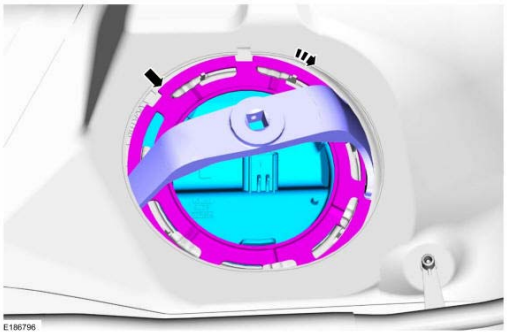


13.

Connect electrical connector and fuel tube quick release coupling. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

14.

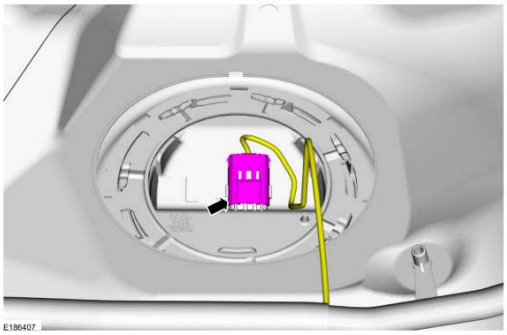
Install the access cover.



NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

15.
Install a new O-ring seal.

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the fuel level sensor when removing the lock ring.



16.
Using the special tool install the fuel level sensor lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.

17.
Connect the electrical connector.

18.

Install the access cover.

19.

Install the rear seat cushion. Refer to: Rear Seat Cushion .

20.

Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE

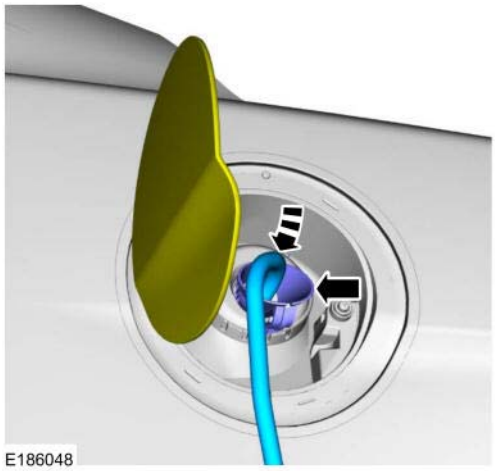
Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE > REMOVAL

NOTE: Removal steps in this procedure may contain installation steps.

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

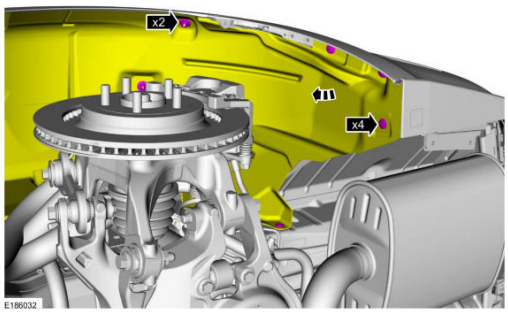
3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

E186048

NOTE: This step is to remove approximately one-eighth tank of the fuel from a

completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the fuel tank filler pipe inlet.

4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove approximately one-eighth (approximately 2 gallons) of fuel from the tank.



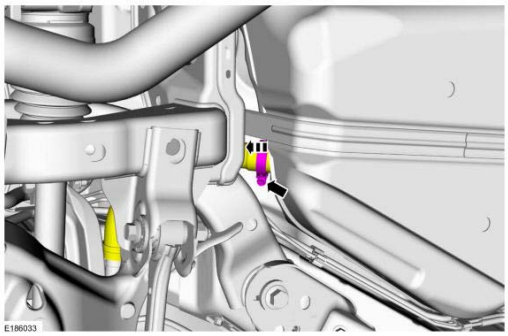
Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

Remove the rear wheel on the LH side. Refer to: Wheel and Tire .

6.

Remove the retainers and position aside LH rear wheel splash shield aside.



NOTE: Some fuel may remain in the fuel tank filler pipe after draining. Carefully disconnect the fuel tank filler pipe hose from the fuel tank and drain any residual fuel into a suitable container.

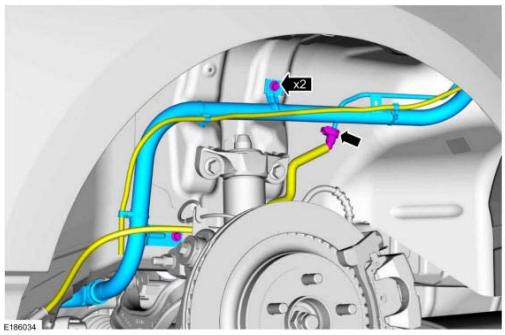
7.
Release the clamp and disconnect the fuel tank filler pipe from the fuel tank.

Torque

: 53 lb.in (6 Nm)

8.

1.



Disconnect the vapor tube Quick Release Coupling. Refer to: QUICK RELEASE COUPLING - 2.3L EcoBoost (231kW/314PS).

2.

Remove retainers and the Fuel Tank Filler Pipe.

Torque

: 18 lb.ft (25 Nm)

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE > INSTALLATION

1.

To install, reverse the removal procedure.

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Tank Capacity	
Fuel Tank Capacity - 3.7L Duratec, 5.0L Ti-VCT	16.0 gal (60.55 L)

DESCRIPTION AND OPERATION > FUEL TANK AND LINES - OVERVIEW

The fuel system consists of the :

- saddle-type fuel tank.
- quick connect fuel and vapor tube couplings.
- fuel tank filler pipe assembly, which cannot be modified in any way, that also contains a restrictor plate to permit only unleaded fuel to be pumped into the tank.
- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- Fuel Pump Control Module (FPCM).
- fuel rail.
- fuel injectors.
- Fuel Tank Pressure (FTP) sensor (part of the fuel vapor tube assembly).
- Mechanical Returnless Fuel System (MRFS).
- Fuel Level Sensor
- Fuel Pump (FP) module containing:
    - The electric FP module which provides pressurized fuel to the high pressure Fuel Pump (FP).
    - The Fuel Level Sender
    - A check valve which maintains system pressure after the pump is shut off.
    - A pressure relief for overpressure protection in the event of restricted fluid flow.
    - A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

The vehicle:

- has a serviceable fuel level sender mounted on the fuel pump module.

- has a fuel tank filler pipe which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank.
- has an Easy Fuel (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- has a supplemental refueling adapter located in the luggage compartment.
- has a lifetime in tank fuel filter serviced as part of the fuel pump.
- has fuel tubes (liquid and vapor) combined in a bundle along with the brake tubes mounted on the underside of the floorpan and covered with a protective cover shield.
- has quick connect and spring lock fuel tube couplings.
- has a FPDM that shuts off fuel in the event of a collision.

DESCRIPTION AND OPERATION > FUEL TANK AND LINES - OVERVIEW > FUEL PUMP SHUT-OFF FEATURE

NOTE: Refer to the DESCRIPTION AND OPERATION to review the procedures for achieving the various ignition states (ignition OFF, ignition in ACCESSORY, ignition ON and ignition START) on vehicles with this feature.

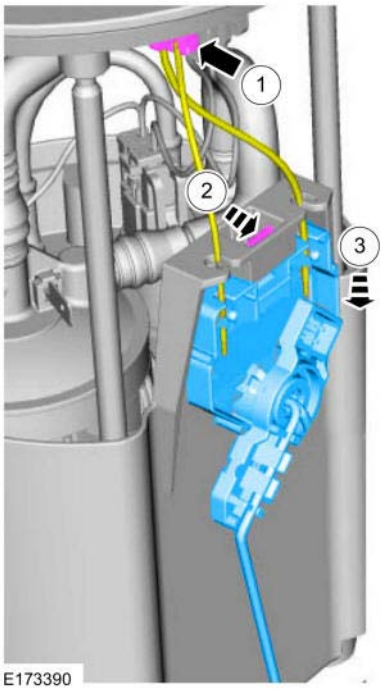
In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the FPDM. Signal communication between the RCM and the FPDM allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL TANK AND LINES

Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .



REMOVAL AND INSTALLATION > FUEL LEVEL SENDER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the Fuel Pump and Sender Unit. Refer to: Fuel Pump and Sender Unit .

2.

REMOVAL AND INSTALLATION > FUEL LEVEL SENDER > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR

Special Tool(s) / General Equipment

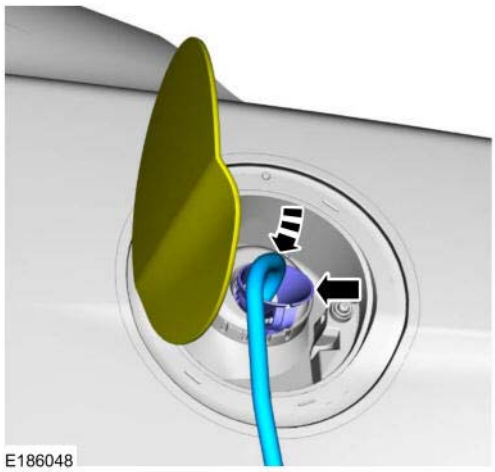
REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > REMOVAL

1.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 3.7L Duratec (227kW/301PS).

2.

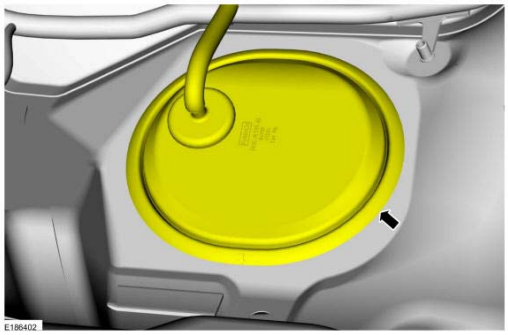
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

> *NOTE: The supplemental refueling adapter is located in the luggage compartment.*

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

> *NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.*

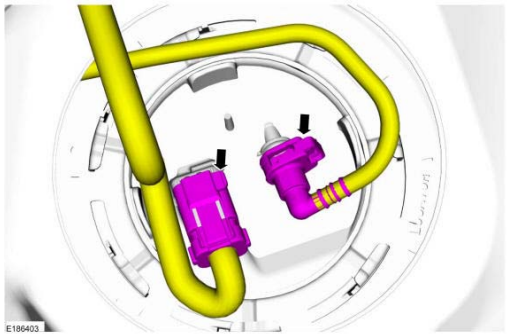
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004Fuel Tanker 100 GPM.

5.

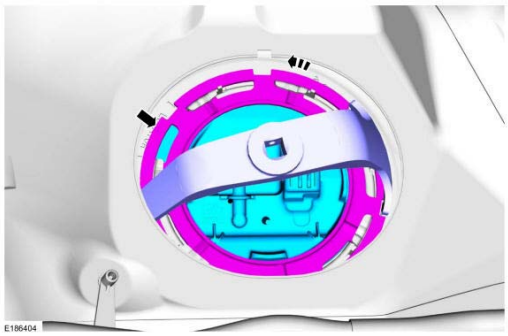
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

Remove the access cover and position aside.

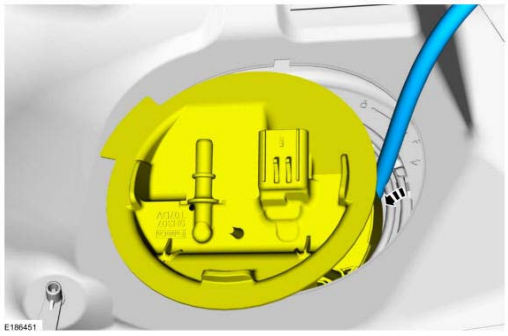
7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: QUICK RELEASE COUPLING - 3.7L Duratec (227kW/301PS).

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.

8.
Using the special tool remove the Fuel Pump and Sender Unit lock ring.



Use Special Service Tool: 310-123Locking Ring, Fuel Tank.

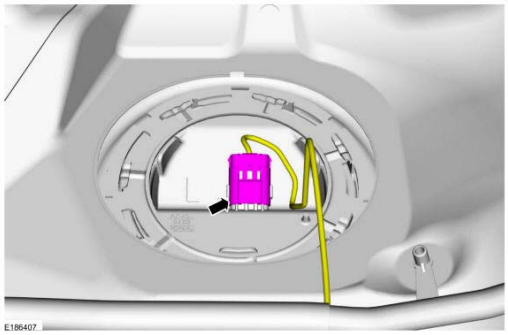
NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.

Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

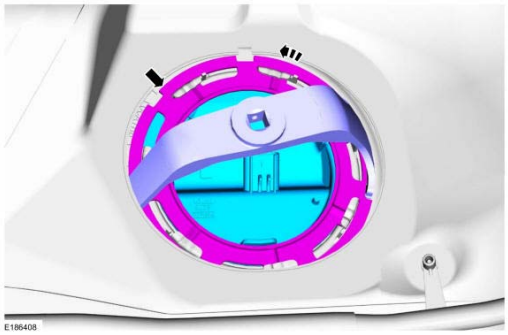
NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

10.
Remove and discard the O-ring seal.



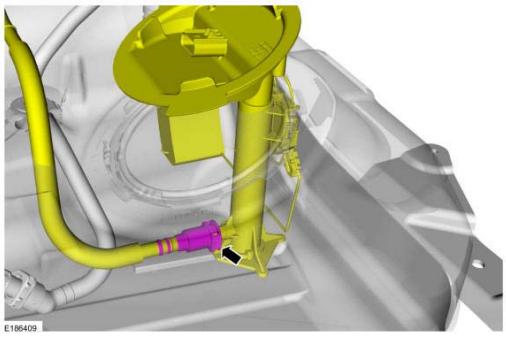
11.

Remove the Fuel Level Sensor access cover and position aside.



NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.

12.
Disconnect the electrical connector.



NOTE: Carefully install the Fuel Tank Sender Unit Socket to avoid damage to the fuel level sensor when removing the lock ring.

13.
Using the lock ring wrench remove the Fuel Level Sensor lock ring.

14.

Disconnect the internal fuel tube-to-Fuel Level Sensor quick connect coupling. Refer to: QUICK RELEASE COUPLING - 3.7L Duratec (227kW/301PS).

REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > INSTALLATION

NOTE: Make sure the alignment tabs on the Fuel Level Sensor and the fuel tank

meet prior to tightening the Fuel Level Sensor lock ring.

NOTE: Make sure to install a new Fuel Level Sensor O-ring seal.

1.
To install, reverse the removal procedure.

Service Manual: FUEL TANK AND LINES - 5.0L 32V TI-VCT

SPECIFICATIONS > GENERAL SPECIFICATIONS

Item	Specification
Fuel Tank Capacity	
Fuel Tank Capacity - 3.7L Duratec, 5.0L Ti-VCT	16.0 gal (60.55 L)

DESCRIPTION AND OPERATION > FUEL TANK AND LINES - OVERVIEW

Fuel System

The fuel tank and lines consist of the:

- saddle-type fuel tank.
- Fuel, vapor and brake tubes in an integrated bundle assembly.
- Quick connect fuel and vapor tube couplings.
- Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way and is serviced only by the installation of a new fuel tank filler pipe assembly.
- A supplemental refueling adapter located in the spare tire compartment.
- A Fuel Pump Control Module (FPCM).
- FPDM
- A Mechanical Returnless Fuel System (MRFS).
- Fuel Level Sensor
- A Fuel Pump (FP) and Sender Unit containing:
    - The electric Fuel Pump (FP) and Sender Unit which provides pressurized fuel to the high pressure Fuel Pump (FP).
    - The Fuel Level Sender
    - A check valve which maintains system pressure after the pump is shut off.
    - A pressure relief for overpressure protection in the event of restricted fluid flow.
    - A lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.

The vehicle:

- has a serviceable fuel level sender mounted on the fuel pump module.
- has a fuel tank filler pipe which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank.

- has an Easy Fuel™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- has a supplemental refueling adapter located in the luggage compartment.
- has a lifetime in tank fuel filter serviced as part of the fuel pump.
- has fuel tubes (liquid and vapor) combined in a bundle along with the brake tubes mounted on the underside of the floorpan and covered with a protective cover shield.
- has quick connect and spring lock fuel tube couplings.
- has a FPDM that shuts off fuel in the event of a collision.

Fuel Pump Shut-off Feature

NOTE: Refer to the DESCRIPTION AND OPERATION , Intelligent Access with Push Button Start to review the procedures for achieving the various ignition states (ignition OFF, ignition in ACCESSORY, ignition ON and ignition START) on vehicles with this feature.

In the event of a moderate to severe collision, the vehicle is equipped with a Fuel Pump and Sender Shut-off Feature that is initiated by the event notification signal.

The event notification signal is a signal provided by the RCM to the FPDM. Signal communication between the RCM and the FPDM allows the PCM to shut-off the Fuel Pump.

Should the vehicle shut off after a collision due to this feature, the vehicle may be restarted by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances the vehicle may not start the first time and may take one additional ignition cycle.

DIAGNOSIS AND TESTING > FUEL TANK AND LINES

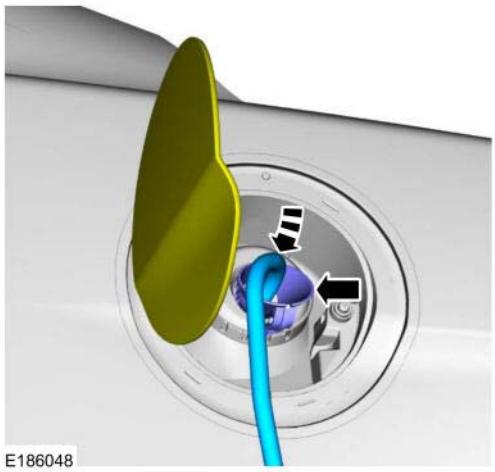
REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > REMOVAL

1.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

2.

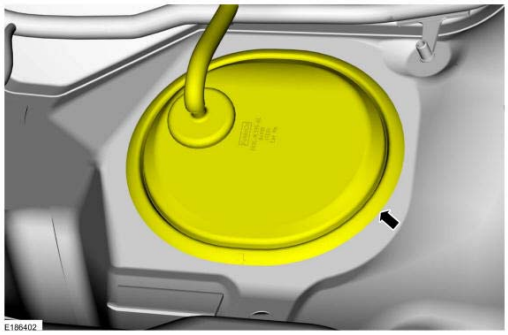
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

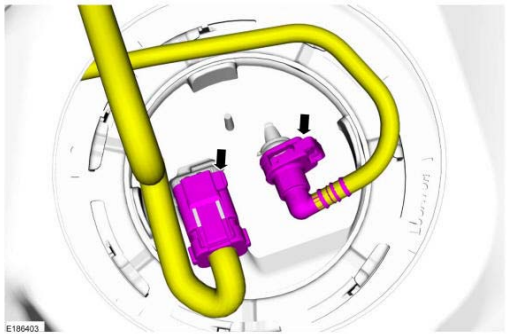
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

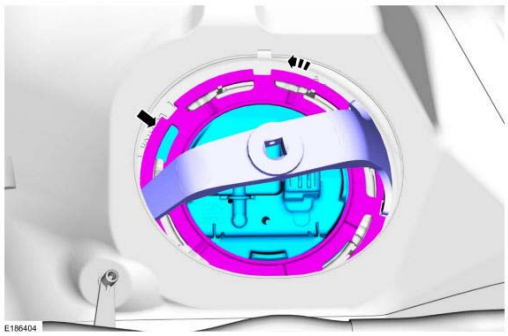
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

Remove the access cover and position aside.

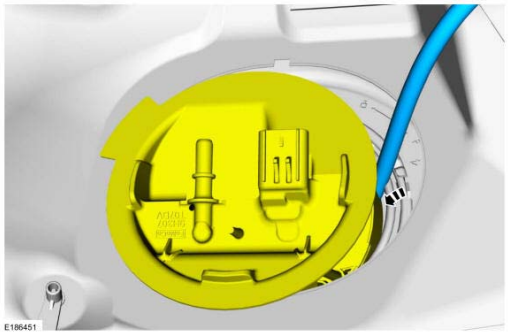
7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.

8.
Using the special tool remove the Fuel Pump and Sender Unit lock ring.



Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

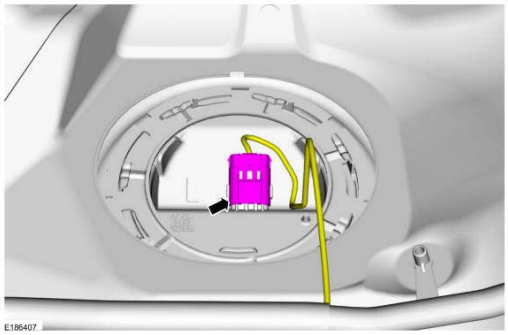
NOTE: The Fuel Pump and Sender Unit must be handled carefully to avoid damage to the float arm.

9.

Position the Fuel Pump and Sender Unit aside. Using the Fuel Storage Tanker, completely drain the remaining fuel from the LH saddle of the fuel tank.

NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

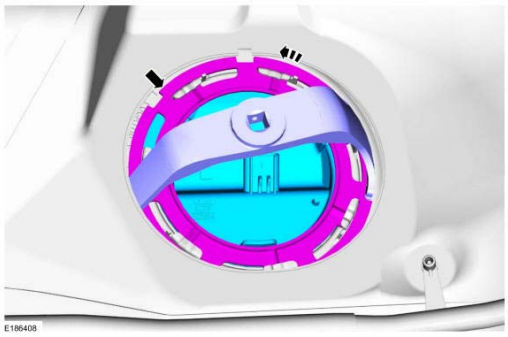
10.
Remove and discard the O-ring seal.



11.

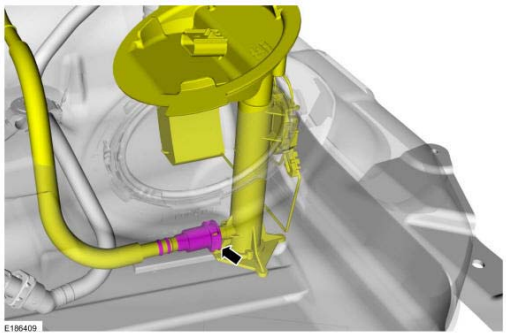
Remove the access cover and position aside.

NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.



12.
Disconnect the electrical connector.

NOTE: Carefully install the Fuel Tank Sender Unit Socket to avoid damage to the fuel level sensor when removing the lock ring.



13.
Using the special tool remove the Fuel Level Sensor lock ring.

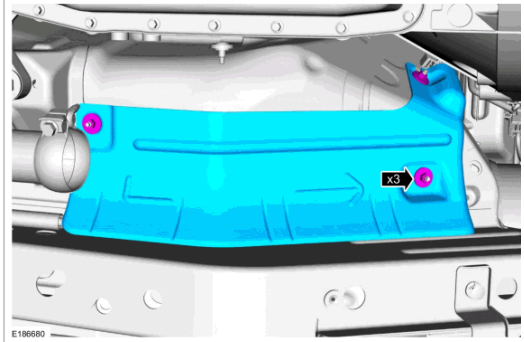
Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

14.

Disconnect the internal fuel tube-to-Fuel Level Sensor quick connect coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

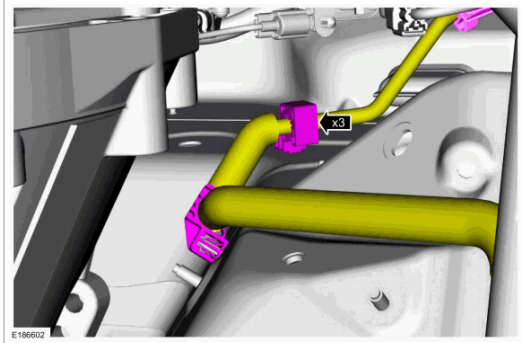
REMOVAL AND INSTALLATION > FUEL LEVEL SENSOR > INSTALLATION

NOTE: Make sure to install a new Fuel Level Sensor O-ring seal.



NOTE: Make sure the alignment tabs on the Fuel Level Sensor and the fuel tank meet prior to tightening the Fuel Level Sensor lock ring.

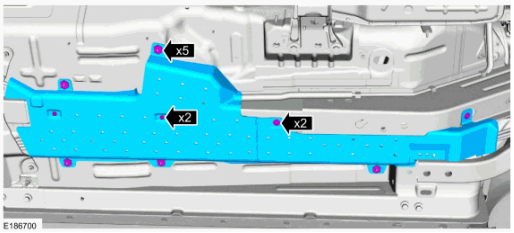
1.
To install, reverse the removal procedure.



REMOVAL AND INSTALLATION > FUEL LINES > REMOVAL

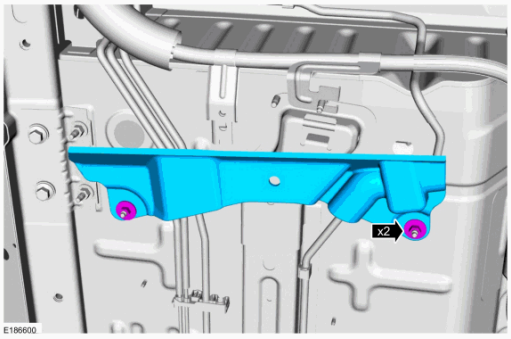
1. Remove the fuel tank. Refer to: Fuel Tank .
2. Remove LH Catalytic Converter. Refer to: CATALYTIC CONVERTER LH .
3. Remove the nuts and the heat shield.

   Torque: 71 lb.in (8 Nm)

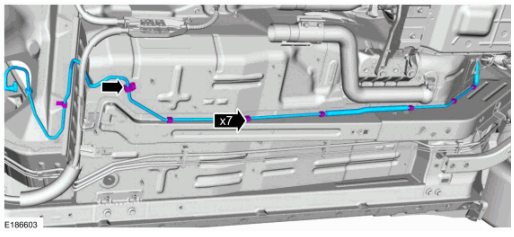


4. Release the fuel line from the retainers.

5. Disconnect the fuel line-to-fuel rail jumper tube spring lock coupling. Refer to: SPRING LOCK COUPLINGS .



6. Remove the nuts, bolts, push-pins and splash shield.



7. Remove the nuts and the fuel tank deflector.

   Torque: 18 lb.ft (25 Nm)

8. Release the retainers and remove the fuel line.

REMOVAL AND INSTALLATION > FUEL LINES > INSTALLATION

NOTE: Make sure the fuel tubes are completely seated and that the quick connect couplings are locked correctly in place. Pull on the tube to make sure it is

fully seated. Upon completion, pressurize the system and check for leaks.

1. To install, reverse the removal procedure.

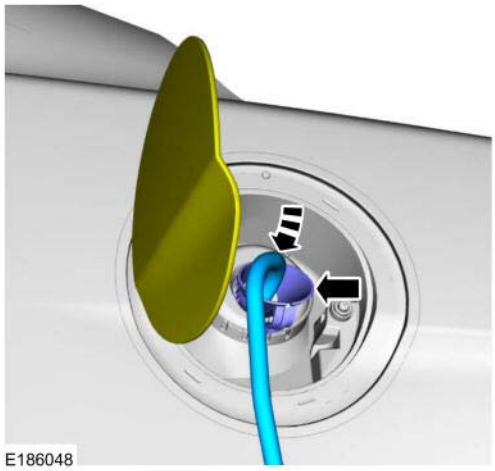
REMOVAL AND INSTALLATION > FUEL PUMP AND SENDER UNIT

Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM
 E80148	310-123 Locking Ring, Fuel Tank TKIT-2004J-F TKIT-2005U-LM

REMOVAL AND INSTALLATION > FUEL PUMP AND SENDER UNIT > REMOVAL

1.



Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

2.

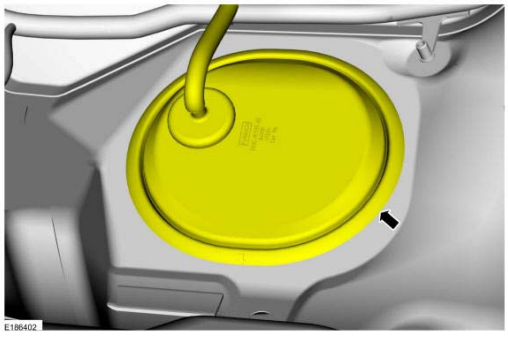
Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately 3/16 tank of the fuel (3 gallons) from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump and Sender Unit mounting flange.

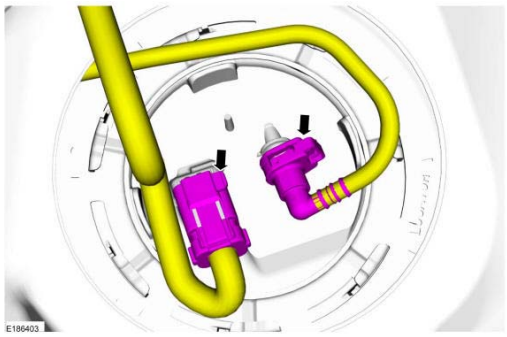
4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove as much fuel as possible from the tank.



Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

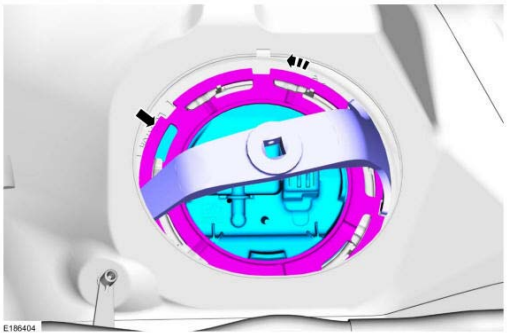
Remove the rear seat cushion. Refer to: Rear Seat Cushion .



6.

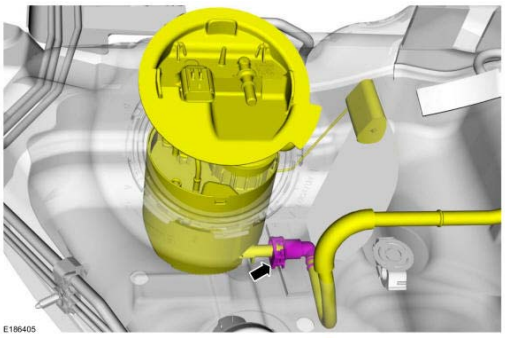
Remove the access cover and position aside.

7.



Disconnect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

8.



Using the lock ring wrench remove the Fuel Pump and Sender Unit lock ring.

Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

9.

Disconnect the internal fuel tube-to-Fuel Pump and Sender Unit quick connect coupling and remove the Fuel Pump and Sender Unit. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

REMOVAL AND INSTALLATION > FUEL PUMP AND SENDER UNIT > INSTALLATION

NOTE: Make sure to install a new Fuel Pump and Sender Unit O-ring seal.

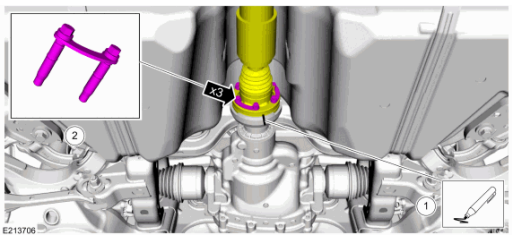
NOTE: Make sure the alignment tabs on the Fuel Pump and Sender Unit and the fuel tank meet prior to tightening the Fuel Pump and Sender Unit lock ring.

1.
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FUEL TANK

Special Tool(s) / General Equipment

	310-123 Locking Ring, Fuel Tank TKIT-2004J-F TKIT-2005U-LM
Flat Headed Screw Driver	



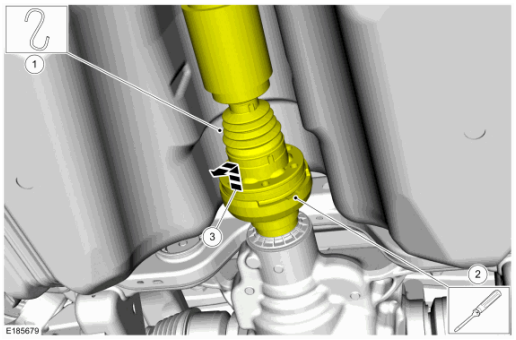
Materials

Name	Specification
Threadlock and Sealer TA-25-B	-

REMOVAL AND INSTALLATION > FUEL TANK > REMOVAL

NOTE: Removal steps in this procedure may contain installation steps.

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .
2. Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .
3. Drain the fuel tank. Refer to: FUEL TANK DRAINING .
4. Remove the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).
5. 1. Index mark the driveshaft and pinion flange for reference during installation.
   2. Remove the driveshaft to pinion flange bolts.

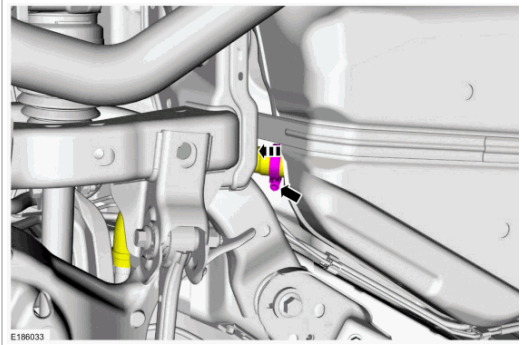


NOTE: Do not over articulate the driveshaft or damage may occur.

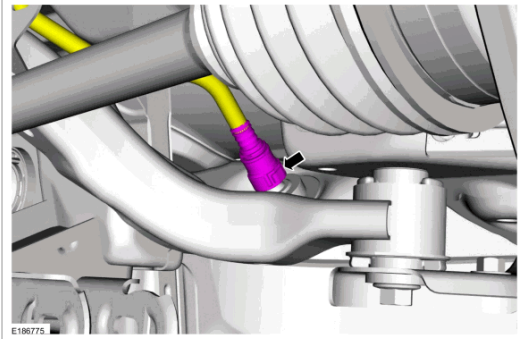
6. 1. Support the driveshaft.
   2. Using a screwdriver inserted into the slot on the pinion flange, pry the driveshaft from the pinion flange.

      Use the General Equipment: Flat Headed Screw Driver

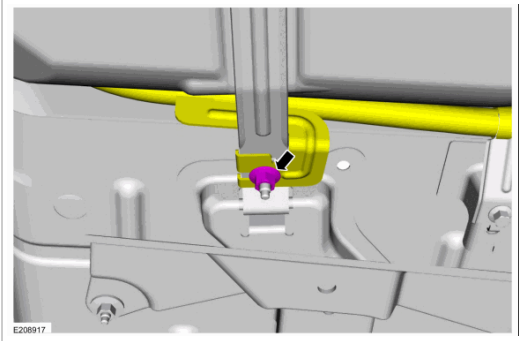
   3. Separate the driveshaft from the pinion flange.



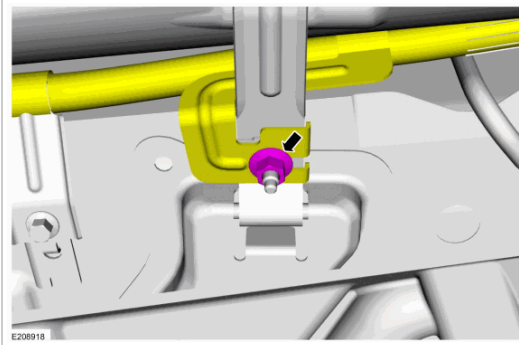
NOTE: Do not over articulate the driveshaft or damage may occur.



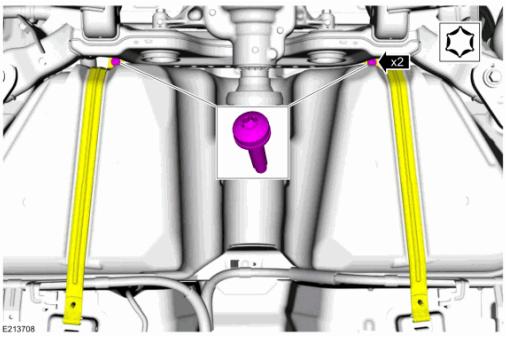
7. Remove the driveshaft center support bearing bolts and lower the driveshaft away from the rear axle flange.



8. Release the clamp and disconnect the fuel tank filler pipe from the fuel tank.

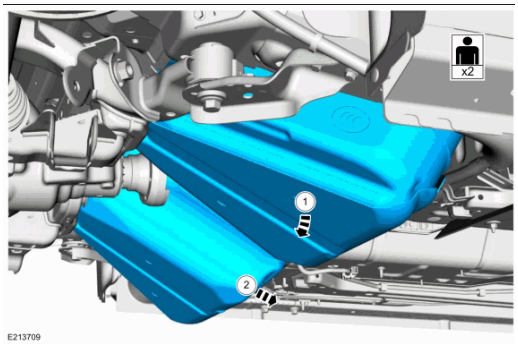


9. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

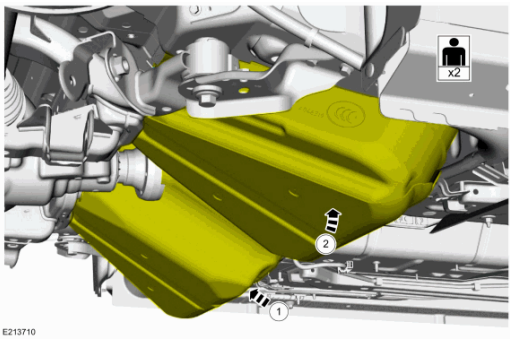


10. Remove the nut and position the LH emergency brake cable bracket aside

11. Remove the nut and position the RH emergency brake cable bracket aside.



12. Using an appropriate impact tool and a TP50 "Torx Plus" Socket Driver, remove the fuel tank strap bolts.

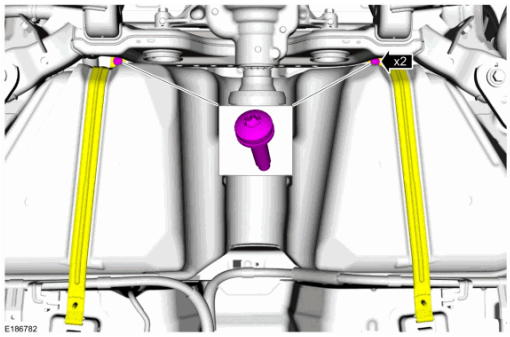


NOTE: Once the fuel tank is removed from the vehicle, reinstall the driveshaft center support bearing bolts by hand and support the rear of the driveshaft with a jackstand or mechanics wire.

13. 1. Lower the front of the fuel tank.
    2. Remove the fuel tank.

REMOVAL AND INSTALLATION > FUEL TANK > INSTALLATION

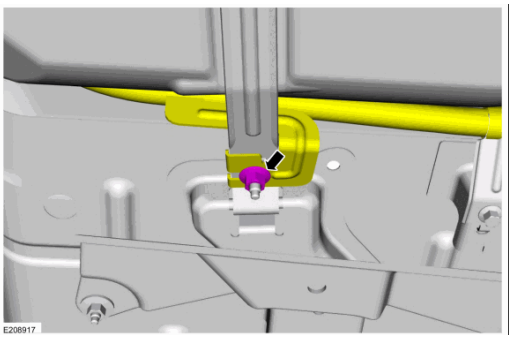
1. 1. Position the fuel tank above the rear differential.
   2. Raise the fuel tank into position.



2. 1. Clean the bolts and weld nuts lightly with a wire brush.
   2. Apply the thread locking sealant to the bolt threads.

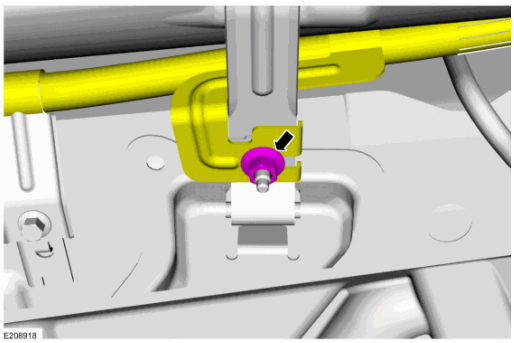
Material: Threadlock and Sealer / TA-25-B

> *NOTE: To insure that the bolts are threaded in straight, start the bolts by hand and turn several threads before tightening.*



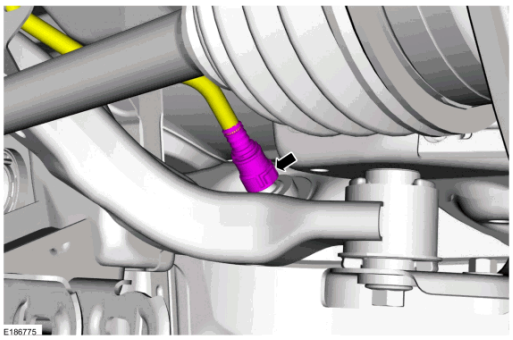
3. Position the fuel tank straps and install the bolts.

   Torque: 38 lb.ft (52 Nm)



3. Reposition the LH emergency brake cable bracket and install the nut.

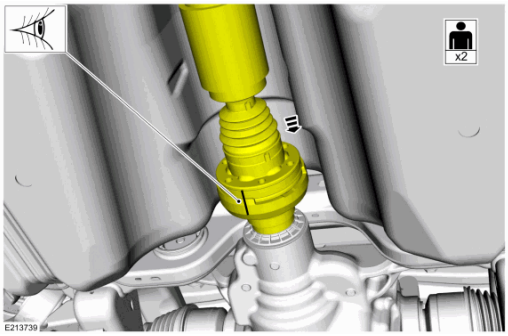
   Torque: 18 lb.ft (25 Nm)



4. Reposition the RH emergency brake cable bracket and install the nut.

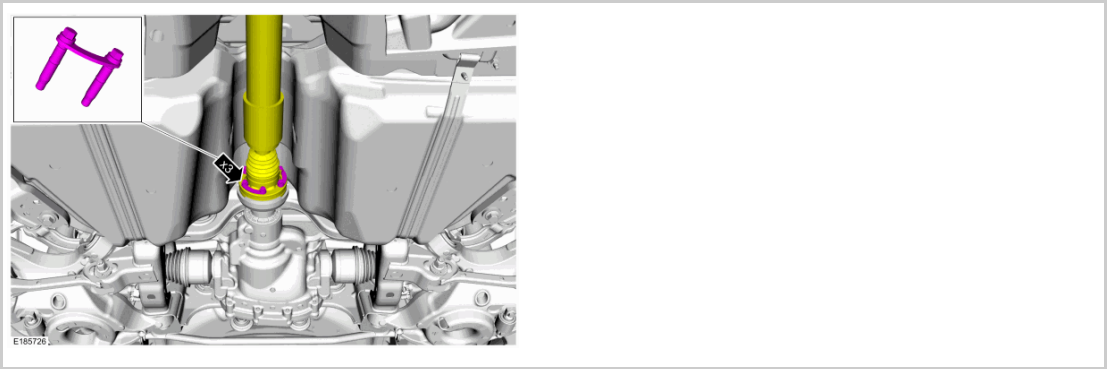
   Torque: 18 lb.ft (25 Nm)

5. Connect the fuel vapor tube assembly-to-fuel tank quick connect coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



6. Connect the hose to the fuel tank and tighten the clamp.

NOTE: The help of a assistant will be needed. Do not over articulate the driveshaft or damage may occur.



7. Align the index marks on the driveshaft to the rear axle pinion flange.

8. 1. Clean the bolts.
   2. Apply the thread locking sealant to the bolt threads.

      Material: Threadlock and Sealer / TA-25-B
   3. Install the bolts.

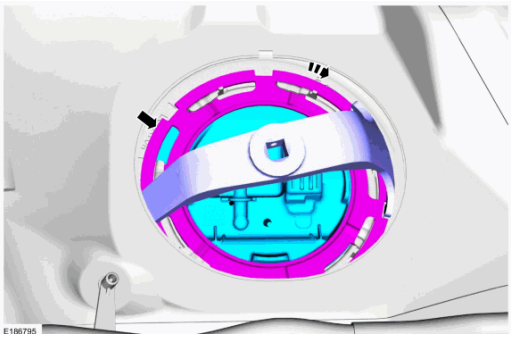
      Torque: 41 lb.ft (55 Nm)

9. 1. Clean the bolts
   2. Apply thread locking sealant to the bolt threads.

      Material: Threadlock and Sealer / TA-25-B
   3. Install the bolts.

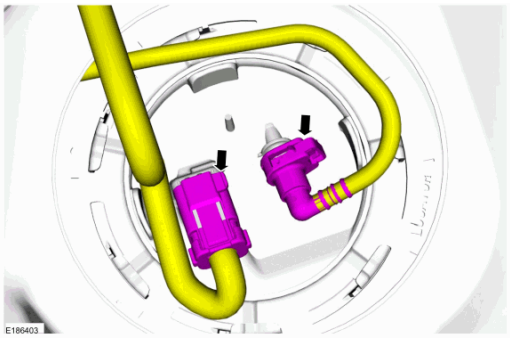
      Torque: 35 lb.ft (48 Nm)

10. Install the muffler and tailpipe. Refer to: MUFFLER AND TAILPIPE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



> *NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.*

11. Install a new O-ring seal.



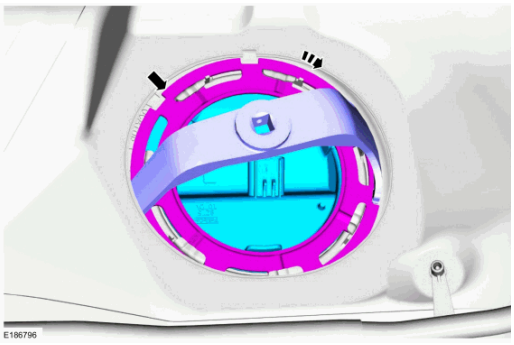
> *NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the Fuel Pump and Sender Unit when removing the lock ring.*

12. Using the special tool install the Fuel Pump and Sender Unit lock ring.

    Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.

13. Connect electrical connector and fuel tube quick release coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

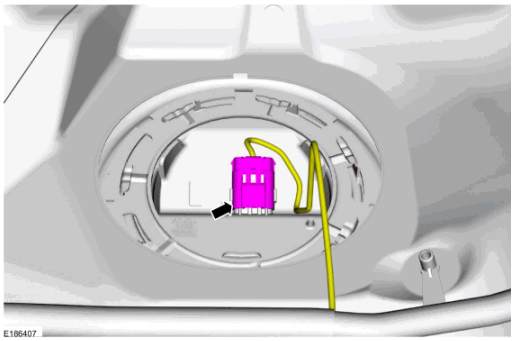
14. Install the access cover.



NOTE: Inspect the surfaces of the Fuel Pump and Sender Unit flange and fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new Fuel Pump and Sender Unit or fuel tank if the O-ring seal contact area is bent, scratched or corroded.

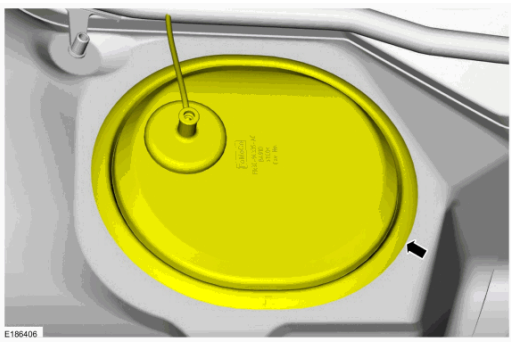
15. Install a new Fuel Level Sensor O-ring seal.

NOTE: Carefully install the Fuel Tank Sender Unit lock ring wrench to avoid damage to the fuel level sensor when removing the lock ring.



16. Using the special tool install the fuel level sensor lock ring.

    Use Special Service Tool: 310-123 Locking Ring, Fuel Tank.



NOTE: Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.

17. Connect the electrical connector.

18. Install the access cover.

19. Install the rear seat cushion. Refer to: Rear Seat Cushion .
20. Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE

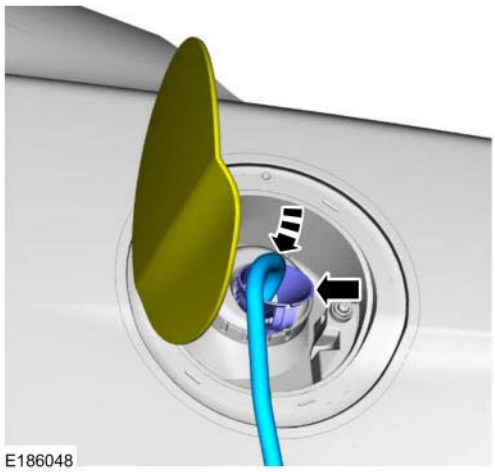
Special Tool(s) / General Equipment

 ST1134A	292-00004 Fuel Tanker 100 GPM

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE > REMOVAL

NOTE: Removal steps in this procedure may contain installation steps.

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

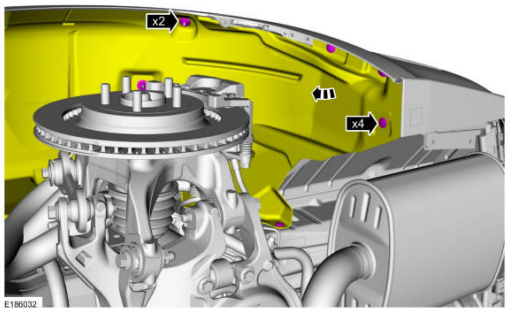
NOTE: The supplemental refueling adapter is located in the luggage compartment.

3.
Install the supplemental refueling adapter and a 6 ft. length of 5/8 in. semi-rigid fuel drain tube into the Easy Fuel™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

NOTE: This step is to remove approximately one-eighth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the fuel tank filler pipe inlet.

4.
Attach the Fuel Storage Tanker to the fuel drain tube and remove approximately one-eighth

(approximately 2 gallons) of fuel from the tank.



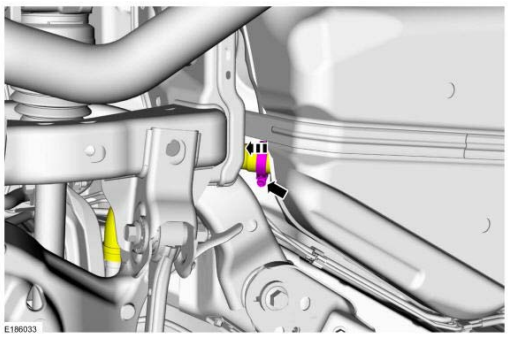
Use Special Service Tool: 292-00004 Fuel Tanker 100 GPM.

5.

Remove the rear wheel on the LH side. Refer to: Wheel and Tire .

6.

Remove the retainers and position aside LH rear wheel splash shield aside.



NOTE: Some fuel may remain in the fuel tank filler pipe after draining. Carefully disconnect the fuel tank filler pipe hose from the fuel tank and drain any residual fuel into a suitable container.

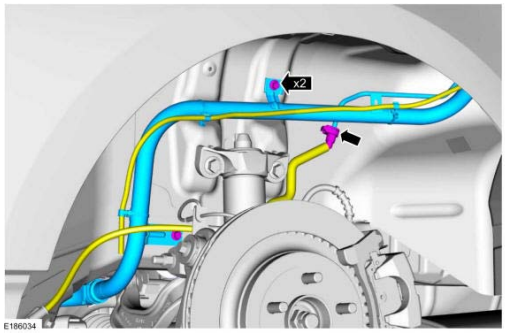
7.
Release the clamp and disconnect the Fuel Tank Filler Pipe from the fuel tank.

Torque

: 53 lb.in (6 Nm)

8.

1.



Disconnect the vapor tube Quick Release Coupling. Refer to: Quick Release Coupling - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

2.

Remove retainers and the Fuel Tank Filler Pipe.

Torque

: 18 lb.ft (25 Nm)

REMOVAL AND INSTALLATION > FUEL TANK FILLER PIPE > INSTALLATION

1.

To install, reverse the removal procedure.

DESCRIPTION AND OPERATION > INTAKE AIR DISTRIBUTION AND FILTERING > OVERVIEW

The air intake system cleans intake air with a replaceable, dry-type engine Air Cleaner (ACL) element made of treated, pleated paper. A new Air Cleaner (ACL) element must be installed periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the Air Cleaner (ACL) element is reached.

The Charge Air Cooler (CAC) subsystem cools and increases the density of the compressed turbocharged air.

The air intake system measures air temperature with the IAT sensor.

DIAGNOSIS AND TESTING > INTAKE AIR DISTRIBUTION AND FILTERING

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these, REFER to: Diagnostic Methods .

For PCM DTC, REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST.

For driveability symptoms without DTC, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

GENERAL PROCEDURES > CHARGE AIR COOLER (CAC) CLEANING

Cleaning

1.

Remove the CAC. Refer to: Charge Air Cooler (CAC) .

2.

Remove the screw and the Turbocharger Boost Pressure Sensor from the CAC.

NOTE: Do not use a high-pressure power washer to clean the CAC or damage to the CAC may occur.

NOTE: Drain all contaminates such as coolant, fuel and oil prior to cleaning the CAC.

NOTE: Thoroughly clean the joint clamp areas as well as the turbocharger

connection, engine connection and the CAC connections, using metal brake parts cleaner.

3.
Lay the CAC flat with the inlet and outlet ports pointing up.

NOTE: Plug or cap the CAC openings prior to agitating.

4.
Add an appropriate amount of commercially available detergent cleaner such as Simple Green Pro HD, or equivalent to the CAC. Follow the manufacturer's directions for cleaning. Fill the CAC to 40% of its volume with water.

5.

Raise one end of the CAC and agitate it by hand for at least 5 minutes.

6.

Raise the opposite end of the CAC and agitate it by hand for at least 5 minutes.

7.

Drain the CAC.

8.

Flush the CAC thoroughly with clean water.

9.

Repeat Steps 3 through 8 until no contaminates are found in the flush water.

10.

Allow the CAC to air dry.

NOTE: The following leak test steps must be performed prior to installing the CAC.

11.
Install the Turbocharger Boost Pressure Sensor and the screw on the CAC.

Torque

: 44 lb.in (5 Nm)

NOTE: Use a commercially available kit, such as the Johnson Manufacturing Company Charge Air Cooler Test Set Part No. 351-CAS, or equivalent.

12.
Install the commercially available cooler tester on the CAC following the manufacturer's installation instructions.

13.

Tighten the clamps.

Torque

: 44 lb.in (5 Nm)

14.

> *WARNING: Never exceed the specified pressure. Excessive pressure may cause the test adapter to blow off or may damage the charge air cooler (CAC). Failure to follow this instruction may result in serious personal injury.*

Slowly apply air pressure.

Pressure

: 21.8psi (150kPa)

15.

Let the CAC stand for a few minutes and note any loss in pressure.

16.

Release the air pressure.

17.

Repeat Steps 14 through 16 as many times as necessary to verify the readings. The reading is considered verified when 3 consecutive tests show approximately the same pressure drop.

> *NOTE: If the pressure loss exceeds 10 kPa (1.5 psi) per minute, install a new CAC.*

18.
Install the CAC. Refer to: Charge Air Cooler (CAC) .

REMOVAL AND INSTALLATION > AIR CLEANER > REMOVAL

> *NOTE: Removal steps in this procedure may contain installation details.*

1.

1.

Loosen the clamp, position aside the air outlet pipe.

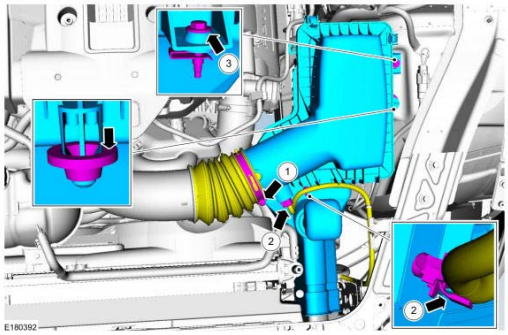
Torque

: 48 lb.in (5.4 Nm)

2.

Detach the wiring harness retainers and disconnect the IAT sensor electrical connectors.

3.



Remove the bolt.

Torque

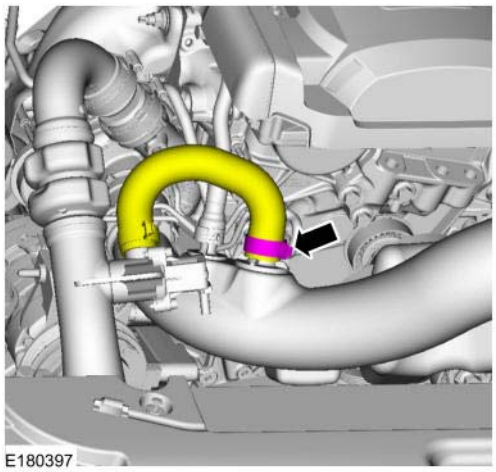
: 71 lb.in (8 Nm)

4.

Remove the air cleaner assembly.

REMOVAL AND INSTALLATION > AIR CLEANER > INSTALLATION

1.



To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > AIR CLEANER OUTLET PIPE > REMOVAL

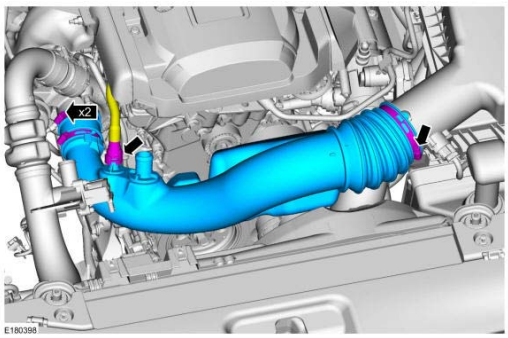
NOTE: Removal steps in this procedure may contain installation details.

1.

Loosen the clamp, disconnect and position aside the CAC bypass valve inlet tube from the air cleaner outlet pipe.

2.

1.



Disconnect and position aside the crankcase ventilation tube.

2.

Loosen the 3 clamps and remove the air cleaner outlet pipe.

Torque

: 48 lb.in (5.4 Nm)

REMOVAL AND INSTALLATION > AIR CLEANER OUTLET PIPE > INSTALLATION

1.

To install, reverse the removal procedure.

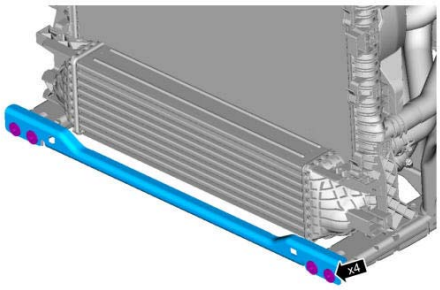
REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

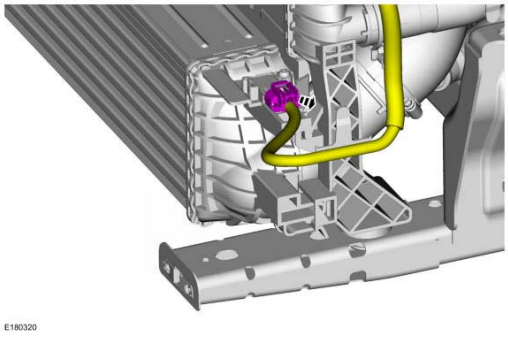
2.



Remove the active grill shutter. Refer to: Active Grille Shutter .

3.

Remove the 4 bolts and the lower radiator support bracket.

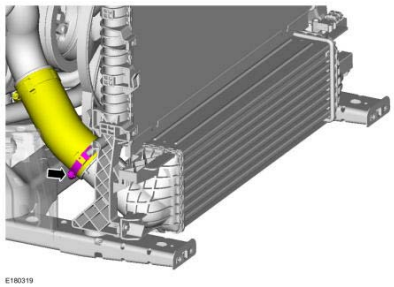


Torque

: 71 lb.in (8 Nm)

4.

Disconnect the turbocharger boost pressure sensor electrical connector from the CAC.

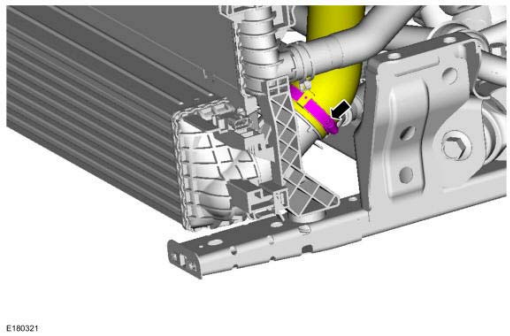


5.

Loosen the clamp and disconnect the CAC inlet tube.

Torque

: 48 lb.in (5.4 Nm)

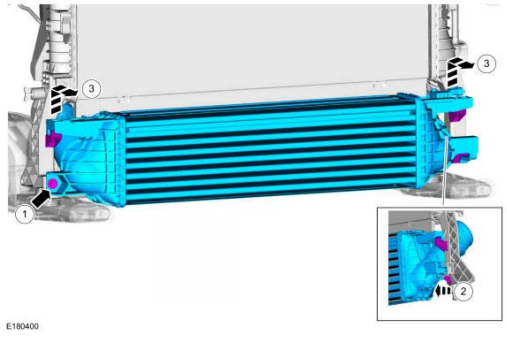


6.

Loosen the clamp and disconnect the CAC outlet tube.

Torque

: 48 lb.in (5.4 Nm)



7.

Remove the bolt and CAC in a sequence as shown in illustration.

Torque

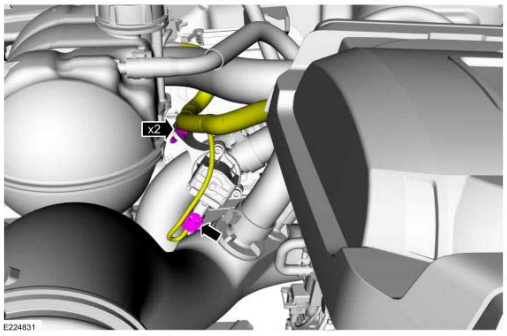
: 55 lb.in (6.2 Nm)

REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) > INSTALLATION

NOTE: When installing the CAC tubes, thoroughly clean the joint clamp areas using metal brake parts cleaner.

1.
To install, reverse the removal procedure.

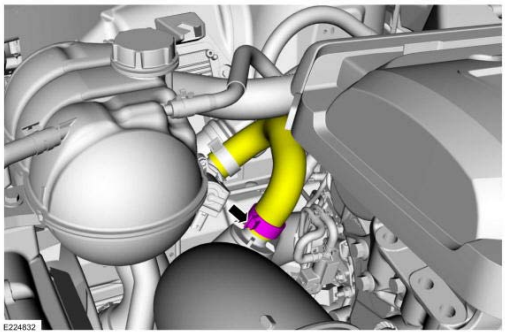
REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) INTAKE PIPE > REMOVAL



NOTE: When removing any turbocharger air intake system components, make sure to cover any open ports to prevent debris from entering the system. The turbocharger compressor vanes can be damaged by even the smallest particles. All components need to be inspected and cleaned prior to installation or reassembly.

NOTE: Removal steps in the procedure may contain installation details.

Charge Air Cooler (CAC) Intake Pipe - Upper

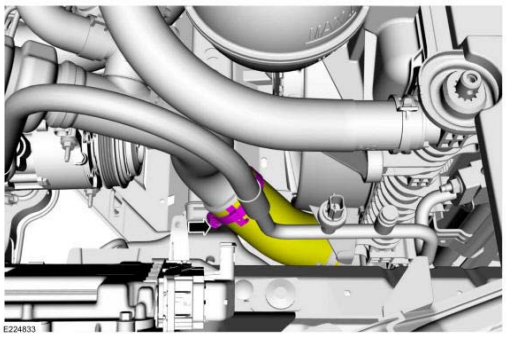


1.

Disconnect the electrical connector and detach the wire harness retainers.

2.

Disconnect and position aside the bypass tube.

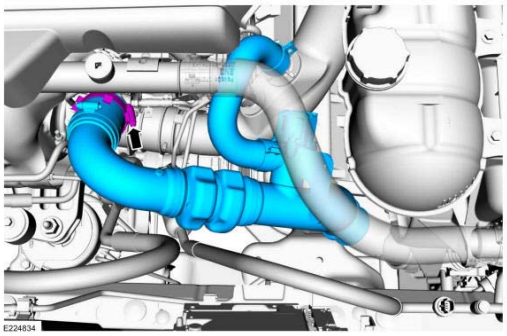


3.

Loosen the clamp and position aside the lower intake pipe.

Torque

: 44 lb.in (5 Nm)



4.

Loosen the clamp and remove the upper intake pipe.

Torque

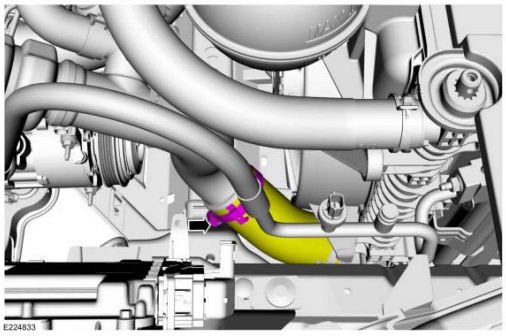
: 44 lb.in (5 Nm)

5.

Clean, inspect, and cover all open ports.

Charge Air Cooler (CAC) Intake Pipe - Lower

6.



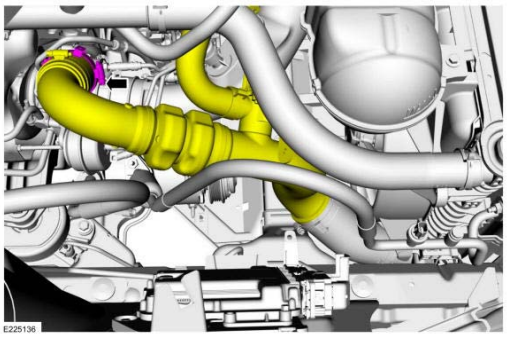
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

7.

Loosen the clamp and position aside the lower intake pipe.

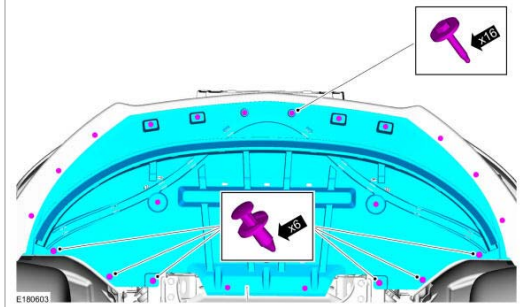
Torque

: 44 lb.in (5 Nm)



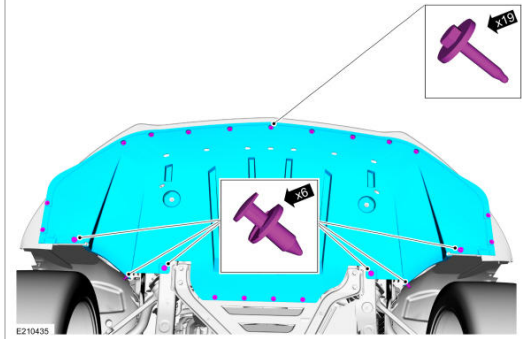
8.

Loosen the clamp and position aside the upper intake pipe.



Torque

: 44 lb.in (5 Nm)

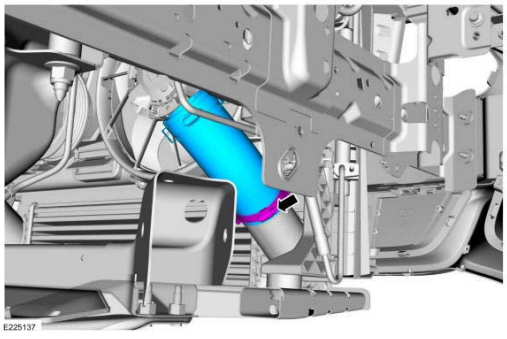


NOTE: If equipped.

9.
Remove the underbody shield.

NOTE: If equipped.

10.
Remove the underbody shield.



11.

Loosen the clamp and remove the lower intake pipe.

Torque

: 44 lb.in (5 Nm)

12.

Clean, inspect, and cover all open ports.

REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) INTAKE PIPE > INSTALLATION

1.

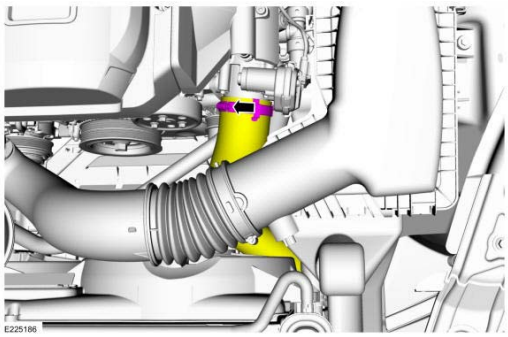
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) OUTLET PIPE > REMOVAL

NOTE: When removing any turbocharger air intake system components, make sure to cover any open ports to prevent debris from entering the system. The turbocharger compressor vanes can be damaged by even the smallest particles. All components need to be inspected and cleaned prior to installation or reassembly.

NOTE: Removal steps in the procedure may contain installation details.

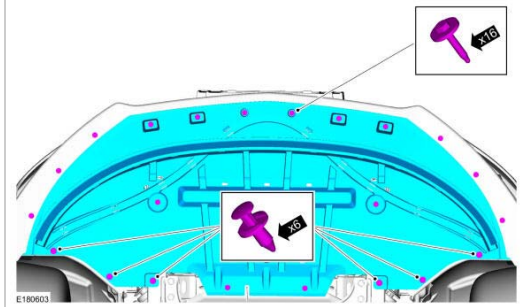
1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

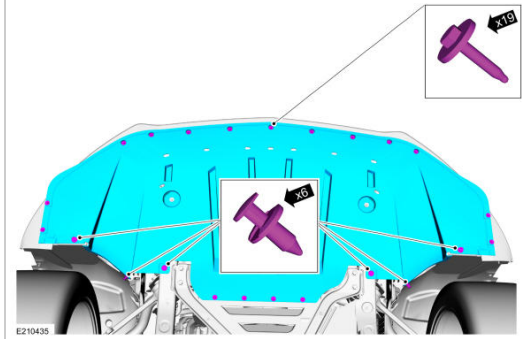
2.

Loosen the clamp and disconnect the outlet pipe.



Torque

: 44 lb.in (5 Nm)

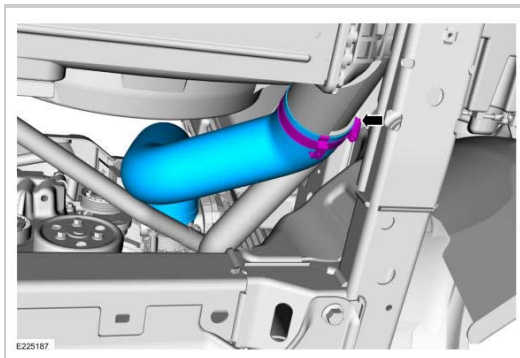


NOTE: If equipped.

3.
Remove the underbody shield.

NOTE: If equipped.

4.
Remove the underbody shield.



5.

Loosen the clamp and remove the outlet pipe.

Torque

: 44 lb.in (5 Nm)

6.

Clean, inspect, and cover all open ports.

REMOVAL AND INSTALLATION > CHARGE AIR COOLER (CAC) OUTLET PIPE > INSTALLATION

1.

To install, reverse the removal procedure.

DESCRIPTION AND OPERATION > INTAKE AIR DISTRIBUTION AND FILTERING - OVERVIEW > OVERVIEW

The air intake system cleans intake air with a replaceable, dry-type engine Air Cleaner (ACL) element made of treated, pleated paper. A new Air Cleaner (ACL) element must be installed periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the Air Cleaner (ACL) element is reached.

1.

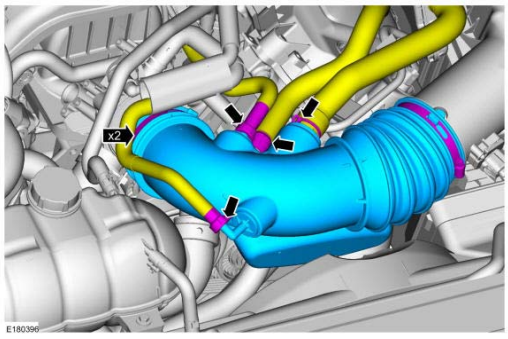
Remove the engine appearance cover.

2.

1.



Disconnect and position aside the 2 brake booster tubes, crankcase ventilation tube and resonator air inlet tube.

2.

Loosen the 2 clamps and remove the air cleaner outlet pipe.

Torque

: 48 lb.in (5.4 Nm)

REMOVAL AND INSTALLATION > AIR CLEANER OUTLET PIPE > INSTALLATION

1.

To install, reverse the removal procedure.

SPECIFICATIONS > SPECIFICATIONS

General Specifications

Item	Specification
Normal engine cranking speed (Average)	200-250 RPM
Starting circuit maximum voltage drop (Engine at normal operating temperature) (Average)	0.5 volt
Starter motor maximum load current draw	800 amps
Starter motor no-load current draw (Average)	60-80 amps
Starter motor normal load current draw (Average)	130-190 amps

DESCRIPTION AND OPERATION > STARTING SYSTEM - OVERVIEW > STARTING SYSTEM

The starting system controls the cranking of the engine. When the PCM receives inputs from the ignition switch - push button start, transmission (with automatic transmission) or clutch pedal position switch (with manual transmission), run/start relay and the BCM it then energizes the BJB starter relay. When the starter relay is energized it applies power to the starter motor which cranks the engine.

DESCRIPTION AND OPERATION > STARTING SYSTEM - OVERVIEW > REMOTE START

Vehicles with automatic transmission are equipped with a remote start system. The remote start system allows the vehicle to be started from up to 30 meters (98 feet) away. For more information on the remote start system, refer to the owner's literature and Refer to: Handles, Locks, Latches and Entry Systems - System Operation and Component Description .

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages Powertrain Control Module (PCM)

Broadcast Message	Originating Module	Message Purpose
Crank request	BCM	Provides the PCM with indication that the driver has commanded the engine to crank.
Power mode	BCM	Provides the PCM with ignition mode.
Ignition status	BCM	Provides the PCM with ignition mode.

Module Network Input Messages Body Control Module (BCM)

Broadcast Message	Originating Module	Message Purpose
Intelligent access system status	RFA module	The response from the BCM request for the RFA module ID. If the RFA module ID response is incorrect, then the PATS is disabled.

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PUSH BUTTON START SYSTEM

This vehicle is equipped with a PATS that disables the engine from cranking if an unprogrammed PATS key is used or an invalid PCM ID is received. The PATS is controlled by the BCM. If there is a PATS concern that causes the engine to be disabled, the IPC displays the corresponding message in the message center. For additional information, Refer to: Passive Anti-Theft System (PATS) - System Operation and Component Description .

Ignition modes are controlled by the RFA module and the BCM. For additional information on the ignition switch - push button start modes, Refer to: Steering Wheel and Column Electrical Components - System Operation and Component Description .

The ignition switch - push button start is connected to the RFA module and the BCM as a backup in case of a failure. If there is a circuit failure to either module from the ignition switch - push button start, the modules communicate the ignition switch - push button start request to each other over the Medium Speed Controller Area Network (MS-CAN).

During a start event the ignition switch - push button start is pressed in combination with either the brake pedal (automatic transmission) or the clutch pedal (manual transmission) input. The RFA module, the BCM and the PCM receive a request to start the engine. The PCM recognizes the correct inputs and provides voltage and ground to energize the starter relay coil and close the starter relay contacts. The starter relay contacts close, providing voltage to the starter solenoid, allowing the starter motor to crank the engine. The PCM disengages the starter motor once an engine Revolutions Per Minute (RPM) threshold is reached, a set crank time is exceeded or the ignition switch - push button start is pressed indicating an engine shutdown.

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REMOTE START

Vehicles with automatic transmission are equipped with a remote start system. The remote start feature allows the operator to remotely start the engine from up to 30 meters (98 feet) away and is activated using the Passive Key. Once started, the engine runs for 10 minutes. The run time can be extended by the operator. Refer to the Owner's Guide for more information. For more information on enabling the Remote start system Refer to: Handles, Locks, Latches and Entry Systems - System Operation and Component Description .

Component Description

Ignition Switch - Push Button Start

The ignition switch - push button start (Engine Start/Stop button) is a momentary contact switch that is hardwired to the BCM and the PCM. The ignition switch - push button start is used to obtain the OFF, ON or START ignition modes. The ignition switch - push button start is part of the FCIM and cannot be serviced separately. For more information, Refer to: Steering Wheel and Column Electrical Components - System Operation and Component Description .

BCM

Refer to: Module Controlled Functions - System Operation and Component Description .

PCM

The PCM provides power and ground to the starter relay to initiate cranking of the engine.

DIAGNOSIS AND TESTING > STARTING SYSTEM > INSPECTION AND VERIFICATION

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

1.

Verify the customer concern.

2.

Check the battery for loose, damaged or corroded connections.

3.

Check the generator for loose, damaged or corroded connections.

4.

Check the battery condition and state of charge. REFER to: BATTERY .

5.

Remove the accessory drive belt. REFER to: ACCESSORY DRIVE BELT - 3.7L Duratec (227kW/301PS). Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.

6.

If any aftermarket accessories have been added to the vehicle, make sure they are properly wired.

7.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

DIAGNOSIS AND TESTING > STARTING SYSTEM > DTC CHARTS

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

PCM DTC Chart

DTC	Description	Action
P06E9	Engine Starter Performance	If the engine cranks, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) . If the engine does not crank, GO to Pinpoint Test A
P0830	Clutch Pedal Switch "A" Circuit	GO to Pinpoint Test A
P1594	Forced Engine Shutdown - Remote Start System Fault, No Unattended Vehicle Timeout	REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).
P1595	Forced Engine Shutdown - Remote Start System Fault, Transmission Range Not In Park Position	REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).
P162F	Starter Motor Disabled - Engine Crank Time Too Long	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .
P2535	Ignition Switch Run/Start Position Circuit High	GO to Pinpoint Test D
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

BCM DTC Chart

DTC	Description	Action
C113A:11	Wakeup Control: Circuit Short To Ground	GO to Pinpoint Test C
C113A:15	Wakeup Control: Circuit Short To Battery or Open	GO to Pinpoint Test C
P0830:11	Clutch Pedal Switch "A" Circuit: Circuit Short To Ground	GO to Pinpoint Test A
All Other DTCs	-	REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > STARTING SYSTEM > SYMPTOM CHART(S)

Symptom Chart: Starting System

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
The engine does not crank	Refer to the Pinpoint Test	GO to Pinpoint Test A
The engine cranks slowly	Refer to the Pinpoint Test	PERFORM the starter system component test. REFER to Starter Motor - Positive Circuit Test in Component Test(s) .
The engine cranks but will not start	Fuses PCM Fuel pump Fuel pump relay Starter Wiring, terminals or connectors	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .
Unusual starter noise	Refer to the Pinpoint Test	GO to Pinpoint Test B
The starter spins but the engine does not crank	Starter motor	INSPECT the starter motor mounting and engagement. REPAIR as necessary.
	Damaged flexplate	INSPECT the flexplate for damaged, missing or worn teeth. REPAIR as necessary.
The starter does not disengage from the flexplate	Starter relay Wiring, terminals or connectors	REMOVE the starter relay. If the engine stops cranking, INSTALL a new relay. If the engine continues to crank, REPAIR circuit CDC25 (BN/GN) for a short to voltage.
The remote start is inoperative	Remote start feature not enabled Passive Key or battery PCM Wiring, terminals or connectors	REFER to: Locks, Latches and Entry Systems .
The remote start has poor range performance	Passive key or battery After market systems High power devices TV/radio transmission towers	REFER to: Locks, Latches and Entry Systems .

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S)

Engine Does Not Crank

Refer to Starting System for schematic and connector information.

Normal Operation and Fault Conditions

REFER to: Starting System - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P06E9	Engine Starter Performance	The PCM sets this DTC when no engine rotation is detected during a crank event.
P0830:11	Clutch Pedal Switch "A" Circuit: Circuit Short To Ground	The BCM sets this DTC when a short to ground is detected on the clutch bottom of travel circuit during an on-demand self test.

Possible Sources

- Battery
- Battery cables
- IPC
- Starter motor
- BJB starter relay

Visual Inspection and Diagnostic Pre-checks

- Inspect the run/start relay.
- Inspect the high current BJB connections.
- Verify the BJB fuse 60 (5A).
- Verify the BJB fuse 30 (30A).
- Inspect the passive key.
- Inspect the CPP switch (manual transmission only).

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST A : ENGINE DOES NOT CRANK > PINPOINT TEST A : ENGINE DOES NOT CRANK

A1 PERFORM INSPECTION AND VERIFICATION

NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: If it is necessary to leave the battery charger connected during testing, do not leave it on its highest or boost setting. The highest settings can exceed 16 volts, resulting in false test results and setting of DTCs.

Perform Inspection and Verification .

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to A2

A2 CHECK FOR NO KEY DETECTED MESSAGE IN THE MESSAGE CENTER

NOTE: There are certain areas inside the vehicle where the passive key may not be detected and the message center displays NO KEY DETECTED. If the passive key is in the far outside edges of the interior (like in a door map pocket or above a sun visor) it might not be detected. Move the passive key to a different location and try to start the vehicle again.

Check the message displayed in the message center while pressing the engine start/stop switch.

Is NO KEY DETECTED displayed?

Yes	DIAGNOSE the NO KEY DETECTED concern. REFER to: Passive Anti-Theft System (PATS) .

No	GO to A3

A3 VERIFY THE BCM (BODY CONTROL MODULE), IPC (INSTRUMENT PANEL CLUSTER) AND PCM (POWERTRAIN CONTROL MODULE) PASS THE NETWORK TEST

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the BCM, IPC and PCM pass the Network Test?

Yes	GO to A4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

A4 RETRIEVE BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform BCM self-test.

Are any BCM Diagnostic Trouble Codes (DTCs) present?

Yes	For DTC P0830:11 GO to A26 For all BCM Diagnostic Trouble Codes (DTCs), REFER to the BCM DTC Chart in DTC Charts .

No	GO to A5

A5 RETRIEVE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform PCM self-test.

Are any PCM Diagnostic Trouble Codes (DTCs) other than P06E9 present?

Yes	REFER to the PCM DTC Chart in DTC Charts .

No	With automatic transmission, GO to A6With manual transmission, GO to A11

A6 CHECK THE OPERATION OF THE STOPLAMPS

While observing the stoplamps, apply the brake pedal.

Do the stoplamps illuminate?

Yes	GO to A7

No	DIAGNOSE All the Stoplamps are inoperative. REFER to: Stoplamps .

A7 CHECK THE BRAKE PEDAL POSITION (BOO1) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM B001 PID while applying the brake pedal.

Does the PID read On?

Yes	GO to A9

No	GO to A8

A8 CHECK THE BPP (BRAKE PEDAL POSITION) SWITCH CIRCUIT FOR VOLTAGE AT THE PCM (POWERTRAIN CONTROL MODULE)

Ignition OFF.

Disconnect PCM C1381B .

While applying the brake pedal, measure:

Positive Lead	Measurement / Action	Negative Lead

C1381B-67		Ground

Is the voltage greater than 11 volts?

Yes	GO to A28

No	REPAIR the circuit.

A9 CHECK BCM (BODY CONTROL MODULE) IGN_SW_STATE PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Make sure the transmission is in PARK or NEUTRAL.

Monitor the BCM PID IGN_SW_STATE while pressing the engine start/stop switch and the brake pedal.

Does the PID change from Off to Start when the ignition switch - push button start and brake pedal are pressed?

Yes	GO to A10

No	DIAGNOSE No power in ON. REFER to: Steering Wheel and Column Electrical Components .

A10 CHECK THE PCM (POWERTRAIN CONTROL MODULE) IN GEAR-TRANSMISSION IS APPLYING A LOAD TO ENGINE (IN_GEAR) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the PCM Parameter Identifications (PIDs).

Monitor the PCM PID IN_GEAR, while placing the gear selector in PARK and then NEUTRAL.

Does the PID read No in both positions?

Yes	GO to A12

No	REFER to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 3.7L Duratec (227kW/301PS) .

A11 CHECK THE PCM (POWERTRAIN CONTROL MODULE) CLUTCH PEDAL AT OR NEAR BOTTOM OF TRAVEL (CPP_BOT) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, while viewing the PCM PID CPP_BOT, fully apply the clutch pedal and release.

Does the PID change from NO to YES when the clutch pedal is fully applied?

Yes	GO to A12

No	GO to A23

A12 CHECK THE PCM (POWERTRAIN CONTROL MODULE) ENGINE CRANKING (ENG_CRANK) PID (PARAMETER IDENTIFICATION)

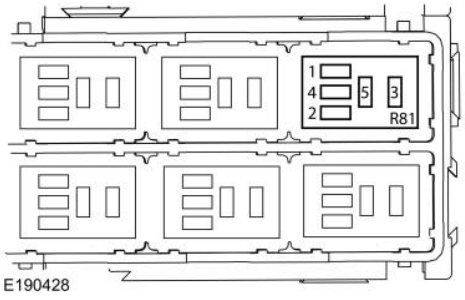
Make sure the transmission is in PARK or NEUTRAL.

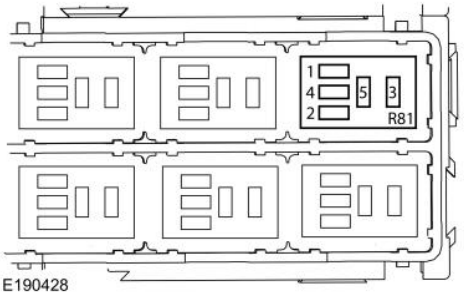
Using a diagnostic scan tool, view the PCM Parameter Identifications (PIDs).

Monitor the PCM PID ENG_CRANK while pressing the engine start/stop switch and the brake pedal (with automatic transmission) or fully apply the clutch pedal (with manual transmission).

Does the PID change from Inactive to Active?

Yes	GO to A13





No	GO to A28

NOTE: The following step uses a test light to simulate normal circuit loads. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A13 CHECK THE STARTER RELAY CONTROL OPERATION

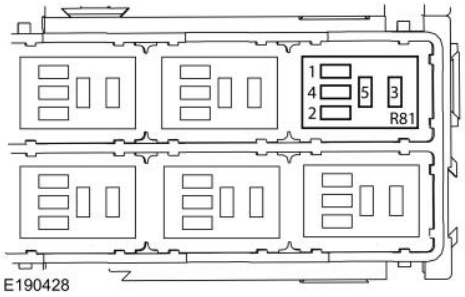
Remove the BJB starter relay.

Measure:

Positive Lead	Measurement / Action	Negative Lead
 BJB starter relay pin 1		 BJB starter relay pin 2

Make sure the transmission is in PARK or NEUTRAL.

While pressing the engine start/stop switch and the brake pedal, observe the test light.



Does the test light illuminate when the engine start/stop switch is pressed?

Yes	GO to A14

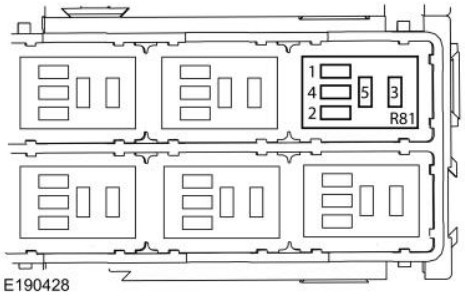
No	GO to A21

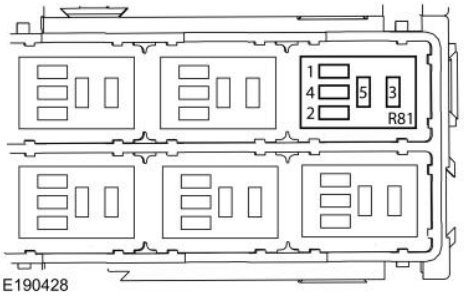
A14 CHECK THE VOLTAGE TO THE STARTER RELAY

Measure:

Positive Lead	Measurement / Action	Negative Lead
 E190428 BJB starter relay pin 3		Ground

Is the voltage greater than 11 volts?





Yes	GO to A15

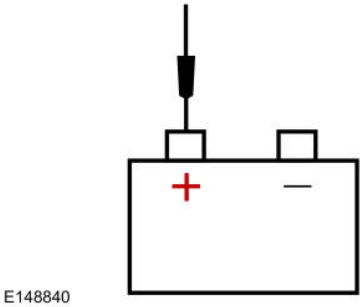
No	VERIFY BJB fuse 30 (30A) is OK. If OK, REPAIR the circuit for an open. If not OK, REFER to the SYSTEM WIRING DIAGRAMS article to identify the possible causes of the circuit short.

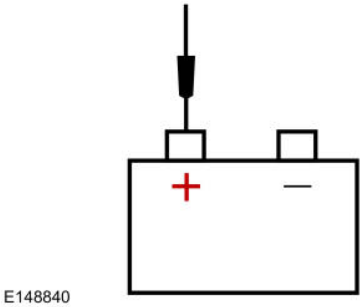
A15 CHECK THE STARTER MOTOR OPERATION AT THE STARTER RELAY

Ignition OFF.

With the transmission in PARK or NEUTRAL, momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 E190428 BJB starter relay pin 3		 E190428 BJB starter relay pin 5





Did the starter engage and the engine crank?

Yes	INSTALL a new starter relay.

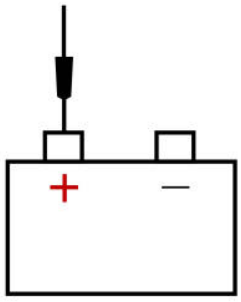
No	GO to A16

A16 CHECK THE BATTERY GROUND CABLES

Measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		Ground G106
 E148840		Ground G108

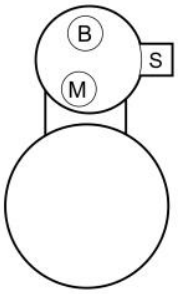
Are the voltages greater than 11 volts?



Yes	GO to A17

No	CLEAN or INSTALL new negative battery cables as necessary. REFER to: Battery Cables - 3.7L Duratec (227kW/301PS) .

A17 CHECK THE STARTER MOTOR GROUND



Measure:

Positive Lead	Measurement / Action	Negative Lead

E148840

E148837

Starter motor case

Is the voltage greater than 11 volts?

Yes	GO to A18

No	CLEAN the starter motor mounting flange and MAKE SURE the starter motor is correctly mounted. REFER to: Starter Motor .

A18 CHECK THE VOLTAGE TO THE STARTER MOTOR

Measure:

Positive Lead	Measurement / Action	Negative Lead
C197A-1 ("B" terminal)		Ground

Is the voltage greater than 11 volts?

Yes	GO to A19

No	INSTALL a new positive battery cable. REFER to: Battery Cables - 3.7L Duratec (227kW/301PS) .

A19 CHECK THE STARTER MOTOR FOR CORRECT OPERATION

Perform Starter Motor - Positive Circuit Test in Component Test(s) .

Was an obvious cause found?

Yes	Correct the cause as necessary.

No	GO to A20

A20 CHECK FOR START INPUT AT THE STARTER

Connect BJB starter relay.

Disconnect Starter solenoid C197A .

While holding the key in the START position, measure:

Positive Lead	Measurement / Action	Negative Lead
C197C-1 ("S" terminal)		Ground

Is the voltage greater than 11 volts?

Yes	CLEAN the starter solenoid "S" terminal and starter solenoid connector. CHECK the wiring and the starter motor for a loose or intermittent connection.

No	REPAIR the circuit for an open.

A21 CHECK THE PCM (POWERTRAIN CONTROL MODULE) STARTER RELAY CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BJB starter relay.

Disconnect PCM C1381B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-1	Ω	Ground
C1381B-58	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A22

No	REPAIR the affected circuit.

A22 CHECK THE PCM (POWERTRAIN CONTROL MODULE) STARTER RELAY CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-1	Ω	BJB starter relay pin 1
C1381B-58	Ω	BJB starter relay pin 2

Are the resistances less than 3 ohms?

Yes	GO to A28

No	REPAIR the affected circuit.

A23 CHECK THE CPP (CLUTCH PEDAL POSITION) SWITCH OPERATION

Ignition OFF.

Disconnect PCM C1381B .

While fully applying the clutch pedal, measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-9	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A28

No	GO to A24

A24 CHECK THE CPP (CLUTCH PEDAL POSITION) GROUND CIRCUIT FOR AN OPEN

Disconnect CPP switch C2353 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2353-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A25

No	REPAIR the circuit.

A25 CHECK THE CPP (CLUTCH PEDAL POSITION) SWITCH CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-9	Ω	C2353-1

Is the resistance less than 3 ohms?

Yes	INSTALL a new CPP switch. REFER to: CLUTCH PEDAL POSITION (CPP) SWITCH - 3.7L Duratec (227kW/301PS).

No	REPAIR the circuit.

A26 CHECK FOR DTC WITH CPP (CLUTCH PEDAL POSITION) SWITCH DISCONNECTED

Ignition OFF.

Disconnect CPP switch C2353 .

Ignition ON.

Using a diagnostic scan tool, perform BCM self-test.

Was DTC P0830:11 retrieved during on-demand self-test with the CPP switch disconnected?

Yes	GO to A27

No	INSTALL a new CPP switch. REFER to: CLUTCH PEDAL POSITION (CPP) SWITCH - 3.7L Duratec (227kW/301PS).

A27 CHECK THE CLUTCH BOTTOM OF TRAVEL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280A .

Disconnect PCM C1381B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-9	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A29

No	REPAIR the circuit.

A28 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 3.7L Duratec (227kW/301PS.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

A29 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST B : UNUSUAL STARTER NOISE

Normal Operation and Fault Conditions

Correct starter operation relies on correct mounting of the starter to the engine, alignment of the starter ring gear to the flexplate and correct functioning of the starter assembly (internal gears, bearings).

Possible Sources

- Engine

- Starter motor
- Starter motor mounting

Visual Inspection and Diagnostic Pre-checks

- Inspect the starter motor.
- Inspect the starter motor mounting.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST B : UNUSUAL STARTER NOISE > PINPOINT TEST B : UNUSUAL STARTER NOISE

B1 CHECK THE STARTER MOUNTING

Inspect the starter mounting bolts for looseness.

Is the starter motor mounted correctly?

Yes	GO to B2

No	INSTALL the starter motor correctly. REFER to: Starter Motor .

B2 CHECK FOR STARTER NOISE

Ignition OFF.

Connect a remote starter switch between the starter solenoid C197A-1 ("B" terminal) and C197C-1 ("S" terminal).

Engage the starter and verify the noise is due to starter operation.

Is the noise due to the starter engagement?

Yes	REFER to: Starter Motor Drive Gear and Flywheel Ring Gear Inspection .

No	REFER to: ENGINE SYSTEM - GENERAL INFORMATION to continue diagnosis.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST C : C113A:11 OR C113A:15

Refer to Electronic Engine Controls - 3.7L for schematic and connector information.

Normal Operation and Fault Conditions

The wake-up control circuit wakes up the PCM prior to the engine cranking. The PCM needs to wake up prior to a crank request so it has time to go through its initialization. The wake-up control circuit is controlled by the BCM. The BCM activates the wake-up control circuit when the driver door is opened or when the ignition is in the ON or START position.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C113A:11	PCM Wakeup Control: Circuit Short to Ground	This DTC is set by the BCM when a short to ground is detected on the wake-up control circuit.
C113A:15	PCM Wakeup Control: Circuit Short to Battery or Open	This DTC is set by the BCM when a short to voltage or an open is detected on the wake-up control circuit.

Possible Sources

- BCM
- PCM
- Wiring, terminals or connectors

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST C : C113A:11 OR C113A:15 > PINPOINT TEST C : C113A:11 OR C113A:15

C1 CHECK FOR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the BCM self-test.

Is DTC C113A:11 present?

Yes	GO to C2

No	If DTC C113A:15 is present, GO to C4For all other BCM Diagnostic Trouble Codes (DTCs), REFER to: Body Control Module (BCM) .

C2 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C1381B .

Ignition ON.

Using a diagnostic scan tool, clear the BCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform the BCM self-test.

Is BCM DTC C113A:11 present?

Yes	GO to C3

No	GO to C8

C3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-65	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to C7

No	REPAIR the circuit.

C4 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR INTERNAL SHORT OR OPEN

Ignition OFF.

Disconnect PCM C1381B .

Ignition ON.

Using a diagnostic scan tool, clear the BCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform the BCM self-test.

Is BCM DTC C113A:15 present?

Yes	GO to C5

No	GO to C8

C5 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1381B-65		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to C6

C6 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-65	Ω	C2280F-18

Is the resistance less than 3 ohms?

Yes	GO to C7

No	REPAIR the circuit.

C7 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

C8 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 3.7L Duratec (227kW/301PS.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST D : P2535

Refer to Electronic Engine Controls - 3.7L for schematic and connector information.

Normal Operation and Fault Conditions

When the ignition switch - push button start has been pressed, the PCM receives a voltage signal on the crank detect circuit. When the required inputs have been received, the PCM supplies voltage and ground to the starter relay coil. The ignition switch - push button start is part of the FCIM and cannot be serviced separately. For more information, REFER to: Starting System - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P2535	Ignition Switch Run/Start Position Circuit High	The PCM sets this DTC when the PCM detects voltage on the crank detect circuit while engine is running.

Possible Sources

- Ignition switch - push button start

- BCM
- PCM
- Wiring, terminals or connectors

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST D : P2535 > PINPOINT TEST D : P2535

D1 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE PCM (POWERTRAIN CONTROL MODULE) DISCONNECTED

Ignition OFF.

Disconnect PCM C1381B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-42		Ground

Is any voltage present?

Yes	GO to D2

No	GO to D4

D2 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE IGNITION SWITCH - PUSH BUTTON START DISCONNECTED

Ignition OFF.

Disconnect FCIM C2402A .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-42		Ground

Is any voltage present?

Yes	GO to D3

No	Install a new ignition switch - push button start. REFER to: Front Controls Interface Module

	(FCIM) - Vehicles With: AM/FM/CD/SYNC (without touchscreen) or REFER to: Front Controls Interface Module (FCIM) - Vehicles With: Touchscreen Display

D3 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE BCM (BODY CONTROL MODULE) DISCONNECTED

Ignition OFF.

Disconnect BCM C2280B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1381B-42		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	

D4 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 3.7L Duratec (227kW/301PS.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > COMPONENT TEST(S)

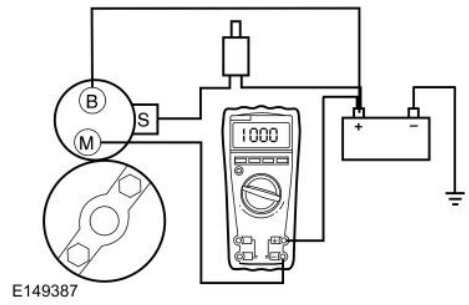
Starter Motor - Positive Circuit Test

NOTE: Always make the multimeter connection at the component terminal rather than at the wiring end of the connector. Making a connection at the wiring end of the connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and component.

1.

Make sure the battery is fully charged. REFER to: BATTERY .

2.



Perform a battery drain test. REFER to: Battery Drain Check .

3.

Connect a remote starter switch between starter solenoid "S" terminal and the battery positive terminal.

4.

Connect the multimeter positive lead to the battery positive post. Connect the negative lead to the starter solenoid "M" terminal.

5.

Place gear selector lever in Park or Neutral.

6.

Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.

7.

If the voltage reading is 0.5 volt or less, perform Starter Motor - Ground Circuit Test in Component Test(s) .

8.

A voltage reading greater than 0.5 volt is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Remove the cables from the solenoid "B", "S" and "M" terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6.

9.

If the voltage reading is still greater than 0.5 volt when checked at the "M" terminal, move the multimeter negative lead to the starter solenoid "B" terminal.

10.

With the gear selector lever in Park or Neutral, engage the remote starter switch. Read and record the voltage.

11.

If the voltage reading at the "B" terminal is lower than 0.5 volt, the concern is in the connections at the starter solenoid or in the solenoid contacts. Install a new starter motor.REFER to: Starter Motor .

12.

If the voltage reading taken at the solenoid "B" terminal is greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is in the positive battery cable connection or in the positive battery cable itself. Clean the positive battery cable connection. If this does not resolve the concern, install a new positive battery cable. REFER to: Battery Cables - 3.7L Duratec (227kW/301PS) .

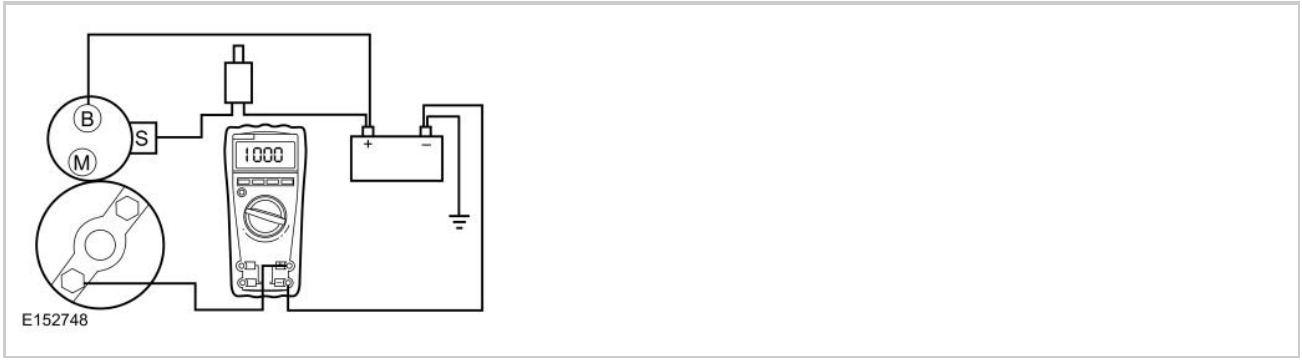
Starter Motor - Ground Circuit Test

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. This procedure checks the voltage drop in the ground circuit.

1.

Connect a remote starter switch between starter solenoid "S" terminal and the battery positive terminal.

2.



Connect the multimeter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative battery terminal.

3.

Place gear selector lever in Park or Neutral.

4.

Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.

5.

If the voltage reading is greater than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.

6.

If the voltage reading is greater than 0.5 volt, install a new negative battery cable.REFER to: Battery Cables - 3.7L Duratec (227kW/301PS) .

7.

If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor.REFER to: Starter Motor .

GENERAL PROCEDURES > STARTER MOTOR DRIVE GEAR AND FLYWHEEL RING GEAR INSPECTION

Inspection

1.

Remove the starter motor. Refer to: Starter Motor .

2.

Check the wear patterns on the starter drive gear and the flywheel or flexplate ring gear. If the wear pattern is normal, then install the starter motor. Refer to: Starter Motor .

3.

If the starter motor drive gear and the flywheel or flexplate ring gear are not fully engaging and the starter motor drive gear is scored or damaged, then install a new starter motor.Refer to: Starter Motor .

4.

If the teeth on the flywheel or flexplate ring gear are scored or damaged, then install a new flywheel or flexplate. Refer to: FLEXPLATE - 3.7L Duratec (227kW/301PS). Refer to: FLYWHEEL - 3.7L Duratec (227kW/301PS).

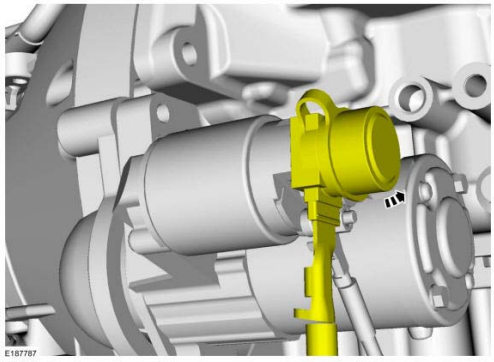
REMOVAL AND INSTALLATION > STARTER MOTOR > REMOVAL

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

3.

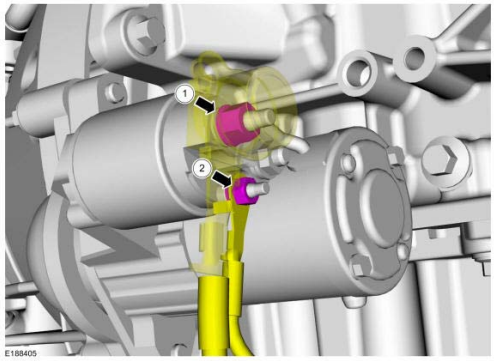
Open the starter motor solenoid battery cable cover.

4.

1.

Remove the starter motor solenoid battery cable nut and then disconnect the starter motor solenoid battery cable.

Torque



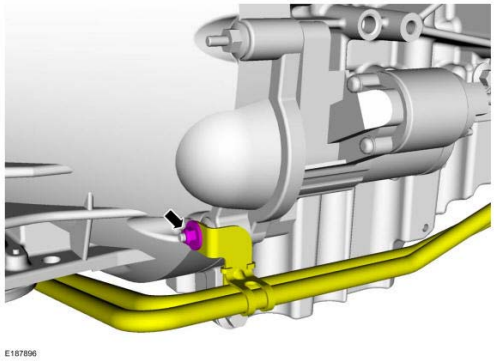
: 106 lb.in (12 Nm)

2.

Remove the starter motor solenoid wire nut and then disconnect starter motor solenoid wire.

Torque

: 53 lb.in (6 Nm)



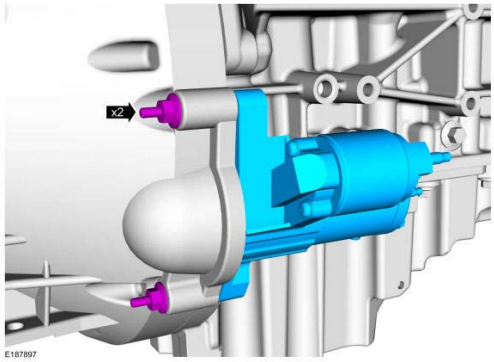
Automatic Transmission

5.

Remove the transmission cooling tube mounting bracket nut and then position the transmission cooling tube mounting bracket aside.

Torque

: 119 lb.in (13.5 Nm)



All vehicles

6.

Remove the starter motor mounting studbolts and then remove starter motor.

Torque

: 35 lb.ft (47.5 Nm)

7.

Inspect the starter motor drive gear and flywheel ring gear. Refer to: Starter Motor Drive Gear and Flywheel Ring Gear Inspection .

REMOVAL AND INSTALLATION > STARTER MOTOR > INSTALLATION

1.

To install, reverse the removal procedure.

SPECIFICATIONS > SPECIFICATIONS

General Specifications

Item	Specification
Normal engine cranking speed (Average)	200-250 RPM
Starting circuit maximum voltage drop (Engine at normal operating temperature) (Average)	0.5 volt
Starter motor maximum load current draw	800 amps
Starter motor no-load current draw (Average)	60-80 amps
Starter motor normal load current draw (Average)	130-190 amps

DESCRIPTION AND OPERATION > STARTING SYSTEM - OVERVIEW > STARTING SYSTEM

The starting system controls the cranking of the engine. When the PCM receives inputs from the ignition switch - push button start, transmission (with automatic transmission) or clutch pedal position switch (with manual transmission), run/start relay and the BCM it then energizes the BJB starter relay. When the starter relay is energized it applies power to the starter motor which cranks the engine.

DESCRIPTION AND OPERATION > STARTING SYSTEM - OVERVIEW > REMOTE START

Vehicles with automatic transmission are equipped with a remote start system. The remote start system allows the vehicle to be started from up to 30 meters (98 feet) away. For more information on the remote start system, refer to the owner's literature and Refer to: HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS .

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages Powertrain Control Module (PCM)

Broadcast Message	Originating Module	Message Purpose
Crank request	BCM	Provides the PCM with indication that the driver has commanded the engine to crank.
Power mode	BCM	Provides the PCM with ignition mode.
Ignition status	BCM	Provides the PCM with ignition mode.

Module Network Input Messages Body Control Module (BCM)

Broadcast Message	Originating Module	Message Purpose
Intelligent access system status	RFA module	The response from the BCM request for the RFA module ID. If the RFA module ID response is incorrect, then the PATS is disabled.

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PUSH BUTTON START SYSTEM

This vehicle is equipped with a PATS that disables the engine from cranking if an unprogrammed PATS key is used or an invalid PCM ID is received. The PATS is controlled by the BCM. If there is a PATS concern that causes the engine to be disabled, the IPC displays the corresponding message in the message center. For additional information, Refer to: Passive Anti-Theft System (PATS) - System Operation and Component Description .

Ignition modes are controlled by the RFA module and the BCM. For additional information on the ignition switch - push button start modes, Refer to: Steering Wheel and Column Electrical Components - System Operation and Component Description .

The ignition switch - push button start is connected to the RFA module and the BCM as a backup in case of a failure. If there is a circuit failure to either module from the ignition switch - push button start, the modules communicate the ignition switch - push button start request to each other over the Medium Speed Controller Area Network (MS-CAN).

During a start event the ignition switch - push button start is pressed in combination with either the brake pedal (automatic transmission) or the clutch pedal (manual transmission) input. The RFA module, the BCM and the PCM receive a request to start the engine. The PCM recognizes the correct inputs and provides voltage and ground to energize the starter relay coil and close the starter relay contacts. The starter relay contacts close, providing voltage to the starter solenoid, allowing the starter motor to crank the engine. The PCM disengages the starter motor once an engine Revolutions Per Minute (RPM) threshold is reached, a set crank time is exceeded or the ignition switch - push button start is pressed indicating an engine shutdown.

DESCRIPTION AND OPERATION > STARTING SYSTEM - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REMOTE START

Vehicles with automatic transmission are equipped with a remote start system. The remote start feature allows the operator to remotely start the engine from up to 30 meters (98 feet) away and is activated using the Passive Key. Once started, the engine runs for 10 minutes. The run time can be extended by the operator. Refer to the Owner's Guide for more information. For more information on enabling the Remote start system refer to: Handles, Locks, Latches and Entry Systems - System Operation and Component Description and the Owner's Literature.

Component Description

Ignition Switch - Push Button Start

The ignition switch - push button start (Engine Start/Stop button) is a momentary contact switch that is hardwired to the BCM and the PCM. The ignition switch - push button start is used to obtain the OFF, ON or START ignition modes. The ignition switch - push button start is part of the FCIM and cannot be serviced separately. For more information, Refer to: Steering Wheel and Column Electrical Components - System Operation and Component Description .

BCM

Refer to: Module Controlled Functions - System Operation and Component Description .

PCM

The PCM provides power and ground to the starter relay to initiate cranking of the engine.

DIAGNOSIS AND TESTING > STARTING SYSTEM > INSPECTION AND VERIFICATION

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

1.

Verify the customer concern.

2.

Check the battery for loose, damaged or corroded connections.

3.

Check the generator for loose, damaged or corroded connections.

4.

Check the battery condition and state of charge. BATTERY .

5.

Remove the accessory drive belt. REFER to: ACCESSORY DRIVE BELT - 2.3L EcoBoost (231kW/314PS). Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.

6.

If any aftermarket accessories have been added to the vehicle, make sure they are properly wired.

7.

If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

DIAGNOSIS AND TESTING > STARTING SYSTEM > DTC CHARTS

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

PCM DTC Chart

DTC	Description	Action
P06E4	Control Module Wake-up Circuit Performance	RETRIEVE and RECORD all CMDTCs. If BCM DTC C113A:11 or C113A:15 is found, GO to Pinpoint Test C Clear all Diagnostic Trouble Codes (DTCs). RERUN the PCM self-test. If the DTC returns, CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS).
P06E9	Engine Starter Performance	If the engine cranks, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) . If the engine does not crank, GO to Pinpoint Test A
P0830	Clutch Pedal Switch "A" Circuit	GO to Pinpoint Test A
P1594	Forced Engine Shutdown - Remote Start System Fault, No Unattended Vehicle Timeout	REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS).
P1595	Forced Engine Shutdown - Remote Start System Fault, Transmission Range Not In Park Position	REFER to: ELECTRONIC ENGINE CONTROLS - 2.3L ECOBOOST (231KW/314PS).
P162F	Starter Motor Disabled - Engine Crank Time Too Long	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .
P2535	Ignition Switch Run/Start Position Circuit High	GO to Pinpoint Test D
All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

BCM DTC Chart

DTC	Description	Action
C113A:11	Wakeup Control: Circuit Short To Ground	GO to Pinpoint Test C
C113A:15	Wakeup Control: Circuit Short To Battery or Open	GO to Pinpoint Test C
P0830:11	Clutch Pedal Switch "A" Circuit: Circuit Short To Ground	GO to Pinpoint Test A
All Other DTCs	-	REFER to: Body Control Module (BCM) .

DIAGNOSIS AND TESTING > STARTING SYSTEM > SYMPTOM CHART(S)

Symptom Chart: Starting System

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
The engine does not crank	Refer to the Pinpoint Test	GO to Pinpoint Test A
The engine cranks slowly	Refer to the Pinpoint Test	PERFORM the starter system component test. REFER to Starter Motor - Positive Circuit Test in Component Test(s) .
The engine cranks but will not start	Fuses PCM Fuel pump Fuel pump relay Starter Wiring, terminals or connectors	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .
Unusual starter noise	Refer to the Pinpoint Test	GO to Pinpoint Test B
The starter spins but the engine does not crank	Starter motor	INSPECT the starter motor mounting and engagement. REPAIR as necessary.
	Damaged flexplate	INSPECT the flexplate for damaged, missing or worn teeth. REPAIR as necessary.
The starter does not disengage from the flexplate	Starter relay Wiring, terminals or connectors	REMOVE the starter relay. If the engine stops cranking, INSTALL a new relay. If the engine continues to crank, REPAIR circuit CDC25 (BN/GN) for a short to voltage.

The remote start is inoperative	Remote start feature not enabled Passive Key or battery PCM Wiring, terminals or connectors	REFER to: Locks, Latches and Entry Systems .
The remote start has poor range performance	Passive key or battery After market systems High power devices TV/radio transmission towers	REFER to: Locks, Latches and Entry Systems .

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S)

Engine Does Not Crank

Refer to Starting System for schematic and connector information.

Normal Operation and Fault Conditions

REFER to: Starting System - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P06E9	Engine Starter Performance	The PCM sets this DTC when no engine rotation is detected during a crank event.
P0830	Clutch Pedal "A" Circuit	The PCM sets this DTC when the PCM receives vehicle speed input, indicating vehicle movement and does not detect the switching input from the clutch pedal position switch.
P0830:11	Clutch Pedal Switch "A" Circuit: Circuit Short To Ground	The BCM sets this DTC when a short to ground is detected on the clutch bottom of travel circuit during an on-demand self test.

Possible Sources

- Battery
- Battery cables
- IPC
- Starter motor
- BJB starter relay

Visual Inspection and Diagnostic Pre-checks

- Inspect the run/start relay.

- Inspect the high current BJB connections.
- Verify the BJB fuse 60 (5A).
- Verify the BJB fuse 30 (30A).
- Inspect the passive key.
- Inspect the CPP switch (manual transmission only).

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST A : ENGINE DOES NOT CRANK > PINPOINT TEST A : ENGINE DOES NOT CRANK

A1 PERFORM INSPECTION AND VERIFICATION

> *NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.*

> *NOTE: If it is necessary to leave the battery charger connected during testing, do not leave it on its highest or boost setting. The highest settings can exceed 16 volts, resulting in false test results and setting of DTCs.*

Perform Inspection and Verification .

Was an obvious cause for an observed or reported concern found?

Yes	CORRECT the cause as necessary.

No	GO to A2

A2 CHECK FOR NO KEY DETECTED MESSAGE IN THE MESSAGE CENTER

> *NOTE: There are certain areas inside the vehicle where the passive key may not be detected and the message center displays NO KEY DETECTED. If the passive key is in the far outside edges of the interior (like in a door map pocket or above a sun visor) it might not be detected. Move the passive key to a different location and try to start the vehicle again.*

Check the message displayed in the message center while pressing the engine start/stop switch.

Is NO KEY DETECTED displayed?

Yes	DIAGNOSE the NO KEY DETECTED concern. REFER to: Passive Anti-Theft System (PATS) .

No	GO to A3

A3 VERIFY THE BCM (BODY CONTROL MODULE), IPC (INSTRUMENT PANEL CLUSTER) AND PCM (POWERTRAIN CONTROL MODULE) PASS THE NETWORK TEST

Ignition ON.

Using a diagnostic scan tool, perform the Network Test.

Did the BCM, IPC and PCM pass the Network Test?

Yes	GO to A4

No	REFER to: MODULE COMMUNICATIONS NETWORK .

A4 RETRIEVE BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform BCM self-test.

Are any BCM Diagnostic Trouble Codes (DTCs) present?

Yes	For DTC P0830:11 GO to A26 For all BCM Diagnostic Trouble Codes (DTCs), REFER to the BCM DTC Chart in DTC Charts .

No	GO to A5

A5 RETRIEVE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, perform PCM self-test.

Are any PCM Diagnostic Trouble Codes (DTCs) other than P06E9 present?

Yes	REFER to the PCM DTC Chart in DTC Charts .

No	With automatic transmission, GO to A6 With manual transmission, GO to A11

A6 CHECK THE OPERATION OF THE STOPLAMPS

While observing the stoplamps, apply the brake pedal.

Do the stoplamps illuminate?

Yes	GO to A7

No	DIAGNOSE All the Stoplamps are inoperative. REFER to: Stoplamps .

A7 CHECK THE BRAKE PEDAL POSITION (BOO1) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the PCM B001 PID while applying the brake pedal.

Does the PID read On?

Yes	GO to A9

No	GO to A8

A8 CHECK THE BPP (BRAKE PEDAL POSITION) SWITCH CIRCUIT FOR VOLTAGE AT THE PCM (POWERTRAIN CONTROL MODULE)

Ignition OFF.

Disconnect PCM C1551B .

While applying the brake pedal, measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-66		Ground

Is the voltage greater than 11 volts?

Yes	GO to A28

No	REPAIR the circuit.

A9 CHECK BCM (BODY CONTROL MODULE) IGN_SW_STATE PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the BCM Parameter Identifications (PIDs).

Make sure the transmission is in PARK or NEUTRAL.

Monitor the BCM PID IGN_SW_STATE while pressing the engine start/stop switch and the brake pedal.

Does the PID change from Off to Start when the ignition switch - push button start and brake pedal are pressed?

Yes	GO to A10

No	DIAGNOSE No power in ON. REFER to: Steering Wheel and Column Electrical Components .

A10 CHECK THE PCM (POWERTRAIN CONTROL MODULE) IN GEAR-TRANSMISSION IS APPLYING A LOAD TO ENGINE (IN_GEAR) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the PCM Parameter Identifications (PIDs).

Monitor the PCM PID IN_GEAR, while placing the gear selector in PARK and then NEUTRAL.

Does the PID read No in both positions?

Yes	GO to A12

No	REFER to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 2.3L EcoBoost (201kW/273PS) .

A11 CHECK THE PCM (POWERTRAIN CONTROL MODULE) CLUTCH PEDAL AT OR NEAR BOTTOM OF TRAVEL (CPP_BOT) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, while viewing the PCM PID CPP_BOT, fully apply the clutch pedal and release.

Does the PID change from NO to YES when the clutch pedal is fully applied?

Yes	GO to A12

No	GO to A23

A12 CHECK THE PCM (POWERTRAIN CONTROL MODULE) ENGINE CRANKING (ENG_CRANK) PID (PARAMETER IDENTIFICATION)

Make sure the transmission is in PARK or NEUTRAL.

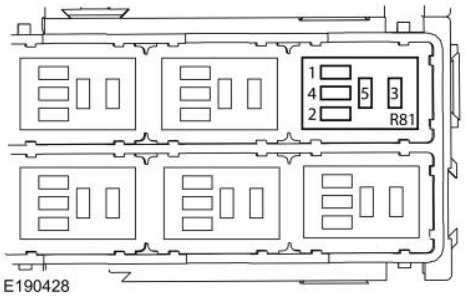
Using a diagnostic scan tool, view the PCM Parameter Identifications (PIDs).

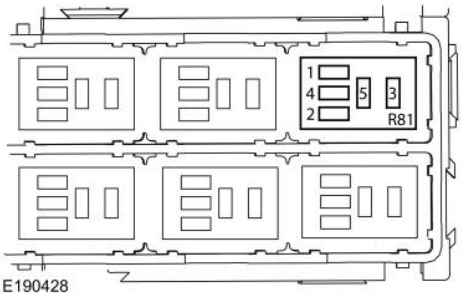
Monitor the PCM PID ENG_CRANK while pressing the engine start/stop switch and the brake pedal (with automatic transmission) or fully apply the clutch pedal (with manual transmission).

Does the PID change from Inactive to Active?

Yes	GO to A13

No	GO to A28





NOTE: The following step uses a test light to simulate normal circuit loads. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.

A13 CHECK THE STARTER RELAY CONTROL OPERATION

Remove the BJB starter relay.

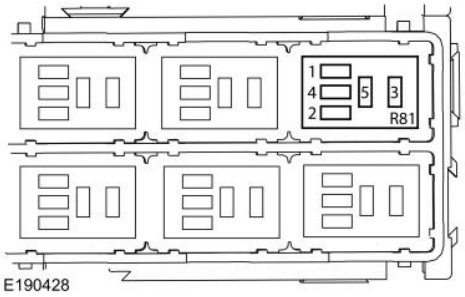
Measure:

Positive Lead	Measurement / Action	Negative Lead

 BJB starter relay pin 1		 BJB starter relay pin 2

Make sure the transmission is in PARK or NEUTRAL.

While pressing the engine start/stop switch and the brake pedal, observe the test light.



Does the test light illuminate when the engine start/stop switch is pressed?

Yes	GO to A14

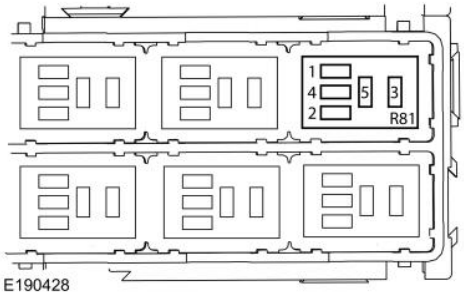
No	GO to A21

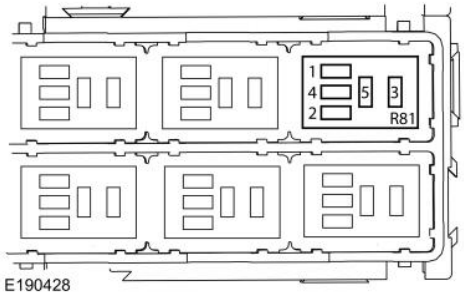
A14 CHECK THE VOLTAGE TO THE STARTER RELAY

Measure:

Positive Lead	Measurement / Action	Negative Lead
 BJB starter relay pin 3		Ground

Is the voltage greater than 11 volts?





Yes	GO to A15

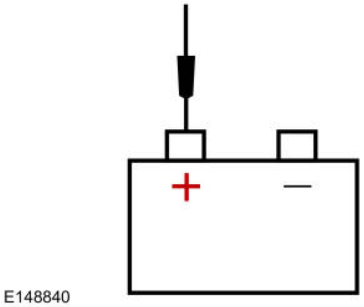
No	VERIFY BJB fuse 30 (30A) is OK. If OK, REPAIR the circuit for an open. If not OK, REFER to the SYSTEM WIRING DIAGRAMS to identify the possible causes of the circuit short.

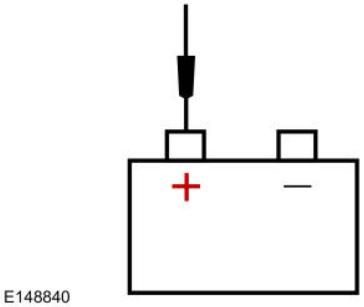
A15 CHECK THE STARTER MOTOR OPERATION AT THE STARTER RELAY

Ignition OFF.

With the transmission in PARK or NEUTRAL, momentarily connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
 BJB starter relay pin 3		 BJB starter relay pin 5





Did the starter engage and the engine crank?

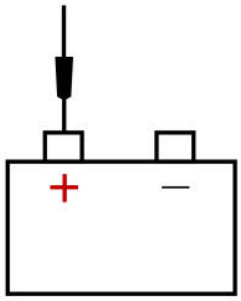
Yes	INSTALL a new starter relay.

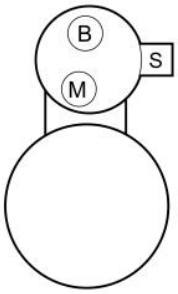
No	GO to A16

A16 CHECK THE BATTERY GROUND CABLES

Measure:

Positive Lead	Measurement / Action	Negative Lead
		Ground G106
		Ground G108





Are the voltages greater than 11 volts?

Yes	GO to A17

No	CLEAN or INSTALL new negative battery cables as necessary. REFER to: Battery Cables - 2.3L EcoBoost (201kW/273PS) .

A17 CHECK THE STARTER MOTOR GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
 E148840		 E148837 Starter motor case

Is the voltage greater than 11 volts?

Yes	GO to A18

No	CLEAN the starter motor mounting flange and MAKE SURE the starter motor is correctly mounted. REFER to: Starter Motor .

A18 CHECK THE VOLTAGE TO THE STARTER MOTOR

Measure:

Positive Lead	Measurement / Action	Negative Lead
C197A-1 ("B" terminal)		Ground

Is the voltage greater than 11 volts?

Yes	GO to A19

No	INSTALL a new positive battery cable. REFER to: Battery Cables - 2.3L EcoBoost (201kW/273PS) .

A19 CHECK THE STARTER MOTOR FOR CORRECT OPERATION

Perform Starter Motor - Positive Circuit Test in Component Test(s) .

Was an obvious cause found?

Yes	Correct the cause as necessary.

No	GO to A20

A20 CHECK FOR START INPUT AT THE STARTER

Connect BJB starter relay.

Disconnect Starter solenoid C197A .

While holding the key in the START position, measure:

Positive Lead	Measurement / Action	Negative Lead
C197C-1 ("S" terminal)		Ground

Is the voltage greater than 11 volts?

Yes	CLEAN the starter solenoid "S" terminal and starter solenoid connector. CHECK the wiring and the starter motor for a loose or intermittent connection.

No	REPAIR the circuit for an open.

A21 CHECK THE PCM (POWERTRAIN CONTROL MODULE) STARTER RELAY CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BJB starter relay.

Disconnect PCM C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-43	Ω	Ground
C1551B-62	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A22

No	REPAIR the affected circuit.

A22 CHECK THE PCM (POWERTRAIN CONTROL MODULE) STARTER RELAY CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-43	Ω	BJB starter relay pin 2
C1551B-62	Ω	BJB starter relay pin 1

Are the resistances less than 3 ohms?

Yes	GO to A28

No	REPAIR the affected circuit.

A23 CHECK THE CPP (CLUTCH PEDAL POSITION) SWITCH OPERATION

Ignition OFF.

Disconnect PCM C1551B .

While fully applying the clutch pedal, measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-30	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A28

No	GO to A24

A24 CHECK THE CPP (CLUTCH PEDAL POSITION) GROUND CIRCUIT FOR AN OPEN

Disconnect CPP switch C2353 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2353-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A25

No	REPAIR the circuit.

A25 CHECK THE CPP (CLUTCH PEDAL POSITION) SWITCH CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-30	Ω	C2353-1

Is the resistance less than 3 ohms?

Yes	INSTALL a new CPP switch. REFER to: CLUTCH PEDAL POSITION (CPP) SWITCH - 2.3L EcoBoost (231kW/314PS).

No	REPAIR the circuit.

A26 CHECK FOR DTC WITH CPP (CLUTCH PEDAL POSITION) SWITCH DISCONNECTED

Ignition OFF.

Disconnect CPP switch C2353 .

Ignition ON.

Using a diagnostic scan tool, perform BCM self-test.

Was DTC P0830:11 retrieved during on-demand self-test with the CPP switch disconnected?

Yes	GO to A27

No	INSTALL a new CPP switch. REFER to: CLUTCH PEDAL POSITION (CPP) SWITCH - 2.3L EcoBoost (231kW/314PS).

A27 CHECK THE CLUTCH BOTTOM OF TRAVEL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280A .

Disconnect PCM C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-30	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A29

No	REPAIR the circuit.

A28 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS).

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

A29 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST B : UNUSUAL STARTER NOISE

Unusual Starter Noise

Normal Operation and Fault Conditions

Correct starter operation relies on correct mounting of the starter to the engine, alignment of the starter ring gear to the flexplate and correct functioning of the starter assembly (internal gears, bearings).

Possible Sources

- Engine
- Starter motor
- Starter motor mounting

Visual Inspection and Diagnostic Pre-checks

- Inspect the starter motor.
- Inspect the starter motor mounting.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST B : UNUSUAL STARTER NOISE > PINPOINT TEST B : UNUSUAL STARTER NOISE

B1 CHECK THE STARTER MOUNTING

Inspect the starter mounting bolts for looseness.

Is the starter motor mounted correctly?

Yes	GO to B2

No	INSTALL the starter motor correctly. REFER to: Starter Motor .

B2 CHECK FOR STARTER NOISE

Ignition OFF.

Connect a remote starter switch between the starter solenoid C197A-1 ("B" terminal) and C197C-1 ("S" terminal).

Engage the starter and verify the noise is due to starter operation.

Is the noise due to the starter engagement?

Yes	REFER to: Starter Motor Drive Gear and Flywheel Ring Gear Inspection .

No	REFER to: ENGINE to continue diagnosis.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST C : C113A:11 OR C113A:15

C113A:11 or C113A:15

Refer to Electronic Engine Controls - 2.3L for schematic and connector information.

Normal Operation and Fault Conditions

The wake-up control circuit wakes up the PCM prior to the engine cranking. The PCM needs to wake up prior to a crank request so it has time to go through its initialization. The wake-up control circuit is controlled by the BCM. The BCM activates the wake-up control circuit when the driver door is opened or when the ignition is in the ON or START position.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C113A:11	PCM Wakeup Control: Circuit Short to Ground	This DTC is set by the BCM when a short to ground is detected on the wake-up control circuit.
C113A:15	PCM Wakeup Control: Circuit Short to Battery or Open	This DTC is set by the BCM when a short to voltage or an open is detected on the wake-up control circuit.

Possible Sources

- BCM
- PCM
- Wiring, terminals or connectors

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST C : C113A:11 OR C113A:15 > PINPOINT TEST C : C113A:11 OR C113A:15

C1 CHECK FOR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform the BCM self-test.

Is DTC C113A:11 present?

Yes	GO to C2

No	If DTC C113A:15 is present, GO to C4 For all other BCM Diagnostic Trouble Codes (DTCs), REFER to: Body Control Module (BCM) .

C2 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM C1551B .

Ignition ON.

Using a diagnostic scan tool, clear the BCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform the BCM self-test.

Is BCM DTC C113A:11 present?

Yes	GO to C3

No	GO to C8

C3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect BCM C2280F .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-28	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to C7

No	REPAIR the circuit.

C4 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR INTERNAL SHORT OR OPEN

Ignition OFF.

Disconnect PCM C1551B .

Ignition ON.

Using a diagnostic scan tool, clear the BCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform the BCM self-test.

Is BCM DTC C113A:15 present?

Yes	GO to C5

No	GO to C8

C5 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect BCM C2280F .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-28		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to C6

C6 CHECK THE PCM (POWERTRAIN CONTROL MODULE) WAKE-UP SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-28	Ω	C2280F-18

Is the resistance less than 3 ohms?

Yes	GO to C7

No	REPAIR the circuit.

C7 CHECK FOR CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the BCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

C8 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS).

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST D : P2535

P2535

Refer to Starting System for schematic and connector information.

Normal Operation and Fault Conditions

When the ignition switch - push button start has been pressed, the PCM receives a voltage signal on the

crank detect circuit. When the required inputs have been received, the PCM supplies voltage and ground to the starter relay coil. The ignition switch - push button start is part of the FCIM and cannot be serviced separately. For more information, REFER to: Starting System - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P2535	Ignition Switch Run/Start Position Circuit High	The PCM sets this DTC when the PCM detects voltage on the crank detect circuit while engine is running.

Possible Sources

- Ignition switch - push button start
- BCM
- PCM
- Wiring, terminals or connectors

DIAGNOSIS AND TESTING > STARTING SYSTEM > PINPOINT TEST(S) > PINPOINT TEST D : P2535 > PINPOINT TEST D : P2535

D1 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE PCM (POWERTRAIN CONTROL MODULE) DISCONNECTED

Ignition OFF.

Disconnect PCM C1551B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-47		Ground

Is any voltage present?

Yes	GO to D2

No	GO to D4

D2 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE IGNITION SWITCH - PUSH BUTTON START DISCONNECTED

Ignition OFF.

Disconnect FCIM C2402A .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-47		Ground

Is any voltage present?

Yes	GO to D3

No	Install a new ignition switch - push button start. REFER to: Front Controls Interface Module (FCIM) - Vehicles With: AM/FM/CD/SYNC (without touchscreen) or REFER to: Front Controls Interface Module (FCIM) - Vehicles With: Touchscreen Display.

D3 CHECK THE CRANK DETECT CIRCUIT FOR A SHORT TO VOLTAGE WITH THE BCM (BODY CONTROL MODULE) DISCONNECTED

Ignition OFF.

Disconnect BCM C2280B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1551B-47		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	

D4 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connectors or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: POWERTRAIN CONTROL MODULE (PCM) - 2.3L EcoBoost (231kW/314PS).

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > STARTING SYSTEM > COMPONENT TEST(S)

Starter Motor - Positive Circuit Test

NOTE: Always make the multimeter connection at the component terminal rather than at the wiring end of the connector. Making a connection at the wiring end of the connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and component.

1.

Make sure the battery is fully charged. REFER to: BATTERY .

2.

Perform a battery drain test. REFER to: Battery Drain Check .

3.

Connect a remote starter switch between starter solenoid "S" terminal and the battery positive terminal.

4.

Connect the multimeter positive lead to the battery positive post. Connect the negative lead to the starter solenoid "M" terminal.

5.

Place gear selector lever in Park or Neutral.

6.

Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.

7.

If the voltage reading is 0.5 volt or less, perform Starter Motor - Ground Circuit Test below.

8.

A voltage reading greater than 0.5 volt is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Remove the cables from the solenoid "B", "S" and "M" terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6.

9.

If the voltage reading is still greater than 0.5 volt when checked at the "M" terminal, move the multimeter negative lead to the starter solenoid "B" terminal.

10.

With the gear selector lever in Park or Neutral, engage the remote starter switch. Read and record the voltage.

11.

If the voltage reading at the "B" terminal is lower than 0.5 volt, the concern is in the connections at the starter solenoid or in the solenoid contacts. Install a new starter motor. REFER to: Starter Motor .

12.

If the voltage reading taken at the solenoid "B" terminal is greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is in the positive battery cable connection or in the positive battery cable itself. Clean the positive battery cable connection. If this does not resolve the concern, install a new positive battery cable. REFER to: Battery Cables - 2.3L EcoBoost (201kW/273PS) .

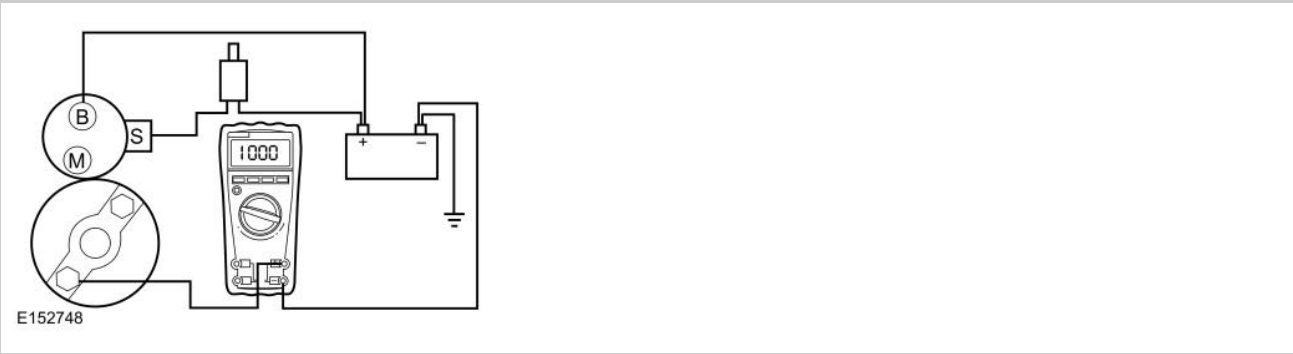
Starter Motor - Ground Circuit Test

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. This procedure checks the voltage drop in the ground circuit.

1.

Connect a remote starter switch between starter solenoid "S" terminal and the battery positive terminal.

2.



Connect the multimeter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative battery terminal.

3.

Place gear selector lever in Park or Neutral.

4.

Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.

5.

If the voltage reading is greater than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.

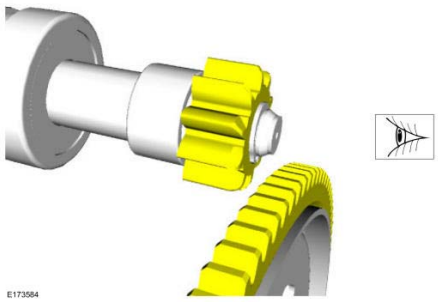
6.

If the voltage reading is greater than 0.5 volt, install a new negative battery cable. REFER to: Battery Cables - 2.3L EcoBoost (201kW/273PS) .

7.

If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor. REFER to: Starter Motor .

GENERAL PROCEDURES > STARTER MOTOR DRIVE GEAR AND FLYWHEEL RING GEAR INSPECTION



Inspection

1.

Remove the starter motor. Refer to: Starter Motor .

2.

Check the wear patterns on the starter drive gear and the flywheel or flexplate ring gear. If the wear pattern is normal, then install the starter motor. Refer to: Starter Motor .

3.

If the starter motor drive gear and the flywheel or flexplate ring gear are not fully engaging and the starter motor drive gear is scored or damaged, then install a new starter motor. Refer to: Starter Motor .

4.

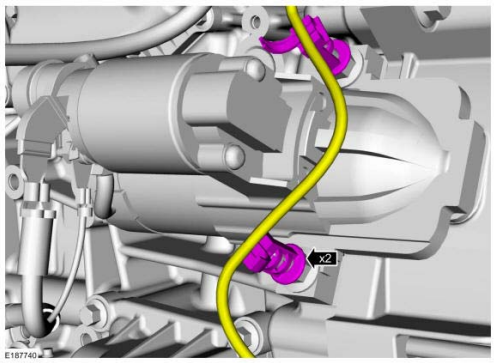
If the teeth on the flywheel or flexplate ring gear are scored or damaged, then install a new flywheel or flexplate. Refer to: FLEXPLATE - 2.3L EcoBoost (231kW/314PS). Refer to: FLYWHEEL - 2.3L EcoBoost (231kW/314PS).

REMOVAL AND INSTALLATION > STARTER MOTOR > REMOVAL

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1.



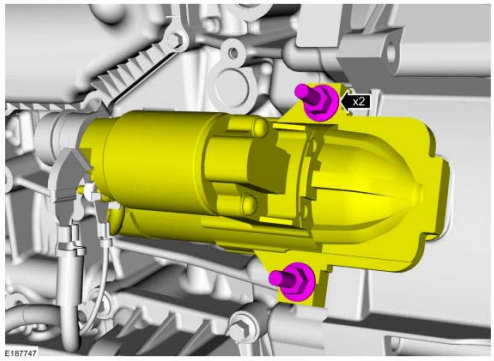
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the battery. Refer to: Battery Disconnect and Connect .

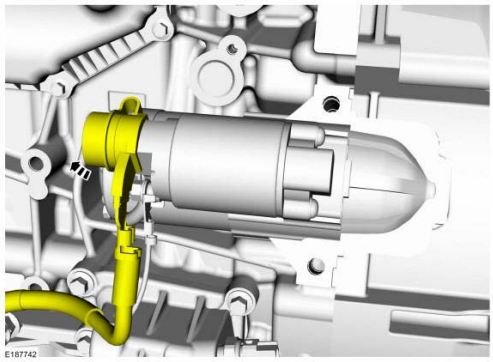
3.

Disconnect the wire harness retainers from the starter motor mounting studbolts and position the wire harness aside.



4.

Remove the starter motor mounting studbolts and then position starter motor aside.



Torque

: 35 lb.ft (47.5 Nm)

5.

Open the starter motor solenoid battery cable cover.

6.

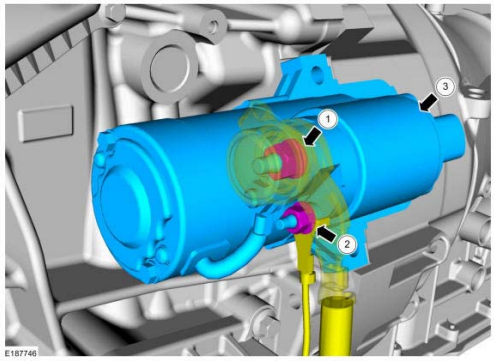
1.

Remove the starter motor solenoid battery cable nut and then disconnect the starter motor solenoid battery cable.

Torque

: 106 lb.in (12 Nm)

2.



Remove the starter motor solenoid wire nut and then disconnect the starter solenoid wire.

Torque

: 53 lb.in (6 Nm)

3.

Remove the starter motor.

7.

Inspect the starter motor drive gear and flywheel ring gear. Refer to: Starter Motor Drive Gear and Flywheel Ring Gear Inspection .

REMOVAL AND INSTALLATION > STARTER MOTOR > INSTALLATION

1.

To install, reverse the removal procedure.

Service Manual: ACCELERATION CONTROL

DESCRIPTION AND OPERATION > ACCELERATION CONTROL - OVERVIEW > OVERVIEW

The acceleration controls consist of the accelerator pedal and sensor assembly.

The throttle is controlled by an APP sensor on the accelerator pedal assembly. The APP sensor sends a signal to the PCM in response to throttle pedal movements initiated by the driver. The PCM sends a signal to the electronic throttle control which increases and decreases throttle position.

The engine management system electronically operates the throttle of the engine in response to throttle pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a "limp home" mode which allows the car to be driven with limited performance.

DIAGNOSIS AND TESTING > ACCELERATION CONTROL > SYMPTOM CHART(S)

REFER to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) . See ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

REMOVAL AND INSTALLATION > ACCELERATOR PEDAL > REMOVAL

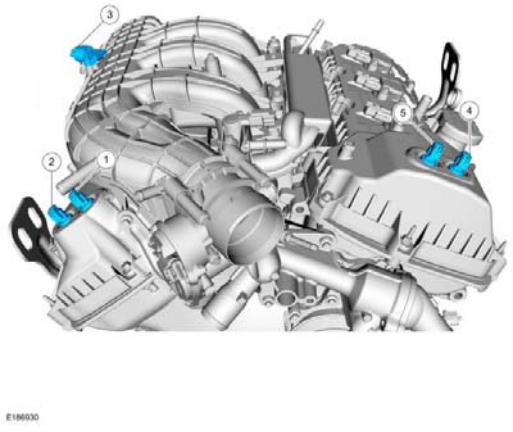
NOTE: Removal steps in this procedure may contain installation details.

NOTE: To prevent setting Diagnostic Trouble Codes (DTCs), make sure the ignition switch is in the OFF position prior to disconnecting the accelerator pedal electrical connector.

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

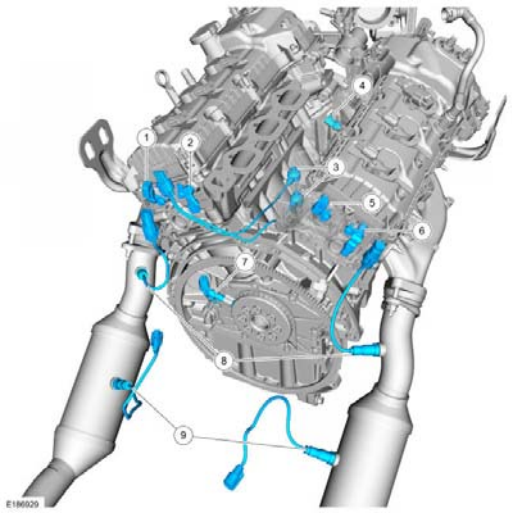
1. Refer to: HEALTH AND SAFETY PRECAUTIONS .
2. Disconnect the accelerator pedal sensor electrical connector. Remove the 3 nuts and the accelerator pedal and sensor assembly.

   Torque: 80 lb.in (9 Nm)



REMOVAL AND INSTALLATION > ACCELERATOR PEDAL > INSTALLATION

1. To install, reverse the removal procedure.



DESCRIPTION AND OPERATION > ELECTRONIC ENGINE CONTROLS - COMPONENT LOCATION

Item	Description
1	RH intake VCT oil control solenoid
2	RH exhaust VCT oil control solenoid
3	MAPT sensor
4	LH exhaust VCT oil control solenoid
5	LH intake VCT oil control solenoid

Electronic Engine Controls - Rear

Item	Description
1	LH exhaust CMP sensor
2	LH intake CMP sensor
3	KS
4	CHT sensor
5	RH intake CMP sensor
6	RH exhaust CMP sensor
7	CKP sensor
8	HO2S
9	Catalyst monitor sensor

Powertrain Control Module (PCM)

Item	Description
1	PCM

DESCRIPTION AND OPERATION > ELECTRONIC ENGINE CONTROLS - OVERVIEW

Authoring Template

DESCRIPTION AND OPERATION > ELECTRONIC ENGINE CONTROLS - OVERVIEW > OVERVIEW

The EEC system provides optimum control of the engine through the enhanced capability of the PCM. The EEC system also has an OBD monitoring system with features and functions to meet federal regulations on exhaust emissions.

The EEC system has two major divisions: hardware and software. The hardware includes the PCM, sensors, switches, actuators, solenoids, and interconnecting terminals. The software in the PCM provides the strategy control for outputs (engine hardware) based on the values of the inputs to the PCM.

The PCM receives information from a variety of sensor and switch inputs. Based on the strategy and calibration stored within the PCM, the PCM generates the appropriate output. The system is designed to minimize emissions and optimize fuel economy and driveability. The software strategy controls the basic operation of the engine, provides the OBD strategy, controls the MIL, communicates to the scan tool over the DLC, allows for flash EEPROM, provides idle air and fuel trim, and controls failure mode effects management (FMEM).

DESCRIPTION AND OPERATION > ELECTRONIC ENGINE CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

Refer to the ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > DTC CHART: POWERTRAIN CONTROL MODULE (PCM)

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Powertrain Control Module (PCM) DTC Chart

DTC	Description	Action
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	REFER to: ENGINE COOLING - 3.7L Duratec (227kW/301PS).
P0217	Engine Coolant Overtemperature Condition	REFER to: ENGINE COOLING - 3.7L Duratec (227kW/301PS).
P0218	Transmission Fluid Temperature Sensor "A" Over Temperature Condition	REFER to: Diagnostic Trouble Code (DTC) Charts and Pinpoint Tests - 3.7L Duratec (227kW/301PS) .

U0212	Lost Communication With Steering Column Control Module	GO to Pinpoint Test B

All Other DTCs	-	Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST A : U0121

DTC Fault Trigger Condition-PCM

DTC	Description	Fault Trigger Conditions
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	The PCM sets this DTC if data messages received from the ABS module over the High Speed Controller Area Network (HS-CAN) are missing.

Normal Operation and Fault Conditions

REFER to: MODULE COMMUNICATIONS NETWORK .

Possible Sources

- ABS module
- BCM
- PCM

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST A : U0121 > PINPOINT TEST A : U0121

A1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to A2

No	The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, perform a network test.

Does the ABS module pass the network test?

Yes	GO to A3

No	REFER to: MODULE COMMUNICATIONS NETWORK .

A3 PERFORM ABS (ANTI-LOCK BRAKE SYSTEM) MODULE SELF-TEST

Using a diagnostic scan tool, perform a ABS module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Anti-Lock Brake System (ABS) and Stability Control .

No	GO to A4

A4 CHECK THE BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, retrieve the BCM Diagnostic Trouble Codes (DTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to A5

A5 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0562 or DTC P0563 recorded?

Yes	REFER to DTC Chart: Powertrain Control Module (PCM) .

No	GO to A6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the PMI, or the PMI may not have been carried out.

A6 RECHECK THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the PCM self-test.

Is DTC U0121 still present?

Yes	GO to A7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0121 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, retrieve **all** Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Is DTC U0121 set in any other module?

Yes	GO to A8

No	GO to A9

A8 CHECK FOR CORRECT ABS (ANTI-LOCK BRAKE SYSTEM) MODULE OPERATION

Ignition OFF.

Disconnect and inspect all ABS MODULE connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the ABS MODULE connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical

	Service Bulletins (TSBs) address this concern, INSTALL a new ABS MODULE. REFER to: Anti-Lock Brake System (ABS) Module .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

A9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect PCM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST B : U0212

DTC Fault Trigger Condition-PCM

DTC	Description	Fault Trigger Conditions
U0212	Lost Communication With Steering Column Control Module	The PCM sets this DTC if data messages received from the SCCM over the High Speed Controller Area Network (HS-CAN) are missing.

Normal Operation and Fault Conditions

REFER to: MODULE COMMUNICATIONS NETWORK .

Possible Sources

- SCCM
- BCM
- PCM

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST B : U0212 > PINPOINT TEST B : U0212

B1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to B2

No	The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

B2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, perform a network test.

Does the SCCM module pass the network test?

Yes	GO to B3

No	REFER to: MODULE COMMUNICATIONS NETWORK .

B3 PERFORM SCCM (STEERING COLUMN CONTROL MODULE) MODULE SELF-TEST

Using a diagnostic scan tool, perform a SCCM module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Steering Wheel and Column Electrical Components .

No	GO to B4

B4 CHECK THE BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, retrieve the BCM Diagnostic Trouble Codes (DTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to B5

B5 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0562 or DTC P0563 recorded?

Yes	REFER to DTC Chart: Powertrain Control Module (PCM) .

No	GO to B6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the PMI, or the PMI may not have been carried out.

B6 RECHECK THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the PCM self-test.

Is DTC U0212 still present?

Yes	GO to B7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

B7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0212 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, retrieve **all** Continuous Memory Diagnostic Trouble Codes

(CMDTCs).

Is DTC U0212 set in any other module?

Yes	GO to B8

No	GO to B9

B8 CHECK FOR CORRECT SCCM (STEERING COLUMN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all SCCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the SCCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new SCCM MODULE.REFER to: Steering Column Control Module (SCCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

B9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect PCM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM.REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST C : U0164

DTC Fault Trigger Condition-PCM

DTC	Description	Fault Trigger Conditions
U0164	Lost Communication With HVAC Control Module	The PCM sets this DTC if data messages received from the FCIM through the GWM are missing.

Normal Operation and Fault Conditions

The HVAC control module is housed in the FCIM. REFER to: MODULE COMMUNICATIONS NETWORK .

Possible Sources

- FCIM module
- BCM
- PCM

DIAGNOSIS AND TESTING > ELECTRONIC ENGINE CONTROLS > PINPOINT TESTS > PINPOINT TEST C : U0164 > PINPOINT TEST C : U0164

C1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to C2

No	The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

C2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, perform a network test.

Does the FCIM module pass the network test?

Yes	GO to C3

No	REFER to: MODULE COMMUNICATIONS NETWORK .

C3 PERFORM FCIM (FRONT CONTROLS INTERFACE MODULE) MODULE SELF-TEST

Using a diagnostic scan tool, perform a FCIM module self-test.

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	Without touchscreen, REFER to: Information and Entertainment System - Vehicles With: AM/FM/CD/SYNC. With touchscreen, REFER to: Information and Entertainment System - Vehicles With: Touchscreen Display.

No	GO to C4

C4 CHECK THE BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, retrieve the BCM Diagnostic Trouble Codes (DTCs).

Are any Diagnostic Trouble Codes (DTCs) recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to C5

C5 PERFORM THE PCM (POWERTRAIN CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform the PCM self-test.

Is DTC P0562 or DTC P0563 recorded?

Yes	REFER to DTC Chart: Powertrain Control Module (PCM) .

No	GO to C6

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the PMI, or the PMI may not have been carried out.

C6 RECHECK THE PCM (POWERTRAIN CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Using a diagnostic scan tool, clear the Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Repeat the PCM self-test.

Is DTC U0164 still present?

Yes	GO to C7

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

C7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0164 SET IN OTHER MODULES

Using a diagnostic scan tool, clear all Diagnostic Trouble Codes (DTCs).

Ignition OFF.

Ignition ON.

Wait 10 seconds.

Using a diagnostic scan tool, retrieve **all** Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Is DTC U0164 set in any other module?

Yes	GO to C8

No	GO to C9

C8 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) MODULE OPERATION

Ignition OFF.

Disconnect and inspect all FCIM MODULE connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all the FCIM MODULE connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM MODULE.Without touchscreen, REFER to: FRONT CONTROLS INTERFACE MODULE (FCIM) - Vehicles With: AM/FM/CD/SYNC. With touchscreen, REFER to: FRONT CONTROLS INTERFACE MODULE (FCIM) - Vehicles With: Touchscreen Display.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

C9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect PCM connector.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connector. Make sure it seats and latches correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

REMOVAL AND INSTALLATION > CAMSHAFT POSITION (CMP) SENSOR

Materials

Name	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) XO-5W20-QSP (U.S.)	WSS-M2C945-A

REMOVAL AND INSTALLATION > CAMSHAFT POSITION (CMP) SENSOR > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

RH (right-hand) Camshaft Position (CMP) Sensors

1.

Remove the upper intake manifold. Refer to: UPPER INTAKE MANIFOLD - 3.7L Duratec (227kW/301PS).

2.

1.

Disconnect the intake CMP sensor electrical connector and remove the retainer and the CMP sensor.

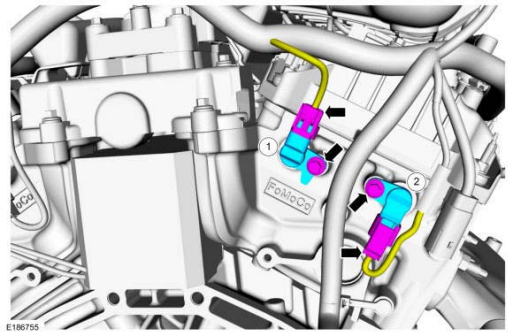
Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

Torque

: 89 lb.in (10 Nm)

2.



Disconnect the exhaust CMP sensor electrical connector and remove the retainer and the CMP sensor.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

Torque

: 89 lb.in (10 Nm)

LH (left-hand) Camshaft Position (CMP) Sensors

3.

1.

Disconnect the exhaust CMP sensor electrical connector and remove the retainer and the CMP sensor.

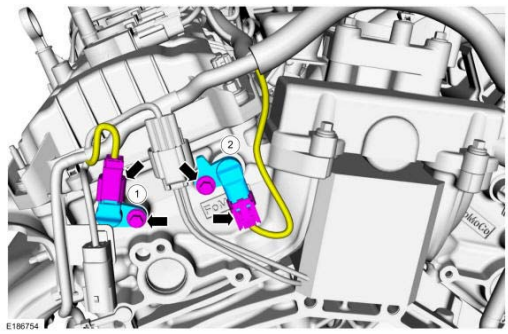
Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

Torque

: 89 lb.in (10 Nm)

2.



Disconnect the intake CMP sensor electrical connector and remove the retainer and the CMP sensor.

Material

: Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (U.S.) / XO-5W20-QSP (U.S.) (WSS-M2C945-A)

Torque

: 89 lb.in (10 Nm)

REMOVAL AND INSTALLATION > CAMSHAFT POSITION (CMP) SENSOR > INSTALLATION

NOTE: Before installation, lubricate the CMP sensor O-ring seal with clean engine oil.

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CATALYST MONITOR SENSOR

Special Tool(s) / General Equipment

 E172696	303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor TKIT-1994-F TKIT-1994-FLM/FM TKIT-1994-LM/M

Materials

Name	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	-
Penetrating and Lock Lubricant XL-1	-

REMOVAL AND INSTALLATION > CATALYST MONITOR SENSOR > REMOVAL

All sensors

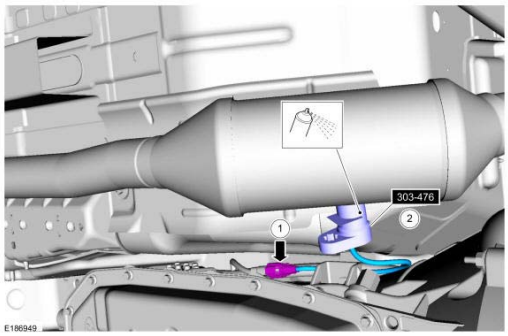
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

Right hand (RH) Catalyst monitor sensor

2.

1.



Disconnect the catalyst monitor sensor electrical connector.

2.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.

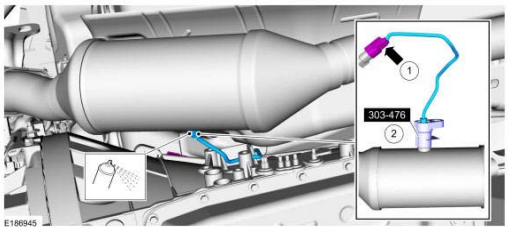
Material

: Penetrating and Lock Lubricant / XL-1

Left hand (LH) Catalyst monitor sensor

3.

1.



Disconnect the catalyst monitor sensor electrical connector.

2.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.

Material

: Penetrating and Lock Lubricant / XL-1

REMOVAL AND INSTALLATION > CATALYST MONITOR SENSOR > INSTALLATION

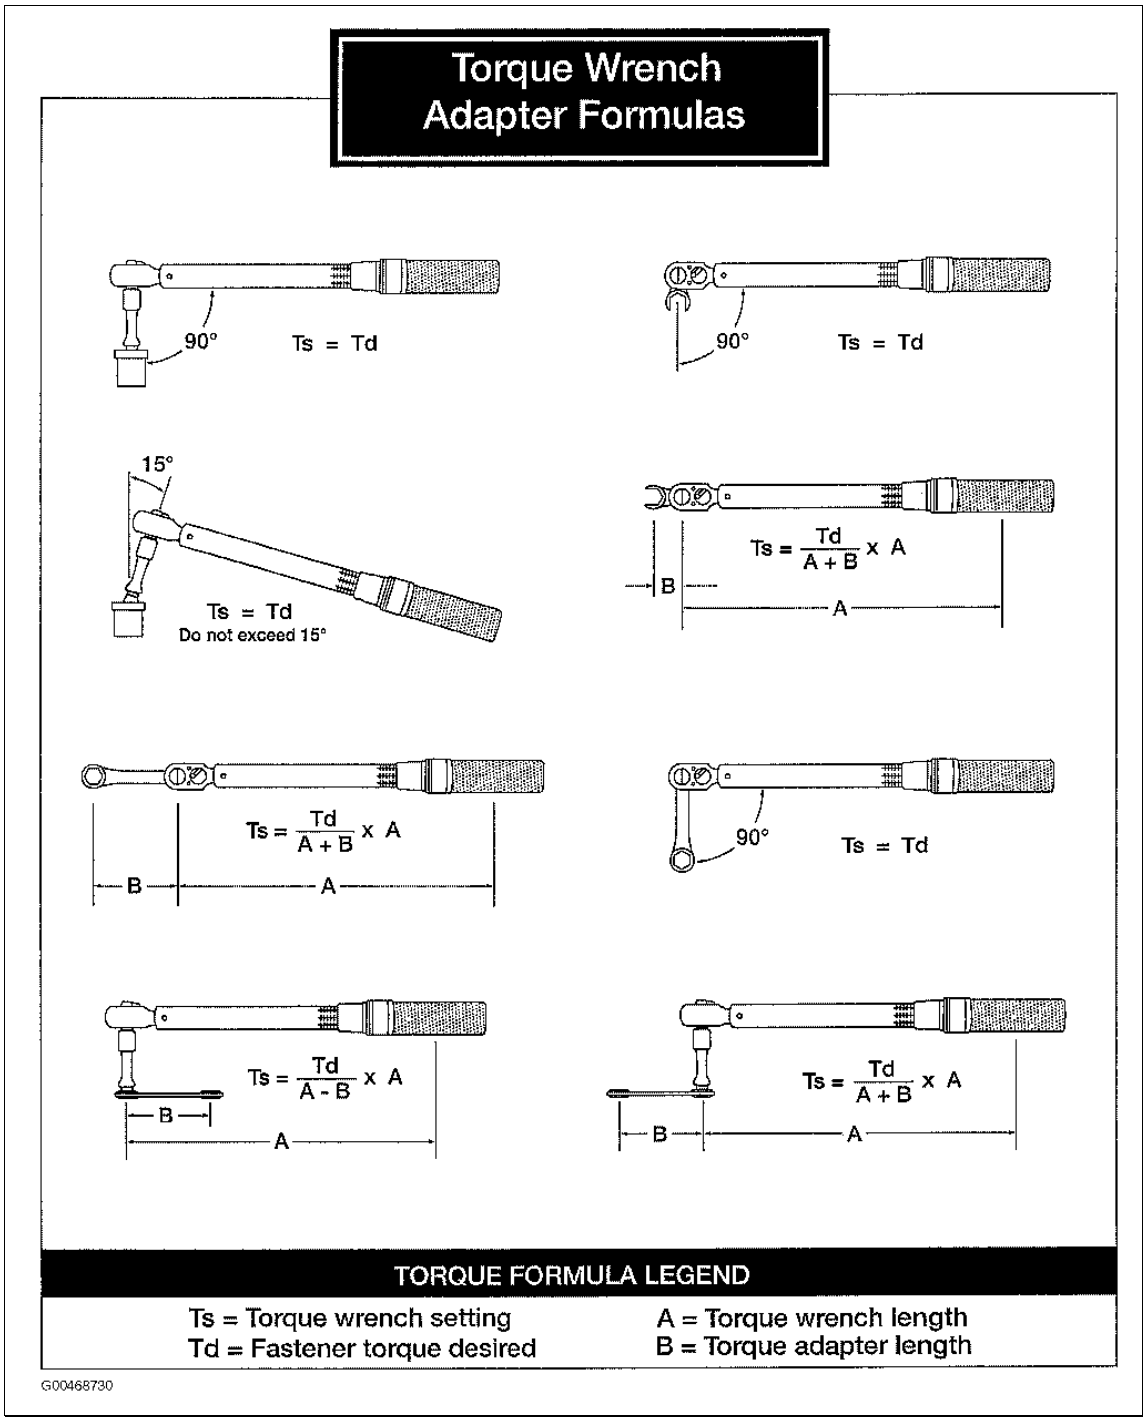
Left hand (LH) Catalyst monitor sensor

1.

1.

Calculate the correct torque wrench setting for the following torque. Refer to Torque Wrench Adapter Formula in the illustration below.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.



Material

: High Temperature Nickel Anti-Seize Lubricant / XL-2

Torque

: 35 lb.ft (48 Nm)

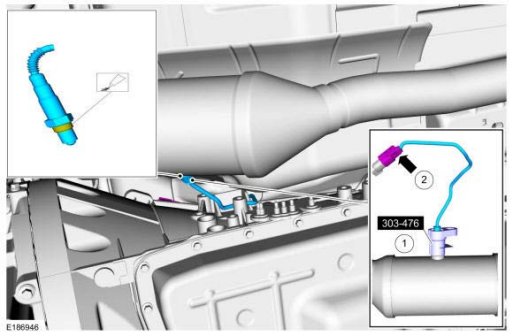


Fig 1: Torque Wrench Adapter Formulas

Courtesy of FORD MOTOR CO.

2.

Connect the catalyst monitor sensor electrical connector.

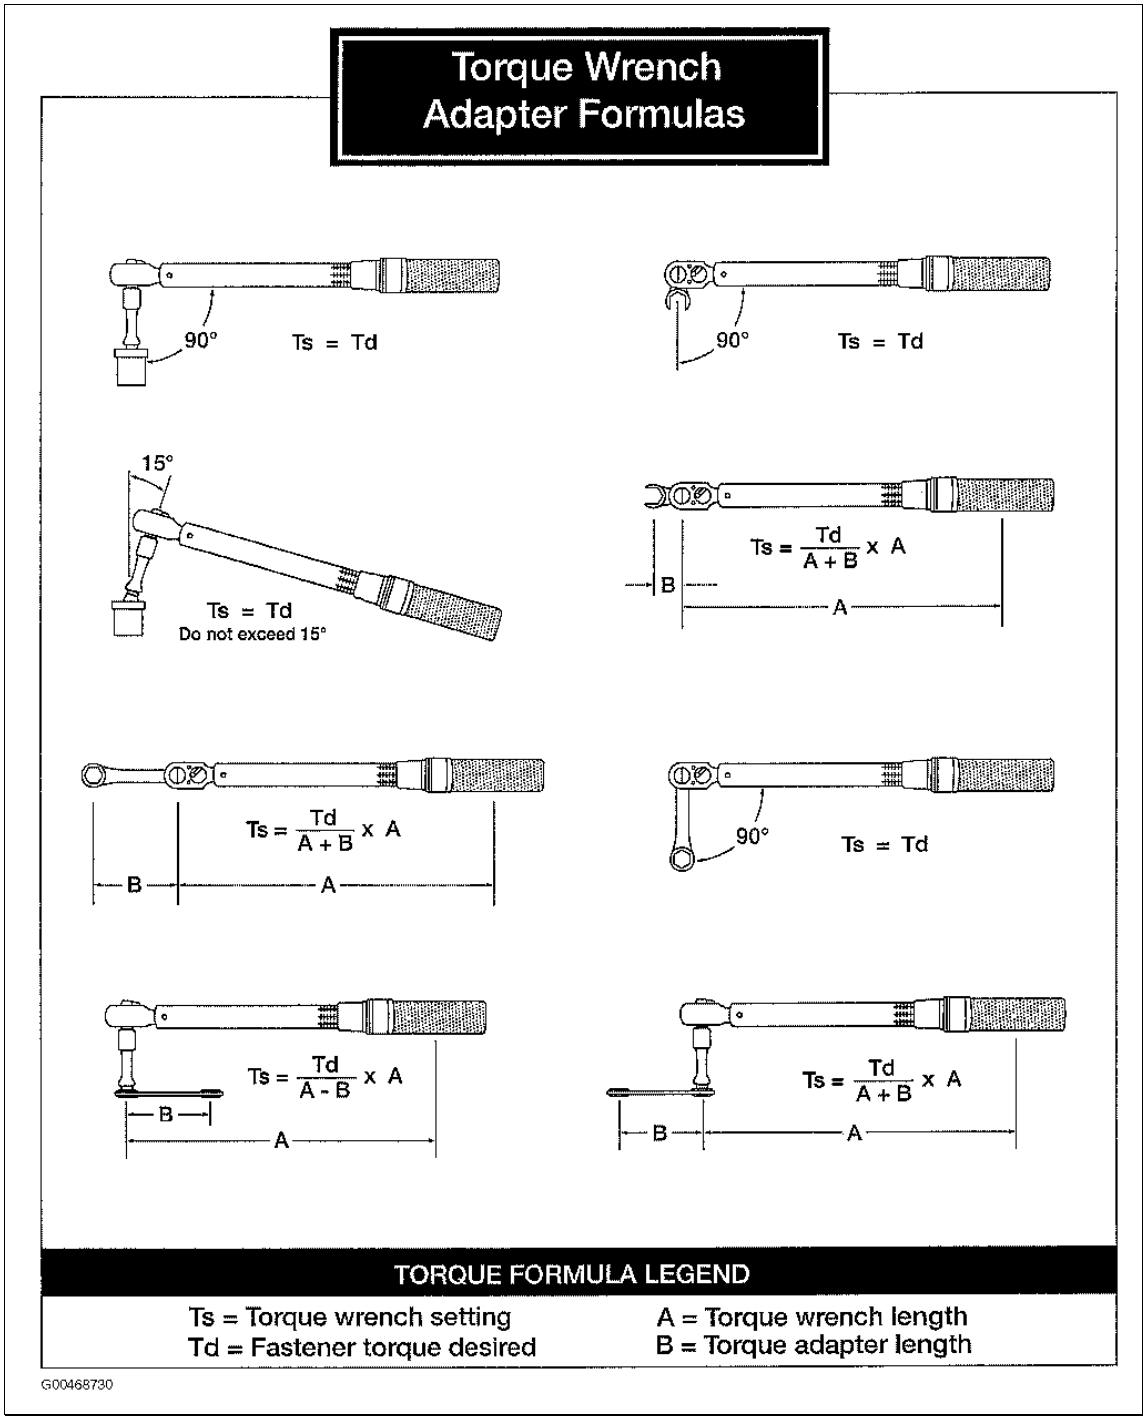
Right hand (RH) Catalyst monitor sensor

2.

1.

Calculate the correct torque wrench setting for the following torque. Refer to Torque Wrench Adapter Formula in the illustration below.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.



Material

: High Temperature Nickel Anti-Seize Lubricant / XL-2

Torque

: 35 lb.ft (48 Nm)

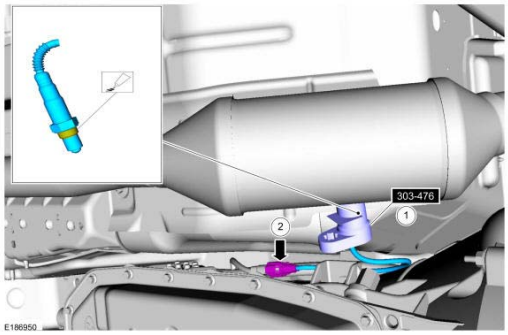


Fig 2: Torque Wrench Adapter Formulas

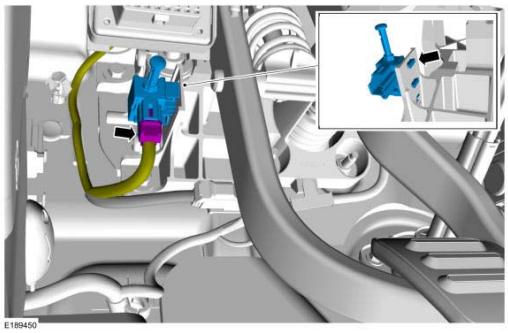
Courtesy of FORD MOTOR CO.

2.

Connect the catalyst monitor sensor electrical connector.



REMOVAL AND INSTALLATION > CLUTCH PEDAL POSITION (CPP) SWITCH > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

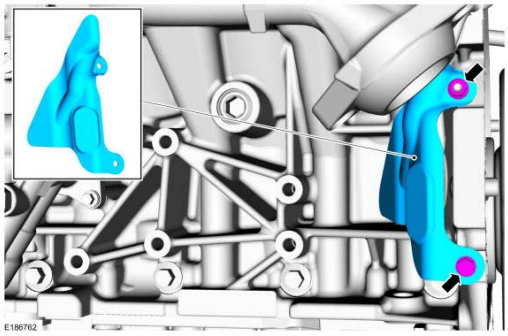
1.

Disconnect the electrical connector and remove CPP switch from the bracket.

REMOVAL AND INSTALLATION > CLUTCH PEDAL POSITION (CPP) SWITCH > INSTALLATION

1.

To install, reverse the removal procedure.



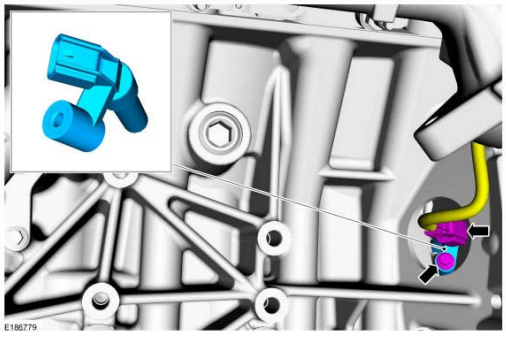
REMOVAL AND INSTALLATION > CRANKSHAFT POSITION (CKP) SENSOR > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the nut, bolt and the heat shield.



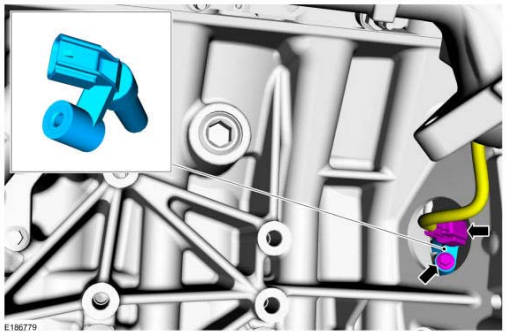
3.

Position aside the CKP sensor access plug.

NOTE: Remove the bolt and the CKP sensor from the bell housing before disconnecting the electrical connector to prevent the CKP sensor from falling in the bell housing.

4.
Remove the bolt, disconnect the CKP sensor electrical connector and the sensor.

REMOVAL AND INSTALLATION > CRANKSHAFT POSITION (CKP) SENSOR >



INSTALLATION

1.

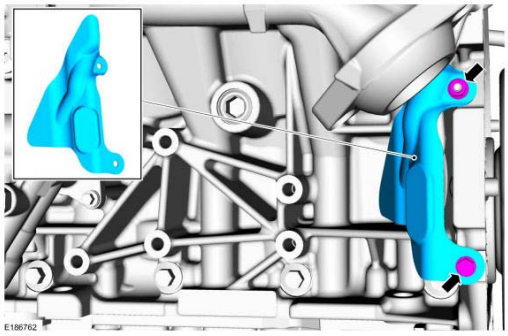
Connect the CKP sensor electrical connector, install the sensor and the bolt.

Torque

: 89 lb.in (10 Nm)

2.

Position back the CKP sensor access plug.



3.

Install the heat shield, nut and bolt.

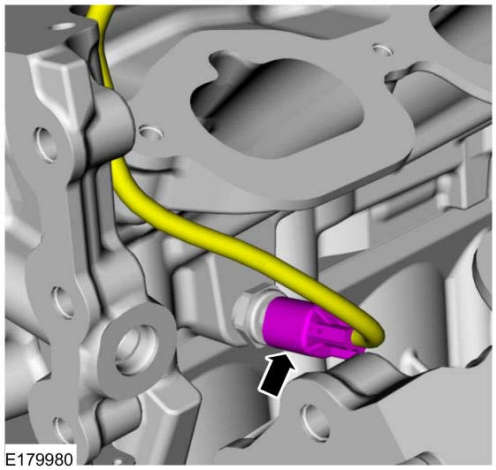
Torque

: 97 lb.in (11 Nm)

4.

Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

REMOVAL AND INSTALLATION > CYLINDER HEAD TEMPERATURE (CHT) SENSOR > REMOVAL



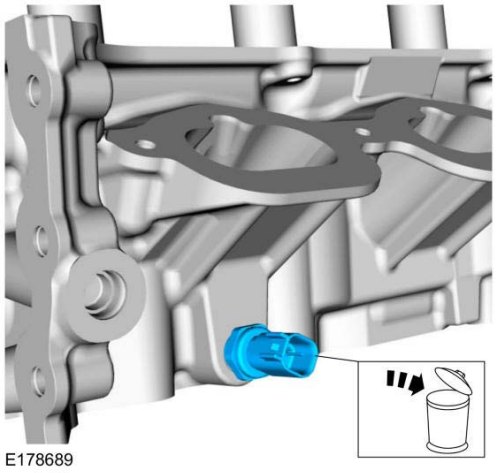
NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the lower intake manifold. Refer to: LOWER INTAKE MANIFOLD .

2.

Disconnect the CHT sensor electrical connector.



NOTE: Do not reuse the CHT sensor, install a new sensor.

3.
Remove and discard the CHT sensor.

Torque

: 89 lb.in (10 Nm)

E178689

REMOVAL AND INSTALLATION > CYLINDER HEAD TEMPERATURE (CHT) SENSOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > HEATED OXYGEN SENSOR (HO2S)

Special Tool(s) / General Equipment

 E172696	303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor TKIT-1994-F TKIT-1994-FLM/FM TKIT-1994-LM/M

Materials

Name	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	-
Penetrating and Lock Lubricant XL-1	-

REMOVAL AND INSTALLATION > HEATED OXYGEN SENSOR (HO2S) > REMOVAL

All sensors

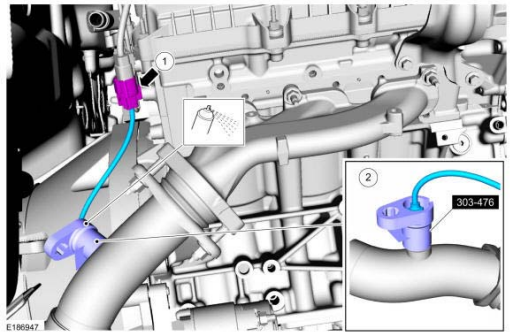
1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

RH (right-hand) Heated Oxygen Sensor (HO2S)

2.

1.



Disconnect the HO2S electrical connector.

2.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.

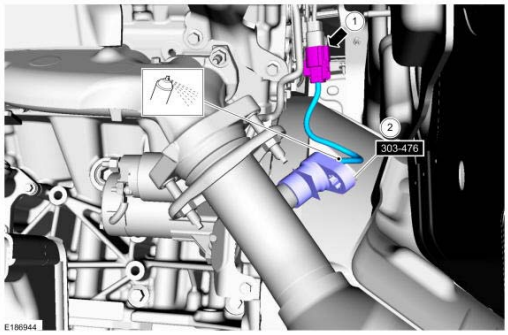
Material

: Penetrating and Lock Lubricant / XL-1

LH (left-hand) Heated Oxygen Sensor (HO2S)

3.

1.



Disconnect the HO2S electrical connector.

2.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.

Material

: Penetrating and Lock Lubricant / XL-1

REMOVAL AND INSTALLATION > HEATED OXYGEN SENSOR (HO2S) > INSTALLATION

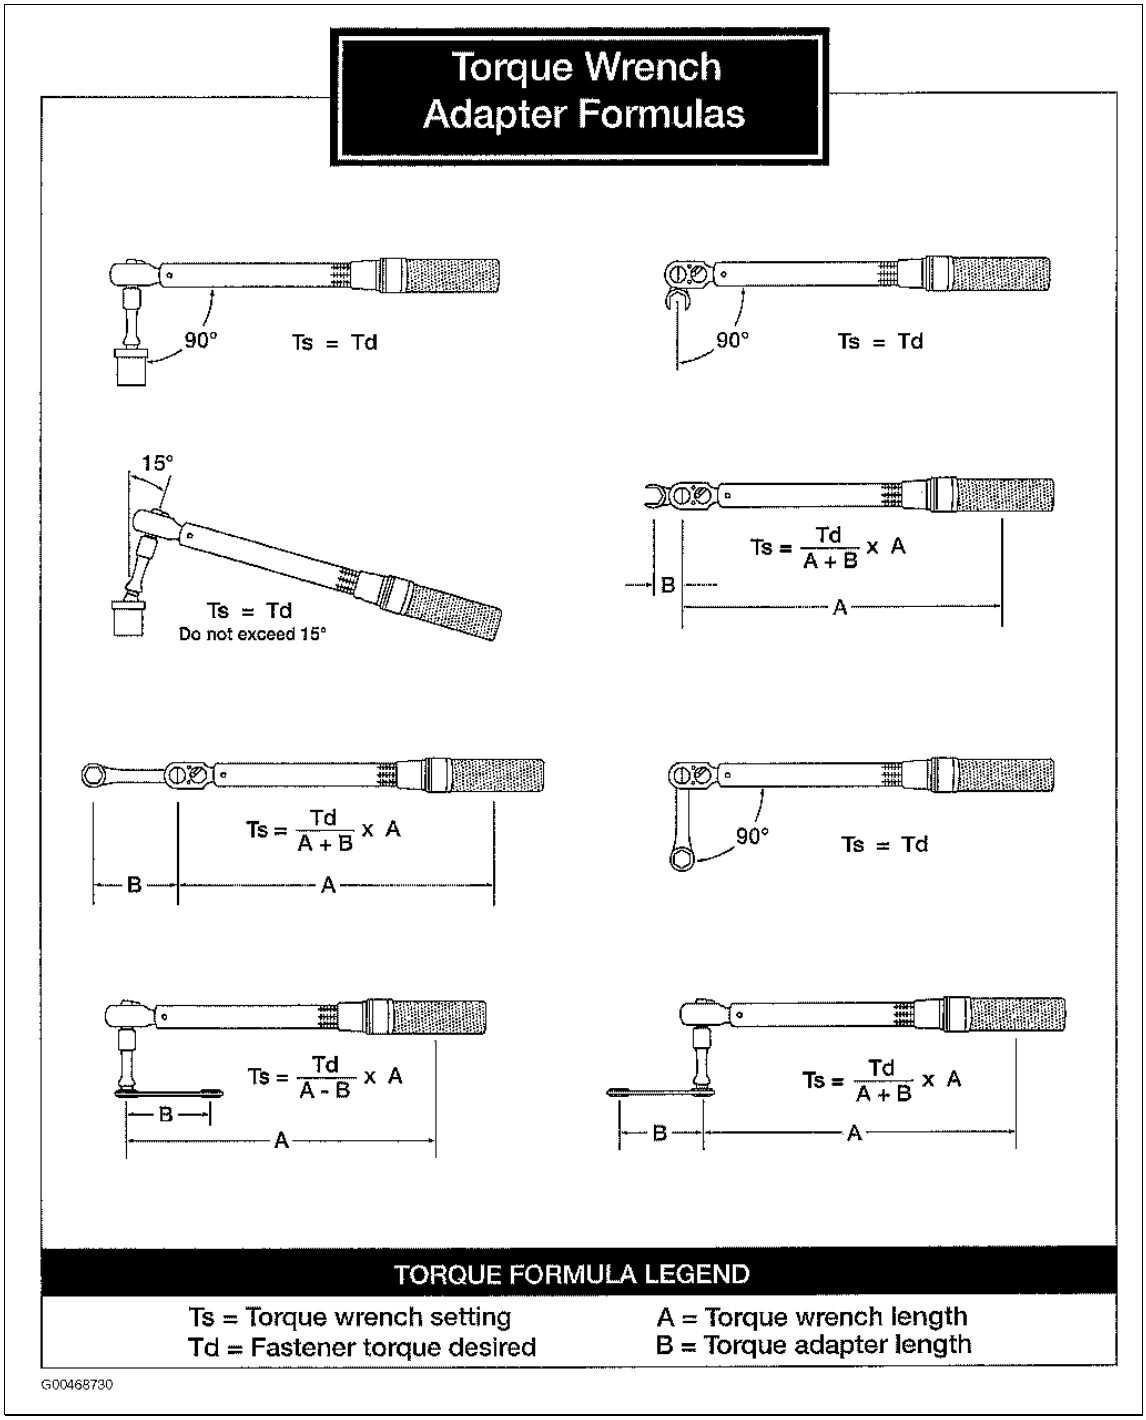
LH (left-hand) Heated Oxygen Sensor (HO2S)

1.

1.

Calculate the correct torque wrench setting for the following torque. Refer to Torque Wrench Adapter Formula in the illustration below.

Use Special Service Tool: 303-476 (T94P-9472-A)Socket, Exhaust Gas Oxygen Sensor.



Material

: High Temperature Nickel Anti-Seize Lubricant / XL-2

Torque

: 35 lb.ft (48 Nm)

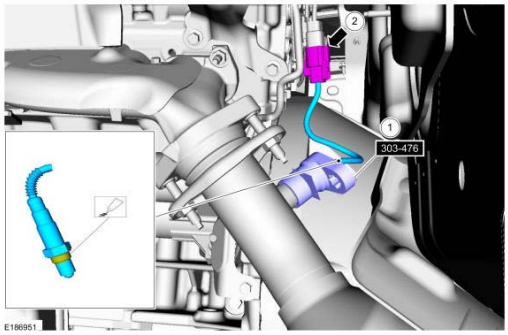


Fig 1: Torque Wrench Adapter Formulas

Courtesy of FORD MOTOR CO.

2.

Connect the HO2S electrical connector.

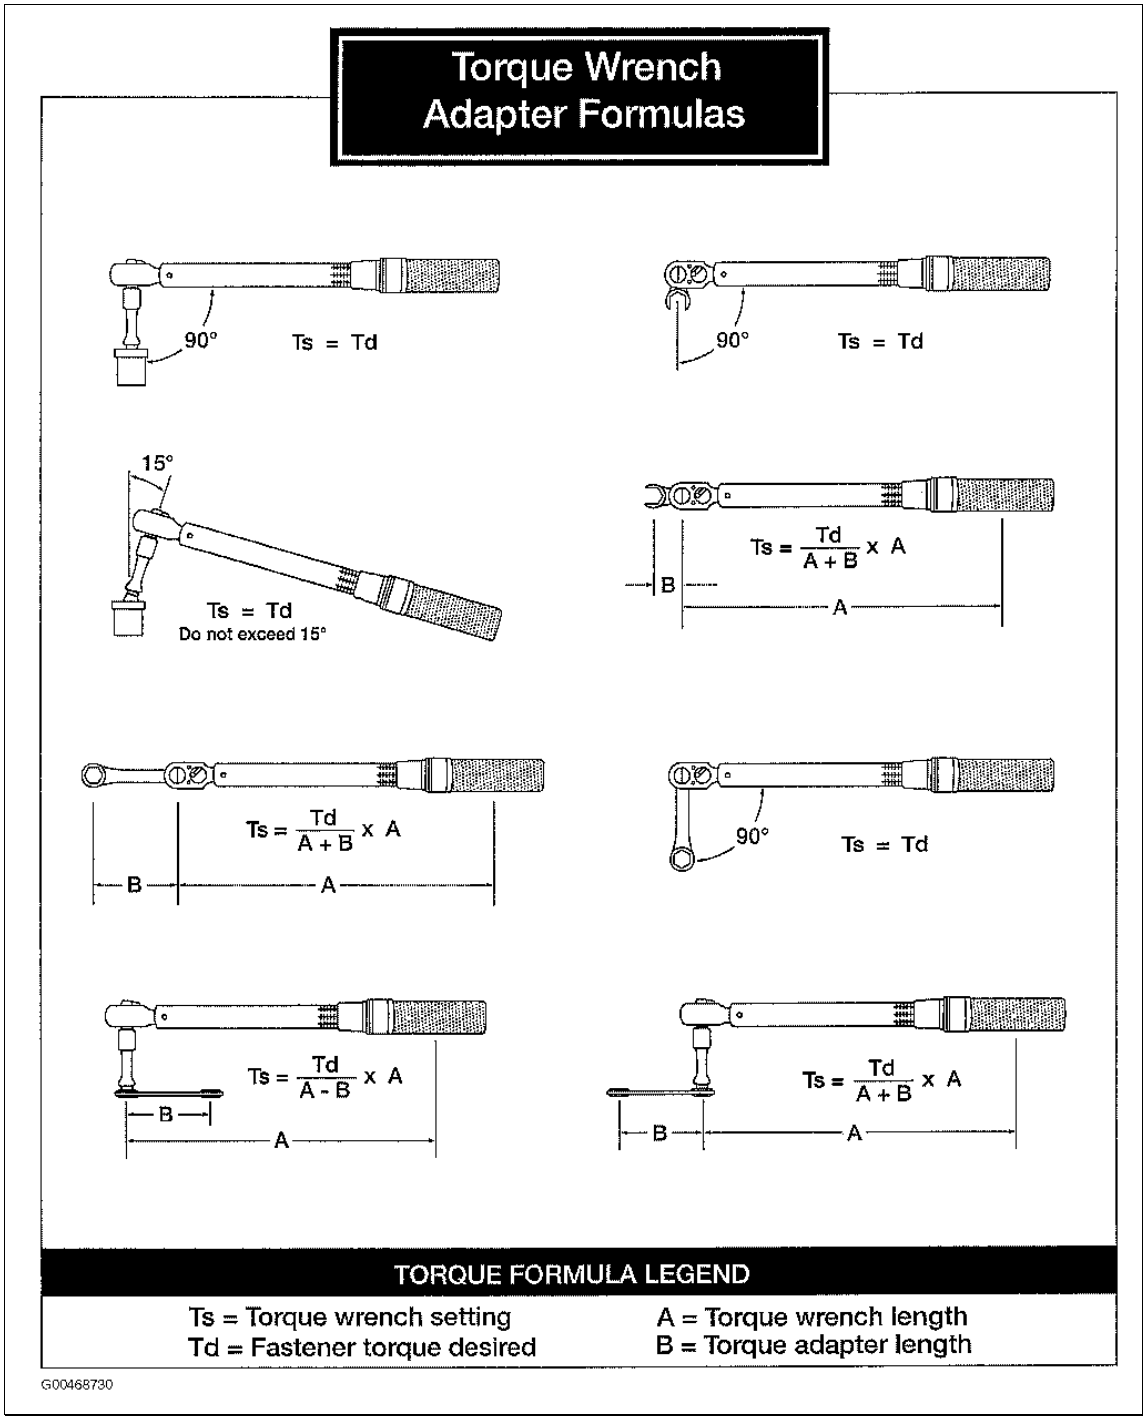
RH (right-hand) Heated Oxygen Sensor (HO2S)

2.

1.

Calculate the correct torque wrench setting for the following torque. Refer to Torque Wrench Adapter Formula in the illustration below.

Use Special Service Tool: 303-476 (T94P-9472-A) Socket, Exhaust Gas Oxygen Sensor.



Material

: High Temperature Nickel Anti-Seize Lubricant / XL-2

Torque

: 35 lb.ft (48 Nm)

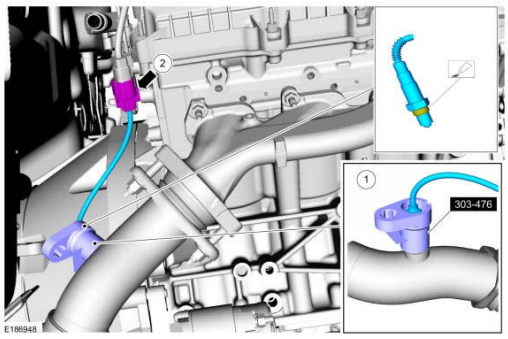


Fig 2: Torque Wrench Adapter Formulas

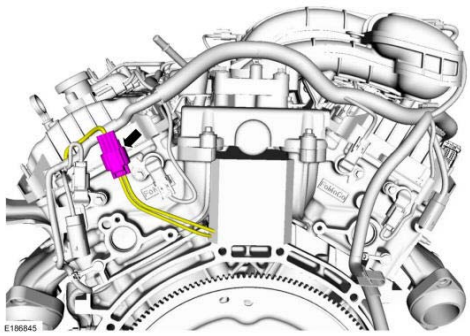
Courtesy of FORD MOTOR CO.

2.

Connect the HO2S electrical connector.



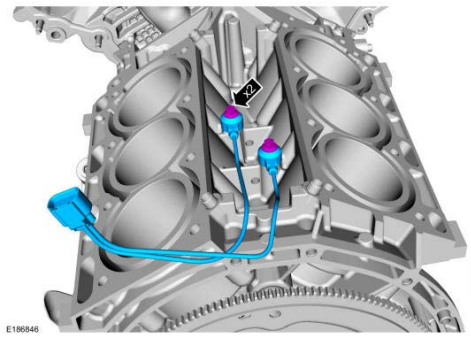
REMOVAL AND INSTALLATION > KNOCK SENSOR (KS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Disconnect the KS electrical connector.

2.



Remove the lower intake manifold. Refer to: LOWER INTAKE MANIFOLD .

NOTE: The cylinder heads are removed for clarity.

3.
Remove the bolts and the KS.

Torque

: 177 lb.in (20 Nm)

REMOVAL AND INSTALLATION > KNOCK SENSOR (KS) > INSTALLATION

1.

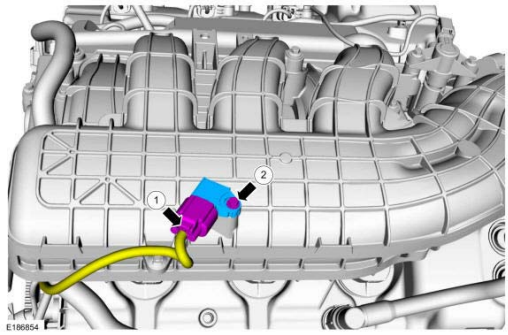
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > MANIFOLD ABSOLUTE PRESSURE AND TEMPERATURE (MAPT) SENSOR > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

1.



Disconnect the MAPT sensor electrical connector.

2.

Remove the retainer and the MAPT sensor.

Torque

: 35 lb.in (4 Nm)

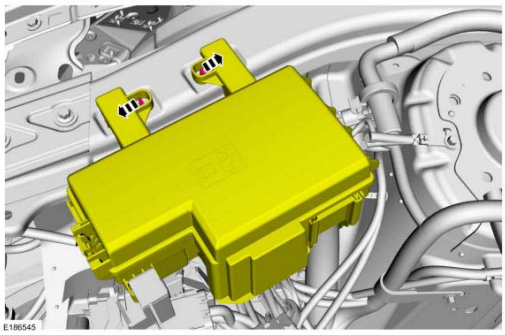
REMOVAL AND INSTALLATION > MANIFOLD ABSOLUTE PRESSURE AND TEMPERATURE (MAPT) SENSOR > INSTALLATION

NOTE: Second fastener hole available for use during re-install if needed.

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > POWERTRAIN CONTROL MODULE (PCM) > REMOVAL



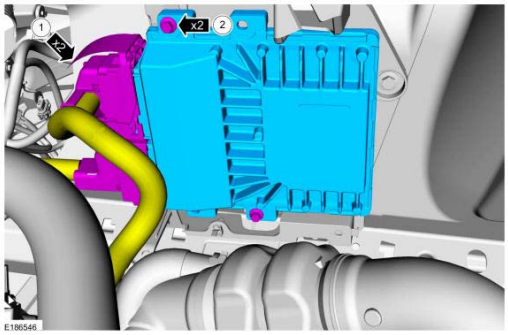
NOTE: This step is only necessary when installing a new component.

NOTE: PCM installation DOES NOT require new keys or programming of keys, only a Parameter Reset of the PATS.

1.
Download the module information to the diagnostic tool using the PMI routine. Refer to: MODULE CONFIGURATION .

2.

Unclip and position aside the BJB.



3.

1.

Disconnect the PCM electrical connectors.

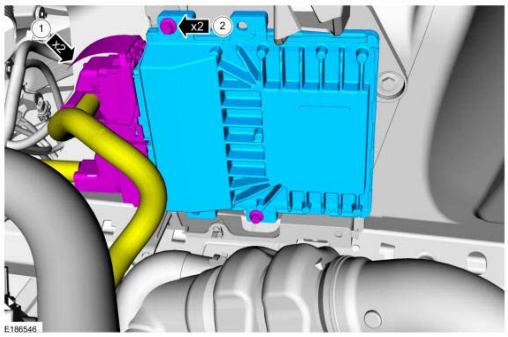
2.

Remove the retainers and the PCM.

REMOVAL AND INSTALLATION > POWERTRAIN CONTROL MODULE (PCM) > INSTALLATION

1.

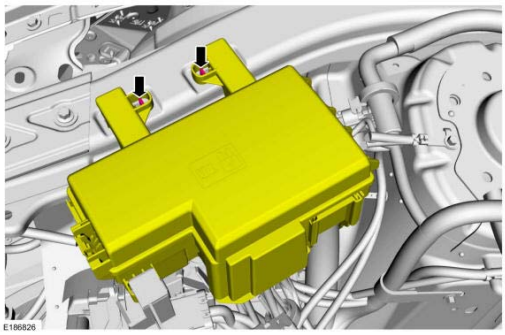
1.



Connect the PCM electrical connectors.

2.

Install the PCM and the retainers.



Torque

: 62 lb.in (7 Nm)

2.

Position back the BJB.

NOTE: This step is only necessary when installing a new component.

3.
Upload the module information from the diagnostic tool using the Programmable Modules Installation routine. Refer to: MODULE CONFIGURATION .

4.

Carry out the Parameter Reset procedure. Refer to: Anti-Theft Security Access .

5.

Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

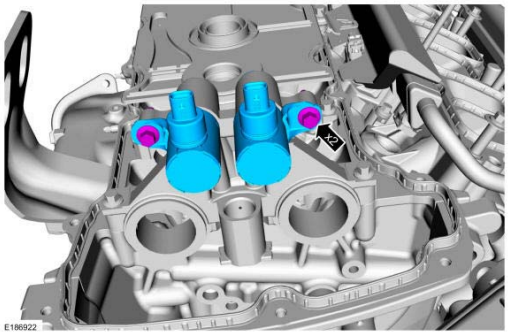
REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

RH (right-hand) Variable Camshaft Timing (VCT) Oil Control Solenoids

1.

Remove the RH valve cover. Refer to: VALVE COVER RH - 3.7L Duratec (227kW/301PS).



2.

Remove the bolts and the RHVCT oil control solenoids.

Torque:

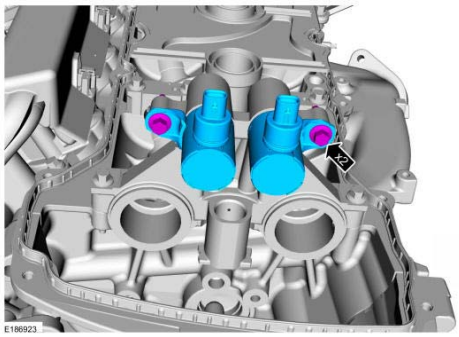
Stage 1: 71 lb.in (8 Nm)

Stage 2: 20°

LH (left-hand) Variable Camshaft Timing (VCT) Oil Control Solenoids

3.

Remove the LH valve cover. Refer to: VALVE COVER LH .



4.

Remove the bolts and the LHVCT oil control solenoids.

Torque:

Stage 1: 71 lb.in (8 Nm)

Stage 2: 20°

REMOVAL AND INSTALLATION > VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID > INSTALLATION

1.

To install, reverse the removal procedure.

Service Manual: EMISSION APPLICATIONS

EMISSION APPLICATIONS

2015 Mustang

Engine & Fuel System	(1) Emission Control Systems & Devices	EGR Test No.
2.3L (140") 4-Cyl Turbo DI	**PCV, EVAP, TWC, SPK, (2) HO2S, CEC, MIL,** EVAP-CVS, EVAP-FTPS, EVAP-FVCV, EVAP-VC	...
3.7L (227") V6 SFI	**PCV, EVAP, (2) TWC, FR, SPK, (3) HO2S, CEC, MIL,** EVAP-CPV, EVAP-CVS, EVAP-FTPS, EVAP-FVCV, EVAP-VC, SPK-CC	...
5.0L (302") V8 SFI	**PCV, EVAP, (2) TWC, FR, SPK, (3) HO2S, CEC, MIL,** EVAP-CPV, EVAP-CVS, EVAP-FTPS, EVAP-FVCV, EVAP-VC, SPK-CC	...

(1)	Major emission control systems and devices are listed in bold type; components and other related devices are listed in light type.
(2)	Equipped with 2.
(3)	Equipped with 4.

VEHICLE EMISSION CONTROL INFORMATION (VECI) > VECI DECAL

Each vehicle has a VECI decal containing emission control information that applies specifically to the vehicle and engine. The specifications on the decal are critical to repairing the emissions systems.

Fig 1: VECI Decal Location

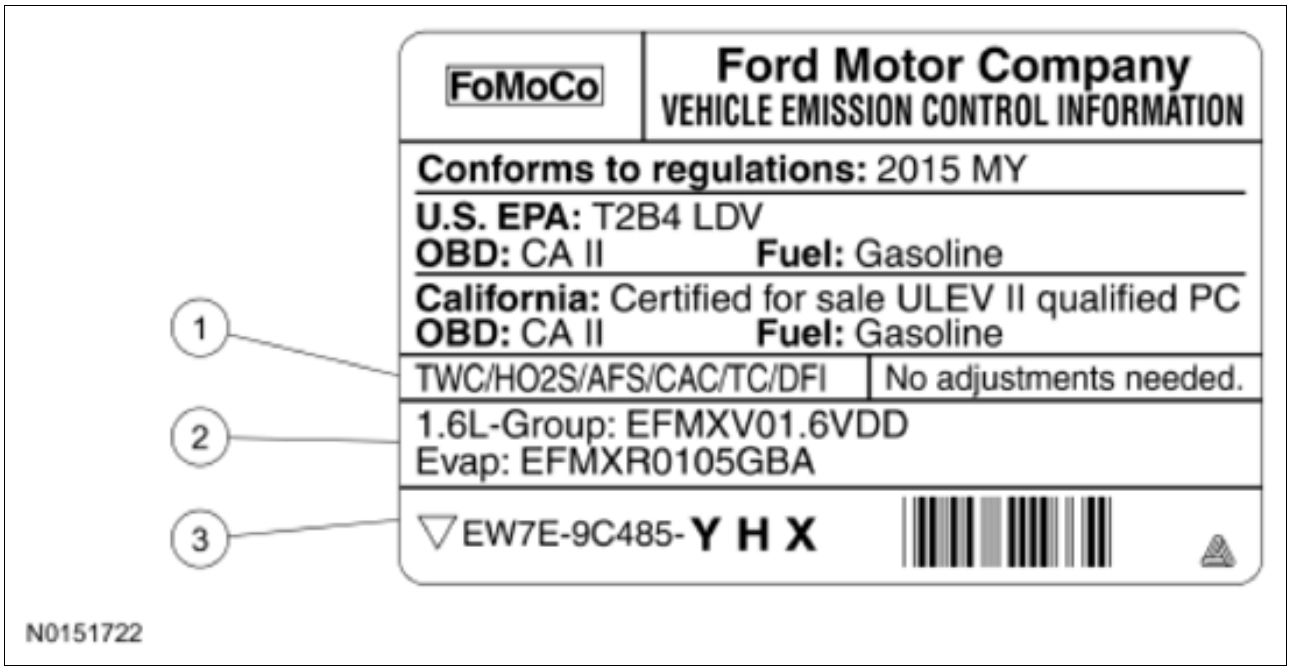
Courtesy of FORD MOTOR CO.

VEHICLE EMISSION CONTROL INFORMATION (VECI) > VECI DECAL LOCATION

The decal is typically located on the underside of the hood or on the radiator support sight shield.

VEHICLE EMISSION CONTROL INFORMATION (VECI) > ENGINE/EVAPORATIVE EMISSION (EVAP) SYSTEM INFORMATION

Manufacturers must use a standardized system for identifying their individual engine families. The system described below was developed by the Environmental Protection Agency (EPA) in 1991 to meet new regulatory requirements for 1994 and later model years.



The engine family group and evaporative family name consist of 12 characters each.

Both the engine family group and the evaporative family name are listed in the box on the emission decal in the area marked as engine evaporative family information. The first line contains engine size and the 12 - character engine family group. The second line contains the 12-character evaporative family name

information. Both the engine family group and the evaporative family name are specific to the vehicle. Refer to the Engine Family Group and the Evaporative Family Name worksheet for decoding information.

ULEV: Ultra Low Emission Vehicle

ZEV: Zero Emission Vehicle

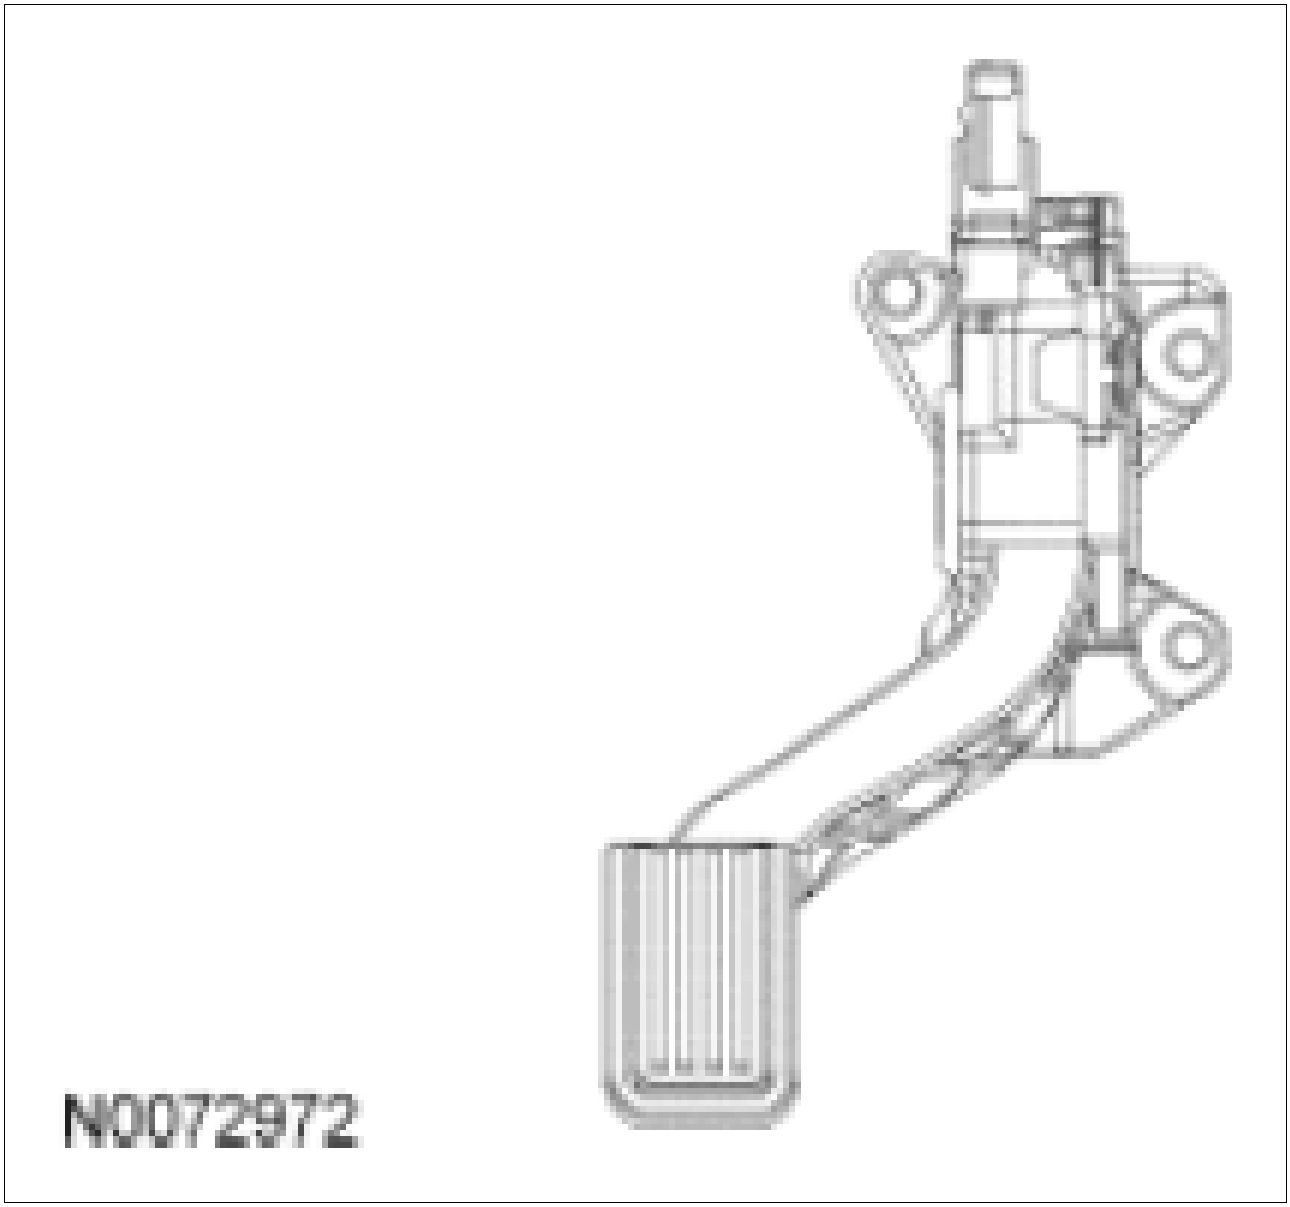
ENGINE CONTROL COMPONENTS

> *NOTE: Transmission inputs which are not described in this service information are discussed in the applicable transmission service information.*

ENGINE CONTROL COMPONENTS > ACCELERATOR PEDAL POSITION (APP) SENSOR

The APP sensor is an input to the PCM and determines the amount of torque requested by the operator.

ENGINE CONTROL COMPONENTS > ACCELERATOR PEDAL POSITION (APP) SENSOR > FIESTA



There are 2 separate pedal position sensors in the accelerator pedal. The APP1 sensor signal generates a pulse width modulated (PWM) signal to the PCM. The APP1 sensor uses a VPWR circuit, a ground circuit and a signal circuit. Only the APP1 signal circuit is connected to the PCM. The APP2 sensor signal has a positive slope (increasing angle, increasing voltage) and is a class 2 message from the instrument panel cluster (IPC) to the PCM. The APP2 sensor uses a reference voltage circuit, a signal return circuit, and a signal circuit between the IPC and the APP sensor assembly. The two pedal position signals make sure the PCM receives a correct input even if one of the signals has a concern. The PCM determines if a signal is incorrect by calculating an expected position, inferred from the other signals. If a concern is present with one of the circuits the other input is used. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software converts these degrees to counts, which is the input to the torque based strategy. For additional information, refer to TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC) in this service information

ENGINE CONTROL COMPONENTS > ACCELERATOR PEDAL POSITION (APP) SENSOR > ALL OTHERS

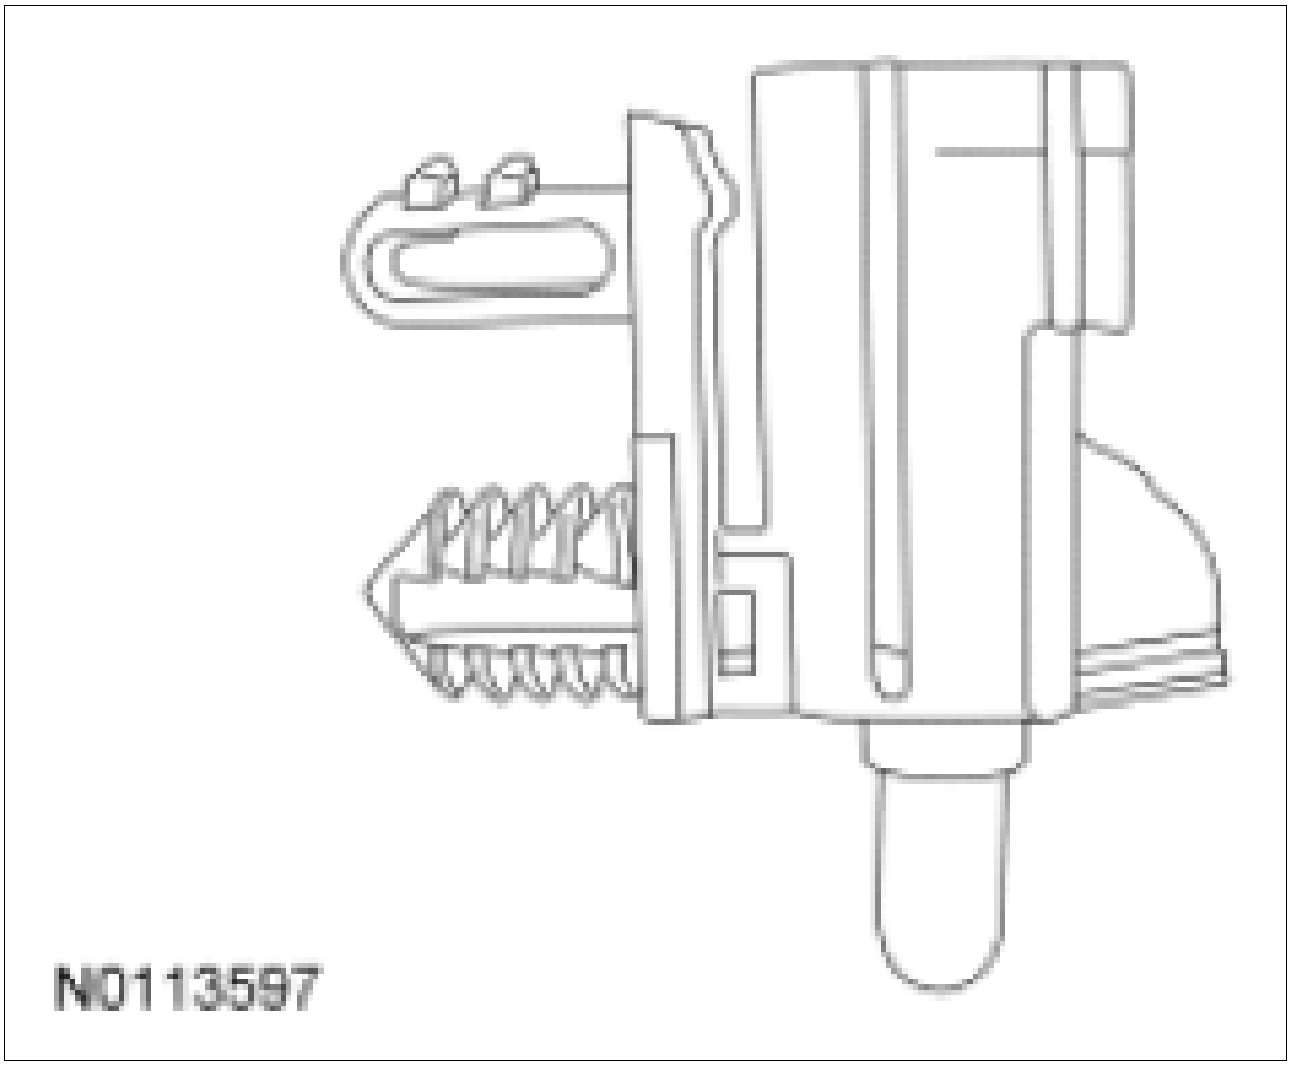
There are 2 pedal position signals in the sensor. Both signals, APP1 and APP2, have a positive slope

(increasing angle, increasing voltage), but are offset and increase at different rates. The 2 pedal position signals make sure the PCM receives a correct input even if one of the signals has a concern. The PCM determines if a signal is incorrect by calculating where it should be, inferred from the other signals. If a concern is present with one of the circuits the other input is used. There are 2 reference voltage circuits, 2 signal return circuits, and 2 signal circuits (a total of 6 circuits and pins) between the PCM and the APP sensor assembly. The pedal position signal is converted to pedal travel degrees (rotary angle) by the PCM. The software converts these degrees to counts, which is the input to the torque based strategy. For additional information, refer to TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC) in this service information.

Fig 1: Identifying APP Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > AMBIENT AIR TEMPERATURE (AAT) SENSOR



The AAT sensor is a thermistor device in which resistance changes with temperature. The resistance of

a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The AAT sensor provides ambient air temperature information to the PCM for the temperature sensor correlation tests. The PCM also communicates the AAT sensor information to all other modules on the controller area network (CAN).

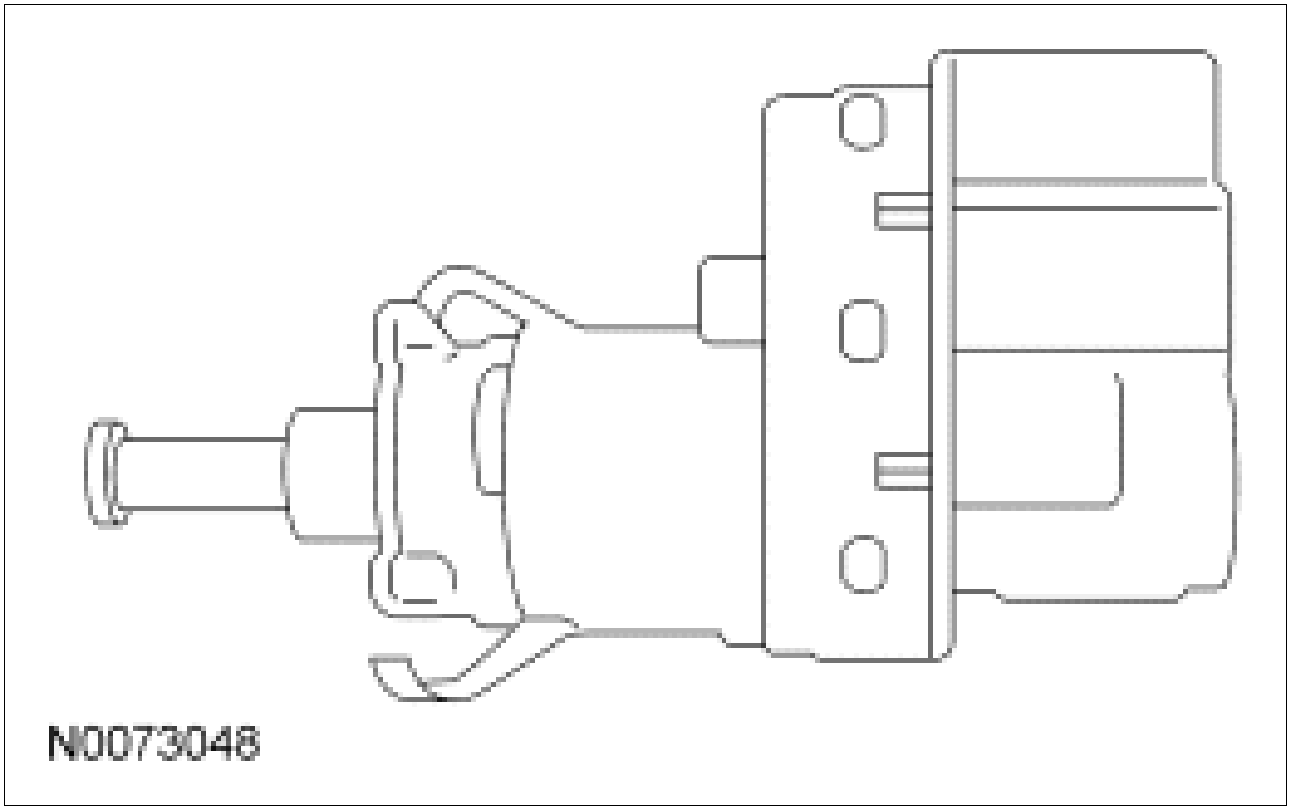
Fig 1: Identifying AAT Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > BAROMETRIC PRESSURE (BARO) SENSOR

The BARO sensor measures barometric pressure to estimate the exhaust back pressure.

For vehicles with a turbocharger intake pressure and temperature (TCIPT) sensor, the BARO value is inferred by comparing the TCIPT sensor, manifold absolute pressure (MAP) sensor, and turbocharger boost pressure (TCBP) sensor values at key on, engine off (KOEO). While driving, the BARO is updated by monitoring the TCIPT sensor when air flow volume is below 2 parts per million.



For direct injection vehicles, a BARO sensor is mounted internally to the PCM. The BARO sensor measures the barometric pressure to estimate the exhaust back pressure.

For all other vehicles without a BARO sensor, the BARO value is inferred by the PCM based on the volumetric efficiency of the engine, comparing the mass air flow (MAF) sensor and the ambient temperature values. The actual MAF value is used to calculate an inferred MAP value based on operating conditions and volumetric efficiency. At or near wide open throttle, the BARO value is calculated to be slightly higher than the inferred MAP value, with the difference calculated by the pressure drop across the throttle plate.

ENGINE CONTROL COMPONENTS > BRAKE PEDAL POSITION (BPP) SWITCH

The BPP switch is sometimes referred to as the stoplamp switch. The BPP switch provides a signal to the PCM indicating the brakes are applied. The BPP switch is normally open and mounted on the brake pedal support. The BPP switch supplies battery positive (B+) voltage to the PCM when the brake pedal is applied.

Fig 1: Identifying BPP Switch

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > BRAKE PRESSURE SWITCH

The brake pressure switch is used for cruise control deactivation. The brake pressure switch is a normally closed switch and is typically mounted on the brake pedal support. When the brake pedal is applied, the normally closed switch opens.

On some applications the normally closed brake pressure switch, along with the normally open BPP switch, are used for a brake rationality test within the PCM. The PCM misfire monitor profile learn function may be disabled if a brake switch concern occurs. If one or both brake pedal inputs to the PCM is not changing states as expected, a DTC is set by the PCM strategy.

ENGINE CONTROL COMPONENTS > CAMSHAFT POSITION (CMP) SENSOR

The CMP sensor detects the position of the camshaft. The CMP sensor identifies when piston number 1 is on its compression stroke. A signal is then sent to the PCM and used for synchronizing the sequential firing of the fuel injectors. Coil on plug (COP) ignition applications use the CMP sensor signal to select the correct ignition coil to fire.

Inline engines with 2 camshafts and with variable camshaft timing (VCT) are equipped with 2 CMP sensors. The second sensor identifies the exhaust camshaft position.

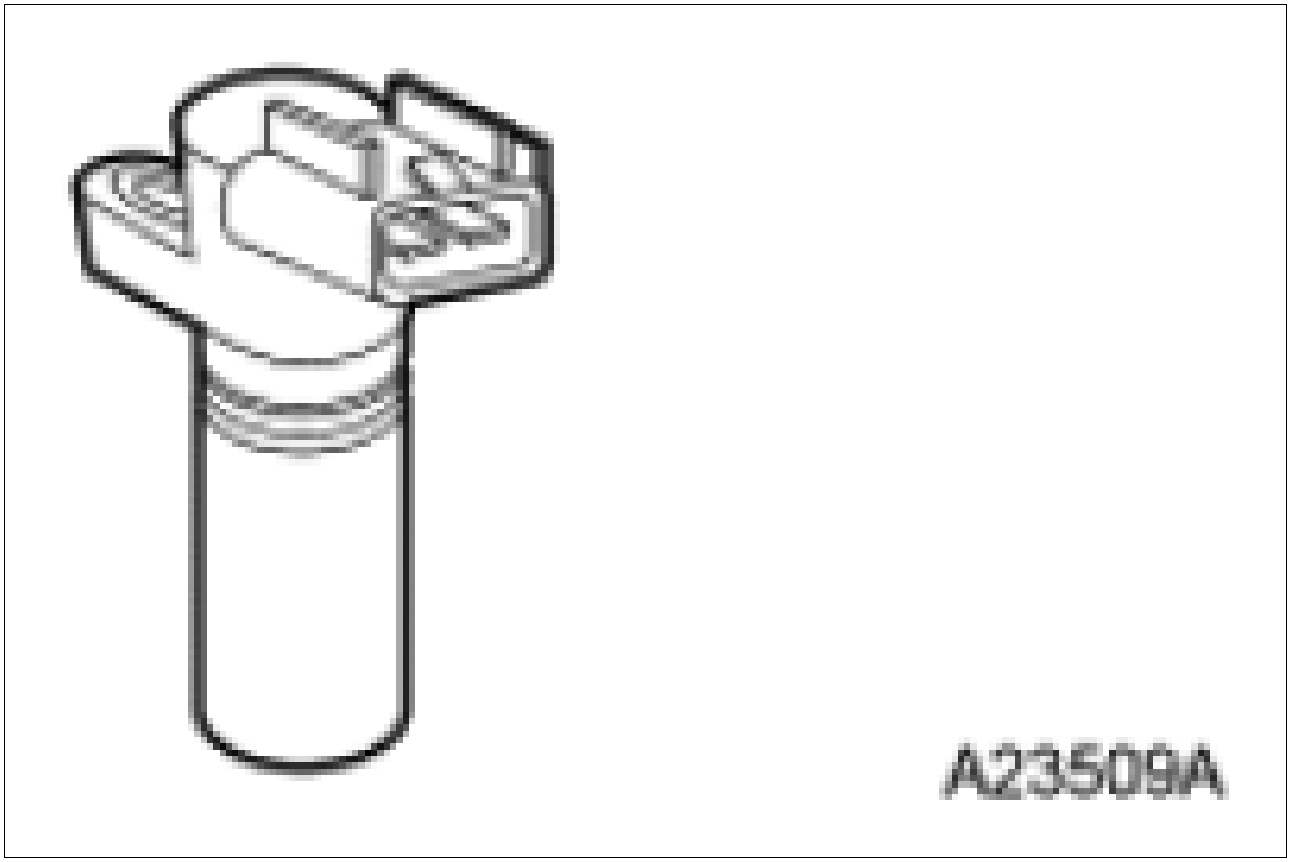
The 2 sensor system on inline engines use the following CMP sensor signal circuit names:

- CMP11 - bank 1, sensor 1 (intake camshaft)
- CMP12 - bank 1, sensor 2 (exhaust camshaft)

Engines with 1 camshaft per bank and with VCT are equipped with 2 CMP sensors. The second sensor identifies the camshaft position on bank 2.

The 2 sensor system on engines with 1 camshaft per bank and with VCT use the following CMP sensor signal circuit names:

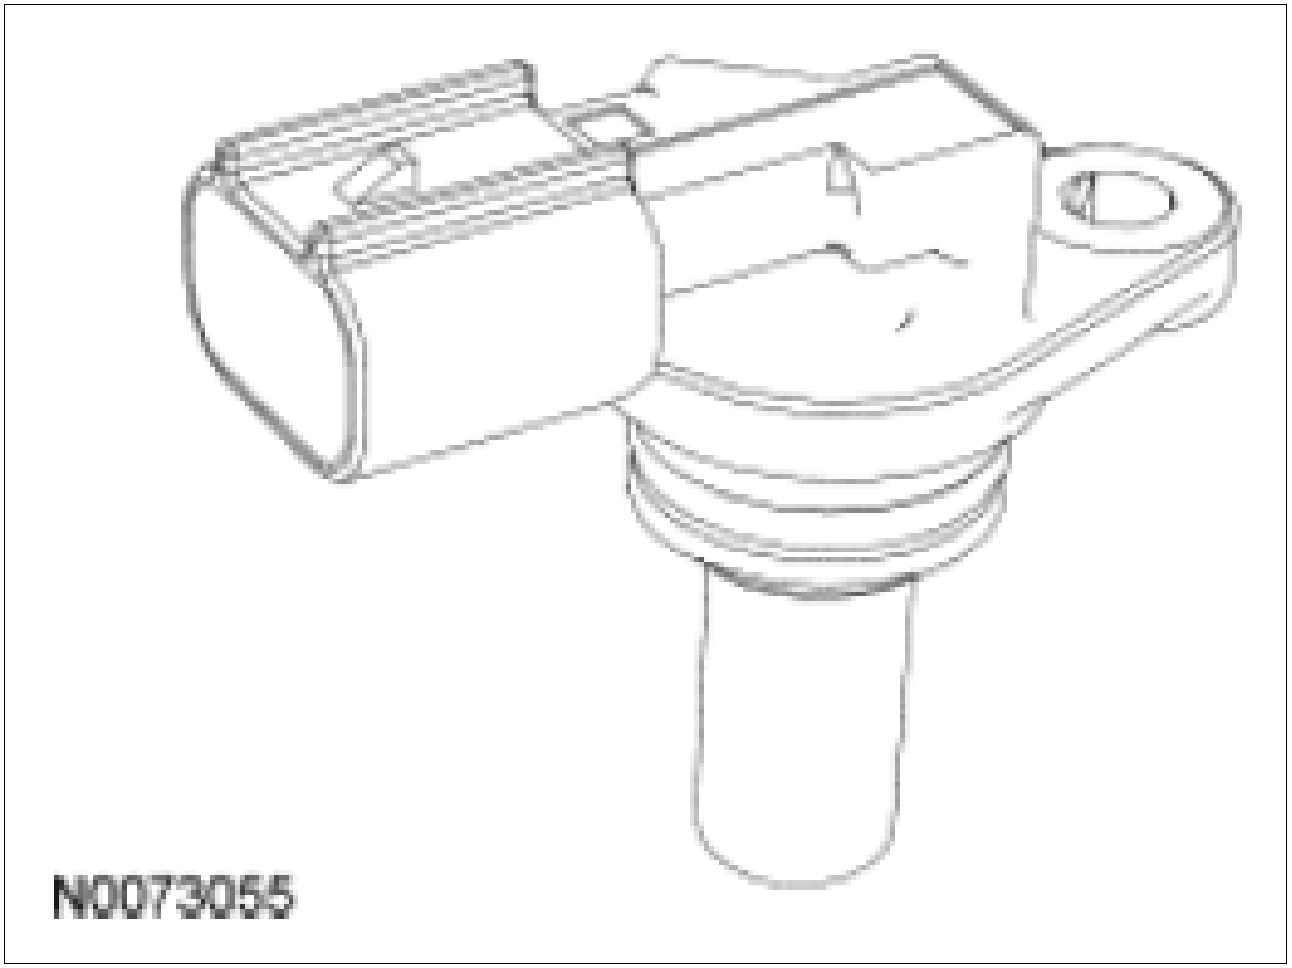
- CMP11 - bank 1, sensor 1 (intake camshaft)
- CMP21 - bank 2, sensor 1 (exhaust camshaft)



Engines with 4 camshafts and with VCT are equipped with 4 CMP sensors. The 4 sensors identify the position of each camshaft.

The 4 sensor system uses the following CMP sensor signal circuit names:

- CMP11 - bank 1, sensor 1 (intake camshaft)
- CMP12 - bank 1, sensor 2 (exhaust camshaft)
- CMP21 - bank 2, sensor 1 (intake camshaft)
- CMP22 - bank 2, sensor 2 (exhaust camshaft)

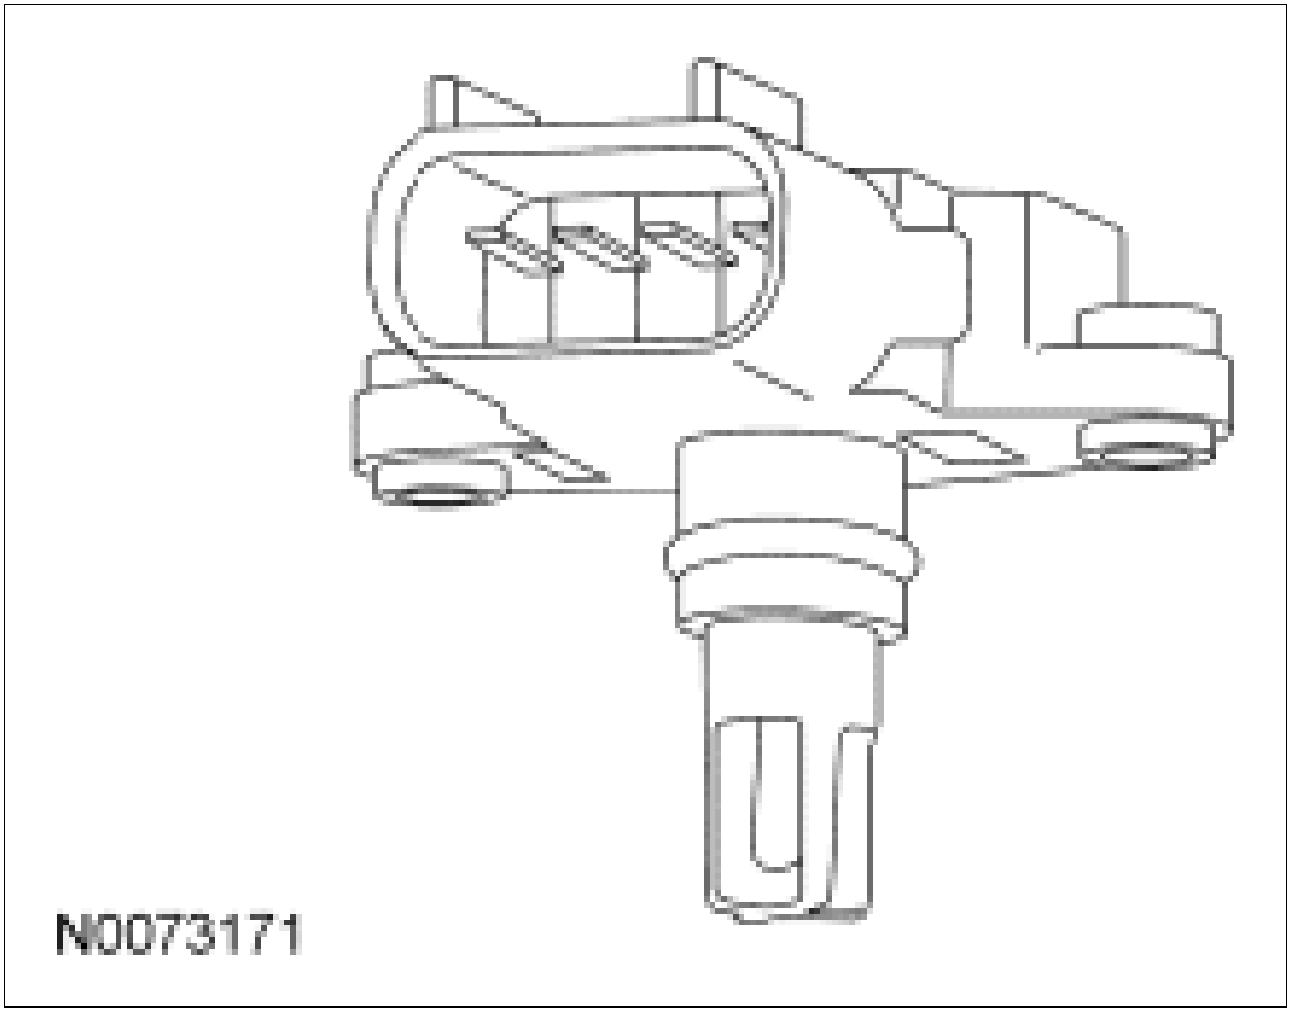


There are the 2 types of CMP sensors used. The 2 pin variable reluctance sensor and the 3 pin Hall effect sensor.

Fig 1: Identifying Variable Reluctance CMP Sensor

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Hall Effect CMP Sensor



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > CHARGE AIR COOLER TEMPERATURE (CACT) SENSOR

The CACT sensor is located in the intake air path between the charge air cooler (CAC) and the cylinder head. The CACT sensor measures the air temperature after the CAC. The CACT sensor may be integrated with a turbocharger boost pressure (TCBP) sensor or a manifold absolute pressure and temperature (MAPT) sensor.

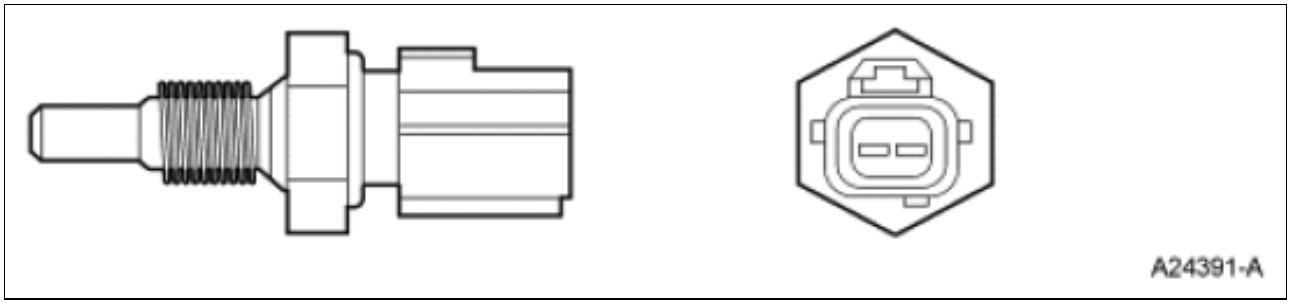
Fig 1: Identifying CACT Sensor Integrated With TCBP Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > CHARGE AIR COOLER (CAC) COOLING FAN

The PCM monitors certain parameters (such as manifold pressure, charge air temperature, and engine coolant temperature) to determine CAC cooling fan needs. The CAC cooling fan is relay controlled by the PCM. The PCM controls the CAC cooling fan operation with the CACCF circuit through the CAC cooling fan relay.

ENGINE CONTROL COMPONENTS > CHARGE AIR COOLER (CAC) COOLANT TEMPERATURE SENSOR



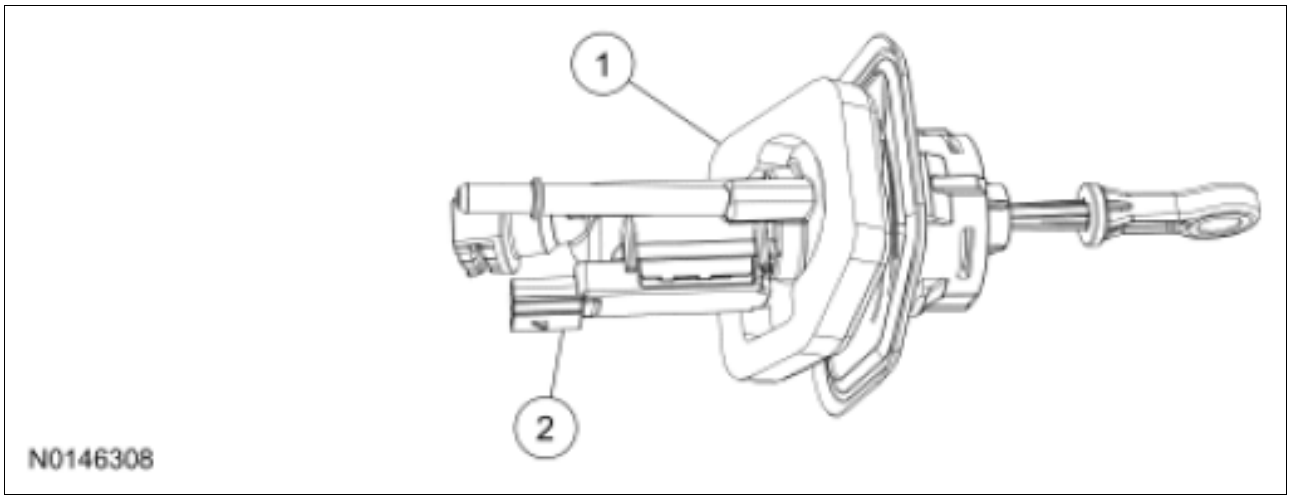
The CAC coolant temperature sensor is a thermistor device in which resistance changes with the temperature. The resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage

divider network so varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor (pull-up resistor) in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The CAC coolant temperature sensor is installed in the side of the CAC radiator and measures the CAC system coolant temperature. The PCM uses the CAC coolant temperature sensor to determine desired operating condition of the CAC coolant pump.

Fig 1: Identifying CAC Coolant Temperature Sensor



Courtesy of FORD MOTOR CO.

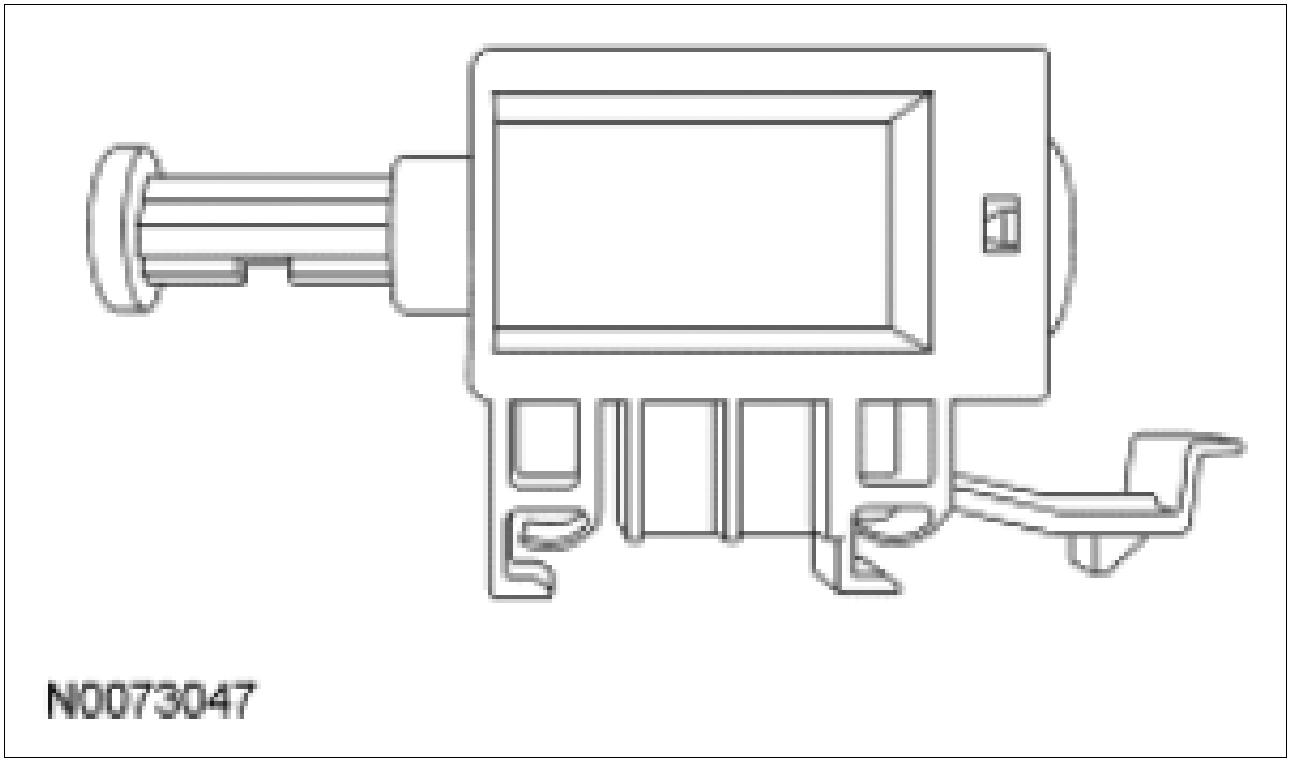
ENGINE CONTROL COMPONENTS > CLUTCH PEDAL POSITION (CPP) SENSOR

The CPP signal is converted to percent of pedal travel by the PCM. During normal operation, the CPP is used as the indication of the clutch pedal position by the PCM strategy.

There is 1 reference voltage circuit, 1 signal return circuit, and 1 signal circuit between the PCM and the CPP sensor. The CPP sensor is typically mounted on the clutch master cylinder or pedal assembly.

Fig 1: Identifying Clutch Pedal Position (CPP) Sensor

Courtesy of FORD MOTOR CO.



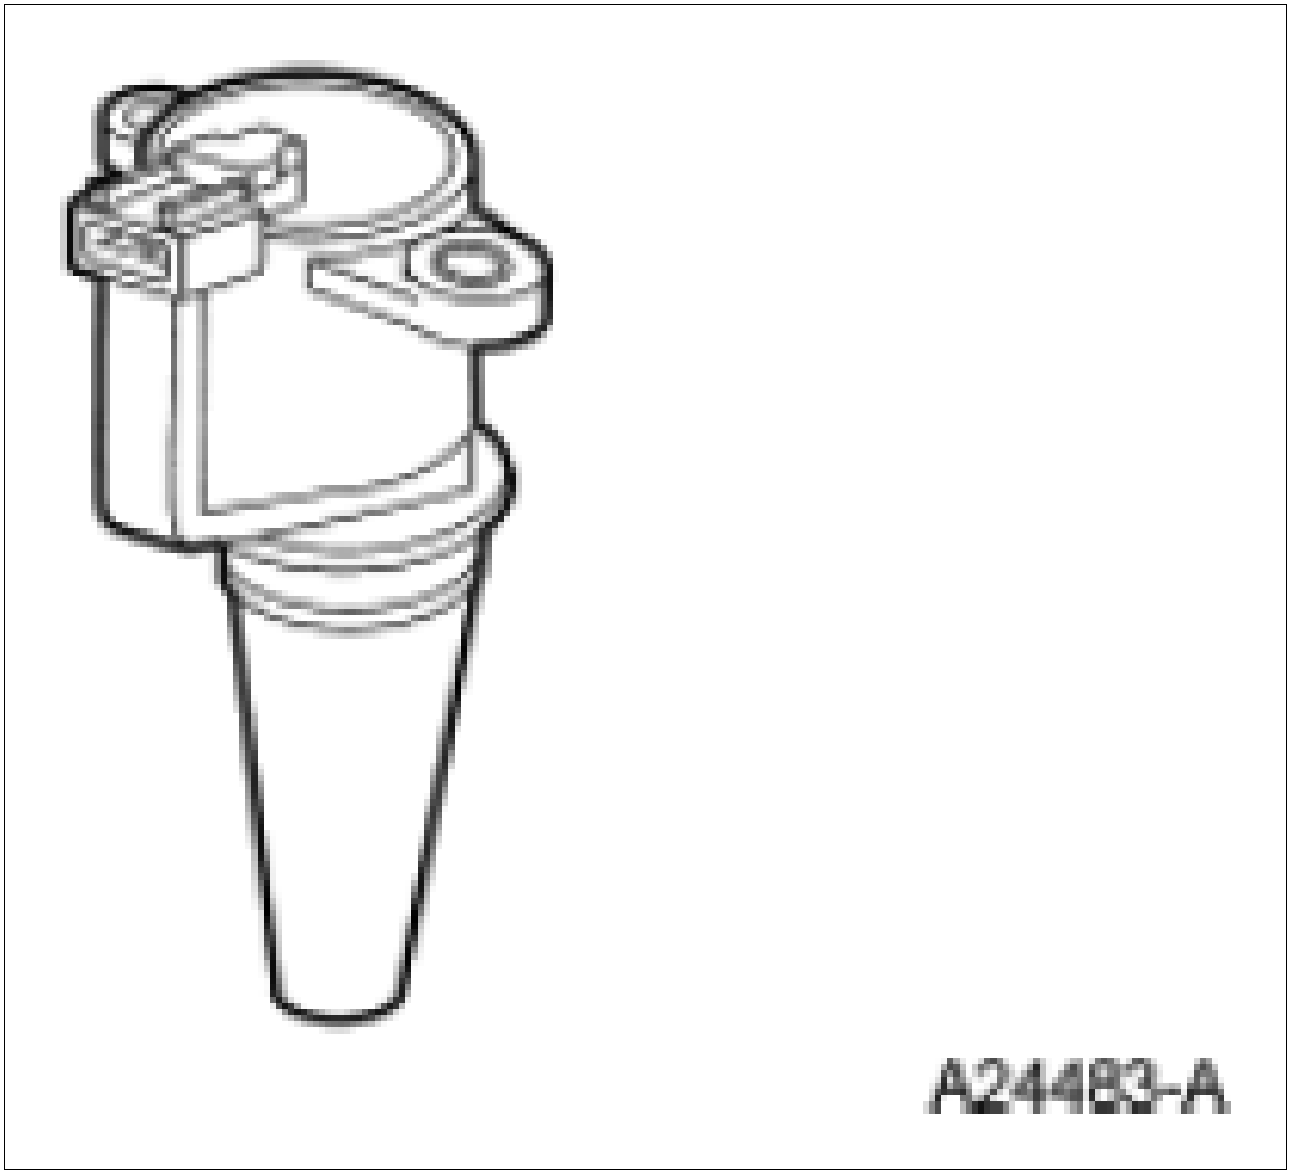
Item	Number	Description

1	-	Clutch Master Cylinder
2	-	CPP Sensor Assembly

ENGINE CONTROL COMPONENTS > CLUTCH PEDAL POSITION (CPP) SWITCH

The CPP switch is an input to the PCM indicating the clutch pedal position. The PCM provides a low current voltage on the CPP circuit. When the CPP switch is closed, this voltage is pulled low through the signal return (SIGRTN) circuit. The CPP input to the PCM is used to detect a reduction in engine load. The PCM uses the load information for mass airflow and fuel calculations.

Fig 1: Identifying Clutch Pedal Position (CPP) Switch



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > COIL ON PLUG (COP)

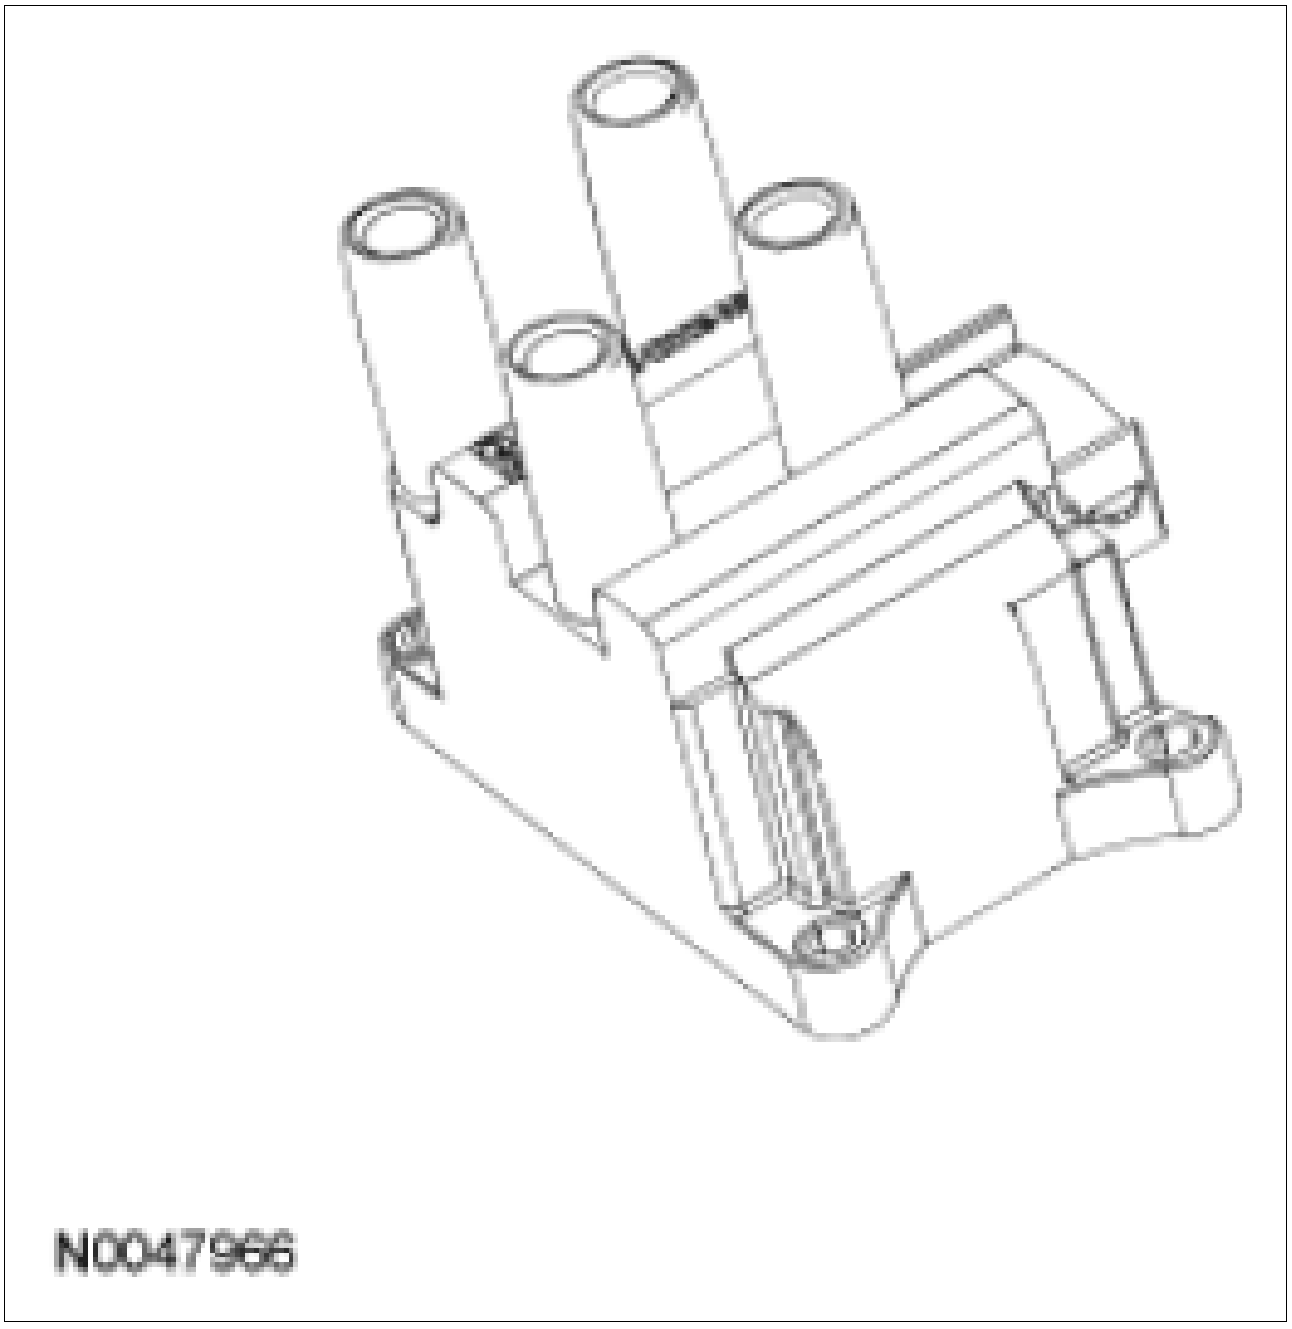
The COP ignition operates similar to a standard coil pack ignition except each plug has 1 coil per plug. The COP operates in engine crank, engine running and camshaft position failure mode effects management (FMEM) modes. The COP eliminates the need for secondary spark plug wires which improves reliability. Currently there are two types of COP in use today. The first type is a 2 circuit system that consists of the coil and boot that is installed directly on top of the spark plug which is fired by a driver located in the PCM. The second type is a 3 circuit system with the driver integrated in the COP assembly that is triggered when the PCM supplies the signal to fire. This configuration eliminates the need for high current lines from the PCM to the COP. For additional information, refer to IGNITION SYSTEMS in this service information.

Fig 1: Identifying Coil On Plug (COP)

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Coil On Plug (COP) With Integrated Driver

Courtesy of FORD MOTOR CO.



ENGINE CONTROL COMPONENTS > COIL PACK

The PCM provides a grounding switch for the coil primary circuit. When the switch is closed, voltage is applied to the coil primary circuit. This creates a magnetic field around the primary coil. The PCM opens the switch, causing the magnetic field to collapse, inducing the high voltage in the secondary coil windings and firing the spark plug. The spark plugs are paired so that as 1 spark plug fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired the order is reversed. The next pair of spark plugs fire according to the engine firing order.

Two adjacent coil towers share a common coil and are called a matched pair, the matched pairs are 1 and 4 and 2 and 3.

When the coil is fired by the PCM, spark is delivered through the matched pair towers to their respective spark plugs. The spark plugs are fired simultaneously and are paired so that as one fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired, the situation is reversed. The next pair of spark plugs fire according to the engine firing order.

Fig 1: Identifying Tower Coil Pack

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > COOLING FAN

The PCM monitors certain parameters (such as engine coolant temperature, vehicle speed, A/C ON/OFF status, A/C pressure) to determine engine cooling fan needs.

For Variable Speed Electric Fans:

The PCM controls the fan speed and operation using a duty cycle output on the FCV circuit. The fan controller (located at or integral to the engine cooling fan assembly) receives the FCV command and operates the cooling fan at the speed requested (by varying the power applied to the fan motor).

The fan controller is able to detect certain failure modes within the fan motors. Under certain failure modes, such as a motor that is drawing excessive current, the fan controller shuts the fans off. Fan motor concerns may not set a specific DTC. With the fan motor disconnected from the fan controller, voltage may not be present at the fan controller.

For Relay Controlled Fans:

The PCM controls the fan operation through the fan control LFC (single speed applications), and LFC (low speed), MFC (medium speed), HFC (high speed) for multiple speed applications. Some applications have the xFC circuit wired to 2 separate relays.

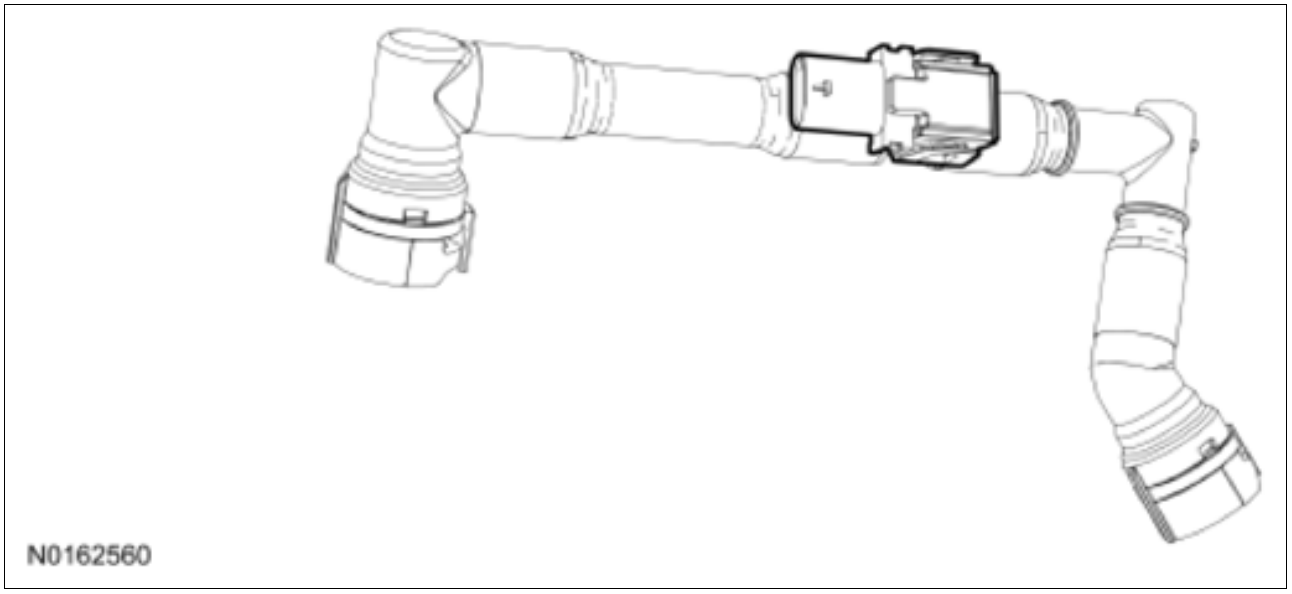
For 2 speed fans, although the PCM output circuits are called LFC and HFC, cooling fan speed is controlled by a combination of these outputs.

For 3 speed fans, although the PCM output circuits are called LFC, MFC, and HFC, cooling fan speed is controlled by a combination of these outputs.

ENGINE CONTROL COMPONENTS > COOLING FAN CLUTCH

The cooling fan clutch is an electrically actuated viscous clutch that consists of 3 main elements:

- a working chamber
- a reservoir chamber
- a cooling fan clutch actuator valve and a fan speed sensor (FSS)



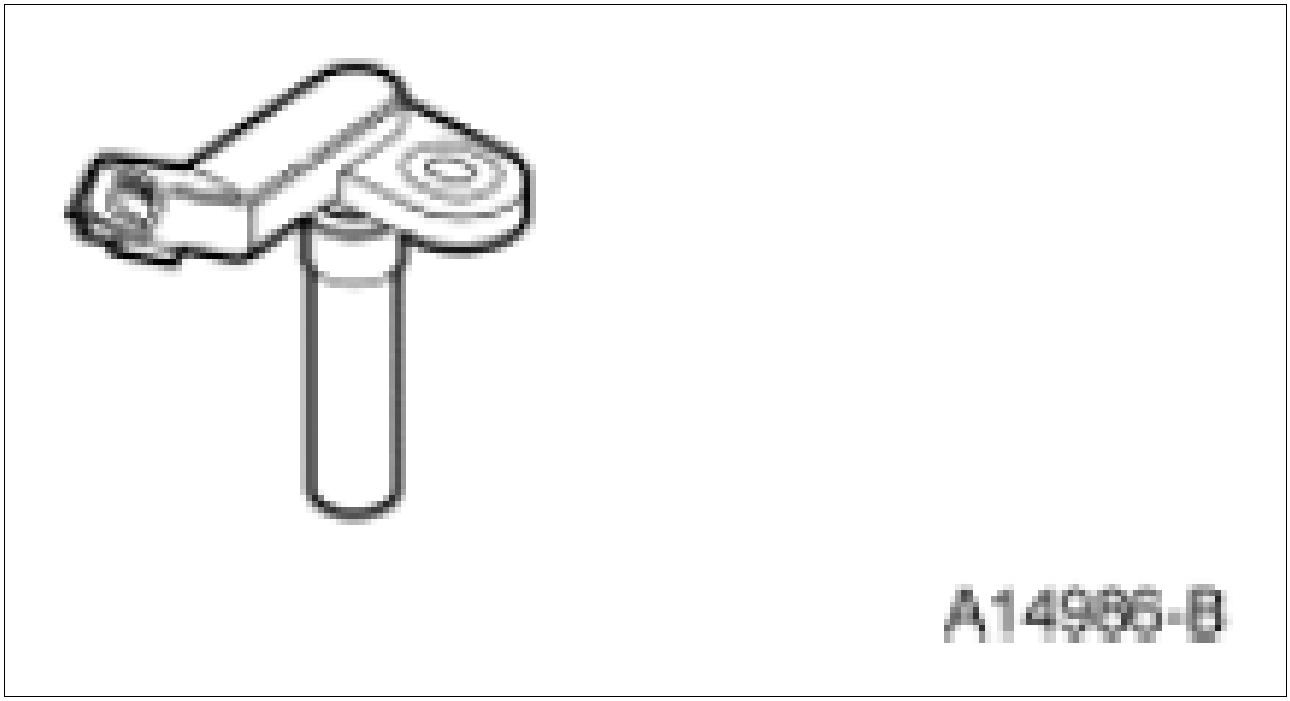
The cooling fan clutch actuator valve controls the fluid flow from the reservoir into the working chamber. Once viscous fluid is in the working chamber, shearing of the fluid results in fan rotation. The cooling fan clutch actuator valve is activated with a pulse width modulated (PWM) output signal from the PCM. By opening and closing the fluid port valve, the PCM can control the cooling fan speed. The cooling fan speed is measured by a Hall effect sensor and monitored by the PCM during closed loop operation.

The PCM optimizes fan speed based on engine coolant temperature, engine oil temperature, transmission fluid temperature, intake air temperature, or air conditioning requirements. When an increased demand for fan speed is requested for vehicle cooling, the PCM monitors the fan speed through the Hall effect sensor. If a fan speed increase is required, the PCM outputs the PWM signal to the fluid port, providing the required fan speed increase.

ENGINE CONTROL COMPONENTS > CRANKCASE PRESSURE SENSOR

The crankcase pressure sensor measures the vacuum in the positive crankcase ventilation (PCV) system. A change in the PCV system vacuum greater than a calibrated threshold indicates the PCV system is disconnected and will set a DTC. The crankcase pressure sensor is located in the PCV system hose between the intake air system air cleaner and the engine crankcase PCV inlet.

Fig 1: Identifying Crankcase Pressure Sensor Integrated With Crankcase Ventilation Tube



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > CRANKSHAFT POSITION (CKP) SENSOR

The CKP sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP sensor is the primary sensor for ignition information to the PCM. The pulse wheel for some V6 and V8 engines have a total of 35 teeth spaced 10 degrees apart with 1 empty space for a missing tooth. The pulse wheel for some 4 cylinder engines and some V6 engines have a total of 58 teeth spaced 6 degrees apart with 2 empty spaces. The 6.8L 10 cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference for the CKP sensor configuration. The PCM also uses the CKP sensor signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

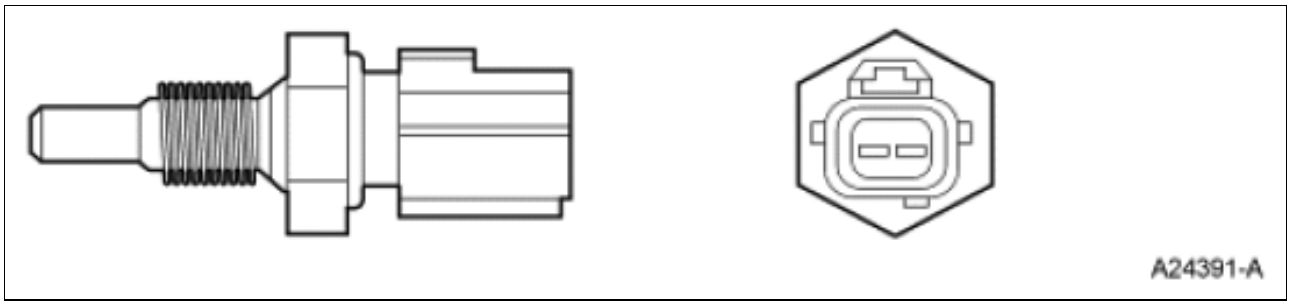
There are 2 types of CKP sensors used. The 2 pin variable reluctance sensor and the 3 pin Hall effect sensor.

Fig 1: Identifying CKP Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > CYLINDER HEAD TEMPERATURE (CHT) SENSOR

NOTE: If the CHT sensor is removed from the cylinder head for any reason it must be replaced with a new sensor.



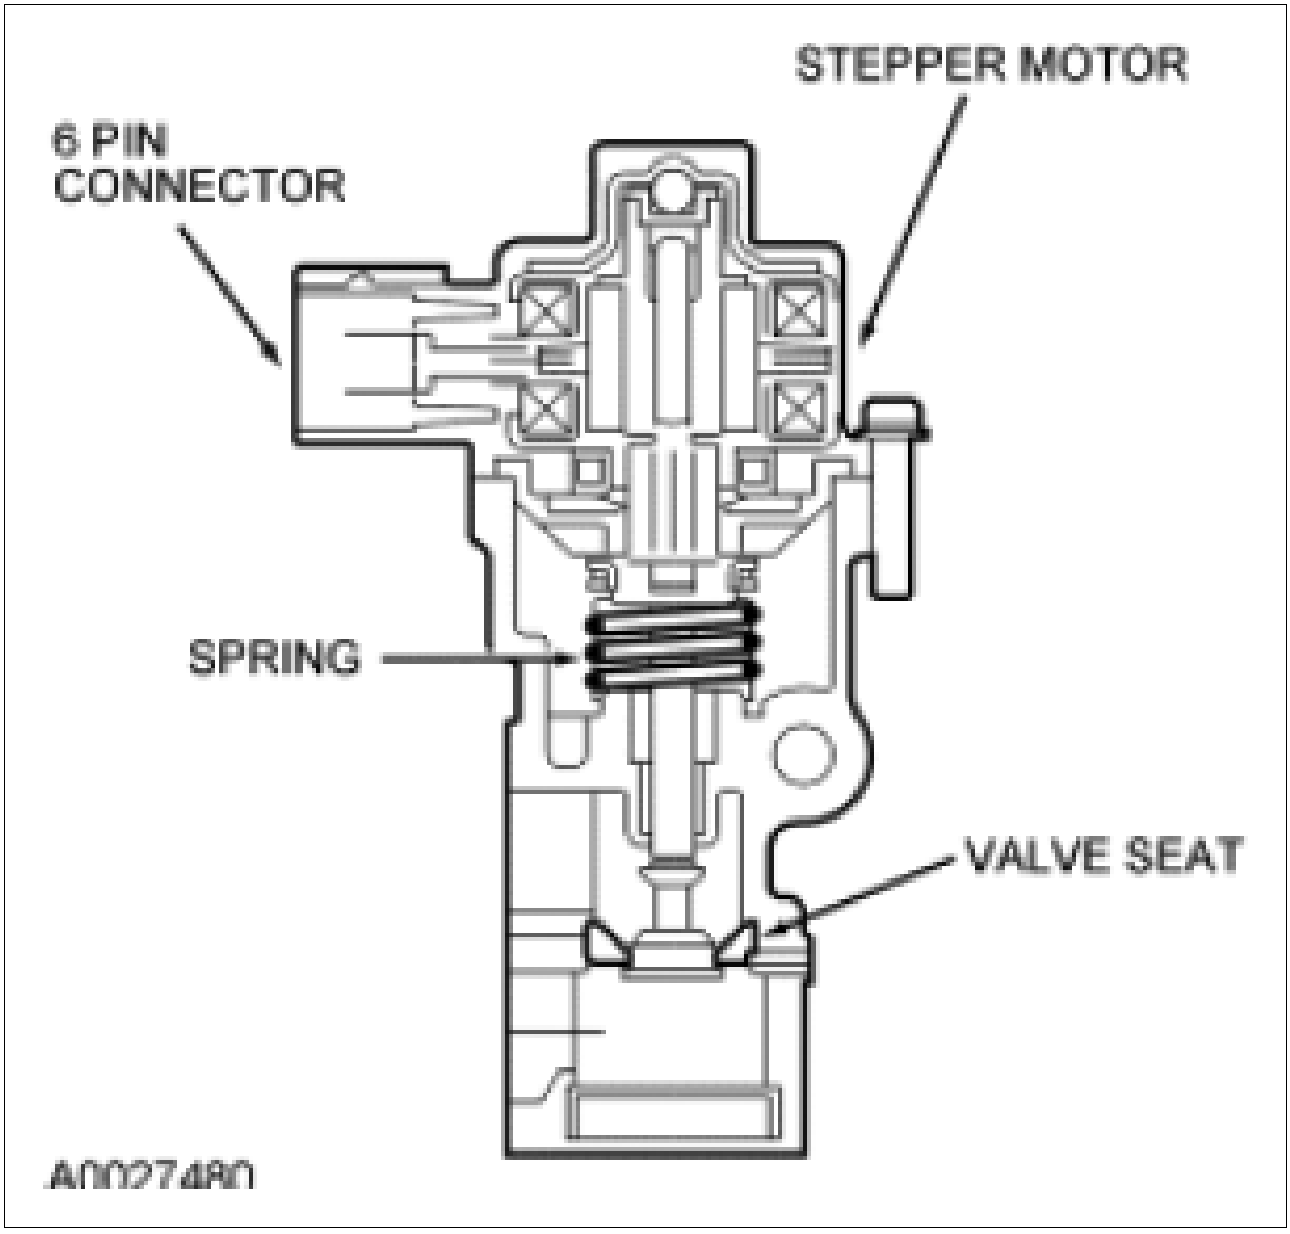
The CHT sensor is a thermistor device in which resistance changes with the temperature. The resistance of a thermistor decreases as temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor (pull-up resistor) in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

On a typical vehicle, the CHT sensor is located in the cylinder head and the CHT2 sensor is located in the exhaust manifold. The CHT sensor provides complete engine temperature information and is used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM, the PCM initiates a fail-safe cooling strategy based on information from the CHT sensor. A cooling system concern, such as low coolant or coolant loss, could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability. For additional information, refer to POWERTRAIN CONTROL SOFTWARE for Fail-Safe Cooling Strategy in this

service information.

Fig 1: Identifying CHT Sensor

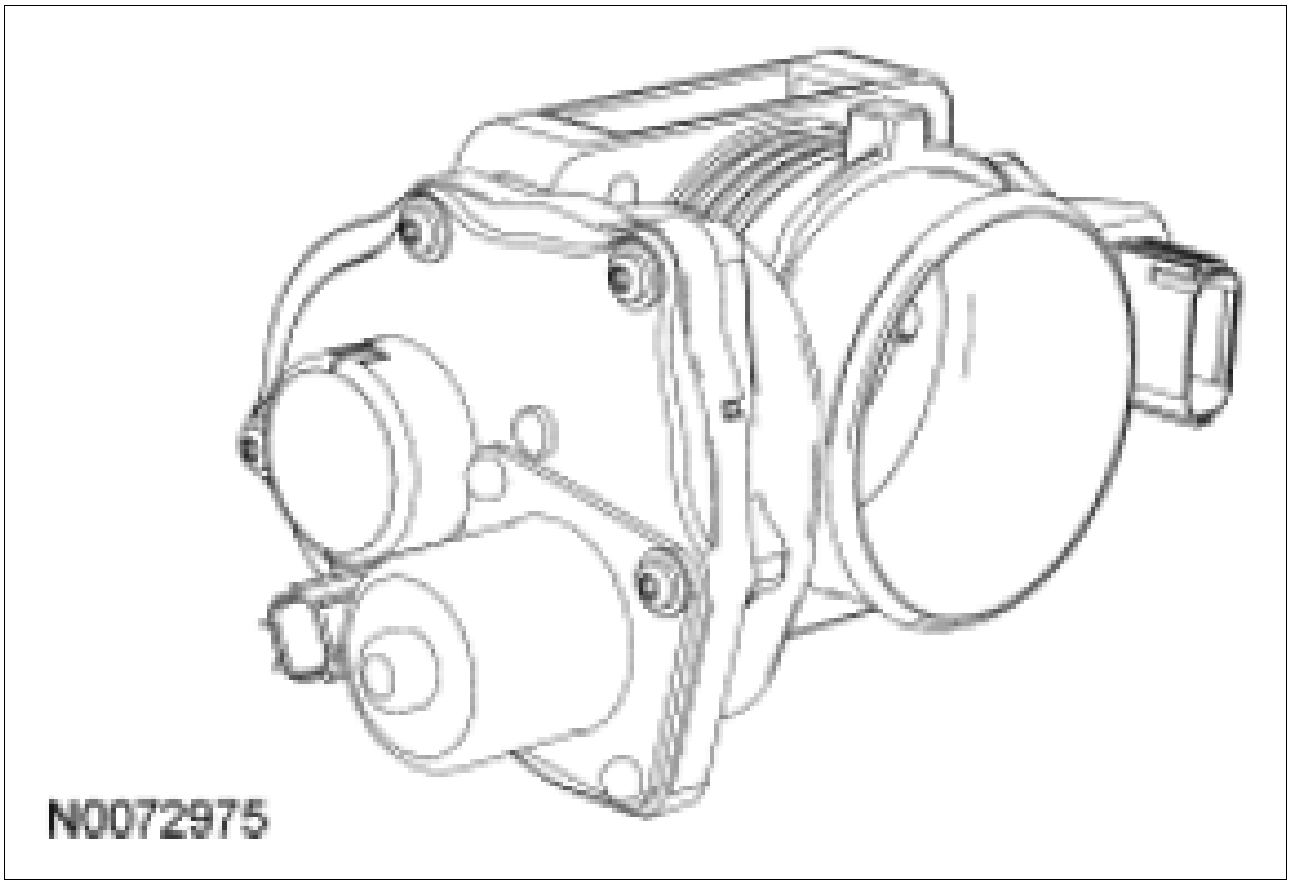


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) VALVE

Depending on the application, the EEGR valve is either a water cooled or an air cooled motor/valve assembly. The motor is commanded to move in 52 discrete steps as it acts directly on the EEGR valve. The position of the valve determines the rate of EGR. The built-in spring works to close the valve against the motor opening force.

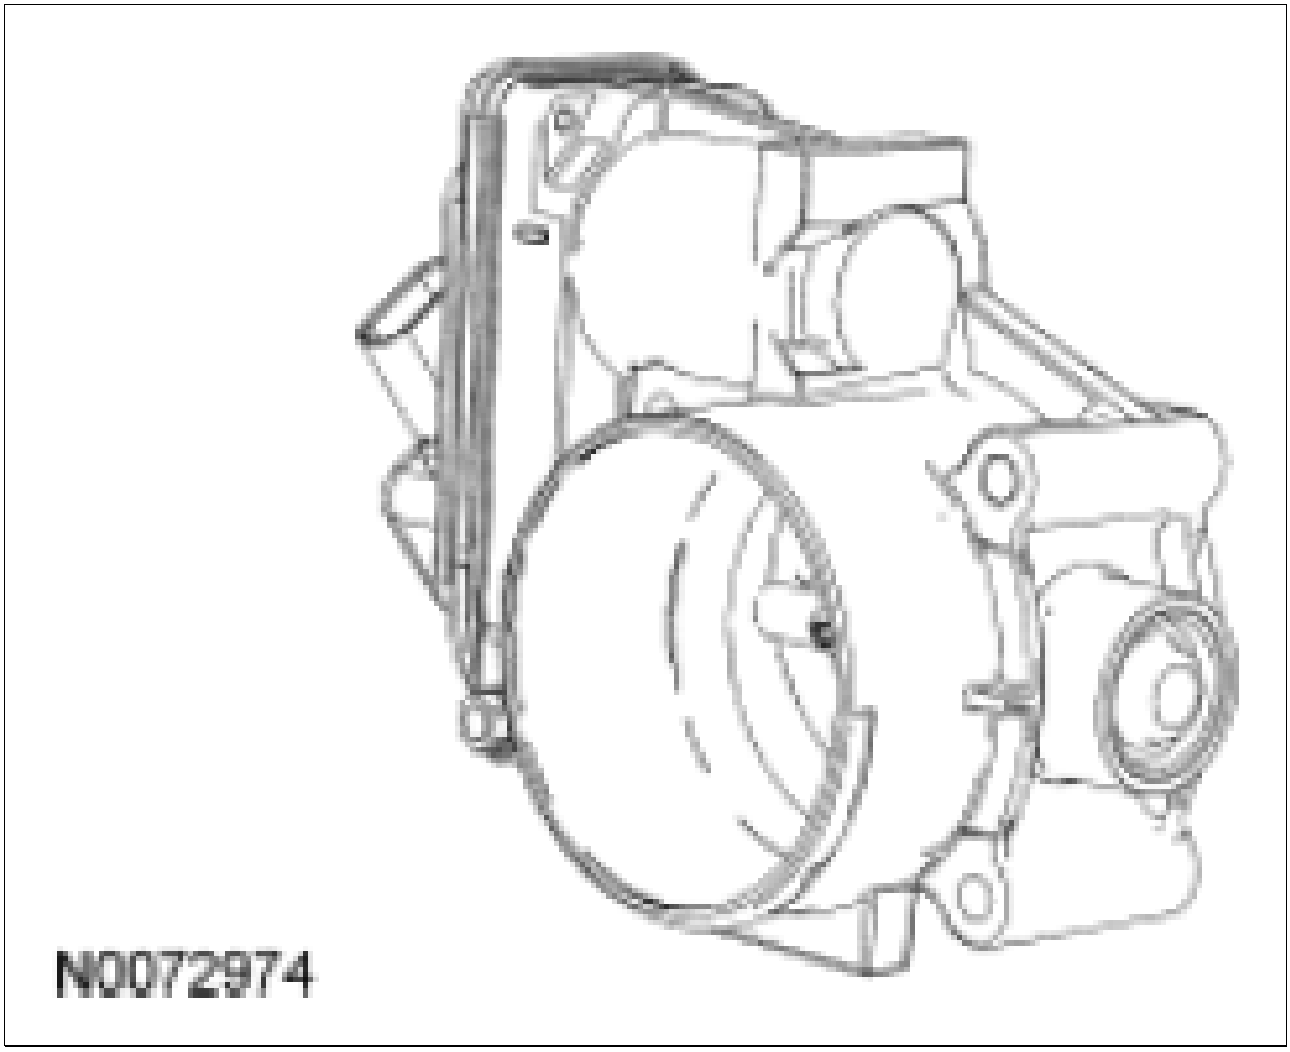
Fig 1: Identifying EEGR Motor/Valve Assembly



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > ELECTRONIC THROTTLE BODY THROTTLE ACTUATOR CONTROL (TAC)

The electronic throttle body TAC is a DC motor controlled by the PCM. There are 2 designs for the electronic throttle body TAC, parallel and inline. The parallel design has the motor under the bore parallel to the plate shaft. The motor housing is integrated into the main housing. The inline design has a separate motor housing. Both designs use an internal spring to return the throttle plate to a default position. The default position is typically a throttle angle of 7 to 8 degrees from the hard stop angle. The closed throttle plate hard stop prevents the throttle from binding in the bore. This hard stop setting is not adjustable and is set to result in less airflow than the minimum engine airflow required at idle. For additional information, refer to TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC) in this



service information.

Fig 1: Identifying Inline Electronic Throttle Body TAC Design

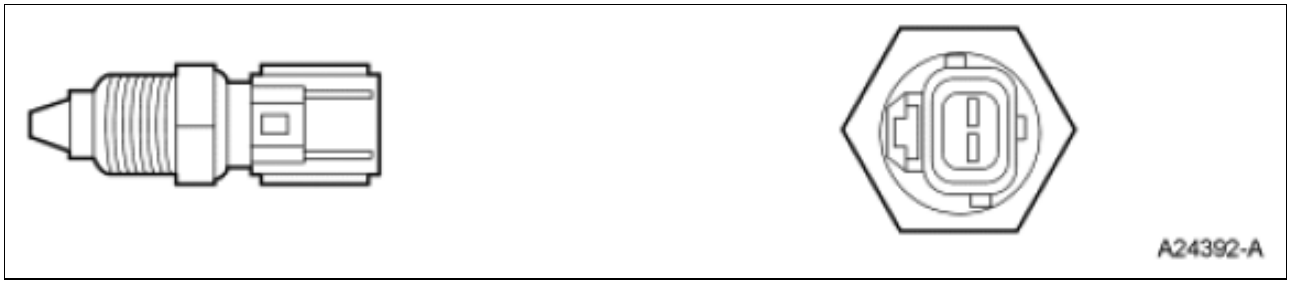
Courtesy of FORD MOTOR CO.

Fig 2: Identifying Parallel Electronic Throttle Body TAC Design

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > ELECTRONIC THROTTLE BODY THROTTLE POSITION SENSOR (ETBTPS)

The ETBTPS has two signal circuits in the sensor for redundancy. The redundant ETBTPS signals are required for increased monitoring. The first ETBTPS signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second signal (TP2) has a positive slope (increasing angle, increasing voltage). The two ETBTPS signals make sure the PCM receives a correct input even if one signal has a concern. For Fiesta, there is one reference voltage circuit (ETCREF) and one signal return circuit (ETCRTN) for the sensor dedicated to the ETBTPS. For all others, there is one reference voltage circuit (ETCREF) and one signal return circuit (ETCRTN) for the sensor shared with the reference voltage circuits (APPVREF1 and APPVREF2) and signal return circuits (APPRTN1 and APPRTN2) used by the APP sensor. For additional information, refer to TORQUE BASED ELECTRONIC THROTTLE CONTROL (ETC) in this service information.



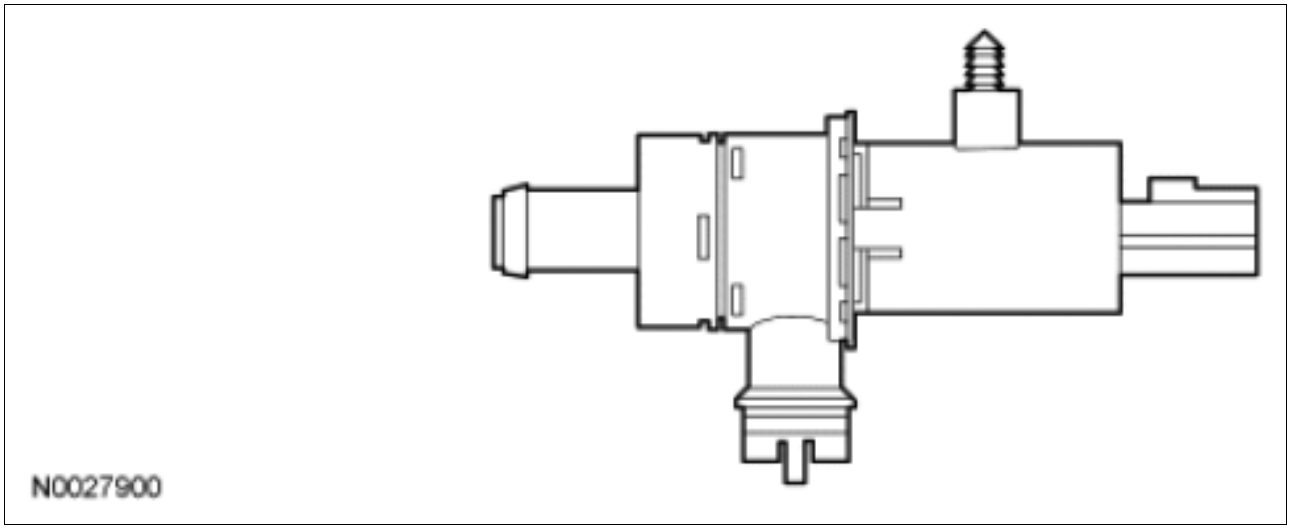
ENGINE CONTROL COMPONENTS > ENGINE COOLANT TEMPERATURE (ECT) SENSOR

The ECT sensor is a thermistor device in which resistance changes with temperature. The resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance changes the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor (pull-up resister) in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT sensor is located in an engine coolant passage and measures the engine coolant temperature. The PCM uses the engine coolant temperature input for fuel control and for cooling fan control. The ECT sensor can be a threaded or twist lock type.

Fig 1: Identifying Threaded ECT Sensor

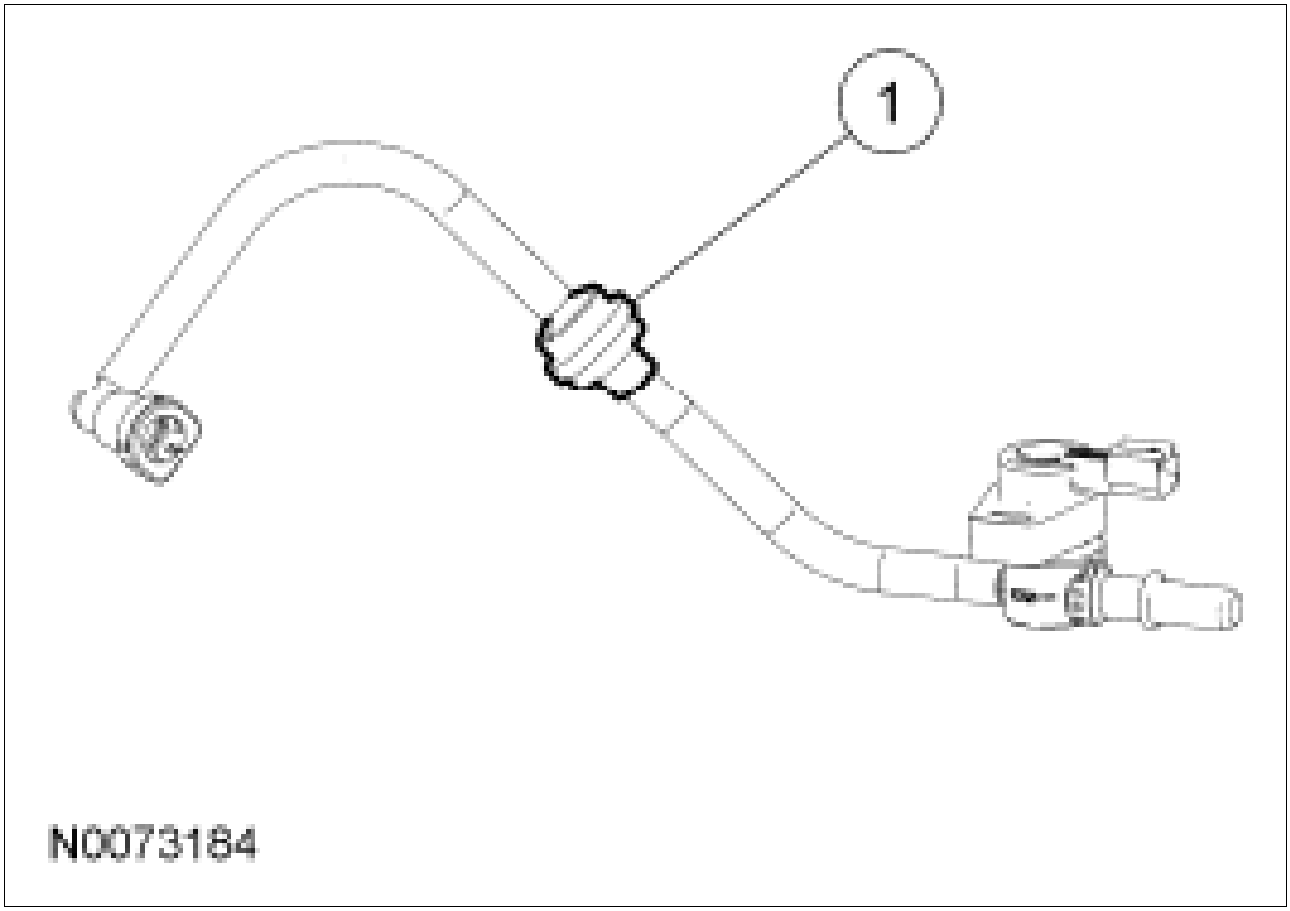


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) CANISTER VENT VALVE

The EVAP canister vent valve (located near the EVAP canister) is part of the enhanced EVAP system controlled by the PCM. During the EVAP leak check monitor, the EVAP canister vent valve seals the EVAP canister from the atmospheric pressure. This allows the EVAP purge valve to achieve the target vacuum in the fuel tank during the EVAP leak check monitor.

Fig 1: Identifying EVAP Canister Vent Valve



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) CHECK VALVE > EVAP CHECK VALVE

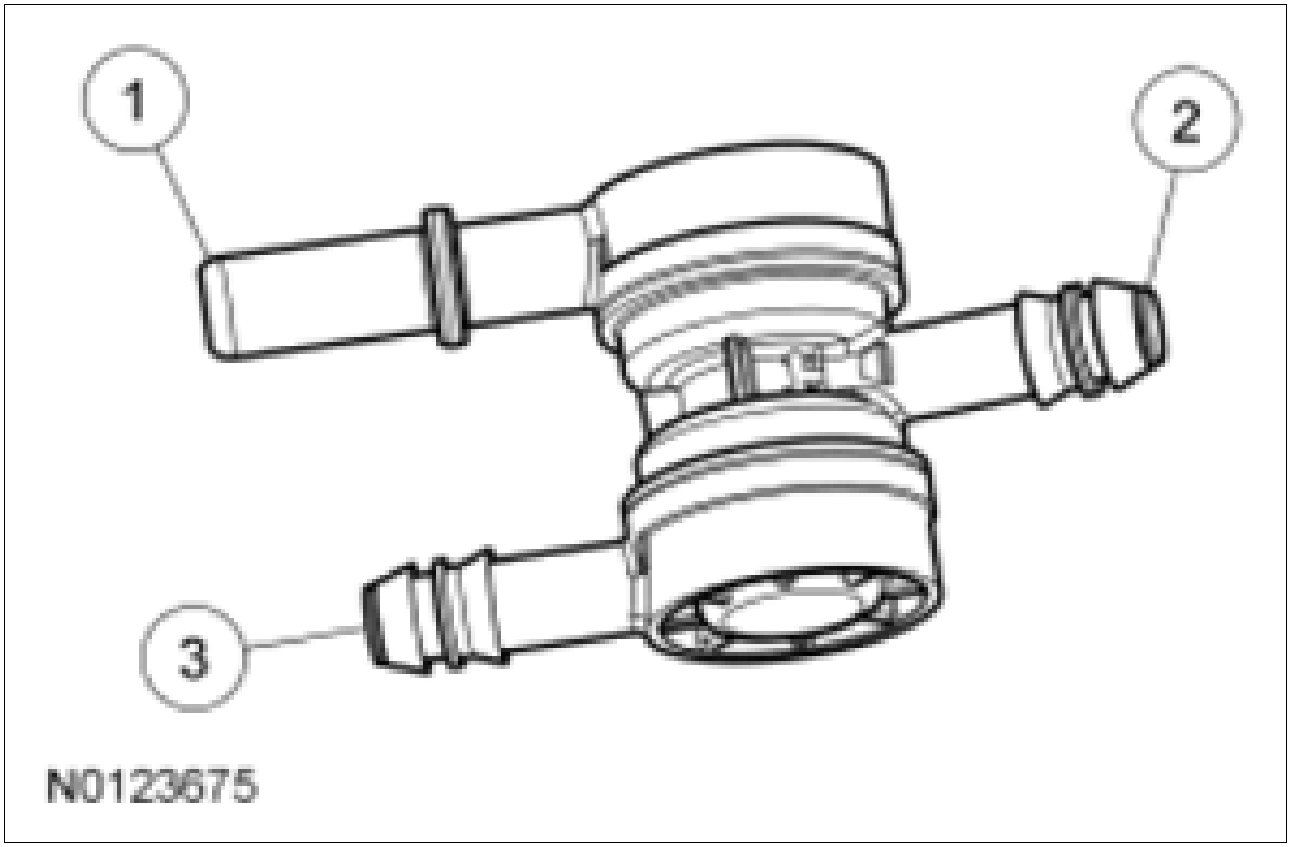
The EVAP check valve is used on turbocharged engines to prevent boost pressure from forcing open the EVAP purge valve and entering the EVAP system. The valve is open under normal engine vacuum. The valve closes during boost conditions to prevent the fuel tank from being pressurized and hydrocarbons forced out of the EVAP system into the atmosphere through the EVAP canister vent valve. When the engine is OFF, or at atmospheric pressure, the EVAP check valve is in an indeterminate state. The EVAP check valve is an integral part of the EVAP purge valve assembly.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) CHECK VALVE > TYPICAL EVAP CHECK VALVE

Fig 1: Identifying EVAP Check Valve

Courtesy of FORD MOTOR CO.

Item	Number	Description
1	-	EVAP Check Valve



ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) CHECK VALVE > EVAP DUAL CHECK VALVE

The EVAP dual check valve allows purge flow during boost conditions. Fuel vapors flow through the EVAP dual check valve to the intake air system upstream of the turbocharger before entering the intake manifold. When the engine is OFF, or at atmospheric pressure, the EVAP dual check valve is in an indeterminate state.

There are 2 types of EVAP dual check valves on turbocharged engines. One type has the check valves integrated in a single housing assembly. The second type has separate check valves connected to a hose assembly with the EVAP ejector integrated with one of the check valves.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) EJECTOR

The EVAP ejector is used on turbocharged engines to create a vacuum in the EVAP purge line from the EVAP purge valve to the intake air system. During boost conditions, boost pressure flows through a venturi inside the EVAP ejector creating a vacuum in the EVAP purge line to the intake air inlet to the turbocharger. When the second EVAP check valve is open, the purge vapor is drawn through the EVAP ejector into the intake air tube, through the turbocharger and charge air cooler, to the intake manifold.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) EJECTOR > TYPICAL EVAP EJECTOR

1	-	EVAP Ejector

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) PURGE VALVE

The EVAP purge valve (located near the engine) is part of the enhanced EVAP system controlled by the PCM. This valve controls the flow of vapors (purging) from the EVAP canister to the intake manifold during various engine operating modes. The EVAP purge valve is a normally closed valve. The PCM outputs a duty cycle between 0% and 100% to control the EVAP purge valve.

ENGINE CONTROL COMPONENTS > EVAPORATIVE EMISSION (EVAP) VAPOR BLOCKING VALVE

The EVAP vapor blocking valve is a normally open valve, electrically closed by the PCM, to isolate the fuel tank from the rest of the EVAP system. This prevents the canister from becoming saturated causing hydrocarbons (HC) to be released into the atmosphere in a situation where the engine is OFF, and the ignition is ON during a drive cycle. The EVAP vapor blocking valve will automatically open to relieve excess pressure or vacuum, in the fuel tank, if the pressure or vacuum reaches a maximum calibrated value. The EVAP vapor blocking valve is located near the EVAP canister.

Fig 1: Identifying EVAP Vapor Blocking Valve

Courtesy of FORD MOTOR CO.

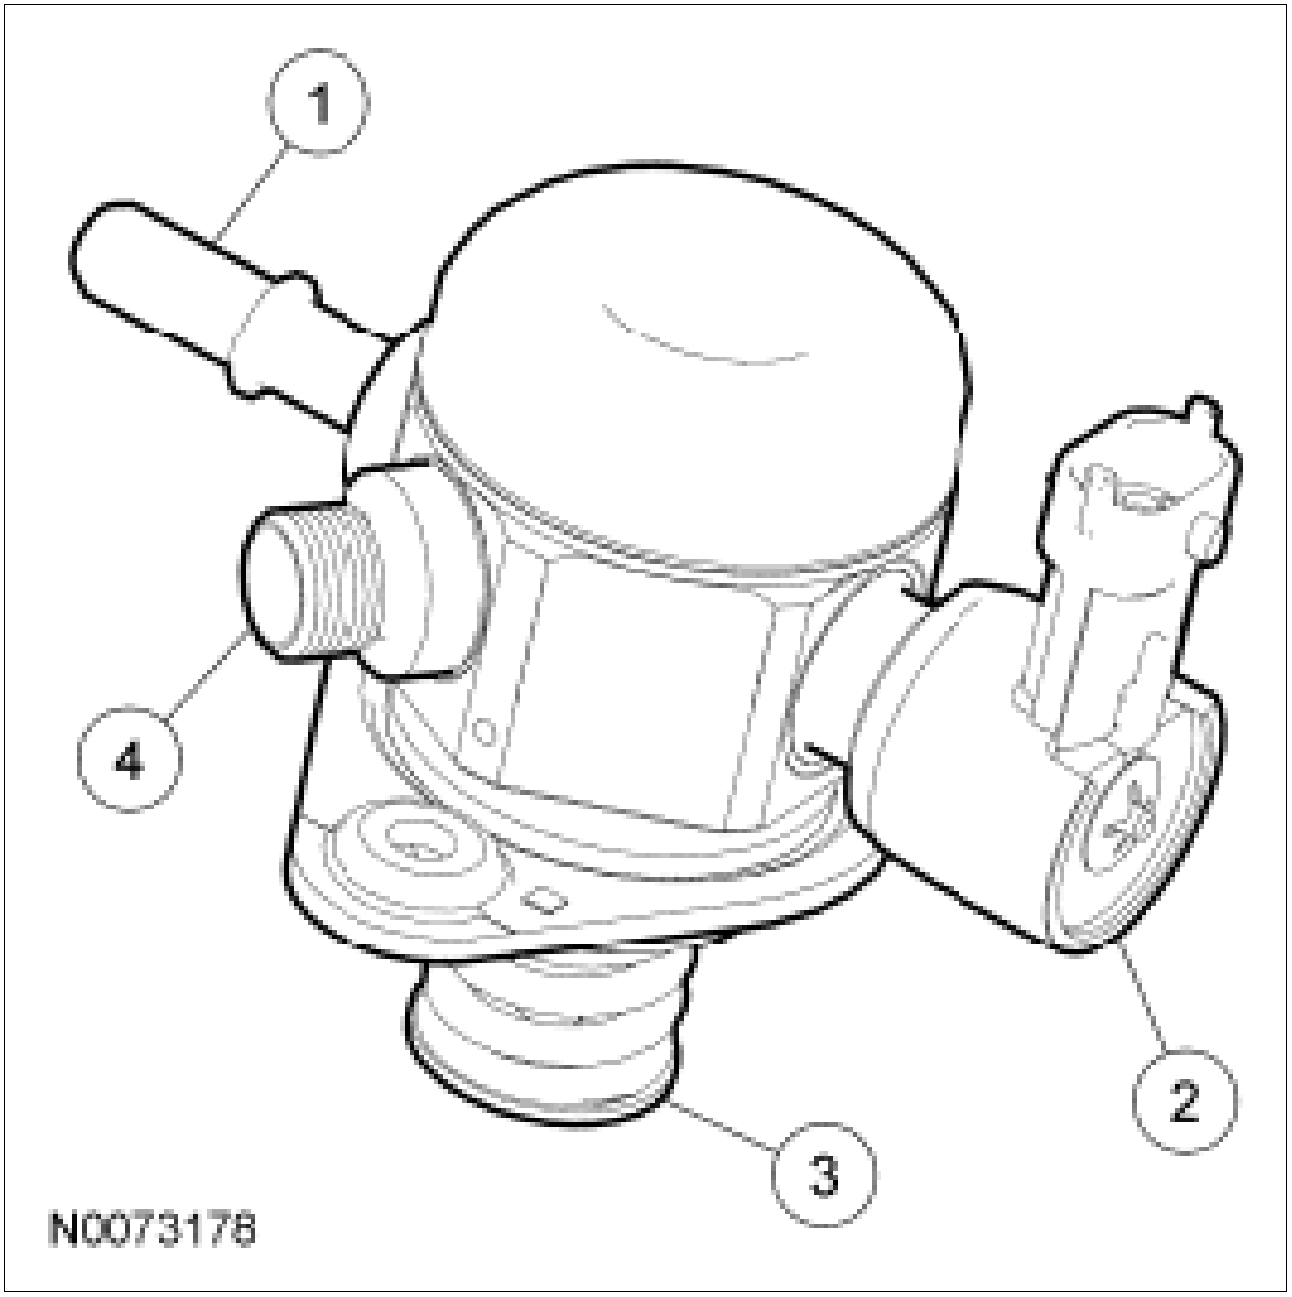
ENGINE CONTROL COMPONENTS > FAN SPEED SENSOR (FSS)

The FSS is a Hall effect sensor that measures the cooling fan clutch speed by generating a waveform with a frequency proportional to the fan speed. If the cooling fan clutch is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the cooling fan clutch speed increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the FSS as a feedback for closed loop control of the cooling fan clutch. For additional information on the cooling fan clutch, refer to COOLING FAN CLUTCH in this service information.

ENGINE CONTROL COMPONENTS > FUEL INJECTION PUMP

NOTE: Do not apply battery positive (B+) voltage directly to the fuel volume regulator solenoid electrical connector terminals. Internal damage to the solenoid may occur in a matter of seconds.

The engine driven fuel injection pump increases fuel rail pressure to the desired level to support fuel injection requirements. Unlike conventional port fuel injection systems, with direct injection the desired fuel rail pressure ranges widely over operating conditions. The pump receives fuel from the fuel pump (FP) assembly, increases the fuel pressure from approximately 448 kPa (65 psi) to a variable pressure up to 20 MPa (2900 psi), and delivers it to the fuel rails. The fuel injection pump is driven by a dedicated



intake camshaft lobe and is located on top of the engine.

The fuel volume regulator is a solenoid valve permanently mounted to the pump assembly. The PCM commands the fuel volume regulator to meter in a specified fuel volume with each pump stroke. The PCM regulates the fuel volume entering the rail to achieve the desired fuel rail pressure.

The fuel volume regulator control is synchronous to the cam position on which the pump is mounted. The fuel volume regulator control takes into account that camshaft phasing varies during engine operation for purposes of valve control.

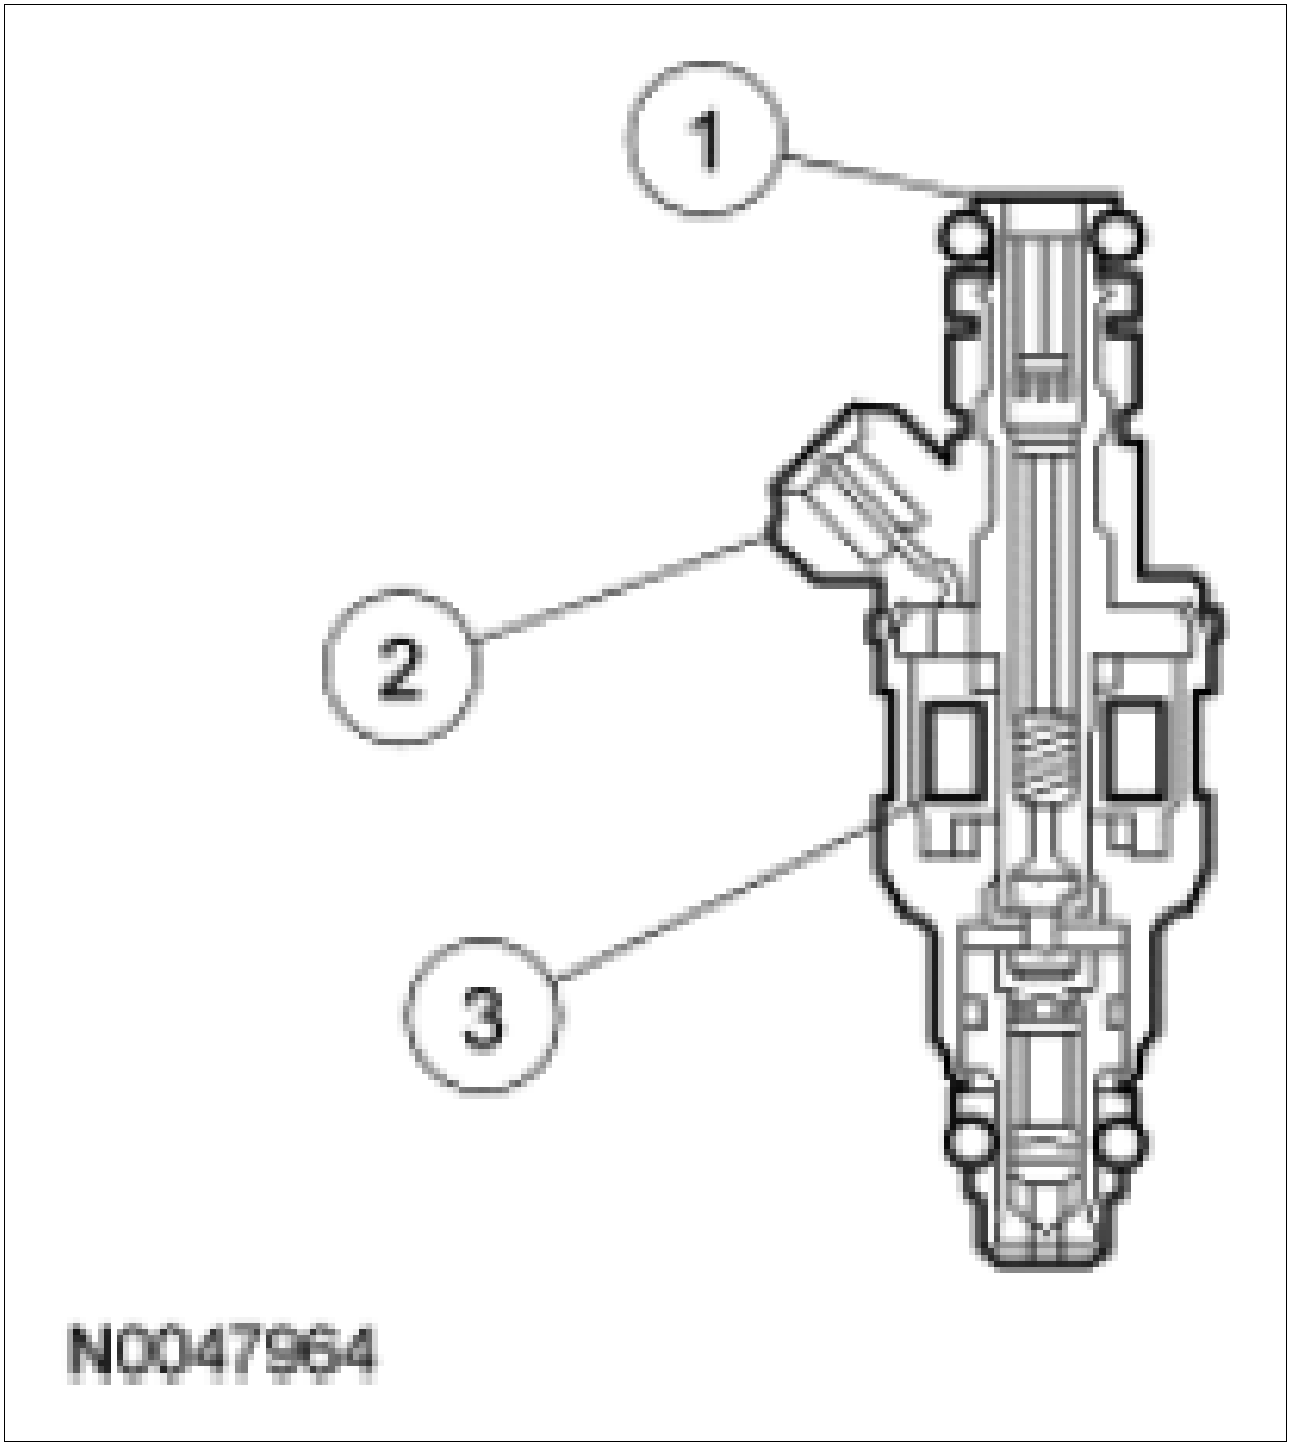
ENGINE CONTROL COMPONENTS > FUEL INJECTORS

NOTE: Do not apply battery positive (B+) voltage directly to the fuel injector electrical connector terminals. Internal damage to the solenoid may occur in a matter of seconds.



The fuel injector is a solenoid operated valve that meters fuel flow to the engine. The fuel injector opens and closes a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open.

The fuel injector is normally closed and is operated by a 12 volt source from either the PCM power relay or fuel pump relay. The ground signal is controlled by the PCM.

The fuel injector is a deposit resistant injector (DRI) type and does not have to be cleaned. Install a new fuel injector if the flow is checked and found to be out of specification.

ENGINE CONTROL COMPONENTS > FUEL INJECTORS > TYPICAL FUEL INJECTOR

Fig 1: Identifying Fuel Injector

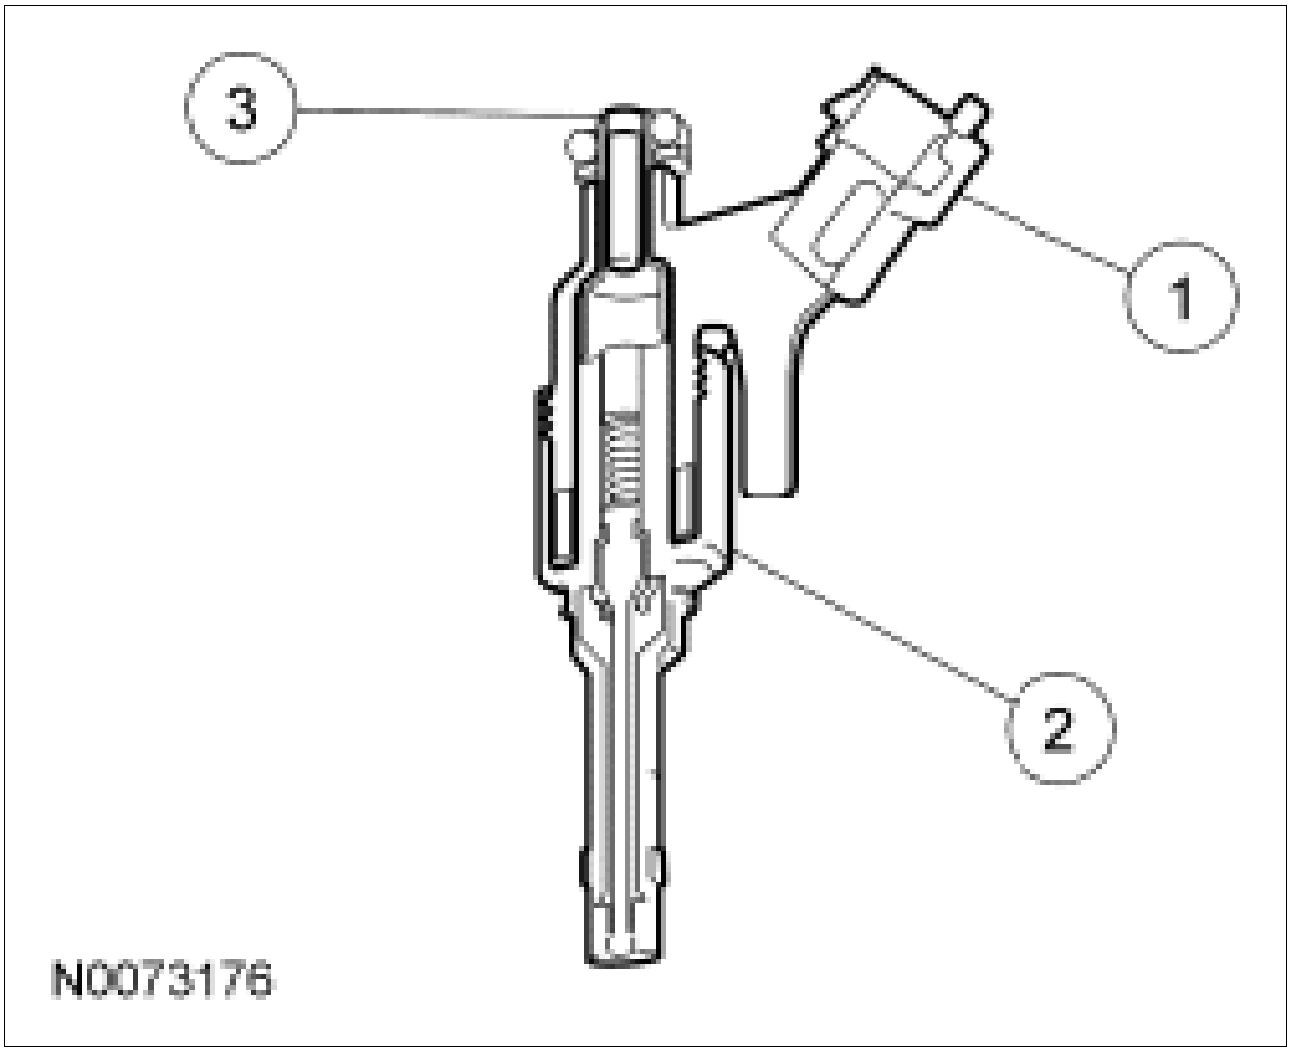
Item	Number	Description
1	-	Fuel Filter Screen
2	-	Connector
3	-	Solenoid Coil

ENGINE CONTROL COMPONENTS > FUEL INJECTORS - DIRECT INJECTION



The gasoline direct fuel injection fuel injector delivers fuel directly into the cylinder under high pressure. Each injector is controlled by 2 circuits from the PCM.

A boosted voltage supply, up to 65 volts, is generated in the PCM and used to initially open the injector. The injector driver controls three transistor switches that apply the boost voltage to open the injector and then modulates the current to hold the injector open. If boost voltage is unavailable, the correct injector opening current may not be generated in the time required.

The PCM contains a smart driver that monitors and compares high side and low side injector currents to diagnose numerous concerns. Each fuel injector high side circuit is paired inside the PCM with another fuel injector high side circuit. All injector concerns are reported with a single DTC per injector.

ENGINE CONTROL COMPONENTS > FUEL INJECTORS - DIRECT INJECTION > TYPICAL DIRECT FUEL INJECTION FUEL INJECTOR

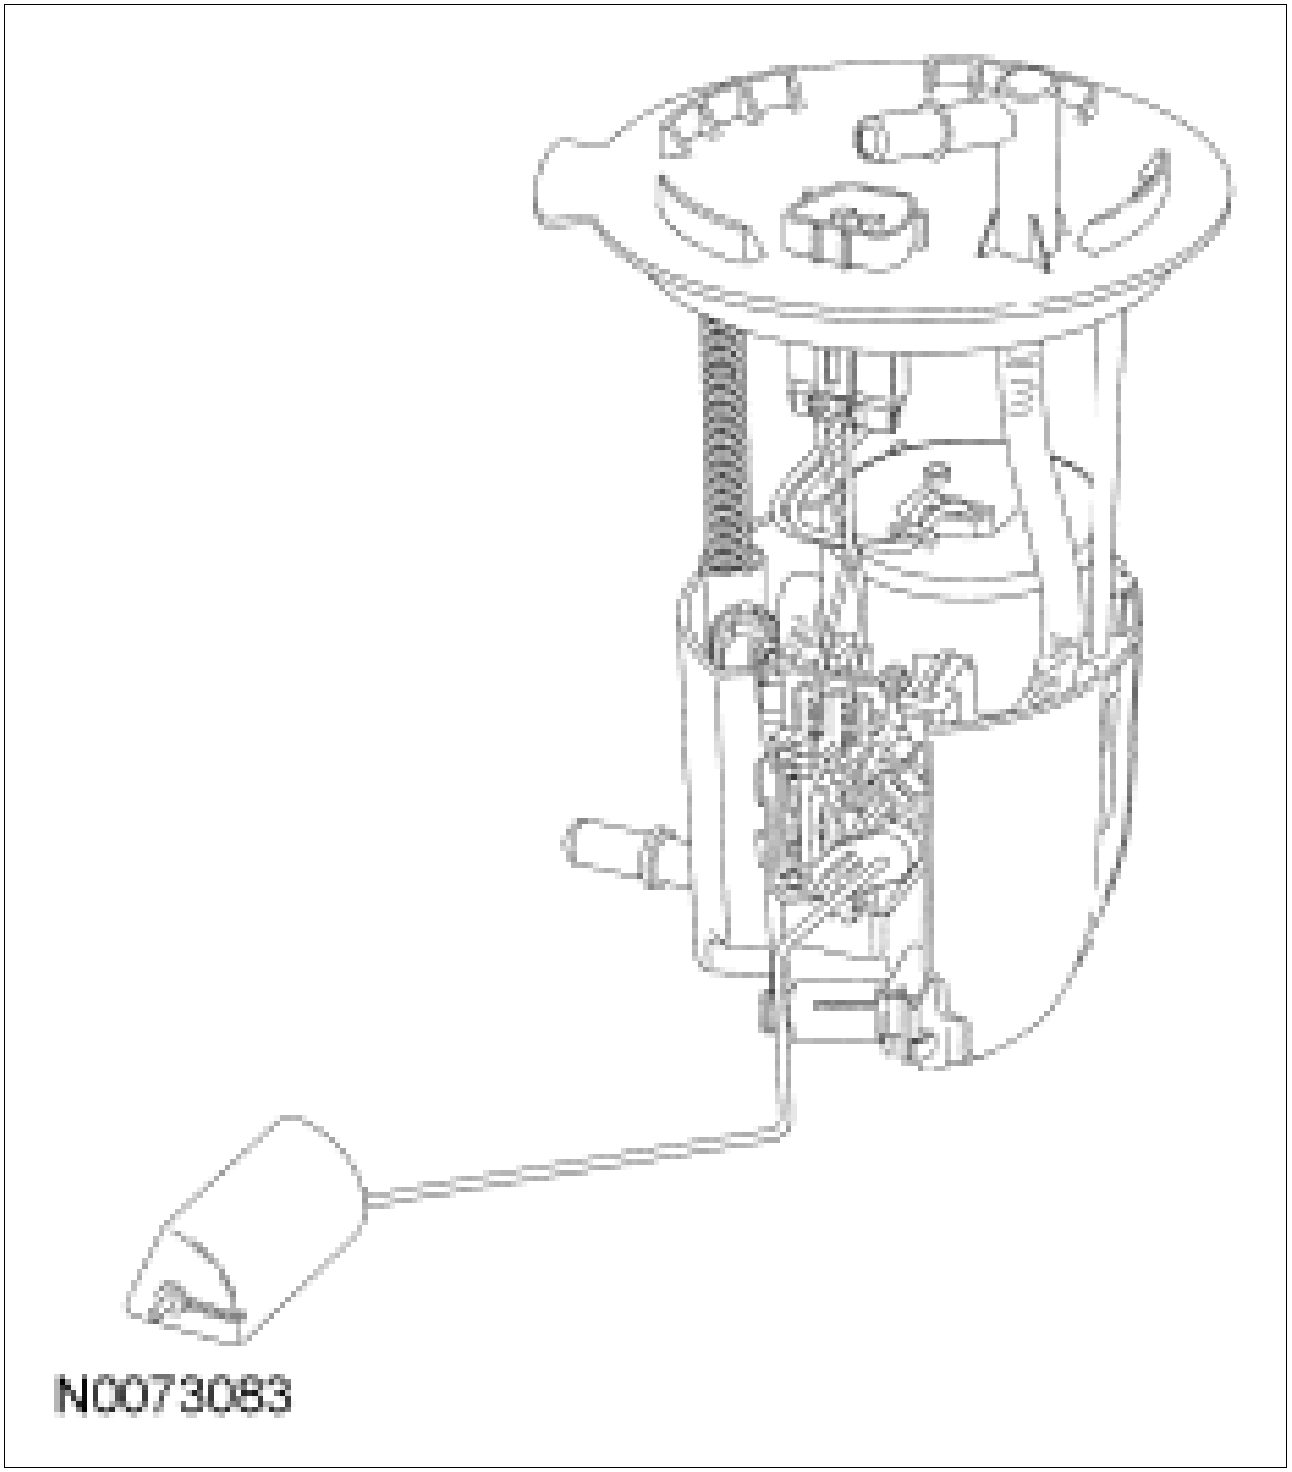
ENGINE CONTROL COMPONENTS > FUEL PRESSURE SENSOR

The fuel pressure sensor (located in the fuel line either near the fuel tank or near the engine) provides a pressure feedback signal for the low pressure fuel system to the PCM. The PCM uses the FLP signal to determine correct operation of the low pressure fuel system.

Fig 1: Identifying Fuel Pressure Sensor



Courtesy of FORD MOTOR CO.

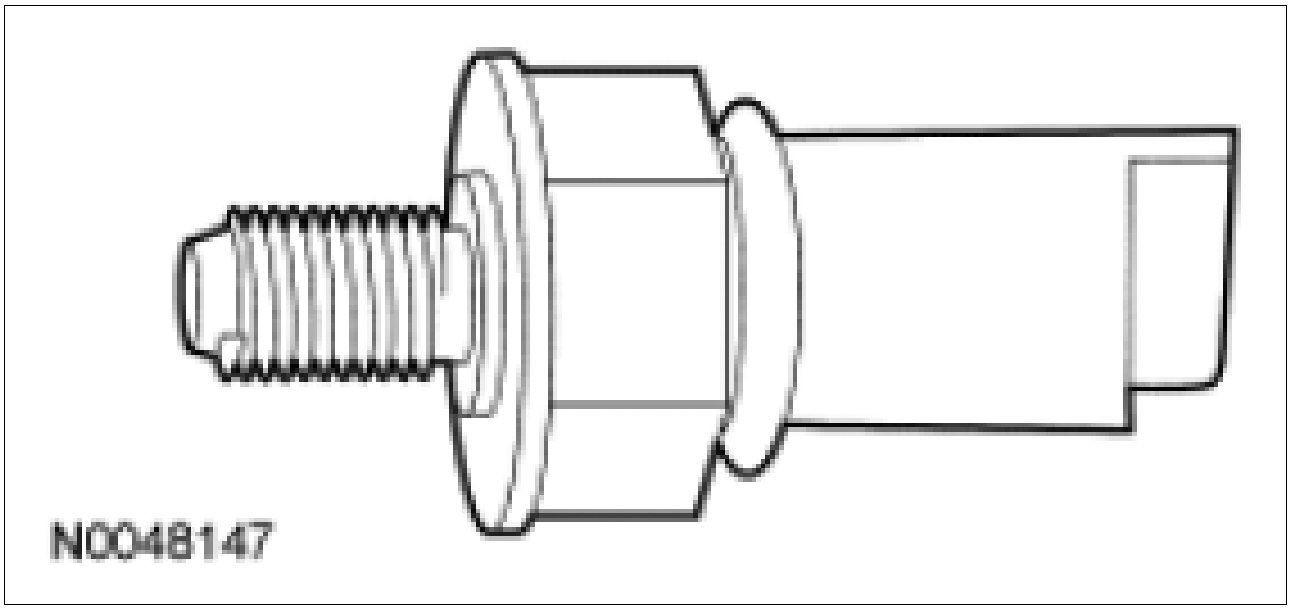
ENGINE CONTROL COMPONENTS > FUEL PUMP (FP) ASSEMBLY

The FP assembly contains the fuel pump and sender assembly. The fuel pump is located inside the FP assembly reservoir and supplies fuel through the FP assembly manifold to the engine and FP assembly jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

Fig 1: Identifying Mechanical Returnless FP Assembly

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > FUEL PUMP (FP) ASSEMBLY AND RESERVOIR



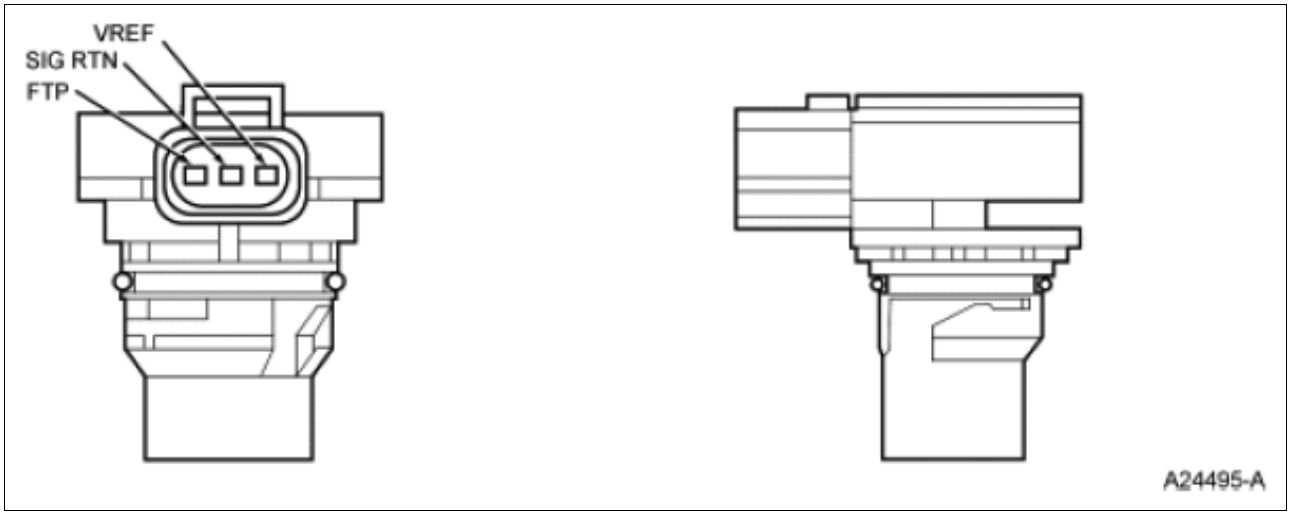
The FP assembly is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains the system pressure after the ignition has been turned OFF to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

ENGINE CONTROL COMPONENTS > FUEL RAIL PRESSURE (FRP) SENSOR

The FRP sensor is a diaphragm strain gauge device. The FRP sensor measures the pressure difference between the fuel rail and atmospheric pressure. The FRP sensor nominal output varies between 0.5 and 4.5 volts, with 0.5 volts corresponding to 0 MPa (0 psi) gauge and 4.5 volts corresponding to 26 MPa (3771 psi) gauge. The sensor can read vacuum and may lower the output voltage to slightly below 0.5 volts. This condition is normal and is usually the case after several hours of cold soak before the vehicle dome light is turned ON. The FP assembly is energized at the same time the dome light is commanded ON. A disabled or malfunctioning dome light does not affect the FP assembly control.

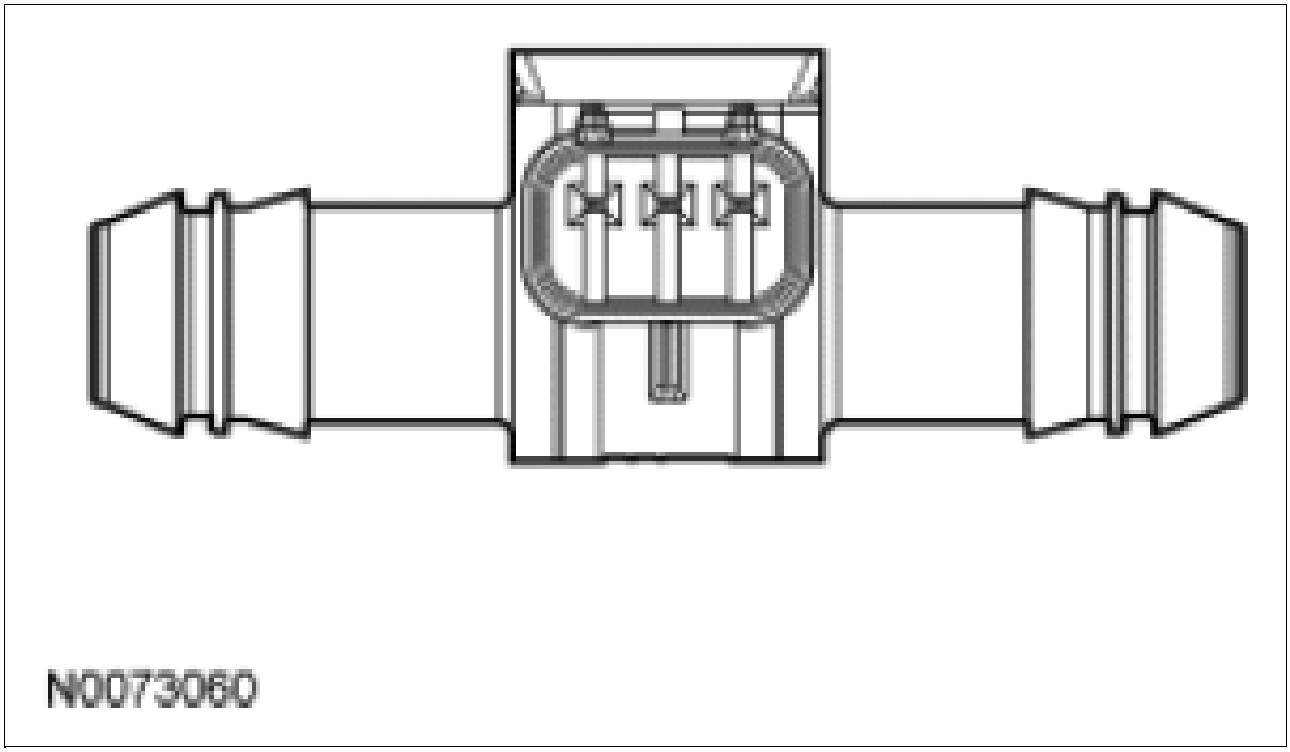
The FRP sensor is located on the fuel rail and provides a feedback signal to indicate the fuel rail pressure to the PCM. The PCM uses the FRP signal to command the correct injector timing and pulse width for correct fuel delivery at all speed and load conditions. The FRP sensor, along with the fuel volume regulator (part of the fuel injection pump), form a closed loop fuel pressure control system. An electrically faulted FRP sensor results in the deactivation of the fuel injection pump. Fuel pressure to injectors is then provided only by the FP assembly. When the fuel injection pump is de-energized and the injectors are active, the fuel rail pressure is approximately 70 kPa (10 psi) lower than FP assembly pressure due to the pressure drop across the fuel injection pump. Thus, if the FP assembly pressure is 448 kPa (65 psi), then the fuel rail pressure would be approximately 379 kPa (55 psi) if the injectors are active.

Fig 1: Identifying Fuel Rail Pressure (FRP) Sensor



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > FUEL TANK PRESSURE (FTP) SENSOR



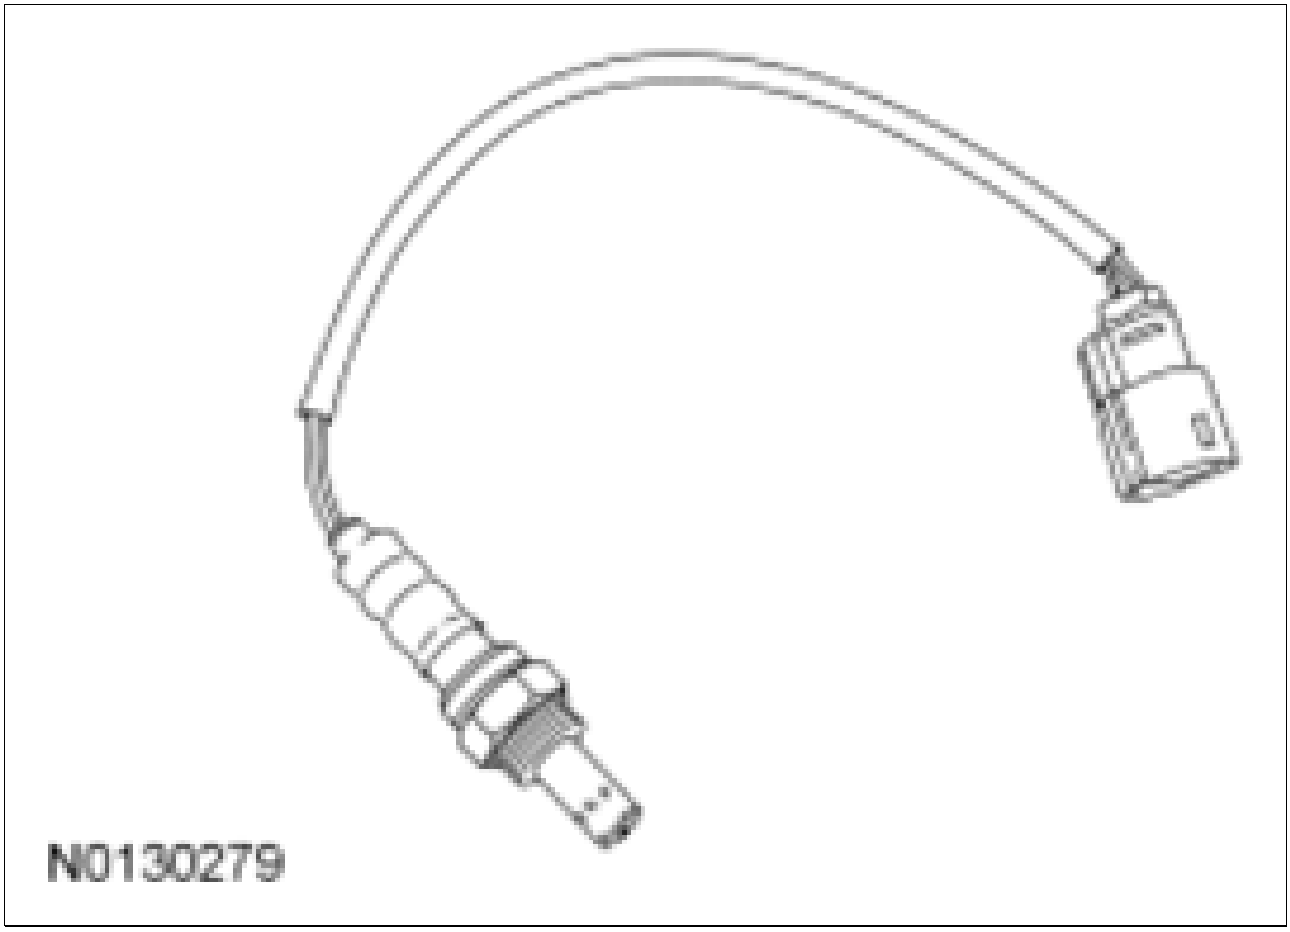
The in tank FTP sensor or the inline FTP sensor measures the fuel tank pressure.

Fig 1: Identifying Tank FTP Sensor

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Inline FTP Sensor

Courtesy of FORD MOTOR CO.



ENGINE CONTROL COMPONENTS > HEATED OXYGEN SENSOR (HO2S)

The HO2S detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air to fuel ratio) in the exhaust produces a voltage signal less than 0.4 volt. A low concentration of oxygen (rich air to fuel ratio) produces a voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air

to fuel ratio in order to achieve a near stoichiometric air to fuel ratio of 14.7:1 during closed loop engine operation. The HO2S generates a voltage between 0.0 and 1.1 volts.

The HO2S heater is embedded with the sensing element. The heating element heats the sensor to a temperature of 800°C (1, 472°F). At approximately 300°C (572°F) the engine enters closed loop operation. The VPWR circuit supplies voltage to the heater. The PCM turns the heater ON by providing the ground when the correct conditions occur. The heater allows the engine to enter closed loop operation sooner. The use of this heater requires the HO2S heater control to be duty cycled, to prevent damage to the heater.

Fig 1: Identifying Heated Oxygen Sensor (HO2S)

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > INERTIA FUEL SHUTOFF (IFS) SWITCH

The IFS switch is used in conjunction with the electric fuel pump. The IFS switch shuts off the fuel pump if a collision occurs. It consists of an inverted pendulum mass that is retained in a conical cone through a set of linear springs. When a sharp impact occurs, the pendulum shifts out of the conical cone, opens the circuit and shuts off the electric fuel pump. Once the switch is open, it must be manually reset before restarting the vehicle.

Fig 1: Identifying IFS Switch

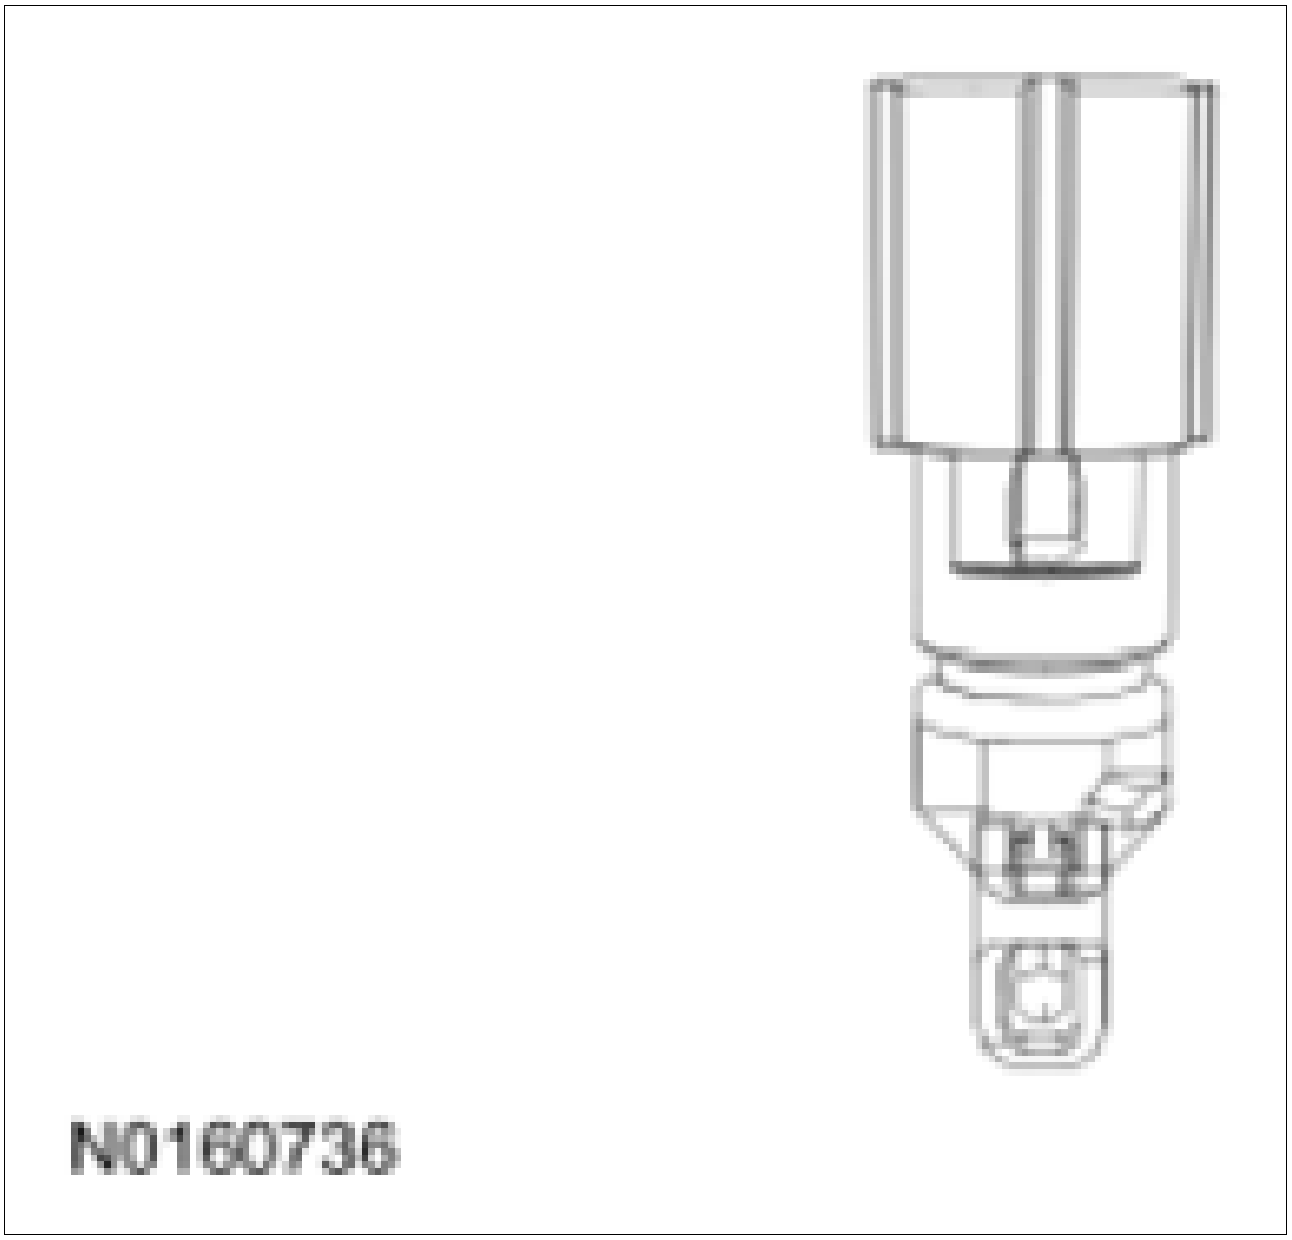
Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > INTAKE AIR TEMPERATURE (IAT) SENSOR

The IAT sensor is a thermistor device in which resistance changes with temperature. The resistance of a thermistor decreases as the temperature increases, and the resistance increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow. Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

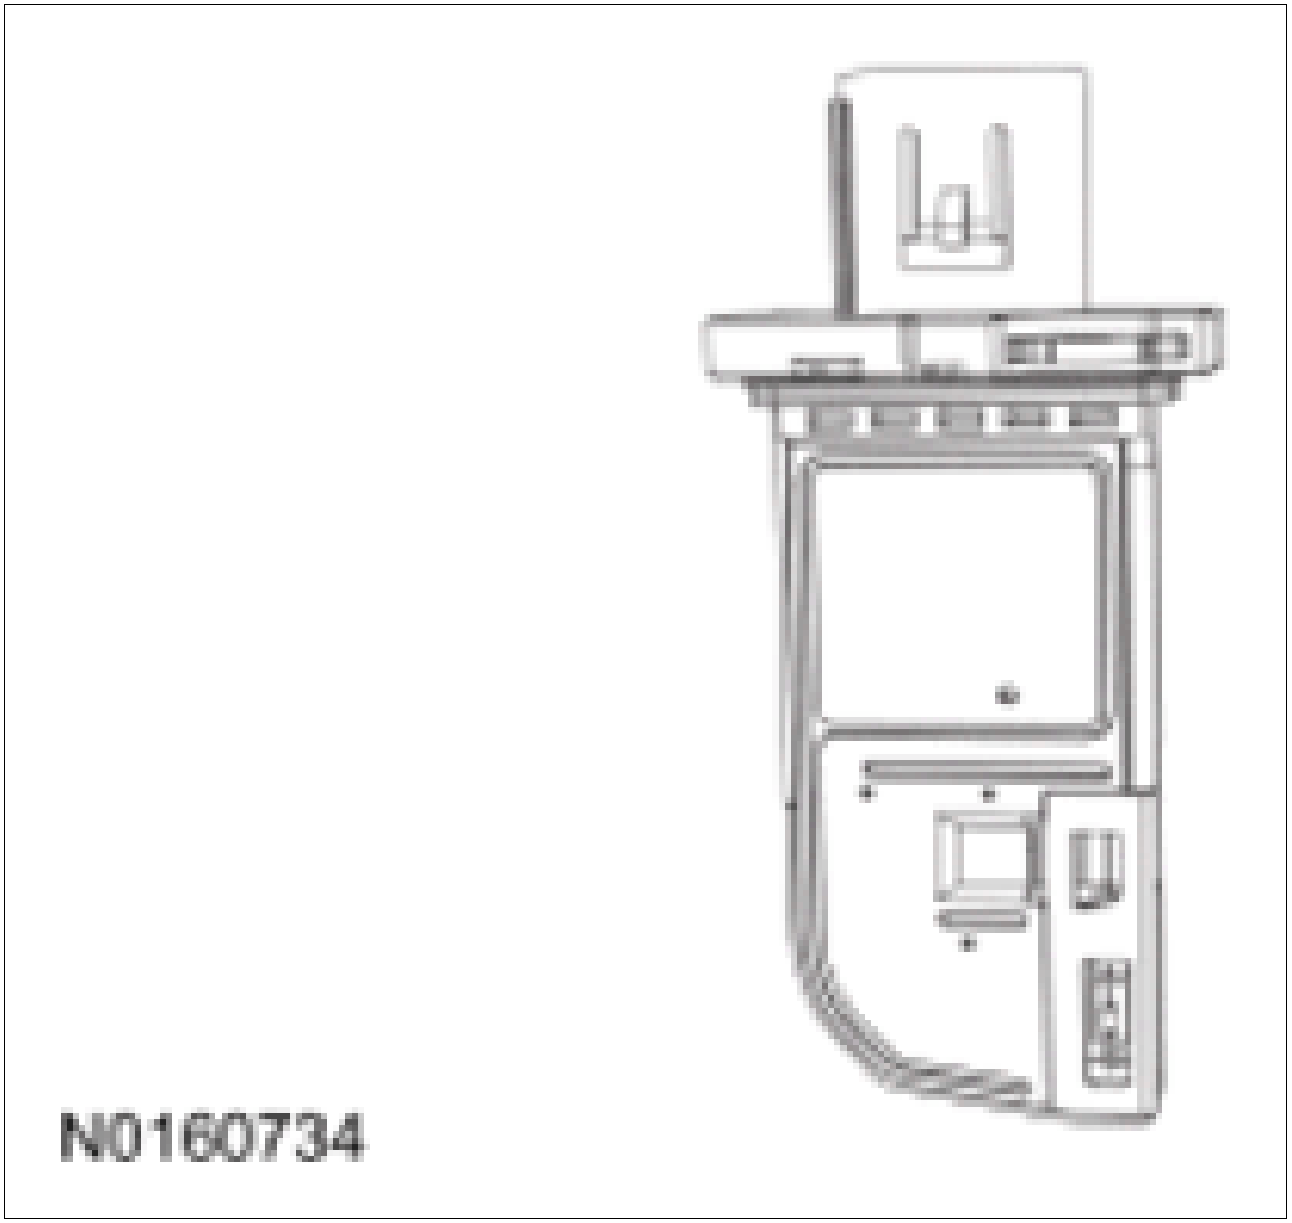
The IAT sensor provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of fuel, spark, and airflow.



The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

Currently there are 2 types of IAT sensors used, a stand alone and an integrated type. Both types function the same, however the integrated type is incorporated into the mass airflow (MAF) sensor or the turbocharger intake pressure and temperature (TCIPT) sensor instead of being a stand alone sensor.

The IAT2 sensor is centrally located on the intake manifold and is used to measure the intake manifold



temperature. The PCM uses this information to determine the air charge and provide input for various engine control functions. The IAT2 sensor is integrated with the manifold absolute pressure (MAP) sensor.

ENGINE CONTROL COMPONENTS > INTAKE MANIFOLD RUNNER CONTROL (IMRC)

WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

The IMRC is a vacuum actuated system with a PCM controlled electric solenoid and manifold mounted vacuum actuators for bank 1 and bank 2. The IMRC solenoid controls each vacuum actuator to activate a shutter device attached to the actuator shaft. There is an intake manifold runner control sensor mounted to each actuator shaft to provide the shutter position to the PCM.

The IMRC shutters are in the closed position below 3, 000 RPM to create air flow turbulence for better charge mixing in the cylinder. The IMRC shutters are in the open position above 3, 000 RPM to reduce air flow restriction.

Fig 1: Identifying Intake Manifold Runner Control (IMRC)

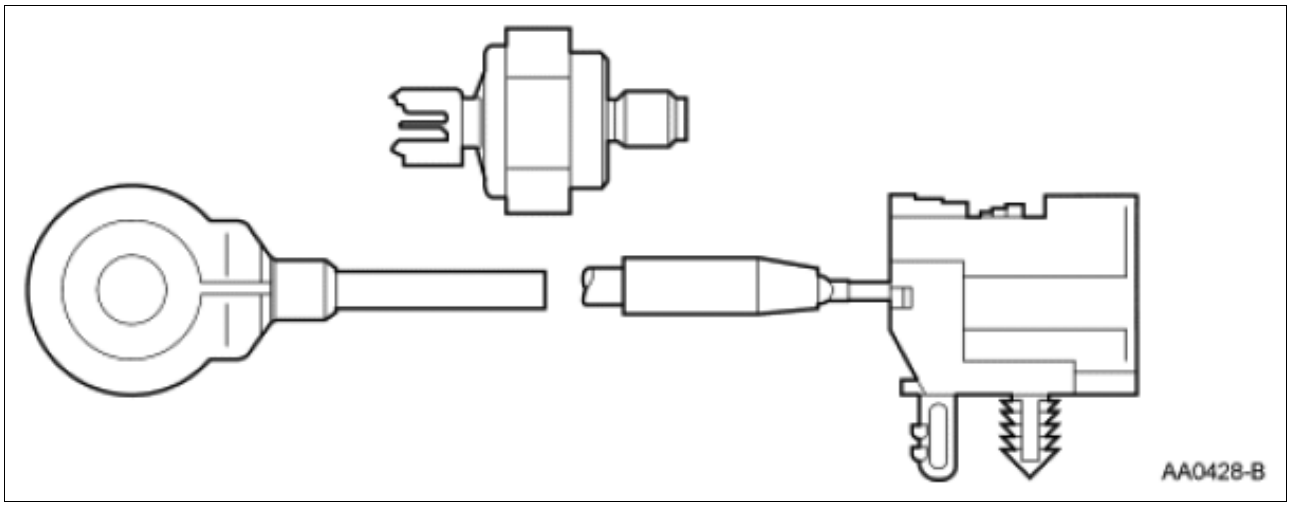
ENGINE CONTROL COMPONENTS > INTAKE MANIFOLD TUNING VALVE (IMTV)

WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS

SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.



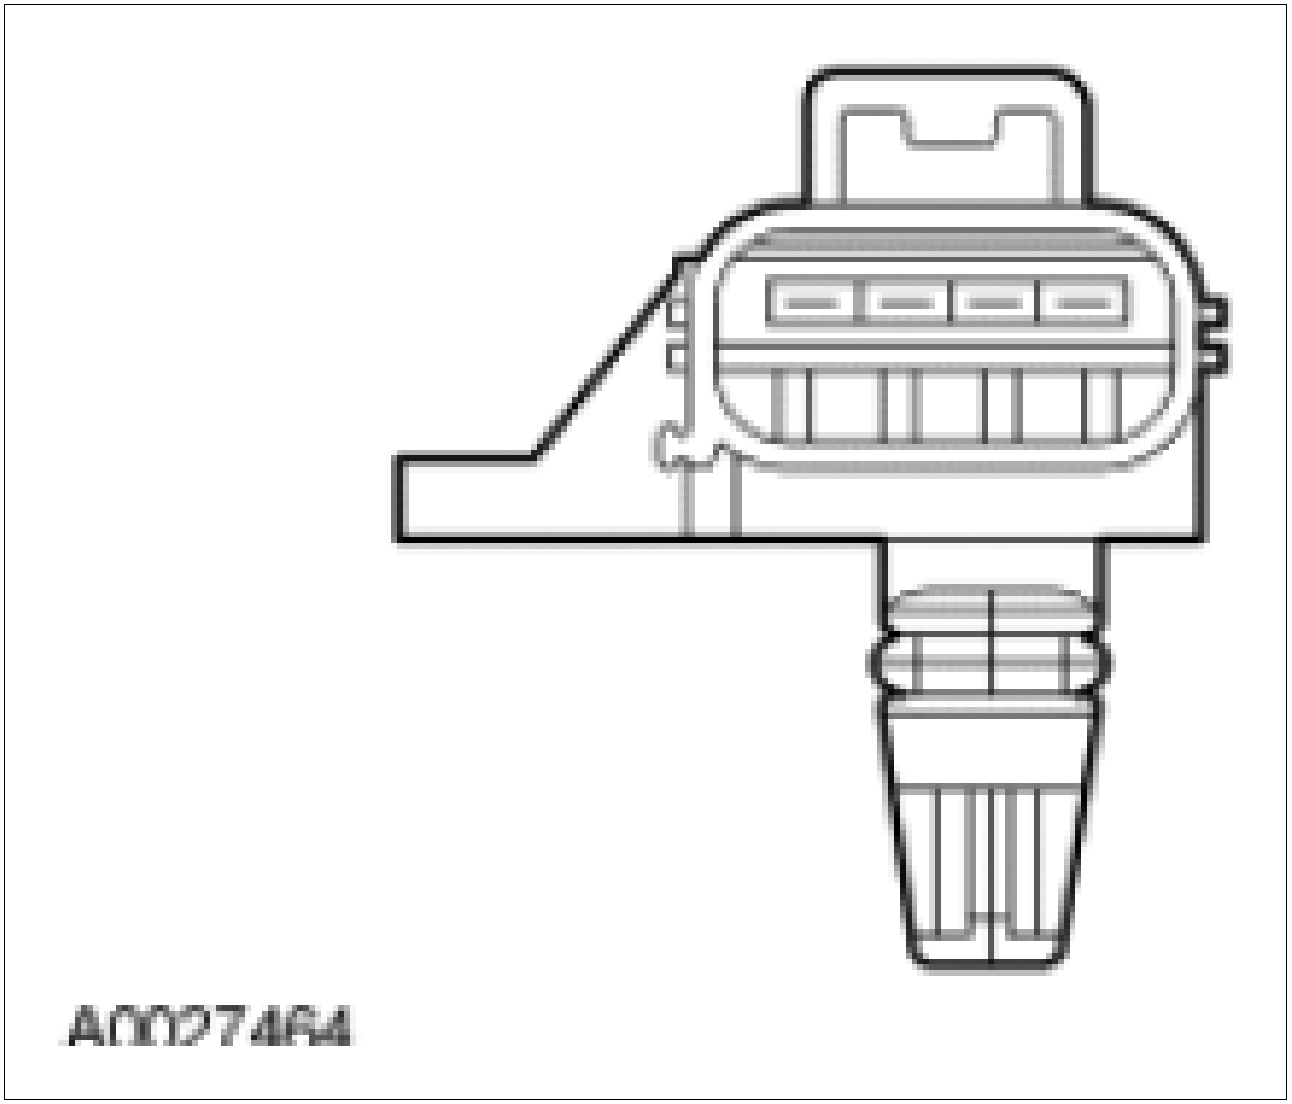
The IMTV is a motorized actuated unit mounted directly to the intake manifold. The IMTV actuator controls a shutter device attached to the actuator shaft. There is no monitor input to the PCM with this system to indicate shutter position.

The motorized IMTV unit is not energized below a calibrated RPM. The shutter is in the closed position to prevent airflow blend from occurring in the intake manifold. The motorized unit is energized above a calibrated RPM. The motorized unit is commanded ON by the PCM initially at a 100 percent duty cycle to move the shutter to the open position, and then falling to approximately 50 percent to continue to hold the shutter open.

ENGINE CONTROL COMPONENTS > KNOCK SENSOR (KS)

The KS is a tuned accelerometer on the engine which converts engine vibration to an electrical signal. The PCM uses this signal to determine the presence of engine knock and to retard spark timing.

Fig 1: Identifying Knock Sensor (KS)

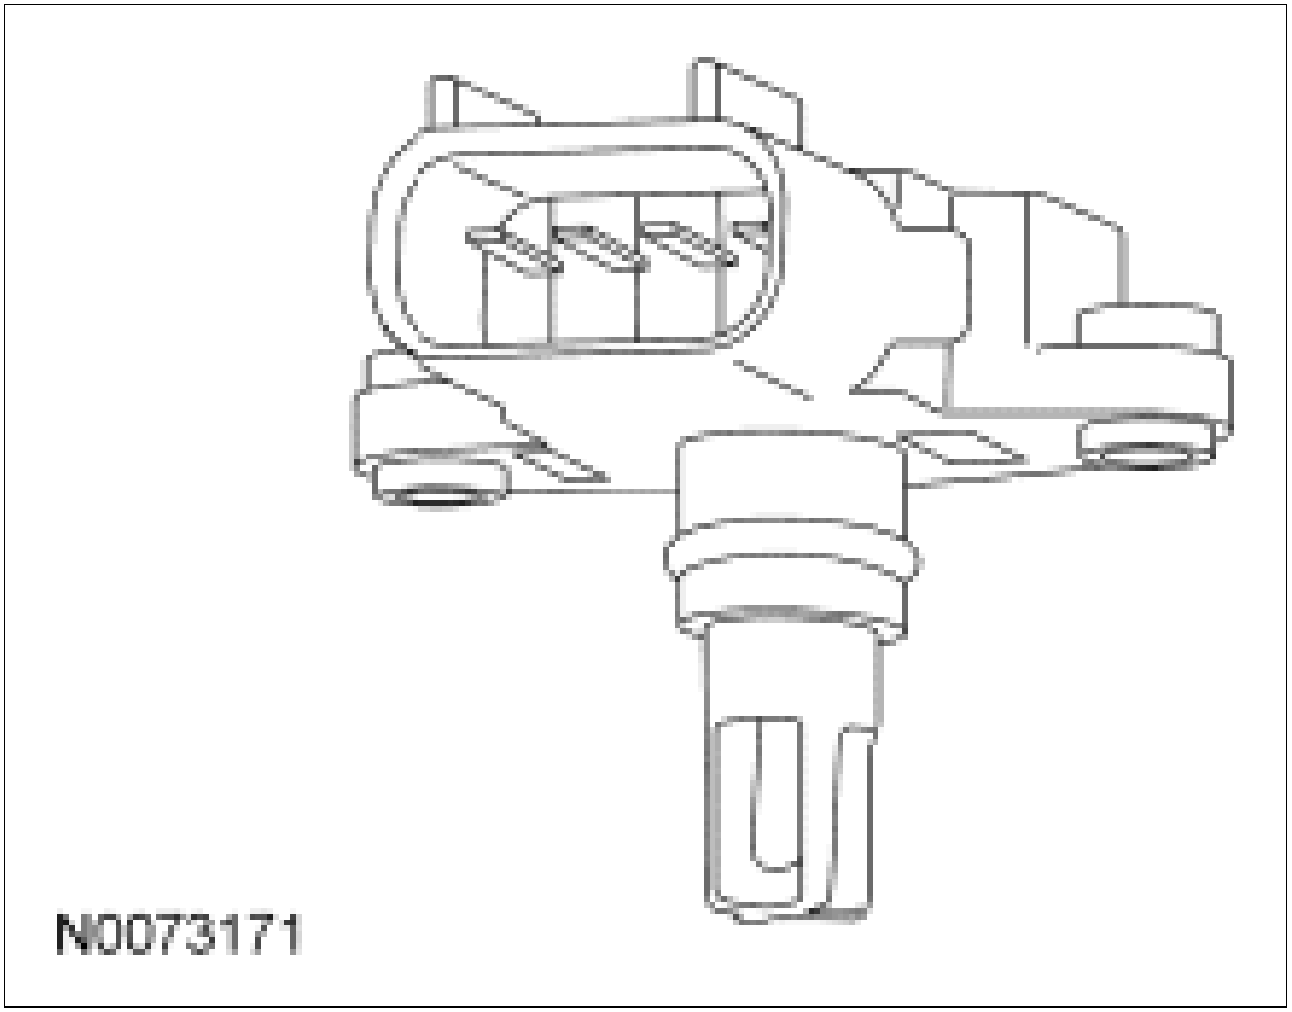


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

The MAP sensor is located on the intake manifold and measures the intake manifold pressure. The PCM uses this information to determine the air charge and to provide the input for various engine control functions. The MAP sensor may be integrated with an intake air temperature (IAT) sensor.

Fig 1: Identifying MAP Sensor

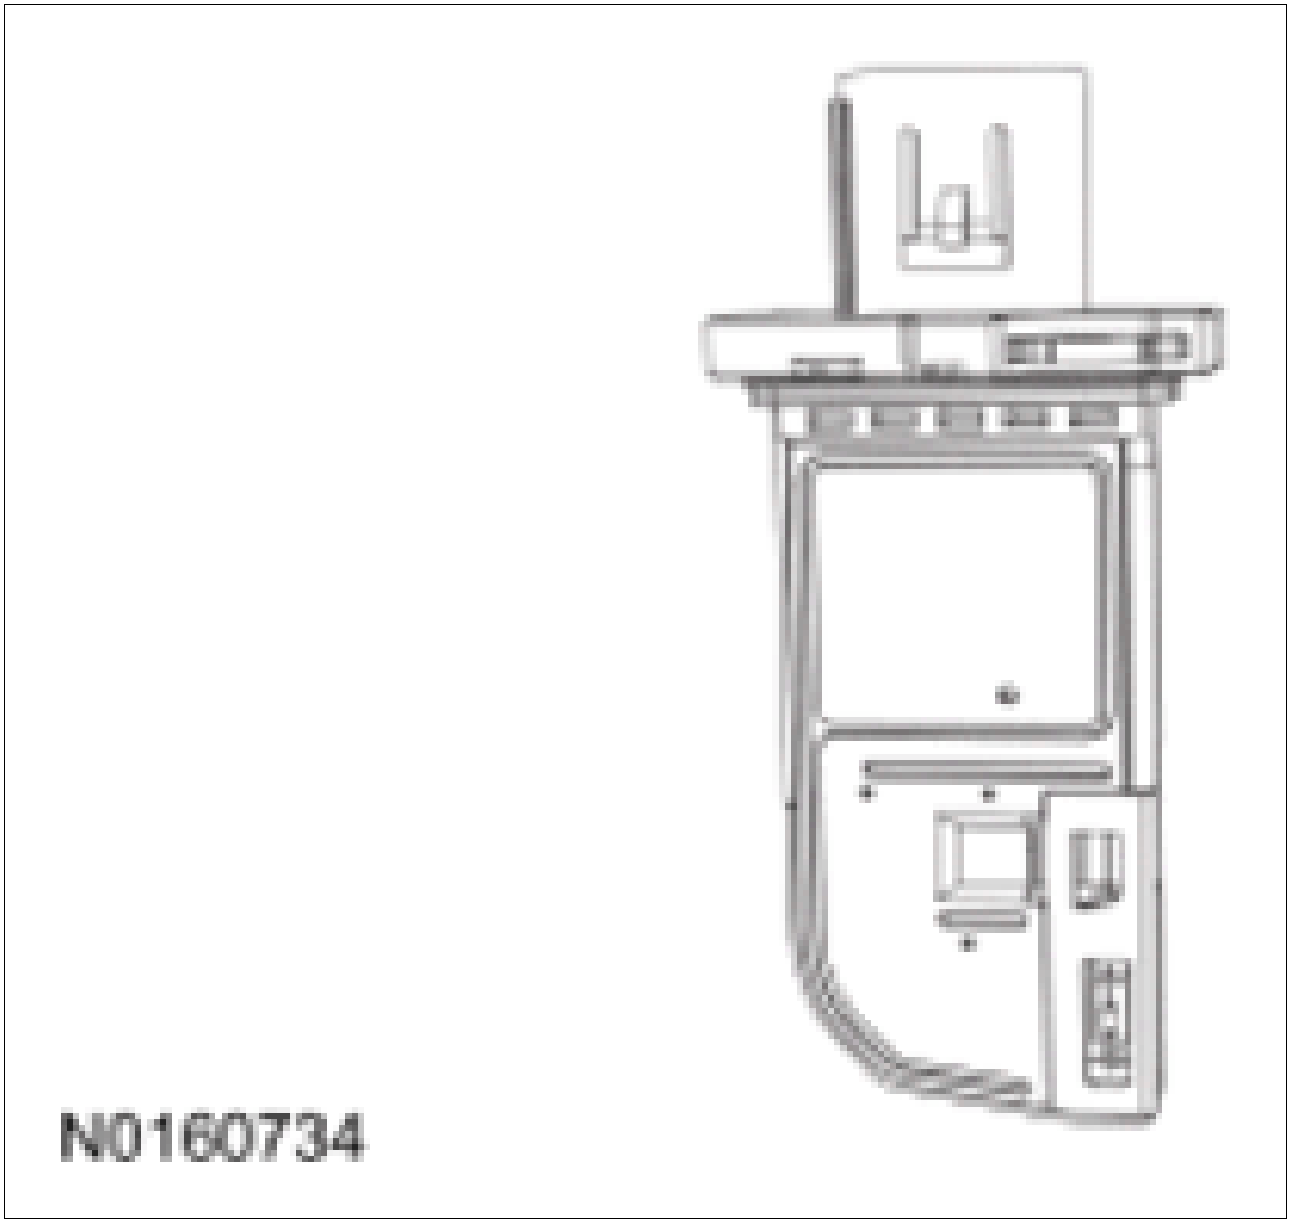


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > MANIFOLD ABSOLUTE PRESSURE TEMPERATURE (MAPT) SENSOR

The MAPT sensor is located on the intake manifold and may be integrated with an intake air temperature (IAT) sensor or a charge air cooler temperature (CACT) sensor.

Fig 1: Identifying MAPT Sensor



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > MASS AIRFLOW (MAF) SENSOR

The MAF sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above the ambient temperature as measured by a constant cold wire. The current required to maintain the temperature of the hot wire is proportional to the mass airflow. The MAF sensor then outputs a signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air to fuel ratio. This input is also used in determining transmission electronic pressure control (EPC), shift, and torque converter clutch (TCC) scheduling.

The MAF sensor is located near the air cleaner assembly. Most MAF sensors have an integrated IAT sensor.

Fig 1: Identifying MAF Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > OUTPUT SHAFT SPEED (OSS) SENSOR

The OSS sensor provides the PCM with the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information that is generated.

ENGINE CONTROL COMPONENTS > POWER TAKE OFF (PTO) SWITCH AND CIRCUITS

The PTO circuit is used by the PCM to disable some of the OBD monitors during PTO operation. The PTO switch is normally open. When the PTO unit is activated, the PTO switch is closed and battery voltage is supplied to the PTO input circuit. This indicates to the PCM that an additional load is being applied to the engine. The PTO indicator lamp illuminates when the PTO system is functioning correctly and flashes when the PTO system is damaged.

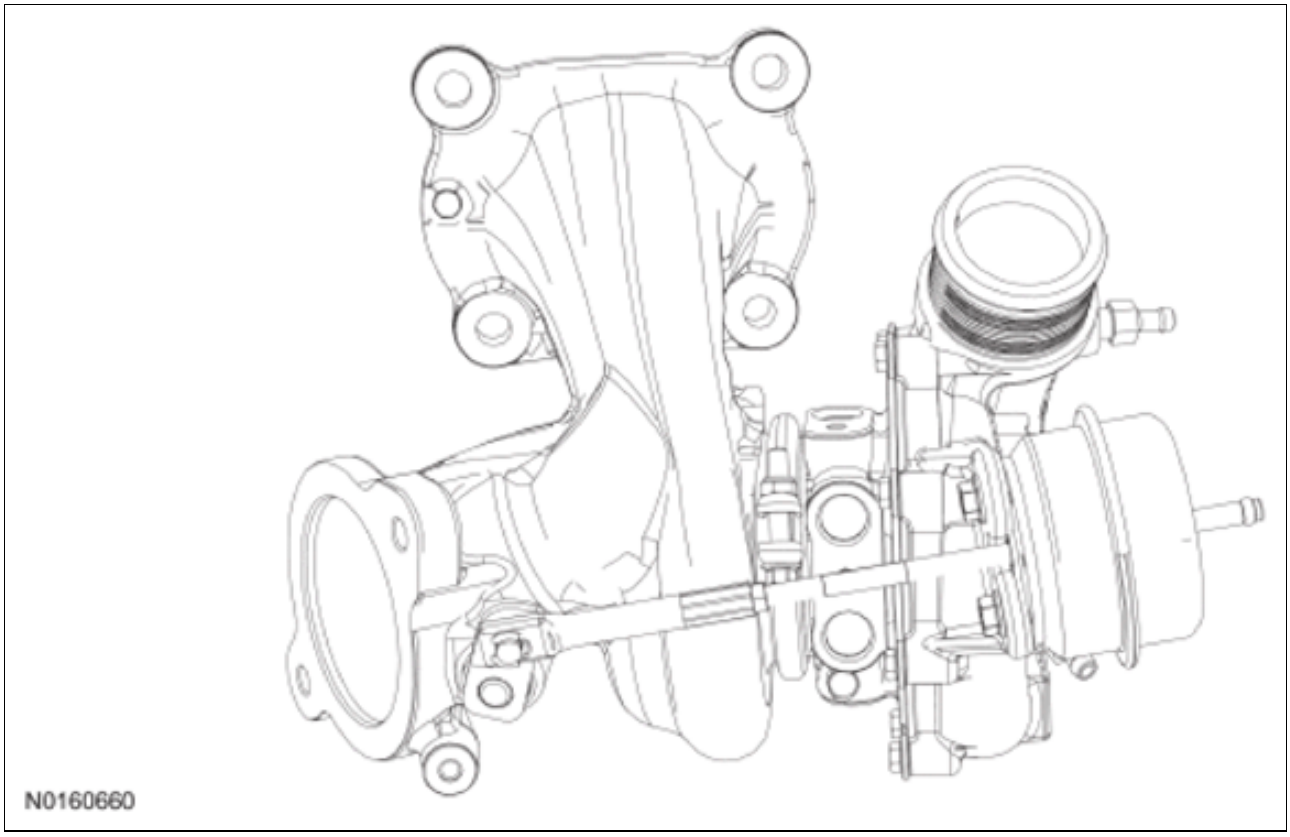
When the PTO unit is activated, the PCM disables some OBD monitors which may not function reliably during PTO operation. Without the PTO circuit information to the PCM, false DTCs may be set during PTO operation. Prior to an inspection/maintenance (I/M) test, operate the vehicle with the PTO disengaged long enough to successfully complete the OBD monitors.

ENGINE CONTROL COMPONENTS > POWER TAKE OFF (PTO) SWITCH AND CIRCUITS > PTO CIRCUITS DESCRIPTION

The 3 PTO input circuits are PTO mode, PTO engage, and PTO RPM.

The PTO engage circuit is used when the operator is requesting the PCM to check the needed inputs required to initiate the PTO engagement.

The PTO RPM circuit is used when the operator is requesting additional engine RPM for PTO operation.



ENGINE CONTROL COMPONENTS > TURBOCHARGER

The turbocharger assembly is an exhaust driven centrifugal compressor. Expanding exhaust gases drive the turbine shaft assembly to speeds over 100, 000 RPM. The turbocharger increases the power output of an engine by increasing the mass of air entering the engine.

Two types of turbocharger are currently being used.

The first type of turbocharger has an integrated wastegate and a remote bypass valve.

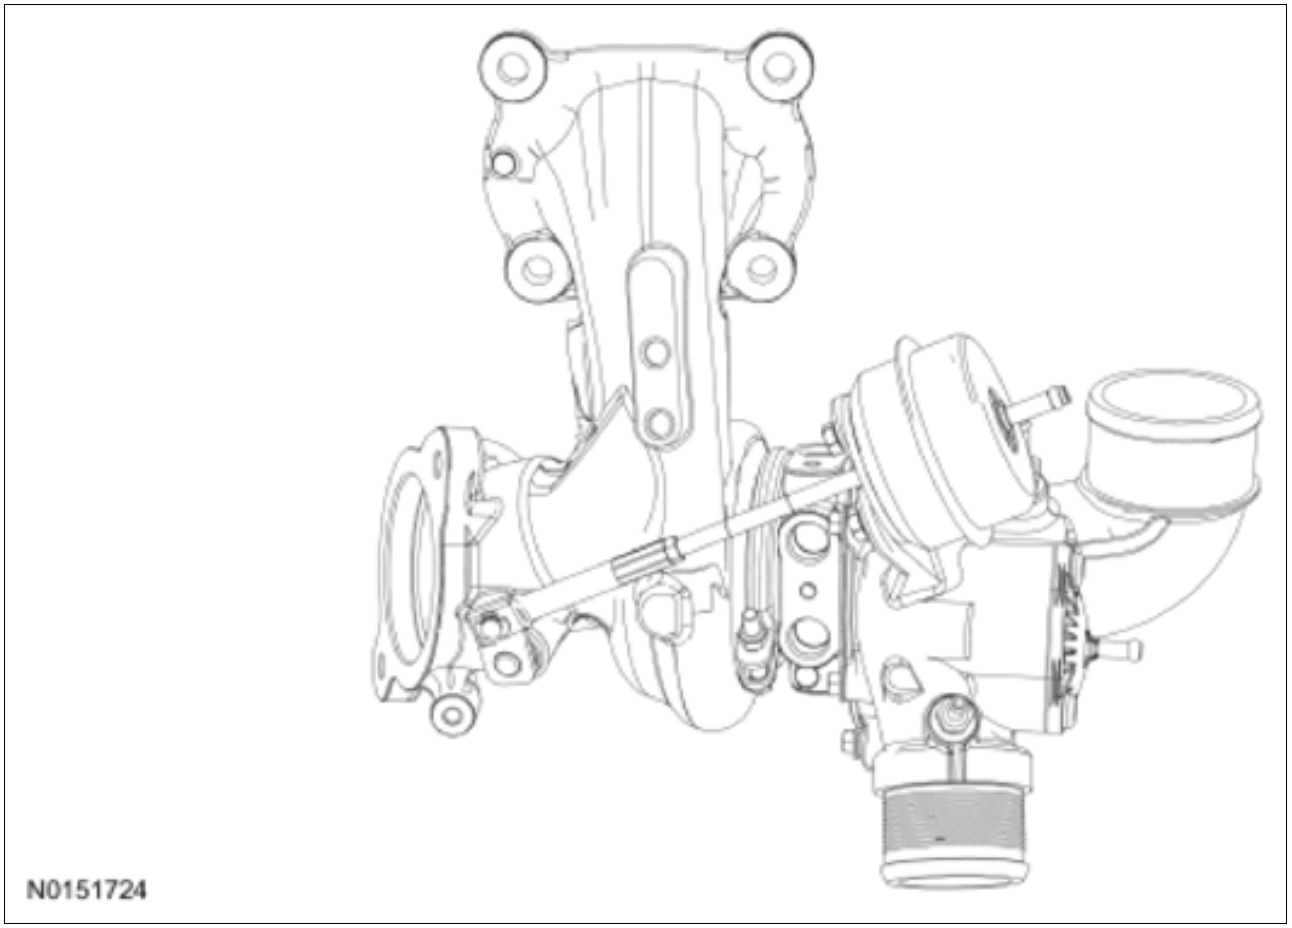


Fig 1: Identifying Turbocharger With Integrated Wastegate And Remote Bypass Valve

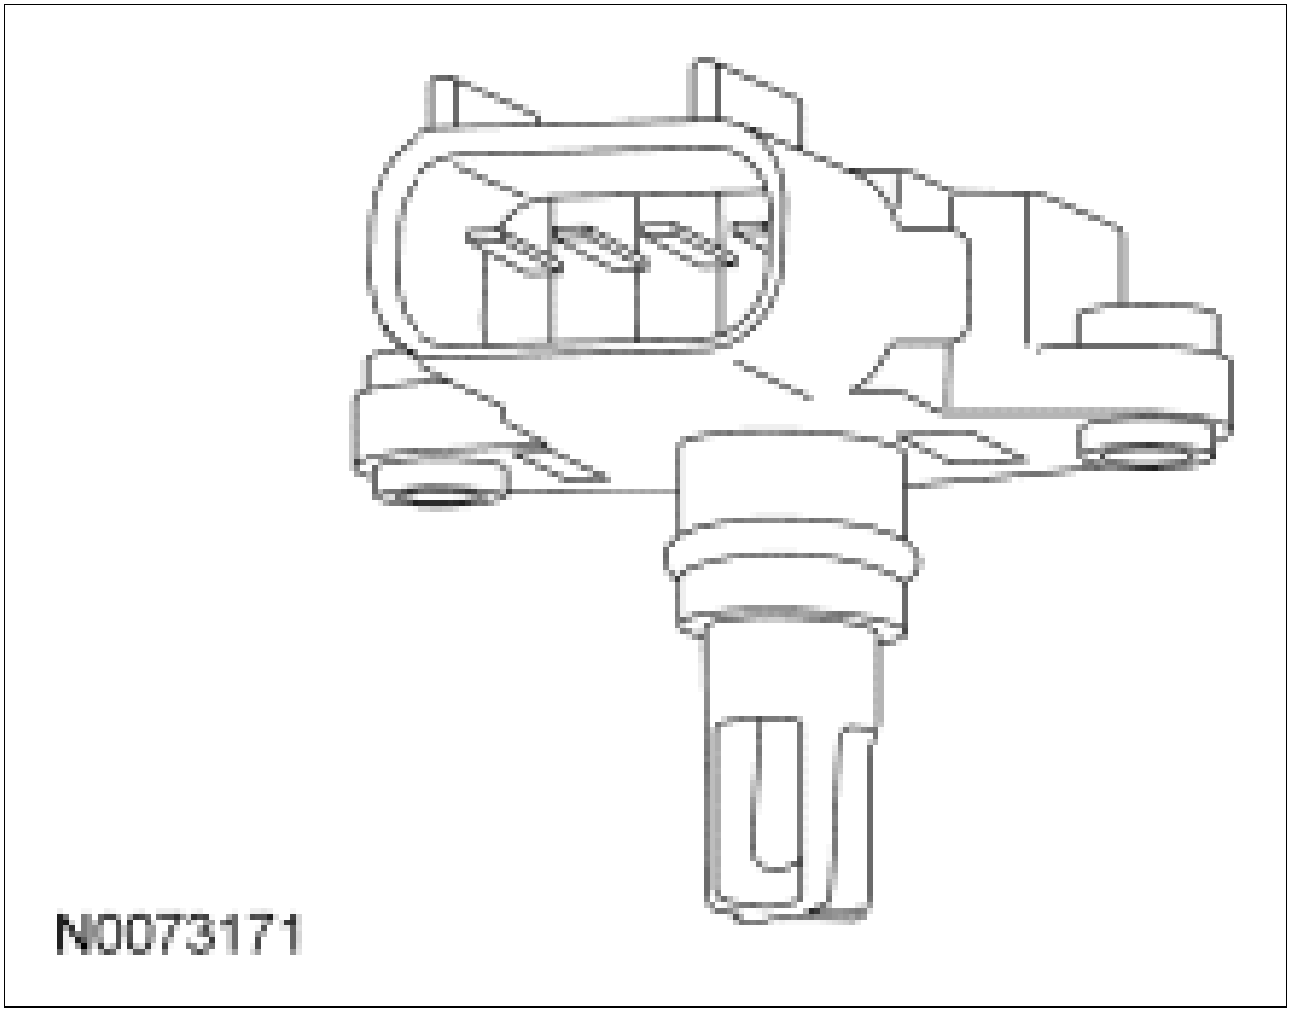
Courtesy of FORD MOTOR CO.

The second type of turbocharger has an integrated wastegate and an integrated bypass valve in the turbocharger housing.

Fig 2: Identifying Turbocharger With Integrated Wastegate And Integrated Bypass Valve



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > TURBOCHARGER BOOST PRESSURE (TCBP) SENSOR

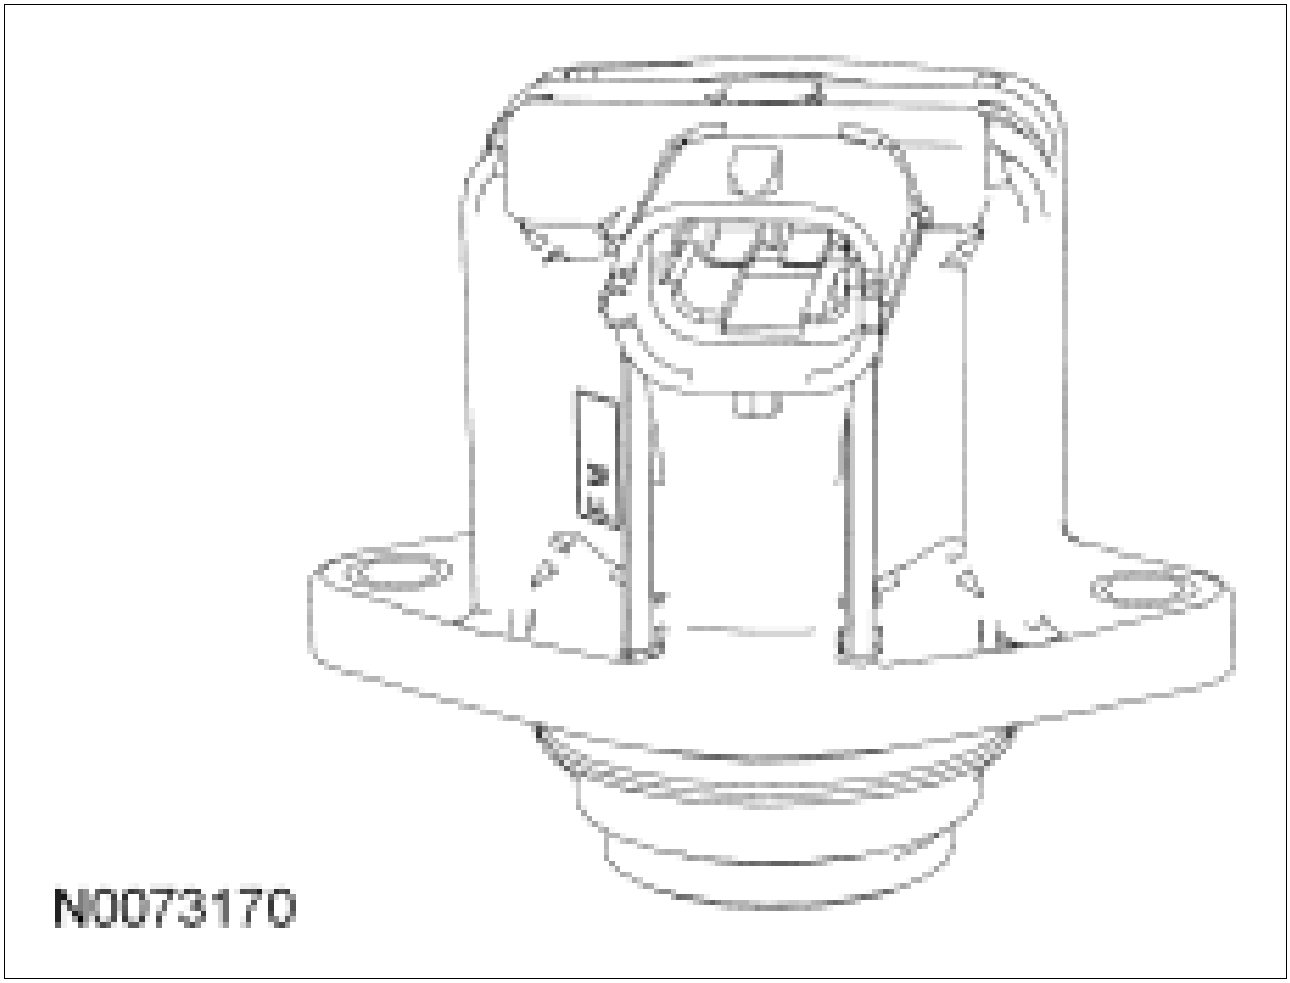
The TCBP sensor is located in the intake air tube between the turbocharger and the charge air cooler (CAC). The TCBP sensor measures the throttle inlet pressure. The PCM uses the information from the TCBP sensor to refine the estimate of the airflow rate through the throttle and to determine the desired boost pressure. The TCBP sensor may be integrated with a charge air cooler temperature (CACT) sensor.

Fig 1: Identifying TCBP Sensor Integrated With CACT Sensor

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > TURBOCHARGER BYPASS VALVE

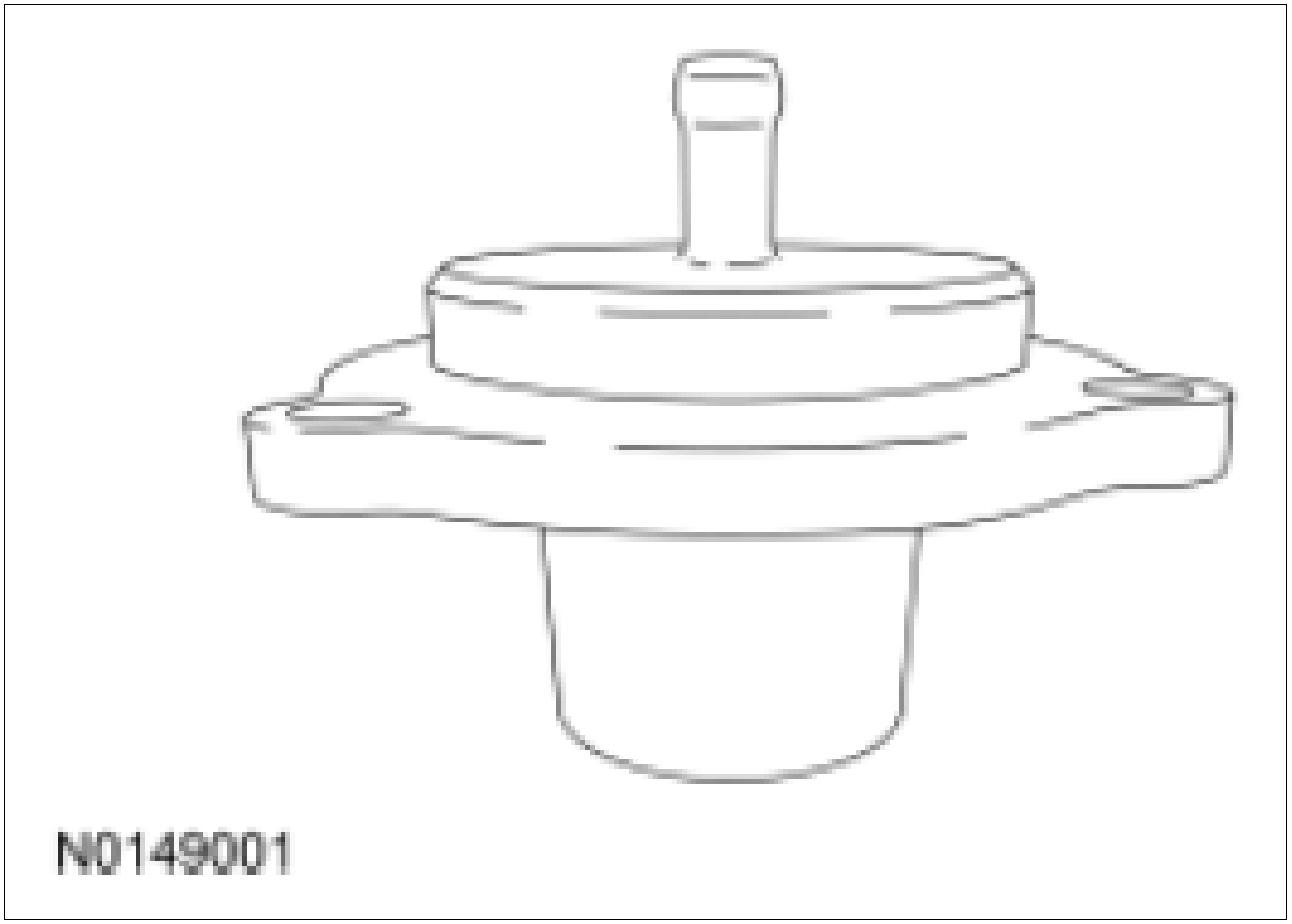
The turbocharger bypass valve prevents back flow through the turbocharger when the throttle is rapidly closed to avoid undesirable noise. The high pressure downstream of the turbocharger is vented back to the intake air upstream when the turbocharger bypass valve is open reducing pressure in the system.



There are three types of turbocharger bypass valves currently in use.

The first type of turbocharger bypass valve is solenoid controlled and located between the turbocharger intake and the turbocharger boost pressure output to the charge air cooler (CAC).

The second type of turbocharger bypass valve is solenoid controlled and is integrated in the turbocharger housing. The operation of the turbocharger bypass valves that are solenoid controlled is similar.

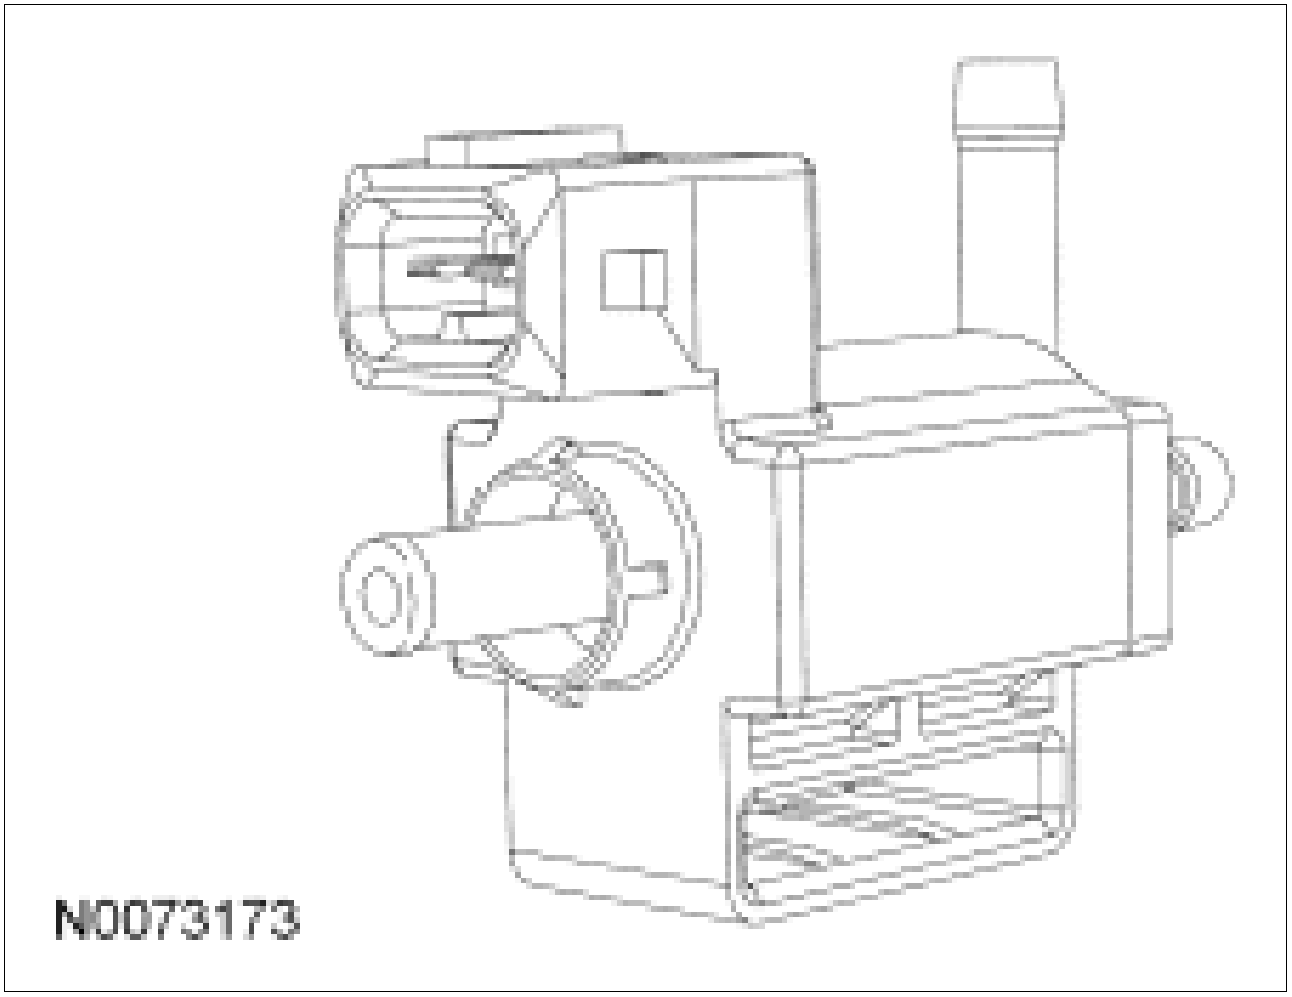


The third type of turbocharger bypass valve is an electropneumatically controlled system, integrated in the turbocharger housing, that consists of a pneumatically controlled turbocharger bypass, a vacuum source from the vacuum pump, a control solenoid for vacuum and pressure, and the tubing.

Fig 1: Identifying Turbocharger Bypass Valve (Integrated Solenoid)

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Turbocharger Bypass Valve (Pneumatic Control)

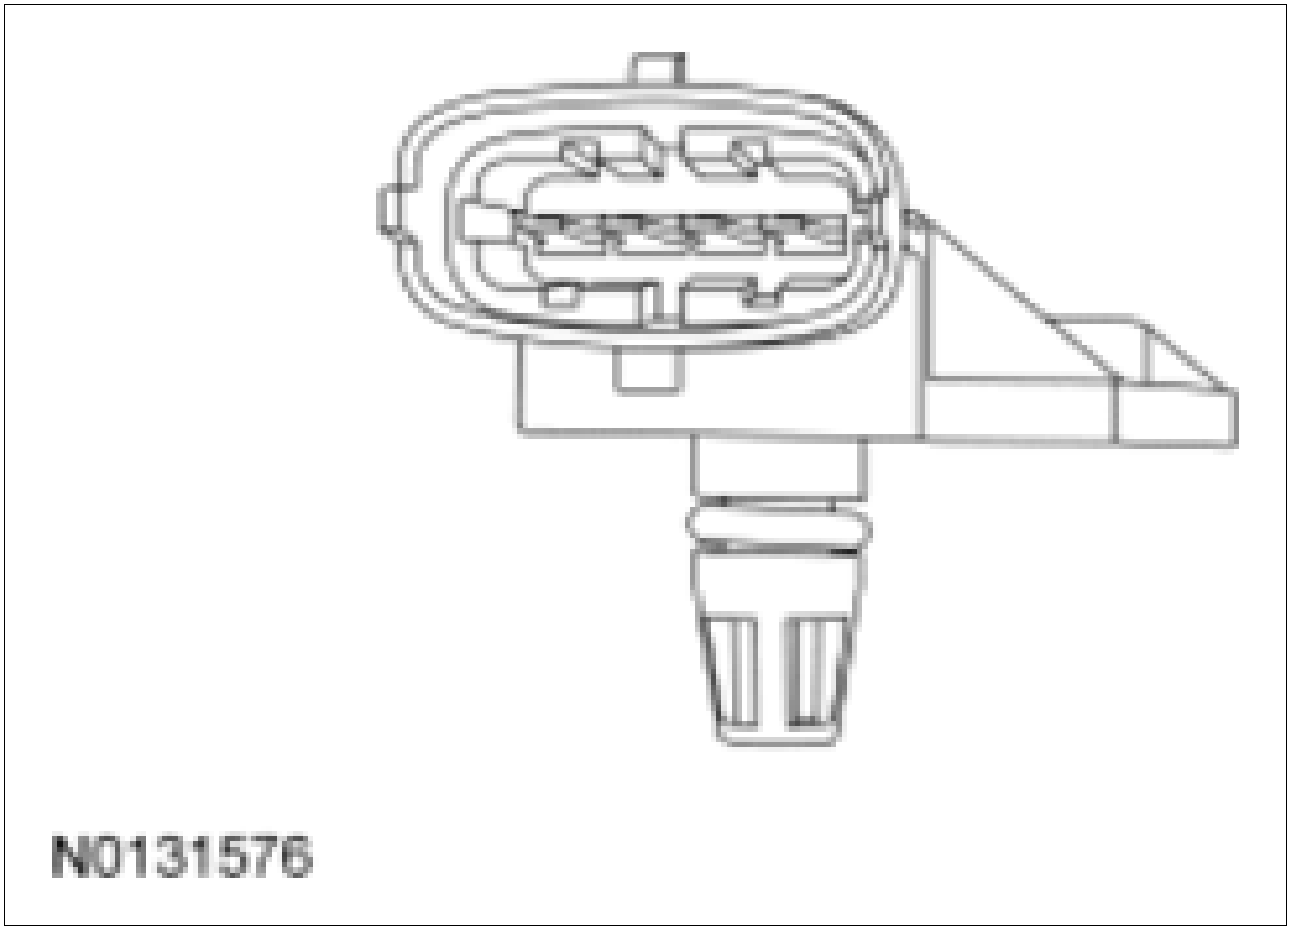


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > TURBOCHARGER BYPASS VALVE SOLENOID

The turbocharger bypass valve solenoid is pulse width modulated (PWM) by the PCM to control the pneumatically actuated turbocharger bypass valve. The turbocharger bypass valve solenoid supplies or vents vacuum to the pneumatically controlled turbocharger bypass valve to open or close the turbocharger bypass valve.

Fig 1: Identifying Turbocharger Bypass Valve Solenoid (Remote Solenoid)



Courtesy of FORD MOTOR CO.

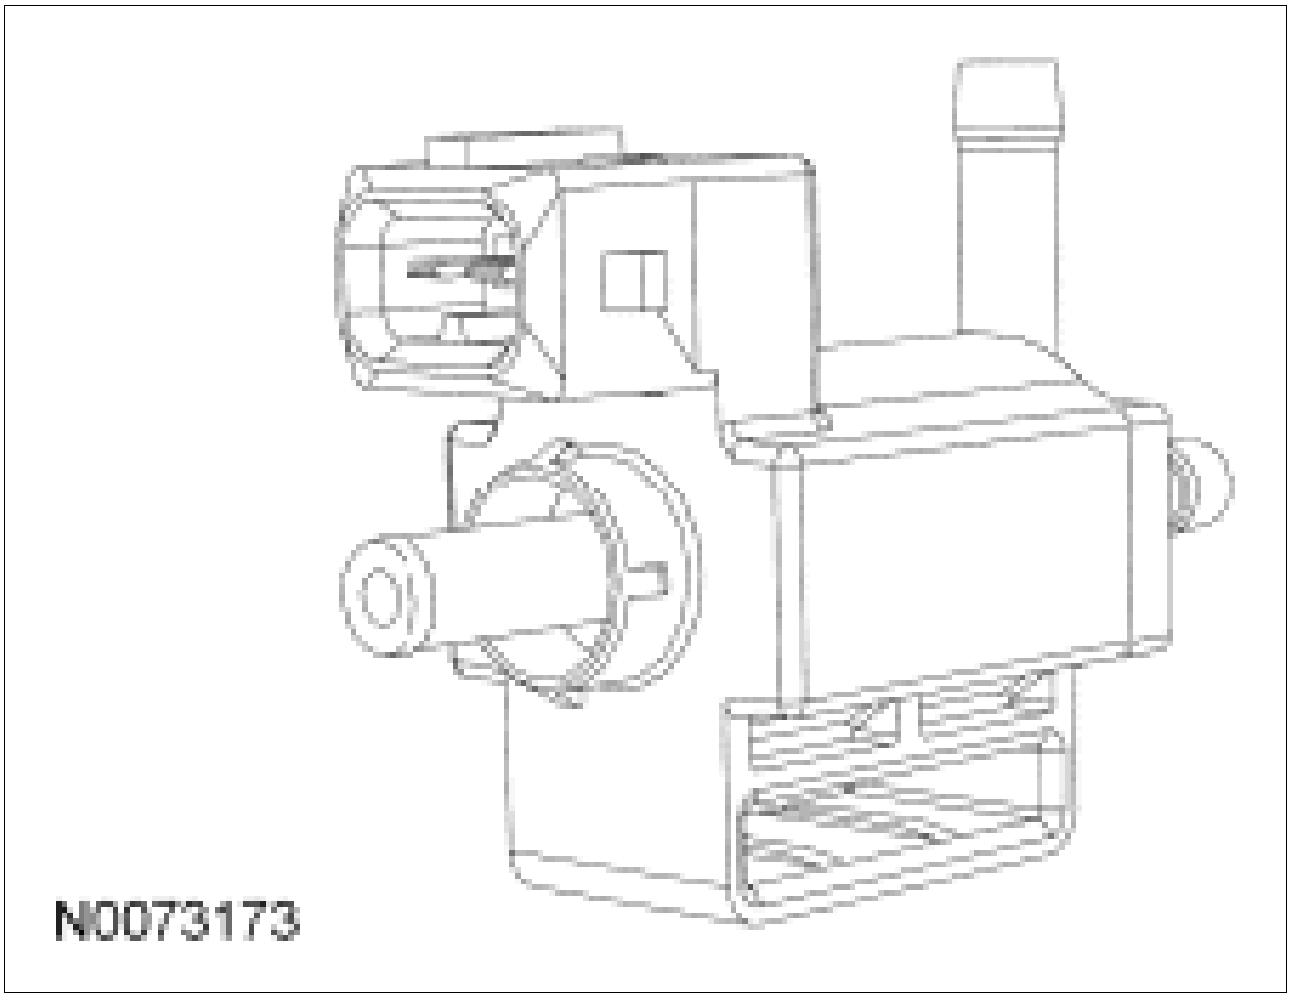
ENGINE CONTROL COMPONENTS > TURBOCHARGER INTAKE PRESSURE AND TEMPERATURE (TCIPT) SENSOR

The TCIPT sensor is located in the intake air tube between the air filter assembly and the turbocharger. The TCIPT sensor measures the turbocharger intake pressure and temperature. The PCM uses the information from the TCIPT sensor to determine if the airflow to the turbocharger is being restricted by a clogged air filter or other debris. An IAT sensor is integrated with the TCIPT sensor.

Fig 1: Identifying TCIPT Sensor

Courtesy of FORD MOTOR CO.

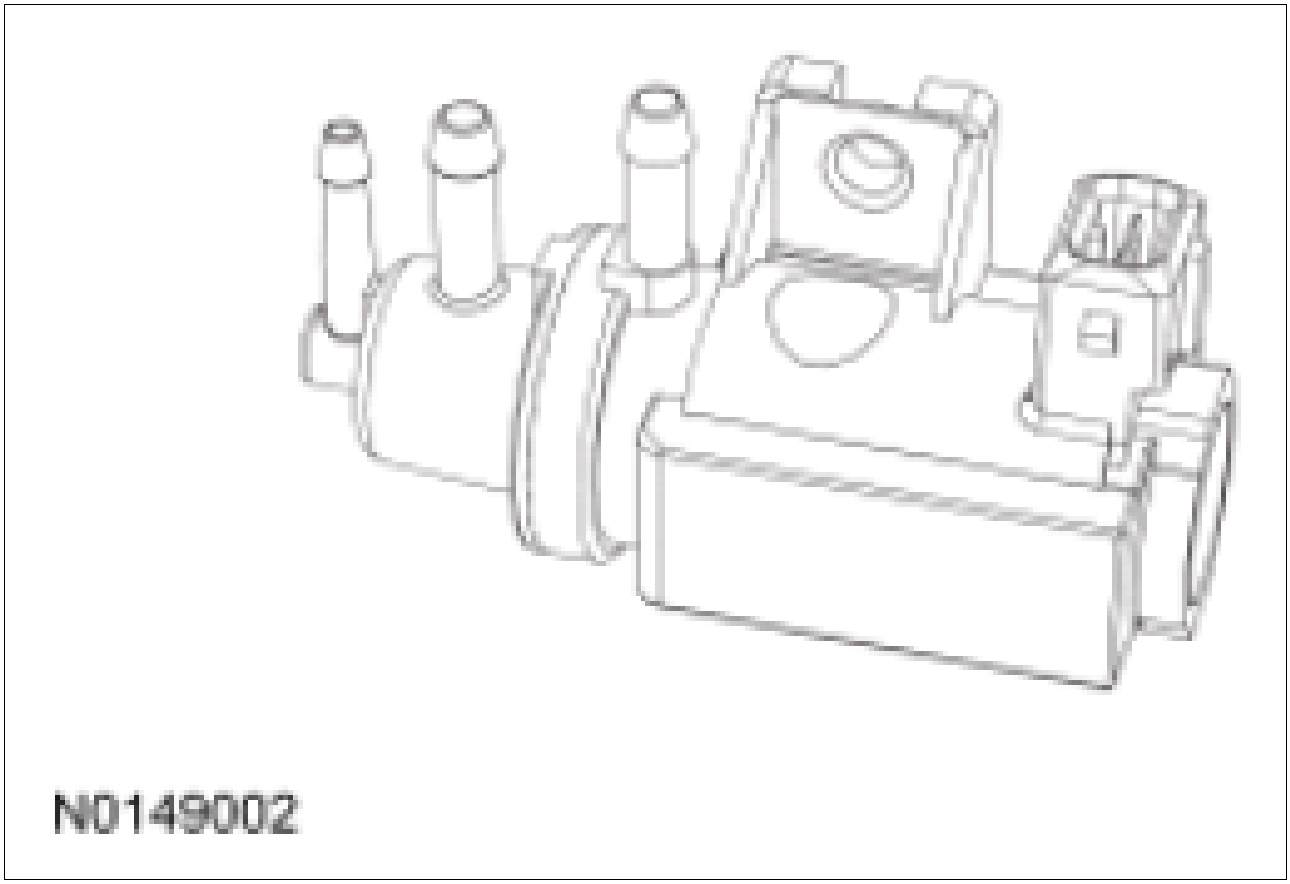
ENGINE CONTROL COMPONENTS > TURBOCHARGER WASTEGATE REGULATING VALVE SOLENOID



The turbocharger wastegate regulating valve solenoid allows the PCM to control the turbocharger wastegate position. The turbocharger wastegate regulating valve solenoid controls the pressure or vacuum supplied to the pneumatically actuated wastegate diaphragm in order to control the boost pressure limit. When the compressor outlet pressure increases, a pneumatically powered actuator opens the turbocharger wastegate and limits the compressor outlet pressure. The turbocharger wastegate regulating valve solenoid supplies pressure or vacuum to the pneumatically actuated wastegate canister diaphragm, which regulates the boost pressure to the desired value.

For the pressure actuated turbocharger wastegate, the turbocharger wastegate regulating valve solenoid controls the pressure applied to the turbocharger wastegate actuator. The amount of pressure vented from the pneumatic turbocharger wastegate actuator allows the PCM to control boost pressure. To generate maximum boost pressure, the PCM controls the turbocharger wastegate regulating valve solenoid to completely vent the pressure being applied to the turbocharger wastegate actuator. If a concern is present, the spring pressure in the pneumatic turbocharger wastegate actuator defaults the turbocharger wastegate to a fully closed position.

For the vacuum actuated turbocharger wastegate, the turbocharger wastegate regulating valve solenoid



controls vacuum applied to the turbocharger wastegate actuator. The amount of vacuum applied to the turbocharger wastegate actuator allows the PCM to control the boost pressure. To generate maximum boost pressure, the PCM controls the turbocharger wastegate regulating valve solenoid to apply full vacuum to the turbocharger wastegate actuator. If a concern is present, the spring pressure in the pneumatic turbocharger wastegate actuator defaults the turbocharger wastegate to a fully open position.

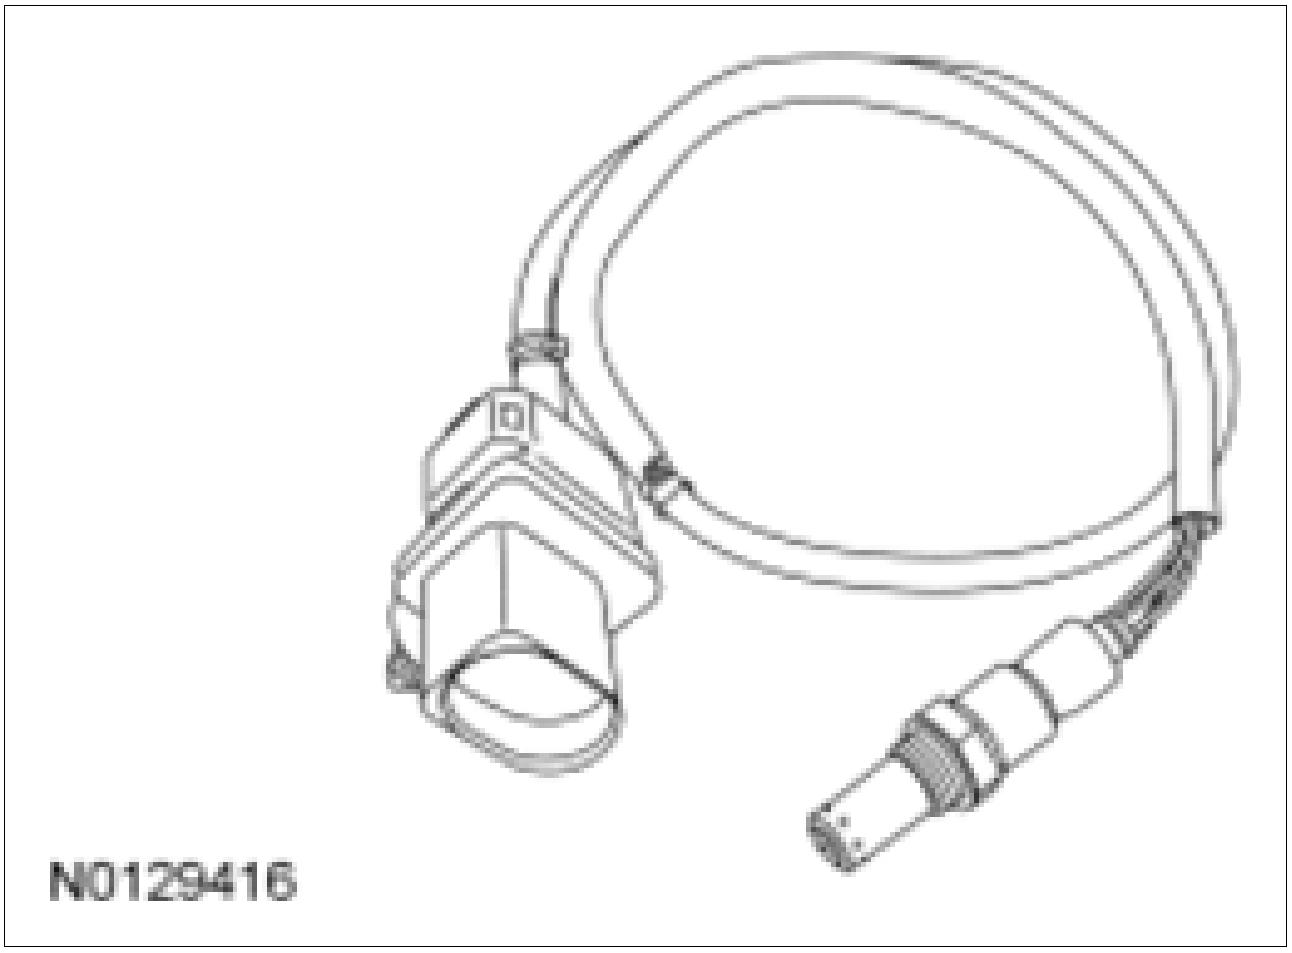
Fig 1: Identifying Turbocharger Wastegate Regulating Valve Solenoid (Pressure Actuated Wastegate)

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Turbocharger Wastegate Regulating Valve Solenoid (Vacuum Actuated Wastegate)

Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > UNIVERSAL HEATED OXYGEN SENSOR (HO2S)



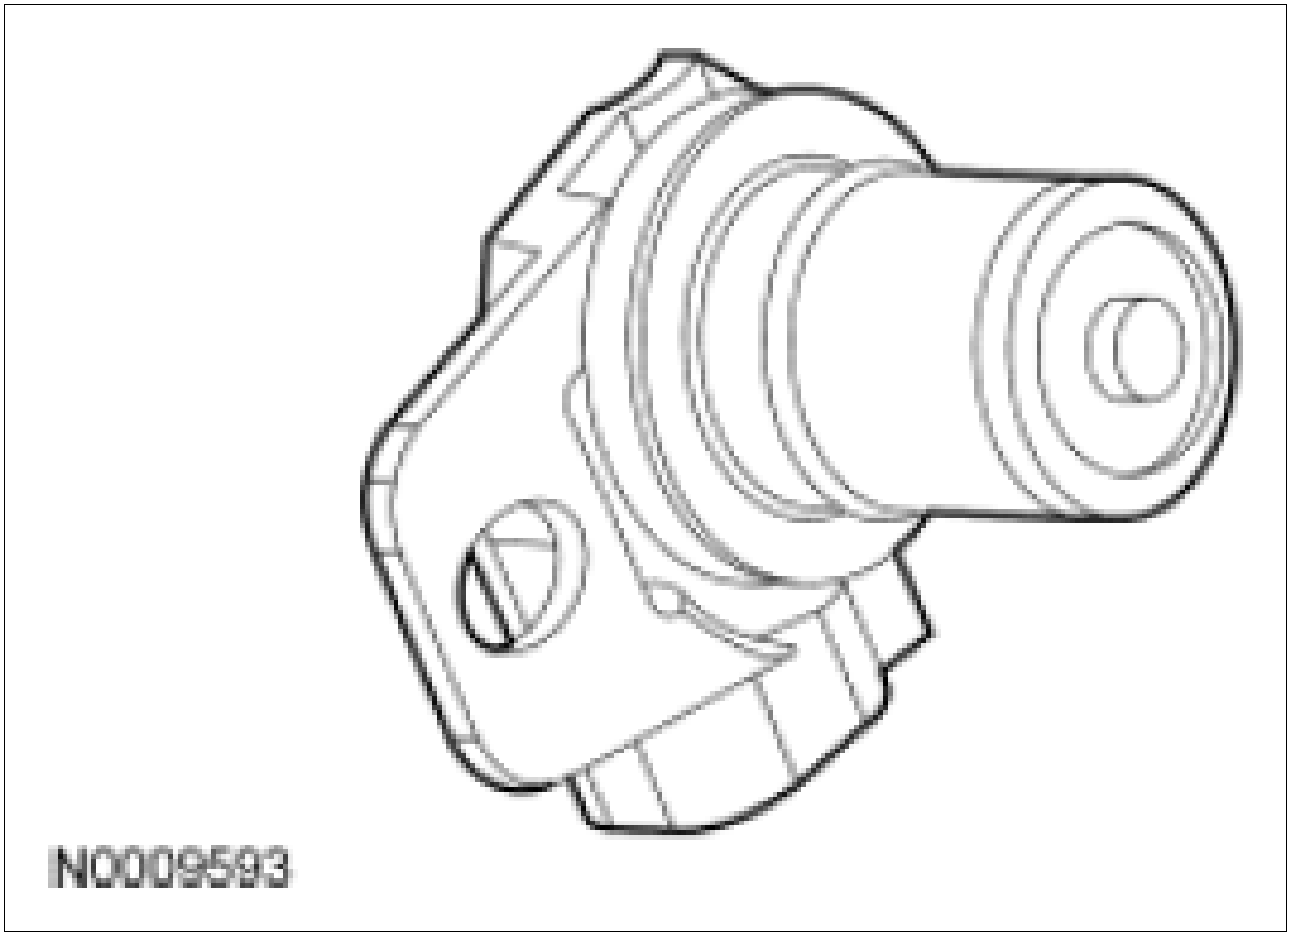
The universal HO2S, sometimes referred to as a wideband oxygen sensor, uses the typical HO2S combined with a current controller in the PCM to infer an air to fuel ratio relative to the stoichiometric air to fuel ratio. This is accomplished by balancing the amount of oxygen ions pumped in or out of a measurement chamber within the sensor. The typical HO2S within the universal HO2S detects the oxygen content of the exhaust gas in the measurement chamber. The oxygen content inside the measurement chamber is maintained at the stoichiometric air to fuel ratio by pumping oxygen ions in and out of the measurement chamber. As the exhaust gasses get richer or leaner, the amount of oxygen that must be pumped in or out to maintain a stoichiometric air to fuel ratio in the measurement chamber varies in proportion to the air to fuel ratio. The amount of current required to pump the oxygen ions in or out of the measurement chamber is used to measure the air to fuel ratio. The measured air to fuel ratio is actually the output from the current controller in the PCM and not a signal that comes directly from the sensor.

The universal HO2S also uses a self contained reference chamber to make sure an oxygen differential is always present. The oxygen for the reference chamber is supplied by pumping small amounts of oxygen ions from the measurement chamber into the reference chamber. The universal HO2S does not need access to outside air.

Part to part variance is compensated for by placing a resistor in the connector. This resistor trims the current measured by the current controller in the PCM.

The universal HO2S heater is embedded with the sensing element allowing the engine to enter closed loop operation sooner. The heating element heats the sensor to a temperature of 780°C to 830°C (1, 436°F to 1, 526°F). The VPWR circuit supplies voltage to the heater. The PCM controls the heater ON and OFF by providing the ground to maintain the sensor at the correct temperature for maximum accuracy.

Fig 1: Identifying Universal HO2S

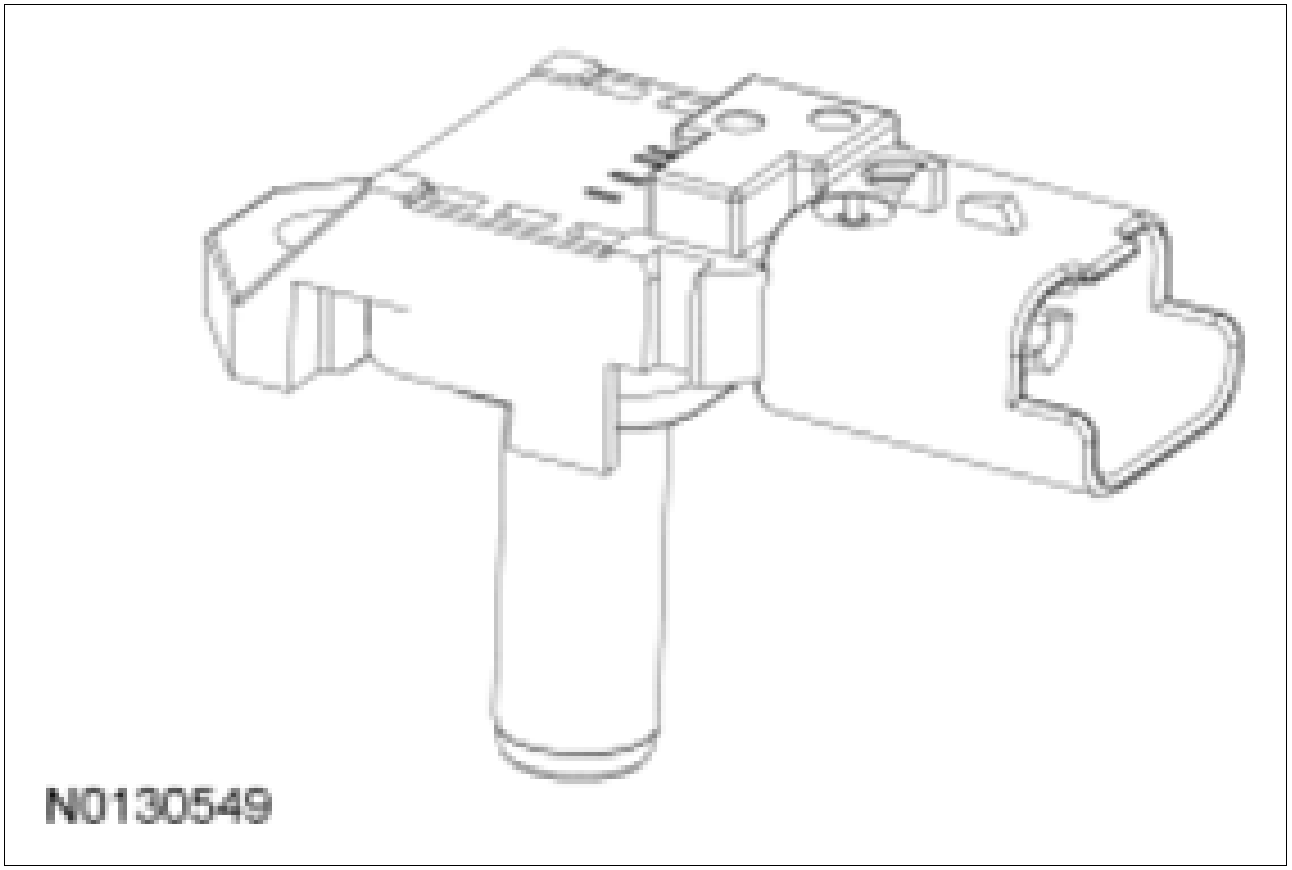


Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > VEHICLE SPEED SENSOR (VSS)

The VSS is a variable reluctance or Hall effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low speed, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission shift scheduling, and TCC scheduling.

Fig 1: Identifying Vehicle Speed Sensor (VSS)



Courtesy of FORD MOTOR CO.

ENGINE CONTROL COMPONENTS > WASTEGATE VACUUM SENSOR

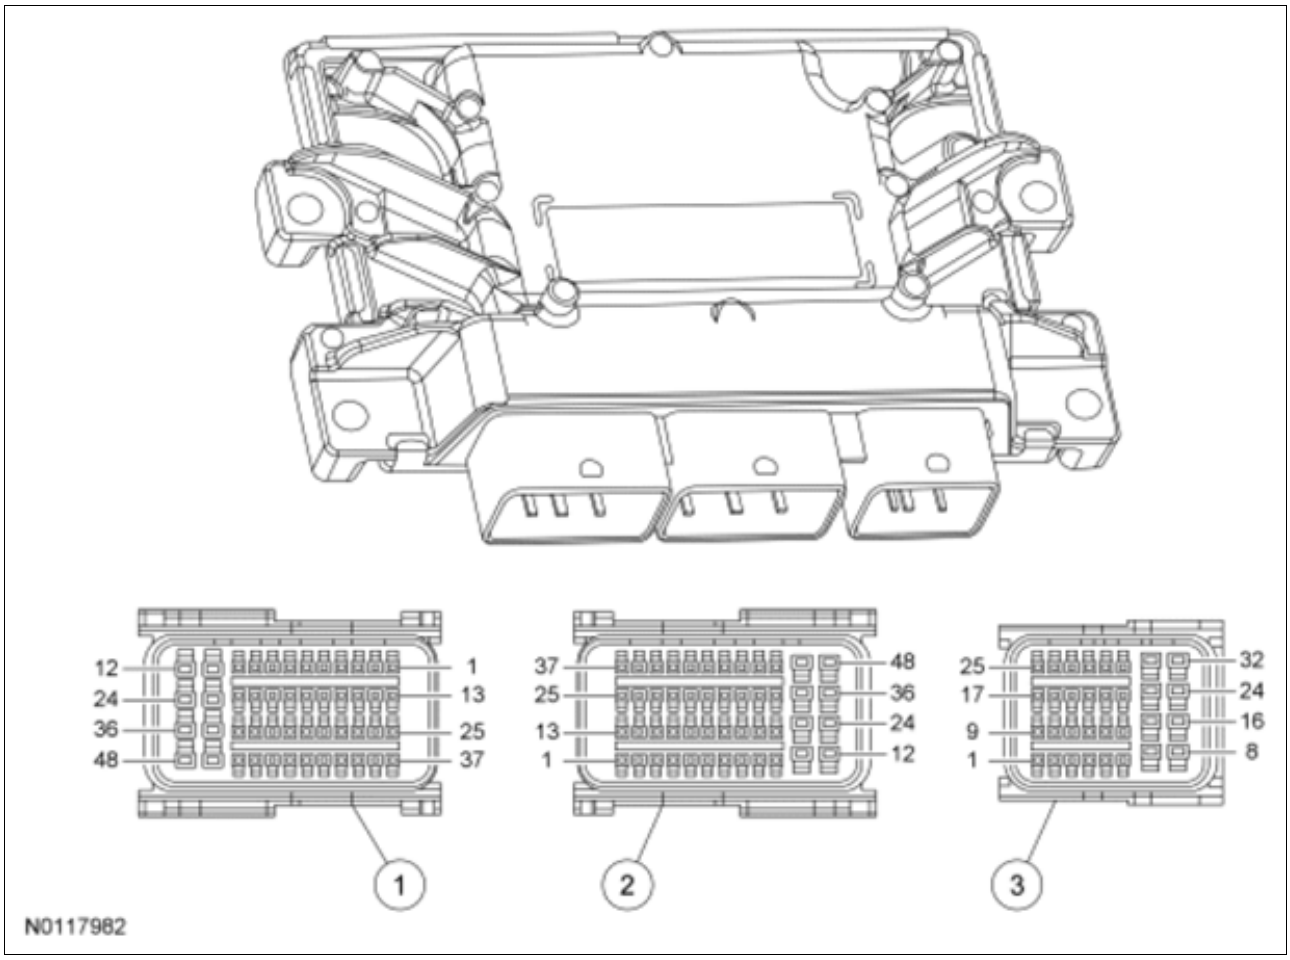
The wastegate vacuum sensor is an absolute pressure sensor that provides the PCM an analog voltage output that is proportional to the applied vacuum. The wastegate vacuum sensor is located near the turbocharger and the turbocharger wastegate regulating valve solenoid. The wastegate vacuum sensor measures the vacuum supplied by the turbocharger wastegate regulating valve solenoid to the wastegate actuator. The PCM uses the information from the wastegate vacuum sensor to determine the amount of vacuum being applied to the wastegate actuator.

Fig 1: Identifying Wastegate Vacuum Sensor

Courtesy of FORD MOTOR CO.

POWERTRAIN CONTROL HARDWARE > POWERTRAIN CONTROL MODULE (PCM)

The center of the engine control (EC) system is a microprocessor called the PCM. The PCM receives input from sensors and other electronic components (switches, relays). Based on the information received and programmed into its memory, the PCM generates output signals to control various relays, solenoids and actuators. There are several different types of PCMs in use for this model year. Refer to the VEHICLE PCM APPLICATION TABLE below for PCM types and their applications.



VEHICLE PCM APPLICATION LIST

PCM Type	Applications
128 Pin	Fiesta (1.6L TIVCT)
154 Pin	Explorer (2.0L)
190 Pin	E-Series, Escape (2.5L), Explorer (3.5L TIVCT, 3.7L), F-650/F-750, F-Series Super Duty, Flex (3.5L TIVCT), Fusion (2.5L), MKS (3.7L), MKT (3.7L), MKX, MKZ (3.7L), Taurus (3.5L TIVCT, 3.7L), Transit (3.7L TiVCT), Transit Connect (2.5L)

198 Pin	Edge, Escape (1.6L, 2.0L), Expedition, Explorer (3.5L GTDI), F-150, Fiesta (1.0L, 1.6L GTDI), Flex (3.5L GTDI), Focus, Fusion (1.5L, 2.0L), MKC, MKS (3.5L), MKT (2.0L, 3.5L), MKZ (2.0L), Mustang, Navigator, Taurus (2.0L, 3.5L GTDI), Transit (3.5L GTDI), Transit Connect (1.6L)

PCM Locations

For PCM location, removal and installation procedures, refer to the service information , Electronic Engine Controls.

POWERTRAIN CONTROL HARDWARE > FUEL PUMP CONTROL MODULE

The fuel pump control module receives a duty cycle signal from the PCM and controls the fuel pump operation in relation to this duty cycle. The PCM requests low or high speed fuel pump operation depending on engine fuel demand. The fuel pump control module controls the fuel pump by switching the fuel pump power circuit ON and OFF at the required duty cycle. The fuel pump control module sends diagnostic information to the PCM on the FPM circuit. For additional information on the fuel pump control and the fuel pump monitor, refer to FUEL SYSTEMS in this service information.

On vehicles with gasoline direct fuel injection, the high pressure fuel system may be under vacuum after several hours of cold soak. Fuel vapor may collect at the fuel injection pump, causing a long start condition. To prevent this, the fuel pump relay is energized for 1 or 2 seconds, depending on application, as soon as the dome light is commanded ON. This causes the fuel pump control module and the fuel pump to cycle for 1 or 2 seconds and purge any trapped air or fuel vapor from the high pressure fuel system.

POWERTRAIN CONTROL HARDWARE > KEEP ALIVE MEMORY (KAM)

The PCM stores information about vehicle operating conditions in the KAM (a memory integrated circuit chip) and then uses this information to compensate for component variability. The KAM remains powered when the ignition is in the OFF position so the information is not lost.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > ACCELERATOR PEDAL POSITION REFERENCE VOLTAGE (APPVREF)

The APPVREF is a consistent positive voltage (5 volts plus or minus 0.5 volt) circuit.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > ACCELERATOR PEDAL POSITION RETURN (APPRTN)

The APPRTN is a return path for APPVREF circuit.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > ELECTRONIC THROTTLE CONTROL REFERENCE VOLTAGE (ETCREF)

The ETCREF is a consistent positive voltage (5 volts plus or minus 0.5 volt) circuit.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > ELECTRONIC THROTTLE CONTROL RETURN (ETCRTN)

The ETCRTN is a return path for ETCREF circuit.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > GOLD PLATED PINS

Some engine control hardware has gold plated pins within the connectors and mating harness connectors to improve electrical stability for low current draw circuits and to enhance corrosion resistance. The engine control (EC) components equipped with gold plated terminals vary by vehicle application. Only replace gold plated terminals with new gold plated terminals.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > KEEP ALIVE POWER (KAPWR)

The KAPWR provides a constant voltage input independent of ignition switch state to the PCM. This voltage is used by the PCM to maintain the KAM.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > MASS AIRFLOW RETURN (MAFRTN)

The MAFRTN is a signal return circuit from the mass airflow (MAF) sensor.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > POWER GROUND (PWRGND)

The PWRGND circuits provides a return path for the PCM vehicle power (VPWR) circuits.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > SIGNAL RETURN (SIGRTN)

The SIGRTN is a dedicated return path for VREF applied components.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > STARTER MOTOR REQUEST (SMR) CIRCUIT

The SMR circuit provides the PCM with a signal from the ignition switch to the PCM. The input is pulled high when the ignition is in the START position and the transmission range (TR) sensor ignition lockout circuit allows the starter to engage.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > VARIABLE RELUCTANCE SENSOR RETURN (VRSRTN)

The VRSRTN circuit is a dedicated return path for variable reluctance (VR) type sensors.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > VEHICLE BUFFERED POWER (VBPWR)

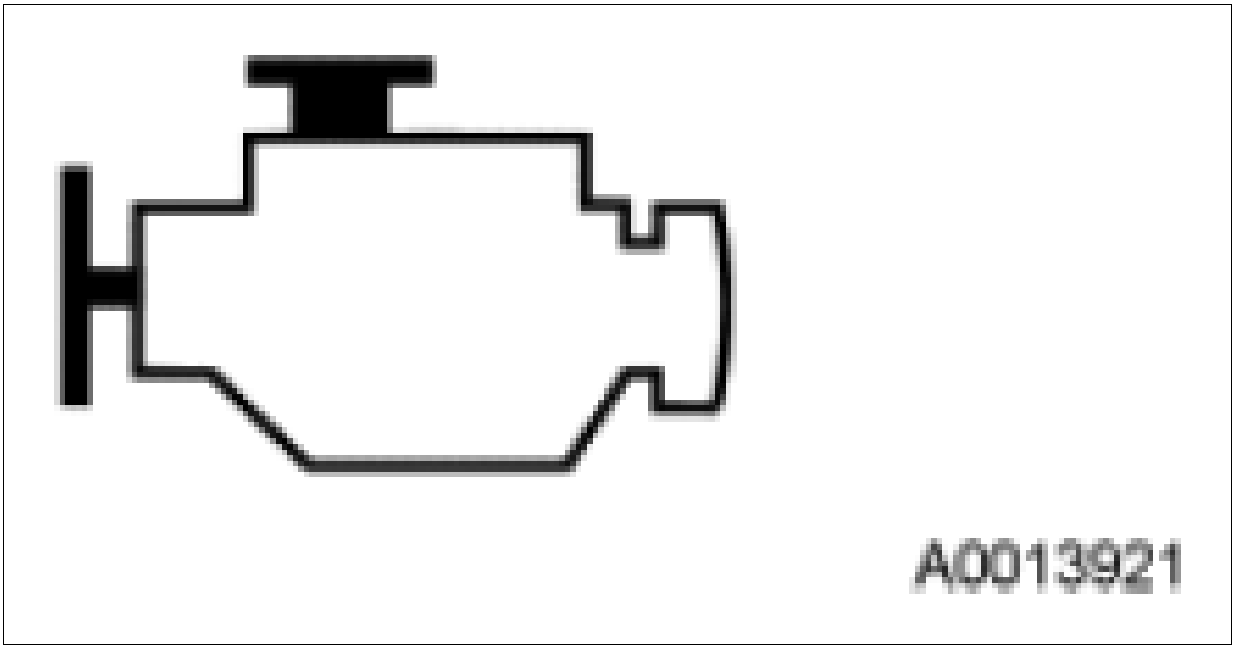
The VBPWR is a regulated voltage supplied by the PCM to vehicle sensors. These sensors require a

constant 12 volts for operation and cannot withstand VPWR voltage variations. VBPWR is regulated to VPWR minus 1.5 volts and is also current limited to protect the sensors.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > VEHICLE POWER (VPWR)

The VPWR is the primary source of PCM power. VPWR is switched through the PCM power relay.

POWERTRAIN CONTROL HARDWARE > POWER AND GROUND SIGNALS > VEHICLE REFERENCE VOLTAGE (VREF)



The VREF is a consistent positive voltage (5 volts plus or minus 0.5 volt) provided by the PCM. VREF is typically used by 3-wire sensors and some digital input signals.

MALFUNCTION INDICATOR LAMP (MIL)

The MIL notifies the driver the PCM has confirmed an on board diagnostic (OBD) emission related component or system concern. When this occurs, an OBD DTC sets.

- The MIL is located in the instrument panel cluster (IPC) and is labeled CHECK ENGINE, SERVICE ENGINE SOON or the international standards organization (ISO) standard engine symbol.
- The MIL is illuminated with the ignition ON, engine OFF, until the engine is cranked for starting. The MIL will turn OFF after engine start if no concerns are present.
- The MIL may flash after 17 seconds with the ignition ON, engine OFF, unless the OBD inspection/maintenance (I/M) readiness indicators indicate all of the OBD monitors have completed since the last keep alive memory (KAM) reset or since the PCM DTCs have been cleared with a reset command from the scan tool.
- The MIL will remain illuminated after engine start if a confirmed emission related concern or an OBD DTC exists.
- If the MIL flashes at a steady rate, after engine start, a severe misfire condition may exist.
- The MIL will remain OFF with the ignition ON, engine OFF, if a MIL indicator or IPC concern is present.
- To turn OFF the MIL after a repair, a reset command from the scan tool must be sent, or 3 consecutive drive cycles must be completed without a concern.
- If the MIL flashes erratically, a low battery voltage concern may be present causing the PCM to reset during cranking.
- For all MIL concerns, go to SYMPTOM CHARTS .

IGNITION SYSTEMS > OVERVIEW

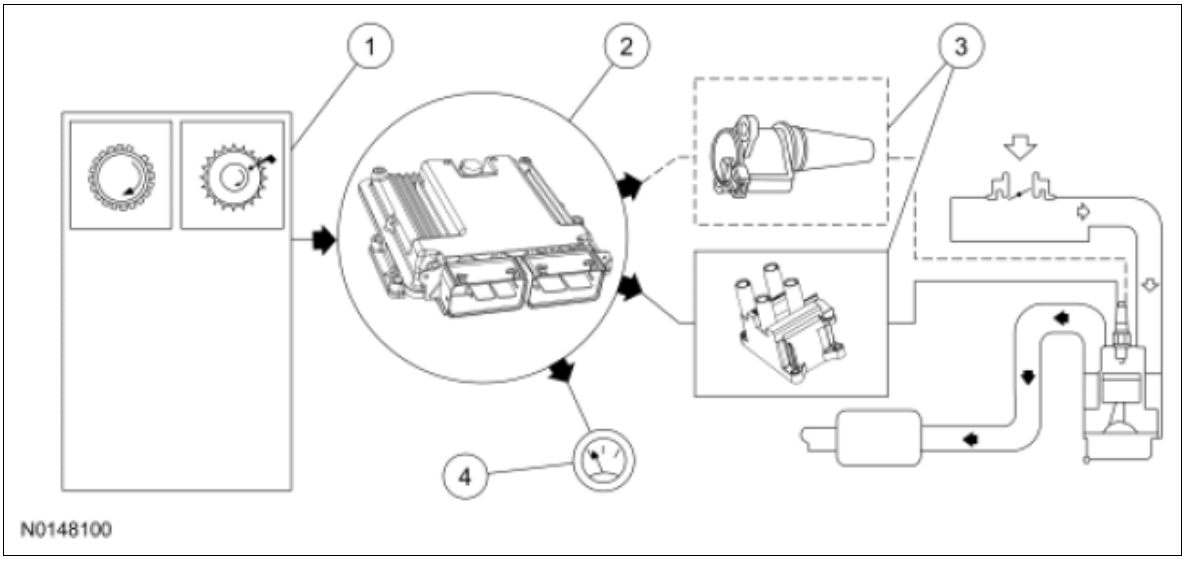
The ignition system is designed to ignite the compressed air to fuel mixture in an internal combustion engine by a high voltage spark delivered from an ignition coil controlled by the powertrain control module (PCM).

IGNITION SYSTEMS > INTEGRATED ELECTRONIC IGNITION SYSTEM

NOTE: Electronic ignition engine timing is controlled entirely by the PCM. Electronic ignition engine timing is not adjustable. Do not attempt to check base timing. You will receive false readings.

The integrated electronic ignition system consists of a crankshaft position (CKP) sensor, coil pack or coil on plug (COP), connecting wiring, and a PCM. For additional information on the ignition system components, refer to ENGINE CONTROL COMPONENTS in this service information. The COP integrated electronic ignition system uses a separate coil per spark plug, and each coil is mounted directly onto the plug. The COP integrated electronic ignition system eliminates the need for spark plug wires, but does require input from the camshaft position (CMP) sensor. Operation of the components are as follows:

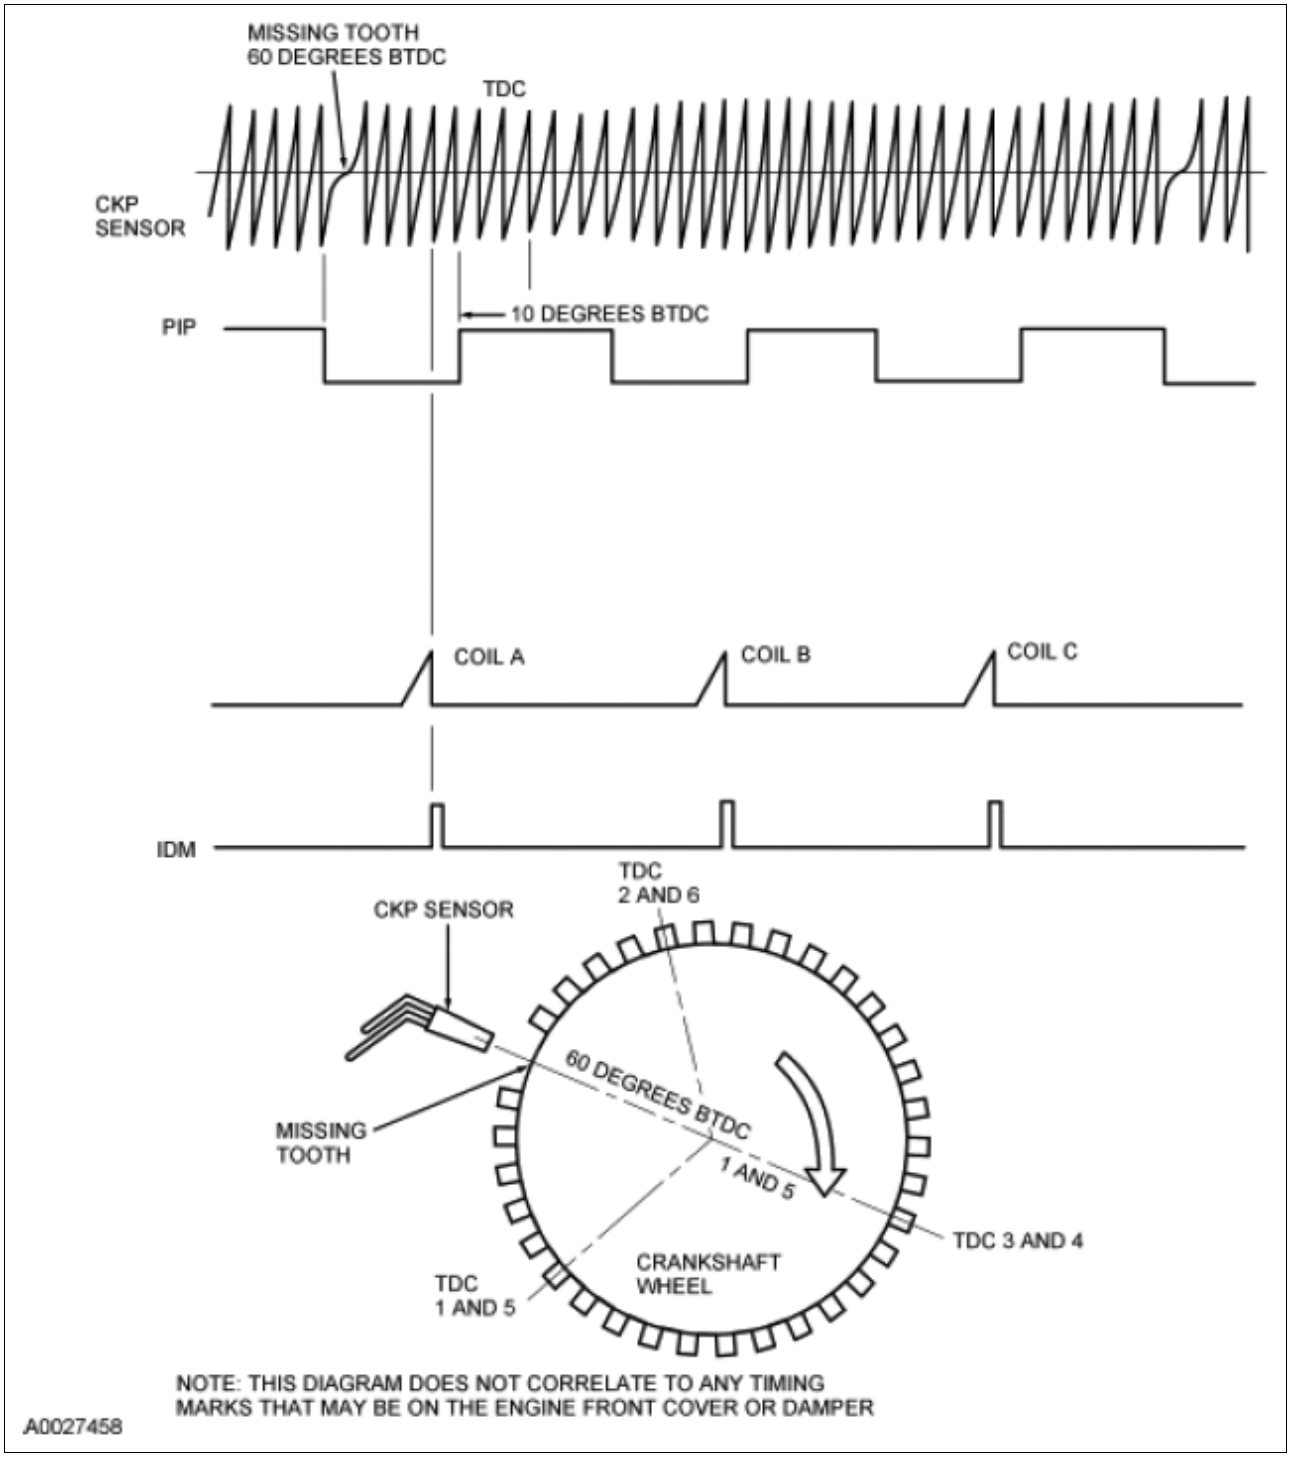
1. The CKP sensor indicates the crankshaft position and speed by sensing a missing tooth on a pulse wheel mounted to the crankshaft. The COP integrated electronic ignition system uses the CMP sensor to identify the compression stroke of cylinder 1, and to synchronize the firing of the individual coils.



2. The PCM uses the CKP sensor signal to calculate a spark target and then fires the coil pack or COP to that target illustrate. The PCM uses the CMP sensor signal to identify the compression stroke of cylinder 1, and to synchronize the firing of the individual coils.

3. The PCM controls the ignition coils after it calculates the spark target. The COP system fires only one spark plug per coil upon synchronization during the compression stroke. For the coil pack ignition system, each coil within a pack fires 2 spark plugs at the same time. The plugs are paired so that as one fires during the compression stroke the other fires during the exhaust stroke.

   The current flow, or dwell, through the primary ignition coil is controlled by the PCM by providing a switched ground path through the ignition coil driver to ground. When the ignition coil driver is switched ON, current rapidly builds up to a maximum value, determined by the coil inductance and resistance. When the current is switched OFF, the magnetic field collapses which induces a secondary high voltage surge and the spark plug is fired. This high voltage surge creates a flyback voltage which the PCM uses as a feedback during the ignition diagnostics. The PCM uses the charge current dwell time characteristics to carry out the ignition diagnostics.



4. The PCM processes the CKP sensor signal and uses it to drive the tachometer as the clean tach output (CTO) signal.

Fig 1: Integrated Electronic Ignition System Flow Diagram

Courtesy of FORD MOTOR CO.

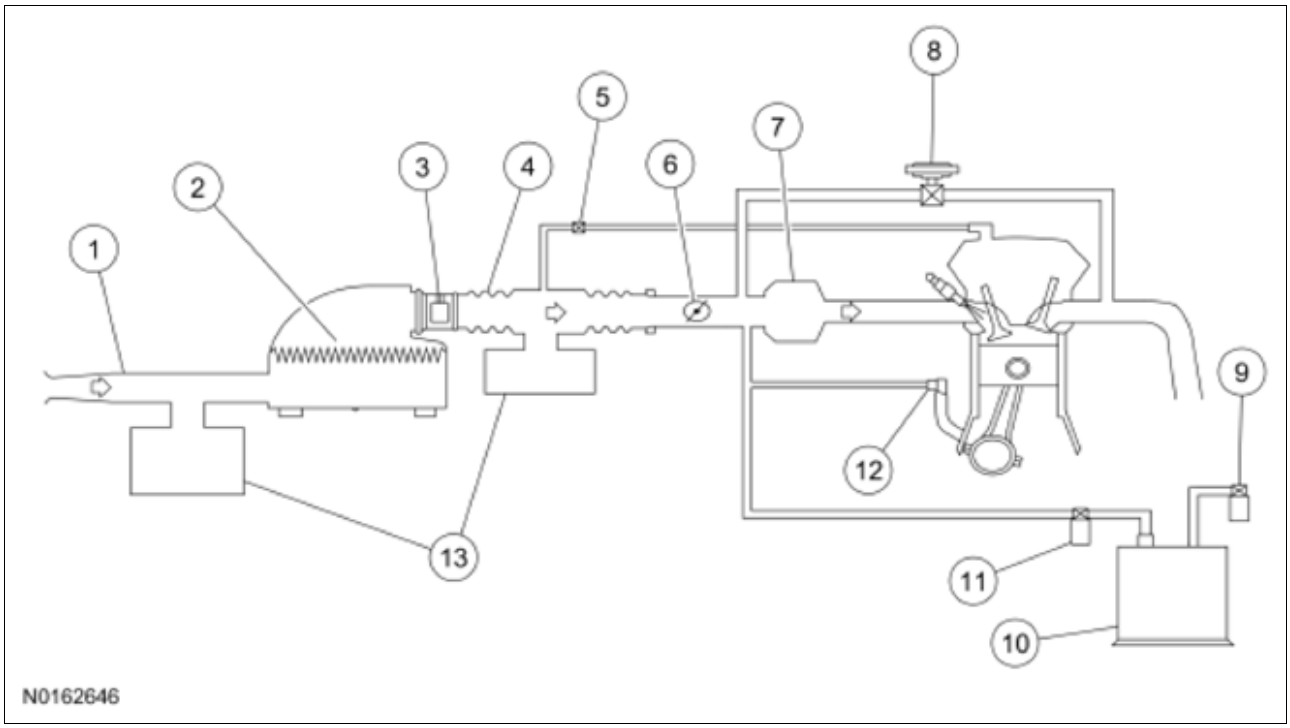
Fig 2: Six Cylinder Integrated Electronic Ignition Waveforms

Courtesy of FORD MOTOR CO.

IGNITION SYSTEMS > ENGINE CRANK/ENGINE RUNNING

During engine crank the PCM fires 2 spark plugs simultaneously. Of the 2 spark plugs fired, one is under compression while the other is on the exhaust stroke. Both spark plugs fire until camshaft position is identified by a successful CMP sensor signal. Once camshaft position is identified only the cylinder

under compression is fired.



IGNITION SYSTEMS > CAMSHAFT POSITION FAILURE MODE EFFECTS MANAGEMENT (FMEM)

During camshaft position FMEM the COP ignition works the same as during engine crank. This allows the engine to operate without the PCM knowing if cylinder 1 is under compression or exhaust.

INTAKE AIR SYSTEMS > OVERVIEW

The intake air system provides clean air to the engine, optimizes airflow, and reduces unwanted induction noise. The intake air system consists of an air cleaner assembly, resonator assemblies, and hoses. Some vehicles use a hydrocarbon filter trap to help reduce emissions by preventing fuel vapor from escaping into the atmosphere from the intake when the engine is OFF. It is typically located inside the intake air system. The mass airflow (MAF) sensor is attached to the air cleaner assembly and measures the volume of air delivered to the engine. The hydrocarbon trap is part of the evaporative emission (EVAP) system. For more information on the EVAP system, refer to EVAPORATIVE EMISSION (EVAP) SYSTEMS in this service information. The MAF sensor can be replaced as an individual component. The intake air system also contains a sensor that measures the intake air temperature, which is integrated with the MAF sensor. For additional information on the intake air system components, refer to ENGINE CONTROL COMPONENTS in this service information. Intake air components can be separate components or part of the intake air housing. The function of a resonator is to reduce induction noise. The intake air components are connected to each other and to the throttle body assembly with hoses.

INTAKE AIR SYSTEMS > THROTTLE BODY SYSTEM OVERVIEW

The throttle body system meters air to the engine during idle, part throttle, and wide open throttle (WOT) conditions. The throttle body system consists of single or dual bores with butterfly valve throttle plates and a throttle position (TP) sensor. The airflow is measured by the MAF sensor.

The major components of the throttle body assembly include the TP sensor and the throttle body housing assembly. For additional information on the intake air system components, refer to ENGINE CONTROL COMPONENTS in this service information.

INTAKE AIR SYSTEMS > FEATURES OF THE THROTTLE BODY ASSEMBLY INCLUDE

1. A preset stop to locate the WOT position.
2. A throttle body mounted TP sensor.
3. A coating sealant on the throttle bore and throttle plate makes the throttle body airflow tolerant to engine intake sludge accumulation. Some vehicles have a decal advising not to clean.
4. A non adjustable stop screw for close plate idle airflow.

INTAKE AIR SYSTEMS > INTAKE MANIFOLD RUNNER CONTROL (IMRC) AND INTAKE MANIFOLD TUNING VALVE (IMTV)

WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

There are 2 basic types of intake air subsystems:

- IMRC
- IMTV

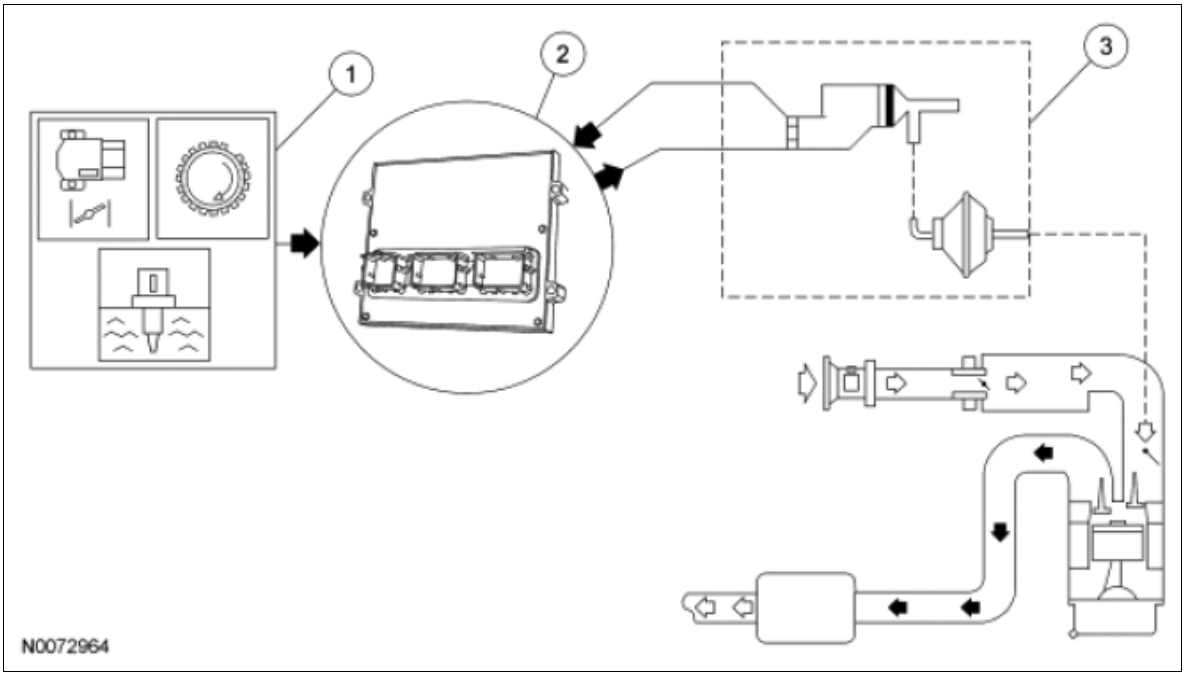
There are several different styles of hardware used to control airflow within the engine air intake system. In general, the devices are defined based on whether they control charge motion or manifold tuning.

The IMRC modifies the air charge motion in the intake manifold. The IMRC is located at the rear of the intake manifold. The IMRC system must have a monitor feedback system in order to meet OBD II regulations.

The IMTV modifies the airflow volume of the manifold by connecting multiple plenums or inlets within the intake manifold. The IMTV control valve is located in the center of the intake manifold. The IMTV system does not have to be monitored for OBD II regulations.

These subsystems provide increased intake airflow to improve torque, emissions and performance. The overall volume of air metered to the engine is controlled by the throttle body.

INTAKE AIR SYSTEMS > INTAKE MANIFOLD RUNNER CONTROL (IMRC) SYSTEM



WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

The IMRC system consists of a manifold mounted vacuum actuator and a PCM controlled electric solenoid. For additional information on IMRC vacuum actuated components, refer to ENGINE CONTROL COMPONENTS in this service information. The linkage from the actuator attaches to the manifold plate lever. The IMRC vacuum actuator and manifold has a single intake air passage for each cylinder. The passage has a valve plate that blocks a large percentage of the opening when actuated, leaving the top of the passage open to generate turbulence. The housing uses a return spring to hold the valve plates open. The IMRC sensors provide feedback to the PCM indicating the valve plate position.

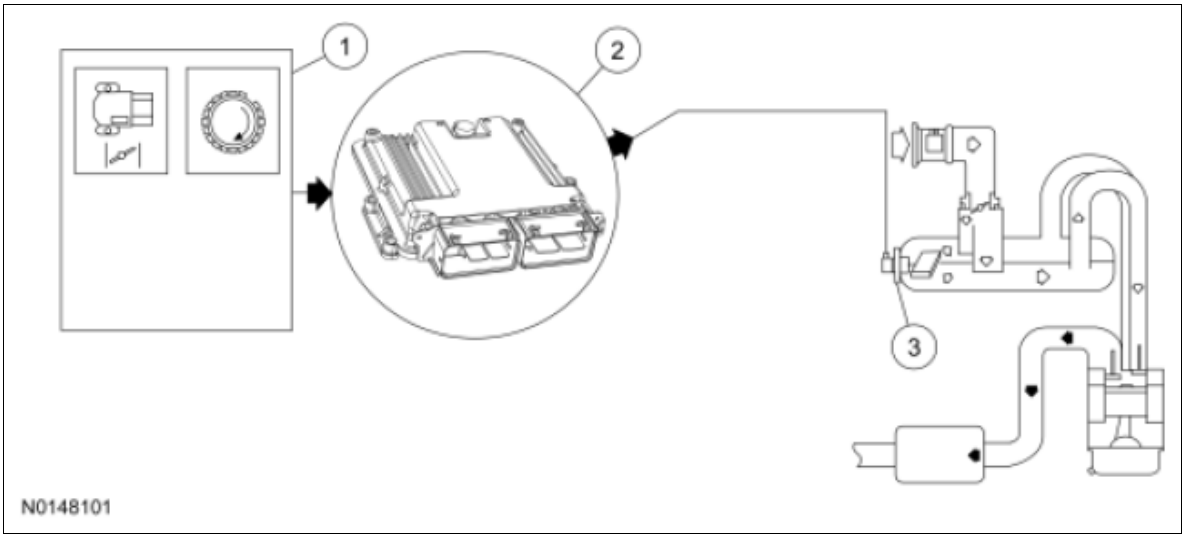
1. The PCM monitors the TP sensor, cylinder head temperature (CHT) sensor, and CKP sensor signals to determine activation of the IMRC system. There must be a positive change in voltage from the TP sensor along with the increase in RPM at the correct engine temperature to open the IMRC valve plates.
2. The PCM uses the information from the input signals to control the IMRC solenoid based upon changes in the throttle position, the engine temperature, and the RPM.
3. The PCM energizes the IMRC solenoid with the ignition ON and the engine running. Vacuum is

then applied to the actuator to pull the valve plates closed.

Fig 1: IMRC Vacuum Actuated System Flow Diagram

Courtesy of FORD MOTOR CO.

INTAKE AIR SYSTEMS > INTAKE MANIFOLD TUNING VALVE (IMTV) SYSTEM



WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

The IMTV is a motorized actuated unit mounted directly to the intake manifold. For additional information on IMTV components, refer to ENGINE CONTROL COMPONENTS in this service information.

The motorized IMTV unit is disabled below a calibrated RPM. The shutter is in the closed position preventing airflow blend in the intake manifold. Above a calibrated RPM the motorized unit is enabled. The motorized unit is initially commanded ON by the PCM at a 100 percent duty cycle to move the shutter to the open position, and then falling to approximately 50 percent to continue to hold the shutter open.

1. The PCM uses the TP sensor and CKP sensor signals to determine activation of the IMTV system. There must be a positive change in voltage from the TP sensor along with the increase in RPM to open the shutter.
2. The PCM uses the information from the input signals to control the IMTV.
3. When commanded ON by the PCM, the motorized actuator shutter opens up the end of the vertical separating wall at high engine speeds to allow both sides of the manifold to blend together.

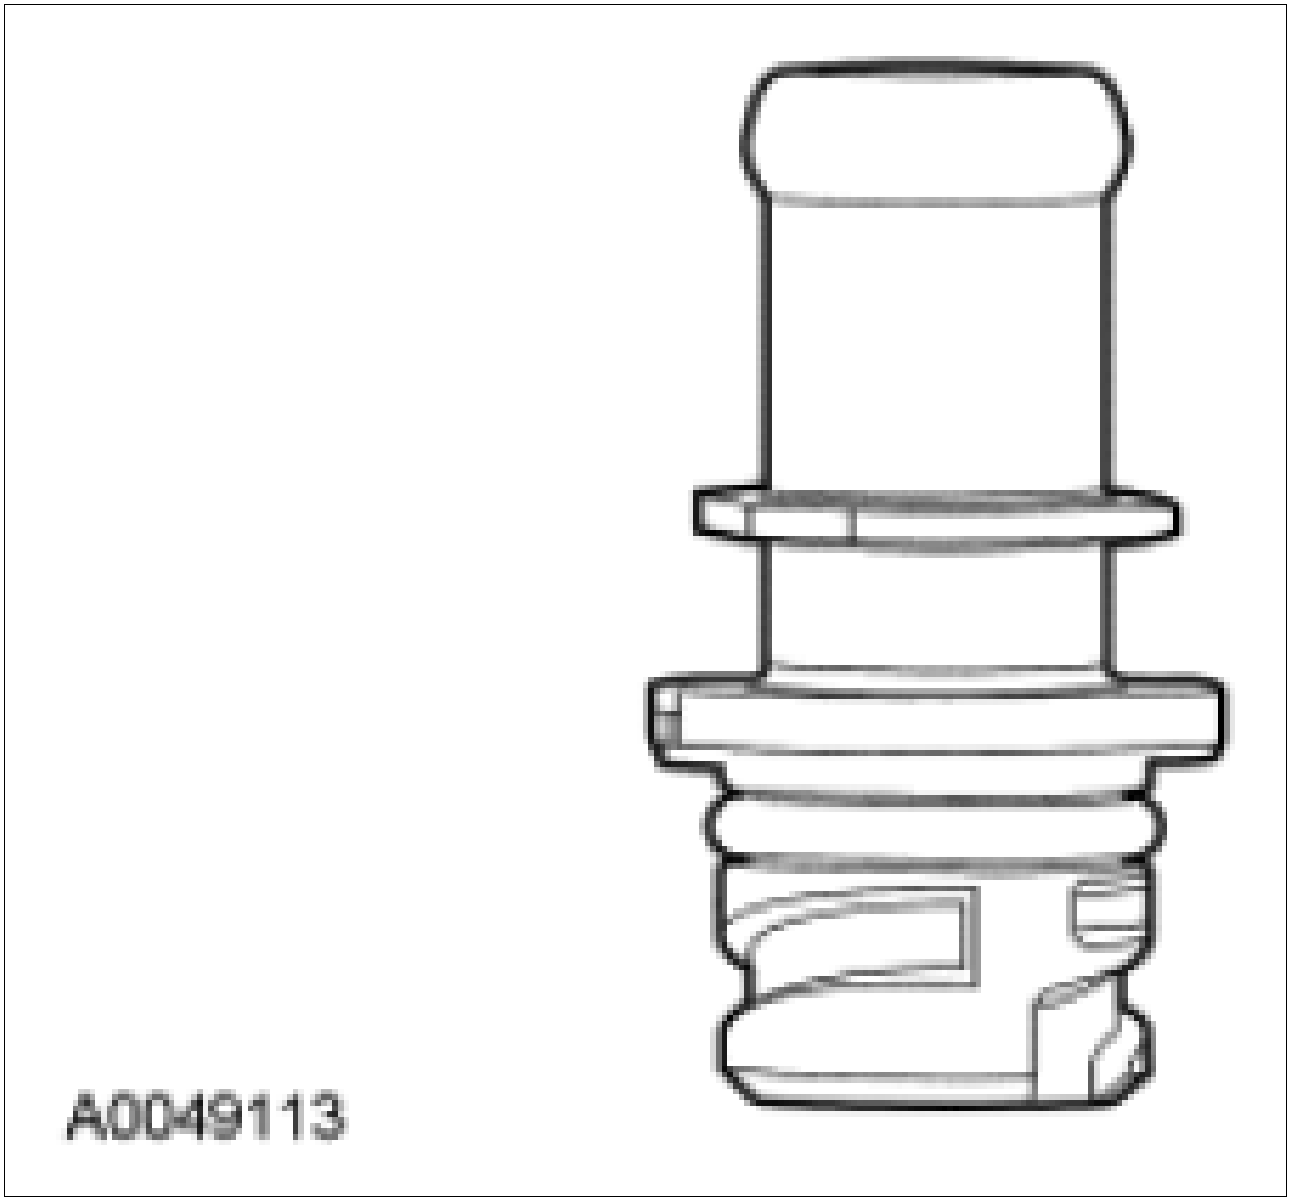
POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM > OVERVIEW

The PCV system circulates crankcase gases through the intake air system into the engine where they are burned. The PCV system regulates the amount of ventilated air and blowby gases to the intake manifold.

The PCV system on some vehicles will include a crankcase pressure sensor to detect a disconnection of the fresh air hose.



The PCV systems comply with on board diagnostics (OBD) PCV monitoring requirements to prevent accidental disconnection from the valve cover. For more information about the PCV monitor and crankcase pressure sensor, refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM MONITOR in this service informationn.

(TORQUE BASED) ELECTRONIC THROTTLE CONTROL (ETC) > OVERVIEW

The torque based ETC is a hardware and software strategy that delivers an engine output torque (via throttle angle) based on driver demand (pedal position). It uses an electronic throttle body throttle actuator control (TAC), the PCM, and an accelerator pedal assembly to control the throttle opening and engine torque.

Torque based ETC enables aggressive automatic transmission shift schedules (earlier upshifts and later downshifts). This is possible by adjusting the throttle angle to achieve the same wheel torque during shifts, and by calculating this desired torque, the system prevents engine lugging (low RPM and low manifold vacuum) while still delivering the performance and torque requested by the driver. It also enables many fuel economy/emission improvement technologies such as variable camshaft timing (VCT), which delivers same torque during transitions.

The torque based ETC system illuminates a powertrain malfunction indicator (wrench) on the instrument panel cluster (IPC) when a concern is present. Concerns are accompanied by diagnostic trouble codes (DTCs) and may also illuminate the malfunction indicator lamp (MIL).

(TORQUE BASED) ELECTRONIC THROTTLE CONTROL (ETC) > ELECTRONIC THROTTLE BODY THROTTLE ACTUATOR CONTROL (TAC)

For additional information on the electronic throttle body TAC, refer to ENGINE CONTROL COMPONENTS in this service information.

(TORQUE BASED) ELECTRONIC THROTTLE CONTROL (ETC) > ELECTRONIC THROTTLE BODY THROTTLE POSTION SENSOR

There is one reference voltage and one signal return circuit between the PCM and the electronic throttle body throttle position sensor. The reference voltage and the signal return circuits are shared with the reference voltage and signal return circuits used by the accelerator pedal position (APP) sensor. There are also 2 throttle position (TP) signal circuits for redundancy. The redundant TP signals are required for increased monitoring reasons. The first TP signal (TP1) has a negative slope (increasing angle, decreasing voltage) and the second TP signal (TP2) has a positive slope (increasing angle, increasing voltage). The TP2 signal reaches a limit of approximately 4.5 volts at approximately 45 degrees of throttle angle.

For additional information on the electronic throttle body throttle position sensor, refer to ENGINE CONTROL COMPONENTS in this service information.

(TORQUE BASED) ELECTRONIC THROTTLE CONTROL (ETC) > ACCELERATOR PEDAL POSITION (APP) SENSOR

For additional information on the APP sensor, refer to ENGINE CONTROL COMPONENTS in this service information.

(TORQUE BASED) ELECTRONIC THROTTLE CONTROL (ETC) > ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM STRATEGY

The ETC strategy was developed to improve fuel economy and to accommodate variable camshaft timing. This is possible by not coupling the throttle angle to the driver pedal position. Uncoupling the throttle angle (produce engine torque) from the pedal position (driver demand) allows the powertrain control strategy to optimize fuel control and transmission shift schedules while delivering the requested wheel torque.

The ETC monitor system is distributed across 2 processors within the PCM: the main powertrain control processor unit (CPU) and a separate monitoring processor. The primary monitoring function is carried out by the independent plausibility checker software, which resides on the main processor. It is responsible for determining the driver demanded torque and comparing it to an estimate of the actual

torque delivered. If the generated torque exceeds driver demand by a specified amount, appropriate corrective action is taken.

ETC SYSTEM FAILURE MODE AND EFFECTS MANAGEMENT

Effect	Failure Mode
No Effect On Driveability	A loss of redundancy or loss of a non critical input could result in a concern that does not affect driveability. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. However, cruise control and power take off (PTO) may be disabled. A DTC sets to indicate the component or circuit with the concern.
Delayed APP Sensor Response With Brake Override	This mode is caused by the loss of one APP sensor input due to sensor, wiring, or PCM concerns. The system is unable to verify the APP sensor input and driver demand. The throttle plate response to the APP sensor input is delayed as the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP sensor related DTC sets.
Time Based Driver Demand With Brake Override	This mode is caused by the loss of one brake pedal position (BPP) and one APP sensor input or both APP sensor inputs due to sensor, wiring, or PCM concerns. The system is unable to determine driver demand. There is no response when the accelerator pedal is applied. The engine returns to idle RPM whenever the brake pedal is applied. When the brake pedal is released, the PCM slowly increases the APP signal to a fixed value. The powertrain malfunction indicator (wrench) illuminates, but the MIL does not illuminate in this mode. An APP or BPP sensor related DTC sets.
RPM Guard With Pedal Follower	In this mode, torque control is disabled due to the loss of a critical sensor or PCM concern. The throttle is controlled in pedal follower mode as a function of the APP sensor input only. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC related component sets. The EGR and VCT outputs are set to default values and cruise control is disabled.
RPM Guard With Default Throttle	In this mode, the throttle plate control is disabled due to the loss of both TP sensor inputs, loss of throttle plate control, stuck throttle plate, significant processor concerns, or other major electronic throttle body concern. The spring returns the throttle plate to the default (limp home) position. A maximum allowed RPM is determined based on the position of the accelerator pedal (RPM Guard). If the actual RPM exceeds this limit, spark and fuel are used to bring the RPM below the limit. The powertrain malfunction indicator (wrench) and the MIL illuminate in this mode and a DTC for an ETC related component sets. The EGR and VCT outputs are set to default values and cruise control is disabled.

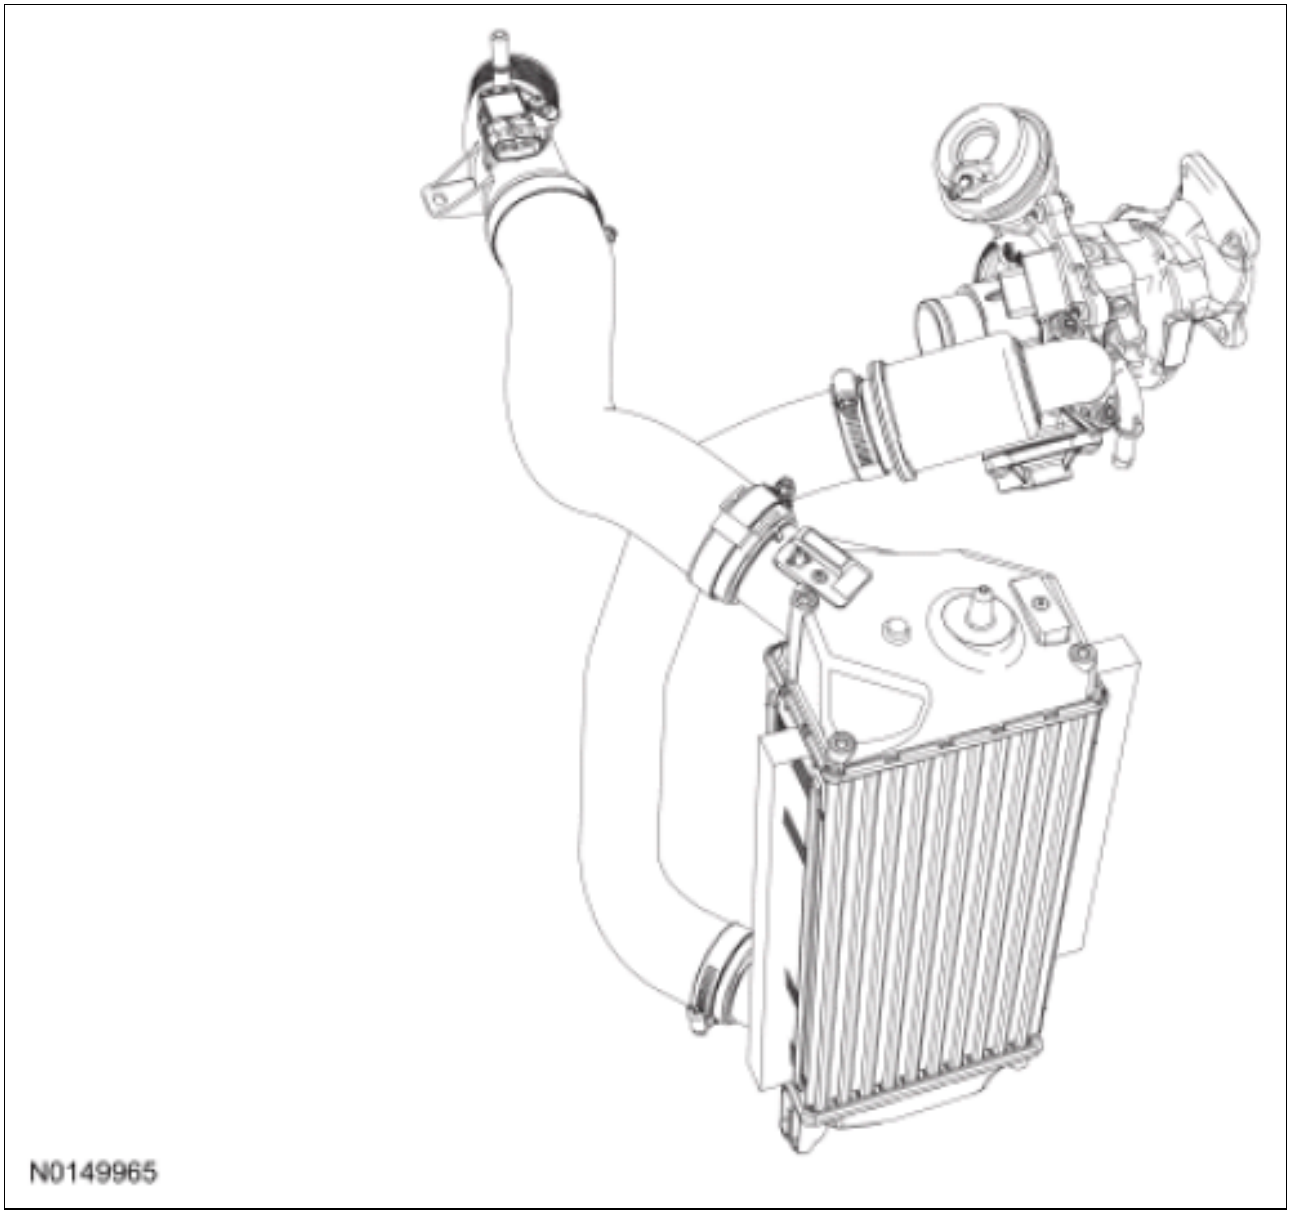
TURBOCHARGER AND CHARGE AIR COOLER (CAC) SYSTEMS > TURBOCHARGER SYSTEM

A turbocharger is an exhaust gas driven device used to increase the power output of an engine by the turbocharger compressor increasing the pressure of the air entering the engine. The turbocharger uses

exhaust gas energy to drive the turbine connected to the compressor. Compressing the air causes the temperature to increase. The CAC lowers the temperature of compressed air which increases the density of the air before entering the cylinder.

The 6 cylinder engine uses 2 turbochargers in a parallel arrangement with 1 turbine connected to the exhaust of each cylinder bank. This configuration improves engine responsiveness due to the reduced inertia of 2 small rotating assemblies in the place of 1 large rotating assembly while pumping adequate air to achieve the rated power. Emission compliance is achieved by mounting the catalysts very close to the turbo outlet.

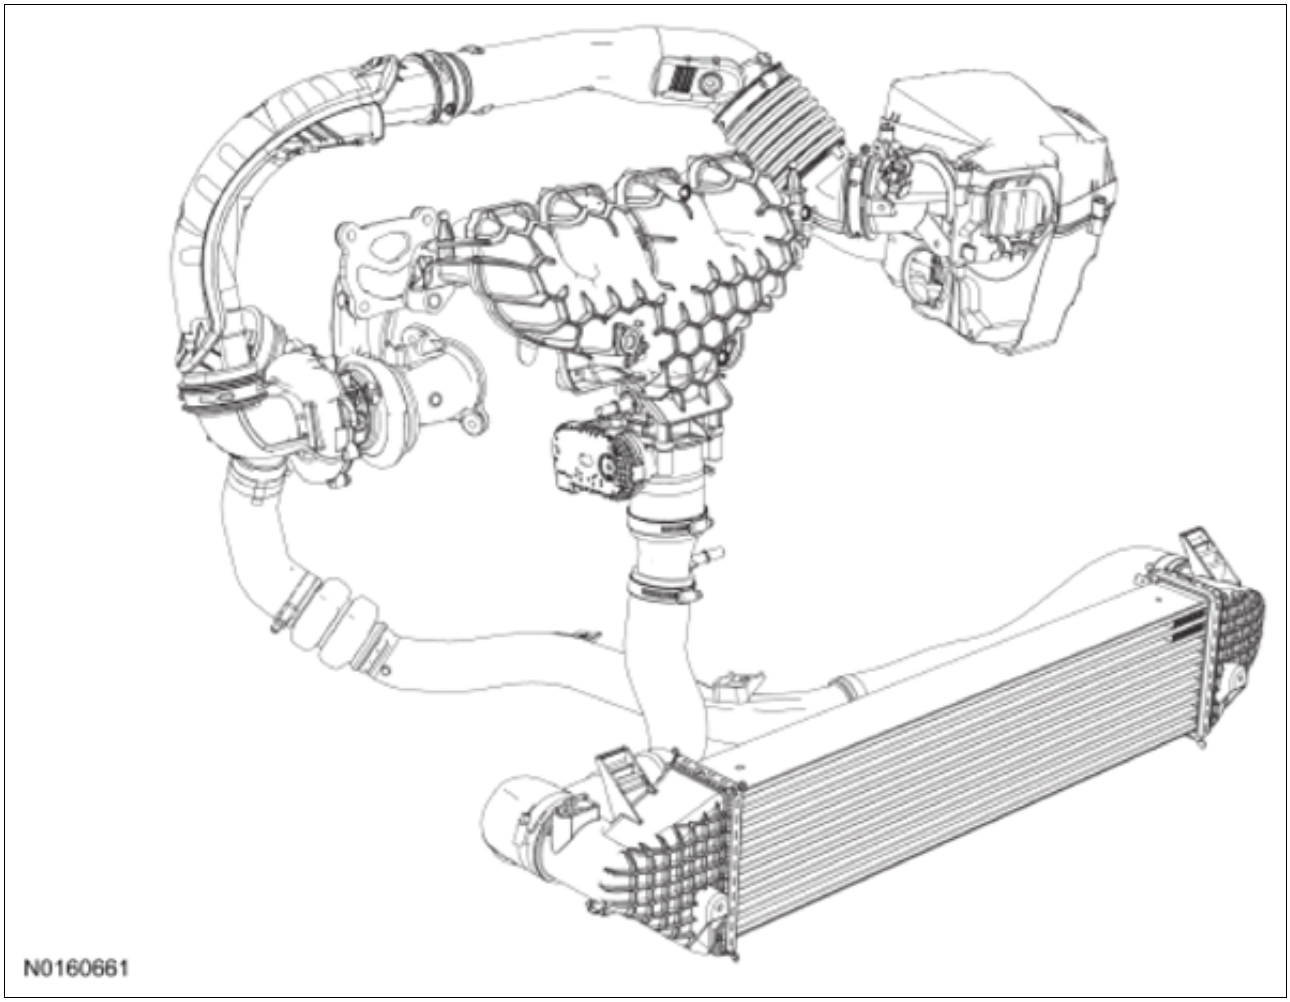
The turbocharger bypass valve is used to create a path from the high pressure compressor outlet to the low pressure compressor inlet. This path recirculates airflow to reduce turbocharger lag and prevent unwanted air rush noise from the turbocharger on heavy throttle releases. The wastegate on the turbocharger turbine side is opened to reduce exhaust gas flow through the turbine when boost pressure is not needed. A pneumatic actuator controls the wastegate valve opening. The turbocharger wastegate is controlled by the PCM through a pulse width modulated (PWM) turbocharger wastegate regulating valve solenoid. The turbocharger wastegate regulating valve solenoid supplies pressure to the wastegate actuator to open the poppet style wastegate valve. The wastegate may be pressure or vacuum actuated, and the poppet style wastegate valve could be normally opened or normally closed at idle or low engine airflow conditions depending on vehicle configuration and requirements such as fuel economy and boost performance. The 6 cylinder wastegates are coupled by having one control output from the turbocharger wastegate regulating valve solenoid that drives both turbocharger wastegate actuators.



The 4 cylinder system uses only 1 turbocharger, 1 turbocharger wastegate and 1 turbocharger bypass valve. The turbocharger bypass valve can be electric or pneumatic and may be mounted in the intake air system or in the turbocharger housing.

The 3 cylinder system uses only 1 turbocharger, 1 turbocharger wastegate and 1 turbocharger bypass valve. The turbocharger bypass valve is mounted in the turbocharger housing and is PCM controlled.

TURBOCHARGER AND CHARGE AIR COOLER (CAC) SYSTEMS > TURBOCHARGER SYSTEM > CHARGE AIR COOLER (CAC) SYSTEM - AIR TO AIR COOLED



The CAC system cools the intake air which has been heated by the turbocharger. The removal of heat from the pressurized air going into the CAC increases the air density which improves combustion efficiency, engine horsepower, and torque. The system consists of a CAC radiator in the grille and tubing to interconnect these components. The CAC is positioned after the turbocharger directly in the flow of the intake air. As the heated air flows through the CAC, it is cooled by the airflow through the grille. The PCM maintains a desirable intake air temperature by monitoring the TCBP/CACT (located at the throttle body) and the MAP/IAT2 (located at the intake manifold) sensors.

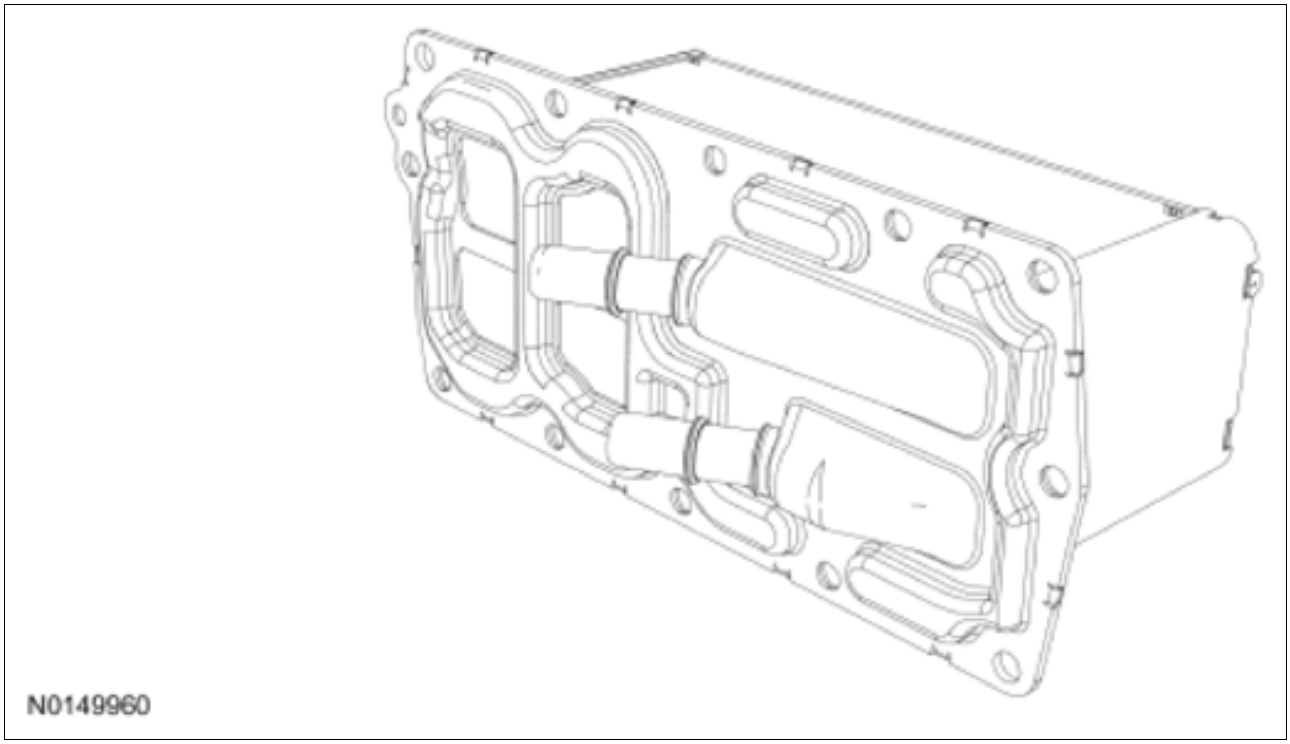
TURBOCHARGER AND CHARGE AIR COOLER (CAC) SYSTEMS > TURBOCHARGER SYSTEM > CHARGE AIR COOLER (CAC) SYSTEM - AIR TO LIQUID COOLED



The CAC system cools the intake air which has been heated by the turbocharger. The removal of heat from the pressurized air going into the CAC increases the air density which improves combustion efficiency, engine horsepower, and torque. The system consists of an additional CAC radiator in the grille, a reservoir, an electric water pump, the CAC located in the intake manifold, and tubing to interconnect these components. The CAC is positioned after the turbocharger directly in the flow of the intake air. As the heated air flows through the CAC, heat is transferred to the coolant which is circulated back to the CAC radiator to be cooled by the airflow through the grille. The CAC pump is controlled by PCM. The PCM maintains a desirable intake air temperature by monitoring the CAC coolant temperature sensor in the CAC radiator.

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM > OVERVIEW

The VCT system enables rotation of the camshafts relative to the crankshaft rotation as a function of engine operating conditions. There are 4 types of VCT systems.

- Exhaust phase shifting (EPS) - the exhaust cam is the active cam being retarded.
- Intake phase shifting (IPS) - the intake cam is the active cam being advanced.
- Dual equal phase shifting (DEPS) - both intake and exhaust cams are phase shifted and equally advanced or retarded.
- Twin independent phase shifting - where both the intake and exhaust cams are shifted independently.

All systems have 4 operational modes: idle, part throttle, wide open throttle (WOT), and default mode. At idle and low engine speeds with closed throttle, the powertrain control module (PCM) determines the phase angle based on airflow, engine oil temperature and engine coolant temperature. At part and wide open throttle the PCM determines the phase angle based on engine RPM, load, and throttle position. VCT systems provide reduced emissions and enhanced engine power, fuel economy and idle quality. IPS systems also have the added benefit of improved torque. In addition, some VCT system applications can eliminate the need for an external exhaust gas recirculation (EGR) system. The elimination of the EGR system is accomplished by controlling the overlap time between the intake valve opening and exhaust valve closing.

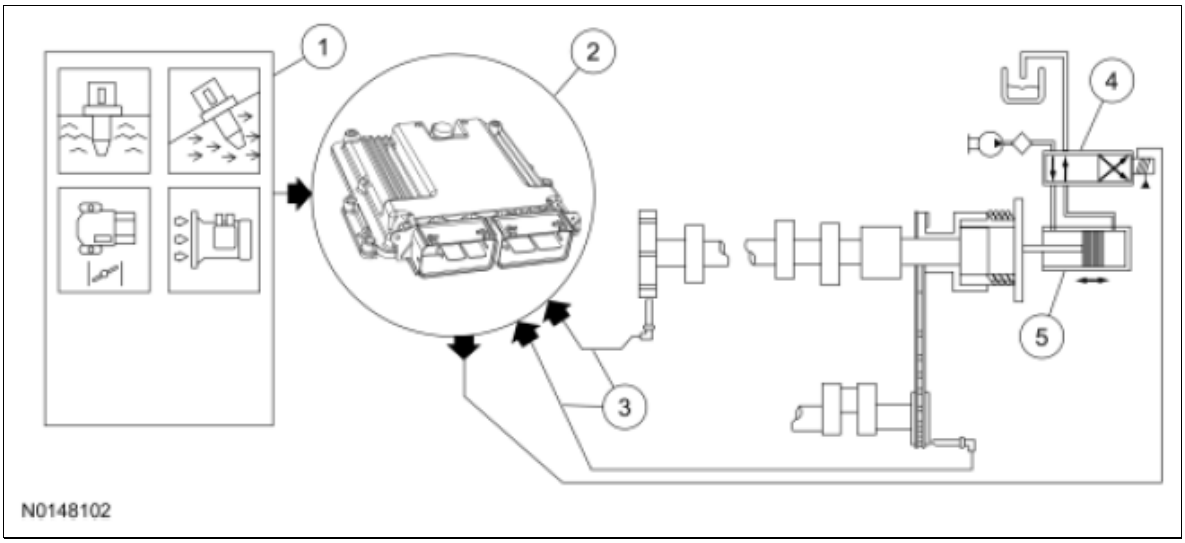
The VCT system knocking and noise concerns are diagnosed in the service information. For additional information, refer to the service information , Engine System - General Information. Verification of incorrect VCT phasing on a warm engine operating below 1500 RPM can be isolated using a stethoscope and by monitoring the PIDs using a scan tool. If the VCT phaser does not maintain correct valve timing, low oil pressure or oil flow restrictions are primary possible causes. Verify correct oil pressure and flow, refer to the service information , Engine System - General Information.

PID	Description
VCTADV, VCTADV2, VCT_INT_ACT1, VCT_EXH_ACT1, VCT_INT_ACT2 and VCT_EXH_ACT2	Monitors the VCT advance and displays the advance angle in degrees. The actual camshaft position is measured using the camshaft position (CMP) sensor.
VCT1_F, VCT2_F, VCT1_INTK_F, VCT1_EXH_F, VCT2_INTK_F and VCT2_EXH_F	Displays FAULT or NO FAULT to indicate a VCT related concern is detected. The CMP circuit DTCs cause the VCT advance to default to 0. Correct any CMP DTCs prior to diagnosing engine timing or VCT DTCs.
VCTADVERR, VCTADVERR2, VCT_INTK_DIFF1, VCT_EXH_DIFF1, VCT_INTK_DIFF2 and VCT_EXH_DIFF2	Displays the error in VCT advance. The CMP signal is used to determine the difference between the actual camshaft position and the camshaft advance requested. The difference is displayed as a percentage that ranges from -5 to +5%. When the accelerator pedal is cycled this may range as high as 20%.
VCTDC, VCTDC2, VCT_INTK_DC1, VCT_EXH_DC1, VCT_INTK_DC2 and VCT_EXH_DC2	Variable camshaft timing duty cycle ranges from 0 to 100%. The PCM controls the VCT solenoid operation through the duty cycled ground.
VCTSYS	Variable camshaft timing system displays whether the engine is in open or closed loop. In open loop, the PCM defaults the VCT system to OFF (0% duty cycle). In closed loop, the PCM turns the VCT system to ON (varies the VCT duty cycle). If a VCT DTC is detected, the VCT system defaults to open loop operation.

VARIABLE CAMSHAFT TIMING (VCT) SYSTEM > VCT SYSTEM

The VCT system consists of an electric hydraulic positioning control solenoid, a camshaft position (CMP) sensor, and a trigger wheel. The CMP sensor trigger wheel indicates the camshaft position signal for that bank. A crankshaft position (CKP) sensor provides the PCM with crankshaft positioning information in 10 degree increments.

1. The PCM receives input signals from the intake air temperature (IAT), engine coolant temperature (ECT), CMP, throttle position (TP), mass airflow (MAF), and CKP sensors to determine the operating conditions of the engine. At idle and low engine speeds with closed throttle, the PCM controls the camshaft position based on engine coolant temperature, engine oil temperature, intake air temperature, and mass airflow. During part and wide open throttle, the camshaft position is determined by engine RPM, load and throttle position. The VCT system does not operate until the engine is at normal operating temperature.
2. The VCT system is enabled by the PCM when the correct conditions are met.



3. The CKP signal is used as a reference for camshaft positioning.

4. The VCT solenoid valve is an integral part of the VCT system. The solenoid valve controls the flow of engine oil in the VCT actuator assembly. As the PCM controls the duty cycle of the solenoid valve, oil pressure/flow advances or retards the cam timing. Duty cycles near 0% or 100% represent rapid movement of the camshaft. Retaining a fixed camshaft position is accomplished by dithering (oscillating) the solenoid valve duty cycle.

   The PCM calculates and determines the desired camshaft position. It continually updates the VCT solenoid duty cycle until the desired position is achieved. A difference between the desired and actual camshaft position represents a position error in the PCM VCT control loop. The PCM disables the VCT and places the camshaft in a default position if a concern is detected. A related DTC also sets when the concern is detected.

5. When the VCT solenoid is energized, engine oil is allowed to flow to the VCT actuator assembly which advances or retards the camshaft timing. One half of the VCT actuator is coupled to the camshaft and the other half is connected to the timing chain. Oil chambers between the 2 halves couple the camshaft to the timing chain. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the camshaft to rotate in either an advance or retard position depending on the oil flow.

ON BOARD DIAGNOSTICS (OBD) MONITORS > OBD I, OBD II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW

The California Air Resources Board (CARB) began regulating OBD systems for vehicles sold in California beginning with the 1988 model year. The initial requirements, known as OBD I, required identifying the likely area of concern with regard to the fuel metering system, exhaust gas recirculation (EGR) system, emission related components and the PCM. A malfunction indicator lamp (MIL) was required to illuminate and alert the driver of the concern and the need to repair the emission control system. A DTC was required to assist in identifying the system or component associated with the concern.

Starting with the 1994 model year, both CARB and the Environmental Protection Agency (EPA) mandated enhanced OBD systems, commonly known as OBD II. The objectives of the OBD II system are to improve air quality by reducing high in-use emissions caused by emission related concerns, reducing the time between the occurrence of a concern and its detection and repair, and assisting in the diagnosis and repair of emission related problems.

ON BOARD DIAGNOSTICS (OBD) MONITORS > OBD I, OBD II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW > OBD I SYSTEMS

OBD I vehicles use the same PCM, controller area network (CAN) serial data communication link, J1962 Data Link Connector, and PCM software as the corresponding OBD II vehicle. The only difference is the possible removal of the rear oxygen sensors, fuel tank pressure (FTP) sensor, EVAP canister vent valve, and a different PCM calibration. Starting in the 2006 model year, all Federal vehicles from 8, 500 to 14, 000 lbs. Gross Vehicle Weight Rating (GVWR) will have been phased into OBD II and OBD I systems will no longer be utilized in vehicles up to 14, 000 lbs. GVWR.

ON BOARD DIAGNOSTICS (OBD) MONITORS > OBD I, OBD II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW > OBD II SYSTEMS

The OBD II system monitors virtually all emission control systems and components that can affect tailpipe or evaporative emissions. In most cases, concerns must be detected before emissions exceed 1.5 times the applicable 120, 000 or 150, 000 mile emission standards. Partial zero emission vehicles (PZEV) and super ultra low emission vehicles (SULEV-II) can use 2.5 times the standard in place of the 1.5 times the standard. If a system or component exceeds emission thresholds or does not operate within a manufacturer's specifications, a DTC is stored and the MIL is illuminated within 2 drive cycles.

The OBD II system monitors for concerns either continuously (regardless of driving mode) or non-continuously (once per drive cycle during specific drive modes). A pending DTC is stored in the PCM keep alive memory (KAM) when a concern is initially detected. Pending DTCs are displayed as long as the concern is present. OBD regulations require a complete concern free monitoring cycle to occur before erasing a pending DTC. This means that a pending DTC is erased on the next power up after a concern free monitoring cycle. However, if the concern is still present after 2 consecutive drive cycles, the MIL is illuminated. Once the MIL is illuminated, 3 consecutive drive cycles without a concern being detected are required to extinguish the MIL. The DTC is erased after 40 engine warm-up cycles once the MIL is extinguished.

In addition to specifying and standardizing much of the diagnostics and MIL operation, OBD requires the use of a standard data link connector (DLC), standard communication links and messages, standardized DTCs and terminology. Examples of standard diagnostic information are freeze frame data and inspection/maintenance (I/M) readiness indicators.

Freeze frame data describes data stored in KAM at the point the concern is initially detected and the pending DTC is stored. Freeze frame data consists of parameters such as engine RPM, engine load, vehicle speed or throttle position. Freeze frame data is updated when the concern is detected again on a subsequent drive cycle and a confirmed DTC is stored; however, a previously stored freeze frame is overwritten if a higher priority fuel or misfire concern is detected. This data is accessible with the scan tool to allow duplicating the conditions when the concern occurred in order to assist in repairing the vehicle.

OBD I/M readiness indicators show whether all of the OBD monitors have been completed since the last time the KAM or the PCM DTCs have been cleared. Ford vehicles blink the MIL after 15 seconds of ignition ON engine OFF time to indicate that some monitors have not completed. In some states, it may be necessary to carry out an OBD check in order to renew a vehicle registration. The I/M readiness indicators must show that all monitors have been completed prior to the OBD check.

Starting in the 1996 model year, OBD II was required on all California and California State gasoline engine vehicles up to 14, 000 lbs. GVWR. Starting in the 1997 model year, diesel engine vehicles up to 14, 000 lbs. GVWR required OBD II.

California states are ones that have adopted California emission regulations, starting in the 1998 model year. For example, Connecticut, Maine, Massachusetts, New Jersey, New York, Oregon, Pennsylvania, Rhode Island, Vermont and Washington have adopted California's emission regulations. These states receive California-certified vehicles for passenger cars, light trucks, and medium-duty vehicles up to 14, 000 lbs GVWR.

Starting in the 1996 model year, OBD II was also required on all Federal gasoline engine vehicles up to 8, 500 lbs. GVWR. Starting in the 1997 model year, diesel engine vehicles up to 8, 500 lbs. GVWR required OBD II.

Starting in the 2004 model year, Federal vehicles over 8, 500 lbs. are required to phase in OBD II. Starting in the 2004 model year, gasoline fueled medium duty passenger vehicles (MDPVs) are required to have OBD II. By the 2006 model year, all Federal vehicles from 8, 500 to 14, 000 lbs. GVWR will have been phased into OBD II.

ON BOARD DIAGNOSTICS (OBD) MONITORS > OBD I, OBD II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW > HEAVY DUTY (HD) OBD II SYSTEMS

Starting in the 2010 model year, California and Federal gasoline fueled and diesel fueled on road heavy duty engines used in vehicles over 14, 000 lbs. GVWR are required to phase into HD OBD II. All vehicles over 14, 000 lbs. GVWR must comply for the 2013 model year. Vehicles that do not comply with HD OBD II during the phase in period must comply with EMD+.

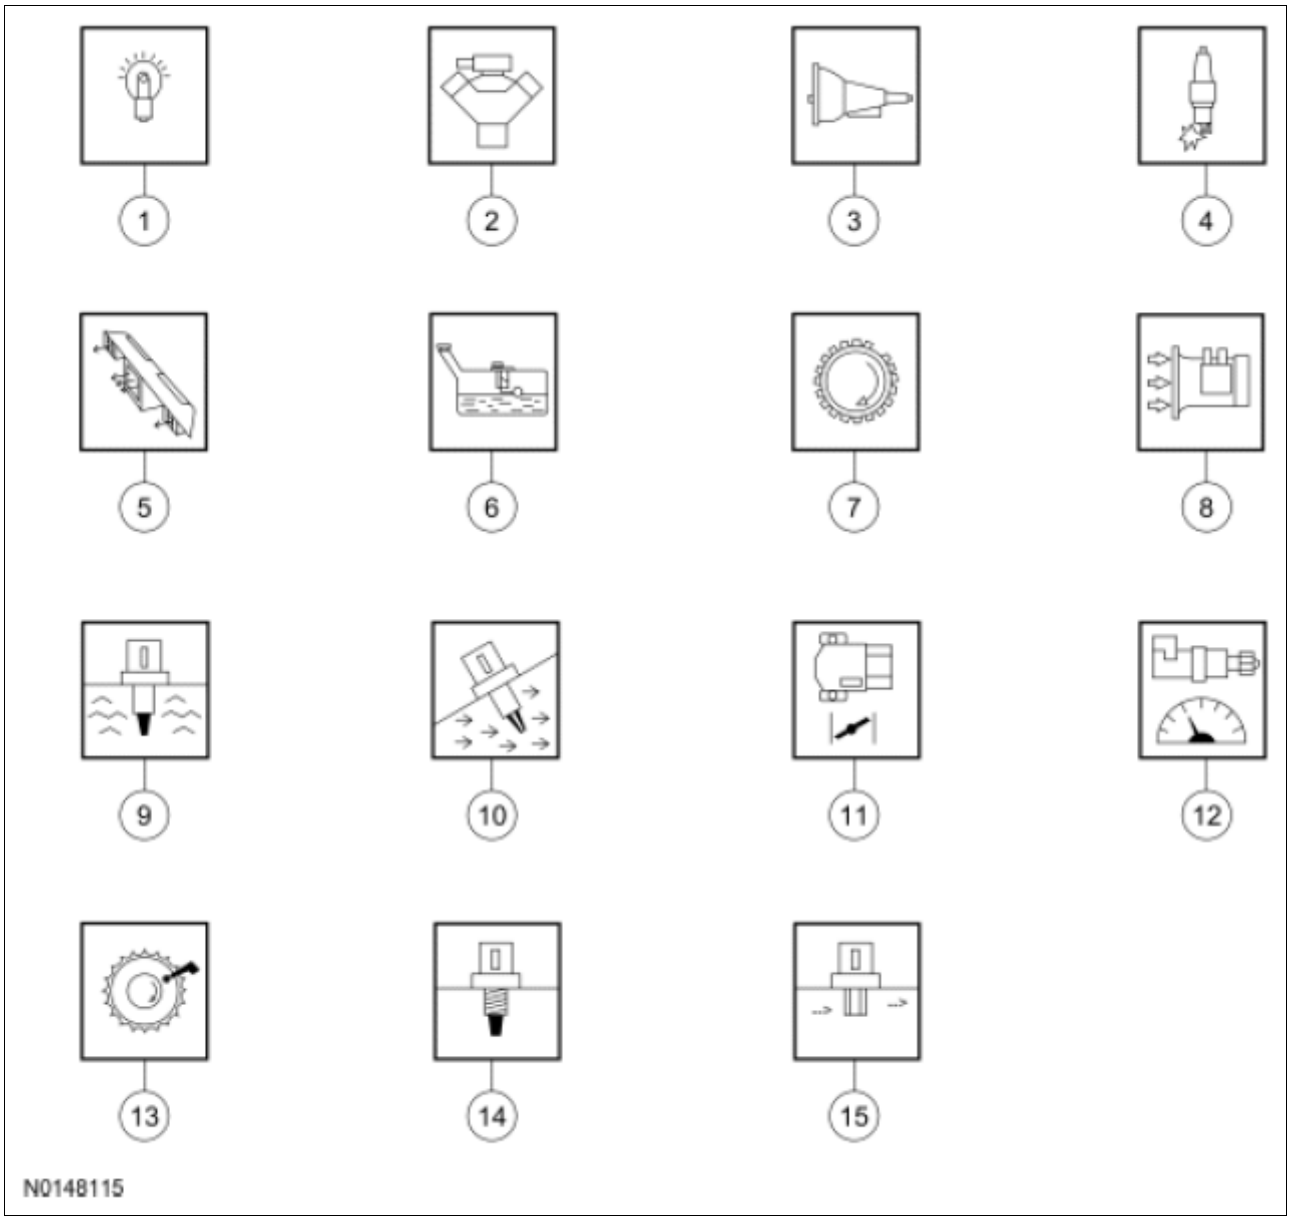
ON BOARD DIAGNOSTICS (OBD) MONITORS > OBD I, OBD II AND ENGINE MANUFACTURER DIAGNOSTICS (EMD) OVERVIEW > EMD SYSTEMS

EMD was required on all 2007 model year and beyond California gasoline and diesel fueled on road heavy duty engines used in vehicles over 14, 000 lbs GVWR. EMD systems are required to functionally monitor the fuel delivery system, exhaust gas recirculation (EGR) system, particulate matter trap, as well as emission related PCM inputs for circuit continuity and rationality, and emission related outputs for circuit continuity and functionality. For gasoline engines which have no particulate matter trap, EMD requirements are very similar to current OBD I system requirements. As such, OBD I system philosophy is employed, the only change being the addition of some comprehensive component monitor (CCM) rationality and functionality checks.

The EMD vehicles use the same PCM, CAN, serial data communication link, J1962 DLC, and PCM software as the corresponding OBD II vehicle. The only difference is the possible removal of the rear oxygen sensors, FTP sensor, EVAP canister vent valve, and a different PCM calibration.

Starting in the 2010 model year, EMD requires functional monitoring of the NO_X aftertreatment system on gasoline engines. This requirement is commonly known as EMD+.

The following list indicates what monitors and functions have been altered from OBD II for gasoline engine EMD calibrations:



Monitor/Feature	Calibration for Gasoline Engines
Catalyst Monitor	Functional catalyst monitor required starting in the 2010 model year.
Misfire Monitor	Calibrated in for repair, all DTCs are non-MIL. Catalyst damage misfire criteria calibrated out, emission threshold criteria set to 4%, enabled between 66°C (150°F) and 104°C (220°F), 254 second startup delay.
Oxygen Sensor Monitor	Front O2 sensor lack of switching tests and all circuit and heater tests calibrated in, response or delay test calibrated out. Rear O2 sensor functional tests and all circuit and heater tests calibrated in, response or delay test calibrated out.
EGR or VCT Monitor	Same as OBD II calibration except that DTC P0402 test uses a higher threshold.
Fuel System Monitor	Fuel system monitor and fore aft oxygen sensor (FAOS) monitor same as OBD II calibration, Air Fuel Ratio Imbalance monitor calibrated out.
Evaporative Emission (EVAP) System Monitor	EVAP system leak check calibrated out, fuel level input circuit checks retained as non-MIL. Fuel tank pressure sensor and EVAP canister vent valve may be deleted.
PCV Monitor	Same hardware and function as OBD II.
Thermostat Monitor	Thermostat monitor calibrated out.
Comprehensive Component Monitor (CCM)	All circuit checks, rationality and functional tests are the same as OBD II.
Communication Protocol and DLC	Same as OBD II, all generic and enhanced scan tool modes work the same as OBD II, but reflect the EMD calibration that contains fewer supported monitors. OBD supported PID indicates EMD.
MIL Control	Same as OBD II, it takes 2 drive cycles to illuminate the MIL.

The following monitor descriptions provide a general description of each OBD monitor. In these descriptions the monitor strategy, hardware, testing requirements, and methods are presented to provide an overall understanding of monitor operation. An illustration of each monitor may also be provided. These illustrations should be used as typical examples and are not intended to represent all possible vehicle configurations.

Each illustration depicts the PCM as the main focus with primary inputs and outputs for each monitor. The icons to the left of the PCM represent the inputs used by each of the monitor strategies to enable or activate the monitor. The components and subsystems to the right of the PCM represent the hardware and signals used while carrying out the tests and the systems being tested. The CCM illustration has numerous components and signals involved which are illustrate generically. When referring to the illustrations, match the numbers to the corresponding numbers in the monitor descriptions for a better understanding of the monitor and associated DTCs.

These icons are used in the illustrations of the OBD monitors and throughout this service information.

AIR FUEL RATIO IMBALANCE MONITOR

The air fuel ratio imbalance monitor is an on board diagnostic strategy designed to monitor the cylinder to cylinder air fuel ratio per engine bank.

1. The air fuel ratio imbalance monitor estimates the cylinder to cylinder difference using the universal heated oxygen sensor (HO2S) high frequency signal. The difference between two consecutive universal HO2S signals is continuously monitored and a differential signal value is calculated. If the difference between two consecutive samples exceeds a calibrated threshold, a cylinder to cylinder deviation is estimated and the differential signal accumulation is calculated. The differential signal accumulation is calculated continuously after vehicle startup and during closed loop fuel conditions during a short calibrated RPM window. Typically the window has over 50 engine revolutions. The differential signal accumulation is then compared to a calibrated signal threshold. The counter is incremented if the threshold is exceeded. At the same time, the total RPM window counter calculates number of completed RPM windows. When the monitor completes a calibrated number of total RPM windows, the air fuel ratio imbalance index is calculated. The monitor index is a ratio of failed RPM windows over total RPM windows required to complete the monitor. If the monitor index exceeds the threshold value the test fails.
2. The malfunction indicator lamp (MIL) is activated after a concern is detected on 2 consecutive drive cycles.

CATALYST EFFICIENCY MONITOR

The catalyst efficiency monitor uses an oxygen sensor before and after the catalyst to infer the hydrocarbon (HC) efficiency based on the oxygen storage capacity of the catalyst. Under normal closed loop fuel conditions, high efficiency catalysts have significant oxygen storage. This makes the switching frequency of the rear heated oxygen sensor (HO2S) very slow and reduces the amplitude, which provides for a shorter signal length. As the catalyst efficiency deteriorates due to thermal and chemical deterioration, the catalyst ability to store oxygen declines. The post catalyst or downstream HO2S signal begins to switch more rapidly with increasing amplitude and signal length. The predominant failure mode for high mileage catalysts is chemical deterioration (phosphorus deposits on the front brick of the catalyst), not thermal deterioration.

The catalyst monitor calculates the rear HO2S signal lengths for 10 to 20 seconds during part throttle, closed loop fuel conditions after the engine is warmed up, the inferred catalyst temperature is within limits, and fuel tank vapor purge is disabled. The catalyst monitor is enabled for 10 to 20 seconds per drive cycle. When the catalyst monitor is active, the PCM commands a fixed fuel control routine. During monitor operation the rear HO2S signal lengths are continually calculated. The calculated rear HO2S signal length is then divided by a calibrated signal length, which has compensation for mass airflow. The calibrated signal length is based on the signal length of an HO2S placed after a catalyst without a washcoat. An index ratio near 0.0 indicates high oxygen storage capacity and high HC efficiency. An index ratio near 1.0 indicates low oxygen storage capacity and low HC efficiency. If the actual index ratio exceeds the threshold index ratio, the catalyst is considered failed.

Inputs from engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), mass airflow (MAF), crankshaft position (CKP), throttle position (TP), and vehicle speed sensors are required to enable the catalyst efficiency monitor.

Typical Monitor Entry Conditions:

- Minimum 330 seconds since start up at 21°C (70°F)
- Engine coolant temperature is between 76.6°C - 110°C (170°F - 230°F)

- Intake air temperature is between -7°C - 82°C (20°F - 180°F)
- Time since entering closed loop is 30 seconds
- Inferred rear HO2S temperature of 482°C (900°F)
- EGR is between 1% and 12%
- Part throttle, maximum rate of change is 0.2 volts/0.050 sec
- Vehicle speed is between 8 and 112 km/h (5 and 70 MPH)
- Fuel level is greater than 15%
- First Airflow Cell

  Engine RPM 1, 000 to 1, 300 RPM

  Engine load 15 to 35%

  Inferred catalyst temperature 454°C - 649°C (850°F - 1, 200°F)

  Number of universal HO2S switches is 50
- Second Airflow Cell

  Engine RPM 1, 200 to 1, 500 RPM

  Engine load 20 to 35%

  Inferred catalyst temperature 482°C - 677°C (900°F - 1, 250°F)

  Number of universal HO2S switches is 70
- Third Airflow Cell

  Engine RPM 1, 300 to 1, 600 RPM

  Engine load 20 to 40%

  Inferred catalyst temperature 510°C - 704°C (950°F - 1, 300°F)

  Number of universal HO2S switches is 30

Six drive cycles may be required to illuminate the malfunction indicator lamp (MIL) during normal customer driving, because an exponentially weighted moving average algorithm is used to determine a concern. If the keep alive memory (KAM) is reset, a concern illuminates the MIL in 2 drive cycles.

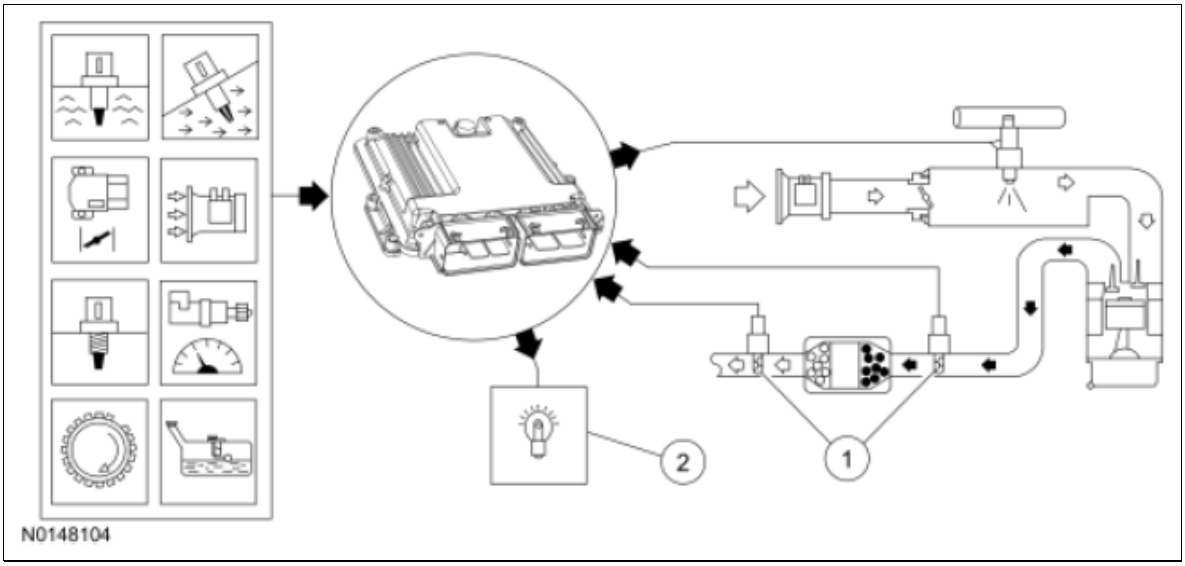
CATALYST EFFICIENCY MONITOR > GENERAL CATALYST MONITOR OPERATION

The catalyst monitor duration is 12 seconds, once per drive cycle. If the catalyst monitor conditions are met, the catalyst monitor may run and complete after all of the upstream HO2S functional tests are complete and the EVAP system is functional, with no stored DTCs; however, the catalyst monitor may run and complete before the downstream HO2S deceleration fuel shut off test is complete. In this case, the catalyst monitor inspection maintenance (I/M) readiness flag may indicate complete before the O2S I/M readiness flag indicates complete. If the catalyst monitor does not complete during a particular

driving cycle, the already accumulated switch/signal data is retained in the KAM and is used during the next driving cycle to allow the catalyst monitor a better opportunity to complete.

Some vehicles that are part of the low emission vehicle (LEV) catalyst monitor phase in, monitor less than 100% of the catalyst volume. Often this is the first catalyst brick of the catalyst system. Partial volume monitoring is done on LEV and ultra low emission vehicle (ULEV) vehicles in order to meet the 1.75 emission standard. The rationale for this strategy is the catalyst nearest the engine deteriorates first, allowing the catalyst monitor to be more sensitive and illuminate the MIL correctly at lower emission standards.

Some applications use partial volume monitoring, where the rear HO2S is located after the first light off catalyst can or after the second catalyst can in a three can per bank system (a few applications placed the HO2S in the middle of the catalyst can, between the first and second bricks). For additional HO2S information, refer to the HEATED OXYGEN SENSOR (HO2S) MONITOR in this service information.



Index ratios for ethanol (flex fuel) vehicles vary based on the changing concentration of alcohol in the fuel. The threshold to determine a concern typically increases as the percent of alcohol increases. For example, a threshold of 0.5 may be used at E10 (10% ethanol) and 0.9 may be used at E85 (85% ethanol). The thresholds are adjusted based on the percentage of alcohol in the fuel. Standard fuel may contain up to 10% ethanol.

The PCM calibration prevents the catalyst monitor from running on a new vehicle until 60 minutes of time has accumulated with the catalyst temperature greater than 426°C (800°F) or 483 km (300 miles) have accumulated. A replacement PCM or updated calibration does not prevent the catalyst monitor from running.

1. The HO2S can be located in various configurations to monitor different kinds of exhaust systems. Inline engines and many V engines are monitored by their individual bank. A rear HO2S is used along with the front, fuel control universal HO2S for each bank. Two sensors are used on an inline engine and 4 sensors are used on a V engine. Some V engines have exhaust banks that combine into a single underbody catalyst. These systems are referred to as Y pipe systems. They use only one rear HO2S along with the 2 front, fuel control universal HO2S. The Y pipe system uses 3 sensors in all. For Y piped systems, the 2 front universal HO2S signals are combined by the PCM software to infer what the exhaust oxygen content would have been in front of the monitored catalyst. The inferred front exhaust oxygen content and the rear HO2S signal is then used to calculate the index ratio.

2. The malfunction indicator lamp (MIL) is activated after a concern is detected on 2 consecutive drive cycles.

Fig 1: Catalyst Efficiency Monitor Flow Diagram

Courtesy of FORD MOTOR CO.

CATALYST EFFICIENCY MONITOR > INTEGRATED AIR FUEL CATALYST MONITOR

The integrated air fuel catalyst monitor is an on board strategy designed to monitor the oxygen storage capacity of the catalyst after a deceleration fuel shut off (DFSO) event. The monitor determines the amount of fuel needed to drive the catalyst to a rich condition when starting from an oxygen saturated, lean condition. The monitor is a measure of how much fuel is required to force the catalyst from a lean to a rich condition. The monitor runs during fuel reactivation following a DFSO event. The monitor completes after a calibrated number of DFSO monitoring events have occurred.

COLD START EMISSION REDUCTION MONITOR > OVERVIEW

The cold start emission reduction monitor is an on board strategy designed for vehicles that meet the low emissions vehicle-II (LEV-II) emissions standards. The monitor works by detecting the lack of catalyst warm up resulting from a failure to apply sufficient cold start emission reduction during a cold start. There are 2 types of monitors:

- cold start emission reduction component monitor
- cold start emission reduction system monitor

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR

The engine speed monitor and the spark timing monitor are carried out during the cold start emission reduction component monitor. The engine speed monitor checks the average difference between the actual and desired engine speeds. The spark timing monitor compares the average difference between desired and commanded spark to a calibrated threshold.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > ENGINE SPEED AND SPARK TIMING MONITOR

The system monitor and component monitor share the same entry conditions and monitor flow. During the first 15 seconds of a cold start, the monitor checks the entry conditions, counts time in idle, observes catalyst temperature, calculates the average difference between desired and actual engine speed, and calculates the average difference between desired and commanded spark.

If the expected change in catalyst temperature is large enough, the monitor then begins a waiting period of 300 seconds after engine start. This waiting period allows time to diagnose other components and systems that affect the validity of the test. During this waiting period, there are no constraints on drive cycle and the monitor cannot be disabled without turning OFF the ignition.

If the system monitor result falls below its threshold and all of the component monitor results are below their respective thresholds, the monitor determines if the idle time was sufficient. If the idle time was sufficient the test is considered to be a pass and the monitor is complete. If idle time was not sufficient, the monitor will not make a pass call and does not complete. This prevents tip-ins from resulting in false passes.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > COLD START ENGINE SPEED MONITOR OPERATION

Once the waiting period is complete, the monitor compares the average difference between desired and commanded spark to a calibrated threshold that is a function of the engine coolant temperature at start. If the difference exceeds the calibrated threshold, a DTC sets.

- DTC: P050A Cold start idle air control system performance
- Monitor execution: Once per driving cycle, during the first 15 seconds of a cold start
- Monitor sequence: None
- Monitoring duration: Data gathering occurs during the first 15 seconds of a cold start. The decision to set P050A is made 300 seconds after start. This delay gives time for other diagnostics (for example, misfire monitor) to determine if another DTC should set instead of P050A.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > ENGINE SPEED MONITOR ENTRY CONDITIONS

- Barometric pressure of 76.2 kPa (22.5 in-Hg) or greater
- Engine coolant temperature at start is between -17.8°C (35°F) and 37.8°C (100°F)
- Catalyst temperature at start is between -17.8°C (35°F) and 51.7°C (125°F)

- Fuel level is above 15%
- Injector cutout torque reduction is inactive
- Power take off (PTO) operation is disabled

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > COLD START SPARK TIMING MONITOR OPERATION

Once the waiting period is complete, the monitor compares the average difference between desired and commanded spark to a calibrated threshold that is a function of the engine coolant temperature at start. If the difference exceeds the calibrated threshold, a DTC is set.

- DTC: P050B Cold start ignition timing performance
- Monitor execution: Once per driving cycle, during the first 15 seconds of a cold start
- Monitor sequence: None
- Monitoring duration: Data gathering occurs during the first 15 seconds of a cold start. The decision to set P050B is made 300 seconds after start. This delay gives time for other diagnostics (for example, misfire monitor) to determine if another DTC should set instead of P050B.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > SPARK TIMING MONITOR ENTRY CONDITIONS

- Barometric pressure of 76.2 kPa (22.5 in-Hg) or greater
- Engine coolant temperature at start is between -17.8°C (35°F) and 37.8°C (100°F)
- Catalyst temperature at start is between -17.8°C (35°F) and 51.7°C (125°F)
- Fuel level is above 15%
- Injector cutout torque reduction is inactive
- PTO operation is disabled

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION COMPONENT MONITOR > COLD START VARIABLE CAM TIMING (VCT) MONITOR

If the VCT cam phasing is used during a cold start to improve catalyst heating, the VCT system checks the functionality by monitoring the closed loop cam position error correction. If the correct cam position cannot be maintained and the system has an advance or retard error greater than the malfunction threshold, a cold start emission reduction VCT control malfunction is indicated.

- DTC: P052A Cold start camshaft position timing over-advanced (Bank 1)
- DTC: P052B Cold start camshaft timing over-retarded (Bank 1)
- DTC: P052C Cold start camshaft timing over-advanced (Bank 2)
- DTC: P052D Cold start camshaft timing over-retarded (Bank 2)
- Monitor execution: Continuous
- Monitor sequence: None
- Monitoring duration: 5 seconds

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION SYSTEM MONITOR

The PCM uses the cold start emission reduction system monitor to calculate the actual catalyst warm up temperature during a cold start. The actual catalyst warm up temperature calculation uses measured engine speed, measured air mass and commanded spark timing inputs to the PCM. The PCM then compares the actual temperature to the expected catalyst temperature. The expected catalyst temperature calculation uses desired engine speed, desired air mass and desired spark timing inputs to the PCM. The difference between the actual and expected temperatures is reflected in a ratio. This ratio is a measure of how much loss of catalyst heating occurred over the period of time and when compared with a calibrated threshold it helps the PCM to determine if the cold start emission reduction system is working correctly. This ratio correlates to tailpipe emissions, and a malfunction indicator lamp (MIL) illuminates and a DTC sets when the calibrated threshold is exceeded. The monitor is disabled if a concern is present in any of the sensors or systems used for expected catalyst temperature model calculation.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION SYSTEM MONITOR > COLD START EMISSION REDUCTION SYSTEM MONITOR OPERATION

- DTC: P050E Cold start engine exhaust temperature too low
- Monitor execution: Once per driving cycle, during the first 15 seconds of a cold start
- Monitor sequence: None
- Monitoring duration: Data gathering occurs during the first 15 seconds of a cold start. The decision to set P050E is made 300 seconds after start. This delay gives time for other diagnostics (for example, misfire monitor) to determine if another DTC should set instead of P050E.

COLD START EMISSION REDUCTION MONITOR > COLD START EMISSION REDUCTION SYSTEM MONITOR > COLD START EMISSION REDUCTION SYSTEM MONITOR ENTRY CONDITIONS

- Barometric pressure is above 74.5 kPa (22 in-Hg)
- Engine coolant temperature at the start of the monitor is between 1.67°C (35°F) and 37.78°C (100°F)
- Catalyst temperature at the start of the monitor is between 1.67°C (35°F) and 51.67°C (125°F)
- Fuel level is above 15%
- Injector cutout torque reduction is inactive
- PTO operation is disabled

COMPREHENSIVE COMPONENT MONITOR (CCM)

The CCM checks for concerns in any powertrain electronic component or circuit that provides input or output signals to the PCM that can affect emissions and is not monitored by another on board diagnostics (OBD) monitor. Inputs and outputs are, at a minimum, monitored for circuit continuity or correct range of values. Where feasible, inputs are checked for rationality and outputs are checked for correct functionality.

The CCM covers many components and circuits and tests them in various ways depending on the hardware, function, and type of signal. For example, analog inputs such as throttle position or engine coolant temperature are typically checked for opens, shorts, and out of range values. This type of monitoring is carried out continuously. Some digital inputs like brake switch or crankshaft position rely on rationality checks that are checking to see if the input value makes sense at the current engine operating conditions. These types of tests may require monitoring several components and can only be carried out under the appropriate test conditions.

Outputs such as coil drivers are checked for opens and shorts by monitoring a feedback circuit or smart driver associated with the output. Other outputs, such as relays, require additional feedback circuits to monitor the secondary side of the relay. Some outputs are also monitored for correct function by observing the reaction of the control system to a given change in the output command. An idle air control solenoid can be functionally tested by monitoring the idle RPM relative to the target idle RPM. Some tests can only be carried out under the appropriate test conditions. For example, the transmission shift solenoids can only be tested when the PCM commands a shift.

The following is an example of some of the input and output components monitored by the CCM. The component monitor may belong to the engine, ignition, transmission, air conditioning, or any other PCM supported subsystem.

1. Inputs:

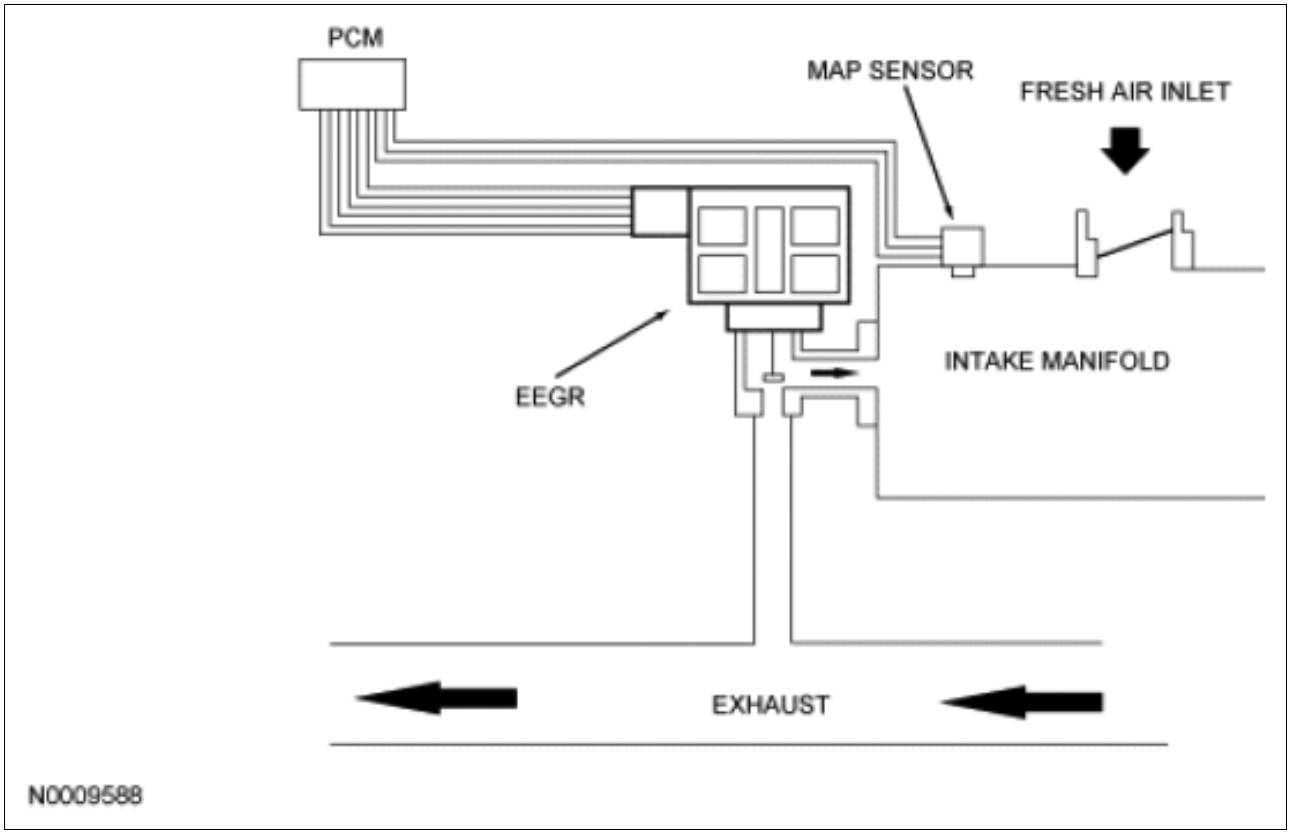
   Air conditioning pressure (ACP) transducer sensor, camshaft position (CMP) sensor, crankshaft position (CKP) sensor, engine coolant temperature (ECT) sensor, fuel rail pressure temperature (FRPT) sensor, fuel tank pressure (FTP) sensor, intake air temperature (IAT) sensor, mass airflow (MAF) sensor (if equipped), throttle position (TP) sensor.

2. Outputs:

   EVAP purge valve, EVAP canister vent valve, fuel injector, fuel pump (FP), shift solenoid, torque converter clutch (TCC) solenoid, variable camshaft timing (VCT) actuator, wide open throttle A/C cutout (WAC).

3. The CCM is enabled after the engine starts and is running. A DTC is stored in keep alive memory (KAM) and the malfunction indicator lamp (MIL) is illuminated after 2 driving cycles when a concern is detected. Many of the CCM tests are also carried out during an on demand self-test.

Fig 1: CCM Flow Diagram



Courtesy of FORD MOTOR CO.

ELECTRIC EXHAUST GAS RECIRCULATION (EEGR) SYSTEM MONITOR

The EEGR system monitor is an on board strategy designed to test the integrity and flow characteristics of the EGR system. The EEGR system monitor consists of an electrical and functional test that checks the stepper motor and the EEGR system for correct flow. The powertrain control module (PCM) controls the EEGR valve by commanding from 0 to 52 discrete increments or steps to get the valve from the fully closed position to the fully open position. The stepper motor electrical test is a continuous check of the 4 electric stepper motor coils and circuits to the PCM. A concern is indicated if an open circuit, short to voltage, or short to ground has occurred in one or more of the stepper motor coils or circuits for a calibrated period of time. If a concern has been detected, the EEGR system is disabled, setting a diagnostic trouble code (DTC). Additional monitoring is suspended for the remainder of the drive cycle, or until the next engine start.

The intake manifold pressure is higher when EGR is flowing than when it is not flowing. Therefore, when the exhaust gas is delivered into the intake manifold, the manifold absolute pressure (MAP) sensor reading increases. The detection of EGR flow occurs by monitoring this increase in pressure. If the difference in the pressure between EGR commanded ON versus commanded OFF is below a minimum threshold, then an EGR valve concern has occurred.

Fig 1: EEGR System Monitor Flow Diagram

Courtesy of FORD MOTOR CO.

ENGINE OFF TIMER MONITOR

The engine off time is obtained from the powertrain control module (PCM) or the body control module (BCM). If the engine off time is obtained from the BCM, the PCM expects to receive a message with the engine off time from the BCM shortly after engine start up. If the message is not available on the controller area network (CAN) or a battery disconnect has occurred, a communication DTC sets.

There are two parts to this test.

The first part determines if the timer is incrementing during engine OFF. The PCM determines the timer is incrementing during engine OFF by comparing the engine coolant temperature value prior to shut down, to the engine coolant temperature value at ignition ON to determine if an engine OFF soak has occurred. For an engine OFF soak to occur, the engine coolant temperature value must be greater than 71°C (160 °F) while the engine is running. The timer starts at ignition OFF and the engine coolant temperature value must decrease by greater than 17°C (30 °F) before the next ignition ON signal. If the engine off timer indicates a value less than 30 seconds, a DTC sets.

The second part checks the accuracy of the engine off timer. The PCM determines the accuracy of the engine off timer by comparing time in the BCM with the time in the PCM. The timer in the BCM is allowed to count up for 5 minutes and compared to a different clock in the PCM. If the two timers differ by more than 15 seconds, a DTC sets.

ENHANCED THERMOSTAT MONITOR

The enhanced thermostat monitor helps to reduce the time it takes to identify a thermostat concern. This monitor is executed once per drive cycle during a cold start and has a run duration of 300 seconds.

During a cold start, when the thermostat should be closed, the enhanced thermostat monitor uses intake air temperature, engine speed, and engine load to predict the engine coolant temperature. Once the predicted temperature has exceeded a target temperature for a length of time, the actual engine coolant temperature is compared to its required threshold. This threshold is 11°C (20°F) below the thermostat regulating temperature. If the engine coolant temperature exceeds this threshold, the thermostat is functioning correctly. If the engine coolant temperature is too low, the thermostat may be stuck open and DTC P0128 sets.

EVAPORATIVE EMISSION (EVAP) LEAK CHECK MONITOR

The EVAP leak check monitor is an on board strategy designed to detect a leak from an opening equal to or greater than 0.508 mm (0.020 inch) in the enhanced EVAP system. The correct function of the individual components of the enhanced EVAP system, as well as its ability to flow fuel vapor to the engine, is also examined. The EVAP leak check monitor relies on the individual components of the enhanced EVAP system to either allow a natural vacuum to occur in the fuel tank or apply engine vacuum to the fuel tank and then seal the entire enhanced EVAP system from the atmosphere. The fuel tank pressure is then monitored to determine the total vacuum lost (bleed up) for a calibrated period of time. Inputs from the engine coolant temperature (ECT) sensor or cylinder head temperature (CHT) sensor (if equipped), intake air temperature (IAT) sensor, mass airflow (MAF) sensor (if equipped), vehicle speed, fuel level input (FLI) and fuel tank pressure (FTP) sensor, are required to enable the EVAP leak check monitor.

During the EVAP leak check monitor repair verification drive cycle, clearing the continuous diagnostic trouble codes (DTCs) and resetting the emission monitors information in the PCM, bypasses the minimum soak time required to complete the monitor. The EVAP leak check monitor does not run if the ignition is turned OFF after clearing the continuous DTCs and resetting the emission monitors information in the PCM. The EVAP leak check monitor does not initiate until the heated oxygen sensor (HO2S) monitor is complete.

If the vapor generation is high on some vehicle enhanced EVAP systems, where the monitor does not pass, the result is treated as a no test. Therefore, the test is complete for the day.

Some vehicle applications have an engine OFF natural vacuum (EONV) check as part of the EVAP leak check monitor.

EVAPORATIVE EMISSION (EVAP) LEAK CHECK MONITOR > ENGINE ON EVAP LEAK CHECK MONITOR

The engine on EVAP leak check monitor is executed by the individual components of the enhanced EVAP system as follows:

1. The EVAP purge valve controls the flow of vacuum from the engine and creates a target vacuum on the fuel tank.
2. The EVAP canister vent valve seals the EVAP system from the atmosphere. It is closed by the

PCM (100% duty cycle) to allow the EVAP purge valve to achieve the target vacuum on the fuel tank.

3. The FTP sensor is used by the engine on EVAP leak check monitor to determine if the target vacuum necessary to carry out the leak check on the fuel tank is reached. Some vehicle applications with the engine on EVAP leak check monitor use a remote inline FTP sensor. Once the target vacuum on the fuel tank is achieved, the change in fuel tank vacuum over a calibrated period of time determines if a leak exists.

4. If the initial target vacuum cannot be reached, DTC P0455 (gross leak detected) sets. The engine on EVAP leak check monitor aborts and does not continue with the leak check portion of the test.

   For some vehicle applications, if the initial target vacuum cannot be reached after a refueling event and the purge vapor flow is excessive, DTC P0457 (fuel cap off) sets.

   If the initial target vacuum is exceeded, a system flow concern exists and DTC P1450 (unable to bleed up fuel tank vacuum) is set. The engine on EVAP leak check monitor aborts and does not continue with the leak check portion of the test.

   If the vacuum increase is quicker than expected, a blocked fuel vapor tube is suspected and if confirmed after an intrusive test, DTC P144A sets.

   If the target vacuum is achieved on the fuel tank, the change in the fuel tank vacuum (bleed up) is calculated for a calibrated period of time. The calculated change in fuel tank vacuum is compared to a calibrated threshold for a leak from an opening of 1.016 mm (0.040 inch) in the enhanced EVAP system. If the calculated bleed up is less than the calibrated threshold, the enhanced EVAP system passes. If the calibrated bleed up exceeds the calibrated threshold, the test aborts. The test can be repeated up to 3 times.

   If the bleed up threshold is still being exceeded after 3 tests, a vapor generation test is carried out before DTC P0442 (small leak detected) sets. This is accomplished by returning the enhanced EVAP system to atmospheric pressure by closing the EVAP purge valve and opening the EVAP canister vent valve. Once the FTP sensor observes the fuel tank is at atmospheric pressure, the EVAP canister vent valve closes and seals the enhanced EVAP system.

   The fuel tank pressure build up over a calibrated period of time is compared to a calibrated threshold for pressure build up due to vapor generation.

   If the fuel tank pressure build up exceeds the threshold, the leak test results are invalid due to vapor generation. The engine on EVAP leak check monitor attempts to repeat the test again.

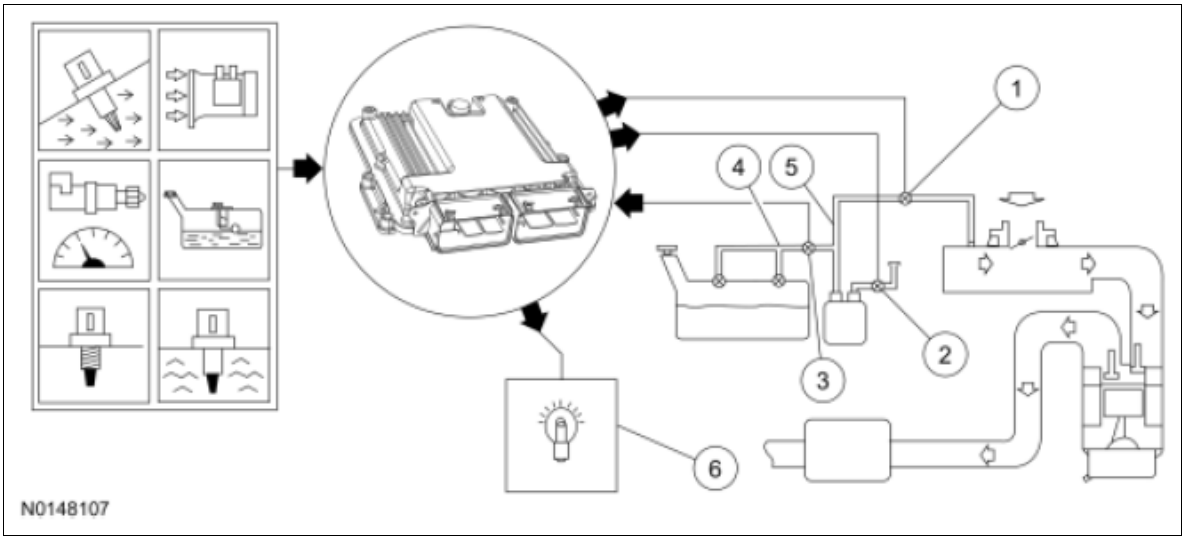
   If the fuel tank pressure build up does not exceed the threshold, the leak test results are valid and DTC P0442 sets.

5. If the 1.016 mm (0.040 inch) test passes, the test time is extended to allow the 0.508 mm (0.020 inch) test to run.

   The calculated change in fuel vacuum over the extended time is compared to a calibrated threshold for a leak from a 0.508 mm (0.020 inch) opening.

   If the calculated bleed up exceeds the calibrated threshold, the vapor generation test is run. If the vapor generation test passes (no vapor generation), an internal flag sets in the PCM to run a 0.508 mm (0.020 inch) test at idle (vehicle stopped).

   On the next start following a long engine OFF period, the enhanced EVAP system is sealed



and evacuated for the first 10 minutes of operation.

If the appropriate conditions are met, a 0.508 mm (0.020 inch) leak check is conducted at idle.

If the test at idle fails, DTC P0456 sets. There is no vapor generation test with the idle test.

6. The malfunction indicator lamp (MIL) is activated any enhanced EVAP system component DTCs.

EVAPORATIVE EMISSION (EVAP) LEAK CHECK MONITOR > ENGINE OFF NATURAL VACUUM (EONV) EVAP LEAK CHECK MONITOR

The EONV EVAP leak check monitor is executed during ignition OFF, after the engine on EVAP leak check monitor is completed. The EONV EVAP leak check monitor determines a leak is present when the naturally occurring change in fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low power consuming, microprocessor in the PCM manages the EONV leak check. The engine OFF EVAP leak check monitor is executed by the individual components of the enhanced EVAP system as follows:

1. The EVAP purge valve is normally closed at ignition OFF.

2. The normally open EVAP canister vent valve remains open for a calibrated amount of time to allow the fuel tank pressure to stabilize with the atmosphere. During this time period the FTP sensor is monitored for an increase in pressure. If pressure remains below a calibrated limit the EVAP canister vent valve is closed by the PCM (100% duty cycle) and seals the EVAP system from the atmosphere.

3. The EONV EVAP leak check monitor uses the FTP sensor to determine if the target pressure or vacuum necessary to complete the EONV EVAP leak check monitor on the fuel tank is reached. Some vehicle applications with the EONV EVAP leak check monitor use a remote inline FTP sensor. If the target pressure or vacuum on the fuel tank is achieved within the calibrated amount of time, the test is complete.

4. The EONV EVAP leak check monitor uses the naturally occurring change in fuel tank pressure as a means to detect a leak in the EVAP system. At ignition OFF, a target pressure and vacuum is determined by the PCM. These target values are based on the fuel level and the ambient temperature at ignition OFF. As the fuel tank temperature increases, the pressure in the tank increases and as the temperature decreases a vacuum develops. If a leak is present in the EVAP system the fuel tank pressure or vacuum does not exceed the target value during the testing time period. The EONV EVAP leak check monitor begins at ignition OFF. After ignition OFF the normally open EVAP canister vent valve remains open for a calibrated amount of time to allow the fuel tank pressure to stabilize with the atmosphere. During this time period the FTP sensor is monitored for an increase in pressure. If pressure remains below a calibrated limit the EVAP canister vent valve is closed by the PCM (100% duty cycle) and seals the EVAP system from the atmosphere.

   If the pressure on the fuel tank decreases after the EVAP system is sealed, the EONV EVAP leak check monitor begins to monitor the fuel tank pressure. When the target vacuum is exceeded within the calibrated amount of time the test completes and the fuel tank pressure and time since ignition OFF information is stored. If the target vacuum is not reached in the calibrated amount of time, a leak is suspected and the fuel tank pressure and time since ignition OFF information is stored.

   If the pressure on the fuel tank increases after the EVAP system is sealed, but does not exceed the target pressure within a calibrated amount of time, the EVAP canister vent valve is opened to allow the fuel tank pressure to again stabilize with the atmosphere. After a calibrated amount of time the EVAP canister vent valve is closed by the PCM and seals the EVAP system. When the fuel tank pressure exceeds either the target pressure or vacuum within the calibrated amount of time, the test completes and the fuel tank pressure and time since ignition OFF information is stored. If the target pressure or vacuum is not reached in the calibrated amount of time, a leak is suspected and the fuel tank pressure and time since ignition OFF information is stored.

   On ISO 14229 vehicles, a fast initial response occurs during the first 4 tests after the battery is disconnected or the DTCs are cleared. The PCM processes unfiltered data to quickly indicate a fault is present. The MIL illuminates if the PCM suspects a leak within 2 consecutive trips after a DTC clear or a battery disconnect using the fast initial response logic.

   A step change logic becomes active after the 4th EONV monitor test. The step change logic detects an abrupt change from a no leak condition to a suspected leak condition. The MIL illuminates if the PCM suspects a leak within 2 consecutive trips using the step change logic.

   During the EONV monitor test the PCM uses an exponentially weighted moving average to filter test data. The PCM uses this average after the fourth EONV test and illuminates the MIL on the first trip when the exponentially weighted moving average is greater than a calibrated threshold.

   When a leak is suspected a DTC sets and the MIL is illuminated.

   On non ISO 14229 vehicles, when a leak is suspected, the PCM uses the stored fuel tank pressure and time since ignition OFF information from an average run of 4 tests to suspect a leak. Some vehicles use an alternative method of a single run of 5 tests to determine the presence of a leak. If a leak is still suspected after 2 consecutive runs of 4 tests, (8 total tests) or one run of 5 tests, a DTC sets and the MIL is illuminated.

5. The EONV EVAP leak check monitor is controlled by a separate low power consuming microprocessor inside the PCM. The fuel level input, fuel tank pressure, and battery voltage are inputs to the microprocessor. The microprocessor outputs are the EVAP canister vent

valve and the stored test information. If the separate microprocessor is unable to control the EVAP canister vent valve or communicate with other processors a DTC sets.

6. The MIL is activated for any enhanced EVAP system component DTCs.

FUEL SYSTEM MONITOR

The fuel system monitor is an on board strategy designed to monitor the fuel control system. The fuel control system uses fuel trim tables stored in the PCM keep alive memory (KAM) to compensate for the variability that occurs in fuel system components due to normal wear and aging. Fuel trim tables are based on air mass. During closed loop fuel control, the fuel trim strategy learns the corrections needed to correct a biased rich or lean fuel system. The correction is stored in the fuel trim tables. The fuel trim has 2 means of adapting: long term fuel trim and a short term fuel trim. Refer to POWERTRAIN CONTROL SOFTWARE , FUEL TRIM in this service information. Long term fuel trim relies on the fuel trim tables and short term fuel trim refers to the desired air to fuel ratio parameter called LAMBSE. LAMBSE is calculated by the PCM from the universal heated oxygen sensor (HO2S) inputs and helps maintain a 14.7:1 air to fuel ratio during closed loop operation. Short term fuel trim and long term fuel trim work together. If the universal HO2S indicates the engine is running rich, the PCM corrects the rich condition by moving the short term fuel trim into the negative range, less fuel to correct for a rich combustion. If after a certain amount of time the short term fuel trim is still compensating for a rich condition, the PCM learns this and moves the long term fuel trim into the negative range to compensate and allow the short term fuel trim to return to a value near 0%. Inputs from the engine coolant temperature (ECT) sensor or cylinder head temperature (CHT) sensor (if equipped), the intake air temperature (IAT) sensor and the mass airflow (MAF) sensor (if equipped) are required to activate the fuel trim system, which in turn activates the fuel system monitor. Once activated, the fuel system monitor looks for the fuel trim tables to reach the adaptive clip (adaptive limit) and LAMBSE to exceed a calibrated limit. The fuel system monitor stores the appropriate DTC when a concern is detected as described below.

1. The universal HO2S detects the presence of oxygen in the exhaust and provides the PCM with feedback indicating air to fuel ratio.

2. A correction factor is added to the fuel injector pulse width calculation and the mass airflow

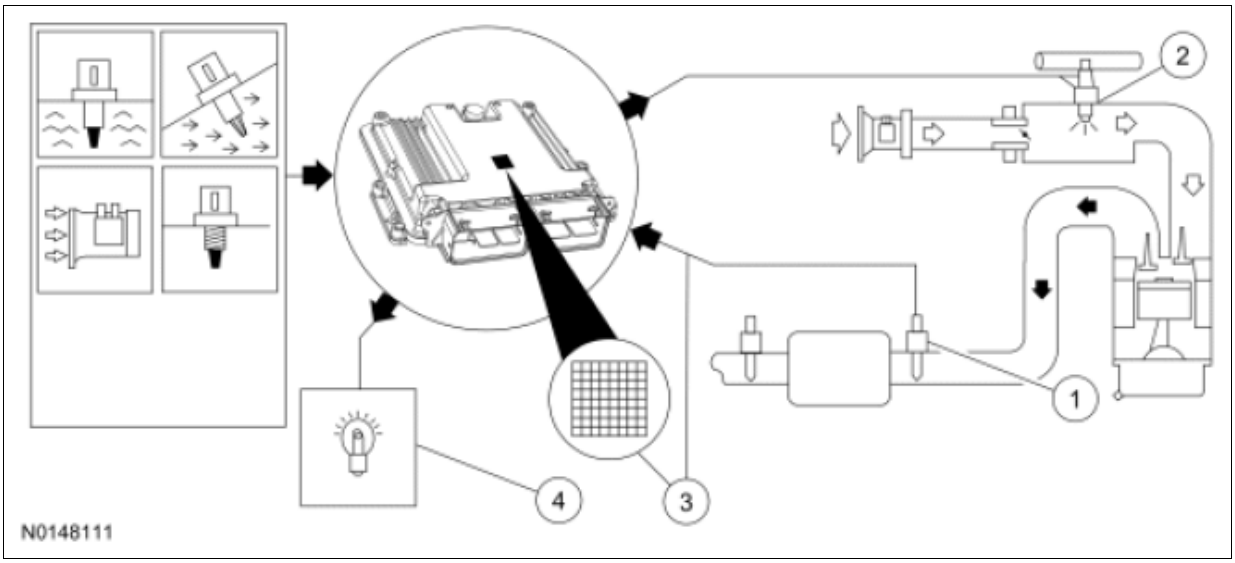
calculation, according to the long and short term fuel trims as needed to compensate for variations in the fuel system.

3. When deviation in the LAMBSE parameter increases, air to fuel control suffers and emissions increase. When LAMBSE exceeds a calibrated limit and the fuel trim table has clipped, the fuel system monitor sets a DTC as follows:

   The DTCs associated with the monitor detecting a lean shift in fuel system operation are P0171 (Bank 1) and P0174 (Bank 2).

   The DTCs associated with the monitor detecting a rich shift in fuel system operation are P0172 (Bank 1) and P0175 (Bank 2).

4. The malfunction indicator lamp (MIL) is activated after a concern is detected on 2 consecutive drive cycles.



Typical fuel system monitor entry conditions:

- Air mass range greater than 5.67 g/sec (0.75 lb/min)
- Purge duty cycle of 0%
- Engine coolant temperature is between 65.5° C to 110° C (150° F to 230° F)
- Engine load greater than 12%
- Intake air temperature -34° C to 65° C (-30° F to 150° F)

Typical fuel monitor thresholds:

- Lean Condition Concern: LONGFT greater than 25%, SHRTFT greater than 5%
- Rich Condition Concern: LONGFT less than 25%, SHRTFT less than 10%

Fig 1: Fuel System Monitor Flow Diagram

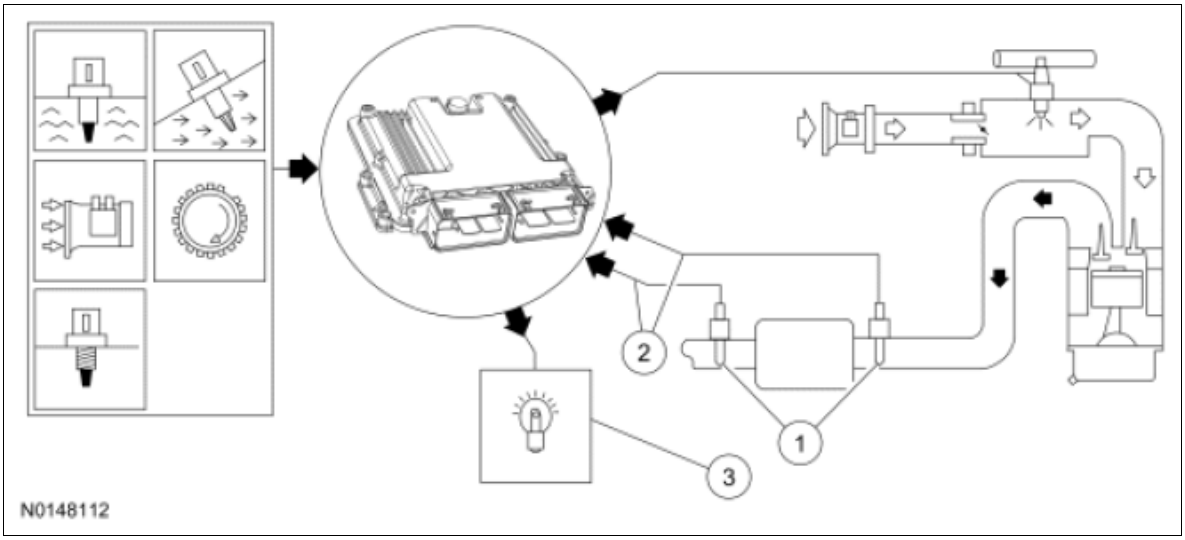
HEATED OXYGEN SENSOR (HO2S) MONITOR

The HO2S monitor is an on board strategy designed to monitor the heated oxygen sensors for concerns or deterioration which can affect emissions. The fuel control or stream 1 HO2S are checked for correct output voltage and response rate. Response rate is the time it takes to switch from lean to rich or rich to lean. The rear or stream 2 HO2S is monitored for correct output voltage and is used for catalyst monitoring and fore aft oxygen sensor (FAOS) control. Input is required from the camshaft position (CMP) sensor, the crankshaft position (CKP) sensor, the engine coolant temperature (ECT) sensor or the cylinder head temperature (CHT) sensor (if equipped), the fuel rail pressure temperature (FRPT) sensor, the fuel tank pressure (FTP) sensor, the intake air temperature (IAT) sensor, the mass airflow (MAF) sensor (if equipped), the manifold absolute pressure (MAP) sensor, the throttle position (TP) sensor and vehicle speed to activate the HO2S monitor. The fuel system monitor and misfire detection monitor must also have completed successfully before the HO2S monitor is enabled.



1. The HO2S senses the oxygen content in the exhaust flow. The typical HO2S outputs a voltage between 0 and 1.0 volt. Lean of stoichiometric, air to fuel ratio of approximately 14.7:1, the HO2S generates a voltage between 0 and 0.45 volt. Rich of stoichiometric, the HO2S generates a voltage between 0.45 and 1.0 volt. The current required to maintain the universal HO2S at 0.45 volt is used by the PCM to calculate the air to fuel ratio. The HO2S monitor evaluates the HO2S for correct function.

2. The time between HO2S switches is monitored after vehicle startup and during closed loop fuel conditions. Excessive time between switches or no switches since startup indicates a concern. Since lack of switching concerns can be caused by HO2S concerns or by shifts in the fuel system, DTCs are stored that provide additional information for the lack of switching concern. Different DTCs indicate whether the sensor always indicates lean, rich, or disconnected. The HO2S signal is also monitored for high voltage, in excess of 1.1 volts. An over voltage condition is caused by a HO2S heater or battery power short to the HO2S signal line.

   A functional test of the rear HO2S is done during normal vehicle operation. The peak rich and lean voltages are continuously monitored. Voltages that exceed the calibrated rich and lean thresholds indicate a functional sensor. If the voltages have not exceeded the thresholds after a long period of vehicle operation, the air to fuel ratio may be forced rich or lean in an attempt to get the rear sensor to switch. This situation normally occurs only with a green, less than 804.7 km (500 miles), catalyst. If the sensor does not exceed the rich and lean peak thresholds, a concern is indicated. Also, a deceleration fuel shut off rear HO2S response test is done during a deceleration fuel shut off (DFSO) event. Carrying out the HO2S response test during a DFSO event helps to isolate a sensor concern from a catalyst concern. The response test monitors how quickly the sensor switches from a rich to lean voltage. It also monitors if there is a delay in the response to the rich or lean condition. If the sensor responds very slowly to the rich to lean voltage switch or is never greater than a rich voltage threshold or less than a lean voltage threshold, a concern is indicated.

3. The malfunction indicator lamp (MIL) is activated after a concern is detected on 2 consecutive drive cycles.

Fig 1: HO2S Monitor Flow Diagram

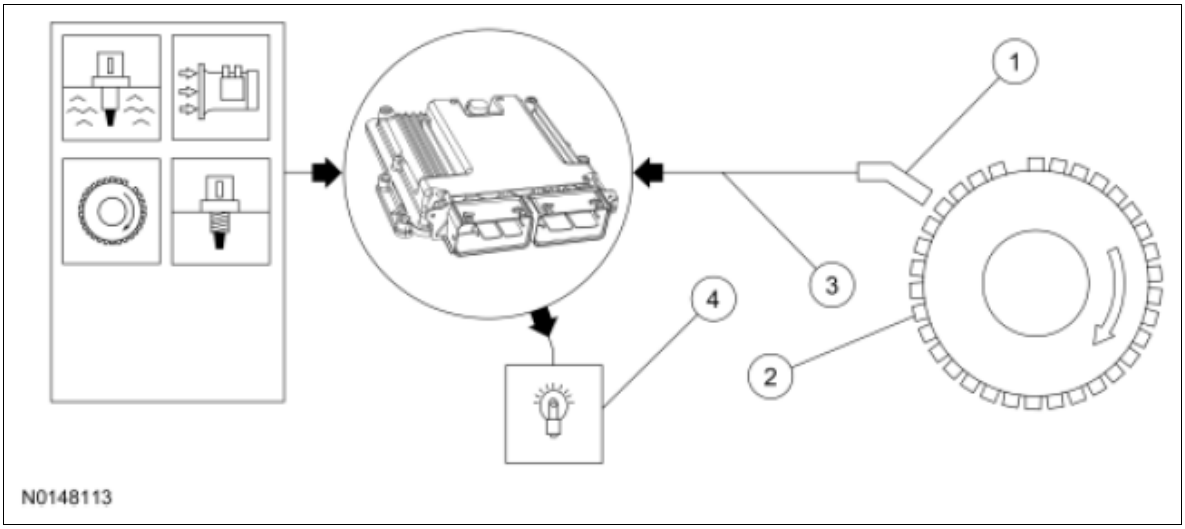
MISFIRE DETECTION MONITOR

The misfire detection monitor is an on board strategy designed to monitor engine misfire and identify the specific cylinder in which the misfire has occurred. Misfire is defined as lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or any other cause. The misfire detection monitor is enabled only when certain base engine conditions are first satisfied. Input from the engine coolant temperature (ECT) or cylinder head temperature (CHT), intake air temperature (IAT), and mass airflow (MAF) sensors is required to enable the monitor. The misfire detection monitor is also carried out during an on-demand self-test.



1. The PCM synchronized ignition spark is based on information received from the crankshaft position (CKP) sensor. The CKP sensor signal generated is also the main input used in determining cylinder misfire.

2. The input signal generated by the CKP sensor is derived by sensing the passage of teeth from the crankshaft position wheel mounted on the end of the crankshaft.

3. The input signal to the PCM is then used to calculate the time between CKP sensor signal edges and the crankshaft rotational velocity and acceleration. By comparing the accelerations of each cylinder event, the power loss of each cylinder is determined. When the power loss of a particular cylinder is sufficiently less than a calibrated value and other criteria are met, then the suspect cylinder is determined to have misfired.

4. The malfunction indicator lamp (MIL) is activated after one of the above tests fail on 2 consecutive drive cycles.

Fig 1: Misfire Detection Monitor Flow Diagram

Courtesy of FORD MOTOR CO.

MISFIRE DETECTION MONITOR > MISFIRE MONITOR OPERATION

The signal from the crankshaft position sensor and timing wheel is processed by the PCM into individual tooth period measurements and provided to the misfire monitor. The misfire monitor uses the tooth period measurements to calculate crankshaft acceleration signals for misfire detection.

A low data rate (LDR) and high data rate (HDR) are the 2 different types of misfire monitoring systems used. The LDR system is capable of meeting the federal test procedure monitoring requirements on most engines and is capable of meeting the full range of misfire monitoring requirements on 3 and 4 cylinder engines. It is also used on 6 cylinder engines with rear mounted crank sensors. The HDR system is capable of meeting the full range of misfire monitoring requirements on 8 cylinder and 10 cylinder engines. The HDR system on these engines meets the full range of misfire phase-in requirements specified in the on board diagnostic (OBD) regulations. The PCM software allows for detection of any misfires that occur 6 engine revolutions after initially cranking the engine. This meets the OBD requirement to identify misfires within 2 engine revolutions after exceeding the warm drive, idle RPM.

The monitor includes a diagnostic check on the crank sensor input that checks the number of tooth period measurements received on each cylinder event. If the monitor receives an invalid number of tooth period measurements, DTC P1336 will set. This DTC indicates that noise is present on the crank sensor input or there is a lack of synchronization between the camshaft and crankshaft sensors.

MISFIRE DETECTION MONITOR > LOW DATA RATE (LDR) SYSTEM

The LDR misfire monitor uses a low data rate CKP sensor signal which indicates one time measurement signal for each cylinder event. The PCM uses the CKP sensor signal to calculate the crankshaft speed and acceleration for each cylinder. The crankshaft acceleration is then processed to detect a sporadic, single-cylinder misfire patterns or multi-cylinder misfire patterns. The changes in overall engine RPM are removed by subtracting the median engine acceleration over a complete engine cycle. The crankshaft acceleration is then processed by three algorithms. The first algorithm, called pattern cancellation, is optimized for detection of sporadic patterns of misfire. The algorithm learns the normal pattern of cylinder

accelerations from the mostly good firing events and is then able to accurately detect deviations from that pattern. The second algorithm, called pattern cancellation by opposing engine revolution, is optimized for single cylinder patterns. The algorithm compares the acceleration of a cylinder to its opposite cylinder on the opposing engine revolution. The algorithm learns the normal patterns that repeat every engine revolution and is then able to accurately detect deviations between the paired cylinders. The third algorithm is a non filtered acceleration signal that is a general purpose signal for all patterns including multi cylinder patterns. The resulting deviant cylinder acceleration values are used in evaluating misfire. Refer to the GENERAL MISFIRE PROCESSING in this service information for more information.

MISFIRE DETECTION MONITOR > HIGH DATA RATE (HDR) SYSTEM

The HDR misfire monitor uses a high data rate CKP sensor signal which indicates 36 position references per crankshaft revolution. This high resolution signal is processed with a digital low pass filter. The low pass filter filters the high resolution crankshaft velocity signal to remove some of the crankshaft torsional vibrations that degrade signal to noise. Two low pass filters are used to enhance detection capability: a base filter and a more aggressive filter to enhance single cylinder capability at higher RPM. This significantly improves detection capability for continuous misfires on single cylinders up to red line. The changes in overall engine rpm are removed by subtracting the median engine acceleration over a complete engine cycle. The crankshaft acceleration is then processed by three algorithms similar to the LDR system. The final stage is to decimate the high resolution signals by selecting the peak acceleration values from within a window location for each cylinder. The resulting deviant cylinder acceleration values are used in evaluating misfire. Refer to the GENERAL MISFIRE PROCESSING in this service information for more information.

MISFIRE DETECTION MONITOR > GENERAL MISFIRE PROCESSING

The acceleration that a piston undergoes during a normal firing event is directly related to the amount of torque that cylinder produces. The calculated piston and cylinder acceleration values are compared to a misfire threshold that is continuously adjusted based on inferred engine torque. Deviant accelerations exceeding the threshold are conditionally labeled as misfires. The cold start emission reduction (CSER) monitor uses a threshold multiplier during startup to compensate for the reduction in the signal amplitude during ignition spark retard conditions. The threshold adjustments may also be applied to compensate for torque reduction during gear shift events, and to compensate for changes in driveline coupling with torque convertor lock status.

The calculated deviant acceleration values are also evaluated for noise. Normally, misfire results in a nonsymmetrical loss of cylinder acceleration. Mechanical noise, such as rough roads or crankshaft oscillations at low rpm or high load conditions, will produce symmetrical positive acceleration variations. Noise limits are calculated by applying a negative multiplier to the misfire threshold. If the noise limits are exceeded, a noisy signal condition is inferred and the misfire monitor is suspended for a brief interval. Noise free deviant acceleration exceeding a given threshold is labeled a misfire.

The number of misfires are counted over a continuous 200 revolution and 1, 000 revolution period. The revolution counters are not reset if the misfire monitor is temporarily disabled such as for negative torque mode. At the end of the evaluation period, the total misfire rate and the misfire rate for each individual cylinder is computed. The misfire rate is evaluated every 200 revolution period (Type A) and compared to a threshold value achieved from an engine speed and load table. This misfire threshold is designed to prevent damage to the catalyst due to sustained excessive temperature 899°C (1, 650°F) for Pt/Pd/Rh advanced washcoat and 982°C (1, 800°F) for Pd-only high tech washcoat. If the misfire

threshold is exceeded and the catalyst temperature model calculates a catalyst mid-bed temperature that exceeds the catalyst damage threshold, the MIL blinks at a 1 Hz rate while the misfire is present. If the threshold is again exceeded on a subsequent driving cycle, the MIL is illuminated.

At high engine speed and load operating conditions the monitor continuously evaluates the misfire rate during each 200 revolution period. If a calibrated number of misfire events have been accumulated within a 200 revolution block such that the misfire threshold is already exceeded before the end of the block has been reached, the monitor will declare a fault immediately rather than wait for the end of the block. This improves the capability of the monitor to prevent damage to the catalyst.

If a single cylinder is determined to be consistently misfiring in excess of the catalyst damage criteria, the monitor will initiate failure mode effects management (FMEM) to prevent catalyst damage. The fuel injector to that cylinder is disabled for a calibrated period of time, typically 30 to 60 seconds. Up to 2 cylinders may be disabled at the same time on 6, 8 and 10 cylinder engines and 1 cylinder on 3 and 4 cylinder engines. The fuel control will go open loop and target lambda as slightly lean. The software may also use the throttle to limit the airflow (limit boost) on GTDI engines for additional exhaust component protection. After the calibrated period of time, typically 30 seconds, the injector is enabled and the system returns to normal operation. On some vehicles, the software may continue FMEM beyond 30 seconds if the engine is operating at high speed or load at the end of the 30 second period. The software will wait for a low airflow condition to exit from FMEM. This protects the catalyst should the misfire fault still be present when the fuel injector is turned back on. If a misfire is detected on that cylinder again after 200 revolutions (about 5 to 10 seconds), the fuel injector is disabled again and the process repeats until the misfire is no longer present. Note that ignition coil primary circuit failures trigger the same type of fuel injector disablement. For additional information, refer to COMPREHENSIVE COMPONENT MONITOR (CCM) in this service information.

If fuel level is below 15%, the misfire monitor continues to evaluate misfire over every 200 revolution period to determine if catalyst damaging misfire is present so that the fuel shut off FMEM can be utilized to control catalyst temperatures. When a misfire occurs at low fuel levels, DTC P0313 will set in place of DTCs P0300 to P0310.

The misfire rate is also evaluated every 1, 000 revolution period and compared to a single (type B) threshold value to indicate an emission threshold concern, which can be either a single 1, 000 over revolution event from startup or 4 subsequent 1, 000 over revolution events on a drive cycle after startup. Many vehicles set DTC P0316 if the type B threshold is exceeded during the first 1, 000 revolutions after engine startup. This DTC P0316 is stored in addition to the normal P03xx DTC that indicates the misfiring cylinder. If the misfire is detected but it can not be attributed to a specific cylinder, DTC P0300 is stored.

MISFIRE DETECTION MONITOR > ROUGH ROAD DETECTION

The misfire detection monitor may include a rough road detection system to eliminate false misfire indications due to rough road conditions. The rough road detection system uses data from the anti-lock brake system (ABS) wheel speed sensors for estimating the severity of rough road conditions. This is a more direct measurement of rough road over other methods which are based on drive line feedback via crankshaft velocity measurements. It improves accuracy over these other methods since it eliminates interactions with actual misfire.

In the event of a rough road detection system failure, the rough road detection output is ignored and the misfire detection monitor remains active. A rough road detection system failure could be caused by a failure in any of the input signals to the algorithm. This includes the ABS wheel speed sensors, brake pedal position (BPP) switch, or controller area network (CAN) hardware concerns. Specific DTCs

indicate the source of these component concerns.

A redundant check is also carried out on the rough road detection system to verify it is not stuck high due to other unforeseen causes. If the rough road detection system indicates rough road during low vehicle speed conditions where it is not expected, the rough road detection output is ignored and the misfire monitor remains active.

MISFIRE DETECTION MONITOR > PROFILE CORRECTION

Profile correction software is used to learn and correct for mechanical inaccuracies in the crankshaft position wheel tooth spacing. Since the sum of all the angles between the crankshaft teeth must equal 360 degrees, a correction factor can be calculated for each misfire sample interval that makes all the angles between individual teeth equal. The LDR system learns one profile correction factor per cylinder (that is, 3 correction factors for a 3 cylinder engine or 4 correction factors for a 4 cylinder engine), while the HDR system learns 36, 40 or 60 correction factors depending on the number of crankshaft wheel teeth (that is, 35 for some V6 and V8 engines, 39 for V10 engines and 58 for some I4 and V6 engines).

The corrections are calculated from several engine cycles of misfire sample interval data. The correction factors are the average of a selected number of samples. In order to assure the accuracy of these corrections, a tolerance is placed on the incoming values such that an individual correction factor must be repeatable within the tolerance during learning. This is to reduce the possibility of learning incorrect corrections due to crankshaft velocity disturbances.

Since inaccuracies in the wheel tooth spacing can produce a false indication of misfire, the misfire monitor is not active until the corrections are learned.

Two methods of learning profile correction are used. The first is neutral profile correction and non volatile memory and the second is customer drive cycle for profile correction 97 to 64 km/h (60 to 40 MPH deceleration).

MISFIRE DETECTION MONITOR > NEUTRAL PROFILE CORRECTION AND NON VOLATILE MEMORY

Neutral profile learning is used at end of line to learn profile correction through a series of one or more neutral engine RPM throttle snaps. This allows the misfire monitor to be activated at the assembly plant. A scan tool command is required to enable neutral profile correction learning. Learning profile correction factors at high speed (3, 000 RPM) neutral conditions versus during 97 to 64 km/h (60 to 40 MPH) decelerations optimizes correction factors for higher RPMs where they are most needed and eliminates driveline or transmission and road noise effects. This improves signal to noise characteristics which means improved detection capability.

The profile correction factors learned at the assembly plant are stored into non volatile memory. This eliminates the need for specific customer drive cycles. However, misfire profiles may need to be relearned using a scan tool procedure if major engine work is done or a new PCM is installed. Relearning is not required for a reflash.

On selected vehicles, the neutral profile correction strategy is the only method used for profile correction learning. In the event of a loss of non volatile memory content (new PCM installed), the correction factors are lost and must be relearned. The P0315 DTC is set until the misfire profile is relearned using a scan tool procedure.

MISFIRE DETECTION MONITOR > CUSTOMER DRIVE CYCLE FOR PROFILE CORRECTION (60 TO 40 MPH DECELERATION)

To prevent any fueling or combustion differences from affecting the correction factors, learning is done during deceleration fuel shut off (DFSO). This can be done during closed throttle, nonbraking, defueled decelerations in the 97 to 64 km/h (60 to 40 MPH) range after exceeding 97 km/h (60 MPH) (likely to correspond to a freeway exit condition). In order to minimize the learning time for the correction factors, a more aggressive DFSO strategy may be used when the conditions for learning are present. The corrections are typically learned in a single 97 to 64 km/h (60 to 40 MPH) deceleration, but may take up to 3 decelerations or a greater number of shorter decelerations.

If the software is unable to learn a profile after three, 97 to 64 km/h (60 to 40 MPH) deceleration cycles, DTC P0315 is set.

MISFIRE DETECTION MONITOR > MISFIRE DETECTION MONITOR SPECIFICATIONS

Misfire detection monitor operation: DTCs P0300 to P0310 (random and specific cylinder misfire), P1336 (noisy crank sensor, no crankshaft and camshaft sensor synchronization), P0315 (crankshaft position system variation not learned), P0316 (misfire detected on startup [first 1000 revolutions]), P0313 (misfire detect with low fuel level). The monitor execution is continuous, misfire rate calculated every 200 or 1, 000 revolutions. The monitor does not have a specific sequence. The CKP, CMP, MAF, and ECT or CHT sensors have to be operating correctly to run the monitor. The monitoring duration is the entire driving cycle (see disablement conditions below).

Typical misfire detection monitor entry conditions: Minimum to maximum time since engine startup is 0 seconds, engine coolant temperature is -7°C to 121°C (20°F to 250°F), RPM range is (full-range misfire certified, with 2 revolution delay) 2 revolutions after exceeding 150 RPM below drive idle RPM to red line on tach or fuel cutoff, profile correction factors are learned in KAM, and the fuel tank level is greater than 15%.

Typical misfire temporary disablement conditions: Closed throttle deceleration (negative torque, engine being driven), Fuel shut off due to vehicle speed limiting or engine RPM limiting mode, a high rate of change of torque (heavy throttle tip-in or tip out) and rough road conditions.

The profile learning operation includes DTC P0315 if the profile correction factors are not learned. On selected vehicles, DTC P0315 is set immediately after a new PCM is installed until the scan tool procedure for neutral profile correction is completed. On all other vehicles, DTC P0315 is set if profile learning does not complete during the customer drive cycle for profile correction. The monitoring duration for the customer drive cycle is 10 cumulative seconds in conditions (a maximum of three, 97 to 64 km/h (60 to 40 MPH) defueled decelerations). The monitor execution is once per profile learning sequence. The monitor sequence: profile must be learned before the misfire monitor is active, the CKP and CMP sensors are required to be operating correctly; and the CKP and CMP signals must be synchronized.

Assembly plant or repair facility typical profile learning entry conditions from minimum to maximum: The engine in deceleration fuel shut off (DFSO) mode for 4 engine cycles with the vehicle in PARK or NEUTRAL gear. The engine RPM is 2, 000 to 3, 000 RPM. The learning tolerance is 1%.

Customer drive cycle typical profile learning entry conditions from minimum to maximum: The engine in deceleration fuel shut off mode for 4 engine cycles. The brakes are not applied. The engine RPM is 1, 300 to 3, 700 RPM and the change is less than 600 RPM. The vehicle speed is 48 to 121 km/h (30 to

75 MPH). The learning tolerance is 1%.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM MONITOR

The PCV system monitor consists of a modified PCV system design. The PCV system is designed to prevent accidental disconnection. High retention force molded plastic lines are used from the valve cover to the intake manifold. The diameter of the lines and the intake manifold entry fitting are increased so that disconnection of the lines may cause an engine to stall. In the event the vehicle does not stall if the line between the intake manifold and PCV system is disconnected, the vehicle has a large vacuum leak that causes the vehicle to run lean at idle. The lean condition illuminates the malfunction indicator lamp (MIL) and stores a lean bank 1 or bank 2 DTC.

The PCV monitor sets a DTC if the PCV vacuum hose is disconnected, or if a large air leak between the throttle body and intake valves is present. An idle speed symptom may be present when the DTC is set.

The PCV system on some vehicles will include a crankcase pressure sensor to detect a disconnection of the fresh air hose. A disconnection of the fresh air hose would allow the discharge of crankcase vapor into the atmosphere while the engine was under boost.

For additional PCV information, refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM in this service information.

THERMOSTAT MONITOR

The thermostat monitor is designed to verify correct thermostat operation. This monitor is executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a concern is present, DTC P0125 or P0128 is set and the malfunction indicator lamp (MIL) is illuminated.

A timer is initialized while the engine is at moderate load and the vehicle speed is above a calibrated limit. The target timer value is based on ambient air temperature at startup. If the timer exceeds the target time and engine coolant temperature or cylinder head temperature has not warmed up to the target temperature, a concern is indicated. The test runs if the startup intake air temperature from the intake air temperature (IAT) sensor is at or below the target temperature. A 2 hour engine OFF soak time is also required to enable the monitor and to prevent erasing of any pending DTCs during a hot soak. This soak time feature also prevents false passes of the monitor when the engine coolant temperature rises after the engine is turned OFF during a short engine OFF soak period.

The target temperature is calibrated to within 11°C (20°F) less than the thermostat regulating temperature. For a typical 90°C (195°F) thermostat, the target temperature would be calibrated to 79°C (175°F). Some vehicle calibrations may lower the target temperature to less than 27°C (50°F) for vehicles that do not warm-up to thermostat regulating temperatures in the 11°C (20°F) to 27°C (50°F) ambient temperature range.

1. Inputs: ECT or CHT, IAT, engine LOAD from mass airflow (MAF) sensor and vehicle speed input.

   Typical monitor entry conditions:

   1. vehicle speed greater than 24 km/h (15 MPH)

   2. intake air temperature at startup is between -7°C (20°F) and target thermostat

temperature

3. engine load greater than 30%
4. engine OFF (soak) time greater than 2 hours

2. Output: MIL.

Fig 1: Thermostat Monitor Flow Diagram

Courtesy of FORD MOTOR CO.

VARIABLE CAMSHAFT TIMING (VCT) MONITOR

The VCT output driver in the powertrain control module (PCM) is checked electrically for opens or shorts. The VCT system is checked functionally by monitoring the closed loop camshaft position error correction. If the correct camshaft position cannot be maintained and the system has an advance or retard error greater than the calibrated threshold, a VCT control concern is indicated.

For additional information, refer to VARIABLE CAMSHAFT TIMING (VCT) SYSTEM in this service information.

DIAGNOSTIC METHODS > OVERVIEW

When following powertrain diagnostics on vehicles with on board diagnostic (OBD), the system may be checked by an off-board tester referred to as a scan tool. This section contains information for carrying out diagnostics with a scan tool. A scan tool has certain generic capabilities that are standard across the automotive industry in the United States and Canada. All functions are selected from a menu. Refer to the service information provided by the tool manufacturer.

DIAGNOSTIC TOOLS

Below is an equipment list with corresponding part numbers:

REQUIRED EQUIPMENT:

- Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool with functionality described in SCAN TOOL SETUP AND FUNCTIONALITY service information.
- Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 (522) or equivalent.

RECOMMENDED EQUIPMENT:

- Rotunda Vacuum/Pressure Tester 164-R0253 or equivalent. Range 0-101.3 kPa (0-30 in-Hg.) Resolution 3.4 kPa (1 in-Hg.)
- Fuel Pressure Test Kit 310-D009 (D95L-7211A) or equivalent.
- Fuel Pressure Test Adapter 310-180 or equivalent.
- Digital Multimeter (DMM) FLU77-4 or equivalent.
- Adjustable Ignition Spark Tester THX458 or equivalent.
- Non-powered test lamp.
- Fuel Pressure T Adapter (5/16") 310-D251 or equivalent
- Deluxe Noid Lite and Signal Test Light Set AST7898 or equivalent.

SCAN TOOL SETUP AND FUNCTIONALITY

Connect the scan tool to the data link connector (DLC) for communication with the vehicle.

The DLC is located on the driver side of the vehicle under the steering column. It is attached to the instrument panel and accessible from the driver seat.

The DLC is rectangular in design and capable of accommodating up to 16 terminals. The connector has

keying features to allow easy connection.

The required scan tool functions are described below:

- monitor, record, and playback of parameter identification (PID)
- freeze frame PID data
- diagnostic test modes; self-test, clear diagnostic trouble codes (DTCs)
- output state control (OSC)
- resetting keep alive memory (KAM)
- diagnostic monitoring test results (mode 6) for on board diagnostic (OBD) monitors
- on board system readiness (OBD monitor completion status)

Some of these functions are described in this service information. Refer to the scan tool manufacturer's instruction manual for specific information on scan tool setup and operation.

SCAN TOOL SETUP AND FUNCTIONALITY > INTERNATIONAL STANDARDS ORGANIZATION (ISO) 14229 DTC DESCRIPTIONS

The ISO 14229 DTC is a set of common requirements for diagnostic systems. The scan tool displays a failure type and a status type with the DTC. The types display additional information on the scan tool for the condition that set the DTC. For a list of failure type descriptions, refer to POWERTRAIN CONTROL SOFTWARE , International Standards Organization (ISO) 14229 Diagnostic Trouble Code (DTC) Descriptions.

VEHICLE CHECK AND PREPARATION

Before using the scan tool to carry out any test, refer to the important Safety Notice located at the beginning of this manual and the necessary visual checks listed below.

VEHICLE CHECK AND PREPARATION > VISUAL CHECKS

- Inspect the air cleaner and inlet duct.
- Check all engine vacuum hoses for damage, leaks, cracks, kinks, and proper routing.
- Check the electronic engine control (EEC) system wiring harness for proper connections, bent or broken pins, corrosion, loose wires, and proper routing.
- Check the PCM, sensors, and actuators for physical damage.
- Check the engine coolant for proper level and mixture.
- Check the transmission fluid level and quality.

- Make all necessary repairs before continuing with the quick test. For additional information, refer to QUICK TEST DESCRIPTION in this service information.

VEHICLE CHECK AND PREPARATION > VEHICLE PREPARATION

- Carry out all safety steps required to start and run vehicle tests. Apply the parking brake, place the gear selector lever firmly into the PARK position on automatic transmission vehicles or NEUTRAL on manual transmission vehicles, and block the drive wheels.
- Turn off all electrical loads such as radios, lamps, A/C, blower, and fans.
- Start the engine (if the engine runs) and bring it up to the normal operating temperature before running the quick test.

QUICK TEST DESCRIPTION > QUICK TEST

The quick test is divided into 3 specialized tests:

1. Key On Engine Off (KOEO) On Demand Self-Test
2. Key On Engine Running (KOER) On Demand Self-Test
3. Continuous Memory Self-Test

The quick test checks the integrity and function of the electronic engine control (EEC) system and outputs the test results when requested by the scan tool. The quick test also provides a quick check of the powertrain control system, and is usually carried out at the start of each diagnostic procedure with all accessories off. The quick test is also carried out at the end of most pinpoint tests for verification of the repair and to make sure no other concerns are incurred while repairing a previous concern. A system pass is displayed when no diagnostic trouble codes (DTCs) are output and a scan tool communication error does not exist. System pass means that hardware monitored by the PCM is functioning within the normal operating limits. Only a system pass, a DTC, or an incomplete on board diagnostic (OBD) drive cycle is displayed.

For applications that use a stand alone transmission control module (TCM) the PCM does not output TCM DTCs. For TCM self-test and diagnostics, refer to the service information Automatic Transmission.

QUICK TEST DESCRIPTION > KEY ON ENGINE OFF (KOEO) ON DEMAND SELF-TEST

The KOEO on demand self-test is a functional test of the PCM carried out on demand with the ignition ON and the engine OFF. This test carries out checks on certain sensor and actuator circuits. A concern must be present at the time of testing for the KOEO self-test to detect the concern. When a concern is detected, a DTC is output on the data link at the end of the test as requested by the scan tool.

QUICK TEST DESCRIPTION > KEY ON ENGINE RUNNING (KOER) ON DEMAND SELF-TEST

The KOER on demand self-test is a functional test of the PCM carried out on demand with the ignition ON, the engine running and the vehicle stopped. A check of certain inputs and outputs is made during operating conditions and at a normal operating temperature. The brake pedal position, transmission control, and the power steering tests are part of the KOER on demand self-test and must be carried out during this operation if applicable. These are described below. A concern must be present at the time of testing for the KOER on demand self-test to detect the concern. When a concern is detected, a DTC is output on the data link at the end of the test as requested by the scan tool.

QUICK TEST DESCRIPTION > BRAKE PEDAL POSITION (BPP) TEST

The BPP test checks the ability of the EEC system to detect a change of state in the BPP switch. The brake pedal is briefly applied and released on all vehicles equipped with a BPP input. This is done during a KOER on demand self-test.

QUICK TEST DESCRIPTION > CONTINUOUS MEMORY SELF-TEST

The continuous memory self-test is a functional test of the PCM carried out under any condition (engine running or OFF) with the ignition ON. Unlike the KOEO and KOER self-tests, which can only be activated on demand, the continuous memory self-test is always active. A concern does not need to be present when accessing continuous memory self-test DTCs, making the test valuable when diagnosing intermittent concerns. The vehicle may need to be driven or the OBD drive cycle completed to allow the PCM to detect a concern. Refer to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE in this service information for more information. When a concern is stored in memory, a DTC is output on the data link when requested by the scan tool.

There are two types of continuous DTCs. The first type is an emission related code which illuminates the malfunction indicator lamp (MIL) in the instrument cluster. The second is a non emission related, non-MIL DTC which does not illuminate the instrument cluster indicator.

For emission related MIL DTCs, the PCM stores the DTC in continuous memory when a concern is detected for the first time. At this point the DTC does not illuminate the MIL and is considered a pending code. The purpose of pending codes is to assist in repair verification by reporting a pending DTC after one drive cycle. If the same concern is detected after the next drive cycle, the emission related MIL DTC illuminates the MIL and sets both a confirmed MIL DTC and a permanent DTC. The MIL remains illuminated even if the concern is intermittent. A permanent DTC is stored until three consecutive passing drive cycles have been completed after a repair and the MIL turns off, or after a request to clear DTCs has been made using the scan tool and the next monitoring cycle has completed and passed for that DTC.

Confirmed emission related MIL DTCs and any non-emission related, non-MIL DTCs are erased approximately 40 vehicle warm-up cycles after the concern was last detected, or if the DTCs are cleared by the scan tool.

Pending emission related MIL DTCs that never detect a concern on a second consecutive drive cycle (and never illuminate the MIL) are not stored in memory for any number of vehicle warm-up cycles; they are immediately cleared when the next monitoring cycle has completed and passed for that DTC, or until a request to clear DTCs has been made by the scan tool.

Any scan tool that meets OBD requirements can access the continuous memory to retrieve emission related MIL DTCs. However, not all scan tools access pending and non-emission related, non-MIL DTCs

in the same way.

During most diagnostic procedures in this service information, it is required that all DTCs be retrieved and cleared. Permanent DTCs cannot be directly cleared by the scan tool. When a scan tool clears DTCs, pending and confirmed DTCs are immediately cleared. Permanent DTCs will not clear until the next monitoring cycle has completed and passed for that DTC. For additional information, refer to POWERTRAIN CONTROL SOFTWARE , Permanent Diagnostic Trouble Code (DTC).

CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM) > DESCRIPTION

All on board diagnostic (OBD) scan tools support the clearing of continuous DTCs and resetting of emission monitors information in the PCM.

The clearing of the continuous DTCs allows the scan tool to command the PCM to clear and reset all emission related diagnostic information.

The following events occur when the continuous DTCs and the emission monitors information is cleared from the PCM:

- the number of DTCs is reset
- the DTCs are cleared (on vehicles with permanent DTCs, additional vehicle operation is required to complete and pass the appropriate monitors to complete the clearing of permanent DTCs)
- the freeze frame data is cleared
- the diagnostic monitoring test results are reset
- the status of the OBD system monitors is reset

RESETTING THE KEEP ALIVE MEMORY (KAM) > DESCRIPTION

Resetting the KAM returns the PCM memory to its default setting. Adaptive learning contents such as adaptive airflow, idle speed, refueling event, and fuel trim are included. Clearing the continuous diagnostic trouble codes (DTCs) and resetting the emission monitors information in the PCM, is part of a KAM reset. Refer to CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM) service information. Both can be useful in post-repair testing.

After the KAM has been reset, the vehicle may exhibit certain driveability concerns. It is necessary to allow the engine to idle at normal operating temperature with the A/C off for 2 minutes. Then drive the vehicle to allow the PCM to learn the values for optimum driveability and performance.

This function may not be supported by all scan tools. Refer to the scan tool manufacturer's instruction manual.

ON BOARD SYSTEM READINESS (OSR) TEST > DESCRIPTION

All on board diagnostic (OBD) scan tools display the OSR test. The OSR displays the supported monitors on the vehicle and the status of all monitors (complete or not complete) at that time. Fuel, misfire, and comprehensive component monitors (CCMs) run continuously and always display a YES status. Clearing the continuous diagnostic trouble codes (DTCs) and resetting the emission monitors information in the PCM, or resetting the keep alive memory (KAM) causes the non-continuous monitors to change to a NO status.

A detailed description of completing the OBD monitors is found service information. Refer to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE .

PARAMETER IDENTIFICATION (PID) > DESCRIPTION

The PID mode allows access to PCM information. This includes analog and digital signal inputs and outputs along with calculated values and the system status. There are two types of PID lists available and both are used throughout this service information. The first is the generic (J1979) OBD PID list. This is a standard set of PIDs that all scan tools must be able to access. The second is a Ford specific (J2190) list which can be accessed by an appropriate scan tool. When accessing any of these PIDs, the values are continuously updated. The generic or Ford PID list provides definitions and values in appropriate units.

PARAMETER IDENTIFICATION (PID) > GENERIC OBD PID LIST

An X in the Freeze Frame column denotes both a mode 1 and mode 2 PID (real time and freeze frame).

Freeze Frame	Acronym	Description	Measurement Units
X	APP_D	Accelerator Pedal Position D	%
X	APP_E	Accelerator Pedal Position E	%
X	BARO	Barometric Pressure	kPa
X	CATEMP11	Catalyst Temperature Bank 1, Sensor 1	Degrees
X	CATEMP12	Catalyst Temperature Bank 1, Sensor 2	Degrees
X	CATEMP21	Catalyst Temperature Bank 2, Sensor 1	Degrees
X	CATEMP22	Catalyst Temperature Bank 2, Sensor 2	Degrees
X	CLRDIST	Distance Since Codes Cleared	Km/mi
X	CLRWRMUP	Number Of Warm Ups Since DTCs Cleared	Units
X	ECT	Engine Coolant Temperature	Degrees
X	EGRPCT	Commanded EGR	%
X	EGR_ERR	EGR Error	%
X	EVAP_VP	Evaporative System Vapor Pressure	kPa
X	EQ_RAT	Commanded Equivalence Ratio	Unit

X	FLI	Fuel Level Input	%
X	FRP	Fuel Rail Pressure	kPa
X	FUEL SYS1	Fuel System Feedback Control Status Bank 1	Open Loop/Closed Loop
X	FUEL SYS2	Fuel System Feedback Control Status Bank 2	Open Loop/Closed Loop
X	IAT	Intake Air Temperature	Degrees

X	TP	REL Relative Throttle Position	%
	VSS	Vehicle Speed Sensor	km/h-mph

PARAMETER IDENTIFICATION (PID) > FORD PID LIST

NOTE: This is not a complete list of Ford PIDs available. This is a list of Ford PIDs in this service information.

PID	Description	Ford Units
AAT	Ambient Air Temperature	Degrees
AAT_V	Ambient Air Temperature Voltage	Volts
AEIS_ACTION	Number Of Drive Cycles Where Automatic Engine Idle Shutdown Occurred	Count
AEIS_POSS	Number Of Drive Cycles Where Automatic Engine Idle Shutdown Possible	Count
APP	Accelerator Pedal Position	Percent
APP1	Accelerator Pedal Position 1	Volts
APP2	Accelerator Pedal Position 2	Volts
APP_MAXDIFF	Maximum Difference Between APP1 And APP2	Degrees
APP_MODE	Accelerator Pedal Position Mode	Pedal Position
AXLE	Axle Ratio	Ratio
B+	Battery Voltage	Volts
BARO	Barometric Pressure Sensor	Frequency/Pressure
BOO	Brake Pedal Position (BPP) Switch	On/Off
BOO1	Brake Pedal Position (BPP) Switch	On/Off
BOO2	Brake Pressure Applied	On/Off
BPP/BOO	Brake Pedal Position (BPP) Switch	On/Off
BRKOVRD_POSS	Number Of Drive Cycles In Which Brake Override Accelerator Action Possible	Numeric Value
BRKOVR_ACTION	Number Of Drive Cycles Where Brake Override Accelerator Action Occurred	Numeric Value
CAC_T	Charge Air Cooler Temperature	Degrees F
CAC_V	Charge Air Cooler Voltage	Volts

CACC_FANSTAT	Charge Air Cooler Cooling Fan Output Status	Status
CACCT	Charge Air Cooler (CAC) Coolant Temperature Sensor	Degrees F
CACCT_V	Charge Air Cooler (CAC) Coolant Temperature Sensor Voltage	Volts
CAT_EVAL	Catalyst Evaluated	Yes/No
CHT	Cylinder Head Temperature Input	Volt/Degrees F
CHT2	Cylinder Head Temperature 2	Degrees F
CHT2_V	Cylinder Head Temperature 2 Voltage	Volt
CLRDIST	Distance Since DTCs Cleared	Miles
CLRWRMUP	Number Of Warm-Ups Since DTCs Cleared	Count
CPP_BOT	Clutch Pedal At Or Near Bottom Of Travel	Yes/No
CPP	Clutch Pedal Position Switch Input	On/Off
CPP/PNP	Clutch Pedal Position/Park Neutral Position Switch Input	Neutral/Drive
CRNKAS_PRS	Crankcase Pressure (Gauge) Measured	Pressure
CRNKAS_P_V	Crankcase Pressure Sensor Circuit Input Voltage	Volts
DECHOKE	Crank Fueling Disabled	Yes/No
DIST_AEIS	Distance Since Automatic Engine Idle Shutdown Occurred	Miles
DIST_BRKOVRD	Distance Since Brake Override Accelerator Action Occurred	Miles
ECT	Engine Coolant Temperature Input	Volts/Degrees F
EGRMC1F	EGR Motor Control Fault	Fault/No Fault
EGRMC2F	EGR Motor Control Fault	Fault/No Fault
EGRMC3F	EGR Motor Control Fault	Fault/No Fault
EGRMC4F	EGR Motor Control Fault	Fault/No Fault
EGRMDSD	Electric EGR Motor Commanded In Steps	On/Off
EGRPCT	Commanded EGR	Percent
EGR_EVAL	EGR Evaluated	Yes/No
EGR_STEP	EGR Valve Motor Position	Position
EONV_RDY	EVAP Monitor Test Ready At Next Key Off	Ready/Not Ready
EQ_RAT11	Equivalence Ratio Lambda Bank 1, Sensor 1	Ratio
EQ_RAT21	Equivalence Ratio Lambda Bank 2, Sensor 1	Ratio
ETC_ACT	Electronic Throttle Control Actual	Degrees
ETC_DSD	Electronic Throttle Control Desired	Degrees

ETC_TRIM	Electronic Throttle Control Trim	Degrees
EVAP020C	Evaporative Emissions Monitor	Yes/No
EVAP020D	Evaporative Emissions Monitor	Allow/Disallow
EVAP020R	Evaporative Emissions Monitor	Ready/Not Ready
EVAPCP	Evaporative Emissions Canister Purge Valve	Percent/On/Off
EVAPCV	Evaporative Emissions Canister Purge Vent Control	Percent/On/Off
EVAPCV_F	Evaporative Emissions Canister Purge Vent Fault	Fault/No Fault
EVAPSOAK	Evaporative Emissions Monitor Soak Conditions Are Met	Yes/No
EVAPSTA	Evaporative Emissions Monitor Completed Cycle	Status
EVAP_ACTIVE	Evaporative Emissions Activation Switch Position At Start Detection	Yes/No
EVAP_EVAL	Evaporative Emissions Monitor Evaluated	Yes/No
EVAP_SWITCH	Evaporative Emissions Actual Switch	Open/Closed
EVMV	Electronic Vapor Management Valve Commanded Current	Current
FAN	Engine Cooling Fan Operation	On/Off
FANDC	Variable Speed Fan Duty Cycle	Percent
FAN_DSD	Fan Speed Desired	Percent
FANSS	Fan Speed Sensor Signal	RPM
FANVAR	Variable Speed Fan Output	Percent
FANVAR_F	Variable Speed Fan Output Fault	Fault/No Fault
FCIL	Fuel Cap Indicator Light	On/Off
FF_INF	Inferred Flex Fuel Percentage	Percent
FF_LRND	Inferred Flex Fuel Learned	Yes/No
FLI	Fuel Level Indicator Input	Percent
FLP	Low Side Fuel Pressure	Pressure
FP	Fuel Pump	Percent/On/Off
FPM	Fuel Pump Secondary Monitor	Percent/On/Off
FPM2	Fuel Pump Secondary 2 Monitor	Percent/On/Off
FPM_STAT	Fuel Pump Monitor Status	Fault/No Fault
FRP	Fuel Rail Pressure Input	Volts/Pressure
FRP_DSD	Fuel Rail Pressure Desired	Pressure
FRT	Fuel Rail Temperature	Degrees F/Volts

FTP	Fuel Tank Pressure Input	Volts/Pressure
FTP_H2O	Fuel Tank Pressure Input	Pressure
FTP_INF	Inferred Fuel Tank Pressure	Pressure
FUELPW1	Injector Pulse Width Bank 1	Time
FUELPW2	Injector Pulse Width Bank 2	Time
FUELSYS	Fuel System Status	Open Loop/ Closed Loop
F_VCV	Fuel Volume Control Valve	Percent
GEAR	Transmission Gear Status	Gear
HFC	High Speed Fan Control	On/Off
HTR11	Bank 1 Sensor 1 HO2S Heater Control	On/Off
HTR11F	Bank 1 Sensor 1 HO2S Heater Circuit Fault	Fault/No Fault
HTR12	Bank 1 Sensor 2 HO2S Heater Control	On/Off
HTR12F	Bank 1 Sensor 2 HO2S Heater Circuit Fault	Fault/No Fault
HTR21	Bank 2 Sensor 1 HO2S Heater Control	On/Off
HTR21F	Bank 2 Sensor 1 HO2S Heater Circuit Fault	Fault/No Fault
HTR22	Bank 2 Sensor 2 HO2S Heater Control	On/Off
HTR22F	Bank 2 Sensor 2 HO2S Heater Circuit Fault	Fault/No Fault
HTRCM11	Bank 1 Sensor 1 O2S Heater Circuit Current	Current
HTRCM12	Bank 1 Sensor 2 O2S Heater Circuit Current	Current
HTRCM21	Bank 2 Sensor 1 O2S Heater Circuit Current	Current
HTRCM22	Bank 2 Sensor 2 O2S Heater Circuit Current	Current
HTRX1	HO2S Sensor 1 (Upstream) Heater Control	On/Off
HTRX2	HO2S Sensor 2 (Downstream) Heater Control	On/Off
HO2S11	Bank 1 Sensor 1 HO2S Input	Volts
HO2S12	Bank 1 Sensor 2 HO2S Input	Volts
HO2S21	Bank 2 Sensor 1 HO2S Input	Volts
HO2S22	Bank 2 Sensor 2 HO2S Input	Volts
IAC	Idle Air Control	Percent
IACTRIM	Short Term Airflow Trim	Numeric Value
IAT	Intake Air Temperature Input	Degrees F/Volts
IAT2	Intake Air Temperature Sensor 2 Input	Degrees F/Volts
IGN_R/S	Ignition Switch Run/Start	On/Off

IMRC	Intake Manifold Runner Control	On/Off
IMRC_F	Intake Manifold Runner Control Fault	Fault/No Fault
IMRC1M	Intake Manifold Runner Control Bank 1 Monitor	Volts
IMRC2M	Intake Manifold Runner Control Bank 2 Monitor	Volts
IMTV	Intake Manifold Tuning Valve Control	Percent
INJ1F-8F	Fuel Injector Primary Fault (Cylinders 1-8)	Fault/No Fault
INJ9F-10F	Fuel Injector Primary Fault (Cylinders 9 and 10)	Fault/No Fault
INJPWR_M	Injectors Circuit Voltage Monitor	Volts
KNOCK1	Knock Sensor 1 Signal	Count
KNOCK2	Knock Sensor 2 Signal	Count
LFC	Low Speed Fan Control	On/Off
LOAD	Calculated Engine Load	Percent
LONGFT1	Long Term Fuel Trim Bank 1	Percent
LONGFT2	Long Term Fuel Trim Bank 2	Percent
MAF	Mass Airflow Rate Input	Frequency/Volts/Mass Flow
MAP	Intake Manifold Absolute Pressure	Frequency/Volts /Pressure
MAP_DMD	Manifold Absolute Pressure Demanded	Pressure
MFC	Medium Speed Fan Control	On/Off
MIL	Malfunction Indicator Lamp Control	On/Off
MIL_DIS	Distance Since MIL Was Activated	Miles
MISFIRE	Misfire Status	Yes/No
MP_LRN	Learned Misfire Correction Profile	Yes/No
NM	Number Of Misfires	Count
NUM	Misfire Events During Latest Misfire Cycle	Count
O2BANK1	Bank 1 O2S Status	Rich/Lean
O2BANK2	Bank 2 O2S Status	Rich/Lean

FREEZE FRAME DATA > OBDII FREEZE FRAME DATA

Freeze frame data allows access to emission related values from specific generic parameter identification (PID). These values are stored when an emission related diagnostic trouble code (DTC) is stored in continuous memory. This provides a snapshot of the conditions that were present when the DTC was stored. Once one set of freeze frame data is stored, this data remains in memory even if another emission related DTC is stored, with the exception of misfire or fuel system DTCs. Once freeze frame data for a misfire or fuel system DTC is stored it overwrites any previous data, and freeze frame data is no longer overwritten. When a DTC associated with the freeze frame data is erased or the DTCs are cleared, new freeze frame data can be stored again. In the event of multiple emission related DTCs in memory, always note the DTC for the freeze frame data.

Some unique PIDs are stored in the keep alive memory (KAM) of the PCM to help in diagnosing the root cause of misfires. These PIDs are collectively called misfire freeze frame (MFF) data. These parameters are separate from the generic freeze frame data stored for every MIL code and are used for misfire diagnosis only. The MFF data could be more useful for misfire diagnosis than the generic freeze frame data. It is captured at the time of the highest misfire rate, not when the DTC is stored at the end of a 200 or 1, 000 revolution block (generic freeze frame data for misfire can be stored minutes after the misfire actually occurred).

The MFF PIDs are supported on all vehicles, but may not be available on all scan tools because enhanced PID access may vary by scan tool manufacturer.

MISFIRE FREEZE FRAME PIDS DESCRIPTION

PID Name	Description	Measurement Units
MFF_EGR	EGR DPFE Sensor At The Time Of Misfire	Volts
MFF_IAT	Intake Air Temperature At The Time Of Misfire	Degrees
MFF_INGEAR	Transmission In Gear At The Time Of Misfire	Yes/No
MFF_LOAD	Engine Load At The Time Of Misfire	%
MFF_PNP	Park/Neutral Position At The Time Of Misfire	Mode
MFF_RNTM	Engine Running Time At The Time Of Misfire	Time
MFF_RPM	Engine RPM At The Time Of Misfire	RPM
MFF_RUN	Engine Running Time At The Time Of Misfire	Time

MFF_TP	Throttle Position At The Time Of Misfire	Volts
MFF_TRIP	Number Of Driving Cycles At The Time Of Misfire (At Least One 1, 000 Rev Block)	Number of Trips
MFF_VSS	Vehicle Speed At The Time Of Misfire	km/h-mph
MP_ LRN	Learned Misfire Correction Profile	Yes/No

FREEZE FRAME DATA > OBDII FREEZE FRAME DATA > MANUFACTURER SPECIFIC FREEZE FRAME

The manufacturer specific freeze frame data is DTC snapshot data that allows a manufacturer to store vehicle condition information when a DTC sets. This is similar to the OBDII freeze frame functionality that already exists in the PCM. The manufacturer defines the snapshot data to provide the conditions at the time when a fault occurred. Each snapshot is about 40 - 50 PIDs with up to 5 snapshots available for up to 5 different DTCs. The PCM reports the most recent fault conditions for the DTC, and refreshes a maximum of once per operation cycle.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > DESCRIPTION

The flash EEPROM is contained in an integrated circuit internal to the PCM. The flash EEPROM contains the vehicle strategy including calibration information specific to the vehicle, and is capable of being programmed or flashed repeatedly.

As part of the calibration there is an area referred to as the vehicle identification (VID) block. The VID block is programmed when installing a new PCM as described under Programming the VID Block for a Replacement PCM. Failure to carry out this procedure may generate DTC P1635 or P1639. The VID block in an existing PCM can also be programmed to accommodate various hardware or parameter changes made to the vehicle since production. Failure to carry out this procedure correctly may generate DTC P1635, Tire or Axle Ratio out of Acceptable Range. An incorrect tire or axle ratio is one of the main causes for DTC P1635. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the vehicle identification number (VIN), octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control, and 4 wheel drive electronic shift on the fly (ESOF) versus manual shift on the fly (MSOF). Only items applicable to the vehicle hardware and supported by the VID block are displayed on the scan tool.

When changing items in the VID block, the strategy places range limits on certain items such as tire and axle ratio. The number of times the VID block may be reconfigured is limited. When this limit is reached, the scan tool displays a message indicating the need to flash the PCM again to reset the VID block.

Some vehicles must have the engine serial number programmed. The DTC P264F Engine Serial Number Not Programmed Or Incompatible may set if the procedure is not carried out.

For Fiesta, the instrument panel cluster (IPC) communicates the VIN to the PCM. When a new PCM is installed, the PCM obtains the VIN the first time the ignition is turned to the ON position. If there is a concern with the VIN not being received or being invalid, DTC P0630 is set.

On some vehicles, the VIN, tire size, axle ratio, and cruise control configuration are communicated to the PCM from the body control module (BCM). If a new PCM is installed, the new PCM obtains this data the first time the ignition is turned to the ON position. If the data is not received, DTCs U0140 and U0422 set and DTC P0630 may set. If the data is received but the values are invalid or not configured, DTC U0422 sets and DTC P0630 may set. If the data received is valid but the proper learning command has not been received from the diagnostic tool, DTC P160A sets. There are associated PIDs to indicate the status of each data item.

On vehicles equipped with permanent DTC reporting capabilities, neutral profile correction should be learned after a PCM replacement in order to activate the misfire monitor. This is accomplished using the Misfire Monitor Neutral Profile Learn function on the scan tool. Refer to the scan tool manufacturer's instruction manual for details.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > NEUTRAL PROFILE CORRECTION

In order for the misfire detection system to function correctly, any mechanical inaccuracies in the crankshaft position (CKP) sensor must be learned by the PCM. This information is stored in non-volatile memory (NVM) in the PCM. It is not cleared when the keep alive memory (KAM) is reset.

Neutral profile learning is accomplished using the scan tool any time a PCM is replaced. It should also be

relearned any time the CKP sensor or the crankshaft pulse wheel is replaced or major engine repairs have been completed.

To determine if the neutral profile learning has been completed, check the MP_LRN parameter identification (PID) using the scan tool. The PID should read YES if the neutral profile learning has been completed. If the PID reads NO, complete the neutral profile learning prior to diagnosing any misfire DTCs.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > NEUTRAL PROFILE CORRECTION > PROGRAMMING THE VID BLOCK FOR A REPLACEMENT PCM

The VID block on a replacement PCM is blank and requires programming. There are two procedures available. The first is an automatic data transfer from the old PCM to the new PCM, the second is service information data entry into the new PCM.

Automatic data transfer is carried out if the old PCM is capable of communicating. This is done by using a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can be downloaded to the new PCM after it has been installed.

For Fiesta, the instrument panel cluster (IPC) communicates the vehicle identification number (VIN) to the PCM. When a new PCM is installed, the PCM obtains the VIN the first time the ignition is turned to the ON position. If there is a concern with the VIN not being received or being invalid, DTC P0630 is set.

On some vehicles, the VIN, tire size, axle ratio, and cruise control configuration are communicated to the PCM from the body control module (BCM). If a new PCM is installed, the new PCM obtains this data the first time the ignition is turned to the ON position. If the data is not received DTCs U0140 and U0422 set and DTC P0630 may set. If the data is received but the values are invalid or not configured, DTC U0422 sets and DTC P0630 may set. If the data received is valid but the proper learning command has not been received from the diagnostic tool, DTC P160A sets. There are associated PIDs to indicate the status of each data item.

Carry out manual data entry if the old PCM is damaged or incapable of communicating. Remove and install a new PCM. Using a compatible scan tool, select and carry out the module/parameter programming, referring to the scan tool manufacturer's instruction manual. Make certain that all parameters are included. Failure to correctly program tire size in revolutions per mile, (rev/mile equals 63, 360 divided by the tire circumference in inches), axle ratio, 4x4 or 4x2, or MSOF and ESOF may result in DTCs P1635 and P1639. You may be instructed to contact the As-Built Data Center for the information needed to manually update the VID block with the scan tool. Contact the center only if the old PCM cannot be used or the data is corrupt. For Ford and Lincoln technicians, contact your National Hotline or the Professional Technician Society (PTS) web site for As-Built data listed under the Service Publications Index. Non-Ford technicians use the Motorcraft® web site at www.motorcraft.com. From the Motorcraft® home page, use the search function to find the Module Programming or As-Built Data.

For Ford and Lincoln technicians, check the Programmable Module Installation link on the PTS web site for quick Programmable Module data information by vehicle.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > NEUTRAL PROFILE CORRECTION > PROGRAMMING THE ENGINE

SERIAL NUMBER FOR A REPLACEMENT PCM

The engine serial number on a replacement PCM is blank and requires programming. Manual data entry is required. If the old PCM is capable of communicating, the engine serial number is available using a compatible scan tool. Refer to the scan tool manufacturers manual for instructions.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > NEUTRAL PROFILE CORRECTION > MAKING CHANGES TO THE VID BLOCK

A programmed PCM may require changes to be made to certain VID information to accommodate the vehicle hardware. Refer to Module Reprogramming on the scan tool.

FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) > NEUTRAL PROFILE CORRECTION > MAKING CHANGES TO THE PCM CALIBRATION

At certain times, the EEPROM needs to be completely reprogrammed. This is due to changes made to the strategy or calibration after production or the need to reset the VID block because it has reached its limit. Refer to PCM or Module Reprogramming on the scan tool.

DIAGNOSTIC MONITORING TEST RESULTS MODE 6

Mode 6 allows access to the results of on board diagnostic (OBD) monitor diagnostic test results. The test values are stored at the time of the particular monitor completion. Refer to mode 6 on the scan tool for test information.

ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE > DESCRIPTION OF ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE

The following procedure is designed to execute and complete the OBD monitors. To complete a specific monitor for repair verification, follow steps 1 through 4, then continue with the step described by the appropriate monitor found under the OBD Monitor Exercised column. For the evaporative emissions (EVAP) monitor to run, the ambient air temperature must be between 4.4 to 37.8°C (40 to 100°F), and the altitude below 2, 438 meters (8, 000 feet). If the OBD monitors must be completed in these conditions, the PCM must detect them once (twice on some applications) before the EVAP monitor can be bypassed and OBD monitors readied. The EVAP bypassing procedure is described in the following drive cycle.

Use a scan tool to carry out the OBD drive cycle. Refer to the scan tool manufacturer's instruction manual for each described function.

A detailed description for clearing the continuous diagnostic trouble codes (DTCs) is found in this service information. Refer to CLEAR THE CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS) AND

RESET THE EMISSION MONITORS INFORMATION IN THE POWERTRAIN CONTROL MODULE (PCM) .

ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE > DRIVE CYCLE RECOMMENDATIONS

WARNING: STRICT OBSERVANCE OF POSTED SPEED LIMITS AND ATTENTION TO DRIVING CONDITIONS ARE MANDATORY WHEN PROCEEDING THROUGH THE FOLLOWING DRIVE CYCLES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

1. Most OBD monitors complete more readily using a steady foot driving style during cruise or acceleration modes. Operating the throttle in a smooth fashion minimizes the time required for monitor completion.
2. The fuel tank level should be between 1/2 and 3/4 full with 3/4 full being the most desirable.
3. The evaporative monitor can operate only during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize fuel slosh.
4. When bypassing the EVAP engine soak times, the PCM must remain powered (ignition ON) after clearing the continuous DTCs and relearning emission diagnostic information.

For best results, follow each of the following steps as accurately as possible:

OBD Monitor Exercised	Drive Cycle Procedure	Purpose of Drive Cycle Procedure
Drive Cycle Preparation	*NOTE: To bypass the EVAP soak timer (normally 6 hours), the PCM must remain powered after clearing the continuous DTCs and resetting the emission monitors information in the PCM.* 1. Install the scan tool. Turn the ignition ON with the engine OFF. Cycle the ignition OFF, then ON. If needed, select the appropriate vehicle and engine qualifier. Clear the continuous DTCs and reset the emission monitors information in the PCM.	Bypasses the engine soak timer. Resets the OBD monitor status.
	2. Begin to monitor the following PIDs (if available): AAT, ECT, EVAPDC, FLI, IAT and TP MODE. Start the vehicle without returning the ignition to the OFF position. 3. Idle the vehicle for 15 seconds. Drive at 77 to 104 km/h (48 to 65 mph) until the engine coolant temperature is at least 76.7°C (170°F).	
Prep for Monitor Entry	4. Is the intake air temperature between 4.4 and 37.8°C (40 and 100°F)? If not, complete the following steps, but	Engine warm-up and provides intake air

	note that step 14 is required to bypass the EVAP monitor and complete the OBD drive cycle.	temperature input to the PCM.
HO2S	5. Cruise at 77 to 104 km/h (48 to 65 mph) for greater than 5 minutes.	Executes the HO2S monitor.
EVAP	6. Cruise at 77 to 104 km/h (48 to 65 mph) for 10 minutes (avoid sharp turns and hills). NOTE: To initiate the monitor, the throttle should be at part throttle, EVAPDC must be greater than 75%, and FLI must be between 15 and 85%, and for fuel tanks over 25 gallons FLI must be between 30 and 85%.	Executes the EVAP monitor if the intake air temperature is between 4.4 to 37.8°C (40 to 100°F).
Catalyst	7. Drive in stop and go traffic conditions. Include 5 different constant cruise speeds, ranging from 40 to 72 km/h (25 to 45 mph) over a 10 minute period.	Executes the catalyst monitor.
EGR	8. From a stop, idle for 30 seconds, accelerate to 72 km/h (45 mph) at 1/2 to 3/4 throttle, cruise at steady throttle for 1 minute. Repeat idle, acceleration and cruise 3 times.	Executes the exhaust gas recirculation (EGR) monitor.
CCM (Engine)	9. Bring the vehicle to a stop. Idle with the transmission in drive (neutral for M/T) for 2 minutes.	Executes the idle air control portion of the comprehensive component monitor (CCM).
CCM (Transmission)	10. For M/T, accelerate from 0 to 80 km/h (0 to 50 mph), and continue to step 11. For A/T, from a stop and in overdrive, moderately accelerate to 80 km/h (50 mph) and cruise for greater than 15 seconds. Stop the vehicle and repeat without overdrive to 64 km/h (40 mph) cruising for greater than 30 seconds. While at 64 km/h (40 mph), activate the overdrive, accelerate to 80 km/h (50 mph) and cruise for greater than 15 seconds. Stop for at least 20 seconds and repeat step 10 five times.	Executes the transmission portion of the CCM.
Misfire, Fuel And Deceleration Fuel Shut Off Rear HO2S Monitors	11. From a stop, accelerate to 104 km/h (65 mph), hold steady throttle for 5 seconds, then decelerate at closed throttle to 64 km/h (40 mph) (no brakes), accelerate from 64 km/h (40 mph) to 104 km/h (65 mph), hold steady throttle for 5 seconds, repeat deceleration 5 times.	Allows learning for the misfire monitor, and completion of the deceleration fuel shut off rear HO2S monitor.
Readiness Check	12. Access the On Board System Readiness (OBD monitor status) function on the scan tool. Determine whether all non-continuous monitors have completed. If not, go to step 13.	Determines if any monitor has not completed.
Pending Code Check And EVAP Monitor Bypass Check	13. With the scan tool, check for pending codes. Conduct the normal repair procedures for any pending code concern. Otherwise, repeat any incomplete monitor. If the EVAP monitor is not complete and the intake air temperature was out of the 4.4 to 37.8°C (40 to 100°F) temperature range in step 4, or the altitude is over 2438 m (8000 ft.), the EVAP bypass procedure must be followed. Go to Step 14.	Determines if a pending code is preventing the completion of the OBD drive cycle.

EVAP Monitor Bypass	14. Park the vehicle for a minimum of 8 hours. Repeat steps 2 through 11. Do not repeat step 1.	Allows the bypass counter to increment to 2.

INTERMITTENT DIAGNOSTIC TECHNIQUES

Intermittent diagnostic techniques help find and isolate the root cause of intermittent concerns associated with the electronic engine control (EEC) system. The information is organized to help find the concern and carry out the repair. The process of finding and isolating an intermittent concern starts with recreating a fault symptom, accumulating PCM data, and comparing that data to typical values, then analyzing the results. Refer to the scan tool manufacturer's instruction manual for the functions described below.

Before proceeding, be sure that:

- Customary mechanical system tests and inspections do not reveal a concern. Mechanical component conditions can make a PCM system react abnormally.
- Technical Service Bulletins (TSBs) and Online Automotive Service Information System (OASIS) messages, if available, are reviewed.
- Quick Test and associated diagnostic subroutines have been completed without finding a concern, and the symptom is still present.

INTERMITTENT DIAGNOSTIC TECHNIQUES > RECREATING THE FAULT

Recreating the concern is the first step in isolating the cause of the intermittent symptom. A thorough investigation should start with the customer information worksheet located in the back of this manual. If freeze frame data is available, it may help in recreating the conditions at the time of a malfunction indicator lamp diagnostic trouble code (MIL DTC). Listed below are some of the conditions for recreating the concern:

ENGINE FAULT CONDITIONS

Engine Type Conditions	Non-Engine Type Conditions
Engine Temperature	Ambient Temperature
Engine RPM	Moisture Conditions
Engine Load	Road Conditions (Smooth-Bumpy)
Engine Idle/Accel/Deceleration	

INTERMITTENT DIAGNOSTIC TECHNIQUES > ACCUMULATING PCM DATA

PCM data can be accumulated in a number of ways. This includes circuit measurements with a digital multimeter (DMM) or scan tool parameter identification (PID) data. Acquisition of PCM PID data using a

scan tool is one of the easiest ways to gather information. Gather as much data as possible when the concern is occurring to prevent improper diagnosis. Data should be accumulated during different operating conditions and based on the customer description of the intermittent concern. Compare this data with the known good data values. Refer to TYPICAL DIAGNOSTIC REFERENCE VALUES . This requires recording data in four conditions for comparison: 1) KOEO, 2) Hot Idle, 3) 48 km/h (30 mph), and 4) 89 km/h (55 mph).

INTERMITTENT DIAGNOSTIC TECHNIQUES > PERIPHERAL INPUTS

Some signals may require certain peripherals or auxiliary tools for diagnosis. In some cases, these devices can be inserted into the measurement jacks of the scan tool or DMM. For example, connecting an electronic fuel pressure gauge to monitor and record the fuel pressure voltage reading and capturing the data would help find the fault.

INTERMITTENT DIAGNOSTIC TECHNIQUES > COMPARING PCM DATA

After the PCM values are acquired, it is necessary to determine the concern area. This typically requires the comparison of the actual values from the vehicle to the typical values from Section 6. Refer to TYPICAL DIAGNOSTIC REFERENCE VALUES . The charts apply to different vehicle applications (engine, model, transmission).

INTERMITTENT DIAGNOSTIC TECHNIQUES > COMPARING PCM DATA > ANALYZING PCM DATA

Look for abnormal events or values that are clearly incorrect. Inspect the signals for abrupt or unexpected changes. For example, during a steady cruise most of the sensor values should be relatively stable. Sensors such as throttle position (TP) and mass airflow (MAF), as well as an RPM that changes abruptly when the vehicle is traveling at a constant speed, are clues to a possible concern area.

Look for an agreement in related signals. For example, if the APP1 or APP2 changes during acceleration, a corresponding change should occur in RPM and SPARK ADV PID.

Make sure the signals act in proper sequence. An increase in RPM after the TP1 and TP2 increases is expected. If the RPM increases without a TP1 and TP2 change, a concern may exist.

The PID values are not always captured from the same execution loop. Depending on the number of PIDs acquired, the sample rate may be 60 ms or longer. For example, the ETC_ACT reading will always lag behind the ETC_DSD reading due to the physical time to move the throttle plate. This is an expected difference between ETC_ACT and ETC_DSD during these events.

Scroll through the PID data while analyzing the information. Look for sudden drops or spikes in the values.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES

The Adaptive Fuel DTC Diagnostic Techniques help isolate the root cause of the adaptive fuel concern.

Before proceeding, attempt to verify if any driveability concerns are present. These diagnostic aids are meant as a supplement to the pinpoint test steps in Section 5. For a description of fuel trim, refer to POWERTRAIN CONTROL SOFTWARE , Fuel Trim.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > OBTAIN FREEZE FRAME DATA

Freeze frame data is helpful in duplicating and diagnosing adaptive fuel concerns. The data (a snapshot of certain PID values recorded at the time the DTC is stored in continuous memory) is helpful to determine how the vehicle was being driven when the concern occurred, and is especially useful on intermittent concerns. Freeze frame data, in many cases, helps isolate possible areas of concern as well as rule out others. Refer to FREEZE FRAME DATA in this service information for a more detailed description of this data.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > USING THE LONGFT1 AND LONGFT2 (DUAL BANK ENGINES) PIDS

The LONGFT1 and LONGFT2 PIDs are useful for diagnosing fuel trim concerns. A negative PID value indicates fuel is being reduced to compensate for a rich condition. A positive PID value indicates fuel is being increased to compensate for a lean condition. It is important to know there is a separate LONGFT value used for each RPM and load point of engine operation. When viewing the LONGFT1 and LONGFT2 PIDs, the values may change a great deal as the engine is operating at different RPM and load points. This is because the fuel system may have learned corrections for fuel delivery concerns that can change as a function of engine RPM and load. The LONGFT1 and LONGFT2 PIDs display the fuel trim currently being used at that RPM and load point. Observing the changes in LONGFT1 and LONGFT2 can help when diagnosing fuel system concerns. For example:

- A contaminated mass airflow (MAF) sensor results in matching LONGFT1 and LONGFT2 correction values that are negative at idle (reducing fuel), but positive (adding fuel) at higher RPM and loads.
- LONGFT1 values that differ greatly from LONGFT2 values rule out concerns that are common for both banks (for example, fuel pressure concerns, MAF sensor, etc. can be ruled out).
- Vacuum leaks result in large rich corrections (positive LONGFT1 and LONGFT2 values) at idle, but little or no correction at higher RPM and loads.
- A plugged fuel filter results in no correction at idle, but large rich corrections (positive LONGFT1 and LONGFT2 values) at high RPM and load.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > RESETTING LONG TERM FUEL TRIMS

Long term fuel trim corrections are reset by resetting the keep alive memory (KAM). Refer to RESETTING THE KEEP ALIVE MEMORY (KAM) in this service information. After making a fuel system repair, reset the KAM. For example, if dirty or plugged injectors cause the engine to run lean and generate rich long term corrections, installing new injectors and not resetting the KAM causes the engine

to run very rich. The rich correction eventually leans out during closed loop operation, but the vehicle may have poor driveability and high carbon monoxide (CO) emissions while it is learning.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > DTCS P0171 AND P0174 SYSTEM TOO LEAN DIAGNOSTIC AIDS

> *NOTE: If the system is lean at certain conditions, then the LONGFT PID would be a positive value at those conditions, indicating that increased fuel is needed.*

The ability to identify the type of lean condition causing the concern is crucial to diagnosis.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > AIR MEASUREMENT SYSTEM

With this condition, the engine runs rich or lean of stoichiometry (14.7:1 air to fuel ratio) if the PCM is not able to compensate enough to correct for the condition.

For example, the MAF sensor measurement is inaccurate due to a corroded connector, contaminated or dirty connector. A contaminated MAF sensor typically results in a rich system at low airflows (PCM reduces fuel) and a lean system at high airflows (PCM increases fuel).

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > VACUUM LEAKS AND UNMETERED AIR

With this condition, the engine may actually run lean of stoichiometry (14.7:1 air to fuel ratio) if the PCM is not able to compensate enough to correct for the condition. This condition can be caused by unmetered air entering the engine. Vacuum leaks normally are most apparent when high manifold vacuum is present (for example, during idle or light throttle). If freeze frame data indicates the fault occurred at idle, a check for vacuum leaks and unmetered air might be the best starting point.

For example, loose, leaking or disconnected vacuum lines, intake manifold gaskets or O-rings, throttle body gaskets, brake booster, air inlet tube or unseated engine oil dipstick.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > INSUFFICIENT FUELING

With this condition, the engine runs lean of stoichiometry (14.7:1 air to fuel ratio) if the PCM is not able to compensate enough to correct for the condition. This condition is caused by a fuel delivery system concern that restricts or limits the amount of fuel being delivered to the engine. This condition is normally apparent as the engine is under a heavy load and at high RPM, when a higher volume of fuel is required. If the freeze frame data indicates the concern occurs under a heavy load and at higher RPM, a check of the fuel delivery system (checking fuel pressure with engine under a load) is the best starting point.

Examples of this include:

- low fuel pressure (fuel pump, fuel filter, fuel leaks, restricted fuel supply lines)
- fuel injector concerns

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > EXHAUST SYSTEM LEAKS

In this type of condition, the engine runs rich of stoichiometry (14.7:1 air to fuel ratio) because the fuel control system is adding fuel to compensate for a perceived (not actual) lean condition. This condition is caused by the heated oxygen sensor (HO2S) sensing the oxygen (air) entering the exhaust system from an external source. The PCM reacts to this exhaust leak by increasing fuel delivery. This condition causes the exhaust gas mixture from the cylinder to be rich.

Examples of this include:

- exhaust system leaks upstream or near the HO2S
- cracked or leaking HO2S boss

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > DTCS P0172 AND P0175 SYSTEM TOO RICH DIAGNOSTIC AIDS

NOTE: If the system is rich at certain conditions, then the LONGFT PID would be a negative value at that airflow, indicating that decreased fuel is needed.

System rich concerns are caused by fuel system concerns, although the MAF sensor and base engine (for example, engine oil contaminated with fuel) should also be checked.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > AIR MEASUREMENT SYSTEM

With this condition, the engine runs rich or lean of stoichiometry (14.7:1 air to fuel ratio) if the PCM is not able to compensate enough to correct for the condition.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > FUEL SYSTEM

With this condition, the engine runs rich of stoichiometry (14.7:1 air to fuel ratio), if the PCM is not able to compensate enough to correct for the condition. This situation causes a fuel delivery system that is delivering excessive fuel to the engine.

Examples of this include:

- fuel pressure regulator (mechanical returnless fuel systems) causes excessive fuel pressure (system rich at all airflows), fuel pressure is intermittent, going to pump deadhead pressure, then returning to normal after the engine is turned off and restarted.
- fuel injector leaks (injector delivers extra fuel).
- evaporative emission (EVAP) purge valve leak (introduces extra fuel).
- fuel rail pressure (FRP) sensor (electronic returnless fuel systems) concern causes the sensor to indicate a lower pressure than actual. The PCM commands a higher duty cycle to the fuel pump control module, causing high fuel pressure (system rich at all airflows).

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > INTAKE AIR SYSTEM

A restriction within any of the intake air system components may be significant enough to affect the ability of the PCM adaptive fuel control.

ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES > BASE ENGINE

Engine oil contaminated with fuel can contribute to a rich running engine.

INTRODUCTION

NOTE: The descriptions and specifications contained in this service information were in effect at the time this service information was approved for publication. Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring obligation.

INTRODUCTION > REPAIR TECHNIQUES

Appropriate service methods and procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual doing the work. This service information provides general directions for performing service with tested, effective techniques. Following them will help assure reliability.

There are numerous variations in procedure, techniques, tools and parts for servicing vehicles, as well as in the skill of the individual doing the work. This service information cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this service information must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools or parts.

INTRODUCTION > REPAIR TECHNIQUES > NOTE, NOTICE, CAUTION AND WARNING

As you read through this service information, you may come across a NOTE, NOTICE, CAUTION or WARNING. Each one is there for a specific purpose. A NOTE calls attention to unique, additional or essential information related to the subject procedure. A NOTICE identifies a hazard that could damage the vehicle or property. A CAUTION identifies a hazard that could result in minor personal injury to yourself or others. A WARNING identifies a hazard that could result in severe personal injury or death to yourself or others. Some general WARNINGS that you should follow when you work on a vehicle are listed below.

- ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.
- KEEP SOLVENTS AWAY FROM IGNITION SOURCES. SOLVENTS MAY BE FLAMMABLE AND COULD IGNITE OR EXPLODE IF NOT HANDLED CORRECTLY.
- USE SAFETY STANDS WHENEVER A PROCEDURE REQUIRES YOU TO BE UNDER THE VEHICLE.
- MAKE SURE THAT THE IGNITION SWITCH IS ALWAYS IN THE OFF POSITION, UNLESS OTHERWISE REQUIRED BY THE PROCEDURE.
- SET THE PARKING BRAKE WHEN WORKING ON THE VEHICLE. IF YOU HAVE AN AUTOMATIC TRANSMISSION, SET IN PARK UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. IF YOU HAVE A MANUAL TRANSMISSION, IT SHOULD BE IN REVERSE (ENGINE

OFF) OR NEUTRAL (ENGINE ON) UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. PLACE WOOD BLOCKS (4" X 4" OR LARGER) OR WHEEL CHOCKS AGAINST THE FRONT AND REAR SURFACES OF THE TIRES TO HELP PREVENT THE VEHICLE FROM MOVING.

- OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA TO AVOID THE DANGER OF CARBON MONOXIDE POISONING.
- KEEP YOURSELF AND YOUR CLOTHING AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE DRIVE BELTS.
- TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT METAL PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD, TAIL PIPE, THREE WAY CATALYTIC CONVERTER AND MUFFLER.
- DO NOT SMOKE WHILE WORKING ON A VEHICLE.
- TO AVOID INJURY, ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING BEFORE BEGINNING TO WORK ON A VEHICLE.
- WHEN IT IS NECESSARY TO WORK UNDER THE HOOD, KEEP HANDS AND OTHER OBJECTS CLEAR OF THE COOLING FAN BLADES!

INTRODUCTION > PREFACE

This service information provides a step-by-step approach for diagnosing driveability, emission, and powertrain control system symptoms. Before beginning diagnosis, it may be helpful to refer to any Technical Service Bulletins (TSBs) or On-line Automotive Service Information System (OASIS) information when this is available. The TSB and OASIS information is available on either the Professional Technician Society (PTS) or Motorcraft® website.

This service information is used in conjunction with the Wiring Diagrams. The service information provide additional diagnostic or component removal and installation information. The Wiring Diagrams provide vehicle specific wiring information, component, connector, and splice locations.

The following is a description contained in this service information.

INTRODUCTION > PREFACE > DESCRIPTION AND OPERATION

This contains description and operation information on powertrain control systems and components and provides the technician with a general knowledge of the powertrain control system. Use this when general information about the powertrain control system is desired.

INTRODUCTION > PREFACE > DIAGNOSTIC METHODS

This contains information on specific diagnostic tasks that are used during diagnosis. Descriptions of specific diagnostic methods are included, as well as detailed instructions on how to access or carry out the task.

INTRODUCTION > PREFACE > SYMPTOM CHARTS

All diagnosis begins in SYMPTOM CHARTS with QT Powertrain Control Module (PCM) Quick Test. If the PCM Quick Test is completed and no diagnostic trouble codes (DTCs) have been retrieved, the technician is directed to the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX The No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index contains the list of symptoms addressed in this service information, and directs the technician to the appropriate chart in the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS . If no PCM DTCs are present and the vehicle symptom is not listed in the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index, the technician should go to the appropriate service information to continue diagnosis.

INTRODUCTION > PREFACE > POWERTRAIN DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS

This section contains the Diagnostic Trouble Code (DTC) Charts and Descriptions. These charts and descriptions are referenced if a DTC is retrieved in SYMPTOM CHARTS . Also included in this service information is the list of possible causes and diagnostic aids.

INTRODUCTION > PREFACE > PINPOINT TESTS

All pinpoint tests are included in this service information. Never enter a pinpoint test unless directed there. When directed to a pinpoint test, always read the information included at the beginning of the pinpoint test.

INTRODUCTION > PREFACE > REFERENCE VALUES

This contains the Typical Diagnostic Reference Values charts. The technician is directed to these charts from Pinpoint Test Z in Section 5.

INTRODUCTION > HOW TO USE THE DIAGNOSTIC PROCEDURES

- Use the information about the vehicle driveability or emission concerns to attempt to verify/recreate the symptom. Look for any vehicle modifications or aftermarket items that may contribute to the symptom. A check of any applicable TSBs or OASIS messages may be useful if this information is available.
- Go to QT1 Powertrain Control Module (PCM) Quick Test. Carry out the PCM quick test steps. Follow any notes as directed.
- If the PCM quick test is completed, no DTCs were retrieved, and no special notes applied, go to the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX .
- Select the symptom that best describes the vehicle symptom (for multiple symptoms select the one

that is most evident). Go to the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS as indicated. If no PCM DTCs are present and the vehicle symptom is not listed in the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart Index, go to the appropriate service information to continue diagnosis.

- The No Diagnostic Trouble Codes (DTCs) Present Symptom Charts contain areas to be tested for diagnosis of the vehicle symptom. The chart is arranged to place the higher probability or easiest to test items toward the top of the chart. However, the technician is not required to follow this order due to reasons such as variations in vehicle type, vehicle repair history, or technician experience.
    - The System/Component column indicates the areas that are tested. This column may also contain a quick system/component test.
    - The Reference column indicates where to go for the System/Component testing. All references are to the beginning of a pinpoint test in PINPOINT TEST of this service information unless noted otherwise. If referred to a pinpoint test in this service information go to the procedures. Follow the directions given in those procedures, including directions to other tests or service information. If a damaged part is found, repair as directed. If no concern is found, and diagnosis in that area is complete, return to the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS to continue to the next item.
    - If a quick system/component test is in the System/Component column, the Reference column indicates where to go if the test failed.
- During diagnosis, if directed to test a system/component that is not contained on that vehicle, go to the next step.
- If the No Diagnostic Trouble Codes (DTCs) Present Symptom Chart for the vehicle symptom is completed and no concern is found, return to the NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX to address the next most prominent symptom. If all diagnosis is complete and no concern is found, it may be helpful to GO to Pinpoint Test Z service information to continue diagnosis.
- The installation of any new component that affects the PCM adaptive learning strategies (adaptive airflow, idle speed, refueling event, or fuel trim) requires the reset of keep alive memory (KAM). Refer to RESETTING THE KEEP ALIVE MEMORY (KAM) to reset the KAM.
- After any repair, reconnect any components and remove any test equipment. Verify the vehicle is operating correctly and the original complaint is no longer present. If a DTC was present, clear the DTCs and repeat the self-test to verify the repair.
- If a symptom is determined to be intermittent, a careful visual and physical underhood inspection of connectors, wiring harnesses, vacuum lines, and components is required. The Customer Information Worksheet may contain more detailed symptom information. Before an in-depth diagnosis begins, start the engine and wiggle wires, tap on components while listening for an indication of a concern (such as a RPM change or a relay clicking).

Information about engine conditions is stored when a DTC that illuminates the malfunction indicator lamp (MIL) is set. This information is called freeze frame data and may be helpful in diagnosing intermittent concerns. Refer to FREEZE FRAME DATA for additional information.

INTRODUCTION > WHAT'S NEW IN THIS MANUAL

The following is a list of changes to this service information for 2015:

- The all new Edge with a 2.0L GTDI engine, a new 2.7L GTDI engine with a new crankcase pressure sensor, and a 3.5L TIVCT engine.
- The Expedition with a new 3.5L GTDI engine with a new crankcase pressure sensor and a new 198 pin PCM.
- The all new F-150 with a new 2.7L GTDI engine with a new crankcase pressure sensor, a 3.5L TIVCT engine, a 3.5L GTDI engine with a new 198 pin PCM, and a 5.0L TIVCT engine including a dual bank intake manifold runner control (IMRC).
- The Focus with a new 1.0L GTDI engine with a new crankcase pressure sensor and a new charge air cooler (CAC) fan.
- The Fusion 1.5L GTDI engine with a new CHT sensor.
- The all new MKC with a 2.0L GTDI engine, a new 2.3L GTDI engine, engine coolant temperature (ECT) sensor, a 198 pin PCM, and an optional 5 relay three speed engine cooling fan system.
- The all new Mustang with a new 2.3L GTDI engine with a new crankcase pressure sensor and the 5.0L TIVCT engine with a new dual bank intake manifold runner control (IMRC) system.
- The Navigator with a new 3.5L GTDI engine with a new crankcase pressure sensor and a new 198 pin PCM.
- The all new Transit with a 3.5L GTDI engine and a 3.7L TIVCT engine.

ACRONYMS AND DEFINITIONS

> *NOTE: This acronyms and definitions listing contains technical terms applicable to Ford Motor Company products. It is not intended to be an all-inclusive dictionary of components and their functions. If a detailed description of a particular system or component is desired, refer to the applicable service information within this PC/ED service information or refer to the additional service information regarding the specific vehicle being repaired.*

AAT: Ambient Air Temperature

APP: Accelerator Pedal Position

A/T: Automatic Transmission

AWD: All Wheel Drive

BARO: Barometric Pressure

BPP: Brake Pedal Position

BTDC: Before Top Dead Center

CAC: Charge Air Cooler

CAN: Controller Area Network

CCM: Comprehensive Component Monitor

CF: Cooling Fan

CHT: Cylinder Head Temperature

CKP: Crankshaft Position

CL: Closed Loop

CMP: Camshaft Position

CO: Carbon Monoxide

CO 2: Carbon Dioxide

COP: Coil On Plug

CPP: Clutch Pedal Position

CPU: Central Processing Unit

CTO: Clean Tach Output

DC: 1. Direct Current 2. Duty Cycle

DFI: Direct Fuel Injection

DFSO: Deceleration Fuel Shut Off

DLC: Data Link Connector

DTC: Diagnostic Trouble Code

E10: Fuel containing 10% ethanol

E85: Fuel containing 85% ethanol

ECT: Engine Coolant Temperature

EEC: Electronic Engine Control

EEGR: Electric Exhaust Gas Recirculation

EEPROM: Electrically Erasable Programmable Read-Only Memory

EGR: Exhaust Gas Recirculation

EI: Electronic Ignition

EMD: Engine Manufacturers Diagnostics

EMI: Electromagnetic Interference

EONV: Engine Off Natural Vacuum

EOT: Engine Oil Temperature

EPS: Exhaust Phase Shifting

ERFS: Electronic Returnless Fuel System

ESOF: Electronic Shift-on-the-Fly

ETB: Electronic Throttle Body

ETBTACM: Electronic Throttle Body Throttle Actuator Control Motor

ETBTPS: Electronic Throttle Body Throttle Position Sensor

ETC: Electronic Throttle Control

EVAP: Evaporative Emission

EVAPCP: Evaporative Emission Canister Purge Valve

IPC: Independent Plausibility Checker

IPS: Intake Phase Shifting

ISO: International Standards Organization

KAM: Keep Alive Memory

KOEO: Key On Engine Off

KOER: Key On Engine Running

KS: Knock Sensor

LDR: Low Data Rate

LONGFT: Long-Term Fuel Trim

MAF: Mass Airflow

MAP: Manifold Absolute Pressure

MAP/IAT2: Manifold Absolute Pressure/Intake Air Temperature 2

MFF: Misfire Freeze Frame

MIL: Malfunction Indicator Lamp

MRFS: Mechanical Returnless Fuel System

MSOF: Manual Shift-on-the-Fly

M/T: Manual Transmission

NO_X : Nitrogen Oxides

NVM: Non-Volatile Memory

NVRAM: Non-Volatile Random Access Memory

OASIS: On-line Automotive Service Information System

OBD: On Board Diagnostic

OL: Open Loop

ORVR: On Board Refueling Vapor Recovery

OSC: Output State Control

OSR: On Board System Readiness

OSS: Output Shaft Speed

PATS: Passive Anti-Theft System

PCM: Powertrain Control Module

PCV: Positive Crankcase Ventilation

Pd: Palladium

PID: Parameter Identification

PIP: Profile Ignition Pickup

PPM: Parts per Million

PSP: Power Steering Pressure

Pt: Platinum

PTS: Professional Technician Society

PWM: Pulse Width Modulation

PZEV: Partial Zero Emission Vehicle

RAM: Random Access Memory

Rh: Rhodium

ROM: Read-Only Memory

RPM: Revolutions Per Minute

RWD: Rear Wheel Drive

SAE: Society of Automotive Engineers

SCB: Supercharger Bypass

SFI: Sequential Multiport Fuel Injection

SHRTFT: Short-Term Fuel Trim

TAC: Throttle Actuator Control

TACM: Throttle Actuator Control Motor

TC: Turbocharger

TCBP/CACT: Turbocharger Boost Pressure/Charge Air Cooler Temperature

TCBY: Turbocharger Bypass

TCIPT: Turbocharger Intake Pressure And Temperature

TCM: Transmission Control Module

TCS: Transmission Control Switch

TDC: Top Dead Center

TIVCT: Twin Independent Variable Camshaft Timing

TP: Throttle Position

TPPC: Throttle Plate Position Controller

TR: Transmission Range

TSB: Technical Service Bulletin

TWC: Three Way Catalytic Converter

VCT: Variable Camshaft Timing

VECI: Vehicle Emission Control Information

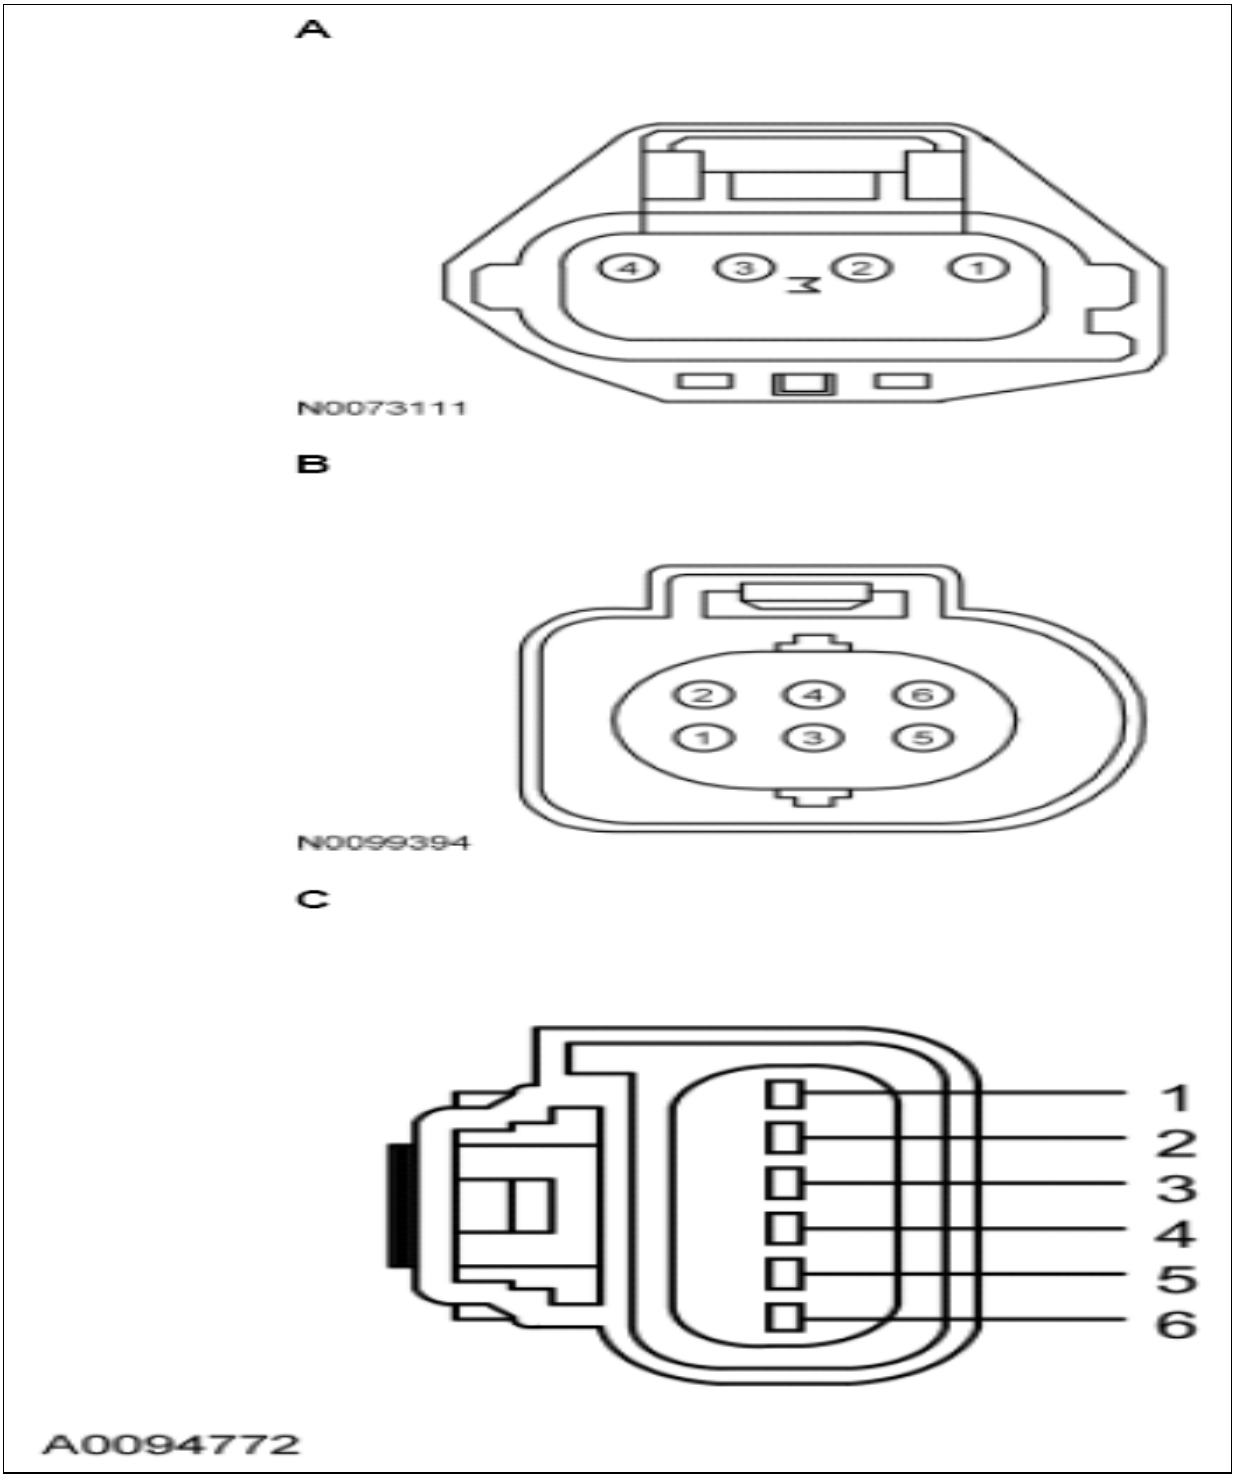
VID: Vehicle Identification

VIN: Vehicle Identification Number

VR: Variable Reluctance

VSS: Vehicle Speed Sensor

WOT: Wide Open Throttle



PINPOINT TEST A: NO START > INTRODUCTION

> *WARNING: STOP THIS TEST AT THIS TEST AT THE FIRST SIGN OF A FUEL LEAK AND REPAIR AS REQUIRED.*
> *NO OPEN FLAME. NO SMOKING DURING FUEL DELIVERY CHECKS.*
> *FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.*

This pinpoint test is intended to diagnose the following:

- spark (as related to electronic engine control)
- PCM (12A650)

Fig 1: Identifying Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector

Pin	Circuit

13	FEPS (Flash EEPROM Programming Signal)

PINPOINT TEST A: NO START > TEST PROCEDURE

A1 ATTEMPT TO CRANK THE ENGINE

NOTE: Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature for location.

Does the engine crank?

Yes	No
GO to **A2** .	REFER to the service information, Starting System, and DIAGNOSE the engine does not crank symptom.

A2 IDENTIFY THE TYPE OF NO START

NOTE: The purpose of this test step is to identify intermittent no starts in order to determine the correct repair procedure.

Does the vehicle start?

Yes	No
The vehicle has an intermittent no start. GO to PINPOINT TEST Z .	For DTCs P0320 or P0322, GO to PINPOINT TEST JD . For all others, GO to **A3** .

A3 CHECK VREF VOLTAGE TO THE ETBTPS

Ignition OFF.

ETBTPS connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No

GO to **A4** .	GO to PINPOINT TEST C .

A4 CHECK THE FLASH EEPROM PROGRAMMING SIGNAL (FEPS) CIRCUIT FOR A SHORT TO VOLTAGE

NOTE: For vehicles without a FEPS circuit, follow the Yes answer.

Ignition OFF.

ETBTPS connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) DLC, Harness Side	(-) Vehicle Battery
FEPS - Pin 13	Negative terminal

Is the voltage less than 9 V?

Yes	No
GO to **A5** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

A5 CHECK THE RPM IN THE PCM

NOTE: Connect the scan tool to a voltage source that is powered with the ignition in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.

NOTE: Normal engine cranking speed is between 150 RPM and 350 RPM.

Access the PCM and monitor the RPM (RPM) PID.

Crank the engine while viewing the RPM PID.

Is the RPM between 150 RPM - 350 RPM?

Yes	No
GO to **A6** .	For base engine concerns, REFER to the service information , Engine System - General Information, and DIAGNOSE difficult starting symptom. For all others, GO to JD2.

A6 CHECK FOR CRANKSHAFT POSITION (CKP) AND CAMSHAFT POSITION (CMP) SYNCHRONIZATION

Access the PCM and monitor the SYNC (MODE) PID.

Crank the engine while viewing the SYNC PID.

Does the SYNC PID read YES?

Yes	No
GO to **A7** .	GO to PINPOINT TEST JD .

A7 CHECK FOR SPARK AT THE CYLINDERS

Ignition OFF.

Remove the fuel pump fuse to disable the fuel pump.

Disconnect the ignition coils from the spark plugs on half of the number of cylinders on the engine.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to a spark plug boot and repeat for half the number of cylinders on the engine.

Observe the spark tester while cranking the engine.

Is a bluish-white spark present for each tested cylinder?

Yes	No
GO to **A8** .	For Fiesta 1.6L TiVCT, GO to PINPOINT TEST JE . For all others, GO to PINPOINT TEST JF .

A8 CHECK THE FUEL PRESSURE

WARNING: THE FUEL SYSTEM REMAINS PRESSURIZED WHEN THE ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHEN WORKING ON THE FUEL SYSTEM.
REFER TO THE FUEL SYSTEM WARNING INFORMATION AT THE BEGINNING OF PINPOINT TEST HC.
FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: While activating the fuel pump on an electronic returnless fuel system a brief pressure spike may occur.

Ignition OFF.

Relieve the fuel pressure. Refer to the service information , Fuel System for the Fuel System Pressure Release procedure.

Connect the fuel pressure gauge using the appropriate fuel pressure test hose and adaptor.

Ignition ON, engine OFF.

Access the PCM and control the FP (MODE) PID.

Activate the fuel pump to obtain maximum fuel pressure.

Is the fuel pressure within specification (refer to the FUEL PRESSURE CHART in Pinpoint Test HC)?

Yes	No
GO to **A9** .	GO to PINPOINT TEST HC .

A9 CHECK THE FUEL PRESSURE LEAKDOWN

Ignition ON, engine OFF.

Access the PCM and control the FP (MODE) PID.

Activate the fuel pump to obtain maximum fuel pressure.

Monitor the FRP.

Verify the fuel pressure remains within 34 kPa (5 psi) of the maximum pressure for 1 minute after turning the pump off.

Does fuel pressure remain within 34 kPa (5 psi)?

Yes	No
For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, and	GO to PINPOINT TEST HC .

Transit Connect 1.6L, GO to A11. For all others, GO to **A10** .	

A10 CHECK THE FUEL INJECTORS FOR VOLTAGE

NOTE: A no start condition typically exists only if greater than half of the fuel injectors are without voltage. Check at least 2 fuel injectors, 1 on each bank on V type engines.

Ignition OFF.

Disconnect 2 fuel injectors.

Ignition ON, engine OFF.

Measure the VPWR voltage at each fuel injector harness connector.

Is the voltage greater than 10.5 V?

Yes	No
GO to **A11** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

A11 CHECK THE FUEL INJECTORS' ABILITY TO DELIVER FUEL

Cycle the ignition several times to charge the fuel system.

Disable the fuel pump.

Monitor the fuel pressure gauge while cranking the engine for at least 5 seconds.

Is there a pressure drop greater than 34 kPa (5 psi) while cranking the engine?

Yes	No
For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC,	GO to **A12** .

MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, and Transit Connect 1.6L, GO to PINPOINT TEST DI . For all others, The electronic engine control (EEC) system is not the cause of the no start. RETURN to SYMPTOM CHARTS for further direction.	

A12 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST C: REFERENCE VOLTAGE (VREF) > INTRODUCTION

NOTE: The APPVREF1/APPVREF2/ETCREF circuits and the APPRTN1/APPRTN2 /ETCRTN circuits are internally bussed within the PCM and are dedicated circuits for the APP sensor and the ETBTPS only.

This pinpoint test is intended to diagnose the following:

- harness circuits: APPVREF1, APPVREF2, APPRTN1, APPRTN2, ETCREF, ETCRTN, SIGRTN and VREF
- accelerator pedal position (APP) sensor (9F836)

- air conditioning pressure (ACP) transducer sensor (19D594)
- crankcase pressure sensor (6758)
- crankshaft position (CKP) sensor (6C315)
- camshaft position (CMP) sensor (6B288)
- electronic throttle body throttle position sensor (ETBTPS) (9E928)
- fuel pressure sensor (9F972)
- fuel rail pressure (FRP) sensor (6B288)
- fuel tank pressure (FTP) sensor (9C052)
- generator current sensor (14B357)
- intake manifold runner control bank 1 (IMRC1) sensor (9J559)
- intake manifold runner control bank 2 (IMRC2) sensor (9J559)
- manifold absolute pressure (MAP) sensor (9F479)
- manifold absolute pressure temperature (MAPT) sensor (9F479)
- manifold absolute pressure (MAP)/charge air cooler temperature (CACT) sensor (9F479)
- manifold absolute pressure (MAP)/intake air temperature 2 (IAT2) sensor (9F479)
- turbocharger boost pressure (TCBP) sensor (9F479)
- turbocharger boost pressure (TCBP)/charge air cooler temperature (CACT) sensor (9F479)
- turbocharger intake pressure and temperature (TCIPT) sensor (9F479)
- wastegate vacuum sensor (9F479)
- PCM (12A650)

PINPOINT TEST C: REFERENCE VOLTAGE (VREF) > TEST PROCEDURE

C1 CHECK THE REFERENCE VOLTAGE TO SIGNAL RETURN

NOTE: Diagnostic trouble codes (DTCs) P0642, P0643, P06A6, P06A7 and P06A8 are set due to VREF circuit concerns only. DTCs P0652 and P0653 are set due to ETCREF circuit concerns only. When diagnosing DTC P0642, P0643, P06A6, P06A7 or P06A8, follow the path for VREF concerns. When diagnosing DTC P0652 or P0653, follow the path for ETCREF concerns.

Ignition OFF.

Suspect Sensor connector disconnected.

Ignition ON, engine OFF.

For ETCREF concerns.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

For APPVREF concerns.

Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-) APP Sensor Connector, Harness Side
APPVREF1	APPRTN1
APPVREF2	APPRTN2

For VREF concerns.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-) Suspect Sensor Connector, Harness Side
VREF	SIGRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to C30.	GO to **C2** .

C2 CHECK THE REFERENCE VOLTAGE TO GROUND

For ETCREF concerns.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-)
ETCREF	Ground

For APPVREF concerns.

Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-)

APPVREF1	Ground
APPVREF2	Ground

For VREF concerns.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to C29.	GO to **C3** .

C3 CHECK THE REFERENCE VOLTAGE WITH ALL SENSORS DISCONNECTED

NOTE: Refer to the Sensors Connected To Reference Voltage Chart at the beginning of this pinpoint test and the Wiring Diagrams Manual Electronic Engine Controls Cell to identify the sensors connected to VREF, ETCREF and APPVREF.

Ignition OFF.

Disconnect all of the sensors connected to the reference voltage circuits.

Ignition ON, engine OFF.

Measure the voltage at the sensor disconnected in C1.

For ETCREF concerns.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-)
ETCREF	Ground

For APPVREF concerns.

Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-)
APPVREF1	Ground
APPVREF2	Ground

For VREF concerns.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For APPVREF or ETCREF circuit concerns, GO to C8. For all other VREF concerns, GO to C10.	GO to **C4** .

C4 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR AN

Ignition OFF.

PCM connector disconnected.

For ETCREF concerns.

Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCREF

For APPVREF concerns.

Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APPVREF1	APPVREF1
APPVREF2	APPVREF2

For VREF concerns.

Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VREF

Is the resistance less than 5 ohms?

Yes	No
GO to **C5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

C5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

For APPVREF or ETCREF concerns.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	ETCRTN
APPVREF1	APPRTN1
APPVREF2	APPRTN2
APPVREF1	APPRTN2
APPVREF2	APPRTN1

Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
ETCREF	Ground
APPVREF1	Ground
APPVREF2	Ground

For VREF concerns.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	SIGRTN

Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **C6** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

C6 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VPWR

For ETCREF concerns.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
ETCREF	VPWR

For APPVREF concerns.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
APPVREF1	VPWR
APPVREF2	VPWR

For VREF concerns.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) PCM Connector, Harness Side
VREF	VPWR

Is the resistance greater than 10K ohms?

Yes	No
GO to **C7** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

C7 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For ETCREF concerns.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ETCREF	Ground

For APPVREF concerns.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
APPVREF1	Ground
APPVREF2	Ground

For VREF concerns.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VREF	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to C31.

C8 CHECK THE REFERENCE VOLTAGE WITH THE ETBTPS CONNECTED

*NOTE: If this sensor was used for the measurement in C3, GO to **C9** .*

Ignition OFF.

ETBTPS connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) APP Sensor Connector, Harness Side	(-)
APPVREF1	Ground
APPVREF2	Ground

Are the voltages between 4.5 - 5.5 V?

Yes	No
The concern is intermittent. GO to PINPOINT TEST Z .	INSTALL a new ETBTPS. REFER to the service information , Fuel Charging and Controls or Section 303-14, Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C9 CHECK THE REFERENCE VOLTAGE WITH THE APP SENSOR CONNECTED

Ignition OFF.

APP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-)
ETCREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
The concern is intermittent.	INSTALL a new APP sensor. REFER to the service information , Acceleration Control.

GO to PINPOINT TEST Z .	Clear the PCM DTCs. REPEAT the self-test.

C10 CHECK THE REFERENCE VOLTAGE WITH THE MAP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a MAP sensor or if this sensor was used for the VREF measurement in C3, GO to **C11** .*

Ignition OFF.

MAP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C11** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new MAP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C11 CHECK THE REFERENCE VOLTAGE WITH THE TCBP/CACT SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a TCBP/CACT sensor or if this sensor was used for the VREF measurement in C3, GO to **C12** .*

Ignition OFF.

TCBP/CACT Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No

For additional sensors disconnected, GO to **C12** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new TCBP/CACT sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C12 CHECK THE REFERENCE VOLTAGE WITH THE MAP/IAT2 SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a MAP/IAT2 sensor or if this sensor was used for the VREF measurement in C3, GO to **C13** .*

Ignition OFF.

MAP/IAT2 Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C13** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new MAP/IAT2 sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C13 CHECK THE REFERENCE VOLTAGE WITH THE FRP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a FRP sensor or if this sensor was used for the VREF measurement in C3, GO to **C14** .*

Ignition OFF.

FRP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C14** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new FRP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C14 CHECK THE REFERENCE VOLTAGE WITH THE CRANKCASE PRESSURE SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a crankcase pressure sensor or if this sensor was used for the VREF measurement in C3, GO to **C15** .*

Ignition OFF.

Crankcase Pressure Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C15** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new Crankcase Pressure sensor. REFER to the service information , Engine Emission Control. Clear the PCM DTCs. REPEAT the self-test.

C15 CHECK THE REFERENCE VOLTAGE WITH THE IMRC1 SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with an IMRC1 sensor or if this sensor was used for the VREF measurement in C3, GO to **C16** .*

Ignition OFF.

IMRC1 Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C16** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new IMRC1 sensor. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.

C16 CHECK THE REFERENCE VOLTAGE WITH THE IMRC2 SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with an IMRC2 sensor or if this sensor was used for the VREF measurement in C3, GO to **C17** .*

Ignition OFF.

IMRC2 Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C17** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new IMRC2 sensor. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.

C17 CHECK THE REFERENCE VOLTAGE WITH THE CPP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a CPP sensor or if this sensor was used for the VREF measurement in C3, GO to **C18** .*

Ignition OFF.

CPP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C18** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new CPP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C18 CHECK THE REFERENCE VOLTAGE WITH THE ACP TRANSDUCER SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with an ACP transducer sensor or if this sensor was used for the VREF measurement in C3, GO to **C19** .*

Ignition OFF.

Air Conditioning Pressure (ACP) Transducer Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C19** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new Air Conditioning Pressure (ACP) Transducer Sensor. Clear the PCM DTCs. REPEAT the self-test.

C19 CHECK THE REFERENCE VOLTAGE WITH THE FUEL PRESSURE SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a fuel pressure sensor or if this sensor was used for the VREF measurement in C3, GO to **C20** .*

Ignition OFF.

Fuel Pressure Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C20** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new Fuel Pressure Sensor. REFER to the service information , Fuel Tank and Lines. Clear the PCM DTCs. REPEAT the self-test.

C20 CHECK THE REFERENCE VOLTAGE WITH THE CKP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a CKP sensor or if this sensor was used for the VREF measurement in C3, GO to **C21** .*

Ignition OFF.

CKP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C21** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new CKP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C21 CHECK THE REFERENCE VOLTAGE WITH THE CMP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a CMP sensor or if this sensor was used for the VREF measurement in C3, GO to **C22** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

CMP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C22** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new CMP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C22 CHECK THE REFERENCE VOLTAGE WITH THE TCIPT SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a TCIPT sensor or if this sensor was used for the VREF measurement in C3, GO to **C23** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

TCIPT Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C23** .	INSTALL a new TCIPT sensor. REFER to the service information , Electronic Engine Controls.

For no additional sensors disconnected, GO to PINPOINT TEST Z .	Clear the PCM DTCs. REPEAT the self-test.

C23 CHECK THE REFERENCE VOLTAGE WITH THE WASTEGATE VACUUM SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a wastegate vacuum sensor or if this sensor was used for the VREF measurement in C3, GO to **C24** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

Wastegate Vacuum Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C24** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new Wastegate Vacuum Sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C24 CHECK THE REFERENCE VOLTAGE WITH THE MAPT SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a MAPT sensor or if this sensor was used for the VREF measurement in C3, GO to **C25** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

MAPT Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C25** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new MAPT sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C25 CHECK THE REFERENCE VOLTAGE WITH THE GENERATOR CURRENT SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a generator current sensor or if this sensor was used for the VREF measurement in C3, GO to **C26** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

Generator Current Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C26** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new Generator Current sensor. REFER to the service information , Battery, Mounting and Cables. Clear the PCM DTCs. REPEAT the self-test.

C26 CHECK THE REFERENCE VOLTAGE WITH THE MAP/CACT SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a MAP/CACT sensor or if this sensor was used for the VREF measurement in C3, GO to **C27** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

MAP/CACT Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to **C27** . For no additional sensors disconnected, GO to PINPOINT TEST Z .	INSTALL a new MAP/CACT sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

C27 CHECK THE REFERENCE VOLTAGE WITH THE TCBP SENSOR CONNECTED

*NOTE: If the vehicle is not equipped with a TCBP sensor or if this sensor was used for the VREF measurement in C3, GO to **C28** .*

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

TCBP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
For additional sensors disconnected, GO to	INSTALL a new TCBP sensor. Clear the PCM

C28 . For no additional sensors disconnected, GO to PINPOINT TEST Z .	DTCs. REPEAT the self-test.

C28 CHECK THE REFERENCE VOLTAGE WITH THE FTP SENSOR CONNECTED

Ignition OFF.

FTP Sensor connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Suspect Sensor Connector, Harness Side	(-)
VREF	Ground

Is the voltage between 4.5 - 5.5 V?

Yes	No
The concern is intermittent. GO to PINPOINT TEST Z .	INSTALL a new FTP sensor. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. REPEAT the self-test.

C29 CHECK THE SIGRTN OR ETCRTN CIRCUIT(S) FOR AN OPEN

Ignition OFF.

Disconnect the PCM.

For ETCRTN concerns.

Measure the resistance between:

(+) ETBTPS Connector, Harness Side	(-) PCM Connector, Harness Side
ETCRTN	ETCRTN

For APPRTN concerns.

Measure the resistance between:

(+) APP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
APPRTN1	APPRTN1
APPRTN2	APPRTN2

For SIGRTN concerns.

Measure the resistance between:

(+) Suspect Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
SIGRTN	SIGRTN

Is the resistance less than 5 ohms?

Yes	No
GO to C31.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

C30 CHECK THE SUSPECT SENSOR FOR AN INTERNAL SHORT

Clear the KOEO, KOER, and continuous DTCs.

Ignition OFF.

Connect the suspect sensor.

Ignition ON, engine OFF.

Carry out the PCM self-test.

Is the concern still present?

Yes	No
INSTALL a new sensor for the sensor in question. Clear the PCM DTCs. REPEAT the self-test.	The concern is intermittent. GO to PINPOINT TEST Z .

C31 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

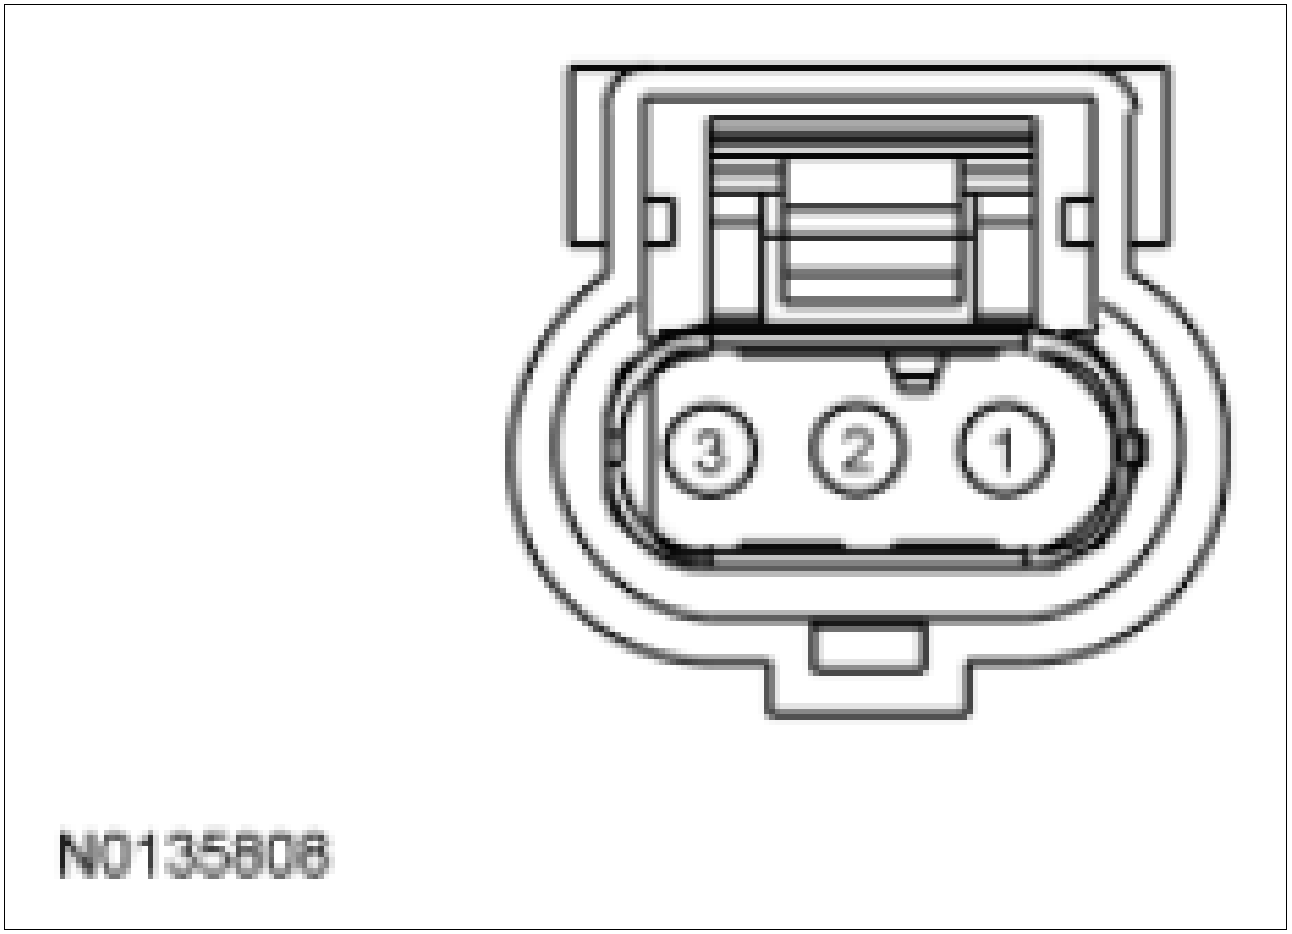
Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DD: FUEL PRESSURE AND FUEL RAIL PRESSURE (FRP) SENSORS > INTRODUCTION

WARNING: VEHICLE FUEL SYSTEMS ARE PRESSURIZED EVEN WHEN THE ENGINE IS NOT RUNNING. TO AVOID FIRE OR PERSONAL INJURY, DISABLE THE FUEL DELIVERY SYSTEM AND RELIEVE FUEL SYSTEM PRESSURE BEFORE REMOVING ANY FUEL SYSTEM COMPONENT. REFER TO THE FUEL SYSTEM INFORMATION AT THE BEGINNING OF PINPOINT HC. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: With the engine running, the FRP PID value may be 48-70 kPa (7-10 psi) higher than a fuel pressure reading taken with a mechanical gauge.

This pinpoint test is intended to diagnose the following:



- fuel pressure sensor (9F972)
- fuel rail pressure (FRP) sensor (6B288)
- harness circuits: FLP and FRP
- PCM (12A650)

Tables and Graphs

FRP SENSOR VOLTAGE AND PRESSURE SPECIFICATIONS

Voltage	Pressure, MPa (gauge)	Pressure, psi (gauge)
4.80	27.95	4054
4.50	26	3771
3.50	19.5	2828
2.50	13.0	1885
1.50	6.5	943
0.50	0	0
0.20	-1.95	-283

Transit	198 PIN	E35	FRP
All other vehicles	198 PIN	E37 B71	FRP FLP

PINPOINT TEST DD: FUEL PRESSURE AND FUEL RAIL PRESSURE (FRP) SENSORS > TEST PROCEDURE

DD1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P018C, P018D, P0192 or P0193 present?

Yes	No

For DTCs P018C or P018D, GO to **DD2** . For all others, GO to DD7.	RETURN to SYMPTOM CHARTS for further direction.

DD2 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN

Ignition OFF.

Fuel Pressure Sensor connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pressure Sensor Connector, Harness Side	(-) Fuel Pressure Sensor Connector, Harness Side
VREF - Pin 3	SIGRTN - Pin 2

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to **DD3** .	GO to PINPOINT TEST C .

DD3 CHECK THE FLP CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) Fuel Pressure Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
FLP - Pin 1	FLP

Is the resistance less than 5 ohms?

Yes	No
GO to **DD4** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DD4 CHECK THE FLP CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Fuel Pressure Sensor Connector, Harness Side	(-)
FLP - Pin 1	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **DD5** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DD5 CHECK THE FLP CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pressure Sensor Connector, Harness Side	(-)
FLP - Pin 1	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DD6** .

DD6 CHECK THE FLP CIRCUIT FOR AN INTERMITTENT CONCERN

Ignition OFF.

Fuel Pressure Sensor connector connected.

PCM connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the FLP_V (VOLT) PID.

While observing the PID, carry out the following:

Tap on the sensor to simulate road shock

Wiggle the sensor connector

Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM

Check the connector for damage or corrosion.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Fuel Pressure Sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. GO to PINPOINT TEST HC . REFER to the service information , Fuel Tank and Lines. Clear the PCM DTCs. REPEAT the self-test.

DD7 CHECK THE VREF AND SIGRTN CIRCUITS FOR AN OPEN

Ignition OFF.

FRP Sensor connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) FRP Sensor Connector, Harness Side	(-) FRP Sensor Connector, Harness Side
VREF	SIGRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to **DD8** .	GO to PINPOINT TEST C .

DD8 CHECK THE FRP CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) FRP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
FRP	FRP

Is the resistance less than 5 ohms?

Yes	No
GO to **DD9** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DD9 CHECK THE FRP CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) FRP Sensor Connector, Harness Side	(-)
FRP	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **DD10** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DD10 CHECK THE FRP CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) FRP Sensor Connector, Harness Side	(-)
FRP	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DD11** .

DD11 CHECK THE FRP CIRCUIT FOR AN INTERMITTENT CONCERN

Ignition OFF.

PCM connector connected.

Fuel Pressure Sensor connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the FRP (VOLT) PID.

While observing the PID, carry out the following:

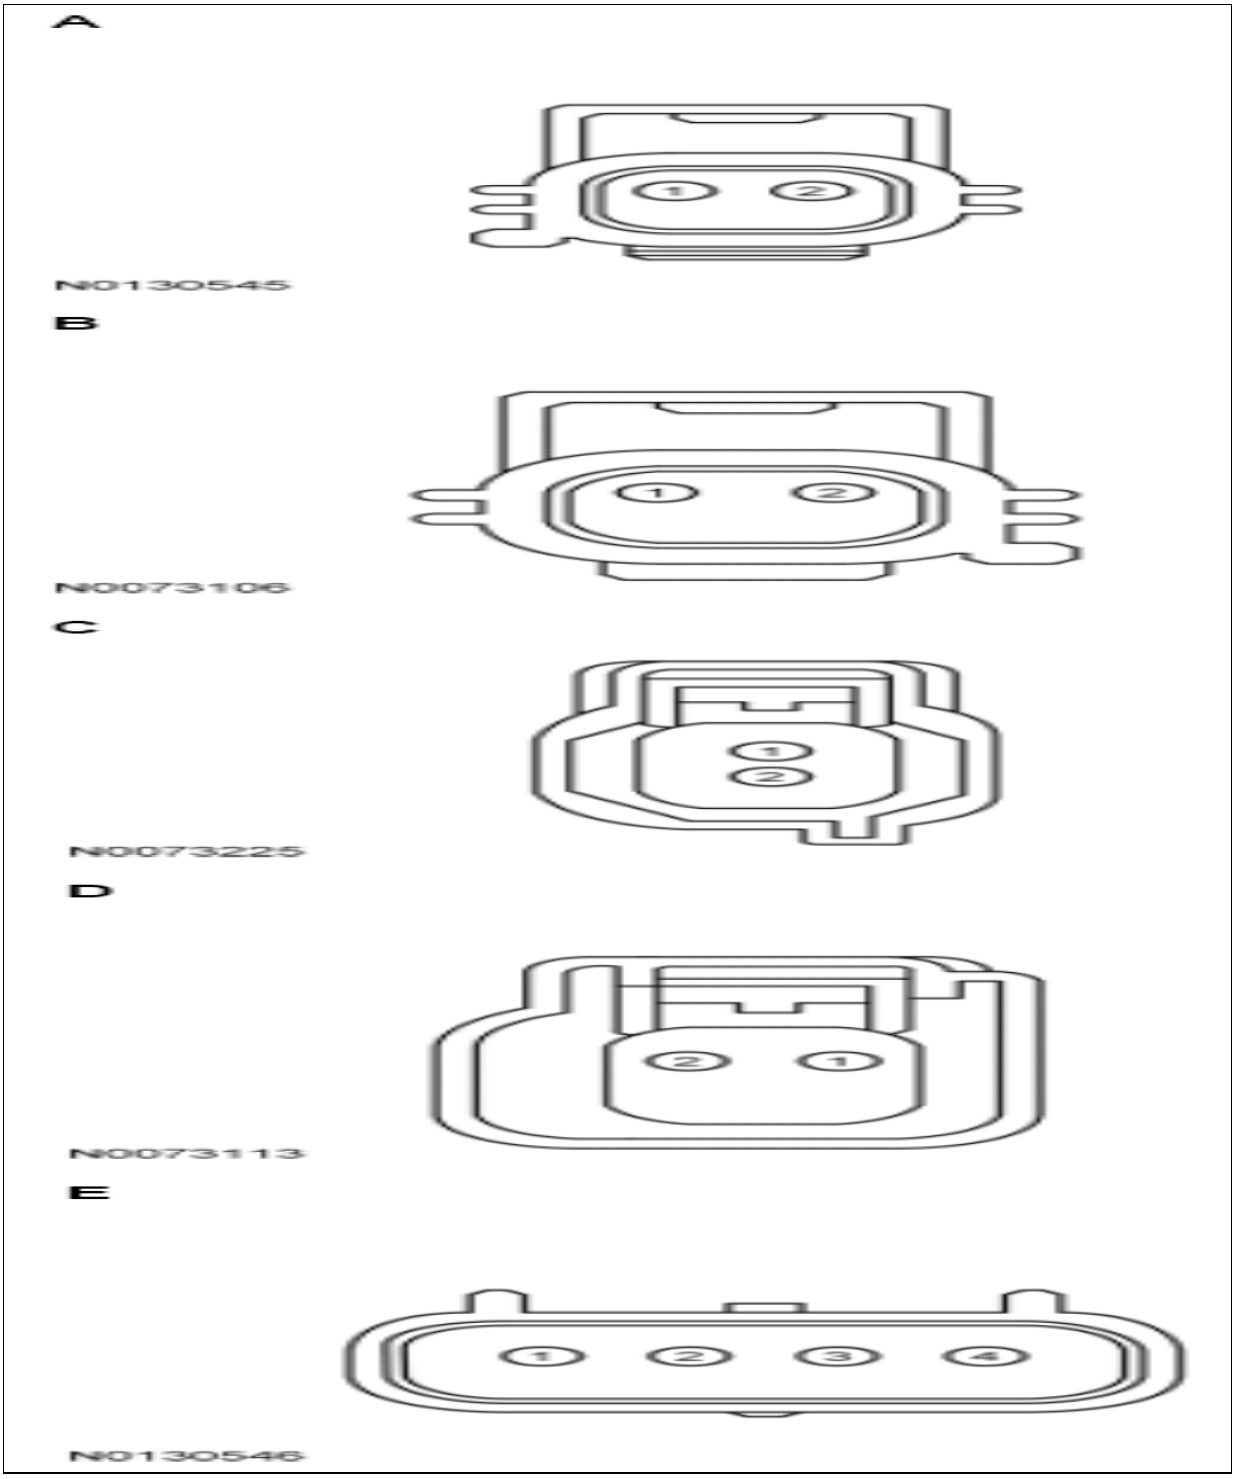
Tap on the sensor to simulate road shock

Wiggle the sensor connector

Wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM

Check the connector for damage or corrosion.

Is a concern present?



Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new FRP sensor. REFER to the fuel system WARNING information at the beginning of Pinpoint Test HC. GO to PINPOINT TEST HC . REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

PINPOINT TEST DG: KNOCK SENSOR (KS) > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- KS1 and KS2 (12A699)
- harness circuits: KS1+, KS1-, KS2+, and KS2-
- PCM (12A650)

Fig 1: Identifying Knock Sensor 1 (KS1) Connector

PINPOINT TEST DG: KNOCK SENSOR (KS) > TEST PROCEDURE

DG1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: Verify the KS is correctly installed before continuing diagnosis. Refer to

the service information , Electronic Engine Controls.

Are DTCs P0325, P0326, P0327, P0328, P0330, P0331, P0332, P0333 or P130D present?

Yes	No
For DTC P130D, GO to DG6. For all others, GO to **DG2** .	RETURN to SYMPTOM CHARTS for further direction.

DG2 CHECK THE KS CIRCUIT FOR AN OPEN

Ignition OFF.

KS connector disconnected.

PCM connector disconnected.

Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+
Suspect KS-	Suspect KS-

Are the resistances less than 5 ohms?

Yes	No
GO to **DG3** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DG3 CHECK THE KS CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) KS Connector, Harness Side	(-)
Suspect KS+	Ground
Suspect KS-	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **DG4** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DG4 CHECK THE KS CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) KS Connector, Harness Side	(-)
Suspect KS+	Ground
Suspect KS-	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DG5** .

DG5 CHECK THE KS CIRCUIT FOR INTERMITTENT CONCERNS

While observing the resistance, wiggle, shake, and bend small sections of the wiring harness working from the sensor to the PCM.

Measure the resistance between:

(+) KS Connector, Harness Side	(-) PCM Connector, Harness Side
Suspect KS+	Suspect KS+
Suspect KS-	Suspect KS-

Are the resistances less than 5 ohms?

Yes	No
For Edge 2.0L, Edge 2.7L, Escape/Kuga, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta, Flex 3.5L GTDI, Focus 1.0L, Focus 2.0L GTDI, Fusion, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, and	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

Transit Connect, GO to **DG6** . For all others, GO to DG7.	

DG6 IDENTIFY THE TYPE OF KNOCK

> *NOTE: Knock counts on a single cylinder may indicate a concern with the ignition or fuel components for the suspect cylinder. Knock counts distributed among multiple cylinders may indicate a fuel quality concern.*

Ignition ON, engine running.

Access the PCM and monitor the KNK_CNTR_CYL1 (MODE), KNK_CNTR_CYL2 (MODE), KNK_CNTR_CYL3 (MODE), KNK_CNTR_CYL4 (MODE), KNK_CNTR_CYL5 (MODE) and KNK_CNTR_CYL6 (MODE) PIDs.

Are the majority of the knock counts on a single cylinder?

Yes	No
DIAGNOSE ignition coil and fuel injection components for the suspect cylinder. REPAIR or INSTALL a new component as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **DG7** .

DG7 CHECK THE LEARNED OCTANE ADJUSTMENT

Access the PCM and monitor the OCTADJ_R_LRND (PER) PID.

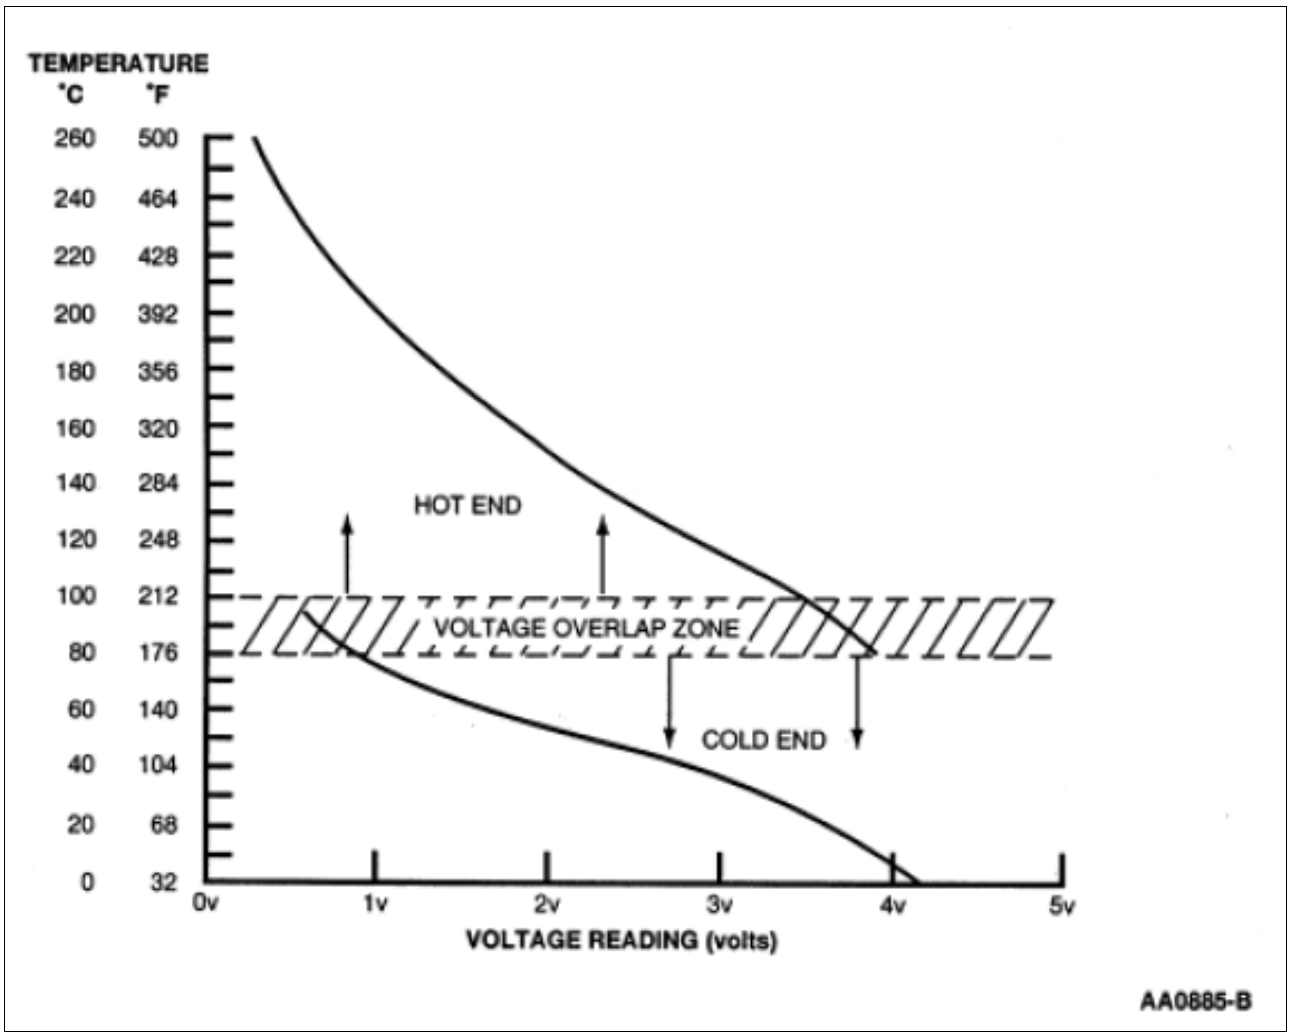
Does the OCTADJ_R_LRND PID read less than 15%?

Yes	No
DRAIN and CLEAN the fuel system, REFILL with correct grade fuel. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new KS. REFER to the service information , Electronic Engine Controls. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST DL: CYLINDER HEAD TEMPERATURE (CHT) SENSOR > INTRODUCTION

> *NOTE: On a typical vehicle, the CHT sensor is located in the cylinder head and the CHT2 sensor is located in the exhaust manifold.*

This pinpoint test is intended to diagnose the following:



- cylinder head temperature (CHT) sensor (6G004)
- cylinder head temperature 2 (CHT2) sensor (6G004)

- harness circuits: CHT, CHT2, and SIGRTN
- PCM (12A650)

On applications that do not use an engine coolant temperature (ECT) sensor, the CHT sensor is used to determine the engine coolant temperature. To cover the entire temperature range of both the CHT and ECT sensors, the PCM has a dual switching resistor circuit on the CHT input. A graph showing the temperature switching from the COLD END line to the HOT END line, with increasing temperature and back with decreasing temperature is included. Note the temperature to voltage overlap zone. Within this zone it is possible to have either a COLD END or HOT END voltage at the same temperature. For example, at 90°C (194°F) the voltage could read either 0.60 volt or 3.71 volts. On applications with a CHT2 sensor, the PCM has a single resistor circuit on the CHT2 input. Refer to the table for the temperature to voltage expected values.

Voltage values calculated for VREF = 5 volts. These values can vary by 15% due to sensor and VREF variations.

Fig 1: Cylinder Head Temperature (CHT) Sensor Voltage Graph

Courtesy of FORD MOTOR CO.

CYLINDER HEAD TEMPERATURE (CHT) SENSOR EXPECTED VALUES SPECIFICATIONS

PINPOINT TEST DL: CYLINDER HEAD TEMPERATURE (CHT) SENSOR > TEST PROCEDURE

DL1 CHECK FOR DTCS

Are DTCs P0116, P0119, P0125, P0128, P017C, P017D, P017E, P101F, P1021, P1022, P1023, P1024, P1025, P1026, P1285, P1288, P1289, P128A, or P1290 present?

Yes	No
GO to **DL2** .	For temperature warning indicator lamp or gauge (applications with CHT sensor only) symptom, GO to DL12. For all others, RETURN to SYMPTOM CHARTS for further direction.

DL2 CHECK THE COOLING SYSTEM

WARNING: TO AVOID PERSONAL INJURY DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE. STEAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENED SLIGHTLY. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: DTC P0125 or P0128 indicates the engine coolant temperature has not achieved the required engine operation temperature level, since start-up within a specified amount of time.

Check the cooling system for:

correct coolant level

internal or external coolant leaks

blockage of the radiator

cooling fan operation

Is the cooling system OK?

Yes	No
For DTCs P0125 or P0128,	REFER to the service information , Engine Cooling to

GO to DL11. For all others, GO to **DL3** .	diagnose a cooling system concern. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL3 CHECK THE RESISTANCE OF THE CHT SENSOR WITH THE ENGINE OFF

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

Ignition OFF.

For the CHT2 sensor,

CHT2 Sensor connector disconnected.

Measure the resistance between:

(+) CHT2 Sensor Connector, Component Side	(-) CHT2 Sensor Connector, Component Side
CHT2 - Pin 1	SIGRTN - Pin 2

For all others,

CHT Sensor connector disconnected.

Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT	SIGRTN

Is the resistance within specification?

Yes	No
GO to **DL4** .	INSTALL a new CHT sensor. REFER to the service information , Electronic Engine Controls. CLEAR the DTCs. REPEAT the self-test.

DL4 CHECK FOR AN OPEN CIRCUIT

Ignition OFF.

PCM connector disconnected.

For the CHT2 sensor,

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CHT2 Sensor Connector, Harness Side

CHT2	CHT2 - Pin 1
SIGRTN	SIGRTN - Pin 2

For all others,

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) CHT Sensor Connector, Harness Side
CHT	CHT
SIGRTN	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **DL5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DL5 CHECK FOR A SHORT TO GROUND

For the CHT2 sensor,

Measure the resistance between:

(+) CHT2 Sensor Connector, Harness Side	(-)
CHT2 - Pin 1	Ground

For all others,

Measure the resistance between:

(+) CHT Sensor Connector, Harness Side	(-)
CHT	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **DL6** .	REPAIR the short circuit. CLEAR the DTCs. REPEAT the self-test.

DL6 CHECK FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For the CHT2 sensor,

Measure the voltage between:

(+) CHT2 Sensor Connector, Harness Side	(-)
CHT2 - Pin 1	Ground

For all others,

Measure the voltage between:

(+) CHT Sensor Connector, Harness Side	(-)
CHT	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DL7** .

DL7 CHECK THE RESISTANCE OF THE CHT SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

Ignition OFF.

CHT Sensor connector connected.

CHT2 Sensor connector connected.

PCM connector connected.

Run the engine until the engine temperature stabilizes.

Ignition OFF.

For the CHT2 sensor,

CHT2 Sensor connector disconnected.

Measure the resistance between:

(+) CHT2 Sensor Connector, Component Side	(-) CHT2 Sensor Connector, Component Side
CHT2 - Pin 1	SIGRTN - Pin 2

For all others,

CHT Sensor connector disconnected.

Measure the resistance between:

(+) CHT Sensor Connector, Component Side	(-) CHT Sensor Connector, Component Side
CHT	SIGRTN

Is the resistance within specification?

Yes	No
For the CHT2 sensor, GO to **DL8** . For all others, GO to DL9.	INSTALL a new CHT sensor. REFER to the service information , Electronic Engine Controls. CLEAR the DTCs. REPEAT the self-test.

DL8 CHECK THE CHT2 SENSOR

Ignition ON, engine OFF.

Measure the voltage between:

(+) CHT2 Sensor Connector, Harness Side	(-) CHT2 Sensor Connector, Harness Side
CHT2 - Pin 1	SIGRTN - Pin 2

Observe the digital multi meter (DMM) for an indication of a concern while shaking, wiggling, and bending the CHT2 circuit between the CHT2 and the PCM. Note that voltage changes suddenly when a concern is detected.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .

DL9 INTERMITTENT CHECK

Ignition OFF.

CHT Sensor connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the CHT (TEMP) PID.

While observing the PID, carry out the following:

Tap on the sensor to simulate road shock

Wiggle the sensor connector

Is there a large change in the PID value?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For DTC P1285, GO to **DL10** . For all others, Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .

DL10 CHECK THE CHT SENSOR OPERATION

NOTE: The engine temperature warning indicator (gauge or lamp) is a warning system that gives the driver information during an engine overheating condition. The PCM monitors the CHT sensor and determines if fail-safe cooling mode is needed. If fail-safe cooling mode is needed, the PCM sends a controller area network (CAN) message to the instrument cluster to signal an overheating condition. This causes the instrument cluster indicator to illuminate and forces the temperature gauge to the H (hot) zone. DTC P1285 is stored in the PCM.

Run the engine until the engine temperature stabilizes.

Verify the radiator hoses are hot and the cooling system is pressurized.

Carry out the PCM self-test.

Is DTC P1285 present?

Yes	No
REFER to the service information , Engine Cooling to diagnose the cooling system concern. Clear the PCM DTCs. REPEAT the self-test.	The system is operating correctly at this time. REPAIR any other DTCs as necessary. Clear the PCM DTCs. REPEAT the self-test.

DL11 CHECK THE SENSOR OPERATION

Run the engine until the engine temperature stabilizes.

Verify the radiator hoses are hot and the cooling system is pressurized.

Access the PCM and monitor the CHT (TEMP) PID.

Record the PID value.

Is the PID temperature greater than 77 C (170.6 F)?

Yes	No
The system is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test.	REFER to the service information , Engine Cooling, to diagnose the engine not reaching normal operating temperature. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

DL12 ENGINE TEMPERATURE INDICATOR LAMP ON OR TEMPERATURE GAUGE

INDICATES HOT WITH NO DTCS

NOTE: For Engine Temperature Warning Indicator system problems, refer to the service information , Instrument Cluster.

PCM connector disconnected.

Ignition ON, engine OFF.

Does the engine temperature warning indicator lamp turn OFF (prove out) and\or the temperature gauge return to the normal zone with the PCM disconnected?

Yes	No
GO to **DL13** .	REFER to the service information , Instrument Cluster to diagnose the incorrect temperature gauge. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.

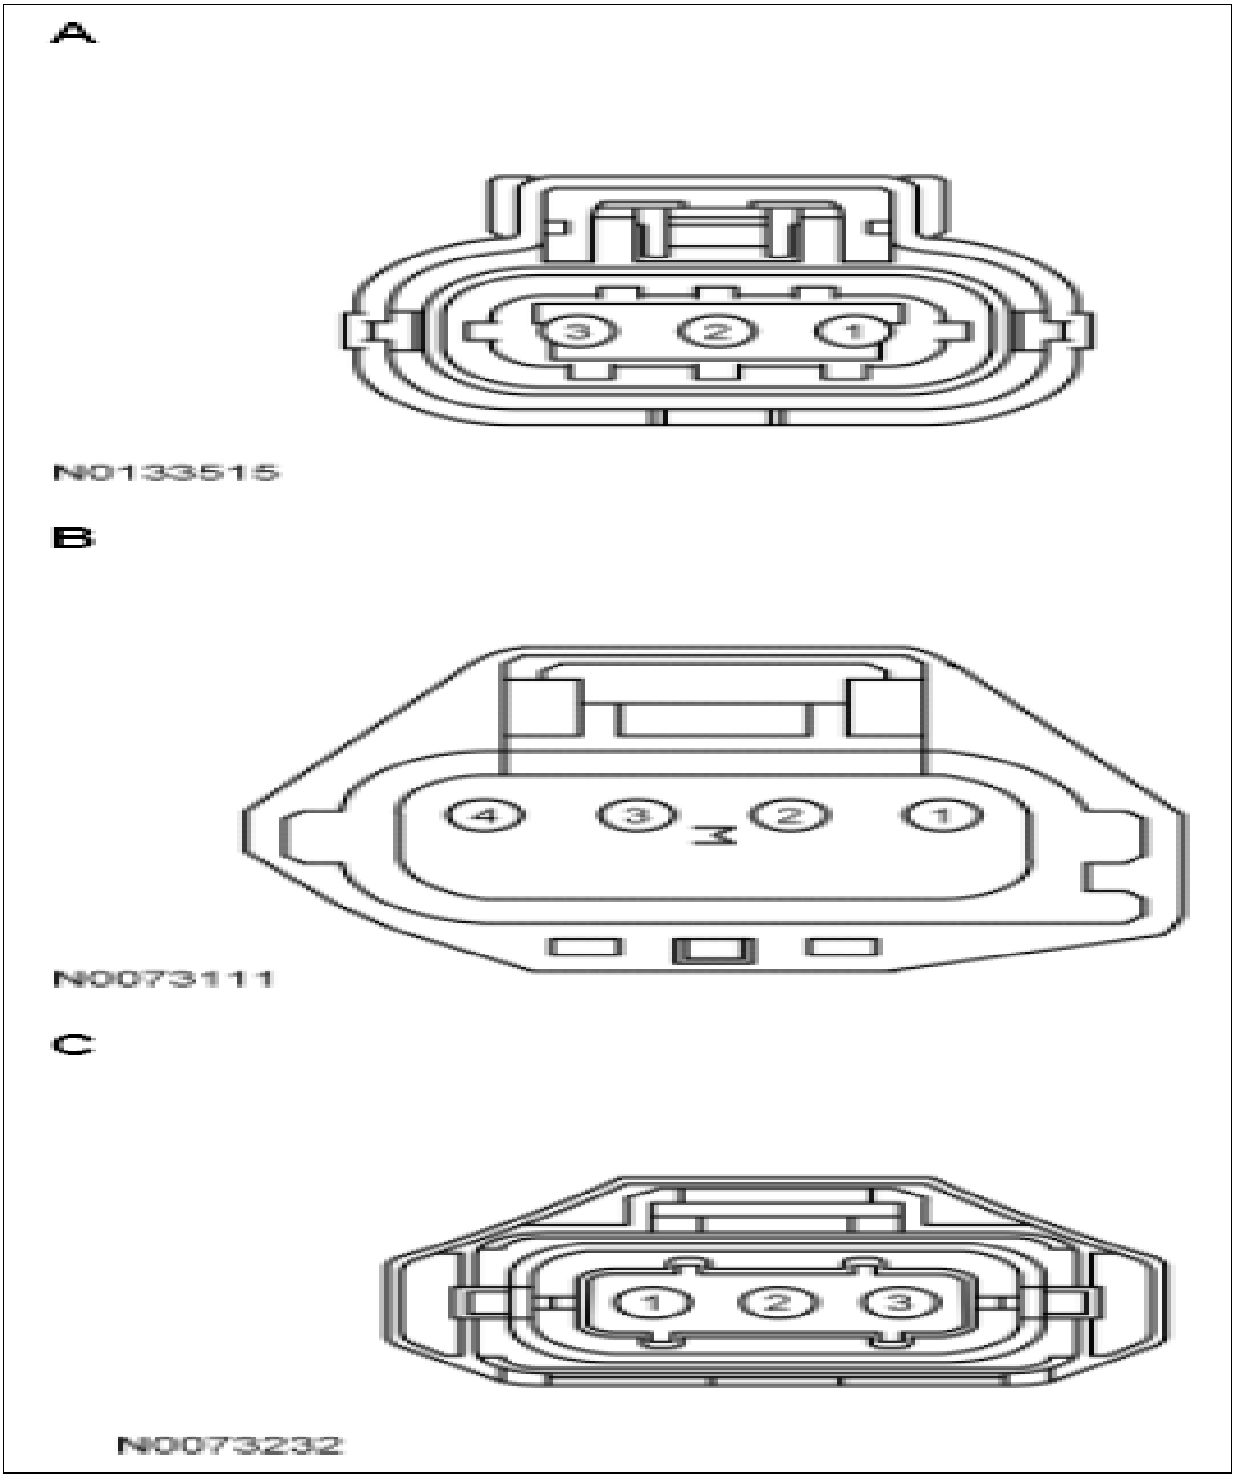
DL13 ENGINE OVERHEAT CONDITION INDICATED

WARNING: TO AVOID PERSONAL INJURY DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE. STEAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENED SLIGHTLY. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

Check the engine coolant level.

Is the engine coolant fill level correct?

Yes	No
REFER to the service information , Engine Cooling, to diagnose the engine overheating symptom. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.	REFER to the service information , Engine Cooling to diagnose the loss of coolant. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST DM: MANIFOLD PRESSURE SENSORS > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- manifold absolute pressure (MAP) sensor (9F479)
- manifold absolute pressure (MAP)/charge air cooler temperature (CACT) sensor (9F479)
- manifold absolute pressure and temperature (MAPT) sensor (9F479)
- turbocharger boost pressure (TCBP) sensor (9F479)

- turbocharger boost pressure (TCBP)/charge air cooler temperature (CACT) sensor (9F479)
- turbocharger inlet pressure and temperature (TCIPT) sensor (9F479)
- harness circuits: MAP, TCBP, TCIP, SIGRTN, and VREF
- PCM (12A650)

PINPOINT TEST DM: MANIFOLD PRESSURE SENSORS > TEST PROCEDURE

DM1 CHECK FOR DTCS

NOTE: This pinpoint test is designed to diagnose multiple components in the same test steps, only measure the circuits that apply to the vehicle and the component being diagnosed.

NOTE: Diagnose circuit concerns before range or performance concerns.

Are DTCs P0106, P0107, P0108, P0109, P012B, P012C, P012D, P012E, P0236, P0237, P0238, or P025E present?

Yes	No
GO to **DM2** .	For symptoms without DTCs, GO to **DM2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

DM2 MONITOR THE MAP PID

Ignition ON, engine OFF.

For the TCIPT sensor.

Access the PCM and monitor the TURBO_INLET_V (VOLT) PID.

For the TCBP or TCBP/CACT sensor,

Access the PCM and monitor the TCBP_V (VOLT) PID.

For all others,

Access the PCM and monitor the MAP (VOLT) PID.

Is the voltage between 0.05 - 4.95 V?

Yes	No
For DTCs P0106, P012B or P0236, GO to DM9. For all others, GO to DM8.	GO to **DM3** .

DM3 CHECK THE VOLTAGE BETWEEN THE VREF AND SIGRTN CIRCUITS

Ignition OFF.

For the MAP sensor,

MAP Sensor connector disconnected.

Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
VREF	SIGRTN

For the MAP/CACT sensor,

MAP/CACT Sensor connector disconnected.

Measure the voltage between:

(+) MAP/CACT Sensor Connector, Harness Side	(-) MAP/CACT Sensor Connector, Harness Side
VREF - Pin 3	SIGRTN - Pin 1

For the MAPT sensor,

MAPT Sensor connector disconnected.

Measure the voltage between:

(+) MAPT Sensor Connector, Harness Side	(-) MAPT Sensor Connector, Harness Side
VREF	SIGRTN

For the TCBP sensor,

TCBP Sensor connector disconnected.

Measure the voltage between:

(+) TCBP Sensor Connector, Harness Side	(-) TCBP Sensor Connector, Harness Side
VREF	SIGRTN

For the TCBP/CACT sensor,

TCBP/CACT Sensor connector disconnected.

Measure the voltage between:

(+) TCBP/CACT Sensor Connector, Harness Side	(-) TCBP/CACT Sensor Connector, Harness Side
VREF	SIGRTN

For the TCIPT sensor,

TCIPT Sensor connector disconnected.

Measure the voltage between:

(+) TCIPT Sensor Connector, Harness Side	(-) TCIPT Sensor Connector, Harness Side
VREF - Pin 3	SIGRTN - Pin 1

Ignition ON, engine OFF.

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to **DM4** .	GO to PINPOINT TEST C .

DM4 CHECK FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For the MAP sensor,

Measure the resistance between:

(+) MAP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	MAP
SIGRTN	SIGRTN

For the MAP/CACT sensor,

Measure the resistance between:

(+) MAP/CACT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
MAP - Pin 4	MAP
SIGRTN - Pin 1	SIGRTN

For the MAPT sensor,

Measure the resistance between:

(+) MAPT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
MAP	SIGRTN
SIGRTN	SIGRTN

For the TCBP sensor,

Measure the resistance between:

(+) TCBP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side

TCBP	TCBP
SIGRTN	SIGRTN

For the TCBP/CACT sensor,

Measure the resistance between:

(+) TCBP/CACT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
TCBP	TCBP
SIGRTN	SIGRTN

For the TCIPT sensor,

Measure the resistance between:

(+) TCIPT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
TCIP - Pin 4	TCIP
SIGRTN - Pin 1	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **DM5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DM5 CHECK FOR A SHORT TO SIGRTN OR GROUND

For the MAP sensor,

Measure the resistance between:

(+) MAP Sensor Connector, Harness Side	(-)
MAP	Ground

Measure the resistance between:

(+) MAP Sensor Connector, Harness Side	(-) MAP Sensor Connector, Harness Side
MAP	SIGRTN

For the MAP/CACT sensor,

Measure the resistance between:

(+) MAP/CACT Sensor Connector, Harness Side	(-)
MAP - Pin 4	Ground

Measure the resistance between:

(+) MAP/CACT Sensor Connector, Harness Side	(-) MAP/CACT Sensor Connector, Harness Side
MAP - Pin 4	SIGRTN - Pin 1

For the MAPT sensor,

Measure the resistance between:

(+) MAPT Sensor Connector, Harness Side	(-)
MAP	Ground

Measure the resistance between:

(+) MAPT Sensor Connector, Harness Side	(-) MAPT Sensor Connector, Harness Side
MAP	SIGRTN

For the TCBP sensor,

Measure the resistance between:

(+) TCBP Sensor Connector, Harness Side	(-)
TCBP	Ground

Measure the resistance between:

(+) TCBP Sensor Connector, Harness Side	(-) TCBP Sensor Connector, Harness Side
TCBP	SIGRTN

For the TCBP/CACT sensor,

Measure the resistance between:

(+) TCBP/CACT Sensor Connector, Harness Side	(-)
TCBP	Ground

Measure the resistance between:

(+) TCBP/CACT Sensor Connector, Harness Side	(-) TCBP/CACT Sensor Connector, Harness Side
TCBP	SIGRTN

For the TCIPT sensor,

Measure the resistance between:

(+) TCIPT Sensor Connector, Harness Side	(-)
TCIP - Pin 4	Ground

Measure the resistance between:

(+) TCIPT Sensor Connector, Harness Side	(-) TCIPT Sensor Connector, Harness Side
TCIP - Pin 4	SIGRTN - Pin 1

Are the resistances greater than 10K ohms?

Yes	No
GO to **DM6** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DM6 CHECK FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For the MAP sensor,

Measure the voltage between:

(+) MAP Sensor Connector, Harness Side	(-)
MAP	Ground

For the MAP/CACT sensor,

Measure the voltage between:

(+) MAP/CACT Sensor Connector, Harness Side	(-)
MAP - Pin 4	Ground

For the MAPT sensor,

Measure the voltage between:

(+) MAPT Sensor Connector, Harness Side	(-)
MAP	Ground

For the TCBP sensor,

Measure the voltage between:

(+) TCBP Sensor Connector, Harness Side	(-)

TCBP	Ground

For the TCBP/CACT sensor,

Measure the voltage between:

(+) TCBP/CACT Sensor Connector, Harness Side	(-)
TCBP	Ground

For the TCIPT sensor,

Measure the voltage between:

(+) TCIPT Sensor Connector, Harness Side	(-)
TCIP - Pin 4	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DM7** .

DM7 INDUCE THE OPPOSITE VOLTAGE

Ignition OFF.

PCM connector connected.

For the MAP sensor,

Connect a 5 amp fused jumper wire between the following:

Point A MAP Sensor Connector, Harness Side	Point B MAP Sensor Connector, Harness Side
MAP	SIGRTN

For the MAP/CACT sensor,

Connect a 5 amp fused jumper wire between the following:

Point A MAP/CACT Sensor Connector, Harness Side	Point B MAP/CACT Sensor Connector, Harness Side
MAP - Pin 4	SIGRTN - Pin 1

For the MAPT sensor,

Connect a 5 amp fused jumper wire between the following:

Point A MAPT Sensor Connector, Harness Side	Point B MAPT Sensor Connector, Harness Side
MAP	SIGRTN

Access the PCM and monitor the MAP (VOLT) PID.

For the TCBP sensor,

Connect a 5 amp fused jumper wire between the following:

Point A TCBP Sensor Connector, Harness Side	Point B TCBP Sensor Connector, Harness Side
TCBP	SIGRTN

For the TCBP/CACT sensor,

Connect a 5 amp fused jumper wire between the following:

Point A TCBP/CACT Sensor Connector, Harness Side	Point B TCBP/CACT Sensor Connector, Harness Side
TCBP	SIGRTN

Access the PCM and monitor the TCBP_V (VOLT) PID.

For the TCIPT sensor,

Connect a 5 amp fused jumper wire between the following:

Point A TCIPT Sensor Connector, Harness Side	Point B TCIPT Sensor Connector, Harness Side
TCIP - Pin 4	SIGRTN - Pin 1

Access the PCM and monitor the TURBO_INLET_V (VOLT) PID.

Ignition ON, engine OFF.

Is the voltage less than 4.6V?

Yes	No
INSTALL a new sensor in question. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.	GO to DM11.

DM8 CHECK THE CIRCUITS FOR INTERMITTENT CONCERNS

Ignition ON, engine OFF.

For the MAP, MAP/CACT, or MAPT sensor,

Access the PCM and monitor the MAP (VOLT) PID.

For the TCBP or TCBP/CACT sensor,

Access the PCM and monitor the TCBP_V (VOLT) PID.

For the TCIPT sensor.

Access the PCM and monitor the TURBO_INLET_V (VOLT) PID.

Lightly tap on the sensor in question and wiggle the harness connector to simulate road shock.

Does a sudden change in voltage occur while monitoring the PID?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .

DM9 MAP VOLTAGE

Ignition ON, engine OFF.

Access the PCM and monitor the MAP (VOLT) PID.

Record the PID value.

Ignition ON, engine running.

Record the PID value.

Does the PID value change?

Yes	No
For Escape 2.5L, Fiesta 1.6L TIVCT, Fusion 2.5L, and Transit Connect 2.5L, Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z . For all others, GO to **DM10** .	INSTALL a new sensor in question. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

DM10 CHECK FOR KOEO BARO, MAP, TCBP VALUE CORRELATIONS

NOTE: All PIDS may not be available on all vehicles.

Ignition ON, engine OFF.

Access the PCM and monitor the BARO (PRESS), MAP (PRESS), TCBP (PRESS) and TURBO_INLET (PRESS) PIDs.

Is the suspect sensor PID reading within 10.35 kPa (1.5 psi) of the other sensors?

Yes	No
GO to **DM11** .	For the BARO sensor, GO to PINPOINT TEST DO . For all others, CHECK the sensor in question for contamination or obstructions. REPAIR as necessary. If no concerns are present, INSTALL a new sensor in question. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

DM11 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DO: BAROMETRIC PRESSURE (BARO) SENSOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- BARO sensor
- PCM (12A650)

BARO SENSOR TRANSFER SPECIFICATIONS

Volts	Pressure in kPa	Pressure in psi	Pressure in in-Hg
0.3	7.6	1.1	2.2
0.5	12.7	1.84	3.8
2.64	60	8.7	17.7

4.54	115	16.68	34
4.75	120.3	17.45	35.5
4.8	121.6	17.66	35.9

PINPOINT TEST DO: BAROMETRIC PRESSURE (BARO) SENSOR > TEST PROCEDURE

DO1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P2227, P2228, P2229, or P2230 present?

Yes	No
GO to **DO2** .	RETURN to SYMPTOM CHARTS for further direction.

DO2 CHECK BARO SENSOR OPERATION

NOTE: Most local weather reports include a barometric pressure that is corrected to factor in sea level. However, the BARO PID indicates the barometric pressure for the actual vehicle altitude. Local weather conditions (high or low pressure) may change the local barometric pressure by several inches of mercury.

Ignition ON, engine OFF.

Access the PCM and monitor the BARO (PRESS) PID.

Record the BARO PID value.

Verify that the BARO PID value is approximately the same as the daily barometric pressure from your local weather report.

Does the BARO PID value compare with the reported barometric pressure?

Yes	No
The system is operating correctly at this time. Clear the PCM DTCs. REPEAT the self-test.	GO to **DO3** .

DO3 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

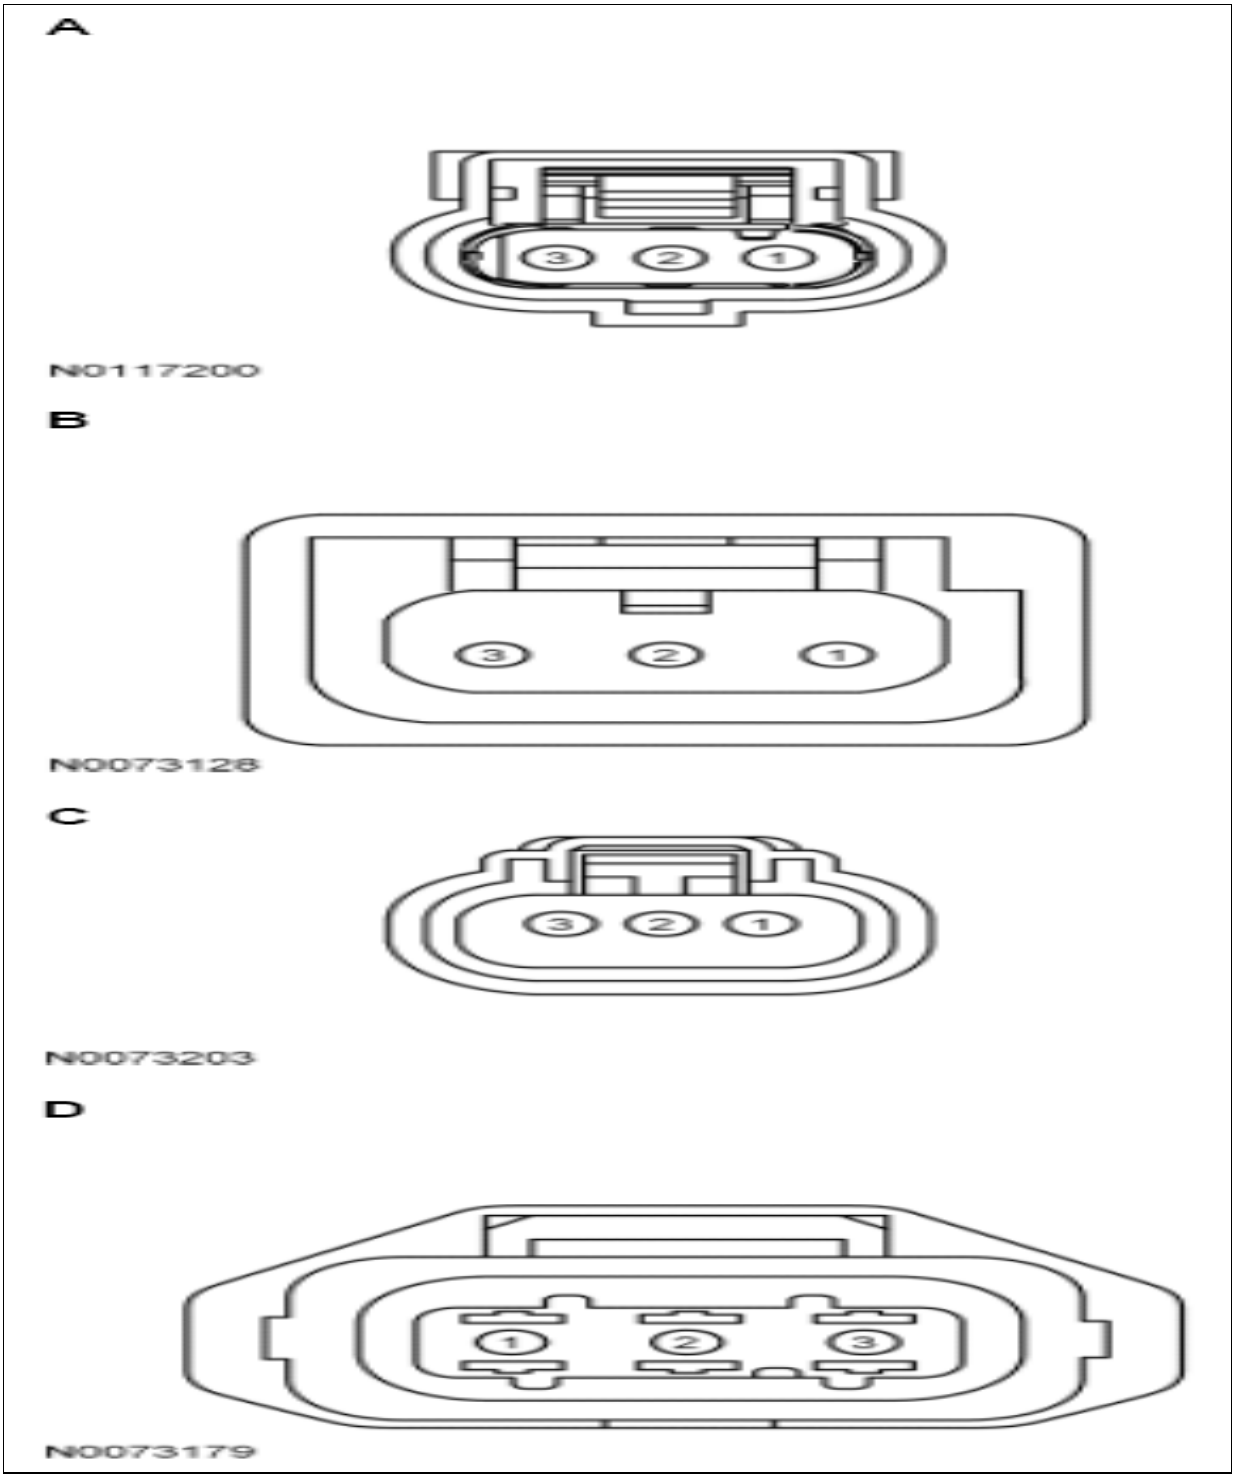
corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

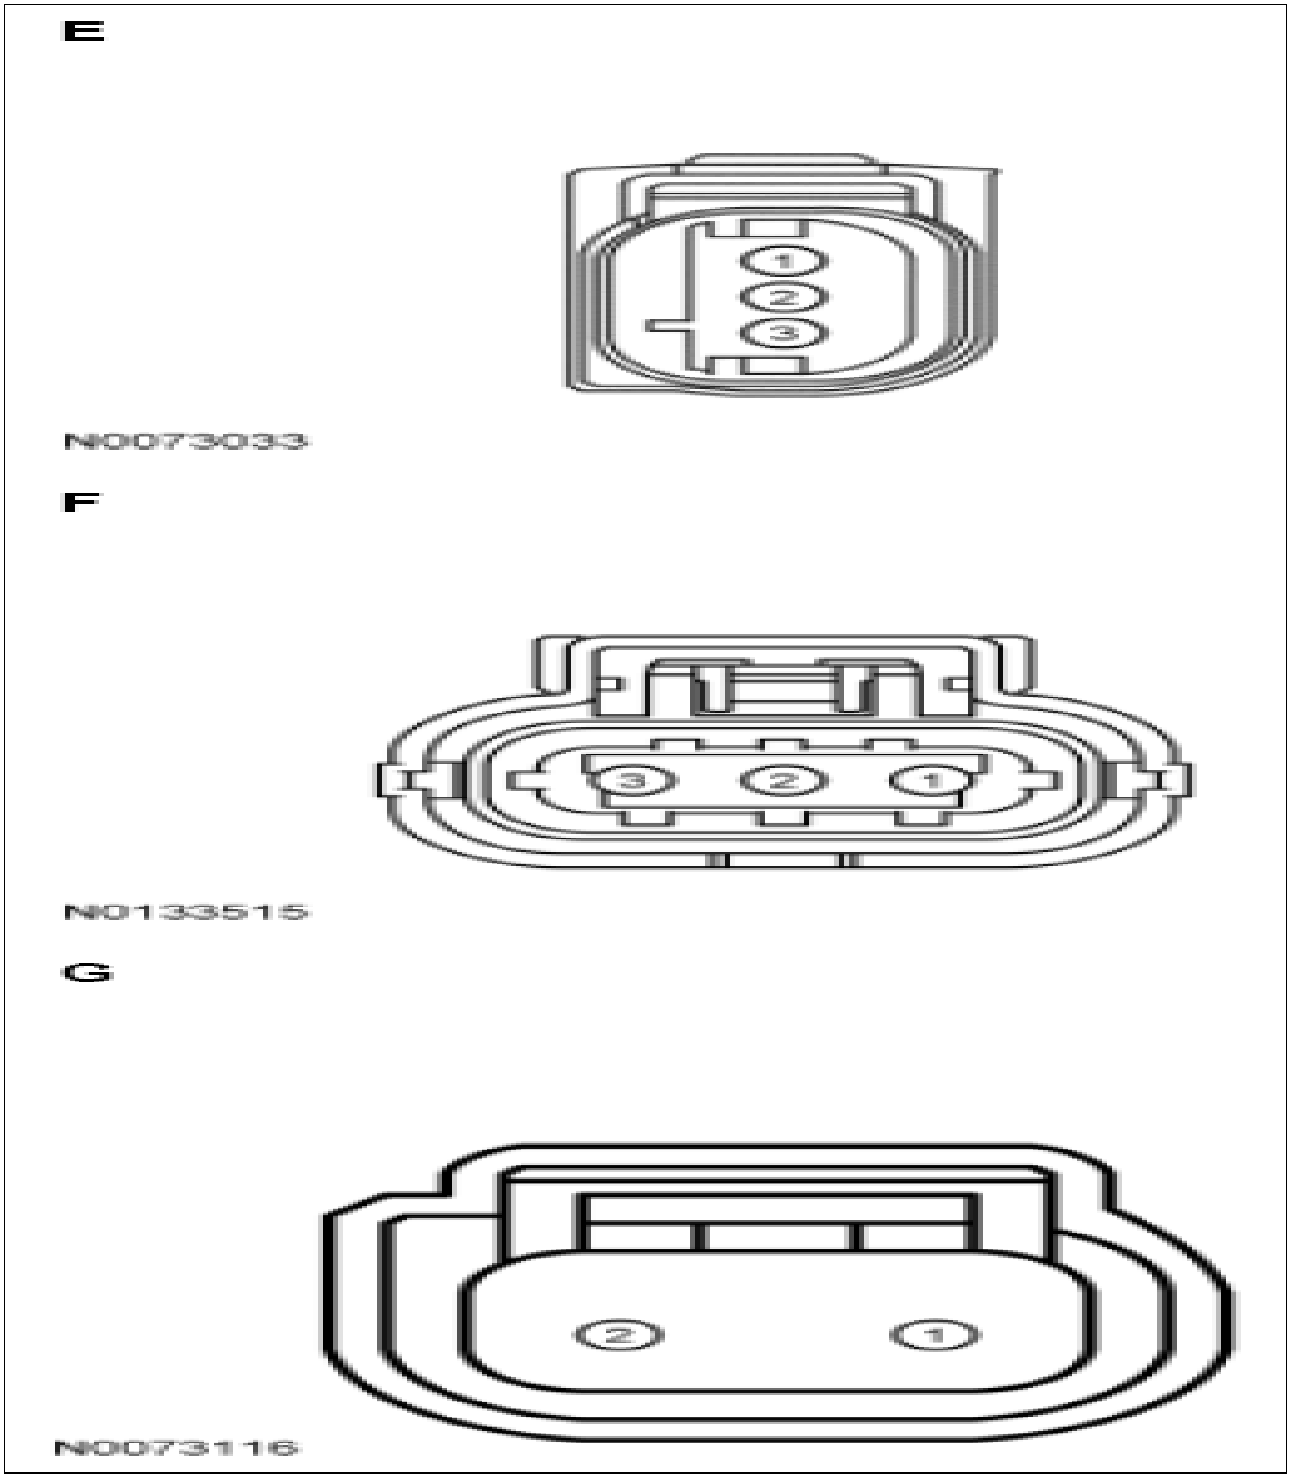
Is the concern still present?



Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DR: CAMSHAFT POSITION (CMP) SENSOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:



- CMP sensor (6B288 or 12K073)
- harness circuits: CMP, SIGRTN, VBPWR or VREF
- PCM (12A650)

Fig 1: Identifying Camshaft Position Bank 1 Sensor 1 (CMP11) Sensor Connector (1 Of 2)

PINPOINT TEST DR: CAMSHAFT POSITION (CMP) SENSOR > TEST PROCEDURE

DR1 CHECK FOR DTCS

Are DTCs P0340, P0341, P0344, P0345, P0346, P0349, P0365, P0366, P0369, P0390, P0391, or P0394 present?

Yes	No
For vehicles with DTCs and a no crank or no start symptom, GO to DR5. For all others, GO to **DR2** .	For symptoms without DTCs, GO to **DR2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

DR2 INSPECT THE HARNESS

Ignition OFF.

Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems.

Check the CMP connector for damage or corrosion.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **DR3** .

DR3 CLEAR AND ATTEMPT TO RETRIEVE THE DTC

NOTE: Consider the ignition system, alternator noise, radio frequency interference and crankshaft position (CKP) sensor concerns if DTCs P0340, P0341, P0344, P0345, P0346, P0349, P0365, P0366, P0369, P0390, P0391, or P0394 are present.

NOTE: For vehicles with variable camshaft timing (VCT), concerns with the engine oil level, oil filter, oil contamination, or the VCT system may cause camshaft positioning errors.

Ignition ON, engine OFF.

Clear the PCM DTCs.

Ignition ON, engine running.

Increase engine speed to greater than 1, 500 RPM for 10 seconds. Repeat this 3 times.

Carry out the PCM self-test.

Are DTCs P0340, P0341, P0344, P0345, P0346, P0349, P0365, P0366, P0369, P0390, P0391 or P0394 present?

Yes	No
GO to **DR4** .	For symptoms without DTCs, RETURN to SYMPTOM CHARTS for further direction.

	For all others, GO to PINPOINT TEST Z .

DR4 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE

NOTE: If the generator/regulator is electrically noisy, the noise decreases when the B+ connector is disconnected.

Ignition ON, engine running.

Monitor the generator for an audible electric noise.

Ignition OFF.

Generator/regulator B+ connector disconnected.

Ignition ON, engine running.

With the engine running, determine if the generator noise remains steady, decreases or increases in volume.

Does the generator noise remain steady when the B+ connector is disconnected?

Yes	No
CONNECT the generator/regulator B+ connector. GO to **DR5** .	REFER to the service information , Charging System, to DIAGNOSE the generator is noisy symptom.

DR5 CHECK THE VOLTAGE TO THE CMP SENSOR

*NOTE: Diagnose the suspect CMP sensor indicated by the DTC. For 2 pin VR type CMP sensor DTCs, GO to **DR6** .*

CMP Sensor connector disconnected.

Ignition ON, engine OFF.

For VBPWR CMP sensors,

Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-)
VBPWR	Ground

For VREF CMP sensors,

Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side

VREF	SIGRTN

Is the voltage greater than 10.5 V on the VBPWR circuit or between 4.5 and 5.5 V on the VREF circuit?

Yes	No
GO to **DR6** .	For Edge 2.0L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Explorer 2.0L, Fiesta, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L, and Transit Connect 1.6L, GO to PINPOINT TEST C . For all others, REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DR6 CHECK THE CMP SENSOR RESISTANCE

NOTE: Diagnose the suspect CMP sensor indicated by the DTC.

Ignition OFF.

CMP Sensor connector disconnected.

Measure the resistance between:

(+) CMP Sensor Connector, Component Side	(-) CMP Sensor Connector, Component Side
CMP	SIGRTN

Vehicle	Minimum Resistance (ohms)	Maximum Resistance (ohms)
Edge, F-150 5.0L, MKX, MKZ 3.7L	586	2, 033
All others	250	1, 000

Is the resistance within specification?

Yes	No
GO to **DR7** .	INSTALL a new CMP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

DR7 CHECK THE CMP SENSOR CIRCUITS FOR AN OPEN

PCM connector disconnected.

Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side

CMP	CMP
SIGRTN	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **DR8** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DR8 CHECK THE CMP CIRCUIT FOR A SHORT

Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-) CMP Sensor Connector, Harness Side
CMP	SIGRTN

Measure the resistance between:

(+) CMP Sensor Connector, Harness Side	(-)
CMP	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **DR9** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DR9 CHECK THE CMP CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) CMP Sensor Connector, Harness Side	(-)
CMP	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	For E-Series, F-650/F-750, F-Series Super Duty 6.8L, and Motorhome/Stripped Chassis/Step Van, GO to DR11. For all others, GO to **DR10** .

DR10 CHECK FOR VARIABLE CAMSHAFT TIMING (VCT) CONCERNS

NOTE: Only diagnose the bank indicated by the DTC.

CMP Sensor connector connected.

PCM connector connected.

Check the VCT system for correct operation.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **DR11** .

DR11 CHECK THE CMP SENSOR OPERATION

Ignition OFF.

CMP Sensor connector connected.

PCM connector disconnected.

Ignition ON, engine running.

Access the PCM and monitor the SYNC (MODE) PID.

Does the engine start and does the SYNC PID read YES?

Yes	No
GO to **DR12** .	INSTALL a new CMP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

DR12 CHECK FOR DTCS

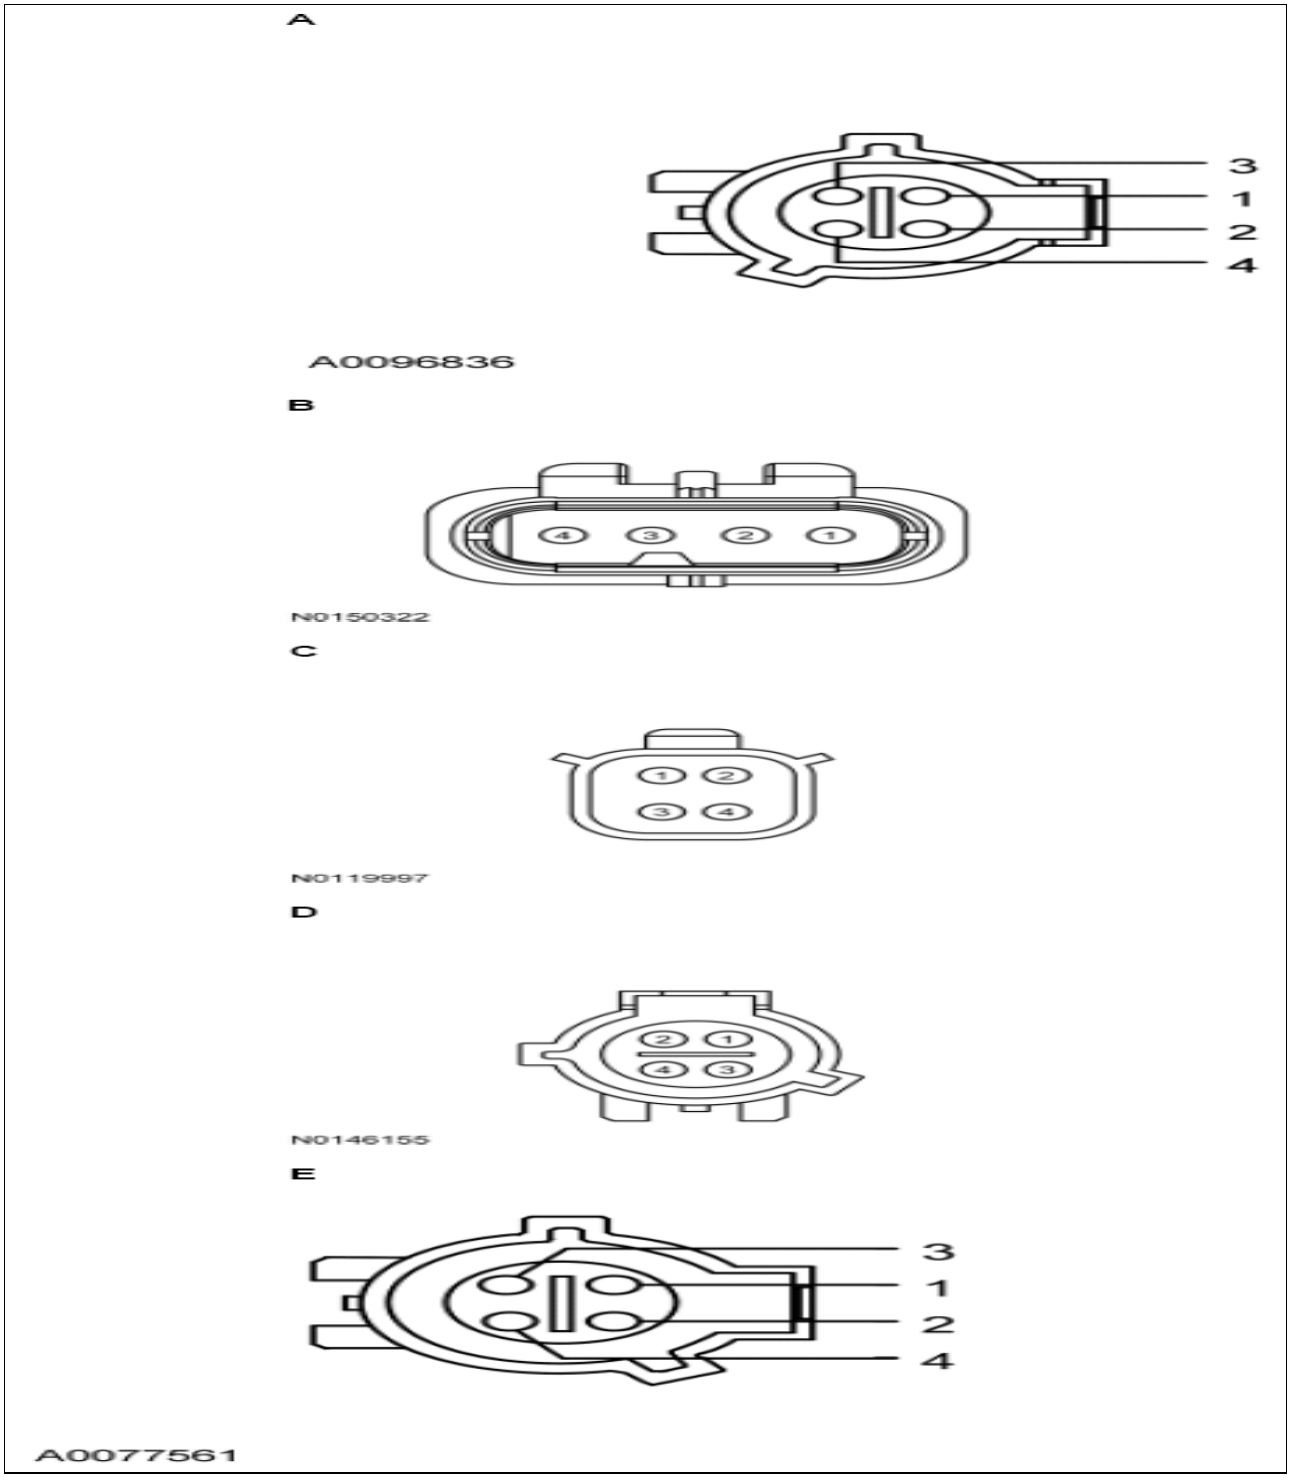
Carry out the PCM self-test.

Are any DTCs present?

Yes	No
INSTALL a new CMP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. Clear the PCM DTCs. REPEAT the self-test.

PINPOINT TEST DW: HEATED OXYGEN SENSOR (HO2S) > INTRODUCTION

WARNING: WHILE CONDUCTING TESTS ON A HOT ENGINE TAKE ALL SAFETY PRECAUTIONS TO PREVENT SKIN CONTACT WITH HOT ENGINE COMPONENTS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.



This pinpoint test is intended to diagnose the following:

- HO2S (9G444)
- harness circuits: HO2S12, HO2S22, HTR12, HTR22, VPWR and SIGRTN
- PCM (12A650)

Heated Oxygen Sensor Bank 1, Sensor 2 (HO2S12) Connector

The pin numbering for the connector is in reference to the connector lock tab. Not all connector key combinations are shown.

Fig 1: Identifying Heated Oxygen Sensor Bank 1, Sensor 2 (HO2S12) Connector

PINPOINT TEST DW: HEATED OXYGEN SENSOR (HO2S) > TEST PROCEDURE

DW1 CHECK FOR DTCS

Are DTCs P0036, P0037, P0038, P0041, P0054, P0056, P0060, P00D2, P0136, P0137, P0138, P0139, P013A, P013B, P013C, P013E, P0140, P0141, P014A, P0157, P0158, P0159, P0161, P2A01 or P2A04 present?

Yes	No
GO to **DW2** .	RETURN to SYMPTOM CHARTS for further direction.

DW2 VISUALLY INSPECT THE HO2S HARNESS

Ignition OFF.

Verify the HO2S connectors are connected to the correct engine bank.

Visually inspect for:

crossed sensor wires

pinched, shorted, and corroded wiring and pins

oil or water contamination

damaged HO2S

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For DTC P0041, GO to **DW3** . For DTCs P013A, P013C, P013E or P014A, GO to DW6. For DTCs P0036, P0037, P0038, P0054, P0056, P0060, P0141 or P0161, GO to DW12. For all others, GO to DW5.

DW3 CARRY OUT THE KOER SELF-TEST

Engine at normal operating temperature.

Carry out the PCM KOER self-test.

Is DTC P0041 present?

Yes	No
GO to DW8.	GO to **DW4** .

DW4 CHECK FOR A SOURCE OF POTENTIAL HO2S CONTAMINATION

Investigate the following items as potential sources of HO2S contamination:

use of unapproved silicon sealers

fuel contaminated by silicon additives

excessive oil consumption

glycol leaking internally in the engine

contaminated fuel

short drive cycles in cold weather

use of unapproved cleaning agents

Is a concern present?

Yes	No
REPAIR the source of the contamination. CHANGE the engine oil and oil filter. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.	GO to **DW5** .

DW5 CHECK FOR UNMETERED AIR LEAKS

NOTE: Fuel calculations can be affected by unmetered air leaks.

Carefully inspect the following areas for potential air leaks:

hoses connecting to the mass air flow (MAF) sensor assembly

hoses connecting to the throttle body

intake manifold gasket leaks

positive crankcase ventilation (PCV) system

the vacuum lines are disconnected

incorrectly seated engine oil dipstick, tube or oil fill cap

Are any air leaks present?

Yes	No
REPAIR the source of the air leak. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.	GO to **DW6** .

DW6 CHECK FOR EXHAUST SYSTEM CONCERNS

NOTE: Pressure above 241 kPa (35 psi) can cause damage to system components. Regulate the shop air to 34.4 kPa (5 psi) before connecting to the system.

Pressurize the exhaust system at the exhaust pipe outlet with 34.4 kPa (5 psi) regulated shop air.

Check the exhaust system for leaks using a soap and water solution.

Apply the soap and water solution to the following areas:

exhaust flanges and gaskets

universal HO2S and mounting surface

downstream HO2S and mounting surface

Is a concern present?

Yes	No
For DTCs P013A, P013C, P013E or P014A, REPAIR as necessary. CARRY OUT the HO2S and Catalyst OBD Monitor Drive Cycle Procedures. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE . Clear the PCM DTCs. REPEAT the self-test. For all others, REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For DTCs P013A, P013C, P013E or P014A, INSTALL a new HO2S. REFER to the service information , Electronic Engine Controls. CARRY OUT the HO2S and Catalyst OBD Monitor Drive Cycle Procedures. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE . Clear the PCM DTCs. REPEAT the self-test. For all others, GO to **DW7** .

DW7 CHECK FOR FUEL SELECTION CONCERNS

Verify with the customer that flex fuel is not being used on a non-flex fuel vehicle.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **DW8** .

DW8 CHECK THE HO2S CIRCUITS FOR AN OPEN

NOTE: Check both halves the HO2S connector for any water contamination.

Ignition OFF.

PCM connector disconnected.

For HO2S12,

HO2S12 connector disconnected.

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S12	HO2S12

SIGRTN	SIGRTN

For HO2S22,

HO2S22 connector disconnected.

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-) PCM Connector, Harness Side
HO2S22	HO2S22
SIGRTN	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **DW9** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DW9 CHECK THE HO2S CIRCUIT FOR A SHORT

For HO2S12,

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-) HO2S12 Connector, Harness Side
HO2S12	SIGRTN
HO2S12	VPWR

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-)
HO2S12	Ground

For HO2S22,

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-) HO2S22 Connector, Harness Side
HO2S22	SIGRTN
HO2S22	VPWR

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-)
HO2S22	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **DW10** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DW10 CHECK THE HO2S CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For HO2S12,

Measure the voltage between:

(+) HO2S12 Connector, Harness Side	(-)
HO2S12	Ground

For HO2S22,

Measure the voltage between:

(+) HO2S22 Connector, Harness Side	(-)
HO2S22	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **DW11** .

DW11 CARRY OUT A THOROUGH WIGGLE TEST ON THE HO2S HARNESS

Ignition OFF.

PCM connector connected.

For HO2S12,

HO2S12 connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the O2S12 (VOLT) PID.

Carry out a thorough wiggle test on the HO2S12 harness.

For HO2S22,

HO2S22 connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the O2S22 (VOLT) PID.

Carry out a thorough wiggle test on the HO2S22 harness.

Does the voltage change during the wiggle test?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For DTC P00D2, GO to **DW12** . For all others, INSTALL a new HO2S. REFER to the service information , Electronic Engine Controls. CLEAR the DTCs. REPEAT the self-test.

DW12 CHECK FOR VPWR

NOTE: Diagnose the suspect sensor indicated by the DTC.

Ignition OFF.

For HO2S12,

HO2S12 connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) HO2S12 Connector, Harness Side	(-)
VPWR	Ground

For HO2S22,

HO2S22 connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) HO2S22 Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **DW13** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DW13 CHECK THE HO2S HEATER CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For HO2S12,

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-) PCM Connector, Harness Side
HTR12	HTR12

For HO2S22,

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-) PCM Connector, Harness Side
HTR22	HTR22

Is the resistance less than 5 ohms?

Yes	No
GO to **DW14** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

DW14 CHECK THE HO2S HEATER FOR SHORT CIRCUITS

For HO2S12,

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-)
HTR12	Ground

Measure the resistance between:

(+) HO2S12 Connector, Harness Side	(-) HO2S12 Connector, Harness Side
HTR12	VPWR
HTR12	SIGRTN
HTR12	HO2S12

For HO2S22,

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-)
HTR22	Ground

Measure the resistance between:

(+) HO2S22 Connector, Harness Side	(-) HO2S22 Connector, Harness Side
HTR22	VPWR
HTR22	SIGRTN
HTR22	HO2S22

Are the resistances greater than 10K ohms?

Yes	No
GO to **DW15** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

DW15 CHECK THE INTERNAL RESISTANCE OF THE HO2S HEATER

For HO2S12,

Measure the resistance between:

(+) HO2S12 Connector, Component Side	(-) HO2S12 Connector, Component Side
HTR12	VPWR

For HO2S22,

Measure the resistance between:

(+) HO2S22 Connector, Component Side	(-) HO2S22 Connector, Component Side
HTR22	VPWR

Is the resistance between 2 - 30 ohms?

Yes	No
GO to **DW16** .	INSTALL a new HO2S. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.

DW16 CHECK THE HEATER CIRCUIT FOR AN INTERNAL SHORT TO GROUND

For HO2S12,

Measure the resistance between:

(+) HO2S12 Connector, Component Side	(-) HO2S12 Connector, Component Side
HTR12	SIGRTN

Measure the resistance between:

(+) HO2S12 Connector, Component Side	(-)
HTR12	Ground

For HO2S22,

Measure the resistance between:

(+) HO2S22 Connector, Component Side	(-) HO2S22 Connector, Component Side
HTR22	SIGRTN

Measure the resistance between:

(+) HO2S22 Connector, Component Side	(-)
HTR22	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **DW17** .	INSTALL a new HO2S. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.

DW17 CHECK FOR CORRECT PCM OPERATION

Ignition OFF.

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST DY: ENGINE OIL TEMPERATURE (EOT) SENSOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- engine overheating concerns
- vehicle driving conditions

PINPOINT TEST DY: ENGINE OIL TEMPERATURE (EOT) SENSOR > TEST PROCEDURE

DY1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Is DTC P0298 present?

Yes	No
GO to **DY2** .	RETURN to SYMPTOM CHARTS for further direction.

DY2 ENGINE OIL OVER TEMPERATURE CONDITION

NOTE: The engine oil temperature protection strategy in the PCM has been activated. This protects the engine against mechanical damage due to overheating.

Check for an overheating condition and base engine concerns.

Are there any overheating or base engine concerns?

Yes	No
ISOLATE the concern. REPAIR as necessary. REFER to the service information , Engine Cooling to diagnose the overheat symptom. Clear the PCM DTCs. REPEAT the self-test.	GO to **DY3** .

DY3 IDENTIFY THE CUSTOMER'S DRIVING HABITS

Identify the customer's driving habits.

Access the freeze frame data (if available) and record the DTC concern conditions.

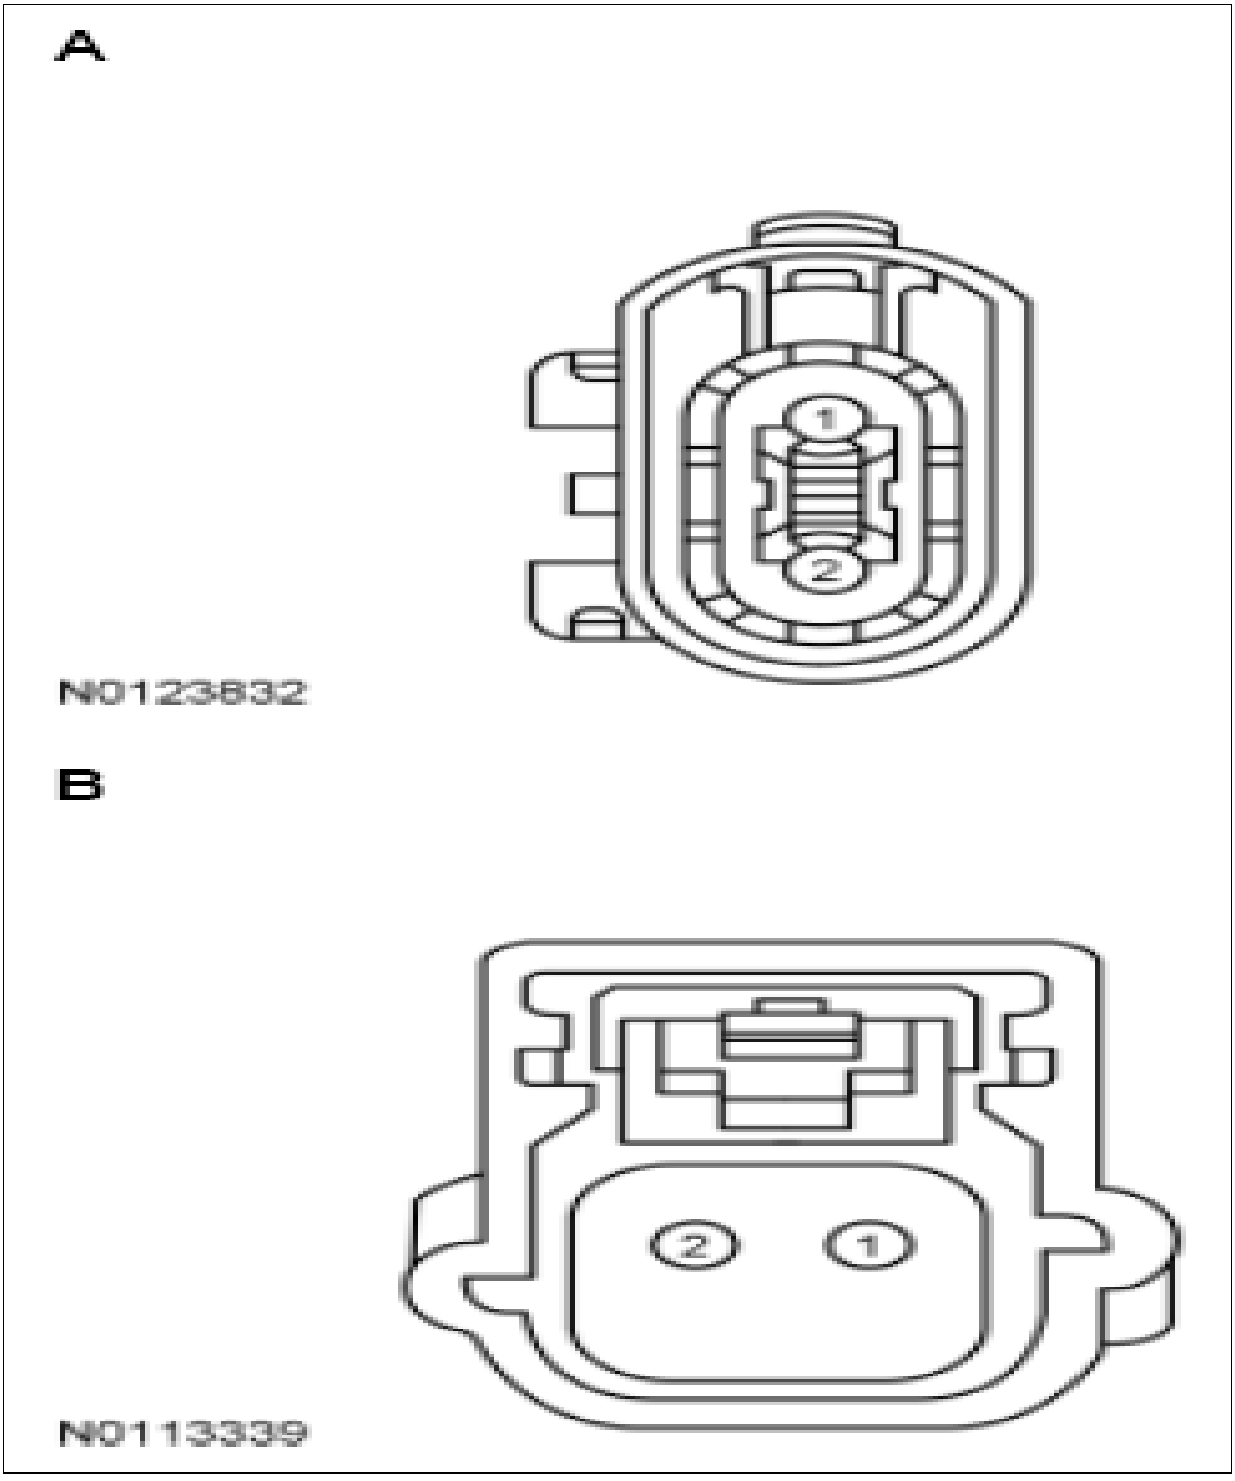
Does the vehicle appear to have been driven in an incorrect transmission gear or at high RPM for an extended period?

Yes	No
ADVISE the customer that incorrect transmission gear selection and high RPM for an extended period initializes the engine protection strategy. Clear the PCM DTCs. REPEAT the self-test.	GO to **DY4** .

DY4 TYPE OF ENGINE COOLANT SENSOR

NOTE: The PCM uses an oil algorithm to infer actual temperature based on input from the engine temperature sensor.

Is the vehicle equipped with a cylinder head temperature (CHT) sensor?



Yes	No
GO to PINPOINT TEST DL .	GO to PINPOINT TEST DX .

PINPOINT TEST FA: AMBIENT AIR TEMPERATURE (AAT) SENSOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- AAT sensor
- harness circuits: AAT and SIGRTN
- PCM (12A650)

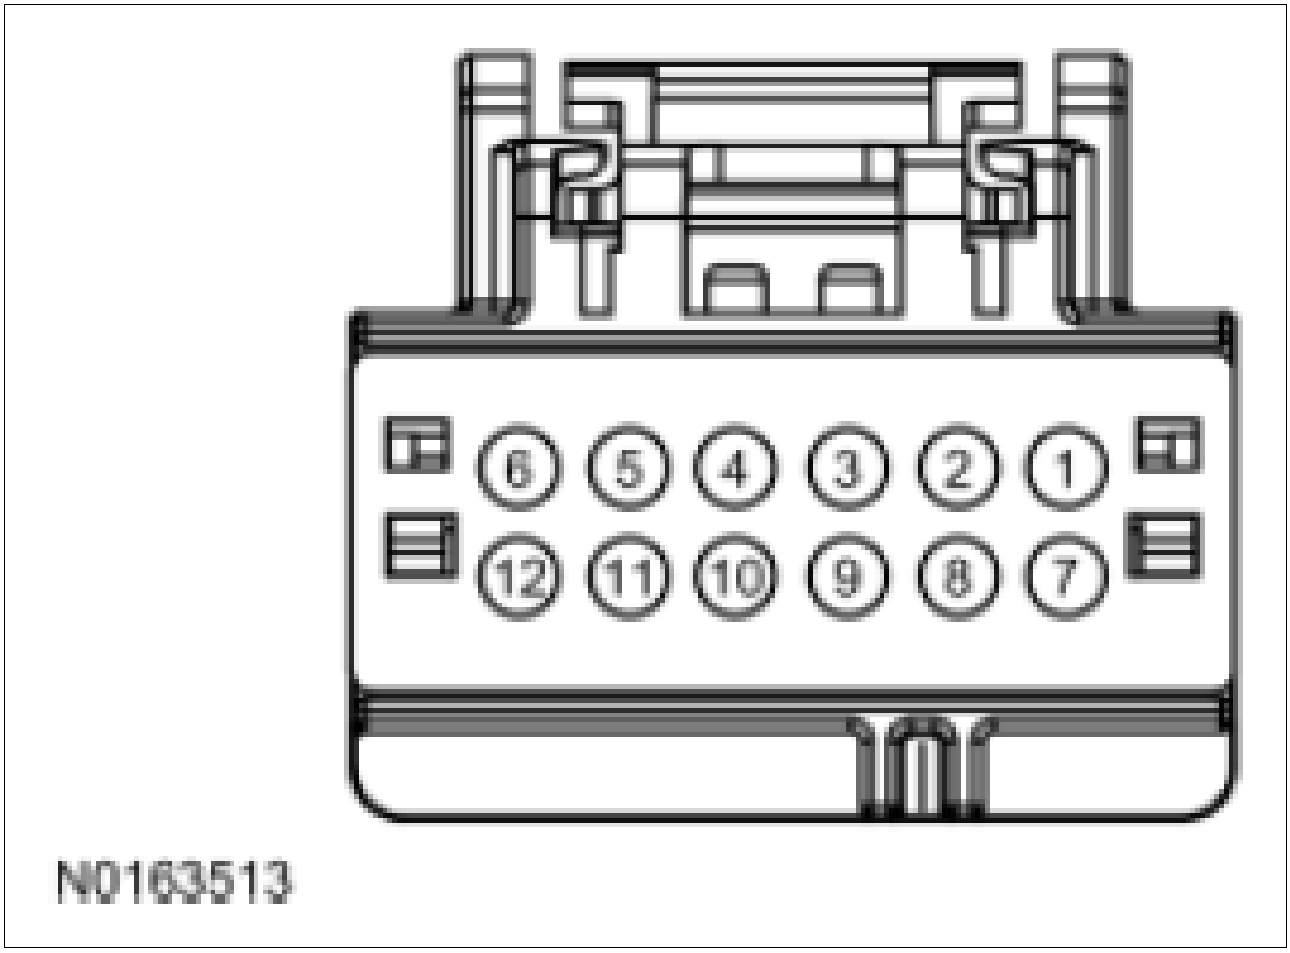


Fig 1: Identifying Ambient Air Temperature (AAT) Sensor Connector

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Transit	A	2 1	SIGRTN AAT
All other vehicles	B	2 1	SIGRTN AAT

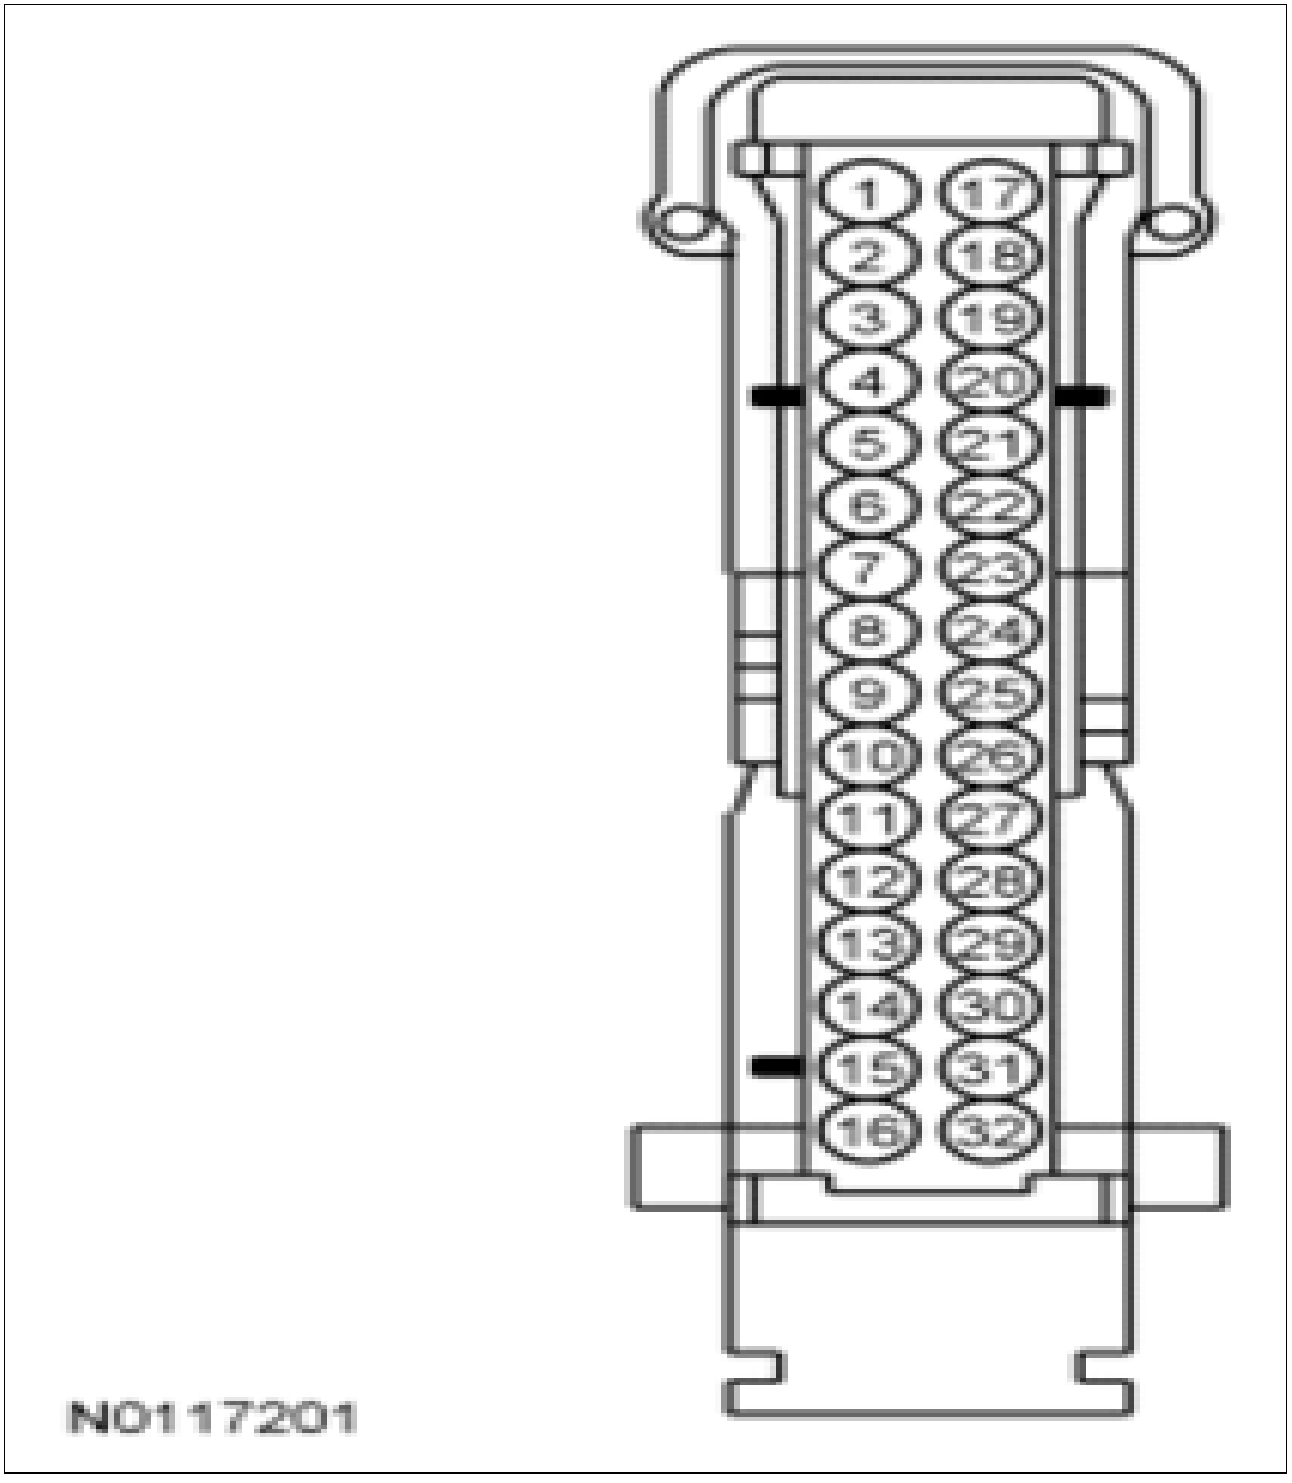

Fig 2: Identifying Right Exterior Rear View Mirror Assembly Connector

Courtesy of FORD MOTOR CO.

Pin	Circuit
10	SIGRTN (Signal Return)
9	AAT (Ambient Air Temperature)

Fig 3: Identifying Instrument Panel Cluster (IPC) Connector

Courtesy of FORD MOTOR CO.

Pin	Circuit
19	SIGRTN (Signal Return)
20	AAT (Ambient Air Temperature)

PINPOINT TEST FA: AMBIENT AIR TEMPERATURE (AAT) SENSOR > INTRODUCTION > POWERTRAIN CONTROL MODULE (PCM) CONNECTOR

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
Edge 3.5L, F-150 TiVCT 3.5L, F-150 5.0L, Mustang 3.7L, Mustang 5.0L	198 PIN	B51 B47	SIGRTN AAT
Escape/Kuga 2.5L, Explorer 3.7L, Explorer TiVCT 3.5L, F-Series Super Duty, Flex TiVCT 3.5L, Fusion 2.5L, MKS 3.7L, MKT 3.7L, MKZ 3.7L, Taurus TiVCT 3.5L, Taurus 3.7L, Transit 3.7L, Transit Connect 2.5L	190-PIN	B56 B17	SIGRTN AAT
Explorer 2.0L	154 PIN	B21 B35	SIGRTN AAT
Focus 1.0L	198 PIN	B34 B51	SIGRTN AAT
Focus GDI 2.0L	198 PIN	B34 B35	SIGRTN AAT
Fusion 1.6L	198 PIN	E17, E34 B51	SIGRTN AAT
MKX	190-PIN	B56 E29	SIGRTN AAT
Motorhome/Stripped Chassis/Step Van	190-PIN	B56	SIGRTN
All other vehicles	198 PIN	B18 B51	SIGRTN AAT

PINPOINT TEST FA: AMBIENT AIR TEMPERATURE (AAT) SENSOR > TEST PROCEDURE

FA1 CHECK FOR DTCS

Are DTCs P0071, P0072, P0073 or P0074 present?

Yes	No
For DTC P0071, GO to FA8. For DTC P0072, GO to **FA2** . For DTC P0073, GO to FA3. For all others, GO to FA7.	RETURN to SYMPTOM CHARTS for further direction.

FA2 INDUCING THE OPPOSITE DTC

NOTE: The AAT sensor is disconnected to simulate the opposite DTC.

Ignition OFF.

For Focus,

Right Exterior Rear View Mirror Assembly connector disconnected.

For all others,

AAT Sensor connector disconnected.

Ignition ON, engine OFF.

Carry out the PCM self-test.

Is the DTC P0073 present?

Yes	No
For Focus, INSTALL a new Right Exterior Rear View Mirror. REFER to the service information , Rear View Mirrors. For all others, INSTALL a new AAT sensor. REFER to the service information , Climate Control. Clear the PCM DTCs. REPEAT the self-test.	GO to FA4.

FA3 INDUCING THE OPPOSITE DTC

NOTE: DTCs set as a result of the connector being disconnected.

Ignition OFF.

For Focus,

Right Exterior Rear View Mirror Assembly connector disconnected.

Connect a 5 amp fused jumper wire between the following:

Point A Right Exterior Rear View Mirror Assembly Connector, Harness Side	Point B Right Exterior Rear View Mirror Assembly Connector, Harness Side

AAT - Pin 9	SIGRTN - Pin 10

For all others,

AAT Sensor connector disconnected.

Connect a 5 amp fused jumper wire between the following:

Point A AAT Sensor Connector, Harness Side	Point B AAT Sensor Connector, Harness Side
AAT	SIGRTN

Ignition ON, engine OFF.

Carry out the on-demand self-test.

Is DTC P0072 present?

Yes	No
For Focus, INSTALL a new Right Exterior Rear View Mirror. REFER to the service information , Rear View Mirrors. For all others, INSTALL a new AAT sensor. REFER to the service information , Climate Control. Clear the PCM DTCs. REPEAT the self-test.	GO to **FA4** .

FA4 CHECK THE AAT AND SIGRTN CIRCUITS FOR AN OPEN

Ignition OFF.

For Fiesta,

IPC connector disconnected.

Measure the resistance between:

(+) AAT Sensor Connector, Harness Side	(-) IPC Connector, Harness Side
AAT	AAT - Pin 20
SIGRTN	SIGRTN - Pin 19

For Focus,

PCM connector disconnected.

Measure the resistance between:

(+) Right Exterior Rear View Mirror Assembly Connector, Harness Side	(-) PCM Connector, Harness Side
AAT - Pin 9	AAT
SIGRTN - Pin 10	SIGRTN

For all others,

PCM connector disconnected.

Measure the resistance between:

(+) AAT Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
AAT	AAT
SIGRTN	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **FA5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

FA5 CHECK THE AAT CIRCUIT FOR A SHORT TO GROUND

For Focus,

Measure the resistance between:

(+) Right Exterior Rear View Mirror Assembly Connector, Harness Side	(-)
AAT - Pin 9	Ground

For all others,

Measure the resistance between:

(+) AAT Sensor Connector, Harness Side	(-)
AAT	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **FA6** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

FA6 CHECK THE AAT AND SIGRTN CIRCUITS FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For Focus,

Measure the voltage between:

(+) Right Exterior Rear View Mirror Assembly Connector, Harness Side	(-)

AAT - Pin 9	Ground
SIGRTN - Pin 10	Ground

For all others,

Measure the voltage between:

(+) AAT Sensor Connector, Harness Side	(-)
AAT	Ground
SIGRTN	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **FA7** .

FA7 INTERMITTENT CHECK

Ignition OFF.

For Fiesta,

IPC connector connected.

For all others,

PCM connector connected.

For Focus,

Right Exterior Rear View Mirror Assembly connector connected.

For all others,

AAT Sensor connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the AAT (TEMP) PID.

While observing the PID, carry out the following:

Lightly tap on the sensor and wiggle the accessible harness from the sensor to the module.

Wiggle the connectors.

Look for sudden changes in the temperature when the sensor is tapped and the harness and connector are wiggled.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **FA8** .

FA8 TEMPERATURE SENSOR CORRELATION

NOTE: Check temperature values while engine is at ambient temperature, cold soak the engine for a minimum of 8 hours while not in direct sunlight, if necessary.

Ignition ON, engine OFF.

Access the PCM and monitor the AAT (TEMP), ECT (TEMP) and IAT (TEMP) PIDs.

Are the temperature readings within 18°C (32.4°F) of each other?

Yes	No
For Fiesta, GO to **FA9** . For all others, GO to FA10.	For Focus, INSTALL a new Right Exterior Rear View Mirror. REFER to the service information , Rear View Mirrors. For all others, INSTALL a new AAT sensor. REFER to the service information , Climate Control. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . Clear the PCM DTCs. REPEAT the self-test.

FA9 CHECK FOR CORRECT INSTRUMENT PANEL CLUSTER (IPC) OPERATION

Disconnect all the IPC connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the IPC connectors and make sure they seat correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new IPC. REFER to the service information , Instrumentation, Message Center, and Warning Chimes.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

FA10 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST FB: POWER TAKE OFF (PTO) > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- PTO switch
- harness circuit: PTO and PTOIL
- powertrain control module (PCM) (12A650)

PINPOINT TEST FB: POWER TAKE OFF (PTO) > INTRODUCTION > POWERTRAIN CONTROL MODULE (PCM) CONNECTOR

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
E-Series 6.8L	190-PIN	B7 B11 B9 B26	PTORPM PTOIL PTOENG PTO
E-Series 5.4L	190-PIN	B8 B11 B6 B3	PTORPM PTOIL PTOENG PTO
All other vehicles	190-PIN	B8 B11 B6 B22	PTORPM PTOIL PTOENG PTO

PINPOINT TEST FB: POWER TAKE OFF (PTO) > TEST PROCEDURE

FB1 PTO INDICATOR LAMP

Did you come to this pinpoint test for an always on/never on PTO indicator?

Yes	No
GO to FB6.	GO to **FB2** .

FB2 PTO NOT WORKING CORRECTLY: CHECK THE PTO INDICATOR LAMP OPERATION

NOTE: The following conditions must be met before the PTO engages:

engine at normal operating temperature

accelerator pedal is released

transmission fluid temperature (TFT) within normal operating temperature

parking brake is applied

brake pedal is released

automatic transmission is in the PARK position

manual transmission - the clutch pedal is released

NOTE: This step requires operating the PTO component. Refer to the aftermarket manufacturer for the PTO operating instructions. Follow all safety precautions.

Ignition ON, engine running.

Activate the PTO switch.

Does the PTO indicator illuminate?

Yes	No
GO to the aftermarket PTO mechanical manual.	GO to **FB3** .

FB3 CHECK THE INTEGRITY OF THE PTO SWITCH AND THE PTO SWITCH CIRCUIT

Access the PCM and monitor the PTO (MODE) PID.

Cycle the PTO switch, from off to on to off.

Does the PTO PID change state?

Yes	No
GO to **FB4** .	REPAIR the PTO circuit or switch as necessary. Clear the PCM DTCs. REPEAT the self-test.

FB4 CHECK THE PTO LOAD PID STATE IN THE PCM

Access the PCM and monitor the PTOLOAD (MODE) PID.

Cycle the PTO switch,

Does the PTO LOAD PID change state?

Yes	No
GO to **FB5** .	REPAIR the PTO ENG circuit or switch as necessary. Clear the PCM DTCs. REPEAT the self-test.

FB5 CHECK THE PTOIR_V PID STATE IN THE PCM

NOTE: The PTOIR_V PID represents an analog input which reflects the user requested engine speed.

Access the PCM and monitor the PTOIR_V (VOLT) PID.

Cycle the PTO switch,

Does the PTOIR_V PID change state?

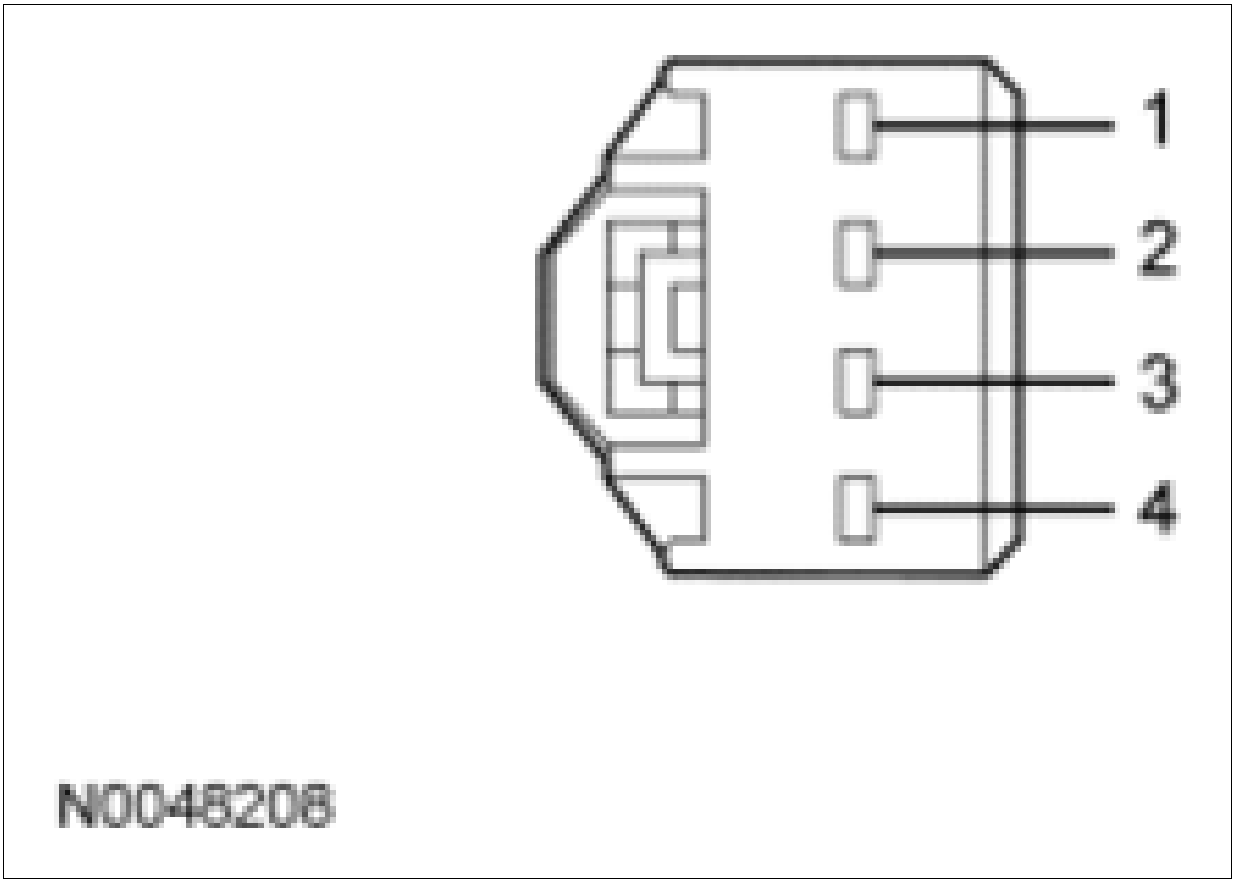
Yes	No
GO to **FB6** .	REPAIR the PTO RPM circuit or switch as necessary. Clear the PCM DTCs. REPEAT the self-test.

FB6 CHECK THE PTOIL PID STATE IN THE PCM

Access the PCM and monitor the PTOIL (MODE) PID.

Cycle the PTO switch,

Does the PTOIL PID change state?



Yes	No
GO to the aftermarket PTO mechanical manual.	REPAIR the circuit as necessary. Clear the PCM DTCs. REPEAT the self-test.

PINPOINT TEST FD: BRAKE PEDAL INPUTS > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- brake pedal position (BPP) switch (13480)
- harness circuits: B+, BPP, BPS and BPS1
- PCM (12A650)

Fig 1: Identifying Brake Pedal Position (BPP) Switch Connector

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
E-Series	A	3	BPS
Escape/Kuga, Expedition, Explorer, Focus, Mustang, Navigator, Transit Connect	A	2 3	GND BPS
Motorhome/Stripped Chassis/Step Van	A	3 2	GND BPS1
All other vehicles	A	3 2	GND BPS

PINPOINT TEST FD: BRAKE PEDAL INPUTS > INTRODUCTION > POWERTRAIN CONTROL MODULE (PCM) CONNECTOR

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
E-Series 6.8L	190-PIN	E65 B13	BPS BPP

PINPOINT TEST FD: BRAKE PEDAL INPUTS > TEST PROCEDURE

FD1 CHECK FOR DTCS

Are DTCs P0504, P0571, P0572, P0573, P0703, P1572 or P1703 present?

Yes	No
For KOER DTCs P0571, P0703 or P1703, GO to **FD2** . For all others, GO to FD3.	RETURN to SYMPTOM CHARTS for further direction.

FD2 VERIFY THE BRAKE PEDAL WAS APPLIED

Was the brake pedal applied and released during the KOER self-test?

Yes	No
GO to **FD3** .	REPEAT the KOER self-test. APPLY and RELEASE the brake pedal during the KOER test. Clear the PCM DTCs. REPEAT the self-test.

FD3 CHECK THE OPERATION OF THE STOPLAMPS

Ignition ON, engine OFF.

Apply and release the brake pedal and check the stop lamp operation.

Do the stoplamps operate correctly?

Yes	No
GO to **FD4** .	REFER to the service information , Exterior Lighting, to diagnose all the stoplamps are inoperative. Clear the PCM DTCs. REPEAT the self-test.

FD4 CHECK THE BPP SWITCH OPERATION

Ignition ON, engine OFF.

Access the PCM and monitor the BOO1 (MODE) PID.

Apply and release the brake pedal while monitoring the brake position PID.

Does the PID cycle ON and OFF?

Yes	No
For Fiesta, GO to FD15. For E-Series, GO to FD13. For all others, GO to FD6.	GO to **FD5** .

FD5 CHECK FOR BPP CIRCUIT CYCLING

Ignition OFF.

PCM connector disconnected.

Ignition ON, engine OFF.

Apply and release the brake pedal while monitoring the voltage.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPP	Ground

Is voltage less than 1 volt with the brake pedal released and greater than 10.5 volts with the brake pedal fully applied?

Yes	No
For Fiesta, GO to FD15. For E-Series, GO to FD13. For all others, GO to **FD6** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

FD6 CHECK BPS CIRCUIT CONTINUITY

PCM connector disconnected.

BPP Switch connector disconnected.

For Motorhome/Stripped Chassis/Step Van,

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) BPP Switch Connector, Harness Side
BPS1	BPS1

For all others,

Measure the resistance between:

(+) PCM Connector, Harness Side	(-) BPP Switch Connector, Harness Side
BPS	BPS

Is the resistance less than 5 ohms?

Yes	No
GO to **FD7** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

FD7 CHECK THE BPS CIRCUIT

For Motorhome/Stripped Chassis/Step Van,

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-)
BPS1	Ground

For all others,

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-)
BPS	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **FD8** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

FD8 CHECK THE BPS CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For Motorhome/Stripped Chassis/Step Van,

Measure the voltage between:

(+) BPP Switch Connector, Harness Side	(-)
BPS1	Ground

For all others,

Measure the voltage between:

(+) BPP Switch Connector, Harness Side	(-)
BPS	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **FD9** .

FD9 CHECK THE SIGRTN OR GND CIRCUIT FOR AN OPEN

Ignition OFF.

For F-150 3.5L,

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-) PCM Connector, Harness Side
SIGRTN	SIGRTN

For all others,

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-)
GND	Ground

Is the resistance less than 5 ohms?

Yes	No
For F-150 3.5L, GO to **FD10** . For all others, GO to FD11.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

FD10 CHECK THE SIGRTN CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-)
SIGRTN	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **FD11** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

FD11 CHECK THE CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For F-150 3.5L,

Measure the voltage between:

(+) BPP Switch Connector, Harness Side	(-)
SIGRTN	Ground

For all others,

Measure the voltage between:

(+) BPP Switch Connector, Harness Side	(-)
GND	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **FD12** .

FD12 CHECK THE BPP SWITCH

For F-150 3.5L,

Measure the resistance between:

(+) BPP Switch Connector, Component Side	(-) BPP Switch Connector, Component Side
BPS	SIGRTN

For all others,

Measure the resistance between:

(+) BPP Switch Connector, Component Side	(-) BPP Switch Connector, Component Side
BPS	GND

Is the resistance less than 5 ohms with brake pedal released and greater than 10K ohms with the brake pedal pressed?

Yes	No
GO to FD15.	INSTALL a new BPP switch. Clear the PCM DTCs. REPEAT the self-test.

FD13 CHECK FOR BPS CIRCUIT CYCLING

Ignition OFF.

PCM connector disconnected.

Ignition ON, engine OFF.

Apply and release the brake pedal while monitoring the voltage.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
BPS	Ground

Is voltage greater than 10.5 volts with the brake pedal released and less than 1 volt with the brake pedal fully applied?

Yes	No
GO to **FD14** .	REFER to the service information , Cruise Control. CARRY OUT the diagnostic steps for DTC P1703 to continue diagnosis.

FD14 CHECK THE BPS CIRCUIT

Measure the resistance between:

(+) BPP Switch Connector, Harness Side	(-)
BPS	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to **FD15** .	REFER to the service information , Cruise Control. CARRY OUT the diagnostic steps for DTC P1703 to continue diagnosis.

FD15 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HC: FUEL DELIVERY SYSTEM > INTRODUCTION

WARNING: THE FUEL SYSTEM REMAINS UNDER PRESSURE AFTER THE ENGINE IS OFF. RELIEVE PRESSURE BEFORE REPAIRING. HIGHLY FLAMMABLE MIXTURES ARE PRESENT. TO RELEASE PRESSURE FROM THE FUEL SYSTEM, CARRY OUT THE

FOLLOWING:

- *CONNECT FUEL PRESSURE TEST KIT 310-D009 (D95L-7211A) OR EQUIVALENT.*
- *GRADUALLY OPEN THE TESTING KIT VALVE TO RELIEVE THE FUEL PRESSURE IN THE VEHICLE FUEL SYSTEM AND DRAIN THE FUEL INTO A SUITABLE CONTAINER OR RETURN IT TO THE FUEL TANK.*
- *TO AVOID UNNECESSARY FUEL SPILLAGE AND FIRE HAZARD, ANY TIME FUEL LINES ARE DISCONNECTED, THE IGNITION SWITCH MUST BE IN THE OFF POSITION UNLESS FUEL PUMP OPERATION IS REQUIRED FOR TEST PURPOSES.*

FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

WARNING: BEFORE WORKING ON OR DISCONNECTING ANY OF THE FUEL TUBES OR FUEL SYSTEM COMPONENTS, RELIEVE THE FUEL SYSTEM PRESSURE TO PREVENT ACCIDENTAL SPRAYING OF FUEL. FUEL IN THE FUEL SYSTEM REMAINS UNDER HIGH PRESSURE, EVEN WHEN THE ENGINE IS NOT RUNNING. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN SERIOUS PERSONAL INJURY.

WARNING: DO NOT SMOKE, CARRY LIGHTED TOBACCO OR HAVE AN OPEN FLAME OF ANY TYPE WHEN WORKING ON OR NEAR ANY FUEL-RELATED COMPONENT. HIGHLY FLAMMABLE MIXTURES ARE ALWAYS PRESENT AND MAY BE IGNITED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN SERIOUS PERSONAL INJURY.

WARNING: DO NOT CARRY PERSONAL ELECTRONIC DEVICES SUCH AS CELL PHONES, PAGERS OR AUDIO EQUIPMENT OF ANY TYPE WHEN WORKING ON OR NEAR ANY FUEL-RELATED COMPONENT. HIGHLY FLAMMABLE MIXTURES ARE ALWAYS PRESENT AND MAY BE IGNITED. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN SERIOUS PERSONAL INJURY.

WARNING: WHEN HANDLING FUEL, ALWAYS OBSERVE FUEL HANDLING PRECAUTIONS AND BE PREPARED IN THE EVENT OF FUEL SPILLAGE. SPILLED FUEL MAY BE IGNITED BY HOT VEHICLE COMPONENTS OR OTHER IGNITION SOURCES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN SERIOUS PERSONAL INJURY.

WARNING: CLEAN ALL FUEL RESIDUE FROM THE ENGINE COMPARTMENT. IF NOT REMOVED, FUEL RESIDUE MAY IGNITE WHEN THE ENGINE IS RETURNED TO OPERATION. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN SERIOUS PERSONAL INJURY.

NOTE: Replacement fuel injectors may not be the same color as the original injectors in the vehicle. Verify the replacement injector is correct for the application by part number.

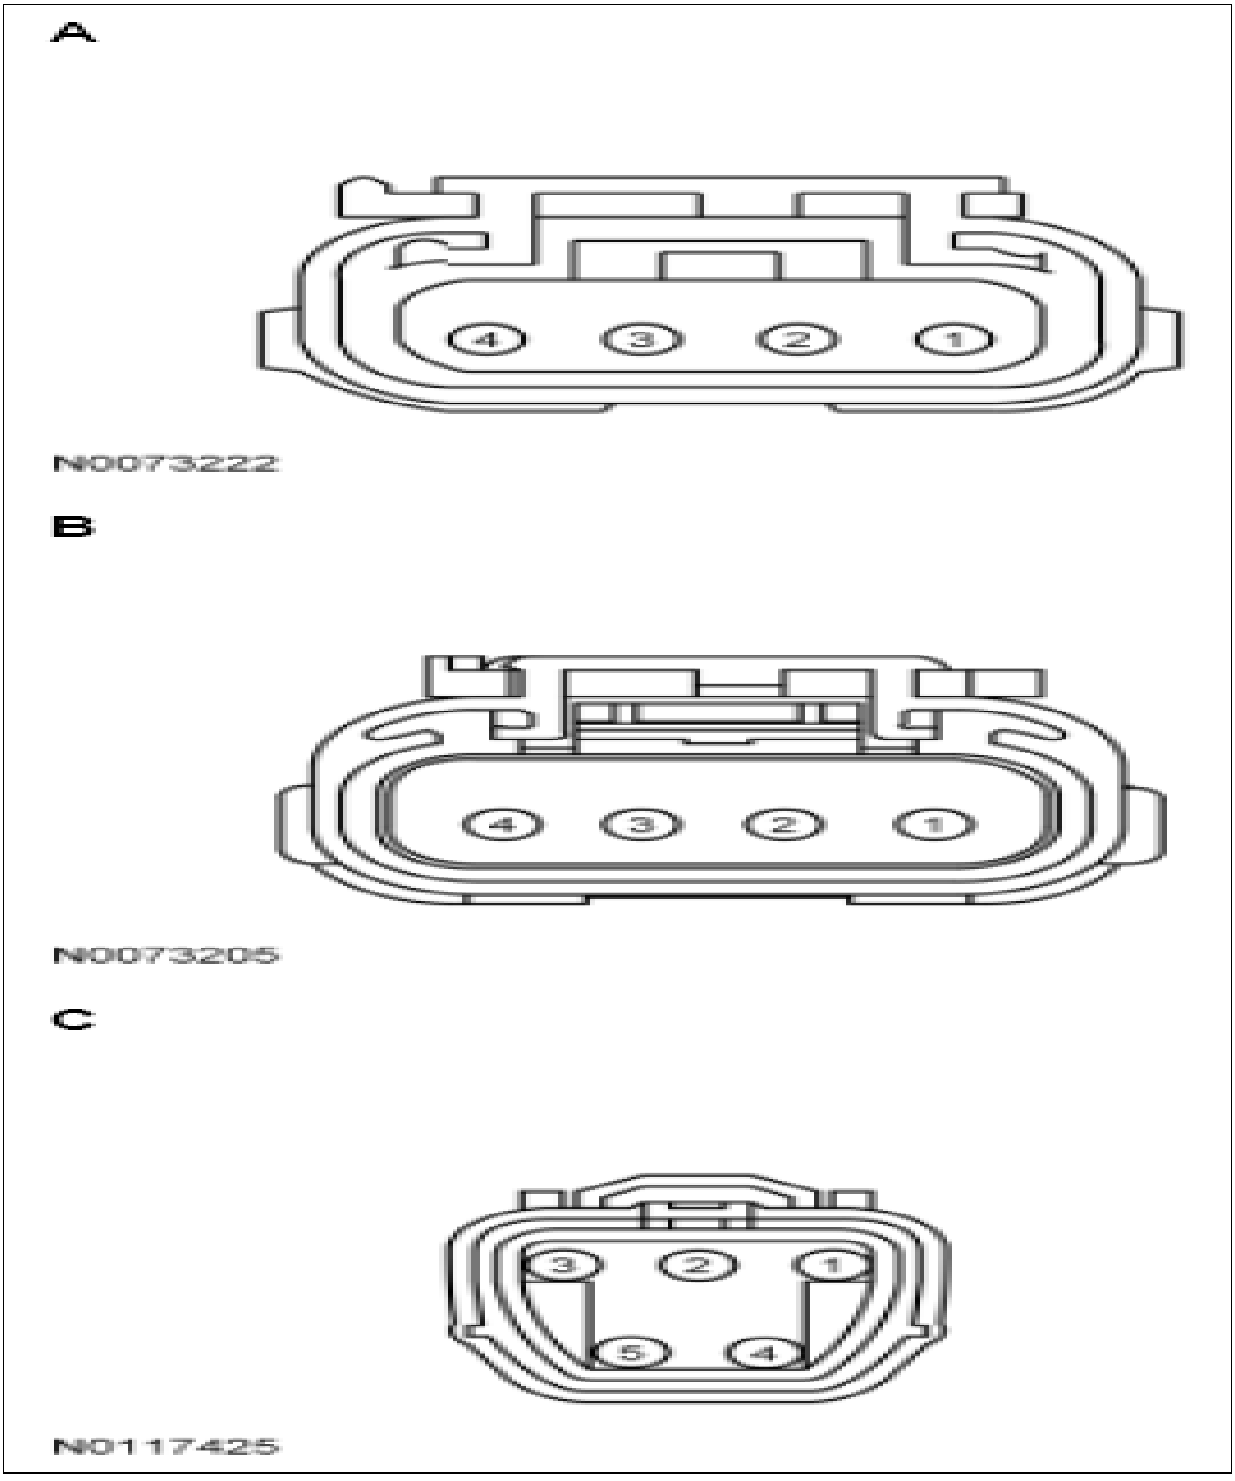
This pinpoint test is intended to diagnose the following:

- chassis components
- engine vacuum
- fuel pressure
- fuel supply line
- fuel supply
- fuel filter (9155)
- fuel injector(s) (9F593)
- fuel pump (9H307)

NOTE: With the engine running, the FRP PID value may be higher than a fuel pressure reading taken with a mechanical gauge.

FUEL SYSTEM SPECIFICATION CHART (IGNITION ON, ENGINE OFF VALUES)

Application	FLP PID Fuel Pressure	External Pressure Gauge
E-Series, Escape 2.5L, F-150 3.5L TiVCT, F-150 5.0L, F-Series Super Duty, Mustang 3.7L, Mustang 5.0L, Transit 3.7L	-	350-415 kPa (51-60 psi)
Edge 2.0L, Edge 2.7L, Explorer 2.0L	350-500 kPa (51-73 psi)	350-500 kPa (51-73 psi)
Escape 1.6L, Escape 2.0L, Fiesta 1.0L, Fiesta 1.6L GTDI, Focus, Transit Connect 1.6L	380-500 kPa (55-73 psi)	380-500 kPa (55-73 psi)
Transit Connect 2.5L, Fusion 2.5L	-	350-450 kPa (51-65 psi)
Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, Mustang 2.3L	320-540 kPa (46-78 psi)	320-540 kPa (46-78 psi)
Expedition, F-150 2.7L, F-150 3.5L GTDI, Navigator, Transit 3.5L	-	425-510 kPa (62-74 psi)
All Others	-	331-485 kPa (48-70 psi)



PINPOINT TEST HC: FUEL DELIVERY SYSTEM > INTRODUCTION > INERTIA FUEL

SHUTOFF (IFS) SWITCH - RESET INSTRUCTIONS

WARNING: IF YOU SEE OR SMELL GASOLINE AT ANY TIME OTHER THAN DURING FUELING, DO NOT RESET THE INERTIA FUEL SHUTOFF (IFS) SWITCH. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

- Key in OFF position.
- Check for fuel leaks in the engine compartment.
- If no leak is present, reset the IFS switch by pushing the reset button on the top of the switch. Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch.
- In the closed position, the button can be pressed an additional 1.57 mm (1/16 in) against a spring.
- Key ON, engine OFF.
- Key in OFF position.
- Key ON, engine OFF.
- Key in OFF position.
- Check for leaking fuel.

Fig 1: Identifying Fuel Pump (FP) Connector

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
E-Series, Expedition, F-150, Mustang,	A	4 3	FPPWR FPRTN

Navigator, Transit			
F-650/F-750, F-Series Super Duty, Motorhome/Stripped Chassis/Step Van	B	4 3	FPPWR FPRTN
All other vehicles	C	5 4	FPPWR FPRTN

PINPOINT TEST HC: FUEL DELIVERY SYSTEM > TEST PROCEDURE

HC1 CHECK THE SYSTEM INTEGRITY

Visually inspect the complete fuel delivery system for damage and leakage.

Check the following:

fuel lines and connections

relays

fuel tank

fuel pump

fuel pressure regulator

fuel rail at injectors

damaged connector pins

electrical connectors not fully engaged

Verify the vehicle has followed the maintenance schedule. A new fuel filter should have been installed within the last 48, 280 km (30, 000 miles) (vehicles with inline fuel filter).

Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch (if equipped).

Verify the fuse integrity.

Verify the battery is fully charged.

Verify clean sufficient fuel.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HC2** .

HC2 CHECK THE FUEL PRESSURE

Ignition OFF.

Relieve the fuel pressure. Refer to the service information , Fuel System for the Fuel System Pressure Release procedure.

Mechanical fuel pressure gauge connected.

Ignition ON, engine OFF.

Pressurize the fuel system. Refer to the service information , Fuel System for the Fuel System Pressure Release procedure to pressurize the fuel system.

FP connector connected.

Cycle the ignition several times to charge the fuel system.

Compare the fuel pressure reading to the Fuel System Specification Chart.

Is the fuel pressure within range?

Yes	No
For DTCs P0171, P0174, P2195 or P2197, GO to HC14. For DTCs P008A or P008B, GO to HC11. For all others, GO to HC5.	GO to **HC3** .

HC3 CHECK THE FUEL PUMP GROUND CIRCUIT FOR AN OPEN CIRCUIT

Ignition OFF.

FP connector disconnected.

Measure the voltage between:

(+) Vehicle Battery	(-) FP Connector, Harness Side
Positive terminal	FPRTN

Ignition ON, engine OFF.

Are the voltages greater than 10.5 V?

Yes	No
GO to **HC4** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HC4 CHECK THE FUEL PUMP POWER CIRCUIT FOR AN OPEN

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds. Be aware that output state control turns the FP off after a calibrated time. If this happens, command the output ON to continue testing.

Verify the inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to the Owner's Literature, Roadside Emergencies for the location of the IFS switch (if equipped).

Ignition ON, engine OFF.

Measure the voltage between:

(+) FP Connector, Harness Side	(-) Vehicle Battery
FPPWR	Negative terminal

Access the PCM and control the FP (MODE) PID.

Command the fuel pump ON.

Does the voltage increase with the PID commanded ON?

Yes	No
For Vehicles that do not start, GO to HC15.	REPAIR the open circuit. Clear the PCM DTCs.
For all others, GO to HC11.	REPEAT the self-test.

HC5 CHECK THE SEPARATION LEVEL OF THE ETHANOL/WATER MIXTURE AND GASOLINE IN THE FUEL

NOTE: This step requires the use of a locally obtained 200 ml beaker and a 25 ml graduated cylinder.

NOTE: After approximately 3 minutes of standing, the ethanol and water mixes together and settles to the bottom of the 25 ml graduated cylinder. The gasoline rises to the top.

Fill the 200 ml beaker with 5 ml of clean water.

Use the pressure relief valve on the mechanical fuel gauge to drain 22 ml of fuel into an approved clean container.

Pour 20 ml of fuel from the approved clean container into the 25 ml graduated cylinder.

Add enough water from the 200 ml beaker to the 25 ml graduated cylinder to bring the total volume of liquid to 24 ml.

Insert a stopper plug in the opening of the 25 ml graduated cylinder.

Firmly hold the stopper in place and shake the 25 ml graduated cylinder to mix the water and fuel.

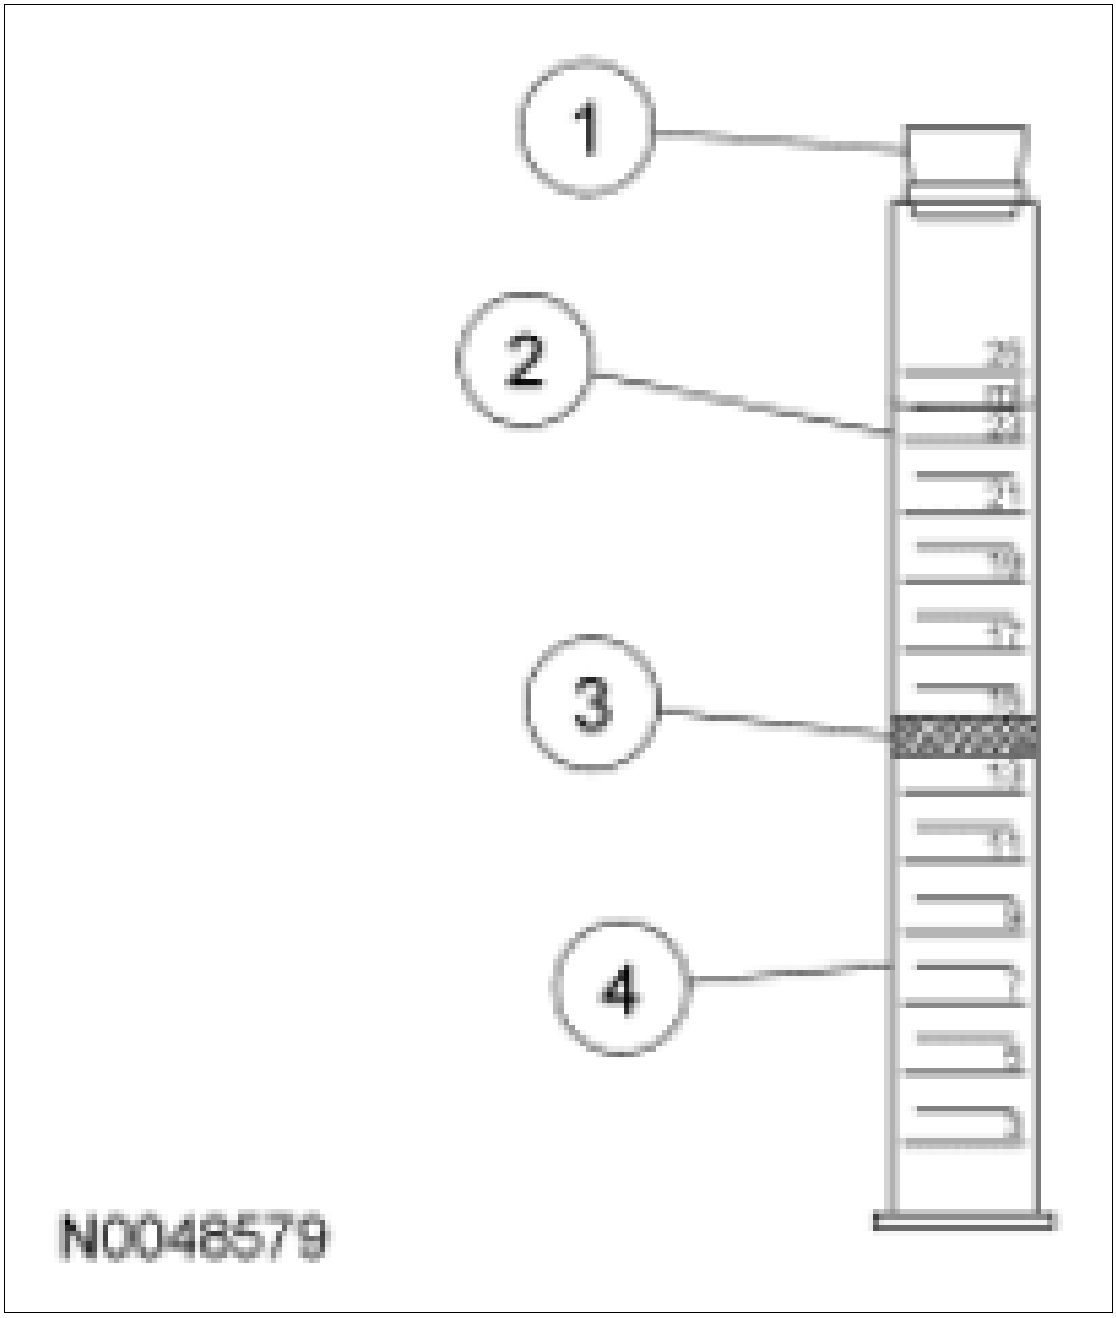
Allow the liquid to stand and separate for approximately 3 minutes.

Record the separation level from the 25 ml graduated cylinder where the ethanol/water mixture and gasoline meet.

Did the ethanol/water mixture and gasoline separate?

Yes	No
GO to **HC6** .	The ethanol/water mixture will separate from the gasoline. If the fuel does not appear to separate, then the fuel is either 100% ethanol or a mixture of ethanol and water. REPLACE the contaminated fuel. Clear the PCM DTCs. REPEAT the self-test.

HC6 CALCULATE THE PERCENTAGE OF ETHANOL IN THE FUEL



NOTE: Use the illustration as an example for calculating the percentage of ethanol in the following steps. If the separation level is at 14 ml the calculation becomes; 14 minus 4, then multiply by 5 to equal 50. The percentage of ethanol in the fuel is 50%.

Ignition OFF.

Take the recorded separation level from the previous step and subtract the amount of water added.

Multiply the new value by 5. This new value is the percentage of ethanol in the fuel.

Fig 1: Calculating Percentage Of Ethanol In Fuel

Courtesy of FORD MOTOR CO.

Item Number	Description
1	Stopper
2	Gasoline
3	Separation Point at 14 ml
4	Ethanol and Water Mixture

Record the calculated percentage of ethanol in the fuel.

Is any ethanol present in the fuel?

Yes	No
For flex fuel vehicles, GO to **HC7** . For all others, GO to HC10.	GO to HC11.

HC7 COMPARE THE FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

NOTE: When determining if the FF_INF PID value is within 20% of the calculated percentage of ethanol, for example, if the calculated percentage of ethanol value is 40% then the PID value should be between 32 - 48%. The PID value cannot be less than zero.

Ignition ON, engine OFF.

Access the PCM and monitor the FF_INF (PER) PID.

Compare the FF_INF PID to the calculated percentage of ethanol.

Is the FF_INF PID value within 20% of the calculated percentage of ethanol?

Yes	No
GO to HC11.	GO to **HC8** .

HC8 RESET THE PERCENT ETHANOL PARAMETER IN THE PCM

NOTE: Certain customer fueling practices such as only fueling with small amounts of fuel or repeatedly switching between gasoline and an ethanol blend greater than E15 may prevent the PCM from learning the correct ethanol content in the fuel.

Reset the keep alive memory (KAM). Refer to RESETTING THE KEEP ALIVE MEMORY (KAM) .

Ignition ON, engine running.

Access the PCM and monitor the FF_LRND (MODE) PID.

Drive the vehicle approximately 11.3 km (7 miles) or until the FF_LRND PID indicates yes.

Is the PID state YES?

Yes	No
GO to **HC9** .	GO to HC17.

HC9 COMPARE THE UPDATED FF_INF PID TO THE CALCULATED PERCENTAGE OF ETHANOL

Ignition OFF.

Ignition ON, engine OFF.

Access the PCM and monitor the FF_INF (PER) PID.

Is the FF_INF PID value within 20% of the calculated percentage of ethanol?

Yes	No
RETURN the vehicle to the customer. ADVISE the customer of the correct fueling practices when using flex fuel. REFER to the Owner's Literature for additional information. ADVISE the customer to continue to use the same fuel for the next 2-3 refuels. This practice helps verify the PCM is learning the correct percentage of ethanol in the fuel.	A fuel system concern may be present, which prevents the PCM from learning the correct percentage of ethanol in the fuel, GO to HC11.

HC10 DETERMINE IF THE PERCENTAGE OF ETHANOL IN THE FUEL IS LESS THAN 25%

Check the recorded calculated percentage of ethanol in the fuel.

Is the calculated percentage of ethanol in the fuel less than 25%?

Yes	No
GO to **HC11** .	REPAIR as necessary. ADVISE the customer of the correct fuel type required for this vehicle. REFER to the Owner's Literature for additional information. Clear the PCM DTCs. REPEAT the self-test.

HC11 CHECK THE FUEL PRESSURE LEAKDOWN

NOTE: When the fuel pump is commanded off, the fuel pressure may substantially decrease and then stabilize.

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds. Be aware that output state control turns the FP off after a calibrated time. If this happens, command the output ON to continue testing.

Mechanical fuel pressure gauge connected.

Ignition ON, engine OFF.

Access the PCM and control the FP (MODE) PID.

Run the fuel pump to obtain maximum fuel pressure.

Command the fuel pump OFF.

Allow the fuel pressure to stabilize.

Record the stabilized reading.

Monitor the fuel pressure for 1 minute.

Does the fuel pressure remain within 34 kPa (5 psi) of the recorded reading (MRFS) or greater than 275 kPa (40 psi) (ERFS) after 1 minute?

Yes	No
For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, and Transit Connect 1.6L, GO to HC13. For all others, GO to HC14.	GO to **HC12** .

HC12 CARRY OUT THE RELATIVE INJECTOR FLOW TEST

NOTE: The IDS test referenced in this step may not be available on all vehicles. Follow the YES answer if the IDS test is not available.

Carry out the Relative Injector Flow Test. Refer to the instruction manual provided by the scan tool manufacturer.

Does the test pass?

Yes	No
For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L,	INSTALL a new fuel injector as necessary. REFER to the service information , Fuel Charging and Controls. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.

Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, and Transit Connect 1.6L, GO to **HC13** . For all others, GO to HC14.	

HC13 COMPARE THE FLP PID TO THE MECHANICAL GAUGE

NOTE: The vehicle may exhibit a long crank until the fuel system is pressurized.

Ignition OFF.

Relieve the fuel pressure. Refer to the service information , Fuel System for the Fuel System Pressure Release procedure.

Disable the fuel pump.

Ignition ON, engine OFF.

Monitor the mechanical gauge.

Access the PCM and monitor the FLP (PRESS) PID.

Compare the FLP PID value to the mechanical gauge.

Ignition OFF.

Pressurize the fuel system. Refer to the service information , Fuel System for the Fuel System Pressure Release procedure to pressurize the fuel system.

Ignition ON, engine running.

Allow the fuel pressure to stabilize.

Ignition OFF.

Ignition ON, engine OFF.

Compare the FLP PID value to the mechanical gauge.

Are the FLP PID values within 34 kPa (5 psi) of the mechanical gauge readings?

Yes	No
GO to **HC14** .	INSTALL a new Fuel Pressure Sensor. REFER to the fuel system WARNING information at the beginning of this pinpoint test. REFER to the service information , Fuel Tank and Lines. Clear the PCM DTCs. REPEAT the self-test.

HC14 MONITOR THE FUEL PRESSURE WHILE ROAD TESTING THE VEHICLE

WARNING: STRICT OBSERVANCE OF POSTED SPEED LIMITS AND ATTENTION TO DRIVING CONDITIONS ARE MANDATORY WHEN CARRYING OUT THE ROAD TEST. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: Some concerns may only be present during certain fuel level conditions. Determine the fuel level at the time of the concern. Access the information from the customer information worksheet and the customer.

Ignition OFF.

Securely route the mechanical gauge so that the gauge is viewable while road testing the vehicle.

Ignition ON, engine running.

Engine at normal operating temperature.

Monitor the mechanical gauge.

From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.

Is the fuel pressure always greater than 352 kPa (51 psi)?

Yes	No
For misfire DTC diagnosis, GO to HD11. For DTCs P0171, P0174, P2195 or P2197, GO to H21. For the fuel pressure leakdown concern, INSTALL a new FP. REFER to the service information , Fuel Tank and Lines.	GO to **HC15** .

For all others, RETURN to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX for further direction.	

HC15 CHECK THE FUEL SUPPLY LINE FOR RESTRICTION

NOTE: Observe the Warnings, Cautions, and Notes.

Ignition OFF.

Disconnect the fuel supply line at the fuel rail.

Disconnect the fuel supply line at the fuel pump.

Check the fuel supply line for restriction.

Apply 21 to 34 kPa (3 to 5 psi) air pressure to the fuel supply line.

Does air flow freely through the line?

Yes	No
GO to **HC16** .	REPAIR the cause of the restriction. Clear the PCM DTCs. REPEAT the self-test.

HC16 VERIFY THE REPAIR

WARNING: STRICT OBSERVANCE OF POSTED SPEED LIMITS AND ATTENTION TO DRIVING CONDITIONS ARE MANDATORY WHEN CARRYING OUT THE ROAD TEST. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: For vehicles that do not start, follow the NO answer.

Ignition ON, engine running.

Engine at normal operating temperature.

Monitor the mechanical gauge.

From a stop, accelerate to 89 km/h (55 mph) at full throttle. Repeat this 3 times.

Is the fuel pressure always greater than 352 kPa (51 psi)?

Yes	No
For DTC P0087, GO to PINPOINT TEST HP .	INSTALL a new FP. REFER to the service information , Fuel Tank and Lines.

For all others, the test is complete and no concerns are present.	Clear the PCM DTCs. REPEAT the self-test.

HC17 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

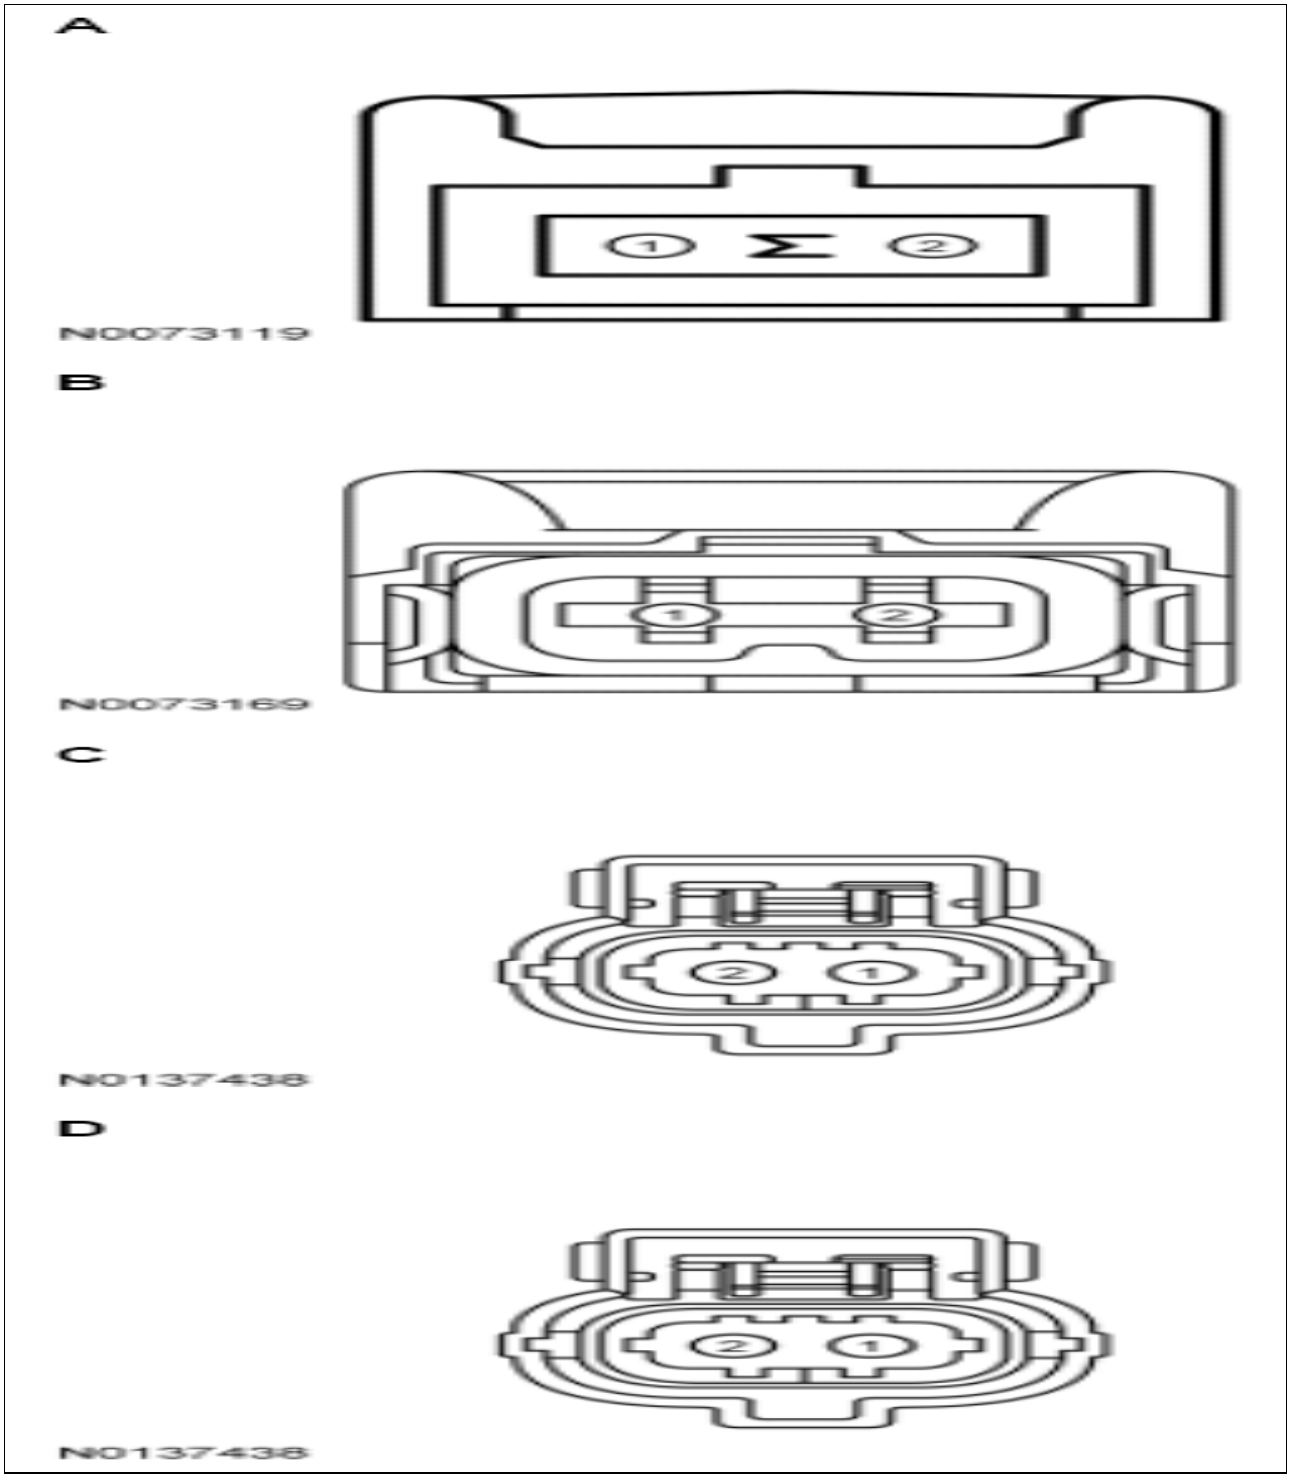
PINPOINT TEST HN: TURBOCHARGER SYSTEM > INTRODUCTION

WARNING: WHILE CONDUCTING TESTS ON A HOT ENGINE TAKE ALL SAFETY PRECAUTIONS TO PREVENT SKIN CONTACT WITH HOT ENGINE COMPONENTS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

WARNING: STRICT OBSERVANCE OF POSTED SPEED LIMITS AND DRIVING CONDITIONS IS MANDATORY WHEN PROCEEDING THROUGH THE FOLLOWING DRIVE CYCLES.
FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

This pinpoint test is intended to diagnose the following:



- turbocharger bypass (TCBY) valve (9K378)
- turbocharger bypass 2 (TCBY2) valve (9K378)

- turbocharger wastegate regulating valve solenoid (9961 pressure actuated, 9E882 vacuum actuated)
- wastegate vacuum sensor (9F479)
- leaks or restrictions in the intake air system and charge air cooler (CAC)
- powertrain control module (PCM) (12A650)

PINPOINT TEST HN: TURBOCHARGER SYSTEM > TEST PROCEDURE

HN1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: This pinpoint test is designed to diagnose multiple components in the same test steps, only measure the circuits that apply to the vehicle and component being diagnosed.

NOTE: Diagnose circuit concerns prior to range or performance concerns.

Are DTCs P0034, P0035, P00C1, P00C2, P0234, P0245, P0246, P0299, P100F, P1011, P1012, P1013, P1014, P1015 or P1016 present?

Yes	No
GO to **HN2** .	For symptoms without DTCs, GO to HN12. For all others, RETURN to SYMPTOM CHARTS for further direction.

HN2 VISUALLY INSPECT THE TURBOCHARGER SYSTEM

Visually inspect the turbocharger system for:

correct vacuum supply system hose connections and routing

correct vacuum turbocharger wastegate control hose connection and routing

correct pressure turbocharger wastegate control hose connection and routing

correct vacuum turbocharger bypass control hose connection and routing

leaks around tubing and intake manifold

correct electrical connections

damaged or leaking exhaust system

turbocharger oil leaks. Refer to the service information , Fuel Charging and Controls - Turbocharger.

damaged or restricted turbocharger oil return tubes. Refer to the service information , Fuel Charging and Controls - Turbocharger.

damaged turbocharger. Refer to the service information , Fuel Charging and Controls - Turbocharger.

Do the visual inspections reveal any concerns?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For DTC P100F only, GO to **HN3** . For DTC P1011, P1012, P1013, P1014, P1015 or P1016. GO to HN4. For all others, GO to HN5.

HN3 SENSOR CORRELATION

Ignition ON, engine OFF.

Access the PCM and monitor the BARO (PRESS), MAP (PRESS), TCBP (PRESS) and WGATE_PRES (PRESS) PIDs.

Is the WGATE_PRES PID reading within 6.77 kPa (0.98 psi) of the other PID readings?

Yes	No
GO to HN5.	CHECK the turbocharger wastegate vacuum system hoses for restrictions. REPAIR as necessary. If no concerns are present, INSTALL a new Wastegate Vacuum Sensor. Clear the PCM DTCs. REPEAT the self-test.

HN4 CHECK FOR VREF AT THE SENSOR

Ignition OFF.

Wastegate Vacuum Sensor connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Wastegate Vacuum Sensor Connector, Harness Side	(-) Wastegate Vacuum Sensor Connector, Harness Side
VREF - Pin 1	SIGRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to HN6.	GO to PINPOINT TEST C .

HN5 CHECK FOR VOLTAGE AT THE COMPONENT

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition OFF.

For TCBY,

TCBY Valve connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) TCBY Valve Connector, Harness Side	(-)
VPWR	Ground

For TCBY2,

TCBY2 Valve connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) TCBY2 Valve Connector, Harness Side	(-)
VPWR - Pin 1	Ground

For turbocharger wastegate regulating valve solenoid,

Turbocharger Wastegate Regulating Valve Solenoid connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Turbocharger Wastegate Regulating Valve Solenoid Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **HN6** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HN6 CHECK FOR AN OPEN

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition OFF.

PCM connector disconnected.

For TCBY,

Measure the resistance between:

(+) TCBY Valve Connector, Harness Side	(-) PCM Connector, Harness Side
TCBY	TCBY

For TCBY2,

Measure the resistance between:

(+) TCBY2 Valve Connector, Harness Side	(-) PCM Connector, Harness Side
TCBY2 - Pin 2	TCBY2

For turbocharger wastegate regulating valve solenoid,

Measure the resistance between:

(+) Turbocharger Wastegate Regulating Valve Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
TCWRVS	TCWRVS

For wastegate vacuum sensor,

Measure the resistance between:

(+) Wastegate Vacuum Sensor Connector, Harness Side	(-) PCM Connector, Harness Side

WVS - Pin 3	WVS
SIGRTN - Pin 2	SIGRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **HN7** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HN7 CHECK FOR A SHORT TO GROUND

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition OFF.

For TCBY,

Measure the resistance between:

(+) TCBY Valve Connector, Harness Side	(-)
TCBY	Ground

For TCBY2,

Measure the resistance between:

(+) TCBY2 Valve Connector, Harness Side	(-)
TCBY2 - Pin 2	Ground

For turbocharger wastegate regulating valve solenoid,

Measure the resistance between:

(+) Turbocharger Wastegate Regulating Valve Solenoid Connector, Harness Side	(-)
TCWRVS	Ground

For wastegate vacuum sensor,

Measure the resistance between:

(+) Wastegate Vacuum Sensor Connector, Harness Side	(-)
WVS - Pin 3	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HN8** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HN8 CHECK FOR A SHORT TO VOLTAGE

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition ON, engine OFF.

For TCBY,

Measure the voltage between:

(+) TCBY Valve Connector, Harness Side	(-)
TCBY	Ground

For TCBY2,

Measure the voltage between:

(+) TCBY2 Valve Connector, Harness Side	(-)
TCBY2 - Pin 2	Ground

For turbocharger wastegate regulating valve solenoid,

Measure the voltage between:

(+) Turbocharger Wastegate Regulating Valve Solenoid Connector, Harness Side	(-)
TCWRVS	Ground

For wastegate vacuum sensor,

Measure the voltage between:

(+) Wastegate Vacuum Sensor Connector, Harness Side	(-)
WVS - Pin 3	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	For DTCs P1011, P1012, P1013, P1014, P1015 or P1016, GO to HN10. For all others, GO to **HN9** .

HN9 CHECK THE COMPONENT RESISTANCE

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition OFF.

For TCBY,

Measure the resistance between:

(+) TCBY Valve Connector, Component Side	(-) TCBY Valve Connector, Component Side
TCBY	VPWR

For TCBY2,

Measure the resistance between:

(+) TCBY2 Valve Connector, Component Side	(-) TCBY2 Valve Connector, Component Side
TCBY2 - Pin 2	VPWR - Pin 1

For turbocharger wastegate regulating valve solenoid,

Measure the resistance between:

(+) Turbocharger Wastegate Regulating Valve Solenoid Connector, Component Side	(-) Turbocharger Wastegate Regulating Valve Solenoid Connector, Component Side
TCWRVS	VPWR

TURBOCHARGER CONTROL COMPONENT RESISTANCE SPECIFICATIONS

Component	Resistance (Ohms)
Turbocharger Bypass Valve (Integrated Solenoid 2.7L and 3.5L GTDI)	8 to 10
Turbocharger Bypass Valve (Integrated Solenoid All Others)	12 to 14
Turbocharger Bypass Valve Solenoid (Remote Solenoid)	21 to 25
Turbocharger Wastegate Regulating Valve Solenoid (Edge, Explorer 2.0L, F-150 2.7L, Fiesta 1.0L, Focus 1.0L, Fusion 1.5L)	14 to 17
Turbocharger Wastegate Regulating Valve Solenoid (All Others)	21 to 25

Is the resistance within specification?

Yes	No
GO to **HN10** .	INSTALL a new suspect component. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

HN10 CHECK THE WIRING HARNESS

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

Ignition OFF.

PCM connector connected.

For TCBY or TCBY2,

Suspect TCBY Solenoid connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the TURBO_BP1_STAT (MODE) PID.

Access the PCM and monitor the TURBO_BP2_STAT (MODE) PID.

For the turbocharger wastegate regulating valve solenoid,

Turbocharger Wastegate Regulating Valve Solenoid connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the TWGATE_STAT (MODE) PID.

For wastegate vacuum sensor,

Wastegate Vacuum Sensor connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the WGATE_PRES_F (MODE) PID.

While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the component to the PCM.

Is there a change in the PID reading?

Yes	No
ISOLATE the concern. REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HN11** .

HN11 INTERMITTENT CHECK

NOTE: This step applies to multiple components, only measure the circuits that apply to the vehicle and component being diagnosed.

For TCBY or TCBY2,

Access the PCM and monitor the TURBO_BP1_STAT (MODE) PID.

Access the PCM and monitor the TURBO_BP2_STAT (MODE) PID.

For the turbocharger wastegate regulating valve solenoid,

Access the PCM and monitor the TWGATE_STAT (MODE) PID.

For wastegate vacuum sensor,

Access the PCM and monitor the WGATE_PRES_F (MODE) PID.

While observing the PID, carry out the following:

lightly tap on the suspect component to simulate road shock

wiggle the suspect component connector

Is there a change in the PID reading?

Yes	No
INSTALL a new suspect component. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.	For DTCs P1011, P1015 or P1016, GO to HN27. For all others, GO to **HN12** .

HN12 TURBOCHARGER SYSTEM PERFORMANCE CONCERNS

NOTE: For a performance concern related to a plugged or restricted exhaust, GO to HF8.

NOTE: Diagnose circuit concerns prior to range or performance concerns.

NOTE: Visually inspect the vehicle for aftermarket accessories and performance modifications (exhaust system, turbocharger, performance chip). Refer to ENGINE CONTROL (EC) SYSTEM , Modifications to OBD Vehicles.

Ignition OFF.

Check the air filter element and housing for contamination, blockage or water intrusion.

Disconnect the air intake and check for restrictions and water intrusion.

Visually inspect the turbocharger system for:

correct vacuum supply system hose connections and routing

correct vacuum turbocharger wastegate control hose connection and routing

correct pressure turbocharger wastegate control hose connection and routing

correct vacuum turbocharger bypass control hose connection and routing

leaks around tubing and intake manifold

correct electrical connections

damaged or leaking exhaust system

turbocharger oil leaks. Refer to the service information , Fuel Charging and Controls - Turbocharger.

damaged or restricted turbocharger oil return tubes. Refer to the service information , Fuel Charging and Controls - Turbocharger.

damaged turbocharger. Refer to the service information , Fuel Charging and Controls - Turbocharger.

Check the charge air cooler (CAC) system for leaks (hoses and cooler).

Check the CAC and intake air system for restrictions.

Check for aftermarket exhaust accessories and performance modifications.

Visually inspect the exhaust system for the following:

leaks, cracks, or punctures upstream of turbocharger

aftermarket accessories and performance modifications

tailpipe modifications that increase the exhaust restriction

plugged or restricted exhaust

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HN13** .

HN13 CHECK THE CHARGE AIR COOLER (CAC) AND INTAKE AIR SYSTEMS FOR LEAKS AND RESTRICTIONS

NOTE: Remember to reinstall the sensor, reconnect the CAC tube to the throttle body and remove the plastic bag from the air filter at the completion of this step.

Disconnect the CAC tube from the throttle body.

Use a suitable method to temporarily plug the CAC tube outlet.

Place the air filter in a plastic bag to prevent air flow out the intake port and reinstall it in the vehicle.

Remove the IAT or TCIPT sensor from the ducting between the air filter housing and the turbocharger.

Connect the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 (522) or equivalent to the intake air system using an appropriate adapter.

Fill the intake air system with smoke.

Check the intake air system for leaks and restrictions.

Are any leaks or restrictions present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HN14** .

HN14 CHECK BYPASS VALVE OPERATION

NOTE: For vehicles without a commandable RPM PID, use the accelerator pedal to hold the engine RPM at approximately 2, 000 RPM.

NOTE: The change in the TCBP PID value on a 2.0L engine will be 3.45 kPa (0.5 psi) or less when the TURBO_BYPASS PID is commanded ON.

Ignition ON, engine running.

Access the PCM and control the TURBO_BPASS (MODE) PID.

Access the PCM and control the TURBO_BPASS_2 (MODE) PID.

Command the TURBO_BPASS PID and the TURBO_BPASS_2 PID to OFF.

Access the PCM and control the TURBO_WGATE (PER) PID.

Command the TURBO_WGATE PID duty cycle to 0%.

Access the PCM and monitor the TCBP (PRESS) PID.

Access the PCM and control the RPM (RPM) PID.

Command the RPM PID to the maximum RPM.

Record the TCBP PID reading.

Command the TURBO_BPASS and the TURBO_BPASS_2 PIDs ON and record the TCBP PID reading.

Does the TCBP PID reading decrease when the bypass valves are commanded ON?

Yes	No
GO to **HN15** .	For Escape/Kuga 2.0L, Explorer 2.0L, Fiesta 1.0L, Focus 2.0L GTDI, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, and Taurus 2.0L, GO to HN19. For all others, INSTALL a new Suspect TCBY solenoid. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

HN15 CHECK WASTEGATE OPERATION

NOTE: For vehicles without a commandable RPM PID, use the accelerator pedal to hold the engine RPM at approximately 2, 000 RPM.

Ignition ON, engine running.

Access the PCM and control the TURBO_BPASS (MODE) PID.

Access the PCM and control the TURBO_BPASS_2 (MODE) PID.

Command the TURBO_BPASS PID and the TURBO_BPASS_2 PID to OFF.

Access the PCM and control the TURBO_WGATE (PER) PID.

Command the TURBO_WGATE PID duty cycle to 0%.

Access the PCM and monitor the TCBP (PRESS) PID.

Access the PCM and control the RPM (RPM) PID.

Command the RPM PID to the maximum RPM.

Record the TCBP PID reading.

Command the TURBO_WGATE PID duty cycle to 100% and record the TCBP PID reading.

Does the TCBP PID reading increase when the TURBO_WGATE PID duty cycle is commanded to 100%?

Yes	No
GO to HN26.	For Edge 2.0L, Edge 2.7L, Explorer 2.0L, F-150 2.7L, Fiesta 1.0L,

	Focus 1.0L, and Fusion 1.5L, GO to HN22. For all others, GO to **HN16** .

HN16 CHECK TURBOCHARGER PRESSURE WASTEGATE ACTUATOR OPERATION

NOTE: Do not exceed 103.4 kPa (15 psi) of pressure applied to the turbocharger actuators, excessive pressure will damage the actuators.

Disconnect the turbocharger wastegate control hose from the turbocharger wastegate actuator.

Record each of the turbocharger wastegate actuator linkage positions.

Using a suitable hand pump with pressure gauge, pressurize the turbocharger wastegate actuator to 48.3 kPa (7 psi).

Does each turbocharger wastegate actuator linkage move from the starting position and does the pressure remain steady?

Yes	No
GO to **HN17** .	GO to HN18.

HN17 CHECK PRESSURE SYSTEM TO THE TURBOCHARGER WASTEGATE ACTUATOR

NOTE: Do not exceed 103.4 kPa (15 psi) of pressure applied to the turbocharger actuators, excessive pressure will damage the actuators.

Disconnect the pressure supply hose from the inlet of the turbocharger wastegate regulating valve solenoid.

Disconnect the pressure control hose from the outlet of the turbocharger wastegate regulating valve solenoid.

Using a suitable adaptor, connect the pressure supply hose to the pressure control hose.

Disconnect the turbocharger wastegate pressure supply hose from the high pressure tube.

Using a suitable hand pump with pressure gauge, pressurize the turbocharger wastegate pressure supply hose to 48.3 kPa (7 psi).

Does each turbocharger wastegate actuator linkage move from the starting position and does the pressure remain steady?

Yes	No
INSTALL a new Turbocharger Wastegate Regulating Valve solenoid.	A pressure system leak or restriction is the cause of the concern. DIAGNOSE the turbocharger wastegate pressure system leak or restriction.

REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.	REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

HN18 CHECK THE TURBOCHARGER WASTEGATE ACTUATOR LINKAGE FOR DAMAGE OR OBSTRUCTIONS

Attempt to manually activate the suspect actuator.

Can the suspect actuator be activated manually?

Yes	No
INSTALL a new turbocharger wastegate actuator. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.	Visually inspect the suspect turbocharger wastegate actuator linkage for damage or obstructions. Repair as necessary. If no turbocharger wastegate actuator linkage concerns are present, INSTALL a new turbocharger assembly. Refer to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.

HN19 CHECK THE TURBOCHARGER BYPASS VALVE SOURCE VACUUM

Disconnect the vacuum supply tube from the vacuum reservoir.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, measure the vacuum at the vacuum reservoir.

Ignition ON, engine running.

Record the vacuum.

Is the vacuum greater than 33.86 kPa (10 in-Hg)?

Yes	No
GO to **HN20** .	DIAGNOSE a loss of vacuum. REFER to the service information , Brake System. Clear the PCM DTCs. REPEAT the self-test.

HN20 CHECK THE BYPASS VALVE

Disconnect the vacuum control tube from the turbocharger bypass valve.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, apply 33.86 kPa (10 in-hg) of vacuum to the turbocharger bypass valve.

Does the vacuum remain steady?

Yes	No

GO to **HN21** .	INSTALL a new TCBY valve. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.

HN21 CHECK THE VACUUM SYSTEM

Disconnect the vacuum supply tube from the inlet of the turbocharger bypass valve solenoid.

Disconnect the vacuum control tube from the outlet of the turbocharger bypass valve solenoid.

Using a suitable adaptor, connect the vacuum supply tube to the vacuum control tube.

Disconnect the vacuum supply tube from the vacuum reservoir.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, apply 33.86 kPa (10 in-hg) of vacuum to the vacuum supply tube.

Does the vacuum remain steady?

Yes	No
INSTALL a new TCBY solenoid. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.	A vacuum system leak or restriction is the cause of the concern. DIAGNOSE the vacuum system leak or restriction. REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

HN22 CHECK THE TURBOCHARGER WASTEGATE SOURCE VACUUM

Disconnect the vacuum supply tube from the vacuum reservoir.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, measure the vacuum at the vacuum reservoir.

Ignition ON, engine running.

Record the vacuum.

Is the vacuum greater than 33.86 kPa (10 in-Hg)?

Yes	No
GO to **HN23** .	DIAGNOSE a loss of vacuum. REFER to the service information , Brake System. Clear the PCM DTCs. REPEAT the self-test.

HN23 CHECK TURBOCHARGER VACUUM WASTEGATE ACTUATOR OPERATION

Disconnect the turbocharger wastegate control hose from the turbocharger wastegate actuator.

Record each of the turbocharger wastegate actuator linkage positions.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, apply 33.86 kPa (10 in-hg) of vacuum to the turbocharger wastegate actuator.

Does each turbocharger wastegate actuator linkage move from the starting position and does the pressure remain steady?

Yes	No
GO to **HN24** .	GO to HN25.

HN24 CHECK THE VACUUM SUPPLY HOSE FROM THE VACUUM RESERVOIR TO THE TURBOCHARGER WASTEGATE ACTUATOR

Disconnect the vacuum supply hose from the inlet of the turbocharger wastegate regulating valve solenoid.

Disconnect the vacuum control hose from the outlet of the turbocharger wastegate regulating valve solenoid.

Using a suitable adaptor, connect the vacuum supply hose to the vacuum control hose.

Disconnect the turbocharger wastegate vacuum supply hose from the vacuum reservoir.

Using the DSL ENG Pressure Test Kit 014-00761 or equivalent, apply 33.86 kPa (10 in-hg) of vacuum to the vacuum supply hose.

Does each turbocharger wastegate actuator linkage move from the starting position and does the vacuum remain steady?

Yes	No
INSTALL a new Turbocharger Wastegate Regulating Valve solenoid. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.	A vacuum system leak or restriction is the cause of the concern. DIAGNOSE the turbocharger wastegate vacuum system leak or restriction. REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

HN25 CHECK THE TURBOCHARGER WASTEGATE ACTUATOR LINKAGE FOR DAMAGE OR OBSTRUCTIONS

Attempt to manually activate the suspect actuator.

Can the suspect actuator be activated manually?

Yes	No
INSTALL a new turbocharger wastegate actuator. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the	Visually inspect the suspect turbocharger wastegate actuator linkage for damage or obstructions. Repair as necessary. If no turbocharger wastegate actuator linkage concerns are present, INSTALL a new turbocharger

self-test.	assembly. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.

HN26 TURBOCHARGER COMPRESSOR WHEEL CHECK

Inspect the turbocharger compressor wheel and housing for the following:

ability to spin freely

noise while spinning

damage to vanes on the compressor wheel

out of balance condition

debris in housing

Is a concern present?

Yes	No
INSTALL a new suspect turbocharger assembly. REFER to the service information , Fuel Charging and Controls, Turbocharger. Clear the PCM DTCs. REPEAT the self-test.	GO to HN28.

HN27 CHECK THE WASTEGATE VACUUM SENSOR

Ignition ON, engine OFF.

Access the PCM and monitor the WGATE_V (VOLT) PID.

Record the PID value.

Disconnect the wastegate vacuum tube from the vacuum port on the turbocharger wastegate vacuum sensor.

Using a suitable hand pump with gauge, apply 34.47 kPa (5 in-Hg) vacuum to the wastegate vacuum sensor port.

Record the PID value.

Does the PID value change when vacuum is applied?

Yes	No
A vacuum system leak or restriction is the cause of the concern. DIAGNOSE the vacuum system leak or restriction. REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Wastegate Vacuum Sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

HN28 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

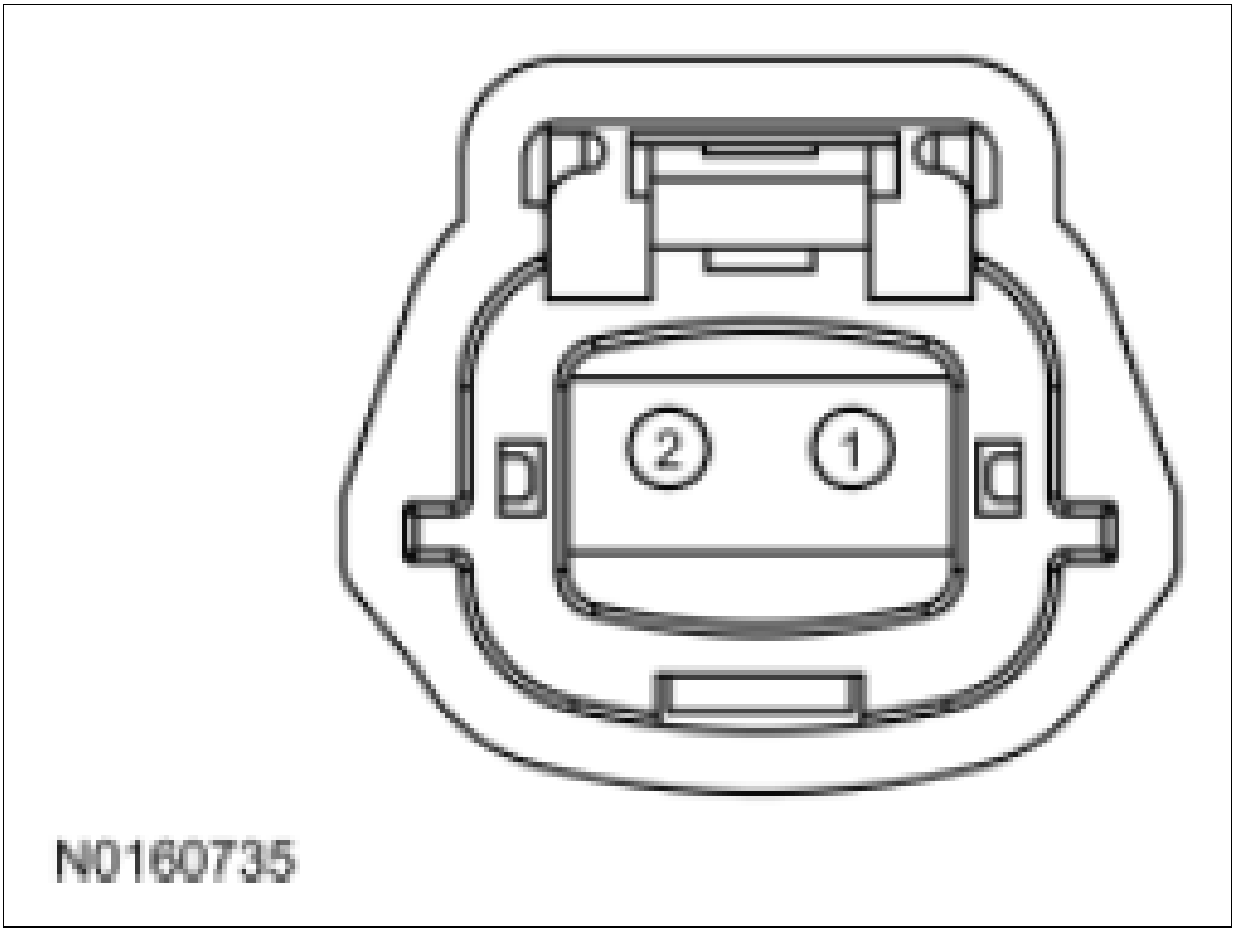
corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?



Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HU: INTAKE AIR SYSTEMS > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- air cleaner assembly (including air cleaner element) (9600)
- air inlet tube (9F843)
- clean air tube hose and resonator (9R504) and (9F593)
- intake manifold runner control bank 1 (IMRC1) solenoid (9J559)
- intake manifold runner control bank 2 (IMRC2) solenoid (9J559)
- intake manifold runner control bank 1 (IMRC1) sensor (9P471)
- intake manifold runner control bank 2 (IMRC2) sensor (9P471)
- intake manifold tuning valve (IMTV) (9L490)
- IMTV electric actuator assembly (9L490)
- throttle body assembly (9E926)
- harness circuits: IMRC, IMRC1, IMRC1A, IMRC2, IMRC2A, IMTV, SIGRTN, VPWR and VREF
- PCM (12A650)

PINPOINT TEST HU: INTAKE AIR SYSTEMS > TEST PROCEDURE

HU1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P0505, P0506, P0660, P0663, P2004, P2005, P2006, P2007, P2008, P2011, P2014, P2019, P2070, or P2071 present?

Yes	No
For DTCs P0505 or P0506, GO to **HU2** . For DTCs P0660, P0663, P2070 or P2071, GO to HU9. For all others, GO to HU18.	For lack/loss of power, GO to HU9. For all other symptoms without DTCs, GO to **HU2** .

HU2 CHECK THE BASE IDLE SPEED

NOTE: The vehicle must be at operating temperature and at idle for a minimum of 1 minute.

Ignition ON, engine running.

Determine if the idle speed is incorrect. Refer to the REFERENCE VALUES Typical Reference Value Charts, if necessary.

Access the PCM and monitor the RPM (RPM) PID.

Is vehicle idle speed correct?

Yes	No
GO to HU4.	GO to **HU3** .

HU3 CHECK FOR VACUUM LEAKS

Listen for vacuum leaks.

Inspect the entire intake air system from the mass airflow (MAF) sensor to the intake manifold for leaks such as:

cracked or punctured intake air tube.

loose connections on the intake air tube at the air cleaner housing or throttle body

EGR valve gasket leak to intake manifold

intake manifold assembly or gasket

EGR valve diaphragm or control solenoid

vacuum supply connectors and hose

Are any leaks present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HU4** .

HU4 CHECK FOR BINDING OR STICKING IN THE THROTTLE SYSTEM

Gently cycle the throttle from fully closed to fully open and back to fully closed. Check for a restriction during rotation.

Is a concern present?

Yes	No
GO to HU6.	GO to **HU5** .

HU5 CHECK THE FUNCTIONALITY OF THE THROTTLE POSITION (TP) SENSOR

Ignition ON, engine OFF.

Access the PCM and monitor the TP1 (VOLT) PID.

Access the PCM and monitor the TP2 (VOLT) PID.

Gently cycle the throttle from fully closed to fully open and back to fully closed.

Do the TP PIDs display a smooth voltage reading?

Yes	No
GO to **HU6** .	INSTALL a new TP sensor. REFER to the service information , Electronic Engine Controls. Clear the PCM DTCs. REPEAT the self-test.

HU6 CHECK THE INTAKE AIR SYSTEM FOR LEAKS, OBSTRUCTIONS AND DAMAGE

NOTE: The Focus air cleaner element is integral to the air cleaner assembly. Inspect the air restriction gauge (if equipped) for a restriction indication.

Ignition OFF.

Remove the air cleaner element. Check the air cleaner for blockage.

Check for restrictions between the air inlet and the throttle body.

Are any concerns present?

Yes	No

REMOVE the restriction. INSTALL a new air cleaner element. REFER to the service information Workshop , Intake Air Distribution and Filtering. Clear the PCM DTCs. REPEAT the self-test.	REINSTALL the air cleaner element. GO to **HU7** .

HU7 CHECK THE POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

NOTE: A high idle may indicate a vacuum leak.

Check for any PCV system leaks.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For Edge 2.0L, Escape/Kuga, Explorer 2.0L, Fiesta, Focus, Fusion, MKC, MKT 2.0L, MKZ, Taurus 2.0L, and Transit Connect, GO to **HU8** . For all others, GO to HU27.

HU8 CHECK THE THROTTLE BODY FOR EXCESSIVE WEAR

Ignition OFF.

Remove the throttle body assembly. Refer to the service information , Fuel Charging and Controls for removal and inspection.

Check the following:

excessive wear or grooving in the throttle bore

misaligned or worn throttle plate

excessive gap between the throttle bore and plate

Are any concerns present?

Yes	No
INSTALL a new throttle body assembly. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.	The concern is elsewhere. RETURN to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX , to DIAGNOSE performance while driving concerns.

HU9 VISUAL INSPECTION OF THE INTAKE MANIFOLD TUNING VALVE

Inspect the component for signs of damage.

Check the harness and connection.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HU10** .

HU10 CHECK THE VPWR CIRCUIT FOR AN OPEN

IMTV Actuator connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) IMTV Actuator Connector, Harness Side	(-) Vehicle Battery
VPWR - Pin 1	Negative terminal

Is the voltage greater than 10.5 V?

Yes	No
GO to **HU11** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HU11 CHECK THE IMTV CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) IMTV Actuator Connector, Harness Side	(-) PCM Connector, Harness Side
IMTV - Pin 3	IMTV

Is the resistance less than 5 ohms?

Yes	No
GO to **HU12** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HU12 CHECK THE IMTV CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
IMTV	Ground

Is the resistance greater than 10K ohms?

Yes	No

GO to **HU13** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HU13 CHECK THE IMTV CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage between:

(+) IMTV Actuator Connector, Harness Side	(-)
IMTV - Pin 3	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **HU14** .

HU14 CHECK THE IMTV DRIVER CIRCUIT WITH THE PCM CONNECTED

IMTV Actuator connector disconnected.

PCM connector connected.

Ignition ON, engine OFF.

Connect a non-powered test lamp between:

Point A IMTV Actuator Connector, Harness Side	Point B IMTV Actuator Connector, Harness Side
VPWR - Pin 1	IMTV - Pin 3

Does the test lamp illuminate?

Yes	No
GO to HU29.	GO to **HU15** .

HU15 CHECK THE IMTV PCM DRIVER CIRCUIT WHEN COMMANDED ON

Connect a non-powered test lamp between:

Point A IMTV Actuator Connector, Harness Side	Point B IMTV Actuator Connector, Harness Side
VPWR - Pin 1	IMTV - Pin 3

Carry out the PCM KOEO self-test.

Does the test lamp illuminate?

Yes	No
GO to **HU16** .	GO to HU29.

HU16 CHECK THE IMTV FOR DAMAGE

Ignition OFF.

Remove the IMTV. Refer to the service information , Engine or Section 303-14, Electronic Engine Controls.

Visually inspect the shutter for damage.

Manually rotate the shutter.

Is a concern present?

Yes	No
INSTALL a new IMTV actuator. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.	GO to **HU17** .

HU17 CHECK THE IMTV FOR FUNCTIONALITY WHEN COMMANDED ON

IMTV Actuator connector connected.

Carry out the PCM KOEO self-test.

Does the IMTV shutter rotate?

Yes	No
The concern is an intermittent. GO to PINPOINT TEST Z .	INSTALL a new IMTV actuator. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.

HU18 VISUAL INSPECTION FOR DISCONNECTED IMRC LINKAGE

Inspect the IMRC for any disconnected or damaged linkages.

Inspect the IMRC solenoid and vacuum lines for correct connection, damage, vacuum leaks or restrictions.

Disconnect the IMRC linkage.

Inspect the linkage for restrictions. Spring tension in one direction is normal.

Rotate the IMRC plate to fully open and to fully closed, contacting both limits.

Check for restrictions during rotation.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **HU19** .

HU19 CHECK THE FUNCTIONALITY OF THE IMRC

WARNING: KEEP FINGERS CLEAR OF THE MECHANISM. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: On vacuum operated systems the engine must run for 20 seconds to restore vacuum between state commands.

Connect the IMRC linkage.

Ignition ON, engine running.

Access the PCM and monitor the IMRC1M (VOLT) and IMRC2M (VOLT) PIDs.

Access the PCM and control the IMRC (MODE) PID.

Command the IMRC PID to ON and then to OFF.

Do the IMRC1 and IMRC2 PIDs indicate full travel of the IMRC plates?

Yes	No
The concern is an intermittent. GO to PINPOINT TEST Z .	For DTCs P2008 or P2011, GO to **HU20** . For all others, GO to HU23.

HU20 CHECK IMRC SOLENOID COIL FOR AN OPEN

NOTE: Identify the IMRC solenoid connector location before disconnecting the connector.

Ignition OFF.

For DTC P2008,

IMRC1 Solenoid connector disconnected.

Measure the resistance between:

(+) IMRC1 Solenoid Connector, Component Side	(-) IMRC1 Solenoid Connector, Component Side
IMRC1A - Pin 2	VPWR - Pin 1

For all others,

IMRC2 Solenoid connector disconnected.

Measure the resistance between:

(+) IMRC2 Solenoid Connector, Component Side	(-) IMRC2 Solenoid Connector, Component Side

IMRC2A - Pin 2	VPWR - Pin 1

Is the resistance between 22 - 26 ohms?

Yes	No
GO to **HU21** .	INSTALL a new IMRC solenoid. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.

HU21 CHECK THE VPWR CIRCUIT FOR AN OPEN

Ignition OFF.

For DTC P2008,

IMRC1 Solenoid connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) IMRC1 Solenoid Connector, Harness Side	(-)
VPWR - Pin 1	Ground

For all others,

IMRC2 Solenoid connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) IMRC2 Solenoid Connector, Harness Side	(-)
VPWR - Pin 1	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **HU22** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HU22 CHECK THE IMRC CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For DTC P2008,

Measure the resistance between:

(+) IMRC1 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side

IMRC1A - Pin 2	IMRC1A

For all others,

Measure the resistance between:

(+) IMRC2 Solenoid Connector, Harness Side	(-) PCM Connector, Harness Side
IMRC2A - Pin 2	IMRC2A

Is the resistance less than 5 ohms?

Yes	No
INSTALL a new IMRC solenoid. REFER to the service information , Engine.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HU23 CHECK THE VREF CIRCUIT FOR AN OPEN

Ignition OFF.

For DTCs P2004, P2006, or P2014,

IMRC1 Sensor connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) IMRC1 Sensor Connector, Harness Side	(-) IMRC1 Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 3

For all others,

IMRC2 Sensor connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) IMRC2 Sensor Connector, Harness Side	(-) IMRC2 Sensor Connector, Harness Side
VREF - Pin 2	SIGRTN - Pin 3

Is the voltage between 4.5 - 5.5 V?

Yes	No
GO to **HU24** .	GO to PINPOINT TEST C .

HU24 CHECK THE IMRCM CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For DTCs P2004, P2006, or P2014,

Measure the resistance between:

(+) IMRC1 Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRC1 - Pin 1	IMRC1

For all others,

Measure the resistance between:

(+) IMRC2 Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
IMRC2 - Pin 1	IMRC2

Is the resistance less than 5 ohms?

Yes	No
GO to **HU25** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HU25 CHECK FOR A SHORT TO GROUND

For DTCs P2004, P2006, or P2014,

Measure the resistance between:

(+) IMRC1 Sensor Connector, Harness Side	(-)
IMRC1 - Pin 1	Ground

For all others,

Measure the resistance between:

(+) IMRC2 Sensor Connector, Harness Side	(-)
IMRC2 - Pin 1	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HU26** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HU26 CHECK THE IMRC1 OR IMRC2 CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For DTCs P2004, P2006, or P2014,

Measure the voltage between:

(+) IMRC1 Sensor Connector, Component Side	(-)
VREF - Pin 2	Ground

For all others,

Measure the voltage between:

(+) IMRC2 Sensor Connector, Component Side	(-)
VREF - Pin 2	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new IMRC1 or IMRC2 sensor. REFER to the service information , Engine. Clear the PCM DTCs. REPEAT the self-test.

HU27 PRELIMINARY DIAGNOSIS FOR IDLE AIR CONCERNS

Ignition ON, engine OFF.

Are any DTCs present other than P0505 or P0506?

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .	GO to **HU28** .

HU28 MONITOR THE INTAKE AIR SYSTEM RELATED PIDS

NOTE: Verify the vehicle has reached the normal engine coolant operating temperature of 77°C (170° F). Allow the engine to idle an additional 5 minutes.

NOTE: The ETC_TRIM PID may not be available on all vehicles.

Access the PCM and monitor the ECT (TEMP) PID.

Access the PCM and monitor the ETC_TRIM (ANGL) PID.

Access the PCM and monitor the IACTRIM (NUM) and IACKAM2 (NUM) PIDs.

Mathematically add and record the value of the IACTRIM PID to the IACKAM2 PID value, for the total IAC value at idle.

Is the ETC_TRIM PID angle equal to 3.5 degrees or is the total IAC value greater than 0.5 lb/min?

Yes	No
INSTALL a new throttle body assembly. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.	RETURN to SYMPTOM CHARTS for further direction.

HU29 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST HX: EVAPORATIVE EMISSION (EVAP) SYSTEM AND MONITOR > INTRODUCTION

WARNING: BEFORE REPAIRING OR INSTALLING A NEW COMPONENT IN THE FUEL SYSTEM, REDUCE THE POSSIBILITY OF INJURY OR FIRE BY FOLLOWING THE WARNING, CAUTION, AND HANDLING DIRECTIONS IN PINPOINT TEST HC. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

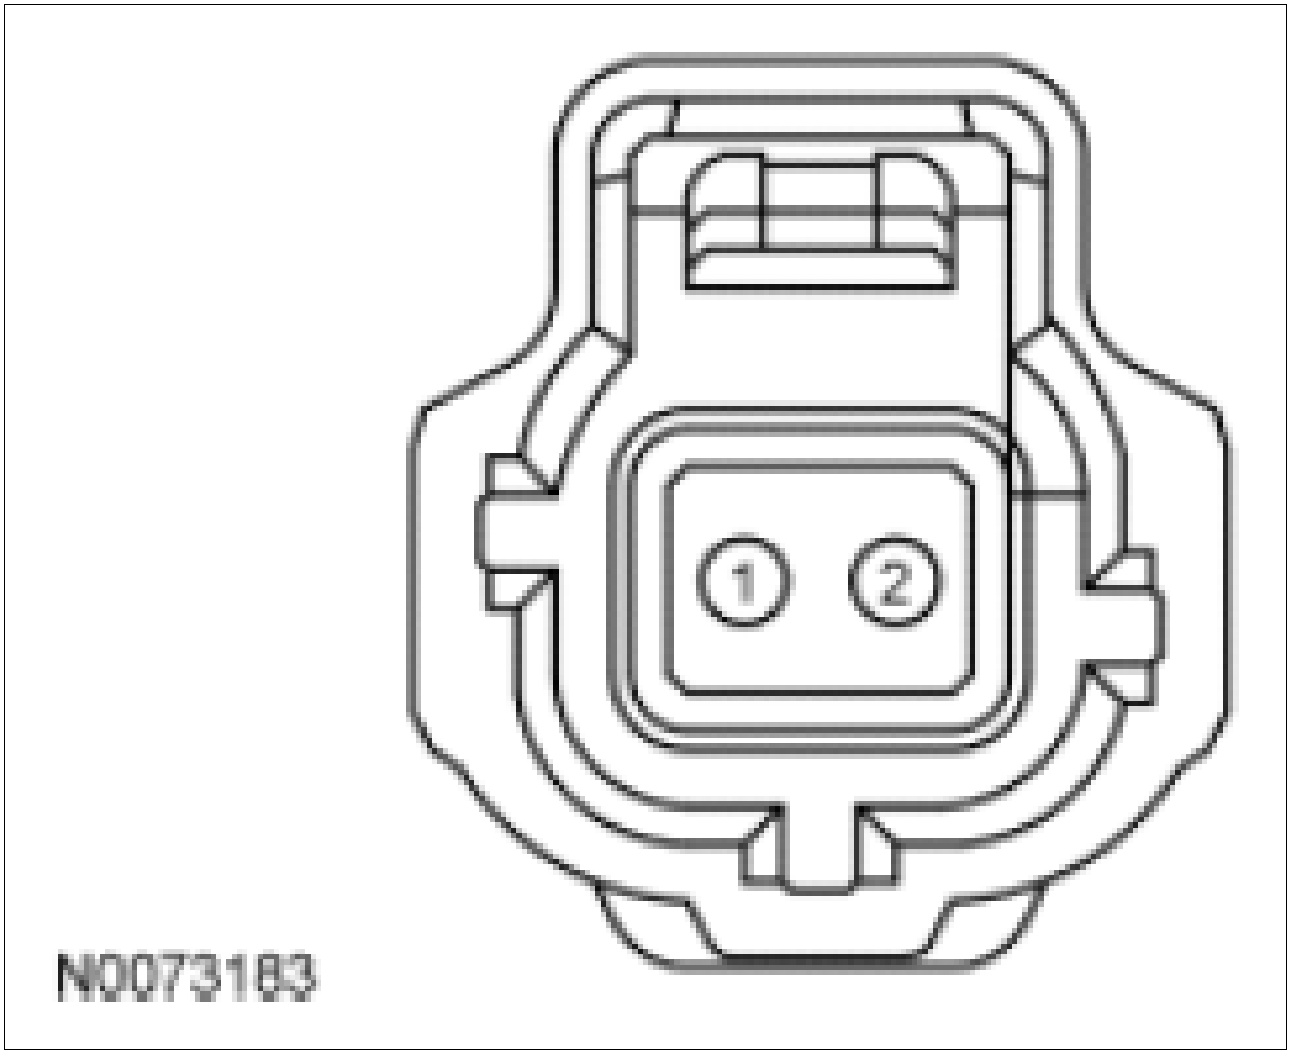
NOTE: Use this pinpoint test only when directed here.

Using a soap solution around the fuel filler cap or capless fuel tank filler pipe (if equipped) or using the hydrocarbon emission analyzer to determine an evaporative emission system leak is not recommended. The mandatory Rotunda Evaporative Emission System Leak Tester for On Board Diagnostic (OBD) (including the ultrasonic tester) and the Rotunda Smoke Machine, Fuel Evaporative Emission System

Tester 218-00001 or equivalent are the only devices to be used at this time for evaporative emission system leak detection.

When using the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 or equivalent, the fuel level in the fuel tank must be less than 85% full.

This pinpoint test is intended to diagnose the following:



- EVAP canister vent valve (9F945)
- fuel filler cap (9030)
- capless fuel tank filler pipe (9034)
- fuel tank pressure (FTP) sensor (9C052)
- EVAP purge valve (9C915)
- EVAP check valve
- EVAP ejector
- EVAP vapor blocking valve
- EVAP system leaks using the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001
- harness circuits: B+, CANV, EVAPCP, FTP, SIGRTN, VBV, VPWR and VREF
- PCM (12A650)

For additional information on the EVAP system, refer to EVAPORATIVE EMISSION (EVAP) SYSTEMS , or the Workshop Manual Section 303-13, Evaporative Emissions.

Evaporative Emission (EVAP) Canister Vent Valve Connector

For applications using the engine off natural vacuum (EONV) EVAP leak check monitor, KAPWR provides voltage to the EVAP canister vent valve instead of VPWR.

PINPOINT TEST HX: EVAPORATIVE EMISSION (EVAP) SYSTEM AND MONITOR > TEST PROCEDURE

HX1 CARRY OUT THE EVAPORATIVE EMISSION (EVAP) TEST

NOTE: The IDS test referenced in this step may not be available on all vehicles. Proceed to the next step if the IDS test is not available.

Carry out the EVAP Test. Refer to the instruction manual provided by the scan tool manufacturer.

Does the test pass?

Yes	No
For DTCs P0442, P0455 or P0457, the system is operating correctly at this time. Clear the PCM DTCs. REPEAT the self-test. For all others, GO to **HX2** .	GO to **HX2** .

HX2 CHECK FOR DTCS

Are DTCs P0442, P0443, P0446, P0451, P0452, P0453, P0454, P0455, P0456, P0457, P0460, P0461, P0462, P0463, P144A, P144C, P1450, P2418, P2450 or P260F present?

Yes	No
For DTC P0443, GO to **HX3** . For DTC P0446, GO to HX23. For DTC P0460, GO to HX36. For DTC P144C, GO to HX47. For DTC P1450, GO to HX9. For DTC P2418, GO to HX29. For DTCs P144A or P2450, GO to HX10. For DTCs P0461 through P0463, GO to HX34.	For symptoms without DTCs, GO to HX12. For all others, RETURN to SYMPTOM CHARTS for further direction.

For DTCs P0442, P0455, P0456 or P0457, GO to HX37. For DTCs P0451, P0452, P0453 or P0454, GO to HX18. For all others, GO to HX48.	

HX3 CHECK THE PCM OUTPUT TO EVAP PURGE VALVE

Ignition OFF.

Evaporative Emission (EVAP) Purge Valve connector disconnected.

Connect a non-powered test lamp between:

Point A Evaporative Emission (EVAP) Purge Valve Connector, Harness Side	Point B Evaporative Emission (EVAP) Purge Valve Connector, Harness Side
VPWR	EVAPCP

Ignition ON, engine OFF.

Access the PCM and control the EVAPCP (PER) PID.

Does the test lamp turn ON and OFF when the output is commanded ON and OFF?

Yes	No
GO to **HX4** .	GO to HX5.

HX4 CHECK THE EVAP PURGE VALVE RESISTANCE

Ignition OFF.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Purge Valve Connector, Component Side	(-) Evaporative Emission (EVAP) Purge Valve Connector, Component Side
EVAPCP	VPWR

Is the resistance between 15 - 25 ohms?

Yes	No
Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .	INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.

HX5 CHECK THE VPWR VOLTAGE TO THE EVAP PURGE VALVE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Purge Valve Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **HX6** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX6 CHECK THE EVAPCP CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Purge Valve Connector, Harness Side	(-) PCM Connector, Harness Side
EVAPCP	EVAPCP

Is the resistance less than 5 ohms?

Yes	No
GO to **HX7** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX7 CHECK THE EVAPCP CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Evaporative Emission (EVAP) Purge Valve Connector, Harness Side	(-)
EVAPCP	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HX8** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HX8 CHECK THE EVAPCP CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Purge Valve Connector, Harness Side	(-)

EVAPCP	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to HX52.

HX9 CHECK FOR VISUAL CAUSES OF EXCESSIVE FUEL TANK VACUUM

NOTE: If the EVAP canister vent valve and the fuel tank assemblies are not accessible during this step, refer to the service information , Evaporative Emissions and 310-01, Fuel Tank and Lines for removal instructions.

Check for kinks or bends in the fuel vapor hoses and tubes (EVAP purge valve outlet tube and EVAP canister tube).

Visually inspect the EVAP canister inlet port, EVAP canister vent valve filter, and canister vent hose assembly for blockage, contamination or debris.

Is a concern present?

Yes	No
REMOVE any blockage, contamination or debris around the fuel vapor hose and tubes and EVAP canister vent valve assembly. REMOVE kinks or bends in the EVAP purge valve outlet tube, EVAP canister tube, and canister vent hose assembly. Clear the PCM DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE .	GO to **HX10** .

HX10 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

NOTE: After installing the supplemental refueling adaptor or removing the fuel filler cap, wait one minute to allow the pressure in the fuel tank to equalize with the ambient air pressure before accessing the PID.

For vehicles with a capless fuel filler pipe,

Install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

For all others,

Remove the fuel filler cap.

Ignition ON, engine OFF.

Access the PCM and monitor the FTP (PRESS) PID.

Measurement Unit	Minimum Pressure	Maximum Pressure
kPa	-0.50	0.50
psi	-0.07	0.07
in-H20	-2.0	2.0
V	2.35	2.9

Is the pressure within specifications?

Yes	No
For DTC P144A, GO to HX15. For DTC P1450, GO to HX16. For all others, GO to HX29.	GO to **HX11** .

HX11 CHECK FOR ANY OTHER DTC

Check for other 3-wire sensor DTCs (KOEO, KOER, or continuous memory) present with the DTC P1450 or P144A.

Are any other DTCs present?

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .	GO to HX18.

HX12 CHECK IF THE ENGINE IDLES

Ignition ON, engine running.

Does the engine stall or is it unable to maintain idle?

Yes	No
GO to **HX13** .	GO to HX14.

HX13 CHECK THE EVAP SYSTEM FOR A STUCK OPEN EVAP PURGE VALVE

Ignition OFF.

Disconnect the fuel vapor to intake manifold line at the EVAP purge valve and cap the line at the EVAP purge valve.

Ignition ON, engine running.

Does the engine stall or is it unable to maintain idle?

Yes	No
The EVAP system is not the cause of the symptom. RETURN to SYMPTOM CHARTS for further direction.	INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.

HX14 CHECK FOR BLOCKAGE IN THE FUEL TANK VENT SYSTEM

NOTE: Do not allow FTP sensor voltage drop to less than 1.2 volts during this step. Excessive vacuum inside the fuel tank could trigger the vacuum release in the fuel filler cap or capless fuel filler system.

NOTE: The EVAP canister vent valve is normally open and venting to the atmosphere.

Ignition ON, engine running.

Access the PCM and monitor the EVAPCV (MODE) PID.

Access the PCM and monitor the FTP (VOLT) PID.

Access the PCM and control the EVAPCP (PER) PID.

While monitoring the FTP PID, ramp open the EVAP purge valve by incrementally commanding the EVAPCP PID to 100%.

Does the FTP sensor voltage drop below 1.5 volts when the EVAP purge valve is commanded fully open?

Yes	No
CHECK for blockage in the vapor line to the EVAP canister vent valve. CHECK the EVAP canister vent valve filter for blockage or contamination. CHECK the EVAP canister for blockage. If OK, INSTALL a new EVAP canister vent valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.	GO to HX16.

HX15 CHECK FOR A BLOCKED FUEL VAPOR TUBE BETWEEN THE FTP SENSOR AND THE FUEL TANK

Ignition OFF.

Remove the fuel vapor tube assembly. Refer to the service information , Evaporative Emissions.

Visually inspect the fuel vapor tube for a blockage between the FTP sensor and the

connection to the fuel tank or fuel pump module.

Visually inspect the connection at the fuel tank or fuel pump module for a blockage.

Is a concern present?

Yes	No
REMOVE the blockage. GO to **HX16** .	GO to **HX16** .

HX16 CHECK FOR A STUCK OPEN EVAP PURGE VALVE

Install the fuel vapor tube assembly if removed in the previous step.

Install the fuel filler cap or remove the supplemental refueling adaptor.

Ignition ON, engine running.

Access the PCM and monitor the FTP (PRESS) PID.

Access the PCM and control the EVAPCP (PER) PID.

Close the EVAP purge valve by commanding the EVAPCP PID to 0%.

Access the PCM and control the EVAPCV (MODE) PID.

Close the EVAP canister vent valve by commanding the EVAPCV PID to ON (100% duty cycle).

Does the FTP PID decrease?

Yes	No
INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.	For DTC P144A, Clear the PCM DTCs. REPEAT the self-test. For all others, GO to **HX17** .

HX17 EVAP PURGE VALVE TEST

Access the PCM and control the (MODE) PID.

Ignition ON, engine running.

Access the PCM and control the EVAPCV (MODE) PID.

Close the EVAP canister vent valve by commanding the EVAPCV PID to ON (100% duty cycle).

Access the PCM and monitor the FTP (PRESS) PID.

Access the PCM and control the EVAPCP (PER) PID.

While monitoring the FTP PID, ramp open the EVAP purge valve by incrementally

commanding the EVAPCP PID to 100%.

Does the FTP PID decrease?

Yes	No
For DTC P1450, unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z . For all others, CHECK the EVAP system for leaks. GO to HX37.	CHECK for blockages between the fuel tank, the EVAP purge valve, and the engine intake manifold. CHECK for obstructions in the EVAP purge valve diaphragm and ports. If OK, INSTALL a new EVAP purge valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.

HX18 CHECK THE VOLTAGE TO THE FTP SENSOR

Ignition ON, engine OFF.

Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
VREF	SIGRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No
For DTCs P144A or P1450, INSTALL a new FTP sensor. REFER to the service information , Evaporative Emissions. For some vehicles, the FTP sensor is integral to the fuel vapor tube assembly. Clear the PCM DTCs. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE . For all others, GO to **HX19** .	GO to PINPOINT TEST C .

HX19 CHECK THE FTP CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) FTP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
FTP	FTP

Is the resistance less than 5 ohms?

Yes	No
GO to **HX20** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX20 CHECK FOR A SHORT BETWEEN CIRCUITS

Measure the resistance between:

(+) FTP Sensor Connector, Harness Side	(-) FTP Sensor Connector, Harness Side
FTP	VREF
FTP	SIGRTN

Measure the resistance between:

(+) FTP Sensor Connector, Harness Side	(-)
FTP	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HX21** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HX21 CHECK THE FTP CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) FTP Sensor Connector, Harness Side	(-)
FTP	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **HX22** .

HX22 INTERMITTENT CHECK

Ignition OFF.

FTP Sensor connector connected.

PCM connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the FTP (VOLT) PID.

While monitoring the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.

Is the voltage between 2.2 - 4.8 V?

Yes	No
For DTC P0451, GO to HX41. For all others, INSTALL a new FTP sensor. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. For repair verification, CARRY OUT the evaporative emission leak check monitor repair verification drive cycle. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE . CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.	REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

HX23 CHECK THE PCM OUTPUT TO THE EVAP CANISTER VENT VALVE

NOTE: For applications using the EONV EVAP leak check monitor, KAPWR provides voltage to the EVAP canister vent valve instead of VPWR.

Ignition OFF.

Evaporative Emission (EVAP) Canister Vent Valve connector disconnected.

Connect a non-powered test lamp between:

Point A Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side	Point B Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side
KAPWR - Pin 1	CANV - Pin 2
VPWR	CANV - Pin 2

Ignition ON, engine OFF.

Access the PCM and control the EVAPCV (MODE) PID.

Does the test lamp turn ON and OFF when the output is commanded ON and OFF?

Yes	No
GO to **HX24** .	GO to HX25.

HX24 CHECK THE EVAP CANISTER VENT VALVE RESISTANCE

NOTE: For applications using the EONV EVAP leak check monitor, KAPWR provides voltage to the EVAP canister vent valve instead of VPWR.

Ignition OFF.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Canister Vent Valve Connector, Component Side	(-) Evaporative Emission (EVAP) Canister Vent Valve Connector, Component Side
KAPWR - Pin 1	CANV - Pin 2
VPWR	CANV - Pin 2

Are the resistances between 40 - 70 ohms?

Yes	No
Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .	INSTALL a new Evaporative Emission (EVAP) Canister Vent valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.

HX25 CHECK THE VPWR VOLTAGE TO THE EVAP CANISTER VENT VALVE

NOTE: For applications using the EONV EVAP leak check monitor, KAPWR provides voltage to the EVAP canister vent valve instead of VPWR.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side	(-)
KAPWR - Pin 1	Ground
VPWR	Ground

Are the voltages greater than 10.5 V?

Yes	No
GO to **HX26** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX26 CHECK THE CANV CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side	(-) PCM Connector, Harness Side
CANV - Pin 2	CANV

Is the resistance less than 5 ohms?

Yes	No
GO to **HX27** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX27 CHECK THE CANV CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side	(-)
CANV - Pin 2	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HX28** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HX28 CHECK THE CANV CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Canister Vent Valve Connector, Harness Side	(-)
CANV - Pin 2	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to HX52.

HX29 CHECK THE EVAP VAPOR BLOCKING VALVE RESISTANCE

Ignition OFF.

Evaporative Emission (EVAP) Vapor Blocking Valve connector disconnected.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Component Side	(-) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Component Side
VBV - Pin 1	VPWR - Pin 2

Is the resistance between 23 - 30 ohms?

Yes	No
GO to **HX30** .	INSTALL a new Evaporative Emission (EVAP) Vapor Blocking valve. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. REPEAT the self-test.

HX30 CHECK THE VOLTAGE TO THE EVAP VAPOR BLOCKING VALVE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Harness Side	(-)
VPWR - Pin 2	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **HX31** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX31 CHECK THE VBV CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Harness Side	(-) PCM Connector, Harness Side
VBV - Pin 1	VBV

Is the resistance less than 5 ohms?

Yes	No
GO to **HX32** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

HX32 CHECK THE VBV CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Harness Side	(-)
VBV - Pin 1	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **HX33** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

HX33 CHECK THE VBV CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Evaporative Emission (EVAP) Vapor Blocking Valve Connector, Harness Side	(-)
VBV - Pin 1	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Evaporative Emission (EVAP) Vapor Blocking valve. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. REPEAT the self-test.

HX34 CHECK THE INSTRUMENT PANEL CLUSTER (IPC) FOR DTCS

Ignition ON, engine OFF.

Carry out the IC (IPC) self-test.

Are any DTCs present?

Yes	No
REFER to the service information , Instrumentation, Message Center, and Warning Chimes, DTC Charts, to continue diagnosis.	GO to **HX35** .

HX35 CHECK THE FLI PID

Ignition ON, engine running.

Access the PCM and monitor the FLI (PER) PID.

Does the FLI PID match the fuel gauge?

Yes	No
GO to **HX36** .	GO to HX52.

HX36 CHECK FOR FUEL TANK FLOAT LEVEL RESPONSE

NOTE: A dual-container (saddle type) fuel tank has two fuel level sensors. The

FLI PID in the PCM is the average value of both fuel level sensors. Some dual-container tanks may require the fuel level to be greater 3/4 full before the fuel level equalizes.

Ignition ON, engine running.

Access the PCM and monitor the FLI (PER) PID.

Ignition OFF.

If the fuel level is less than 1/4 (25% on FLI), add approximately 1/4 tank of fuel.

If the fuel level is greater than 3/4 (75% on FLI), drain approximately 1/4 tank of fuel.

Ignition ON, engine running.

Does the FLI PID indicate a movement upward or downward as fuel is either added or drained?

Yes	No
Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, Symptom Charts, to diagnose the incorrect fuel gauge indication symptom.

HX37 CHECK THE FUEL FILLER CAP OR CAPLESS FUEL TANK FILLER PIPE

For vehicles with a fuel filler cap, visually inspect the fuel filler cap without initially disturbing it.

Verify the fuel filler cap tether is visible and free to move.

Check for missing or loose fuel filler cap.

Check the fuel filler cap for damage.

For vehicles with a capless fuel tank filler pipe, visually inspect the capless fuel tank filler pipe inlet without initially disturbing it.

Check the capless fuel tank filler pipe inlet for an obstruction that prevents it from sealing.

Check the capless fuel tank filler pipe for damage.

Install and remove the supplemental fueling adapter five times in the capless fuel tank filler pipe to clear debris on the seal and repeat the test. Refer to the Owner Literature for the location of the supplemental fueling adapter in the vehicle.

Is a concern present?

Yes	No
For repair verification, CARRY OUT the Smoke Machine PHASE 1 -	For DTCs P0442 or

Leak Verification Pressure Test. REPAIR as necessary. GO to HX43.	P0456, GO to HX43. For DTCs P0455 or P0457, GO to **HX38** .

HX38 CHECK FOR FLI DTCS

Ignition ON, engine OFF.

Carry out the PCM self-test.

Are DTCs P0460, P0461, P0462 or P0463 present?

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .	GO to **HX39** .

HX39 CHECK THE OPERATION OF THE FUEL GAUGE

NOTE: A fuel gauge that always indicates a fuel level less than a 1/2 tank or always a full tank, may be caused by a fuel level input (FLI) concern.

Check operation of the fuel gauge.

Is the fuel gauge functioning correctly?

Yes	No
GO to **HX40** .	CHECK the functionality of the FLI circuit. RETURN to SYMPTOM CHARTS for further direction.

HX40 EVAPORATIVE EMISSION SYSTEM VISUAL INSPECTION

Ignition OFF.

Visually inspect for:

EVAP system lines and hoses (check for correct connections, damage or blockage)

loose fuel vapor hose and tube connections to the EVAP system components

blocked vacuum hose between the EVAP purge valve and the engine intake manifold

damaged fuel tank or fuel filler pipe

Are there any concerns found during the visual inspection?

Yes	No
REPAIR as necessary. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak	GO to **HX41** .

Verification Pressure Test. GO to HX43.	

HX41 CHECK THE FTP SENSOR VOLTAGE WITH THE FUEL FILLER CAP REMOVED OR THE CAPLESS FUEL TANK FILLER PIPE OPENED

For vehicles with a capless fuel filler pipe,

Install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe.

For all others,

Remove the fuel filler cap.

Ignition ON, engine OFF.

Access the PCM and monitor the FTP (VOLT) PID.

Is the voltage between 2.35 - 2.9 V?

Yes	No
For DTC P0451, CHECK for kinks or bends in the fuel vapor hoses and tubes between the fuel tank and dust separator. CHECK the EVAP canister ports and canister vent hose assembly for contamination or debris. CHECK the dust separator for blockage. REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test. For all others, GO to **HX42** .	For DTC P0451, INSTALL a new FTP sensor. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test. For all others, INSTALL a new FTP sensor. REFER to the service information , Evaporative Emissions. REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to HX43.

HX42 EVAP PURGE VALVE TEST

Ignition OFF.

Install the fuel filler cap or remove the supplemental refueling adaptor.

Ignition ON, engine running.

Access the PCM and control the EVAPCV (MODE) PID.

Close the EVAP canister vent valve by commanding the EVAPCV PID to ON (100% duty cycle).

Access the PCM and monitor the FTP (PRESS) PID.

Access the PCM and control the EVAPCP (PER) PID.

While monitoring the FTP PID, ramp open the EVAP purge valve by incrementally commanding the EVAPCP PID to 100%.

Does the FTP PID decrease, the engine RPM change, or the engine stall as an indication that the EVAP purge valve is opening?

Yes	No
GO to **HX43** .	INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. REPEAT the test and VERIFY the results. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test. GO to **HX43** .

HX43 HOOK UP THE SMOKE MACHINE

NOTE: The smoke and air flow from the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 or equivalent will not pass through liquid fuel. Liquid fuel may be present in the fuel tank filler pipe.

Ignition OFF.

Connect the smoke machine power cables to the vehicle battery. Check to see that the smoke machine power indicator lamp is on, indicating a good battery contact.

For Explorer 3.7L, Fiesta 1.6L TiVCT, Flex 3.5L TiVCT, Focus 2.0L GDI, Fusion 2.5L, MKS 3.7L, MKT 3.7L, Taurus 3.5L TiVCT and Taurus 3.7L,

Disconnect the fuel vapor to intake manifold line at the EVAP purge valve and cap the line.

Connect a suitable hose adapter to the fuel vapor to intake manifold connection at the EVAP purge valve.

For all others:

Disconnect the fuel vapor to EVAP canister line at the EVAP purge valve.

Connect a suitable hose adapter to the fuel vapor to EVAP canister connection at the EVAP purge valve.

Is the smoke machine hook up complete?

Yes	No
For leak detection, GO to **HX44** . For leak repair verification, GO to HX45.	REFER to the smoke machine operator manual for additional instructions and for helpful tips.

HX44 CARRY OUT SMOKE MACHINE PHASE 2 - LEAK DETECTION SMOKE TEST

NOTE: Check the EVAP hoses, EVAP purge valve, EVAP canister vent valve, EVAP canister, fuel tank, fuel filler pipe, the fuel tank area, at the fuel filler cap or capless fuel tank filler pipe inlet for leaks. Wiggle the components and connections and look for signs of leaking smoke. Smoke under pressure may not reach a leak in the fuel tank filler pipe between the check valve and the fuel filler cap or capless fuel tank filler pipe inlet. If leaking smoke is not found, carry out a visual inspection of the fuel tank filler pipe, fuel filler cap or capless fuel tank filler pipe inlet.

Set the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 or equivalent to SMOKE.

Remove the fuel filler cap or install the supplemental refueling adaptor.

Connect the smoke supply hose nozzle tip into the suitable hose adapter.

Ignition ON, engine OFF.

Access the PCM and control the EVAPCV (PER) PID.

Close the EVAP canister vent valve by commanding the EVAPCV PID to ON (100% duty cycle).

Access the PCM and control the EVAPCP (PER) PID.

Open the EVAP purge valve by commanding the EVAPCP PID to 100%.

Start the smoke machine.

Verify the connection at the EVAP purge valve is not leaking.

If smoke does not exit the fuel tank filler pipe after the system is pressurized, command the EVAPCV PID open to purge the EVAP canister vent valve. Once smoke is seen at the EVAP canister vent valve, command the EVAPCV PID close.

Install the fuel filler cap or remove the supplemental refueling adaptor once smoke exits the fuel tank filler pipe.

Continue to apply smoke to the EVAP system for 60 seconds.

Press and release the remote starter button in intervals of approximately 15 seconds on and 15 seconds off while checking for exiting smoke.

Use the halogen spotlight along the EVAP system path and look for smoke exiting at the leak.

Is the EVAP leak located?

Yes	No
REPAIR as necessary. CONNECT all the disconnected components. For repair verification, CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test.	The test passed. CONNECT all the disconnected components. CARRY OUT the Smoke Machine PHASE 1 - Leak Verification Pressure Test.

GO to **HX45** .	GO to **HX45** .

HX45 CARRY OUT THE SMOKE MACHINE PHASE 1 - LEAK VERIFICATION PRESSURE TEST

Position the control lever located on the Rotunda Smoke Machine, Fuel Evaporative Emission System Tester 218-00001 or equivalent to METER.

Calibrate the smoke machine flowmeter using the 0.020 (DTC P0456) standard or the 0.040 (DTC P0442) standard as follows:

Insert the air supply hose (transparent hose) nozzle tip into the appropriate EVAP system standard located on the front of the smoke machine.

Press the remote starter button on the smoke machine. Observe the position of the flowmeter indicator ball.

Position the flowmeter red pointer flag so that it aligns with the measurement of the indicator ball.

Release the button and remove the air supply hose nozzle tip from the EVAP system standard.

Connect the air supply hose (transparent hose) nozzle tip into the suitable hose adapter.

Ignition ON, engine OFF.

Access the PCM and control the EVAPCV (MODE) PID.

Close the EVAP canister vent valve by commanding the EVAPCV PID to ON (100% duty cycle).

Access the PCM and control the EVAPCP (PER) PID.

Open the EVAP purge valve by commanding the EVAPCP PID to 100%.

Press the remote starter button on the smoke machine. Notice that the ball in the flowmeter is all the way at the top. This indicates the system is being pressurized.

Continue to press the remote starter button until the ball stops descending. Once the ball stops descending, observe if it is above or below the red pointer flag. If the measurement is below the indicator flag, the system has passed the pressure test. If the measurement is above the indicator flag, the EVAP system has an unacceptable leak.

Does the EVAP system pass the leak verification pressure test?

Yes	No
For DTC P0456, GO to **HX46** . For all others, the test passed and no concerns are present. Clear the PCM DTCs. REPEAT the self-test.	GO to HX44.

HX46 CARRY OUT THE EVAP PURGE VALVE LEAK TEST

Remove the EVAP purge valve from the vehicle. Refer to the service information , Evaporative Emissions.

Connect a suitable hose adapter to the EVAP purge valve.

Connect the air supply hose (transparent hose) nozzle tip into the suitable hose adapter.

Press the remote starter button on the smoke machine. Notice that the ball in the flowmeter is all the way at the top. This indicates the system is being pressurized.

Continue to press the remote starter button until the ball stops descending. Once the ball stops descending, observe if it is above or below the red pointer flag. If the measurement is below the indicator flag, the EVAP purge valve has passed the pressure test. If the measurement is above the indicator flag, the EVAP purge valve has an unacceptable leak.

Does the EVAP purge valve pass the leak verification test?

Yes	No
The test passed and no concerns are present. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. CARRY OUT the EVAP Test. REFER to the instruction manual provided by the scan tool manufacturer. Clear the PCM DTCs. REPEAT the self-test.

HX47 CHECK THE EVAP EJECTOR CONNECTIONS

Remove the EVAP ejector from the vehicle. Refer to the service information , Evaporative Emissions.

Visually inspect the EVAP ejector connections at the intake air system tube for a restriction.

Visually inspect the EVAP ejector connections for a restriction.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For F-150 3.5L GTDI and Transit 3.5L, INSTALL a new EVAP Ejector. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. REPEAT the self-test. For all others, INSTALL a new Evaporative Emission (EVAP) Purge valve. REFER to the service information , Evaporative Emissions. Clear the PCM DTCs. REPEAT the self-test.

HX48 CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

Ignition ON, engine OFF.

Check for self-test DTCs in all of the vehicle modules.

Are any communication concerns or communication DTCs present?

Yes	No

For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS . For communication concerns in other modules, REFER to the applicable service information to diagnose the communication DTC.	GO to **HX49** .

HX49 CHECK THE PERFORMANCE OF THE PROCESSOR

Ignition OFF.

Disconnect the battery and wait for 1 minute. Refer to the service information , Battery, Mounting and Cables.

Connect the battery.

Ignition ON, engine running.

Allow the engine idle to stabilize.

Access the PCM and monitor the FTP (VOLT) PID.

Is the voltage between 2.35 - 2.9 V?

Yes	No
GO to HX51.	GO to **HX50** .

HX50 CHECK FOR SELF-TEST DTC P260F

Idle the engine for 2 minutes.

Carry out the PCM self-test.

Is DTC P260F present?

Yes	No
GO to **HX51** .	RETURN the vehicle to the customer.

HX51 CHECK THE PCM FOR THE LATEST CALIBRATION

Program the PCM to the latest calibration.

Ignition ON, engine running.

Idle the engine for 2 minutes.

Carry out the PCM self-test.

Is DTC P260F present?

Yes	No
GO to **HX52** .	RETURN the vehicle to the customer.

HX52 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

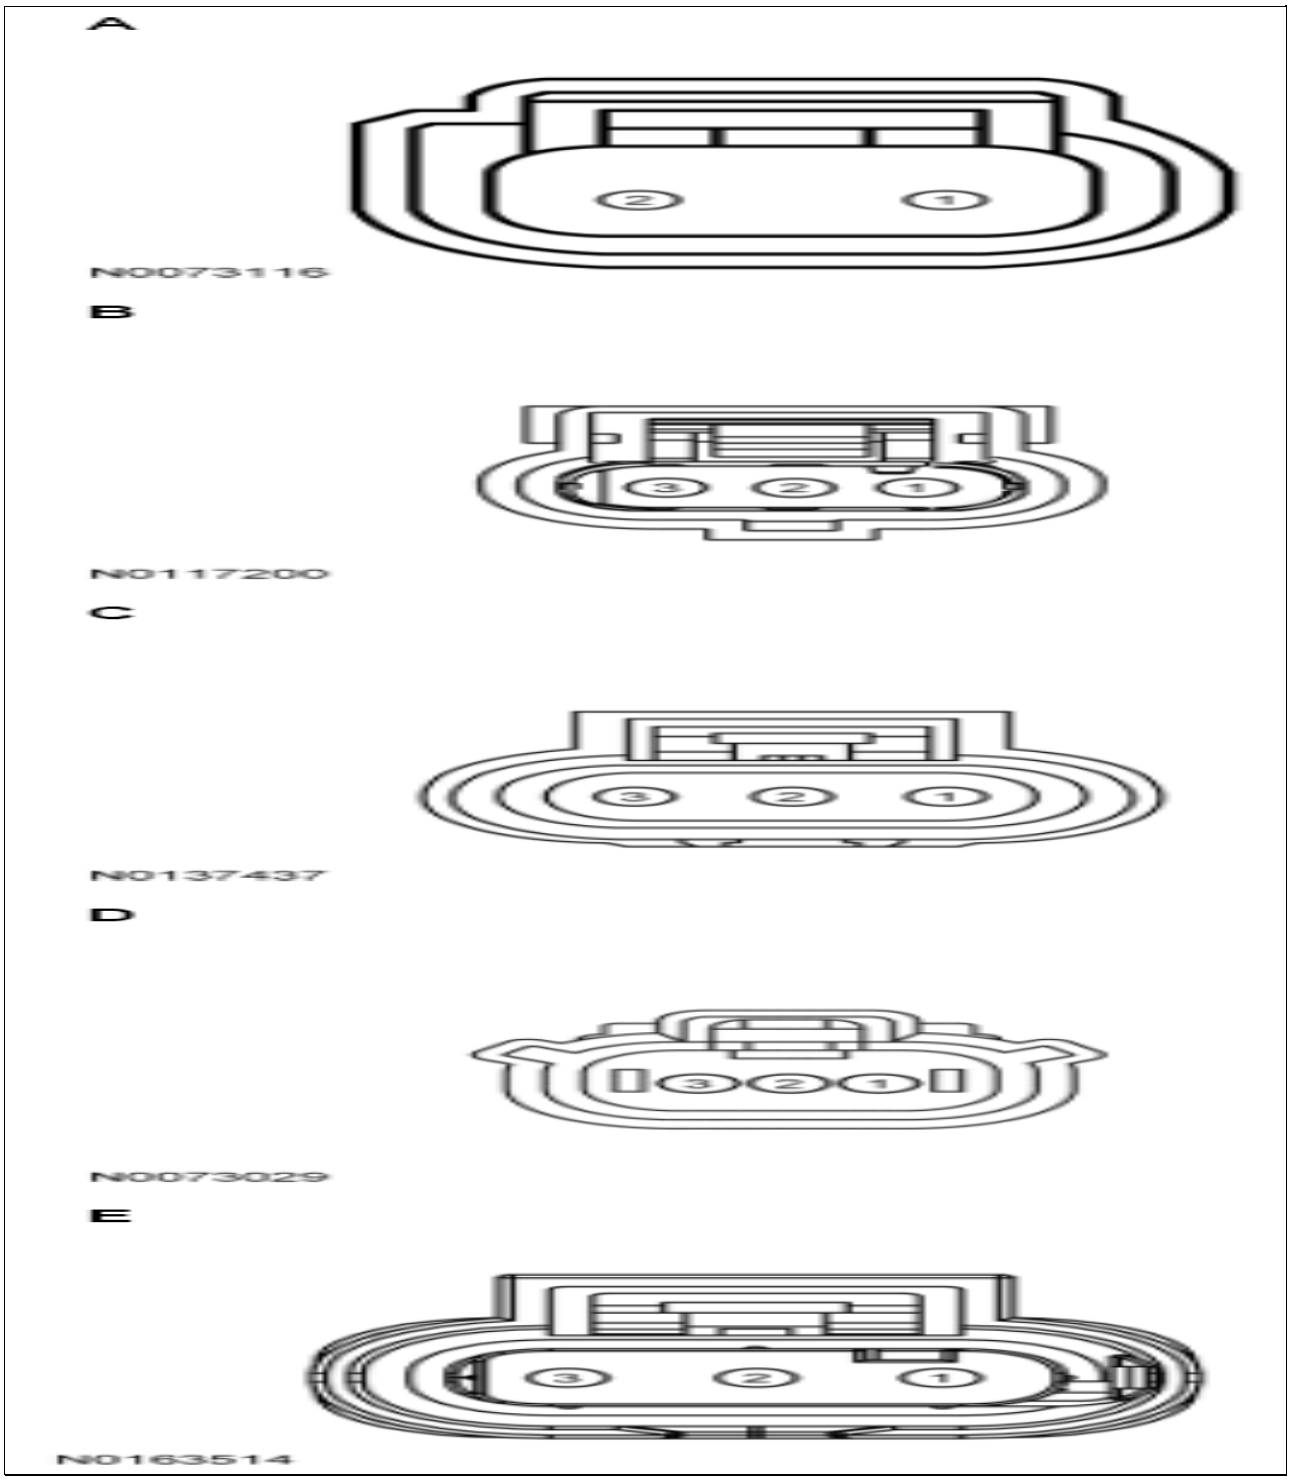
PINPOINT TEST JB: SECONDARY IGNITION (COP) > INTRODUCTION

NOTE: A damaged ignition system may cause high catalyst temperatures. Check the components next to the catalyst and muffler for heat damage.

NOTE: There is additional information available on this procedure. Refer to the Service Tips tab and select the appropriate test listed under the Job Aids title.

For 2 wire coil harness connectors, select the PCM Ignition Coil Driver Test.

For 3 wire coil harness connectors, select the Driver On Coil Ignition Test.



This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- secondary side of the coil
- exhaust spark plug wire (12286) (6.2L engine only)

Vehicle	Firing Order for Coil On Plug Applications
Fusion 1.5L	1 2 4 3
Mustang 5.0L, F-150, F-250 - F-550 6.2L	1 5 4 8 6 3 7 2

3-cylinder applications	1 2 3
4-cylinder applications	1 3 4 2
6-cylinder applications	1 4 2 5 3 6
8-cylinder applications	1 3 7 2 6 5 4 8
10-cylinder applications	1 6 5 10 2 7 3 8 4 9

Fig 1: Identifying Coil On Plug (COP) Connector

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
E-Series, F-Series Super Duty 6.8L, Motorhome/Stripped Chassis/Step Van	A	2 1	COP VPWR
Edge 2.0L, Edge 2.7L, Escape/Kuga 2.0L, Explorer 2.0L, F-150 2.7L, Focus 2.0L, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L	B	2 1 3	GND COP VPWR
Escape/Kuga 1.6L, Fiesta, Fusion 1.5L, Fusion 1.6L, Transit Connect 1.6L	C	2 1 3	GND COP VPWR
Escape/Kuga 2.5L, Fusion 2.5L, Transit Connect 2.5L	A	1 2	COP VPWR
Expedition, Explorer GTDI 3.5L, F-150 GTDI 3.5L, Flex GTDI 3.5L, MKS 3.5L, MKT 3.5L, Navigator, Taurus GTDI 3.5L, Transit 3.5L	D	1 2 3	GND COP VPWR
F-Series Super Duty 6.2L	D	3 1	COP VPWR
Focus 1.0L	E	2 1 3	GND COP VPWR
All other vehicles	D	1 3	COP VPWR

PINPOINT TEST JB: SECONDARY IGNITION (COP) > TEST PROCEDURE

JB1 CHECK FOR DTCS

NOTE: Do not disconnect any COP while the engine is running, damage to the COP or PCM may occur.

Are DTCs P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, P0310 or P0316 present?

Yes	No
GO to **JB2** .	For symptoms without DTCs, GO to **JB2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

JB2 CYLINDER POWER BALANCE TEST

NOTE: The IDS test referenced in this step may not be available on all vehicles. Follow the YES answer if the IDS test is not available.

Carry out the Power Balance Test. Refer to the instruction manual provided by the scan tool manufacturer.

Are all cylinders contributing correctly during the power balance test?

Yes	No
GO to **JB3** .	GO to JB4.

JB3 VISUAL INSPECTION OF THE IGNITION SYSTEM

Visually inspect the engine compartment to make sure all coils are correctly and securely connected.

Examine all the wiring harnesses and connectors for damaged, burned, or overheated insulation, and loose or broken conditions.

Make sure the vehicle battery is in good condition and all of the accessories are turned off.

For the 6.2L engine, check the condition of the exhaust spark plug wire and boots.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **JB4** .

JB4 CHECK THE VPWR TO THE SUSPECT COIL

Ignition ON, engine OFF.

Suspect Coil Assembly connector disconnected.

Measure the voltage between:

(+) COP Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **JB5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

JB5 MISFIRE ON CYLINDERS 1 THROUGH 10

Are DTCs P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309, or P0310 present?

Yes	No
For Edge 3.5L, Explorer 3.5L TiVCT, Explorer 3.7L, F-150 3.5L TiVCT, Flex 3.5L TiVCT, MKS 3.7L, MKT 3.7L, MKX, MKZ 3.7L, Mustang 3.7L, Taurus 3.5L TiVCT, Taurus 3.7L, and Transit 3.7L, GO to **JB6** . For all others, GO to JB8.	GO to JB9.

JB6 CHECK FOR BANK 1 OR BANK 2 MISFIRE DTCS

NOTE: DTCs P0301, P0302, P0303 apply to bank 1 and DTCs P0304, P0305, P0306 apply to bank 2 on 6 cylinder engines.

Are DTCs P0301, P0302 or P0303 present?

Yes	No
GO to **JB7** .	GO to JB8.

JB7 CONFIRM COMPONENTS FOR CYLINDER MISFIRE

Remove the suspect coil (as determined from the table) for the appropriate DTC. For additional information, refer to the service information , Engine Ignition.

Remove the suspect spark plug (as determined from the table) for the appropriate DTC.

For additional information, refer to the service information , Engine Ignition.

Remove the suspect fuel injector (as determined from the table) for the appropriate DTC. For additional information, refer to the service information , Fuel Charging and Controls.

Remove opposite bank coil. For additional information, refer to the service information , Engine Ignition.

Remove the opposite bank spark plug. For additional information, refer to the service information , Engine Ignition.

Remove the opposite bank fuel injector. For additional information, refer to the service information , Fuel Charging and Controls.

Install removed components from bank 1 on the opposite cylinder in bank 2 and install the components removed from bank 2 in bank 1.

Make sure the vehicle is correctly reassembled.

Drive the vehicle to determine if the misfire is still present.

Carry out the PCM self-test.

Does the misfire move from the suspect cylinder in bank 1 to the opposite cylinder in bank 2?

Yes	No
GO to **JB8** .	GO to JB15.

JB8 CHECK FOR SPARK AT THE CYLINDERS INDICATED BY THE DTCS

Ignition OFF.

Remove the fuel pump fuse to disable the fuel pump.

Disconnect the ignition coils from the spark plugs.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to the ignition coil boot.

Observe the spark tester while cranking the engine.

For the 6.2L engine,

Connect the ignition coils to the spark plugs.

Disconnect the exhaust spark plug wires from the spark plugs.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to the exhaust spark plug wire.

Observe the spark tester while cranking the engine.

Is a bluish-white spark present?

Yes	No
GO to JB13.	For Edge 3.5L, E-Series, Escape/Kuga 2.5L, F-150 3.5L TiVCT, F-150 5.0L, F-650/F-750, F-Series Super Duty, Fusion 2.5L, Motorhome/Stripped Chassis/Step Van, Mustang 3.7L, Mustang 5.0L, Transit 3.7L, and Transit Connect 2.5L, GO to JB10. For all others, INSTALL a new COP. Clear the PCM DTCs. REPEAT the self-test.

JB9 CHECK FOR SPARK AT ALL CYLINDERS

Ignition OFF.

Remove the fuel pump fuse to disable the fuel pump.

Disconnect the ignition coils from the spark plugs.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to the ignition coil boot.

Observe the spark tester at each cylinder while cranking the engine.

For the 6.2L engine,

Connect the ignition coils to the spark plugs.

Disconnect the exhaust spark plug wires from the spark plugs.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to the exhaust spark plug wire.

Observe the spark tester at each cylinder while cranking the engine.

Is a bluish-white spark consistent between all cylinders?

Yes	No
GO to JB13.	RECORD the cylinders with inconsistent spark. For Edge 3.5L, E-Series, Escape/Kuga 2.5L, F-150 3.5L TiVCT, F-150 5.0L, F-650/F-750, F-Series Super Duty,

	Fusion 2.5L, Motorhome/Stripped Chassis/Step Van, Mustang 3.7L, Mustang 5.0L, Transit 3.7L, and Transit Connect 2.5L, GO to **JB10** . For all others, INSTALL a new COP. Clear the PCM DTCs. REPEAT the self-test.

JB10 COMPONENT INSPECTION

Inspect the coil boots for the missing cylinders. Install a new coil boot if necessary. Refer to the service information , Engine Ignition.

Inspect the spark plugs for the missing cylinders. Measure the resistance of the spark plugs. Install a new spark plug if the resistance is lower than 2, 000 ohms or higher than 12, 000 ohms at a room temperature of 25°C (77°F).

For the 6.2L engine,

Inspect the exhaust spark plug wires for damaged insulation, burns, and high voltage etching in either of the boots for the missing cylinders. Install a new exhaust spark plug wire if the resistance is lower than 5, 875 ohms or higher than 7, 875 ohms at a room temperature of 25°C (77°F).

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For F-Series Super Duty 6.2L, GO to JB12. For all others, GO to **JB11** .

JB11 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

Ignition OFF.

Suspect Coil Assembly connector disconnected.

Measure resistance between: Suspect coil connector, VPWR, component side and ignition coil spring, located in the ignition coil boot.

Is the resistance between 5, 000 and 6, 000 ohms?

Yes	No
GO to PINPOINT TEST Z .	INSTALL a new COP. Clear the PCM DTCs. REPEAT the self-test.

JB12 CHECK THE SECONDARY COIL RESISTANCE

Ignition OFF.

Measure resistance between: Suspect coil connector, VPWR, component side and ignition coil spring, located in the ignition coil boot.

Is the resistance between 33, 900 ohms and 41, 500 ohms at a room temperature of 25°C (77°F)?

Yes	No
GO to PINPOINT TEST Z .	INSTALL a new COP. Clear the PCM DTCs. REPEAT the self-test.

JB13 CHECK THE SPARK PLUGS

NOTE: To determine the condition of the spark plugs, refer to the service information , Engine and carry out the Spark Plug Inspection.

Ignition OFF.

Remove and inspect the spark plugs for damage, wear, carbon tracking or deposits and correct spark plug gap.

Are the plugs OK?

Yes	No
GO to **JB14** .	REPAIR the spark plugs. ADJUST the gap or INSTALL a new spark plug as necessary. REFER to the service information Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.

JB14 CHECK THE SPARK PLUG RESISTANCE

Measure the spark plug resistance.

Is the resistance between 2, 000 ohms and 12, 000 ohms at a room temperature of 25°C (77°F)?

Yes	No
GO to **JB15** .	INSTALL a new spark plug. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.

JB15 TEST DIRECTION FOR SYMPTOM CHARTS

Were you directed to this pinpoint test from Section 3?

Yes	No
RETURN to SYMPTOM CHARTS for further direction.	GO to **JB16** .

JB16 TEST DIRECTION FOR PINPOINT TEST HD

Were you directed to this pinpoint test from pinpoint test step HD8 ?

Yes	No

GO to HD9.	The concern is intermittent. GO to PINPOINT TEST Z .

PINPOINT TEST JC: SECONDARY IGNITION (COIL PACK) > INTRODUCTION

NOTE: There is additional information available on this procedure. Copy and paste the following URL into your internet browser: mms://multimedia.ford.com/seopts/Service_Tips /ignition3.wmv.

This pinpoint test is intended to diagnose the following:

- spark plugs (12405)
- spark plug wires (12280, 12281)

PINPOINT TEST JC: SECONDARY IGNITION (COIL PACK) > TEST PROCEDURE

JC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P0300, P0301, P0302, P0303 or P0304?

Yes	No
For DTC P0300, GO to **JC2** . For all others, GO to JC10.	For symptoms without DTCs, GO to **JC2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

JC2 CYLINDER POWER BALANCE TEST

NOTE: The IDS test referenced in this step may not be available on all vehicles. Follow the YES answer if the IDS test is not available.

Carry out the Power Balance Test. Refer to the instruction manual provided by the scan tool manufacturer.

Are all cylinders contributing correctly during the power balance test?

Yes	No
GO to **JC3** .	For a coil pack using an engine analyzer, GO to JC4. For a coil pack not using an engine analyzer, GO to JC10.

JC3 VISUAL INSPECTION OF THE IGNITION SYSTEM

Visually inspect the engine compartment to make sure all coils and spark plug wires are correctly and securely connected.

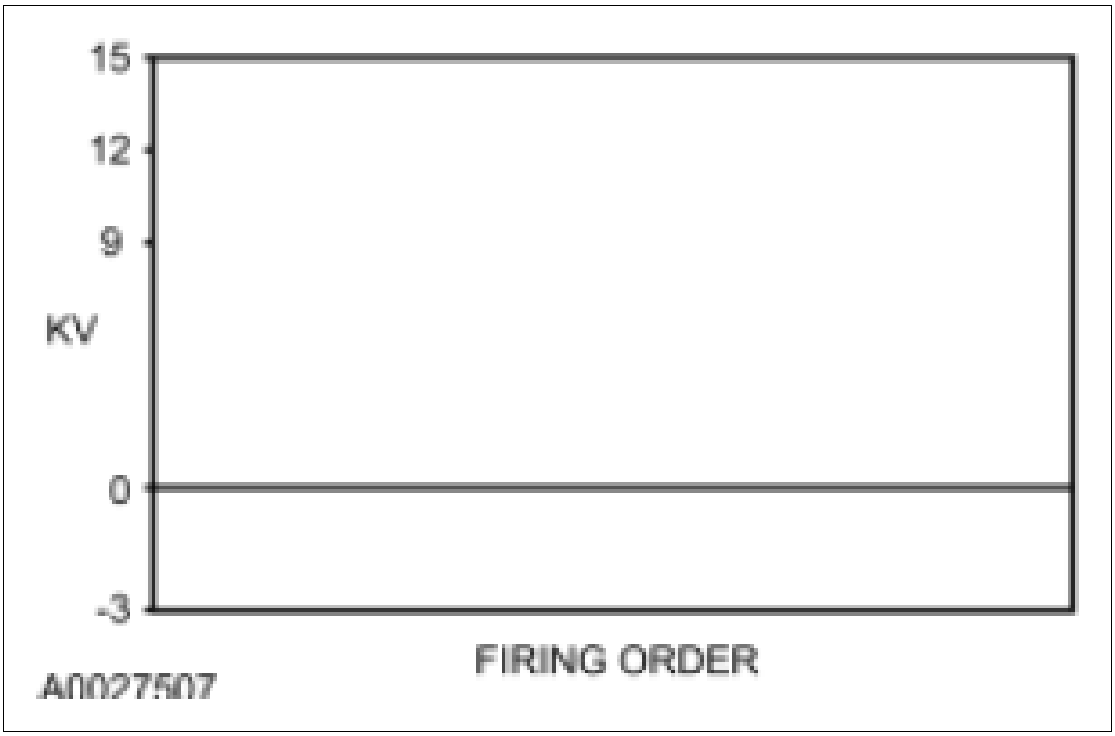
Examine all wiring harnesses and connectors for damaged, burned or overheated insulation and loose or broken conditions.

Visually inspect the interior and exterior surfaces of the coil tower for damage or carbon tracking.

Visually inspect the interior and exterior surfaces of the spark plug wire boots for damage or carbon tracking.

Make sure the vehicle battery is in good condition and all accessories are turned off.

Is a concern present?



Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For a coil pack using an engine analyzer, GO to **JC4** . For a coil pack not using an engine analyzer, GO to JC10.

JC4 CHECK FOR THE IGNITION PATTERN

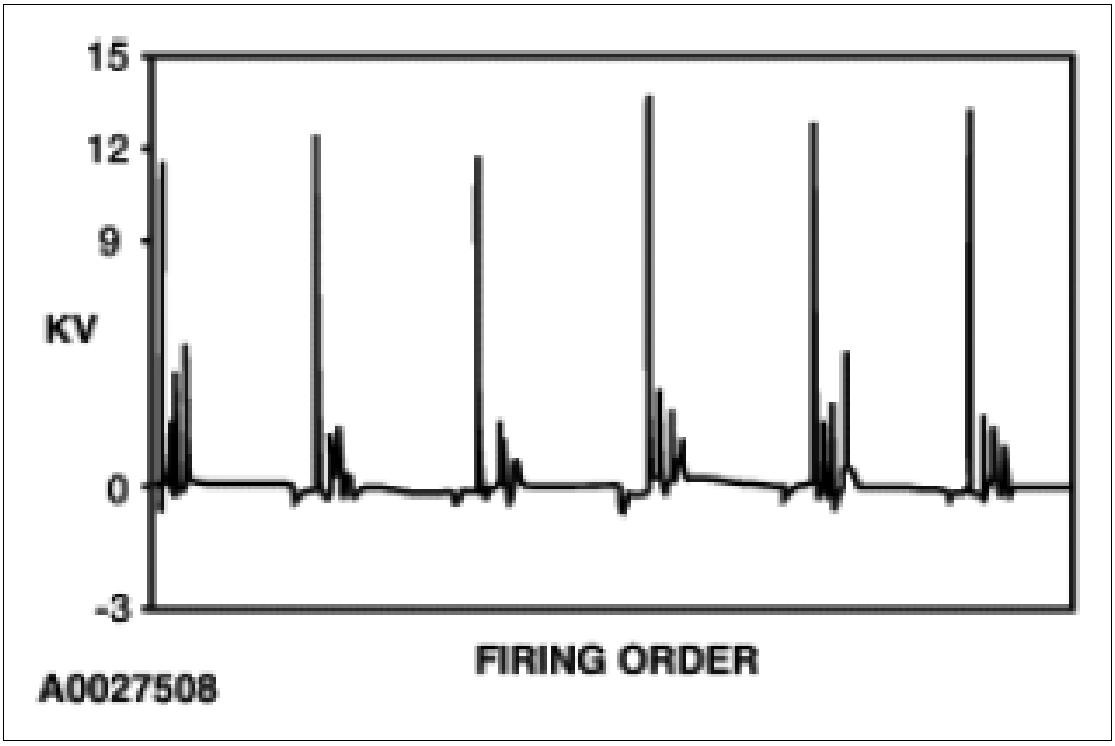
Connect an engine analyzer to diagnose concerns in the secondary side of the ignition system.

Observe the pattern on a scope while cranking the engine.

Fig 1: Ignition Pattern

Courtesy of FORD MOTOR CO.

Is the pattern flat, which indicates no ignition spark on all cylinders?



Yes	No
GO to PINPOINT TEST JE .	GO to **JC5** .

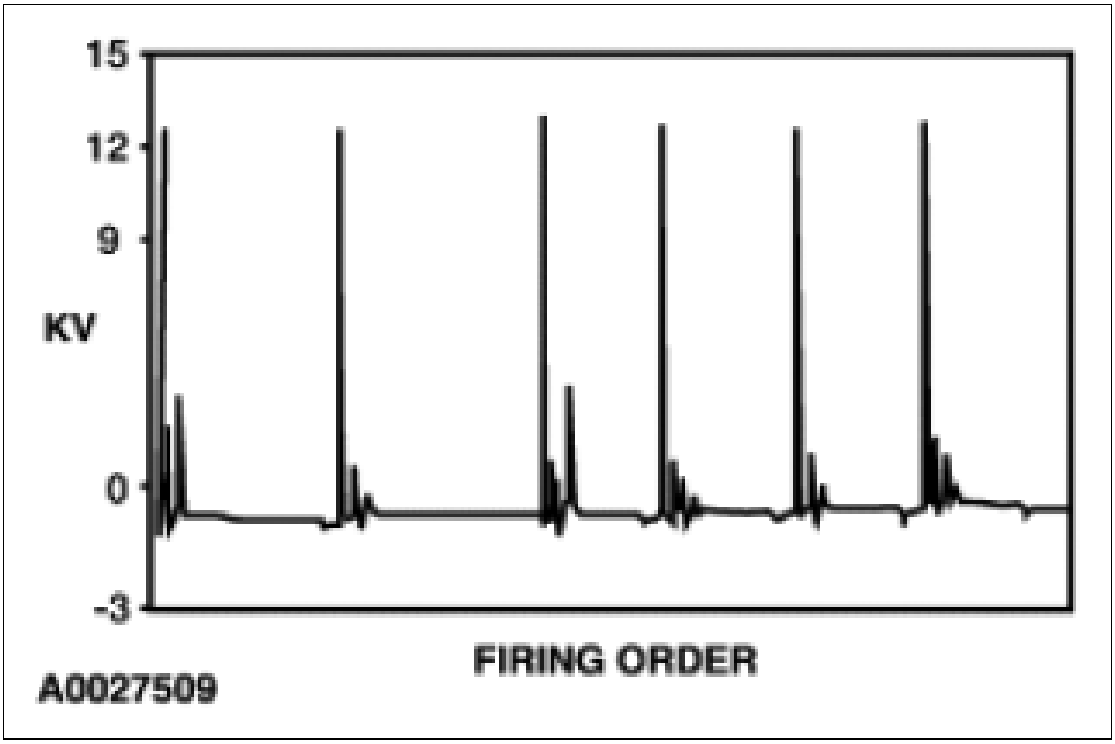
JC5 CHECK FOR A NORMAL IGNITION PATTERN

NOTE: Spark plugs may be fired more than once per combustion event. Multi-strike operating mode is RPM dependent.

Ignition ON, engine running. If no start, crank the engine.

Fig 2: Normal Ignition Pattern

Courtesy of FORD MOTOR CO.



Are the patterns even and is the average value of spark plug firing voltage between 9 kV and 15 kV (higher during engine crank/no start)?

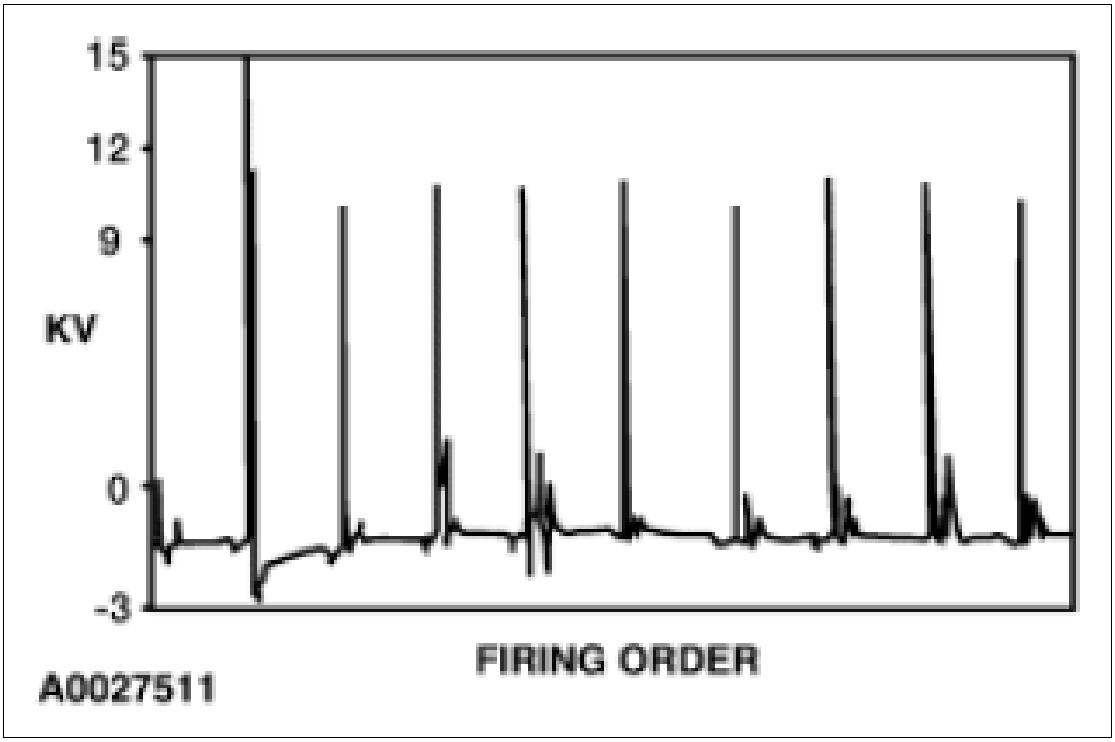
Yes	No
GO to PINPOINT TEST Z .	GO to **JC6** .

JC6 CHECK FOR MISSING SPARK PATTERNS

Observe for missing spark pattern.

Fig 3: Missing Spark Pattern

Courtesy of FORD MOTOR CO.



Is the spark pattern inconsistent?

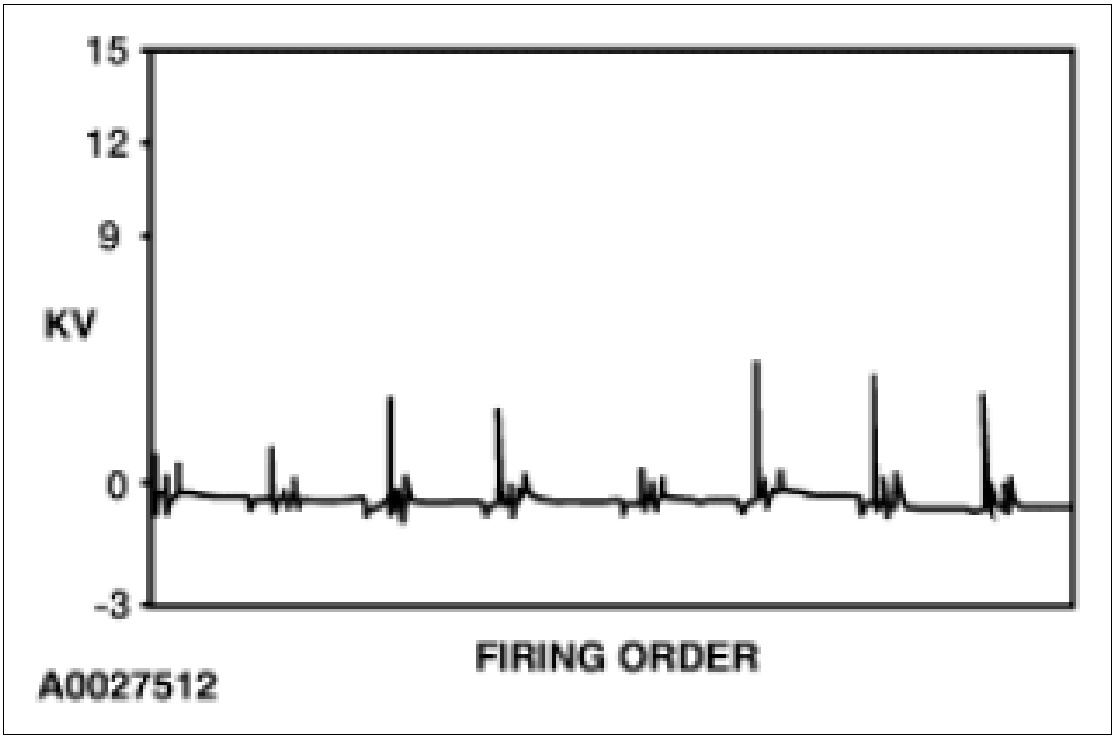
Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7, 000 ohms per 30.5 cm (1 foot). REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test. GO to JE2.	GO to **JC7** .

JC7 CHECK FOR A HIGH SPARK PLUG FIRING VOLTAGE

Observe for a high spark plug firing voltage.

Fig 4: High Spark Plug Firing Voltage Pattern

Courtesy of FORD MOTOR CO.



Is the average value of the spark plug firing voltage greater than 15 kV?

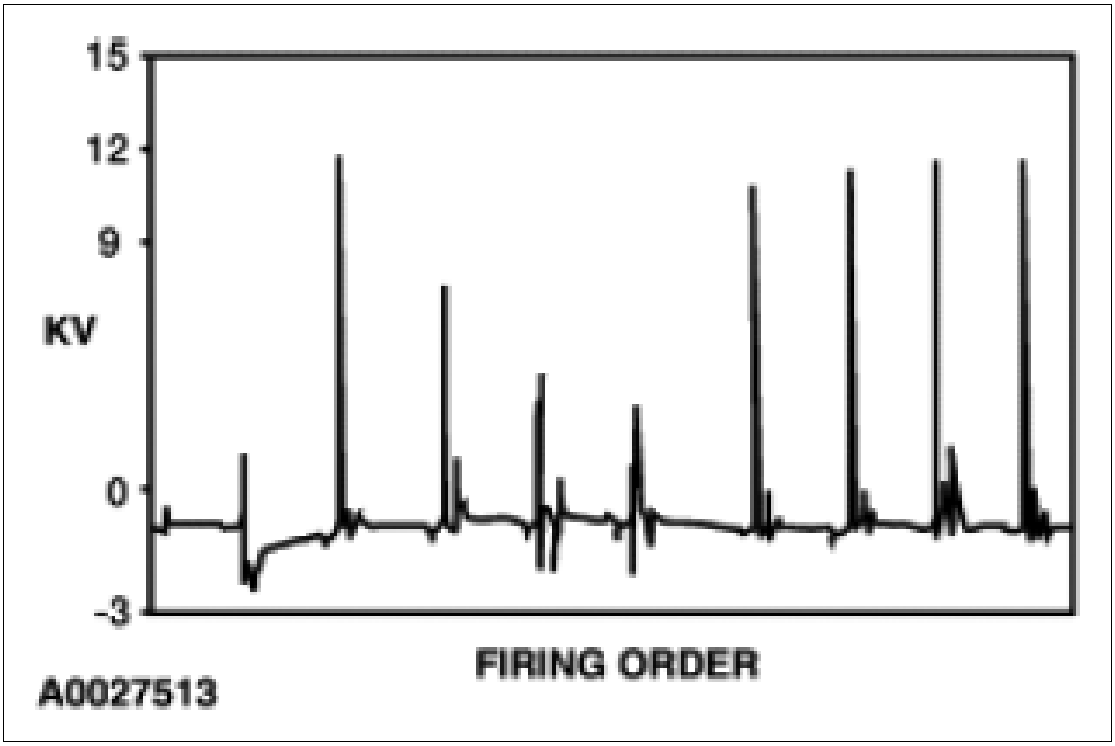
Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7, 000 ohms per 30.5 cm (1 foot). REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.	GO to **JC8** .

JC8 CHECK FOR LOW SPARK PLUG FIRING VOLTAGE

Check the spark plug firing voltage average pattern.

Fig 5: Spark Plug Firing Voltage Average Pattern

Courtesy of FORD MOTOR CO.



Is there consistently low spark plug firing voltage or sloping sparkline on one or more cylinders?

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7, 000 ohms per 30.5 cm (1 foot). MEASURE the resistance of the spark plugs. INSTALL a new spark plugs if the resistance is lower than 2, 000 or higher than 12, 000 ohms. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.	GO to **JC9** .

JC9 CHECK FOR EVENNESS BETWEEN CYLINDERS

Check the spark plug firing voltage average pattern.

Fig 6: Spark Plug Firing Voltage Average Pattern

Courtesy of FORD MOTOR CO.

Is the evenness of spark plug firing voltage greater than 6 kV?

Yes	No
INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wire if the resistance is greater than 7, 000 ohms per 30.5 cm (1 foot). CHECK for damaged spark plugs or narrow spark plug gaps. MEASURE the resistance of the spark plugs. INSTALL a new spark plugs if the resistance is lower than 2, 000 or higher than 12, 000 ohms. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.	GO to PINPOINT TEST Z .

JC10 CHECK FOR SPARK AT ALL CYLINDERS

Ignition OFF.

Disconnect the spark plug wires from the spark plugs.

Connect the Adjustable Ignition Spark Tester THX458 or equivalent to a spark plug wire.

Check for spark while cranking the engine.

Is the bluish-white spark present?

Yes	No
GO to JC12.	INSPECT the spark plug wires for missing cylinders. MEASURE the resistance of the spark plug wires. INSTALL a new spark plug wires, if the resistance is greater

	than 7, 000 ohms per 30.5 cm (1 foot). REFER to the service information , Engine Ignition. If the spark plug wires are OK, GO to **JC11** .

JC11 CHECK THE SECONDARY COIL RESISTANCE FOR THE MISSING CYLINDERS

NOTE: Two adjacent coil towers share a common coil and are called a matched pair. The matched pairs are 1 and 4, and 2 and 3.

Ignition OFF.

Ignition coil pack disconnected.

Disconnect spark plug wires from the coil pack.

Measure the resistance of each matched pair.

Is the resistance between 8, 000 and 9, 600 ohms?

Yes	No
GO to PINPOINT TEST Z .	INSTALL a new ignition coil pack. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.

JC12 CHECK THE SPARK PLUGS

Ignition OFF.

Check for damaged spark plugs or narrow spark plug gaps.

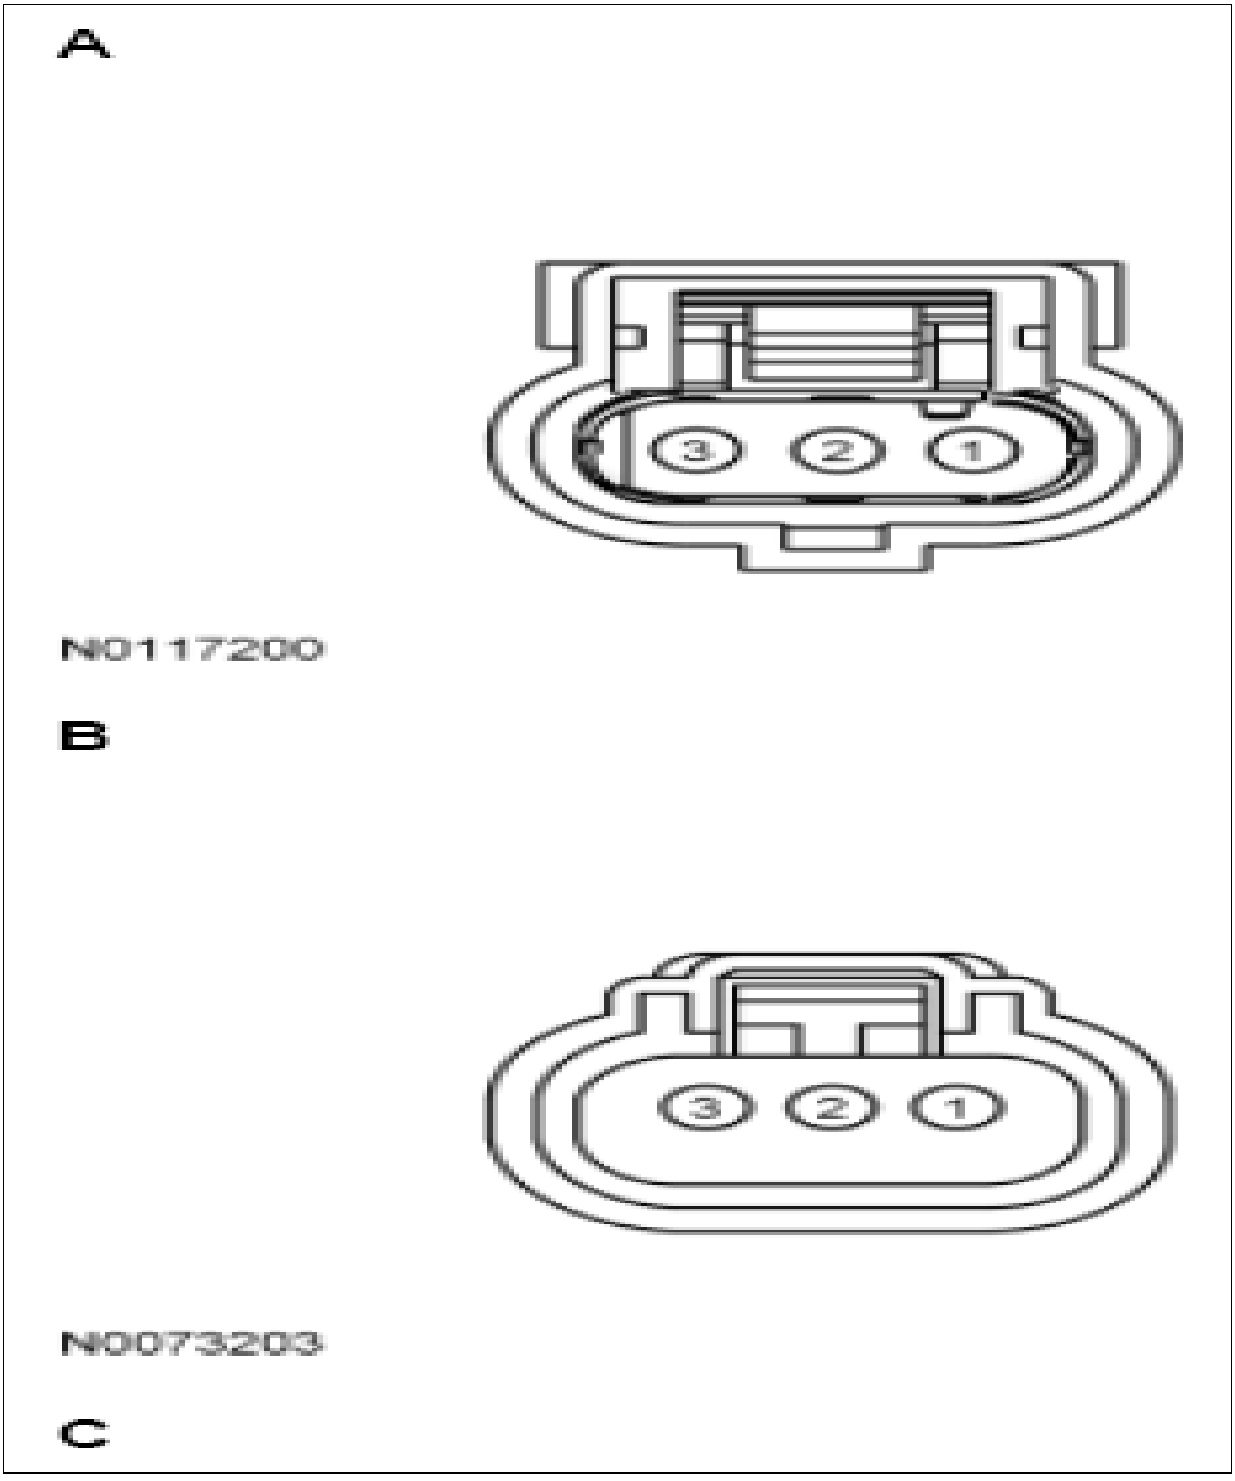
Are the plugs OK?

Yes	No
GO to **JC13** .	REPAIR the spark plugs. ADJUST the gap or INSTALL a new spark plugs as necessary. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.

JC13 CHECK THE SPARK PLUG RESISTANCE

Measure the spark plug resistance.

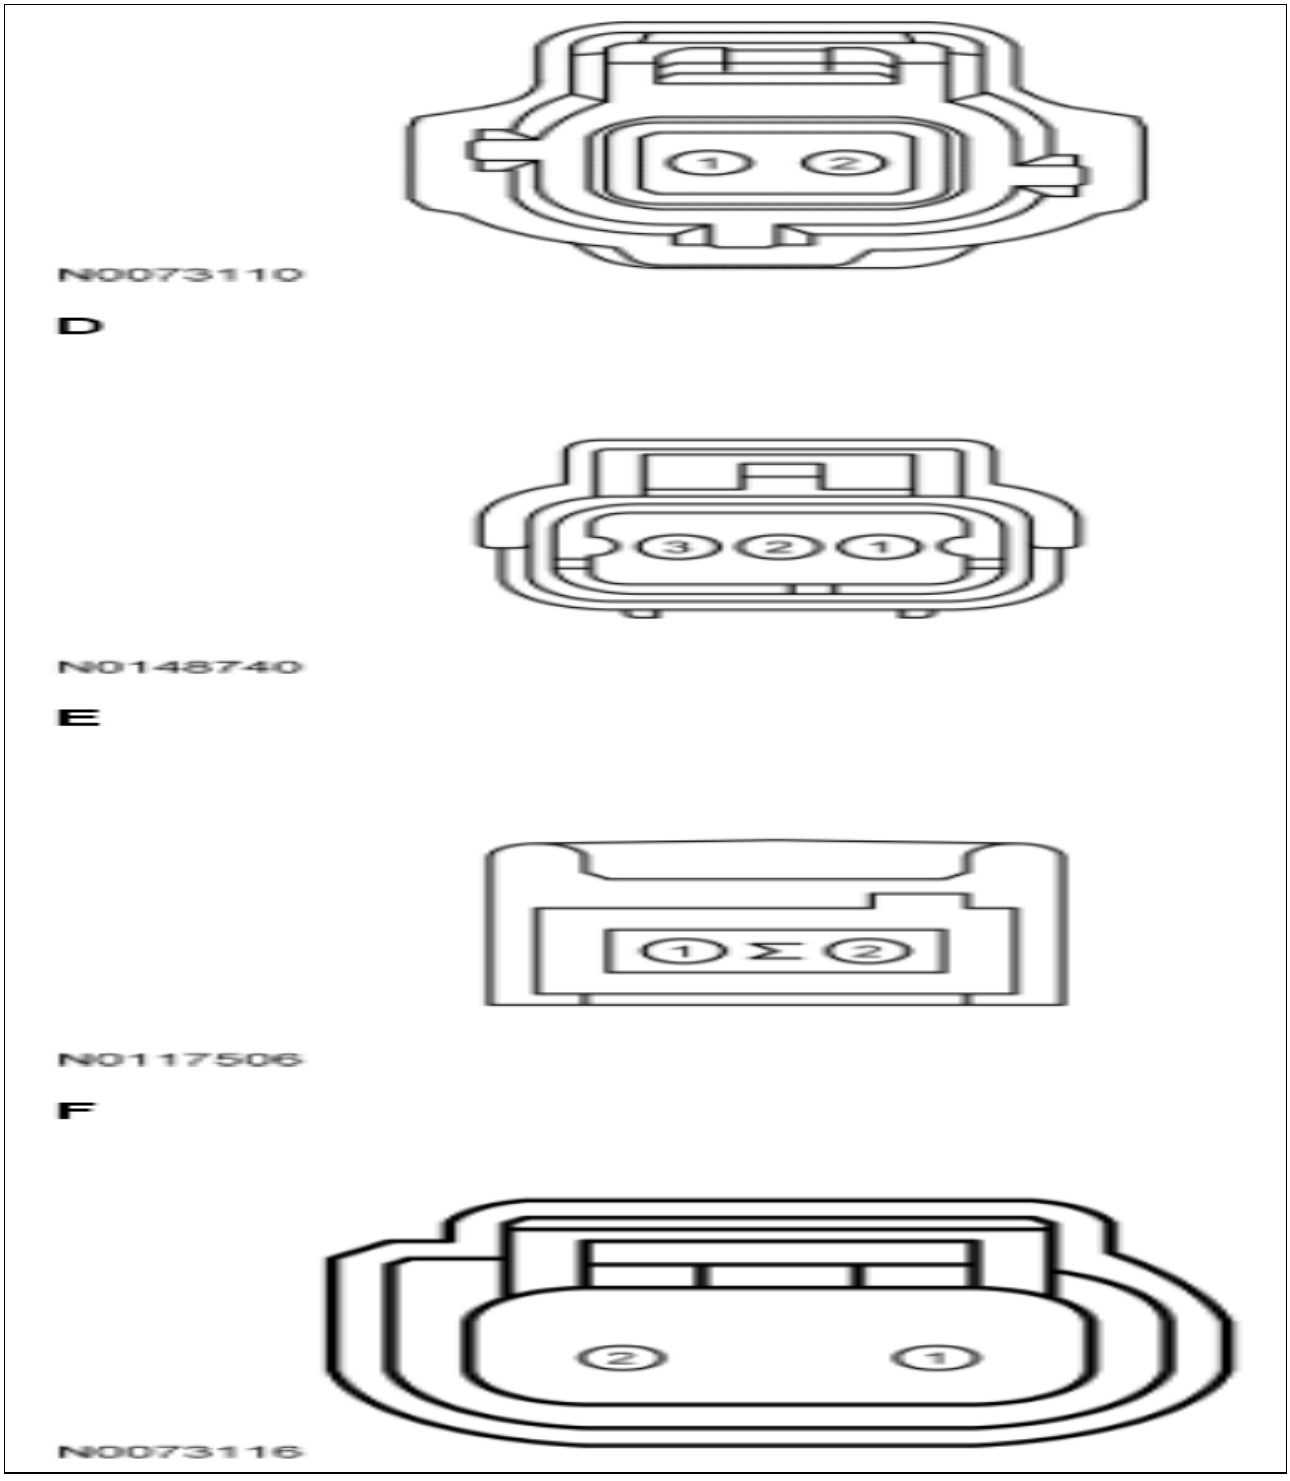
Is the resistance between 2, 000 and 20, 000 ohms?



Yes	No
GO to PINPOINT TEST Z .	INSTALL a new spark plugs. REFER to the service information , Engine Ignition. Clear the PCM DTCs. REPEAT the self-test.

PINPOINT TEST JD: CRANKSHAFT POSITION (CKP) SENSOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:



- CKP sensor (6C315)
- harness circuits: CKP, CKP+ and CKP-
- PCM (12A650)

Fig 1: Identifying Crankshaft Position (CKP) Sensor Connector (1 Of 2)

Courtesy of FORD MOTOR CO.

Fig 2: Identifying Crankshaft Position (CKP) Sensor Connector (2 Of 2)

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Edge 2.0L, Focus GTDI 2.0L, Fusion 2.0L, MKZ 2.0L	A	2 3 1	CKP SIGRTN VREF

Edge 2.7L, F-150 2.7L	A	2 1 3	CKP SIGRTN VREF
Escape/Kuga 1.6L	B	3 2 1	CKP SIGRTN VREF

PINPOINT TEST JD: CRANKSHAFT POSITION (CKP) SENSOR > TEST PROCEDURE

- **JD1 CHECK THE CKP SENSOR SIGNAL SENT TO THE PCM**

> *NOTE: The battery should be fully charged and the starting system should be functioning correctly.*

  - Remove the fuel pump fuse to disable the fuel pump.
  - Ignition ON, engine OFF.
  - Access the PCM and monitor the RPM (RPM) PID.
  - Crank the engine.

Is the RPM greater than 150 RPM?

Yes	No
For DTCs P0335, P0336 or P0339, GO to **JD2** . For DTC P1336 with no start, GO to PINPOINT TEST A . For DTC P1336, GO to PINPOINT TEST HD . For all others, the CKP, PCM, and harness are working correctly. RETURN to SYMPTOM CHARTS for further direction.	GO to **JD2** .

- **JD2 CHECK THE CKP SENSOR AND TRIGGER WHEEL FOR OBVIOUS PHYSICAL DAMAGE**
  - Ignition OFF.
  - Visually check the CKP sensor and trigger wheel for physical damage.

Are any trigger wheel teeth bent more than 1.0 mm or are any parts physically damaged?

Yes	No
REPAIR as necessary. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . For Edge, F-150, Fiesta 1.0L, Fiesta 1.6L GTDI, Focus, MKC, Mustang, and Transit, COMPLETE the Misfire Monitor Neutral Profile Correction procedure using the scan tool. For all others, COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE , Misfire, Fuel and Deceleration Fuel Shut Off Rear, HO2S Monitors.	For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, and Transit Connect 1.6L, GO to JD10. For all others, GO to **JD3** .

- **JD3 CHECK FOR CORRECT CKP BIAS VOLTAGES IN THE PCM**

- CKP Sensor connector disconnected.
- Ignition ON, engine OFF.
- Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

Are the voltages between 1 - 3 V?

Yes	No
GO to **JD4** .	GO to JD6.

- **JD4 CHECK THE CKP SENSOR RESISTANCE**
  - Ignition OFF.
  - Measure the resistance between:

(+) CKP Sensor Connector, Component Side	(-) CKP Sensor Connector, Component Side
CKP+	CKP-

Is the resistance between 0.25K - 1.1K ohms?

Yes	No
GO to **JD5** .	INSTALL a new CKP sensor. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . For Edge, F-150, Fiesta 1.0L, Fiesta 1.6L GTDI, Focus, MKC, Mustang, and Transit, COMPLETE the Misfire Monitor Neutral Profile Correction procedure using the scan tool. For all others, COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE , Misfire, Fuel and Deceleration Fuel Shut Off Rear, HO2S Monitors.

- **JD5 CHECK THE CKP HARNESS SHIELD GROUND**

NOTE: The harness shield protects the CKP signal from electrical noise and is

grounded at one end, typically near the PCM.

NOTE: Carry out the following resistance measurement between the CKP shield and the ground.

- Measure the resistance between:

(+) CKP_SHLD Assembly Connector, Harness Side	(-)
CKP_SHLD	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to **JD6** .	REPAIR the open circuit. CHECK for an intermittent ground connection. Clear the PCM DTCs. REPEAT the self-test.

- **JD6 CHECK FOR SHORT BETWEEN CKP(+) AND CKP(-)**
  - Ignition OFF.
  - PCM connector disconnected.
  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) CKP Sensor Connector, Harness Side
CKP+	CKP-

Is the resistance greater than 10K ohms?

Yes	No
GO to **JD7** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

- **JD7 CHECK THE CKP CIRCUITS FOR AN OPEN**
  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CKP-	CKP-
CKP+	CKP+

Are the resistances less than 5 ohms?

Yes	No

GO to **JD8** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

- **JD8 CHECK THE CKP CIRCUITS FOR A SHORT TO GROUND**
  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

Are the resistances greater than 10K ohms?

Yes	No
GO to **JD9** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

- **JD9 CHECK THE CKP CIRCUIT FOR A SHORT TO VOLTAGE**
  - Ignition ON, engine OFF.
  - Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-) Vehicle Battery
CKP+	Negative terminal
CKP-	Negative terminal

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to JD14.

- **JD10 CHECK FOR VOLTAGE AT THE SENSOR**
  - Ignition OFF.
  - CKP Sensor connector disconnected.
  - Ignition ON, engine OFF.
  - Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-) CKP Sensor Connector, Harness Side
VREF	SIGRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No

GO to **JD11** .	GO to PINPOINT TEST C .

- **JD11 CHECK FOR AN OPEN**
  - Ignition OFF.
  - PCM connector disconnected.
  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CKP	CKP

Is the resistance less than 5 ohms?

Yes	No
GO to **JD12** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

- **JD12 CHECK FOR A SHORT BETWEEN CIRCUITS**
  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-)
CKP	Ground

  - Measure the resistance between:

(+) CKP Sensor Connector, Harness Side	(-) CKP Sensor Connector, Harness Side
CKP	VREF
CKP	SIGRTN

Are the resistances greater than 10K ohms?

Yes	No
GO to **JD13** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

- **JD13 CHECK FOR A SHORT TO VOLTAGE**
  - Ignition ON, engine OFF.
  - Measure the voltage between:

(+) CKP Sensor Connector, Harness Side	(-)
CKP	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **JD14** .

- **JD14 INTERMITTENT CHECK**

> *NOTE: Chafed CKP or CMP wires or other physical damage to the harness may cause an intermittent short in the CKP or CMP circuit.*

  - Ignition OFF.
  - PCM connector connected.
  - Visually check for chafed CKP and CMP wires or other physical damage to the CKP or CMP harness.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **JD15** .

- **JD15 CHECK FOR PID CHANGE**
  - Ignition ON, engine OFF.
  - Access the PCM and monitor the FP (PER) PID.
  - Record the FP PID value.
  - Connect a 5 amp fused jumper wire between the following:

Point A CKP Sensor Connector, Harness Side	Point B CKP Sensor Connector, Harness Side
CKP	SIGRTN

  - Record the FP PID value.

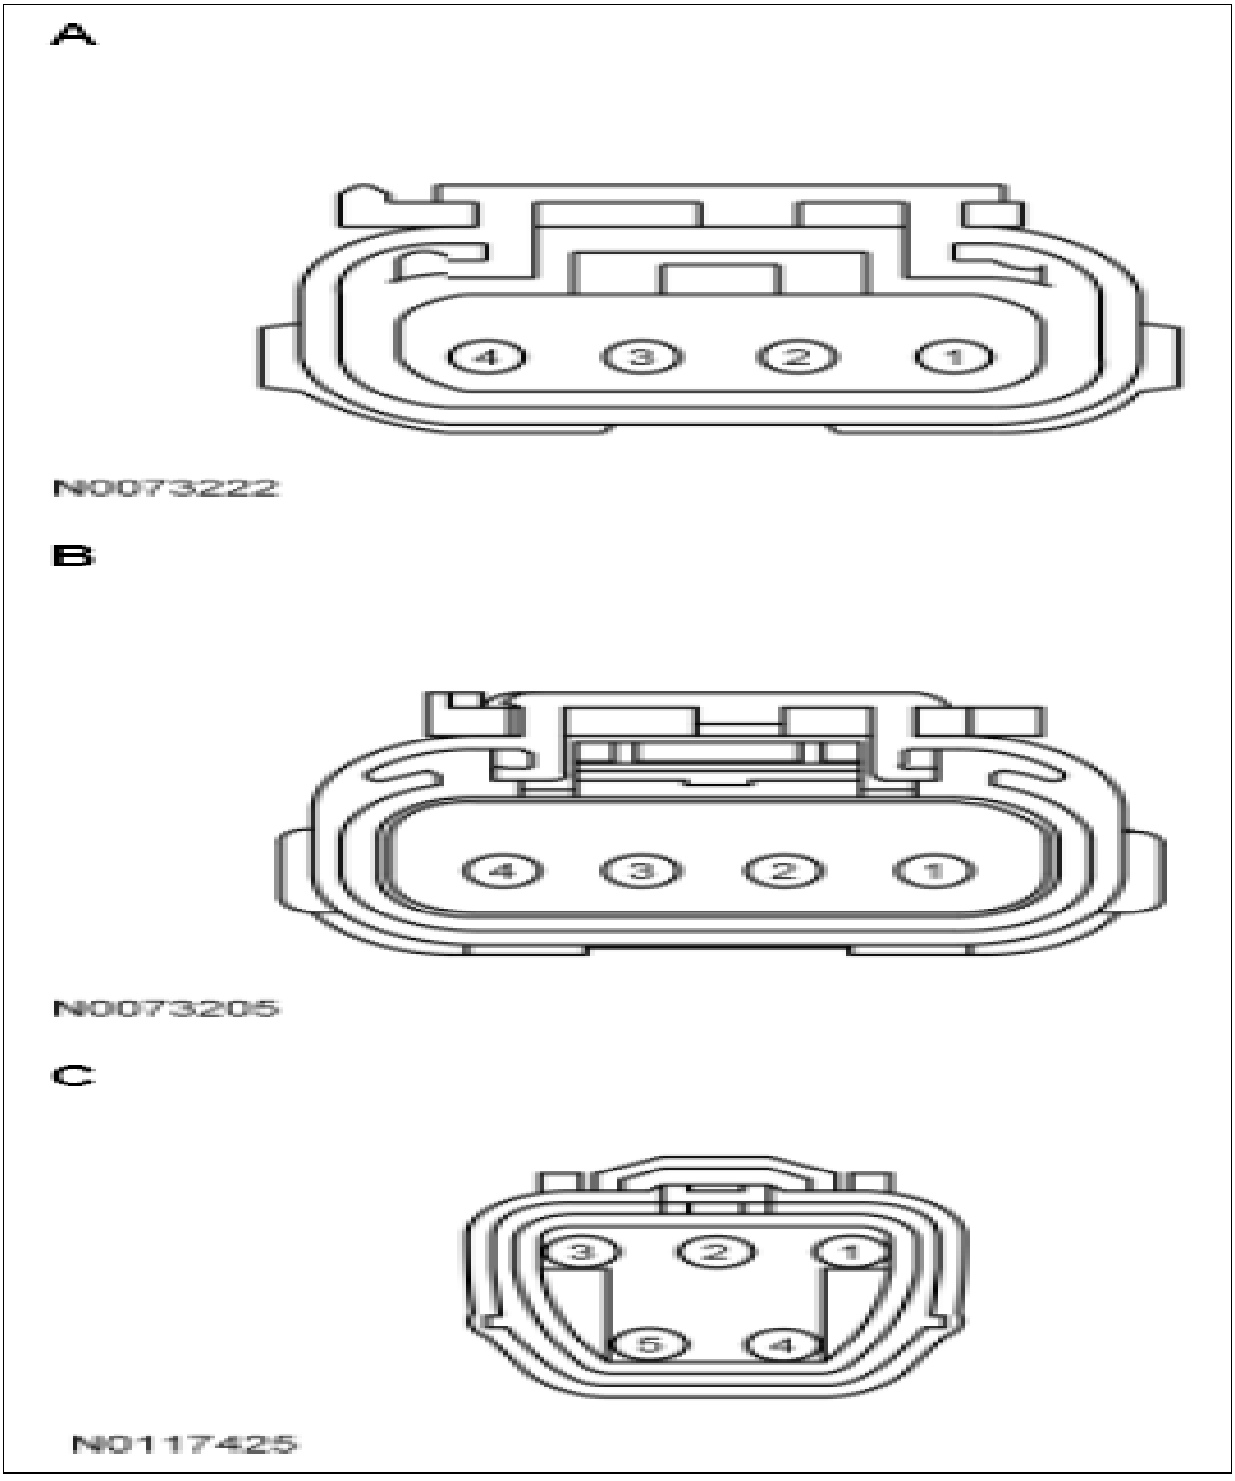
Does the PID value change?

Yes	No
INSTALL a new CKP sensor. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM), REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . For Edge, F-150, Fiesta 1.0L, Fiesta 1.6L GTDI,	GO to **JD16** .

Focus, MKC, Mustang, and Transit, COMPLETE the Misfire Monitor Neutral Profile Correction procedure using the scan tool. For all others, COMPLETE the Misfire and Fuel Monitors drive cycle procedure to learn the profile. REFER to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE , Misfire, Fuel and Deceleration Fuel Shut Off Rear, HO2S Monitors.	

- **JD16 CHECK FOR CORRECT PCM OPERATION**
  - Disconnect all the PCM connectors.
  - Visually inspect for:
    - pushed out pins
    - corrosion
  - Connect all the PCM connectors and make sure they seat correctly.
  - Carry out the PCM self-test.
  - Verify the concern is still present.

  Is the concern still present?



Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KC: FUEL PUMP CONTROL MODULE > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- fuel pump (9H307)
- fuel pump control module (9D370)
- fuel pump control module relay
- inertia fuel shutoff (IFS) switch (9341)
- harness circuits: B+, GND, FPC, FPM, FPPWR, FPRTN, IES, VPWR, and VPWR Fuel
- PCM (12A650)

PINPOINT TEST KC: FUEL PUMP CONTROL MODULE > TEST PROCEDURE

KC1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P025A, P025B, P025C, P025D, P0627, P166A, U0109 or U210B present?

Yes	No
For DTC P0627, GO to KC9. For DTC P166A, GO to KC30. For DTC U210B, GO to KC24. For all others, GO to **KC2** .	RETURN to SYMPTOM CHARTS for further direction.

KC2 CHECK THE VOLTAGE TO THE FUEL PUMP CONTROL MODULE

NOTE: Verify the IFS switch is set (button pressed) (if equipped).

Ignition OFF.

Fuel Pump Control Module connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
VPWR Fuel	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **KC3** .	GO to KC7.

KC3 CHECK THE GND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)

GND	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to **KC4** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC4 CHECK THE FPC AND FPM CIRCUITS FOR AN OPEN

PCM connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) PCM Connector, Harness Side
FPC	FPC
FPM	FPM

Are the resistances less than 5 ohms?

Yes	No
GO to **KC5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC5 CHECK THE FPC AND FPM CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
FPC	Ground
FPM	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **KC6** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC6 CHECK THE FPC AND FPM CIRCUITS FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
FPC	Ground
FPM	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Fuel Pump Control Module. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.

KC7 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN

Ignition OFF.

For Escape, Focus and Transit Connect,

BCM-E connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Component Side	(-) BCM-E Connector, Harness Side
VPWR Fuel	VPWR - Pin E9

For all others,

Fuel Pump Control Module Relay connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) Fuel Pump Control Module Relay Connector, Harness Side
VPWR Fuel	VPWR Fuel

Is the resistance less than 5 ohms?

Yes	No
For Escape/Kuga, Focus, and Transit Connect, GO to **KC8** . For all others, GO to KC17.	For Motorhome/Stripped Chassis/Step Van, GO to KC22. For all others, REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC8 CHECK THE BODY CONTROL MODULE FOR CRASH STATUS PIDS

Ignition ON, engine OFF.

Access the BdyCM and monitor the CRASH (MODE) PID.

Is the PID state NO?

Yes	No
INSTALL a new BCM. REFER to the service information ,	RESET the PID.

Multifunction Electronic Modules. Clear the PCM DTCs. REPEAT the self-test.	Clear the PCM DTCs. REPEAT the self-test.

KC9 CHECK THE FPPWR CIRCUIT, FPRTN CIRCUIT, AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

Ignition OFF.

Fuel Pump Control Module connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) Fuel Pump Control Module Connector, Harness Side
FPPWR	FPRTN

Is the resistance less than 10 ohms?

Yes	No
GO to KC12.	GO to **KC10** .

KC10 CHECK THE FPPWR AND FPRTN CIRCUITS FOR AN OPEN

FP connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPPWR
FPRTN	FPRTN

Are the resistances less than 5 ohms?

Yes	No
GO to **KC11** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC11 CHECK THE FP FOR AN OPEN

Measure the resistance between:

(+) FP Connector, Component Side	(-) FP Connector, Component Side
FPPWR	FPRTN

Is the resistance less than 10 ohms?

Yes	No

GO to **KC12** .	INSTALL a new FP. REFER to the service information , Fuel Tank and Lines. Clear the PCM DTCs. REPEAT the self-test.

KC12 CHECK THE FPPWR AND FPRTN CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
FPPWR	Ground
FPRTN	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **KC13** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC13 CHECK FOR FPPWR AND FPRTN CIRCUITS SHORTED TOGETHER

Measure the resistance between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPRTN

Is the resistance greater than 10K ohms?

Yes	No
GO to **KC14** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC14 CHECK THE FPPWR AND FPRTN CIRCUITS FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
FPPWR	Ground
FPRTN	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC15** .

KC15 INTERMITTENT CHECK

Ignition OFF.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPPWR
FPRTN	FPRTN

While monitoring the resistance measurement, wiggle, shake, and bend small sections of the wiring harness while working from the FP to the fuel pump control module.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC16** .

KC16 CHECK THE FUEL PUMP CONTROL MODULE FOR CORRECT OPERATION

NOTE: During output state control, the fuel pump stays commanded on for only about 5 seconds. Be aware that output state control turns the FP off after a calibrated time. If this happens, command the output ON to continue testing.

Fuel Pump Control Module connector connected.

Measure the voltage between:

(+) FP Connector, Harness Side	(-) FP Connector, Harness Side
FPPWR	FPRTN

Ignition ON, engine OFF.

Access the PCM and control the FP (MODE) PID.

Command the FP PID ON.

Does the voltage increase with the PID commanded ON?

Yes	No
INSTALL a new FP. REFER to the service information , Fuel Tank and Lines. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Fuel Pump Control Module. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.

KC17 CHECK THE FUEL PUMP CONTROL MODULE RELAY FOR CORRECT OPERATION

Carry out the fuel pump control module relay component test. Refer to the service information Component Testing.

Is a concern present?

Yes	No
INSTALL a new Fuel Pump Control Module relay. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC18** .

KC18 CHECK THE B+ CIRCUITS FOR AN OPEN

Measure the voltage between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-)
B+	Ground

Is the voltage greater than 10.5 V?

Yes	No
For E-Series, F-650/F-750, Fiesta, and Motorhome/Stripped Chassis/Step Van, GO to **KC19** . For all others, GO to KC21.	A B+ circuit concern is present. CHECK the condition of the related fuse/fuse links. If OK, REPAIR the open circuit. If the fuse/fuse link is damaged, CHECK the circuit for a short to ground before installing a new fuse/fuse link.

KC19 CHECK THE VPWR VOLTAGE TO THE FUEL PUMP CONTROL MODULE RELAY

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **KC20** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC20 CHECK THE FUEL PUMP CONTROL MODULE RELAY GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure the resistance between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-)
GND	Ground

Is the resistance less than 5 ohms?

Yes	No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC21 CHECK THE FP CIRCUIT FOR AN OPEN

For Edge, Fusion, MKZ and Transit,

BCM-C connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-) BCM-C Connector, Harness Side
FP	FP

For all others,

BCM-F connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-) BCM-F Connector, Harness Side
FP	FB

Is the resistance less than 5 ohms?

Yes	No
INSTALL a new BCM. REFER to the service information , Multifunction Electronic Modules. Clear the PCM DTCs. REPEAT the self-test.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC22 ISOLATE THE OPEN IN THE VPWR FUEL CIRCUIT

IFS Switch connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Relay Connector, Harness Side	(-) IFS Switch Connector, Harness Side
VPWR Fuel	VPWR Fuel - A - Pin 2

Is the resistance less than 5 ohms?

Yes	No
GO to **KC23** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC23 CHECK THE VPWR FUEL CIRCUIT FOR AN OPEN BETWEEN THE IFS SWITCH AND FUEL PUMP CONTROL MODULE

Measure the resistance between:

(+) IFS Switch Connector, Harness Side	(-) Fuel Pump Control Module Connector, Harness Side
VPWR Fuel - B - Pin 1	VPWR Fuel

Is the resistance less than 5 ohms?

Yes	No
INSTALL a new IFS switch. REFER to the service information , Fuel Tank And Lines. Clear the PCM DTCs. REPEAT the self-test.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC24 CHECK FOR RESTRAINTS CONTROL MODULE (RCM) DTCS

Carry out the RCM self-test.

Are any RCM DTCs present?

Yes	No
DIAGNOSE the supplemental restraint system concern. REFER to the service information , Supplemental Restraint System. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC25** .

KC25 INSPECT THE HARNESS BETWEEN THE FUEL PUMP CONTROL MODULE AND RESTRAINTS CONTROL MODULE (RCM)

Ignition OFF.

Check the harness for the following:

damage

corrosion

correct routing

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC26** .

KC26 CHECK THE ENS CIRCUIT FOR AN OPEN

NOTE: Refer to the service information , Supplemental Restraint System.

Depower the supplemental restraint system (SRS). Refer to the service information , Supplemental Restraint System for the Supplemental Restraint System (SRS) Depowering and Repowering procedure.

RCM connector disconnected.

Connect the battery ground cable.

Fuel Pump Control Module connector disconnected.

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-) RCM Connector, Harness Side
ENS	ENS

Is the resistance less than 5 ohms?

Yes	No
GO to **KC27** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KC27 CHECK THE ENS CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
ENS	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **KC28** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC28 CHECK THE ENS CIRCUIT FOR VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Fuel Pump Control Module Connector, Harness Side	(-)
ENS	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **KC29** .

KC29 CHECK THE ENS CIRCUIT FOR CORRECT RESPONSE

Ignition OFF.

Fuel Pump Control Module connector connected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) RCM Connector, Harness Side	(-)
ENS	Ground

Is the voltage greater than 10.5 V?

Yes	No
INSTALL a new RCM. REFER to the service information , Supplemental Restraint System. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Fuel Pump Control Module. REFER to the service information , Fuel Charging and Controls. Clear the PCM DTCs. REPEAT the self-test.

KC30 CHECK THE IES CIRCUIT FOR AN OPEN

BCM-C connector disconnected.

PCM connector disconnected.

Measure the resistance between:

(+) BCM-C Connector, Harness Side	(-) PCM Connector, Harness Side
IES	IES

Is the resistance less than 5 ohms?

Yes	No
GO to **KC31** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC31 CHECK THE IES CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) BCM-C Connector, Harness Side	(-)
IES	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **KC32** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KC32 CHECK THE IES FOR A SHORT TO VOLTAGE

Measure the voltage between:

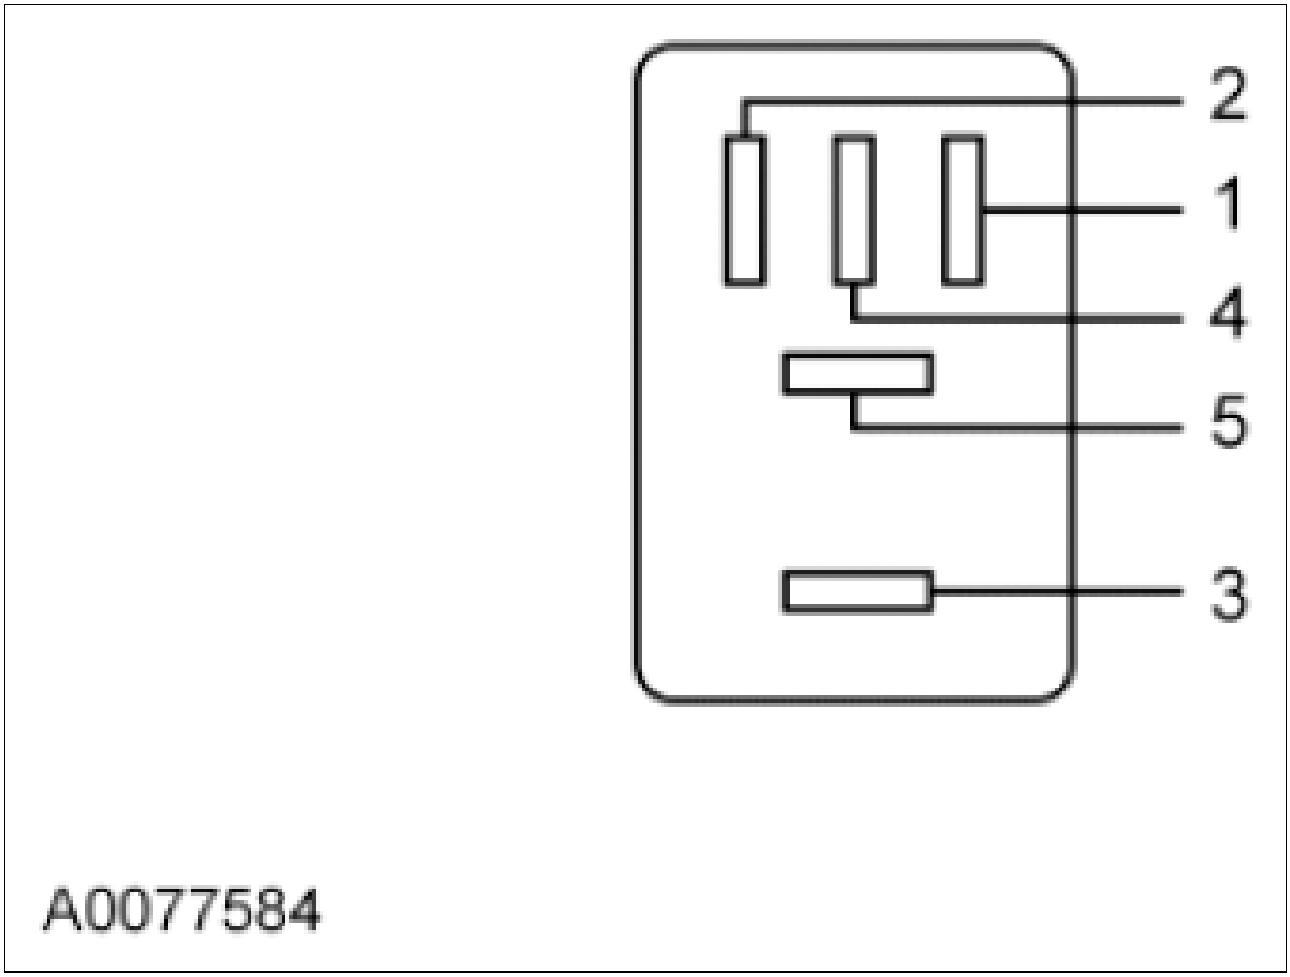
(+) BCM-C Connector, Harness Side	(-)
IES	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new BCM. REFER to the service information , Multifunction Electronic Modules.

PINPOINT TEST KF: FAN CONTROL RELAYS > INTRODUCTION

This pinpoint test is intended to diagnose the following:



- CAC fan relay
- fan control (FC1, FC2, FC3, FC4, FC5) relays
- harness circuits: CACCF, LFC, MFC, HFC and VPWR
- PCM (12A650)

Although the PCM output circuits are called LFC, MFC, and HFC, cooling fan operation is controlled by a combination of these outputs.

COOLING FAN REFERENCE

	PCM Output	Low Speed	Medium Speed	High Speed
Vehicles With 5 Fan Control Relays	LFC	ON	ON	ON
	MFC	OFF	ON	ON
	HFC	OFF	OFF	ON
All others	LFC	ON	N/A	ON
	HFC	OFF	N/A	ON

PINPOINT TEST KF: FAN CONTROL RELAYS > TEST PROCEDURE

KF1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P028D, P028E, P0480, P0481 or P0482 present?

Yes	No
For DTC P028D, P028E, or P0480, GO to KF3. For DTC P0481, GO to KF8. For all others, GO to KF13.	For symptoms without DTCs, GO to **KF2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

KF2 VERIFY A/C STATUS

Verify the A/C system is OFF.

Ignition ON, engine running.

Access the PCM and monitor the AC_REQ (MODE) PID.

Is A/C being requested?

Yes	No

REFER to the service information , Climate Control System, to diagnose the A/C system.	GO to **KF3** .

KF3 CHECK THE VOLTAGE TO THE RELAYS

Ignition OFF.

For DTCs P028D or P028E,

Charge Air Cooler Cooling Fan Relay connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Charge Air Cooler Cooling Fan Relay Connector, Harness Side	(-)
VPWR - Pin 1	Ground
B+ - Pin 3	Ground

For all others,

FC1 Relay connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) FC1 Relay Connector, Harness Side	(-)
VPWR	Ground
B+	Ground

Are the voltages greater than 10.5 V?

Yes	No
GO to **KF4** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF4 CHECK THE RELAYS

Carry out the Relay Component Test. Refer to service information .

Is a concern present?

Yes	No
INSTALL a new relay in question. Clear the PCM DTCs. REPEAT the self-test.	GO to **KF5** .

KF5 CHECK THE CACCF AND LFC CIRCUITS FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For DTCs P028D or P028E,

Measure the resistance between:

(+) Charge Air Cooler Cooling Fan Relay Connector, Harness Side	(-) PCM Connector, Harness Side
CACCF - Pin 2	CACCF

For all others,

Measure the resistance between:

(+) FC1 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
LFC	LFC

Is the resistance less than 5 ohms?

Yes	No
GO to **KF6** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF6 CHECK THE CACCF AND LFC CIRCUIT FOR A SHORT TO GROUND

For DTCs P028D or P028E,

Measure the resistance between:

(+) Charge Air Cooler Cooling Fan Relay Connector, Harness Side	(-)
CACCF - Pin 2	Ground

For all others,

Measure the resistance between:

(+) FC1 Relay Connector, Harness Side	(-)
LFC	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **KF7** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KF7 CHECK THE CACCF AND LFC CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

For DTCs P028D or P028E,

Measure the voltage between:

(+) Charge Air Cooler Cooling Fan Relay Connector, Harness Side	(-)
CACCF - Pin 2	Ground

For all others,

Measure the voltage between:

(+) FC1 Relay Connector, Harness Side	(-)
LFC	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	For Focus 1.0L and Fiesta 1.6L TIVCT, GO to KF18. For DTCs P028D, P028E, or P0480, GO to KF23. For all others, GO to **KF8** .

KF8 CHECK THE VOLTAGE TO THE RELAYS

Ignition OFF.

FC3 Relay connector disconnected.

Ignition ON, engine OFF.

For Fiesta 1.0L,

Measure the voltage between:

(+) FC3 Relay Connector, Harness Side	(-)
VPWR	Ground
B+	Ground

For MKC with 5 fan relays,

FC3 Relay connector disconnected.

FC5 Relay connector disconnected.

Measure the voltage between:

(+) FC3 Relay Connector, Harness Side	(-)
VPWR	Ground

Measure the voltage between:

(+) FC5 Relay Connector, Harness Side	(-)
VPWR - Pin 1, 5	Ground
B+ - Pin 3	Ground

For all others,

FC2 Relay connector disconnected.

Measure the voltage between:

(+) FC2 Relay Connector, Harness Side	(-)
VPWR	Ground

Measure the voltage between:

(+) FC3 Relay Connector, Harness Side	(-)
VPWR	Ground
B+	Ground

Are the voltages greater than 10.5 V?

Yes	No
GO to **KF9** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF9 CHECK FC2 AND FC3 RELAYS

Carry out the Relay Component Test. Refer to service information .

Is a concern present?

Yes	No
INSTALL a new relay in question. Clear the PCM DTCs. REPEAT the self-test.	GO to **KF10** .

KF10 CHECK THE HFC CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

For Fiesta 1.0L,

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

For MKC with 5 fan relays,

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

Measure the resistance between:

(+) FC5 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC - Pin 2	HFC

For all others,

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

Are the resistances less than 5 ohms?

Yes	No
GO to **KF11** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF11 CHECK THE HFC CIRCUIT FOR A SHORT TO GROUND

For Fiesta 1.0L,

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

For MKC with 5 fan relays,

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC	HFC

Measure the resistance between:

(+) FC5 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
HFC - Pin 2	HFC

For all others,

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-)
HFC	Ground

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-)
HFC	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **KF12** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KF12 CHECK THE HFC CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
HFC	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	For DTC P0481, GO to KF23. For all others, GO to **KF13** .

KF13 CHECK THE VOLTAGE TO THE FC2 AND FC4 RELAYS

Ignition OFF.

FC2 Relay connector disconnected.

FC4 Relay connector disconnected.

Ignition ON, engine OFF.

Access the PCM and control the LFC (MODE) PID.

Command the PID ON.

Measure the voltage between:

(+) FC2 Relay Connector, Harness Side	(-)
VPWR	Ground

Access the PCM and control the HFC (MODE) PID.

Command the PID ON.

Measure the voltage between:

(+) FC4 Relay Connector, Harness Side	(-)
VPWR - Pin 1, 3	Ground

Are the voltages greater than 10.5 V?

Yes	No
GO to **KF14** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF14 CHECK THE FC2 AND FC4 RELAYS

Carry out the Relay Component Test. Refer to service information

Is a concern present?

Yes	No
INSTALL a new FC2 or FC4 relay in question. Clear the PCM DTCs. REPEAT the self-test.	GO to **KF15** .

KF15 CHECK THE MFC CIRCUIT FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
MFC	MFC

Measure the resistance between:

(+) FC4 Relay Connector, Harness Side	(-) PCM Connector, Harness Side
MFC - Pin 2	MFC

Are the resistances less than 5 ohms?

Yes	No
GO to **KF16** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF16 CHECK THE MFC CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-)
MFC	Ground

Measure the resistance between:

(+) FC4 Relay Connector, Harness Side	(-)
MFC - Pin 2	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **KF17** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KF17 CHECK THE MFC CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
MFC	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	For DTC P0482, GO to KF23. For all others, GO to **KF18** .

KF18 CHECK THE FAN PWR CIRCUIT FOR AN OPEN

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

For Fiesta 1.0L,

Measure the resistance between:

(+) FC1 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FANPWR	FANPWR

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FANPWR	FANPWR

For Focus 1.0L,

Measure the resistance between:

(+) Charge Air Cooler Cooling Fan Relay Connector, Harness Side	(-) Charge Air Cooler Cooling Fan Motor Connector, Harness Side
FANPWR - Pin 5	FANPWR - Pin 1

For all others FC1 relay,

Measure the resistance between:

(+) FC1 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FANPWR	FANPWR

For all others FC2 relay,

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FC	FC

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-) Cooling Fan Motor 2 Connector, Harness Side
FANPWR	FANPWR - Pin 1

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FANRSTR1	FANPWR

FANPWR	FANPWR

For all others FC3 relay,

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) Cooling Fan Motor 2 Connector, Harness Side
FANPWR	FANPWR - Pin 1

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-) Cooling Fan Motor 1 Connector, Harness Side
FC	FC

For all others FC4 relay,

Measure the resistance between:

(+) FC4 Relay Connector, Harness Side	(-) Cooling Fan Motor 2 Connector, Harness Side
FANRSTR2 - Pin 4	FANPWR - Pin 1
FANPWR - Pin 5	FANPWR - Pin 1

Are the resistances less than 5 ohms?

Yes	No
GO to **KF19** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF19 CHECK THE FAN PWR CIRCUIT FOR A SHORT TO VOLTAGE

NOTE: For vehicles with a single cooling fan, disregard the cooling fan motor 2 measurement in this step.

Ignition ON, engine OFF.

For Focus 1.0L,

Measure the voltage between:

(+) Charge Air Cooler Cooling Fan Motor Connector, Harness Side	(-)
FANPWR - Pin 1	Ground

For all others,

Measure the voltage between:

(+) Cooling Fan Motor 1 Connector, Harness Side	(-)
FANPWR	Ground

Measure the voltage between:

(+) Cooling Fan Motor 2 Connector, Harness Side	(-)
FANPWR - Pin 1	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **KF20** .

KF20 CHECK GROUND CIRCUITS

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

Ignition OFF.

For Fiesta,

Measure the resistance between:

(+) Cooling Fan Motor 1 Connector, Harness Side	(-)
GND	Ground

For Focus 1.0L,

Measure the resistance between:

(+) Charge Air Cooler Cooling Fan Motor Connector, Harness Side	(-)
GND - Pin 2	Ground

For all others,

Measure the resistance between:

(+) FC2 Relay Connector, Harness Side	(-)
GND	Ground

Measure the resistance between:

(+) Cooling Fan Motor 2 Connector, Harness Side	(-)
GND - Pin 2	Ground

Measure the resistance between:

(+) FC3 Relay Connector, Harness Side	(-)
GND	Ground

Are the resistances less than 5 ohms?

Yes	No
GO to **KF21** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KF21 COMMAND THE FANS ON AND CHECK FOR VOLTAGE TO THE COOLING FAN MOTORS

NOTE: Only measure the circuits that apply to the vehicle being diagnosed.

NOTE: Not all vehicles will have cooling fan motor 2, MFC PID, or the HFC PID.

Ignition OFF.

PCM connector connected.

Charge Air Cooler Cooling Fan Relay connector connected.

FC1 Relay connector connected.

FC2 Relay connector connected.

FC3 Relay connector connected.

FC4 Relay connector connected.

FC5 Relay connector connected.

Ignition ON, engine OFF.

Access the PCM and control the COOLANT_PMP_A (MODE) PID.

Access the PCM and control the LFC (MODE) PID.

Access the PCM and control the MFC (MODE) PID.

Access the PCM and control the HFC (MODE) PID.

Command the PIDs ON.

Measure the voltage between:

(+) Charge Air Cooler Cooling Fan Motor Connector, Harness Side	(-)
FANPWR - Pin 1	Ground

Measure the voltage between:

(+) Cooling Fan Motor 1 Connector, Harness Side	(-)
FANPWR	Ground

Measure the voltage between:

(+) Cooling Fan Motor 2 Connector, Harness Side	(-)
FANPWR - Pin 1	Ground

For Fiesta,

Record the voltage.

Command the LFC PID OFF.

Record the voltage.

Are the voltages greater than 10.5 V?

Yes	No
GO to **KF22** .	GO to KF23.

KF22 CHECK FOR CORRECT FAN OPERATION

NOTE: Not all vehicles will have cooling fan motor 2, MFC PID, or the HFC PID.

Ignition OFF.

Charge Air Cooler Cooling Fan Motor connector connected.

Cooling Fan Motor 1 connector connected.

Cooling Fan Motor 2 connector connected.

Ignition ON, engine OFF.

Access the PCM and control the COOLANT_PMP_A (MODE) PID.

Access the PCM and control the LFC (MODE) PID.

Access the PCM and control the MFC (MODE) PID.

Access the PCM and control the HFC (MODE) PID.

Command the PIDs ON.

For Fiesta,

Check for fan operation.

Command the LFC PID OFF.

Check for fan operation.

Do the fans operate when commanded ON?

Yes	No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.	INSTALL a new Cooling Fan motor in question. Clear the PCM DTCs. REPEAT the self-test.

KF23 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

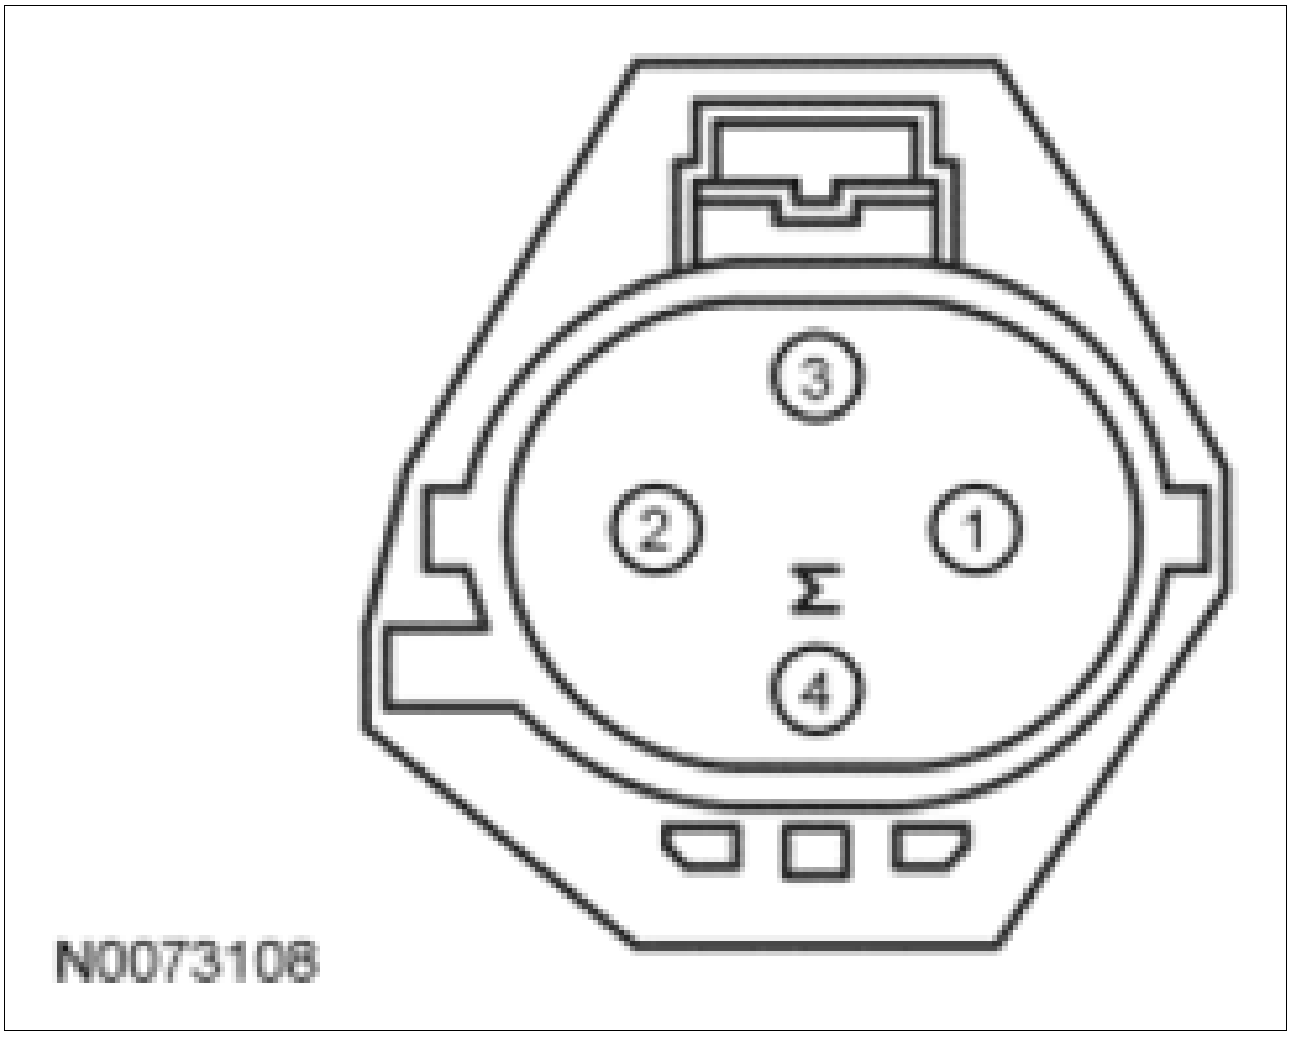
Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KN: VARIABLE SPEED ELECTRIC COOLING FAN MOTOR > INTRODUCTION

This pinpoint test is intended to diagnose the following:



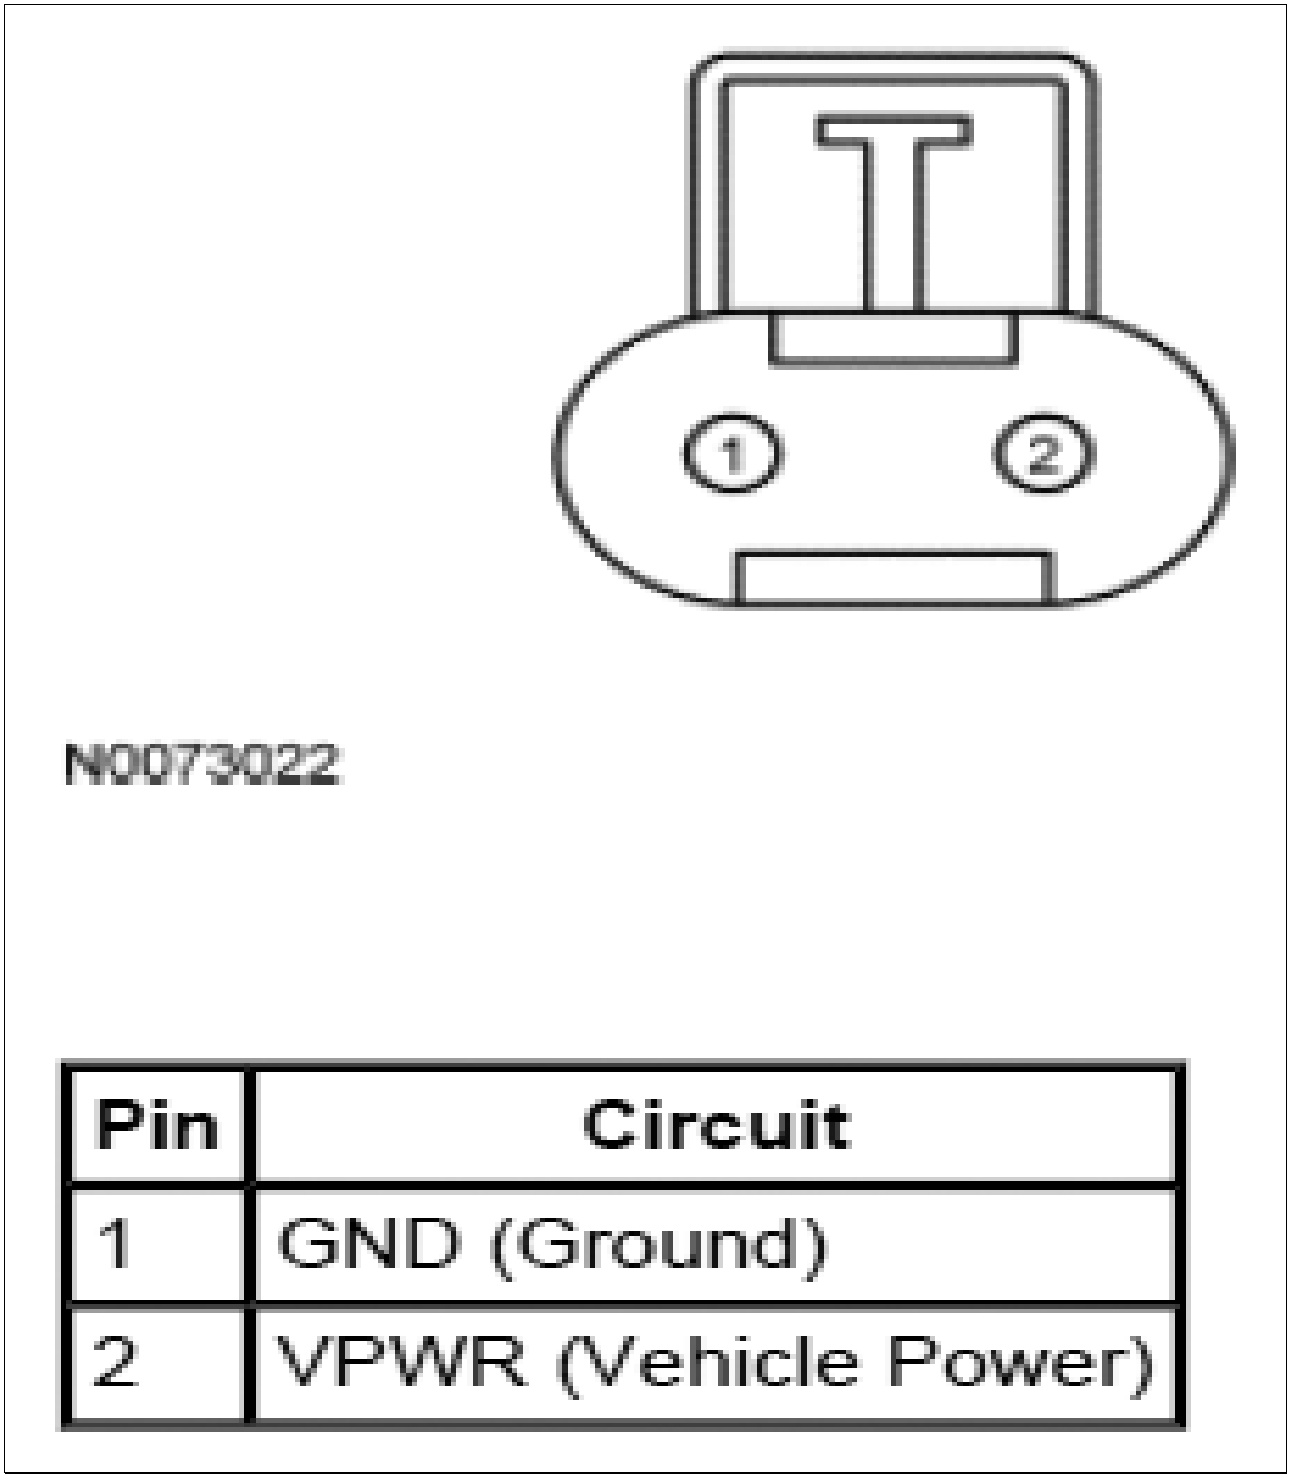
- cooling fan (CF) module (8B658)
- cooling fan assembly (8C607)
- harness circuits: FCV, FANPWR and GND

- powertrain control module (PCM) (12A650)

FCV DUTY CYCLE OUTPUT FROM PCM DESCRIPTION (NEGATIVE DUTY CYCLE)

FCV Duty Cycle Command (Negative Duty Cycle)	Cooling Fan Response And Speed
Less Than 10%	Fan OFF, Controller Inactive
10% - 90%	Linear Speed Increase
Greater Than 90% But Less Than 95%	100%
Greater Than 95% But Less Than 100%	Fan OFF

Fig 1: Identifying Cooling Fan (CF) Module Connector



Courtesy of FORD MOTOR CO.

Pin	Circuit
4	FCV (Fan Control Variable)
2	GND (Ground)

1	FANPWR (Fan Power)

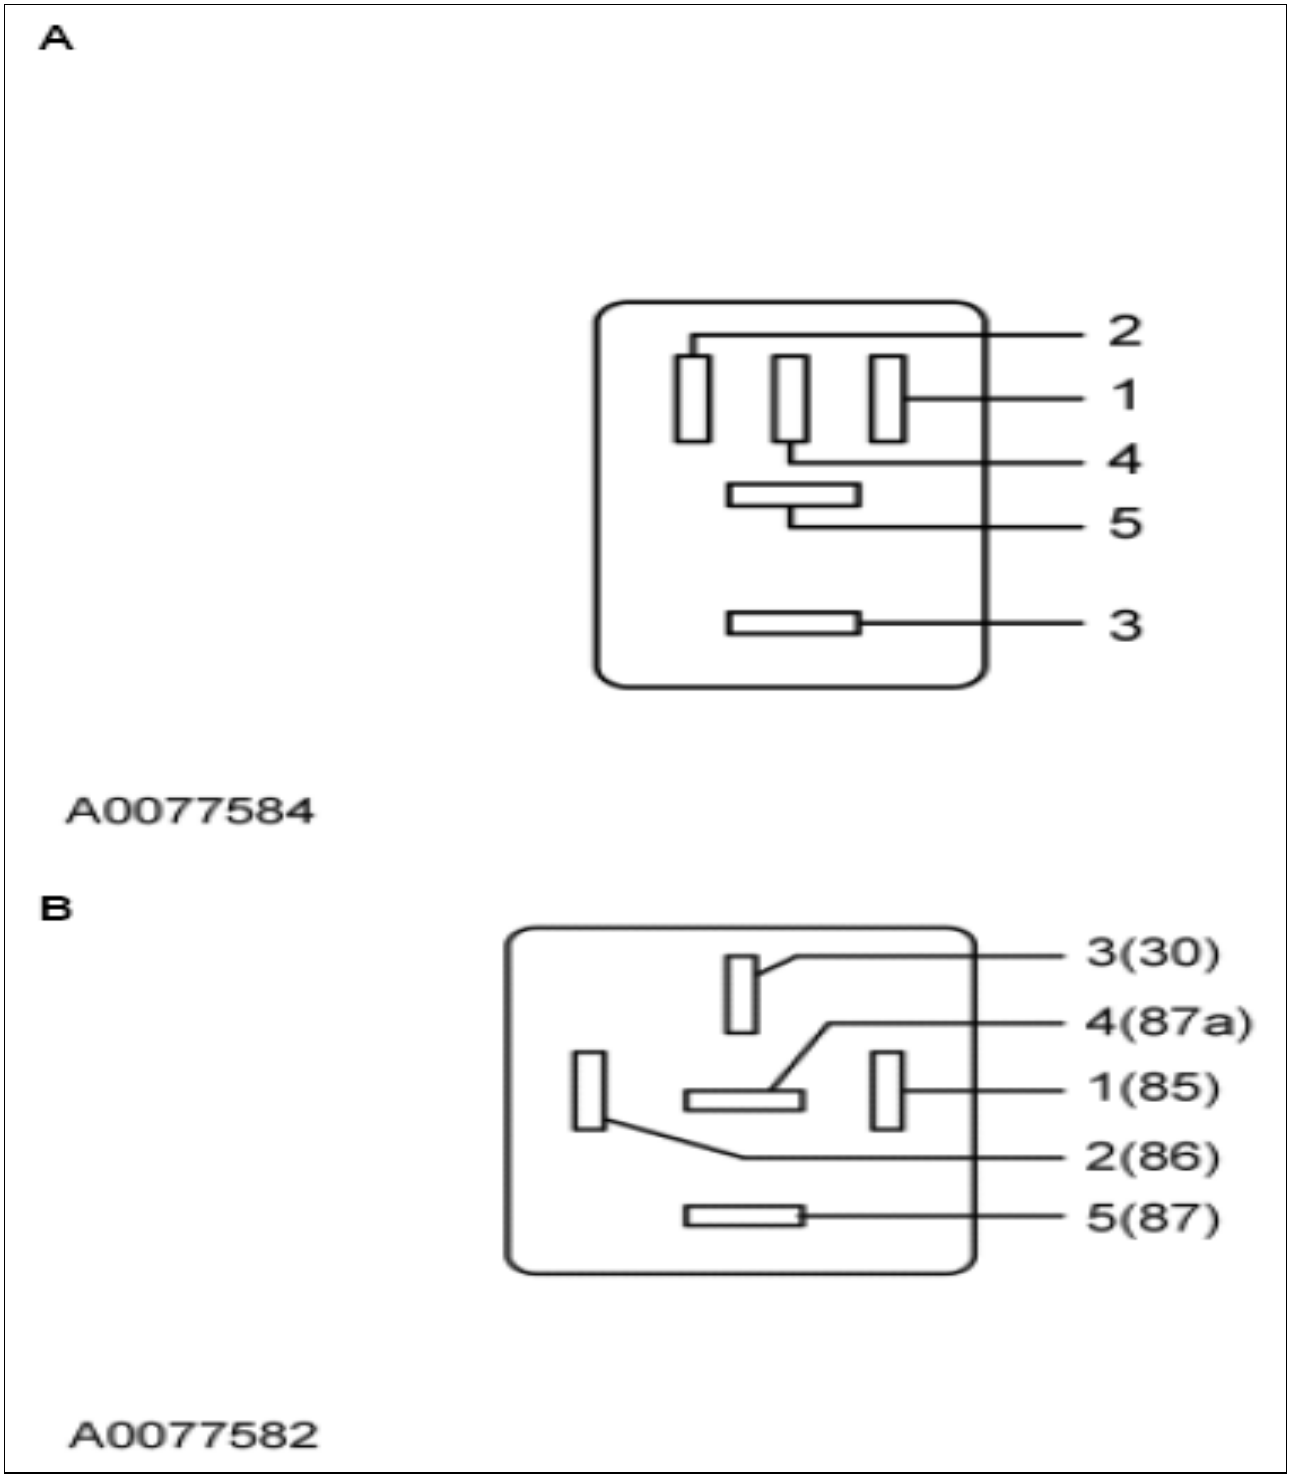


Fig 2: Identifying Cooling Fan (CF) Motor Connector

Courtesy of FORD MOTOR CO.

Pin	Circuit
1	GND (Ground)
2	FANPWR (Fan Power)

Fig 3: Identifying Fan Control (FC) Relay Connector

Courtesy of FORD MOTOR CO.

Vehicle	Connector	Pin	Circuit
Fiesta	A	5 2 1 3	FANPWR GND VPWR B+

All other vehicles	B	5 2 1 3	FANPWR GND VPWR B+

PINPOINT TEST KN: VARIABLE SPEED ELECTRIC COOLING FAN MOTOR > INTRODUCTION > POWERTRAIN CONTROL MODULE (PCM) CONNECTOR

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
Escape/Kuga 2.5L, MKX, Transit Connect 2.5L	190-PIN	B34	FCV
Fiesta, Focus 1.0L	198 PIN	B5	FCV
Focus GDI 2.0L	198 PIN	B8	FCV
All other vehicles	198 PIN	B4	FCV

PINPOINT TEST KN: VARIABLE SPEED ELECTRIC COOLING FAN MOTOR > TEST PROCEDURE

KN1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Is DTC P0480 present?

Yes	No
GO to KN3.	For symptoms without DTCs. GO to **KN2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

KN2 VERIFY A/C STATUS

Verify the A/C system is OFF.

Ignition ON, engine running.

Access the PCM and monitor the AC_REQ (MODE) PID.

Is A/C being requested?

Yes	No
REFER to the service information , Climate Control System, to diagnose the A/C system.	GO to **KN3** .

KN3 COMMAND THE COOLING FAN ON TO CHECK OPERATION

Rotate the cooling fan by hand. The cooling fan should rotate freely, with no abnormal binding. If binding is present, remove any foreign materials or install a new cooling fan as required.

Ignition ON, engine OFF.

Access the PCM and control the FAN_DSD (PER) PID.

Command the fan to full ON.

Does the cooling fan operate when commanded ON?

Yes	No
The concern is elsewhere. RETURN to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX for further direction.	GO to **KN4** .

KN4 CHECK THE VOLTAGE TO THE COOLING FAN MODULE

Ignition OFF.

CF Module connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FANPWR - Pin 1	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to KN8.	For MKX, REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test. For all others, GO to **KN5** .

KN5 CHECK FOR VOLTAGE TO THE RELAY

Ignition OFF.

FC Relay connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) FC Relay Connector, Harness Side	(-)
B+	Ground

VPWR	Ground

Are the voltages greater than 10.5 V?

Yes	No
GO to **KN6** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KN6 CHECK THE RELAY

Carry out the Relay Component Test. Refer to Wiring Diagrams Cell 149.

Is a concern present?

Yes	No
INSTALL a new FC relay. Clear the PCM DTCs. REPEAT the self-test.	GO to **KN7** .

KN7 CHECK THE FC RELAY GROUND

Ignition OFF.

Measure the resistance between:

(+) FC Relay Connector, Harness Side	(-)
GND	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to **KN8** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KN8 CHECK FOR AN OPEN CIRCUIT

Ignition OFF.

PCM connector disconnected.

Measure the resistance between:

(+) CF Module Connector, Harness Side	(-)
GND - Pin 2	Ground

Measure the resistance between:

(+) CF Module Connector, Harness Side	(-) PCM Connector, Harness Side

FCV - Pin 4	FCV

For Escape and Focus,

Measure the resistance between:

(+) FC Relay Connector, Harness Side	(-) CF Module Connector, Harness Side
FANPWR	FANPWR - Pin 1

Are the resistances less than 5 ohms?

Yes	No
GO to **KN9** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KN9 CHECK THE FCV CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **KN10** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KN10 CHECK THE FCV CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) CF Module Connector, Harness Side	(-)
FCV - Pin 4	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **KN11** .

KN11 CHECK THE FCV CIRCUIT(S) FOR INTERMITTENT CONCERNS

NOTE: Not all vehicles have a FC relay.

Ignition OFF.

CF Motor connector disconnected.

Visually inspect all connectors for:

pushed out pins

corrosion

CF Motor connector connected.

CF Module connector connected.

PCM connector connected.

FC Relay connector connected.

Ignition ON, engine OFF.

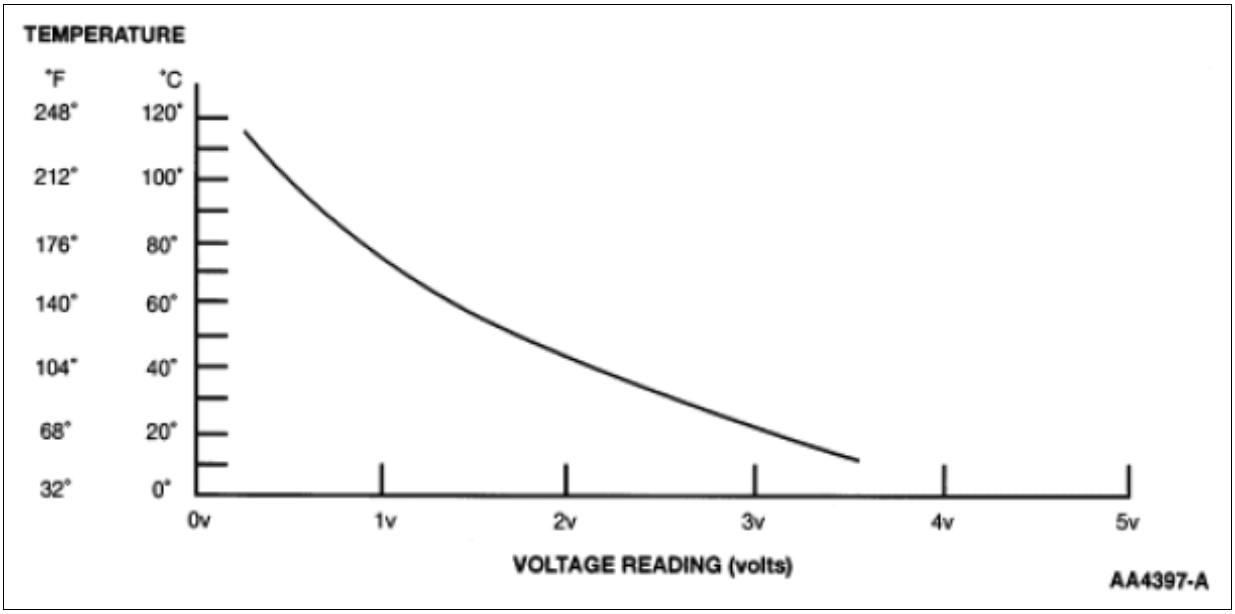
Access the PCM and control the FAN_DSD (PER) PID.

Command the fan to full ON.

While observing the fan, wiggle, shake, and bend small sections of the wiring harness while working from the CF module to the PCM.

Lightly tap on the CF motor and wiggle the harness connector to simulate road shock.

Is a concern present?



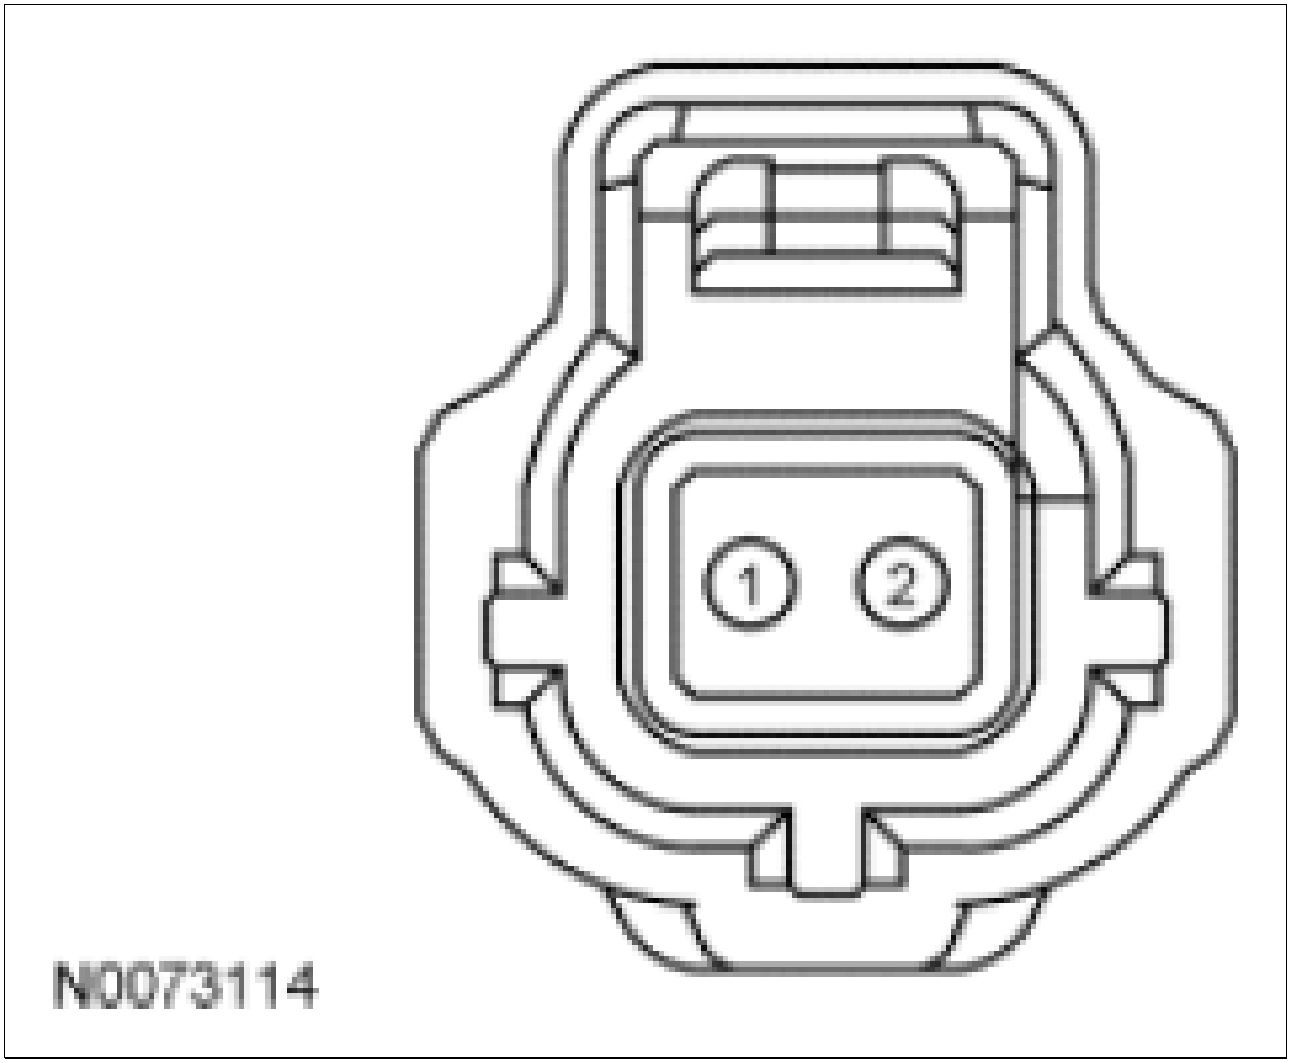
Yes	No
REPAIR as necessary. If a wiring concern is not present, INSTALL a new CF motor. REFER to the service information , Engine Cooling. Clear the PCM DTCs. REPEAT the self-test.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST KP: CHARGE AIR COOLER (CAC) > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- CAC coolant temperature sensor (12A648)
- CAC pump (8501)
- harness circuits: CAC, CACCTS, SIGRTN, PUMPPWR and GND
- PCM (12A650)

Fig 1: CAC Coolant Temperature Sensor Voltage Graph



Courtesy of FORD MOTOR CO.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values	
°C	°F	Voltage	Resistance (K ohms)
120	248	0.28	1.18
110	230	0.36	1.55
100	212	0.47	2.07
90	194	0.61	2.80
80	176	0.80	3.84
70	158	1.05	5.37
60	140	1.37	7.70
50	122	1.77	10.97
40	104	2.23	16.15
30	86	2.74	24.27
20	68	3.26	37.30
10	50	3.73	58.75
0	32	4.14	95.85
-10	14	4.45	160.31

2	PUMPPWR (Pump Power)

PINPOINT TEST KP: CHARGE AIR COOLER (CAC) > INTRODUCTION > POWERTRAIN CONTROL MODULE (PCM) CONNECTOR

For PCM connector views or reference values, refer to REFERENCE VALUES .

Connector	Pin	Circuit
198 PIN	E13 B19 E23	CAC SIGRTN CACCTS

PINPOINT TEST KP: CHARGE AIR COOLER (CAC) > TEST PROCEDURE

KP1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Are DTCs P00DF, P00E0, P00E1, P00E2, P023A, P023B, P023C or P026A present?

Yes	No
For DTC P00DF, P00E0, P00E1, P00E2, GO to **KP2** . For all others, GO to KP9.	For symptoms without DTCs, GO to **KP2** . For all others, RETURN to SYMPTOM CHARTS for further direction.

KP2 CHECK THE CAC COOLING SYSTEM
