WARNING: TO AVOID PERSONAL INJURY DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE. STEAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENED SLIGHTLY. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: Verify cooling fan operation before proceeding with this test.

Check the CAC cooling system for any loss of coolant or overheating concerns.

Is the CAC cooling system OK?

Yes	No
GO to **KP3** .	REFER to the service information , Charge Air Cooling, to continue CAC cooling system diagnosis.

KP3 CHECK THE RESISTANCE OF THE CAC COOLANT TEMPERATURE SENSOR

NOTE: Refer to the chart at the beginning of this test for the resistance specifications.

Ignition OFF.

Charge Air Cooler (CAC) Coolant Temperature Sensor connector disconnected.

Measure the resistance between:

(+) Charge Air Cooler (CAC) Coolant Temperature Sensor Connector, Component Side	(-) Charge Air Cooler (CAC) Coolant Temperature Sensor Connector, Component Side

CACCTS - Pin 1	SIGRTN - Pin 2

Is the resistance within specification?

Yes	No
GO to **KP4** .	INSTALL a new Charge Air Cooler (CAC) Coolant Temperature sensor. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM), REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . Clear the PCM DTCs. REPEAT the self-test.

KP4 CHECK THE CAC COOLANT TEMPERATURE SENSOR CIRCUITS FOR AN OPEN

PCM connector disconnected.

Measure the resistance between:

(+) Charge Air Cooler (CAC) Coolant Temperature Sensor Connector, Harness Side	(-) PCM Connector, Harness Side
CACCTS - Pin 1	CACCTS - Pin E23
SIGRTN - Pin 2	SIGRTN - Pin B19

Are the resistances less than 5 ohms?

Yes	No
GO to **KP5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KP5 CHECK THE CAC COOLANT TEMPERATURE SENSOR CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between:

(+) Charge Air Cooler (CAC) Coolant Temperature Sensor Connector, Harness Side	(-)
CACCTS - Pin 1	Ground
SIGRTN - Pin 2	Ground

Are the resistances greater than 10K ohms?

Yes	No
GO to **KP6** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KP6 CHECK THE CAC COOLANT TEMPERATURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Charge Air Cooler (CAC) Coolant Temperature Sensor Connector, Harness Side	(-)
CACCTS - Pin 1	Ground
SIGRTN - Pin 2	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	GO to **KP7** .

KP7 CAC COOLANT TEMPERATURE SENSOR INTERMITTENT CHECK

Charge Air Cooler (CAC) Coolant Temperature Sensor connector connected.

PCM connector connected.

Ignition ON, engine OFF.

Access the PCM and monitor the CACCT_V (VOLT) PID.

While observing the PID, wiggle, shake, and bend small sections of the wiring harness while working from the sensor to the PCM.

Lightly tap on the CAC coolant temperature sensor and wiggle the harness and connector to simulate road shock.

Does the PID reading change?

Yes	No
REPAIR as necessary or INSTALL a new CAC coolant temperature sensor. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM), REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) .	GO to **KP8** .

KP8 CHECK THE CHARGE AIR COOLER COOLANT TEMPERATURE AND THE ENGINE COOLANT TEMPERATURE CORRELATION

NOTE: Check temperature values while engine is at ambient temperature, cold soak the engine for a minimum of 6 hours if necessary. Make sure the vehicle has not been in direct sun light.

Access the PCM and monitor the CACCT (TEMP) and ECT (TEMP) PIDs.

Are the temperature readings within 16.6° C (30°F) of each other?

Yes	No
GO to KP14.	INSTALL a new Charge Air Cooler (CAC) Coolant Temperature sensor. REFER to the service information , Electronic Engine Controls. RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . Clear the PCM DTCs. REPEAT the self-test.

KP9 CHECK THE PUMPPWR CIRCUIT FOR AN OPEN

Ignition OFF.

Charge Air Cooler (CAC) Pump connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-)
PUMPPWR - Pin 2	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **KP10** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KP10 CHECK THE GND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure the resistance between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-)
GND - Pin 1	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to **KP11** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KP11 CHECK THE CAC CIRCUIT FOR AN OPEN

PCM connector disconnected.

Measure the resistance between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-) PCM Connector, Harness Side

CAC - Pin 3	CAC - Pin E13

Is the resistance less than 5 ohms?

Yes	No
GO to **KP12** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

KP12 CHECK THE CAC CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-)
CAC - Pin 3	Ground

Is the resistance greater than 10K ohms?

Yes	No
GO to **KP13** .	REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.

KP13 CHECK THE CAC CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON, engine OFF.

Measure the voltage between:

(+) Charge Air Cooler (CAC) Pump Connector, Harness Side	(-)
CAC - Pin 3	Ground

Is any voltage present?

Yes	No
REPAIR the short circuit. Clear the PCM DTCs. REPEAT the self-test.	INSTALL a new Charge Air Cooler (CAC) Pump. REFER to the service information , Charge Air Cooling. Clear the PCM DTCs. REPEAT the self-test.

KP14 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

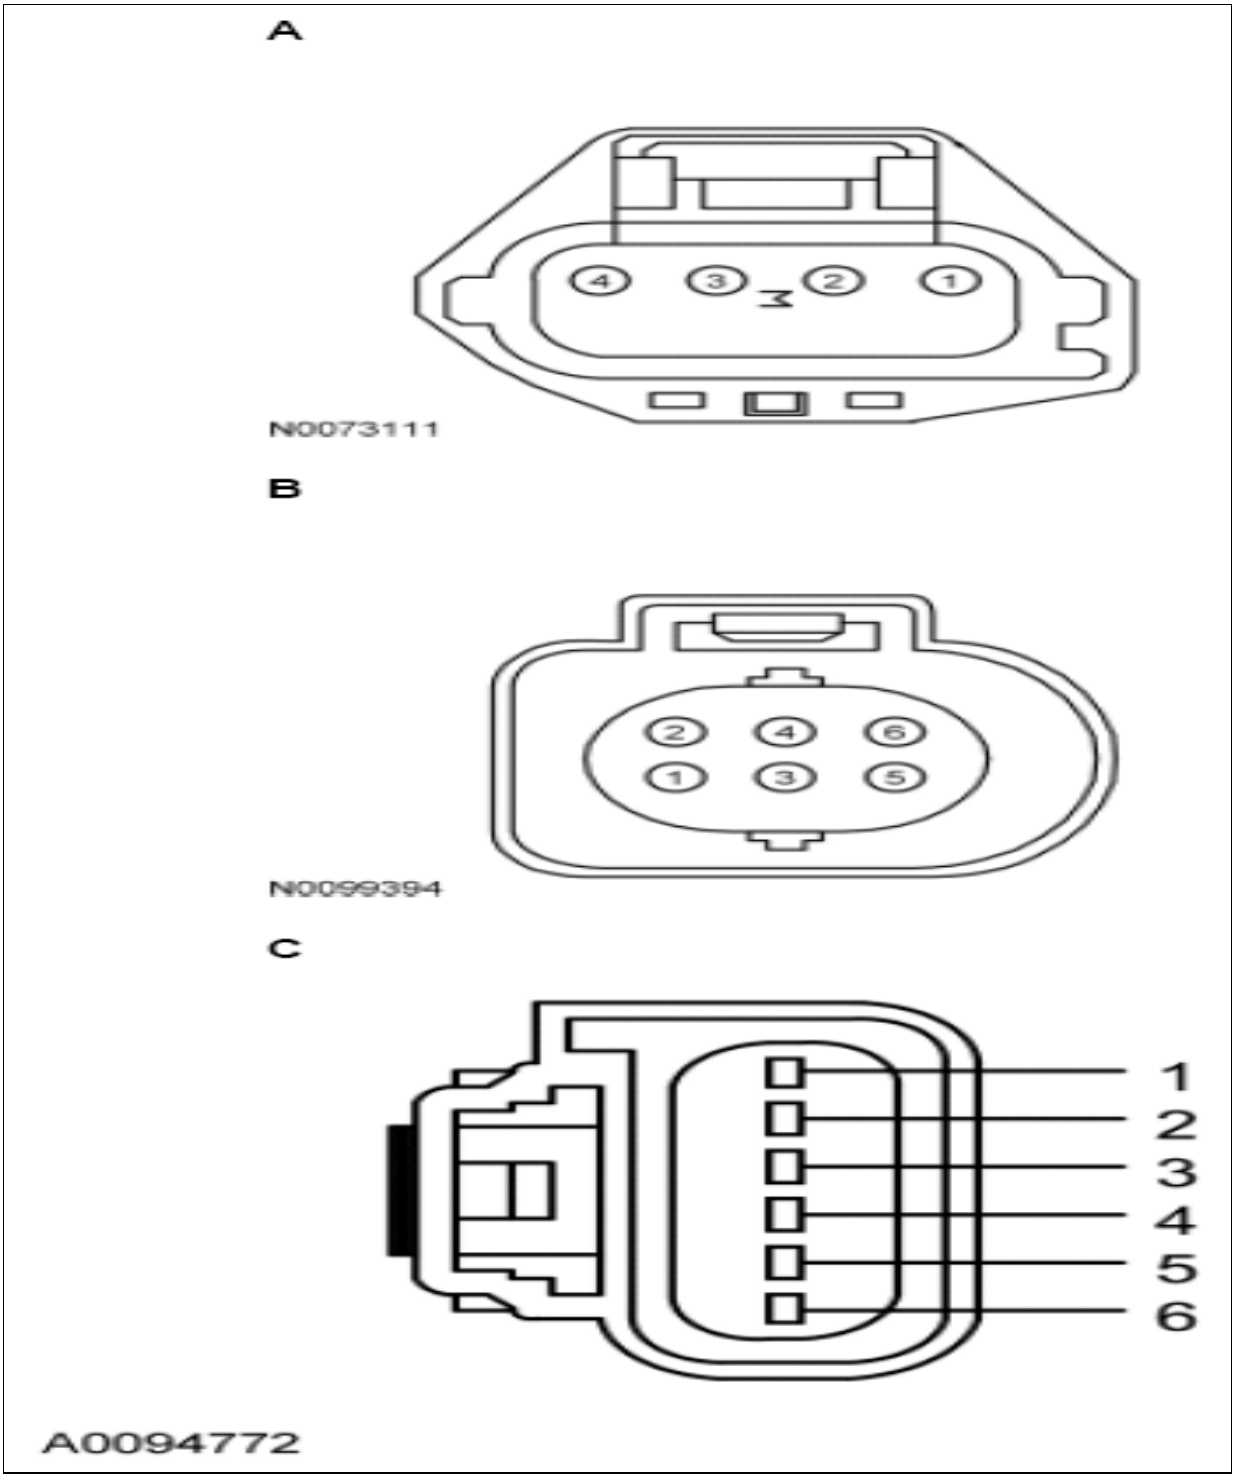
- pushed out pins
- corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?



Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. GO to PINPOINT TEST Z .

PINPOINT TEST QA: UNABLE TO ACTIVATE SELF-TEST/NETWORK COMMUNICATION ERROR > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- unable to communicate with powertrain control module (PCM)
- unable to activate the PCM self-test
- incorrect self-test procedure
- harness circuits: ISP-R, PCMRC, PWRGND and VPWR

Fig 1: Identifying Electronic Throttle Body Throttle Position Sensor (ETBTPS) Connector

PINPOINT TEST QA: UNABLE TO ACTIVATE SELF-TEST/NETWORK COMMUNICATION ERROR > TEST PROCEDURE

QA1 CARRY OUT A VEHICLE INSPECTION AND VERIFY THE SELF-TEST PROCEDURE

NOTE: If the self-test or communication concern occurred after a failed or an aborted reprogram, the module may be blank. Attempt to reprogram the module again before continuing with this pinpoint test.

Visually inspect the following for obvious signs of electrical damage:

harness wiring

electrical connections

Verify the correct procedure was used to activate the self-test for the scan tool. Refer to SCAN TOOL SETUP AND FUNCTIONALITY .

Was the correct self-test procedure used?

Yes	No
GO to **QA2** .	REFER to SCAN TOOL SETUP AND FUNCTIONALITY .

QA2 CARRY OUT THE NETWORK TEST

NOTE: When using Integrated Diagnostic System (IDS), the scan tool attempts to communicate with the PCM first. After establishing communication with the PCM, the scan tool then attempts to communicate with all modules on the vehicle. If an IDS session cannot be established, IDS may state no communication can be established with the PCM:

choose No when the scan tool prompts whether or not to retry communication.

enter a PCM part number, tear tag or calibration number to identify the vehicle and start a session. The PCM part number and 4-character tear tag are located on the PCM.

Ignition ON, engine OFF.

Carry out the network test.

Do all modules indicate pass?

Yes	No
For DTCs U0101, U0402, U1011 or U1013, GO to QA7. For DTC U0104, GO to QA12. For DTCs U0121, U0415, U1012 or U1039, GO to QA8. For DTC U0138, GO to QA13. For DTCs U0140 or U0422, GO to QA9. For DTCs U0155 or U0423, GO to QA10. For DTC U0212, GO to QA11. For DTC U0298, GO to QA14. For all others, REFER to QT :	If only PCM indicates fail, GO to **QA3** . For network test or all other modules indicates fail, REFER to the service information , Module Communications Network, to diagnose the PCM does not respond to the scan tool or no high speed controller area network (CAN) communication, all modules are not responding symptom.

QA3 CHECK FOR VREF VOLTAGE AT THE ETBTPS SENSOR

Ignition ON, engine OFF.

ETBTPS connector disconnected.

Measure the voltage between:

(+) ETBTPS Connector, Harness Side	(-) ETBTPS Connector, Harness Side
ETCREF	ETCRTN

Is the voltage between 4.5 - 5.5 V?

Yes	No
REFER to the service information , Module Communications Network, to diagnose the PCM does not respond to the scan tool or no high speed controller area network (CAN) communication, all modules are not responding symptom.	GO to **QA4** .

QA4 CHECK THE ISP-R VOLTAGE AT THE PCM

Ignition OFF.

PCM connector disconnected.

Ignition ON, engine OFF.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
ISP-R	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **QA5** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

QA5 CHECK THE PCM VPWR CIRCUITS FOR VOLTAGE

Ignition OFF.

Disconnect the PCM.

Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
PCMRC	Ground

Ignition ON, engine OFF.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **QA6** .	GO to PINPOINT TEST B .

QA6 CHECK THE PCM GROUND CIRCUITS FOR AN OPEN

Ignition OFF.

Measure the resistance between:

(+) PCM Connector, Harness Side	(-)
PWRGND	Ground

Is the resistance less than 5 ohms?

Yes	No
GO to QA17.	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

QA7 CHECK FOR A TRANSMISSION CONTROL MODULE (TCM) CONCERN

Check for any TCM DTCs.

Check for other TCM related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Automatic Transmission, DTC Charts to continue diagnosis.	For DTCs U1011 or U1013, GO to QA15. For all others, GO to QA17.

QA8 CHECK FOR AN ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CONCERN

Check for any ABS module DTCs.

Check for other ABS related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Vehicle Dynamic Systems, DTC Charts to continue diagnosis.	For DTC U1012, GO to QA15. For all others, GO to QA17.

QA9 CHECK FOR A BODY CONTROL MODULE (BCM) CONCERN

Check for any BCM DTCs.

Check for other BCM related symptoms.

Is a concern present?

Yes	No

REFER to the service information , Multifunction Electronic Modules, DTC Charts to continue diagnosis.	GO to QA17.

QA10 CHECK FOR AN INSTRUMENT PANEL CLUSTER (IPC) CONCERN

Check for any IPC DTCs.

Check for other IPC related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Instrumentation, Message Center, and Warning Chimes, DTC Charts to continue diagnosis.	GO to QA17.

QA11 CHECK FOR A CRUISE CONTROL CONCERN

Check for any other PCM DTCs.

Check for other PCM related symptoms.

Is a concern present?

Yes	No
Refer to the service information , Cruise Control to continue diagnosis of the cruise control system.	GO to QA17.

QA12 CHECK FOR A STEERING ANGLE SENSOR MODULE (SASM) CONCERN

Check for any SASM DTCs.

Check for other SASM related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Vehicle Dynamic Systems to continue diagnosis of the SASM system.	GO to QA17.

QA13 CHECK FOR AN ALL TERRAIN CONTROL MODULE (ATCM) CONCERN

Check for any ATCM DTCs.

Check for other ATCM related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Four Wheel Drive 4WD Systems to continue diagnosis of the ATCM system.	GO to QA17.

QA14 CHECK FOR A DC TO DC CONVERTOR CONTROL MODULE CONCERN

Check for any DC to DC convertor control module DTCs.

Check for other DC to DC convertor control module related symptoms.

Is a concern present?

Yes	No
REFER to the service information , Voltage Convertor/Invertor to continue diagnosis of the DC to DC control module system.	GO to QA17.

QA15 CHECK FOR A POWERTRAIN CONTROL MODULE (PCM) CONCERN

Check for any other PCM DTCs.

Is a concern present?

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .	GO to **QA16** .

QA16 REFLASH THE PCM

Clear the PCM DTCs.

Reprogram or update the PCM calibration. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Road test the vehicle.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
For Fiesta and Focus with DTC U1013, INSTALL a new TCM. REFER to the service information , Automatic Transmission. Clear the PCM DTCs. REPEAT the self-test. For DTC U1012, REPROGRAM or UPDATE the ABS Calibration. REFER to the service information , Module Configuration. Clear the PCM DTCs. REPEAT the self-test. For all others, REPROGRAM or UPDATE the TCM Calibration. REFER to the service information , Module Configuration. Clear the PCM DTCs. REPEAT the self-test.	The system is operating correctly at this time.

QA17 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the network test and verify the concern is still present.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QB: KEEP ALIVE POWER (KAPWR) > INTRODUCTION

This pinpoint test is intended to diagnose the following:

- battery terminal condition
- KAPWR wire routing
- harness circuit: KAPWR
- powertrain control module (PCM) (12A650)

Powertrain Control Module (PCM) Connector

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
Explorer GTDI 3.5L, Fusion 2.0L, Fusion 1.6L, Fusion 1.5L, MKZ 2.0L, Transit 3.5L	198 PIN	B100	KAPWR
Fiesta	128 PIN	B10	KAPWR
All other vehicles	190-PIN	B62	KAPWR

PINPOINT TEST QB: KEEP ALIVE POWER (KAPWR) > TEST PROCEDURE

QB1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: The DTC P2610 may set after a PCM reprogramming. If this DTC is retrieved after a PCM reprogramming, disregard this DTC.

Carry out a visual inspection.

Record the DTCs.

Record the freeze frame data.

Clear the PCM DTCs.

Carry out the PCM self-test.

Are DTCs P0603, P1633 or P2610 present?

Yes	No
For DTC P2610, GO to QB6. For all others, GO to **QB2** .	Unable to duplicate the condition. CHECK for a loose connection, and damaged or corroded terminals. WIGGLE the harness attempting to recreate the concern. REPAIR as necessary. REFER to QT , if a driveability concern exists. Clear the PCM DTCs. REPEAT the self-test.

QB2 CHECK THE 12-VOLT BATTERY TERMINALS

NOTE: If the KAPWR is interrupted to the PCM, a DTC can be generated on the first power-up.

NOTE: If DTC P0603 occurred right after or during an unsuccessful reprogramming of the PCM, clear the DTCs and repeat the PCM self-test. If DTC P0603 is retrieved again, continue with this pinpoint test.

Inspect the 12 volt battery cables for loose connections and for corrosion.

Are the 12 volt battery terminal connections in good condition?

Yes	No
GO to **QB3** .	REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

QB3 INSPECT THE ENGINE COMPARTMENT FOR CORRECT WIRE ROUTING

Inspect the electronic engine control (EEC) system wiring for correct wire routing.

Check the wiring routing to establish if any of the electrical connectors are being stressed due to incorrectly routed wiring. If necessary re-route and secure the wiring.

Visually inspect the wiring and connectors.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	For Fiesta 1.6L GTDI, or Focus 2.0L GTDI, GO to QB5. For all others, GO to **QB4** .

QB4 CHECK KAPWR TO THE PCM

Ignition OFF.

PCM connector disconnected.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-) 12 Volt Vehicle Battery
KAPWR	Negative terminal

Is the voltage greater than 10.5 V?

Yes	No
GO to **QB5** .	ISOLATE the concern and REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.

QB5 CHECK FOR A REOCCURRENCE OF THE DTC

PCM connector connected.

Clear the PCM DTCs.

Test drive the vehicle and allow the engine to reach normal operating temperature.

Carry out the PCM self-test.

Is DTC P0603 or P1633 present?

Yes	No
GO to QB8.	Unable to duplicate or identify the concern at this time. GO to PINPOINT TEST Z .

QB6 CHECK THE ENGINE OFF TIMER

NOTE: Turning the ignition ON then OFF without an engine start for the purpose

of checking the engine coolant temperature does not affect the test results.

Ignition ON, engine running.

Allow the engine to stabilize at the correct operating temperature.

Ignition OFF.

Ignition ON, engine OFF.

Clear the PCM DTCs.

Ignition OFF.

Allow the engine to cold soak long enough for the engine coolant temperature to drop at least 16.7°C (30°F).

Ignition ON, engine OFF.

Carry out the PCM self-test.

Is DTC P2610 present?

Yes	No
GO to **QB7** .	Unable to duplicate the condition. REFER to QT , to continue diagnosis.

QB7 CHECK FOR ANY BODY CONTROL MODULE (BDYCM) DTCS

Carry out the BdyCM self-test.

Are any DTCs present?

Yes	No
REFER to the service information , Multifunction Electronic Modules, to continue diagnosis.	GO to **QB8** .

QB8 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST QC: ON BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS > INTRODUCTION

NOTE: The vehicle may not have completed an OBD drive cycle. This is indicated by the inspection maintenance (I/M) readiness status not complete. In some areas, the OBD drive cycle must be completed to pass an I/M test. Refer to ON BOARD DIAGNOSTIC (OBD) DRIVE CYCLE .

PINPOINT TEST QC: ON BOARD DIAGNOSTIC (OBD) SYSTEMS READINESS > TEST PROCEDURE

QC1 CHECK FOR PTO

Is the vehicle equipped with PTO?

Yes	No
GO to **QC2** .	INFORM the customer the law in your area may require additional driving to complete an inspection/maintenance test.

QC2 CHECK THE PTO PID

Ignition ON, engine running.

Access the PCM and monitor the PTO (MODE) PID.

Cycle the PTO switch/actuator ON and OFF. (Follow the PTO aftermarket instructions).

Does the PTO PID cycle ON and OFF?

Yes	No
INFORM the customer the law in your area may require additional driving to complete an inspection/maintenance test.	GO to PINPOINT TEST FB .

PINPOINT TEST QE: ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM > INTRODUCTION

NOTE: Diagnose and repair the following DTCs through DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS , and the Workshop Manual respectively before entering this pinpoint test:

- *C1165*
- *P0102-P0104*
- *P0106-P0108*
- *P0236-P0238*
- *P0321*
- *P0715*
- *P0720*
- *P0731-P0735*
- *P2227-P2229*
- *U1027*

This pinpoint test is intended to diagnose the informational PCM DTCs.

The informational DTCs are the result of the failure mode effects management (FMEM) operating strategy that maintains limited vehicle function in the event of a PCM, harness or component concern.

Circuit DTCs can be accompanied by the informational DTCs and should be diagnosed first. Informational DTCs without circuit DTCs may or may not indicate the actual concern and should be diagnosed as a symptom.

Powertrain Control Module (PCM) Connector

For PCM connector views or reference values, refer to REFERENCE VALUES .

Vehicle	Connector	Pin	Circuit
E-Series 6.8L, Escape/Kuga 2.5L, Explorer 3.7L, Explorer TiVCT 3.5L, F-650/F-750, F-Series Super Duty, Flex TiVCT 3.5L, Fusion 2.5L, MKS 3.7L, MKT 3.7L, MKX, MKZ 3.7L, Motorhome/Stripped Chassis/Step Van, Taurus TiVCT 3.5L,	190-PIN	B67, B68 B38	VPWR PCMRC

Taurus 3.7L, Transit 3.7L, Transit Connect 2.5L			
E-Series 5.4L	190-PIN	B30, B67, B68 B38	VPWR PCMRC
Edge 3.5L, F-150 TiVCT 3.5L, F-150 5.0L, Mustang 3.7L, Mustang 5.0L	198 PIN	B97, B99 B20	VPWR PCMRC
Explorer 2.0L	154 PIN	B5, B6 B27	VPWR PCMRC
Fiesta TiVCT 1.6L	128 PIN	B11, B12, E13, E37 B1	VPWR PCMRC
All other vehicles	198 PIN	B101, B102, B103 B58	VPWR PCMRC

PINPOINT TEST QE: ELECTRONIC THROTTLE CONTROL (ETC) SYSTEM > TEST PROCEDURE

QE1 CHECK FOR DTCS

NOTE: For DTC P061B, make sure the air cleaner and air inlet are correctly seated and correctly installed before continuing diagnosis.

Are any DTCs present other than the following: P0600, P060A, P060B, P060C, P060D, P061A, P061B, P061C, P061D, P061F, P062B, P062C, P1674, P2105, or U0300?

Yes	No
RETURN to SYMPTOM CHARTS for further direction.	For DTCs P0600, P060A or U0300, GO to **QE2** . For DTC P060B, GO to QE4. For DTC P061B, GO to QE11. For DTC P061C, GO to QE6. For DTC P061F, GO to QE8. For DTC P062B, GO to QE5. For DTCs P062C or P2105, GO to QE9. For all others, GO to QE3.

QE2 CHECK THE PCM VOLTAGE CIRCUITS FOR AN OPEN

Ignition OFF.

PCM connector disconnected.

Connect a 5 amp fused jumper wire between the following:

Point A PCM Connector, Harness Side	Point B
PCMRC	Ground

Ignition ON, engine OFF.

Measure the voltage between:

(+) PCM Connector, Harness Side	(-)
VPWR	Ground

Is the voltage greater than 10.5 V?

Yes	No
GO to **QE3** .	REPAIR the open circuit. Clear the PCM DTCs. REPEAT the self-test.

QE3 CHECK THE PCM FOR THE LATEST CALIBRATION

Ignition OFF.

Remove the jumper wire(s).

PCM connector connected.

Program the PCM to the latest calibration.

Ignition OFF.

Ignition ON, engine OFF.

Ignition OFF.

Ignition ON, engine running.

Use the customer information to recreate the concern.

Carry out the PCM self-test.

Are DTCs P0600, P060A, P060C, P060D, P061A, P061D, P1674 or U0300 present?

Yes	No
GO to QE15.	The concern is not present at this time.

QE4 CHECK FOR REFERENCE VOLTAGE CONCERNS

Inspect the PCM harness for damage.

Verify the correct operation of the sensors using ETCREF, VREF and related circuits.
GO to PINPOINT TEST C and follow the pinpoint test direction.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **QE5** .

QE5 CHECK FOR AN INTERMITTENT CONCERN

Clear the PCM DTCs.

Carry out the PCM KOER self-test.

Are DTCs P060B or P062B present?

Yes	No
GO to QE15.	The concern is not present at this time.

QE6 CHECK THE CRANKSHAFT POSITION (CKP) SENSOR FOR CORRECT OPERATION

Verify correct operation of the CKP sensor and related circuits. GO to PINPOINT TEST JD and follow the pinpoint test direction.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **QE7** .

QE7 CHECK THE CAMSHAFT POSITION (CMP) SENSOR FOR CORRECT OPERATION

Verify correct operation of the CMP sensor and related circuits. GO to PINPOINT TEST DR and follow the pinpoint test direction.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to **QE8** .

QE8 VERIFY THE CUSTOMER CONCERN

Clear the PCM DTCs.

Use the customer information to recreate the concern.

Carry out the PCM self-test.

Are DTCs P061C or P061F present?

Yes	No

GO to QE15.	The concern is not present at this time.

QE9 CHECK FOR DTCS IN OTHER VEHICLE MODULES

Check for self-test DTCs in all of the vehicle modules.

Are any DTCs present?

Yes	No
REFER to the applicable service information to DIAGNOSE the DTC.	GO to **QE10** .

QE10 CHECK FOR THE PRESENCE OF ANY MODULE COMMUNICATION CONCERNS

Check for self-test DTCs in all of the vehicle modules.

Are any communication concerns or communication DTCs present?

Yes	No
For communication concerns in the PCM, DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS . For communication concerns in other modules, REFER to the applicable service information to DIAGNOSE the communication DTC.	For DTC P062C, GO to QE14. For all others, GO to **QE11** .

QE11 CHECK FOR THE PRESENCE OF PCM DTCS

NOTE: An intermittent CKP sensor or harness concern may cause DTC P061B to set. Check for intermittent CKP sensor and harness concerns.

NOTE: P2105 may be set in combination with other DTCs.

Clear the PCM DTCs.

Check for self-test DTCs.

Are any DTCs present other than P061B or P2105?

Yes	No
DISREGARD the current diagnostic trouble code (DTC) at this time. DIAGNOSE the next DTC. GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS .	For DTC P061B, GO to QE13. For all others, GO to **QE12** .

QE12 CARRY OUT A VISUAL INSPECTION

Ignition OFF.

Visually inspect the following for obvious signs of damage:

ETB

PCM

Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems. Make sure aftermarket wiring is not routed near the PCM.

Verify aftermarket equipment does not generate radio frequency interference or electromagnetic interference.

Is a concern present?

Yes	No
ISOLATE the concern and REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	GO to QE15.

QE13 CHECK FOR MASS AIRFLOW (MAF) AND THROTTLE POSITION (TP) SENSOR CORRELATION CONCERNS

NOTE: For a MAF and TP sensor correlation concern DTC P061B may set before DTC P0068 sets.

Check for a MAF and TP sensor correlation concern. GO to PINPOINT TEST DV and follow the pinpoint test direction for DTC P0068.

Is a concern present?

Yes	No
REPAIR as necessary. Clear the PCM DTCs. REPEAT the self-test.	CHECK for an intermittent concern with an ETC related harness or sensor. GO to PINPOINT TEST Z .

QE14 CHECK FOR ANTILOCK BRAKING SYSTEM (ABS) AND WHEEL SPEED SENSOR CONCERNS

Ignition ON, engine running.

Access the PCM and monitor the VSS (SPD) PID.

Access the ABS and monitor the LF_WSPD (SPD), LR_WSPD (SPD), RF_WSPD (SPD) and RR_WSPD (SPD) PIDs.

Road test the vehicle under various load conditions while comparing the PIDs. Check for signals that are intermittent or do not correspond.

Do the PID values correspond with the vehicle operating conditions?

Yes	No

CHECK for an intermittent concern with an ETC related harness or sensor. GO to PINPOINT TEST Z .	REFER to the service information , Vehicle Dynamic Systems, to DIAGNOSE any ABS concerns.

QE15 CHECK FOR CORRECT PCM OPERATION

Disconnect all the PCM connectors.

Visually inspect for:

pushed out pins

corrosion

Connect all the PCM connectors and make sure they seat correctly.

Carry out the PCM self-test.

Verify the concern is still present.

Is the concern still present?

Yes	No
INSTALL a new PCM. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

PINPOINT TEST Z: INTERMITTENT > INTRODUCTION

This pinpoint test is intended to diagnose and isolate intermittent concerns for all electronic engine control (EEC) subsystems.

This chart is used to determine which test to run for the suspect circuit. Parameter identifiers (PIDs) corresponding to each circuit are listed. Some circuits do not have an associated PID or the PID may not be available and has to be measured with a digital multimeter (DMM). More specific information on the PID can be found in REFERENCE VALUES .

PINPOINT TEST Z: INTERMITTENT > TEST PROCEDURE

Z1 DIRECTION FOR INTERMITTENT DIAGNOSTIC PATH

NOTE: Proceed with this step only if the PCM DTCs and the freeze frame data have not been cleared. Record freeze frame data prior to clearing the PCM DTCs. Clearing the DTCs clears any freeze frame data and eliminates FMEM. This helps to recreate the original conditions that set the DTCs or caused the symptom.

Ignition ON, engine OFF.

Clear the PCM DTCs.

Are the PCM DTCs cleared?

Yes	No
GO to **Z2** .	RESET the keep alive memory (KAM). REFER to RESETTING THE KEEP ALIVE MEMORY (KAM) . REPEAT the self-test.

Z2 SELECT THE PIDS AND/OR SIGNALS RELATED TO THE SYSTEM

A list of related PIDs and/or signals are needed for use with the scan tool to monitor the suspect areas. Obtain the customer symptom description. Use the Reference Value Symptom chart and proceed to the Reference Value PID/Signal Measurement chart located at the beginning of REFERENCE VALUES .

Highlight each available PID/signal recommended by the charts under the PID/signal selection menu on the scan tool.

Are all available PIDs/signals related to the symptom selected?

Yes	No
GO to **Z3** .	REPEAT the test step. GO to **Z2** .

Z3 DECISION TO VERIFY THE SYMPTOM

NOTE: The path to symptom verification is optional but is recommended for several reasons. For example, the vehicle is back for a repeat repair, or there is no DTC present.

Is a concern or symptom present?

Yes	No
GO to Z10.	GO to **Z4** .

Z4 COLLECT ANY SYMPTOM RELATED DATA TO AID IN VERIFICATION

NOTE: Only MIL codes trigger freeze frame data. Refer to the scan tool instruction manual to retrieve the freeze frame information.

Prepare the freeze frame data for use with information from the SYMPTOM CHARTS .

Check for continuous memory DTCs that should have been recorded from an earlier pinpoint test.

Access the information from the customer information worksheet and the customer if available. Access any other symptom related data available, such as TSBs and OASIS reports.

Is all available data recorded?

Yes	No
GO to **Z5** .	GATHER as much data as possible to aid in isolating the intermittent concern area. REPEAT the test step. GO to **Z4** .

Z5 RECREATE THE SYMPTOM USING ALL AVAILABLE DATA

NOTE: To recreate the original conditions that set the DTC or caused the symptom, the vehicle may require driving.

With the scan tool, select and monitor the same PIDs as displayed in freeze frame along with any previously selected PIDs/signals from step Z2. Using the freeze frame data recorded earlier, recreate the conditions described by each freeze frame PID. Pay special attention to ECT, LOAD, RPM and VSS. Also, use any available data from the customer, TSBs, and other sources to aid in producing the correct conditions for recreating the symptom.

When the symptom occurs, press the trigger to begin recording. Refer to the scan tool instruction manual for information on the recorder function.

Can the symptom be recreated?

Yes	No
GO to Z10.	GO to **Z6** .

Z6 RECREATE THE SYMPTOM

NOTE: PIDs for output in the Reference Value Charts represent command values only. Circuit measurements with a DMM indicate the actual output status. Therefore, in the case of a concern, the PID and circuit reading on the vehicle may not correspond with each other. PIDs for PCM circuits with a mismatch in the DMM measurement indicate a possible PCM concern.

The road test is the last attempt to locate the area of concern before physically disturbing

vehicle circuits.

The Intermittent Road Test Procedure is a set of instructions for monitoring PIDs/signals with a scan tool and circuit measurements with a DMM. This is done under 4 different conditions - ignition on and engine off, hot idle, 48 km/h (30 mph) and 88 km/h (55 mph). Use the typical diagnostic reference values from REFERENCE VALUES to compare with the actual vehicle.

Locate the correct reference value chart in REFERENCE VALUES .

Setup the vehicle to measure the circuits with a DMM and a scan tool.

Connect a scan tool to the DLC.

Ignition ON, engine OFF.

With the scan tool, select and monitor PIDs and measure the circuits shown in the reference value chart in REFERENCE VALUES .

Compare the scan tool PIDs and DMM values to the reference value charts.

Are any values out of range?

Yes	No
GO to Z10.	GO to **Z7** .

Z7 RECREATE THE SYMPTOM USING THE HOT IDLE ROAD TEST

NOTE: The engine temperature should be at least 87°C (189°F).

Ignition ON, engine running.

Continue to monitor the PIDs and circuits as in the previous step.

Are any values out of range?

Yes	No
GO to Z10.	GO to **Z8** .

Z8 RECREATE THE SYMPTOM DURING AN 48 KM/H (30 MPH) ROAD TEST

Drive the vehicle on a preplanned route.

Continue to monitor the PIDs and circuits as in the previous step.

Are any values out of range?

Yes	No
GO to Z10.	GO to **Z9** .

Z9 RECREATE THE SYMPTOM DURING AN 88 KM/H (55 MPH) ROAD TEST

Continue to drive the vehicle on the preplanned route.

Continue to monitor the PIDs and circuits as in the previous step.

Are any values out of range?

Yes	No
GO to **Z10** .	It is now necessary to physically disturb the selected vehicle circuits in an attempt to recreate the intermittent concern. GO to **Z10** .

Z10 SELECT THE CIRCUITS FROM THE PCM PIDS/SIGNALS CHART

NOTE: From the same chart, be sure to select and proceed with the appropriate test type.

NOTE: The Input Test step should be used on sensing inputs such as temperature, position or oxygen.

NOTE: The Output Test step should be used on output devices such as relays, coils or solenoids.

Remain in the PID/Signal selection menu with the scan tool.

Highlight only the PIDs/signals from step Z2.

Proceed to the PCM PIDS/SIGNALS chart located at the beginning of this test.

Match the selected PIDs/signals to the corresponding circuit in the chart. There may be more than one circuit to test. If a PID/signal recording was made with the scan tool, it may be helpful to replay it at this time. Refer to the scan tool instruction manual for additional information.

Has a test been chosen?

Yes	No
For the input test step, GO to **Z11** . For the output test step, GO to Z15.	RETURN to SYMPTOM CHARTS for further direction.

Z11 KOEO INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

Using the circuits chosen from the REFERENCE VALUES , PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.

Proceed to the area of the suspect wiring or component concern.

Ignition ON, engine OFF.

If the input is a switch type-component, turn it on manually.

Monitor the PID or DMM while tapping on the component.

Monitor while wiggling the sensor harness wire from the component to the PCM/TCM.

Look for abrupt changes in the values. Compare these actual values to the reference values in REFERENCE VALUES .

Are there abrupt changes in the PID values that do not compare with the REFERENCE VALUES , **typical reference values?**

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z12** .

Z12 KOER INPUT TEST PROCEDURE FOR THE PCM SENSORS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

Ignition ON, engine running.

Continue to monitor the PIDs and circuits as in the previous step.

Proceed to the area of the suspect wiring or component concern.

If the input is a switch type-component, turn it on manually.

Monitor the PID or DMM while tapping on the component.

Monitor while wiggling the sensor harness wire from the component to the PCM.

Look for abrupt changes in the values. Compare these actual values to the reference values in REFERENCE VALUES .

Are any values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z13** .

Z13 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

> *WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.*

Ignition ON, engine OFF.

Continue to monitor the PIDs and circuits as in the previous step.

Proceed to the area of the suspect wiring or component concern.

If the input is a switch type-component, turn it on manually.

Monitor the PID or DMM values while lightly spraying a water mist on the component.

Monitor while spraying the sensor harness wire from the component to the PCM.

Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values in REFERENCE VALUES .

Are any values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z14** .

Z14 KOER WATER SOAK TEST PROCEDURE FOR THE PCM SENSORS, EXCLUDING HIGH VOLTAGE CIRCUITS

> *WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.*

Ignition ON, engine running.

Continue to monitor the PIDs and circuits as in the previous step.

Proceed to the area of the suspect wiring or component concern.

If the input is a switch type-component, turn it on manually.

Monitor the PID or DMM values while lightly spraying a water mist on the component.

Monitor while spraying the sensor harness wire from the component to the PCM.

Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values in REFERENCE VALUES .

Are any values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z15** .

Z15 KOER WIGGLE TEST PROCEDURE FOR THE PCM SENSORS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A DMM measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.

Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.

Ignition ON, engine OFF.

With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction manual.

Proceed to the area of the suspect wiring or component concern.

Monitor the PID or DMM while tapping on the component.

Monitor while wiggling the sensor harness wire from the component to the PCM.

Look for abrupt changes in the values. Compare these actual values to the reference values in REFERENCE VALUES .

Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the reference value charts in REFERENCE VALUES , **Reference Values?**

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z16** .

Z16 KOER OUTPUT TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE

OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A DMM measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.

Ignition ON, engine running.

Proceed to the area of the suspect wiring or component concern.

Monitor the PIDs with the scan tool and note the values. Compare the scan tool values with values from a DMM with the engine at idle. While tapping on the suspect component look for fluctuations in the values.

If a coil for a coil on plug application is suspect, turn off the ignition. Gain access to the coil and measure continuity from the spark plug terminal to the signal terminal while tapping the coil. A large fluctuation in resistance indicates an intermittent open or short.

Monitor while wiggling the sensor harness wire from the component to the PCM.

Look for abrupt changes in the values. Compare these actual values to the reference values in REFERENCE VALUES .

Is there a scan tool to DMM value mismatch or an idle fluctuation?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z17** .

Z17 KOEO WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS, EXCLUDING HIGH VOLTAGE CIRCUITS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

NOTE: Remember that PIDs selected from the PCM PIDS/SIGNALS Chart display commanded values only. A DMM measurement is needed to display the actual values. Be sure to compare them. Look for fluctuations to occur during any part of the following test. The output state test may not control some outputs, such as injectors and ignition coils and may not be available for all actuators.

Ignition ON, engine OFF.

With the scan tool, turn on selected outputs using output state control. Refer to the scan tool instruction manual.

Proceed to the area of the suspect wiring or component concern.

Monitor the PID or DMM values while lightly spraying a water mist on the component.

Look for abrupt changes in the values. Compare these actual values to the reference values in REFERENCE VALUES .

Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the reference value charts in REFERENCE VALUES , **Reference Values?**

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z18** .

Z18 KOER WATER SOAK TEST PROCEDURE FOR THE PCM ACTUATORS

WARNING: WHEN CARRYING OUT ANY TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, BELTS OR HOT SURFACES.
FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

Ignition ON, engine running.

Using the circuits chosen from the PCM PIDS/SIGNALS Chart, select only the recommended PIDs/signals to monitor with the scan tool. If a PID is not available for the circuit, use a DMM to check the value.

Proceed to the area of the suspect wiring or component concern.

Monitor the PID or DMM values while lightly spraying a water mist on the component.

Monitor while spraying the sensor harness wire from the component to the PCM/TCM.

Look for abrupt changes in the values. Compare these actual values to the Typical Diagnostic Reference Values in REFERENCE VALUES .

Is there a mismatch between command and actual or are any values fluctuating in and out of range when compared to the Reference Value Charts in Section 6?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	GO to **Z19** .

Z19 INSPECT FOR INTERMITTENT MECHANICAL CONCERNS

NOTE: It is possible for an intermittent mechanical concern to cause a good PCM system to react abnormally.

An inspection of DTC related mechanical systems should have been carried out in an earlier section. If not, visually inspect at this time.

Look for possible vacuum lines, wires, cables, linkage or hoses that may become kinked, shorted or restricted during normal engine operation.

This may include engine/transmission gear changes, acceleration and deceleration, rough roads and various engine RPM and torque related conditions.

Is a mechanical concern detected?

Yes	No
REPAIR as necessary. VERIFY the repair. Clear the PCM DTCs. REPEAT the self-test.	It is necessary to seek additional help. REFER to the Professional Technician Society (PTS) web site, the OASIS system or the Technical Hotline. A vehicle data recorder (VDR) or similar recorder may also be useful.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS

NOTE: Refer to the applicable service information to diagnose the body and chassis DTCs.

NOTE: An X equals any number 0 through 9 or the letter A through F.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0001 - FUEL VOLUME REGULATOR CONTROL CIRCUIT/OPEN - DTC CHART

P0001 - FUEL VOLUME REGULATOR CONTROL CIRCUIT/OPEN - DTC CHART

Description: This DTC sets when the PCM detects high or low voltage on the FVR and FVRRTN circuits.

Possible Causes:

- FVR circuit open
- FVRRTN circuit open
- Fuel volume regulator solenoid coil open

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0003 - FUEL VOLUME REGULATOR CONTROL CIRCUIT LOW - DTC CHART

P0003 - FUEL VOLUME REGULATOR CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when the PCM detects high or low voltage on the FVR and FVRRTN circuits.

Possible Causes:

- FVR circuit short to ground

- FVRRTN circuit short to ground

Diagnostic Aids: A FVRRTN circuit short to ground may damage the solenoid coil. If P0001 is retrieved after a circuit repair, check the solenoid coil for an open circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0004 - FUEL VOLUME REGULATOR CONTROL CIRCUIT HIGH - DTC CHART

P0004 - FUEL VOLUME REGULATOR CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the PCM detects high or low voltage on the FVR and FVRRTN circuits.

Possible Causes:

- FVR circuit short to FVRRTN circuit
- FVRRTN circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P000A - INTAKE A CAMSHAFT POSITION SLOW RESPONSE BANK 1 - DTC CHART

P000A - INTAKE A CAMSHAFT POSITION SLOW RESPONSE BANK 1 - DTC CHART

Description: The PCM monitors and evaluates the response of the actual position on a target position change. The setpoint and camshaft position are saved at the beginning of a setpoint change. If this change over time is large enough (gradient), the camshaft phasing change is evaluated. If the change after the diagnostic time is smaller than a threshold, a slow response is detected, and if the value is greater, then there is no concern. By detecting a concern, an antibounce counter is incremented otherwise the counter is decremented. This DTC sets when the counter exceeds an adjustable limit.

Possible Causes:

- Variable camshaft timing (VCT) unit to camshaft alignment
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body

- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT phaser
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, to check the engine timing and VCT phasers.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P000B - EXHAUST B CAMSHAFT POSITION SLOW RESPONSE BANK 1 - DTC CHART

P000B - EXHAUST B CAMSHAFT POSITION SLOW RESPONSE BANK 1 - DTC CHART

Description: The PCM monitors and evaluates the response of the actual position on a target position change.
The setpoint and camshaft position are saved at the beginning of a setpoint change. If this change over time is large enough (gradient), the camshaft phasing change is evaluated. If the change after the diagnostic time is smaller than a threshold, a slow response is detected, and if the value is greater, then there is no concern. By detecting a concern, an antibounce counter is incremented otherwise the counter is decremented. This DTC sets when the counter exceeds an adjustable limit.

Possible Causes:

- Variable camshaft timing (VCT) unit to camshaft alignment
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body
- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT phaser
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, to check the engine timing and VCT phasers.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0010 - INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1) - DTC CHART

P0010 - INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1) - DTC CHART

Description: This DTC sets when a low or high voltage on the VCT11 circuit is detected. The test fails if the voltage exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT11 circuit open
- VCT11 circuit short to voltage
- VCT11 circuit short to ground
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 1 (VCT11)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0011 - INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1) - DTC CHART

P0011 - INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- VCT unit to camshaft alignment
- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body

- Variable camshaft timing bank 1 solenoid 1 (VCT11) valve stuck open
- VCT11 circuit open
- VCT11 circuit short to voltage
- VCT11 circuit short to ground
- VPWR circuit open
- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT11 phaser
- Damaged camshaft position bank 1 sensor 1 (CMP11)
- CMP11 sensor circuits open
- CMP11 sensor circuits short to voltage
- CMP11 sensor circuits short to ground
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, to check the engine timing and VCT phasers.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0012 - INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1) - DTC CHART

P0012 - INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- VCT unit to camshaft alignment
- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber

- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body
- variable camshaft timing bank 1 solenoid 1 (VCT11) valve stuck open
- VCT11 circuit open
- VCT11 circuit short to voltage
- VCT11 circuit short to ground
- VPWR circuit open
- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT11 phaser
- Damaged camshaft position bank 1 sensor 1 (CMP11)
- CMP11 sensor circuits open
- CMP11 sensor circuits short to voltage
- CMP11 sensor circuits short to ground
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, to check the engine timing and VCT phasers.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0013 - EXHAUST CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1) - DTC CHART

P0013 - EXHAUST CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1) - DTC CHART

Description: This DTC sets when a low or high voltage on the VCT12 circuit is detected. The test fails if the voltage exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT12 circuit open
- VCT12 circuit short to voltage

- VCT12 circuit short to ground
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 2 (VCT12)

Diagnostic Aids:

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0014 - EXHAUST CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1) - DTC CHART

P0014 - EXHAUST CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- VCT unit to camshaft alignment
- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body
- Variable camshaft timing bank 1 solenoid 2 (VCT12) valve stuck open
- VCT12 circuit open
- VCT12 circuit short to voltage
- VCT12 circuit short to ground
- VPWR circuit open
- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT12 phaser
- Damaged camshaft position bank 1 sensor 2 (CMP12)
- CMP12 sensor circuits open
- CMP12 sensor circuits short to voltage
- CMP12 sensor circuits short to ground

- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, to check the engine timing and VCT phasers.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0015 - EXHAUST CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1) - DTC CHART

P0015 - EXHAUST CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- VCT unit to camshaft alignment
- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body
- Variable camshaft timing bank 1 solenoid 2 (VCT12) valve stuck open
- VCT12 circuit open
- VCT12 circuit short to voltage
- VCT12 circuit short to ground
- VPWR circuit open
- Camshaft advance mechanism binding (VCT unit)
- Damaged VCT12 phaser
- Damaged camshaft position bank 1 sensor 2 (CMP12)
- CMP12 sensor circuits open

- CMP12 sensor circuits short to voltage
- CMP12 sensor circuits short to ground
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all camshaft position (CMP) sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0016 - CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A - DTC CHART

P0016 - CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A - DTC CHART

Description: This DTC sets when a misalignment between the camshaft and crankshaft is detected. The test fails when the misalignment is 1 tooth or greater. This DTC can also set due to variable camshaft timing (VCT) system concerns (oil contamination or VCT solenoid stuck).

Possible Causes:

- VCT unit to camshaft alignment
- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Erratic camshaft position due to low oil pressure
- Oil flow restriction in the oil passages or the VCT valve body
- variable camshaft timing bank 1 solenoid 1 (VCT11) stuck in position
- VCT11 circuit open
- VCT11 circuit short to voltage
- VCT11 circuit short to ground
- VPWR circuit open
- Camshaft advance mechanism binding (VCT unit)

- Damaged VCT11 phaser
- Damaged camshaft position bank 1 sensor 1 (CMP11)
- CMP11 sensor circuits open
- CMP11 sensor circuits short to voltage
- CMP11 sensor circuits short to ground
- Radio frequency interference

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all CMP sensor DTCs first. If no CMP sensor related DTCs are present, continue to follow diagnosis for this DTC.
This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0030 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

P0030 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

Description: The PCM controls the universal heated oxygen sensor bank 1, sensor 1 (HO2S11) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- UO2S11 circuit open
- UO2SGREF11 circuit open

- UO2SHTR11 circuit open
- UO2SHTR11 circuit short to voltage
- VPWR circuit open
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged universal HO2S11

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0034 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE A CONTROL CIRCUIT LOW - DTC CHART

P0034 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE A CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when the PCM detects a short to ground in the TCBY circuit.

Possible Causes:

- Damaged turbocharger bypass (TCBY) valve
- TCBY circuit short to ground
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC only sets when the valve is commanded closed.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0035 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE A CONTROL CIRCUIT HIGH - DTC CHART

P0035 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE A CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the PCM detects an open circuit or high voltage in the TCBY circuit.

Possible Causes:

- Damaged turbocharger bypass (TCBY) valve
- TCBY circuit open
- TCBY circuit short to voltage

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC only sets when the valve is commanded open.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0036 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

P0036 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

Description: The PCM controls the heated oxygen sensor bank 1, sensor 2 (HO2S12) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- VPWR circuit open
- HTR12 circuit open
- HTR12 circuit short
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged HO2S12

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0037 - HO2S HEATER CONTROL CIRCUIT LOW (BANK 1, SENSOR 2) - DTC CHART

P0037 - HO2S HEATER CONTROL CIRCUIT LOW (BANK 1, SENSOR 2) - DTC CHART

Description: The PCM controls the heated oxygen sensor bank 1, sensor 2 (HO2S12) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- HTR12 circuit short
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged HO2S12

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0038 - HO2S HEATER CONTROL CIRCUIT HIGH (BANK 1, SENSOR 2) - DTC CHART

P0038 - HO2S HEATER CONTROL CIRCUIT HIGH (BANK 1, SENSOR 2) - DTC CHART

Description: The PCM controls the heated oxygen sensor bank 1, sensor 2 (HO2S12) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- HTR12 circuit short
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged HO2S12

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0040 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1 - DTC CHART

P0040 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1 - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor determines if the universal HO2S signal response for a fuel shift corresponds to the correct engine bank. This DTC sets when there is no response from the universal HO2S being tested.

Possible Causes:

- Crossed universal HO2S harness connectors
- Crossed universal HO2S wiring at the harness connectors
- Crossed universal HO2S wiring at the PCM connectors

Diagnostic Aids: Connect the universal HO2S connector to the correct bank.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0041 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2 - DTC CHART

P0041 - OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2 - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor determines if the HO2S signal response for a fuel shift corresponds to the correct engine bank. This DTC sets when there is no response from the HO2S being tested.

Possible Causes:

- Crossed HO2S harness connectors
- Crossed HO2S wiring at the harness connectors
- Crossed HO2S wiring at the PCM connectors

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0050 - HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

P0050 - HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

Description: The PCM controls the universal heated oxygen sensor bank 2, sensor 1 (HO2S21) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- UO2S21 circuit open
- UO2SGREF21 circuit open
- UO2SHTR21 circuit open
- UO2SHTR21 circuit short to voltage
- VPWR circuit open
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged universal HO2S21

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

P0053 - HO2S HEATER RESISTANCE (BANK 1, SENSOR 1) - DTC CHART

Description: This DTC sets when the heater current requirements are too low or too high in the UO2SHTR11 circuit.

Possible Causes:

- VPWR circuit open
- UO2SHTR11 circuit open

- UO2SHTR11 circuit short
- Damaged universal HO2S11 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0054 - HO2S HEATER RESISTANCE (BANK 1, SENSOR 2) - DTC CHART

P0054 - HO2S HEATER RESISTANCE (BANK 1, SENSOR 2) - DTC CHART

Description: This DTC sets when the heater current requirements are too low or too high in the HTR12 circuit.

Possible Causes:

- VPWR circuit open
- HTR12 circuit open
- HTR12 heater circuit short
- Damaged HO2S12 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0056 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

P0056 - HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

Description: The PCM controls the heated oxygen sensor bank 1, sensor 2 (HO2S12) heater ON and OFF duty cycle to maintain a calibrated temperature. This DTC sets when the sensor does not warm up to the required temperature in a calibrated amount of time. This DTC also sets when the PCM is not able to maintain the required temperature after the sensor is warm.

Possible Causes:

- VPWR circuit open
- HTR12 circuit open

- HTR12 circuit short
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged HO2S12

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0059 - HO2S HEATER RESISTANCE (BANK 2, SENSOR 1) - DTC CHART

P0059 - HO2S HEATER RESISTANCE (BANK 2, SENSOR 1) - DTC CHART

Description: This DTC sets when the heater current requirements are too low or too high in the UO2SHTR21 circuit.

Possible Causes:

- VPWR circuit open
- UO2SHTR21 circuit open
- UO2SHTR21 circuit short
- Damaged universal HO2S21 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0060 - HO2S HEATER RESISTANCE (BANK 2, SENSOR 2) - DTC CHART

P0060 - HO2S HEATER RESISTANCE (BANK 2, SENSOR 2) - DTC CHART

Description: This DTC sets when the heater current requirements are too low or too high in the HTR22 circuit.

Possible Causes:

- VPWR circuit open
- HTR22 circuit open
- HTR22 circuit short
- Damaged HO2S22 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0068 - MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION - DTC CHART

P0068 - MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION - DTC CHART

Description: The PCM monitors a vehicle operation rationality check by comparing sensed throttle position to mass airflow readings. This continuous memory DTC sets when during a key ON, engine running (KOER) self-test, the comparison of the throttle position (TP) sensor and MAF sensor readings are not consistent with the calibrated load values.

Possible Causes:

- Air leak at any connection or line of the intake air system components before or after the electronic throttle body (ETB)
- Leak in the positive crankcase ventilation (PCV) system
- TP sensor not seated correctly
- Damaged MAF sensor
- Damaged TP sensor

Diagnostic Aids: An intake air system leak at a hose, line or connection of any intake air system or PCV system component may cause this DTC to set.
Diagnose any MAF or TP DTCs first.
If the throttle plate is closed and the LOAD PID is greater than 55%, or with the throttle plate at wide open throttle (WOT) with the LOAD PID less than 30% indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0071 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0071 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the ambient air temperature (AAT) sensor reading does not correlate with the other temperature sensor readings at ignition ON. The PCM runs this logic after an engine off and a calibrated soak period, typically 6 to 8 hours. This soak period allows the AAT sensor and the other temperature sensors to stabilize and not differ by greater than a calibrated value, typically 18°C (32.4°F).

Possible Causes:

- Damaged AAT sensor

Diagnostic Aids: Make sure the AAT sensor reading and the other temperature sensor readings are similar when the engine is cold and the vehicle has not been in direct sun light.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0072 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

P0072 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when the ambient air temperature (AAT) sensor signal is less than the self-test minimum.

Possible Causes:

- AAT circuit short to ground
- Damaged AAT sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0073 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

P0073 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the ambient air temperature (AAT) sensor signal is greater than the self-test maximum.

Possible Causes:

- AAT circuit open
- AAT circuit short to voltage
- Damaged AAT sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0074 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P0074 - AMBIENT AIR TEMPERATURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the ambient air temperature (AAT) sensor signal changes beyond the minimum or maximum calibrated limit.

Possible Causes:

- AAT circuit intermittent open
- AAT circuit intermittent short to voltage
- AAT circuit intermittent short to ground
- Damaged AAT sensor

Diagnostic Aids: Check the harness and connection. Monitor the sensor PID while wiggling and bending the harness from the sensor to the PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P007B - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

P007B - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

Description: This DTC sets when the CAC_T PID does not correlate with the IAT or the IAT2 PIDs at ignition ON or if the IAT PID reading is greater than a maximum calibrated value while driving.

Possible Causes:

- Damaged charge air cooler temperature (CACT) sensor
- Contaminated or restricted CACT sensor
- Slow responding CACT sensor

Diagnostic Aids: Check temperature values while engine is at ambient temperature, cold soak the engine for a minimum of 6 hours if necessary.
Check airflow through charge air cooler (CAC), remove debris if necessary.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P007C - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT LOW (BANK 1) - DTC CHART

P007C - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT LOW (BANK 1) - DTC CHART

Description: This DTC sets when the charge air cooler temperature (CACT) is greater than a calibrated value or a short to ground is detected in the CACT circuit.

Possible Causes:

- Damaged charge air cooler temperature (CACT) sensor
- CACT circuit short to ground
- VPWR circuit open
- Low airflow through the charge air cooler (CAC)
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P007D - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT HIGH (BANK 1) - DTC CHART

P007D - CHARGE AIR COOLER TEMPERATURE SENSOR CIRCUIT HIGH (BANK 1) - DTC CHART

Description: This DTC sets when the charge air cooler temperature (CACT) is lower than a calibrated value or an open or short to voltage is detected in the CACT circuit.

Possible Causes:

- Damaged charge air cooler temperature (CACT) sensor
- CACT circuit open
- CACT circuit short to voltage
- SIGRTN circuit open
- Output from the charge air cooler (CAC) is colder than the calibrated threshold

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0087 - FUEL RAIL/SYSTEM PRESSURE - TOO LOW - DTC CHART

P0087 - FUEL RAIL/SYSTEM PRESSURE - TOO LOW - DTC CHART

Description: The PCM regulates the fuel rail pressure by controlling the fuel volume regulator. This DTC sets when the PCM is no longer capable of maintaining the fuel pressure within the calibrated parameters.

Possible Causes:

- Fuel filter plugged or dirty
- Fuel supply line restricted
- Damaged fuel pump module
- Damaged fuel injection pump

Diagnostic Aids: Diagnose any FRP and FVR circuit DTCs first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test HP .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0088 - FUEL RAIL/SYSTEM PRESSURE - TOO HIGH - DTC CHART

P0088 - FUEL RAIL/SYSTEM PRESSURE - TOO HIGH - DTC CHART

Description: The PCM regulates the fuel rail pressure by controlling the fuel volume regulator. This DTC sets when the PCM is no longer capable of maintaining the fuel pressure within the calibrated parameters.

Possible Causes:

- Damaged fuel injection pump

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P008A - LOW PRESSURE FUEL SYSTEM PRESSURE - TOO LOW - DTC CHART

P008A - LOW PRESSURE FUEL SYSTEM PRESSURE - TOO LOW - DTC CHART

Description: The PCM monitors the fuel pressure sensor. This DTC sets when the low pressure fuel system pressure falls below an expected threshold.

Possible Causes:

- Low or no fuel
- Low fuel pressure
- Damaged fuel pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P008B - LOW PRESSURE FUEL SYSTEM PRESSURE - TOO HIGH - DTC CHART

P008B - LOW PRESSURE FUEL SYSTEM PRESSURE - TOO HIGH - DTC CHART

Description: The PCM monitors the fuel pressure sensor. This DTC sets when the low pressure fuel system pressure rises above an expected threshold.

Possible Causes:

- High fuel pressure
- Damaged fuel pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0093 - FUEL SYSTEM LEAK DETECTED - LARGE LEAK - DTC CHART

P0093 - FUEL SYSTEM LEAK DETECTED - LARGE LEAK - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0094 - FUEL SYSTEM LEAK DETECTED - SMALL LEAK - DTC CHART

P0094 - FUEL SYSTEM LEAK DETECTED - SMALL LEAK - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0096 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

P0096 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

Description: This DTC sets when the intake air temperature 2 (IAT2) sensor PID does not correlate with the charge air cooler temperature (CACT) sensor or the intake air temperature (IAT) sensor PIDs at ignition ON. It also sets if the IAT2 sensor PID exceeds the maximum calibrated temperature threshold while driving.

Possible Causes:

- Slow responding intake air temperature 2 (IAT2) sensor
- Damaged IAT2 sensor

Diagnostic Aids: The IAT2 sensor is located on top of the intake manifold. Aftermarket heaters that are attached to the engine, transmission or battery may cause DTC P0096 to set in cold weather climates after a 6 hour soak period.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0097 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW - DTC CHART

P0097 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW - DTC CHART

Description: This DTC sets when the intake air temperature 2 (IAT2) sensor signal is less than the

self-test minimum. The IAT2 sensor minimum is 0.2 volt.
Possible Causes: • IAT2 circuit short to ground • Incorrect harness connection • Damaged IAT2 sensor
Diagnostic Aids: Monitor the IAT2 sensor PID value. A typical IAT2 sensor temperature should be greater than the IAT sensor temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0098 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH - DTC CHART

P0098 - INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the intake air temperature 2 (IAT2) sensor signal is greater than the self-test maximum. The IAT2 sensor maximum is 4.6 volts.
Possible Causes: • IAT2 circuit open • IAT2 circuit short to voltage • Incorrect harness connection • Damaged IAT2 sensor
Diagnostic Aids: Monitor the IAT2 sensor PID value. A typical IAT2 sensor temperature should be greater than the IAT sensor temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00BA - LOW FUEL PRESSURE FORCED LIMITED POWER - DTC CHART

P00BA - LOW FUEL PRESSURE FORCED LIMITED POWER - DTC CHART

Description: This DTC sets when the fuel delivery volume is less than the requested fuel delivery volume and the PCM has reduced engine power as a result.

Possible Causes:

- Restricted fuel filter
- Restricted fuel supply line
- Damaged or worn fuel pump
- Fuel sloshing at low fuel level
- Sudden acceleration
- Vehicle driven on hilly or steep inclines

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00BB - FUEL INJECTOR INSUFFICIENT FLOW - FORCED LIMITED POWER - DTC CHART

P00BB - FUEL INJECTOR INSUFFICIENT FLOW - FORCED LIMITED POWER - DTC CHART

Description: This DTC sets when the requested fuel delivery volume is greater than the fuel injectors maximum delivery volume.

Possible Causes:

- High ethanol content in the fuel tank
- Customer driving habits
- Restricted fuel filter
- Restricted fuel supply line
- Damaged or worn fuel pump

Diagnostic Aids: A high fuel ethanol content combined with pulling or carrying a heavy load up a steep grade could set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00C1 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE B CONTROL CIRCUIT LOW - DTC CHART

P00C1 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE B CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the TCBY2 circuit.

Possible Causes:

- Damaged turbocharger bypass 2 (TCBY2) valve
- TCBY2 circuit short to ground
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC only sets when the valve is commanded closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00C2 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE B CONTROL CIRCUIT HIGH - DTC CHART

P00C2 - TURBOCHARGER/SUPERCHARGER BYPASS VALVE B CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is an open circuit or high voltage in the TCBY2 circuit.

Possible Causes:

- Damaged turbocharger bypass 2 (TCBY2) valve
- TCBY2 circuit open
- TCBY2 circuit short to voltage

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC only sets when the valve is commanded open.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00C6 - FUEL

RAIL PRESSURE TOO LOW - ENGINE CRANKING - DTC CHART

P00C6 - FUEL RAIL PRESSURE TOO LOW - ENGINE CRANKING - DTC CHART

Description: The high pressure fuel system must reach a minimum pressure threshold before the engine can be started. This DTC sets if the high pressure fuel system cannot achieve this threshold within certain time and crankshaft rotation limits; the PCM attempts to start the engine at fuel pump assembly pressure.

Possible Causes:

- Fuel filter plugged or dirty
- Fuel supply line restricted
- Damaged fuel pump module
- Damaged fuel injection pump

Diagnostic Aids: Diagnose any fuel rail pressure (FRP) and FVR circuit DTCs first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00CE - INTAKE AIR TEMPERATURE MEASUREMENT SYSTEM - MULTIPLE SENSOR CORRELATION - DTC CHART

P00CE - INTAKE AIR TEMPERATURE MEASUREMENT SYSTEM - MULTIPLE SENSOR CORRELATION - DTC CHART

Description: This DTC sets when the charge air cooler temperature (CACT), intake air temperature (IAT) and the intake air temperature 2 (IAT2) PIDs are each greater than 16.67°C (30°F) different from each other at start up or that each sensor is out of the calibrated range at engine start up after a soak period of at least 6 hours when a block heater is not used.

Possible Causes:

- Damaged CACT, IAT or IAT2 sensors
- Contaminated or restricted CACT, IAT or IAT2 sensors
- Slow responding CACT, IAT or IAT2 sensors

Diagnostic Aids: Compare all sensor readings to the ambient temperature to determine which sensor is reading correctly.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00D2 - HO2S HEATER CONTROL CIRCUIT RANGE/PERFORMANCE (BANK 1 SENSOR 2) - DTC CHART

P00D2 - HO2S HEATER CONTROL CIRCUIT RANGE/PERFORMANCE (BANK 1 SENSOR 2) - DTC CHART

Description: This DTC sets when the internal impedance of the heated oxygen sensor bank 1, sensor 2 (HO2S12) exceeds the calibrated threshold.

Possible Causes:

- Incorrect connections
- Damaged or corroded terminals
- Damaged HO2S12 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00DF - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P00DF - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the charge air cooler (CAC) coolant temperature sensor PID does not correlate with the IAT sensor or the ECT sensor PIDs at ignition ON or if the CAC coolant temperature PID reading is greater than a maximum calibrated value while driving.

Possible Causes:

- Damaged CAC coolant temperature sensor
- Slow responding CAC coolant temperature sensor

Diagnostic Aids: Check temperature values while engine is at ambient temperature, cold soak the engine for a minimum of 6 hours if necessary.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00E0 - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

P00E0 - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when the charge air cooler (CAC) coolant temperature is greater than a calibrated value or a short to ground is detected in the CACCTS circuit.			
Possible Causes: • CACCTS circuit short to ground • Damaged CAC coolant temperature sensor			
Diagnostic Aids: A CAC coolant temperature sensor reading less than the self-test minimum with ignition ON, engine OFF or during any engine operating mode indicates a concern is present.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00E1 - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

P00E1 - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the charge air cooler (CAC) coolant temperature is less than a calibrated value or a short to voltage is detected in the CACCTS circuit.			
Possible Causes: • CACCTS circuit open • CACCTS circuit short to voltage • Damaged CAC coolant temperature sensor			
Diagnostic Aids: A CAC coolant temperature sensor reading greater than the self-test maximum with ignition ON, engine OFF or during any engine operating mode indicates a concern is present.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P00E2 -

CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR INTERMITTENT/ERRATIC - DTC CHART

P00E2 - CHARGE AIR COOLER COOLANT TEMPERATURE SENSOR INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the charge air cooler (CAC) coolant temperature sensor signal changes from an in range value to beyond the minimum or maximum calibrated limit a calibrated number of times.

Possible Causes:

- CACCTS circuit intermittent open
- CACCTS circuit intermittent short to ground
- CACCTS circuit intermittent short to voltage
- Damaged CAC coolant temperature sensor
- Damaged CAC coolant temperature sensor wiring

Diagnostic Aids: Check the harness and connection. Monitor the sensor PID while wiggling and bending the harness from the sensor to the PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0100 - MASS OR VOLUME AIR FLOW A CIRCUIT - DTC CHART

P0100 - MASS OR VOLUME AIR FLOW A CIRCUIT - DTC CHART

Description: This DTC sets when the mass airflow (MAF) sensor frequency changes below a minimum calibrated limit for greater than 0.5 seconds.

Possible Causes:

- Open MAF sensor element
- Intake air system components incorrectly connected

Diagnostic Aids: Install a new mass airflow/intake air temperature (MAF/IAT) sensor. Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0101 - MASS OR VOLUME AIR FLOW A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0101 - MASS OR VOLUME AIR FLOW A CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the actual airflow is less or greater than the modeled airflow by greater than a calibrated value for 2.4 seconds.

Possible Causes:

- Restricted airflow
- Intake air system leak
- Damaged mass airflow (MAF) sensor

Diagnostic Aids: Check the MAF sensor for contamination and the intake air system for leaks.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0102 - MASS OR VOLUME AIR FLOW A CIRCUIT LOW - DTC CHART

P0102 - MASS OR VOLUME AIR FLOW A CIRCUIT LOW - DTC CHART

Description: This DTC sets when during key ON, engine running (KOER), the mass airflow (MAF) sensor output changes below a minimum calibrated limit for greater than a set period of time.

Possible Causes:

- MAF circuit short to ground
- Damaged MAF sensor

Diagnostic Aids: Make sure the MAF sensor connector is locked and seated correctly.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0103 - MASS OR VOLUME AIR FLOW A CIRCUIT HIGH - DTC CHART

P0103 - MASS OR VOLUME AIR FLOW A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the mass airflow (MAF) sensor output changes above a maximum

calibrated limit while the engine is running.
Possible Causes: • MAF circuit open • MAF circuit short to voltage • Damaged MAF sensor
Diagnostic Aids: Make sure the MAF sensor connector is locked and seated correctly.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0104 - MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P0104 - MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when a concern exists in the MAF circuit, or the air tube containing the mass airflow (MAF) sensor, causing an incorrect sensor output reading.
Possible Causes: • MAF circuit intermittent open • MAF circuit intermittent short to voltage
Diagnostic Aids: Check the MAF sensor tube for air leaks.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0106 - MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE - DTC CHART

P0106 - MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE - DTC CHART

For Vehicles With 2.7L And 3.5L GTDI Engines
Description: This DTC sets when the MAP PID does not correlate with the BARO or the TCBP PID.
Possible Causes: • Slow responding manifold absolute pressure (MAP) sensor

- Damaged MAP sensor

Diagnostic Aids: This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

For All Others

Description: This DTC sets when the manifold absolute pressure (MAP) sensor input does not correlate with an inferred MAP value. The inferred value is based on the mass airflow (MAF) sensor.

Possible Causes:

- Slow responding MAP sensor
- Damaged MAP sensor
- Damaged MAF sensor

Diagnostic Aids: This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0107 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW - DTC CHART

P0107 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW - DTC CHART

Description: This DTC sets when the manifold absolute pressure (MAP) sensor operating voltage is below the minimum calibrated parameter of 0.024 volt.

Possible Causes:

- MAP circuit short to ground
- VREF circuit open
- VREF circuit short to ground
- Damaged MAP sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0108 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR HIGH - DTC CHART

P0108 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR HIGH - DTC CHART

Description: This DTC sets when the manifold absolute pressure (MAP) sensor operating voltage is greater than the maximum allowable calibrated parameter of 4.96 volts.

Possible Causes:

- VREF circuit short to voltage
- MAP circuit open
- MAP circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0109 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT - DTC CHART

P0109 - MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT - DTC CHART

Description: This DTC sets when the manifold absolute pressure (MAP) sensor signal is intermittent.

Possible Causes:

- MAP circuit intermittent open
- MAP circuit intermittent short to voltage
- MAP circuit intermittent short to ground
- Damaged MAP sensor
- Incorrect harness connections

Diagnostic Aids: Check the harness and connection.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0111 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0111 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE - DTC CHART

For Vehicles With 2.7L And 3.5L GTDI Engines

Description: This DTC sets when either of the following conditions are present.
When the IAT sensor PID does not correlate with the charge air cooler temperature (CACT) sensor or the intake air temperature 2 (IAT2) sensor PIDs at ignition ON.
When the IAT sensor PID exceeds the maximum calibrated temperature threshold while driving.

Possible Causes:

- Slow responding IAT sensor
- Damaged IAT sensor

Diagnostic Aids: The IAT sensor is located on the air filter housing.

For All Others

Description: This DTC sets when the intake air temperature value is higher than a calibrated value indicating that the rationality test has failed and could prevent one or more on board diagnostic (OBD) monitors from completing.
The PCM runs this logic after an engine OFF and a calibrated soak period (typically 6 to 8 hours). This soak period allows the intake air temperature (IAT) sensor and other temperature sensors to stabilize and not differ by greater than a calibrated value. DTC P0111 sets when the IAT sensor value at engine start exceeds the other temperature sensors by greater than a calibrated value, typically 17°C (30°F).

Possible Causes:

- Damaged IAT sensor

Diagnostic Aids: Make sure the IAT reading and the other temperature sensor readings are similar when the engine is cold.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0112 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW - DTC CHART

P0112 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW - DTC CHART

Description: This DTC sets when the IAT sensor signal is less than the self-test minimum.

Possible Causes:

- IAT circuit short to ground
- Damaged IAT sensor
- Incorrect harness connection

Diagnostic Aids: An IAT sensor PID reading less than the self-test minimum with ignition ON engine OFF or during any engine operating mode indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0113 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH - DTC CHART

P0113 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the IAT sensor signal is greater than the self-test maximum.

Possible Causes:

- IAT circuit open
- IAT circuit short to voltage
- Damaged IAT sensor
- Incorrect harness connection

Diagnostic Aids: An IAT sensor PID reading greater than self-test maximum with the ignition ON engine OFF or during any engine operating mode indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0114 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC - DTC CHART

P0114 - INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the IAT sensor signal was intermittent during the comprehensive component monitor (CCM).

Possible Causes:

- IAT circuit intermittent open

- IAT circuit intermittent short to voltage
- IAT circuit intermittent short to ground
- Damaged IAT sensor
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Monitor the IAT sensor value on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the engine coolant temperature or cylinder head temperature value is higher than the calibrated value and could prevent one or more on board diagnostic (OBD) monitors from completing. The PCM runs this logic after an engine off and a calibrated soak period (typically 6 hours). This soak period allows the intake air temperature and the engine coolant temperature or cylinder head temperature to stabilize and not differ by greater than a calibrated value. This DTC sets when all of the following conditions are met:
The engine coolant temperature at engine start exceeds the intake air temperature at engine start by greater than a calibrated value, typically 17°C (30°F).
The engine coolant temperature exceeds a calibrated value, typically 107°C (225°F).
The fuel system, heated oxygen and misfire monitors have not completed.
The calibrated time to set this DTC has expired.

Possible Causes:

- ECT or cylinder head temperature (CHT) sensor
- Coolant system concern

Diagnostic Aids: Make sure the intake air temperature and the engine coolant temperature or cylinder head temperature are similar when the engine is cold. Also make sure the ECT or CHT sensor and the actual engine operating temperatures are the same.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 2.0L, Explorer 2.0L,	GO to Pinpoint Test DX .		

F-150 2.7L, Fiesta, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L, Transit Connect 1.6L	
All others	GO to Pinpoint Test DL .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW - DTC CHART

P0117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW - DTC CHART

Description: This DTC sets when the ECT sensor signal is less than the self-test minimum. The ECT sensor signal minimum is 121°C (250°F).

Possible Causes:

- ECT circuit short to ground
- Damaged ECT sensor
- Incorrect harness connection

Diagnostic Aids: A concern is present if the ECT (TEMP) PID reading is greater than 121° C (250° F) with the ignition ON engine OFF or during any engine operating mode.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0118 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH - DTC CHART

P0118 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the ECT sensor signal is greater than the self-test maximum. The ECT sensor signal maximum is -50° C (-58° F).

Possible Causes:

- ECT circuit open
- ECT circuit short to voltage
- Incorrect harness connection
- Damaged ECT sensor

Diagnostic Aids: A concern is present if the ECT (TEMP) PID reading is less than -50° C (-58° F) with the ignition ON engine OFF or during any engine operating mode.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0119 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P0119 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the ECT circuit is intermittently open or shorted while the engine is running.

Possible Causes:

- Damaged ECT harness
- Damaged ECT sensor
- Damaged ECT harness connector
- Low engine coolant

Diagnostic Aids: Monitor the engine coolant temperature or the cylinder head temperature on a scan tool, look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 2.0L, Explorer 2.0L, F-150 2.7L, Fiesta, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L,	GO to Pinpoint Test DX .		

MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L, Transit Connect 1.6L	
All others	GO to Pinpoint Test DL .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P011E - ENGINE COOLANT TEMPERATURE 1/AMBIENT AIR TEMPERATURE CORRELATION - DTC CHART

P011E - ENGINE COOLANT TEMPERATURE 1/AMBIENT AIR TEMPERATURE CORRELATION - DTC CHART

Description: This DTC sets when the engine coolant temperature (ECT) and ambient air temperature (AAT) sensor readings differ by greater than a calibrated value.

Possible Causes:

- Biased ECT or AAT sensor
- Damaged ECT or AAT sensor
- Damaged intake air temperature (IAT) sensor

Diagnostic Aids: Make sure the ECT, AAT and IAT sensor readings are within 18°C (32.4°F) of each other after 6 to 8 hours at a stabilized ambient temperature and the vehicle has not been in direct sunlight.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0122 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW - DTC CHART

P0122 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW - DTC CHART

Description: This DTC sets when the electronic throttle control (ETC) throttle position 1 (TP1) signal is too low.

Possible Causes:

- TP1 circuit open
- TP1 circuit short to ground

- Damaged TP1 sensor

Diagnostic Aids: This concern exhibits a symptom of limited power. A TP1 PID reading less than 0.25 volt in ignition ON, engine OFF or ignition ON, engine running indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0123 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH - DTC CHART

P0123 - THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the electronic throttle control (ETC) throttle position 1 (TP1) signal is too high.

Possible Causes:

- TP1 circuit short to voltage
- TP1 circuit short to VREF
- ETCRTN circuit open
- Damaged TP1 sensor

Diagnostic Aids: This concern exhibits a symptom of limited power. A TP1 PID reading greater than 4.75 volts in ignition ON, engine OFF or ignition ON, engine running indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0125 - INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL - DTC CHART

P0125 - INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL - DTC CHART

Description: This DTC sets when the engine coolant temperature (ECT) or the cylinder head temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.

Possible Causes:

- Insufficient warm up time

- Low engine coolant level
- Leaking or stuck open thermostat
- Damaged ECT sensor
- Damaged CHT sensor

Diagnostic Aids: Compare the thermostat specification to the actual engine coolant temperature using the engine temperature PID (ECT or CHT). The temperature reading should be similar when the engine is at a normal operating temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 2.0L, Explorer 2.0L, F-150 2.7L, Fiesta, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L, Transit Connect 1.6L	GO to Pinpoint Test DX .		
All others	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0128 - COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE) - DTC CHART

P0128 - COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE) - DTC CHART

Description: This DTC sets when the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

Possible Causes:

- Insufficient warm up time
- Low engine coolant level
- Leaking or stuck open thermostat
- Damaged engine coolant temperature (ECT) sensor

- Damaged cylinder head temperature (CHT) sensor

Diagnostic Aids: Refer to THERMOSTAT MONITOR for system information.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 2.0L, Explorer 2.0L, F-150 2.7L, Fiesta, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKT 2.0L, MKZ 2.0L, Mustang 2.3L, Taurus 2.0L, Transit Connect 1.6L	GO to Pinpoint Test DX .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P012B - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P012B - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the TCIP PID does not correlate within the calibrated threshold of the average of the BARO, the TCBP or the MAP PID.

Possible Causes:

- Slow responding turbocharger inlet pressure and temperature (TCIPT) sensor
- Damaged TCIPT sensor

Diagnostic Aids: Check the air filter element and housing for contamination, blockage or water intrusion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P012C -

TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW - DTC CHART

P012C - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when the turbocharger inlet pressure (TCIP) reading is less than the minimum calibrated threshold.

Possible Causes:

- TCIP circuit open
- TCIP circuit short to ground
- VREF circuit open
- VREF circuit short to ground
- Damaged turbocharger inlet pressure and temperature (TCIPT) sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P012D - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH - DTC CHART

P012D - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the turbocharger inlet pressure (TCIP) reading is greater than the maximum calibrated threshold.

Possible Causes:

- TCIP circuit open
- TCIP circuit short to voltage
- VREF circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P012E - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P012E - TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the manifold absolute pressure (MAP) sensor signal is intermittent.

Possible Causes:

- MAP circuit intermittent open
- MAP circuit intermittent short to voltage
- MAP circuit intermittent short to ground
- Damaged MAP sensor

Diagnostic Aids: Check the harness and connection.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0130 - O2 CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

P0130 - O2 CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S11 circuit open
- UO2S11 circuit short to ground
- UO2S11 circuit short to voltage
- UO2SGREF11 circuit open
- UO2SGREF11 circuit short to ground
- UO2SGREF11 circuit short to voltage
- UO2SPC11 circuit short to ground
- UO2SPC11 circuit short to voltage

- UO2SPCT11 circuit short to ground
- UO2SPCT11 circuit short to voltage
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0131 - O2 CIRCUIT LOW VOLTAGE (BANK 1, SENSOR 1) - DTC CHART

P0131 - O2 CIRCUIT LOW VOLTAGE (BANK 1, SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S11 circuit short to ground
- UO2SGREF11 circuit short to ground
- UO2SPC11 circuit short to ground
- UO2SPCT11 circuit short to ground
- Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)

Diagnostic Aids: An engine stall condition or an extremely rich air to fuel ratio may set this DTC. Diagnose any engine stall or rich air to fuel ratio concerns before diagnosing this DTC.
Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0132 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1) - DTC CHART

P0132 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1) - DTC CHART

Description: This DTC sets when an over voltage concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S11 circuit short to voltage
- UO2SGREF11 circuit short to voltage
- UO2SPC11 circuit short to voltage
- UO2SPCT11 circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0133 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1) - DTC CHART

P0133 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1) - DTC CHART

Description: The PCM monitors oxygen sensor response time by commanding a calibrated fuel control routine. This routine sets the air fuel ratio to a calibrated limit to produce a predictable oxygen sensor signal amplitude. This DTC sets when the oxygen sensor signal does not reach the predicted amplitude within a predetermined response time.

Possible Causes:

- Exhaust leaks
- Incorrect fueling
- Mass airflow (MAF) sensor
- Intake air leaks
- Contaminated universal heated oxygen sensor bank 1, sensor 1 (HO2S11)
- Deteriorating universal HO2S11

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0134 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1) - DTC CHART

P0134 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1) - DTC CHART

Description: If the sensor signal value is not changing from the default value, the PCM commands an oscillating air to fuel ratio attempting to detect some movement in the signal value. This DTC sets when the PCM is unable to detect movement in the sensor signal while the air to fuel ratio is oscillating.
Possible Causes: • UO2SPC11 circuit open • Deteriorating universal heated oxygen sensor bank 1, sensor 1 (HO2S11)
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0135 - O2 HEATER CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

P0135 - O2 HEATER CIRCUIT (BANK 1, SENSOR 1) - DTC CHART

Description: This DTC sets when an open or short circuit is detected or the universal heated oxygen sensor bank 1, sensor 1 (HO2S11) heater current draw exceeds a calibrated limit.
Possible Causes: • UO2SHTR11 circuit open • UO2SHTR11 circuit short to voltage • VPWR circuit open • Low battery voltage • Water in the harness connector • Corrosion • Incorrect connections • Damaged universal HO2S11 heater
Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0136 - O2

CIRCUIT (BANK 1, SENSOR 2) - DTC CHARTP0136 - O2 CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

P0136 - O2 CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- HO2S12 circuit open
- SIGRTN circuit open
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged heated oxygen sensor bank 1, sensor 2 (HO2S12)

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0137 - O2 SENSOR CIRCUIT LOW VOLTAGE (BANK 1 SENSOR 2) - DTC CHART

P0137 - O2 SENSOR CIRCUIT LOW VOLTAGE (BANK 1 SENSOR 2) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- HO2S12 circuit open
- HO2S12 circuit short to ground
- Damaged heated oxygen sensor bank 1, sensor 2 (HO2S12)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0138 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2) - DTC CHART

P0138 - O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2) - DTC CHART

Description: This DTC sets when an over voltage condition is present on the HO2S12 circuit.

Possible Causes:

- HO2S12 circuit short to voltage

Diagnostic Aids: An O2S12 PID voltage of 1.5 volts or greater indicates a short to voltage.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0139 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2) - DTC CHART

P0139 - O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2) - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor tracks the rate of voltage change during the rise and fall of the heated oxygen sensor bank 1, sensor 2 (HO2S12) signal. When the rate of voltage change is less than a calibrated value, the PCM begins to modify the fuel trim attempting to increase the HO2S voltage switch rate. This DTC sets when the PCM is at the allowable limit or has exceeded an allowable length of time for fuel trim modification, without detecting an acceptable rate of voltage change.

Possible Causes:

- Exhaust leaks
- Aftermarket accessories
- Performance modifications
- Contaminated HO2S12
- Deteriorating HO2S12
- Damaged HO2S12

Diagnostic Aids: Access the HO2S test results from the Generic OBD II menu to verify the DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P013A - O2

SENSOR SLOW RESPONSE - RICH TO LEAN (BANK 1, SENSOR 2) - DTC CHART

P013A - O2 SENSOR SLOW RESPONSE - RICH TO LEAN (BANK 1, SENSOR 2) - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor tracks the rate of voltage change during the rise and fall of the heated oxygen sensor bank 1, sensor 2 (HO2S12) signal. The measured rate of the rich to lean switch is compared to a calibrated fault threshold value. The threshold value takes into account the level of oxygen in the catalyst, which has an impact on how quickly the rich to lean switch occurs. This DTC sets when the measured value is slower than the threshold value.

Possible Causes:

- Exhaust leaks before or near the HO2S12
- Damaged HO2S12

Diagnostic Aids: Check for leaks in the exhaust system.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P013B - O2 SENSOR SLOW RESPONSE - LEAN TO RICH BANK 1, SENSOR 2 - DTC CHART

P013B - O2 SENSOR SLOW RESPONSE - LEAN TO RICH BANK 1, SENSOR 2 - DTC CHART

Description: During a deceleration fuel shut-off (DFSO) event, the PCM monitors how quickly the heated oxygen sensor bank 1, sensor 2 (HO2S12) switches from lean to rich. The measured rate of the lean to rich switch is compared to a calibrated fault threshold value. The measured rate of the lean to rich switch is compared to a calibrated fault threshold value. This DTC sets when the measured value is slower than the threshold value.

Possible Causes:

- Exhaust leaks before or near the HO2S12
- Damaged HO2S12

Diagnostic Aids: Check for leaks in the exhaust system.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P013C - O2 SENSOR SLOW RESPONSE - RICH TO LEAN (BANK 2, SENSOR 2) - DTC CHART

P013C - O2 SENSOR SLOW RESPONSE - RICH TO LEAN (BANK 2, SENSOR 2) - DTC CHART

Description: During a deceleration fuel shut-off (DFSO) event, the PCM monitors how quickly the heated oxygen sensor bank 2, sensor 2 (HO2S22) switches from rich to lean. The measured rate of the rich to lean switch is compared to a calibrated fault threshold value. The threshold value takes into account the level of oxygen in the catalyst, which has an impact on how quickly the rich to lean switch occurs. This DTC sets when the measured value is slower than the threshold value.

Possible Causes:

- Exhaust leaks before or near the HO2S22
- Damaged HO2S22

Diagnostic Aids: Check for leaks in the exhaust system.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P013E - SENSOR DELAYED RESPONSE - RICH TO LEAN (BANK 1, SENSOR 2) - DTC CHART

P013E - SENSOR DELAYED RESPONSE - RICH TO LEAN (BANK 1, SENSOR 2) - DTC CHART

Description: During a deceleration fuel shut-off (DFSO) event, the PCM monitors the heated oxygen sensor bank 1, sensor 2 (HO2S12) signal to determine if the signal is stuck in range. The PCM expects the signal to exceed a calibrated rich or lean value within a calibrated amount of time. If the signal voltage remains less than the rich value after a number of occurrences, the PCM intrusively controls the fuel system rich over increasing time periods in an attempt to force the signal to greater than the calibrated rich value.
This DTC sets when, after three consecutive intrusive attempts, the signal cannot be forced greater than the calibrated rich value. Also, if the signal voltage remains greater than the lean value after a calibrated amount of time with the fuel injectors off, a counter is incremented. This DTC sets when after three consecutive occurrences the signal is not less than the calibrated lean value.

Possible Causes:

- Exhaust leaks before or near the HO2S12
- Aftermarket exhaust accessories or performance modifications
- Ethanol content in the fuel
- HO2S12 circuit intermittent
- Damaged HO2S12

Diagnostic Aids: Check for leaks in the exhaust system. Check for an intermittent HO2S12 signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0140 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 2) - DTC CHART

P0140 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 2) - DTC CHART

Description: If the sensor signal value is not changing from the default value, the PCM commands an oscillating air to fuel ratio attempting to detect some movement in the signal value. This DTC sets when the PCM is unable to detect movement in the sensor signal while the air to fuel ratio is oscillating.

Possible Causes:

- HO2S12 circuit open
- Damaged heated oxygen sensor bank 1, sensor 2 (HO2S12)

Diagnostic Aids: An O2S12 PID switching across 0.45 volt from 0.2 to 0.9 volts indicates a normal switching HO2S.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0141 - O2 HEATER CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

P0141 - O2 HEATER CIRCUIT (BANK 1, SENSOR 2) - DTC CHART

Description: This DTC sets when an open or short circuit is detected or the heated oxygen sensor bank 1, sensor 2 (HO2S12) heater current draw exceeds a calibrated limit.

Possible Causes:

- HTR12 circuit open
- HTR12 circuit short to voltage
- VPWR circuit open
- GND circuit open
- Low battery voltage
- Water in the harness connector
- Corrosion
- Incorrect connections
- Damaged HO2S12 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0148 - FUEL DELIVERY ERROR - DTC CHART

P0148 - FUEL DELIVERY ERROR - DTC CHART

Description: At least one bank is lean at wide open throttle (WOT).

Possible Causes:

- Severely restricted fuel filter
- Severely restricted fuel supply line
- Damaged or worn fuel pump
- Damaged or contaminated mass airflow (MAF) sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P014A - SENSOR DELAYED RESPONSE - RICH TO LEAN (BANK 2, SENSOR 2) - DTC CHART

P014A - SENSOR DELAYED RESPONSE - RICH TO LEAN (BANK 2, SENSOR 2) - DTC CHART

Description: During a deceleration fuel shut-off (DFSO) event, the PCM monitors the heated oxygen sensor bank 2, sensor 2 (HO2S22) signal to determine if the signal is stuck in range. The PCM expects the signal to exceed a calibrated rich or lean value within a calibrated amount of time. If the signal voltage remains less than the rich value after a number of occurrences, the PCM intrusively controls the fuel system rich over increasing time periods in an attempt to force the signal to greater than the calibrated rich value.
This DTC sets when, after three consecutive intrusive attempts, the signal cannot be forced greater than the calibrated rich value. Also, if the signal voltage remains greater than the lean value after a calibrated amount of time with the fuel injectors off, a counter is incremented. This DTC sets when after three consecutive occurrences the signal is not less than the calibrated lean value.

Possible Causes:

- Exhaust leaks before or near the HO2S
- Aftermarket exhaust accessories or performance modifications

- Ethanol content in the fuel
- HO2S22 circuit intermittent
- Damaged HO2S22

Diagnostic Aids: Check for leaks in the exhaust system. Check for an intermittent HO2S22 signal.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0150 - O2 CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

P0150 - O2 CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S21 circuit open
- UO2S21 circuit short to ground
- UO2S21 circuit short to voltage
- UO2SGREF21 circuit open
- UO2SGREF21 circuit short to ground
- UO2SGREF21 circuit short to voltage
- UO2SPC21 circuit short to ground
- UO2SPC21 circuit short to voltage
- UO2SPCT21 circuit short to ground
- UO2SPCT21 circuit short to voltage
- Incorrect connections
- Damaged or corroded terminals
- Exhaust temperature significantly higher than expected
- Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21) heater

Diagnostic Aids:

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	GO to Pinpoint Test DZ .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0151 - O2 CIRCUIT LOW VOLTAGE (BANK 2, SENSOR 1) - DTC CHART

P0151 - O2 CIRCUIT LOW VOLTAGE (BANK 2, SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S21 circuit short to ground
- UO2SGREF21 circuit short to ground
- UO2SPC21 circuit short to ground
- UO2SPCT21 circuit short to ground
- Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21)

Diagnostic Aids: An engine stall condition or an extremely rich air to fuel ratio may set this DTC. Diagnose any engine stall or rich air to fuel ratio concerns before diagnosing this DTC.
Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0152 - O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 1) - DTC CHART

P0152 - O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 1) - DTC CHART

Description: This DTC sets when an over voltage concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S21 circuit short to voltage
- UO2SGREF21 circuit short to voltage
- UO2SPC21 circuit short to voltage
- UO2SPCT21 circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0153 - O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 1) - DTC CHART

P0153 - O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 1) - DTC CHART

Description: The PCM monitors the universal heated oxygen sensor bank 2, sensor 1 (HO2S21) response time by commanding a calibrated fuel control routine. This routine sets the air to fuel ratio to a calibrated limit to produce a predictable oxygen sensor signal amplitude. This DTC sets when the oxygen sensor signal does not reach the predicted amplitude within a predetermined response time.

Possible Causes:

- Exhaust leaks
- Incorrect fueling
- Intake air system leaks
- Mass airflow (MAF) sensor (if equipped)
- Contaminated universal HO2S21
- Deteriorating universal HO2S21

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0154 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 2, SENSOR 1) - DTC CHART

P0154 - O2 CIRCUIT NO ACTIVITY DETECTED (BANK 2, SENSOR 1) - DTC CHART

Description: If the sensor signal value is not changing from the default value, the PCM commands an oscillating air to fuel ratio attempting to detect some movement in the signal value. This DTC sets when the PCM is unable to detect movement in the sensor signal while the air to fuel ratio is oscillating.

Possible Causes:

- UO2SPC21 circuit open
- Contaminated universal heated oxygen sensor bank 2, sensor 1 (HO2S21)

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0155 - O2 HEATER CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

P0155 - O2 HEATER CIRCUIT (BANK 2, SENSOR 1) - DTC CHART

Description: This DTC sets when an open or short circuit is detected or the universal heated oxygen sensor bank 2, sensor 1 (HO2S21) heater current draw exceeds a calibrated limit.

Possible Causes:

- UO2SHTR21 circuit open
- UO2SHTR21 circuit short to voltage
- VPWR circuit open
- Low battery voltage
- Water in the harness connector
- Corrosion
- Incorrect connections
- Damaged universal HO2S21 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0157 - O2 SENSOR CIRCUIT LOW VOLTAGE (BANK 2 SENSOR 2) - DTC CHART

P0157 - O2 SENSOR CIRCUIT LOW VOLTAGE (BANK 2 SENSOR 2) - DTC CHART

Description: This DTC sets when a concern is detected with one of the circuits used to determine the oxygen content in the exhaust gas.

Possible Causes:

- HO2S22 circuit open
- HO2S22 circuit short to ground

- Damaged heated oxygen sensor bank 2, sensor 2 (HO2S22)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0158 - O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 2) - DTC CHART

P0158 - O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 2) - DTC CHART

Description: The heated oxygen sensor bank 2, sensor 2 (HO2S22) signal is monitored for an over voltage condition. This DTC sets when the HO2S signal voltage is 1.5 volts or greater.

Possible Causes:

- HO2S22 circuit short to voltage

Diagnostic Aids: See the diagnostic aids for DTC P0132.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0159 - O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 2) - DTC CHART

P0159 - O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 2) - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor tracks the rate of voltage change during the rise and fall of the heated oxygen sensor bank 2, sensor 2 (HO2S22) signal. When the rate of voltage change is less than a calibrated value, the PCM begins to modify the fuel trim attempting to increase the HO2S voltage switch rate. This DTC sets when the PCM is at the allowable limit or has exceeded an allowable length of time for fuel trim modification, without detecting an acceptable rate of voltage change.

Possible Causes:

- Exhaust leaks
- Aftermarket accessories
- Performance modifications
- Contaminated HO2S22
- Deteriorating HO2S22

- Damaged HO2S22

Diagnostic Aids: Access the HO2S test results from the Generic OBD II menu to verify the DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0161 - O2 HEATER CIRCUIT (BANK 2, SENSOR 2) - DTC CHART

P0161 - O2 HEATER CIRCUIT (BANK 2, SENSOR 2) - DTC CHART

Description: This DTC sets when an open or short circuit is detected or the universal heated oxygen sensor bank 2, sensor 2 (HO2S22) heater current draw exceeds a calibrated limit.

Possible Causes:

- HTR22 circuit open
- HTR22 circuit short to voltage
- VPWR circuit open
- GND circuit open
- Low battery voltage
- Water in the harness connector
- Corrosion
- Incorrect connections
- Damaged HO2S22 heater

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0171 - SYSTEM TOO LEAN (BANK 1) - DTC CHART

P0171 - SYSTEM TOO LEAN (BANK 1) - DTC CHART

Description: The adaptive fuel strategy continuously monitors the fuel delivery hardware. This DTC sets when the adaptive fuel tables reach a rich calibrated limit. Refer to POWERTRAIN CONTROL SOFTWARE , Fuel Trim for additional information.

Possible Causes:

- Ethanol content in the fuel
- Fuel filter plugged or dirty
- Damaged or worn fuel pump
- Leaking fuel pump check valve
- Leaking or contaminated fuel injectors
- Low fuel pressure or running out of fuel
- EVAP purge valve is leaking when the canister is clean
- Fuel supply line restricted
- Fuel rail pressure (FRP) sensor bias
- Exhaust leaks in the exhaust manifold gasket or mating gaskets before or near the heated oxygen sensor (HO2S)
- Air leaks after the mass airflow (MAF) sensor (if equipped)
- Vacuum leaks
- Positive crankcase ventilation (PCV) system is leaking or the valve is stuck open
- Incorrectly seated engine oil dipstick
- Intake air turbulence due to incorrect air filter
- Contaminated MAF sensor (if equipped)
- Damaged MAF sensor (if equipped)

Diagnostic Aids: View the freeze frame data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES , for additional information and the appropriate pinpoint test for specific concern identification.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H :		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0172 - SYSTEM TOO RICH (BANK 1) - DTC CHART

P0172 - SYSTEM TOO RICH (BANK 1) - DTC CHART

Description: The adaptive fuel strategy continuously monitors the fuel delivery hardware. This DTC sets when the adaptive fuel tables reach a lean calibrated limit. Refer to POWERTRAIN CONTROL

SOFTWARE , Fuel Trim for additional information.

Possible Causes:

- Leaking fuel injectors
- Fuel return line restricted
- Fuel rail pressure (FRP) sensor bias
- EVAP purge valve is leaking when the canister is full
- Contaminated mass airflow (MAF) sensor (if equipped)
- Damaged MAF sensor (if equipped)

Diagnostic Aids: View the freeze frame data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES , for additional information and the appropriate pinpoint test for specific concern identification.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0174 - SYSTEM TOO LEAN (BANK 2) - DTC CHART

P0174 - SYSTEM TOO LEAN (BANK 2) - DTC CHART

Description: The adaptive fuel strategy continuously monitors the fuel delivery hardware. This DTC sets when the adaptive fuel tables reach a rich calibrated limit. Refer to POWERTRAIN CONTROL SOFTWARE , Fuel Trim for additional information.

Possible Causes:

- Ethanol content in the fuel
- Fuel filter plugged or dirty
- Damaged or worn fuel pump
- Leaking fuel pump check valve
- Leaking or contaminated fuel injectors
- Low fuel pressure or running out of fuel
- EVAP purge valve is leaking when the canister is clean
- Fuel supply line restricted
- Fuel rail pressure (FRP) sensor bias

- Exhaust leaks in the exhaust manifold gasket or mating gaskets before or near the heated oxygen sensor (HO2S)
- Air leaks after the mass airflow (MAF) sensor (if equipped)
- Vacuum leaks
- Positive crankcase ventilation (PCV) system is leaking or the valve is stuck open
- Incorrectly seated engine oil dipstick
- Intake air turbulence due to incorrect air filter
- Contaminated MAF sensor (if equipped)
- Damaged MAF sensor (if equipped)

Diagnostic Aids: View the freeze frame data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES , for additional information and the appropriate pinpoint test for specific concern identification.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0175 - SYSTEM TOO RICH (BANK 2) - DTC CHART

P0175 - SYSTEM TOO RICH (BANK 2) - DTC CHART

Description: The adaptive fuel strategy continuously monitors the fuel delivery hardware. This DTC sets when the adaptive fuel tables reach a lean calibrated limit. Refer to POWERTRAIN CONTROL SOFTWARE , Fuel Trim for additional information.

Possible Causes:

- Leaking fuel injectors
- Fuel return line restricted
- Fuel rail pressure (FRP) sensor bias
- EVAP purge valve is leaking when the canister is full
- Contaminated mass airflow (MAF) sensor (if equipped)
- Damaged MAF sensor (if equipped)

Diagnostic Aids: View the freeze frame data to determine the operating conditions when the DTC was set. Observe the LONGFT1 and LONGFT2 PIDs. Refer to ADAPTIVE FUEL DIAGNOSTIC TROUBLE CODE (DTC) DIAGNOSTIC TECHNIQUES , for additional information and the appropriate pinpoint test for specific concern identification.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P017C - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

P017C - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when the CHT circuit is shorted to ground.

Possible Causes:

- CHT circuit short to ground
- Damaged cylinder head temperature (CHT) sensor
- Incorrect harness connection

Diagnostic Aids: The DTC P0117 may also be reported when this DTC sets. Either of these DTCs illuminates the malfunction indicator lamp (MIL).

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P017D - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

P017D - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when a CHT circuit concern is detected.

Possible Causes:

- CHT circuit open
- CHT circuit short to voltage
- Damaged cylinder head temperature (CHT) sensor
- Incorrect harness connection

Diagnostic Aids: The DTC P0118 may also be reported when this DTC sets. Either of these DTCs illuminate the malfunction indicator lamp (MIL).

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P017E - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P017E - CYLINDER HEAD TEMPERATURE SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the CHT circuit becomes intermittently open or short while the engine is running.

Possible Causes:

- Damaged CHT harness or connector
- Damaged cylinder head temperature (CHT) sensor
- CHT circuit open
- CHT circuit short to ground
- Low engine coolant

Diagnostic Aids: Monitor the CHT PID on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P018C - FUEL PRESSURE SENSOR B CIRCUIT LOW - DTC CHART

P018C - FUEL PRESSURE SENSOR B CIRCUIT LOW - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the FLP circuit to the PCM for low voltage. The test fails if the voltage falls below a calibrated limit for a calibrated amount of time during testing.

Possible Causes:

- FLP signal short to SIGRTN or GND
- Damaged fuel pressure sensor

Diagnostic Aids: An FLP PID value during ignition ON, engine OFF, or ignition ON, engine running, less than 0.3 volt indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test DD .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P018D - FUEL PRESSURE SENSOR B CIRCUIT HIGH - DTC CHART

P018D - FUEL PRESSURE SENSOR B CIRCUIT HIGH - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the FLP circuit to the PCM for high voltage. The test fails if the voltage exceeds a calibrated limit for a calibrated amount of time during testing.

Possible Causes:

- FLP circuit short to voltage
- FLP circuit open
- Damaged fuel pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0192 - FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW - DTC CHART

P0192 - FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the fuel rail pressure (FRP) sensor circuit to the PCM for low voltage. The test fails if the FRP voltage falls below a calibrated limit and amount of time during testing.

Possible Causes:

- FRP circuit short to SIGRTN or GND
- Damaged FRP sensor

Diagnostic Aids: A FRP PID value during ignition ON, engine OFF or ignition ON, engine running less than 0.3 volt indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0193 - FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH - DTC CHART

P0193 - FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the fuel rail pressure (FRP) sensor circuit to the PCM for high voltage. The test fails if the FRP voltage exceeds a calibrated limit and amount of time during testing.

Possible Causes:

- FRP signal short to voltage
- FRP signal open
- Damaged FRP sensor

Diagnostic Aids: An FRP signal high condition can be caused by any number of conditions, including a short on FRP signal to VREF, an open FRP signal or signal return. The FRP signal line is pulled up by the PCM and VREF at the sensor, and down by the sensor through SIGRTN.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0201 - CYLINDER 1 INJECTOR CIRCUIT/OPEN - DTC CHART

P0201 - CYLINDER 1 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open (if equipped)
- INJ1 circuit open
- INJ1 circuit short to ground (direct injection vehicles)
- INJ1 circuit short to voltage (direct injection vehicles)
- INJ1RTN circuit open (if equipped)
- INJ1RTN circuit short to ground (if equipped)
- INJ1RTN circuit short to voltage (if equipped)
- Damaged fuel injector 1
- Damaged PCM

Diagnostic Aids: For direct injection vehicles, the INJ1_F PID flags a concern. For all others, the INJ1_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, Transit Connect 1.6L	GO to Pinpoint Test DI .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0202 - CYLINDER 2 INJECTOR CIRCUIT/OPEN - DTC CHART

P0202 - CYLINDER 2 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open (if equipped)
- INJ2 circuit open
- INJ2 circuit short to ground (direct injection vehicles)
- INJ2 circuit short to voltage (direct injection vehicles)

- INJ2RTN circuit open (if equipped)
- INJ2RTN circuit short to ground (if equipped)
- INJ2RTN circuit short to voltage (if equipped)
- Damaged fuel injector 2
- Damaged PCM

Diagnostic Aids: For direct injection vehicles, the INJ2_F PID flags a concern. For all others, the INJ2_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, Transit Connect 1.6L	GO to Pinpoint Test DI .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0203 - CYLINDER 3 INJECTOR CIRCUIT/OPEN - DTC CHART

P0203 - CYLINDER 3 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector

drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open (if equipped)
- INJ3 circuit open
- INJ3 circuit short to ground (direct injection vehicles)
- INJ3 circuit short to voltage (direct injection vehicles)
- INJ3RTN circuit open (if equipped)
- INJ3RTN circuit short to ground (if equipped)
- INJ3RTN circuit short to voltage (if equipped)
- Damaged fuel injector 3
- Damaged PCM

Diagnostic Aids: For direct injection vehicles, the INJ3_F PID flags a concern. For all others, the INJ3_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus 2.0L, Taurus 3.5L GTDI, Transit 3.5L, Transit Connect 1.6L	GO to Pinpoint Test DI .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0204 - CYLINDER 4 INJECTOR CIRCUIT/OPEN - DTC CHART

P0204 - CYLINDER 4 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open (if equipped)
- INJ4 circuit open
- INJ4 circuit short to ground (direct injection vehicles)
- INJ4 circuit short to voltage (direct injection vehicles)
- INJ4RTN circuit open (if equipped)
- INJ4RTN circuit short to ground (if equipped)
- INJ4RTN circuit short to voltage (if equipped)
- Damaged fuel injector 4
- Damaged PCM

Diagnostic Aids: For direct injection vehicles, the INJ4_F PID flags a concern. For all others, the INJ4_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L,	GO to Pinpoint Test DI .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0206 - CYLINDER 6 INJECTOR CIRCUIT/OPEN - DTC CHART

P0206 - CYLINDER 6 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open (if equipped)
- INJ6 circuit open
- INJ6 circuit short to ground (direct injection vehicles)
- INJ6 circuit short to voltage (direct injection vehicles)
- INJ6RTN circuit open (if equipped)
- INJ6RTN circuit short to ground (if equipped)
- INJ6RTN circuit short to voltage (if equipped)
- Damaged fuel injector 6
- Damaged PCM

Diagnostic Aids: For direct injection vehicles, the INJ6_F PID flags a concern. For all others, the INJ6_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge 2.7L, Expedition, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Flex 3.5L GTDI, MKS 3.5L, MKT 3.5L, Navigator, Taurus 3.5L GTDI, Transit 3.5L	GO to Pinpoint Test DI .		

All others	GO to Pinpoint Test KG .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0207 - CYLINDER 7 INJECTOR CIRCUIT/OPEN - DTC CHART

P0207 - CYLINDER 7 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open
- INJ7 circuit open
- Damaged fuel injector 7
- Damaged PCM

Diagnostic Aids: The INJ7_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0208 - CYLINDER 8 INJECTOR CIRCUIT/OPEN - DTC CHART

P0208 - CYLINDER 8 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open
- INJ8 circuit open
- Damaged fuel injector 8
- Damaged PCM

Diagnostic Aids: The INJ8_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0209 - CYLINDER 9 INJECTOR CIRCUIT/OPEN - DTC CHART

P0209 - CYLINDER 9 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open
- INJ9 circuit open
- Damaged fuel injector 9
- Damaged PCM

Diagnostic Aids: The INJ9_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0210 - CYLINDER 10 INJECTOR CIRCUIT/OPEN - DTC CHART

P0210 - CYLINDER 10 INJECTOR CIRCUIT/OPEN - DTC CHART

Description: The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. This DTC sets when the fuel injector circuitry is inoperative.

Possible Causes:

- VPWR circuit open
- INJ10 circuit open
- Damaged fuel injector 10
- Damaged PCM

Diagnostic Aids: The INJ10_F PID flags equals YES.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0217 - ENGINE COOLANT OVER TEMPERATURE CONDITION - DTC CHART

P0217 - ENGINE COOLANT OVER TEMPERATURE CONDITION - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Engine Cooling to diagnose the engine overheats symptom.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0218 - TRANSMISSION FLUID OVER TEMPERATURE CONDITION - DTC CHART

P0218 - TRANSMISSION FLUID OVER TEMPERATURE CONDITION - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0219 - ENGINE OVER SPEED CONDITION - DTC CHART

P0219 - ENGINE OVER SPEED CONDITION - DTC CHART

Description: This DTC sets when the vehicle has been operated in a manner which caused the engine speed to exceed a calibrated limit. The engine RPM is continuously monitored and evaluated by the PCM. This DTC sets when the RPM exceeds the calibrated limit set within the PCM.
For additional information on the engine RPM limiter, refer to POWERTRAIN CONTROL SOFTWARE .

Possible Causes:

- Wheel slippage (water, ice, mud, and snow)
- Excessive engine RPM in NEUTRAL or operated in the incorrect transmission gear
- High engine RPM with engine temperature within a calibrated limit of an overheating condition (GTDI engine)

Diagnostic Aids: This DTC may be accompanied by other DTCs. If DTC P1285 or P1299 is present, disregard DTC P0219 at this time. Diagnose DTC P1285 or P1299 first. If there are no other symptoms, return the vehicle to the customer with information about the DTC. If a symptom is present, refer to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX .			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0222 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT LOW - DTC CHART

P0222 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT LOW - DTC CHART

Description: This DTC sets when the electronic throttle control (ETC) throttle position 2 (TP2) signal is too low.

Possible Causes:

- TP2 circuit open
- TP2 circuit short to ground
- Damaged TP2 sensor

Diagnostic Aids: This concern exhibits a symptom of limited power. A TP2 PID reading less than 0.25 volt in ignition ON, engine OFF or ignition ON, engine running indicates a concern is present.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0223 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT HIGH - DTC CHART

P0223 - THROTTLE/PEDAL POSITION SENSOR/SWITCH B CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the electronic throttle control (ETC) throttle position (TP) sensor signal is too high.

Possible Causes:

- TP2 circuit short to voltage
- TP2 circuit short to VREF
- TP2 circuit open
- ETCRTN circuit open

- Damaged TP2 sensor

Diagnostic Aids: This concern exhibits a symptom of limited power. A TP2 PID reading greater than 4.75 volts in ignition ON, engine OFF or ignition ON, engine running indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0234 - TURBOCHARGER/SUPERCHARGER A OVERBOOST CONDITION - DTC CHART

P0234 - TURBOCHARGER/SUPERCHARGER A OVERBOOST CONDITION - DTC CHART

Description: This DTC sets when the actual TCBP value is greater than the desired TCBP value by 27.6 kPa (4 psi) or more for 5 seconds, indicating an over boost condition.

Possible Causes:

- Damaged turbocharger (TC) wastegate regulating valve solenoid
- Damaged wastegate adjusting rod
- TC wastegate regulating solenoid valve stuck
- Wastegate stuck closed
- Wastegate control hose open or plugged
- Incorrect wastegate adjustment

Diagnostic Aids: Check tubing for restrictions, cracks and incorrect fitting connections.
Check the turbocharger wastegate regulating valve solenoid for correct operation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0236 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0236 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the TCBP PID does not correlate with the BARO or the MAP PID.

Possible Causes:

- Damaged turbocharger boost pressure (TCBP) sensor
- Contaminated or restricted TCBP sensor
- Slow responding TCBP sensor

Diagnostic Aids: Check the intake air system for leaks and restrictions.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0237 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT LOW - DTC CHART

P0237 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the TCBP circuit.

Possible Causes:

- TCBP circuit short to ground
- Damaged turbocharger boost pressure (TCBP) sensor
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0238 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT HIGH - DTC CHART

P0238 - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is an open circuit or high voltage in the TCBP circuit.

Possible Causes:

- TCBP circuit open
- TCBP circuit short to voltage

- Damaged turbocharger boost pressure (TCBP) sensor

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DM .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P023A - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT OPEN - DTC CHART

P023A - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT OPEN - DTC CHART

Description: This DTC sets when the CAC circuit is open or an internal failure of the charge air cooler (CAC) pump occurs.

Possible Causes:

- CAC circuit open
- Damaged CAC pump

Diagnostic Aids: A CAC circuit open condition will result in the CAC pump running continuously.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P023B - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT LOW - DTC CHART

P023B - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when the CAC circuit is shorted to ground or an internal failure of the charge air cooler (CAC) pump occurs.

Possible Causes:

- CAC circuit short to ground
- Damaged CAC pump

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P023C - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT HIGH - DTC CHART

P023C - CHARGE AIR COOLER COOLANT PUMP CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the CAC circuit is shorted to voltage or an internal failure of the charge air cooler (CAC) pump occurs.

Possible Causes:

- CAC circuit short to voltage
- Damaged CAC pump

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0245 - TURBOCHARGER/SUPERCHARGER WASTEGATE SOLENOID A LOW - DTC CHART

P0245 - TURBOCHARGER/SUPERCHARGER WASTEGATE SOLENOID A LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the TCWRVS circuit.

Possible Causes:

- TCWRVS circuit short to ground
- Damaged turbocharger (TC) wastegate regulating valve solenoid
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC only sets when the solenoid valve is energized.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0246 - TURBOCHARGER/SUPERCHARGER WASTEGATE SOLENOID A HIGH - DTC CHART

P0246 - TURBOCHARGER/SUPERCHARGER WASTEGATE SOLENOID A HIGH - DTC CHART

Description: This DTC sets when there is an open circuit or high voltage in the TCWRVS circuit.
Possible Causes: • TCWRVS circuit open • TCWRVS circuit short to voltage • Damaged turbocharger (TC) wastegate regulating valve solenoid
Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components. This DTC only sets when the solenoid is not energized.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P025A - FUEL PUMP MODULE A CONTROL CIRCUIT/OPEN - DTC CHART

P025A - FUEL PUMP MODULE A CONTROL CIRCUIT/OPEN - DTC CHART

Description: The PCM monitors the fuel pump command (FPC) circuit for a concern. When the PCM commands the fuel pump (FP) ON, the PCM is able to detect a short to voltage on the FPC circuit. When the PCM commands the FP OFF, the PCM is able to detect an open circuit or a short to ground on the FPC circuit. The test fails if the voltage is less than or greater than a calibrated limit, for a calibrated amount of time.
Possible Causes: • FPC circuit open or short to ground • FPC circuit short to voltage • Damaged fuel pump control module
Diagnostic Aids: Check for any harness concerns.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P025B - FUEL PUMP MODULE A CONTROL CIRCUIT RANGE/PERFORMANCE - DTC CHART

P025B - FUEL PUMP MODULE A CONTROL CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: The fuel pump control module monitors the duty cycle and frequency of the signal it receives from the PCM. The fuel pump control module determines if the signal from the PCM on the fuel pump command (FPC) circuit is a valid duty cycle and frequency. If the duty cycle or frequency is invalid, the fuel pump control module sends a 20% duty cycle signal on the fuel pump monitor (FPM) circuit to report the concern to the PCM. The test fails when the fuel pump control module is still reporting that it is receiving an invalid duty cycle or frequency from the PCM after a calibrated amount of time.

Possible Causes:

- FPC circuit open or short to ground
- FPC circuit short to voltage
- Radio frequency interference or electromagnetic interference
- Damaged fuel pump control module
- Damaged PCM

Diagnostic Aids: Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P025C - FUEL PUMP MODULE A CONTROL CIRCUIT LOW - DTC CHART

P025C - FUEL PUMP MODULE A CONTROL CIRCUIT LOW - DTC CHART

Description: The PCM monitors the fuel pump command (FPC) circuit for a concern. When the PCM commands the fuel pump (FP) ON, the PCM is able to detect a short to voltage on the FPC circuit. When the PCM commands the FP OFF, the PCM is able to detect an open circuit or a short to ground on the FPC circuit. The test fails if the FPC voltage is less than or greater than a calibrated limit, for a calibrated amount of time.

Possible Causes:

- FPC circuit short to ground
- Damaged fuel pump control module

Diagnostic Aids: Check for any harness concerns.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P025D - FUEL PUMP MODULE A CONTROL CIRCUIT HIGH - DTC CHART

P025D - FUEL PUMP MODULE A CONTROL CIRCUIT HIGH - DTC CHART

Description: The PCM monitors the fuel pump command (FPC) circuit for a concern. When the PCM commands the fuel pump (FP) ON, the PCM is able to detect a short to voltage on the FPC circuit. When the PCM commands the FP OFF, the PCM is able to detect an open circuit or a short to ground on the FPC circuit. The test fails if the FPC voltage is less than or greater than a calibrated limit, for a calibrated amount of time.

Possible Causes:

- FPC circuit open or short to voltage
- Damaged fuel pump control module

Diagnostic Aids: Check for any harness concerns.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P025E - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A INTERMITTENT/ERRATIC - DTC CHART

P025E - TURBOCHARGER/SUPERCHARGER BOOST SENSOR A INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when there are intermittent events in the TCBP circuit during a single drive cycle.

Possible Causes:

- TCBP circuit intermittent open
- TCBP circuit intermittent short to voltage
- TCBP circuit intermittent short to ground
- Damaged turbocharger boost pressure (TCBP) sensor
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.
This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P026A - CHARGE AIR COOLER EFFICIENCY BELOW THRESHOLD - DTC CHART

P026A - CHARGE AIR COOLER EFFICIENCY BELOW THRESHOLD - DTC CHART

Description: This DTC sets when the temperature differential between the intake air temperature 2 (IAT2) sensor value and the charge air cooler temperature (CACT) sensor value is less than a calibrated value.

Possible Causes:

- Low coolant
- Cooling system concern
- Biased IAT2 sensor
- Biased CACT sensor
- Damaged charge air cooler (CAC)

Diagnostic Aids: Check for any cooling system concerns.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P028D - CHARGE AIR COOLER COOLING FAN CONTROL CIRCUIT LOW - DTC CHART

P028D - CHARGE AIR COOLER COOLING FAN CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when the PCM detects an open circuit or a short to ground in the CACCF circuit.

Possible Causes:

- Damaged charge air cooler (CAC) fan relay
- CACCF circuit short to ground
- CACCF circuit open
- Damaged harness connector
- Damaged harness

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P028E - CHARGE AIR COOLER COOLING FAN CONTROL CIRCUIT HIGH - DTC CHART

P028E - CHARGE AIR COOLER COOLING FAN CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the PCM detects a short to voltage in the CACCF circuit.

Possible Causes:

- Damaged charge air cooler (CAC) fan relay
- CACCF circuit short to voltage
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Check the harness for intermittent concerns, incorrect connections, routing, alterations and damage due to contact with other components.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0297 - VEHICLE OVER SPEED CONDITION - DTC CHART

P0297 - VEHICLE OVER SPEED CONDITION - DTC CHART

Description: This DTC sets when the vehicle has been operated in a manner which caused the vehicle speed to exceed a calibration limit. The vehicle speed is continuously monitored and evaluated by the PCM. For additional information on the vehicle speed limiter, refer to POWERTRAIN CONTROL SOFTWARE .

Possible Causes:

- Vehicle driven at a high rate of speed

Diagnostic Aids: If there are no other symptoms, return the vehicle to the customer with information about the DTC.
If a symptom is present, refer to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0298 - ENGINE OIL OVER TEMPERATURE CONDITION - DTC CHART

P0298 - ENGINE OIL OVER TEMPERATURE CONDITION - DTC CHART

Description: This DTC sets when the engine oil temperature protection strategy in the PCM has been activated. This temporarily prohibits high engine speed operation by disabling injectors, to reduce the risk of engine damage from high engine oil temperature. The PCM uses an oil algorithm to determine actual engine oil temperature.

Possible Causes:

- Very high engine RPM for an extended period of time
- Overheating condition
- Base engine concerns

Diagnostic Aids: The engine is operating in high RPM range due to incorrect gear selection. This may cause a lack/loss of power or surge.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DY .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0299 - TURBOCHARGER/SUPERCHARGER A UNDERBOOST CONDITION - DTC CHART

P0299 - TURBOCHARGER/SUPERCHARGER A UNDERBOOST CONDITION - DTC CHART

Description: This DTC sets when the actual TCBP value is less than the desired TCBP value by 27.6 kPa (4 psi) or more for 5 seconds, indicating an under boost condition.

Possible Causes:

- Damaged turbocharger (TC) wastegate regulating valve solenoid
- TC wastegate regulating solenoid valve stuck
- Wastegate stuck open
- Wastegate control hose open or plugged
- Air leak between turbocharger and throttle

Diagnostic Aids: Check tubing for restrictions, cracks and incorrect fitting connections.
Check the turbocharger wastegate regulating valve solenoid for correct operation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0300 - RANDOM MISFIRE DETECTED - DTC CHART

P0300 - RANDOM MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in multiple cylinders or the PCM cannot identify which cylinder is misfiring.

Possible Causes:

- Damaged camshaft position (CMP) sensor
- Low fuel (less than 1/8 tank)
- Stuck open exhaust gas recirculation (EGR) valve
- Restricted EGR passages
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: One or more EGR passages may be restricted.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0301 - CYLINDER 1 MISFIRE DETECTED - DTC CHART

P0301 - CYLINDER 1 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 1.

Possible Causes:

- Ignition system
- Fuel injector 1
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine

- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0302 - CYLINDER 2 MISFIRE DETECTED - DTC CHART

P0302 - CYLINDER 2 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 2.

Possible Causes:

- Ignition system
- Fuel injector 2
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0303 -

CYLINDER 3 MISFIRE DETECTED - DTC CHART

P0303 - CYLINDER 3 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 3.

Possible Causes:

- Ignition system
- Fuel injector 3
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0304 - CYLINDER 4 MISFIRE DETECTED - DTC CHART

P0304 - CYLINDER 4 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 4.

Possible Causes:

- Ignition system
- Fuel injector 4
- Running out of fuel
- EVAP purge valve

- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0305 - CYLINDER 5 MISFIRE DETECTED - DTC CHART

P0305 - CYLINDER 5 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 5.

Possible Causes:

- Ignition system
- Fuel injector 5
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause. The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0306 - CYLINDER 6 MISFIRE DETECTED - DTC CHART

P0306 - CYLINDER 6 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 6.

Possible Causes:

- Ignition system
- Fuel injector 6
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0307 - CYLINDER 7 MISFIRE DETECTED - DTC CHART

P0307 - CYLINDER 7 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 7.

Possible Causes:

- Ignition system
- Fuel injector 7
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0308 - CYLINDER 8 MISFIRE DETECTED - DTC CHART

P0308 - CYLINDER 8 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 8.

Possible Causes:

- Ignition system
- Fuel injector 8
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0309 - CYLINDER 9 MISFIRE DETECTED - DTC CHART

P0309 - CYLINDER 9 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 9.

Possible Causes:

- Ignition system
- Fuel injector 9
- Running out of fuel
- EVAP purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0310 - CYLINDER 10 MISFIRE DETECTED - DTC CHART

P0310 - CYLINDER 10 MISFIRE DETECTED - DTC CHART

Description: This DTC sets when the misfire detection monitor detects an engine misfire in cylinder 10.

Possible Causes:

- Ignition system
- Fuel injector 10

- Running out of fuel
- EVAP canister purge valve
- Fuel pressure
- Evaporative emission system
- Exhaust gas recirculation (EGR) system
- Base engine
- Misfire monitor neutral profile correction has not been relearned since the last mechanical repair

Diagnostic Aids: Misfire is defined as lack of combustion in a cylinder due to absence of spark, incorrect fuel metering, low compression, or any other cause.
The malfunction indicator lamp (MIL) blinks once per second when a misfire severe enough to cause catalyst damage is detected. If the MIL is on steady state due to a misfire, this indicates the threshold for emissions was exceeded and caused the vehicle to fail an inspection and maintenance tailpipe test.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0313 - MISFIRE DETECTED WITH LOW FUEL - DTC CHART

P0313 - MISFIRE DETECTED WITH LOW FUEL - DTC CHART

Description: This DTC sets when an engine misfire fault is detected with low fuel level.

Possible Causes:

- Customer driving habits
- Low fuel or no fuel in tank (less than 1/8 tank)

Diagnostic Aids: Verify the fuel level is above 1/8 before diagnosing engine misfire DTCs.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0315 - CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED - DTC CHART

P0315 - CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED - DTC CHART

For Neutral Profile Correction Using Scan Tool

Description: The PCM has not learned the crankshaft pulse wheel tooth spacing. This DTC disables the misfire monitor.

Possible Causes:

- PCM replacement
- Internal PCM non-volatile random access memory (NVRAM) error

Diagnostic Aids: Complete the Misfire Monitor Neutral Profile Correction procedure using the scan tool.

For All Others

Description: The PCM is unable to learn and correct for mechanical inaccuracies in crankshaft pulse wheel tooth spacing. This DTC disables the misfire monitor.

Possible Causes:

- Damaged crankshaft pulse wheel teeth
- Damaged crankshaft position (CKP) sensor

Diagnostic Aids: Requires visual inspection of the CKP sensor and the crankshaft pulse wheel teeth for damage.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Edge, F-150, Fiesta 1.0L, Fiesta 1.6L GTDI, Focus, MKC, Mustang, Transit	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0316 - MISFIRE DETECTED ON STARTUP (FIRST 1000 REVOLUTIONS) - DTC CHART

P0316 - MISFIRE DETECTED ON STARTUP (FIRST 1000 REVOLUTIONS) - DTC CHART

Description: DTC P0316 sets in addition to any type B misfire DTC which occurs in the first 1, 000 revolution test interval following engine start.

Possible Causes:

- Damaged crankshaft position (CKP) sensor
- Damaged ignition system

- Damaged fuel injectors
- Running out of fuel
- Fuel quality
- Base engine
- Damaged PCM

Diagnostic Aids: Freeze frame data and the DTC P03xx are also stored, indicating which cylinder the misfire occurred.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0320 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT - DTC CHART

P0320 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT - DTC CHART

Description: This DTC sets when several erratic profile ignition pickup (PIP) pulses have occurred in the crankshaft position (CKP) sensor signal within a calibrated time period when the camshaft speed exceeds the equivalent speed of engine idle.

Possible Causes:

- CKP+ circuit intermittent open (VR type)
- CKP- circuit intermittent open (VR type)
- CKP circuit intermittent open (Hall effect)
- VREF circuit intermittent open (Hall effect)
- SIGRTN circuit intermittent open (Hall effect)
- CKP+ circuit intermittent short to voltage (VR type)
- CKP- circuit intermittent short to voltage (VR type)
- CKP circuit intermittent short to voltage (Hall effect)
- VREF circuit intermittent short to voltage (Hall effect)
- SIGRTN circuit intermittent short to voltage (Hall effect)
- CKP+ circuit intermittent short to ground (VR type)
- CKP- circuit intermittent short to ground (VR type)
- CKP circuit intermittent short to ground (Hall effect)

- VREF circuit intermittent short to ground (Hall effect)
- SIGRTN circuit intermittent short to ground (Hall effect)
- CKP sensor incorrectly installed
- Damaged CKP sensor
- Incorrect, damaged or corroded connections
- Arcing secondary ignition components (coil, wires and plugs)
- Arcing relays or other high current devices (cooling fan or starter motor)
- On board 2 way radio transceiver
- Radio frequency interference or electromagnetic interference from an external source
- Improperly grounded high power aftermarket equipment

Diagnostic Aids:

All	GO to Pinpoint Test A :		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0322 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT NO SIGNAL - DTC CHART

P0322 - IGNITION/DISTRIBUTOR ENGINE SPEED INPUT CIRCUIT NO SIGNAL - DTC CHART

Description: This DTC sets when the crankshaft position (CKP) sensor profile ignition pickup (PIP) pulse is missing for greater than a calibrated number of camshaft revolutions when the camshaft speed exceeds the equivalent speed of engine idle.

Possible Causes:

- CKP+ circuit intermittent open (VR type)
- CKP- circuit open (VR type)
- CKP circuit open (Hall effect)
- VREF circuit open (Hall effect)
- SIGRTN circuit open (Hall effect)
- CKP+ circuit short to voltage (VR type)
- CKP- circuit short to voltage (VR type)
- CKP circuit short to voltage (Hall effect)
- VREF circuit short to voltage (Hall effect)

- SIGRTN circuit short to voltage (Hall effect)
- CKP+ circuit short to ground (VR type)
- CKP- circuit short to ground (VR type)
- CKP circuit short to ground (Hall effect)
- VREF circuit short to ground (Hall effect)
- SIGRTN circuit short to ground (Hall effect)
- Damaged CKP sensor
- CKP sensor incorrectly installed
- Incorrect, damaged or corroded connections

Diagnostic Aids: An inactive CKP signal causes a no start condition. Monitor the RPM PID while cranking the engine. A value of 0 RPM indicates a CKP concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test A .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0325 - KNOCK SENSOR 1 CIRCUIT (BANK 1) - DTC CHART

P0325 - KNOCK SENSOR 1 CIRCUIT (BANK 1) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 1 (KS1) detects vibrations upon increase and decrease in engine RPM. The KS1 generates a voltage based on this vibration.

Possible Causes:

- KS1+ circuit open
- KS1- circuit open
- KS1+ circuit short to voltage
- KS1- circuit short to voltage
- KS1+ circuit short to ground
- KS1- circuit short to ground
- Damaged KS1

Diagnostic Aids: A KS1 voltage greater than 0.5 volt with the ignition ON, engine OFF, indicates a concern is present.
The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0326 - KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

P0326 - KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE (BANK 1) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 1 (KS1) detects vibrations upon increase and decrease in engine RPM. The KS1 generates a voltage based on this vibration.

Possible Causes:

- KS1+ circuit open
- KS1- circuit open
- KS1+ circuit short to voltage
- KS1- circuit short to voltage
- KS1+ circuit short to ground
- KS1- circuit short to ground
- Damaged KS1

Diagnostic Aids: A KS1 voltage greater than 0.5 volt with the ignition ON, engine OFF, indicates a concern is present.
The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0327 - KNOCK SENSOR 1 CIRCUIT LOW (BANK 1) - DTC CHART

P0327 - KNOCK SENSOR 1 CIRCUIT LOW (BANK 1) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 1 (KS1) detects vibrations upon increase and decrease in engine RPM. The KS1 generates a voltage based on this vibration.

Possible Causes:

- KS1+ circuit open

- KS1- circuit open
- KS1+ circuit short to ground
- KS1- circuit short to ground
- Damaged KS1

Diagnostic Aids: The vehicle may need to be driven for several minutes to set this DTC.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0328 - KNOCK SENSOR 1 CIRCUIT HIGH (BANK 1) - DTC CHART

P0328 - KNOCK SENSOR 1 CIRCUIT HIGH (BANK 1) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 1 (KS1) detects vibrations upon increase and decrease in engine RPM. The KS1 generates a voltage based on this vibration.

Possible Causes:

- KS1+ circuit short to voltage
- KS1- circuit short to voltage
- Damaged KS1

Diagnostic Aids: The vehicle may need to be driven for several minutes to set this DTC.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0330 - KNOCK SENSOR 2 CIRCUIT (BANK 2) - DTC CHART

P0330 - KNOCK SENSOR 2 CIRCUIT (BANK 2) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 2 (KS2) detects vibrations upon increase and decrease in engine RPM. The KS2 generates a voltage based on this vibration.

Possible Causes:

- KS2+ circuit open

- KS2- circuit open
- KS2+ circuit short to voltage
- KS2- circuit short to voltage
- KS2+ circuit short to ground
- KS2- circuit short to ground
- Damaged KS2

Diagnostic Aids: A KS2 voltage greater than 0.5 volt with the ignition ON, engine OFF, indicates a concern is present.
The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0331 - KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE LOW (BANK 2) - DTC CHART

P0331 - KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE LOW (BANK 2) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 2 (KS2) detects vibrations upon increase and decrease in engine RPM. The KS2 generates a voltage based on this vibration.

Possible Causes:

- KS2+ circuit open
- KS2- circuit open
- KS2+ circuit short to voltage
- KS2- circuit short to voltage
- KS2+ circuit short to ground
- KS2- circuit short to ground
- Damaged KS2

Diagnostic Aids: A KS2 voltage greater than 0.5 volt with the ignition ON, engine OFF, indicates a concern is present.
The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0332 - KNOCK SENSOR 2 CIRCUIT LOW (BANK 2) - DTC CHART

P0332 - KNOCK SENSOR 2 CIRCUIT LOW (BANK 2) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 2 (KS2) detects vibrations upon increase and decrease in engine RPM. The KS2 generates a voltage based on this vibration.

Possible Causes:

- KS2+ circuit open
- KS2- circuit open
- KS2+ circuit short to ground
- KS2- circuit short to ground
- Damaged KS2

Diagnostic Aids: The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0333 - KNOCK SENSOR 2 CIRCUIT HIGH (BANK 2) - DTC CHART

P0333 - KNOCK SENSOR 2 CIRCUIT HIGH (BANK 2) - DTC CHART

Description: This DTC sets when the voltage goes outside a calibrated level. The knock sensor 2 (KS2) detects vibrations upon increase and decrease in engine RPM. The KS2 generates a voltage based on this vibration.

Possible Causes:

- KS2+ circuit short to voltage
- KS2- circuit short to voltage
- Damaged KS2

Diagnostic Aids: The vehicle may need to be driven for several minutes to set this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0335 - CRANKSHAFT POSITION SENSOR A CIRCUIT - DTC CHART

P0335 - CRANKSHAFT POSITION SENSOR A CIRCUIT - DTC CHART

Description: This DTC sets when the crankshaft position (CKP) sensor profile ignition pickup (PIP) pulse is missing for greater than a calibrated number of camshaft revolutions when the camshaft speed exceeds the equivalent speed of engine idle or the starter motor is engaged.

Possible Causes:

- CKP+ circuit intermittent open (VR type)
- CKP- circuit open (VR type)
- CKP circuit open (Hall effect type)
- VREF circuit open (Hall effect type)
- SIGRTN circuit open (Hall effect type)
- CKP+ circuit short to voltage (VR type)
- CKP- circuit short to voltage (VR type)
- CKP circuit short to voltage (Hall effect type)
- VREF circuit short to voltage (Hall effect type)
- SIGRTN circuit short to voltage (Hall effect type)
- CKP+ circuit short to ground (VR type)
- CKP- circuit short to ground (VR type)
- CKP circuit short to ground (Hall effect type)
- VREF circuit short to ground (Hall effect type)
- SIGRTN circuit short to ground (Hall effect type)
- Damaged CKP sensor
- CKP sensor incorrectly installed
- Incorrect, damaged or corroded connections

Diagnostic Aids: An inactive CKP signal causes a no start condition. Monitor the RPM PID while cranking the engine. A value of 0 RPM indicates a CKP concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0336 - CRANKSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0336 - CRANKSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the input signal from the crankshaft position (CKP) sensor is erratic.

Possible Causes:

- CKP circuit noise
- Damaged CKP sensor connection
- Damaged CKP sensor
- Damaged crankshaft pulse wheel teeth

Diagnostic Aids: An inactive CKP signal causes a no start condition. Monitor the RPM PID while cranking the engine. A value of 0 RPM indicates a CKP concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0339 - CRANKSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT - DTC CHART

P0339 - CRANKSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when several erratic profile ignition pickup (PIP) pulses have occurred in the crankshaft position (CKP) sensor signal within a calibrated time period when the camshaft speed exceeds the equivalent speed of engine idle or the starter motor is engaged.

Possible Causes:

- CKP+ circuit intermittent open (VR type)
- CKP- circuit intermittent open (VR type)
- CKP circuit intermittent open (Hall effect type)
- VREF circuit intermittent open (Hall effect type)
- SIGRTN circuit intermittent open (Hall effect type)
- CKP+ circuit intermittent short to voltage (VR type)
- CKP- circuit intermittent short to voltage (VR type)
- CKP circuit intermittent short to voltage (Hall effect type)
- VREF circuit intermittent short to voltage (Hall effect type)

- SIGRTN circuit intermittent short to voltage (Hall effect type)
- CKP+ circuit intermittent short to ground (VR type)
- CKP- circuit intermittent short to ground (VR type)
- CKP circuit intermittent short to ground (Hall effect type)
- VREF circuit intermittent short to ground (Hall effect type)
- SIGRTN circuit intermittent short to ground (Hall effect type)
- CKP sensor incorrectly installed
- Damaged CKP sensor
- Incorrect, damaged or corroded connections
- Arcing secondary ignition components (coil, wires and plugs)
- Arcing relays or other high current devices (cooling fan or starter motor)
- On board 2 way radio transceiver
- Radio frequency interference or electromagnetic interference from an external source
- Improperly grounded high power aftermarket equipment

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0340 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 1 OR SINGLE SENSOR) - DTC CHART

P0340 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 1 OR SINGLE SENSOR) - DTC CHART

Description: This DTC sets when the CMP11 circuit signal cannot be detected. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- CMP11 circuit open
- CMP11 circuit short to ground
- CMP11 circuit short to voltage
- SIGRTN circuit open
- VRSRTN circuit open

- CMP11 circuit shorted to other CMP circuits (2 or more CMP sensor systems)
- Damaged camshaft position bank 1 sensor 1 (CMP11) shielding
- CMP11 sensor incorrectly installed
- Damaged CMP11 sensor

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0341 - CAMSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE (BANK 1 OR SINGLE SENSOR) - DTC CHART

P0341 - CAMSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE (BANK 1 OR SINGLE SENSOR) - DTC CHART

Description: This DTC sets when the CMP11 circuit has a noisy signal. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- Radio frequency interference or electromagnetic interference
- Damaged camshaft phaser and sprocket
- Damaged camshaft position bank 1 sensor 1 (CMP11) shielding

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0344 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 1 OR SINGLE SENSOR) - DTC CHART

P0344 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 1 OR SINGLE SENSOR) - DTC CHART

Description: This DTC sets when the CMP11 circuit signal is intermittent. For additional camshaft

position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- Intermittent open circuit
- Intermittent short circuit
- Damaged CMP sensor shielding
- Incorrect harness connections
- Corrosion
- Damaged camshaft position bank 1 sensor 1 (CMP11)

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0345 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 2) - DTC CHART

P0345 - CAMSHAFT POSITION SENSOR A CIRCUIT (BANK 2) - DTC CHART

Description: This DTC sets when the CMP21 circuit signal cannot be detected. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- CMP21 circuit open
- CMP21 circuit short to ground
- CMP21 circuit short to voltage
- SIGRTN circuit open
- VRSRTN circuit open
- CMP21 circuit shorted to other CMP circuits (2 or more CMP sensor systems)
- Damaged CMP sensor shielding
- Camshaft position bank 2 sensor 1 (CMP21) incorrectly installed
- Damaged CMP21 sensor

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0346 - CAMSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE (BANK 2) - DTC CHART

P0346 - CAMSHAFT POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE (BANK 2) - DTC CHART

Description: This DTC sets when the CMP21 circuit has a noisy signal. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- Radio frequency interference or electromagnetic interference
- Damaged camshaft phaser and sprocket
- Damaged camshaft position bank 2 sensor 1 (CMP21) shielding

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0349 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2) - DTC CHART

P0349 - CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2) - DTC CHART

Description: This DTC sets when the CMP21 circuit signal is intermittent. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- Intermittent open circuit
- Intermittent short circuit
- Damaged CMP sensor shielding
- Incorrect harness connections
- Corrosion
- Damaged camshaft position bank 2 sensor 1 (CMP21)

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DR .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0351 - IGNITION COIL A PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0351 - IGNITION COIL A PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP1 circuit open (COP)
- CDA circuit open (coil pack)
- COP1 circuit short to voltage (COP)
- CDA circuit short to voltage (coil pack)
- COP1 circuit short to ground (COP)
- CDA circuit short to ground (coil pack)
- Damaged COP (if equipped)
- Damaged coil pack (if equipped)

Diagnostic Aids: The DTC P0351 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0351. The DTC P0301 does not set for a coil primary circuit malfunction. The DTC P0351 may set with or without the DTC P0301, however the DTC P0351 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		

All others	GO to Pinpoint Test JF .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0352 - IGNITION COIL B PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0352 - IGNITION COIL B PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP2 circuit open (COP)
- CDB circuit open (coil pack)
- COP2 circuit short to voltage (COP)
- CDB circuit short to voltage (coil pack)
- COP2 circuit short to ground (COP)
- CDB circuit short to ground (coil pack)
- Damaged COP (if equipped)
- Damaged coil pack (if equipped)

Diagnostic Aids: The DTC P0352 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0352. The DTC P0302 does not set for a coil primary circuit malfunction. The DTC P0352 may set with or without the DTC P0302, however the DTC P0352 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		
All others	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0353 -

IGNITION COIL C PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0353 - IGNITION COIL C PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP3 circuit open
- COP3 circuit short to voltage
- COP3 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0353 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0353. The DTC P0303 does not set for a coil primary circuit malfunction. The DTC P0353 may set with or without the DTC P0303, however the DTC P0353 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0354 - IGNITION COIL D PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0354 - IGNITION COIL D PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP4 circuit open

- COP4 circuit short to voltage
- COP4 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0354 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0354. The DTC P0304 does not set for a coil primary circuit malfunction. The DTC P0354 may set with or without the DTC P0304, however the DTC P0354 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality. Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector.
Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0355 - IGNITION COIL E PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0355 - IGNITION COIL E PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP5 circuit open
- COP5 circuit short to voltage
- COP5 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0355 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0355. The DTC P0305 does not set for a coil primary circuit malfunction. The DTC P0355 may set with or without the DTC P0305, however the DTC P0355 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not

replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0356 - IGNITION COIL F PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0356 - IGNITION COIL F PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP6 circuit open
- COP6 circuit short to voltage
- COP6 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0356 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0356. The DTC P0306 does not set for a coil primary circuit malfunction. The DTC P0356 may set with or without the DTC P0306, however the DTC P0356 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0357 - IGNITION COIL G PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0357 - IGNITION COIL G PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP7 circuit open
- COP7 circuit short to voltage
- COP7 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0357 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0357. The DTC P0307 does not set for a coil primary circuit malfunction. The DTC P0357 may set with or without the DTC P0307, however the DTC P0357 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0358 - IGNITION COIL H PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0358 - IGNITION COIL H PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP8 circuit open
- COP8 circuit short to voltage
- COP8 circuit short to ground

- Damaged COP

Diagnostic Aids: The DTC P0358 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0358. The DTC P0308 does not set for a coil primary circuit malfunction. The DTC P0358 may set with or without the DTC P0308, however the DTC P0358 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0359 - IGNITION COIL I PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0359 - IGNITION COIL I PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP9 circuit open
- COP9 circuit short to voltage
- COP9 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0359 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0359. The DTC P0309 does not set for a coil primary circuit malfunction. The DTC P0359 may set with or without the DTC P0309, however the DTC P0359 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to voltage, or short to ground.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0360 - IGNITION COIL J PRIMARY/SECONDARY CIRCUIT - DTC CHART

P0360 - IGNITION COIL J PRIMARY/SECONDARY CIRCUIT - DTC CHART

Description: This DTC sets when the PCM does not receive a valid ignition diagnostic monitor (IDM) pulse signal from the ignition module PCM.

Possible Causes:

- VPWR circuit open
- VPWR circuit short to ground
- COP10 circuit open
- COP10 circuit short to voltage
- COP10 circuit short to ground
- Damaged COP

Diagnostic Aids: The DTC P0360 only sets for a coil primary circuit failure. A secondary ignition coil or spark plug failure does not set the DTC P0360. The DTC P0310 does not set for a coil primary circuit malfunction. The DTC P0360 may set with or without the DTC P0310, however the DTC P0360 sets first.
When this DTC is set, the PCM enters failure mode effects management (FMEM) which shuts down the injector for the associated cylinder in order to protect the catalytic converter. This is normal operation, do not attempt to diagnose the injector with this DTC present.
If a primary coil is damaged due to a harness short to ground the PCM will not be damaged. Do not replace the PCM without verifying the coil driver functionality.
Use the 12 volt non-powered test lamp to verify VPWR voltage at the ignition coil harness connector. Check the coil driver circuit for open, short to VPWR, or short to ground.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0365 - CAMSHAFT POSITION SENSOR B CIRCUIT (BANK 1) - DTC CHART

P0365 - CAMSHAFT POSITION SENSOR B CIRCUIT (BANK 1) - DTC CHART

Description: This DTC sets when the CMP12 circuit signal cannot be detected. For additional camshaft position (CMP) sensor location information, refer to ENGINE CONTROL COMPONENTS .

Possible Causes:

- CMP12 circuit open
- CMP12 circuit short to ground
- CMP12 circuit short to voltage
- SIGRTN circuit open
- VRSRTN circuit open
- CMP12 circuit shorted to other CMP circuits (2 or more CMP sensor systems)
- Damaged camshaft position bank 1 sensor 2 (CMP12) shielding
- CMP12 sensor incorrectly installed
- Damaged CMP12 sensor

Diagnostic Aids: Harness routing, harness alterations, incorrect shielding, or electrical interference from other systems may have an intermittent impact on the CMP signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0400 - EXHAUST GAS RECIRCULATION (EGR) FLOW - DTC CHART

P0400 - EXHAUST GAS RECIRCULATION (EGR) FLOW - DTC CHART

Description: The electric EGR (EEGR) system is monitored once per drive cycle at high and low load conditions. This DTC sets when a concern is detected by PCM calculations indicating the EGR flow is less or greater than expected.

Possible Causes:

- EEGR valve stuck open or closed
- EEGR connector not seated correctly
- EEGR stepper motor
- VPWR circuit open
- EGRMC circuit open
- EGRMC circuit short to voltage
- EGRMC circuit short to ground
- Vacuum signal to manifold absolute pressure (MAP) sensor restricted or leaking
- Mass airflow (MAF) sensor signal erroneous
- Carbon build up in the EEGR valve seat area

Diagnostic Aids: The following sensors input data to the PCM for correct operation of the EEGR system: engine coolant temperature (ECT), crankshaft position (CKP), intake air temperature (IAT), MAF, throttle position (TP), MAP and vehicle speed sensor (VSS). Diagnose any DTC relating to these sensors prior to addressing this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test KD .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0403 - EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT - DTC CHART

P0403 - EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT - DTC CHART

Description: The electric EGR (EEGR) system is continuously monitored to check the four EEGR motor coils, circuits, and the PCM for opens, shorts to voltage and ground. If a concern is detected, the EEGR system is disabled and additional monitoring is suspended for the remainder of the drive until the next drive cycle.

Possible Causes:

- EEGR stepper motor windings open
- EEGR connector not seated correctly
- EGRMC circuit open
- EGRMC circuit short to voltage
- EGRMC circuit short to ground
- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0420 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1) - DTC CHART

P0420 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1) - DTC CHART

Description: This DTC sets when the bank 1 catalyst system efficiency is below the acceptable threshold.

Possible Causes:

- Use of leaded fuel
- Damaged heated oxygen sensor (HO2S)
- Out of range engine coolant temperature (ECT) sensor
- High fuel pressure

- Damaged exhaust manifold
- Damaged catalytic converter
- Oil contamination
- Cylinder misfiring
- Downstream HO2S wires incorrectly connected
- Damaged exhaust system pipe
- Damaged muffler and tailpipe assembly
- Retarded spark timing
- Leaking fuel injector

Diagnostic Aids: Under normal closed loop fuel conditions, high efficiency catalysts have oxygen storage which reduces the frequency and amplitude of the downstream HO2S. As catalyst efficiency deteriorates, its ability to store oxygen declines and the downstream HO2S signal has an increased amplitude and frequency. The PCM compares the signal line length of the downstream HO2S to an expected signal line length of the downstream HO2S with a deteriorated catalytic converter.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0430 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2) - DTC CHART

P0430 - CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2) - DTC CHART

Description: This DTC sets when the bank 2 catalyst system efficiency is below the acceptable threshold.

Possible Causes:

- Use of leaded fuel
- Damaged heated oxygen sensor (HO2S)
- Out of range engine coolant temperature (ECT) sensor
- High fuel pressure.
- Damaged exhaust manifold
- Damaged catalytic converter
- Oil contamination
- Cylinder misfiring

- Downstream HO2S wires incorrectly connected
- Damaged exhaust system pipe
- Damaged muffler and tailpipe assembly
- Retarded spark timing
- Leaking fuel injector

Diagnostic Aids: Under normal closed loop fuel conditions, high efficiency catalysts have oxygen storage which reduces the frequency and amplitude of the downstream HO2S. As catalyst efficiency deteriorates, its ability to store oxygen declines and the downstream HO2S signal has an increased amplitude and frequency. The PCM compares the signal line length of the downstream HO2S to an expected signal line length of the downstream HO2S with a deteriorated catalytic converter.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0442 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK) - DTC CHART

P0442 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK) - DTC CHART

Description: This DTC sets when a fuel vapor leak from an opening as small as 1.016 mm (0.040 in) is detected by the EVAP running loss monitor test.

Possible Causes:

- Aftermarket EVAP hardware that does not conform to the required specifications
- Small holes or cuts in the fuel vapor hoses or tubes
- EVAP canister vent valve stays partially open on closed command
- Damaged, missing or loosely installed fuel filler cap (if equipped)
- Capless fuel tank filler pipe damaged or not sealed correctly (if equipped)
- Loose fuel vapor hose or tube connections to the EVAP system components
- EVAP system component seals leaking at or near the EVAP purge valve, fuel tank pressure (FTP) sensor, EVAP canister vent valve, fuel vapor control valve tube assembly or fuel vapor vent valve assembly

Diagnostic Aids: Check for a missing fuel filler cap or the integrity of the cap (if equipped). Verify the capless fuel tank filler pipe is sealed correctly (if equipped). Install and remove the supplemental fueling adapter five times in the capless fuel tank filler pipe to clear debris on the seal. Refer to the Owner Literature for the location of the supplemental fueling adapter in the vehicle. Check for loose or damaged vapor hoses. Visually inspect the EVAP canister inlet port, EVAP canister vent valve filter, and canister vent hose assembly for contamination or debris.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0443 - EVAPORATIVE EMISSION SYSTEM PURGE CONTROL VALVE CIRCUIT - DTC CHART

P0443 - EVAPORATIVE EMISSION SYSTEM PURGE CONTROL VALVE CIRCUIT - DTC CHART

Description: This DTC sets when the signal moves outside the minimum or maximum limit for the commanded state.

Possible Causes:

- VPWR circuit open
- EVAPCP circuit open
- EVAPCP circuit short to ground
- EVAPCP circuit short to voltage
- Damaged EVAP purge valve
- Damaged PCM

Diagnostic Aids: To verify normal function, monitor the EVMV PID or EVAPCP PID and the signal voltage (PCM control side). With the valve closed, the EVMV indicates 0 mA (0% duty cycle for EVAPCP) and voltage approximately equal to battery voltage. When the valve is commanded fully open, EVMV indicates 1, 000 mA (100% duty cycle for EVAPCP) and a voltage drop of 3 volts minimum is normal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0446 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT - DTC CHART

P0446 - EVAPORATIVE EMISSION SYSTEM VENT CONTROL CIRCUIT - DTC CHART

Description: This DTC sets when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified EVAP canister vent valve duty cycle by PCM command.

Possible Causes:

- VPWR circuit open
- KAPWR circuit open

- CANV circuit open
- CANV circuit short to ground
- CANV circuit short to voltage
- CANV circuit short to KAPWR
- Damaged EVAP canister vent valve
- Damaged PCM

Diagnostic Aids: To verify normal function, monitor the EVAP canister vent valve signal PID EVAPCV and the signal voltage (PCM control side). With the valve open, EVAPCV indicates 0% duty cycle and a voltage approximately equal to battery voltage. When the valve is commanded fully closed, EVAPCV indicates 100% duty cycle, and a minimum voltage drop of 4 volts is normal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0451 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH RANGE/PERFORMANCE - DTC CHART

P0451 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when a fuel tank pressure (FTP) sensor range (offset) concern is detected. The FTP sensor output is offset by greater than 1.7 inches of water or less than -1.7 inches of water.

Possible Causes:

- FTP circuit intermittent open
- FTP circuit intermittent short
- FTP sensor intermittent open
- FTP sensor intermittent short
- Contaminated FTP sensor
- Damaged FTP sensor
- Damaged PCM

Diagnostic Aids: With the FTP sensor at atmospheric pressure, the FTP PID normally indicates 0 inches of water. Remove the fuel filler cap or, for vehicles with a capless fuel filler pipe, install the supplemental refueling adaptor provided with the vehicle to open the capless fuel tank filler pipe. After installing the supplemental refueling adaptor or removing the fuel filler cap, wait one minute to allow the

pressure in the fuel tank to equalize with the ambient air pressure before accessing the PID.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0452 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH LOW - DTC CHART

P0452 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH LOW - DTC CHART

Description: This DTC sets when the fuel tank pressure (FTP) sensor signal average drops below a minimum allowable calibrated parameter.

Possible Causes:

- Contamination internal to the FTP sensor connector
- FTP circuit open
- VREF circuit open
- FTP circuit short to ground
- FTP circuit short to SIGRTN
- Damaged FTP sensor

Diagnostic Aids: An FTP voltage PID reading less than 0.22 volt in ignition ON, engine OFF or ignition ON, engine running indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0453 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH HIGH - DTC CHART

P0453 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH HIGH - DTC CHART

Description: This DTC sets when the fuel tank pressure (FTP) sensor signal average jumps above a minimum allowable calibrated parameter.

Possible Causes:

- Contamination internal to the FTP sensor connector
- FTP circuit open

- FTP circuit short to voltage
- VREF circuit short to voltage
- SIGRTN circuit open
- Damaged FTP sensor

Diagnostic Aids: An FTP voltage PID reading greater than 4.85 volts with the ignition ON, engine OFF or with the ignition ON, engine running, indicates a concern is present.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0454 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH INTERMITTENT - DTC CHART

P0454 - EVAPORATIVE EMISSION SYSTEM PRESSURE SENSOR/SWITCH INTERMITTENT - DTC CHART

Description: This DTC sets when the fuel tank pressure changes greater than 14 inches of water in 0.10 seconds.

Possible Causes:

- FTP circuit intermittent open
- FTP circuit intermittent short
- FTP sensor intermittent open
- FTP sensor intermittent short
- Contaminated FTP sensor
- Damaged FTP sensor

Diagnostic Aids: Monitor the FTP PID and note if it changes from greater than 15 inches of water to less than minus (-) 15 inches of water often in 1 minute.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0455 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (GROSS LEAK/NO FLOW) - DTC CHART

P0455 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (GROSS LEAK/NO FLOW) - DTC CHART

Description: The PCM monitors the complete evaporative emission (EVAP) control system for no purge flow, the presence of a large fuel vapor leak, or multiple small fuel vapor leaks. This DTC sets when no purge flow, which is attributed to fuel vapor blockages or restrictions, a large fuel vapor leak, or multiple fuel vapor leaks are detected by the EVAP running loss monitor test with the engine running, but not at idle.

Possible Causes:

- Damaged, missing or loosely installed fuel filler cap (if equipped)
- Aftermarket EVAP hardware that does not conform to the required specifications
- Disconnected or cracked fuel EVAP canister tube, EVAP canister purge outlet tube, or EVAP return tube
- EVAP purge valve stuck closed
- Capless fuel tank filler pipe damaged or not sealed correctly (if equipped)
- Blockages or restrictions in the fuel vapor hoses or tubes
- Loose fuel vapor hose or tube connections to the EVAP system components
- EVAP canister vent valve stuck open
- Damaged fuel tank pressure (FTP) sensor
- Damaged EVAP canister

Diagnostic Aids: Check for audible vacuum noise or significant fuel odor in the engine compartment or near the EVAP canister and fuel tank. Verify the capless fuel tank filler pipe is sealed correctly. Install and remove the supplemental fueling adapter five times in the capless fuel tank filler pipe to clear debris on the seal. Refer to the Owner Literature for the location of the supplemental fueling adapter in the vehicle.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0456 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (VERY SMALL LEAK) - DTC CHART

P0456 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (VERY SMALL LEAK) - DTC CHART

Description: This DTC sets when a fuel vapor leak from an opening as small as 0.508 mm (0.020 inch) is detected by the EVAP running loss monitor test.

Possible Causes:

- Very small holes or cuts in the fuel vapor hoses or tubes
- Loose fuel vapor hose or tube connections to the EVAP system components
- EVAP system component seals leaking

Diagnostic Aids: Check for a missing fuel filler cap or the integrity of the cap (if equipped). Verify the capless fuel tank filler pipe is sealed correctly (if equipped). Install and remove the supplemental fueling adapter five times in the capless fuel tank filler pipe to clear debris on the seal. Refer to the Owner Literature for the location of the supplemental fueling adapter in the vehicle. Check for loose or damaged vapor hoses. Visually inspect the EVAP canister inlet port, EVAP canister vent valve filter, and EVAP canister vent hose assembly for contamination or debris.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0457 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (FUEL CAP LOOSE/OFF) - DTC CHART

P0457 - EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (FUEL CAP LOOSE/OFF) - DTC CHART

Description: The PCM continuously monitors the fuel level and retains the last updated value prior to the ignition switch being placed in the OFF position. After the ignition switch is placed in the ON position a new fuel level is taken and compared to the level recorded at ignition OFF. If the fuel level has increased, a flag is set in the PCM indicating the vehicle was refueled. This DTC sets when the evaporative emission (EVAP) monitor detects a gross leak while the refueling flag is set and a loose fuel filler cap (if equipped) or an incorrectly sealed capless fuel tank filler pipe (if equipped) is suspected. On most vehicles, when the DTC sets, a message on the instrument panel cluster (IPC) displays to instruct the driver to check the fuel cap or capless fuel tank filler pipe (if equipped).

Possible Causes:

- Damaged, missing, or loosely installed fuel filler cap (if equipped)
- Capless fuel tank filler pipe damaged or not sealed correctly (if equipped)

Diagnostic Aids: Check for a missing fuel filler cap or the integrity of the cap (if equipped). Verify the capless fuel tank filler pipe is sealed correctly (if equipped). Install and remove the supplemental fueling adapter five times in the capless fuel tank filler pipe to clear debris on the seal. Refer to the Owner Literature for the location of the supplemental fueling adapter in the vehicle. If OK, clear the continuous memory DTCs and test the system for correct operation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0460 - FUEL LEVEL SENSOR A CIRCUIT - DTC CHART

P0460 - FUEL LEVEL SENSOR A CIRCUIT - DTC CHART

Description: The PCM calculates the amount of fuel used during operation. This DTC sets when the FLI signal does not change or does not correspond with the calculated fuel usage. For vehicles with a dual container (saddle type) fuel tank, either fuel level sensor may set this DTC.

Possible Causes:

- Stuck float arm
- Fuel level is always greater than 95% due to refueling patterns
- Fuel level is always less than 5% due to refueling patterns
- Fuel level is always at the same level between 3% and 97% full due to refueling patterns
- Fuel pump (FP) module concern
- Damaged instrument panel cluster (IPC)

Diagnostic Aids: Check with the customer for driving and fueling habits that would keep the fuel level at approximately the same value. Monitor the FLI PIDs while attempting to move the fuel level float by adding or removing fuel as necessary.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0461 - FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0461 - FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the FLI signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank. For vehicles with a dual container (saddle type) fuel tank, either fuel level sensor may set this DTC.

Possible Causes:

Diagnostic Aids: Verify aftermarket equipment does not generate radio frequency interference or electromagnetic interference which may cause noisy FLI input signal.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0462 - FUEL LEVEL SENSOR A CIRCUIT LOW - DTC CHART

P0462 - FUEL LEVEL SENSOR A CIRCUIT LOW - DTC CHART

Description: This DTC sets when the FLI signal is less than the minimum allowable calibrated parameter for a specified fuel fill percentage in the fuel tank.

Possible Causes:

- Empty fuel tank
- Incorrectly installed fuel gauge
- Fuel pump (FP) module concern
- Damaged instrument panel cluster (IPC)
- Damaged fuel gauge

Diagnostic Aids: Monitor the FLI PIDs with the ignition ON, engine running. A concern is present if the FLI percentage PID is at 25% fill and the FLI voltage PIDs is less than 0.90 volt with a non-matching fuel gauge or the FLI percentage PIDs is at 75% fill and the FLI voltage PIDs is greater than 2.45 volts with a non-matching fuel gauge.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0463 - FUEL LEVEL SENSOR A CIRCUIT HIGH - DTC CHART

P0463 - FUEL LEVEL SENSOR A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the FLI signal is greater than the maximum allowable calibrated parameter for a specified fuel fill percentage in the fuel tank.

Possible Causes:

- Overfilled fuel tank
- Fuel pump (FP) module concern
- Incorrectly installed fuel gauge
- Damaged instrument panel cluster (IPC)
- Damaged fuel gauge

Diagnostic Aids: Monitor the FLI PIDs in ignition ON, engine running. A concern is present if the FLI percentage PID is at 25% fill and the FLI voltage PID is less than 0.90 volt with a non-matching fuel gauge or the FLI percentage PID is at 75% fill and the FLI voltage PID is greater than 2.45 volts with a

non-matching fuel gauge.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0480 - FAN 1 CONTROL CIRCUIT - DTC CHART

P0480 - FAN 1 CONTROL CIRCUIT - DTC CHART

For Relay Controlled Electric Cooling Fan

Description: This DTC sets when the PCM grounds the LFC circuit and excessive current draw is detected on the LFC circuit; or with the LFC circuit not grounded by the PCM the voltage is not detected on the LFC circuit. The PCM expects to detect VPWR voltage coming through the low speed fan control (FC) relay coil to the LFC circuit.

Possible Causes:

- LFC circuit open
- LFC circuit short
- VPWR circuit to the LFC relay open
- Damaged LFC relay

Diagnostic Aids: When the LFC_F PID reads YES, a concern is present. A short to voltage can only be detected when the PCM is grounding the LFC circuit.

For Variable Speed Electric Cooling Fan

Description: This DTC sets if the PCM detects the voltage on the FCV circuit is not within the expected range.

Possible Causes:

- FCV circuit open
- FCV circuit short
- B+ or ground circuit concern to cooling fan
- VPWR open to cooling fan (if applicable)
- Damaged cooling fan module

Diagnostic Aids:

For Cooling Fan Clutch

Description: This DTC sets if the PCM detects the voltage on the FCV circuit is not within the expected range.

Possible Causes:

- FCV circuit open
- FCV circuit short
- Damaged cooling fan clutch solenoid

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0481 - FAN 2 CONTROL CIRCUIT - DTC CHART

P0481 - FAN 2 CONTROL CIRCUIT - DTC CHART

Description: This DTC sets when the HFC output is commanded on (grounded) and excessive current draw is detected on the HFC circuit; or when the HFC circuit is commanded off and voltage is not detected on the HFC circuit. The PCM expects to detect VPWR voltage through the high speed fan control (FC) relay coil to the HFC circuit.

Possible Causes:

- HFC circuit open

- HFC circuit short
- VPWR circuit to the HFC relay open
- Damaged HFC relay

Diagnostic Aids: When the HFC_F PID reads YES, a concern is present. An open circuit or short to ground can only be detected when the PCM is not grounding the HFC circuit. A short to voltage can only be detected when the PCM is grounding the HFC circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0482 - FAN 3 CONTROL CIRCUIT - DTC CHART

P0482 - FAN 3 CONTROL CIRCUIT - DTC CHART

Description: This DTC sets when the MFC output is commanded on (grounded) and excessive current draw is detected on the MFC circuit; or when the MFC circuit is commanded off and voltage is not detected on the MFC circuit. The PCM expects to detect VPWR voltage through the medium speed fan control (FC) relay coil to the MFC circuit.

Possible Causes:

- MFC circuit open
- MFC circuit short
- VPWR circuit to the MFC relay open
- Damaged MFC relay

Diagnostic Aids: When the MFC_F PID reads YES, a concern is present. An open circuit or short to ground can only be detected when the PCM is not grounding the MFC circuit. A short to voltage can only be detected when the PCM is grounding the MFC circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P04DB - CRANKCASE VENTILATION SYSTEM DISCONNECTED - DTC CHART

P04DB - CRANKCASE VENTILATION SYSTEM DISCONNECTED - DTC CHART

Description: This DTC sets when the crankcase pressure sensor voltage is less than 2.5 V.

Possible Causes:

- Disconnected positive crankcase ventilation (PCV) system hose or component
- VREF circuit open
- SIGRTN circuit open
- CKCP circuit open

Diagnostic Aids: Verify the integrity of the PCV system.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0500 - VEHICLE SPEED SENSOR (VSS) A - DTC CHART

P0500 - VEHICLE SPEED SENSOR (VSS) A - DTC CHART

Description: This DTC sets when an error in the vehicle speed information is detected. Vehicle speed data is received from either the VSS or the anti-lock brake system (ABS) module. If the engine RPM is above the torque converter stall speed (automatic transmission) and the engine load is high, it can be inferred that the vehicle must be moving. If there is insufficient vehicle speed data input to the PCM, a concern is indicated and this DTC sets. On most vehicle applications the malfunction indicator lamp (MIL) illuminates when this DTC sets.

Possible Causes:

- VSS+ circuit open (VR type)
- VSS- circuit open (VR type)
- VSS circuit open (Hall effect type)
- VSS circuit short to ground (Hall effect type)
- VSS circuit short to voltage (Hall effect type)
- Damaged drive mechanism for VSS
- Damaged VSS
- Damaged wheel speed sensors
- Damaged wheel speed sensor harness circuits

Diagnostic Aids: Monitor the VSS PID while driving the vehicle. This DTC sets when a sudden loss of vehicle speed signal over a period of time is detected. If vehicle speed data is lost, check the source of the vehicle speed input: VSS or ABS.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
F-650/F-750, F-Series Super Duty, Fiesta, Fusion, Motorhome/Stripped Chassis/Step Van	GO to Pinpoint Test DF .		
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	The PCM uses information from the ABS module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0501 - VEHICLE SPEED SENSOR A RANGE/PERFORMANCE - DTC CHART

P0501 - VEHICLE SPEED SENSOR A RANGE/PERFORMANCE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0503 - VEHICLE SPEED SENSOR (VSS) A INTERMITTENT/ERRATIC/HIGH - DTC CHART

P0503 - VEHICLE SPEED SENSOR (VSS) A INTERMITTENT/ERRATIC/HIGH - DTC CHART

Description: This DTC sets when an incorrect or noisy VSS signal is detected. Vehicle speed data is received from either the VSS or the anti-lock brake system (ABS) module.

Possible Causes:

- Noisy VSS input signal from radio frequency interference or electromagnetic interference external sources, such as ignition components or the charging circuit
- Damaged VSS or driven gears
- Damaged VSS wiring harness or connectors
- Concern in the modules or circuits connected to the VSS circuit
- Aftermarket add-on

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0504 - BRAKE SWITCH CORRELATION - DTC CHART

P0504 - BRAKE SWITCH CORRELATION - DTC CHART

Description: This DTC sets when the calibrated threshold is exceeded during a comparison test between the brake pedal switch (BPS) and the brake pedal position (BPP) switch.

Possible Causes:

- Damaged brake switch
- BPS circuit open
- BPS circuit short to voltage
- BPS circuit short to ground
- BPP circuit open
- BPP circuit short to voltage
- BPP circuit short to ground

Diagnostic Aids: Check the state of the BOO1 and BOO2 PIDs. The BOO1 PID is normally open and BOO2 PID is normally closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0505 - IDLE AIR CONTROL (IAC) SYSTEM - DTC CHART

P0505 - IDLE AIR CONTROL (IAC) SYSTEM - DTC CHART

Description: This DTC sets when the desired RPM could not be reached or controlled during the key ON, engine running (KOER), self-test.

Possible Causes:

- Failure mode effects management (FMEM) condition is present
- Intake air restriction
- Exhaust restriction
- Sludged throttle body
- Vacuum leaks

- Damaged electronic throttle body (ETB)
- Damaged PCM

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTC and carry out the KOER, self-test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0506 - IDLE AIR CONTROL (IAC) SYSTEM RPM LOWER THAN EXPECTED - DTC CHART

P0506 - IDLE AIR CONTROL (IAC) SYSTEM RPM LOWER THAN EXPECTED - DTC CHART

Description: This DTC sets when the engine idle speed is less than the desired RPM.

Possible Causes:

- Intake air restriction
- Vacuum leaks
- Exhaust restriction
- Engine mechanical concern
- Sludged throttle body
- Damaged electronic throttle body (ETB)
- Damaged PCM

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTC and carry out the key ON, engine running (KOER), self-test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0507 - IDLE AIR CONTROL (IAC) SYSTEM RPM HIGHER THAN EXPECTED - DTC CHART

P0507 - IDLE AIR CONTROL (IAC) SYSTEM RPM HIGHER THAN EXPECTED - DTC CHART

Description: This DTC sets when the engine idle speed is greater than the desired RPM.

Possible Causes:

- Intake air leak after throttle body
- Vacuum leaks
- Damaged evaporative emission (EVAP) system
- Exhaust gas recirculation (EGR) valve leaks vacuum
- Damaged electronic throttle body (ETB)
- Damaged PCM

Diagnostic Aids: This DTC is informational only and it may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTC and repeat the self-test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P050A - COLD START IDLE AIR CONTROL PERFORMANCE - DTC CHART

P050A - COLD START IDLE AIR CONTROL PERFORMANCE - DTC CHART

Description: This DTC sets when the difference between desired and actual engine speed exceeds the calibrated threshold.

Possible Causes:

- Intake air restriction
- Exhaust restriction
- Engine mechanical concern
- Damaged or sludged electronic throttle body (ETB)
- Vacuum leaks
- Damaged PCM

Diagnostic Aids: Disregard the freeze frame data. Freeze frame data does not apply to the cold start monitor.
This DTC is informational only and may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTCs and verify the engine coolant temperature is below 37.8°C (100°F). Allow the vehicle to soak for 2 to 3 hours if necessary for the engine coolant temperature to fall below 37.8°C (100°F).
Start the engine without touching the accelerator pedal and allow the engine to idle for 6 minutes in

park. If no DTCs are present and the malfunction indicator lamp (MIL) is not illuminated after idling for 6 minutes, carry out the key ON, engine running (KOER), self-test to confirm that no DTCs are present and the repair is complete.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P050B - COLD START IGNITION TIMING PERFORMANCE - DTC CHART

P050B - COLD START IGNITION TIMING PERFORMANCE - DTC CHART

Description: This DTC sets when the difference between desired and commanded spark timing exceeds the calibrated threshold.

Possible Causes:

- Intake air restriction
- Exhaust restriction
- Engine mechanical concern
- Damaged or sludged electronic throttle body (ETB)
- Vacuum leaks
- Damaged PCM

Diagnostic Aids: Disregard the freeze frame data. Freeze frame data does not apply to the cold start monitor.
This DTC is informational only and may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTCs and verify the engine coolant temperature is below 37.8°C (100°F). Allow the vehicle to soak for 2 to 3 hours if necessary for the engine coolant temperature to fall below 37.8°C (100°F).
Start the engine without touching the accelerator pedal and allow the engine to idle for 6 minutes in park. If no DTCs are present and the malfunction indicator lamp (MIL) is not illuminated after idling for 6 minutes, carry out the key ON, engine running (KOER), self-test to confirm that no DTCs are present and the repair is complete.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P050E - COLD START ENGINE EXHAUST TEMPERATURE OUT OF RANGE - DTC CHART

P050E - COLD START ENGINE EXHAUST TEMPERATURE OUT OF RANGE - DTC CHART

Description: The PCM calculates the actual catalyst warm up temperature during a cold start. The PCM then compares the actual catalyst temperature to the expected catalyst temperature model. The difference between the actual and expected temperatures is a ratio. This DTC sets when this ratio exceeds the calibrated value and the malfunction indicator lamp (MIL) illuminates.

Possible Causes:

- Intake air restriction
- Exhaust restriction
- Engine mechanical concern
- Damaged or sludged electronic throttle body (ETB)
- Vacuum leaks
- Damaged PCM

Diagnostic Aids: Disregard the freeze frame data. Freeze frame data does not apply to the cold start monitor.
This DTC is informational only and may be accompanied by other DTCs. Diagnose other DTCs first. If no other DTCs are present, inspect the intake air system for air restrictions, vacuum leaks, and damage. If no concerns are present, clear the DTCs and verify the engine coolant temperature is below 37.8°C (100°F). Allow the vehicle to soak for 2 to 3 hours if necessary for the engine coolant temperature to fall below 37.8°C (100°F).
Start the engine without touching the accelerator pedal and allow the engine to idle for 6 minutes in park. If no DTCs are present and the malfunction indicator lamp (MIL) is not illuminated after idling for 6 minutes, carry out the key ON, engine running (KOER), self-test to confirm that no DTCs are present and the repair is complete.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0512 - STARTER REQUEST CIRCUIT - DTC CHART

P0512 - STARTER REQUEST CIRCUIT - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information , Starting System to continue diagnosis.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P051B -

CRANKCASE PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P051B - CRANKCASE PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the crankcase pressure sensor is greater than or less than an expected value for the current operating conditions.

Possible Causes:

- Crankcase pressure sensor is not within a calibrated range during key ON, engine OFF
- Crankcase pressure sensor voltage indicates high pressure
- Crankcase pressure sensor voltage indicates high vacuum at low airflow
- Leak in the positive crankcase ventilation (PCV) system
- Damaged crankcase pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P051C - CRANKCASE PRESSURE SENSOR CIRCUIT LOW - DTC CHART

P051C - CRANKCASE PRESSURE SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when the crankcase pressure sensor voltage is less than 1 V.

Possible Causes:

- CKCP circuit short to ground
- Damaged crankcase pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P051D - CRANKCASE PRESSURE SENSOR CIRCUIT HIGH - DTC CHART

P051D - CRANKCASE PRESSURE SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the crankcase pressure sensor voltage is greater than 4.9 V.

Possible Causes:

- CKCP circuit open
- CKCP circuit short to voltage
- Damaged crankcase pressure sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0528 - FAN SPEED SENSOR CIRCUIT NO SIGNAL - DTC CHART

P0528 - FAN SPEED SENSOR CIRCUIT NO SIGNAL - DTC CHART

Description: The PCM uses the fan speed sensor (FSS) input to monitor the cooling fan clutch speed. This DTC sets if the indicated fan speed is lower than the calibrated value during the key ON engine running (KOER) self-test.

Possible Causes:

- FSS VPWR circuit open
- FSS PWRGND circuit open
- FSS circuit open
- FSS circuit short
- Damaged FSS
- Damaged PCM

Diagnostic Aids: Visually inspect the cooling fan clutch for damage or restriction.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P052A - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1) - DTC CHART

P052A - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 1 solenoid 1 (VCT11) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P052B - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1) - DTC CHART

P052B - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 1 solenoid 1 (VCT11) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test HK .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P052C - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2) - DTC CHART

P052C - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- variable camshaft timing bank 2 solenoid 1 (VCT21) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P052D - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2) - DTC CHART

P052D - COLD START INTAKE (A) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber

- Variable camshaft timing bank 2 solenoid 1 (VCT21) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P053F - COLD START FUEL PRESSURE PERFORMANCE BANK 1 - DTC CHART

P053F - COLD START FUEL PRESSURE PERFORMANCE BANK 1 - DTC CHART

Description: The PCM monitors fuel rail pressure to control split injection. This DTC sets if the fuel rail pressure falls outside a calibrated threshold limit for controlling split injection during a cold start.

Possible Causes:

- Restricted fuel filter
- Restricted fuel supply line
- Damaged fuel pump assembly
- Damaged fuel injection pump

Diagnostic Aids: Diagnose any FRP and FVR circuit DTCs first.
Various engine driveability symptoms, including no start, hard start, rough idle, and backfiring may occur as a result of this DTC setting. This DTC may be accompanied by other DTCs, particularly P0087, P0088, or P00C6.
Freeze frame data is not applicable to the cold start emission reduction monitor. For additional information, refer to COLD START EMISSION REDUCTION MONITOR .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HP .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P054A - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1) - DTC CHART

P054A - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 1 solenoid 2 (VCT12) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P054B - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1) - DTC CHART

P054B - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 1) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 1 solenoid 2 (VCT12) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P054C - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2) - DTC CHART

P054C - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 2) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-advanced during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 2 solenoid 2 (VCT22) valve stuck open
- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P054D - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2) - DTC CHART

P054D - COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2) - DTC CHART

Description: This DTC sets when the variable camshaft timing (VCT) position is over-retarded during cold start up. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in a retarded position.

Possible Causes:

- Camshaft timing incorrectly set
- Continuous oil flow to the VCT piston chamber
- Variable camshaft timing bank 2 solenoid 2 (VCT22) valve stuck open

- Camshaft advance mechanism binding (VCT unit)

Diagnostic Aids: This DTC is a functional check of the VCT unit. Diagnose any base engine concerns related to the engine oil pressure or engine timing. Refer to the service information , Engine System, Oil Pressure Test, to check the engine oil pressure. Refer to the service information , Engine, Timing Drive Components, to check the engine timing.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0562 - SYSTEM VOLTAGE LOW - DTC CHART

P0562 - SYSTEM VOLTAGE LOW - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0563 - SYSTEM VOLTAGE HIGH - DTC CHART

P0563 - SYSTEM VOLTAGE HIGH - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0571 - BRAKE SWITCH A CIRCUIT - DTC CHART

P0571 - BRAKE SWITCH A CIRCUIT - DTC CHART

Description: This DTC sets when the brake switch does not toggle during the key ON engine running

(KOER) test.

Possible Causes:

- BPP circuit open
- BPP circuit short to ground
- Concern in modules connected to the BPP circuit
- Damaged brake switch
- Incorrectly adjusted brake switch

Diagnostic Aids: Using the scan tool, check the BPP/BOO PID. The BPP/BOO PID should toggle on and off with brake pedal activation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0572 - BRAKE SWITCH A CIRCUIT LOW - DTC CHART

P0572 - BRAKE SWITCH A CIRCUIT LOW - DTC CHART

Description: This DTC sets when the brake switch is stuck in the ON position.

Possible Causes:

- BPP circuit open
- BPP circuit short to voltage
- BPP circuit short to ground
- Stoplamp circuits open
- Stoplamp circuits short to voltage
- Stoplamp circuits short to ground
- Damaged brake switch
- Incorrectly adjusted brake switch

Diagnostic Aids: Using the scan tool, check the BPP/BOO PID. The BPP/BOO PID should toggle on and off with brake pedal activation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0573 - BRAKE SWITCH A CIRCUIT HIGH - DTC CHART

P0573 - BRAKE SWITCH A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the brake switch is stuck in the OFF position.

Possible Causes:

- BPP circuit open
- BPP circuit short to voltage
- BPP circuit short to ground
- Stoplamp circuits open
- Stoplamp circuits short to voltage
- Stoplamp circuits short to ground
- Damaged brake switch
- Incorrectly adjusted brake switch

Diagnostic Aids: Using the scan tool, check the BPP/BOO PID. The BPP/BOO PID should toggle on and off with brake pedal activation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P05XX - DTC CHART

P05XX - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information , Electronic Engine Controls, PCM DTC Chart, to continue diagnosis.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0600 -

SERIAL COMMUNICATION LINK - DTC CHART

P0600 - SERIAL COMMUNICATION LINK - DTC CHART

Description: This DTC sets when an error occurs in the PCM. This DTC may set alone or with P2105.
Possible Causes: • Software incompatibility issue • Damaged PCM
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0602 - POWERTRAIN CONTROL MODULE PROGRAMMING ERROR - DTC CHART

P0602 - POWERTRAIN CONTROL MODULE PROGRAMMING ERROR - DTC CHART

Description: This DTC sets when there is a programming error within the vehicle identification (VID) block.
Possible Causes: • VID data corrupted by the scan tool during VID reprogramming
Diagnostic Aids: Program the VID block. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Making Changes to the VID Block. If the PCM does not allow reprogramming of the VID block, reflashing of the PCM is required.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0603 - INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR - DTC CHART

P0603 - INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR - DTC CHART

Description: This DTC sets when the PCM has experienced an internal memory concern. However, there are external items that can cause this DTC.
Possible Causes: • Reprogramming

- Battery terminal corrosion
- KAPWR to PCM interrupt/open
- Incorrect battery connection

Diagnostic Aids: If KAPWR is interrupted to the PCM because of a battery or PCM disconnect, this DTC can be generated on the first power-up.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QB .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0604 - INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR - DTC CHART

P0604 - INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR - DTC CHART

Description: This DTC sets when the PCM RAM has been corrupted.

Possible Causes:

- Module reprogramming
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0605 - INTERNAL CONTROL MODULE READ ONLY MEMORY (ROM) ERROR - DTC CHART

P0605 - INTERNAL CONTROL MODULE READ ONLY MEMORY (ROM) ERROR - DTC CHART

Description: The PCM ROM has been corrupted.

Possible Causes:

- An attempt was made to change the calibration

- Module programming error
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: Reprogram the vehicle identification (VID) block. Check for other DTCs or drive symptoms for further action. Check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the (VID) Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0606 - CONTROL MODULE PROCESSOR - DTC CHART

P0606 - CONTROL MODULE PROCESSOR - DTC CHART

Description: This DTC sets when there is an internal PCM communication error.

Possible Causes:

- Module programming error
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs and diagnose those first. Check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0607 - CONTROL MODULE PERFORMANCE - DTC CHART

P0607 - CONTROL MODULE PERFORMANCE - DTC CHART

Description: This DTC sets when the PCM internal central processing unit (CPU) has encountered an error. The PCM monitors itself and carries out internal checks of its own CPU. This DTC sets if any of these checks returns an incorrect value.

Possible Causes:

- Module programming error
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs and diagnose those first. Check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P060A - INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE - DTC CHART

P060A - INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM. This DTC may set alone or with P2105.

Possible Causes:

- Software incompatibility issue
- Damaged PCM

Diagnostic Aids: Verify the PCM is at the latest calibration level.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P060B - INTERNAL CONTROL MODULE A/D PROCESSING PERFORMANCE - DTC CHART

P060B - INTERNAL CONTROL MODULE A/D PROCESSING PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.

Possible Causes:

- Damaged PCM

Diagnostic Aids: Inspect the wiring harness for damage. Verify correct operation of the sensors using VREF and related circuits.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P060C - INTERNAL CONTROL MODULE MAIN PROCESSOR PERFORMANCE - DTC CHART

P060C - INTERNAL CONTROL MODULE MAIN PROCESSOR PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.			
Possible Causes: • Software incompatibility issue • Damaged PCM			
Diagnostic Aids: Verify the PCM is at the latest calibration level.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P060D - INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE - DTC CHART

P060D - INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM. This DTC sets when the PCM detects a concern identifying an issue with an accelerator pedal position (APP) sensor signal or with processing the brake pedal sensor input.			
Possible Causes: • Damaged PCM			
Diagnostic Aids: Verify the PCM is at the latest calibration level.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0610 - CONTROL MODULE VEHICLE OPTIONS ERROR - DTC CHART

P0610 - CONTROL MODULE VEHICLE OPTIONS ERROR - DTC CHART

Description: This DTC sets when one or more of the PCM VID Block fields were configured incorrectly.

Possible Causes:

- Module reprogramming
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061A - INTERNAL CONTROL MODULE TORQUE PERFORMANCE - DTC CHART

P061A - INTERNAL CONTROL MODULE TORQUE PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.

Possible Causes:

- Software incompatibility issue
- Damaged PCM

Diagnostic Aids: Verify the PCM is at the latest calibration level.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061B - INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE - DTC CHART

P061B - INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE - DTC CHART

Description: This DTC sets when a calculation error occurs in the PCM.			
Possible Causes:			
Diagnostic Aids: Check for sensor and circuit related DTCs. Do not install a new electronic throttle body (ETB) for this DTC.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061C - INTERNAL CONTROL MODULE ENGINE RPM PERFORMANCE - DTC CHART

P061C - INTERNAL CONTROL MODULE ENGINE RPM PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.

Possible Causes:

- CKP circuit open
- CKP circuit short
- CKP circuit intermittent
- CMP circuit open
- CMP circuit short
- CMP circuit intermittent
- Damaged crankshaft position (CKP) sensor
- Damaged camshaft position (CMP) sensor
- Damaged PCM

Diagnostic Aids: Verify correct operation of the CKP and CMP sensors and related circuits.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061D - INTERNAL CONTROL MODULE ENGINE AIR MASS PERFORMANCE - DTC CHART

P061D - INTERNAL CONTROL MODULE ENGINE AIR MASS PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.			
Possible Causes: • Software incompatibility issue • Damaged PCM			
Diagnostic Aids: Verify the PCM is at the latest calibration level.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061E - INTERNAL CONTROL MODULE BRAKE SIGNAL PERFORMANCE - DTC CHART

P061E - INTERNAL CONTROL MODULE BRAKE SIGNAL PERFORMANCE - DTC CHART

Description: This DTC sets when an incorrect brake pedal position (BPP) sensor signal is received by the PCM. This DTC also sets when an internal PCM communication error occurs in the PCM.			
Possible Causes: • Incorrectly adjusted BPP sensor • Damaged BPP sensor • Damaged PCM			
Diagnostic Aids: Check for an incorrectly adjusted BPP sensor. Refer to service information , Exterior Lighting. Check for other DTCs and diagnose those first. Check for aftermarket performance products before installing a new PCM. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061F - INTERNAL CONTROL MODULE THROTTLE ACTUATOR CONTROLLER PERFORMANCE - DTC CHART

P061F - INTERNAL CONTROL MODULE THROTTLE ACTUATOR CONTROLLER PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.

Possible Causes:			
Diagnostic Aids: Verify correct operation of the electronic throttle control (ETC) components and related circuits.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P061X - DTC CHART

P061X - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0627 - FUEL PUMP A CONTROL CIRCUIT/OPEN - DTC CHART

P0627 - FUEL PUMP A CONTROL CIRCUIT/OPEN - DTC CHART

Description: The fuel pump control module monitors the fuel pump module and secondary circuits for a concern. If the fuel pump control module detects a concern with the fuel pump module or secondary circuits, the fuel pump control module sends an 80% duty cycle signal on the fuel pump monitor (FPM) circuit to report the concern to the PCM. The test fails when the fuel pump control module is still reporting a concern with the fuel pump module or secondary circuits after a calibrated amount of time.

Possible Causes:

- FPPWR circuit open
- FPPWR circuit short to ground
- FPRTN circuit open
- FPPWR circuit short to voltage
- FPRTN circuit short to voltage
- Damaged fuel pump assembly
- Damaged fuel pump control module

Diagnostic Aids: Check for any harness concerns. The fuel pump control module controls the speed of the fuel pump module by supplying a variable voltage to the fuel pump module on the FPPWR circuit.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P062B - INTERNAL CONTROL MODULE FUEL INJECTOR CONTROL PERFORMANCE - DTC CHART

P062B - INTERNAL CONTROL MODULE FUEL INJECTOR CONTROL PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.			
Possible Causes: • Damaged PCM			
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P062C - INTERNAL CONTROL MODULE VEHICLE SPEED PERFORMANCE - DTC CHART

P062C - INTERNAL CONTROL MODULE VEHICLE SPEED PERFORMANCE - DTC CHART

Description: This DTC sets when a network communication error occurred in the PCM.			
Possible Causes: • Module communications network concerns • Output shaft speed (OSS) sensor concern • Anti-lock brake system (ABS) concern			
Diagnostic Aids: Repair any ABS or TCM DTCs, ABS or TCM related DTCs in other modules, or vehicle communication concerns.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P062F - INTERNAL CONTROL MODULE EEPROM ERROR - DTC CHART

P062F - INTERNAL CONTROL MODULE EEPROM ERROR - DTC CHART

Description: The PCM read only memory (ROM) has been corrupted.

Possible Causes:

- Aftermarket performance products
- An attempt was made to change the calibration
- PCM programming error
- PCM internal software error
- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P062X - DTC CHART

P062X - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0630 - VIN NOT PROGRAMMED OR INCOMPATIBLE - ECM/PCM - DTC CHART

P0630 - VIN NOT PROGRAMMED OR INCOMPATIBLE - ECM/PCM - DTC CHART

Description: This DTC sets when the PCM detects various VID data that is out of a specified

acceptable range.
Possible Causes:
Diagnostic Aids: The PCM did not receive a valid vehicle identification number (VIN) during reprogramming. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming The VID Block For A Replacement PCM, to reprogram the PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0642 - SENSOR REFERENCE VOLTAGE A CIRCUIT LOW - DTC CHART

P0642 - SENSOR REFERENCE VOLTAGE A CIRCUIT LOW - DTC CHART

Description: This DTC sets when the VREF circuit is less than VREF minimum.

Possible Causes:

- VREF circuit short to ground
- Damaged sensor
- Incorrect harness connection

Diagnostic Aids: This DTC sets due to an under voltage condition on the VREF circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test C :		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0643 - SENSOR REFERENCE VOLTAGE A CIRCUIT HIGH - DTC CHART

P0643 - SENSOR REFERENCE VOLTAGE A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the VREF circuit is greater than VREF maximum.

Possible Causes:

- VREF circuit short to voltage
- Damaged sensor
- Incorrect harness connection

Diagnostic Aids: This DTC sets due to an over voltage condition on the VREF circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P064A - FUEL PUMP CONTROL MODULE A - DTC CHART

P064A - FUEL PUMP CONTROL MODULE A - DTC CHART

Description: This DTC sets when the fuel pump control module detects an internal concern.

Possible Causes:

- Damaged fuel pump control module

Diagnostic Aids: Clear the PCM DTCs. Repeat the self-test. If the DTC is retrieved again, install a new fuel pump control module. Refer to the service information , Fuel Charging And Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P064D - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 1 - DTC CHART

P064D - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 1 - DTC CHART

Description: The PCM monitors the application specific integrated circuit that controls and monitors the universal heated oxygen sensor bank 1, sensor 1 (HO2S11). This DTC sets when the PCM detects an internal circuit or communication concern.

Possible Causes:

- Damaged universal HO2S11 wiring
- Damaged PCM

Diagnostic Aids: Check for other DTCs and diagnose those first. Check for intermittent universal HO2S wiring concerns. Check the universal HO2S wiring between the PCM and the sensor for damage. Check for aftermarket performance products.
Reprogram or update the calibration. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P064E - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 2 - DTC CHART

P064E - INTERNAL CONTROL MODULE O2 SENSOR PROCESSOR PERFORMANCE - BANK 2 - DTC CHART

Description: The PCM monitors the application specific integrated circuit that controls and monitors the universal heated oxygen sensor bank 2, sensor 1 (HO2S21). This DTC sets when the PCM detects an internal circuit or communication concern.

Possible Causes:

- Damaged universal HO2S21 wiring
- Damaged PCM

Diagnostic Aids: Check for other DTCs and diagnose those first. Check for intermittent universal HO2S wiring concerns. Check the universal HO2S wiring between the PCM and the sensor for damage. Check for aftermarket performance products.
Reprogram or update the calibration. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0652 - SENSOR REFERENCE VOLTAGE B CIRCUIT LOW - DTC CHART

P0652 - SENSOR REFERENCE VOLTAGE B CIRCUIT LOW - DTC CHART

Description: This DTC sets when the electronic throttle control reference voltage (ETCREF) circuit is less than VREF minimum.

Possible Causes:

- ETCREF circuit short to ground
- Damaged sensor
- Incorrect harness connection

Diagnostic Aids: This DTC sets due to an under voltage condition on the ETCREF circuit.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0653 - SENSOR REFERENCE VOLTAGE B CIRCUIT HIGH - DTC CHART

P0653 - SENSOR REFERENCE VOLTAGE B CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the electronic throttle control reference voltage (ETCREF) circuit is greater than VREF maximum.			
Possible Causes: • ETCREF circuit short to voltage • Damaged sensor • Incorrect harness connection			
Diagnostic Aids: This DTC sets due to an over voltage condition on the ETCREF circuit.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0657 - ACTUATOR SUPPLY VOLTAGE A CIRCUIT/OPEN - DTC CHART

P0657 - ACTUATOR SUPPLY VOLTAGE A CIRCUIT/OPEN - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P065X - DTC CHART

P065X - DTC CHART

Description:
Possible Causes:
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0660 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 1 - DTC CHART

P0660 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 1 - DTC CHART

Description: This DTC sets when the intake manifold tuning valve (IMTV) control signal is greater or less than an expected calibrated range during continuous, key ON, engine OFF (KOEO) or key ON, engine running (KOER), self-tests.

Possible Causes:

- IMTV circuit open
- IMTV circuit short to ground
- Damaged IMTV actuator

Diagnostic Aids: An IMTVM PID reading may indicate a fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0663 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 2 - DTC CHART

P0663 - INTAKE MANIFOLD TUNING VALVE (IMTV) CONTROL CIRCUIT OPEN - BANK 2 - DTC CHART

Description: This DTC sets when the intake manifold tuning valve (IMTV) control signal is greater or less than an expected calibrated range during continuous, key ON, engine OFF (KOEO) or key ON, engine running (KOER), self-tests.

Possible Causes:

- IMTV circuit open
- IMTV circuit short to ground
- Damaged IMTV actuator

Diagnostic Aids: An IMTVM PID reading may indicate a fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test HU .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0685 - ECM/PCM POWER RELAY CONTROL CIRCUIT/OPEN - DTC CHART

P0685 - ECM/PCM POWER RELAY CONTROL CIRCUIT/OPEN - DTC CHART

Description: This DTC sets when the ignition switch position run (ISP-R) circuit indicates the ignition is in the OFF, ACC, or LOCK position, and the amount of time the PCM remains powered through the PCM power relay exceeds a predetermined amount of time.

Possible Causes:

- PCMRC circuit short to ground
- Damaged PCM power relay

Diagnostic Aids: Ability to communicate with the PCM when the ignition is in the OFF, ACC, or LOCK position indicates a hard fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B :		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0686 - ECM/PCM POWER RELAY CONTROL CIRCUIT LOW - DTC CHART

P0686 - ECM/PCM POWER RELAY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when the ignition switch position run (ISP-R) circuit indicates the ignition is in the OFF, ACC, or LOCK position, and the amount of time the PCM remains powered through the PCM power relay exceeds a predetermined amount of time.

Possible Causes:

- PCMRC circuit short to ground
- Damaged PCM

Diagnostic Aids: Ability to communicate with the PCM when the ignition is in the OFF, ACC, or LOCK position indicates a hard fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0687 -

ECM/PCM POWER RELAY CONTROL CIRCUIT HIGH - DTC CHART

P0687 - ECM/PCM POWER RELAY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the ignition switch position run (ISP-R) circuit indicates the ignition is in the OFF, ACC, or LOCK position, and the amount of time the PCM remains powered through the PCM power relay exceeds a predetermined amount of time.

Possible Causes:

- PCMRC circuit short to voltage
- Damaged PCM power relay

Diagnostic Aids: Ability to communicate with the PCM when the ignition is in the OFF, ACC, or LOCK position indicates a hard fault.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0689 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT LOW - DTC CHART

P0689 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT LOW - DTC CHART

Description: This DTC sets when the ISP-R and the INJPWRM circuit voltages do not correspond for a calibrated period of time.

Possible Causes:

- Ignition circuit fuse
- ISP-R circuit open
- ISP-R circuit short to ground
- VPWR circuit short to voltage
- INJPWR circuit short to voltage
- Damaged ignition switch
- Damaged fuel pump relay
- Damaged PCM power relay

Diagnostic Aids: The INJPWRM PID voltage reading should be 0 volts when the ignition is in the OFF, ACC or LOCK position.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P068A - ECM/PCM POWER RELAY DE-ENERGIZED - TOO EARLY - DTC CHART

P068A - ECM/PCM POWER RELAY DE-ENERGIZED - TOO EARLY - DTC CHART

Description: This DTC sets when the non volatile random access memory (NVRAM) write did not complete successfully after the ignition key was turned OFF, prior to PCM shutdown. This DTC also sets when the PCM power relay is de-energized too early.

Possible Causes:

- PCMRC circuit open
- PCM power relay
- Low battery voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0690 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT HIGH - DTC CHART

P0690 - ELECTRONIC CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER RELAY SENSE CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the voltage on the ISP-R and the INJPWRM or VPWR circuits do not correspond for a calibrated period of time.

Possible Causes:

- ISP-R circuit short to voltage
- VPWR circuit open
- INJPWRM circuit open
- Damaged fuel pump relay
- Damaged PCM power relay

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06A6 - SENSOR REFERENCE VOLTAGE A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P06A6 - SENSOR REFERENCE VOLTAGE A CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the VREF circuit is not within a calibrated voltage range.			
Possible Causes: • VREF circuit short to voltage • VREF circuit short to ground • Damaged sensor			
Diagnostic Aids: This DTC may set with additional component DTCs.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06A7 - SENSOR REFERENCE VOLTAGE B CIRCUIT RANGE/PERFORMANCE - DTC CHART

P06A7 - SENSOR REFERENCE VOLTAGE B CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the VREF circuit is not within a calibrated voltage range.			
Possible Causes: • VREF circuit short to voltage • VREF circuit short to ground • Damaged sensor			
Diagnostic Aids: This DTC may set with additional component DTCs.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06A8 - SENSOR REFERENCE VOLTAGE C CIRCUIT RANGE/PERFORMANCE - DTC CHART

P06A8 - SENSOR REFERENCE VOLTAGE C CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the VREF circuit is not within a calibrated voltage range.

Possible Causes:

- VREF circuit short to voltage
- VREF circuit short to ground
- Damaged sensor

Diagnostic Aids: This DTC may set with additional component DTCs.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test C .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06B6 - INTERNAL CONTROL MODULE KNOCK SENSOR PROCESSOR 1 PERFORMANCE - DTC CHART

P06B6 - INTERNAL CONTROL MODULE KNOCK SENSOR PROCESSOR 1 PERFORMANCE - DTC CHART

Description: This DTC sets when the PCM has detected an error condition with the knock sensor (KS) processor integrated circuit.

Possible Causes:

- Damaged PCM

Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06B8 - INTERNAL CONTROL MODULE NON-VOLATILE RANDOM ACCESS MEMORY (NVRAM) ERROR - DTC CHART

P06B8 - INTERNAL CONTROL MODULE NON-VOLATILE RANDOM ACCESS MEMORY (NVRAM)

ERROR - DTC CHART

Description: This DTC sets when a concern with the ability of the PCM to correctly store permanent DTCs is present.
Possible Causes: • Low battery voltage • Battery or charging system concern • VPWR circuit intermittently short • VPWR circuit intermittently open • PWRGND circuit intermittently open
Diagnostic Aids: Check for other DTCs and diagnose those first. Check for aftermarket performance products. Check for an electrical or charging system concern. If an updated calibration is available, update the calibration to the latest level. If an updated calibration is not available, clear the DTCs and repeat the self-test. If this DTC is retrieved after a PCM reprogramming, turn the ignition OFF and allow the PCM to complete a normal power down sequence. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a Replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06D1 - INTERNAL CONTROL MODULE IGNITION COIL CONTROL MODULE PERFORMANCE - DTC CHART

P06D1 - INTERNAL CONTROL MODULE IGNITION COIL CONTROL MODULE PERFORMANCE - DTC CHART

Description: This DTC sets when the PCM has detected an error with the ignition coil driver and diagnostic circuit.
Possible Causes: • Aftermarket performance products • Damaged PCM
Diagnostic Aids: Reprogram or update the calibration. Check for other DTCs or drive symptoms for further action. Make sure to check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P06E9 - ENGINE STARTER PERFORMANCE - DTC CHART

P06E9 - ENGINE STARTER PERFORMANCE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0703 - BRAKE SWITCH B INPUT CIRCUIT - DTC CHART

P0703 - BRAKE SWITCH B INPUT CIRCUIT - DTC CHART

Description: This DTC sets when the brake pedal position (BPP) input is missing.

Possible Causes:

- BPP circuit open
- BPP circuit short to ground
- Damaged modules connected to the BPP circuit
- Damaged brake switch
- Incorrectly adjusted brake switch

Diagnostic Aids: Check for correct function of the stoplamps. Using a scan tool, check the BPP PID. The stoplamps and PID should turn ON and OFF with brake pedal activation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Expedition, Navigator	Verify the brake pedal was applied and released during the key ON engine running (KOER) self-test. For additional concerns, refer to the service information , Vehicle Dynamic Systems.		
All others	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0704 - CLUTCH SWITCH INPUT CIRCUIT - DTC CHART

P0704 - CLUTCH SWITCH INPUT CIRCUIT - DTC CHART

Description: When the clutch pedal is applied the voltage switches to low. This DTC sets if the PCM does not see the clutch pedal voltage change from high to low.

Possible Causes:

- CPP circuit short to voltage
- Damaged clutch pedal position (CPP) switch
- SIGRTN circuit open

Diagnostic Aids: When the clutch pedal is applied and then released, the clutch pedal switch voltage should cycle.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0720 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT - DTC CHART

P0720 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT - DTC CHART

Description: This DTC sets when the OSS sensor signal input exceeds the calibrated threshold. The OSS sensor provides a signal to the PCM based on the speed of the output shaft of the transmission.

Possible Causes:

- OSS circuit short to ground
- OSS circuit short to voltage
- OSS circuit open
- Damaged OSS sensor

Diagnostic Aids: Verify the sensor signal output varies with the vehicle speed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	Refer to the service information , Automatic Transmission, Diagnostic Trouble Code (DTC) Index to continue diagnosis.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0721 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P0721 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the OSS sensor signal input exceeds the calibrated threshold or has excessive electrical noise. The OSS signal is very sensitive to electrical noise. This electrical noise distorts the OSS input to the PCM.

Possible Causes:

- Incorrect OSS wiring harness routing
- Aftermarket add-on
- OSS wiring damaged
- OSS wiring insulation wear

Diagnostic Aids: Check the routing of the OSS wiring harness.
Check the OSS wiring and the OSS connector for damage.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	Refer to the service information , Automatic Transmission, Diagnostic Trouble Code (DTC) Index to continue diagnosis.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0722 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT NO SIGNAL - DTC CHART

P0722 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT NO SIGNAL - DTC CHART

Description: This DTC sets when the OSS sensor signal is missing upon the initial movement of the vehicle.

Possible Causes:

- Damaged OSS connector
- Damaged OSS sensor
- Incorrectly installed OSS sensor
- OSS wiring harness intermittent short
- OSS wiring harness open

Diagnostic Aids: Check the wiring, connector, and OSS sensor for damage.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	Refer to the service information , Automatic Transmission, Diagnostic Trouble Code (DTC) Index to continue diagnosis.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0723 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT - DTC CHART

P0723 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when the OSS sensor signal provided to the PCM is irregular or interrupted.

Possible Causes:

- OSS connector not correctly seated
- OSS circuit intermittently short
- OSS circuit intermittently open
- Damaged OSS connector
- OSS sensor not installed correctly
- Damaged OSS sensor

Diagnostic Aids: Verify OSS harness and connector integrity. Verify correct installation of the OSS sensor.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	Refer to the service information , Automatic Transmission, Diagnostic Trouble Code (DTC) Index to continue diagnosis.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P07XX - DTC CHART

P07XX - DTC CHART

Description:

Possible Causes:			
Diagnostic Aids: Refer to the service information or the Master DTC Chart on the Professional Technician Society (PTS) web site to continue diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0830 - CLUTCH PEDAL SWITCH A CIRCUIT - DTC CHART

P0830 - CLUTCH PEDAL SWITCH A CIRCUIT - DTC CHART

Description: The PCM monitors the clutch pedal position (CPP) bottom of travel (CPP-BT) switch only during the calibrated engine speed range (cranking speed range). This DTC sets when the CPP-BT switch does not indicate that the clutch is disengaged (clutch pedal pressed) when the engine is cranked.

Possible Causes:

- Damaged CPP-BT switch
- Damaged CPP-BT harness
- GND circuit open to the CPP-BT switch
- Vehicle push-started with the clutch engaged (clutch pedal released)
- Aftermarket remote starting device

Diagnostic Aids: Verify the vehicle was not push-started with the clutch engaged. Check for aftermarket equipment such as remote starting devices which may bypass the CPP switch when cranking the engine. Refer to the service information , Starting System, The Engine Does Not Crank to diagnose the symptom no start, no crank.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0833 - CLUTCH PEDAL SWITCH B CIRCUIT - DTC CHART

P0833 - CLUTCH PEDAL SWITCH B CIRCUIT - DTC CHART

Description: The PCM monitors the clutch pedal position top of travel (CPP-TT) switch only during the calibrated engine speed range (cranking speed range). This DTC sets when the CPP-TT does not indicate that the clutch is disengaged (clutch pedal pressed) when the engine is cranked.

Possible Causes:

- Damaged CPP-TT switch
- Damaged CPP-TT harness
- GND circuit open to the CPP-TT switch
- Vehicle push-started with the clutch engaged (clutch pedal released)
- Aftermarket remote starting device

Diagnostic Aids: Verify the vehicle was not push-started with the clutch engaged. Check for aftermarket equipment such as remote starting devices which may bypass the CPP-TT switch when cranking the engine. Refer to the service information , Cruise Control, the speed control does not disengage when the clutch pedal is applied to continue diagnosis.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08A9 - CLUTCH PEDAL POSITION SENSOR A CIRCUIT LOW - DTC CHART

P08A9 - CLUTCH PEDAL POSITION SENSOR A CIRCUIT LOW - DTC CHART

Description: This DTC sets when the clutch pedal position 1 (CPP1) signal is out of self-test range low.

Possible Causes:

- CPP1 circuit open
- CPP1 circuit short to ground
- Damaged CPP sensor

Diagnostic Aids: A CPP1 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08AA - CLUTCH PEDAL POSITION SENSOR A CIRCUIT HIGH - DTC CHART

P08AA - CLUTCH PEDAL POSITION SENSOR A CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the clutch pedal position 1 (CPP1) signal is out of self-test range

high.
Possible Causes: • CPP1 circuit open • CPP1 circuit short to voltage • Damaged CPP sensor
Diagnostic Aids: A CPP1 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08B6 - CLUTCH PEDAL POSITION SENSOR B CIRCUIT LOW - DTC CHART

P08B6 - CLUTCH PEDAL POSITION SENSOR B CIRCUIT LOW - DTC CHART

Description: This DTC sets when the clutch pedal position 2 (CPP2) signal is out of self-test range low.
Possible Causes: • CPP2 circuit open • CPP2 circuit short to ground • Damaged CPP sensor
Diagnostic Aids: A CPP sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08B7 - CLUTCH PEDAL POSITION SENSOR B CIRCUIT HIGH - DTC CHART

P08B7 - CLUTCH PEDAL POSITION SENSOR B CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the clutch pedal position 2 (CPP2) signal is out of self-test range high.
Possible Causes: • CPP sensor assembly is binding

- CPP2 circuit short to voltage
- Damaged CPP sensor

Diagnostic Aids: A CPP sensor PID reading may indicate a concern.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08B9 - CLUTCH PEDAL POSITION SENSOR A/B CORRELATION - DTC CHART

P08B9 - CLUTCH PEDAL POSITION SENSOR A/B CORRELATION - DTC CHART

Description: The PCM compares the clutch pedal position information from CPP1 and CPP2 signals. This DTC sets when the CPP sensor inputs CPP1 and CPP2 disagree on the position of the clutch pedal by greater than an expected value.

Possible Causes:

- CPP sensor circuit concerns
- Damaged CPP sensor

Diagnostic Aids: Monitor the CPP sensor PIDs while applying and releasing the clutch pedal.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test TA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P08XX - DTC CHART

P08XX - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: Refer to the service information or the Master DTC Chart on the Professional Technician Society (PTS) web site to continue diagnosis.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P09XX - DTC

CHART

P09XX - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Automatic Transmission.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0A3B - GENERATOR OVER TEMPERATURE - DTC CHART

P0A3B - GENERATOR OVER TEMPERATURE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P0A5X - DTC CHART

P0A5X - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1001 - KEY ON ENGINE RUNNING (KOER) NOT ABLE TO COMPLETE, KOER ABORTED - DTC CHART

P1001 - KEY ON ENGINE RUNNING (KOER) NOT ABLE TO COMPLETE, KOER ABORTED - DTC

CHART

Description: This non-malfunction indicator lamp (MIL) DTC sets when the KOER self-test does not complete in the time allowed.
Possible Causes: • Incorrect self-test procedure • Unexpected response from the self-test monitors • RPM out of specification
Diagnostic Aids: Carry out the KOEO self-test. Refer to GO to Pinpoint Test QT .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P100F - WASTEGATE CONTROL PRESSURE/BARO CORRELATION - DTC CHART

P100F - WASTEGATE CONTROL PRESSURE/BARO CORRELATION - DTC CHART

Description: This DTC sets when the difference between the wastegate vacuum sensor reading is greater than the barometric pressure (BARO) sensor, manifold absolute pressure (MAP) sensor and the turbocharger boost pressure (TCBP) sensor readings by a calibrated threshold at key ON, engine OFF (KOEO), and the fault timer has exceeded the calibrated time threshold.
Possible Causes: • Contaminated or restricted wastegate vacuum sensor • Restricted wastegate actuator control tube • Restricted vent tube from the turbocharger wastegate regulating valve to the intake air tube • Damaged wastegate vacuum sensor
Diagnostic Aids: The typical sensor difference threshold is 8.47 kPa (1.23 psi) and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1011 - WASTEGATE CONTROL PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

P1011 - WASTEGATE CONTROL PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the wastegate vacuum sensor reading has exceeded the atmospheric pressure by greater than a calibrated threshold and the fault timer has exceeded the calibrated time threshold.
Possible Causes: • Damaged wastegate vacuum sensor
Diagnostic Aids: The typical maximum threshold is 10.16 kPa (1.47 psi) and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1012 - WASTEGATE CONTROL PRESSURE CIRCUIT LOW - DTC CHART

P1012 - WASTEGATE CONTROL PRESSURE CIRCUIT LOW - DTC CHART

Description: This DTC sets when the wastegate vacuum sensor reading is less than a calibrated threshold and the fault timer has exceeded the calibrated time threshold indicating a short to SIGRTN or ground.
Possible Causes: • WVS circuit short to ground • Damaged wastegate vacuum sensor
Diagnostic Aids: The typical minimum threshold is 0.2V and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1013 - WASTEGATE CONTROL PRESSURE CIRCUIT HIGH - DTC CHART

P1013 - WASTEGATE CONTROL PRESSURE CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the wastegate vacuum sensor reading is greater than a calibrated threshold and the fault timer has exceeded the calibrated time threshold indicating an open circuit or a short to voltage.

Possible Causes:

- WVS circuit open
- WVS circuit short to voltage
- Damaged wastegate vacuum sensor

Diagnostic Aids: The typical maximum threshold is 4.93 V and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1014 - WASTEGATE CONTROL PRESSURE CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P1014 - WASTEGATE CONTROL PRESSURE CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the wastegate vacuum sensor reading is less than or greater than the minimum or maximum calibrated thresholds and the fault counter has exceeded the calibrated count threshold indicating an intermittent open or short circuit.

Possible Causes:

- WVS circuit intermittent open
- WVS circuit intermittent short to voltage
- WVS circuit intermittent short to ground
- Damaged wiring or harness connector
- Damaged wastegate vacuum sensor

Diagnostic Aids: The typical minimum and maximum threshold is 0.2 V and 4.93 V and the count threshold is 25.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1015 - WASTEGATE CONTROL PRESSURE LOWER THAN EXPECTED - DTC CHART

P1015 - WASTEGATE CONTROL PRESSURE LOWER THAN EXPECTED - DTC CHART

Description: This DTC sets when the measured wastegate vacuum sensor reading is less than the

expected reading by greater than the calibrated threshold and the fault timer has exceeded the calibrated time threshold.
Possible Causes: • Restricted vent tube from the turbocharger wastegate regulating valve to the intake air tube • Damaged turbocharger wastegate regulating valve • Contaminated or restricted wastegate vacuum sensor • Damaged wastegate vacuum sensor
Diagnostic Aids: The typical difference threshold is 16.93 kPa (2.46 psi) and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1016 - WASTEGATE CONTROL PRESSURE HIGHER THAN EXPECTED - DTC CHART

P1016 - WASTEGATE CONTROL PRESSURE HIGHER THAN EXPECTED - DTC CHART

Description: This DTC sets when the measured wastegate vacuum sensor reading is higher than the expected reading by greater than the calibrated threshold and the fault timer has exceeded the calibrated time threshold.
Possible Causes: • Leak in control tube between the turbocharger wastegate regulating valve and the wastegate actuator • Leak in the tube between the vacuum reservoir and the turbocharger wastegate regulating valve • Damaged turbocharger wastegate regulating valve
Diagnostic Aids: The typical difference threshold is 16.93 kPa (2.46 psi) and time threshold is 5 seconds.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HN .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P101F - CYLINDER HEAD TEMPERATURE SENSOR 1 OUT OF SELF-TEST RANGE - DTC CHART

P101F - CYLINDER HEAD TEMPERATURE SENSOR 1 OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the cylinder head temperature (CHT) sensor is out of self-test range. The engine is not at a normal operating temperature.

Possible Causes:

- Cold engine
- Engine overheating
- Low engine coolant level
- Damaged CHT harness connector
- Damaged CHT sensor

Diagnostic Aids: Bring the engine to operating temperature and repeat the self-test. If the engine overheats, check the cooling system. Refer to the service information , Engine Cooling, to diagnose the engine overheats symptom.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1021 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT RANGE/PERFORMANCE - DTC CHART

P1021 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the cylinder head temperature value is higher than the calibrated value and could prevent one or more on board diagnostic (OBD) monitors from completing. The PCM runs this logic after an engine off and a calibrated soak period (typically 6 hours). This soak period allows the intake air temperature and the cylinder head temperature to stabilize and not differ by greater than a calibrated value. This DTC sets when all of the following conditions are met:
The cylinder head temperature at engine start exceeds the intake air temperature at engine start by greater than a calibrated value, typically 17°C (30°F).
The cylinder head temperature exceeds a calibrated value, typically 107°C (225°F).
The fuel system, heated oxygen and misfire monitors have not completed.
The calibrated time to set this DTC has expired.

Possible Causes:

- Cylinder head temperature 2 (CHT2) sensor
- Coolant system concern

Diagnostic Aids: Make sure the intake air temperature and the cylinder head temperature are similar when the engine is cold. Also make sure the CHT sensor and the actual engine operating temperatures are the same.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1022 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT LOW - DTC CHART

P1022 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT LOW - DTC CHART

Description: This DTC sets when a CHT2 circuit concern is present.

Possible Causes:

- CHT2 circuit short to ground
- Damaged CHT2 sensor
- Incorrect CHT2 harness connection

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1023 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT HIGH - DTC CHART

P1023 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT HIGH - DTC CHART

Description: This DTC sets when a CHT2 circuit concern is present.

Possible Causes:

- CHT2 circuit open
- CHT circuit short to voltage
- Damaged CHT2 sensor
- Incorrect CHT2 harness connection

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1024 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P1024 - CYLINDER HEAD TEMPERATURE SENSOR 2 CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when a CHT2 circuit concern is intermittently present while the engine is running.

Possible Causes:

- Damaged CHT2 harness or connector
- Damaged CHT2 sensor
- CHT2 circuit open
- CHT2 circuit short to ground

Diagnostic Aids: Monitor the CHT PID on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1025 - CYLINDER HEAD TEMPERATURE SENSOR 2 OUT OF SELF TEST RANGE - DTC CHART

P1025 - CYLINDER HEAD TEMPERATURE SENSOR 2 OUT OF SELF TEST RANGE - DTC CHART

Description: This DTC sets when the cylinder head temperature 2 (CHT2) sensor is out of self-test range. The engine is not at a normal operating temperature.

Possible Causes:

- Cold engine
- Engine overheating
- Low engine coolant level
- Damaged CHT2 harness connector
- Damaged CHT2 sensor

Diagnostic Aids: Bring the engine to operating temperature and repeat the self-test. If the engine overheats, check the cooling system. Refer to the service information , Engine Cooling, to diagnose the engine overheats symptom.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1026 - ENGINE COOLANT TEMPERATURE 1/CYLINDER HEAD TEMPERATURE 2 CORRELATION - DTC CHART

P1026 - ENGINE COOLANT TEMPERATURE 1/CYLINDER HEAD TEMPERATURE 2 CORRELATION - DTC CHART

Description: This DTC sets when the engine coolant temperature (ECT) and cylinder head temperature 2 (CHT2) sensor readings differ by greater than a calibrated value.

Possible Causes:

- Biased CHT2 sensor
- Damaged CHT2 sensor

Diagnostic Aids: Make sure the ECT and CHT2 sensor readings are within 17°C (30°F) of each other after 6 hours at ambient temperature.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1100 - MASS AIR FLOW (MAF) SENSOR CIRCUIT INTERMITTENT - DTC CHART

P1100 - MASS AIR FLOW (MAF) SENSOR CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when the PCM has detected a sudden input change in the MAF sensor circuit through the comprehensive component monitor (CCM). If during the last 40 warm-up cycles in ignition ON, engine running, the PCM detects an input change beyond the minimum or maximum calibrated limit, a continuous memory DTC is stored.

Possible Causes:

- MAF circuit intermittent open
- MAF circuit intermittent short to voltage
- MAF circuit intermittent short to ground
- Damaged MAF sensor
- Damaged harness connector

- Damaged harness

Diagnostic Aids: While accessing the MAF PID on the scan tool, lightly tap on the MAF sensor or wiggle the MAF sensor connector and harness. If the MAF PID suddenly changes, an intermittent fault is indicated.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1101 - MASS AIR FLOW (MAF) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

P1101 - MASS AIR FLOW (MAF) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when during ignition ON, engine OFF, the MAF sensor output signal is greater than a calibrated limit or during ignition ON, engine running, the MAF output signal is not within the calibrated range.

Possible Causes:

- Low battery charge
- MAF sensor partially connected
- MAF sensor contamination
- GND circuit open
- MAFRTN circuit open
- Damaged MAF sensor
- Intake air leaks

Diagnostic Aids: Diagnose circuit DTCs before range or performance DTCs.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1112 - INTAKE AIR TEMPERATURE (IAT) CIRCUIT INTERMITTENT - DTC CHART

P1112 - INTAKE AIR TEMPERATURE (IAT) CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when the IAT sensor signal is intermittent.

Possible Causes:

- IAT circuit intermittent open
- IAT circuit intermittent short to voltage
- IAT circuit intermittent short to ground
- Damaged IAT sensor
- Damaged harness connector
- Damaged harness

Diagnostic Aids: Monitor the IAT PID on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

P1116 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the ECT sensor is out of self-test range. The correct range is 0.3 to 3.7 volts.

Possible Causes:

- Overheating condition
- Damaged thermostat
- Damaged ECT sensor
- Low engine coolant
- Damaged ECT harness connector

Diagnostic Aids: The engine coolant temperature must be greater than 10°C (50°F) to pass the key ON engine OFF (KOEO) self-test and greater than 82°C (180°F) to pass the key ON engine running (KOER) self-test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT - DTC CHART

P1117 - ENGINE COOLANT TEMPERATURE (ECT) SENSOR CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when the ECT circuit is intermittently open or short while the engine is running.

Possible Causes:

- Damaged ECT harness or connector
- Damaged ECT sensor
- ECT circuit open
- ECT circuit short to ground
- Low engine coolant

Diagnostic Aids: Monitor the ECT PID on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P111B - ENGINE COOLANT WARM-UP NOT DETECTED - DTC CHART

P111B - ENGINE COOLANT WARM-UP NOT DETECTED - DTC CHART

Description: This DTC sets when the engine coolant temperature does not rise by a calibrated threshold value when compared to the inferred engine coolant temperature.

Possible Causes:

- Low engine coolant
- Damaged heater core shut off valve
- Damaged coolant bypass valve
- Damaged ECT sensor

Diagnostic Aids: Verify the engine cooling system is operating correctly. Refer to the service information , Engine Cooling.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1121 - THROTTLE POSITION SENSOR A INCONSISTENT WITH MAF/MAP SENSOR - DTC CHART

P1121 - THROTTLE POSITION SENSOR A INCONSISTENT WITH MAF/MAP SENSOR - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1124 - THROTTLE POSITION SENSOR A OUT OF SELF-TEST RANGE - DTC CHART

P1124 - THROTTLE POSITION SENSOR A OUT OF SELF-TEST RANGE - DTC CHART

Description: During key ON engine OFF (KOEO) and key ON, engine running (KOER) self-tests, the PCM monitors the electronic throttle control (ETC) throttle position (TP) sensor inputs to determine if the TP1 and TP2 signals are less than an expected value. This DTC sets when TP1 or TP2 is greater than the expected value.

Possible Causes:

- Accelerator pedal applied during KOEO or KOER self-test

Diagnostic Aids: Repeat the self-test without applying the accelerator pedal. Make sure the floor mat is not interfering with the accelerator pedal. Diagnose any TP circuit DTCs first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1127 -

EXHAUST TEMPERATURE OUT OF RANGE, O2 SENSOR TESTS NOT COMPLETED - DTC CHART

P1127 - EXHAUST TEMPERATURE OUT OF RANGE, O2 SENSOR TESTS NOT COMPLETED - DTC CHART

Description: The heated oxygen sensor (HO2S) monitor uses an exhaust temperature model to determine when the universal HO2S heaters are cycled ON. This DTC sets when the inferred exhaust temperature is below a minimum calibrated value.

Possible Causes:

- Engine not operating long enough before carrying out the key ON, engine running (KOER) self-test
- Exhaust system too cool

Diagnostic Aids: Monitor the universal HO2S heater PIDs to determine the ON or OFF state. DTC P1127 is present if the exhaust is not hot.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P115E - THROTTLE ACTUATOR CONTROL (TAC) THROTTLE BODY AIR FLOW TRIM AT MAX LIMIT - DTC CHART

P115E - THROTTLE ACTUATOR CONTROL (TAC) THROTTLE BODY AIR FLOW TRIM AT MAX LIMIT - DTC CHART

Description: During idle, the PCM monitors the throttle angle and airflow. If the airflow is determined to be less than expected, the PCM adjusts the throttle angle to compensate. The airflow reduction is typically the result of engine deposit buildup around the throttle plate. This DTC sets when the PCM has reached the maximum allowed compensation and is no longer able to compensate for the buildup.

Possible Causes:

- Engine deposits around the throttle plate

Diagnostic Aids: Install a new throttle body. Refer to the service information , Fuel Charging and Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P117A - ENGINE OIL OVER TEMPERATURE - FORCED LIMITED POWER - DTC CHART

P117A - ENGINE OIL OVER TEMPERATURE - FORCED LIMITED POWER - DTC CHART

Description: This DTC sets when the engine oil protection strategy is enabled when the engine oil temperature reaches a predetermined level in the PCM. The PCM then limits the engine RPMs until the engine oil temperature returns to normal.

Possible Causes:

- Engine overheating
- Low engine coolant
- Loaded weight is greater than the maximum vehicle weight rating. Refer to the Owner's Literature for vehicle weight ratings.

Diagnostic Aids: This DTC is an informational DTC and may be set by an engine overheating concern. If the engine overheats, check the cooling system. Refer to the service information , Engine Cooling, to diagnose the engine overheats symptom.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1184 - ENGINE OIL TEMPERATURE (EOT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

P1184 - ENGINE OIL TEMPERATURE (EOT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the EOT was out of self-test range.

Possible Causes:

- Engine oil temperature below self-test threshold

Diagnostic Aids: The engine should be at operating temperature before carrying out the self-test.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P124X - DTC CHART

P124X - DTC CHART

Description:

Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1260 - THEFT DETECTED, VEHICLE IMMOBILIZED - DTC CHART

P1260 - THEFT DETECTED, VEHICLE IMMOBILIZED - DTC CHART

Description: This DTC can be set if the passive anti-theft system (PATS) has determined a theft condition existed and the engine is disabled or an engine start was attempted using a non- PATS key. This DTC is a good indicator to check the PATS for DTCs.
This DTC can also be set when a new instrument panel cluster (IPC) or PCM is installed without correctly programming either module even if the vehicle is not equipped with PATS.

Possible Causes:

- Incorrectly programmed PCM
- Incorrectly programmed IPC
- Previous theft condition
- Anti-theft system concern

Diagnostic Aids: Theft indicator flashing rapidly or on solid when the ignition is in the ON position. Check the anti-theft system for DTCs. Refer to the service information Anti-Theft, Diagnostic Trouble Code (DTC) Charts to continue diagnosis.
If a new IPC or PCM is installed without correctly programming either module, the parameters must be reset in both modules. Refer to the service information Anti-Theft, Passive Anti-Theft System (PATS) Parameter Reset, to continue diagnosis.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1270 - ENGINE RPM OR VEHICLE SPEED LIMITER REACHED - DTC CHART

P1270 - ENGINE RPM OR VEHICLE SPEED LIMITER REACHED - DTC CHART

Description: This DTC sets when the vehicle has been operated in a manner which caused the engine or vehicle to exceed a calibration limit. The engine RPM and vehicle speed are continuously monitored and evaluated by the PCM. This DTC sets when the RPM or vehicle speed falls out of a calibrated range. For additional information on the engine RPM/vehicle speed limiter, refer to POWERTRAIN

CONTROL SOFTWARE .

Possible Causes:

- Wheel slippage (water, ice, mud, and snow)
- Excessive engine RPM in NEUTRAL or operated in the wrong transmission gear
- Vehicle driven at a high rate of speed

Diagnostic Aids: If there are no other symptoms, return the vehicle to the customer with information about the DTC.
If a symptom is present, refer to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1285 - CYLINDER HEAD OVER TEMPERATURE CONDITION - DTC CHART

P1285 - CYLINDER HEAD OVER TEMPERATURE CONDITION - DTC CHART

Description: This DTC sets when an engine overheat condition was sensed by the cylinder head temperature (CHT) sensor.

Possible Causes:

- Low engine coolant level
- Base engine concerns
- Engine cooling system concerns
- CHT sensor concern

Diagnostic Aids: On some applications when this fault occurs the engine temperature warning indicator illuminates or forces the temperature gauge to the full H (hot) zone. The warning indicator can be triggered by either grounding the engine temperature warning circuit when wired to the PCM, or by sending a PCM network message to the instrument panel cluster (IPC).

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1288 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

P1288 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the CHT sensor is out of self-test range. The engine is not at a normal operating temperature.

Possible Causes:

- Cold engine
- Engine overheating
- Damaged CHT wiring harness or connector
- Low engine coolant level
- Damaged CHT sensor

Diagnostic Aids: Bring the engine to operating temperature. If cold, repeat the self-test. If the engine overheats, check the cooling system. Refer to the service information , Engine Cooling, The Engine Overheats for cooling system diagnosis.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1289 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT HIGH - DTC CHART

P1289 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT HIGH - DTC CHART

Description: This DTC sets when a CHT circuit open concern is present.

Possible Causes:

- CHT circuit open
- CHT circuit short to voltage
- Damaged CHT sensor
- Damaged CHT wiring harness or connector

Diagnostic Aids: The DTC P0118 may also be reported when this DTC sets. Either of these DTCs illuminate the malfunction indicator lamp (MIL).

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P128A - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P128A - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the CHT circuit is intermittently open or short while the engine is running.

Possible Causes:

- Damaged harness or connector
- Damaged sensor
- CHT circuit open
- CHT circuit short to ground

Diagnostic Aids: Monitor the CHT PID on a scan tool. Look for sudden changes in the reading when the harness is wiggled or the sensor is tapped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1290 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT LOW - DTC CHART

P1290 - CYLINDER HEAD TEMPERATURE (CHT) SENSOR CIRCUIT LOW - DTC CHART

Description: This DTC sets when a CHT circuit short to ground concern is present.

Possible Causes:

- CHT circuit short to ground
- Damaged CHT sensor
- Damaged CHT wiring harness or connector

Diagnostic Aids: The DTC P0117 may also be reported when this DTC sets. Either of these DTCs illuminates the malfunction indicator lamp (MIL).

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DL .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1299 - CYLINDER HEAD OVER TEMPERATURE PROTECTION ACTIVE - DTC CHART

P1299 - CYLINDER HEAD OVER TEMPERATURE PROTECTION ACTIVE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Engine Cooling to diagnose the engine overheats symptom.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P130D - ENGINE KNOCK/COMBUSTION PERFORMANCE - FORCED LIMITED POWER - DTC CHART

P130D - ENGINE KNOCK/COMBUSTION PERFORMANCE - FORCED LIMITED POWER - DTC CHART

Description: This DTC sets when the knock sensor (KS) voltage has exceeded a maximum value greater than a calibrated number of times within a set time period.

Possible Causes:

- Fuel quality
- Base engine concerns
- Damaged spark plug
- Loose or corroded connector on ignition coil
- Lean fuel injector
- Long term fuel trim at lean limits
- Positive crankcase ventilation (PCV) system is leaking or stuck open
- Oil and filter maintenance beyond recommended intervals
- Charge air cooler (CAC) restriction
- Damaged PCM

Diagnostic Aids: Engine performance may be limited to protect the engine if this DTC is set.
Verify no base engine concerns are present before continuing with diagnosis. Refer to the service information , Engine System.
The following driving conditions may cause this DTC to set: heavy acceleration from a stop, towing, carrying a heavy load or driving up a grade during a boost condition.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1336 - CRANKSHAFT/CAMSHAFT SENSOR RANGE/PERFORMANCE - DTC CHART

P1336 - CRANKSHAFT/CAMSHAFT SENSOR RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when the input signal from the crankshaft position (CKP) sensor or the camshaft position (CMP) sensor is erratic.

Possible Causes:

- Damaged CKP sensor
- Damaged CMP sensor
- Base engine concerns
- Harness concerns

Diagnostic Aids: Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1397 - SYSTEM VOLTAGE OUT OF SELF - TEST RANGE - DTC CHART

P1397 - SYSTEM VOLTAGE OUT OF SELF - TEST RANGE - DTC CHART

Description: This DTC sets when the 12-volt system voltage is too high or too low during the key ON engine OFF (KOEO) or key ON engine running (KOER) self-test. It sets if the system voltage falls below or exceeds the calibrated threshold at any time during the KOEO or KOER self-test.

Possible Causes:

- Battery or charging system concern

Diagnostic Aids: Make sure the battery voltage is between 11 and 18 volts before running a KOEO or KOER self-test. Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1408 - EXHAUST GAS RECIRCULATION (EGR) FLOW OUT OF SELF-TEST RANGE - DTC CHART

P1408 - EXHAUST GAS RECIRCULATION (EGR) FLOW OUT OF SELF-TEST RANGE - DTC CHART

Description: This test is carried out during the key ON, engine running (KOER) on demand self-test only. The EGR system is commanded on at a fixed engine speed. This DTC sets when the measured EGR flow falls above or below the required calibration.

Possible Causes:

- For electric EGR (EEGR) system,
- EEGR valve stuck open or closed
- EEGR connector not seated correctly
- EEGR stepper motor
- VPWR circuit open
- EGRMC circuit open
- EGRMC circuit short to voltage
- EGRMC circuit short to ground
- Vacuum signal to manifold absolute pressure (MAP) sensor restricted or leaking
- Mass airflow (MAF) sensor signal erroneous
- Carbon build up in the EEGR valve seat area

Diagnostic Aids: Use the output state control function of the scan tool and monitor the manifold absolute pressure (MAP) PID and the EEGR PID (EGRMDSD) while commanding the EEGR on. If EGR is introduced into the engine at idle, the RPM drops or stalls out.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P144A - EVAPORATIVE EMISSION SYSTEM PURGE VAPOR LINE RESTRICTED/BLOCKED - DTC CHART

P144A - EVAPORATIVE EMISSION SYSTEM PURGE VAPOR LINE RESTRICTED/BLOCKED - DTC CHART

Description: The PCM monitors the evaporative emission (EVAP) system for a restricted fuel vapor

tube between the fuel tank pressure (FTP) sensor and the fuel tank. During the initial phase of the EVAP monitor, the PCM closes the canister vent and a vacuum develops in the fuel vapor tubes and lines and in the fuel tank. The PCM monitors the FTP sensor to determine the amount of vacuum and how quickly the vacuum increases. The rate at which the vacuum increases is compared to an expected value. If the vacuum increases quicker than expected, a restricted fuel vapor tube is suspected and an intrusive test is carried out in the final phase of the EVAP monitor. This DTC sets when the intrusive test confirms a blockage a counter is incremented and the counter reaches a calibrated number of completions.

Possible Causes:

- Restricted fuel vapor tube between the FTP sensor and the fuel tank
- EVAP purge valve stuck partially open

Diagnostic Aids: Check the fuel vapor tube for blockage between the FTP sensor and the fuel tank.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P144C - EVAPORATIVE EMISSION SYSTEM PURGE CHECK VALVE PERFORMANCE - DTC CHART

P144C - EVAPORATIVE EMISSION SYSTEM PURGE CHECK VALVE PERFORMANCE - DTC CHART

Description: The EVAP check valve test is performed during minimal boost conditions, once per drive cycle, when entry conditions are met. This DTC sets when the fuel tank pressure exceeds a calibrated amount within a specified amount of time during the test.

Possible Causes:

- Restricted EVAP ejector connections at the intake air system
- Stuck open EVAP check valve
- Stuck closed EVAP check valve
- Damaged EVAP ejector
- Damaged EVAP check valve

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1450 - UNABLE TO BLEED UP FUEL TANK VACUUM - DTC CHART

P1450 - UNABLE TO BLEED UP FUEL TANK VACUUM - DTC CHART

Description: This DTC sets when the evaporative emission (EVAP) running loss monitor detects excessive fuel tank vacuum with the engine running, but not at idle.

Possible Causes:

- EVAP purge valve stuck open
- Blockages or kinks in the EVAP canister tube or EVAP canister purge outlet tube between the fuel tank, the EVAP purge valve and the EVAP canister
- Fuel filler cap stuck closed, preventing vacuum relief (if equipped)
- Capless fuel tank filler pipe damaged, preventing vacuum relief (if equipped)
- Contaminated fuel vapor elbow on the EVAP canister
- Restricted EVAP canister
- EVAP canister vent valve stuck partially or fully closed
- Plugged EVAP canister vent valve filter
- VREF circuit open
- Damaged FTP sensor

Diagnostic Aids: Visually inspect the EVAP canister inlet port, EVAP canister vent valve filter, and EVAP canister vent hose assembly for contamination or debris.
Check EVAP purge valve for vacuum leak.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1500 - VEHICLE SPEED SENSOR (VSS) - DTC CHART

P1500 - VEHICLE SPEED SENSOR (VSS) - DTC CHART

Description: This DTC sets when a VSS concern interferes with other on board diagnostic (OBD) tests, such as the catalyst efficiency monitor, the EVAP monitor or the HO2S monitor. Presence of this DTC indicates the VSS input signal was intermittent.

Possible Causes:

- Intermittent VSS connections
- VSS harness circuits intermittent open
- VSS harness circuits intermittent short

- Damaged VSS

Diagnostic Aids: Check the wiring, connector, and sensor for damage.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-650/F-750, F-Series Super Duty, Fiesta, Fusion, Motorhome/Stripped Chassis/Step Van	GO to Pinpoint Test DF .		
Manual Transmission	GO to Pinpoint Test DP .		
All others	The PCM uses information from the ABS control module and the TCM to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1501 - VEHICLE SPEED SENSOR (VSS) OUT OF SELF-TEST RANGE - DTC CHART

P1501 - VEHICLE SPEED SENSOR (VSS) OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the VSS input signal is out of self-test range. If the PCM detects a VSS input signal any time during the self-test, this DTC sets and the test aborts.

Possible Causes:

- Electrical noise on the VSS input signal from radio frequency interference or electro magnetic interference
- External sources, such as ignition wires, the charging circuit or aftermarket equipment

Diagnostic Aids: Verify the VSS input is 0 km/h (0 mph) when the vehicle transmission is in PARK.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
F-650/F-750, F-Series Super Duty, Fiesta, Fusion, Motorhome/Stripped Chassis/Step Van	GO to Pinpoint Test DF .		
Manual Transmission	GO to Pinpoint Test DP .		
All others	The PCM uses information from the ABS control module and the TCM to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1502 -

VEHICLE SPEED SENSOR (VSS) INTERMITTENT - DTC CHART

P1502 - VEHICLE SPEED SENSOR (VSS) INTERMITTENT - DTC CHART

Description: This DTC sets when there is a concern with the vehicle speed data. Vehicle speed data is received from either the VSS or anti-lock brake system (ABS) control module. This DTC sets the same way as P0500. However, it is intended to flash the transmission control indicator lamp (TCIL) for first time VSS circuit error.

Possible Causes:

- Noisy VSS input signal from the radio frequency interference/electromagnetic interference (RFI/EMI) external sources, such as ignition wires, the charging circuit or after market equipment

Diagnostic Aids: Verify the VSS input is 0 km/h (0 mph) when the vehicle transmission is in PARK.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
F-650/F-750, F-Series Super Duty, Fiesta, Fusion, Motorhome/Stripped Chassis/Step Van	GO to Pinpoint Test DF .		
Manual Transmission	GO to Pinpoint Test DP .		
All others	The PCM uses information from the ABS module and the TCM to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1548 - ENGINE AIR FILTER RESTRICTION - DTC CHART

P1548 - ENGINE AIR FILTER RESTRICTION - DTC CHART

Description: This DTC sets when the airflow is out of range at various engine speeds and during wide open throttle (WOT) operation when compared to the calibrated value.

Possible Causes:

- Intake air restriction
- Clogged air filter

Diagnostic Aids: If this DTC sets, inspect the intake air system and replace the air filter if no restrictions are found. Refer to the service information , Intake Air Distribution and Filtering for air filter replacement.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1561 - BRAKE LINE PRESSURE SENSOR CIRCUIT - DTC CHART

P1561 - BRAKE LINE PRESSURE SENSOR CIRCUIT - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1572 - BRAKE PEDAL SWITCH CIRCUIT - DTC CHART

P1572 - BRAKE PEDAL SWITCH CIRCUIT - DTC CHART

Description: This DTC sets when the brake input rationality test for brake pedal position (BPP) and brake pressure switch (BPS) has detected a concern. One or both inputs to the PCM did not change state when expected. On some vehicles with stability assist, the BPP switch is connected to the anti-lock brake system (ABS) module and the ABS generates a driver brake application signal, which is then sent to the PCM.

Possible Causes:

- Incorrectly adjusted BPP switch
- Blown fuse
- Damaged BPP switch
- Damaged BPS
- BPP circuit open
- BPP circuit short to voltage
- BPP circuit short to ground
- BPS circuit open
- BPS circuit short to voltage
- BPS circuit short to ground

Diagnostic Aids: This DTC sets when the PCM does not sense the correct sequence of the brake pedal input signal from both the BPP switch and the BPS when the brake pedal is pressed and

released.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1575 - PEDAL POSITION OUT OF SELF TEST RANGE - DTC CHART

P1575 - PEDAL POSITION OUT OF SELF TEST RANGE - DTC CHART

Description: During key ON engine OFF (KOEO) self-test, the PCM monitors the accelerator pedal position (APP) sensor inputs to determine if the APP1 and APP2 signals are less than an expected value. This DTC sets when either APP1 or APP2 is greater than the expected value.

Possible Causes:

- Accelerator pedal applied during KOEO self-test

Diagnostic Aids: Repeat the self-test without applying the accelerator pedal. Make sure the floor mat is not interfering with the accelerator pedal. Diagnose any APP circuit DTCs first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P160A - CONTROL MODULE VEHICLE OPTIONS RECONFIGURATION ERROR - DTC CHART

P160A - CONTROL MODULE VEHICLE OPTIONS RECONFIGURATION ERROR - DTC CHART

Description: This DTC sets when the body control module (BCM) detects a mismatch in configuration data and programmable parameters between the PCM and BCM.

Possible Causes:

- Module reprogramming
- Aftermarket performance products
- PCM

Diagnostic Aids: Reprogram or update the calibration. If the PCM already has the latest calibration, carry out the RELEARN VEHICLE DATA procedure from the SERVICE FUNCTIONS menu on the scan tool. Check for other DTCs or drive symptoms for further action. Make sure to check for aftermarket performance products before installing a new PCM. If it is necessary to install a new PCM, refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming the VID Block for a replacement PCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P161A - INCORRECT RESPONSE FROM IMMOBILIZER CONTROL MODULE - DTC CHART

P161A - INCORRECT RESPONSE FROM IMMOBILIZER CONTROL MODULE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P162F - STARTER MOTOR DISABLED - ENGINE CRANK TIME TOO LONG - DTC CHART

P162F - STARTER MOTOR DISABLED - ENGINE CRANK TIME TOO LONG - DTC CHART

Description: This DTC sets when there has been at least 60 seconds of total accumulated cranking time without sufficient time allowed between crank attempts for the starter to cool down.

Possible Causes:

- Repeated excessive attempts to start the engine
- Vehicle is low on fuel
- Battery or starter motor concerns

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose all other DTCs first. Clear the DTCs and repeat the self-test. If the DTC is retrieved again, check for the cause of the excessive crank time.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1633 - KEEP ALIVE POWER (KAPWR) VOLTAGE TOO LOW - DTC CHART

P1633 - KEEP ALIVE POWER (KAPWR) VOLTAGE TOO LOW - DTC CHART

Description: This DTC sets when the KAPWR circuit has experienced a voltage interrupt.
Possible Causes: • KAPWR circuit open • KAPWR intermittent
Diagnostic Aids: Loss of KAPWR to the PCM results in immediate malfunction indicator lamp (MIL) illumination and sets DTC P1633.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QB .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1635 - TIRE/AXLE RATIO OUT OF ACCEPTABLE RANGE - DTC CHART

P1635 - TIRE/AXLE RATIO OUT OF ACCEPTABLE RANGE - DTC CHART

Description: This DTC sets when the tire and axle information contained in the vehicle identification (VID) block does not match the vehicle hardware.
Possible Causes: • Incorrect tire size • Incorrect axle ratio • Incorrect VID configuration parameters
Diagnostic Aids: Using the scan tool, view the tire and axle parameters within the VID. They must match the vehicle hardware.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1636 - INDUCTIVE SIGNATURE CHIP COMMUNICATION ERROR - DTC CHART

P1636 - INDUCTIVE SIGNATURE CHIP COMMUNICATION ERROR - DTC CHART

Description: This DTC sets when the PCM has lost communication with the inductive signature chip.
Possible Causes: • Damaged PCM

Diagnostic Aids: Check for other DTCs and diagnose those first. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1639 - VEHICLE ID (VID) BLOCK CORRUPTED, NOT PROGRAMMED - DTC CHART

P1639 - VEHICLE ID (VID) BLOCK CORRUPTED, NOT PROGRAMMED - DTC CHART

Description: This DTC sets when the VID block is not programmed or the information within is corrupt.

Possible Causes:

- New PCM
- Incorrect PCM
- Incorrect VID configuration

Diagnostic Aids: Program the PCM to the most recent calibration available.
The VID block must be programmed. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Making Changes to the VID Block.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1646 - LINEAR O2 SENSOR CONTROL CHIP (BANK 1) - DTC CHART

P1646 - LINEAR O2 SENSOR CONTROL CHIP (BANK 1) - DTC CHART

Description: The PCM monitors the application specific integrated circuit that controls and monitors the universal heated oxygen sensor bank 1, sensor 1 (HO2S11). This DTC sets when the PCM detects an internal circuit or communication concern.

Possible Causes:

- Damaged universal HO2S11 wiring
- Damaged PCM

Diagnostic Aids: Check for other DTCs and diagnose those first. Check for intermittent universal HO2S wiring concerns. Check the universal HO2S wiring between the PCM and the sensor for damage. Check for aftermarket performance products.

Reprogram or update the calibration. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1647 - LINEAR O2 SENSOR CONTROL CHIP (BANK 2) - DTC CHART

P1647 - LINEAR O2 SENSOR CONTROL CHIP (BANK 2) - DTC CHART

Description: The PCM monitors the application specific integrated circuit that controls and monitors the universal heated oxygen sensor bank 2, sensor 1 (HO2S21). This DTC sets when the PCM detects an internal circuit or communication concern.

Possible Causes:

- Damaged universal HO2S21 wiring
- Damaged PCM

Diagnostic Aids: Check for other DTCs and diagnose those first. Check for intermittent universal HO2S wiring concerns. Check the universal HO2S wiring between the PCM and the sensor for damage. Check for aftermarket performance products.
Reprogram or update the calibration. Clear the DTCs, repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P164A - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT PERFORMANCE (BANK 1 SENSOR 1) - DTC CHART

P164A - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT PERFORMANCE (BANK 1 SENSOR 1) - DTC CHART

Description: A resistor is installed in the universal heated oxygen sensor bank 1, sensor 1 (HO2S11) connector for part to part variance. The PCM determines the value of this resistor by taking multiple measurements of the resistor during each ignition ON event. The PCM uses this value to compensate for the variance in the pumping current signal. This DTC sets when the PCM receives an inconsistent or erratic measurement of the resistor.

Possible Causes:

- Corrosion
- Incorrect connections
- Damaged universal HO2S11

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P164B - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT PERFORMANCE (BANK 2 SENSOR 1) - DTC CHART

P164B - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT PERFORMANCE (BANK 2 SENSOR 1) - DTC CHART

Description: A resistor is installed in the universal heated oxygen sensor bank 2, sensor 1 (HO2S21) connector for part to part variance. The PCM determines the value of this resistor by taking multiple measurements of the resistor during each ignition ON event. The PCM uses this value to compensate for the variance in the pumping current signal. This DTC sets when the PCM receives an inconsistent or erratic measurement of the resistor.

Possible Causes:

- Corrosion
- Incorrect connections
- Damaged universal HO2S21

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P164C - INTERNAL CONTROL MODULE START-STOP PERFORMANCE - DTC CHART

P164C - INTERNAL CONTROL MODULE START-STOP PERFORMANCE - DTC CHART

Description: This DTC sets when an error occurs in the PCM.

Possible Causes:

- Module programming error
- Aftermarket performance products
- Damaged PCM

Diagnostic Aids: This DTC may be accompanied by other DTCs. Check for other DTCs and diagnose those first. If no DTCs are present, continue to follow diagnosis for this DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test AA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P166A - RESTRAINTS DEPLOYMENT COMMUNICATION CIRCUIT - DTC CHART

P166A - RESTRAINTS DEPLOYMENT COMMUNICATION CIRCUIT - DTC CHART

Description: This DTC sets when the PCM detects an open or short in the IES circuit.

Possible Causes:

- IES circuit open
- IES circuit short to ground
- IES circuit short to voltage

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1674 - CONTROL MODULE SOFTWARE CORRUPTED - DTC CHART

P1674 - CONTROL MODULE SOFTWARE CORRUPTED - DTC CHART

Description: This DTC sets when an error occurs in the PCM. This DTC sets in combination with P2105.

Possible Causes:

- Software incompatibility issue
- Damaged PCM

Diagnostic Aids: Verify the PCM is at the latest calibration level.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1703 - BRAKE SWITCH OUT OF SELF-TEST RANGE - DTC CHART

P1703 - BRAKE SWITCH OUT OF SELF-TEST RANGE - DTC CHART

Description: This DTC sets when the BPP signal is high during the key ON engine OFF (KOEO) self-test or the BPP signal did not cycle high and low during the key ON engine running (KOER) self-test.

Possible Causes:

- BPP circuit open
- BPP circuit short to ground
- Concern in modules connected to the BPP circuit
- Damaged brake switch
- Incorrectly adjusted brake switch
- Stoplamp circuits open
- Stoplamp circuits short to ground

Diagnostic Aids: Check for correct function of the stoplamps. Using a scan tool, check the brake pedal position PID. The stoplamps and PID should turn ON and OFF with brake pedal activation.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test FD .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1705 - TRANSMISSION RANGE SENSOR OUT OF SELF-TEST RANGE - DTC CHART

P1705 - TRANSMISSION RANGE SENSOR OUT OF SELF-TEST RANGE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1709 - PARK/NEUTRAL POSITION (PNP) SWITCH OUT OF SELF-TEST RANGE - DTC CHART

P1709 - PARK/NEUTRAL POSITION (PNP) SWITCH OUT OF SELF-TEST RANGE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1780 - TRANSMISSION CONTROL SWITCH (TCS) OUT OF SELF-TEST RANGE - DTC CHART

P1780 - TRANSMISSION CONTROL SWITCH (TCS) OUT OF SELF-TEST RANGE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1793 - IGNITION SUPPLY MALFUNCTION - DTC CHART

P1793 - IGNITION SUPPLY MALFUNCTION - DTC CHART

Description: The ignition switch position run (ISP-R) circuit is monitored for low and high voltage conditions. This DTC sets when the voltage is less than 7 volts or greater than 16 volts.

Possible Causes:

- ISP-R circuit short to voltage
- ISP-R circuit short to ground
- Battery or charging system concern

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P17XX - DTC CHART

P17XX - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P18XX - DTC CHART

P18XX - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1900 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT - DTC CHART

P1900 - OUTPUT SHAFT SPEED (OSS) SENSOR CIRCUIT INTERMITTENT - DTC CHART

Description: This DTC sets when the OSS sensor signal to the PCM is irregular or interrupted.

Possible Causes:

- OSS sensor connector not correctly seated
- OSS harness circuits intermittent open

- OSS harness circuits intermittent short
- Damaged OSS sensor connector
- OSS sensor damaged, or not installed correctly

Diagnostic Aids: Verify the OSS harness and connector integrity. Verify correct installation of the OSS sensor.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Manual Transmission	GO to Pinpoint Test DP .		
Automatic Transmission	Refer to the service information , Automatic Transmission, Pinpoint Test Output Shaft Speed Sensor to continue diagnosis.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P1934 - VEHICLE SPEED SIGNAL - DTC CHART

P1934 - VEHICLE SPEED SIGNAL - DTC CHART

Description: This DTC sets when there is a sudden loss of vehicle speed signal over a period of time. Vehicle speed data is received from either the transmission control module (TCM) or the anti-lock brake system (ABS) module.

Possible Causes:

- VSS+ circuit open
- VSS- circuit open
- VSS circuit short to ground
- VSS circuit short to voltage
- Damaged drive mechanism for VSS
- Damaged VSS
- Damaged wheel speed sensors
- Damaged wheel speed sensor harness circuits

Diagnostic Aids: Monitor the VSS PID while driving the vehicle. If vehicle speed data is lost, check the TCM or ABS module for related DTCs.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Manual Transmission	GO to Pinpoint Test DP .		
All others	The PCM uses information from the ABS module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P193C - STEERING WHEEL ANGLE SIGNAL - DTC CHART

P193C - STEERING WHEEL ANGLE SIGNAL - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Check for other module DTCs or related symptoms. Refer to the appropriate service information to diagnose any other DTCs retrieved. If no other module DTCs are retrieved, follow the service information diagnostic routine for steering wheel rotation sensor concerns.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P193F - VEHICLE SPEED SIGNAL INTERMITTENT - DTC CHART

P193F - VEHICLE SPEED SIGNAL INTERMITTENT - DTC CHART

Description: This DTC sets when the vehicle speed sensor (VSS) input signal was intermittent. This DTC sets when the PCM detects the vehicle speed signal has been interrupted several times during a drive cycle.

Possible Causes:

- VSS connections intermittent
- VSS circuits intermittent short
- VSS circuits intermittent open
- Damaged VSS

Diagnostic Aids: Check the wiring, connector, and sensor for damage.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Manual Transmission	GO to Pinpoint Test DP .		
All others	The PCM uses information from the anti-lock brake system (ABS) module and the transmission control module (TCM) to calculate vehicle speed. Check these modules for DTCs.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P19XX - DTC

CHART

P19XX - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Automatic Transmission.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2004 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1) - DTC CHART

P2004 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 1) - DTC CHART

Description: This DTC sets when the IMRC is commanded closed and the intake manifold runner control bank 1 (IMRC1) sensor indicates the IMRC is open.

Possible Causes:

- IMRC1 circuit short to voltage
- IMRC1 circuit short to SIGRTN
- IMRC1 circuit short to ground
- Damaged IMRC actuator
- Damaged IMRC solenoid
- Restricted vacuum hoses
- Damaged PCM

Diagnostic Aids: The IMRC1 sensor value should change when the IMRC is commanded open or closed.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2005 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2) - DTC CHART

P2005 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK OPEN (BANK 2) - DTC CHART

Description: This DTC sets when the IMRC is commanded closed and the intake manifold runner control bank 2 (IMRC2) sensor indicates the IMRC is open.

Possible Causes:

- IMRC2 circuit short to voltage
- IMRC2 circuit short to SIGRTN
- IMRC2 circuit short to ground
- Damaged IMRC actuator
- Damaged IMRC solenoid
- Blocked vacuum hoses
- Damaged PCM

Diagnostic Aids: The IMRC2 sensor value should change when the IMRC is commanded open or closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2006 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1) - DTC CHART

P2006 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 1) - DTC CHART

Description: This DTC sets when the IMRC is commanded open and the intake manifold runner control bank 1 (IMRC1) sensor indicates the IMRC is closed.

Possible Causes:

- IMRC circuit open
- IMRC1 circuit open
- IMRC1 circuit short to voltage
- Damaged IMRC actuator
- Damaged IMRC solenoid

Diagnostic Aids: The IMRC1 sensor value should change when the IMRC is commanded open or closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2007 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2) - DTC CHART

P2007 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) STUCK CLOSED (BANK 2) - DTC CHART

Description: This DTC sets when the IMRC is commanded open and the intake manifold runner control bank 2 (IMRC2) sensor indicates the IMRC is closed.

Possible Causes:

- IMRC circuit open
- IMRC2 circuit open
- IMRC2 circuit short to voltage
- Damaged IMRC actuator
- Damaged IMRC solenoid

Diagnostic Aids: The IMRC2 sensor value should change when the IMRC is commanded open or closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2008 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 1) - DTC CHART

P2008 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 1) - DTC CHART

Description: This DTC sets when an open circuit is detected in the IMRC1A circuit.

Possible Causes:

- IMRC1A circuit open

Diagnostic Aids: The IMRC1 and IMRC2 sensor values should change when the IMRC is commanded open or closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test HU .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2011 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 2) - DTC CHART

P2011 - INTAKE MANIFOLD RUNNER CONTROL (IMRC) CIRCUIT OPEN (BANK 2) - DTC CHART

Description: This DTC sets when an open circuit is detected in the IMRC2A circuit.			
Possible Causes: • IMRC2A circuit open			
Diagnostic Aids: The IMRC1 and IMRC2 sensor values should change when the IMRC is commanded open or closed.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2014 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 1) - DTC CHART

P2014 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 1) - DTC CHART

Description: This DTC sets when the IMRC1 circuit voltage is greater than or less than a calibrated range.			
Possible Causes: • IMRC1 circuit open • Mechanical concern, damage or restriction of IMRC hardware			
Diagnostic Aids: The IMRC1 sensor value should change when the IMRC is commanded open or closed.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2019 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 2) - DTC

CHART

P2019 - INTAKE MANIFOLD RUNNER POSITION SENSOR/SWITCH CIRCUIT (BANK 2) - DTC CHART

Description: This DTC sets when the IMRC2 circuit voltage is greater than or less than a calibrated range.
Possible Causes: • IMRC2 circuit open • Mechanical concern, damage or restriction of IMRC hardware
Diagnostic Aids: The IMRC2 sensor value should change when the IMRC is commanded open or closed.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P206X - DTC CHART

P206X - DTC CHART

Description:
Possible Causes:
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2070 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK OPEN BANK 1 - DTC CHART

P2070 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK OPEN BANK 1 - DTC CHART

Description: This DTC sets when the signal is greater or less than an expected calibrated range during self-test.
Possible Causes: • IMTV circuit short to ground • Damaged IMTV actuator

Diagnostic Aids: An IMTVM PID reading may indicate a fault.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2071 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK CLOSED BANK 1 - DTC CHART

P2071 - INTAKE MANIFOLD TUNING VALVE (IMTV) STUCK CLOSED BANK 1 - DTC CHART

Description: This DTC sets when the signal is greater or less than an expected calibrated range during self-test.

Possible Causes:

- IMTV circuit open
- IMTV circuit short to ground
- Damaged IMTV actuator

Diagnostic Aids: An IMTVM PID reading may indicate a fault.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HU .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2088 - A CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT LOW BANK 1 - DTC CHART

P2088 - A CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT LOW BANK 1 - DTC CHART

Description: This DTC sets when a low voltage on the VCT11 circuit exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT11 circuit open
- VCT11 circuit short to ground
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 1 (VCT11)

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**

All	GO to Pinpoint Test HK .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2089 - A CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT HIGH BANK 1 - DTC CHART

P2089 - A CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT HIGH BANK 1 - DTC CHART

Description: This DTC sets when a high voltage on the VCT11 circuit exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT11 circuit open
- VCT11 circuit short to voltage
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 1 (VCT11)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2090 - B CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT LOW BANK 1 - DTC CHART

P2090 - B CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT LOW BANK 1 - DTC CHART

Description: This DTC sets when a low voltage on the VCT12 circuit exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT12 circuit open
- VCT12 circuit short to ground
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 2 (VCT12)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2091 - B CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT HIGH BANK 1 - DTC CHART

P2091 - B CAMSHAFT POSITION ACTUATOR CONTROL CIRCUIT HIGH BANK 1 - DTC CHART

Description: This DTC sets when high voltage on the VCT12 circuit exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- VCT12 circuit open
- VCT12 circuit short to voltage
- VPWR circuit open
- Damaged variable camshaft timing bank 1 solenoid 2 (VCT12)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2096 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 1 - DTC CHART

P2096 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 1 - DTC CHART

Description: The PCM monitors the correction value from the heated oxygen sensor bank 1, sensor 2 (HO2S12) as part of the fore-aft oxygen sensor control routine. This DTC sets when the correction value is greater than a calibrated limit.

Possible Causes:

- Corrosion
- Incorrect connections
- Exhaust leaks
- Contaminated universal HO2S11

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2097 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 1 - DTC CHART

P2097 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 1 - DTC CHART

Description: The PCM monitors the correction value from the heated oxygen sensor bank 1, sensor 2 (HO2S12) as part of the fore-aft oxygen sensor control routine. This DTC sets when the correction value is greater than a calibrated limit.

Possible Causes:

- Corrosion
- Incorrect connections
- Exhaust leaks
- Contaminated universal HO2S11

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2098 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 2 - DTC CHART

P2098 - POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 2 - DTC CHART

Description: The PCM monitors the correction value from the heated oxygen sensor bank 2, sensor 2 (HO2S22) as part of the fore-aft oxygen sensor control routine. This DTC sets when the correction value is greater than a calibrated limit.

Possible Causes:

- Corrosion
- Incorrect connections
- Exhaust leaks
- Contaminated universal HO2S21

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2099 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 2 - DTC CHART

P2099 - POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 2 - DTC CHART

Description: The PCM monitors the correction value from the heated oxygen sensor bank 2, sensor 2 (HO2S22) as part of the fore-aft oxygen sensor control routine. This DTC sets when the correction value is greater than a calibrated limit.

Possible Causes:

- Corrosion
- Incorrect connections
- Exhaust leaks
- Contaminated universal HO2S21

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2100 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR CIRCUIT/OPEN - DTC CHART

P2100 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR CIRCUIT/OPEN - DTC CHART

Description: This DTC sets when a PCM fault flag is set indicating the motor circuit is open.

Possible Causes:

- ETBTACM connector is unplugged
- TACM+ circuit open
- TACM+ circuit short to voltage
- TACM- circuit open
- TACM- circuit short to voltage
- TACM+ and TACM- circuits are short together
- TAC motor has an open winding
- Damaged TAC motor

Diagnostic Aids: A TAC motor circuit PID reading may indicate a concern, if available.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2101 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR RANGE/PERFORMANCE - DTC CHART

P2101 - THROTTLE ACTUATOR CONTROL (TAC) MOTOR RANGE/PERFORMANCE - DTC CHART

Description: This DTC sets when a PCM fault flag is set indicating the motor circuit is open.
Possible Causes: • TAC motor circuits are cross wired
Diagnostic Aids: A TAC motor circuit PID reading may indicate a concern, if available.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2105 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED ENGINE SHUTDOWN - DTC CHART

P2105 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - FORCED ENGINE SHUTDOWN - DTC CHART

Description: This DTC sets when the TAC system is in the failure mode effects management (FMEM) mode of forced engine shutdown.
Possible Causes:
Diagnostic Aids: This DTC is an informational DTC and may set with a number of other DTCs which are causing the FMEM. Diagnose other DTCs first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2107 - THROTTLE ACTUATOR CONTROL (TAC) MODULE PROCESSOR - DTC CHART

P2107 - THROTTLE ACTUATOR CONTROL (TAC) MODULE PROCESSOR - DTC CHART

Description: This DTC sets when the electronic throttle control (ETC) area of the PCM failed the self-test. The concern could be the result of an incorrect throttle position command, or TAC motor wires shorted together.

Possible Causes:

- TACM+ circuit short to ground
- TACM+ circuit short to voltage
- TACM- circuit short to ground
- TACM- circuit short to voltage
- Damaged electronic throttle body (ETB)
- Damaged PCM

Diagnostic Aids: This DTC may be accompanied by other DTCs. Diagnose other DTCs first. A TAC motor circuit PID reading may indicate a concern, if available.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2111 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK OPEN - DTC CHART

P2111 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK OPEN - DTC CHART

Description: This DTC sets when the PCM fault status indicates the throttle plate is at a greater angle than commanded.

Possible Causes:

- Throttle body stuck open or binding
- TACM+ circuit open
- TACM- circuit open
- TACM+ and TACM- circuits are cross wired
- TACM+ and TACM- circuits are shorted together
- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2112 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK CLOSED - DTC CHART

P2112 - THROTTLE ACTUATOR CONTROL (TAC) SYSTEM - STUCK CLOSED - DTC CHART

Description: This DTC sets when the fault status indicates the throttle plate is at a lower angle than commanded.

Possible Causes:

- Throttle body stuck closed
- Throttle body stuck binding
- TACM+ circuit open
- TACM- circuit open
- TACM+ and TACM- circuits are cross wired
- TACM+ and TACM- circuits are shorted together
- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2122 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT LOW - DTC CHART

P2122 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT LOW - DTC CHART

Description: This DTC sets when the accelerator pedal position 1 (APP1) is out of self-test range low.

Possible Causes:

- APP1 circuit open
- APP1 circuit short to ground
- Damaged APP sensor

Diagnostic Aids: An APP1 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2123 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT HIGH - DTC CHART

P2123 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the accelerator pedal position 1 (APP1) is out of self-test range high.

Possible Causes:

- APP1 circuit open
- APP1 circuit short to voltage
- Damaged APP sensor

Diagnostic Aids: An APP1 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2127 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT LOW - DTC CHART

P2127 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT LOW - DTC CHART

Description: This DTC sets when the accelerator pedal position 2 (APP2) is out of self-test range low.

Possible Causes:

- APP2 circuit open
- APP2 circuit short to ground
- Damaged APP sensor

Diagnostic Aids: An APP2 sensor PID reading may indicate a concern.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2128 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT HIGH - DTC CHART

P2128 - THROTTLE/PEDAL POSITION SENSOR/SWITCH E CIRCUIT HIGH - DTC CHART

Description: This DTC sets when the accelerator pedal position 2 (APP2) is out of self-test range high.			
Possible Causes: • APP sensor assembly is binding • APP2 circuit short to voltage • Damaged APP sensor			
Diagnostic Aids: An APP2 sensor PID reading may indicate a concern.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2135 - THROTTLE/PEDAL POSITION SENSOR/SWITCH A/B VOLTAGE CORRELATION - DTC CHART

P2135 - THROTTLE/PEDAL POSITION SENSOR/SWITCH A/B VOLTAGE CORRELATION - DTC CHART

Description: This DTC sets when the PCM indicates that throttle position (TP) voltage PIDs TP1 and TP2 disagree by greater than a calibrated limit.			
Possible Causes: • Corrosion • Incorrect connections • Damaged TP sensor			
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DV .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2138 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D/E VOLTAGE CORRELATION - DTC CHART

P2138 - THROTTLE/PEDAL POSITION SENSOR/SWITCH D/E VOLTAGE CORRELATION - DTC CHART

Description: The PCM compares the accelerator pedal position (APP) sensor information from APP1 and APP2 signals. This DTC sets when the APP sensor inputs APP1 and APP2 disagree on the position of the accelerator pedal by greater than an expected value.

Possible Causes:

- APP sensor circuit concerns
- Damaged APP sensor

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DK .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2195 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 1, SENSOR 1 - DTC CHART

P2195 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 1, SENSOR 1 - DTC CHART

Description: A universal heated oxygen sensor bank 1, sensor 1 (HO2S11) indicating lean at the end of a test is trying to correct for an over lean condition. This DTC sets when the fuel control system no longer detects switching for a calibrated amount of time.

Possible Causes:

- Water in the harness connector
- UO2SPC11 circuit open
- Corrosion
- Incorrect connections
- Low fuel pressure or running out of fuel
- EVAP purge valve stuck open
- Biased MAP sensor signal
- Incorrect learned ethanol content
- Air leaks after the mass airflow (MAF) sensor (if equipped)
- Contaminated MAF sensor (if equipped)
- Vacuum leaks
- Positive crankcase ventilation (PCV) system is leaking
- Incorrectly seated engine oil dipstick
- Leaking gasket

- Camshaft timing
- Exhaust leaks before or near the universal HO2S11
- Damaged universal HO2S11
- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2196 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 1, SENSOR 1 - DTC CHART

P2196 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 1, SENSOR 1 - DTC CHART

Description: A universal heated oxygen sensor bank 1, sensor 1 (HO2S11) indicating rich at the end of a test is trying to correct for an over rich condition. This DTC sets when the fuel control system no longer detects switching for a calibrated amount of time.

Possible Causes:

- Water in the harness connector
- UO2SPC11 circuit open
- Corrosion
- Incorrect connections
- Excessive fuel pressure
- Leaking or contaminated fuel injectors
- EVAP purge valve stuck open
- Biased MAP sensor signal
- Incorrect learned ethanol content
- Contaminated MAF sensor (if equipped)
- Positive crankcase ventilation (PCV) system
- Contaminated oil
- Oil overfill
- Camshaft timing
- Damaged universal HO2S11

- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2197 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 2, SENSOR 1 - DTC CHART

P2197 - O2 SENSOR SIGNAL BIASED/STUCK LEAN - BANK 2, SENSOR 1 - DTC CHART

Description: A universal heated oxygen sensor bank 2, sensor 1 (HO2S21) indicating lean at the end of a test is trying to correct for an over lean condition. This DTC sets when the fuel control system no longer detects switching for a calibrated amount of time.

Possible Causes:

- Water in the harness connector
- UO2SPC21 circuit open
- Corrosion
- Incorrect connections
- Low fuel pressure or running out of fuel
- EVAP purge valve stuck open
- Biased MAP sensor signal
- Incorrect learned ethanol content
- Air leaks after the mass airflow (MAF) sensor (if equipped)
- Contaminated MAF sensor (if equipped)
- Vacuum leaks
- Positive crankcase ventilation (PCV) system is leaking
- Incorrectly seated engine oil dipstick
- Leaking gasket
- Camshaft timing
- Exhaust leaks before or near the universal HO2S21
- Damaged universal HO2S21
- Damaged PCM

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2198 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 2, SENSOR 1 - DTC CHART

P2198 - O2 SENSOR SIGNAL BIASED/STUCK RICH - BANK 2, SENSOR 1 - DTC CHART

Description: A universal heated oxygen sensor bank 2, sensor 1 (HO2S21) indicating rich at the end of a test is trying to correct for an over rich condition. This DTC sets when the fuel control system no longer detects switching for a calibrated amount of time.

Possible Causes:

- Water in the harness connector
- UO2SPC21 circuit open
- Corrosion
- Incorrect connections
- Excessive fuel pressure
- Leaking or contaminated fuel injectors
- EVAP purge valve stuck open
- Biased MAP sensor signal
- Incorrect learned ethanol content
- Contaminated MAF sensor (if equipped)
- Positive crankcase ventilation (PCV) system
- Contaminated oil
- Oil overfill
- Camshaft timing
- Damaged universal HO2S21
- Damaged PCM

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P219A - BANK 1 AIR/FUEL RATIO IMBALANCE - DTC CHART

P219A - BANK 1 AIR/FUEL RATIO IMBALANCE - DTC CHART

Description: The air to fuel imbalance monitor is designed to detect differences in the air to fuel ratio between cylinders per engine bank. This DTC sets when the air to fuel ratio difference per cylinder is greater than a calculated amount.

Possible Causes:

- Leaking or contaminated fuel injectors
- Low fuel pressure or running out of fuel
- Leaking EVAP purge valve
- Exhaust or intake air system leaks
- Exhaust gas recirculation (EGR) system
- Positive crankcase ventilation (PCV) system is leaking
- Ignition system
- Incorrectly seated engine oil dipstick, tube or oil fill cap
- Base engine concerns

Diagnostic Aids: The EGR port is restricted.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P219B - BANK 2 AIR/FUEL RATIO IMBALANCE - DTC CHART

P219B - BANK 2 AIR/FUEL RATIO IMBALANCE - DTC CHART

Description: The air to fuel imbalance monitor is designed to detect differences in the air to fuel ratio between cylinders per engine bank. This DTC sets when the air to fuel ratio difference per cylinder is greater than a calculated amount.

Possible Causes:

- Leaking or contaminated fuel injectors
- Low fuel pressure or running out of fuel
- Leaking EVAP purge valve
- Exhaust or intake air system leaks
- Positive crankcase ventilation (PCV) system is leaking

- Ignition system
- Incorrectly seated engine oil dipstick, tube or oil fill cap
- Base engine concerns

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2227 - BAROMETRIC PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

P2227 - BAROMETRIC PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE - DTC CHART

For Fiesta

Description: This DTC sets when there is an out of range condition in the BARO circuit.

Possible Causes:

- Damaged barometric pressure (BARO) sensor
- Damaged PCM

Diagnostic Aids: The BARO sensor is integral to the PCM. A BARO reading less than 50 kPa (7.25 psi) indicates a concern.
Clear the PCM DTCs. Repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

For Vehicles With 2.7L And 3.5L GTDI Engines

Description: This DTC sets when either of the following conditions are present.
When the BARO PID does not correlate with the TCBP and the MAP PIDs at ignition ON, engine OFF.
When the MAP and TCBP PIDs correlate with the engine running, but the TCBP PID does not correlate with the BARO PID at idle.

Possible Causes:

- Damaged BARO sensor
- Damaged PCM

Diagnostic Aids: This DTC is only operational between 1, 000 feet below sea level to 15, 000 feet above sea level, it should be disregarded if set outside the operational range.

For All Others

Description: This DTC sets when the BARO does not correlate with an inferred barometric pressure calculation based on the MAP or mass airflow (MAF) value.

Possible Causes:

- Damaged BARO sensor
- Damaged PCM

Diagnostic Aids: This DTC is only operational between 1, 000 feet below sea level to 15, 000 feet above sea level, it should be disregarded if set outside the operational range.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		
All others	GO to Pinpoint Test DO .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2228 - BAROMETRIC PRESSURE SENSOR A CIRCUIT LOW - DTC CHART

P2228 - BAROMETRIC PRESSURE SENSOR A CIRCUIT LOW - DTC CHART

For Fiesta

Description: This DTC sets when the signal from the barometric pressure (BARO) sensor is below the minimum threshold.

Possible Causes:

- Damaged BARO sensor
- Damaged PCM

Diagnostic Aids: The BARO sensor is integral to the PCM.
When the BARO signal is less than the calibrated threshold, a concern is indicated.
Clear the PCM DTCs. Repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

For All Others

Description: This DTC sets when the barometric pressure (BARO) reading is abnormally low indicating an extreme high altitude.

Possible Causes:

- Damaged BARO sensor

Diagnostic Aids: When the BARO signal is less than the calibrated threshold for greater than 100 ms, a concern is indicated.
This DTC is only operational between 1, 000 feet below sea level to 15, 000 feet above sea level, it should be disregarded if set outside the operational range.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

All others	GO to Pinpoint Test DO .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2229 - BAROMETRIC PRESSURE SENSOR A CIRCUIT HIGH - DTC CHART

P2229 - BAROMETRIC PRESSURE SENSOR A CIRCUIT HIGH - DTC CHART

For Fiesta

Description: This DTC sets when the signal from the barometric pressure (BARO) sensor is above the maximum threshold.

Possible Causes:

- Damaged BARO sensor
- Damaged PCM

Diagnostic Aids: The BARO sensor is integral to the PCM.
When the BARO signal is greater than a calibrated threshold, a concern is indicated.
Clear the PCM DTCs. Repeat the self-test. If the DTC is retrieved again, install a new PCM. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) .

For All Others

Description: This DTC sets when the barometric pressure (BARO) reading is abnormally high indicating an extreme low altitude.

Possible Causes:

- Damaged BARO sensor

Diagnostic Aids: When the BARO signal is greater than a calibrated threshold for greater than 100 ms, a concern is indicated.
This DTC is only operational between 1, 000 feet below sea level to 15, 000 feet above sea level, it should be disregarded if set outside the operational range.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		
All others	GO to Pinpoint Test DO .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2230 - BAROMETRIC PRESSURE SENSOR A CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

P2230 - BAROMETRIC PRESSURE SENSOR A CIRCUIT INTERMITTENT/ERRATIC - DTC CHART

Description: This DTC sets when the BARO reading is intermittently above the maximum value or intermittently below the minimum value for a calibrated number of times.			
Possible Causes: • Damaged BARO sensor			
Diagnostic Aids: When the BARO signal is greater than or less than a calibrated threshold for greater than 100 ms, a concern is indicated. This DTC is only operational between 1, 000 feet below sea level to 15, 000 feet above sea level, it should be disregarded if set outside the operational range.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DO .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2237 - O2 SENSOR POSITIVE CURRENT CONTROL CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

P2237 - O2 SENSOR POSITIVE CURRENT CONTROL CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.			
Possible Causes: • UO2SPC11 circuit open • Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)			
Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2240 - O2 SENSOR POSITIVE CURRENT CONTROL CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

P2240 - O2 SENSOR POSITIVE CURRENT CONTROL CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2SPC21 circuit open
- Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2243 - O2 SENSOR REFERENCE VOLTAGE CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

P2243 - O2 SENSOR REFERENCE VOLTAGE CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S11 circuit open
- Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2247 - O2 SENSOR REFERENCE VOLTAGE CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

P2247 - O2 SENSOR REFERENCE VOLTAGE CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2S21 circuit open
- Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test DZ .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2251 - O2 SENSOR NEGATIVE CURRENT CONTROL CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

P2251 - O2 SENSOR NEGATIVE CURRENT CONTROL CIRCUIT OPEN - BANK 1, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2SGREF11 circuit open
- Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2254 - O2 SENSOR NEGATIVE CURRENT CONTROL CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

P2254 - O2 SENSOR NEGATIVE CURRENT CONTROL CIRCUIT OPEN - BANK 2, SENSOR 1 - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2SGREF21 circuit open
- Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2270 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 2 - DTC CHART

P2270 - O2 SENSOR SIGNAL STUCK LEAN - BANK 1, SENSOR 2 - DTC CHART

Description: The heated oxygen sensor bank 1, sensor 2 (HO2S12) is forced rich and lean and monitored by the PCM. This DTC sets when the PCM does not detect the output of the HO2S12 in a calibrated amount of time.

Possible Causes:

- Pinched, shorted, and corroded wiring and pins
- Crossed HO2S12 wires
- Exhaust leaks
- Contaminated HO2S12
- Damaged HO2S12

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2271 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 2 - DTC CHART

P2271 - O2 SENSOR SIGNAL STUCK RICH - BANK 1, SENSOR 2 - DTC CHART

Description: The heated oxygen sensor bank 1, sensor 2 (HO2S12) is forced rich and lean and monitored by the PCM. This DTC sets when the PCM does not detect the output of the HO2S in a calibrated amount of time.

Possible Causes:

- Pinched, shorted, and corroded wiring and pins
- Crossed HO2S12 wires
- Exhaust leaks
- Contaminated HO2S12
- Damaged HO2S12

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test H .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2272 - O2 SENSOR SIGNAL STUCK LEAN - BANK 2, SENSOR 2 - DTC CHART

P2272 - O2 SENSOR SIGNAL STUCK LEAN - BANK 2, SENSOR 2 - DTC CHART

Description: The heated oxygen sensor bank 2, sensor 2 (HO2S22) is forced rich and lean and monitored by the PCM. This DTC sets when the PCM does not detect the output of the HO2S22 in a calibrated amount of time.

Possible Causes:

- Pinched, shorted, and corroded wiring and pins
- Crossed HO2S22 wires
- Exhaust leaks
- Contaminated HO2S22
- Damaged HO2S22

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2273 - O2 SENSOR SIGNAL STUCK RICH - BANK 2, SENSOR 2 - DTC CHART

P2273 - O2 SENSOR SIGNAL STUCK RICH - BANK 2, SENSOR 2 - DTC CHART

Description: The heated oxygen sensor bank 2, sensor 2 (HO2S22) is forced rich and lean and monitored by the PCM. This DTC sets when the PCM does not detect the output of the HO2S22 in a calibrated amount of time.

Possible Causes:

- Pinched, shorted, and corroded wiring and pins
- Crossed HO2S22 wires
- Exhaust leaks
- Contaminated HO2S22
- Damaged HO2S22

Diagnostic Aids:			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test H .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2279 - INTAKE AIR SYSTEM LEAK - DTC CHART

P2279 - INTAKE AIR SYSTEM LEAK - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2280 - AIR FLOW RESTRICTION/AIR LEAK BETWEEN AIR FILTER AND MAF BANK 1 - DTC CHART

P2280 - AIR FLOW RESTRICTION/AIR LEAK BETWEEN AIR FILTER AND MAF BANK 1 - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2281 - AIR LEAK BETWEEN MAF AND THROTTLE BODY - DTC CHART

P2281 - AIR LEAK BETWEEN MAF AND THROTTLE BODY - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2282 - AIR LEAK BETWEEN THROTTLE BODY AND INTAKE VALVE - DTC CHART

P2282 - AIR LEAK BETWEEN THROTTLE BODY AND INTAKE VALVE - DTC CHART

Description: This DTC sets when the PCM detects an air leak that exceeds a calibrated limit for greater than 5 seconds. If the airflow entering the engine exceeds the airflow through the throttle, a leak is detected and this diagnostic fails.

Possible Causes:

- Unmetered air leaks between throttle body and intake valves
- Air leaks at the intake manifold
- Positive crankcase ventilation (PCV) system is leaking

Diagnostic Aids: Verify the integrity of the PCV system. Refer to POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM for system information.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HG .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2300 - IGNITION COIL A PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2300 - IGNITION COIL A PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP1 (COP) or CDA (coil pack) circuit.

Possible Causes:

- COP1 circuit short to ground (COP)
- CDA circuit short to ground (coil pack)
- Damaged COP (if equipped)
- Damaged coil pack (if equipped)
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		
All others	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2301 - IGNITION COIL A PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2301 - IGNITION COIL A PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP1 (COP) or CDA (coil pack) circuit.

Possible Causes:

- COP1 circuit short to voltage (COP)
- CDA circuit short to voltage (coil pack)
- Damaged COP (if equipped)

- Damaged coil pack (if equipped)
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		
All others	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2303 - IGNITION COIL B PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2303 - IGNITION COIL B PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP2 (COP) or CDB (coil pack) circuit.

Possible Causes:

- COP2 circuit short to ground (COP)
- CDB circuit short to ground (coil pack)
- Damaged COP (if equipped)
- Damaged coil pack (if equipped)
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		
All others	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2304 - IGNITION COIL B PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2304 - IGNITION COIL B PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP2 (COP) or CDB (coil pack) circuit.

Possible Causes:

- COP2 circuit short to voltage (COP)
- CDB circuit short to voltage (coil pack)
- Damaged COP (if equipped)
- Damaged coil pack (if equipped)
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
Fiesta 1.6L TiVCT	GO to Pinpoint Test JE .		
All others	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2306 - IGNITION COIL C PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2306 - IGNITION COIL C PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP3 circuit.

Possible Causes:

- COP3 circuit short to ground
- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2307 - IGNITION COIL C PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2307 - IGNITION COIL C PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP3 circuit.

Possible Causes:

- COP3 circuit short to voltage

- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2309 - IGNITION COIL D PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2309 - IGNITION COIL D PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP4 circuit.

Possible Causes:

- COP4 circuit short to ground
- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2310 - IGNITION COIL D PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2310 - IGNITION COIL D PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP4 circuit.

Possible Causes:

- COP4 circuit short to voltage
- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory

All	GO to Pinpoint Test JF .

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2312 - IGNITION COIL E PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2312 - IGNITION COIL E PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP5 circuit.

Possible Causes:

- COP5 circuit short to ground
- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2313 - IGNITION COIL E PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2313 - IGNITION COIL E PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP5 circuit.

Possible Causes:

- COP5 circuit short to voltage
- Damaged ignition coil
- Damaged ignition coil wiring harness

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2315 - IGNITION COIL F PRIMARY CONTROL CIRCUIT LOW - DTC CHART

P2315 - IGNITION COIL F PRIMARY CONTROL CIRCUIT LOW - DTC CHART

Description: This DTC sets when there is a short to ground in the COP6 circuit.
Possible Causes: • COP6 circuit short to ground • Damaged ignition coil • Damaged ignition coil wiring harness
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2316 - IGNITION COIL F PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

P2316 - IGNITION COIL F PRIMARY CONTROL CIRCUIT HIGH - DTC CHART

Description: This DTC sets when there is a short to voltage in the COP6 circuit.
Possible Causes: • COP6 circuit short to voltage • Damaged ignition coil • Damaged ignition coil wiring harness
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test JF .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2418 - EVAP SYSTEM SWITCHING VALVE CONTROL CIRCUIT/OPEN - DTC CHART

P2418 - EVAP SYSTEM SWITCHING VALVE CONTROL CIRCUIT/OPEN - DTC CHART

Description: This DTC sets when the signal moves outside the minimum or maximum limit for the commanded state of the evaporative emission (EVAP) vapor blocking valve.
Possible Causes: • VPWR circuit open

- VBV circuit open
- VBV circuit short to ground
- Damaged EVAP vapor blocking valve

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2450 - EVAP SYSTEM SWITCHING VALVE PERFORMANCE/STUCK OPEN - DTC CHART

P2450 - EVAP SYSTEM SWITCHING VALVE PERFORMANCE/STUCK OPEN - DTC CHART

Description: The PCM commands the evaporative emission (EVAP) vapor blocking valve closed while vacuum is present in the fuel tank. If the valve does not close, the vacuum in the tank is quickly lost. This DTC sets when the rate of vacuum loss is greater than a calibrated threshold.

Possible Causes:

- Contaminated EVAP vapor blocking valve
- EVAP vapor blocking valve stuck open
- Damaged EVAP vapor blocking valve

Diagnostic Aids: Retrieve all continuous memory and on-demand self-test DTCs from the PCM. Diagnose and repair any circuit related EVAP vapor blocking valve DTCs before diagnosing this performance DTC.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2510 - ECM/PCM POWER RELAY SENSE CIRCUIT RANGE/PERFORMANCE - DTC CHART

P2510 - ECM/PCM POWER RELAY SENSE CIRCUIT RANGE/PERFORMANCE - DTC CHART

Description: The ISP-R and the INJPWRM circuits are monitored for correlation. This DTC sets when the voltage on the ISP-R and the INJPWRM circuit voltages do not correspond for a calibrated period of time.

Possible Causes:

- Ignition circuit fuse

- ISP-R circuit open
- ISP-R circuit short to ground
- Fuel injector VPWR circuit short to voltage
- Fuel injector INJPWR circuit short to voltage
- Damaged ignition switch
- Damaged fuel pump relay
- Damaged PCM power relay

Diagnostic Aids: The INJPWRM PID voltage reading should be 0 volts when the ignition is in the OFF, ACC or LOCK position.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P253X - DTC CHART

P253X - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P25B1 - FUEL LEVEL SENSOR B STUCK - DTC CHART

P25B1 - FUEL LEVEL SENSOR B STUCK - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P25B2 - FUEL LEVEL SENSOR A OR B STUCK - DTC CHART

P25B2 - FUEL LEVEL SENSOR A OR B STUCK - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P260F - EVAPORATIVE SYSTEM MONITORING PROCESSOR PERFORMANCE - DTC CHART

P260F - EVAPORATIVE SYSTEM MONITORING PROCESSOR PERFORMANCE - DTC CHART

Description: This DTC sets when a concern is detected internal to the PCM. The microprocessor that controls the engine off natural vacuum (EONV) leak check monitor is separate from the main processor within the PCM.

Possible Causes:

- Module communications network concerns
- PCM calibration level
- Damaged PCM

Diagnostic Aids: Verify the PCM is at the latest calibration level. Reprogram if necessary.

Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test HX .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2610 - ECM/PCM ENGINE OFF TIMER PERFORMANCE - DTC CHART

P2610 - ECM/PCM ENGINE OFF TIMER PERFORMANCE - DTC CHART

Description: This DTC sets when the difference between the engine off time and the central processing unit (CPU) time exceeds a calibrated limit for a calibrated amount of time.

Possible Causes:

- Incorrect or intermittent battery cable connections
- KAPWR circuit to PCM concern
- Engine coolant temperature (ECT) sensor concern
- Engine cooling system concerns
- Electrical interference around vehicle or PCM

Diagnostic Aids: Verify the PCM, remote function actuator (RFA) and instrument panel control (IPC) module are at the latest calibration level.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QB .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2626 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT/OPEN (BANK 1 SENSOR 1) - DTC CHART

P2626 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT/OPEN (BANK 1 SENSOR 1) - DTC CHART

Description: During deceleration fuel shut-off (DFSO) the PCM monitors the integrity of the UO2SPCT11 circuit by comparing the actual oxygen sensor voltage signal to an expected oxygen sensor voltage signal. This DTC sets when the actual oxygen sensor voltage exceeds the maximum expected voltage threshold for a specified amount of time.

Possible Causes:

- Corrosion
- Incorrect connections
- UO2SPCT11 circuit open

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2627 - O2 SENSOR PUMPING CURRENT TRIM CIRCUIT LOW BANK 1, SENSOR 1 - DTC CHART

P2627 - O2 SENSOR PUMPING CURRENT TRIM CIRCUIT LOW BANK 1, SENSOR 1 - DTC CHART

Description: A resistor is installed in the universal heated oxygen sensor (HO2S) connector for part to part variance. The PCM determines the value of this resistor by taking multiple measurements of the

resistor during each ignition ON event. The PCM uses this value in order to compensate for the variance in the pumping current signal. This DTC sets when the PCM determines the resistance value is too high.

Possible Causes:

- UO2SPCT11 circuit open
- UO2SPCT11 circuit short to ground
- Contaminated universal heated oxygen sensor bank 1, sensor 1 (HO2S11)
- Damaged universal HO2S11

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2628 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT HIGH (BANK 1 SENSOR 1) - DTC CHART

P2628 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT HIGH (BANK 1 SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.

Possible Causes:

- UO2SPCT11 circuit short to voltage
- Damaged universal heated oxygen sensor bank 1, sensor 1 (HO2S11)

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2629 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT/OPEN (BANK 2 SENSOR 1) - DTC CHART

P2629 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT/OPEN (BANK 2 SENSOR 1) - DTC CHART

Description: During deceleration fuel shut-off (DFSO) the PCM monitors the integrity of the UO2SPCT21 circuit by comparing the actual oxygen sensor voltage signal to an expected oxygen

sensor voltage signal. This DTC sets when the actual oxygen sensor voltage exceeds the maximum expected voltage threshold for a specified amount of time.
Possible Causes: • Corrosion • Incorrect connections • UO2SPCT21 circuit open
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2630 - O2 SENSOR PUMPING CURRENT TRIM CIRCUIT LOW BANK 2, SENSOR 1 - DTC CHART

P2630 - O2 SENSOR PUMPING CURRENT TRIM CIRCUIT LOW BANK 2, SENSOR 1 - DTC CHART

Description: A resistor is installed in the universal heated oxygen sensor (HO2S) connector for part to part variance. The powertrain control module (PCM) determines the value of this resistor by taking multiple measurements of the resistor during each ignition ON event. The PCM uses this value in order to compensate for the variance in the pumping current signal. This DTC sets when the PCM determines the resistance value is too high.
Possible Causes: • UO2SPCT21 circuit open • UO2SPCT21 circuit short to ground • Contaminated universal heated oxygen sensor bank 2, sensor 1 (HO2S21) • Damaged universal HO2S21
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2631 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT HIGH (BANK 2 SENSOR 1) - DTC CHART

P2631 - O2 SENSOR POSITIVE CURRENT TRIM CIRCUIT HIGH (BANK 2 SENSOR 1) - DTC CHART

Description: This DTC sets when a concern is detected with the circuit used to determine the oxygen content in the exhaust gas.
Possible Causes: • UO2SPCT21 circuit short to voltage • Damaged universal heated oxygen sensor bank 2, sensor 1 (HO2S21)
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DZ .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P264F - ENGINE SERIAL NUMBER NOT PROGRAMMED OR INCOMPATIBLE - DTC CHART

P264F - ENGINE SERIAL NUMBER NOT PROGRAMMED OR INCOMPATIBLE - DTC CHART

Description: This DTC sets when the PCM does not receive a valid engine serial number during reprogramming.
Possible Causes: • Engine serial number corrupted during vehicle identification (VID) reprogramming • PCM replacement • Damaged PCM
Diagnostic Aids: The VID block must be programmed. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) , Programming VID Block. If the PCM does not allow reprogramming of the VID block, reflashing of the PCM is required.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P268X - DTC CHART

All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2A01 - O2 CIRCUIT RANGE/PERFORMANCE BANK 1, SENSOR 2 - DTC CHART

P2A01 - O2 CIRCUIT RANGE/PERFORMANCE BANK 1, SENSOR 2 - DTC CHART

Description: This DTC sets when the heated oxygen sensor bank 1, sensor 2 (HO2S12) voltage is out of range low for a calibrated period of time.

Possible Causes:

- Crossed HO2S12 and SIGRTN circuits
- Corrosion

- Incorrect connections
- Contaminated HO2S12
- Deteriorating HO2S12
- Damaged HO2S12

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > P2A04 - O2 CIRCUIT RANGE/PERFORMANCE BANK 2, SENSOR 2 - DTC CHART

P2A04 - O2 CIRCUIT RANGE/PERFORMANCE BANK 2, SENSOR 2 - DTC CHART

Description: This DTC sets when the heated oxygen sensor bank 2, sensor 2 (HO2S22) voltage is out of range low for a calibrated period of time.

Possible Causes:

- Crossed HO2S22 and SIGRTN circuits
- Corrosion
- Incorrect connections
- Contaminated HO2S22
- Deteriorating HO2S22
- Damaged HO2S22

Diagnostic Aids: Inspect the connectors for signs of damage, water intrusion or corrosion.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test DW .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > PXXXX - DTC CHART

PXXXX - DTC CHART

Description:

Possible Causes:

Diagnostic Aids: For Pxxxx DTCs not listed in this chart, refer to the customer's symptom to determine the applicable service information for diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0046 - VEHICLE COMMUNICATION BUS C - DTC CHART

U0046 - VEHICLE COMMUNICATION BUS C - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls, PCM DTC Chart, to continue diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0101 - LOST COMMUNICATION WITH TCM - DTC CHART

U0101 - LOST COMMUNICATION WITH TCM - DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the transmission control module (TCM). This DTC sets when the PCM does not receive the TCM message within the defined amount of time.			
Possible Causes: • Communication error			
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0104 - LOST COMMUNICATION WITH CRUISE CONTROL MODULE - DTC CHART

U0104 - LOST COMMUNICATION WITH CRUISE CONTROL MODULE - DTC CHART

Description: The PCM continuously monitors for messages from the cruise control module. This DTC sets when the PCM does not receive the cruise control module message within the defined amount of time.
Possible Causes: • Communication error
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0109 - LOST COMMUNICATION WITH FUEL PUMP CONTROL MODULE A - DTC CHART

U0109 - LOST COMMUNICATION WITH FUEL PUMP CONTROL MODULE A - DTC CHART

Description: The PCM monitors the fuel pump monitor (FPM) circuit for the presence of a duty cycled signal. If the FPM circuit is fixed at a low or high voltage, the PCM begins to increment a counter. The test fails when the PCM is still not detecting a duty cycled signal on the FPM circuit after a calibrated amount of time.
Possible Causes: • FPM circuit open or short to ground • FPM circuit short to voltage • VPWR fuel circuit open • GND circuit open • Damaged inertia fuel shutoff (IFS) switch (if equipped) • Damaged fuel pump control module relay
Diagnostic Aids: Check if the inertia fuel shutoff (IFS) switch is tripped.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0121 - LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE - DTC CHART

U0121 - LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE -

DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the ABS. This DTC sets when the PCM fails to receive the ABS message within the defined amount of time.
Possible Causes: • Communication error
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0138 - LOST COMMUNICATION WITH ALL TERRAIN CONTROL MODULE - DTC CHART

U0138 - LOST COMMUNICATION WITH ALL TERRAIN CONTROL MODULE - DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the all terrain control module (ATCM). This DTC sets when the PCM does not receive the ATCM message within the defined amount of time.
Possible Causes: • Communication error
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0140 - LOST COMMUNICATION WITH BODY CONTROL MODULE - DTC CHART

U0140 - LOST COMMUNICATION WITH BODY CONTROL MODULE - DTC CHART

Description: The PCM continuously monitors controller area network (CAN) for messages from body control module (BCM). This DTC sets when the PCM does not receive the BCM message within the defined amount of time.
Possible Causes: • Communication error

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0155 - LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER CONTROL MODULE - DTC CHART

U0155 - LOST COMMUNICATION WITH INSTRUMENT PANEL CLUSTER CONTROL MODULE - DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the instrument panel cluster (IPC) module. This DTC sets when the PCM does not receive the IPC message within the defined amount of time.			
Possible Causes: • Communication error			
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0212 - LOST COMMUNICATION WITH STEERING COLUMN CONTROL MODULE - DTC CHART

U0212 - LOST COMMUNICATION WITH STEERING COLUMN CONTROL MODULE - DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the steering angle sensor. This DTC sets when the PCM does not receive the steering angle sensor message within the defined amount of time.			
Possible Causes: • Communication error			
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U028X - DTC CHART

U028X - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls, PCM DTC Chart, to continue diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0298 - LOST COMMUNICATION WITH DC TO DC CONVERTER CONTROL MODULE A - DTC CHART

U0298 - LOST COMMUNICATION WITH DC TO DC CONVERTER CONTROL MODULE A - DTC CHART

Description: The PCM continuously monitors the controller area network (CAN) for messages from the DC to DC convertor control module. This DTC sets when the PCM does not receive the DC to DC convertor control module message within the defined amount of time.			
Possible Causes: • Communication error			
Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0300 - INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY - DTC CHART

U0300 - INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY - DTC CHART

Description: The electronic throttle control (ETC) system uses multiple microprocessors within the PCM, each having its own software level and function. The microprocessors must have the correct level of software in order to communicate and function together. This DTC sets when there are incompatible software levels within the PCM that control the ETC system.

Possible Causes:			
Diagnostic Aids: Verify the PCM is at the latest calibration level.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	GO to Pinpoint Test QE .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0402 - INVALID DATA RECEIVED FROM TCM - DTC CHART

U0402 - INVALID DATA RECEIVED FROM TCM - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern.
- Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0415 - INVALID DATA RECEIVED FROM ABS CONTROL MODULE - DTC CHART

U0415 - INVALID DATA RECEIVED FROM ABS CONTROL MODULE - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern.
- Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0422 - INVALID DATA RECEIVED FROM BODY CONTROL MODULE - DTC CHART

U0422 - INVALID DATA RECEIVED FROM BODY CONTROL MODULE - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern.
- Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U0423 - INVALID DATA RECEIVED FROM IPC - DTC CHART

U0423 - INVALID DATA RECEIVED FROM IPC - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern.
- Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U042E - INVALID DATA RECEIVED FROM GENERATOR CONTROL MODULE - DTC CHART

U042E - INVALID DATA RECEIVED FROM GENERATOR CONTROL MODULE - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls, PCM DTC Chart, to continue diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U058X - DTC CHART

Description:			
Possible Causes:			
Diagnostic Aids: Refer to the service information , Electronic Engine Controls, PCM DTC Chart, to continue diagnosis.			
Application	**Key On Engine Off**	**Key On Engine Running**	**Continuous Memory**
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U1011 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM ECM/PCM - DTC CHART

U1011 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM ECM/PCM - DTC CHART

Description: Network DTC concerns occur during module to module communication.
Possible Causes: • Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The receiving module logs a DTC related to the invalid data concern.
Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U1012 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE - DTC CHART

U1012 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The receiving module logs a DTC related to the invalid data concern.

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U1013 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM TCM - DTC CHART

U1013 - INVALID INTERNAL CONTROL MODULE MONITORING DATA RECEIVED FROM TCM - DTC CHART

Description: Network DTC concerns occur during module to module communication.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The receiving module logs a DTC related to the invalid data concern.

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U1039 - SCP (J1850) INVALID OR MISSING DATA FOR VEHICLE SPEED - DTC CHART

U1039 - SCP (J1850) INVALID OR MISSING DATA FOR VEHICLE SPEED - DTC CHART

Description: Network DTC(s) occur during module to module communication concerns.

Possible Causes:

- Invalid data network concerns - data is transferred within the normal inter-module message, but contains known invalid data. The transmitting module logs a DTC related to the invalid data concern.
- Missing message network concerns - missing message concerns are logged by the module upon failure to receive a message from another module within a defined retry period.

Diagnostic Aids: Check for other PCM DTCs or PCM related symptoms. Diagnose all other PCM DTCs or PCM related symptoms first.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test QA .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U210B - LOST COMMUNICATION BETWEEN FUEL PUMP CONTROL MODULE A AND RESTRAINTS CONTROL MODULE - DTC CHART

U210B - LOST COMMUNICATION BETWEEN FUEL PUMP CONTROL MODULE A AND RESTRAINTS CONTROL MODULE - DTC CHART

Description: The fuel pump control module monitors the duty cycle and frequency of the signal it receives from the restraints control module (RCM). The fuel pump control module determines if the signal on the event notification signal (ENS) circuit from the RCM is a valid duty cycle and frequency. If the duty cycle or frequency is invalid, the fuel pump control module sends a 40% duty cycle signal on the fuel pump monitor (FPM) circuit to report the concern to the PCM. The test fails when the fuel pump control module is still reporting that it is receiving an invalid duty cycle or frequency from the RCM after a calibrated amount of time.

Possible Causes:

- ENS circuit open or short to ground
- ENS circuit short to voltage
- Radio frequency interference or electromagnetic interference
- Damaged fuel pump control module
- Damaged RCM

Diagnostic Aids: Check the harness for routing, alterations, incorrect shielding, or electrical interference from other systems. The ENS is used to notify the fuel pump control module of an event requiring the fuel pump to be disabled. This signal is used instead of an inertia fuel shutoff (IFS) switch. The fuel pump control module monitors the ENS signal by sending a 12V low current signal on the ENS

circuit to the RCM.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test KC .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > U300C - IGNITION INPUT OFF/ON/START - DTC CHART

U300C - IGNITION INPUT OFF/ON/START - DTC CHART

Description: The PCM monitors the ignition key state. This DTC sets when the key state is not available.

Possible Causes:

- ISP-R circuit open
- ISP-R circuit short to ground

Diagnostic Aids:

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	GO to Pinpoint Test B .		

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS > UXXXX - NETWORK COMMUNICATION - DTC CHART

UXXXX - NETWORK COMMUNICATION - DTC CHART

Description: Powertrain related DTC from another module.

Possible Causes:

- Communication error

Diagnostic Aids: Network DTC concerns occur during module to module communication. Refer to the service information Module Communications Network, Communication Network Diagnostic Trouble Codes (DTC) Index to continue diagnosis.

Application	Key On Engine Off	Key On Engine Running	Continuous Memory
All	Refer to the Description, Possible Causes and Diagnostic Aids for the DTC.		

REFERENCE VALUE SYMPTOM CHART

The Reference Value Symptom Chart provides guidance in selecting the appropriate parameter identification (PID) or measured signal related to the fault area. Select a symptom from the symptom chart along with the category number and go to the PID/MEASURED SIGNAL CHART . For multiple symptoms, select the symptom that is the most evident.

REFERENCE VALUE SYMPTOM CHART > SYMPTOM CHART

Symptom Occurs During	Symptom	Category Number
Startup:	No start/Normal crank	1
	Hard start/Long crank	2
	Stall after start	3
	Diesels/Runs on	4

22-23	VSS

Some signals can only be measured and require the use of a digital multimeter (DMM).

TYPICAL DIAGNOSTIC REFERENCE VALUES

NOTE: Footnotes are referenced throughout the Typical Diagnostic Reference Value Charts. A letter in parentheses next to a value indicates supplemental information is available.
An attempt is made to provide as much information as possible. Some vehicles may not display all input and output signals.
The Typical Diagnostic Reference Value Charts do not display fault parameter identifications (PIDs). These are PIDs which indicate a hard fault with the circuit. They display a value of FAULT or NO FAULT and are PIDs ending with the letter F.
Reference values may vary 20% depending on operating conditions, altitude, and other factors.
The RPM values are axle and tire dependent.
Values are taken at an altitude of approximately 189 meters (620 ft) above sea level with the engine at normal operating temperature and accessories off.
Refer to the Introduction Information, Acronyms and Definitions for technical terms applicable to Ford Motor Company products.
Refer to PARAMETER IDENTIFICATION (PID) , for PID descriptions.
For detailed transmission diagnostics, refer to the sevice information signals may be referred to in either alpha or numeric form. For example, 1=A, 2=B, 3=C.

A. A/C on.

B. Cooling fan on (low or high speed).

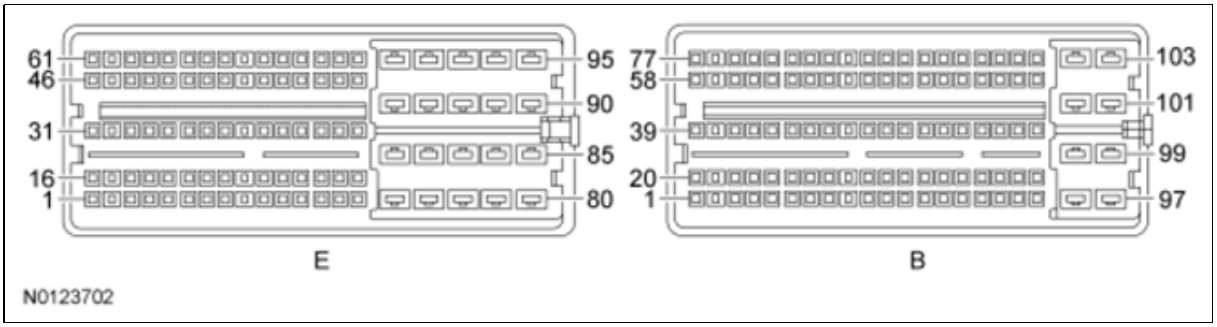
C. Heated oxygen sensors (HO2S) should switch from rich to lean at least once every 3 seconds. HO2S voltage should toggle above and below 0.450 DCV and never be a negative value. Valid HO2S switching occurs only during closed loop fuel control operation.

D. Downstream oxygen sensors stay close to a constant voltage when the catalyst monitor is off (positive value only). When the catalyst monitor is on, the HO2S switches from rich to lean above and below 0.450 DCV and should never be a negative value. For downstream oxygen sensors (12, 22) greater activity results when the catalyst monitor is active.

E. Brake pedal applied.

F. The electric vapor management valve (VMV) commanded current varies from 0 mA - 1000 mA depending on the powertrain control module (PCM) command to purge the evaporative emission (EVAP) system.

G. While pressing the transmission control switch (TCS) or switching to manual drive mode.



H. Value depends on fuel tank level. Typical operating range is 15% (empty) to 90% (full).

I. Value is not useful under this condition.

J. The normal operation value is from -1.5 to 3.5 degrees.

QT: POWERTRAIN CONTROL MODULE (PCM) QUICK TEST > QT1 CARRY OUT THE PCM QUICK TEST

NOTE: For vehicles indicating not ready for inspection maintenance (I/M) testing, refer to the Owner Literature, Readiness For Inspection/Maintenance (I/M) Testing to complete the system readiness. If an I/M testing system readiness concern is still present, GO to Pinpoint Test QC .

NOTE: If the vehicle was brought in with an emission compliance concern, GO to Pinpoint Test EM .

NOTE: For applications that use a stand alone transmission control module (TCM), the PCM does not output TCM related diagnostic trouble codes (DTCs). Refer to the service information , Automatic Transmission, to continue diagnosis.

NOTE: If unable to access the PCM DTCs, or a scan tool communication concern exists, GO to Pinpoint Test QA For additional information on retrieving malfunction indicator lamp (MIL) and non-MIL DTCs, refer to QUICK TEST DESCRIPTION for the Continuous Memory Self-Test.

- Complete the preliminary checks looking for obvious concerns that may relate to the symptom. Check for the following items:
  - fuses
  - electrical circuits and connectors
  - vacuum lines (leaks, routing)
  - air intake system (leaks, restrictions)
  - fuel quality (octane, contamination, winter/summer blend)
  - cooling system (engine operating at correct temperature)
  - oil quality (contamination and correct maintenance)
- Access any related Online Automotive Service Information System (OASIS) or Technical Service Bulletin (TSB) information (if available).
- Carry out the PCM self-test to access any DTCs. Record any key ON engine OFF (KOEO), key ON engine running (KOER) (if the engine runs) and continuous memory (MIL and non-MIL) DTCs.

Are any DTCs present?

Yes	No
GO to DIAGNOSTIC TROUBLE CODE (DTC) CHARTS AND DESCRIPTIONS for direction to repair DTCs after noting the following: DIAGNOSE the DTCs in the following order (begin diagnosis with the first DTC output in that mode and diagnose any circuit related DTCs first). For multiple circuit DTCs that are set as a result of a concern with more than one component, REFER to the service information Wiring Diagrams Electronic Engine Controls Cell and identify the common cause such as SIGRTN, VREF, or VPWR. CONTINUE DTC diagnosis by referring to the appropriately identified pinpoint test. 1. Any KOEO self-test DTCs. 2. Any KOER self-test DTCs. 3. Any continuous memory self-test DTCs. Retrieve any available freeze frame data and disregard any identical/related continuous DTCs already repaired.	GO to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX for direction to the correct symptom chart in NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS . If the symptom is not listed, REFER to the applicable service information to continue diagnosis.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX

DRIVEABILITY - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
Starting Concerns	Hard Start/Long Crank/Erratic Start/Erratic Crank	-	CHART NUMBER: 2
	No crank	-	CHART NUMBER: 22
	No start (engine cranks)	-	CHART NUMBER: 3
Unique Idle Concerns	Slow return to idle	-	CHART NUMBER: 4
	Rolling idle	-	CHART NUMBER: 1
	Fast idle	-	CHART NUMBER: 5
	Low/Slow idle	-	CHART NUMBER: 6

DRIVEABILITY - PERFORMANCE WHILE DRIVING CONCERNS - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
Stalls/Quits	Idle/Acceleration/Cruise	-	CHART NUMBER: 1
	Deceleration	-	CHART NUMBER: 6

	Stall after start	-	CHART NUMBER: 1
Runs Rough		-	CHART NUMBER: 1
Misses		-	CHART NUMBER: 1
Buck/Jerk		-	CHART NUMBER: 1
Hesitation/Stumble		-	CHART NUMBER: 1
Surge		-	CHART NUMBER: 1
Backfires		-	CHART NUMBER: 7
Lack/Loss of Power		-	CHART NUMBER: 8
Spark Knock		-	CHART NUMBER: 9

ADDITIONAL DRIVEABILITY CONCERNS - DTC SYMPTOM CHART

System/Symptom	Oasis Number	Chart Number
Diesels/Runs On	-	CHART NUMBER: 5
Poor Fuel Economy	-	CHART NUMBER: 10
Emissions Compliance	-	CHART NUMBER: 11

ELECTRICAL - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
Warning Indicators	Malfunction indicator lamp (MIL)	-	CHART NUMBER: 12
	Transmission control indicator lamp (TCIL)	-	CHART NUMBER: 12
	Power take off (PTO)	-	CHART NUMBER: 12
	Temperature warning indicator or gauge (for vehicles equipped with a cylinder head temperature (CHT) sensor only)	-	CHART NUMBER: 12
	Check fuel cap	-	CHART NUMBER: 12
	Powertrain malfunction indicator (wrench)	-	CHART NUMBER: 12
Instrumentation	Tachometer inoperative	-	CHART NUMBER: 14
	Speedometer/odometer inoperative	-	CHART NUMBER: 14

	Boost gauge indicates higher than normal boost	-	CHART NUMBER: 14
	Fuel gauge inoperative	-	CHART NUMBER: 14

ENGINE - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
Oil System Concerns	High oil consumption	-	CHART NUMBER: 15
	Leaks	-	CHART NUMBER: 15
Cooling System Concerns	Electric cooling fan does not operate (low, high or variable speed)	-	CHART NUMBER: 16
	Cooling fan clutch does not operate	-	CHART NUMBER: 16
	Electric cooling fan always runs	-	CHART NUMBER: 17
Exhaust System Concerns	Visible smoke	-	CHART NUMBER: 18
	Odor (sulfur or rotten egg smell)	-	CHART NUMBER: 21
Fuel System Concerns	Odor, engine compartment	-	CHART NUMBER: 19
Engine Noise (under hood)		-	CHART NUMBER: 20

DRIVELINE - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
Automatic Transmission (A/T) Shift Concerns	Upshift	-	CHART NUMBER: 13
	Downshift	-	CHART NUMBER: 13
	Engagement	-	CHART NUMBER: 13

POWER TAKE OFF (PTO) - DTC SYMPTOM CHART

System/Symptom		Oasis Number	Chart Number
PTO Concerns	Not working correctly	-	CHART NUMBER: 12

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 1

- Stalls/Quits: Idle, Acceleration, Cruise, Stall After Start
- Runs Rough
- Misses
- Buck/Jerk
- Hesitation/Stumble
- Surge
- Unique Idle Concerns: Rolling Idle

NOTE: For some vehicle applications, the engine may stall if left running while refueling. Advise the customer to turn the engine off while refueling to avoid contamination or damage to the evaporative emission (EVAP) system.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Check the following parameter identifiers (PIDs): • LONGFT1 or LONGFT2 (value between -20 and +20%) • VPWR (value between 10.5 and 17.0 volts, and within 0.5 volt of battery voltage)	**LONGFT1 or LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. **LONGFT1 or LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **VPWR not between 10.5 and 17.0 volts:** REFER to the service information , Charging System, Diagnosis and Testing to continue diagnosis. **VPWR between 10.5 and 17.0 volts, but not within 0.5 volt of battery voltage:** CHECK the B+ voltage to the powertrain control module (PCM) power relay. CHECK the VPWR circuit between the PCM and the PCM power relay. CHECK the PWR GND circuits.
Fuel Injection System	For vehicles that run rough at idle check the INJx_F PIDs (the x indicates the injector number) with the ignition ON, engine running. There is 1 INJx_F PID for each engine cylinder. All INJx_F PIDs must indicate NO FAULT. The INJx_F PIDs indicate a fault (an injector circuit concern is indicated). For Edge 2.0L, Edge 2.7L, Escape/Kuga 1.6L, Escape/Kuga 2.0L, Expedition, Explorer 2.0L, Explorer 3.5L GTDI, F-150 2.7L, F-150 3.5L GTDI, Fiesta 1.0L, Fiesta 1.6L GTDI, Flex 3.5L GTDI, Focus, Fusion 1.5L, Fusion 1.6L, Fusion 2.0L, MKC, MKS 3.5L, MKT 2.0L, MKT 3.5L, MKZ 2.0L, Mustang 2.3L, Navigator, Taurus

	2.0L, Taurus 3.5L GTDI, Transit 3.5L and Transit Connect 1.6L, GO to Pinpoint Test DI . For all others, GO to Pinpoint Test KG .
Mass Airflow (MAF) Sensor	GO to Pinpoint Test DC .
Manifold Absolute Pressure (MAP) Sensor	GO to Pinpoint Test DM .
Secondary Ignition System	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Fuel Delivery System	GO to Pinpoint Test HC .
Exhaust System	GO to Pinpoint Test HF .
Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
EVAP System	GO to Pinpoint Test HX .
Charging System	REFER to the service information , Charging System, Diagnosis and Testing to continue diagnosis.
Universal Heated Oxygen Sensor (HO2S)	GO to Pinpoint Test DZ .
Automatic Transmission	REFER to the service information , Automatic Transmission, Diagnosis By Symptom to continue diagnosis.
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Intake Air System	GO to Pinpoint Test HU .
Auto Start Stop System	GO to Pinpoint Test AA .
Additional Testing	GO to Pinpoint Test Z .
Additional Checks: • Some vehicles have a TQ_CNTRL PID available. Check this PID to determine if the PCM is reducing torque. The TQ_CNTRL PID may indicate which component or system, if any, is requesting a torque reduction. • Correct PCM vehicle identification (VID) block information. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) to carry out the Making Changes to the VID Block procedure. • Be aware of engine RPM and speed limiting functions of the PCM (look for incorrect high vehicle speed signal	REFER to the applicable service information.

from ABS or VSS). • Drivelines • Manual transmission or clutch • Charging system • Traction control system (if equipped) • A/C system (for surge with A/C on) • Cruise control system (for surge with cruise control on)	
Brake Over Accelerator	CHECK for simultaneous brake pedal and accelerator pedal operation inadvertently activating the brake over accelerator feature. CHECK the BRKOVR_ACTION, BRKOVRD_POSS, and DIST_BRKOVRD PIDs for recent simultaneous brake pedal and accelerator pedal operation. ADVISE the customer that simultaneous brake pedal and accelerator pedal operation by the vehicle operator activates the brake over accelerator feature. REFER to POWERTRAIN CONTROL SOFTWARE for additional information.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 2

- Starting Concerns: Hard Start/Long Crank/Erratic Start/Erratic Crank

NOTE: For Escape/Kuga, Focus, Fusion, MKC, MKZ, and Transit Connect, check the BdyCM CRASH PID status. The CRASH PID status YES indicates a crash event has occurred, and may be the cause of the Hard Start/Long Crank/Erratic Start symptom. If the CRASH PID indicates YES, carry out the BdyCM Electrical Service Function Crash Status Reset to reset the PID status. Verify the Hard Start/Long Crank/Erratic Start symptom still exists before continuing with the following diagnostics.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Battery Condition and Current Draw	REFER to the service information , Charging System, Diagnosis and Testing to continue diagnosis.
Secondary Ignition System	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Fuel Delivery System	GO to Pinpoint Test HC .
Exhaust System	GO to Pinpoint Test HF .

Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
EVAP System	GO to Pinpoint Test HX .
Intake Air System	GO to Pinpoint Test HU .
Starting System	REFER to the service information , Starting System to diagnose the engine cranks slowly symptom.
Mass Airflow (MAF) Sensor	GO to Pinpoint Test DC .
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 3

- Starting Concerns: No Start (Engine Cranks)

NOTE: An extended crank because of a no start may load the exhaust system with raw fuel, damaging the catalytic converter after the engine starts.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Add On Anti-Theft Devices	Visual. CHECK with the customer.
Fuel And Ignition	GO to Pinpoint Test A :
Exhaust System Restrictions	GO to Pinpoint Test HF .
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 4

- Unique Idle Concerns: Slow Return To Idle

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Vacuum Leaks, Throttle Body	Visual.
Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
Intake Air System Leaks	GO to Pinpoint Test HU .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 5

- Unique Idle Concerns: Fast Idle
- Diesels/Runs On

> *NOTE: If the vehicle runs normally with the ignition in the OFF position, check for a damaged ignition switch, an IGN START/RUN or ISP-R circuit short to voltage, or a VPWR circuit short to voltage.*

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Base Engine	Check for air leaks, including correct sealing of intake manifold and components or vacuum lines attached to intake air (such as the PCV or EGR valve or vacuum lines). REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Cooling System	Verify the engine operates at normal temperature. REFER to the service information , Engine Cooling or NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX , to diagnose any cooling system concerns that are present.
Intake Air System Leaks	GO to Pinpoint Test HU .
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 6

- Unique Idle Concerns: Low/Slow Idle
- Stalls/Quits: Deceleration

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Automatic Transmission (stalls or quits on deceleration)	REFER to the service information , Automatic Transmission to diagnose the torque convertor operation concerns.
Fuel Delivery System	GO to Pinpoint Test HC .
Intake Air System	GO to Pinpoint Test HU .
Charging System	REFER to the service information , Charging System, Diagnosis and Testing to continue diagnosis.
Universal Heated Oxygen Sensor (HO2S)	GO to Pinpoint Test DZ .

Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 7

- Backfires

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Secondary Ignition	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Fuel Delivery System	GO to Pinpoint Test HC .
Base Engine	REFER to the service information Engine System, Diagnosis and Testing to continue diagnosis.
Exhaust System	GO to Pinpoint Test HF .
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 8

- Lack/Loss of Power

NOTE: Verify the symptom is reported under normal driving conditions without excessive engine or vehicle load. Also, be aware of the engine RPM and speed limiting functions of the PCM.

NOTE: For vehicles equipped with a knock sensor (KS), a lack of power may result when the vehicle is operated with a breakout box installed at the PCM. The KS circuits are not shielded in a breakout box, and KS signal noise may be noticed by the PCM. If this happens, spark timing is retarded and a lack of power may result.

NOTE: For applications with a KS, a lack of power may result if the engine has developed an abnormal noise. The KS may interpret some abnormal noise as detonation and retard spark timing.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)

Automatic Transmission Fluid	Visual.
Air Cleaner Element	Visual.
Check the following PIDS: • LONGFT1 or LONGFT2 (value between -20 and +20%) • IMTV_F (if equipped): For both ignition ON, engine OFF and ignition ON, engine running with the transmission in PARK/NEUTRAL and the engine RPM greater than 3, 000 RPM, the PID should indicate NO FAULT in both situations.	**LONGFT1 or LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. **LONGFT1 or LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **IMTV_F PID indicates a fault:** GO to Pinpoint Test HU .
Fuel Delivery System	GO to Pinpoint Test HC .
Secondary Ignition	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Mass Airflow (MAF) Sensor	GO to Pinpoint Test DC .
Exhaust System	GO to Pinpoint Test HF .
Variable Camshaft Timing (VCT) System	GO to Pinpoint Test HK .
Accelerator Pedal Position (APP) Sensor	GO to Pinpoint Test DK .
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Automatic Transmission	REFER to the service information , Automatic Transmission, Shift Point Road Test to continue diagnosis.
Brake System Drag or Binding	REFER to the service information , Brake System.
Turbocharger System	GO to Pinpoint Test HN .
Additional Testing	GO to Pinpoint Test Z .
Additional Checks: • Some vehicles have a TQ_CNTRL PID available. Check this PID to determine if the PCM is reducing torque. The TQ_CNTRL PID may indicate which component or system, if any, is requesting a torque reduction. • Customer driving habits • Correct PCM vehicle identification (VID) block information. Refer to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY	Visual. REFER to the applicable service information.

MEMORY (EEPROM) to carry out the Making Changes to the VID Block procedure. • Intake manifold runner control (IMRC) linkage (if equipped) • Clutch (M/T) • Charging system • Engine RPM or speed limiting functions of the PCM (look for incorrect high vehicle speed signal from ABS or VSS)	
Brake Over Accelerator	CHECK for simultaneous brake pedal and accelerator pedal operation inadvertently activating the brake over accelerator feature. CHECK the BRKOVR_ACTION, BRKOVRD_POSS, and DIST_BRKOVRD PIDs for recent simultaneous brake pedal and accelerator pedal operation. ADVISE the customer that simultaneous brake pedal and accelerator pedal operation by the vehicle operator activates the brake over accelerator feature. REFER to POWERTRAIN CONTROL SOFTWARE for additional information.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 9

- Spark Knock

NOTE: Carbon build up in the combustion chamber and on the back of valves can be a contributing factor for engine spark knock concerns. Remove carbon deposits prior to any component replacements.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Cooling System	Verify the engine operates at normal temperature. REFER to the service information , Engine Cooling, The Engine Overheats or NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX to diagnose any cooling system concerns that are present. Verify correct coolant level and coolant concentration. REFER to the service information , Engine Cooling, Cooling System Draining, Filling and Bleeding for correct coolant concentrations and fill procedures.
Mass Airflow (MAF) Sensor	GO to Pinpoint Test DC .
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.

Fuel Delivery System	GO to Pinpoint Test HC .
Secondary Ignition System	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
Engine Oil Quality	Visual.
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 10

- Poor Fuel Economy

NOTE: Driving styles may have a significant influence on fuel economy. Verify the concern before starting an in-depth diagnosis. If available, use the integrated diagnostic system (IDS) fuel economy test to verify a concern is present. The following external factors may contribute to poor fuel economy:

- *stop and go driving*
- *incorrect tire pressure and size*
- *vehicle loads (such as trailer towing)*
- *extended winter warm-up conditions*
- *high speed driving*
- *incorrect axle ratio*
- *road or weather conditions*
- *aftermarket add ons*
- *short run operations*
- *customer expectations*

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Check the following PIDs: • LONGFT1 or LONGFT2 (value between -20 and +20%) • VPWR (value between 10.5	**LONGFT1 or LONGFT2 value low (-):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. **LONGFT1 or LONGFT2 value high (+):** Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. **VPWR not between 10.5 and 17.0 volts:**

and 17.0 volts, and within 0.5 volt of battery voltage)	REFER to the service information , Charging System, Diagnosis and Testing to continue diagnosis. **VPWR between 10.5 and 17.0 volts, but not within 0.5 volt of battery voltage:** CHECK the B+ voltage to the PCM power relay. CHECK the VPWR circuit between the PCM and the PCM power relay. CHECK the PWR GND circuits.
Cooling System	Verify the engine operates at normal temperature. REFER to the service information , Engine Cooling, Symptom Chart to diagnose any cooling system concerns that are present.
Transmission Fluid Level	Visual.
Secondary Ignition System	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Fuel Delivery System	GO to Pinpoint Test HC .
Exhaust System	GO to Pinpoint Test HF .
Variable Camshaft Timing (VCT) System	GO to Pinpoint Test HK .
Automatic Transmission	REFER to the service information , Automatic Transmission, Diagnosis By Symptom to continue diagnosis.
Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
Grille Shutter	REFER to the service information , Front End Body Panels, to continue diagnosis.
Additional Checks	Check for base engine or intake air system concerns. Check for a contaminated MAF sensor. REFER to the applicable service information. Check for correct PCM VID block information. REFER to FLASH ELECTRICALLY ERASABLE PROGRAMMABLE READ ONLY MEMORY (EEPROM) to CARRY OUT the Making Changes to the VID Block procedure.
Auto Start Stop System	GO to Pinpoint Test AA .
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 11

- Emissions Compliance

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Emissions Related Systems	GO to Pinpoint Test EM .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 12

- Warning Indicators: Check Fuel Cap, Malfunction Indicator Lamp (MIL), Power Take Off (PTO), Temperature Warning Indicator or Gauge (applications with cylinder head temperature [CHT] sensor only), Transmission Control Indicator Lamp (TCIL), Powertrain Malfunction Indicator (Wrench)
- PTO Concerns: Not Working Correctly

NOTE:

- *If the symptom is both a MIL on and exhaust emission test failure, GO directly to Chart 11.*
- *If the engine is a no start, GO directly to Chart 3.*
- *If the engine runs rough at idle, GO directly to Chart 1.*

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Check Fuel Cap	Verify the fuel filler cap is correctly tightened or the capless fuel tank filler pipe is correctly sealed. REFER to the service information , Instrumentation, Message Center, and Warning Chimes, to diagnose the check fuel message.
MIL • Always on when the engine is running (no DTCs present) • Never on (including during indicator prove out)	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, Diagnosis and Testing to continue diagnosis.
PTO	GO to Pinpoint Test FB .
Temperature Warning Indicator or Gauge (applications with CHT sensor only)	For an engine that is overheating, REFER to the service information , Engine Cooling to diagnose the engine overheating symptom. Be aware that since a PCM DTC is not present, the PCM is not attempting to activate the indicator. For an engine operating at normal temperature, GO to Pinpoint Test DL .
TCIL • Always on when the engine is running (no DTCs present) • Never on	REFER to the service information , Automatic Transmission, External Controls.

Powertrain Malfunction Indicator (Wrench)	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, to diagnose the wrench indicator is never/always on or to diagnose the POWERTRAIN MALFUNCTION warning is inoperative.
Additional Testing	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 13

- Automatic Transmission (A/T) Shift Concerns: Upshift, Downshift, Engagement

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Transmission	REFER to the service information , Automatic Transmission, Diagnosis and Testing to continue diagnosis.
Additional Tests	GO to Pinpoint Test Z .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 14

- Instrumentation: Tachometer Inoperative, Speedometer/Odometer Inoperative, Boost Gauge Indicates Higher Than Normal Boost, Fuel Gauge Inoperative

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Tachometer Inoperative	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, to diagnose the incorrect tachometer indication.
Speedometer/Odometer Inoperative	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, to diagnose the inoperative speedometer/odometer.
Boost Gauge	For charge air cooler (CAC) system concerns, GO to Pinpoint Test KP .
Fuel Gauge Inoperative	REFER to the service information , Instrumentation, Message Center, and Warning Chimes, to diagnose the incorrect fuel gauge indication.
Instrumentation	REFER to the service information , Instrumentation, Message Center, and Warning Chimes.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 15

- Oil System Concerns: High Oil Consumption, Leaks

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Positive Crankcase Ventilation (PCV) System	GO to Pinpoint Test HG .
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Additional Checks	Check for external oil leaks and correct oil viscosity. Check the turbocharger system for oil leaks.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 16

- Cooling System Concerns: Electric Cooling Fan Does Not Operate (Low, High or Variable Speed), Cooling Fan Clutch Does Not Operate

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Electric Cooling Fan	For Focus 1.0L GTDI charge air cooler (CAC) cooling fan, GO to Pinpoint Test KF . For Escape/Kuga, Fiesta 1.6L GTDI, Focus, MKX, and Transit Connect, GO to Pinpoint Test KN . For all others, GO to Pinpoint Test KF .
Cooling Fan Clutch	GO to Pinpoint Test HV .
Cooling System	REFER to the service information , Engine Cooling to diagnose the cooling system concern.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 17

- Cooling System Concerns: Electric Cooling Fan Always Runs

> *NOTE: This chart is only intended to diagnose an electric cooling fan that always runs with a cool engine and the A/C and defroster off.*

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Cooling Fan	For Escape/Kuga, Fiesta 1.6L GTDI, Focus, MKX, and Transit Connect, GO to Pinpoint Test KN . For all others, GO to Pinpoint Test KF .
Cooling System	REFER to the service information , Engine Cooling, The Engine Overheats to diagnose the cooling system concern.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 18

- Exhaust System Concerns: Visible Smoke

> *NOTE: Black smoke indicates a rich fuel mixture, blue smoke indicates burning oil, and white smoke indicates water in the combustion chamber.*

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Base Engine	REFER to the service information , Engine System, Diagnosis and Testing to continue diagnosis.
Fuel Delivery System • Black smoke	GO to Pinpoint Test HC .
Ignition System • Black smoke	For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, GO to Pinpoint Test JB .
Positive Crankcase Ventilation (PCV) System • Blue smoke	REFER to the service information , Engine System for a description of the Oil Consumption Test.
Turbocharger System • Blue smoke	REFER to the service information Fuel Charging and Controls - Turbocharger for the Oil Consumption Test.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 19

- Fuel System Concerns: Odor, Engine Compartment

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
EVAP System	Visual.
Fuel Delivery System	Visual. GO to Pinpoint Test HC .

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 20

- Engine Noise (under hood)

NOTE: Attempt to identify the source of the noise. If the noise is from a source other than those listed below, refer to NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHART INDEX (for noise such as spark knock) or the applicable Workshop Manual section to continue diagnosis.

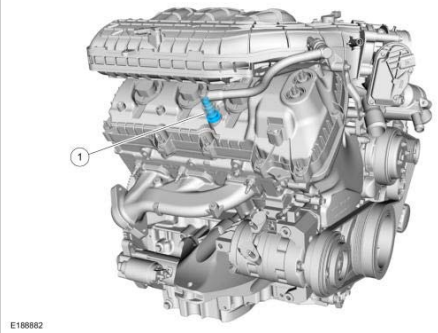
SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Secondary Ignition System	CHECK for a snap noise that may be due to secondary ignition arcing. For Fiesta 1.6L TIVCT, GO to Pinpoint Test JC . For all others, CHECK the condition of the spark plug boots.
Turbocharger System	REFER to the service information Fuel Charging and Controls - Turbocharger to diagnose the turbocharger noise.

NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 21

- Exhaust System Concerns: Odor (Sulfur or Rotten Egg Smell)

NOTE: A slight sulfur smell may be normal. Catalysts with less than 8, 000-16, 000 kilometers (5, 000-10, 000 miles), either from a new vehicle or new catalyst, are likely to have a sulfur smell due to the highly active state of new catalysts. Installing a new catalyst may actually make the symptom worse.

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Fuel Delivery System	GO to Pinpoint Test HC .
Fuel Source	TALK with the customer. Sulfur content can vary in different fuels. SUGGEST trying a different fuel source.



NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT SYMPTOM CHARTS > CHART 22

- Starting Concerns: No Crank

SYSTEM/COMPONENT	REFERENCE (Pinpoint Test unless noted)
Add On Anti-Theft Devices	Visual. CHECK with the customer.
Anti-Theft	REFER to the service information , Anti-Theft to diagnose the vehicle does not start symptom.

Starting system	REFER to the service information , Starting System to diagnose the engine does not crank symptom.

DESCRIPTION AND OPERATION > ENGINE EMISSION CONTROL - COMPONENT LOCATION > 3.7L DURATEC

Item	Description
1	PCV valve

DESCRIPTION AND OPERATION > ENGINE EMISSION CONTROL - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

For System Operation, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) .

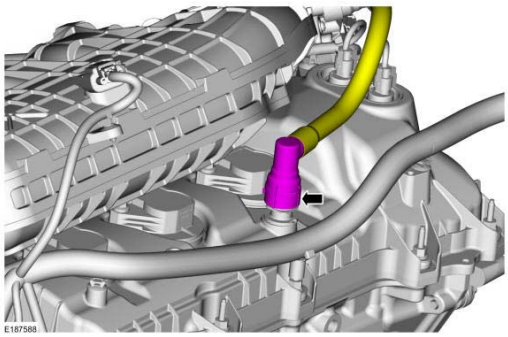
DESCRIPTION AND OPERATION > ENGINE EMISSION CONTROL - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM DESCRIPTION

For Component Description, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > ENGINE EMISSION CONTROL

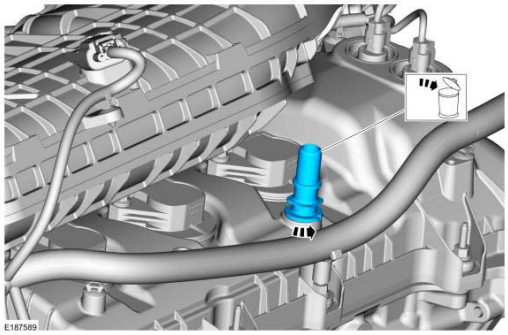
Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these, REFER to: Diagnostic Methods .

For PCM DTC,



REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS) .

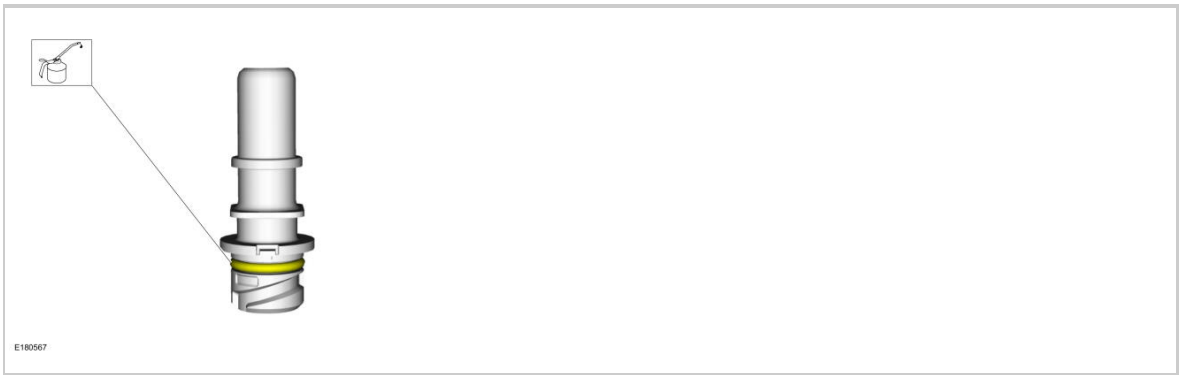
For driveability symptoms without DTC, refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .



REMOVAL AND INSTALLATION > POSITIVE CRANKCASE VENTILATION (PCV) VALVE > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1. Disconnect the crankcase ventilation tube-to-PCV valve quick connect coupling. Refer to: QUICK RELEASE COUPLING .

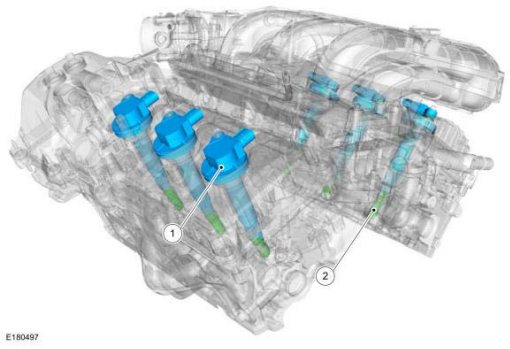


Rotate the PCV valve counterclockwise and remove the PCV valve. Discard the PCV valve.

REMOVAL AND INSTALLATION > POSITIVE CRANKCASE VENTILATION (PCV) VALVE > INSTALLATION

NOTE: A new PCV valve must be installed if removed. Damage will occur to the locking mechanism on the PCV valve.

1. Lubricate the new PCV valve O-ring seal with clean engine oil.



2. To install, reverse the removal procedure.

SPECIFICATIONS > SPECIFICATIONS

Item	Specification
Spark plug	12405
Spark plug gap	0.049-0.053in (1.25-1.35mm)

DESCRIPTION AND OPERATION > ENGINE IGNITION - COMPONENT LOCATION > 3.7L DURATEC (227KW/301PS)

Item	Description
1	Ignition coil-on-plug(s)
2	Spark plug(s)

DESCRIPTION AND OPERATION > ENGINE IGNITION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

For System Operation, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) . .

DESCRIPTION AND OPERATION > ENGINE IGNITION - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

For Component Description, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) . .

DIAGNOSIS AND TESTING > ENGINE IGNITION

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these, REFER to: Diagnostic Methods .

For PCM DTC,

REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS)

For driveability symptoms without DTC, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

REMOVAL AND INSTALLATION > IGNITION COIL-ON-PLUG > REMOVAL

RH Side

NOTE: The upper intake manifold must be removed to access the RH ignition coil-on-plugs.

1.

Remove the upper intake manifold. Refer to: UPPER INTAKE MANIFOLD .

Both sides

NOTE: When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

NOTE: Use compressed air to remove any foreign material from the ignition coil-on-plugs and surrounding area before removing the ignition coil-on-plugs.

2.

1.

Disconnect the ignition coil-on-plug electrical connectors.

2.

Remove the ignition coil-on-plug mounting bolts.

3.

Remove the ignition coil-on-plugs.

REMOVAL AND INSTALLATION > IGNITION COIL-ON-PLUG > INSTALLATION

Both sides

1.

Inspect the ignition coil-on-plugs and replace any ignition coil-on-plug rubber boots with cracks, rips or tears.

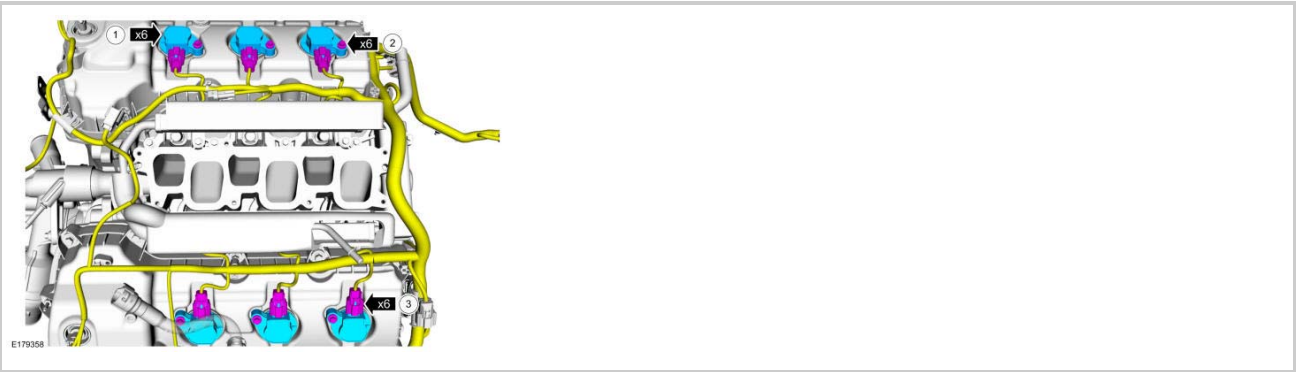
2.

1.

Install the ignition coil-on-plugs.

2.

Install the ignition coil-on-plug mounting bolts.



Torque

Stage 1: 62 lb.in (7 Nm)

Stage 2: 50°

3.

Connect the ignition coil-on-plug electrical connectors.

RH Side

3.

Install the upper intake manifold. Refer to: UPPER INTAKE MANIFOLD .

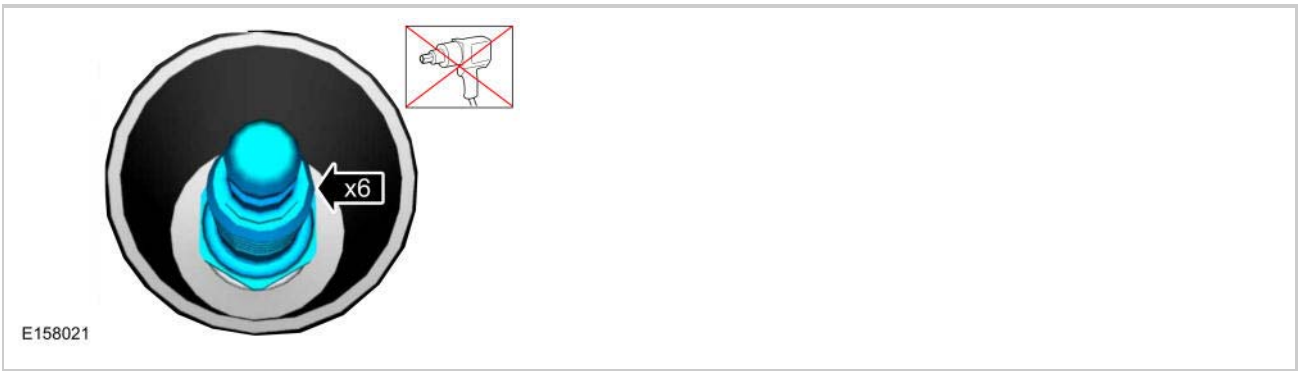
REMOVAL AND INSTALLATION > SPARK PLUGS > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the ignition coil-on-plugs. Refer to: Ignition Coil-On-Plug .

NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.



NOTE: If a spark plug is dropped, internal damage may result and the spark plug must be discarded. The use of a damaged spark plug may cause cylinder misfire resulting in engine damage.

NOTE: Do not remove the spark plugs when the engine is hot or cold soaked. Spark plug thread or cylinder head damage can occur. Make sure the engine is warm (hand touch after cooling down) prior to spark plug removal.

2.
Remove the spark plugs.

Torque

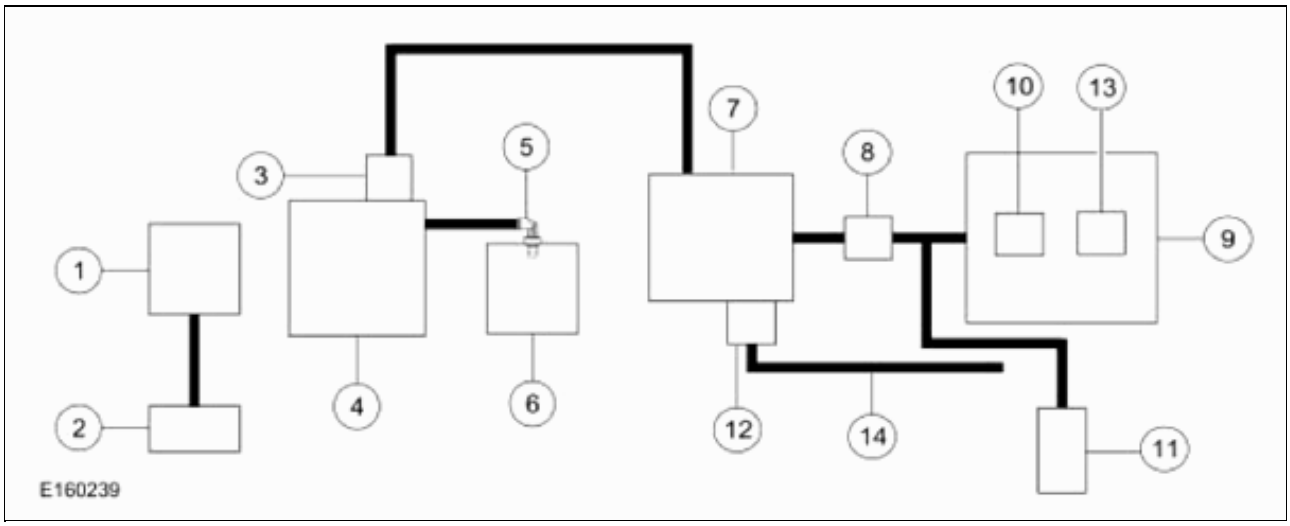
: 133 lb.in (15 Nm)

REMOVAL AND INSTALLATION > SPARK PLUGS > INSTALLATION

1.

To install, reverse the removal procedure.

DESCRIPTION AND OPERATION > EVAPORATIVE EMISSIONS - OVERVIEW > OVERVIEW



The EVAP system prevents hydrocarbon emissions from entering the atmosphere by storing fuel vapors and routing the vapors to the engine to be consumed during normal engine operation.

The EVAP system consists of:

- EVAP canister
- EVAP canister purge valve
- EVAP canister vent solenoid
- Fuel Tank Pressure (FTP) sensor and tube
- Easy Fuel (capless) fuel tank filler pipe

DESCRIPTION AND OPERATION > EVAPORATIVE EMISSIONS - SYSTEM OPERATION AND COMPONENT DESCRIPTION

Fig 1: Evaporative Emissions - System Diagram

Courtesy of FORD MOTOR CO.

Item	Description
1	LH Valve cover
2	Air Cleaner (ACL) outlet pipe
3	EVAP canister purge valve

4	Upper intake manifold
5	PCV
6	RH valve cover
7	EVAP canister
8	Fuel Tank Pressure (FTP) sensor and tube
9	Fuel tank
10	Fuel level sensors
11	Fuel tank filler pipe
12	EVAP canister vent solenoid
13	Fuel pump and sender assembly
14	Fresh air hose

DIAGNOSIS AND TESTING > EVAPORATIVE EMISSIONS > ENGINE DIAGNOSTIC INFORMATION

For PCM DTC, REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS) .

For driveability symptoms without DTC, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

GENERAL PROCEDURES > EVAPORATIVE EMISSION SYSTEM LEAK TEST

Activation

Phase 1 - Leak Verification

1.

Run the EVAP Test with the scan tool.

> *NOTE: Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.*

2.
If the EVAP system failed the EVAP Test, then proceed to Phase 2.

Phase 2 - System Leak Check

3.

Disconnect the fuel vapor tube-to-EVAP canister purge valve quick connect coupling. Refer to: QUICK RELEASE COUPLING .

4.

Connect the VACUTEC Smoke Machine Fuel EVAP Emissions System Tester to the fuel vapor tube quick connect coupling. Refer to the manufacturer's instructions.

> *NOTE: The battery ground cable was previously disconnected in the fuel vapor tube quick connect coupling procedure.*

5.
Connect the battery ground cable. Refer to: Battery Disconnect and Connect .

6.

Close the canister vent solenoid with the scan tool.

> *NOTE: The supplemental refueling adapter is located in the jack storage compartment.*

7.
Install the supplemental refueling adapter into the Easy Fuel™ (capless) fuel tank filler pipe assembly.

> *NOTE: If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.*

8.
Introduce smoke from the VACUTEC Smoke Machine Fuel EVAP Emissions System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

9.

Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

10.

Continue to enter smoke into the system for 60 seconds to obtain pressure.

11.

Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.

12.

Use the halogen light provided with the VACUTEC Smoke Machine Fuel EVAP Emissions System

Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

13.

Repair any leaks as necessary.

14.

Repeat the leak test until the system passes.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER > REMOVAL

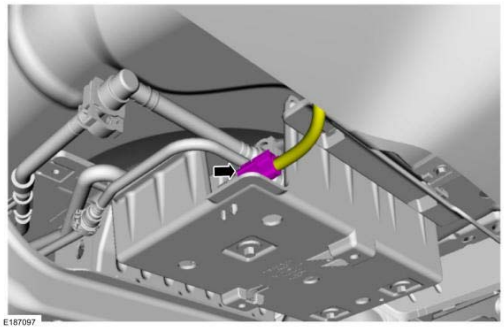
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1.



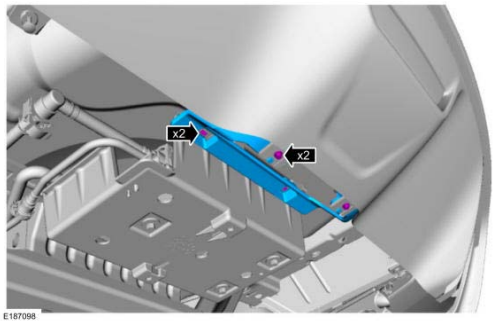
Position the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Disconnect the negative battery cable. Refer to: Battery Disconnect and Connect .

3.

Disconnect the EVAP canister electrical connector.

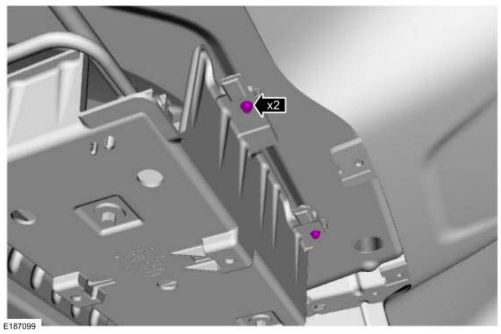


4.

Remove the bolts, pin type retainers and bracket.

Torque

: 44 lb.in (5 Nm)

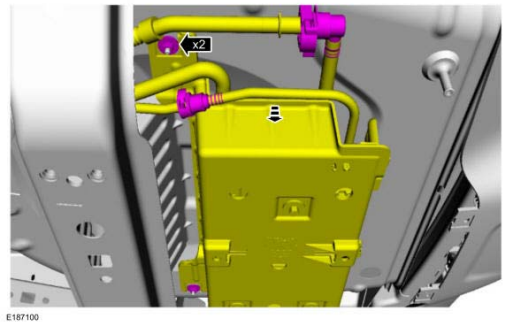


5.

Remove the bolts.

Torque

: 62 lb.in (7 Nm)

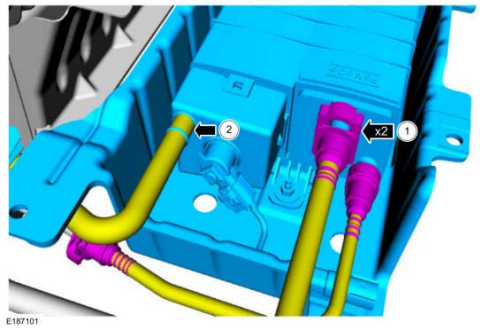


6.

Remove the nuts and lower the EVAP canister.

Torque

: 62 lb.in (7 Nm)



7.

1.

Disconnect the EVAP canister quick connect couplings. Refer to: QUICK RELEASE COUPLING .

2.

Disconnect the vent hose and remove the EVAP canister.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER PURGE VALVE > REMOVAL

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type

when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1.

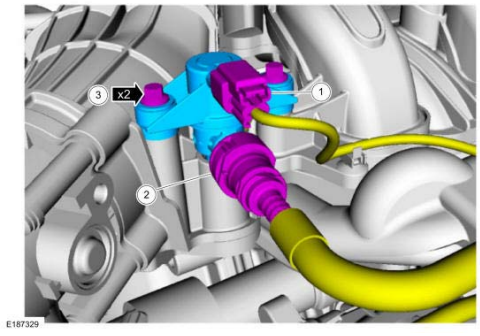
Disconnect the negative battery cable. Refer to Battery Disconnect and Connect .

2.

1.

Disconnect the EVAP canister purge valve electrical connector.

2.



Disconnect the EVAP canister purge valve quick connect coupling. Refer to: QUICK RELEASE COUPLING

3.

Remove the bolts and the EVAP canister purge valve.

Torque

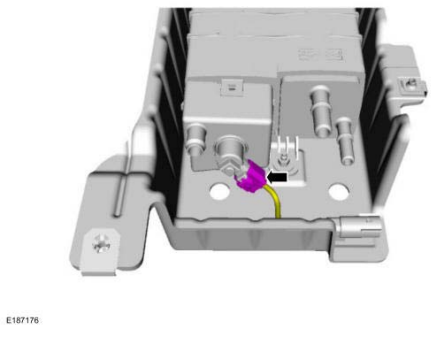
: 89 lb.in (10 Nm)

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER PURGE VALVE > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER VENTILATION FILTER > REMOVAL



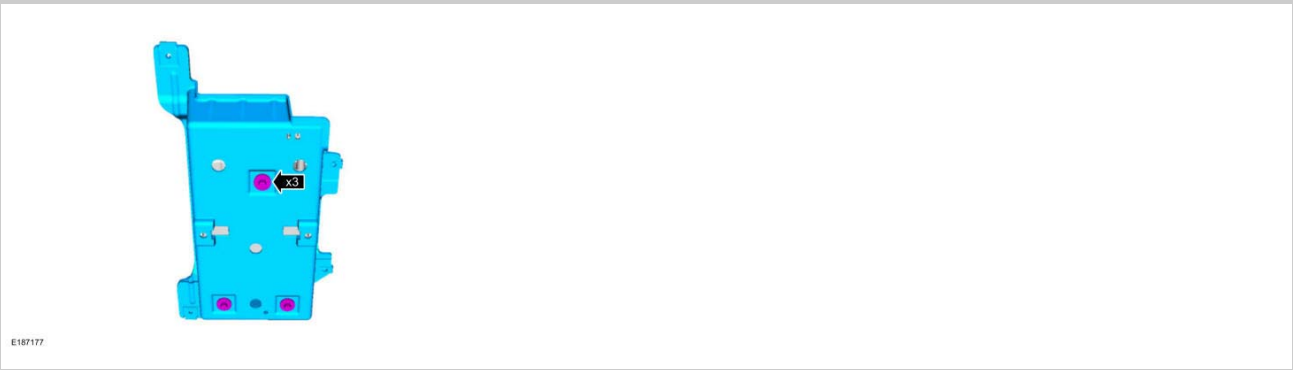
NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the EVAP canister. Refer to: Evaporative Emission Canister .

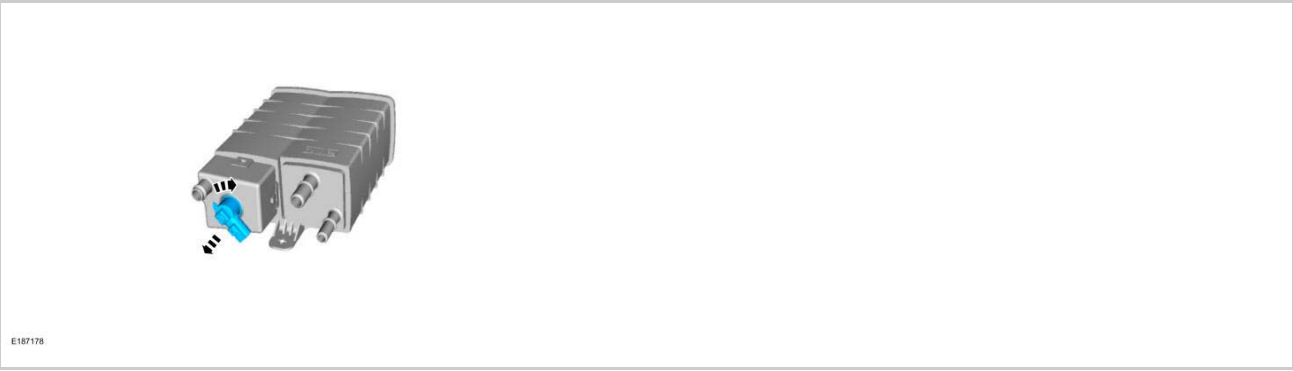
2.

Disconnect the EVAP canister solenoid electrical connector.



3.

Remove the bolts and EVAP canister shield.



Torque

: 62 lb.in (7 Nm)

4.

If necessary, remove the EVAP canister solenoid.

5.

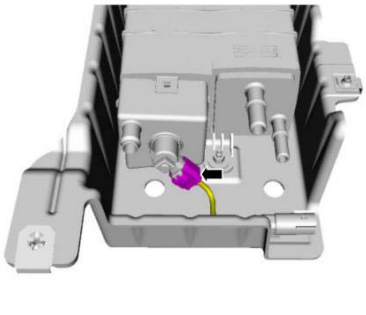
Release the tabs and remove EVAP canister ventilation filter.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER VENTILATION FILTER > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER VENT SOLENOID > REMOVAL



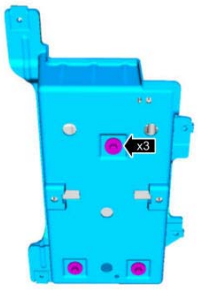
NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the EVAP canister. Refer to: Evaporative Emission Canister .

2.

Disconnect the EVAP canister solenoid electrical connector.



3.

Remove the bolts and EVAP canister shield.

Torque

: 62 lb.in (7 Nm)

4.

Remove the EVAP canister solenoid.

REMOVAL AND INSTALLATION > EVAPORATIVE EMISSION CANISTER VENT SOLENOID > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FUEL TANK PRESSURE SENSOR AND TUBE > REMOVAL

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

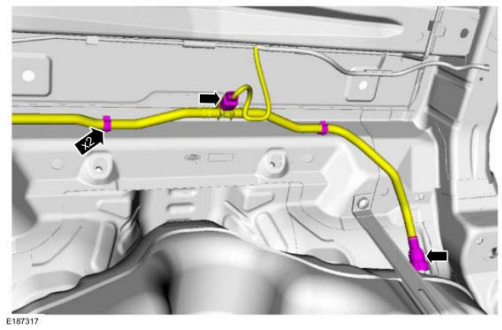
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Removal steps in this procedure may contain installation details.

1.

Position the vehicle on a hoist. Refer to: Jacking and Lifting - Overview .

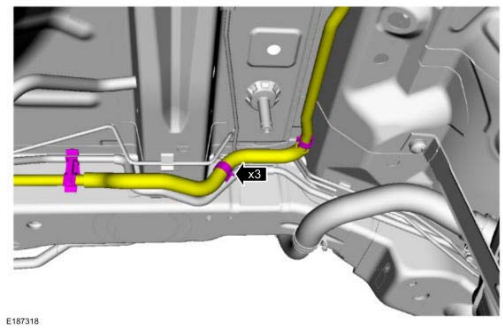
2.



Disconnect the battery ground cable. Refer to: Battery Disconnect and Connect .

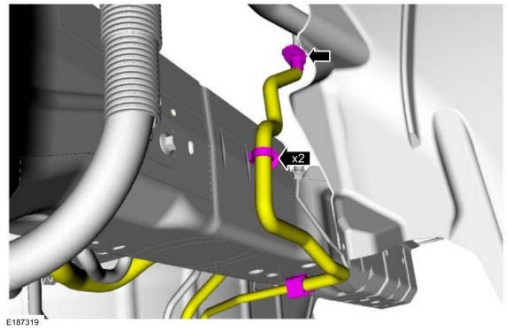
3.

Remove the rear subframe. Refer to: Rear Subframe .



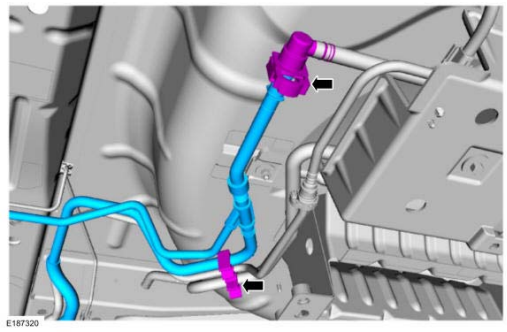
4.

Disconnect the quick release coupling, routing clips and the fuel tank pressure sensor electrical connector. Refer to: QUICK RELEASE COUPLING .



5.

Disconnect the routing clips.

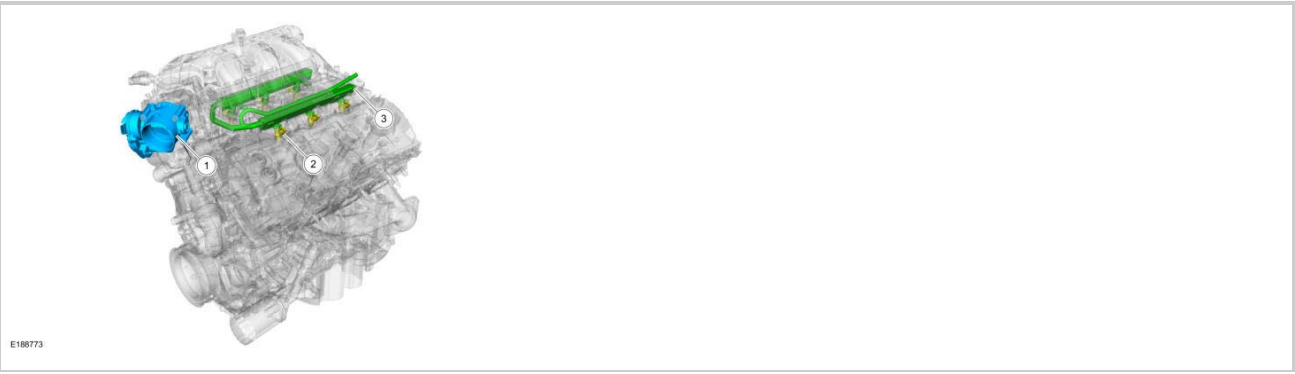


6.

Disconnect the quick release coupling and routing clips. Refer to: QUICK RELEASE COUPLING .

7.

Disconnect the quick release coupling and routing clips. Remove the fuel tank pressure sensor and tube. Refer to: QUICK RELEASE COUPLING .



REMOVAL AND INSTALLATION > FUEL TANK PRESSURE SENSOR AND TUBE > INSTALLATION

1.

To install, reverse the removal procedure.

DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - COMPONENT LOCATION

3.7L Duratec

Item	Description
1	Throttle Body (TB)
2	Fuel injector
3	Fuel rail

FPDM

Item	Description
1	FPDM. (The FPDM is located beneath the rear seat cushion on the LH side).

DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

For System Operation, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) . .

DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) . .

DIAGNOSIS AND TESTING > FUEL CHARGING AND CONTROLS

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these, REFER to: Diagnostic Methods .

For PCM DTC, REFER to: ELECTRONIC ENGINE CONTROLS - 3.7L DURATEC (227KW/301PS).

For driveability symptoms without DTC, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

REMOVAL AND INSTALLATION > FUEL INJECTORS > REMOVAL AND INSTALLATION

1.

The fuel injectors are serviced with the fuel rail. Refer to: Fuel Rail .

REMOVAL AND INSTALLATION > FUEL PUMP DRIVER MODULE (FPDM) > REMOVAL

NOTE: The FPDM is located beneath the rear seat cushion on the LH side.

1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

2.

1.

Disconnect the FPDM electrical connector.

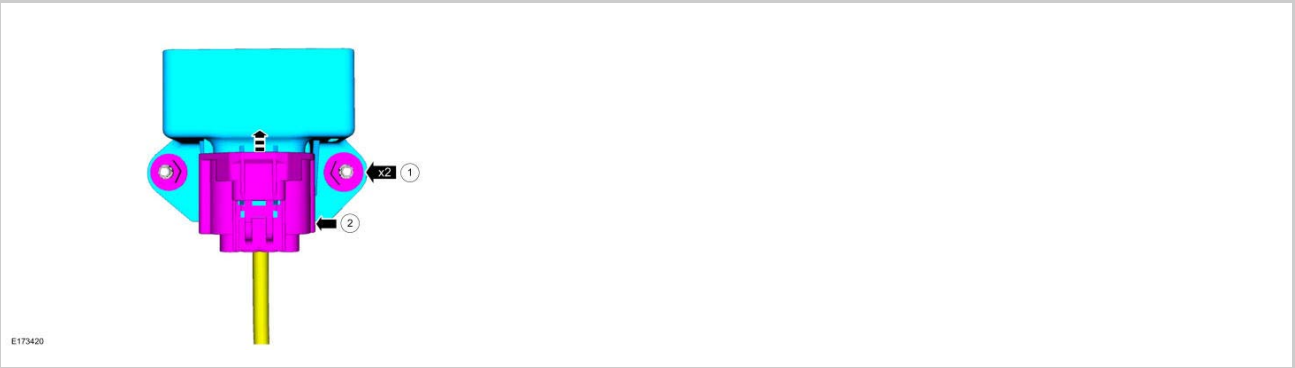
2.

Remove the FPDM retaining nuts and then remove the FPDM.

REMOVAL AND INSTALLATION > FUEL PUMP DRIVER MODULE (FPDM) > INSTALLATION

1.

1.



Install the FPDM, then install and tighten the FPDM retaining nuts.

Torque

: 44 lb.in (5 Nm)

2.

Connect the FPDM electrical connector.

2.

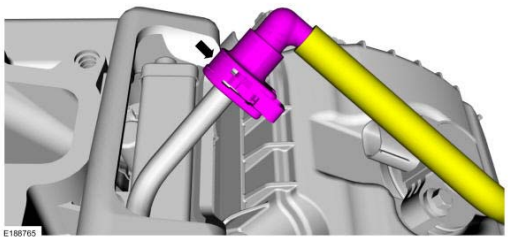
Install the rear seat cushion. Refer to: Rear Seat Cushion .

REMOVAL AND INSTALLATION > FUEL RAIL > REMOVAL

1.

Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE .

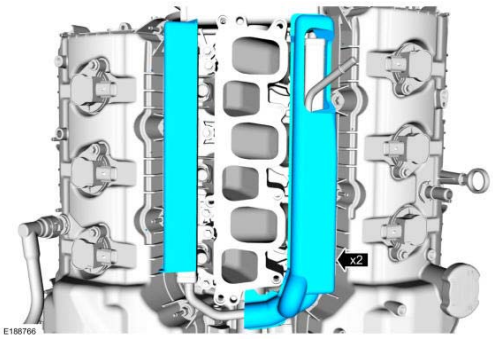
2.



Disconnect the battery. Refer to: Battery Disconnect and Connect .

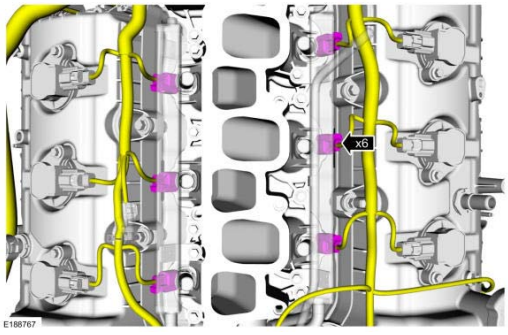
3.

Remove the upper intake manifold. Refer to: UPPER INTAKE MANIFOLD .



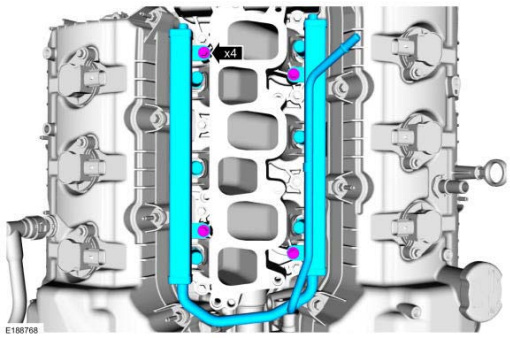
4.

Disconnect the fuel rail fuel feed tube. Refer to: QUICK RELEASE COUPLING .



5.

Remove the RH and LH fuel rail insulators.

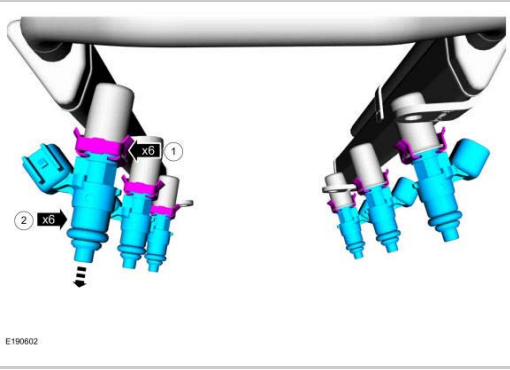


6.

Disconnect the fuel injector electrical connectors.

7.

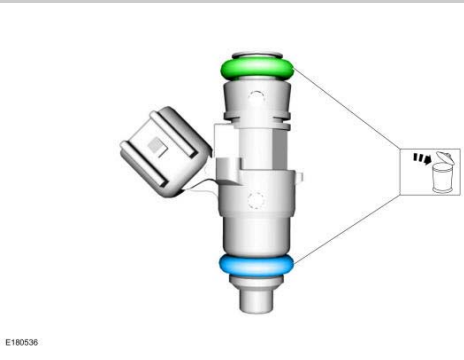
Remove the fuel rail retaining bolts and then remove the fuel rail.



8.

1.

Remove the fuel injector retaining clips.

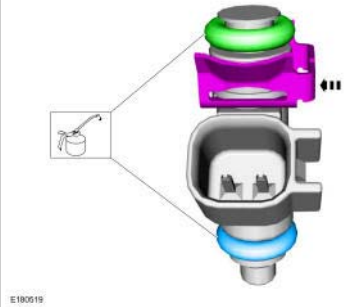


2.

Remove the fuel injectors from the fuel rail.

9.

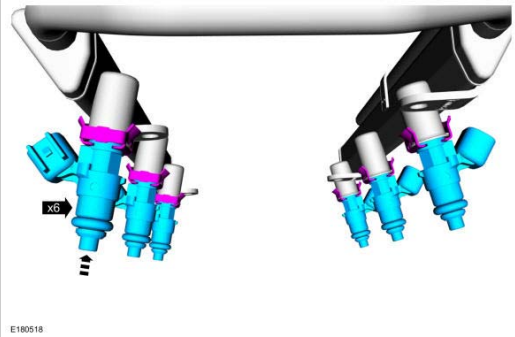
Remove and discard all of the fuel injector O-ring seals.



REMOVAL AND INSTALLATION > FUEL RAIL > INSTALLATION

NOTE: Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.

NOTE: The upper and lower fuel injector O-ring seals are similar in appearance, but are not interchangeable.

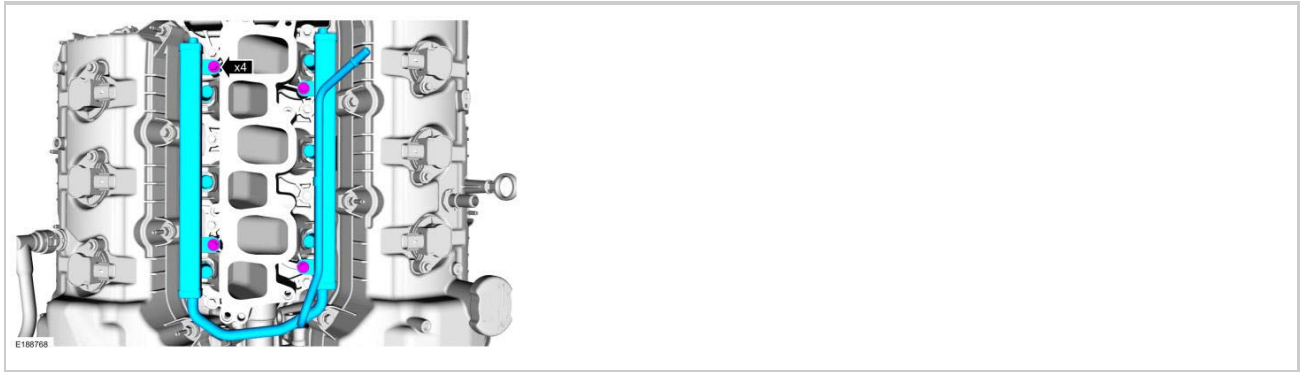


NOTE: Make sure that new fuel injector O-ring seals are installed.

1.
Install the new fuel injector O-ring seals and the fuel injector retaining clips onto the fuel injectors. Lubricate the new fuel injector O-ring seals with clean engine oil.

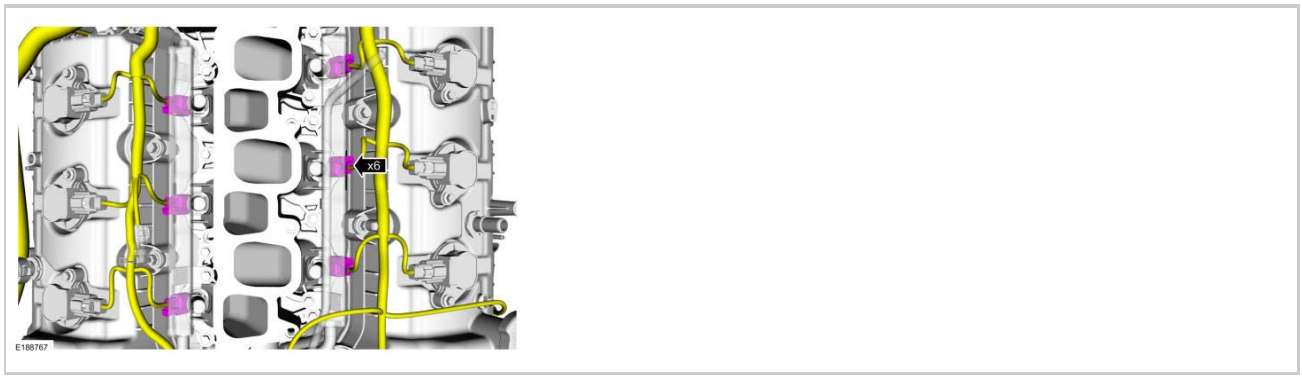
2.

Install the fuel injectors into the fuel rail.



3.

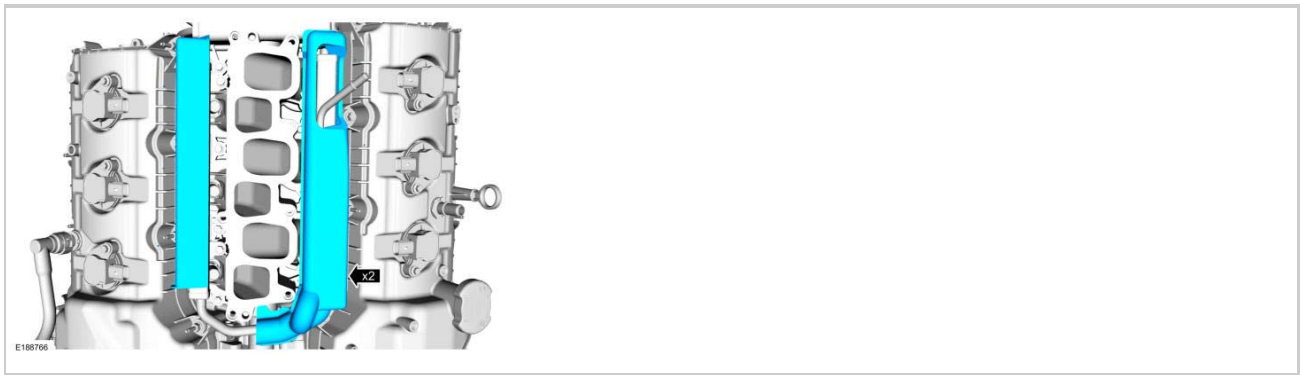
Install the fuel rail, then install and tighten the fuel rail retaining bolts.



Torque

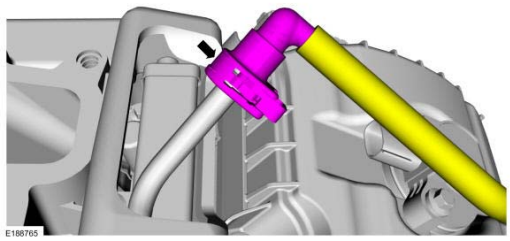
: 89 lb.in (10 Nm)

4.



Connect the fuel injector electrical connectors.

5.



1.

Install the RH and LH fuel rail insulators.

6.

Connect the fuel rail fuel feed tube. Refer to: QUICK RELEASE COUPLING .

7.

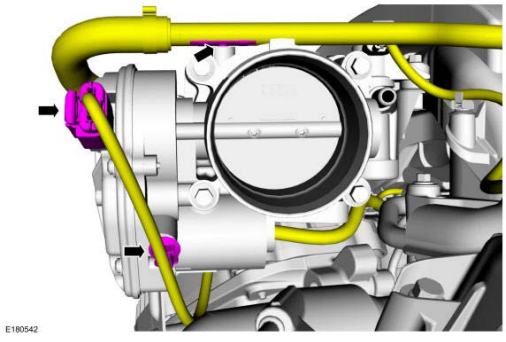
Install the upper intake manifold. Refer to: UPPER INTAKE MANIFOLD .

8.

Reconnect the battery. Refer to: Battery Disconnect and Connect .

9.

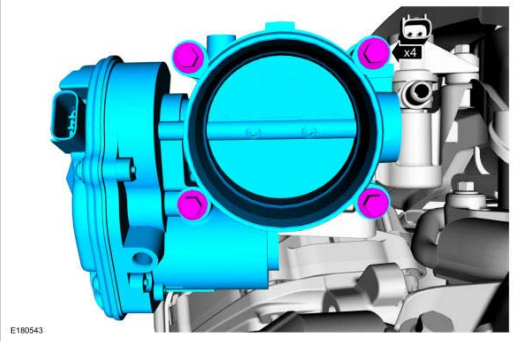
Pressurize the fuel system. Refer to: FUEL SYSTEM PRESSURE RELEASE .



REMOVAL AND INSTALLATION > THROTTLE BODY > REMOVAL

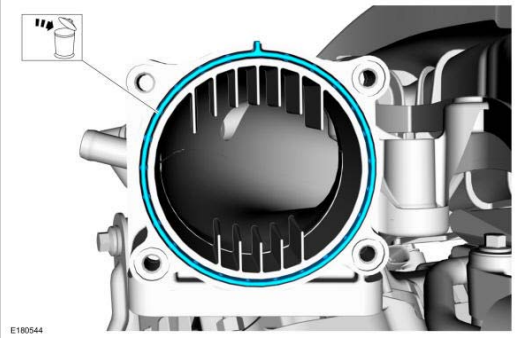
1.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .



2.

Release the brake vacuum hose retainer and the Throttle Body (TB) electrical connector wire harness retainer from the Throttle Body (TB). Disconnect the Throttle Body (TB) electrical connector.

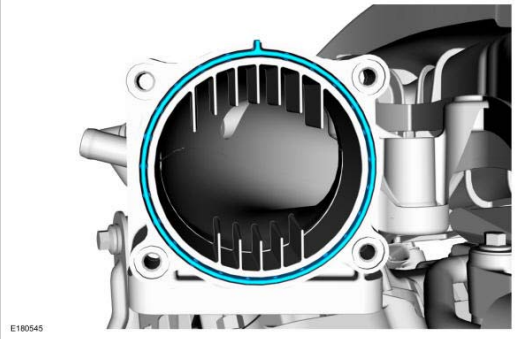


3.

Remove the Throttle Body (TB) retaining bolts and then remove the Throttle Body (TB).

4.

Remove and discard the Throttle Body (TB) gasket.

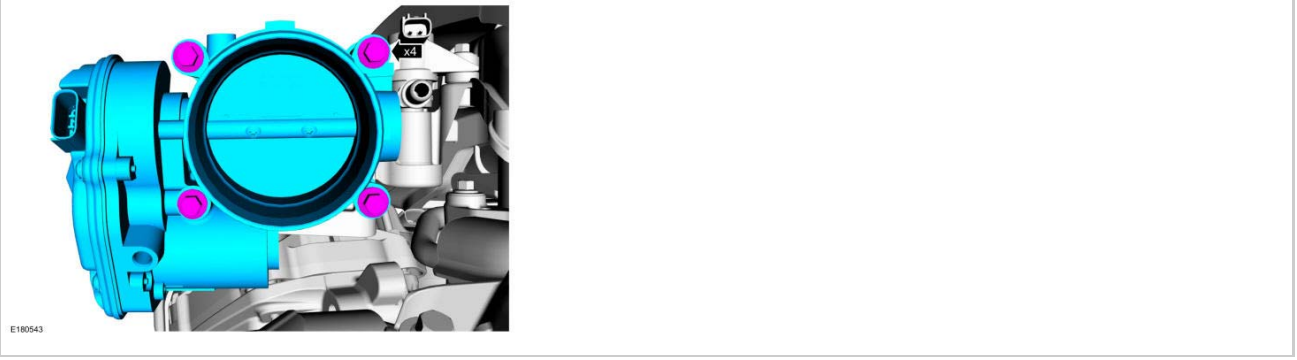


REMOVAL AND INSTALLATION > THROTTLE BODY > INSTALLATION

NOTE: Make sure that the mating faces are clean and free of foreign material.

1.

Install a new Throttle Body (TB) gasket.



2.

Install the Throttle Body (TB), then install and tighten the Throttle Body (TB) retaining bolts.

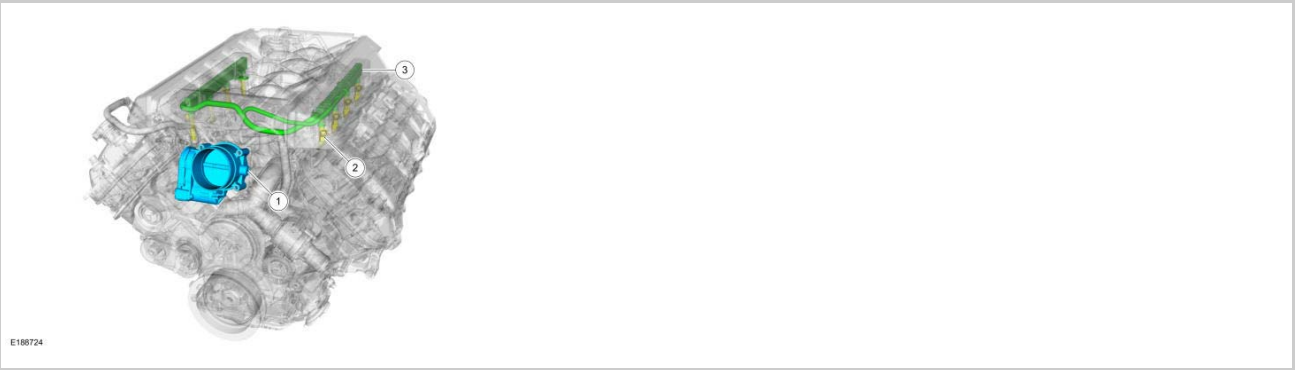
Torque:

Stage 1: 89 lb.in (10 Nm)

Stage 2: 90°

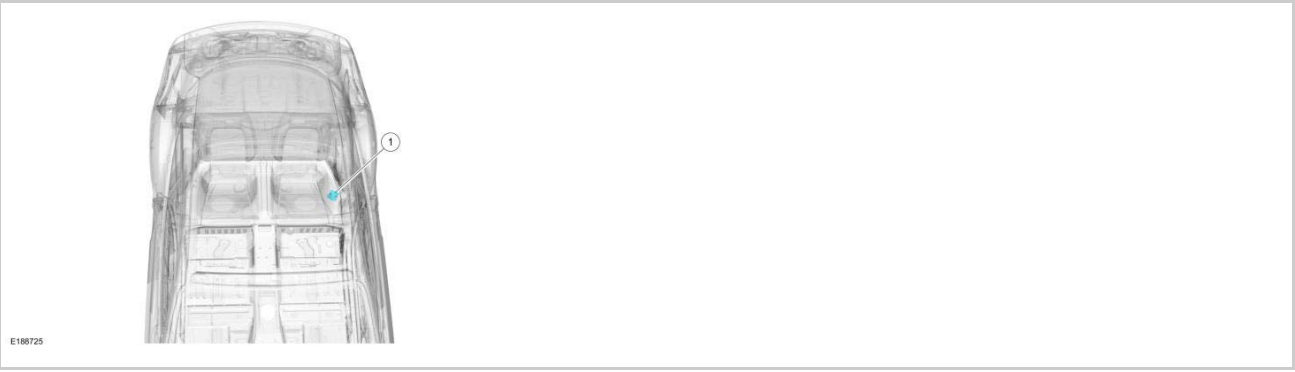
3.

Connect the Throttle Body (TB) electrical connector. Attach the brake vacuum hose retainer and the Throttle Body (TB) electrical connector wire harness retainer to the Throttle Body (TB).



4.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .



DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - COMPONENT LOCATION

5.0L 32V Ti-VCT

Item	Description
1	Throttle Body (TB)
2	Fuel injector
3	Fuel rail

FPDM

Item	Description
1	FPDM. (The FPDM is located beneath the rear seat cushion on the LH side).

DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SYSTEM OPERATION

For System Operation, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) .

DESCRIPTION AND OPERATION > FUEL CHARGING AND CONTROLS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

For Component Description, Refer to ENGINE CONTROLS - DESCRIPTION & OPERATION (EXCEPT DIESEL & HYBRID) .

DIAGNOSIS AND TESTING > FUEL CHARGING AND CONTROLS

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these, REFER to: Diagnostic Methods .

For PCM DTC, REFER to: ELECTRONIC ENGINE CONTROLS - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

For driveability symptoms without DTC, Refer to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

REMOVAL AND INSTALLATION > FUEL INJECTORS > REMOVAL AND INSTALLATION

1.

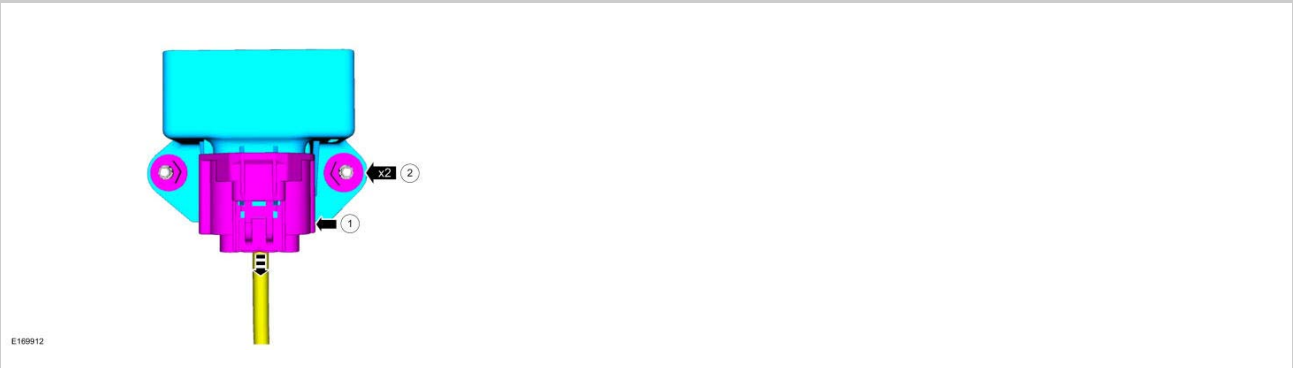
The fuel injectors are serviced with the fuel rail. Refer to: Fuel Rail .

REMOVAL AND INSTALLATION > FUEL PUMP DRIVER MODULE (FPDM) > REMOVAL

NOTE: The FPDM is located beneath the rear seat cushion on the LH side.

1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .



2.

1.

Disconnect the FPDM electrical connector.

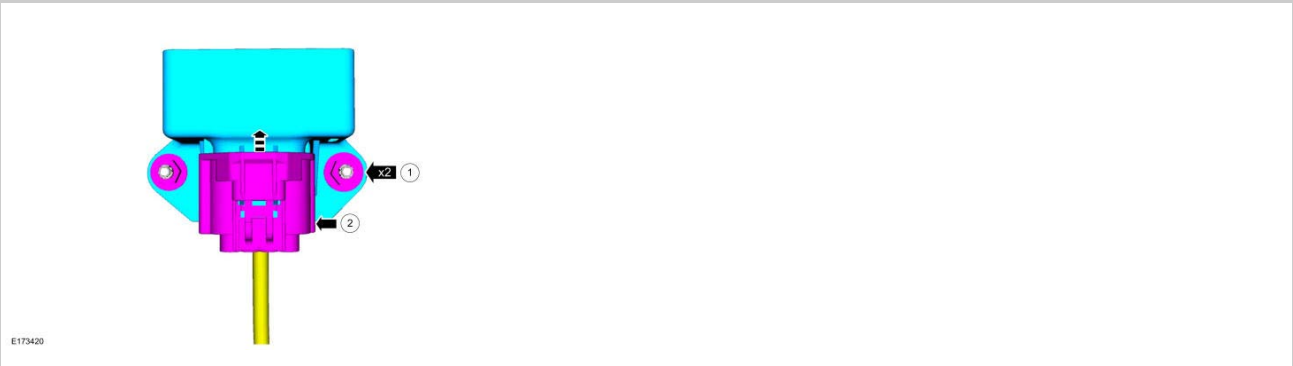
2.

Remove the FPDM retaining nuts and then remove the FPDM.

REMOVAL AND INSTALLATION > FUEL PUMP DRIVER MODULE (FPDM) > INSTALLATION

1.

1.



Install the FPDM, then install and tighten the FPDM retaining nuts.

Torque

: 44 lb.in (5 Nm)

2.

Connect the FPDM electrical connector.

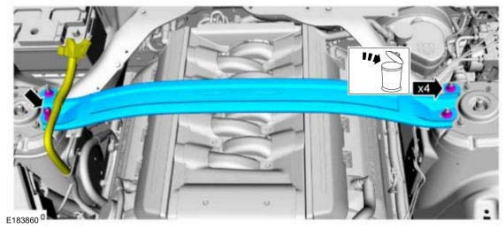
2.

Install the rear seat cushion. Refer to: Rear Seat Cushion .

REMOVAL AND INSTALLATION > FUEL RAIL > REMOVAL

1.

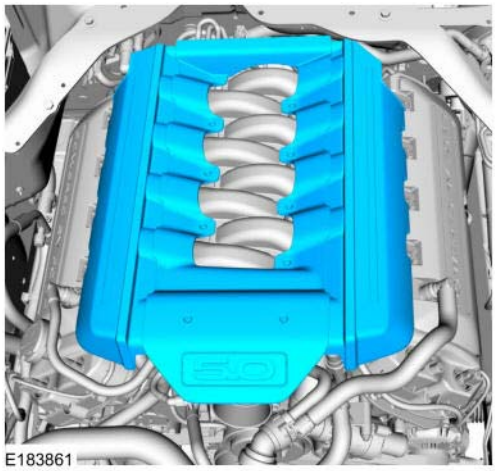
Release the fuel system pressure. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).



2.

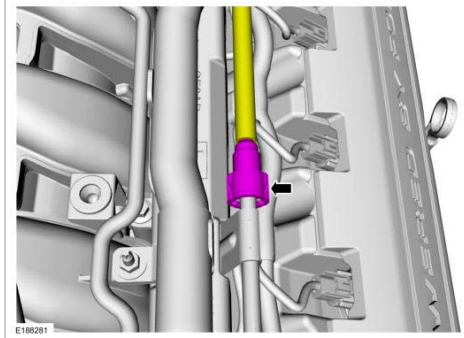
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

3.



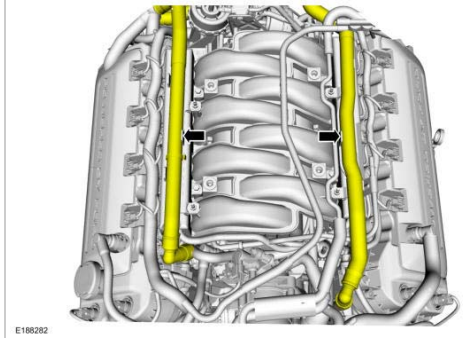
If equipped with a strut tower cross brace, detach the wiring harness retainer.

Remove the nuts and the strut tower cross brace.



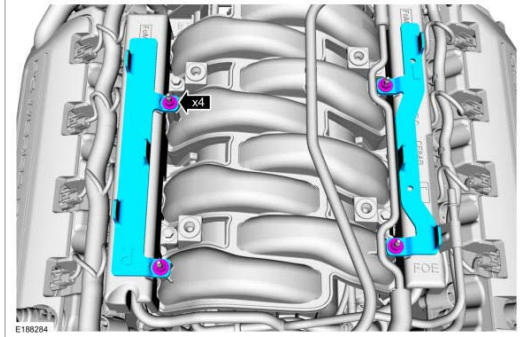
NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

4.
Remove the engine appearance cover.



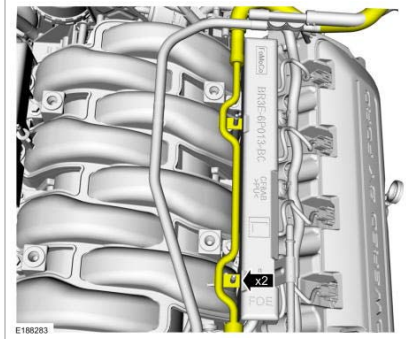
5.

Disconnect the fuel supply tube quick release coupling. Refer to: QUICK RELEASE COUPLING .



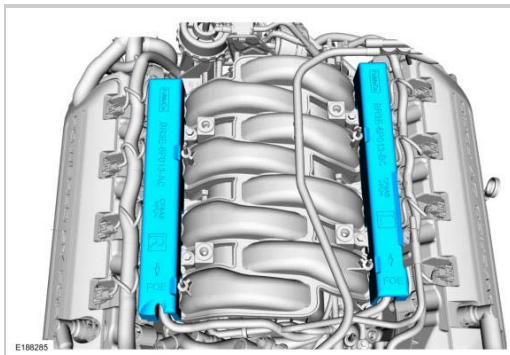
6.

Position the heater hoses aside.



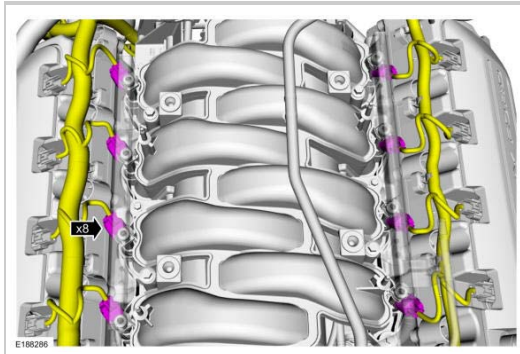
7.

Remove the nuts and then remove the heater hose supports.



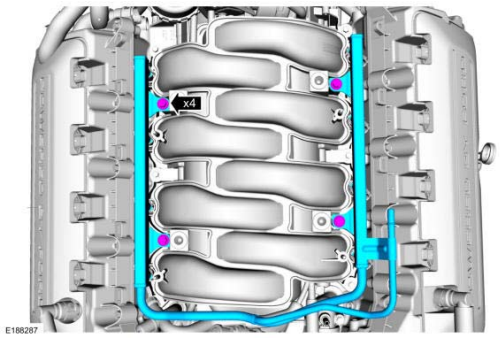
8.

Position the vacuum tube assembly aside.



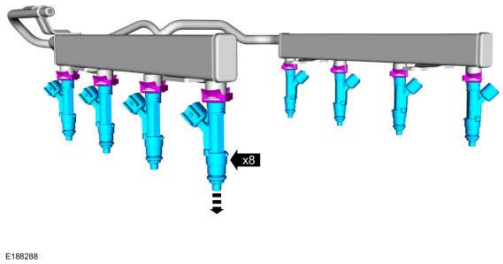
9.

Remove the LH and RH fuel rail insulators.



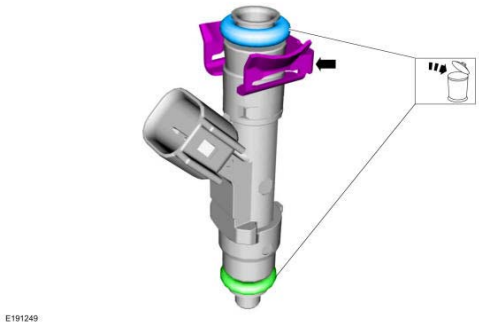
10.

Disconnect the fuel injector electrical connectors.



11.

Remove the fuel rail retaining bolts and remove the fuel rail.



12.

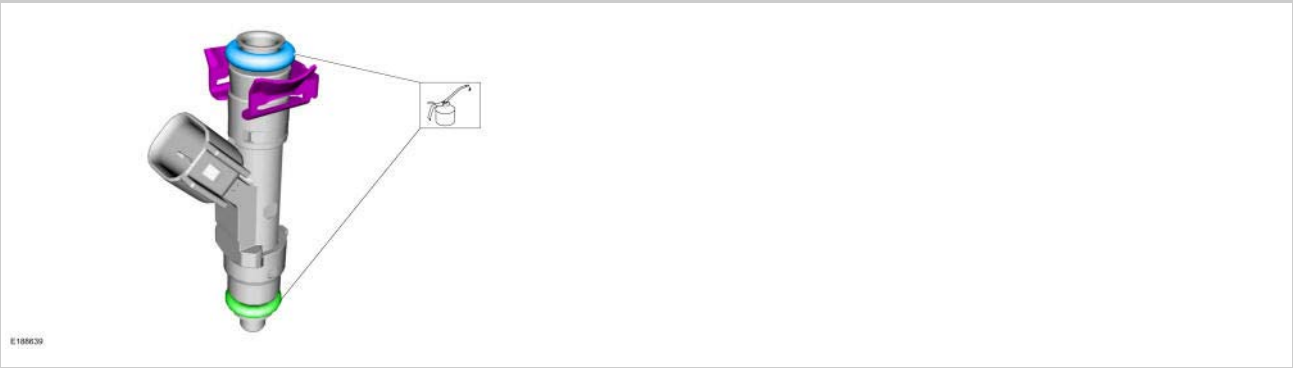
Remove the fuel injectors from the fuel rail.

13.

Remove and discard all of the fuel injector O-ring seals. Remove the fuel injector retaining clips.

REMOVAL AND INSTALLATION > FUEL RAIL > INSTALLATION

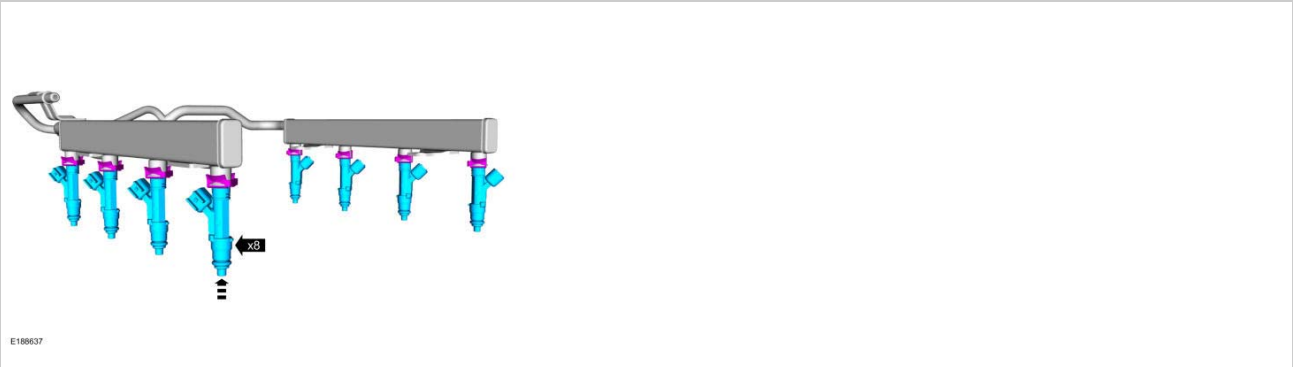
NOTE: Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.



NOTE: The upper and lower fuel injector O-ring seals are similar in appearance,

but are not interchangeable.

NOTE: Make sure that new fuel injector O-ring seals are installed.

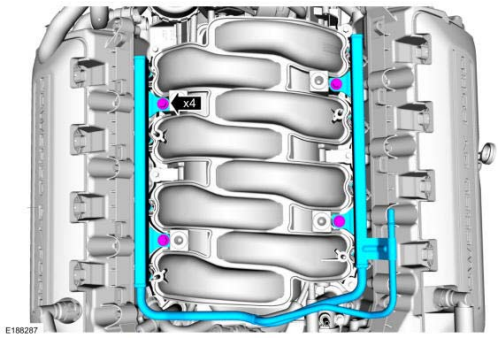


NOTE: The fuel injector clip can be reused if it is not damaged during removal. If the clip is reused, the 2 sides of the clip should be squeezed back into shape by placing it between index finger and thumb.

1.
Install the new fuel injector O-ring seals and the new fuel injector retaining clips onto the fuel injectors. Lubricate the new fuel injector O-ring seals with clean engine oil.

NOTE: Orient the fuel injector assemblies so the flat sides of the fuel rail injector cup is aligned with the flat side of the fuel injector retainer.

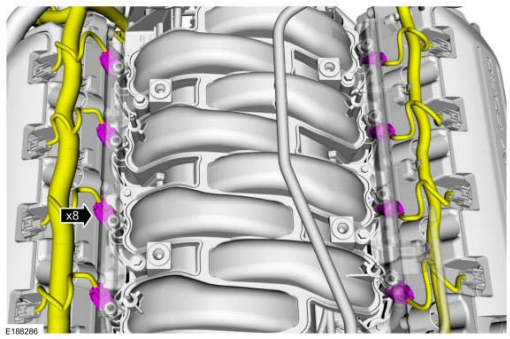
2.
Install the fuel injectors into the fuel rail.



3.

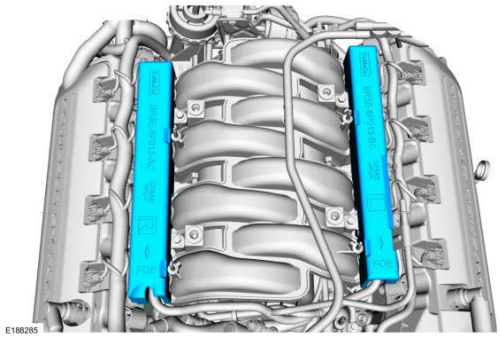
Install the fuel rail, then install and tighten the fuel rail retaining bolts.

Torque:



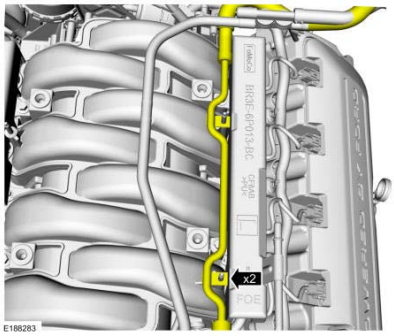
Stage 1: 89 lb.in (10 Nm)

Stage 2: 90°



4.

Connect the fuel injector electrical connectors.

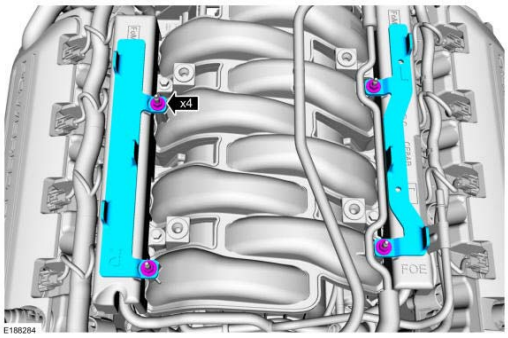


5.

Install the LH and RH fuel rail insulators.

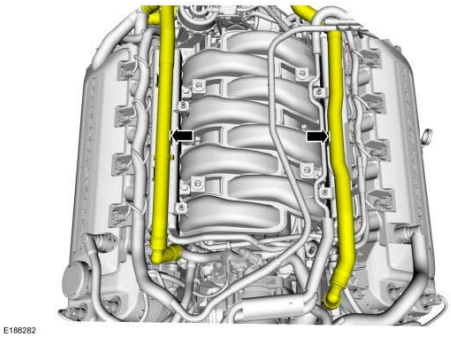
6.

Install the vacuum tube assembly aside.



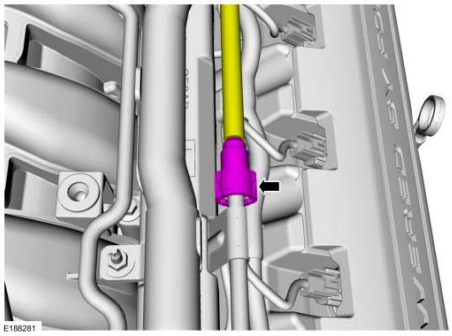
7.

Install the heater hose supports, then install and tighten the heater hose support nuts.



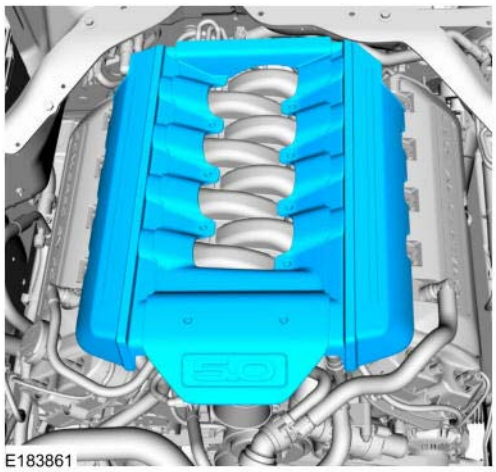
Torque

: 62 lb.in (7 Nm)



8.

Install the heater hoses.

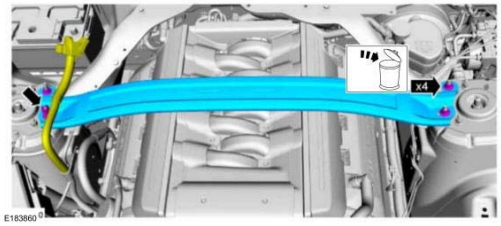


9.

Connect the fuel supply tube quick release coupling. Refer to: QUICK RELEASE COUPLING .

NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

10.
Install the engine appearance cover.



11.

If equipped, install the strut tower cross brace and nuts.

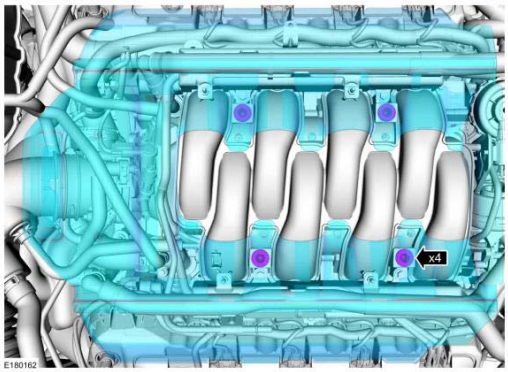
Torque

: 41 lb.ft (55 Nm)

Attach the wiring harness retainer.

12.

Connect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .



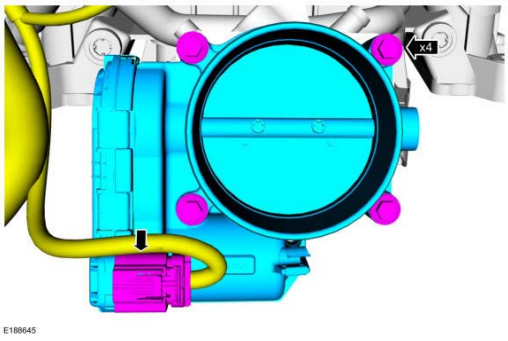
13.

Pressurize the fuel system. Refer to: FUEL SYSTEM PRESSURE RELEASE - 5.0L 32V Ti-VCT/5.0L Ti-VCT V8 (308kW/418PS).

REMOVAL AND INSTALLATION > THROTTLE BODY > REMOVAL

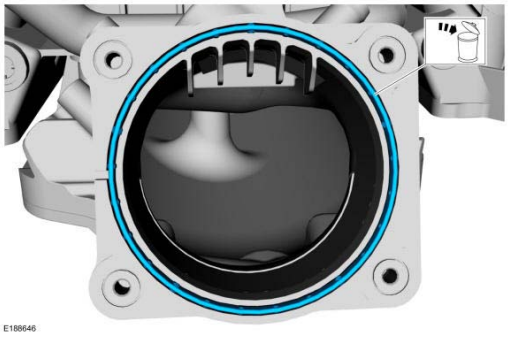
1.

Remove the engine appearance cover.



2.

Remove the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

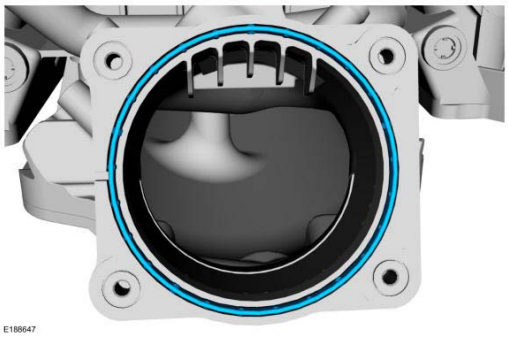


3.

Disconnect the Throttle Body (TB) electrical connector. Remove the Throttle Body (TB) retaining bolts and then remove the Throttle Body (TB).

4.

Remove and discard the Throttle Body (TB) gasket.

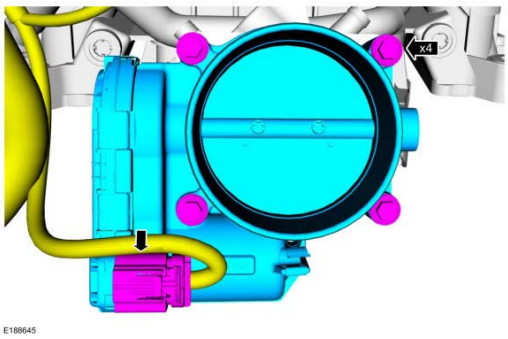


REMOVAL AND INSTALLATION > THROTTLE BODY > INSTALLATION

NOTE: Make sure that the mating faces are clean and free of foreign material.

1.

Install a new Throttle Body (TB) gasket.



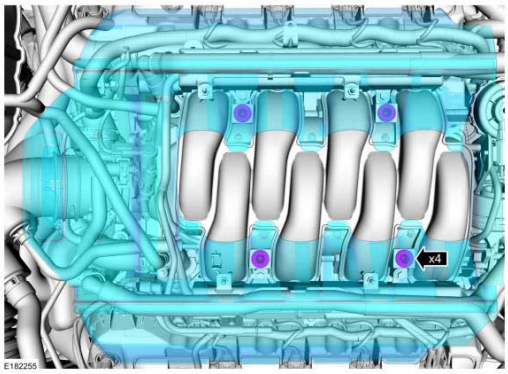
2.

Install the Throttle Body (TB), then install and tighten the Throttle Body (TB) retaining bolts. Connect the Throttle Body (TB) electrical connector.

Torque:

Stage 1: 62 lb.in (7 Nm)

Stage 2: 60°



3.

Install the air cleaner outlet pipe. Refer to: AIR CLEANER OUTLET PIPE .

4.

The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.Install the engine appearance cover.

Service Manual: STATE EMISSION STANDARDS - DIESEL

ARIZONA

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL OPACITY LOADED CRUISE TEST)

Application	Altitude (Feet)	Opacity (% For 10 Seconds)
Light Duty Vehicles (8500 GVWR Or Less)		
All Years	Less Than 2000	20 Or Less
	2001-4000	30 Or Less
	Greater Than 4000	40 Or Less

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL J1667 SNAP IDLE TEST)

Application	Altitude (Feet)	Opacity (% For 10 Seconds)
Heavy Duty Vehicles (8500 GVWR Or Greater)		
1990 & Earlier	All	55
1991 & Newer	All	40

COLORADO

COLORADO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
14,000 GVWR Or Less	
Non-Turbo	40
Turbo	35
14,000 GVWR Or More	
Non-Turbo	35
Turbo	20

CONNECTICUT

CONNECTICUT EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
10,000 GVWR Or Less	
1979 & Newer	20
26,000 GVWR Or More	
1974 & Earlier	70
1974-90	55
1991 & Newer	40

IDAHO

IDAHO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
All Weight Range	
1965-74	70
1975-91	55
1992 & Newer	40

KENTUCKY

KENTUCKY EMISSION STANDARDS - BOONE, CAMPBELL & KENTON COUNTIES (DIESEL OPACITY)

Application	Opacity
18,000 GVWR Or Less	
All Years	10% @ Idle

MASSACHUSETTS

MASSACHUSETTS EMISSION STANDARDS - DIESEL OPACITY

1994-	200 (0.5)	200 (0.5)
Light & Medium Duty Trucks (1)		
1968-72	1000 (5.0)	1000 (4.0)
1973-78	1000 (4.0)	1000 (3.0)
1979-83	1000 (2.0)	1000 (2.0)
1984-93	750 (1.0)	750 (1.0)
1994-	220 (0.5)	220 (0.5)
Heavy Duty Vehicles (2)		
1968-73	1000 (5.0)	1000 (5.0)
1974-93	1000 (4.0)	1000 (4.0)
1994-	220 (1.0)	220 (1.0)

(1) 8500 GVWR or less.

(2) 8500 GVWR or more.

ARIZONA

NOTE: Curb idle only test are for vehicles with full-time 4WD, non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on 1967-80 light-duty gasoline powered vehicles and all heavy-duty gasoline powered vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (CURB IDLE & LOADED CRUISE TESTS)

Application (1)	Idle HC ppm (CO %)	(2) Loaded/Cruise HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)		
1967-71 4-Cyl. Or Less	500 (5.50)	500 (4.20)
1967-71 More Than 4-Cyl.	450 (5.00)	450 (3.75)
1972-74 4-Cyl. Or Less	400 (5.50)	400 (4.20)
1972-74 More Than 4-Cyl.	400 (5.00)	400 (3.75)
1975-78 4-Cyl. Or Less	250 (2.20)	250 (1.65)
1975-78 More Than 4-Cyl.	250 (2.00)	250 (1.50)
Light Duty Vehicles (8500 GVWR Or Less)		
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.20)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Light Duty Trucks (6000 GVWR Or Less)		
1967-80	(3)	(3)
Light Duty Trucks (6001-8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.00)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Heavy Duty Trucks (Greater Than 8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)

1979 & Newer	300 (4.00)	300 (3.00)
Motorcycles		
1967 & Newer	1800 (5.50)	.....

(1)	4-stroke engines only.
(2)	Except AWD, non-defeatable traction control and motorcycles.
(3)	Same as light duty vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (IM147 TEST)

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles		
1981-82	3.0 (25.0)	3.5
1983-85	2.4 (20.0)	3.5
1986-89	1.6 (15.0)	2.5
1990-93	1.0 (12.0)	2.5
1994 & Newer	0.8 (12.0)	2.0
Light Trucks (6000 GVWR Or Less)		
1981-85	4.0 (40.0)	5.5
1986-89	3.0 (25.0)	4.5
1990-93	2.0 (20.0)	4.0
1994 & Newer	1.6 (20.0)	3.0
Light Duty Trucks (6000-8500 GVWR)		
1981-85	4.4 (48.0)	7.0
1986-87	4.0 (40.0)	5.5
1988-89	3.0 (25.0)	5.5
1990-93	3.0 (25.0)	5.0
1994 & Newer	2.4 (25.0)	4.0

NOTE: Curb idle test only for 1967-80 light-duty gasoline vehicles, all vehicles with full-time 4WD and/or non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on all 1981 and later vehicles except those with full-time 4WD and/or non-defeatable traction control.

CALIFORNIA > LEGEND

ESC - Emission Standard Category

GVWR - Manufacture's Gross Vehicle Weight Rating

LVW - Loaded Vehicle Weight

PC - Passenger Car

LDT1 - Light-Duty Truck up through 3750 LVW and GVWR no greater than 6000 lbs.

LDT2 - Light-Duty Truck greater than 3750 LVW and GVWR no greater than 6000 lbs.

MDV - Medium-Duty Vehicle, GVWR from 6001 to 8500 lbs.

HC - Hydrocarbon, ppm

CO - Carbon Monoxide, %

NO - Nitric Oxide, ppm

CALIFORNIA > PASS/FAIL EMISSION STANDARDS = A+B / VTW

PASS/FAIL STANDARDS - Emission standards used to determine if a vehicle passes the emission inspection. A vehicle passes if the emission levels are equal to or less than the standards for HC, CO and NO for ASM 5015 and ASM 2525.

GROSS POLLUTER STANDARDS - Emission standards used to designate a vehicle as a gross polluter. A vehicle is designated as a gross polluter if the emission levels at the time of the initial inspection, before repairs are greater than the gross polluter standards for HC, CO or NO for ASM 5015 or ASM 2525.

NOTE: If test data on emission pass/fail rates or gross polluter identification rates

indicate adjustments are required, the emission standards may be increased or decreased by the bureau by 30% or by the following tolerances, or standards may be set for any specific vehicle and engine configuration which the bureau determines has excessive errors of commission of omission, whichever is necessary to comply with Section 44001.5 of the Health and Safety Code.

COLORADO

COLORADO EMISSION STANDARDS - ENHANCED PROGRAM (IM240)

Application	HC gpm	CO gpm	NOx gpm
Passenger Cars			
1982	3.5	45	5.0

U. S. EPA REVISED FINAL ASM EMISSION STANDARDS (ASM5015 & ASM2525)

NOTE: EPA has not published a revised final standards for High Altitude, Light Duty Trucks 2 (6000-8500 GVWR), or vehicles older than 1980 model year. EPA guidance as of February 2003 states that a program may choose to use combinations of the Original and the Revised Final Standards.

U.S. EPA REVISED FINAL ASM EMISSION STANDARDS

Application	ASM5015		ASM2525	
	HC ppm (CO %)	NOx ppm	HC ppm (CO %)	NOx ppm
Passenger Cars				
1980	275 (1.3)	8500	500 (2.3)	4750
1981-82	275 (1.3)	3600	500 (2.3)	3500
1983-89	275 (1.1)	3600	500 (1.6)	3500
1990 & Newer	275 (1.1)	3600	300 (1.6)	3500

Light Duty Trucks (Less Than 6000 GVWR)				
1980-83	1140 (9.7)	14,145	340 (23.28)	32,200
1984-87	537 (5.4)	14,145	160 (12.96)	32,200
1988-95	537 (5.4)	7380	160 (12.96)	16,800
1996 & Newer	275 (1.1)	6150	82 (4.40)	14,000

U.S. EPA IM240 EMISSION STANDARDS > START-UP STANDARDS

Start-up standards should be used during the first 2 years of program operation. Tier 1 standards are recommended for all 1996 and newer vehicles and may be used for 1994 and newer vehicles certified to Tier 1 standards as well.

U.S. EPA IM240 HYDROCARBONS EMISSION START-UP STANDARDS

Application	Hydrocarbons (Grams/Mile)	
Composite		Phase 2
Light Duty Vehicles		
1996 & Newer	0.80	0.50
1991-95	1.20	0.75

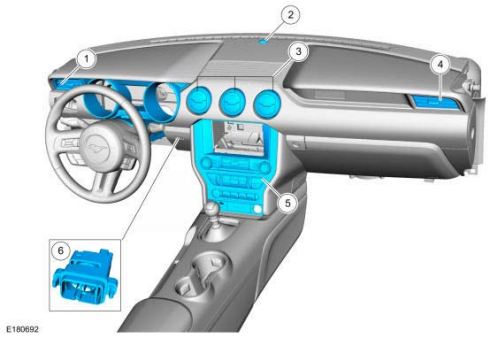
DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - OVERVIEW > OVERVIEW

The Dual Automatic Temperature Control (DATC) system maintains the selected vehicle interior temperature by heating and/or cooling the air depending on the HVAC control panel selection.

- The driver may override the automatic mode of operation.

- The temperature control setting is the desired cabin air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled.
- During A/C operation, the system reduces the relative humidity of the air inside the vehicle.



DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - OVERVIEW > OVERVIEW

The Electronic Manual Temperature Control (EMTC) system heats or cools the vehicle depending on the HVAC control panel selection.

- The control panel selection determines heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the outlet air temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation, the system reduces the relative humidity of the air inside the vehicle.

System Operation

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART

Module Network Input Messages APIM

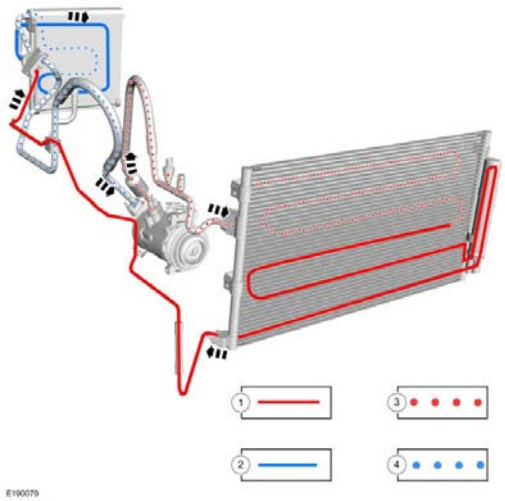
Broadcast Message	Originating Module	Message Purpose
Climate control button status	FCIM	This message contains the climate control button status.

Module Network Input Messages FCIM

Broadcast Message	Originating Module	Message Purpose
Ambient air temperature	PCM	This message contains raw value from the ambient air temperature sensor.
Climate control requests	APIM	This message contains both the climate control system voice commands as well as all climate control system touch screen inputs.
A/C clutch status	PCM	This message contains the status of the A/C compressor clutch.

Module Network Input Messages PCM

Broadcast Message	Originating Module	Message Purpose



HVAC A/C request	FCIM	This message requests the A/C compressor to be engaged.
Evaporator temperature	FCIM	This message contains the evaporator temperature. The PCM uses the evaporator temperature to determine the A/C compressor output.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > THE REFRIGERANT CYCLE

For information regarding base refrigerant operation within the HVAC system, refer to the current Ford Web Based Technical Training courses. The diagram below shows the refrigerant system state in each component on this vehicle.

The following statements apply to this refrigerant system:

- The PCM controls the A/C clutch relay.
- The evaporator temperature sensor monitors the temperature of the air that has passed through the evaporator core and sends a signal to the PCM. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the PCM.
- The line pressure is monitored so that A/C compressor operation is interrupted if the system pressure becomes too high or too low.
- The A/C compressor relief valve opens and vents refrigerant to relieve unusually high system pressure.

Item	Description
1	High pressure liquid

2	Low pressure liquid
3	High pressure vapor
4	Low pressure vapor

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > CONTROL SYSTEM LOGIC

The climate control system controls are in one or more locations depending on vehicle option content:

- FCIM (Dual Automatic Temperature Control (DATC) system)
- FDIM (part of APIM)

When the FDIM touchscreen or voice commands are used and A/C is selected, the APIM sends a function request message over the HS-CAN3 to the GWM. The GWM sends the message to the FCIM over the Medium Speed Controller Area Network (MS-CAN). The GWM sends the requests to the PCM over the High Speed Controller Area Network (HS-CAN)1. The PCM controls the A/C clutch relay.

When the customer directly inputs an A/C request into the FCIM, the module sends the request to the GWM over the Medium Speed Controller Area Network (MS-CAN). The GWM sends the request to the PCM over the High Speed Controller Area Network (HS-CAN)1. The PCM controls the A/C clutch relay.

The FCIM requires Programmable Module Installation (PMI) when it is replaced.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > A/C REQUEST

When an A/C request is received by the PCM, the PCM engages the A/C clutch relay when all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect an ambient air temperature below approximately 32.0 °F (°C).
- The PCM does not detect temperatures from the Mass Airflow/Intake Air Temperature sensor that does not correlate with other temperature sensor readings at ignition ON. (Most Mass Airflow (MAF) sensors have an integrated Intake Air Temperature (IAT) sensor).
- The PCM does not receive a message from the FCIM detecting an evaporator temperature below approximately 33.8 °F (1 °C).

The PCM monitors multiple temperature sensors correlation (AAT, CHT, ECT IAT, MAF...). The PCM runs this logic after an engine off and a calibrated soak period, typically 6 to 8 hours. This soak period allows the Ambient Air Temperature (AAT) sensor and the other temperature sensors to stabilize and not differ by greater than a calibrated value, typically 18 °C (32.4 °F). If a sensor input is found to be reporting a

temperature imbalance the PCM does not allow the A/C clutch to engage. For more information on PCM sensors, Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

The PCM monitors the discharge pressure measured by the A/C pressure transducer. The PCM interrupts A/C compressor operation in the event the A/C pressure transducer indicates high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM does not allow the A/C clutch to engage.

The FCIM may adjust the air inlet door depending on the humidity measured by the in-vehicle temperature and humidity sensor.

The sunload sensor supplies information to the FCIM indicating the intensity of the sun on the vehicle. The FCIM adjusts the system based on the intensity.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > HEATING AND VENTILATION

The heating and ventilation system:

- controls the temperature of the air inside the vehicle.
- reduces the relative humidity of the air inside the vehicle (during A/C compressor operation).
- delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.

The heating and ventilation system uses a reheat method to provide conditioned air to the passenger compartment. Temperature blending is controlled by the temperature doors, which regulate the amount of air that flows through and around the heater core, where it is then mixed and distributed. All airflow from the blower motor passes through the A/C evaporator core.

Vehicles equipped with Auto Start-Stop have a cabin heater coolant pump.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > AIR HANDLING

There are 4 door actuators that control the air flow into the passenger compartment:

- Air distribution
- Air inlet
- Driver side temperature
- Passenger side temperature

All of the door actuators contain a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the FCIM from the contact wiper indicates the

position of the actuator door. The FCIM powers the actuator motors to move the doors to the desired positions. The desired door positions are calculated by the FCIM based on the set temperature, in-vehicle temperature, ambient air temperature and sunload.

When an airflow mode, desired driver or passenger temperature, fresh air, or recirculation mode is selected, the FCIM moves the actuator motor in the desired direction.

The FCIM sends a PWM signal to the blower motor speed control to regulate the blower speed as necessary. The blower motor speed control provides variable ground feed for the blower motor based on the input from the FCIM. A delay function provides a gradual increase or decrease in blower motor speed under all conditions.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > AUTO

When AUTO is selected:

- the HVAC system operates in a manner to achieve and maintain the temperature set by the operator.
- the driver and passenger side temperature doors are automatically controlled by the FCIM based on the temperature setting.
- the A/C compressor is automatically controlled by the PCM from information sent by the FCIM, based on the temperature setting. The A/C compressor does not operate if the outside temperature is below approximately 32.0 °F (°C).
- the blower motor speed is automatically controlled through the blower motor speed control that receives a PWM signal from the FCIM based on the temperature setting, but can be manually overridden.
- the FCIM controls the air inlet door to recirculate, partially recirculate or open to the fresh air position depending on the in-car temperature and humidity sensor inputs.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > OFF

When OFF is selected:

- the air inlet door closes, preventing outside air and allowing only recirculated air.
- the blower motor is off.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND

COMPONENT DESCRIPTION > MAX A/C

When MAX A/C is selected:

- the air inlet door closes, preventing outside air and allowing only recirculated air.
- the recirculated air indicator is illuminated (recirculated air forced on).
- the footwell vent doors and defrost vent/register doors operate in combination to direct airflow to the instrument panel registers.
- the temperature doors move to the full cool position. Air temperature can be manually overridden.
- the A/C button is illuminated.
- the A/C compressor operates if the outside temperature is above approximately 32.0 °F (°C).
- the blower motor is commanded to the highest speed. The blower motor speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PANEL

When PANEL mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the footwell vent doors and defrost vent/register doors operate in combination to direct airflow to the instrument panel registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PANEL/FLOOR

When PANEL/FLOOR mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct and the

instrument panel registers. A small amount of airflow from the side window demisters and defrost duct is present.

- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FLOOR

When FLOOR mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FLOOR/DEFROST

When FLOOR/DEFROST mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MAX DEFROST

When MAX DEFROST mode is selected:

- The recirculated air request button is disabled. The air inlet door opens, allowing only outside air into the passenger compartment.
- The air distribution doors operate in combination to direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- The A/C is turned on in defrost mode. The A/C compressor operates as long as the outside temperature is above approximately 32.0 °F (°C).
- The temperature is set to the highest setting and is **not** adjustable.
- The fan is set to the highest speed and is **not** adjustable.
- MAX DEFROST can be exited by pressing the AUTO button.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MYTEMP

The MyTemp feature can be used to store and recall a preset driver's temperature. This feature is provided so this temperature can be quickly adjusted to a frequently used setting with a single button press. For additional information about MyTemp, refer to the Owner's Literature.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REMOTE START - MESSAGE CENTER SET TO AUTO

Remote start is an optional feature available on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. Additional information on the remote start feature and the other vehicle systems, refer to Owner's Literature.

Set the climate control to operate in Auto mode through the information display setting: Remote Start > Climate Control > Heater-A/C > Auto, refer to the Owner's Literature for more information.

When the factory remote start feature is used, the Dual Automatic Temperature Control (DATC) system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

For cold ambient air temperatures as determined by the FCIM AUTO mode to request heat:

- the airflow mode is set to AUTO if Front Defrost is set to Off in the message center. (if the FCIM requests FOOTWELL in AUTO mode, FOOTWELL/DEFROST will be used in remote start mode).
- the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
- the temperature is set to 22 C (71.6 F).
- the blower speed is set to AUTO.
- the air inlet mode is set to AUTO.
- A/C is set to AUTO.

For moderate and warm ambient air temperatures as determined by the FCIM AUTO mode to request heat or cooling:

- the airflow mode is set to AUTO.
- the temperature is set to 22 C (71.6 F).
- the blower speed is set to AUTO.
- the air inlet mode is set to AUTO.
- A/C is set to AUTO.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REMOTE START - MESSAGE CENTER SET TO LAST USER SETTINGS

Remote start is an optional feature available on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. Additional information on the remote start feature and the other vehicle systems, refer to Owner's Literature.

Set the climate control to operate using the last climate control settings through the information display setting: Remote Start > Climate Control > Heater-A/C > Last Settings, refer to the Owner's Literature for more information.

When the factory remote start feature is used and the IPC message center is set to last user settings, the Dual Automatic Temperature Control (DATC) system automatically sets certain parameters in an attempt to achieve a comfortable cabin temperature. These parameters are set based on outside air temperature. During remote start, the outside air temperature is continually evaluated and HVAC system behavior can change if the outside air changes between cold, moderate and warm temperatures.

For cold ambient air temperatures as determined by the FCIM AUTO mode to request heat:

- the airflow mode is set to the last user setting if Front Defrost is set to Off in the message center.
- the airflow mode is set to DEFROST if Front Defrost is set to Auto in the message center.
- the temperature is set to the last user setting.

- the blower speed is set to the last user setting.
- the air inlet mode is set to the last user setting.
- A/C is set to the last user setting.

For moderate and warm ambient air temperatures as determined by the FCIM AUTO mode to request heat or cooling:

- the airflow mode is set to the last user setting.
- the temperature is set to the last user setting.
- the blower speed is set to the last user setting.
- the air inlet mode is set to the last user setting.
- A/C is set to the last user setting.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

FCIM - Dual Automatic Temperature Control (DATC)

The Dual Automatic Temperature Control (DATC) system uses the FCIM as the HVAC control module. The FCIM also controls the outputs for rear window defrost and climate controlled seats. For vehicles equipped with touchscreen audio, the Dual Automatic Temperature Control (DATC) system uses voice commands or the touchscreen to control the system. For details on the FCIM communication, refer to Control System Logic in this article.

The FCIM utilizes a Field-Effect Transistor (FET) protective circuit strategy for its actuator outputs. Output load (current level) is monitored for excessive current (typically short circuits) and is shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the Field-Effect Transistor (FET) circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (Field-Effect Transistor (FET) protection) and the circuit is still shorted, the Field-Effect Transistor (FET) protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. The Field-Effect Transistor (FET) protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the Field-Effect Transistor (FET) and the ability of the Field-Effect Transistor (FET) to withstand it. A module lifetime level of fault events is established based upon the durability of the Field-Effect Transistor (FET). If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by a command to clear the Diagnostic Trouble Codes (DTCs). The module does not allow the DTC to be cleared or the circuit to be restored to normal operation until a successful self-test proves

that the fault has been repaired. After the self-test has successfully completed (no on-demand Diagnostic Trouble Codes (DTCs) present), DTC U1000:00 and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When each level is reached, the DTC associated with the short circuit sets along with DTC U1000:00. These Diagnostic Trouble Codes (DTCs) can be cleared using the diagnostic scan tool. The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then Diagnostic Trouble Codes (DTCs) U1000:00 and U3000:49 set along with the associated short circuit DTC. DTC U3000:49 cannot be cleared and a new module must be installed after the repair.

The FCIM requires Programmable Module Installation (PMI) when it is replaced.

Ambient Air Temperature (AAT) Sensor

The Ambient Air Temperature (AAT) sensor contains a thermistor. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The Ambient Air Temperature (AAT) sensor is hardwired to the PCM through separate input and return circuits. If the outside air temperature is below approximately 0 °C (32 °F), the PCM does not allow the A/C compressor clutch to engage.

The PCM sends raw ambient air temperature data to the HVAC module. The HVAC module filters the raw data, sends it to the APIM and the touchscreen displays the outside temperature.

After replacing an Ambient Air Temperature (AAT) sensor, the sensor data must be reset by either driving the vehicle at speeds consistently about 20 MPH for at least 5 minutes to update the filtered data or perform the multiple button press reset procedure to update to the current raw value.

The multiple button reset for the Ambient Air Temperature (AAT) sensor is as follows:

- On the HVAC panel controls, press the A/C and Recirc buttons simultaneously, then, release both.
- Within 2 seconds press the A/C button again.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing and the plenum chamber where it is mixed and distributed.

Blower Motor Speed Control

The blower motor speed control uses a PWM signal from the FCIM to determine the desired blower speed and varies the ground feed for the blower motor to control the speed.

Compressor Clutch Assembly

When battery voltage is applied to the A/C compressor clutch field coil, the clutch disc and hub assembly is drawn toward the A/C clutch pulley. The magnetic force locks the clutch disc and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate with the engine. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C clutch pulley.

An A/C clutch diode is integrated into the coil for A/C clutch field coil circuit spike suppression.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the climate control housing. A mixture of liquid refrigerant and oil enters the evaporator through the evaporator inlet tube and continues out of the evaporator through the evaporator outlet tube as a vapor. During A/C compressor operation, airflow from the blower motor is cooled and dehumidified as it flows through the evaporator fins.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to air passing through the heater core.

Climate Control Housing

The climate control housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is directed through or around the heater core by the temperature doors. Airflow is then distributed to the selected outlet by the airflow mode doors.

Air Distribution Door Actuator

The air distribution door actuator contains a reversible electric motor and a potentiometer. The potentiometer allows the FCIM to monitor the position of the airflow mode door.

Air Inlet Door Actuator

The air inlet door actuator contains a reversible electric motor and a potentiometer. The potentiometer allows the FCIM to monitor the position of the air inlet door. The FCIM may adjust the air inlet door depending on the humidity measured by the in-vehicle temperature and humidity sensor. If the vehicle cabin becomes too humid, and recirculated air is not selected, the FCIM adjusts the air inlet door to allow more fresh air. When the humidity level drops, it may adjust back to partial recirculated air. Additionally, when recirculated air is not selected, the FCIM may also adjust the system based on the in-vehicle and outside ambient temperatures to reduce loading on the compressor when required.

Driver Side Temperature Door Actuator

The driver side temperature door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the FCIM to monitor the position of the temperature blend door.

Passenger Side Temperature Door Actuator

The passenger side temperature door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the FCIM to monitor the position of the temperature blend door.

Air Conditioning (A/C) Pressure Transducer

The PCM monitors the discharge pressure measured by the A/C pressure transducer. As the refrigerant pressure changes, the resistance of the A/C pressure transducer changes. It is not necessary to recover the refrigerant before removing the A/C pressure transducer.

In-Vehicle Temperature And Humidity Sensor

The in-vehicle temperature and humidity sensor contains a thermistor and a sensing element which separately measures the in-vehicle air temperature and the humidity, then sends those readings to the FCIM. The in-vehicle temperature and humidity sensor has an electric fan within the sensor that draws in-vehicle air across the two sensing elements. The FCIM may adjust the air inlet door based on the in-vehicle temperature and humidity sensor information to maintain the desired humidity of the passenger cabin air.

Autolamp/Sunload Sensor

The autolamp/sunload sensor supplies information to the FCIM indicating the intensity of the sun on the vehicle. The FCIM compensates high sun load with higher blower and reduced discharge temperatures.

Evaporator Temperature Sensor

The evaporator temperature sensor contains a thermistor. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The evaporator temperature sensor is an input to the FCIM and the information is relayed to the PCM over the CAN. If the evaporator temperature is below approximately 1 °C (33.8 °F), the PCM does not allow the A/C compressor to operate.

Air Discharge Temperature Sensors

There are 2 air discharge temperature sensors in the Dual Automatic Temperature Control (DATC) system:

- Center register air discharge temperature sensor
- Footwell air discharge temperature sensor

The air discharge temperature sensors contain a thermistor and are inputs to the FCIM. The sensors vary their resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The FCIM uses the sensor information to maintain the desired temperature of the passenger cabin air.

Externally Controlled Variable Displacement A/C Compressor (2.3L)

> *NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).*

The externally controlled variable displacement compressor has:

- a non-serviceable shaft seal.
- a serviceable pressure relief valve installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures.
- a serviceable A/C clutch and field coil.
- Uses Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D. This oil contains special additives required for the A/C compressor. The oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil.

Variable displacement compressors have a swash plate that rotates to reciprocate pistons, which compresses refrigerant. Variable displacement compressors change the swash plate angle to change the refrigerant displacement. The externally controlled variable displacement compressor changes the swash plate angle in accordance with an electrical signal from the PCM. Externally controlled variable displacement compressor manages displacement by controlling refrigerant differential pressure before and after a throttle at the discharge side; achieving precise cooling capability control in accordance with cabin environment and driving conditions.

The PCM sends a PWM signal to the solenoid in the compressor to control the compressor displacement based upon the:

- Evaporator temperature
- Ambient air temperature
- Engine RPM
- Vehicle speed
- A/C high side pressure
- Intake air temperature

Fixed Displacement A/C Compressor (3.7L, 5.0L and 5.2L)

> *NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).*

The fixed displacement compressor has:

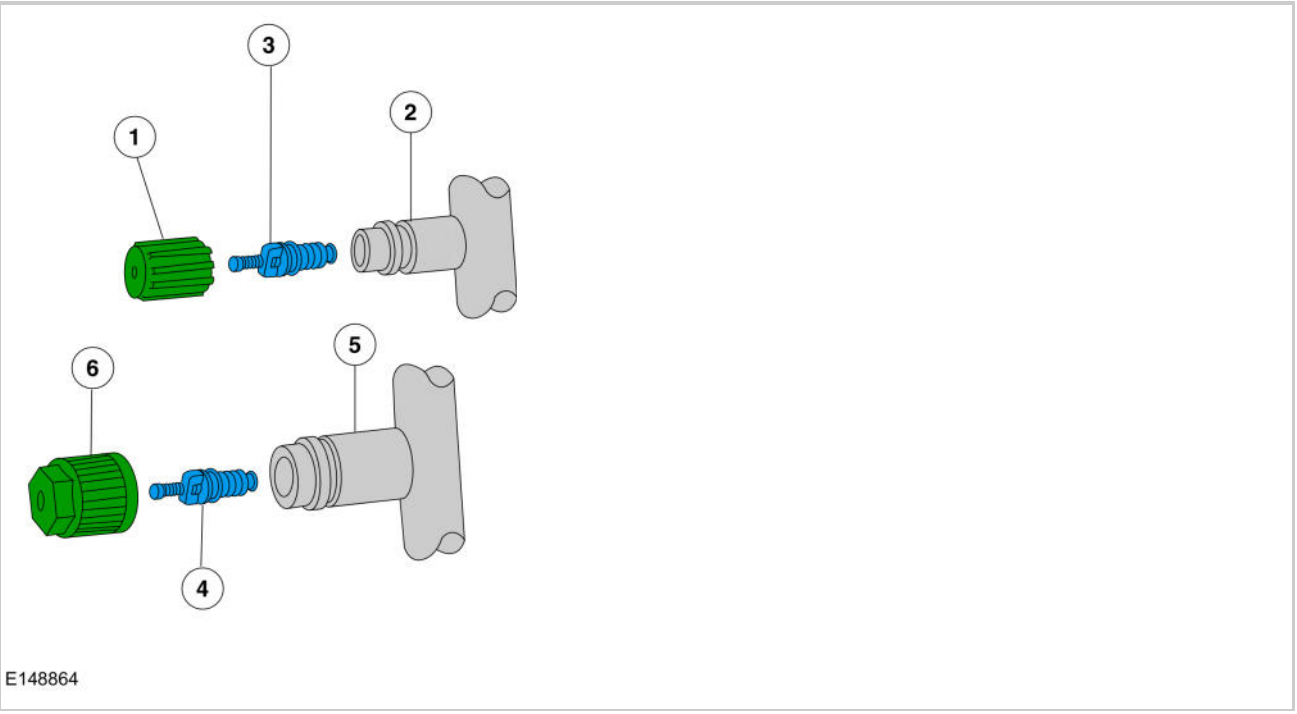
- a non-serviceable shaft seal.
- a serviceable pressure relief valve installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures.
- a serviceable A/C clutch and field coil.
- Uses Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D. This oil contains special additives required for the A/C compressor. The oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil.

Fixed displacement A/C compressors are always at 100% displacement. The pistons are placed around an angled plate (swash plate) and are pushed back and forth as the plate rotates. Cooling performance is controlled by switching the compressor clutch on or off depending upon the evaporator temperature.

Condenser

The A/C condenser is an aluminum fin-and-tube design heat exchanger. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat, and condenses gas to liquid refrigerant as it is cooled. The receiver drier is mounted on the left side of the condenser.

Receiver Drier



The receiver drier stores high-pressure liquid. The desiccant bag mounted inside the receiver drier removes any retained moisture from the refrigerant.

Thermostatic Expansion Valve (TXV)

The Thermostatic Expansion Valve (TXV) is located at the evaporator core inlet and outlet tubes at the center rear of the engine compartment. The TXV provides a restriction to the refrigerant flow and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and

exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Service Gauge Port Valves

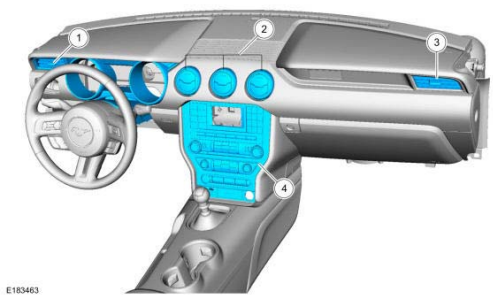
Item	Description	Torque
1	Low-pressure service gauge port valve cap	0.8 Nm (7 lb-in)
2	Low-pressure service gauge port valve	-
3	Low-pressure Schrader-type valve	2.26 Nm (20 lb-in)
4	High-pressure Schrader-type valve	3.4 Nm (30 lb-in)
5	High-pressure service gauge port valve	-
6	High-pressure service gauge port valve cap	0.8 Nm (7 lb-in)

The service gauge port fitting is an integral part of the refrigerant line or component.

- Prior to leak testing, blow air over the service gauge port valves to ensure an accurate test.
- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage around the Schrader-type valve with the service gauge port valve cap removed is considered normal. Install a new Schrader-type valve core if the seal leaks excessively.

- The A/C service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.
- Follow the procedure and the notes for electronic leak testing. Refer to: Electronic Leak Detection .

Refrigerant System Dye



A fluorescent refrigerant system dye wafer is added to the receiver drier desiccant bag at the factory to assist in refrigerant system leak diagnosis. This fluorescent dye wafer dissolves after about 30 minutes of continuous A/C operation. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Refer to: Fluorescent Dye Leak Detection .

Replacement desiccant bags, either separately or part of the receiver drier assembly, are equipped with a new fluorescent dye wafer. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks. If the system has been out of refrigerant through the winter the dye at the leak point may have oxidized and may not fluoresce. If this happens, recharge and operate the A/C system to circulate the oil and allow any residual dye to show up at the leak point. It is important to understand that dye adheres to the oil not the refrigerant; the refrigerant carries the oil out of the leak point.

NOTE: Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > THE REFRIGERANT CYCLE

For information regarding base refrigerant operation within the HVAC system, refer to the current Ford Web Based Technical Training courses. The diagram below shows the refrigerant system state in each component on this vehicle.

The following statements apply to this refrigerant system:

- The PCM controls the A/C clutch relay.
- The evaporator temperature sensor monitors the temperature of the air that has passed through the evaporator core and sends a signal to the PCM. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the PCM.
- The line pressure is monitored so that A/C compressor operation is interrupted if the system pressure becomes too high or too low.
- The A/C compressor relief valve opens and vents refrigerant to relieve unusually high system pressure.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > CONTROL SYSTEM LOGIC

When the customer directly inputs an A/C request into the FCIM, the module sends the request to the GWM over the MS-CAN. The GWM sends the request to the PCM over the HS-CAN. The PCM controls the A/C clutch relay. The GWM also sends the climate control button status to the IPC.

The FCIM requires Programmable Module Installation (PMI) when it is replaced.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > A/C REQUEST

When an A/C request is received by the PCM, the PCM engages the A/C clutch relay when all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect an ambient air temperature below approximately 32.0 °F (°C).
- The PCM does not detect temperatures from the Mass Airflow/Intake Air Temperature sensor that does not correlate with other temperature sensor readings at ignition ON. (Most Mass Airflow (MAF) sensors have an integrated Intake Air Temperature (IAT) sensor).
- The PCM does not receive a message from the FCIM detecting an evaporator temperature below approximately 33.8 °F (1 °C).

The PCM monitors multiple temperature sensors correlation (AAT, CHT, ECT IAT, MAF...). The PCM runs this logic after an engine off and a calibrated soak period, typically 6 to 8 hours. This soak period allows the Ambient Air Temperature (AAT) sensor and the other temperature sensors to stabilize and not differ by greater than a calibrated value, typically 18 °C (32.4 °F). If a sensor input is found to be reporting a temperature imbalance the PCM does not allow the A/C clutch to engage. For more information on PCM sensors, Refer to ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) .

The PCM monitors the discharge pressure measured by the A/C pressure transducer. The PCM interrupts A/C compressor operation in the event the A/C pressure transducer indicates high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM does not allow the A/C clutch to engage.

The FCIM may adjust the air inlet door depending on the humidity measured by the in-vehicle temperature and humidity sensor.

The sunload sensor supplies information to the FCIM indicating the intensity of the sun on the vehicle. The FCIM adjusts the system based on the intensity.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > HEATING AND VENTILATION

The heating and ventilation system:

- controls the temperature of the air inside the vehicle.
- reduces the relative humidity of the air inside the vehicle (during A/C compressor operation).
- delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.

The heating and ventilation system uses a reheat method to provide conditioned air to the passenger compartment. Temperature blending is controlled by the temperature door, which regulates the amount of air that flows through and around the heater core, where it is then mixed and distributed. All airflow from

the blower motor passes through the A/C evaporator core.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > AIR HANDLING

There are 3 door actuators that control the air flow into the passenger compartment:

- Air distribution
- Air inlet
- Driver side temperature

All of the door actuators contain a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the FCIM from the contact wiper indicates the position of the actuator door. The FCIM powers the actuator motors to move the doors to the desired positions. The desired door positions are calculated by the FCIM based on the set temperature and ambient air temperature.

When an airflow mode, desired temperature, fresh air, or recirculation mode is selected, the FCIM moves the actuator motor in the desired direction.

The FCIM sends a PWM signal to the blower motor speed control to regulate the blower speed as necessary. The blower motor speed control provides variable ground feed for the blower motor based on the input from the FCIM. A delay function provides a gradual increase or decrease in blower motor speed under all conditions.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > OFF

When OFF is selected:

- the recirculated air request button is disabled.
- the air inlet door actuator closes off outside air and admits only recirculated air.
- the A/C request button is disabled.
- the blower motor is off.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MAX A/C

When MAX A/C is selected:

- the air inlet door actuator closes off outside air and admits only recirculated air.
- the recirculated air request button is disabled and the indicator is illuminated.
- the air distribution doors operate in combination to direct airflow to the instrument panel registers.
- the temperature door moves to the full cool position. The air temperature is adjustable.
- the A/C request button is illuminated and disabled.
- the A/C compressor operates if the outside temperature is above approximately 32.0 °F (°C).
- the blower motor is commanded to the highest speed. The blower motor speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PANEL

When PANEL mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the instrument panel registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > PANEL/FLOOR

When PANEL/FLOOR mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct and the instrument panel registers. A small amount of airflow from the side window demisters and defrost duct is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by

pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.

- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FLOOR

When FLOOR mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters is present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > FLOOR/DEFROST

When FLOOR/DEFROST mode is selected:

- the recirculated air request button is enabled. If the recirculated air request button is selected (indicator on), the air inlet door closes, preventing outside air from entering the passenger compartment. If the recirculated air request button is not selected (indicator off), the air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C button (indicator on) can the airflow temperature be cooled below the outside air temperature.
- the blower motor is on and the speed is adjustable.

DEFROST

When DEFROST mode is selected:

- the recirculated air request button is disabled. The air inlet door opens, allowing only outside air

into the passenger compartment.

- the air distribution doors operate in combination to direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- the A/C is turned on in defrost mode. The A/C compressor operates as long as the outside temperature is above approximately 32.0 °F (°C).
- blended air temperature is available.
- the blower motor is on and the speed is adjustable.

MAX

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > DEFROST

When DEFROST mode is selected:

- the recirculated air request button is disabled. The air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- the A/C is turned on in defrost mode. The A/C compressor operates as long as the outside temperature is above approximately 32.0 °F (°C).
- blended air temperature is available.
- the blower motor is on and the speed is adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > MAX DEFROST

When MAX DEFROST mode is selected:

- the recirculated air request button is disabled. The air inlet door opens, allowing only outside air into the passenger compartment.
- the air distribution doors operate in combination to direct airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct is present.
- the A/C is turned on in defrost mode. The A/C compressor operates as long as the outside temperature is above approximately 32.0 °F (°C).
- the temperature is set to the highest setting and is **not** adjustable.
- the fan is set to the highest speed and is **not** adjustable.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > REMOTE START

Remote start is an optional feature available on this vehicle. In addition to being able to start the vehicle remotely, the remote start feature also utilizes other vehicle systems to increase the level of comfort to the vehicle occupants upon entering the vehicle. Additional information on the remote start feature and the other vehicle systems, refer to Owner's Literature.

When the factory remote start feature is used, the EMTC system runs at the setting it was set to when the vehicle was last turned off. You cannot adjust the climate control system during remote start operation. Turn the ignition on to return the system to its previous settings.

Set the climate control to operate using the last climate control settings through the information display setting: Remote Start > Climate Control > Heater-A/C > Last Settings, refer to the Owner's Literature for more information.

DESCRIPTION AND OPERATION > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > COMPONENT DESCRIPTION

FCIM - Electronic Manual Temperature Control (EMTC)

The EMTC system uses the FCIM as the HVAC control module. The FCIM also controls the outputs for rear window defrost and climate controlled seats. For details on the FCIM communication, refer to Control System Logic in this article.

The FCIM utilizes a Field-Effect Transistor (FET) protective circuit strategy for its actuator outputs. Output load (current level) is monitored for excessive current (typically short circuits) and is shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the Field-Effect Transistor (FET) circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (Field-Effect Transistor (FET) protection) and the circuit is still shorted, the Field-Effect Transistor (FET) protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. The Field-Effect Transistor (FET) protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the Field-Effect Transistor (FET) and the ability of the Field-Effect Transistor (FET) to withstand it. A module lifetime level of fault events is established based upon the durability of the Field-Effect Transistor (FET). If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by a command to clear the Diagnostic Trouble Codes (DTCs). The module does not allow the DTC to be cleared or the circuit to be restored to normal operation until a successful self-test proves

that the fault has been repaired. After the self-test has successfully completed (no on-demand Diagnostic Trouble Codes (DTCs) present), DTC U1000:00 and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When each level is reached, the DTC associated with the short circuit sets along with DTC U1000:00. These Diagnostic Trouble Codes (DTCs) can be cleared using the diagnostic scan tool. The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then Diagnostic Trouble Codes (DTCs) U1000:00 and U3000:49 set along with the associated short circuit DTC. DTC U3000:49 cannot be cleared and a new module must be installed after the repair.

The FCIM requires Programmable Module Installation (PMI) when it is replaced.

Ambient Air Temperature (AAT) Sensor

The Ambient Air Temperature (AAT) sensor contains a thermistor. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The Ambient Air Temperature (AAT) sensor is hardwired to the PCM through separate input and return circuits. If the outside air temperature is below approximately 0 °C (32 °F), the PCM does not allow the A/C compressor clutch to engage.

The PCM sends raw ambient air temperature data to the HVAC module. The HVAC module filters the raw data, sends it to the APIM and the touchscreen displays the outside temperature.

After replacing an Ambient Air Temperature (AAT) sensor, the sensor data must be reset by either driving the vehicle at speeds consistently about 20 MPH for at least 5 minutes to update the filtered data or perform the multiple button press reset procedure to update to the current raw value.

The multiple button reset for the Ambient Air Temperature (AAT) sensor is as follows:

- On the HVAC panel controls, press the A/C and Recirc buttons simultaneously, then, release both.
- Within 2 seconds press the A/C button again.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing and the plenum chamber where it is mixed and distributed.

Blower Motor Speed Control

The blower motor speed control uses a PWM signal from the FCIM to determine the desired blower speed and varies the ground feed for the blower motor to control the speed.

Compressor Clutch Assembly

When battery voltage is applied to the A/C compressor clutch field coil, the clutch disc and hub assembly is drawn toward the A/C clutch pulley. The magnetic force locks the clutch disc and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate with the engine. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C clutch pulley.

An A/C clutch diode is integrated into the coil for A/C clutch field coil circuit spike suppression.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the climate control housing. A mixture of liquid refrigerant and oil enters the evaporator through the evaporator inlet tube and continues out of the evaporator through the evaporator outlet tube as a vapor. During A/C compressor operation, airflow from the blower motor is cooled and dehumidified as it flows through the evaporator fins.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to air passing through the heater core.

Climate Control Housing

The climate control housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is directed through or around the heater core by the temperature door. Airflow is then distributed to the selected outlet by the airflow mode doors.

Air Distribution Door Actuator

The air distribution door actuator contains a reversible electric motor and a potentiometer. The potentiometer allows the FCIM to monitor the position of the airflow mode door.

Air Inlet Door Actuator

The air inlet door actuator contains a reversible electric motor and a potentiometer. The potentiometer allows the FCIM to monitor the position of the air inlet door. The FCIM drives the actuator motor in the direction necessary to move the door to the position set by the recirculation button and when the MAX A/C, Defrost or MAX Defrost buttons are selected.

Driver Side Temperature Door Actuator

The EMTC system has one temperature door actuator located on the driver side of the climate control housing. The driver side temperature door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the FCIM to monitor the position of the temperature blend door.

Evaporator Temperature Sensor

The evaporator temperature sensor contains a thermistor. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The evaporator temperature sensor is an input to the FCIM and the information is relayed to the PCM over the CAN. If the evaporator temperature is below approximately 1 °C (33.8 °F), the PCM does not allow the A/C compressor to operate.

Air Conditioning (A/C) Pressure Transducer

The PCM monitors the discharge pressure measured by the A/C pressure transducer. As the refrigerant pressure changes, the resistance of the A/C pressure transducer changes. It is not necessary to recover the refrigerant before removing the A/C pressure transducer.

In-Vehicle Temperature And Humidity Sensor

The in-vehicle temperature and humidity sensor contains a thermistor and a sensing element which separately measures the in-vehicle air temperature and the humidity, then sends those readings to the FCIM. The in-vehicle temperature and humidity sensor has an electric fan within the sensor that draws in-vehicle air across the two sensing elements. The FCIM may adjust the air inlet door based on the in-vehicle temperature and humidity sensor information to maintain the desired humidity of the passenger

cabin air.

Externally Controlled Variable Displacement A/C Compressor (2.3L)

> *NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).*

The externally controlled variable displacement compressor has:

- a non-serviceable shaft seal.
- a serviceable pressure relief valve installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures.
- a serviceable A/C clutch and field coil.
- Uses Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D. This oil contains special additives required for the A/C compressor. The oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil.

Variable displacement compressors have a swash plate that rotates to reciprocate pistons, which compresses refrigerant. Variable displacement compressors change the swash plate angle to change the refrigerant displacement. The externally controlled variable displacement compressor changes the swash plate angle in accordance with an electrical signal from the PCM. Externally controlled variable displacement compressor manages displacement by controlling refrigerant differential pressure before and after a throttle at the discharge side; achieving precise cooling capability control in accordance with cabin environment and driving conditions.

The PCM sends a PWM signal to the solenoid in the compressor to control the compressor displacement based upon the:

- Evaporator temperature
- Ambient air temperature
- Engine RPM
- Vehicle speed
- A/C high side pressure
- Intake air temperature

Fixed Displacement A/C Compressor (3.7L, 5.0L and 5.2L)

> *NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).*

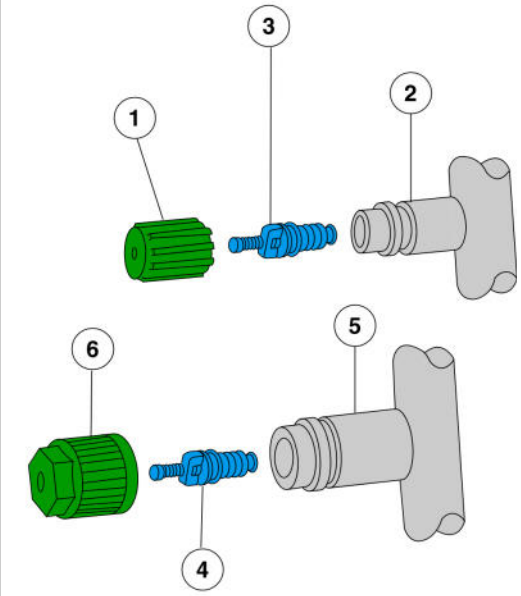
The fixed displacement compressor has:

- a non-serviceable shaft seal.
- a serviceable pressure relief valve installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures.
- a serviceable A/C clutch and field coil.
- Uses Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D. This oil contains special additives required for the A/C compressor. The oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil.

Fixed displacement A/C compressors are always at 100% displacement. The pistons are placed around an angled plate (swash plate) and are pushed back and forth as the plate rotates. Cooling performance is controlled by switching the compressor clutch on or off depending upon the evaporator temperature.

Condenser

The A/C condenser is an aluminum fin-and-tube design heat exchanger. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat, and condenses gas to liquid refrigerant as it is cooled. The receiver drier is mounted on the left side of the condenser.



Receiver Drier

The receiver drier stores high-pressure liquid. The desiccant bag mounted inside the receiver drier removes any retained moisture from the refrigerant.

Thermostatic Expansion Valve (TXV)

The Thermostatic Expansion Valve (TXV) is located at the evaporator core inlet and outlet tubes at the center rear of the engine compartment. The TXV provides a restriction to the refrigerant flow and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Service Gauge Port Valves

E148864

Item	Description	Torque
1	Low-pressure service gauge port valve cap	0.8 Nm (7 lb-in)
2	Low-pressure service gauge port valve	-
3	Low-pressure Schrader-type valve	2.26 Nm (20 lb-in)
4	High-pressure Schrader-type valve	3.4 Nm (30 lb-in)
5	High-pressure service gauge port valve	-
6	High-pressure service gauge port valve cap	0.8 Nm (7 lb-in)

The service gauge port fitting is an integral part of the refrigerant line or component.

- Prior to leak testing, blow air over the service gauge port valves to ensure an accurate test.
- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage around the Schrader-type valve with the service gauge port valve cap removed is considered normal. Install a new Schrader-type valve core if the seal leaks excessively.
- The A/C service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.
- Follow the procedure and the notes for electronic leak testing. Refer to: Electronic Leak Detection .

Refrigerant System Dye

A fluorescent refrigerant system dye wafer is added to the receiver drier desiccant bag at the factory to assist in refrigerant system leak diagnosis. This fluorescent dye wafer dissolves after about 30 minutes of continuous A/C operation. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Refer to: Fluorescent Dye Leak Detection .

Replacement desiccant bags, either separately or part of the receiver drier assembly, are equipped with a new fluorescent dye wafer. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks. If the system has been out of refrigerant through the winter the dye at the leak point may have oxidized and may not fluoresce. If this happens, recharge and operate the A/C system to circulate the oil and allow any residual dye to show up at the leak point. It is important to understand that dye adheres to the oil not the refrigerant; the refrigerant carries the oil out of the leak point.

NOTE: Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > DTC CHART: FRONT CONTROLS INTERFACE MODULE (FCIM) - DUAL AUTOMATIC TEMPERATURE CONTROL (DATC)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Network Diagnostic Trouble Codes (DTCs) (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle repair procedures, such as module reprogramming, often set network Diagnostic Trouble Codes (DTCs). Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery. REFER to: BATTERY, MOUNTING AND CABLES .

Condition	Possible Sources	Actions
A module does not communicate with the diagnostic scan tool	Fuse(s) Wiring, terminals or connectors	REFER to: MODULE COMMUNICATIONS NETWORK .

Externally Controlled Variable Displacement Compressor (EVDC) poor performance/does not operate correctly	Refer to Pinpoint Test	GO to Pinpoint Test R
Unable To Duplicate The Customer Concern And No Diagnostic Trouble Codes (DTCs) Present	Refer to Pinpoint Test	GO to Pinpoint Test C
HVAC functions are inoperative/do not operate correctly from touchscreen only	Communication network FCIM APIM	Refer to the appropriate article for the procedure.
Reduced outlet airflow	Plugged cabin air filter	INSPECT the cabin air filter. REFER to: Cabin Air Filter . If OK, DIAGNOSE for low refrigerant charge, A/C always commanded on or blower motor not operating correctly.
	Improper refrigerant level	CARRY OUT the refrigerant system tests. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT . If refrigerant charge is OK, GO to Pinpoint Test H
	Blower motor	GO to Pinpoint Test L
The air inlet door is inoperative	Refer to Pinpoint Test	GO to Pinpoint Test D
Incorrect or erratic direction of airflow from outlets	Refer to Pinpoint Test	GO to Pinpoint Test E
Insufficient, erratic or no heat	Refer to Pinpoint Test	GO to Pinpoint Test F
The A/C is inoperative	Refer to Pinpoint Test	GO to Pinpoint Test G
The A/C is always on - A/C mode always commanded ON	Refer to Pinpoint Test	GO to Pinpoint Test H
Temperature control is inoperative/does not operate correctly - driver side	Refer to Pinpoint Test	GO to Pinpoint Test I
Temperature control is inoperative/does not operate correctly - passenger side	Refer to Pinpoint Test	GO to Pinpoint Test J
The blower motor is inoperative	Refer to Pinpoint Test	GO to Pinpoint Test K
The blower motor does not operate correctly	Refer to Pinpoint Test	GO to Pinpoint Test L

Insufficient A/C cooling	Improper refrigerant level	CARRY OUT the refrigerant system tests. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT . If OK, DIAGNOSE for a temperature door actuator not operating correctly.
	Temperature door actuator	For inadequate temperature out of the driver side, GO to Pinpoint Test I For inadequate temperature out of the passenger side, GO to Pinpoint Test J
A/C pressure relief valve discharging	A/C pressure relief valve	CHECK the high side system pressure. REFER to: Specifications If the pressure is below the A/C pressure relief valve open pressure, INSTALL a new A/C pressure relief valve. Refer to the appropriate article for the procedure.
	High system pressure	CHECK the high side system pressure. REFER to: Specifications . If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the A/C system for a restriction.
Climate control does not operate only when remote start is used	IPC information display settings Non-Ford approved remote start system installed	VERIFY Remote Start - Message Center Set To Auto, or Remote Start - Message Center Set To Last User Settings. REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description . VERIFY module communications network operation. DIAGNOSE Diagnostic Trouble Codes (DTCs) if present.

Symptom Chart: Noise, Vibration, and Harshness (NVH)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
Noisy A/C compressor	A/C compressor pulley bearing worn	INSPECT the A/C compressor pulley bearing for roughness. If bearing roughness is found, INSTALL a new A/C compressor clutch and A/C clutch field coil. REFER to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .
Excessive hissing from the plenum when the A/C is on	Incorrect A/C refrigerant level	CHECK the A/C refrigerant level. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST A : P0532, P0533

Refer to Automatic Climate Control System for schematic and connector information.

Normal operation and Fault Conditions

The A/C pressure transducer receives a ground from the PCM. A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM. The A/C pressure transducer then sends a voltage to the PCM to indicate the A/C pressure.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0532	A/C Refrigerant Pressure Sensor "A" Circuit Low	This DTC sets if the feedback voltage is less than 0.26 volt for at least 2 seconds and the ambient air temperature is greater than 0 °C (32 °F).
P0533	A/C Refrigerant Pressure Sensor "A" Circuit High	This DTC sets if the feedback voltage is greater than 4.95 volts for at least 2 seconds and the ambient air temperature is greater than 0 °C (32 °F).

Possible Sources

- Wiring, terminals or connectors
- A/C pressure transducer

- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for loose or corroded PCM and A/C pressure transducer connections.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST A : P0532, P0533 > PINPOINT TEST A : P0532, P0533

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) PRESSURE SENSOR (ACP_PRESS) PID (PARAMETER IDENTIFICATION) WITH THE MANIFOLD GAUGE SET READINGS

Allow the A/C system to stabilize to the outside ambient temperature.

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM ACP_PRESS PID.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ± 103 kPa (15 psi)?

Yes	IGNORE the Diagnostic Trouble Codes (DTCs). REFER to the Symptom Chart .

No	GO to A2

A2 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM, 2.3L C1551B , 3.7L C1381B or 5.0L and 5.2L C175B .

Disconnect A/C pressure transducer C1260 .

Disconnect Turbocharger boost pressure sensor C1588 (if equipped).

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1		Ground
C1260-2		Ground
C1260-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to A3

A3 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	Ground
C1260-2	Ω	Ground
C1260-3	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR the circuit.

A4 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR AN OPEN

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1551B-56
C1260-2	Ω	C1551B-31
C1260-3	Ω	C1551B-52

3.7L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1381B-18
C1260-2	Ω	C1381B-52
C1260-3	Ω	C1381B-11

5.0L or 5.2L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C175B-18
C1260-2	Ω	C175B-52
C1260-3	Ω	C175B-11

Are the resistances less than 3 ohms?

Yes	GO to A5

No	REPAIR the circuit.

A5 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1260-2
C1260-1	Ω	C1260-3
C1260-2	Ω	C1260-3

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new A/C pressure transducer. REFER to: Air Conditioning (A/C) Pressure Transducer . TEST the system for normal operation. If the concern is still present, GO to A6

No	REPAIR the circuits.

A6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST B : P0645

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is provided to the A/C clutch relay. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0645	A/C Clutch Relay Control Circuit	This DTC sets when the PCM grounds the relay circuit and more voltage than expected is detected on the relay circuit. This DTC also sets when the relay circuit is off and no voltage is detected on the relay circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.

Possible Sources

- Wiring, terminals or connectors
- A/C clutch relay
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuses 23 (10A) and 42 (15A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST B : P0645 > PINPOINT TEST B : P0645

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE VOLTAGE TO THE A/C (AIR CONDITIONING) CLUTCH RELAY VOLTAGE SUPPLY CIRCUITS

Ignition OFF.

Disconnect A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 1	V	Ground
A/C clutch relay socket 3	V	Ground

Are the voltages greater than 11 volts?

Yes	GO to B2

No	VERIFY BJB fuses 23 (10A) and 42 (15A) are OK. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short. If OK, REPAIR the circuit.

B2 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY

Carry out the component test on the A/C clutch relay. Refer to Component Testing for schematic and connector information.

Did the relay pass the component test?

Yes	GO to B3

No	INSTALL a new A/C clutch relay.

B3 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect A/C clutch relay.

Disconnect PCM, 2.3L C1551B , 3.7L C1381B or 5.0L and 5.2L C175B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to B4

B4 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to B5

No	REPAIR the circuit.

B5 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR AN OPEN

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C1551B-2

3.7L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C1381B-15

5.0L or 5.2L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C175B-15

Is the resistance less than 3 ohms?

Yes	GO to B6

No	REPAIR the circuit.

B6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT

This diagnostic procedure tests the functions of the HVAC system and identifies the correct HVAC symptom pinpoint test.

Normal Operation and Fault Conditions

System Operation REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT

C1 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform PCM self-test.

Are any climate control related Diagnostic Trouble Codes (DTCs) present?

Yes	REFER to the PCM DTC chart .

No	GO to C2

C2 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform FCIM self-test.

Are any Diagnostic Trouble Codes (DTCs) present?

Yes	REFER to the FCIM DTC chart .

No	GO to C3

C3 CHECK THE BLOWER MOTOR OPERATION

Ignition ON.

Select panel mode.

Observe blower motor operation and select each blower motor speed.

Does the blower motor operate in all ranges?

Yes	GO to C4

No	If the blower motor does not operate in any setting, GO to Pinpoint Test K If the blower motor does not correctly change speeds or shut off, GO to Pinpoint Test L

C4 CHECK AIRFLOW OPERATION

Select the highest blower motor setting.

While observing the airflow, select each of the airflow positions (panel, panel/floor, floor, floor/defrost, defrost).

Is the airflow directed to the correct outlets?

Yes	GO to C5

No	GO to Pinpoint Test E

C5 VERIFY TEMPERATURE CONTROL OPERATION

Start the vehicle and allow it to reach normal operating temperature.

With the A/C off, select panel mode.

Change the driver and passenger temperature settings from the coldest to the warmest and back to the coldest.

Does the temperature change between very warm to cool?

Yes	GO to C6

No	If the temperature does not get very warm, GO to Pinpoint Test F If the driver side temperature does not change at all, GO to Pinpoint Test I If the passenger side temperature does not change at all, GO to Pinpoint Test J

C6 VERIFY THE AIR CONDITIONING COMPRESSOR DOES NOT ENGAGE WITH A/C (AIR CONDITIONING) OFF

With the engine running and the A/C off, select panel mode.

Select the coldest temperature setting.

Is the outlet temperature close to ambient air temperature?

Yes	GO to C7

No	If the driver side temperature is warmer than ambient air temperature, GO to Pinpoint Test I If the passenger side temperature is warmer than ambient air temperature, GO to Pinpoint Test J If the outlet temperature is significantly colder than ambient air temperature and the A/C compressor clutch is engaged, GO to Pinpoint Test H

C7 VERIFY THE A/C (AIR CONDITIONING) COMPRESSOR IS OPERATIONAL IN THE A/C (AIR CONDITIONING) MODE

Make sure the ambient air temperature is above 0 °C (32 °F).

With the engine running, select panel mode.

Press the A/C button (indicator on).

Is the A/C compressor operational when the panel and A/C button (indicator on) is pressed?

Yes	GO to C8

No	GO to Pinpoint Test G

C8 CHECK THE RECIRCULATED AIR OPERATION

With the engine running, press the recirculated air button (indicator off).

Select panel mode.

Select the highest blower motor setting.

Observe airflow noise.

Press the recirculated air button (indicator on).

Does the airflow noise increase when the recirculated air mode is selected (indicator on)?

Yes	GO to C9

No	GO to Pinpoint Test D

C9 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) LEFT DISCHARGE FLOOR TEMPERATURE (LDFTEMP) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the FCIM Parameter Identifications (PIDs).

Monitor the LDFTEMP PID.

Is the temperature coming out of the driver footwell vent similar to the PID?

Yes	GO to C10

No	GO to Pinpoint Test M

C10 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) LEFT DISCHARGE PANEL TEMPERATURE (LDPT) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view the FCIM Parameter Identifications (PIDs).

Monitor the LDPT PID.

Is the temperature coming out of the driver side register similar to the PID?

Yes	GO to C11

No	GO to Pinpoint Test M

C11 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) INTERIOR TEMPERATURE SENSOR (INT_TEMP) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool view the FCIM Parameter Identifications (PIDs).

Monitor the INT_TEMP PID.

Is the air temperature at the cabin temperature sensor similar to the PID?

Yes	GO to C12

No	GO to Pinpoint Test N

C12 CHECK THE TOUCHSCREEN CONTROLS OPERATION

Using the touchscreen controls, select each climate control function.

Using the touchscreen controls, select each audio control function.

Do all touchscreen controls operate?

Yes	The system is operating correctly.

No	Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

To rotate the air inlet door actuator, the FCIM supplies voltage and ground to the air inlet door actuator through the door actuator motor circuits. To reverse the air inlet door actuator rotation, the FCIM reverses the voltage and ground circuits. The air inlet door actuator feedback resistors are supplied a ground from the FCIM by the air inlet door actuator return circuits and a 5-volt reference voltage on the air inlet door actuator reference circuits. The FCIM uses the actuator feedback resistor wiper arm position and the voltage on the air distribution door actuator feedback circuits to determine the air inlet door actuator position.

During an actuator calibration cycle, the FCIM drives the air inlet door until the door reaches both internal stops in the FCIM case. If the air inlet door is temporarily obstructed or binding during a calibration cycle, the FCIM may interpret this as the actual end of travel for the door. When this condition occurs and the FCIM commands the actuator to its end of travel, the air intake may not be from the expected source.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1083:11	Recirculation Damper Motor: Circuit Short To Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1083:12	Recirculation Damper Motor: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1083:13	Recirculation Damper Motor: Circuit Open	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit. The motor cannot move.
B11F0:12	Air Intake Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit,

		indicating a short to voltage.
B11F0:14	Air Intake Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors
- Air inlet door actuator
- Air inlet door binding or stuck
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Air distribution door actuator C232 .

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Passenger side temperature door actuator C2092 .

Disconnect Air inlet door actuator C282 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1		Ground

C282-2	V	Ground
C282-3	V	Ground
C282-5	V	Ground
C282-6	V	Ground

Is there any voltage present?

Yes	REPAIR the circuit.

No	GO to D2

D2 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	Ω	Ground
C282-2	Ω	Ground
C282-3	Ω	Ground
C282-5	Ω	Ground
C282-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to D3

No	REPAIR the circuit.

D3 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	Ω	C2402A-2
C282-2	Ω	C2402A-16

C282-3	Ω	C2402A-3
C282-5	Ω	C2402A-24
C282-6	Ω	C2402A-25

Are the resistances less than 3 ohms?

Yes	GO to D4

No	REPAIR the circuit.

D4 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	Ω	C282-2
C282-1	Ω	C282-3
C282-1	Ω	C282-5
C282-1	Ω	C282-6
C282-2	Ω	C282-3
C282-2	Ω	C282-5
C282-2	Ω	C282-6
C282-3	Ω	C282-5
C282-3	Ω	C282-6
C282-5	Ω	C282-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new air inlet door actuator. REFER to: Air Inlet Door Actuator . TEST the system for normal operation. If the concern is still present, GO to D5

No	REPAIR the circuit.

D5 CHECK FOR CORRECT FRONT CONTROLS INTERFACE MODULE OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

To rotate the air distribution door actuator, the FCIM supplies voltage and ground to the air distribution door actuator through the door actuator motor circuits. To reverse the air distribution door actuator rotation, the FCIM reverses the voltage and ground circuits. The air distribution door actuator feedback resistors are supplied a ground from the FCIM by the air distribution door actuator return circuits and a 5-volt reference voltage on the air distribution door actuator reference circuits. The FCIM uses the actuator feedback resistor wiper arm position and the voltage on the air distribution door actuator feedback circuits to determine the air distribution door actuator position.

During an actuator calibration cycle, the FCIM drives the air distribution door until the door reaches both internal stops in the FCIM case. If the air distribution door is temporarily obstructed or binding during a calibration cycle, the FCIM may interpret this as the actual end of travel for the door. When this condition occurs and the FCIM commands the actuator to its end of travel, the airflow may not be from the expected outlets.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1086:11	Air Distribution Damper Motor: Circuit Short to Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.

B1086:12	Air Distribution Damper Motor: Circuit Short to Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1086:13	Air Distribution Damper Motor: Circuit Open	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit. The motor cannot move.
B11E7:12	Air Distribution Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.
B11E7:14	Air Distribution Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Passenger side temperature door actuator C2092 .

Disconnect Air inlet door actuator C282 .

Disconnect Air distribution door actuator C232 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	V	Ground
C232-2	V	Ground
C232-3	V	Ground
C232-5	V	Ground
C232-6	V	Ground

Is there any voltage present?

Yes	REPAIR the circuit.

No	GO to E2

E2 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	Ground
C232-2	Ω	Ground
C232-3	Ω	Ground
C232-5	Ω	Ground
C232-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to E3

No	REPAIR the circuit.

E3 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	C2402A-2
C232-2	Ω	C2402A-22
C232-3	Ω	C2402A-3
C232-5	Ω	C2402A-20
C232-6	Ω	C2402A-21

Are the resistances less than 3 ohms?

Yes	GO to E4

No	REPAIR the circuit.

E4 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	C232-2
C232-1	Ω	C232-3
C232-1	Ω	C232-5
C232-1	Ω	C232-6
C232-2	Ω	C232-3
C232-2	Ω	C232-5
C232-2	Ω	C232-6
C232-3	Ω	C232-5
C232-3	Ω	C232-6

C232-5	Ω	C232-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new air distribution door actuator, REFER to: Air Distribution Door Actuator . TEST the system for normal operation. If the concern is still present, GO to E5

No	REPAIR the circuit.

E5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT

Normal Operation and Fault Conditions

When the engine is at operating temperature hot coolant flows from the coolant pump through the heater core and back to the coolant pump. Correct coolant temperatures are critical for good heater performance.

Possible Sources

- Wiring, terminals or connectors

- Temperature door actuator(s)
- Air trapped in the coolant system
- Heater core

Visual Inspection and Diagnostic Pre-checks

- Inspect for low engine coolant level.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT > PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT

F1 CHECK FOR CORRECT ENGINE COOLANT LEVEL

Ignition OFF.

Check the engine coolant level.

Is the engine coolant at the correct level as indicated on the engine coolant recovery reservoir?

Yes	GO to F3

No	GO to F2

F2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS

Pressure test the cooling system for leaks. Refer to the appropriate article for the procedure..

Does the engine cooling system leak?

Yes	REPAIR the engine coolant leak. Refer to the appropriate article for the procedure. TEST the system for normal operation.

No	FILL and BLEED the cooling system. Refer to the appropriate article for the procedure. After filling and bleeding the cooling system, GO to F3

F3 CHECK FOR COOLANT FLOW TO THE HEATER CORE

Run the motor until it reaches normal operating temperature. Select the floor position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting.

Increase engine speed to 3, 500 RPM and hold for 30 seconds.

Allow the engine to idle for 30 seconds.

Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.

Is the heater core inlet hose hot?

Yes	GO to F4

No	BLEED the cooling system per the cooling system draining and vacuum filling general procedure. Refer to the appropriate article for the procedure. After bleeding the cooling system, GO to F4

F4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE

Using a suitable temperature measuring device, measure the heater core outlet hose temperature.

Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17 °C [10-30 °F])?

Yes	DIAGNOSE for a temperature door actuator not operating correctly. For inadequate temperature out of the driver side, GO to Pinpoint Test I For inadequate temperature out of the passenger side, GO to Pinpoint Test J

No	INSTALL a new heater core. REFER to: Heater Core .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Control System Logic REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

Possible Sources

- Wiring, terminals or connectors
- Communication network
- Ambient Air Temperature (AAT) sensor
- A/C pressure transducer
- Evaporator temperature sensor

- Electric cooling fan
- Intake Air Temperature (IAT) or other temperature sensors
- Active grille shutters
- FCIM
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuses 23 (10A) and 42 (15A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 CHECK THE A/C (AIR CONDITIONING) SYSTEM PRESSURE

Ignition OFF.

With the R-134a manifold gauge set connected, check the A/C system pressure.

Is the A/C system pressure above 290 kPa (42 psi)?

Yes	GO to G2

No	CHECK the A/C system for leaks. REFER to: Electronic Leak Detection . REFER to: Fluorescent Dye Leak Detection . After the leak is repaired, RECHARGE the A/C system. REFER to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

G2 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the network test.

Do the FCIM and the PCM pass the network test?

Yes	GO to G3

No	DIAGNOSE the FCIM or PCM does not communicate with the diagnostic scan tool.

	REFER to: MODULE COMMUNICATIONS NETWORK .

G3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) PRESSURE SENSOR (ACP_PRESS) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

With a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM ACP_PRESS PID.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ± 103 kPa (15 psi)?

Yes	GO to G4

No	DIAGNOSE the A/C pressure transducer. GO to Pinpoint Test A

G4 ELECTRIC COOLING FAN FUNCTIONAL CHECK

Ignition ON.

Using a diagnostic scan tool, carry out the PCM KOEO self-test.

Does the electric cooling fan operate during the KOEO self-test?

Yes	GO to G5

No	DIAGNOSE the electric cooling fan operation. REFER to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

NOTE: Compare multiple engine sensor readings to the ambient temperature to determine sensors are reading correctly. A faulty sensor can cause the PCM to disable the A/C with or without a DTC.

G5 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) INTAKE AIR TEMPERATURE (IAT) PID (PARAMETER IDENTIFICATION) AND THE OTHER TEMPERATURE SENSOR READINGS TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Allow the vehicle exterior and interior to stabilize to ambient temperature. This can take a soak period of at least 6 hours.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the CHT, ECT, IAT, MAPT, and AAT Parameter Identifications (PIDs) (as applicable).

Are the temperature values similar (typically within 18 °C (32.4 °F)?

Yes	GO to G6

No	DIAGNOSE the suspect temperature sensor. REFER to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

G6 COMPARE THE EVAPORATOR TEMPERATURE SENSOR TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Ignition OFF.

Disconnect Evaporator temperature sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1 (component side)	Ω	C296-2 (component side)

Compare the resistance values to the table below:

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AAT PID.

Is the resistance within the specified values for the temperatures?

Yes	GO to G7

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

G7 VERIFY THE GRILLE SHUTTER OPERATION USING THE PCM (POWERTRAIN CONTROL MODULE) GRILL SHUTTER A POSITION - COMMANDED (GRILL_A_CMD) PID (PARAMETER IDENTIFICATION)

Start the engine and allow it to idle for at least 30 seconds to allow for the grille shutter calibration to complete.

Using a diagnostic scan tool, view PCM PID.

Using a diagnostic scan tool, select the PCM PID GRILL_A_CMD and command the grille shutter from 100% (open) to 0% (closed) while observing the grille shutter operation from the front of the vehicle.

Does the grille shutter fully open and close when commanded by the scan tool?

Yes	GO to G8

No	DIAGNOSE the active grille shutter is inoperative or does not operate correctly. REFER to: Active Grille Shutter .

G8 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH (CC_SW_AC) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) ON

Using a diagnostic scan tool, view FCIM Parameter Identifications (PIDs).

Monitor the CC_SW_AC PID.

Does the PID display Active?

Yes	GO to G9

No	GO to G17

G9 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) ON

Start the engine.

Using a diagnostic scan tool, monitor the PCM AC_REQ PID.

On the HVAC controls, select PANEL and then press the A/C button (indicator on).

Does the PID display Yes when the button is pressed?

Yes	GO to G11

No	GO to G10

G10 RESET THE AMBIENT AIR TEMPERATURE (AAT) SENSOR

On the HVAC controls, press the A/C (air conditioning) and Recirc buttons simultaneously, then release both. Within 2 seconds press A/C button again.

Start the engine.

On the HVAC controls, set the temperature to full cold, select PANEL and select the A/C button (indicator on).

Does the A/C compressor turn on?

Yes	RETEST the A/C system for normal operation. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT .

No	GO to G11

G11 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) COMPRESSOR COMMANDED STATE (ACC_CMD) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) COMMANDED ON

Using a diagnostic scan tool, activate the PCM ACC_CMD PID.

Does the A/C compressor turn on?

Yes	GO to G18

No	GO to G12

G12 CHECK THE VOLTAGE TO THE A/C (AIR CONDITIONING) CLUTCH RELAY

Ignition OFF.

Disconnect the A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 1		Ground
A/C clutch relay socket 3		Ground

Are the voltages greater than 11 volts?

Yes	GO to G13

No	VERIFY BJB fuses 23 (10A) and 42 (15A) are OK. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

G13 BYPASS THE A/C (AIR CONDITIONING) CLUTCH RELAY

Ignition OFF.

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 3		A/C clutch relay socket 5

Ignition ON.

Does the A/C compressor clutch engage?

Yes	REMOVE the fused jumper wire. INSTALL a new A/C clutch relay.

No	LEAVE the fused jumper wire installed. GO to G14

G14 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

Disconnect A/C compressor clutch field coil C100 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-1		Ground

Is the voltage greater than 11 volts?

Yes	REMOVE the fused jumper wire. GO to G15

No	REMOVE the fused jumper wire. REPAIR the circuit.

G15 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-2		Ground

Is the resistance less than 3 ohms?

Yes	GO to G16

No	REPAIR the circuit.

G16 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH AIR GAP

Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley. REFER to: Air Conditioning (A/C) Clutch Air Gap Adjustment .

Is the A/C compressor clutch air gap greater than 0.6 mm (0.0236 in)?

Yes	ADJUST the A/C compressor clutch air gap. REFER to: Air Conditioning (A/C) Clutch Air Gap Adjustment .

No	INSTALL a new A/C compressor clutch and A/C clutch field coil. REFER to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .

G17 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

G18 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Disconnect and inspect all PCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals/pins

pushed-out pins - replace pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Control System Logic REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P1464	A/C Demand Out Of Self Test Range	This DTC sets when the PCM senses an A/C request during a PCM self-test.

Possible Sources

- A/C clutch relay
- Wiring, terminals or connectors
- PCM
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

H1 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY

Carry out the component test on the A/C clutch relay. Refer to Component Testing for schematic and connector information.

Did the relay pass the component test?

Yes	GO to H2

No	INSTALL a new A/C clutch relay.

H2 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect A/C compressor clutch field coil C100 .

Disconnect the A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to H3

H3 COMPARE THE EVAPORATOR TEMPERATURE SENSOR TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Ignition OFF.

Allow the vehicle exterior and interior to stabilize to ambient temperature.

Disconnect Evaporator Temperature Sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1 (component side)	Ω	C296-2 (component side)

Compare the resistance values to the table below:

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AAT PID.

Is the resistance within the specified values for the temperatures?

Yes	GO to H4

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

H4 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH STATUS (CC_SW_AC) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view FCIM Parameter Identifications (PIDs).

Monitor the CC_SW_AC PID.

Select panel mode, press and release the A/C button (indicator off) on the FCIM controls.

Does the PID display Active when pressed and Inactive when released?

Yes	GO to H5

No	GO to H8

H5 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR (ACP_PRESS) PARAMETER IDENTIFICATION (PID)

Using a diagnostic scan tool, view the PCM Parameter Identification (PIDs).

With a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM Parameter Identification (PID) ACP_PRESS.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ± 103 kPa (15 psi)?

Yes	GO to H6

No	INSTALL a new A/C pressure transducer. REFER to: Air Conditioning (A/C) Pressure Transducer .

H6 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) OFF

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AC_REQ PID.

While in panel mode, release the A/C button (indicator off) on the FCIM controls.

Does the PID display No?

Yes	GO to H9

No	GO to H7

H7 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH FCIM (FRONT CONTROLS INTERFACE MODULE) DISCONNECTED

Ignition ON.

Disconnect FCIM C2402A .

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AC_REQ PID.

Does the PID display No?

Yes	GO to H9

No	GO to H8

H8 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Connect FCIM C2402A .

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

H9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals/pins

pushed-out pins - replace pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - DRIVER SIDE

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Temperature Door Actuator - Driver side, REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

During an actuator calibration cycle, the FCIM drives the temperature door until the door reaches both internal stops in the HVAC case. If the temperature door is temporarily obstructed or binding during a calibration cycle, the module may interpret this as the actual end of travel for the door. When this condition occurs and the module commands the actuator to its end of travel, the airflow may not be the expected temperature.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1081:11	Left Temperature Damper Motor: Circuit Short To Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1081:12	Left Temperature Damper Motor: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1081:13	Left Temperature Damper Motor: Open Circuit	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is

		applied to drive the motor, indicating an open circuit. The motor cannot move.
B11E5:12	Left HVAC Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.
B11E5:14	Left HVAC Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors
- Driver side temperature door actuator
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - DRIVER SIDE > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - DRIVER SIDE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK THE DRIVER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Air distribution door actuator C232 .

Disconnect Air inlet door actuator C282 .

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Passenger side temperature door actuator C2092 .

Disconnect Driver side temperature door actuator C2091 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	V	Ground
C2091-2	V	Ground
C2091-3	V	Ground
C2091-5	V	Ground
C2091-6	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I2

I2 CHECK THE DRIVER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	Ground
C2091-2	Ω	Ground
C2091-3	Ω	Ground
C2091-5	Ω	Ground
C2091-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to I3

No	REPAIR the circuit.

I3 CHECK THE DRIVER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	C2402A-2
C2091-2	Ω	C2402A-10
C2091-3	Ω	C2402A-3
C2091-5	Ω	C2402A-8
C2091-6	Ω	C2402A-9

Are the resistances less than 3 ohms?

Yes	GO to I4

No	REPAIR the circuit.

I4 CHECK THE DRIVER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	C2091-2
C2091-1	Ω	C2091-3
C2091-1	Ω	C2091-5
C2091-1	Ω	C2091-6
C2091-2	Ω	C2091-3
C2091-2	Ω	C2091-5
C2091-2	Ω	C2091-6
C2091-3	Ω	C2091-5
C2091-3	Ω	C2091-6
C2091-5	Ω	C2091-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new driver side temperature door actuator. REFER to: Driver Side Temperature Door Actuator . TEST the system for normal operation. If the concern is still present, GO to I5

No	REPAIR the circuit.

I5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST J : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - PASSENGER SIDE

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Temperature Door Actuator - Passenger side, REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

During an actuator calibration cycle, the FCIM drives the temperature door until the door reaches both internal stops in the HVAC case. If the temperature door is temporarily obstructed or binding during a calibration cycle, the module may interpret this as the actual end of travel for the door. When this condition occurs and the module commands the actuator to its end of travel, the airflow may not be the expected temperature.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1082:11	Right Temperature Damper Motor: Circuit Short To Ground	This DTC sets when the module senses lower than expected

		voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1082:12	Right Temperature Damper Motor: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1082:13	Right Temperature Damper Motor: Open Circuit	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit. The motor cannot move.
B11E6:12	Right HVAC Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.
B11E6:14	Right HVAC Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors
- Passenger side temperature door actuator
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST J : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - PASSENGER SIDE > PINPOINT TEST J : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY - PASSENGER SIDE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 CHECK THE PASSENGER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Air distribution door actuator C232 .

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Air inlet door actuator C282 .

Disconnect Passenger side temperature door actuator C2092 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2092-1	V	Ground
C2092-2	V	Ground
C2092-3	V	Ground
C2092-5	V	Ground
C2092-6	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to J2

J2 CHECK THE PASSENGER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2092-1	Ω	Ground

C2092-2	Ω	Ground
C2092-3	Ω	Ground
C2092-5	Ω	Ground
C2092-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to J3

No	REPAIR the circuit.

J3 CHECK THE PASSENGER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2092-1	Ω	C2402A-2
C2092-3	Ω	C2402A-3

Positive Lead	Measurement / Action	Negative Lead
C2092-2	Ω	C2402B-18
C2092-5	Ω	C2402B-13
C2092-6	Ω	C2402B-14

Are the resistances less than 3 ohms?

Yes	GO to J4

No	REPAIR the circuit.

J4 CHECK THE PASSENGER SIDE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2092-1	Ω	C2092-2
C2092-1	Ω	C2092-3

C2092-1	Ω	C2092-5
C2092-1	Ω	C2092-6
C2092-2	Ω	C2092-3
C2092-2	Ω	C2092-5
C2092-2	Ω	C2092-6
C2092-3	Ω	C2092-5
C2092-3	Ω	C2092-6
C2092-5	Ω	C2092-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new passenger side temperature door actuator. REFER to: Passenger Side Temperature Door Actuator . TEST the system for normal operation. If the concern is still present, GO to J5

No	REPAIR the circuit.

J5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL

AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST K : THE BLOWER MOTOR IS INOPERATIVE

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is supplied to the blower motor relay switched contact from the BJB. Ground to the relay coil is a dedicated circuit. When the blower motor relay coil receives power from the FCIM, the relay coil is energized and voltage is delivered to the blower motor speed control. Power and ground for the blower motor is provided by the blower motor speed control. The FCIM sends a PWM signal to the blower motor speed control to control the blower speed.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B10AF:11	Blower Fan Relay: Circuit Short To Ground	This DTC sets when the module senses low voltage on the relay coil voltage circuit when the module is energizing the circuit. The blower motor relay is permanently inactive.
B10AF:15	Blower Fan Relay: Circuit Short To Battery or Open	This DTC sets when the module senses greater than expected voltage on the blower motor relay coil voltage circuit, indicating an open circuit or a short to voltage. The blower motor relay is inactive when circuit is open; the blower motor relay is on all the time when shorted to battery.
B10B9:12	Blower Control: Circuit Short To Battery	This DTC sets when the module senses high voltage on the blower motor control PWM circuit, indicating a short directly to voltage. The blower motor is inoperative.
B10B9:14	Blower Control: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the blower motor control PWM circuit, indicating a short directly to ground or an open circuit. The blower motor runs at full speed if the circuit is shorted to ground. The blower motor is inoperative if the circuit is open.

- Fuse
- Blower motor relay
- Blower motor
- Blower motor speed control
- FCIM

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuse 10 (40A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST K : THE BLOWER MOTOR IS INOPERATIVE > PINPOINT TEST K : THE BLOWER MOTOR IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

K1 CHECK THE BLOWER MOTOR RELAY

Ignition OFF.

Disconnect Blower motor relay.

Carry out the component test on the blower motor relay. Refer to Component Testing for schematic and connector information.

Did the relay pass the component test?

Yes	GO to K2

No	INSTALL a new blower motor relay.

K2 CHECK THE BLOWER MOTOR RELAY SWITCH CONTACT SUPPLY VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 3		Ground

Is the voltage greater than 11 volts?

Yes	GO to K3

No	VERIFY BJB fuse 10 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

K3 CHECK THE BLOWER MOTOR RELAY COIL GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 1	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to K4

No	REPAIR the circuit.

K4 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR A SHORT TO GROUND

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to K5

No	REPAIR the circuit.

K5 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 2	Ω	C2402A-11

Is the resistance less than 3 ohms?

Yes	GO to K6

No	REPAIR the circuit.

K6 CHECK THE BLOWER MOTOR SPEED CONTROL VOLTAGE CIRCUIT

Disconnect Blower motor speed control C297 .

Connect Blower motor relay.

Connect FCIM C2402A .

Ignition ON.

Select PANEL on the HVAC controls.

Select the highest blower motor setting.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-5		Ground

Is the voltage greater than 11 volts?

Yes	GO to K7

No	REPAIR the circuit.

K7 CHECK THE BLOWER MOTOR SPEED CONTROL GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-1		Ground

Is the resistance less than 3 ohms?

Yes	GO to K8

No	REPAIR the circuit.

K8 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to K9

K9 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR AN OPEN

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-2	Ω	C2402A-23

Is the resistance less than 3 ohms?

Yes	GO to K10

No	REPAIR the circuit.

K10 CHECK THE OUTPUTS TO THE BLOWER MOTOR

Disconnect Blower motor C2066 .

Connect Blower motor speed control C297 .

Connect FCIM C2402A .

Ignition ON.

Select PANEL on the HVAC controls.

Select the highest blower motor setting.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2066-1		C2066-2

Is the voltage greater than 11 volts?

Yes	INSTALL a new blower motor. REFER to: Blower Motor .

No	GO to K11

K11 CHECK THE CIRCUITS TO THE BLOWER MOTOR FOR AN OPEN

Ignition OFF.

Disconnect Blower motor speed control C297 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-6	Ω	C2066-1
C297-5	Ω	C2066-2

Are the resistances less than 3 ohms?

Yes	GO to K12

No	REPAIR the circuit in question.

K12 CHECK THE BLOWER MOTOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2066-1	Ω	C2066-2

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new blower motor speed control. REFER to: Blower Motor Speed Control . TEST the system for normal operation. If the concern is still present, GO to K13

No	REPAIR the circuits.

K13 CHECK FOR CORRECT FRONT CONTROLS INTERFACE MODULE (FCIM) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST L : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is supplied to the blower motor relay switched contact from the BJB. Ground to the relay coil is a dedicated circuit. When the blower motor relay coil receives power from the FCIM, the relay coil is energized and voltage is delivered to the blower motor speed control. Power and ground for the blower motor is provided by the blower motor speed control. The FCIM sends a PWM signal to the blower motor speed control to control the blower speed.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B10AF:15	Blower Fan Relay: Circuit Short To Battery or Open	This DTC sets when the module senses greater than expected voltage on the blower relay coil voltage circuit, indicating an open circuit or a short to voltage. Blower relay is inactive when circuit is open; blower relay is on all the time when shorted to battery.

B10B9:14	Blower Control: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the blower motor control PWM circuit, indicating a short directly to ground or an open circuit. The blower motor runs at full speed if the circuit is shorted to ground. The blower motor is inoperative if the circuit is open.

Possible Sources

- Wiring, terminals or connectors
- Blower motor relay

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST L : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY > PINPOINT TEST L : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

L1 VERIFY THE BLOWER MOTOR OPERATION

Ignition ON.

Select PANEL on the HVAC controls. Adjust the blower motor setting to the minimum and maximum settings.

Does the blower motor operate at any setting?

Yes	GO to L2

No	GO to Pinpoint Test K

L2 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Blower motor speed control C297 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-23		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to L3

L3 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-23	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to L4

No	REPAIR the circuit.

L4 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect Blower motor relay.

Connect FCIM C2402A .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C2402A-11		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to L5

L5 CHECK THE BLOWER MOTOR OPERATION WITH THE BLOWER MOTOR RELAY DISCONNECTED

Connect FCIM C2402A .

Ignition OFF.

Connect Blower motor speed control C297 .

Ignition ON.

Operate the system and determine if the concern is still present.

Does the fan still operate all the time?

Yes	REPAIR the blower motor speed control voltage circuit CH402 (YE/GN) for a short to voltage.

No	GO to L6

L6 CHECK FOR CORRECT BLOWER MOTOR SPEED CONTROL OPERATION

Ignition OFF.

Disconnect and inspect all the blower motor speed control connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the blower motor speed control connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	INSTALL a new blower motor speed control. REFER to: Blower Motor Speed Control . TEST the system for normal operation. If the concern is still present, GO to L7

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

L7 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST M : AIR DISCHARGE TEMPERATURE SENSOR CIRCUIT FAULTS

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

The 2 air discharge temperature sensors contain a thermistor. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B10B5:11	Left Panel Air Discharge Temperature: Circuit Short To	This DTC sets when the FCIM senses erratic voltages from the

	Ground	left panel air discharge temperature sensor.
B10B5:15	Left Panel Air Discharge Temperature: Circuit Short To Battery or Open	This DTC sets when the FCIM senses erratic voltages from the left panel air discharge temperature sensor.
B10B6:11	Left Floor Air Discharge Temperature: Circuit Short To Ground	This DTC sets when the FCIM senses erratic voltages from the left floor air discharge temperature sensor.
B10B6:15	Left Floor Air Discharge Temperature: Circuit Short To Battery or Open	This DTC sets when the FCIM senses erratic voltages from the left floor air discharge temperature sensor.

Possible Sources

- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST M : AIR DISCHARGE TEMPERATURE SENSOR CIRCUIT FAULTS > PINPOINT TEST M : AIR DISCHARGE TEMPERATURE SENSOR CIRCUIT FAULTS

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

M1 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR OUTPUT VOLTAGE CIRCUIT

Ignition OFF.

Disconnect the suspect air discharge temperature sensor:

Driver side register air discharge temperature sensor C2438

Driver side footwell air discharge temperature sensor C2436

Ignition ON.

Turn the HVAC system on.

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-1		C2436-2

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-1		C2438-2

Is the voltage between 4.7 and 5.1 volts?

Yes	INSTALL a new air discharge temperature sensor. Refer to the appropriate article for the procedure. CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If Diagnostic Trouble Code (DTC) returns, GO to M9

No	GO to M2

M2 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect FCIM C2402A .

Disconnect FCIM C2402B .

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-1		Ground

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to M3

M3 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL RETURN CIRCUIT FOR A SHORT TO VOLTAGE

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-2		Ground

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to M4

M4 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-1	Ω	Ground

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to M5

No	REPAIR the circuit.

M5 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL RETURN CIRCUIT FOR A

SHORT TO GROUND

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-2	Ω	Ground

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-1	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to M6

No	REPAIR the circuit.

M6 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-1	Ω	C2402B-4

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-2	Ω	C2402B-5

Are the resistances less than 3 ohms?

Yes	GO to M7

No	REPAIR the circuit.

M7 CHECK THE AIR DISCHARGE TEMPERATURE SENSOR SIGNAL RETURN CIRCUIT FOR AN OPEN

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-2	Ω	C2402A-2

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-1	Ω	C2402A-2

Are the resistances less than 3 ohms?

Yes	GO to M8

No	REPAIR the circuit.

M8 CHECK AIR DISCHARGE TEMPERATURE SENSOR SIGNAL CIRCUIT AND THE SIGNAL RETURN FOR A SHORT TO TOGETHER

Measure:

Driver side footwell air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2436-1	Ω	C2436-2

Driver side register air discharge temperature sensor

Positive Lead	Measurement / Action	Negative Lead
C2438-1	Ω	C2438-2

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new air discharge temperature sensor.Refer to the appropriate article for the procedure. CLEAR the Diagnostic Trouble Codes (DTCs). REPEAT the self-test. If Diagnostic Trouble Code (DTC) returns, GO to M9

No	REPAIR the circuit.

M9 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST N : B105A:12, B105A:14, B1A61:11, B1A61:15, B1A69:12, B1A69:14

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

In-Vehicle Temperature and Humidity Sensor, REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B105A:12	Cabin Temperature Sensor Fan: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the in-vehicle temperature and humidity sensor fan motor circuit. The in-vehicle temperature and humidity sensor fan motor is inactive.
B105A:14	Cabin Temperature Sensor Fan: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the in-vehicle temperature and humidity sensor fan motor circuit, indicating an open or a short directly to ground. The in-vehicle temperature and humidity sensor fan motor is active.

B1A61:11	Cabin Temperature Sensor: Circuit Short to Ground	This DTC sets when the module senses lower than expected voltage on the in-vehicle temperature and humidity sensor feedback circuit, indicating a short to ground.
B1A61:15	Cabin Temperature Sensor: Circuit Short to Battery or Open	This DTC sets when the module senses greater than expected voltage on the in-vehicle temperature and humidity sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.
B1A69:12	Humidity Sensor: Circuit Short To Battery	This DTC sets when the module senses greater than expected voltage on the in-vehicle temperature and humidity sensor humidity input circuit, indicating a short to voltage.
B1A69:14	Humidity Sensor: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the in-vehicle temperature and humidity sensor humidity input circuit, indicating a short to ground or an open circuit or sensor.

Are the resistances greater than 10, 000 ohms?

Yes	GO to N5

No	REPAIR the circuit.

N5 CHECK FOR CORRECT IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR OPERATION

Inspect the disconnected connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all disconnected connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	INSTALL a new in-vehicle temperature sensor. REFER to: In-Vehicle Temperature and Humidity Sensor . TEST the system for normal operation. If the concern is still present, GO to N6

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

N6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the

	appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST O : B1A63:11, B1A63:15, B1A64:11, B1A64:15

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Sunload Sensor, REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1A63:11	Right Solar Sensor: Circuit Short To Ground	This DTC sets when the control module senses lower than expected voltage on the RH sensor feedback circuit, indicating a short to ground.
B1A63:15	Right Solar Sensor: Circuit Short To Battery or Open	This DTC sets when the control module senses higher than expected voltage on the RH sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.
B1A64:11	Left Solar Sensor: Circuit Short To Ground	This DTC sets when the control module senses lower than expected voltage on the LH sensor feedback circuit, indicating a short to ground.
B1A64:15	Left Solar Sensor: Circuit Short To Battery or Open	This DTC sets when the control module senses higher than expected voltage on the LH sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

Possible Sources

- Wiring, terminals or connectors
- Sunload sensor

- FCIM
- Inspect loose or corroded FCIM and sunload sensor connections.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST O : B1A63:11, B1A63:15, B1A64:11, B1A64:15 > PINPOINT TEST O : B1A63:11, B1A63:15, B1A64:11, B1A64:15

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

O1 CHECK THE SUNLOAD SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Sunload sensor C286 .

Disconnect FCIM C2402B .

Disconnect BCM C2280B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C286-1	V	Ground
C286-2	V	Ground
C286-3	V	Ground
C286-4	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to O2

O2 CHECK THE SUNLOAD SENSOR CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C286-1	Ω	Ground
C286-2	Ω	Ground
C286-3	Ω	Ground
C286-4	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to O3

No	REPAIR the circuit.

O3 CHECK THE SUNLOAD SENSOR SIGNAL CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C286-1	Ω	C2402B-22
C286-3	Ω	C2402B-21

Positive Lead	Measurement / Action	Negative Lead
C286-2	Ω	C2280B-24
C286-4	Ω	C2280B-22

Are the resistances less than 3 ohms?

Yes	GO to O4

No	REPAIR the circuit.

O4 CHECK THE SUNLOAD SENSOR SIGNAL CIRCUITS FOR A SHORT TO EACH OTHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C286-1	Ω	C286-2
C286-1	Ω	C286-3
C286-1	Ω	C286-4

C286-2	Ω	C286-3
C286-2	Ω	C286-4
C286-3	Ω	C286-4

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new sunload sensor. REFER to: Sunload Sensor . TEST the system for normal operation. If the concern is still present, GO to O5

No	REPAIR the circuit.

O5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST P : B1B71:11, B1B71:15

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Evaporator Temperature Sensor, REFER to: Climate Control System - Vehicles With: Dual Automatic

Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1B71:11	Evaporator Temperature Sensor: Circuit Short To Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground. The module defaults to calculated evaporator temperature and the compressor is shut off.
B1B71:15	Evaporator Temperature Sensor: Circuit Short To Battery or Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit. The module defaults to calculated evaporator temperature and the compressor is shut off.

Possible Sources

- Wiring, terminals or connectors
- Evaporator temperature sensor
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST P : B1B71:11, B1B71:15 > PINPOINT TEST P : B1B71:11, B1B71:15

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

P1 CHECK THE EVAPORATOR TEMPERATURE SENSOR RESISTANCE

Ignition OFF.

Disconnect Evaporator temperature sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C296-1 (component side)	Ω	C296-2 (component side)

Compare the evaporator temperature sensor measured resistance with the table below.

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Is the resistance within the specified values for the temperatures?

Yes	GO to P2

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

P2 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-19		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to P3

P3 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-19	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to P4

No	REPAIR the circuit.

P4 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-19	Ω	C296-1

Is the resistance less than 3 ohms?

Yes	GO to P5

No	REPAIR the circuit.

P5 CHECK THE EVAPORATOR TEMPERATURE SENSOR SIGNAL AND SIGNAL RETURN CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1	Ω	C296-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to P6

No	REPAIR the circuit.

P6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST Q : C1B14:11, C1B14:12

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

A 5-volt reference voltage and ground is supplied to the climate control sensors and actuators from the FCIM.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C1B14:11	Sensor Supply Voltage A: Circuit Short to Ground	This DTC sets when the module senses less than 5 volts on the sensor reference voltage circuit, indicating a short to ground.
C1B14:12	Sensor Supply Voltage A: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the sensor reference voltage circuit, indicating a short to voltage.

Possible Sources

- Wiring, terminals or connectors
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST Q : C1B14:11, C1B14:12 > PINPOINT TEST Q : C1B14:11, C1B14:12

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Q1 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) DTCS

Ignition ON.

Using a diagnostic scan tool, perform FCIM self-test.

Is DTC C1B14:11 present?

Yes	GO to Q2

No	GO to Q5

Q2 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to Q3

No	REPAIR the circuit.

Q3 CHECK THE REFERENCE VOLTAGE CIRCUIT AND THE SIGNAL RETURN CIRCUIT FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	Ω	C2402A-2

Is the resistance greater than 200 ohms?

Yes	GO to Q6

No	GO to Q4

Q4 CHECK THE A/C (AIR CONDITIONING) COMPONENTS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	Ω	C2402A-2

While measuring the resistance, disconnect the following components one at a time, in order. Stop disconnecting components if the measured resistance rises above 200 ohms.

In-vehicle temperature and humidity sensor C233

Driver side temperature door actuator C2091

Air distribution door actuator C232

Passenger temperature door actuator C2092

Air inlet door actuator C289

Did the resistance rise above 200 ohms?

Yes	INSTALL a new sensor or actuator (the last one to be disconnected). Refer to the appropriate article for the procedure. When installing an actuator, CONNECT the actuator electrical connector before the FCIM. This allows the actuator to be calibrated when the FCIM is connected.

No	REPAIR the circuit.

Q5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to Q6

Q6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Connect FCIM C2402A .

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST R : P06A0

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

The externally controlled variable displacement compressor is electronically controlled by the PCM. The PCM pulse width modulates the ground to the externally controlled variable displacement compressor to change the displacement of the A/C compressor. REFER to: Climate Control System - Vehicles With: Dual Automatic Temperature Control (DATC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P06A0	Variable A/C Compressor Control	The PCM senses greater than

	Circuit	expected voltage on the sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

Possible Sources

- Wiring, terminals or connectors
- A/C compressor
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for loose or corroded PCM and A/C compressor connections.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST R : P06A0 > PINPOINT TEST R : P06A0

NOTE: The performance check test is used to determine if the Externally Controlled Variable Displacement Compressor (EVDC) is able to change the displacement by measuring the amperage to the solenoid and monitoring the manifold pressure gauges soon after the air conditioning clutch is engaged.

NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).

R1 EXTERNALLY CONTROLLED VARIABLE DISPLACEMENT COMPRESSOR (EVDC) PERFORMANCE CHECK

Ignition OFF.

Disconnect BJB fuse 42 (15A).

Measure:

Positive Lead	Measurement / Action	Negative Lead
BJB fuse 42 socket, component side		BJB fuse 42 socket, component side

With a manifold gauge set connected, monitor the low side and high side pressures.

Start the engine. Run the engine until it reaches normal operating temperature.

Select the floor position on the HVAC controls. Set the temperature control to full warm and

the blower to the highest setting. Set the A/C to off. Close all windows and doors. Run for 5 minutes to heat up the climate control housing.

Monitor the multi meter and the manifold gauges. Select the PANEL position on the HVAC controls. Set the temperature control to full cold and the blower to the highest setting. Set the recirculated air mode to on. Set the A/C to on.

Record the highest amperage measurement and the A/C pressures.

Did the amperage initially increase approximately 0.8A, and did the low side pressure decrease and the high side pressure increase and after a few minutes did the amperage and high side pressure decrease and low side pressure increase?

Yes	The Externally Controlled Variable Displacement Compressor (EVDC) is able to change the displacement. CHECK refrigerant charge amount. REFER to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

No	GO to R2

R2 CHECK FOR VOLTAGE TO THE A/C (AIR CONDITIONING) COMPRESSOR CONTROL SOLENOID

Ignition OFF.

Connect BJB fuse 42 (15A).

Disconnect A/C Compressor Control Solenoid C1110 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1110-2		Ground

Is the voltage greater than 11 volts?

Yes	GO to R3

No	VERIFY the BJB fuse 42 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

R3 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM 2.3L C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1110-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to R4

No	REPAIR the circuit.

R4 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1110-1	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to R5

R5 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1110-1	Ω	C1551B-41

Is the resistance less than 3 ohms?

Yes	INSTALL a new A/C compressor. For 2.3L REFER to: Air Conditioning (A/C) Compressor - 2.3L EcoBoost (201kW/273PS) . CLEAR the DTC and REPEAT the self-test. If the DTC returns, GO to R6

No	REPAIR the circuit.

R6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST S : P193E

Refer to Automatic Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM controls the A/C compressor clutch field coil based on messages received from the BCM over the HS-CAN. When the FCIM determines it is necessary to activate the A/C compressor due to driver request or automatic climate control settings, the FCIM sends a message to the BCM over the MS-CAN, the BCM then sends a message to the PCM to activate the A/C compressor.

An internal failure of the PCM, BCM or FCIM, or a failure in the MS-CAN or HS-CAN, causes the PCM to set a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions

P193E	A/C Clutch Request Signal	This DTC sets when the PCM does not receive the A/C enable request from the BCM.

Possible Sources

- Network concerns
- BCM
- PCM
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) > PINPOINT TEST(S) > PINPOINT TEST S : P193E > PINPOINT TEST S : P193E

S1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to S2

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

S2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, carry out the Network Test.

Do the BCM, PCM and the FCIM pass the Network Test?

Yes	GO to S3

No	DIAGNOSE the BCM, PCM or FCIM does not communicate with the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

S3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION)

Start the engine.

Using a diagnostic scan tool, monitor the PCM AC_REQ PID.

On the HVAC controls, select PANEL mode, then press the A/C button (indicator ON).

Does the AC_REQ PID display YES when the A/C button indicator is illuminated?

Yes	GO to S7

No	GO to S4

S4 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH (CC_SW_AC) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, monitor the FCIM CC_SW_AC PID while pressing and releasing the A/C button.

Does the PID display Active when the A/C button indicator is illuminated?

Yes	GO to S6

No	GO to S5

S5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

S6 VERIFY CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM electrical connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

Reconnect all BCM electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

S7 VERIFY CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM electrical connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

Reconnect all PCM electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > DTC CHART: FRONT CONTROLS INTERFACE MODULE (FCIM) - ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Network Diagnostic Trouble Codes (DTCs) (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle repair procedures, such as module reprogramming, often set network Diagnostic Trouble Codes (DTCs). Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery. REFER to: BATTERY, MOUNTING AND CABLES .

FCIM - Electronic Manual Temperature Control (EMTC) DTC CHART

DTC	Description	Action
B105A:12	Cabin Temperature Sensor Fan: Circuit Short To Battery	GO to PINPOINT TEST P : B105A:12, B105A:14, B1A61:11, B1A61:15, B1A69:12, B1A69:14

C1B14:12	Sensor Supply Voltage A: Circuit Short To Battery	GO to PINPOINT TEST M : C1B14:11, C1B14:12
All Other FCIM Diagnostic Trouble Codes (DTCs) not listed in this chart	-	Refer to the appropriate article for the procedure.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > DTC CHART: POWERTRAIN CONTROL MODULE (PCM)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. For information about these practices, REFER to: Diagnostic Methods .

Powertrain Control Module (PCM) DTC Chart

DTC	Description	Action
P0532	A/C Refrigerant Pressure Sensor "A" Circuit Low	GO to PINPOINT TEST A : P0532, P0533
P0533	A/C Refrigerant Pressure Sensor "A" Circuit High	GO to PINPOINT TEST A : P0532, P0533
P0645	A/C Clutch Relay Control Circuit	GO to PINPOINT TEST B : P0645
P06A0	Variable A/C Compressor Control Circuit	GO to PINPOINT TEST N : P06A0
P1464	A/C Demand Out Of Self Test Range	If the HVAC selector was not powered off, POWER the HVAC off, CLEAR the Diagnostic Trouble Codes (DTCs) and REPEAT the self-test. If the DTC returns, GO to PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON
P193E	A/C Clutch Request Signal	GO to PINPOINT TEST O : P193E
All Other PCM Diagnostic Trouble Codes (DTCs)	-	For 2.3L PCM DTC Chart, REFER to: Electronic Engine Controls . For 3.7L PCM DTC Chart, REFER to: Electronic Engine Controls .

		For 5.0L PCM DTC Chart, REFER to: Electronic Engine Controls .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > SYMPTOM CHART(S)

Symptom Chart: Climate Control - Electronic Manual Temperature Control (EMTC)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
A module does not communicate with the diagnostic scan tool	Fuse(s) Wiring, terminals or connectors	REFER to: MODULE COMMUNICATIONS NETWORK .
Externally Controlled Variable Displacement Compressor (EVDC) poor performance/does not operate correctly	Refer to Pinpoint Test	GO to PINPOINT TEST N : P06A0
Unable To Duplicate The Customer Concern And No Diagnostic Trouble Codes (DTCs) Present	Refer to Pinpoint Test	GO to PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT
Reduced outlet airflow	Plugged cabin air filter	INSPECT the cabin air filter. REFER to: Cabin Air Filter . If OK, DIAGNOSE for low refrigerant charge, A/C always commanded on or blower motor not operating correctly.
	Improper refrigerant level	CARRY OUT the refrigerant system tests. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT . If refrigerant charge is OK, GO to PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON

	Blower motor	GO to PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY
The air inlet door is inoperative	Refer to Pinpoint Test	GO to PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE
Incorrect or erratic direction of airflow from outlets	Refer to Pinpoint Test	GO to PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS
Insufficient, erratic or no heat	Refer to Pinpoint Test	GO to PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT .
The A/C is inoperative	Refer to Pinpoint Test	GO to PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE .
The A/C is always on - A/C mode always commanded ON	Refer to Pinpoint Test	GO to PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON
Temperature control is inoperative/does not operate correctly	Refer to Pinpoint Test	GO to PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY
The blower motor is inoperative	Refer to Pinpoint Test	GO to PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE
The blower motor does not operate correctly	Refer to Pinpoint Test	GO to PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY
Insufficient A/C cooling	Improper refrigerant level	CARRY OUT the refrigerant system tests. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT .
	Temperature door actuator	GO to PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY
A/C pressure relief valve discharging	A/C pressure relief valve	CHECK the high side system pressure. REFER to: Specifications . If the pressure is below the A/C pressure relief valve

		open pressure, INSTALL a new A/C pressure relief valve. Refer to the appropriate article for the procedure.
	High system pressure	CHECK the high side system pressure. REFER to: Specifications . If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the A/C system for a restriction.
Climate control does not operate only when remote start is used	IPC information display settings Non-Ford approved remote start system installed	VERIFY Remote Start - Message Center Set To Auto, or Remote Start - Message Center Set To Last User Settings. REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description . VERIFY module communications network operation. DIAGNOSE Diagnostic Trouble Codes (DTCs) if present.

Symptom Chart: Noise, Vibration, and Harshness (NVH)

Diagnostics in this article assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Symptom Chart

Condition	Possible Sources	Actions
Noisy A/C compressor	A/C compressor pulley bearing worn	INSPECT the A/C compressor pulley bearing for roughness. If bearing roughness is found, INSTALL a new A/C compressor clutch and A/C clutch field coil. REFER to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .
Excessive hissing from the plenum when the A/C is on	Incorrect A/C refrigerant level	CHECK the A/C refrigerant level. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH:

ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST A : P0532, P0533

Refer to Manual Climate Control System for schematic and connector information.

Normal operation and Fault Conditions

The A/C pressure transducer receives a ground from the PCM. A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM. The A/C pressure transducer then sends a voltage to the PCM to indicate the A/C pressure.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0532	A/C Refrigerant Pressure Sensor "A" Circuit Low	This DTC sets if the feedback voltage is less than 0.26 volt for at least 2 seconds and the ambient air temperature is greater than 0 °C (32 °F).
P0533	A/C Refrigerant Pressure Sensor "A" Circuit High	This DTC sets if the feedback voltage is greater than 4.95 volts for at least 2 seconds and the ambient air temperature is greater than 0 °C (32 °F).

Possible Sources

- Wiring, terminals or connectors
- A/C pressure transducer
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for loose or corroded PCM and A/C pressure transducer connections.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST A : P0532, P0533 > PINPOINT TEST A : P0532, P0533

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) PRESSURE SENSOR (ACP_PRESS) PID (PARAMETER IDENTIFICATION) WITH THE MANIFOLD GAUGE SET READINGS

Allow the A/C system to stabilize to the outside ambient temperature.

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM ACP_PRESS PID.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ± 103 kPa (15 psi)?

Yes	IGNORE the Diagnostic Trouble Codes (DTCs). REFER to the Symptom Chart .

No	GO to A2

A2 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect PCM, 2.3L C1551B , 3.7L C1381B or 5.0L and 5.2L C175B .

Disconnect A/C pressure transducer C1260 .

Disconnect Turbocharger boost pressure sensor C1588 (if equipped).

Disconnect Generator current sensor C1645 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1		Ground
C1260-2		Ground
C1260-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to A3

A3 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	Ground
C1260-2	Ω	Ground
C1260-3	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR the circuit.

A4 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR AN OPEN

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1551B-56
C1260-2	Ω	C1551B-31
C1260-3	Ω	C1551B-52

3.7L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1381B-18
C1260-2	Ω	C1381B-52
C1260-3	Ω	C1381B-11

5.0L or 5.2L

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C175B-18
C1260-2	Ω	C175B-52
C1260-3	Ω	C175B-11

Are the resistances less than 3 ohms?

Yes	GO to A5

No	REPAIR the circuit.

A5 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1260-1	Ω	C1260-2
C1260-1	Ω	C1260-3
C1260-2	Ω	C1260-3

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new A/C pressure transducer. REFER to: Air Conditioning (A/C) Pressure Transducer . TEST the system for normal operation. If the concern is still present, GO to A6

No	REPAIR the circuits.

A6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST B : P0645

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is provided to the A/C clutch relay. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P0645	A/C Clutch Relay Control Circuit	This DTC sets when the PCM grounds the relay circuit and more voltage than expected is detected on the relay circuit. This DTC also sets when the relay circuit is off and no voltage is detected on the relay circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.

Possible Sources

- Wiring, terminals or connectors
- A/C clutch relay
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuses 23 (10A) and 42 (15A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST B : P0645 > PINPOINT TEST B : P0645

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when taking

measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE VOLTAGE TO THE A/C (AIR CONDITIONING) CLUTCH RELAY VOLTAGE SUPPLY CIRCUITS

Ignition OFF.

Disconnect A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 1		Ground
A/C clutch relay socket 3		Ground

Are the voltages greater than 11 volts?

Yes	GO to B2

No	VERIFY BJB fuses 23 (10A) and 42 (15A) are OK. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short. If OK, REPAIR the circuit.

B2 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY

Carry out the component test on the A/C clutch relay. Refer to Component Testing for schematic and connector information.

Did the relay pass the component test?

Yes	GO to B3

No	INSTALL a new A/C clutch relay.

B3 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect A/C clutch relay.

Disconnect PCM, 2.3L C1551B , 3.7L C1381B or 5.0L and 5.2L C175B .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to B4

B4 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to B5

No	REPAIR the circuit.

B5 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY CONTROL CIRCUIT FOR AN OPEN

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C1551B-2

3.7L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C1381B-15

5.0L or 5.2L

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 2	Ω	C175B-15

Is the resistance less than 3 ohms?

Yes	GO to B6

No	REPAIR the circuit.

B6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT

This diagnostic procedure tests the functions of the HVAC system and identifies the correct HVAC symptom pinpoint test.

Normal Operation and Fault Conditions

System Operation REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT > PINPOINT TEST C : UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT

C1 CHECK THE PCM (POWERTRAIN CONTROL MODULE) FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a scan tool, perform PCM self-test.

Are any climate control related Diagnostic Trouble Codes (DTCs) present?

Yes	REFER to the PCM DTC chart .

No	GO to C2

C2 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) FOR DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform FCIM self-test.

Are any Diagnostic Trouble Codes (DTCs) present?

Yes	REFER to the FCIM DTC chart .

No	GO to C3

C3 CHECK THE BLOWER MOTOR OPERATION

Ignition ON.

Select panel mode.

Observe blower motor operation and select each blower motor speed.

Does the blower motor operate in all ranges?

Yes	GO to C4

No	If the blower motor does not operate in any setting, GO to PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE If the blower motor does not correctly change

	speeds or shut off, GO to PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY .

C4 CHECK AIRFLOW OPERATION

Select the highest blower motor setting.

While observing the airflow, select each of the airflow positions (panel, panel/floor, floor, floor/defrost, defrost).

Is the airflow directed to the correct outlets?

Yes	GO to C5

No	GO to PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS .

C5 VERIFY TEMPERATURE CONTROL OPERATION

Start the vehicle and allow it to reach normal operating temperature.

With the A/C off, select panel mode.

Change the driver and passenger temperature settings from the coldest to the warmest and back to the coldest.

Does the temperature change between very warm to cool?

Yes	GO to C6

No	If the temperature does not get very warm, GO to PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT If the temperature does not change at all, GO to PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY .

C6 VERIFY THE AIR CONDITIONING COMPRESSOR DOES NOT ENGAGE WITH A/C (AIR CONDITIONING) OFF

With the engine running and the A/C off, select panel mode.

Select the coldest temperature setting.

Is the outlet temperature close to ambient air temperature?

Yes	GO to C7

No	If the temperature is warmer than ambient air temperature, GO to PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY If the outlet temperature is significantly colder than ambient air temperature and the A/C

	compressor clutch is engaged, GO to PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON .

C7 VERIFY THE A/C (AIR CONDITIONING) COMPRESSOR IS OPERATIONAL IN THE A/C (AIR CONDITIONING) MODE

Make sure the ambient air temperature is above 0 °C (32 °F).

With the engine running, select panel mode.

Press the A/C button (indicator on).

Is the A/C compressor operational when the panel and A/C button (indicator on) is pressed?

Yes	GO to C8

No	GO to PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE .

C8 CHECK THE RECIRCULATED AIR OPERATION

With the engine running, press the recirculated air button (indicator off).

Select panel mode.

Select the highest blower motor setting.

Observe airflow noise.

Press the recirculated air button (indicator on).

Does the airflow noise increase when the recirculated air mode is selected (indicator on)?

Yes	The system is operating correctly.

No	GO to PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

To rotate the air inlet door actuator, the FCIM supplies voltage and ground to the air inlet door actuator through the door actuator motor circuits. To reverse the air inlet door actuator rotation, the FCIM reverses the voltage and ground circuits. The air inlet door actuator feedback resistors are supplied a

ground from the FCIM by the air inlet door actuator return circuits and a 5-volt reference voltage on the air inlet door actuator reference circuits. The FCIM uses the actuator feedback resistor wiper arm position and the voltage on the air distribution door actuator feedback circuits to determine the air inlet door actuator position.

During an actuator calibration cycle, the FCIM drives the air inlet door until the door reaches both internal stops in the FCIM case. If the air inlet door is temporarily obstructed or binding during a calibration cycle, the FCIM may interpret this as the actual end of travel for the door. When this condition occurs and the FCIM commands the actuator to its end of travel, the air intake may not be from the expected source.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1083:11	Recirculation Damper Motor: Circuit Short To Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1083:12	Recirculation Damper Motor: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1083:13	Recirculation Damper Motor: Circuit Open	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit. The motor cannot move.
B11F0:12	Air Intake Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.
B11F0:14	Air Intake Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors
- Air inlet door actuator

- Air inlet door binding or stuck
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE > PINPOINT TEST D : THE AIR INLET DOOR IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Air distribution door actuator C232 .

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Air inlet door actuator C282 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	V	Ground
C282-2	V	Ground
C282-3	V	Ground
C282-5	V	Ground
C282-6	V	Ground

Is there any voltage present?

Yes	REPAIR the circuit.

No	GO to D2

D2 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	Ω	Ground
C282-2	Ω	Ground
C282-3	Ω	Ground
C282-5	Ω	Ground
C282-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to D3

No	REPAIR the circuit.

D3 CHECK THE AIR INLET DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C282-1	Ω	C2402A-2
C282-2	Ω	C2402A-16
C282-3	Ω	C2402A-3
C282-5	Ω	C2402A-24
C282-6	Ω	C2402A-25

Are the resistances less than 3 ohms?

Yes	GO to D4

No	REPAIR the circuit.

C282-2	Ω	C282-6
C282-3	Ω	C282-5
C282-3	Ω	C282-6
C282-5	Ω	C282-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new air inlet door actuator. REFER to: Air Inlet Door Actuator . TEST the system for normal operation. If the concern is still present, GO to D5

No	REPAIR the circuit.

D5 CHECK FOR CORRECT FRONT CONTROLS INTERFACE MODULE OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

To rotate the air distribution door actuator, the FCIM supplies voltage and ground to the air distribution door actuator through the door actuator motor circuits. To reverse the air distribution door actuator rotation, the FCIM reverses the voltage and ground circuits. The air distribution door actuator feedback resistors are supplied a ground from the FCIM by the air distribution door actuator return circuits and a 5-volt reference voltage on the air distribution door actuator reference circuits. The FCIM uses the actuator feedback resistor wiper arm position and the voltage on the air distribution door actuator feedback circuits to determine the air distribution door actuator position.

During an actuator calibration cycle, the FCIM drives the air distribution door until the door reaches both internal stops in the FCIM case. If the air distribution door is temporarily obstructed or binding during a calibration cycle, the FCIM may interpret this as the actual end of travel for the door. When this condition occurs and the FCIM commands the actuator to its end of travel, the airflow may not be from the expected outlets.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1086:11	Air Distribution Damper Motor: Circuit Short to Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1086:12	Air Distribution Damper Motor: Circuit Short to Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1086:13	Air Distribution Damper Motor: Circuit Open	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor,

		indicating an open circuit. The motor cannot move.
B11E7:12	Air Distribution Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.
B11E7:14	Air Distribution Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors
- Air distribution door actuator
- Air distribution door binding or stuck
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS > PINPOINT TEST E : INCORRECT OR ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Air inlet door actuator C282 .

Disconnect Air distribution door actuator C232 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1		Ground
C232-2		Ground
C232-3		Ground
C232-5		Ground
C232-6		Ground

Is there any voltage present?

Yes	REPAIR the circuit.

No	GO to E2

E2 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	Ground
C232-2	Ω	Ground
C232-3	Ω	Ground
C232-5	Ω	Ground
C232-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to E3

No	REPAIR the circuit.

E3 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	C2402A-2
C232-2	Ω	C2402A-22
C232-3	Ω	C2402A-3
C232-5	Ω	C2402A-20
C232-6	Ω	C2402A-21

Are the resistances less than 3 ohms?

Yes	GO to E4

No	REPAIR the circuit.

E4 CHECK THE AIR DISTRIBUTION DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C232-1	Ω	C232-2
C232-1	Ω	C232-3
C232-1	Ω	C232-5
C232-1	Ω	C232-6
C232-2	Ω	C232-3
C232-2	Ω	C232-5
C232-2	Ω	C232-6
C232-3	Ω	C232-5
C232-3	Ω	C232-6
C232-5	Ω	C232-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new air distribution door actuator, REFER to: Air Distribution Door Actuator . TEST the system for normal operation. If the concern is still present, GO to E5

No	REPAIR the circuit.

E5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT

Normal Operation and Fault Conditions

When the engine is at operating temperature hot coolant flows from the coolant pump through the heater core and back to the coolant pump. Correct coolant temperatures are critical for good heater performance.

Possible Sources

- Wiring, terminals or connectors
- Temperature door actuator(s)
- Air trapped in the coolant system
- Heater core

Visual Inspection and Diagnostic Pre-checks

- Inspect for low engine coolant level.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) >

PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT > PINPOINT TEST F : INSUFFICIENT, ERRATIC OR NO HEAT

F1 CHECK FOR CORRECT ENGINE COOLANT LEVEL

Ignition OFF.

Check the engine coolant level.

Is the engine coolant at the correct level as indicated on the engine coolant recovery reservoir?

Yes	GO to F3

No	GO to F2

F2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS

Pressure test the cooling system for leaks. Refer to the appropriate article for the procedure.

Does the engine cooling system leak?

Yes	REPAIR the engine coolant leak. Refer to the appropriate article for the procedure. TEST the system for normal operation.

No	FILL and BLEED the cooling system. Refer to the appropriate article for the procedure. After filling and bleeding the cooling system, GO to F3

F3 CHECK FOR COOLANT FLOW TO THE HEATER CORE

Run the motor until it reaches normal operating temperature. Select the floor position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting.

Increase engine speed to 3, 500 RPM and hold for 30 seconds.

Allow the engine to idle for 30 seconds.

Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.

Is the heater core inlet hose hot?

Yes	GO to F4

No	BLEED the cooling system per the cooling system draining and vacuum filling general procedure. Refer to the appropriate article for the procedure. After bleeding the cooling system, GO to F4

F4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE

Using a suitable temperature measuring device, measure the heater core outlet hose temperature.

Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17 °C [10-30 °F])?

Yes	DIAGNOSE for a blend door actuator not operating correctly. For inadequate temperature, GO to PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY

No	INSTALL a new heater core. REFER to: Heater Core .

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Control System Logic REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

Possible Sources

- Wiring, terminals or connectors
- Communication network
- Ambient Air Temperature (AAT) sensor
- A/C pressure transducer
- Evaporator temperature sensor
- Electric cooling fan
- Intake Air Temperature (IAT) or other temperature sensors
- Active grille shutters
- FCIM
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuses 23 (10A) and 42 (15A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE > PINPOINT TEST G : THE A/C (AIR CONDITIONING) IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

G1 CHECK THE A/C (AIR CONDITIONING) SYSTEM PRESSURE

Ignition OFF.

With the R-134a manifold gauge set connected, check the A/C system pressure.

Is the A/C system pressure above 290 kPa (42 psi)?

Yes	GO to G2

No	CHECK the A/C system for leaks. REFER to: Electronic Leak Detection . REFER to: Fluorescent Dye Leak Detection . After leak is repaired, RECHARGE the A/C system. REFER to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

G2 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out the network test.

Do the FCIM and the PCM pass the network test?

Yes	GO to G3

No	DIAGNOSE the FCIM or PCM does not communicate with the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

G3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) PRESSURE SENSOR (ACP_PRESS) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

With a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM ACP_PRESS PID.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ±

103 kPa (15 psi)?

Yes	GO to G4

No	DIAGNOSE the A/C pressure transducer. GO to PINPOINT TEST A : P0532, P0533

G4 ELECTRIC COOLING FAN FUNCTIONAL CHECK

Ignition ON.

Using a diagnostic scan tool, carry out the PCM KOEO self-test.

Does the electric cooling fan operate sometime during the KOEO self-test?

Yes	GO to G5

No	DIAGNOSE the electric cooling fan operation. REFER to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

NOTE: Compare multiple engine sensor readings to the ambient temperature to determine sensors are reading correctly. A faulty sensor can cause the PCM to disable the A/C with or without a DTC.

G5 COMPARE THE PCM (POWERTRAIN CONTROL MODULE) INTAKE AIR TEMPERATURE (IAT) PID (PARAMETER IDENTIFICATION) AND THE OTHER TEMPERATURE SENSOR READINGS TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Allow the vehicle exterior and interior to stabilize to ambient temperature. This can take a soak period of at least 6 hours.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the CHT, ECT, IAT, MAPT, and AAT Parameter Identifications (PIDs) (as applicable).

Are the temperature values similar (typically within 18 °C (32.4 °F)?

Yes	GO to G6

No	DIAGNOSE the suspect temperature sensor. REFER to ENGINE CONTROLS - SYMPTOM CHARTS (EXCEPT DIESEL & HYBRID) .

G6 COMPARE THE EVAPORATOR TEMPERATURE SENSOR TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Ignition OFF.

Disconnect Evaporator temperature sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1 (component side)	Ω	C296-2 (component side)

Compare the resistance values to the table below:

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AAT PID.

Is the resistance within the specified values for the temperatures?

Yes	GO to G7

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

G7 VERIFY THE GRILLE SHUTTER OPERATION USING THE PCM (POWERTRAIN CONTROL MODULE) GRILL SHUTTER A POSITION - COMMANDED (GRILL_A_CMD) PID (PARAMETER IDENTIFICATION)

Start the engine and allow it to idle for at least 30 seconds to allow for the grille shutter calibration to complete.

Using a diagnostic scan tool, view PCM PID.

Using a diagnostic scan tool, select the PCM PID GRILL_A_CMD and command the grille shutter from 100% (open) to 0% (closed) while observing the grille shutter operation from the front of the vehicle.

Does the grille shutter fully open and close when commanded by the scan tool?

Yes	GO to G8

No	DIAGNOSE the active grille shutter is inoperative or does not operate correctly. REFER to: Active Grille Shutter .

G8 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH (CC_SW_AC) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) ON

Using a diagnostic scan tool, view FCIM Parameter Identifications (PIDs).

Monitor the CC_SW_AC PID.

Does the PID display Active?

Yes	GO to G9

No	GO to G17

G9 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) ON

Start the engine.

Using a diagnostic scan tool, monitor the PCM AC_REQ PID.

On the HVAC controls, select PANEL and then press the A/C button (indicator on).

Does the PID display Yes when the button is pressed?

Yes	GO to G11

No	GO to G10

G10 RESET THE AMBIENT AIR TEMPERATURE (AAT) SENSOR

On the HVAC controls, press the A/C (air conditioning) and Recirc buttons simultaneously, then release both. Within 2 seconds press A/C button again.

Start the engine.

On the HVAC controls, set the temperature to full cold, select PANEL and select the A/C button (indicator on).

Does the A/C compressor turn on?

Yes	RETEST the A/C system for normal operation. REFER to: Refrigerant System Tests - 2.3L EcoBoost (201kW/273PS) . REFER to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . REFER to: Refrigerant System Tests - 5.0L 32V Ti-VCT .

No	GO to G11

G11 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) COMPRESSOR COMMANDED STATE (ACC_CMD) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) COMMANDED ON

Using a diagnostic scan tool, activate the PCM ACC_CMD PID.

Does the A/C compressor turn on?

Yes	GO to G18

No	GO to G12

G12 CHECK THE VOLTAGE TO THE A/C (AIR CONDITIONING) CLUTCH RELAY

Ignition OFF.

Disconnect the A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 1		Ground
A/C clutch relay socket 3		Ground

Are the voltages greater than 11 volts?

Yes	GO to G13

No	VERIFY BJB fuses 23 (10A) and 42 (15A) are OK. If not OK, REFER to the ENGINE CONTROLS - INTRODUCTION (EXCEPT DIESEL & HYBRID) to identify the possible causes of the circuit short.

G13 BYPASS THE A/C (AIR CONDITIONING) CLUTCH RELAY

Ignition OFF.

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
A/C clutch relay socket 3		A/C clutch relay socket 5

Ignition ON.

Does the A/C compressor clutch engage?

Yes	REMOVE the fused jumper wire. INSTALL a new A/C clutch relay.

No	LEAVE the fused jumper wire installed. GO to G14

G14 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL VOLTAGE SUPPLY CIRCUIT FOR AN OPEN

Disconnect A/C compressor clutch field coil C100 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-1		Ground

Is the voltage greater than 11 volts?

Yes	REMOVE the fused jumper wire. GO to G15

No	REMOVE the fused jumper wire. REPAIR the circuit.

G15 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-2	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to G16

No	REPAIR the circuit.

G16 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH AIR GAP

Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley. REFER to: Air Conditioning (A/C) Clutch Air Gap Adjustment .

Is the A/C compressor clutch air gap greater than 0.6 mm (0.0236 in)?

Yes	ADJUST the A/C compressor clutch air gap. REFER to: Air Conditioning (A/C) Clutch Air Gap Adjustment .

No	INSTALL a new A/C compressor clutch and A/C clutch field coil. REFER to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .

G17 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

G18 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Disconnect and inspect all PCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals/pins

pushed-out pins - replace pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical

	Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Control System Logic REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P1464	A/C Demand Out Of Self Test Range	This DTC sets when the PCM senses an A/C request during a PCM self-test.

Possible Sources

- A/C clutch relay
- Wiring, terminals or connectors
- PCM
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON > PINPOINT TEST H : THE A/C (AIR CONDITIONING) IS ALWAYS ON - A/C (AIR CONDITIONING) MODE ALWAYS COMMANDED ON

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the

correct probe adapter(s) may damage the connector.

H1 CHECK THE A/C (AIR CONDITIONING) CLUTCH RELAY

Carry out the component test on the A/C clutch relay. Refer to Component Testing for schematic and connector information.

Did the relay pass the component test?

Yes	GO to H2

No	INSTALL a new A/C clutch relay.

H2 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR CLUTCH FIELD COIL VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect A/C compressor clutch field coil C100 .

Disconnect the A/C clutch relay.

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C100-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to H3

H3 COMPARE THE EVAPORATOR TEMPERATURE SENSOR TO THE PCM (POWERTRAIN CONTROL MODULE) AMBIENT AIR TEMPERATURE (AAT) PID (PARAMETER IDENTIFICATION)

Ignition OFF.

Allow the vehicle exterior and interior to stabilize to ambient temperature.

Disconnect Evaporator Temperature Sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C296-1 (component side)	Ω	C296-2 (component side)

Compare the resistance values to the table below:

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Ignition ON.

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AAT PID.

Is the resistance within the specified values for the temperatures?

Yes	GO to H4

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

H4 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH STATUS (CC_SW_AC) PID (PARAMETER IDENTIFICATION)

Ignition ON.

Using a diagnostic scan tool, view FCIM Parameter Identifications (PIDs).

Monitor the CC_SW_AC PID.

Select panel mode, press and release the A/C button (indicator off) on the FCIM controls.

Does the PID display Active when pressed and Inactive when released?

Yes	GO to H5

No	GO to H8

H5 CHECK THE A/C (AIR CONDITIONING) PRESSURE SENSOR (ACP_PRESS) PARAMETER IDENTIFICATION (PID)

Using a diagnostic scan tool, view the PCM Parameter Identification (PIDs).

With a manifold gauge set connected, compare the pressure readings of the manifold gauge set and the PCM Parameter Identification (PID) ACP_PRESS.

Are the pressure values of the manifold gauge set and the ACP_PRESS PCM PID within ± 103 kPa (15 psi)?

Yes	GO to H6

No	INSTALL a new A/C pressure transducer. REFER to: Air Conditioning (A/C) Pressure Transducer .

H6 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH THE A/C (AIR CONDITIONING) OFF

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AC_REQ PID.

While in panel mode, release the A/C button (indicator off) on the FCIM controls.

Does the PID display No?

Yes	GO to H9

No	GO to H7

H7 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION) WITH FCIM (FRONT CONTROLS INTERFACE MODULE) DISCONNECTED

Ignition ON.

Disconnect FCIM C2402A .

Using a diagnostic scan tool, view PCM Parameter Identifications (PIDs).

Monitor the AC_REQ PID.

Does the PID display No?

Yes	GO to H9

No	GO to H8

H8 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Connect FCIM C2402A .

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

H9 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (replace connector or terminals - clean module pins)

damaged or bent pins - replace terminals/pins

pushed-out pins - replace pins as necessary

Reconnect all PCM connectors. Make sure they seat and latch correctly.

Operate the system and verify the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Temperature Door Actuator - Driver side, REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

During an actuator calibration cycle, the FCIM drives the temperature door until the door reaches both internal stops in the HVAC case. If the temperature door is temporarily obstructed or binding during a calibration cycle, the module may interpret this as the actual end of travel for the door. When this condition occurs and the module commands the actuator to its end of travel, the airflow may not be the expected temperature.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1081:11	Left Temperature Damper Motor: Circuit Short To Ground	This DTC sets when the module senses lower than expected voltage on an actuator motor circuit when voltage is applied to drive the motor, indicating a short to ground. The motor can move only in one direction.
B1081:12	Left Temperature Damper Motor: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the actuator motor circuit when ground is applied to drive the motor, indicating a short to voltage. The motor can move only in one direction.
B1081:13	Left Temperature Damper Motor: Open Circuit	This DTC sets when the module senses no voltage on the actuator motor circuit when ground is applied to drive the motor, indicating an open circuit. The motor cannot move.
B11E5:12	Left HVAC Damper Position Sensor: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the actuator feedback circuit, indicating a short to voltage.

B11E5:14	Left HVAC Damper Position Sensor: Circuit Short to Ground or Open	This DTC sets when the module senses less than 1 volt on the actuator feedback circuit, indicating an open circuit or a short to ground.

Possible Sources

- Wiring, terminals or connectors

- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY > PINPOINT TEST I : THE TEMPERATURE CONTROL IS INOPERATIVE OR DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

I1 CHECK THE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect Air inlet door actuator C282 .

Disconnect Air distribution door actuator C232 .

Disconnect Driver side temperature door actuator C2091 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1		Ground
C2091-2		Ground
C2091-3		Ground

C2091-5	V	Ground
C2091-6	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to I2

I2 CHECK THE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	Ground
C2091-2	Ω	Ground
C2091-3	Ω	Ground
C2091-5	Ω	Ground
C2091-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to I3

No	REPAIR the circuit.

I3 CHECK THE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	C2402A-2
C2091-2	Ω	C2402A-10
C2091-3	Ω	C2402A-3
C2091-5	Ω	C2402A-8

C2091-6	Ω	C2402A-9

Are the resistances less than 3 ohms?

Yes	GO to I4

No	REPAIR the circuit.

I4 CHECK THE TEMPERATURE DOOR ACTUATOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2091-1	Ω	C2091-2
C2091-1	Ω	C2091-3
C2091-1	Ω	C2091-5
C2091-1	Ω	C2091-6
C2091-2	Ω	C2091-3
C2091-2	Ω	C2091-5
C2091-2	Ω	C2091-6
C2091-3	Ω	C2091-5
C2091-3	Ω	C2091-6
C2091-5	Ω	C2091-6

Are the resistances greater than 10, 000 ohms?

Yes	INSTALL a new driver side temperature door actuator. REFER to: Driver Side Temperature Door Actuator . TEST the system for normal operation. If the concern is still present, GO to I5

No	REPAIR the circuit.

I5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is supplied to the blower motor relay switched contact from the BJB. Ground to the relay coil is a dedicated circuit. When the blower motor relay coil receives power from the FCIM, the relay coil is energized and voltage is delivered to the blower motor speed control. Power and ground for the blower motor is provided by the blower motor speed control. The FCIM sends a PWM signal to the blower motor speed control to control the blower speed.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B10AF:11	Blower Fan Relay: Circuit Short To Ground	This DTC sets when the module senses low voltage on the relay coil voltage circuit when the module is energizing the circuit. The blower motor relay is permanently inactive.
B10AF:15	Blower Fan Relay: Circuit Short To Battery or Open	This DTC sets when the module senses greater than expected voltage on the blower relay coil voltage circuit, indicating an open circuit or a short to voltage. The blower motor relay is inactive when circuit is open; the blower motor relay is on all the time when shorted to battery.

B10B9:12	Blower Control: Circuit Short To Battery	This DTC sets when the module senses high voltage on the blower motor control PWM circuit, indicating a short directly to voltage. The blower motor is inoperative.
B10B9:14	Blower Control: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the blower motor control PWM circuit, indicating a short directly to ground or an open circuit. The blower motor runs at full speed if the circuit is shorted to ground. The blower motor is inoperative if the circuit is open.

Visual Inspection and Diagnostic Pre-checks

- Inspect BJB fuse 10 (40A).

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE > PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

J1 CHECK THE BLOWER MOTOR RELAY

Ignition OFF.

Disconnect Blower motor relay.

Carry out the component test on the blower motor relay. Refer to Component Testing for

schematic and connector information.

Did the relay pass the component test?

Yes	GO to J2

No	INSTALL a new blower motor relay.

J2 CHECK THE BLOWER MOTOR RELAY SWITCH CONTACT SUPPLY VOLTAGE

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 3		Ground

Is the voltage greater than 11 volts?

Yes	GO to J3

No	VERIFY BJB fuse 10 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

J3 CHECK THE BLOWER MOTOR RELAY COIL GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 1	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to J4

No	REPAIR the circuit.

J4 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR A SHORT TO GROUND

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead

Blower motor relay socket 2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to J5

No	REPAIR the circuit.

J5 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
Blower motor relay socket 2	Ω	C2402A-11

Is the resistance less than 3 ohms?

Yes	GO to J6

No	REPAIR the circuit.

J6 CHECK THE BLOWER MOTOR SPEED CONTROL VOLTAGE CIRCUIT

Disconnect Blower motor speed control C297 .

Connect Blower motor relay.

Connect FCIM C2402A .

Ignition ON.

Select PANEL on the HVAC controls.

Select the highest blower motor setting.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-5	V	Ground

Is the voltage greater than 11 volts?

Yes	GO to J7

No	REPAIR the circuit.

J7 CHECK THE BLOWER MOTOR SPEED CONTROL GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-1	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to J8

No	REPAIR the circuit.

J8 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-2	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to J9

J9 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR AN OPEN

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-2	Ω	C2402A-23

Is the resistance less than 3 ohms?

Yes	GO to J10

No	REPAIR the circuit.

J10 CHECK THE OUTPUTS TO THE BLOWER MOTOR

Disconnect Blower motor C2066 .

Connect Blower motor speed control C297 .

Connect FCIM C2402A .

Ignition ON.

Select PANEL on the HVAC controls.

Select the highest blower motor setting.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2066-1	V	C2066-2

Is the voltage greater than 11 volts?

Yes	INSTALL a new blower motor. REFER to: Blower Motor .

No	GO to J11

J11 CHECK THE CIRCUITS TO THE BLOWER MOTOR FOR AN OPEN

Ignition OFF.

Disconnect Blower motor speed control C297 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C297-6	Ω	C2066-1
C297-5	Ω	C2066-2

Are the resistances less than 3 ohms?

Yes	GO to J12

No	REPAIR the circuit in question.

J12 CHECK THE BLOWER MOTOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2066-1	Ω	C2066-2

Is the resistance greater than 10, 000 ohms?

Yes	INSTALL a new blower motor speed control. REFER to: Blower Motor Speed Control . TEST the system for normal operation. If the concern is still present, GO to J13

No	REPAIR the circuits.

J13 CHECK FOR CORRECT FRONT CONTROLS INTERFACE MODULE (FCIM) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Voltage is supplied to the blower motor relay switched contact from the BJB. Ground to the relay coil is a dedicated circuit. When the blower motor relay coil receives power from the FCIM, the relay coil is energized and voltage is delivered to the blower motor speed control. Power and ground for the blower motor is provided by the blower motor speed control. The FCIM sends a PWM signal to the blower motor speed control to control the blower speed.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B10AF:15	Blower Fan Relay: Circuit Short To Battery or Open	This DTC sets when the module senses greater than expected voltage on the blower relay coil voltage circuit, indicating an open circuit or a short to voltage. Blower relay is inactive when circuit is open; blower relay is on all the time when shorted to battery.
B10B9:14	Blower Control: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the blower motor control PWM circuit, indicating a short directly to ground or an open circuit. The blower motor runs at full speed if the circuit is shorted to ground. The blower motor is inoperative if the circuit is open.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY > PINPOINT TEST K : THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the

correct probe adapter(s) may damage the connector.

K1 VERIFY THE BLOWER MOTOR OPERATION

Ignition ON.

Select PANEL on the HVAC controls. Adjust the blower motor setting to the minimum and maximum settings.

Does the blower motor operate at any setting?

Yes	GO to K2

No	GO to PINPOINT TEST J : THE BLOWER MOTOR IS INOPERATIVE

K2 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Blower motor speed control C297 .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-23		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to K3

K3 CHECK THE BLOWER MOTOR CONTROL PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-23	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to K4

No	REPAIR the circuit.

K4 CHECK THE BLOWER MOTOR RELAY COIL CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect Blower motor relay.

Connect FCIM C2402A .

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-11	V	Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to K5

K5 CHECK THE BLOWER MOTOR OPERATION WITH THE BLOWER MOTOR RELAY DISCONNECTED

Connect FCIM C2402A .

Ignition OFF.

Connect Blower motor speed control C297 .

Ignition ON.

Operate the system and determine if the concern is still present.

Does the fan still operate all the time?

Yes	REPAIR the blower motor speed control voltage circuit CH402 (YE/GN) for a short to voltage.

No	GO to K6

K6 CHECK FOR CORRECT BLOWER MOTOR SPEED CONTROL OPERATION

Ignition OFF.

Disconnect and inspect all the blower motor speed control connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the blower motor speed control connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	INSTALL a new blower motor speed control. REFER to: Blower Motor Speed Control . TEST the system for normal operation. If the concern is still present, GO to K7

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

K7 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST L : B1B71:11, B1B71:15

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

Evaporator Temperature Sensor, REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1B71:11	Evaporator Temperature Sensor: Circuit Short To Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground. The module defaults to calculated evaporator temperature and the compressor is shut off.
B1B71:15	Evaporator Temperature Sensor: Circuit Short To Battery or Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit. The module defaults to calculated evaporator temperature and the compressor is shut off.

Possible Sources

- Wiring, terminals or connectors
- Evaporator temperature sensor
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST L : B1B71:11, B1B71:15 > PINPOINT TEST L : B1B71:11, B1B71:15

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

L1 CHECK THE EVAPORATOR TEMPERATURE SENSOR RESISTANCE

Ignition OFF.

Disconnect Evaporator temperature sensor C296 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1 (component side)	Ω	C296-2 (component side)

Compare the evaporator temperature sensor measured resistance with the table below.

Ambient Temperature °F (°C)	Resistance ohms
-39.9 °F (-40 °C)	98, 625 - 103, 275 ohms
-4.0 °F (-20 °C)	28, 640 - 29, 600 ohms
32.0 °F (°C)	9695 - 9895 ohms
68.0 °F (20 °C)	3675 - 3810 ohms
77.0 °F (25 °C)	2950 - 3050 ohms
86.0 °F (30 °C)	2370 - 2565 ohms
103.9 °F (40 °C)	1565 - 1635 ohms

Is the resistance within the specified values for the temperatures?

Yes	GO to L2

No	INSTALL a new evaporator temperature sensor. REFER to: Evaporator Temperature Sensor .

L2 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C2402A-19		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to L3

L3 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-19	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to L4

No	REPAIR the circuit.

L4 CHECK THE EVAPORATOR TEMPERATURE SENSOR INPUT CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-19	Ω	C296-1

Is the resistance less than 3 ohms?

Yes	GO to L5

No	REPAIR the circuit.

L5 CHECK THE EVAPORATOR TEMPERATURE SENSOR SIGNAL AND SIGNAL RETURN CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C296-1	Ω	C296-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to L6

No	REPAIR the circuit.

L6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST M : C1B14:11, C1B14:12

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

A 5-volt reference voltage and ground is supplied to the climate control sensors and actuators from the FCIM.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C1B14:11	Sensor Supply Voltage A: Circuit Short to Ground	This DTC sets when the module senses less than 5 volts on the sensor reference voltage circuit, indicating a short to ground.
C1B14:12	Sensor Supply Voltage A: Circuit Short to Battery	This DTC sets when the module senses greater than 5 volts on the sensor reference voltage circuit, indicating a short to voltage.

Possible Sources

- Wiring, terminals or connectors
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST M : C1B14:11, C1B14:12 > PINPOINT TEST M : C1B14:11, C1B14:12

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

M1 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) DTCS

Ignition ON.

Using a diagnostic scan tool, perform FCIM self-test.

Is DTC C1B14:11 present?

Yes	GO to M2

No	GO to M5

M2 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C2402A-3	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to M3

No	REPAIR the circuit.

M3 CHECK THE REFERENCE VOLTAGE CIRCUIT AND THE SIGNAL RETURN CIRCUIT FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	Ω	C2402A-2

Is the resistance greater than 200 ohms?

Yes	GO to M6

No	GO to M4

M4 CHECK THE A/C (AIR CONDITIONING) COMPONENTS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3	Ω	C2402A-2

While measuring the resistance, disconnect the following components one at a time, in order. Stop disconnecting components if the measured resistance rises above 200 ohms.

In-vehicle temperature and humidity sensor C233

Air distribution door actuator C232

Driver side temperature door actuator C2091

Air inlet door actuator C282

Did the resistance rise above 200 ohms?

Yes	INSTALL a new sensor or actuator (the last one to be disconnected). Refer to the appropriate article for the procedure. When installing an actuator, CONNECT the actuator electrical connector before the FCIM. This allows the actuator to be calibrated when the FCIM is connected.

No	REPAIR the circuit.

M5 CHECK THE REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect FCIM C2402A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2402A-3		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to M6

M6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Connect FCIM C2402A .

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST N : P06A0

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

The externally controlled variable displacement compressor is electronically controlled by the PCM. The PCM pulse width modulates the ground to the externally controlled variable displacement compressor to change the displacement of the A/C compressor. REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P06A0	Variable A/C Compressor Control Circuit	The PCM senses greater than expected voltage on the sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.

Possible Sources

- Wiring, terminals or connectors
- A/C compressor
- PCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for loose or corroded PCM and A/C compressor connections.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST N : P06A0 > PINPOINT TEST N : P06A0

NOTE: The performance check test is used to determine if the Externally Controlled Variable Displacement Compressor (EVDC) is able to change the displacement by measuring the amperage to the solenoid and monitoring the manifold pressure gauges soon after the air conditioning clutch is engaged.

NOTE: Proper Air Conditioning (A/C) system diagnosis on a vehicle's compressor is dependent on correct refrigerant system charge and tested in ambient temperatures above 21.1 °C (70 °F).

N1 EXTERNALLY CONTROLLED VARIABLE DISPLACEMENT COMPRESSOR (EVDC) PERFORMANCE CHECK

Ignition OFF.

Disconnect BJB fuse 42 (15A).

Measure:

Positive Lead	Measurement / Action	Negative Lead
BJB fuse 42 socket, component side		BJB fuse 42 socket, component side

With a manifold gauge set connected, monitor the low side and high side pressures.

Start the engine. Run the engine until it reaches normal operating temperature.

Select the floor position on the HVAC controls. Set the temperature control to full warm and the blower to the highest setting. Set the A/C to off. Close all windows and doors. Run for 5 minutes to heat up the climate control housing.

Monitor the multi meter and the manifold gauges. Select the PANEL position on the HVAC controls. Set the temperature control to full cold and the blower to the highest setting. Set the recirculated air mode to on. Set the A/C to on.

Record the highest amperage measurement and the A/C pressures.

Did the amperage initially increase approximately 0.8A, and did the low side pressure decrease and the high side pressure increase and after a few minutes did the amperage and high side pressure decrease and low side pressure increase?

Yes	The Externally Controlled Variable Displacement Compressor (EVDC) is able to change the displacement. CHECK refrigerant charge amount. REFER to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

No	GO to N2

N2 CHECK FOR VOLTAGE TO THE A/C (AIR CONDITIONING) COMPRESSOR CONTROL SOLENOID

Ignition OFF.

Connect BJB fuse 42 (15A).

Disconnect A/C Compressor Control Solenoid C1110 .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1110-2		Ground

Is the voltage greater than 11 volts?

Yes	GO to N3

No	VERIFY the BJB fuse 42 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the OEM ELECTRICAL WIRING DIAGRAM INTRODUCTION to identify the possible causes of the circuit short.

N3 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PCM 2.3L C1551B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1110-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to N4

No	REPAIR the circuit.

N4 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR A SHORT TO VOLTAGE

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1110-1		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to N5

N5 CHECK THE A/C (AIR CONDITIONING) COMPRESSOR DISPLACEMENT CONTROL SOLENOID PWM (PULSE WIDTH MODULATION) CIRCUIT FOR AN OPEN

Ignition OFF.

Measure:

2.3L

Positive Lead	Measurement / Action	Negative Lead
C1110-1	Ω	C1551B-41

Is the resistance less than 3 ohms?

Yes	INSTALL a new A/C compressor. For 2.3L REFER to: Air Conditioning (A/C) Compressor - 2.3L EcoBoost (201kW/273PS) . CLEAR the DTC and REPEAT the self-test. If the DTC returns, GO to N6

No	REPAIR the circuit.

N6 CHECK FOR CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect the PCM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) >

PINPOINT TEST O : P193E

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

The PCM controls the A/C compressor clutch field coil based on messages received from the BCM over the HS-CAN. When the FCIM determines it is necessary to activate the A/C compressor due to driver request or automatic climate control settings, the FCIM sends a message to the BCM over the MS-CAN, the BCM then sends a message to the PCM to activate the A/C compressor.

An internal failure of the PCM, BCM or FCIM, or a failure in the MS-CAN or HS-CAN, causes the PCM to set a DTC.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
P193E	A/C Clutch Request Signal	This DTC sets when the PCM does not receive the A/C enable request from the BCM.

Possible Sources

- Network concerns
- BCM
- PCM
- FCIM

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST O : P193E > PINPOINT TEST O : P193E

O1 VERIFY THE CUSTOMER CONCERN

Ignition ON.

Verify there is an observable symptom present.

Is an observable symptom present?

Yes	GO to O2

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

O2 CHECK THE COMMUNICATION NETWORK

Using a diagnostic scan tool, carry out the Network Test.

Do the BCM, PCM and the FCIM pass the Network Test?

Yes	GO to O3

No	DIAGNOSE the BCM, PCM or FCIM does not communicate with the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

O3 CHECK THE PCM (POWERTRAIN CONTROL MODULE) A/C (AIR CONDITIONING) REQUEST SIGNAL (AC_REQ) PID (PARAMETER IDENTIFICATION)

Start the engine.

Using a diagnostic scan tool, monitor the PCM AC_REQ PID.

On the HVAC controls, select PANEL mode, then press the A/C button (indicator ON).

Does the AC_REQ PID display YES when the A/C button indicator is illuminated?

Yes	GO to O7

No	GO to O4

O4 CHECK THE FCIM (FRONT CONTROLS INTERFACE MODULE) A/C (AIR CONDITIONING) SWITCH (CC_SW_AC) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, monitor the FCIM CC_SW_AC PID while pressing and releasing the A/C button.

Does the PID display Active when the A/C button indicator is illuminated?

Yes	GO to O6

No	GO to O5

O5 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the appropriate article for the procedure.

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

O6 VERIFY CORRECT BCM (BODY CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all BCM electrical connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all BCM electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW the TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

O7 VERIFY CORRECT PCM (POWERTRAIN CONTROL MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all PCM electrical connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals or pins

pushed-out pins - install new pins as necessary

Reconnect all PCM electrical connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. For 2.3L, REFER to: Powertrain Control Module (PCM) . For 3.7L, REFER to: Powertrain Control Module (PCM) . For 5.0L, REFER to: Powertrain Control Module (PCM) .

No	The system is operating correctly at this time. The concern may have been caused by module connections. ADDRESS the root cause of any connector or pin issues.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST P : B105A:12, B105A:14, B1A61:11, B1A61:15, B1A69:12, B1A69:14

Refer to Manual Climate Control System for schematic and connector information.

Normal Operation and Fault Conditions

In-Vehicle Temperature and Humidity Sensor, REFER to: Climate Control System - Vehicles With: Electronic Manual Temperature Control (EMTC) - System Operation and Component Description .

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B105A:12	Cabin Temperature Sensor Fan: Circuit Short To Battery	This DTC sets when the module senses higher than expected voltage on the in-vehicle temperature and humidity sensor fan motor circuit. The in-vehicle temperature and humidity sensor fan motor is inactive.
B105A:14	Cabin Temperature Sensor Fan: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the in-vehicle temperature and humidity sensor fan motor circuit, indicating an open or a short directly to ground. The in-vehicle temperature and humidity sensor fan motor is active.
B1A61:11	Cabin Temperature Sensor: Circuit Short to Ground	This DTC sets when the module senses lower than expected

		voltage on the in-vehicle temperature and humidity sensor feedback circuit, indicating a short to ground.
B1A61:15	Cabin Temperature Sensor: Circuit Short to Battery or Open	This DTC sets when the module senses greater than expected voltage on the in-vehicle temperature and humidity sensor feedback circuit, indicating a short to voltage or an open circuit or sensor.
B1A69:12	Humidity Sensor: Circuit Short To Battery	This DTC sets when the module senses greater than expected voltage on the in-vehicle temperature and humidity sensor humidity input circuit, indicating a short to voltage.
B1A69:14	Humidity Sensor: Circuit Short To Ground or Open	This DTC sets when the module senses no voltage on the in-vehicle temperature and humidity sensor humidity input circuit, indicating a short to ground or an open circuit or sensor.

Possible Sources

- Fuse
- Wiring, terminals or connectors
- In-vehicle temperature and humidity sensor
- FCIM

Visual Inspection and Diagnostic Pre-checks

- Make sure the in-vehicle temperature and humidity sensor harness is not chaffed.

DIAGNOSIS AND TESTING > CLIMATE CONTROL SYSTEM - VEHICLES WITH: ELECTRONIC MANUAL TEMPERATURE CONTROL (EMTC) > PINPOINT TEST(S) > PINPOINT TEST P : B105A:12, B105A:14, B1A61:11, B1A61:15, B1A69:12, B1A69:14 > PINPOINT TEST P : B105A:12, B105A:14, B1A61:11, B1A61:15, B1A69:12, B1A69:14

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

P1 CHECK THE IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Disconnect Air distribution door actuator C232 .

Disconnect Driver side temperature door actuator C2091 .

Disconnect Passenger side temperature door actuator C2092 .

Disconnect Air inlet door actuator C282 .

Disconnect In-vehicle temperature and humidity sensor C233 .

Disconnect BCM fuse 21 (5A).

Ignition ON.

Disconnect FCIM C2402A .

Disconnect FCIM C2402B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C233-1		Ground
C233-2		Ground
C233-3		Ground
C233-4		Ground
C233-5		Ground
C233-6		Ground

Is any voltage present?

Yes	REPAIR the circuit.

No	GO to P2

P2 CHECK THE IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR CIRCUITS FOR A SHORT TO GROUND

Connect FCIM C2402A .

Ignition OFF.

Disconnect FCIM C2402A .

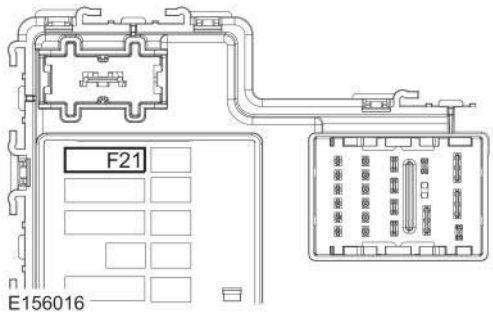
Measure:

Positive Lead	Measurement / Action	Negative Lead
C233-1	Ω	Ground
C233-2	Ω	Ground
C233-3	Ω	Ground
C233-4	Ω	Ground
C233-5	Ω	Ground
C233-6	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to P3

No	REPAIR the circuit.



P3 CHECK THE IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR CIRCUITS FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C233-3	Ω	C2402A-3
C233-5	Ω	C2402A-2

Positive Lead	Measurement / Action	Negative Lead
C233-1	Ω	C2402B-27
C233-2	Ω	C2402B-29
C233-4	Ω	C2402B-19

Positive Lead	Measurement / Action	Negative Lead
C233-6	Ω	BCM fuse 21 cavity, (component side)

Are the resistances less than 3 ohms?

Yes	GO to P4

No	REPAIR the circuit.

P4 CHECK THE IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR CIRCUITS FOR A SHORT TOGETHER

Measure:

Positive Lead	Measurement / Action	Negative Lead
C233-1	Ω	C233-2
C233-1	Ω	C233-3
C233-1	Ω	C233-4
C233-1	Ω	C233-5
C233-1	Ω	C233-6
C233-2	Ω	C233-3
C233-2	Ω	C233-4
C233-2	Ω	C233-5
C233-2	Ω	C233-6
C233-3	Ω	C233-4
C233-3	Ω	C233-5
C233-3	Ω	C233-6
C233-4	Ω	C233-5
C233-4	Ω	C233-6
C233-5	Ω	C233-6

Are the resistances greater than 10, 000 ohms?

Yes	GO to P5

No	REPAIR the circuit.

P5 CHECK FOR CORRECT IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR OPERATION

Inspect the disconnected connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Reconnect all disconnected connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	INSTALL a new in-vehicle temperature sensor. REFER to: In-Vehicle Temperature and Humidity Sensor . TEST the system for normal operation. If the concern is still present, GO to P6

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

P6 CHECK FOR CORRECT FCIM (FRONT CONTROLS INTERFACE MODULE) OPERATION

Ignition OFF.

Disconnect and inspect all FCIM connectors.

Repair:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

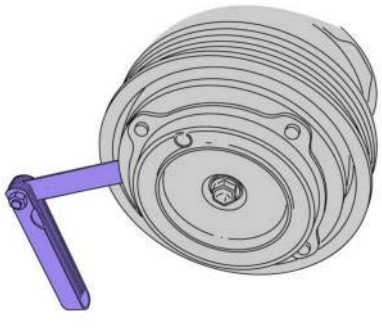
Reconnect all FCIM connectors. Make sure they seat and latch correctly.

Operate the system and determine if the concern is still present.

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new FCIM. Refer to the

	appropriate article for the procedure.



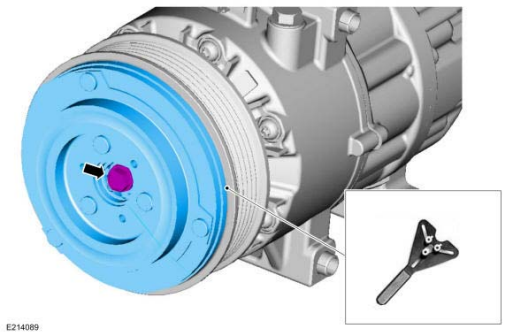
No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ADDRESS the root cause of any connector or pin issues.

GENERAL PROCEDURES > AIR CONDITIONING (A C) CLUTCH AIR GAP ADJUSTMENT

Activation

1.

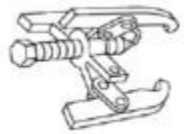
Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley. Refer to: Specifications .



2.

Using the universal clutch holding tool, hold the A/C clutch disc and hub, remove the A/C clutch disc and bolt. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification. Refer to: Specifications .

Torque



: 124 lb.in (14 Nm)

GENERAL PROCEDURES > AIR CONDITIONING (AC) CLUTCH AND AIR

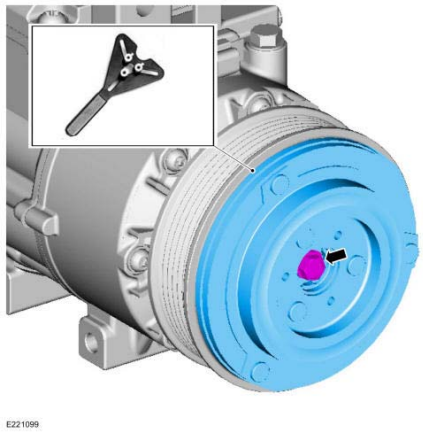
CONDITIONING (AC) CLUTCH FIELD COIL

Special Tool(s) / General Equipment

	412-001 (T71P-19703-B) Remover, Compressor Pulley

Activation

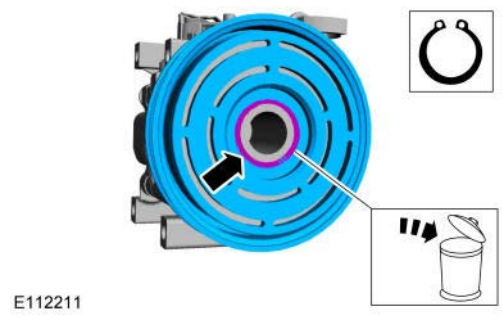
1.



Remove the A/C compressor.

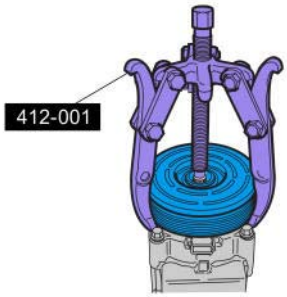
2.

Using the universal clutch holding tool, hold the clutch and remove the A/C clutch disc and hub bolt.



Torque

: 159 lb.in (18 Nm)

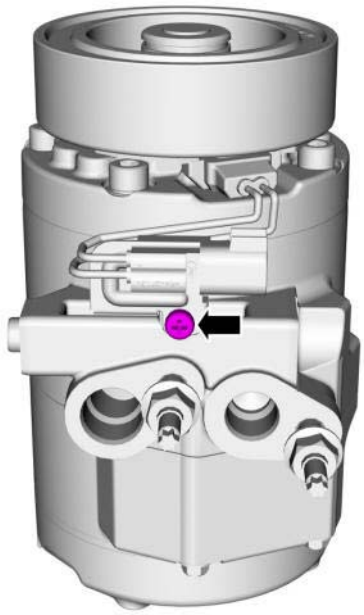


3.

Remove the A/C compressor pulley snap ring.

NOTE: Do not use air tools. Damage to the A/C clutch pulley or A/C compressor may result.

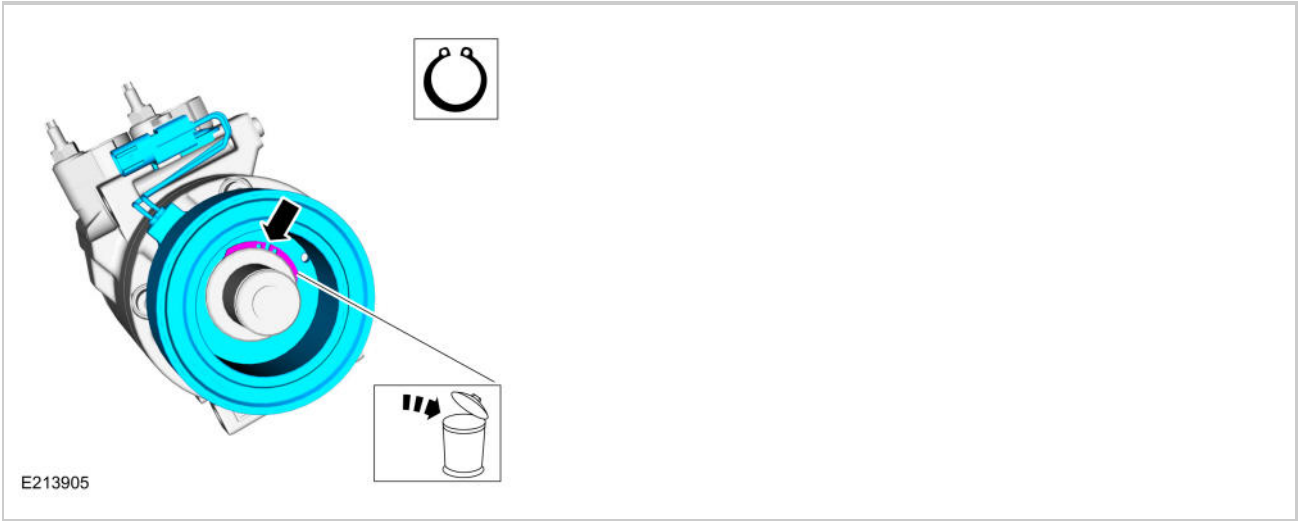
4.
Remove the A/C compressor pulley. Use Special Service Tool: 412-001 (T71P-19703-B) Remover, Compressor Pulley.



E153143

5.

Remove the A/C clutch field coil electrical connector retainer.



Torque

: 35 lb.in (4 Nm)

E213527

6.

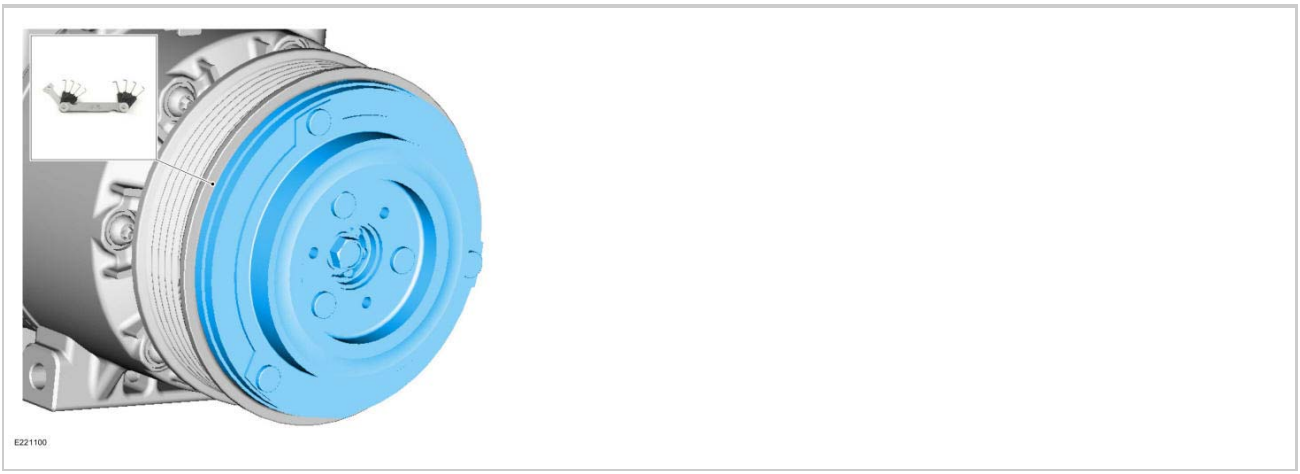
Remove the A/C clutch field coil snap ring, and remove the clutch field coil.

7.

Visually inspect the A/C clutch disc and hub, compressor pulley and clutch field coil for damage.

Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.

Inspect for excessive wear, including grooving in the A/C clutch disc and hub or the compressor pulley that is more than fingernail depth.



Inspect for roughness in the A/C compressor pulley bearing.

8.

To install, reverse the steps in this procedure.

9.

Measure and adjust the clutch air gap by removing or adding clutch disc and hub spacers. Refer to: Air Conditioning (A/C) Clutch Air Gap Adjustment .

GENERAL PROCEDURES > AIR CONDITIONING (A C) ODOR TREATMENT

Special Tool(s) / General Equipment

 E221429	258-62644 (258-00005) A/C ODOR REMOVER FLEXIBLE APPLICATOR

Materials

Name	Specification
Motorcraft ® A/C Cooling Coil Coating YN-29	-

Activation

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors will not be present at temperatures at or below 10 °C (50 °F).

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

Chemical, environmental, human and other interior-generated odors, microbiological odors. Before determining that A/C odor treatment is required, determine the source and the circumstances under which the odor occurs.

1.

NOTE: Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

2.

foam seals

rubber seals

adhesives

standing water

water soaked carpet/trim

3.

Eliminate microbiological odors by removing the source and treating the affected area. Allow standing water to drain and dry out. A/C systems may be treated by using A/C Cooling Coil Coating as described in the service procedure.

4.

Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following list for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell

Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

NOTE: Identify the source of the odor.

5.

Check the evaporator core drain tube for restriction.

Check the passenger and driver side carpet for moisture. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.

Check the cabin air filter and cabin air filter cover for moisture resulting from water bypassing the cowl baffling system. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.

Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.

6.

Open all vehicle windows and doors.

7.

Make sure the A/C is off.

8.

Select REGISTER mode (A/C off).

9.

Adjust the temperature setting to full warm.

10.

Adjust the blower motor speed to HI.

11.

Run the engine for 25 minutes to dry out the A/C system.

12.

Turn the ignition OFF.

13.

Remove the blower motor.

> *NOTE: Blower motor resistors or blower motor speed controls that are mounted outside of the climate control housing and not exposed to the blower motor airflow do not need to be removed.*

14.
Remove the blower motor resister or blower motor speed control (if equipped and exposed to the inside of the climate control housing).

> *NOTE: Only Motorcraft YN-29 is approved for use on Ford vehicles no other coating is approved. Use of other coatings may cause damage to the factory coating and more odor issues.*

> *NOTE: To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.*

15.
Add one full bottle of A/C Cooling Coil Coating to the Flexible Applicator Tool. Use Special Service Tool: 258-62644 (258-00005) A/C ODOR REMOVER FLEXIBLE APPLICATOR.

Material

: Motorcraft ® A/C Cooling Coil Coating / YN-29

16.

Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.

17.

Install the blower motor and blower motor resistor or blower motor speed control.

18.

Repeat Steps 7 through 11 to cure the evaporator core coating.

GENERAL PROCEDURES > AIR CONDITIONING (A C) SYSTEM FLUSHING

Activation

NOTE: Use an A/C refrigerant analyzer before recovering any of the vehicle's refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.

NOTE: Before flushing the A/C system, remove the receiver drier or receiver drier element, front Thermostatic Expansion Valve (TXV), rear TXV (if equipped) and hoses with mufflers. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can be reused unless they are clogged with foreign material. The 3.78L (1 gal) of Motorcraft ® A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 357-405 80001 00 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.

NOTE: Only the A/C Flush and Purge Machine 357-405 80001 00 and Motorcraft ® A/C System Flushing Solvent are approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (A/C condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Prior to using the A/C Flush and Purge Machine 357-405 80001 00 for the first time, review the operating instructions.

NOTE: Never push shop air directly through an a/c system. Shop air is full of contaminants and must be run through flush machine to clean and dry air.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves using an A/C Flush and Purge Machine 357-405 80001 00 to:

- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) connected to the flush machine is used to push and evaporate any remaining flush solvent from the heat exchanger.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

NOTE: Do not flush through the condenser integrated receiver drier element (if equipped), TXV (if equipped) or hoses with mufflers. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

3.
Use the correct adapters with 357-405 80001 00 to flush the heat exchanger. Do not flush through the condenser integrated receiver drier element (if equipped), TXV (if equipped) or hoses with mufflers. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

NOTE: Use 3.78 L (1 gal) of Motorcraft ® A/C System Flushing Solvent to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter used on the flushing unit is also intended for use on one vehicle only.

4.
Flush the heat exchanger for a minimum of 15 minutes.

5.

Apply 621-862 kPa (90-125 psi) pressurized air to the flush machine, flush the component for a minimum of 30 minutes using the flush machine. The 30-minute purge time is required to force and

evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

6.

Install a new TXV (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure. Refer to: Thermostatic Expansion Valve - 2.3L EcoBoost (201kW/273PS) . Refer to: Thermostatic Expansion Valve - 3.7L Duratec (227kW/301PS) . Refer to: Thermostatic Expansion Valve - 5.0L 32V Ti-VCT .

7.

Install new refrigerant hoses with mufflers if clogged with foreign material.

8.

Install a new receiver drier (if equipped) or receiver drier element (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure. Refer to: Receiver Drier - 5.0L 32V Ti-VCT . Refer to: Receiver Drier - 2.3L EcoBoost (201kW/273PS) . Refer to: Receiver Drier - 3.7L Duratec (227kW/301PS) .

9.

Reconnect the heat exchanger being serviced.

10.

If a new A/C compressor is not being installed, lubricate the refrigerant system with the correct amount of clean PAG oil. Refer to: Refrigerant Oil Adding .

11.

If a new A/C compressor is not being installed, evacuate, leak test and charge the A/C system. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

12.

If a new A/C compressor is being installed, install the A/C compressor. Refer to: Air Conditioning (A/C) Compressor - 2.3L EcoBoost (201kW/273PS) . Refer to: Refrigerant System Tests - 3.7L Duratec (227kW/301PS) . Refer to: Air Conditioning (A/C) Compressor - 5.0L 32V Ti-VCT .

GENERAL PROCEDURES > AIR CONDITIONING (A C) SYSTEM RECOVERY, EVACUATION AND CHARGING

Special Tool(s) / General Equipment

Air Conditioning Service Unit

Recovery

NOTE: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.

1.

NOTE: Ford Motor Company recommends the use of R-134a refrigerant management equipment that meets the requirements of the SAE J2788 standard.

2.

Prior to recovering, verify the purity of the refrigerant. Refer to: Refrigerant Identification Testing .

3.

Connect the tool to the low- and high-pressure service gauge port valves following the manufacturer's instructions. Use the General Equipment: Air Conditioning Service Unit

NOTE: Never attempt to recover from only the low side service gauge port valve (solenoid valves in the system will not allow for full recovery).

4.
Recover the refrigerant from the system following the operating manufacturer's instructions. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete. Refer to: Refrigerant Oil Adding .

5.

Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6.

If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7.

Carry out the required repairs.

Evacuation

NOTE: An A/C refrigerant analyzer must be used before the recovery of any vehicle's

A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.

1.

Connect the tool to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer. Use the General Equipment: Air Conditioning Service Unit

NOTE: Never attempt to recover from only the low side service gauge port valve (solenoid valves in the system will not allow for full recovery).

2.
Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

3.

Turn off the vacuum pump. Observe the low-pressure gauge for 10 minutes to make sure that the system vacuum is held.

Charging

NOTE: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.

1.

Lubricate the refrigerant system with the correct amount of clean PAG (polyalkylene glycol) oil. Refer to: Refrigerant Oil Adding .

2.

Connect the tool to the low-side and high-side service gauge port valves following the manufacturer's instructions. Use the General Equipment: Air Conditioning Service Unit

3.

Set the refrigerant charge amount, and charge the refrigerant system following the manufacturer's instructions.

GENERAL PROCEDURES > ELECTRONIC LEAK DETECTION

Special Tool(s) / General Equipment

UV Leak Detector

Inspection

NOTE: If the surrounding air is contaminated with refrigerant gas, the leak detector indicates this gas all the time. Odors from other chemicals such as antifreeze, disc brake cleaner or other cleaning solvents can cause the same problem.

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the leak detector indicates this gas all the time. Odors from other chemicals such as antifreeze, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

1.
R-134a, if present, is heavier than air, and tends to move down from the source of the leak. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below, above and around the fitting, line or component for the presence of R-134a. Use the General Equipment: UV Leak Detector

NOTE: The system pressure should be 413-551 kPa (60 - 80 psi) at 24 ° C (75.2 ° F) with the engine off and cool. The pressure reading may be higher if the engine is hot.

2.
Leak test the refrigerant system. Follow the instructions included with the Infrared Refrigerant Leak Detector or Dual Mode Refrigerant Gas and UV Dye Leak Detector for handling and operation techniques. Use the General Equipment: UV Leak Detector

GENERAL PROCEDURES > FLUORESCENT DYE LEAK DETECTION

Special Tool(s) / General Equipment

	219-00069 R134a Loop/Add On Kit Set
UV Leak Detector	
Fluorescent Dye Injector	

Activation

Fluorescent Dye Injection Using a R-134a Refrigerant Management Machine and Dye Injector - Vehicles Requiring R-134a Addition

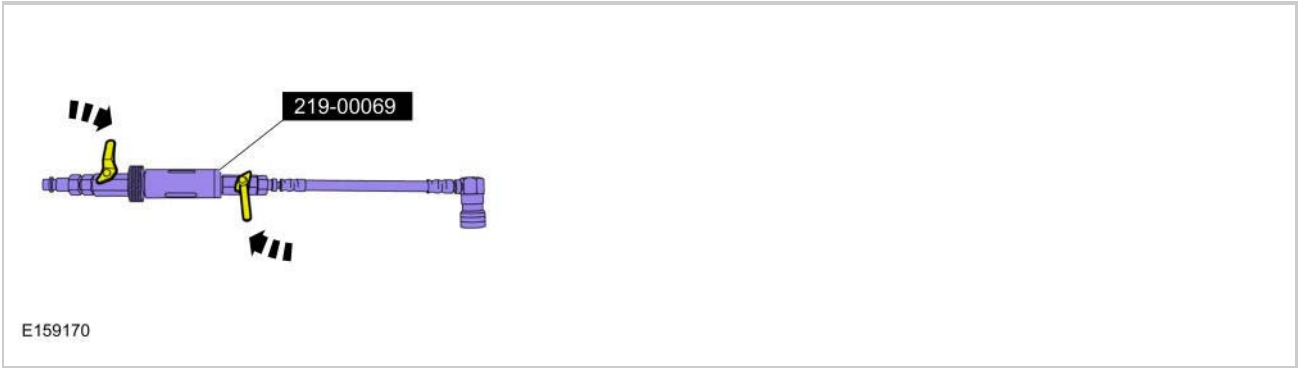
NOTE: This method of fluorescent dye injection requires the addition of R-134a from a R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set hooked to an external tank to charge the dye into the refrigerant system. If adding fluorescent dye to a refrigerant system that is already fully charged, use the R-134a Loop/Add On Injector Kit-Set.

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV lamp. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye wafer included in the desiccant bag which dissolves after approximately 30 minutes of continuous A/C operation. It is not necessary to add dye after flushing the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing procedure.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set when fluorescent dye is to be injected. The dye/lubricant injector has a one-way check valve that prevents refrigerant system recovery and evacuation.

NOTE: If no R-134a pressure is present in the refrigerant system, evacuate the system before carrying out the injection procedure.



1.
Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Connect a R-134a Refrigerant Management Machine or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

3.

Verify the valves on the R-134a Loop/Add On Injector Kit-Set are closed. Install Special Service Tool: 219-00069 R134a Loop/Add On Kit Set.

4.

Fill the R-134a fluorescent dye injector reservoir with 7 ml (0.25 fl. oz.) of fluorescent dye. Use the General Equipment: Fluorescent Dye Injector

5.

Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves. Install Special Service Tool: 219-00069 R134a Loop/Add On Kit Set.

NOTE: Following fluorescent dye injection, the refrigerant system should be fully charged to make sure of correct movement of the dye. The dye moves with the oil not the refrigerant. The oil moves with the refrigerant.

6.
Open all valves and inject the fluorescent dye into the refrigerant system by charging the refrigerant system with the required amount of R-134a.

7.

When fluorescent dye injection is complete, close all valves.

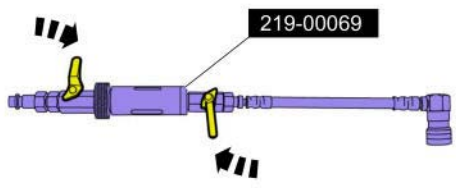
8.

Recover the refrigerant from the dye/lubricant injector.

9.

Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set. Use the General Equipment: Fluorescent Dye Injector

Fluorescent Dye Injection Using a R-134a Loop/Add On Injector Kit-Set - Vehicles Not Requiring R-134a Addition

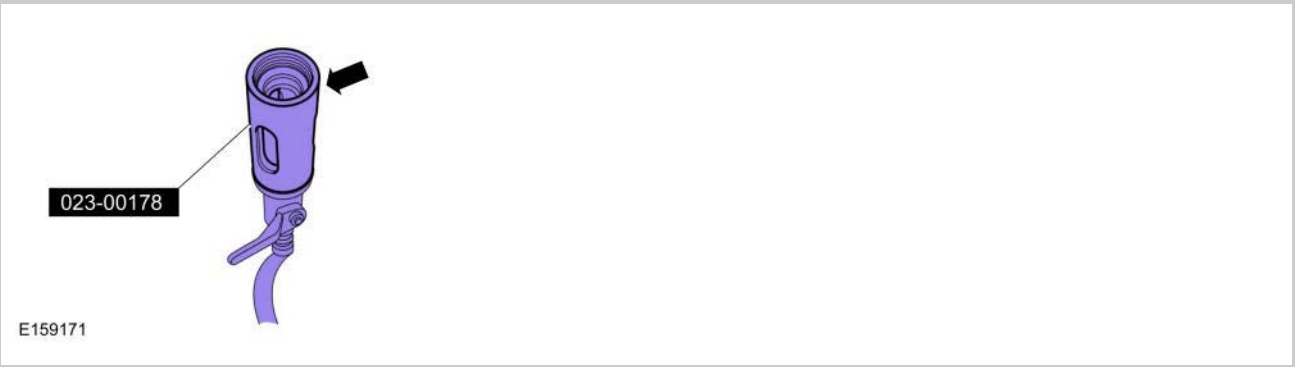


NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV lamp. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver driers are shipped with a fluorescent dye wafer included in the desiccant bag which dissolves after approximately 30 minutes of continuous A/C operation. It is not necessary to add dye after flushing the refrigerant system because a new suction accumulator or receiver drier is installed as part of the flushing procedure.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24 ° C (75 ° F) with the engine off and cool.

10.



Verify the valves on the R-134a Loop/Add On Injector Kit-Set are closed. Install Special Service Tool: 219-00069 R134a Loop/Add On Kit Set.

E159170

11.

Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7 ml (0.25 fl. oz.) of fluorescent dye.

12.

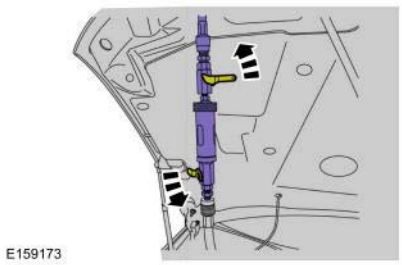
Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves.

NOTE: Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt results in damage to the tools and/or vehicle.

13.
With the A/C off, start the engine. Allow engine speed to stabilize below 1, 000 RPM.

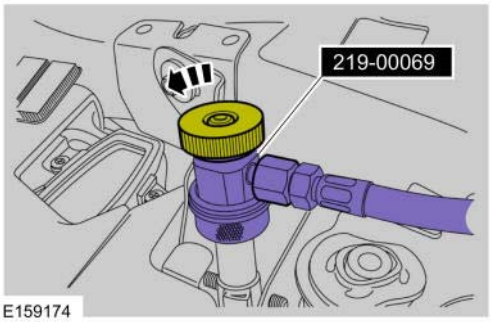
14.

Set the A/C to the ON position.



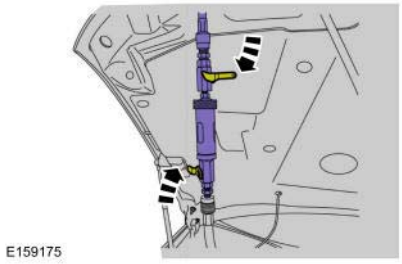
15.

Open the high-pressure service valve.



NOTE: To prevent pressure spike/liquid slug, slowly open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.

16.
Open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.



17.

Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.

NOTE: Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

18.
Close the valves on the R-134a Loop/Add On Injector Kit-Set.

NOTE: Make sure all of the valves on the R-134a Loop/Add On Injector Kit-Set remain closed when not in use.

19.
Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add On Injector Kit-Set from the vehicle. Remove Special Service Tool: 219-00069 R134a Loop/Add On Kit Set.

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, inspect each component, line and fitting in the refrigerant system for a leak.

NOTE: Use of dye-enhancing glasses or goggles greatly improves the detection of the dye under the UV lamp.

NOTE: Not all UV lamps will fluoresce the dye used in Ford vehicles. All Rotunda UV lamps are optimized to fluoresce the dye.

20.

Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.

21.

Inspect all components, lines and fittings of the refrigerant system.

22.

After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

23.

Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp. Use the General Equipment: UV Leak Detector

GENERAL PROCEDURES > REFRIGERANT IDENTIFICATION TESTING

Special Tool(s) / General Equipment

Refrigerant Identification Equipment

Activation

NOTE: Use a Refrigerant Blend Identifier to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

1.
Follow the instructions included with Refrigerant Blend Identifier to obtain the sample for testing.

Use the General Equipment: Refrigerant Identification Equipment

> *NOTE: The refrigerant identifier displays one of the following:*

2.

If the purity level of R-134a is 98% or greater by weight, the green PASS LED. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.

If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED and an alarm sounds alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons are displayed on the digital display.

If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED, "Hydrocarbon High" will be displayed on the digital display, and an alarm sounds alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons also are displayed on the digital display.

3.

The percentage of air contained in the sample is displayed if the R-134a content is 98% or greater. The refrigerant identifier eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the refrigerant identifier has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, it prompts the user if an air purge is desired.

4.

If contaminated refrigerant is detected, repeat the refrigerant identification test to verify the refrigerant is indeed contaminated.

> *NOTE: Install a new suction accumulator or receiver/drier as directed by the A/C system flushing procedure.*

> *NOTE: If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a recovery/recycling equipment. Recovery of contaminated refrigerant contaminates the recovered refrigerant supply and may damage the recovery/recycling equipment.*

5.
Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.

6.

Determine and correct the cause of the customer's initial concern.

7.

Refer to: Air Conditioning (A/C) System Flushing .

8.

Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

GENERAL PROCEDURES > REFRIGERANT OIL ADDING

Special Tool(s) / General Equipment

Air Conditioning Service Unit

Check

Compressor Type

NOTE: New compressors come fully charged with PAG (polyalkylene glycol) compressor oil. The old compressor is only partially charged because some of the oil is elsewhere in the A/C system.

NOTE: The purpose of oil balance is to make sure the amount of oil in the system is not increased or decreased as a result of the replacement component(s).

NOTE: Perform an oil balance when replacing a compressor where system flush will not be performed.

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

NOTE: Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D only must be used as a refrigerant system lubricant. Addition of any oil other than Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D to the refrigerant system will damage the A/C compressor and contaminate the refrigerant system.

NOTE: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of

contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.

1.
Verify the location of the drain plug by compressor type. Once the compressor type has been identified, proceed to appropriate compressor type below for compressor oil matching steps.

NOTE: ***Type 1: (IVDC) Internal Variable Displacement Air Conditioning (A/C) Compressor***

2.

E169516

NOTE: ***Type 2: (EVDC) External Variable Displacement Air Conditioning (A/C) Compressor***

3.

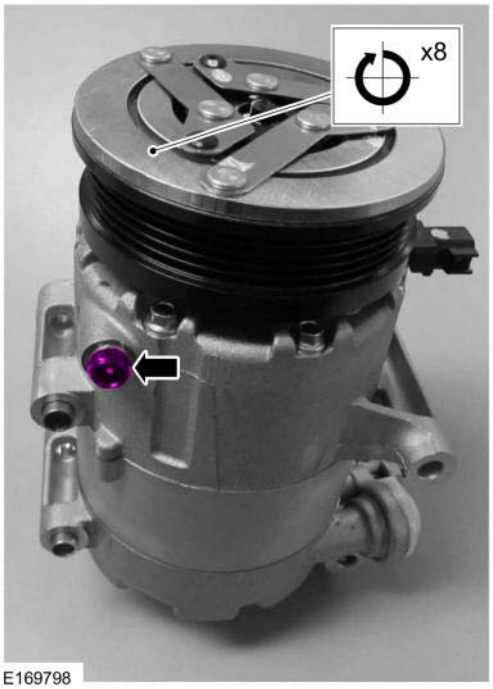
E169517

NOTE: ***Type 3: (EVDC) External Variable Displacement Air Conditioning (A/C) Compressor***

4.

E169628

NOTE: ***Type 4: Fixed Air Conditioning (A/C) Compressor***



5.

Type 1

> *NOTE: Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.*

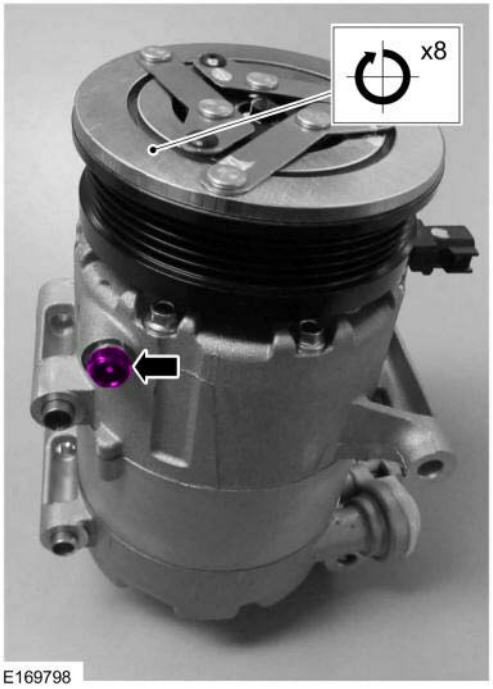
6.
Remove the oil drain bolt and rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

7.

Install the oil drain bolt in the old A/C compressor.

Torque

: 177 lb.in (20 Nm)



8.

Remove the suction and discharge port seal cap from the new A/C compressor.

NOTE: Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.

9.
Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

10.

Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

11.

Install the oil drain bolt in the new A/C compressor.

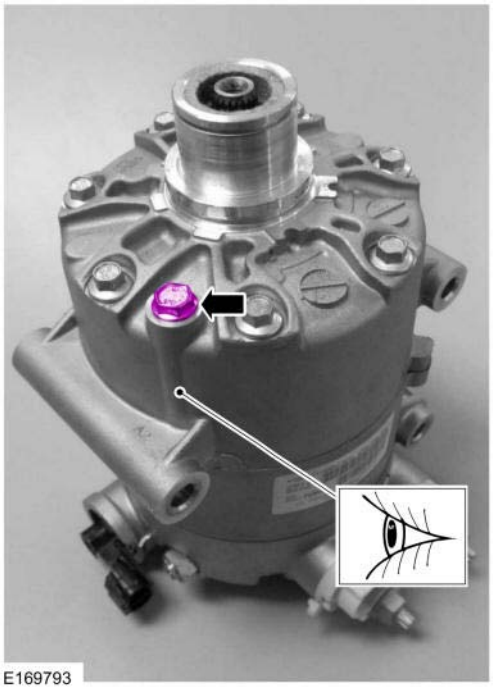
Torque

: 177 lb.in (20 Nm)

E169516

12.

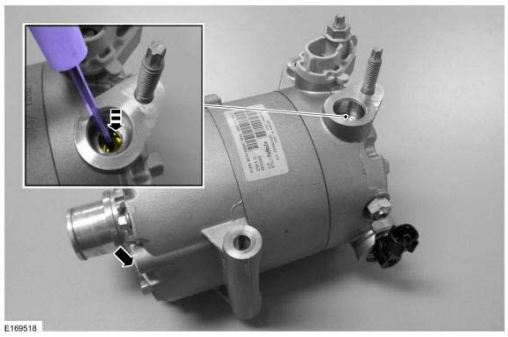
Install the suction and discharge port seal cap on the new A/C compressor.



Type 2

13.

Remove the A/C clutch and A/C clutch field coil from the old A/C compressor. Refer to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .



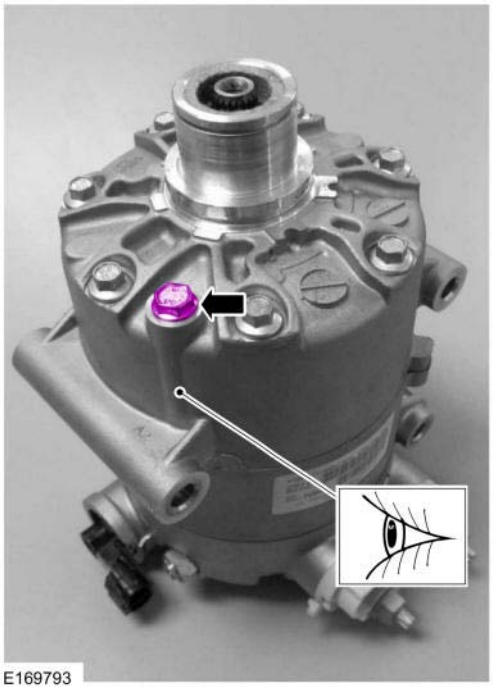
14.

Remove the oil drain bolt from the old A/C compressor.

15.

Press the suction damper to allow proper ventilation while draining the oil from the old A/C compressor.

16.



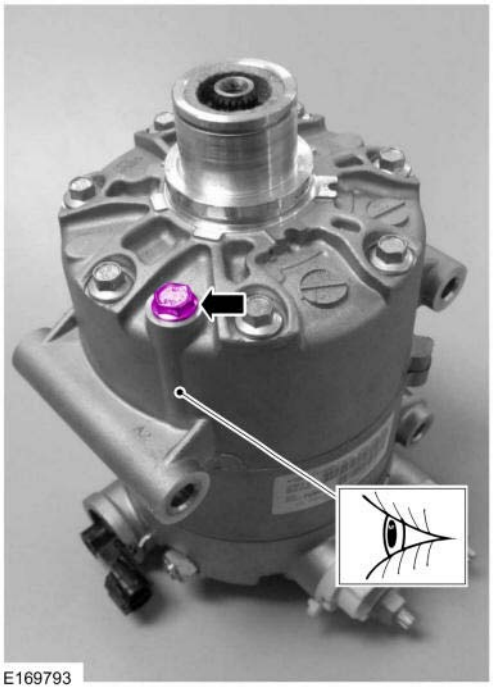
Drain as much oil from the old A/C compressor.

17.

Install the oil drain bolt in the old A/C compressor.

Torque

: 80 lb.in (9 Nm)

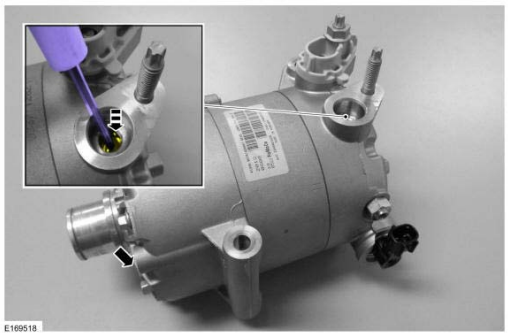


18.

Remove the A/C clutch and A/C clutch field coil from the new A/C compressor. Refer to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .

19.

Remove the oil drain bolt from the new A/C compressor.



20.

Remove the suction port seal cap.

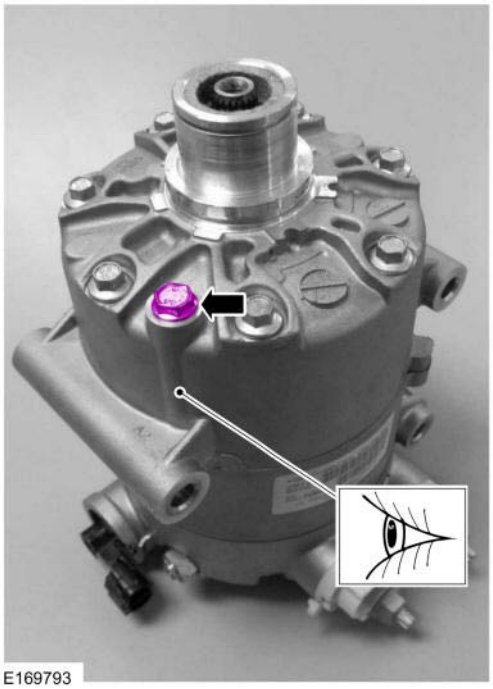
21.

Press the suction damper to allow proper ventilation while draining the oil from the old A/C compressor.

22.

Drain as much oil from the new A/C compressor.

23.



Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

24.

Install the oil drain bolt in the new A/C compressor.

Torque

: 80 lb.in (9 Nm)

25.

Install the suction port seal cap.

26.

Install the A/C clutch and A/C clutch field coil on the new A/C compressor. Refer to: Air Conditioning (A/C) Clutch and Air Conditioning (A/C) Clutch Field Coil .

Type 3

NOTE: Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.

27.
Remove the oil drain bolt and rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

28.

Install the oil drain bolt in the old A/C compressor.

Torque

: 22 lb.ft (30 Nm)

29.

Remove the suction and discharge port seal cap from the new A/C compressor.

NOTE: Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.

30.
Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device.

31.

Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

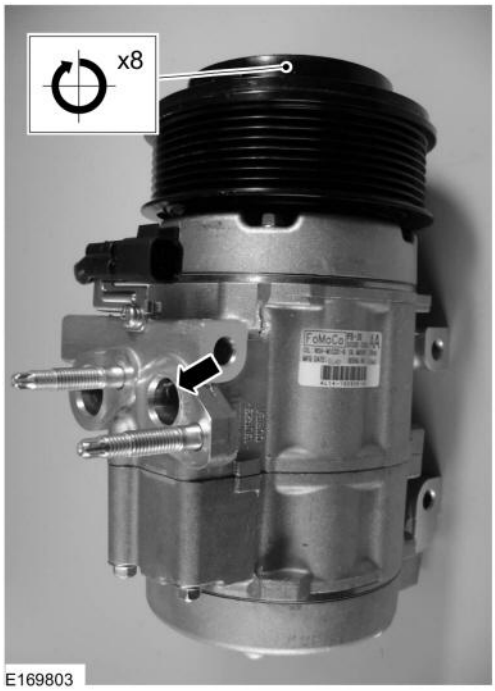
32.

Install the oil drain bolt in the new A/C compressor.

Torque

: 22 lb.ft (30 Nm)

E169802



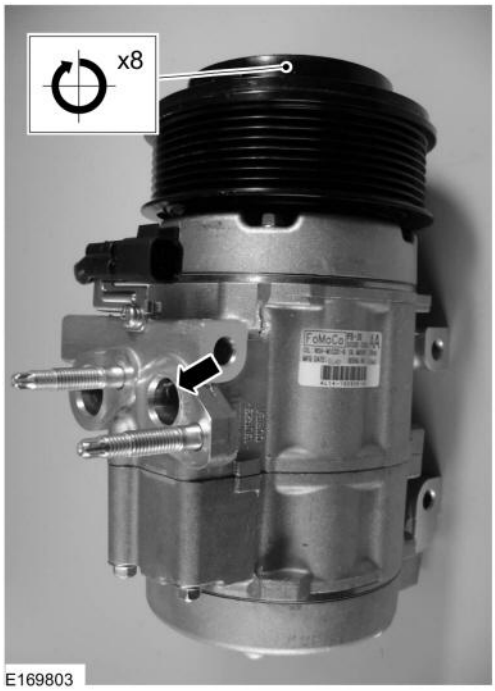
33.

Install the suction and discharge port seal cap on the new A/C compressor.

Type 4

NOTE: Make sure the old A/C compressor shaft is rotating and not just the A/C pulley.

34.
Rotate the old A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device from the A/C compressor discharge port.



35.

Remove the suction and discharge port seal cap from the new A/C compressor.

NOTE: Make sure the new A/C compressor shaft is rotating and not just the A/C pulley.

36.
Remove the drain bolt and rotate the new A/C compressor clutch 6 to 8 revolutions while collecting oil in a clean measuring device from the A/C compressor discharge port.

37.

Measure the amount of oil drained for the old A/C compressor and add the same amount of new oil to the new A/C compressor.

38.

Install the suction and discharge port seal cap on the new A/C compressor.

Activation

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

NOTE: Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D only must be used as a refrigerant system lubricant. Addition of any oil other than Motorcraft ® PAG Refrigerant Compressor Oil YN-12-D to the refrigerant system will damage the A/C compressor and contaminate the refrigerant system.

NOTE: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering

contaminated A/C refrigerant. Dispose of all contaminated A/C refrigerant as hazardous waste. For all equipment, follow the manufacturer's instructions.

1.

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the PAG (polyalkylene glycol) oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

NOTE: Make sure the equipment is clean and free of foreign material.

2.
Refer to the chart below for refrigerant oil adding amounts and methods of installation.**Refrigerant Oil Adding (When new components are installed)**

	PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D Oil Amount fl. oz. (ml)	Method of Adding
After installing the A/C Compressor.	Service compressor contains full system charge of oil. Oil matching required plus amount collected during recovery.	Refer to oil adding steps above.
After installing the receiver/drier.	2 fl. oz. (60 ml) plus the amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing the receiver/drier element.	1 fl. oz. (30 ml) plus the amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing the condenser core.	1.5 fl. oz. (45 ml) plus the amount collected during refrigerant recovery.	Add directly to inlet port or inject to low-side service port during system charging.
After installing the condenser core, and the receiver/drier element.	2 fl. oz. (60 ml) plus the amount collected during refrigerant recovery.	Add directly to inlet port or inject to low-side service port during system charging.
After installing the evaporator core.	1.5 fl. oz. (45 ml) plus the amount collected during refrigerant recovery.	Add directly to inlet port or inject to low-side service port during system charging.

After installing/reassembling the thermostatic expansion valve.	Amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
After installing a refrigerant Hose/Line.	2 fl. oz. (60 ml) plus the amount collected during refrigerant recovery **FOOTNOTE (a)** .	Inject to low-side service port during system charging.
After an O-ring Leak Repair.	1 fl. oz. (30 ml) plus the amount collected during refrigerant recovery **FOOTNOTE (b)** .	Inject to low-side service port during system charging.
After a service port leak repair.	Amount collected during refrigerant recovery.	Inject to low-side service port during system charging.
FOOTNOTE (a) If an excessive amount of PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D is lost due to a hose rupture/separation or other damage, the total system PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D capacity must be added. Also, it is necessary to replace the receiver/drier.		
FOOTNOTE (b) The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the PAG (polyalkylene glycol) Refrigerant Compressor Oil YN-12-D amount by the number of O-ring leaks being repaired.		

Use the General Equipment: Air Conditioning Service Unit

Oil Injection Using a Dye/Lubricant Injector

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24 ° C (75 ° F) with the engine off and cool.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV black light. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye wafer included in the desiccant bag which dissolves after approximately 30 minutes of continuous A/C operation. It is not necessary to add dye after flushing the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing procedure. Replace hose/accumulator, receiver/drier or receiver/drier element.

3.

Evacuate the refrigerant system. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

4.

Assemble the dye/lubricant injector and the correct adapters to match the amount of refrigerant compressor oil to be injected.

5.

Verify that all the valves on the dye/lubricant injector are closed.

6.

Fill the dye/lubricant injector with the correct amount of clean, new PAG (polyalkylene glycol) oil.

7.

Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.

NOTE: Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt results in damage to the tools and/or vehicle.

8.
Open all valves and charge the refrigerant system. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

GENERAL PROCEDURES > REFRIGERANT SYSTEM TESTS - 2.3L ECOBOOST (201KW 273PS)

Activation

NOTE: In order to perform an accurate test the vehicle ambient temperature must be 21 °C (70 °F) or above.

NOTE: Procedure 1 - Ambient Temperature between 21 °C (70 °F) and 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

Open all vehicle windows and leave the hood open for the test. Open the rear doors.

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.

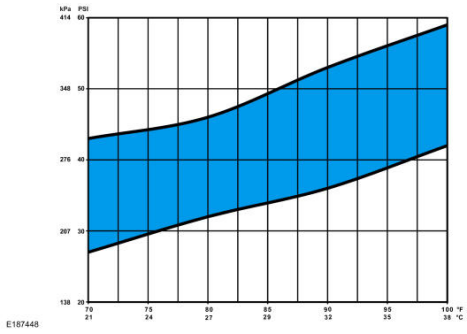
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow. Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)**
Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)**
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.
Additional Possible Components or Causes Associated With Inadequate Compressor Operation		
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting		

Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer
Additional Possible Components or Causes Associated With a Damaged Compressor
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

Inspection

NOTE: Procedure 2 - Ambient Temperature Above 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

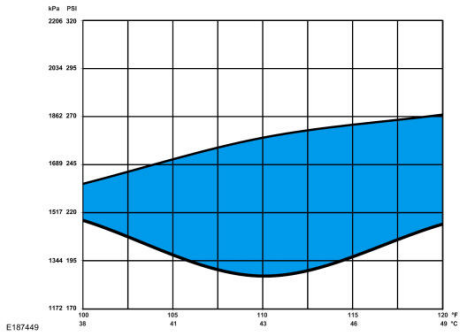
Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.



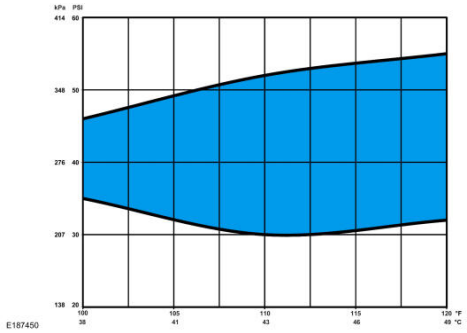
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow. Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.

Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)**
Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)**
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.
Additional Possible Components or Causes Associated With Inadequate Compressor Operation		
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer		
Additional Possible Components or Causes Associated With a Damaged Compressor		
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks		

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

GENERAL PROCEDURES > REFRIGERANT SYSTEM TESTS - 3.7L DURATEC (227KW 301PS)

Activation

NOTE: In order to perform an accurate test the vehicle ambient temperature must be 21 °C (70 °F) or above.

NOTE: Procedure 1 - Ambient Temperature between 21 °C (70 °F) and 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

Open all vehicle windows and leave the hood open for the test. Open the rear doors.

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.

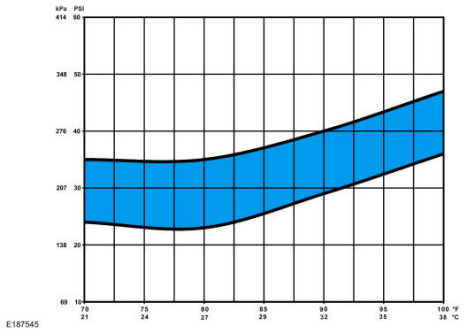
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow. Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)**
Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)**
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.

Additional Possible Components or Causes Associated With Inadequate Compressor Operation
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer
Additional Possible Components or Causes Associated With a Damaged Compressor
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

Inspection

NOTE: Procedure 2 - Ambient Temperature Above 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

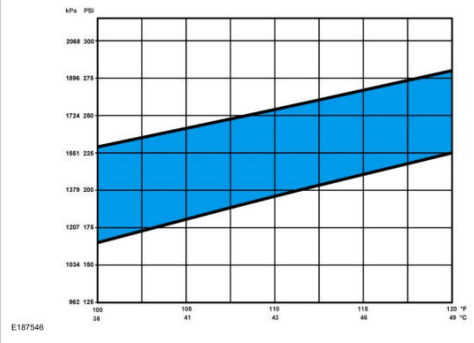
Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.



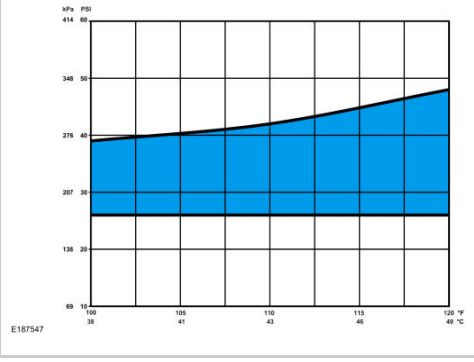
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow.

		Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)**
Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)**
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.
Additional Possible Components or Causes Associated With Inadequate Compressor Operation		
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer		
Additional Possible Components or Causes Associated With a Damaged Compressor		
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks		

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

GENERAL PROCEDURES > REFRIGERANT SYSTEM TESTS - 5.0L 32V TI-VCT

Activation

NOTE: In order to perform an accurate test the vehicle ambient temperature must be 21

°C (70 °F) or above.

NOTE: Procedure 1 - Ambient Temperature between 21 °C (70 °F) and 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

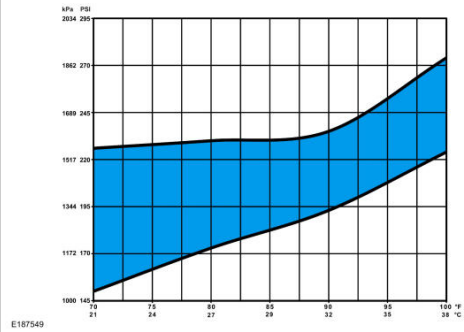
Open all vehicle windows and leave the hood open for the test. Open the rear doors.

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.



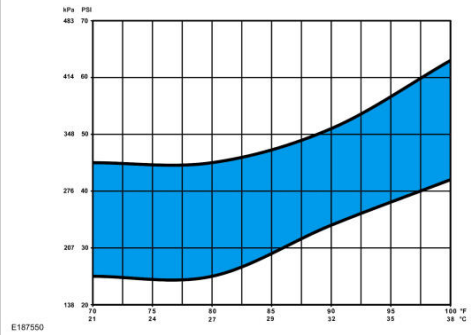
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 21 - 38 °C (70 - 100 °F) Ambient (30 - 60% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow. Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)** .

Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)** .
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.
Additional Possible Components or Causes Associated With Inadequate Compressor Operation		
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer		
Additional Possible Components or Causes Associated With a Damaged Compressor		
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks		

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

Inspection

NOTE: Procedure 2 - Ambient Temperature Above 38 °C (100 °F)

1.
Run the engine until it reaches normal operating temperature.

2.

Connect the air conditioning service unit to the refrigerant system.

3.

Set temperature to (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an Air Conditioning (A/C) switch or compressor on switch, set it to Air Conditioning (A/C) ON.

4.

Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5.

Confirm the compressor is operating and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6.

Record the ambient (shop) temperature.

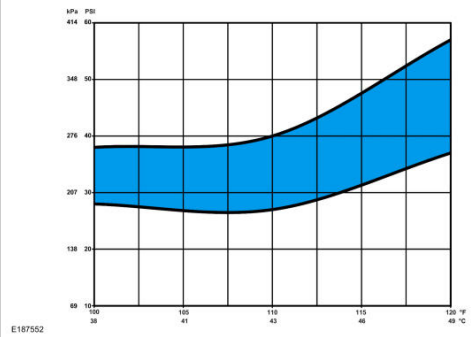
7.

Record the discharge pressure. If the pressure is fluctuating, record the average value.

8.

Determine if the discharge pressure falls within the normal operating limits using the

Normal Refrigerant Discharge Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.



9.

Record the suction pressure. If the pressure is fluctuating, record the average value.

10.

Determine if the suction pressure falls within the normal operating limits using the

Normal Refrigerant Suction Pressures 38 - 49 °C (100 - 120 °F) Ambient (15 - 40% Relative Humidity) chart below.

NOTE: Use the following table to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

11.
Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High	Normal to High	Condenser - inadequate airflow. Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	High	A/C Compressor - low performance.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. **FOOTNOTE (a)**
Normal to Low	Low	Low refrigerant charge - leak in system. A/C suction line - partially restricted or plugged. **FOOTNOTE (b)**
Erratic Operation or Compressor Not Running		Ambient Air Temperature (AAT) sensor - poor connection. A/C pressure transducer - poor connection. Evaporator temperature sensor - poor connection. Low refrigerant charge - leak in system.
Additional Possible Components or Causes Associated With Inadequate Compressor Operation		
Compressor drive belt - loose Compressor clutch - slipping Clutch coil open - shorted, or loose mounting		

Control assembly switch - dirty contacts or sticking open Clutch wiring circuit - high resistance, open or blown fuse Compressor operation interrupted by engine computer
Additional Possible Components or Causes Associated With a Damaged Compressor
Incorrect clutch air-gap Suction accumulator - refrigerant oil bleed hose plugged Refrigerant leaks

FOOTNOTE (a) Low pressure reading will be normal to high if restriction is downstream of service access valve. **FOOTNOTE (b)** Low pressure reading will be low if restriction is upstream of service access valve.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: If installing a new A/C compressor due to an internal failure of the old unit, carry out the following procedures to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.

- **If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor.**
- **If A/C flushing equipment is not available, replace all contaminated components after a new A/C compressor has been installed.**
- **Install a new Thermostatic Expansion Valve (TXV) as directed by the A/C flushing.**
- **Install a new receiver drier element as directed by the A/C flushing.**

NOTE: Installation of a new receiver drier element is not required when repairing the A/C system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver drier element.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

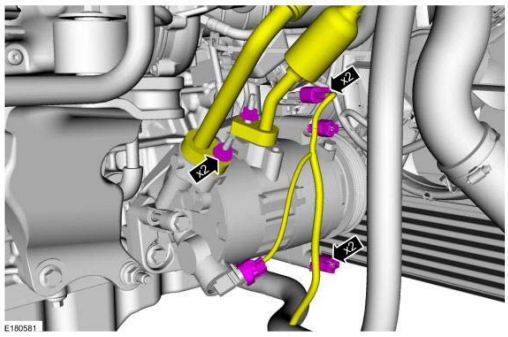
NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the A/C compressor belt. Refer to: Air Conditioning (A/C) Compressor Belt .



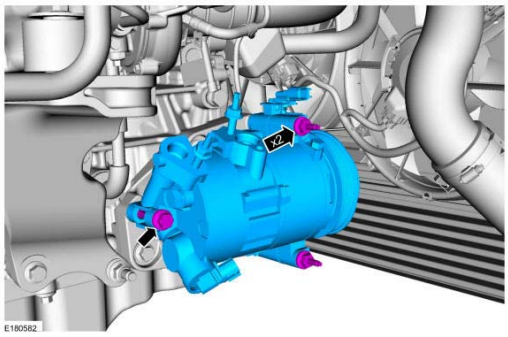
> *NOTE: Make sure that all openings are sealed.*

> *NOTE: Discard the O-ring seals and gaskets.*

3.
Remove the wiring harness retainers and disconnect the electrical connectors. Remove the nuts and disconnect the A/C compressor inlet and outlet lines.

Torque

: 159 lb.in (18 Nm)



4.

Remove the bolt, studbolts and the A/C compressor.

Torque

: 18 lb.ft (25 Nm)

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

2.

Install new O-ring seals and gasket seals.

3.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: If installing a new A/C compressor due to an internal failure of the old unit, carry out the following procedures to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.

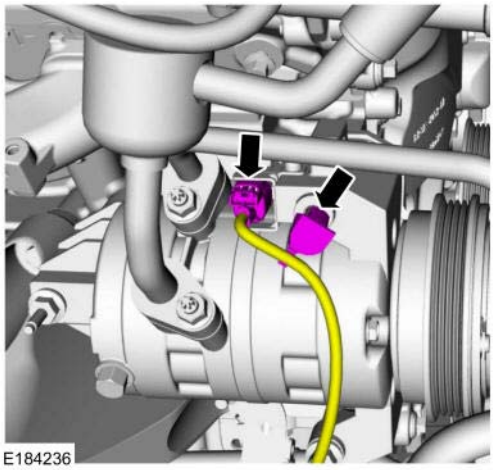
- **If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor.**
- **If A/C flushing equipment is not available, replace all contaminated components after a new A/C compressor has been installed.**
- **Install a new Thermostatic Expansion Valve (TXV) as directed by the A/C flushing.**
- **Install a new receiver drier element as directed by the A/C flushing.**

NOTE: Installation of a new receiver drier element is not required when repairing the A/C system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver drier element.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

NOTE: Removal steps in this procedure may contain installation details.

1.



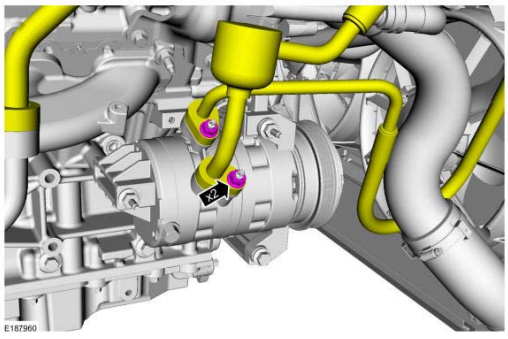
Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the A/C compressor belt. Refer to: Air Conditioning (A/C) Compressor Belt .

3.

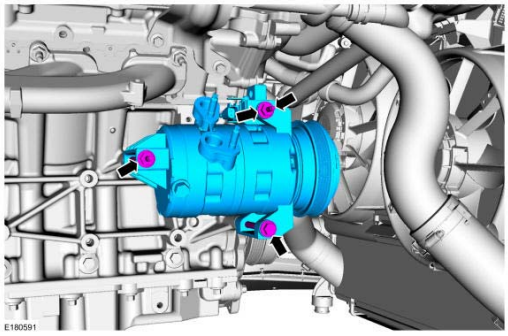
Disconnect the A/C compressor electrical connector and the wire harness retainer.



NOTE: Make sure that all openings are sealed.

NOTE: Discard the O-ring seals and gaskets.

4.
Remove the nuts and disconnect the A/C compressor inlet and outlet lines.



Torque

: 159 lb.in (18 Nm)

5.

Remove the bolt, studbolts and the A/C compressor.

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

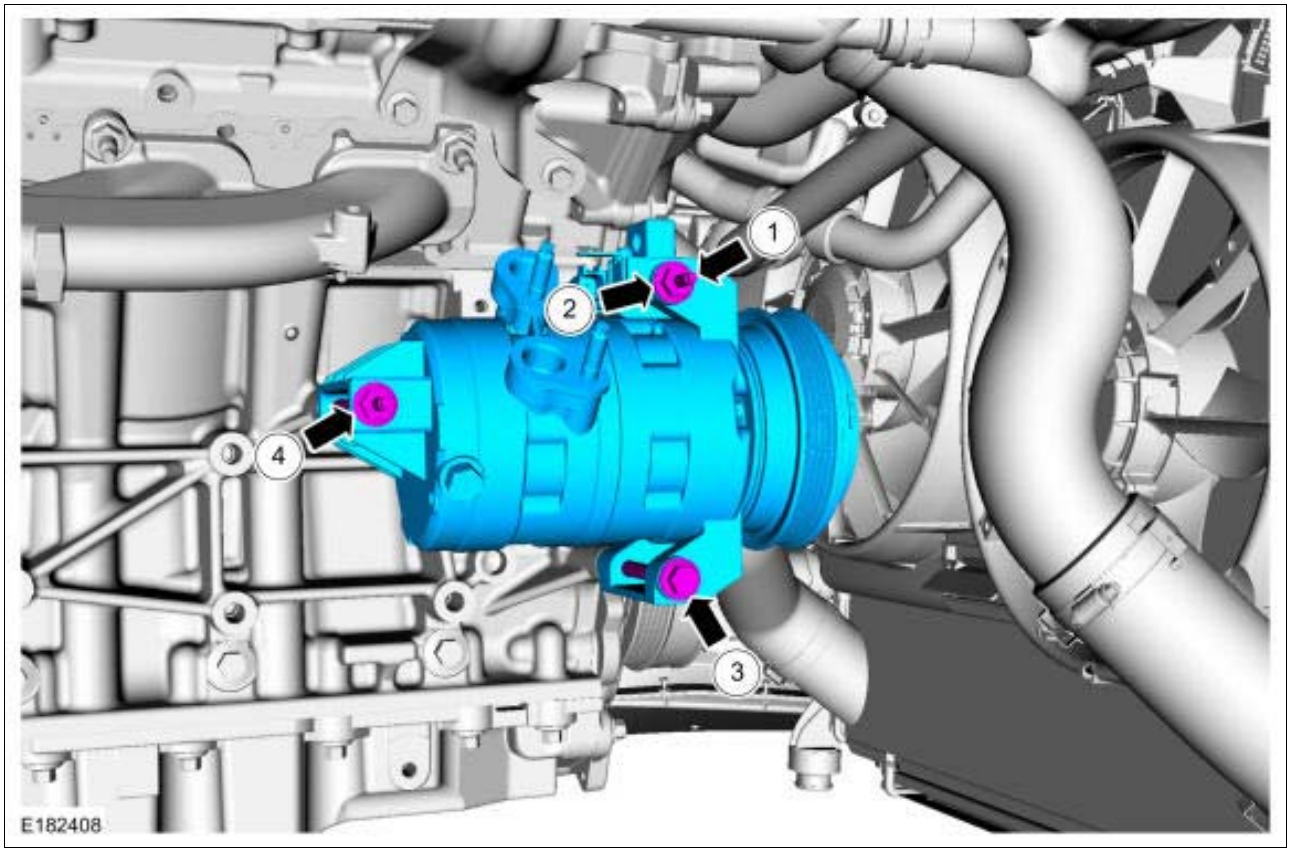
Add the correct amount of clean PAG oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

2.

Install new O-ring seals and gasket seals.

3.

To install, reverse the removal procedure.



4.

Tighten the A/C compressor stud, bolt, studbolt and nut in the sequence shown below.

Torque

: 1.: 80 lb.in (9 Nm) 2.: 18 lb.ft (25 Nm)3.: 18 lb.ft (25 Nm) 4.: 18 lb.ft (25 Nm)

NOTE: Installation of a new receiver drier element is not required when repairing the A/C

system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver drier element.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

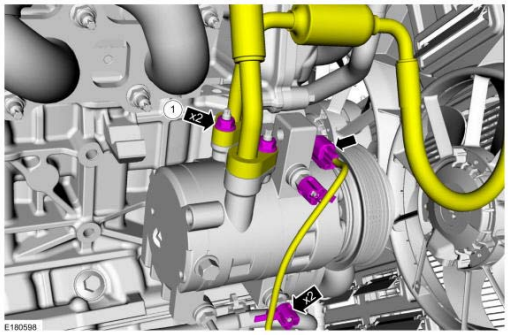
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the A/C compressor belt. Refer to: Air Conditioning (A/C) Compressor Belt .

4.

Remove transmission fluid cooler tubes. Refer to: Transmission Fluid Cooler Tubes - 5.0L 32V Ti-VCT .



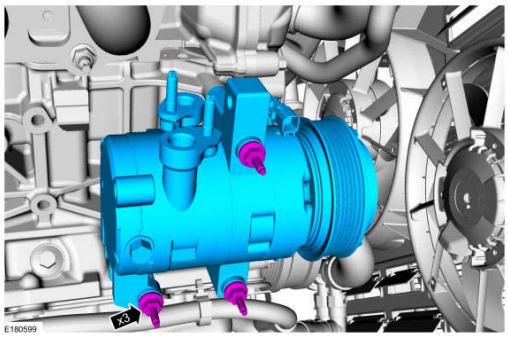
NOTE: Make sure that all openings are sealed.

NOTE: Discard the O-ring seals and gaskets.

5.
Remove the wiring harness retainers and disconnect the electrical connector. Remove the nuts and disconnect the A/C compressor inlet and outlet lines.

Torque

: 159 lb.in (18 Nm)



6.

Remove the studbolts and the A/C compressor.

Torque

: 18 lb.ft (25 Nm)

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR - 5.0L 32V TI-VCT > INSTALLATION

1.

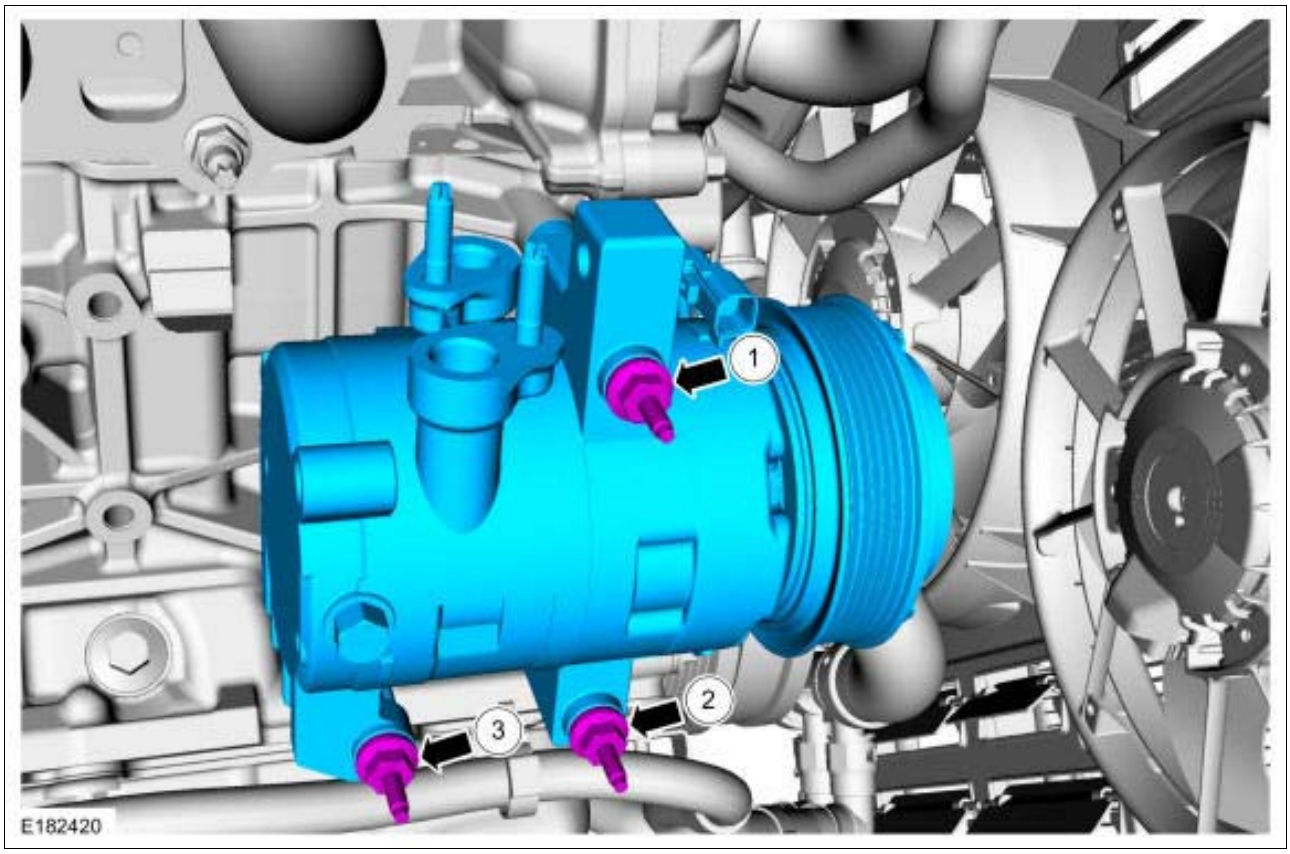
Add the correct amount of clean PAG oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

2.

Install new O-ring seals and gasket seals.

3.

To install, reverse the removal procedure.



4.

Tighten the A/C compressor studbolts in the sequence shown below.

Torque

: 18 lb.ft (25 Nm)

Fig 1: A/C Compressor Bolts Tightening Sequence

Courtesy of FORD MOTOR CO.

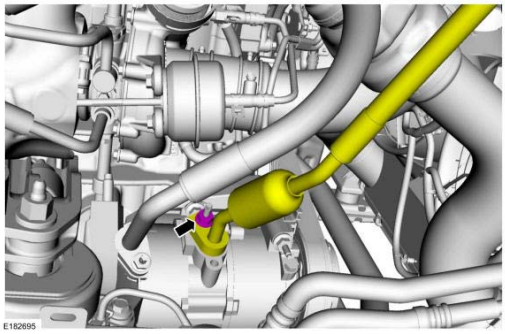
REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

NOTE: Make sure that all openings are sealed.



NOTE: Discard the O-ring seals and gaskets.

2.

Remove the nut and disconnect the A/C compressor outlet line.

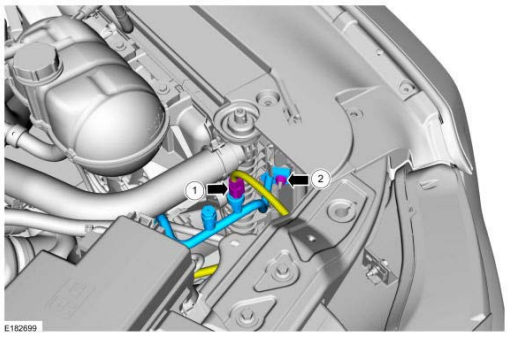
Torque

: 159 lb.in (18 Nm)

NOTE: Discard the O-ring seals and gaskets.

3.

1.



Disconnect the A/C pressure transducer connector.

2.

Remove the nut and the A/C compressor outlet line.

Torque

: 159 lb.in (18 Nm)

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Install new O-ring seals and gasket seals.

3.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) COMPRESSOR OUTLET LINE - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the A/C compressor pressure relief valve.

Torque

: 89 lb.in (10 Nm)

REMOVAL AND INSTALLATION > AIR CONDITIONING (A C) PRESSURE RELIEF VALVE - 5.0L 32V TI-VCT > INSTALLATION

1.

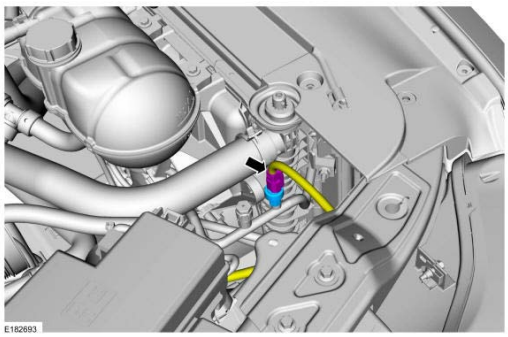
To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

REMOVAL AND INSTALLATION > AIR CONDITIONING (AC) PRESSURE TRANSDUCER > REMOVAL

NOTE: 5.0L engine shown, all others are similar.



NOTE: Removal steps in this procedure may contain installation details.

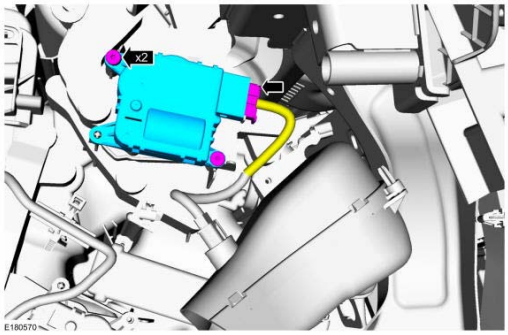
1.

Disconnect the electrical connector and remove the A/C pressure transducer.

Torque

: 62 lb.in (7 Nm)

REMOVAL AND INSTALLATION > AIR CONDITIONING (AC) PRESSURE TRANSDUCER > INSTALLATION



1.

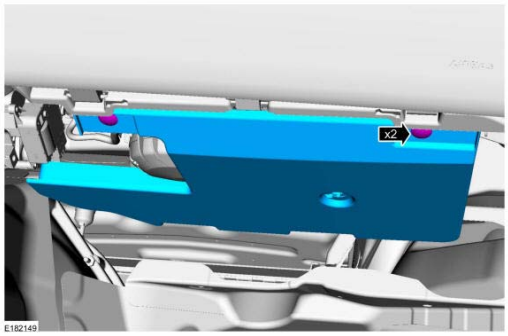
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > AIR DISTRIBUTION DOOR ACTUATOR > REMOVAL

1.

Remove the retainers, the air distribution door actuator and disconnect the electrical connector.

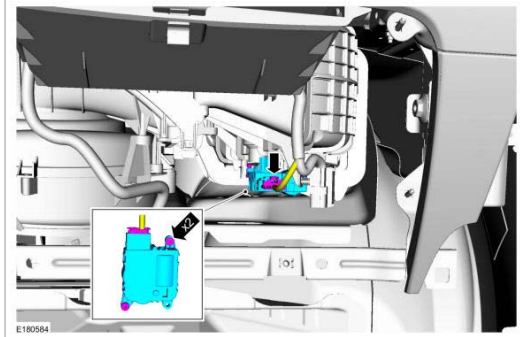
REMOVAL AND INSTALLATION > AIR DISTRIBUTION DOOR ACTUATOR > INSTALLATION



1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > AIR INLET DOOR ACTUATOR > REMOVAL



1.

Remove the retainers and the RH lower instrument panel insulator.

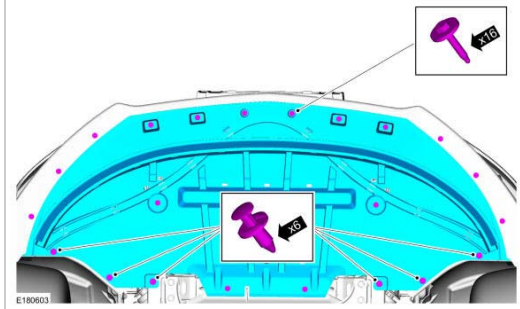
2.

Disconnect the air inlet door actuator connector, remove the retainers and the air inlet door actuator.

REMOVAL AND INSTALLATION > AIR INLET DOOR ACTUATOR > INSTALLATION

1.

To install, reverse the removal procedure.



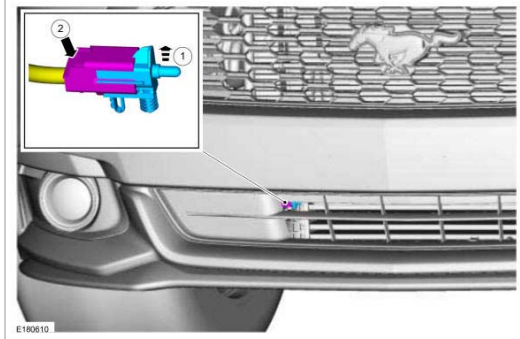
REMOVAL AND INSTALLATION > AMBIENT AIR TEMPERATURE SENSOR > REMOVAL

1.

With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

2.

Remove the underbody shield.



3.

1.

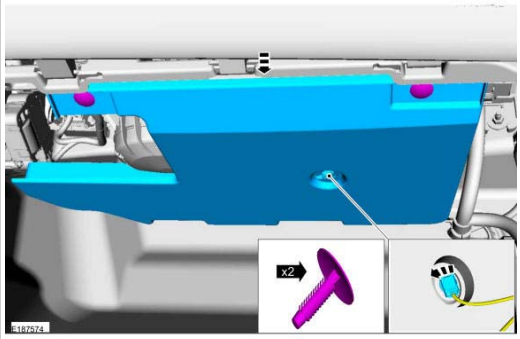
Remove the ambient air temperature sensor.

2.

Disconnect the ambient temperature sensor connector.

REMOVAL AND INSTALLATION > AMBIENT AIR TEMPERATURE SENSOR > INSTALLATION

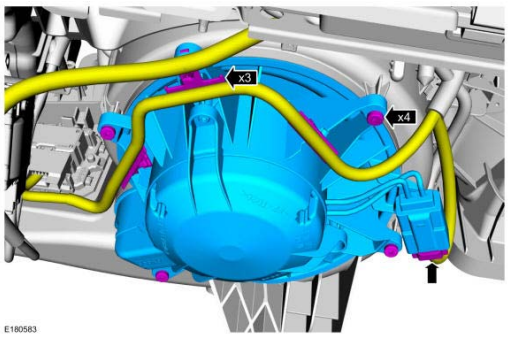
1.



To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > BLOWER MOTOR > REMOVAL

1.



Remove the push pins and remove the RH insulation panel.

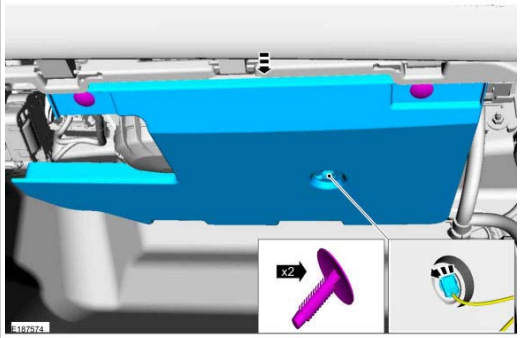
Remove the insulation panel ambient light.

2.

Disconnect the blower motor connector, the wiring harness retainers and position aside the harness. Remove the retainers and the blower motor.

REMOVAL AND INSTALLATION > BLOWER MOTOR > INSTALLATION

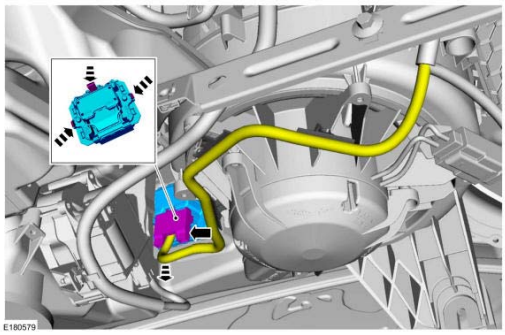
1.



To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > BLOWER MOTOR SPEED CONTROL > REMOVAL

1.



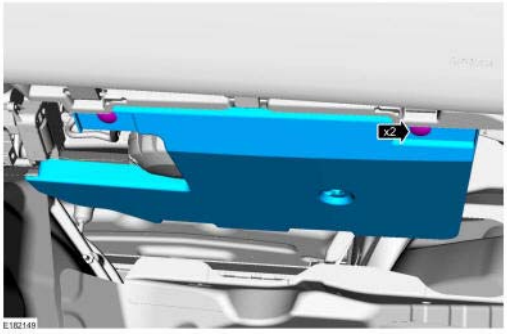
Remove the push pins and remove the RH insulation panel.

Remove the insulation panel ambient light.

2.

Disconnect the blower motor speed control connector, position aside the wiring harness and remove the blower motor speed control.

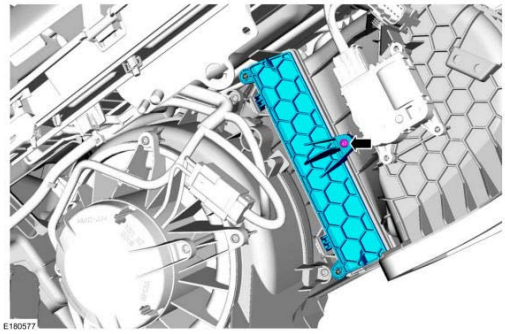
REMOVAL AND INSTALLATION > BLOWER MOTOR SPEED CONTROL > INSTALLATION



1.

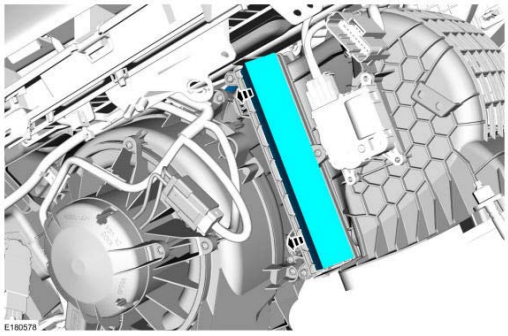
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CABIN AIR FILTER > REMOVAL



1.

Remove the retainers and the RH lower instrument panel insulator.



2.

Remove the retainer and the cabin air filter cover.

3.

Remove the cabin air filter.

REMOVAL AND INSTALLATION > CABIN AIR FILTER > INSTALLATION

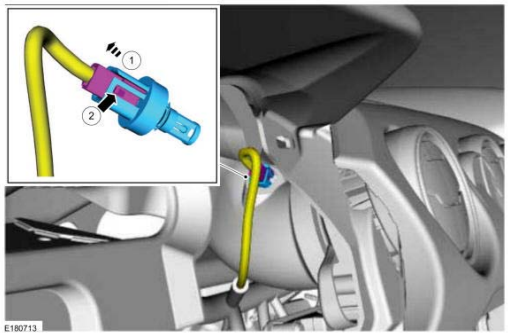
1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CENTER REGISTER AIR DISCHARGE TEMPERATURE SENSOR > REMOVAL

1.

Remove the instrument panel cluster. Refer to: Instrument Panel Cluster (IPC) .



2.

1.

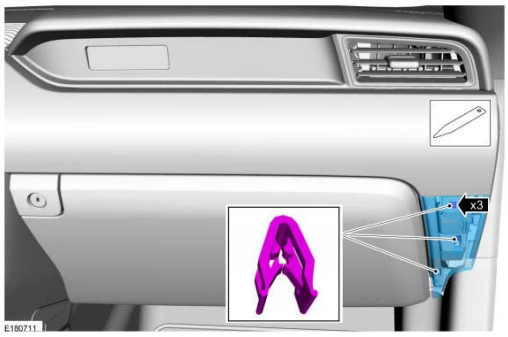
Remove the center register air discharge temperature sensor.

2.

Disconnect the center register air discharge temperature sensor connector.

REMOVAL AND INSTALLATION > CENTER REGISTER AIR DISCHARGE TEMPERATURE SENSOR > INSTALLATION

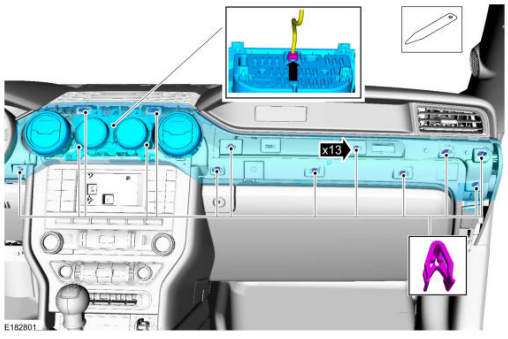
1.



To install, reverse the removal procedure.

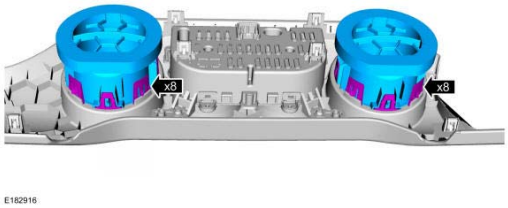
REMOVAL AND INSTALLATION > CENTER REGISTERS > REMOVAL

NOTE: Vehicle with center gauges shown, without center gauges similar.



1.

Remove the instrument panel side trim panel.



2.

Remove the instrument panel center upper trim panel and disconnect the electrical connector.

3.

Release the clips and remove the center registers.

REMOVAL AND INSTALLATION > CENTER REGISTERS > INSTALLATION

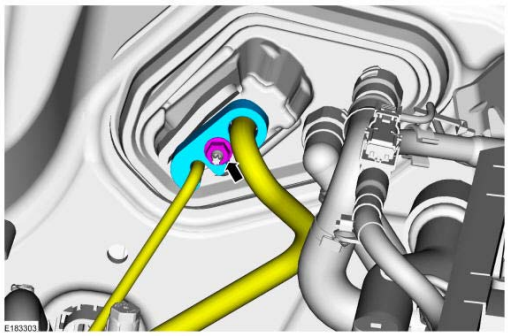
1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

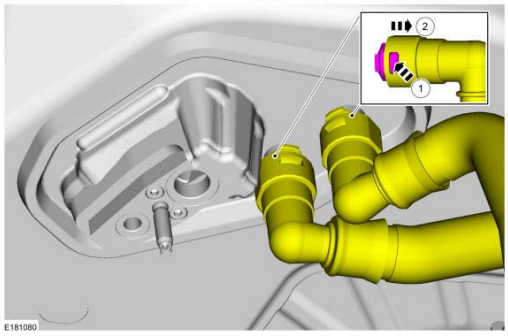
1.



Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the A/C condenser outlet line and the evaporator outlet line.

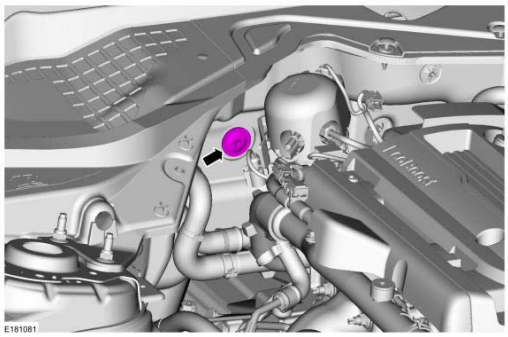


Torque

: 133 lb.in (15 Nm)

3.

Disconnect the heater core inlet and outlet hoses.

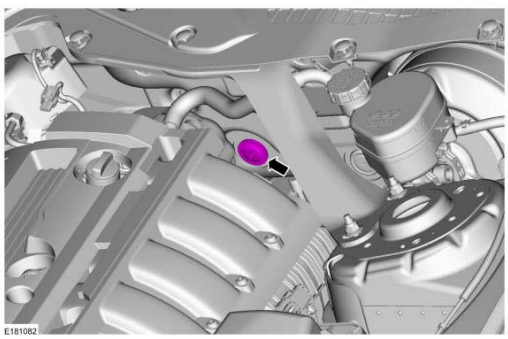


4.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)



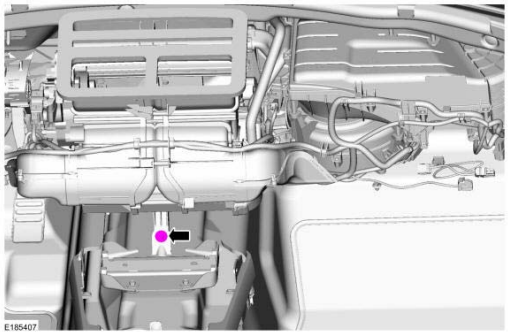
5.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)

6.



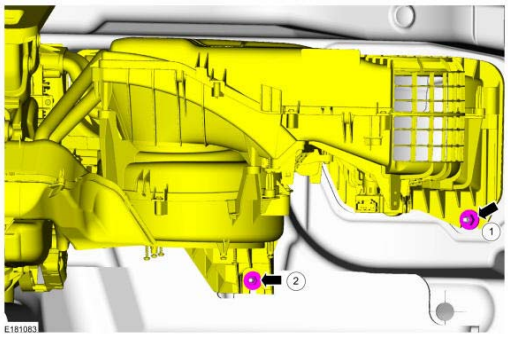
Remove the instrument panel. Refer to: Instrument Panel .

7.

Remove the bolt.

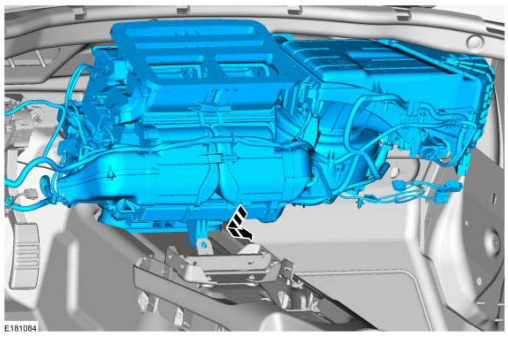
Torque

: 62 lb.in (7 Nm)



8.

Remove the nuts and washers.



Torque

: 1: 62 lb.in (7 Nm)2: 80 lb.in (9 Nm)

9.

Remove the climate control housing.

REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

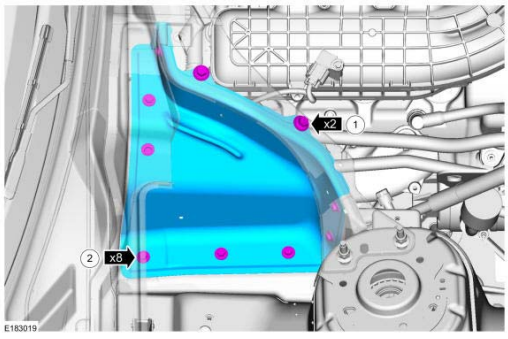
1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the instrument panel. Refer to: Instrument Panel .

3.



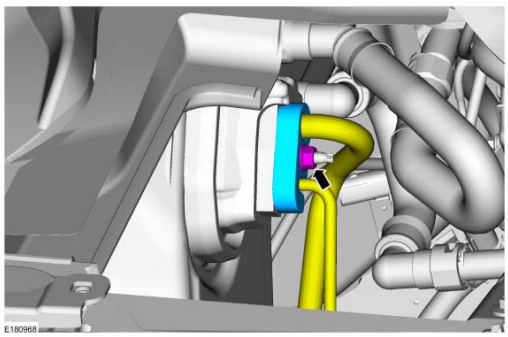
Remove the battery tray. Refer to: Battery Tray .

4.

Remove the 10 bolts and the battery heat shield.

Torque

: 1: 26 lb.ft (35 Nm)2: 80 lb.in (9 Nm)

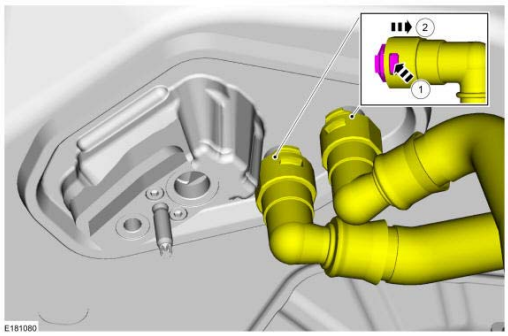


NOTE: Make sure that all openings are sealed.

5.
Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the A/C condenser outlet line and the evaporator outlet line.

Torque

: 133 lb.in (15 Nm)

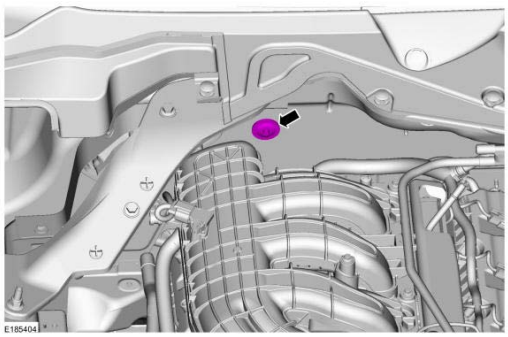


6.

Drain the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

7.

Disconnect the heater core inlet and outlet hoses.

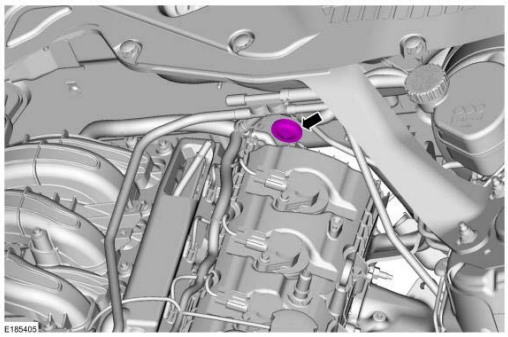


8.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)

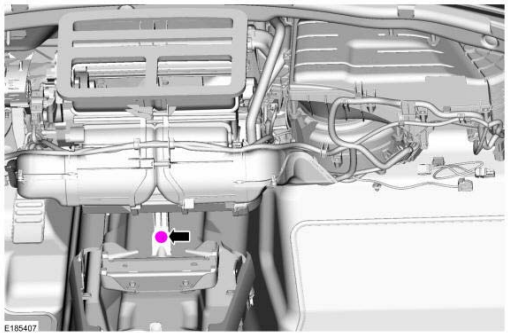


9.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)

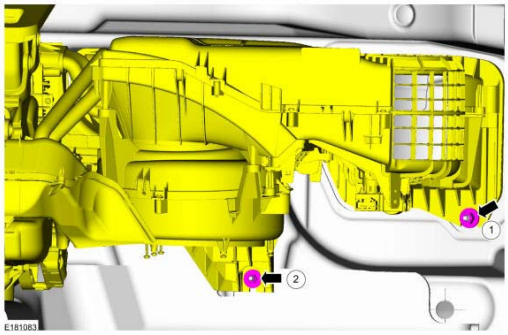


10.

Remove the bolt.

Torque

: 62 lb.in (7 Nm)

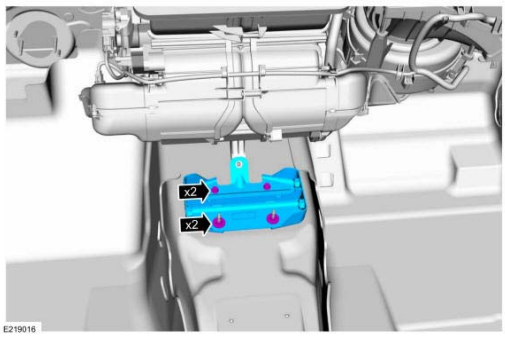


11.

Remove the nuts and washers.

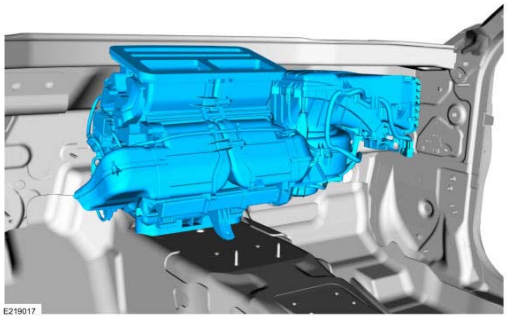
Torque

: 1: 62 lb.in (7 Nm) 2: 80 lb.in (9 Nm)



12.

Remove the bolts, nuts and the bracket.



Torque

: 97 lb.in (11 Nm)

13.

Remove the climate control housing.

REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

3.

Fill and bleed the cooling system. Refer to: Cooling System Draining and Vacuum Filling .

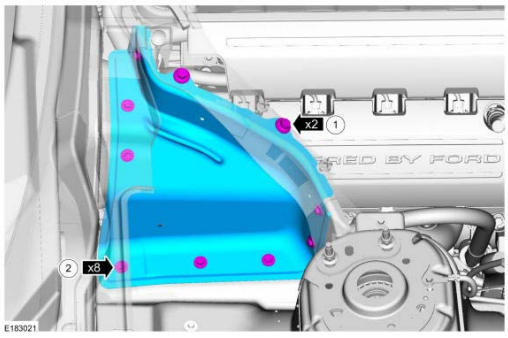
REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



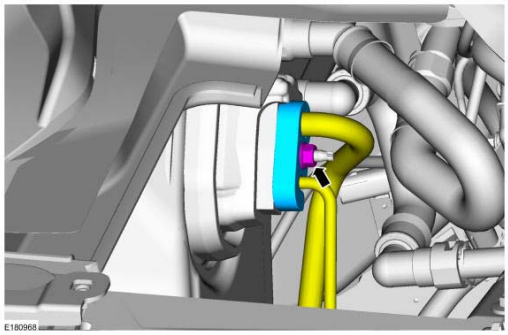
Remove the battery tray. Refer to: Battery Tray .

3.

Remove the 10 bolts and the battery heat shield.

Torque

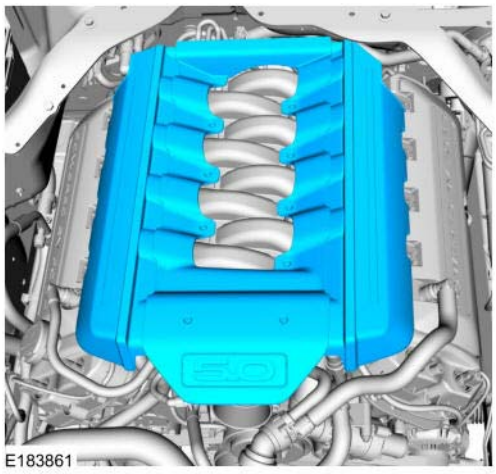
: 1: 26 lb.ft (35 Nm) 2: 80 lb.in (9 Nm)



NOTE: Make sure that all openings are sealed.

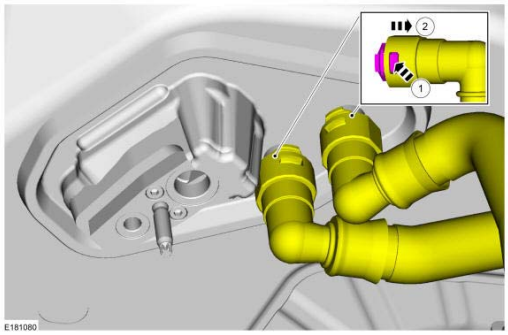
4.
Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the A/C

condenser outlet line and the evaporator outlet line.



Torque

: 133 lb.in (15 Nm)

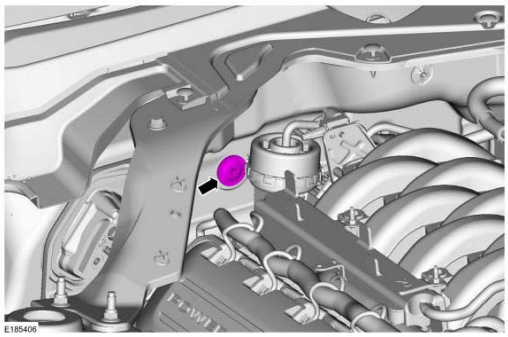


NOTE: The engine appearance cover rubber grommets may remain on the cover. If so, remove the grommets from the cover and install them on the intake manifold before installing the cover.

5.
Remove the engine appearance cover.

6.

Disconnect the heater core inlet and outlet hoses.

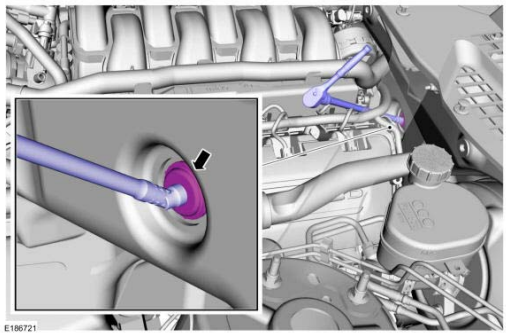


7.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)



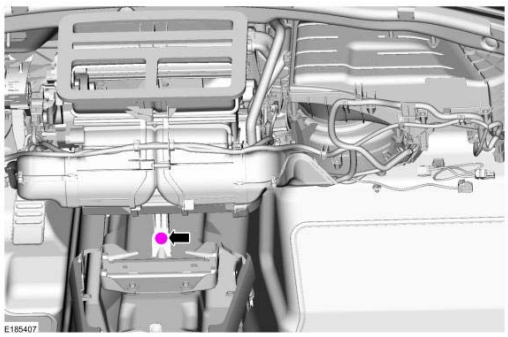
8.

Remove the bolt and washer.

Torque

: 62 lb.in (7 Nm)

9.



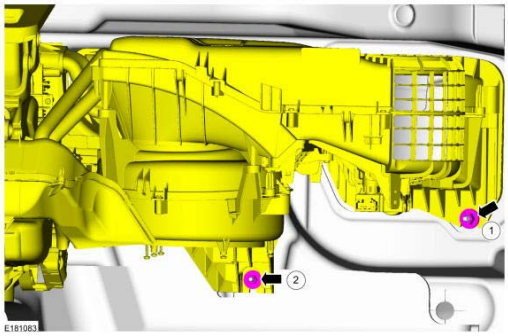
Remove the instrument panel. Refer to: Instrument Panel .

10.

Remove the bolt.

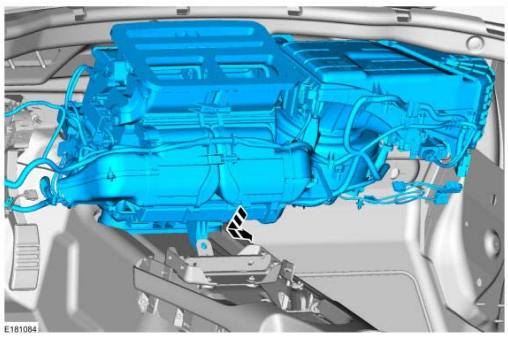
Torque

: 62 lb.in (7 Nm)



11.

Remove the nuts and washers.



Torque

: 1: 62 lb.in (7 Nm)2: 80 lb.in (9 Nm)

12.

Remove the climate control housing.

REMOVAL AND INSTALLATION > CLIMATE CONTROL HOUSING - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

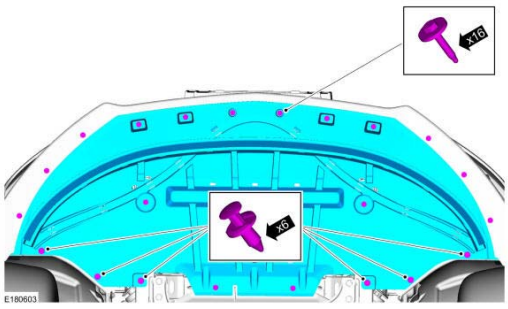
REMOVAL AND INSTALLATION > CONDENSER - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



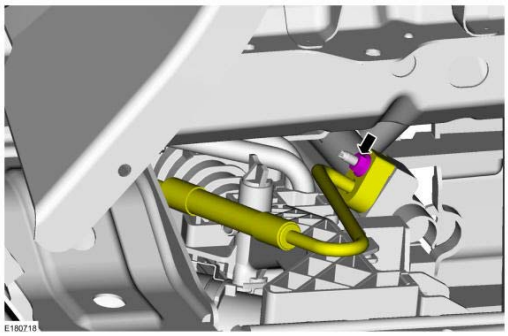
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

Torque

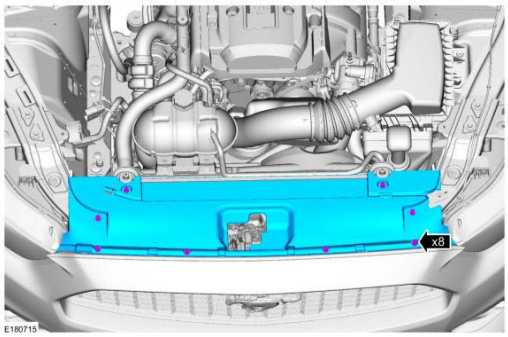
: 18 lb.in (2 Nm)



NOTE: Make sure that all openings are sealed.

4.

Remove the nut and disconnect the A/C condenser outlet line.

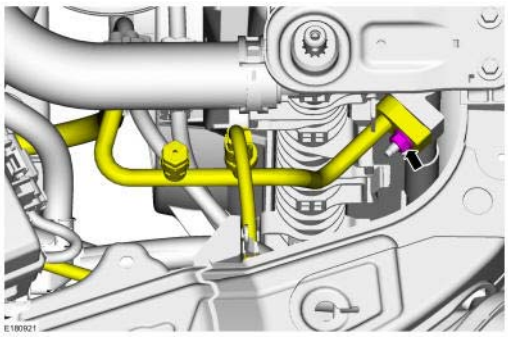


Torque

: 80 lb.in (9 Nm)

5.

Remove the retainers and the radiator sight shield.



NOTE: Make sure that all openings are sealed.

6.
Remove the nut and disconnect the A/C compressor outlet line.

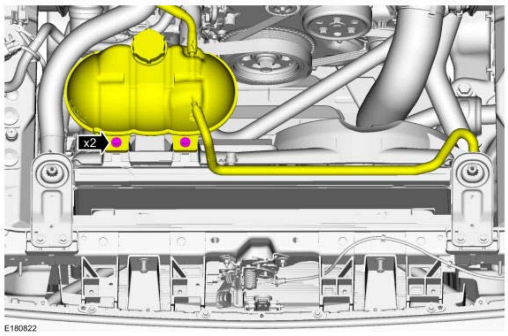
Torque

: 159 lb.in (18 Nm)

7.

Remove the air cleaner. Refer to: Air Cleaner .

8.



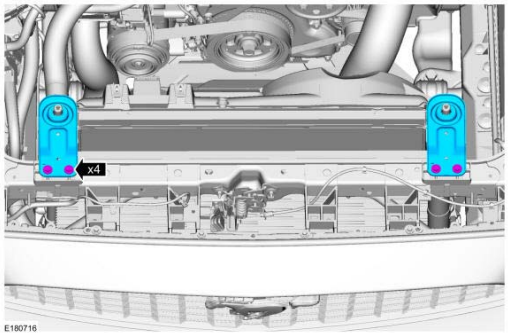
Remove the air cleaner outlet pipe. Refer to: Air Cleaner Outlet Pipe .

9.

Remove the bolts and position the degas bottle aside.

Torque

: 80 lb.in (9 Nm)



10.

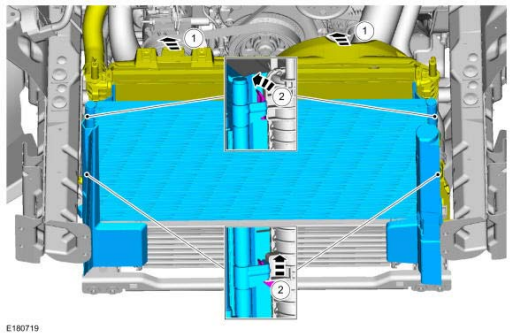
Remove the bolts and the upper radiator brackets.

Torque

: 97 lb.in (11 Nm)

NOTE: Front bumper removed for clarity.

11.



1.

Lift the radiator off the lower radiator support and position the radiator, transmission fluid

cooler assembly and cooling fan motor and shroud toward the engine.

2.

Release the tabs and remove the condenser.

REMOVAL AND INSTALLATION > CONDENSER - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

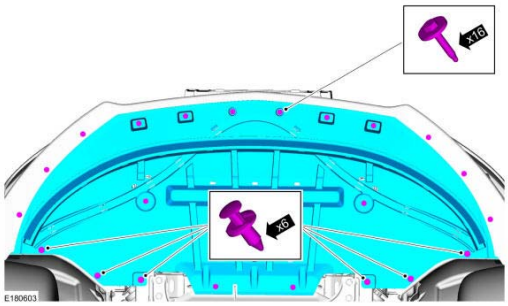
REMOVAL AND INSTALLATION > CONDENSER - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



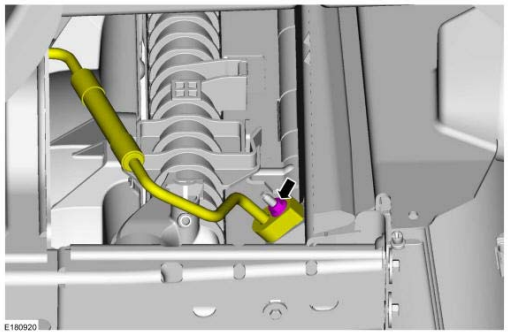
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

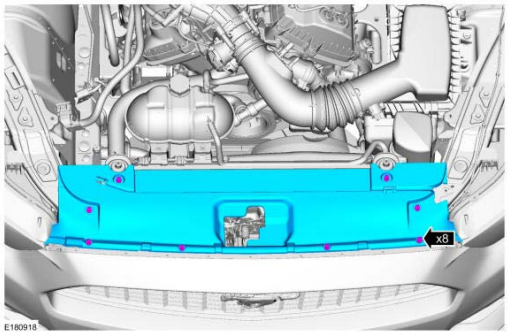
Torque

: 18 lb.in (2 Nm)



NOTE: Make sure that all openings are sealed.

4.
Remove the nut and disconnect the A/C condenser outlet line.

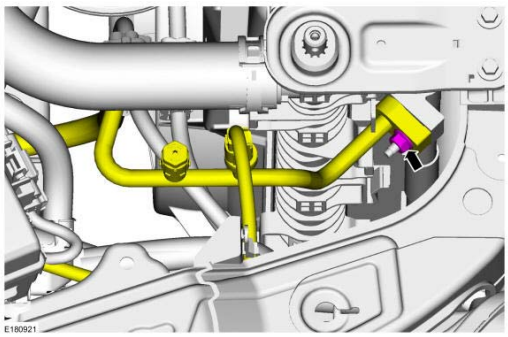


Torque

: 80 lb.in (9 Nm)

5.

Remove the retainers and the radiator sight shield.



NOTE: Make sure that all openings are sealed.

6.
Remove the nut and disconnect the A/C compressor outlet line.

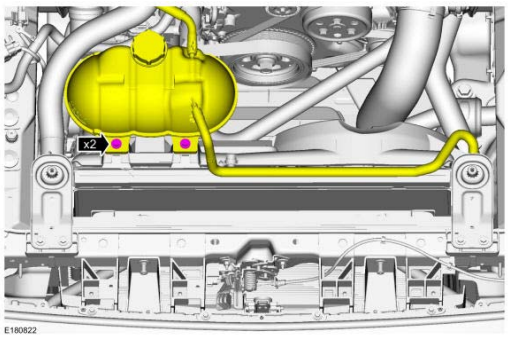
Torque

: 159 lb.in (18 Nm)

7.

Remove the air cleaner. Refer to: Air Cleaner .

8.



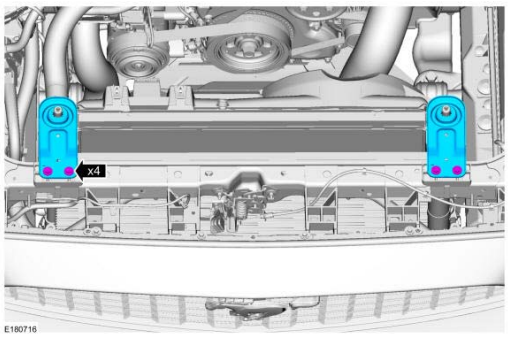
Remove the air cleaner outlet pipe. Refer to: Air Cleaner Outlet Pipe .

9.

Remove the bolts and position the degas bottle aside.

Torque

: 80 lb.in (9 Nm)



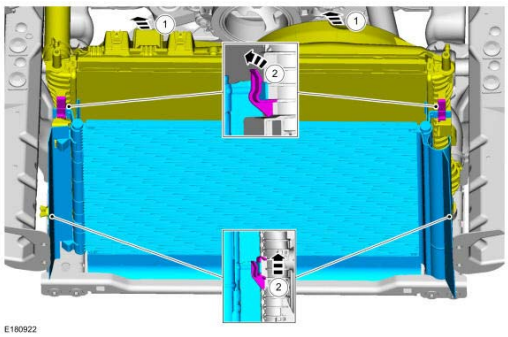
10.

Remove the bolts and the upper radiator brackets.

Torque

: 97 lb.in (11 Nm)

NOTE: Front bumper removed for clarity.



11.

1.

Lift the radiator off the lower radiator support and position the radiator, transmission fluid cooler assembly, and the cooling fan motor and shroud toward the engine.

2.

Release the tabs and remove the condenser.

REMOVAL AND INSTALLATION > CONDENSER - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

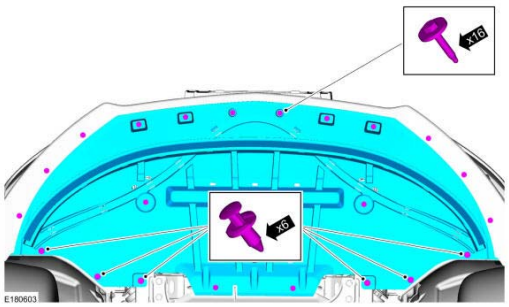
REMOVAL AND INSTALLATION > CONDENSER - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



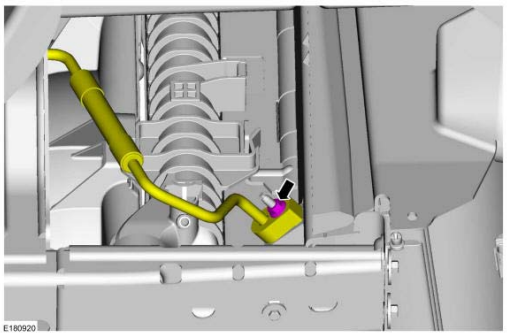
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

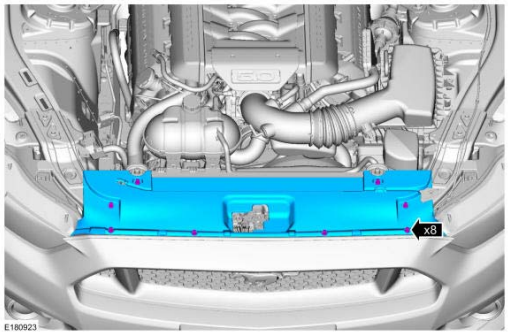
Torque

: 18 lb.in (2 Nm)



NOTE: Make sure that all openings are sealed.

4.
Remove the nut and disconnect the A/C condenser outlet line.

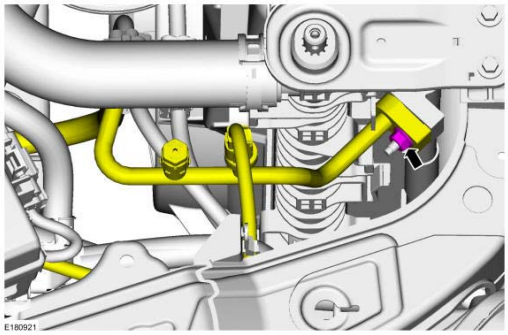


Torque

: 80 lb.in (9 Nm)

5.

Remove the retainers and the radiator sight shield.



NOTE: Make sure that all openings are sealed.

6.
Remove the nut and disconnect the A/C compressor outlet line.

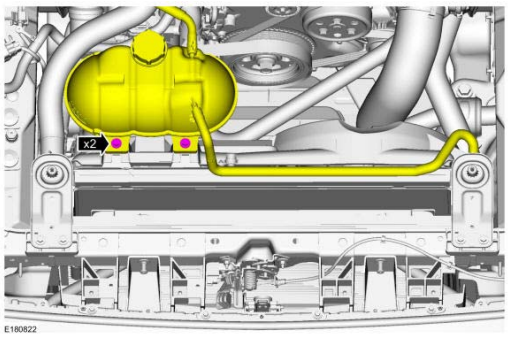
Torque

: 159 lb.in (18 Nm)

7.

Remove the air cleaner. Refer to: Air Cleaner .

8.



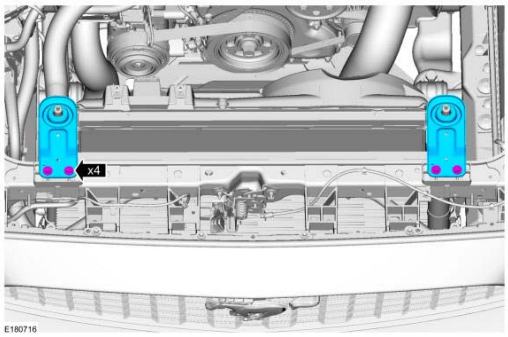
Remove the air cleaner outlet pipe. Refer to: Air Cleaner Outlet Pipe .

9.

Remove the bolts and position the degas bottle aside.

Torque

: 80 lb.in (9 Nm)



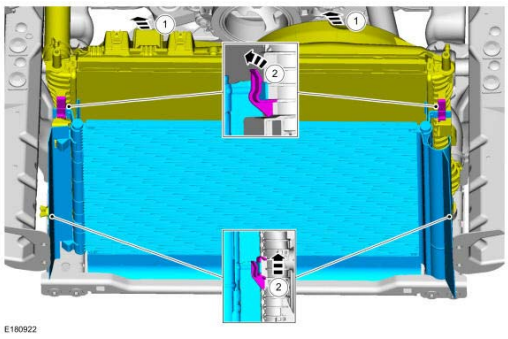
10.

Remove the bolts and the upper radiator brackets.

Torque

: 97 lb.in (11 Nm)

NOTE: Front bumper removed for clarity.



11.

1.

Lift the radiator off the lower radiator support and position the radiator, transmission fluid cooler assembly and cooling fan motor and shroud toward the engine.

2.

Release the tabs and remove the condenser.

REMOVAL AND INSTALLATION > CONDENSER - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

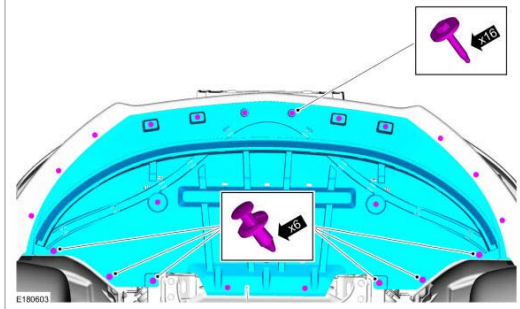
REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



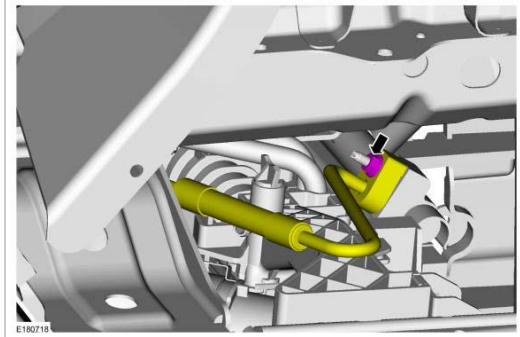
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

Torque

: 18 lb.in (2 Nm)

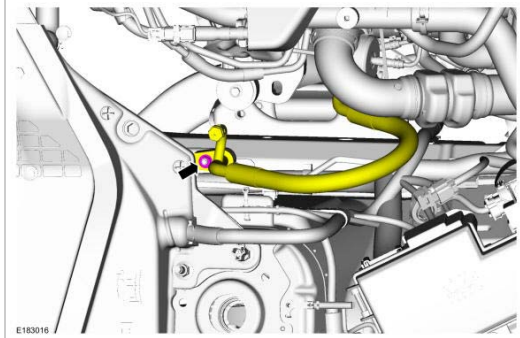


4.

Remove the nut and disconnect the A/C condenser outlet line.

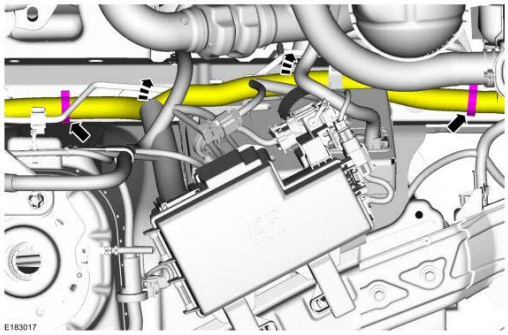
Torque

: 80 lb.in (9 Nm)



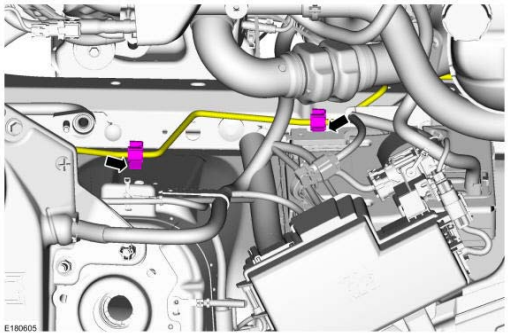
NOTE: Make sure that all openings are sealed.

5.
Remove the nut and disconnect the A/C compressor inlet line.



Torque

: 159 lb.in (18 Nm)

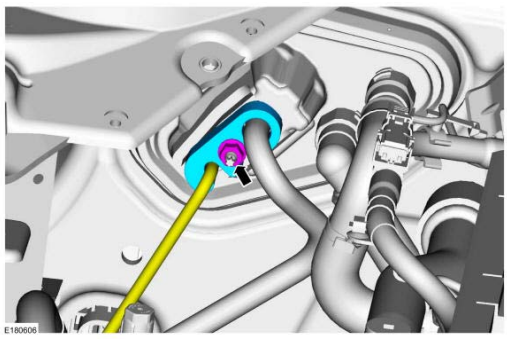


6.

Detach the wiring retainers and position aside the wiring harness.

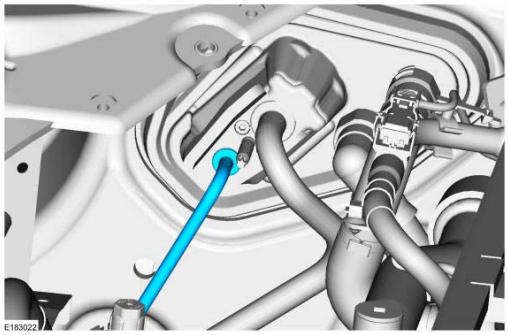
7.

Detach the 2 A/C condenser outlet line clips.



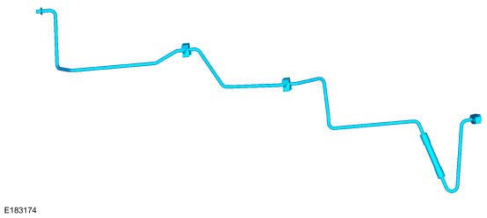
8.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket.



Torque

: 133 lb.in (15 Nm)



9.

Detach the A/C condenser outlet line.

10.

Remove the A/C condenser outlet line.

REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

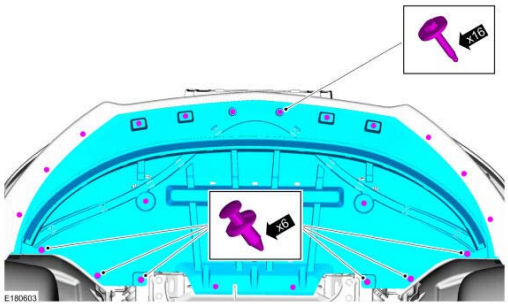
REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



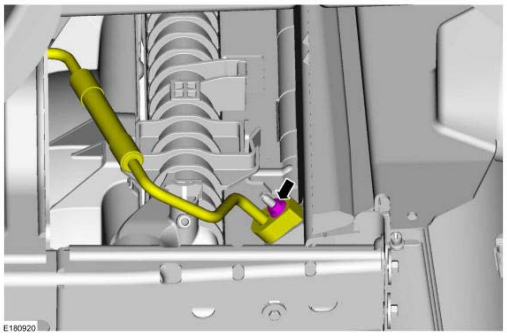
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

Torque

: 18 lb.in (2 Nm)

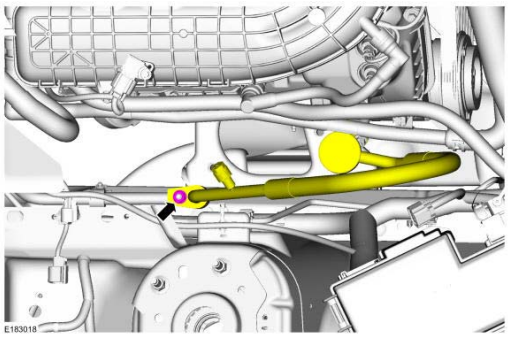


4.

Remove the nut and disconnect the A/C condenser outlet line.

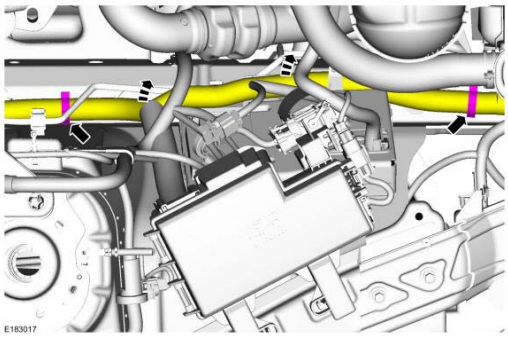
Torque

: 80 lb.in (9 Nm)



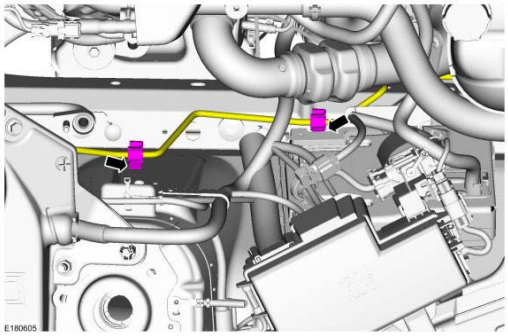
NOTE: Make sure that all openings are sealed.

5.
Remove the nut and disconnect the A/C compressor inlet line.



Torque

: 159 lb.in (18 Nm)



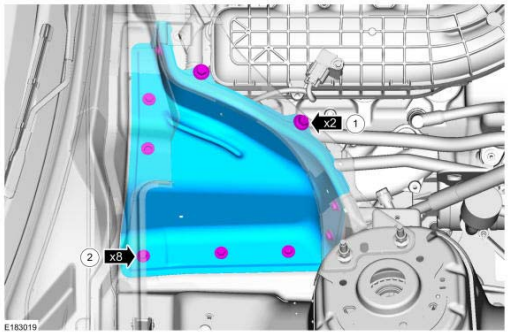
6.

Detach the wiring retainers and position aside the wiring harness.

7.

Detach the 2 A/C condenser outlet line clips.

8.



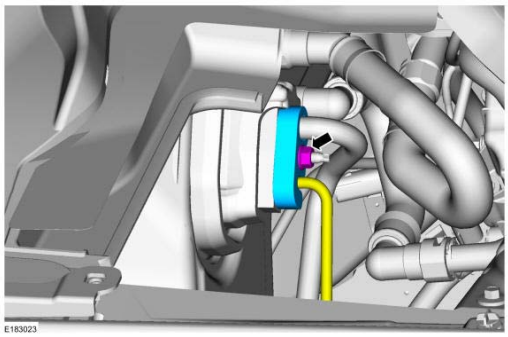
Remove the battery tray. Refer to: Battery Tray .

9.

Remove the 10 bolts and the battery heat shield.

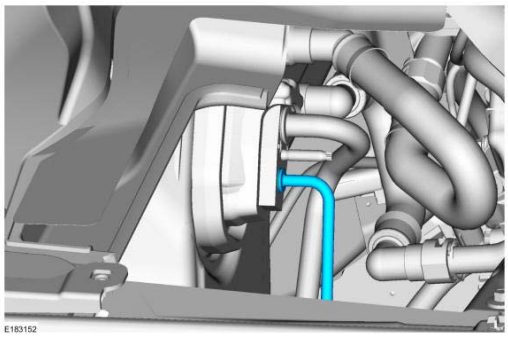
Torque

: 1: 26 lb.ft (35 Nm)2: 80 lb.in (9 Nm)



10.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket.



Torque

: 133 lb.in (15 Nm)

11.

Detach the A/C condenser outlet line.

12.

Remove the A/C condenser outlet line.

REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

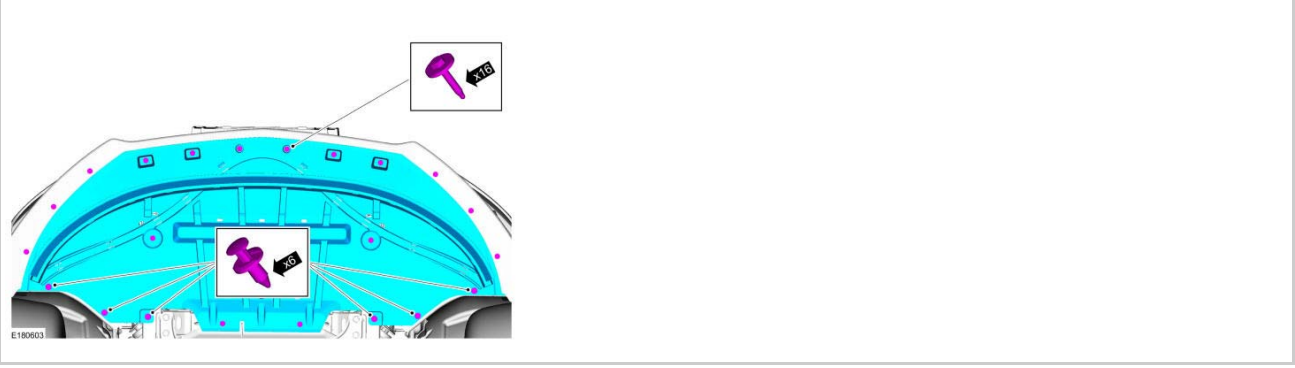
REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



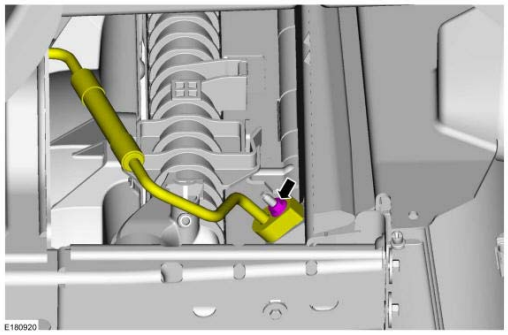
With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

Torque

: 18 lb.in (2 Nm)

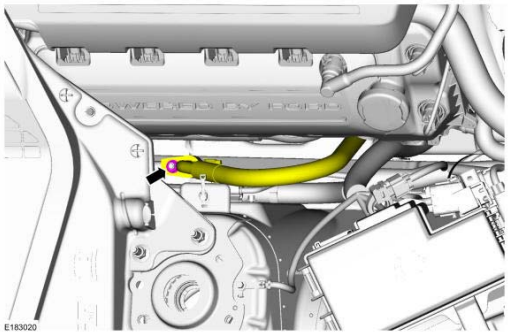


4.

Remove the nut and disconnect the A/C condenser outlet line.

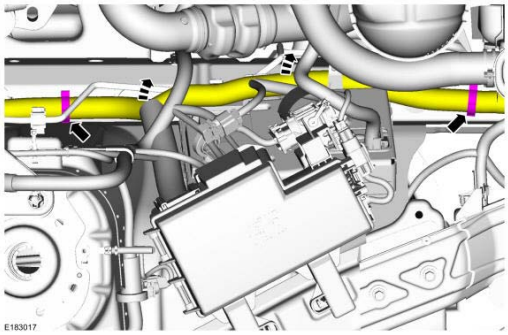
Torque

: 80 lb.in (9 Nm)



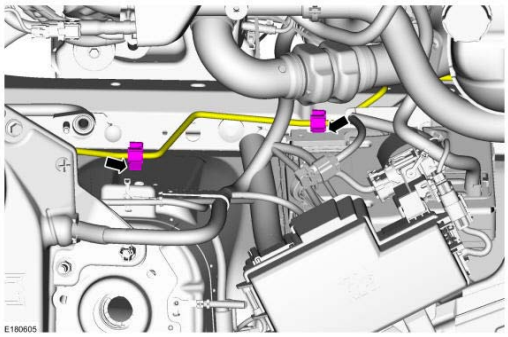
NOTE: Make sure that all openings are sealed.

5.
Remove the nut and disconnect the A/C compressor inlet line.



Torque

: 159 lb.in (18 Nm)



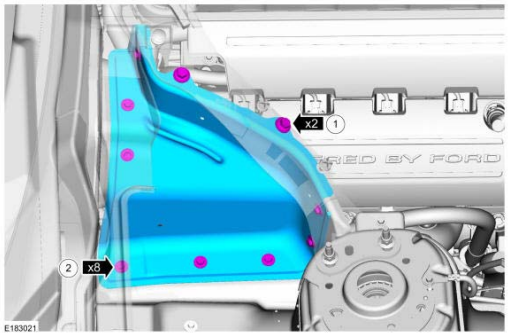
6.

Detach the wiring retainers and position aside the wiring harness.

7.

Detach the 2 A/C condenser outlet line clips.

8.



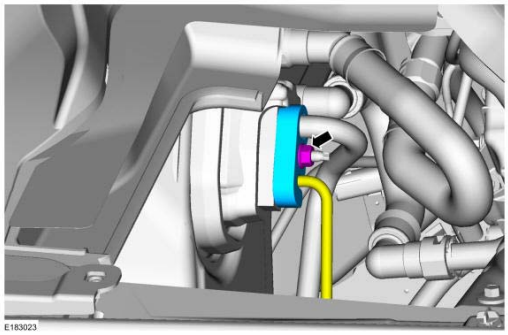
Remove the battery tray. Refer to: Battery Tray .

9.

Remove the 10 bolts and the battery heat shield.

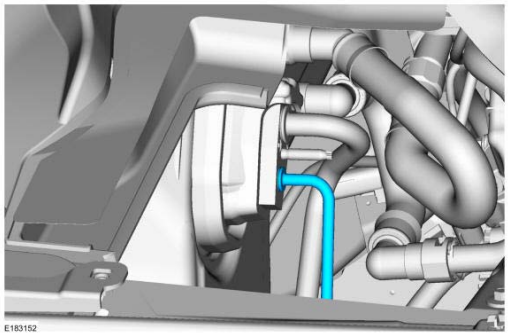
Torque

: 1: 26 lb.ft (35 Nm)2: 80 lb.in (9 Nm)



10.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket.



Torque

: 133 lb.in (15 Nm)

11.

Detach the A/C condenser outlet line.

12.

Remove the A/C condenser outlet line.

REMOVAL AND INSTALLATION > CONDENSER OUTLET LINE - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > DRIVER SIDE REGISTER

Special Tool(s) / General Equipment

Interior Trim Remover

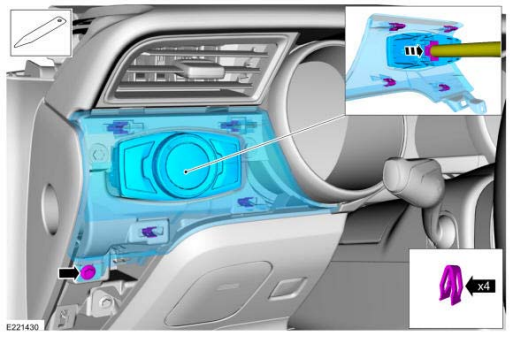
REMOVAL AND INSTALLATION > DRIVER SIDE REGISTER > REMOVAL

1.

Remove the instrument panel center finish panel. Refer to: Instrument Panel Center Finish Panel .

2.

Release the clips and remove the LH instrument panel trim panel. Use the General Equipment: Interior Trim Remover



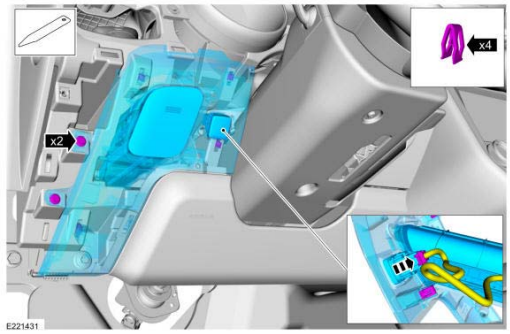
3.

Remove the bolt, release the clips and remove the lighting switch trim panel.

Disconnect the electrical connector. Use the General Equipment: Interior Trim Remover

Torque

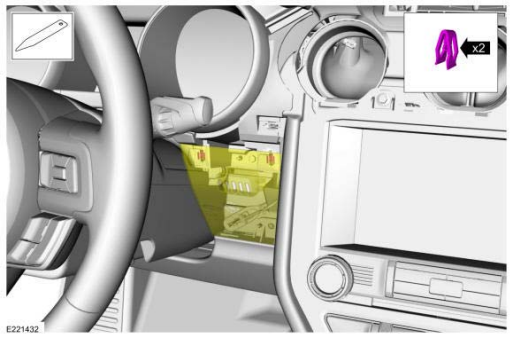
: 27 lb.in (3 Nm)



4.

Remove the bolts, release the clips and remove the LH finish panel.

Disconnect the electrical connector. Use the General Equipment: Interior Trim Remover

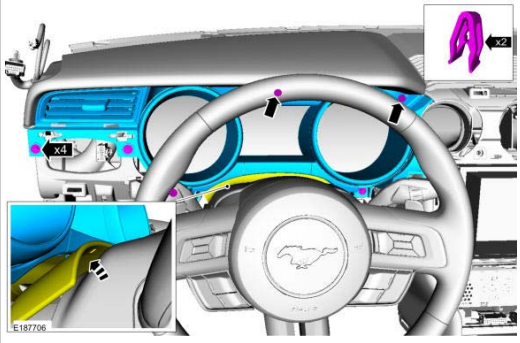


Torque

: 27 lb.in (3 Nm)

5.

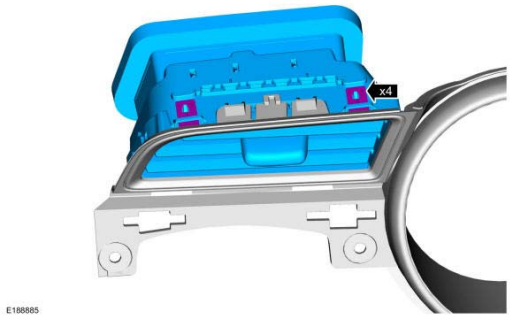
Release the clips and position aside the lower instrument panel cover. Use the General Equipment: Interior Trim Remover



6.

Remove the bolts, release the clips and remove the IPC trim panel.

Detach the gap hider from the upper steering column trim cover.



Torque

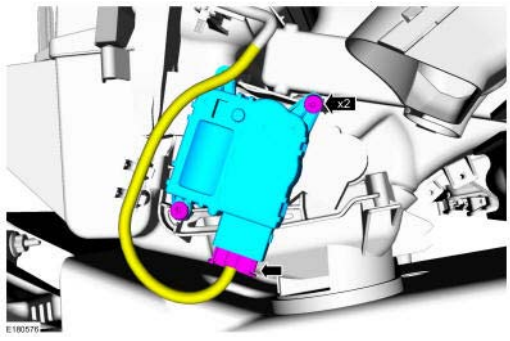
: 27 lb.in (3 Nm)

7.

Release the clips and remove the driver side register assembly.

REMOVAL AND INSTALLATION > DRIVER SIDE REGISTER > INSTALLATION

1.



To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > DRIVER SIDE TEMPERATURE DOOR ACTUATOR > REMOVAL

NOTE: If possible, place the temperature door in the mid-position. This will unload the tension on the temperature door to ease replacement of the actuator.

NOTE: Do not apply power to the actuator while disconnected from the temperature door shaft.

1.
Disconnect the driver side temperature door actuator connector, remove the retainers and the driver side temperature door actuator.

REMOVAL AND INSTALLATION > DRIVER SIDE TEMPERATURE DOOR ACTUATOR > INSTALLATION

1.

Inspect and align the timing marks prior to installation of the driver side temperature door actuator.

2.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATOR > REMOVAL

NOTE: The evaporator is available only as part of the climate control housing.

1.

Remove the climate control housing. Refer to: Climate Control Housing - 2.3L EcoBoost (201kW/273PS) . Refer to: Climate Control Housing - 3.7L Duratec (227kW/301PS) . Refer to: Climate Control Housing - 5.0L 32V Ti-VCT .

REMOVAL AND INSTALLATION > EVAPORATOR > INSTALLATION

1.

Transfer the components from the old housing to the new housing as required.

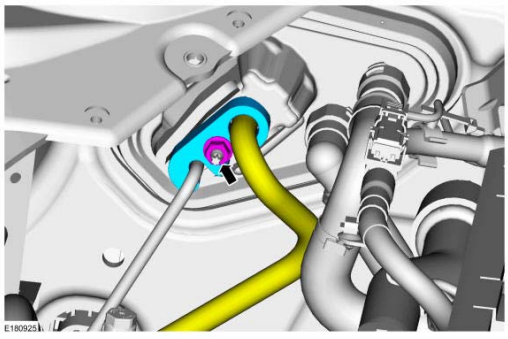
2.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



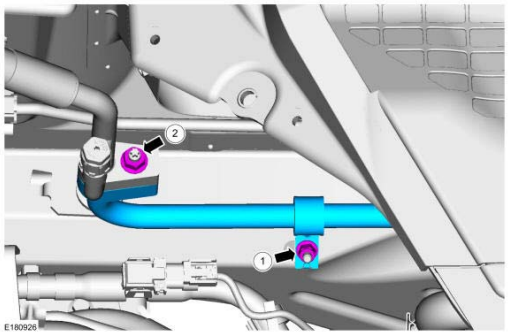
Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the nut, the Thermostatic Expansion Valve (TXV) bracket and disconnect the evaporator outlet line.

Torque

: 133 lb.in (15 Nm)



NOTE: Make sure that all openings are sealed.

3.
Remove the nuts and the evaporator outlet line.

Torque

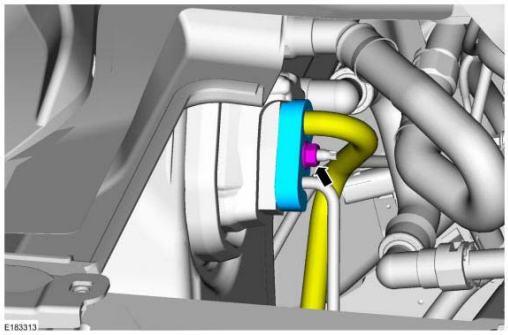
: 1: 62 lb.in (7 Nm)2: 159 lb.in (18 Nm)

REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 3.7L DURATEC (227KW 301PS) > REMOVAL



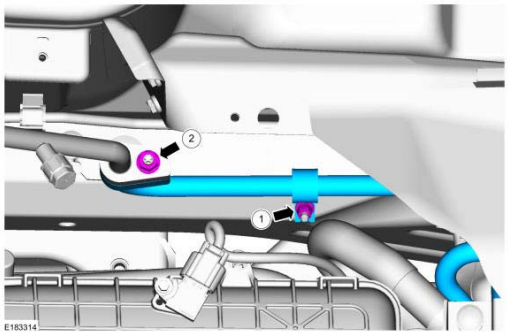
NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the evaporator outlet line.



NOTE: Make sure that all openings are sealed.

3.
Remove the nuts and the evaporator outlet line.

Torque

: 1: 62 lb.in (7 Nm)2: 159 lb.in (18 Nm)

REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

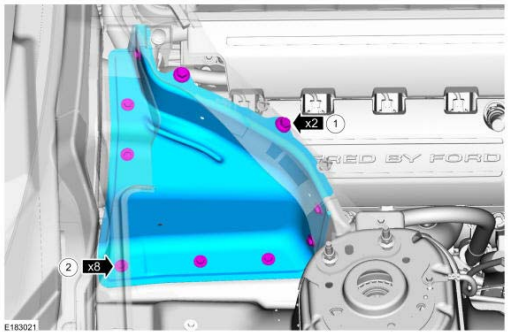
REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

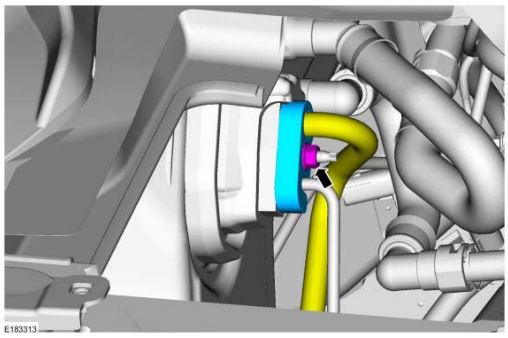
2.



Remove the battery tray. Refer to: Battery Tray .

3.

Remove the 10 bolts and the battery heat shield.

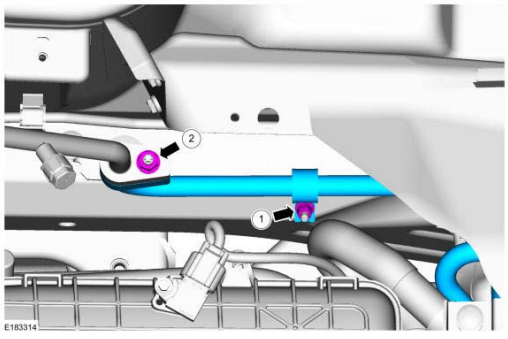


Torque

: 1: 26 lb.ft (35 Nm)2: 80 lb.in (9 Nm)

4.

Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the evaporator outlet line.



NOTE: Make sure that all openings are sealed.

5.
Remove the nuts and the evaporator outlet line.

Torque

: 1: 62 lb.in (7 Nm)2: 159 lb.in (18 Nm)

REMOVAL AND INSTALLATION > EVAPORATOR OUTLET LINE - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > EVAPORATOR TEMPERATURE SENSOR > REMOVAL

NOTE: The evaporator temperature sensor is available only as part of the climate control housing.

1.

Remove the climate control housing. Refer to: Climate Control Housing - 2.3L EcoBoost (201kW/273PS) . Refer to: Climate Control Housing - 3.7L Duratec (227kW/301PS) . Refer to: Climate Control Housing - 5.0L 32V Ti-VCT .

REMOVAL AND INSTALLATION > EVAPORATOR TEMPERATURE SENSOR > INSTALLATION

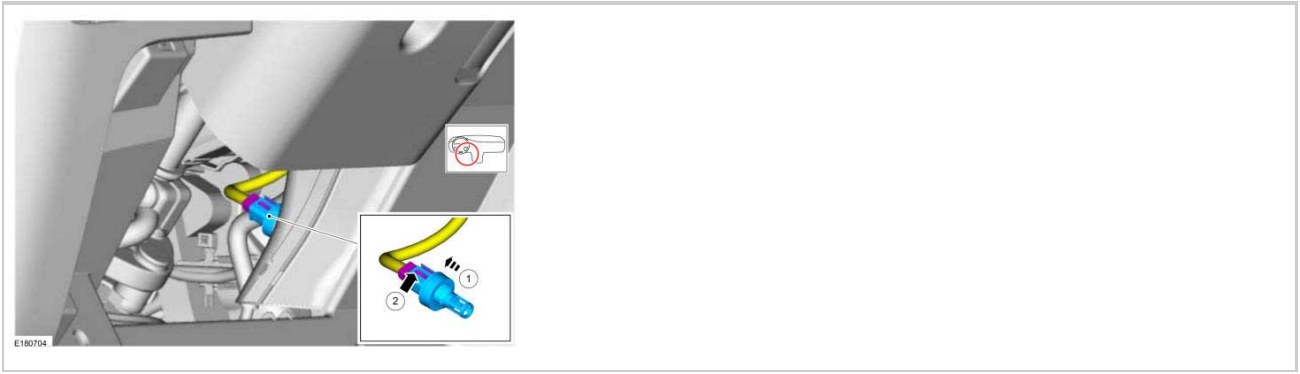
1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FOOTWELL AIR DISCHARGE TEMPERATURE SENSOR > REMOVAL

1.

Remove the driver knee airbag. Refer to: Driver Knee Airbag .



2.

1.

Remove the footwell air discharge temperature sensor.

2.

Disconnect the footwell air discharge temperature sensor connector.

REMOVAL AND INSTALLATION > FOOTWELL AIR DISCHARGE TEMPERATURE SENSOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > HEATER CORE > REMOVAL

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

NOTE: The heater core is available only as part of the climate control housing.

1.

Remove the climate control housing. Refer to: Climate Control Housing - 2.3L EcoBoost (201kW/273PS) . Refer to: Climate Control Housing - 3.7L Duratec (227kW/301PS) . Refer to: Climate Control Housing - 5.0L 32V Ti-VCT .

REMOVAL AND INSTALLATION > HEATER CORE > INSTALLATION

1.

Transfer the components from the old housing to the new housing as required.

2.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > HEATING, VENTILATION AND AIR CONDITIONING (HVAC) CONTROL MODULE > REMOVAL

NOTE: The HVAC (heating, ventilation and air conditioning) module is available only as part of the FCIM (front controls interface module).

1.

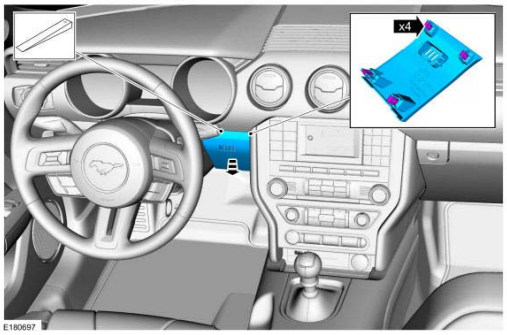
Remove the FCIM. Vehicles With: AM/FM/CD/SYNC Refer to: Front Controls Interface Module (FCIM) . Vehicles With: Touchscreen Display, Refer to: Front Display Interface Module (FDIM) . Vehicles With: AM/FM/CD/SYNC Refer to: Front Controls Interface Module (FCIM) . Vehicles With: AM/FM/CD/SYNC Refer to: Front Controls Interface Module (FCIM) .

REMOVAL AND INSTALLATION > HEATING, VENTILATION AND AIR CONDITIONING (HVAC) CONTROL MODULE > INSTALLATION

1.

To install, reverse the removal procedure.

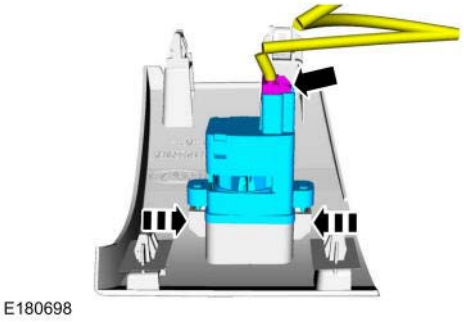
REMOVAL AND INSTALLATION > IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR



Special Tool(s) / General Equipment

Interior Trim Remover

REMOVAL AND INSTALLATION > IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR > REMOVAL



1.

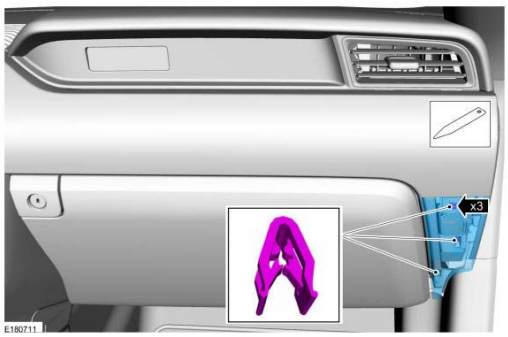
Remove the lower instrument panel cover. Use the General Equipment: Interior Trim Remover

2.

Disconnect the electrical connector and remove the in-vehicle temperature and humidity sensor.

REMOVAL AND INSTALLATION > IN-VEHICLE TEMPERATURE AND HUMIDITY SENSOR > INSTALLATION

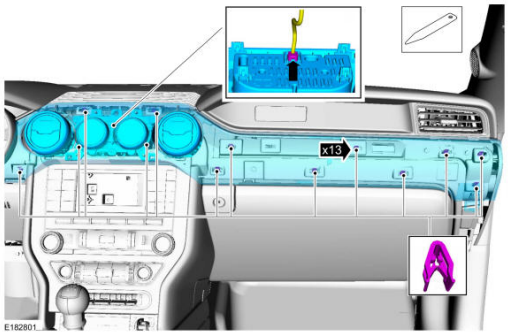
1.



To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > PASSENGER SIDE REGISTER > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

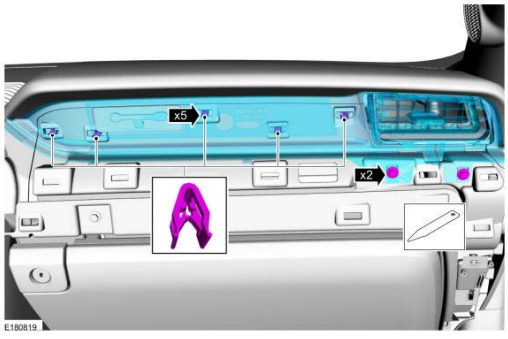


1.

Remove the instrument panel side trim panel.

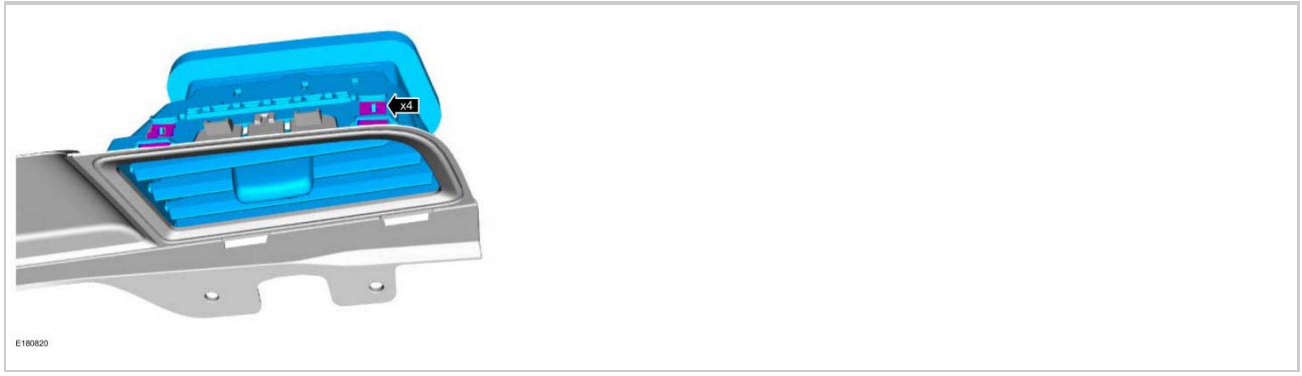
NOTE: Vehicle with center gauges shown, without center gauges similar.

2.
Remove the instrument panel center upper trim panel and disconnect the electrical connector.



3.

Remove the retainers and instrument panel passenger side finish panel.



Torque

: 22 lb.in (2.5 Nm)

4.

Release the clips and remove the passenger side register assembly.

REMOVAL AND INSTALLATION > PASSENGER SIDE REGISTER > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > PASSENGER SIDE TEMPERATURE DOOR ACTUATOR > REMOVAL

NOTE: If possible, place the temperature door in the mid-position. This will unload the tension on the temperature door to ease replacement of the actuator.

1.

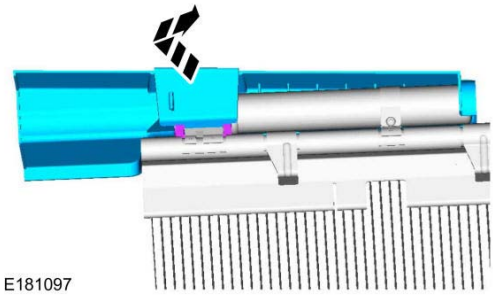
Disconnect the passenger side temperature door actuator connector. Remove the retainers and the passenger side temperature door actuator.

REMOVAL AND INSTALLATION > PASSENGER SIDE TEMPERATURE DOOR ACTUATOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > RECEIVER DRIER - 2.3L ECOBOOST (201KW 273PS) > REMOVAL



NOTE: Removal steps in this procedure may contain installation details.

1.

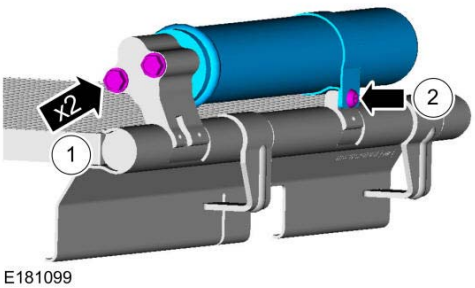
Remove the condenser. Refer to: Condenser - 2.3L EcoBoost (201kW/273PS) .

2.

Remove the air deflector.

3.

1.



Remove the bolts.

Torque

: 80 lb.in (9 Nm)

2.

Remove the retainer and the receiver drier.

REMOVAL AND INSTALLATION > RECEIVER DRIER - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

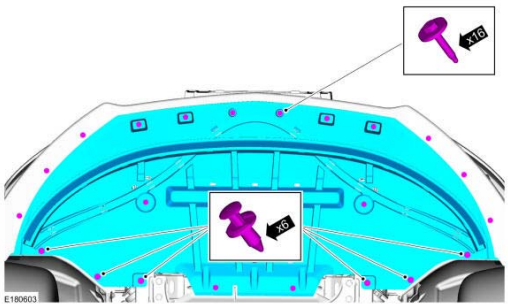
REMOVAL AND INSTALLATION > RECEIVER DRIER - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

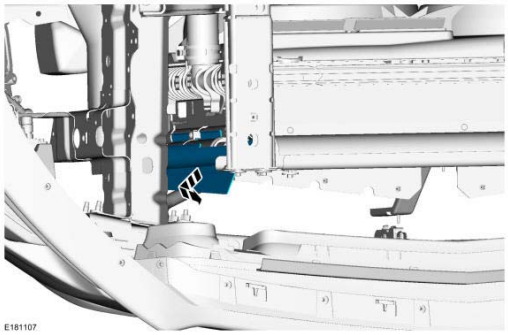
2.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers, and the underbody shield.

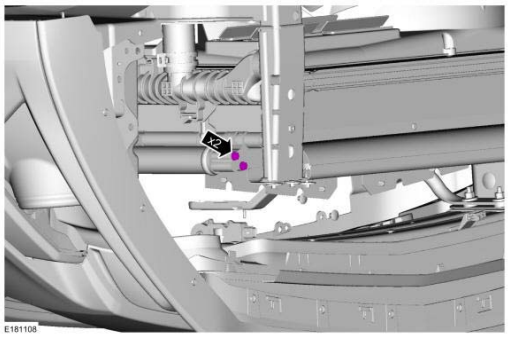


Torque

: 18 lb.in (2 Nm)

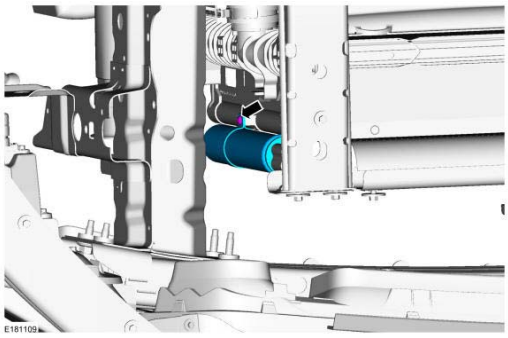
4.

Remove the air deflector.



5.

Remove the bolts.



Torque

: 80 lb.in (9 Nm)

6.

Remove the retainer and the receiver drier.

REMOVAL AND INSTALLATION > RECEIVER DRIER - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

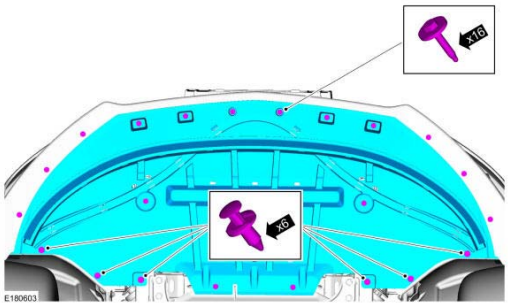
REMOVAL AND INSTALLATION > RECEIVER DRIER - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

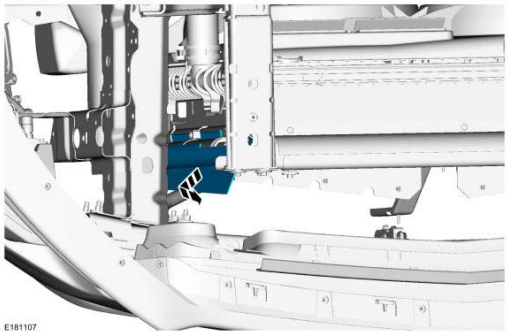
2.



With the vehicle in NEUTRAL, position it on a hoist. Refer to: Jacking and Lifting - Overview .

3.

Remove the bolts, the retainers and the underbody shield.

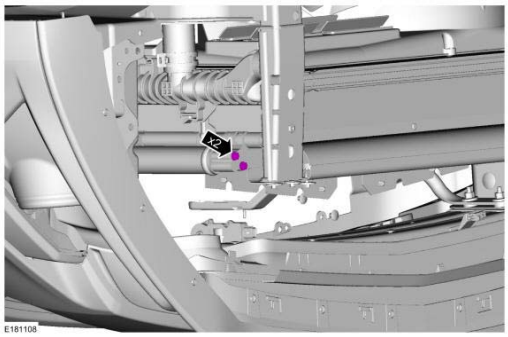


Torque

: 18 lb.in (2 Nm)

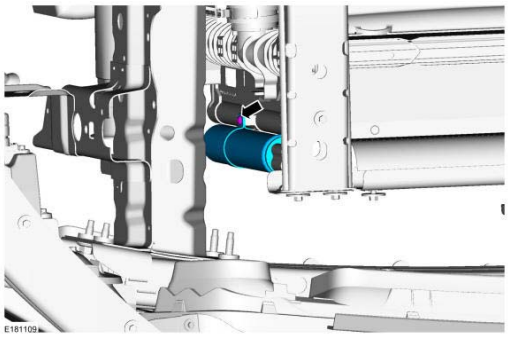
4.

Remove the air deflector.



5.

Remove the bolts.



Torque

: 80 lb.in (9 Nm)

6.

Remove the retainer and the receiver drier.

REMOVAL AND INSTALLATION > RECEIVER DRIER - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

REMOVAL AND INSTALLATION > SUNLOAD SENSOR

Special Tool(s) / General Equipment

Interior Trim Remover

REMOVAL AND INSTALLATION > SUNLOAD SENSOR > REMOVAL

1.

Remove the sunload sensor and disconnect the electrical connector. Use the General Equipment: Interior Trim Remover

REMOVAL AND INSTALLATION > SUNLOAD SENSOR > INSTALLATION

1.

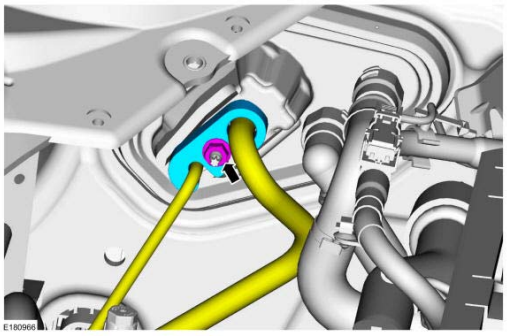
To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 2.3L ECOBOOST (201KW 273PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and



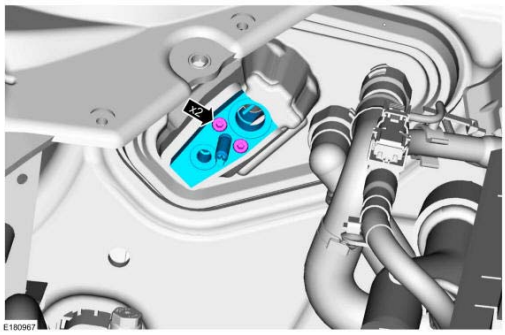
Charging .

NOTE: Make sure that all openings are sealed.

2.
Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the A/C condenser outlet line and the evaporator outlet line.

Torque

: 133 lb.in (15 Nm)



3.

Remove the bolts and the Thermostatic Expansion Valve (TXV).

Torque

: 62 lb.in (7 Nm)

REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 2.3L ECOBOOST (201KW 273PS) > INSTALLATION

1.

To install, reverse the removal procedure.

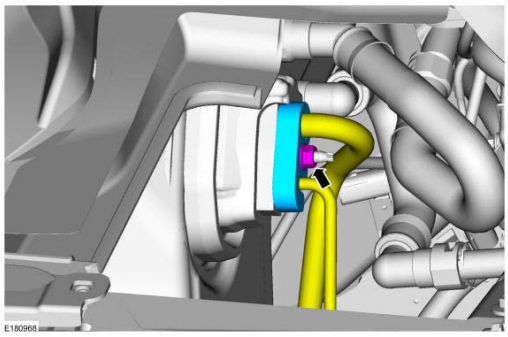
2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 3.7L DURATEC (227KW 301PS) > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.



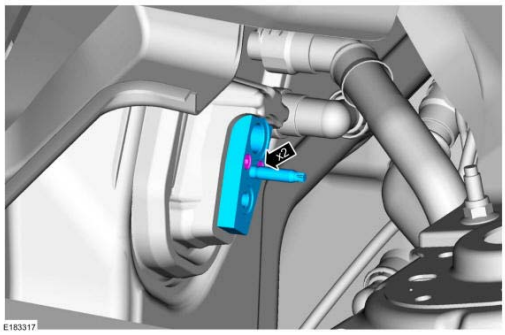
Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

NOTE: Make sure that all openings are sealed.

2.
Remove the nut and the Thermostatic Expansion Valve (TXV) bracket, and disconnect the A/C condenser outlet line and the evaporator outlet line.

Torque

: 133 lb.in (15 Nm)



3.

Remove the bolts and the Thermostatic Expansion Valve (TXV).

Torque

: 62 lb.in (7 Nm)

REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 3.7L DURATEC (227KW 301PS) > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

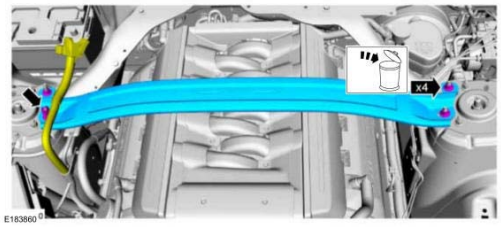
REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 5.0L 32V TI-VCT > REMOVAL

NOTE: Removal steps in this procedure may contain installation details.

1.

Recover the refrigerant. Refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging .

2.



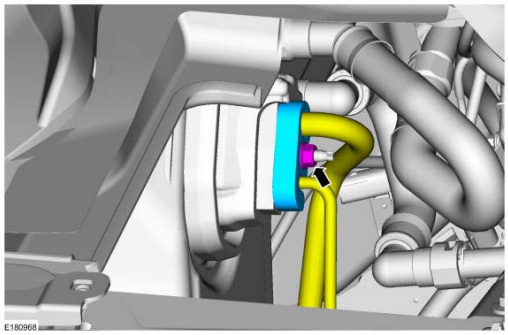
Disconnect the battery ground and positive cables. Refer to: Battery Disconnect and Connect .

NOTE: If equipped.

3.
Detach the battery cable retainer and remove the nuts and the cross brace.

Torque

: 41 lb.ft (55 Nm)

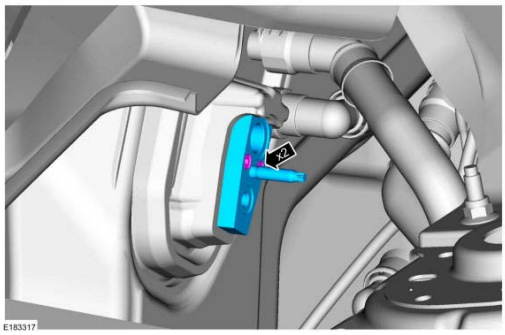


NOTE: Make sure that all openings are sealed.

4.
Remove the nut, the Thermostatic Expansion Valve (TXV) bracket and disconnect the A/C condenser outlet line, the evaporator outlet line.

Torque

: 133 lb.in (15 Nm)



5.

Remove the bolts and the Thermostatic Expansion Valve (TXV).

Torque

: 62 lb.in (7 Nm)

REMOVAL AND INSTALLATION > THERMOSTATIC EXPANSION VALVE - 5.0L 32V TI-VCT > INSTALLATION

1.

To install, reverse the removal procedure.

2.

Add the correct amount of clean Polyalkylene Glycol (PAG) oil to the refrigerant system. Refer to: Refrigerant Oil Adding .

A/C FILTER SERVICE REMINDER

NOTE: To determine the appropriate reset procedure, refer to A/C FILTER SERVICE REMINDER RESET INDEX . Only vehicles listed in this index have a Check A/C (Cabin) Filter Message reset.

A/C FILTER SERVICE REMINDER RESET INDEX

2000-06	A/C Filter Service Reminder Reset - Procedure 1

A/C FILTER SERVICE REMINDER > A/C FILTER SERVICE REMINDER RESET - PROCEDURE 1

1. To reset the A/C filter monitoring system to 100%, press the STATUS control to access the System Check function. Message center will display A/C FILTER XXX% RESET FOR NEW.
2. Press and hold RESET control to change setting to 100%. Message center will now display IF NEW FILTER HOLD RESET.
3. If reset procedure is successful, the message center will display A/C FILTER LIFE SET TO 100%.

MAINTENANCE SERVICE REMINDER (OVERHEAD WARNING LIGHTS)

NOTE: To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX . Only vehicles listed in this index have an Overhead Warning Lights reset.

OVERHEAD WARNING LIGHTS RESET INDEX

Model & Year	Reset Procedure
Cougar	
1992-02	Maintenance Service Reminder Reset - Procedure 1

MAINTENANCE SERVICE REMINDER (OVERHEAD WARNING LIGHTS) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

1. One or more of the 7 overhead lights will turn on after about 358 days or 4800 miles to indicate routine service should be performed.
2. To reset the light, hold the SELECT and UNITS buttons on the trip computer for 5 seconds. The service interval light will be illuminated, and then turn off after about 4 seconds.

MAINTENANCE SERVICE REMINDER (SRI)

Tip: oil change reminder light - 1989 Thunderbird

NOTE: To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX . Only vehicles listed in this index have a Service Interval Reminder Light reset.

SERVICE INTERVAL REMINDER LIGHT RESET INDEX

Model & Year	Reset Procedure
Passenger Cars	
1985-89	Maintenance Service Reminder Reset - Procedure 1
Continental	
1990-94	Maintenance Service Reminder Reset - Procedure 2
Light Duty Trucks	
1985-87	Maintenance Service Reminder Reset - Procedure 3
Non-EEC Light Duty Trucks	
1988	Maintenance Service Reminder Reset - Procedure 3

MAINTENANCE SERVICE REMINDER (SRI) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

Every 5000 or 7500 miles, depending upon engine application, a SERVICE interval reminder light on the dash will illuminate (for approximately 30 seconds), or begin flashing, indicating an oil change is due.

To reset reminder light, turn ignition on. Simultaneously depress and hold TRIP (ODO SEL on Taurus and Sable, SYSTEM CHECK or CHECK OUT on Continental) and RESET or TRIP RESET buttons. On Probe, depress and hold SERVICE RESET button, located on speed alarm keyboard. On all models, 3 beeps will verify that reminder light has been reset.

MAINTENANCE SERVICE REMINDER (SRI) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

During system check sequence, the SERVICE symbol comes on and displays the number of miles to go before the next normal service. To reset the service interval reminder, press SYSTEM CHECK and RESET buttons simultaneously. The display should now show 7200 miles. Service interval reminder light has been reset.

MAINTENANCE SERVICE REMINDER (SRI) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 3

A SRI is used to indicate emission system maintenance is required. Control unit (timer) for maintenance light is located under dash, near steering column or behind glove box. Some models use a non-resettable control unit. Replace it with a resettable type. After servicing emission system, reset SRI.

1. To reset SRI, turn ignition off. Remove tape over reset hole in timer. Lightly push a small Phillips screwdriver into hole in timer unit marked RESET. With light pressure on screwdriver, turn ignition switch to RUN position.
2. Light should stay on while screwdriver is pressed down. Hold screwdriver down for approximately 5 seconds. Remove screwdriver. Light should go out within 2-5 seconds. If light does not go out, repeat step 1
3. Cycle ignition from OFF to RUN position. Light should glow for 2-5 seconds. This verifies proper reset of maintenance reminder light.

MAINTENANCE SERVICE REMINDER (VMM)

NOTE: To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX . Only vehicles listed in this index have a Vehicle Maintenance Monitor reset.

MAINTENANCE SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
Cougar	
1989-92	Maintenance Service Reminder Reset - Procedure 1
Probe	
With Standard Inst.Cluster	
1990-92	Maintenance Service Reminder Reset - Procedure 1

With Electronic Inst.Cluster	
1990-92	Maintenance Service Reminder Reset - Procedure 2
Thunderbird	
1989-92	Maintenance Service Reminder Reset - Procedure 3

MAINTENANCE SERVICE REMINDER (VMM) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

NOTE: For models with Standard Instrument Cluster.

1. The SERVICE light will come on approximately every 7500 miles, indicating routine service is required. The light will remain on for 3 minutes after vehicle is started.
2. To cancel the message and reset SERVICE light on 1990 models, depress and hold SERVICE RESET button until 3 beeps are sounded. This will verify that reminder light has been reset. SERVICE RESET button is located in VMM unit, in center of overhead console.
3. To cancel the message and reset SERVICE light on 1991-92 models, insert a small diameter shank into hole centered directly above VMM display lights, and press switch once.

MAINTENANCE SERVICE REMINDER (VMM) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

NOTE: For models with Electronic Instrument Cluster.

1. SERVICE INTERVAL will be displayed on system scanner every 7500 miles, indicating that routine service is due. At 7500 miles, the message will remain on for 3 minutes after vehicle is started.
2. To cancel message and reset service interval on 1990 models, press and hold ODO SEL and TRIP RESET buttons until 3 beeps are heard. Buttons are located on speed alarm keyboard.
3. To cancel message and reset service interval on 1991-92 models, press and hold SERV button until 3 tones are heard. SERV button is located on speed alarm keyboard.

MAINTENANCE SERVICE REMINDER (VMM) > MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 3

1. Turn ignition switch to ON position. Within 16 seconds of turning ignition on, insert small diameter shank into reset switch hole, and firmly push in switch. Reset switch hole is located on left side of VMM panel.

2. Keep switch depressed until left side of display stops flashing. If switch is not kept depressed until left side of display stops flashing, VMM will not be reset.

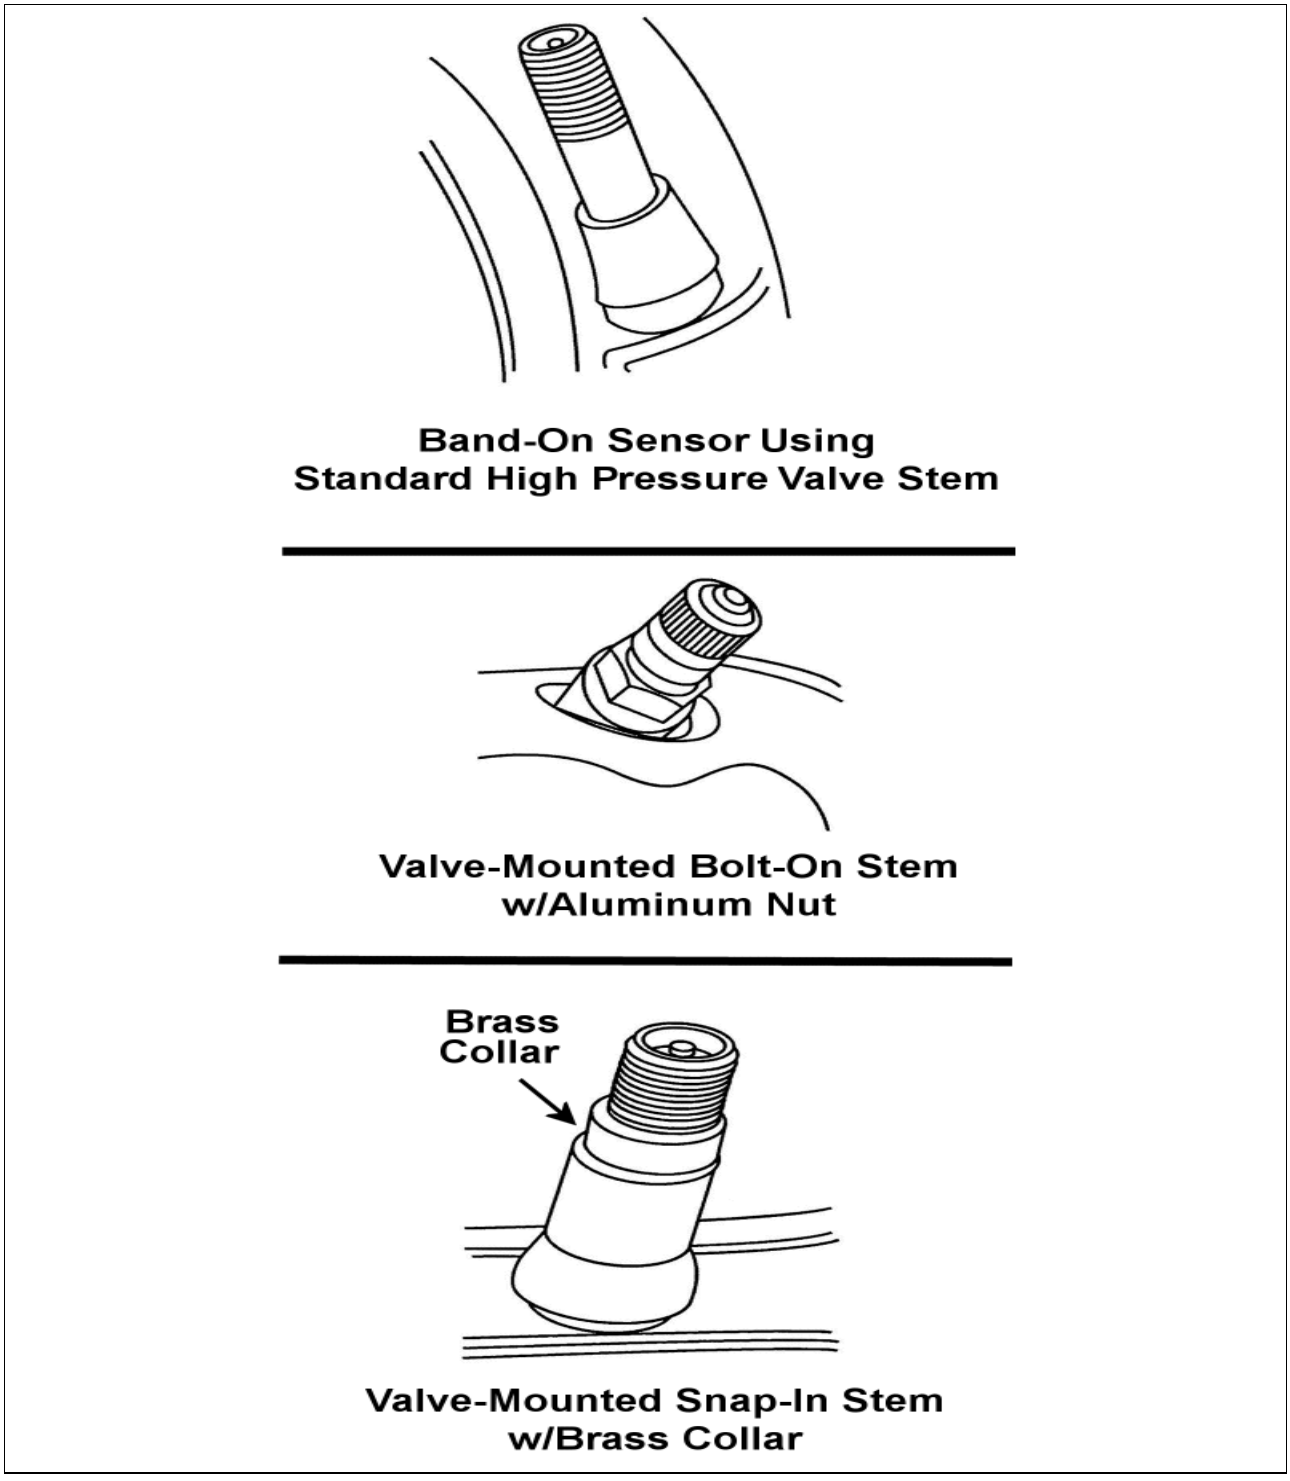
(1)	This is an Indirect TPM System. A transmitter activation tool is not required for this procedure.
(2)	For 2010 models with Integrated Keyhead Transmitter (IKT) or Intelligent Access (IA) type of Remote Keyless Entry system, see TPMS Reminder Reset - Procedure 3 or 4
(3)	For vehicles with Dual Rear wheels, see Procedure 7.



TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS SENSOR TYPES

Ford Motor Company uses three different designs of TPMS sensor:

- Banded Sensor
- Valve Mounted Bolt-On Sensor
- Valve Mounted Snap-In Sensor

> *NOTE: Although the three different system use similar methods for communicating, the tire pressure sensors are not interchangeable.*

Fig 1: Identifying Valve Stems Used With Ford TPMS Sensors

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS SENSOR TYPES > BANDED SENSOR

The banded (or band-on) TPMS sensor assembly consists of:

- A metal band around the center of the wheel

- A cradle or bracket to hold the sensor
- A tire pressure sensor

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS SENSOR TYPES > VALVE MOUNTED BOLT-ON SENSOR

The valve mounted sensors (also known as a Schrader Valve Sensor) are one-piece "bolt-on" valve mounted sensor where the sensor and valve stem are molded together. The sensor is secured in place by a hex nut and uses a rubber grommet to prevent any leaks. This sensor was replaced by the Banded Sensor.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS SENSOR TYPES > VALVE MOUNTED SNAP-IN SENSOR

Beginning in 2009 with the Escape and F-150, a two piece snap-in valve mounted sensor was used. The sensor and valve stem are separate pieces which are screwed together and can be replaced separately.

The sensor is referred to as "snap-in" because it uses a more traditional rubber valve stem for installation and does not use a hex nut fastener or rubber o-ring for attachment.

NOTE: Snap-In Sensors MUST USE new style valve stem.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 1

NOTE: If tire pressure sensor is replaced, it will need to be trained. The TPM system is not affected by wheel and tire rotation.

NOTE: As ambient temperature decreases by 6°C (10°F), tire pressure decreases 1 psi (7 kPa). Because tire pressures fluctuate with temperature changes, tire pressures must be set when tires are at outdoor ambient temperatures. If the tire pressure may drop enough to be detected by the TPM system, which will activate the low pressure warning light.

NOTE: When the tire pressure warning light comes on solid and message center displays "LOW TIRE PRESSURE", check the air pressure of all tires and adjust to the specified cold pressure listed on vehicle certification label (found on driver's door or door pillar). Drive the vehicle at 20 mph (32 km/h) for at least 2 minutes. If the vehicle has been

stationary for more than 30 minutes, a TPM sensor Activation procedure may be needed. Make sure the warning light goes off. If the warning light stays on, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: When the tire pressure warning light flashes for 70 seconds and then remains illuminated, after bulb-check has been performed and message center displays warning messages, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the TPM system may not function properly:

- *Low tire pressure.*
- *Tire pressure sensor is missing or damaged.*
- *Spare tire is installed as a road wheel.*
- *Incorrect tire pressure sensor is installed.*
- *Tire pressure sensor installed incorrectly.*
- *Non-OEM wheels installed (aftermarket rims).*
- *Non-OEM equipped run-flat tires installed.*
- *Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks, etc.)*

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without Radio Frequency (RF) noise and at least 3 ft. (1 m) away from any other vehicle equipped with TPM system. RF noise is generated by electrical motor and appliance operation, cellular telephones and remote transmitters, power inverters and portable entertainment equipment.

NOTE: A new tire pressure sensor is shipped in an OFF mode (or battery saver mode), and must be turned ON before it can be trained. To turn the sensor on, inflate the tire to the recommended inflation pressure and wait at least 2 minutes, then continue with the sensor training procedure.

1. Turn ignition switch to OFF position, then press and release brake pedal.
2. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
3. Press and release the brake pedal.
4. Turn ignition switch to OFF position.

5. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.

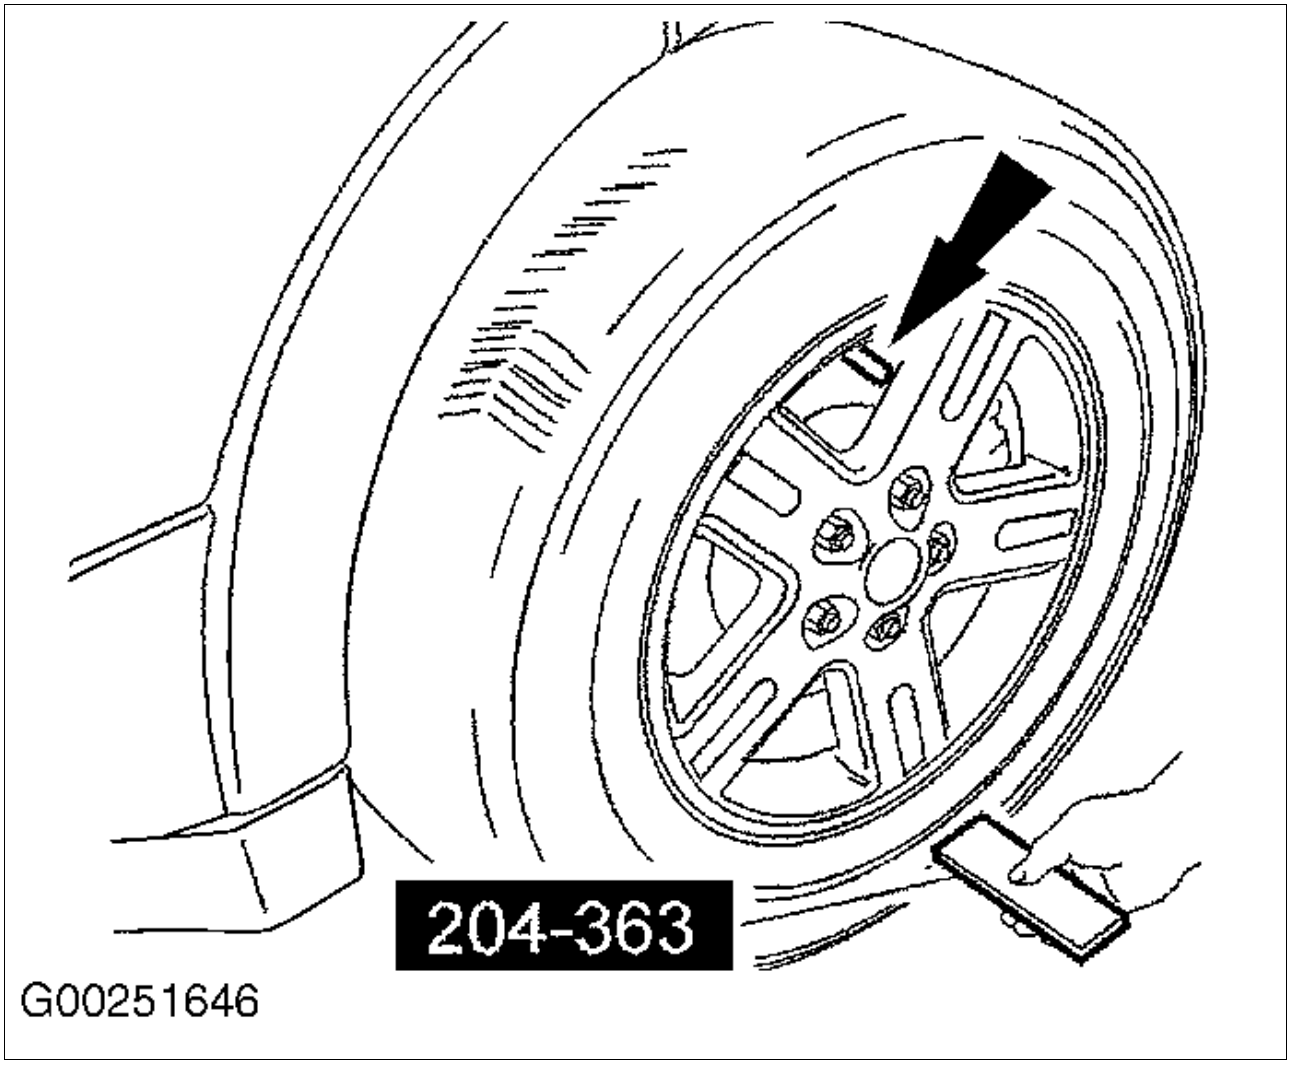
> *NOTE: The horn will sound once and the tire pressure warning light will flash if train mode has been entered successfully (if equipped, the message center displays "TRAIN LF TIRE").*

6. Depending on TPMS sensor type, place transmitter activation tool on the left front tire wall:
    1. **Band-On Type Sensor:** Opposite (180 degrees) from the valve stem. See Fig 1
    2. **Valve-Mounted Type Sensor:** Near the valve stem.

   Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the Driver's Door Module (DDM).

> *NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the transmitter activation tool must remain in place, in the appropriate position relative to the valve stem.*

> *NOTE: If a sensor does not respond to the activation tool, move the vehicle to rotate the wheels at least 1/4 of a turn and attempt to activate the same sensor again.*



> *NOTE: If the DDM does not recognize any one of the 4 tire pressure sensors during the 2 minute time limit for each sensor response, the horn will sound twice and the message center (if equipped) will display "TIRE NOT TRAINED REPEAT". The training procedure must be repeated from the beginning.*

7. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall, in the appropriate position relative to the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.

> *NOTE: Do not wait more than 2 minutes between training each sensor. If the wait time is more than 2 minutes the DDM will stop and the training procedure must be repeated from the beginning.*

8. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

Fig 1: Training Tire Pressure Sensors (Wheels With Band-On Sensors)

Courtesy of FORD MOTOR CO.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 2

NOTE: If vehicle is stationary overnight when outside temperature is significantly lower than daytime temperature, tire pressure may decrease about 3 psi (21 kPa) for a drop of 30°F (17°C) in ambient temperature. This pressure decrease may activate TPM warning system.

NOTE: Since tire pressure information is updated once every minute, it may take up to a minute for warning light to turn off after tire pressure has been adjusted. If vehicle has been parked for over 15 minutes, system information will be updated once an hour. In this case, it may take up to an hour for warning light to turn off after tire pressure has been adjusted.

NOTE: When the tire pressure warning light comes on solid, check the air pressure of all tires and adjust to the specified pressure listed on tire label (located on the driver's door or "B" pillar). Drive the vehicle at 20 mph (32 km/h) for at least 2 minutes. Make sure the warning light goes off. If the warning light stays on, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: When the tire pressure warning light flashes for 20-30 seconds either at start-up or while driving, check to see if a spare tire is being used. Repair as necessary. Make sure the warning light goes off. If the tires are adjusted to the appropriate pressure, spare tire is not in use, and warning light continues to flash, there is a malfunction in the TPM system. See appropriate manufacturer service information.

WARNING: In the following procedure, a magnet is used. Death or serious injury can occur if magnetically sensitive devices are exposed to the relearn magnet. Magnets can affect pacemakers.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency (RF) noise. RF noise is generated by electrical motor and appliance operation, cellular telephones and remote transmitters, power inverters and portable entertainment equipment.

1. Turn ignition switch to OFF position.
2. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
3. Press and release the brake pedal.
4. Turn ignition switch to OFF position.
5. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle. The horn will sound once and the TPMS indicator will flash if train mode has been entered successfully (if equipped, the message center displays "TRAIN LF TIRE").
6. Place the TPM Relearn Magnet on the valve stem of the left front tire pressure sensor. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the TPMS module.
7. Within 2 minutes after the horn sounds, place the magnet on the valve stem of the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.

   NOTE: If the VSM (TPMS module is integral to VSM) does not recognize any one of the 4 tire pressure sensors during the tire training procedure, the horn will sound twice and the message center (if equipped) will display "TIRE NOT TRAINED

REPEAT". If this occurs, procedure must be repeated.

8. When the tire training procedure is complete, the horn will sound once and the message center (if equipped) will display "TIRE TRAINING MODE COMPLETE".

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 3

NOTE: The TPMS can be placed into learn mode using a diagnostic scan tool.

1. *Select Chassis.*
2. *Select TPMS.*
3. *Select Training Mode*

The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN Left Front (LF) TIRE.

Enter Training Mode Without Scan Tool:

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. **Close All Doors.**
3. Turn ignition switch to OFF position, then press and release brake pedal.
4. Using the START/STOP button, switch from OFF to ACCESSORY to RUN position 3 times, ending in RUN position.
5. Press and release the brake pedal.
6. Turn ignition switch to OFF position.
7. Using the START/STOP button, switch from OFF to ACCESSORY to RUN position 3 times, ending in RUN position.
8. Place transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized.
9. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.
10. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF

position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 4

NOTE: The TPMS can be placed into learn mode using a diagnostic scan tool.

1. *Select Chassis.*
2. *Select TPMS.*
3. *Select Training Mode*

The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN Left Front (LF) TIRE.

Enter Training Mode Without Scan Tool:

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to OFF position, then press and release brake pedal.
3. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
4. Press and release the brake pedal.
5. Turn ignition switch to OFF position.
6. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle. The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.
7. Place transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the DDM.

   NOTE: Do not wait more than 2 minutes between training each sensor. If the wait time is more than 2 minutes the DDM will stop and the training procedure must be repeated from the beginning.

8. Within 2 minutes after the horn sounds, place transmitter activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.

9. When the tire training procedure is complete, the message center (if equipped) will display "TIRE TRAINING COMPLETE". For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when ignition is turned off, the training procedure was not successful.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 5

NOTE: After tire rotation, replacement, balancing, alignment or pressure adjustment, TPM system will need to be reset.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 5 > VEHICLES WITH MESSAGE CENTER

1. To reset the system, turn ignition switch to ON position or press ENGINE START/STOP button (brake pedal not depressed).
2. Press and hold the SETUP button and wait for the message center to display "SYSTEM CHECK".
3. Press the RESET button and wait for the message center to display "HOLD RESET TO RELEARN".
4. Continue to hold the RESET button for 3 seconds. The message "HOLD RESET TO RELEARN" and the low tire warning light will flash 3 times, indicating the reset procedure is complete.
5. If the light illuminates, reset the tire pressure to specification, then repeat procedure from step 1.
6. The system normally requires 15-20 minutes of driving in each of 3 speed ranges to learn how the tires behave after the system has been reset. However, the system will become functional in each speed range as soon as learning completes in each individual speed range.
   TIRE LEARNING SPEED RANGES

Speed Range	MPH (KM/H)
Low	25-42 (40-68)
Medium	42-62 (68-100)
High	Above 62 (100)

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET -

PROCEDURE 5 > VEHICLES WITHOUT MESSAGE CENTER

1. To reset the system, turn ignition switch to ON position.
2. Press and hold the Trip/Odometer reset button, and wait until "TIRE RESET" or "CHECK TIRE AND RESET" is displayed in odometer display window.
3. Continue to press the button for 3 seconds, then release. After 3 seconds, the low tire pressure warning light will flash 3 times, indicating that the low tire warning system reset procedure is complete.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 6

1. Drive the vehicle above 20 mph (32 km/h) for at least two minutes and then park in a location where you can easily get to all four tires and have access to an air pump.
2. Turn the ignition ON, with the engine OFF.
3. Turn the hazard flashers on then off three times. This must be accomplished within 10 seconds. If the reset mode has been entered successfully, the horn will sound once, the system indicator will flash and the message center (if equipped) will display TRAIN LEFT FRONT TIRE. If this does not occur, please try again starting at Step 2.
4. Place a transmitter activation tool on the left front tire wall at the valve stem. Press the activation button. The horn will sound briefly to indicate that the tire pressure sensor has been recognized.
5. Within 2 minutes after the horn sounds, place activation tool on the right front tire wall at the valve stem. Then press the activation button to train the right front tire pressure sensor. Repeat procedure for right rear and left rear tires.
6. After all four tires have been trained, remove the valve cap from the valve stem on the left front tire; decrease the air pressure until the horn sounds. The single horn chirp confirms that the sensor identification code has been learned by the module for this position. If a double horn is heard, the reset procedure was unsuccessful, and must be repeated.
7. Repeat the air pressure decrease procedure for the remaining three tires.
8. Training is complete after the horn sounds for the last tire trained (driver's side rear tire), the system indicator stops flashing, and the message center (if equipped) displays TRAINING COMPLETE.
9. Turn the ignition off. If two short horn beeps are heard, the reset procedure was unsuccessful and must be repeated.
10. Set all four tires to the recommended air pressure as indicated on the Safety Compliance Certification Label or Tire Label.

TIRE PRESSURE MONITOR SYSTEM REMINDER > TPMS REMINDER RESET - PROCEDURE 7

NOTE: This procedure is for vehicles the Dual Rear Wheels.

NOTE: The TPMS can be placed into learn mode using a diagnostic scan tool.

1. *Select Chassis.*
2. *Select TPMS.*
3. *Select Training Mode*

The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN Left Front (LF) TIRE.

Enter Training Mode Without Scan Tool:

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to OFF position, then press and release brake pedal.
3. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle.
4. Press and release the brake pedal.
5. Turn ignition switch to OFF position.
6. Turn ignition switch from OFF position to the RUN position 3 times, ending in RUN position. Do not wait more than one minute between each key cycle. The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.
7. Remove both rear outer tires and lay them flat on the ground. Left Rear Outer (LRO) and Right Rear Outer (RRO).
8. Place the transmitter activation tool on the Left Front (LF) tire sidewall at the valve stem. Press and release the test button on the tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the BCM.

   NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the transmitter activation tool must remain in place at the valve stem.

9. Within 2 minutes of the horn sounding, place the transmitter activation tool on the Right Front (RF) tire sidewall at the valve stem and press and release the test button to train the Right Front (RF) tire pressure sensor.
10. Repeat procedure for the Right Rear (RR), (RRO) Left Rear (LR) and (LRO) tires. The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE. For

vehicles not equipped with a message center, successful completion of the training procedure will be verified by positioning the ignition to OFF without the horn sounding. If the horn sounds twice when the ignition is positioned to OFF, the training procedure was not successful

11. Using the scan tool, locate the updated TPMS sensor identifiers trained to the BCM and document them on the applicable warranty claim. This step is required to clear DTC B1182:55, cause the BCM to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed BCM.
12. If the sensors are being trained due to the installation of a new BCM, clear any DTC and carry out the BCM On-Demand Self Test.
13. Install both rear outer tires.

Service Manual: SEATBELT SYSTEMS

DESCRIPTION AND OPERATION > SEATBELT SYSTEMS - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > SEATBELT SYSTEMS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > EMERGENCY LOCKING RETRACTOR (ELR)

All retractors have an Emergency Locking Retractor (ELR) mode, which is a vehicle-sensitive feature designed to activate and lock the safety belt webbing during hard braking, cornering, or an impact of approximately 24 km/h (14.9 mph). The Emergency Locking Retractor (ELR) feature helps reduce the forward movement of the driver and passengers. For testing, see Functional Test - Safety Belt Retractor, Road Test Inspection , Refer to: Seatbelt Systems .

DESCRIPTION AND OPERATION > SEATBELT SYSTEMS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > AUTOMATIC LOCKING RETRACTOR (ALR)

The Automatic Locking Retractor (ALR) mode is used when locking a child seat in any passenger seating position. The Automatic Locking Retractor (ALR) mode automatically activates when the safety belt webbing is fully extracted from the retractor and then allowed to retract. As the safety belt webbing retracts back onto the spool, an audible clicking sound is made, indicating the safety belt retractor is in Automatic Locking Retractor (ALR) mode and the safety belt webbing cannot pull back out of the safety belt retractor. The Automatic Locking Retractor (ALR) mode disengages when the webbing is allowed to fully retract back into the retractor. For testing, see Functional Test - Safety Belt Retractor, Automatic Locking Retractor (ALR) Mode , Refer to: Seatbelt Systems .

DESCRIPTION AND OPERATION > SEATBELT SYSTEMS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SAFETY BELT WARNING INDICATOR AND CHIME

The conditions of operation for the driver and/or front passenger safety belt warning indicator and chime operate as follows:

- If the driver and/or passenger safety belt is not buckled with the ignition ON, then the safety belt warning indicator illuminates for 1 to 2 minutes and the warning chime sounds for 4 to 8 seconds.
- If the driver and/or passenger safety belt is buckled while the warning indicator is illuminated and the warning chime is sounding, then the indicator and chime turn off.
- If the driver and/or passenger safety belt is buckled before the ignition is in the ON position, the safety belt warning indicator and chime remain off.

DESCRIPTION AND OPERATION > SEATBELT SYSTEMS - SYSTEM OPERATION AND COMPONENT DESCRIPTION > BELT-MINDER®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides an additional reminder that the driver and/or front passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning indicator in the IPC.

Either the driver or front passenger safety belt systems may activate the Belt-Minder®. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder® feature.

The passenger Belt-Minder® feature is activated only when the OCS detects a passenger in the right front seat and the passenger weight exceeds a programmed limit. For information on the OCS, Refer to: Airbag and Seatbelt Pretensioner Supplemental Restraint System (SRS) - System Operation and Component Description .

When a MyKey® is in the ignition, the Belt-Minder® feature cannot be deactivated. Refer to the Owner's Literature for further information on MyKey® functionality.

To activate or deactivate the Belt-Minder® feature, Refer to: Seatbelt Minder Deactivating/Activating .

The Belt-Minder® feature works as follows:

If...	Then...
the driver and/or passenger safety belt is buckled before the ignition is turned ON or less than 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature will not activate.
the driver and/or front passenger safety belt is not buckled before the vehicle has reached at least 9.7 km/h (6.0 mph) and 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 25 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.
the driver or front passenger safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 9.7 km/h (6.0 mph) and more than 1-2 minutes have elapsed since the ignition has been ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 25 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.

Component Description

Child Safety Seat Tether Anchor

Child safety seat tether anchors are located at the rear seating positions and are part of the parcel shelf sheet metal.

If a child safety seat was in use during a collision, inspect the child safety seat mounting areas and restore the vehicle to the original production configuration.

Child Safety Seat Tether Anchor - Lower Anchors and Tethers for Children (LATCH)

Lower Anchors and Tethers for Children (LATCH) are located under the rear seat where the backrest and

cushion meet and are released for service. Refer to: Child Safety Seat Tether Anchor .

If a child safety seat was in use during a collision, inspect the child safety seat mounting areas and restore the vehicle to the original production configuration.

DIAGNOSIS AND TESTING > SEATBELT SYSTEMS > SYMPTOM CHART(S)

Preliminary Inspection

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

Before diagnosing or repairing the safety belt system, inspect the following items:

- Safety belt webbing integrity (torn, frayed, cut or stretched)
- Safety belt buckle and tongue assembly

Symptom Chart: Safety Belt System

Symptom Chart

Condition	Possible Sources	Actions
The safety belt warning indicator does not operate	Failed indicator Wiring, terminals or connectors IPC RCM	If the air bag warning indicator is not illuminated, REFER to: Instrumentation, Message Center and Warning Chimes .
The safety belt warning chime does not operate	Wiring, terminals or connectors Safety belt switch IPC RCM	If the air bag warning indicator is illuminated, REFER to: Airbag Supplemental Restraint System (SRS) . If the air bag warning indicator is not illuminated, REFER to: Instrumentation, Message Center and Warning Chimes .
The safety belt retractor webbing does not extract or exhibits excessive pressure on the occupant during use	Safety belt retractor is in Automatic Locking Retractor (ALR) mode Safety belt retractor binding internally	CARRY OUT Functional Test - Safety Belt Retractor, Automatic Locking Retractor (ALR) Mode . INSTALL new components as directed.
The safety belt retractor webbing does not retract or has excessive slack during use	Twisted or incorrectly routed safety belt webbing Safety belt retractor binding internally	CORRECT the twisted safety belt webbing. REFER to: Seatbelt Twisted at the Seatbelt Guide . REFER to: Seatbelt Tongue Rotated On Belt . CARRY OUT Functional Test - Safety Belt Retractor . INSTALL new components as directed.

The Belt-Minder® feature is inoperative	Belt-Minder® feature is deactivated Wiring, terminals or connectors	Activate the Belt-Minder® feature. REFER to: Seatbelt Minder Deactivating/Activating . If the Belt-Minder® is activated, DIAGNOSE the inoperative Belt-Minder® feature. REFER to: Instrumentation, Message Center and Warning Chimes .
The safety belt tongue is rotated on the safety belt webbing	Twisted or incorrectly routed safety belt webbing	REFER to: Seatbelt Tongue Rotated On Belt .
The safety belt webbing is twisted at the safety belt guide	Twisted or incorrectly routed safety belt webbing	REFER to: Seatbelt Twisted at the Seatbelt Guide .
The safety belt webbing is dirty or soiled	Dirty or soiled safety belt webbing	REFER to: Seatbelt Cleaning .

DIAGNOSIS AND TESTING > SEATBELT SYSTEMS > FUNCTIONAL TEST - SAFETY BELT BUCKLE AND TONGUE

NOTE: Make sure the safety belt buckle and tongue assembly operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1.

Verify the following during the latching sequence:

- Tongue insertion does not require excessive effort.
- A click is heard when the safety belt buckle latches the tongue.

2.

Verify the system integrity by forcefully pulling on the safety belt webbing.

3.

Unlatch the safety belt by fully pressing the safety belt buckle release button and allowing the safety belt to release and retract.

4.

Verify the following during the unlatching process:

- Pressing the push button does not require excessive effort.
- The tongue can be removed easily from the buckle.

5.

Repeat the above steps 3 times.

6.

If the functional test reveals a concern(s), install a new safety belt buckle or safety belt retractor as required.

DIAGNOSIS AND TESTING > SEATBELT SYSTEMS > FUNCTIONAL TEST - SAFETY BELT RETRACTOR

NOTE: Make sure the safety belt retractor is freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1.

Extract and retract the safety belt between the full extension and stowed positions.

2.

Verify the safety belt retractor operates without excessive effort or binding.

3.

Install a new safety belt retractor if any concern is found or the complaint has been verified.

DIAGNOSIS AND TESTING > SEATBELT SYSTEMS > FUNCTIONAL TEST - SAFETY BELT RETRACTOR, AUTOMATIC LOCKING RETRACTOR (ALR) MODE

1.

Position the seat backrest fully upright (if adjustable).

2.

Position the safety belt shoulder height adjuster (if equipped) in the full down or up position.

3.

Fasten the safety belt.

4.

Pull out the safety belt webbing until the Automatic Locking Retractor (ALR) feature is activated.

5.

Allow the safety belt webbing to retract until it stops.

6.

Pull on the safety belt webbing to make sure the safety belt retractor has remained in the Automatic Locking Retractor (ALR) mode. If the safety belt retractor is not locked, install a new safety belt retractor.

7.

Unfasten the safety belt and allow the safety belt webbing to retract to its stowed position.

8.

Pull out and retract the safety belt webbing to verify the safety belt retractor has converted automatically out of Automatic Locking Retractor (ALR) mode. If the safety belt retractor remains locked in the Automatic Locking Retractor (ALR) mode, install a new safety belt retractor.

DIAGNOSIS AND TESTING > SEATBELT SYSTEMS > FUNCTIONAL TEST - SAFETY BELT RETRACTOR, ROAD TEST INSPECTION

NOTE: Make sure there is no excessive slack in the safety belt webbing across the torso during testing.

NOTE: Do not jerk on the safety belt webbing when carrying out this test.

1.

Fasten the safety belts and proceed to a safe area.

2.

Reach a speed of 24 km/h (14.9 mph).

WARNING: Apply maximum brake force only on dry concrete or equivalent hard surface, never on wet pavement or gravel. Failure to follow this instruction may result in serious personal injury.

3.

Grasp the shoulder harness, lean forward and apply the brakes, making a maximum braking application without a skid.

4.

The safety belts should lock up with minimum webbing extension.

5.

If there is a lockup of all safety belt retractors being tested, the safety belt retractors are functioning correctly. If any safety belt retractor fails to lock up, install a new safety belt retractor(s).

GENERAL PROCEDURES > SEATBELT CLEANING

Cleaning

> *WARNING: Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.*

1.

Refer to the owner's literature for information on safety belt care and the recommended cleaning solution to use. Follow the manufacturer's instructions provided with the cleaning solution.

GENERAL PROCEDURES > SEATBELT MAINTENANCE

Inspection

> *WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Seatbelt Procedure After a Collision . Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.*

1.

Periodically inspect the safety belt assemblies for damage and that they remain in correct operating condition, particularly if they have been subjected to severe stress.

2.

Before installing the new safety belt assembly, inspect the safety belt retaining areas for damage and distortion. If the retaining points are damaged and distorted, work the sheet metal back to its original shape and structural integrity.

3.

Install the new safety belt(s) using the appropriate instructions. Carry out the appropriate Functional Test procedure for all seating positions. Refer to: Seatbelt Systems .

GENERAL PROCEDURES > SEATBELT PROCEDURE AFTER A COLLISION

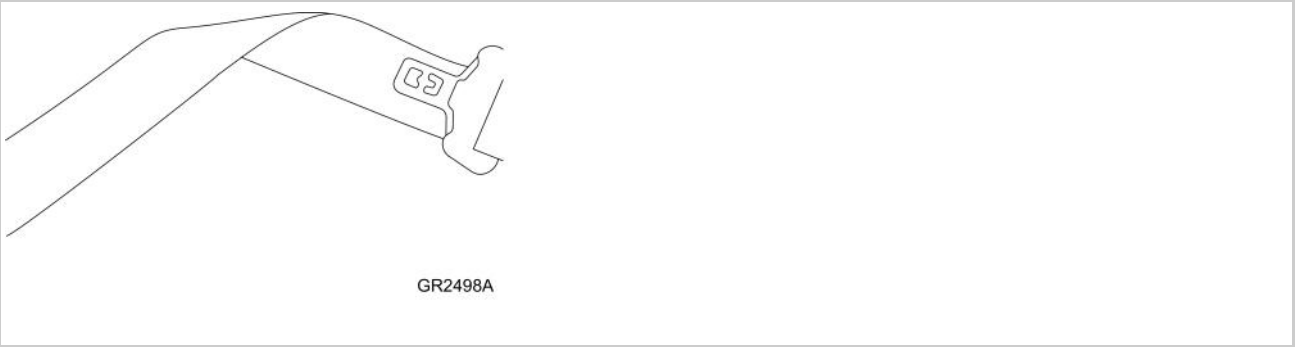
Inspection

> *WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision in this service information . Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.*

1.

Before installing the new safety belt assembly, inspect the safety belt attaching areas for damage and distortion. If the attaching points are damaged and distorted, work the sheet metal back to its original shape and structural integrity.

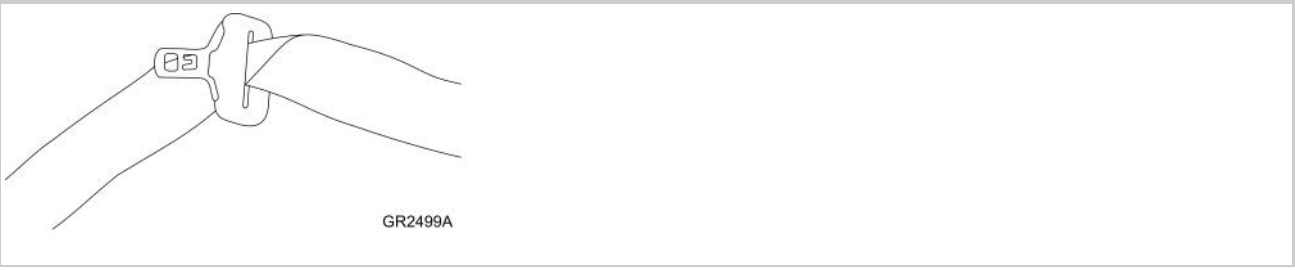
2.



Install new safety belt(s) at any seating position(s) where deployment has occurred and the safety belt(s) were used. Carry out the appropriate Functional Test procedure for all seating positions. Refer to: Seatbelt Systems .

GENERAL PROCEDURES > SEATBELT TONGUE ROTATED ON BELT

Adjustment



1.

Fold the safety belt as indicated.

2.

Pull the safety belt tongue over the fold in the safety belt.

GENERAL PROCEDURES > SEATBELT TWISTED AT THE SEATBELT GUIDE

Adjustment

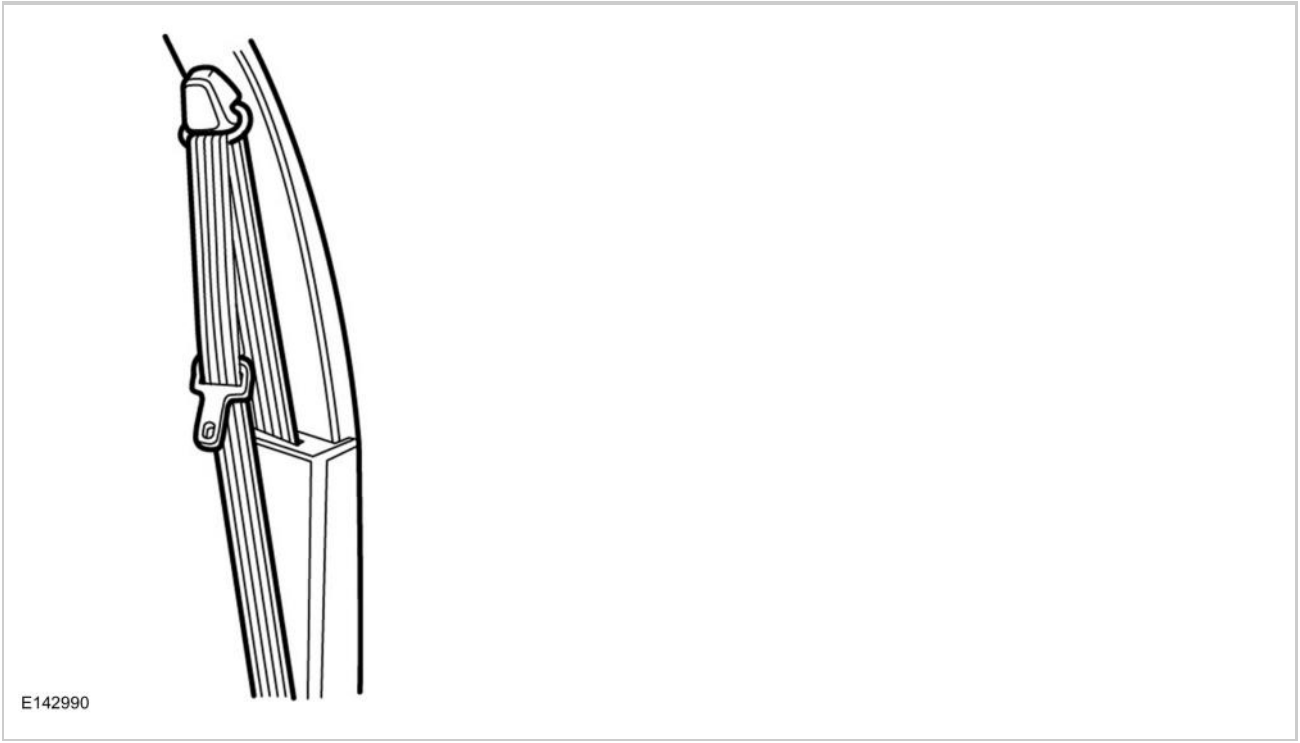
1.

> *WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.*

Refer to: Health and Safety Precautions .

2.

If necessary, remove necessary trim panel(s).



> *NOTE: Typical D-ring shown in illustration, others similar.*

3.
Grasp the safety belt webbing at the D-ring and fold the twisted portion of the safety belt webbing over itself.

4.

Feed the folded portion of the safety belt webbing through the D-ring to remove the twist from the safety belt webbing.

REMOVAL AND INSTALLATION > CHILD SAFETY SEAT TETHER ANCHOR > REMOVAL

NOTE: LHD shown in illustration, RHD similar.

NOTE: RH shown in illustration, LH similar.

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

2.

Remove the retainers and the child safety seat tether anchor.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > CHILD SAFETY SEAT TETHER ANCHOR > INSTALLATION

1.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION > FRONT SEATBELT BUCKLE > REMOVAL

NOTE: LHD passenger seat shown in illustration, all other seats similar.

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the front seat. Refer to: Front Seat .

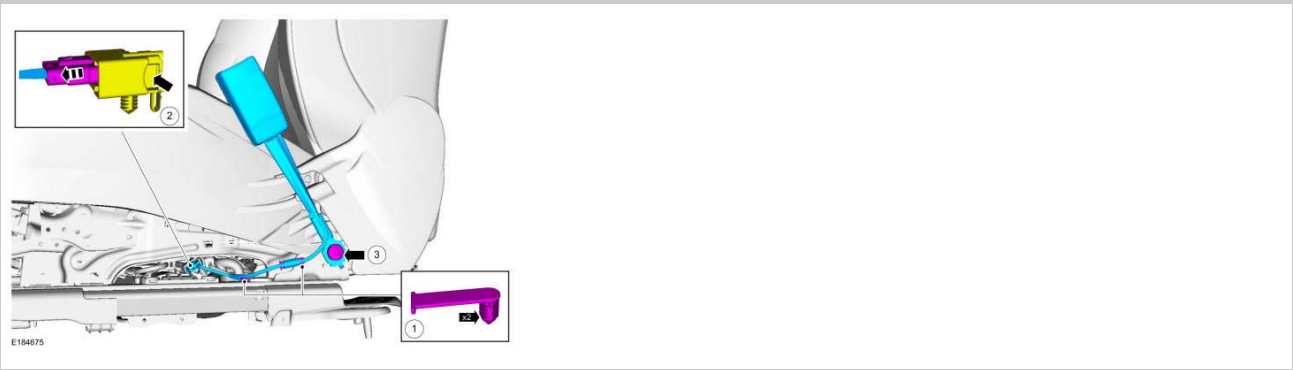
2.

Remove the front safety belt buckle.

1.

Remove the wire harness retainers.

2.



Disconnect the safety belt buckle electrical connector.

3.

Remove the retainer and the safety belt buckle.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > FRONT SEATBELT BUCKLE > INSTALLATION

NOTE: During installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

1.
To install, reverse the removal procedure.

2.

Check the active restraint system for correct operation. Refer to: Seatbelt Systems .

REMOVAL AND INSTALLATION > FRONT SEATBELT RETRACTOR AND PRETENSIONER > REMOVAL

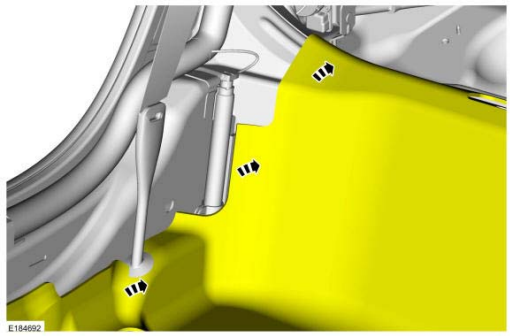
NOTE: LHD shown in illustration, RHD similar.

NOTE: RH shown in illustration, LH similar.

NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1.



Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

Remove the loadspace trim panel. Refer to: Loadspace Trim Panel - Coupe). Refer to: Loadspace Trim Panel - Convertible .

3.

Position the carpet aside.

4.

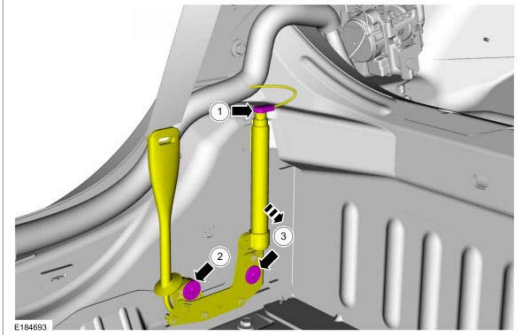
1.

Disconnect the anchor pretensioner electrical connector.

2.

Remove the anchor pretensioner bolt.

Torque



: 30 lb.ft (40 Nm)

NOTE: The rear anchor pretensioner bolt must remain attached and flush to the anchor plate during removal and installation. Failure to follow this instruction prevents correct installation of the anchor pretensioner, requiring installation of a new safety belt assembly.

3.
While pulling outward on the anchor pretensioner, remove the rear bolt.

Torque

: 30 lb.ft (40 Nm)

Convertible

5.

For the RH side, remove the RTM.

1.

Detach the wire harness retainers.

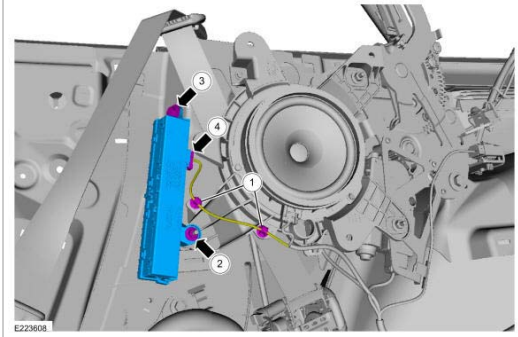
2.

Remove the nut.

Torque

: 71 lb.in (8 Nm)

3.



Remove the bolt.

Torque

: 17 lb.in (1.9 Nm)

4.

Disconnect the electrical connector.

6.

Remove the speaker and bracket assembly.

1.

Detach the wire harness retainer.

2.

Disconnect the electrical connector.

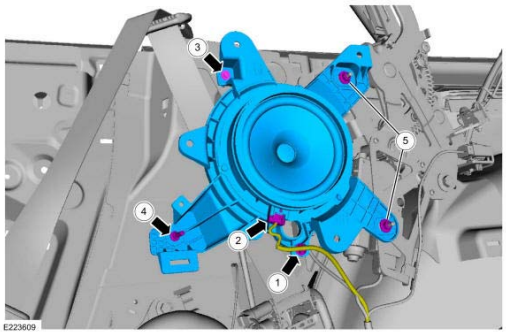
3.

Remove the screw.

4.

Remove the stud bolt.

Torque



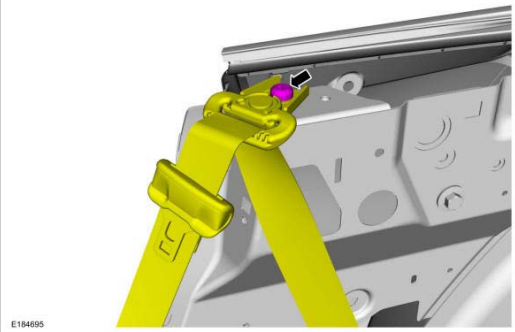
: 97 lb.in (11 Nm)

5.

Remove the nuts.

Torque

: 71 lb.in (8 Nm)

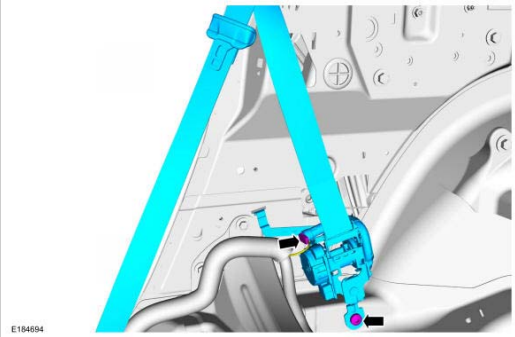


7.

Remove the D-ring bolt and position the safety belt aside.

Torque

: 30 lb.ft (40 Nm)



8.

Disconnect the electrical connector, remove the retainer and the safety belt retractor and pretensioner.

Torque

: 30 lb.ft (40 Nm)

Coupe

NOTE: Follow the unique instructions or graphics for this step in the installation.

9.
Remove the D-ring bolt.

1.

Remove the D-ring bolt cover.

2.

Remove the D-ring bolt and position the safety belt aside.

10.

Remove the safety belt retractor and pretensioner.

1.

Remove the safety belt retractor retainer.

2.

Disconnect the electrical connector and remove the safety belt retractor and pretensioner.

REMOVAL AND INSTALLATION > FRONT SEATBELT RETRACTOR AND PRETENSIONER > INSTALLATION

Convertible

> *NOTE: During installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.*

1.
To install, reverse the removal procedure.

Coupe

2.

Install the safety belt retractor and pretensioner.

1.

Connect the electrical connector and position the safety belt retractor and pretensioner.

2.

Install the safety belt retractor and pretensioner retainer.

Torque

: 30 lb.ft (40 Nm)

3.

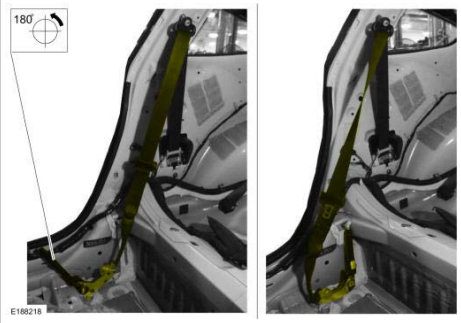
Install the D-ring bolt.

1.

Position the safety belt and install the D-ring bolt.

Torque

: 30 lb.ft (40 Nm)



2.

Install the D-ring bolt cover.

NOTE: During installation, make sure the safety belt webbing is not twisted between the D-ring and the safety belt retractor and a single 180 degree twist clockwise LH side or counterclockwise RH side.

4.
Rotate the anchor pretensioner clockwise on the LH side, counterclockwise on the RH side, 180 degrees.

5.

To install, reverse the removal procedure.

All vehicles

6.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

7.

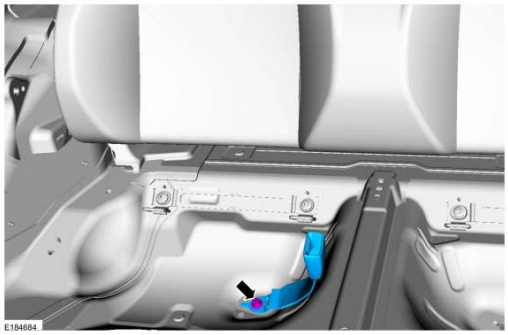
Check the active restraint system for correct operation. Refer to: Seatbelt Systems .

REMOVAL AND INSTALLATION > REAR SEATBELT BUCKLE > REMOVAL

NOTE: RH shown in illustration, LH similar.

NOTE: Removal steps in this procedure may contain installation details.

1.



Remove the rear seat cushion. Refer to: Rear Seat Cushion .

2.

Remove the bolt and the safety belt buckle.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > REAR SEATBELT BUCKLE > INSTALLATION

NOTE: During installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

1.
To install, reverse the removal procedure.

2.

Check the active restraint system for correct operation. Refer to: Seatbelt Systems .

REMOVAL AND INSTALLATION > REAR SEATBELT RETRACTOR - COUPE > REMOVAL

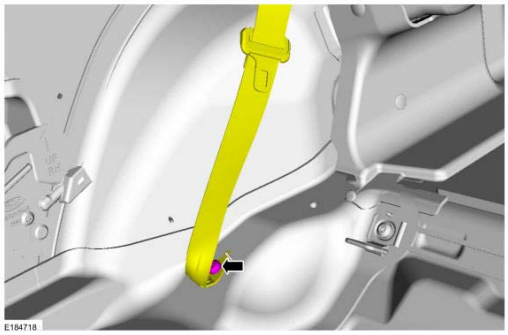
NOTE: RH shown in illustration, LH similar.

NOTE: Removal steps in this procedure may contain installation details.

1.

Remove the rear seat cushion. Refer to: Rear Seat Cushion .

2.



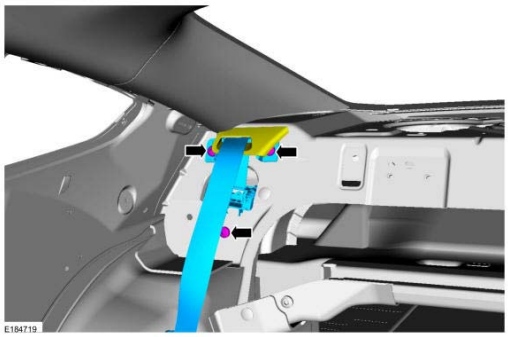
Remove the parcel shelf. Refer to: Parcel Shelf - Coupe .

3.

Remove the retainer and position the safety belt aside.

Torque

: 30 lb.ft (40 Nm)



4.

Remove the retainers and the safety belt retractor.

Torque

: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > REAR SEATBELT RETRACTOR - COUPE > INSTALLATION

NOTE: During installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

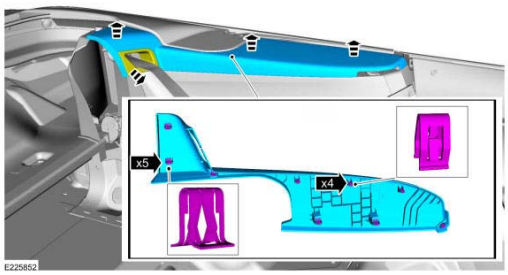
1.
To install, reverse the removal procedure.

2.

Check the active restraint system for correct operation. Refer to: Seatbelt Systems .

REMOVAL AND INSTALLATION > REAR SEATBELT RETRACTOR - CONVERTIBLE > REMOVAL

NOTE: LH shown in illustration, RH similar.



NOTE: Removal steps in this procedure may contain installation details.

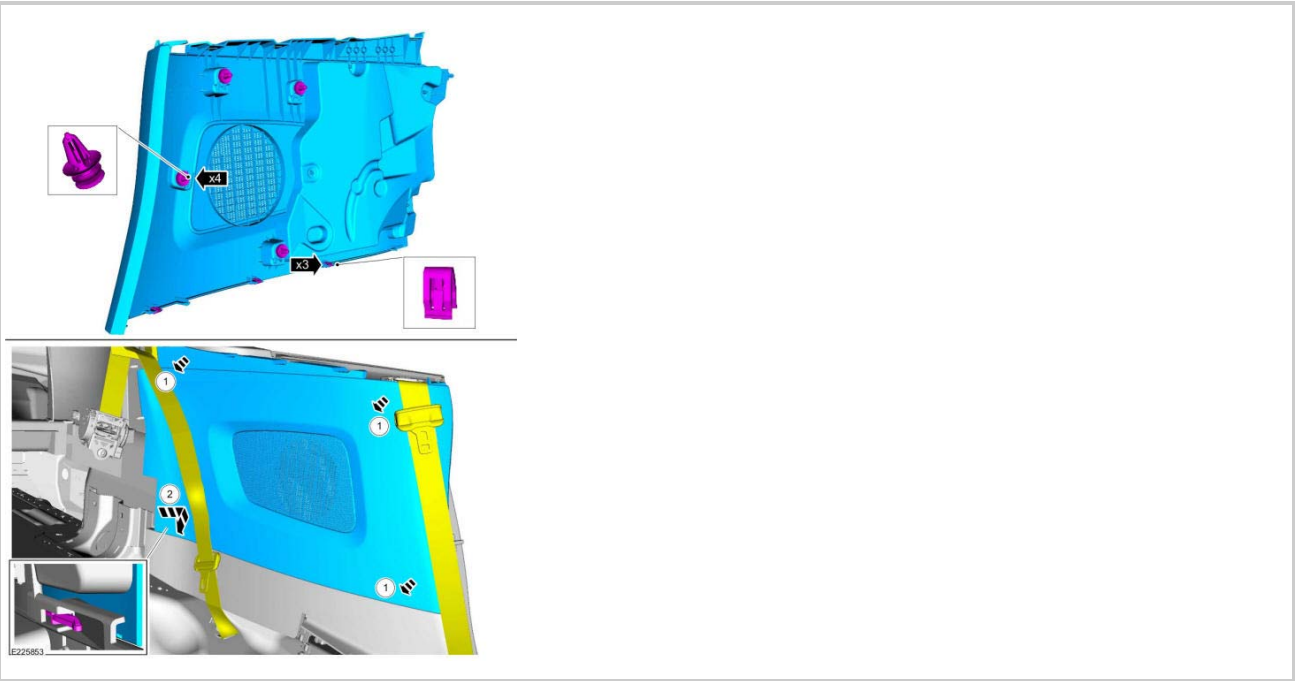
1.

Remove the rear seat backrest. Refer to: Rear Seat Backrest - Convertible .

2.

Position the seatbelt guide aside, release the clips and remove the upper loadspace trim panel.

3.



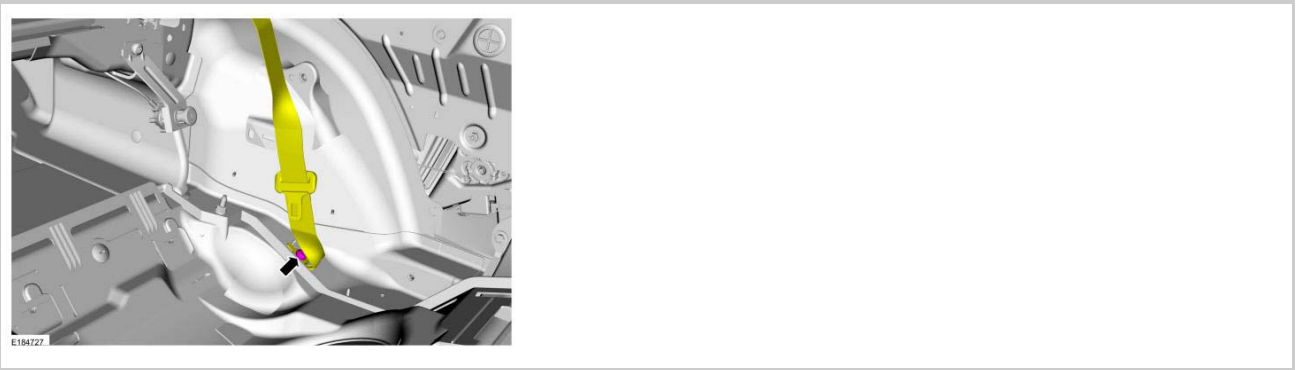
Remove the middle loadspace trim panel.

1.

Release the clips.

2.

Pull forward and outward to release the rear tab, position the front and rear safety belts aside and remove the middle loadspace trim panel.



4.

Remove the retainer and position the seatbelt aside.

Torque

: 30 lb.ft (40 Nm)

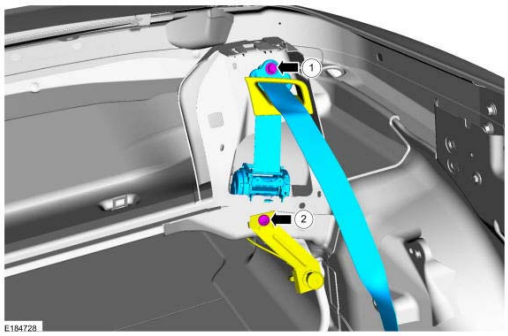
5.

Remove the seatbelt retractor.

1.

Remove the D-ring bolt.

Torque



: 30 lb.ft (40 Nm)

2.

Remove the seatbelt retractor bolt, position the luggage compartment lid lock cylinder bracket aside (LH side only), and remove the seatbelt retractor.

Torque

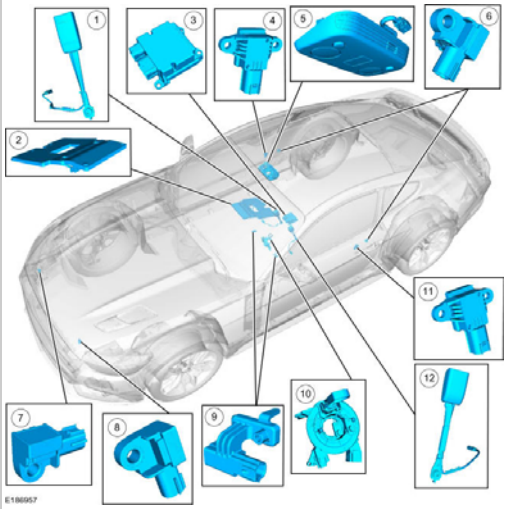
: 30 lb.ft (40 Nm)

REMOVAL AND INSTALLATION > REAR SEATBELT RETRACTOR - CONVERTIBLE > INSTALLATION

NOTE: During installation, make sure the seatbelt webbing is not twisted and the seatbelts and buckles are accessible to the occupants.

1.
To install, reverse the removal procedure.

2.



Check the seatbelt system for correct operation. Refer to: Seatbelt Systems .

10	Deployable steering column
11	Driver knee airbag
12	Passenger knee airbag
13	Passenger airbag

DESCRIPTION AND OPERATION > AIRBAG AND SEATBELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - OVERVIEW > OVERVIEW

The RCM continually receives and monitors inputs from the OCSM and various other hard-wired switches and sensors. If the RCM detects a sudden vehicle deceleration and/or lateral deceleration based on the information received from the various sensors, and determines that deployment is necessary, the RCM applies voltage and current to deploy the appropriate SRS components.

The SRS utilizes Connector Position Assurance (CPA) tabs on deployable component connectors. The tabs disengage the shorting bars of the deployable component from its electrical pins and keep the harness connector securely attached to the deployable component.

If the connector is attached to the deployable component yet the tab is not fully seated, the pins of the

connector still make contact with the deployable component pins. However, because the tab is not fully seated and the shorting bars are still applied to the deployable component pins, the RCM detects a fault (circuit resistance below threshold) during self-diagnostics when the vehicle is powered on (airbag warning indicator is illuminated).

DESCRIPTION AND OPERATION > AIRBAG AND SEATBELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION

System Operation

DESCRIPTION AND OPERATION > AIRBAG AND SEATBELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART - SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

Module Network Input Messages - RCM

Broadcast Message	Originating Module	Message Purpose
eCall confirmation	APIM	Used for SYNC® 911 Assist™ operation. Indicates whether eCall notification is in progress after an airbag deployment.
Ignition status	BCM	Used to qualify certain faults during RCM self-diagnostics.
Airbag warning indicator status	IPC	Confirms airbag warning indicator status to the RCM.
OCS vehicle calibration data	OCSM	Shares application-specific data for comparison purposes to make sure the correct OCSM and RCM are installed.
OCS fault status	OCSM	Indicates an OCS fault, if present.
OCS sensor data	OCSM	OCS sensor readings.
OCS serial number	OCSM	OCSM serial number.
Vehicle configuration data	BCM	Used for verifying vehicle configuration data.

DESCRIPTION AND OPERATION > AIRBAG AND SEATBELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > NETWORK MESSAGE CHART - OCCUPANT

CLASSIFICATION SYSTEM (OCS)

Module Network Input Messages

Broadcast Message	Originating Module	Message Purpose
Front passenger safety belt buckle status	RCM	Used for determining passenger airbag disable status.
RCM serial number	RCM	RCM serial number.

DESCRIPTION AND OPERATION > AIRBAG AND SEATBELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - SYSTEM OPERATION AND COMPONENT DESCRIPTION > SUPPLEMENTAL RESTRAINT SYSTEM

The SRS is controlled by the RCM, which continually monitors various inputs. When these inputs indicate a frontal or side crash, the RCM may deploy some components, based upon the severity of the crash and the sensor inputs.

Although some deployable devices may not have activated for all occupants during a crash, it does not mean that something is wrong with the SRS.

The RCM performs a self-test of the complete SRS during each startup. In addition to the self-test at start up, the RCM continuously monitors all of the SRS components and circuitry for correct operation.

Airbag Warning Indicator

The airbag warning indicator:

- proves out by lighting for 6 seconds and then turning off.
- flashes and/or illuminates based on the message the IPC receives from the RCM.
- illuminates if the IPC does not receive a message from the RCM.

When the ignition is turned ON during normal operation, the IPC illuminates the airbag warning indicator continuously for 6 seconds. If the SRS is free of faults, the airbag warning indicator turns off and remains off. If a SRS fault exists, the airbag warning indicator illuminates and remains illuminated for the rest of the ignition cycle. The RCM communicates with the IPC via the HS-CAN. The IPC illuminates the airbag warning indicator based on messaging from the RCM. The IPC also illuminates the airbag warning indicator if there is no communication between the RCM and IPC.

Event Notification Signal

The event notification feature provides other vehicle subsystems with information pertaining to SRS deployment or fuel cutoff status. When an impact occurs which exceeds a pre-determined threshold, the RCM sends a signal on a dedicated circuit to the BCM.

When the BCM receives the crash signal input, it initiates fuel cutoff to disable the fuel system.

After the fuel system is disabled, the vehicle can be re-started after carrying out the following steps:

a. Turn the ignition ON and wait 10 seconds.

b. Turn the ignition OFF.

c. Turn the ignition ON.

d. Turn the ignition OFF.

e. Turn the ignition ON.

Occupant Classification System (OCS)

The OCS classifies the size of the front passenger seat occupant and provides this information to the RCM.

Pressure is applied to the OCS bladder when weight of any occupant or object in the front passenger seat is present. The pressure is then transferred through a tube and sensed by the OCS pressure sensor within the OCSM. The OCSM sends information concerning the weight of any occupant or object on the front passenger seat to the RCM via the HS-CAN. The RCM uses this information when determining if the passenger airbag or side airbag needs to be deployed in the event of a crash.

The OCS is also used for operation of the passenger Belt-Minder®. For information about Belt-Minder®, Refer to: Seatbelt Systems - System Operation and Component Description .

To deactivate or reactivate the passenger Belt-Minder® feature, Refer to: Seatbelt Minder Deactivating/Activating .

Passenger Airbag Deactivation (PAD) Indicator

The RCM controls the PAD indicator through a direct, hard-wired connection, based on information provided by the OCS. The PAD indicator illuminates to indicate the passenger airbag is disabled. An exception to this is when the front passenger seat is determined to be empty and indication of a deactivated passenger airbag is not necessary. In all other cases, the PAD indicator is off when the passenger airbag is enabled.

The RCM briefly activates the PAD indicator to prove out the indicator function and verify proper functional operation of the PAD indicator to the front occupants.

The following table indicates the passenger airbag and PAD indicator status based on the size of the front passenger occupant.

Occupant Size	Passenger Safety Belt Buckle Status	Passenger Airbag Status	PAD Indicator Status
Empty	Unbuckled	Disabled	Unlit
Empty	Buckled	Disabled	Lit
Small	Buckled or Unbuckled	Disabled	Lit
Large	Buckled or Unbuckled	Enabled	Unlit

Airbag Second Stage Deployment Check

The driver and passenger front airbags each have 2 deployment stages. After an airbag deployment, it is possible that stage 1 has deployed and stage 2 has not. If a front airbag has deployed, the front airbag must be remotely deployed using the appropriate airbag disposal procedure to make sure both stages have been deployed. For information on driver airbag and/or passenger airbag remote deployment, Refer to: Pyrotechnic Device Disposal .

SOS Post-Crash Alert System™

The SOS Post-Crash Alert System™ is controlled by the BCM, but initiated by the RCM.

When a deployment or fuel cutoff event occurs, the RCM sends a message on the HS-CAN2 (via the GWM)

to the BCM. The BCM flashes the turn signal lamps and sounds the horn (except when 911 Assist™ is active) until it is turned off. The system can be turned off 10 seconds after a crash event by pressing the hazard switch. The BCM also unlocks the doors and illuminates the courtesy lamps after a crash event.

Vehicle Spin-out Detection

When internal RCM sensors detect that the vehicle has spun out, the ABS module receives this data on a dedicated HS-CAN and sends a message to the BCM on the HS-CAN2 (via the GWM). The BCM then activates the hazard warning flashers and displays a message in the IPC to indicate the hazard warning flashers are activated due to the spin-out.

Component Description

Front Impact Severity Sensor

The front impact severity sensors measure acceleration (g-rate) and are hardwired to the RCM. Mounting position and orientation is critical for correct operation of the front impact severity sensors.

Occupant Classification System (OCS)

The OCS is found only on the front passenger seat. The OCS classifies the size of the front passenger seat occupant.

The OCS is comprised of a silicone gel-filled bladder mounted between the seat cushion foam and pan, an OCSM which is mounted to the seat frame, and a pressure sensor that is internal to the OCSM. Pressure is applied to the OCS bladder when weight of any occupant or object in the front passenger seat is present. The pressure is then transferred through a tube and sensed by the OCS pressure sensor and OCSM. The components of an OCS bladder system (bladder, tube, and OCSM with integrated pressure sensor) are serviced as an assembly, and the OCS bladder system is serviced as a kit with the seat cushion and seat heater mat (if applicable).

The Belt Tension Sensor (BTS) is a Hall-effect sensor that modifies a reference voltage supplied by the OCSM. As the amount of tension applied to the belt varies, so does the voltage that returns to the OCSM. The Belt Tension Sensor (BTS) is part of the front passenger safety belt anchor and can only be serviced with the front passenger safety belt retractor and pretensioner.

Safety Belt Buckle Sensor

The safety belt buckles contain integrated sensors that are Hall-effect switches. The safety belt buckle sensors are serviced with the safety belt buckle.

Safety Belt Tension Sensor (BTS)

The safety Belt Tension Sensor (BTS) is a 3-wire Hall-effect sensor that is part of the front passenger safety belt buckle and cannot be serviced separately from the front passenger safety belt buckle assembly.

Seat Position Sensor

The seat position sensor is a Hall-effect sensor which indicates the position of the seat along the seat track. The sensor detects the presence of a shunt bracket on the track, indicating the seat has moved past a certain point in the adjustment range.

Side Impact Sensor - Front Door

The front door side impact sensors monitor air pressure within the door in order to detect certain crashes, such as a side impact. Mounting position and orientation is critical for correct operation of the front door side impact sensors.

Side Impact Sensor - Second Row (coupe only)

The second row side impact sensors measure acceleration (g-rate), and are hardwired to the RCM. Mounting position and orientation is critical for correct operation of the second row side impact sensors.

Deployable Steering Column

The deployable steering column includes a device that, once deployed, reduces the amount of force necessary to collapse the steering column during a crash event. The deployable device is activated by the RCM, depending on the driver seat position and the force of the crash. After deployment, a new steering column must be installed.

Driver Airbag

The driver airbag is a dual-stage airbag. Upon receiving a flow of current, it deploys at 1 of 2 different rates, depending upon vehicle impact severity and sensor input.

Driver Knee Airbag

The driver knee airbag is part of the steering column opening trim panel and deploys upon receiving current flow from the RCM.

Passenger Airbag

The passenger airbag is a dual-stage airbag which deploys at 1 of 2 different rates depending upon vehicle impact severity and sensor input.

Passenger Airbag Canister Vent

The passenger airbag canister vent is a deployable device that is part of the passenger airbag. Canister venting controls the inflation rate of the passenger airbag and the escape rate of gases from the airbag. The canister vent cannot be serviced separately from the passenger airbag.

Passenger Airbag Deactivation (PAD) Indicator

The PAD indicator is a LED which is hard-wired to the RCM. The PAD indicator is part of the overhead console and cannot be serviced separately.

Passenger Knee Airbag

The passenger knee airbag is part of the glovebox door and deploys upon receiving current flow from the RCM. The passenger knee airbag is only serviced with the glovebox.

Safety Belt Anchor and Pretensioner

The safety belt anchor pretensioner is a pyrotechnic device that removes excess of webbing slack from the safety belts when deployed. One is included as part of each front row outboard safety belt assembly and cannot be serviced separately.

To diagnose any pretensioner Diagnostic Trouble Codes (DTCs), Refer to: Airbag Supplemental Restraint System (SRS) .

Safety Belt Retractor and Pretensioner

The safety belt retractor and pretensioner is a pyrotechnic device that removes excess of webbing slack from the safety belts when deployed. The retractor and pretensioner are serviced together with the front row outboard safety belt assembly.

To diagnose any pretensioner Diagnostic Trouble Codes (DTCs), Refer to: Airbag Supplemental Restraint

System (SRS) .

For any concerns regarding safety belt retractor function, Refer to: Seatbelt Systems .

Side Air Curtain (coupe only)

The side air curtain is a single-stage airbag which is designed to protect the vehicle occupant(s) during certain side impact crashes.

Side Airbag

The side airbag is a single-stage airbag which is designed to provide protection for the seat occupant's torso. It deploys upon receipt of current flow during certain side impact crashes and is attached to the outboard side of each front seat. It is used in conjunction with the side air curtain or upper side airbag, depending on body style.

Upper Side Airbag (convertible only)

The upper side airbag is a single-stage airbag which is designed to provide protection for the seat occupant's head. It deploys upon receipt of current flow during certain side impact crashes and is attached to the outboard side of each front seat.

Clockspring

The clockspring allows for continuous electrical connections between the driver airbag and the RCM. A spiral-wound cable wraps around the center of the clockspring and as the steering wheel is turned, the spiral cable inside expands or contracts in diameter as the 2 halves of the clockspring turn.

Restraints Control Module (RCM)

NOTE: This vehicle may be equipped with SYNC®, which contains the 911 Assist™ option. Refer to the Owner's Literature for information about this feature.

The RCM monitors various sensor inputs and uses that data for controlling SRS outputs such as event notification function and airbag deployment.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the airbags in the event the ignition circuit is lost or damaged during impact. The backup power supply depletes its stored energy approximately one minute after power and/or ground has been removed from the RCM.

The RCM requires PMI when being replaced. Refer to the diagnostic scan tool instructions to carry out PMI.

DIAGNOSIS AND TESTING > AIRBAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) > DTC CHART: RESTRAINT CONTROL MODULE (RCM)

Diagnostics in this service information assume a certain skill level and knowledge of Ford-specific diagnostic practices. REFER to: Diagnostic Methods .

NOTE: Unlisted Diagnostic Trouble Codes (DTCs) are often retrieved as a result of incorrect repair procedures. Before attempting any repairs for unlisted Diagnostic Trouble Codes (DTCs), check the vehicle service history for recent repairs. For RCM Diagnostic Trouble Codes (DTCs) not listed in this chart,

- Repair all other RCM Diagnostic Trouble Codes (DTCs) before attempting to repair any Diagnostic Trouble Codes (DTCs) not listed in this chart.
- If no other RCM Diagnostic Trouble Codes (DTCs) are retrieved, CLEAR the RCM Diagnostic Trouble Codes (DTCs) and REPEAT the self-test. If the RCM Diagnostic Trouble Codes (DTCs) return, VERIFY that the RCM is the correct part number for the vehicle application, and INSTALL As-Built data following scan tool instructions under Module Programming > As-Built.

RCM DTC Chart

DTC	Description	Action

Symptom Chart

Condition	Possible Sources	Actions
A module does not respond to the diagnostic scan tool	Fuse Diagnostic scan tool DLC Wiring, terminals or connectors Module	REFER to: MODULE COMMUNICATIONS NETWORK .
An audible tone sounds within 60 seconds of ignition ON	SRS fault or airbag warning indicator fault	CARRY OUT the RCM and IPC self-tests. For RCM Diagnostic Trouble Codes (DTCs). REFER to DTC Chart: Restraint Control Module (RCM) . For IPC Diagnostic Trouble Codes (DTCs). REFER to: Instrumentation, Message Center and Warning Chimes .
The airbag indicator is flashing	SRS fault	CARRY OUT the RCM and OCSM self tests. REFER to DTC Chart: Restraint Control Module (RCM) or REFER to DTC Chart: Occupant Classification System Module (OCSM) .
The airbag warning indicator is illuminated continuously	Fuse Wiring, terminals or connectors IPC RCM or OCSM	CARRY OUT the RCM and OCSM self tests. REFER to DTC Chart: Restraint Control Module (RCM) or REFER to DTC Chart: Occupant Classification System Module (OCSM) . If no Diagnostic Trouble Codes (DTCs) were retrieved from the RCM or OCSM. REFER to: Instrumentation, Message Center and Warning Chimes .

		If the OCSM or RCM does not respond to the diagnostic scan tool. REFER to: MODULE COMMUNICATIONS NETWORK .

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: A > B0001:11, B0001:12, B0001:13 AND B0001:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver airbag stage 1 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver airbag

If a fault is detected, the RCM stores DTC B0001:11, B0001:12, B0001:13 or B0001:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Clockspring
- Driver airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0001:11	Driver Frontal Stage 1 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver airbag stage 1 circuit for more than 6 seconds.
B0001:12	Driver Frontal Stage 1 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver airbag stage 1 circuit for more than 6 seconds.
B0001:13	Driver Frontal Stage 1 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance range between driver airbag stage 1 circuits for more than 6 seconds.
B0001:1A	Driver Frontal Stage 1 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between driver airbag stage 1 circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Clockspring
- Driver airbag
- RCM

PINPOINT TEST A : B0001:11, B0001:12, B0001:13 AND B0001:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect

diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog or equivalent to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0001:11, B0001:12, B0001:13 or B0001:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver airbag Diagnostic Trouble Codes (DTCs). For DTC B0001:13 or B0001:1A, GO to A2. For DTC B0001:11, GO to A12. For DTC B0001:12, GO to A15.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only.If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0001:13 or B0001:1A, GO to A20. For DTC B0001:11, GO to A21. For DTC B0001:12, GO to A22.

A2 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_00_R PID.

Does the PID value read between 1.62 and 4.46 ohms?

Yes	GO to A19

No	GO to A3

A3 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

Remove the steering column shrouds to access the clockspring connectors. REFER to: Steering Column Shrouds .

While monitoring the DEPLOY_00_R PID, carry out the harness test of the driver airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.62 and 4.46 ohms while carrying out the harness test?

Yes	DEPOWER the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to: Clockspring . Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	For PID value less than 1.62 ohms, GO to A4. For PID value greater than 4.46 ohms, GO to A8.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0001:1A to B0001:13?

Yes	GO to A17

No	GO to A5

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Clockspring C218A .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0001:1A to B0001:13?

Yes	GO to A18

No	GO to A6

A6 CHECK FOR A SHORT BETWEEN DRIVER AIRBAG STAGE 1 CIRCUITS

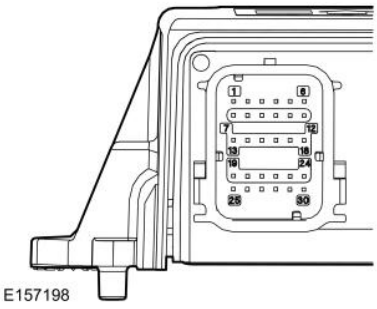
Ignition OFF.

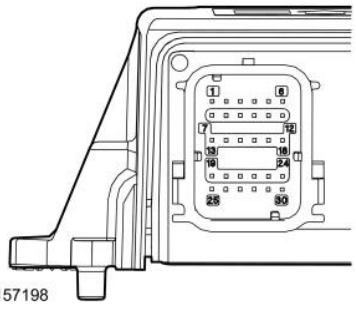
Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-11	Ω	C218A-12

Is the resistance greater than 10, 000 ohms?

Yes	GO to A19





No	GO to A7

A7 CHECK THE RCM (RESTRAINTS CONTROL MODULE) FOR LOW RESISTANCE

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
 E157198 C310A, pin 29, component side	Ω	 E157198 C310A, pin 30, component side

Is the resistance greater than 10, 000 ohms?

Yes	REPAIR the driver airbag stage 1 circuit(s) for a short together. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	GO to A19

A8 CHECK THE DRIVER AIRBAG STAGE 1 CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-29	Ω	C216A-1
C310A-30	Ω	C216A-2

Are the resistances less than 1 ohm?

Yes	GO to A10

No	GO to A9

A9 CHECK THE DRIVER AIRBAG STAGE 1 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)

Disconnect Clockspring C218A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-29	Ω	C218A-12
C310A-30	Ω	C218A-11

Are the resistances less than 0.5 ohm?

Yes	GO to A18

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A10 CHECK THE DRIVER AIRBAG STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C216A-1		C216A-2

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 shows an open circuit fault because the driver airbag is disconnected.

Was DTC B0001:1A retrieved on-demand during self-test?

Yes	REMOVE the fused jumper wire and GO to A17

No	REMOVE the fused jumper wire and GO to A11

A11 CHECK THE DRIVER AIRBAG STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Clockspring C218A .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C218A-11		C218A-12

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 shows an open circuit fault because the clockspring is disconnected.

Was DTC B0001:1A retrieved on-demand during self-test?

Yes	REMOVE the fused jumper wire and GO to A18

No	REMOVE the fused jumper wire and GO to A19

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A12 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0001:11 to B0001:13?

Yes	GO to A17

No	GO to A13

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A13 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Disconnect Clockspring C218A .

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0001:11 to B0001:13?

Yes	GO to A18

No	GO to A14

A14 CHECK THE DRIVER AIRBAG STAGE 1 CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-11	Ω	Ground
C218A-12	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A19

No	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A15 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO BATTERY INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect Clockspring C218A .

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0001:12 to B0001:13?

Yes	GO to A18

No	GO to A16

A16 CHECK THE DRIVER AIRBAG STAGE 1 CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering).

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-11		Ground
C218A-12		Ground

Is any voltage present?

Yes	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	GO to A19

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A17 CONFIRM THE DRIVER AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

inspect Driver Airbag C216A and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Install the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver airbag. REFER to: Driver Airbag . GO to A24.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0001:13 or B0001:1A, GO to A20. For DTC B0001:11, GO to A21. For DTC B0001:12, GO to A22.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A18 CONFIRM THE CLOCKSPRING FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Clockspring C218A .

Install the driver airbag. REFER to: Driver Airbag .

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new clockspring. REFER to: Clockspring . GO to A24.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0001:13 or B0001:1A, GO to A20. For DTC B0001:11, GO to A21. For DTC B0001:12, GO to A22.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will

be recorded.

A19 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Install the driver airbag (if previously removed. REFER to: Driver Airbag .

Connect Clockspring C218A (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A24.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0001:13 or B0001:1A, GO to A20. For DTC B0001:11, GO to A21. For DTC B0001:12, GO to A22.

A20 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_00_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Ignition OFF.

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Ignition ON.

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_00_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.62 and 4.46 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A23.

No	If the driver airbag PID indicates incorrect resistance only when the steering wheel is rotated, INSTALL a new clockspring. REFER to: Clockspring . For all other faults, DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

A21 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Ignition OFF.

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0001:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A23.

A22 CHECK THE DRIVER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint

System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0001:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A23.

A23 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Airbag C216A Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A24.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A24.

A24 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: B > B0002:11, B0002:12, B0002:13 AND B0002:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver airbag stage 2 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver airbag

If a fault is detected, the RCM stores DTC B0002:11, B0002:12, B0002:13 or B0002:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Clockspring
- Driver airbag
- Connections
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0002:11	Driver Frontal Stage 2 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver airbag stage 2 circuit for more than 6 seconds.
B0002:12	Driver Frontal Stage 2 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver airbag stage 2 circuit for more than 6 seconds.
B0002:13	Driver Frontal Stage 2 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance range between driver airbag stage 2 circuits for more than 6 seconds.
B0002:1A	Driver Frontal Stage 2 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between driver airbag stage 2 circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Clockspring
- Driver airbag
- RCM

PINPOINT TEST A : B0002:11, B0002:12, B0002:13 AND B0002:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from

these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0002:11, B0002:12, B0002:13 or B0002:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver airbag Diagnostic Trouble Codes (DTCs). For DTC B0002:13 or B0002:1A, GO to A2. For DTC B0002:11, GO to A11. For DTC B0002:12, GO to A14.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0002:13 or B0002:1A, GO to A19. For DTC B0002:11, GO to A20. For DTC B0002:12, GO to A21.

A2 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_01_R PID.

Does the PID value read between 1.62 and 4.46 ohms?

Yes	GO to A18

No	GO to A3

A3 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

While monitoring the DEPLOY_01_R PID, carry out the harness test of the driver airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.62 and 4.46 ohms while carrying out the harness test?

Yes	DEPOWER the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to: Clockspring . Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

No	For PID value less than 1.62 ohms, GO to A4. For PID value greater than 4.46 ohms, GO to A7.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0002:1A to B0002:13?

Yes	GO to A16

No	GO to A5

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Clockspring C218A .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag / clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0002:1A to B0002:13?

Yes	GO to A17

No	GO to A6

A6 CHECK FOR A SHORT BETWEEN DRIVER AIRBAG STAGE 2 CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-9	Ω	C218A-10

Is the resistance greater than 10, 000 ohms?

Yes	GO to A18

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

A7 CHECK THE DRIVER AIRBAG STAGE 2 CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-22	Ω	C216B-1
C310A-21	Ω	C216B-2

Are the resistances less than 1 ohm?

Yes	GO to A9

No	GO to A8

A8 CHECK THE DRIVER AIRBAG STAGE 2 CIRCUITS FOR AN OPEN (CLOCKSPRING DISCONNECTED)

Disconnect Clockspring C218A .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-22	Ω	C218A-9
C310A-21	Ω	C218A-10

Are the resistances less than 0.5 ohm?

Yes	GO to A17

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A9 CHECK THE DRIVER AIRBAG STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C216B-1		C216B-2

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag stage 2 circuits shorted together, a low resistance fault is normally retrieved on stage 2. Stage 1 shows an open circuit fault because the driver airbag is disconnected.

Was DTC B0002:1A retrieved on-demand during self-test?

Yes	REMOVE the fused jumper wire and GO to A16

No	REMOVE the fused jumper wire and GO to A10

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A10 CHECK THE DRIVER AIRBAG STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Clockspring C218A .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C218A-9		C218A-10

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag stage 2 circuits shorted together, a low resistance fault is normally retrieved on stage 2. Stage 1 shows an open circuit fault because the driver airbag is disconnected.

Was DTC B0002:1A retrieved on-demand during self-test?

Yes	REMOVE the fused jumper wire and GO to A17

No	REMOVE the fused jumper wire and GO to A18

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A11 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver airbag disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0002:11 to B0002:13?

Yes	GO to A16

No	GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A12 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Disconnect Clockspring C218A .

Remove the steering column shrouds to access the clockspring connectors. REFER to: Steering Column Shrouds .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0002:11 to B0002:13?

Yes	GO to A17

No	GO to A13

A13 CHECK THE DRIVER AIRBAG STAGE 2 CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-9	Ω	Ground
C218A-10	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A18

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A14 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO BATTERY INDICATED) (CLOCKSPRING DISCONNECTED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Disconnect Clockspring C218A .

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the clockspring disconnected, open circuit faults are normally retrieved on stages 1 and 2.

Did the on-demand DTC change from B0002:12 to B0002:13?

Yes	GO to A17

No	GO to A15

A15 CHECK THE DRIVER AIRBAG STAGE 2 CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C218A-9		Ground

C218A-10		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

No	GO to A18

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A16 CONFIRM THE DRIVER AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

inspect Driver Airbag C216B and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Clockspring C218A (if previously disconnected).

Install the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver airbag. REFER to: Driver Airbag . GO to A23.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0002:13 or B0002:1A, GO to A19. For DTC B0002:11,

	GO to A20. For DTC B0002:12, GO to A21.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A17 CONFIRM THE CLOCKSPRING FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Clockspring C218A .

Connect RCM C310A and C310B .

Install the driver airbag. REFER to: Driver Airbag .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new clockspring. REFER to: Clockspring . GO to A23.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0002:13 or B0002:1A, GO to A19. For DTC B0002:11, GO to A20. For DTC B0002:12, GO to A21.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A18 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Install the driver airbag (if previously removed. REFER to: Driver Airbag .

Connect Clockspring C218A (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A23.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0002:13 or B0002:1A, GO to A19. For DTC B0002:11, GO to A20. For DTC B0002:12, GO to A21.

A19 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_01_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Ignition OFF.

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Ignition ON.

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_01_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering

wheel frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.62 and 4.46 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A22.

No	If the driver airbag PID indicates incorrect resistance only when the steering wheel is rotated, INSTALL a new clockspring. REFER to: Clockspring . For all other faults, DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

A20 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Ignition OFF.

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0002:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A22.

A21 CHECK THE DRIVER FRONTAL STAGE 2 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Remove the steering column shrouds to access the clockspring connector. REFER to: Steering Column Shrouds .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0002:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A22.

A22 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver airbag. REFER to: Driver Airbag .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C216B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Airbag C216B Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A23.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A23.

A23 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: C

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver knee airbag circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver knee airbag

If a fault is detected, the RCM stores DTC B0004:11, B0004:12, B0004:13 or B0004:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver knee airbag

- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0004:11	Driver Knee Bolster Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver knee airbag circuit for more than 6 seconds.
B0004:12	Driver Knee Bolster Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver knee airbag circuit for more than 6 seconds.
B0004:13	Driver Knee Bolster Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the driver knee airbag circuits for more than 6 seconds.
B0004:1A	Driver Knee Bolster Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the driver knee airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver knee airbag
- RCM

PINPOINT TEST A : B0004:11, B0004:12, B0004:13 AND B0004:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0004:11, B0004:12, B0004:13 and B0004:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver knee airbag Diagnostic Trouble Codes (DTCs). For DTC B0004:13 or B0004:1A, GO to A2. For DTC B0004:11, GO to A8. For DTC B0004:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver knee airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0004:13 or B0004:1A, GO to A13. For DTC B0004:11, GO to A14. For DTC B0004:12, GO to A15.

A2 CHECK THE DRIVER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_02_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_02_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE DRIVER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_02_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_02_R PID, carry out the harness test of the driver knee airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver knee airbag

disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0004:1A to B0004:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE DRIVER KNEE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2432-3	Ω	C2432-4

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE DRIVER KNEE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-7	Ω	C2432-3
C310A-8	Ω	C2432-4

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and

	connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C2432-3		C2432-4

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver knee airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B0004:13 to B0004:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DRIVER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver knee airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0004:11 to B0004:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DRIVER KNEE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2432-3	Ω	Ground
C2432-4	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DRIVER KNEE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2432-3		Ground
C2432-4		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DRIVER KNEE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Knee Airbag C2432 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Install the driver knee airbag. REFER to: Driver Knee Airbag .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver knee airbag. REFER to: Driver Knee Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0004:13 or B0004:1A, GO to A13. For DTC B0004:11, GO to A14. For DTC B0004:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Install the driver knee airbag (if previously removed. REFER to: Driver Knee Airbag .

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0004:13 or B0004:1A, GO to A13. For DTC B0004:11, GO to A14. For DTC B0004:12, GO to A15.

A13 CHECK THE DRIVER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_02_R) PID

(PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_02_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE DRIVER KNEE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0004:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DRIVER KNEE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0004:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the driver knee airbag. REFER to: Driver Knee Airbag .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Knee Airbag C2432 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

Install the driver knee airbag. REFER to: Driver Knee Airbag .

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: D > B0005:11, B0005:12, B0005:13, B0005:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the deployable steering column circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted deployable steering column

If a fault is detected, the RCM stores DTC B0005:11, B0005:12, B0005:13 or B0005:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring

- Connections
- Deployable steering column
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0005:11	Collapsible Steering Column Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either deployable steering column circuit for more than 6 seconds.
B0005:12	Collapsible Steering Column Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either deployable steering column circuit for more than 6 seconds.
B0005:13	Collapsible Steering Column Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the deployable steering column circuits for more than 6 seconds.
B0005:1A	Collapsible Steering Column Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the deployable steering column circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Deployable steering column
- RCM

PINPOINT TEST A : B0005:11, B0005:12, B0005:13 AND B0005:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use

the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0005:11, B0005:12, B0005:13 and B0005:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the deployable steering column Diagnostic Trouble Codes (DTCs). For DTC B0005:13 or B0005:1A, GO to A2. For DTC B0005:11, GO to A8. For DTC B0005:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the deployable steering

	column Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0005:13 or B0005:1A, GO to A13. For DTC B0005:11, GO to A14. For DTC B0005:12, GO to A15.

A2 CHECK THE COLLAPSIBLE STEERING COLUMN DEPLOYMENT CONTROL (DEPLOY_04_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_04_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE COLLAPSIBLE STEERING COLUMN DEPLOYMENT CONTROL (DEPLOY_04_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_04_R PID, carry out the harness test of the deployable steering column circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DEPLOYABLE STEERING COLUMN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the deployable steering column disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0005:1A to B0005:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE DEPLOYABLE STEERING COLUMN CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2360-1	Ω	C2360-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A6 CHECK THE DEPLOYABLE STEERING COLUMN CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-11	Ω	C2360-1
C310A-12	Ω	C2360-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DEPLOYABLE STEERING COLUMN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C2360-1		C2360-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the deployable steering column circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B0005:13 to B0005:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DEPLOYABLE STEERING COLUMN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the deployable steering column disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0005:11 to B0005:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DEPLOYABLE STEERING COLUMN CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2360-1	Ω	Ground
C2360-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DEPLOYABLE STEERING COLUMN CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS)

Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2360-1		Ground
C2360-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DEPLOYABLE STEERING COLUMN FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Deployable Steering Column C2360 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Deployable Steering Column C2360 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new steering column (includes deployable device. REFER to: Steering Column . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0005:13 or B0005:1A, GO to A13. For DTC B0005:11, GO to A14. For DTC B0005:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Deployable Steering Column C2360 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not

	install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0005:13 or B0005:1A, GO to A13. For DTC B0005:11, GO to A14. For DTC B0005:12, GO to A15.

A13 CHECK THE COLLAPSIBLE STEERING COLUMN DEPLOYMENT CONTROL (DEPLOY_04_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_04_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE DEPLOYABLE STEERING COLUMN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0005:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DEPLOYABLE STEERING COLUMN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0005:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Deployable Steering Column C2360 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Deployable Steering Column C2360 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: E > B0010:11, B0010:12, B0010:13 AND B0010:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger airbag stage 1 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger airbag

If a fault is detected, the RCM stores DTC B0010:11, B0010:12, B0010:13 or B0010:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in

resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0010:11	Passenger Frontal Stage 1 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger airbag stage 1 circuit for more than 6 seconds.
B0010:12	Passenger Frontal Stage 1 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger airbag stage 1 circuit for more than 6 seconds.
B0010:13	Passenger Frontal Stage 1 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance range between the passenger airbag stage 1 circuits for more than 6 seconds.
B0010:1A	Passenger Frontal Stage 1 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance range between the passenger airbag stage 1 circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger airbag
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B0010:11, B0010:12, B0010:13 AND B0010:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0010:11, B0010:12, B0010:13 or B0010:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag

	Diagnostic Trouble Codes (DTCs). For DTC B0010:13 or B0010:1A, GO to A2. For DTC B0010:11, GO to A9. For DTC B0010:12, GO to A11.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0010:13 or B0010:1A, GO to A14. For DTC B0010:11, GO to A15. For DTC B0010:12, GO to A16.

A2 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_05_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A13

No	GO to A3

A3 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

Remove the glove compartment. REFER to: Glove Compartment .

While monitoring the DEPLOY_05_R PID, carry out the harness test of the passenger airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A7.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag disconnected, open circuit faults are normally retrieved on passenger airbag stages 1 and 2, and for the passenger airbag canister vent.

Did the on-demand DTC change from B0010:1A to B0010:13?

Yes	GO to A12

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN PASSENGER AIRBAG STAGE 1 CIRCUITS

Ignition OFF.

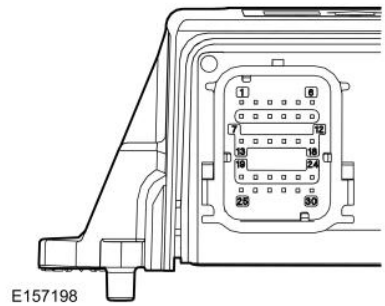
Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

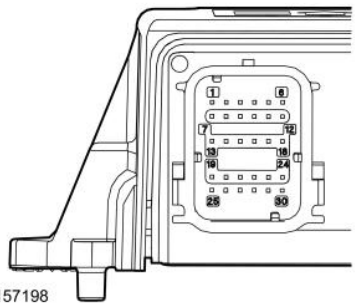
Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-1	Ω	C256-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A13





No	GO to A6

A6 CHECK THE RCM (RESTRAINTS CONTROL MODULE) FOR LOW RESISTANCE

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead

 E157198 C310A, pin 28, component side	Ω	 E157198 C310A, pin 27, component side

Is the resistance greater than 10, 000 ohms?

Yes	REPAIR the passenger airbag stage 1 circuits for a short together. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	GO to A13

A7 CHECK THE PASSENGER AIRBAG STAGE 1 CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-27	Ω	C256-2
C310A-28	Ω	C256-1

Are the resistances less than 0.5 ohm?

Yes	GO to A8

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER AIRBAG STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C256-1		C256-2

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag stage 1 circuits shorted together, a low resistance fault is normally retrieved on stage 1. Stage 2 and the passenger airbag canister vent both show an open circuit fault due to the passenger airbag being disconnected.

Did the on-demand DTC change from B0010:13 to B0010:1A?

Yes	REMOVE the fused jumper wire and GO to A12

No	REMOVE the fused jumper wire and GO to A13

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A9 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Remove the glove compartment. REFER to: Glove Compartment .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag disconnected, open circuit faults are normally retrieved on passenger airbag stages 1 and 2, and for the passenger airbag canister vent.

Did the on-demand DTC change from B0010:11 to B0010:13?

Yes	GO to A12

No	GO to A10

A10 CHECK THE PASSENGER AIRBAG STAGE 1 CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-1	Ω	Ground
C256-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A13

No	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

A11 CHECK THE PASSENGER AIRBAG STAGE 1 CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-1	V	Ground
C256-2	V	Ground

Is any voltage present?

Yes	Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	GO to A13

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE PASSENGER AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

inspect Passenger Airbag C256 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Airbag C256 (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger airbag. REFER to: Passenger Airbag . GO to A18.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0010:13 or B0010:1A, GO to A14. For DTC B0010:11, GO to A15. For DTC B0010:12, GO to A16.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will

be recorded.

A13 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Airbag C256 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A18.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0010:13 or B0010:1A, GO to A14. For DTC B0010:11, GO to A15. For DTC B0010:12, GO to A16.

A14 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL RESISTANCE (DEPLOY_05_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_05_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

No	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

A15 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0010:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A16 CHECK THE PASSENGER FRONTAL STAGE 1 DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Remove the glove compartment. REFER to: Glove Compartment .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0010:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Airbag C256 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A18.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A18.

A18 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: F > B0011:11, B0011:12, B0011:13, B0011:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger airbag stage 2 circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger airbag

If a fault is detected, the RCM stores DTC B0011:11, B0011:12, B0011:13 or B0011:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0011:11	Passenger Frontal Stage 2 Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger airbag stage 2 circuit for more than 6 seconds.
B0011:12	Passenger Frontal Stage 2 Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger airbag stage 2 circuit for more than 6 seconds.
B0011:13	Passenger Frontal Stage 2 Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger airbag stage 2 circuits for more than 6 seconds.
B0011:1A	Passenger Frontal Stage 2 Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger airbag stage 2 circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger airbag
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B0011:11, B0011:12, B0011:13 AND B0011:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0011:11, B0011:12, B0011:13 and B0011:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag Diagnostic Trouble Codes (DTCs). For DTC B0011:13 or B0011:1A, GO to A2. For DTC B0011:11, GO to A8. For DTC B0011:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0011:13 or B0011:1A, GO to A13. For DTC B0011:11, GO to A14. For DTC B0011:12, GO to A15.

A2 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL (DEPLOY_06_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_06_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL (DEPLOY_06_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

Remove the glove compartment. REFER to: Glove Compartment .

While monitoring the DEPLOY_06_R PID, carry out the harness test of the passenger airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag disconnected, an open circuit fault is normally retrieved for passenger airbag stage 2. An open circuit fault is also retrieved for passenger airbag stage 1 and the passenger airbag canister vent, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B0011:1A to B0011:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-4	Ω	C256-5

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-23	Ω	C256-4
C310A-24	Ω	C256-5

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C256-4		C256-5

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag stage 2 circuits shorted together, a low resistance fault is normally retrieved. An open circuit fault is also retrieved for passenger airbag stage 1 and the passenger airbag canister vent, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B0011:13 to B0011:1A?

Yes	REMOVE the fused jumper wire and GO to A11.

No	REMOVE the fused jumper wire and GO to A12.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS)

Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag disconnected, an open circuit fault is normally retrieved for passenger airbag stage 2. An open circuit fault is also retrieved for passenger airbag stage 1 and the passenger airbag canister vent, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B0011:11 to B0011:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-4	Ω	Ground
C256-5	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A10 CHECK THE PASSENGER AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-4		Ground
C256-5		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Airbag C256 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger airbag. REFER to: Passenger Airbag . GO to A17

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0011:13 or B0011:1A, GO to A13. For DTC B0011:11, GO to A14. For DTC B0011:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Remove the glove compartment. REFER to: Glove Compartment .

Connect Passenger Airbag C256 (if previously disconnected).

Remove the glove compartment. REFER to: Glove Compartment .

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0011:13 or B0011:1A, GO to A13. For DTC B0011:11, GO to A14. For DTC B0011:12, GO to A15.

A13 CHECK THE PASSENGER FRONTAL STAGE 2 DEPLOYMENT CONTROL (DEPLOY_06_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Remove the glove compartment. REFER to: Glove Compartment .

While monitoring the DEPLOY_06_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0011:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint

	test. GO to A16.

A15 CHECK THE PASSENGER AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Remove the glove compartment. REFER to: Glove Compartment .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0011:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Airbag C256 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: G > B0013:11, B0013:12, B0013:13, B0013:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger knee airbag circuits for the following faults:

- Resistance out of range

- Unexpected voltage
- Short to ground
- Faulted passenger knee airbag

If a fault is detected, the RCM stores DTC B0013:11, B0013:12, B0013:13 or B0013:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger knee airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0013:11	Passenger Knee Bolster Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger knee airbag circuit for more than 6 seconds.
B0013:12	Passenger Knee Bolster Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger knee airbag circuit for more than 6 seconds.
B0013:13	Passenger Knee Bolster Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger knee airbag circuits for more than 6 seconds.
B0013:1A	Passenger Knee Bolster Deployment Control: Circuit	A fault is indicated when the RCM measures less than the desired

	Resistance Below Threshold	resistance between the passenger knee airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger knee airbag
- RCM

PINPOINT TEST A : B0013:11, B0013:12, B0013:13 AND B0013:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction

may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0013:11, B0013:12, B0013:13 and B0013:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger knee airbag Diagnostic Trouble Codes (DTCs). For DTC B0013:13 or B0013:1A, GO to A2. For DTC B0013:11, GO to A8. For DTC B0013:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger knee airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0013:13 or B0013:1A, GO to A13. For DTC B0013:11, GO to A14. For DTC B0013:12, GO to A15.

A2 CHECK THE PASSENGER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_07_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_07_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE PASSENGER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_07_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_07_R PID, carry out the harness test of the passenger knee airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Lower the glove compartment.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger knee airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0013:1A to B0013:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER KNEE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2600-1	Ω	C2600-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER KNEE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Lower the glove compartment.

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-5	Ω	C2600-1
C310A-6	Ω	C2600-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C2600-1		C2600-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger knee airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B0013:13 to B0013:1A?

Yes	REMOVE the fused jumper wire and GO to A11.

No	REMOVE the fused jumper wire and GO to A12.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER KNEE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Lower the glove compartment.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger knee airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0013:11 to B0013:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER KNEE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2600-1	Ω	Ground
C2600-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER KNEE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Lower the glove compartment.

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2600-1	V	Ground
C2600-2	V	Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER KNEE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Knee Airbag C2600 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Knee Airbag C2600 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger knee airbag. REFER to: Passenger Knee Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0013:13 or B0013:1A, GO to A13. For DTC B0013:11, GO to A14. For DTC B0013:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Knee Airbag C2600 (if previously disconnected).

Lower the glove compartment.

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0013:13 or B0013:1A, GO to A13. For DTC B0013:11, GO to A14. For DTC B0013:12, GO to A15.

A13 CHECK THE PASSENGER KNEE BOLSTER DEPLOYMENT CONTROL (DEPLOY_07_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_07_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER KNEE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0013:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE PASSENGER KNEE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Lower the glove compartment.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0013:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Knee Airbag C2600 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Knee Airbag C2600 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: H > B0050:11, B0050:12, B0050:13, B0050:1D

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver safety belt buckle switch circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Current out of range
- Faulted driver safety belt buckle switch

If a fault is detected, the RCM stores DTC B0050:11, B0050:12, B0050:13 or B0050:1D in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0050:11	Driver Seatbelt Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the driver safety belt buckle switch circuit for more than 6 seconds.
B0050:12	Driver Seatbelt Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the driver safety belt buckle switch circuit for more than 6 seconds.
B0050:13	Driver Seatbelt Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either driver safety belt buckle switch circuit for more than 6 seconds.
B0050:1D	Driver Seatbelt Sensor: Circuit Current Out of Range	A fault is indicated when the RCM measures current outside of an acceptable range on the driver safety belt buckle switch circuit for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged driver safety belt buckle.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B0050:11, B0050:12, B0050:13 AND B0050:1D

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.*

> *NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.*

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

> *WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.*

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0050:11, B0050:12, B0050:13 and B0050:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver safety belt buckle switch Diagnostic Trouble Codes (DTCs). For DTC B0050:11 or B0050:1D, GO to A2. For DTC B0050:12, GO to A4. For DTC B0050:13, GO to A5.

No	If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver safety belt buckle switch Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)

Ignition OFF.

Disconnect Driver Safety Belt Buckle C3201 .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt buckle switch disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0050:11 or B0050:1D to B0050:13?

Yes	GO to A8

No	For DTC B0050:11, GO to A3. For DTC B0050:1D, GO to A9.

A3 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C3201-5	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A4 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Driver Side Airbag (Inline) C345 .

Disconnect Driver Safety Belt Buckle C3201 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3201-5	V	Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A9

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C345 .

Disconnect Driver Safety Belt Buckle C3201 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3201-5		C3201-6

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt buckle switch circuits shorted together, a short to ground fault is normally retrieved.

Did the on-demand DTC change from B0050:13 to B0050:11?

Yes	REMOVE the fused jumper wire and GO to A8

No	REMOVE the fused jumper wire and GO to A6

A6 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-54	Ω	C3201-5

Is the resistance less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A7 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3201-6	Ω	C310B-53

Is the resistance less than 3 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE DRIVER SAFETY BELT BUCKLE SWITCH FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Side Airbag (Inline) C345 (if previously disconnected).

Connect Driver Safety Belt Buckle C3201 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver safety belt buckle (includes safety belt buckle switch. REFER to: Front Seatbelt Buckle . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will

be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RCM C310A and C310B (if previously disconnected).

Connect Driver Side Airbag (Inline) C345 (if previously disconnected).

Connect Driver Safety Belt Buckle C3201 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Buckle C3201 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected component(s) / connector(s).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0050:11, B0050:12, B0050:13 and B0050:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0050:11 or B0050:1D, GO to A2. For DTC B0050:12, GO to A4. For DTC B0050:13, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: I > B0052:11, B0052:12, B0052:13, B0052:1D

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger safety belt buckle switch circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Current out of range
- Faulted passenger safety belt buckle switch

If a fault is detected, the RCM stores DTC B0052:11, B0052:12, B0052:13 or B0052:1D in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0052:11	Passenger Seatbelt Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the passenger safety belt buckle switch circuit for more than 6 seconds.
B0052:12	Passenger Seatbelt Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the passenger safety belt buckle switch circuit for more than 6 seconds.
B0052:13	Passenger Seatbelt Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either passenger safety belt buckle switch circuit for more than 6 seconds.
B0052:1D	Passenger Seatbelt Sensor: Circuit Current Out of Range	A fault is indicated when the RCM measures current outside of an acceptable range on the passenger safety belt buckle

		switch circuit for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged passenger safety belt buckle.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B0052:11, B0052:12, B0052:13 AND B0052:1D

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0052:11, B0052:12, B0052:13 and B0052:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger safety belt buckle switch Diagnostic Trouble Codes (DTCs). For DTC B0052:11 or B0052:1D, GO to A2. For DTC B0052:12, GO to A4. For DTC B0052:13, GO to A5.

No	If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger safety belt buckle switch Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)

Ignition OFF.

Disconnect Passenger Safety Belt Buckle C3238 .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt buckle switch disconnected, an open circuit fault is normally retrieved. A Belt Tension Sensor (BTS) circuit fault will also be present in the OCSM, since the passenger safety belt buckle switch shares a connector with the Belt Tension Sensor (BTS).

Did the on-demand DTC change from B0052:11 or B0052:1D to B0052:13?

Yes	GO to A8

No	For DTC B0052:11, GO to A3. For DTC B0052:1D, GO to A9.

A3 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-5	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A4 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Safety Belt Buckle C3238 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-5	V	Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A9

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Safety Belt Buckle C3238 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3238-5		C3238-6

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt buckle switch circuits shorted together, a short to ground fault is normally retrieved. A Belt Tension Sensor (BTS) circuit fault will also be present in the OCSM, since the passenger safety belt buckle switch shares a connector with the Belt Tension Sensor (BTS).

Did the on-demand DTC change from B0052:13 to B0052:11?

Yes	REMOVE the fused jumper wire and GO to A8

No	REMOVE the fused jumper wire and GO to A6

A6 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C310B-55	Ω	C3238-5

Is the resistance less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A7 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-6	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE PASSENGER SAFETY BELT BUCKLE SWITCH FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Connect Passenger Safety Belt Buckle C3238 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint

System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger safety belt buckle (includes safety belt buckle switch. REFER to: Front Seatbelt Buckle . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RCM C310A and C310B (if previously disconnected).

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Connect Passenger Safety Belt Buckle C3238 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service

	Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Buckle C3238 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected component(s) / connector(s).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0052:11, B0052:12, B0052:13 and B0052:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B0052:11 or B0052:1D, GO to A2. For DTC B0052:12, GO to A4. For DTC B0052:13, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: J > B0070:11, B0070:12, B0070:13, B0070:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver safety belt anchor pretensioner circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver safety belt anchor pretensioner

If a fault is detected, the RCM stores DTC B0070:11, B0070:12, B0070:13 or B0070:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in

resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver safety belt anchor pretensioner
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0070:11	Driver Seatbelt Pretensioner "A" Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver safety belt anchor pretensioner circuit for more than 6 seconds.
B0070:12	Driver Seatbelt Pretensioner "A" Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver safety belt anchor pretensioner circuit for more than 6 seconds.
B0070:13	Driver Seatbelt Pretensioner "A" Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the driver safety belt anchor pretensioner circuits for more than 6 seconds.
B0070:1A	Driver Seatbelt Pretensioner "A" Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the driver safety belt anchor pretensioner circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver safety belt anchor pretensioner
- RCM

PINPOINT TEST A : B0070:11, B0070:12, B0070:13 AND B0070:1A

WARNING: Incorrect repair techniques or actions can cause an accidental

Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0070:11, B0070:12, B0070:13 and B0070:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the anchor pretensioner Diagnostic Trouble Codes (DTCs). For DTC B0070:13 or B0070:1A, GO to A2. For DTC

	B0070:11, GO to A8. For DTC B0070:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the anchor pretensioner Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0070:13 or B0070:1A, GO to A13. For DTC B0070:11, GO to A14. For DTC B0070:12, GO to A15.

A2 CHECK THE DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_29_RES) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_29_RES PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_29_RES) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_29_RES PID, carry out the harness test of the driver safety belt anchor pretensioner circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt anchor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0070:1A to B0070:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE DRIVER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3065-1	Ω	C3065-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-16	Ω	C3065-1
C310B-15	Ω	C3065-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3065-1		C3065-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt anchor pretensioner circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B0070:13 to B0070:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt anchor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0070:11 to B0070:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3065-1	Ω	Ground
C3065-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3065-1		Ground
C3065-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DRIVER SAFETY BELT ANCHOR PRETENSIONER FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Safety Belt Anchor Pretensioner C3065 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Safety Belt Anchor Pretensioner C3065 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver safety belt retractor (includes anchor pretensioner. REFER to: Front Seatbelt Retractor and Pretensioner . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0070:13 or B0070:1A, GO to A13. For DTC B0070:11, GO to A14. For DTC B0070:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Safety Belt Anchor Pretensioner C3065 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM)). GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0070:13 or B0070:1A, GO to A13. For DTC B0070:11, GO to A14. For DTC B0070:12, GO to A15.

A13 CHECK THE DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_29_RES) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_29_RES PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0070:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DRIVER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0070:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Anchor Pretensioner C3065 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Safety Belt Anchor Pretensioner C3065 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint

	test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: K > B0072:11, B0072:12, B0072:13, B0072:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger safety belt anchor pretensioner circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger safety belt anchor pretensioner

If a fault is detected, the RCM stores DTC B0072:11, B0072:12, B0072:13 or B0072:1A in memory and

sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger safety belt anchor pretensioner
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0072:11	Passenger Seatbelt Pretensioner "A" Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger safety belt anchor pretensioner circuit for more than 6 seconds.
B0072:12	Passenger Seatbelt Pretensioner "A" Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger safety belt anchor pretensioner circuit for more than 6 seconds.
B0072:13	Passenger Seatbelt Pretensioner "A" Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger safety belt anchor pretensioner circuits for more than 6 seconds.
B0072:1A	Passenger Seatbelt Pretensioner "A" Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger safety belt anchor pretensioner circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger safety belt anchor pretensioner
- RCM

PINPOINT TEST A : B0072:11, B0072:12, B0072:13 AND B0072:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0072:11, B0072:12, B0072:13 and B0072:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the anchor pretensioner Diagnostic Trouble Codes (DTCs). For DTC B0072:13 or B0072:1A, GO to A2. For DTC B0072:11, GO to A8. For DTC B0072:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the anchor pretensioner Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B0072:13 or B0072:1A, GO to A13. For DTC B0072:11, GO to A14. For DTC B0072:12, GO to A15.

A2 CHECK THE PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_30_RES) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_30_RES PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_30_RES) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_30_RES PID, carry out the harness test of the passenger safety belt anchor pretensioner circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4 For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by

inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt anchor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0072:1A to B0072:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3066-1	Ω	C3066-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-13	Ω	C3066-1
C310B-14	Ω	C3066-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3066-1		C3066-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt anchor pretensioner circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B0072:13 to B0072:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt anchor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B0072:11 to B0072:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3066-1	Ω	Ground
C3066-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3066-1		Ground
C3066-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread

terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Safety Belt Anchor Pretensioner C3066 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Safety Belt Anchor Pretensioner C3066 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger safety belt retractor (includes anchor pretensioner. REFER to: Front Seatbelt Retractor and Pretensioner . GO to A17

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0072:13 or B0072:1A, GO to A13. For DTC B0072:11, GO to A14. For DTC B0072:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Safety Belt Anchor Pretensioner C3066 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B0072:13 or B0072:1A, GO to A13. For DTC B0072:11, GO to A14. For DTC B0072:12, GO to A15.

A13 CHECK THE PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_30_RES) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_30_RES PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A14 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0072:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE PASSENGER SAFETY BELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B0072:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Anchor Pretensioner C3066 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Safety Belt Anchor Pretensioner C3066 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

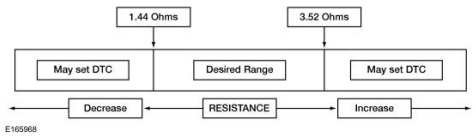
Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: L > B007E:11, B007E:12, B007E:13, B007E:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions



The RCM continuously monitors the driver safety belt retractor pretensioner circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver safety belt retractor pretensioner

If a fault is detected, the RCM stores DTC B007E:11, B007E:12, B007E:13 or B007E:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver safety belt retractor pretensioner
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B007E:11	Driver Seatbelt Pretensioner "C" Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver safety belt retractor pretensioner circuit for more than 6 seconds.
B007E:12	Driver Seatbelt Pretensioner "C" Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver safety belt retractor pretensioner circuit for more than 6 seconds.
B007E:13	Driver Seatbelt Pretensioner "C" Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the driver safety belt retractor pretensioner

		circuits for more than 6 seconds.
B007E:1A	Driver Seatbelt Pretensioner "C" Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the driver safety belt retractor pretensioner circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver safety belt retractor pretensioner
- RCM

PINPOINT TEST A : B007E:11, B007E:12, B007E:13 AND B007E:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007E:11, B007E:12, B007E:13 and B007E:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the retractor pretensioner Diagnostic Trouble Codes (DTCs). For DTC B007E:13 or B007E:1A, GO to A2. For DTC B007E:11, GO to A8. For DTC B007E:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the retractor pretensioner Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B007E:13 or B007E:1A, GO to A13. For DTC B007E:11, GO to A14. For DTC B007E:12, GO to A15.

A2 CHECK THE DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_23_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_23_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_23_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_23_R PID, carry out the harness test of the driver safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4 For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt retractor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B007E:1A to B007E:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C323-1	Ω	C323-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A6 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-52	Ω	C323-1
C310B-51	Ω	C323-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C323-1		C323-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt retractor pretensioner circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B007E:13 to B007E:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver safety belt retractor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B007E:11 to B007E:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C323-1	Ω	Ground
C323-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C323-1	V	Ground
C323-2	V	Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are

connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Safety Belt Retractor Pretensioner C323 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Safety Belt Retractor Pretensioner C323 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver safety belt retractor (includes retractor pretensioner). REFER to: Front Seatbelt Retractor and Pretensioner . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B007E:13 or B007E:1A, GO to A13. For DTC B007E:11, GO to A14. For DTC B007E:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Safety Belt Retractor Pretensioner C323 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B007E:13 or B007E:1A, GO to A13. For DTC B007E:11, GO to A14. For DTC B007E:12, GO to A15.

A13 CHECK THE DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_23_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_23_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR

	as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007E:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007E:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Safety Belt Retractor Pretensioner C323 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Safety Belt Retractor Pretensioner C323 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: M > B007F:11, B007F:12, B007F:13, B007F:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger safety belt retractor pretensioner circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger safety belt retractor pretensioner

If a fault is detected, the RCM stores DTC B007F:11, B007F:12, B007F:13 or B007F:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger safety belt retractor pretensioner
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B007F:11	Passenger Seatbelt Pretensioner	A fault is indicated when the RCM

	"C" Deployment Control: Circuit Short to Ground	senses a short to ground on either passenger safety belt retractor pretensioner circuit for more than 6 seconds.
B007F:12	Passenger Seatbelt Pretensioner "C" Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger safety belt retractor pretensioner circuit for more than 6 seconds.
B007F:13	Passenger Seatbelt Pretensioner "C" Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger safety belt retractor pretensioner circuits for more than 6 seconds.
B007F:1A	Passenger Seatbelt Pretensioner "C" Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger safety belt retractor pretensioner circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger safety belt retractor pretensioner
- RCM

PINPOINT TEST A : B007F:11, B007F:12, B007F:13 AND B007F:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007F:11, B007F:12, B007F:13 and B007F:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the retractor pretensioner Diagnostic Trouble Codes (DTCs). For DTC B007F:13 or B007F:1A, GO to A2. For DTC B007F:11, GO to A8. For DTC B007F:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the retractor pretensioner Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B007F:13 or B007F:1A, GO to A13. For DTC B007F:11, GO to A14. For DTC B007F:12, GO to A15.

A2 CHECK THE PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_24_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_24_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_24_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_24_R PID, carry out the harness test of the passenger safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt retractor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B007F:1A to B007F:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C303-1	Ω	C303-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-49	Ω	C303-1
C310B-50	Ω	C303-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C303-1		C303-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt retractor pretensioner circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B007F:13 to B007F:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger safety belt retractor pretensioner disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B007F:11 to B007F:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C303-1	Ω	Ground
C303-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C303-1	V	Ground

C303-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Safety Belt Retractor Pretensioner C303 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Safety Belt Retractor Pretensioner C303 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger safety belt retractor (includes retractor pretensioner. REFER to: Front Seatbelt Retractor and Pretensioner . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to

	do so in the pinpoint test. For DTC B007F:13 or B007F:1A, GO to A13. For DTC B007F:11, GO to A14. For DTC B007F:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Safety Belt Retractor Pretensioner C303 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B007F:13 or B007F:1A, GO to A13. For DTC B007F:11, GO to A14. For DTC B007F:12, GO to A15.

A13 CHECK THE PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL (DEPLOY_24_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_24_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007F:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16

A15 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B007F:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Safety Belt Retractor Pretensioner C303 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Safety Belt Retractor Pretensioner C303 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: N > B00A0:09, B00A0:4A, B00A0:63, B00A0:64 AND B00A0:68

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM is in constant communication with various control modules on the High Speed Controller Area Network 2 (HS2-CAN). One of those modules is the OCSM. The RCM continuously monitors the High Speed Controller Area Network 2 (HS2-CAN) for fault messages reported by the OCSM. The RCM also checks for the correct identification of the OCSM. If the RCM receives fault message(s) from the OCSM, it stores DTC B00A0:09, B00A0:4A, B00A0:63, B00A0:64 or B00A0:68 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B00A0:09	Occupant Classification System: Component Failure	A fault is indicated when the RCM receives a message from the OCSM that a fault exists within the OCS.
B00A0:4A	Occupant Classification System: Incorrect Component Installed	A fault is indicated when the RCM senses the OCSM is present but not configured.
B00A0:63	Occupant Classification System: Circuit / Component Protection Time-Out	A fault is indicated when the RCM receives 8 or more invalid states from the OCSM.
B00A0:64	Occupant Classification System: Signal Plausibility Failure	A fault is indicated when the RCM receives messages containing upper or lower data limits other than limits stored in memory.

B00A0:68	Occupant Classification System: Event Information	A fault is indicated when the RCM receives a message from the OCSM that indicates an OCS fault is present.

Possible Sources

- OCSM
- OCSM Diagnostic Trouble Codes (DTCs)
- RCM

PINPOINT TEST A : B00A0:09, B00A0:4A, B00A0:63, B00A0:64 AND B00A0:68

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.*

> *NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.*

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

> *WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.*

REFER to: Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00A0:09, B00A0:4A, B00A0:63, B00A0:64 or B00A0:68 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.For DTC B00A0:09, B00A0:63 or B00A0:68, RETRIEVE Diagnostic Trouble Codes (DTCs) from the OCSM an. REFER to DTC Chart: Occupant Classification System Module (OCSM) for diagnostic direction. For DTC B00A0:4A or B00A0:64, GO to A2.

No	CHECK for causes of the intermittent fault. Refer to Supplemental Restraint System for schematic and connector information. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A5.

A2 VERIFY THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) PART NUMBER

Using the Log Viewer function of the diagnostic scan tool, retrieve and record the OCSM part number.

Check the part number recorded against the number listed in the parts catalog and verify the correct OCSM is present in the vehicle.

Is the correct OCSM installed?

Yes	GO to A3

No	INSTALL the correct OCS. REFER to: Occupant Classification System (OCS) Sensor . GO to A5.

A3 VERIFY THE RCM (RESTRAINTS CONTROL MODULE) PART NUMBER

Using the Log Viewer function of the diagnostic scan tool, retrieve and record the RCM part number.

Check the part number recorded against the number listed in the parts catalog and verify the correct RCM is present in the vehicle.

Is the correct RCM installed?

Yes	GO to A4

No	INSTALL the correct RCM. REFER to: Restraints Control Module (RCM) . GO to A5.

A4 VERIFY THE RCM (RESTRAINTS CONTROL MODULE) CONFIGURATION

Carry out PMI for the RCM. Manually enter As-Built data. Refer to the diagnostic scan tool instructions when carrying out PMI.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00A0:4A retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service

	Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A5.

No	The fault is corrected. GO to A5

A5 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: O > B00B5:11, B00B5:12, B00B5:13, B00B5:1D

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver seat track position sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Current out of range
- Faulted driver seat track position sensor

If a fault is detected, the RCM stores DTC B00B5:11, B00B5:12, B00B5:13 or B00B5:1D in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B00B5:11	Driver Seat Track Position Restraints Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the driver seat track position sensor circuit for more than 6 seconds.
B00B5:12	Driver Seat Track Position Restraints Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the driver seat track position sensor circuit for more than 6 seconds.
B00B5:13	Driver Seat Track Position Restraints Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either driver seat track position sensor circuit for more than 6 seconds.
B00B5:1D	Driver Seat Track Position Restraints Sensor: Circuit Current Out of Range	A fault is indicated when the RCM measures current outside of an acceptable range on the driver seat track position sensor circuit for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged driver seat track position sensor.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B00B5:11, B00B5:12, B00B5:13 AND B00B5:1D

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00B5:11, B00B5:12, B00B5:13 and B00B5:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver seat track position sensor Diagnostic Trouble Codes (DTCs). For DTC B00B5:11 or B00B5:1D, GO to A2. For DTC B00B5:12, GO to A4For DTC B00B5:13, GO to A5.
No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver seat track position sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE DRIVER SEAT TRACK POSITION SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)

Ignition OFF.

Disconnect Driver Seat Position Sensor C356 .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver seat track position sensor disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B00B5:11 or B00B5:1D to B00B5:13?

Yes	GO to A8.

No	For DTC B00B5:11, GO to A3. For DTC B00B5:1D, GO to A9.

A3 CHECK THE DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C356-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A4 CHECK THE DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Driver Side Airbag (Inline) C345 .

Disconnect Driver Seat Position Sensor C356 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C356-2		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A9

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE DRIVER SEAT TRACK POSITION SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C345 .

Disconnect Driver Seat Position Sensor C356 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C356-2		C356-1

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver seat track position sensor circuits shorted together, a short to ground fault is normally retrieved.

Did the on-demand DTC change from B00B5:13 to B00B5:11?

Yes	REMOVE the fused jumper wire and GO to A8

No	REMOVE the fused jumper wire and GO to A6

A6 CHECK THE DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-23	Ω	C356-2

Is the resistance less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A7 CHECK THE DRIVER SEAT TRACK POSITION SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C356-1	Ω	C310B-53

Is the resistance less than 3 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE DRIVER SEAT TRACK POSITION SENSOR FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Side Airbag (Inline) C345 (if previously disconnected).

Connect Driver Seat Position Sensor C356 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new driver seat track position sensor. REFER to: Seat Position Sensor . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RCM C310A and C310B (if previously disconnected).

Connect Driver Side Airbag (Inline) C345 (if previously disconnected).

Connect Driver Seat Position Sensor C356 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Seat Position Sensor C356 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected component(s) / connector(s).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00B5:11, B00B5:12, B00B5:13 and B00B5:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.For DTC B00B5:11 or B00B5:1D, GO to A2. For DTC B00B5:12, GO to A4. For DTC B00B5:13, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: P > B00C5:11, B00C5:12, B00C5:13, B00C5:1D

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger seat track position sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground

- Current out of range
- Faulted passenger seat track position sensor

If a fault is detected, the RCM stores DTC B00C5:11, B00C5:12, B00C5:13 or B00C5:1D in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B00C5:11	Passenger Seat Track Position Restraints Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the passenger seat track position sensor circuit for more than 6 seconds.
B00C5:12	Passenger Seat Track Position Restraints Sensor: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the passenger seat track position sensor circuit for more than 6 seconds.
B00C5:13	Passenger Seat Track Position Restraints Sensor: Circuit Open	A fault is indicated when the RCM senses an open on either passenger seat track position sensor circuit for more than 6 seconds.
B00C5:1D	Passenger Seat Track Position Restraints Sensor: Circuit Current Out of Range	A fault is indicated when the RCM measures current outside of an acceptable range on the passenger seat track position sensor circuit for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger seat track position sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged passenger seat track position sensor.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B00C5:11, B00C5:12, B00C5:13 AND B00C5:1D

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from*

these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00C5:11, B00C5:12, B00C5:13 and B00C5:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger seat track position sensor Diagnostic Trouble Codes (DTCs). For DTC B00C5:11 or B00C5:1D, GO to A2. For DTC B00C5:12, GO to A4. For DTC B00C5:13, GO to A5.

No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger seat track position sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND OR CURRENT OUT OF RANGE INDICATED)

Ignition OFF.

Disconnect Passenger Seat Position Sensor C3240 .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger seat track position sensor disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B00C5:11 or B00C5:1D to B00C5:13?

Yes	GO to A8

No	For DTC B00C5:11, GO to A3. For DTC B00C5:1D, GO to A9.

A3 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3240-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and

	connector information. GO to A11.

A4 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Seat Position Sensor C3240 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3240-2		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A9.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Seat Position Sensor C3240 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2

C3240-2		C3240-1

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger seat track position sensor circuits shorted together, a short to ground fault is normally retrieved.

Did the on-demand DTC change from B00C5:13 to B00C5:11?

Yes	REMOVE the fused jumper wire and GO to A8

No	REMOVE the fused jumper wire and GO to A6

A6 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-24	Ω	C3240-2

Is the resistance less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A7 CHECK THE PASSENGER SEAT TRACK POSITION SENSOR GROUND CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3240-1	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A9.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE PASSENGER SEAT TRACK POSITION SENSOR FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Connect Passenger Seat Position Sensor C3240 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger seat track position sensor. REFER to: Seat Position Sensor . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RCM C310A and C310B (if previously disconnected).

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Connect Passenger Seat Position Sensor C3240 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Seat Position Sensor C3240 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected component(s) / connector(s).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00C5:11, B00C5:12, B00C5:13 and B00C5:1D retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.For DTC B00C5:11 or B00C5:1D, GO to A2. For DTC B00C5:12, GO to A4. For DTC B00C5:13, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: Q > B11CF:11, B11CF:12, B11CF:13, B11CF:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger airbag adaptive canister vent circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger airbag adaptive canister vent

If a fault is detected, the RCM stores DTC B11CF:11, B11CF:12, B11CF:13 or B11CF:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger airbag adaptive canister vent
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B11CF:11	Passenger Frontal Airbag Canister Vent: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either

		passenger airbag adaptive canister vent circuit for more than 6 seconds.
B11CF:12	Passenger Frontal Airbag Canister Vent: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger airbag adaptive canister vent circuit for more than 6 seconds.
B11CF:13	Passenger Frontal Airbag Canister Vent: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger airbag adaptive canister vent circuits for more than 6 seconds.
B11CF:1A	Passenger Frontal Airbag Canister Vent: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger airbag adaptive canister vent circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger airbag adaptive canister vent
- RCM

PINPOINT TEST A : B11CF:11, B11CF:12, B11CF:13 AND B11CF:1A

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts*

released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B11CF:11, B11CF:12, B11CF:13 and B11CF:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag adaptive canister vent Diagnostic Trouble Codes (DTCs). For DTC B11CF:13 or B11CF:1A, GO to A2. For DTC B11CF:11, GO to A8. For DTC B11CF:12, GO to A10.

No	This is an intermittent fault when present as a CMDTC only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger airbag adaptive canister vent Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B11CF:13 or B11CF:1A, GO to A13. For DTC B11CF:11, GO to A14. For DTC B11CF:12, GO to A15.

A2 CHECK THE PASSENGER FRONTAL AIRBAG CAN VENT CONTROL (DEPLOY_08_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_08_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE PASSENGER FRONTAL AIRBAG CAN VENT CONTROL (DEPLOY_08_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

Remove the glove compartment. REFER to: Glove Compartment .

While monitoring the DEPLOY_08_R PID, carry out the harness test of the passenger airbag adaptive canister vent circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag adaptive canister vent disconnected, an open circuit fault is normally retrieved. An open circuit fault is also retrieved on passenger airbag stages 1 and 2, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B11CF:1A to B11CF:13?

Yes	GO to A11

No	GO to A5.

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-7	Ω	C256-8

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-10	Ω	C256-7
C310A-9	Ω	C256-8

Are the resistances less than 0.5 ohm?

Yes	GO to A7.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by

inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C256-7		C256-8

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag adaptive canister vent circuits shorted together, a low resistance fault is normally retrieved. An open circuit fault is also retrieved on passenger airbag stages 1 and 2, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B11CF:13 to B11CF:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger airbag adaptive canister vent disconnected, an open circuit fault is normally retrieved. An open circuit fault is also retrieved on passenger airbag stages 1 and 2, due to the passenger airbag connector being disconnected.

Did the on-demand DTC change from B11CF:11 to B11CF:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-7	Ω	Ground
C256-8	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C256-7		Ground
C256-8		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect the passenger airbag and make sure the Connector Position Assurance (CPA) tabs on each deployable connector are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new passenger airbag (includes passenger airbag canister vent). REFER to: Passenger Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B11CF:13 or B11CF:1A, GO to A13. For DTC B11CF:11, GO to A14. For DTC B11CF:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Remove the glove compartment. REFER to: Glove Compartment .

Connect Passenger Airbag C256 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control

	Module (RCM) . GO to A17

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B11CF:13 or B11CF:1A, GO to A13. For DTC B11CF:11, GO to A14. For DTC B11CF:12, GO to A15.

A13 CHECK THE PASSENGER FRONTAL AIRBAG CAN VENT CONTROL (DEPLOY_08_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_08_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Remove the glove compartment. REFER to: Glove Compartment .

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B11CF:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE PASSENGER AIRBAG ADAPTIVE CANISTER VENT DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Remove the glove compartment. REFER to: Glove Compartment .

Disconnect Passenger Airbag C256 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B11CF:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Airbag C256 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect the passenger airbag and make sure the Connector Position Assurance (CPA) tabs on each deployable connector are correctly seated and the clip is not damaged.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint

	test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: R > B11D8:12 AND B11D8:14

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM transmits an event notification signal which communicates crash status and SRS deployment status to the BCM. When the BCM receives an event notification signal which indicates a crash, it initiates fuel cut-off.

The RCM monitors the event notification signal circuit for the following faults:

- Short to voltage
- Short to ground
- Open circuit

If a fault is detected, the RCM stores DTC B11D8:12 or B11D8:14 in memory. The airbag warning indicator

does not illuminate if B11D8:12 or B11D8:14 is set.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B11D8:12	Restraint Event Notification: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the event notification signal circuit for more than 15 seconds.
B11D8:14	Restraint Event Notification: Circuit Short to Ground or Open	A fault is indicated when the RCM senses a short to ground or an open on the event notification signal circuit for more than 15 seconds.

Possible Sources

- Wiring, terminals or connectors
- BCM
- RCM

PINPOINT TEST A : B11D8:12 AND B11D8:14

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Install new components only when directed to do so in the pinpoint test.

NOTE: Always make sure the correct SRS component is being installed. Parts

released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform the RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was DTC B11D8:12 or B11D8:14 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test. For DTC B11D8:14, GO to A2. For DTC B11D8:12, GO to A5.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A8.

A2 CHECK THE EVENT NOTIFICATION SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect BCM C2280E .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-42	Ω	C2280E-49

Is the resistance less than 3 ohms?

Yes	GO to A3.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A9.

A3 CHECK THE EVENT NOTIFICATION SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-49	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A9.

NOTE: Make sure all SRS electrical connectors and the BCM electrical connector are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A4 CONFIRM THE BCM (BODY CONTROL MODULE) OR RCM (RESTRAINTS CONTROL MODULE) FAULT

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect BCM C2280E .

Connect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform the RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was DTC B11D8:14 retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, CLEAR the RCM Diagnostic Trouble Codes (DTCs) and

	REPEAT the RCM self-test. If DTC B11D8:14 returns, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A9. If DTC B11D8:14 does not return, GO to A9.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test. GO to A8.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A5 CHECK THE EVENT NOTIFICATION SIGNAL CIRCUIT DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE

Disconnect BCM C2280E .

Using a diagnostic scan tool, perform the RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was DTC B11D8:12 retrieved on-demand during self-test?

Yes	GO to A6

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, GO to A9.

A6 CHECK THE EVENT NOTIFICATION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C2280E-49		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A9.

No	GO to A7

NOTE: Make sure all SRS electrical connectors and the BCM electrical connector are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A7 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect BCM C2280E .

Connect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform the RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A9.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test. GO to A8.

A8 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect BCM C2280E .

Disconnect RCM C310A and C310B .

inspect connector(s) (including any inline connectors) for loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect BCM C2280E .

Connect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform the RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was DTC B11D8:12 or B11D8:14 retrieved on-demand during self-test?

Yes	The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test.For DTC B11D8:14, GO to A2. For DTC B11D8:12, GO to A5.

No	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. Do not install any new SRS components at this time. Only install SRS components when directed to do so in the pinpoint test. REPAIR any intermittent concerns found. GO to A9.

A9 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all connectors (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, Diagnostic Trouble Codes (DTCs) are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform the

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: S > B1404:11, B1404:12, B1404:13, B1404:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the driver side airbag circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver side airbag

If a fault is detected, the RCM stores DTC B1404:11, B1404:12, B1404:13 or B1404:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver side airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1404:11	Driver Side Airbag Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver side airbag circuit for more than 6 seconds.
B1404:12	Driver Side Airbag Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver side airbag circuit for more than 6 seconds.
B1404:13	Driver Side Airbag Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the driver side airbag circuits for more than 6 seconds.
B1404:1A	Driver Side Airbag Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the driver side airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver side airbag
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B1404:11, B1404:12, B1404:13 AND B1404:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1404:11, B1404:12, B1404:13 and B1404:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver side airbag Diagnostic Trouble Codes (DTCs). For DTC B1404:13 or B1404:1A, GO to A2. For DTC B1404:11, GO to A8. For DTC B1404:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver side airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1404:13 or B1404:1A, GO to A13. For DTC B1404:11, GO to A14. For DTC B1404:12, GO to A15.

A2 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_10_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_10_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_10_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_10_R PID, carry out the harness test of the driver side airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1404:1A to B1404:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE DRIVER SIDE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-3	Ω	C3206-4

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE DRIVER SIDE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-40	Ω	C3206-3
C310B-39	Ω	C3206-4

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is

functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3206-3		C3206-4

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver side airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1404:13 to B1404:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DRIVER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver side airbag

disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1404:11 to B1404:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DRIVER SIDE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-3	Ω	Ground
C3206-4	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DRIVER SIDE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-3	+ V −	Ground

C3206-4		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DRIVER SIDE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Side Airbag C367 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	REMOVE and INSPECT the driver seat backrest harness for damage. REFER to: Side Airbag . If a concern is found, REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17. If a concern is not found, INSTALL a new driver side airbag. REFER to: Side Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1404:13 or B1404:1A, GO to A13. For DTC B1404:11, GO to A14. For DTC B1404:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Side Airbag (Inline) C3206 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1404:13 or B1404:1A, GO to A13. For DTC B1404:11, GO to A14. For DTC B1404:12, GO to A15.

A13 CHECK THE LEFT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_10_R) PID

(PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_10_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE DRIVER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1404:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DRIVER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1404:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Side Airbag (Inline) C3206 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Side Airbag C367 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: T, COUPE > B1405:11, B1405:12, B1405:13, B1405:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the LH side air curtain circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted LH side air curtain

If a fault is detected, the RCM stores DTC B1405:11, B1405:12, B1405:13 or B1405:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections

- LH side air curtain
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1405:11	Driver Side Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either LH side air curtain circuit for more than 6 seconds.
B1405:12	Driver Side Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either LH side air curtain circuit for more than 6 seconds.
B1405:13	Driver Side Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the LH side air curtain circuits for more than 6 seconds.
B1405:1A	Driver Side Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the LH side air curtain circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- LH side air curtain
- RCM

PINPOINT TEST A : B1405:11, B1405:12, B1405:13 AND B1405:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:11, B1405:12, B1405:13 and B1405:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver side air curtain Diagnostic Trouble Codes (DTCs). For DTC B1405:13 or B1405:1A, GO to A2. For DTC B1405:11, GO to A8. For DTC B1405:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver side air curtain Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

A2 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_11_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_11_R PID, carry out the harness test of the LH side air curtain circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the LH side air

curtain disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1405:1A to B1405:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE LH (LEFT-HAND) SIDE AIR CURTAIN CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9031-1	Ω	C9031-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-25	Ω	C9031-1
C310B-26	Ω	C9031-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and

	connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C9031-1		C9031-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the LH side air curtain circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1405:13 to B1405:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS)

Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the LH side air curtain disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1405:11 to B1405:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9031-1	Ω	Ground
C9031-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9031-1		Ground
C9031-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE LH (LEFT-HAND) SIDE AIR CURTAIN FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect LH Side Air Curtain C9031 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH Side Air Curtain C9031 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new LH side air curtain. REFER to: Side Curtain Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH Side Air Curtain C9031 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

A13 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_11_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE LH (LEFT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Side Air Curtain C9031 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect LH Side Air Curtain C9031 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: U > B1407:11, B1407:12, B1407:13, B1407:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger side airbag circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger side airbag

If a fault is detected, the RCM stores DTC B1407:11, B1407:12, B1407:13 or B1407:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections

- Passenger side airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1407:11	Passenger Side Airbag Deployment Control: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger side airbag circuit for more than 6 seconds.
B1407:12	Passenger Side Airbag Deployment Control: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger side airbag circuit for more than 6 seconds.
B1407:13	Passenger Side Airbag Deployment Control: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger side airbag circuits for more than 6 seconds.
B1407:1A	Passenger Side Airbag Deployment Control: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger side airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger side airbag
- RCM

PINPOINT TEST A : B1407:11, B1407:12, B1407:13 AND B1407:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1407:11, B1407:12, B1407:13 and B1407:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger side airbag Diagnostic Trouble Codes (DTCs). For DTC B1407:13 or B1407:1A, GO to A2. For DTC B1407:11, GO to A8. For DTC B1407:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger side airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1407:13 or B1407:1A, GO to A13. For DTC B1407:11, GO to A14. For DTC B1407:12, GO to A15.

A2 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_13_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_13_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_13_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_13_R PID, carry out the harness test of the passenger side airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1407:1A to B1407:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER SIDE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-3	Ω	C219-4

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER SIDE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-37	Ω	C219-3
C310B-38	Ω	C219-4

Are the resistances less than 0.5 ohm?

Yes	GO to A7.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C219-3		C219-4

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger side airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1407:13 to B1407:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS)

Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1407:11 to B1407:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER SIDE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-3	Ω	Ground
C219-4	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER SIDE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-3		Ground
C219-4		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER SIDE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Side Airbag C3459 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	REMOVE and INSPECT the driver seat backrest harness for damage. REFER to: Side Airbag . If a concern is found, REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17. If a concern is not found, INSTALL a new passenger side airbag. REFER to: Side Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1407:13 or B1407:1A, GO to A13. For DTC B1407:11, GO to A14. For DTC B1407:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not

	install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1407:13 or B1407:1A, GO to A13. For DTC B1407:11, GO to A14. For DTC B1407:12, GO to A15.

A13 CHECK THE RIGHT SIDE AIRBAG DEPLOYMENT CONTROL (DEPLOY_13_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_13_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1407:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE PASSENGER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1407:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Side Airbag C3459 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: V, COUPE > B1408:11, B1408:12, B1408:13, B1408:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the RH side air curtain circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted RH side air curtain

If a fault is detected, the RCM stores DTC B1408:11, B1408:12, B1408:13 or B1408:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in

resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- RH side air curtain
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1408:11	Passenger Side Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either RH side air curtain circuit for more than 6 seconds.
B1408:12	Passenger Side Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either RH side air curtain circuit for more than 6 seconds.
B1408:13	Passenger Side Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the RH side air curtain circuits for more than 6 seconds.
B1408:1A	Passenger Side Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the RH side air curtain circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- RH side air curtain
- RCM

PINPOINT TEST A : B1408:11, B1408:12, B1408:13 AND B1408:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious

personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:11, B1408:12, B1408:13 and B1408:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the RH side air curtain Diagnostic Trouble Codes (DTCs). For DTC B1408:13 or B1408:1A, GO to A2. For DTC B1408:11, GO to A8. For DTC B1408:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the RH side air curtain Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

A2 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_14_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_14_R PID, carry out the harness test of the RH side air curtain circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the RH side air curtain disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1408:1A to B1408:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE RH (RIGHT-HAND) SIDE AIR CURTAIN CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9032-1	Ω	C9032-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-17	Ω	C9032-1

C310B-18	Ω	C9032-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C9032-1		C9032-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the RH side air curtain circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1408:13 to B1408:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the RH side air curtain disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1408:11 to B1408:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9032-1	Ω	Ground
C9032-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9032-1		Ground
C9032-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE RH (RIGHT-HAND) SIDE AIR CURTAIN FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect RH Side Air Curtain C9032 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH Side Air Curtain C9032 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS)

Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	INSTALL a new RH side air curtain. REFER to: Side Curtain Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH Side Air Curtain C9032 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service

	Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

A13 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_14_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A14 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE RH (RIGHT-HAND) SIDE AIR CURTAIN DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Side Air Curtain C9032 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect RH Side Air Curtain C9032 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: W > B1413:11 AND B1413:93

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors the LH front impact severity sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted LH front impact severity sensor

If a fault is detected, the RCM stores DTC B1413:11 or B1413:93 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1413:11	Driver Frontal Restraints Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the LH front impact severity sensor feed

		circuit.
B1413:93	Driver Frontal Restraints Sensor: No Operation	A fault is indicated when the RCM senses a faulted LH front impact severity sensor, a short to voltage on the sensor feed circuit or an open feed or return circuit.

Possible Causes

- Wiring, terminals or connectors
- LH front impact severity sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged LH front impact severity sensor.
- Inspect the LH front impact severity sensor mounting and orientation.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B1413:11 AND B1413:93

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1413:11 or B1413:93 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is also retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs).For DTC B1413:11, GO to A2. For DTC B1413:93, GO to A5.
No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE LEFT FRONTAL RESTRAINTS SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Front Impact Severity Sensor C1465 .

Remove the air cleaner. Refer to the appropriate Engine article for the procedure.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1413:11 to B1413:93?

Yes	INSTALL a new LH front impact severity sensor. REFER to: Front Impact Severity Sensor . GO to A11.

No	GO to A3.

A3 CHECK THE LH (LEFT-HAND) FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1465-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A4.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A4 CHECK FOR A SHORT BETWEEN LH (LEFT-HAND) FRONT IMPACT SEVERITY SENSOR CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1465-1	Ω	C1465-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A5 CHECK THE LH (LEFT-HAND) FRONT IMPACT SEVERITY SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Inspect the LH Front Impact Severity Sensor electrical connector C1465 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Remove the air cleaner. Refer to the appropriate Engine article for the procedure.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector as necessary

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1413:93 retrieved on-demand during self-test?

Yes	GO to A6

No	The fault has been corrected. GO to A11

A6 CHECK THE LH (LEFT-HAND) FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Front Impact Severity Sensor C1465 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C1465-1		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A7.

A7 CHECK THE LH (LEFT-HAND) FRONT IMPACT SEVERITY SENSOR CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-17	Ω	C1465-1
C310A-18	Ω	C1465-2

Are the resistances less than 0.5 ohm?

Yes	GO to A8.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE LEFT FRONTAL RESTRAINTS SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire as shown in illustration:

Lead 1	Measurement / Action	Lead 2
C1465-1		C1465-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1413:93 to B1413:11?

Yes	REMOVE the fused jumper wire and INSTALL a new LH front impact severity sensor. REFER to: Front Impact Severity Sensor . GO to A11.

No	REMOVE the fused jumper wire and GO to A9

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH Front Impact Severity Sensor C1465 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to

	do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH Front Impact Severity Sensor C1465 .

Remove the air cleaner. Refer to the appropriate Engine article for the procedure.

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH Front Impact Severity Sensor C1465 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1413:11 or B1413:93 retrieved on-demand during the self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B1413:11, GO to A2. For DTC B1413:93, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: X, COUPE > B1414:11, B1414:93, B1419:11, B1419:93, B1427:11, B14EB:11

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors the driver front door and RH B-pillar side impact sensors and circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted driver front door side impact sensor
- Faulted RH B-pillar side impact sensor

NOTE: A short to ground on either impact sensor feed circuit sets Diagnostic Trouble Codes (DTCs) B1414:11 and B1419:11. A short to voltage on either impact sensor feed or return circuit sets Diagnostic Trouble Codes (DTCs) B1414:93 and B1419:93.

If a fault is detected, the RCM stores DTC B1414:11, B1414:93, B1419:11, B1419:93, B1427:11 or B14EB:11 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM communicates with each impact sensor. If the RCM is unable to communicate with the sensor, a

DTC is stored in memory. A CMDTC **no operation** (failure type: 93) can be set by a short to voltage on the return circuit of the impact sensor.

Some vehicles may be equipped with wiring for pedestrian protection system sensors, although the vehicle is not equipped with the sensors themselves. On these vehicles, if a short to ground condition occurs on the pedestrian protection sensor wiring, short to ground Diagnostic Trouble Codes (DTCs) set for the side impact sensors, in addition to short to ground Diagnostic Trouble Codes (DTCs) for pedestrian protection sensors. Alternatively, if a short to ground condition occurs on the side impact sensor circuits, then pedestrian protection sensor Diagnostic Trouble Codes (DTCs) set as well.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1414:11	Driver Side Restraints Sensor 1: Circuit Short to Ground	A fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted RH B-pillar side impact sensor, a short to ground on the driver front door side impact sensor feed circuit or a short to ground on the RH B-pillar side impact sensor feed circuit. If equipped with wiring for pedestrian protection sensors, a short to voltage on those circuits may also set this DTC.
B1414:93	Driver Side Restraints Sensor 1: No Operation	A fault is indicated when the RCM senses a faulted driver front door side impact sensor, a short to voltage on the feed or return circuit of the driver front door side impact sensor, a short to voltage on the feed or return circuit of RH B-pillar side impact sensor or an open feed or return circuit of the driver front door side impact sensor.
B1419:11	Passenger Side Restraints Sensor 2: Circuit Short to Ground	A fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted RH B-pillar side impact sensor, a short to ground on the driver front door side impact sensor feed circuit or a short to ground on the RH B-pillar side impact sensor feed circuit. If equipped with wiring for pedestrian protection sensors, a short to voltage on those circuits may also set this DTC.
B1419:93	Passenger Side Restraints Sensor 2: No Operation	A fault is indicated when the RCM senses a faulted RH B-pillar side impact sensor, a short to voltage on the feed or return circuit of RH B-pillar side impact sensor, a short

		to voltage on the feed or return circuit of the driver front door side impact sensor or an open feed or return circuit of the RH B-pillar side impact sensor.
B1427:11	Pedestrian Protection Sensor Driver Outer: Circuit Short to Ground	If equipped with wiring for pedestrian protection sensors, a fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted RH B-pillar side impact sensor, a short to ground on the driver front door side impact sensor feed circuit, a short to ground on the RH B-pillar side impact sensor feed circuit, or a short to ground on the wiring for pedestrian protection sensors.
B14EB:11	Pedestrian Protection Sensor Passenger Outer: Circuit Short to Ground	If equipped with wiring for pedestrian protection sensors, a fault is indicated when the RCM senses a shorted driver front door side impact sensor, a shorted RH B-pillar side impact sensor, a short to ground on the driver front door side impact sensor feed circuit, a short to ground on the RH B-pillar side impact sensor feed circuit, or a short to ground on the wiring for pedestrian protection sensors.

Possible Causes

- Wiring, terminals or connectors
- Driver front door side impact sensor
- RH B-pillar side impact sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).

PINPOINT TEST A : B1414:11, B1414:93, B1419:11, B1419:93, B1427:11, B14EB:11

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use*

the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	The fault(s) cannot be cleared until corrected and the Diagnostic Trouble Codes (DTCs) are no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs). For DTC B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11, GO to A2. For DTC B1414:93 **AND** B1419:93, GO to A6

	For DTC B1414:93 **ONLY** , GO to A8 For DTC B1419:93 **ONLY** , GO to Airbag Supplemental Restraint System (SRS) .

No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). The fault is intermittent when present as a CMDTC only. GO to A15.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Front Door Side Impact Sensor C567 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand Diagnostic Trouble Codes (DTCs) change from B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11 to B1414:93?

Yes	INSTALL a new driver front door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A16.

No	GO to A3

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A3 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 2 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect Driver Front Door Side Impact Sensor C567 .

Disconnect RH B-pillar Side Impact Sensor C3212 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11 to B1419:93?

Yes	INSTALL a new RH B-pillar side impact sensor. REFER to: B-Pillar Side Impact Sensor . GO to A16.

No	GO to A4

A4 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Front Door Side Impact Sensor C567 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1	Ω	C567-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1	Ω	Ground

If equipped, measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-19	Ω	Ground
C310B-29	Ω	Ground

If equipped, measure:

Positive Lead	Measurement / Action	Negative Lead

C310B-19	Ω	C310B-20
C310B-29	Ω	C310B-30

Are the resistances greater than 10, 000 ohms?

Yes	GO to A5

No	REPAIR the affected circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

A5 CHECK THE RH (RIGHT-HAND) B-PILLAR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3212-1	Ω	C3212-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3212-1	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A14

No	REPAIR the affected circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

A6 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Front Door Side Impact Sensor C567 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1		Ground
C567-2		Ground

Is any voltage present?

Yes	REPAIR the affected circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

No	GO to A7.

A7 CHECK THE RH (RIGHT-HAND) B-PILLAR SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH B-pillar Side Impact Sensor C3212 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3212-1		Ground
C3212-2		Ground

Is any voltage present?

Yes	REPAIR the affected circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

No	GO to A14.

A8 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Gain access to the driver front door side impact sensor and inspect C567 to make sure it is

fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector(s) as necessary.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1414:93 retrieved on-demand during self-test?

Yes	GO to A9

No	The fault is corrected. GO to A16

A9 CHECK THE DRIVER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Driver Front Door Side Impact Sensor C567 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-44	Ω	C567-1
C310B-43	Ω	C567-2

Are the resistances less than 0.5 ohm?

Yes	GO to A10.

No	REPAIR the affected circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A10 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C567-1		C567-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the DTC change from B1414:93 to B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11?

Yes	REMOVE the fused jumper wire and INSTALL a new driver front door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A16.

No	REMOVE the fused jumper wire and GO to A14

A11 CHECK THE RH (RIGHT-HAND) B-PILLAR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Gain access to the RH B-pillar side impact sensor and inspect C3212 to be fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to be fully seated and locked. Seat and lock the connector(s) as necessary.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1419:93 retrieved on-demand during self-test?

Yes	GO to A12.

No	The fault is corrected. GO to A16.

A12 CHECK THE RH (RIGHT-HAND) B-PILLAR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect RH B-pillar Side Impact Sensor C3212 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-32	Ω	C3212-1
C310B-31	Ω	C3212-2

Are the resistances less than 0.5 ohm?

Yes	GO to A13.

No	REPAIR the affected circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A13 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 2 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3212-1		C3212-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the DTC change from B1419:93 to B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11?

Yes	REMOVE the fused jumper wire and INSTALL a new RH B-pillar side impact sensor. REFER to: B-Pillar Side Impact Sensor . GO to A16.

No	REMOVE the fused jumper wire and GO to A14.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A14 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH B-pillar Side Impact Sensor C3212 (if previously disconnected).

Connect Driver Front Door Side Impact Sensor C567 (if previously disconnected).

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A16.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A15.

A15 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH B-pillar Side Impact Sensor C3212 .

Disconnect Driver Front Door Side Impact Sensor C567 .

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH B-pillar Side Impact Sensor C3212 .

Connect Driver Front Door Side Impact Sensor C567 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1414:11, B1414:93, B1419:11, B1419:93, B1427:11 or B14EB:11 retrieved on-demand during self-test?

Yes	The fault(s) cannot be cleared until corrected and the DTC is no longer retrieved on-demand during self-test.For DTC B1414:11 and B1419:11 and, if equipped, B1427:11 and B14EB:11, GO to A2. For DTC B1414:93 **AND** B1419:93, GO to A6. For DTC B1414:93 **ONLY** , GO to A8. For DTC B1419:93 **ONLY** , GO to A11.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: Y, COUPE > B1415:11, B1415:93, B1418:11, B1418:93, B1424:11

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors the passenger front door and LH B-pillar side impact sensors and circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted passenger front door side impact sensor
- Faulted LH B-pillar side impact sensor

> *NOTE: A short to ground on either impact sensor feed circuit sets DTC B1415:11 and B1418:11. A short to voltage on either impact sensor feed or return circuit sets DTC B1415:93 and B1418:93.*

If a fault is detected, the RCM stores DTC B1415:11, B1415:93, B1418:11, B1418:93 or B1424:11 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM communicates with each impact sensor. If the RCM is unable to communicate with the sensor, a DTC is stored in memory. A Continuous Memory Diagnostic Trouble Code (CMDTC) **no operation** (failure type: 93) can be set by a short to voltage on the return circuit of the impact sensor.

Some vehicles may be equipped with wiring for pedestrian protection system sensors, although the vehicle is not equipped with the sensors themselves. On these vehicles, if a short to ground condition occurs on the pedestrian protection sensor wiring, short to ground Diagnostic Trouble Codes (DTCs) set for the side impact sensors, in addition to short to ground Diagnostic Trouble Codes (DTCs) for pedestrian protection sensors. Alternatively, if a short to ground condition occurs on the side impact sensor circuits, then pedestrian protection sensor Diagnostic Trouble Codes (DTCs) set as well.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1415:11	Driver Side Restraints Sensor 2: Circuit Short to Ground	A fault is indicated when the RCM senses a shorted passenger door side impact sensor, a shorted LH B-pillar side impact sensor, a short to ground on the passenger front door side impact sensor feed circuit or a short to ground on the LH B-pillar side impact sensor feed circuit.
B1415:93	Driver Side Restraints Sensor 2: No Operation	A fault is indicated when the RCM senses a faulted LH B-pillar side impact sensor, a short to voltage on the feed or return circuit of the LH B-pillar side impact sensor, a short to voltage on the feed or return circuit of passenger front door side impact sensor or an open feed or return circuit of the passenger front door impact sensor.
B1418:11	Passenger Side Restraints Sensor 1: Circuit Short to Ground	A fault is indicated when the RCM senses a shorted passenger front door side impact sensor, a shorted LH B-pillar side impact sensor, a short to ground on the passenger front door side impact sensor feed circuit or a short to ground on the LH B-pillar side impact sensor feed circuit.
B1418:93	Passenger Side Restraints Sensor 1: No Operation	A fault is indicated when the RCM senses a faulted passenger front door side impact sensor, a short to voltage on the feed or return circuit of passenger front door side impact sensor, a short to voltage

		on the feed or return circuit of the LH B-pillar side impact sensor or an open feed or return circuit of the passenger front door side impact sensor.
B1424:11	Pedestrian Protection Sensor Center: Circuit Short to Ground	If equipped with wiring for pedestrian protection sensors, a fault is indicated when the RCM senses a shorted passenger front door side impact sensor, a shorted LH B-pillar side impact sensor, a short to ground on the passenger front door side impact sensor feed circuit, a short to ground on the LH B-pillar side impact sensor feed circuit, or a short to ground on the wiring for pedestrian protection sensors.

Possible Causes

- Wiring, terminals or connectors
- Passenger front door side impact sensor
- LH B-pillar side impact sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).

PINPOINT TEST A : B1415:11, B1415:93, B1418:11, B1418:93, B1424:11

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in*

incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	The fault(s) cannot be cleared until corrected and the Diagnostic Trouble Codes (DTCs) are no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is also retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs). For DTC B1415:11, B1418:11 and, if equipped, B1424:11, GO to A2. For DTC B1415:93 **AND** B1418:93, GO to A6. For DTC B1415:93 **ONLY** , GO to A8. For DTC B1418:93 **ONLY** , GO to A11. For any other Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .
No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). The fault is

	intermittent when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A15.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 2 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH B-pillar Side Impact Sensor C3210 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand Diagnostic Trouble Codes (DTCs) change from B1415:11, B1418:11 and, if equipped, B1424:11 to B1415:93?

Yes	INSTALL a new LH B-pillar side impact sensor. REFER to: B-Pillar Side Impact Sensor . GO to A16.

No	GO to A3.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A3 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect LH B-pillar Side Impact Sensor C3210 .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1415:11, B1418:11 and, if equipped, B1424:11 to B1418:93?

Yes	INSTALL a new passenger front door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A16.

No	GO to A4.

A4 CHECK THE LH (LEFT-HAND) B-PILLAR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH B-pillar Side Impact Sensor C3210 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3210-1	Ω	C3210-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3210-1	Ω	Ground

If equipped, measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-22	Ω	Ground

If equipped, measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-22	Ω	C310B-21

Are the resistances greater than 10, 000 ohms?

Yes	GO to A5

No	REPAIR the affected circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for

	schematic and connector information. GO to A16.

A5 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND SHORT BETWEEN SENSOR CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1	Ω	C644-2

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A14

No	REPAIR the affected circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

A6 CHECK THE LH (LEFT-HAND) B-PILLAR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect LH B-pillar Side Impact Sensor C3210 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3210-1		Ground
C3210-2		Ground

Is any voltage present?

Yes	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

No	GO to A7.

A7 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1		Ground
C644-2		Ground

Is any voltage present?

Yes	REPAIR the affected circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

No	GO to A14.

A8 CHECK THE LH (LEFT-HAND) B-PILLAR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Gain access to the LH B-pillar side impact sensor and inspect C3210 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector(s) as necessary.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1415:93 retrieved on-demand during self-test?

Yes	GO to A9

No	The fault is corrected. GO to A16

A9 CHECK THE LH (LEFT-HAND) B-PILLAR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect LH B-pillar Side Impact Sensor C3210 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-33	Ω	C3210-1
C310B-34	Ω	C3210-2

Are the resistances less than 0.5 ohm?

Yes	GO to A10

No	REPAIR the affected circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A10 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 2 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3210-1		C3210-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the DTC change from B1415:93 to B1415:11, B1418:11 and, if equipped, B1424:11?

Yes	REMOVE the fused jumper wire and INSTALL a new LH B-pillar side impact sensor. REFER to: B-Pillar Side Impact Sensor . GO to A16.

No	REMOVE the fused jumper wire and GO to A14

A11 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Gain access to the passenger front door side impact sensor and inspect C644 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector(s) as necessary.

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1418:93 retrieved on-demand during self-test?

Yes	GO to A12

No	Fault corrected. GO to A16

A12 CHECK THE PASSENGER FRONT DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-45	Ω	C644-1
C310B-46	Ω	C644-2

Are the resistances less than 0.5 ohm?

Yes	GO to A13.

No	REPAIR the affected circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A16.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A13 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C644-1		C644-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the DTC change from B1418:93 to B1415:11, B1418:11 and, if equipped, B1424:11?

Yes	REMOVE the fused jumper wire and INSTALL a new passenger front door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A16.

No	REMOVE the fused jumper wire and GO to A14

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A14 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH B-pillar Side Impact Sensor C3210 (if previously disconnected).

Connect Passenger Front Door Side Impact Sensor C644 (if previously disconnected).

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A16.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A15.

A15 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect LH B-pillar Side Impact Sensor C3210 .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect LH B-pillar Side Impact Sensor C3210 .

Connect Passenger Front Door Side Impact Sensor C644 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1415:11, B1415:93, B1418:11, B1418:93 or B1424:11 retrieved on-demand during self-test?

Yes	The fault(s) cannot be cleared until corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B1415:11, B1418:11 and, if equipped, B1424:11, GO to A2 For DTC B1415:93 **AND** B1418:93, GO to A6. For DTC B1415:93 **ONLY** , GO to A8. For DTC B1418:93 **ONLY** , GO to A11.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, Diagnostic Trouble Codes (DTCs) are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform the

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: Z > B1417:11 AND B1417:93

Refer to Supplemental Restraint System for schematic and connector information.

The RCM monitors the RH front impact severity sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted RH front impact severity sensor

If a fault is detected, the RCM stores DTC B1417:11 or B1417:93 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1417:11	Passenger Frontal Restraints Sensor: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the RH front impact severity sensor feed circuit.
B1417:93	Passenger Frontal Restraints Sensor: No Operation	A fault is indicated when the RCM senses a faulted RH front impact severity sensor, a short to voltage on the feed circuit or an open feed or return circuit.

Possible Causes

- Wiring, terminals or connectors

- RH front impact severity sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged RH front impact severity sensor.
- Inspect the RH front impact severity sensor mounting and orientation.
- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B1417:11 AND B1417:93

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information,

refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1417:11 or B1417:93 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.If DTC U3003:16 or U3003:17 is also retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs). For DTC B1417:11, GO to A2. For DTC B1417:93, GO to A5.

No	If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE RIGHT FRONTAL RESTRAINTS SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Front Impact Severity Sensor C1466 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1417:11 to B1417:93?

Yes	INSTALL a new RH front impact severity sensor. REFER to: Front Impact Severity Sensor . GO to A11.

No	GO to A3

A3 CHECK THE RH (RIGHT-HAND) FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1466-1	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A4

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A4 CHECK FOR A SHORT BETWEEN RH (RIGHT-HAND) FRONT IMPACT SEVERITY SENSOR CIRCUITS

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1466-1	Ω	C1466-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

A5 CHECK THE RH (RIGHT-HAND) FRONT IMPACT SEVERITY SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Inspect the RH Front Impact Severity Sensor C1466 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector as necessary.

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint

System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1417:93 retrieved on-demand during self-test?

Yes	GO to A6

No	The fault has been corrected. GO to A11

A6 CHECK THE RH (RIGHT-HAND) FRONT IMPACT SEVERITY SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Front Impact Severity Sensor C1466 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C1466-1		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

No	GO to A7

A7 CHECK THE RH (RIGHT-HAND) FRONT IMPACT SEVERITY SENSOR CIRCUITS FOR AN OPEN (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C310A-16	Ω	C1466-1
C310A-15	Ω	C1466-2

Are the resistances less than 0.5 ohm?

Yes	GO to A8.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE RIGHT FRONTAL RESTRAINTS SENSOR DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect: RCM C310A and C310B .

Connect a fused jumper wire as shown in illustration:

Lead 1	Measurement / Action	Lead 2
C1466-1		C1466-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1417:93 to B1417:11?

Yes	REMOVE the fused jumper wire and INSTALL a new RH front impact severity sensor. REFER to: Front Impact Severity Sensor . GO to A11.

No	REMOVE the fused jumper wire and GO to A9

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH Front Impact Severity Sensor C1466 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RH Front Impact Severity Sensor C1466 .

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct

operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RH Front Impact Severity Sensor C1466 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1417:11 or B1417:93 retrieved on-demand during the self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test.For DTC B1417:11, GO to A2. For DTC B1417:93, GO to A5.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AA > BXXXX:2B (ANY BXXXX DTC WITH A 2B FAILURE TYPE) SIGNAL CROSS COUPLED

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors all deployable device and sensor circuits for a signal cross coupled (short) between components. Signal cross coupled Diagnostic Trouble Codes (DTCs) are present when one or both circuits of a component are shorted to one or both circuits of another component. Signal cross coupled Diagnostic Trouble Codes (DTCs) do not set when the circuits of a single device are shorted together, a different DTC is present (for example, a DTC for circuit resistance below threshold). The RCM sends a message to the IPC to illuminate the airbag warning indicator. When a normal loop fault is present (one loop is either shorted to battery/ground, open circuit or low resistance), then signal cross coupled diagnostics are not active. Once the normal loop fault is repaired, the signal cross coupled diagnostics resume.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0001:2B	Driver Frontal Stage 1 Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver airbag stage 1 circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0002:2B	Driver Frontal Stage 2 Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver airbag stage 2 circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0004:2B	Driver Knee Bolster Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver lower airbag circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0005:2B	Collapsible Steering Column Deployment Control: Signal Cross Coupled	If the RCM detects a short between the deployable steering column circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0010:2B	Passenger Frontal Stage 1 Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger airbag stage 1 circuits and the circuits of another

		SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0011:2B	Passenger Frontal Stage 2 Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger airbag stage 2 circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0013:2B	Passenger Knee Bolster Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger knee bolster circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0050:2B	Driver Seatbelt Sensor: Signal Cross Coupled	If the RCM detects a short between the driver safety belt buckle switch circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0052:2B	Passenger Seatbelt Sensor: Signal Cross Coupled	If the RCM detects a short between the passenger safety belt buckle switch circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0070:2B	Driver Seatbelt Pretensioner "A" Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver safety belt anchor pretensioner circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B0072:2B	Passenger Seatbelt Pretensioner "A" Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger safety belt anchor pretensioner circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B007E:2B	Driver Seatbelt Pretensioner "C" Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver safety belt retractor pretensioner circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B007F:2B	Passenger Seatbelt Pretensioner "C" Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger safety belt retractor pretensioner circuits and the circuits of another SRS component,

		it sets this DTC and the DTC of the corresponding SRS component.
B00B5:2B	Driver Seat Track Position Restraints Sensor: Signal Cross Coupled	If the RCM detects a short between the LH seat track position sensor circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B00C5:2B	Passenger Seat Track Position Restraints Sensor: Signal Cross Coupled	If the RCM detects a short between the RH seat track position sensor circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B11CF:2B	Passenger Frontal Airbag Canister Vent: Signal Cross Coupled	If the RCM detects a short between the passenger airbag canister vent circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B1404:2B	Driver Side Airbag Deployment Control: Signal Cross Coupled	If the RCM detects a short between the driver side airbag circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B1405:2B	Driver Curtain Deployment Control 1: Signal Cross Coupled	If the RCM detects a short between the LH side air curtain circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B1407:2B	Passenger Side Airbag Deployment Control: Signal Cross Coupled	If the RCM detects a short between the passenger side airbag circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.
B1408:2B	Passenger Curtain Deployment Control 1: Signal Cross Coupled	If the RCM detects a short between the RH side air curtain circuits and the circuits of another SRS component, it sets this DTC and the DTC of the corresponding SRS component.

Possible Sources

- Wiring, terminals or connectors
- RCM

Visual Inspection and Diagnostic Pre-Checks

- Inspect the affected wiring harness(es) for damage, if accessible.

PINPOINT TEST A : BXXXX:2B (ANY BXXXX DTC (DIAGNOSTIC TROUBLE CODE) WITH A 2B FAILURE TYPE) SIGNAL CROSS COUPLED

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any signal cross coupled Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. If DTC U3003:16 or U3003:17 is also retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 are not retrieved on-demand, GO to A2

No	If DTC U3003:16 or U3003:17 is retrieved on-demand as well, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 are not retrieved on-demand, DIAGNOSE the signal cross-coupled Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A4.

A2 CHECK THE AFFECTED CIRCUITS FOR A SIGNAL CROSS COUPLED FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Using the signal cross coupled Diagnostic Trouble Codes (DTCs) present on-demand, identify the affected SRS devices.

NOTE: Most signal cross coupled faults are due to connector and/or wiring harness damage. Carry out a thorough inspection of connector(s) and/or wiring harness for damage.

Disconnect all of the affected SRS devices.

Using the following table, measure the resistance between the circuits of one affected SRS device to the other affected SRS device.

Example: If Diagnostic Trouble Codes (DTCs) B0001:2B and B0002:2B are being diagnosed, measure the resistance between circuit CR101 to circuits CR102 and RR102. Then measure the resistance between circuit RR101 to circuits CR102 and RR102.

Device/Loop (DTC)	Connector
Driver airbag stage 1 (B0001:2B)	C216A-1 C216A-2
Driver airbag stage 2 (B0002:2B)	C216B-1 C216B-2
Driver knee airbag (B0004:2B)	C2432-3 C2432-4
Deployable steering column (B0005:2B)	C2360-1 C2360-2

Passenger airbag stage 1 (B0010:2B)	C256-1 C256-2
Passenger airbag stage 2 (B0011:2B)	C256-4 C256-5
Passenger knee airbag (B0013:2B)	C2600-1 C2600-2
Driver safety belt buckle switch (B0050:2B)	C3201-5
Passenger safety belt buckle switch (B0052:2B)	C3238-5
Driver safety belt anchor pretensioner (B0070:2B)	C3065-1 C3065-2
Passenger safety belt anchor pretensioner (B0072:2B)	C3066-1 C3066-2
Driver safety belt retractor pretensioner (B007E:2B)	C323-1 C323-2
Passenger safety belt retractor pretensioner (B007F:2B)	C303-1 C303-2
Driver seat position sensor (B00B5:2B)	C356-2
Passenger seat track position sensor (B00C5:2B)	C3240-2
Passenger airbag canister vent (B11CF:2B)	C256-7 C256-8
Driver side airbag (B1404:2B)	C3206-3 (Inline) C3206-4 (Inline)
LH side air curtain (B1405:2B, coupe only)	C9031-1 C9031-2
Driver upper side airbag (B1405:2B, convertible only)	C3206-1 (Inline) C3206-2 (Inline)
Passenger side airbag (B1407:2B)	C219-3 (Inline) C219-4 (Inline)
RH side air curtain (B1408:2B, coupe only)	C9032-1 C9032-2
Passenger upper side airbag (B1408:2B, convertible only)	C219-1 (Inline) C219-2 (Inline)

Are the resistances greater than 10, 000 ohms between the affected circuits?

Yes	GO to A3

No	REPAIR the affected circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A5

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A3 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected restraint system component(s).

Connect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any signal cross coupled Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A5.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A4.

NOTE: Most cross link faults are due to connector and/or wiring harness damage. Carry out a thorough inspection of connector(s) and/or wiring harness for damage.

A4 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect all of the affected SRS devices. Refer to Supplemental Restraint System for schematic and connector information.

Inspect the wiring harness(es) for any type of damage. If damage is found, repair as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any signal cross coupled Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. GO to A2.

No	The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A5

A5 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AB > BXXXX:4A (ANY BXXXX DTC WITH A 4A FAILURE TYPE) INCORRECT COMPONENT INSTALLED

Normal Operation and Fault Conditions

The RCM monitors all SRS device connections. If the RCM detects a connection or device connected that is not stored in memory or is not configured for the component, the RCM sets a DTC and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0001:4A	Driver Frontal Stage 1 Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0002:4A	Driver Frontal Stage 2 Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0004:4A	Driver Knee Bolster Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0005:4A	Collapsible Steering Column Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0010:4A	Passenger Frontal Stage 1 Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0011:4A	Passenger Frontal Stage 2 Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0013:4A	Passenger Knee Bolster Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0050:4A	Driver Seatbelt Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0052:4A	Passenger Seatbelt Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0070:4A	Driver Seatbelt Pretensioner "A" Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0072:4A	Passenger Seatbelt Pretensioner "A" Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B007E:4A	Driver Seatbelt Pretensioner "C" Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.

B007F:4A	Passenger Seatbelt Pretensioner "C" Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B0080:4A	Driver Seatbelt Load Limiter Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B00B5:4A	Driver Seat Track Position Restraints Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B00C5:4A	Passenger Seat Track Position Restraints Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B00D5:4A	Restraint System Passenger Disable Indicator: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B11CF:4A	Passenger Frontal Airbag Canister Vent: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1404:4A	Driver Side Airbag Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1405:4A	Driver Curtain Deployment Control 1: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1407:4A	Passenger Side Airbag Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1408:4A	Passenger Curtain Deployment Control 1: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1413:4A	Driver Frontal Restraints Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1414:4A	Driver Side Restraints Sensor 1: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1415:4A	Driver Side Restraints Sensor 2: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1417:4A	Passenger Frontal Restraints Sensor: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1418:4A	Passenger Side Restraints Sensor 1: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.

B1419:4A	Passenger Side Restraints Sensor 2: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B1424:4A	Pedestrian Protection Sensor Center: Incorrect Component Installed	This DTC sets if the RCM detects an unexpected impact sensor.
B1427:4A	Pedestrian Protection Sensor Driver Outer: Incorrect Component Installed	This DTC sets if the RCM detects an unexpected impact sensor.
B1469:4A	Unused Satellite Restraints Sensor 1: Incorrect Component Installed	This DTC sets if the RCM detects an unexpected impact sensor.
B146A:4A	Unused Satellite Restraints Sensor 2: Incorrect Component Installed	This DTC sets if the RCM detects an unexpected impact sensor.
B147D:4A	Driver Side Hood Hinge Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B147E:4A	Passenger Side Hood Hinge Deployment Control: Incorrect Component Installed	This DTC sets if the RCM detects the device but it is not configured for this component.
B14EB:4A	Pedestrian Protection Sensor Passenger Outer: Incorrect Component Installed	This DTC sets if the RCM detects an unexpected impact sensor.

Possible Sources

- RCM not configured or configured incorrectly
- Incorrect RCM installed
- Incorrect impact sensor installed

Visual Inspection and Diagnostic Pre-checks

- Review recent service history to identify repairs where an incorrect component may have been installed.

PINPOINT TEST A : BXXXX:4A (ANY BXXXX DTC (DIAGNOSTIC TROUBLE CODE) WITH A 4A FAILURE TYPE) INCORRECT COMPONENT INSTALLED

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were any incorrect component installed Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during self-test. If DTC B00A0:4A was retrieved. REFER to: Pinpoint Test - DTC: N . If DTC U3003:16 or U3003:17 is retrieved on-demand as well, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . For all other incorrect component installed Diagnostic Trouble Codes (DTCs), GO to A2.
No	If DTC U3003:16 or U3003:17 is retrieved on-demand as well, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 are not retrieved on-demand, DIAGNOSE the Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A5.

A2 CHECK THE RCM (RESTRAINTS CONTROL MODULE) PART NUMBER

Ignition ON.

Check the vehicle repair history. Using the Log Viewer function of the diagnostic scan tool, retrieve and record the RCM part number.

Check the part number recorded against the number listed in the Ford parts catalog and verify the correct RCM is installed in the vehicle.

Is the correct RCM installed?

Yes	GO to A3

No	INSTALL the correct RCM. REFER to: Restraints Control Module (RCM) . GO to A6.

A3 VERIFY THE RCM (RESTRAINTS CONTROL MODULE) CONFIGURATION

Carry out PMI for the RCM. Use As-Built data when carrying out PMI. Refer to the scan tool instructions to carry out PMI.

Using a diagnostic scan tool, perform RCM self-test.

Were any incorrect component installed Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	For DTC B1413:4A, B1414:4A, B1415:4A, B1417:4A, B1418:4A or B1419:4A, GO to A4. For all other incorrect component installed Diagnostic Trouble Codes (DTCs), CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A6.

No	The fault is corrected. GO to A6.

A4 VERIFY THE SUSPECT IMPACT SENSOR PART NUMBER

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Gain access to the suspect impact sensor(s) for which incorrect component installed Diagnostic Trouble Codes (DTCs) were retrieved. Refer to the chart for the appropriate procedure(s).

DTC	Component	Procedure
B1413:4A	LH front impact severity sensor	REFER to: Front Impact Severity Sensor .
B1414:4A	Driver front door side impact sensor	REFER to: Front Door Side Impact Sensor .
B1415:4A	LH B-pillar side impact sensor	REFER to: B-Pillar Side Impact Sensor .
B1417:4A	RH front impact severity sensor	REFER to: Front Impact Severity Sensor .
B1418:4A	Passenger front door side impact sensor	REFER to: Front Door Side Impact Sensor .

B1419:4A	RH B-pillar side impact sensor	REFER to: B-Pillar Side Impact Sensor .

Record the part number from each suspect impact sensor.

Check the part number(s) recorded against the number listed in the Ford parts catalog and verify that each suspect impact sensor installed in the vehicle is correct.

Do the part numbers of all suspect impact sensors match the part numbers listed in the Ford parts catalog?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. GO to A6.

No	INSTALL the correct impact sensor(s) as necessary. For DTC B1413:4A or B1417:4. REFER to: Front Impact Severity Sensor . For DTC B1414:4A or B1418:4. REFER to: Front Door Side Impact Sensor . For DTC B1415:4A or B1419:4. REFER to: B-Pillar Side Impact Sensor . GO to A6.

A5 CHECK FOR AN INTERMITTENT FAULT

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform RCM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Were any incorrect component installed Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A6.

No	Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A6.

A6 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	CLEAR all RCM and OCSM Continuous Memory Diagnostic Trouble Codes (CMDTCs). PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AC > C0061:68, C0062:68, C0063:68, C0064:68, C0065:68

Diagnostic Overview

Normal Operation and Fault Conditions

The RCM provides the stability/traction control system with acceleration sensor data over the HS-CAN2. In addition to transmitting the data, the RCM monitors this data internally to make sure that the data is within an expected range.

If the data is outside of the expected range and a fault is detected, the RCM stores DTC C0061:68, C0062:68, C0063:68, C0064:68, and/or C0065:68 in memory. However, the RCM does not request that the IPC illuminate the airbag warning indicator when these faults are present.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
C0061:68	Lateral Acceleration Sensor: Event Information	A fault is indicated when the lateral acceleration sensor is transmitting data that is outside of the range expected by the RCM.
C0062:68	Longitudinal Acceleration Sensor: Event Information	A fault is indicated when the longitudinal acceleration sensor is transmitting data that is outside of the range expected by the RCM.
C0063:68	Yaw Rate Sensor: Event Information	A fault is indicated when the yaw rate sensor is transmitting data that is outside of the range expected by the RCM.
C0064:68	Roll Rate Sensor: Event Information	A fault is indicated when the roll rate sensor is transmitting data that is outside of the range expected by the RCM.

C0065:68	Vertical Acceleration Sensor: Event Information	A fault is indicated when the vertical acceleration sensor is transmitting data that is outside of the range expected by the RCM.

Possible Sources

- Aggressive driving conditions or rough roads
- RCM mounting
- RCM

PINPOINT TEST A : C0061:68, C0062:68, C0063:68, C0064:68, C0065:68

WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Were Diagnostic Trouble Codes (DTCs) C0061:68, C0062:68, C0063:68, C0064:68, or C0065:68 the only Diagnostic Trouble Codes (DTCs) retrieved?

Yes	CLEAR the RCM Diagnostic Trouble Codes (DTCs). GO to A2

No	DIAGNOSE all other RCM Diagnostic Trouble Codes (DTCs) first. REFER to: Airbag Supplemental Restraint System (SRS) .

A2 CHECK FOR A RETURNING FAULT

Test drive the vehicle. Choose a route with LH and RH turns. Avoid rough roads and **do not** drive the vehicle aggressively.

Using a diagnostic scan tool, perform RCM self-test.

Were Diagnostic Trouble Codes (DTCs) C0061:68, C0062:68, C0063:68, C0064:68, or C0065:68 the only RCM Diagnostic Trouble Codes (DTCs) retrieved?

Yes	GO to A3

No	If no RCM Diagnostic Trouble Codes (DTCs) were retrieved, the Diagnostic Trouble Codes (DTCs) may have been triggered by aggressive driving or rough road conditions. INFORM the customer that aggressive driving conditions or rough road conditions can set these Diagnostic Trouble Codes (DTCs). RETURN the vehicle to the customer. If any other RCM Diagnostic Trouble Codes (DTCs) were retrieved, DIAGNOSE those Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

A3 CHECK THE RCM (RESTRAINTS CONTROL MODULE) INSTALLATION

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Inspect the RCM installation and make sure that the hardware is fully seated and tightened correctly. REFER to: Restraints Control Module (RCM) .

Inspect the RCM mounting surface for damage, corrosion, or foreign materials.

Is the RCM mounted correctly and is the mounting surface clean and free from damage?

Yes	GO to A4

No	REPAIR the mounting or INSTALL new hardware, as necessary. GO to A6

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A4 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread

terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect RCM C310A and C310B .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, clear all RCM Diagnostic Trouble Codes (DTCs).

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A6.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A5.

A5 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect RCM C310A and C310B for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harnesses for any damaged, pinched, cut or pierced wires.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A6.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint

	test. GO to A6.

A6 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, Diagnostic Trouble Codes (DTCs) are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform the

Restraints self-test to retrieve Diagnostic Trouble Codes (DTCs).

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	CLEAR all RCM and OCSM Continuous Memory Diagnostic Trouble Codes (CMDTCs). PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AD > U0100:00

Normal Operation and Fault Conditions

The OCSM and RCM both use information contained in messages from the PCM sent on the HS-CAN.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0100:00	Lost Communication with ECM/PCM "A": No Sub Type Information	This DTC sets if the OCSM does not receive an expected message from the PCM.

U0100:00	Lost Communication with ECM/PCM "A": No Sub Type Information	This DTC sets if the RCM does not receive an expected message from the PCM.

Possible Causes

- Network traffic
- PCM
- RCM
- OCSM

PINPOINT TEST A : U0100:00

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.*

A1 VERIFY DIAGNOSTIC SCAN TOOL COMMUNICATION WITH THE PCM (POWERTRAIN CONTROL MODULE)

> *WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.*

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Connect the diagnostic scan tool.

Check that a vehicle session can be established using the diagnostic scan tool.

Can a vehicle session be established?

Yes	If DTC U0100:00 was retrieved from the OCSM, GO to A2. If DTC U0100:00 was retrieved from the RCM, GO to A3.

No	To diagnose no communication with the PCM. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Using a diagnostic scan tool, perform OCSM self-test.

Using a diagnostic scan tool, clear OCSM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform OCSM self-test.

Is DTC U0100:00 retrieved again?

Yes	GO to A4

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 CHECK THE RCM (RESTRAINTS CONTROL MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U0100:00 retrieved again?

Yes	GO to A4

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE PCM (POWERTRAIN CONTROL MODULE) KOEO (KEY ON, ENGINE OFF) SELF-TEST

Using a diagnostic scan tool, perform PCM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the PCM KOEO self-test.

Is DTC P0562 or P0563 recorded?

Yes	DIAGNOSE the PCM Diagnostic Trouble Codes (DTCs). Refer to the appropriate Engine article for the procedure.

No	If DTC U0100:00 was originally retrieved from the OCSM, GO to A5. If DTC U0100:00 was originally retrieved from the RCM, GO to A6.

A5 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) SELF-TEST

Using a diagnostic scan tool, perform OCSM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the OCSM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A7.

A6 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform RCM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A8.

A7 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0100:00 SET IN MODULES OTHER THAN THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE)

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0100:00 set in the ABS module or in the RCM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. Refer to the appropriate Engine article for the procedure.

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new OCS. REFER to: Occupant Classification System (OCS) Sensor .

A8 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0100:00 SET IN OTHER MODULES OTHER THAN THE RCM (RESTRAINTS CONTROL MODULE)

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0100:00 set in the ABS module or in the OCSM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new PCM. Refer to the appropriate Engine article for the procedure.

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AE > U0140:00

Normal Operation and Fault Conditions

The RCM uses information contained in messages from the BCM sent on the HS-CAN2.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0140:00	Lost Communication with Body Control Module: No Sub Type Information	This DTC sets if the RCM does not receive an expected message from the BCM.

Possible Sources

- Network traffic
- BCM
- RCM

PINPOINT TEST A : U0140:00

WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when

instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK THE COMMUNICATION NETWORK

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, carry out a network test.

Does the BCM pass the network test?

Yes	GO to A2

No	To diagnose no communication with the BCM. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE RCM (RESTRAINTS CONTROL MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U0140:00 retrieved again?

Yes	GO to A3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A4

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE BCM (BODY CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform BCM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the BCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Body Control Module (BCM) .

No	GO to A5

A5 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0140:00 SET IN OTHER MODULES

Ignition ON.

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0140:00 set in the ABS Module or in the IPC?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern,

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AF > U0154:00

Normal Operation and Fault Conditions

The RCM uses information contained in messages from the OCSM sent on the High Speed Controller Area Network 2 (HS2-CAN).

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0154:00	Lost Communication with Restraints Occupant Classification System Module: No Sub Type Information	This DTC sets if the RCM does not receive an expected message from the OCSM.

Possible Sources

- Network traffic

- RCM

PINPOINT TEST A : U0154:00

WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK THE COMMUNICATION NETWORK

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, carry out a network test.

Does the OCSM pass the network test?

Yes	GO to A2

No	To diagnose no communication with the OCSM. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE RCM (RESTRAINTS CONTROL MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U0154:00 retrieved again?

Yes	GO to A3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A4

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) SELF-TEST

Using a diagnostic scan tool, perform OCSM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the OCSM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . REPEAT the RCM self-test. If DTC U0154:00 returns, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor .

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AG > U0155:00

Normal Operation and Fault Conditions

The RCM uses information contained in messages from the IPC sent on the HS-CAN.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0155:00	Lost Communication with Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	This DTC sets if the RCM does not receive an expected message from the IPC for 6 seconds.

Possible Causes

- Network traffic
- IPC
- RCM

PINPOINT TEST A : U0155:00

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts

released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK THE COMMUNICATION NETWORK

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, carry out a network test.

Does the IPC pass the network test?

Yes	GO to A2

No	To diagnose no communication with the IPC. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE RCM (RESTRAINTS CONTROL MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U0155:00 retrieved again?

Yes	GO to A3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Check the recorded Diagnostic Trouble Codes (DTCs) from the RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A4

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE IPC (INSTRUMENT PANEL CLUSTER) SELF-TEST

Using a diagnostic scan tool, perform IPC self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the IPC self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Instrumentation, Message Center and Warning Chimes .

No	GO to A5

A5 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0155:00 SET IN OTHER MODULES

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0155:00 set in the BCM, ACM, or APIM (if equipped)?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, .

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

Normal Operation and Fault Conditions

The RCM uses information contained in messages from the APIM sent on the High Speed Controller Area Network 2 (HS2-CAN).

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0253:00	Lost Communication with Accessory Protocol Interface Module: No Sub	This DTC sets if the RCM does not receive an expected message

	Type Information	from the APIM.

Possible Sources

- Network traffic
- APIM
- RCM

PINPOINT TEST A : U0253:00

WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK THE COMMUNICATION NETWORK

Ignition ON.

Using a diagnostic scan tool, carry out a network test.

Does the APIM pass the network test?

Yes	GO to A2
No	To diagnose no communication with the APIM. REFER to: MODULE COMMUNICATIONS

	NETWORK .

A2 CHECK THE RCM (RESTRAINTS CONTROL MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, clear RCM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U0253:00 retrieved again?

Yes	GO to A3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Check for recorded Diagnostic Trouble Codes (DTCs) from the RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A4

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE APIM (SYNC MODULE) SELF-TEST

Using a diagnostic scan tool, perform APIM self-test.

Check for recorded Diagnostic Trouble Codes (DTCs) from the APIM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to the appropriate procedure to DIAGNOSE the battery voltage Diagnostic Trouble Codes (DTCs). Refer to the appropriate Information and Entertainment System article for the procedure.

No	GO to A5

A5 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0253:00 SET IN OTHER MODULES

Ignition ON.

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0253:00 set in the ACM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new APIM. Refer to the appropriate Information and Entertainment System article for the procedure.

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AI > U2300:55, U2300:64

Refer to Supplemental Restraint System for schematic and connector information.

NOTE: DTC U2300:55 is set in every new RCM that has not previously been installed or that has previously been installed but has not yet successfully received configuration data messages from the BCM. DO NOT replace any components for this DTC unless directed to do so by the following pinpoint test.

Normal Operation and Fault Conditions

The RCM receives a configuration data message from the BCM when the RCM proves out during the very first ignition cycle after it is installed. During prove-out at the beginning of each subsequent ignition cycle, the BCM sends configuration data to the RCM and the RCM compares the message to the message that was received during the very first ignition cycle.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U2300:55	Central Configuration: Not Configured	This DTC is present in every new RCM. Once the new RCM is installed and it successfully receives a configuration data message from the BCM, this DTC reports as a Continuous Memory Diagnostic Trouble Code (CMDTC). If the RCM reports this DTC on-demand, it means that the configuration data message has not been received from the BCM.
U2300:64	Central Configuration: Signal Plausibility Failure	If the RCM receives a configuration data message that does not match the configuration

		data that was previously received and stored, it sets this DTC. This DTC can set on-demand during the RCM prove-out, but change to a Continuous Memory Diagnostic Trouble Code (CMDTC) later on in the ignition cycle if the correct message is eventually received. If PMI has not been carried out for the BCM, this DTC sets.

Possible Sources

- RCM or BCM configuration
- BCM
- RCM

PINPOINT TEST A : U2300:55, U2300:64

WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Record the RCM Diagnostic Trouble Codes (DTCs) that were retrieved during the self-test.

Is DTC U2300:55 or U2300:64 retrieved on-demand?

Yes	GO to A2.

No	If DTC U2300:55 or U2300:64 is retrieved as a Continuous Memory Diagnostic Trouble Code (CMDTC), CLEAR the RCM Diagnostic Trouble Codes (DTCs) and REPEAT the self-test. If DTC U2300:55 or U2300:64 does not return, RELEASE the vehicle to the customer. If DTC U2300:55 or U2300:64 returns on-demand, GO to A2.

A2 CHECK FOR THE CORRECT BCM (BODY CONTROL MODULE)

Using the Log Viewer function of the diagnostic scan tool, retrieve and record the BCM part number.

Check the recorded part number against the number listed in the Ford parts catalog.

Does the recorded part number match the number listed in the Ford parts catalog?

Yes	GO to A3

No	INSTALL the correct BCM and USE As-Built data when carrying out PM. REFER to: Body Control Module (BCM) . GO to A4.

A3 CHECK FOR THE CORRECT RCM (RESTRAINTS CONTROL MODULE)

Using the Log Viewer function of the diagnostic scan tool, retrieve and record the RCM part number.

Check the recorded part number against the number listed in the Ford parts catalog.

Does the recorded part number match the number listed in the Ford parts catalog?

Yes	CARRY OUT PMI for the BCM using As-Built data. CLEAR the Diagnostic Trouble Codes (DTCs) and REPEAT the RCM self-test. If DTC U2300:55 or U2300:64 are retrieved, CARRY OUT PMI for the RCM using As-Built data. GO to A4.

No	INSTALL the correct RCM and use As-Built data when carrying out PM. REFER to: Restraints Control Module (RCM) . GO to A4.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A4 CHECK FOR ADDITIONAL RCM (RESTRAINTS CONTROL MODULE) OR BCM (BODY CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Using a diagnostic scan tool, perform BCM self-test.

Were any Diagnostic Trouble Codes (DTCs) retrieved from the RCM or BCM during self-test?

Yes	If RCM Diagnostic Trouble Codes (DTCs) were retrieved, do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) . If BCM Diagnostic Trouble Codes (DTCs) were retrieved, diagnose the BCM. REFER to: Body Control Module (BCM) .

No	CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AJ > U3003:16 AND U3003:17

Refer to Supplemental Restraint System for schematic and connector information.

NOTE: Diagnostic Trouble Codes (DTCs) U3003:16 and U3003:17 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

Normal Operation - RCM

The RCM continuously monitors the input voltage for correct operation. If the RCM detects input voltage below 9.0 volts while a fault is present, or below 6.0 volts, whether or not a fault is present, it stores DTC U3003:16 in memory. If the RCM detects input voltage above 16 volts while a fault is present, or above 18 volts, regardless of fault status, it stores DTC U3003:17 in memory. If the RCM sets DTC U3003:16 or U3003:17, it sends a message to the IPC to illuminate the airbag warning indicator.

Normal Operation - OCSM

The OCSM continuously monitors the input voltage for correct operation. If the OCSM detects input voltage below 8 volts, it stores DTC U3003:16 in memory. If the OCSM detects input voltage above 18 volts, it stores DTC U3003:17 in memory. If the OCSM sets DTC U3003:16 or U3003:17, it sends a fault message to the RCM. The RCM then sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	This DTC sets if the RCM detects voltage below 9 volts with certain SRS faults present or below 6

		volts, whether or not a SRS fault exists.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	This DTC sets if the RCM detects voltage above 16 volts with certain SRS faults present or above 18 volts without a SRS fault.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	This DTC sets if the OCSM detects voltage below 8 volts.
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	This DTC sets if the OCSM detects voltage above 18 volts.

Possible Sources

- Wiring, terminals or connectors
- OCSM
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : U3003:16 AND U3003:17

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Install new components only when directed to do so in the pinpoint test.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE ALL CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS) IN ALL MODULES

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, retrieve ALL Continuous Memory Diagnostic Trouble Codes (CMDTCs).

Is DTC B1317, B1318, B1676, U3003:16 or U3003:17 present in one or more modules AND are any charging system Diagnostic Trouble Codes (DTCs) present in the PCM?

Yes	DIAGNOSE the charging system. Refer to the appropriate Battery and Charging System article for the procedure.

No	GO to A2

A2 TEST BATTERY CONDITION

Ignition OFF.

Carry out the Battery Condition Test. REFER to: BATTERY .

Did the battery pass the condition test?

Yes	If the battery passed the condition test but required a recharge, DIAGNOSE the charging system. Refer to the appropriate Battery and Charging System article for the procedure. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs).If the battery passed the condition test and did not require a recharge, GO to A3.

No	INSTALL a new battery. REFER to: Battery . CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

A3 CHECK THE CHARGING SYSTEM VOLTAGE

Start the engine.

Measure the voltage of the battery.

For DTC U3003:17, turn off all accessories while measuring the battery voltage.

For DTC U3003:16, turn on headlights and HVAC fan on high while measuring the battery voltage.

Is the voltage between 13 and 15.2 volts?

Yes	For DTC U3003:16, GO to A4. For DTC U3003:17, GO to A6.

No	DIAGNOSE the charging system. Refer to the appropriate Battery and Charging System article for the procedure. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

A4 CHECK FOR OPEN IGNITION CIRCUIT TO THE MODULE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect the module with the concern:

For the RCM, disconnect C310A and C310B .

For the OCSM, disconnect C3159 .

For the RCM, measure:

Positive Lead	Measurement / Action	Negative Lead
C310A-19	Ω	C2280A-4

For the OCSM, measure:

Positive Lead	Measurement / Action	Negative Lead
C3043-1	Ω	C2280C-23

Is the resistance less than 1 ohm?

Yes	GO to A5

No	REPAIR the circuit as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

A5 CHECK FOR OPEN GROUND TO THE MODULE

For the RCM, measure:

Positive Lead	Measurement / Action	Negative Lead
RCM mounting bracket	Ω	Ground

For the OCSM, measure:

Positive Lead	Measurement / Action	Negative Lead
C3043-6	Ω	Ground

Is the resistance less than 1 ohm?

Yes	GO to A6

No	For the RCM, VERIFY there is no corrosion between the RCM and the mounting surface. VERIFY the fasteners are clean and tightened to specification with no corrosion. REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. For the OCSM, REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs).

A6 CHECK FOR MODULE OPERATION

Ignition OFF.

If not previously directed to do so. Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect the module with the concern:

For the RCM, disconnect C310A and C310B (if not previously disconnected).

For the OCSM, disconnect OCSM C3043 (if not previously disconnected).

Check for the following:

corrosion (install new connector or terminals - clean module pins)

damaged or bent pins - install new terminals/pins

pushed-out pins - install new pins as necessary

Connect the module with the concern:

For the RCM, connect C310A and C310B . Make sure the connector seats correctly and engages the Connector Position Assurance (CPA) lever/lock.

For the OCSM, connect C3043 . Make sure the connector seats correctly.

Repower the SRS. Refer to: Supplemental Restraint System (SRS) Repowering .

Is the concern still present?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern and DTC U3003:16 or U3003:17 was present in the RCM, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . If no Technical Service Bulletins (TSBs) address this concern and DTC U3003:16 or U3003:17 was present in the OCSM, INSTALL a new OCS. REFER to: Occupant Classification System (OCS) Sensor .

No	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AK > B0061:11, B0061:12, B0061:13, B0061:49 AND B0061:64

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The Belt Tension Sensor (BTS) operates in conjunction with the OCS. The OCS interprets a variable voltage signal provided by the Belt Tension Sensor (BTS) to identify the possible presence of a child safety seat in the front passenger seat. The voltage output of the Belt Tension Sensor (BTS) is proportional to the amount of tension applied to the sensor by the belt: no belt tension causes a low voltage (approximately 0.95 volt) to be output and high belt tension causes a high voltage (approximately 3.8 volts) to be returned to the OCSM.

The OCSM monitors the Belt Tension Sensor (BTS) and related circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted Belt Tension Sensor (BTS) (part of RH front passenger safety belt buckle)

If a fault is detected, the OCSM stores DTC B0061:11, B0061:12, B0061:13, B0061:49 or B0061:64 in memory and sends a message to the RCM over the HS-CAN2 indicating that an OCS fault is present. Upon receipt of this message, the RCM sets DTC B00A0:09 and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B0061:11	Passenger Seatbelt Tension Sensor: Circuit Short to Ground	A fault is indicated when the OCSM measures voltage below a predetermined threshold on the Belt Tension Sensor (BTS) signal circuit. An open Belt Tension Sensor (BTS) VREF circuit can also set this DTC.
B0061:12	Passenger Seatbelt Tension Sensor: Circuit Short to Battery	A fault is indicated when the OCSM measures voltage above a predetermined threshold on the Belt

		Tension Sensor (BTS) signal circuit. An open Belt Tension Sensor (BTS) return circuit can also set this DTC.
B0061:13	Passenger Seatbelt Tension Sensor: Circuit Open	A fault is indicated when the OCSM senses an open on either Belt Tension Sensor (BTS) circuit.
B0061:49	Passenger Seatbelt Tension Sensor: Internal Electronic Failure	A fault is indicated when the OCSM senses an internal fault on the Belt Tension Sensor (BTS) signal circuit.
B0061:64	Passenger Seatbelt Tension Sensor: Signal Plausibility Failure	A fault is indicated when the passenger safety belt is unbuckled and the OCSM measures voltage on the Belt Tension Sensor (BTS) signal circuit greater than the maximum voltage returned during normal sensor operation.

Possible Sources

- Wiring, terminals or connectors
- Belt Tension Sensor (BTS) (part of RH front passenger safety belt buckle)
- OCSM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged passenger safety belt buckle or Belt Tension Sensor (BTS).
- Inspect for a damaged passenger seat cushion wiring harness.
- Inspect for a loose or damaged OCSM or Belt Tension Sensor (BTS) connector.
- Inspect for a damaged OCSM.

PINPOINT TEST A : B0061:11, B0061:12, B0061:13, B0061:49 AND B0061:64

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

Was DTC B0061:11, B0061:12, B0061:13, B0061:49 or B0061:64 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test. For DTC B0061:11, GO to A2. For DTC B0061:12, GO to A5. For DTC B0061:13, GO to A7. For DTC B0061:49, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor . GO to A13. For DTC B0061:64, GO to A9.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A12.

NOTE: This pinpoint test step attempts to change the fault reported by the OCSM by inducing a different fault condition. If the fault reported changes, this indicates the OCSM is functioning correctly and is not the source of the fault.

A2 CHECK THE BELT TENSION SENSOR (BTS)

Ignition OFF.

Disconnect Passenger Safety Belt Buckle C3238 .

Using a diagnostic scan tool, perform OCSM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the Belt Tension Sensor (BTS) disconnected, an open circuit fault is normally retrieved. The Belt Tension Sensor (BTS) shares a connector with the passenger safety belt buckle switch, and a passenger safety belt buckle switch circuit fault will also be present in the RCM.

Was DTC B0061:11 retrieved on-demand during self-test?

Yes	GO to A3

No	INSTALL a new front passenger safety belt buckle. REFER to: Front Seatbelt Buckle . GO to A13.

A3 CHECK THE BELT TENSION SENSOR (BTS) CIRCUITS FOR A SHORT TO GROUND OR A SHORT TOGETHER

Ignition OFF.

Disconnect OCSM C3043 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-1	Ω	Ground

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-1	Ω	C3238-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to A4.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

A4 CHECK THE BELT TENSION SENSOR (BTS) VREF CIRCUIT FOR AN OPEN

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3043-5	Ω	C3238-2

Is the resistance less than 0.5 ohm?

Yes	GO to A11.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

A5 CHECK THE BELT TENSION SENSOR (BTS) SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Safety Belt Buckle C3238 .

Disconnect OCSM C3043 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3043-6		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

No	GO to A6

A6 CHECK THE BELT TENSION SENSOR (BTS) GROUND CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-3	Ω	Ground

Is the resistance less than 3 ohms?

Yes	GO to A10

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

NOTE: This pinpoint test step will attempt to change the fault reported by the OCSM by inducing a different fault condition. If the fault reported changes, this indicates the OCSM is functioning correctly and is not the source of the fault.

A7 CHECK THE BELT TENSION SENSOR (BTS)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Safety Belt Buckle C3238 .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3238-1		C3238-3

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the Belt Tension Sensor (BTS) circuits shorted together, a short to ground fault is normally retrieved. The Belt Tension Sensor (BTS) shares a connector with the passenger safety belt buckle switch, and a passenger safety belt buckle switch circuit fault will also be present in the RCM.

Did the on-demand DTC change from B0061:13 to B0061:11?

Yes	INSTALL a new front passenger safety belt buckle. REFER to: Front Seatbelt Buckle . GO to A13.

No	GO to A8

A8 CHECK THE BELT TENSION SENSOR (BTS) SIGNAL CIRCUIT FOR AN OPEN

Ignition OFF.

Disconnect OCSM C3043 .

Measure:

Positive Lead	Measurement / Action	Negative Lead

C3238-1	Ω	C3043-6

Is the resistance less than 0.5 ohm?

Yes	GO to A10

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

A9 CHECK THE BELT TENSION SENSOR (BTS) SIGNAL CIRCUIT FOR A SHORT TO THE BELT TENSION SENSOR (BTS) VREF CIRCUIT

WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

Ignition OFF.

Disconnect OCSM C3043 .

Disconnect Passenger Safety Belt Buckle C3238 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-2	Ω	C3238-1

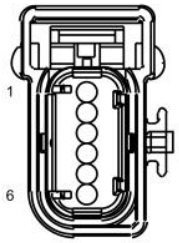
Is the resistance greater than 10, 000 ohms?

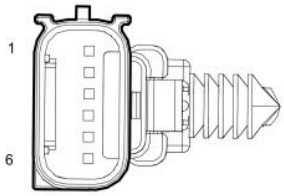
Yes	GO to A10

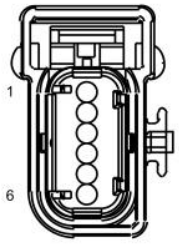
No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A13.

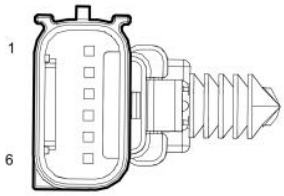
A10 CHECK BELT TENSION SENSOR (BTS) VOLTAGE OUTPUT

Ignition OFF.







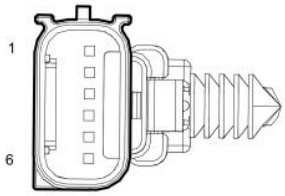


Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect OCSM C3043 .

Disconnect Passenger Side Airbag (Inline) C219 .

Connect fused jumper wires:



Lead 1	Measurement / Action	Lead 2

 E155161 C3238, pin 2, harness side		 E155160 C3238, pin 2, component side
 E155161 C3238, pin 3, harness side		 E155160 C3238, pin 3, component side

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
 E155160 C3238, pin 1, component side		Ground

Does the voltage vary from approximately 0.95 volt with no tension applied to the sensor to approximately 3.8 volts with full tension applied to the sensor?

Yes	REMOVE the fused jumper wires and GO to A11

No	REMOVE the fused jumper wires and INSTALL a new front passenger safety belt buckle. REFER to: Front Seatbelt Buckle . GO to A13.

NOTE: Make sure all OCS components, SRS electrical connectors and the RCM

electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) FAULT

Ignition OFF.

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect OCSM C3043 .

Connect Passenger Safety Belt Buckle C3238 (if previously disconnected).

If previously directed to disconnect Passenger Side Airbag (Inline) C219 . Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor . GO to A13.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test. GO to A12.

A12 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Disconnect Passenger Safety Belt Buckle C3238 .

Inspect connector(s) (including any inline connectors) for loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for

schematic and connector information.

Connect Passenger Safety Belt Buckle C3238 .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

Was DTC B0061:11, B0061:12, B0061:13, B0061:49 or B0061:64 retrieved on-demand during self-test?

Yes	The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test.For DTC B0061:11, GO to A2. For DTC B0061:12, GO to A5. For DTC B0061:13, GO to A7. For DTC B0061:49, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor . GO to A13. For DTC B0061:64, GO to A9.

No	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other system in the same wire harness. Do not install any new SRS components at this time. Only install SRS components when directed to do so in the pinpoint test. REPAIR any intermittent concerns found. GO to A13

A13 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

If previously directed to disconnect Passenger Side Airbag (Inline) C219 . Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AL > B00C2:11 AND B00C2:12

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The Belt Tension Sensor (BTS) operates in conjunction with the OCS. The OCSM provides a reference voltage to the Belt Tension Sensor (BTS), which changes as it passes through the sensor, based on how much tension is applied to the safety belt and Belt Tension Sensor (BTS).

The OCSM monitors the Belt Tension Sensor (BTS) reference voltage circuit for a short to voltage or a short to ground.

If a fault is detected, the OCSM stores DTC B00C2:11 or B00C2:12 in memory and sends a message to the RCM over the HS-CAN2 indicating that an OCS fault is present. Upon receipt of this message, the RCM sets DTC B00A0:09 and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B00C2:11	Passenger Seat Occupant Classification Sensor "C": Circuit Short to Ground	A fault is indicated when the OCSM senses a short to ground on the Belt Tension Sensor (BTS) reference voltage circuit.
B00C2:12	Passenger Seat Occupant Classification Sensor "C": Circuit Short to Battery	A fault is indicated when the OCSM senses a short to voltage on the Belt Tension Sensor (BTS) reference voltage circuit.

Possible Sources

- Wiring, terminals or connectors
- Belt Tension Sensor (BTS) (part of RH front passenger safety belt buckle)
- OCSM

Visual Inspection and Diagnostic Pre-checks

- Inspect for a damaged passenger safety belt buckle or Belt Tension Sensor (BTS).
- Inspect for a damaged passenger seat cushion wiring harness.
- Inspect for a loose or damaged OCSM or Belt Tension Sensor (BTS) connector.
- Inspect for a damaged OCSM.

PINPOINT TEST A : B00C2:11 AND B00C2:12

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

Was DTC B00C2:11 or B00C2:12 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test. For DTC B00C2:11, GO to A2. For DTC B00C2:12, GO to A4.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the OCSM by

inducing a different fault condition. If the fault reported changes, this indicates the OCSM is functioning correctly and is not the source of the fault.

A2 CHECK THE BELT TENSION SENSOR (BTS)

Ignition OFF.

Disconnect Passenger Safety Belt Buckle C3238 .

Using a diagnostic scan tool, perform OCSM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the Belt Tension Sensor (BTS) disconnected, an open circuit fault is normally retrieved. The Belt Tension Sensor (BTS) shares a connector with the passenger safety belt buckle switch, and a passenger safety belt buckle switch circuit fault will also be present in the RCM.

Was DTC B00C2:11 retrieved on-demand during self-test?

Yes	GO to A3.

No	INSTALL a new passenger safety belt buckle. REFER to: Front Seatbelt Buckle . GO to A7.

A3 CHECK THE BELT TENSION SENSOR (BTS) VREF CIRCUIT FOR A SHORT TO GROUND

WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

Ignition OFF.

Disconnect OCSM C3043 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A5.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A7.

A4 CHECK THE BELT TENSION SENSOR (BTS) VREF CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Side Airbag (Inline) C219 .

Disconnect Passenger Safety Belt Buckle C3238 .

Disconnect OCSM C3043 .

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3238-2		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A7.

No	GO to A5.

NOTE: Make sure all OCS system components, restraint system sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A5 CONFIRM THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) FAULT

Ignition OFF.

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect OCSM C3043 (if previously disconnected).

Connect Passenger Safety Belt Buckle C3238 .

If previously directed to disconnect Passenger Side Airbag (Inline) C3049 Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect Passenger Side Airbag (Inline) C219 (if previously disconnected).

Repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor . GO to A7.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test. GO to A6.

A6 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Disconnect Passenger Safety Belt Buckle C3238 .

inspect connector(s) (including any inline connectors) for loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damage, pinched, cut or pierced wires.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Safety Belt Buckle C3238 .

Ignition ON.

Using a diagnostic scan tool, perform OCSM self-test to retrieve Diagnostic Trouble Codes (DTCs).

Was DTC B00C2:11 or B00C2:12 retrieved on-demand during self-test?

Yes	The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during the self-test. For DTC B00C2:11, GO to A2For DTC B00C2:12, GO to A4.

No	CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other system in the same wire harness. Do not install any new SRS components at this time. Only install SRS components when directed to do so in the pinpoint test. REPAIR any intermittent concerns found. GO to A7.

A7 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

If previously directed to disconnect Passenger Side Airbag (Inline) C219 . Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS. Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolve. REFER to: Airbag Supplemental Restraint System (SRS) .

No	CLEAR all RCM and OCSM Diagnostic Trouble Codes (DTCs). PROVE OUT the SRS. The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AM > U0151:00

Normal Operation and Fault Conditions

The OCSM uses information contained in messages from the RCM sent on the High Speed Controller Area Network 2 (HS2-CAN).

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
U0151:00	Lost Communication with Restraints Control Module: No Sub Type Information	This DTC sets if the OCSM does not receive an expected message from the RCM.

Possible Sources

- Network traffic
- OCSM
- RCM

PINPOINT TEST A : U0151:00

> *WARNING: Do not handle, move or change the original horizontal mounting position of the Restraints Control Module (RCM) while the Restraints Control Module (RCM) is connected and the ignition switch is ON. Failure to follow this instruction may result in the*

accidental deployment of the Safety Canopy® and cause serious personal injury or death.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

A1 CHECK THE COMMUNICATION NETWORK

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, carry out a network test.

Does the RCM pass the network test?

Yes	GO to A2

No	To diagnose no communication with the RCM. REFER to: MODULE COMMUNICATIONS NETWORK .

A2 CHECK THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODES (CMDTCS)

Using a diagnostic scan tool, perform OCSM self-test.

Using a diagnostic scan tool, clear OCSM Diagnostic Trouble Codes (DTCs).

Wait 10 seconds.

Using a diagnostic scan tool, perform OCSM self-test.

Is DTC U0151:00 retrieved again?

Yes	GO to A3

No	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

A3 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE RCM (RESTRAINTS CONTROL MODULE) SELF-TEST

Using a diagnostic scan tool, perform RCM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A4

A4 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE OCSM (OCCUPANT CLASSIFICATION SYSTEM MODULE) SELF-TEST

Using a diagnostic scan tool, perform OCSM self-test.

Check the recorded Diagnostic Trouble Codes (DTCs) from the OCSM self-test.

Is DTC U3003:16 or U3003:17 recorded?

Yes	REFER to: Pinpoint Test - DTC: AJ .

No	GO to A5

A5 CHECK FOR DTC (DIAGNOSTIC TROUBLE CODE) U0151:00 SET IN OTHER MODULES

Ignition ON.

Using a diagnostic scan tool, perform self-test for all modules.

Is DTC U0151:00 set in the ABS module or in the BCM?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) .

No	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new OCS sensor. REFER to: Occupant Classification System (OCS) Sensor .

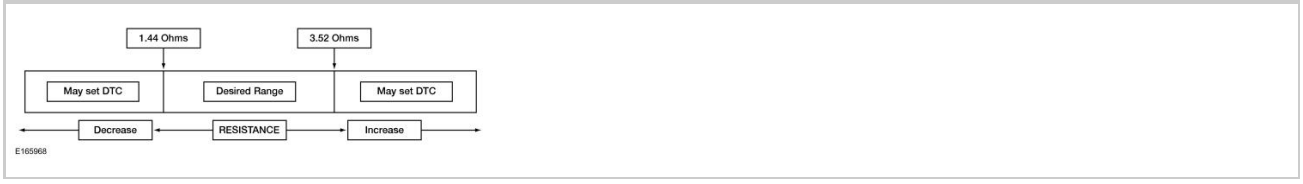
DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AN, CONVERTIBLE

Pinpoint Test - DTC: AN, Convertible

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AN, CONVERTIBLE > B1405:11, B1405:12, B1405:13, B1405:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions



The RCM continuously monitors the driver upper side airbag circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted driver upper side airbag

If a fault is detected, the RCM stores DTC B1405:11, B1405:12, B1405:13 or B1405:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Driver upper side airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions

B1405:11	Driver Side Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either driver upper side airbag circuit for more than 6 seconds.
B1405:12	Driver Side Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either driver upper side airbag circuit for more than 6 seconds.
B1405:13	Driver Side Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the driver upper side airbag circuits for more than 6 seconds.
B1405:1A	Driver Side Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the driver upper side airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Driver upper side airbag
- RCM

PINPOINT TEST A : B1405:11, B1405:12, B1405:13 AND B1405:1A

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts*

released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:11, B1405:12, B1405:13 and B1405:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver upper side airbag Diagnostic Trouble Codes (DTCs). For DTC B1405:13 or B1405:1A, GO to A2. For DTC B1405:11, GO to A8. For DTC B1405:12, GO to A10.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the driver upper side airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

A2 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_11_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_11_R PID, carry out the harness test of the driver upper side airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4. For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE DRIVER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver upper side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1405:1A to B1405:13?

Yes	GO to A11.

No	GO to A5.

A5 CHECK FOR A SHORT BETWEEN THE DRIVER UPPER SIDE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-1	Ω	C3206-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE DRIVER UPPER SIDE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-25	Ω	C3206-1
C310B-26	Ω	C3206-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C3206-1		C3206-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver upper side airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1405:13 to B1405:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE DRIVER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the driver upper side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1405:11 to B1405:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE DRIVER UPPER SIDE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-1	Ω	Ground
C3206-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE DRIVER UPPER SIDE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C3206-1	V	Ground
C3206-2	V	Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE DRIVER UPPER SIDE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Upper Side Airbag C3464 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Upper Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	REMOVE and INSPECT the driver seat backrest harness for damage. REFER to: Side Airbag . If a concern is found, REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17. If a concern is not found, INSTALL a new driver upper side airbag. REFER to: Side Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are

connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Upper Side Airbag (Inline) C3206 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1405:13 or B1405:1A, GO to A13. For DTC B1405:11, GO to A14. For DTC B1405:12, GO to A15.

A13 CHECK THE LEFT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_11_R) PID (PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_11_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17

A14 CHECK THE DRIVER UPPER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE DRIVER UPPER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1405:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Upper Side Airbag (Inline) C3206 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Driver Upper Side Airbag C3464 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AO, CONVERTIBLE > B1408:11, B1408:12, B1408:13, B1408:1A

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM continuously monitors the passenger upper side airbag circuits for the following faults:

- Resistance out of range
- Unexpected voltage
- Short to ground
- Faulted passenger upper side airbag

If a fault is detected, the RCM stores DTC B1408:11, B1408:12, B1408:13 or B1408:1A in memory and sends a message to the IPC to illuminate the airbag warning indicator.

The RCM analyzes the deployment loop resistance to determine if a fault exists. The value displayed in the PID is the deployment loop resistance measured by the RCM. If the value displayed is lower or higher than the desired range (refer to diagram below in illustration), the RCM can set a DTC. As the deployment loop resistance drifts farther outside the desired range, the chance for a DTC increases. Small variations in resistance can occur due to the effect of road vibrations on terminal fit. Crimps and terminals can be affected by stress and harness movement and can cause an increase in resistance due to wire strain. These variables can result in an intermittent fault. For this reason, the test requires the PID value to be within the desired range before the fault is considered repaired, regardless if the module is reporting an on-demand DTC at the time of diagnosis. Following this direction helps make sure that minor changes in resistance do not create a repeat concern. This test uses process of elimination to diagnose each part of the deployment loop circuit including:

- Wiring
- Connections
- Passenger upper side airbag
- RCM

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1408:11	Passenger Side Curtain Deployment Control 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on either passenger upper side airbag circuit for more than 6 seconds.
B1408:12	Passenger Side Curtain Deployment Control 1: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on either passenger upper side airbag circuit for more than 6 seconds.
B1408:13	Passenger Side Curtain Deployment Control 1: Circuit Open	A fault is indicated when the RCM measures more than the desired resistance between the passenger upper side airbag circuits for more than 6 seconds.
B1408:1A	Passenger Side Curtain Deployment Control 1: Circuit Resistance Below Threshold	A fault is indicated when the RCM measures less than the desired resistance between the passenger upper side airbag circuits for more than 6 seconds.

Possible Sources

- Wiring, terminals or connectors
- Passenger upper side airbag
- RCM

PINPOINT TEST A : B1408:11, B1408:12, B1408:13 AND B1408:1A

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect

diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:11, B1408:12, B1408:13 and B1408:1A retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger upper side airbag Diagnostic Trouble Codes (DTCs). For DTC B1408:13 or B1408:1A, GO to A2. For DTC B1408:11, GO to A8. For DTC B1408:12, GO to A10.
No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. If DTC U3003:16 or U3003:17 is also retrieved on-demand. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the passenger upper side airbag Continuous Memory Diagnostic Trouble Codes (CMDTCs). For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

A2 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID (PARAMETER IDENTIFICATION)

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

Monitor and record the resistance value displayed by the DEPLOY_14_R PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	GO to A12

No	GO to A3

A3 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID (PARAMETER IDENTIFICATION) WHILE CARRYING OUT THE HARNESS TEST

While monitoring the DEPLOY_14_R PID, carry out the harness test of the passenger upper side airbag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness and connectors frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms while carrying out the harness test?

Yes	DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	For PID value less than 1.44 ohms, GO to A4 For PID value greater than 3.52 ohms, GO to A6.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A4 CHECK THE PASSENGER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (LOW RESISTANCE INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger upper side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1408:1A to B1408:13?

Yes	GO to A11

No	GO to A5

A5 CHECK FOR A SHORT BETWEEN THE PASSENGER UPPER SIDE AIRBAG CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-1	Ω	C219-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A12.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A6 CHECK THE PASSENGER UPPER SIDE AIRBAG CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-17	Ω	C219-1
C310B-18	Ω	C219-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is

functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (OPEN INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire:

Lead 1	Measurement / Action	Lead 2
C219-1		C219-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger upper side airbag circuits shorted together, a low resistance fault is normally retrieved.

Did the on-demand DTC change from B1408:13 to B1408:1A?

Yes	REMOVE the fused jumper wire and GO to A11

No	REMOVE the fused jumper wire and GO to A12

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE PASSENGER UPPER SIDE AIRBAG DEPLOYMENT CONTROL DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the passenger upper

side airbag disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B1408:11 to B1408:13?

Yes	GO to A11

No	GO to A9

A9 CHECK THE PASSENGER UPPER SIDE AIRBAG CIRCUITS FOR A SHORT TO GROUND

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-1	Ω	Ground
C219-2	Ω	Ground

Are the resistances greater than 10, 000 ohms?

Yes	GO to A12.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A10 CHECK THE PASSENGER UPPER SIDE AIRBAG CIRCUITS FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C219-1		Ground

C219-2		Ground

Is any voltage present?

Yes	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	GO to A12

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A11 CONFIRM THE PASSENGER UPPER SIDE AIRBAG FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Upper Side Airbag C3465 and make sure the Connector Position Assurance (CPA) tabs are not broken and the clip is not damaged.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Upper Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	REMOVE and INSPECT the passenger seat backrest harness for damage. REFER to: Side Airbag . If a concern is found, REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17. If a concern is not found, INSTALL a new passenger upper side airbag. REFER to: Side Airbag . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test.For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A12 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

Inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damaged, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Upper Side Airbag (Inline) C219 (if previously disconnected).

Connect RCM C310A and C310B (if previously disconnected).

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A17.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. For DTC B1408:13 or B1408:1A, GO to A13. For DTC B1408:11, GO to A14. For DTC B1408:12, GO to A15.

A13 CHECK THE RIGHT CURTAIN DEPLOYMENT CONTROL 1 (DEPLOY_14_R) PID

(PARAMETER IDENTIFICATION) FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT FAULT

Using a diagnostic scan tool, view RCM Parameter Identifications (PIDs).

While monitoring the DEPLOY_14_R PID, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently. Record the resistance value indicated by the PID.

Does the PID value read between 1.44 and 3.52 ohms?

Yes	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

No	Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering . REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

A14 CHECK THE PASSENGER UPPER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO GROUND FAULT

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:11 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A15 CHECK THE PASSENGER UPPER SIDE AIRBAG DEPLOYMENT CONTROL CIRCUITS FOR AN INTERMITTENT SHORT TO BATTERY FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness frequently.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1408:12 retrieved on-demand during self-test?

Yes	DEPOWER the SRS and REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A16.

A16 CHECK THE HARNESS AND CONNECTORS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Upper Side Airbag (Inline) C219 .

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Inspect Passenger Upper Side Airbag C3465 Connector Position Assurance (CPA) tab to verify that it is correctly seated and free of damage.

Were any concerns found?

Yes	REPAIR as necessary. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A17.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A17.

A17 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AP, CONVERTIBLE > B1414:11 AND B1414:93

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors the driver door side impact sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted driver door side impact sensor

If a fault is detected, the RCM stores DTC B1414:11 or B1414:93 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1414:11	Driver Side Restraints Sensor 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the driver door side impact sensor feed circuit.
B1414:93	Driver Side Restraints Sensor 1: No Operation	A fault is indicated when the RCM senses a faulted driver door side impact sensor, a short to voltage on the sensor feed circuit or an open feed or return circuit.

Possible Causes

- Wiring, terminals or connectors
- Driver door side impact sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B1414:11 AND B1414:93

> *WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.*

> *NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.*

> *NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.*

> *NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.*

> *NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.*

> *NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.*

> *NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter*

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1414:11 or B1414:93 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs). For DTC B1414:11, GO to A2. For DTC B1414:93, GO to A4.

No	If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A9.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Front Door Side Impact Sensor C567 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1414:11 to B1414:93?

Yes	INSTALL a new driver door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A10.

No	GO to A3.

A3 CHECK THE DRIVER DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO GROUND AND A SHORT BETWEEN SENSOR CIRCUITS

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1	Ω	Ground

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1	Ω	C567-2

Are the resistances greater than 10, 000 ohms?

Yes	GO to A8.

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

A4 CHECK THE DRIVER DOOR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Inspect the Driver Front Door Side Impact Sensor electrical connector C567 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector as necessary

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1414:93 retrieved on-demand during self-test?

Yes	GO to A5.

No	The fault has been corrected. GO to A10.

A5 CHECK THE DRIVER DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Front Door Side Impact Sensor C567 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C567-1	V	Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

No	GO to A6

A6 CHECK THE DRIVER DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-44	Ω	C567-1
C310B-43	Ω	C567-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE DRIVER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire as shown in illustration:

Lead 1	Measurement / Action	Lead 2
C567-1		C567-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1414:93 to B1414:11?

Yes	REMOVE the fused jumper wire and INSTALL a new driver door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A10.

No	REMOVE the fused jumper wire and GO to A8.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for

correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Door Side Impact Sensor C567 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A10.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A9.

A9 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Driver Door Side Impact Sensor C567 .

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Driver Door Side Impact Sensor C567 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1414:11 or B1414:93 retrieved on-demand during the self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B1414:11, GO to A2. For DTC B1414:93, GO to A4.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AQ, CONVERTIBLE > B1418:11 AND B1418:93

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM monitors the passenger door side impact sensor circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted passenger door side impact sensor

If a fault is detected, the RCM stores DTC B1418:11 or B1418:93 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B1418:11	Passenger Side Restraints Sensor 1: Circuit Short to Ground	A fault is indicated when the RCM senses a short to ground on the passenger door side impact sensor feed circuit.
B1418:93	Passenger Side Restraints Sensor 1: No Operation	A fault is indicated when the RCM senses a faulted passenger door side impact sensor, a short to voltage on the sensor feed circuit or an open feed or return circuit.

Possible Causes

- Wiring, terminals or connectors
- Passenger door side impact sensor
- RCM

Visual Inspection and Diagnostic Pre-checks

- Inspect for damaged wiring harness(es).
- Inspect for loose or damaged connectors.

PINPOINT TEST A : B1418:11 AND B1418:93

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Do not probe any impact sensor. The impact sensor cannot be tested using a multi-meter

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1418:11 or B1418:93 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Diagnostic Trouble Codes (DTCs). For DTC B1418:11, GO to A2. For DTC B1418:93, GO to A4.
No	If DTC U3003:16 or U3003:17 is retrieved on-demand, DIAGNOSE those Diagnostic Trouble Codes (DTCs) first. REFER to: Pinpoint Test - DTC: AJ . If DTC U3003:16 or U3003:17 is not retrieved on-demand during self-test, DIAGNOSE the impact sensor Continuous Memory

	Diagnostic Trouble Codes (CMDTCs). This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A9.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A2 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1418:11 to B1418:93?

Yes	INSTALL a new passenger door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A10.

No	GO to A3

A3 CHECK THE PASSENGER DOOR SIDE IMPACT SENSOR FEED CIRCUITS FOR A SHORT TO GROUND OR A SHORT TOGETHER

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1	Ω	Ground

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1	Ω	C644-2

Is the resistance greater than 10, 000 ohms?

Yes	GO to A8.

No	REPAIR the circuits. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

A4 CHECK THE PASSENGER DOOR SIDE IMPACT SENSOR AND RCM (RESTRAINTS CONTROL MODULE) CONNECTIONS (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Inspect the Passenger Front Door Side Impact Sensor electrical connector C644 to make sure it is fully seated and locked. Seat and lock the connector as necessary.

Gain access to the RCM and inspect C310A and C310B to make sure they are fully seated and locked. Seat and lock the connector as necessary

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1418:93 retrieved on-demand during self-test?

Yes	GO to A5

No	The fault has been corrected. GO to A10

A5 CHECK THE PASSENGER DOOR SIDE IMPACT SENSOR FEED CIRCUIT FOR A SHORT TO VOLTAGE (NO OPERATION INDICATED)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Front Door Side Impact Sensor C644 .

Disconnect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C644-1		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

No	GO to A6

A6 CHECK THE PASSENGER DOOR SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C310B-45	Ω	C644-1
C310B-46	Ω	C644-2

Are the resistances less than 0.5 ohm?

Yes	GO to A7.

No	REPAIR the circuit(s). Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A10.

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A7 CHECK THE PASSENGER SIDE RESTRAINTS SENSOR 1 DTC (DIAGNOSTIC TROUBLE CODE) FOR A FAULT STATUS CHANGE (NO OPERATION INDICATED)

Connect RCM C310A and C310B .

Connect a fused jumper wire as shown in illustration:

Lead 1	Measurement / Action	Lead 2
C644-1		C644-2

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Did the on-demand DTC change from B1418:93 to B1418:11?

Yes	REMOVE the fused jumper wire and INSTALL a new passenger door side impact sensor. REFER to: Front Door Side Impact Sensor . GO to A10.

No	REMOVE the fused jumper wire and GO to A8.

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A8 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Door Side Impact Sensor C644 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A10.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A9.

A9 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect Passenger Door Side Impact Sensor C644 .

Disconnect RCM C310A and C310B .

Inspect:

harness and component connectors for loose or spread terminals and loose or frayed wire connections at terminals.

wire harness for any damage, pinched, cut or pierced wires.

RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect Passenger Door Side Impact Sensor C644 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B1418:11 or B1418:93 retrieved on-demand during the self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B1418:11, GO to A2. For DTC B1418:93, GO to A4.

No	The fault is not present and cannot be recreated at this time. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

> *NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.*

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

DIAGNOSIS AND TESTING > PINPOINT TEST - DTC: AR > B00D5:11, B00D5:12 AND B00D5:13

Refer to Supplemental Restraint System for schematic and connector information.

Normal Operation and Fault Conditions

The RCM briefly activates the PAD indicator to prove-out and verify correct functional operation of the PAD indicator to the occupants.

The RCM monitors the PAD indicator power supply and LED circuits for the following faults:

- Open circuit
- Short to voltage
- Short to ground
- Faulted PAD indicator

If a fault is detected, the RCM stores DTC B00D5:11, B00D5:12 or B00D5:13 in memory and sends a message to the IPC to illuminate the airbag warning indicator.

DTC Fault Trigger Conditions

DTC	Description	Fault Trigger Conditions
B00D5:11	Restraint System Passenger Disable Indicator: Circuit Short to	A fault is indicated when the RCM senses a short to ground on the

	Ground	PAD indicator LED circuit.
B00D5:12	Restraint System Passenger Disable Indicator: Circuit Short to Battery	A fault is indicated when the RCM senses a short to voltage on the PAD indicator LED circuit.
B00D5:13	Restraint System Passenger Disable Indicator: Circuit Open	A fault is indicated when the RCM senses an open on the PAD indicator LED circuit. An open on the ignition voltage supply circuit to the PAD indicator also sets this DTC.

Possible Causes

- Wiring, terminals or connectors
- PAD indicator
- RCM

Visual Inspection and Diagnostic Pre-checks

- Verify BCM fuse 19 (5A) is OK.

PINPOINT TEST A : B00D5:11, B00D5:12 AND B00D5:13

WARNING: Incorrect repair techniques or actions can cause an accidental Supplemental Restraint System (SRS) deployment. Never compromise or depart from these instructions. Failure to precisely follow all instructions could result in serious personal injury from an accidental deployment.

NOTE: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may cause damage to the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Only disconnect or reconnect SRS components when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford parts catalog to make sure the correct component is being installed. If an incorrect SRS component is installed, Diagnostic Trouble Codes (DTCs) may set.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 RETRIEVE RCM (RESTRAINTS CONTROL MODULE) DIAGNOSTIC TROUBLE CODES (DTCS)

WARNING: Before beginning any service procedure in this service information, refer to Safety Warnings in GENERAL INFORMATION . Failure to follow this instruction may result in serious personal injury.

REFER to: Pyrotechnic Device Health and Safety Precautions .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00D5:11, B00D5:12 or B00D5:13 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B00D5:11, GO to A2. For DTC B00D5:12, GO to A7. For DTC B00D5:13, GO to A4.

No	This is an intermittent fault when present as a Continuous Memory Diagnostic Trouble Code (CMDTC) only. GO to A10

A2 CHECK THE PAD (PASSENGER AIRBAG DEACTIVATION) INDICATOR 'OFF' LED (LIGHT EMITTING DIODE) CONTROL CIRCUIT FOR A SHORT TO GROUND

Ignition OFF.

Disconnect PAD Indicator C9801 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9801-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	GO to A3

A3 CHECK THE RCM (RESTRAINTS CONTROL MODULE) FOR LOW RESISTANCE

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9801-2	Ω	Ground

Is the resistance greater than 10, 000 ohms?

Yes	GO to A9

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11

A4 CHECK THE PAD (PASSENGER AIRBAG DEACTIVATION) INDICATOR 'OFF' LED (LIGHT EMITTING DIODE) CIRCUIT FOR AN OPEN

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect PAD Indicator C9801 .

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9801-2	Ω	C310A-20

Is the resistance less than 0.5 ohm?

Yes	GO to A5

No	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11

A5 CHECK THE IGNITION CIRCUIT AT THE PAD (PASSENGER AIRBAG DEACTIVATION) INDICATOR FOR VOLTAGE

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead
C9801-3	V	Ground

Is the voltage greater than 10 volts?

Yes	GO to A6

No	VERIFY BCM fuse 19 (5A) is OK. If OK, REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. If not OK. REFER to the SYSTEM WIRING DIAGRAMS to identify the possible causes of the circuit short. GO to A11.

A6 CHECK THE PAD (PASSENGER AIRBAG DEACTIVATION) INDICATOR

Ignition OFF.

Connect PAD Indicator C9801 .

Connect a fused jumper wire:

Positive Lead	Measurement / Action	Negative Lead
C310A-20		Ground

Ignition ON.

Monitor the PAD indicator.

Does the PAD indicator LED illuminate?

Yes	REMOVE the fused jumper wire and GO to A9

No	REMOVE the fused jumper wire, INSTALL a new PAD indicator and GO to A11

A7 CHECK THE PAD (PASSENGER AIRBAG DEACTIVATION) INDICATOR 'OFF' LED (LIGHT EMITTING DIODE) CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Disconnect RCM C310A and C310B .

Disconnect PAD Indicator C9801 .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Measure:

Positive Lead	Measurement / Action	Negative Lead

C9801-2		Ground

Is any voltage present?

Yes	REPAIR the circuit. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information. GO to A11

No	GO to A8

NOTE: This pinpoint test step attempts to change the fault reported by the RCM by inducing a different fault condition. If the reported fault changes, this indicates the RCM is functioning correctly and is not the source of the fault.

A8 CHECK THE RCM (RESTRAINTS CONTROL MODULE)

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

DIAGNOSTIC TIP: When viewing Diagnostic Trouble Codes (DTCs) with the PAD indicator disconnected, an open circuit fault is normally retrieved.

Did the on-demand DTC change from B00D5:12 to B00D5:13?

Yes	INSTALL a new PAD indicator. GO to A11

No	GO to A9

NOTE: Make sure all SRS components and the RCM electrical connectors are connected before carrying out the self-test. If not, Diagnostic Trouble Codes (DTCs) will be recorded.

A9 CONFIRM THE RCM (RESTRAINTS CONTROL MODULE) FAULT

Ignition OFF.

Depower the SRS. REFER to: Supplemental Restraint System (SRS) Depowering .

Prior to reconnecting any previously disconnected SRS component:

inspect connector(s) (including any inline connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.

inspect wire harness for any damaged, pinched, cut or pierced wires.

inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect PAD Indicator C9801 .

Connect RCM C310A and C310B .

Repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was the original DTC retrieved on-demand during self-test?

Yes	CHECK OASIS for any applicable Technical Service Bulletins (TSBs). If a TSB exists for this concern, DISCONTINUE this test and FOLLOW TSB instructions. If no Technical Service Bulletins (TSBs) address this concern, INSTALL a new RCM. REFER to: Restraints Control Module (RCM) . GO to A11.

No	In the process of diagnosing the fault, the fault condition has become intermittent. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A10.

A10 CHECK FOR AN INTERMITTENT FAULT

Ignition OFF.

Connect PAD Indicator C9801 (if previously disconnected).

Inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

Inspect wire harness for any damage, pinched, cut or pierced wires.

Inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation.

Repair any concerns found. Refer to OEM CONNECTOR REPAIR PROCEDURES for schematic and connector information.

Connect all previously disconnected component(s) / connector(s).

Ignition ON.

Using a diagnostic scan tool, perform RCM self-test.

Was DTC B00D5:11, B00D5:12 or B00D5:13 retrieved on-demand during self-test?

Yes	This fault cannot be cleared until it is corrected and the DTC is no longer retrieved on-demand during self-test. For DTC B00D5:11, GO to A2. For DTC B00D5:12, GO to A7. For DTC B00D5:13, GO to A4.

No	CHECK for causes of intermittent open, short to ground or short to voltage on the PAD indicator circuit. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. Do not install any new SRS components at this time. Install SRS components only when directed to do so in the pinpoint test. GO to A11.

A11 CHECK FOR ADDITIONAL SRS (SUPPLEMENTAL RESTRAINT SYSTEM) DIAGNOSTIC TROUBLE CODES (DTCS)

Ignition OFF.

Reconnect all SRS components (if previously disconnected).

If previously directed to depower the SRS, repower the SRS.

Do not prove out the SRS at this time. REFER to: Supplemental Restraint System (SRS) Repowering .

Ignition ON.

NOTE: When selecting Restraints from the Self Test menu, DTCs are retrieved from the RCM and OCSM.

Using a diagnostic scan tool, perform

Restraints self-test.

Are any RCM and/or OCSM Diagnostic Trouble Codes (DTCs) retrieved on-demand during self-test?

Yes	Do not clear any Diagnostic Trouble Codes (DTCs) until all Diagnostic Trouble Codes (DTCs) have been resolved. DIAGNOSE and REPAIR the RCM and/or OCSM Diagnostic Trouble Codes (DTCs). REFER to: Airbag Supplemental Restraint System (SRS) .

No	The repair is complete. RETURN the vehicle to the customer.

GENERAL PROCEDURES > CLOCKSPRING ADJUSTMENT

Special Tool(s) / General Equipment

Adhesive Tape

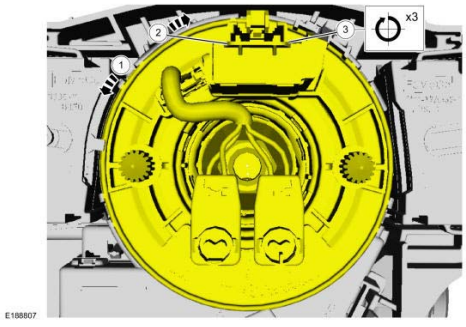
WARNING: If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.

NOTE: Typical clockspring shown in illustration, others similar.

NOTE: This procedure is not for use on vehicles with adaptive steering.

1.

NOTE: Do not over-rotate the clockspring rotor. The internal ribbon wire is connected to the clockspring rotor. The internal ribbon wire acts as a stop and can be broken from its internal connection. Failure to follow this instruction may result in component damage and/or system failure.



1.
Turn the clockspring rotor counterclockwise, carefully feeling for resistance to turning.

2.

Turn the clockspring rotor clockwise so the electrical connector is in the 12 o'clock position.

NOTE: After final positioning, do not allow the clockspring rotor to rotate from this position.

3.
Turn the clockspring rotor clockwise through 3 complete turns ending with the clockspring rotor electrical connector in the 12 o'clock position.

2.

Use the General Equipment: Adhesive Tape

GENERAL PROCEDURES > INSPECTION AND REPAIR AFTER A SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPLOYMENT

Inspection

NOTE: Deployable devices such as airbags, pretensioners and inflatable belt inflators, may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate service information procedures prior to carrying out vehicle repairs affecting the SRS and SEATBELT SYSTEMS article.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Refer to the correct removal and installation procedure for all SRS components being installed.

1.
When any deployable device or combination of devices have deployed and/or the RCM has DTC B1193:00 (event threshold exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal of all impact sensors and installation of new impact sensors and the removal and installation of a new RCM. Diagnostic Trouble Codes (DTCs) must be cleared from all required modules after repairs are carried out.

NOTE: After installation of new OCS components, use a diagnostic scan tool to carry out the OCS Reset procedure as in this service information.

2.
When a vehicle has been involved in a collision and the OCSM has DTC B1193:00 stored in memory, the repair of the OCS is to include the following procedures for the specified system:

3.

For a weight sensor bolt-type OCS, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS weight sensor bolts. The DTC must be cleared from the OCSM before carrying out OCS Reset. Do not install a new OCSM unless DTC B1193:00 cannot be cleared.

For a bladder-type OCS, inspect for damage and repair as necessary. If installation of an OCS component is required, an OCS service kit must be installed.

4.

When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.

5.

When the driver airbag has deployed, install a new steering wheel, clockspring and steering column.

6.

New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners.

7.

New second row safety belt systems (including retractors, buckles and inflators) must be installed if the vehicle is involved in a collision that results in deployment of the rear inflatable safety belt system.

8.

Inspect the entire vehicle for damage, including the following components:

9.

Steering column lower shaft (verify the length is correct). Refer to: Steering Column Collapsed Check .

Steering column (deployable column if equipped)

Instrument panel knee bolsters and mounting points

Safety Canopy® and mounting points

Instrument panel braces and brackets

Instrument panel and mounting points

Seats and seat mounting points

Safety belts, safety belt buckles, safety belt retractors and safety belt anchors.

SRS wiring, wiring harnesses and connectors

10.

After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

11.

Inspect the fuel system for damage or leaks. Repair the system and install new components as necessary.

12.

Connect a diagnostic scan tool and view the BCM CRASH PID.

If the BCM CRASH PID is present and reads 'Yes', use the diagnostic scan tool to carry out the BCM Crash Status Reset under "Electrical - Service Functions".

If the BCM CRASH PID reads 'No' or is not present, complete any necessary repairs before returning the vehicle to the customer.

GENERAL PROCEDURES > PYROTECHNIC DEVICE DISPOSAL

Disposal

Disposal of Deployable Devices and Pyrotechnic Devices That Are Undeployed-Inoperative

NOTE: All inoperative airbags, safety belt pretensioners and inflatable safety belt inflators have been placed on the Mandatory Return List. Treat all discolored or damaged airbags the same as any inoperative live airbag being returned.

1.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

2.

Remove the undeployed/inoperative device. Refer to the appropriate procedure in this service information or in the SEATBELT SYSTEMS article.

NOTE: When installing a new airbag or inflatable safety belt inflator, a prepaid return postcard is provided with the replacement part. The serial number for the new part and the VIN must be recorded and sent to Ford Motor Company.

3.
If installing a new airbag, or inflatable safety belt inflator, record the necessary information and return the inoperative airbag to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

4.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

5.

Remove the deployed device. Refer to the appropriate procedure in this service information or in the SEATBELT SYSTEMS article.

> *NOTE: If a dual stage driver or passenger airbag has deployed due to a crash event, the airbag requires manual deployment to make sure both stages and the active canister vent (if equipped) have deployed before scrapping the vehicle or disposing of the airbag.*

6.
Determine if the vehicle is equipped with dual stage driver or passenger airbags. Refer to: Airbag and Seatbelt Pretensioner Supplemental Restraint System (SRS) - System Operation and Component Description .

7.

REFER to: Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment in this procedure.

8.

Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

> *NOTE: Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.*

9.

To determine the deployable devices a vehicle is equipped with: Refer to: Airbag and Seatbelt Pretensioner Supplemental Restraint System (SRS) - System Operation and Component Description .

10.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

11.

Driver airbag

Inflatable safety belt inflators

Knee airbag

Passenger airbag

Seat side airbag

Safety Canopy®

Side air curtain

12.

To determine the pyrotechnic devices a vehicle is equipped with: Refer to: Airbag and Seatbelt Pretensioner Supplemental Restraint System (SRS) - System Operation and Component Description .

13.

A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

14.

Inflatable safety belt inflators

Safety belt buckle pretensioners

Safety belt retractor pretensioners

Safety belt anchor pretensioners

Adaptive load-limiting retractors

Deployable steering column

NOTE: If a dual stage driver or passenger airbag has deployed due to a crash event, the airbag requires manual deployment to make sure both stages and the active canister vent (if equipped) have deployed before scrapping the vehicle or disposing of the airbag.

15.
To determine if a vehicle is equipped with dual stage driver or passenger airbags: Refer to: Airbag and Seatbelt Pretensioner Supplemental Restraint System (SRS) - System Operation and Component Description .

16.

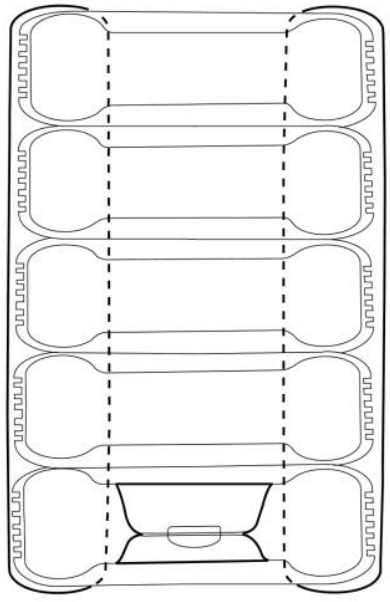
If a dual stage driver or passenger airbag has deployed due to a crash event, the airbag requires manual deployment to make sure both stages and the active canister vent have deployed before scrapping the vehicle or disposing of the airbag. Refer to Driver, Passenger, Knee and Seat Side Airbags - Remote Deployment below.

Driver, Passenger, Knee and Seat Side Airbags - Remote Deployment

NOTE: For airbags with multiple loops, deploy all of the loops on the airbag.

NOTE: Some driver and passenger front airbags have 2 deployment stages and an active canister vent. After a collision it is possible that Stage 1 has deployed and Stage 2 and the active canister vent have not. If a front airbag has deployed, it is mandatory the front airbag be remotely deployed using the appropriate airbag disposal procedure.

NOTE: A typical airbag disposal is shown in illustration that is similar for all vehicles.



17.

NOTE: The tires must be of sufficient size to accommodate the airbag.

Obtain a tire and wheel assembly and 4 additional tires (without wheels) of the same size.

With the tire and wheel assembly on the bottom, stack the tires.

Securely tie all of the tires together.

E142968

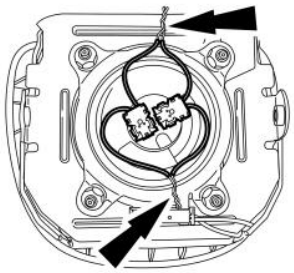
18.

Depower the SRS. Refer to: Supplemental Restraint System (SRS) Depowering .

19.

Remove the airbag. Refer to the appropriate procedure in this service information.

20.



If the airbag does not have a hard-wired pigtail, cut each of the airbag wires near the electrical connector that connects to the vehicle wire harness.

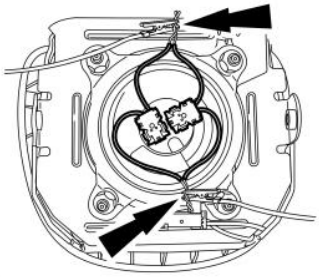
21.

Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

NOTE: Typical driver airbag with 2 loops shown in illustration, other airbags with multiple loops or multiple features (canister vent, active tether) similar.

22.
For airbags with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

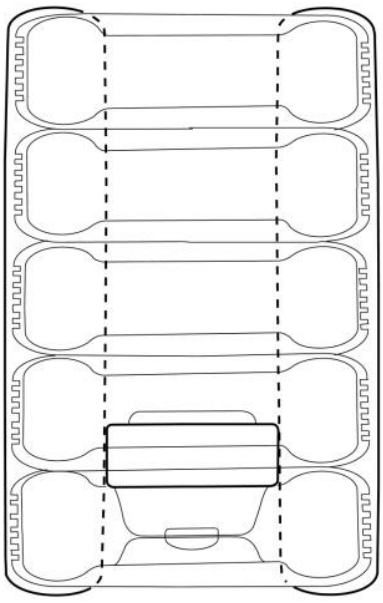
E144159



23.

Make a jumper harness to deploy the airbag module by obtaining 2 wires (20 gauge minimum) at least 9.14 m (30 ft).

At one end of the jumper harness, connect the wires together.



24.
