

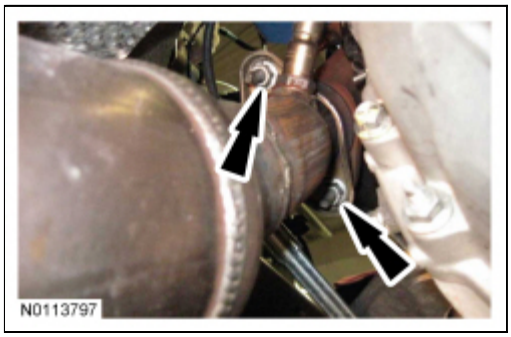
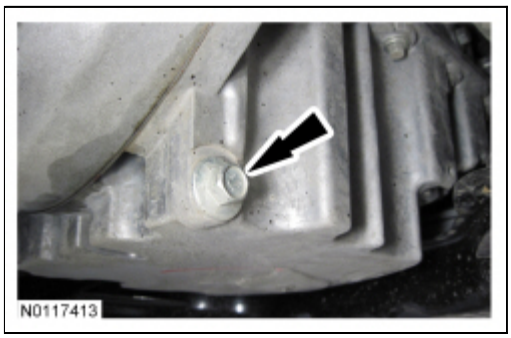
32. **NOTE:** LH shown, RH similar.

    Disconnect the LH and RH Heated Oxygen Sensor (HO2S) electrical connectors.



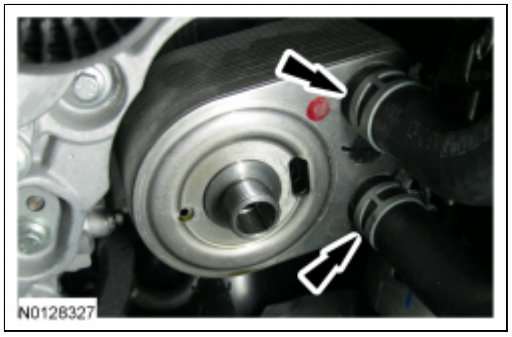
33. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.



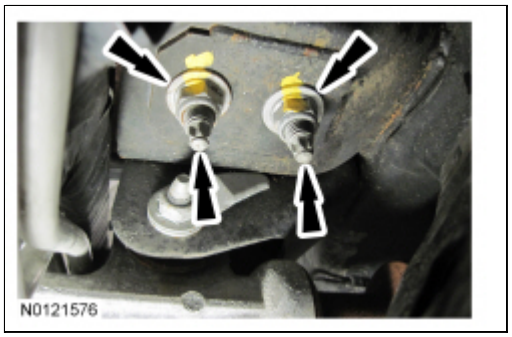
34. **NOTE:** LH shown, RH similar.

    Remove and discard the 2 LH and RH catalytic converter-to-exhaust manifold nuts.

35. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).



36. Remove and discard the engine oil filter.

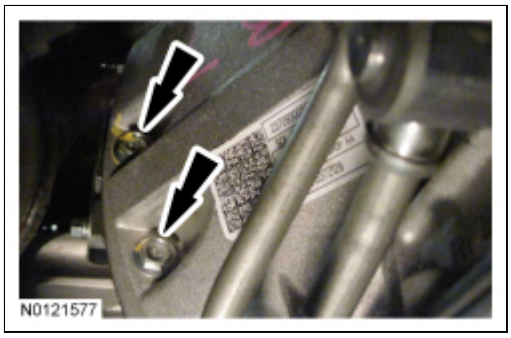


37. If equipped, remove the 2 coolant hoses from the oil cooler.

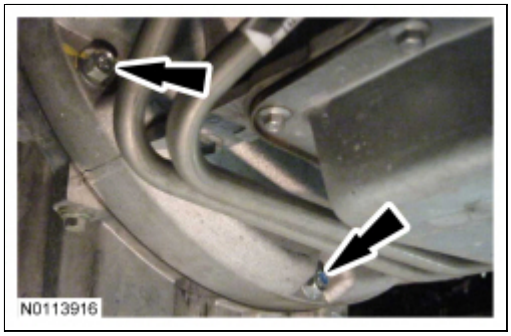
repair4less

38. **NOTE:** The 2 engine mount stud may come off with the nuts.

    Remove and discard the 2 RH engine support insulator nuts and studs.

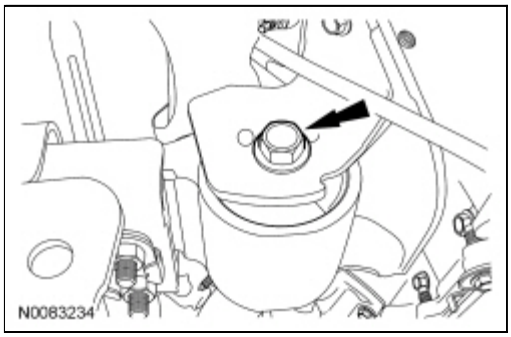


39. Remove the engine-to-bellhousing bolt.



40. Remove the oil pan-to-bellhousing bolt.

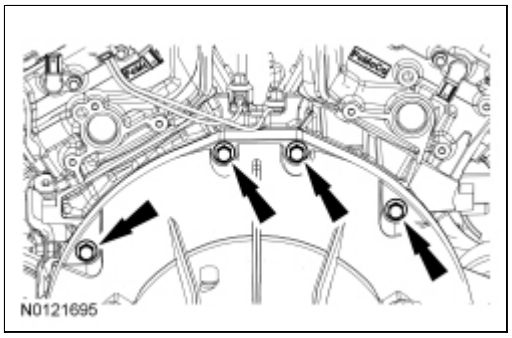
41. Remove the 2 LH bellhousing-to-engine bolts.



42. Remove the 2 LH bellhousing-to-oil pan bolts.

43. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

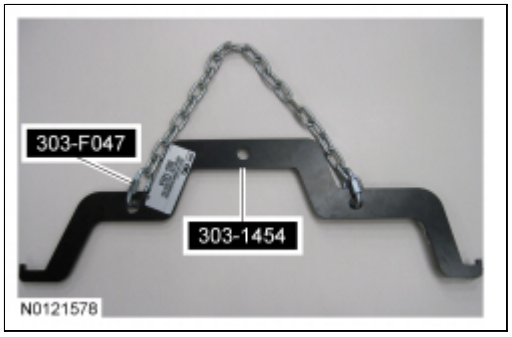
    Remove and discard the LH engine mount through bolt.



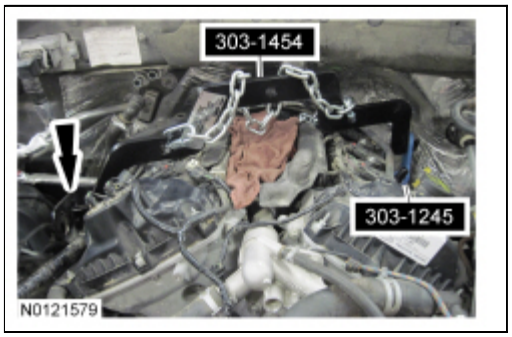
44. ***NOTICE:*** **Do not support the transmission by the fluid pan, failure to follow this instruction may result in serious damage to the transmission.**

    Support the bellhousing of the transmission with a suitable floor jack and a block of wood.

45. Remove the 4 upper bellhousing-to-engine bolts.

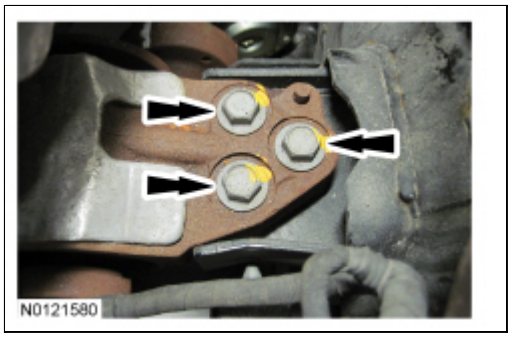


repair4less



46. Install the LH engine lift eye.

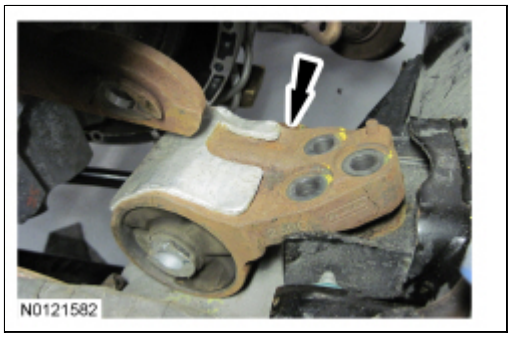
47. Using part of Engine Lifting Bracket and a chain, assemble the Engine Spreader Bar as shown.



48. Install the Engine Spreader Bar assembly into the Engine Lift Eyes.

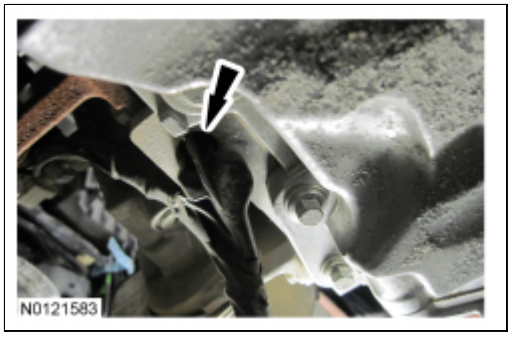
49. **NOTE:** After removing the bolts leave the LH engine support insulator in place.

    Remove the 3 bolts for the LH engine support insulator.



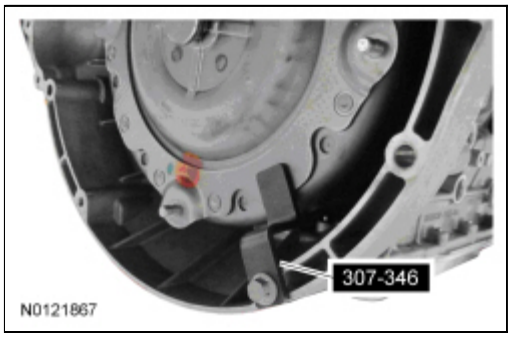
50. **NOTE:** The use of a ratchet strap may be needed to level the engine.

    Using the Heavy Duty Floor Crane and Engine Spreader Bar assembly, raise the engine for clearance to remove the LH engine support insulator.



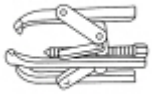
51. Remove the LH engine support insulator.

52. Detach the generator wiring harness retainer from the lower LH side of the engine block.

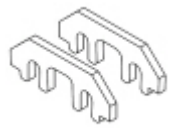


repair4less

53. Using the Heavy Duty Floor Crane and Engine Spreader Bar assembly, remove the engine.



54. Install the Torque Converter Retainer.



repair4less

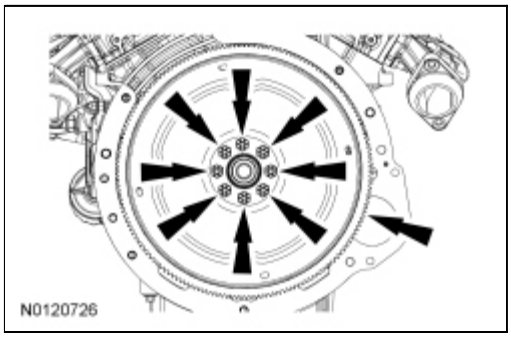
Material

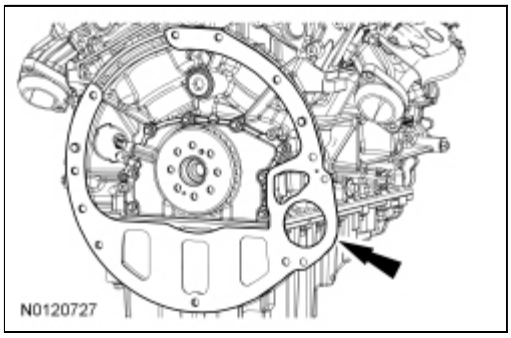
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**



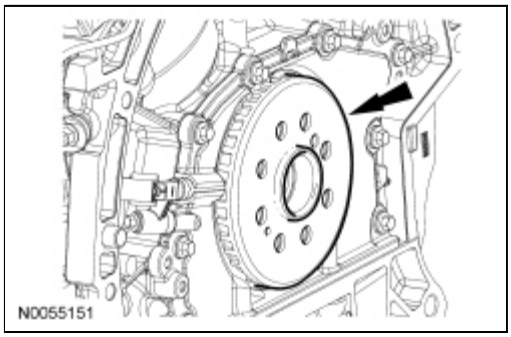
NOTE: If the cylinder head(s) is replaced, a new secondary timing chain tensioner will need to be installed.

repair4less



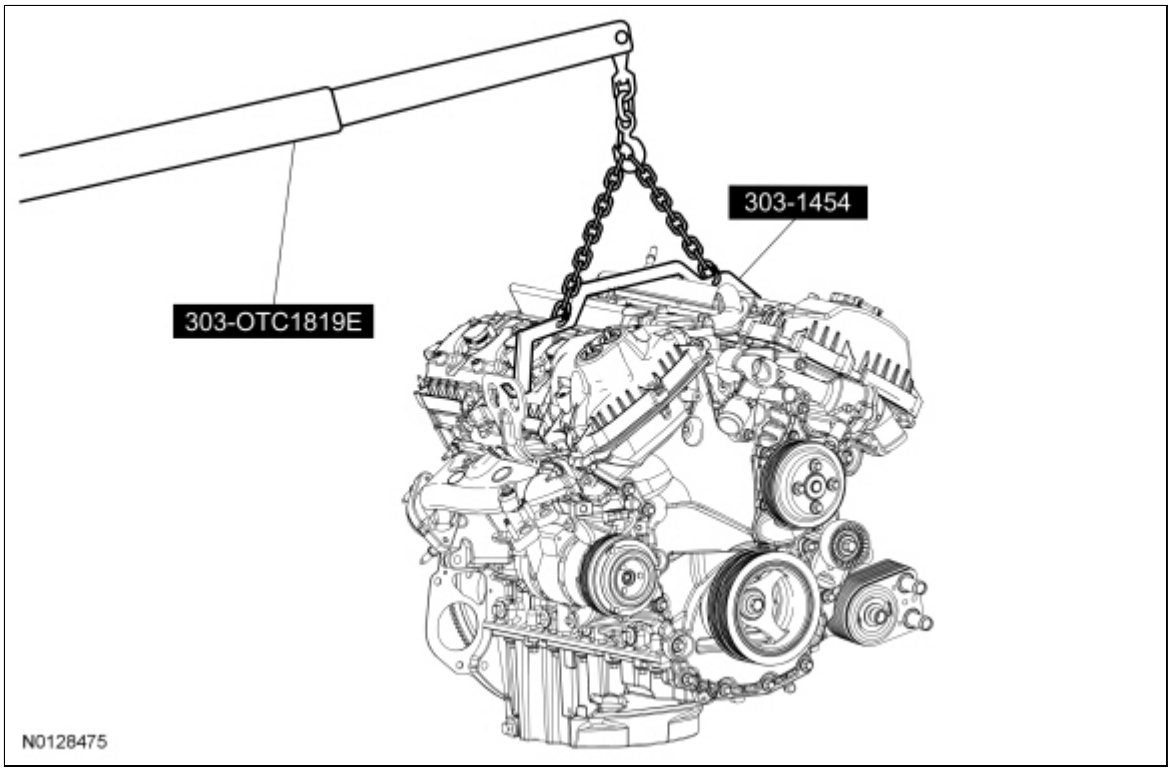
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.

All engines

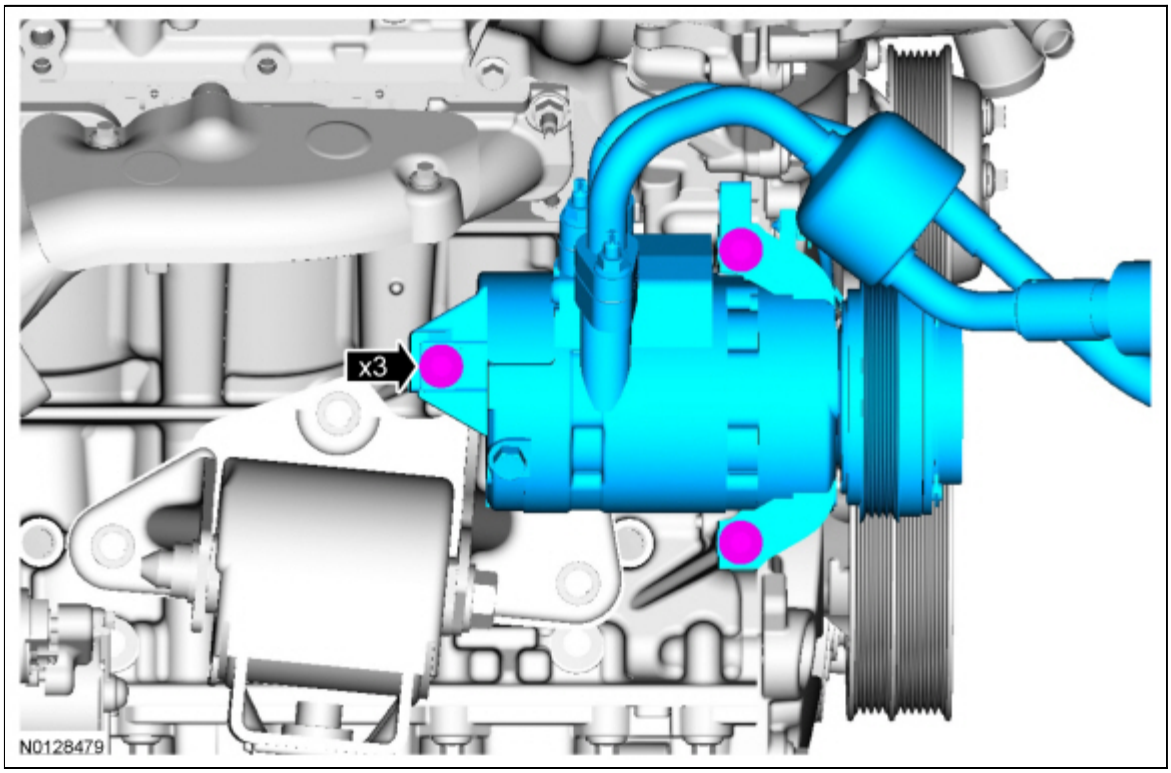


1. Remove the 8 bolts and the flexplate.

2. Remove the spacer plate.

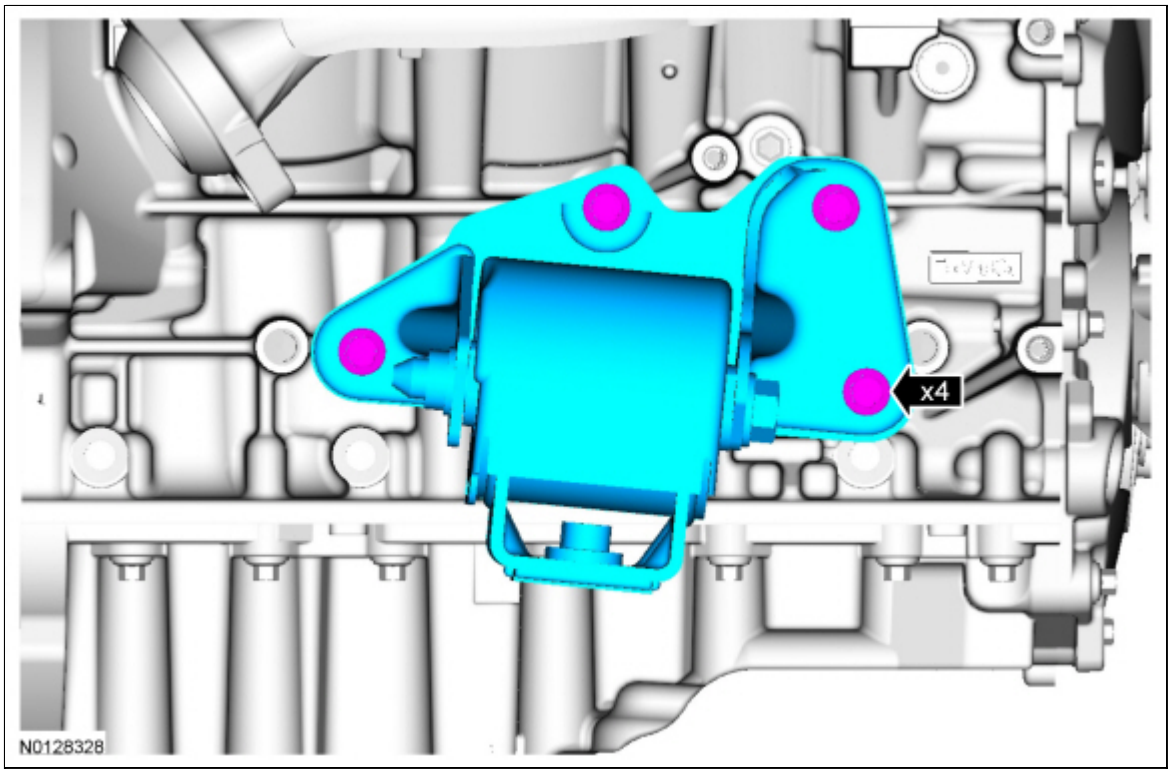


3. Remove the crankshaft sensor ring.



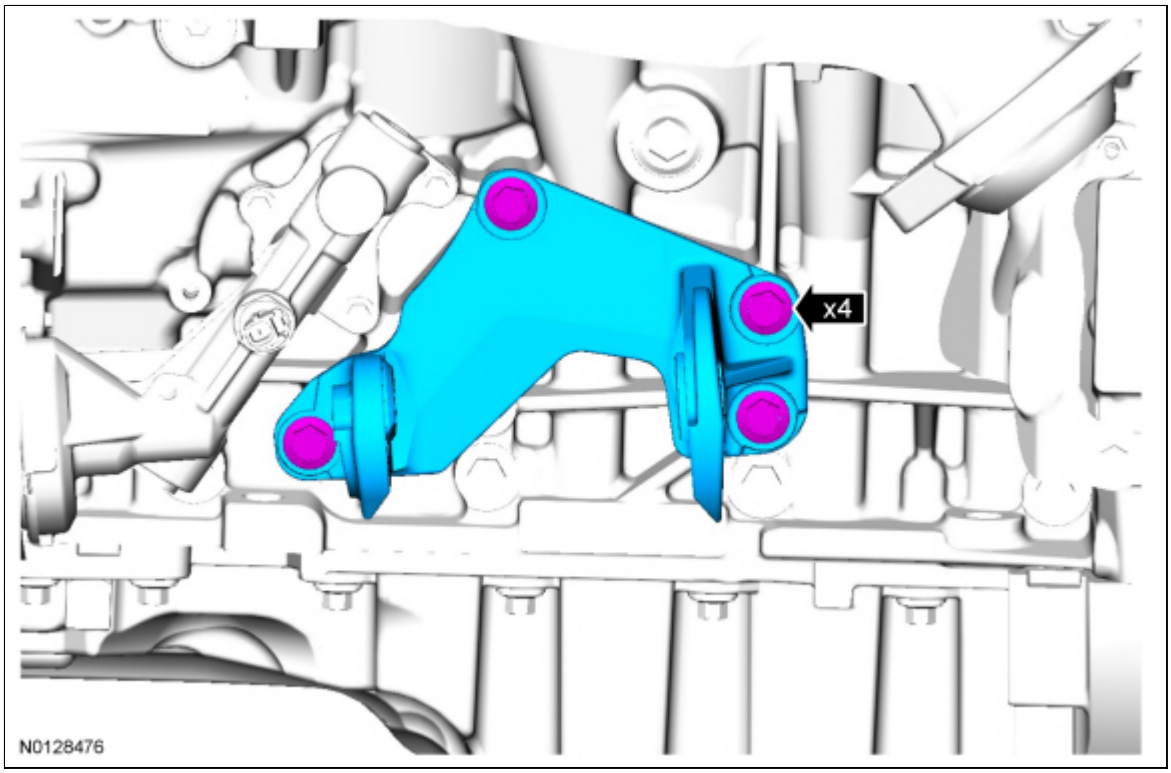
4. **NOTE:** Install the engine stand bolts into the cylinder block only. Do not install the bolts into the oil pan.

   Using the Heavy Duty Floor Crane and Spreader Bar, mount the engine on a suitable engine stand.

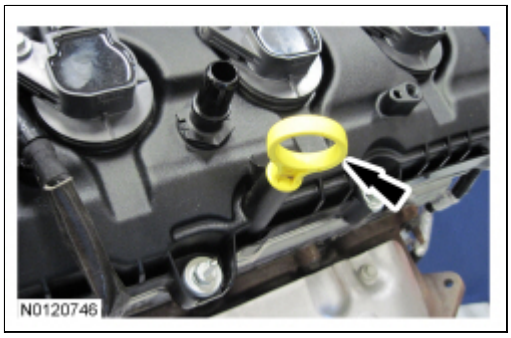


5. Remove the LH and RH engine lift eyes.

6. Remove the 3 bolts and the A/C compressor .

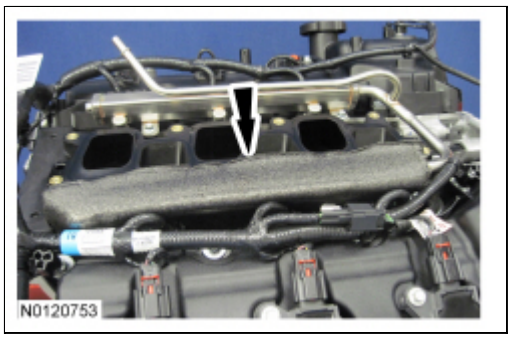


7. Remove the 4 bolts and the RH engine support insulator.

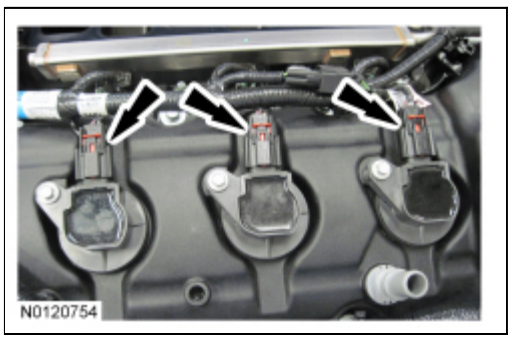


repair4less

8. Remove the 4 bolts and the LH engine support insulator-to-cylinder block bracket.

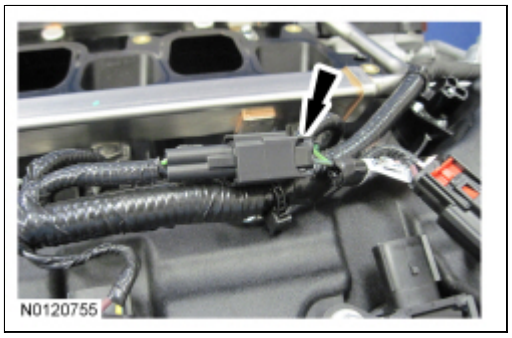


9. Remove the engine oil level indicator.

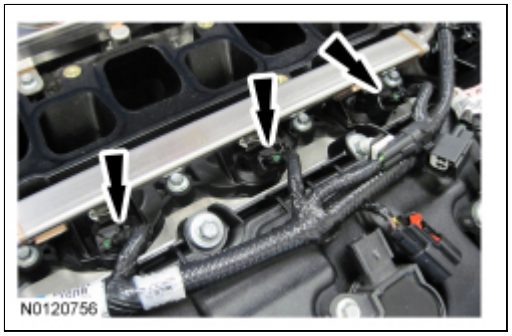


10. Remove the LH fuel rail insulator.

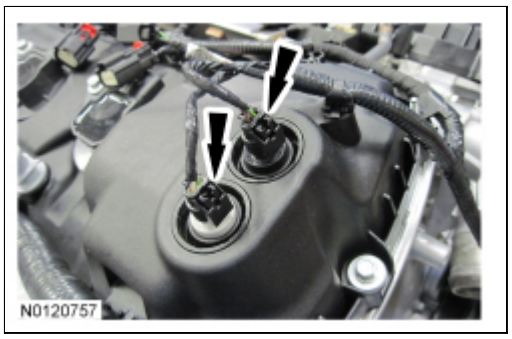
11. Remove the RH fuel rail insulator.



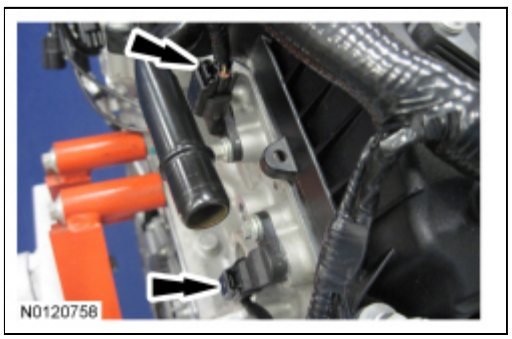
12. Disconnect the 3 RH ignition coil-on-plug electrical connectors.



13. Disconnect the Cylinder Head Temperature (CHT) sensor wiring harness jumper electrical connector.



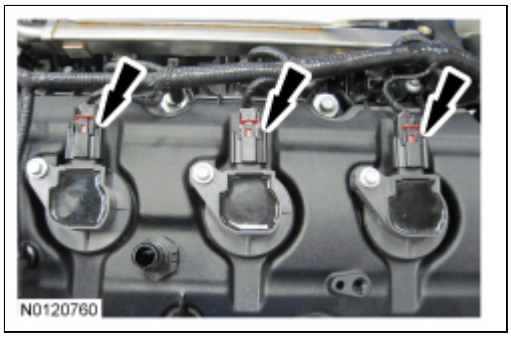
repair4less



14. Disconnect the 3 RH fuel rail electrical connectors.

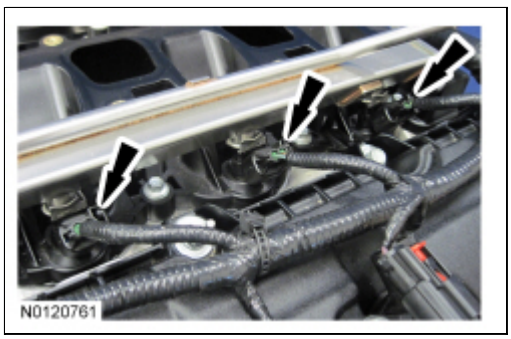
15. Disconnect the 2 RH Variable Camshaft Timing (VCT) solenoid electrical connectors.

16. Disconnect the 2 RH Camshaft Position (CMP) sensors electrical connectors.



17. Detach all of the wiring harness retainers from the RH cylinder head, valve cover and stud bolts.

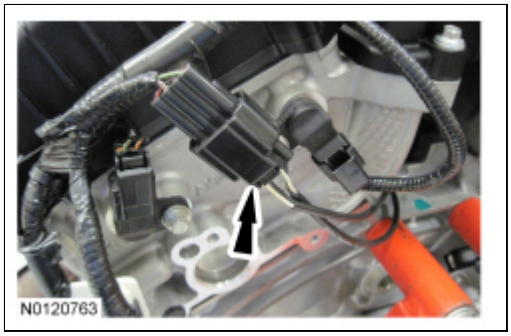
18. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.



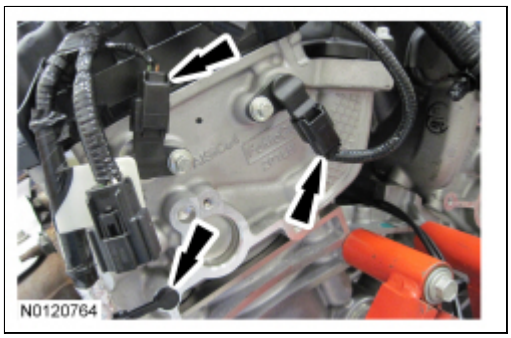
- Detach the EOP switch wiring harness retainer from the cylinder head.

19. Disconnect the 3 LH ignition coil-on-plug electrical connectors.

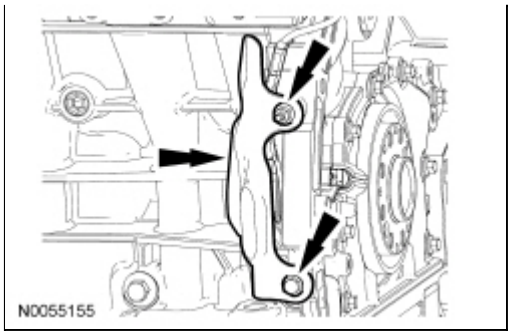
20. Disconnect the 3 LH fuel rail electrical connectors.



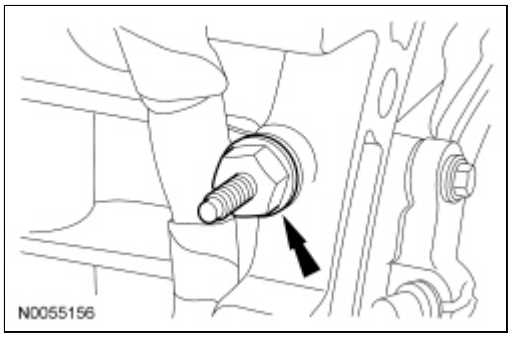
21. Disconnect the 2 LH VCT solenoid electrical connectors.



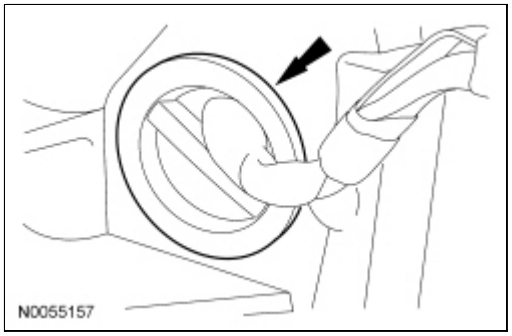
repair4less



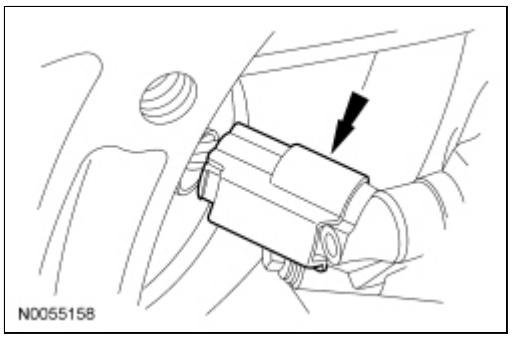
22. Disconnect the Knock Sensor (KS) electrical connector.



23. Disconnect the 2 LH CMP sensors electrical connectors.
    - Detach the wiring harness retainer from the rear of the cylinder head.

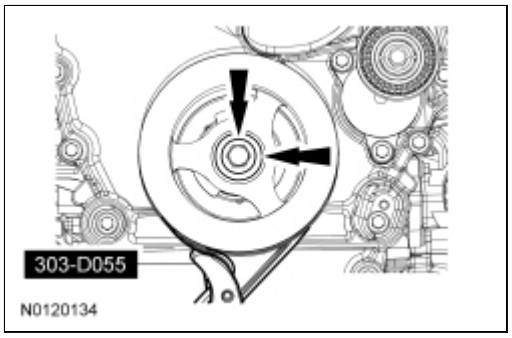


24. Remove the nut, the bolt and the heat shield.

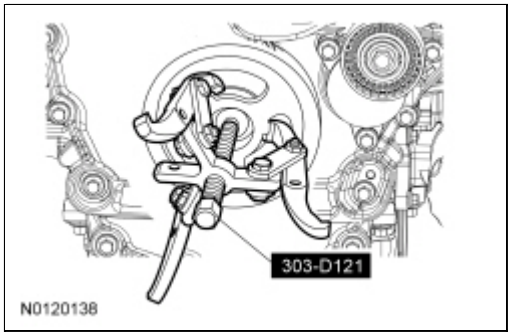


25. Remove the wiring harness retainer stud bolt.

26. Remove the wiring harness grommet.

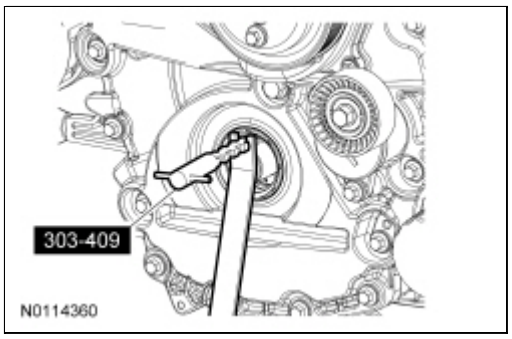


27. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

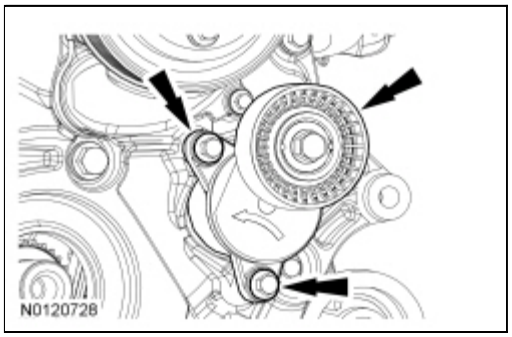


28. Detach all of the wiring harness retainers from the LH cylinder head, valve cover and stud bolts.

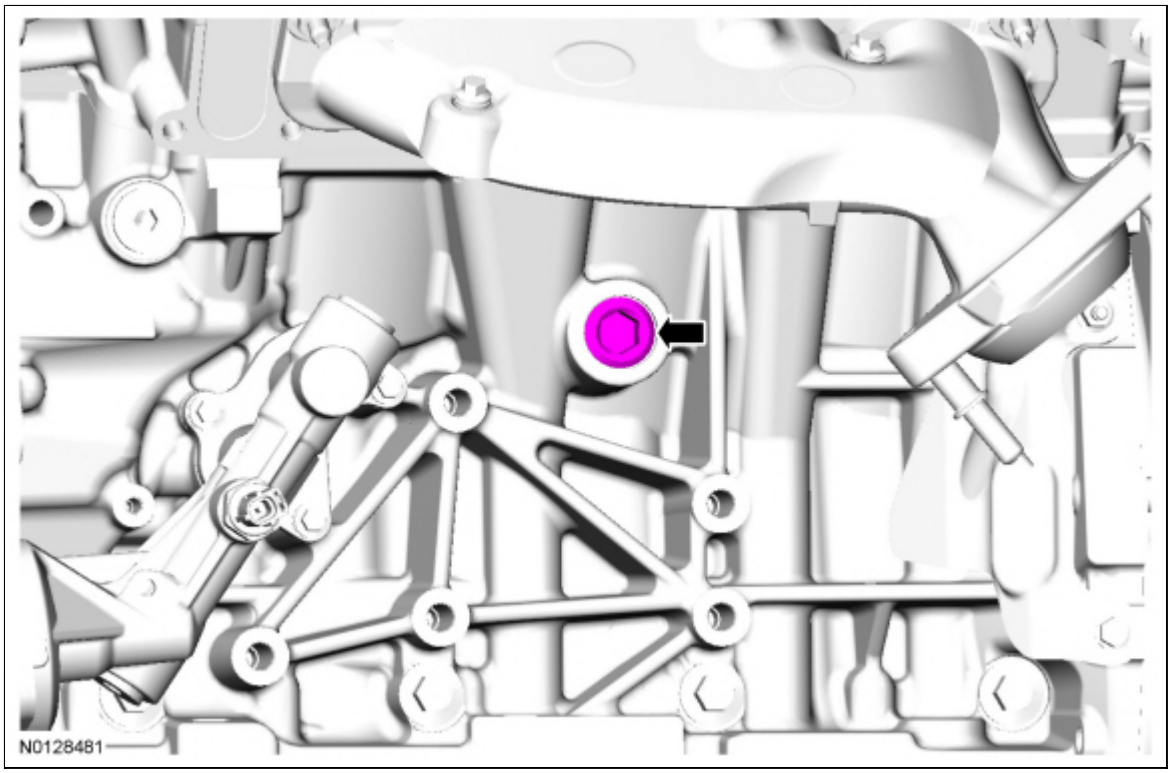
29. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
    - Inspect the crankshaft pulley sealing surface for nicks or scratches that may effect the crankshaft front seal lip, replace the crankshaft pulley if necessary.
    - Discard the bolt.



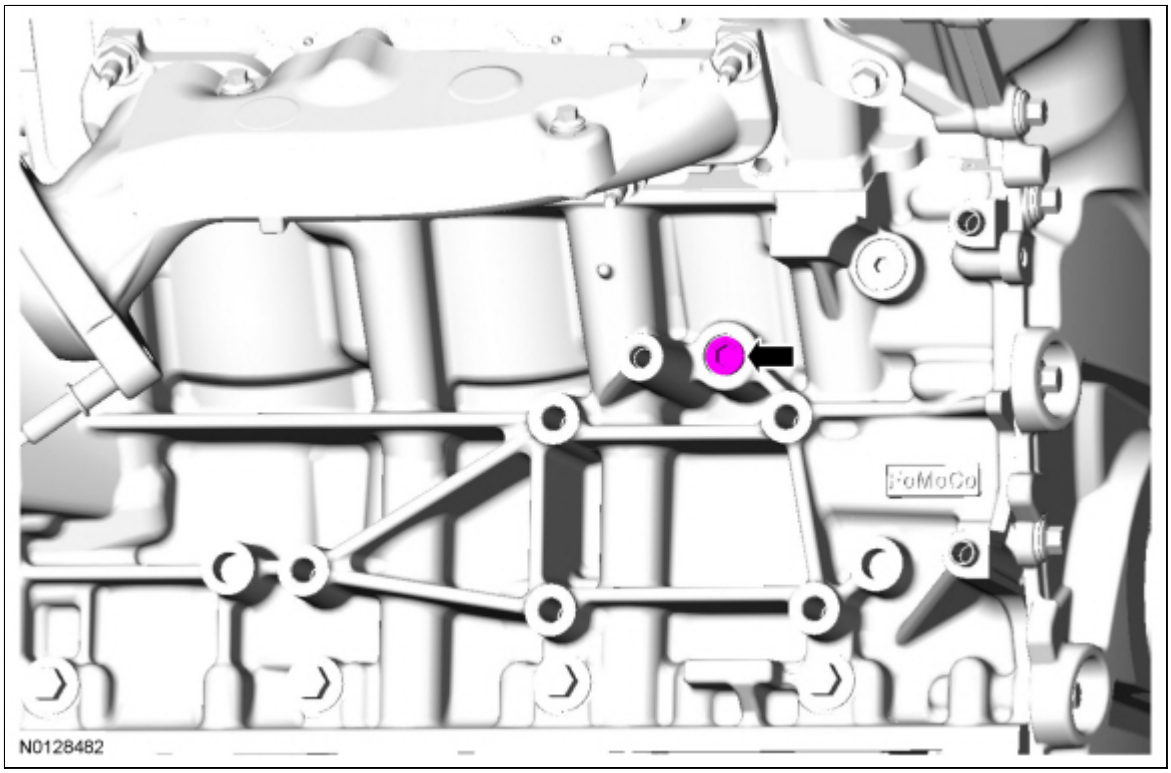
repair4less



30. Using the 3 Jaw Puller, remove the crankshaft pulley.

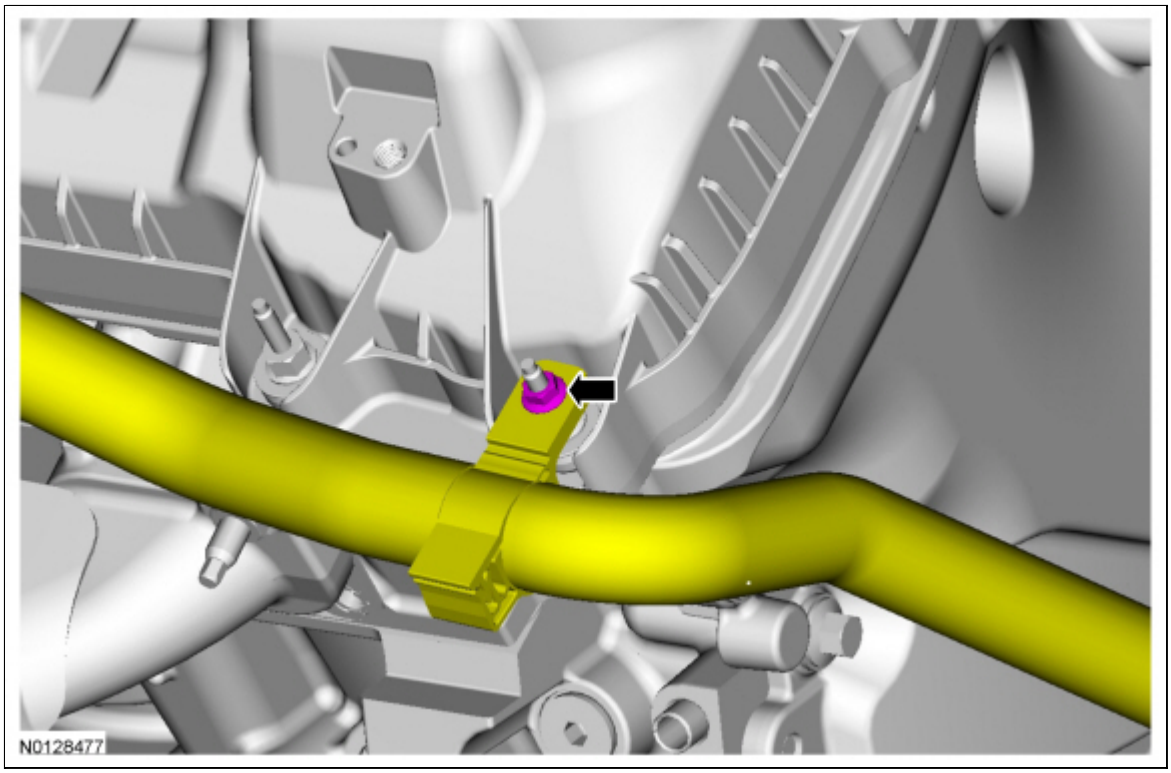


31. Using the Oil Seal Remover, remove and discard the crankshaft front seal.

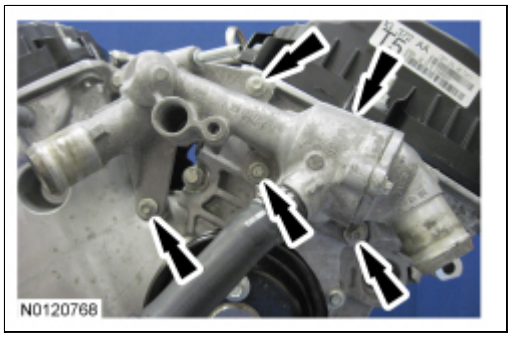


32. Remove the 2 bolts and the accessory drive belt tensioner.

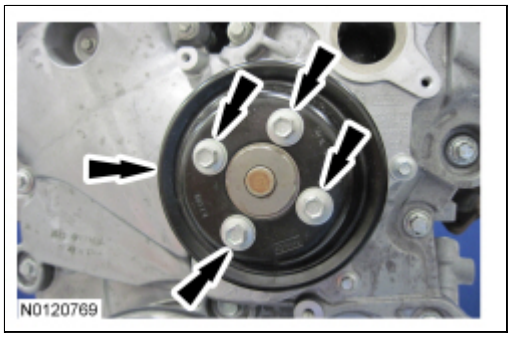
33. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.



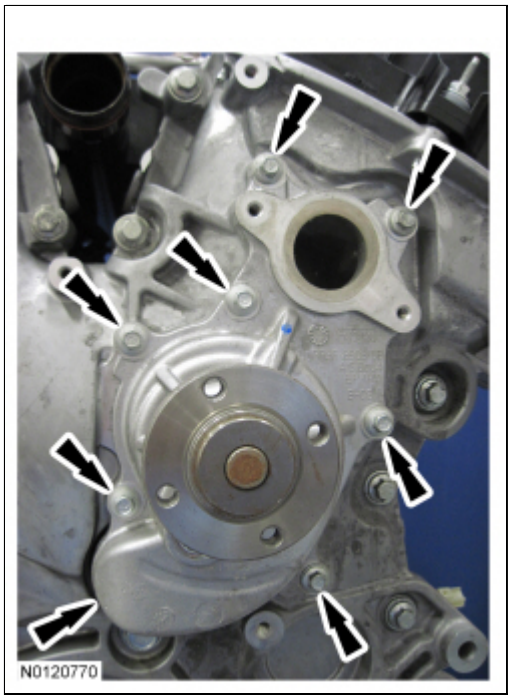
34. Remove the RH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.



35. Remove the nut and the heater hose bracket from the valve cover stud bolt.

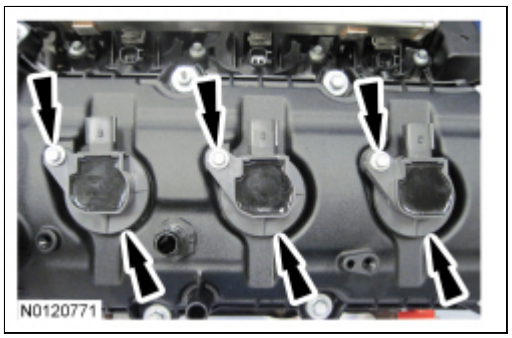


repair4less



36. Remove the 4 bolts and the thermostat housing.
    - Discard the thermostat housing and coolant inlet tube O-ring seals.

37. Remove the 4 bolts and the coolant pump pulley.



38. Remove the 7 bolts and the coolant pump.
    - Discard the coolant pump gasket and coolant pump O-ring seal.

39. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

    Remove the 3 bolts and the 3 LH ignition coil-on-plugs.

40. ***NOTICE:*** **Only use hand tools when removing the spark plugs, or damage may occur to the cylinder head or spark plug.**

    NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

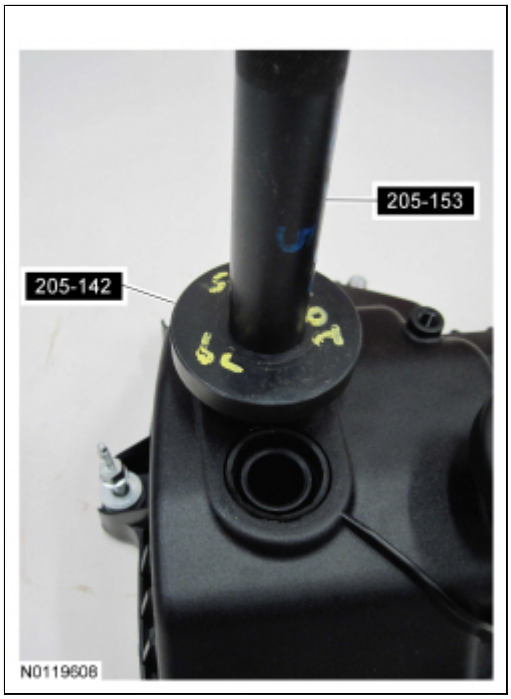
    Remove the 3 LH spark plugs.

41. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

    NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.**

    NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12

repair4less

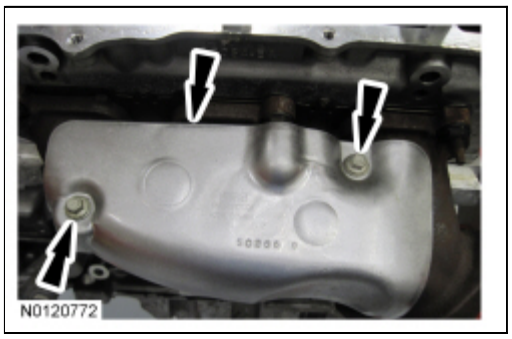


degrees inside the steel housing, which is normal.

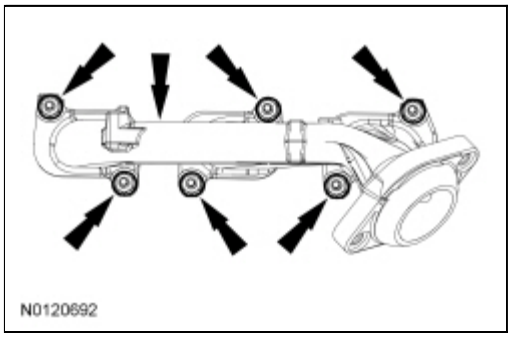
Loosen the 7 stud bolts, 4 bolts and remove the LH valve cover.

- Discard the gasket.

42. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

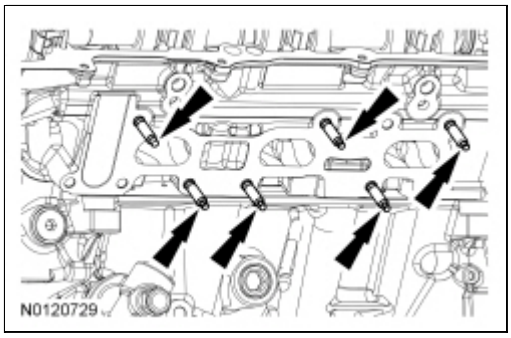


43. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



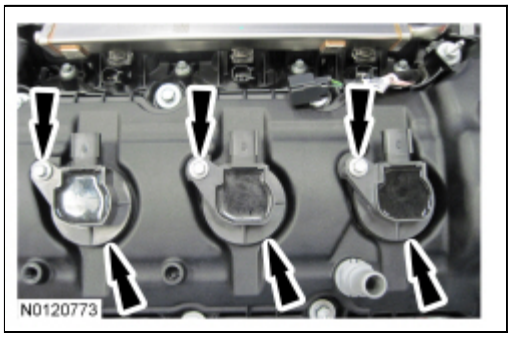
44. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

45. Remove the 2 bolts and the LH exhaust manifold heat shield.



46. Remove the 6 nuts and the LH exhaust manifold.
    - Discard the nuts and exhaust manifold gaskets.

47. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .



48. Remove and discard the 6 LH exhaust manifold studs.

repair4less

49. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

    Remove the 3 bolts and the 3 RH ignition coil-on-plugs.

50. ***NOTICE:*** **Only use hand tools when removing the spark plugs, or damage may occur to the cylinder head or spark plug.**

    NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

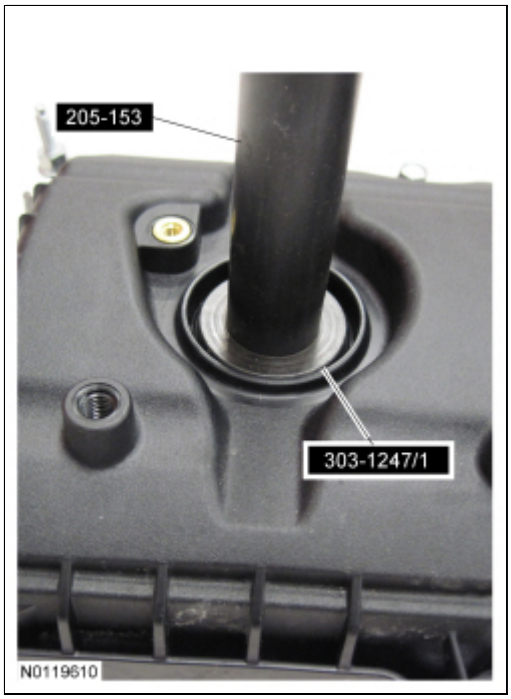
    Remove the 3 RH spark plugs.

51. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

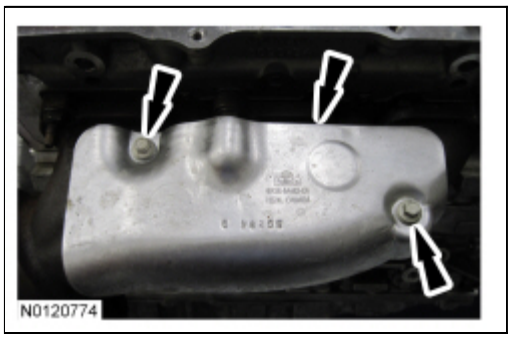
    NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.**

    NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12 degrees inside the steel housing, which is normal.

    Loosen the 8 stud bolts, 3 bolts and remove the RH valve cover.
    - Discard the gasket.

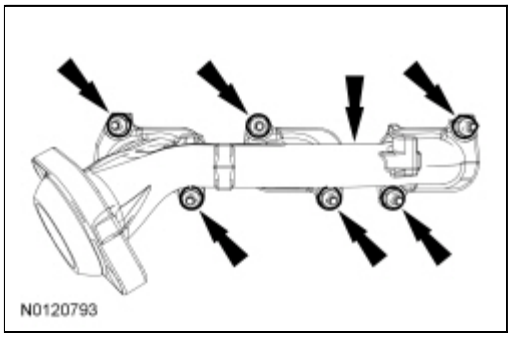


52. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).



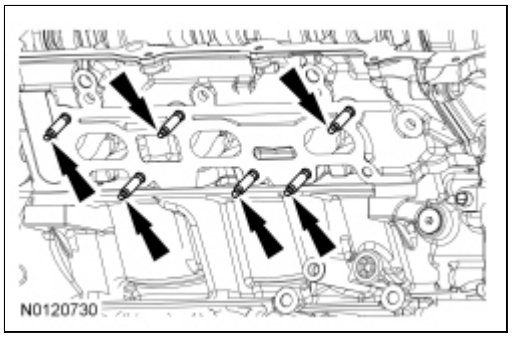
53. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

repair4less

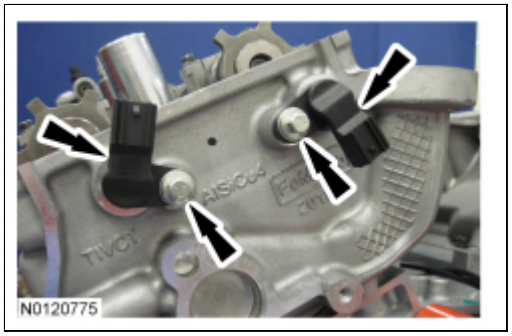


54. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

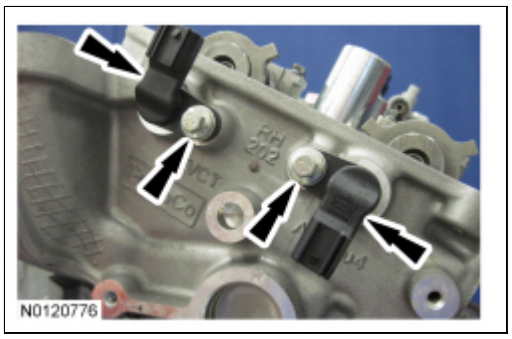
55. Remove the 2 bolts and the RH exhaust manifold heat shield.



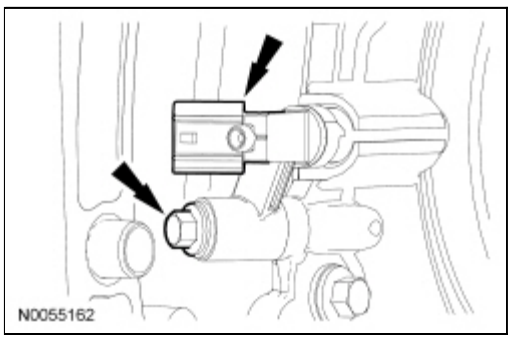
56. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and exhaust manifold gaskets.



57. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

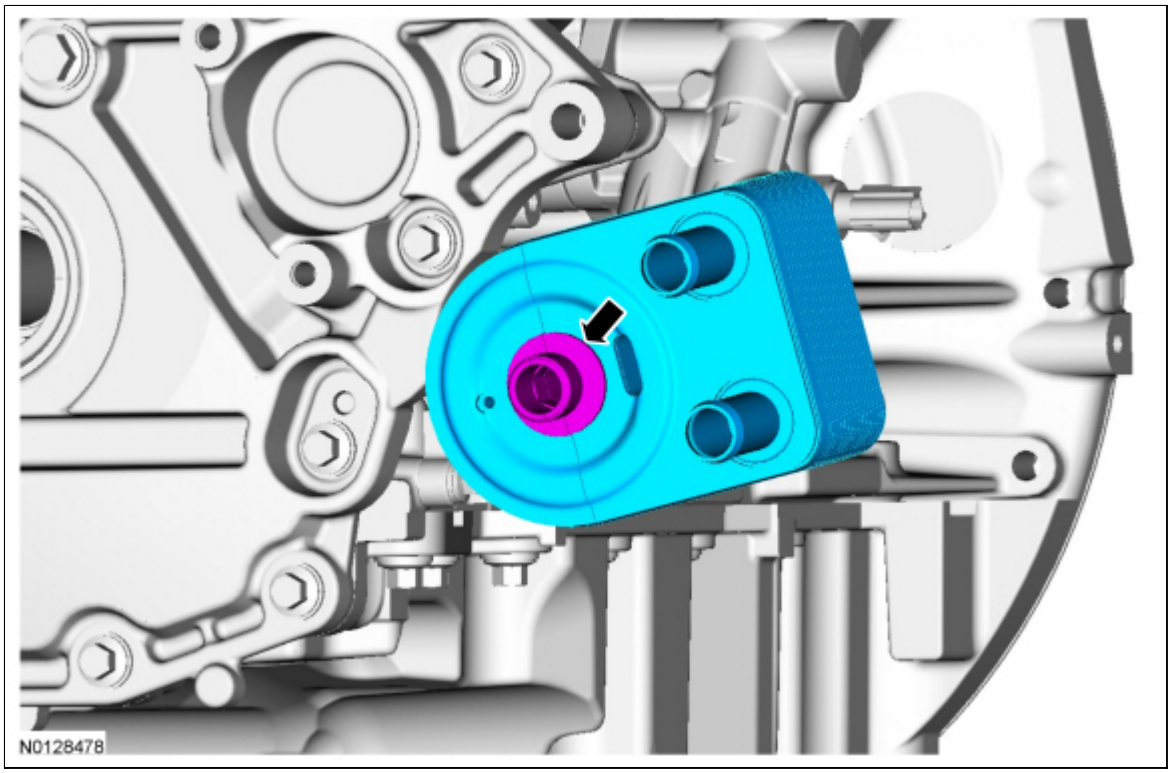


58. Remove and discard the 6 RH exhaust manifold studs.

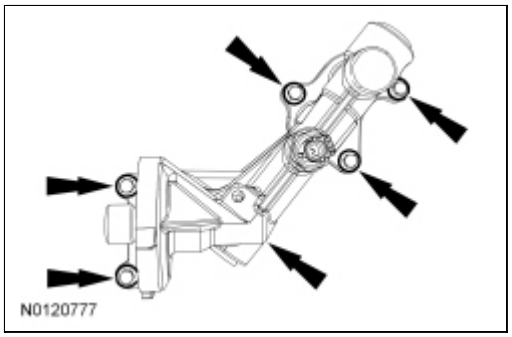


59. Remove the 2 bolts and the LH CMP sensors.

60. Remove the 2 bolts and the RH CMP sensors.

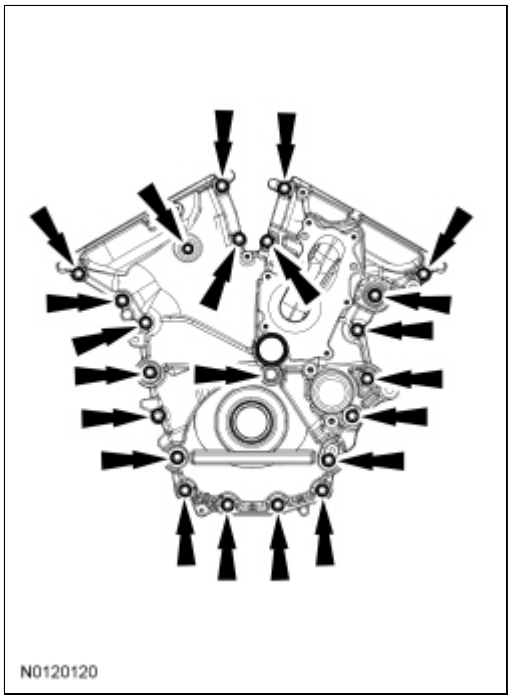


61. Remove the bolt and the CKP sensor.

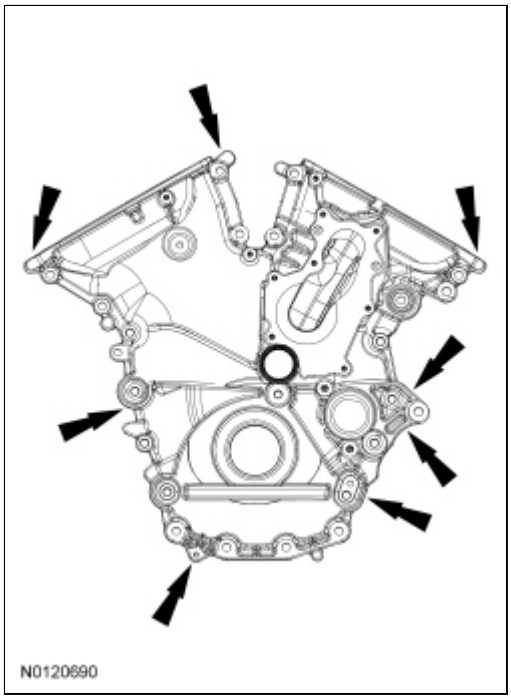


62. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

    If equipped, remove the oil cooler mounting bolt and the oil cooler.



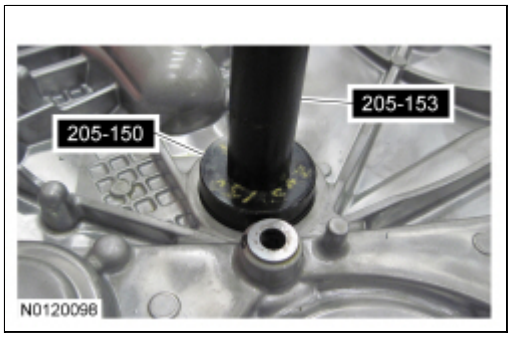
repair4less



63. Remove the 5 bolts and the oil filter adapter.
    - Discard the gasket.

64. Remove the 22 engine front cover bolts.

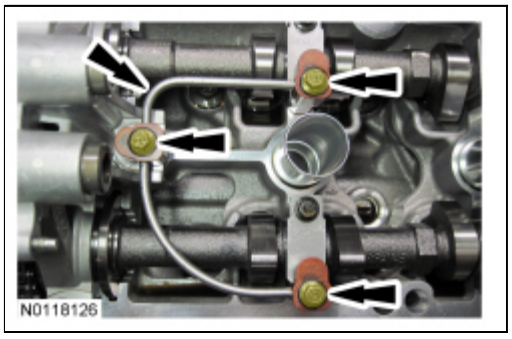
65. Using a pry tool, locate the 7 pry pads shown and pry the engine front cover loose and remove.



66. **NOTE:** Inspect front cover radial seal and replace if necessary.

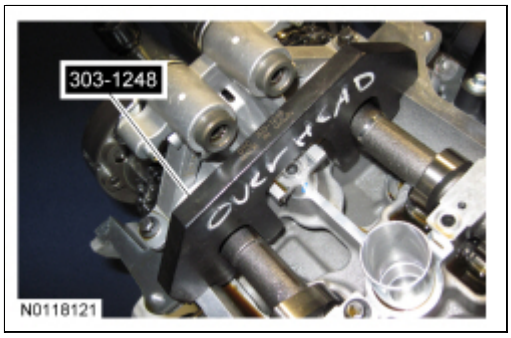
    NOTE: Use Spindle Bearing Installer 205-150 to remove the seal.

    If necessary, using the Spindle Bearing Installer and Handle, remove the front cover radial seal from the rear side of the front cover.

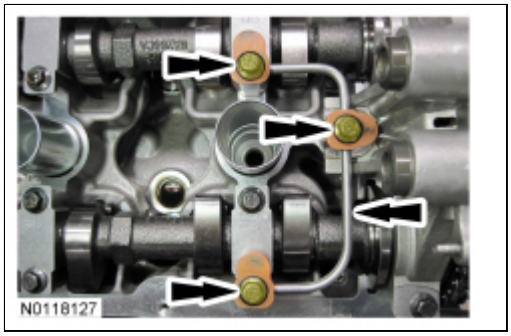


repair4less

67. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

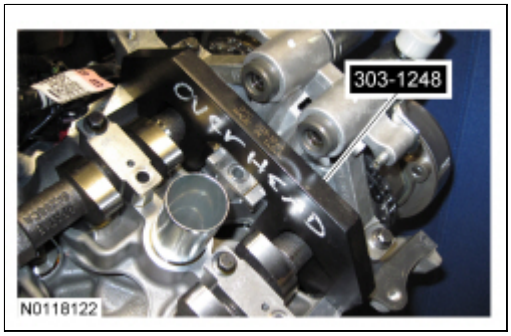


68. Remove the 3 bolts and the LH valve train oil tube.

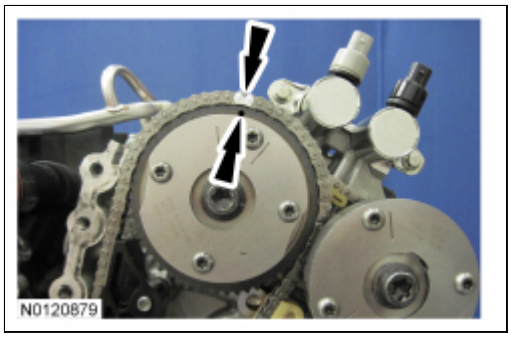


69. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

    Install the Camshaft Holding Tool onto the flats of the LH camshafts.

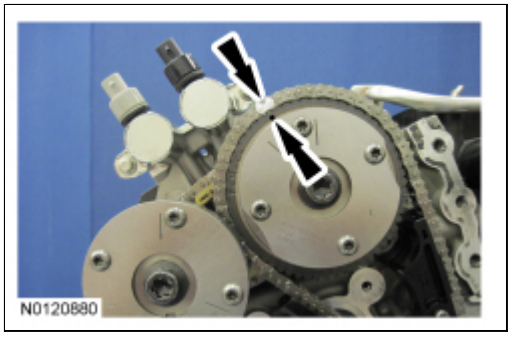


70. Remove the 3 bolts and the RH valve train oil tube.



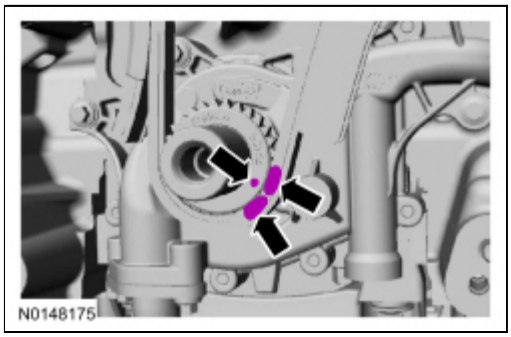
71. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the RH camshafts.



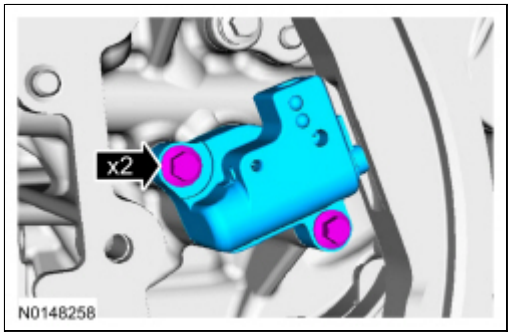
NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

72. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



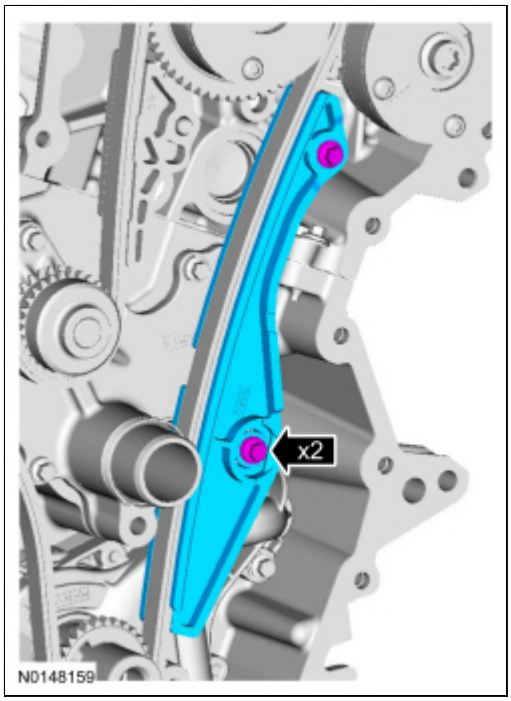
repair4less

73. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



74. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

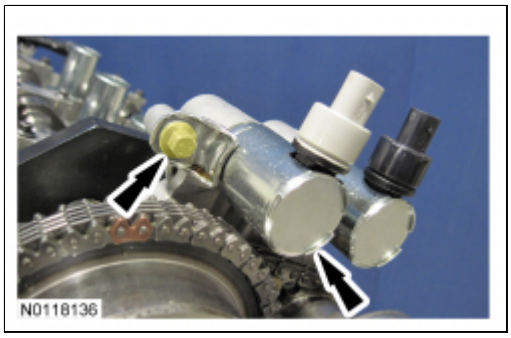
    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



75. Remove the 2 bolts and the primary timing chain tensioner.

76. Remove the primary timing chain tensioner arm.

77. Remove the 2 bolts and the lower LH primary timing chain guide.



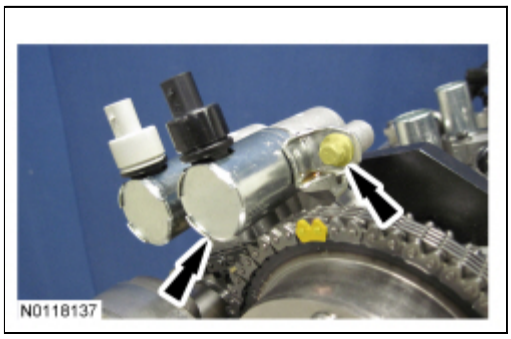
78. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.

repair4less



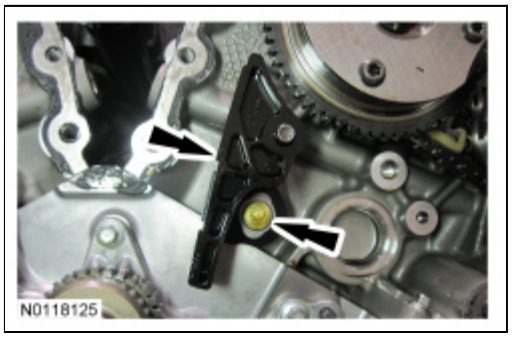
79. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

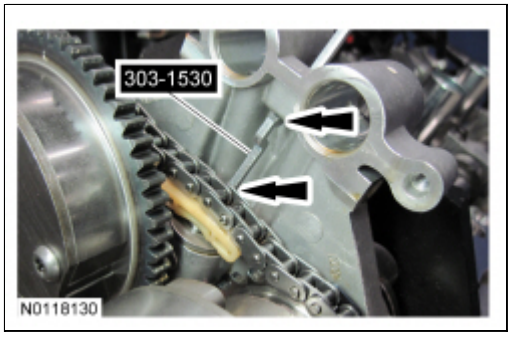
80. Remove the primary timing chain.



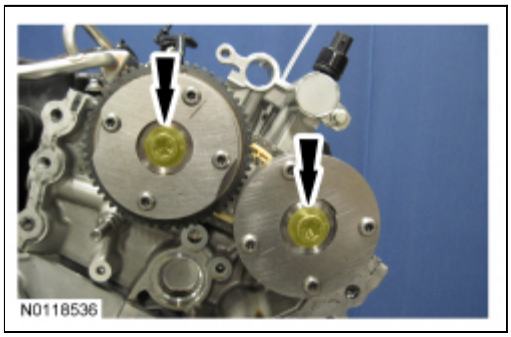
81. Remove the crankshaft timing chain sprocket.

82. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**

    Remove the bolt and the upper LH primary timing chain guide.



repair4less

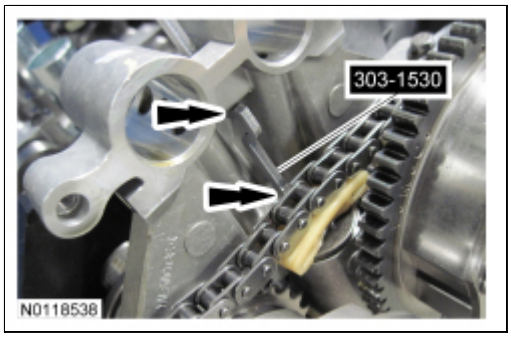


83. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

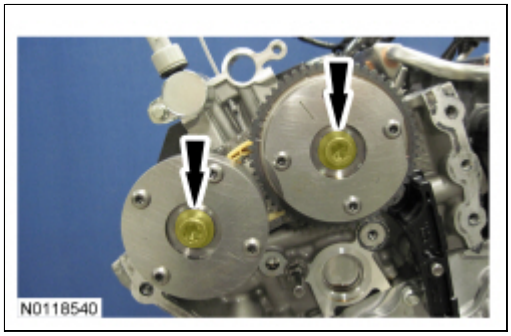
    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

84. Remove and discard the 2 LH VCT assembly bolts.



85. Remove the 2 LH VCT assemblies and secondary timing chain.



86. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

87. Remove and discard the 2 RH VCT assembly bolts.

88. Remove the 2 RH VCT assemblies and secondary timing chain.

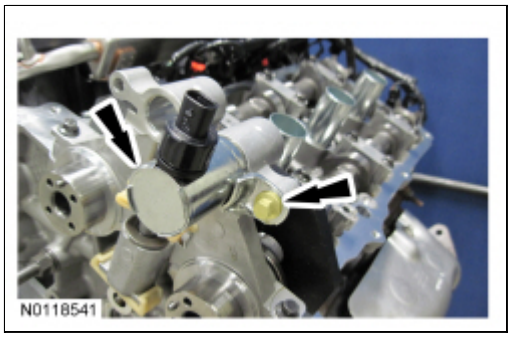
89. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.**

    Remove the bolt and the RH primary timing chain guide.

90. Remove the 9 bolts and the channel cover plate.

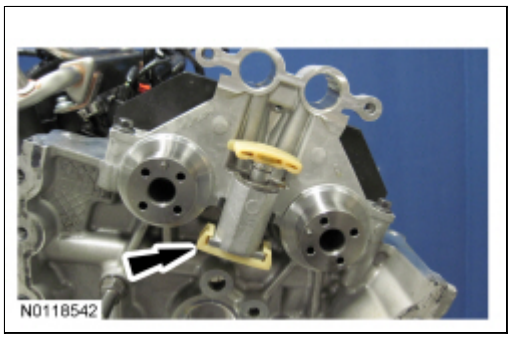
repair4less

- Discard the gaskets.



Engines with secondary timing chain tensioner removed

NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.**

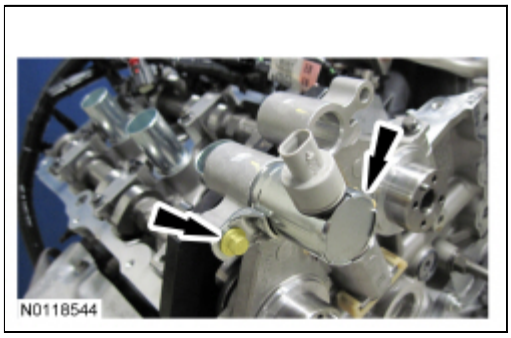


91. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

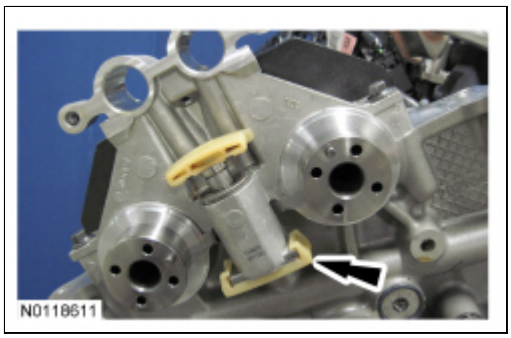
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the LH exhaust VCT oil control solenoid.

92. Remove the LH secondary timing chain tensioner shoe.



93. Remove the LH secondary timing chain tensioner by pushing up from the bottom and remove.



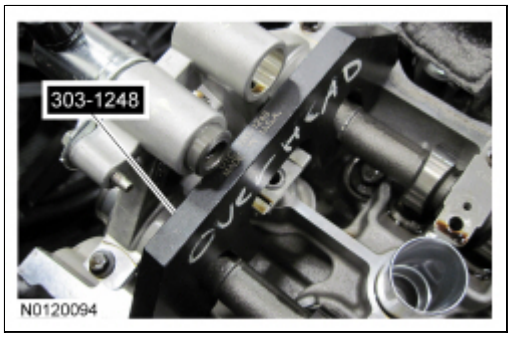
94. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the RH exhaust VCT oil control solenoid.

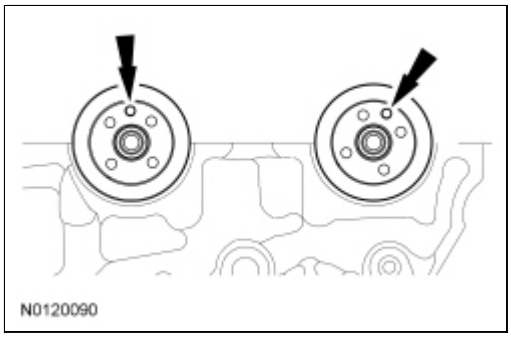
95. Remove the RH secondary timing chain tensioner shoe.

96. Remove the RH secondary timing chain tensioner by pushing up from the bottom and remove.



repair4less

All engines



97. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the LH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the LH camshafts.

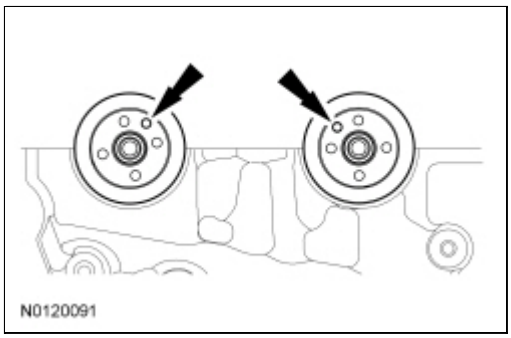
98. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

    Verify the LH camshafts are in the neutral position.

99. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

    Remove the 12 bolts, 6 camshaft caps, mega cap and the LH camshafts.

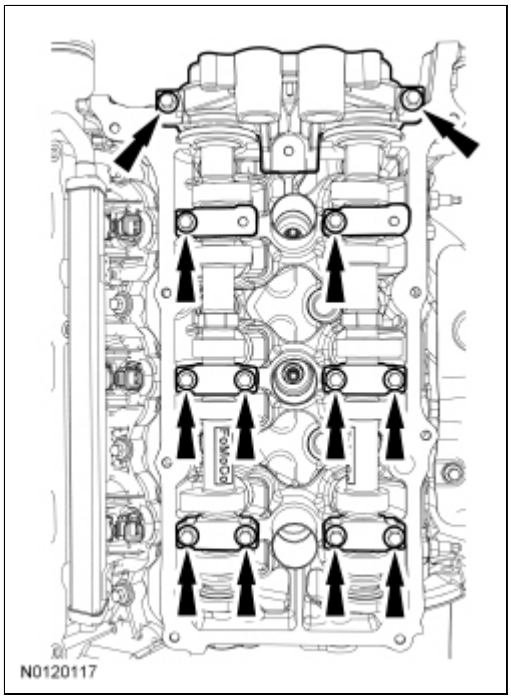


100. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the RH camshafts approximately 3 degrees to a neutral position.

Remove the Camshaft Holding Tool from the RH camshafts.

101. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

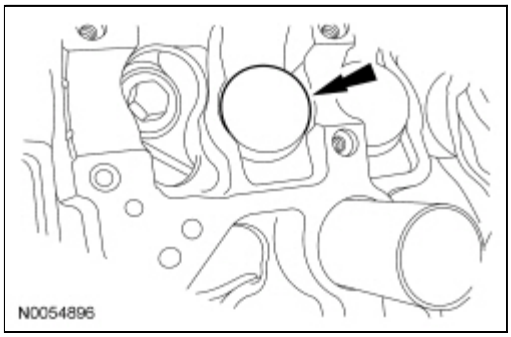
Rotate the RH camshafts counterclockwise to the neutral position.



repair4less

102. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

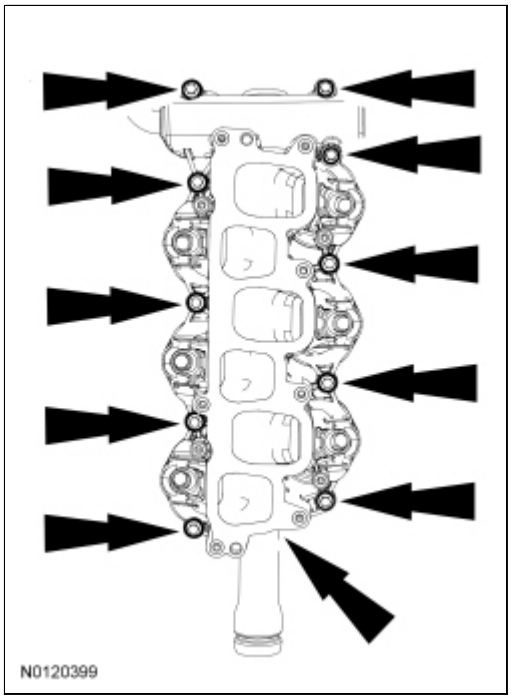


Remove the 12 bolts, 6 camshaft caps, mega cap and the RH camshafts.

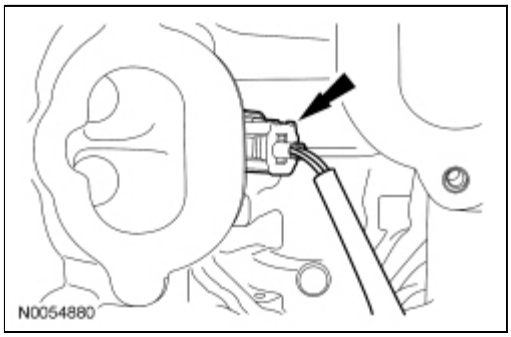
103. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

NOTE: LH shown, RH similar.

Remove the valve tappets from the cylinder heads.



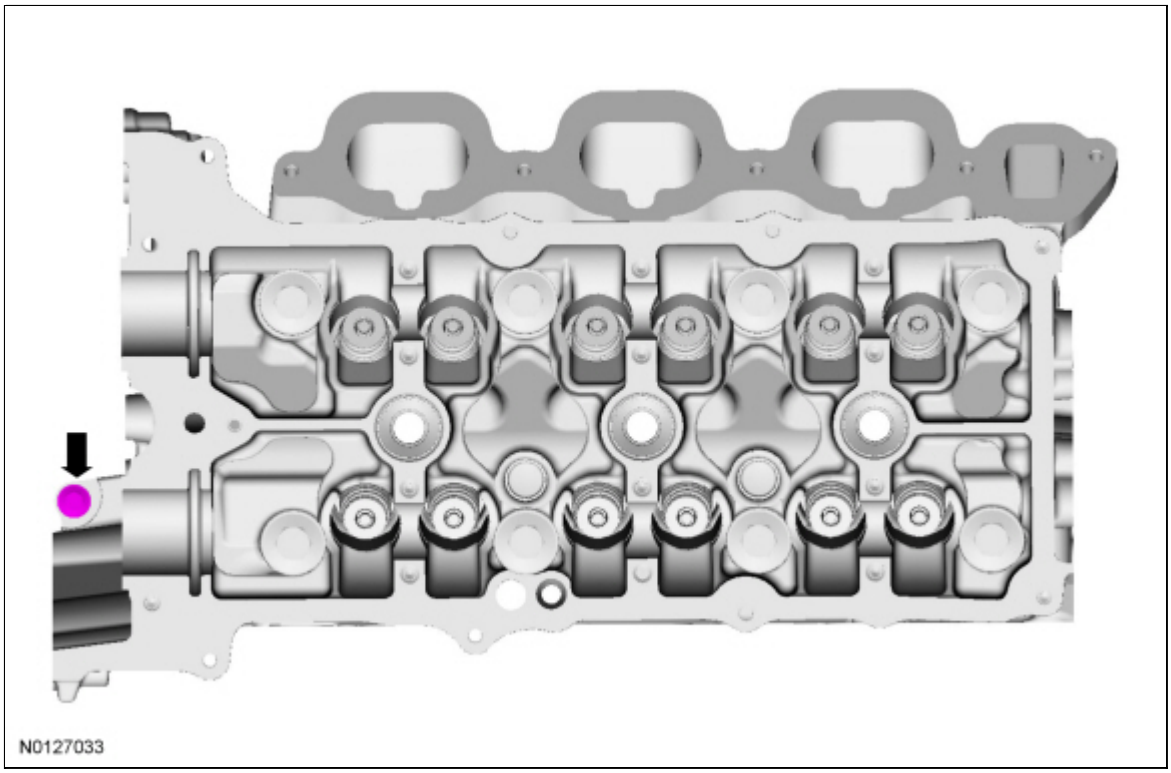
104. Inspect the valve tappets. For additional information, refer to Section 303-00 .



105. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

Remove the 10 bolts and the lower intake manifold.

- Discard the gaskets.



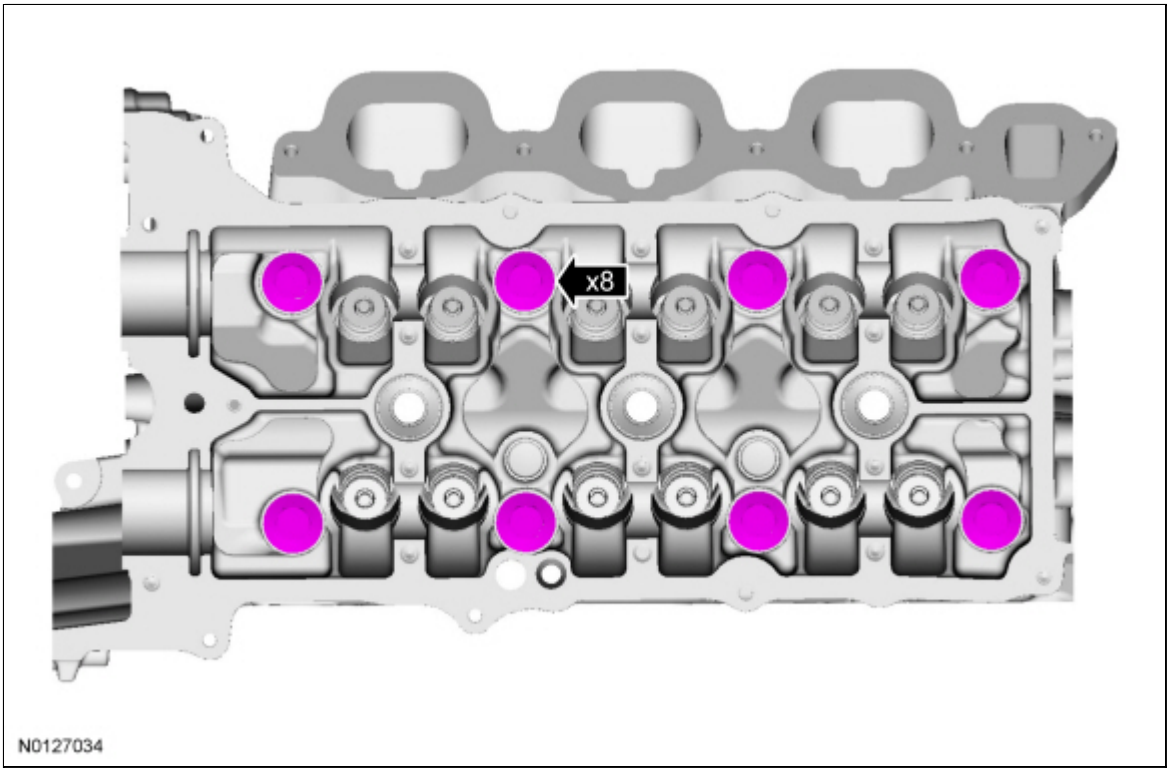
106. Disconnect and remove the CHT sensor jumper harness.

107. **NOTE:** LH shown, RH similar.

Remove and discard the M6 bolt from each cylinder head.

repair4less

108. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**



NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

NOTE: LH shown, RH similar.

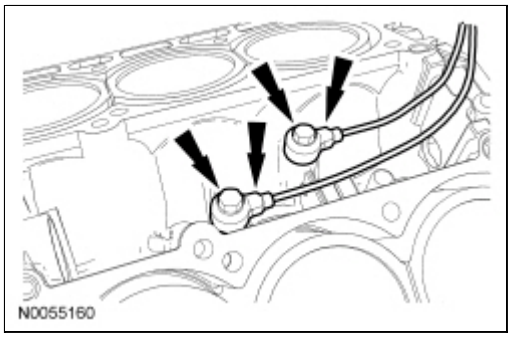
Remove and discard the 8 bolts from each cylinder head.

- Remove the cylinder heads.
- Discard the cylinder head gaskets.

109. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

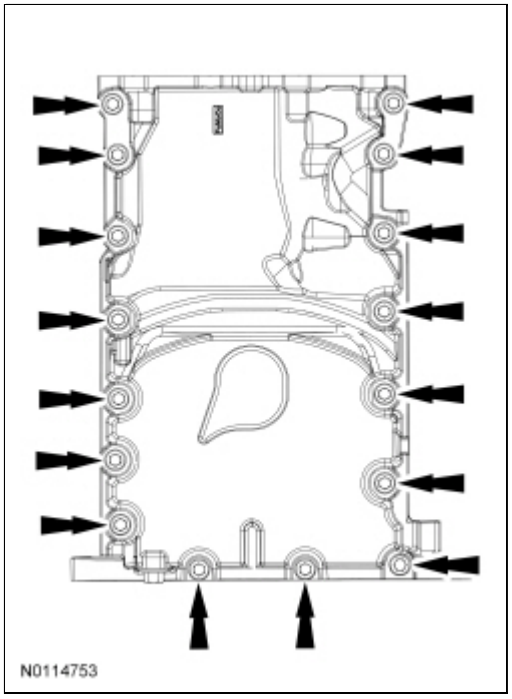
NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.



Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.

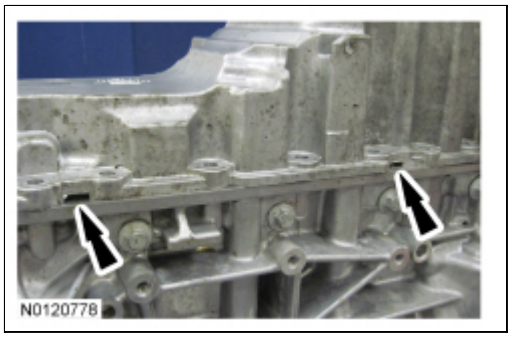
1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.



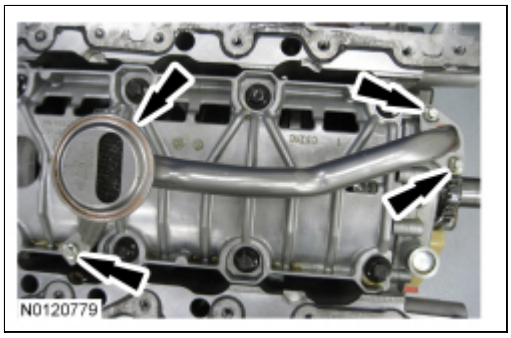
110. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

111. Remove the 2 bolts and the KS .

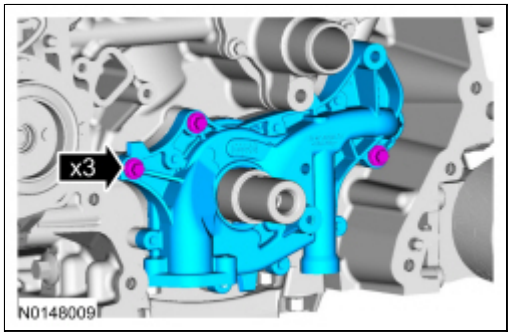
repair4less



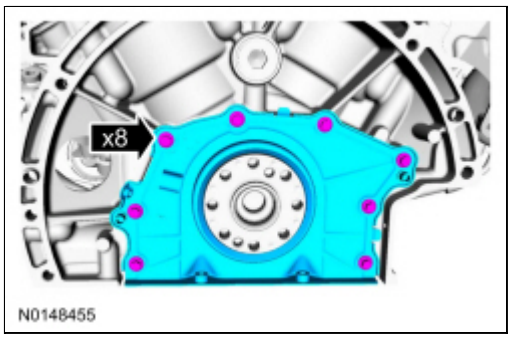
112. Remove the 16 oil pan bolts.



113. **NOTE:** RH shown, LH similar.



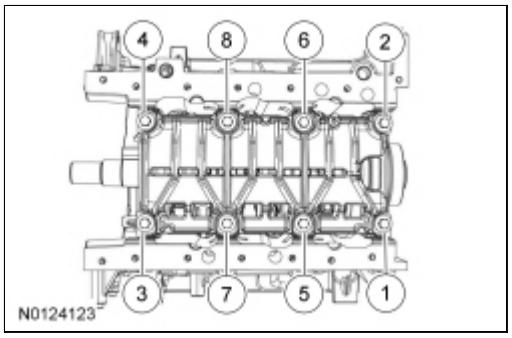
Using a pry tool, locate the 2 pry pads at the LH and RH side of the oil pan and pry the oil pan loose and remove.



114. Remove the 3 bolts and the oil pump screen and the pickup tube.
    - Discard the O-ring seal.

115. Remove the 3 bolts and the oil pump.

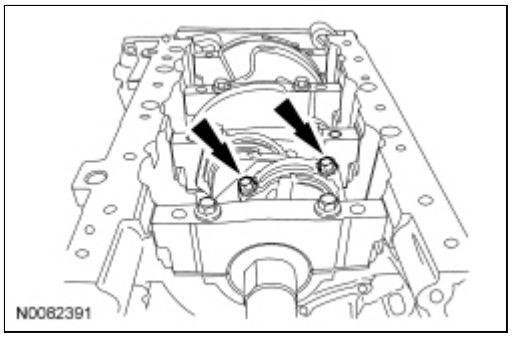
116. Remove the 8 bolts and the crankshaft rear seal retainer plate.
    - Discard the crankshaft rear seal retainer plate.



117. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

118. **NOTE:** The main bearing cap support brace bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove the bolts in the sequence shown.
    - Remove the main bearing cap support brace.
    - Discard the bolts.



repair4less

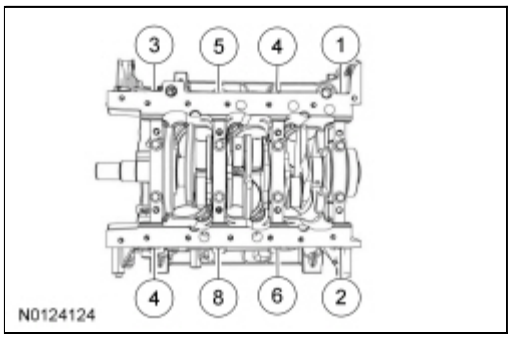
119. **NOTE:** The connecting rod cap bolts are a tighten-to-yield design. The original connecting rod cap bolts will be used when measuring the connecting rod large end bore during assembly. The connecting rod cap bolts will be discarded after measurement.

    NOTE: Clearly mark the position and orientation of the connecting rods, connecting rod caps and connecting rod bearings for reassembly.

    Remove the connecting rod cap bolts and cap.

120. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Remove the piston/rod assembly from the engine block.

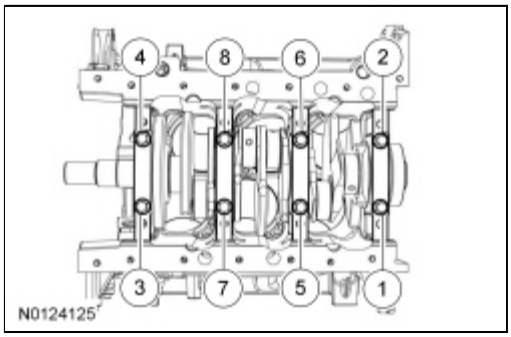


121. Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

122. **NOTE:** The 8 main bearing cap side bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.

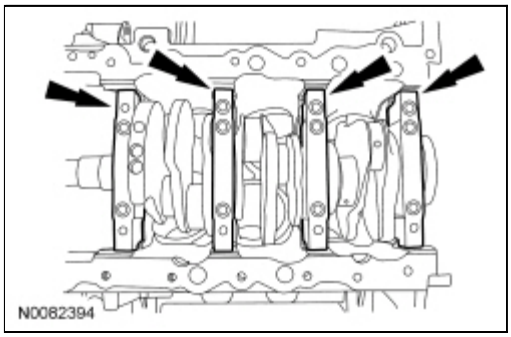
    Remove the 8 main bearing cap side bolts in the sequence shown.



- Discard the bolts.

123. **NOTE:** The 8 main bearing cap bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

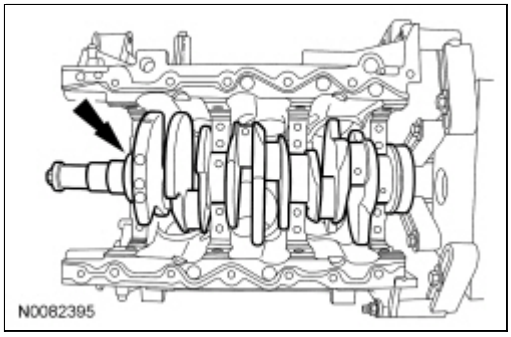
NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.



Remove the 8 main bearing cap bolts in the sequence shown.
- Discard the bolts.

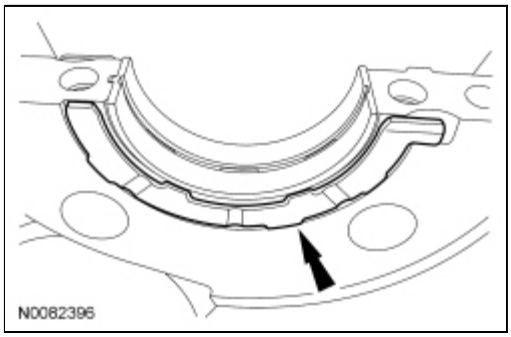
124. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

NOTE: Note the position of the thrust washer on the outside of the No. 4 rear main bearing cap.



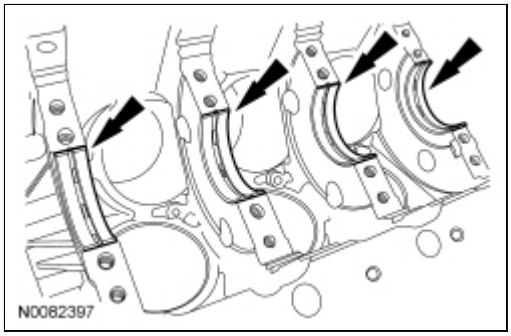
Remove the 4 main bearing caps.

125. **NOTE:** Note the position of the 2 thrust washers on the inside and outside of the rear main bearing bulkhead.



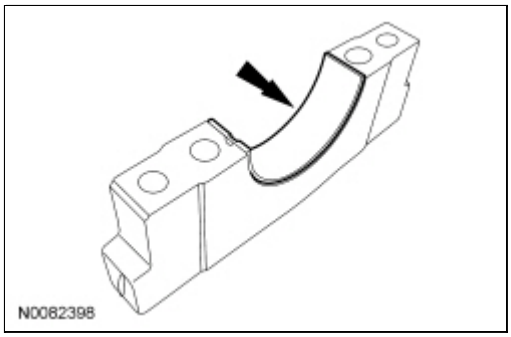
repair4less

Remove the crankshaft.



126. **NOTE:** Inside shown, outside similar.

Remove the 2 crankshaft thrust bearings from the rear main bearing bulkhead.



127. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

Remove the 4 crankshaft main bearings from the cylinder block.

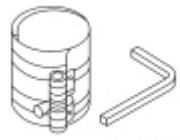
128. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

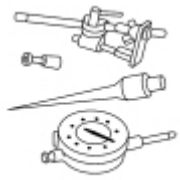
Remove the 4 crankshaft main bearings from the main bearing caps.

129. Inspect the cylinder block, bearing cap support brace, pistons and connecting rods. For additional information, refer to Section 303-00 .

130. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

    Clean the sealing surfaces of the cylinder heads, the cylinder block and the oil pan in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
    5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.





131. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover and oil pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover and oil pan. These tools cause scratches and gouges that make leak paths.**

    Clean the engine front cover and oil pan using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.
    - Thoroughly wash the engine front cover and oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

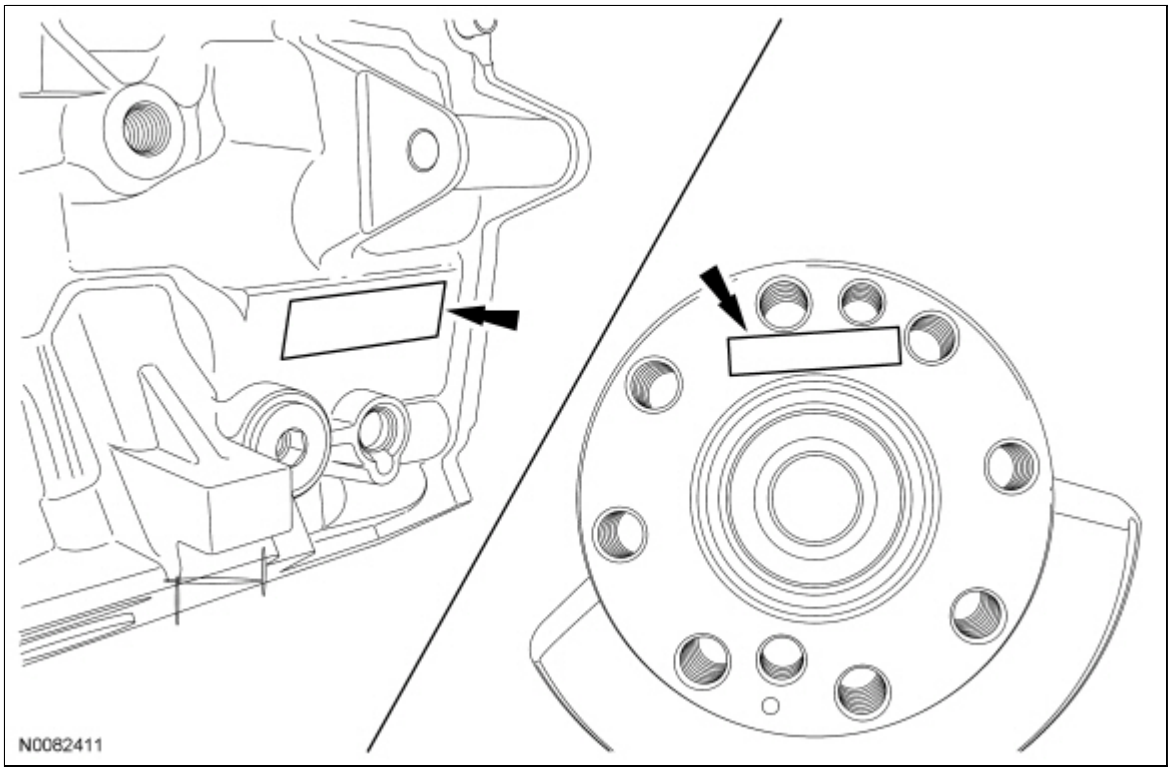
21	6C364	Main bearing cap support brace



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

NOTE: Assembly of the engine requires various inspections/measurements of the engine components. These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .

All engines

1. **NOTE:** This procedure is for selecting bearings using a new crankshaft.

   Select the crankshaft main bearings for each crankshaft journal.
   - Read the code on the crankshaft flange.
   - Read the code on the cylinder block face.
     - The first letter after the first asterisk makes up the code for main No. 1 and the next letter for main No. 2. The first letter after the second asterisk makes up the code for main No. 3 and the last letter for main No. 4.

2. **NOTE:** This chart is for selecting main bearings 1 and 4 only, the remaining bearings will be selected using a different chart in the next step.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 1 and 4.
   - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.
   - Repeat the above steps using the fourth letter of the block and crankshaft codes to select the No. 4 bearing.

repair4less

3. **NOTE:** This chart is for selecting main bearings 2 and 3 only.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 2 and 3.
   - Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the No. 2 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is "1".
   - Repeat the above steps using the third letter of the block and crankshaft codes to select the No. 3.

4. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

   Using the original connecting rod cap bolts, install the connecting rod caps and bolts.
   - Tighten the bolts in 3 stages:
   - Stage 1: Tighten to 23 Nm (17 lb-ft).
   - Stage 2: Tighten to 43 Nm (32 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.

5. Measure the connecting rod large end bore in 2 directions.
   - Remove the bolts and the rod cap.
     - Discard the connecting rod cap bolts.

6. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions.

repair4less

7. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.

		CONNECTING ROD LARGE END BORE (59.XXX)

	3	1.925 mm	1.931 mm	1.928 mm

N0082806

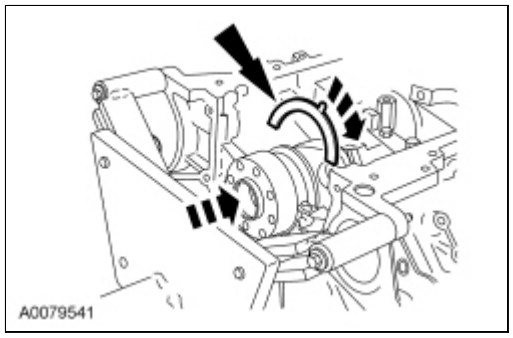
8. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Lubricate the upper crankshaft main bearings with clean engine oil and install the 4 crankshaft main bearings in the cylinder block.

9. **NOTE:** Do not install the upper thrust bearings until the crankshaft is installed.

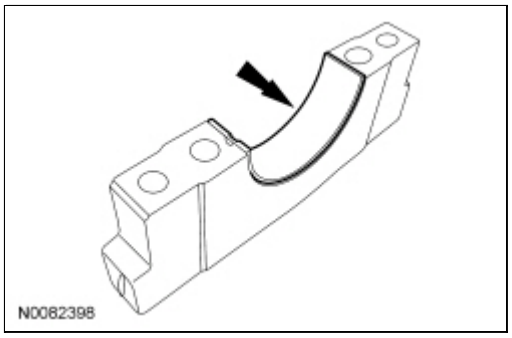
   NOTE: Lubricate the thrust surfaces of the crankshaft with clean engine oil.

   Install the crankshaft onto the upper main bearings.



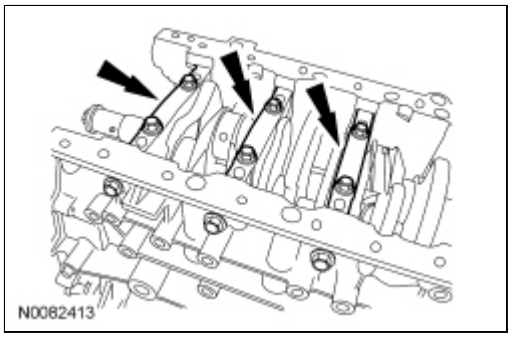
10. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 4 rear bulkhead.



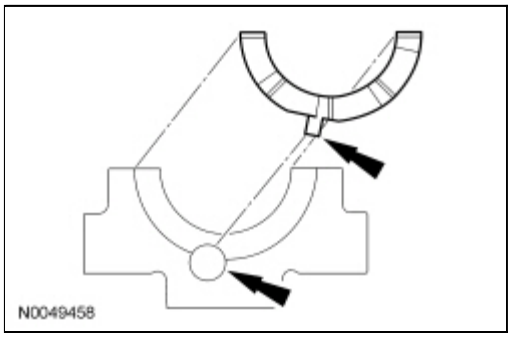
11. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 4 rear bulkhead.

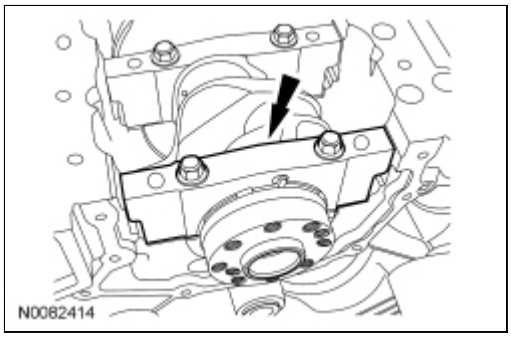


12. Lubricate the crankshaft lower main bearings with clean engine oil and install them into the main bearing caps. Visually check seating and squareness of the bearings to make sure of proper seating in caps.

repair4less



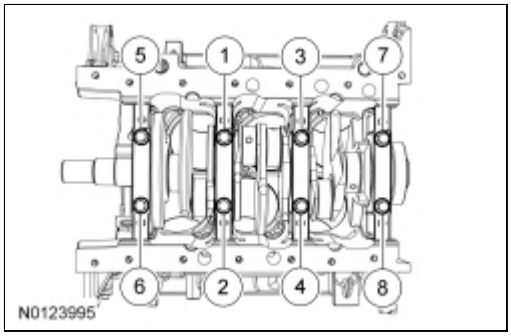
13. Position the No. 1, No. 2 and No. 3 main bearing caps on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the new bolts until the main bearing caps are seated.



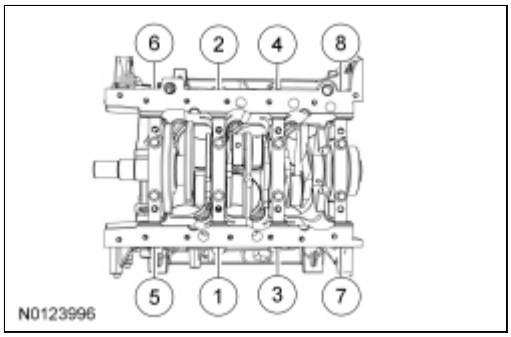
14. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    NOTE: To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

    Install the lower crankshaft thrust washer to the back side of the No. 4 rear main bearing cap, with the tab aligned with the cutout in the main bearing cap.



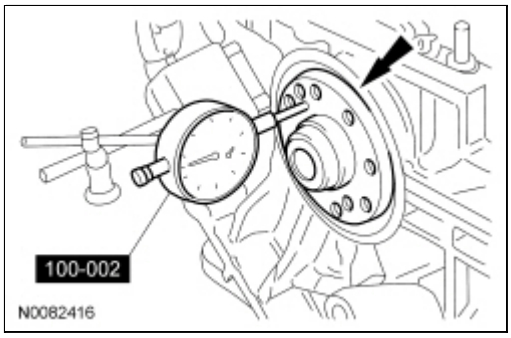
15. Position main bearing cap No. 4 on the cylinder block and keeping the cap as square as possible, alternately draw the cap down evenly using the new bolts until the main bearing cap is seated.



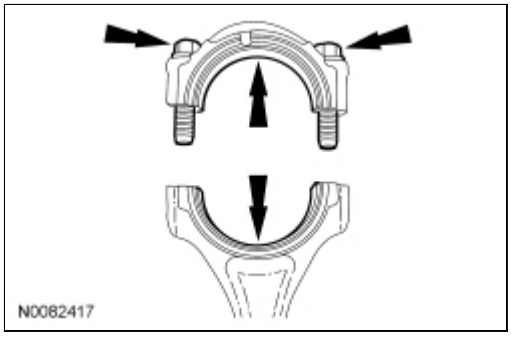
16. Loosen the No. 4 main bearing cap bolts.

17. **NOTE:** While tightening the main bearing vertical bolts, push the crankshaft forward and the No. 4 main bearing cap rearward to seat the crankshaft thrust washers.

    Tighten the main bearing bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten fasteners 1 through 8 to 33 Nm (24 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 135 degrees.

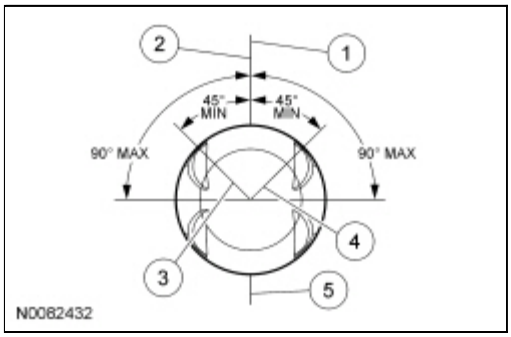


18. Install the new 8 main bearing cap side bolts. Tighten in the sequence shown in 2 stages:
    - Stage 1: Tighten fasteners 1 through 8 to 24 Nm (18 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 180 degrees.



19. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

repair4less



20. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

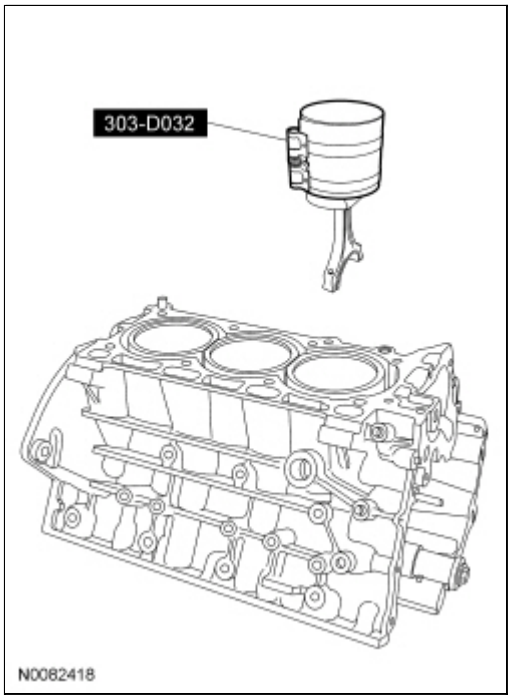
    Prepare the connecting rod and cap.
    - Insert the new bolts in the rod cap.
    - Insert the upper and lower rod bearings into the rod and cap.

21. Before installing the pistons into the cylinder block, verify proper ring gap location.
    1. Center line of the piston parallel to the wrist pin bore
    2. Upper compression ring gap location
    3. Upper oil control segment ring gap location
    4. Lower oil control segment ring gap location
    5. Expander ring and lower compression ring gap location

22. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: The next 3 steps are for all 6 connecting rods, rod caps and pistons. Only 1 connecting rod, rod cap and piston is shown.

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with



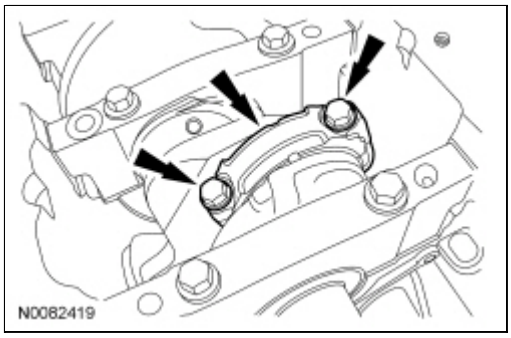
clean engine oil.

NOTE: Make sure the piston rings are positioned to specifications for installation. For additional information, refer to Disassembly and Assembly of Subassemblies - Piston in this section.

NOTE: If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

NOTE: If the piston and connecting rod are to be reinstalled, they must be installed in the same orientation as disassembled.

Using the Piston Ring Compressor, install the piston and connecting rod assemblies.



23. Seat the connecting rod on the crankshaft journal.

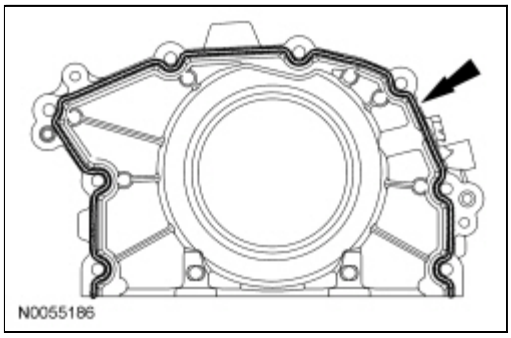
24. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

    NOTE: After installation of each piston, connecting rod, rod cap and bolts, rotate the crankshaft to verify smooth operation.

    Install the connecting rod cap and bolts.
    - Tighten the bolts in 3 stages:
    - Stage 1: Tighten to 23 Nm (17 lb-ft).
    - Stage 2: Tighten to 43 Nm (32 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

repair4less

25. Repeat the previous 3 steps until all 6 piston, connecting rod and connecting rod cap assemblies are installed.

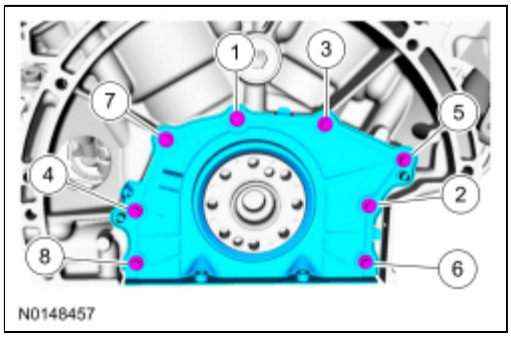


26. Install the main bearing cap support brace and the new bolts. Tighten in the sequence shown in 2 steps.
    - Stage 1: Tighten fasteners to 20 Nm (177 lb-in).
    - Stage 2: Tighten fasteners an additional 180 degrees.

27. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

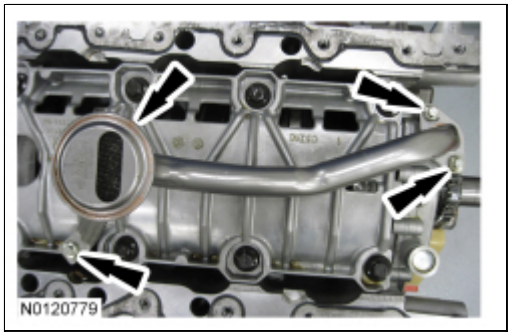
    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.



28. **NOTE:** Lubricate the crankshaft rear seal with clean engine oil.

    NOTE: Use the 2 handles during installation to avoid touching the sealant.

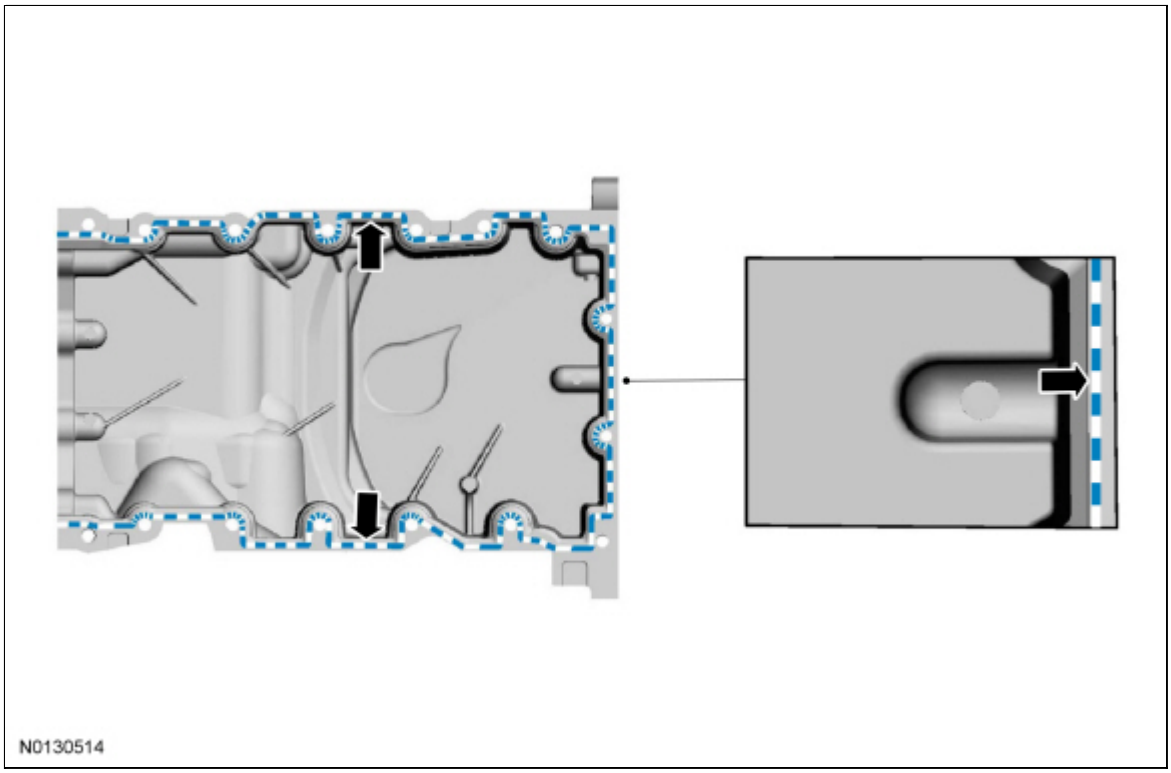
Install the 8 crankshaft rear seal retainer plate bolts. Tighten in the sequence shown.



- Tighten to 10 Nm (89 lb-in).

29. Install the oil pump and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

30. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

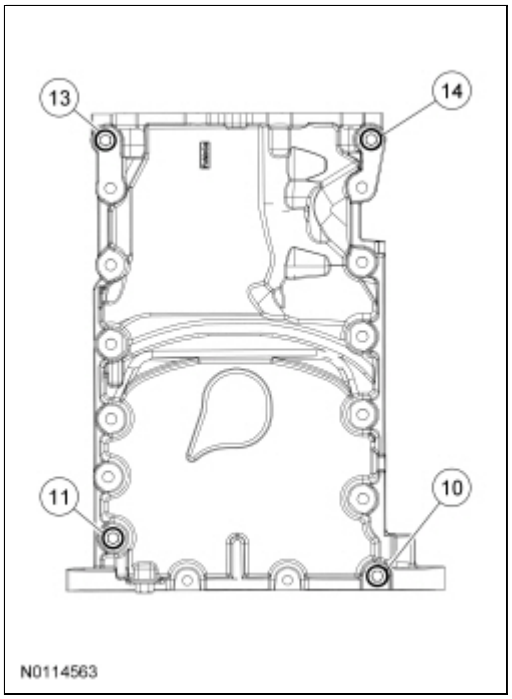


31. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

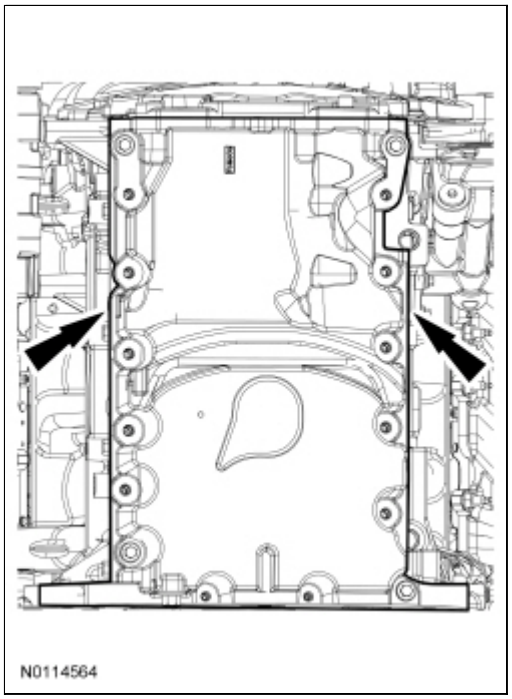
    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the oil pan to the sealing surface of the oil pan-to-engine block mating surface.

repair4less

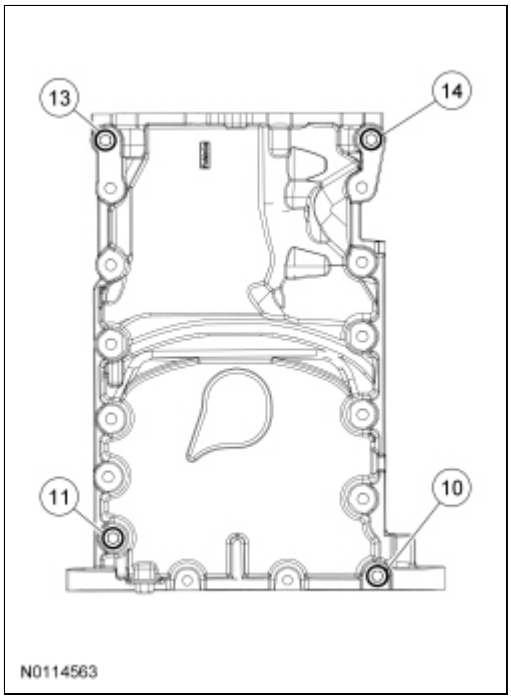


32. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

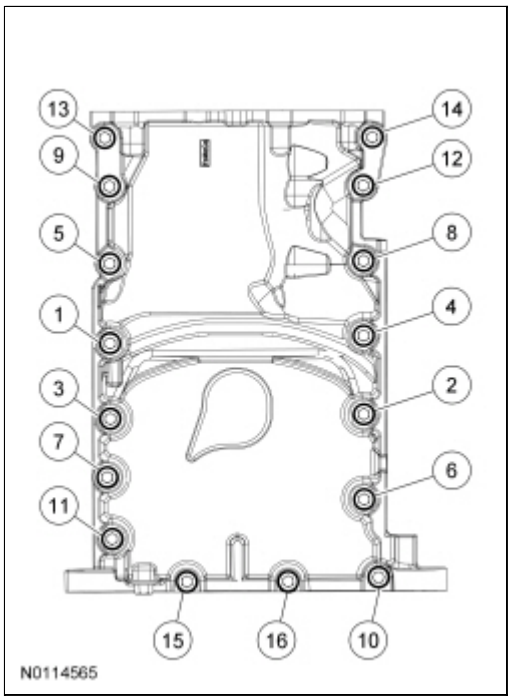


33. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.

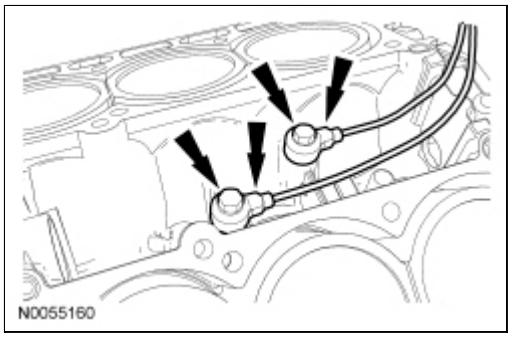
    Install the oil pan and bolts 10, 11, 13 and 14 finger tight.



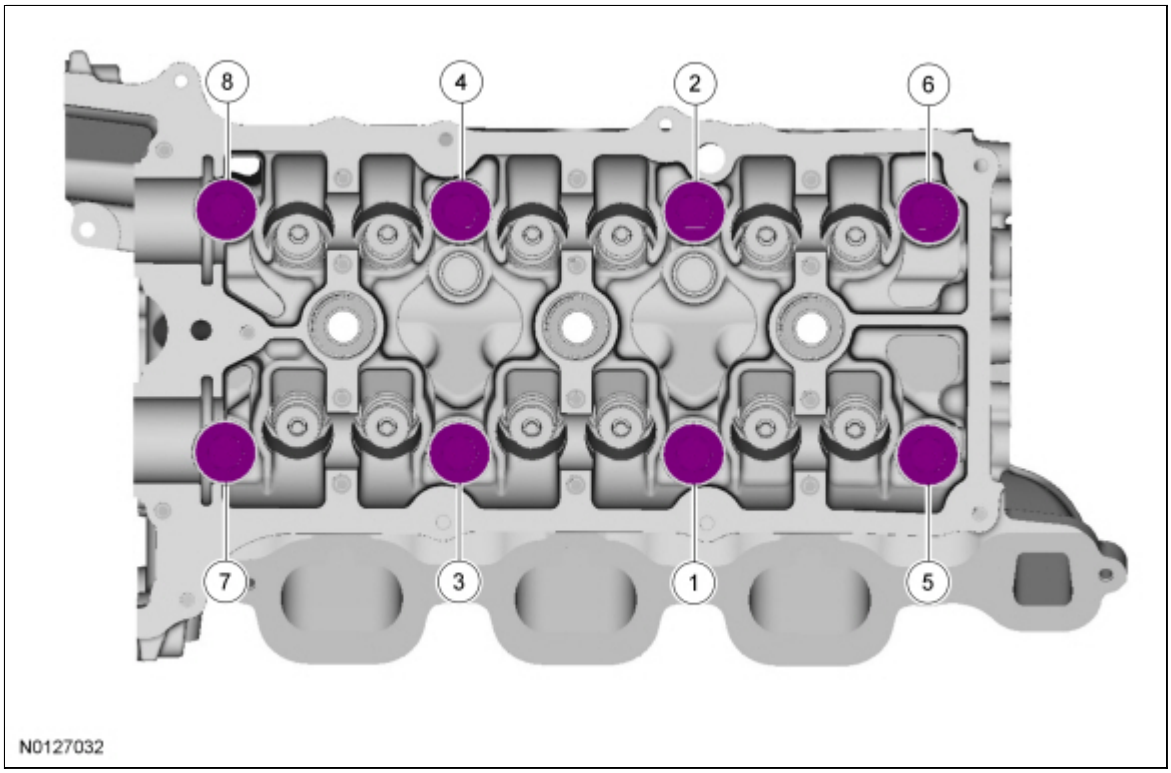
34. Laterally align the oil pan to the block. Make sure the oil pan is flush with the block at these 2 points.



35. Tighten bolts 10, 11, 13 and 14 in the sequence shown to 3 Nm (27 lb-in).

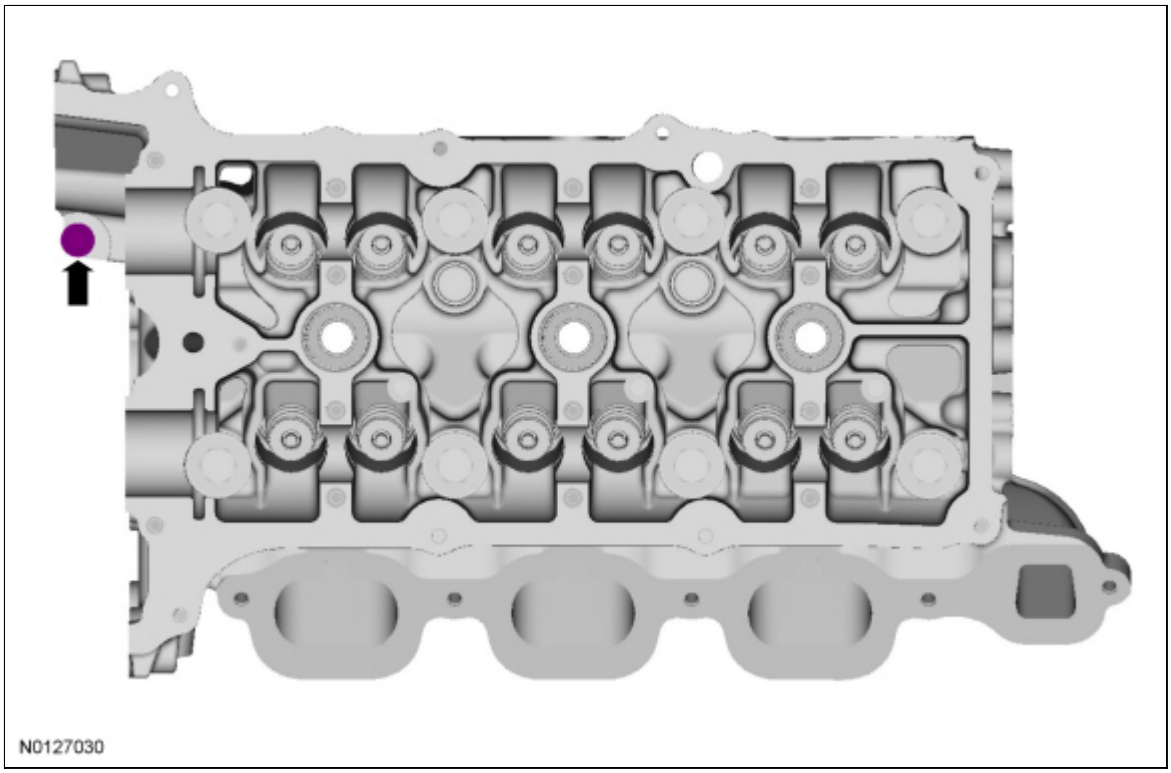


repair4less

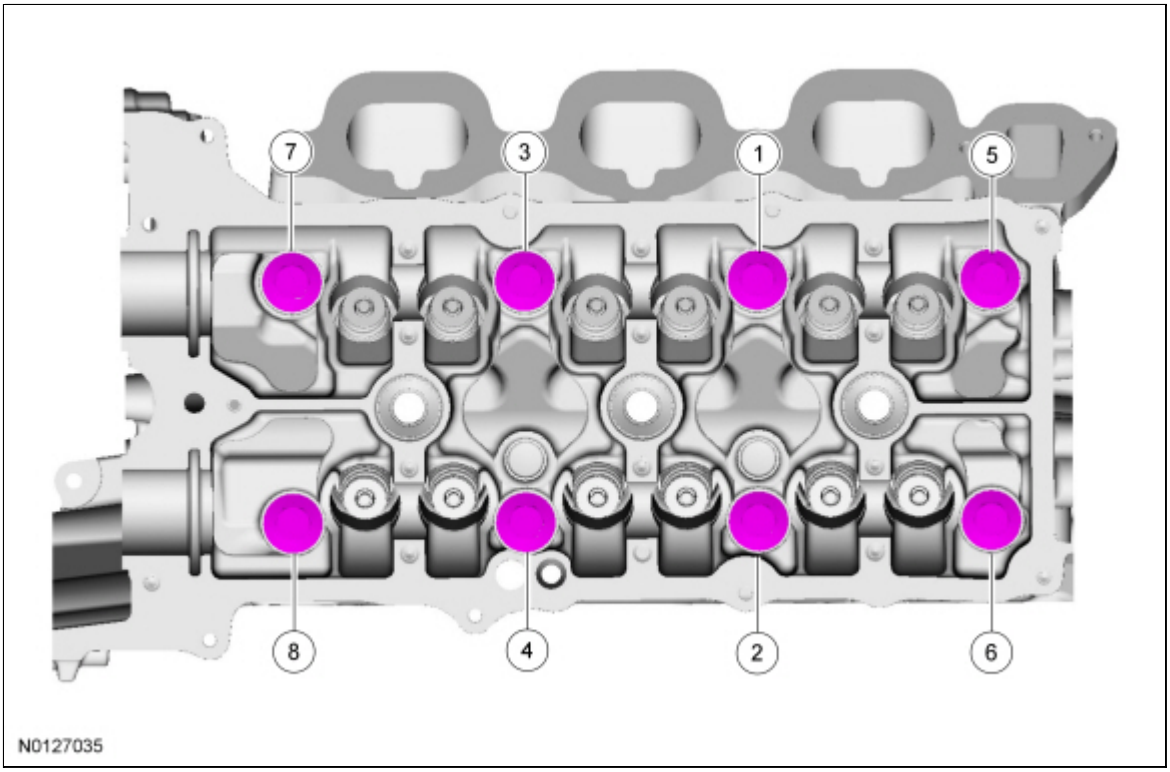


36. Install the remaining oil pan bolts and tighten in the sequence shown.
    - Tighten bolts 1-9 and 11-14 to 20 Nm (177 lb-in), then rotate an additional 45 degrees.
    - Tighten bolts 15 and 16 to 10 Nm (89 lb-in), then rotate an additional 45 degrees.
    - Tighten bolt 10 to 20 Nm (177 lb-in), then rotate an additional 90 degrees.

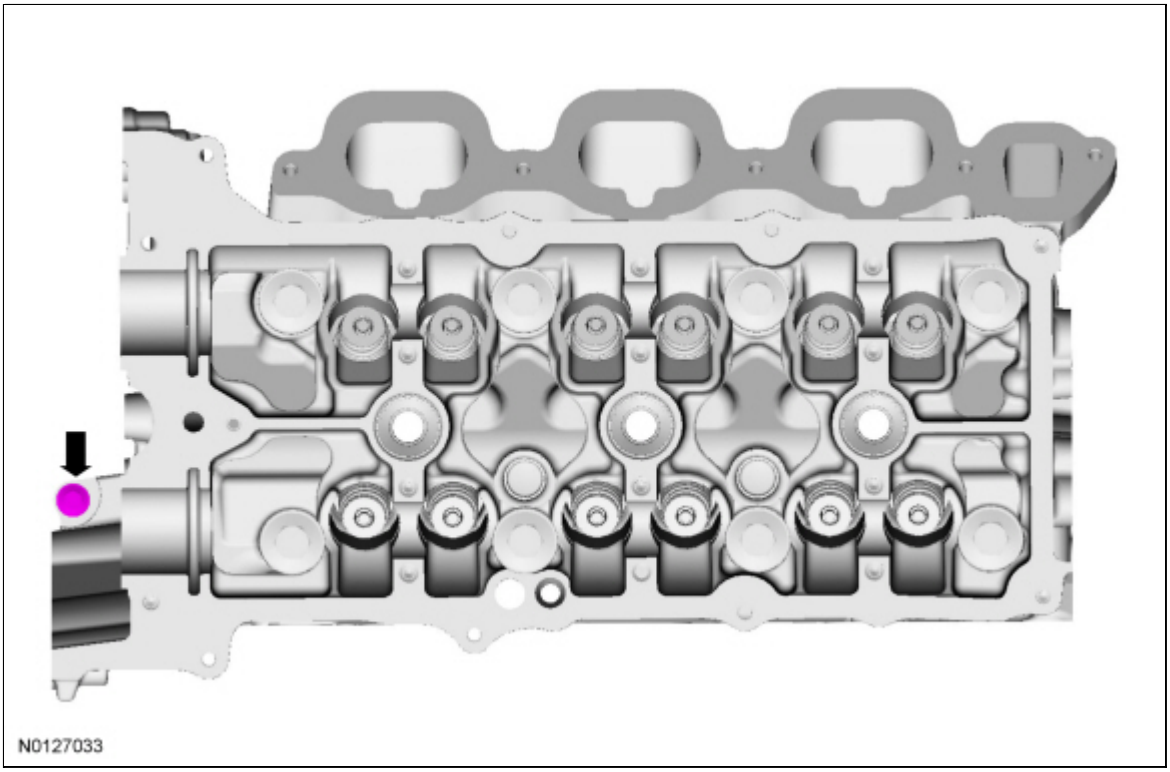
37. Install the Knock Sensor (KS) and the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).



38. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.

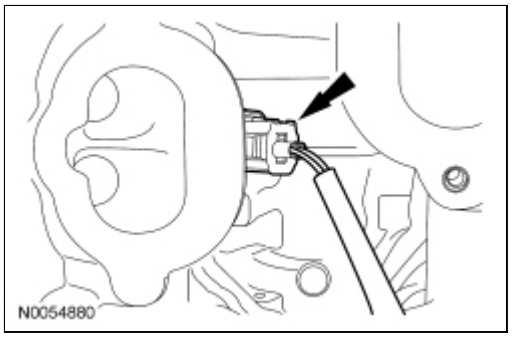


39. Install the RH M6 bolt.
    - Tighten to 10 Nm (89 lb-in).

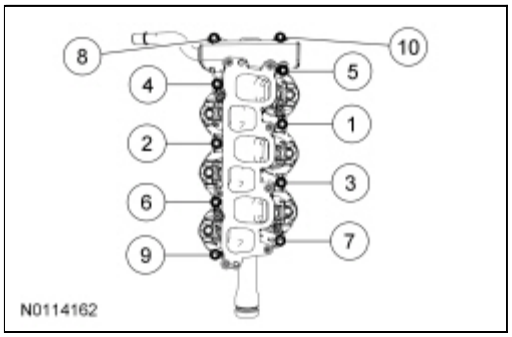


repair4less

40. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



41. Install the LH M6 bolt.
    - Tighten to 10 Nm (89 lb-in).

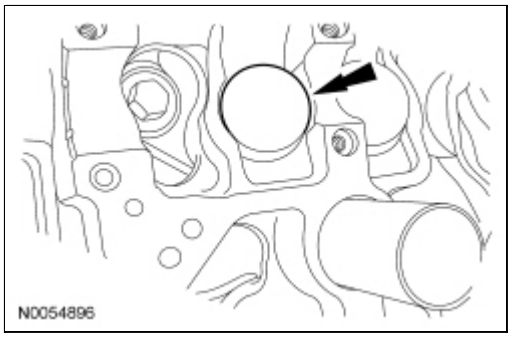


42. Connect the Cylinder Head Temperature (CHT) sensor jumper harness.

repair4less

43. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris if found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Using new lower intake manifold gaskets, install the lower intake manifold and the 10 bolts and tighten in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

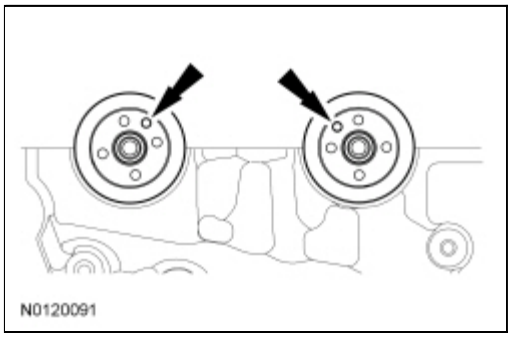


44. **NOTE:** The valve tappets must be installed in their original positions.

    NOTE: Coat the valve tappets with clean engine oil prior to installation.

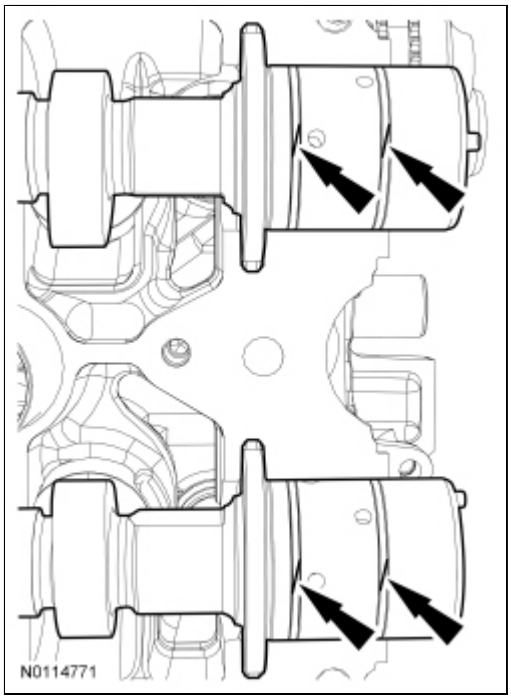
    NOTE: LH shown, RH similar.

    Install the valve tappets.



45. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

Position the crankshaft dowel pin in the 9 o'clock position.

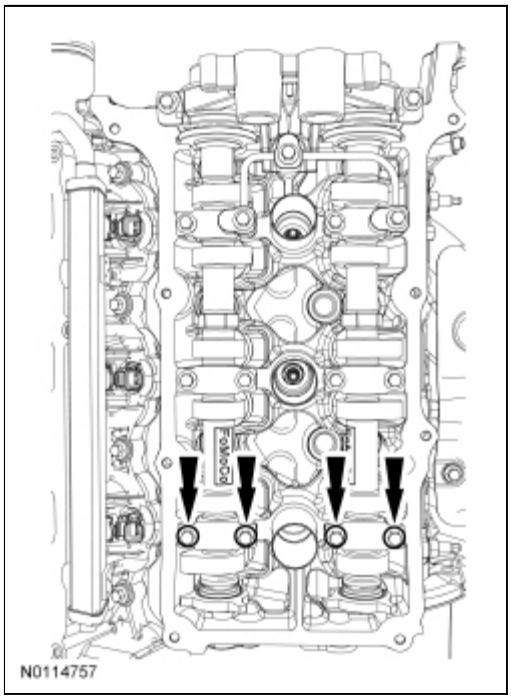


46. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

    Position the camshafts onto the RH cylinder head in the neutral position as shown.

47. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

    Position the 4 camshaft seals gaps as shown.

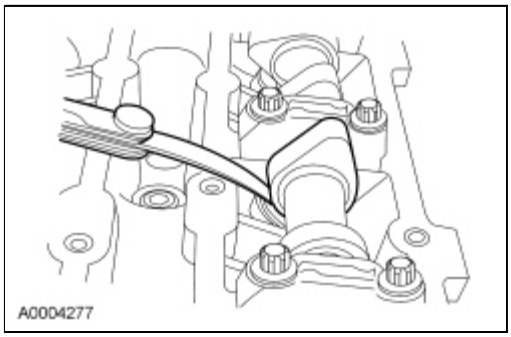


repair4less

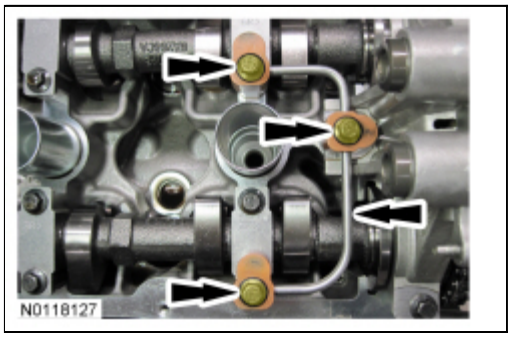
48. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.

49. Loosen the 4 camshaft caps bolts.



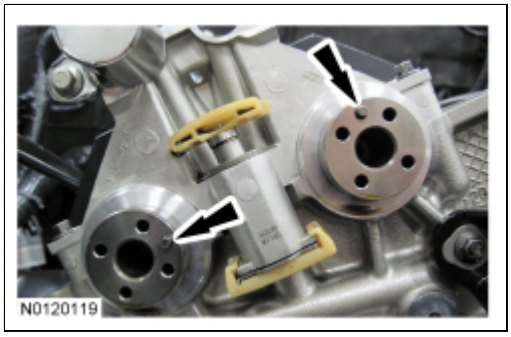
50. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then an additional 45 degrees.



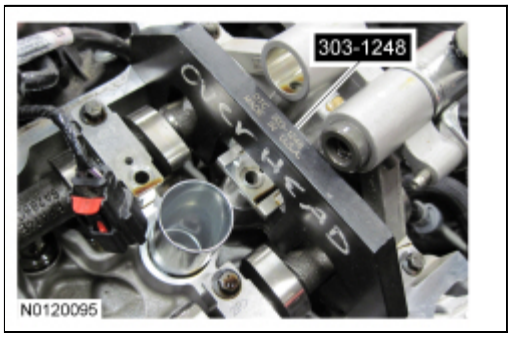
51. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet (s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

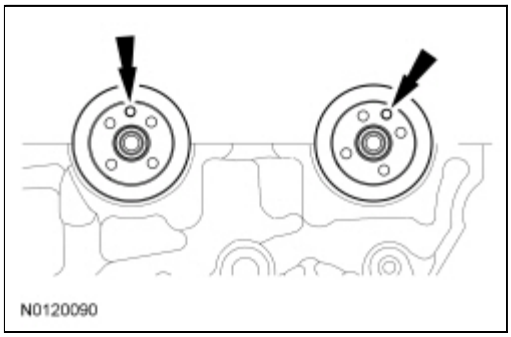


52. Remove the 3 bolts and the RH valve train oil tube.



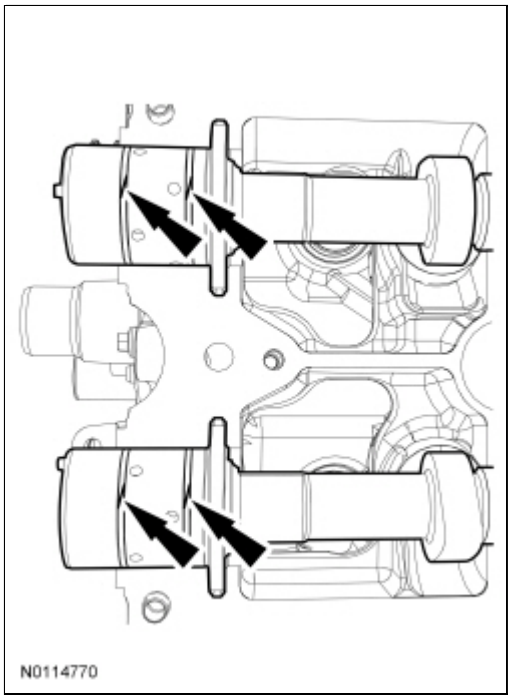
repair4less

53. Rotate the RH camshafts to the Top Dead Center (TDC) position as shown.



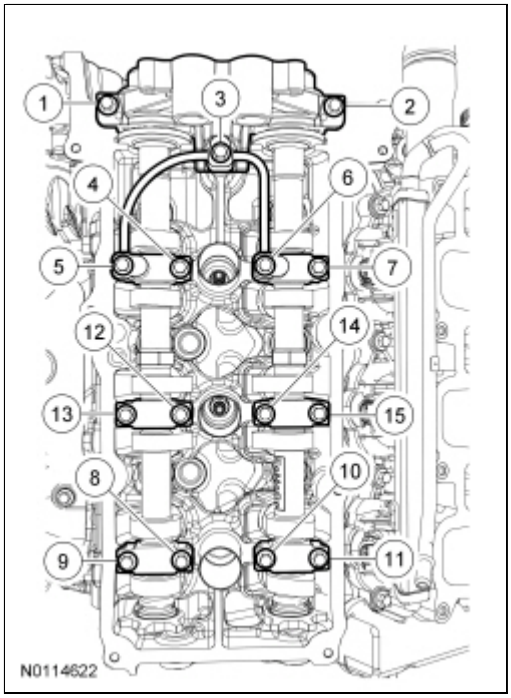
54. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the RH camshafts.



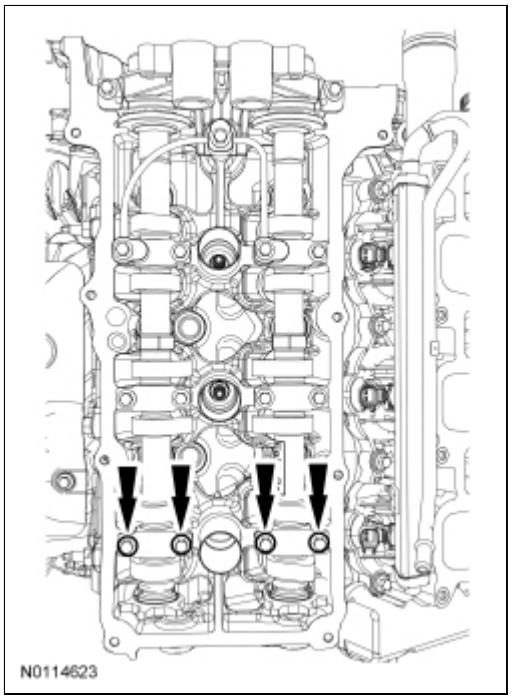
55. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

    Position the camshafts onto the LH cylinder head in the neutral position as shown.



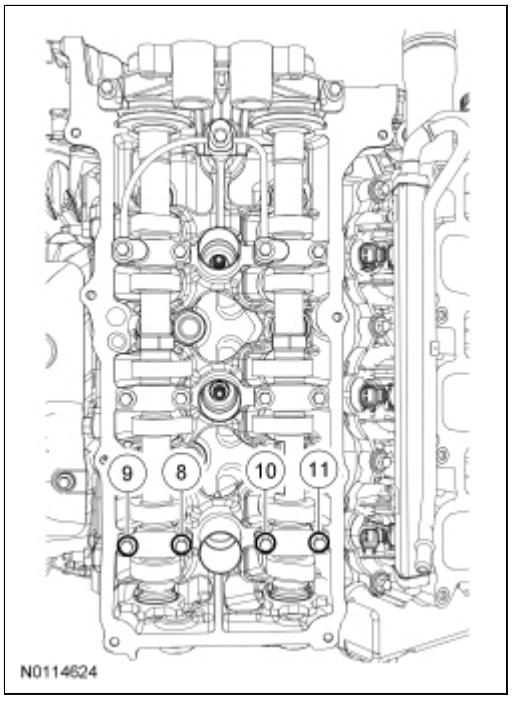
56. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

    Position the 4 camshaft seals gaps as shown.



57. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

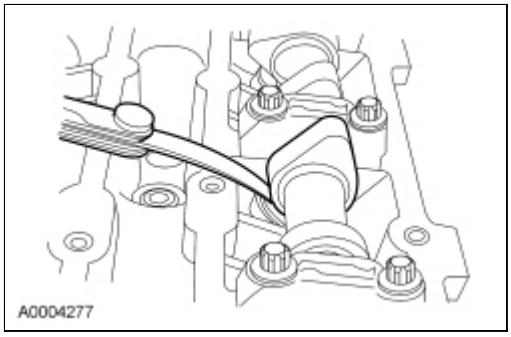
    Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.



58. Loosen the 4 camshaft caps bolts.

repair4less

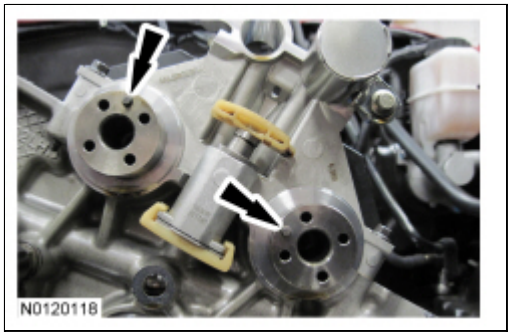
59. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then an additional 45 degrees.



60. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

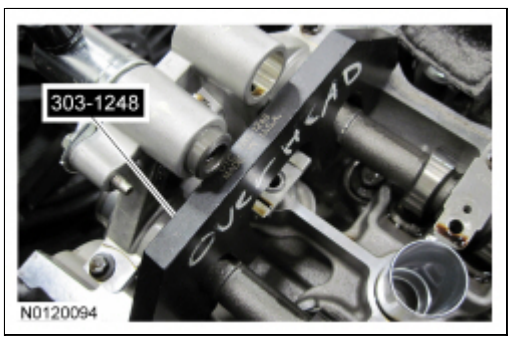
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet

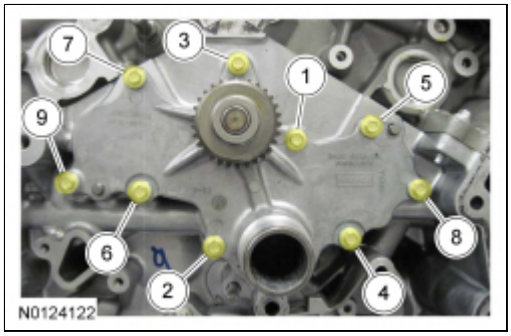


(s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

61. Remove the 3 bolts and the LH valve train oil tube.



62. Rotate the LH camshafts to the TDC position as shown.



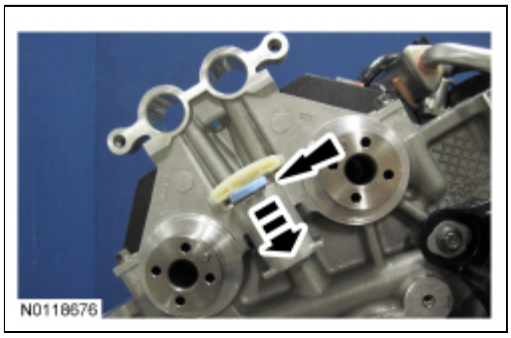
63. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the LH camshafts.

repair4less

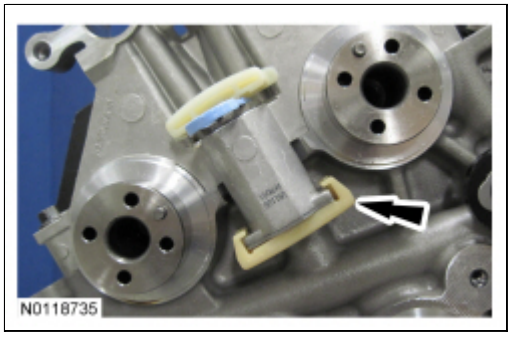
64. Using new gaskets, install the channel cover plate and the 9 bolts. Tighten in the sequence shown in 2 stages:
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

65. Install the RH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).



Engines with secondary timing chain tensioner removed

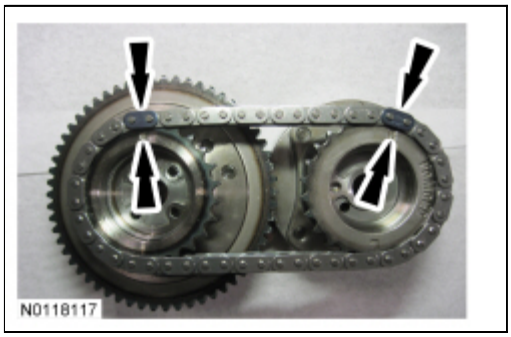
NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed or damage to the engine may occur.**



66. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

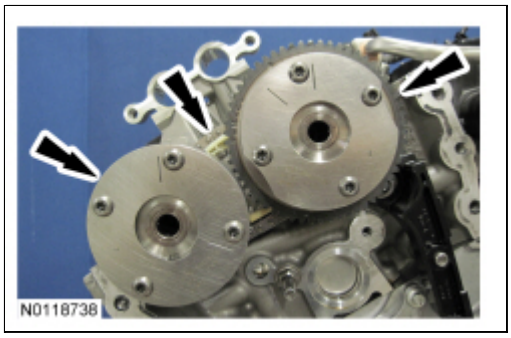
    NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

    Install the RH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

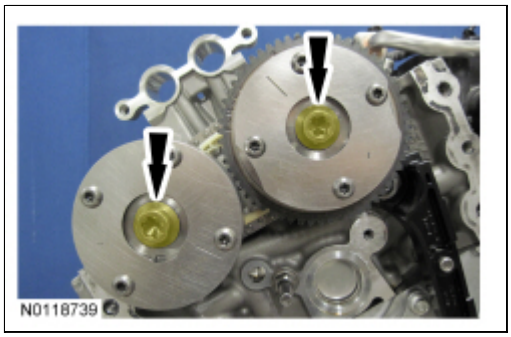


67. Install the RH secondary timing chain tensioner shoe.

68. Remove and discard the RH secondary timing chain tensioner shipping clip.

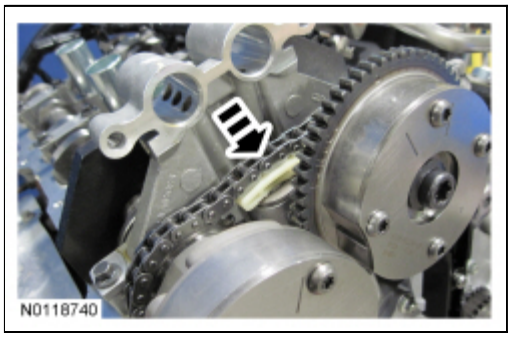


69. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



70. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

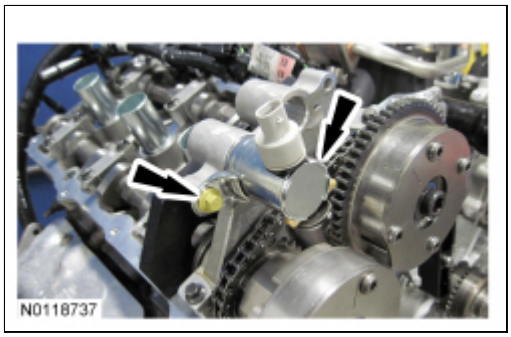
    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



repair4less

71. Install the 2 new RH VCT bolts and tighten in 4 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

72. Activate the RH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

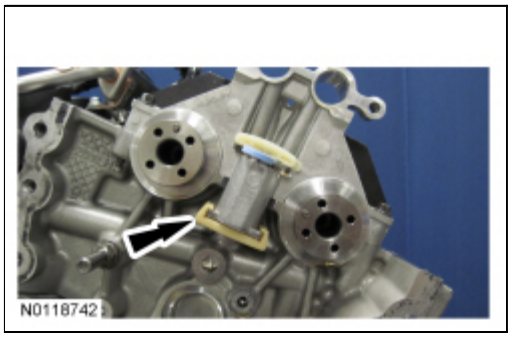


73. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

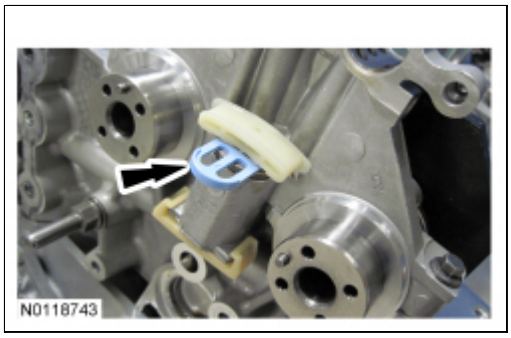
    Install the RH exhaust VCT oil control solenoid.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



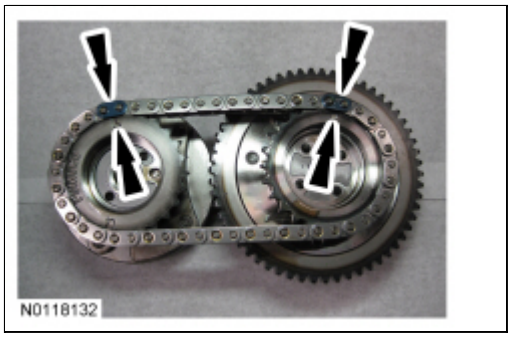
74. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

    NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

    Install the LH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

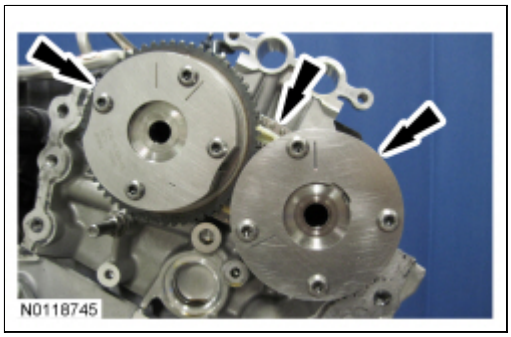


75. Install the LH secondary timing chain tensioner shoe.

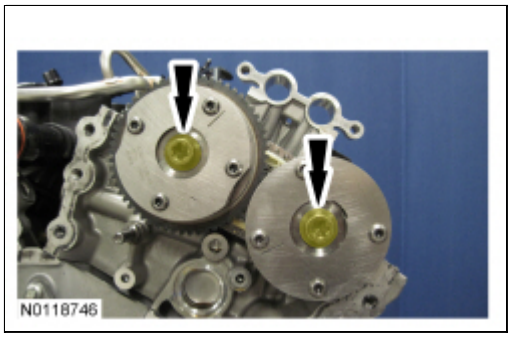


76. Remove and discard the LH secondary timing chain tensioner shipping clip.

repair4less



77. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

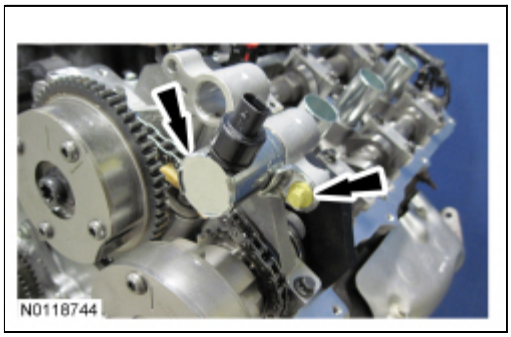


78. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

79. Install the 2 new LH VCT bolts and tighten in 4 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

80. Activate the LH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

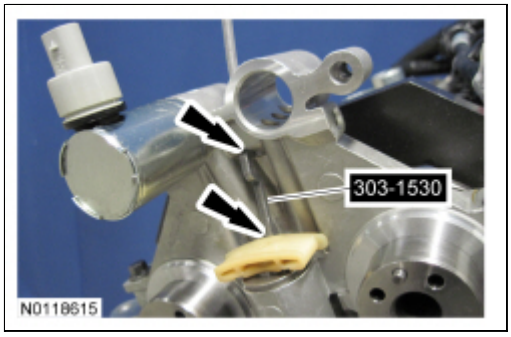


81. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

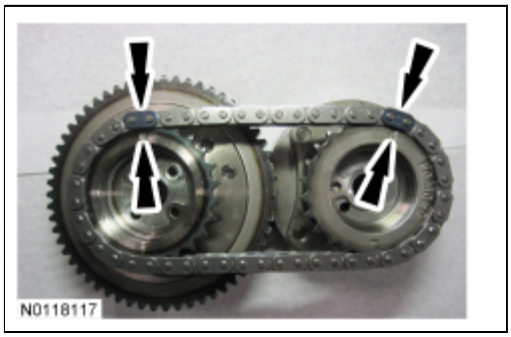
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the LH exhaust VCT oil control solenoid.



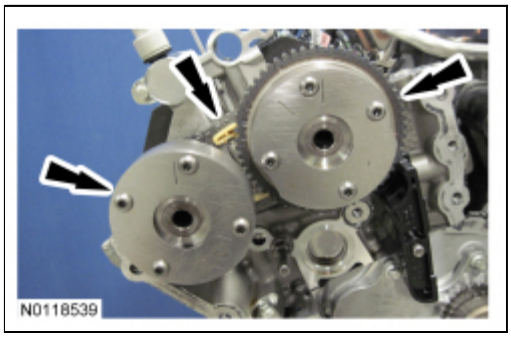
- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



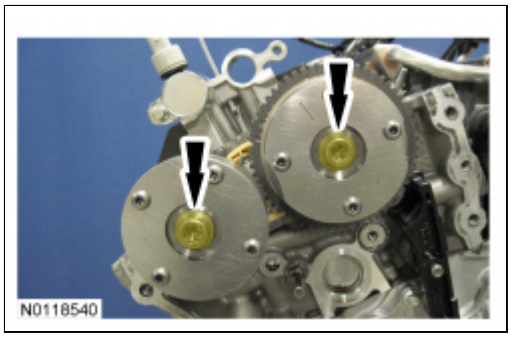
Engines with secondary timing chain tensioner not removed

82. Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

repair4less

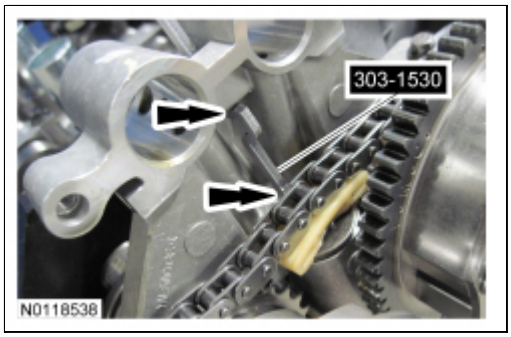


83. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

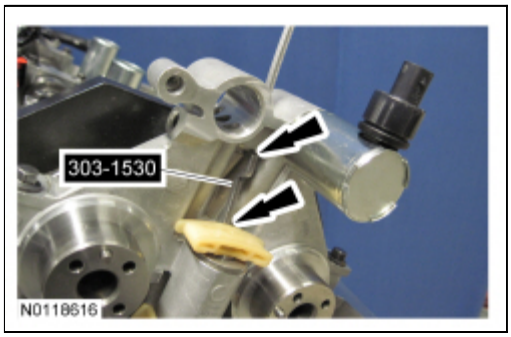


84. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

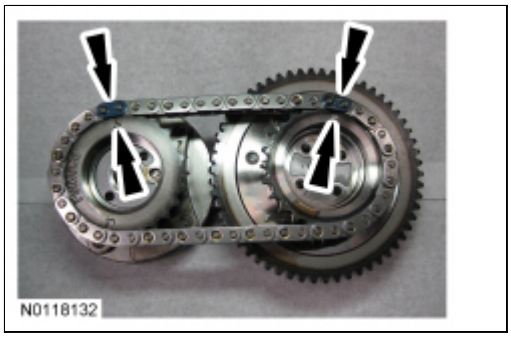


85. Install the 2 new RH VCT bolts and tighten in 4 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

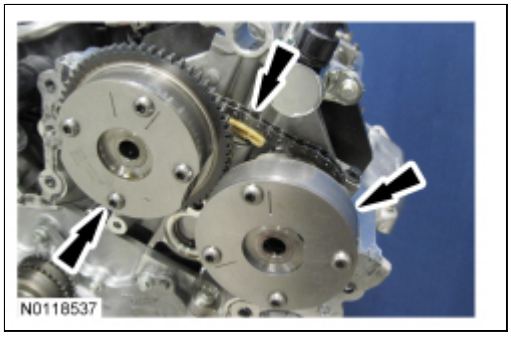


86. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

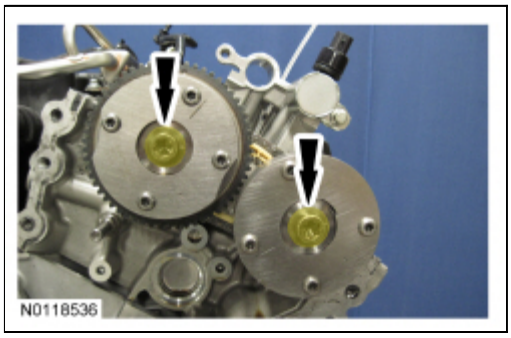


87. Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.



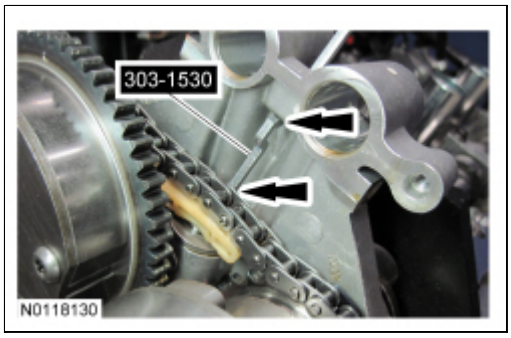
88. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

repair4less

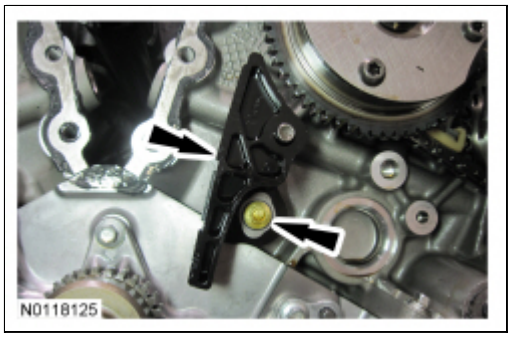


89. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

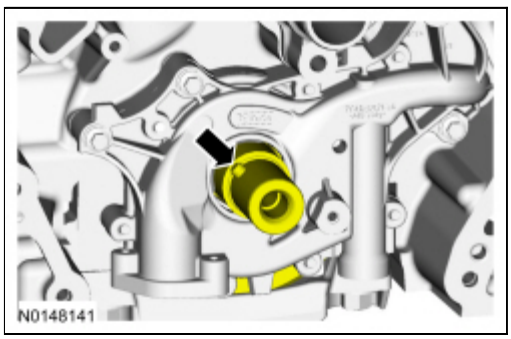


90. Install the 2 new LH VCT bolts and tighten in 4 stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

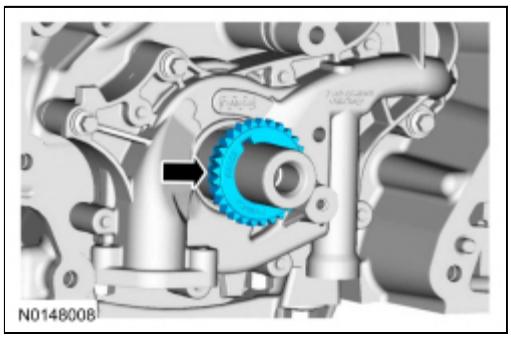


91. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

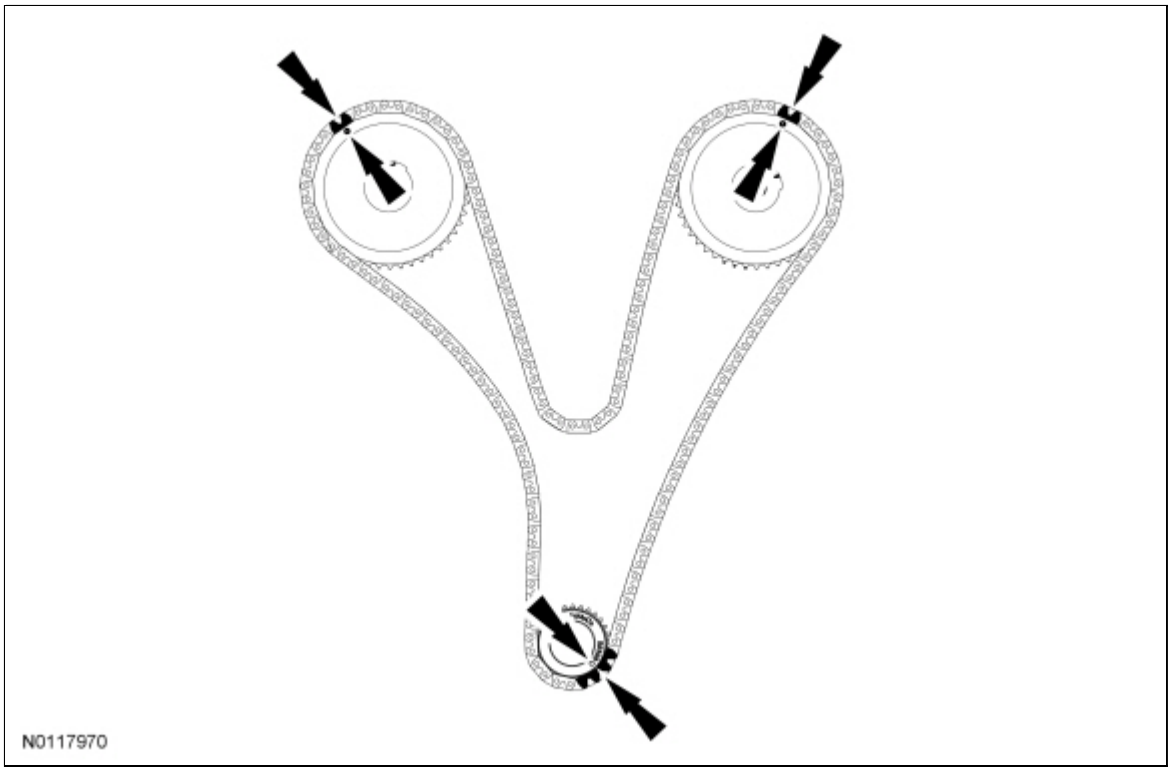


All engines

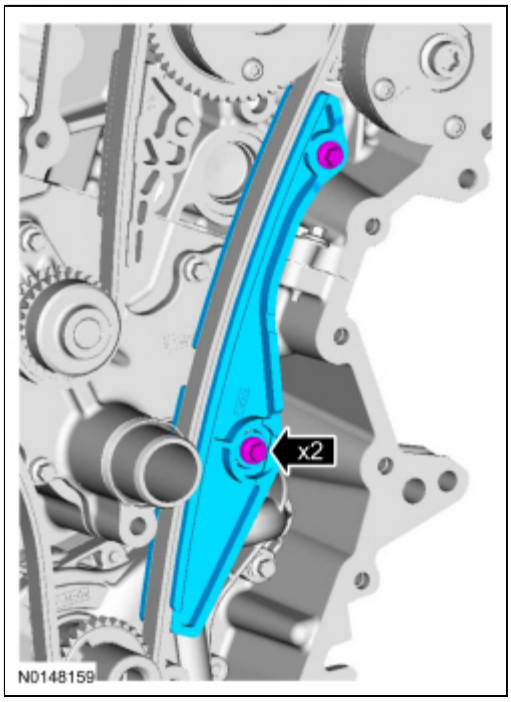


92. Install the upper LH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

93. Rotate the crankshaft clockwise 60 degrees to the Top Dead Center (TDC) position (crankshaft dowel pin at 11 o'clock).

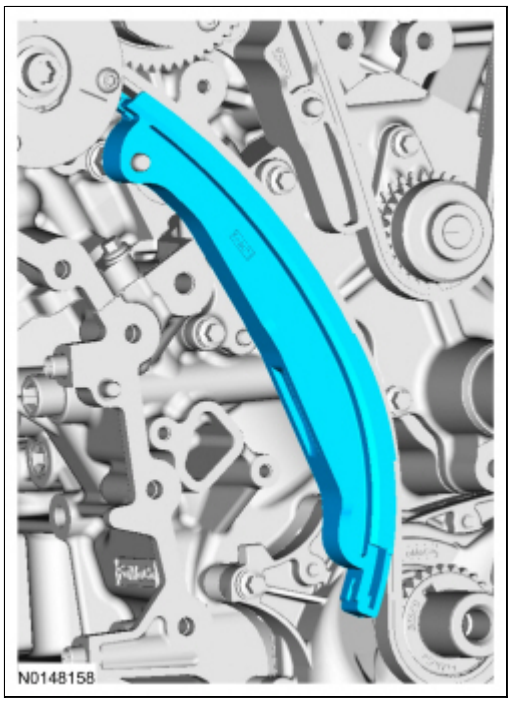


94. Install the crankshaft timing chain sprocket with timing dot mark out.



repair4less

95. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

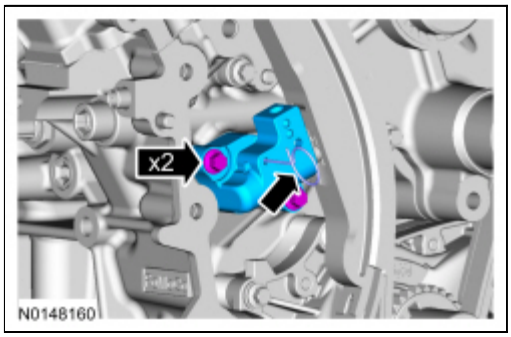


Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

96. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

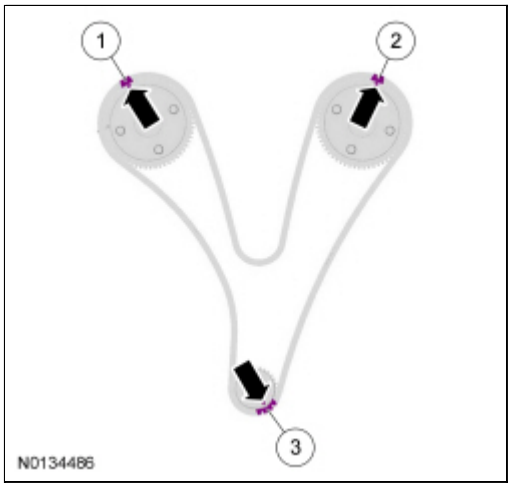
97. Install the primary timing chain tensioner arm.

98. Reset the primary timing chain tensioner.
    - Release the ratchet detent.
    - Using a soft-jawed vise, compress the ratchet plunger.
    - Align the hole in the ratchet plunger with the hole in the tensioner housing.
    - Install a suitable lockpin.



99. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to

repair4less

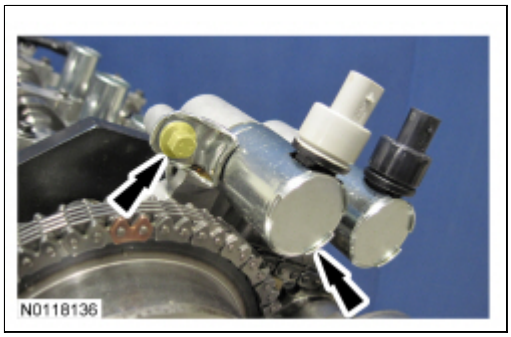


install the tensioner.

Install the primary tensioner and the 2 bolts.

- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

100. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).



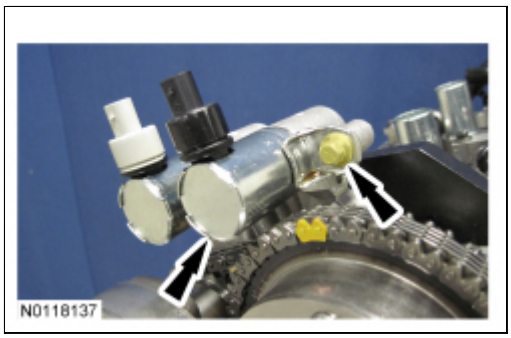
101. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

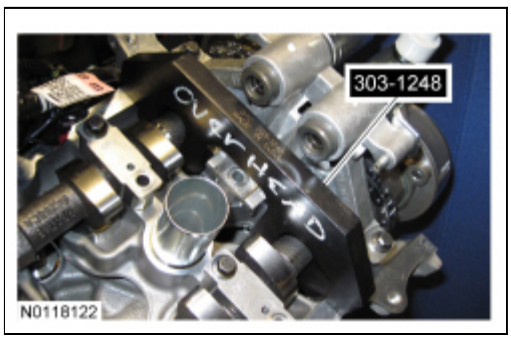
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



102. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

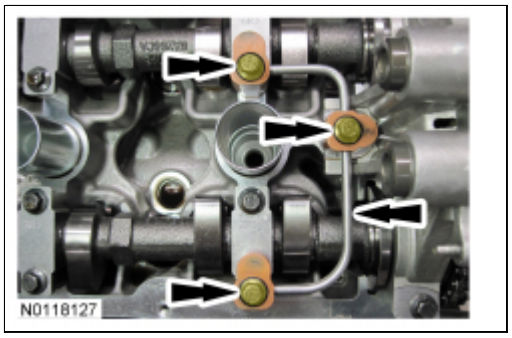
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.



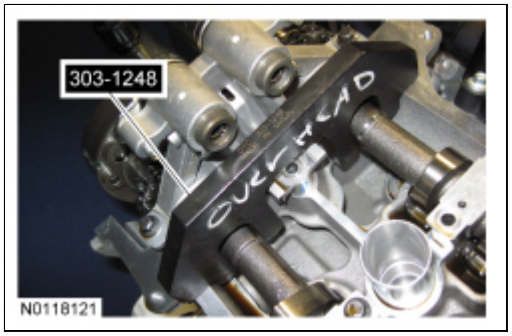
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

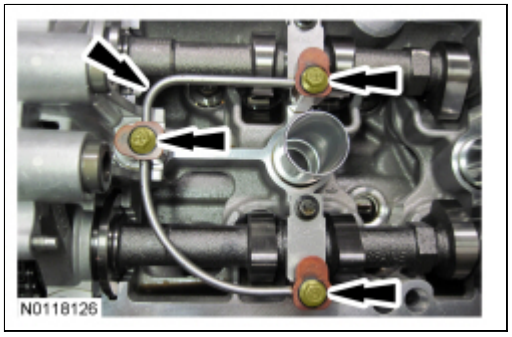


103. Remove the RH Camshaft Holding Tool.



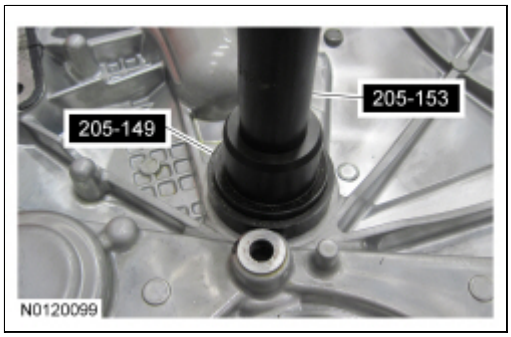
104. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages:

- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.



repair4less

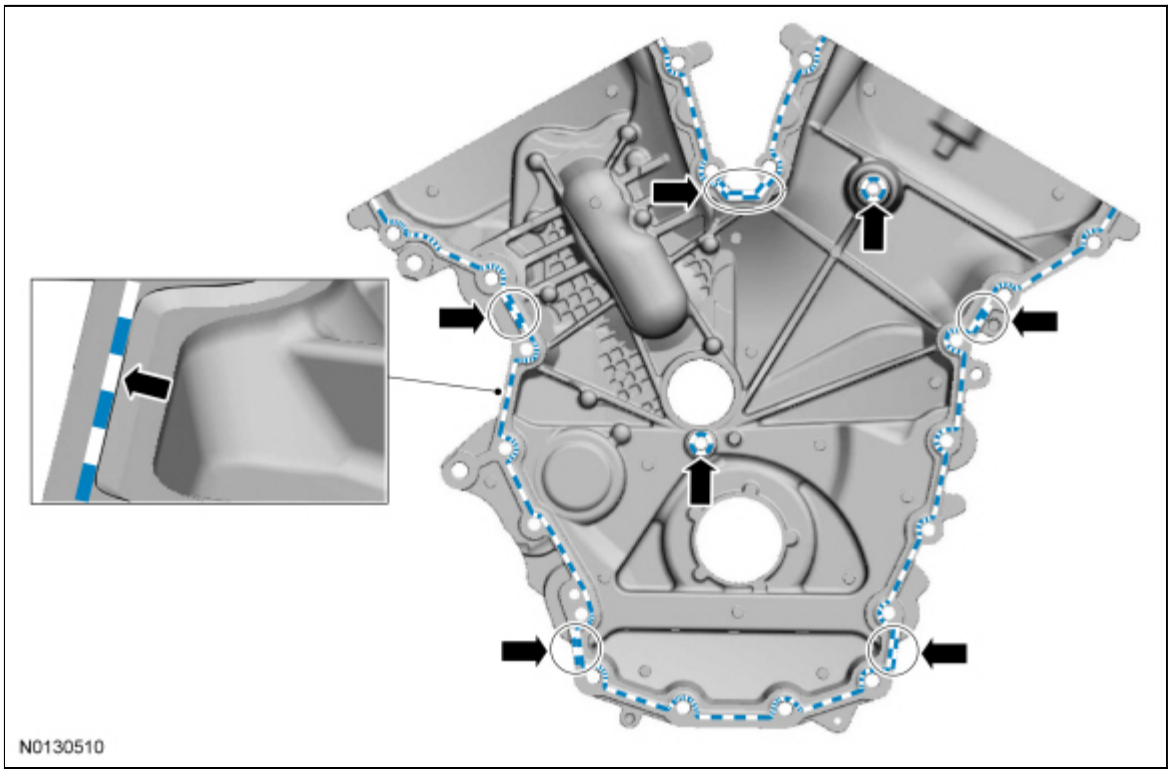
105. Remove the LH Camshaft Holding Tool.



106. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages:
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

107. **NOTE:** Use Spindle Bearing Installer 205-149 to install the seal.

    If removed, using the Spindle Bearing Installer, install the front cover radial seal from the rear side of the front cover.



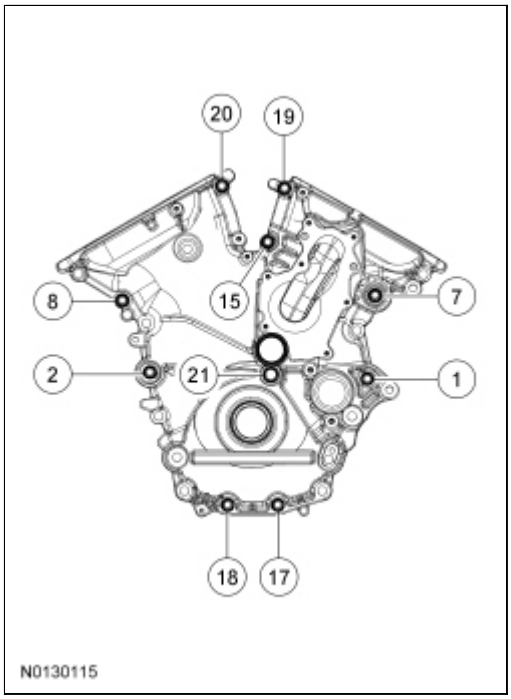
108. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

NOTICE: **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow these instructions may cause engine oil leakage.**

NOTE: The engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 must be installed within 10 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

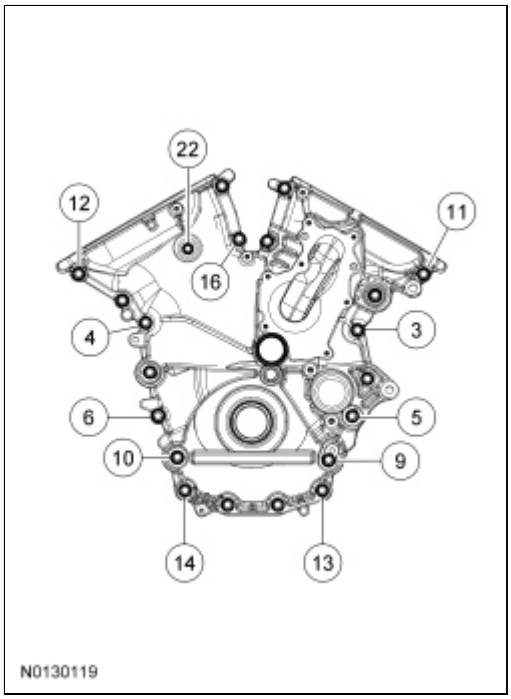
Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the engine front cover to the engine front cover sealing surfaces including the 2 engine front cover bolt bosses.

- Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



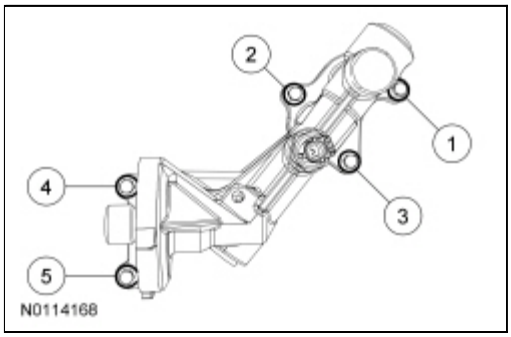
repair4less

109. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.



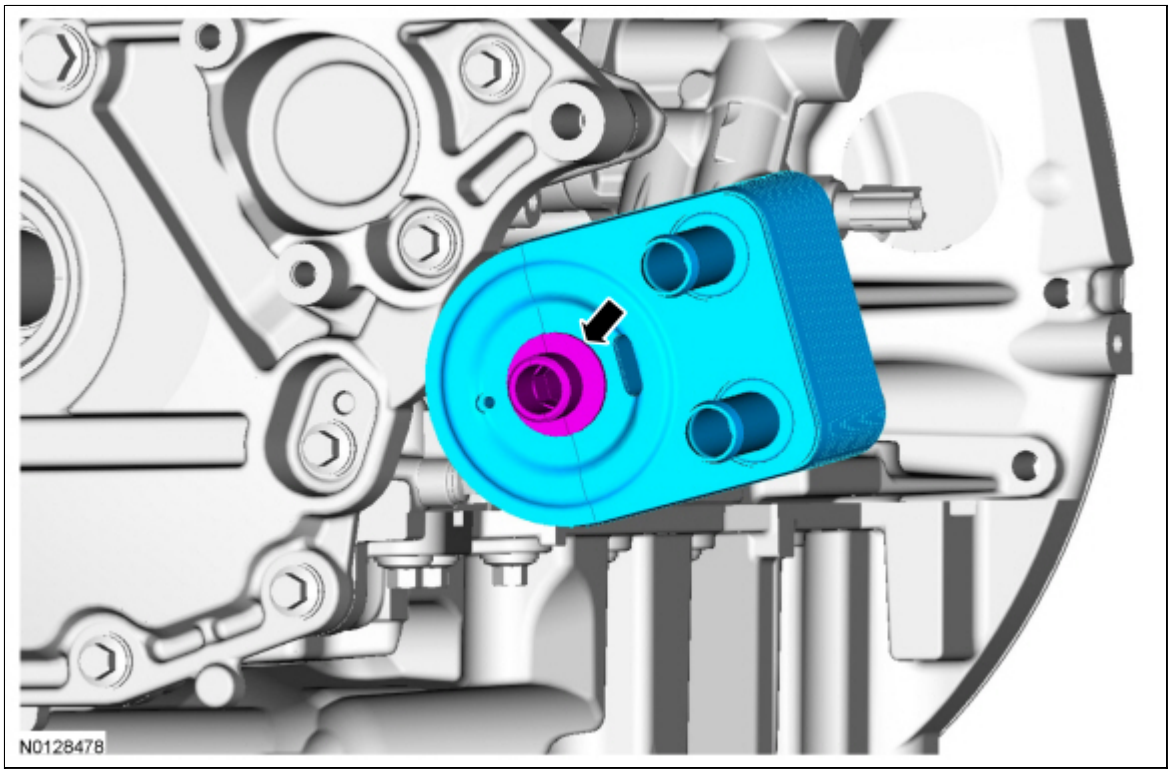
Install the engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 and tighten sequence shown in 3 stages:

- Stage 1: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 in sequence to 10 Nm (89 lb-in).
- Stage 2: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19 and 20 in sequence to 20 Nm (177 lb-in) then an additional 45 degrees.
- Stage 3: Tighten bolt 21 to 20 Nm (177 lb-in) then an additional 90 degrees.

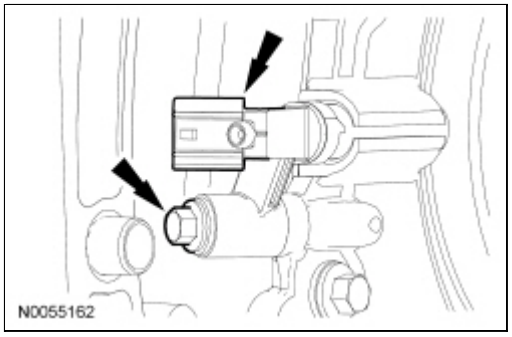


110. Install the remaining 12 engine front cover bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, 16 and 22. Tighten all of the engine front cover bolts in the sequence shown in 3 stages:

- Stage 1: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14 and 16 to 10 Nm (89 lb-in).
- Stage 2: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14 and 16 to 20 Nm (177 lb-in) then an additional 45 degrees.
- Stage 3: Tighten bolt 22 to 10 Nm (89 lb-in) then an additional 45 degrees.

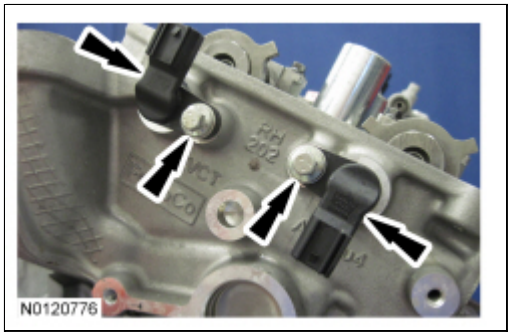


111. Using a new gasket, install the oil filter adapter and the 5 bolts and tighten in sequence shown.
    - Tighten to 10 Nm (89 lb-in) and then an additional 45 degrees.



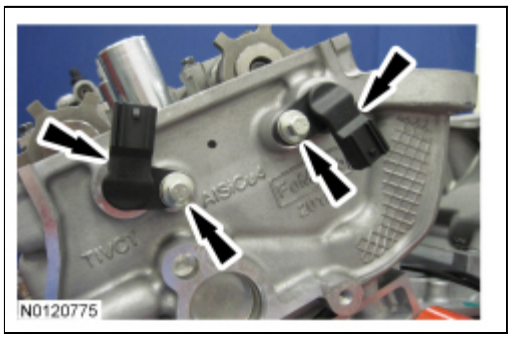
112. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

    If equipped, install the new oil cooler and the mounting bolt.
    - Tighten to 58 Nm (43 lb-ft).

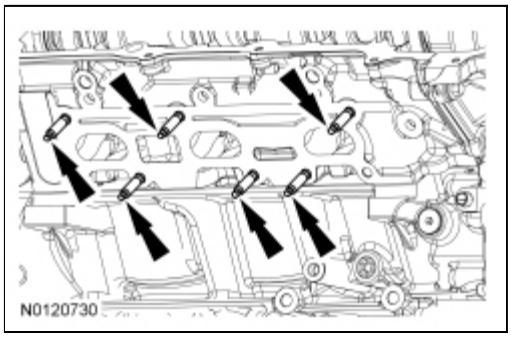


repair4less

113. Install the Crankshaft Position (CKP) sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

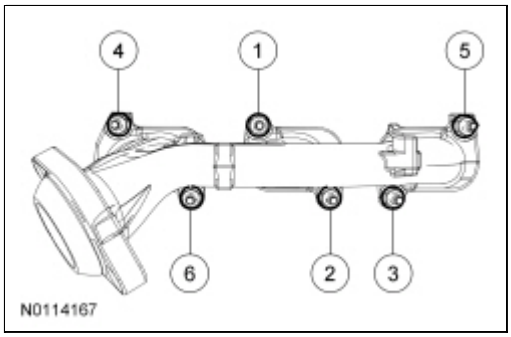


114. Install the 2 RH Camshaft Position (CMP) sensors and the bolts.
    - Tighten to 10 Nm (89 lb-in).

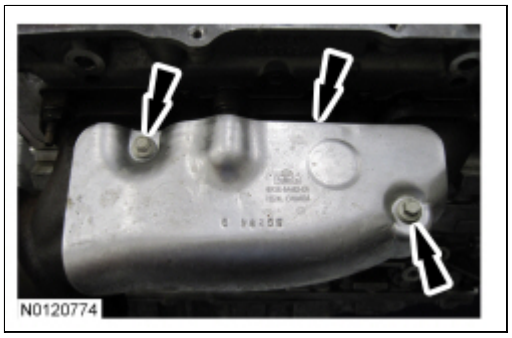


115. Install the 2 LH CMP sensors and the bolts.

- Tighten to 10 Nm (89 lb-in).



116. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

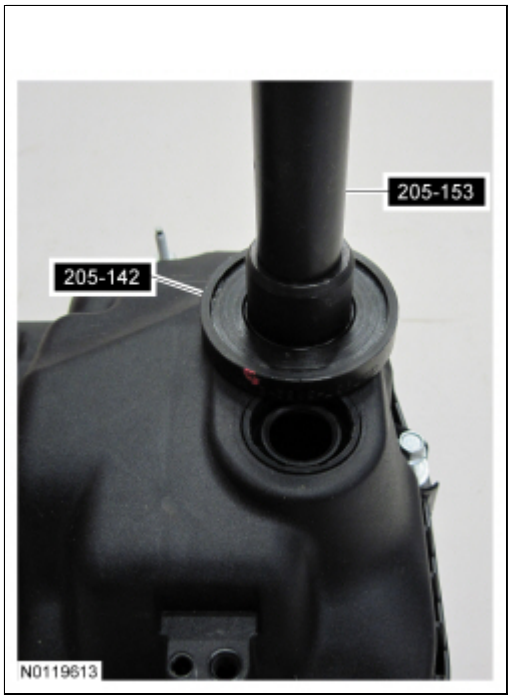


117. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

118. Install the RH exhaust manifold heat shield and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

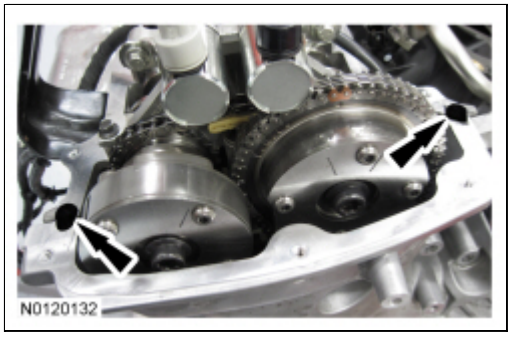
repair4less



119. **NOTE:** Installation of new seals is only required if damaged seals were removed.

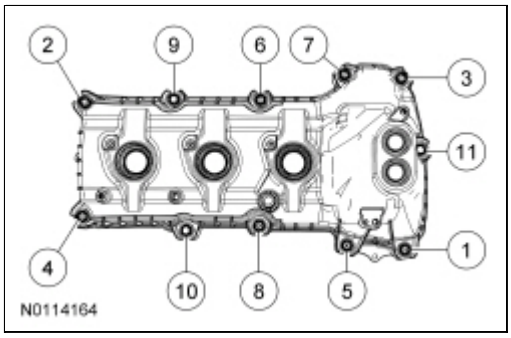
Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

120. **NOTE:** Installation of new seals is only required if damaged seals were removed.



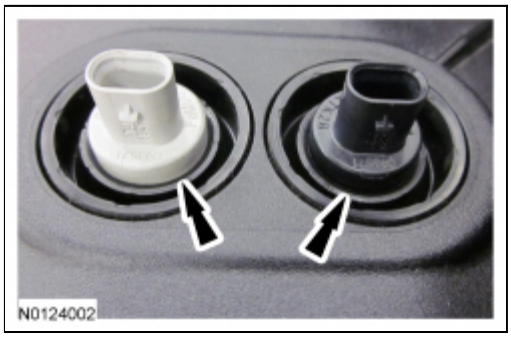
Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).

121. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**



NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

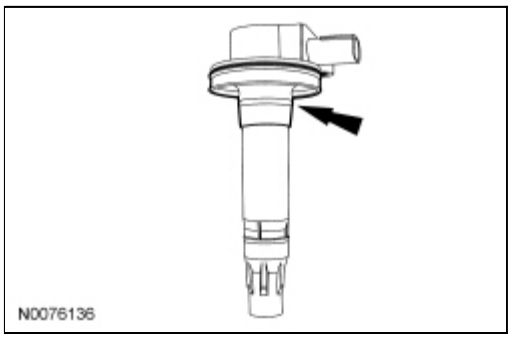
Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.



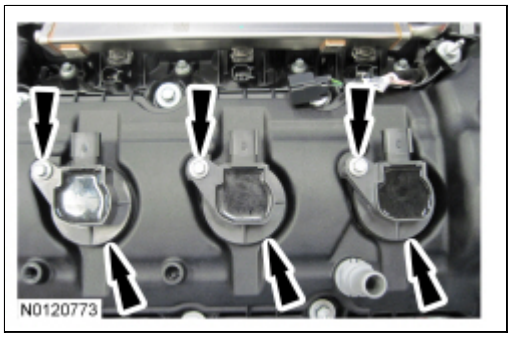
122. Using a new gasket, install the RH valve cover and tighten the 3 bolts and 8 stud bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

repair4less

123. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

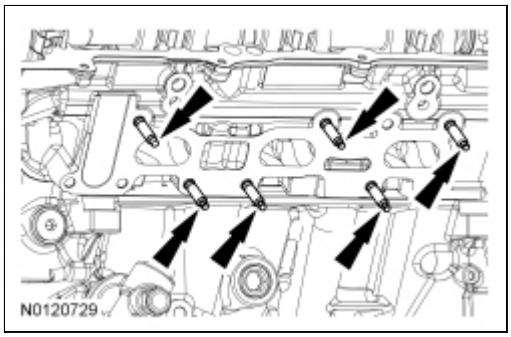


124. ***NOTICE:*** **Only use hand tools when installing the spark plugs, or damage may occur to the cylinder head or spark plug.**



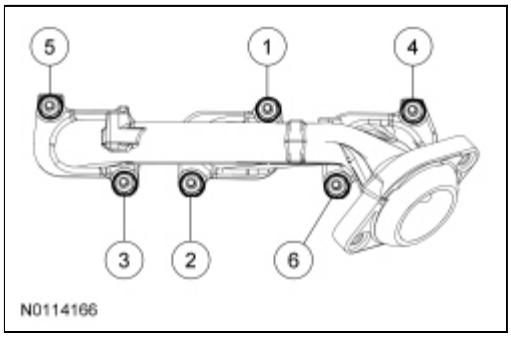
Install the 3 RH spark plugs.

- Tighten to 15 Nm (133 lb-in).

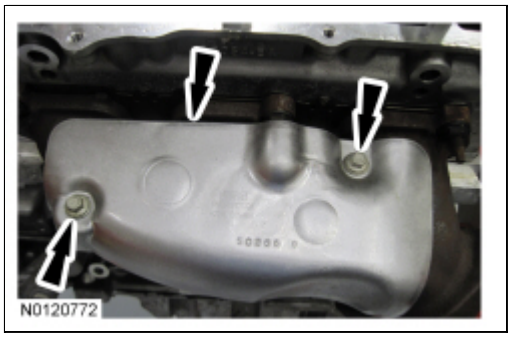


125. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
    - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.

126. Install the 3 RH ignition coil-on-plug assemblies and the 3 bolts.
    - Tighten to 7 Nm (62 lb-in).

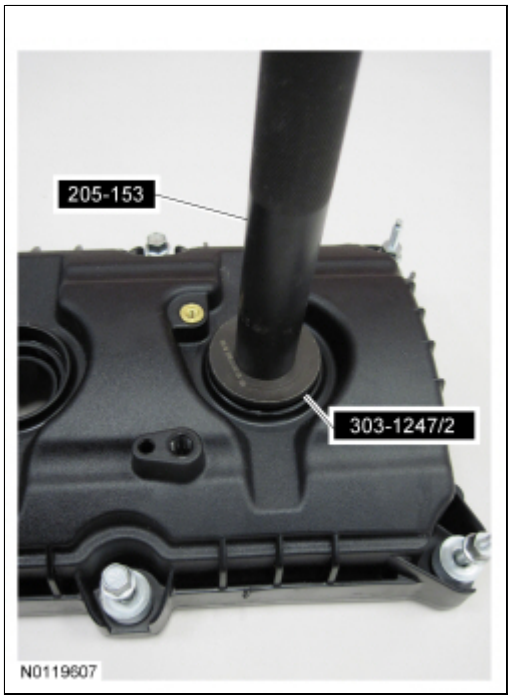


127. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



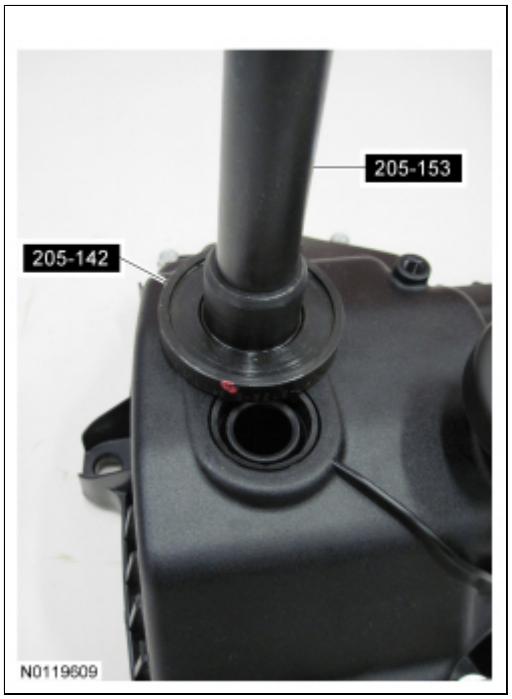
128. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



129. Install the LH exhaust manifold heat shield and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

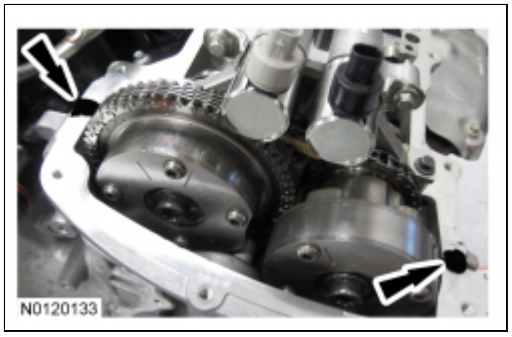
repair4less



130. **NOTE:** Installation of new seals is only required if damaged seals were removed.

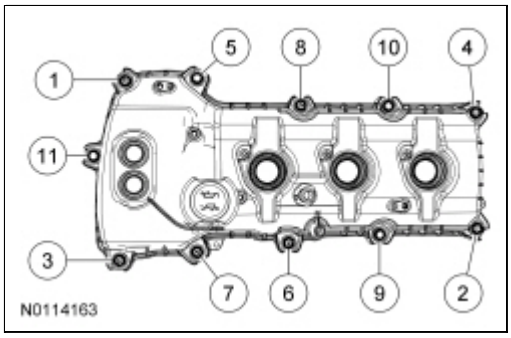
Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

131. **NOTE:** Installation of new seals is only required if damaged seals were removed.



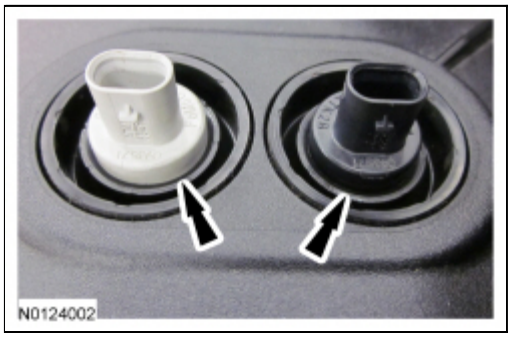
Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).

132. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**



NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

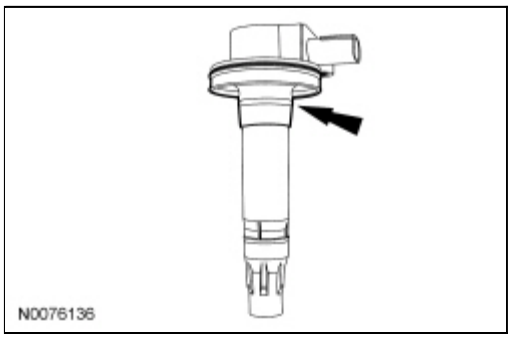
Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.



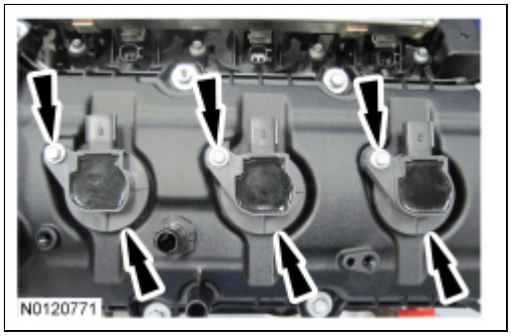
133. Using a new gasket, install the LH valve cover and tighten the 4 bolts and 7 stud bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

repair4less

134. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.



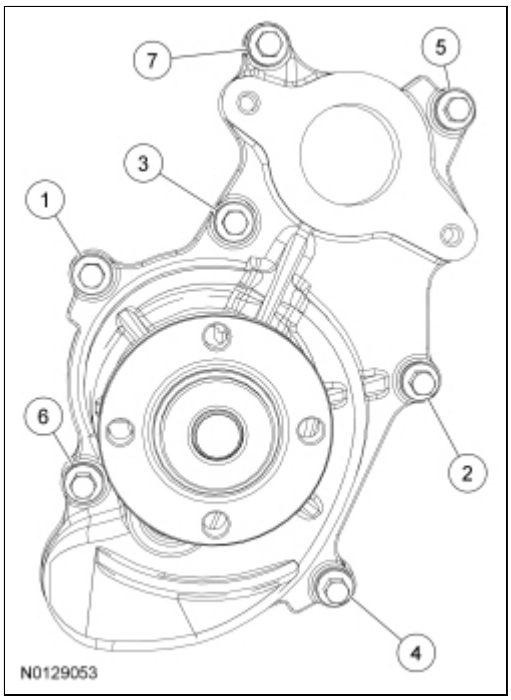
135. ***NOTICE:*** **Only use hand tools when installing the spark plugs, or damage may occur to the cylinder head or spark plug.**



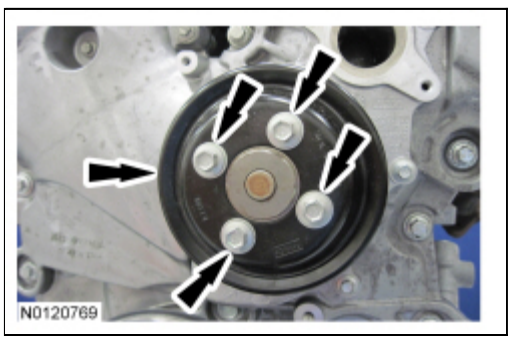
Install the 3 LH spark plugs.

- Tighten to 15 Nm (133 lb-in).

136. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
    - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.



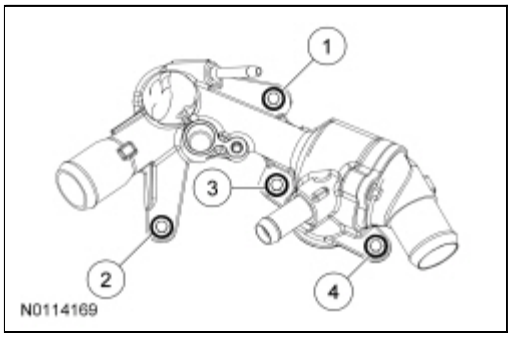
137. Install the 3 LH ignition coil-on-plug assemblies and the 3 bolts.
    - Tighten to 7 Nm (62 lb-in).



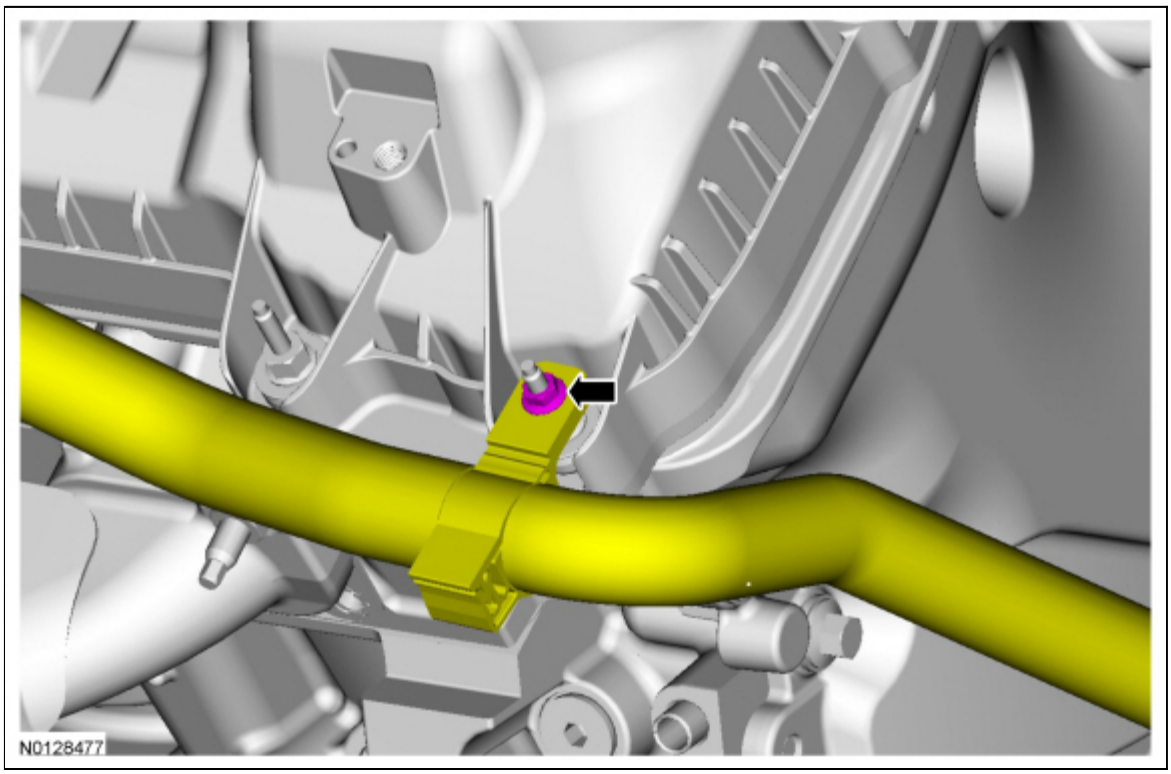
138. **NOTE:** Lubricate the O-ring seal with clean engine coolant.

Using new coolant pump gasket and coolant pump O-ring seal, install the coolant pump and the 7 bolts and tighten in the sequence shown in 2 stages:

- Stage 1: Tighten to 10 Nm (89 lb-in).
- Stage 2: Tighten an additional 45 degrees.

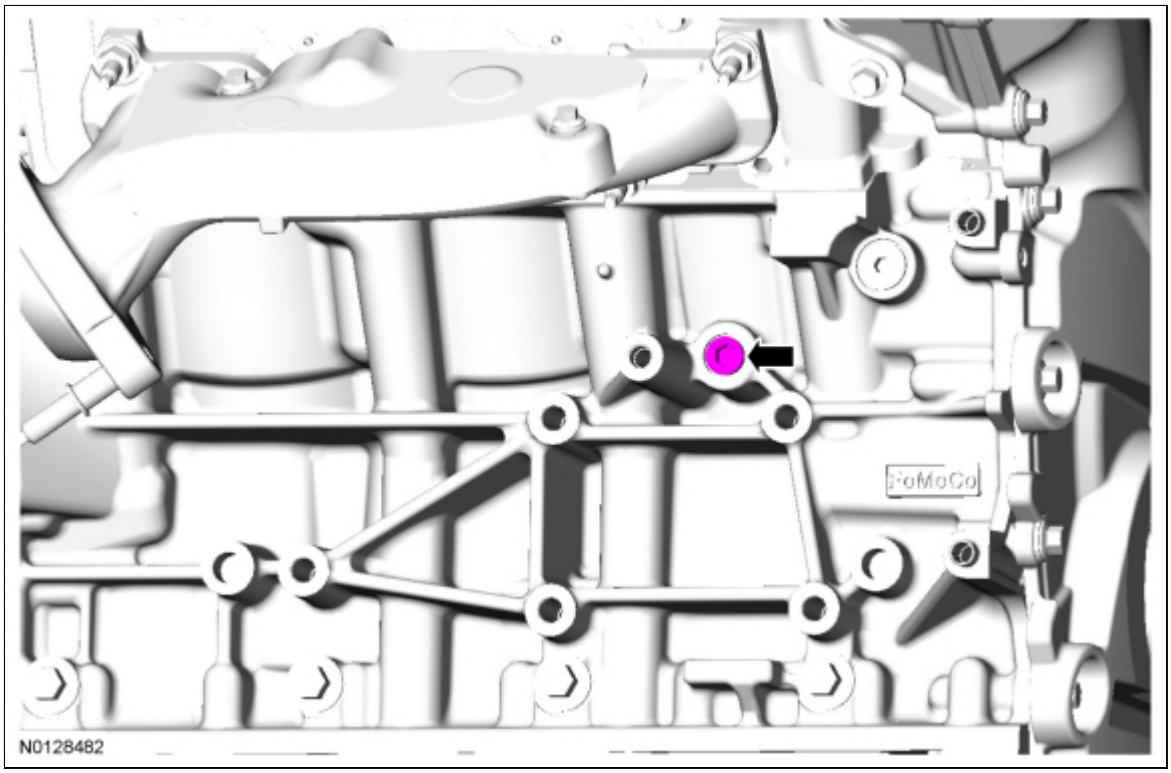


139. Install the coolant pump pulley and the 4 bolts.
    - Tighten to 24 Nm (18 lb-ft).

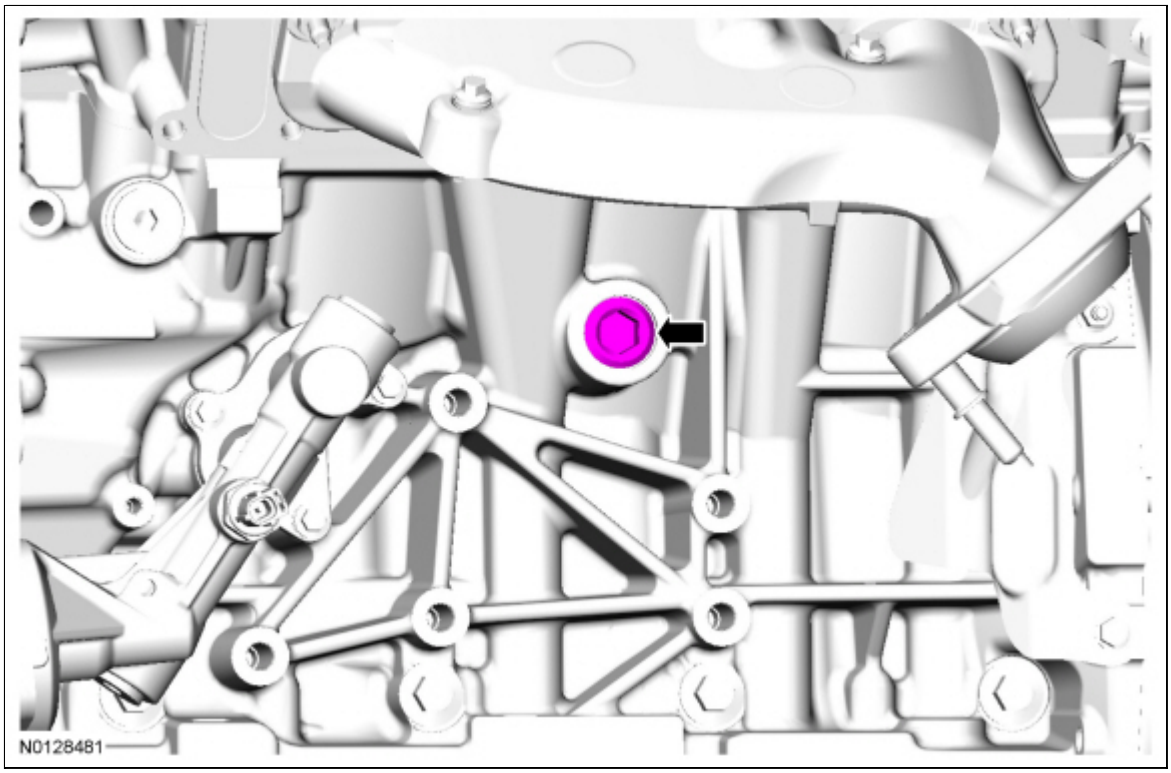


repair4less

140. **NOTE:** Lubricate the coolant inlet tube O-ring seal with clean engine coolant.

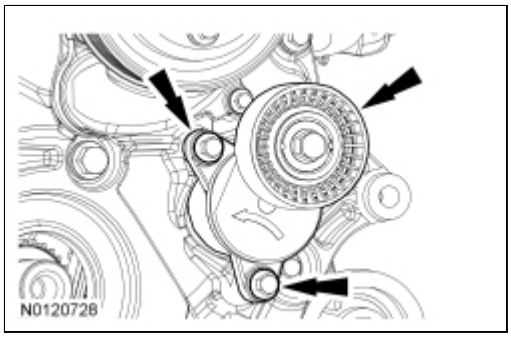


Install the thermostat housing and the 4 bolts and tighten in the sequence shown in 2 stages:
- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.

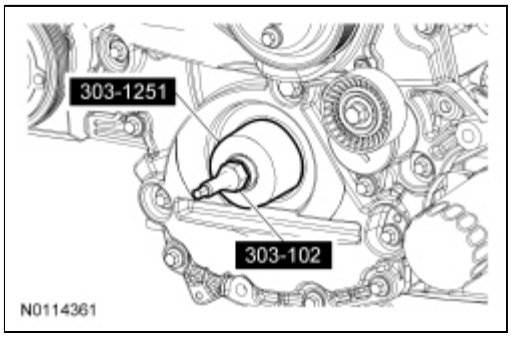


141. Install the heater hose bracket on the valve cover stud bolt and install the nut.
- Tighten to 8 Nm (71 lb-in).

142. Install the RH cylinder block drain plug.
- Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.



143. Install the LH cylinder block drain plug.
    - Tighten the cylinder block drain plug to 10 Nm (89 lb-in) plus an additional 720 degrees.

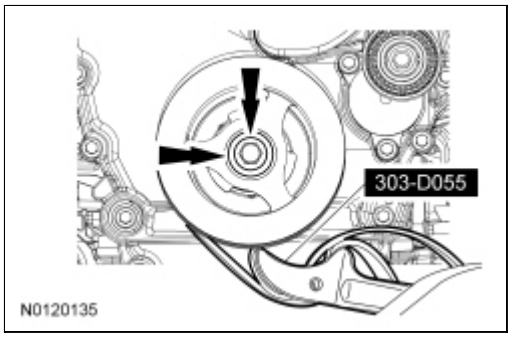


144. Install the accessory drive belt tensioner and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

repair4less

145. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

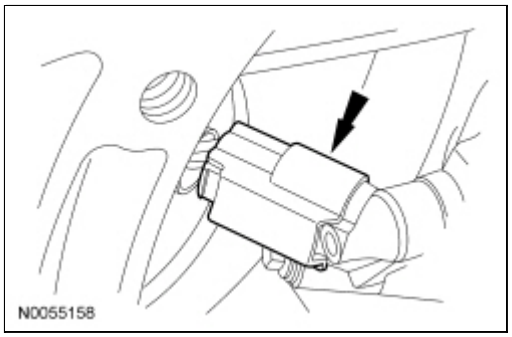
    Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.



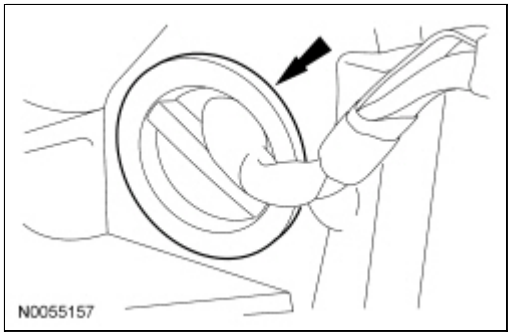
146. Lubricate the crankshaft front seal inner lip with clean engine oil.

147. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

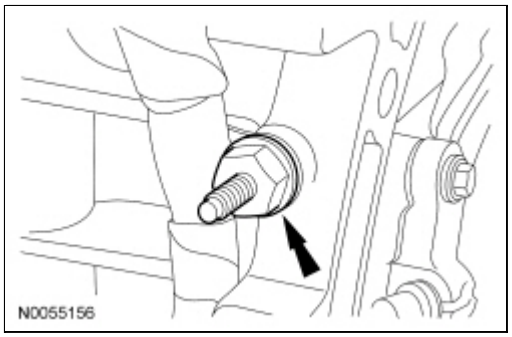
    Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Replacer, install the crankshaft pulley.



148. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages:
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

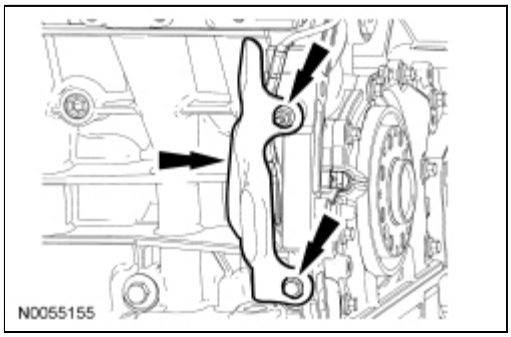


149. Attach all of the wiring harness retainers to the LH cylinder head, valve cover and stud bolts.

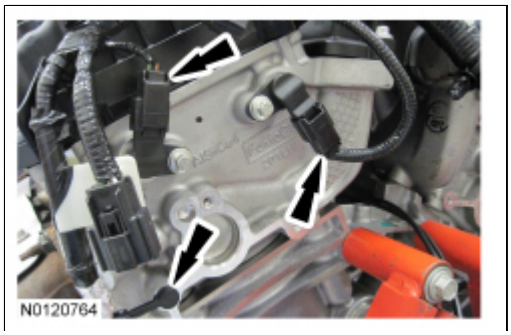


150. Connect the CKP sensor electrical connector.

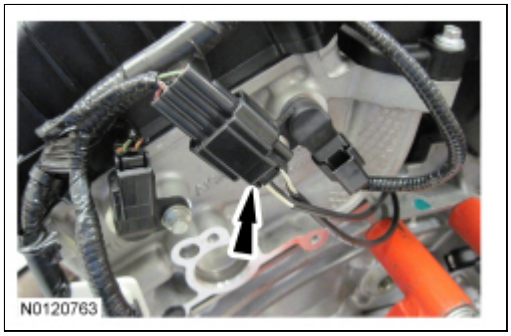
151. Install the wiring harness grommet.



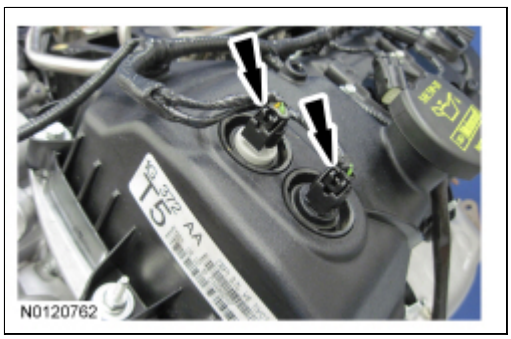
152. Install the wiring harness retainer stud bolt.
    - Tighten to 10 Nm (89 lb-in).



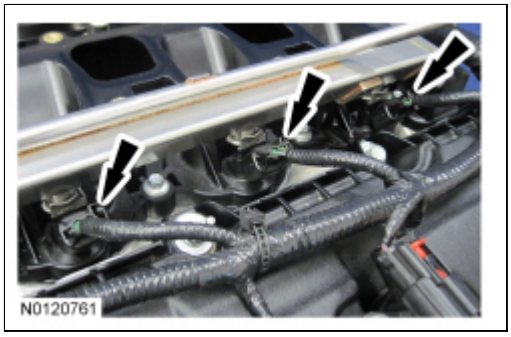
repair4less



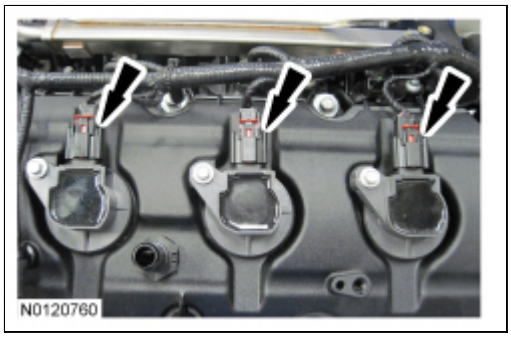
153. Install the heat shield, the nut and the bolt.
    - Tighten to 10 Nm (89 lb-in).



154. Connect the 2 LH CMP sensors electrical connectors.
    - Attach the wiring harness retainer to the rear of the cylinder head.



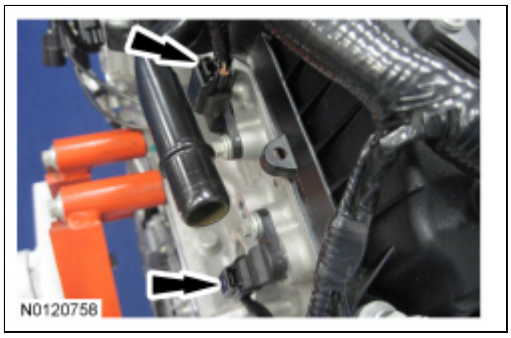
155. Connect the KS electrical connector.



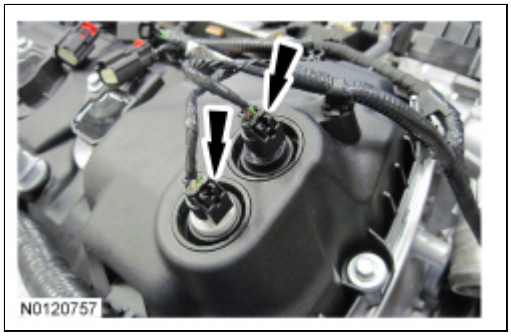
156. Connect the 2 LH VCT solenoid electrical connectors.

157. Connect the 3 LH fuel rail electrical connectors.

158. Connect the 3 LH ignition coil-on-plug electrical connectors.

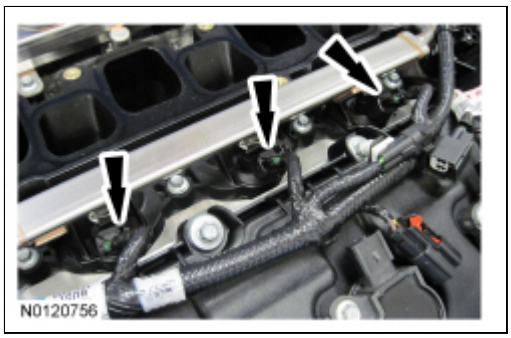


159. Connect the Engine Oil Pressure (EOP) switch electrical connector.
    - Attach the EOP switch wiring harness retainer to the cylinder head.

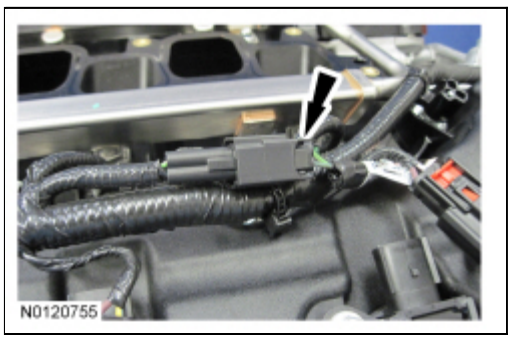


160. Attach all of the wiring harness retainers to the RH cylinder head, valve cover and stud bolts.

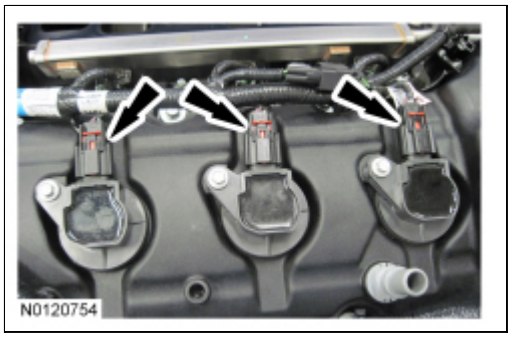
161. Connect the 2 RH CMP sensors electrical connectors.



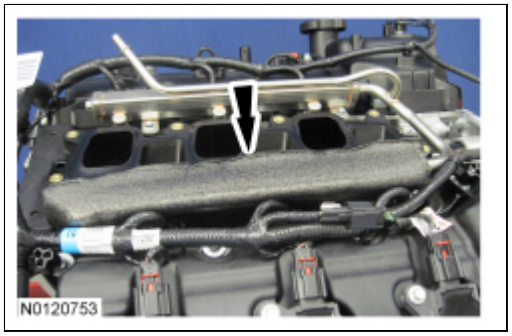
repair4less



162. Connect the 2 RH VCT solenoid electrical connectors.

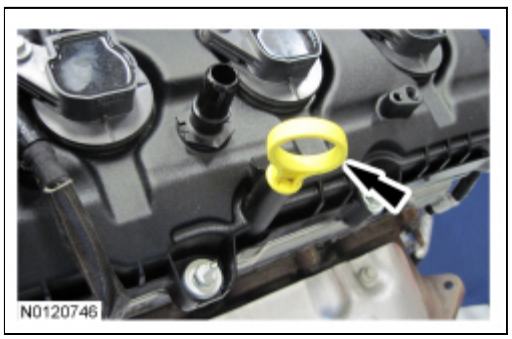


163. Connect the 3 RH fuel rail electrical connectors.



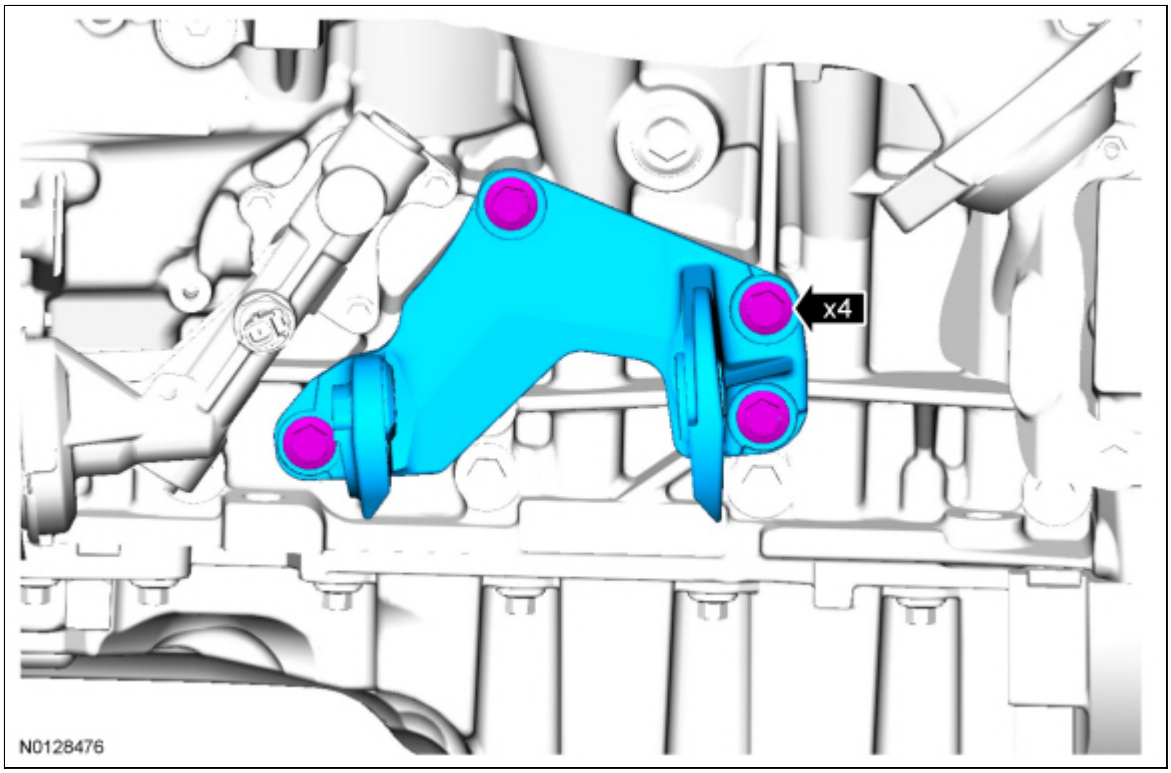
164. Connect the CHT sensor wiring harness jumper electrical connector.

165. Connect the 3 RH ignition coil-on-plug electrical connectors.

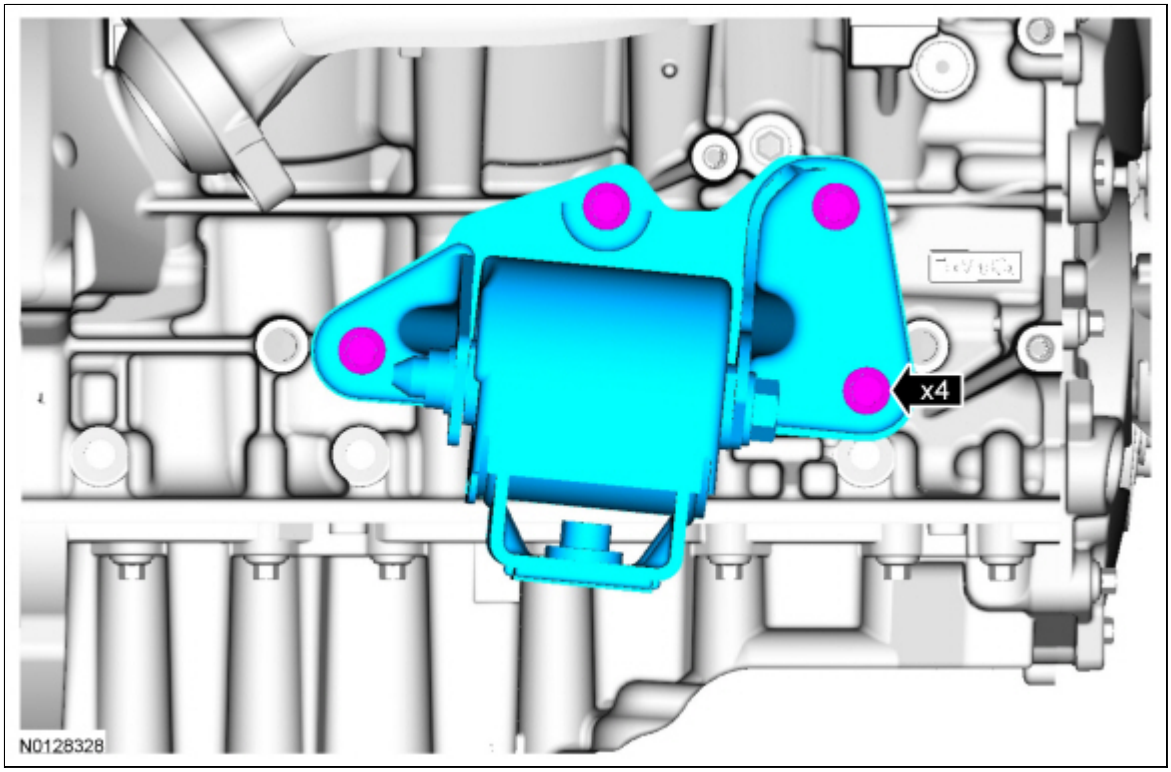


166. Install the RH fuel rail insulator.

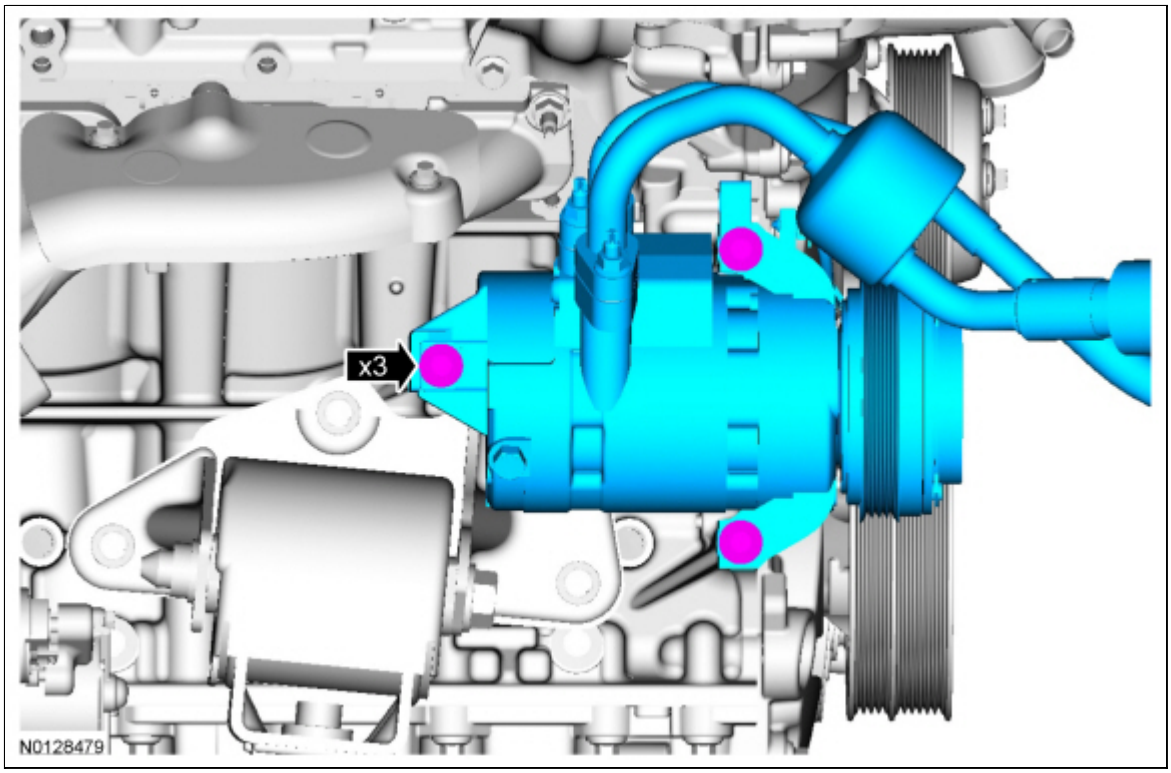
167. Install the LH fuel rail insulator.



168. Install the engine oil level indicator.

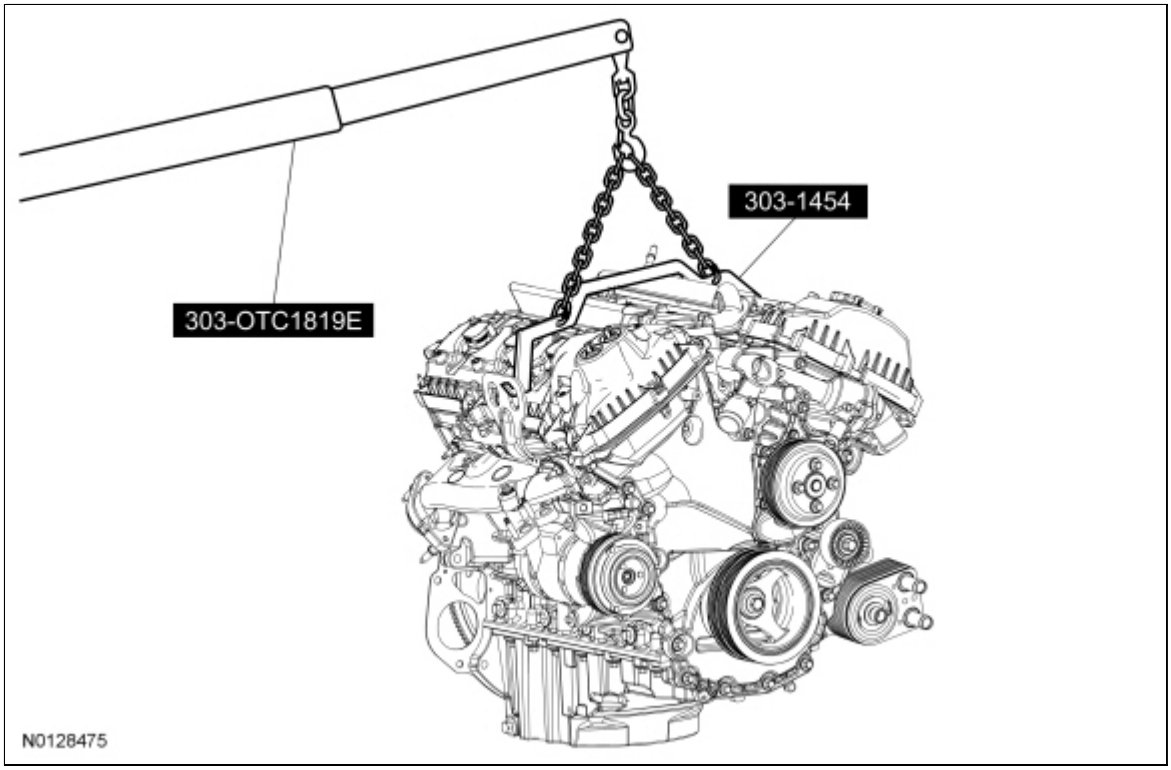


169. Install the LH engine support insulator-to-cylinder block bracket and the 4 bolts.
    - Tighten to 63 Nm (46 lb-ft).

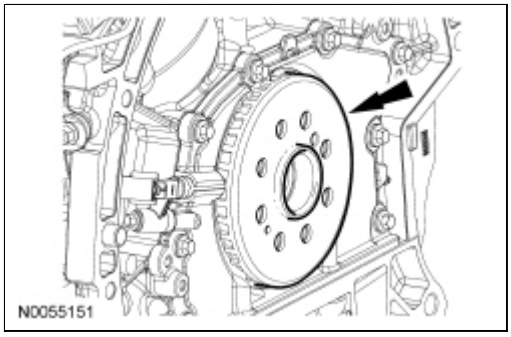


repair4less

170. Install the RH engine support insulator and the 4 bolts.
    - Tighten to 63 Nm (46 lb-ft).

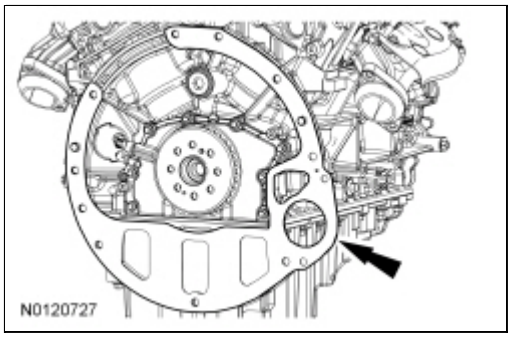


171. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

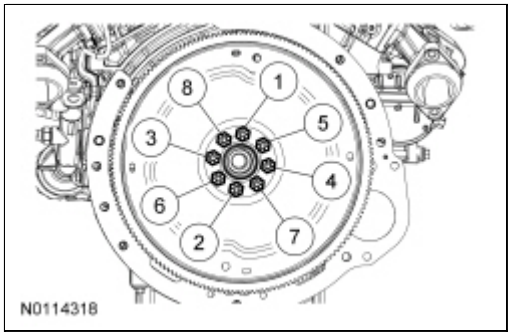


172. Install the LH and RH engine lift eyes.
    - Tighten to 25 Nm (18 lb-ft).

173. Using the Heavy Duty Floor Crane and Spreader Bar, remove the engine from the stand.



repair4less



174. Install the crankshaft sensor ring.

175. Install the spacer plate.

176. Install the flexplate and the 8 bolts and tighten is sequence shown.
    - Tighten to 80 Nm (59 lb-ft).

repair4less

Engine

Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E
 ST3101-A	Bar, Engine Spreader 303-1454

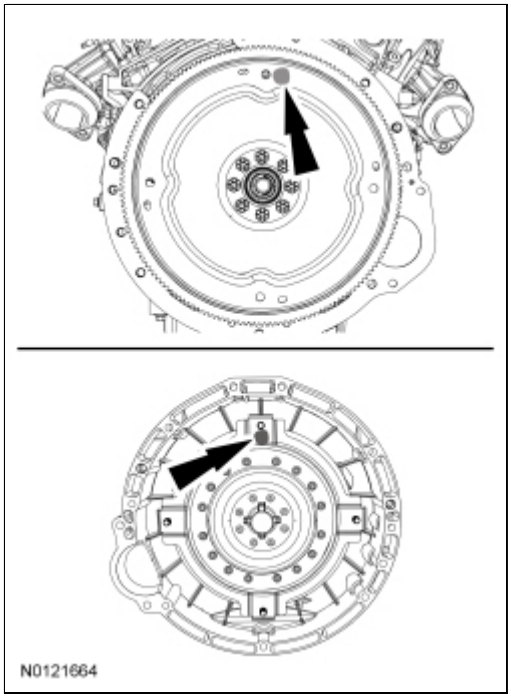
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Multi-Purpose Grease XL-5	ESB-M1C93-B

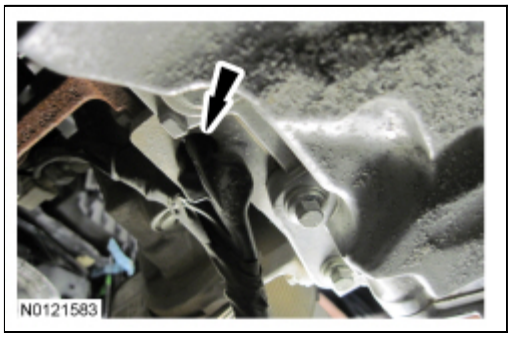


WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. ***NOTICE:*** **Prior to installation of the engine, the torque converter pilot hub must be lubricated with multi-purpose grease or damage to the torque converter or the engine crankshaft can occur**

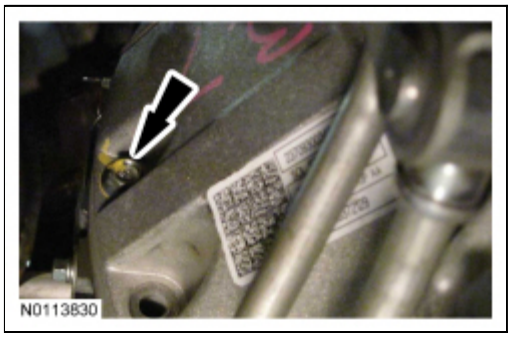
   Lubricate the torque converter pilot hub with multi-purpose grease.

2. Align the torque converter stud and flexplate hole near the paint marks at the 12 o'clock position.

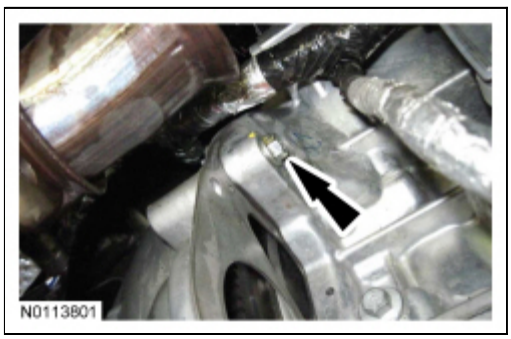


3. Using the Heavy Duty Floor Crane and Engine Spreader Bar, position the engine in the engine compartment.

repair4less

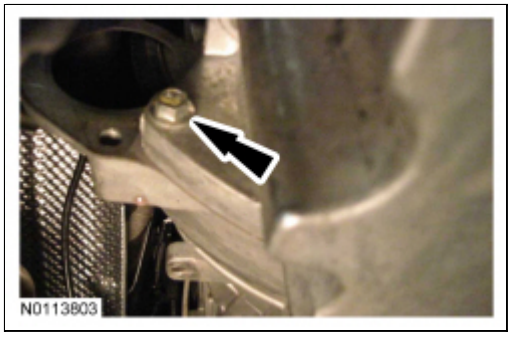


4. Attach the generator wiring harness retainer to the lower LH side of the engine block.



5. Using the Heavy Duty Floor Crane and Engine Spreader Bar, position the engine to the transmission.

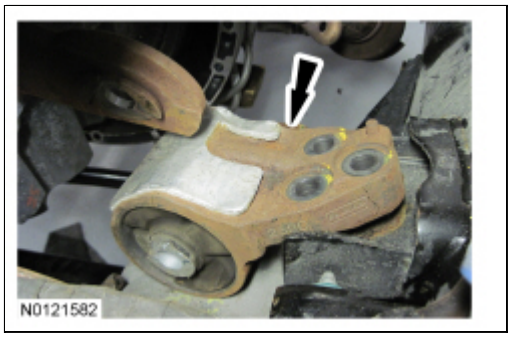
6. Align the engine to the transmission and install LH bellhousing-to-engine bolt.
    - Tighten the bolt, it will be torqued at a later step.



7. Install the engine-to-bellhousing bolt.
    - Tighten the bolt, it will be torqued at a later step.

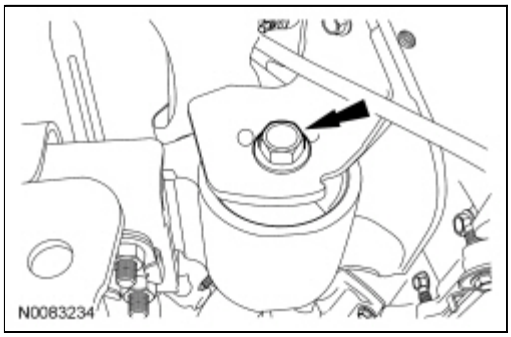
8. Install the oil pan-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).

repair4less



9. Tighten the engine-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).

10. Using the Heavy Duty Floor Crane and Engine Spreader Bar, raise the engine for clearance for the LH engine support insulator.

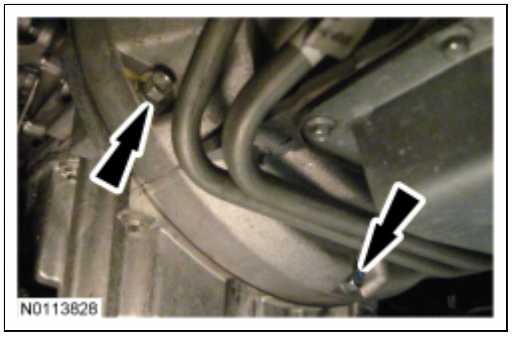


11. Install the LH engine support insulator.

12. ***NOTICE:*** **Use only hand tools when installing the LH engine support insulator through bolt or the engine support insulator may be damaged.**

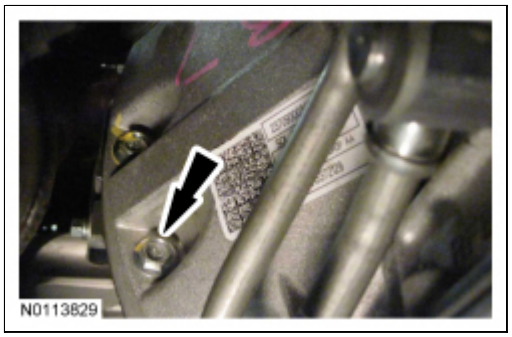
    NOTE: Clean the LH and RH engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

    Install the new LH engine support insulator and the through bolt.
    - Do not torque at this time.

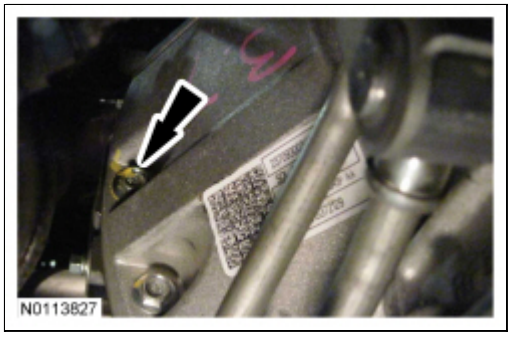


13. Lower the engine.

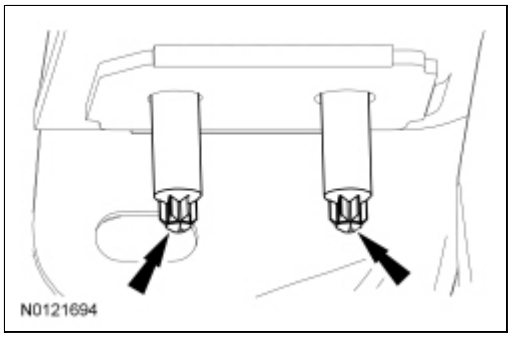
14. Install the 3 LH engine support insulator bolts.
    - Tighten to 175 Nm (129 lb-ft).



15. Install the 2 LH bellhousing-to-oil pan bolts.
    - Tighten to 48 Nm (35 lb-ft).

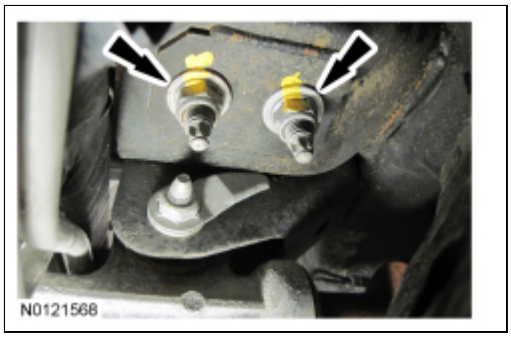


repair4less

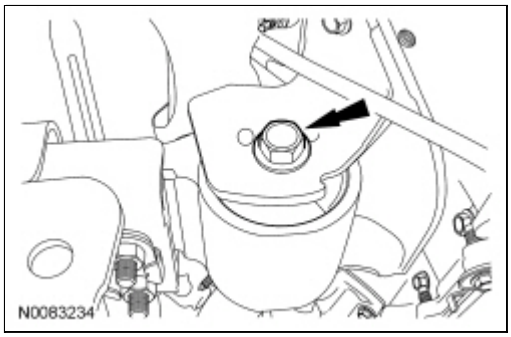


16. Install the LH bellhousing-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

17. Tighten LH bellhousing-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

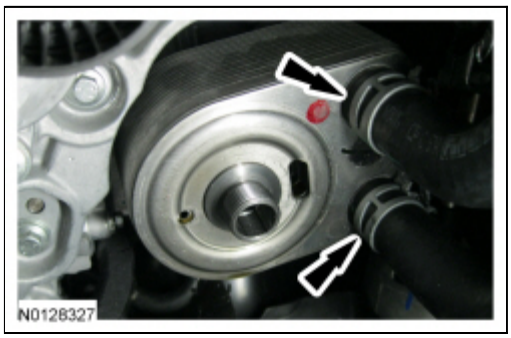


18. Install the 2 new RH engine support insulator studs.
    - Tighten to 30 Nm (22 lb-ft).



19. ***NOTICE:*** **Use only hand tools when installing the RH engine support insulator nuts or the engine support insulator may be damaged.**

    Install the 2 new RH engine support insulator nuts.
    - Tighten to 175 Nm (129 lb-ft).



20. ***NOTICE:*** **Use only hand tools when tightening the LH engine support insulator through bolt or the engine support insulator may be damaged.**

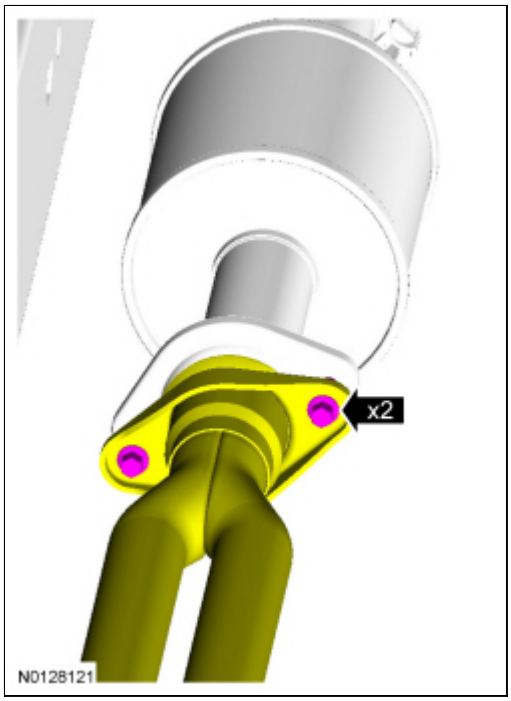
    Tighten the LH engine mount through bolt.
    - Tighten to 350 Nm (258 lb-ft).

21. If equipped, install the 2 coolant hoses to the oil cooler.

22. **NOTE:** Do not lubricate the engine oil filter gasket.

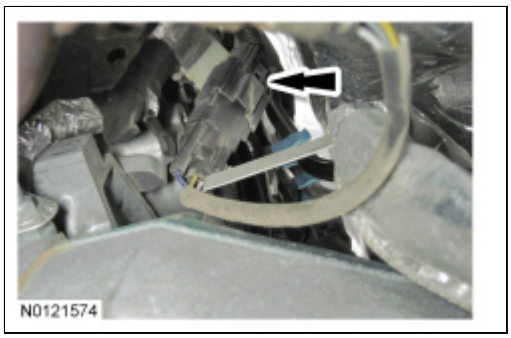
    Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

repair4less

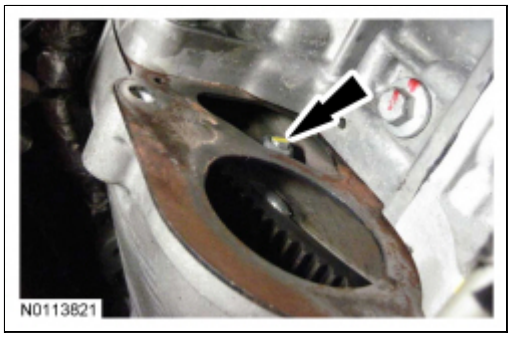


23. **NOTE:** LH shown, RH similar.

    Install the new 2 LH and RH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 45 Nm (35 lb-ft).

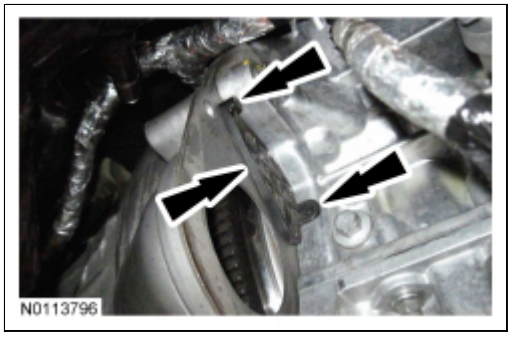


24. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

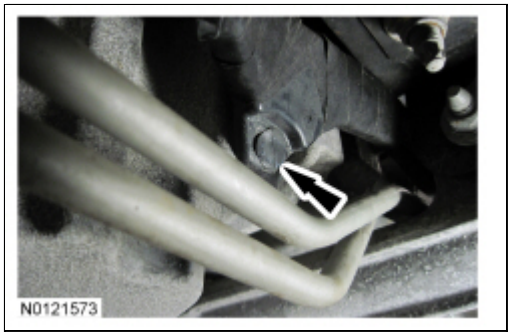


25. **NOTE:** LH shown, RH similar.

    Connect the LH and RH Heated Oxygen Sensor (HO2S) electrical connectors.

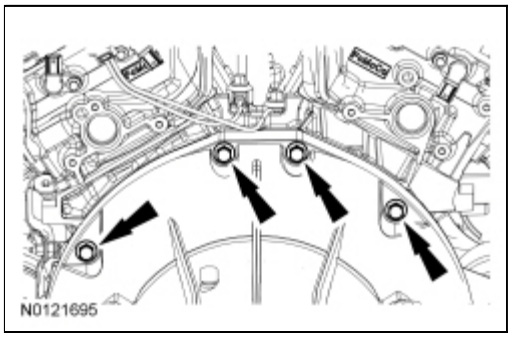


26. Install the 4 torque converter nuts.
    - Tighten to 44 Nm (32 lb-ft).

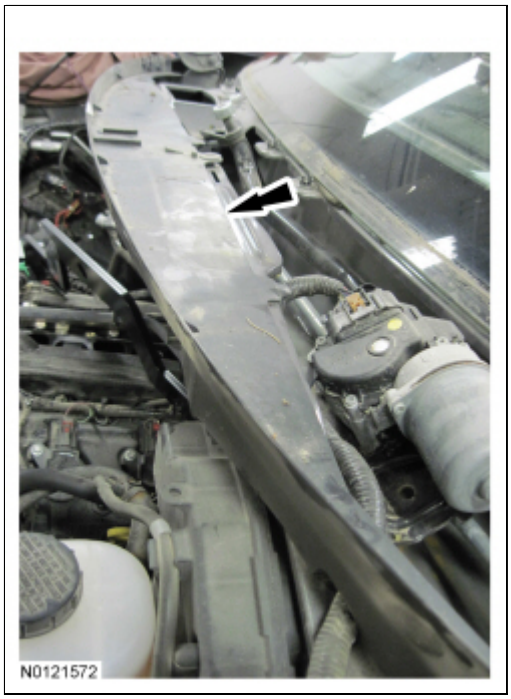


27. Install the access cover and the 2 pin-type retainers.

repair4less



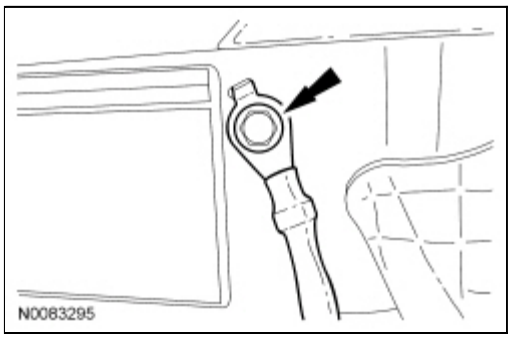
28. Attach the starter motor wiring harness retainer to the oil pan.



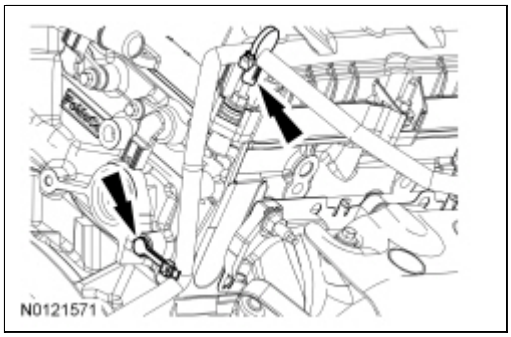
29. Install the starter motor. For additional information, refer to Section 303-06 .

30. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .

31. Install the 4 upper bellhousing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

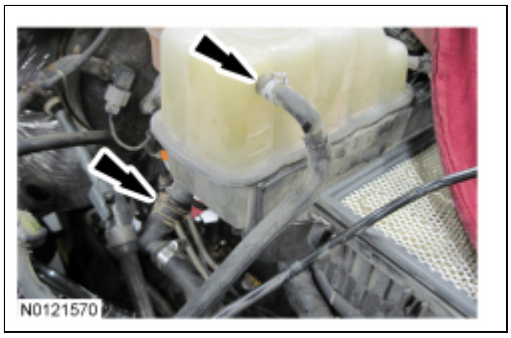


32. Install the cowl panel and attach the 2 clips and install the 6 screws.

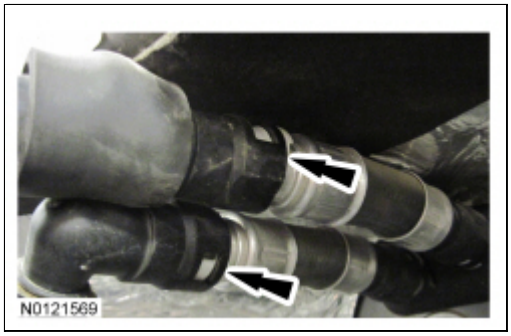


33. Install the cowl panel grille. For additional information, refer to Section 501-02 .

34. Install the ground strap and bolt to the cowl.
    - Tighten to 10 Nm (89 lb-in).

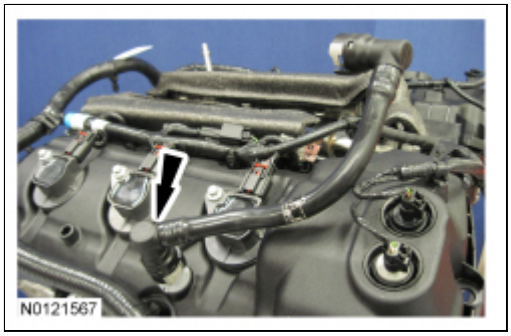


35. Attach the wiring harness retainers to the rear of the RH valve cover stud bolt and the rear of the RH cylinder head.

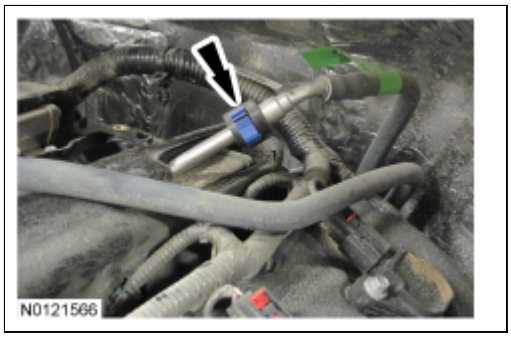


36. Connect the 2 coolant hoses to the degas bottle.

repair4less

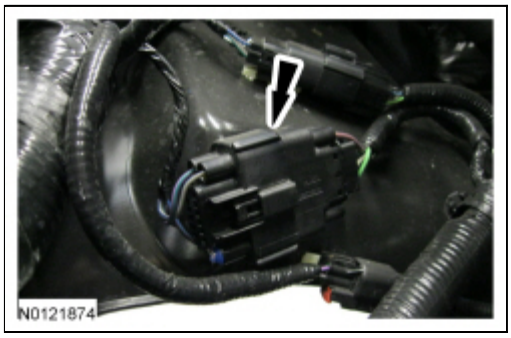


37. Connect the 2 heater hose couplings at the rear of the engine.



38. Install the crankcase vent tube quick connect coupling to LH valve cover. For additional information, refer to Section 310-00 .

39. Install the PVC tube quick connect coupling to RH valve cover. For additional information, refer to Section 310-00 .

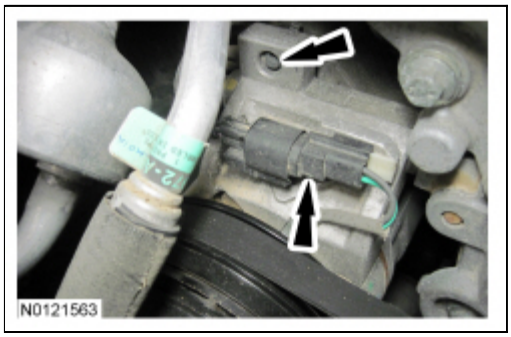


40. Connect the fuel supply tube quick connect coupling to the fuel rail. For additional information, refer to Section 310-00 .

41. Install the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.

42. Attach and connect the engine harness electrical connector.

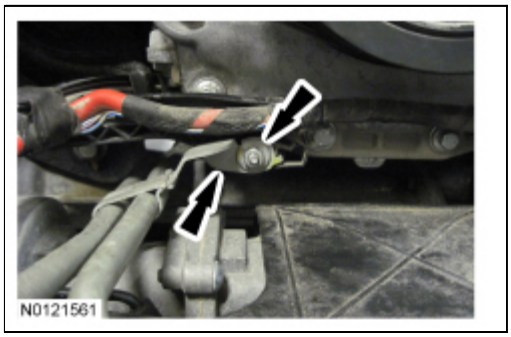
43. Connect the middle PCM electrical connector.
    - Attach the wiring harness retainer to the fender splash shield.



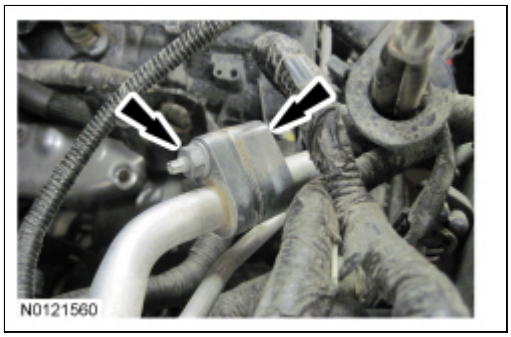
44. Install the Air Conditioning (A/C) compressor belt. For additional information, refer to Section 303-05 .

repair4less

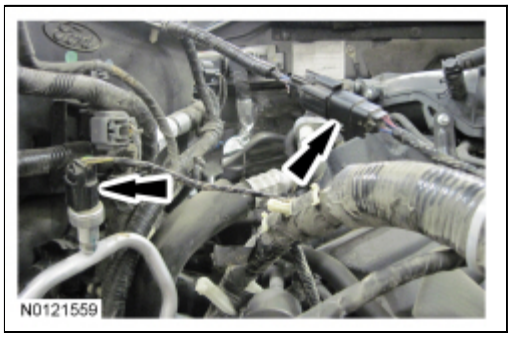
45. Install the generator. For additional information, refer to Section 414-00 .



46. Connect the A/C compressor electrical connector.
    - Attach the A/C compressor wiring harness to the A/C compressor.



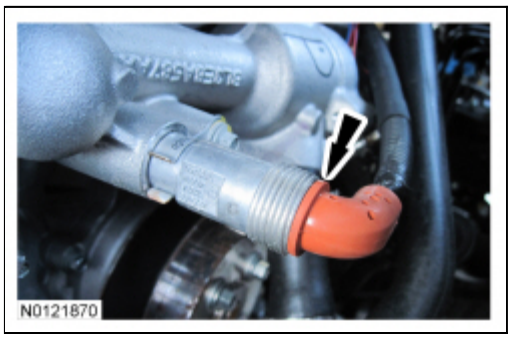
47. Attach the generator wiring harness to the engine front cover.



48. Install the transmission cooler line bracket and nut to the engine front cover stud bolt.
    - Tighten to 12 Nm (106 lb-in).

49. Using a new O-ring seal and gasket seal, install the A/C tube and the nut.
    - Tighten to 15 Nm (133 lb-in).

50. Connect the Battery Junction Box (BJB) wiring harness and the A/C pressure transducer electrical connectors.



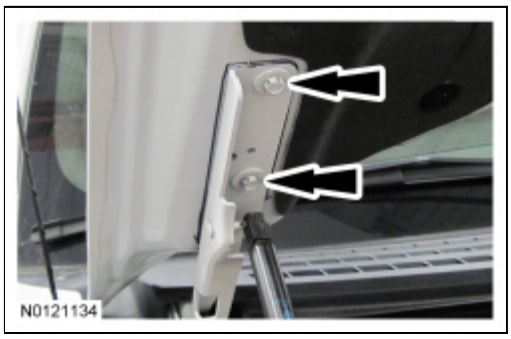
51. Fill the engine with clean engine oil.

52. Install the Air Cleaner (ACL) upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .

53. Install the cooling module. For additional information, refer Section 303-03 .

54. If equipped, connect the block heater electrical connector at the thermostat housing.
    - Attach the block heater wiring harness retainer to the LH valve cover stud bolt.

55. Connect the battery ground cable. For additional information, refer to Section 414-01 .

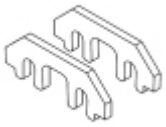


56. **NOTE:** Align the index marks made during hood removal.

    NOTE: RH shown, LH similar.

    Position the hood and install the 4 bolts.

repair4less



- Tighten to 12 Nm (106 lb-in).

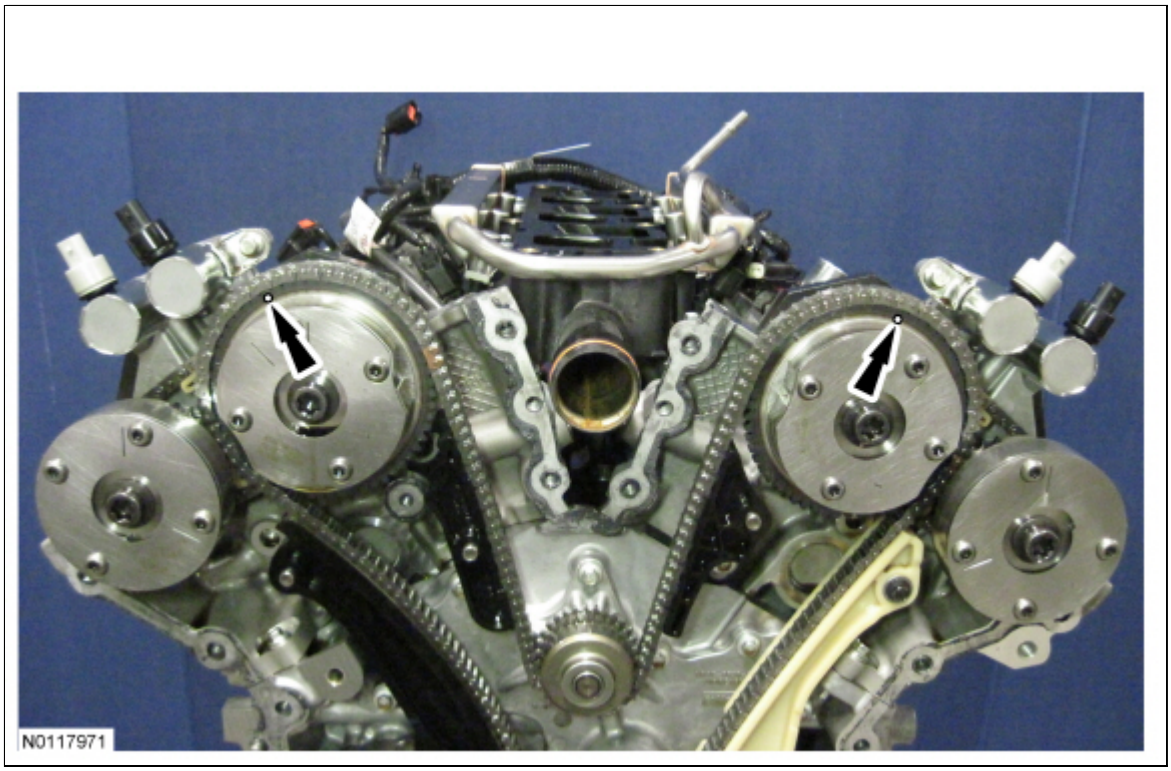
57. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Camshaft — LH

Special Tool(s)

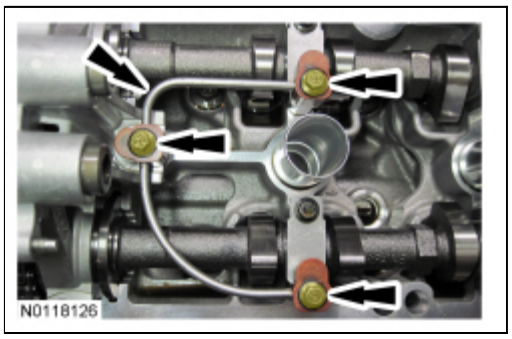
 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

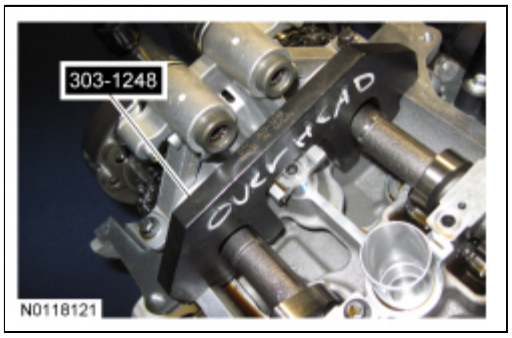
Removal



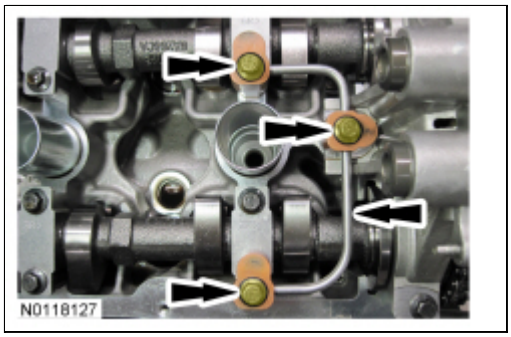
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Rotate the crankshaft clockwise and align the timing marks on the intake Variable Camshaft Timing (VCT) assemblies as shown.

repair4less

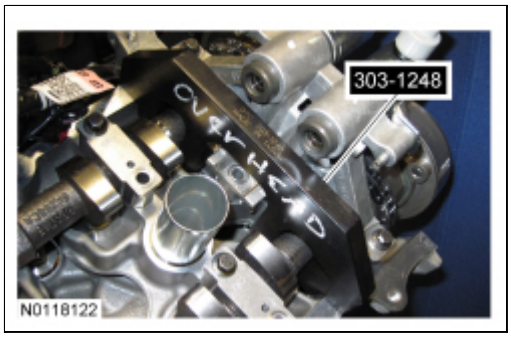


3. Remove the 3 bolts and the LH valve train oil tube.

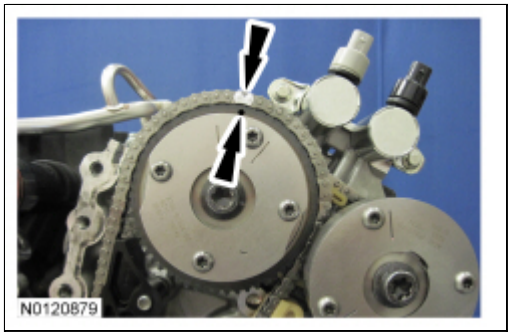


4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.

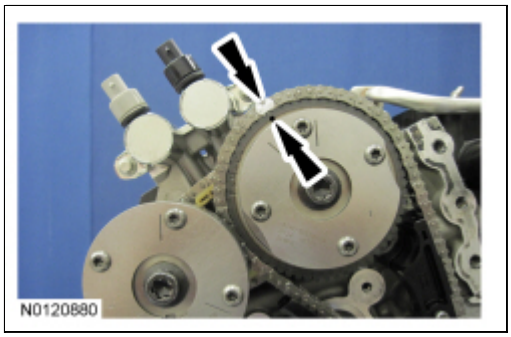


5. Remove the 3 bolts and the RH valve train oil tube.



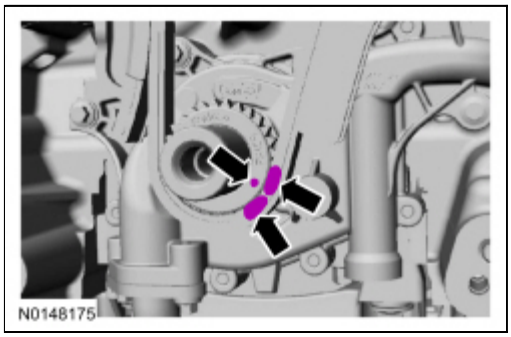
6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

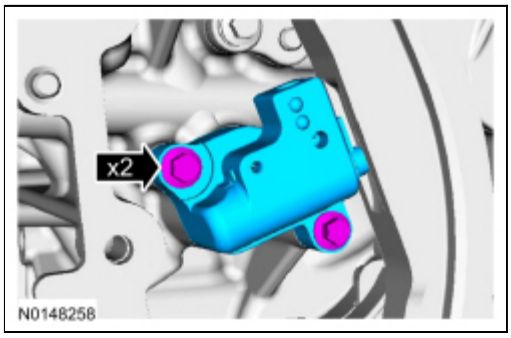


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



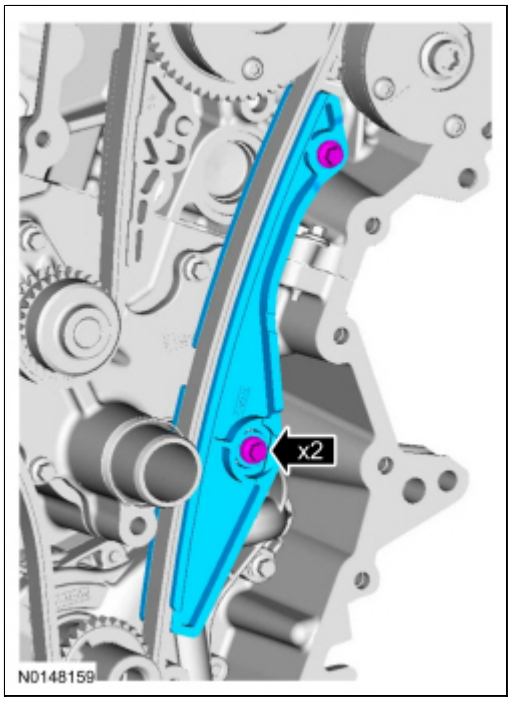
8. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



repair4less

9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

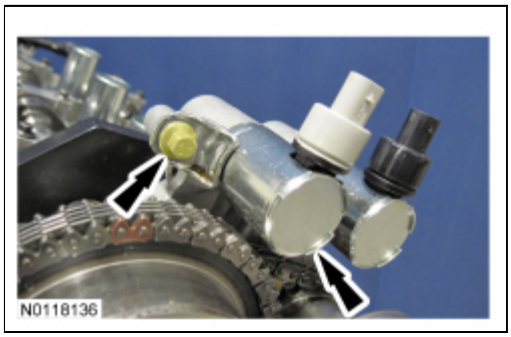
   Mark the 2 timing chain links that aligns with the timing mark on the crankshaft sprocket as shown.



10. Remove the 2 bolts and the primary timing chain tensioner.

11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.

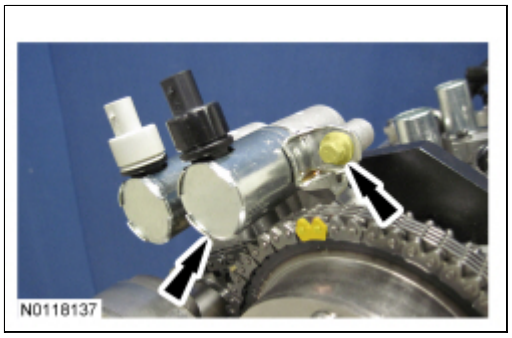


13. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.



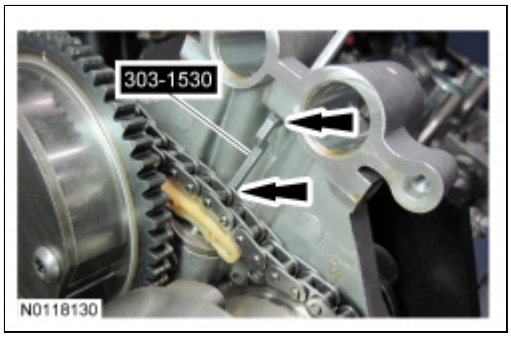
14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

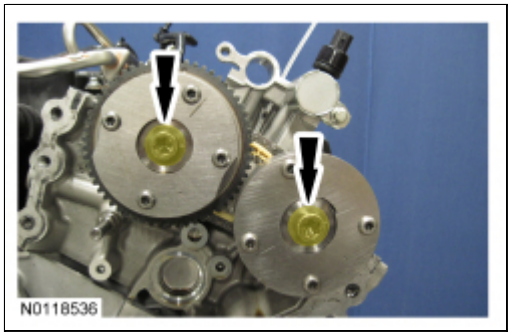
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

repair4less



15. Remove the primary timing chain.

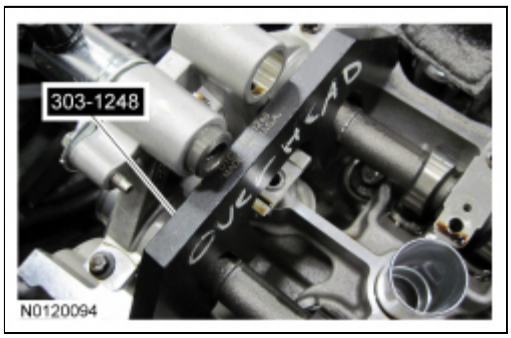


16. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

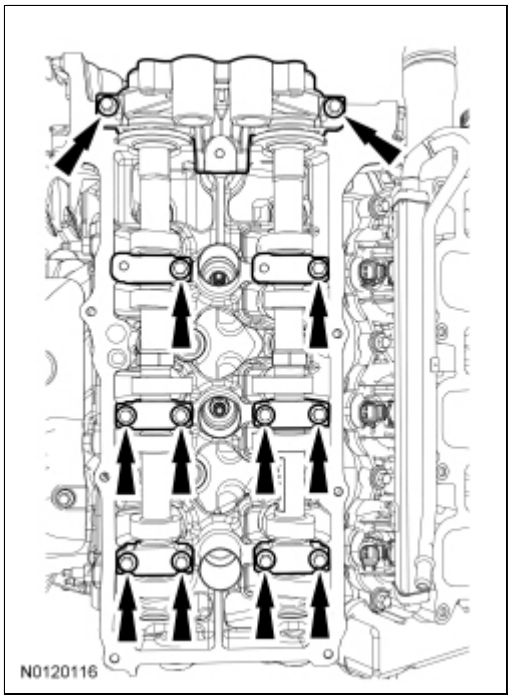
17. Remove and discard the 2 LH VCT assembly bolts.



18. Remove the 2 LH VCT assemblies and secondary timing chain.
    - Remove the Secondary Chain Hold Down.

19. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the LH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the LH camshafts.



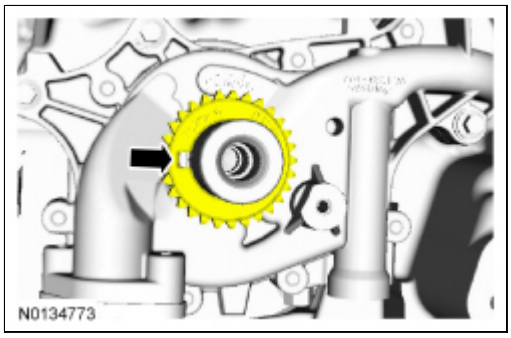
repair4less

20. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

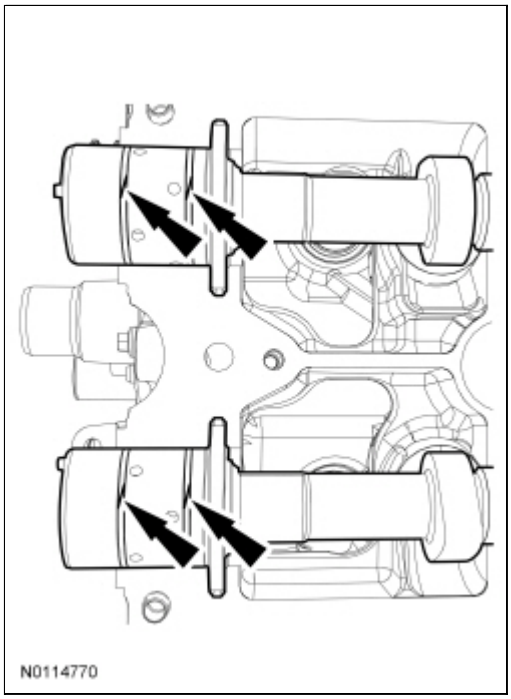
    Remove the 12 bolts, 6 camshaft caps, mega cap and the LH camshafts.

Installation



1. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

   Position the camshafts onto the LH cylinder head in the neutral position as shown.

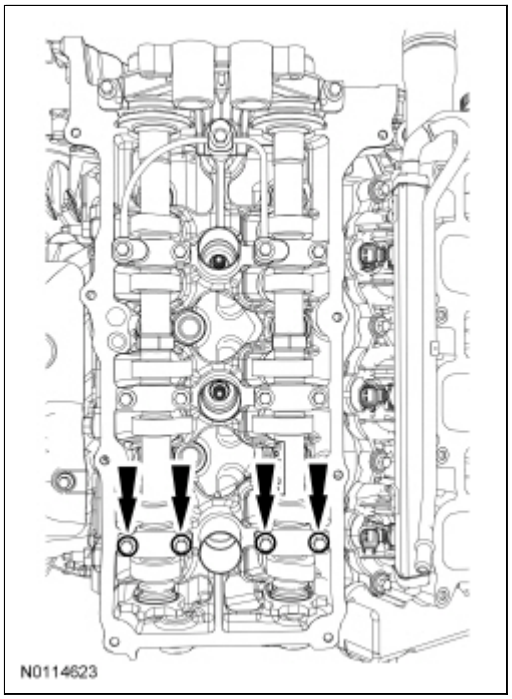


2. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

   Rotate the crankshaft counterclockwise until the crankshaft dowel pin is in the 9 o'clock position.

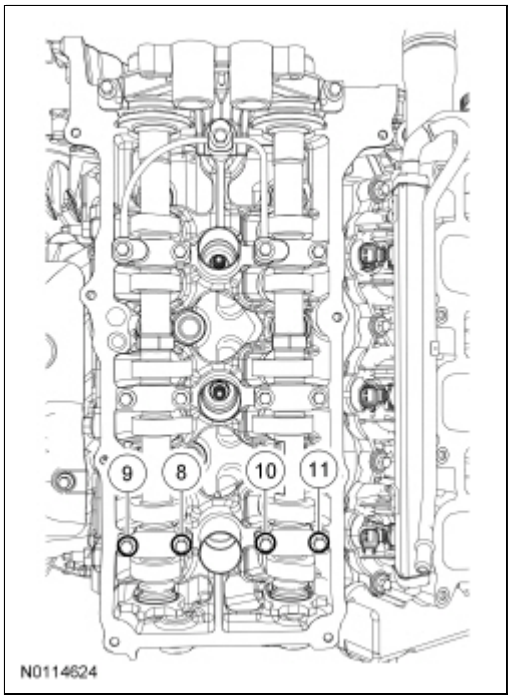
3. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

   Position the 4 camshaft seals gaps as shown.



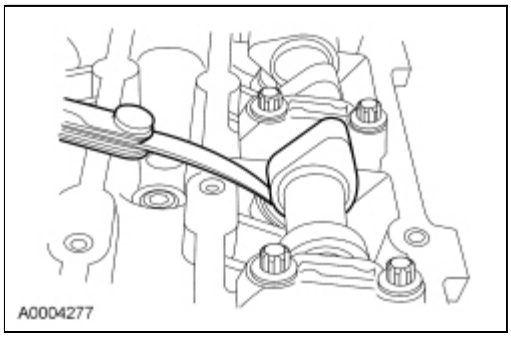
4. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

   Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in) then additional 45 degrees.

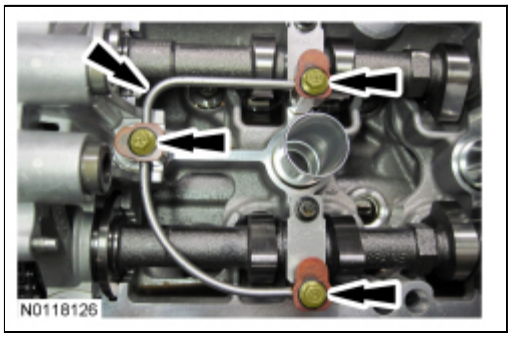


repair4less

5. Loosen the 4 camshaft caps bolts.



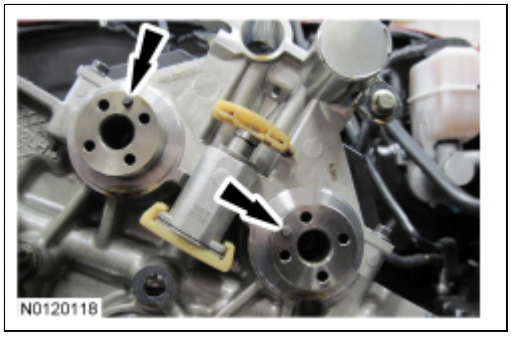
6. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then additional 45 degrees.



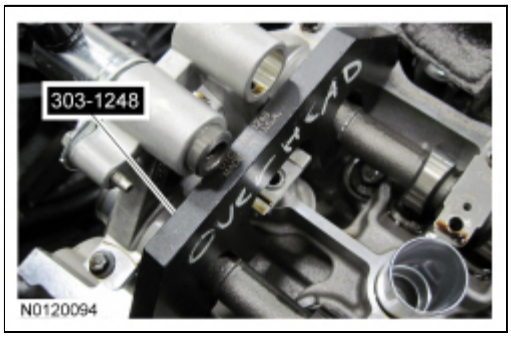
7. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

   NOTE: Use a camshaft sprocket bolt to turn the camshafts.

   Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet (s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

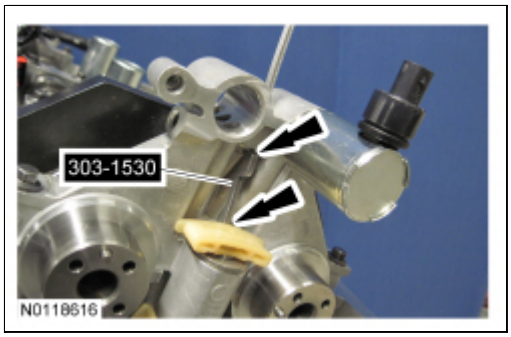


8. Remove the 3 bolts and the LH valve train oil tube.



repair4less

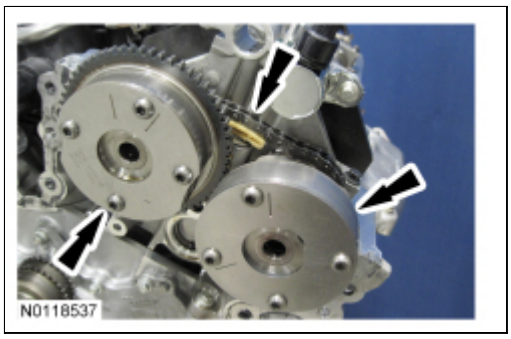
9. Rotate the LH camshafts to the TDC position as shown.



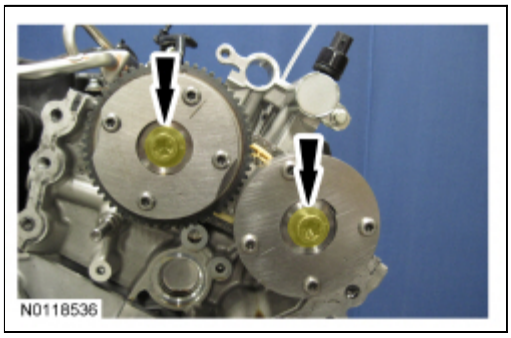
10. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

    Install the Camshaft Holding Tool onto the flats of the LH camshafts.

11. Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

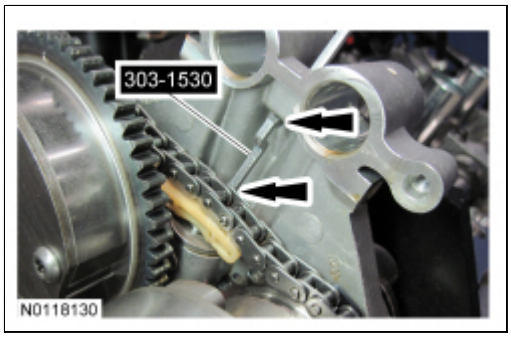


12. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

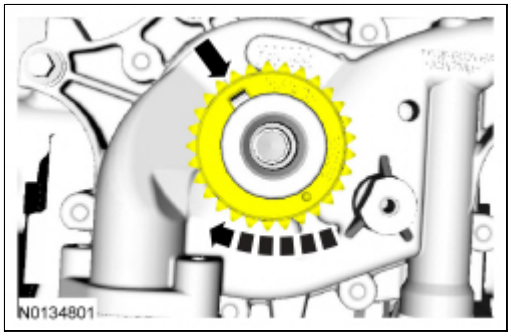


13. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



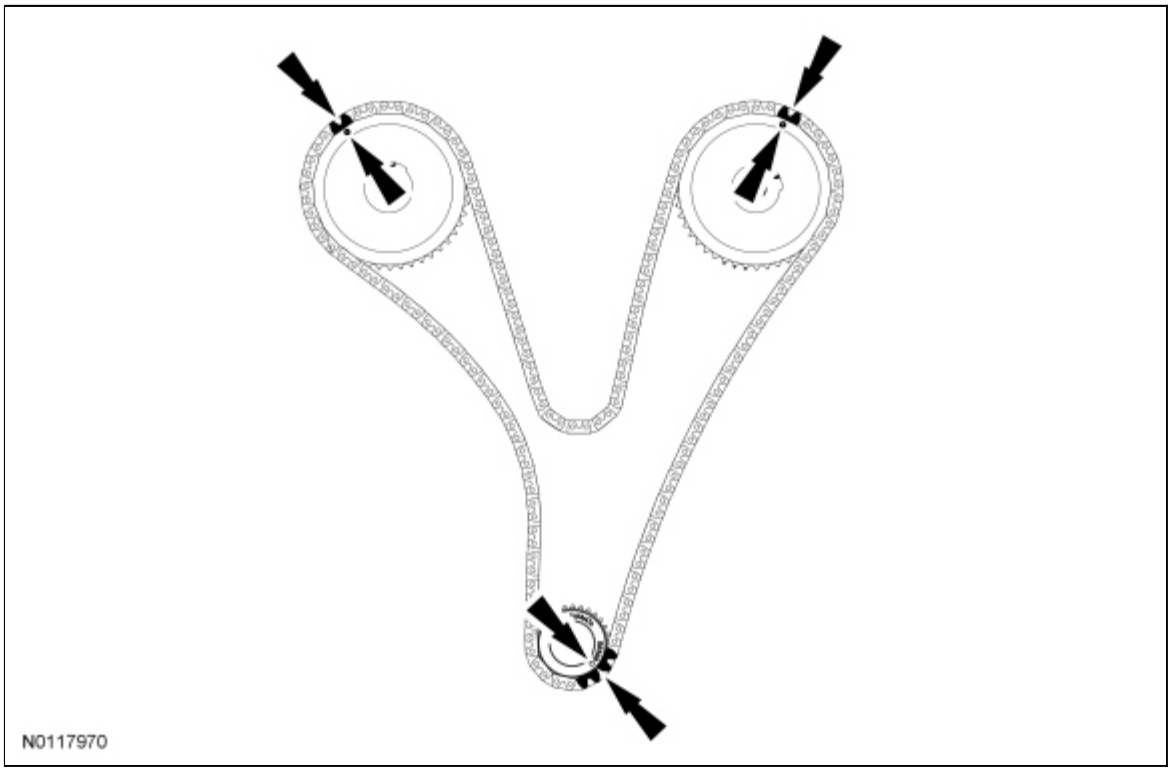
14. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.



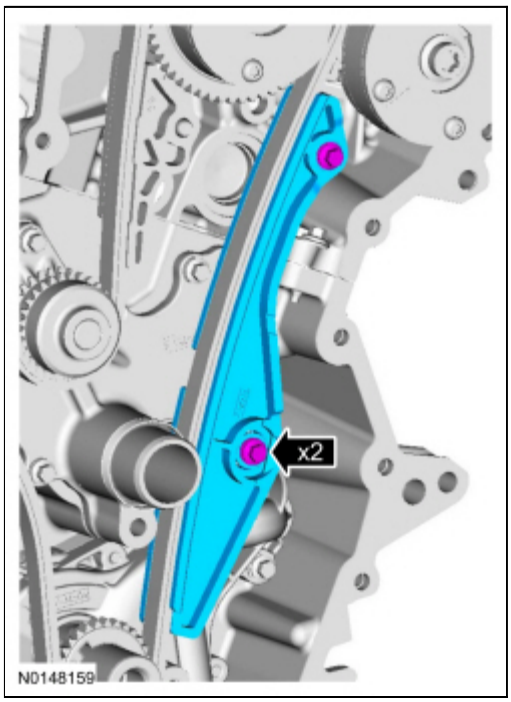
15. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

repair4less

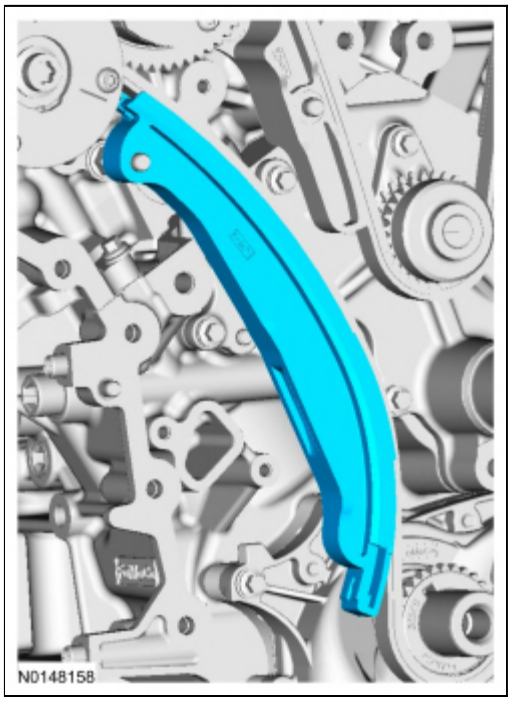


16. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).



17. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

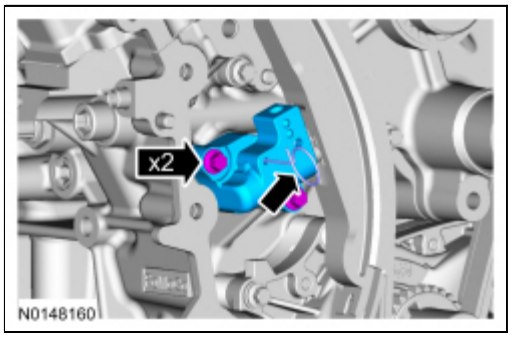
    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



18. Install the lower LH primary timing chain guide and the 2 bolts.

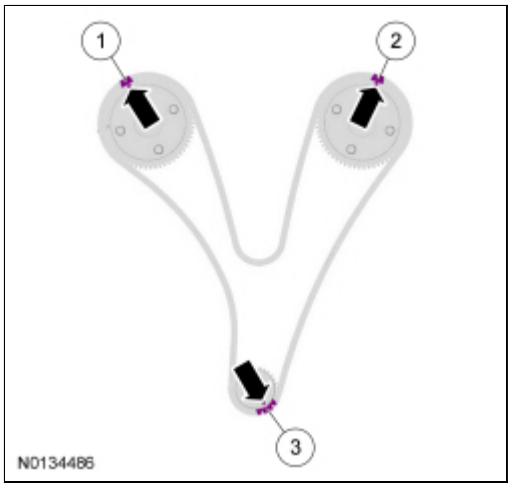
- Tighten to 10 Nm (89 lb-in).

19. Install the primary timing chain tensioner arm.



20. Reset the primary timing chain tensioner.
    - Release the ratchet detent.
    - Using a soft-jawed vise, compress the ratchet plunger.
    - Align the hole in the ratchet plunger with the hole in the tensioner housing.
    - Install a suitable lockpin.

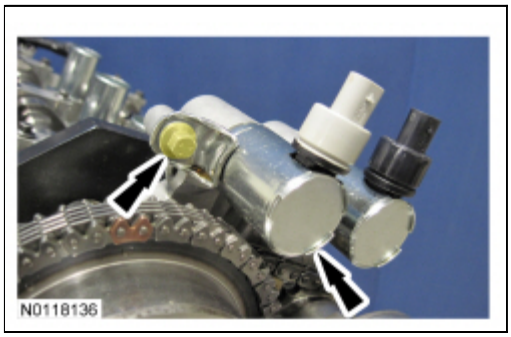
repair4less



21. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lockpin.

22. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).



23. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

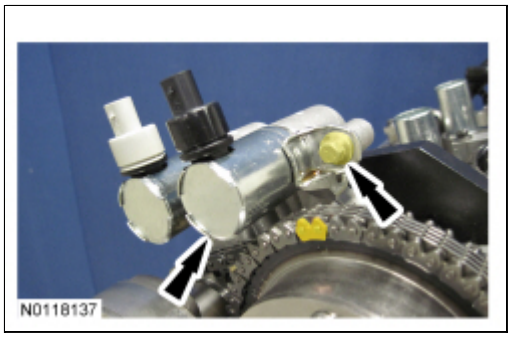
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the LH intake VCT oil control solenoid and the bolt.

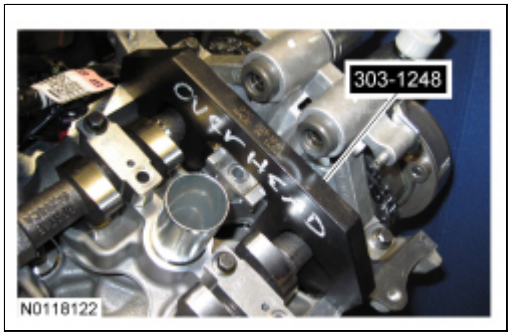
- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

24. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**



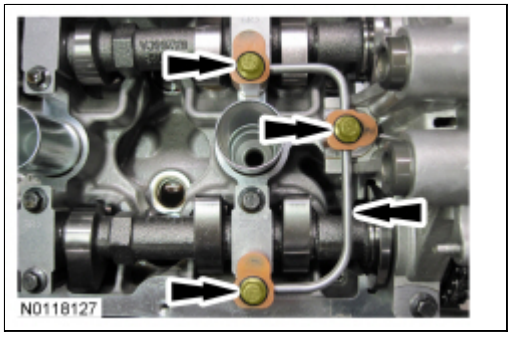
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

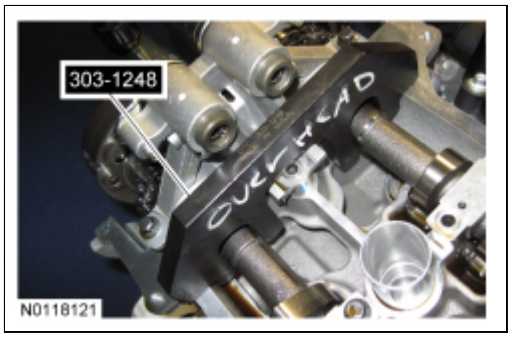


Install the RH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

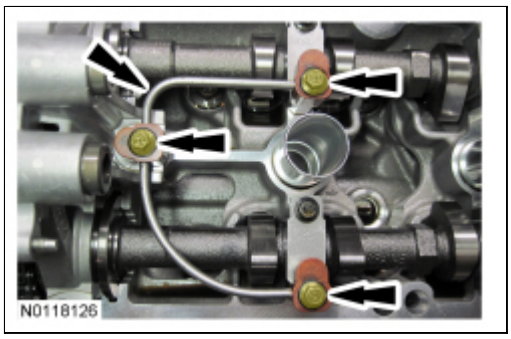


repair4less



25. Remove the RH Camshaft Holding Tool.

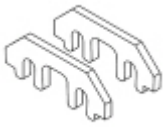
26. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



27. Remove the LH Camshaft Holding Tool.

28. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.

- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.



29. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

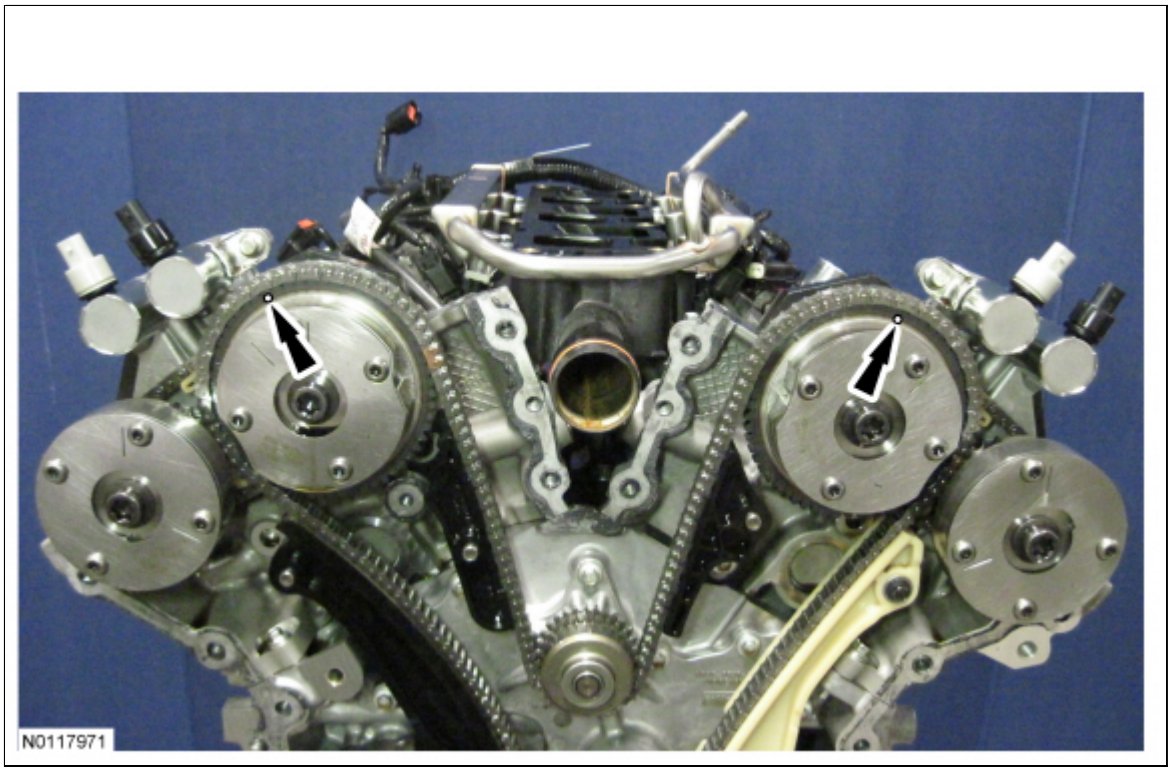
repair4less

Camshaft — RH

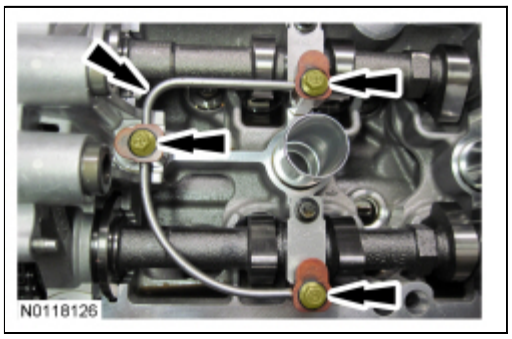
Special Tool(s)

 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248



Material

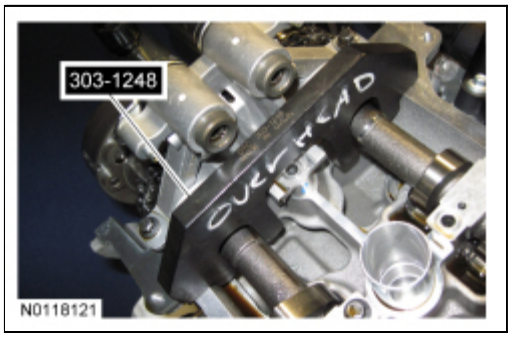
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



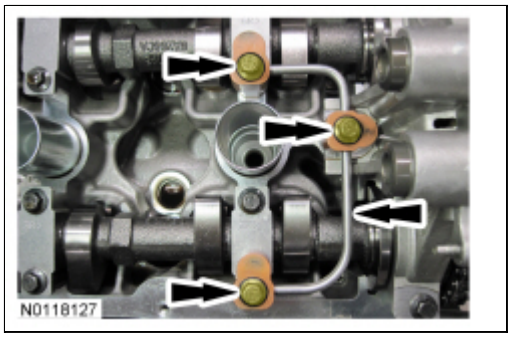
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Rotate the crankshaft clockwise and align the timing marks on the intake Variable Camshaft Timing (VCT) assemblies as shown.

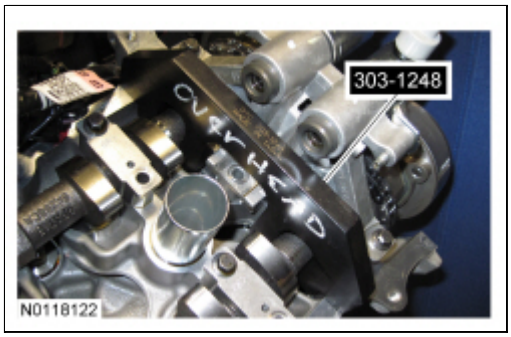


3. Remove the 3 bolts and the LH valve train oil tube.



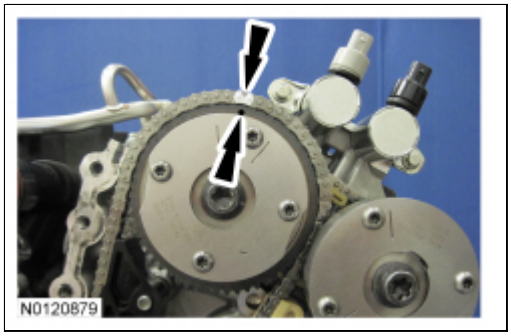
4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



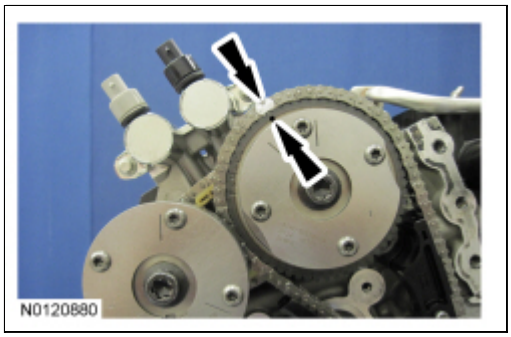
5. Remove the 3 bolts and the RH valve train oil tube.

repair4less



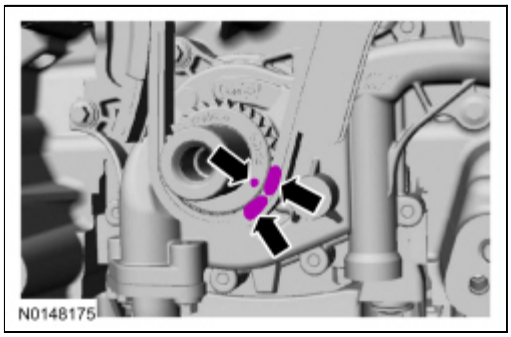
6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

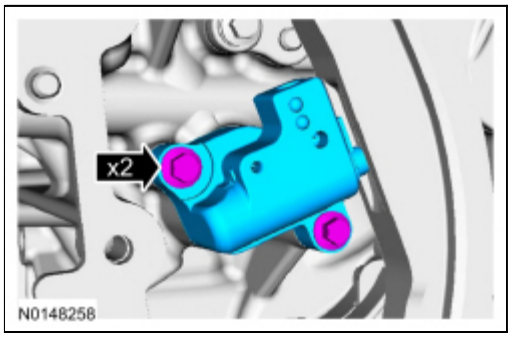


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



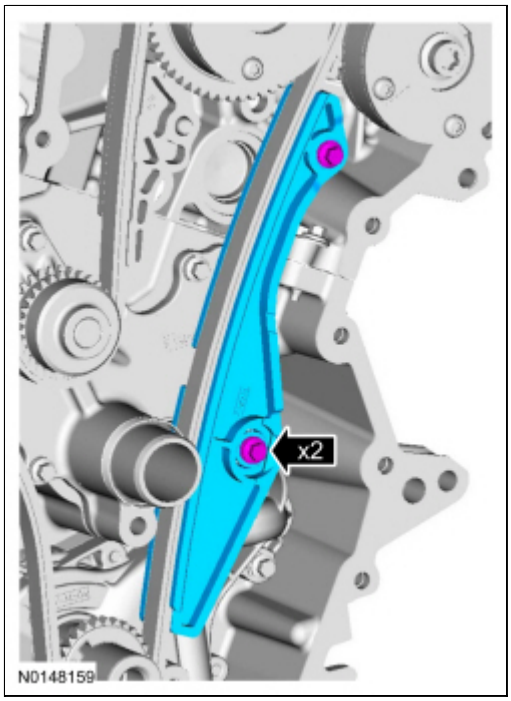
8. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

   Mark the 2 timing chain links that aligns with the timing mark on the crankshaft sprocket as shown.

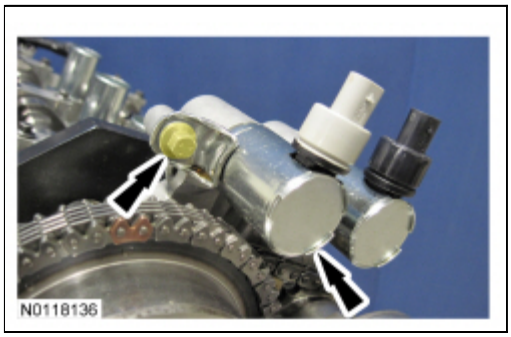
10. Remove the 2 bolts and the primary timing chain tensioner.



11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.

repair4less

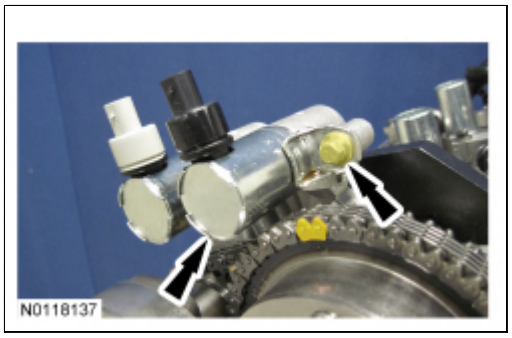


13. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.



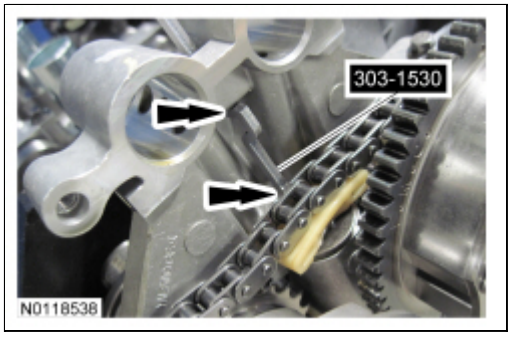
14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

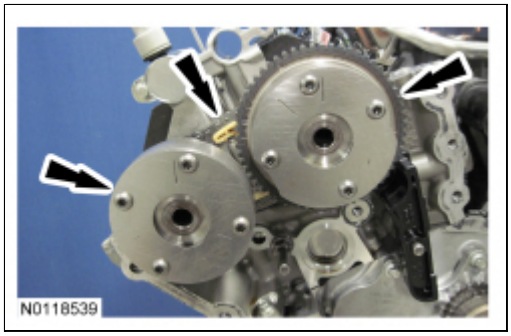
15. Remove the primary timing chain.



16. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

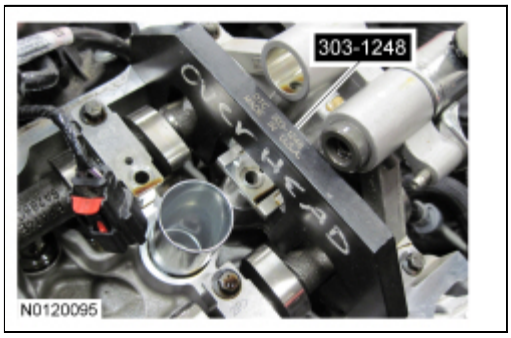
    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.



repair4less

17. Remove and discard the 2 RH VCT assembly bolts.



18. Remove the 2 RH VCT assemblies and secondary timing chain.
    - Remove the Secondary Chain Hold Down.

19. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the RH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the RH camshafts.

20. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

    Remove the 12 bolts, 6 camshaft caps, mega cap and the RH camshafts.

Installation

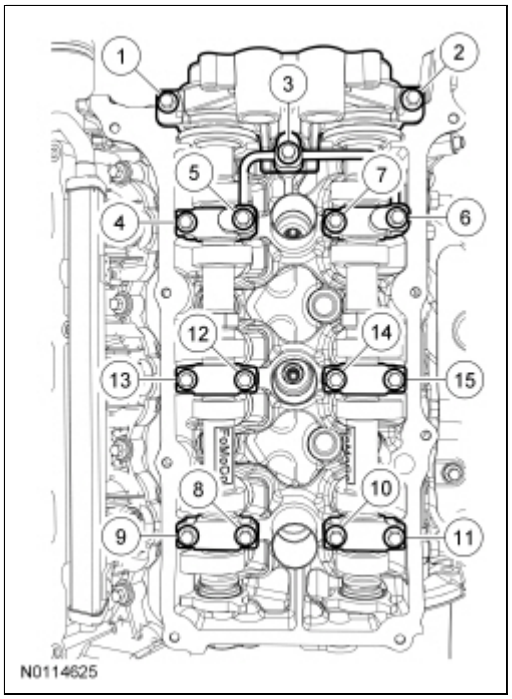
1. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

   Position the camshafts onto the RH cylinder head in the neutral position as shown.

2. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

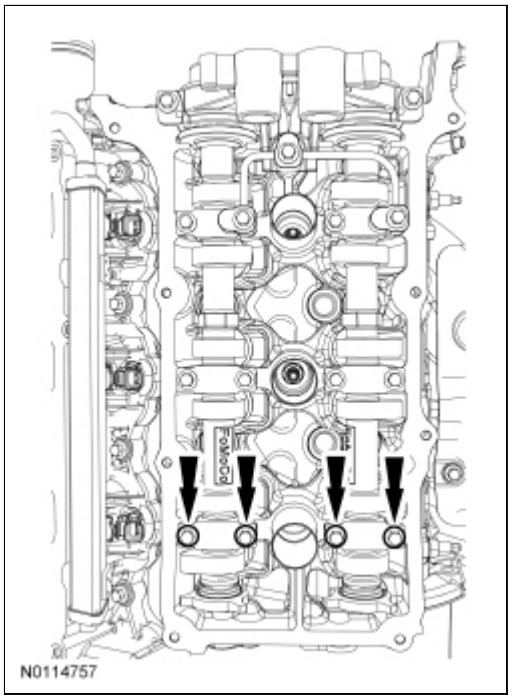
   Rotate the crankshaft counterclockwise until the crankshaft dowel pin is in the 9 o'clock position.

repair4less



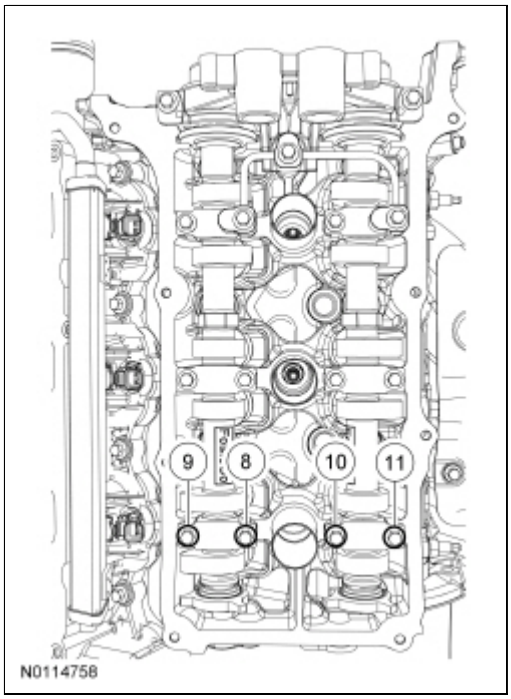
3. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

   Position the 4 camshaft seals gaps as shown.



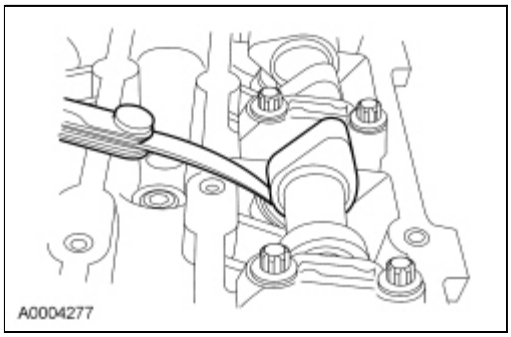
4. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

   Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in) then additional 45 degrees.

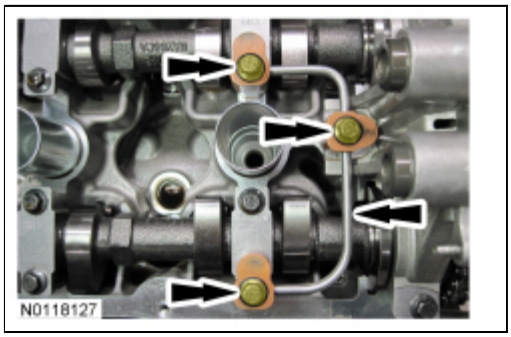


5. Loosen the 4 camshaft caps bolts.

6. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then additional 45 degrees.



repair4less

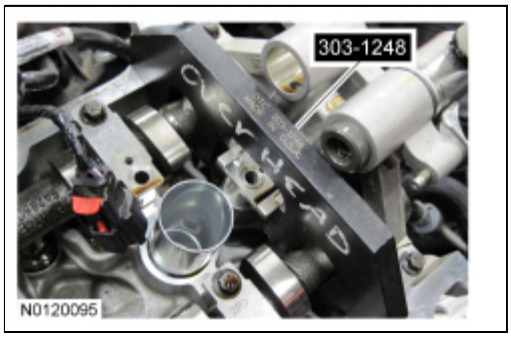


7. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

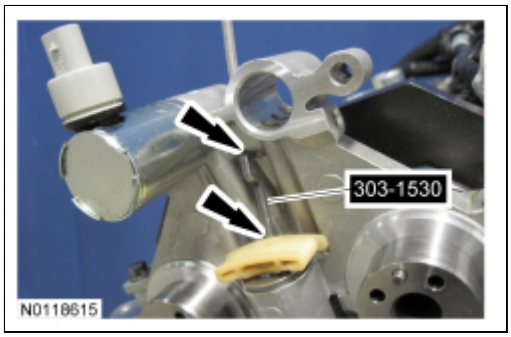
   NOTE: Use a camshaft sprocket bolt to turn the camshafts.

   Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet (s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

8. Remove the 3 bolts and the RH valve train oil tube.

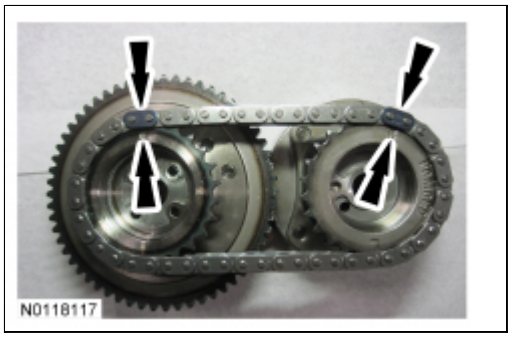


9. Rotate the RH camshafts to the TDC position as shown.

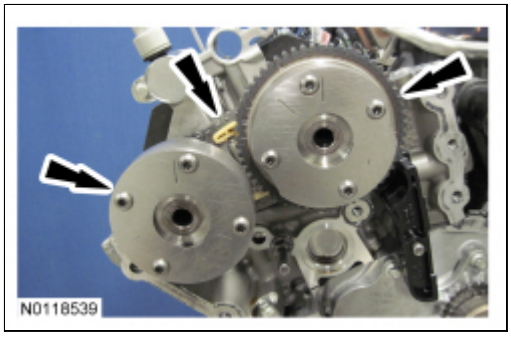


10. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the RH camshafts.

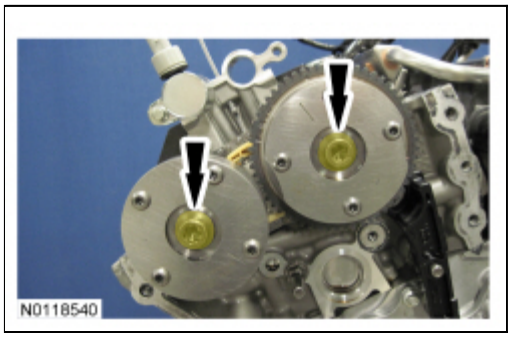


11. Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.



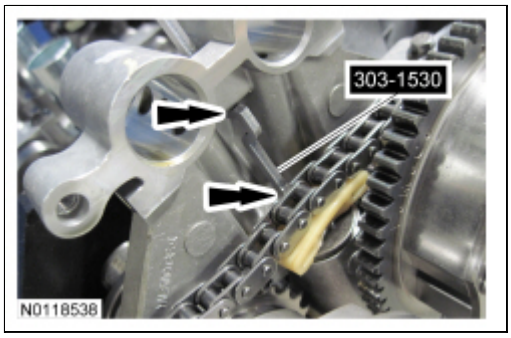
12. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

repair4less

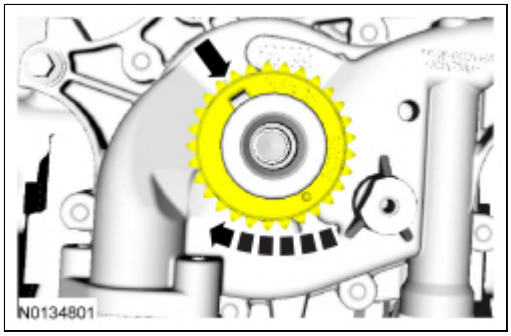


13. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

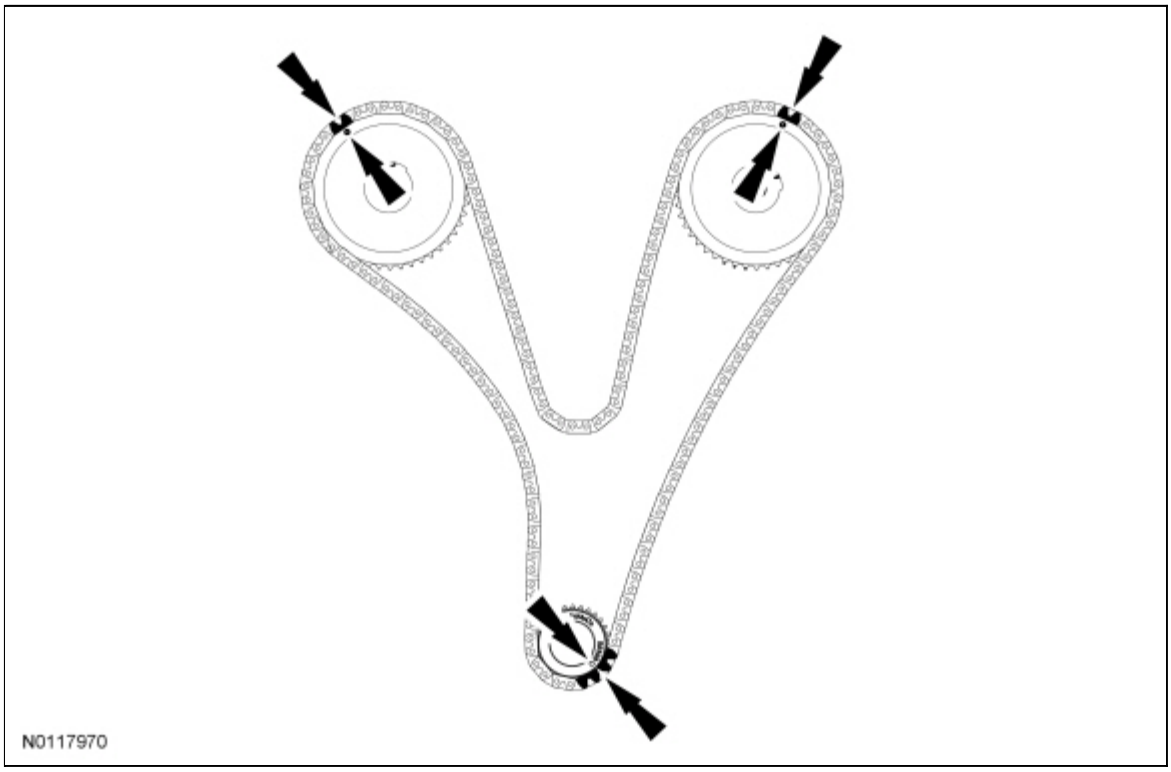


14. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.



15. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

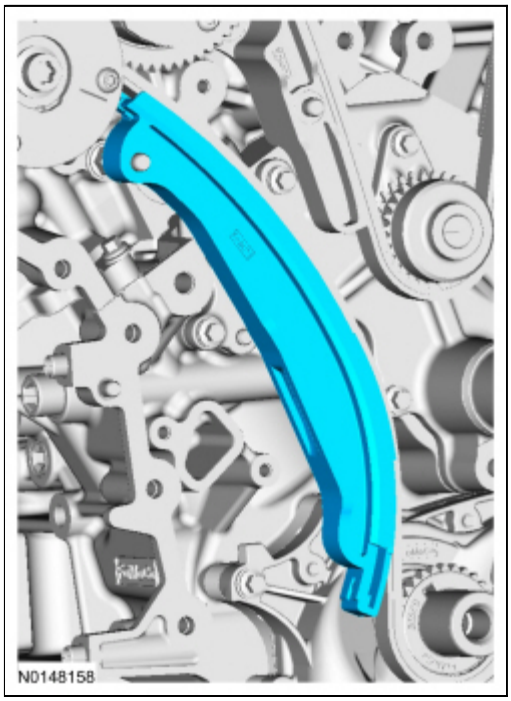
    Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.



16. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

17. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

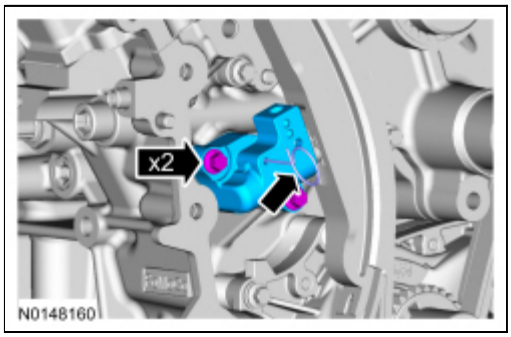


18. Install the lower LH primary timing chain guide and the 2 bolts.

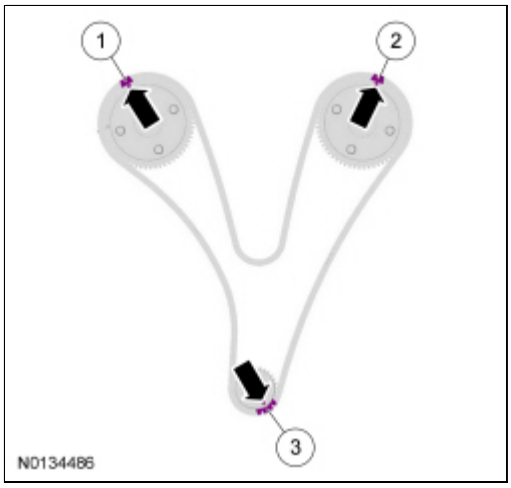
repair4less

- Tighten to 10 Nm (89 lb-in).

19. Install the primary timing chain tensioner arm.



20. Reset the primary timing chain tensioner.
    - Release the ratchet detent.
    - Using a soft-jawed vise, compress the ratchet plunger.
    - Align the hole in the ratchet plunger with the hole in the tensioner housing.
    - Install a suitable lockpin.

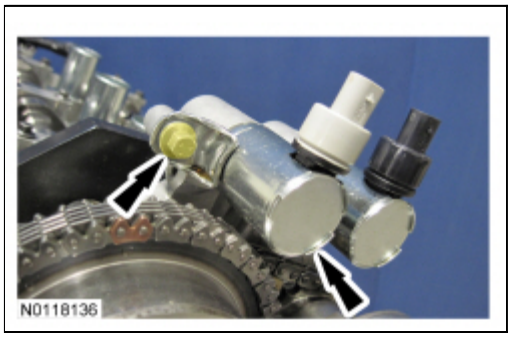


21. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lockpin.

22. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).

repair4less



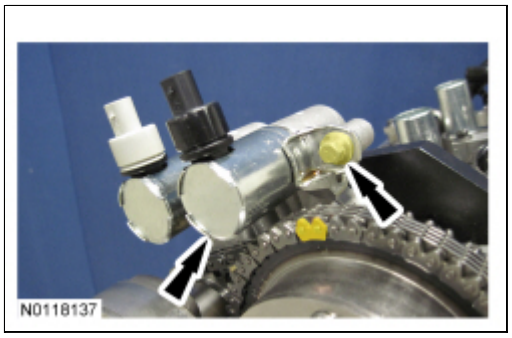
23. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

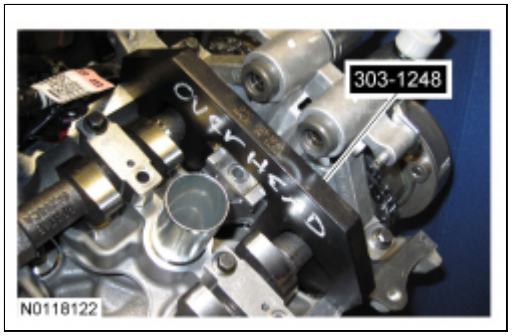
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



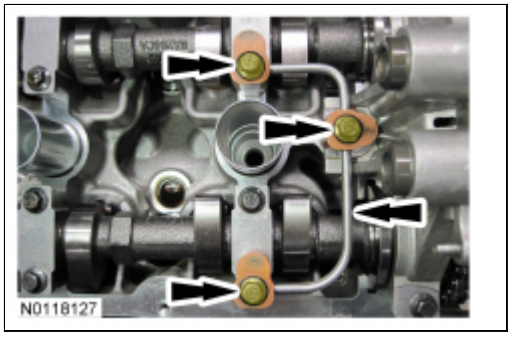
24. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

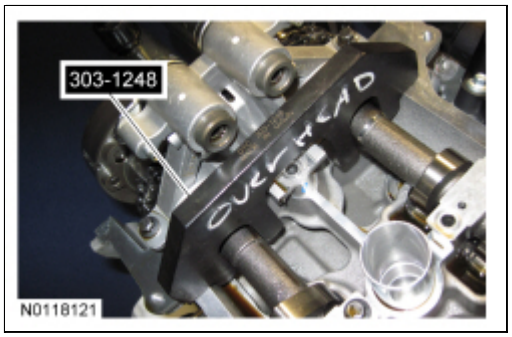


NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH intake VCT oil control solenoid and the bolt.

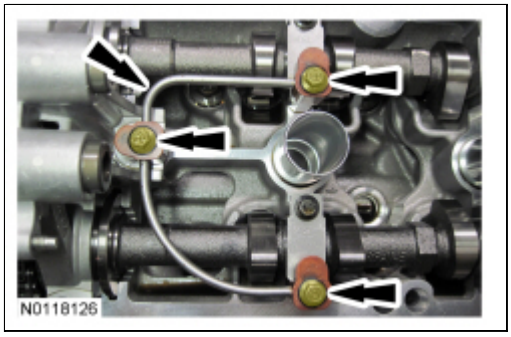


- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



25. Remove the RH Camshaft Holding Tool.

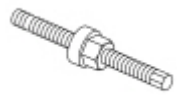
26. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



27. Remove the LH Camshaft Holding Tool.

28. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.

repair4less



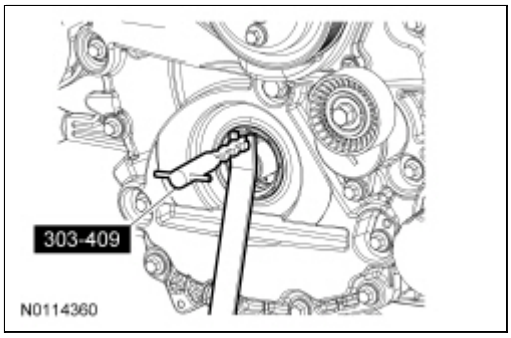
- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.

29. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Crankshaft Front Seal

Special Tool(s)

 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2981-A	Installer, Front Crankshaft Seal 303-1251
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700CH)

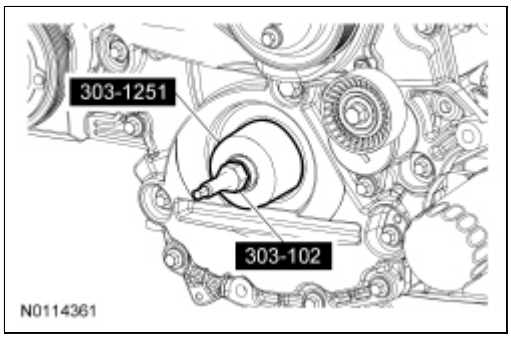


Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

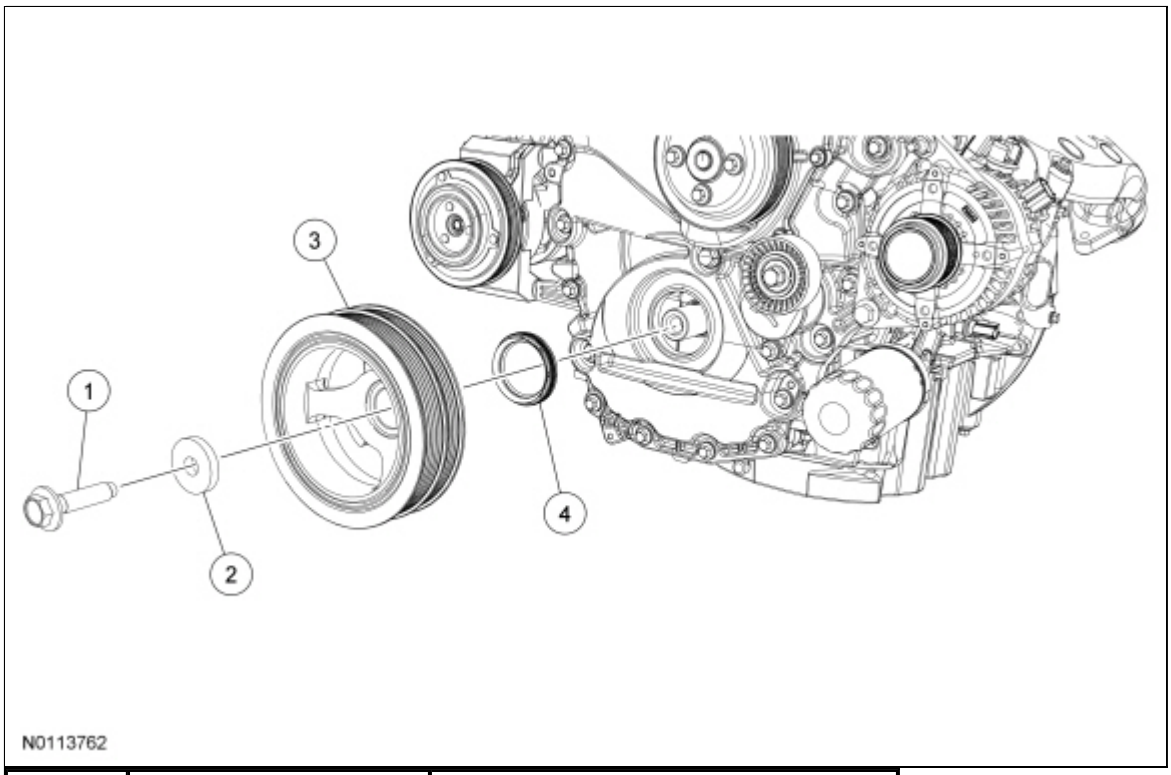
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
3. Using the Oil Seal Remover, remove and discard the crankshaft front seal.
    - Clean all sealing surfaces with metal surface prep.



repair4less

Installation

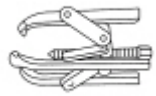


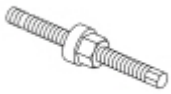
1. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

   Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Crankshaft Pulley and Crankshaft Front Seal — Exploded View





Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Washer
3	6312	Crankshaft pulley
4	6700	Crankshaft front seal

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

repair4less

Crankshaft Pulley

Special Tool(s)

 ST1184-A	3 Jaw Puller 303-D121 or equivalent
 ST2296-A	Installer, Front Cover Oil Seal 303-335
 ST1287-A	Replacer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

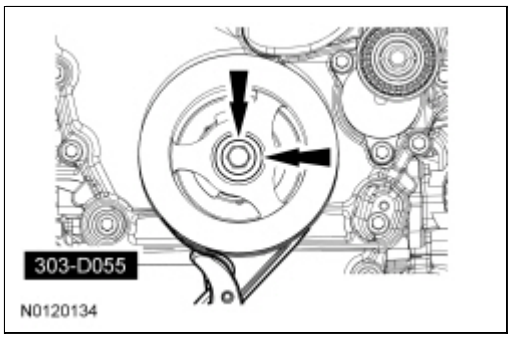
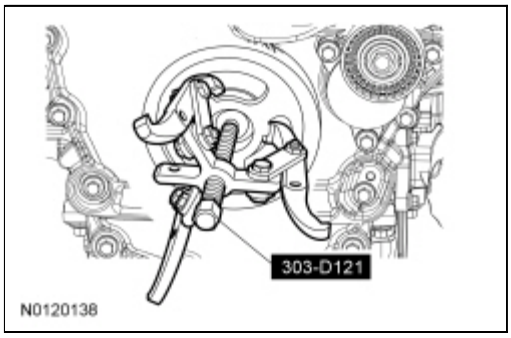
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal

repair4less

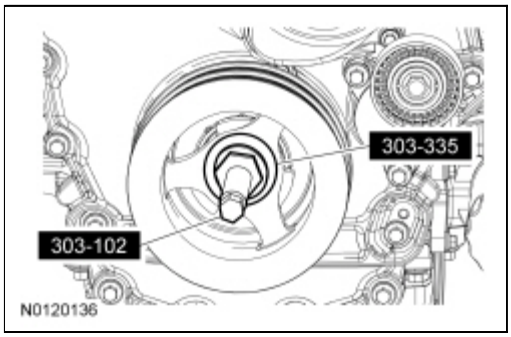


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

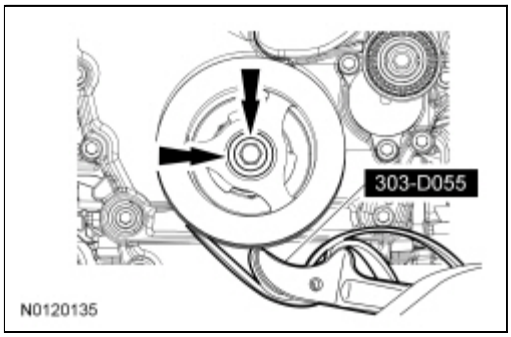
2. Remove the accessory drive belt and the A/C belt. For additional information, refer to Section 303-05 .

3. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
   - Discard the bolt.

4. Using the 3 Jaw Puller, remove the crankshaft pulley.
   - Inspect the crankshaft pulley sealing surface for nicks or scratches that may effect the crankshaft front seal lip, replace the crankshaft pulley if necessary.



Installation



1. Lubricate the crankshaft front seal inner lip with clean engine oil.

2. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

   Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Replacer, install the crankshaft pulley.

3. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

4. Install the accessory drive belt and the A/C belt. For additional information, refer to Section 303-05 .

5. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

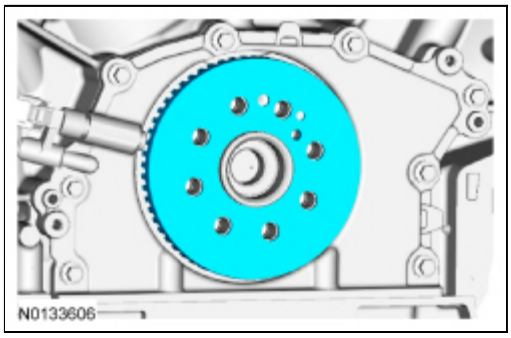
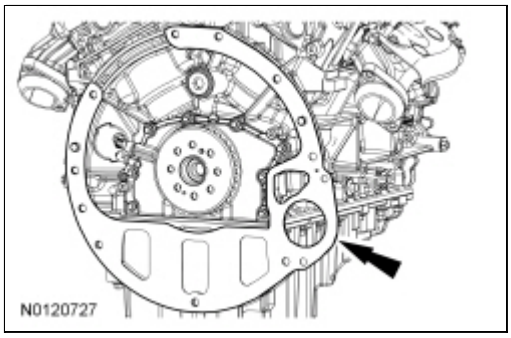
Crankshaft Rear Seal with Retainer Plate



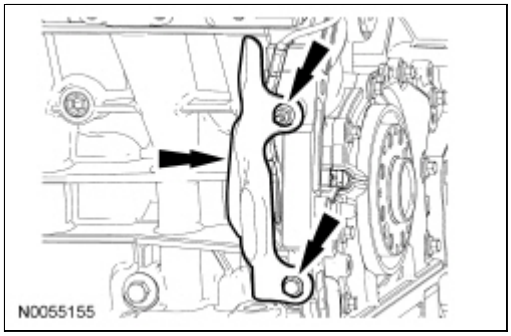
Material

Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	—

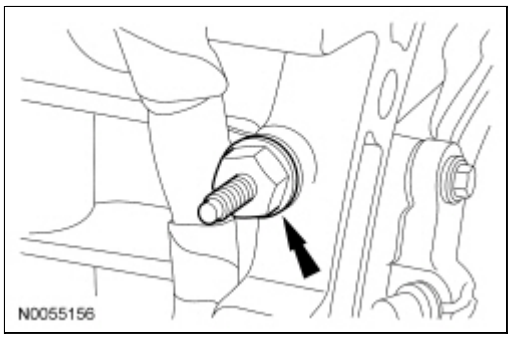


Removal

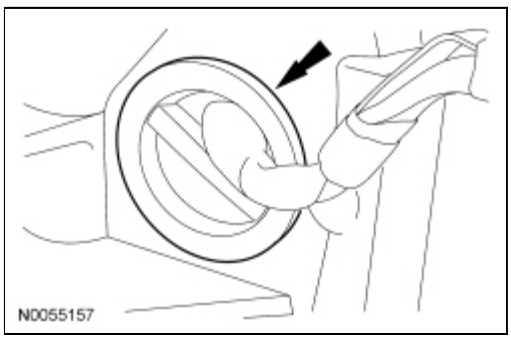
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the flexplate. For additional information, refer to Flexplate in this section.
3. Remove the crankshaft sensor ring.

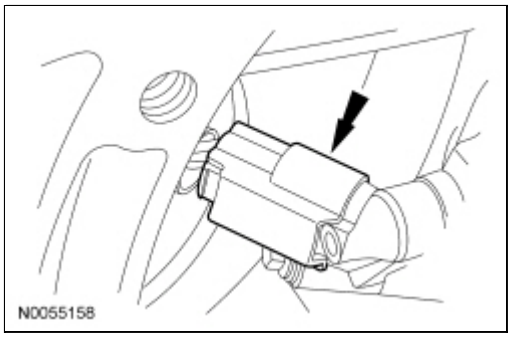


4. Remove the engine-to-transmission spacer plate.

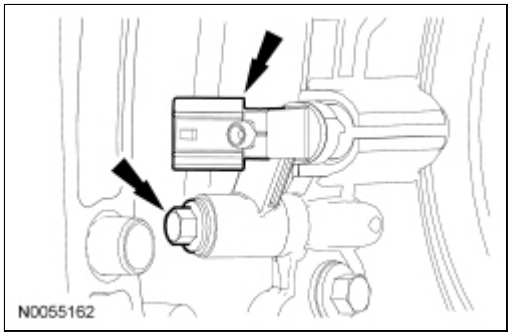


5. Remove the nut, the bolt and the heat shield.

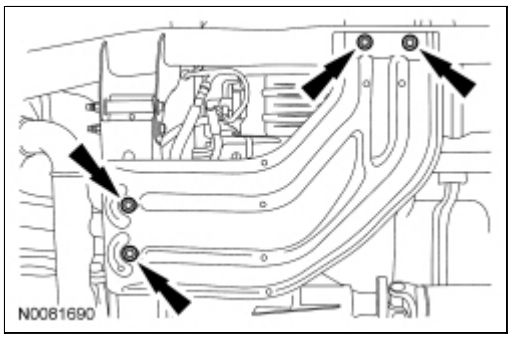
6. Remove the wiring harness retainer stud bolt.



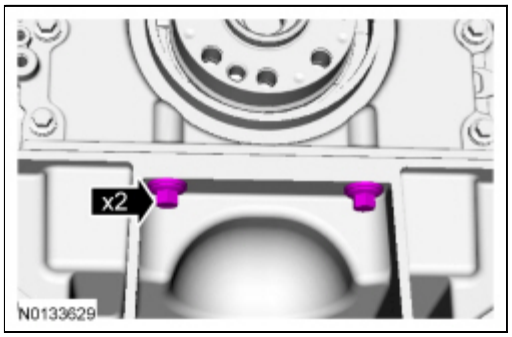
7. Remove the wiring harness grommet.



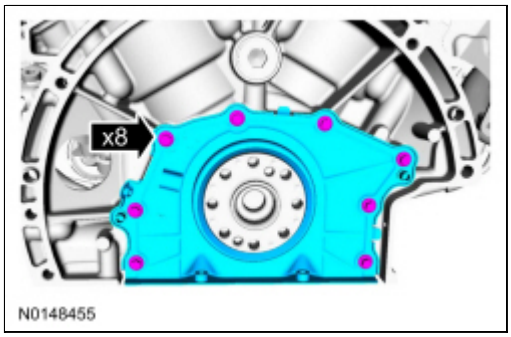
8. Disconnect the Crankshaft Position (CKP) sensor electrical connector.



repair4less



9. Remove the bolt and the CKP sensor.



10. If equipped, remove the bolts and the skid plate.

11. Remove the 2 oil pan-to-crankshaft rear seal retainer plate bolts.

12. Remove the 8 bolts and the crankshaft rear seal retainer plate.
    - Discard the crankshaft rear seal retainer plate.

13. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

    Clean the sealing surfaces of the cylinder block and oil pan flange in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

1. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

    Apply a 5 mm (0.196 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 cylinder block/oil pan joints.

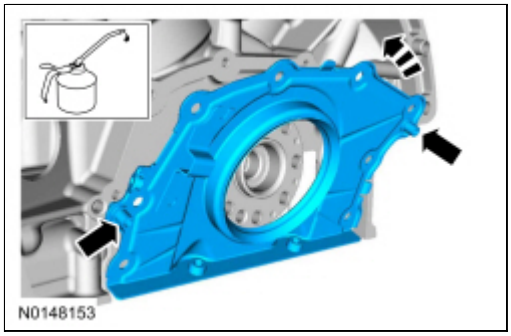
2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

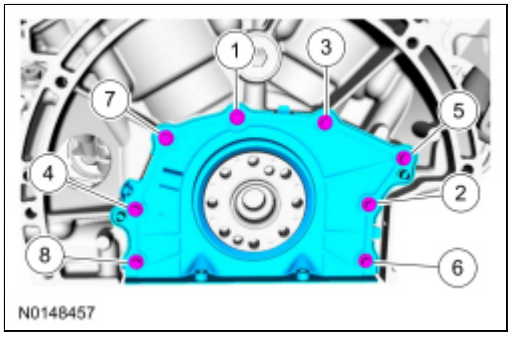
    NOTE: The stamped steel crankshaft rear seal retainer plate comes with the crankshaft rear seal.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing

repair4less



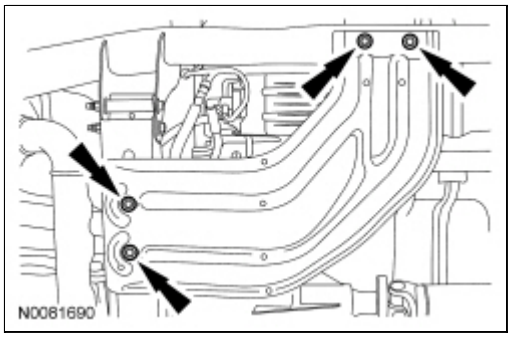
surface of the crankshaft rear seal retainer.



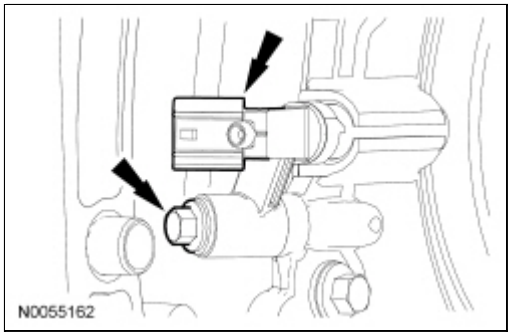
3. **NOTE:** Lubricate the crankshaft rear seal with clean engine oil.

   NOTE: Use the 2 handles during installation to avoid touching the sealant.

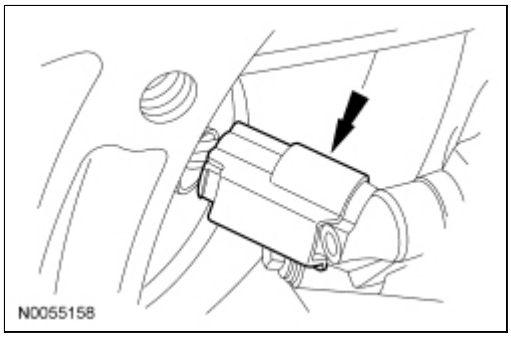
   Install the crankshaft rear seal retainer at an angle above the oil pan flange to avoid scraping off the sealer. Tilt the seal retainer up and onto the rear of the cylinder block.



4. Install the 8 crankshaft rear seal retainer plate bolts. Tighten in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

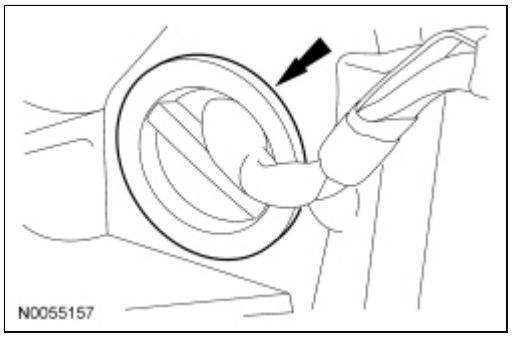


5. Install the 2 oil pan-to-crankshaft rear seal retainer plate bolts.
   - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

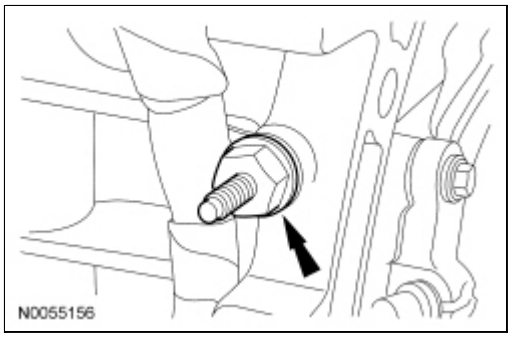


6. If equipped, install the skid plate and the bolts.
    - Tighten to 48 Nm (35 lb-ft).

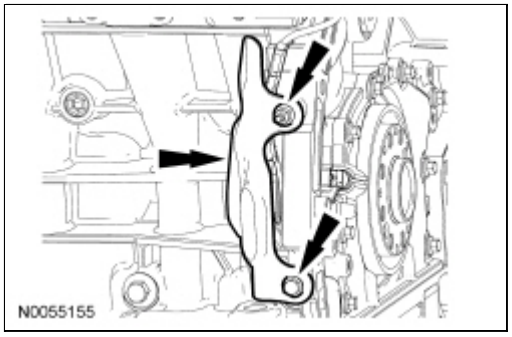
7. Install the CKP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



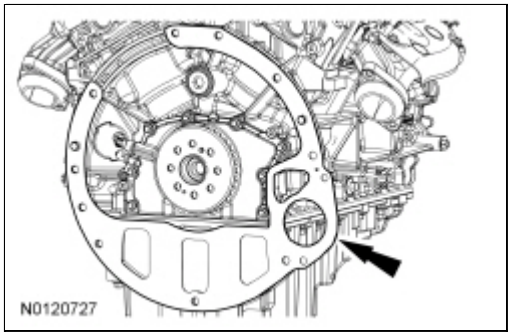
8. Connect the CKP sensor electrical connector.



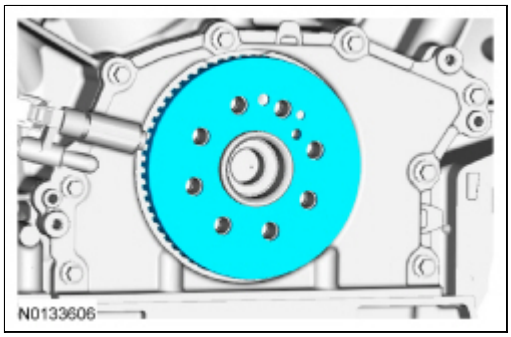
9. Install the wiring harness grommet.



repair4less



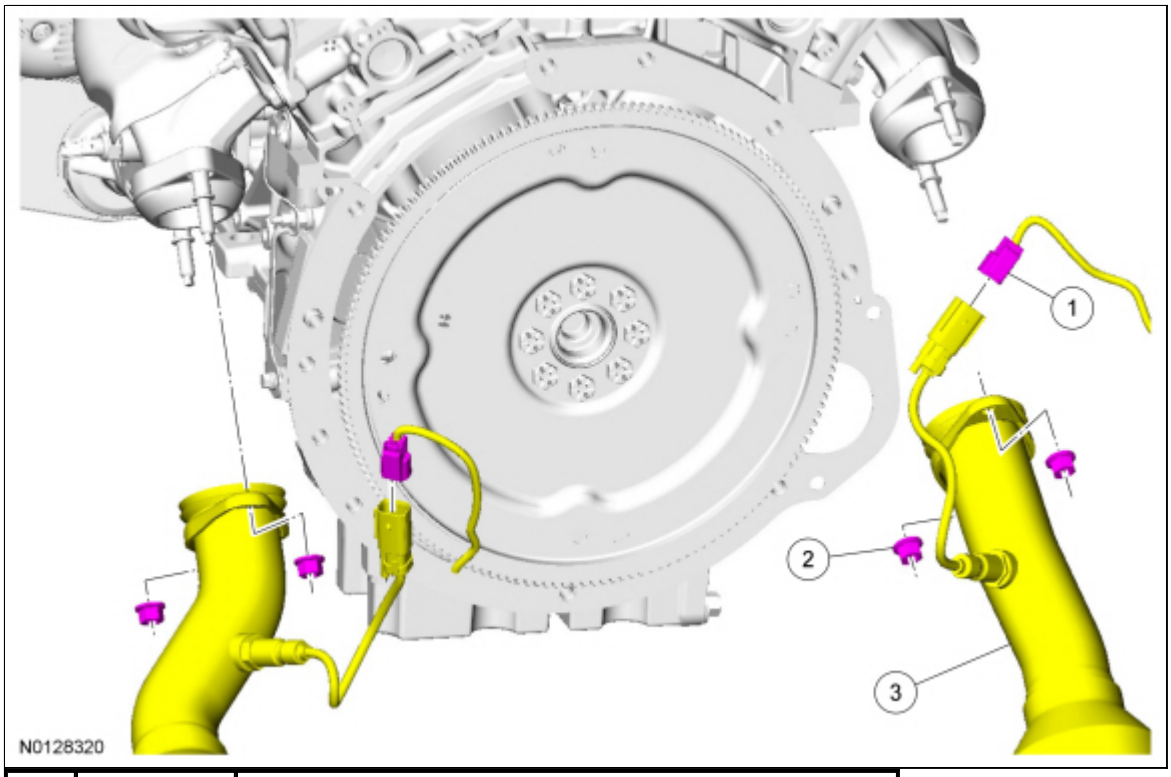
10. Install the wiring harness retainer stud bolt.
    - Tighten to 10 Nm (89 lb-in).



11. Install the heat shield, the nut and the bolt.
    - Tighten to 10 Nm (89 lb-in).

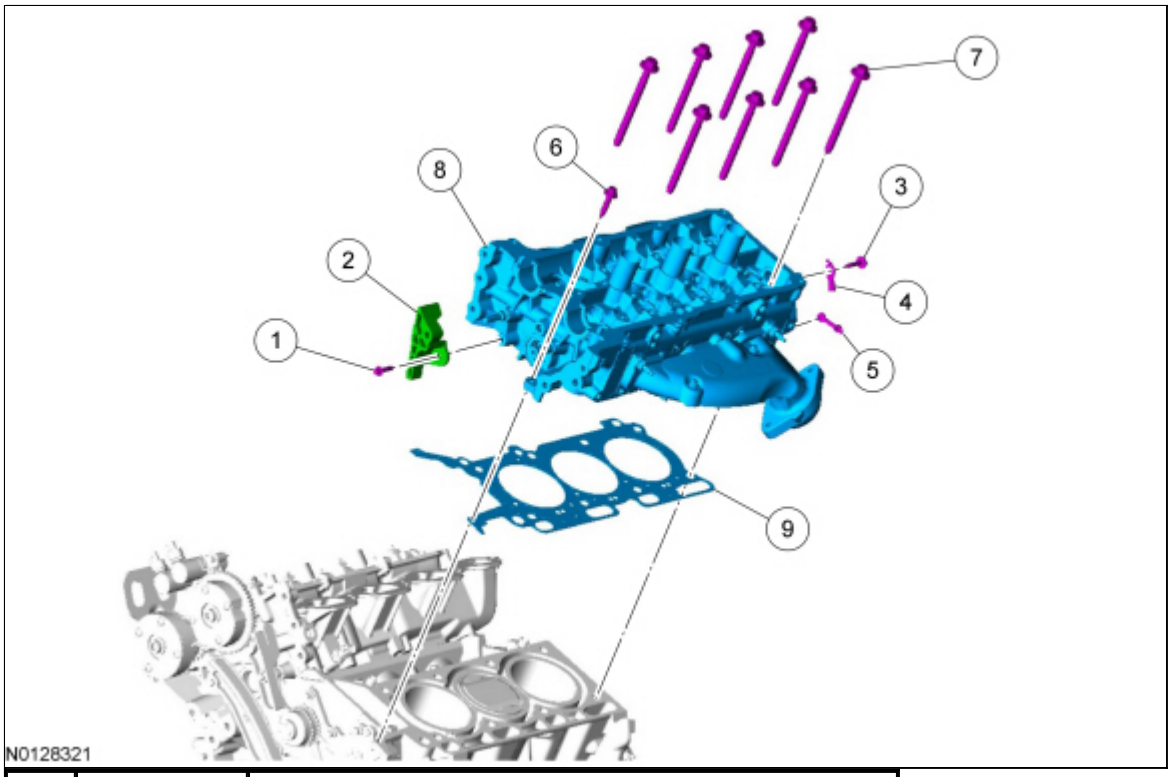
12. Install the engine-to-transmission spacer plate.

13. Install the crankshaft sensor ring.



14. Install the flexplate. For additional information, refer to Flexplate in this section.

repair4less



Cylinder Head — LH

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	—	Heated Oxygen Sensor (HO2S) electrical connector (part of 14A411) (2 required)
2	W714265	Catalytic converter-to-exhaust manifold nuts (4 required) - 45 Nm (35 lb-ft)
3	5F250	Catalytic converter assembly (Y-pipe)

Item	Part Number	Description
1	W709818	LH upper primary timing chain guide bolt - 10 Nm (89 lb-in)
2	6K297	LH upper primary timing chain guide
3	W707193	Ground strap bolt - 10 Nm (89 lb-in)
4	19A095	Ground strap
5	—	Wiring harness retainer (part of 14A411)
6	W710702	Cylinder head M6 bolt
7	6065	Cylinder head bolt (8 required)
8	6049	Cylinder head
9	6051	Cylinder head gasket

Removal

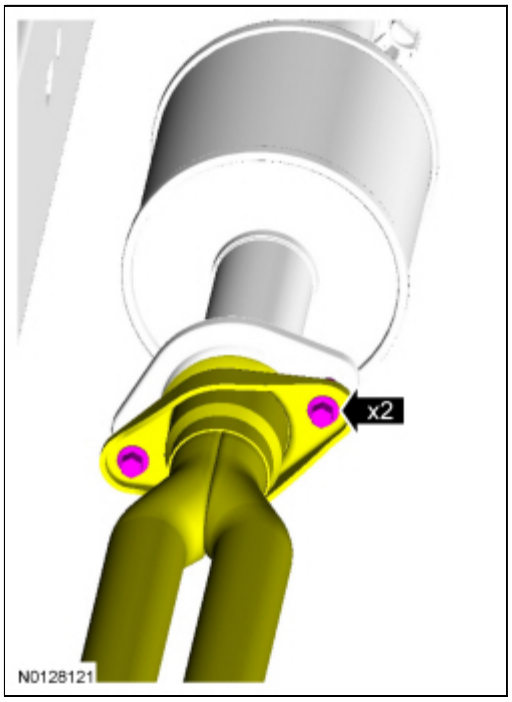
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio

repair4less

equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

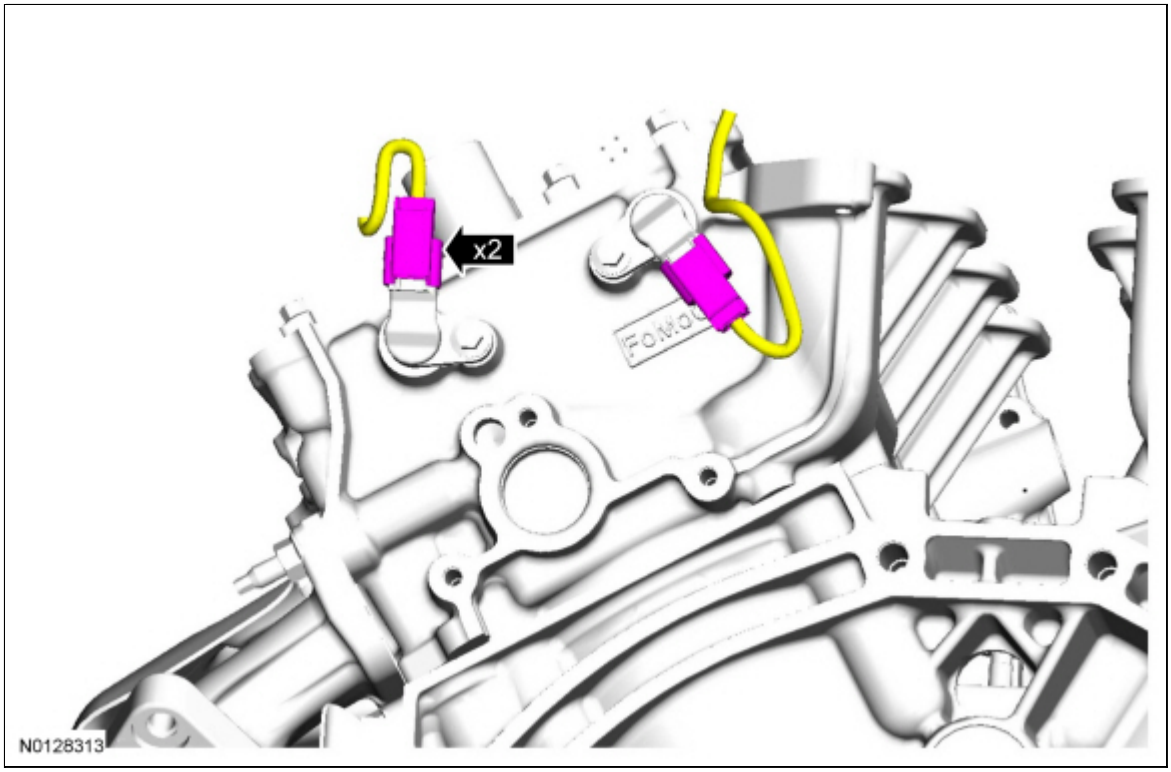
WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Detach and disconnect the RH and LH Heated Oxygen Sensor (HO2S) electrical connectors.
4. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.

5. Remove and discard the LH and RH catalytic convertor-to-exhaust manifold nuts and lower the catalytic convertor assembly.



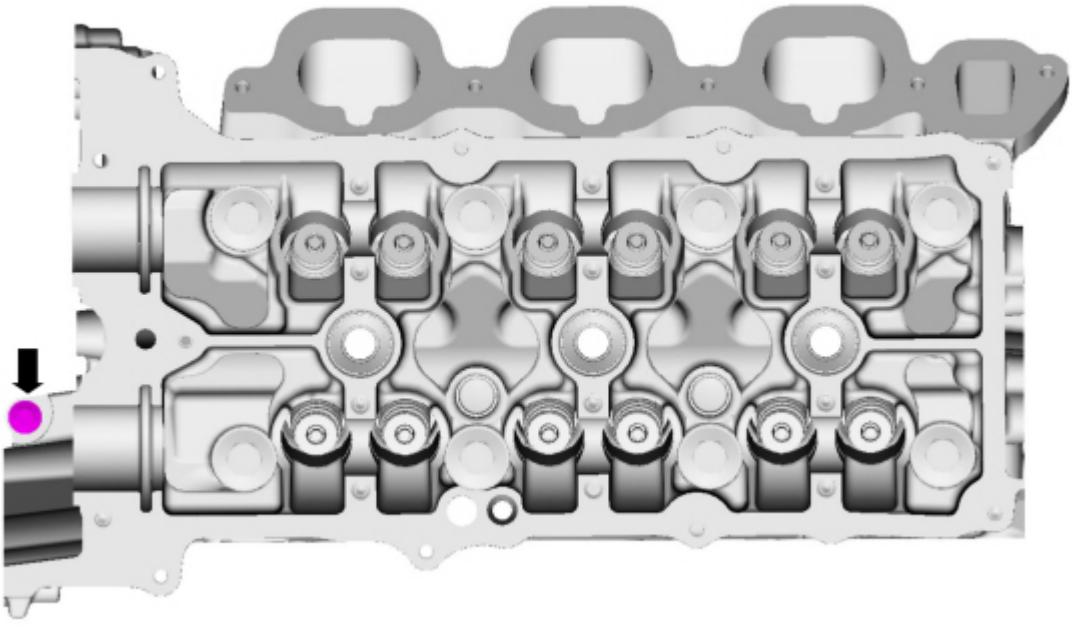
6. Remove the LH camshafts. For additional information, refer to Camshaft — LH in this section.

7. Remove the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.

8. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**

   Remove the bolt and the LH upper primary timing chain guide.

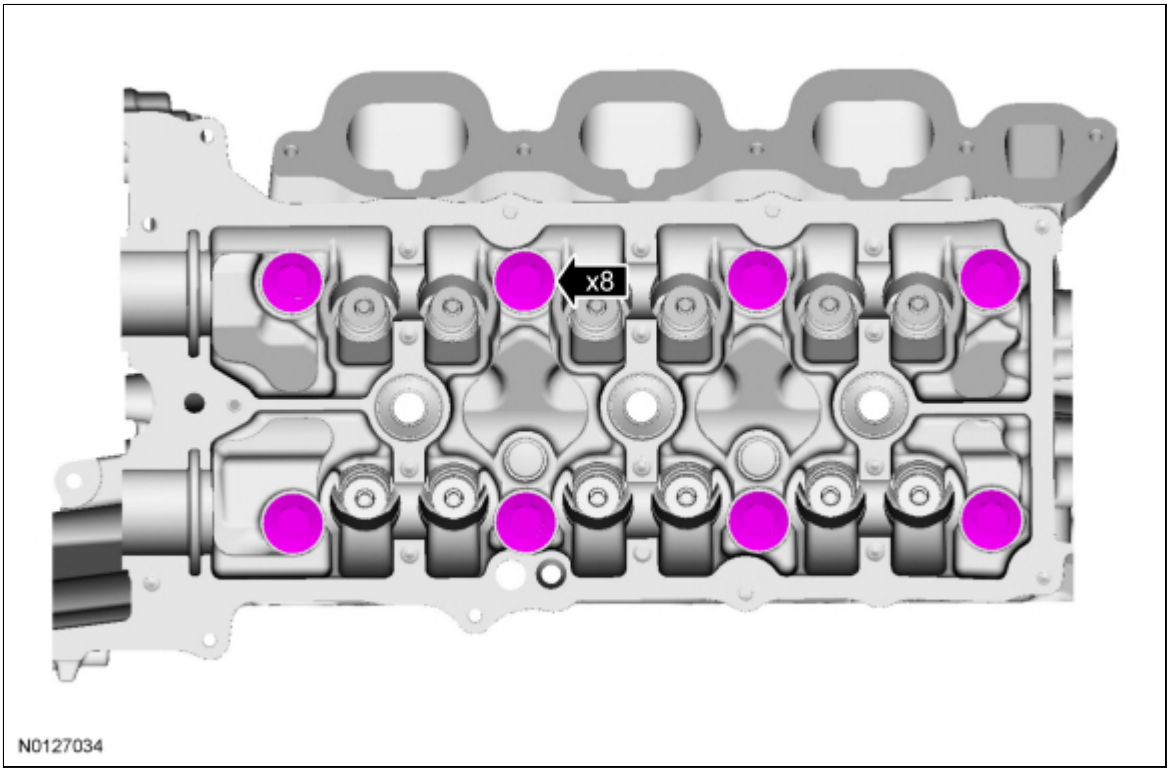
9. Disconnect the 2 LH Camshaft Position (CMP) sensors electrical connectors.



10. Remove the 2 bolts and the 2 LH CMP sensors.

repair4less

11. If equipped, remove the bolt and ground strap from the rear of the LH cylinder head.
12. Detach the wiring harness retainer from the rear of the LH cylinder head.
13. Inspect the valve tappets. For additional information, refer to Section 303-00 .
14. Remove and discard the M6 bolt.



15. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.

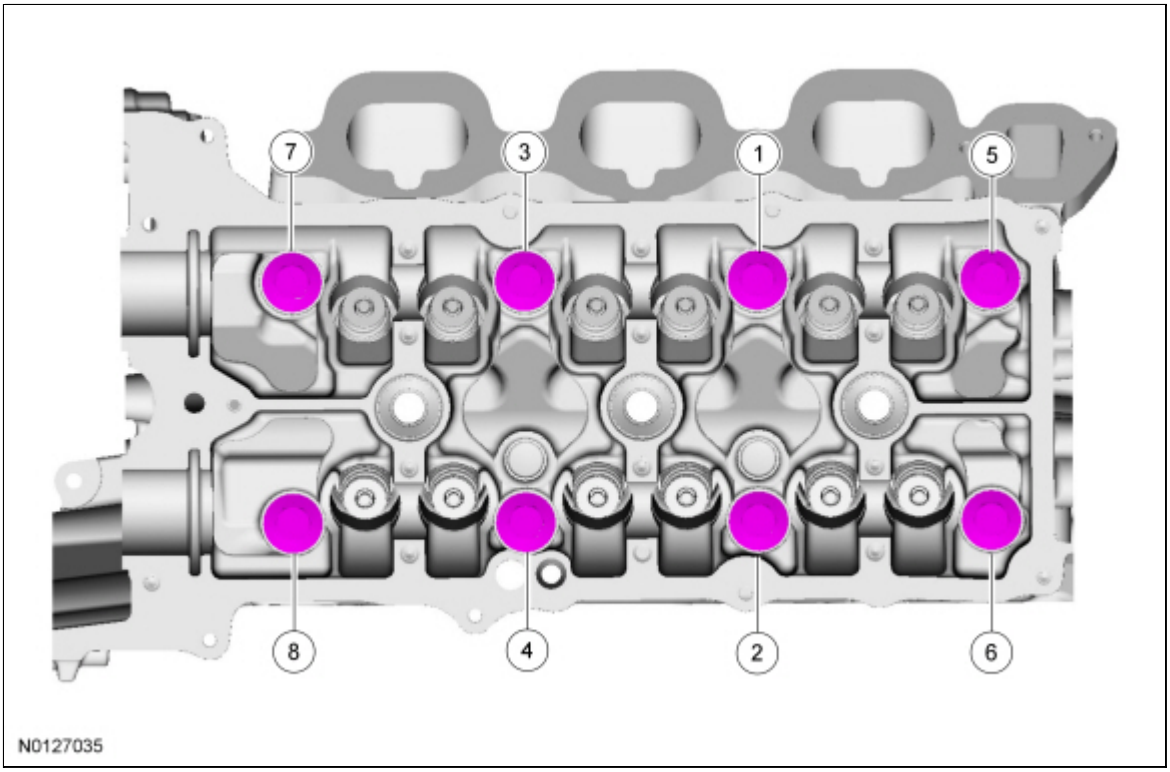
repair4less

16. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.



17. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

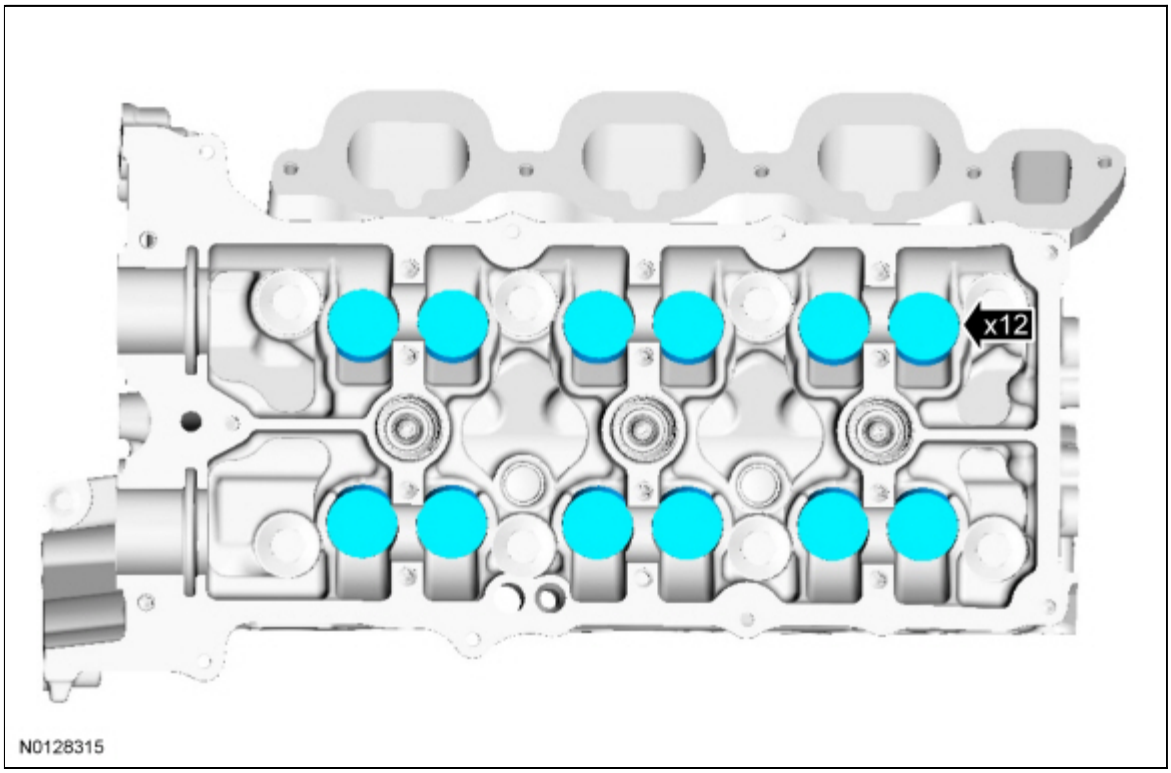
Installation

1. **NOTE:** If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

   Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Tighten to 35 Nm (26 lb-ft).
- Stage 3: Tighten 90 degrees.
- Stage 4: Tighten 90 degrees
- Stage 5: Tighten 45 degrees.

2. Install the M6 bolt.
    - Tighten to 10 Nm (89 lb-in).

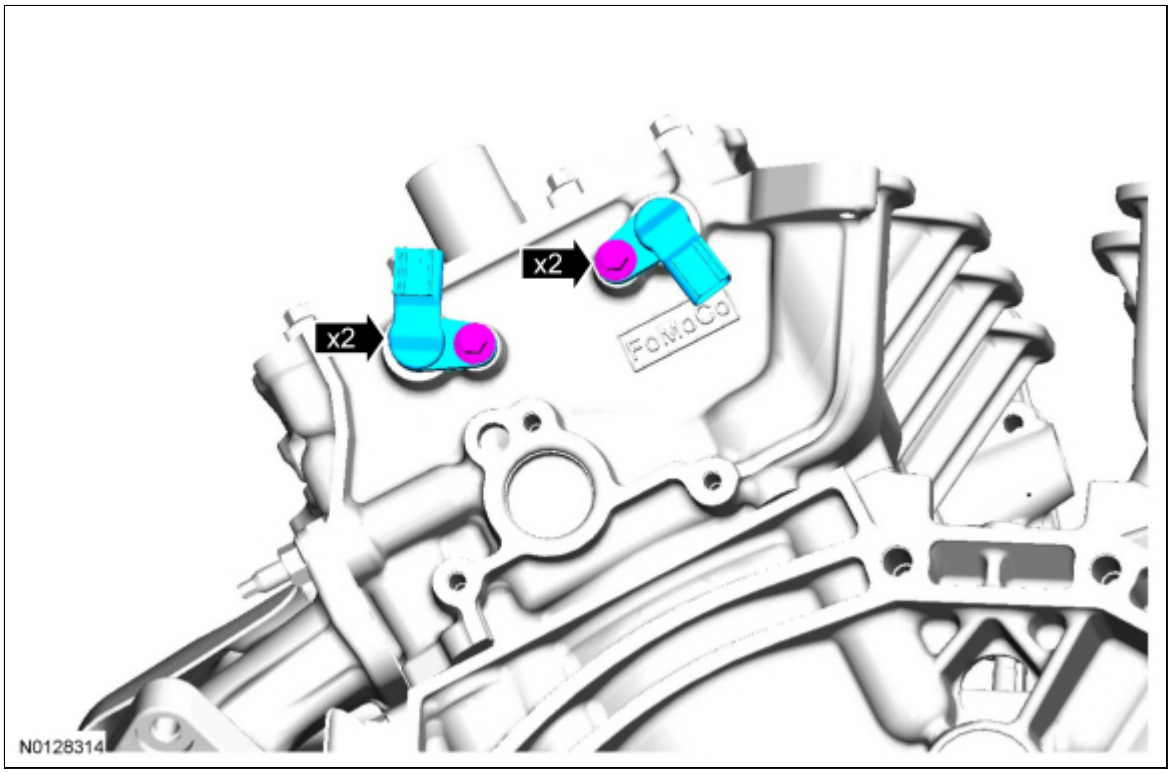


repair4less

3. **NOTE:** The valve tappets must be installed in their original positions.

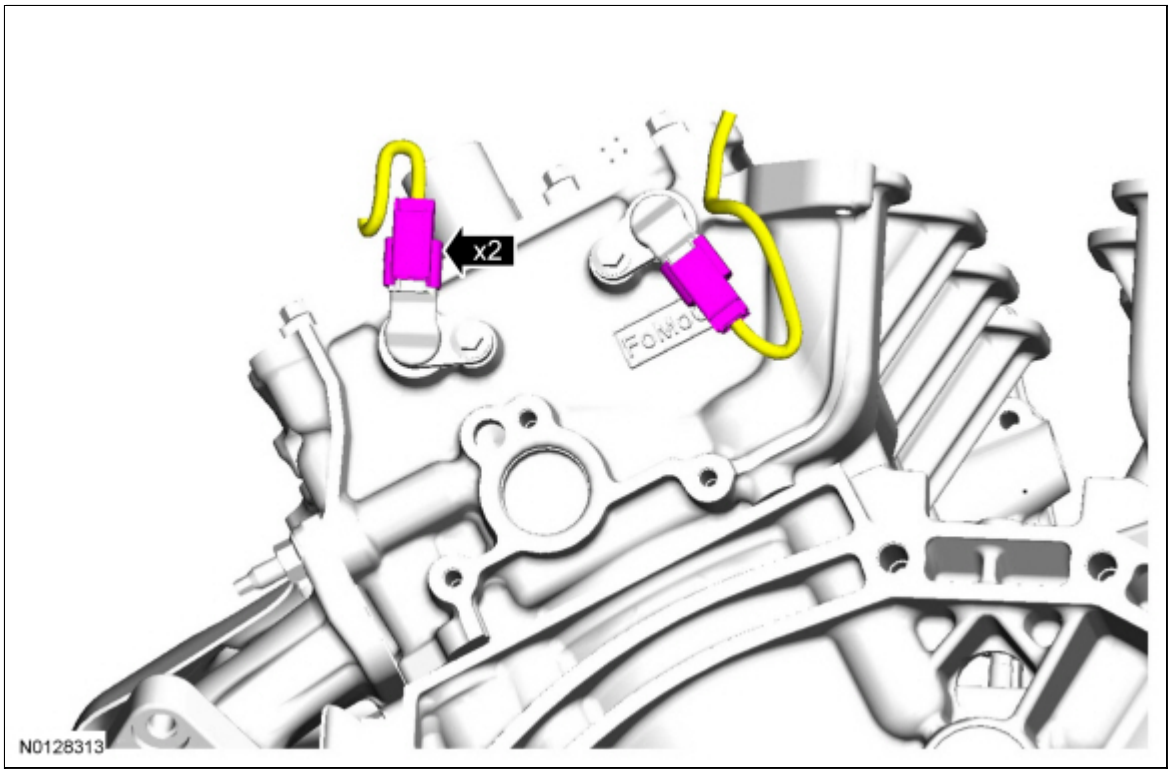
   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the LH valve tappets.



4. Attach the wiring harness retainer to the rear of the LH cylinder head.

5. If equipped, install the ground strap and bolt.
   - Tighten the bolt to 10 Nm (89 lb-in).

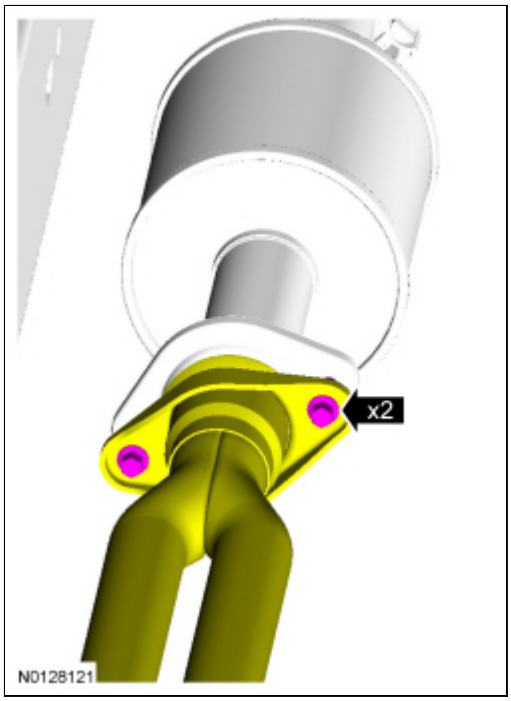


6. **NOTE:** Lubricate the 2 CMP sensor O-ring seals with clean engine oil.

   Install the 2 LH CMP sensors and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

7. Connect the 2 LH CMP sensors electrical connectors.

repair4less



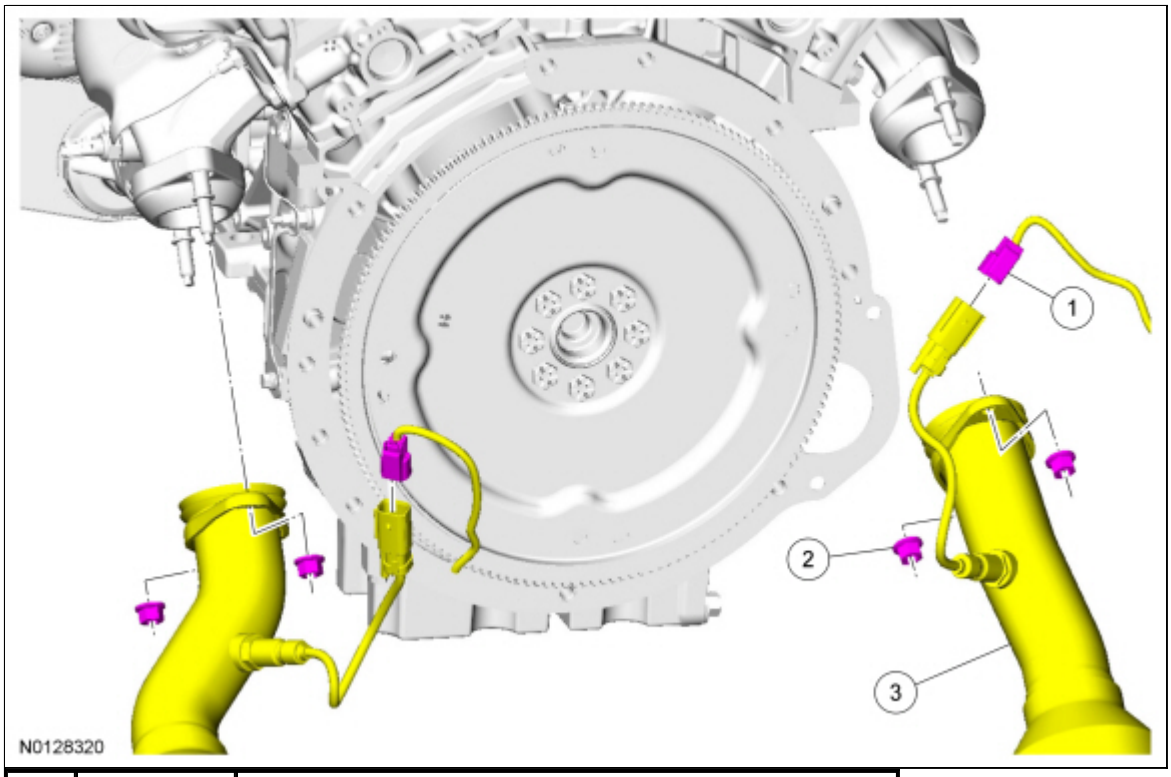
8. Install the LH upper primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

9. Install the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.

10. Install the LH camshafts. For additional information, refer to Camshaft — LH in this section.

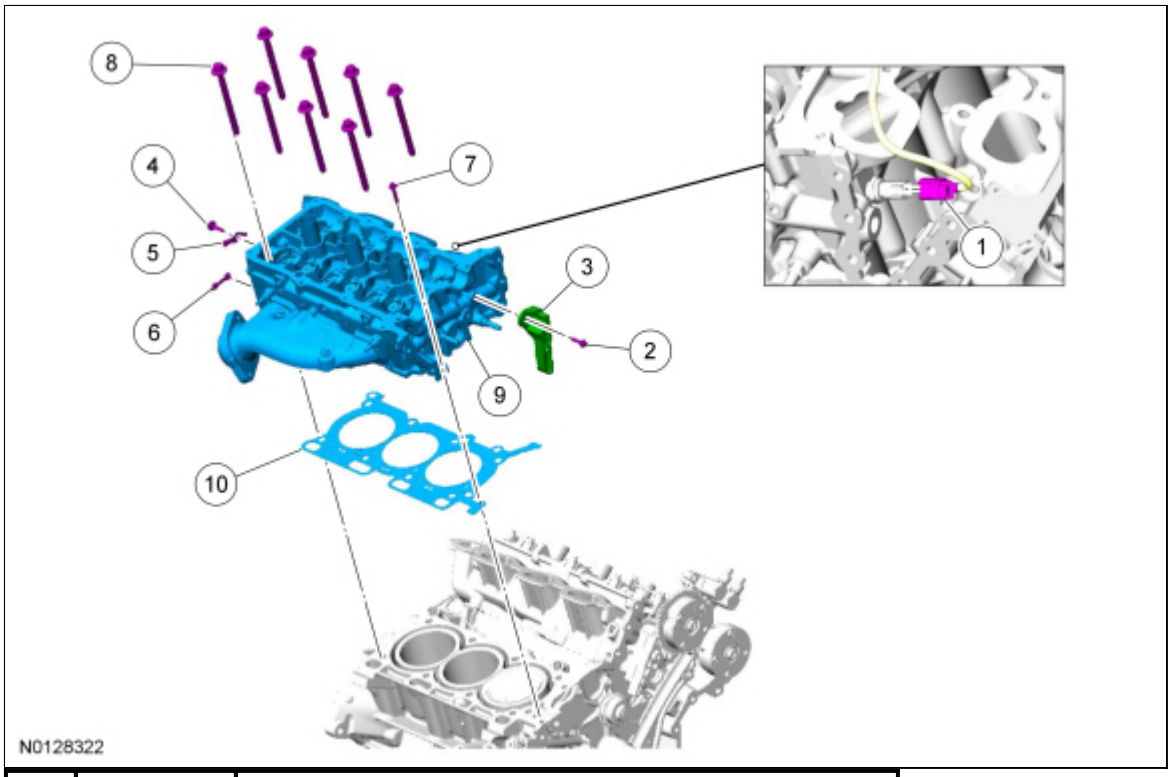
11. Raise the catalytic convertor and install the new LH and RH catalytic convertor-to-exhaust manifold nuts.
    - Tighten to 45 Nm (35 lb-ft).

12. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



13. Connect and attach the RH and LH HO2S electrical connectors.
14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less



Cylinder Head — RH

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description

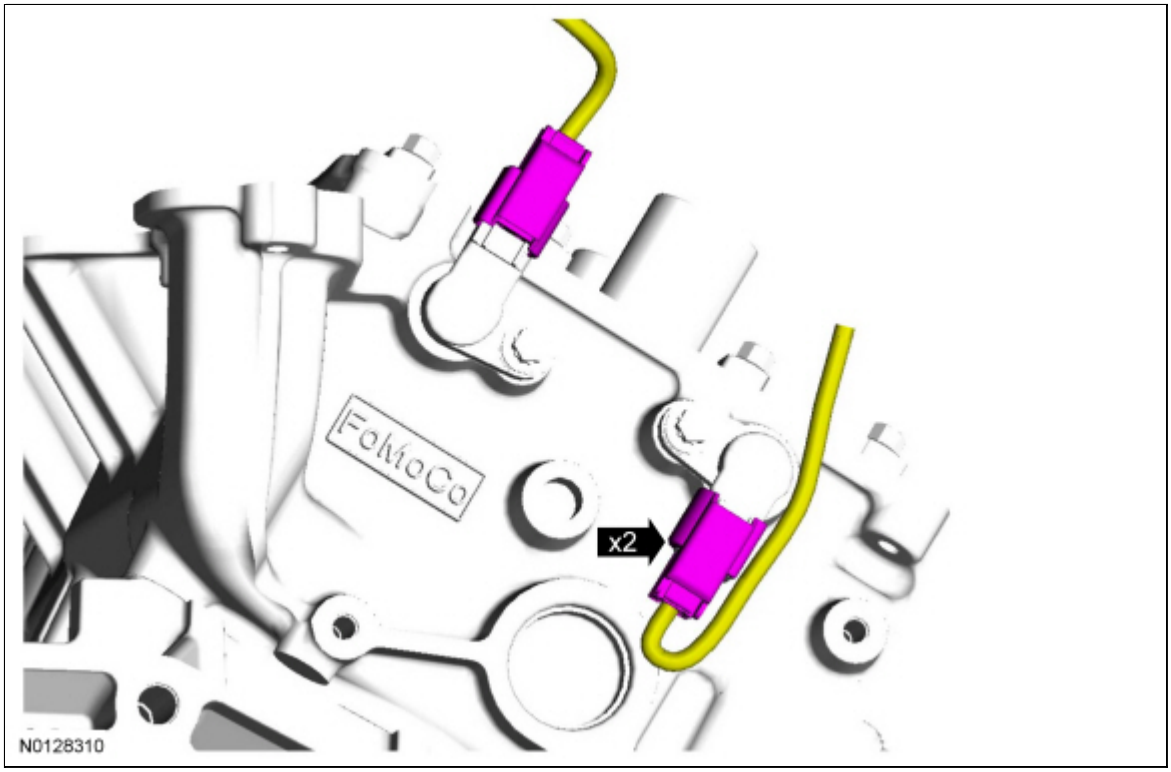
NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Detach and disconnect the RH and LH Heated Oxygen Sensor (HO2S) electrical connectors.
4. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.

5. Remove and discard the LH and RH catalytic converter-to-exhaust manifold nuts and lower the catalytic converter assembly.

6. Remove the RH camshafts. For additional information, refer to Camshaft — RH in this section.



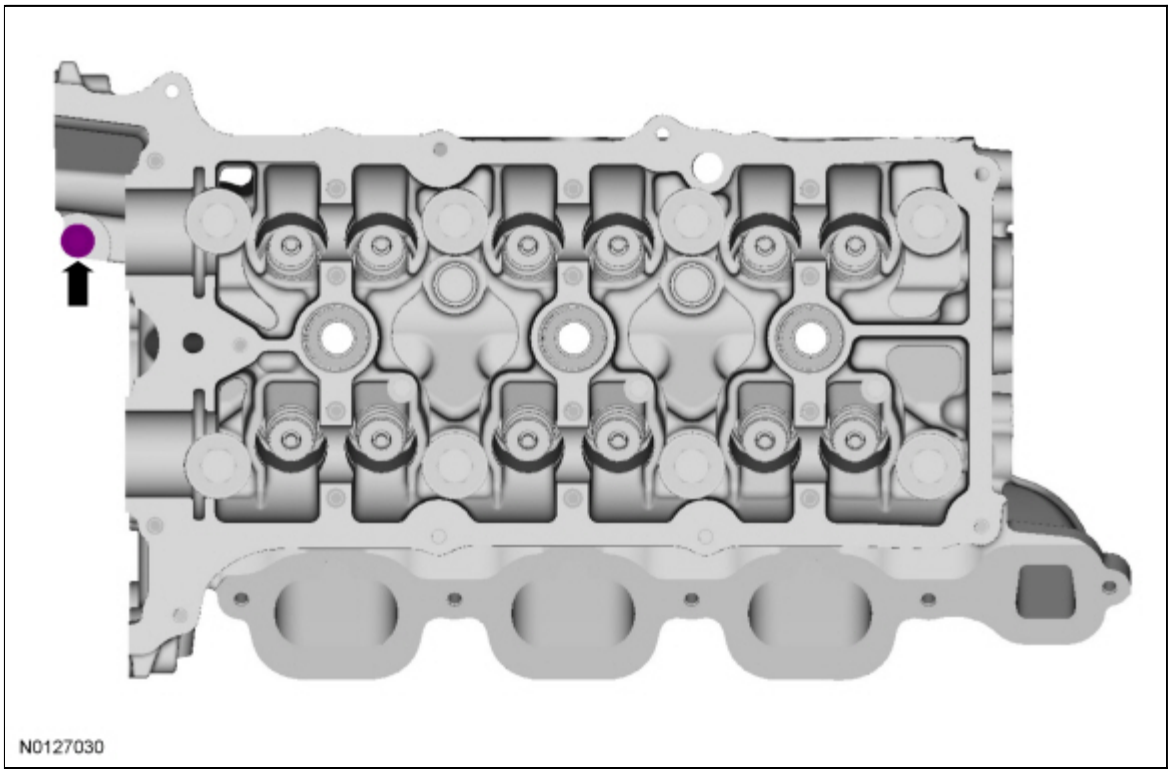
7. Remove the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.

8. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

9. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.**

   Remove the bolt and the RH upper primary timing chain guide.

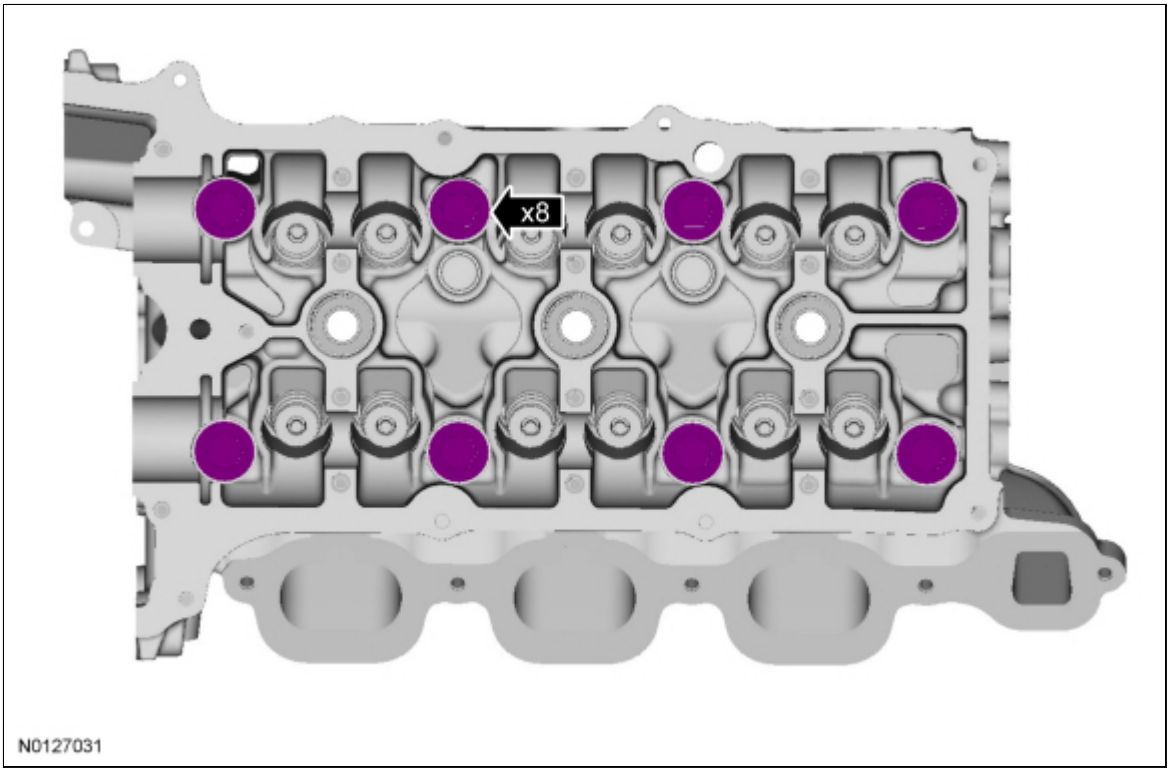
10. Disconnect the 2 RH Camshaft Position (CMP) sensors electrical connectors.



11. Remove the 2 bolts and the 2 RH CMP sensors.

repair4less

12. Remove the bolt and ground wire from the rear of the RH cylinder head.
13. Inspect the valve tappets. For additional information, refer to Section 303-00 .
14. Remove and discard the M6 bolt.



15. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.

16. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

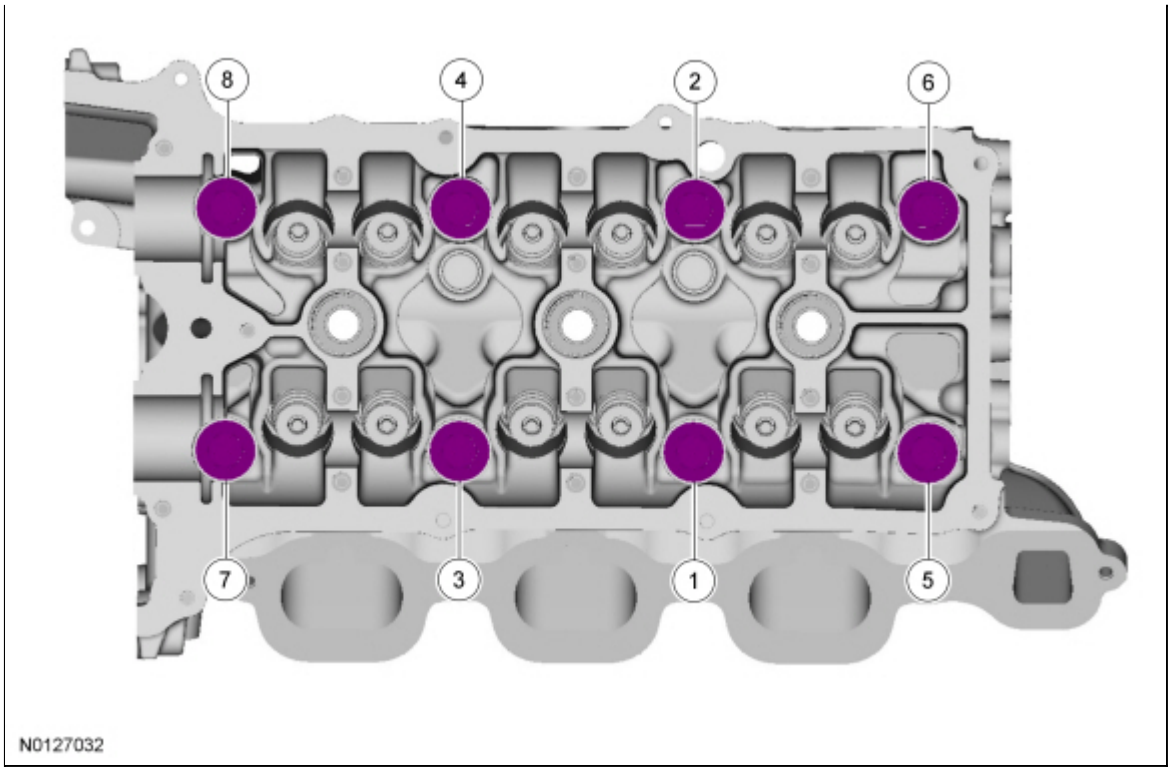
    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone

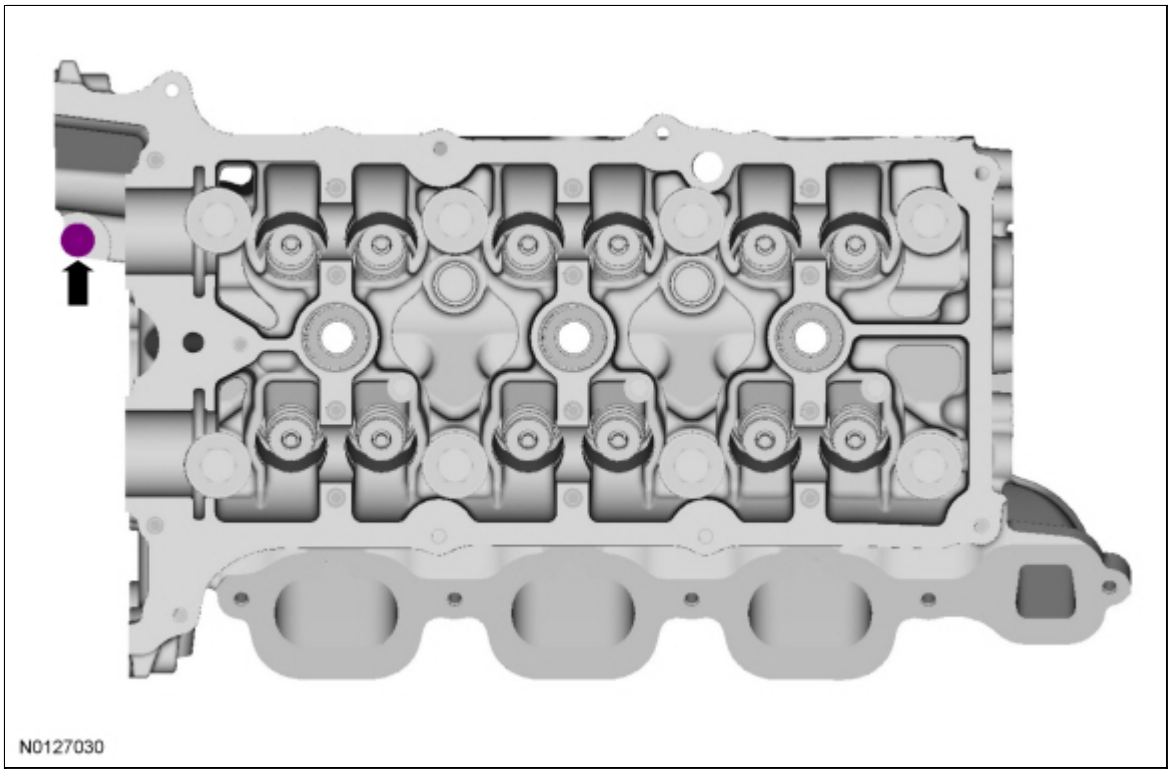
repair4less

gasket remover may be required if residual traces of silicone or gasket material remain.



4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

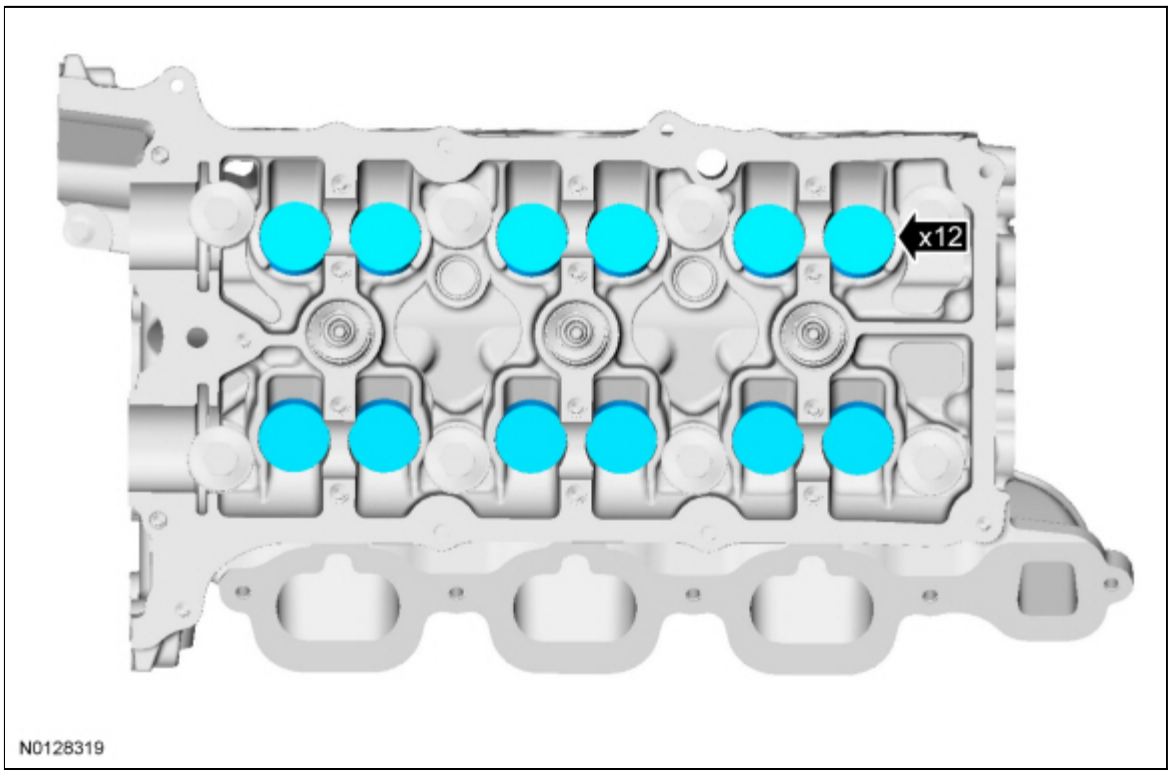
17. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .



Installation

1. **NOTE:** If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

   Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 35 Nm (26 lb-ft).
   - Stage 3: Tighten 90 degrees.
   - Stage 4: Tighten 90 degrees
   - Stage 5: Tighten 45 degrees.

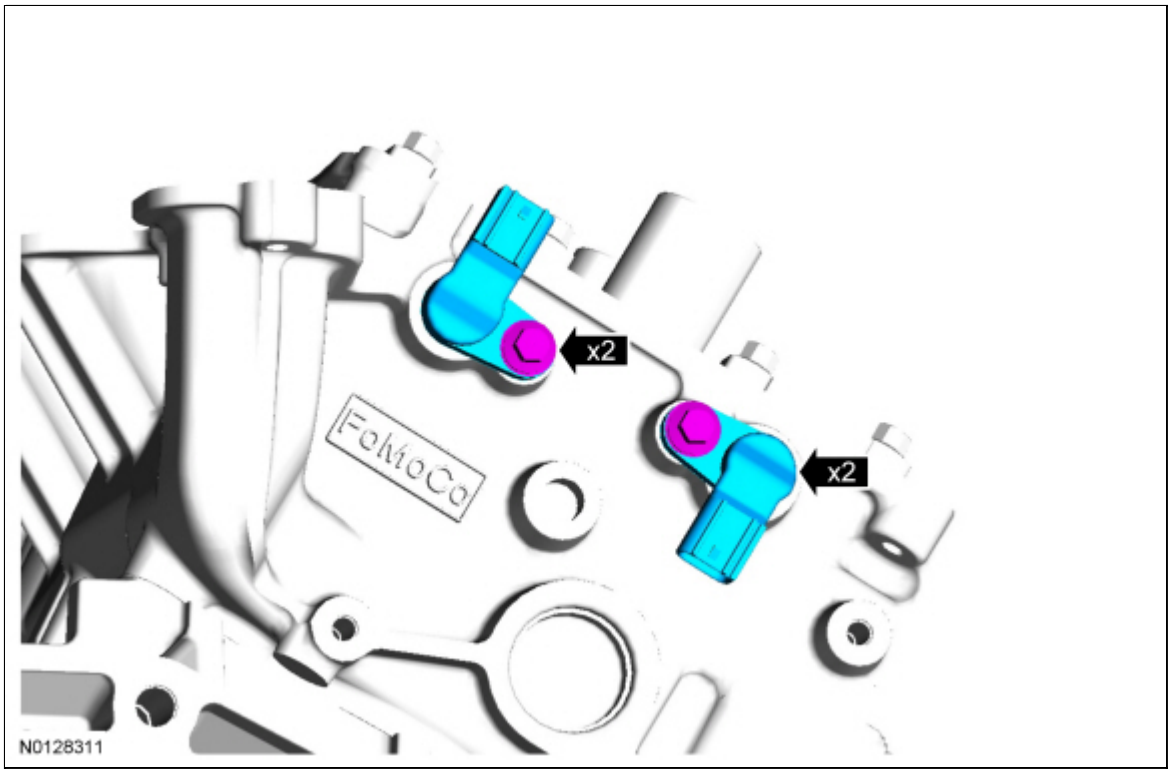


2. Install the M6 bolt.
   - Tighten to 10 Nm (89 lb-in).

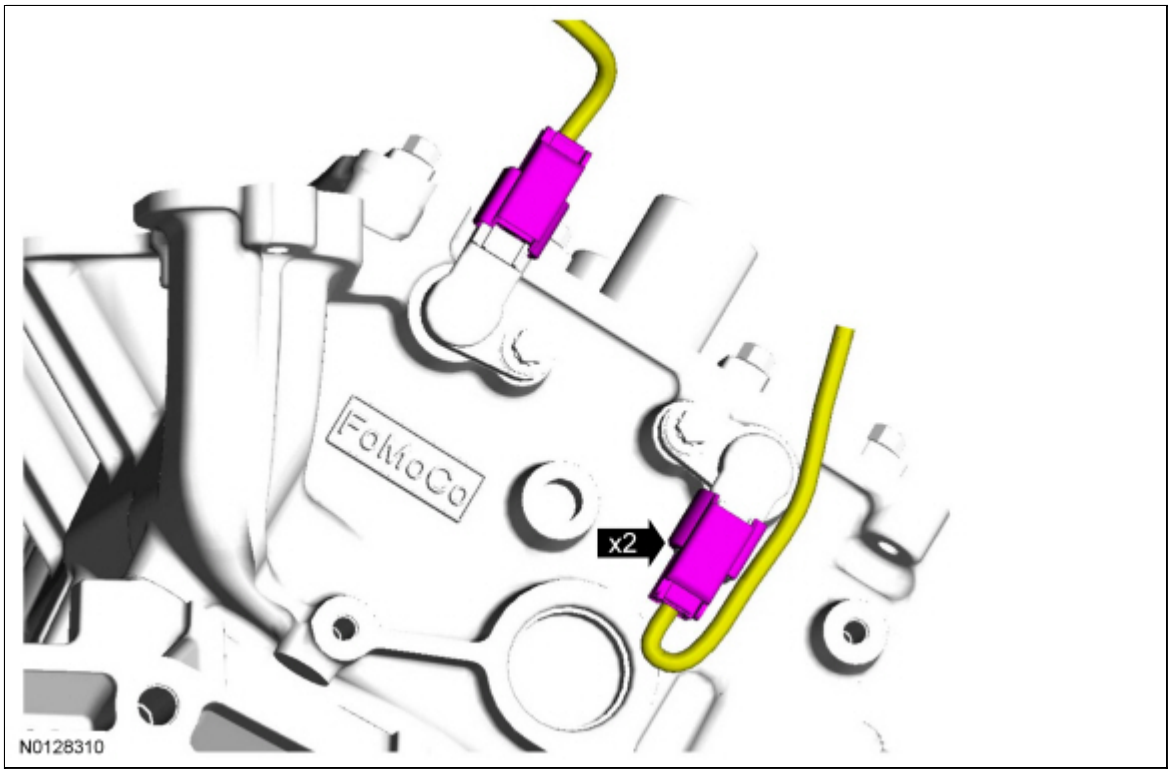
3. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the RH valve tappets.



repair4less



4. Install the ground wire and bolt to the rear of the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

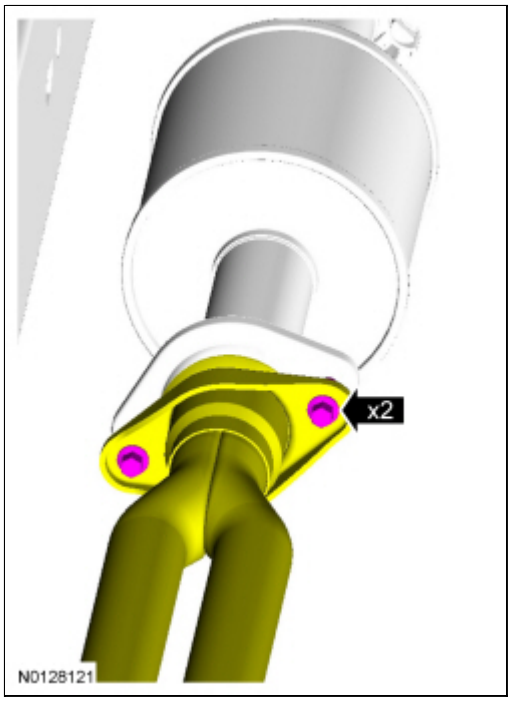
5. **NOTE:** Lubricate the 2 CMP sensor O-ring seals with clean engine oil.

   Install the 2 RH CMP sensors and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

6. Connect the 2 RH CMP sensors electrical connectors.

7. Install the RH upper primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

8. Connect the CHT sensor electrical connector.

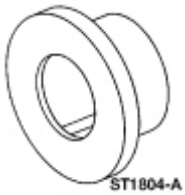


9. Install the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.

10. Install the RH camshafts. For additional information, refer to Camshaft — RH in this section.

11. Raise the catalytic converter and install the new LH and RH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 45 Nm (35 lb-ft).

12. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



repair4less

13. Connect and attach the RH and LH HO2S electrical connectors.
14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

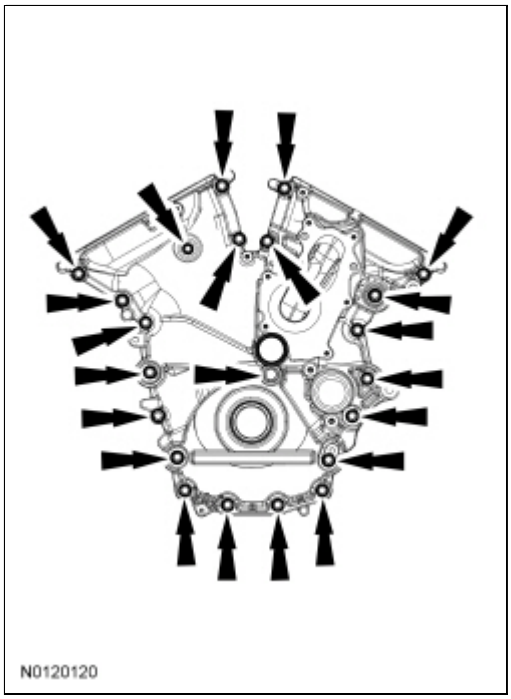
Removal

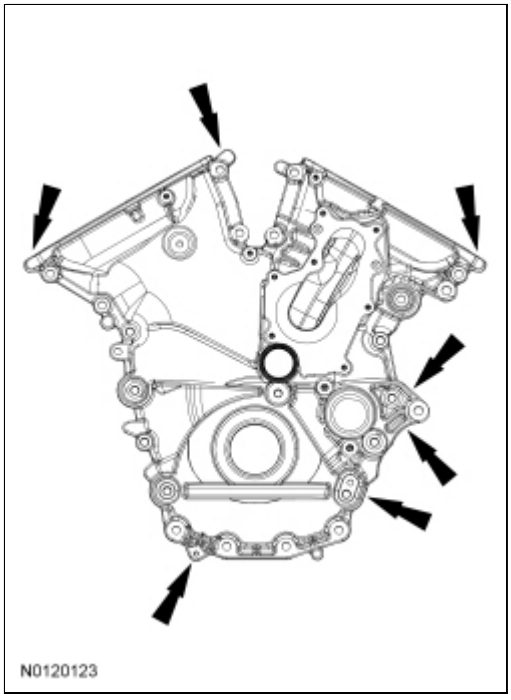
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the LH and RH valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.
4. Remove the drain plug and drain the engine oil.
   - Install the drain plug and tighten to 27 Nm (20 lb-ft).
5. Loosen the 4 coolant pump pulley bolts.
6. Remove the A/C belt. For additional information, refer to Section 303-05 .

repair4less



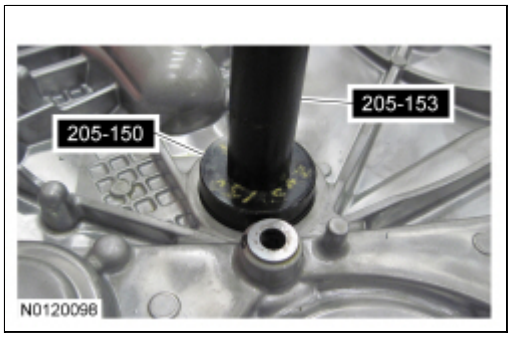
7. Remove the coolant pump. For additional information, refer to Section 303-03 .
8. Remove the nut, bolt and position the generator aside.
9. Remove the generator stud.
10. Remove the 2 bolts and the accessory drive belt tensioner.
11. Remove the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.
12. Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.



13. Detach the generator wiring harness from the engine front cover.

14. Remove the 22 engine front cover bolts.

15. Using a suitable pry tool, locate the 7 pry pads shown and pry the engine front cover loose and remove.



16. **NOTE:** Inspect front cover radial seal and replace if necessary.

    NOTE: Use Spindle Bearing Installer 205-150 to remove the seal.

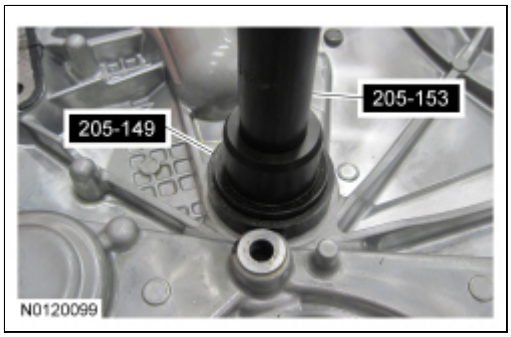
    If necessary, using the Spindle Bearing Installer and Handle, remove the front cover radial seal from the rear side of the front cover.

repair4less

Installation

1. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.**

   Clean the engine front cover using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.
   - Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.



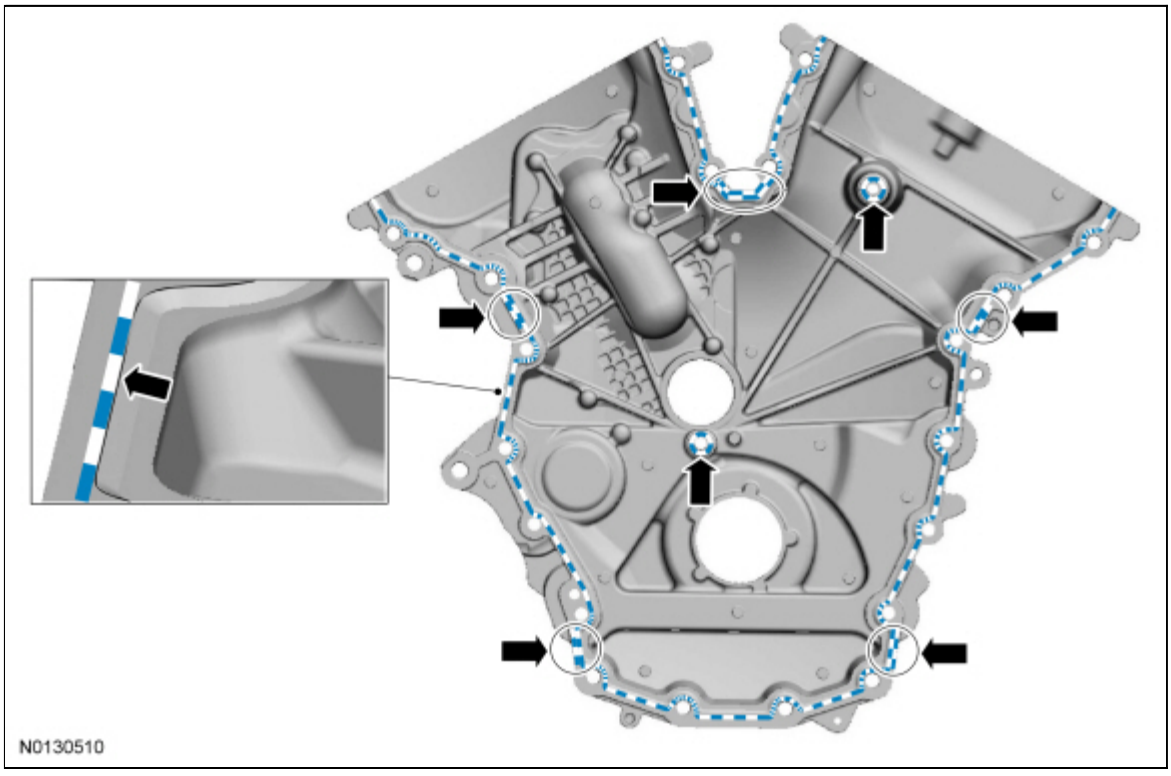
2. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan may cause engine failure.**

   NOTICE: **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

   Clean the sealing surfaces of the cylinder heads, the cylinder block and the oil pan in the following sequence.
   1. Remove any large deposits of silicone or gasket material.
   2. Apply silicone gasket remover and allow to set for several minutes.
   3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
   4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
   5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

3. **NOTE:** Use Spindle Bearing Installer 205-149 to install the seal.

   If removed, using the Spindle Bearing Installer, install the front cover radial seal from the rear side of the front cover.



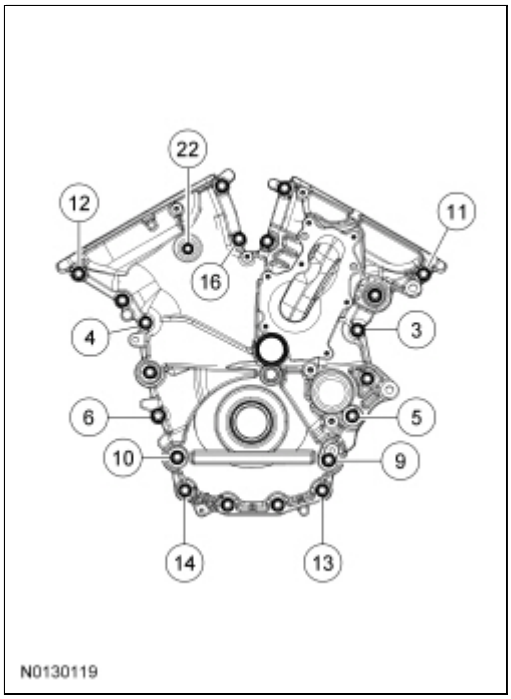
4. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTICE: **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow these instructions may cause engine oil leakage.**

   NOTE: The engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 must be installed within 10 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the engine front cover to the engine front cover sealing surfaces including the 2 engine front cover bolt bosses.

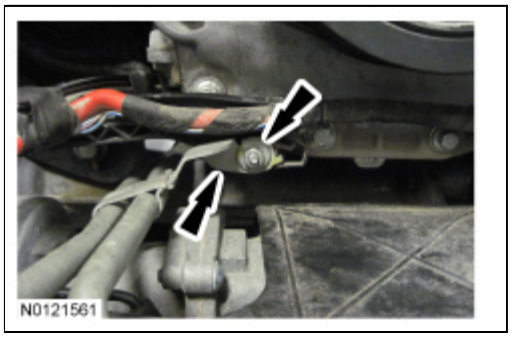
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



repair4less

5. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

   Install the engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 and tighten sequence shown in 3 stages:
   - Stage 1: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 in sequence to 10 Nm (89 lb-in).
   - Stage 2: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19 and 20 in sequence to 20 Nm (177 lb-in) then an additional 45 degrees.
   - Stage 3: Tighten bolt 21 to 20 Nm (177 lb-in) then an additional 90 degrees.



6. Install the remaining 12 engine front cover bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, 16 and 22. Tighten all of the engine front cover bolts in the sequence shown in 3 stages:
   - Stage 1: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14 and 16 to 10 Nm (89 lb-in).
   - Stage 2: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14 and 16 to 20 Nm (177 lb-in) then an additional 45 degrees.
   - Stage 3: Tighten bolt 22 to 10 Nm (89 lb-in) then an additional 45 degrees.

7. Attach the generator wiring harness to the engine front cover.

8. Install the transmission cooler line bracket and nut to the engine front cover stud bolt.
   - Tighten to 12 Nm (106 lb-in).

9. Install the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.

10. Install the accessory drive belt tensioner and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

repair4less

11. Install the generator stud.
    - Tighten to 8 Nm (71 lb-in).

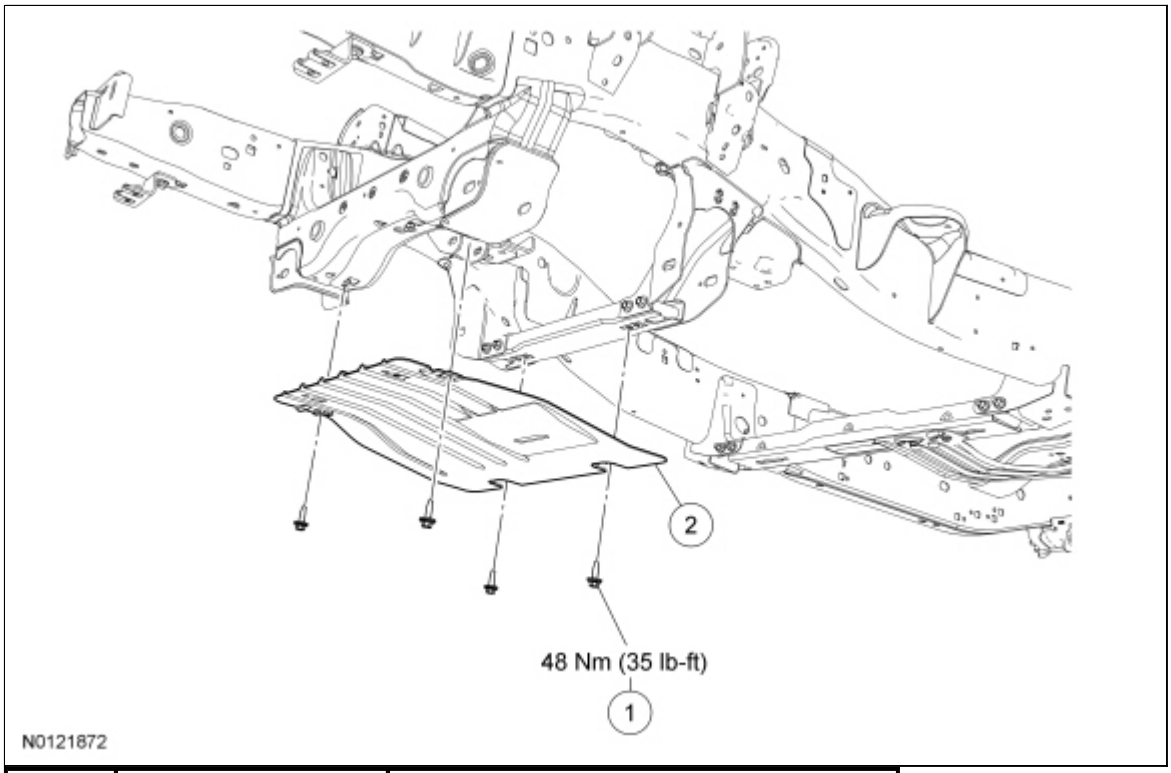
12. Position the generator and install the nut and bolt.
    - Tighten to 48 Nm (35 lb-ft).

13. Install the A/C belt. For additional information, refer to Section 303-05 .

14. Install the coolant pump. For additional information, refer to Section 303-03 .

15. Tighten the 4 coolant pump pulley bolts.
    - Tighten to 25 Nm (18 lb-ft).

16. Install the LH and RH valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.



17. Connect the battery ground cable. For additional information, refer to Section 414-01 .

18. Fill the engine with clean engine oil.

25	W503282	Oil pump bolt (3 required)
26	6600	Oil pump

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

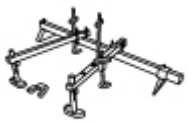
repair4less

Engine Oil Pressure (EOP) Switch

Material

Item	Specification
Motorcraft® Thread Sealant with PTFE TA-24	WSK-M2G350-A2

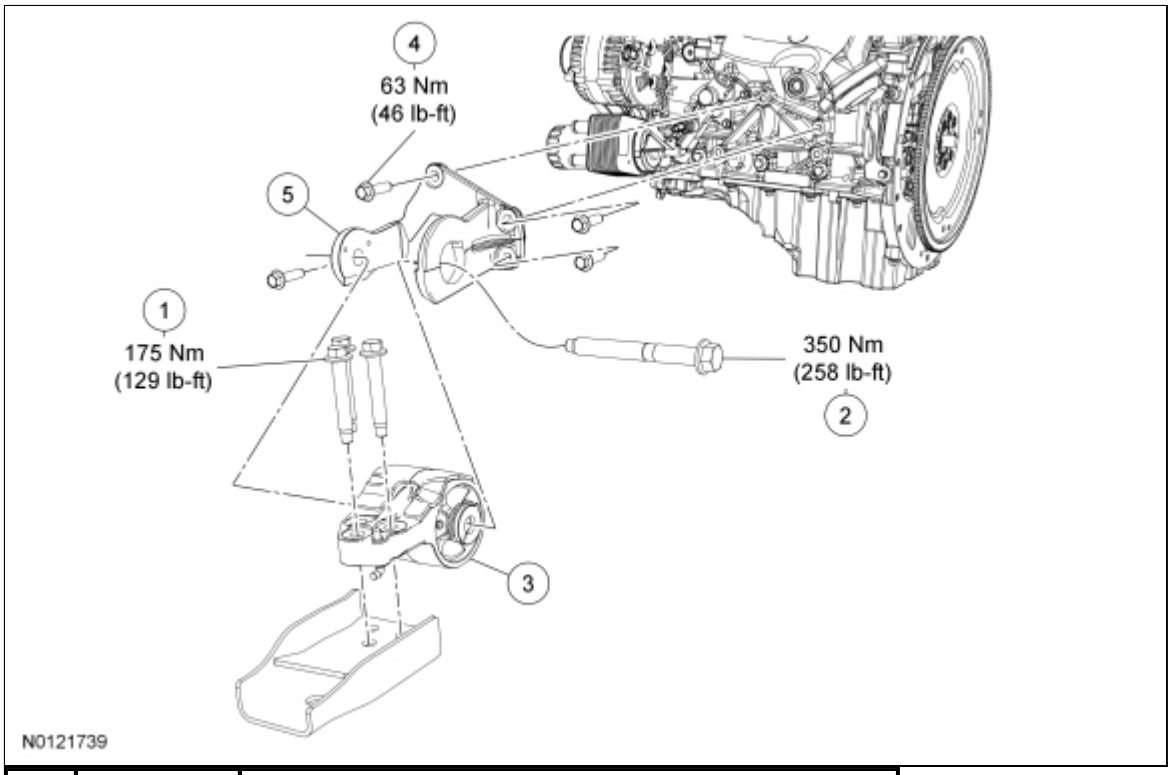
Removal and Installation



1. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

2. Remove the EOP switch.
    - To install, tighten to 14 Nm (124 lb-in) then an additional 180 degrees.

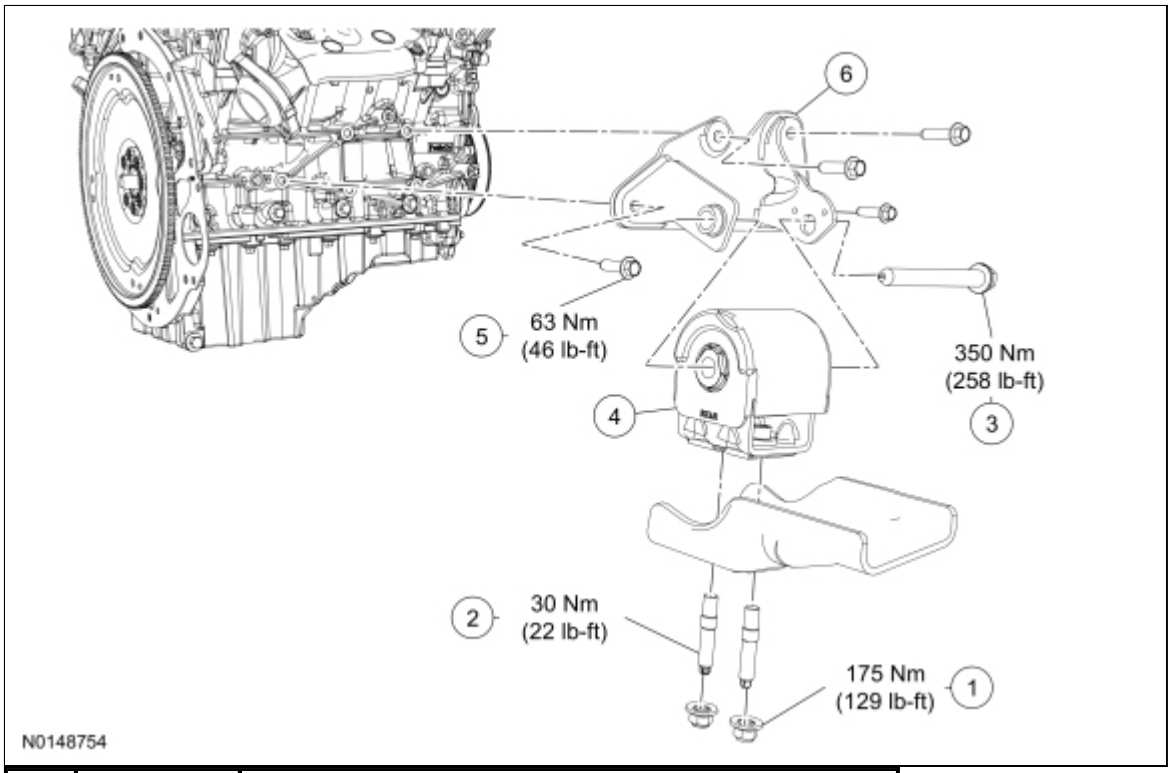
3. To install, reverse the removal procedure.
    - Apply thread sealant with PTFE to the EOP switch threads prior to installation.



Engine Support Insulators

Special Tool(s)

 ST3101-A	Bar, Engine Spreader 303-1454
 ST2976A	Eye, Engine Lift 303-1245
 ST2176-A	Support Bar, Engine 303-F070



Engine Support Insulator — LH

repair4less

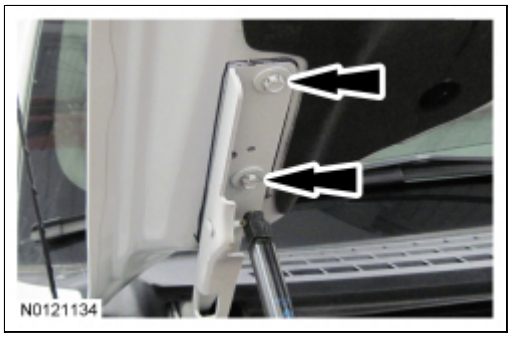
Item	Part Number	Description
1	W713244	LH engine support insulator-to-frame bolt (3 required)
2	W715211	LH engine support insulator through bolt
3	6038	LH engine support insulator
4	W714735	LH engine support insulator-to-cylinder block bracket bolt (4 required)
5	6038	LH engine support insulator-to-cylinder block bracket

Engine Support Insulator — RH

Item	Part Number	Description
1	W707251	RH engine support insulator nut (2 required)
2	—	RH engine support insulator stud bolt (part of 6038) (2 required)
3	—	RH engine support insulator through bolt (part of 6038)
4	6038	RH engine support insulator
5	W714735	RH engine support insulator-to-cylinder block bracket bolt (4 required)
6	—	RH engine support insulator-to-cylinder block bracket (part of 6038)

Removal

All engine support insulator



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

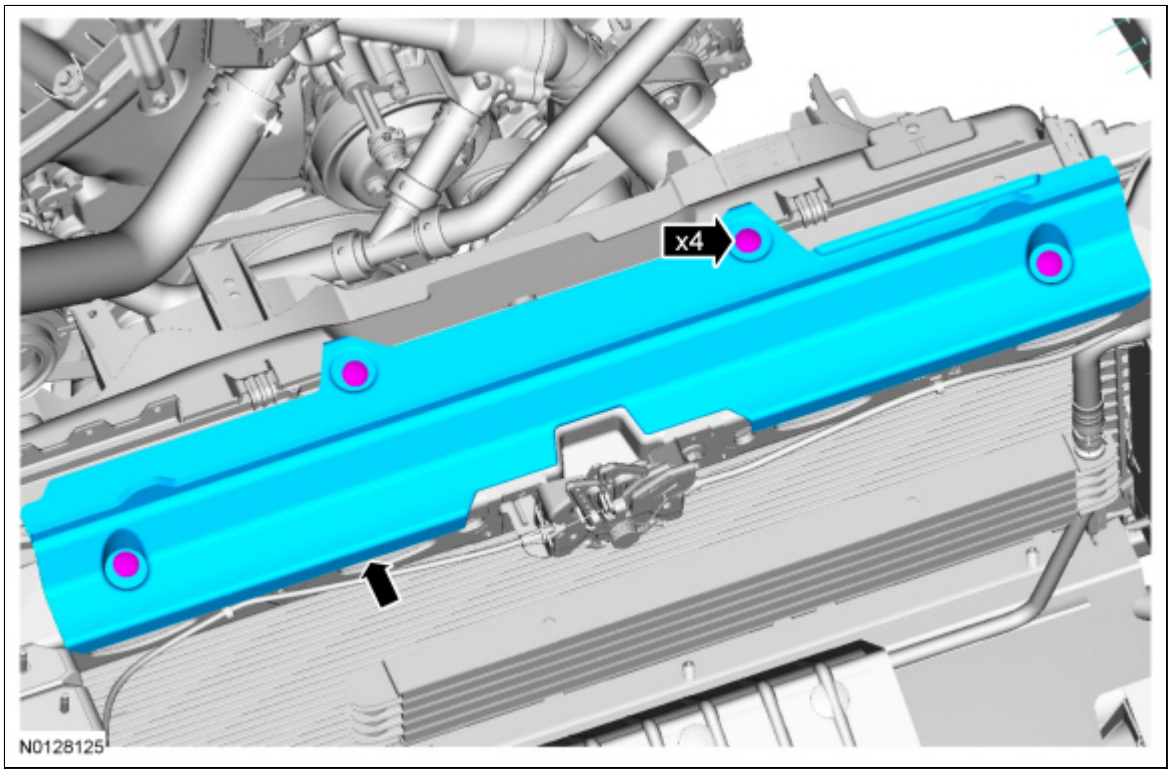
   NOTE: RH shown, LH similar.

   Remove the 4 bolts (2 shown) and the hood.

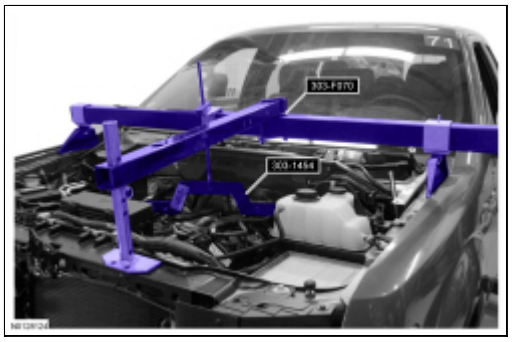
repair4less

3. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.

4. Remove the cowl panel grille. For additional information, refer to Section 501-02 .

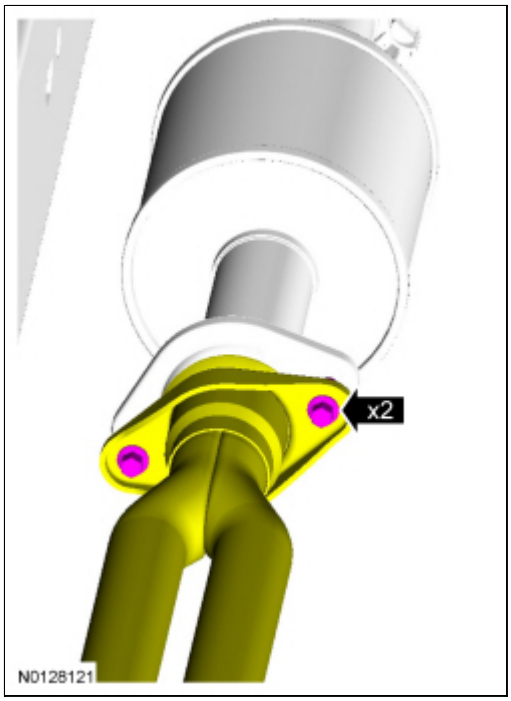


5. Remove the 6 screws and release the 2 cowl panel clips and remove the cowl panel.



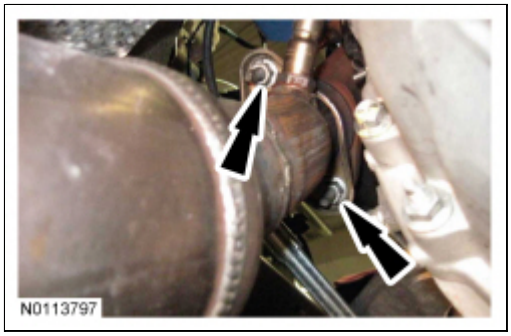
6. Install the LH engine lift eye.

7. Remove the 4 pushpins and the upper radiator air deflector.



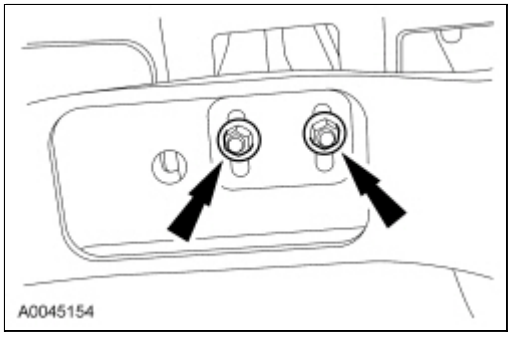
8. Install the Engine Support Bar.

9. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .



10. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.

repair4less



11. **NOTE:** LH shown, RH similar.

    Remove and discard the 2 LH and RH catalytic converter-to-exhaust manifold nuts.

12. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

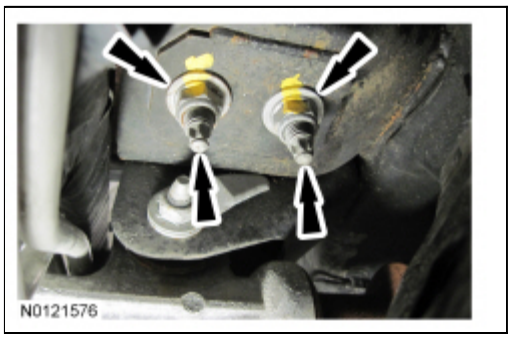
    Loosen the 2 transmission mount-to-crossmember nuts.

RH engine support insulator

13. Remove the Air Conditioning (A/C) compressor belt. For additional information, refer to Section 303-05 .

14. Remove the 3 bolts and position the A/C compressor aside.

15. Remove the starter. For additional information, refer to Section 303-06 .



16. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove and discard the RH and LH engine support insulator through bolts.

17. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator nuts or damage to the engine support insulator can occur.**

    NOTICE: **Only use hand tools when removing or installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    Remove and discard the 2 RH engine support insulator nuts and stud bolts.

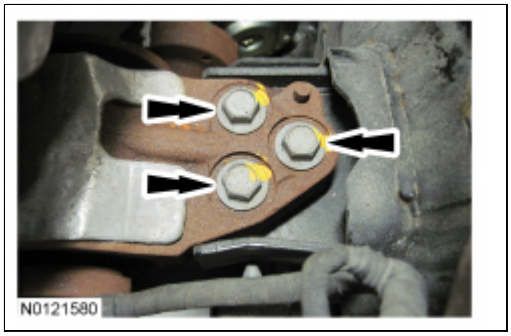
repair4less

18. Raise the engine approximately 30 mm (1.18 in).

19. Remove the RH engine support insulator.

20. Remove the 4 bolts and the RH engine support insulator-to-cylinder block bracket.

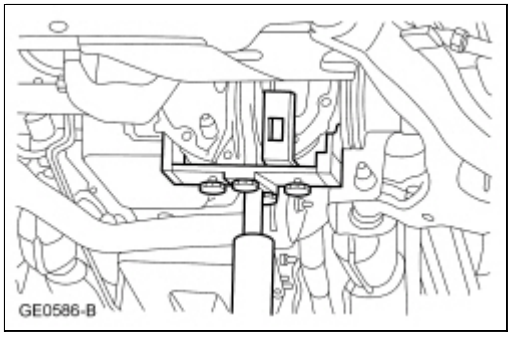
LH engine support insulator



21. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

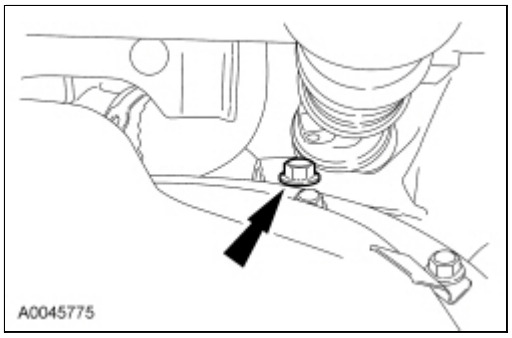
    Remove and discard the LH and RH engine support insulator through bolts.

22. Raise the engine approximately 30 mm (1.18 in).

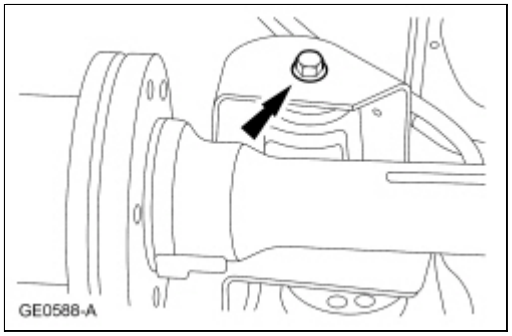


23. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

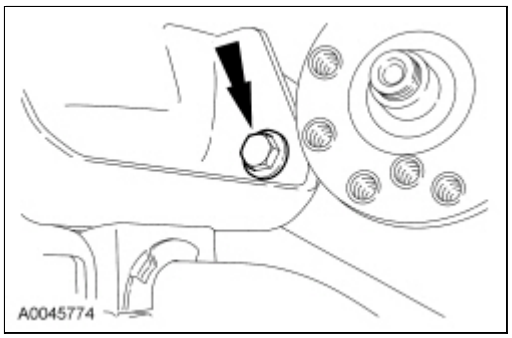
    Remove the 3 LH engine support insulator-to-frame bolts.



Four-Wheel Drive (4WD) — LH engine support insulator

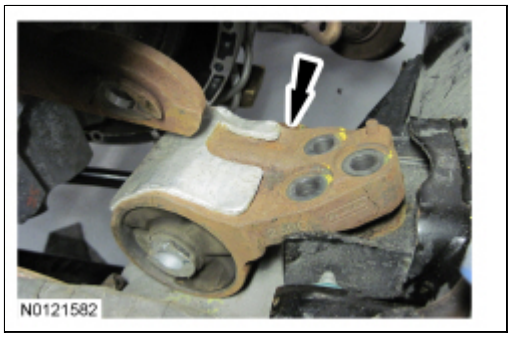


24. Position a suitable hydraulic jack under the front axle. Securely strap the jack to the axle.



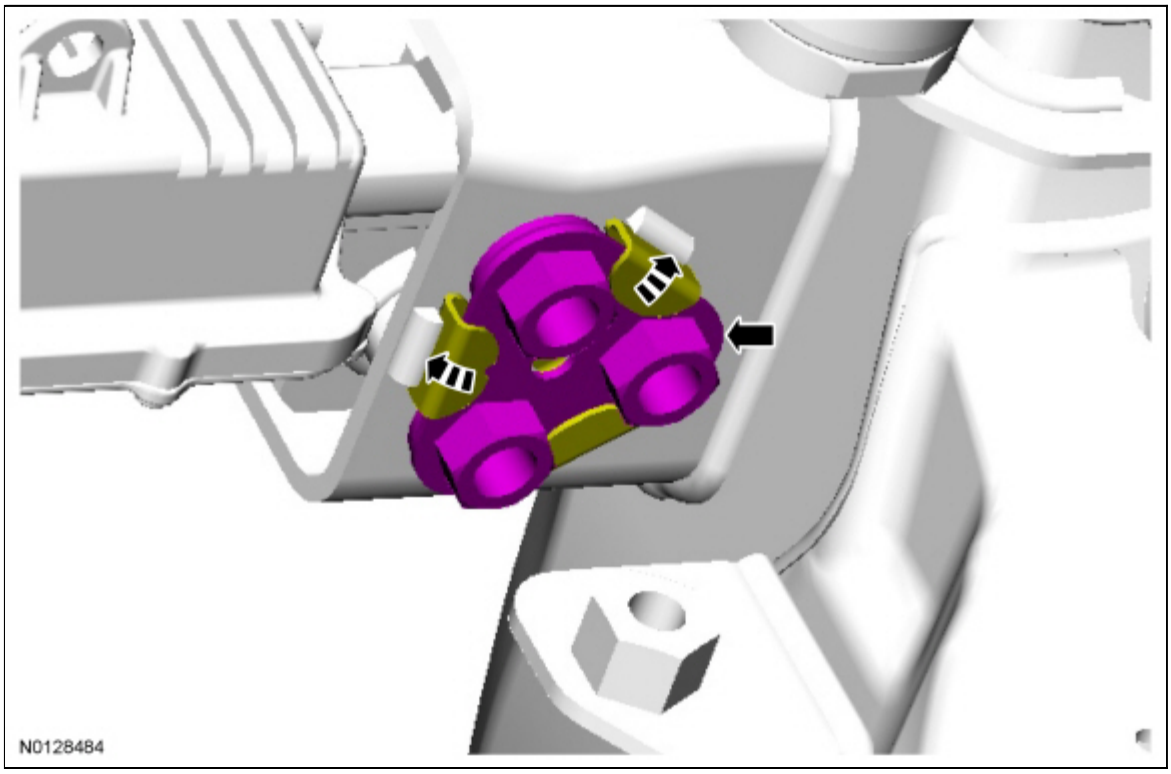
25. Remove the upper front axle carrier mounting bushing bolt.

26. Remove the axle shaft housing carrier bushing bolt.



27. Remove the lower front axle carrier mounting bushing bolt.

28. Lower the front axle to allow clearance to the LH engine support insulator.

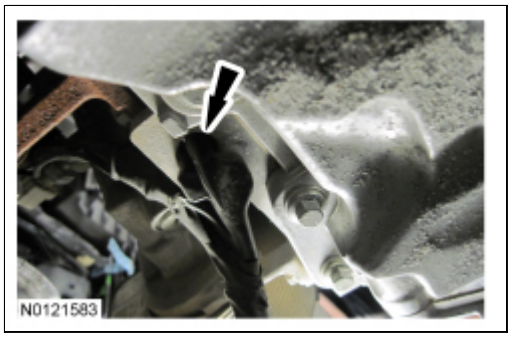


LH engine support insulator

29. Remove the LH engine support insulator.

repair4less

30. Inspect the engine support insulator-to-frame nut plate for thread damage. If the nut plate is damaged, bend 2 tabs back and remove the nut plate. Replace the nut plate with service part number 56190 and bend the 2 tabs back to the original position.



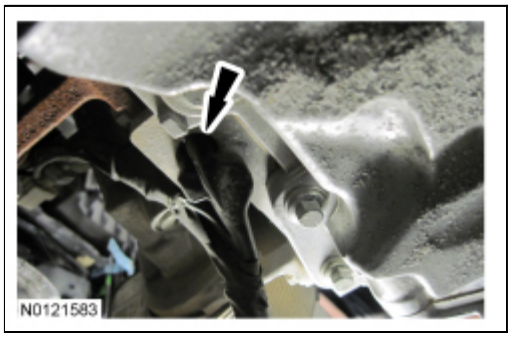
NOTE: If necessary, the following 3 steps are to remove the LH engine support insulator-to-cylinder block bracket.

31. Detach the generator wiring harness from the engine front cover.
    - Detach the generator wiring harness retainer from the oil filter adapter.

32. Detach the generator wiring harness retainer from the lower LH side of the engine block.

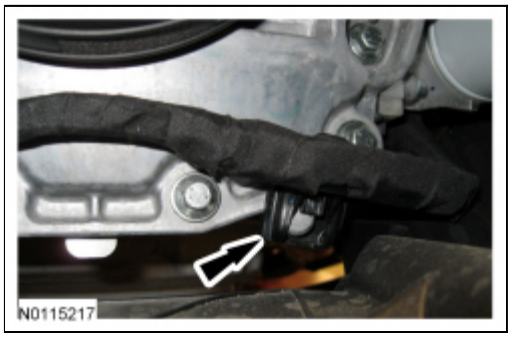
33. Remove the 4 bolts and the LH engine support insulator-to-cylinder block bracket.

Installation



LH engine support insulator

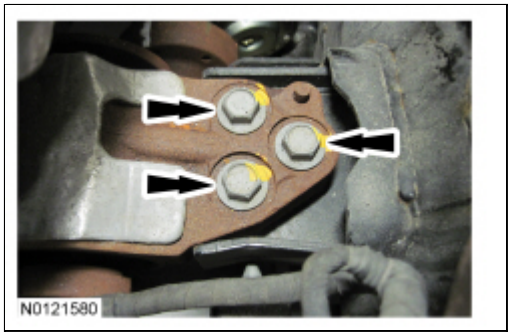
1. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.



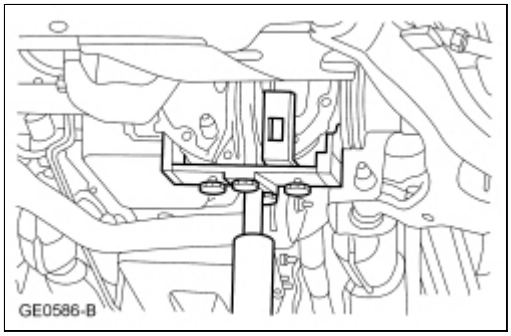
NOTE: If removed, the following 3 steps are to install the LH engine support insulator-to-cylinder block bracket.

2. Install the LH engine support insulator-to-cylinder block bracket and install the 4 bolts.
    - Tighten to 63 Nm (46 lb-ft).

3. Attach the generator wiring harness retainer to the lower LH side of the engine block.

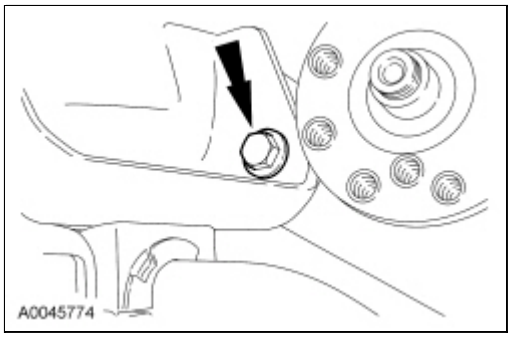


4. Attach the generator wiring harness to the engine front cover.
    - Attach the generator wiring harness retainer to the oil filter adapter.

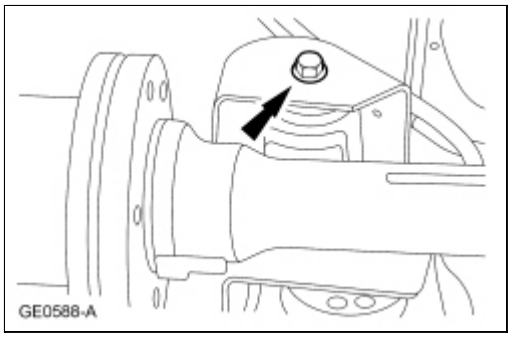


repair4less

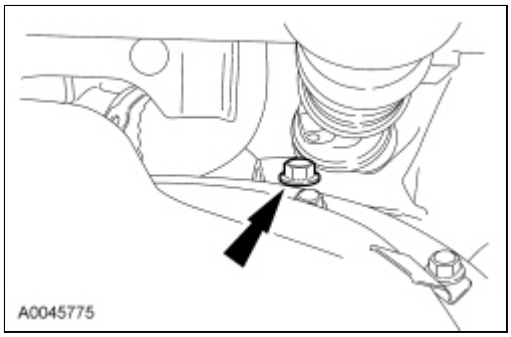
5. Position the LH engine support insulator and hand start the 3 new engine support insulator-to-frame bolts.
    - Do not torque at this time.



4WD — LH engine support insulator

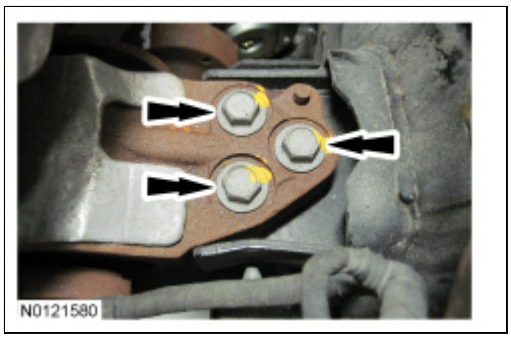


6. Raise the front axle carrier into position.



7. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

8. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



9. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

LH engine support insulator

10. Tighten the LH engine support insulator-to-frame bolts to 175 Nm (129 lb-ft).

11. Lower the engine to the installed position.

12. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Install the new RH and LH engine support insulator through bolts.
    - Tighten to 350 Nm (258 lb-ft).

RH engine support insulator

13. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

repair4less

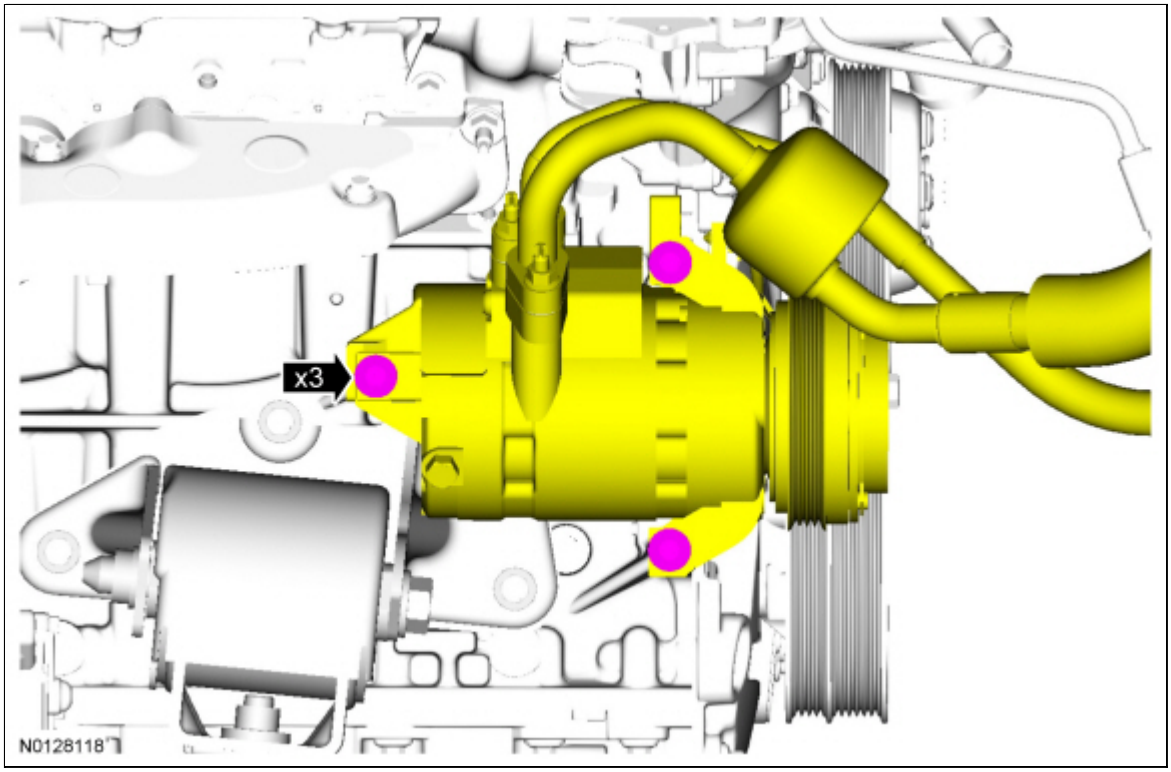
14. Position the RH engine support insulator-to-cylinder block bracket and install the 4 bolts.
    - Tighten to 63 Nm (46 lb-ft).

15. ***NOTICE:*** **Only use hand tools when installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    Position the RH engine support insulator into the vehicle and install the 2 new stud bolts.
    - Tighten to 30 Nm (22 lb-ft).

16. ***NOTICE:*** **Only use hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

    Install the 2 new RH engine support insulator nuts.
    - Tighten to 175 Nm (129 lb-ft).



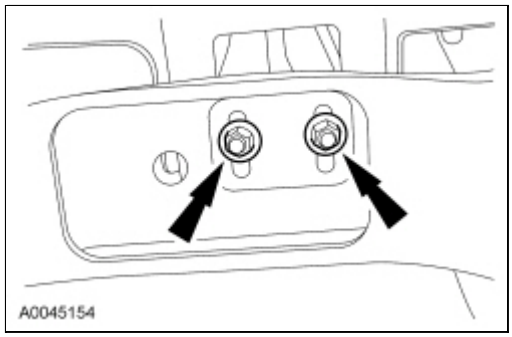
17. Lower the engine to the installed position.

18. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Install the new RH and LH engine support insulator through bolts.
    - Tighten to 350 Nm (258 lb-ft).

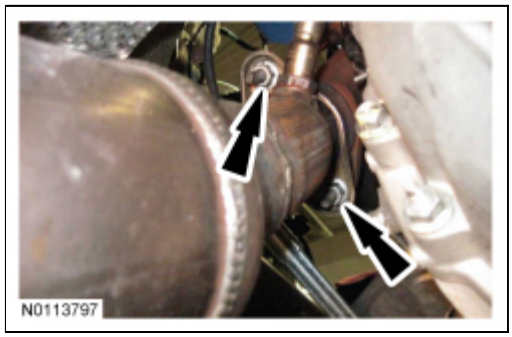
19. Install the starter. For additional information, refer to Section 303-06 .

20. Position the A/C compressor and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



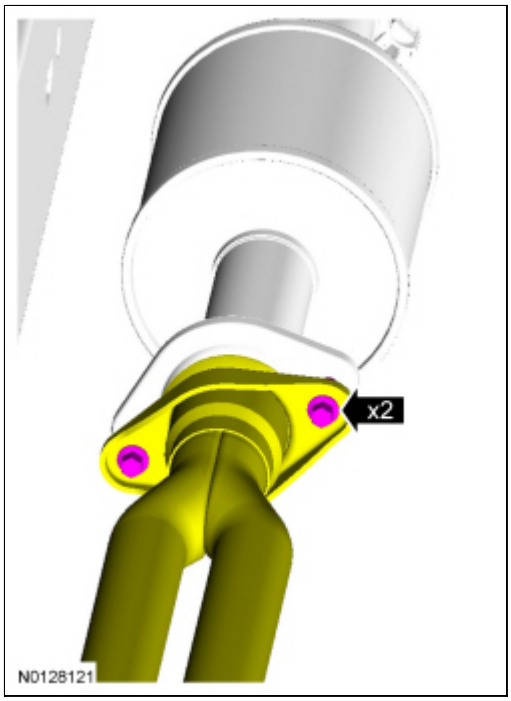
21. Install the A/C compressor belt. For additional information, refer to Section 303-05 .

All vehicles



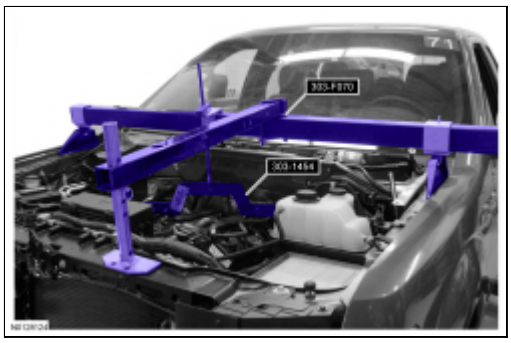
22. ***NOTICE:*** **Only use hand tools when installing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

    Tighten the transmission mount-to-crossmember nuts to 103 Nm (76 lb-ft).



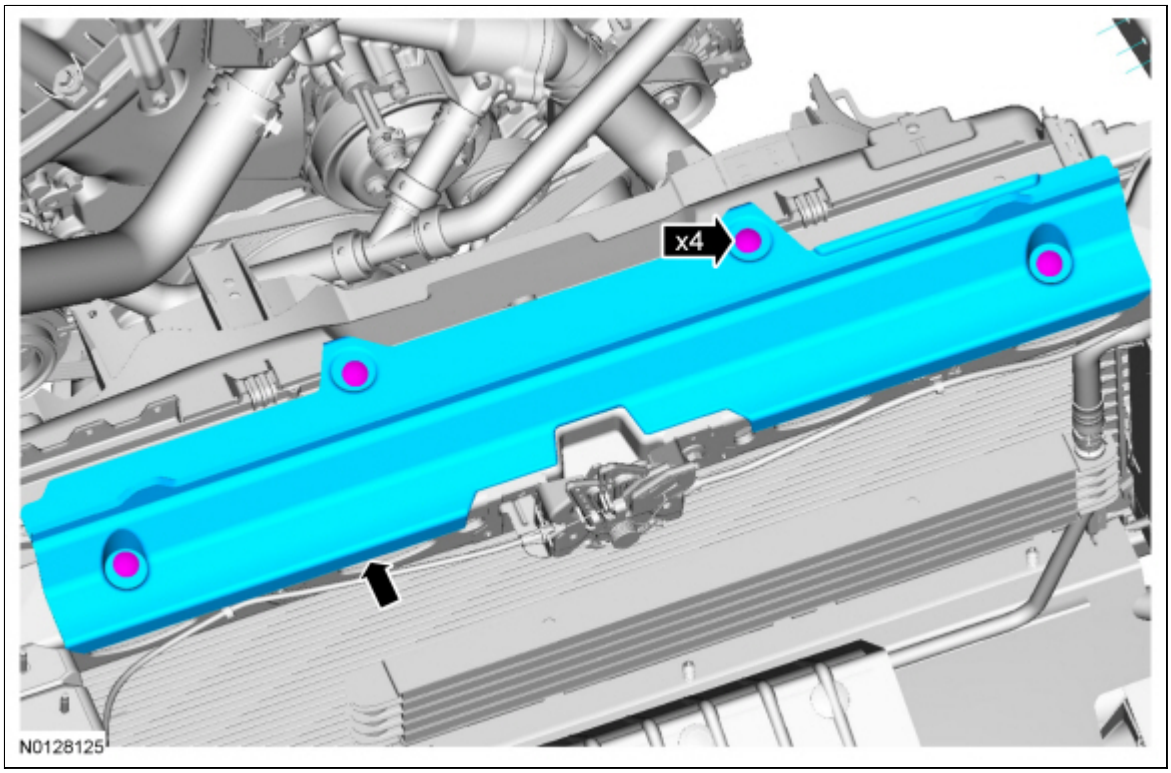
23. **NOTE:** LH shown, RH similar.

    Install the new 2 LH and RH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 45 Nm (35 lb-ft).



24. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

repair4less



25. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .

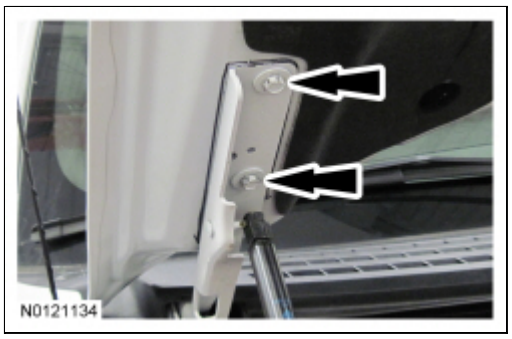
26. Remove the Engine Support Bar.

27. Install the upper radiator air deflector and the 4 pushpins.

28. Remove the LH engine lift eye.

29. Install the cowl panel and attach the 2 clips and install the 6 screws.

repair4less



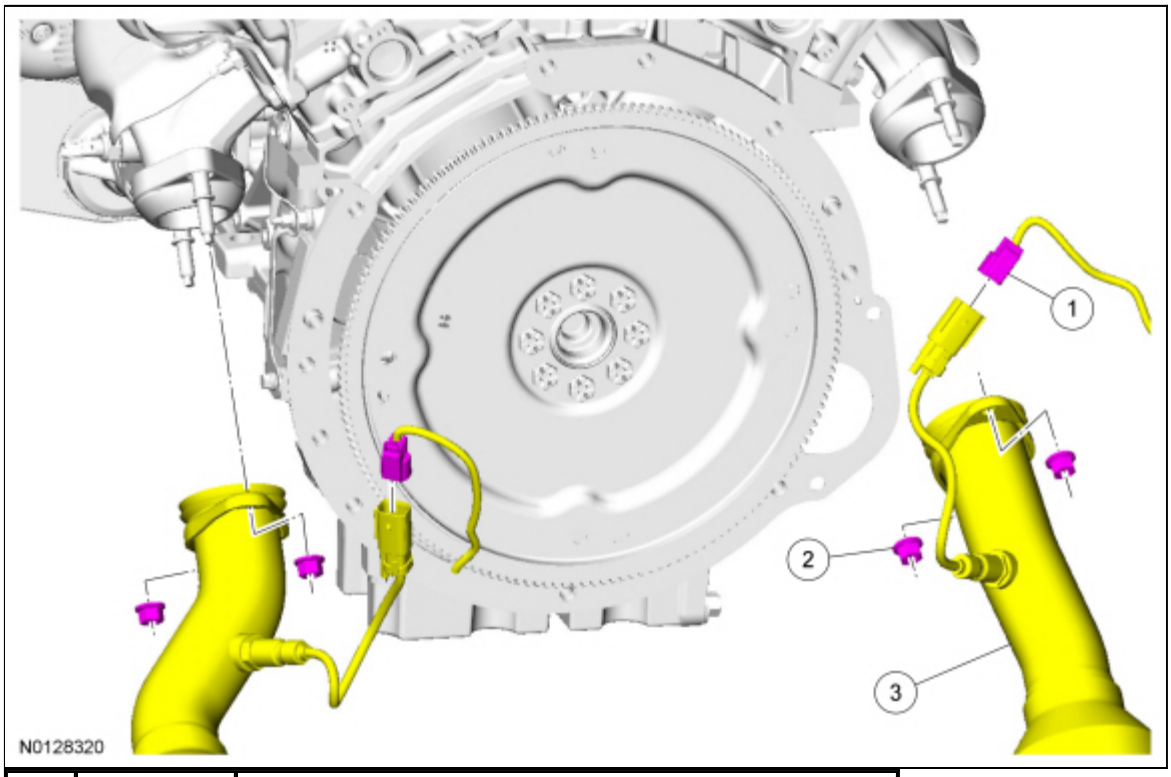
30. Install the cowl panel grille. For additional information, refer to Section 501-02 .

31. Install the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.

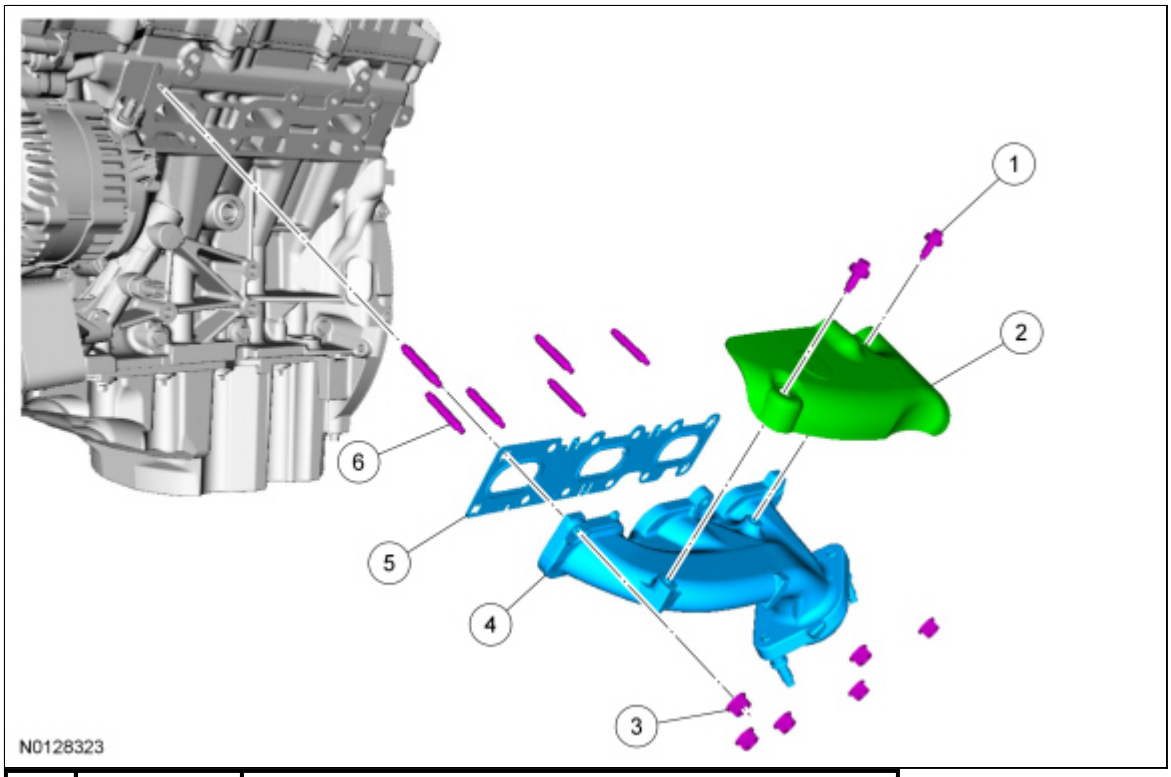
32. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

    NOTE: RH shown, LH similar.

    Position the hood and install the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).



repair4less



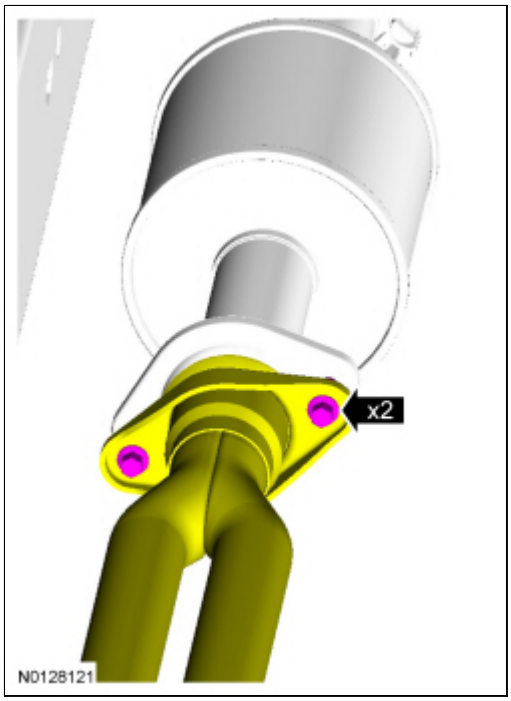
Exhaust Manifold — LH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

Item	Part Number	Description
1	—	Heated Oxygen Sensor (HO2S) electrical connector (part of 14A411) (2 required)
2	W714265	Catalytic converter-to-exhaust manifold nuts (4 required) - 45 Nm (35 lb-ft)
3	5F250	Catalytic converter assembly (Y-pipe)

Item	Part Number	Description
1	W714133	LH exhaust manifold heat shield bolt (2 required) - 12 Nm (106 lb-in)
2	9Y427	LH exhaust manifold heat shield
3	W701706	LH exhaust manifold nut (6 required)
4	9431	LH exhaust manifold
5	9448	LH exhaust manifold gasket
6	W712244	LH exhaust manifold stud (6 required) - 12 Nm (106 lb-in)



Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Detach and disconnect the RH and LH Heated Oxygen Sensor (HO2S) electrical connectors.

3. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
   - Discard the 2 bolts.

repair4less

4. Remove and discard the LH and RH catalytic converter-to-exhaust manifold nuts and lower the catalytic converter assembly.

5. Remove the LH front wheel and tire. For additional information, refer to Section 204-04 .

6. Remove the 2 bolts and the LH exhaust manifold heat shield.

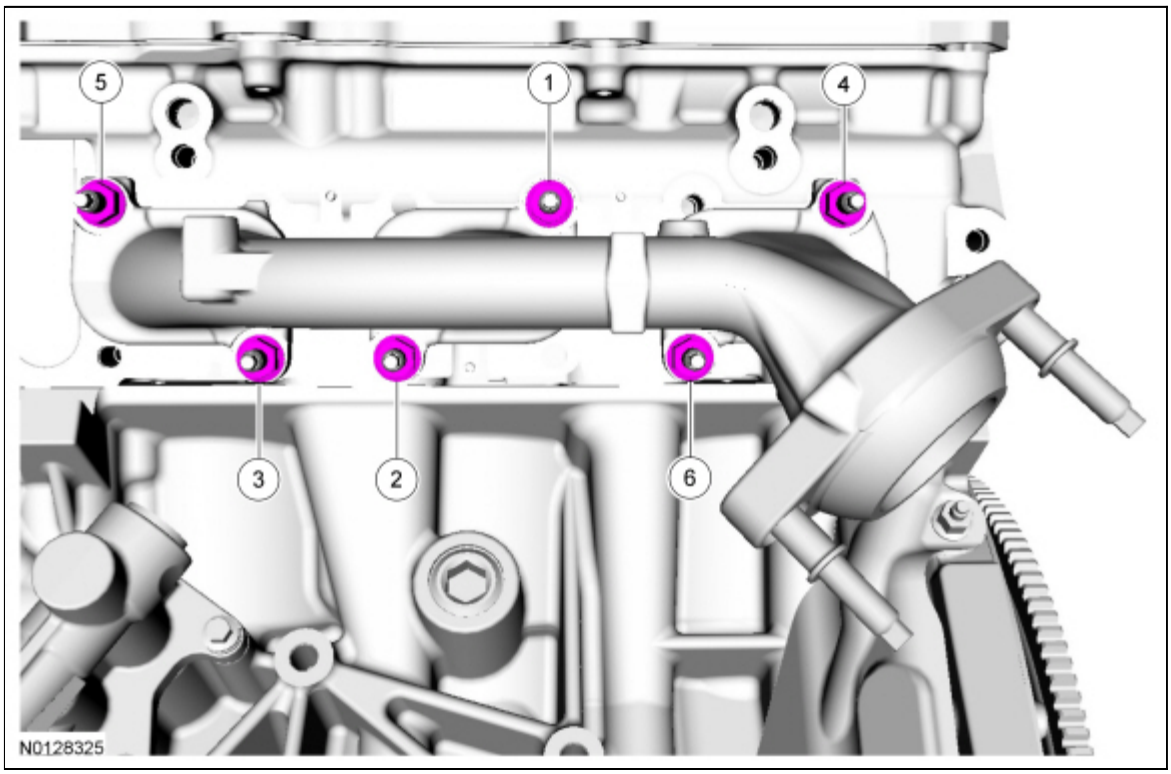
7. Remove the 6 nuts and the LH exhaust manifold.
   - Discard the nuts and gasket.

8. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

9. Remove and discard the 6 LH exhaust manifold studs.

10. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.



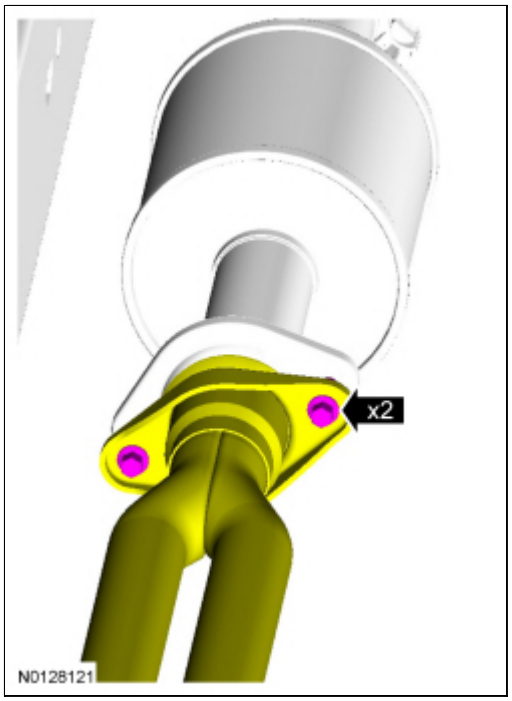
Installation

1. Install 6 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

   Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
   - Stage 1: Tighten to 19 Nm (168 lb-in).

- Stage 2: Tighten to 25 Nm (18 lb-ft).



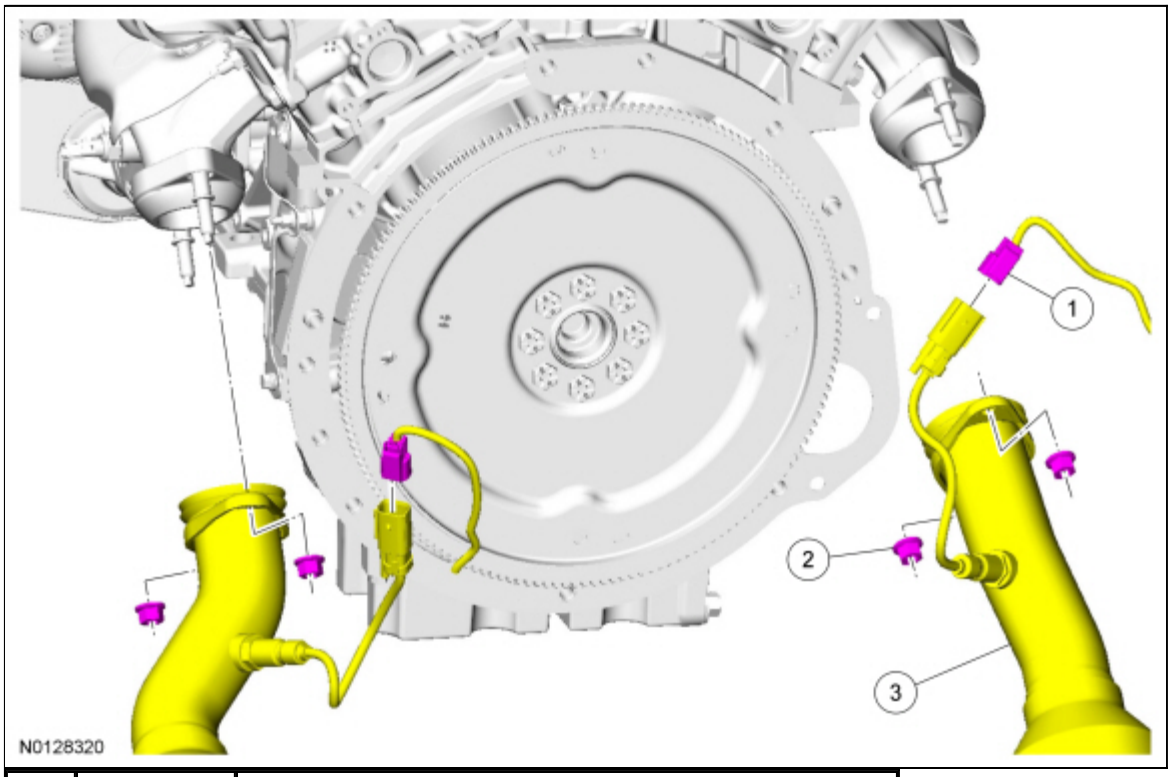
3. Install the LH exhaust manifold heat shield and the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).

4. Install the LH front wheel and tire. For additional information, refer to Section 204-04 .

5. Raise the catalytic converter and install the new LH and RH catalytic converter-to-exhaust manifold nuts.
   - Tighten to 45 Nm (35 lb-ft).

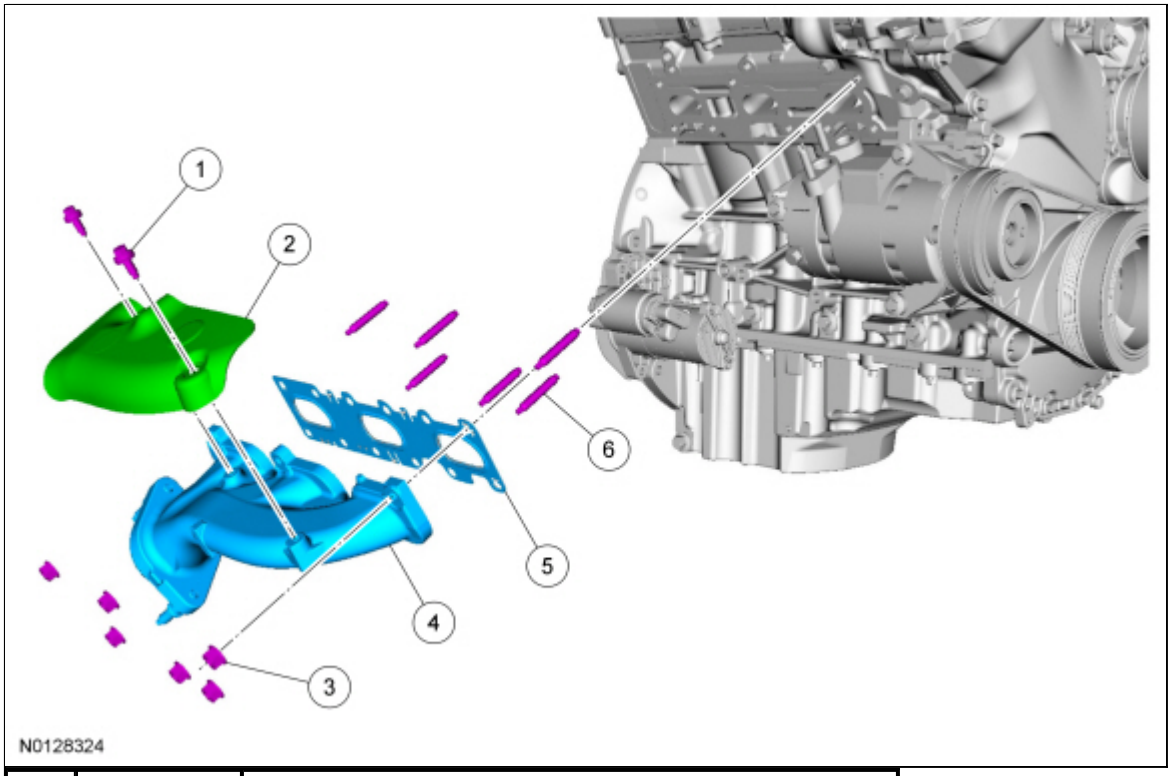
6. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
   - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
   - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

repair4less



7. Connect and attach the RH and LH HO2S electrical connectors.

Exhaust Manifold — RH

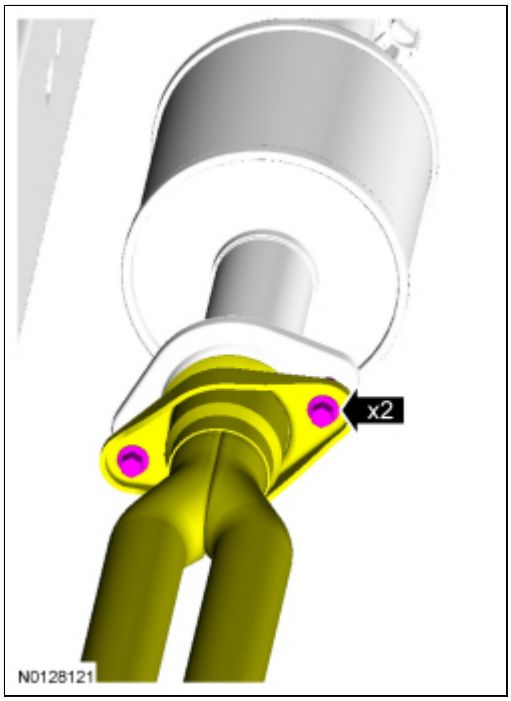


Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

Item	Part Number	Description
1	—	Heated Oxygen Sensor (HO2S) electrical connector (part of 14A411) (2 required)
2	W714265	Catalytic converter-to-exhaust manifold nuts (4 required) - 45 Nm (35 lb-ft)
3	5F250	Catalytic converter assembly (Y-pipe)

repair4less



Item	Part Number	Description
1	W714133	RH exhaust manifold heat shield bolt (2 required) - 12 Nm (106 lb-in)
2	9A462	RH exhaust manifold heat shield
3	W701706	RH exhaust manifold nut (6 required)
4	9430	RH exhaust manifold
5	9448	RH exhaust manifold gasket
6	W712244	RH exhaust manifold stud (6 required) - 12 Nm (106 lb-in)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Detach and disconnect the RH and LH Heated Oxygen Sensor (HO2S) electrical connectors.

3. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
   - Discard the 2 bolts.

4. Remove and discard the LH and RH catalytic converter-to-exhaust manifold nuts and lower the catalytic converter assembly.

5. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .

6. Remove the 2 bolts and the RH exhaust manifold heat shield.

7. Remove the 6 nuts and the RH exhaust manifold.
   - Discard the nuts and gasket.

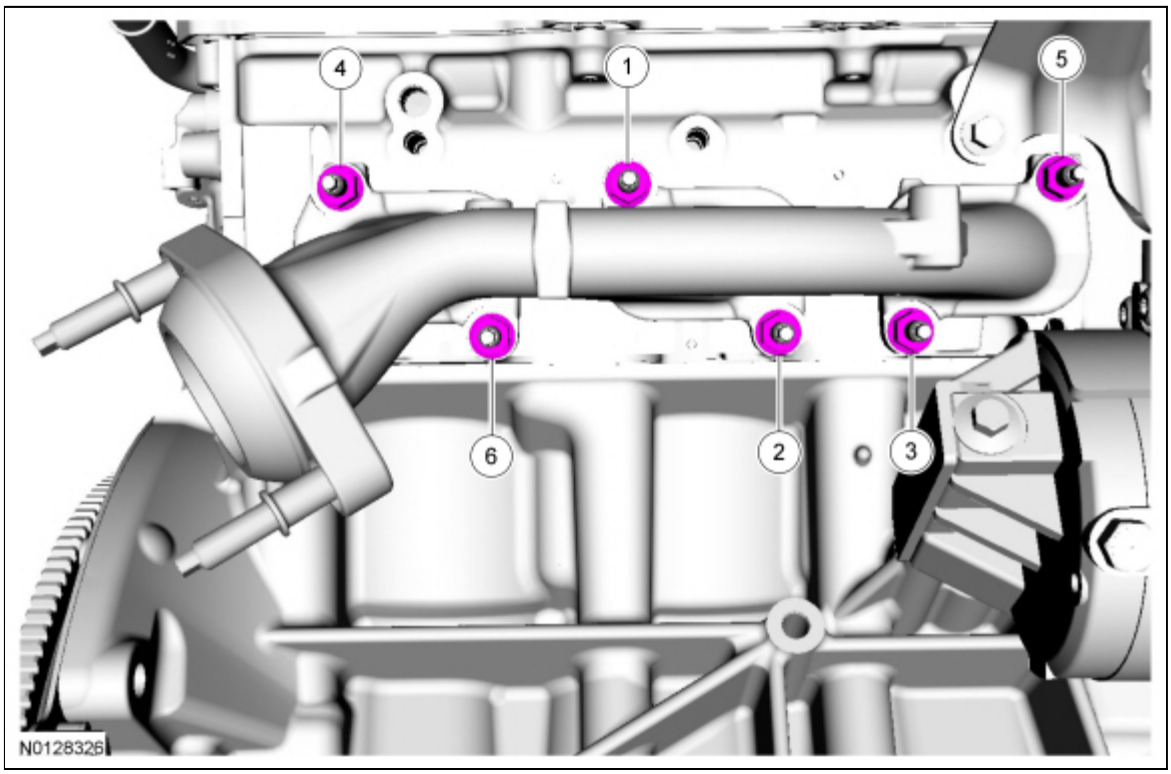
8. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

9. Remove and discard the 6 RH exhaust manifold studs.

10. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

Installation



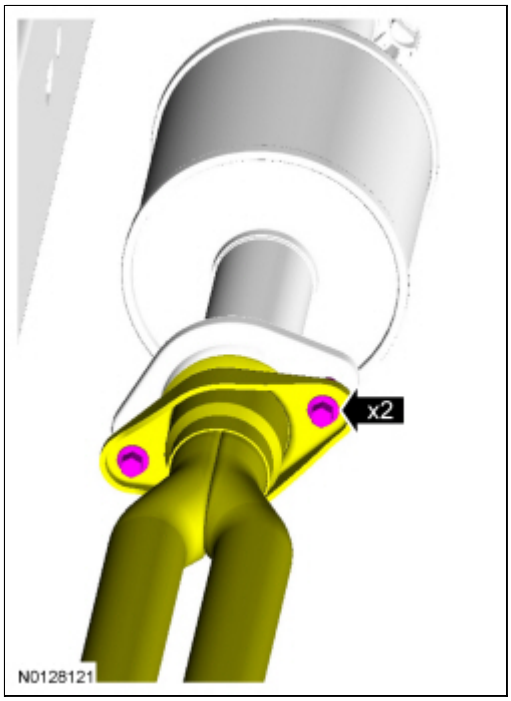
1. Install 6 new RH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

   Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
   - Stage 1: Tighten to 19 Nm (168 lb-in).

repair4less

- Stage 2: Tighten to 25 Nm (18 lb-ft).



3. Install the RH exhaust manifold heat shield and the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).

4. Install the RH front wheel and tire. For additional information, refer to Section 204-04 .

5. Raise the catalytic converter and install the new LH and RH catalytic converter-to-exhaust manifold nuts.
   - Tighten to 45 Nm (35 lb-ft).

6. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
   - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
   - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

7. Connect and attach the RH and LH HO2S electrical connectors.

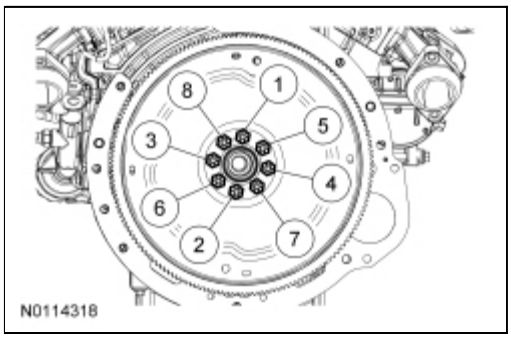
---

repair4less

Flexplate

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



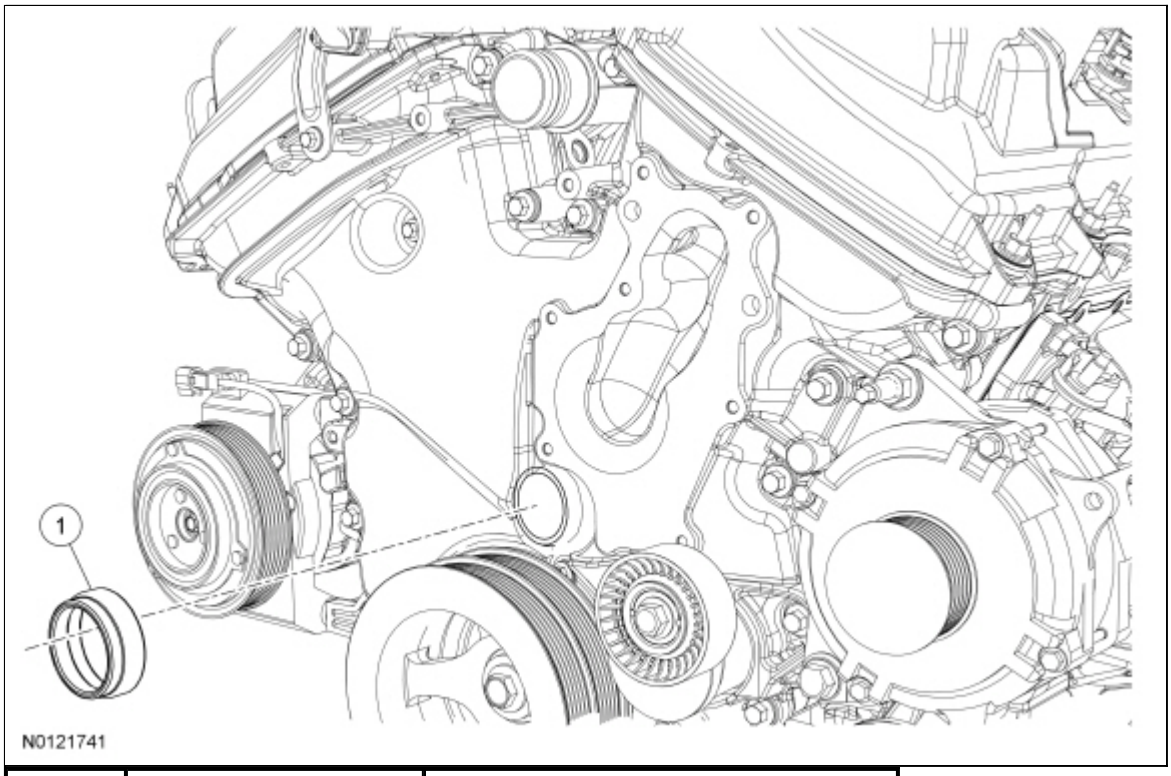
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the automatic transmission. For additional information, refer to Section 307-01 .
3. Remove the 8 bolts and the flexplate.

Installation

1. **NOTE:** One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.

   Install the flexplate and the 8 bolts and tighten in sequence shown.
   - Tighten to 80 Nm (59 lb-ft).



2. Install the automatic transmission. For additional information, refer to Section 307-01 .
3. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

repair4less

Front Cover Radial Seal

Special Tool(s)

 ST3232-A	Remover/Installer, Water Tube Seal 303-1528

Item	Part Number	Description
1	6020	Front cover radial seal

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the Air Conditioning (A/C) compressor belt. For additional information, refer to Section 303-05 .

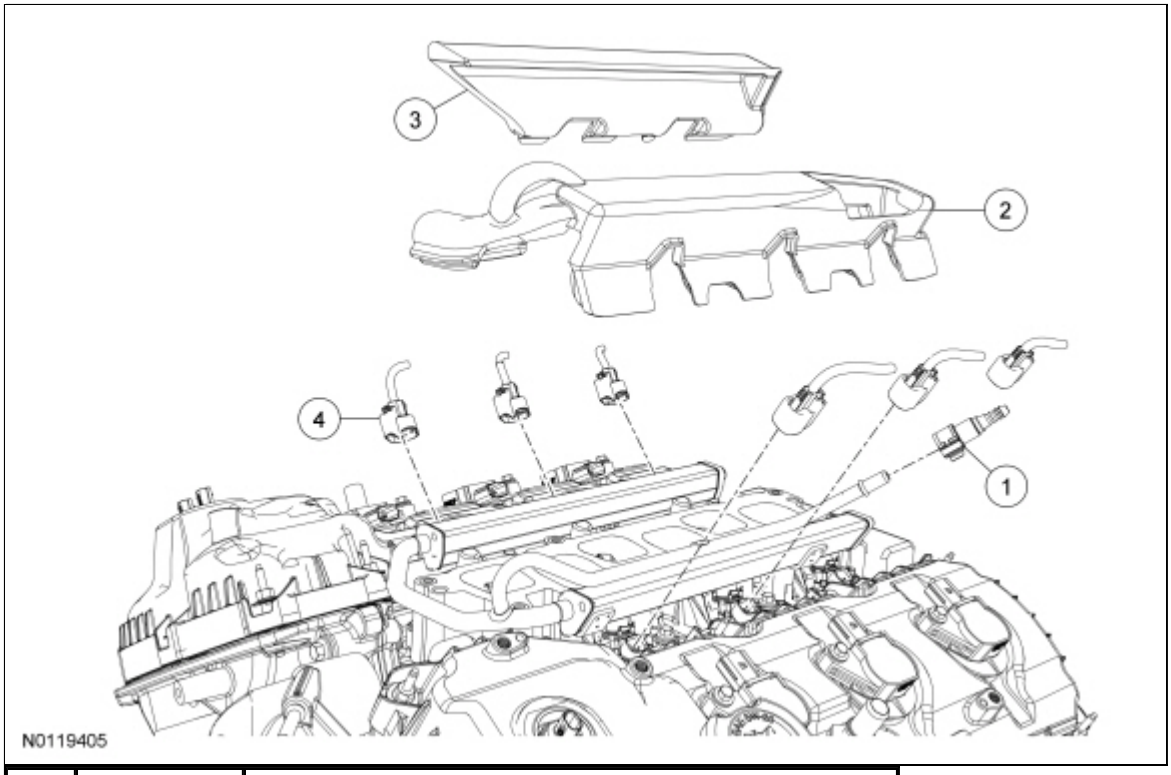
2. Remove the coolant pump. For additional information, refer to Section 303-03 .

3. Using the Water Tube Seal Remover, remove the front cover radial seal.
    - Reset the Water Tube Seal Remover center bolt to its retracted position.
    - Screw the Water Tube Seal Remover onto the front cover radial seal until it bottoms out.
    - Using a brass hammer, give the Water Tube Seal Remover a slight tap inward to break the front cover radial seal lose.
    - Turn the Water Tube Seal Remover center bolt clockwise and remove the front cover radial seal.

4. Clean the engine front cover radial seal area.

Installation

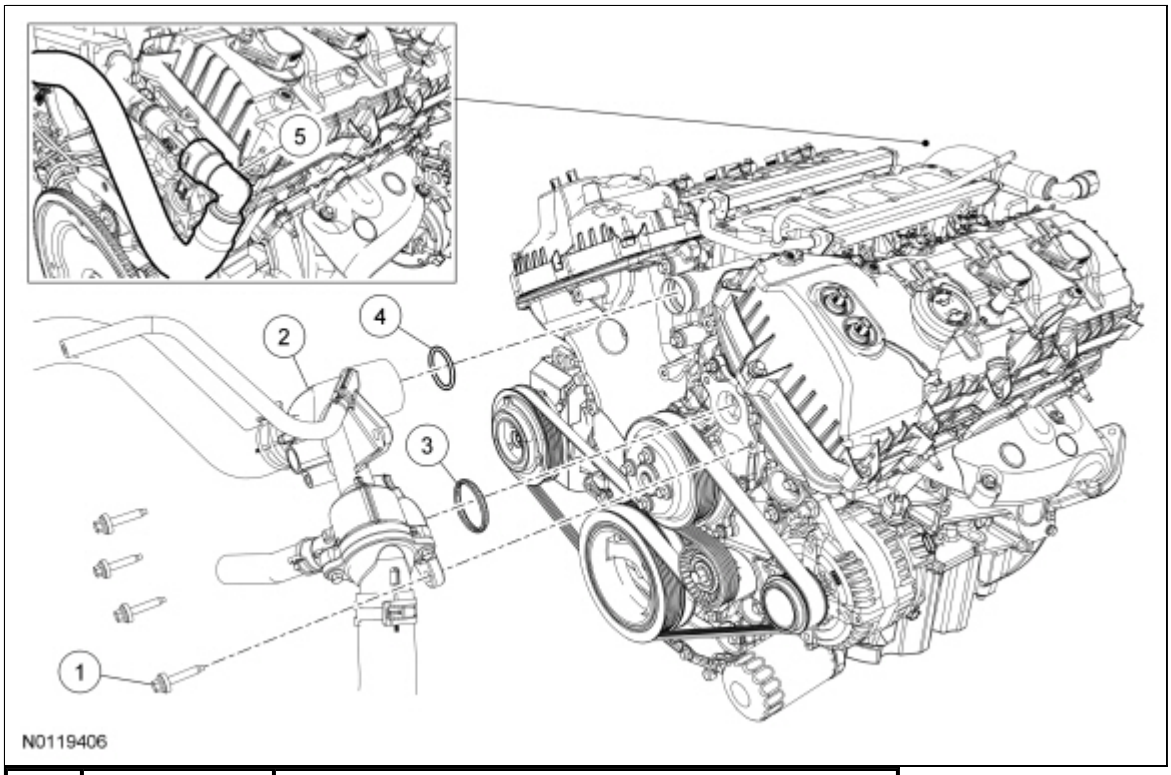
1. Using the Water Tube Seal Installer, install the front cover radial seal.
    - Position the front cover radial seal on the Water Tube Seal Installer.
    - Position the Water Tube Seal Installer into the engine front cover.
    - Using a brass hammer, tap the Water Tube Seal Installer until the front cover radial seal bottoms out.



2. Inspect the front cover radial seal for proper installation or damage.
3. Install the coolant pump. For additional information, refer to Section 303-03 .
4. Install the A/C compressor belt. For additional information, refer to Section 303-05 .

repair4less

Lower Intake Manifold

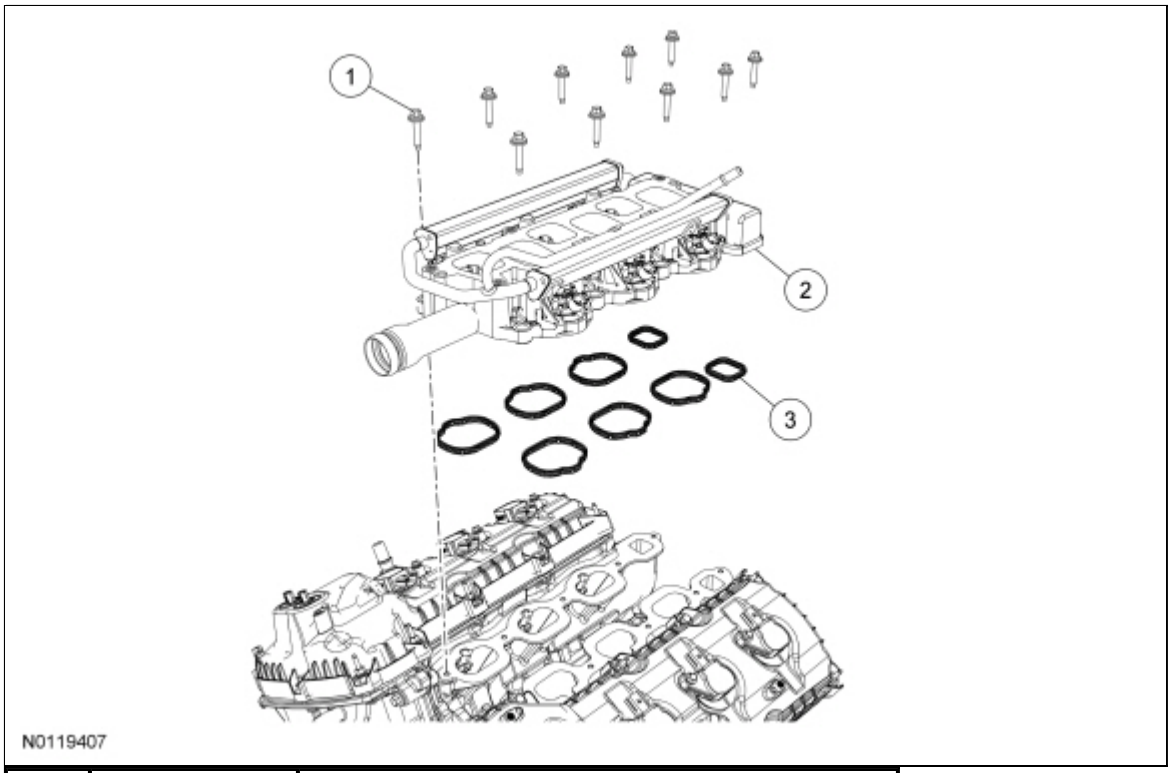


Lower Intake Manifold (View 1 of 3)

Item	Part Number	Description
1	—	Fuel tube-to-fuel rail quick connect coupling (part of 9J280)
2	6P013	LH fuel rail noise insulator shield
3	6P013	RH fuel rail noise insulator shield
4	—	Fuel injector electrical connector (part of 12C508) (6 required)

Lower Intake Manifold (View 2 of 3)

repair4less



Item	Part Number	Description
1	W714841	Thermostat housing bolt (4 required)
2	8592	Thermostat housing
3	8A571	Thermostat housing gasket
4	9A425	Thermostat housing-to-coolant tube O-ring seal
5	18472	Heater hose-to-lower intake manifold

Lower Intake Manifold (View 3 of 3)

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

Item	Part Number	Description
1	W503279	Lower intake manifold bolt (10 required)
2	9424	Lower intake manifold
3	9439	Lower intake manifold gasket (8 required)

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

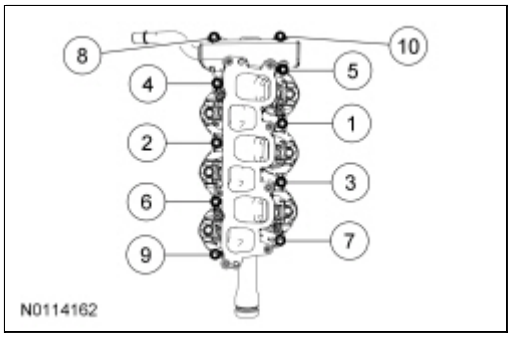
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

repair4less

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

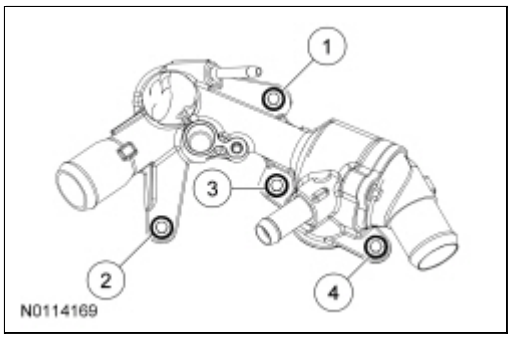
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**



1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Drain the cooling system. For additional information, refer to Section 303-03 .
4. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.
5. Disconnect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .
6. Remove the LH and RH fuel rail noise insulator shields.
7. Disconnect the 6 fuel injector electrical connectors.
8. ***NOTICE:*** **Cover the accessory drive belts to prevent coolant contamination of the belts.**

   Completely cover the accessory drive belts with waterproof plastic.
9. Remove the 4 bolts and remove the thermostat housing from the coolant tube.
   - Remove and discard the thermostat housing gasket and coolant tube O-ring seal.
10. Disconnect the heater hose from the rear of the lower intake manifold.
11. Remove the 10 bolts and the lower intake manifold.
    - Remove and discard the lower intake manifold gaskets.
    - Clean and inspect all sealing surfaces.

Installation



1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris if found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new lower intake manifold gaskets, install the lower intake manifold and the 10 bolts and tighten in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

2. Connect the heater hose to the lower intake manifold.

3. Using a new thermostat housing gasket and coolant tube O-ring seal, install the thermostat housing and the 4 bolts and tighten in the sequence shown in 2 stages.
   - Stage 1: Tighten to 8 Nm (71 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

4. Connect the 6 fuel injector electrical connectors.

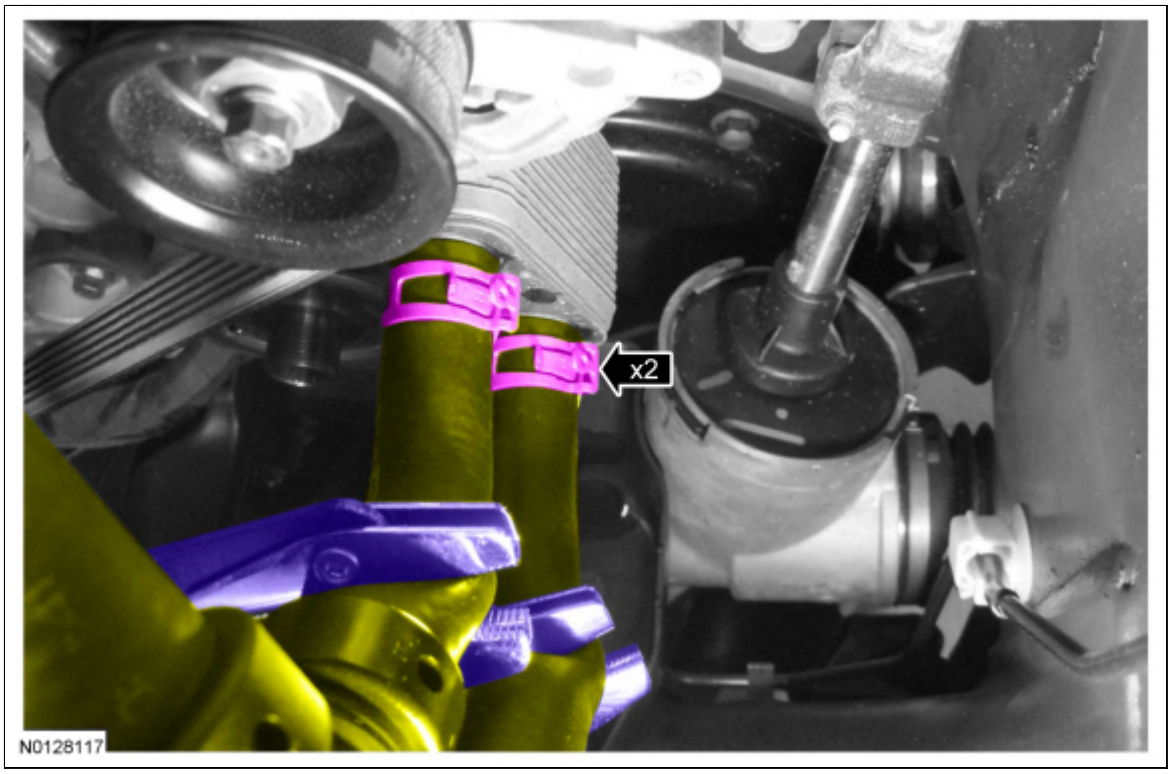
5. Install the LH and RH fuel rail noise insulator shields.

6. Connect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .

7. Install the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.

8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

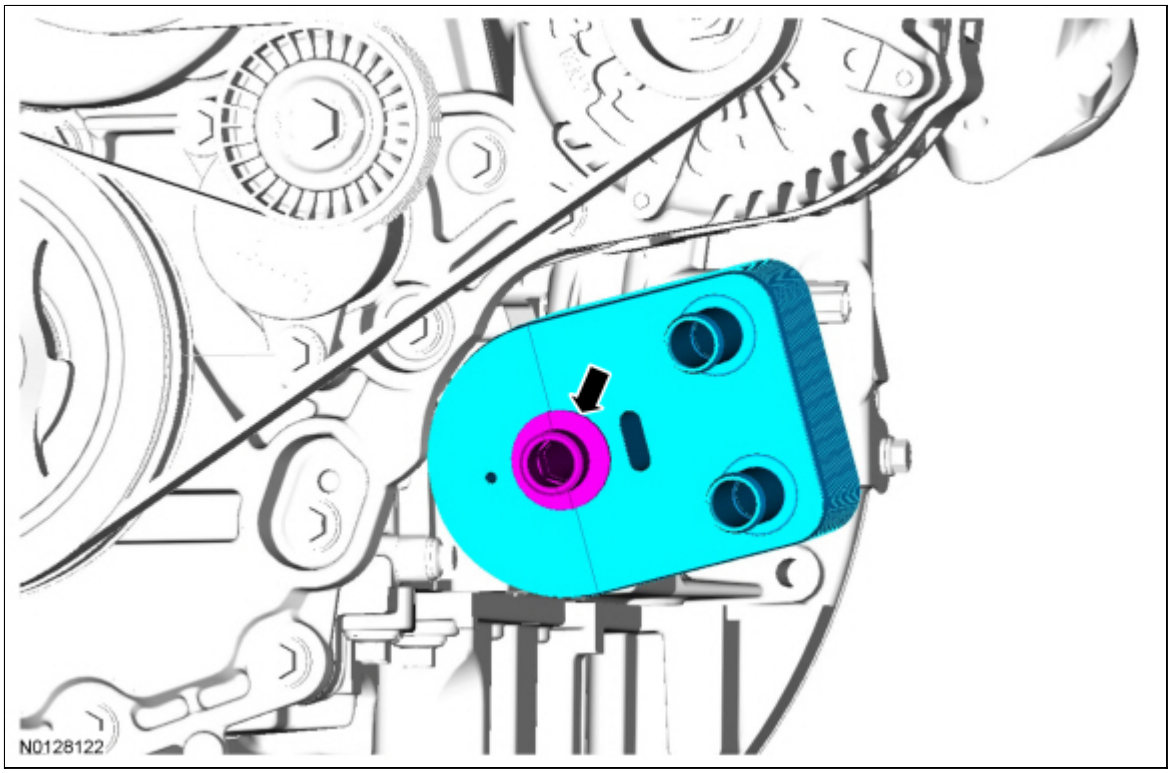
9. Remove the waterproof plastic from accessory drive belts.



10. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .

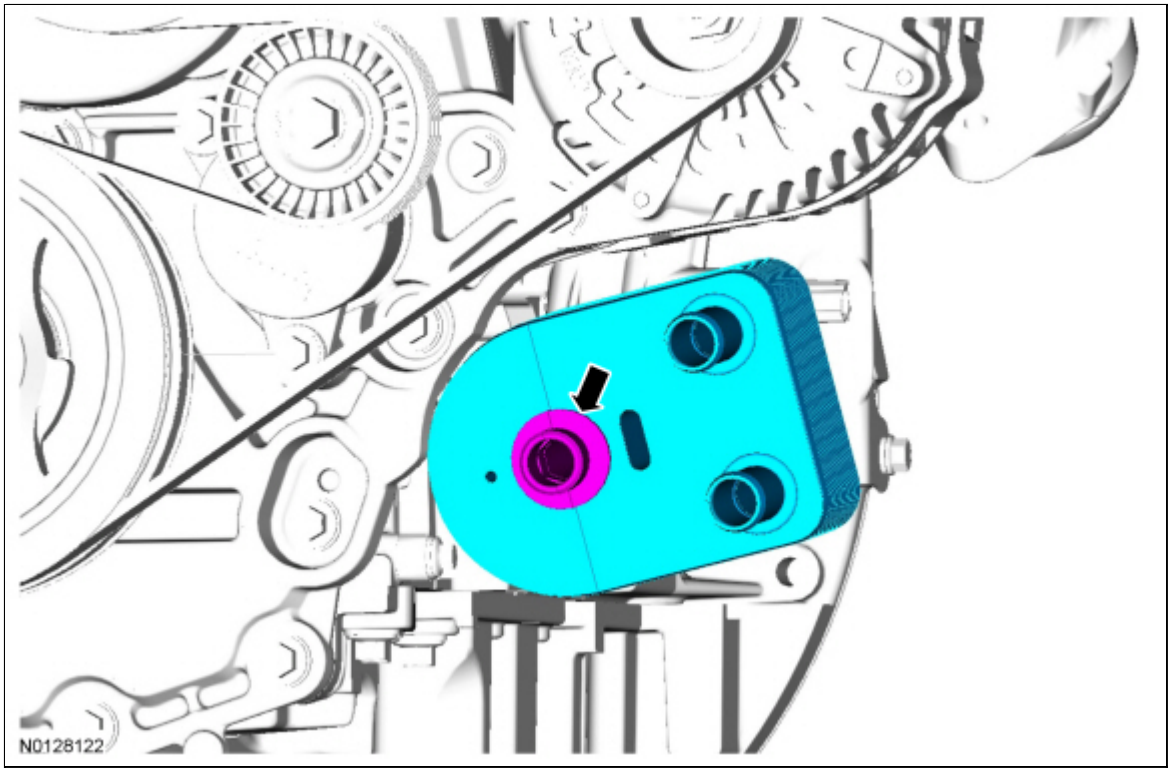
repair4less

Oil Cooler



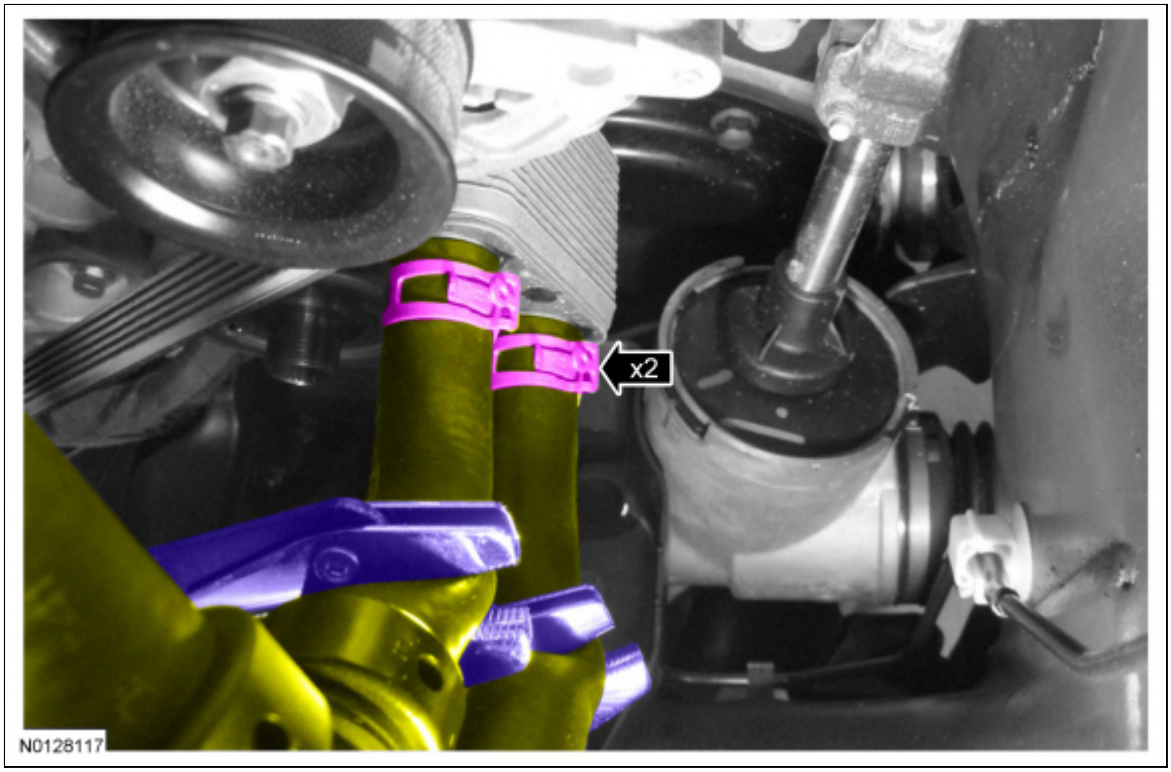
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove and discard the engine oil filter.
3. Using hose clamp pliers, clamp the 2 oil cooler coolant hoses and remove the 2 coolant hoses from the oil cooler.



4. Loosen the oil cooler insert bolt and remove the oil cooler.
    - Inspect the oil cooler gasket, replace if necessary.

repair4less



Installation

1. Align the oil cooler to the oil filter adapter and tighten the oil cooler insert bolt.
    - Tighten to 58 Nm (43 lb-ft).

2. Connect the 2 coolant hoses to the engine oil cooler and remove the hose clamp pliers.

3. **NOTE:** Do not lubricate the engine oil filter gasket.

   Install a new engine oil filter.
   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

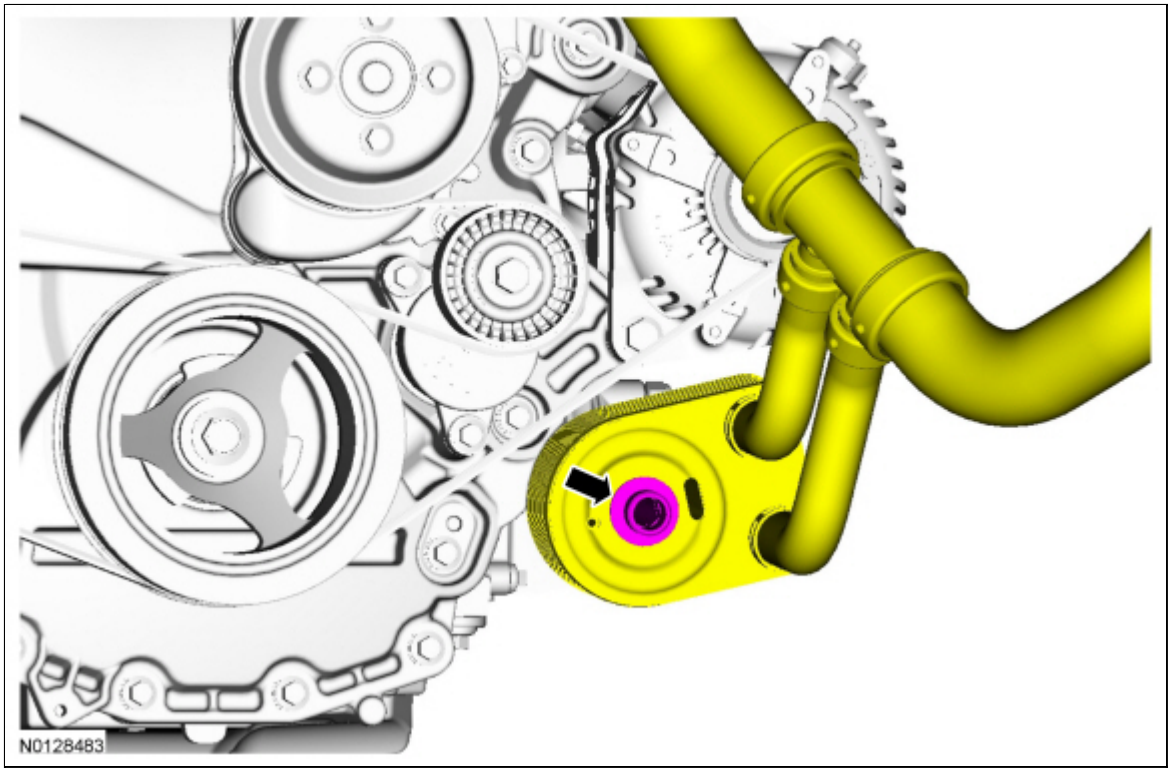
4. Inspect and adjust the coolant level in the degas bottle.

5. Inspect and adjust the engine oil level.

---

repair4less

Oil Filter Adapter

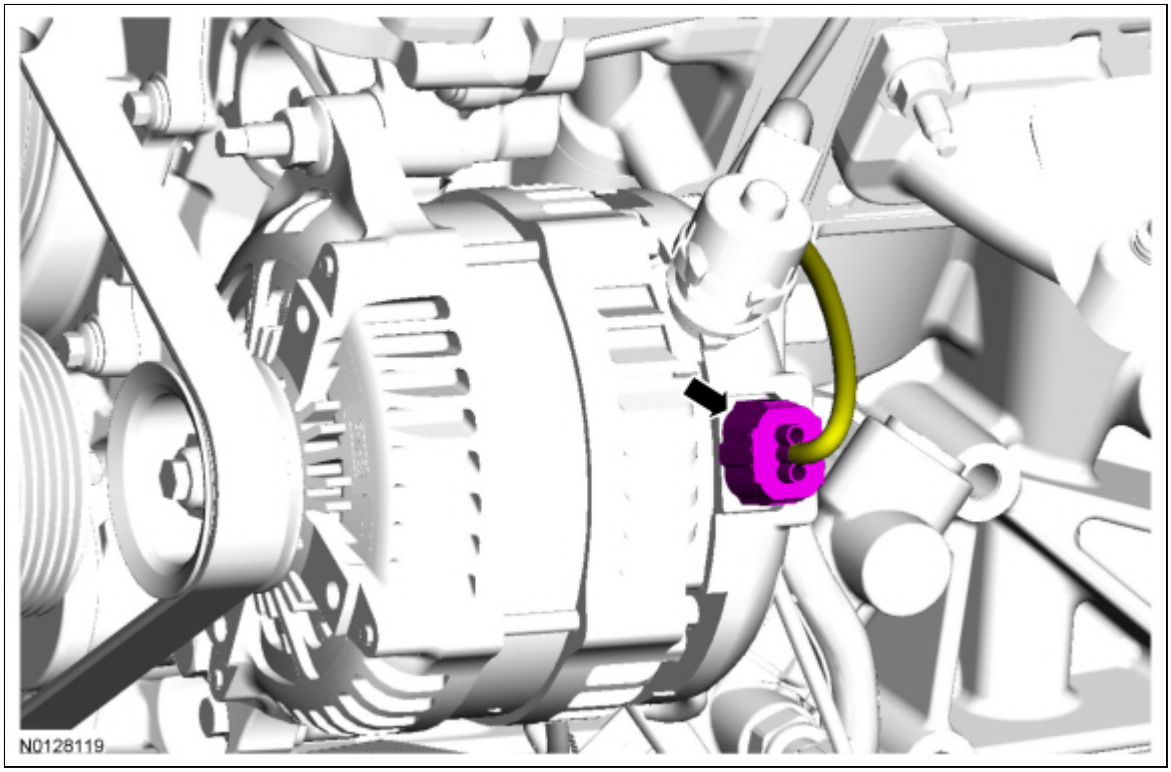


Removal

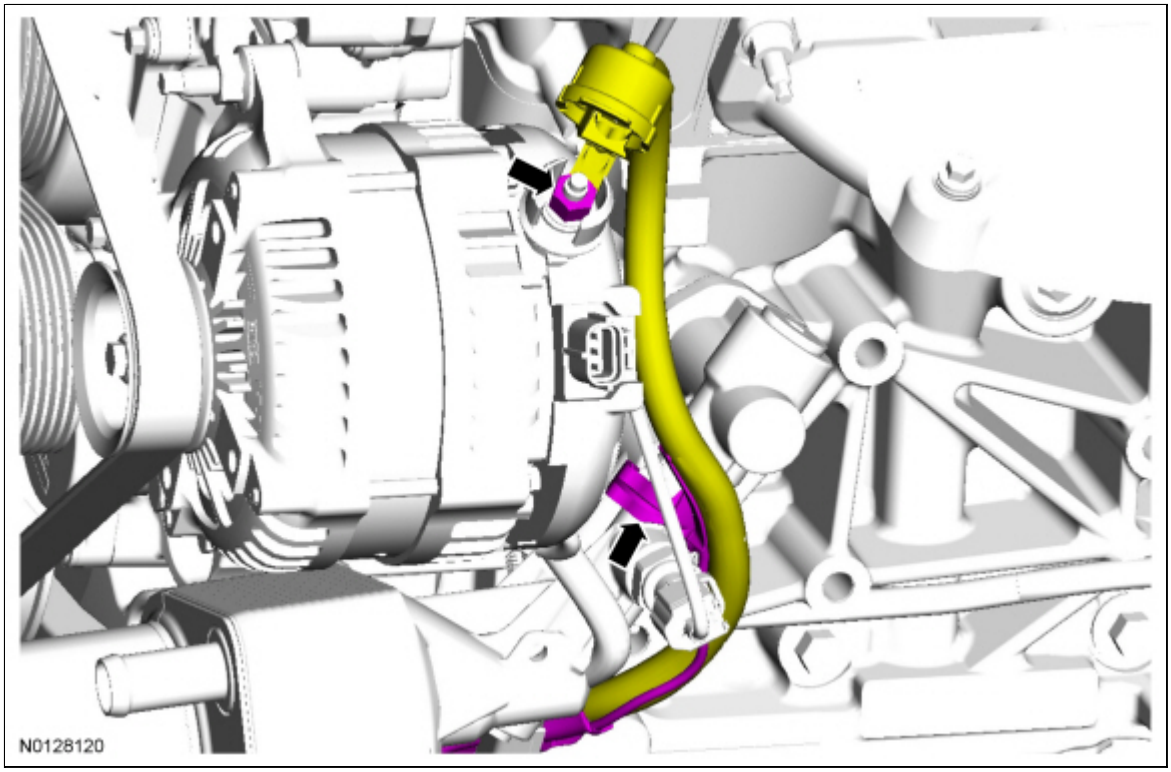
All engines

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the Air Cleaner (ACL) outlet tube and the ACL upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .
4. Remove and discard the engine oil filter.

Engine with oil cooler



5. Loosen the oil cooler insert bolt and position the oil cooler aside.
    - Inspect the oil cooler gasket, replace if necessary.

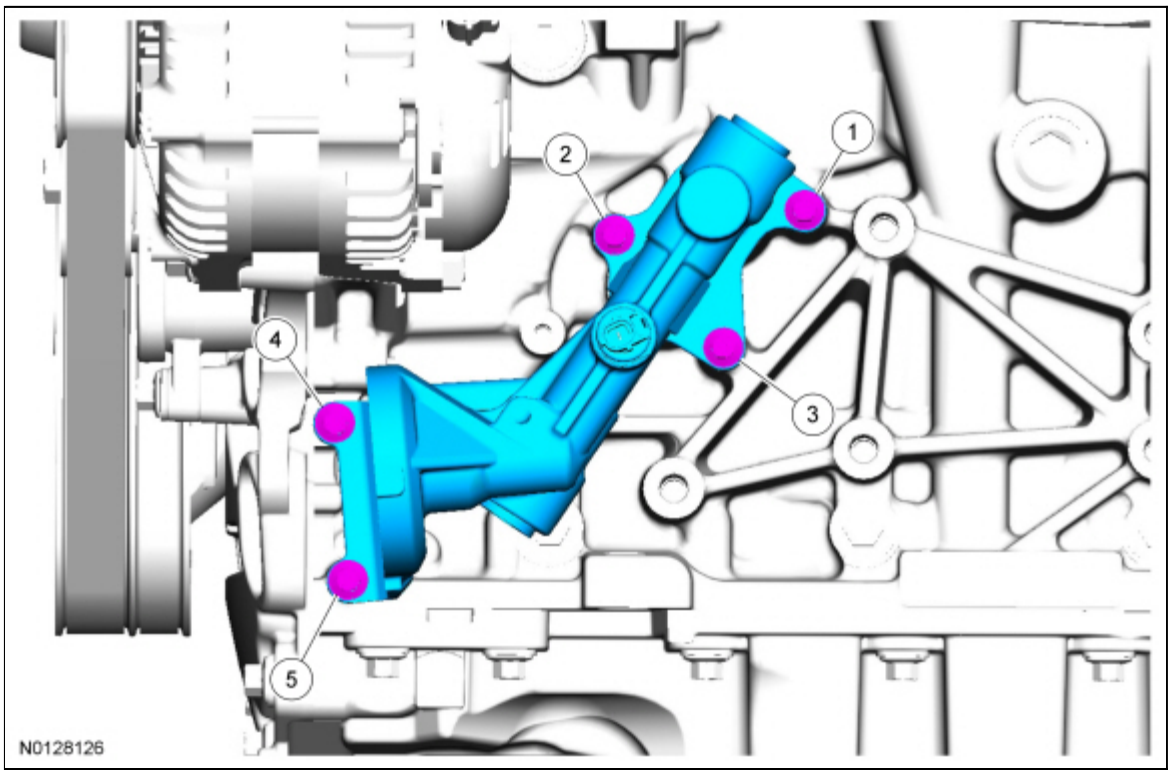


All engines

6. Disconnect the generator electrical connector.

repair4less

7. Position the generator B+ protective boot aside, remove the B+ nut and position the B+ terminal aside.
    - Detach the generator wiring harness retainer from the oil filter adapter and position the generator wiring harness aside.

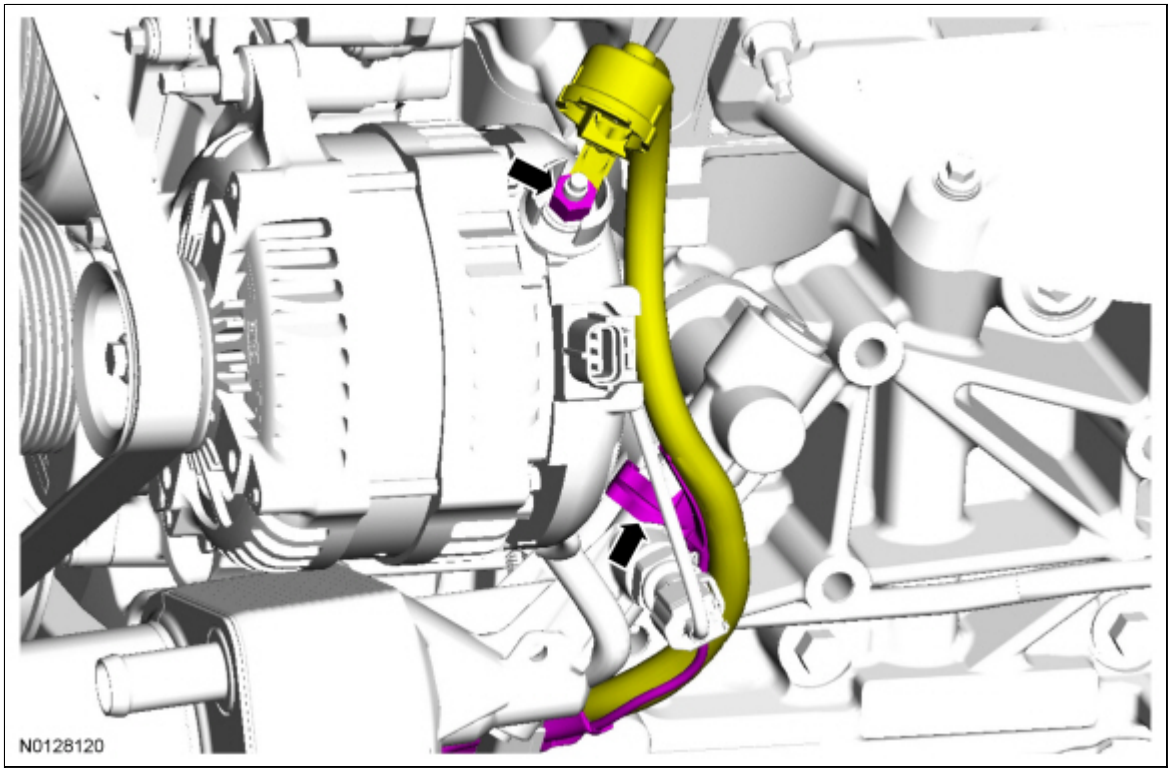


8. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

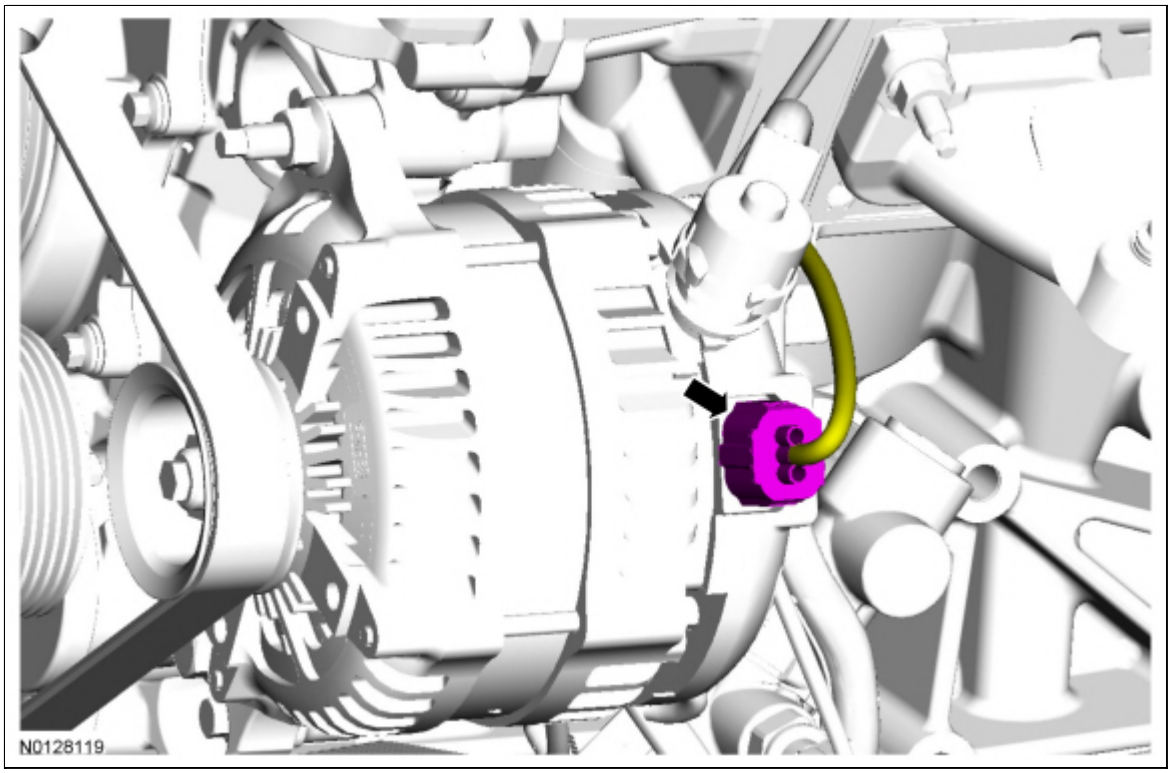
9. Remove the 5 bolts and the oil filter adapter.
    - Discard the gasket.
    - Clean and inspect all sealing surfaces.

Installation

All engines



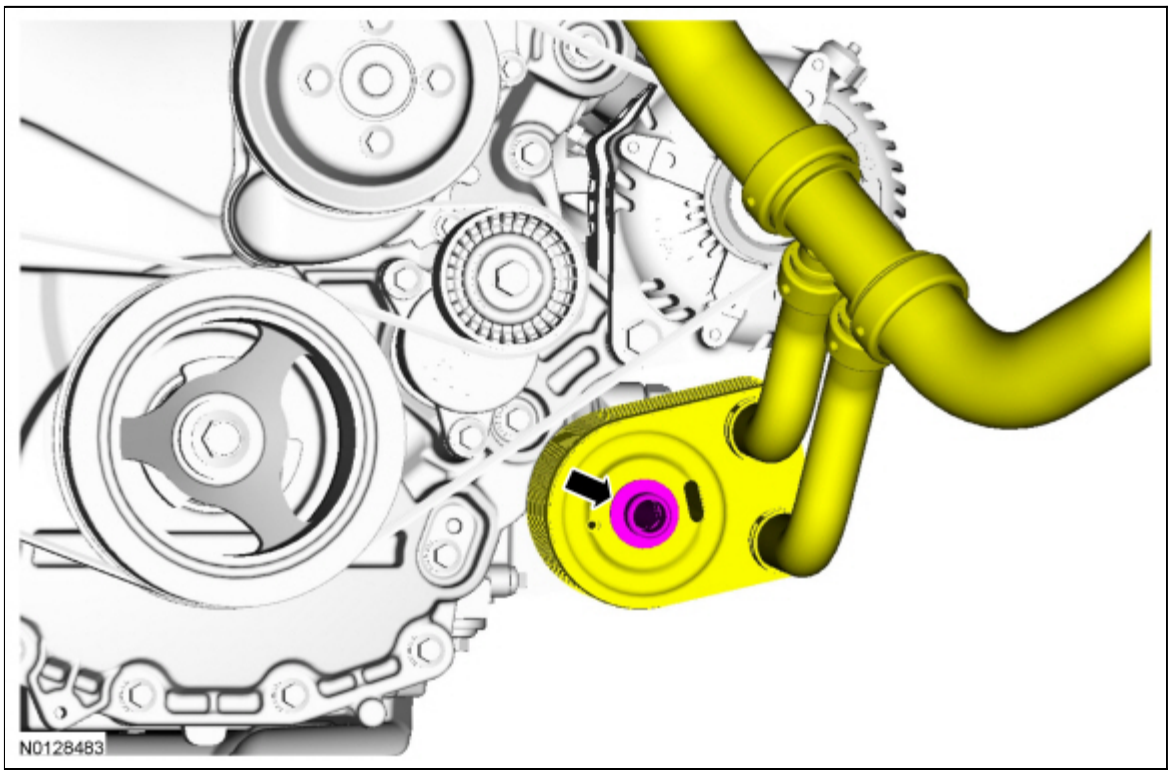
1. Using a new gasket, install the oil filter adapter and the 5 bolts and tighten in sequence shown.
    - Tighten to 10 Nm (89 lb-in) and then an additional 45 degrees.



2. Connect the EOP switch electrical connector.
    - Attach the generator wiring harness retainer.

3. Position back the generator wiring harness and B+ terminal and install the nut.
    - Tighten to 17 Nm (150 lb-in).
    - Position back the generator B+ protective boot.
    - Attach the generator wiring harness retainer to the oil filter adapter.

repair4less



4. Connect the generator electrical connector.

Engine with oil cooler

5. Position the oil cooler and tighten the oil cooler insert bolt.

- Tighten to 58 Nm (43 lb-ft).

All engines

6. **NOTE:** Do not lubricate the engine oil filter gasket.

   Install a new engine oil filter.
   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

7. Install the ACL outlet tube and the ACL upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .

8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

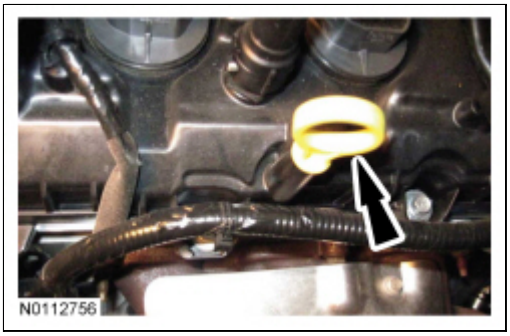
9. Inspect and adjust the engine oil level.

---

repair4less

Oil Pan

Material



Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—

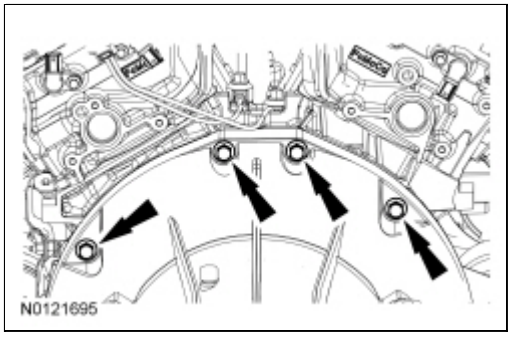
Motorcraft® Silicone Gasket Remover ZC-30	—

Removal

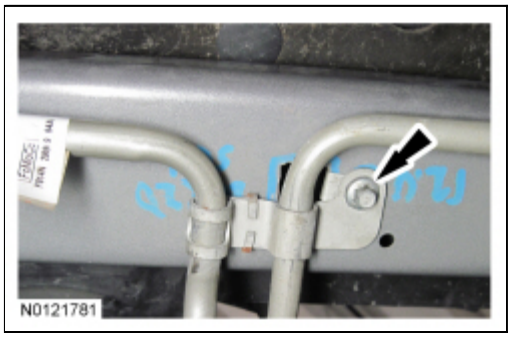
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

All vehicles



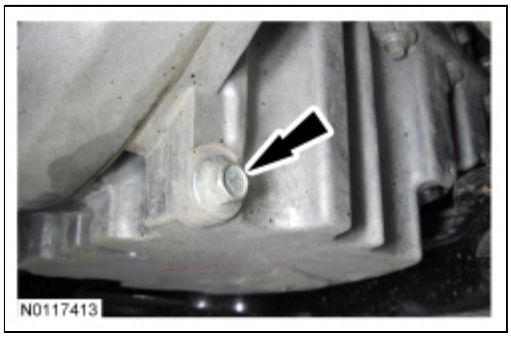
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the oil level indicator.

4. **NOTE:** This step does not apply if the engine front cover is removed.



repair4less

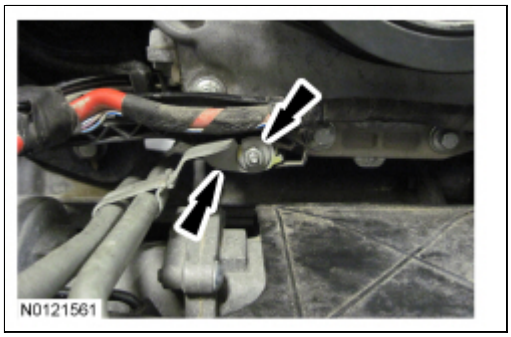
Loosen the 4 upper bellhousing-to-engine bolts 5 mm (0.19 in).



5. If equipped, remove the bolts and the skid plate.

6. Remove the bolt for the transmission cooler tube bracket from the radiator support.

7. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).



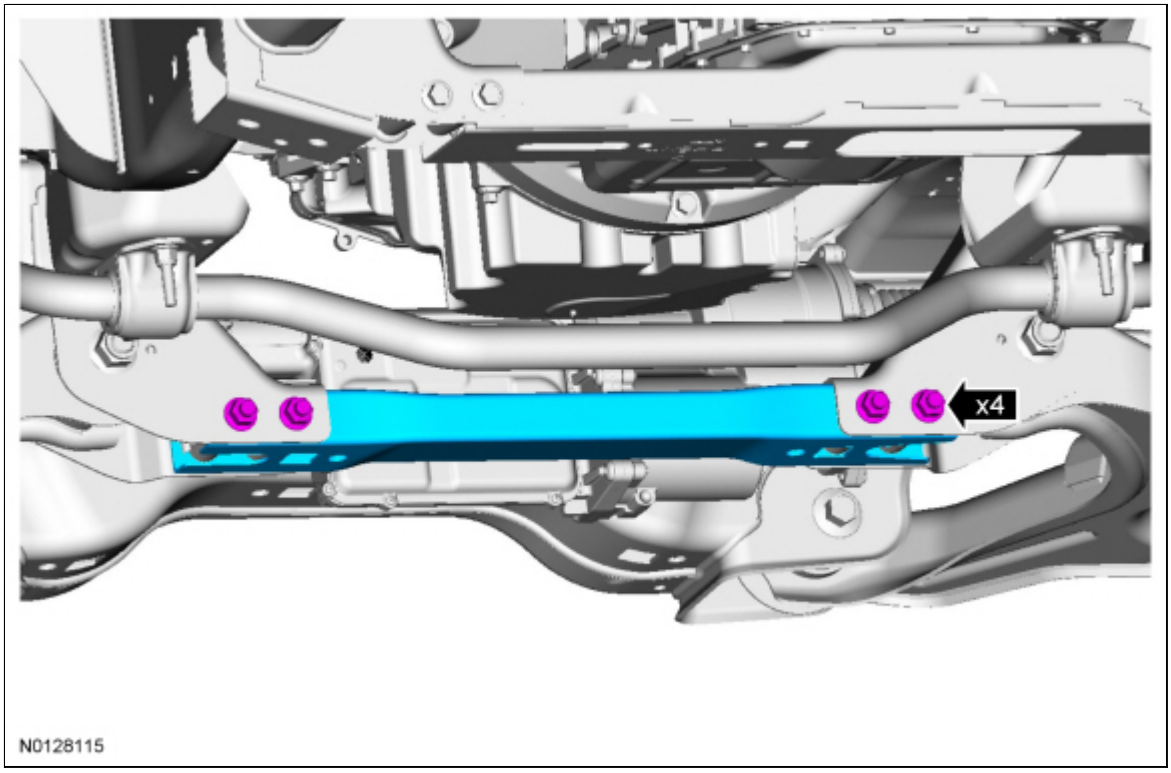
8. Remove and discard the engine oil filter.

9. **NOTE:** This step does not apply if the engine front cover is removed.

   Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.

10. **NOTE:** This step does not apply if the engine front cover is removed.

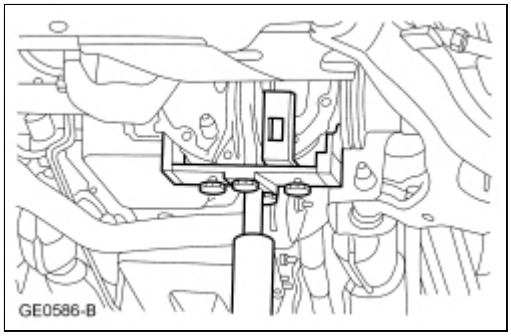
    Detach the generator wiring harness from the engine front cover.



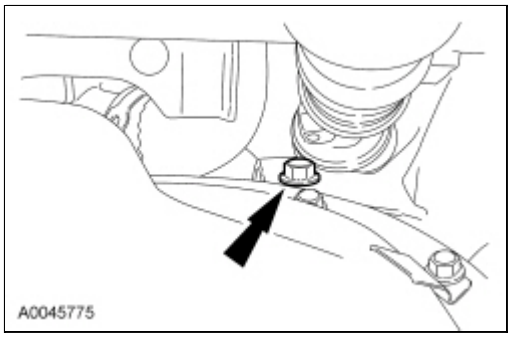
11. Remove the starter motor. For additional information, refer to Section 303-06 .

12. Detach the starter motor wiring harness retainer from the oil pan.

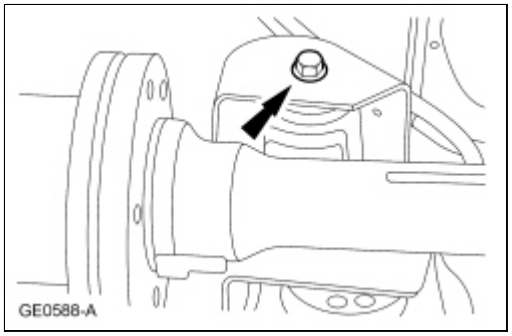
repair4less



13. Remove the 4 nuts and bolts and the crossmember.

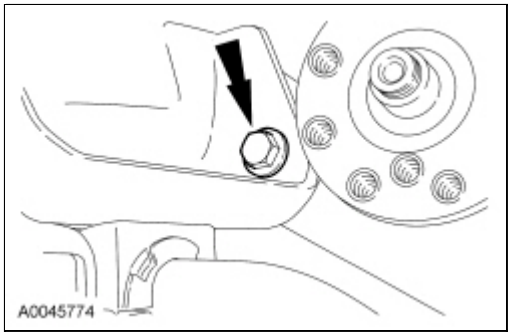


Four Wheel Drive (4X4) vehicles



14. Position a suitable hydraulic jack under the front axle. Securely strap the jack to the axle.

15. Remove the upper front axle carrier mounting bushing bolt.



16. Remove the axle shaft housing carrier bushing bolt.

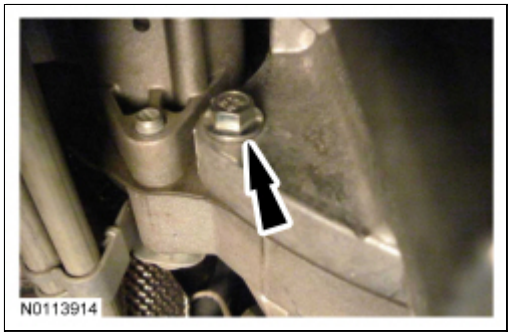
17. **NOTE:** Front driveshaft removed for clarity only.

    Remove the lower front axle carrier mounting bushing bolt.

18. ***NOTICE:*** **Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

    Lower the axle to allow clearance for the oil pan to be removed.

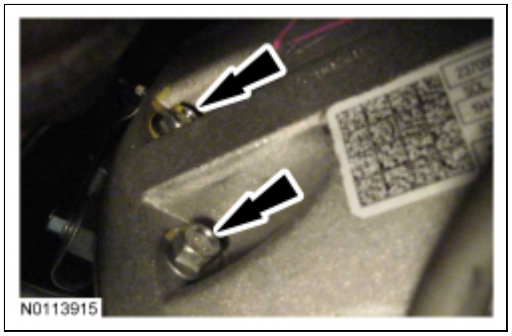
All vehicles



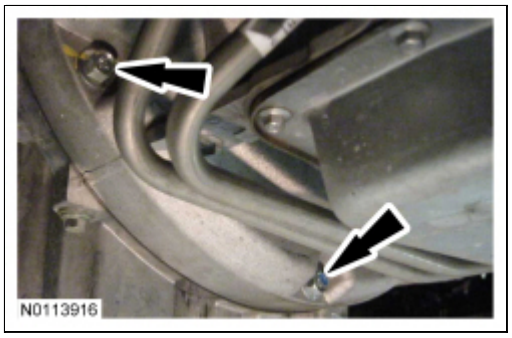
19. **NOTE:** This step does not apply if the engine front cover is removed.

    Loosen the engine-to-bellhousing bolt above the starter motor 5 mm (0.19 in).

repair4less

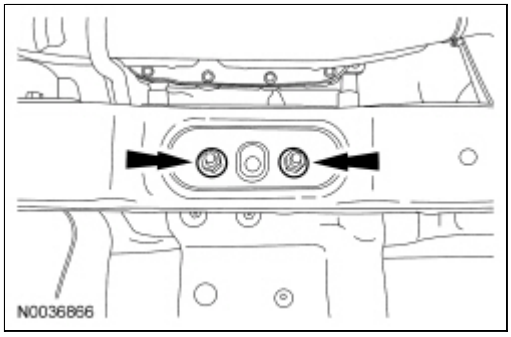


20. Remove the oil pan-to-bellhousing bolt from below the starter motor.



21. **NOTE:** This step does not apply if the engine front cover is removed.

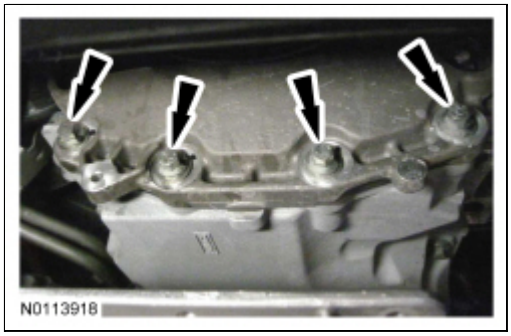
    Loosen the 2 LH bellhousing-to-engine bolts 5 mm (0.19 in).



22. Remove the 2 LH bellhousing-to-oil pan bolts.

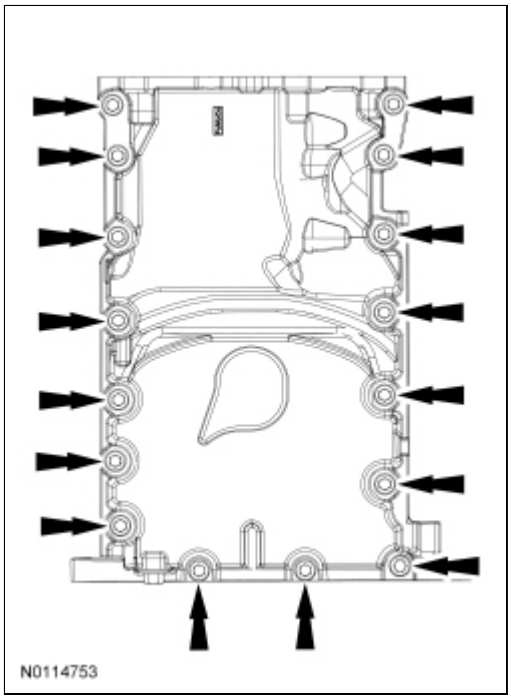
23. **NOTE:** This step does not apply if the engine front cover is removed.

Loosen the 2 transmission crossmember nuts.



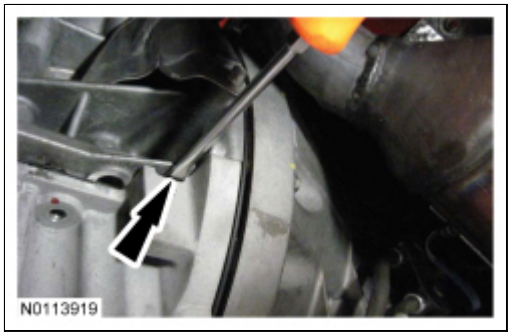
24. **NOTE:** This step does not apply if the engine front cover is removed.

    Slide the transmission rearward 5 mm (0.19 in).



25. **NOTE:** This step does not apply if the engine front cover is removed.

    Remove the 4 lower engine front cover bolts.



26. Remove the 16 oil pan bolts.

repair4less

27. **NOTE:** LH rear shown, RH front similar.

    Using a suitable pry tool, locate the 2 pry pads at the LH and RH sides of the oil pan and pry the oil pan loose and remove.

28. **NOTE:** The generator wiring harness retainer is being removed for clearance to install the oil pan.

    Detach the generator wiring harness retainer from the engine block.

29. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the oil**

pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.

Clean the engine oil pan using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

- Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

30. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the cylinder block and engine front cover sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

    Clean the sealing surfaces of the cylinder block and engine front cover in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

All vehicles

1. **NOTE:** This step does not apply if the engine front cover is removed.

    Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 engine front cover-to-cylinder block joint areas on the sealing surface of the oil pan.

2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTICE: **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the oil pan. Failure to follow these instructions may cause engine oil leakage.**

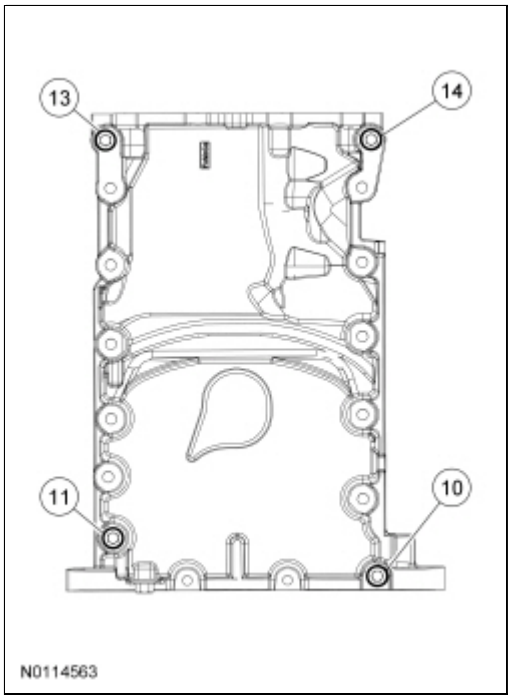
    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

    NOTE: Do not apply Motorcraft® High Performance Engine RTV Silicone to the front edge of the oil pan, if the engine front cover is removed.

repair4less

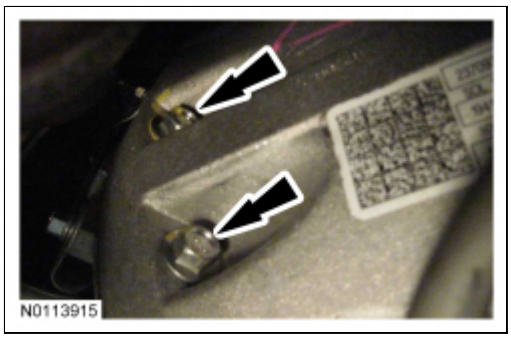
Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the oil pan to the sealing surface of the oil pan-to-engine block and to the oil pan-to-engine front cover mating surface.

3. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.



4. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant

application.

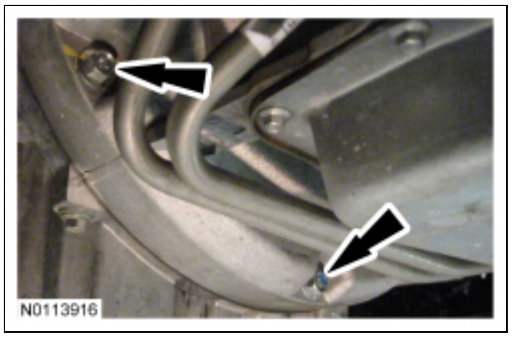


NOTE: Keep the oil pan as close as possible to the transmission while installing, then slide forward towards the engine front cover to prevent wiping off of the sealant.

Install the oil pan and bolts 10, 11, 13 and 14 finger tight.

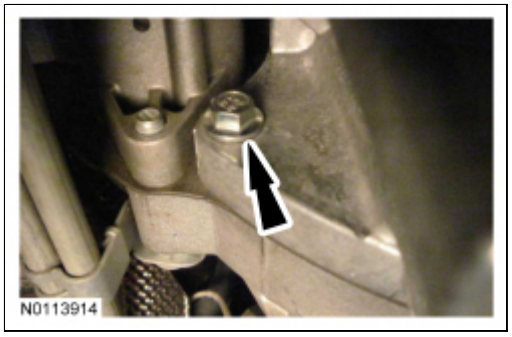
5. **NOTE:** This step does not apply if the engine front cover is removed.

   Tighten the 2 LH bellhousing-to-engine bolts.
   - Do not torque at this time.

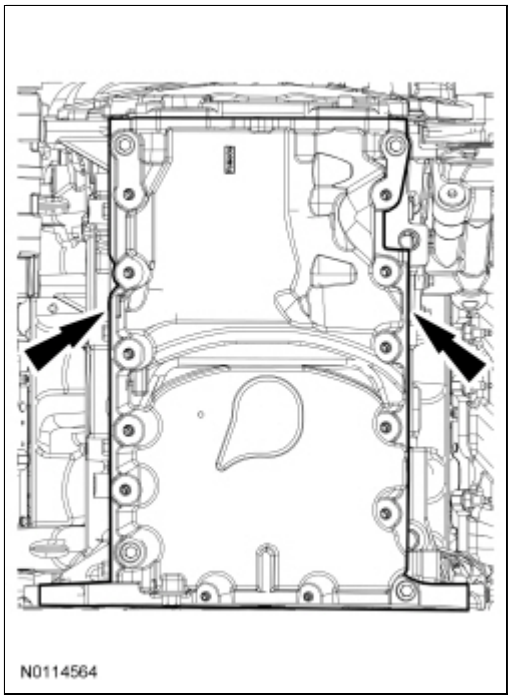


6. **NOTE:** This step does not apply if the engine front cover is removed.

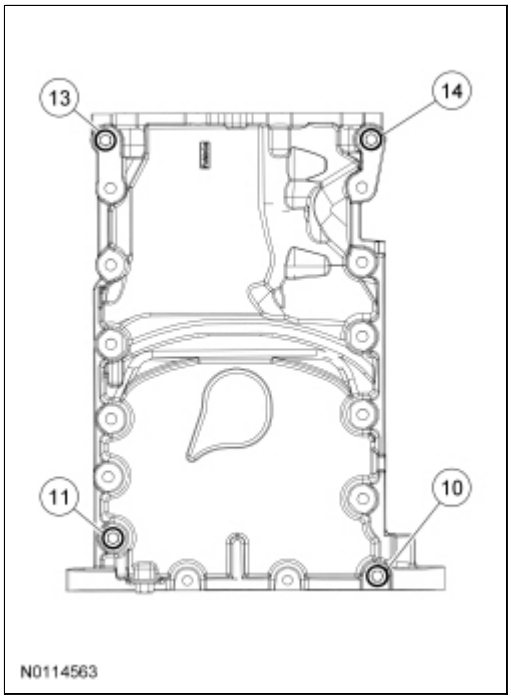
   Tighten the RH engine-to-bellhousing bolt.
   - Do not torque at this time.



repair4less

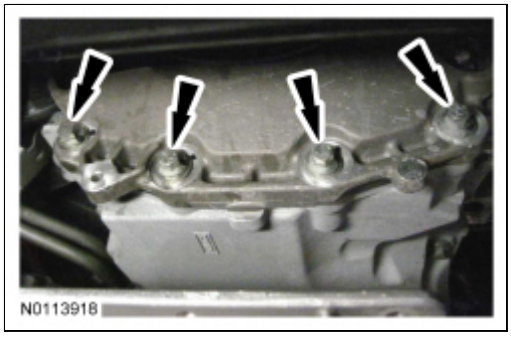


7. Install and tighten the 2 LH bellhousing-to-oil pan bolts.
    - Do not torque at this time.

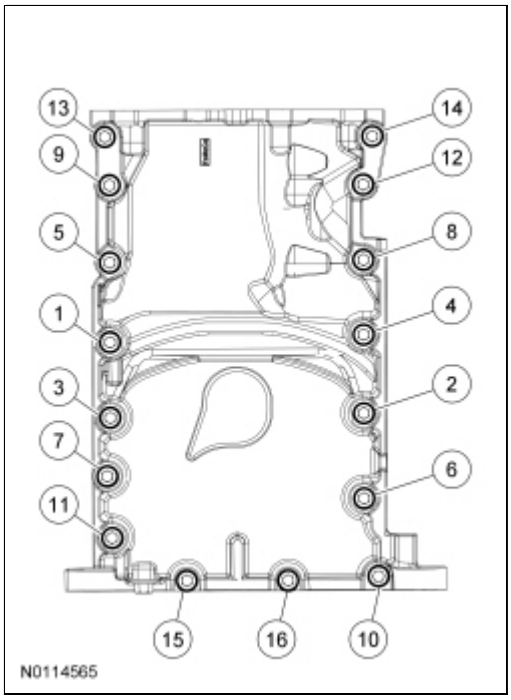


8. Install and tighten the RH oil pan-to-bellhousing bolt.
    - Do not torque at this time.

9. Laterally align the oil pan to the block. Make sure the oil pan is flush with the block at these 2 points.



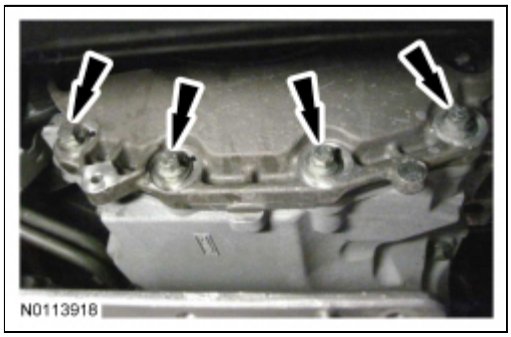
10. Tighten bolts 10, 11, 13 and 14 in the sequence shown to 3 Nm (27 lb-in).



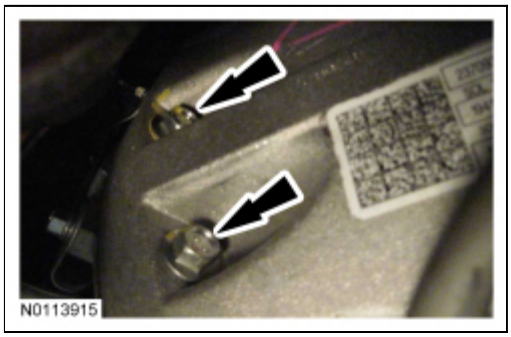
11. **NOTE:** This step does not apply if the engine front cover is removed.

    Install the 4 lower engine front cover bolts finger tight.

repair4less

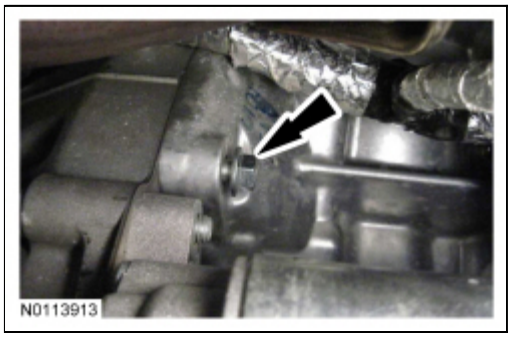


12. Install the remaining oil pan bolts and tighten in the sequence shown.
    - Tighten bolts 1-9 and 11-14 to 20 Nm (177 lb-in), then rotate an additional 45 degrees.
    - Tighten bolts 15 and 16 to 10 Nm (89 lb-in), then rotate an additional 45 degrees.
    - Tighten bolt 10 to 20 Nm (177 lb-in), then rotate an additional 90 degrees.



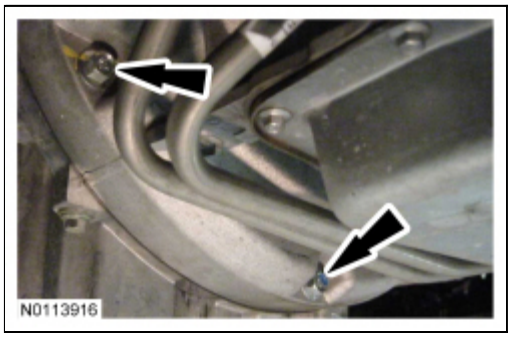
13. **NOTE:** This step does not apply if the engine front cover is removed.

    Tighten the 4 lower engine front cover bolts to 24 Nm (18 lb-ft).



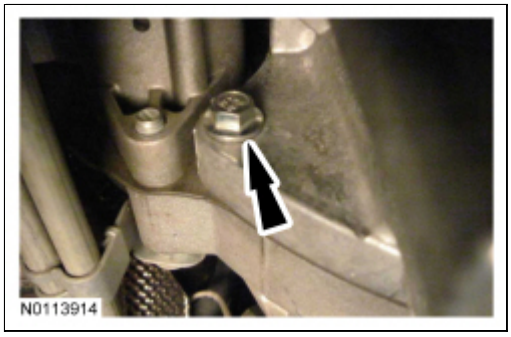
14. **NOTE:** This step does not apply if the engine front cover is removed.

    Tighten the 2 LH bellhousing-to-engine bolts to 48 Nm (35 lb-ft).

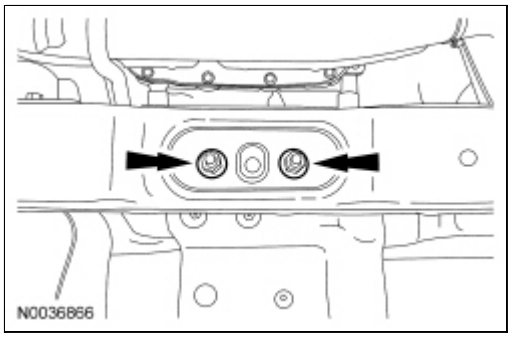


15. **NOTE:** This step does not apply if the engine front cover is removed.

    Tighten the RH engine-to-bellhousing bolt to 48 Nm (35 lb-ft).

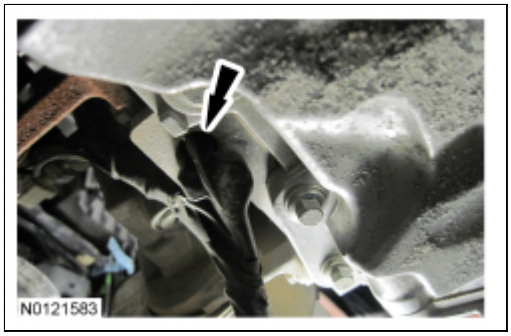


16. Tighten the 2 LH bellhousing-to-oil pan bolts to 48 Nm (35 lb-ft).



17. Tighten the RH oil pan-to-bellhousing bolt to 48 Nm (35 lb-ft).

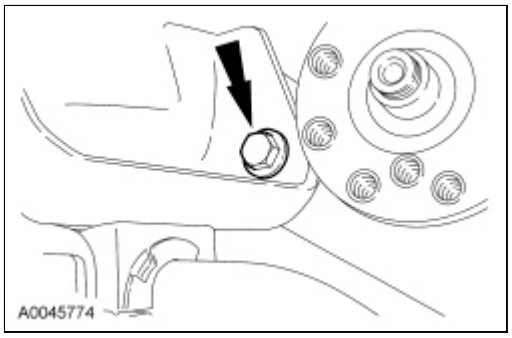
repair4less



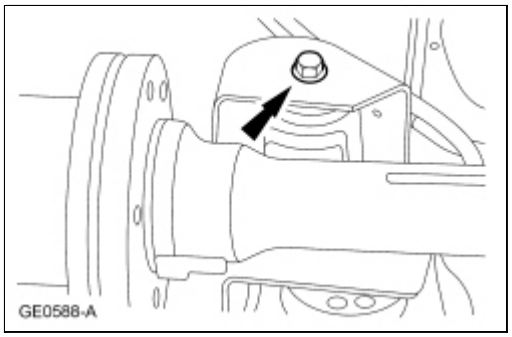
18. **NOTE:** This step does not apply if the engine front cover is removed.

    Tighten the 2 transmission crossmember nuts to 103 Nm (75 lb-ft).

19. Attach the generator wiring harness retainer to the engine block.

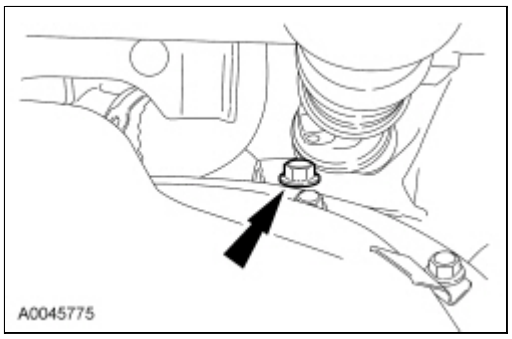


Four Wheel Drive (4X4) vehicles



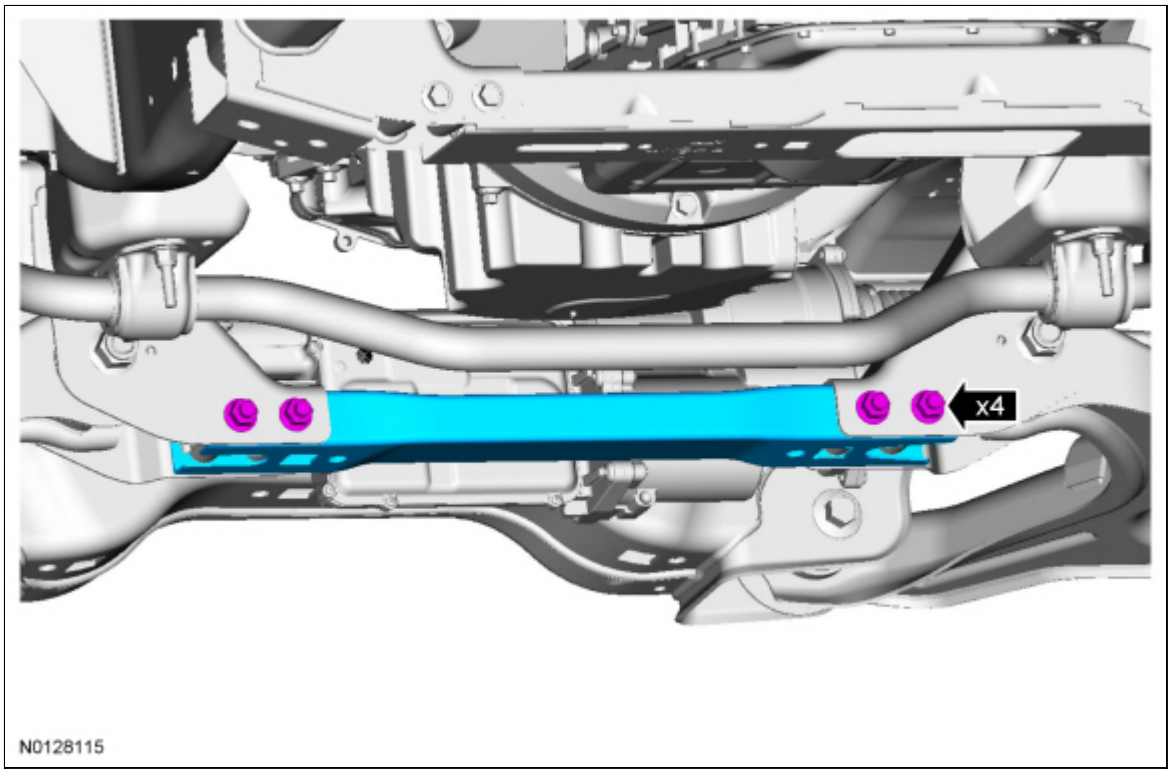
20. ***NOTICE:*** **Use care when positioning the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

    Raise the front axle carrier into position.

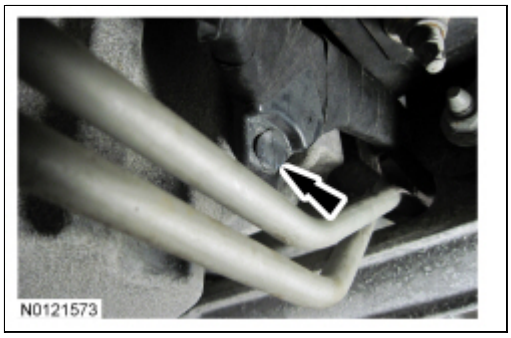


21. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

22. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



23. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



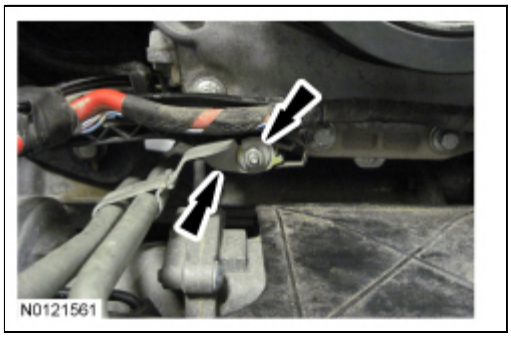
All vehicles

24. Position the crossmember and install the 4 nuts and bolts.
    - Tighten to 90 Nm (66 lb-ft).

repair4less

25. Attach the starter motor wiring harness retainer to the oil pan.

26. Install the starter motor. For additional information, refer to Section 303-06 .

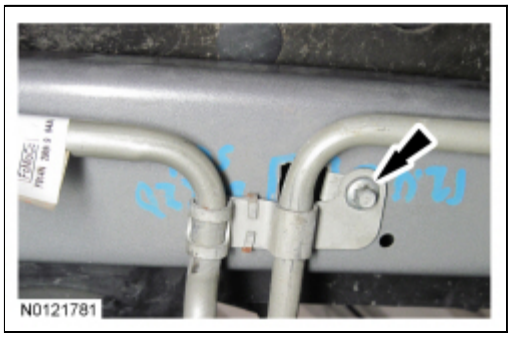


27. **NOTE:** This step does not apply if the engine front cover is removed.

    Attach the generator wiring harness to the engine front cover.

28. **NOTE:** This step does not apply if the engine front cover is removed.

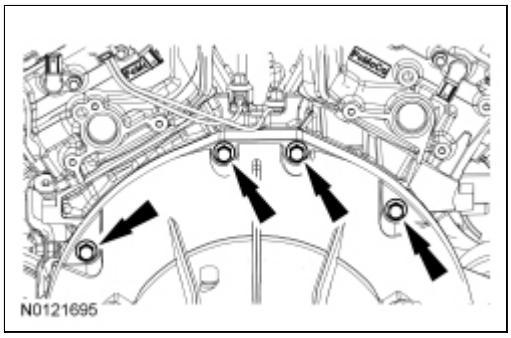
    Install the transmission cooler line bracket and nut to the engine front cover stud bolt.
    - Tighten to 12 Nm (106 lb-in).



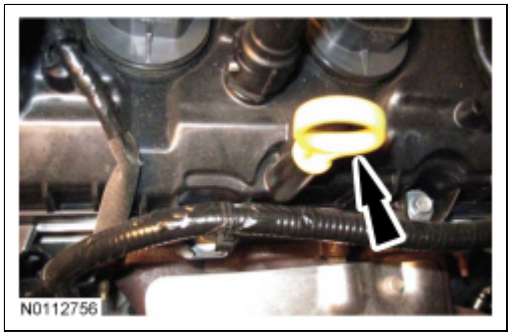
29. **NOTE:** Do not lubricate the engine oil filter gasket.

    Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

30. Position the transmission cooler tube bracket to the radiator support and install the bolt.
    - Tighten to 12 Nm (106 lb-in).



31. If equipped, install the skid plate and the bolts.
    - Tighten to 48 Nm (35 lb-ft).



32. **NOTE:** This step does not apply if the engine front cover is removed.

    Tighten the 4 upper bellhousing-to-engine bolts to 48 Nm (35 lb-ft).

repair4less

33. Install the oil level indicator.

34. Fill the engine with clean engine oil.

35. Connect the battery ground cable. For additional information, refer to Section 414-01 .

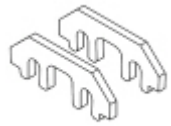
Oil Pump Screen and Pickup Tube

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.

2. Remove the 3 bolts and the oil pump screen and pickup tube.
   - Discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

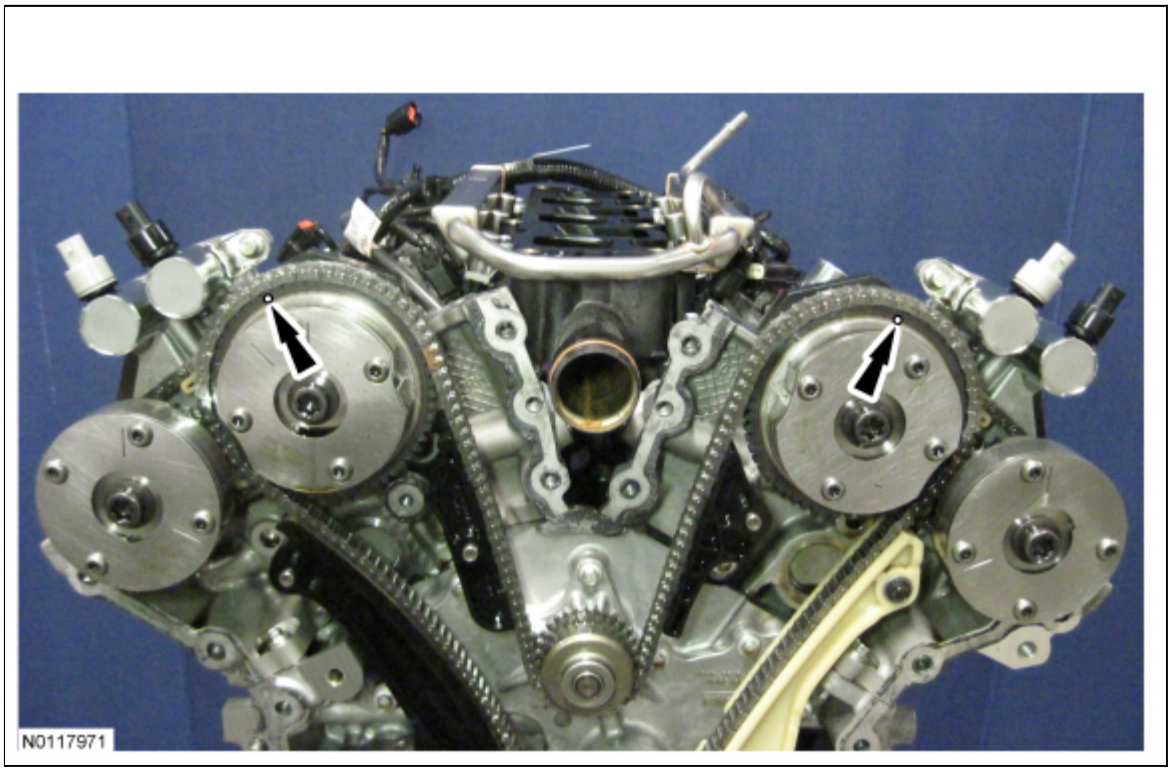


3. **NOTE:** Install a new O-ring seal.

   To install, reverse the removal procedure.

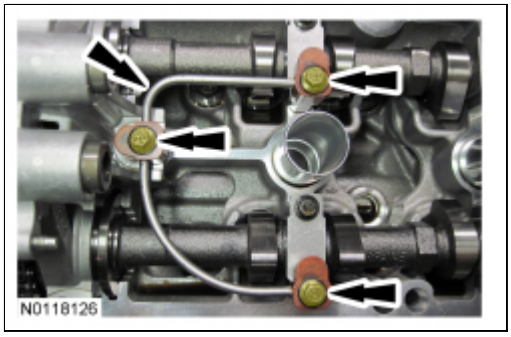
repair4less

Oil Pump



Special Tool(s)

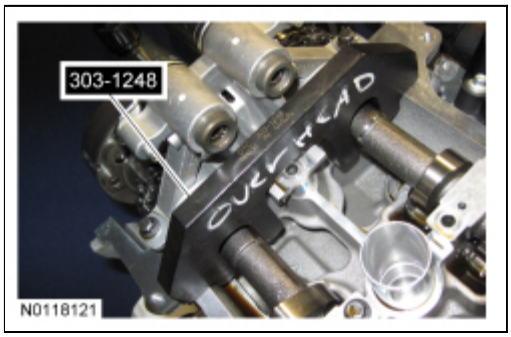
 ST2979-A	Tool, Camshaft Holding 303-1248



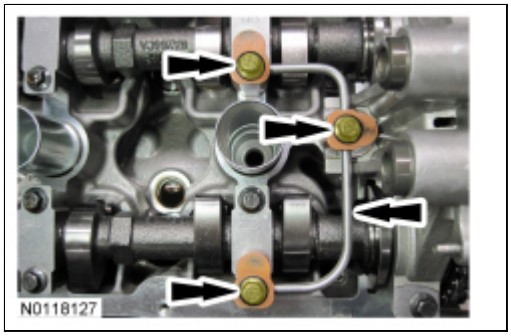
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
3. Rotate the crankshaft clockwise and align the timing marks on the intake Variable Camshaft Timing (VCT) assemblies as shown.

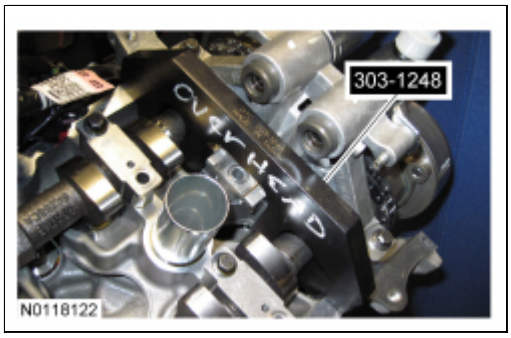


4. Remove the 3 bolts and the LH valve train oil tube.



5. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.

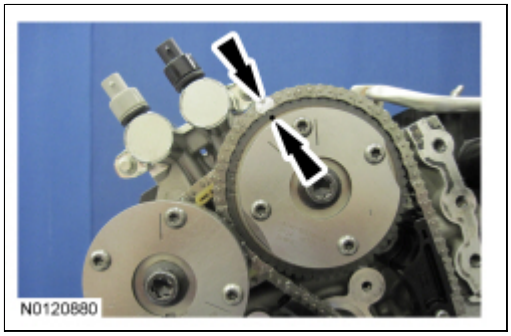


6. Remove the 3 bolts and the RH valve train oil tube.

7. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

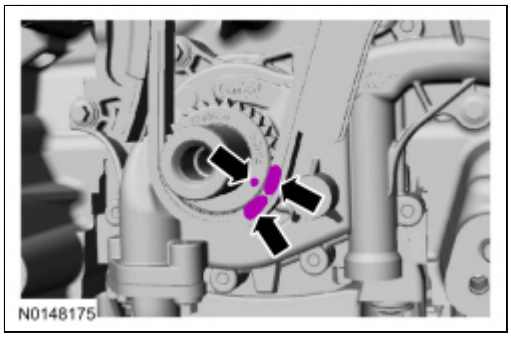
   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

repair4less

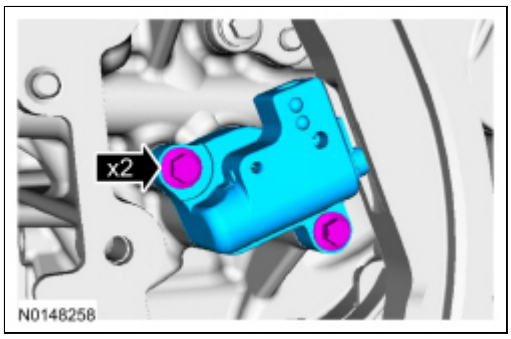


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



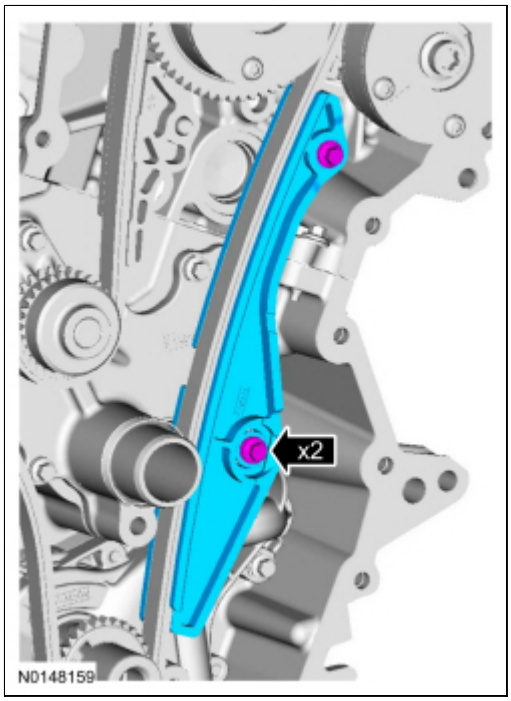
9. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



10. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.

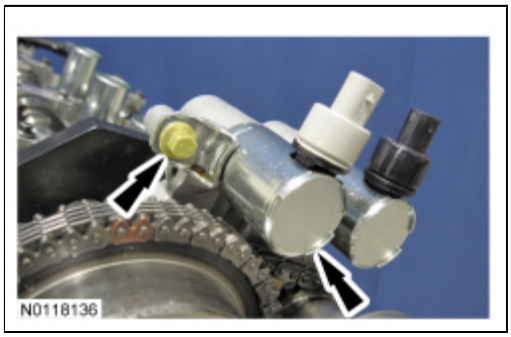
11. Remove the 2 bolts and the primary timing chain tensioner.



12. Remove the primary timing chain tensioner arm.

13. Remove the 2 bolts and the lower LH primary timing chain guide.

repair4less

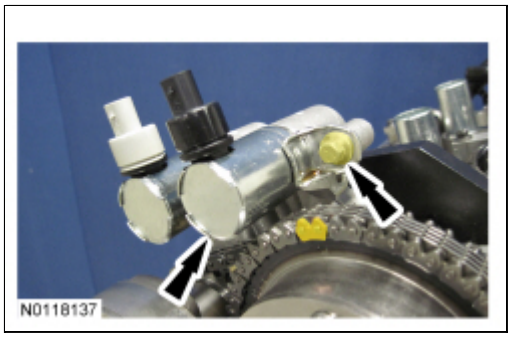


14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.

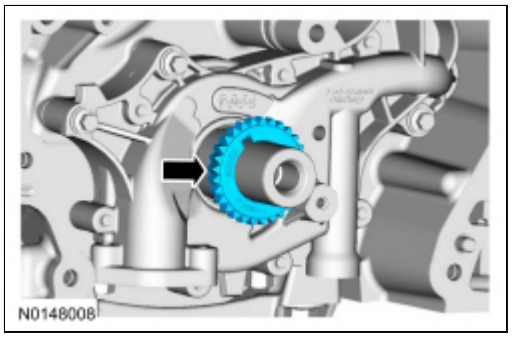


15. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

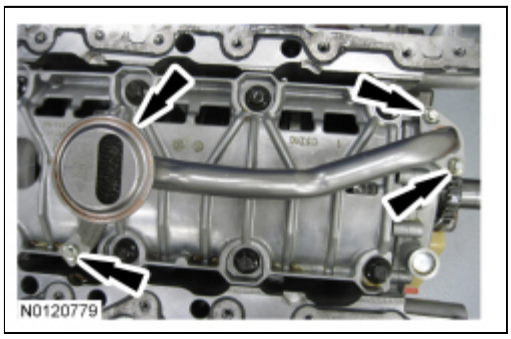
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

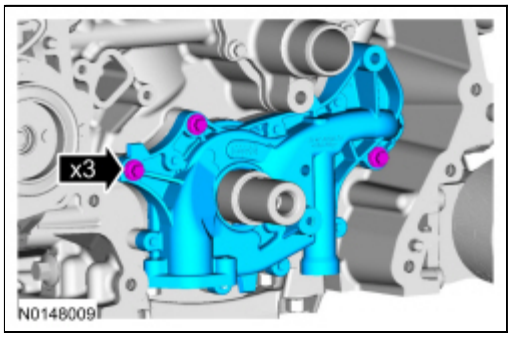


16. Remove the primary timing chain.

17. Remove the oil pan. For additional information, refer to Oil Pan in this section.



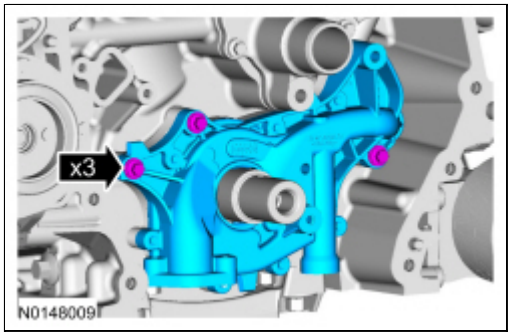
18. Remove the crankshaft timing chain sprocket.



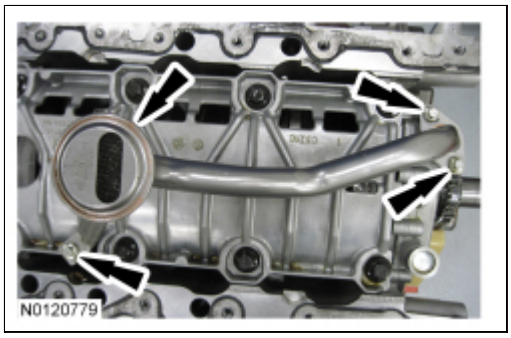
19. Remove the 3 bolts and the oil pump screen and pickup tube.

repair4less

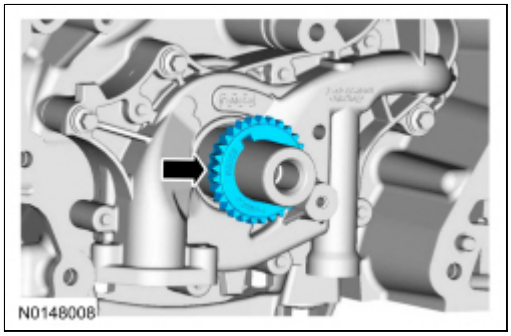
- Discard the O-ring seal.



20. Remove the 3 bolts and the oil pump.

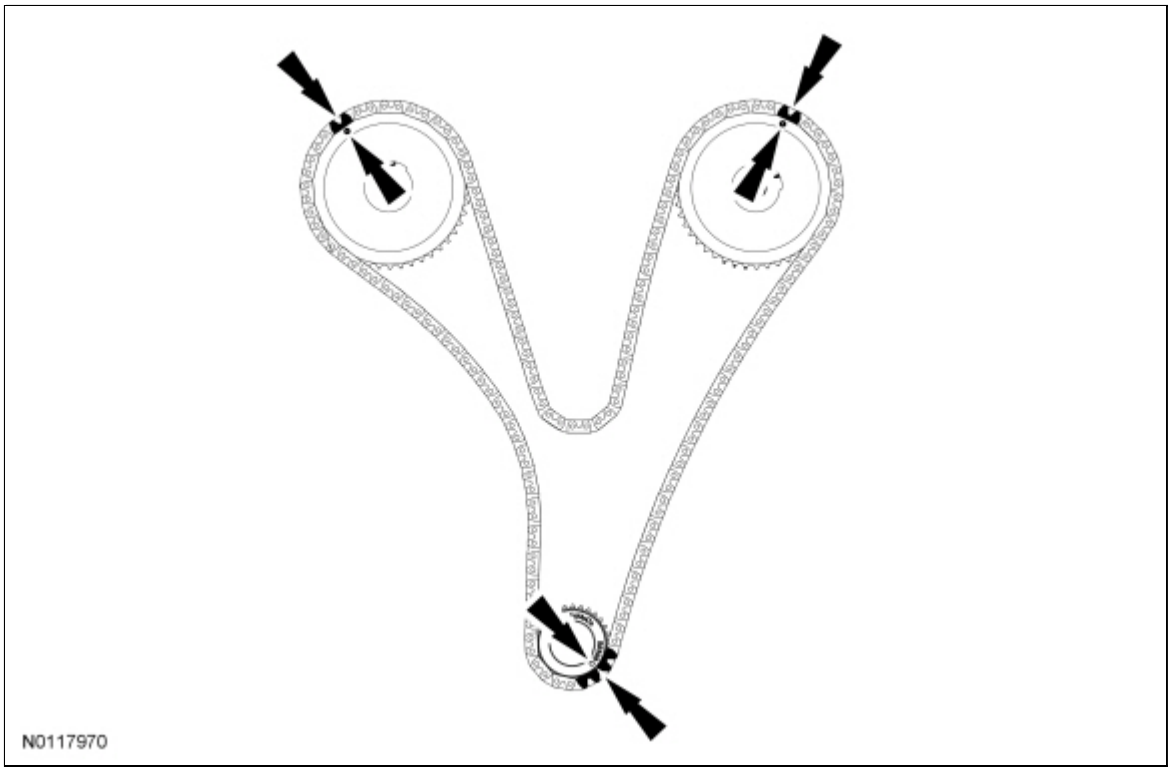


Installation



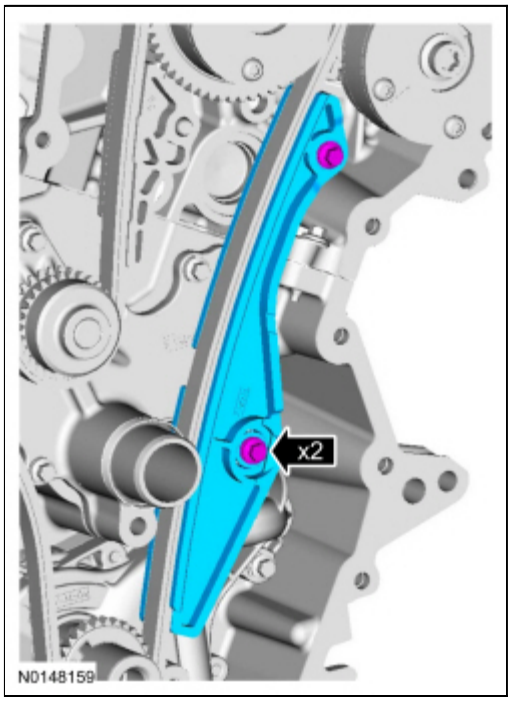
1. Install the oil pump and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

2. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



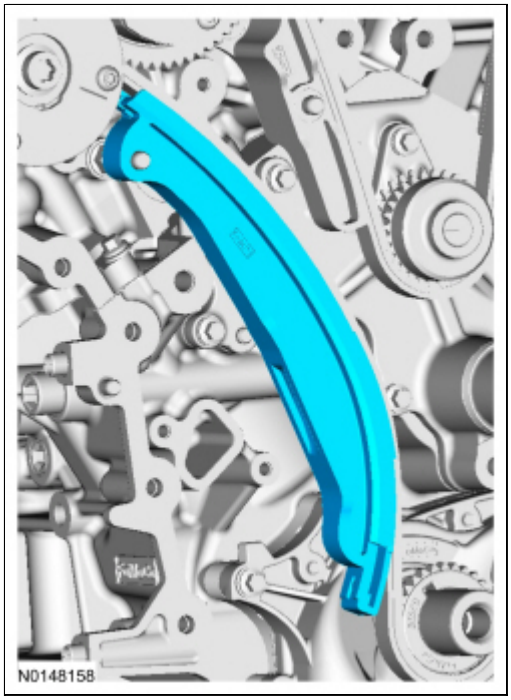
3. Install the crankshaft timing chain sprocket.

4. Install the oil pan. For additional information, refer to Oil Pan in this section.



5. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

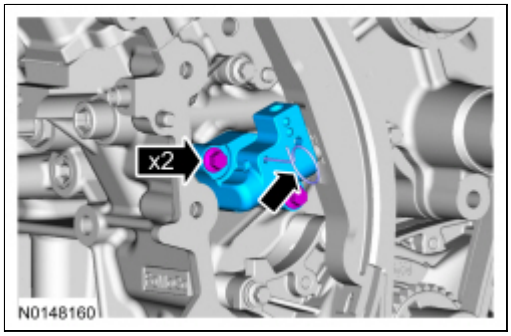
   Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



repair4less

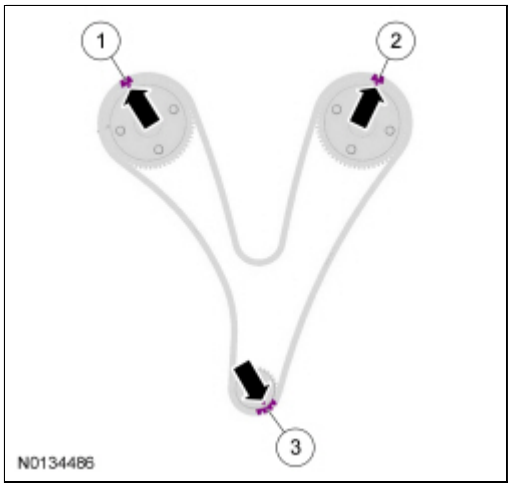
6. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

7. Install the primary timing chain tensioner arm.



8. Reset the primary timing chain tensioner.
    - Release the ratchet detent.
    - Using a soft-jawed vise, compress the ratchet plunger.
    - Align the hole in the ratchet plunger with the hole in the tensioner housing.

- Install a suitable lockpin.

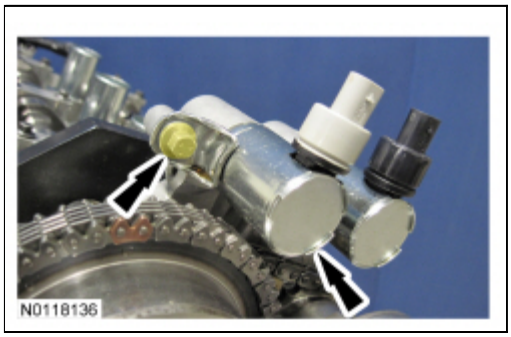


9. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

   Install the primary timing chain tensioner and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).
   - Remove the lockpin.

10. As a post-check, verify correct alignment of all timing marks.
    - There is 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There is 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).

repair4less

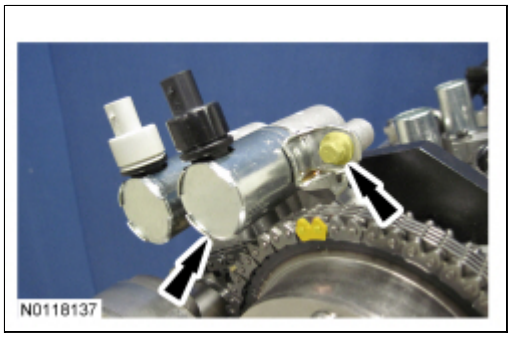


11. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the LH intake VCT oil control solenoid and the bolt.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

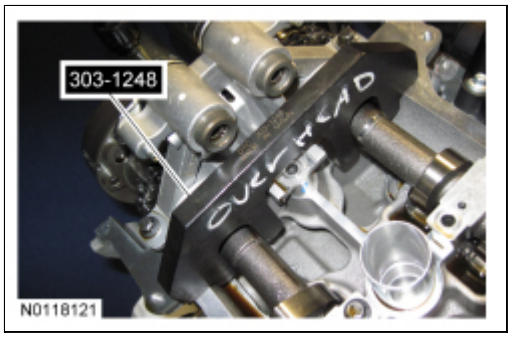


12. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

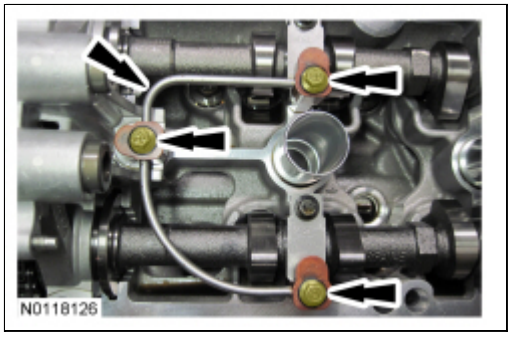
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the RH intake VCT oil control solenoid and the bolt.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



13. Remove the Camshaft Holding Tool.

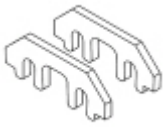
14. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



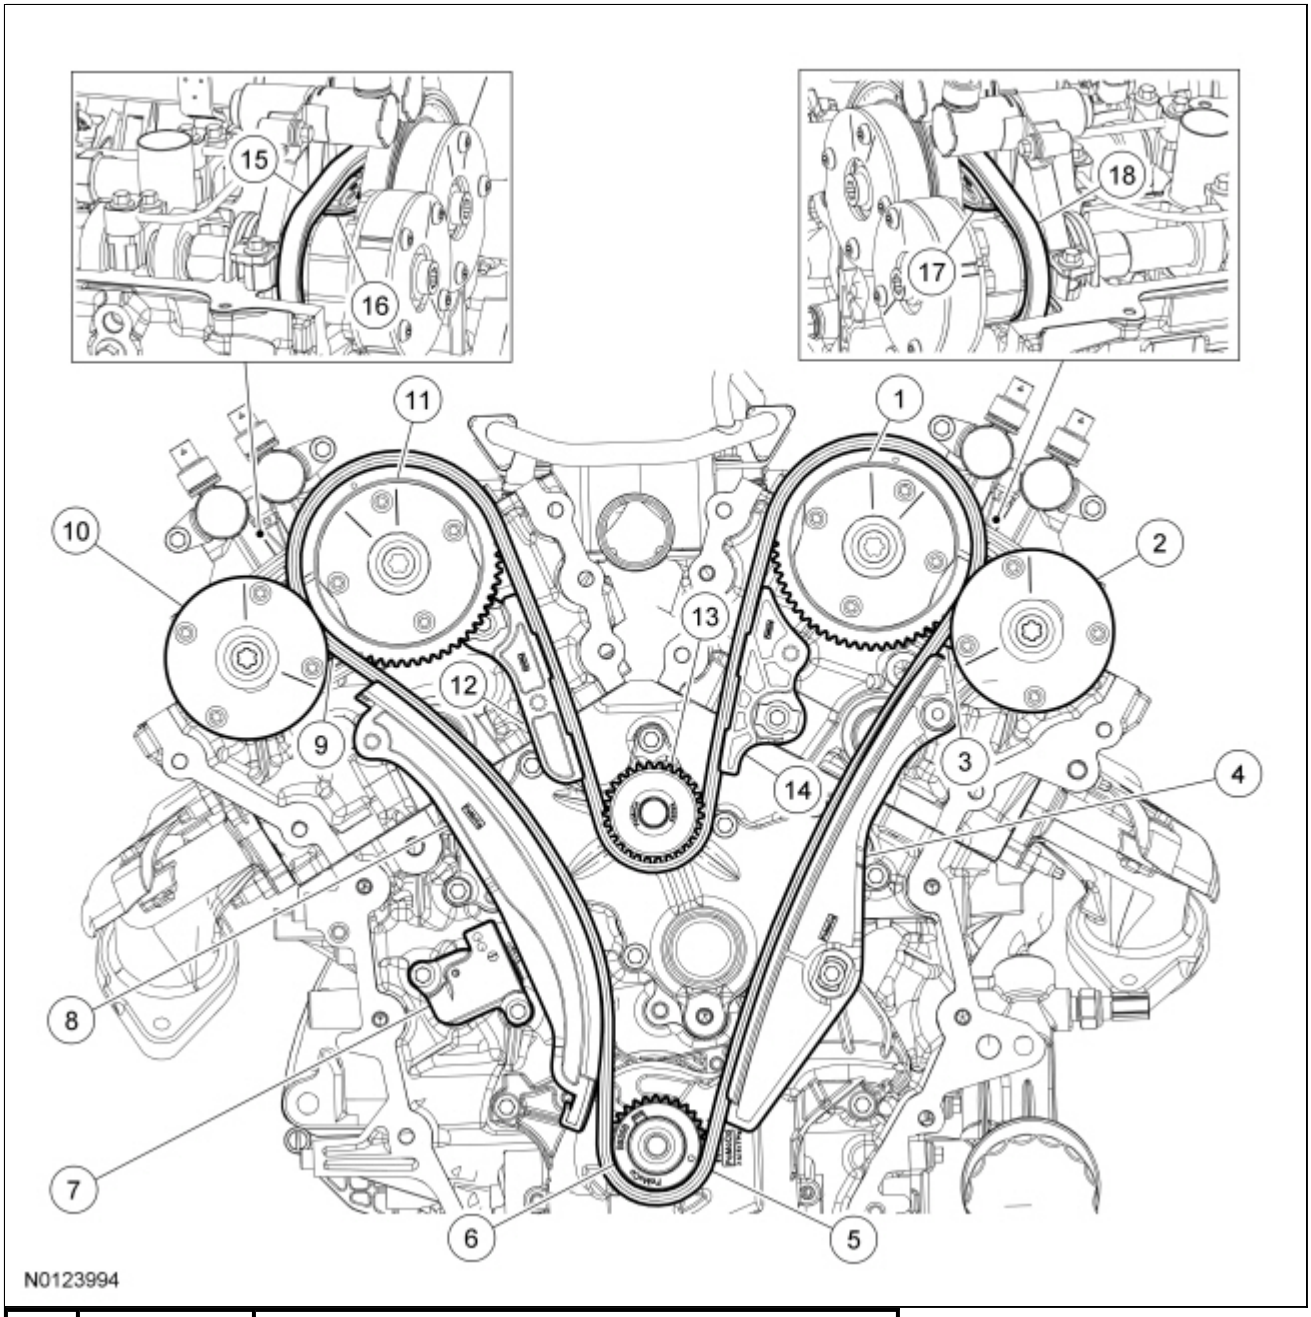
15. Remove the Camshaft Holding Tool.

16. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.

repair4less



- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.



17. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.
18. Fill the engine with clean engine oil.

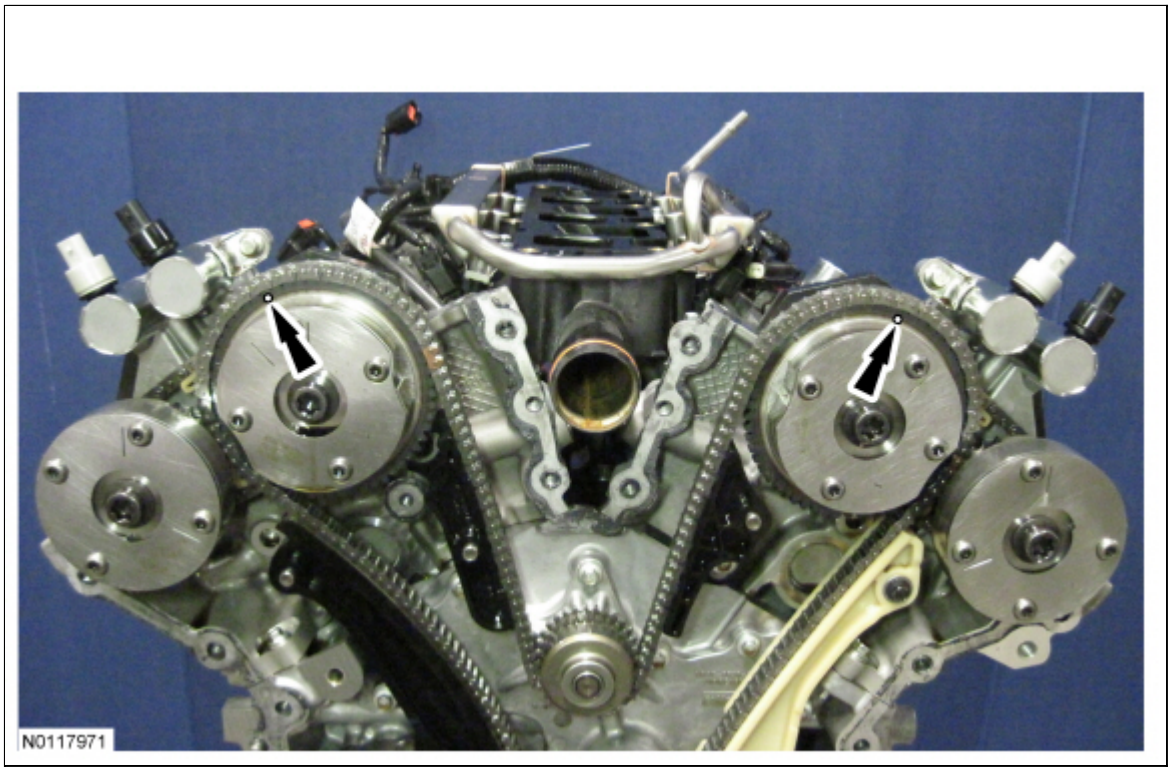
Timing Drive Components

Special Tool(s)

 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248

repair4less

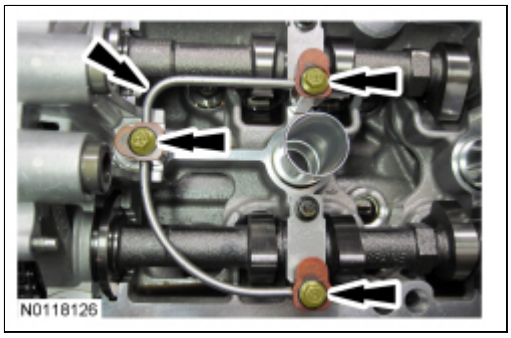
Item	Part Number	Description
1	6256	LH intake Variable Camshaft Timing (VCT) assembly
2	6C525	LH exhaust VCT assembly
3	6K297	LH secondary timing chain tensioner shoe
4	6B274	LH primary timing chain guide
5	6268	Primary timing chain
6	6306	Crankshaft timing chain sprocket
7	6L266	Primary timing chain tensioner
8	6K255	RH primary timing chain tensioner arm
9	6K297	RH secondary timing chain tensioner shoe



10	6C525	RH exhaust VCT assembly
11	6256	RH intake VCT assembly
12	6K297	RH primary timing chain guide
13	8501	Channel cover plate
14	6K297	LH primary timing chain guide
15	6268	RH secondary timing chain
16	6K254	RH secondary timing chain tensioner
17	6K254	LH secondary timing chain tensioner
18	6268	LH secondary timing chain

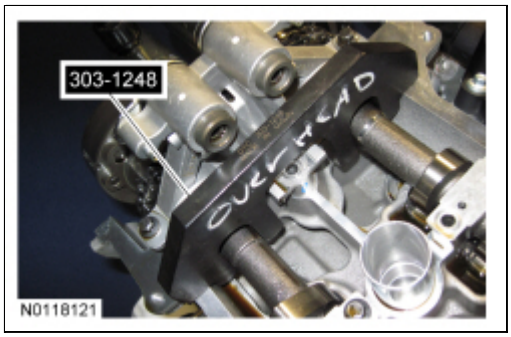
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**



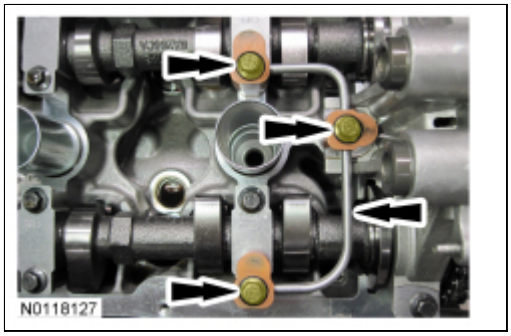
All engines

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Rotate the crankshaft clockwise and align the timing marks on the intake Variable Camshaft Timing (VCT) assemblies as shown.



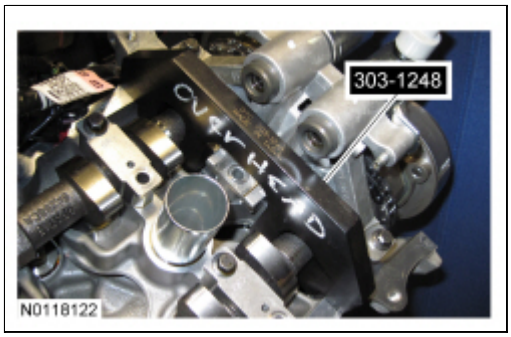
3. Remove the 3 bolts and the LH valve train oil tube.

repair4less

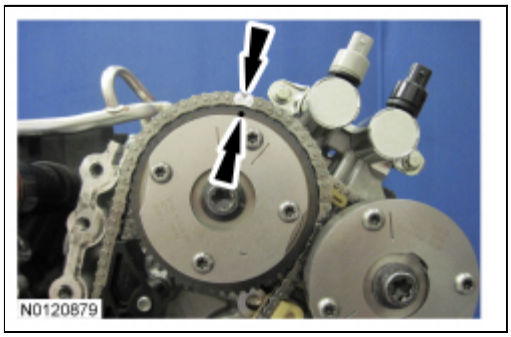


4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.

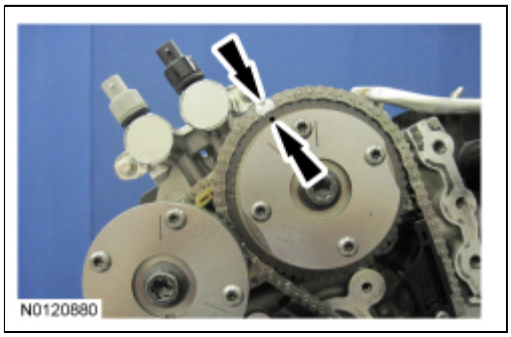


5. Remove the 3 bolts and the RH valve train oil tube.



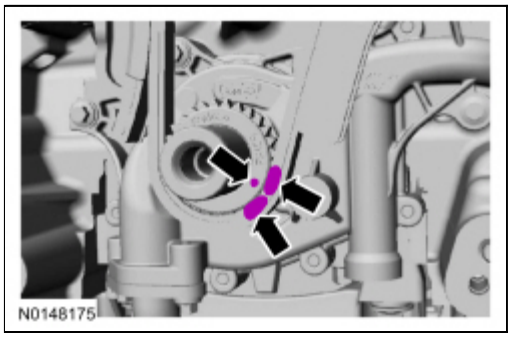
6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

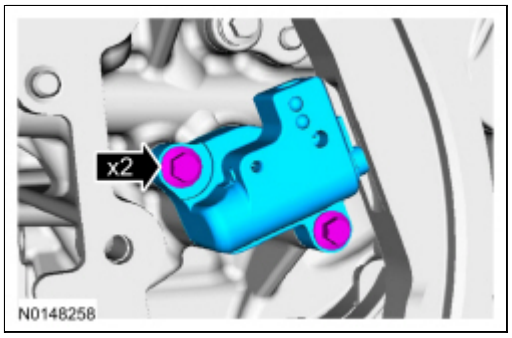


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.

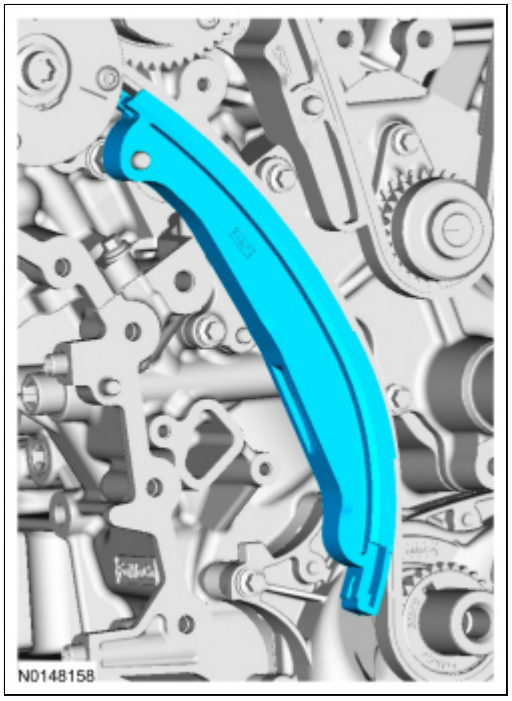


8. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.

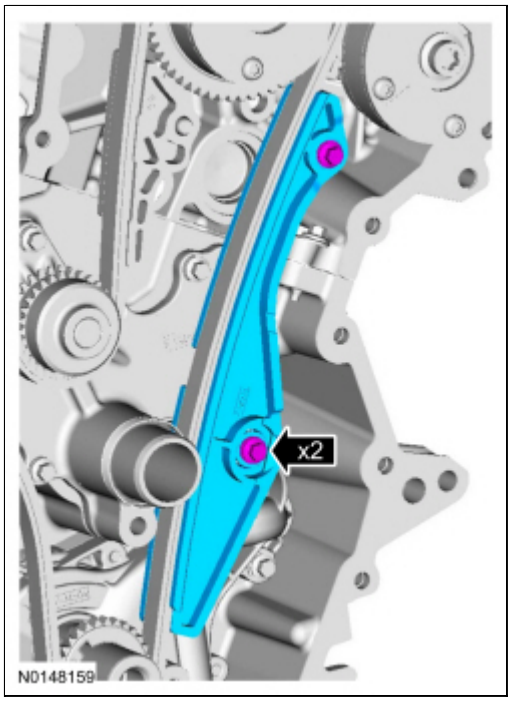


9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



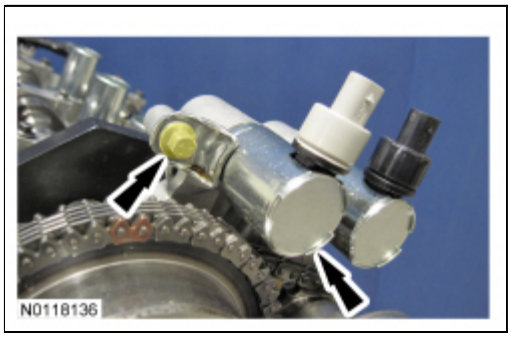
10. Remove the 2 bolts and the primary timing chain tensioner.



repair4less

11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.

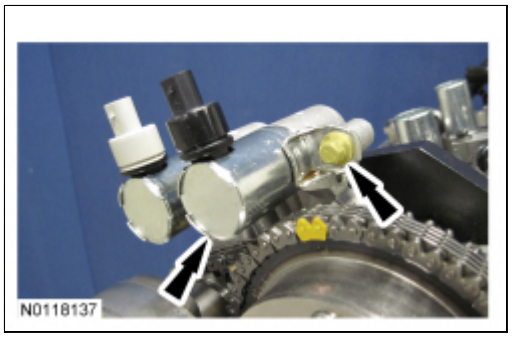


13. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.

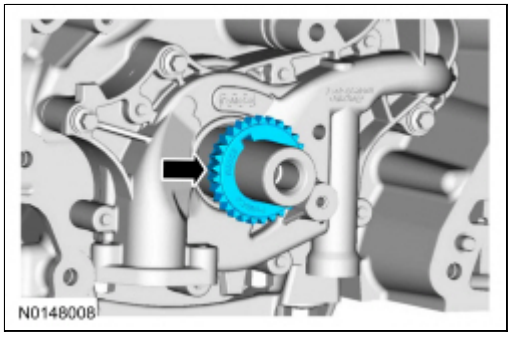


14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

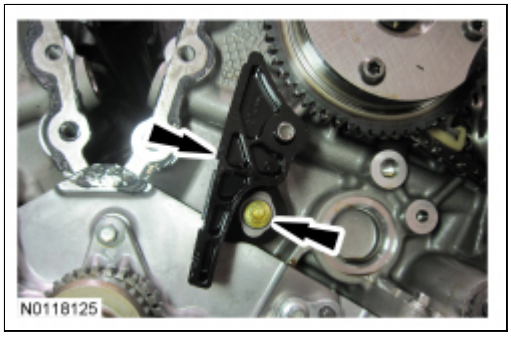
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.



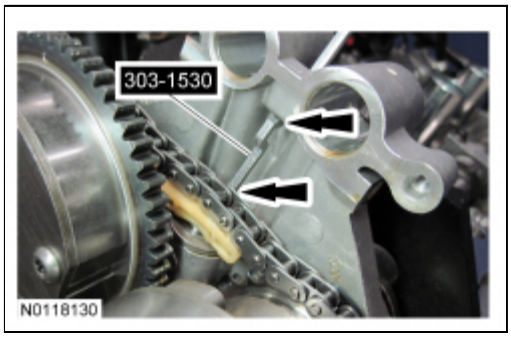
repair4less

15. Remove the primary timing chain.

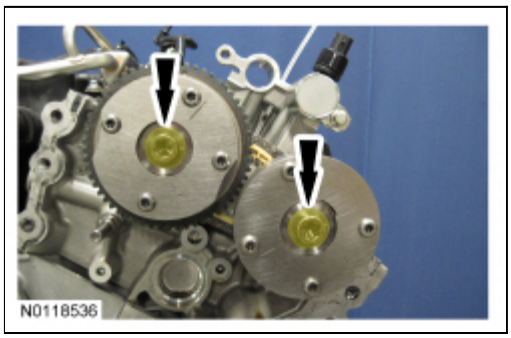


16. Remove the crankshaft timing chain sprocket.

17. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**



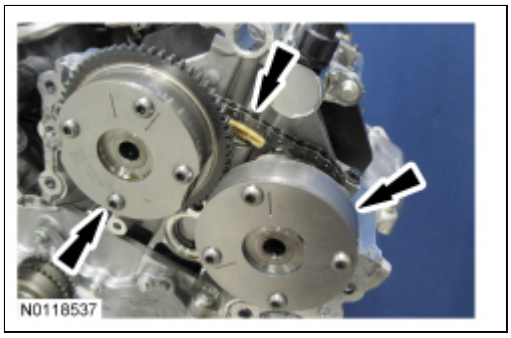
Remove the bolt and the upper LH primary timing chain guide.



18. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

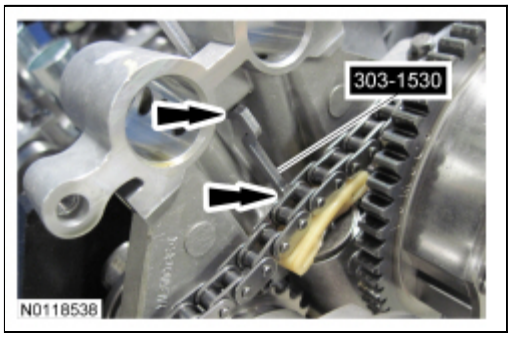
    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

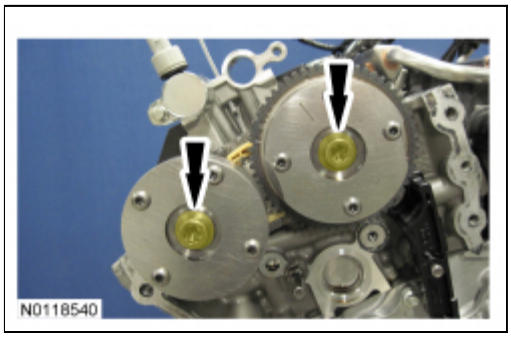


19. Remove and discard the 2 LH VCT assembly bolts.

20. Remove the 2 LH VCT assemblies and secondary timing chain.



repair4less



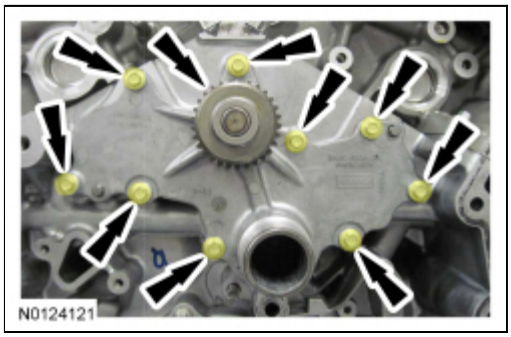
21. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

22. Remove and discard the 2 RH VCT assembly bolts.

23. Remove the 2 RH VCT assemblies and secondary timing chain.

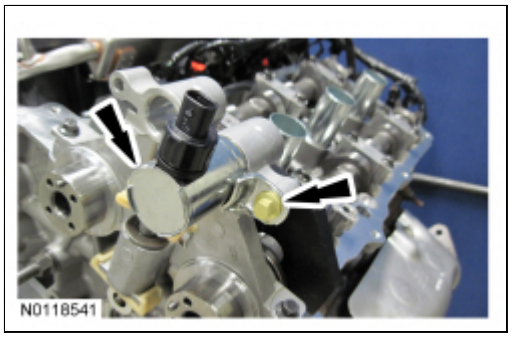


24. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.**

    Remove the bolt and the RH primary timing chain guide.

25. Remove the 9 bolts and the channel cover plate.
    - Discard the gaskets.

Engines with secondary timing chain tensioner removed

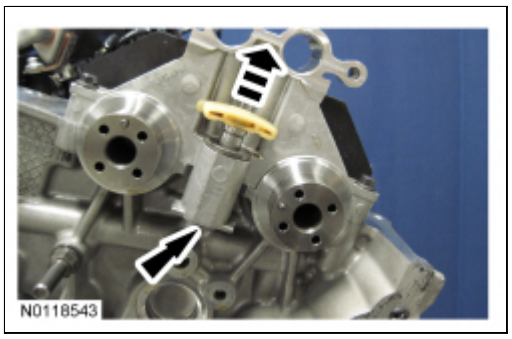


NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.**

26. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

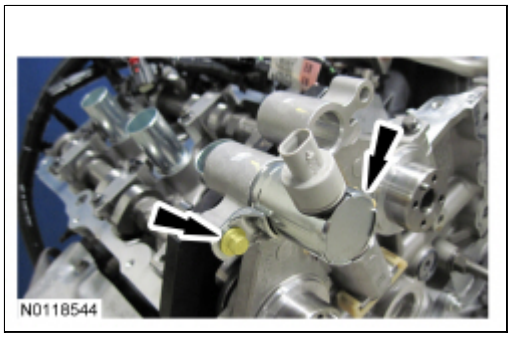
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the LH exhaust VCT oil control solenoid.

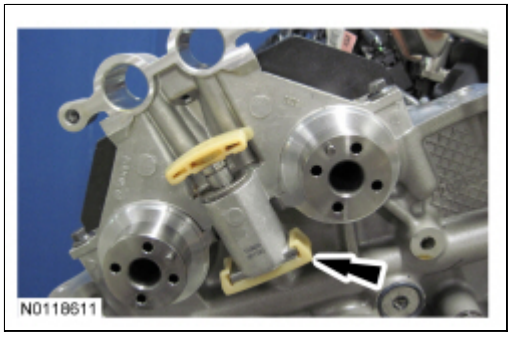


repair4less

27. Remove the LH secondary timing chain tensioner shoe.



28. Remove the LH secondary timing chain tensioner by pushing up from the bottom and remove.

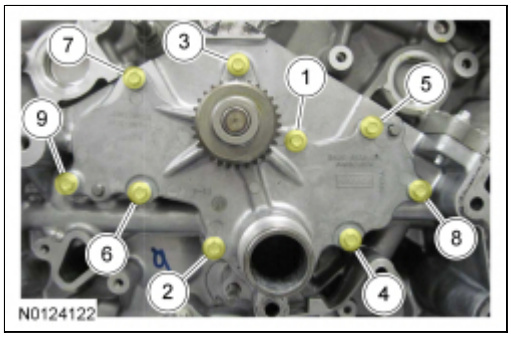


29. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the RH exhaust VCT oil control solenoid.

30. Remove the RH secondary timing chain tensioner shoe.



31. Remove the RH secondary timing chain tensioner by pushing up from the bottom and remove.

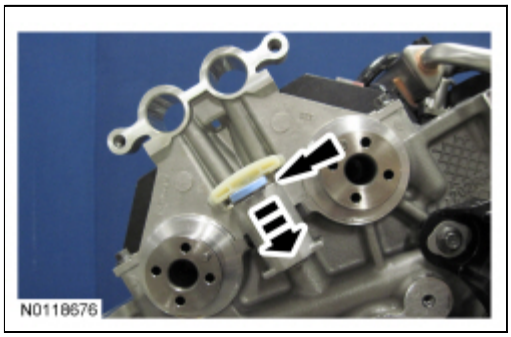
Installation

All engines

1. Using new gaskets, install the channel cover plate and the 9 bolts. Tighten in the sequence shown in 2 stages:
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

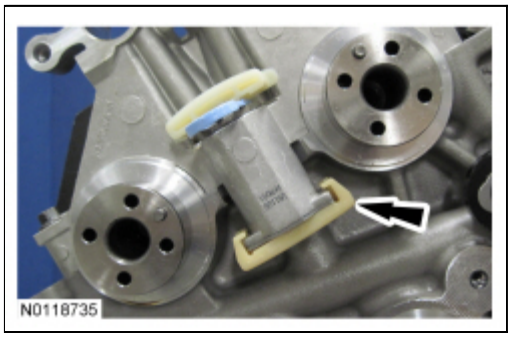
2. Install the RH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

repair4less



Engines with secondary timing chain tensioner removed

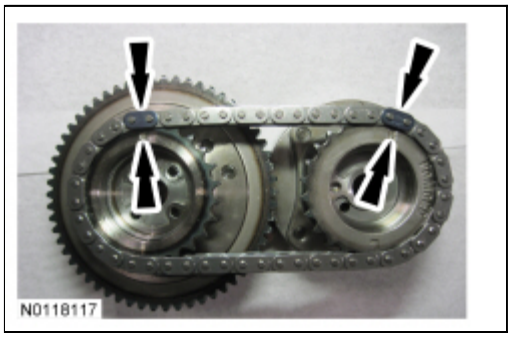
NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed or damage to the engine may occur.**



3. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

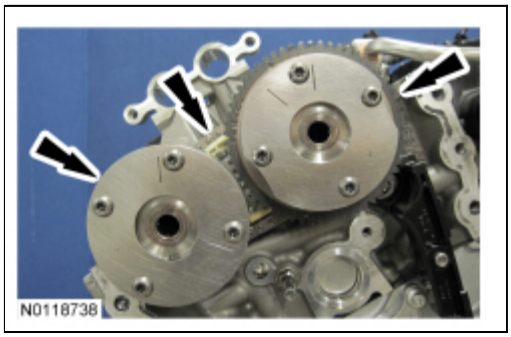
   NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

   Install the RH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

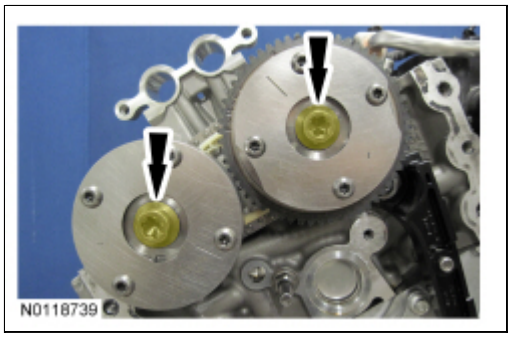


4. Install the RH secondary timing chain tensioner shoe.

5. Remove and discard the RH secondary timing chain tensioner shipping clip.

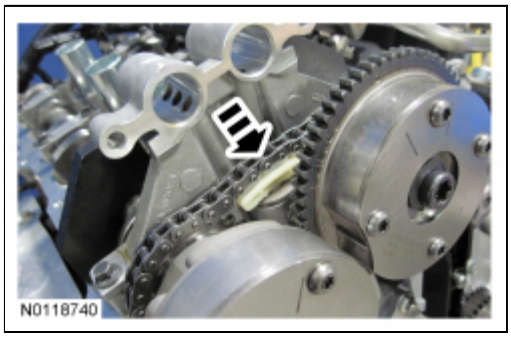


6. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



7. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

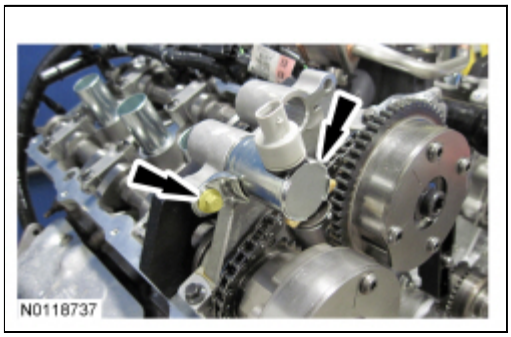
   Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



8. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

repair4less

9. Activate the RH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

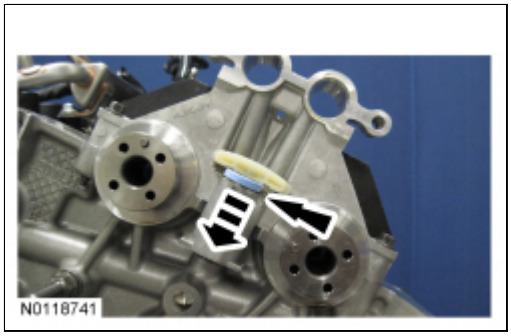


10. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

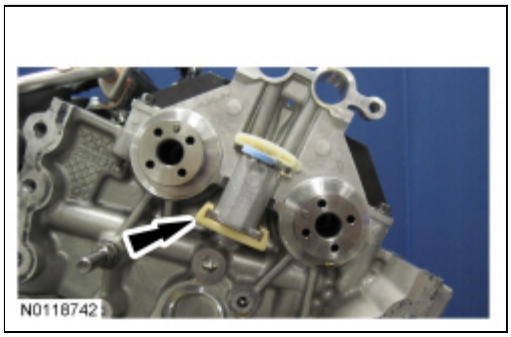
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH exhaust VCT oil control solenoid.

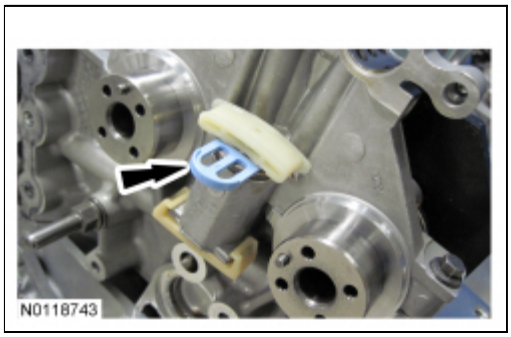


- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

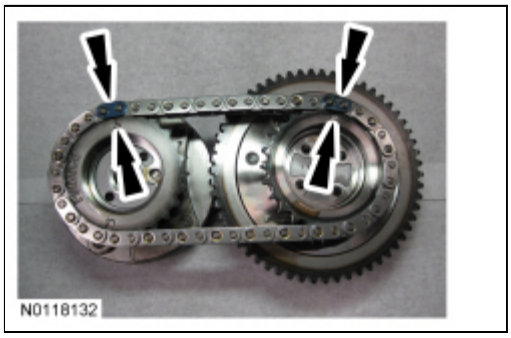


11. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

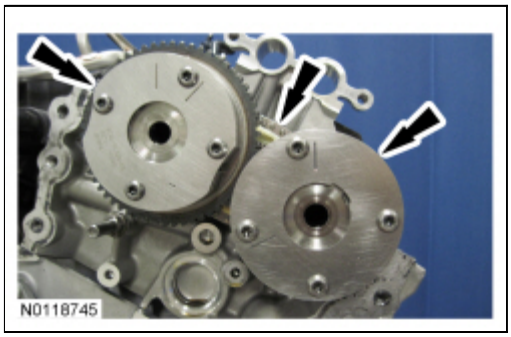


Install the LH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

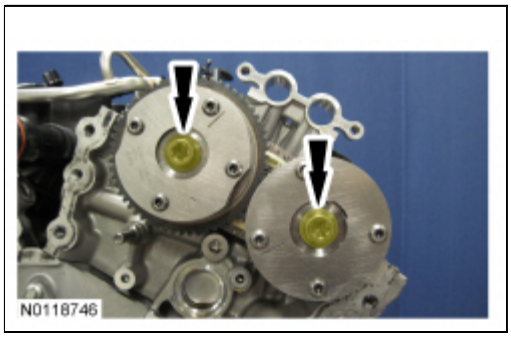


12. Install the LH secondary timing chain tensioner shoe.

13. Remove and discard the LH secondary timing chain tensioner shipping clip.



14. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.



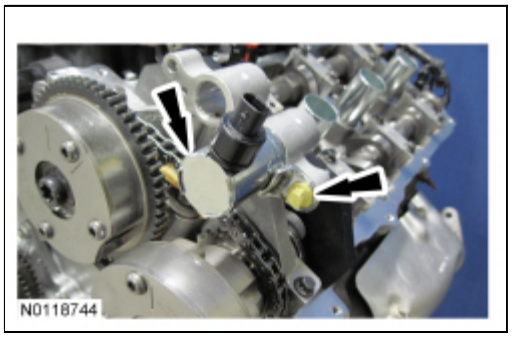
repair4less

15. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

16. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

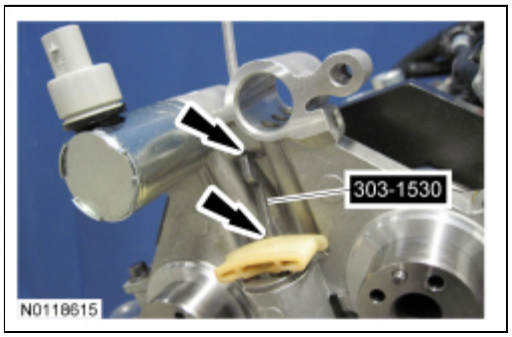
17. Activate the LH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.



18. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

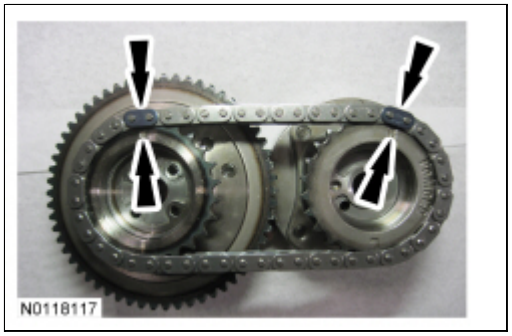
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.



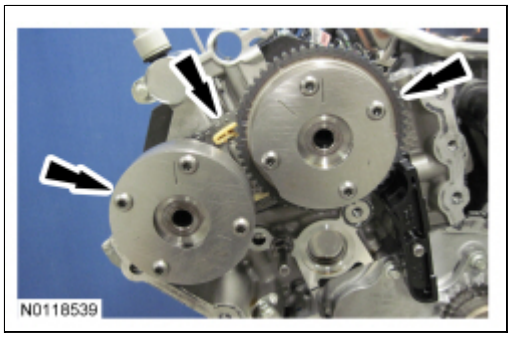
Install the LH exhaust VCT oil control solenoid.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

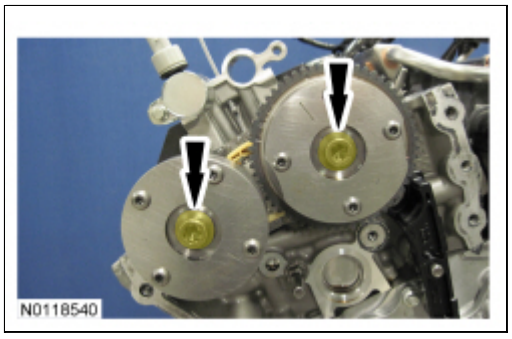


Engines with secondary timing chain tensioner not removed

19. Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.



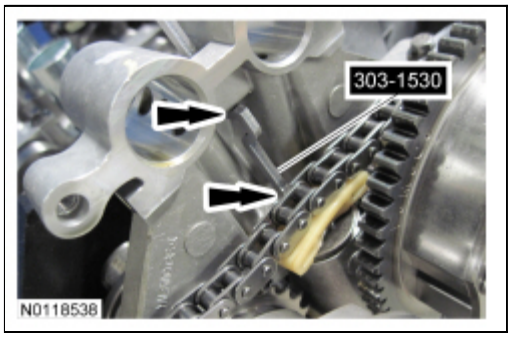
20. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



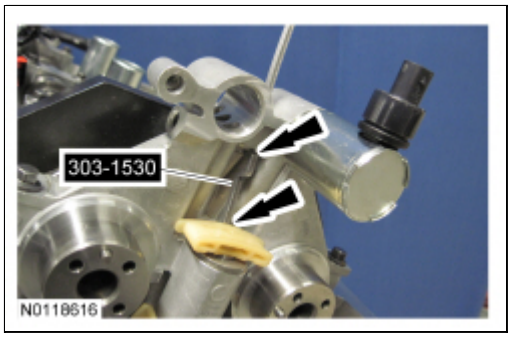
21. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

repair4less



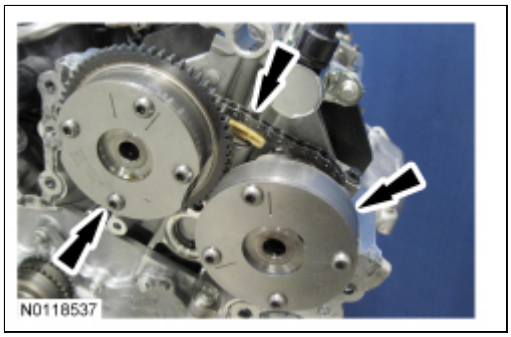
22. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.



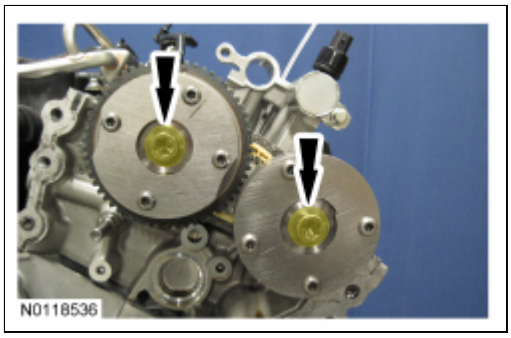
23. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

24. Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

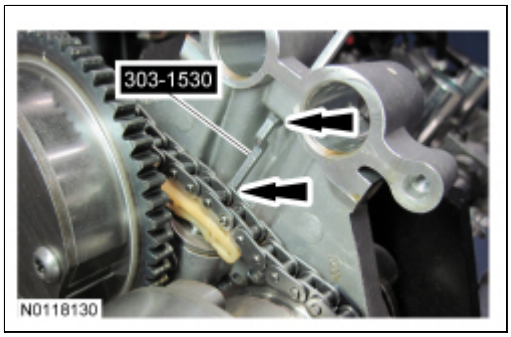


25. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.



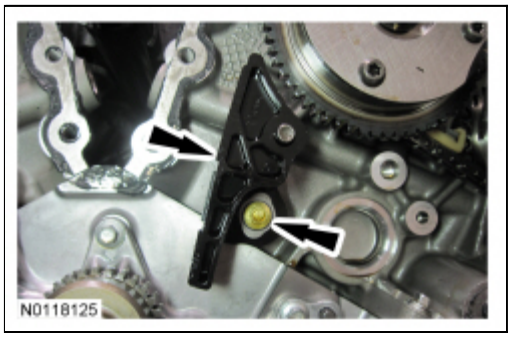
26. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



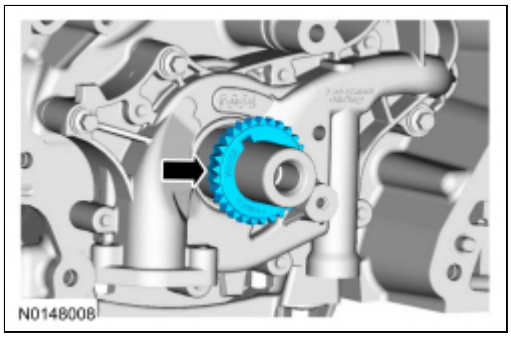
27. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

repair4less



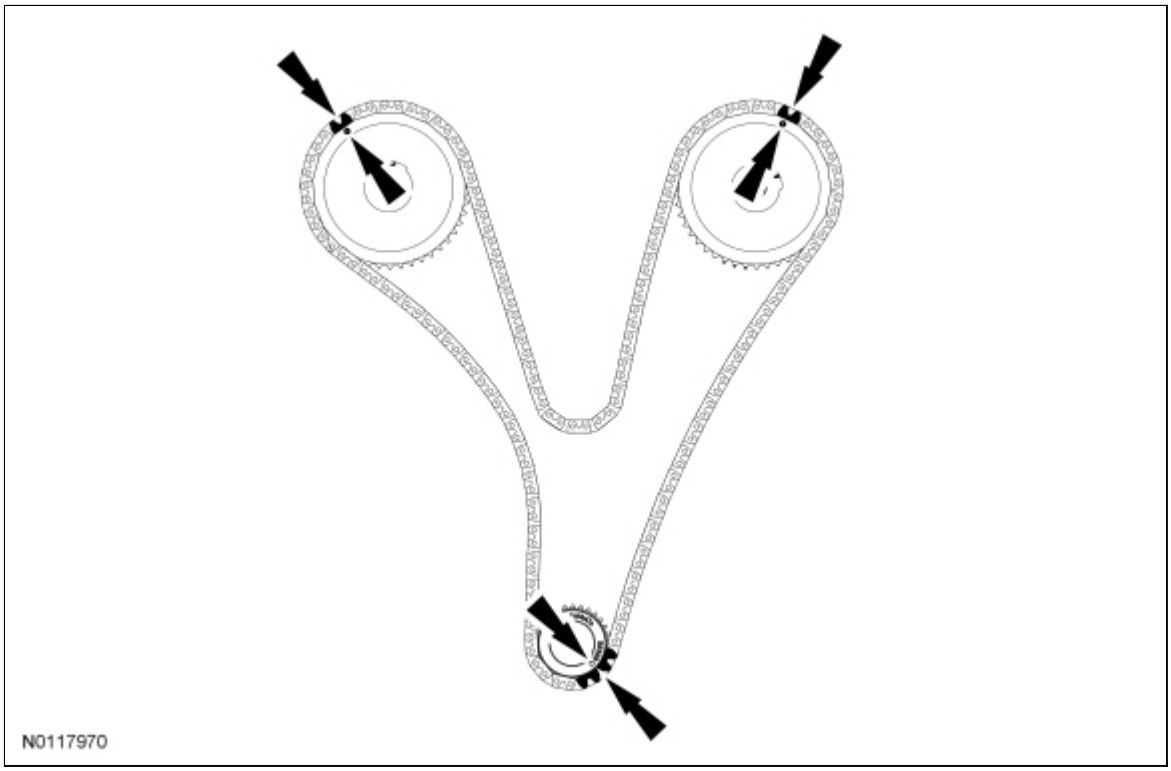
28. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

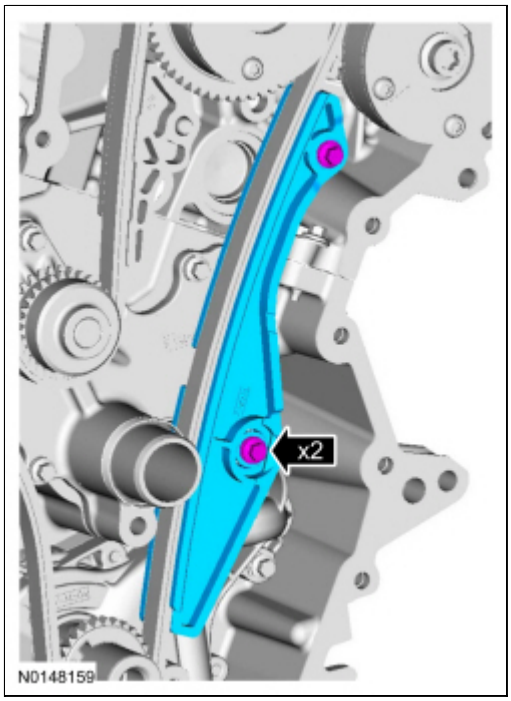


All engines

29. Install the upper LH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

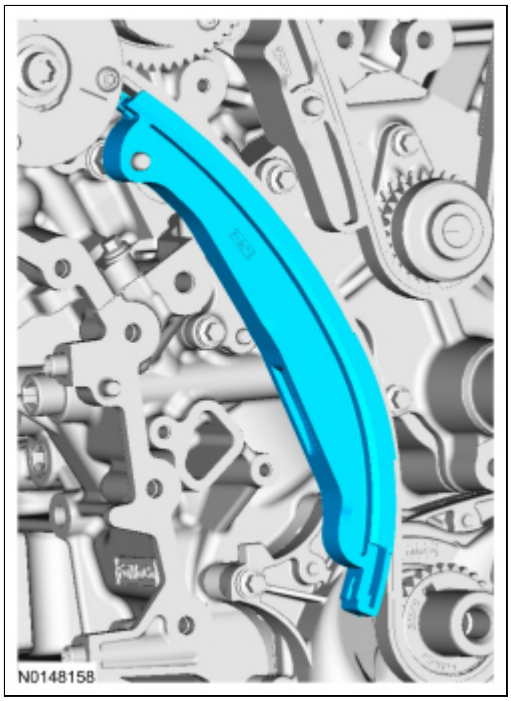


30. Install the crankshaft timing chain sprocket with timing dot mark out.



31. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

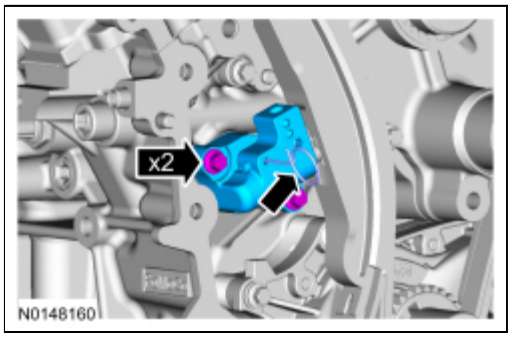
    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



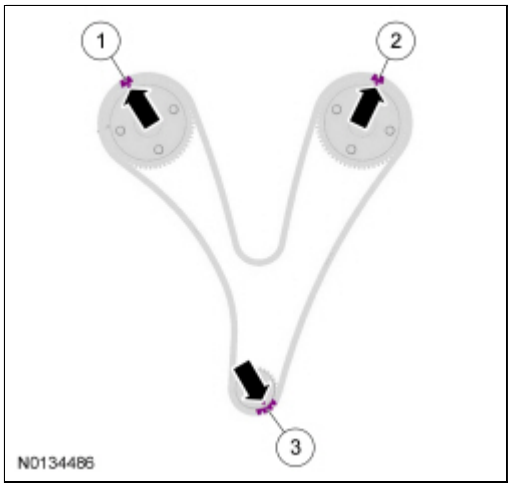
32. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

repair4less

33. Install the primary timing chain tensioner arm.



34. Reset the primary timing chain tensioner.
    - Release the ratchet detent.
    - Using a soft-jawed vise, compress the ratchet plunger.
    - Align the hole in the ratchet plunger with the hole in the tensioner housing.
    - Install a suitable lockpin.

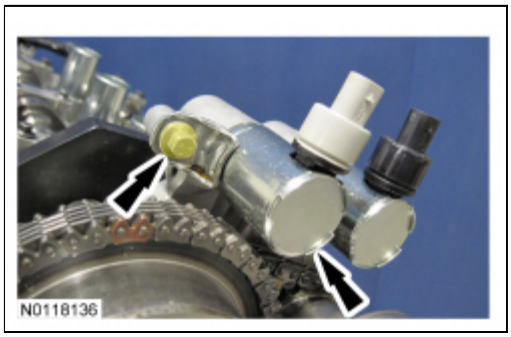


35. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lockpin.

36. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).

repair4less

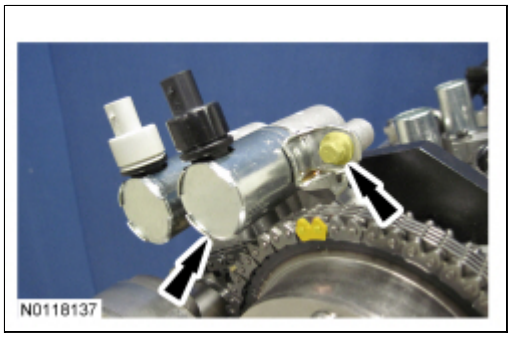


37. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the LH intake VCT oil control solenoid and the bolt.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

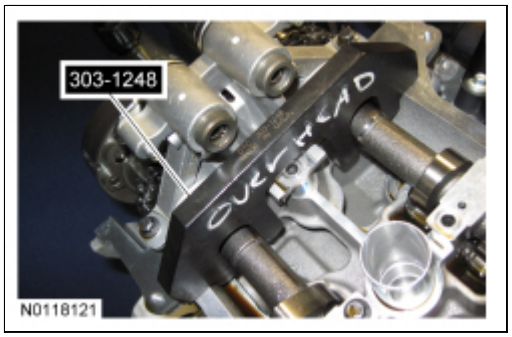


38. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

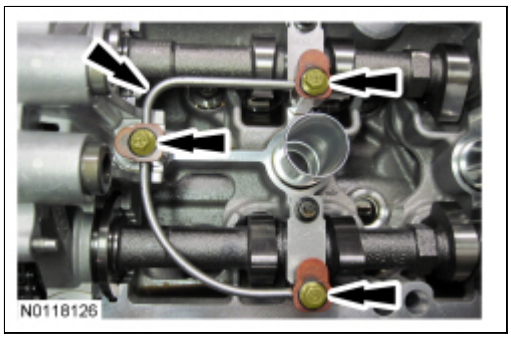
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the RH intake VCT oil control solenoid and the bolt.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



39. Remove the RH Camshaft Holding Tool.

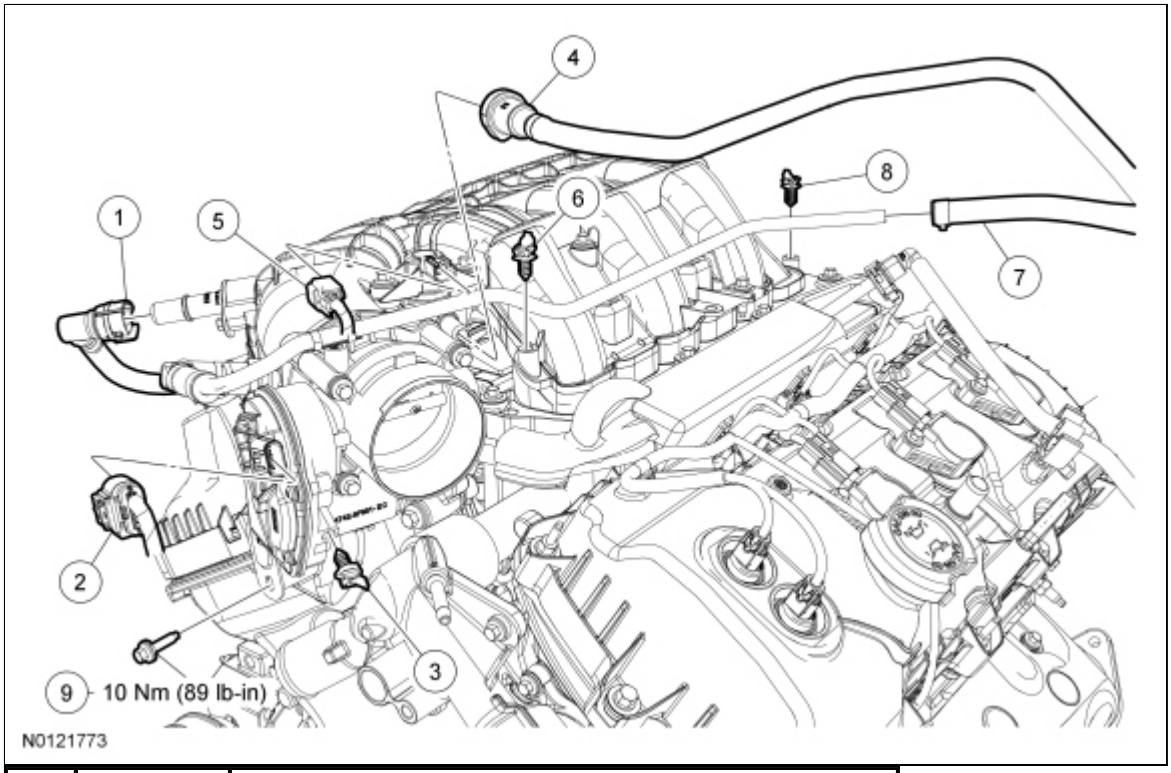
40. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



41. Remove the LH Camshaft Holding Tool.

42. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.

repair4less

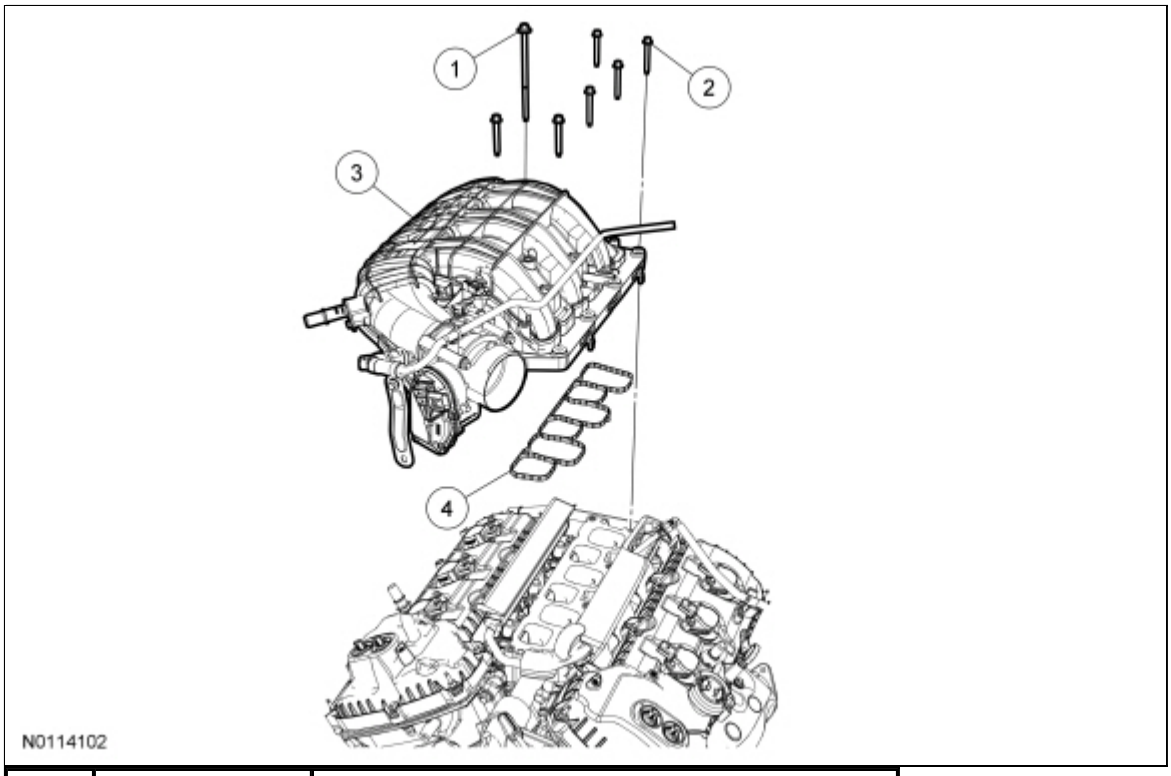


- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.

43. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Upper Intake Manifold

Upper Intake Manifold (View 1 of 2)



Item	Part Number	Description
1	6A664	PCV tube quick connect coupling
2	—	Throttle Body (TB) electrical connector (part of 14A411)
3	—	TB electrical connector wiring harness pin-type retainer (part of 14A411)
4	9J280	Evaporative Emission (EVAP) tube
5	—	EVAP canister purge valve electrical connector (part of 14A411)
6	—	EVAP canister purge valve electrical connector wiring harness pin-type retainer (part of 14A411)
7	—	Brake booster vacuum hose (part of 9C482)
8	—	Wiring harness pin-type retainer (part of 14A411)
9	W503275	Upper intake manifold support bracket bolt

Upper Intake Manifold (View 2 of 2)

repair4less

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

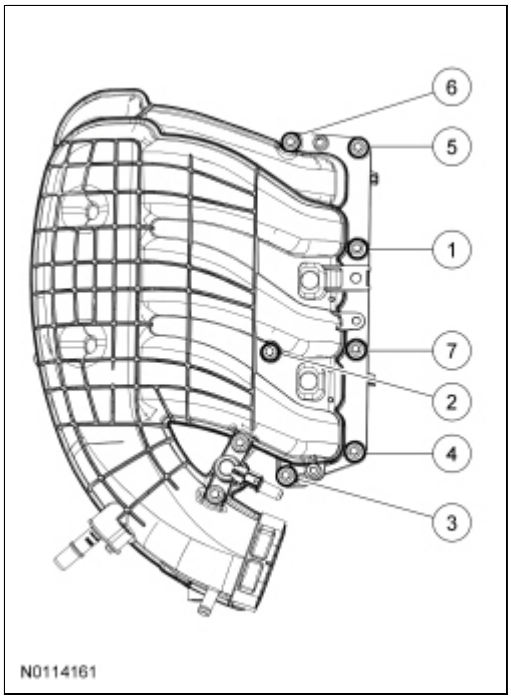
Item	Part Number	Description
1	W715096	Upper intake manifold bolt
2	9Y450	Upper intake manifold bolt (6 required)
3	9424	Upper intake manifold
4	9H486	Upper intake manifold gasket

Removal

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the PCV tube quick connect coupling from the intake manifold. For additional information, refer to Section 310-00 .
3. Disconnect the Throttle Body (TB) electrical connector.
   - Detach the TB electrical connector wiring harness pin-type retainer from the TB .
4. Disconnect Evaporative Emission (EVAP) tube from the EVAP canister purge valve. For additional information, refer to Section 310-00 .
   - Detach the EVAP hose retainer from the intake manifold.
5. Disconnect the EVAP canister purge valve electrical connector.
   - Detach the EVAP canister purge valve electrical connector wiring harness pin-type retainer.

6. Disconnect the brake booster vacuum hose from the engine.

7. Detach the wiring harness pin-type retainer from the rear of the upper intake manifold.



8. Remove the upper intake manifold support bracket bolt from the front of the RH cylinder head.

9. Loosen the 7 bolts and remove the upper intake manifold.
    - Remove and discard the gaskets.
    - Clean and inspect all of the sealing surfaces of the upper and lower intake manifold.

Installation

1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new gaskets, install the upper intake manifold and tighten the 7 bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

2. Install the upper intake manifold support bracket bolt to the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

3. Attach the wiring harness pin-type retainer to the rear of the upper intake manifold.

4. Connect the brake booster vacuum hose to the engine.

5. Connect the EVAP canister purge valve electrical connector.
    - Attach the EVAP canister purge valve electrical connector wiring harness pin-type retainer.

repair4less

6. Connect EVAP tube to the EVAP canister purge valve. For additional information, refer to Section 310-00 .
    - Attach the EVAP hose retainer to the intake manifold.

7. Connect the TB electrical connector.
    - Attach the TB electrical connector wiring harness pin-type retainer to the TB .

8. Connect the PCV tube quick connect coupling to the intake manifold. For additional information, refer to Section 310-00 .

9. Install the ACL outlet pipe. For additional information, refer to Section 303-12 .

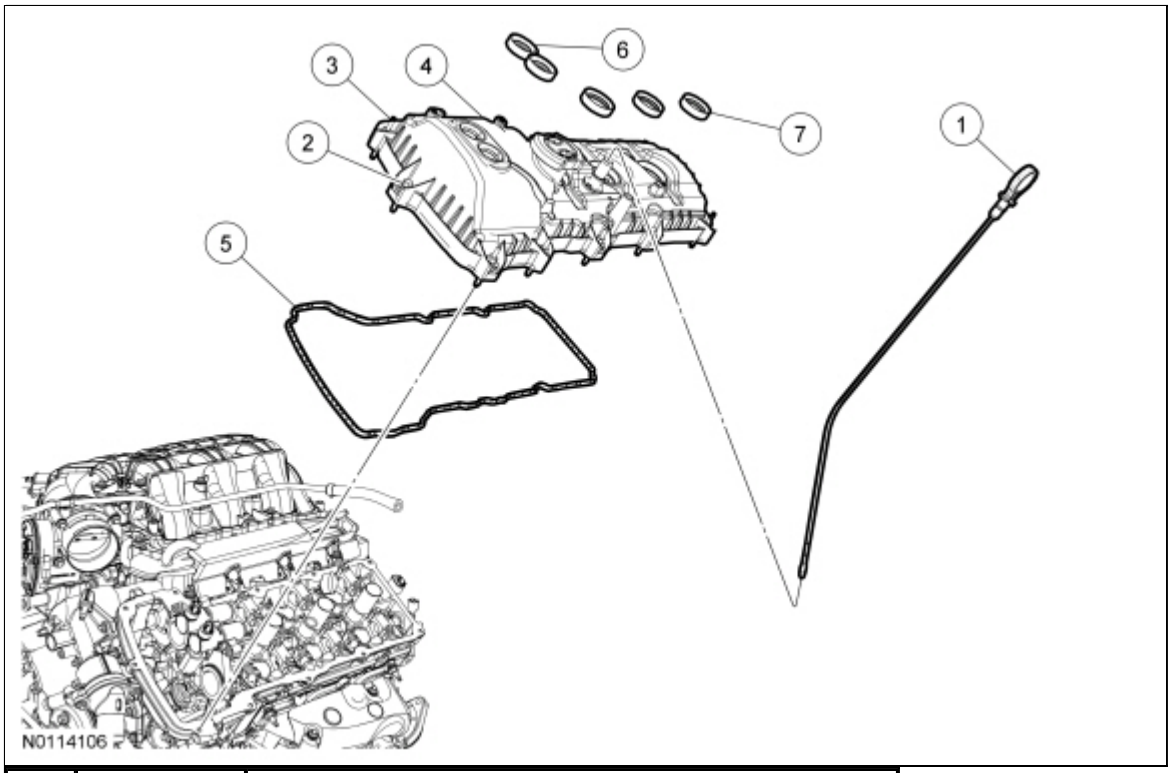
Valve Cover — LH

Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2212-A	Installer, Differential Bearing Cone 205-142 (T80T-4000-J)
 ST2983-A	Installer, Spark Plug Tube Seal 303-1247/2
 ST2982-A	Remover, Spark Plug Tube Seal 303-1247/1

Material

Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—



Valve Cover — LH (View 1 of 2)

repair4less

Item	Part Number	Description
1	—	Engine Oil Pressure (EOP) switch electrical connector (part of 14A411)
2	—	EOP switch electrical connector wiring harness pin-type retainer (part of 14A411)
3	6758	Crankcase ventilation tube
4	—	LH Variable Camshaft Timing (VCT) electrical connector (part of 14A411) (2 required)
5	—	LH valve cover wiring harness pin-type retainer (part of 14A411) (2 required)
6	—	LH valve cover stud bolt wiring harness retainer (part of 14A411)
7	—	LH valve cover stud bolt wiring harness retainer (part of 14A411)
8	—	LH valve cover stud bolt wiring harness retainer (part of 14A411)

Valve Cover — LH (View 2 of 2)

Item	Part Number	Description
1	6750	Oil level indicator
2	6C519	Valve cover bolt (4 required)
3	6C519	Valve cover stud bolt (7 required)
4	6582	LH valve cover
5	6584	LH valve cover gasket
6	6C535	Variable Camshaft Timing (VCT) solenoid seal (2 required)
7	6C535	Spark plug tube seal (3 required)

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the Air Cleaner (ACL) outlet tube and the ACL upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .

2. Disconnect and remove the crankcase ventilation tube quick connect coupling from the LH valve cover. For additional information, refer to Section 310-00 .

3. Remove the oil level indicator.

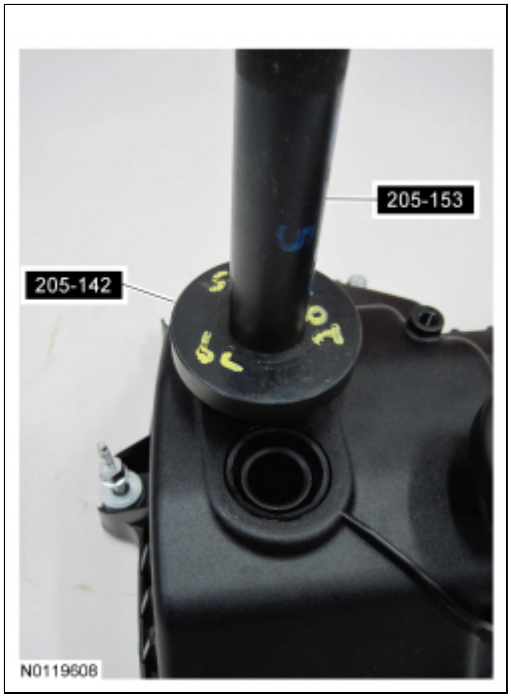
4. Remove the LH ignition coils. For additional information, refer to Section 303-07A .

5. Disconnect the 2 LH Variable Camshaft Timing (VCT) solenoid electrical connectors.

repair4less

6. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.
    - Detach the EOP switch wiring harness retainer from the cylinder head.

7. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.



8. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

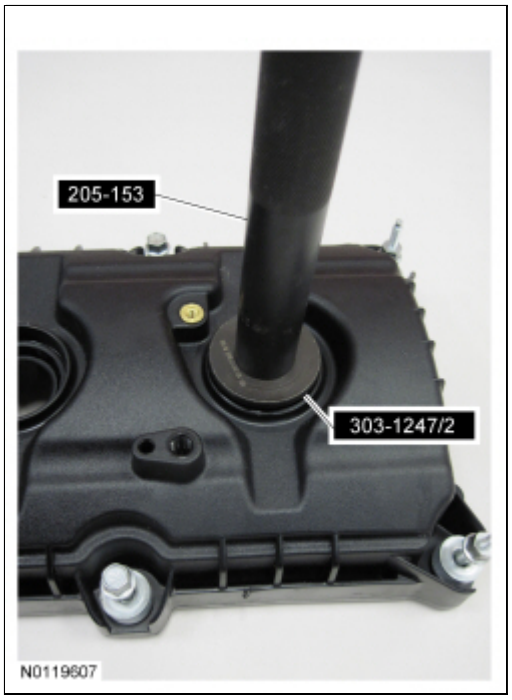
   NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.**

   NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12 degrees inside the steel housing, which is normal.

   Loosen the 7 stud bolts, 4 bolts and remove the LH valve cover.
    - Discard the gasket.

9. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

10. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



11. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

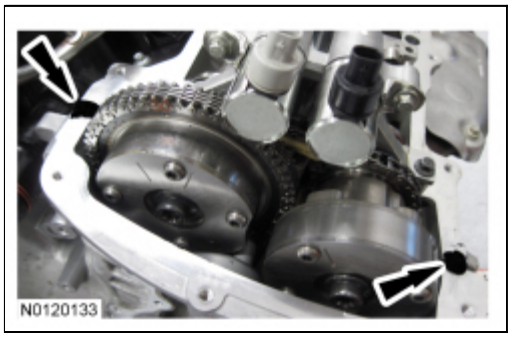
Installation

1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

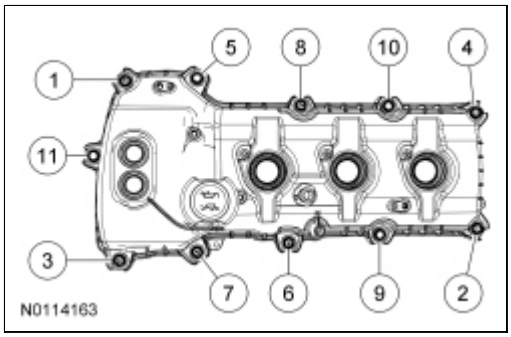
   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

repair4less



Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).



3. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

4. Using a new gasket, install the LH valve cover and tighten the 4 bolts and 7 stud bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

5. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

6. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.

7. Connect the EOP switch electrical connector.
   - Attach the EOP switch wiring harness retainer to the cylinder head.

8. Connect the 2 LH VCT solenoid electrical connectors.

9. Install the LH ignition coils. For additional information, refer to Section 303-07A .

10. Install the oil level indicator.

11. Connect the crankcase ventilation tube quick connect coupling to the LH valve cover. For additional information, refer to Section 310-00 .

12. Install the ACL outlet tube and the ACL upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .

repair4less

Valve Cover — RH

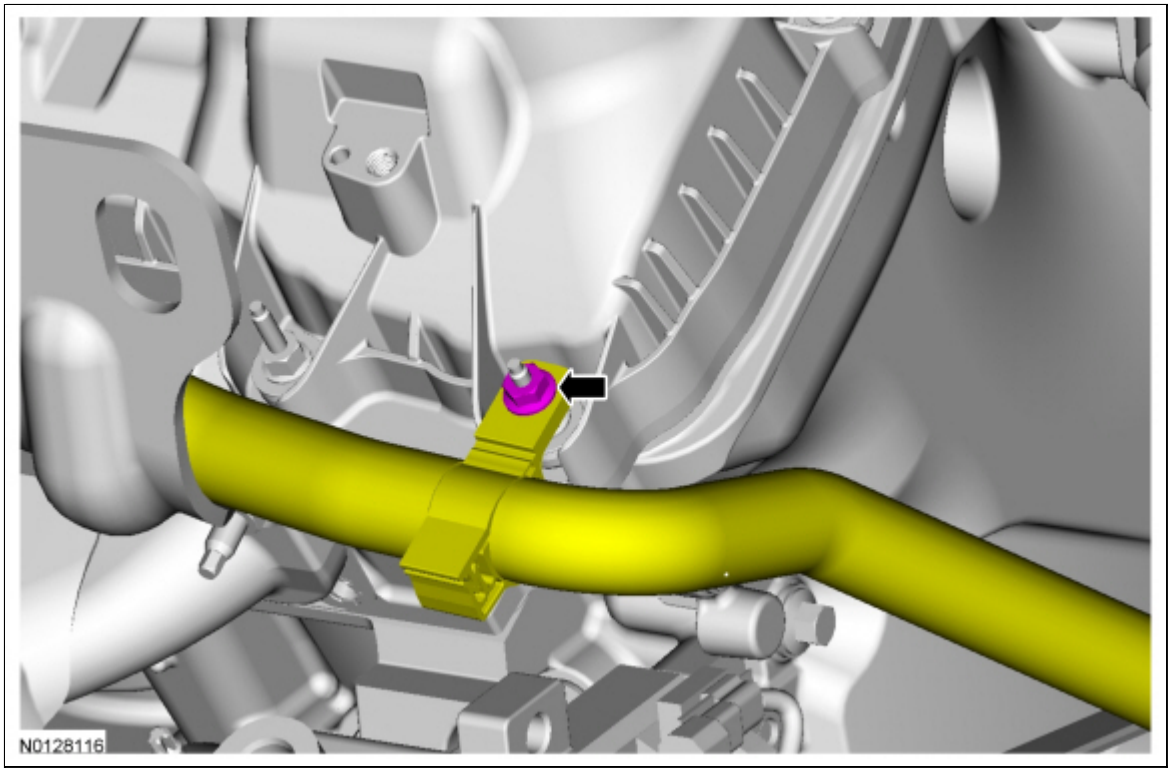
Valve Cover — RH (View 1 of 2)

repair4less

Item	Part Number	Description
	—	
1	6A664	PCV tube
2	—	RH valve cover stud bolt wiring harness retainer (part of 14A411) (3 required)
3	—	RH Variable Camshaft Timing (VCT) electrical connector (part of 14A411) (2 required)
4	—	RH valve cover wiring harness pin-type retainer (part of 14A411)
5	—	RH valve cover stud bolt wiring harness retainer (part of 14A411)
6	—	RH valve cover stud bolt wiring harness retainer (part of 14A411)
7	—	RH valve cover stud bolt wiring harness retainer (part of 14A411)

Valve Cover — RH (View 2 of 2)



Item	Part Number	Description
1	6C519	Valve cover bolt (3 required)
2	6C519	Valve cover stud bolt (8 required)
3	6582	RH valve cover
4	6584	RH valve cover gasket
5	6C535	Variable Camshaft Timing (VCT) solenoid seal (2 required)
6	6C535	Spark plug tube seal (3 required)

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the RH ignition coils. For additional information, refer to Section 303-07B .
2. Disconnect and remove the PCV tube quick connect coupling from the RH valve cover. For additional information, refer to Section 310-00 .
3. Disconnect the 2 RH Variable Camshaft Timing (VCT) solenoid electrical connectors.
4. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.
5. Remove the nut and position the heater hose and bracket aside.

repair4less

6. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

   NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.**

   NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12 degrees inside the steel housing, which is normal.

   Loosen the 8 stud bolts, 3 bolts and remove the RH valve cover.
   - Discard the gasket.

7. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
   - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

8. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

9. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

Installation

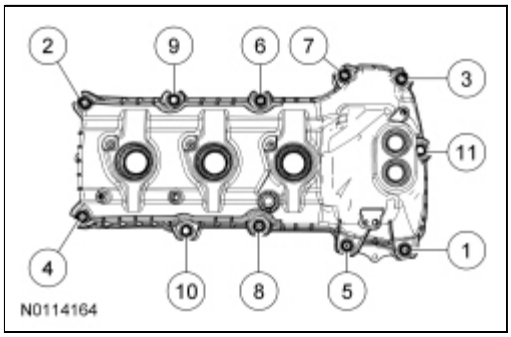
1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

repair4less

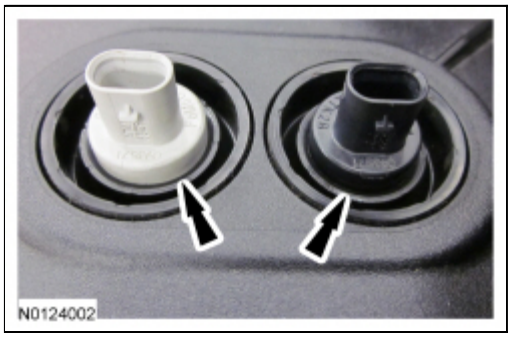
2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

   Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).



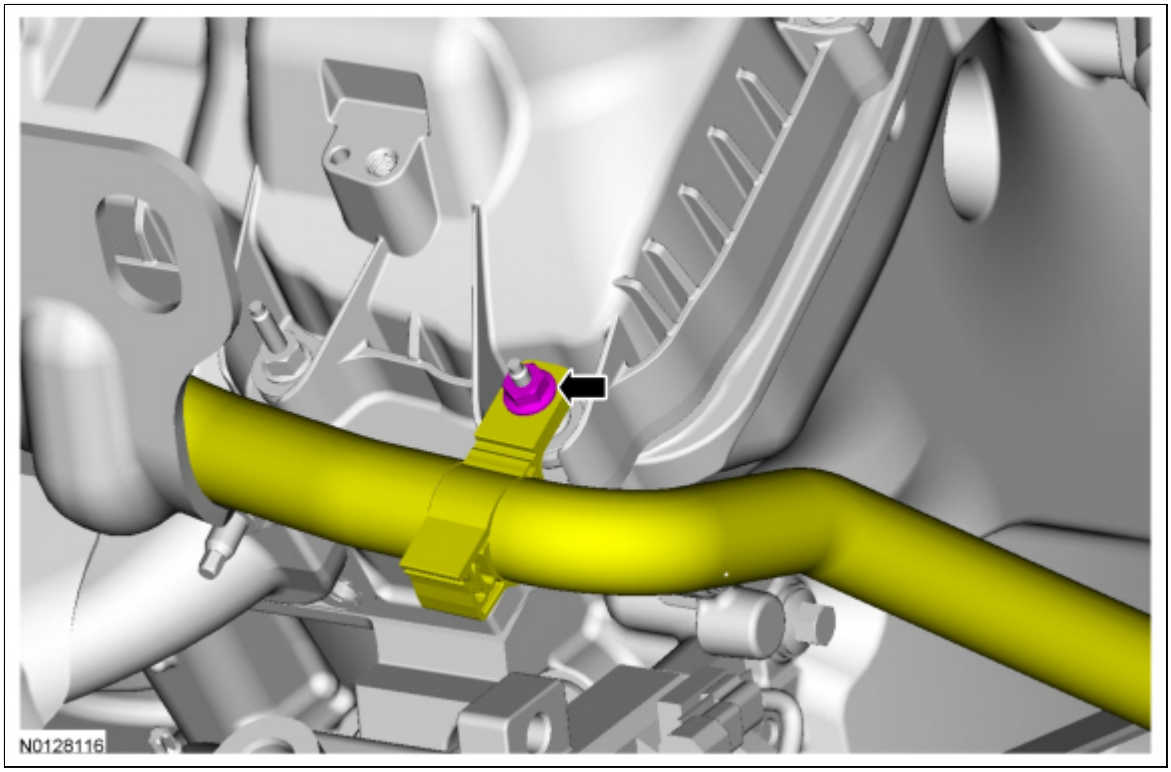
3. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.



Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

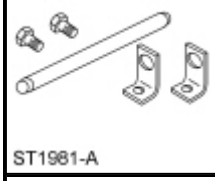
4. Using a new gasket, install the RH valve cover and tighten the 3 bolts and 8 stud bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

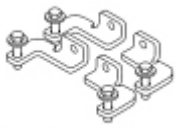


5. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

6. Position the heater hose and bracket on the valve cover stud bolt and install the nut.
    - Tighten to 8 Nm (71 lb-in).

repair4less





7. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.
8. Connect the 2 RH VCT solenoid electrical connectors.
9. Connect the PCV tube quick connect coupling to the RH valve cover. For additional information, refer to Section 310-00 .
10. Install the RH ignition coils. For additional information, refer to Section 303-07B .

repair4less

Valve Spring, Retainer and Seal

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249
 ST1906-A	Installer, Valve Stem Oil Seal 303–470 (T94P-6510–CH)

Material

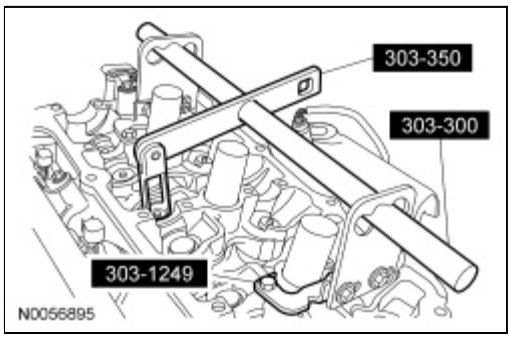
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the valve tappets from the cylinder being serviced. For additional information, refer to Valve Tappets in this section.

2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.



3. ***NOTICE:*** **If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal or engine damage may occur.**

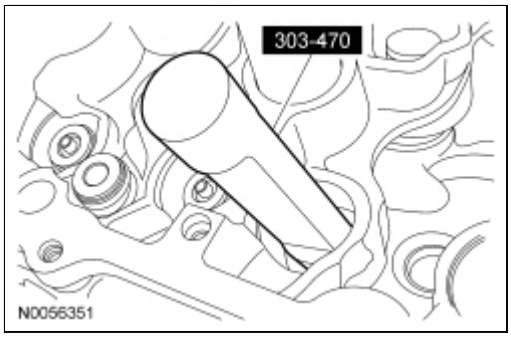
   NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head — RH or Cylinder Head — LH in this section.

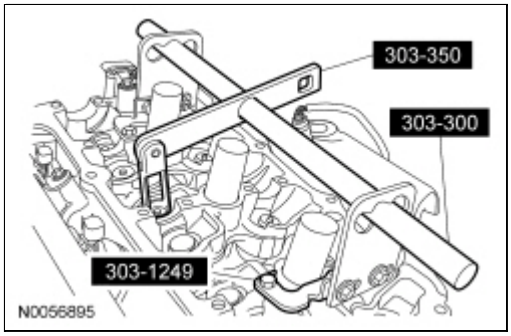
   Pressurize the cylinder using compressed air.

4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

5. Remove and discard the valve stem seal.



Installation



1. **NOTE:** Lubricate the valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

repair4less

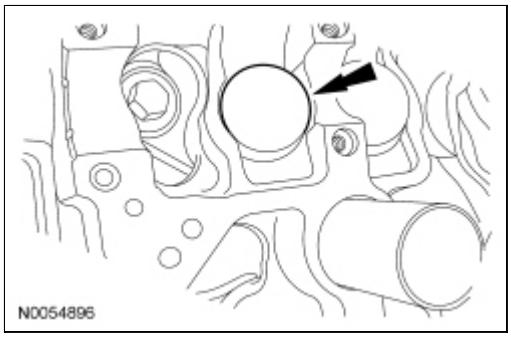
2. Using the Valve Spring Compressors, install the valve spring, retainer and key.

3. Install the valve tappets. For additional information, refer to Valve Tappets in this section.

Valve Tappets

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Depending on the valve tappets being serviced, remove the LH and/or the RH camshafts. For additional information, refer to Camshaft — RH and/or the Camshaft — LH in this section.

2. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   Remove the valve tappets from the cylinder head.

3. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   To install, reverse the removal procedure.

repair4less

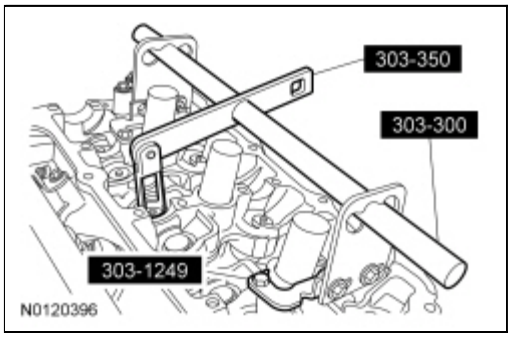
18	6571	Exhaust valve stem seal (6 required)
19	6507	Exhaust valve (6 required)
20	6049	RH cylinder head

Disassembly

All cylinder heads

1. Remove the 2 bolts and the exhaust manifold heat shield.

2. Remove the 6 nuts and the exhaust manifold.
   - Discard the nuts and gasket.



3. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .

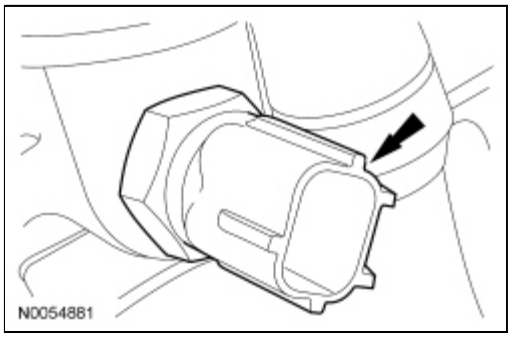
4. Remove and discard the 6 exhaust manifold studs.

5. Remove the timing chain guide pin.

6. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   Using the Valve Spring Compressors, remove the keys, retainer and spring.

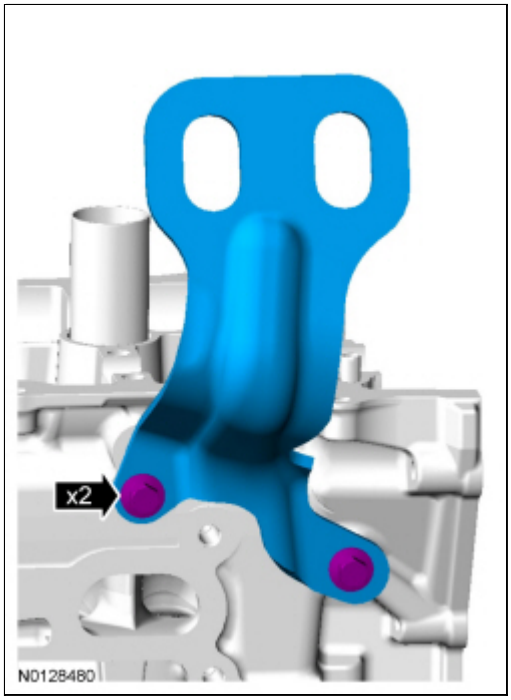
7. Remove the valve from the cylinder head.



8. Remove and discard the valve stem seal.

9. Repeat the above steps for each valve.

RH cylinder head

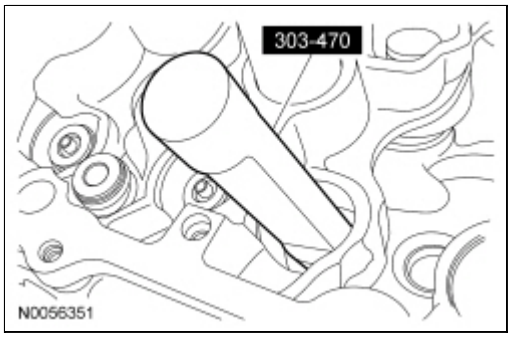


10. Remove the timing chain tensioner arm pin.

11. Remove and discard the Cylinder Head Temperature (CHT) sensor.

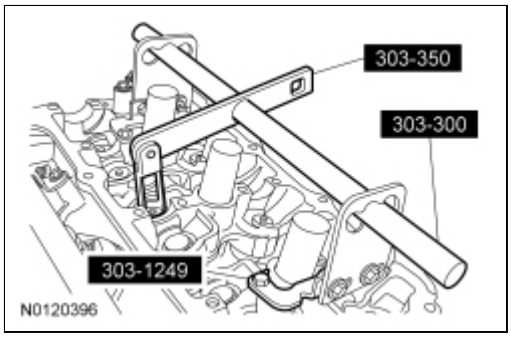
repair4less

12. Remove the 2 bolts and the engine lift eye.



Assembly

All cylinder heads

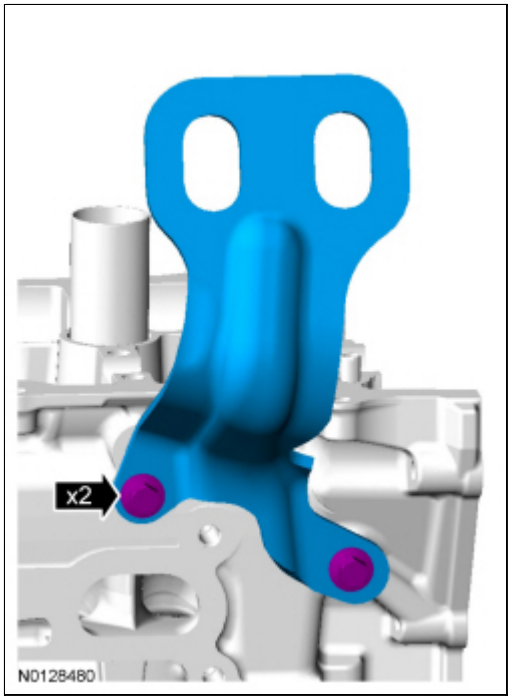


1. **NOTE:** If the components are to being reinstalled, they must be installed into their original location.

   NOTE: Lubricate the valve stem and valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

2. Install the valve.
3. Using the Valve Spring Compressors, install the valve spring, retainer and key.



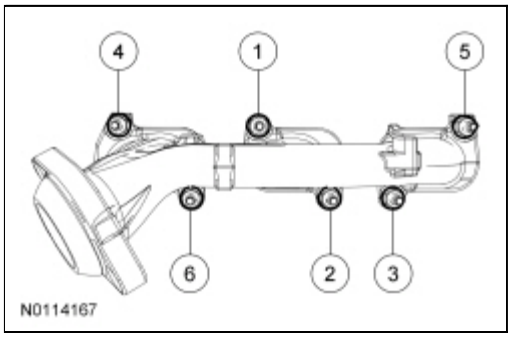
4. Repeat the above steps for each valve.

5. Install the timing chain guide pin and tighten in 2 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

RH cylinder head

6. Install the engine lift eye and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

7. Install a new CHT sensor.
    - Tighten to 10 Nm (89 lb-in).



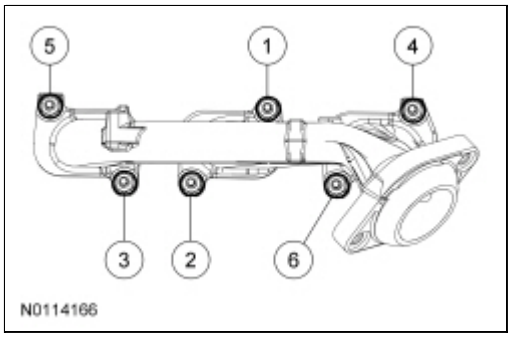
8. Install the timing chain tensioner arm pin and tighten in 2 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

9. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

repair4less

10. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



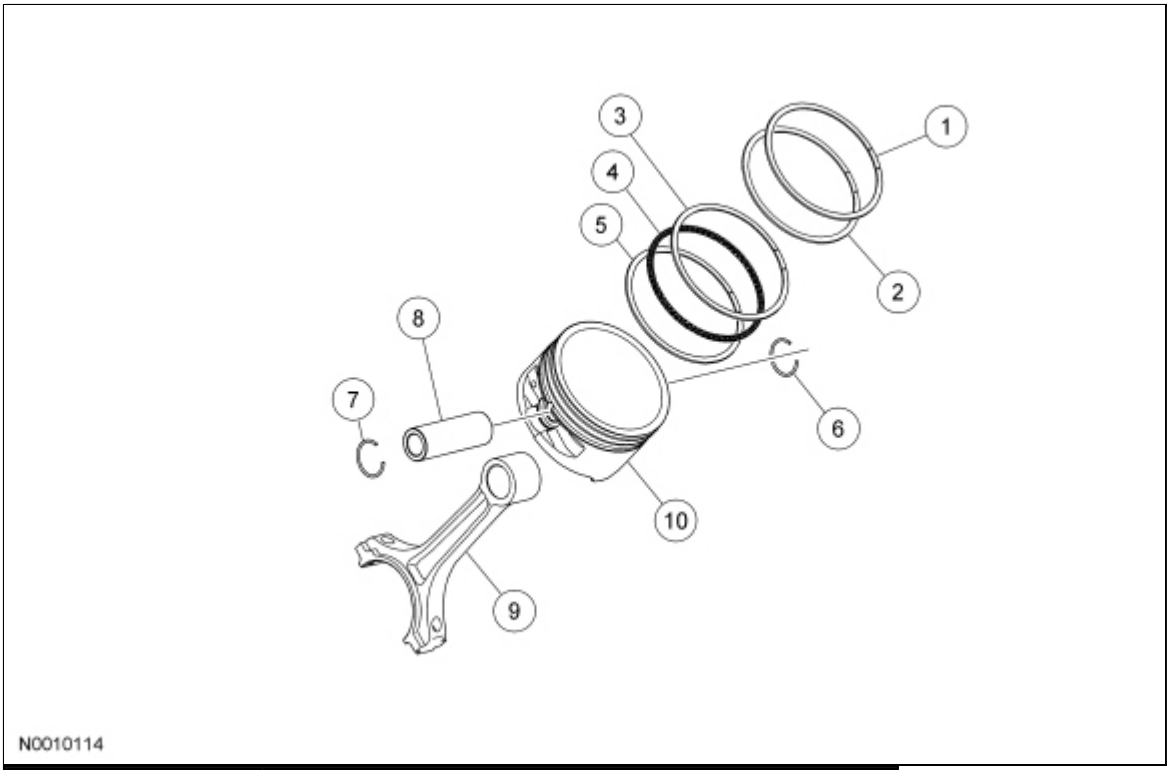
11. Install the RH exhaust manifold heat shield and the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).

LH cylinder head

12. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

13. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



14. Install the LH exhaust manifold heat shield and the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).

repair4less

Piston

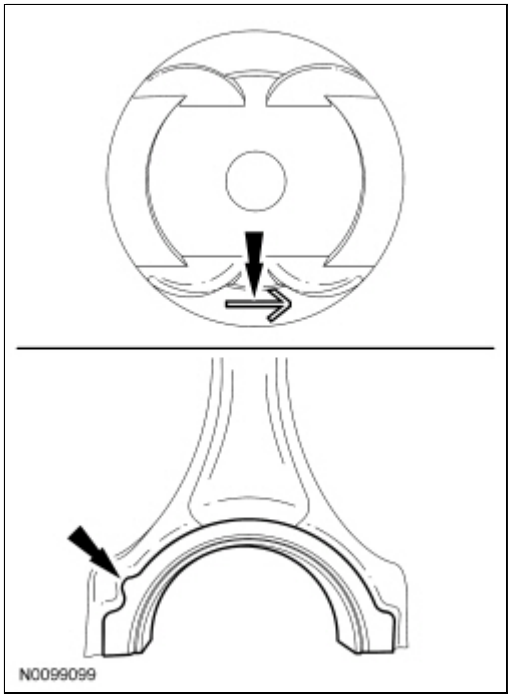
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	—	Piston compression upper ring (part of 6148)
2	—	Piston compression lower ring (part of 6148)
3	—	Piston oil control upper segment ring (part of 6148)
4	—	Piston oil control spacer (part of 6148)
5	—	Piston oil control lower segment ring (part of 6148)
6	6140	Piston pin retainer clip
7	6140	Piston pin retainer clip
8	6135	Piston pin

9	6200	Connecting rod
10	6110	Piston

Disassembly



1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.
   - Discard the 2 piston pin retainer clips.

3. **NOTE:** If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

   NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   Separate the piston from the connecting rod.

4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

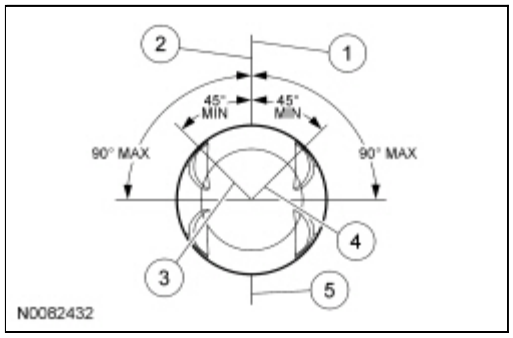
Assembly

1. Align the piston-to-connecting rod orientation marks and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.

4. Install the new piston pin retaining clips in the piston.



repair4less

- The piston pin retaining clip gap orientation must be toward the top or dome of piston.

5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression upper and lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

   Install the piston rings onto the piston as shown.
   1. Center line of the piston parallel to the wrist pin bore
   2. Upper compression ring gap location
   3. Upper oil control segment ring gap location
   4. Lower oil control segment ring gap location
   5. Expander ring and lower compression ring gap location

Engine weight	197.3 kg (435 lb)
Cylinder Head and Valve Train	
Combustion chamber volume	54.5-57.5 cc (3.33-3.51 cu in)
Valve stem diameter — intake	5.975-5.995 mm (0.2352-0.2360 in)
Valve stem diameter — exhaust	5.950-5.970 mm (0.2342-0.2350 in)
Valve stem-to-guide clearance — intake	0.020-0.069 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance — exhaust	0.045-0.094 mm (0.0018-0.0037 in)
Valve head diameter — intake	37 mm (1.45 in)
Valve head diameter — exhaust	31 mm (1.22 in)
Valve face runout	0.05 mm (0.0019 in)
Valve face angle	45 degrees
Valve seat width — intake	1.3-1.5 mm (0.051-0.059 in)
Valve seat width — exhaust	1.4-1.6 mm (0.059-0.063 in)
Valve seat runout	0.04 mm (0.0016 in)
Valve seat angle	120/90/60 degrees
Valve spring free length — intake	51.32 mm (2.02 in)
Valve spring free length — exhaust	51.32 mm (2.02 in)
Valve spring perpendicularity — intake	3 mm (0.118 in)
Valve spring perpendicularity — exhaust	3 mm (0.118 in)
Valve spring compression force — intake	650 N
Valve spring compression force — exhaust	650 N
Valve spring installed height — intake	40 mm (1.5748 in)
Valve spring installed height — exhaust	40 mm (1.5748 in)
Valve spring installed force — intake	265 N
Valve spring installed force — exhaust	265 N
Roller follower ratio	2:1
Head gasket surface flatness	0.025 mm (0.001 in) in any 25 mm (1 in) x 25 mm (1 in) area; 0.050 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.1 mm (0.004 in) overall
Hydraulic Lash Adjuster	
Diameter — intake	11.89-12.00 mm (0.4681-0.472 in)
Diameter — exhaust	11.89-12.00 mm (0.4681-0.472 in)
Clearance-to-bore	0.018-0.050 mm (0.0007-0.0019 in)
Hydraulic leakdown rate — intake	0.45-3 seconds [a]
Hydraulic leakdown rate — exhaust	0.45-3 seconds [a]
Collapsed lash adjuster gap	0.35-0.85 mm (0.0137-0.0334 in)
Camshaft	

Lobe lift — intake	5.258 mm (0.2070 in)
Lobe lift — exhaust	5.488 mm (0.2160 in)
Journal diameter	28.607-28.633 mm (1.1262-1.1272 in)
Journal bore inside diameter	28.682-28.657 mm (1.1292-1.1282 in)
Journal-to-bearing clearance	0.025-0.075 mm (0.001-0.002 in)
Runout	0.04 mm (0.0016 in) (4 places)
End play	0.15 mm (0.0059 in)
Cylinder Block	
Cylinder bore diameter	92.200-92.220 mm (3.6299-3.6307 in)
Cylinder bore maximum taper	0.013 mm (0.0005 in)
Cylinder bore maximum out-of-round	0.010 mm (0.0004 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.850-2.851 in)
Head gasket surface flatness	0.0254 mm (0.001 in) across any 38.1 mm (1.5 in) square
Crankshaft	
Main bearing journal diameter	67.481-67.505 mm (2.657-2.658 in)
Main bearing journal maximum taper	0.004 mm (0.0002 in)
Main bearing journal maximum out-of-round	0.008 mm (0.0003 in) between cross sections
Main bearing journal-to-main bearing clearance	0.025-0.045 mm (0.0009-0.0018 in)
Connecting rod journal diameter	52.983-53.003 mm (2.086-2.087 in)
Connecting rod journal maximum taper	0.004 mm (0.0002 in)
Crankshaft maximum end play	0.28 mm (0.011 in)
Piston and Connecting Rod	
Piston diameter	92.161-92.175 mm (3.6283-3.6289 in)
Piston-to-cylinder bore clearance (at grade size) [b]	0.025-0.059 mm (0.0009-0.0023 in)
Piston ring end gap — top	0.15-0.25 mm (0.0059-0.0098 in)
Piston ring end gap — intermediate	0.30-0.55 mm (0.0118-0.0216 in)
Piston ring gap — oil control	0.15-0.45 mm (0.0059-0.0177 in)
Piston ring groove width — top	1.220-1.250 mm (0.0480-0.0492 in)
Piston ring groove width — intermediate	1.220-1.240 mm (0.0480-0.0488 in)
Piston ring groove width — oil control	2.530-2.550 mm (0.0996-0.1003 in)
Piston ring width — top	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring width — intermediate	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring-to-groove clearance — top	0.030-0.080 mm (0.0019-0.0031 in)
Piston ring-to-groove clearance — intermediate	0.030-0.070 mm (0.0019-0.0028 in)
Piston pin bore diameter	22.004-22.010 mm (0.8663-0.8665 in)
Piston pin diameter	21.997-22.000 mm (0.8649-0.8661 in)
Piston pin length	60.7-61.0 mm (2.3897-2.4015 in)
Piston pin-to-piston fit (clearance)	0.004-0.013 mm (0.0002-0.0005 in)

repair4less

Connecting rod-to-pin clearance	0.003-0.018 mm (0.0001-0.0007 in)
Connecting rod pin bore diameter	22.003-22.015 mm (0.8663-0.8667 in)
Connecting rod length (centerline bore-to-bore)	150.7 mm (5.933 in)
Connecting rod maximum allowed bend	0.038 mm (0.0015 in)
Connecting rod maximum allowed twist	0.050 mm (0.0019 in)
Connecting rod bearing-to-crankshaft clearance	0.028-0.069 mm (0.0011-0.0027 in)
Connecting rod side clearance (as assembled to crank) — standard play	0.325 mm (0.0128 in)
Connecting rod side clearance (as assembled to crank) — max. play	0.500 mm (0.0197 in)

[a] Time required for the plunger to leak down 1.6 mm of travel with 222 N force and leakdown fluid in the lash adjuster.
[b] Before Grafal coating.

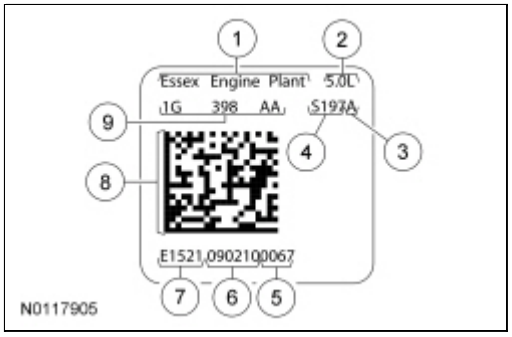
[a] Refer to the procedure in this section.
[b] Do not lubricate O-ring seal, tighten to 16 Nm (142 lb-in).
[c] Tighten to 14 Nm (124 lb-in) plus an additional 180 degrees.

Engine

The 5.0L (302 CID) is a V-8 engine with the following features:



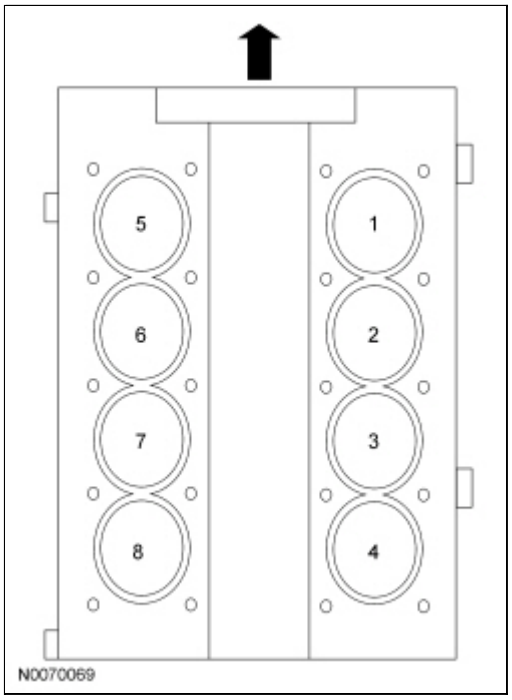
- Dual overhead camshafts
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- Aluminum cylinder heads
- Aluminum, 90-degree V-cylinder block
- Individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- Electronic ignition system with 8 ignition coils
- Engine oil cooler

Engine Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions. The Ford Master Parts Catalog contains a complete listing of the codes and their applications.

Engine Code Information Label

The engine code information label, located on the valve cover, contains the following:



Item	Description
1	Essex engine plant
2	Engine displacement
3	Transmission
4	Vehicle line
5	Sequential number

repair4less

6	Engine build date (DDMMYY)
7	Essex engine plant
8	Bar code
9	Engine part number

Engine Cylinder Identification

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 8 solenoid-operated fuel injectors:

- are mounted in the fuel injection supply manifold and the intake manifold above the cylinder heads.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.
- supply fuel from the fuel tank by a fuel pump mounted in the fuel tank.

Crankshaft

The crankshaft is supported on the bottom of the cylinder block by 5 crankshaft main bearings.

Camshafts

The camshafts:

- are arranged in pairs, one each (intake and exhaust) on each cylinder head.
- are synchronized through a secondary timing chain.
- depress the roller followers to actuate the valves.

Valve Train

The valves are actuated by a hydraulic lash adjuster and roller follower. The hydraulic lash adjusters and roller followers:

- provide hydraulic lash adjustment.
- ride on the camshaft lobes.

Twin IndependentVariable Camshaft Timing (VCT) System

The twin independent VCT system allows variable control of intake valve closing which optimizes combustion at full load providing improved power and low speed torque (broadening the torque curve) which enables variable valve overlap which provides better fuel economy and emissions and provides optimized cold start operation with improved exhaust emissions.

PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

Engine Lubrication System

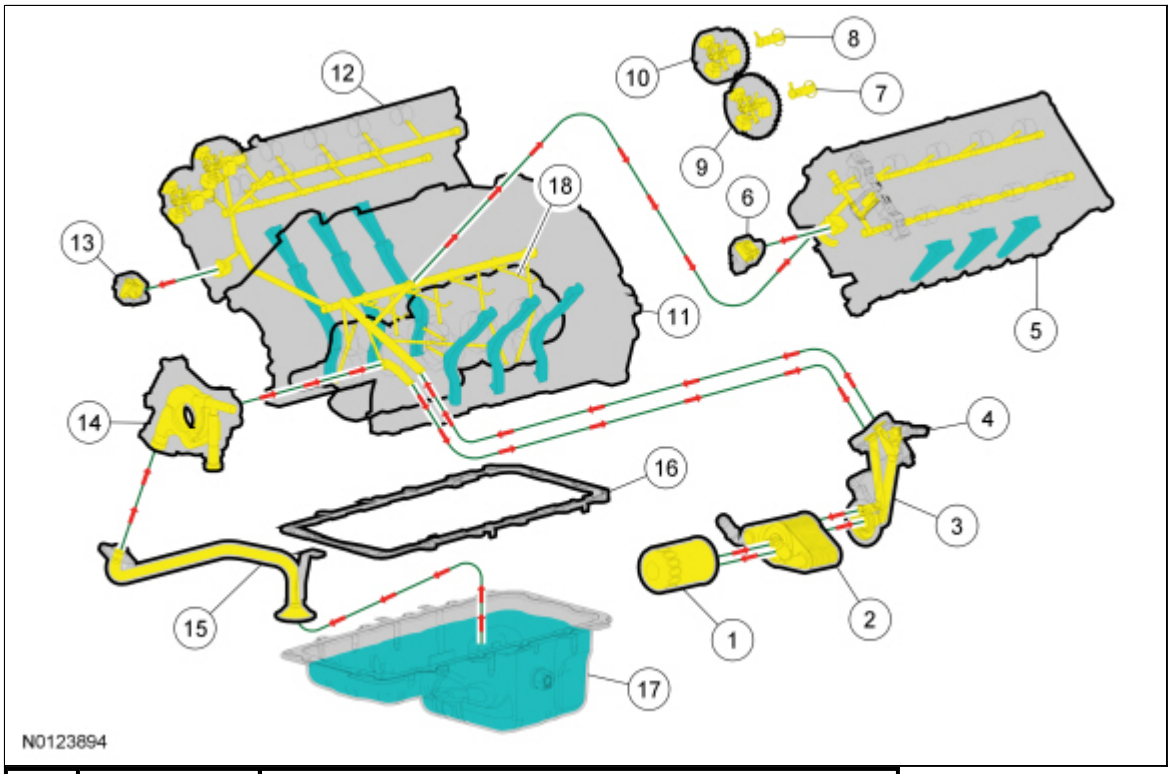
The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the:

- crankshaft main bearings.
- crankshaft thrust main bearing.
- connecting rod bearings.
- oil galleries.
- piston cooling jets.

All other parts are lubricated by splash of the oil.

Oil Pump

The lubrication system of the 5.0L (4V) engine is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors.



repair4less

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Engine Oil Flow Illustration

Engine Assembly

Item	Part Number	Description
1	6714	Oil filter
2	6A642	Oil filter cooler
3	6881	Oil filter adapter
4	9278	Engine Oil Pressure (EOP) switch
5	6049	Cylinder head — LH

6	6L266	Timing chain tensioner — LH

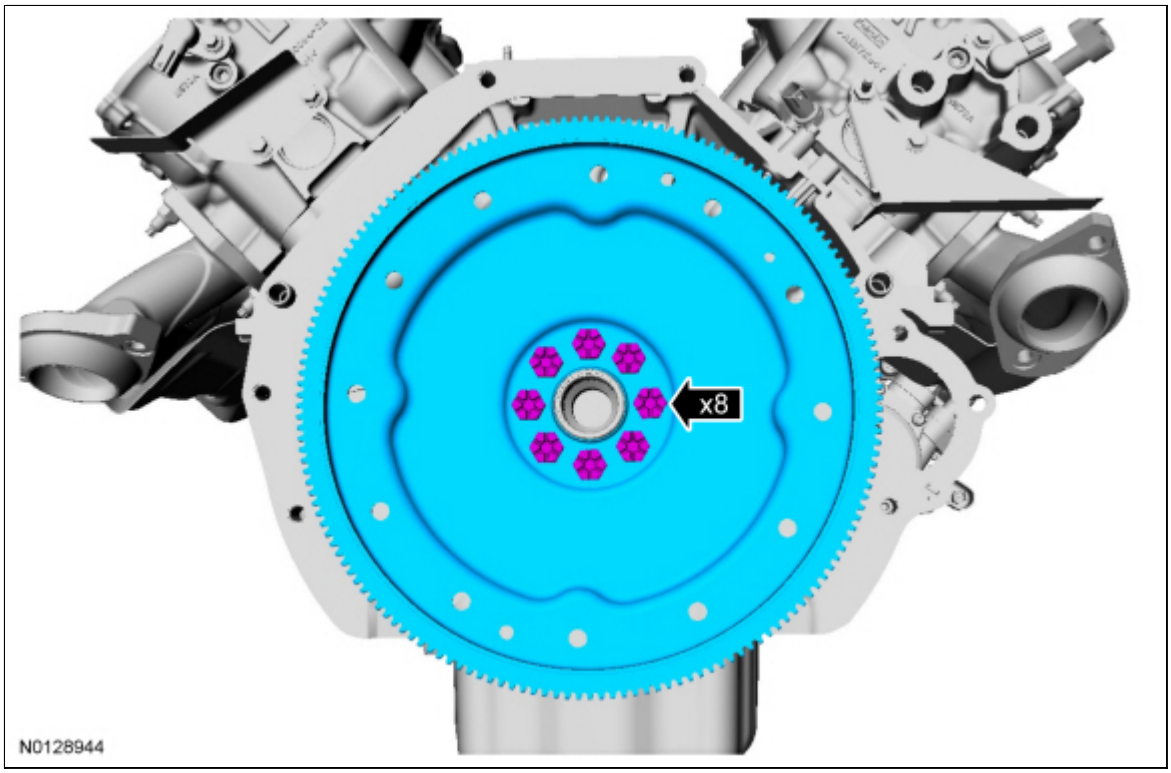
Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—

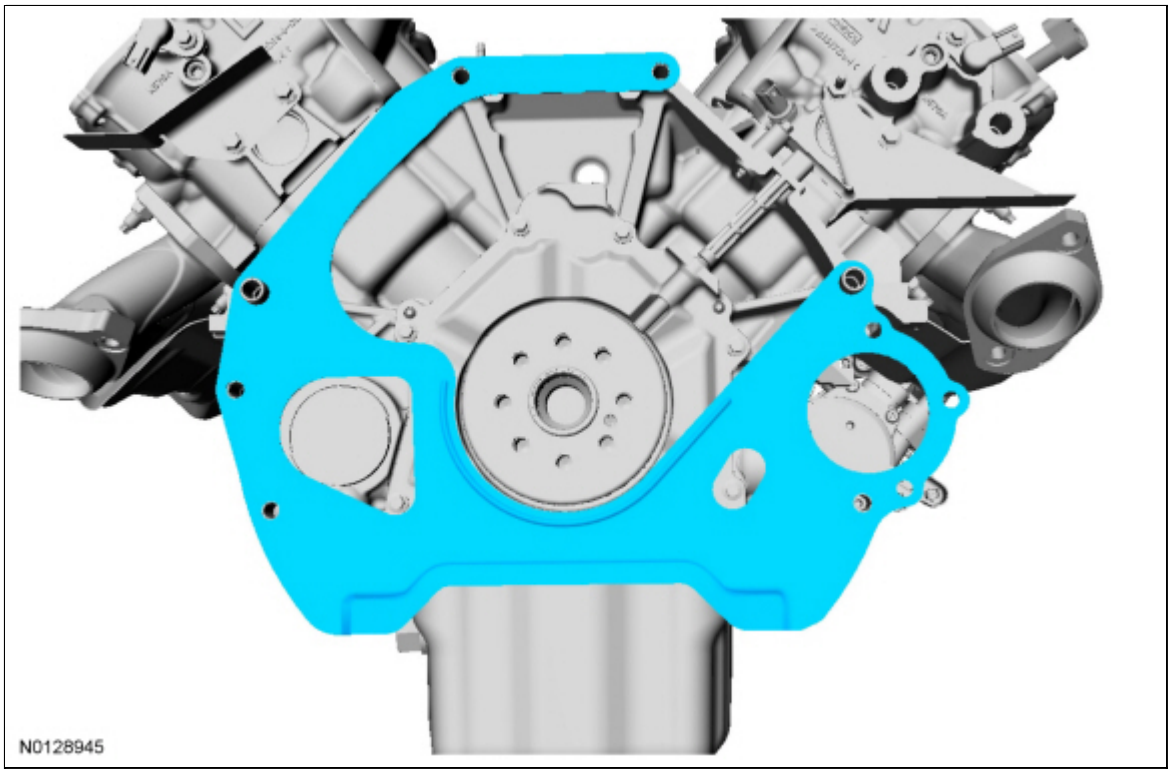
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTICE: **Remove the cylinder heads before removing the crankshaft. Failure to do so can result in engine damage.**



NOTE: If the components are to be reinstalled, they must be installed in their original location. Mark the components for installation into their original location.

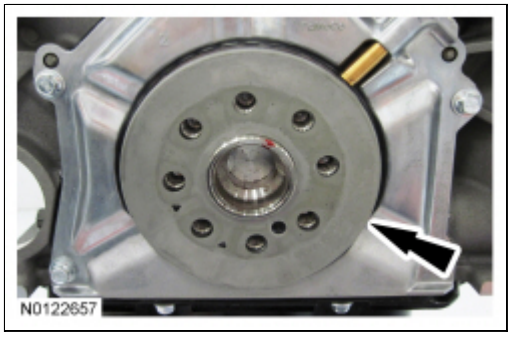
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.



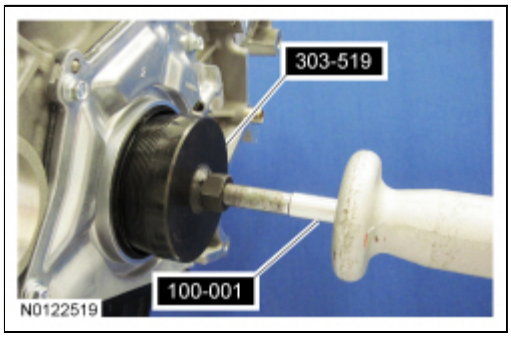
1. Remove the engine. For additional information, refer to Engine in this section.

2. **NOTE:** The flexplate bolts are torque-to-yield design and are not reusable.

   Remove the 8 bolts and the flexplate.
   - Discard the bolts.



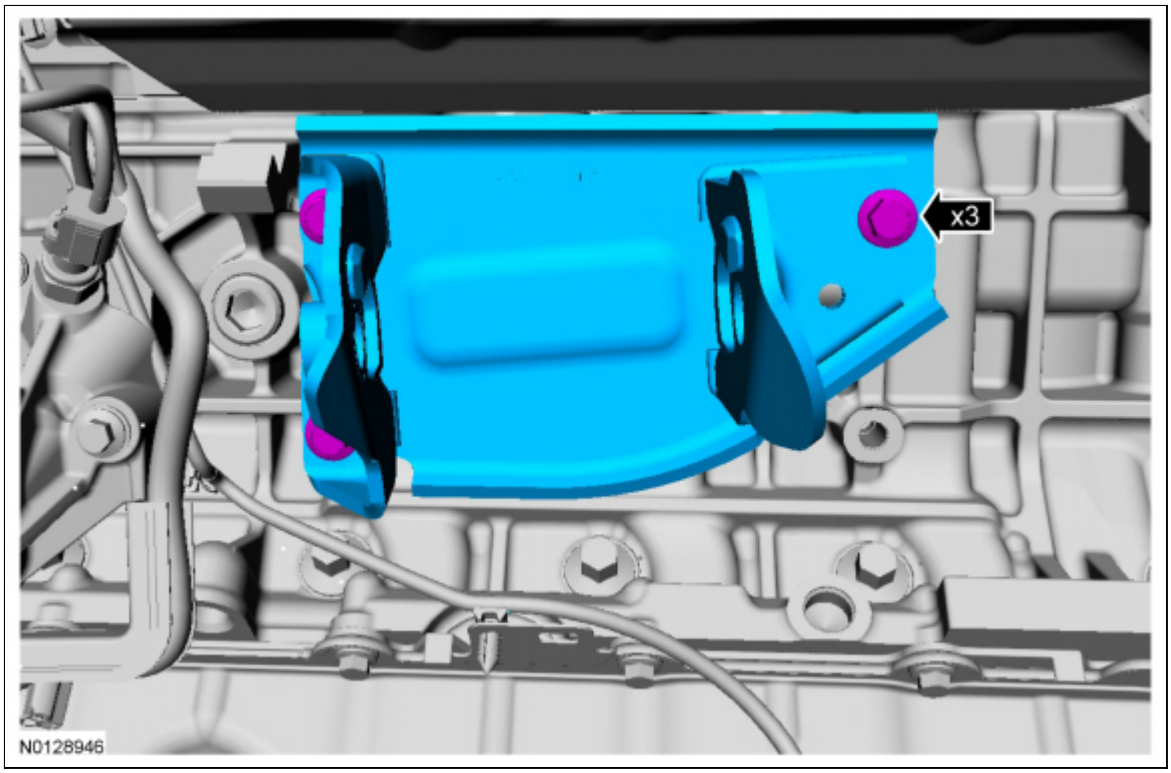
3. Remove the engine separator plate.



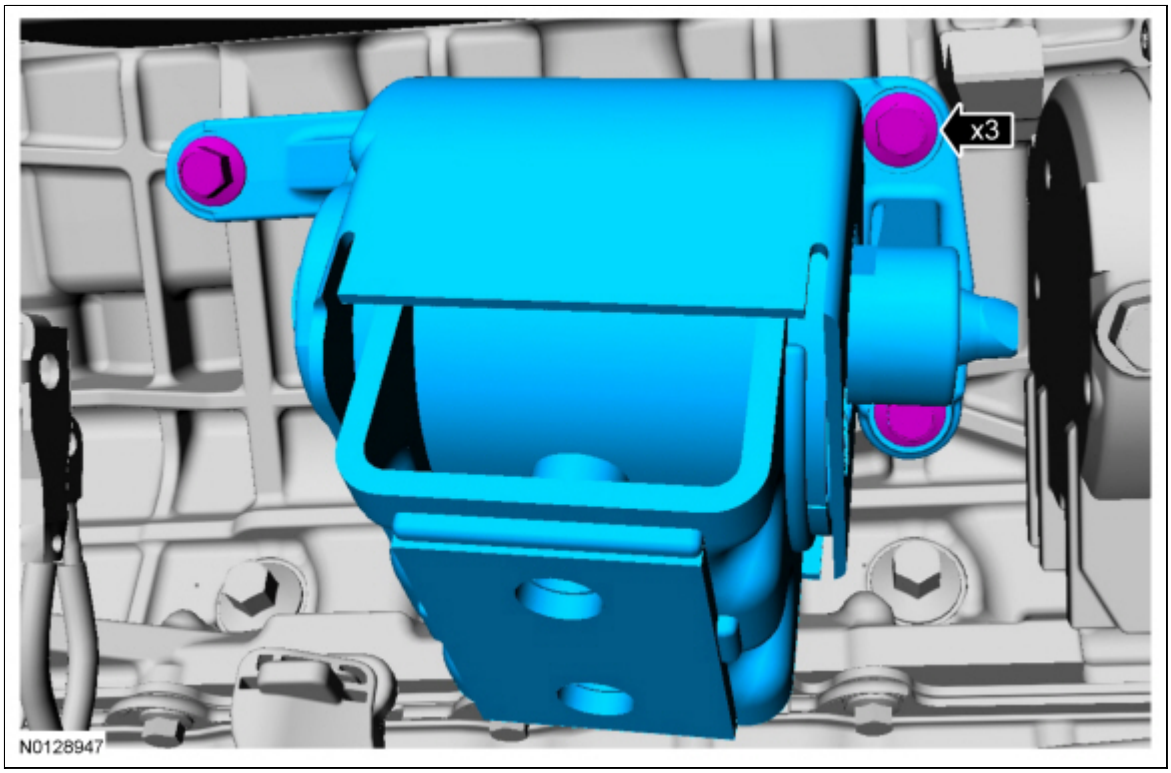
4. **NOTE:** Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be discarded.

repair4less

Remove the crankshaft sensor ring.

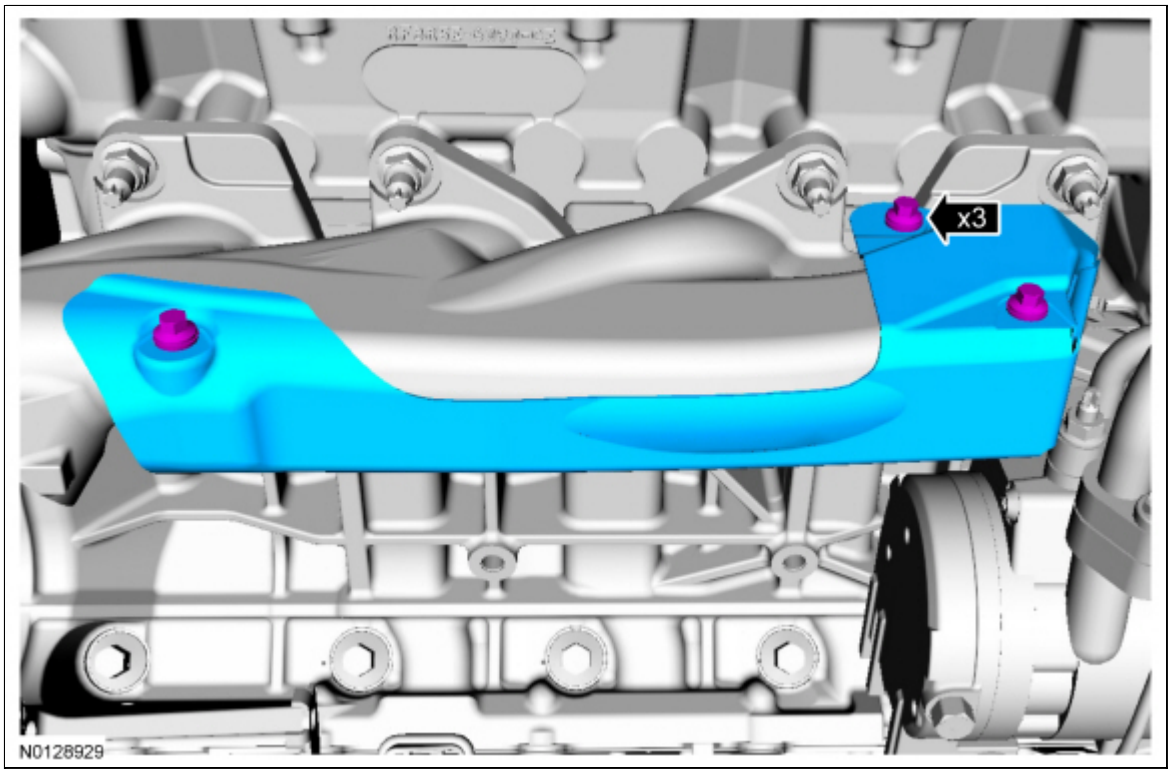


5. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear seal.

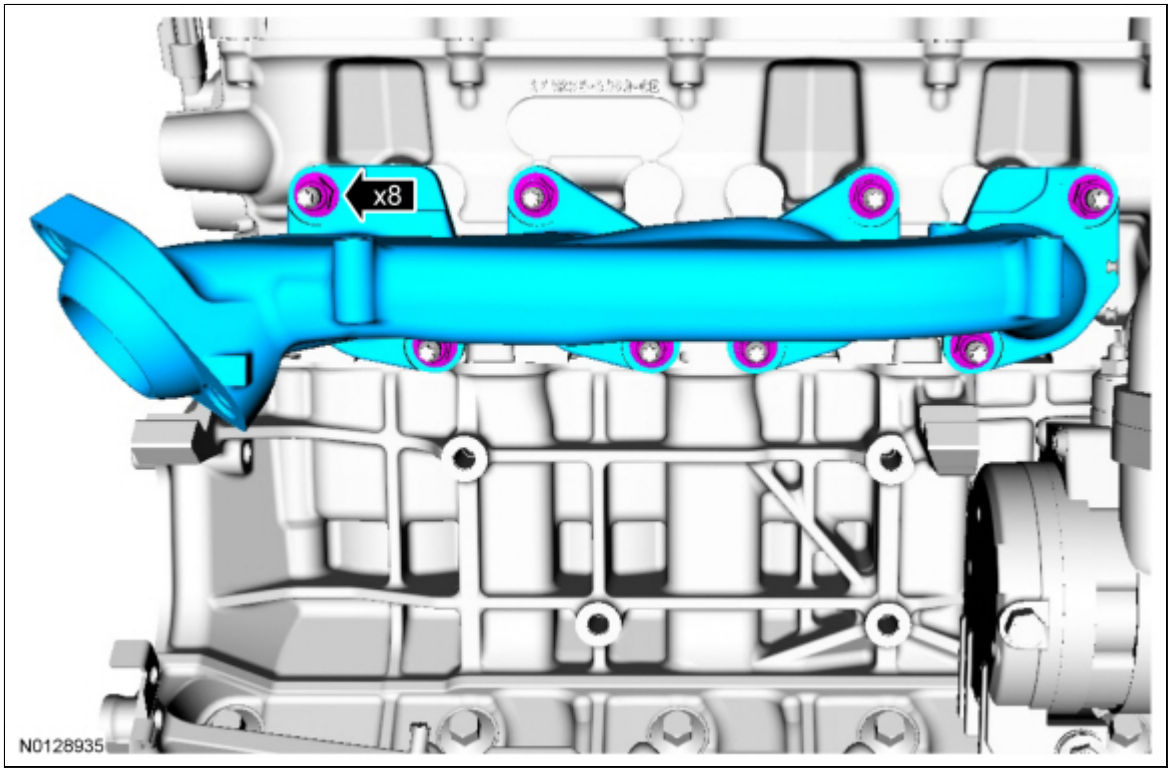


6. Mount the engine on a work stand.

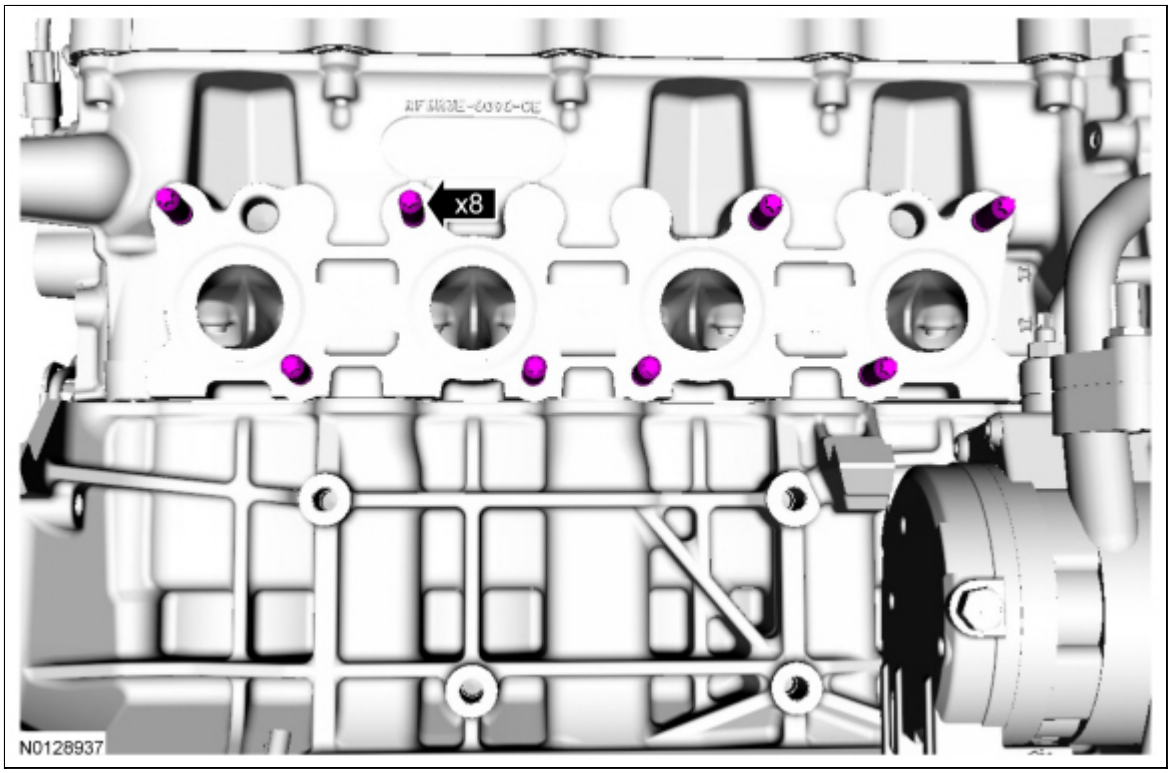
7. Remove the 3 bolts and the LH engine support insulator bracket.



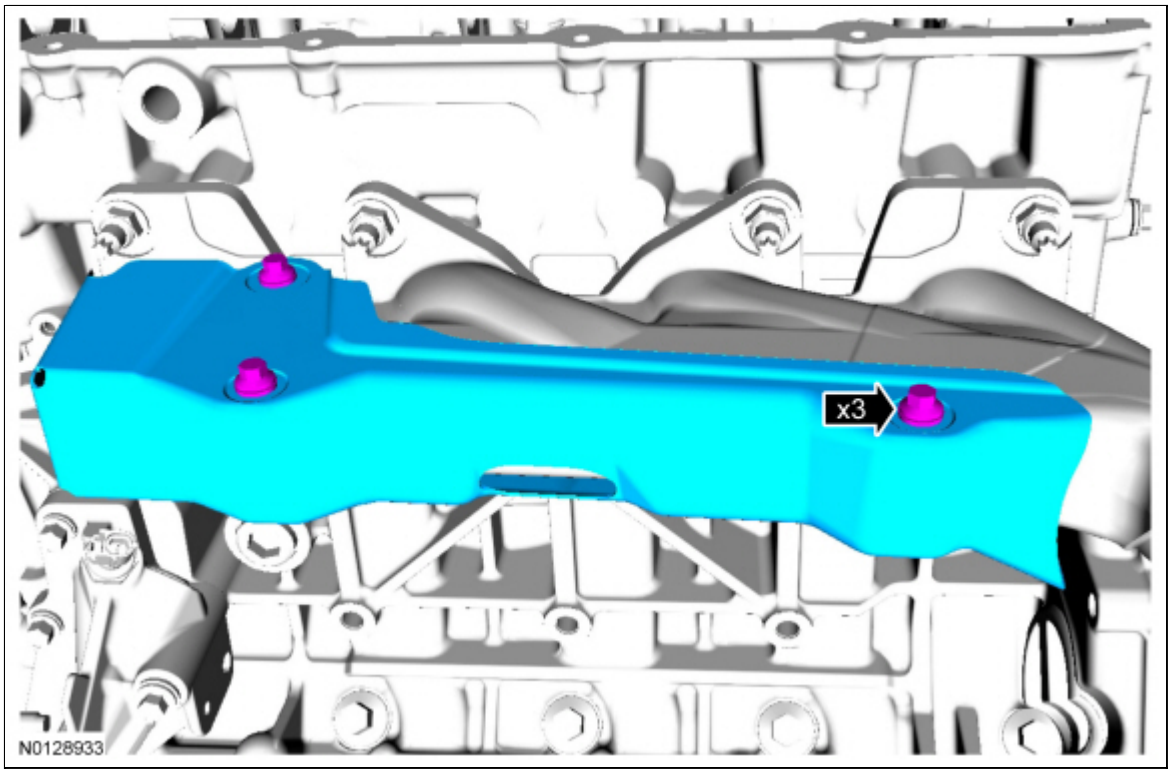
8. Remove the 3 bolts and the RH engine support insulator.



9. Remove the 3 bolts and the RH exhaust manifold heat shield.

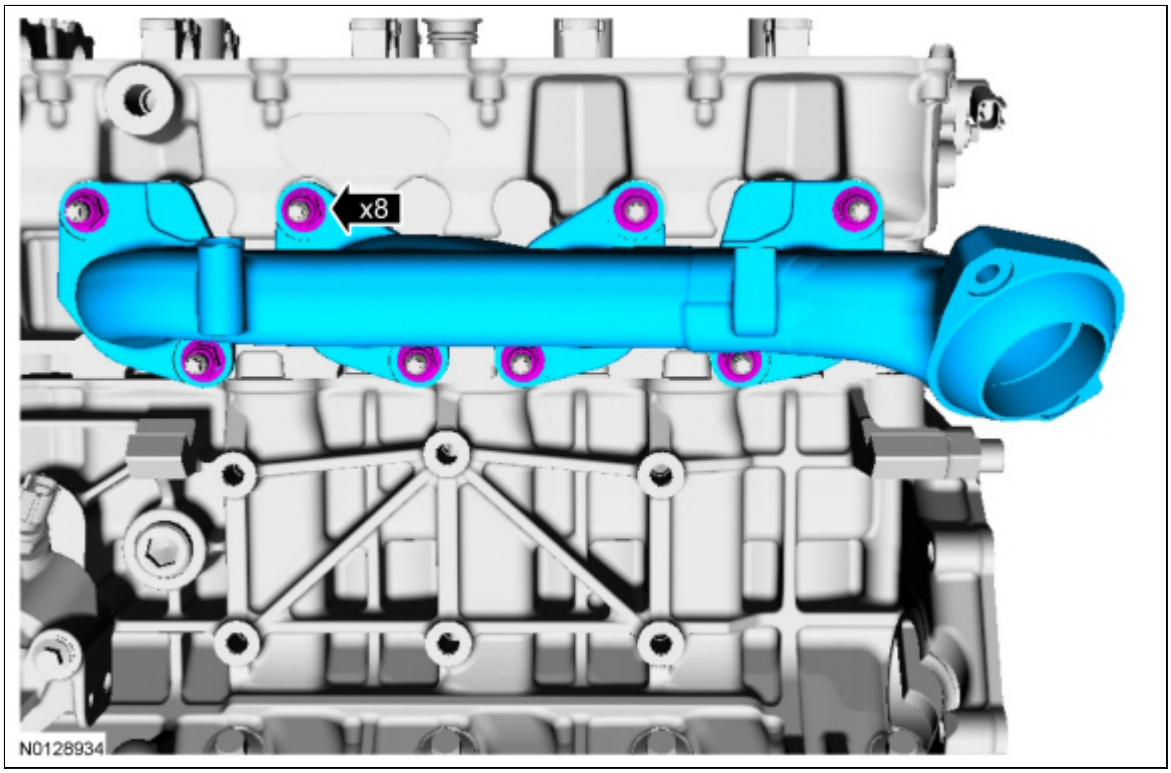


repair4less

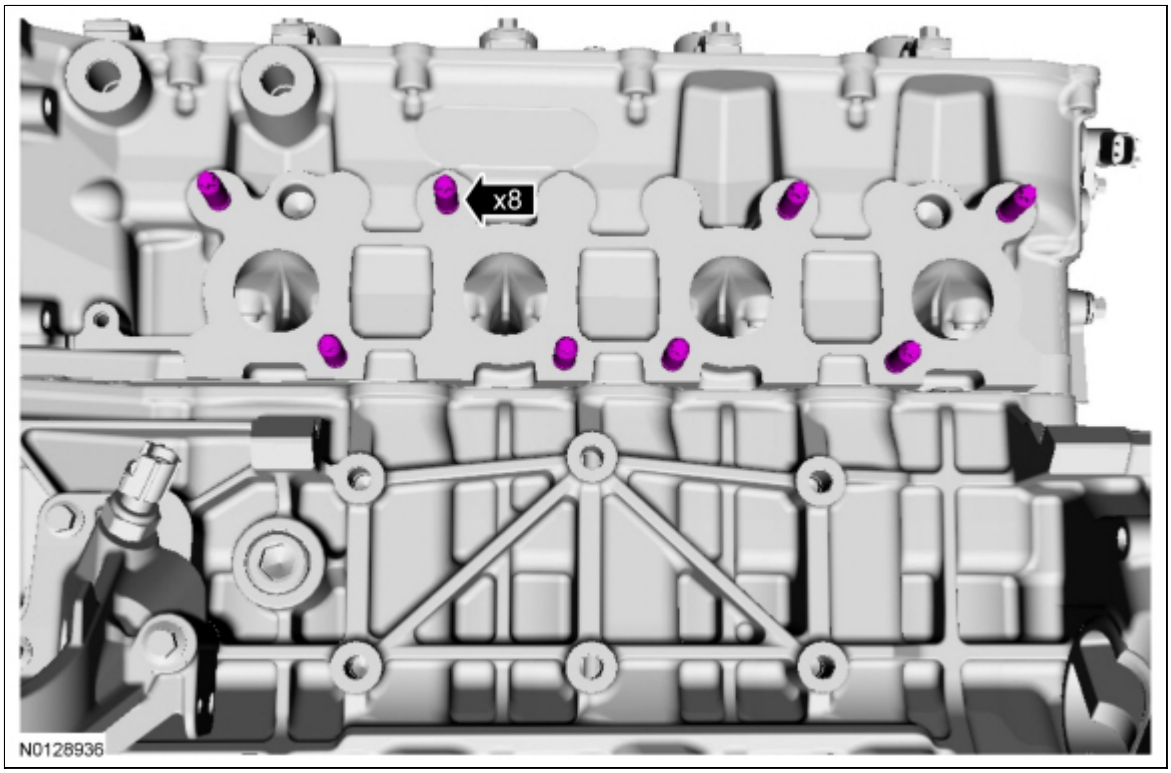


10. Remove the 8 nuts and the RH exhaust manifold.
    - Discard the gasket.

11. Remove and discard the 8 RH exhaust manifold studs.

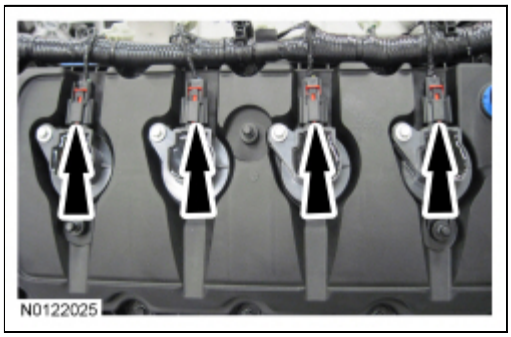


12. Remove the 3 bolts and the LH exhaust manifold heat shield.



13. Remove the 8 nuts and the LH exhaust manifold.
    - Discard the gasket.

repair4less



14. Remove and discard the 8 LH exhaust manifold studs.

15. Clean and inspect the RH and LH exhaust manifolds. For additional information, refer to Section 303-00 .

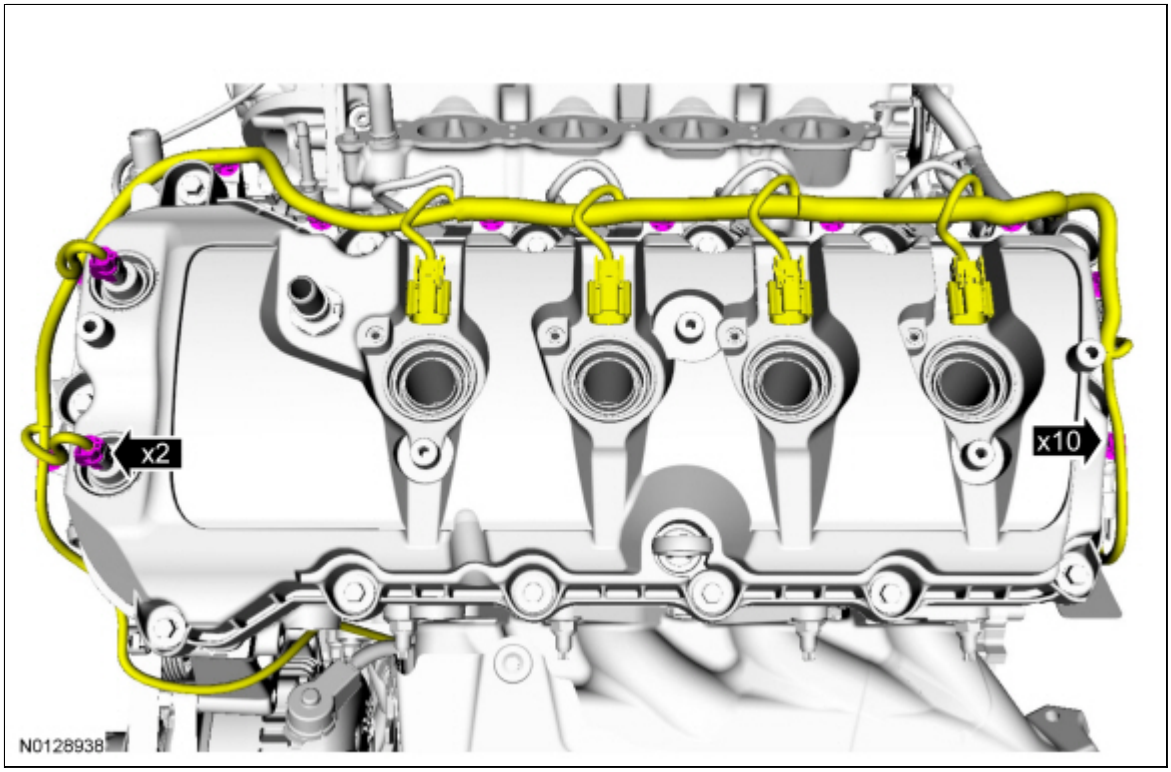
16. **NOTE:** RH shown, LH similar.

    Disconnect the 8 ignition coil electrical connectors.

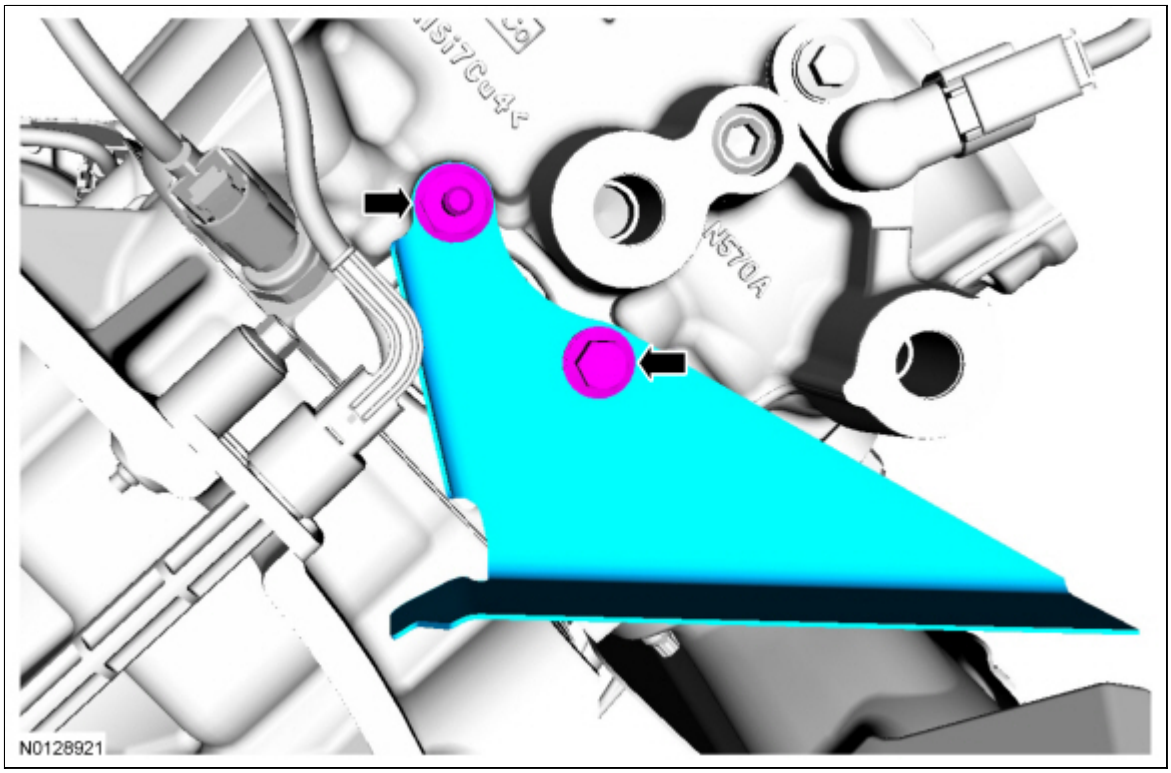
17. **NOTE:** RH shown, LH similar.

    NOTE: When removing the ignition coils, a slight twisting motion will break the seal and ease removal. RH shown, LH similar.

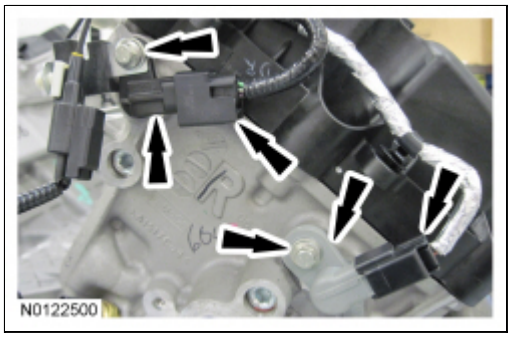
    Remove the 8 bolts and the 8 ignition coils.



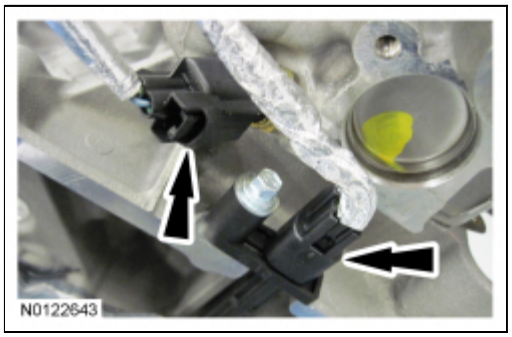
18. Disconnect the 2 Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.
    - Detach the 10 wiring harness retainers from the RH valve cover.



repair4less

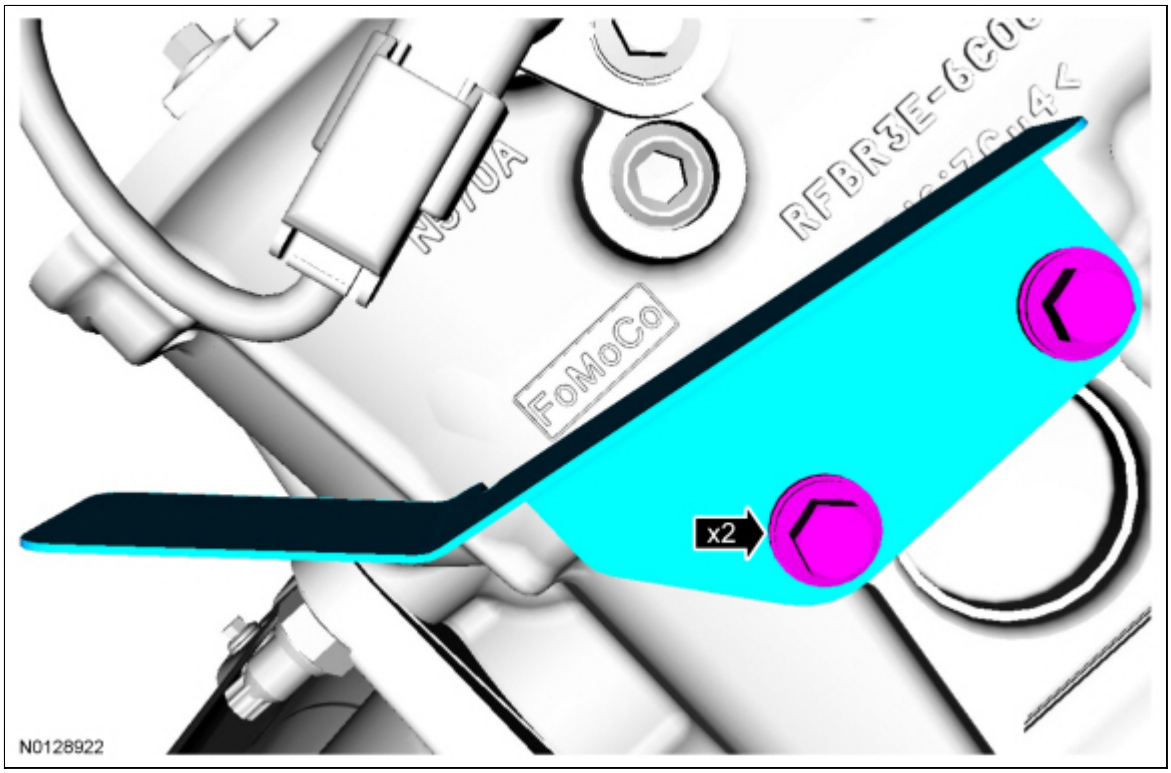


19. Disconnect the 2 VCT variable force solenoid electrical connectors.
    - Detach the 10 wiring harness retainers from the LH valve cover.

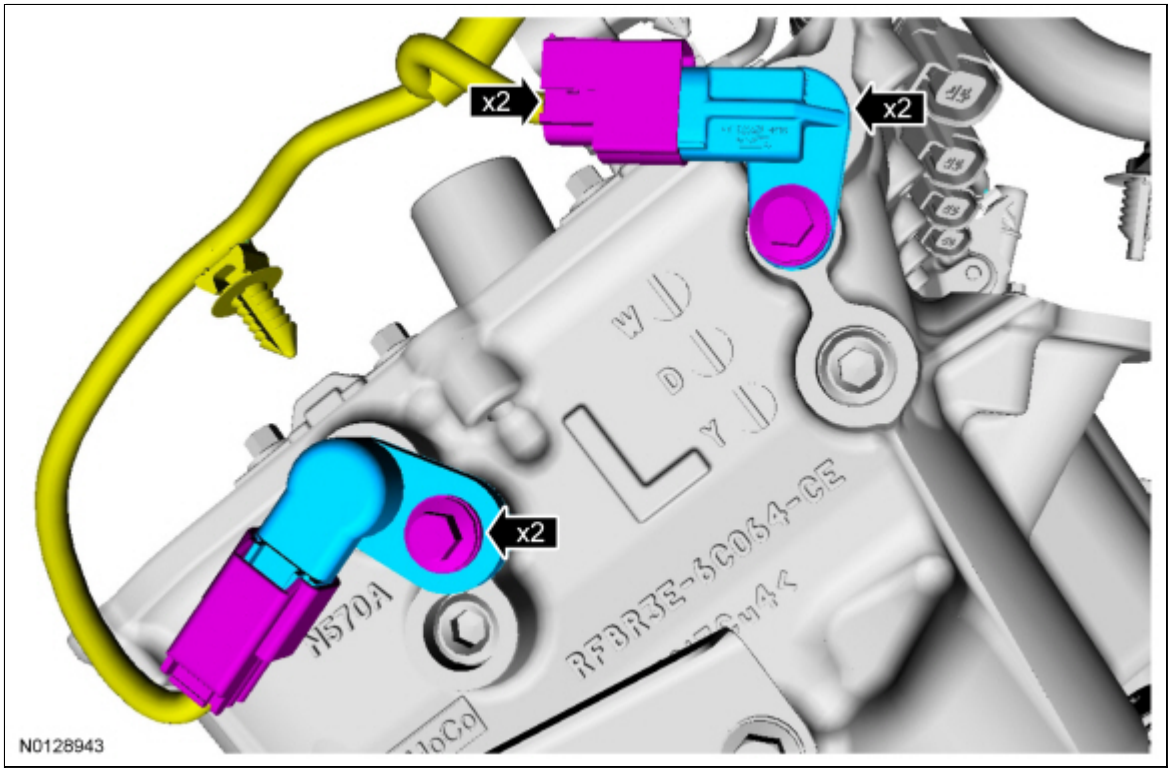


20. Remove the bolt, stud bolt and heat shield from the RH cylinder head.

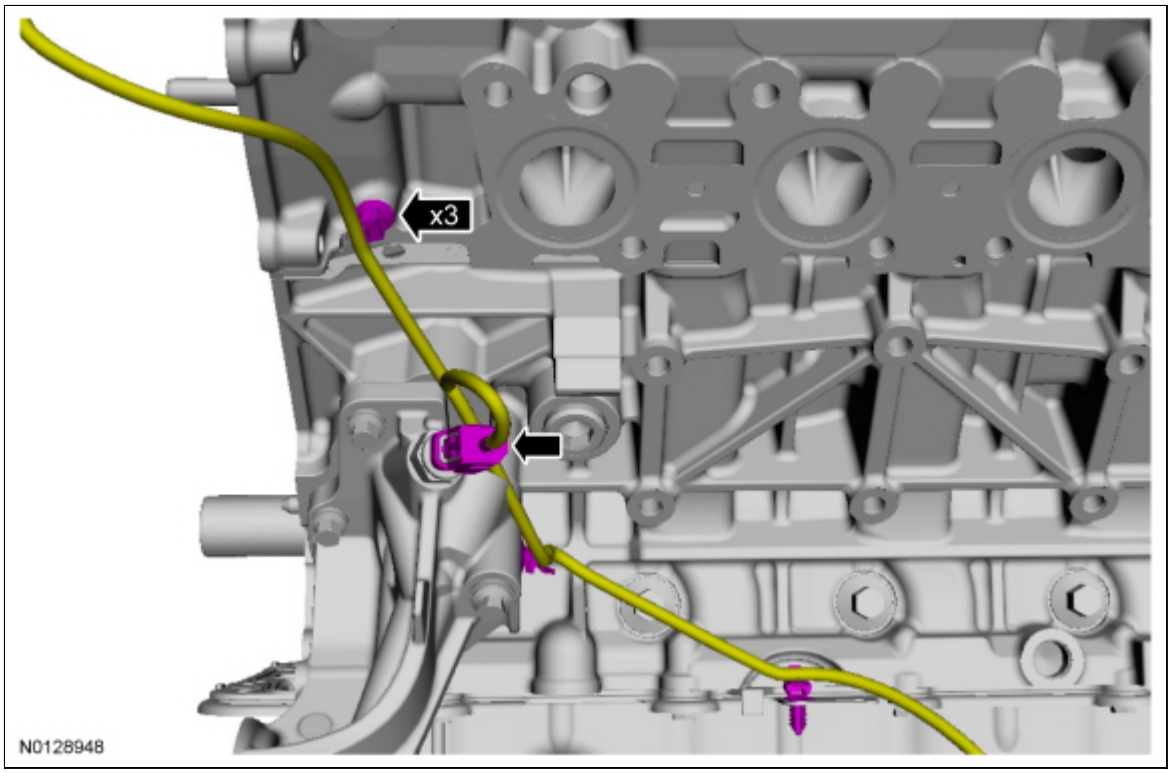
21. Disconnect the RH intake and exhaust Camshaft Position (CMP) sensor electrical connectors.
    - Remove the 2 bolts and the RH intake and exhaust CMP sensors.



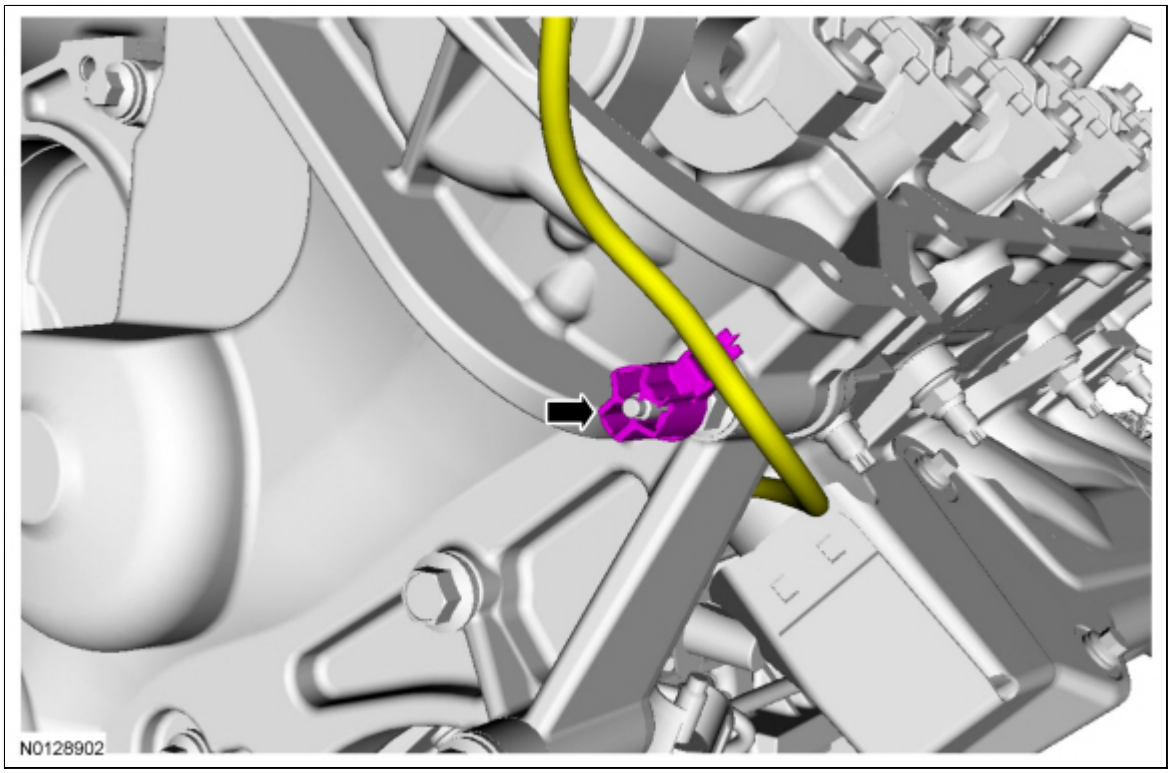
22. Disconnect the Cylinder Head Temperature (CHT) sensor and the Crankshaft Position (CKP) sensor electrical connectors.



23. Remove the 2 bolts and the heat shield from the LH cylinder head.

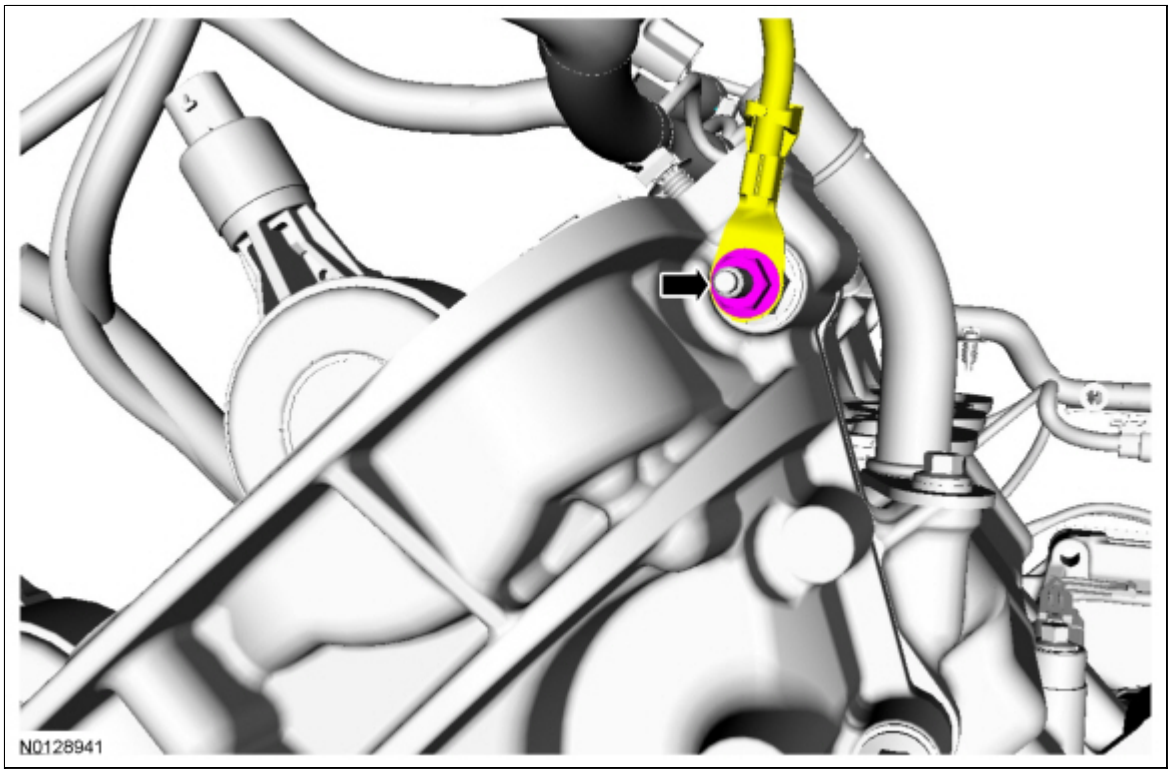


repair4less

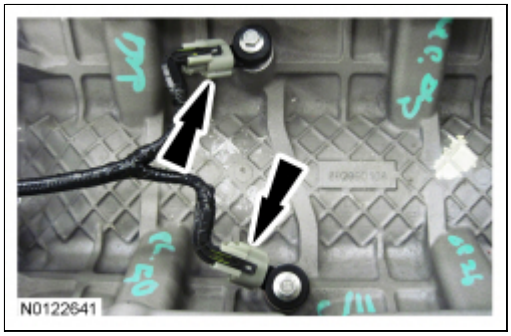


24. Disconnect the LH intake and exhaust Camshaft Position (CMP) sensor electrical connectors.
    - Remove the 2 bolts and the LH intake and exhaust CMP sensors.

25. Disconnect the Engine Oil Pressure (EOP) switch electrical connector and the 3 wiring harness retainers.

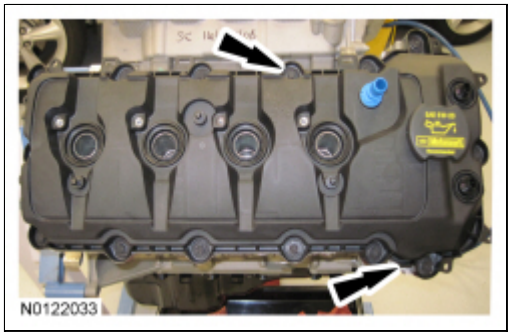


26. Detach the wiring harness retainer from the engine front cover stud bolt.



27. Remove the nut and the ground wire from the engine front cover stud bolt.

repair4less

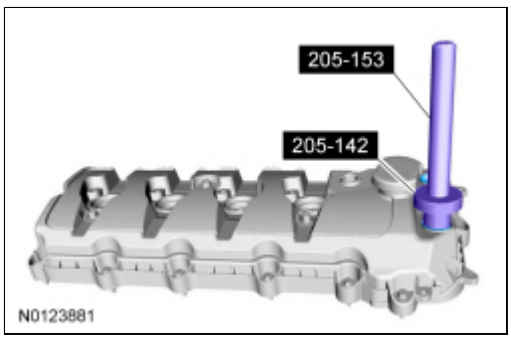


28. Disconnect the 2 Knock Sensor (KS) electrical connectors.
    - Remove the wiring harness from the engine.

29. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Loosen the 14 fasteners and remove the RH valve cover and gasket.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

30. Remove the oil level indicator.

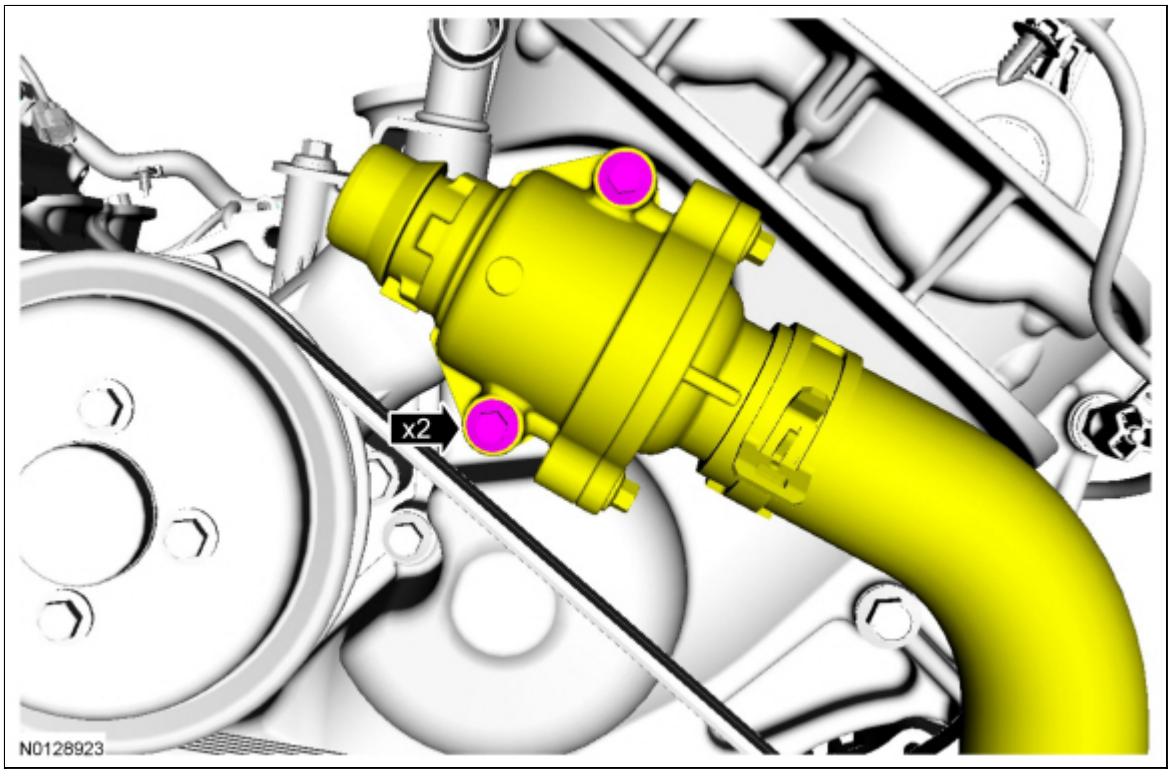


31. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Loosen the 14 fasteners and remove the LH valve cover and gasket.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

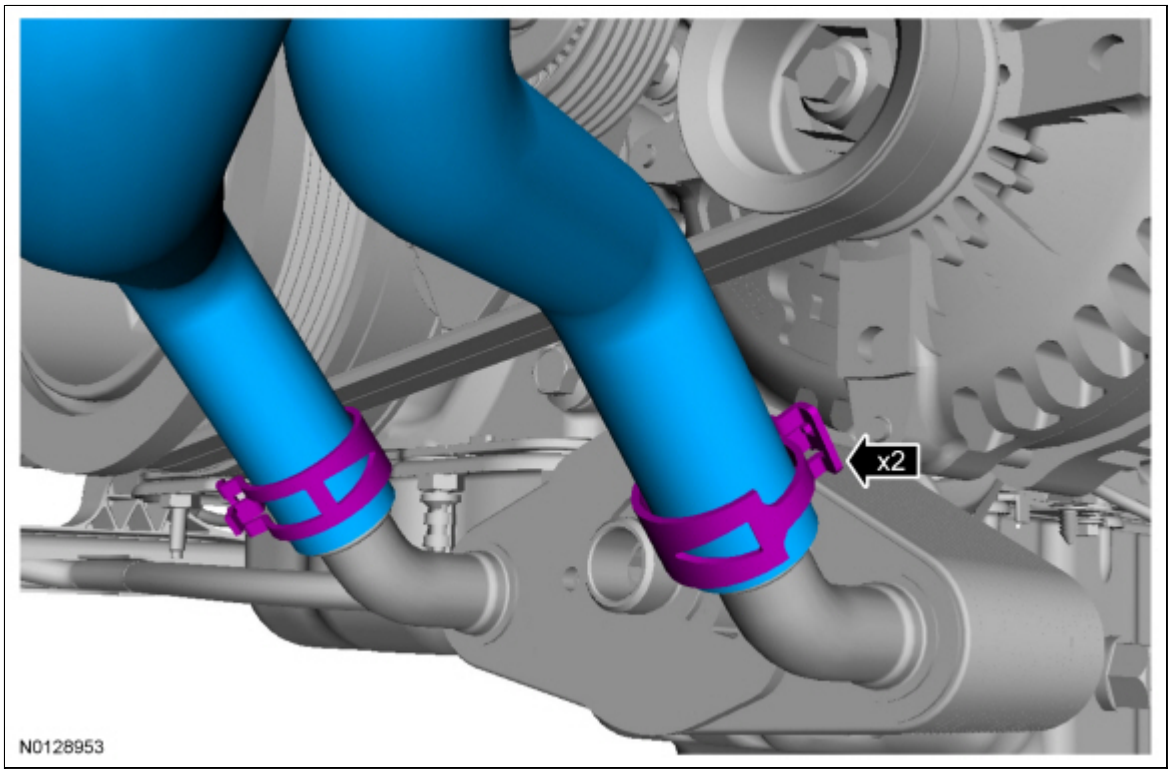
32. **NOTE:** RH shown, LH similar.

    Inspect the 2 VCT variable force solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

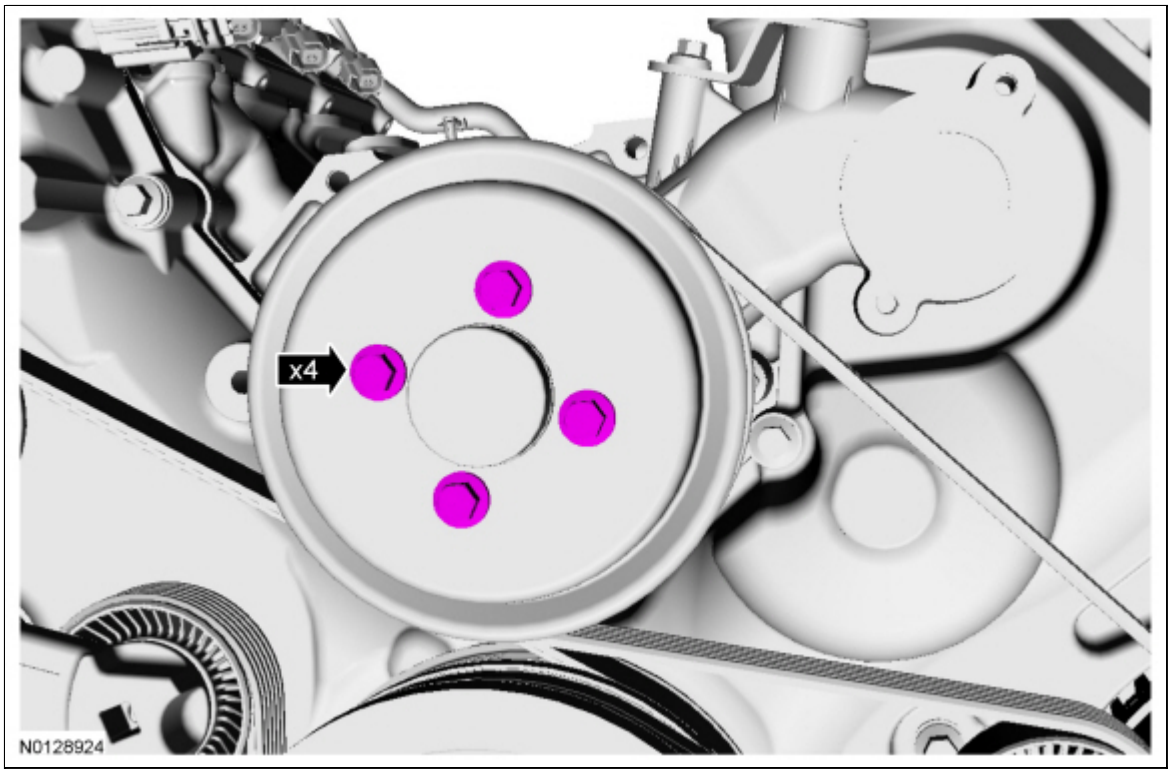


33. **NOTE:** RH shown, LH similar.

    Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

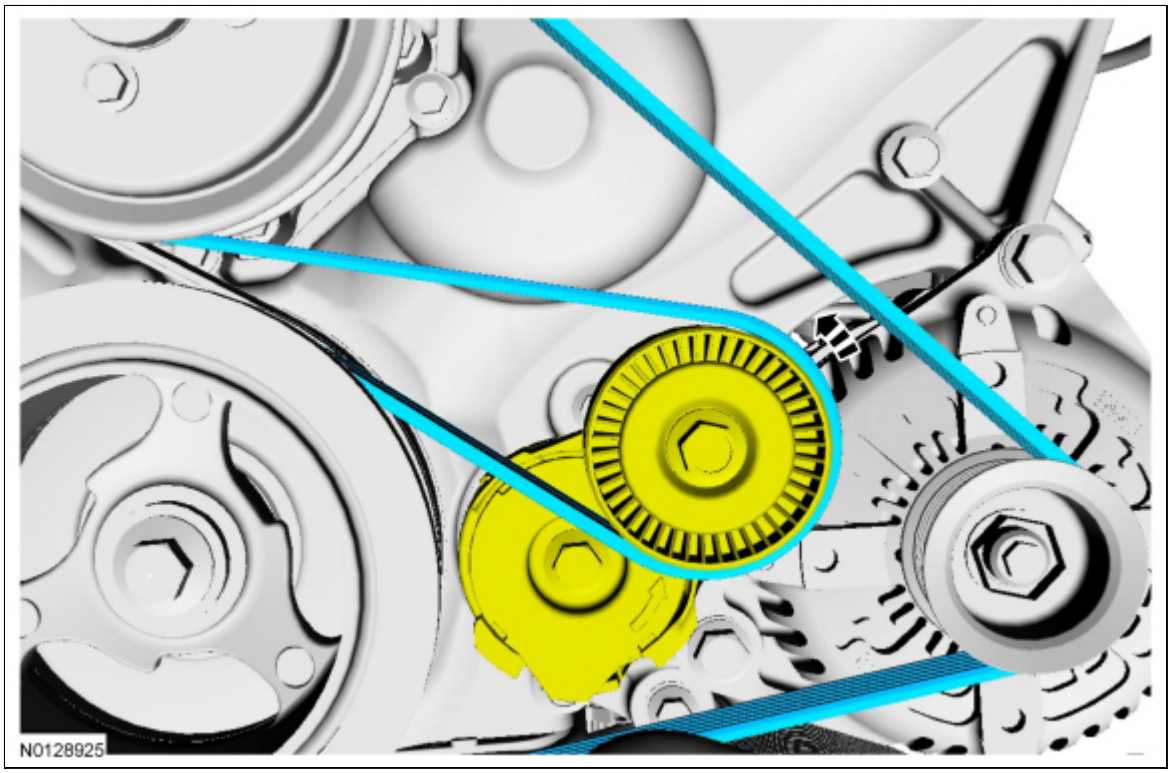


repair4less

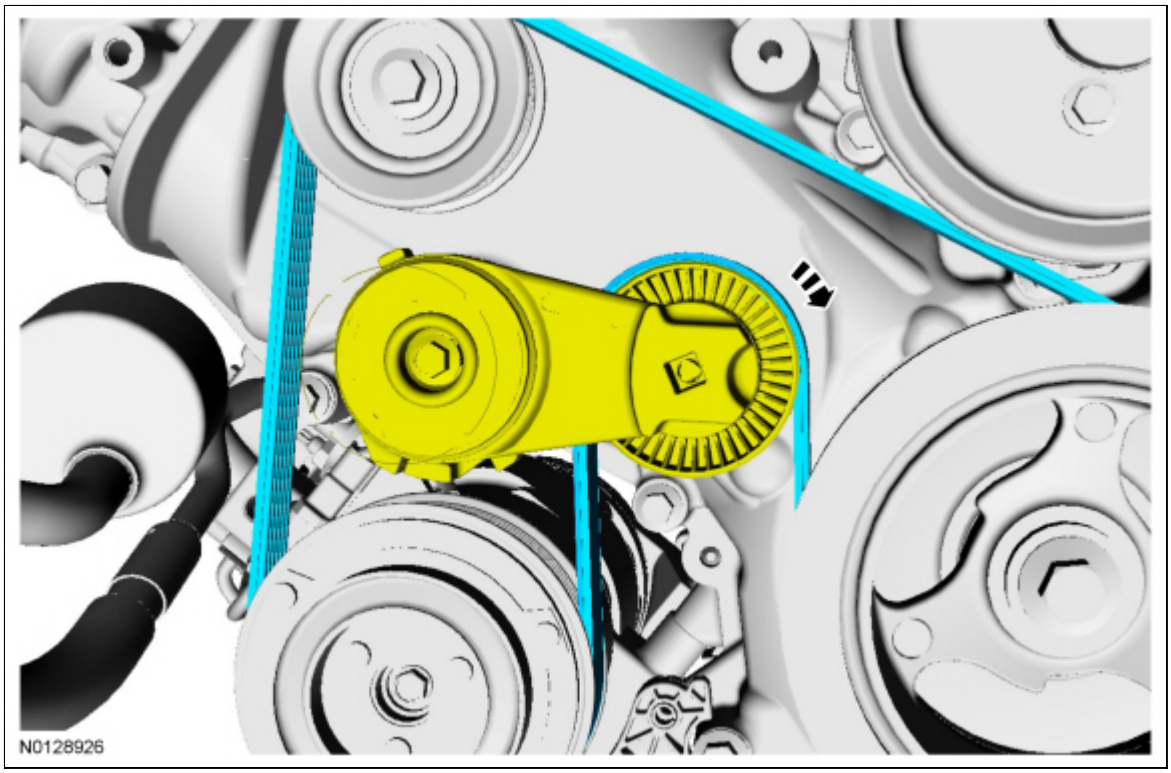


34. Remove the 2 bolts and position the thermostat housing and lower radiator hose aside.
    - Remove and discard the thermostat housing O-ring seal.

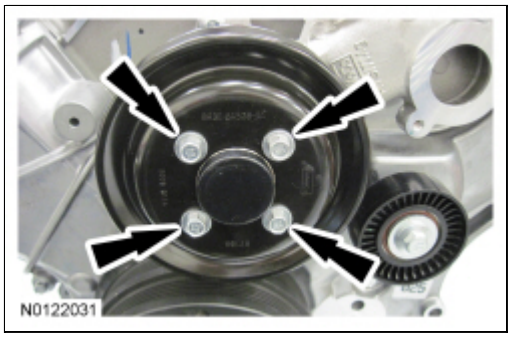
35. Release the 2 clamps and disconnect the coolant hoses from the oil cooler.



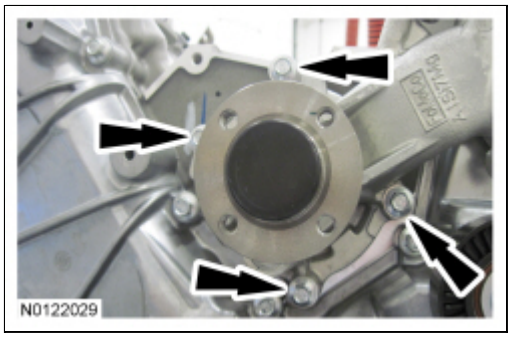
36. Loosen the 4 coolant pump pulley bolts.



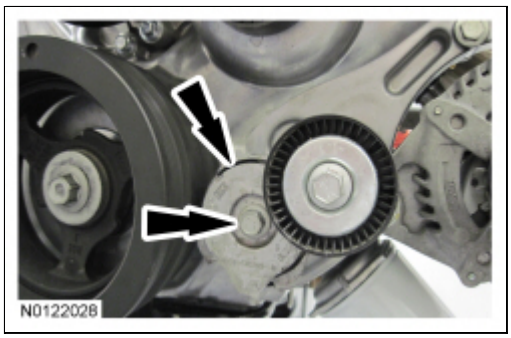
37. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.



repair4less

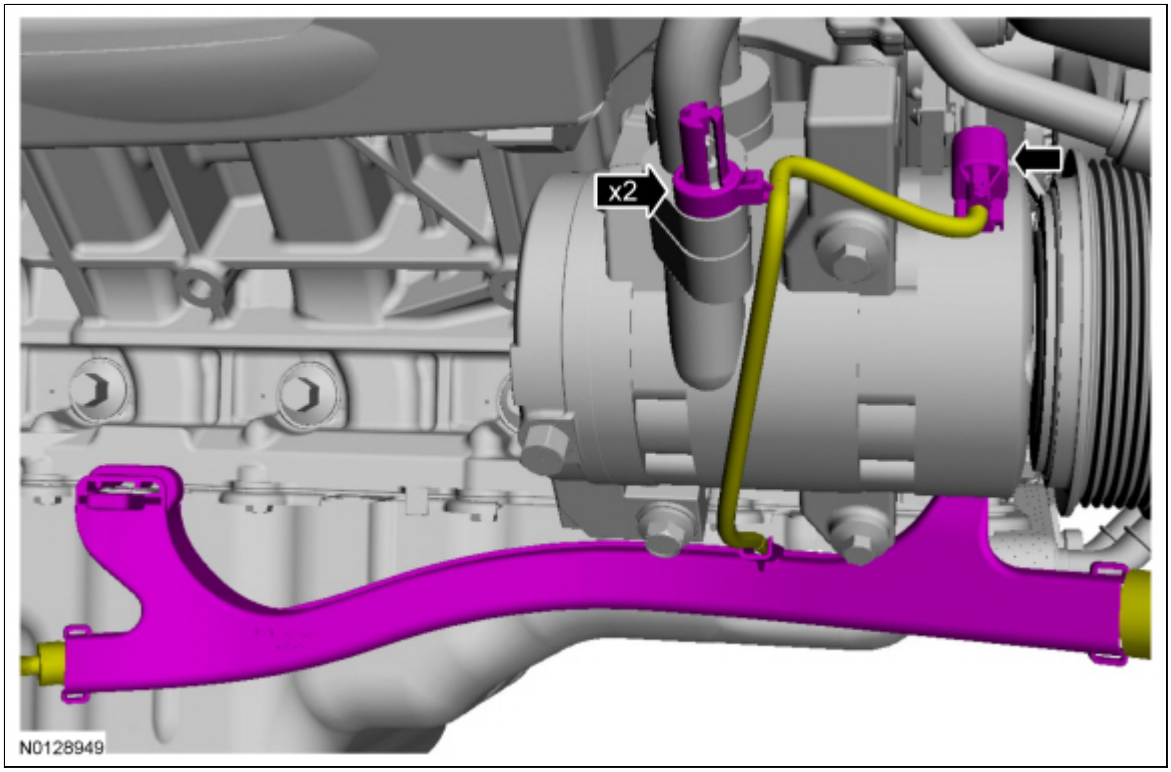


38. Rotate the A/C compressor belt tensioner clockwise and remove the A/C compressor belt.

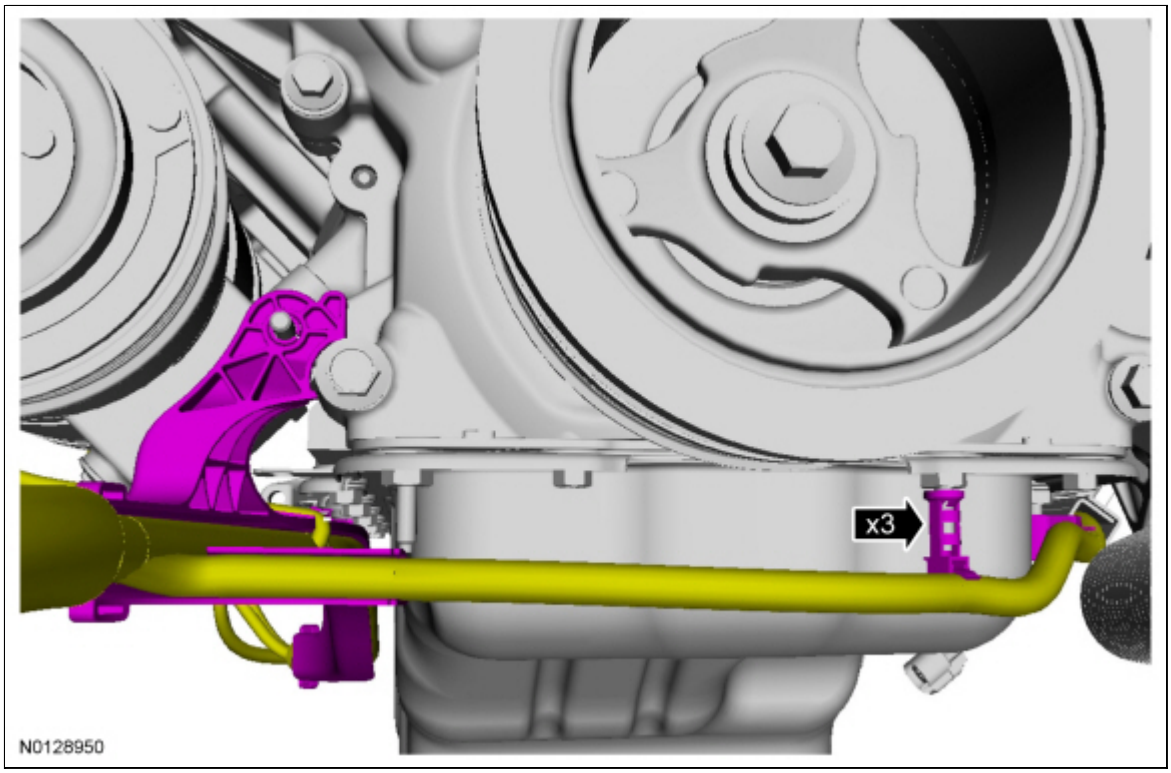


39. Remove the 4 bolts and the coolant pump pulley.

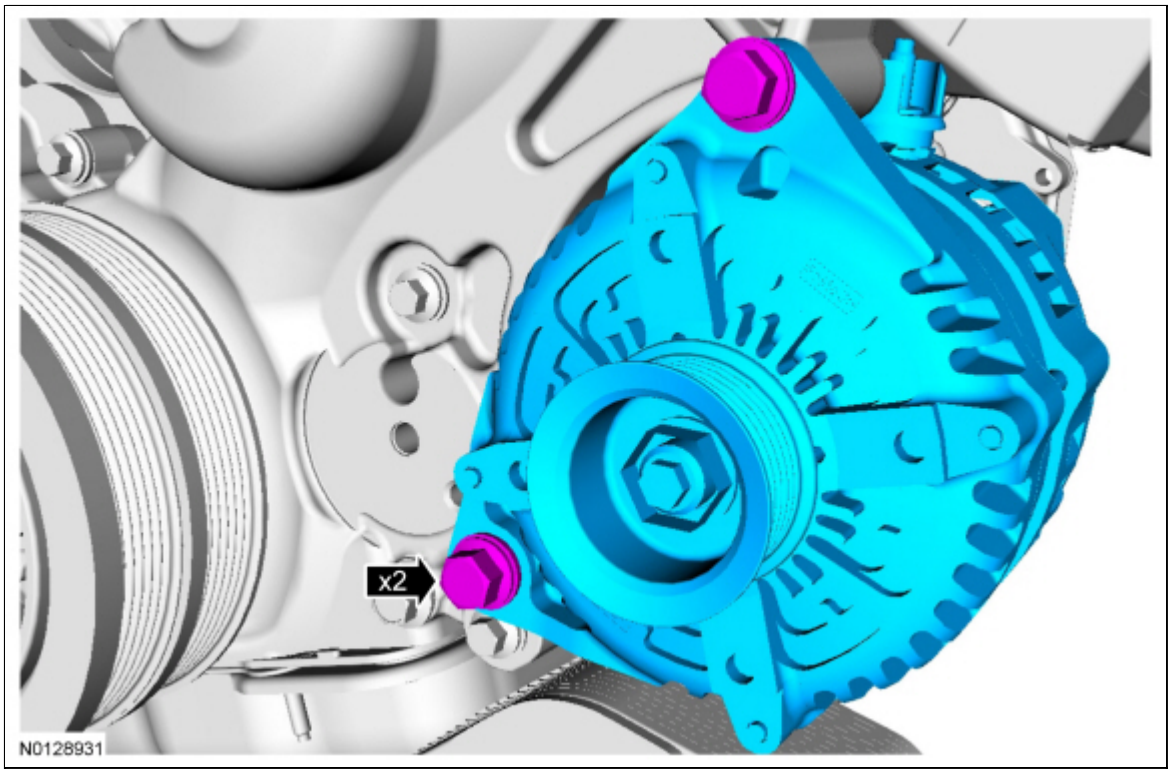
40. Remove the 4 bolts and the coolant pump.
    - Remove and discard the O-ring seal.



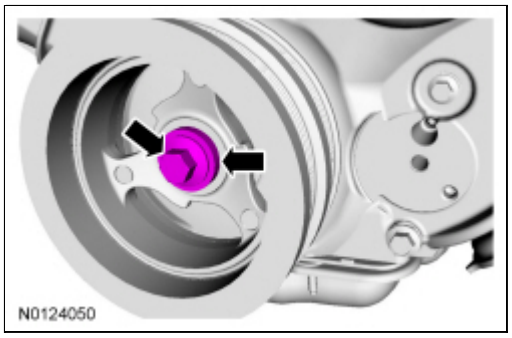
41. Remove the bolt and the accessory drive belt tensioner.



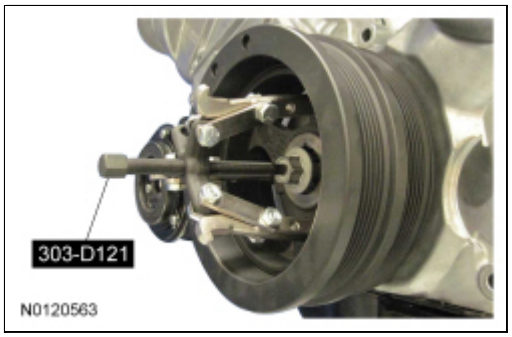
42. Disconnect the A/C compressor electrical connector and the 2 wiring harness retainers.



repair4less

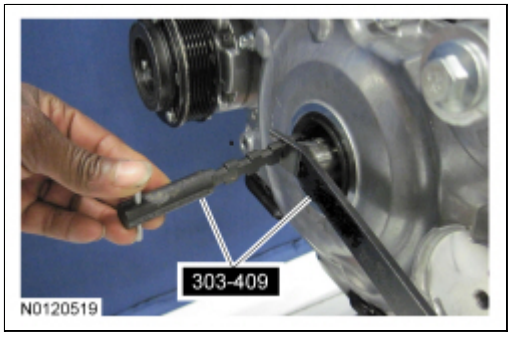


43. Detach the 3 wiring harness retainers.

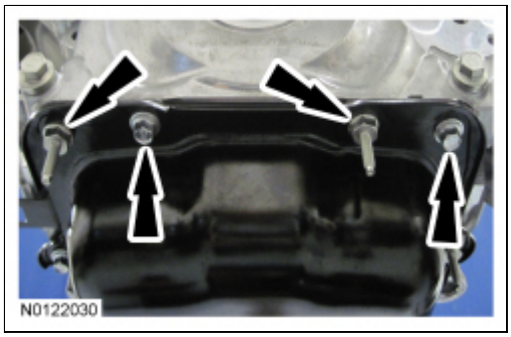


44. Remove the 2 bolts and the generator.

45. Remove the crankshaft pulley bolt and washer.

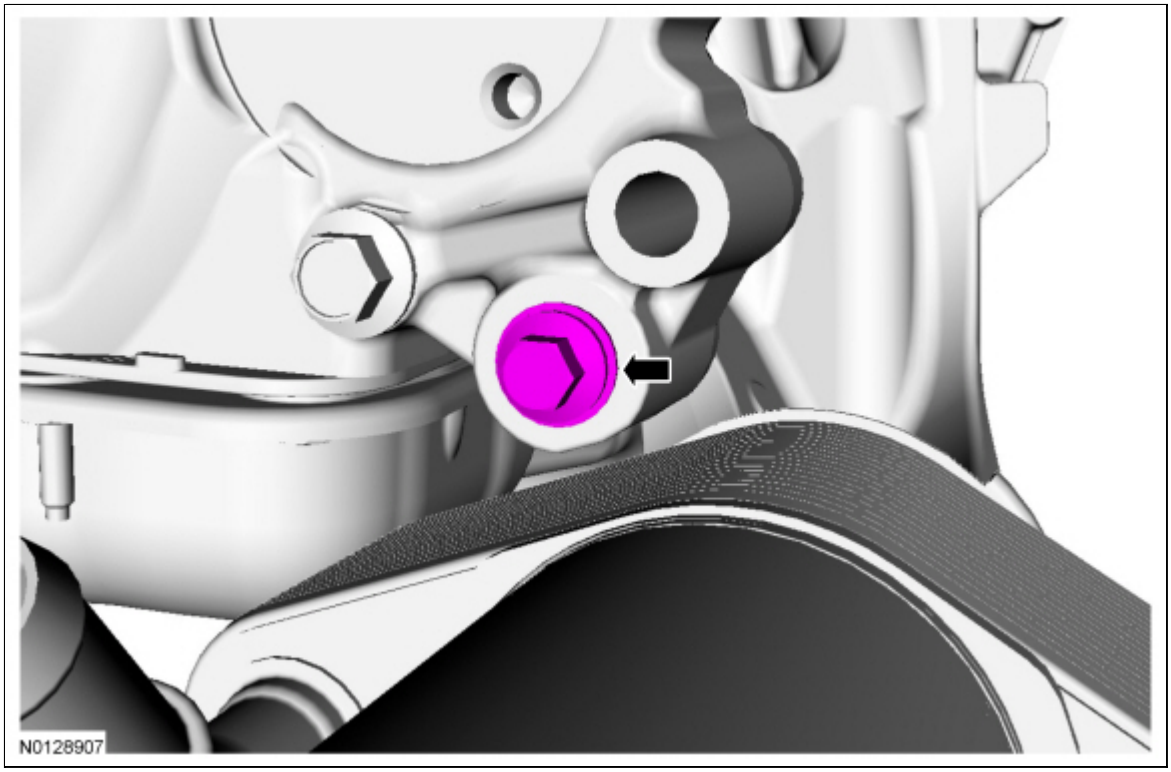


46. Using the 3 Jaw Puller and the crankshaft pulley bolt, remove the crankshaft pulley.
    - Discard the crankshaft pulley bolt.

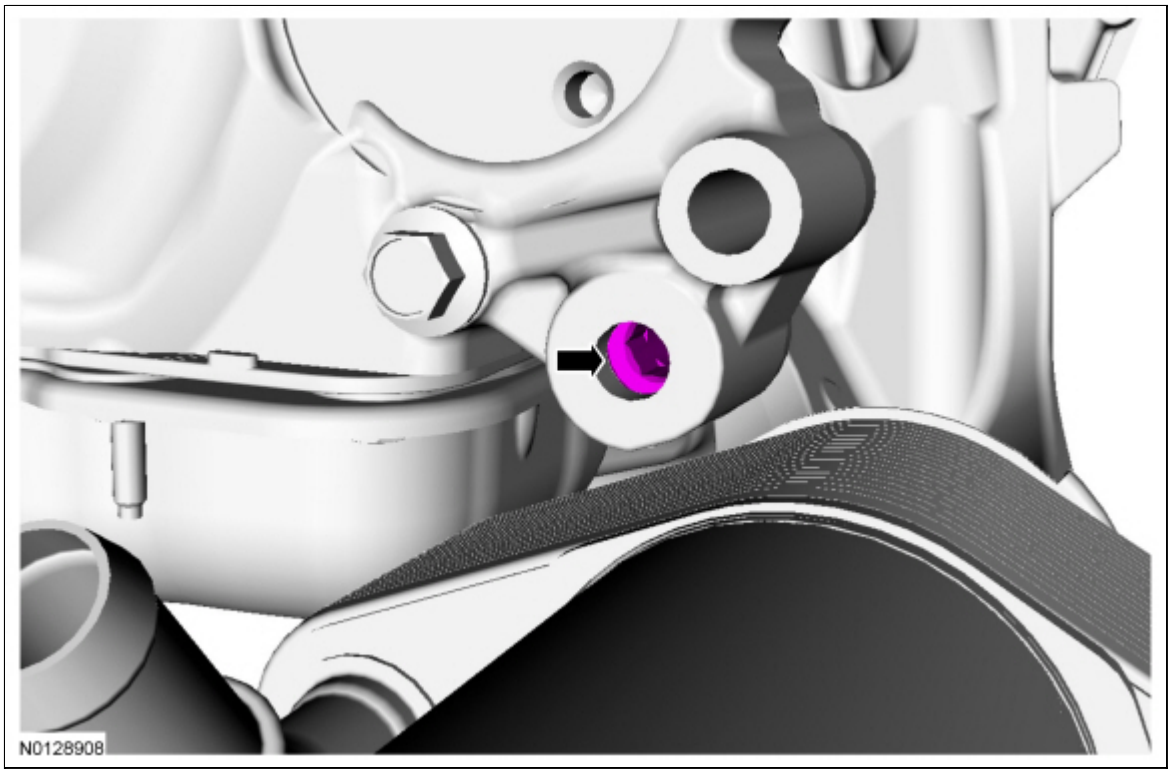


47. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

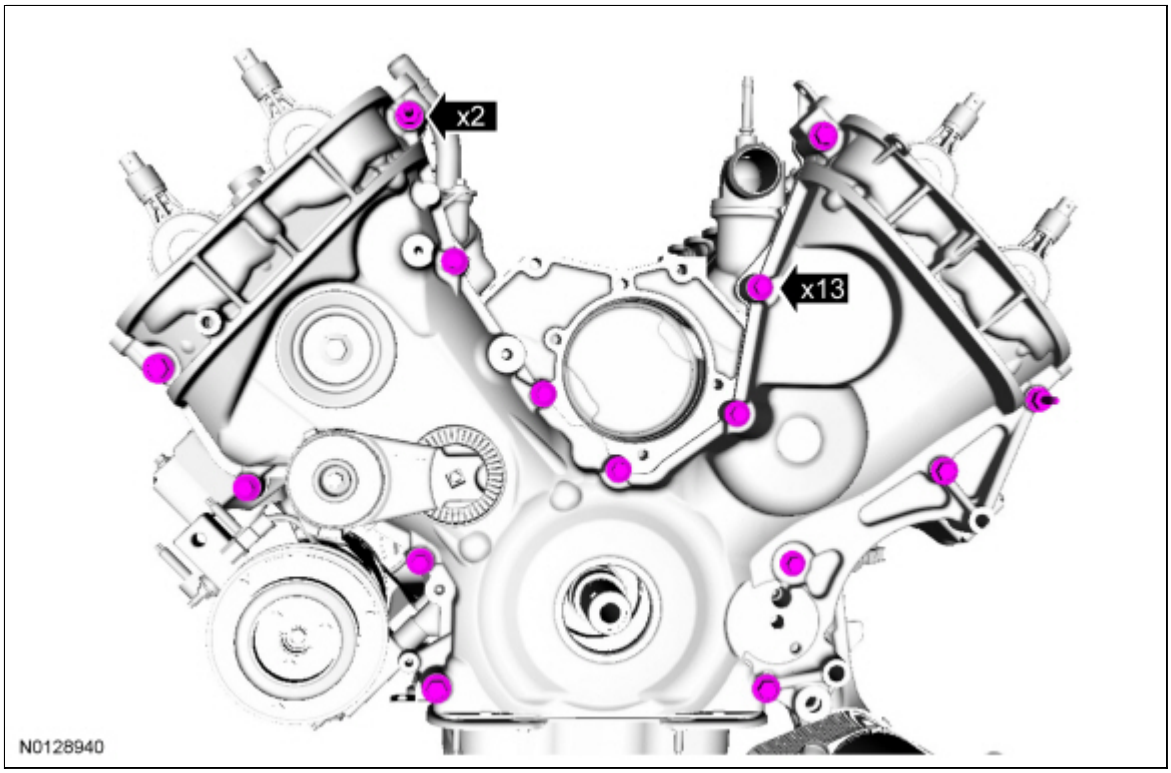
repair4less



Using the Oil Seal Remover, remove the crankshaft front oil seal.



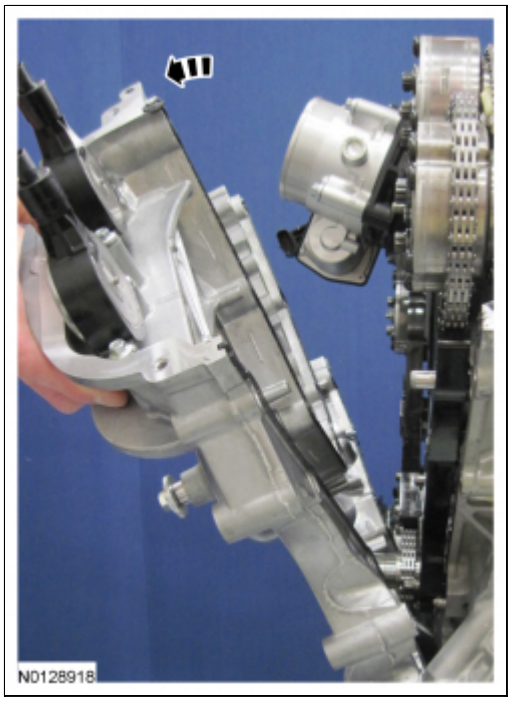
48. Remove the 2 front oil pan stud bolts and 2 front oil pan bolts.



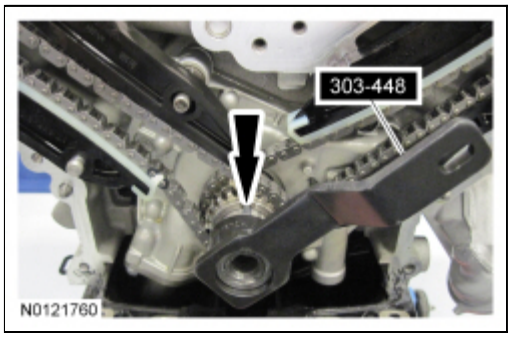
49. Remove the engine front cover-to-oil filter adapter bolt.

50. Using a 10 mm (0.393 in) Hex Bit loosen the engine front cover-to-oil filter adapter jack screw.

51. Remove the 13 engine front cover bolts and the 2 stud bolts.

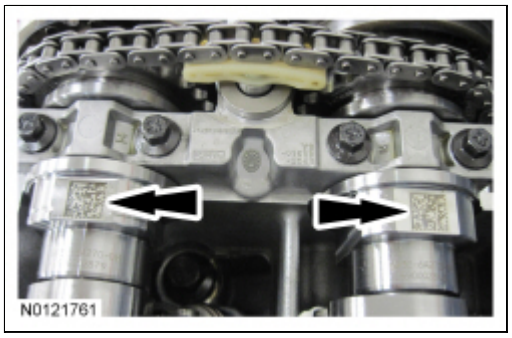


52. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

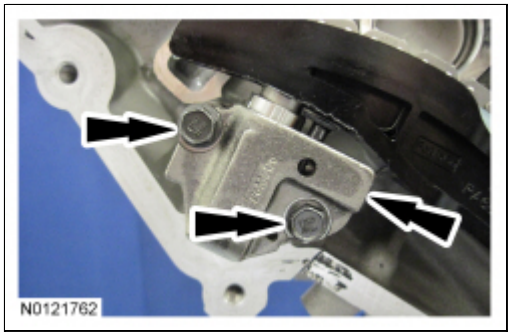


repair4less

Remove the engine front cover.

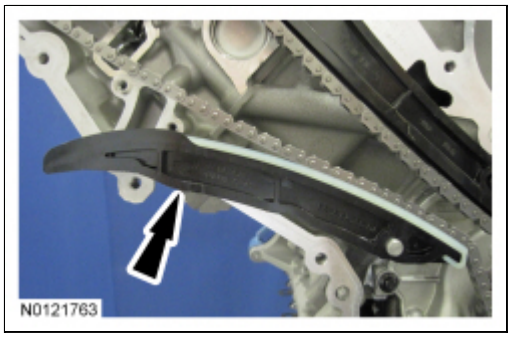


- Remove and discard the engine front cover gaskets.
- Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the mating surfaces.



53. Using the crankshaft holding tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

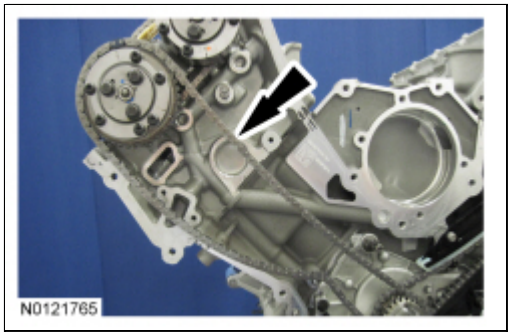
54. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.



55. Remove the 2 bolts and the RH primary timing chain tensioner.

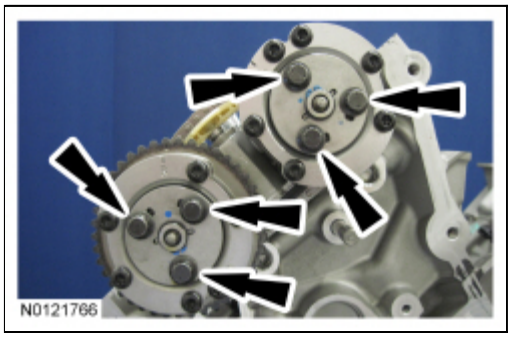
56. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

    Remove the RH timing chain tensioner arm.

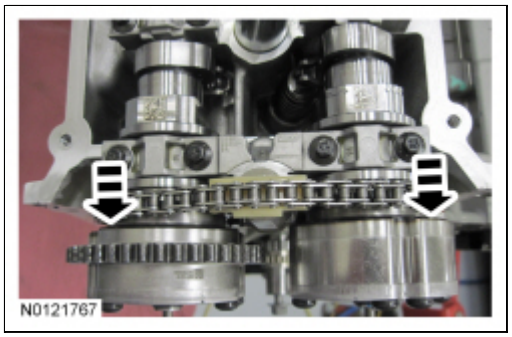


57. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

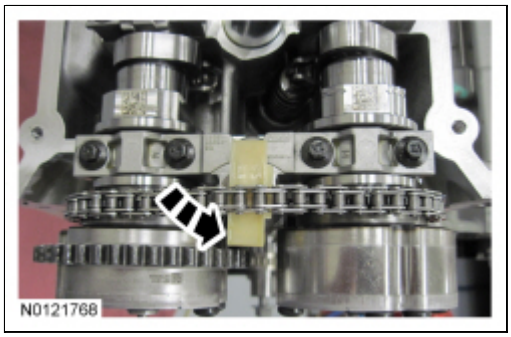
    Remove the bolt and the RH timing chain guide.



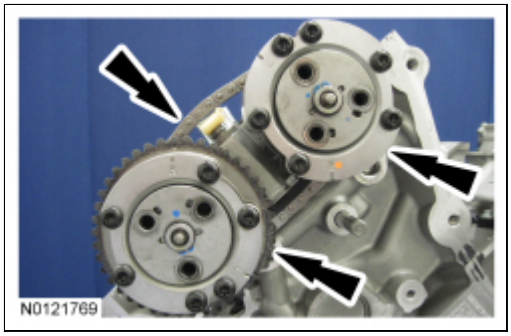
repair4less



58. Remove the RH primary timing chain.

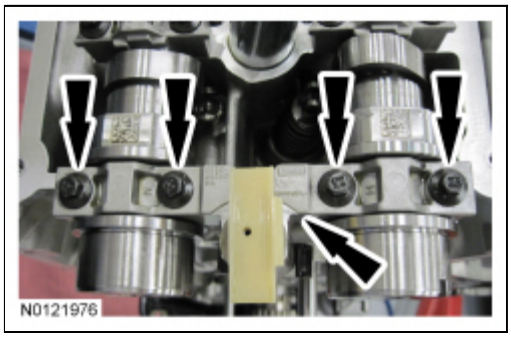


59. Remove the 3 RH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 RH exhaust VCT assembly bolts.

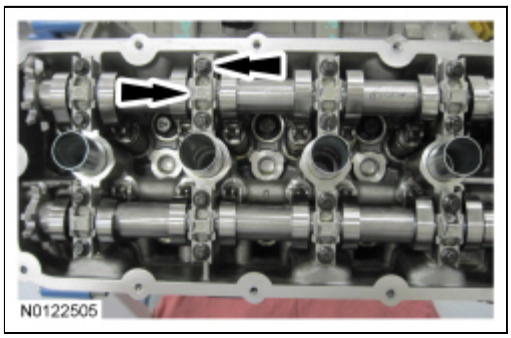


60. Slide the RH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

61. Depress the RH secondary timing chain tensioner and turn the tensioner 90 degrees.

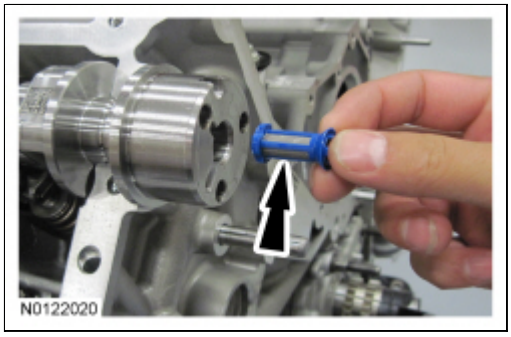


62. Remove the RH VCT assemblies and the RH secondary timing chain.

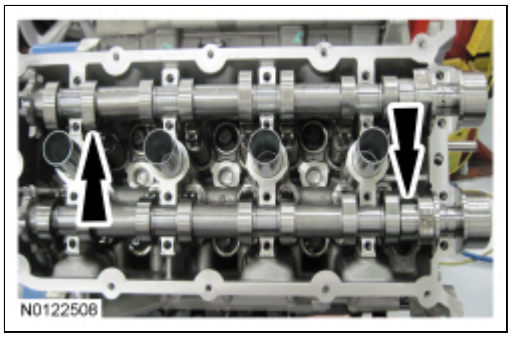


63. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the RH front camshaft bearing mega cap.

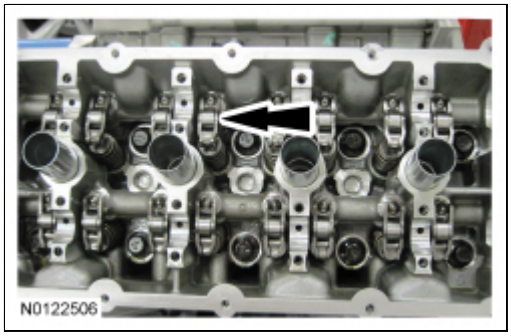


64. Remove the 16 bolts and the 8 camshaft bearing caps.

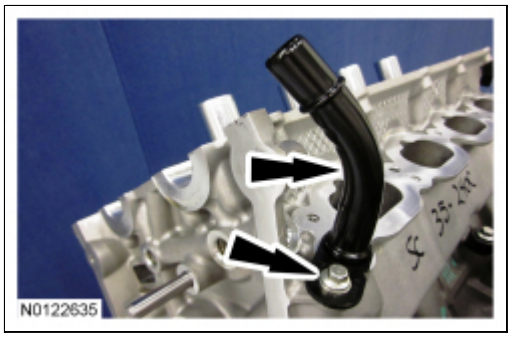


65. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

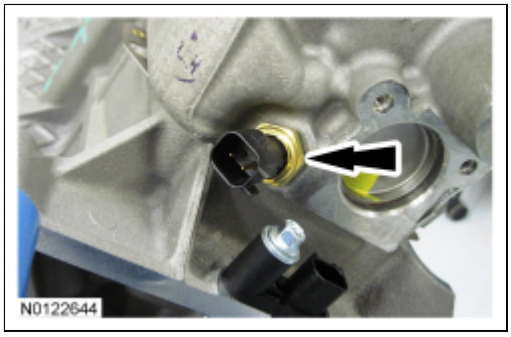
repair4less



Remove the VCT system oil filter from the intake and exhaust camshafts.



66. Remove the RH intake and exhaust camshafts.



67. Remove the 16 camshaft roller follower and hydraulic lash adjuster assemblies.

68. Remove the bolt and the coolant outlet pipe from the RH cylinder head.
    - Remove and discard the O-ring seal.

69. Remove the CHT sensor.

70. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

    NOTICE: **The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    Remove the 10 bolts and the RH cylinder head.
    - Discard the bolts and the cylinder head gasket.

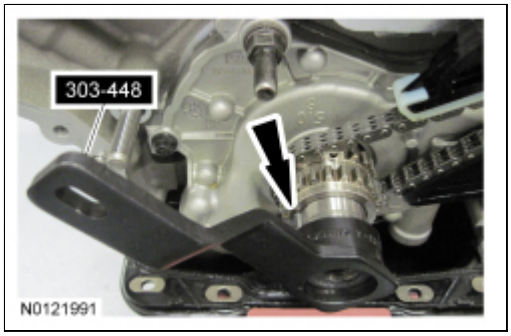
repair4less

71. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or notices and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

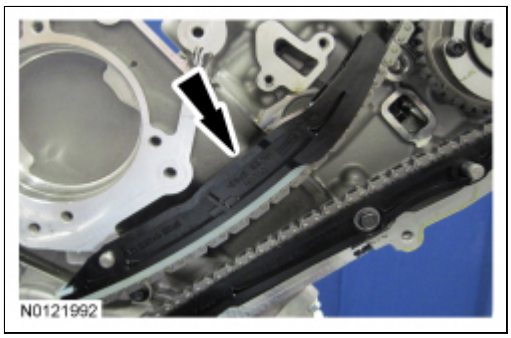


72. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

    NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

    Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

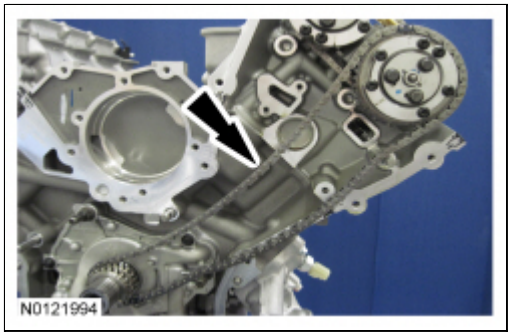
73. Using the crankshaft holding tool, rotate the crankshaft counterclockwise until the crankshaft keyway is at the 9 o'clock position.



74. Remove the 2 bolts and the LH primary timing chain tensioner.

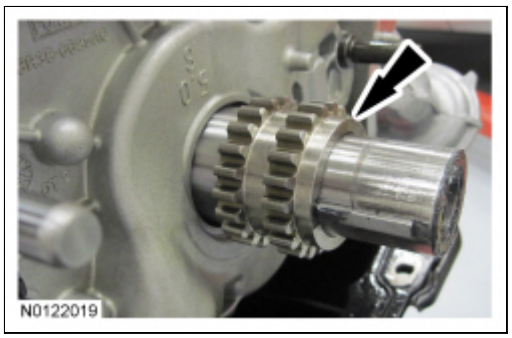
75. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain tensioner arm.

    Remove the LH timing chain tensioner arm.

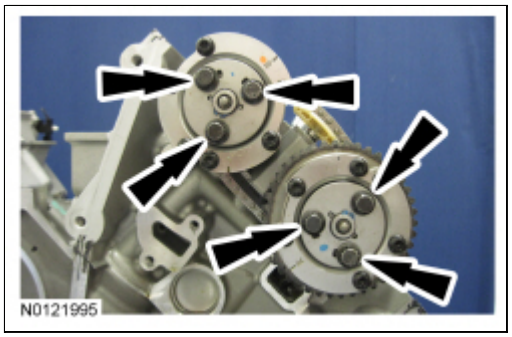


76. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain guide.

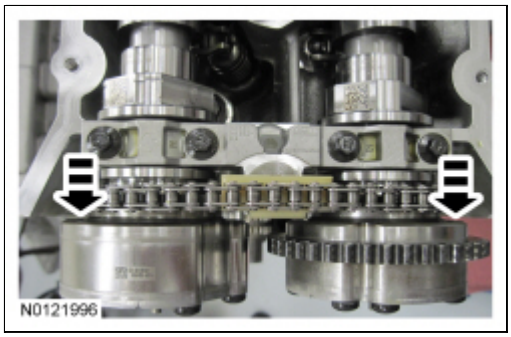
    Remove the bolt and the LH timing chain guide.



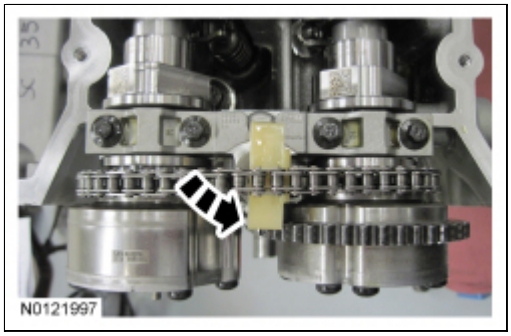
repair4less



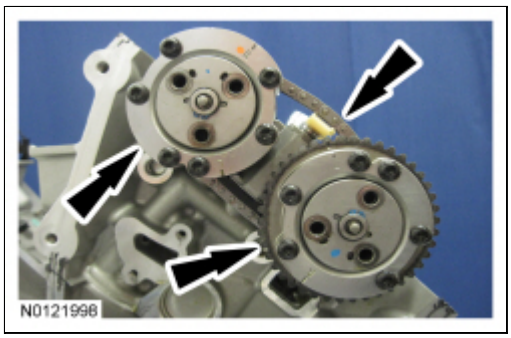
77. Remove the LH primary timing chain.



78. Remove the crankshaft sprocket.

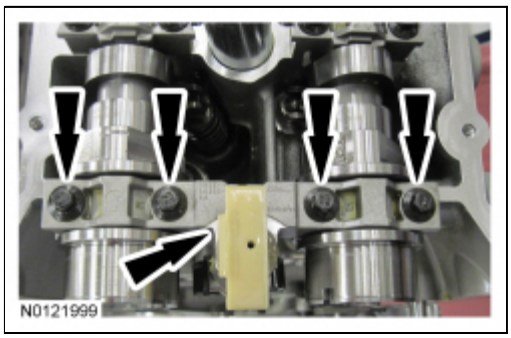


79. Remove the 3 LH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 LH exhaust VCT assembly bolts.

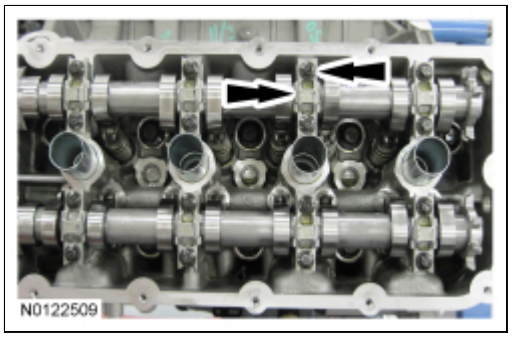


80. Slide the LH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

81. Depress the LH secondary timing chain tensioner and turn the tensioner 90 degrees.

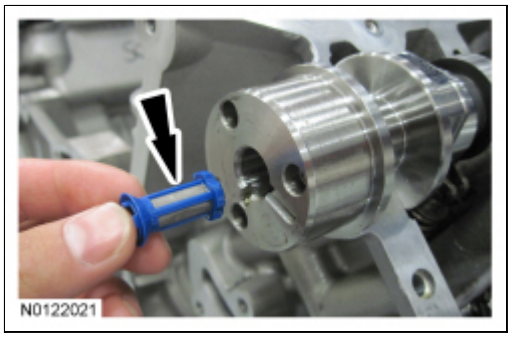


82. Remove the LH VCT assemblies and the LH secondary timing chain.



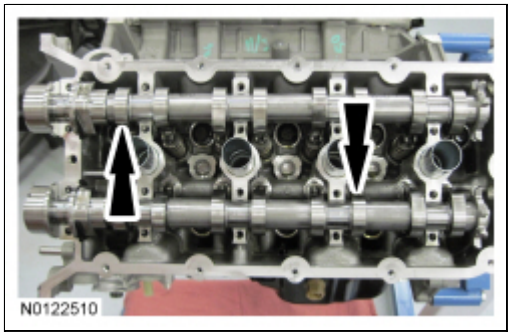
83. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the LH front camshaft bearing mega cap.



84. Remove the 16 bolts and the 8 camshaft bearing caps.

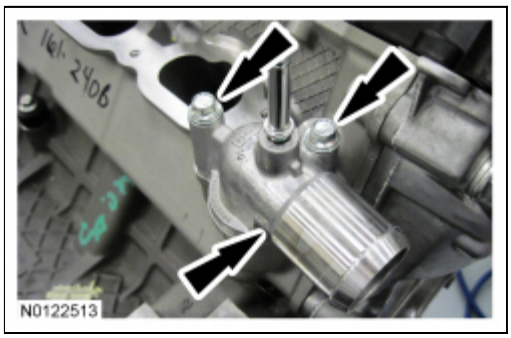
repair4less



85. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Remove the VCT system oil filter from the intake and exhaust camshafts.

86. Remove the LH intake and exhaust camshafts.



87. Remove the 16 camshaft roller follower and hydraulic lash adjuster assemblies.

88. Remove the 2 bolts and the coolant outlet from the LH cylinder head.

- Remove and discard the gasket.

89. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

    NOTICE: **The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

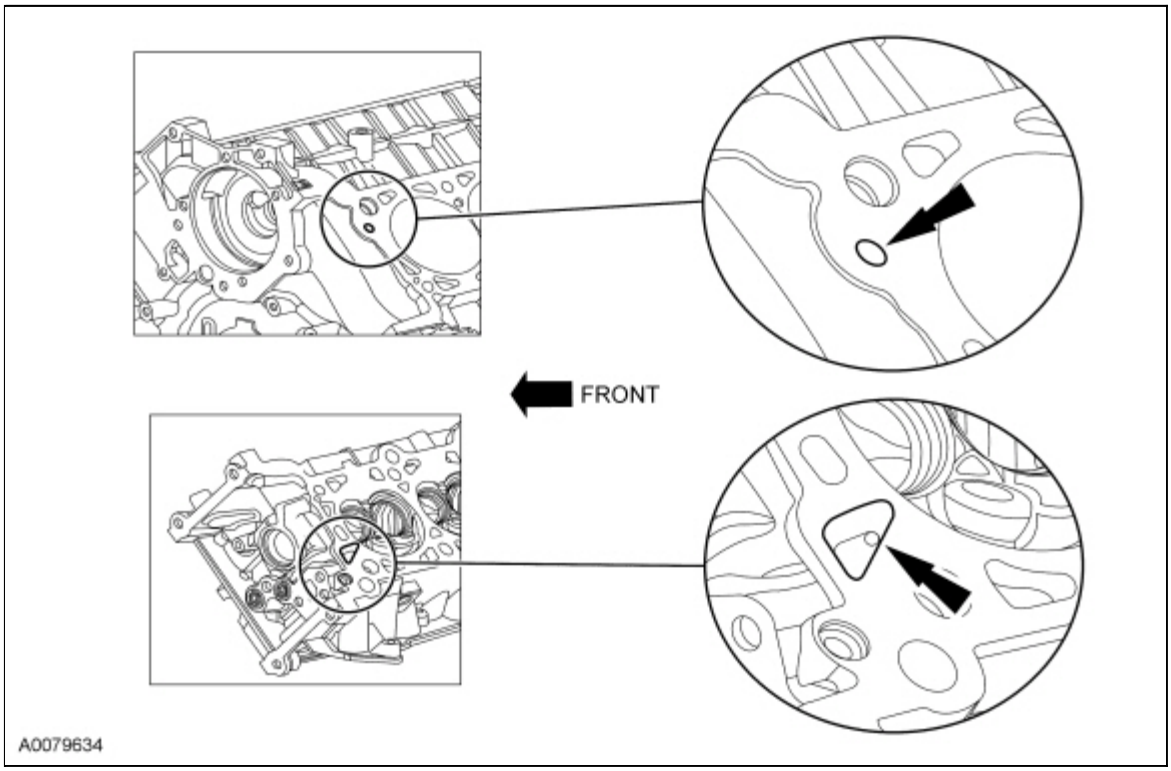
    Remove the 10 bolts and the LH cylinder head.
    - Discard the bolts and the cylinder head gasket.

repair4less

90. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

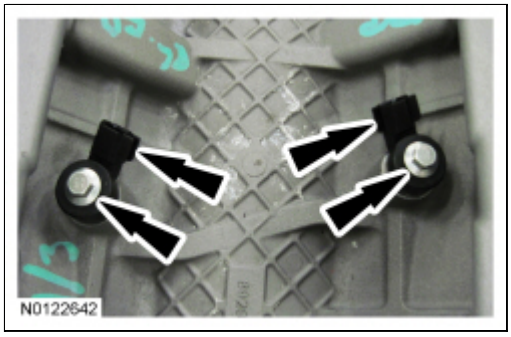
NOTE: Observe all warnings or notices and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.



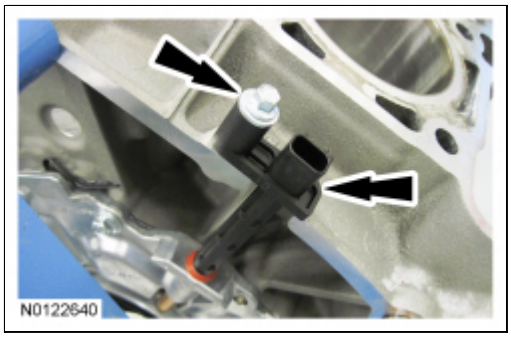
Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.



91. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

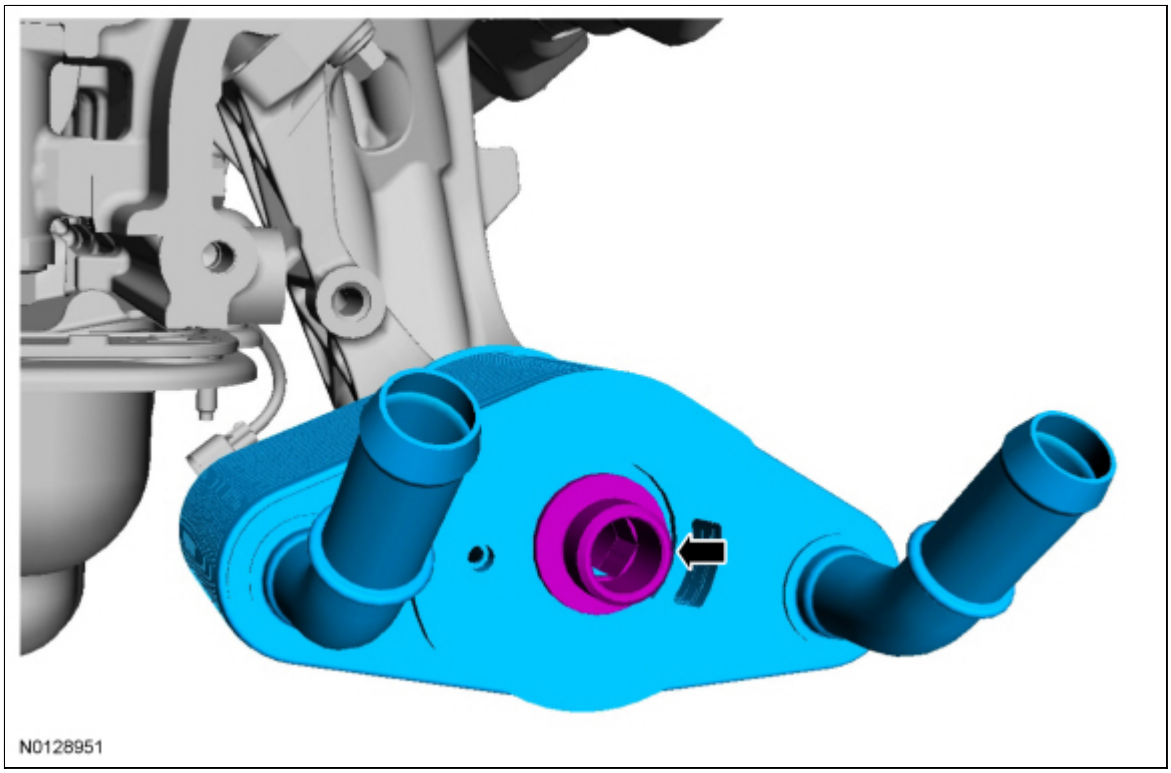
NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.



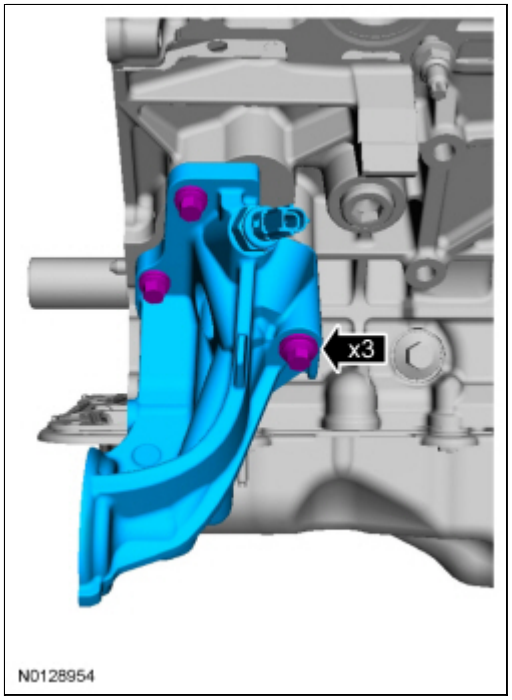
Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

92. Remove the 2 bolts and the 2 KS .

93. Remove the bolt and the Crankshaft Position (CKP) sensor.

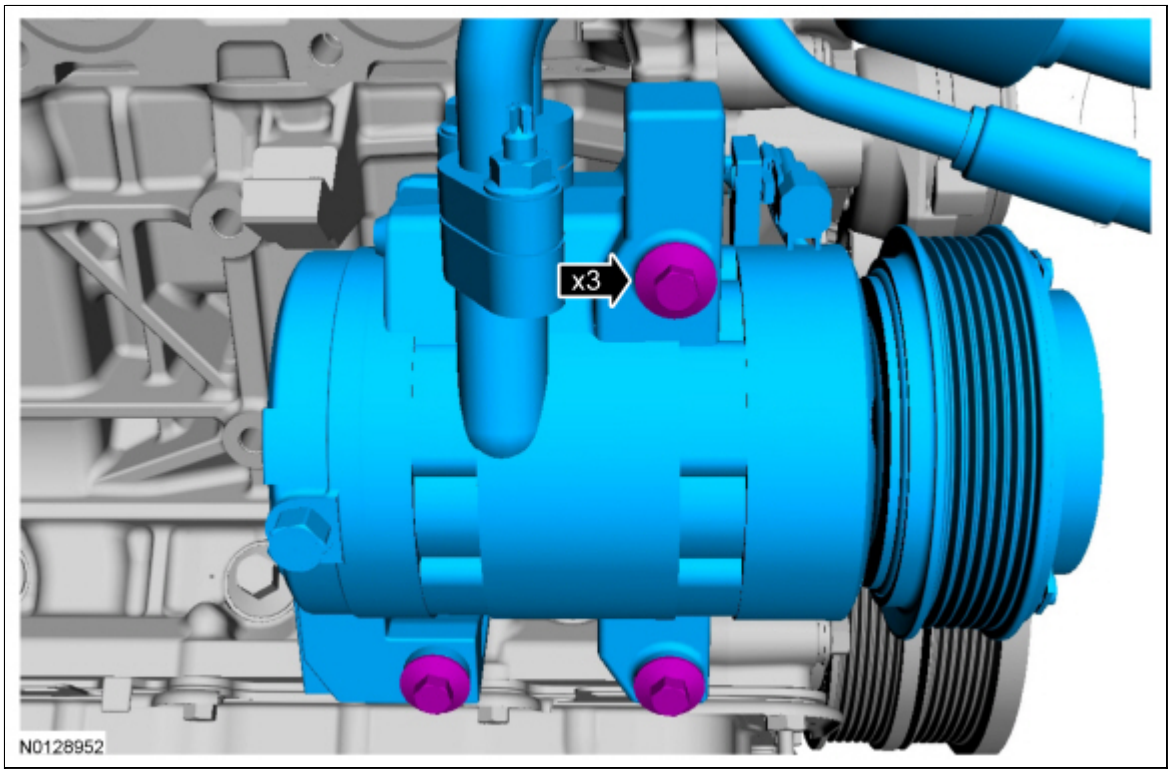


94. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**



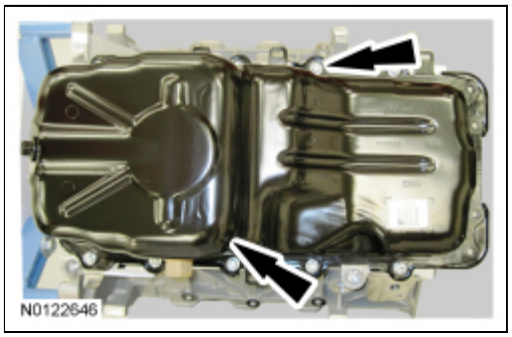
Remove the oil cooler threaded insert and the oil cooler.

- Discard the oil cooler.

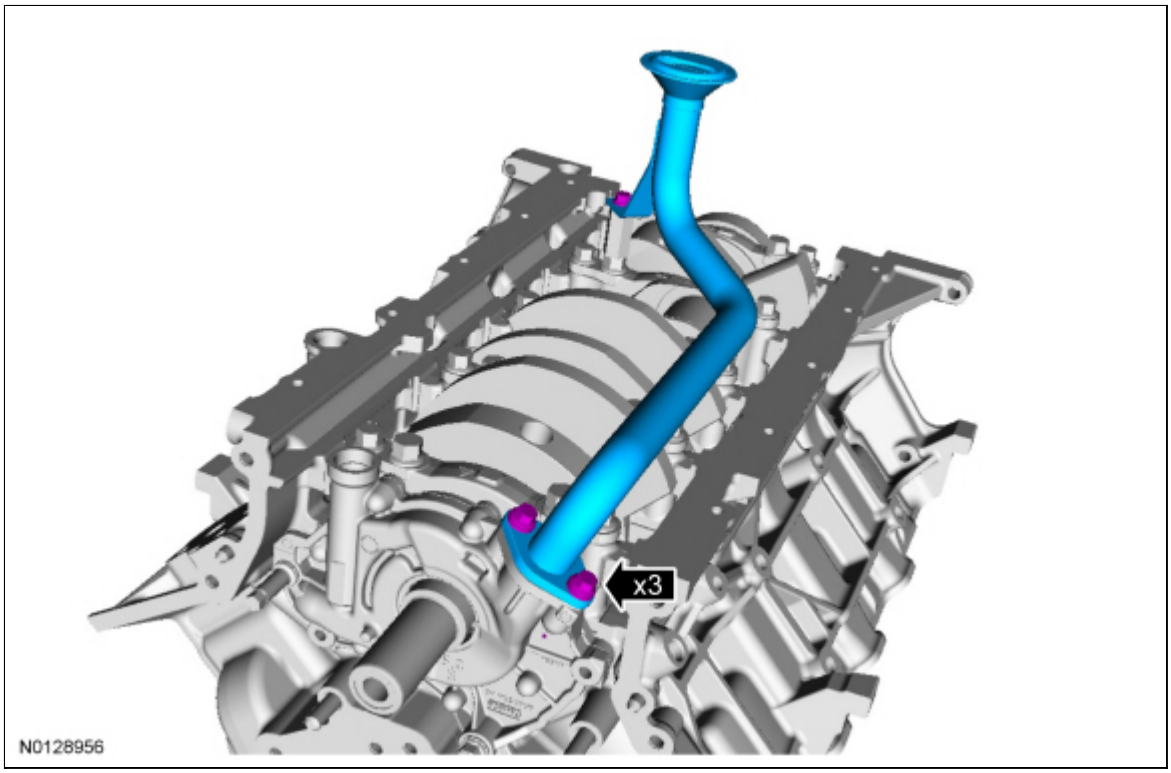


repair4less

95. Remove the 3 bolts and the oil filter adapter.
    - Discard the gasket.

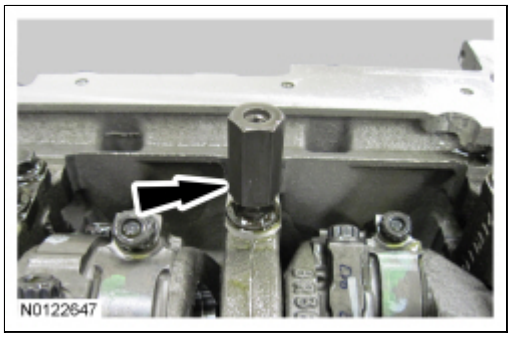


96. Remove the 3 bolts and the A/C compressor.



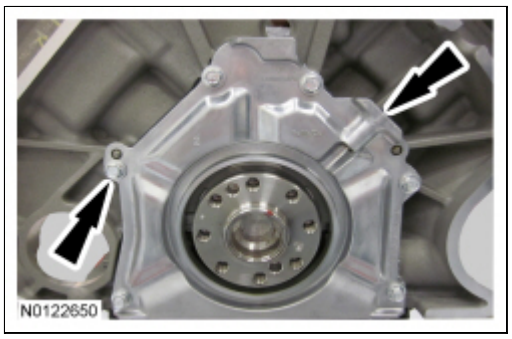
97. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove the bolts and the oil pan.
    - Discard the gasket.
    - Clean and inspect the sealing surface.

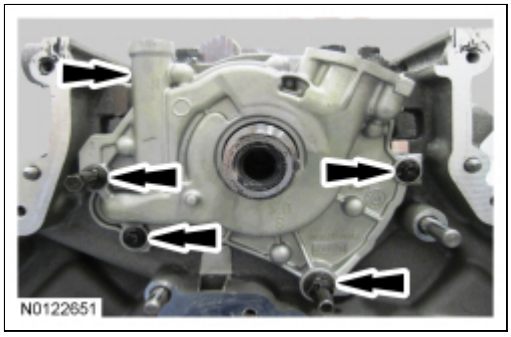


98. Remove the 3 bolts and the oil pump screen and pickup tube.
    - Discard the O-ring seal.

repair4less

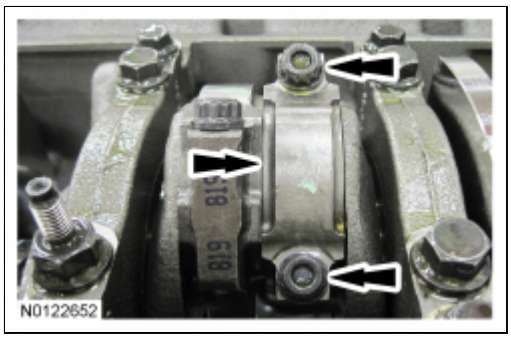


99. Remove the oil pump screen and pickup tube spacer.



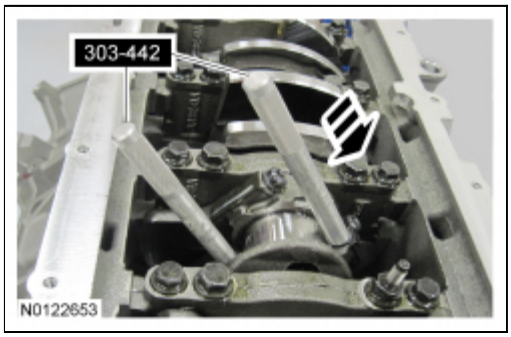
100. Remove the 6 bolts and the crankshaft rear seal retainer plate.
    - ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

      Clean and inspect the sealing surfaces.



101. Remove the 2 bolts, the 2 stud bolts and the oil pump.

102. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following the manufacturer's instructions.

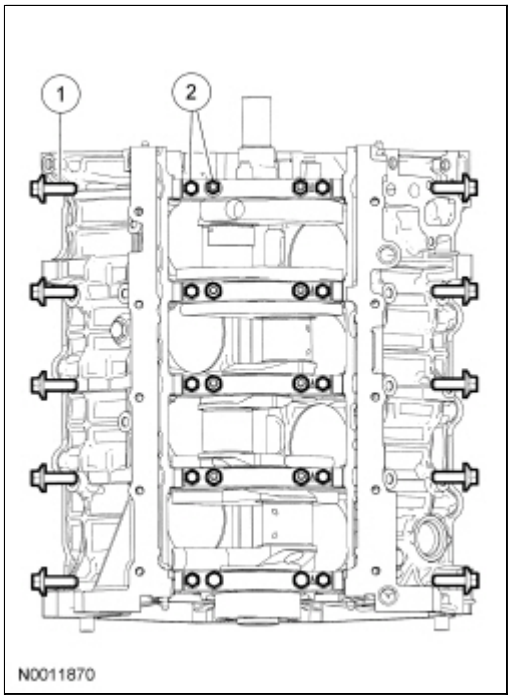


103. ***NOTICE:*** **Verify that the connecting rod and rod cap have orientation numbers cast into them. If not, number the connecting rod and rod cap for correct orientation. Failure to do so can result in engine damage.**

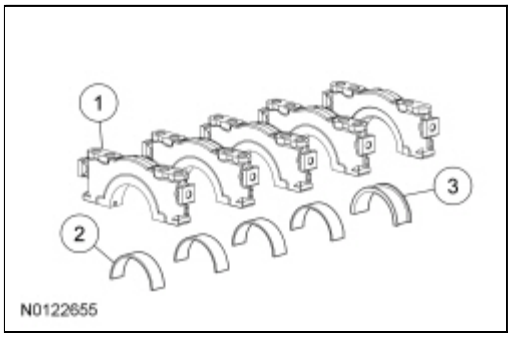
Remove the bolts and the connecting rod cap. Discard the bolts.

104. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod or engine damage may occur.**

Use the Connecting Rod Installer to push the piston through the top of the cylinder block.

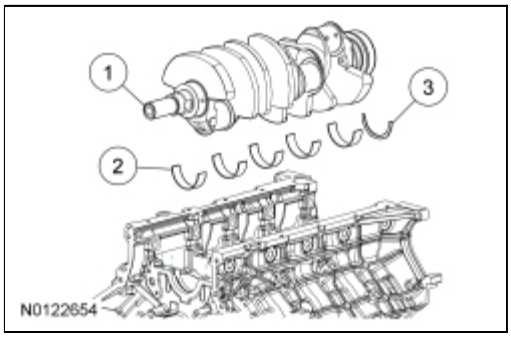


105. Repeat the previous 2 steps for each of the remaining pistons.

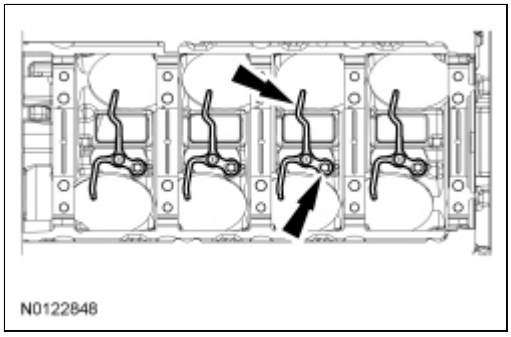


106. Disassemble the 8 pistons. For additional information, refer to Piston in this section.

repair4less

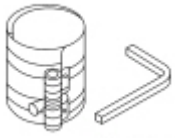


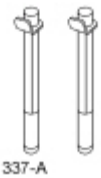
107. Remove the main bearing cap fasteners.
    1. Remove and discard the cross-mounted main cap bolts.
    2. Remove and discard the main bearing cap bolts and stud bolt.



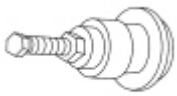
108. Remove the main bearing caps (1), the lower crankshaft main bearings (2) and the lower thrust bearing (3).

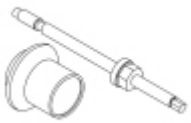
109. Remove the crankshaft (1), the upper crankshaft main bearings (2) and the upper thrust washer (3) from the cylinder block.





110. Remove the 4 bolts and 4 piston cooling jets from the cylinder block.





repair4less

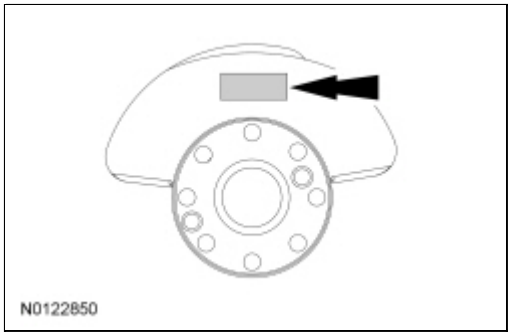
51	9278	Engine Oil Pressure (EOP) switch

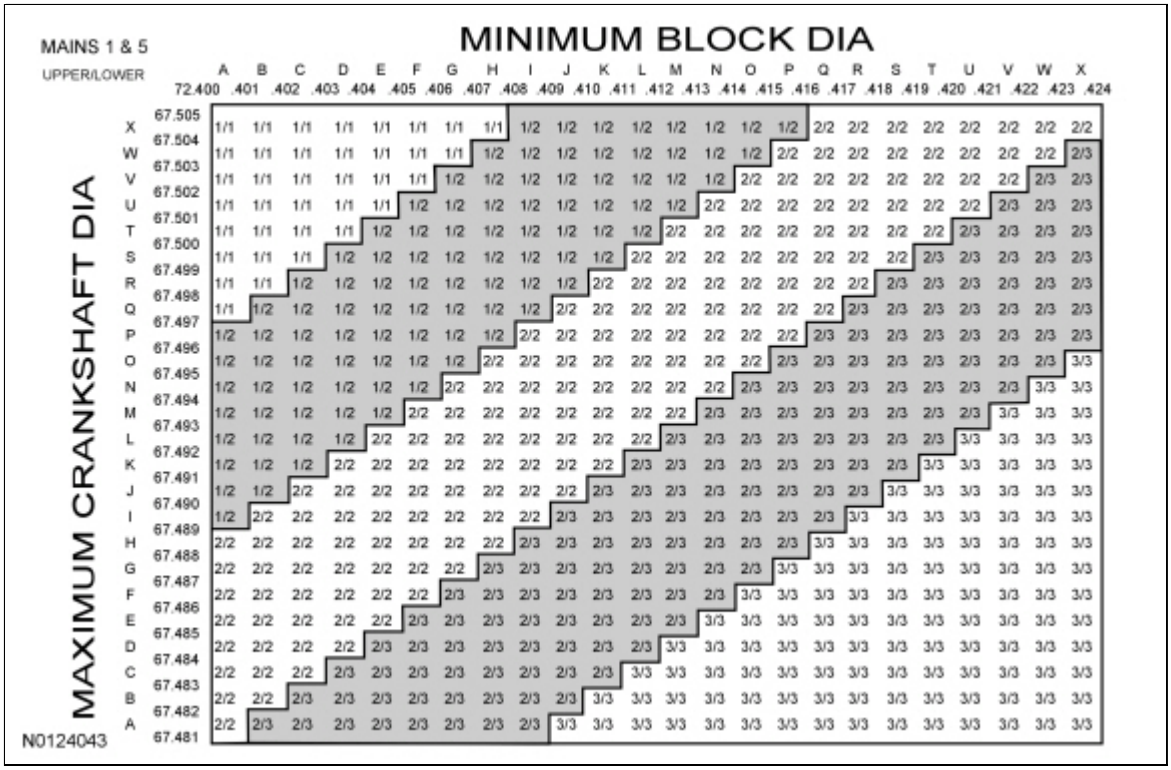
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



NOTICE: **During engine assembly do not allow the piston connecting rods to come in contact with the piston cooling jets or engine damage may occur.**

NOTE: During engine assembly it may become necessary to check bearing clearances and end play. For additional information, refer to Section 303-00 .

1. Record the main bearing code found on the front of the engine block.



2. Record the main bearing code found on the rear of the crankshaft.

3. **NOTE:** This chart is for selecting main bearings 1 and 5 only, the remaining bearings will be selected using a different chart in the next step.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 1 and 5.
   - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.
   - Repeat the above steps using the fifth letter of the block and crankshaft codes to select the No. 5 bearing.

4. **NOTE:** This chart is for selecting main bearings 2, 3 and 4 only.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 2, 3 and 4.
   - Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 2 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.
   - Repeat the above steps using the third and fourth letters of the block and crankshaft codes to select the No. 3 and No. 4 bearings.

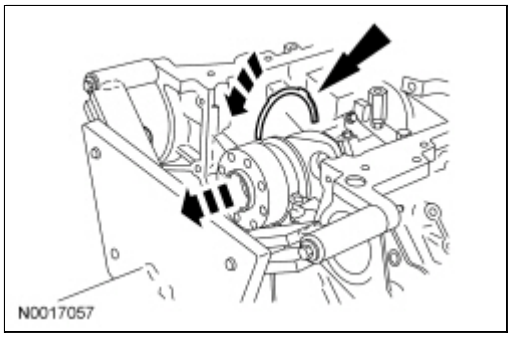
N0124042

NOTE: Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

5. Install the 4 piston cooling jets and 4 bolts. Tighten in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

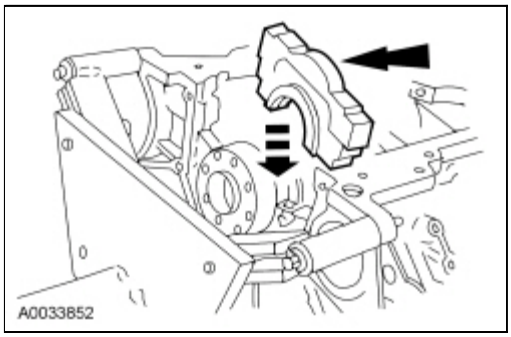
N0122848

6. Install the crankshaft main bearings.
   - Install the crankshaft upper main bearings into the cylinder block.
   - Install the crankshaft lower main bearings and thrust bearing into the bearing caps.
   - Make sure all oil passages are aligned.
   - Lubricate all main bearings with clean engine oil.



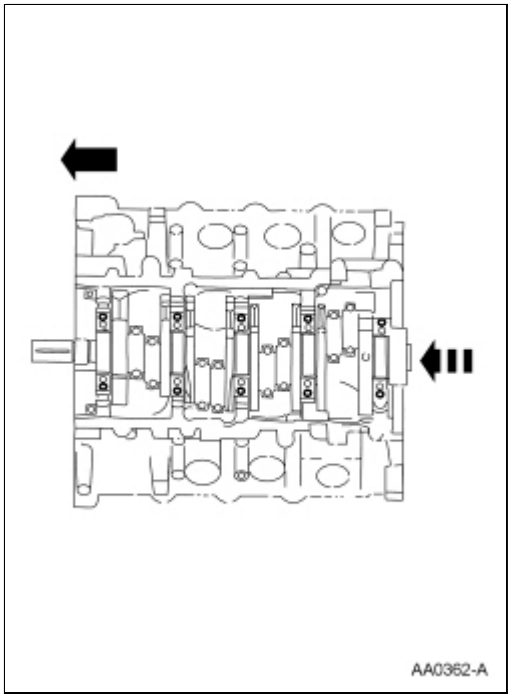
7. **NOTE:** Lubricate the crankshaft bearing journals with clean engine oil.

   Install the crankshaft into the cylinder block.



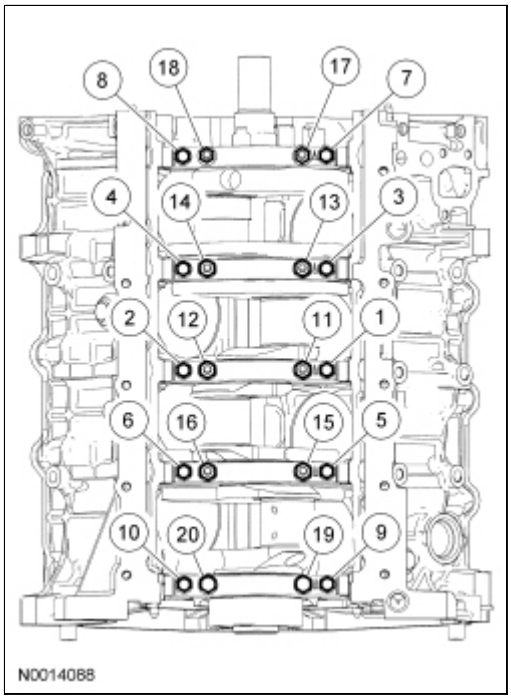
8. **NOTE:** The oil groove on the thrust washer must face toward the rear of the engine (against the

crankshaft thrust surface).

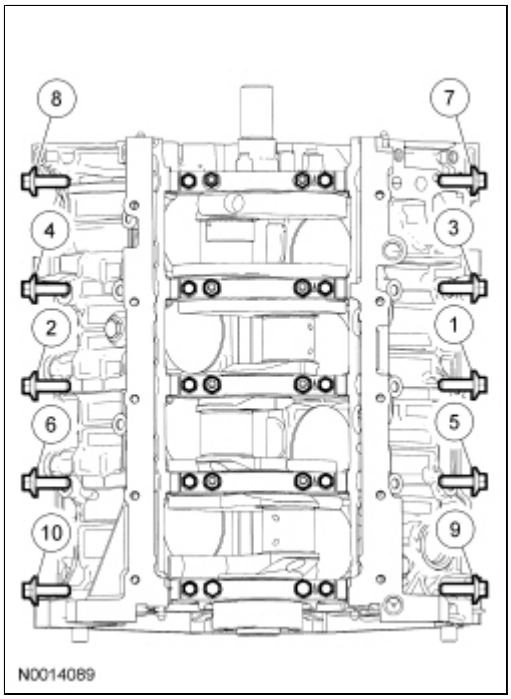


Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 5 main boss.

9. Install the main bearing caps and fasteners on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the cap fasteners.



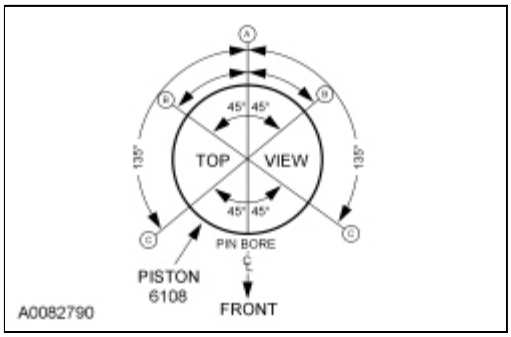
10. Push the crankshaft forward to seat the crankshaft thrust washer. Hold the crankshaft in the forward position.



repair4less

11. Tighten the vertical main bearing cap fasteners in the sequence shown, in 4 stages.
    - Stage 1: Tighten fasteners 1 through 20 to 20 Nm (177 lb-in).
    - Stage 2: Tighten fasteners 1 through 10 to 40 Nm (30 lb-ft).
    - Stage 3: Tighten fasteners 11 through 20 to 65 Nm (48 lb-ft).
    - Stage 4: Tighten fasteners 1 through 20 an additional 90 degrees.

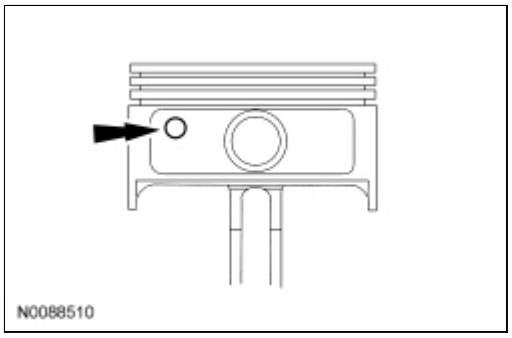
12. Install the cross-mounted main bearing cap fasteners and tighten in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 30 Nm (22 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.



13. Check the crankshaft end play. For additional information, refer to Section 303-00 .

14. Check that crankshaft torque-to-turn does not exceed 6 Nm (53 lb-in).

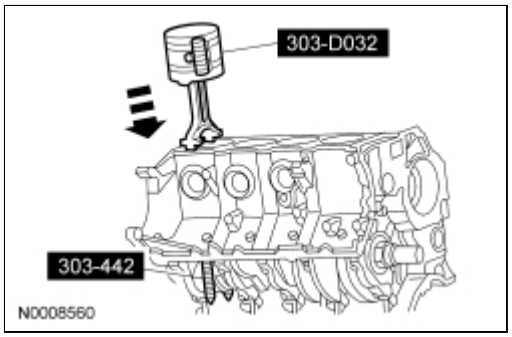
15. Check the piston-to-cylinder block and piston ring clearances. For additional information, refer to Section 303-00 .



16. Assemble the pistons. For additional information, refer to Piston in this section.

17. Make sure the ring gaps (oil spacer-A, oil ring-B, compression ring-C) are correctly spaced around the circumference of the piston.

18. Make sure the dimple in the piston faces the front of the engine.



repair4less

19. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod or engine damage may occur.**

    NOTICE: **Do not allow the piston connecting rods to come in contact with the piston cooling jets or engine damage may occur.**

    Use the Piston Ring Compressor and the Connecting Rod Installers to install the connecting rod with the upper connecting rod bearing in place.
    - Lubricate the piston and ring with clean engine oil.
    - Lubricate the rod bearings with clean engine oil.

20. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod or engine damage may occur.**

    Once the connecting rod is seated on the crankshaft journal, remove the Connecting Rod Installers.

21. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

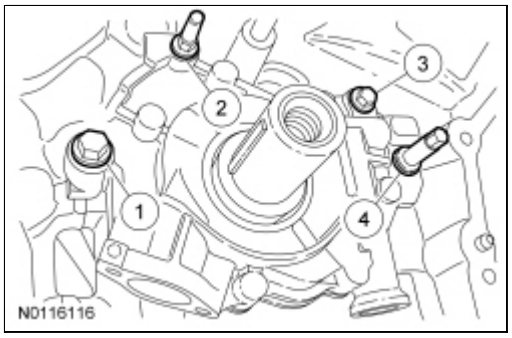
    NOTE: The connecting rod caps are of the "cracked" design and must mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

Position the lower bearing and connecting rod and install the new bolts loosely.

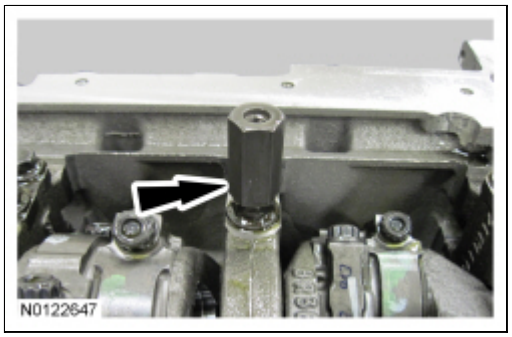
22. Repeat the previous 5 steps for each of the remaining pistons.

23. **NOTE:** Main bearing caps are removed for clarity.

    Tighten the bolts in the sequence shown in 3 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 38 Nm (28 lb-ft).
    - Stage 3: Tighten an additional 105 degrees.



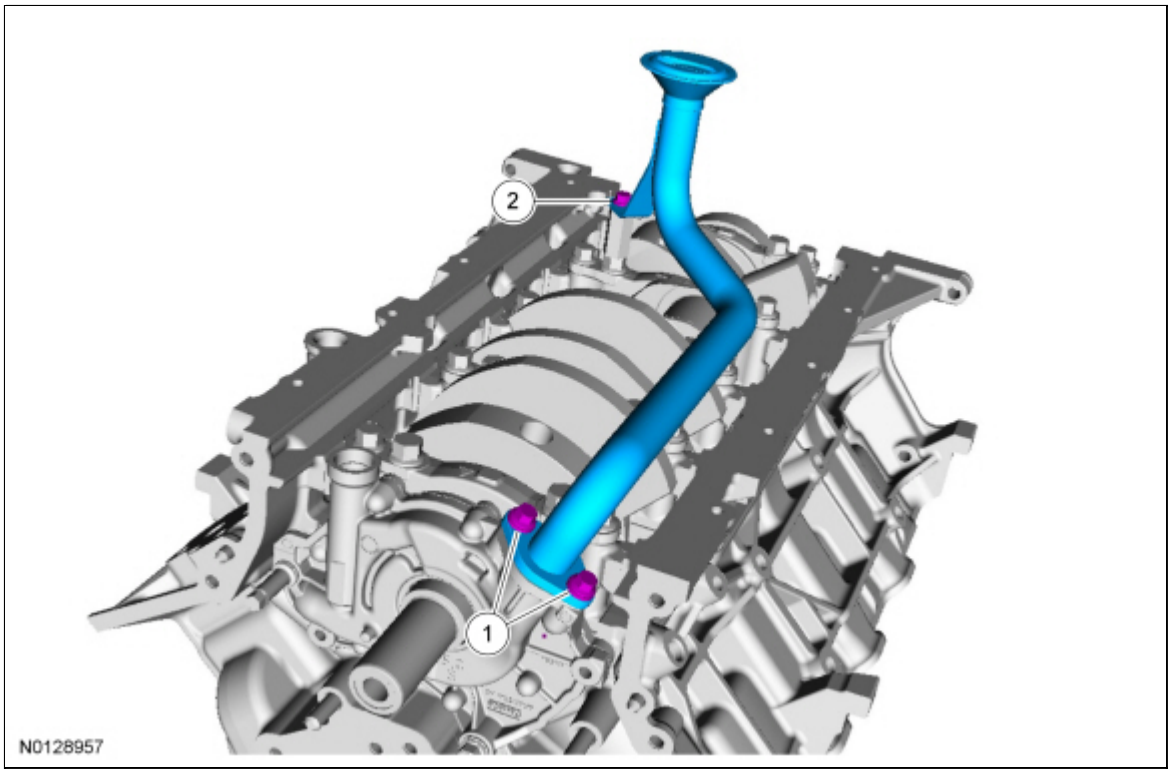
24. Rotate the inner rotor of the oil pump assembly to align the flats on the crankshaft and slip the oil pump over the crankshaft until seated against the block.
    - Rotate the oil pump until the bolt holes are aligned to the block and install the fasteners.



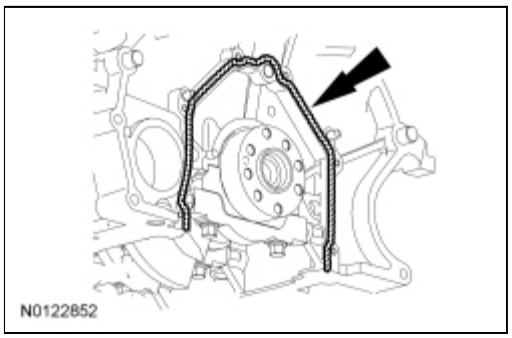
25. **NOTE:** Oil pump must be held against the cylinder block until all bolts are tightened.

    Tighten the fasteners in the sequence shown in 3 stages:
    - Stage 1: Hand tighten.
    - Stage 2: Tighten the bolt (1) to 10 Nm (89 lb-in), the stud bolt (2) to 25 Nm (18 lb-ft), the bolt (3) to 10 Nm (89 lb-in) and the stud bolt (4) to 20 Nm (177 lb-in).
    - Stage 3: Tighten the bolt (1) an additional 45 degrees, the stud bolt (2) an additional 75 degrees, the bolt (3) an additional 45 degrees and the stud bolt (4) an additional 60 degrees.

repair4less

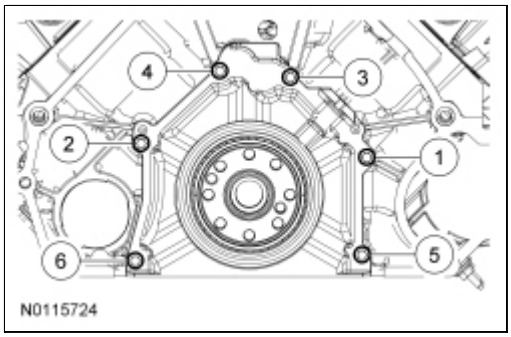


26. Install the oil pump screen and pickup tube spacer.
    - Tighten to 25 Nm (18 lb-ft).



27. **NOTE:** The 2 oil pump screen and pickup tube-to-oil pump bolts must be tightened prior to tightening the oil pump screen and pickup tube-to-spacer bolt.

    Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    1. Tighten the 2 oil pump screen and pickup tube-to-oil pump bolts in 2 stages.
        - Stage 1: Tighten to 10 Nm (89 lb-in).
        - Stage 2: Tighten an additional 45 degrees.
    2. Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).

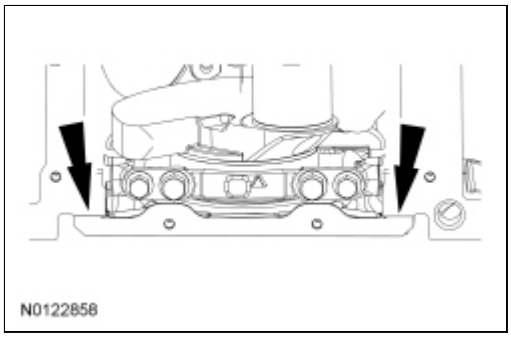


28. **NOTE:** If the rear crankshaft seal retaining plate is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure may cause future oil leaks.

    Apply a 3.75 mm (0.147 in) bead of silicone gasket and sealant to the rear crankshaft seal retainer mating surface on the engine block.

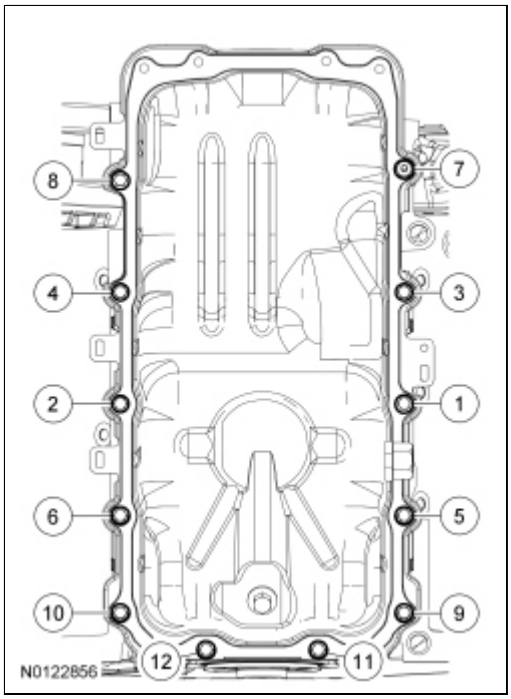
29. Install the crankshaft rear seal retainer plate and the 6 bolts, tighten in the sequence shown in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

repair4less



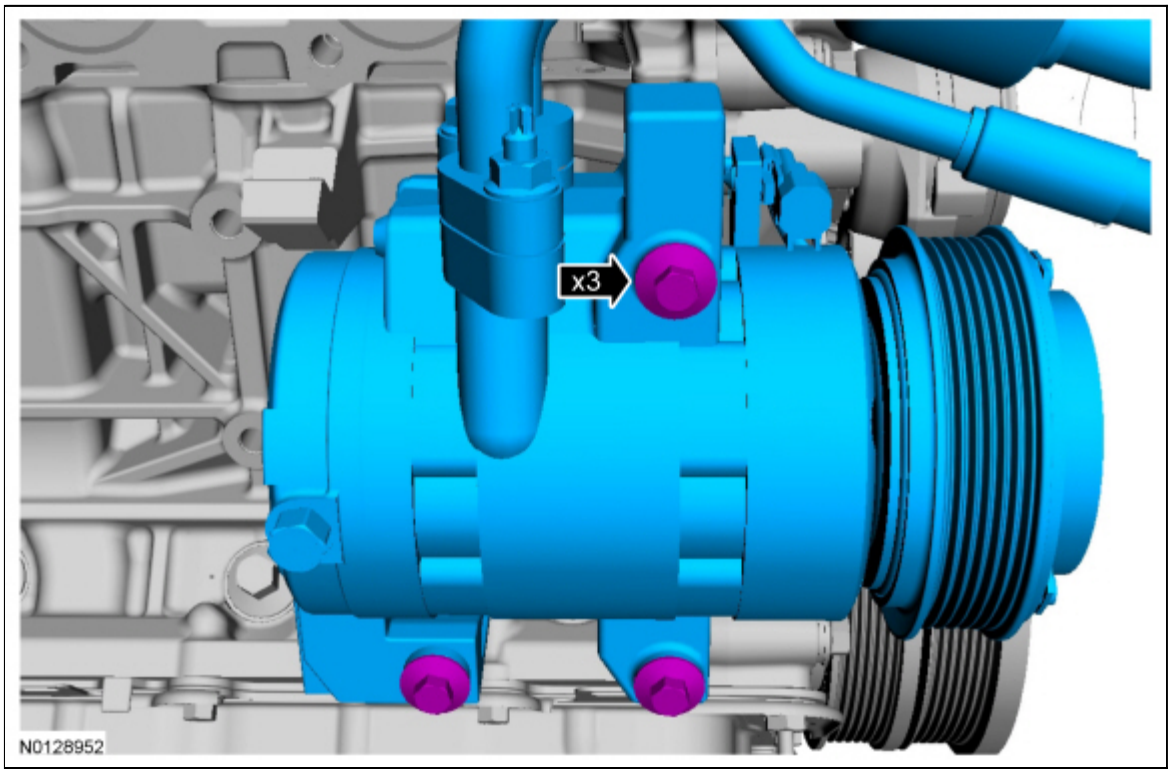
30. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Inspect the oil pan and engine sealing surfaces. Clean the mating surfaces of the engine and oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.



31. **NOTE:** If the oil pan is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage. If this timing cannot be met, tighten fasteners 7, 8, 9 and 10 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer and final torque all of the fasteners within 1 hour of applying the sealer.

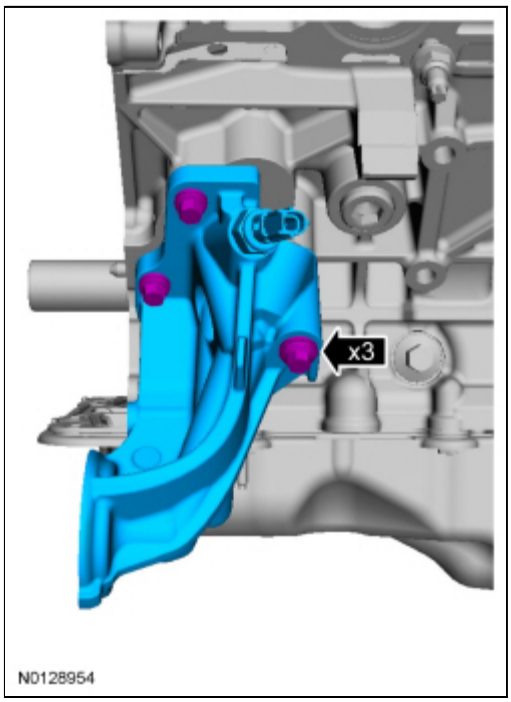
    Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces and the engine front cover-to-cylinder block sealing surfaces.



32. **NOTE:** Fastener location 7 is a stud bolt.

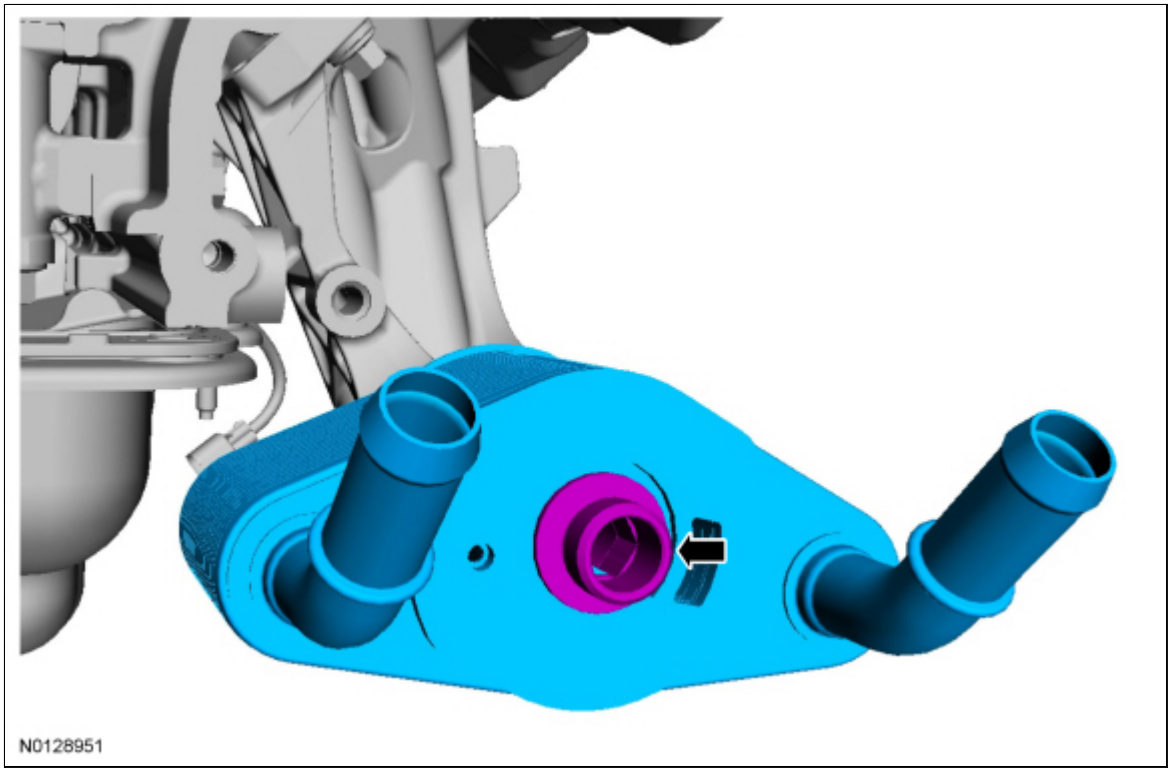
    Using a new gasket, install the oil pan and tighten the fasteners in sequence in 3 stages.
    - Stage 1: Tighten to 2 Nm (18 lb-in)
    - Stage 2: Tighten to 10 Nm (89 lb-in).
    - Stage 3: Tighten an additional 45 degrees.

33. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



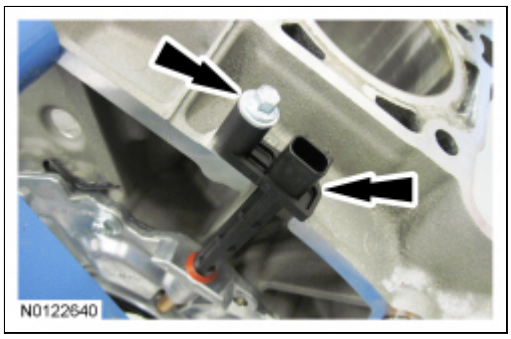
34. **NOTE:** Install a new oil filter adapter gasket.

    Using a new gasket, install the oil filter adapter and the 3 bolts. Tighten the bolts in 2 stages.
    - Stage 1: Tighten the bolts to 20 Nm (177 lb-in).



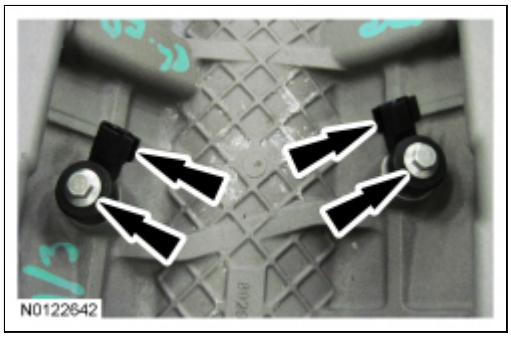
repair4less

- Stage 2: Tighten an additional 60 degrees.



35. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

    Install a new oil cooler and the threaded fitting.
    - Tighten to 57 Nm (42 lb-ft).



36. ***NOTICE:*** **The Crankshaft Position (CKP) sensor must be positioned into the fitting on the crankshaft rear seal retainer plate and be flush against the boss on the engine block before the bolt is installed. If the CKP sensor is installed incorrectly, the CKP sensor can be damaged.**

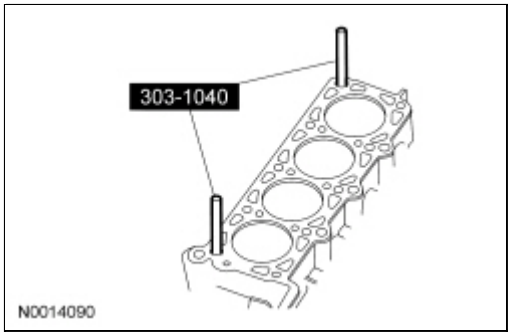
    Position the CKP sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

37. Install the 2 Knock Sensor (KS) and 2 bolts.
    - Tighten to 20 Nm (177 lb-in).

38. Verify the crankshaft keyway is in the 9 o'clock position and install the crankshaft sprocket with the flange facing forward.

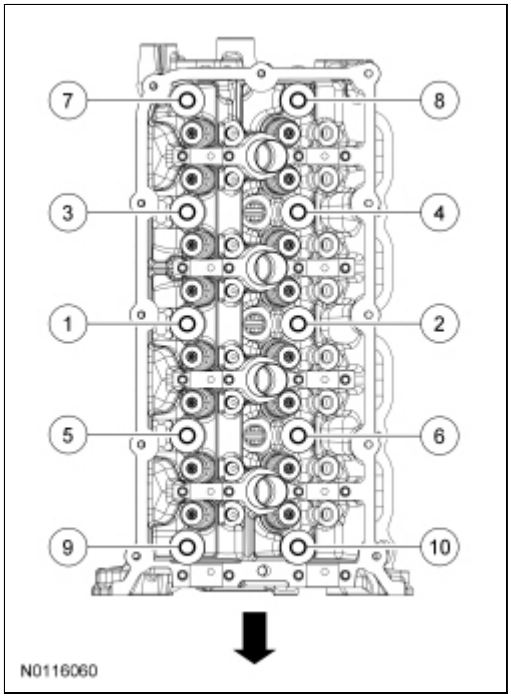
39. ***NOTICE:*** **Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore. Failure to follow these instructions may result in engine damage.**

    NOTICE: **The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry. Failure to follow these instructions may result in future oil leakage.**



repair4less

NOTICE: **The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.**

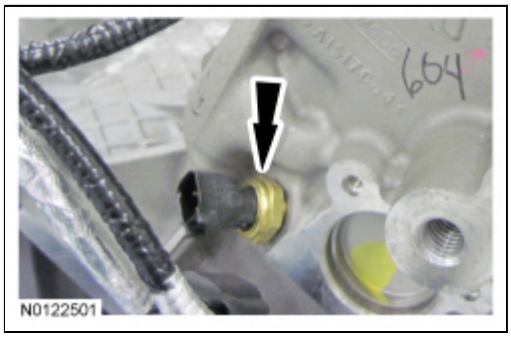


NOTE: Do not turn the crankshaft until instructed to do so.

NOTE: LH shown, RH similar.

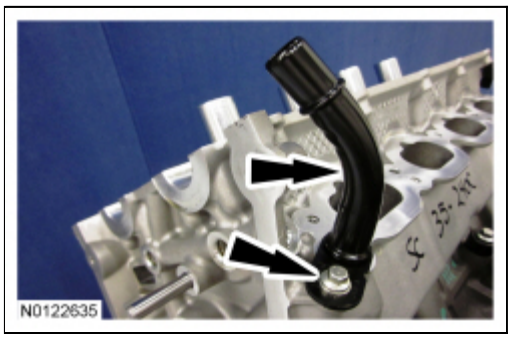
Using the Cylinder Head Alignment Pins, position the cylinder head gaskets and cylinder heads over the dowels and install the cylinder head bolts loosely.

40. Tighten the new RH cylinder head bolts in 4 stages in the sequence shown.
    - Stage 1: Tighten to 25 Nm (18 lb-ft).
    - Stage 2: Tighten to 40 Nm (30 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.
    - Stage 4: Tighten an additional 90 degrees.



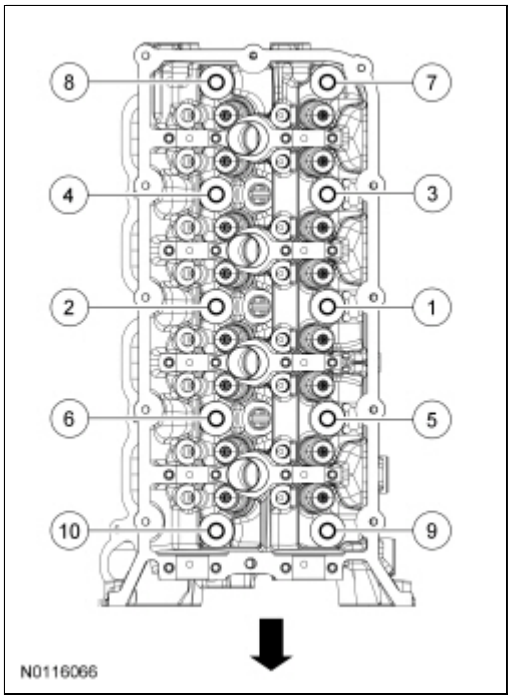
41. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the



directions on the packaging.

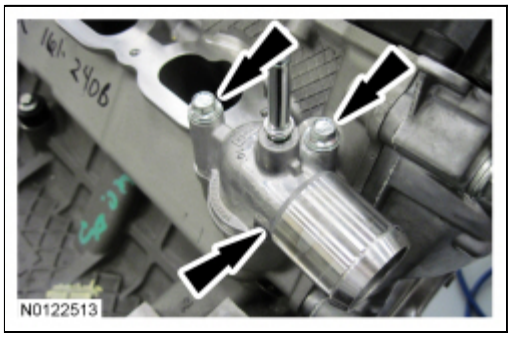
42. Install the Cylinder Head Temperature (CHT) sensor.
    - Tighten to 11 Nm (97 lb-in).



43. ***NOTICE:*** **Lubricate the O-ring seal with clean engine coolant prior to installing.**

    Using a new O-ring seal, install the coolant outlet pipe.
    - Tighten to 10 Nm (89 lb-in).

44. Tighten the new LH cylinder head bolts in 4 stages in the sequence shown.
    - Stage 1: Tighten to 25 Nm (18 lb-ft).
    - Stage 2: Tighten to 40 Nm (30 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.
    - Stage 4: Tighten an additional 90 degrees.

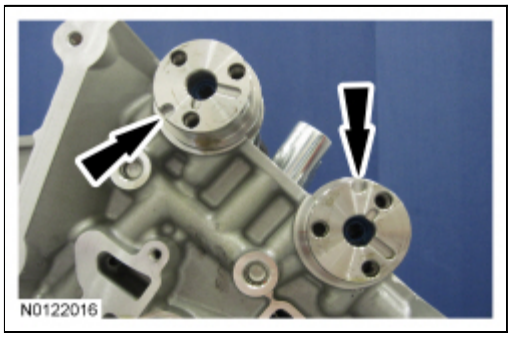


repair4less

45. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

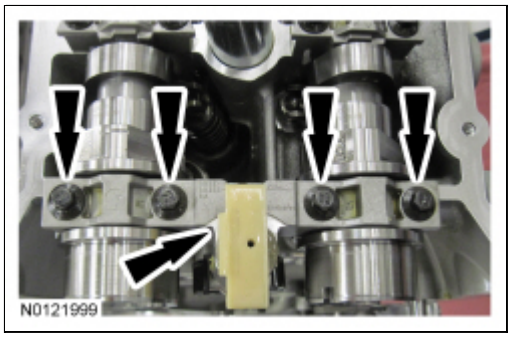
    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

46. Using a new gasket, install the coolant outlet and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



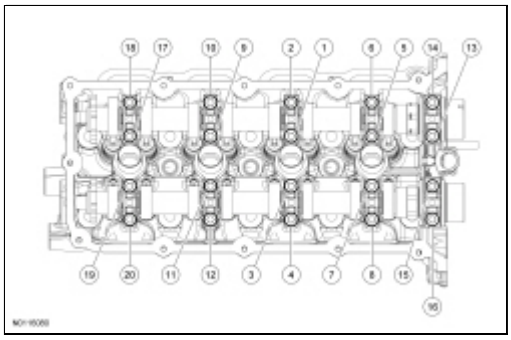
47. **NOTE:** Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil prior to installation.

    Install the 16 camshaft roller follower and hydraulic lash adjuster assemblies.



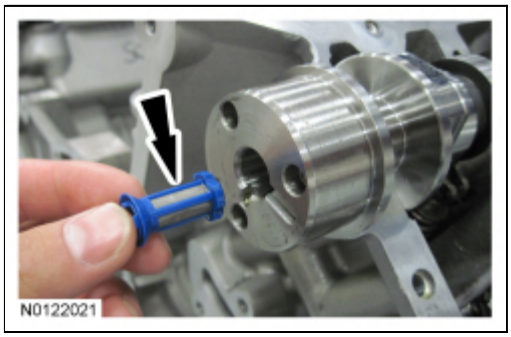
48. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

    Install the LH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.



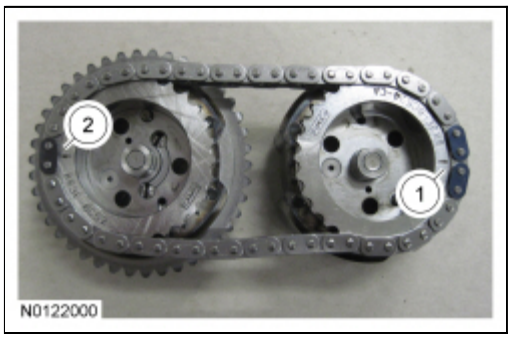
49. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.

50. Install the LH front camshaft bearing mega cap and the 4 bolts. Do not tighten the bolts at this time



51. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

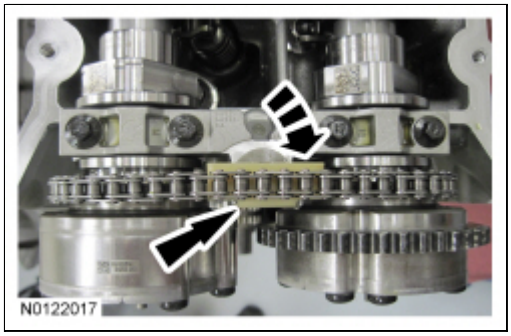
repair4less



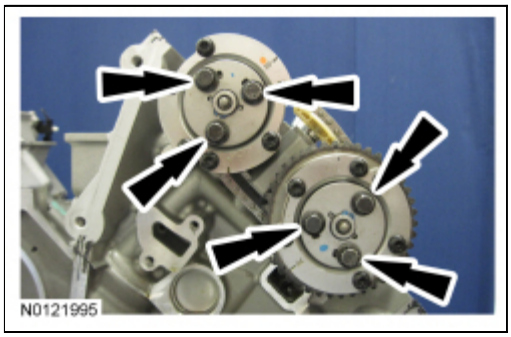
52. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Install the Variable Camshaft Timing (VCT) system oil filter in the intake and exhaust camshafts.

53. Install the secondary timing chain onto the LH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

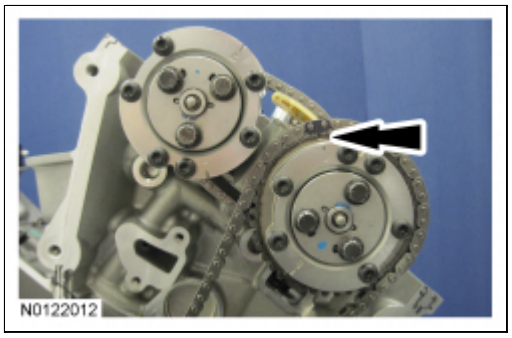


54. Install the LH VCT assemblies and the secondary timing chain onto the LH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 11 o'clock position.



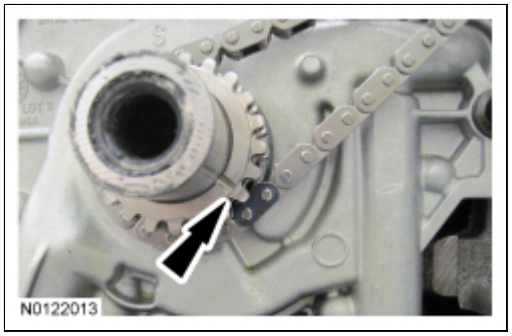
55. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



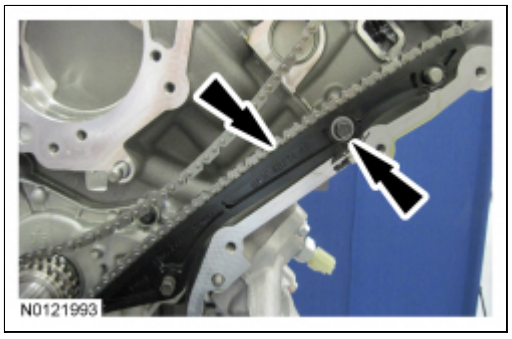
56. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

    Install the 3 LH intake VCT assembly bolts and the 3 LH exhaust VCT assembly bolts.
    - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

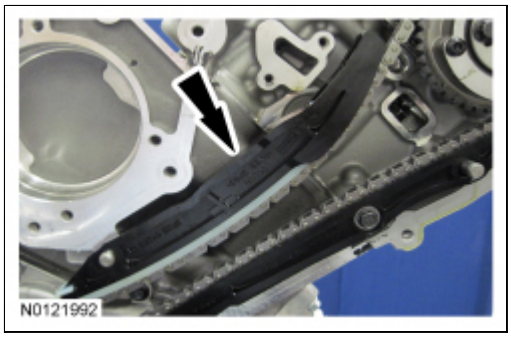


57. Install the LH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the LH VCT assembly.

repair4less



58. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

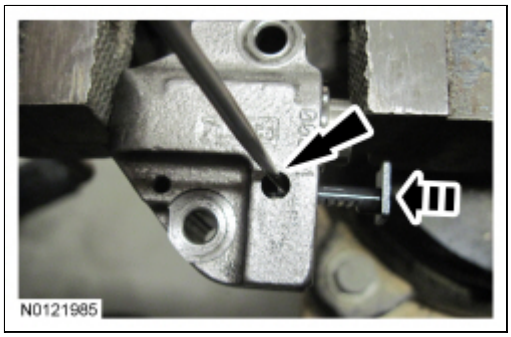


59. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain guide.

    Install the LH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

60. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain tensioner arm.

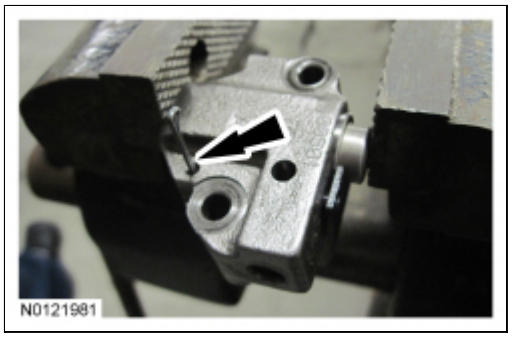
    Install the LH timing chain tensioner arm.



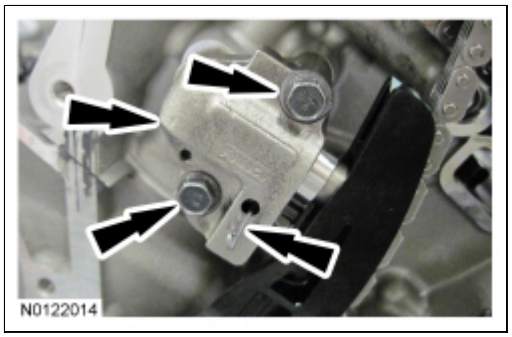
NOTE: Complete the following 3 steps on both the LH and RH primary timing chain tensioners.

61. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

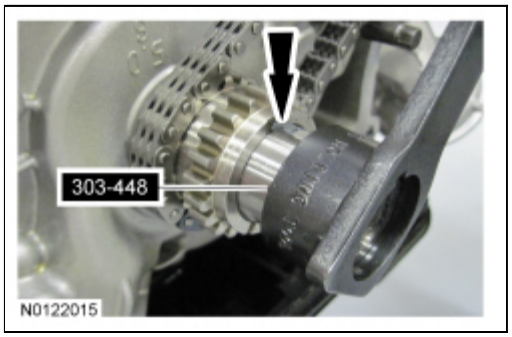
    Compress the primary timing chain tensioner plunger, using an edge of a vise.



62. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.

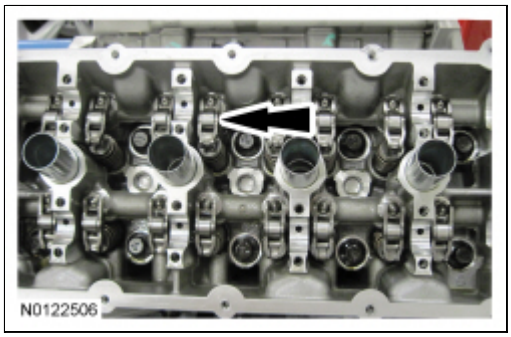


63. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.

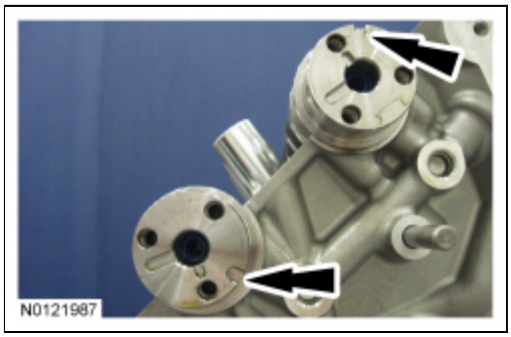


repair4less

64. Install the LH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

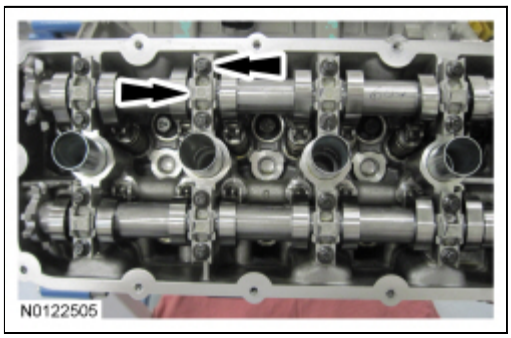


65. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.



66. **NOTE:** Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil prior to installation.

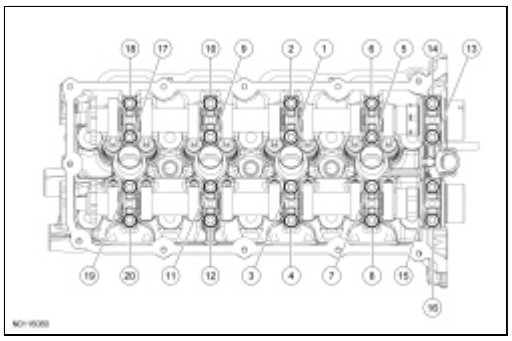
    Install the 16 camshaft roller follower and hydraulic lash adjuster assemblies.



67. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

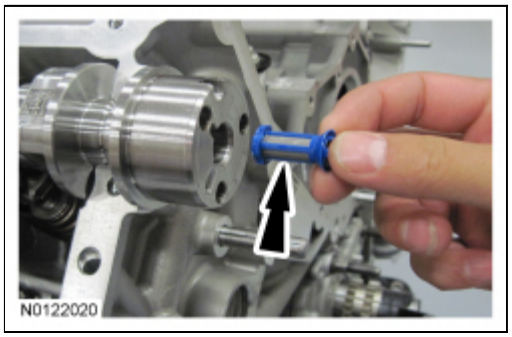
    Install the RH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.

68. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.



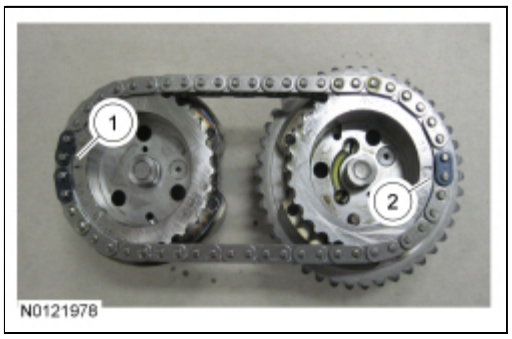
69. Install the RH front camshaft bearing mega cap and the 4 bolts. Do not tighten at this time

70. Tighten the bolts in the sequence shown in 2 stages.



repair4less

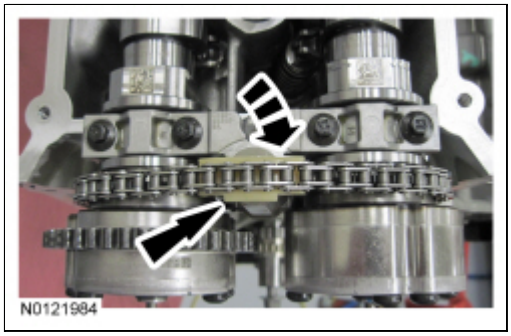
- Stage 1: Tighten to 6 Nm (53 lb-in).
- Stage 2: Tighten an additional 45 degrees.



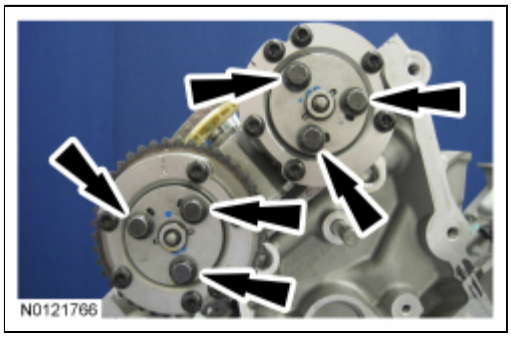
71. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Install the VCT system oil filter in the intake and exhaust camshafts.

72. Install the secondary timing chain onto the RH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

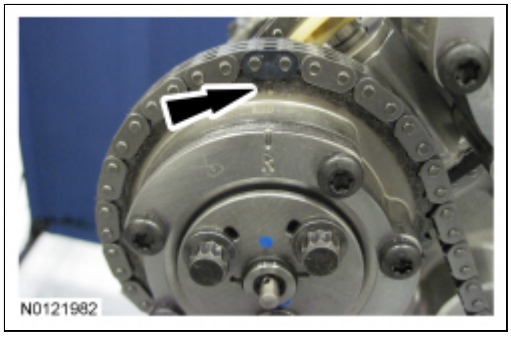


73. Install the RH VCT assemblies and the secondary timing chain onto the RH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 1 o'clock position.



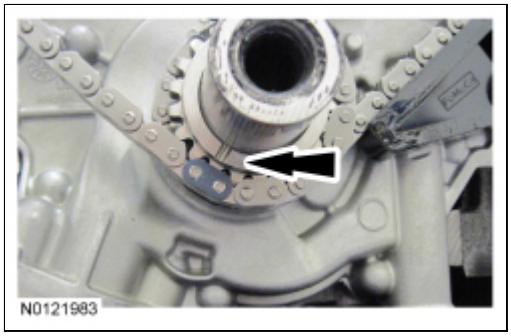
74. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



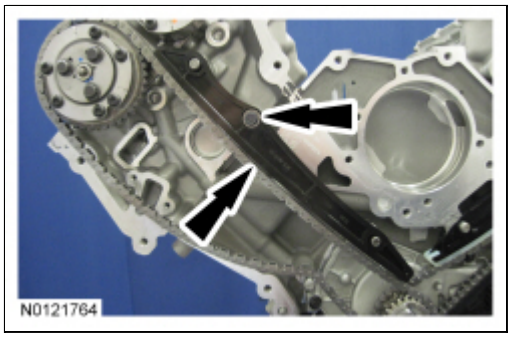
75. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

    Install the 3 RH intake VCT assembly bolts and the 3 RH exhaust VCT assembly bolts.
    - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

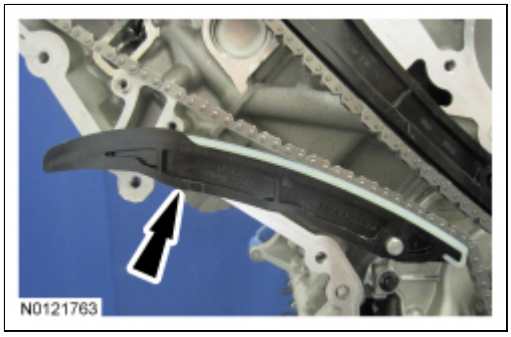


76. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.

repair4less

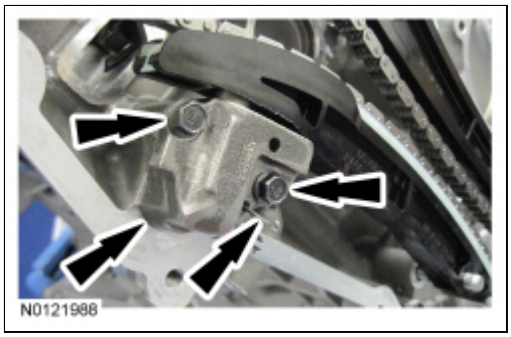


77. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



78. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

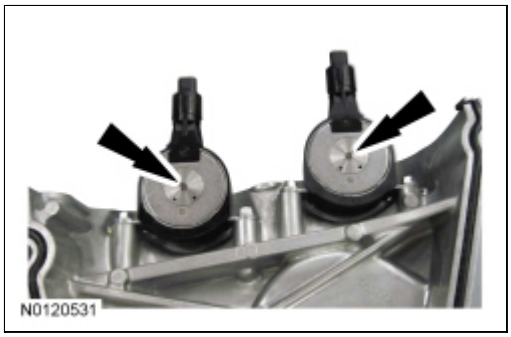


79. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

    Install the RH timing chain tensioner arm.

80. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

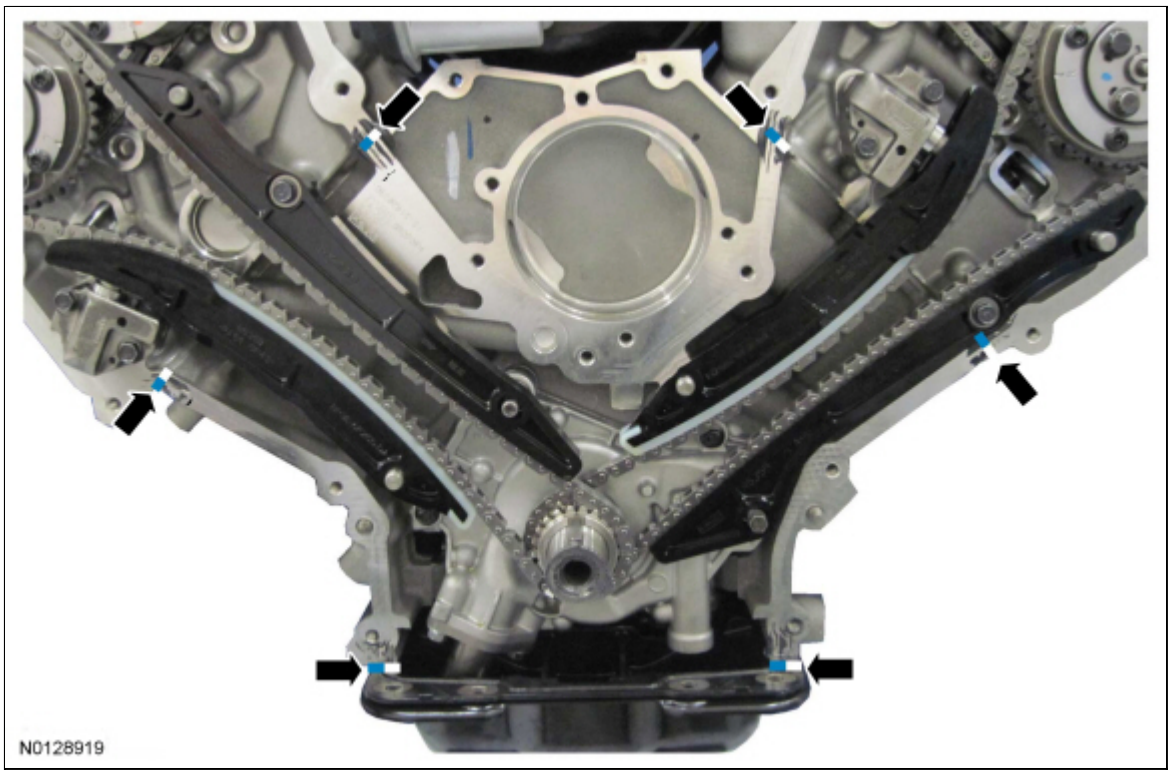
81. With the crankshaft keyway still at the 12 o'clock position, verify the timing mark alignment is correct.



82. ***NOTICE:*** **The Variable Camshaft Timing (VCT) variable force solenoid pins must be fully**

repair4less

depressed to avoid interference with the VCT valve tips when installing the engine front cover. Failure to follow these instructions can result in damage to the engine.

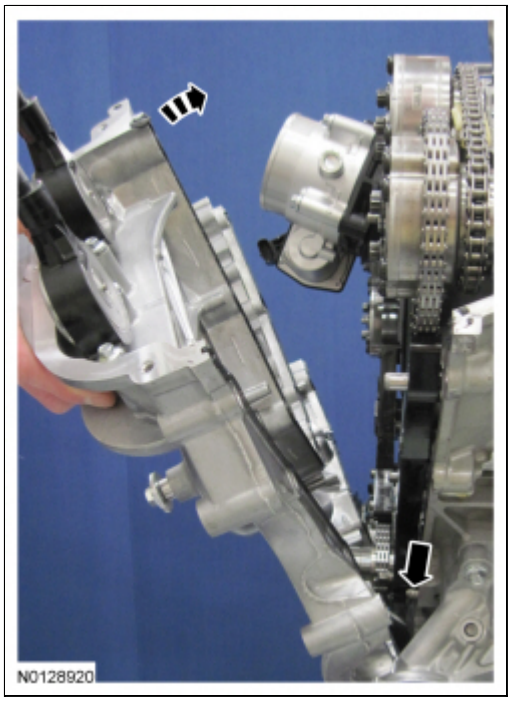


NOTE: LH shown, RH similar.

Fully depress the VCT variable force solenoid pins.

83. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply a bead of silicone gasket and sealant to the cylinder head-to-cylinder block joints and the oil pan-to-cylinder block joints as illustrated.

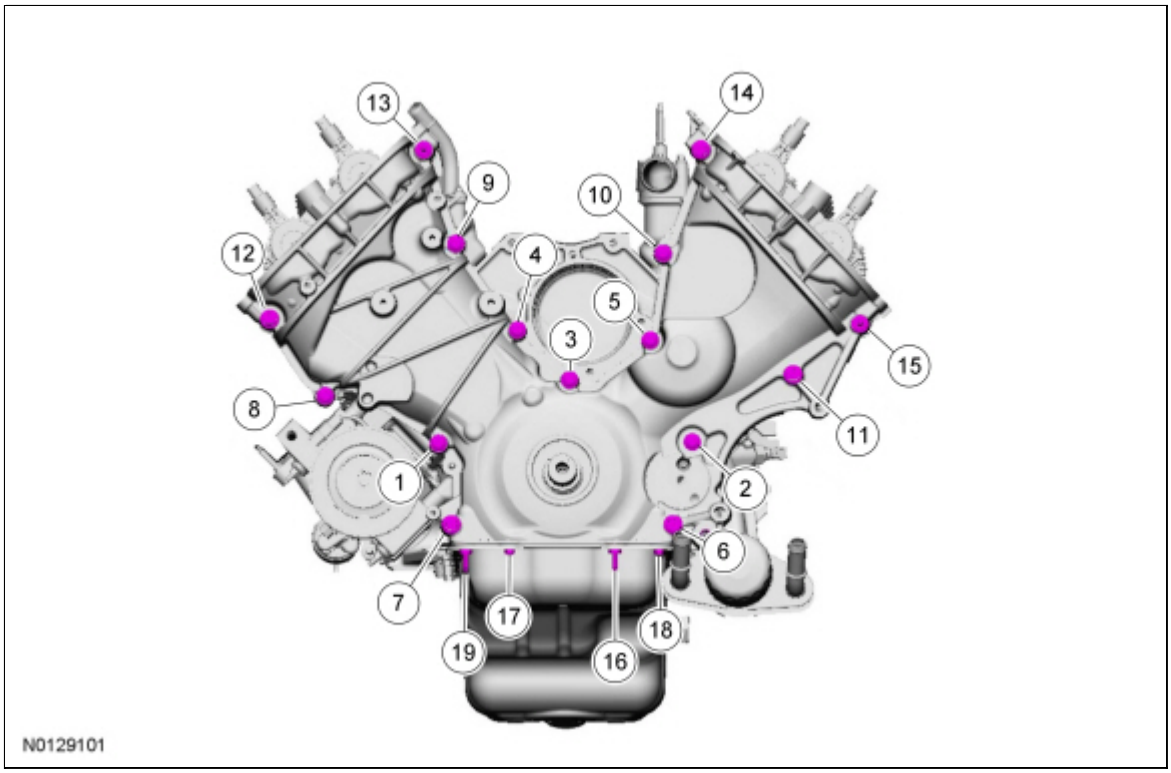


84. **NOTE:** Make sure that the engine front cover gasket is in place on the engine front cover before

installation.

Using new gaskets, position the engine front cover onto the dowels.

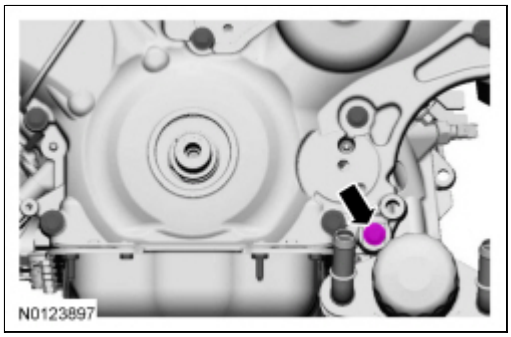
- Install the 13 engine front cover bolts, 2 stud bolts, 2 oil pan-to-engine front cover bolts and 2 oil pan-to-engine front cover stud bolts finger-tight.



85. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

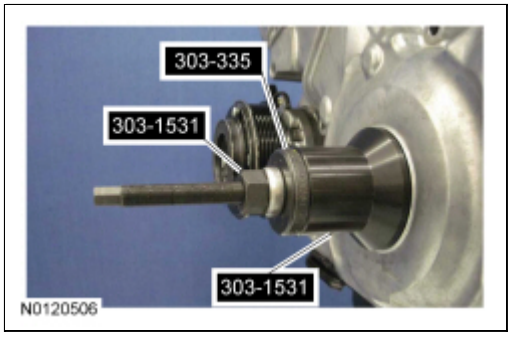
    Tighten the bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten bolts 1-15 to 25 Nm (18 lb-ft) and bolts 16-19 to 10 Nm (89 lb-in).
    - Stage 2: Tighten bolts 1-15 an additional 60 degrees and bolts 16-19 an additional 45 degrees.



repair4less

86. Using a 10 mm Hex Bit, rotate the engine front cover jackscrew into contact with the oil filter adapter to 5 Nm (44 lb-in).



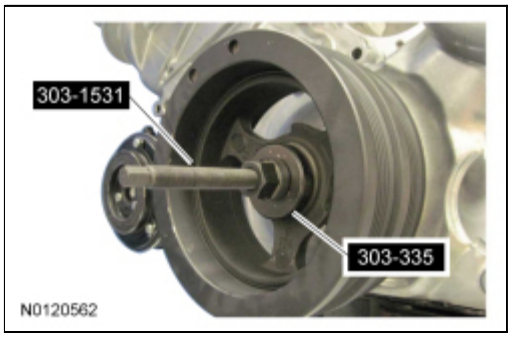
87. Install the engine front cover-to-oil filter adapter bolt and tighten to 25 Nm (18 lb-ft) plus an additional 60 degrees.

88. **NOTE:** Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

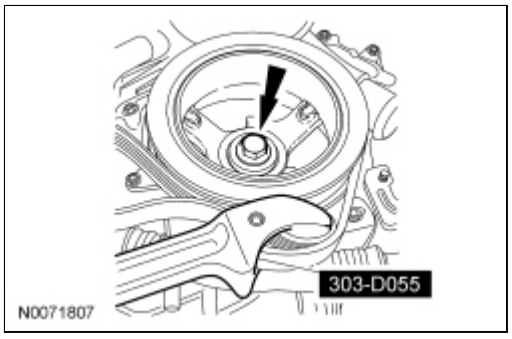
    Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft front oil seal.

89. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

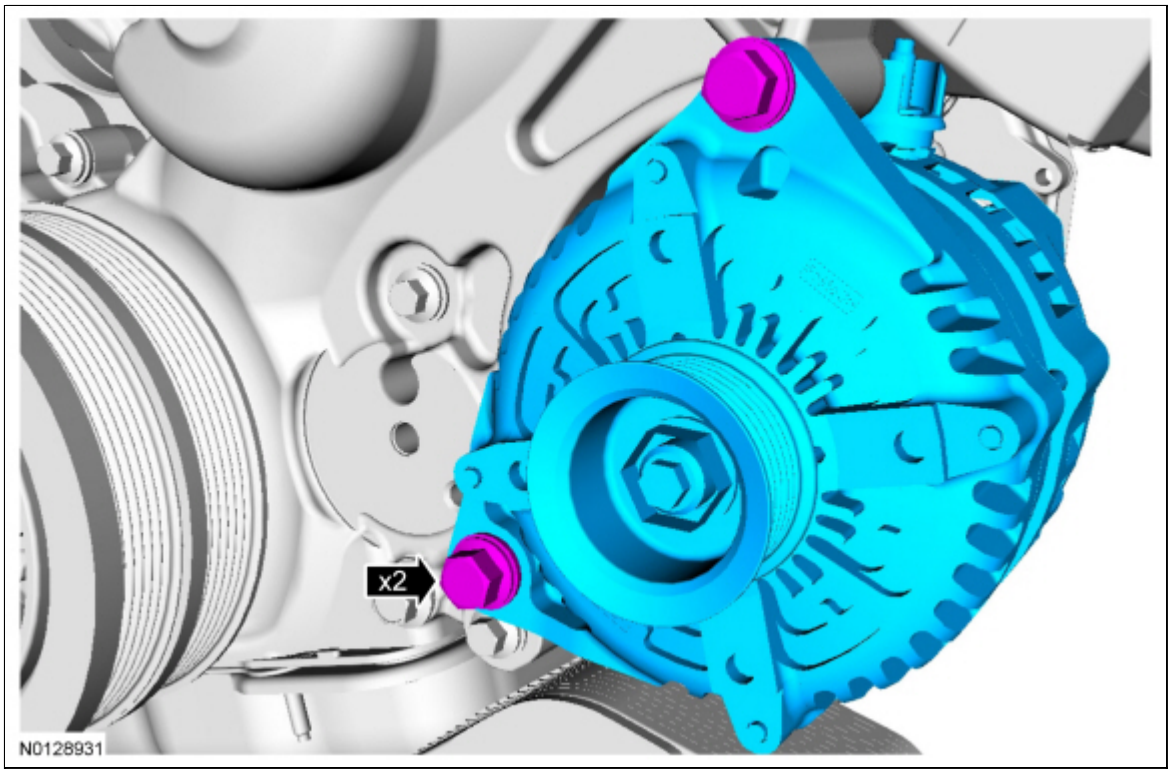
    Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.



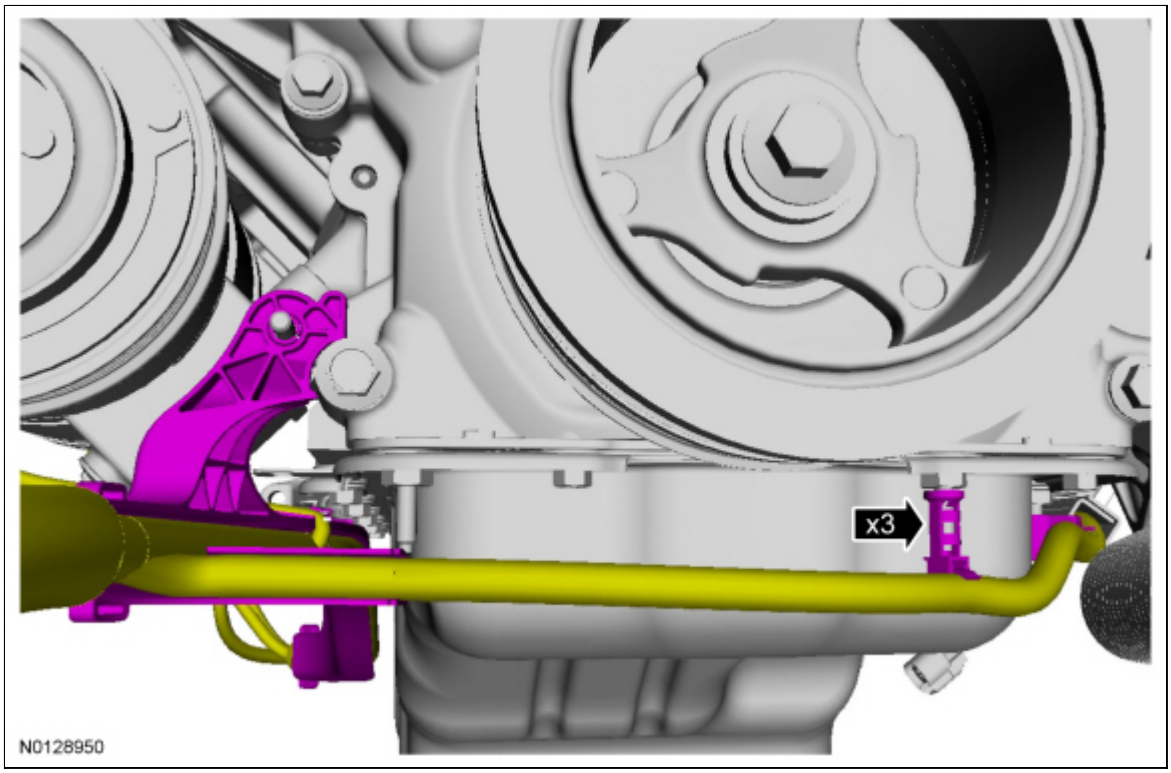
90. Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.



repair4less

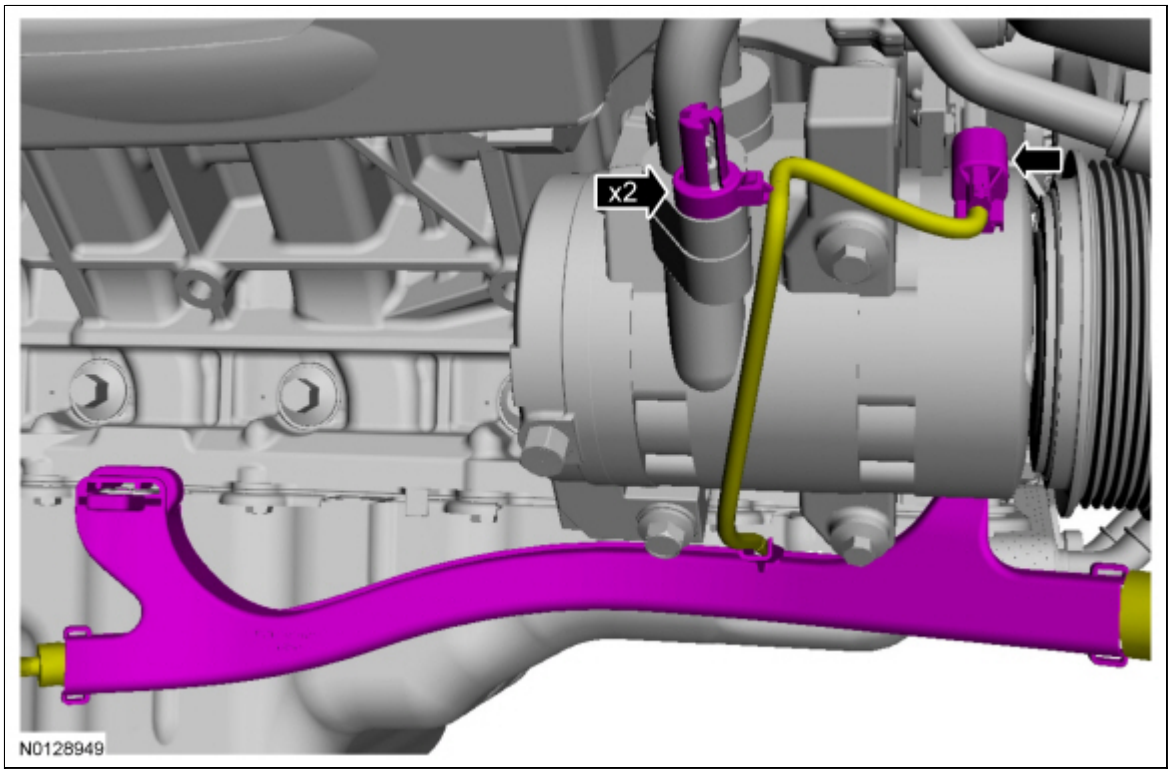


91. Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft pulley.

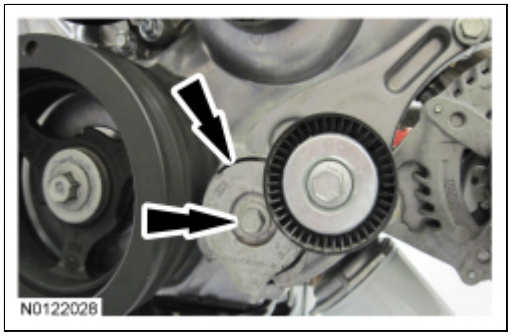


92. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 4 stages:
    - Stage 1: Tighten to 140 Nm (103 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 100 Nm (74 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

93. Install the generator and the 2 bolts.
    - Tighten to 48 Nm (35 lb-ft).

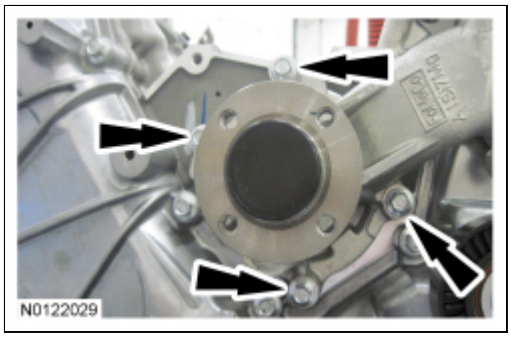


94. Attach the 3 wiring harness retainers.

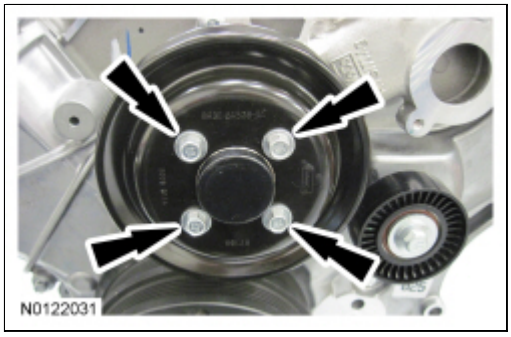


95. Connect the A/C compressor electrical connector and the 2 wiring harness retainers.

repair4less



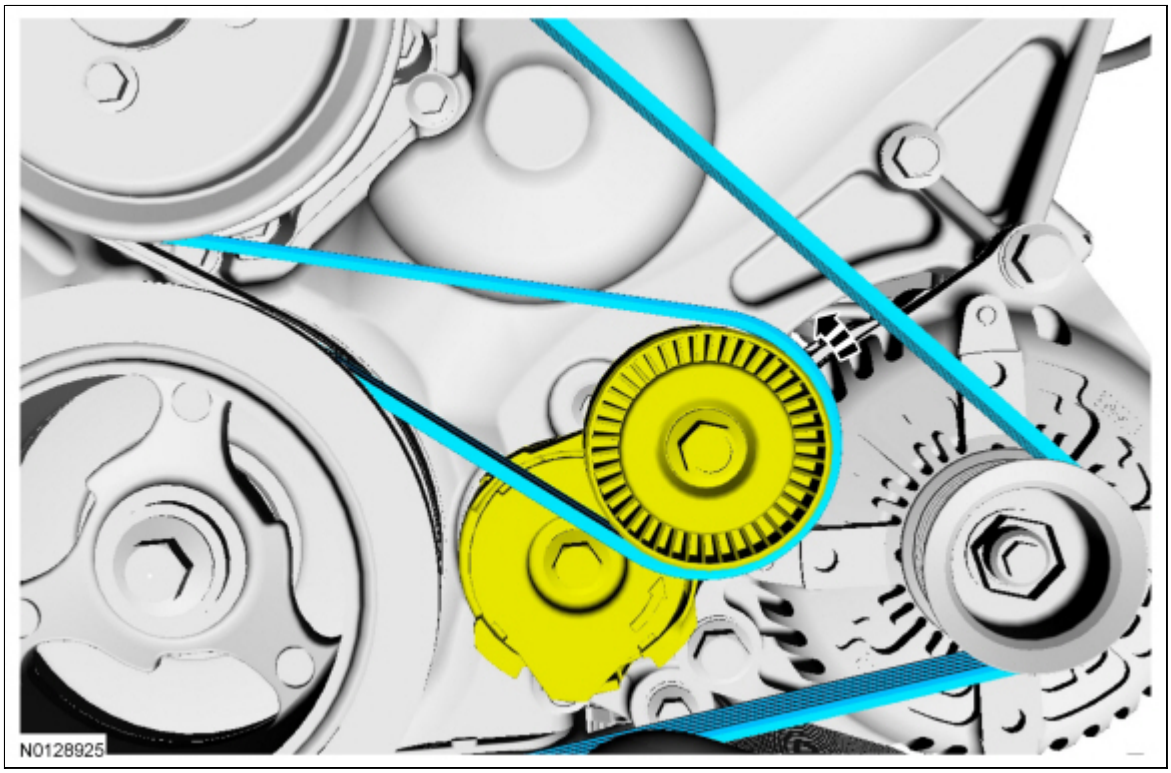
96. Install the accessory drive belt tensioner and the bolt.
    - Tighten to 48 Nm (35 lb-ft).



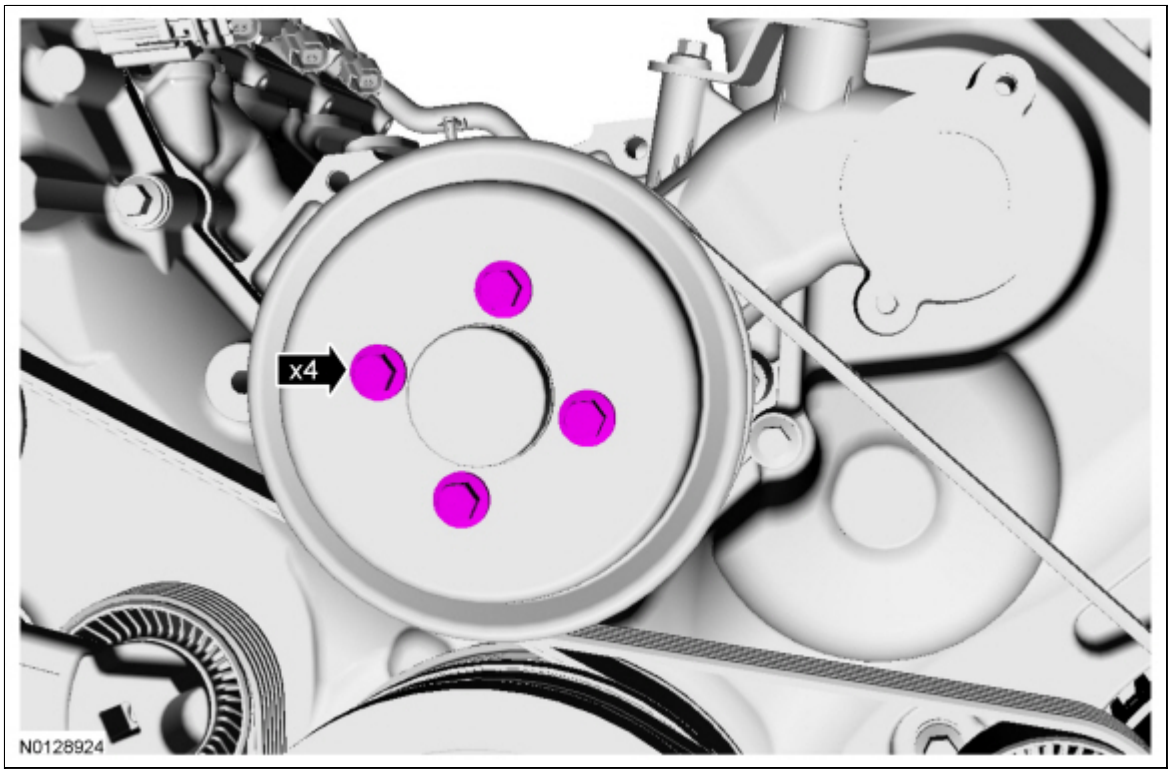
97. **NOTE:** Lubricate the new coolant pump O-ring seal with clean engine coolant.

    Using a new O-ring seal, install the coolant pump and the 4 bolts.
    - Tighten to 20 Nm (177 lb-in) plus an additional 60 degrees.

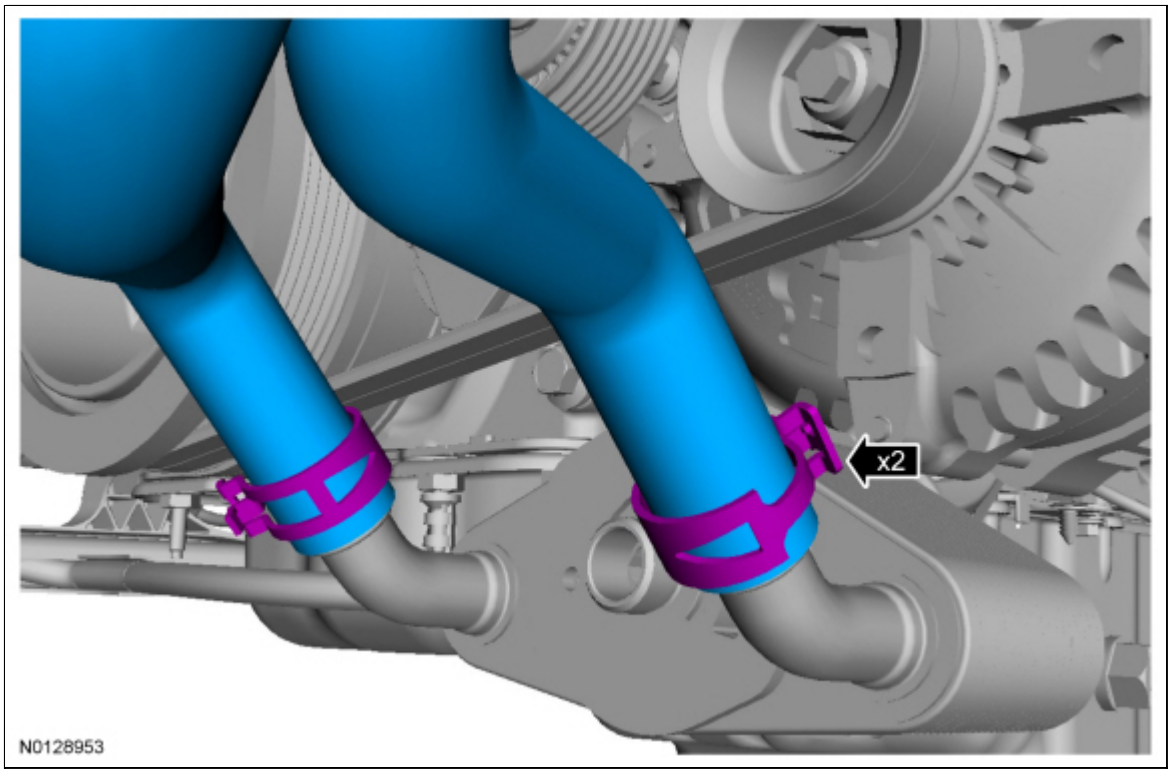
98. Install the coolant pump pulley and the 4 bolts.



99. Rotate the A/C compressor belt tensioner clockwise and install the A/C compressor belt.

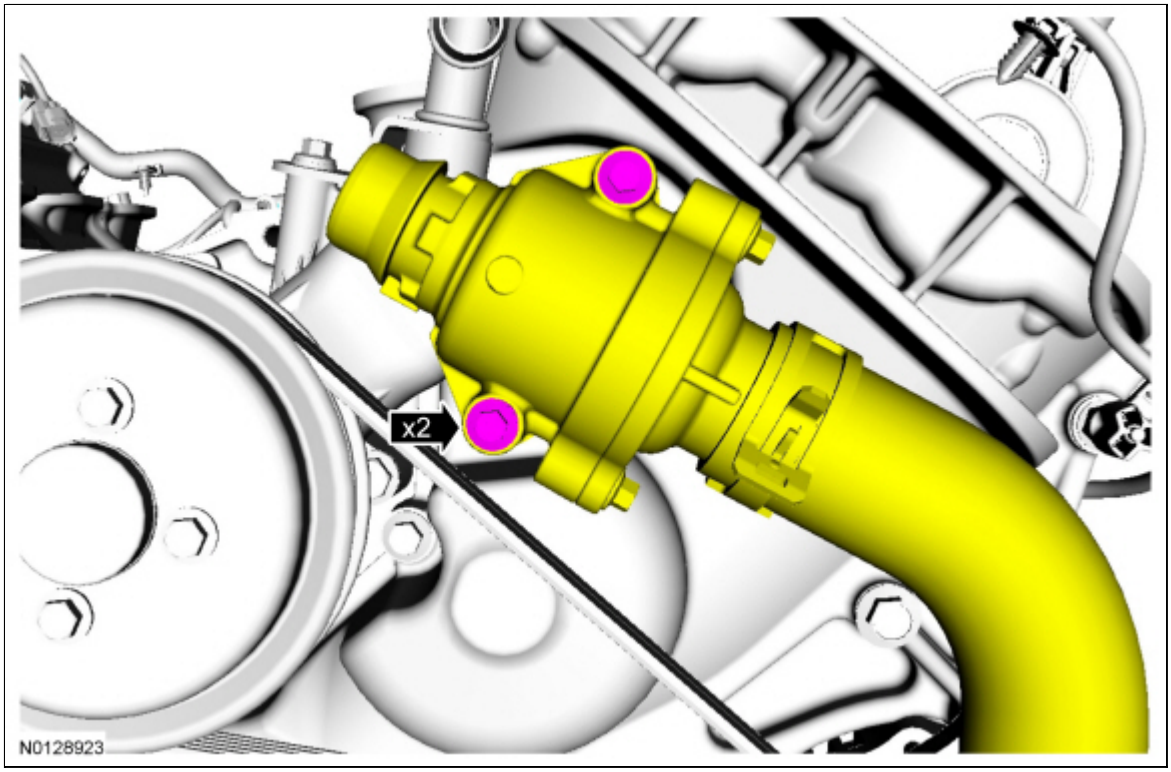


100. Rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.



repair4less

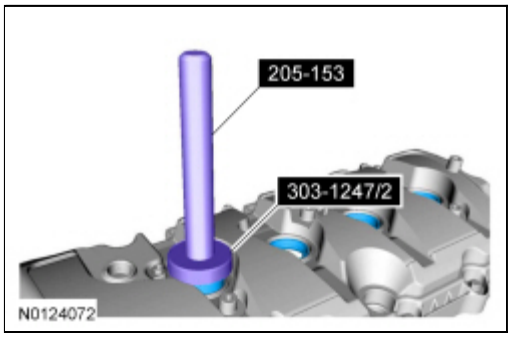
101. Tighten the 4 coolant pump pulley bolts to 25 Nm (18 lb-ft).



102. Connect the 2 coolant hoses to the oil cooler.

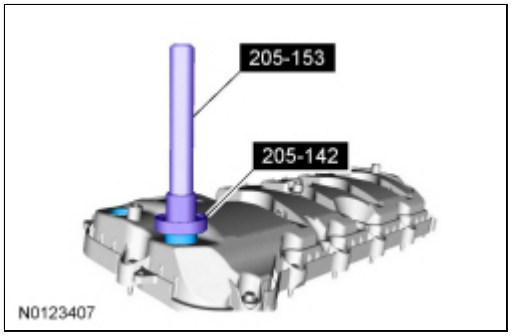
103. **NOTE:** Lubricate the new thermostat housing O-ring seal with clean engine coolant.

Using a new thermostat housing O-ring seal, install the thermostat housing and the 2 bolts.



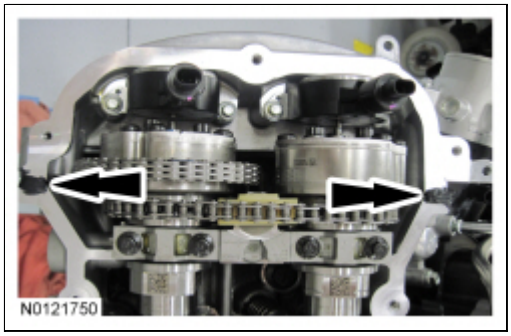
- Tighten to 10 Nm (89 lb-in).

repair4less



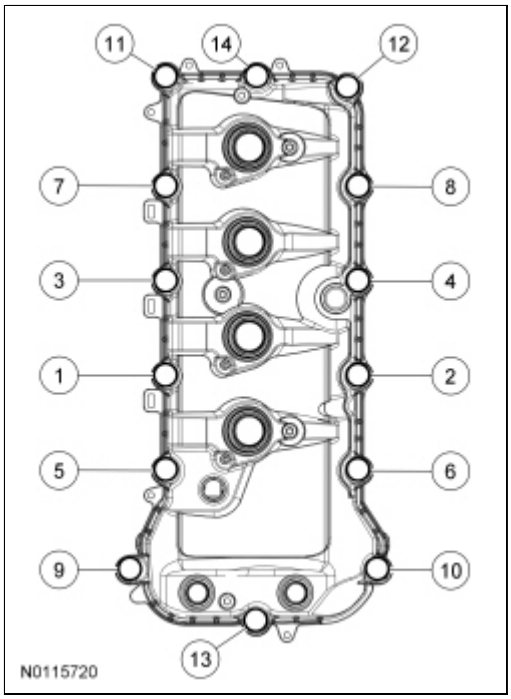
104. **NOTE:** Installation of new seals is only required if damaged seals were removed.

Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.



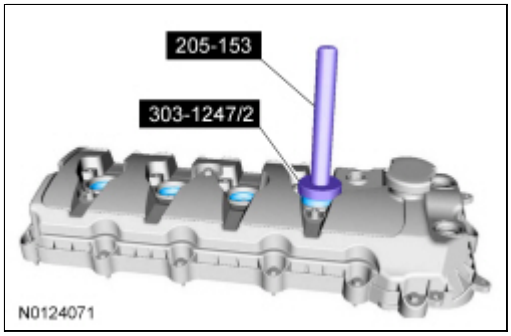
105. **NOTE:** Installation of new seals is only required if damaged seals were removed.

Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).



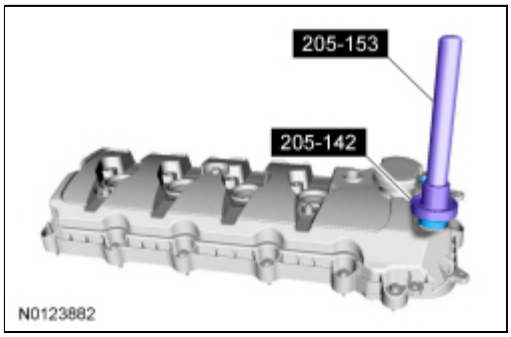
106. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-LH cylinder head joints.



107. Position the LH valve cover and new gasket on the cylinder head.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).

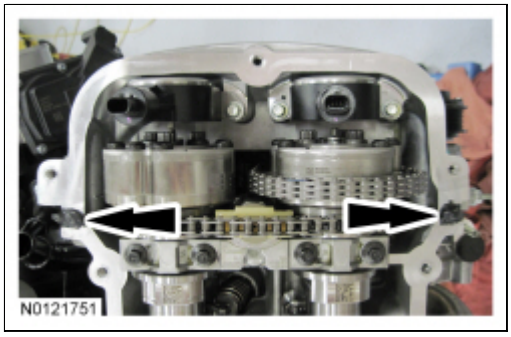
108. Install the oil level indicator.



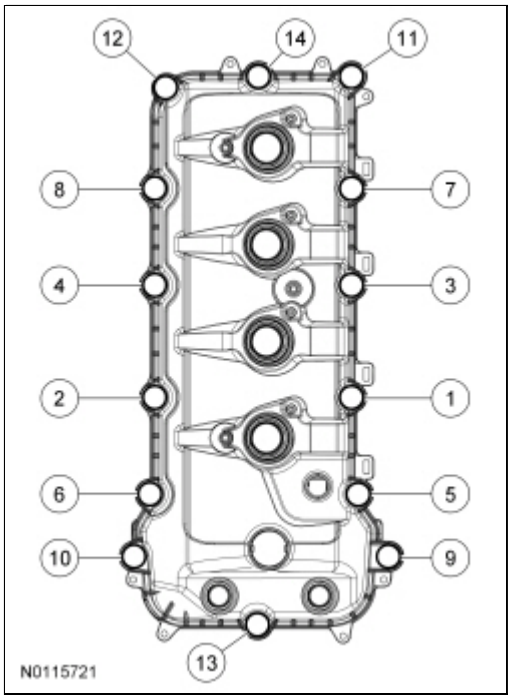
109. **NOTE:** Installation of new seals is only required if damaged seals were removed.

Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

110. **NOTE:** Installation of new seals is only required if damaged seals were removed.



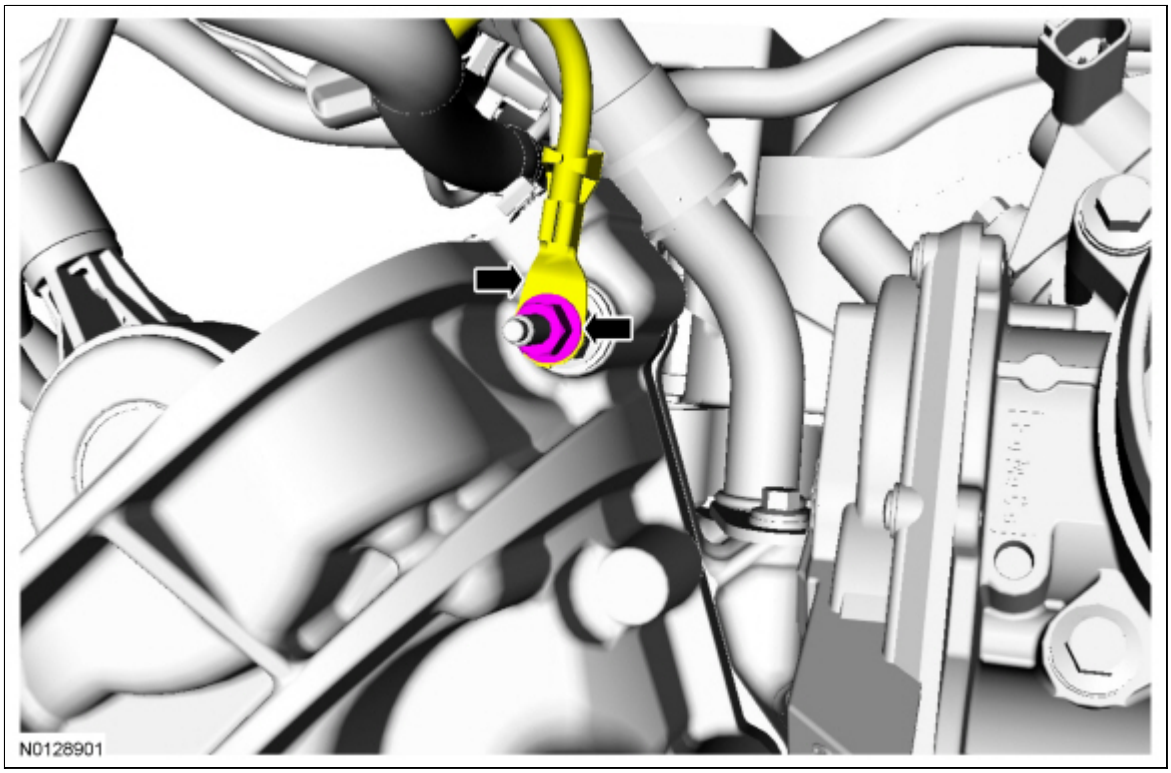
Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).



repair4less

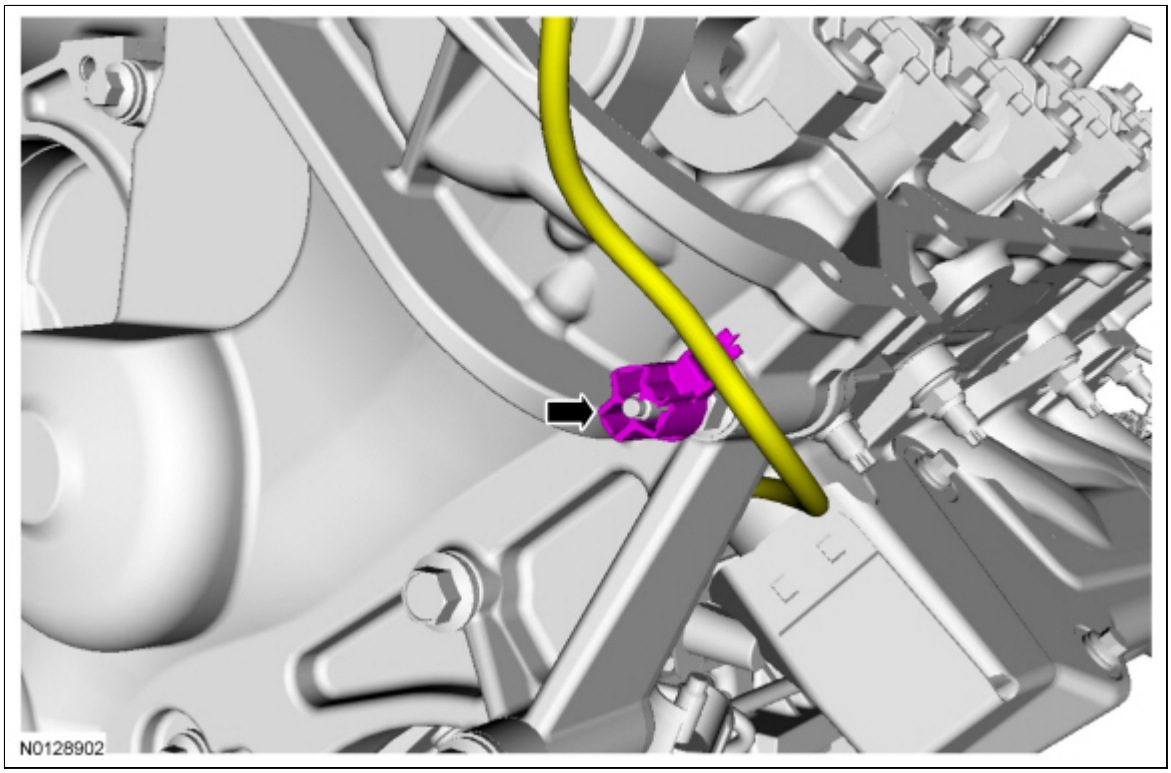
111. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-RH cylinder head joints.

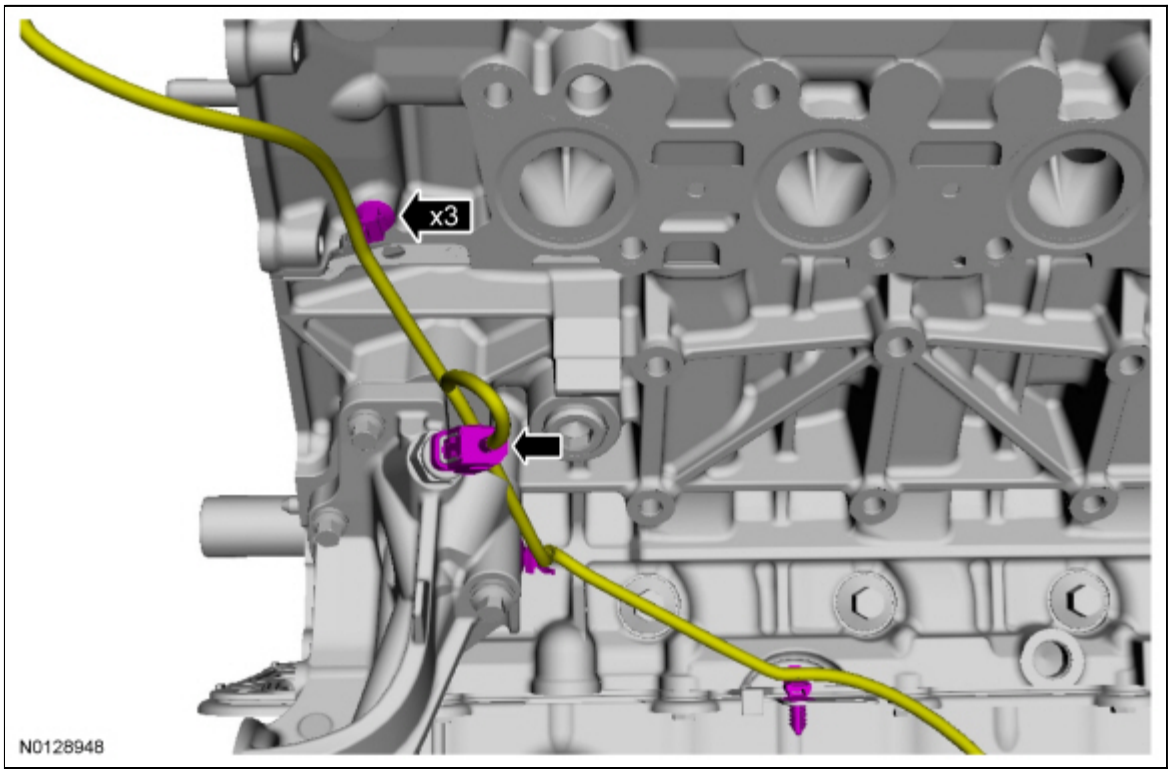


112. Position the RH valve cover and new gasket on the cylinder head.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).

113. Position the wiring harness on the engine.
    - Connect the 2 KS electrical connectors.

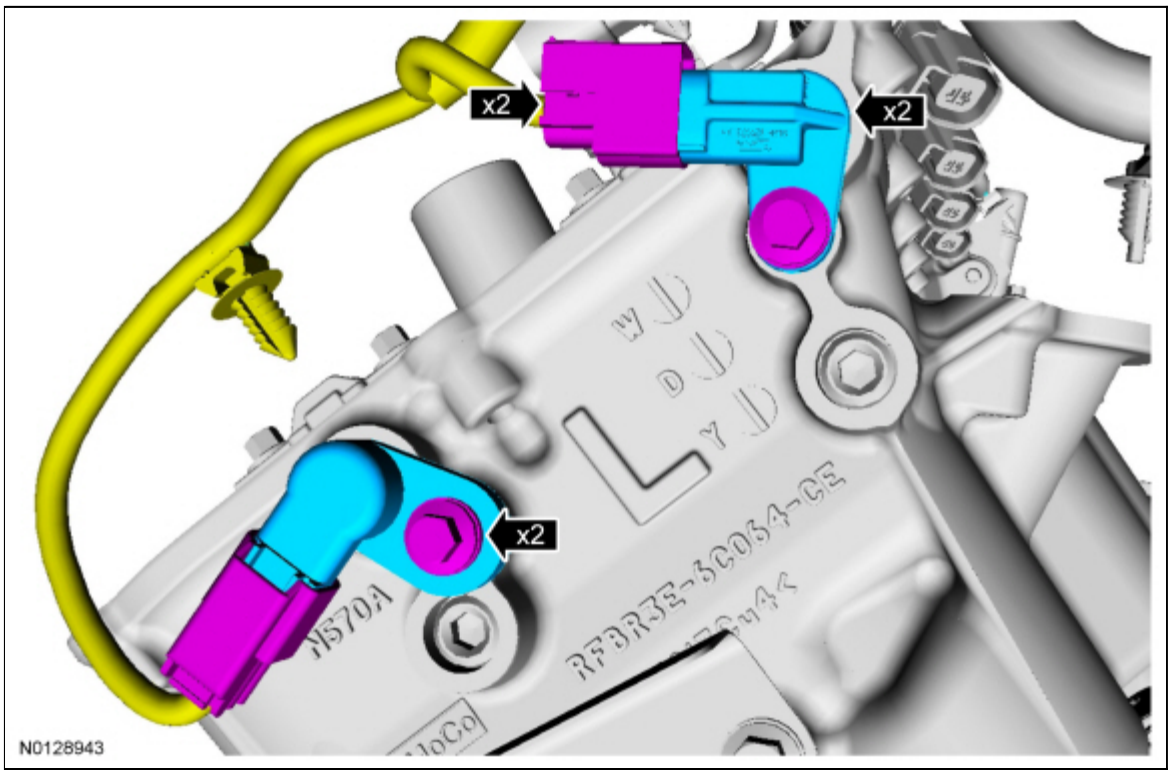


114. Install the ground wire and nut to the engine front cover stud bolt.
    - Tighten to 10 Nm (89 lb-in).

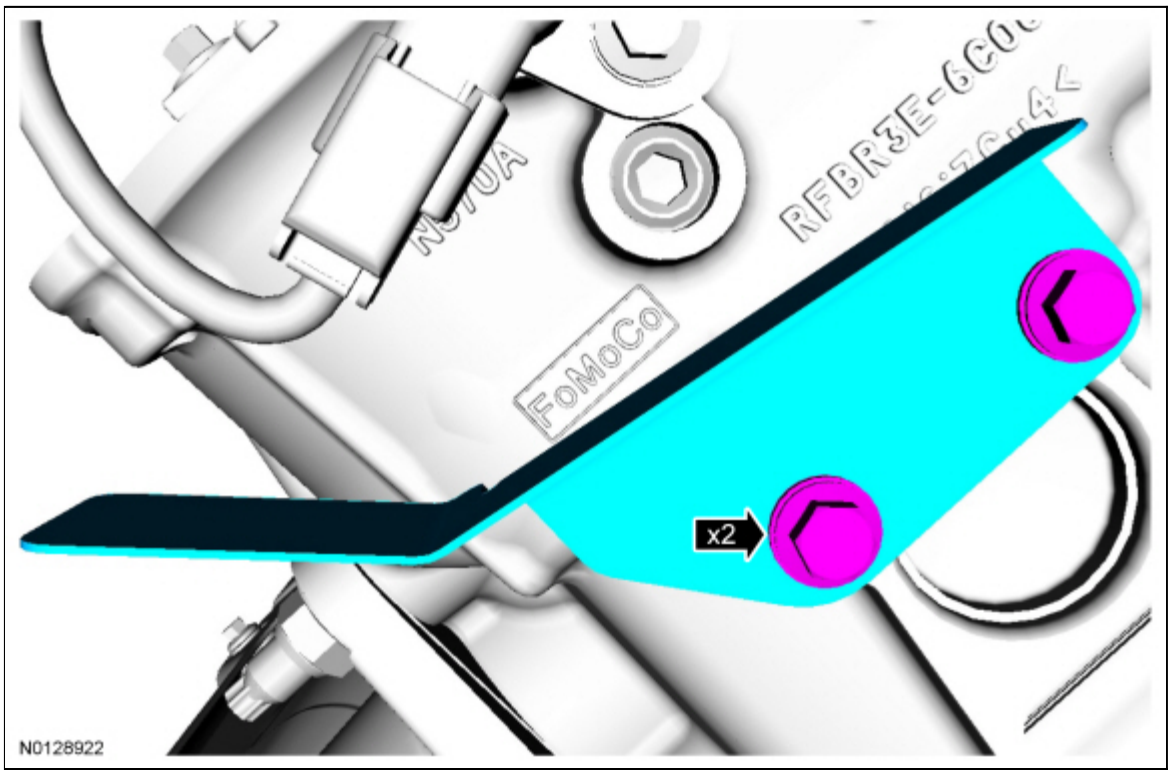


115. Attach the wiring harness retainer to the engine front cover stud bolt.

repair4less

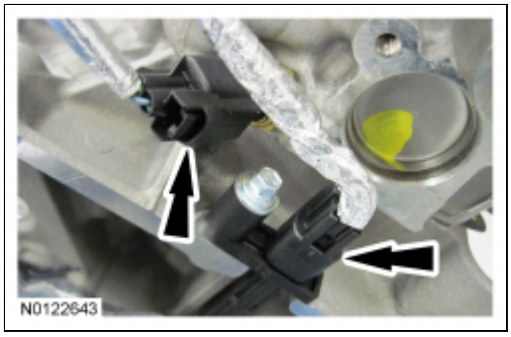


116. Connect the Engine Oil Pressure (EOP) switch electrical connector and the 3 wiring harness retainers.

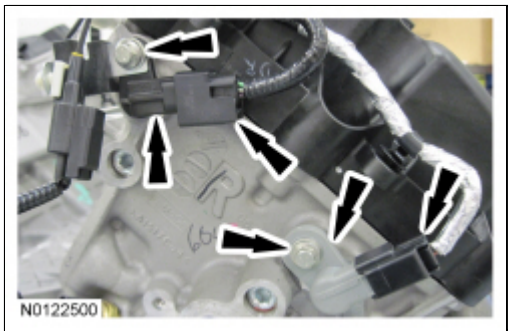


117. If removed, install the LH intake and exhaust Camshaft Position (CMP) sensors and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

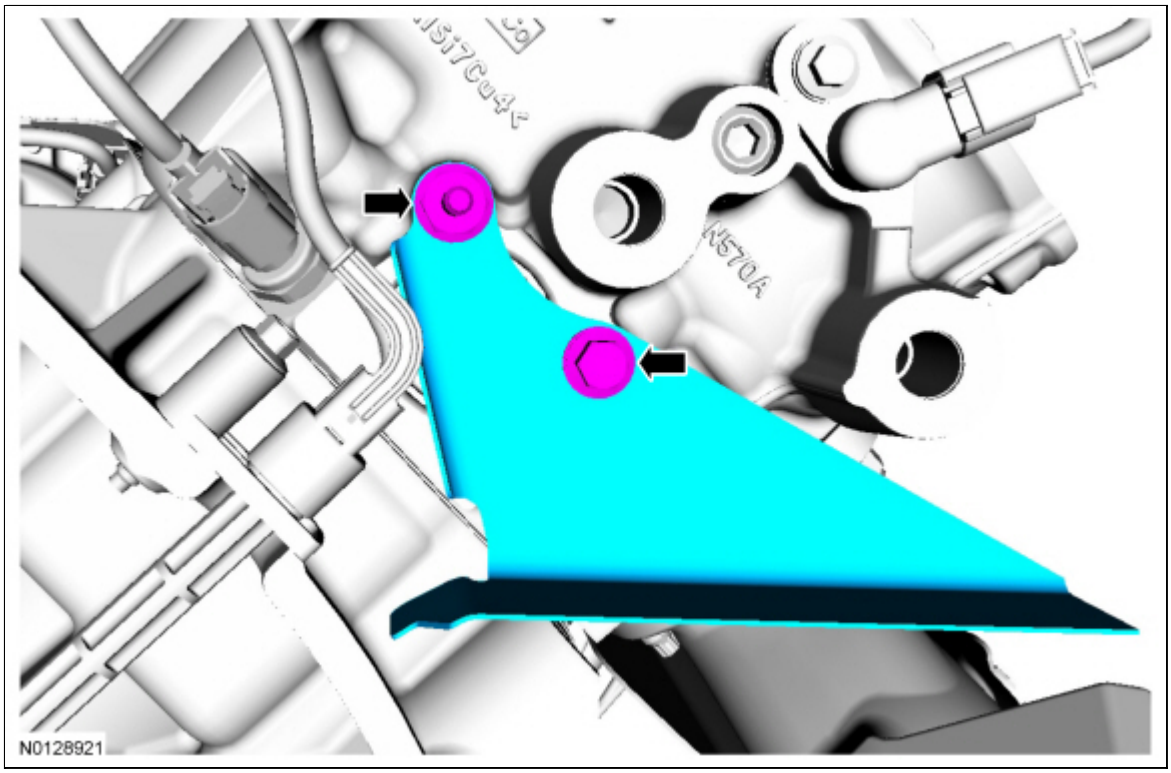
- Connect the LH intake and exhaust CMP sensor electrical connectors.



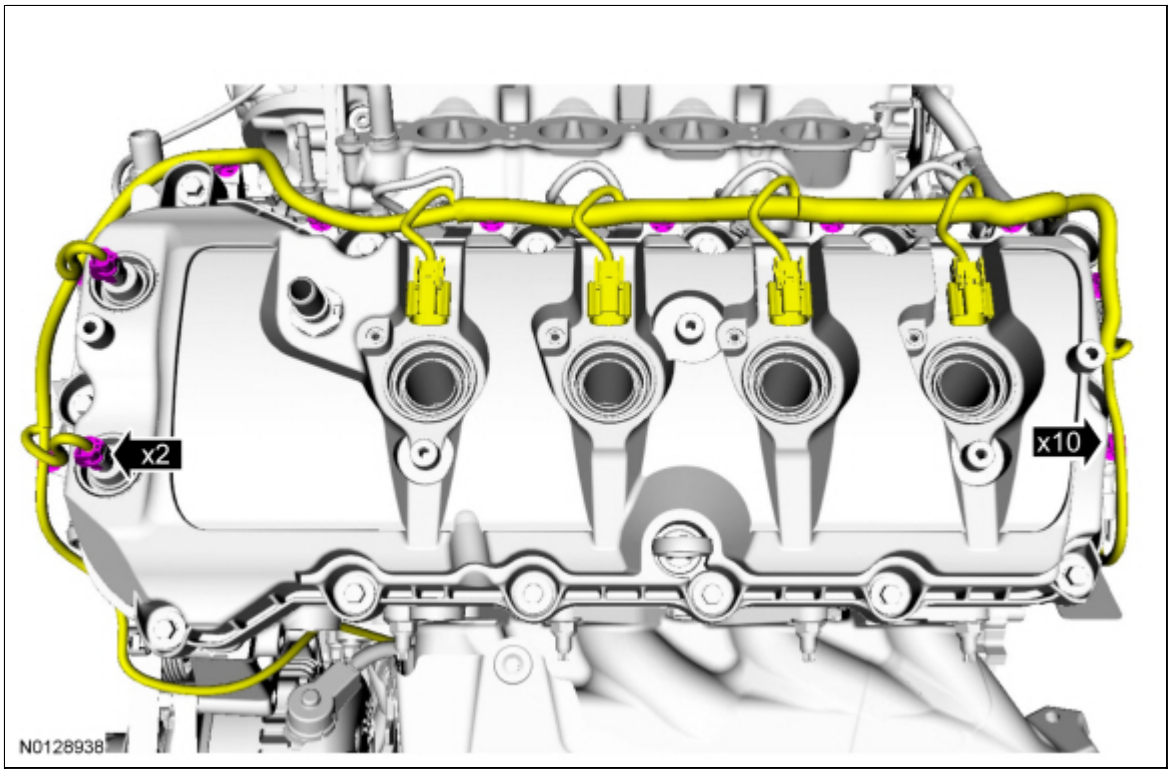
118. Install the heat shield and the 2 bolts to the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).



repair4less

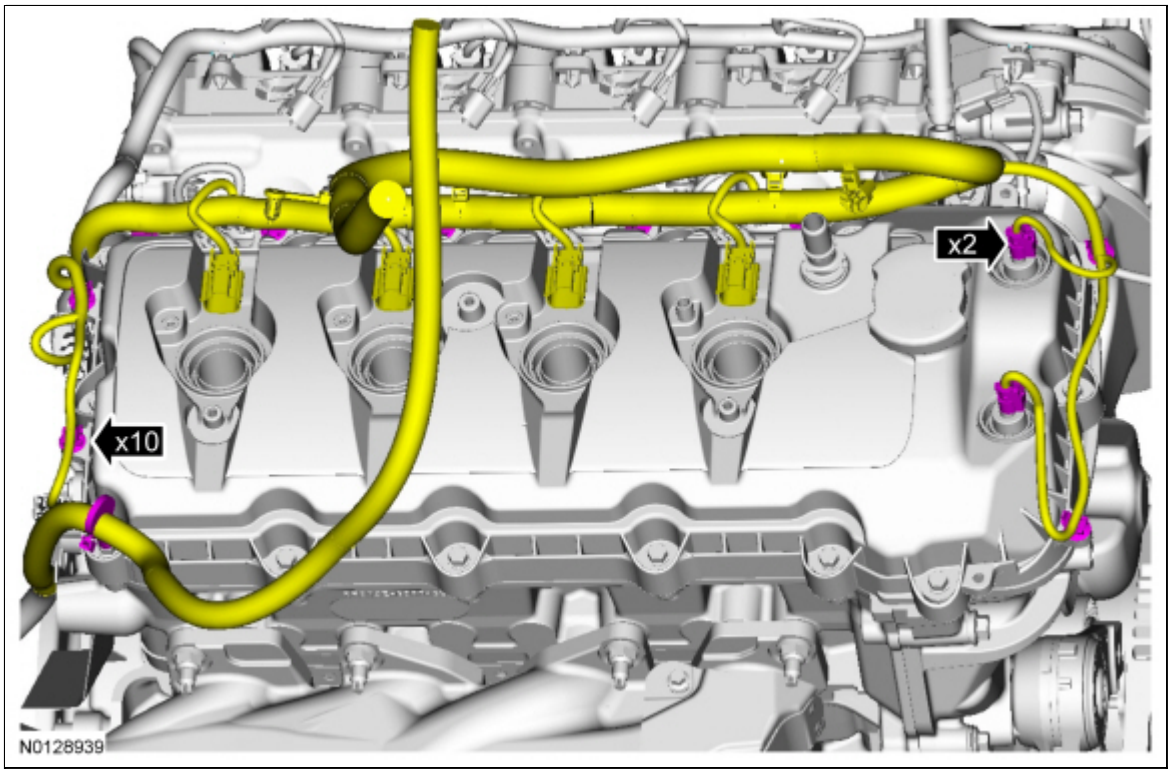


119. Connect the CHT sensor and the CKP sensor electrical connectors.

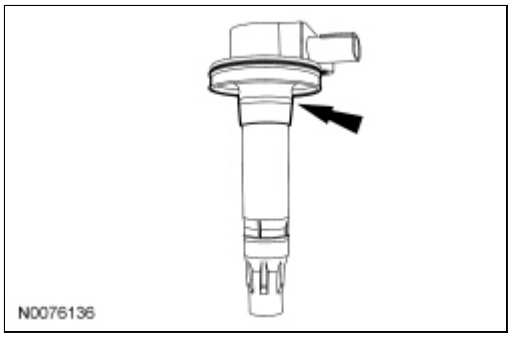


120. Install the RH intake and exhaust CMP sensors and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Connect the RH intake and exhaust CMP sensor electrical connectors.

121. Install the heat shield, the bolt and the stud bolt on the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

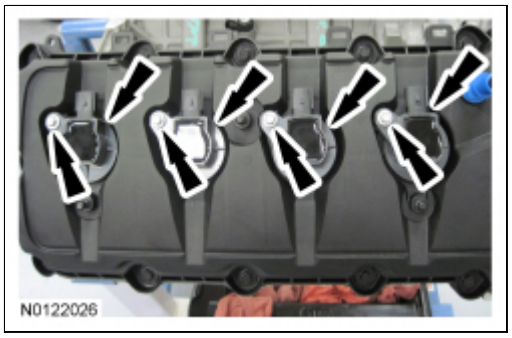


122. Connect the 2 VCT variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers to the LH valve cover.

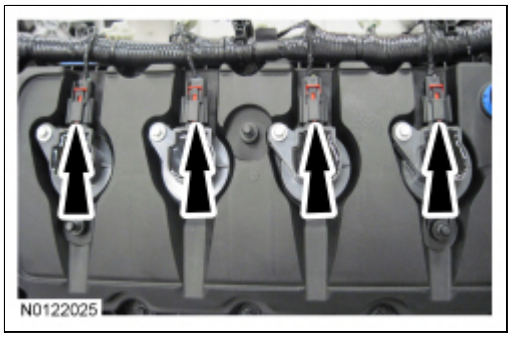


123. Connect the 2 Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers to the RH valve cover.

repair4less

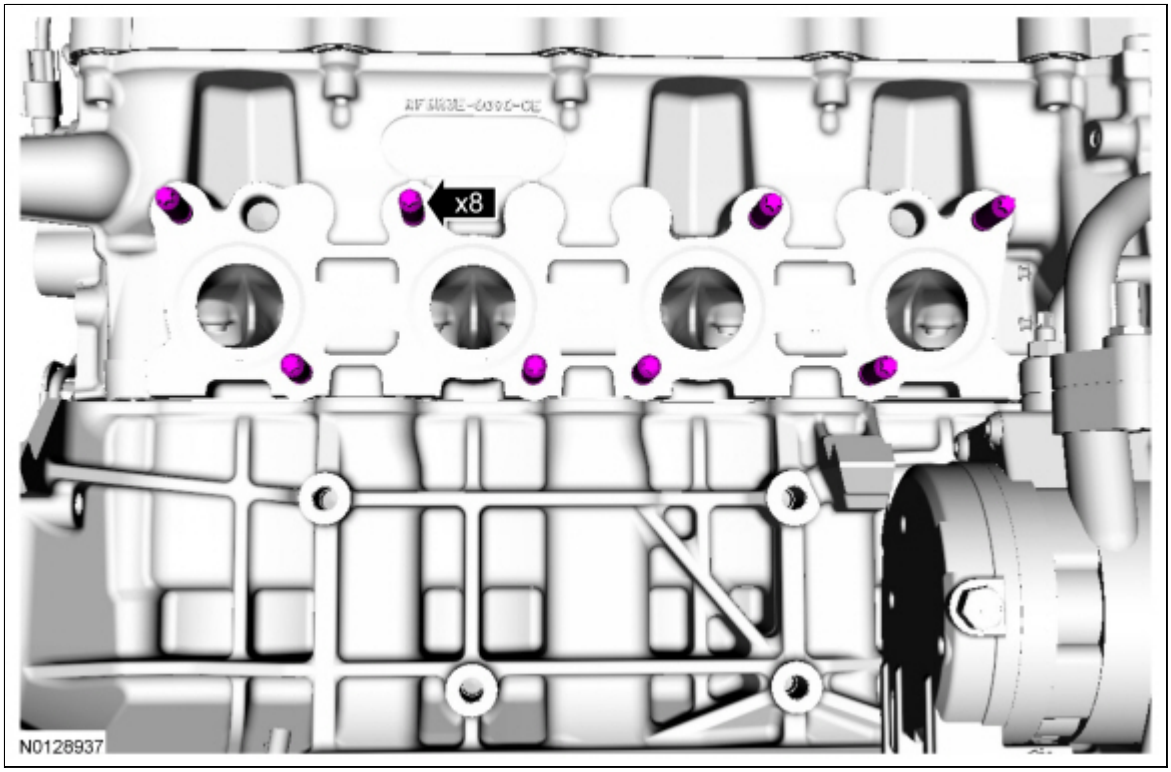


124. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
    - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.



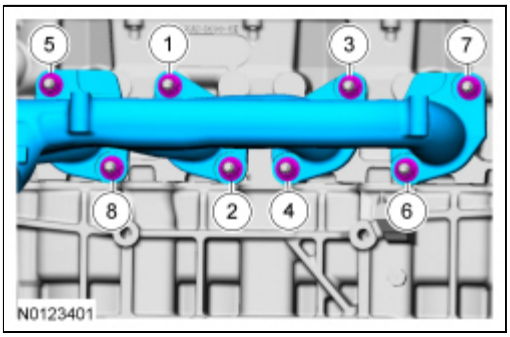
125. **NOTE:** Apply a small amount of dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs. RH shown, LH similar.

    Install the 8 ignition coils and 8 bolts.
    - Tighten to 6 Nm (53 lb-in).

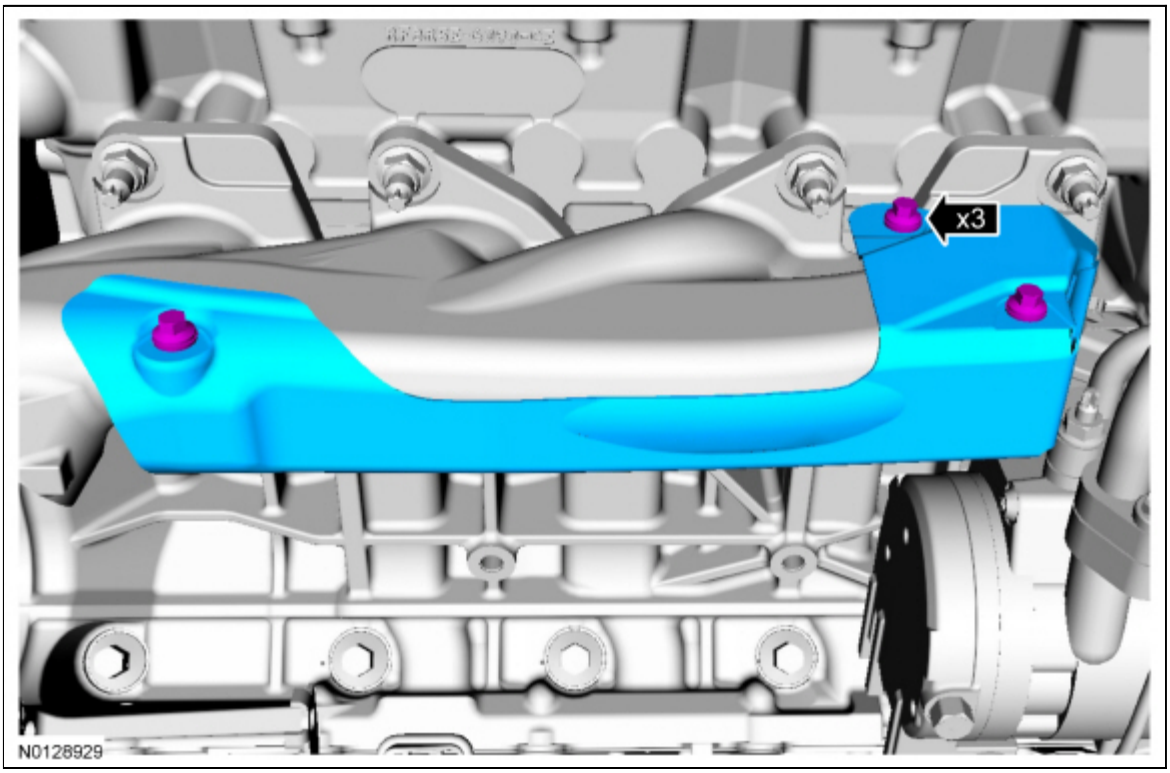


126. **NOTE:** RH shown, LH similar.

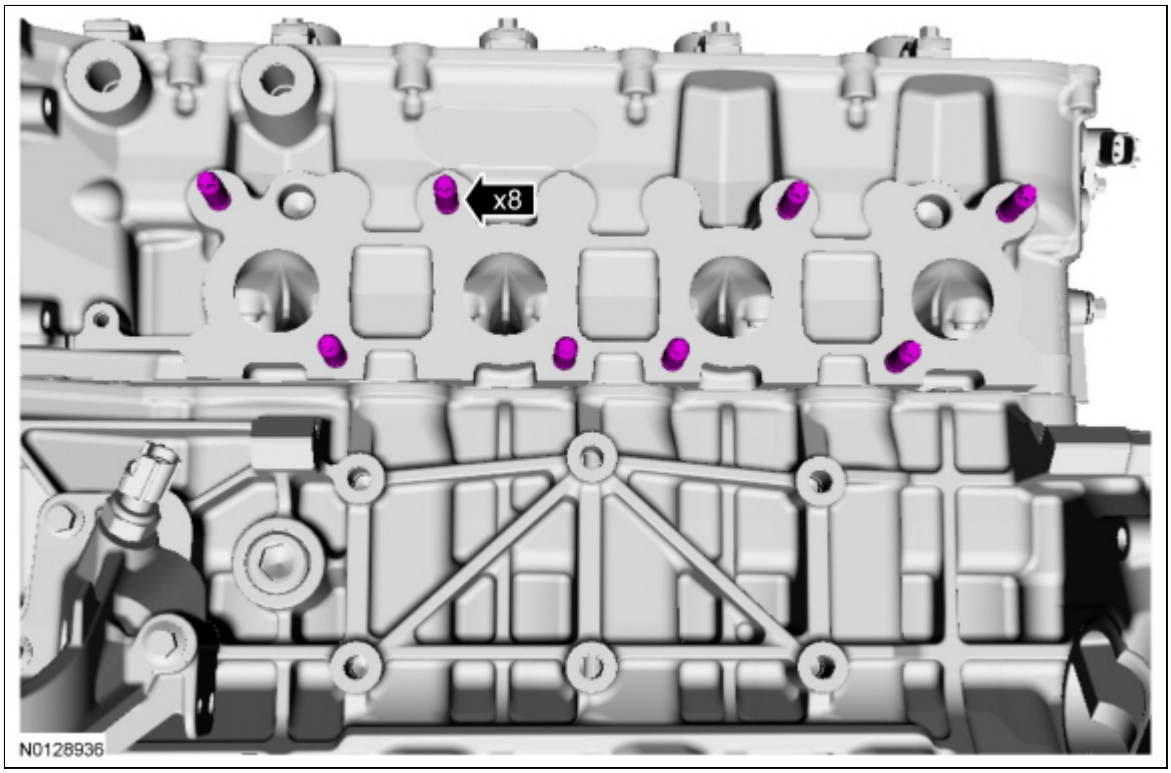
Connect the 8 ignition coil electrical connectors.



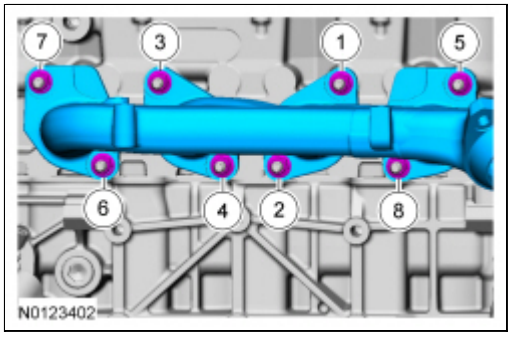
127. Install 8 new RH exhaust manifold studs.
    - Tighten to 25 Nm (18 lb-ft).



repair4less

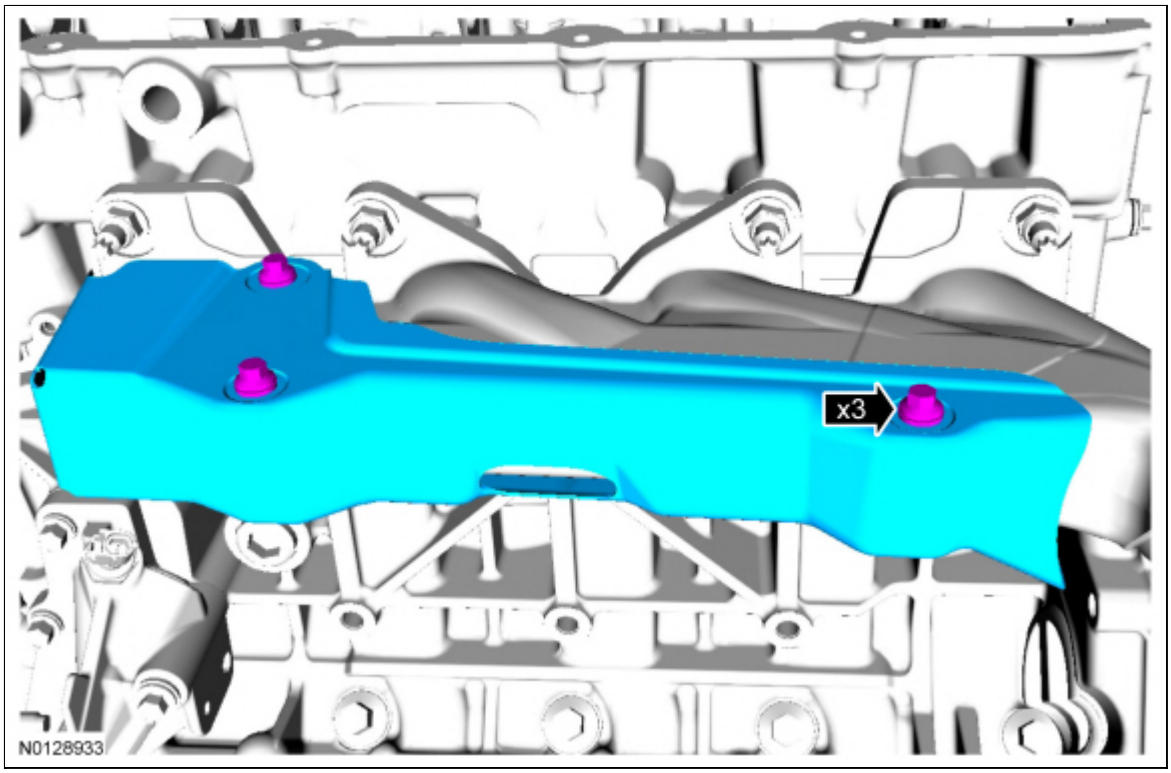


128. Install a new gasket, the RH exhaust manifold and 8 new nuts.
    - Tighten the nuts in the sequence shown in 2 stages.
        - Stage 1: Tighten to 24 Nm (18 lb-ft).
        - Stage 2: Tighten to 32 Nm (24 lb-ft).

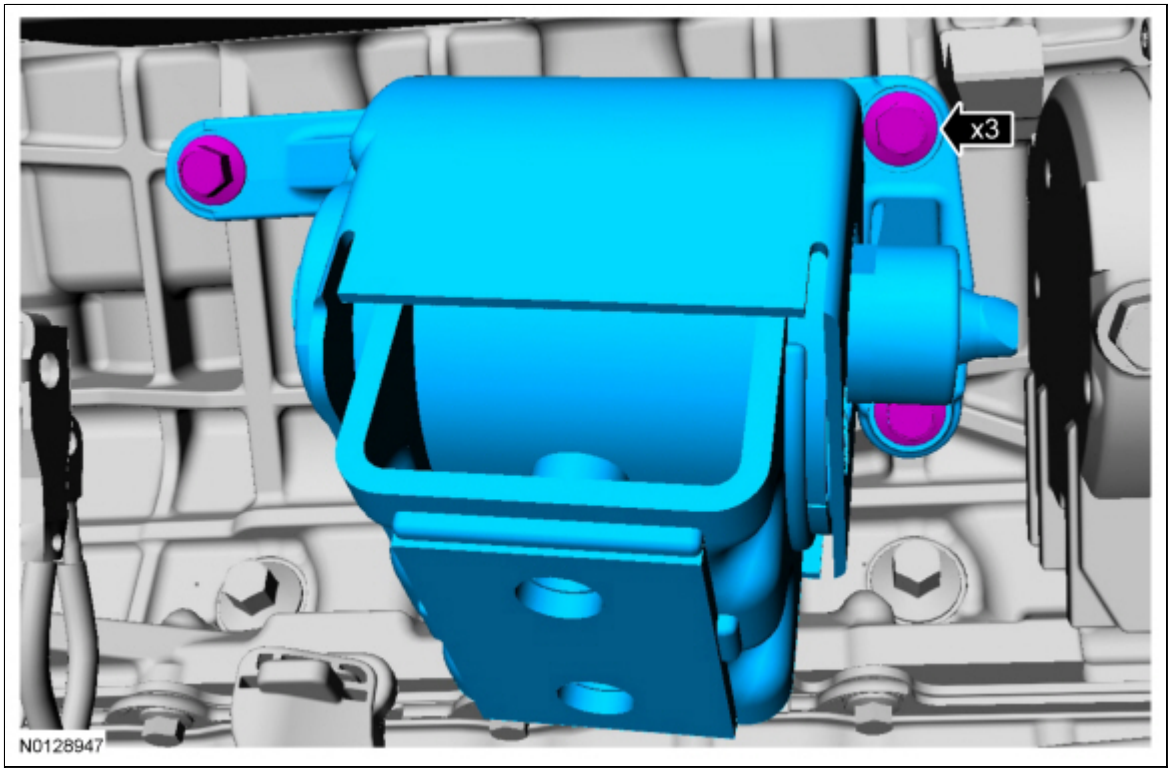


129. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).

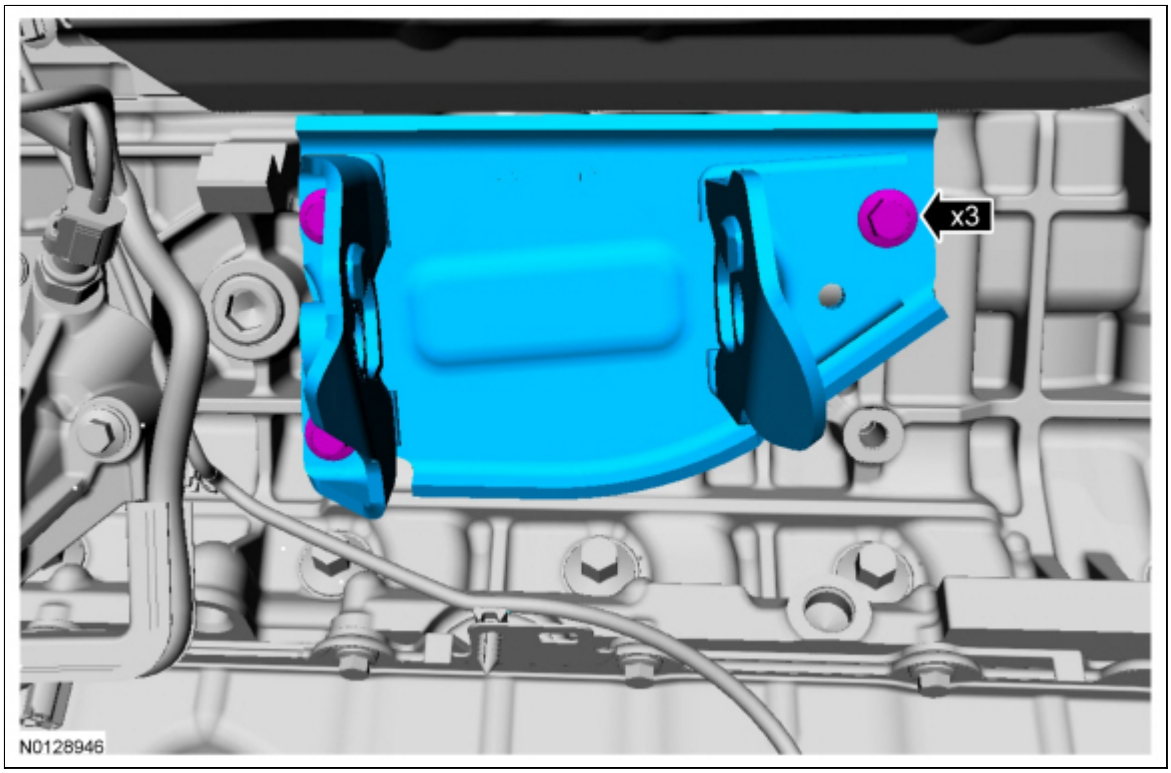
130. Install 8 new LH exhaust manifold studs.
    - Tighten to 25 Nm (18 lb-ft).



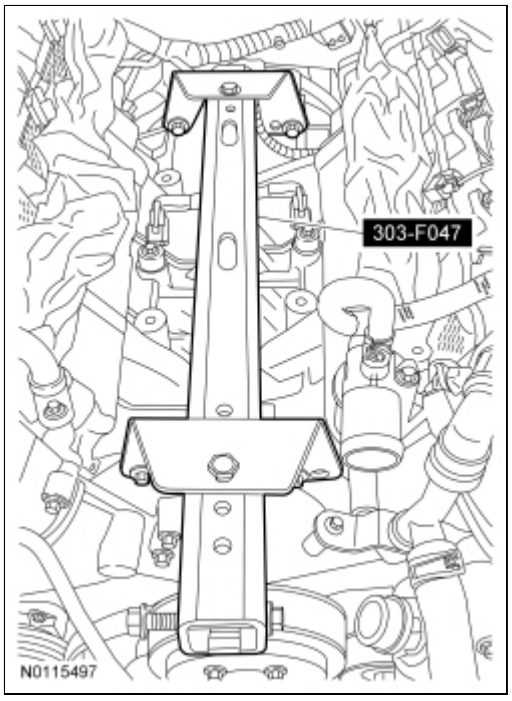
131. Install a new gasket, the LH exhaust manifold and 8 new nuts.
    - Tighten in the sequence shown in 2 stages.
        - Stage 1: Tighten to 24 Nm (18 lb-ft).
        - Stage 2: Tighten to 32 Nm (24 lb-ft).



132. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).



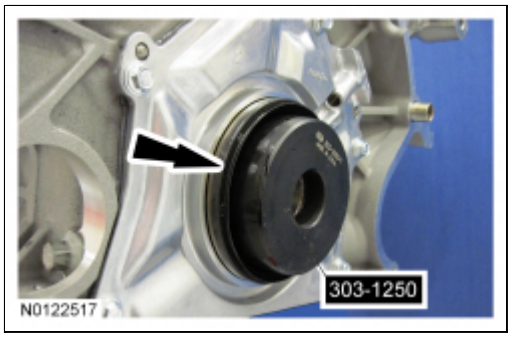
repair4less



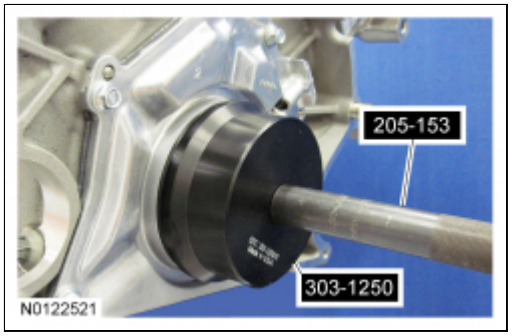
133. Install the RH engine support insulator and the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).

134. Install the LH engine support insulator bracket and the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).

135. Install the Engine Lifting Bracket

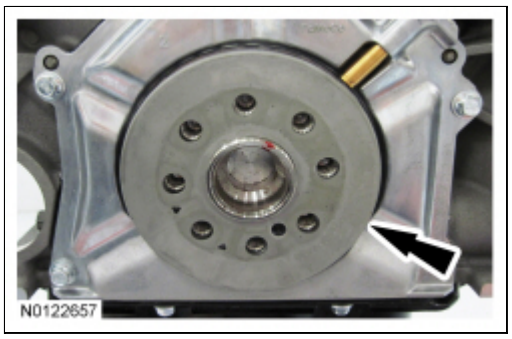


136. Using the Floor Crane, remove the engine from the work stand.

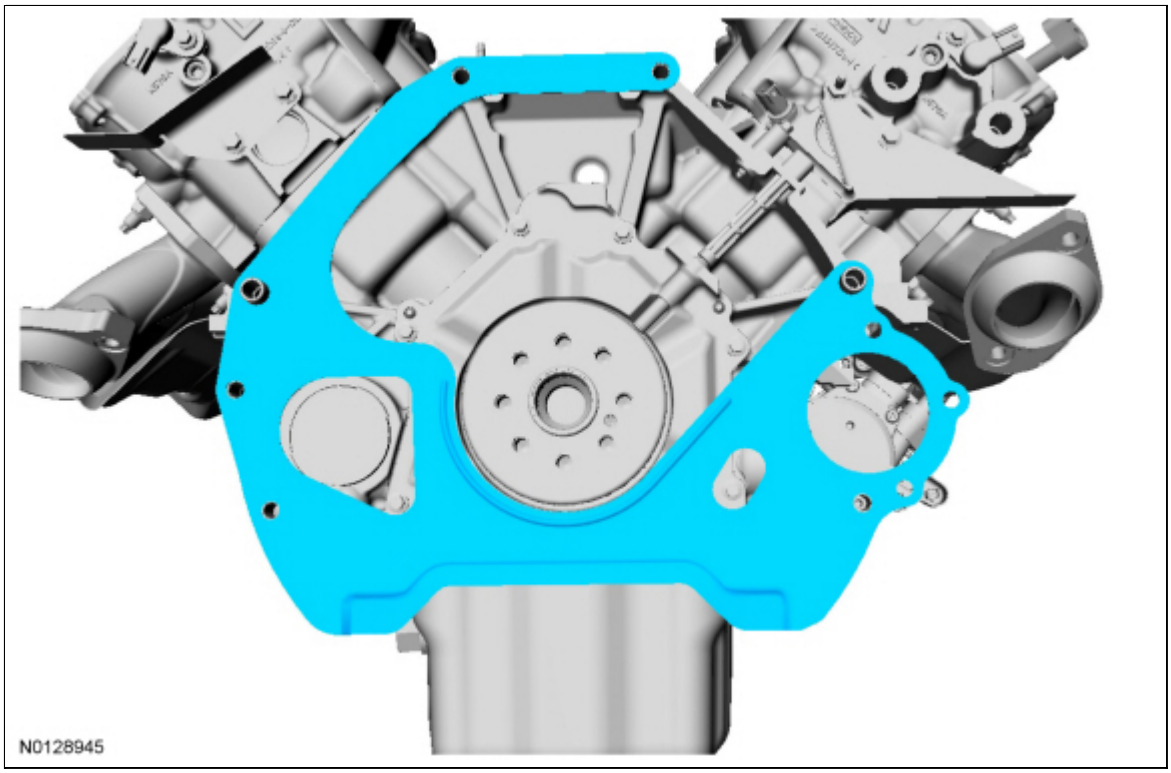


137. **NOTE:** Lubricate the seal lips and bore with clean engine oil prior to installation.

Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

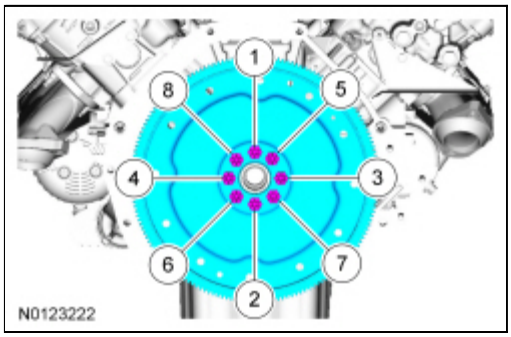


repair4less



138. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

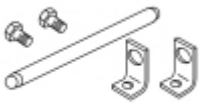
139. Install the crankshaft sensor ring.

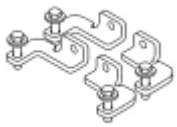


140. Install the engine separator plate.

141. **NOTE:** The flexplate bolts are torque-to-yield design and are not reusable.

Install the engine separator plate, the flexplate and 8 new bolts.





- Tighten in the sequence shown in 2 stages.
  - Stage 1: Tighten to 20 Nm (177 lb-in).
  - Stage 2: Tighten an additional 60 degrees.

repair4less

Cylinder Head

Special Tool(s)

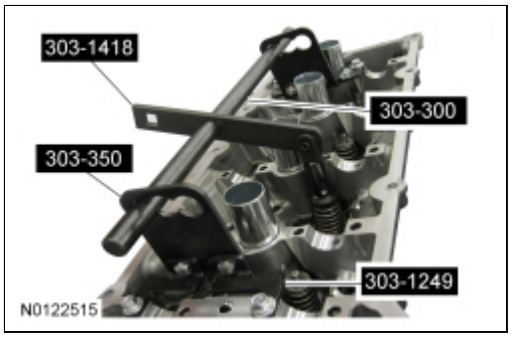
 ST1902-A	Compressor, Valve Spring 303-1418
 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

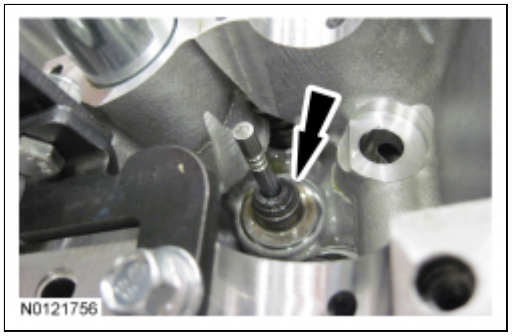
NOTE: LH cylinder head shown, RH cylinder head similar.

repair4less



Item	Part Number	Description
1	6518	Valve spring retainer key (32 required)
2	6514	Valve spring retainer (16 required)
3	6513	Valve spring (16 required)
4	6571	Valve seal (16 required)
5	6507	Intake valve (8 required)
6	6505	Exhaust valve (8 required)

Disassembly

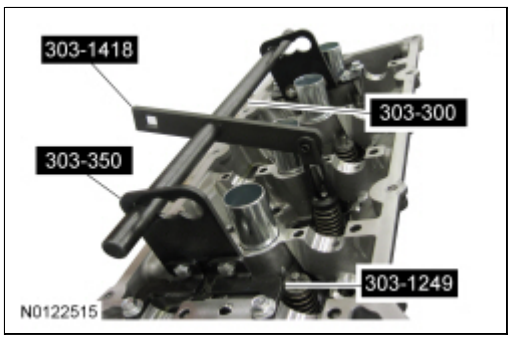


NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

1. Using the Valve Spring Compressors, remove the keys, retainer and spring.

2. Remove and discard the valve seal.



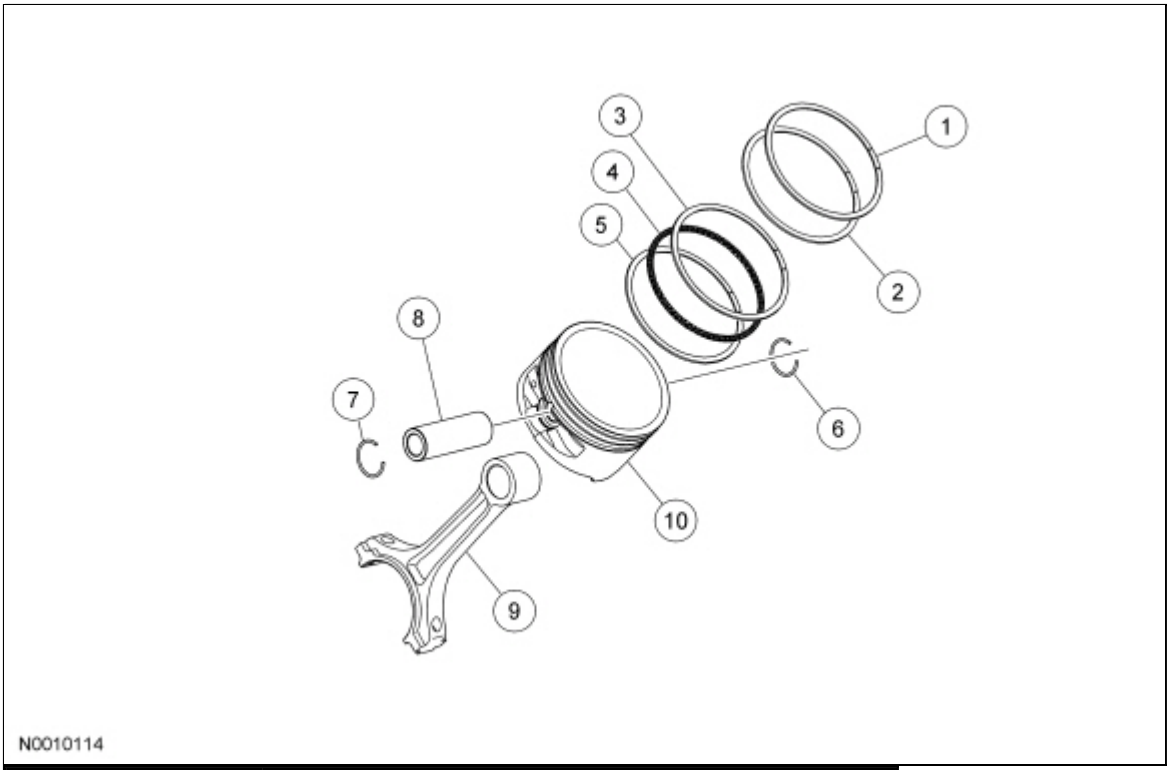
3. Remove the valve from the cylinder head.
4. Repeat the previous steps for each of the remaining valves.

Assembly

NOTE: Apply clean engine oil to the valve seals and the inside diameter of the valve guides prior to assembling the cylinder head components.

1. **NOTE:** The valve seal must be bottomed out on the cylinder head spring seat.

   Install the valve seal.
2. Install the valve into the cylinder head.
3. Using the Valve Spring Compressors, install the spring, retainer and keys.



4. Repeat the previous steps for each of the remaining valves.

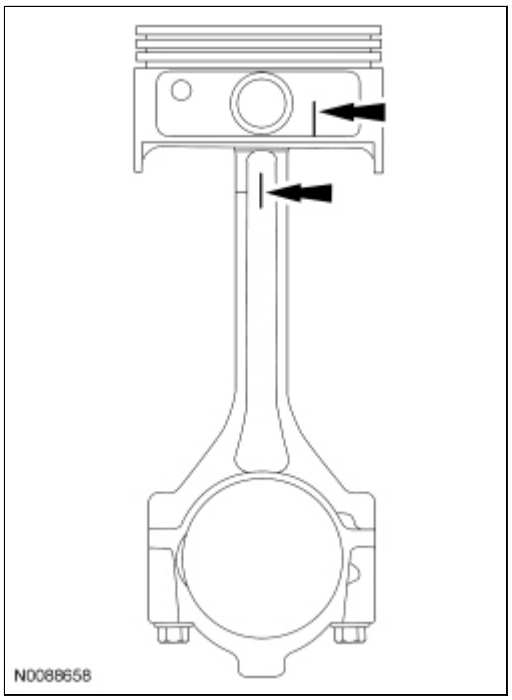
repair4less

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	—	Piston compression upper ring (part of 6148)
2	—	Piston compression lower ring (part of 6148)
3	—	Piston oil control upper segment ring (part of 6148)
4	—	Piston oil control spacer (part of 6148)
5	—	Piston oil control lower segment ring (part of 6148)
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin



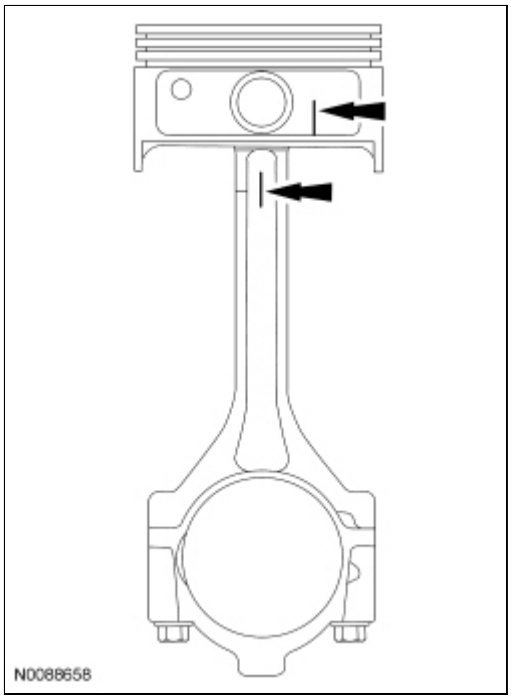
repair4less

9	6200	Connecting rod
10	6110	Piston

Disassembly

WARNING: Since the retainer ring has a tendency to spring out, cover the end of the pin bore with a hand or shop rag when removing the ring. Wear eye protection. Failure to follow these instructions may result in serious personal injury.

1. Remove the piston rings from the piston.
   - Discard the piston rings.
2. Mark the piston and the connecting rod on the same side for assembly reference.



3. Remove the piston pin retainers and the piston pin.
4. Separate the piston from the connecting rod.
5. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

1. **NOTE:** The connecting rod must be installed into the piston with the marks made during disassembly on the same side. If a new piston or connecting rod is being installed, it can be installed in either direction.

   Position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.
3. Install the piston pin in the piston and connecting rod assembly.
4. Install the piston pin retaining clips in the piston.
5. Lubricate the piston and the new piston rings with clean engine oil.
6. Install the piston rings onto the piston.

repair4less

Camshaft — LH

Special Tool(s)

 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

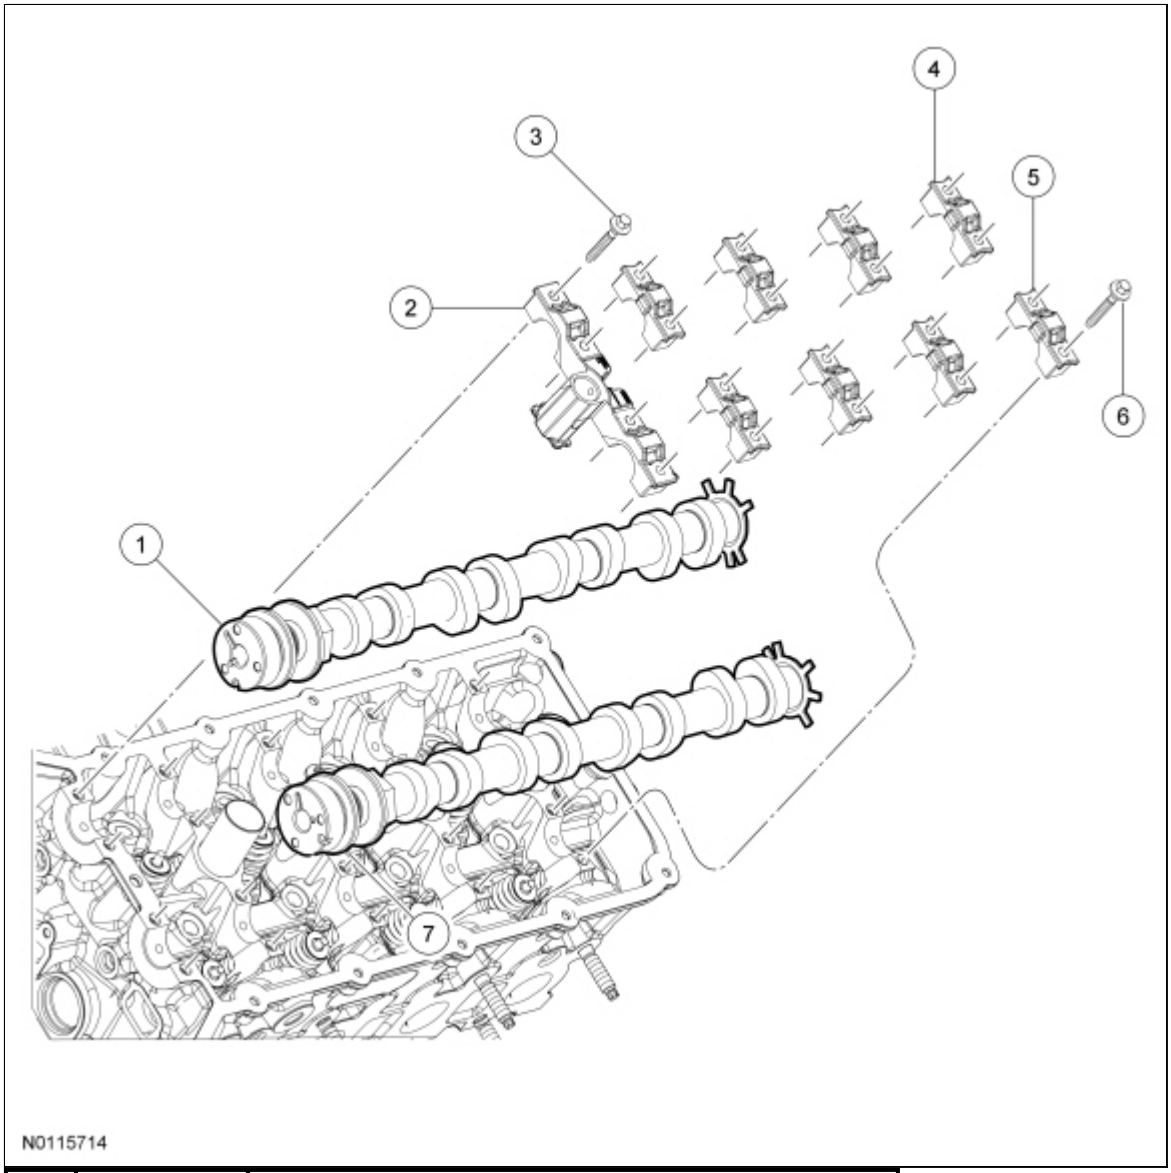
Timing Drive Components



repair4less

Item	Part Number	Description
1	6256	RH exhaust Variable Camshaft Timing (VCT) assembly
2	6K254	RH secondary timing chain tensioner
3	6256	RH intake VCT assembly
4	6268	RH secondary timing chain
5	6M256	RH timing chain guide
6	6K255	LH timing chain tensioner arm
7	6L266	LH primary timing chain tensioner
8	6256	LH intake VCT assembly

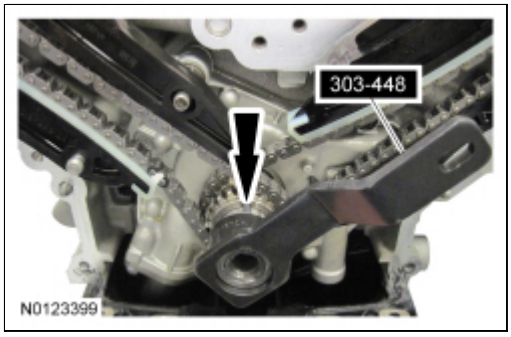
9	6268	LH secondary timing chain
10	6K254	LH secondary timing chain tensioner
11	6268	LH primary timing chain
12	6256	LH exhaust VCT assembly
13	6B274	LH timing chain guide
14	6306	Crankshaft sprocket
15	6268	RH primary timing chain
16	6K255	RH timing chain tensioner arm
17	6L266	RH primary timing chain tensioner

Camshafts

	Part	

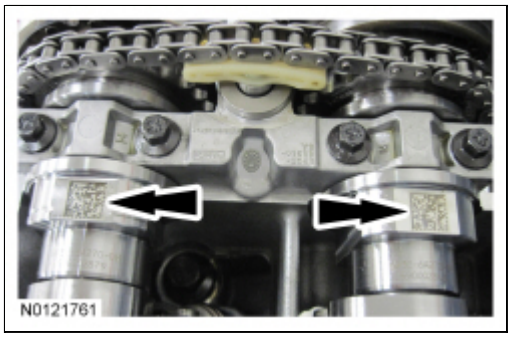
repair4less

Item	Number	Description
1	6250	LH intake camshaft
2	—	Front camshaft bearing mega cap (part of 6049)
3	N806183	Front camshaft bearing mega cap bolt (4 required)
4	—	Intake camshaft bearing cap (part of 6049) (4 required)
5	—	Exhaust camshaft bearing cap (part of 6049) (4 required)
6	N806183	Intake/exhaust camshaft bearing cap bolt (16 required)
7	6250	LH exhaust camshaft



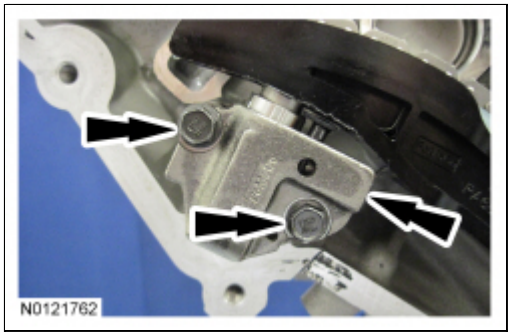
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



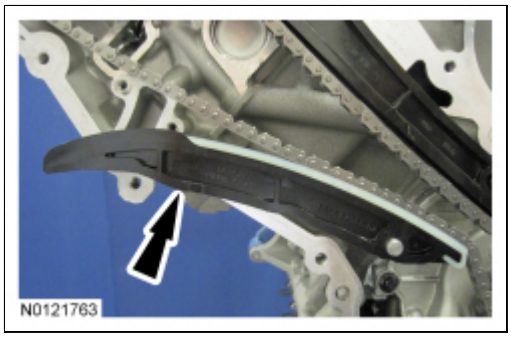
NOTE: If the RH camshafts are being serviced at the same time as the LH camshafts, remove the RH camshafts first. For additional information, refer to Camshaft — RH in this section.

NOTE: If the components are to be reinstalled, they must be installed in their original location. Mark the components for installation into their original location.



1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Using the crankshaft holding tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

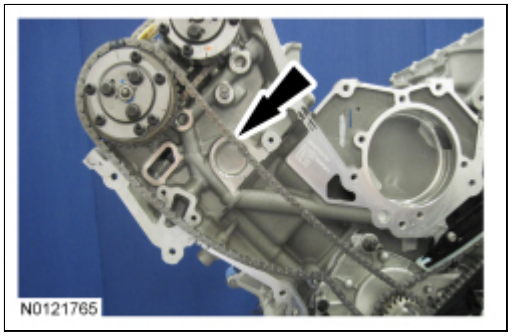
3. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.



4. Remove the 2 bolts and the RH primary timing chain tensioner.

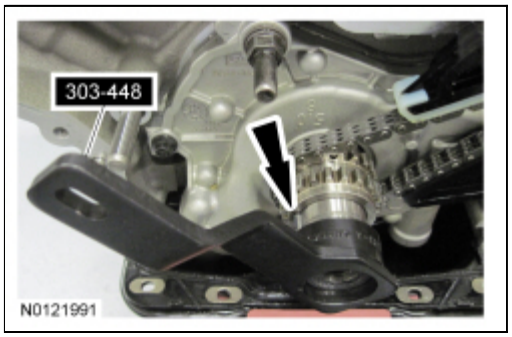
5. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

   Remove the RH timing chain tensioner arm.

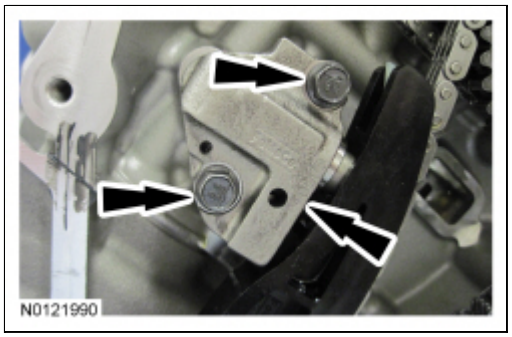


6. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

   Remove the bolt and the RH timing chain guide.

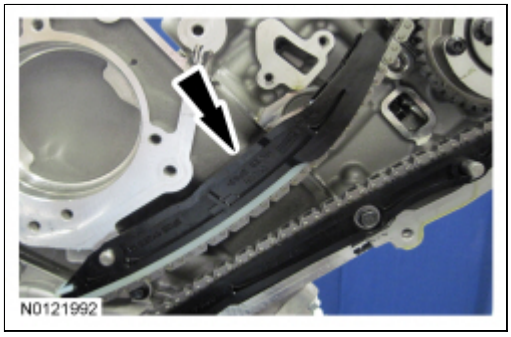


repair4less

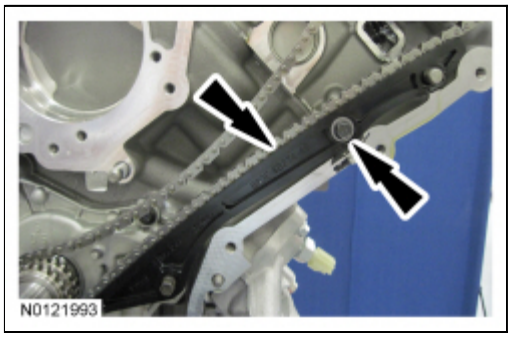


7. Remove the RH primary timing chain.

8. Using the crankshaft holding tool, rotate the crankshaft counterclockwise until the crankshaft keyway is at the 9 o'clock position.

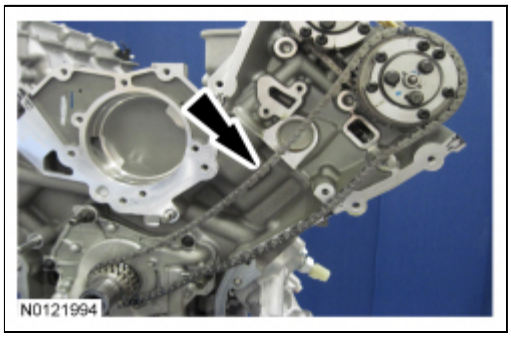


9. Remove the 2 bolts and the LH primary timing chain tensioner.



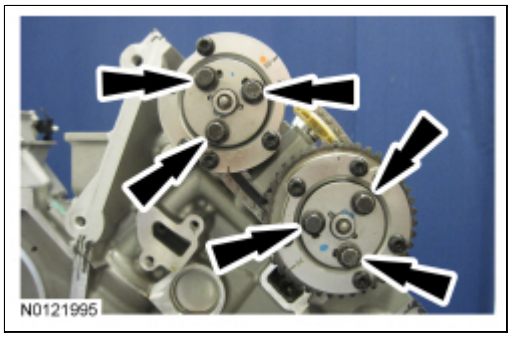
10. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain tensioner arm.

Remove the LH timing chain tensioner arm.

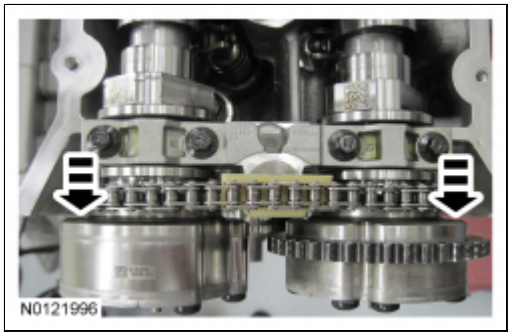


11. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain guide.

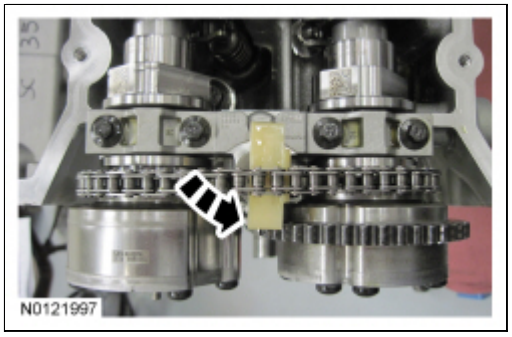
    Remove the bolt and the LH timing chain guide.



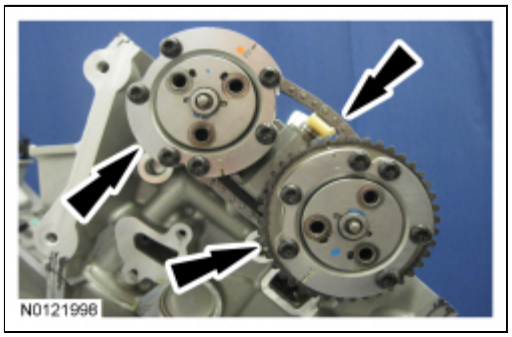
12. Remove the LH primary timing chain.



13. Remove the 3 LH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 LH exhaust VCT assembly bolts.

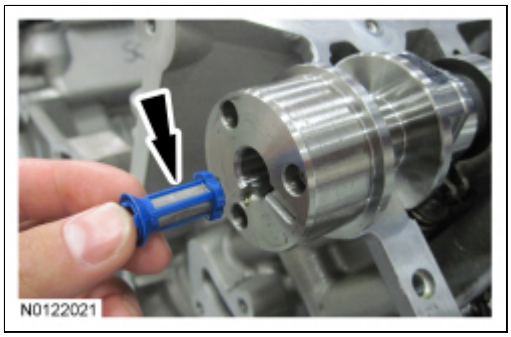


repair4less

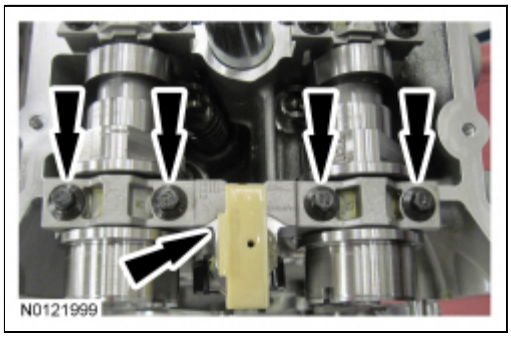


14. Slide the LH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

15. Depress the LH secondary timing chain tensioner and turn the tensioner 90 degrees.



16. Remove the LH VCT assemblies and the LH secondary timing chain.

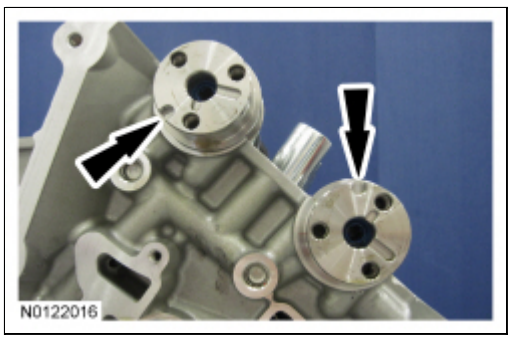


17. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Remove the VCT system oil filter from the intake and exhaust camshafts.

18. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the LH front camshaft bearing mega cap.



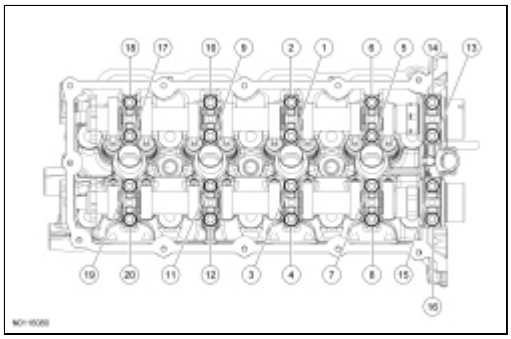
19. Remove the 16 bolts and the 8 camshaft bearing caps.

20. Remove the LH intake and exhaust camshafts.

Installation

1. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

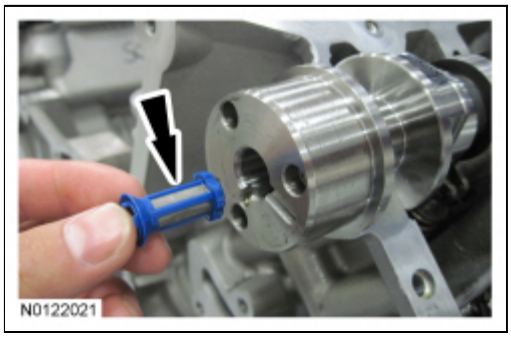
   Install the LH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.



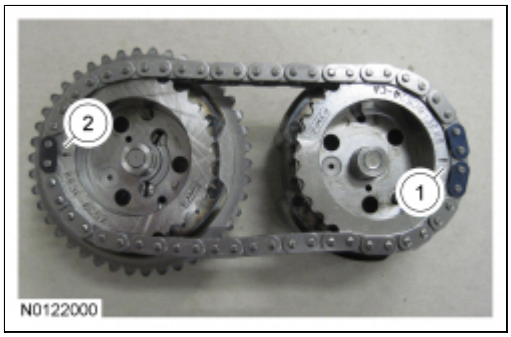
2. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.

3. Install the LH front camshaft bearing mega cap and the 4 bolts. Do not tighten the bolts at this time

repair4less



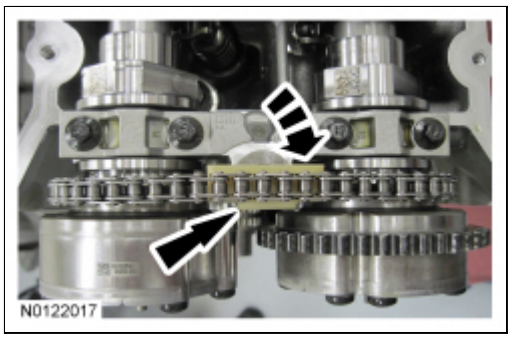
4. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



5. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

   Install the VCT system oil filter in the intake and exhaust camshafts.

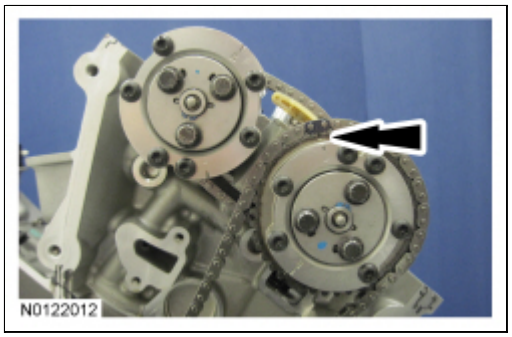
6. Install the secondary timing chain onto the LH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.



7. Install the LH VCT assemblies and the secondary timing chain onto the LH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 11 o'clock position.

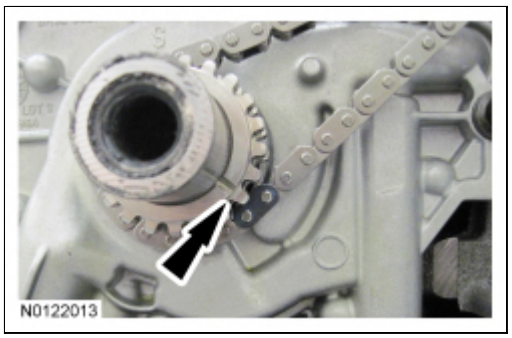
8. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

   Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
   - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.



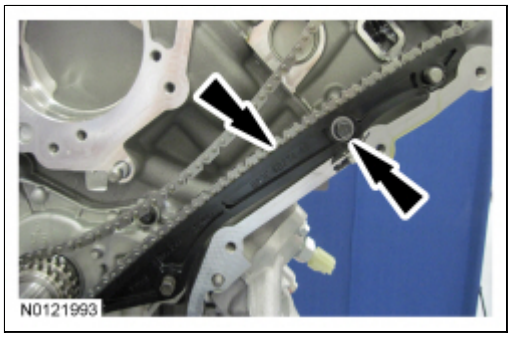
9. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

   Install the 3 LH intake VCT assembly bolts and the 3 LH exhaust VCT assembly bolts.
   - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

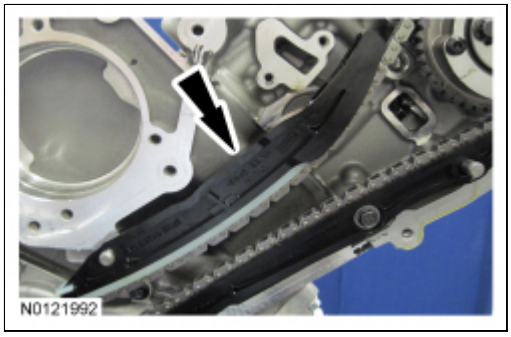


repair4less

10. Install the LH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the LH VCT assembly.



11. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



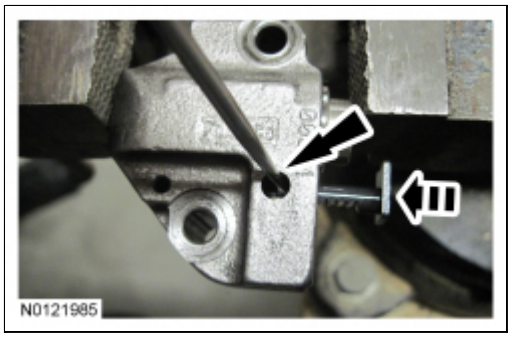
12. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain guide.

    Install the LH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

13. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain tensioner arm.

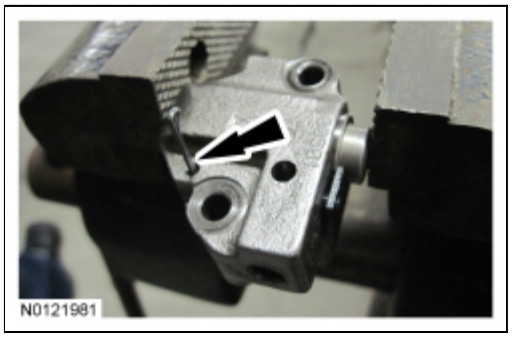
    Install the LH timing chain tensioner arm.

NOTE: Complete the following 3 steps on both the LH and RH primary timing chain tensioners.

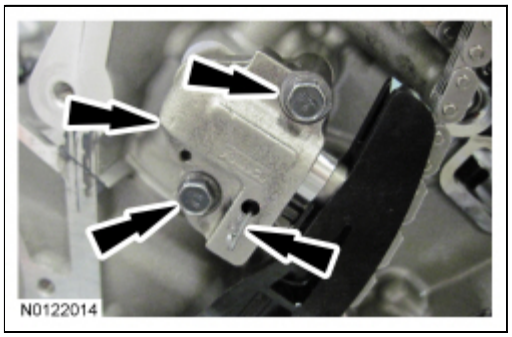


14. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

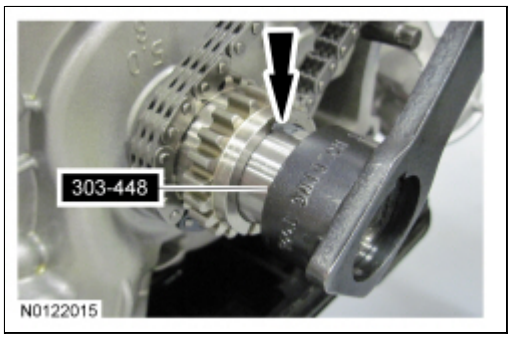
    Compress the primary timing chain tensioner plunger, using an edge of a vise.



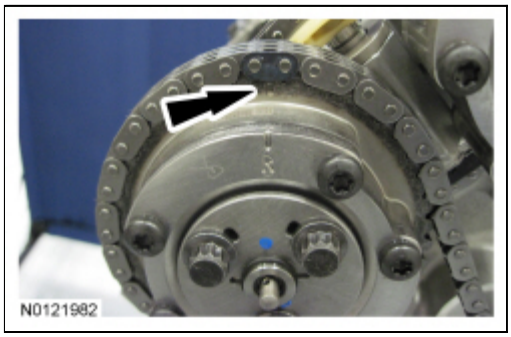
15. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.



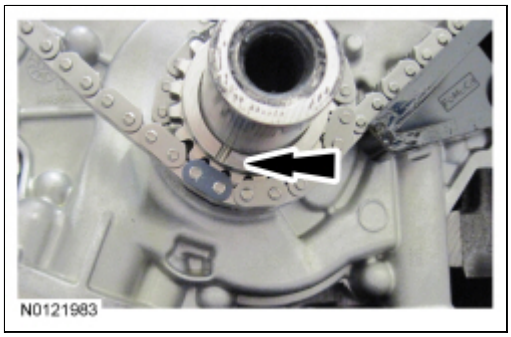
repair4less



16. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.

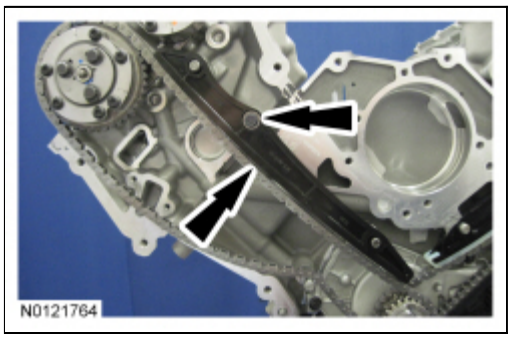


17. Install the LH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.



18. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.

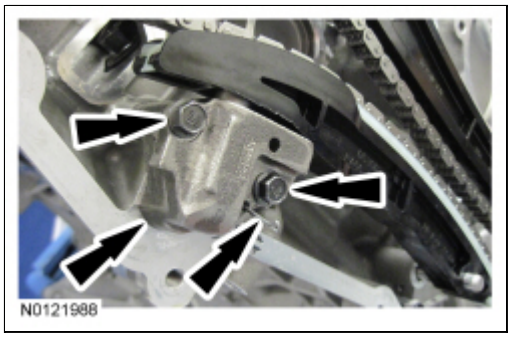
19. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.



20. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

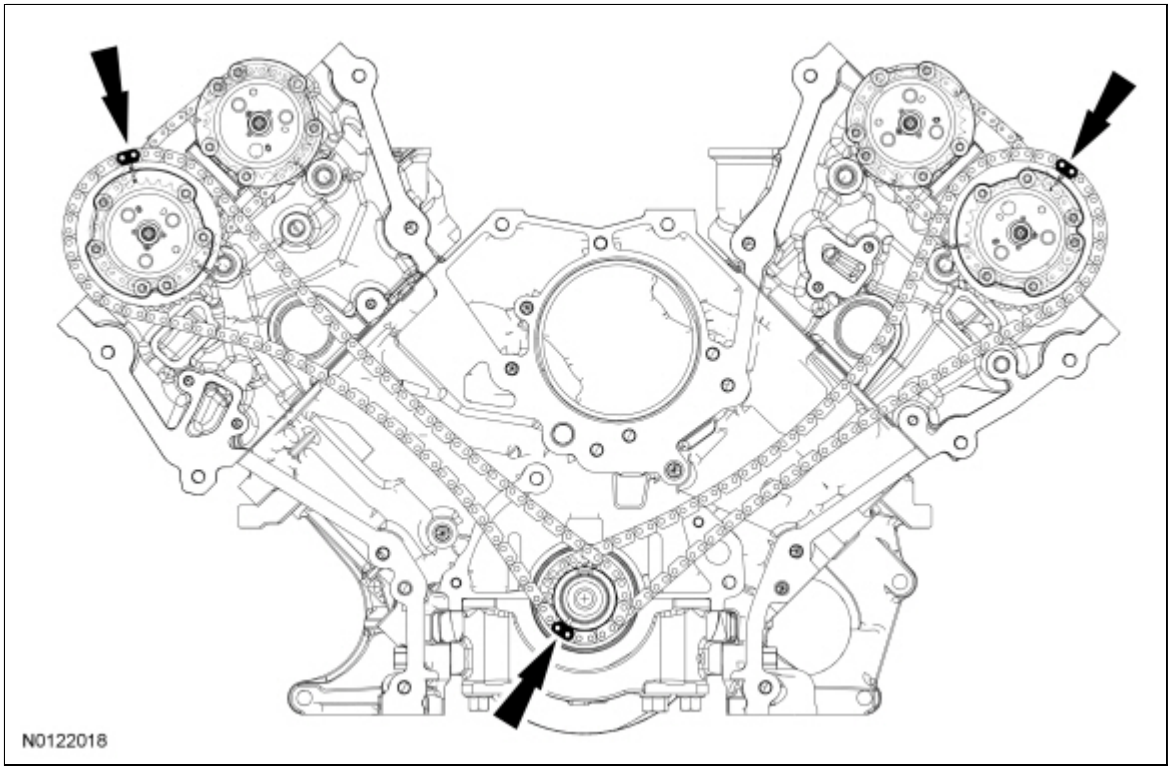
21. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).



22. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

    Install the RH timing chain tensioner arm.



repair4less

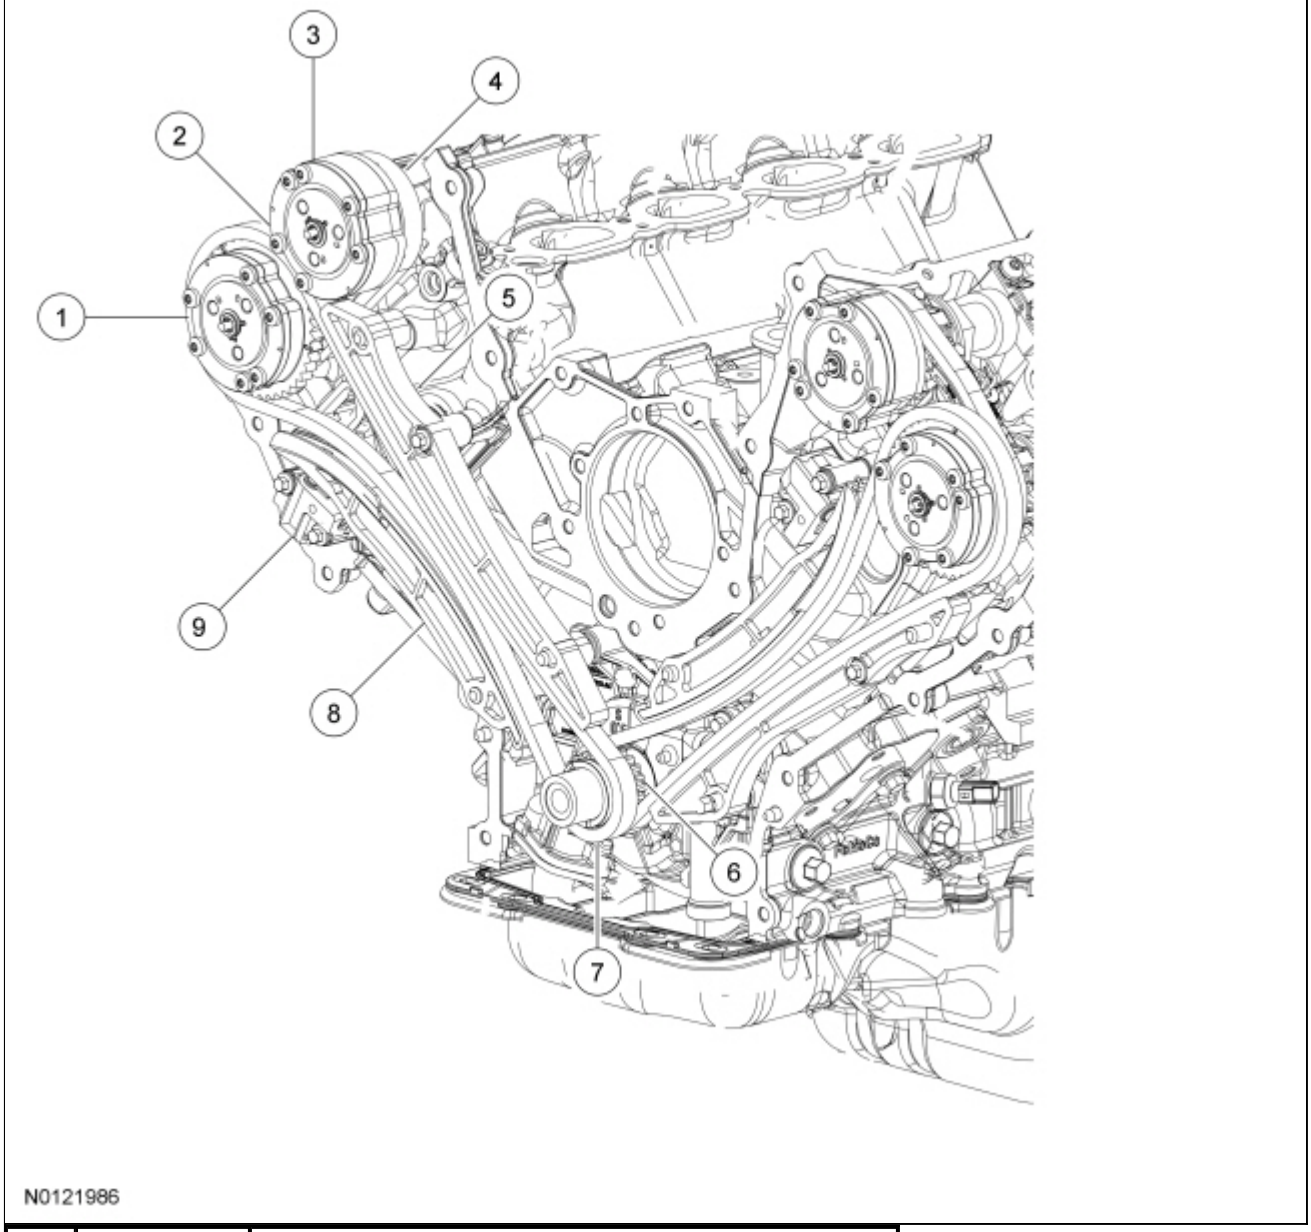
23. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

24. With the crankshaft keyway still at the 12 o'clock position, verify the timing mark alignment is correct.

25. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

repair4less

Camshaft — RH



Special Tool(s)

 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

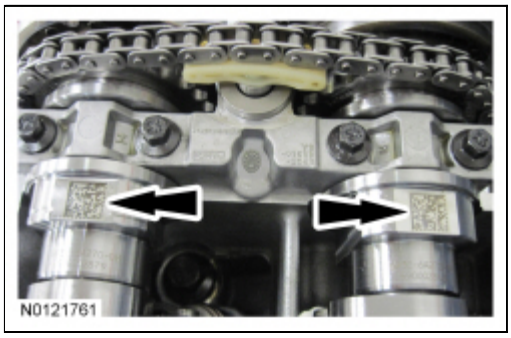
3	—	Front camshaft bearing mega cap (part of 6049)
4	N806183	Front camshaft bearing mega cap bolt (4 required)
5	N806183	Intake/exhaust camshaft bearing cap bolt (16 required)
6	—	Exhaust camshaft bearing cap (part of 6049) (4

		required)
7	6250	RH exhaust camshaft

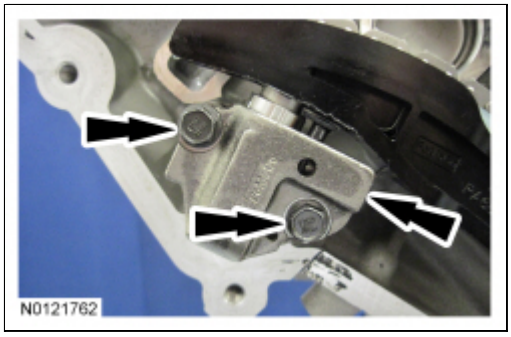
Removal



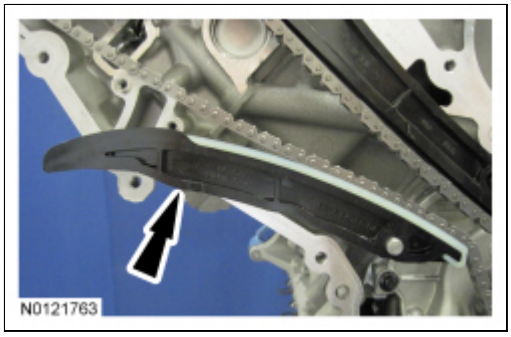
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original location. Mark the components for installation into their original location.

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.

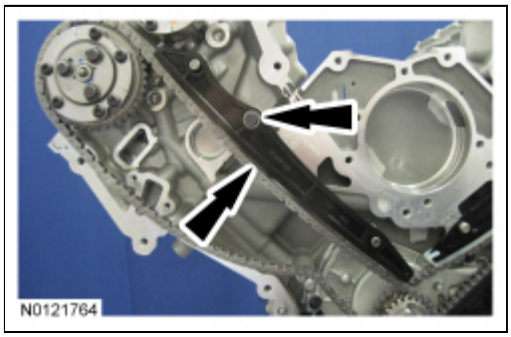


3. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.



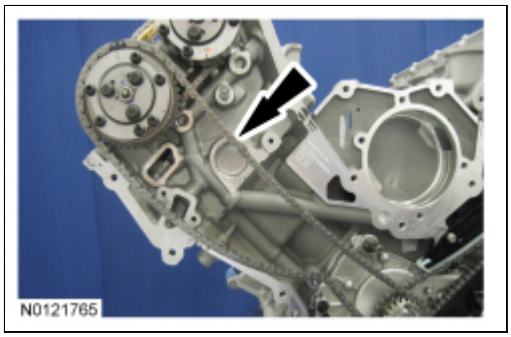
4. Remove the 2 bolts and the RH primary timing chain tensioner.

repair4less



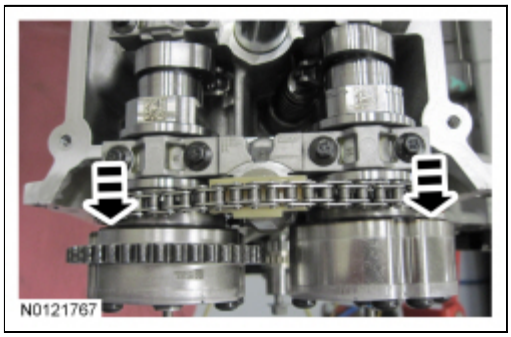
5. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

   Remove the RH timing chain tensioner arm.

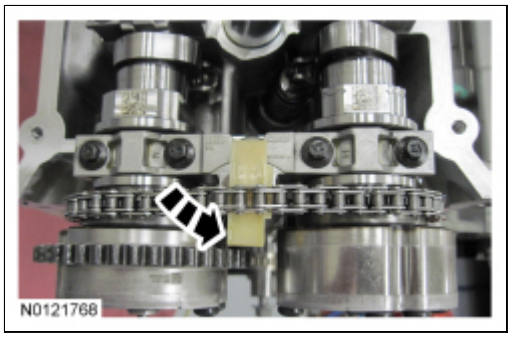


6. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

   Remove the bolt and the RH timing chain guide.

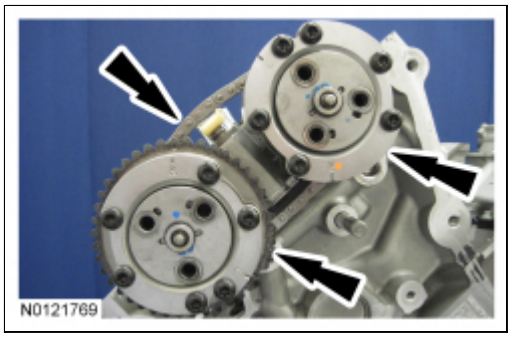


7. Remove the RH primary timing chain.

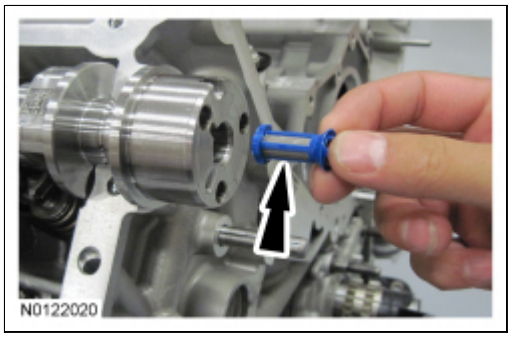


8. Remove the 3 RH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 RH exhaust VCT assembly bolts.

9. Slide the RH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

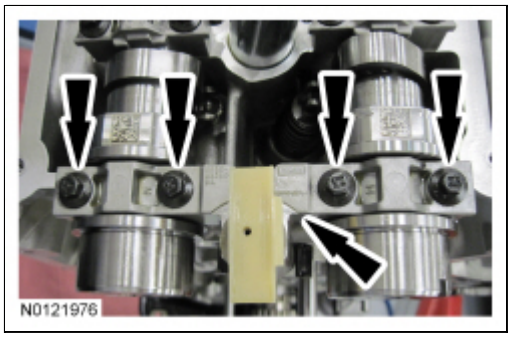


10. Depress the RH secondary timing chain tensioner and turn the tensioner 90 degrees.



11. Remove the RH VCT assemblies and the RH secondary timing chain.

repair4less

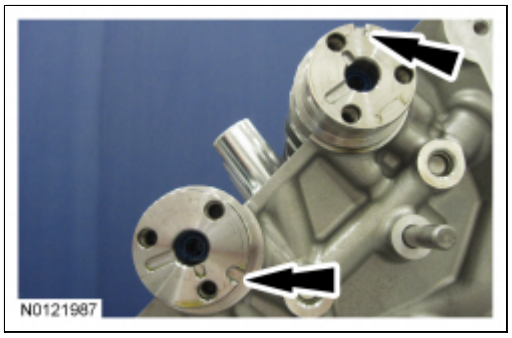


12. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Remove the VCT system oil filter from the intake and exhaust camshafts.

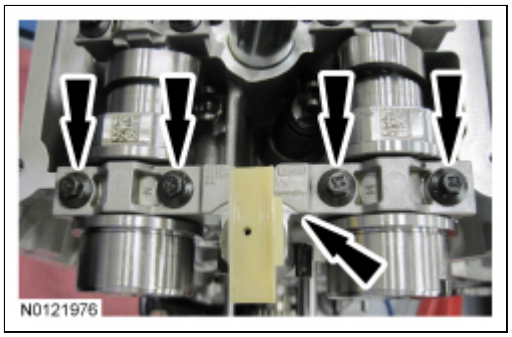
13. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the RH front camshaft bearing mega cap.



14. Remove the 16 bolts and the 8 camshaft bearing caps.

15. Remove the RH intake and exhaust camshafts.

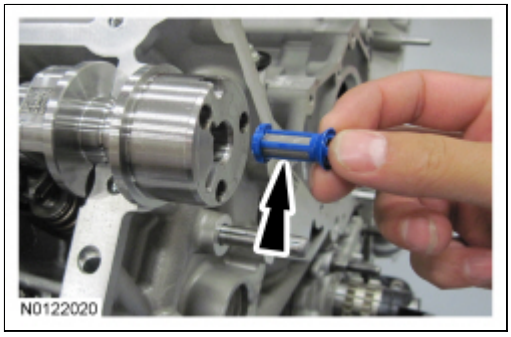


Installation

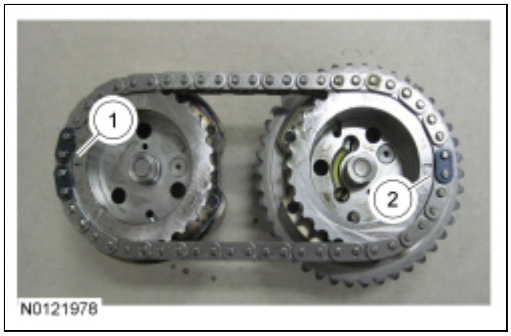
1. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

   Install the RH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.

2. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.
3. Install the RH front camshaft bearing mega cap and the 4 bolts. Do not tighten at this time

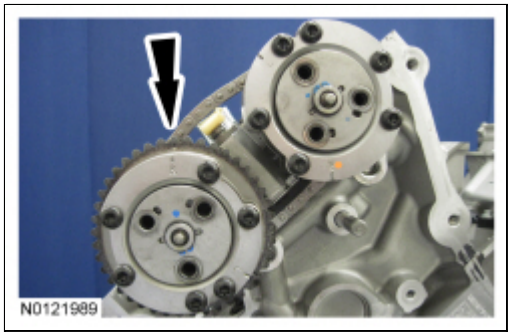


4. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



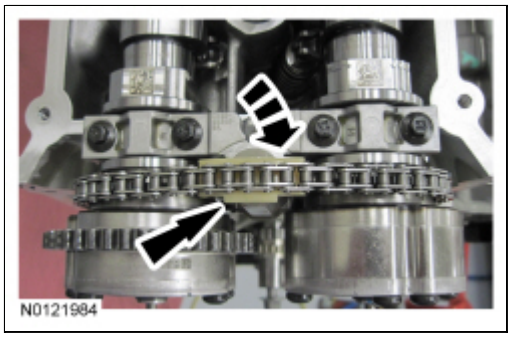
5. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Install the VCT system oil filter in the intake and exhaust camshafts.

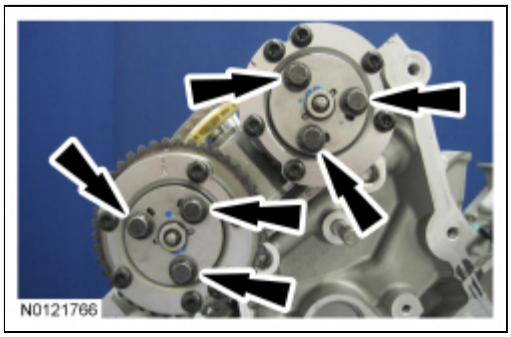


repair4less

6. Install the secondary timing chain onto the RH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

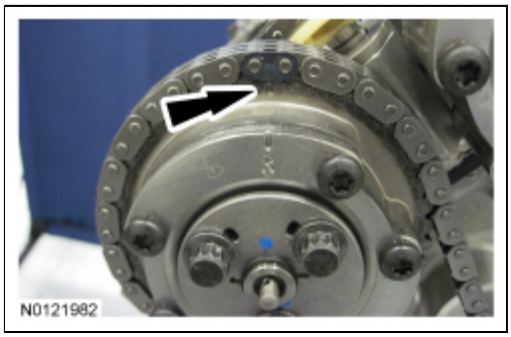


7. Install the RH VCT assemblies and the secondary timing chain onto the RH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 1 o'clock position.



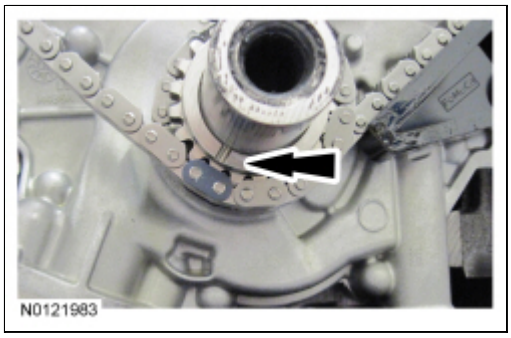
8. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.

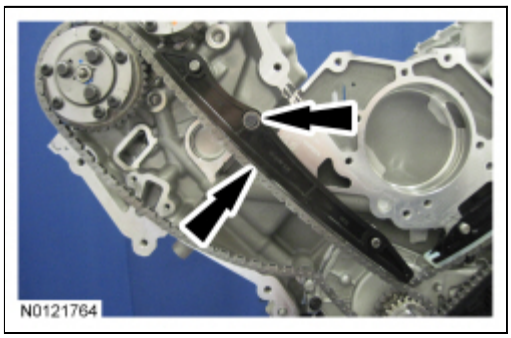


9. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

   Install the 3 RH intake VCT assembly bolts and the 3 RH exhaust VCT assembly bolts.
   - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

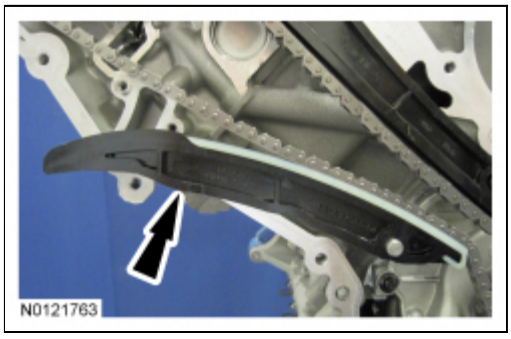


10. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.



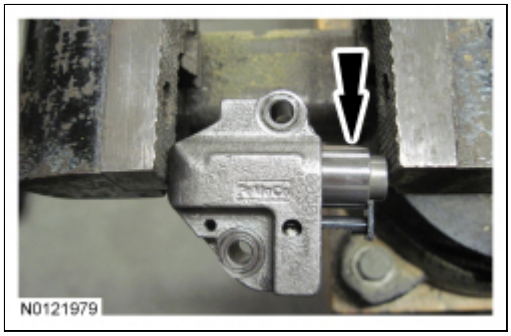
11. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

repair4less



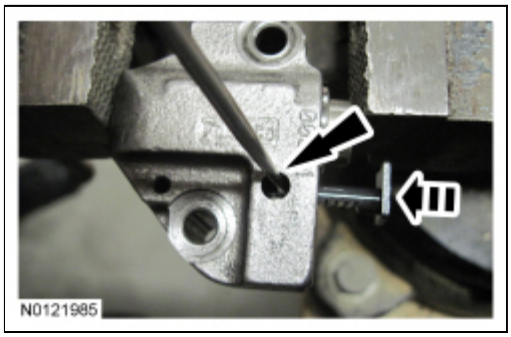
12. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).



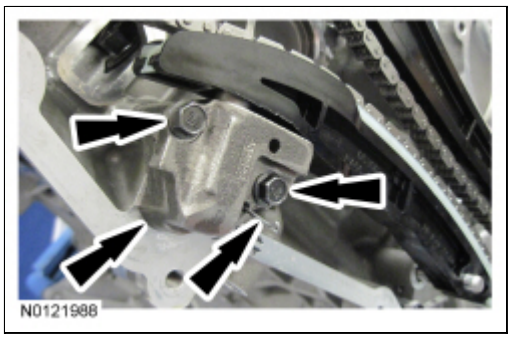
13. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

    Install the RH timing chain tensioner arm.



14. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

    Compress the primary timing chain tensioner plunger, using an edge of a vise.



15. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.

16. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.

17. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

repair4less

18. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Camshaft Roller Follower

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

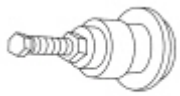
Removal and Installation

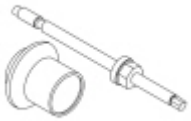
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

1. Remove the camshaft for the camshaft roller follower being serviced. For additional information, refer to Camshaft — RH and/or Camshaft — LH in this section.

2. Remove the camshaft roller follower and hydraulic lash adjuster as an assembly.





3. Separate the hydraulic lash adjuster from the spring clip on the camshaft roller follower.

4. To install, reverse the removal procedure.
   - Lubricate the camshaft roller follower and hydraulic lash adjuster assembly with clean engine oil prior to installation.

repair4less

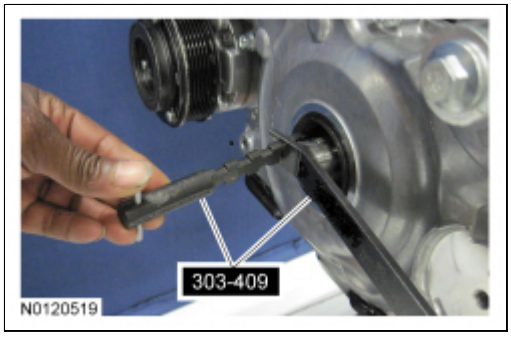
Crankshaft Front Seal

Special Tool(s)

 ST132B-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A2 plate only)
 ST3249-A	Installer, Front Crank Seal and Damper 303-1531
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

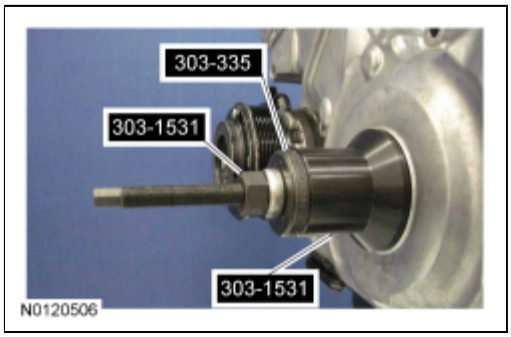


Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
3. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

   Using the Oil Seal Remover, remove the crankshaft front oil seal.



repair4less

Installation

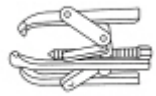
1. **NOTE:** Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

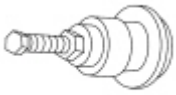
   Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft front oil seal.

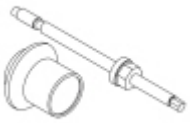
2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

repair4less

Crankshaft Pulley and Crankshaft Front Seal — Exploded View







Item	Part Number	Description
1	6A340	Crankshaft pulley bolt
2	N807033	Crankshaft pulley washer
3	6316	Crankshaft pulley
4	6700	Crankshaft front seal

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

repair4less

Crankshaft Pulley

Special Tool(s)

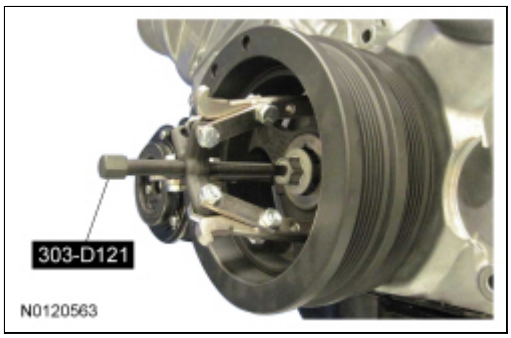
 ST1184-A	3 Jaw Puller 303-D121 or equivalent
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A2 plate only)
 ST3249-A	Installer, Front Crank Seal and Damper 303-1531
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Motorcraft® Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive and A/C compressor belts. For additional information, refer to Section 303-05 .

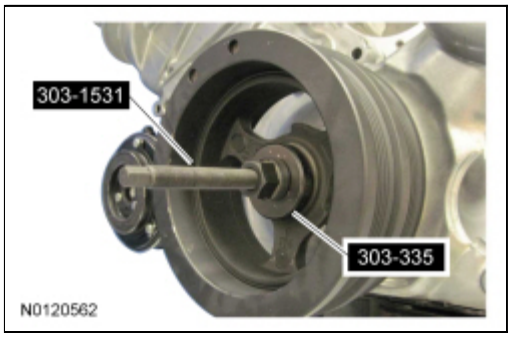
3. Remove the crankshaft pulley bolt and washer.

4. Using the 3 Jaw Puller and the crankshaft pulley bolt, remove the crankshaft pulley.
   - Discard the crankshaft pulley bolt.

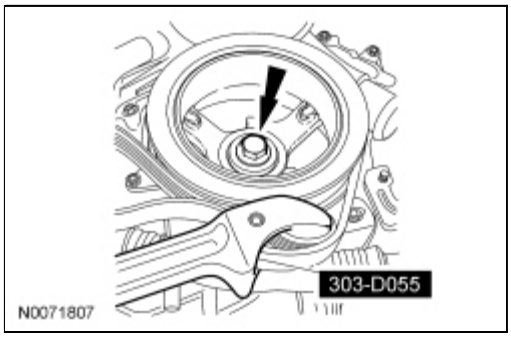
Installation

1. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply silicone sealer to the Woodruff key slot in the crankshaft pulley.



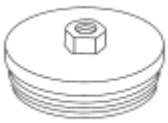
repair4less



2. Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.

3. Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft pulley.

4. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 4 stages:
   - Stage 1: Tighten to 140 Nm (103 lb-ft).
   - Stage 2: Loosen 360 degrees.
   - Stage 3: Tighten to 100 Nm (74 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.



5. Install the accessory drive and A/C compressor belts. For additional information, refer to Section 303-05 .

6. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

repair4less

Crankshaft Rear Seal with Retainer Plate

Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2980-A	Installer, Rear Main Seal 303-1250
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

1. Remove the flexplate. For additional information, refer to Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View and Flexplate .

2. Remove the engine separator plate.

3. **NOTE:** Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be discarded.

   Remove the crankshaft sensor ring.

4. Remove the oil pan. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pan in this section.

5. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

6. Remove the bolt and the CKP sensor.

7. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear seal.

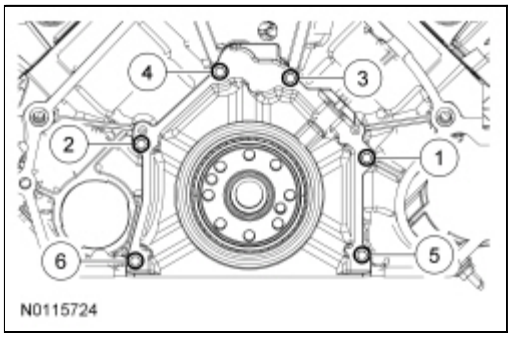
8. Remove the 6 bolts and the crankshaft rear seal retainer plate.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

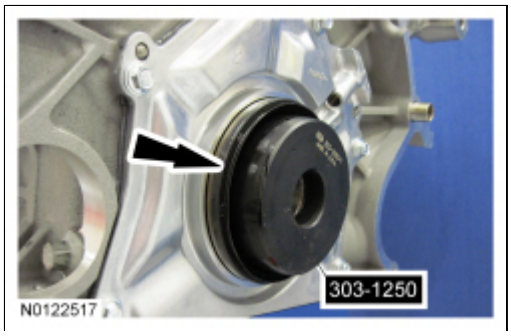
   Clean and inspect the mating surface.



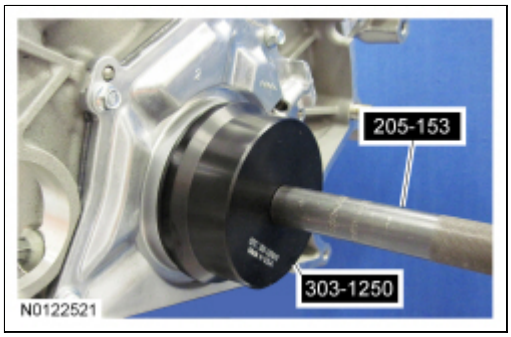
2. **NOTE:** If the rear crankshaft seal retaining plate is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure may cause future oil leaks.

   Apply a 3.75 mm (0.147 in) bead of silicone sealant to the rear crankshaft seal retainer mating surface on the engine block.

repair4less

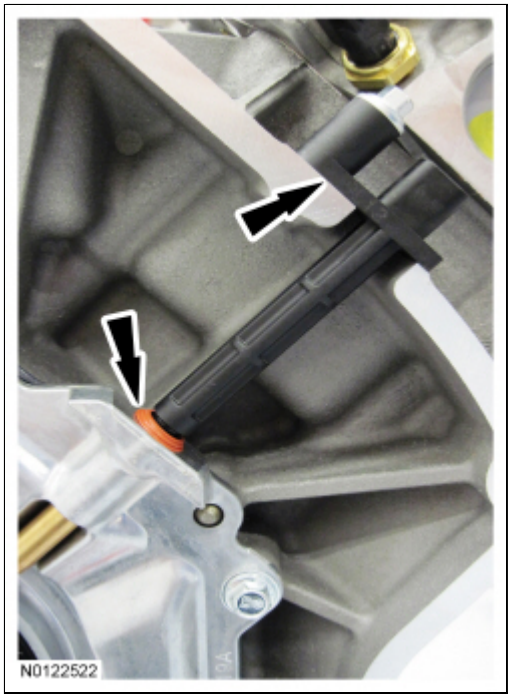


3. Install the crankshaft rear seal retainer plate and the 6 bolts, tighten in the sequence shown in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



4. **NOTE:** Lubricate the seal lips and bore with clean engine oil prior to installation.

    Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.



5. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

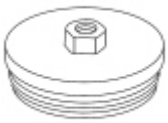
6. ***NOTICE:*** **The Crankshaft Position (CKP) sensor must be positioned into the fitting on the crankshaft rear seal retainer plate and be flush against the boss on the engine block before the bolt is installed. If the CKP sensor is installed incorrectly, the CKP sensor can be damaged.**

   Position the CKP sensor and install the bolt.
   - Tighten to 10 Nm (89 lb-in).

7. Connect the CKP sensor electrical connector.

8. Install the oil pan. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pan in this section.

9. Install the crankshaft sensor ring.



10. Install the engine separator plate.

11. Install the flexplate. For additional information, refer to Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View and Flexplate .

repair4less

Crankshaft Rear Seal

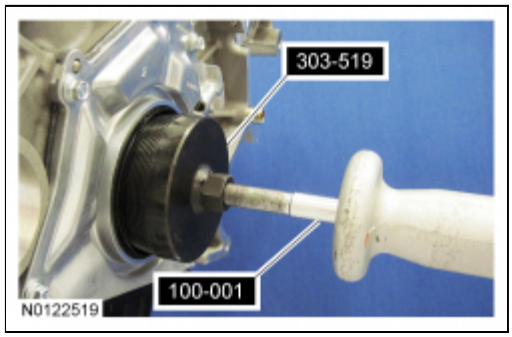
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the flexplate. For additional information, refer to Flexplate or Flywheel and Crankshaft Rear

repair4less

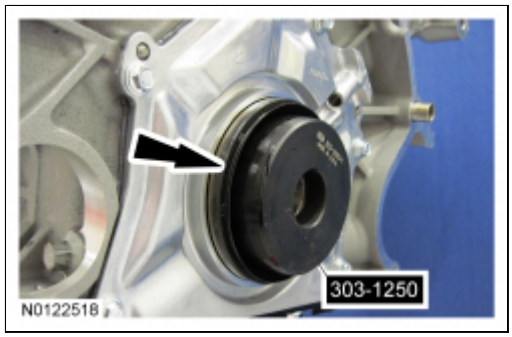


Seal — Exploded View and Flexplate in this section.

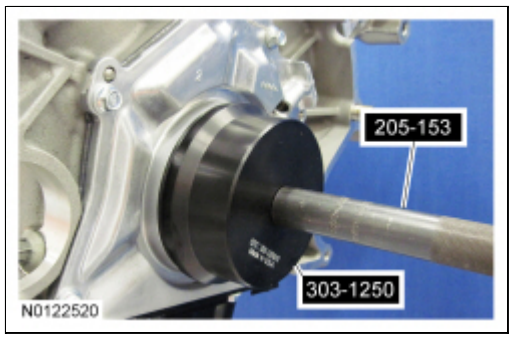
3. Remove the engine separator plate.

4. **NOTE:** Inspect the crankshaft sensor ring for damage. If the crankshaft sensor ring has been dropped or has any visual damage, it must be discarded.

   Remove the crankshaft sensor ring.



5. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear seal.
   - Clean all sealing surfaces with metal surface prep.

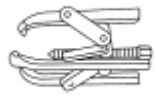


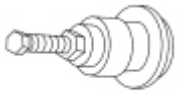
Installation

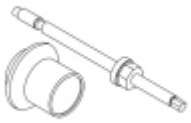
1. **NOTE:** Lubricate the seal lips and bore with clean engine oil prior to installation.

   Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

2. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.







3. Install the crankshaft sensor ring.
4. Install the engine separator plate.
5. Install the flexplate. For additional information, refer to Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View and Flexplate in this section.

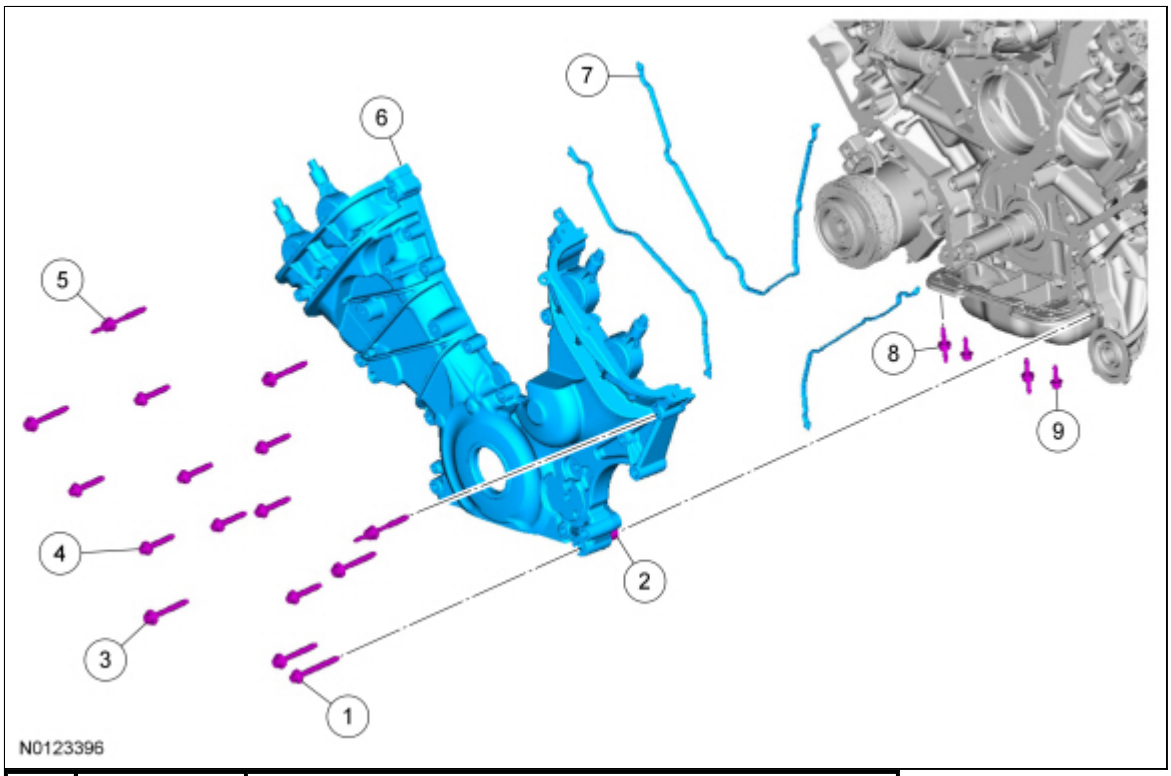
Engine Front Cover



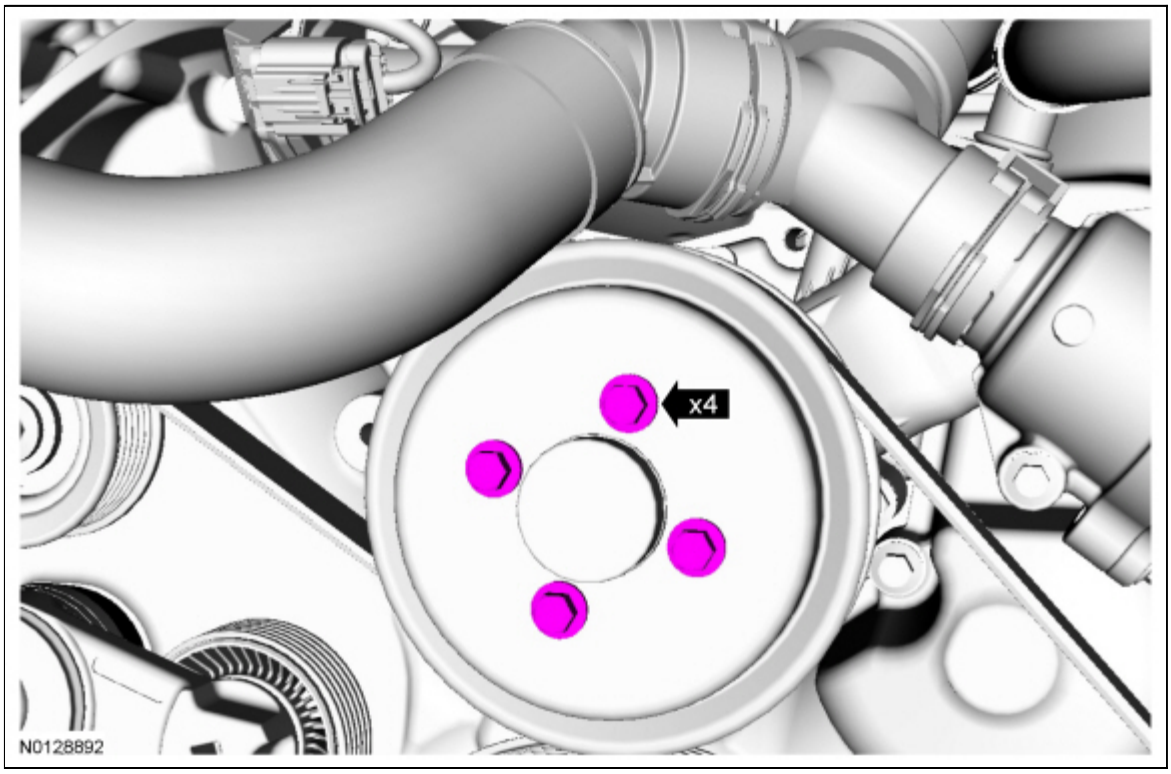
Special Tool(s)

 ST1184-A	3 Jaw Puller 303-D121 or equivalent
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A2 plate only)
 ST3249-A	Installer, Front Crank Seal and Damper 303-1531
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

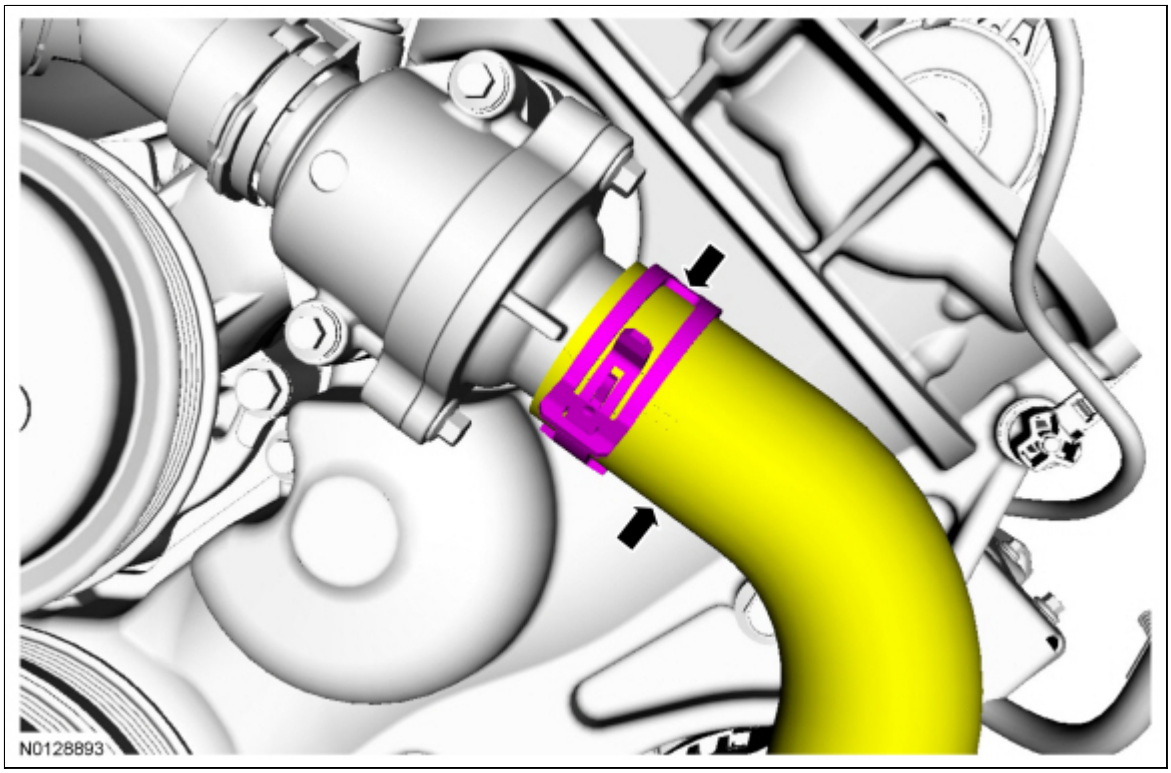
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	—
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



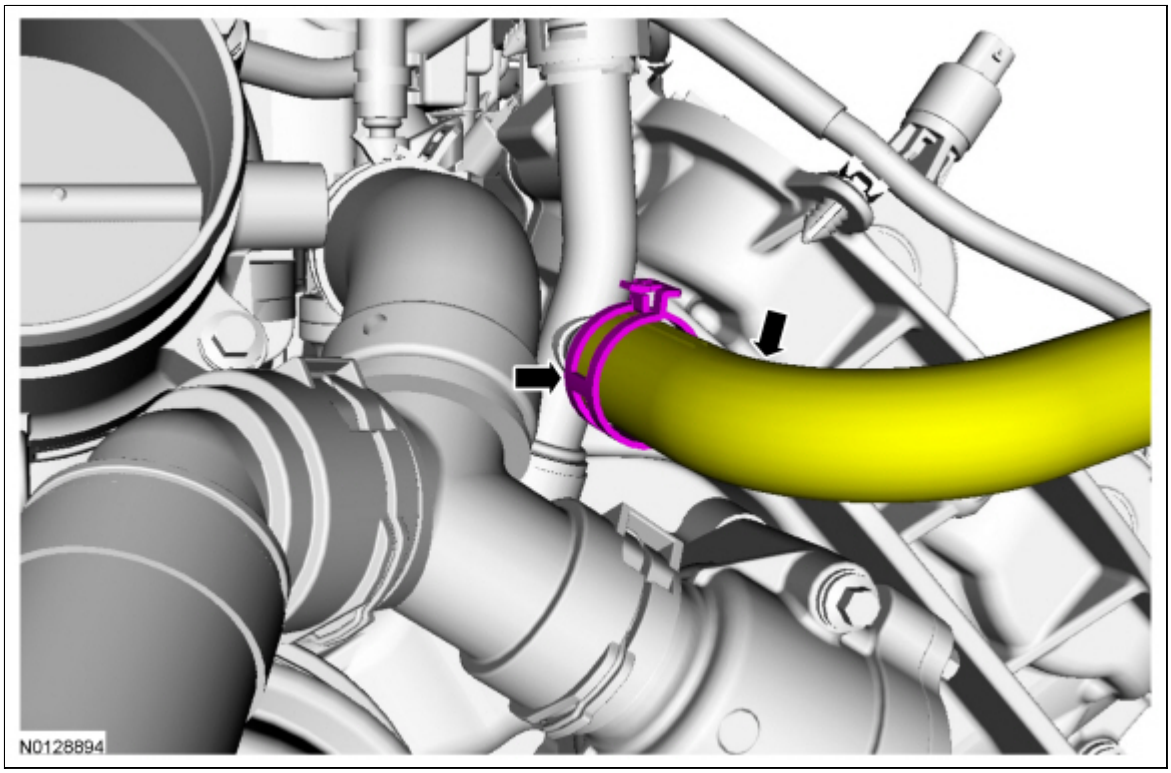
Item	Part Number	Description
1	W503304	Engine front cover-to-oil filter adapter bolt
2	W715209	Engine front cover-to-oil filter adapter jackscrew (part of 6019)
3	W704920	Engine front cover bolt (5 required)
4	W714925	Engine front cover bolt (8 required)
5	W704919	Engine front cover stud bolt (2 required)
6	6019	Engine front cover
7	6020	Engine front cover gasket (3 required)
8	W714963	Oil pan stud bolt (2 required)

repair4less



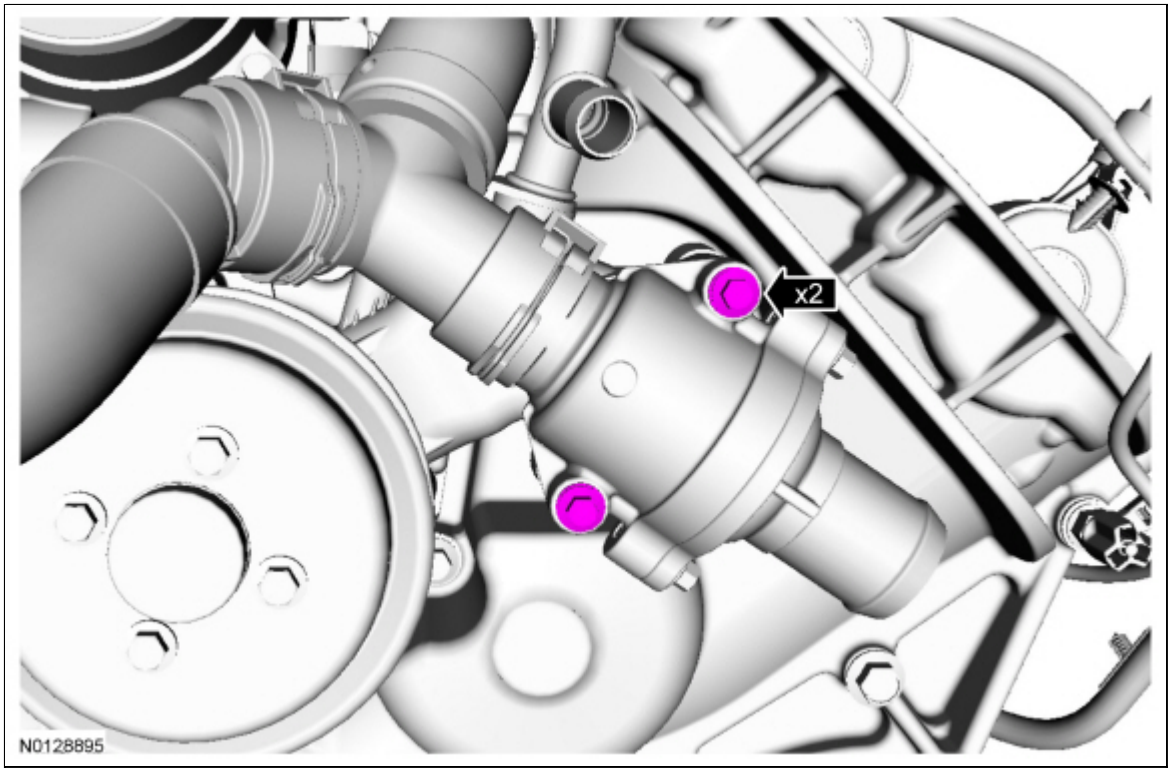
9	W714962	Oil pan bolt (2 required)

Removal

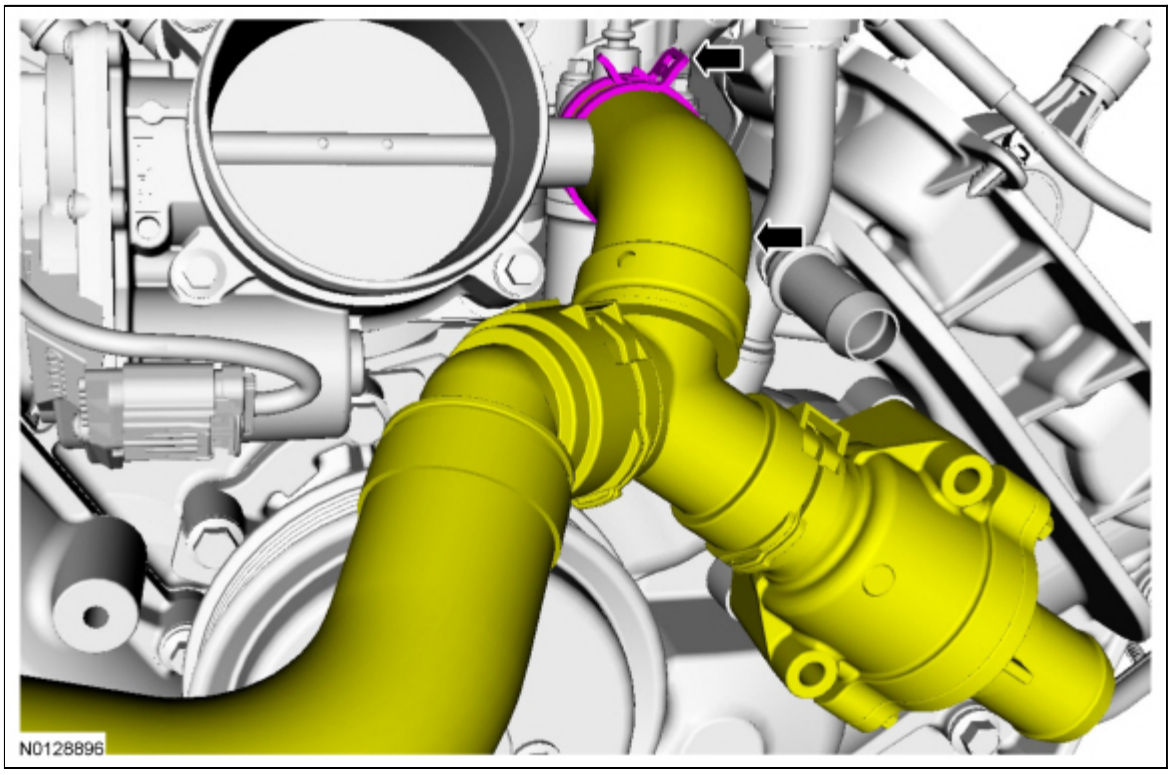


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Drain the engine cooling system. For additional information, refer to Section 303-03 .
4. Remove the RH and LH valve covers. For additional information, refer to Valve Cover — RH and Valve Cover — LH in this section.
5. Loosen the 4 coolant pump pulley bolts.

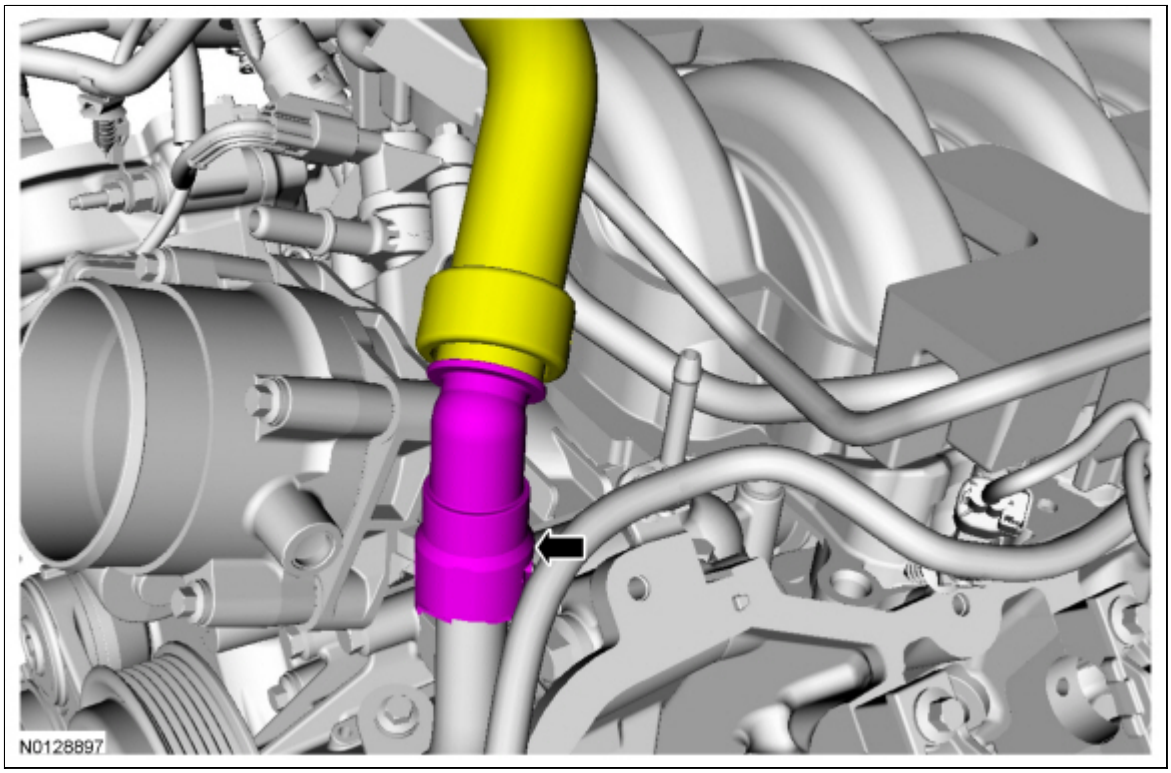
6. Remove the accessory drive and A/C compressor belts. For additional information, refer to Section 303-05 .
7. Release the clamp and disconnect the lower radiator hose from the thermostat housing assembly.



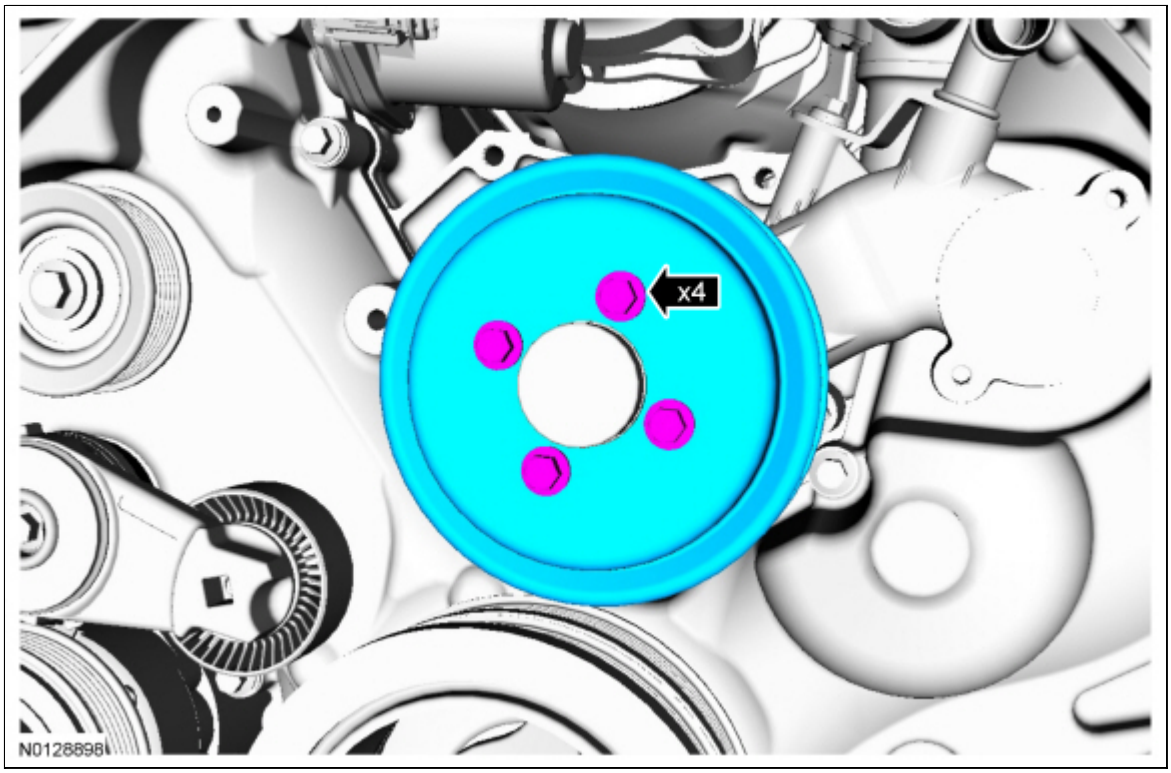
8. Release the clamp and disconnect the degas coolant hose.



9. Remove the 2 thermostat housing bolts.

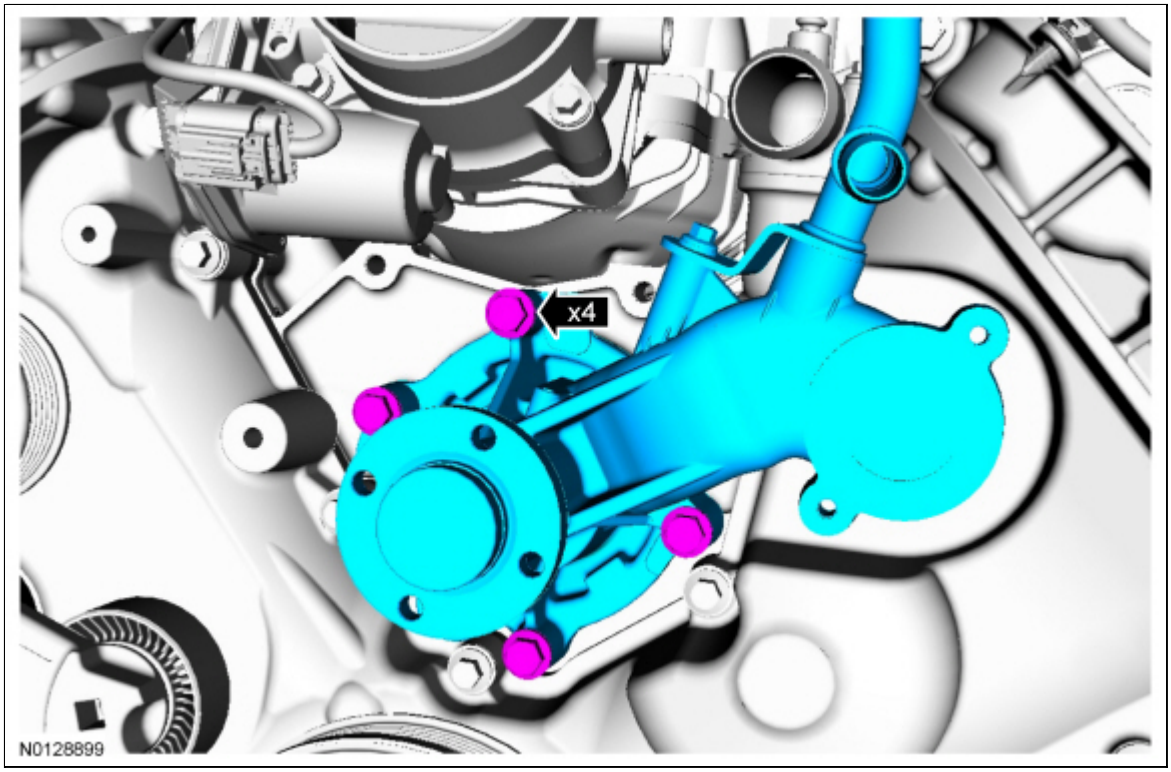


repair4less

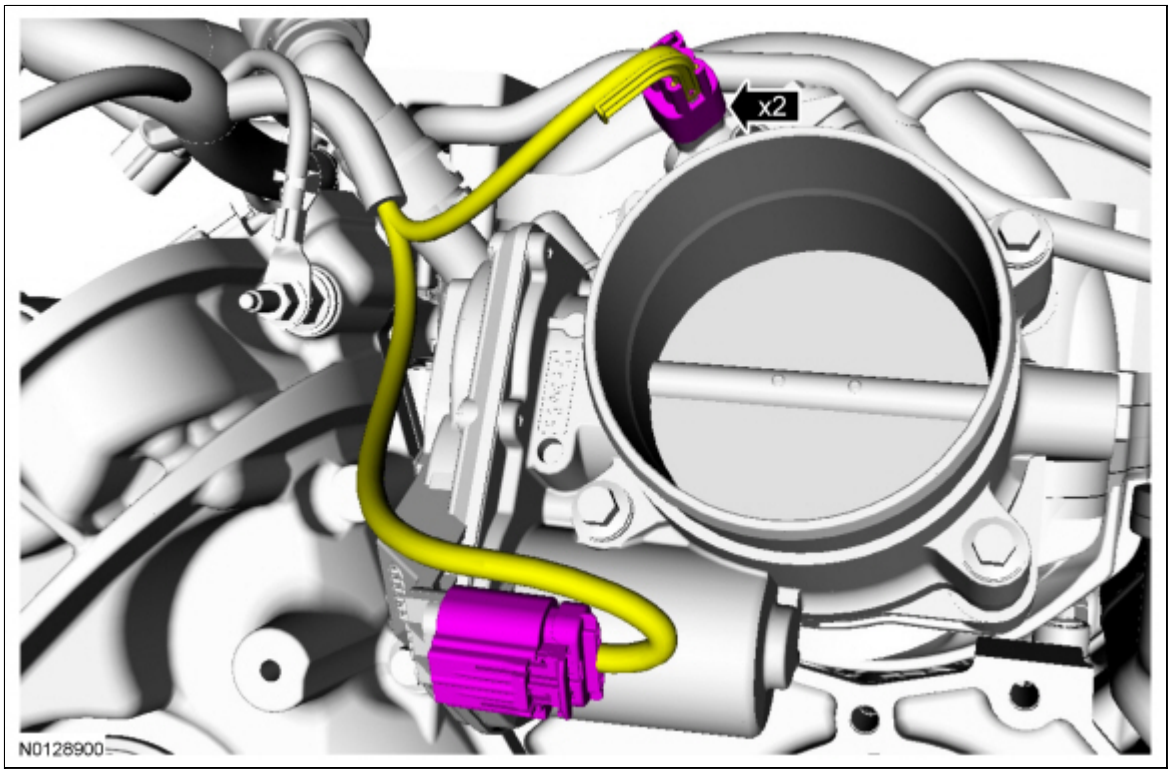


10. Release the clamp and position the upper radiator hose T-connector/thermostat housing assembly aside.
    - Remove and discard the thermostat housing O-ring seal.

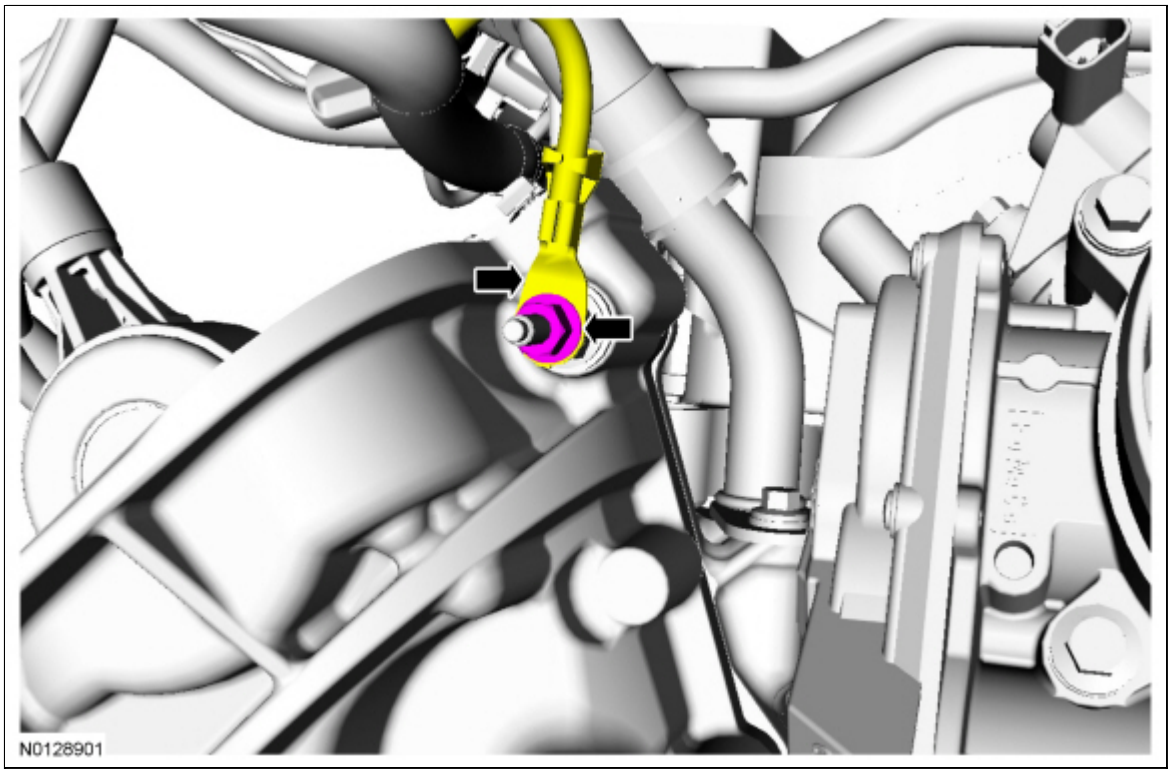
11. Disconnect the heater hose.



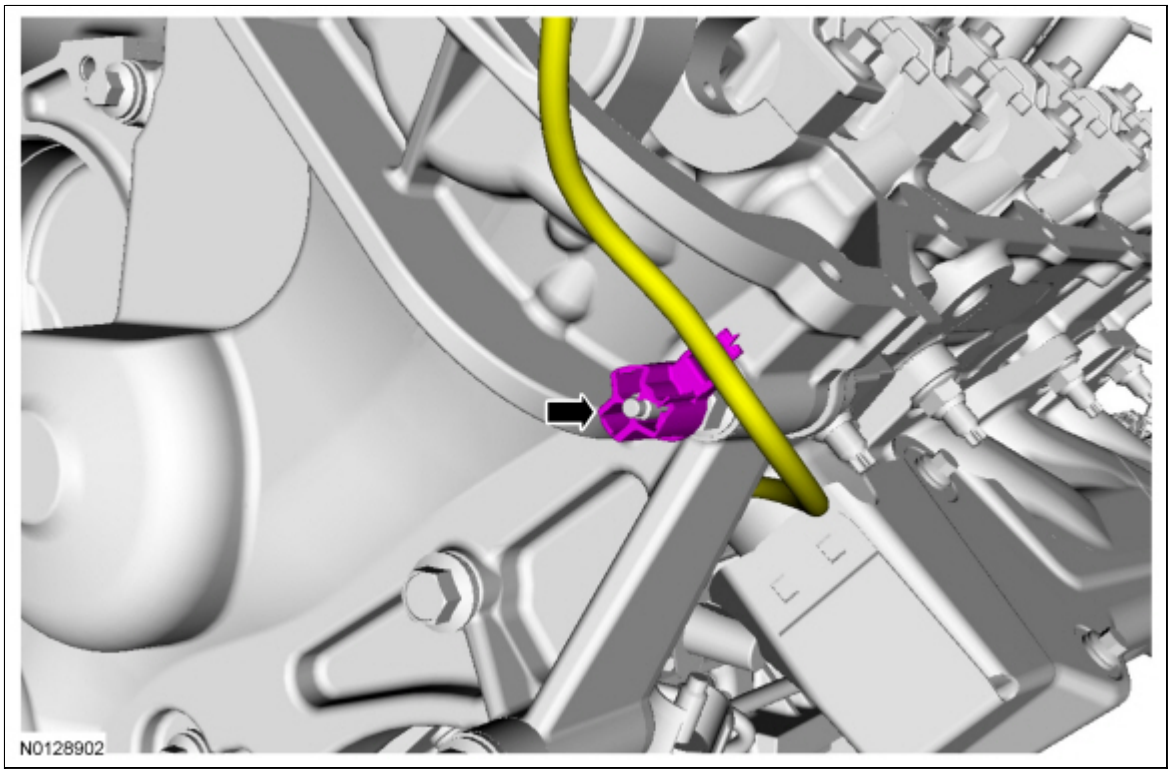
12. Remove the 4 bolts and the coolant pump pulley.



13. Remove the 4 bolts and the coolant pump.
    - Remove and discard the O-ring seal.

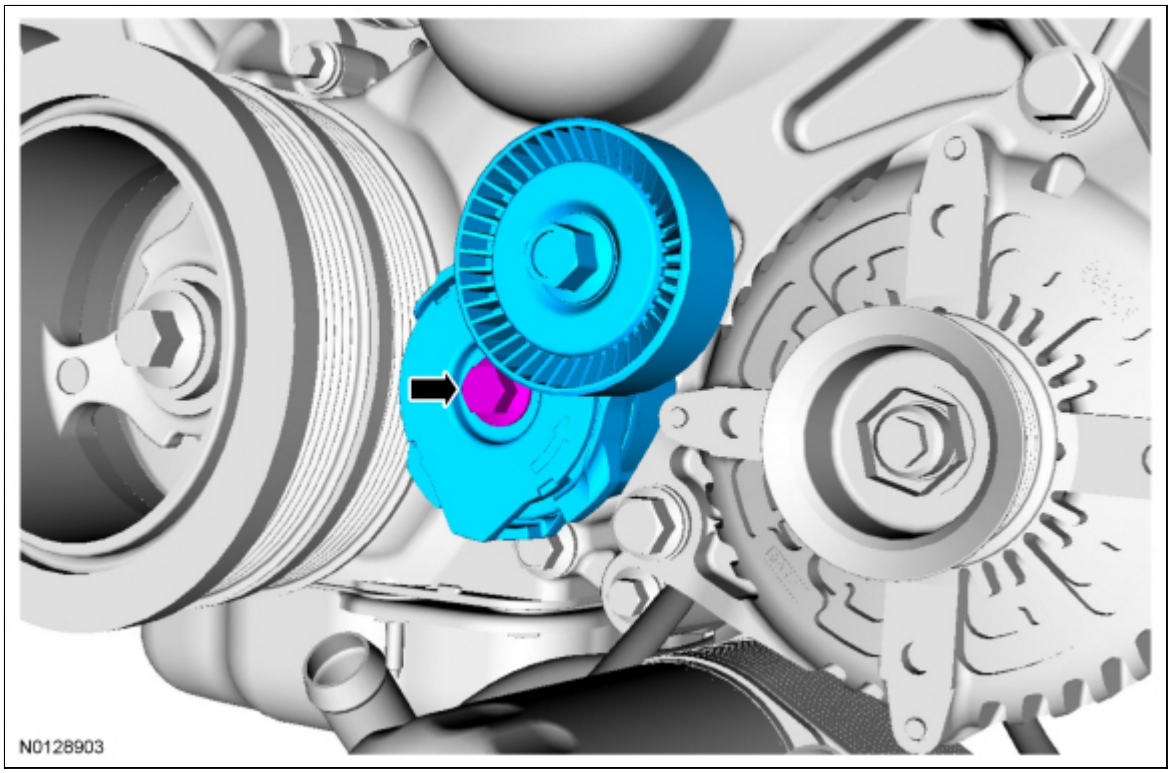


repair4less

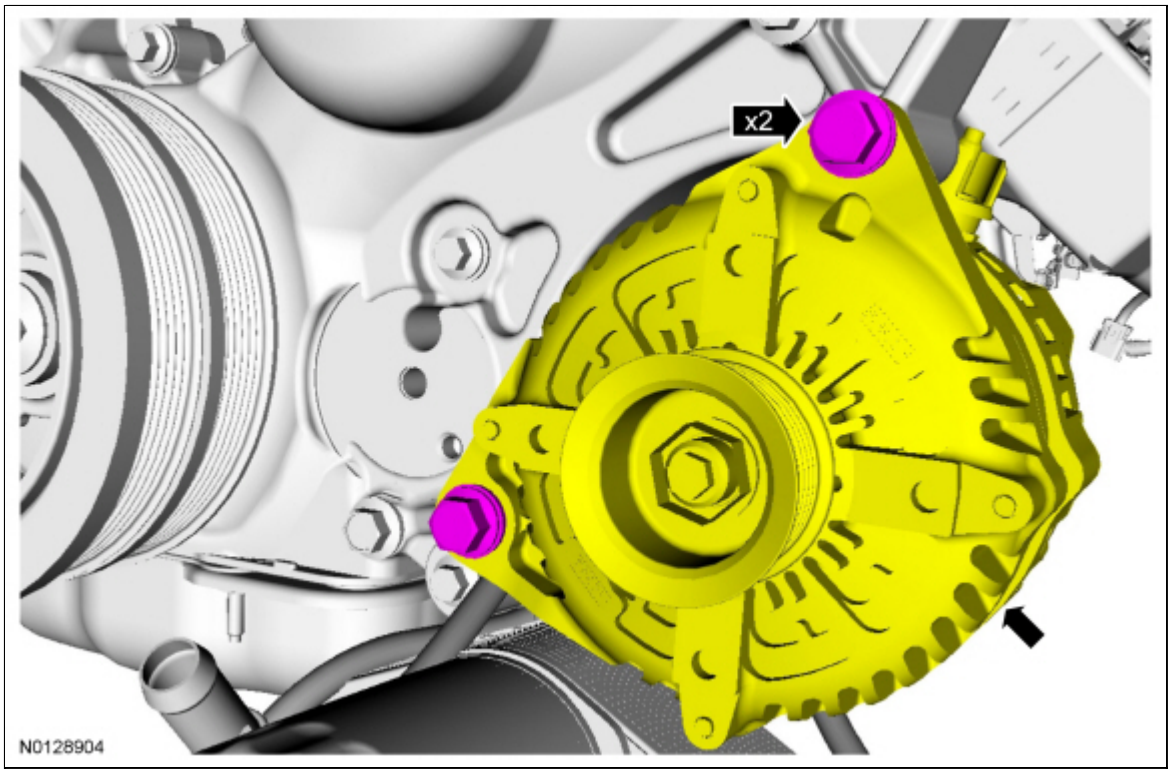


14. Disconnect the throttle body and Evaporative Emission (EVAP) purge valve electrical connectors.

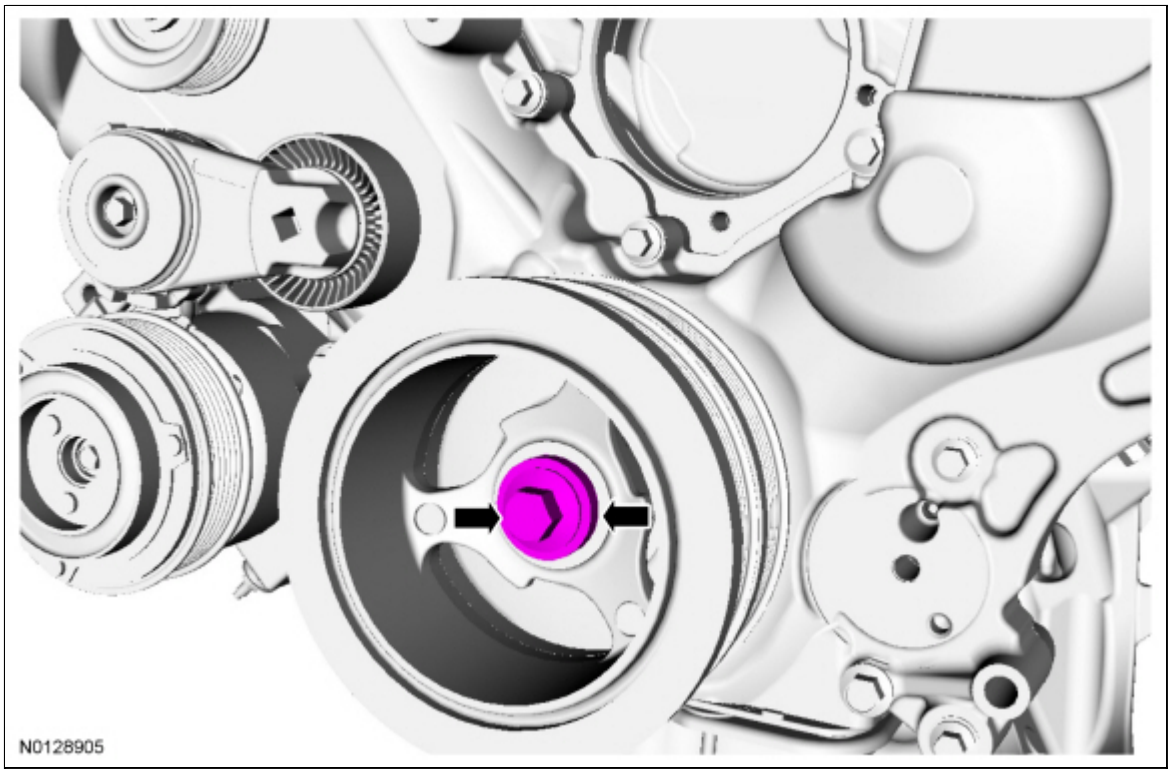
15. Remove the nut and the ground wire from the engine front cover stud bolt.



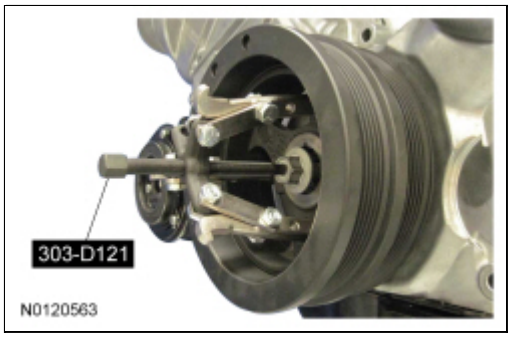
16. Detach the wiring harness retainer from the engine front cover stud bolt.



17. Remove the bolt and the accessory drive belt tensioner.

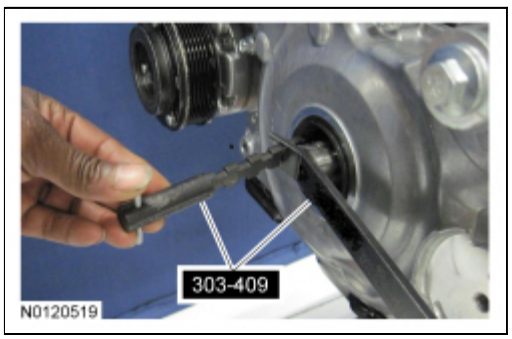


repair4less



18. Remove the 2 bolts and position the generator aside.

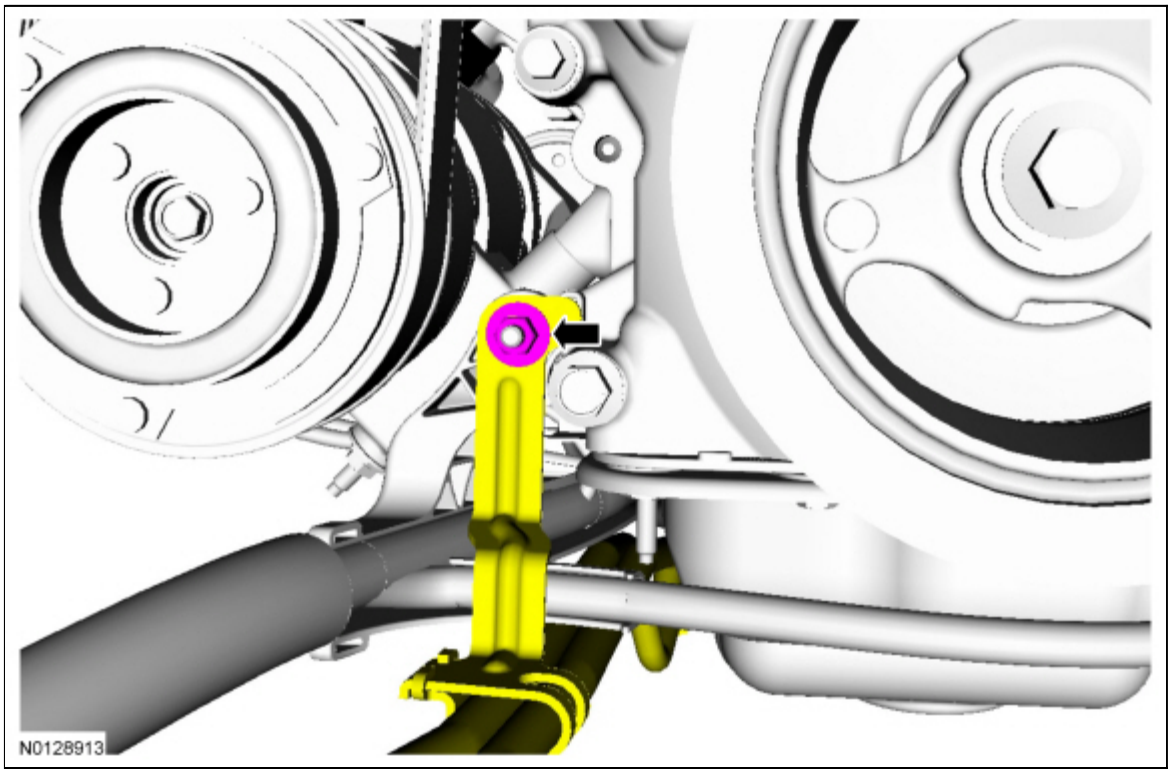
19. Remove the crankshaft pulley bolt and washer.



20. Using the 3 Jaw Puller and the crankshaft pulley bolt, remove the crankshaft pulley.
    - Discard the crankshaft pulley bolt.

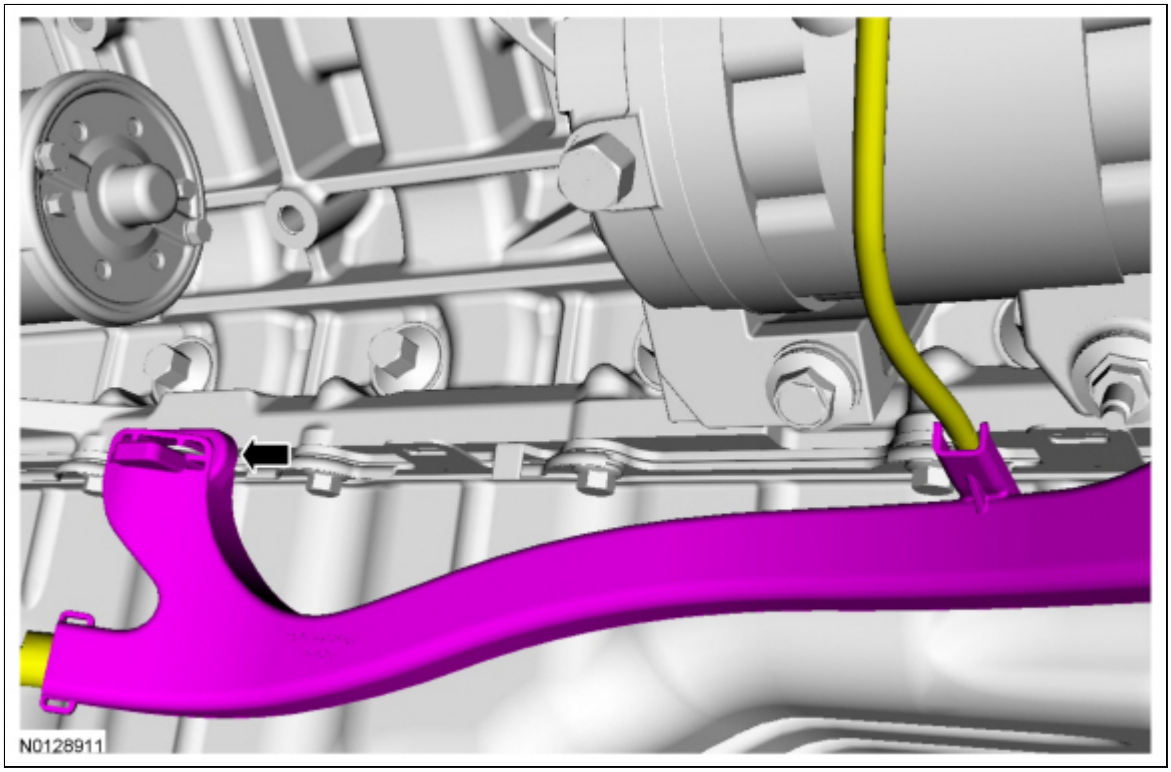
21. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

    Using the Oil Seal Remover, remove the crankshaft front oil seal.

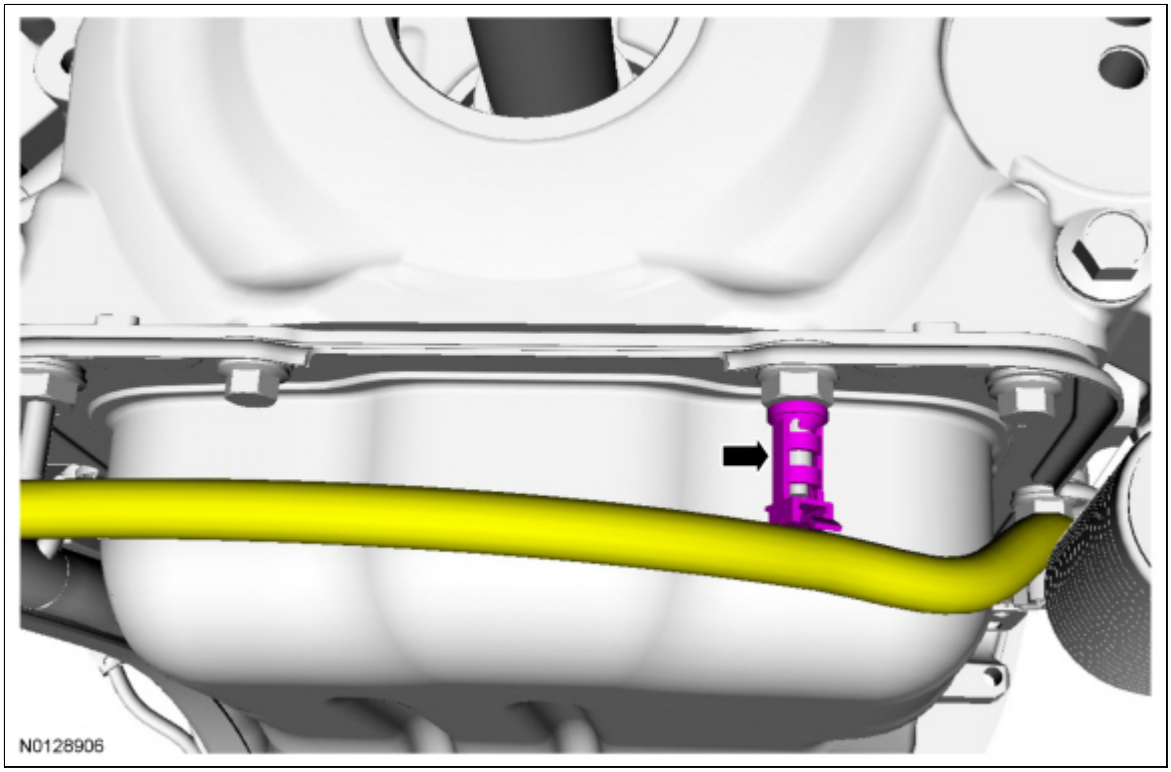


repair4less

22. Remove the 4 bolts and the skid plate.

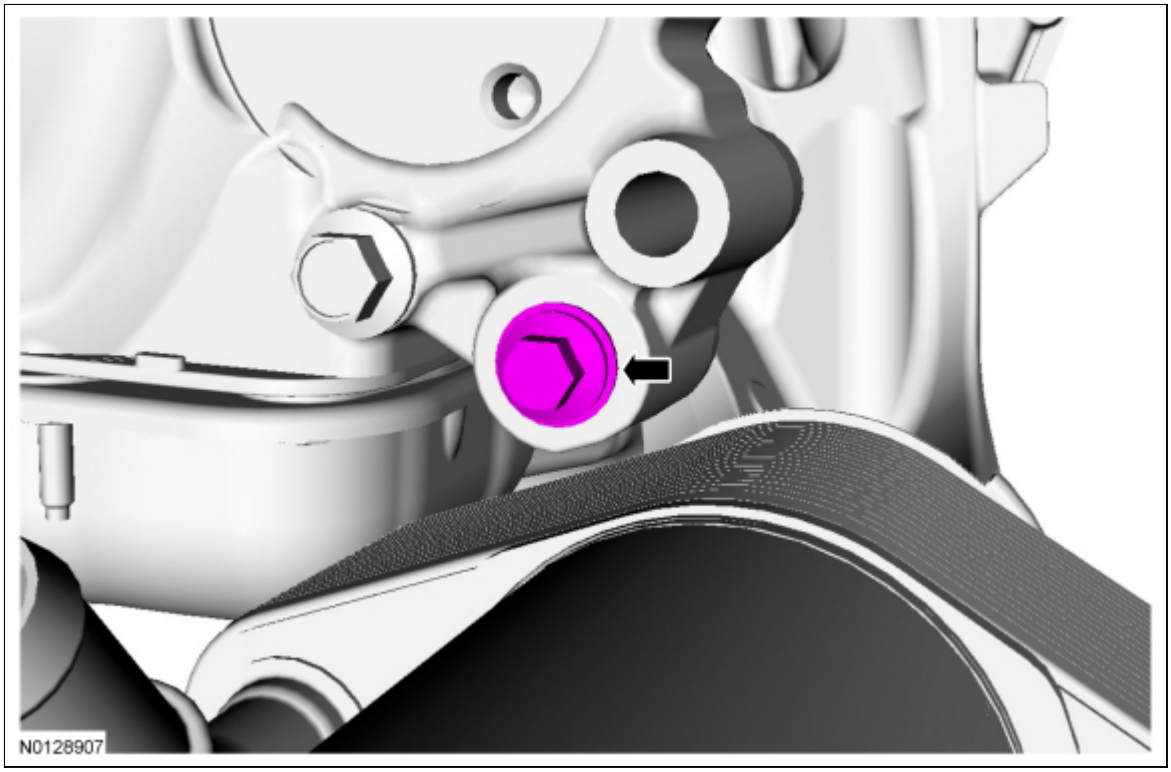


23. Remove the 3 bolts and the oil drain gutter.

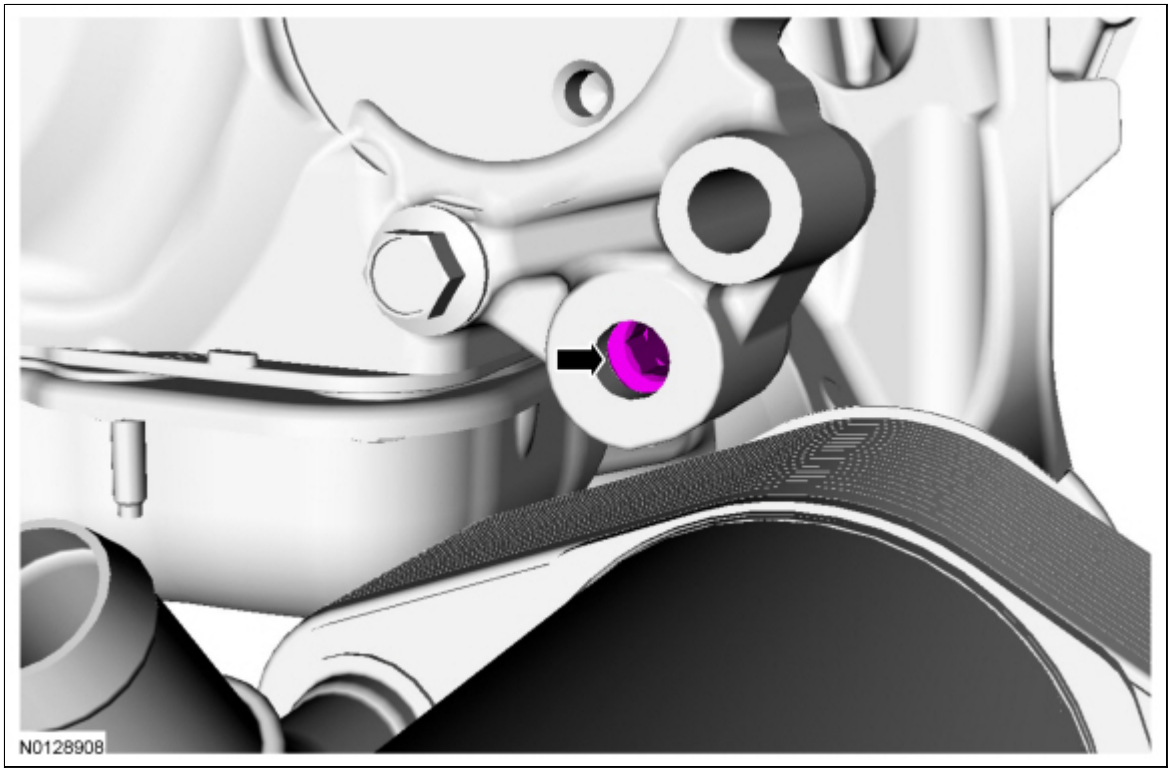


24. Remove the nut and the transmission cooler tube bracket from the engine front cover stud bolt.

25. Detach the starter motor wiring harness retainer from the oil pan.

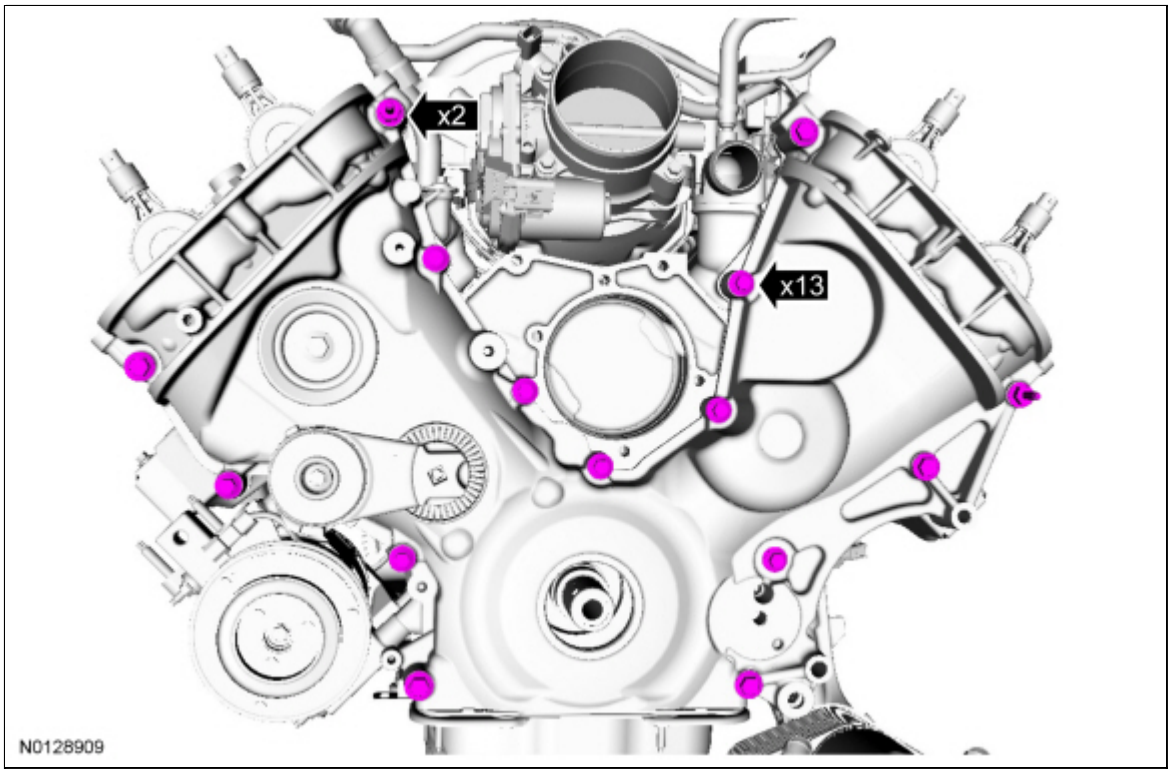


26. Detach the wiring harness retainer from the oil pan stud bolt.



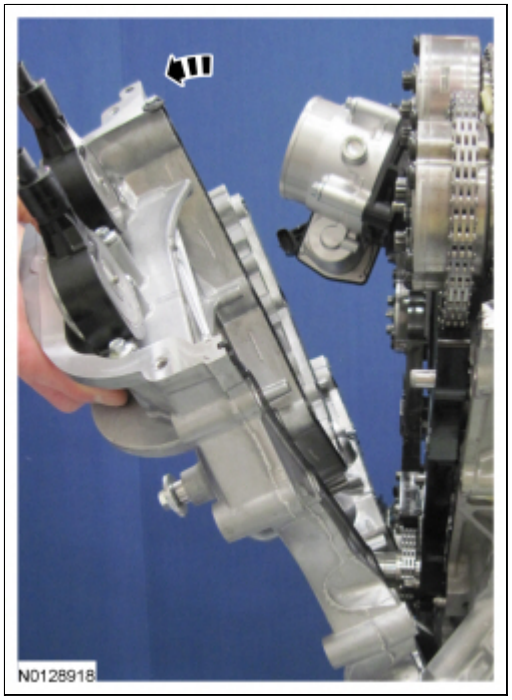
27. Remove the 2 front oil pan stud bolts and 2 front oil pan bolts.

repair4less



28. Remove the engine front cover-to-oil filter adapter bolt.

29. Using a 10 mm (0.393 in) Hex Bit loosen the engine front cover-to-oil filter adapter jack screw.

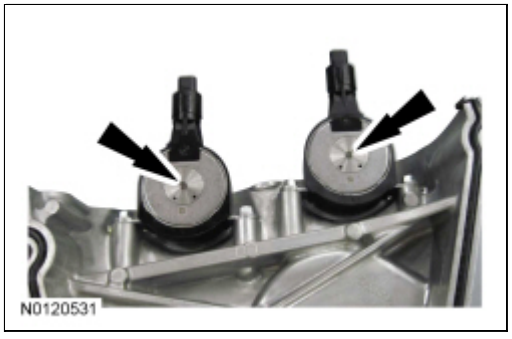


30. Remove the 13 engine front cover bolts and the 2 stud bolts.

31. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove the engine front cover.
    - Remove and discard the engine front cover gaskets.
    - Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the mating surfaces.

repair4less



32. Drain the engine oil.
    - Install the drain plug and tighten to 26 Nm (19 lb-ft).

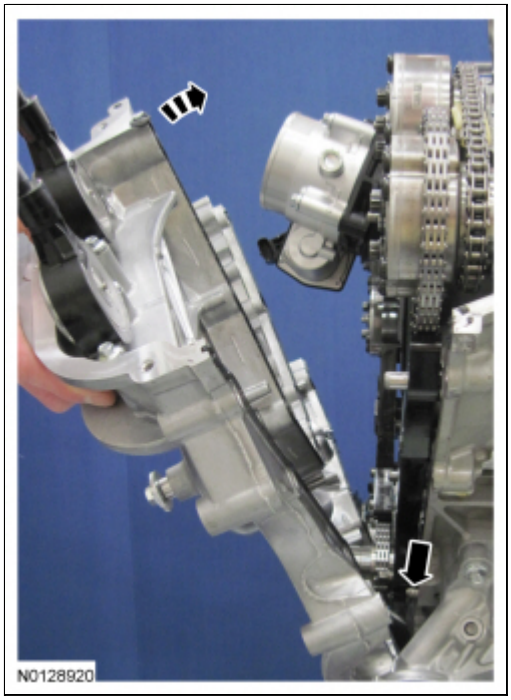
Installation

1. ***NOTICE:*** **The Variable Camshaft Timing (VCT) variable force solenoid pins must be fully depressed to avoid interference with the VCT valve tips when installing the engine front cover. Failure to follow these instructions can result in damage to the engine.**

   NOTE: LH shown, RH similar.

   Fully depress the VCT variable force solenoid pins.

2. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

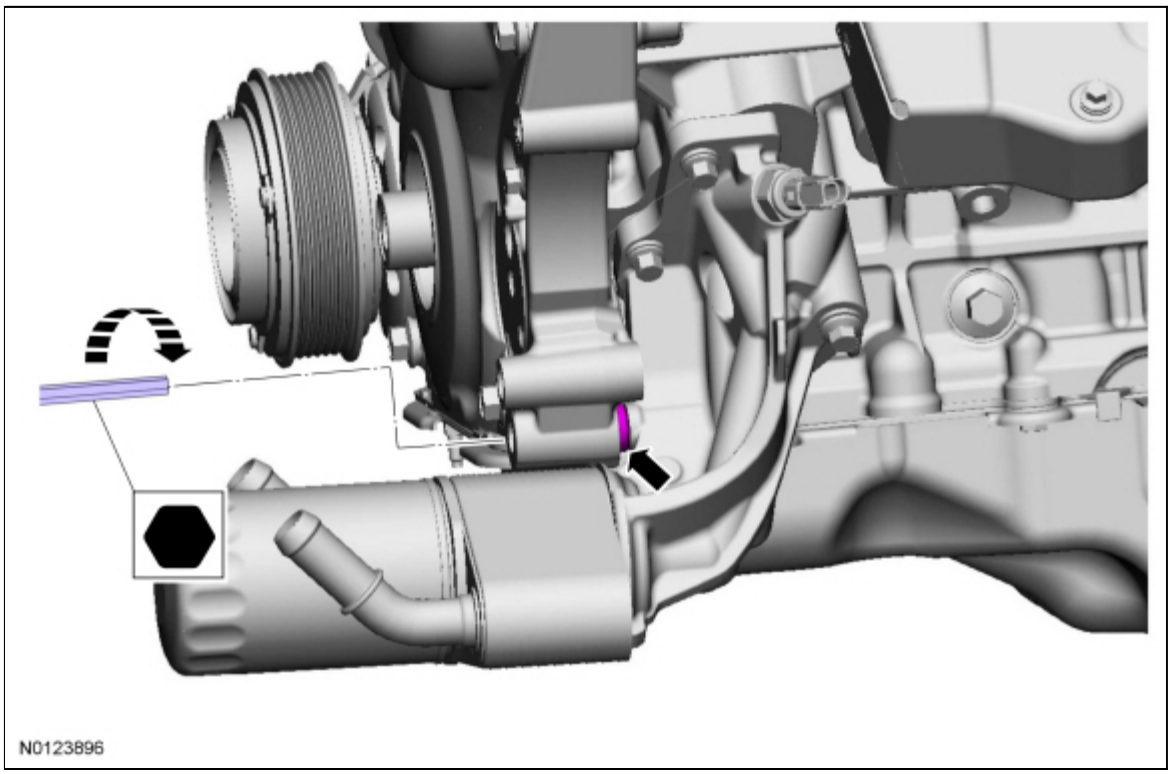


Apply a bead of silicone gasket and sealant to the cylinder head-to-cylinder block joints and the oil pan-to-cylinder block joints as illustrated.

3. **NOTE:** Make sure that the engine front cover gaskets are in place on the engine front cover before installation.

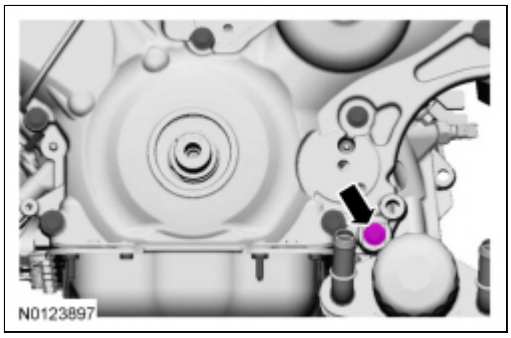
   Using new gaskets, position the engine front cover onto the dowels.
   - Install the 13 engine front cover bolts, 2 stud bolts, the 2 oil pan-to-engine front cover bolts and the 2 oil pan-to-engine front cover stud bolts finger-tight.

repair4less

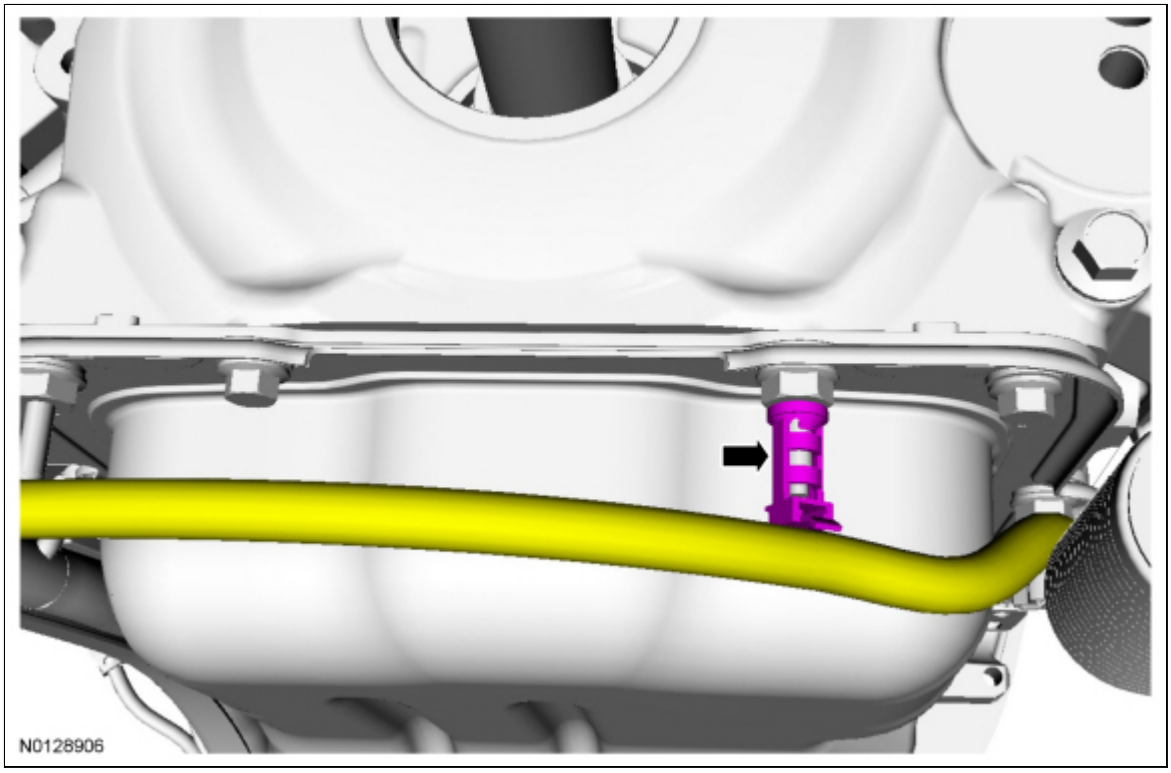


4. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

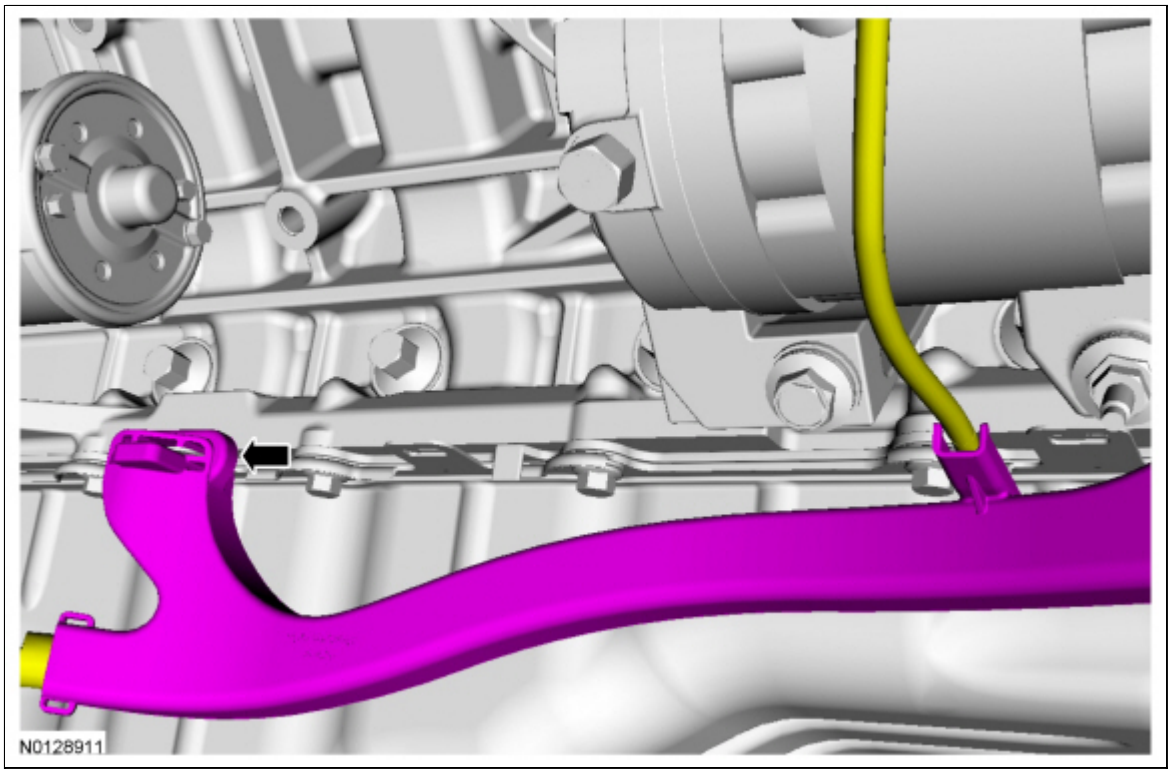
   Tighten the bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten bolts 1-15 to 25 Nm (18 lb-ft) and bolts 16-19 to 10 Nm (89 lb-in).
   - Stage 2: Tighten bolts 1-15 an additional 60 degrees and bolts 16-19 an additional 45 degrees.



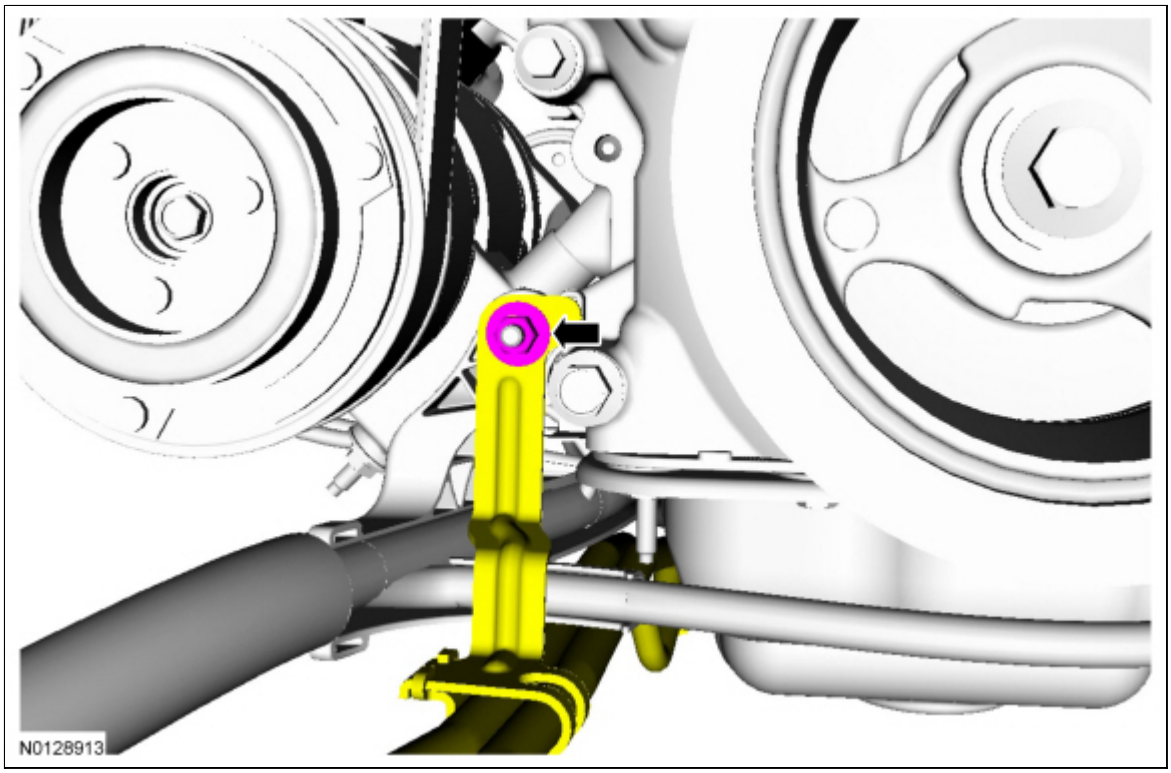
5. Using a 10 mm Hex Bit, rotate the engine front cover jackscrew into contact with the oil filter adapter to 5 Nm (44 lb-in).



6. Install the engine front cover-to-oil filter adapter bolt and tighten to 25 Nm (18 lb-ft) plus an additional 60 degrees.

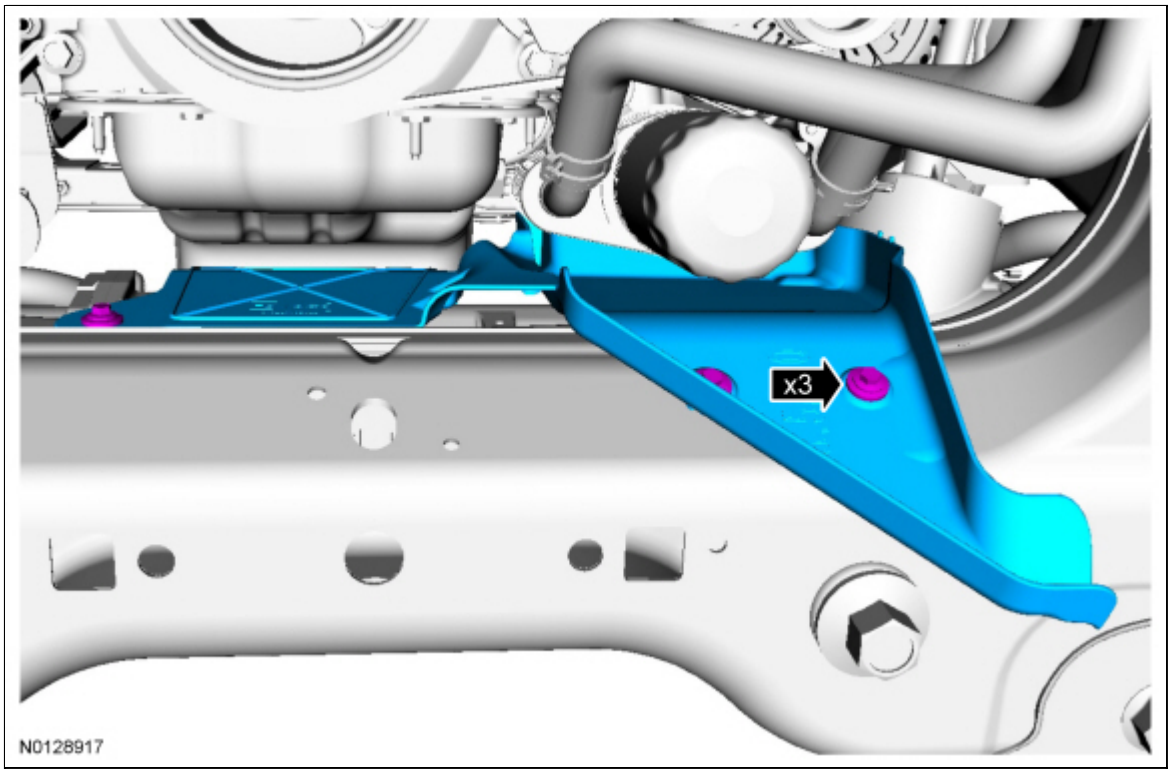


repair4less



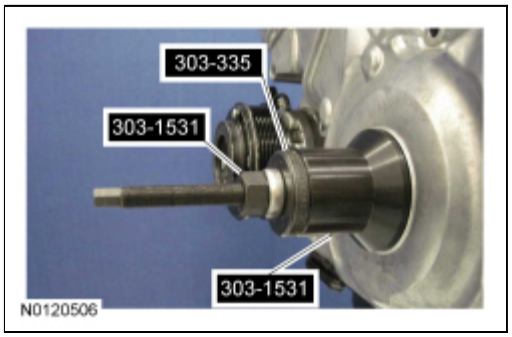
7. Position the wiring harness and install the wiring harness retainer to the oil pan stud bolt.

8. Attach the starter motor wiring harness retainer to the oil pan.



9. Install the transmission cooler line bracket and the nut to the engine front cover stud bolt.
    - Tighten to 13 Nm (115 lb-in).

10. Install the oil drain gutter and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



repair4less

11. Install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

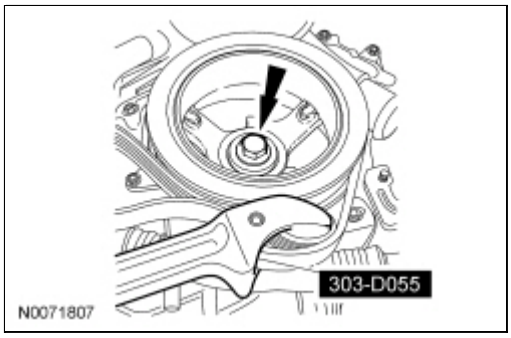
12. **NOTE:** Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

    Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft front oil seal.

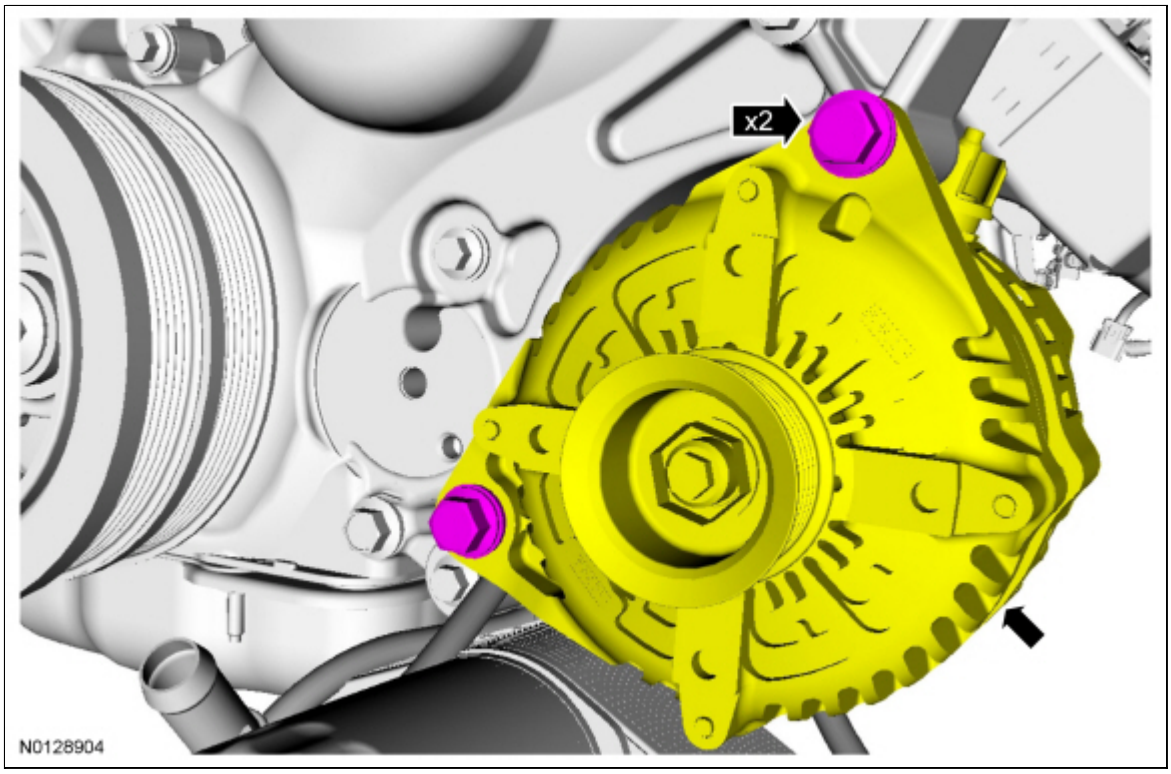
13. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

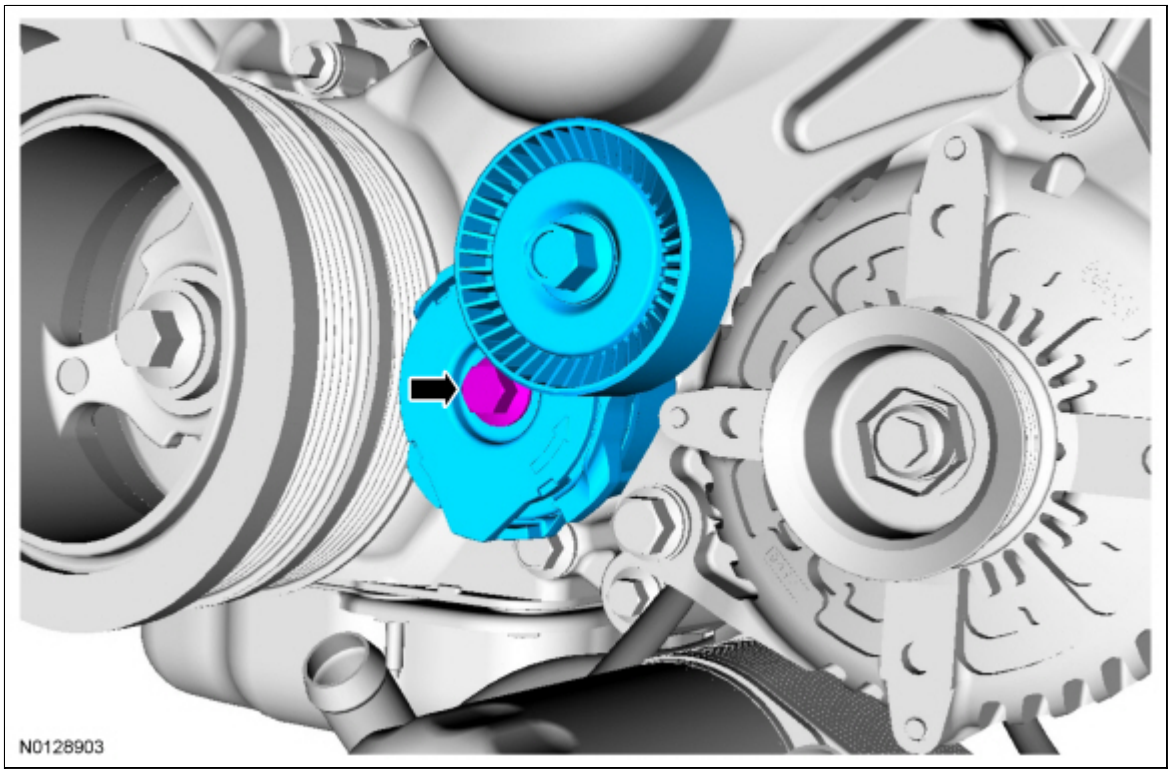
14. Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.



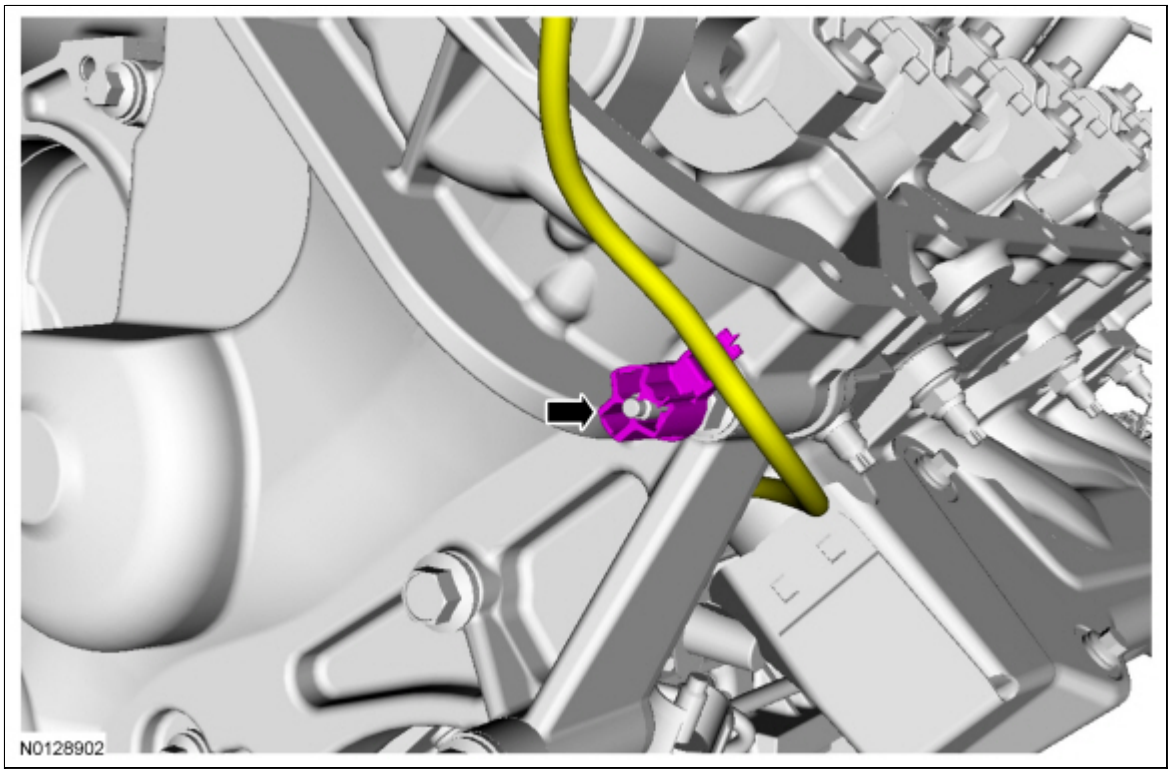
15. Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft pulley.



16. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 4 stages:
    - Stage 1: Tighten to 140 Nm (103 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 100 Nm (74 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

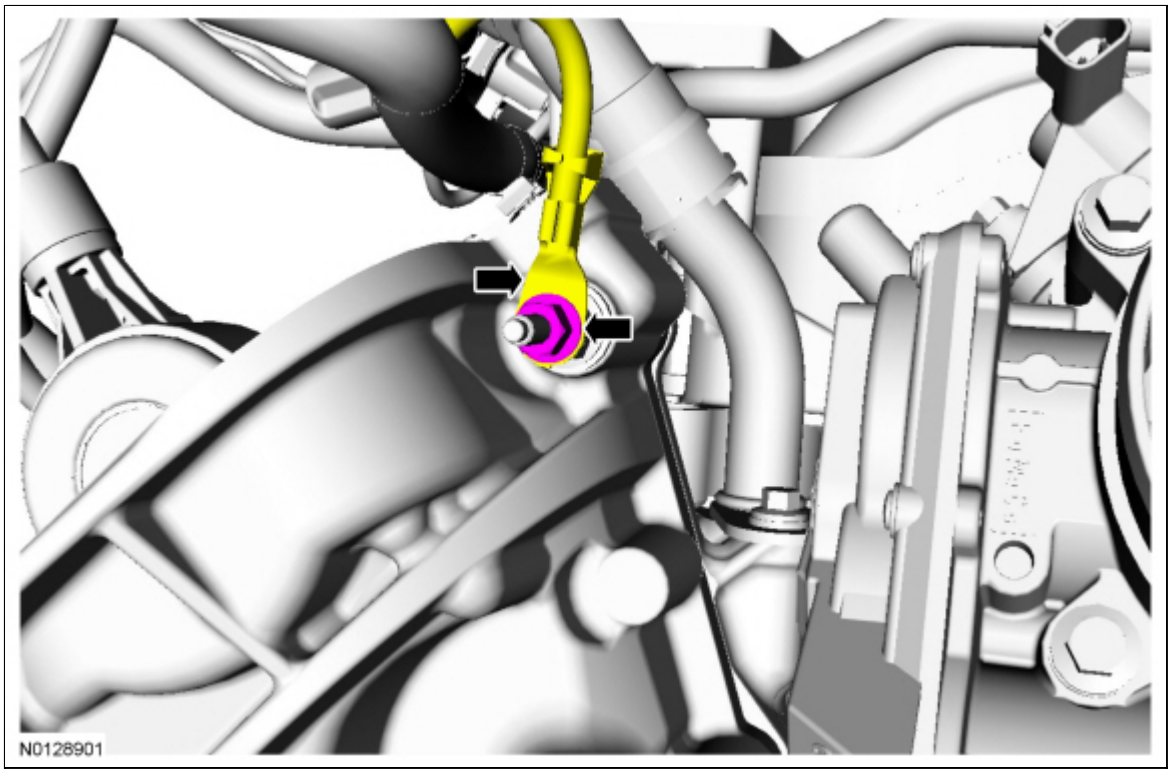


repair4less

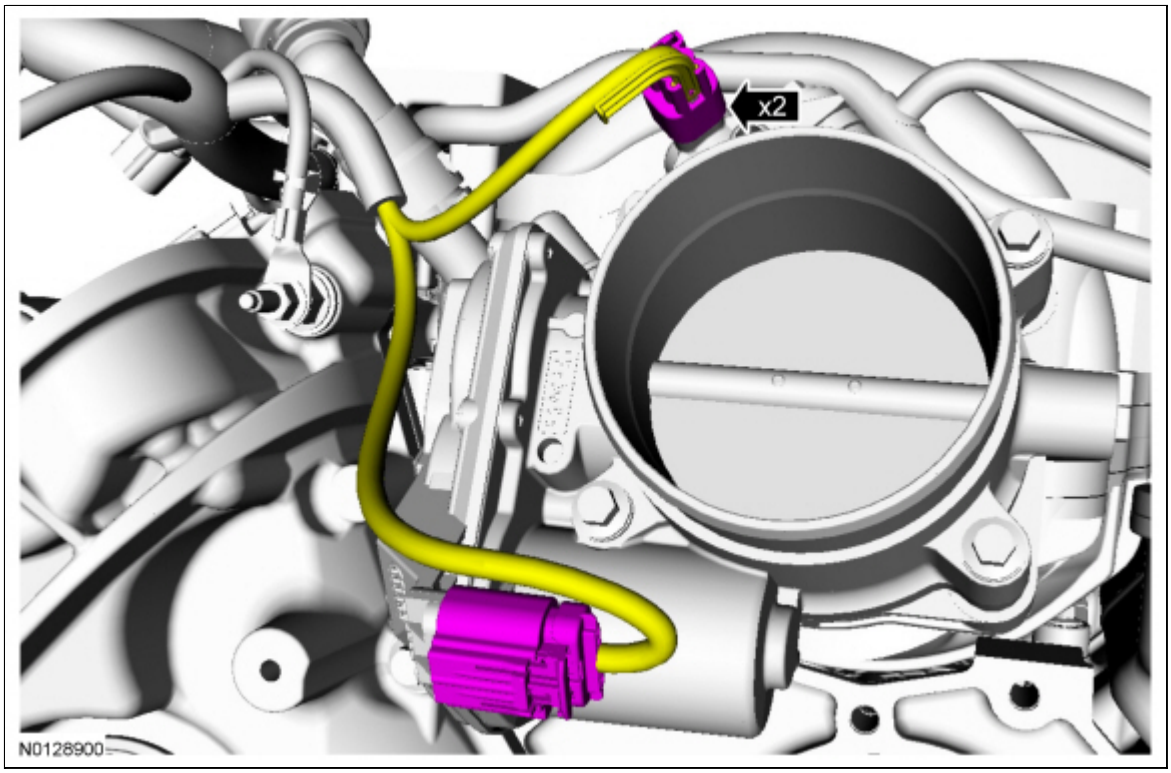


17. Install the generator and the 2 bolts.
    - Tighten to 48 Nm (35 lb-ft).

18. Install the accessory drive belt tensioner and bolt.
    - Tighten to 48 Nm (35 lb-ft).

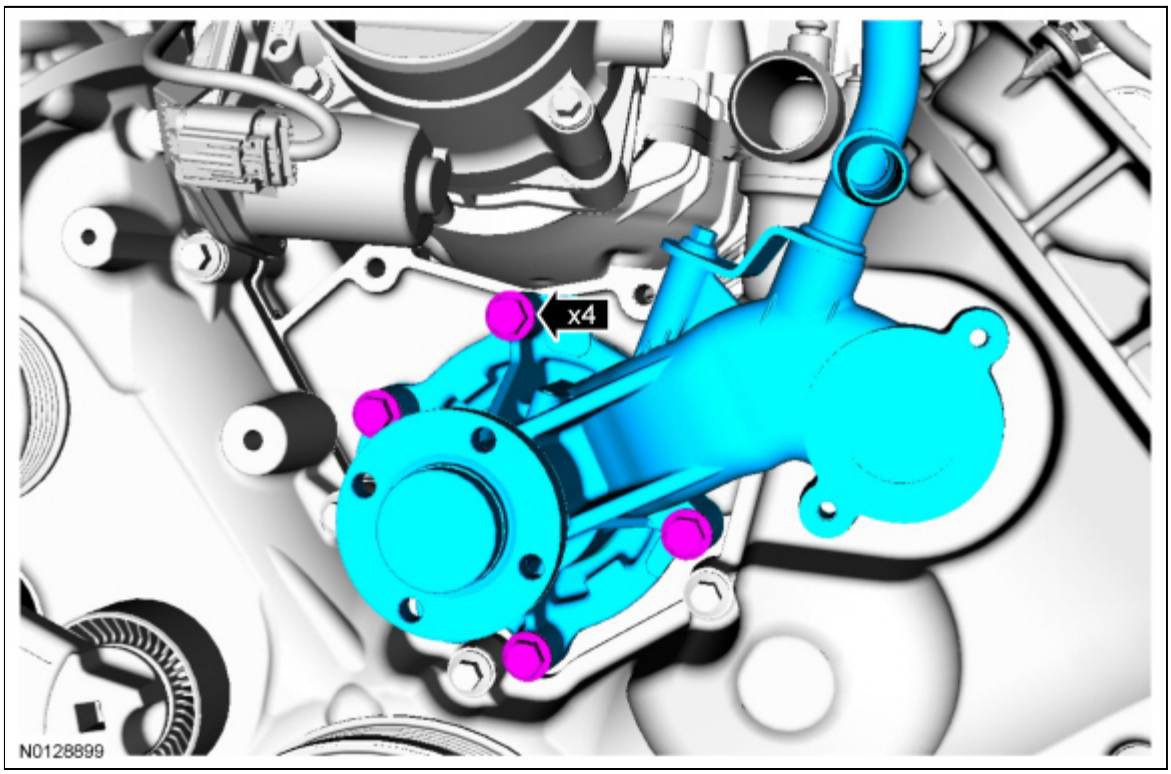


19. Attach the wiring harness retainer to the engine front cover stud bolt.

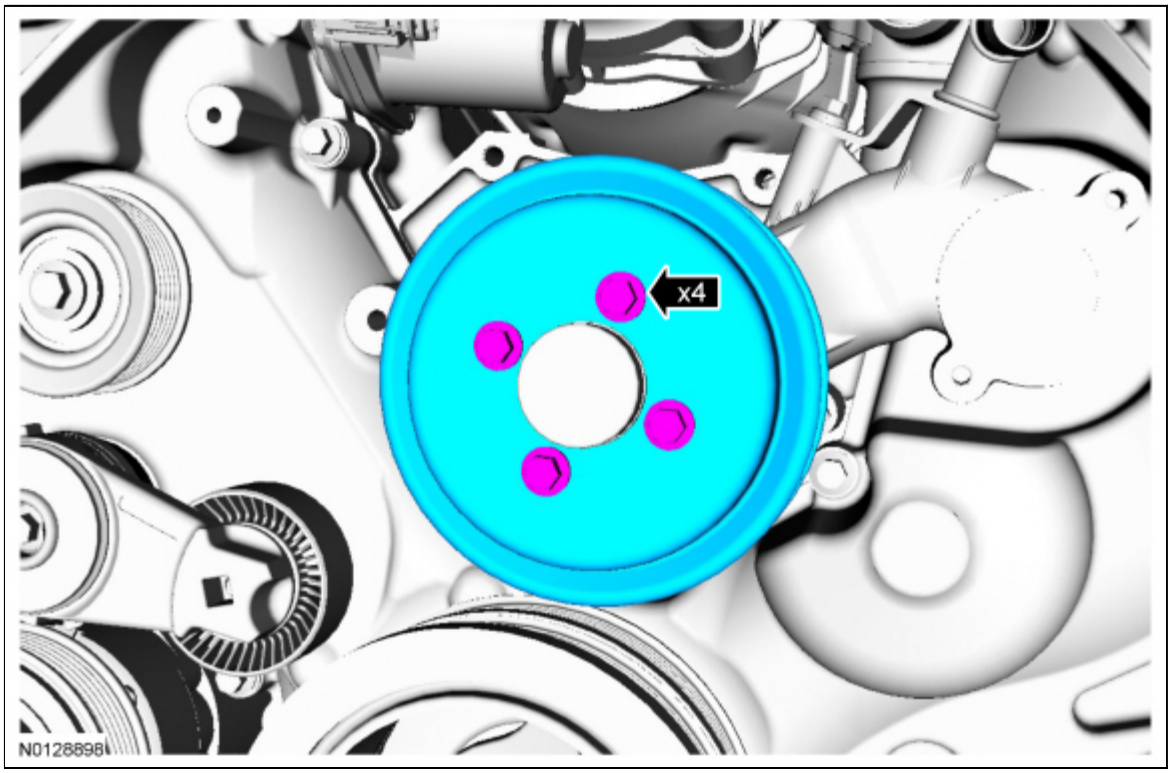


20. Install the ground wire and nut to the engine front cover stud bolt.
    - Tighten to 10 Nm (89 lb-in).

repair4less



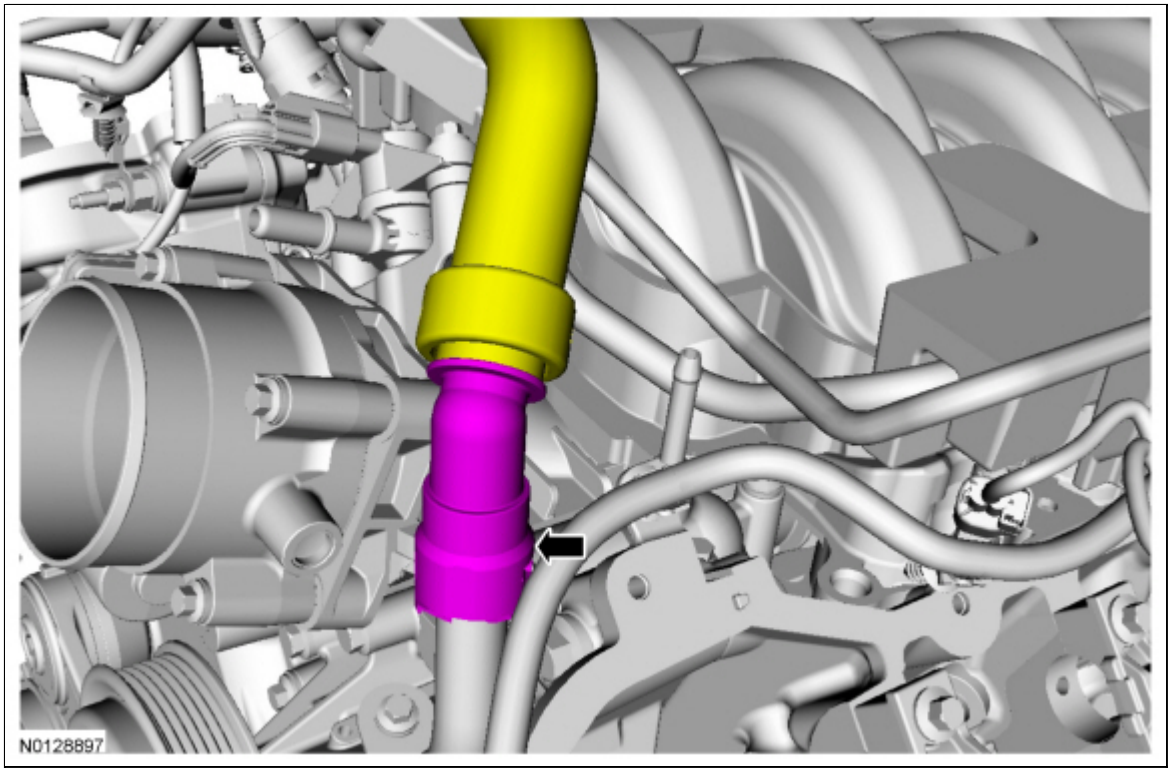
21. Connect the throttle body and EVAP purge valve electrical connectors.



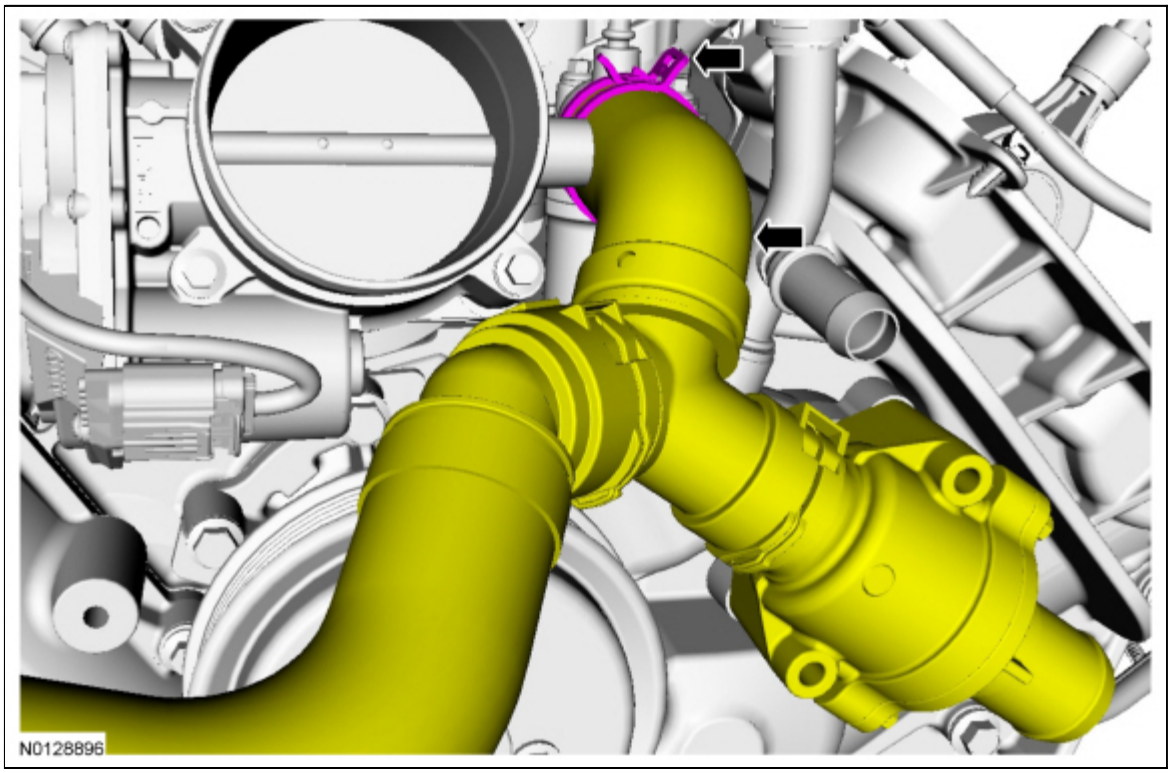
22. **NOTE:** Lubricate the new coolant pump O-ring seal with clean engine coolant.

    Using a new O-ring seal, install the coolant pump and the 4 bolts.

- Tighten to 20 Nm (177 lb-in) plus an additional 60 degrees.

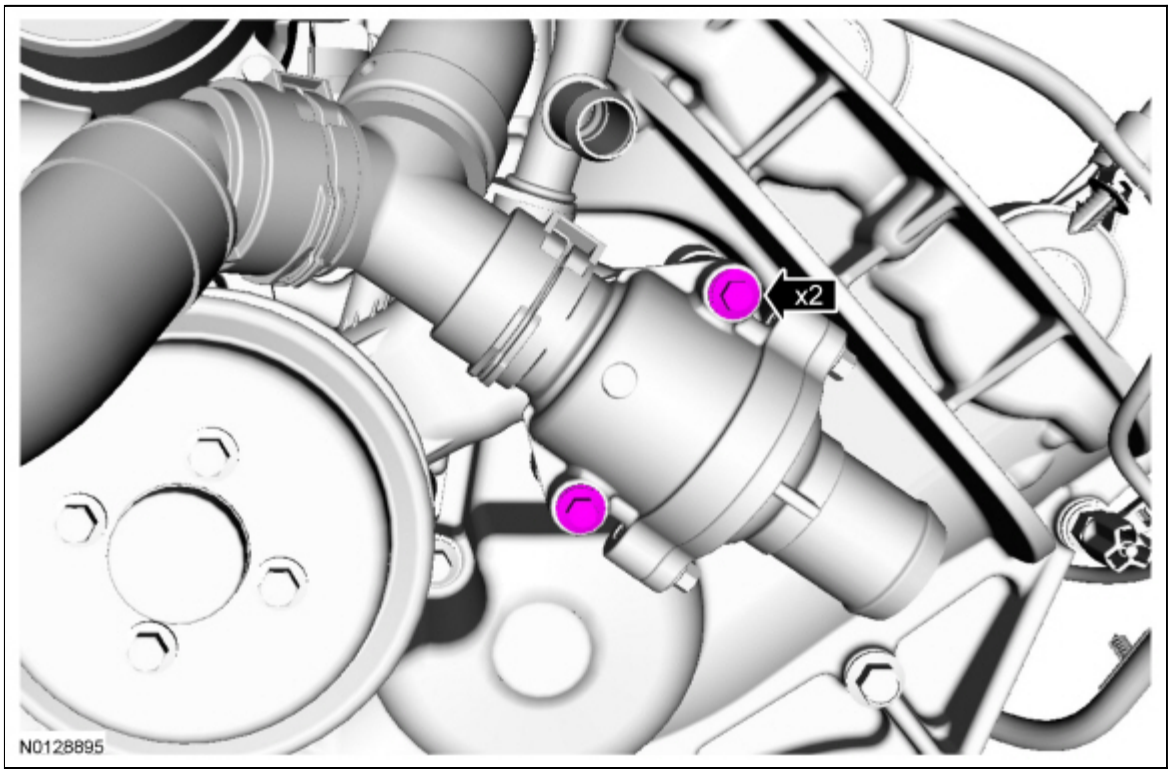


23. Install the coolant pump pulley and the 4 bolts.



24. Connect the heater hose.

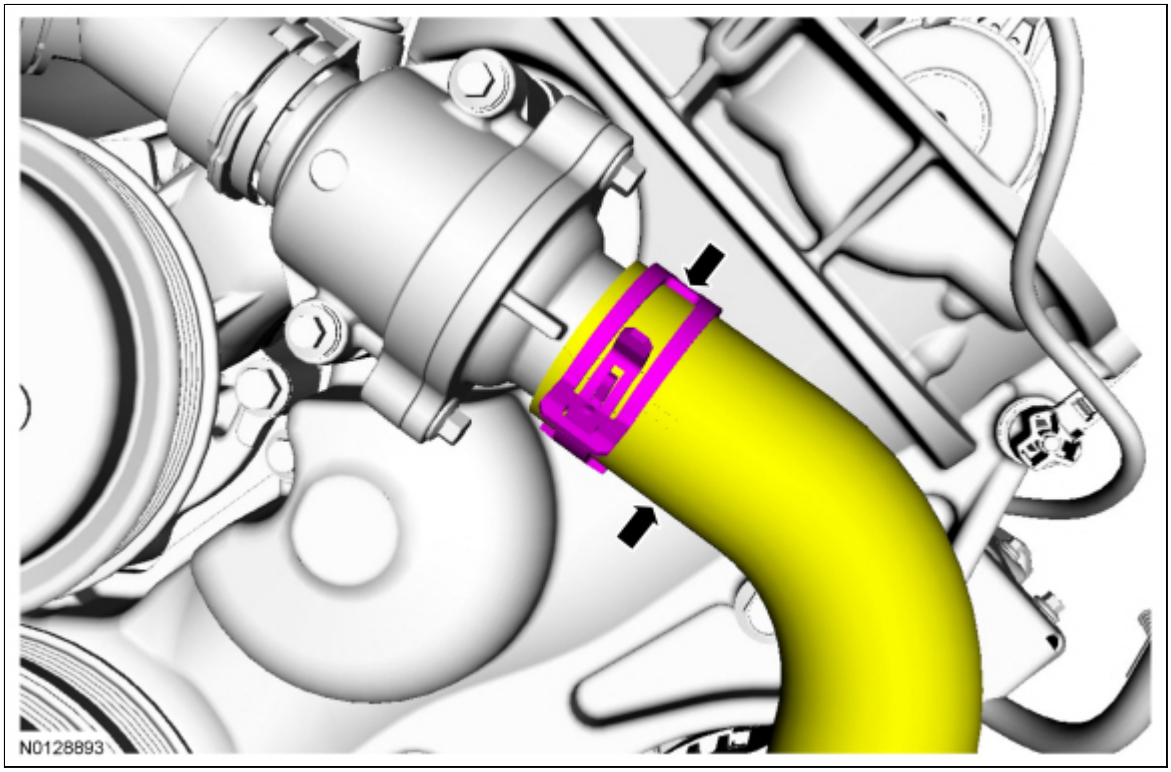
repair4less



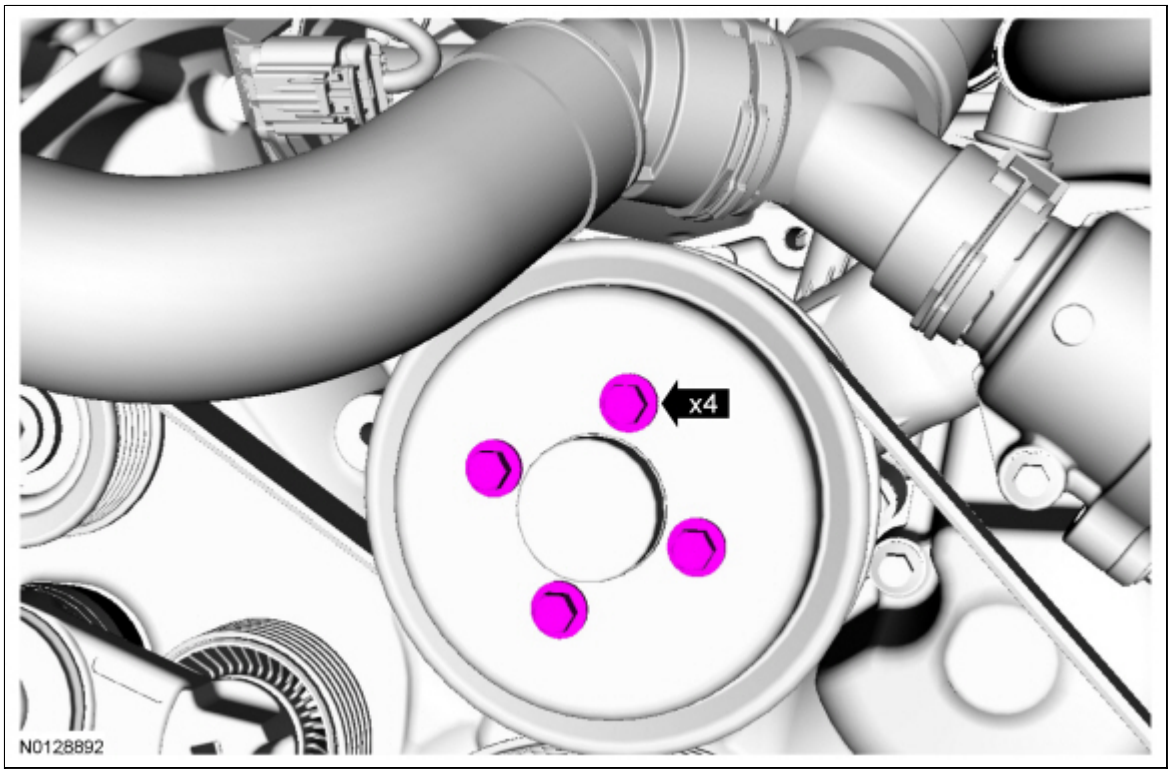
25. **NOTE:** Lubricate the new thermostat housing O-ring seal with clean engine coolant.

    Using a new thermostat housing O-ring seal, install the upper radiator hose T-connector/thermostat housing assembly and clamp.

26. Install the 2 thermostat housing bolts.
    - Tighten to 10 Nm (89 lb-in).



27. Connect the degas coolant hose and clamp.



repair4less

28. Connect the lower radiator hose and clamp to the thermostat housing assembly.

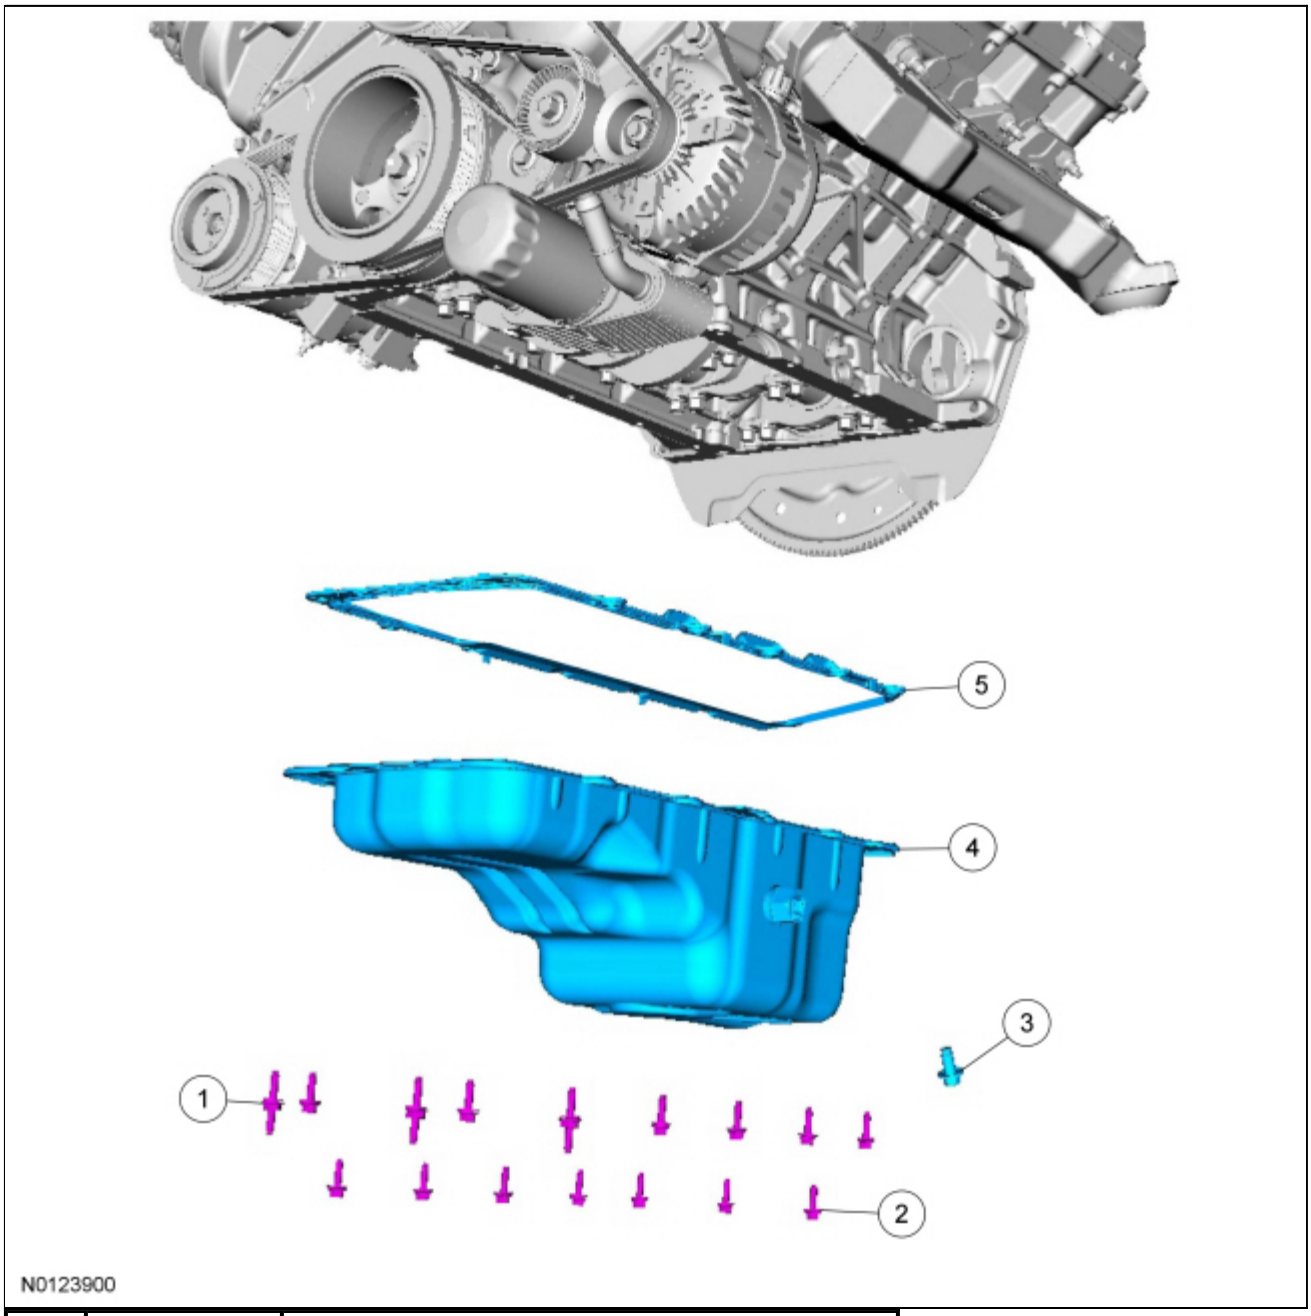
29. Install the accessory drive and A/C compressor belts. For additional information, refer to Section 303-05 .

30. Tighten the 4 coolant pump pulley bolts to 25 Nm (18 lb-ft).

31. Install the RH and LH valve covers. For additional information, refer to Valve Cover — RH and Valve Cover — LH in this section.

32. Fill the crankcase with clean engine oil.

33. Connect the battery ground cable. For additional information, refer Section 414-01 .



34. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

35. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

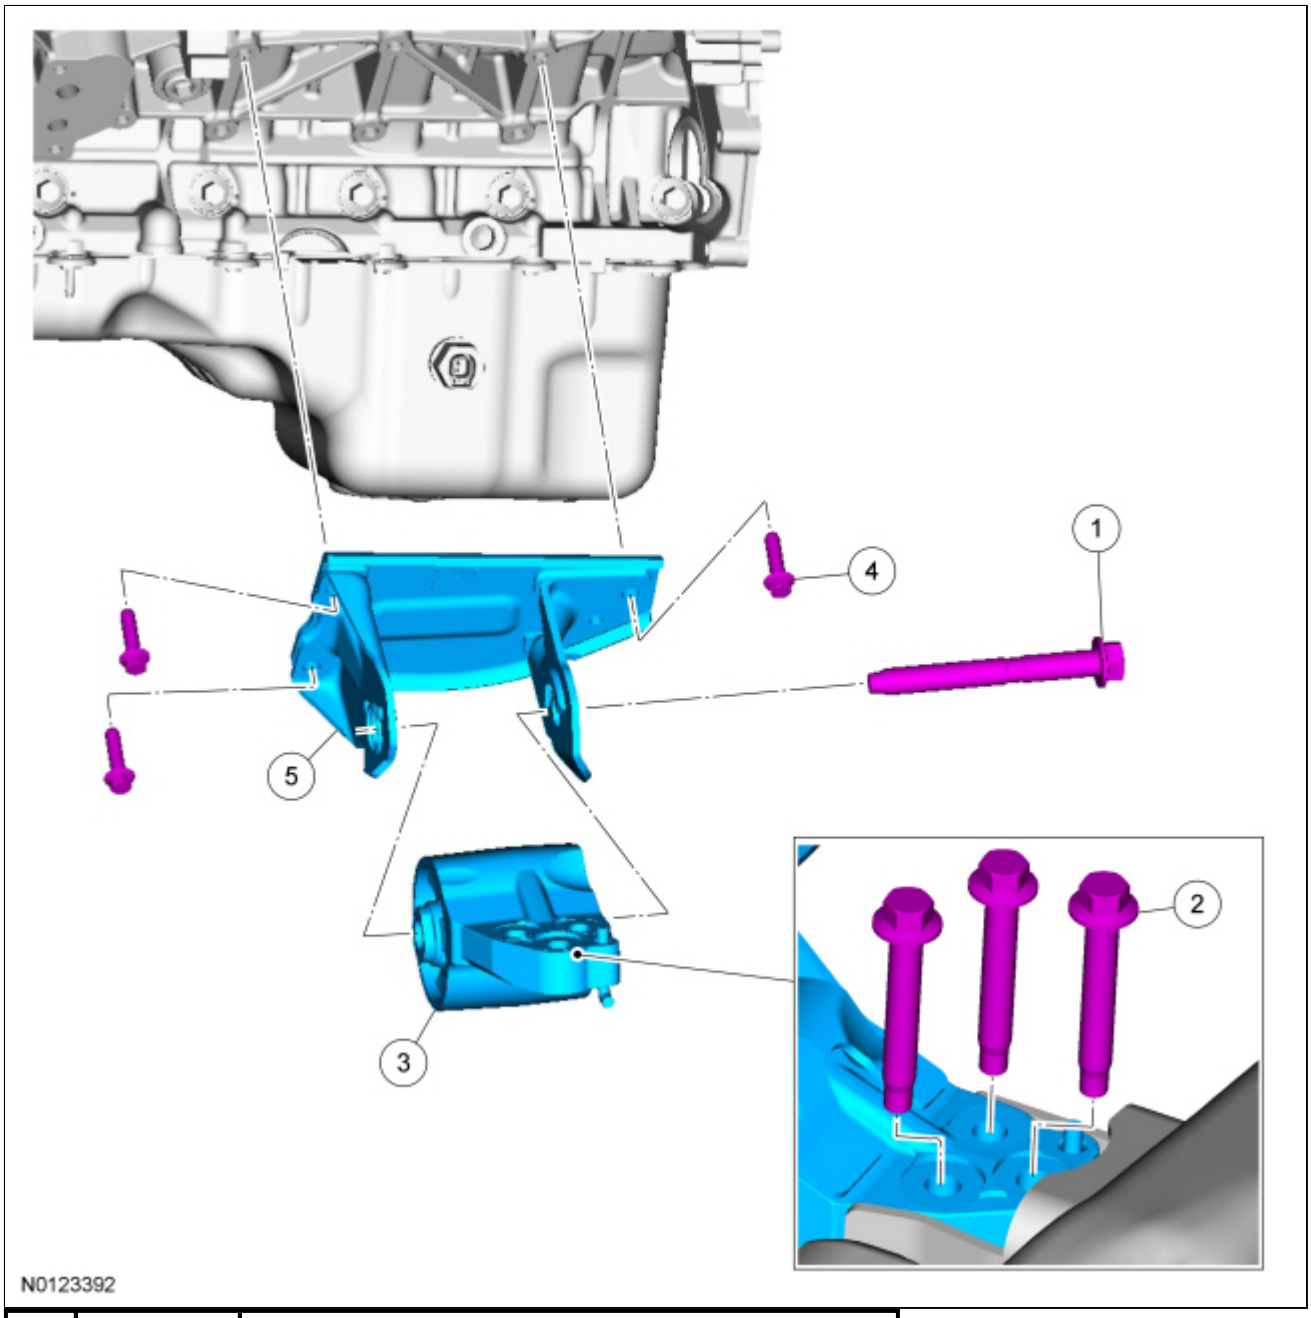
Engine Support Insulators — LH



Special Tool(s)

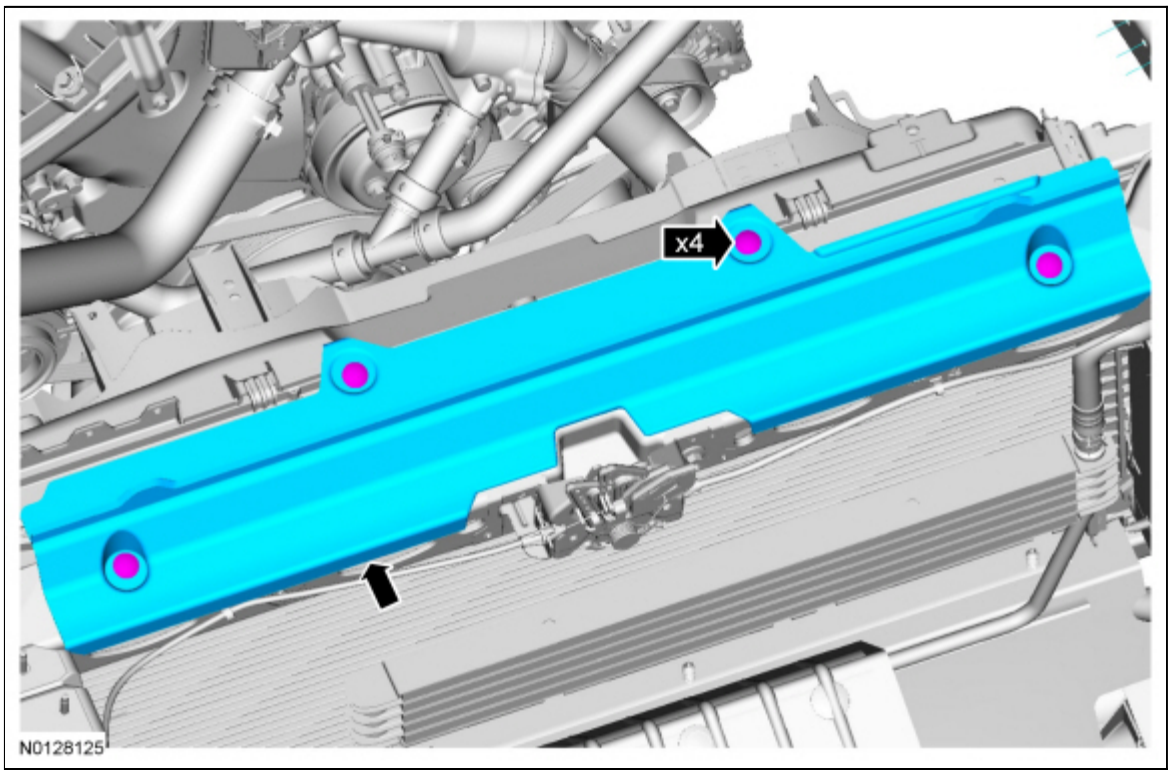
 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2176-B	Support Bar, Engine 303-F070

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

repair4less

Item	Part Number	Description
1	W715211	LH engine support insulator through bolt - 350 Nm (258 lb-ft)
2	W713244	LH engine support insulator bolt (3 required)
3	6038	LH engine support insulator
4	W714735	LH engine support insulator bracket bolt (3 required) - 63 Nm (46 lb-ft)
5	—	LH engine support insulator bracket (part of 6038)



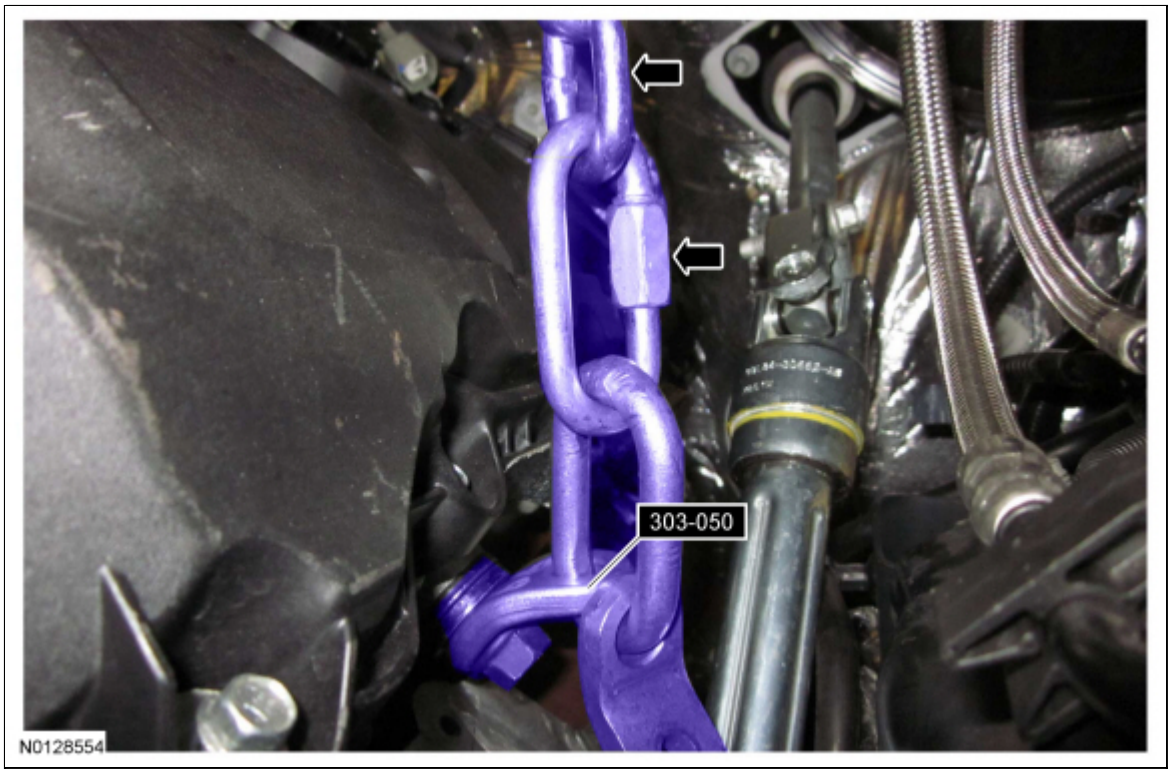
Removal

NOTE: Apply threadlock to the LH and RH engine support insulator through bolt threads prior to installation.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 pin-type retainers and the upper radiator air deflector.

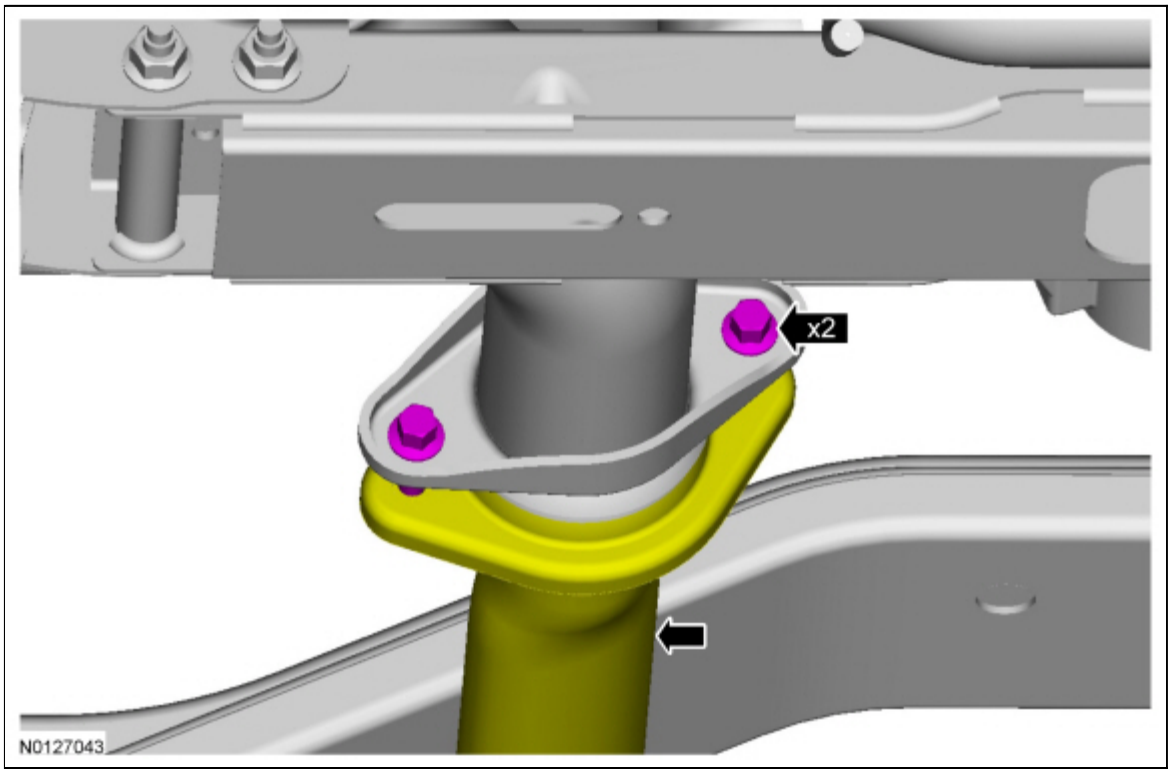


3. Remove the Air Cleaner (ACL) outlet pipe and ACL cover as an assembly. For additional information, refer to Section 303-12 .

4. **NOTE:** It may be necessary to install washers between the Engine Lifting Bracket and the cylinder head to prevent the Engine Lifting Bracket from contacting the valve cover while supporting the engine.

   Install an Engine Lifting Bracket on the side of the LH cylinder head.
   - Attach a length of chain and a connecting link to the Engine Lifting Bracket.

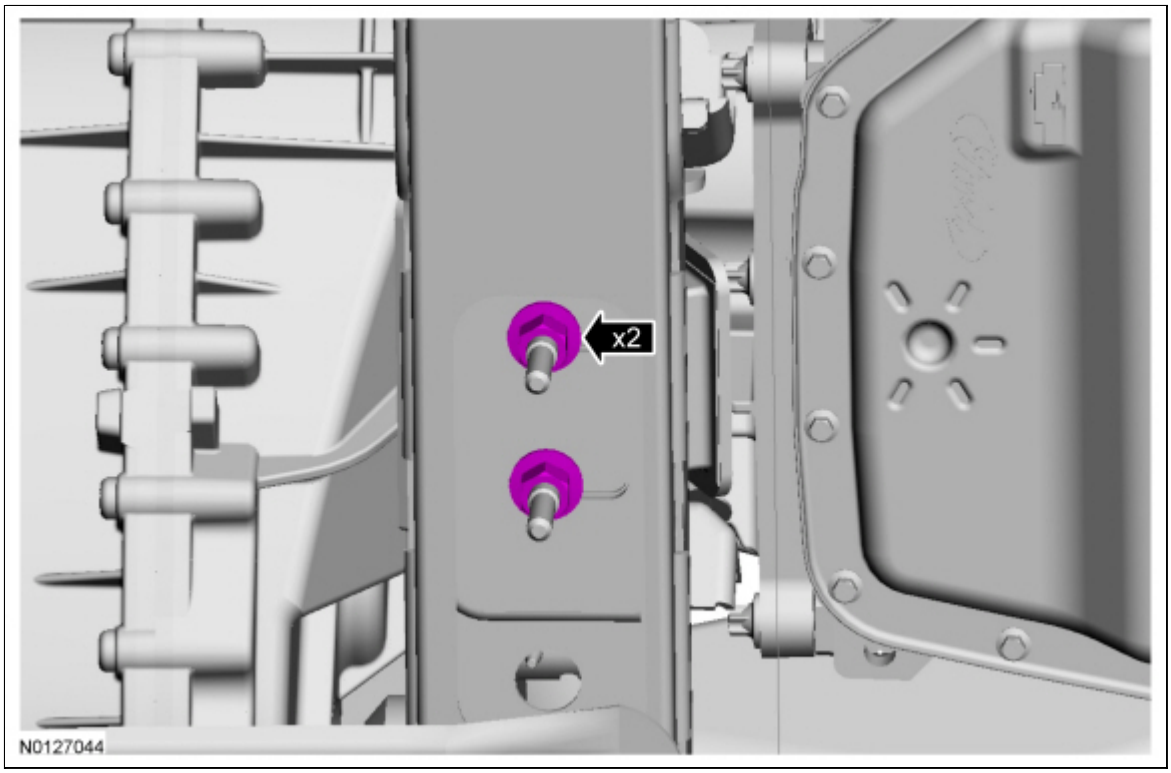
repair4less



5. Install the Engine Support Bar.
    - Attach the chain installed in the previous step to the Engine Support Bar hook to support the engine.

6. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and

separate.

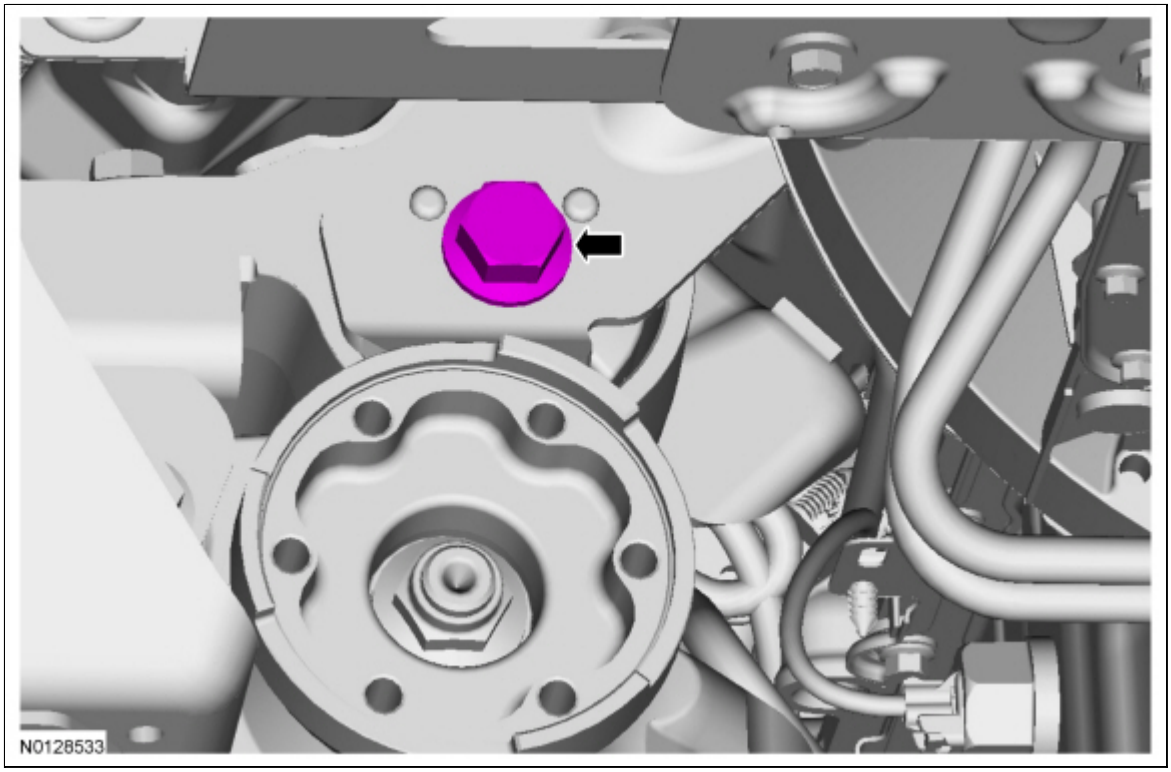


- Discard the 2 bolts.

7. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

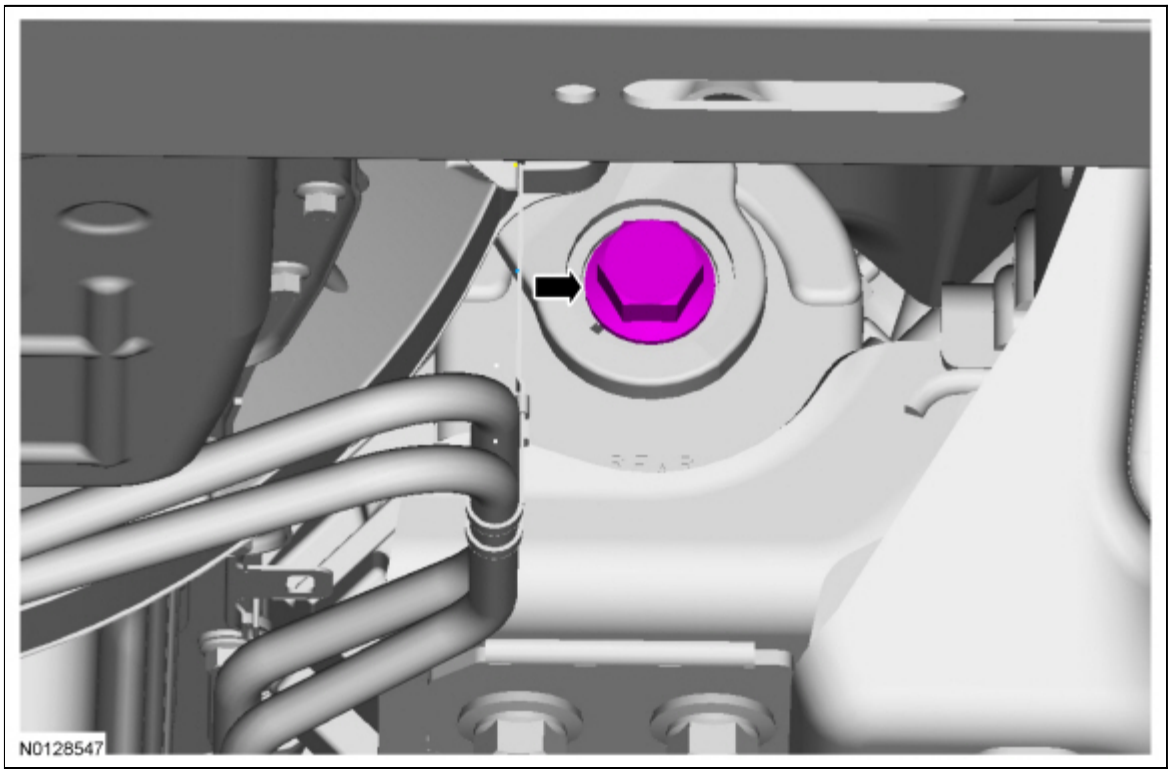
   Loosen the 2 transmission mount-to-crossmember nuts.

repair4less



8. Remove the starter. For additional information, refer to Section 303-06 .

9. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .

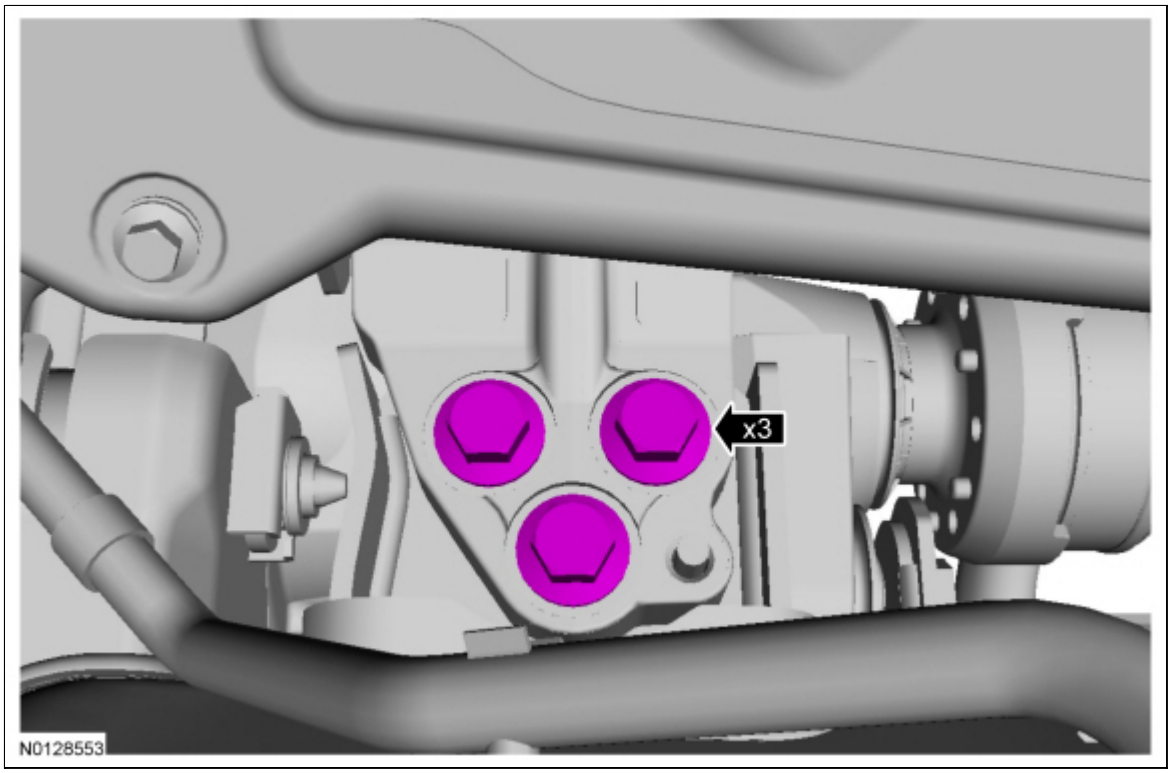


10. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove the LH engine support insulator through bolt.

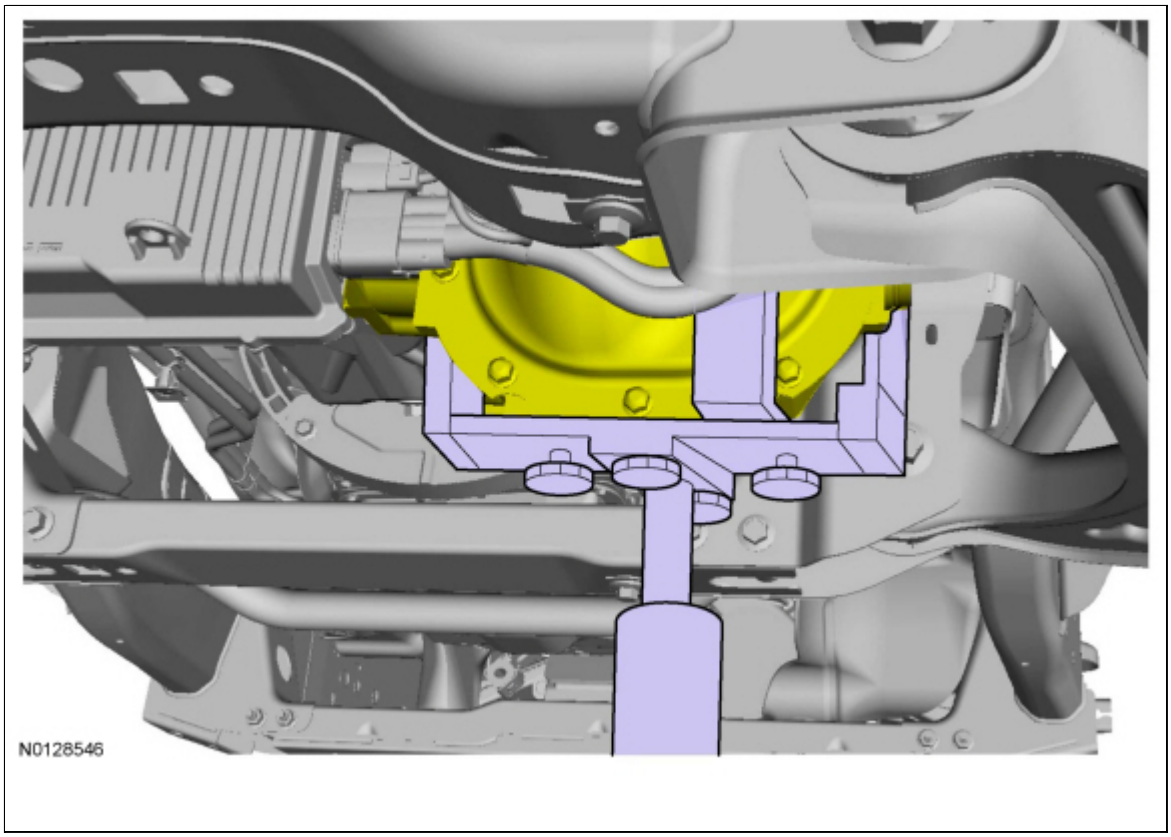
11. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Loosen the RH engine support insulator through bolt.



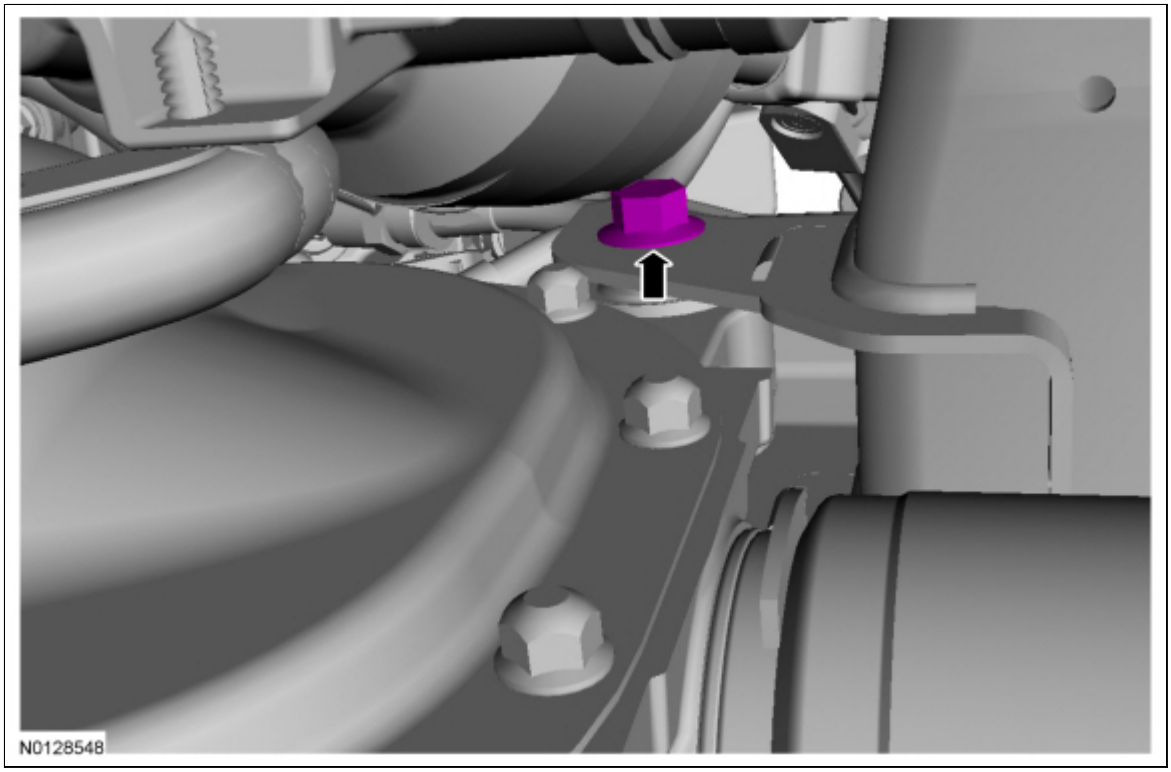
repair4less

12. Raise the LH side of the engine 50 mm (1.968 in).



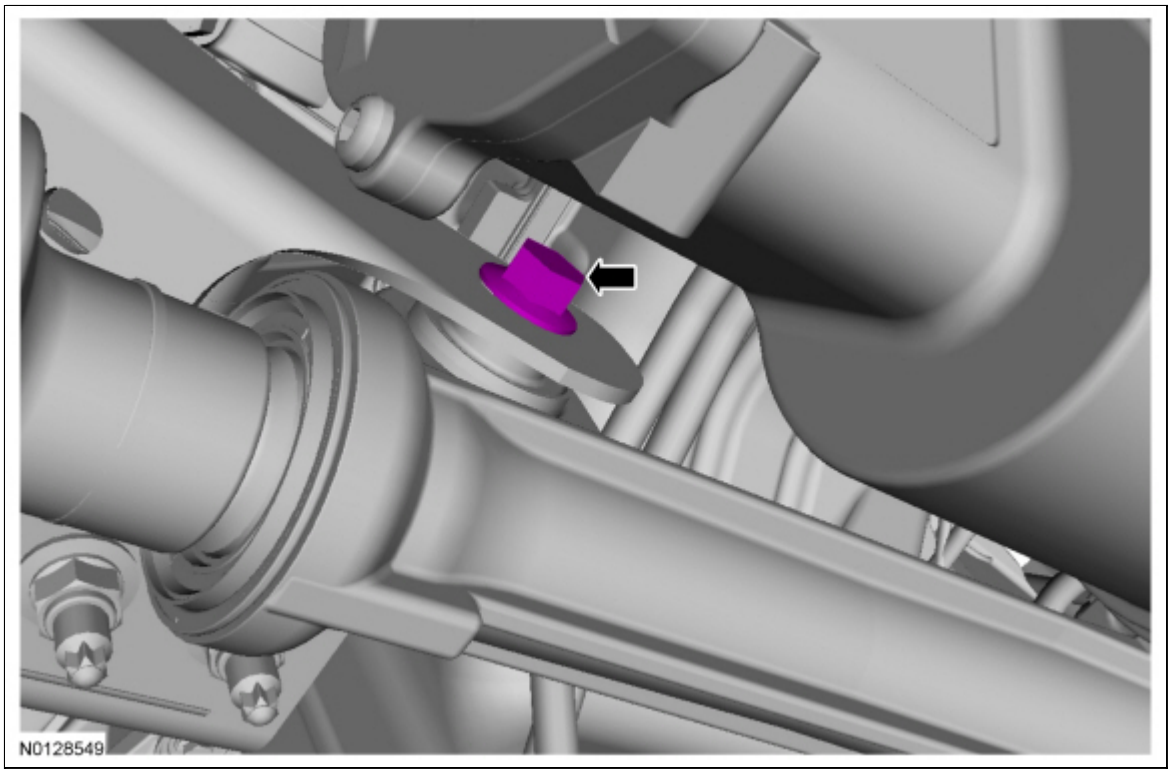
13. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

    Remove the 3 LH engine support insulator-to-frame bolts.

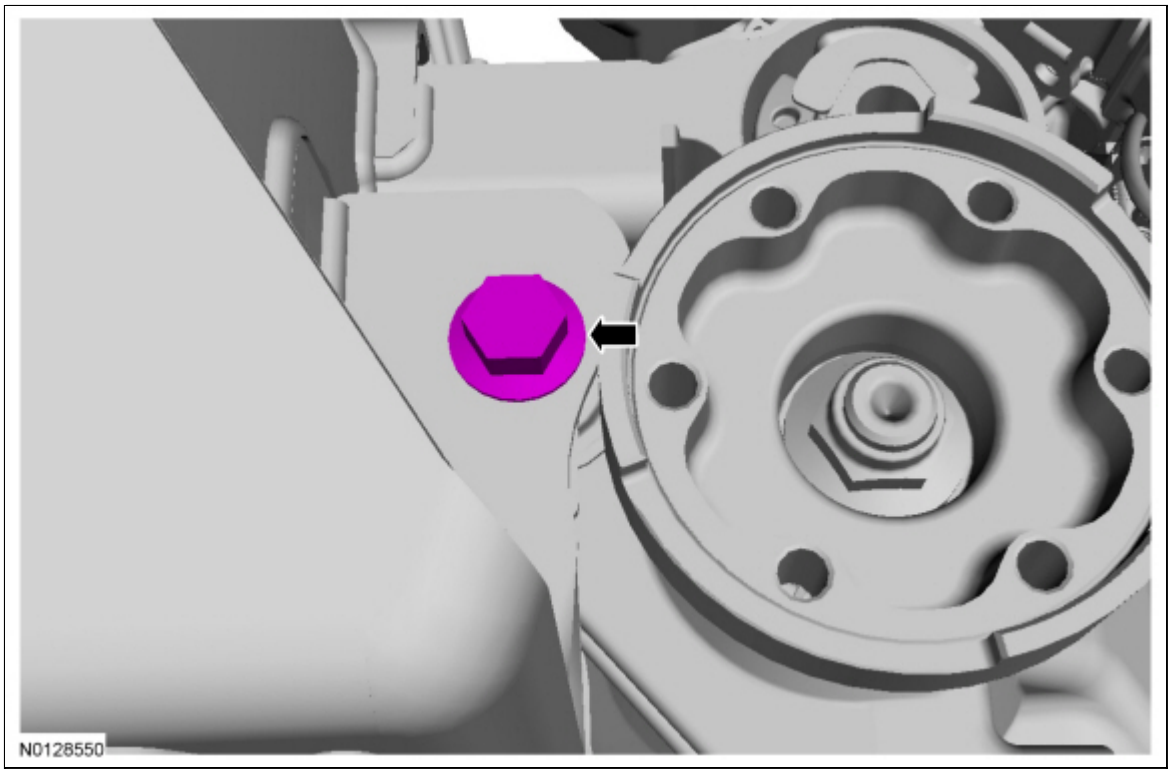


Four-Wheel Drive (4WD) vehicles

14. Position a suitable hydraulic jack under the front axle. Securely strap the jack to the axle.



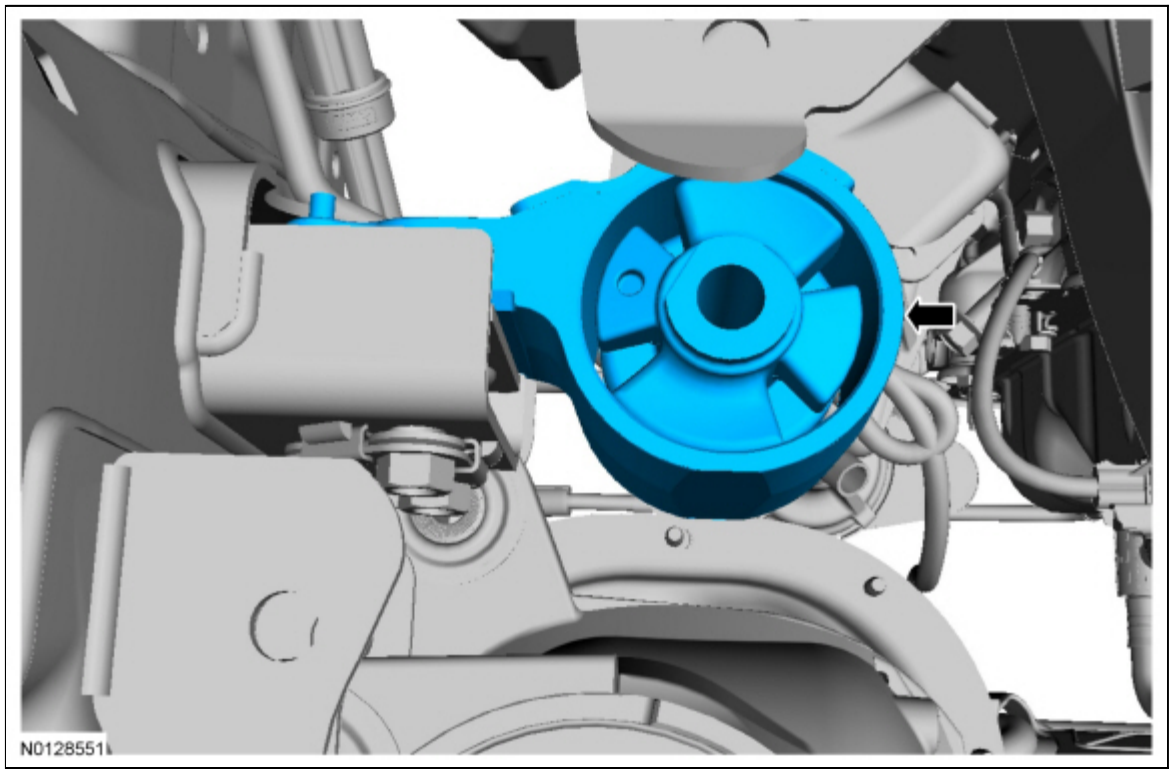
15. Remove the upper front axle carrier mounting bushing bolt.



16. Remove the axle shaft housing carrier bushing bolt.

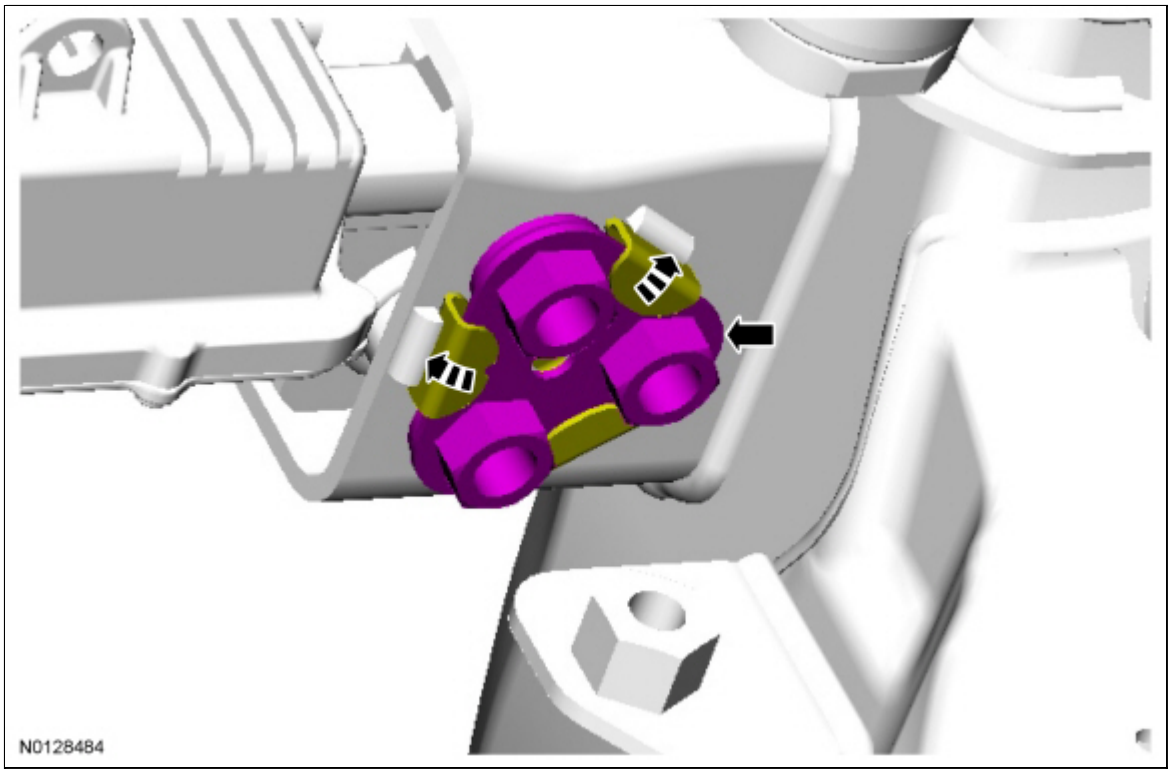
repair4less

17. Remove the lower front axle carrier mounting bushing bolt.



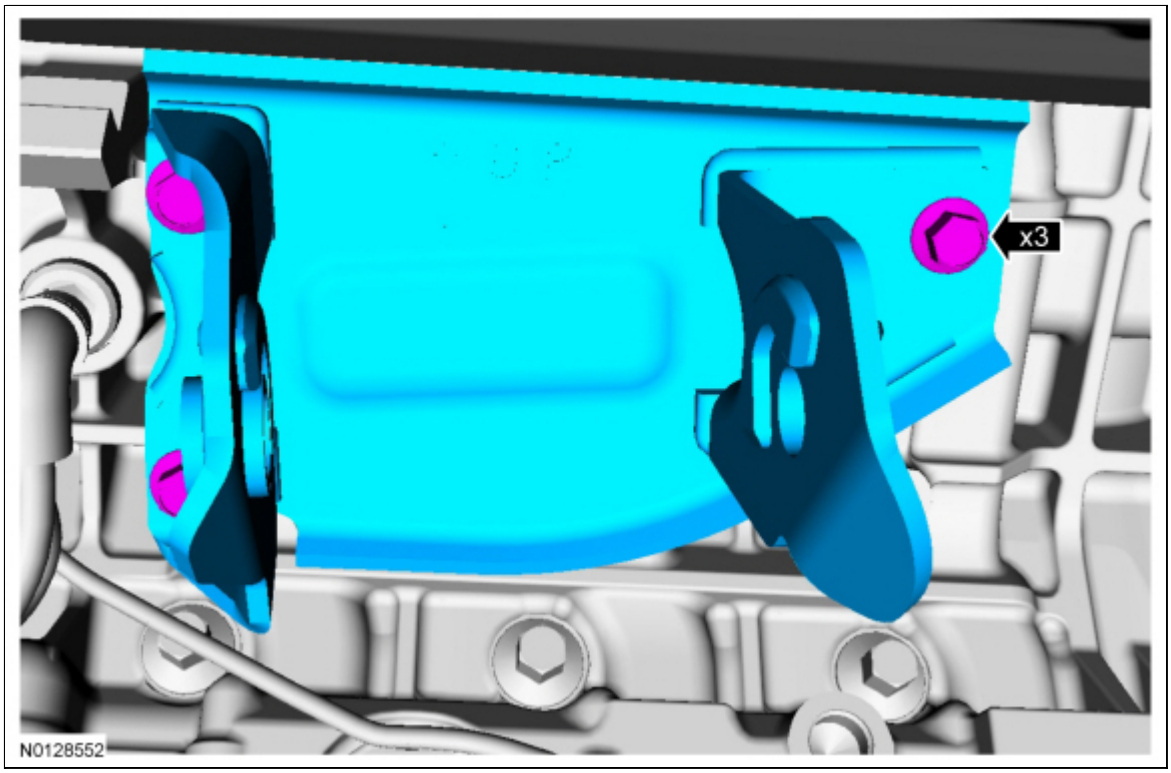
18. ***NOTICE:*** **Use care when positioning the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

Lower the front axle to allow clearance to the LH engine support insulator.



All vehicles

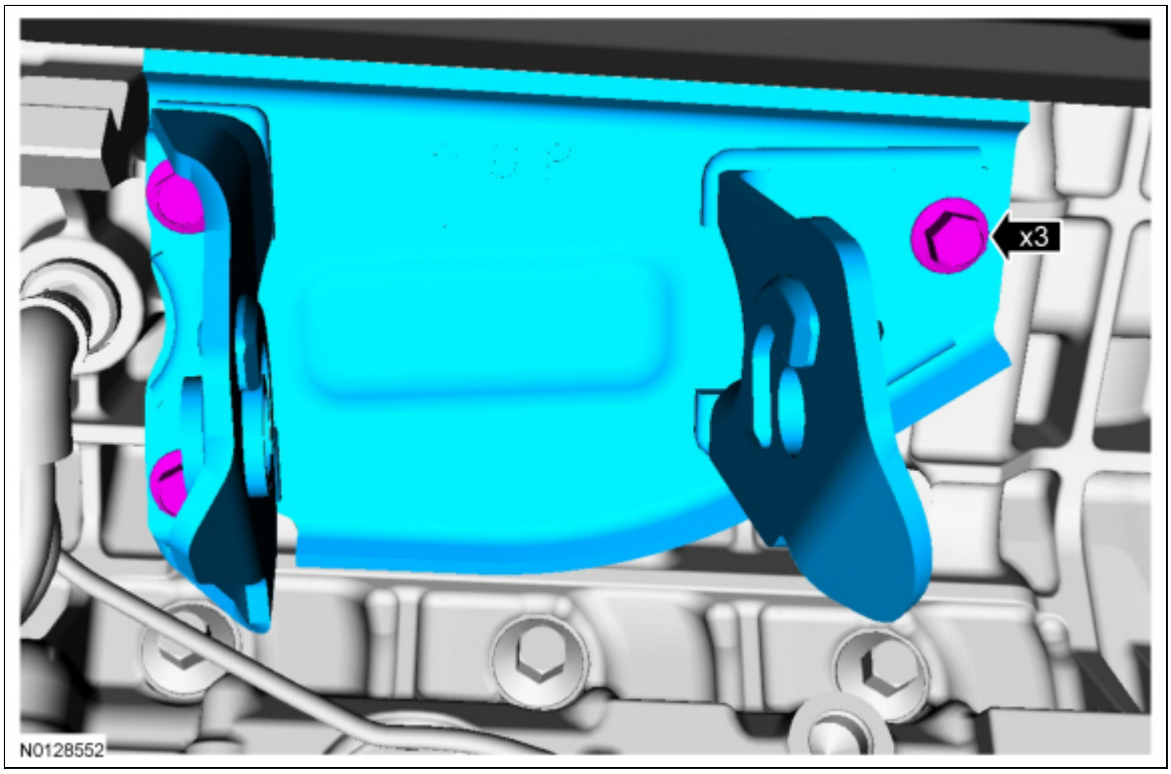
19. Remove the LH engine support insulator.



20. Inspect the engine support insulator-to-frame nut plate for thread damage. If the nut plate is damaged, bend 2 tabs back and remove the nut plate. Replace the nut plate with service part number 56190 and bend the 2 tabs back to the original position.

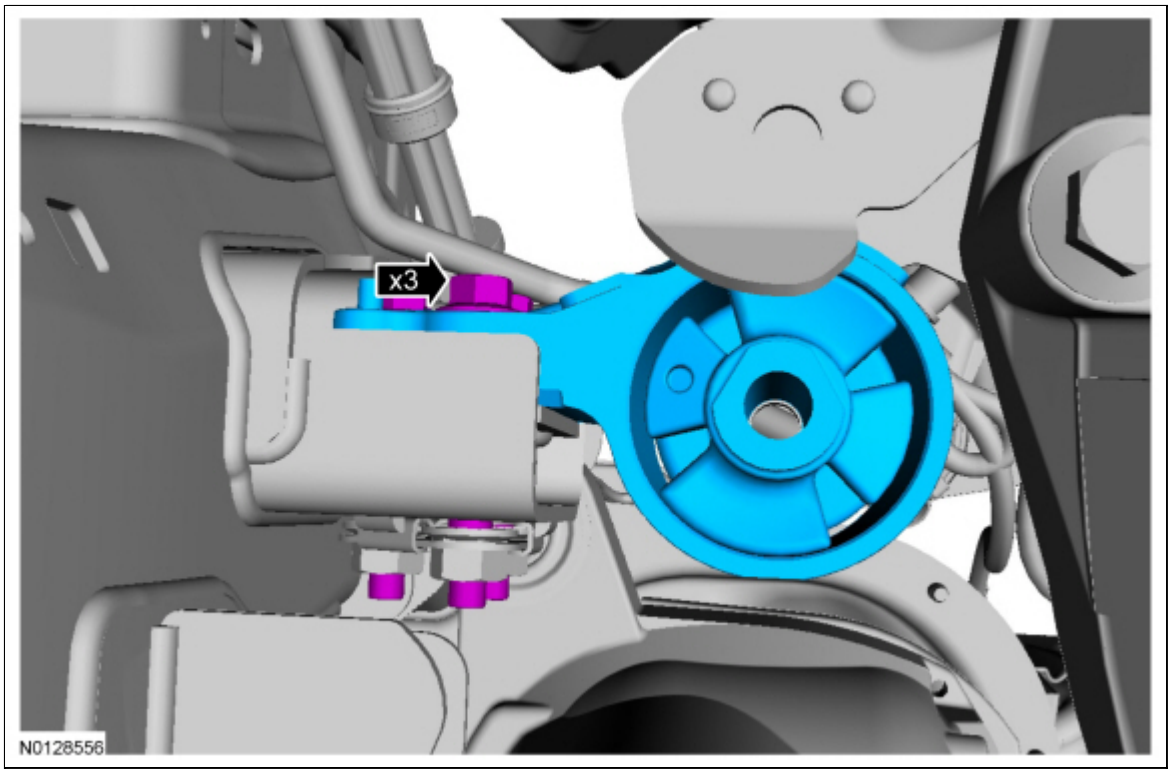
repair4less

21. If necessary, remove the 3 bolts and the LH engine support insulator-to-cylinder block bracket.



Installation

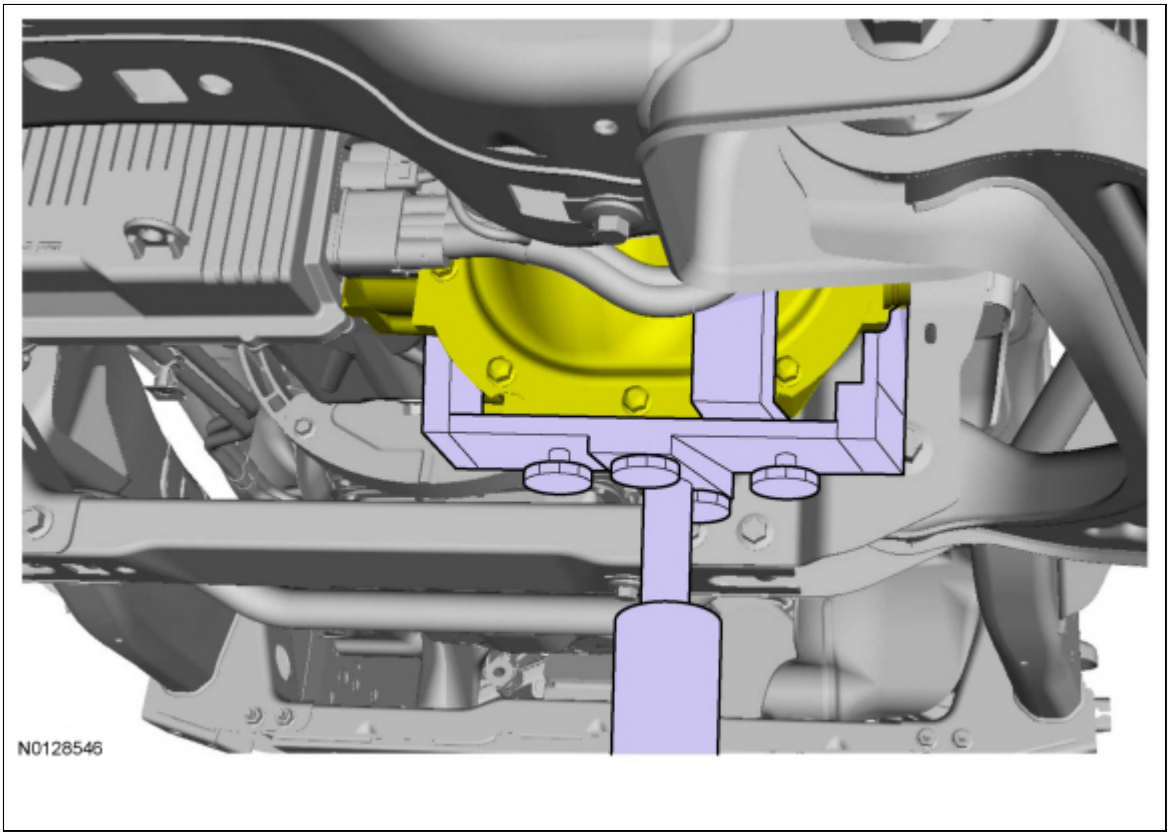
All vehicles



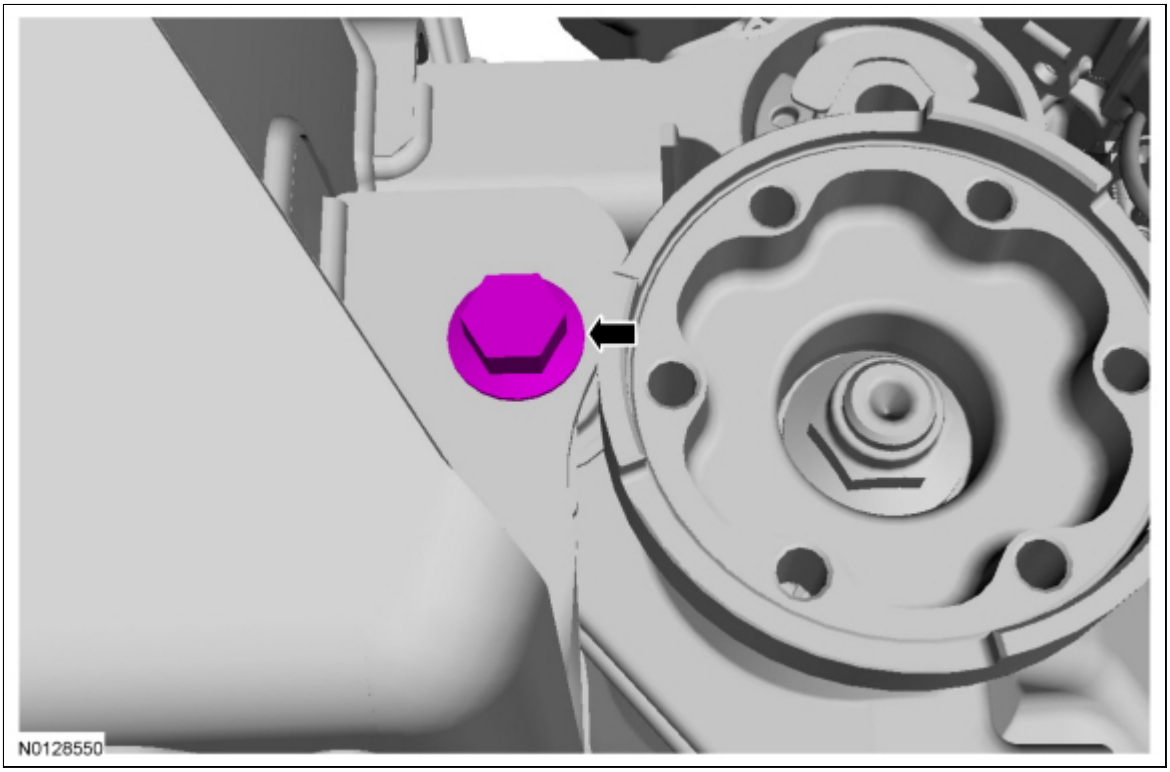
1. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

2. If removed, install the LH engine support insulator-to-cylinder block bracket and install the 3 bolts.
   - Tighten to 63 Nm (46 lb-ft).

3. Position the LH engine support insulator and hand start the 3 new engine support insulator-to-frame bolts.
   - Do not tighten at this time.



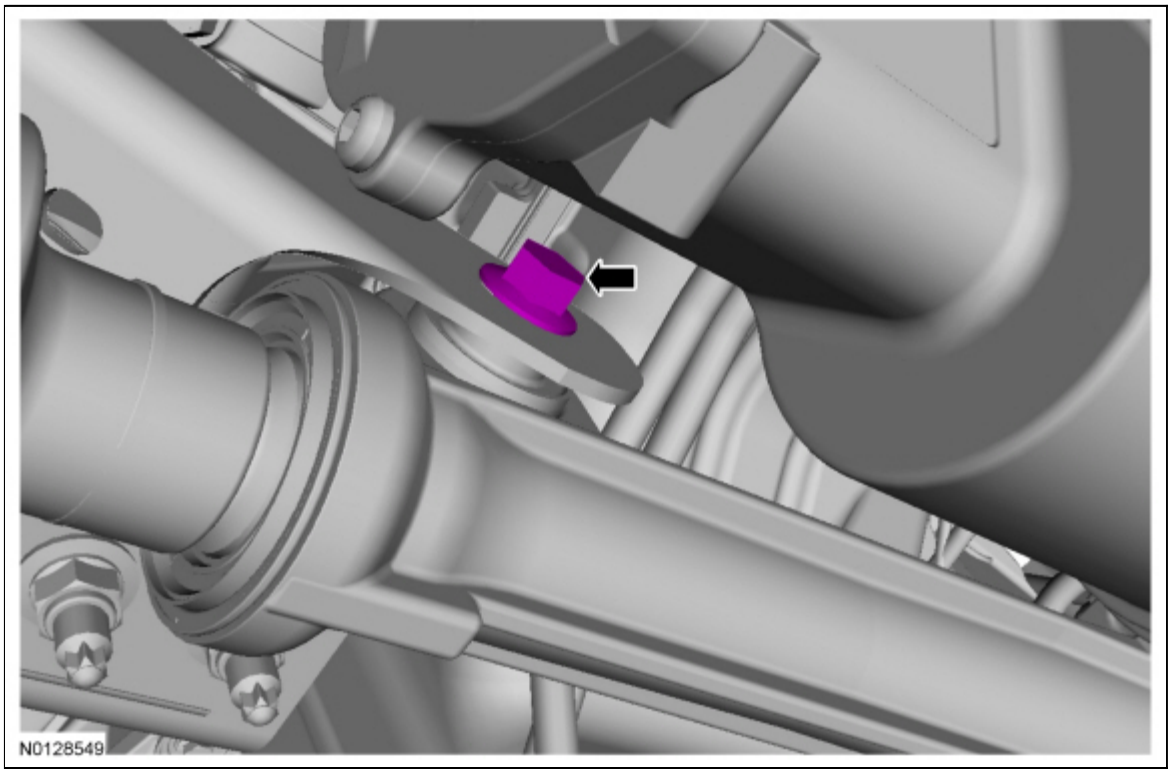
repair4less



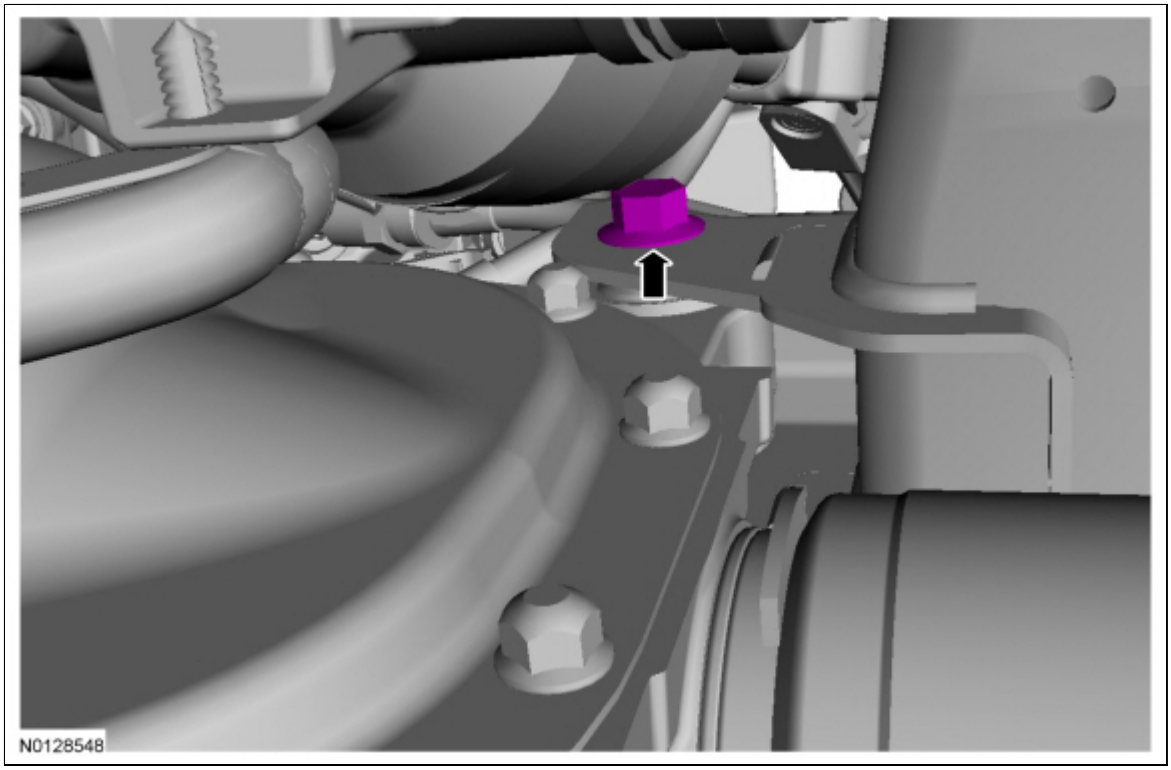
Four-Wheel Drive (4WD) vehicles

4. ***NOTICE:*** **Use care when positioning the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

   Raise the front axle carrier into position.

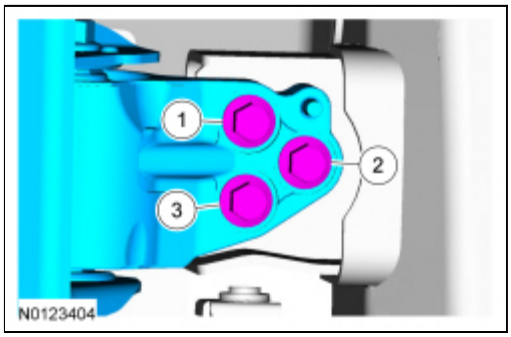


5. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



repair4less

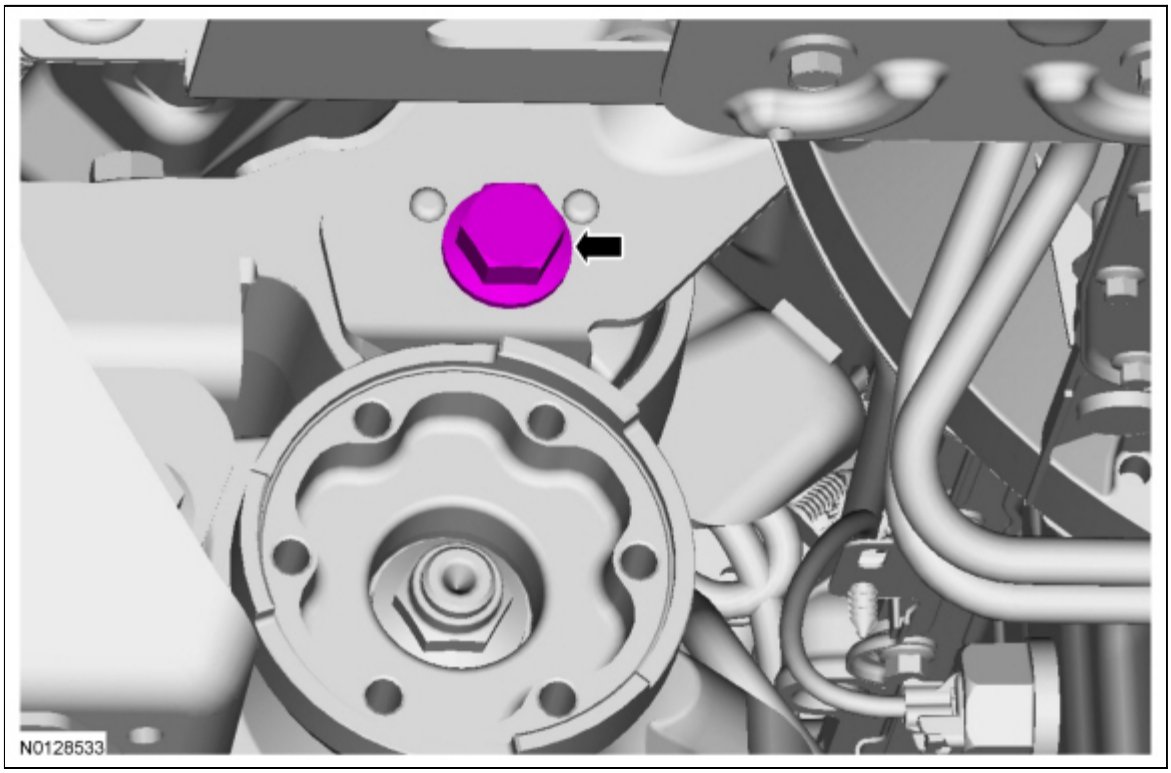
6. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



7. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

All vehicles

8. Tighten the 3 LH engine support insulator bolts in the sequence shown to 175 Nm (129 lb-ft).

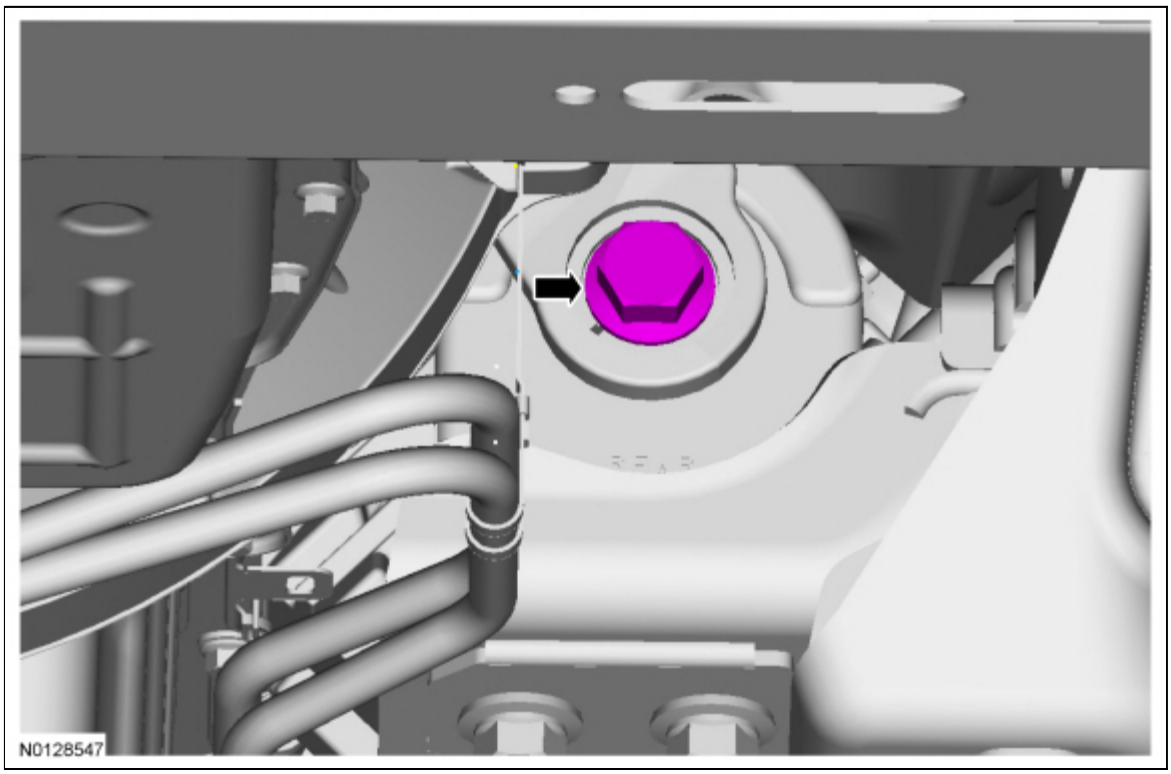


9. Lower the engine to the installed position.

10. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    NOTE: Apply threadlock to the bolt threads prior to installation.

    Install the LH engine support insulator through bolt.
    - Tighten to 350 Nm (258 lb-ft).

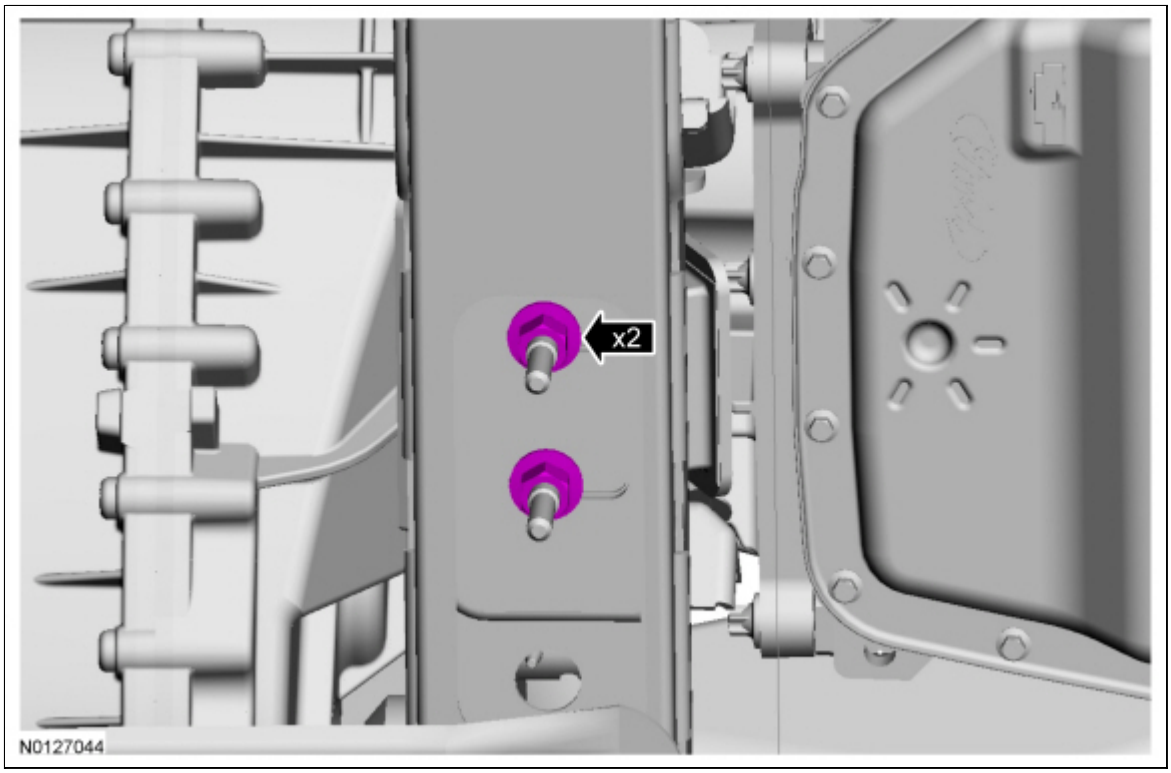


11. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

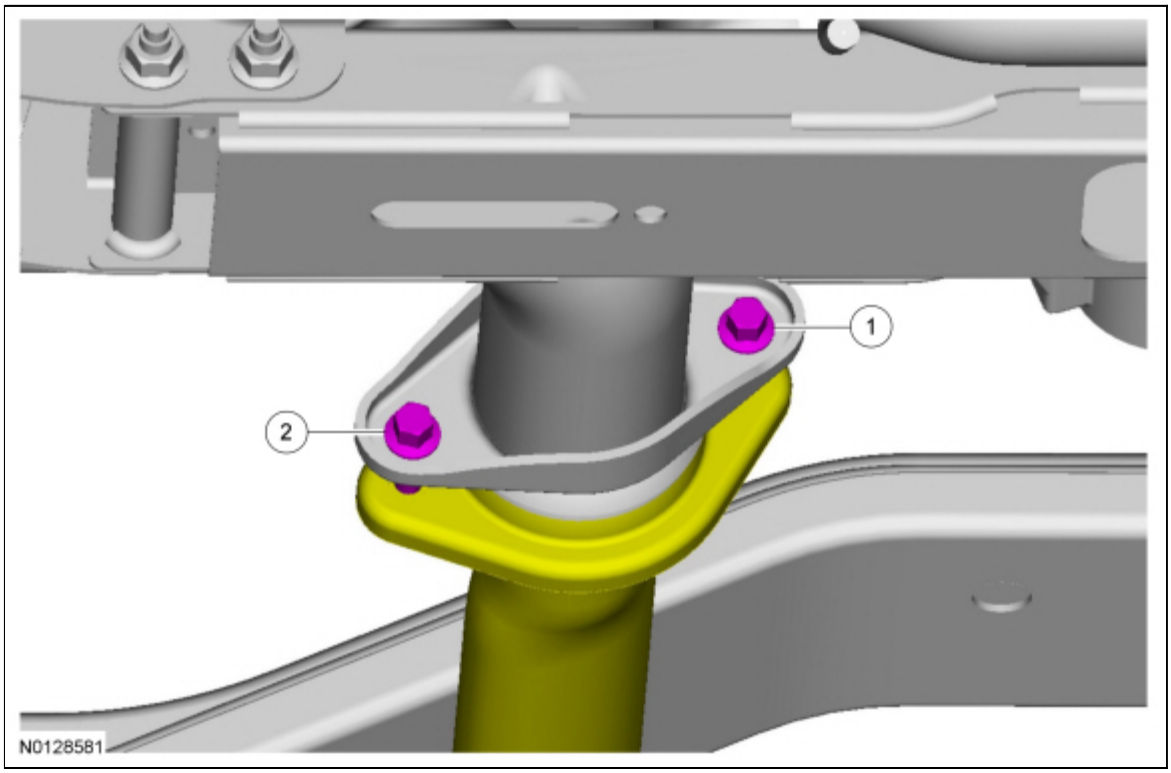
    Remove the RH engine support insulator through bolt and apply threadlock to the bolt threads.

repair4less

- Install the through bolt and tighten to 350 Nm (258 lb-ft).



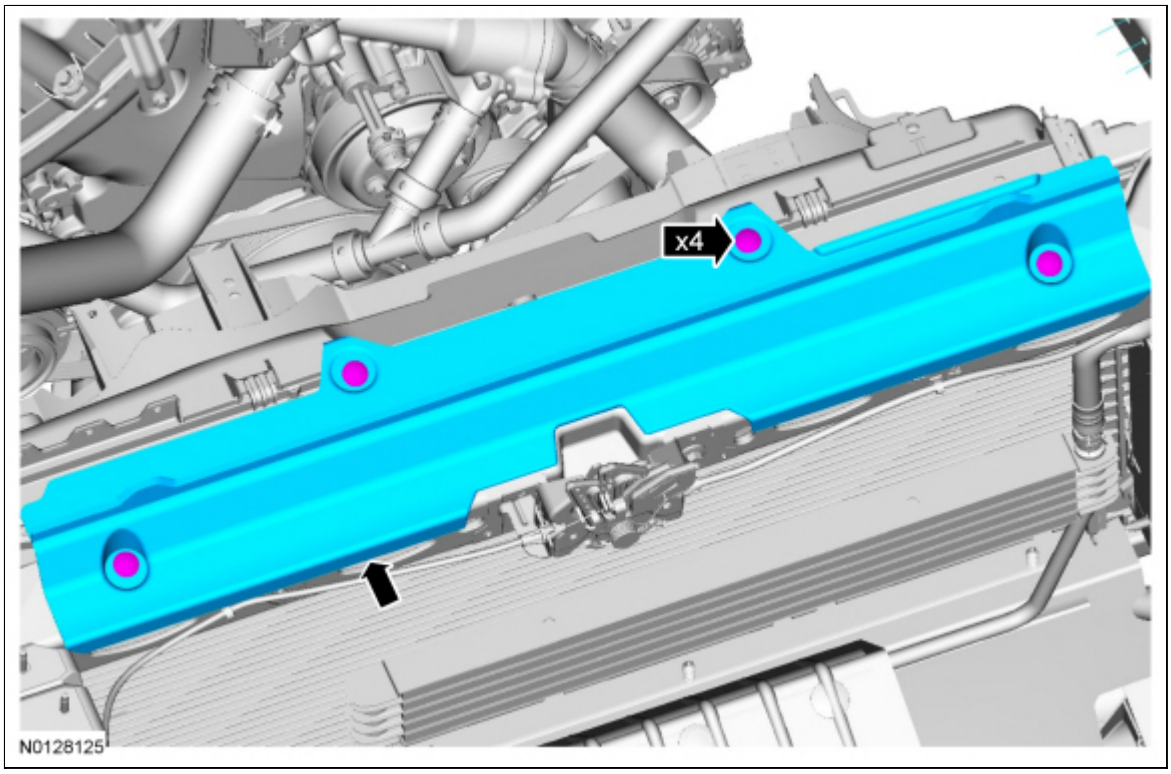
12. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .



13. Install the starter. For additional information, refer to Section 303-06 .

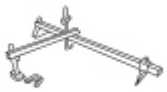
14. ***NOTICE:*** **Only use hand tools when installing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

    Tighten the transmission mount-to-crossmember nuts to 103 Nm (76 lb-ft).



15. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    1. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    2. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).

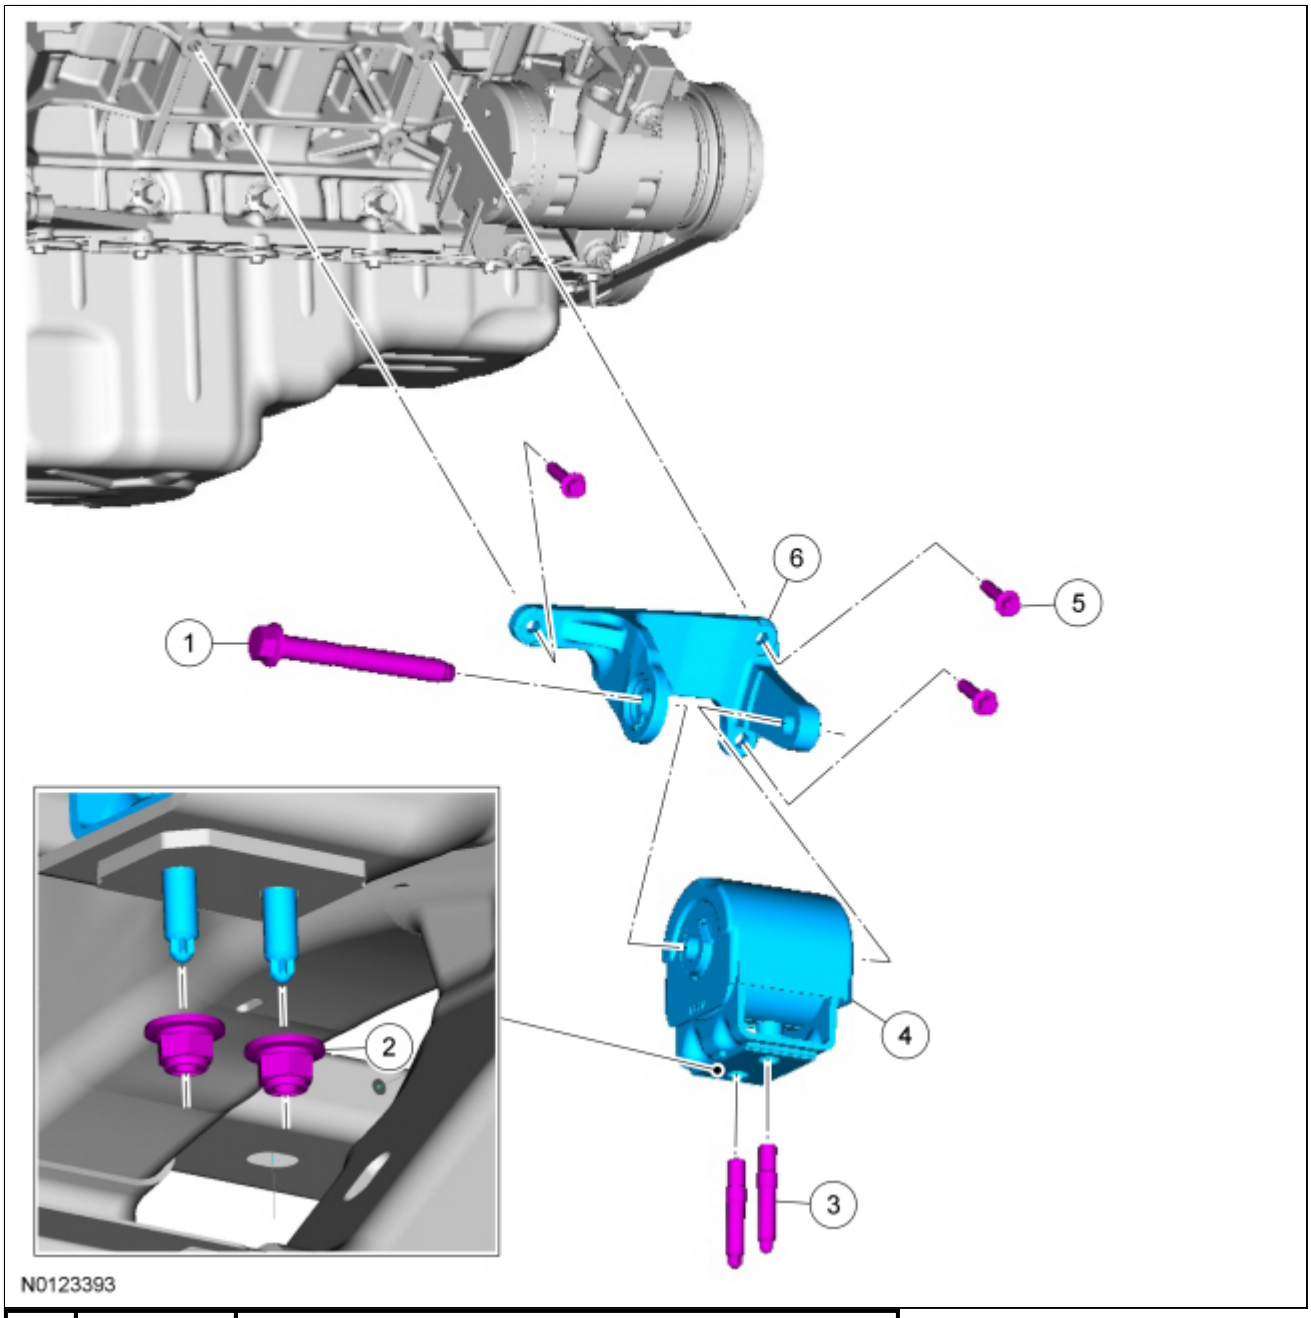
repair4less



16. Install the Air Cleaner (ACL) outlet pipe and ACL cover assembly. For additional information, refer to Section 303-12 .

17. Install the upper radiator air deflector and the 4 pin-type retainers.

Engine Support Insulators — RH



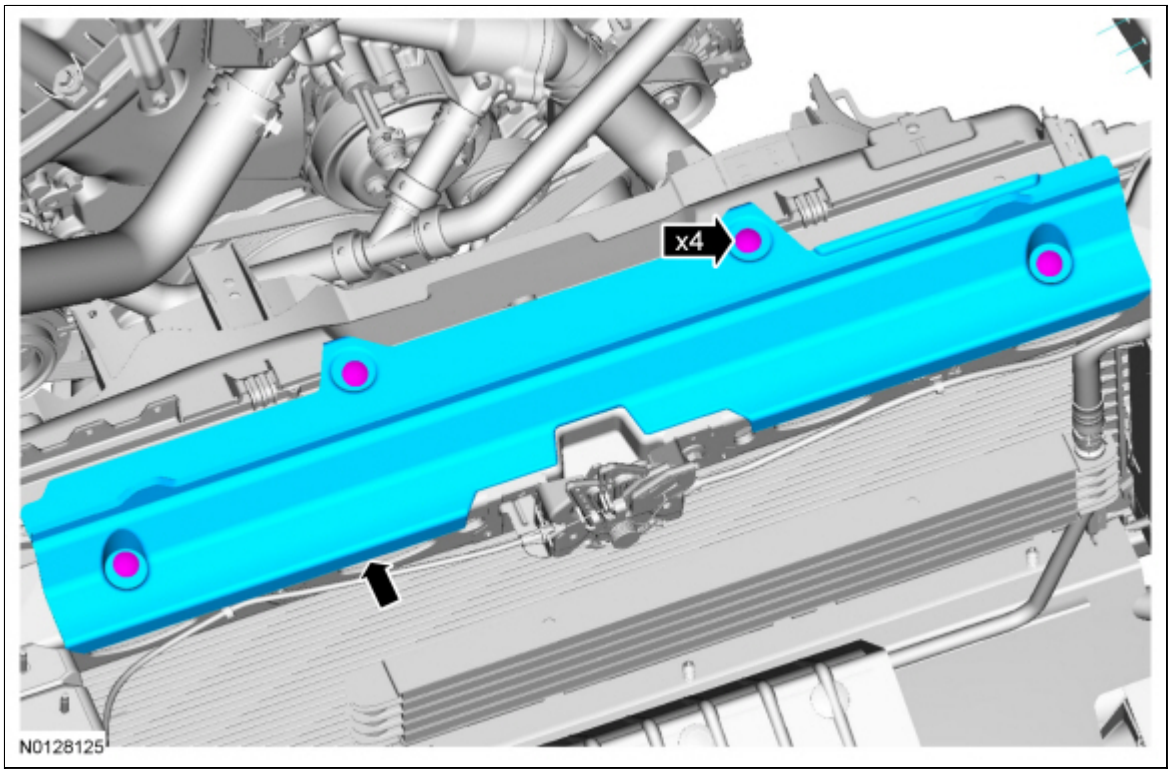
Special Tool(s)

 ST1659-A	Engine Lifting Bracket (D94T-6000-C) 303-D099
 ST2176-B	Support Bar, Engine 303-F070

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

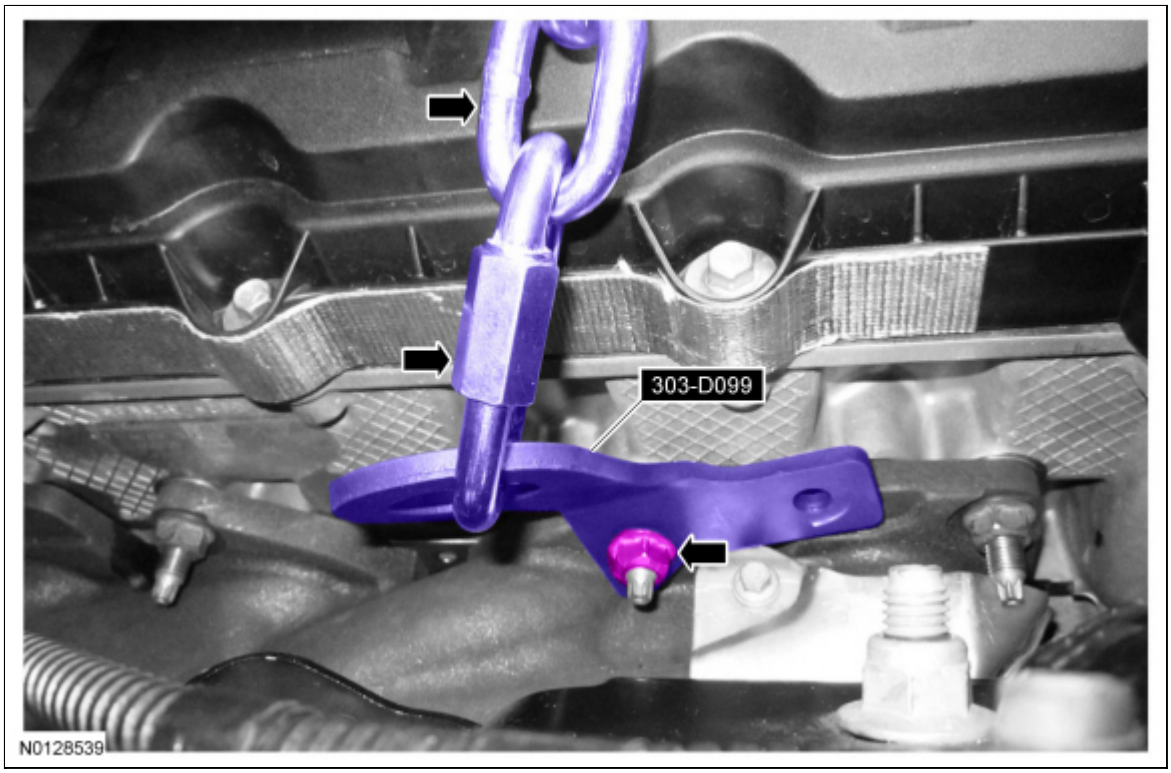
repair4less



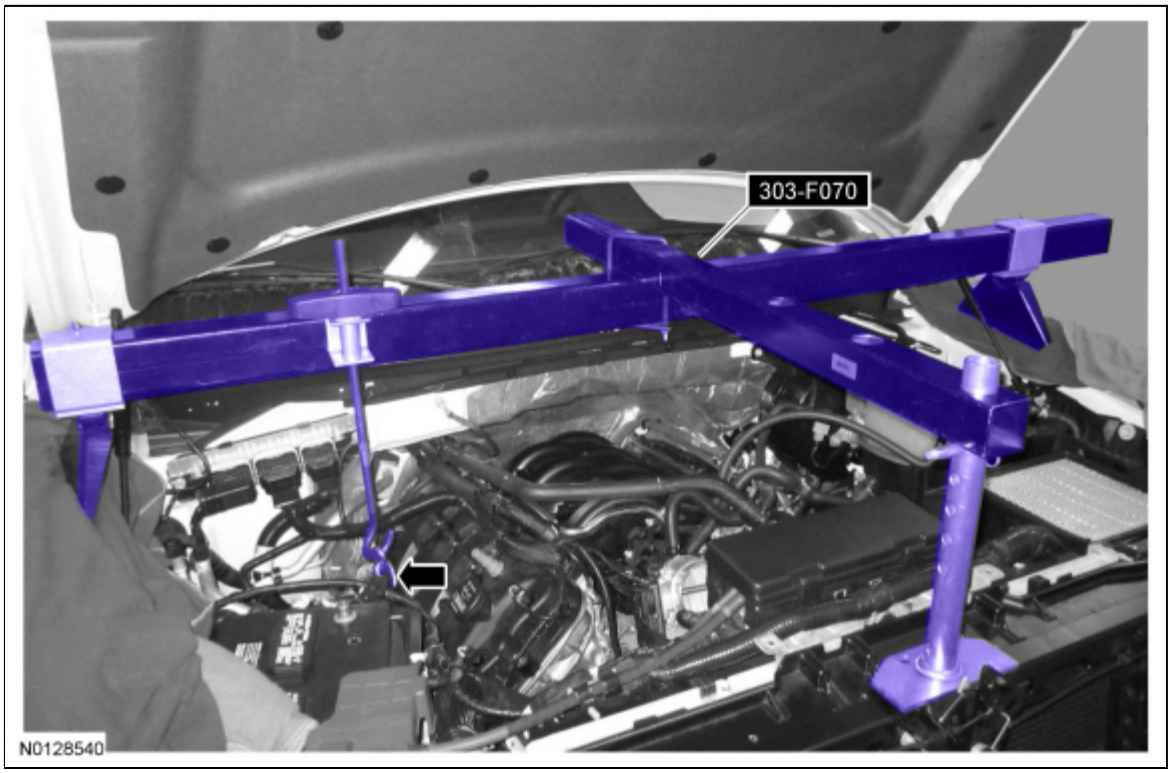
Item	Part Number	Description
1	—	RH engine support insulator through bolt (part of 6038) - 350 Nm (258 lb-ft)
2	W707251	RH engine support insulator nut (2 required) - 175 Nm (129 lb-ft)
3	—	RH engine support insulator stud (part of 6038) (2 required) - 15 Nm (133 lb-in)
4	6038	RH engine support insulator
5	W714735	RH engine support insulator bracket bolt (3 required) - 63 Nm (46 lb-ft)
6	—	RH engine support insulator bracket (part of 6038)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



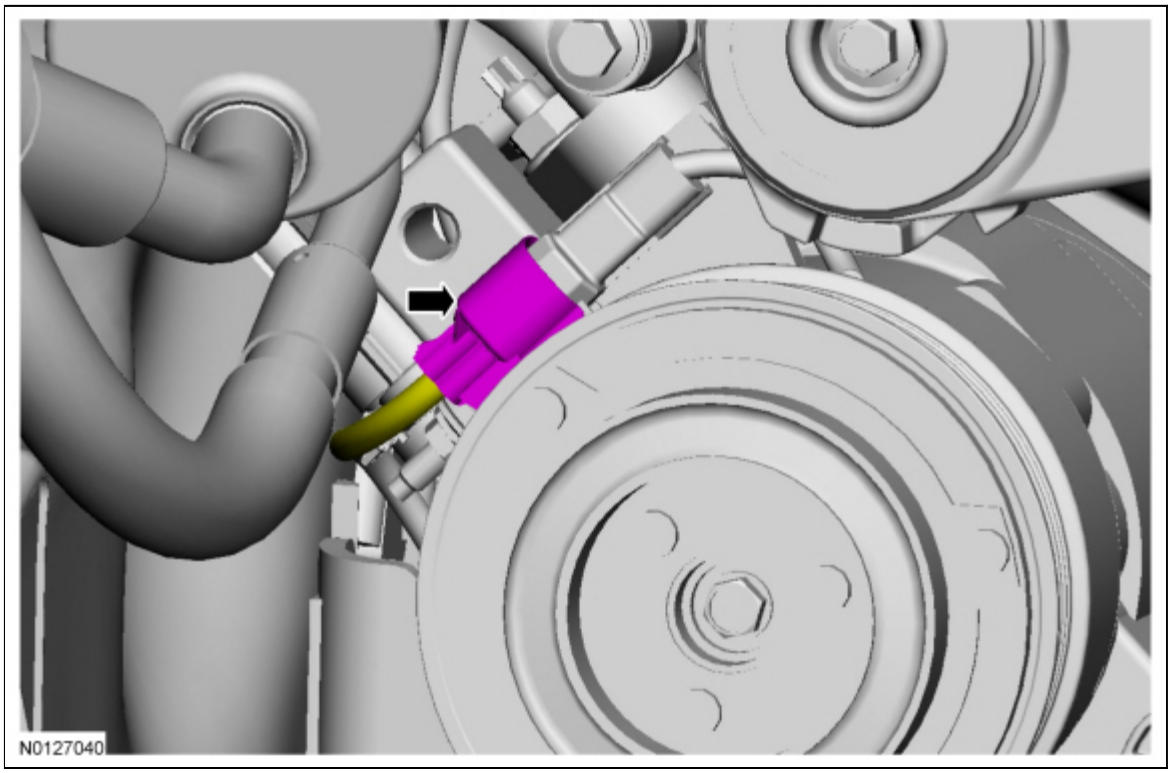
2. Remove the 4 pin-type retainers and the upper radiator air deflector.



3. Remove the Air Conditioning (A/C) compressor belt . For additional information, refer to Section 303-05 .

4. Remove the exhaust manifold nut and install the Engine Lifting Bracket and nut on the RH exhaust manifold stud.
    - Attach a length of chain and a connecting link to the Engine Lifting Bracket.

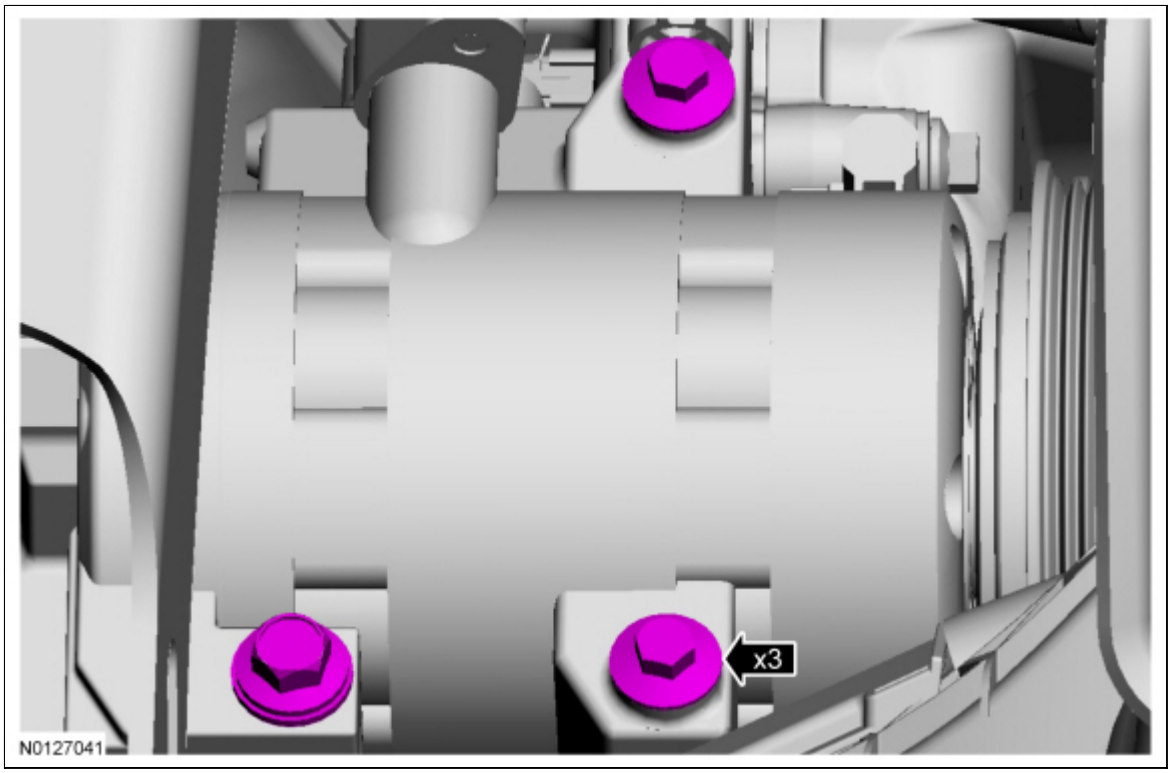
repair4less



5. Install the Engine Support Bar.
    - Attach the chain installed in the previous step to the Engine Support Bar hook to support the engine.

6. Remove the starter. For additional information, refer to Section 303-06 .

7. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .

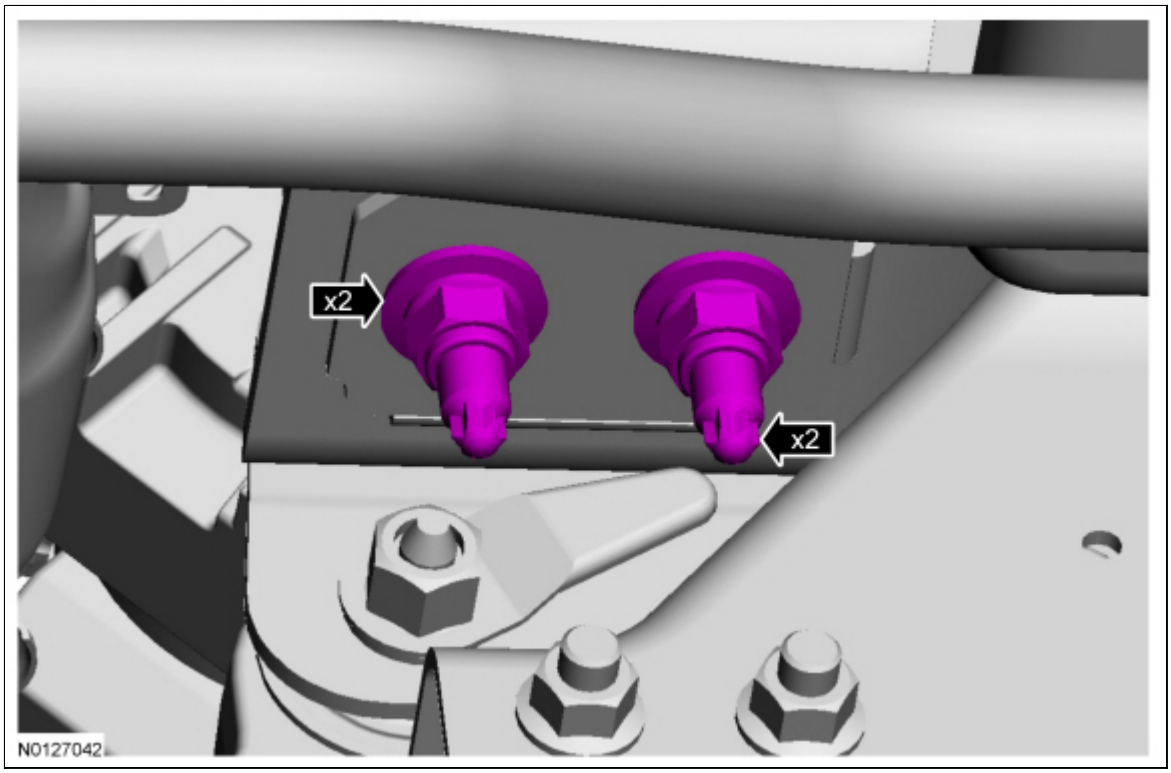


8. Disconnect the A/C compressor electrical connector.

9. ***NOTICE:*** **The upper bolt cannot be completely removed and will remain with the A/C compressor.**

   Remove the 3 bolts and lower the A/C compressor.

repair4less



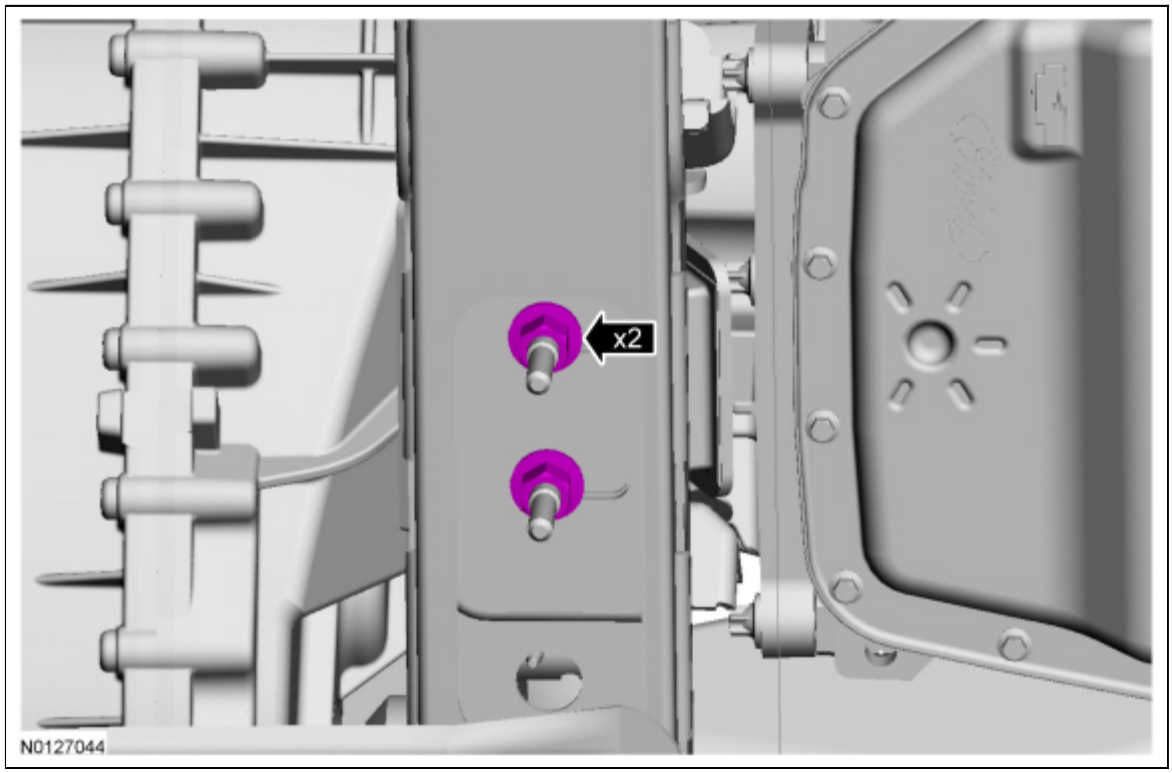
10. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator nuts or damage to the engine support insulator can occur.**

    NOTICE: **Only use hand tools when removing or installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    NOTE: If during nut removal the stud is extracted from the engine support insulator, separate the nut from the stud bolt prior to stud installation.

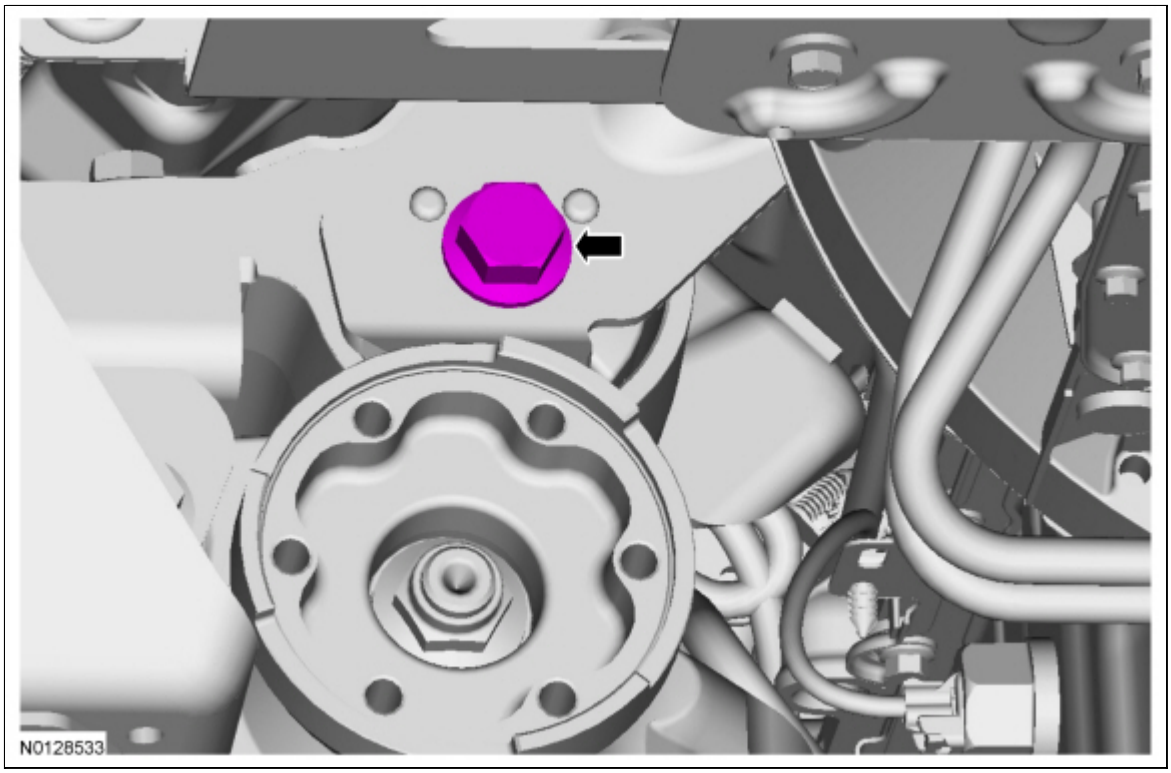
    Remove the 2 RH engine support insulator nuts and studs.

11. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.



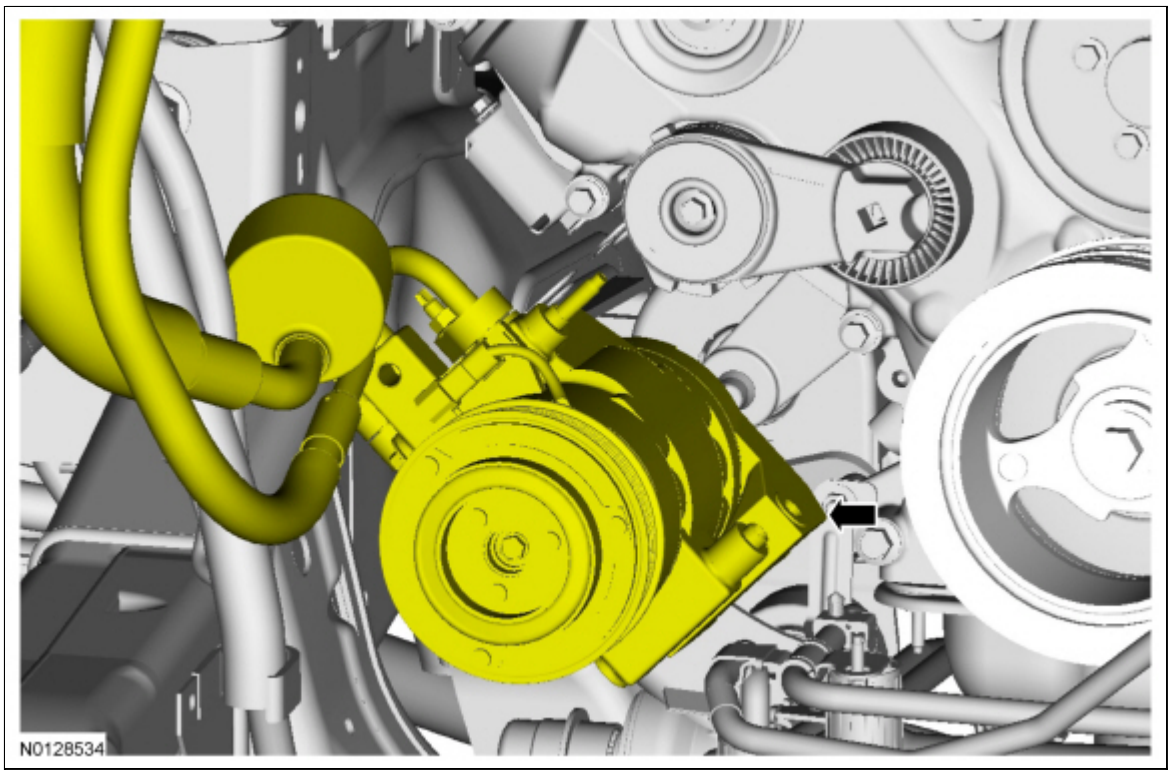
12. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or**

repair4less



damage to the transmission mount can occur.

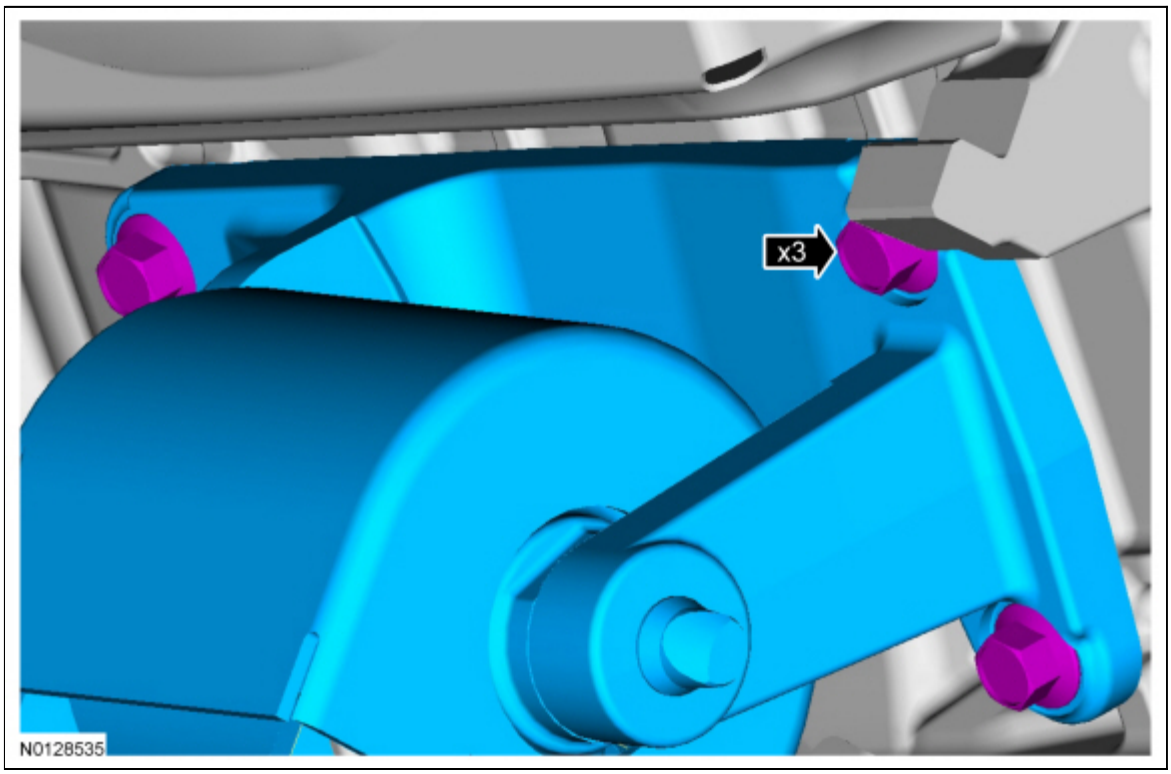
Loosen the 2 transmission mount-to-crossmember nuts.



13. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Loosen the LH engine support insulator through bolt.

14. Raise the RH side of the engine 50 mm (1.968 in).

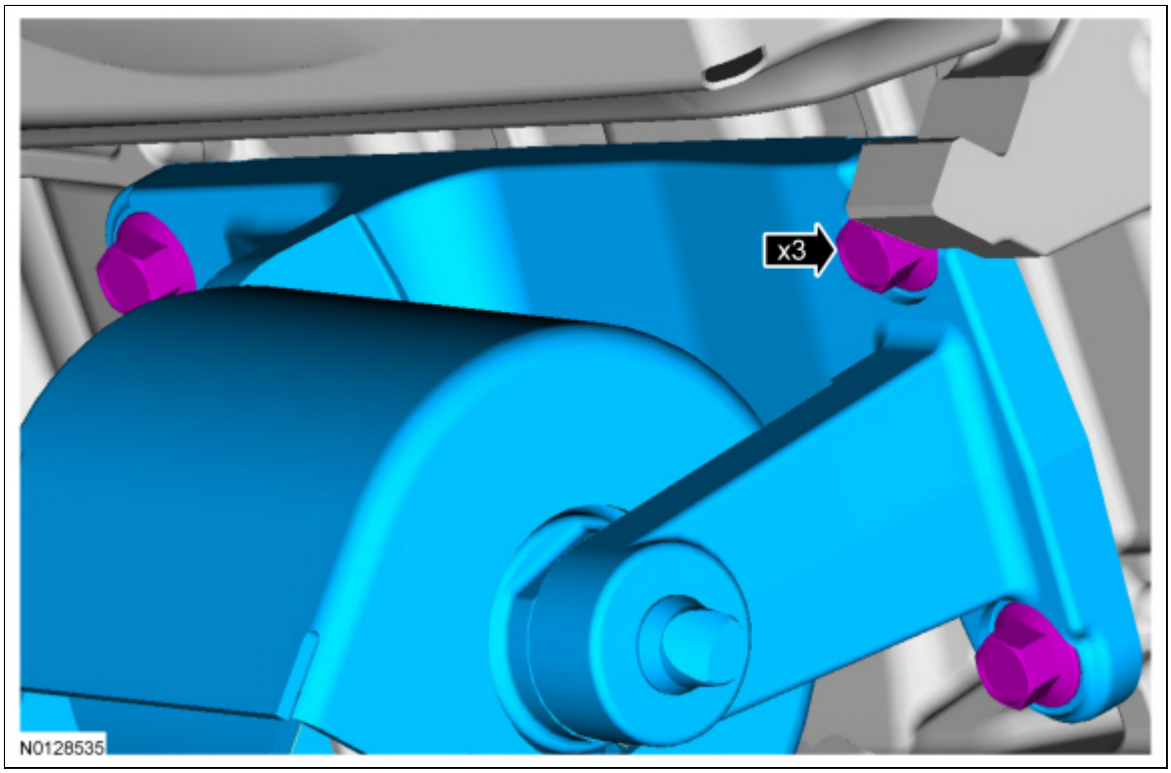


15. Position the A/C compressor aside to access the 2 front engine support insulator bracket bolts.

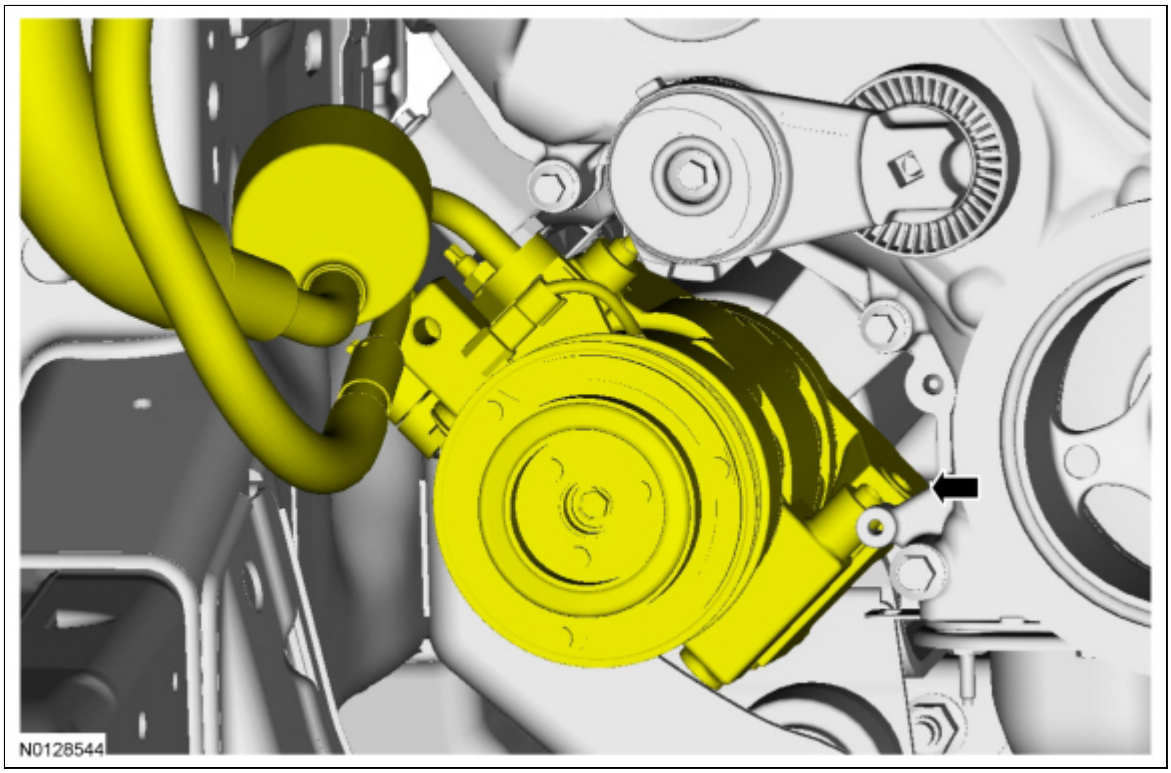
16. Remove the 3 RH engine support insulator bracket-to-engine bolts.

repair4less

- Remove the RH engine support insulator and bracket as an assembly.



Installation



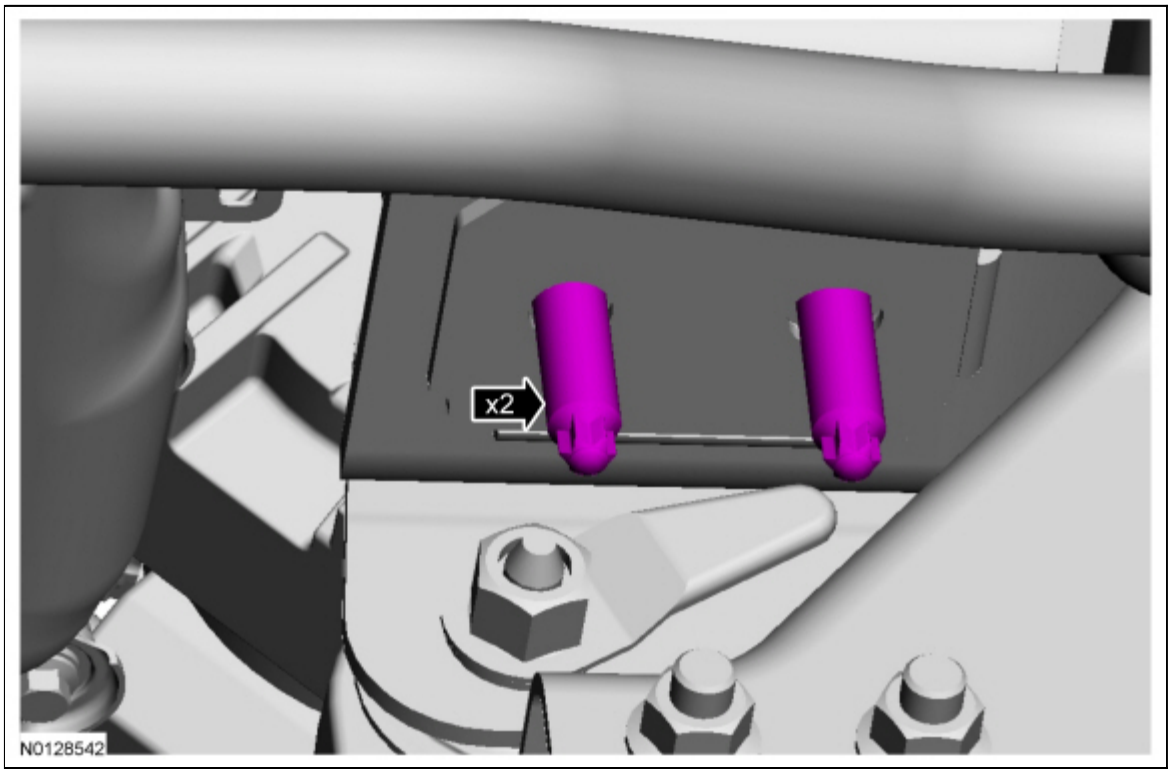
1. Clean the engine support insulator bracket-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

2. **NOTE:** If a new RH engine support insulator is installed, remove the 2 studs prior to positioning the assembly in the vehicle.

   Install the RH engine support insulator and bracket assembly and install the 3 bolts.
   - Tighten to 63 Nm (46 lb-ft).

3. Position the A/C compressor below the RH side of the engine.

4. Lower the engine to the installed position.

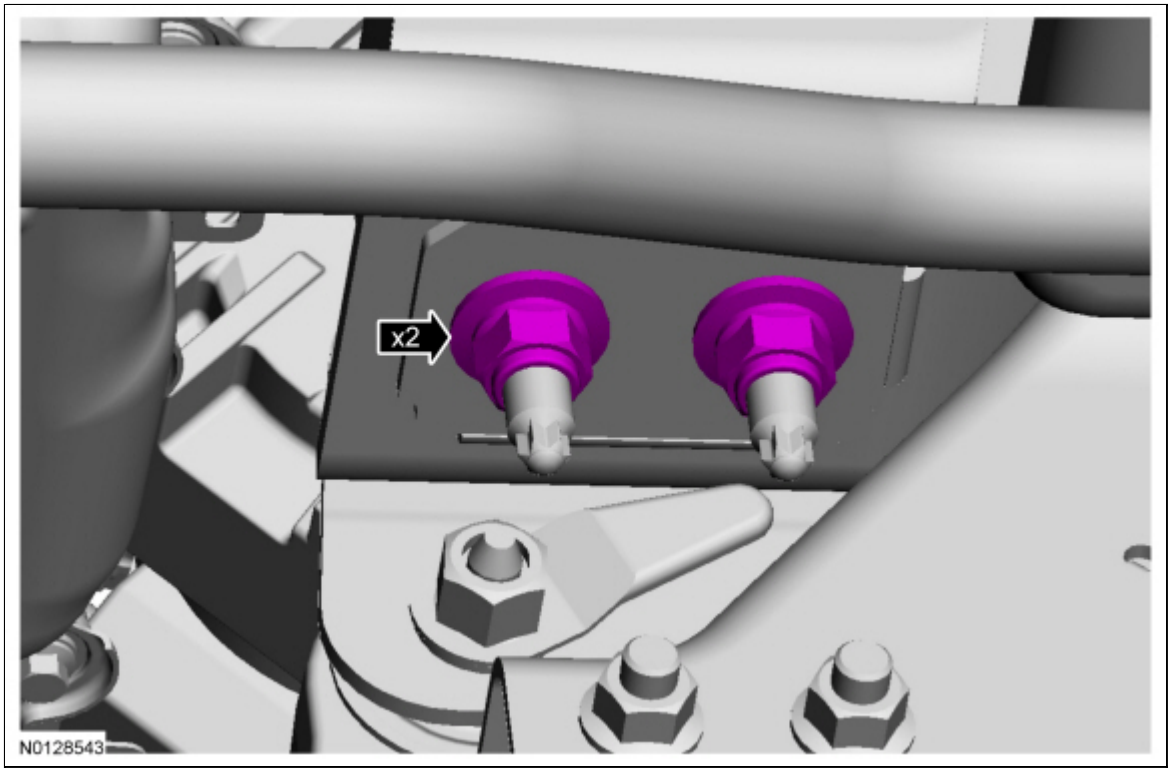


5. ***NOTICE:*** **Only use hand tools when installing the engine support insulator studs or damage to**

repair4less

the engine support insulator can occur.

Install the 2 RH engine support insulator studs.



- Tighten to 15 Nm (133 lb-in).

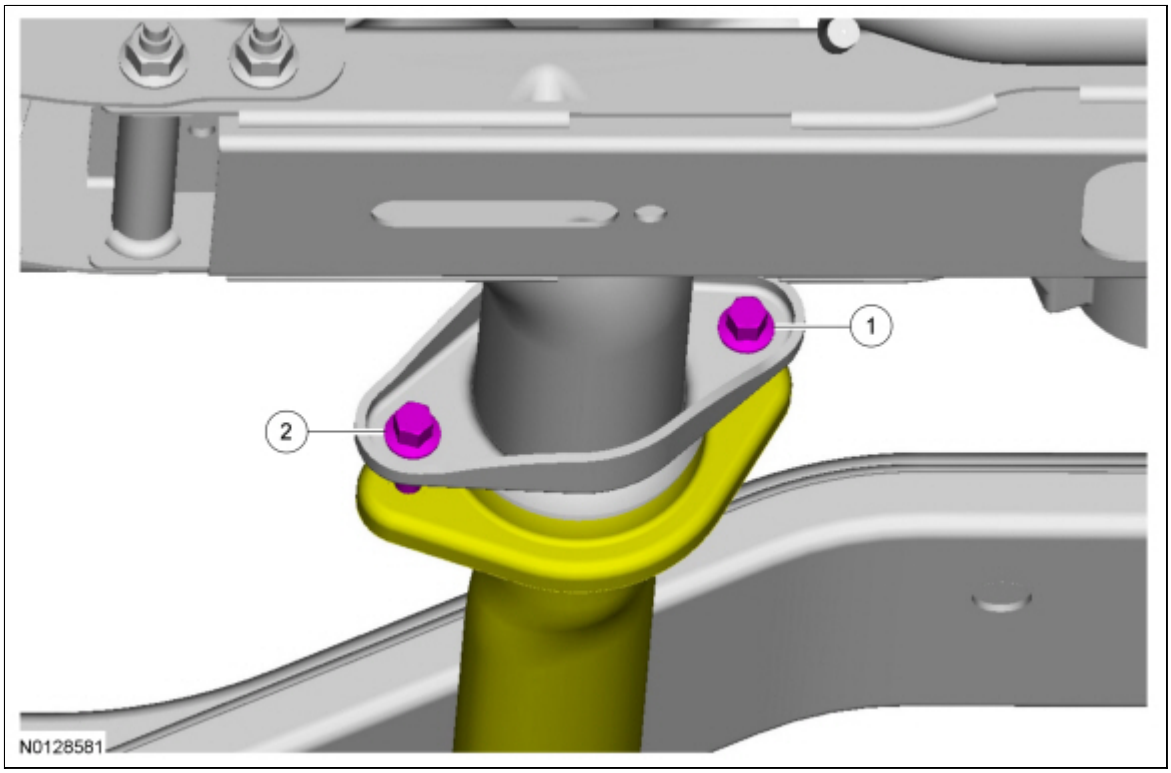
6. ***NOTICE:*** **Only use hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

   Install the 2 RH engine support insulator nuts.

   - Tighten to 175 Nm (129 lb-ft).

7. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

   Remove the LH engine support insulator through bolt and apply threadlock to the bolt threads.
   - Install the through bolt and tighten to 350 Nm (258 lb-ft).

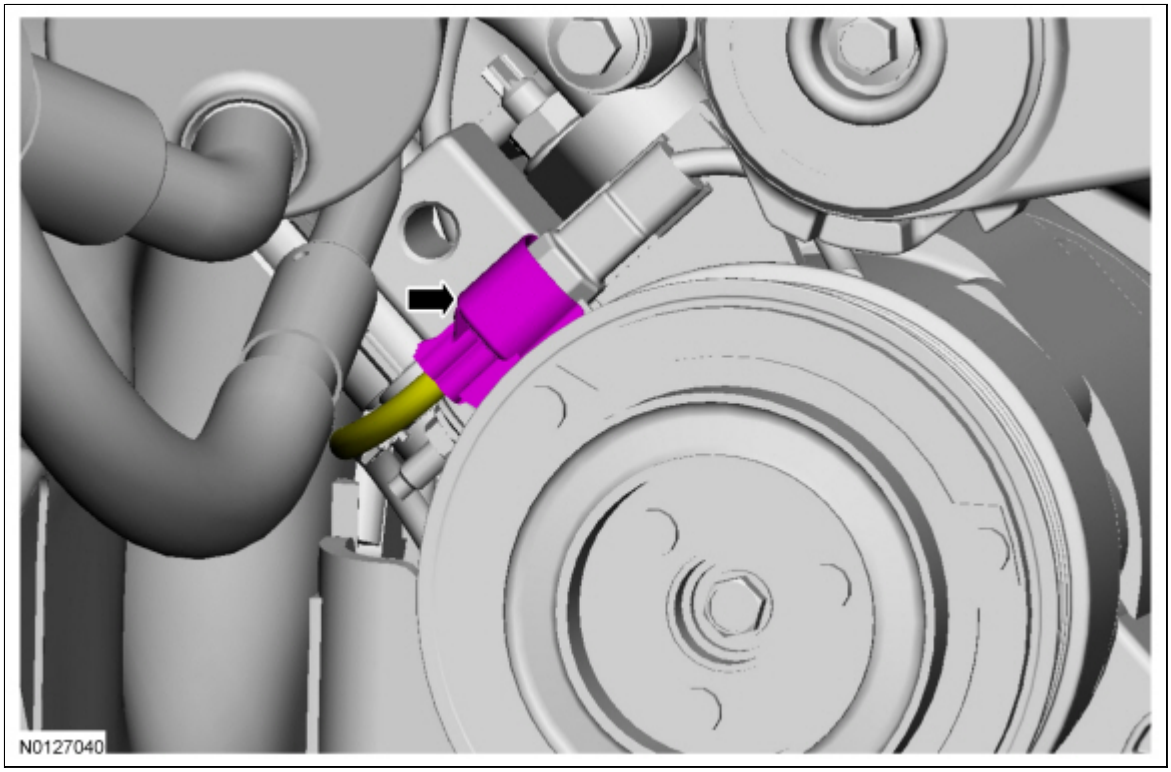


repair4less

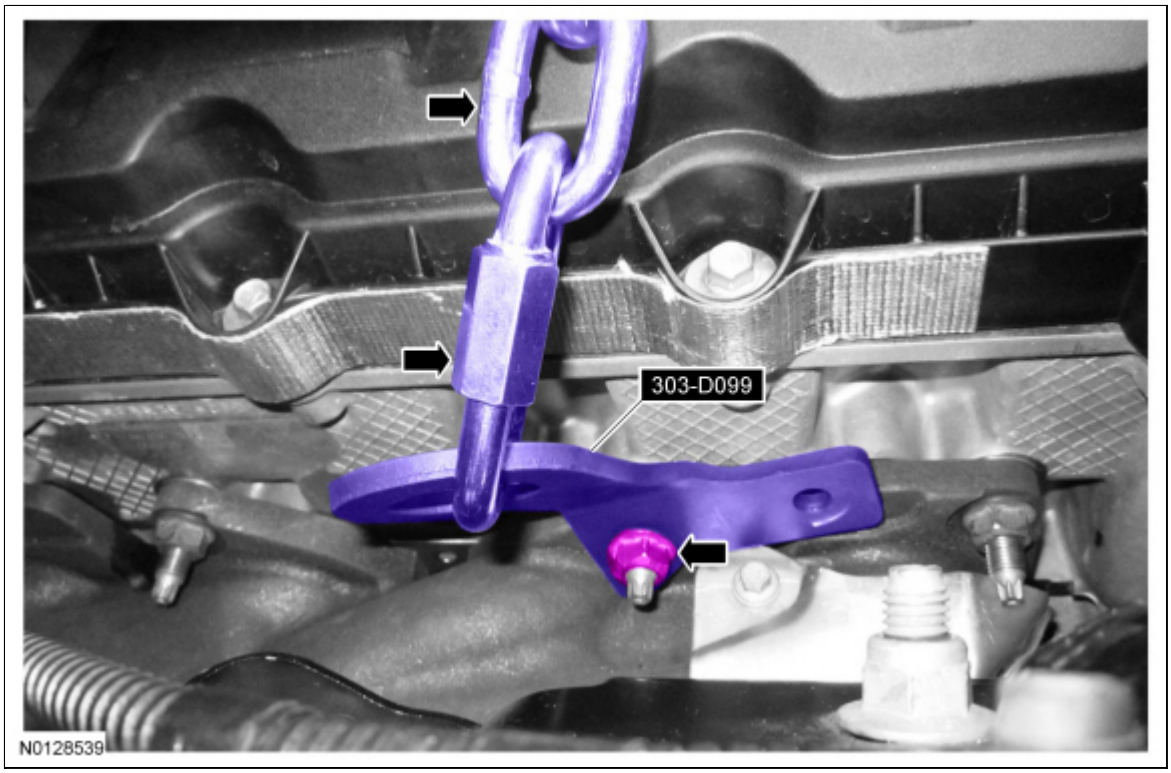
8. ***NOTICE:*** **Only use hand tools when installing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

   Tighten the transmission mount-to-crossmember nuts to 103 Nm (76 lb-ft).

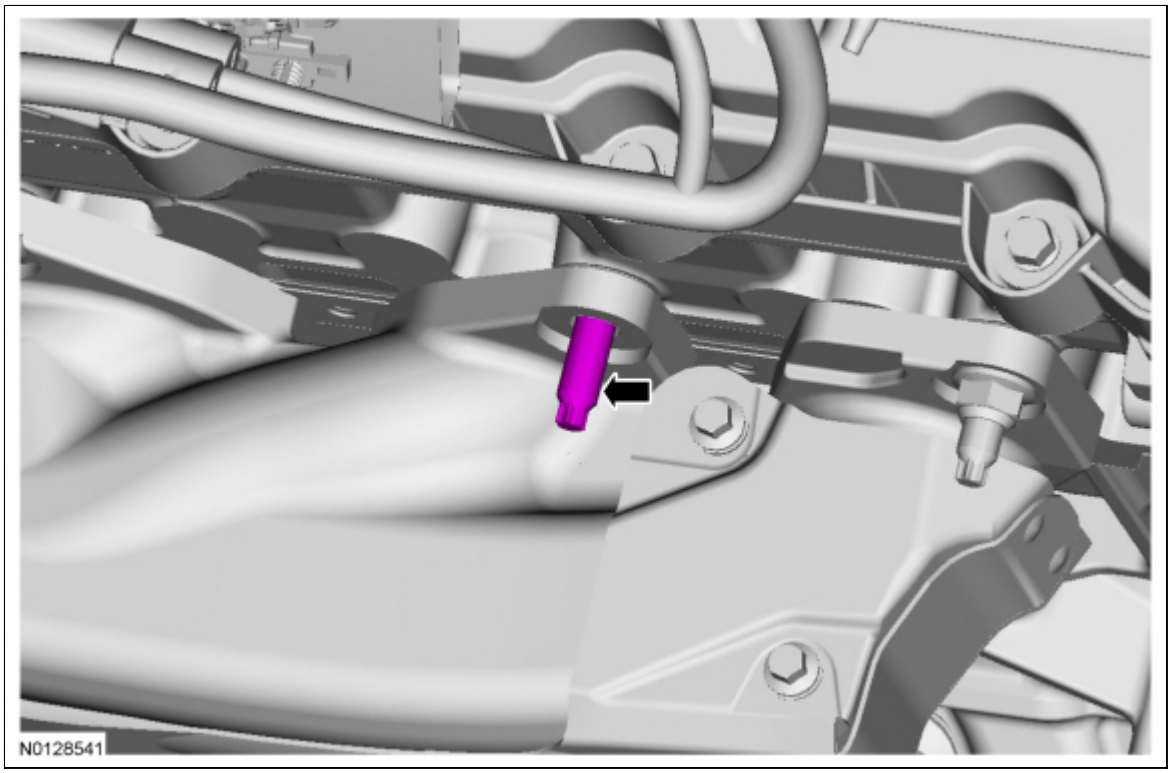
9. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
   1. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
   2. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



10. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

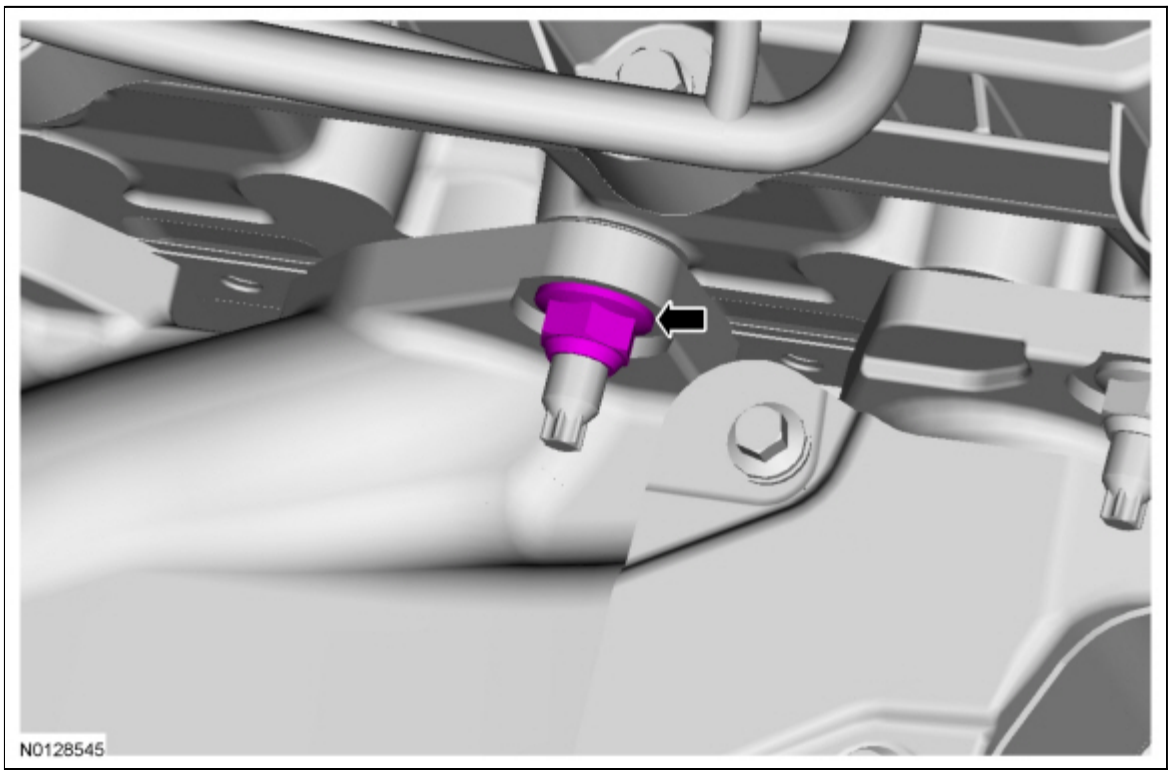


11. Connect the A/C compressor electrical connector.

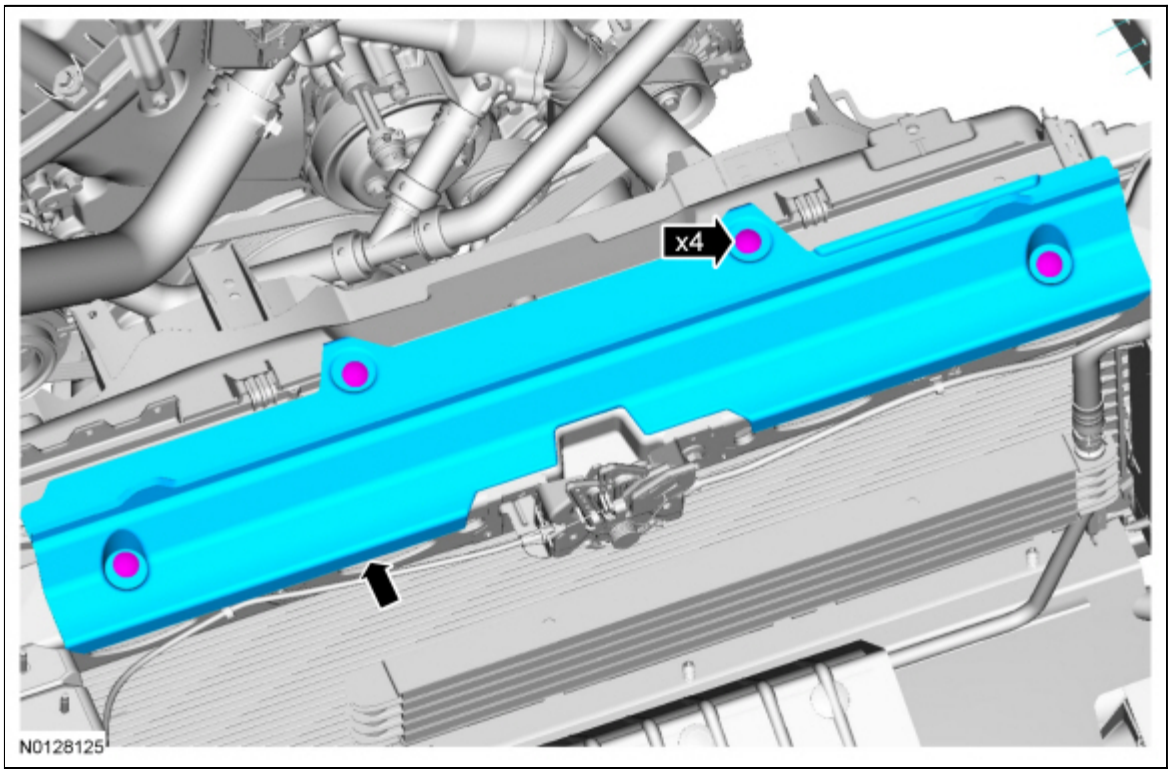


repair4less

12. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .
13. Install the starter. For additional information, refer to Section 303-06 .
14. Install the A/C compressor belt. For additional information, refer to Section 303-05 .
15. Remove the Engine Support Bar.
16. Remove the nut, the Engine Lifting Bracket, the connecting link and chain.



17. Remove and discard the exhaust manifold stud.
    - Install a new exhaust manifold stud and tighten to 25 Nm (18 lb-ft).

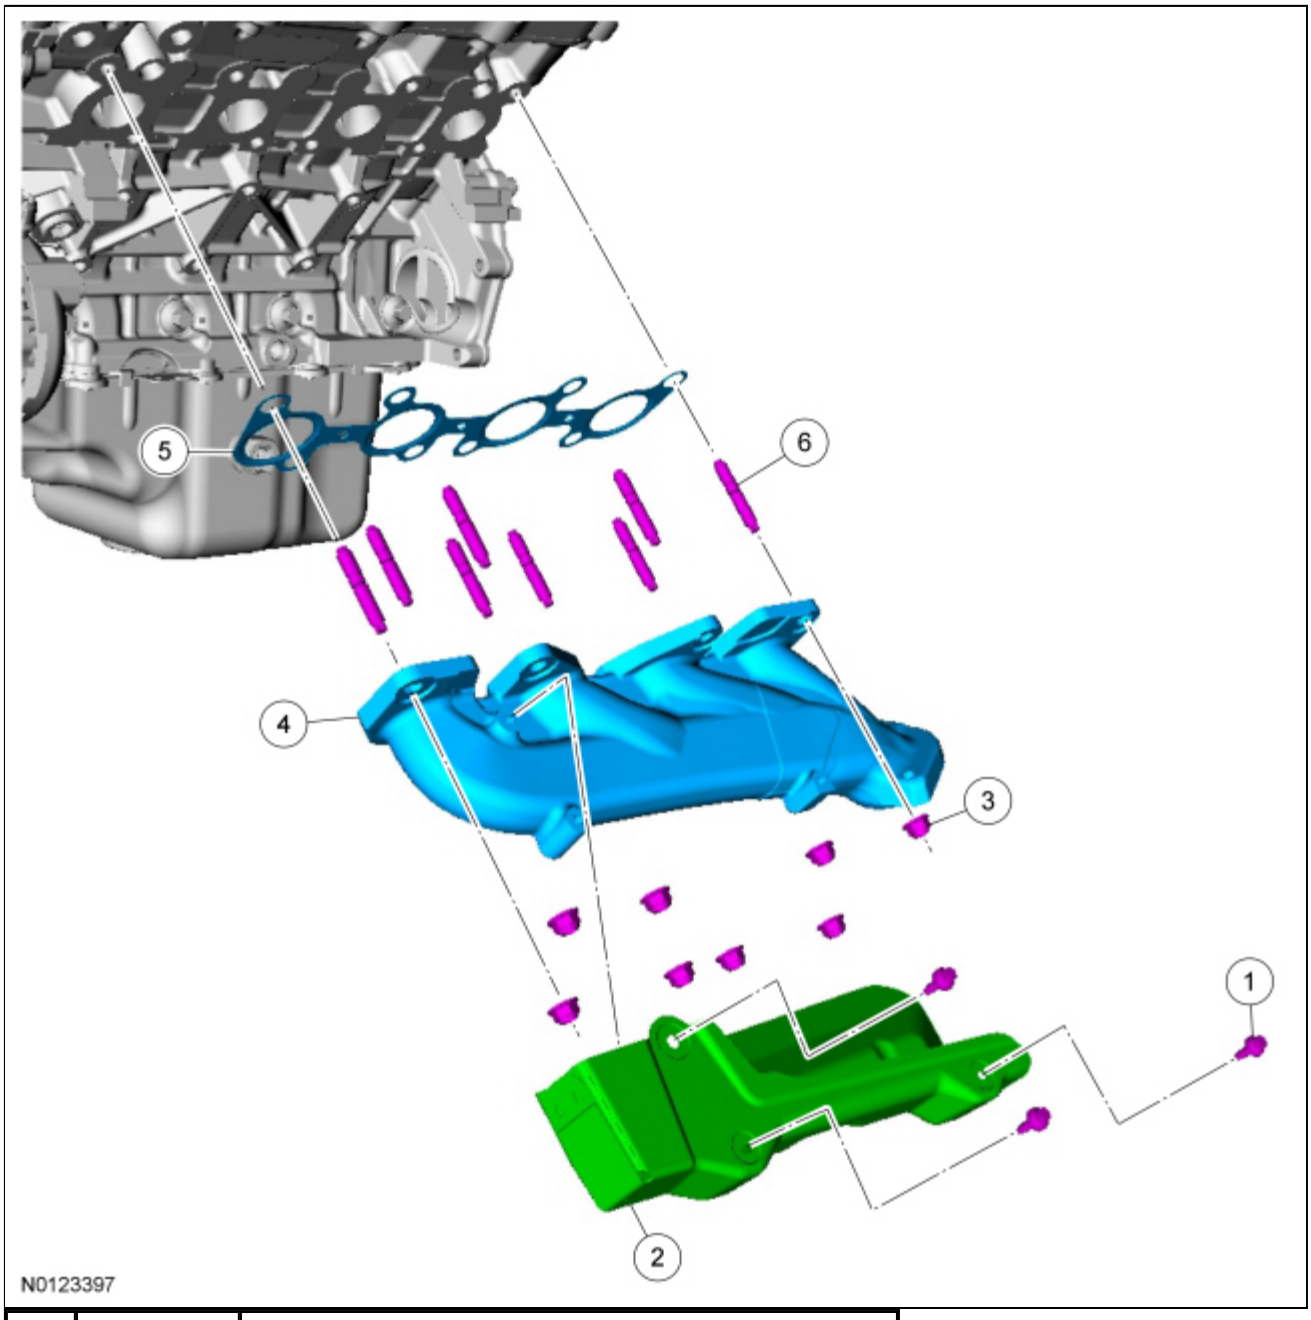


18. Install a new exhaust manifold nut and tighten in 2 stages.
    - Stage 1: Tighten to 24 Nm (18 lb-ft).

repair4less

- Stage 2: Tighten to 32 Nm (24 lb-ft).

19. Install the upper radiator air deflector and the 4 pin-type retainers.

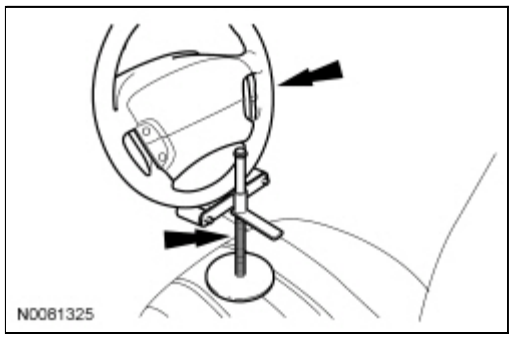


repair4less

Exhaust Manifold — LH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—



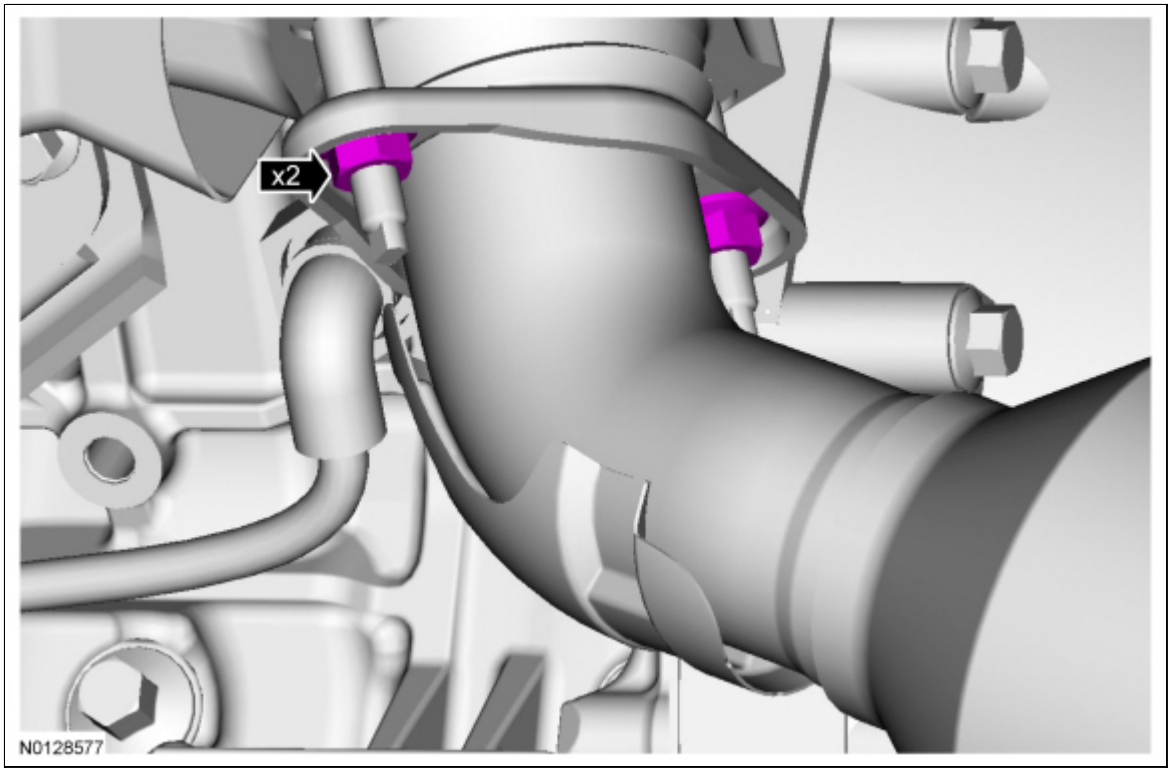
Item	Part Number	Description
1	W714133	LH exhaust manifold heat shield bolts (3 required) - 12 Nm (106 lb-in)
2	9Y427	LH exhaust manifold heat shield
3	W714870	LH exhaust manifold nuts (8 required)
4	9431	LH exhaust manifold
5	9448	LH exhaust manifold gasket
6	W714869	LH exhaust manifold studs (8 required) - 25 Nm (18 lb-ft)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

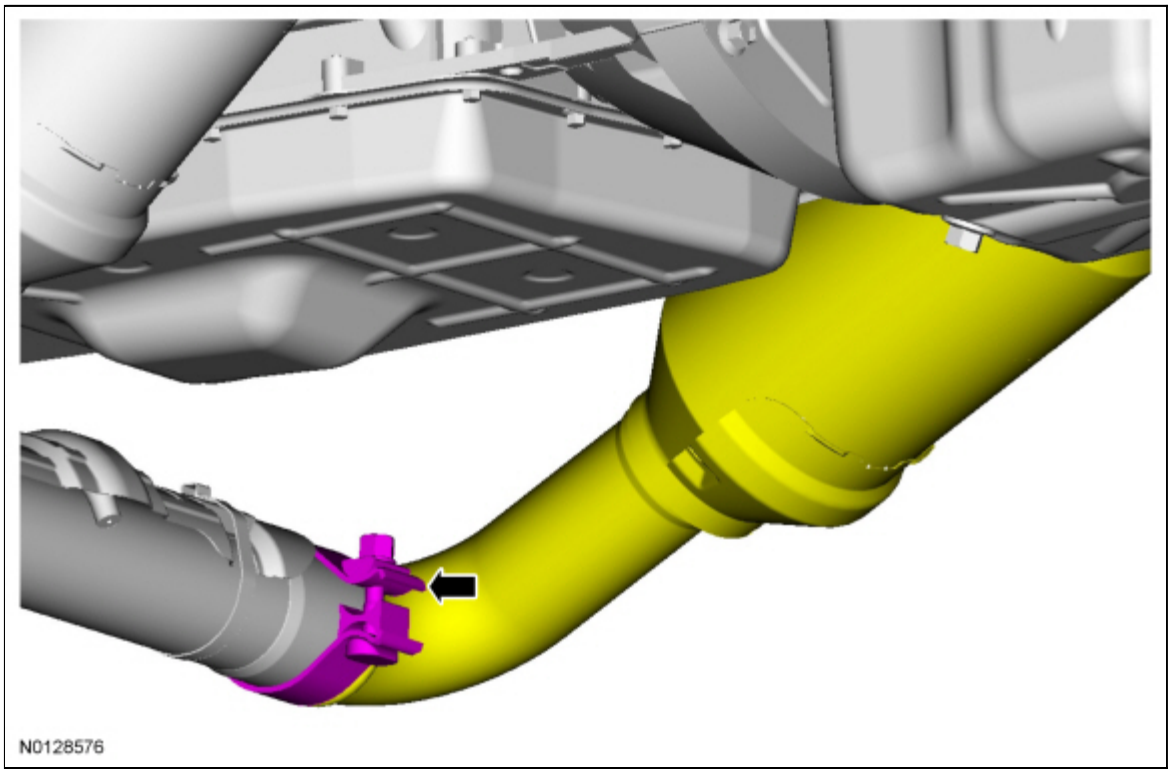
   Using a suitable holding device, hold the steering wheel in the straight-ahead position.



3. Remove the air cleaner outlet pipe and air cleaner cover as an assembly. For additional information, refer to Section 303-12 .

4. Remove the 2 bolts and remove the lower steering column shaft.

repair4less



5. Remove the 3 bolts and the LH exhaust manifold heat shield.
6. Remove the 2 catalytic converter-to-LH exhaust manifold nuts.

7. Loosen the LH catalytic converter-to-RH catalytic converter Torca® clamp.

- Lower the catalytic converter to disengage the catalytic converter flange from the LH exhaust manifold studs.

8. Remove the 8 LH exhaust manifold nuts.

9. Working from under the hood, remove the LH exhaust manifold and gasket.
   - Discard the gasket.

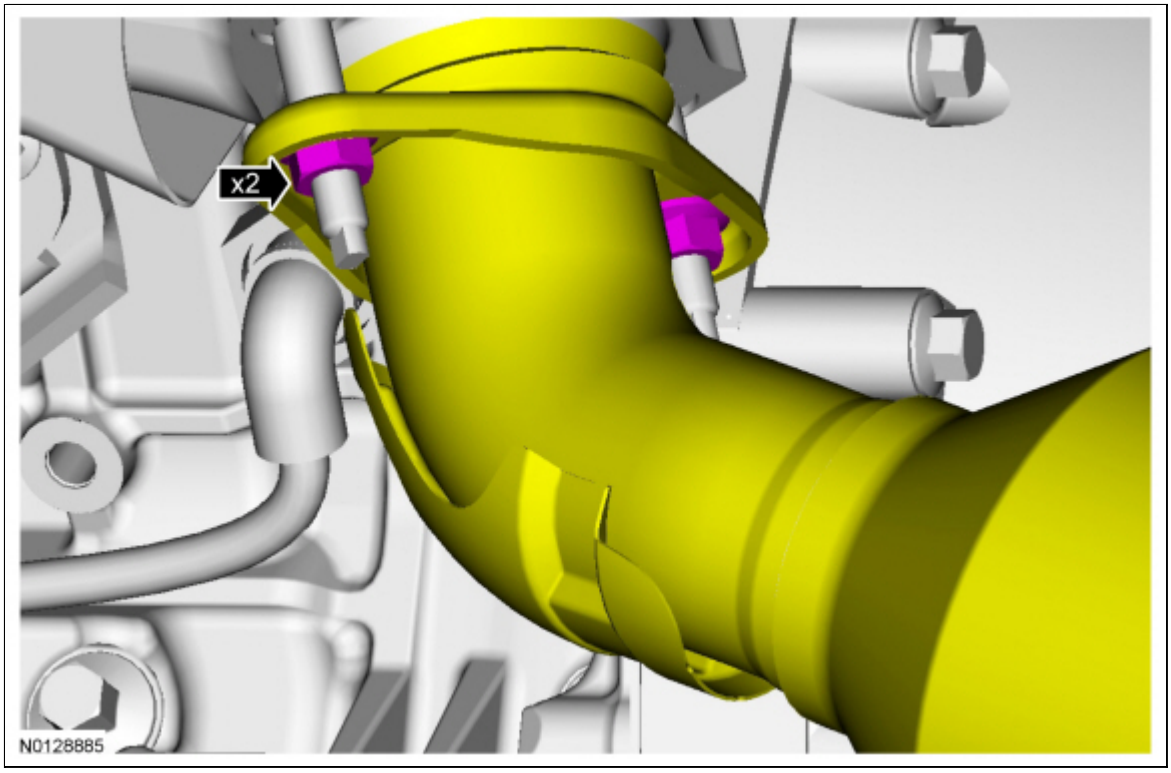
10. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

11. Remove and discard the 8 LH exhaust manifold studs.

12. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

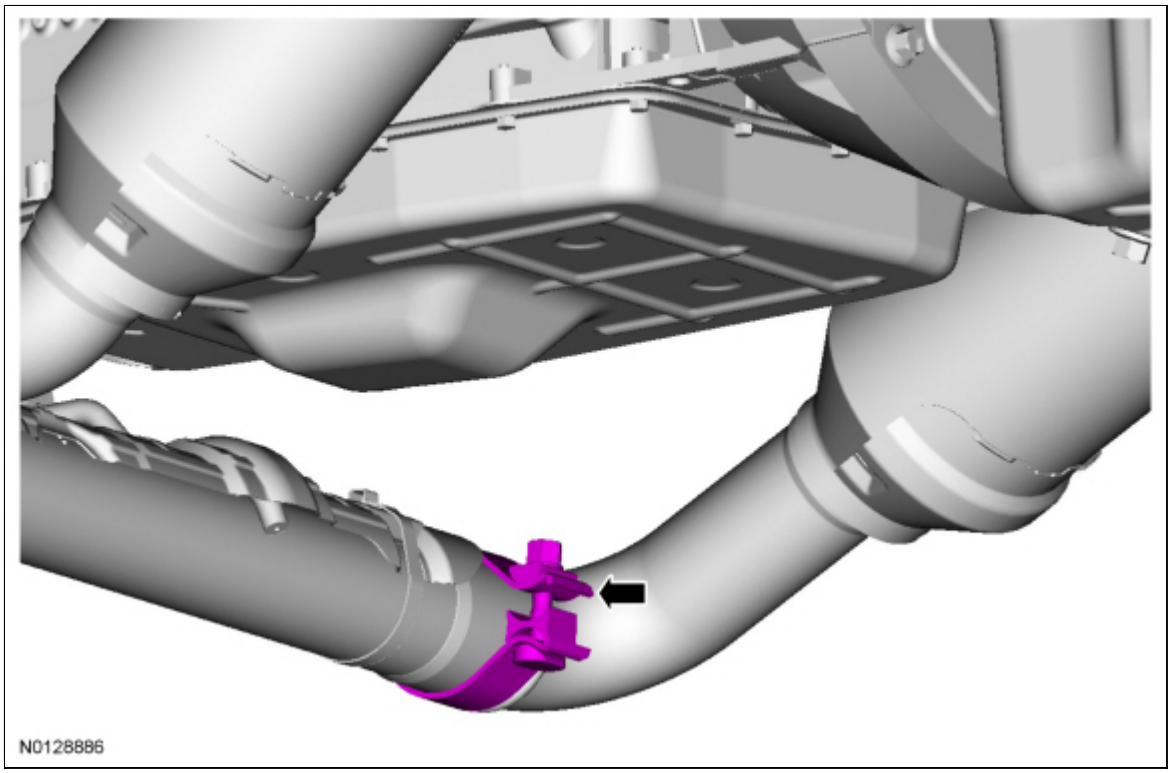
    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

Installation

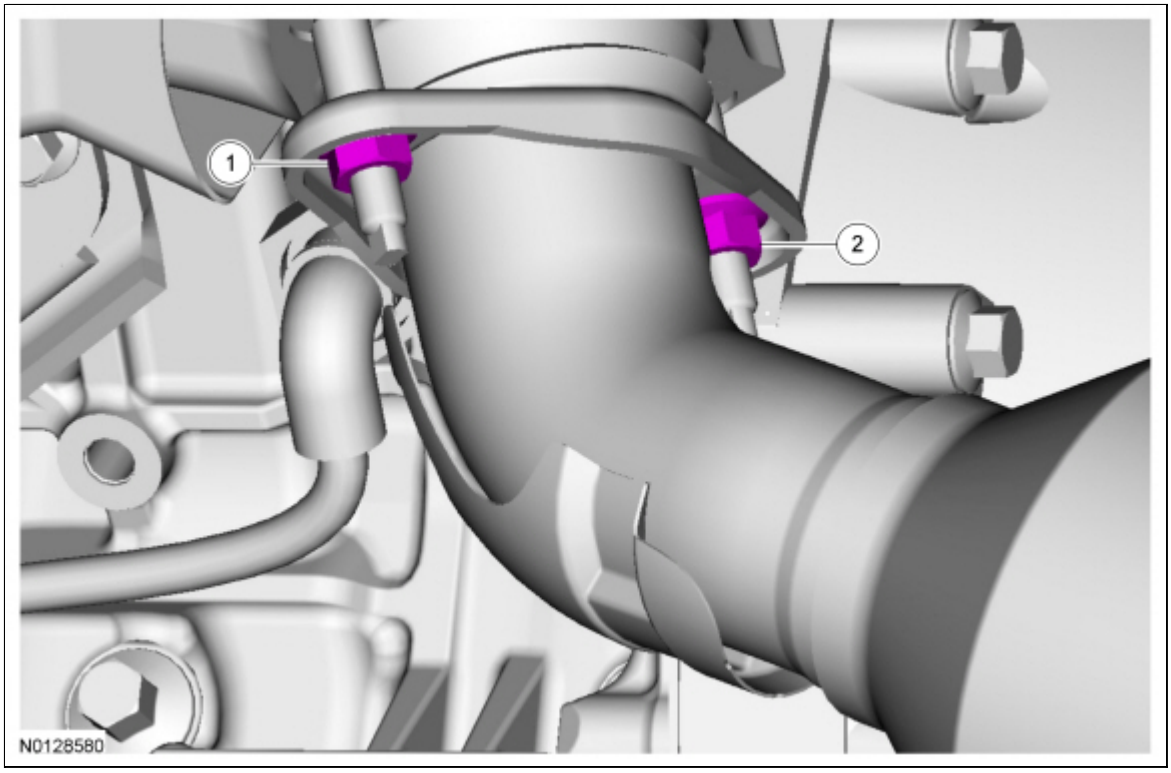


1. Install 8 new LH exhaust manifold studs.
   - Tighten to 25 Nm (18 lb-ft).

2. Install a new gasket, the LH exhaust manifold and 8 new nuts.
   - Tighten in the sequence shown in 2 stages.
     - Stage 1: Tighten to 24 Nm (18 lb-ft).
     - Stage 2: Tighten to 32 Nm (24 lb-ft).



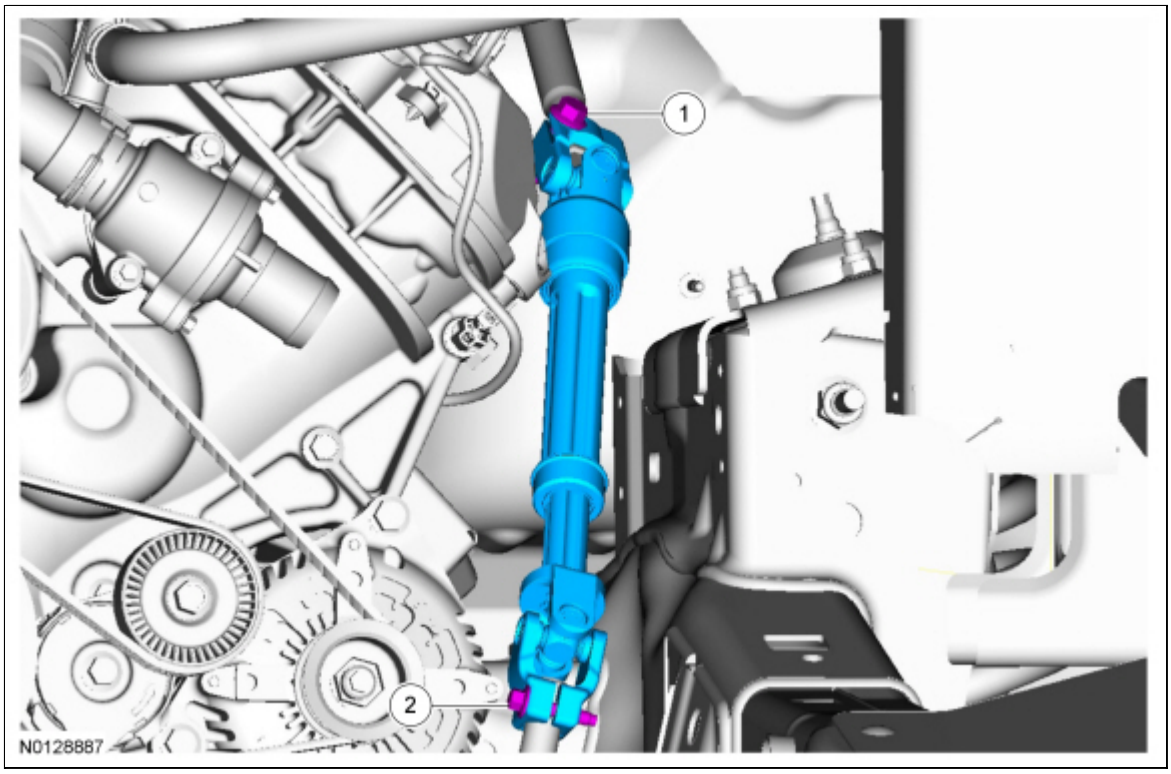
repair4less



3. Position the LH catalytic converter onto the LH exhaust manifold and loosely install the 2 nuts.

4. Tighten the LH catalytic converter-to-RH catalytic converter Torca® clamp to 55 Nm (41 lb-ft).

5. Tighten the 2 new LH catalytic converter-to-exhaust manifold nuts in the following sequence.
    1. Tighten the LH outer catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).
    2. Tighten the LH inner catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).

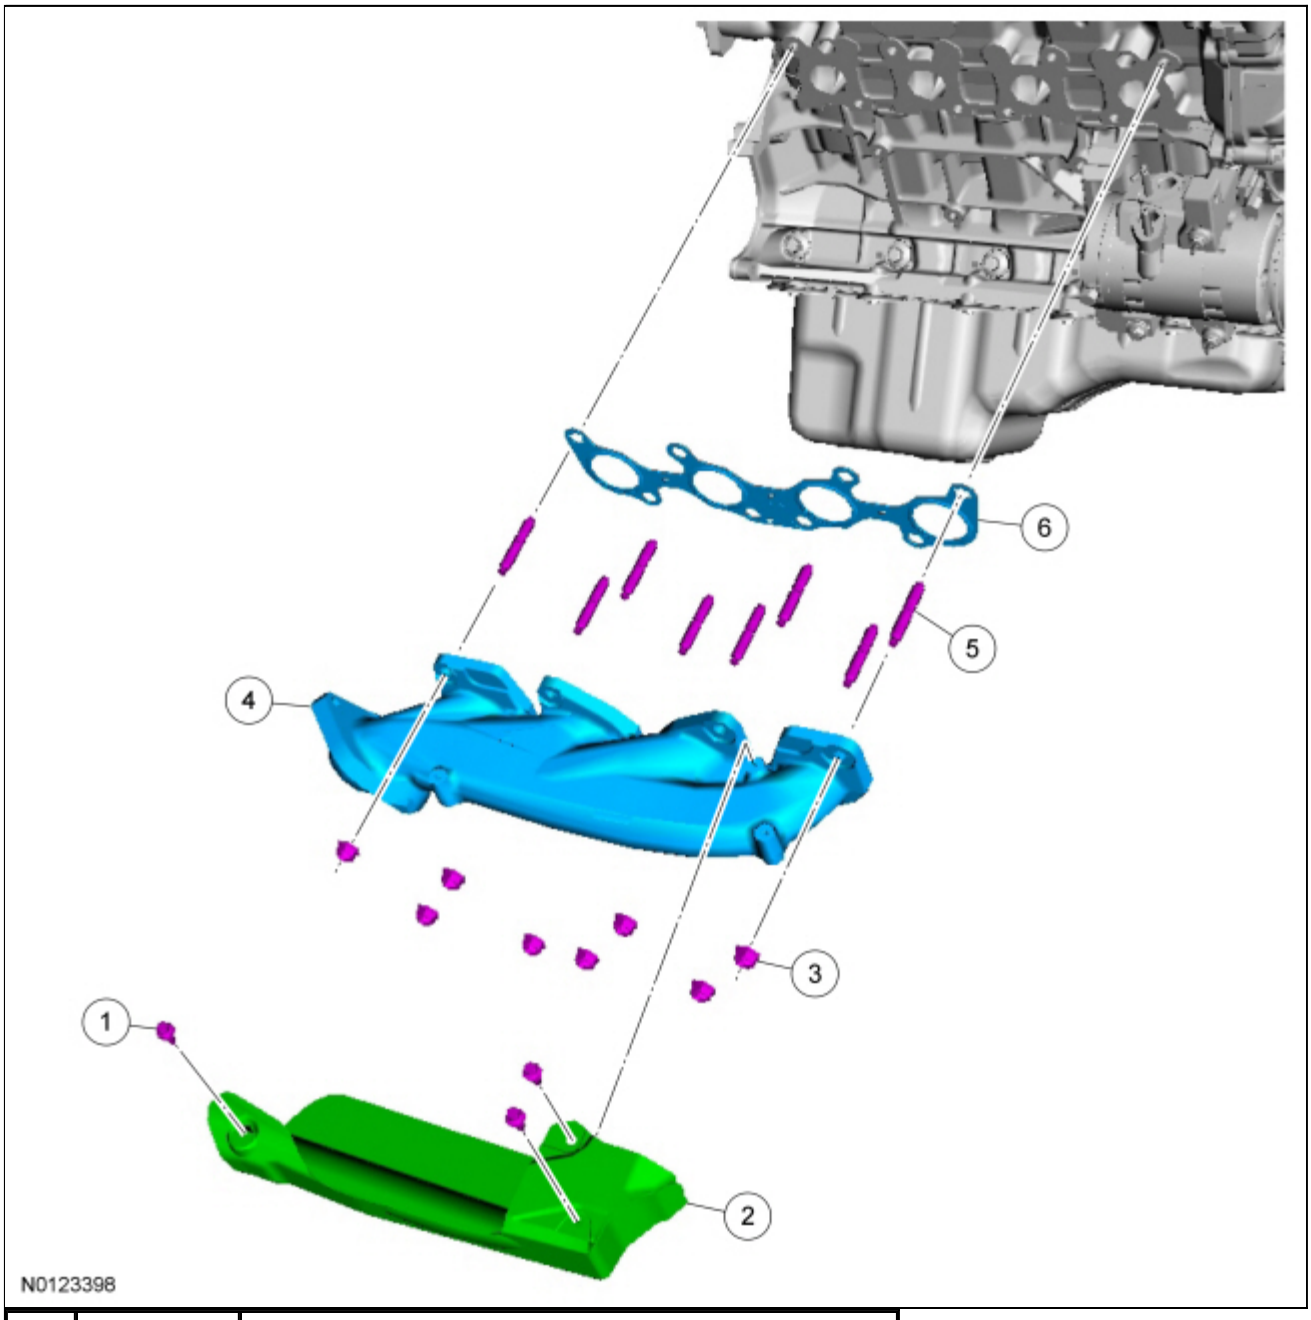


6. Install the LH exhaust manifold heat shield and the 3 bolts.

repair4less

- Tighten to 12 Nm (106 lb-in).

7. Install the lower steering column shaft and the 2 bolts.
    1. Tighten the upper bolt to 48 Nm (35 lb-ft).
    2. Tighten the lower bolt to 30 Nm (22 lb-ft).

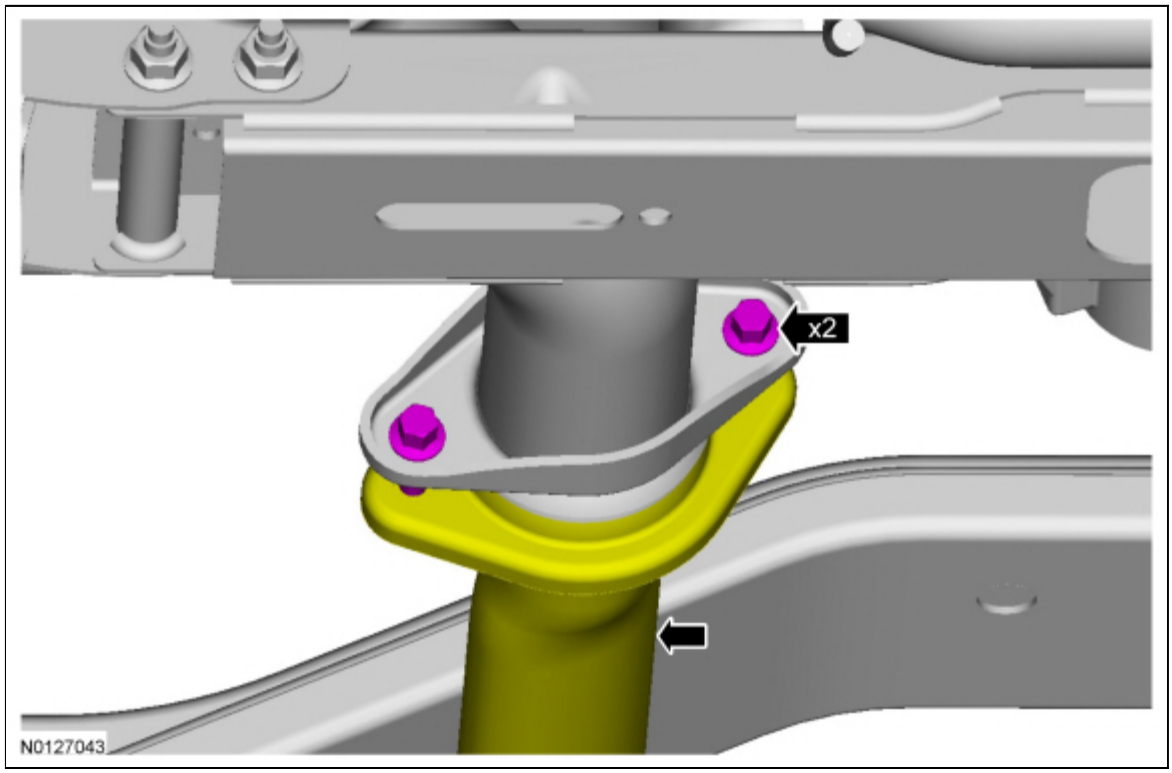


8. Install the air cleaner outlet pipe and air cleaner cover assembly. For additional information, refer to Section 303-12 .

repair4less

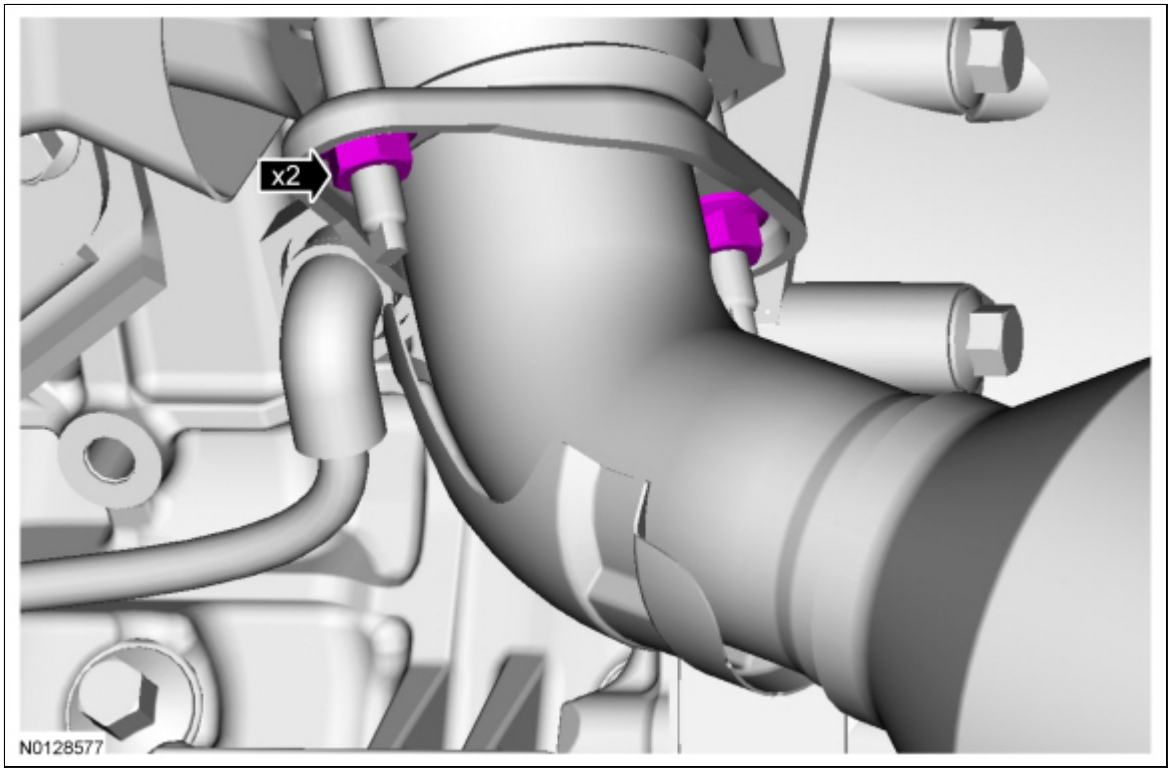
Exhaust Manifold — RH

Material



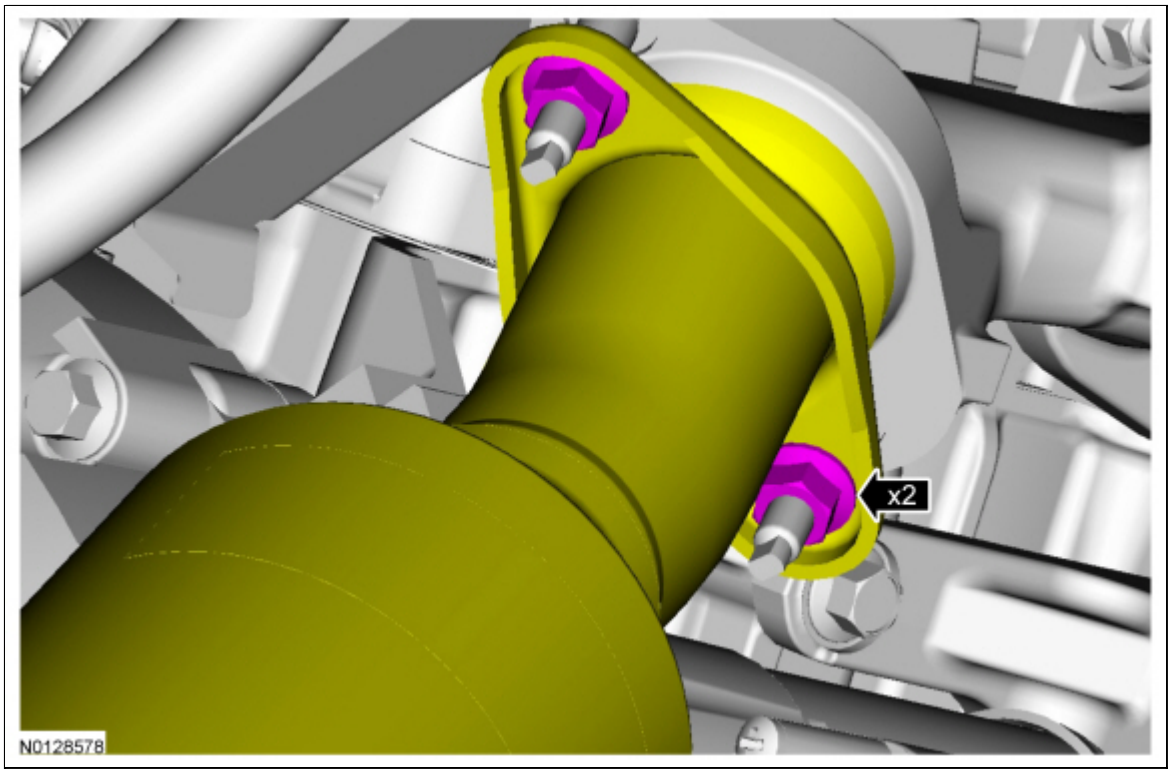
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

Item	Part Number	Description
1	W714133	RH exhaust manifold heat shield bolts (3 required) - 12 Nm (106 lb-in)
2	9A462	RH exhaust manifold heat shield
3	W714870	RH exhaust manifold nuts (8 required)
4	9430	RH exhaust manifold
5	W714869	RH exhaust manifold studs (8 required) - 25 Nm (18 lb-ft)
6	9448	RH exhaust manifold gasket



Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the A/C compressor. For additional information, refer to Section 412-01 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the 3 bolts and the RH exhaust manifold heat shield.
5. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
   - Discard the bolts.



6. Remove the 2 catalytic converter-to-LH exhaust manifold nuts.

repair4less

7. Remove the 2 catalytic converter-to-RH exhaust manifold nuts.
    - Separate the exhaust Y-pipe dual catalytic converter from the exhaust manifolds.

8. Remove the 4 lower RH exhaust manifold nuts.

9. Remove the 4 top RH exhaust manifold nuts.
    - Remove and discard the 4 top RH exhaust manifold studs.

10. Working from under the hood, remove the RH exhaust manifold and gasket.
    - Discard the gasket.

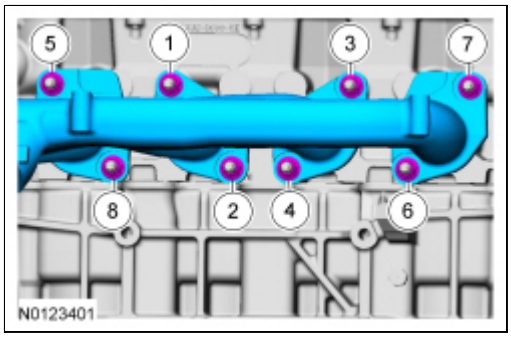
11. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

12. Remove and discard the 4 lower RH exhaust manifold studs.

13. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

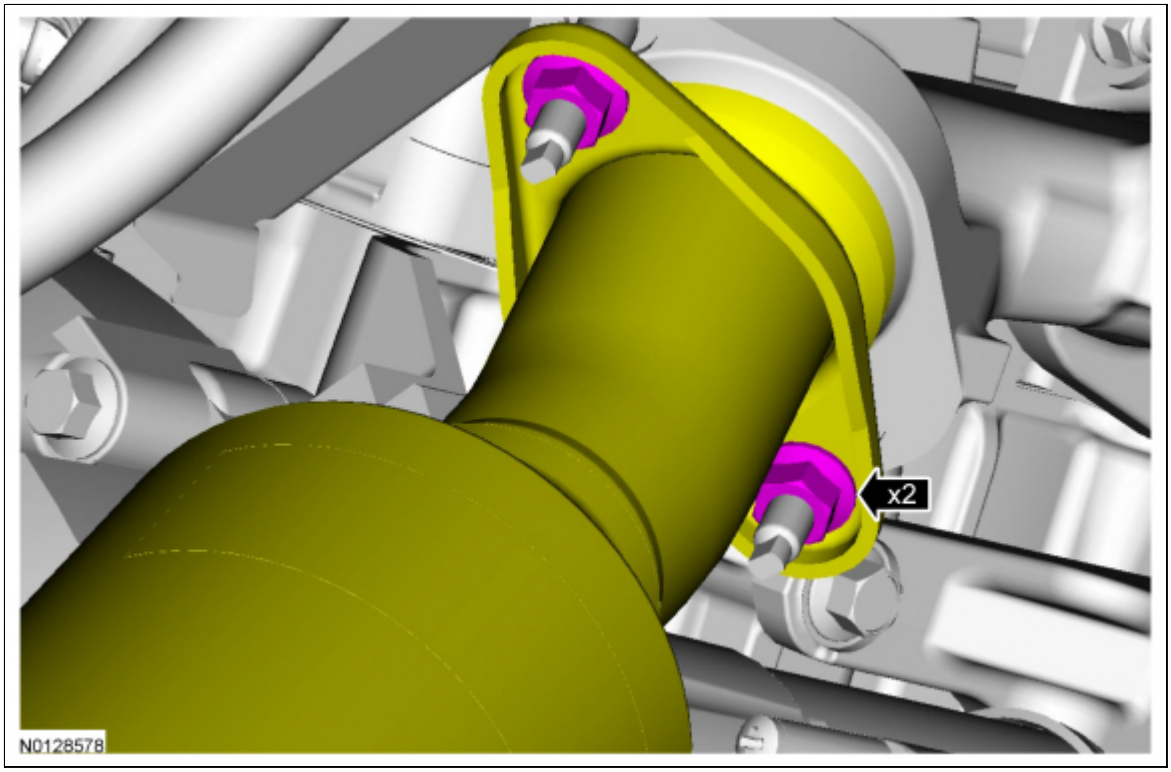
Installation



1. Install 4 new lower RH exhaust manifold studs.
    - Tighten to 25 Nm (18 lb-ft).

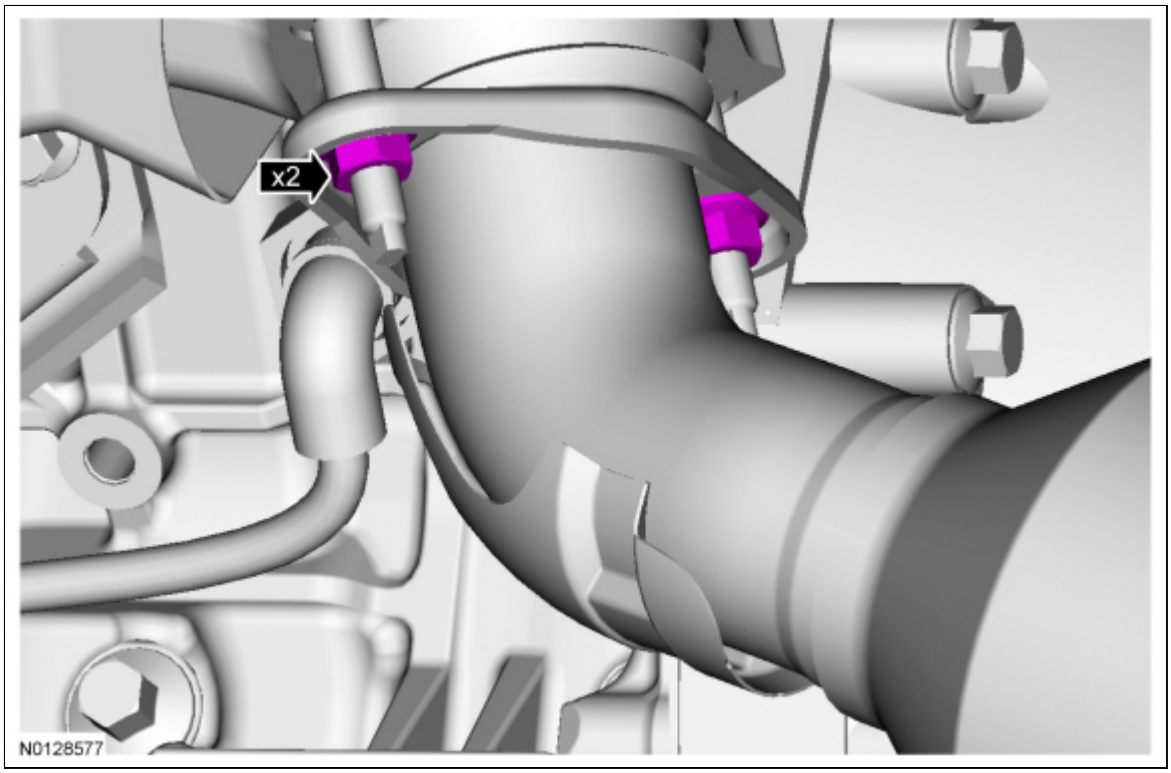
2. Install a new gasket, the RH exhaust manifold and 4 new lower exhaust manifold nuts.
    - Do not tighten the nuts at this time.

3. Install 4 new upper RH exhaust manifold studs.
    - Tighten to 25 Nm (18 lb-ft).

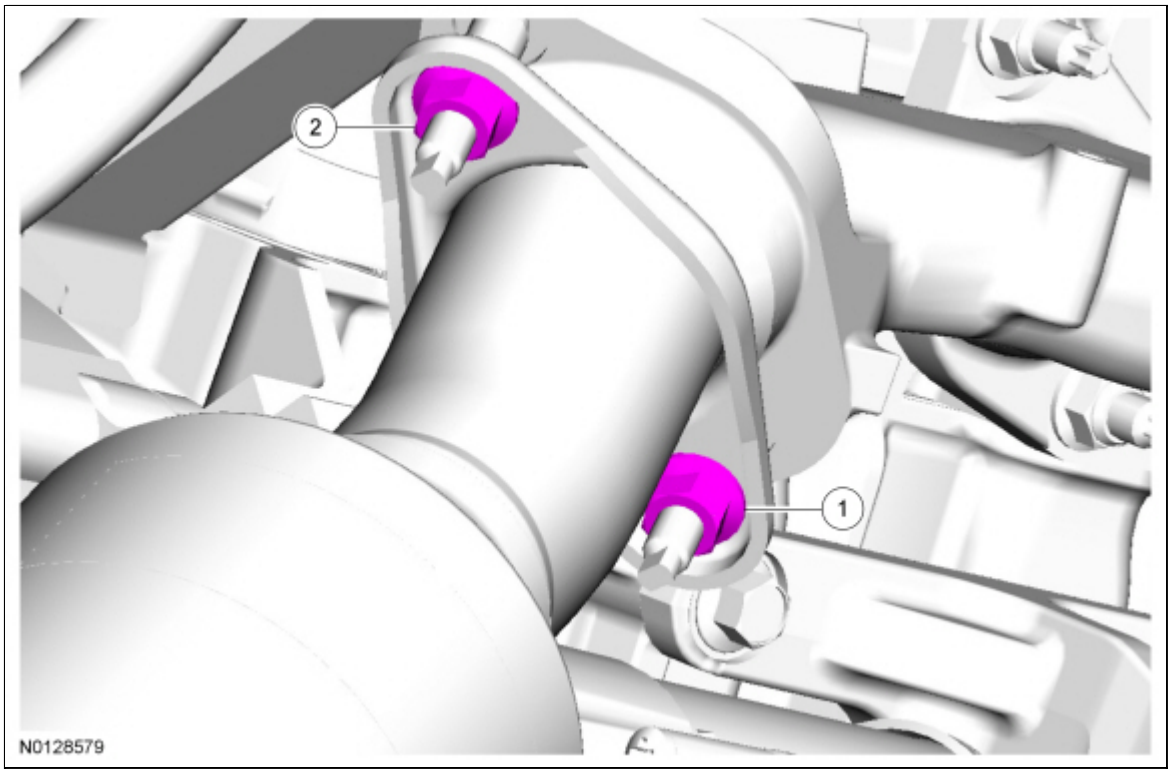


4. Install 4 new upper RH exhaust manifold nuts.
    - Do not tighten the nuts at this time.

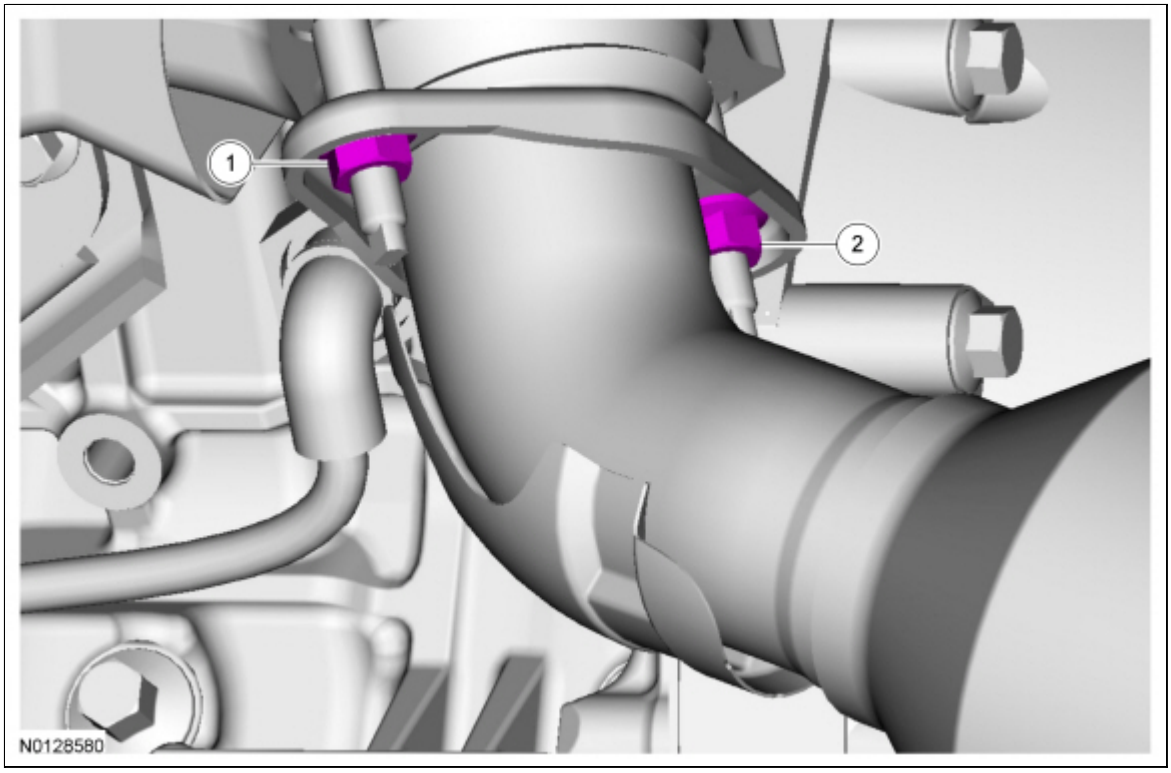
5. Tighten the nuts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 24 Nm (18 lb-ft).
    - Stage 2: Tighten to 32 Nm (24 lb-ft).



6. Position the exhaust Y-pipe dual catalytic converter onto the exhaust manifolds and loosely install 2 new RH catalytic converter-to-exhaust manifold nuts.

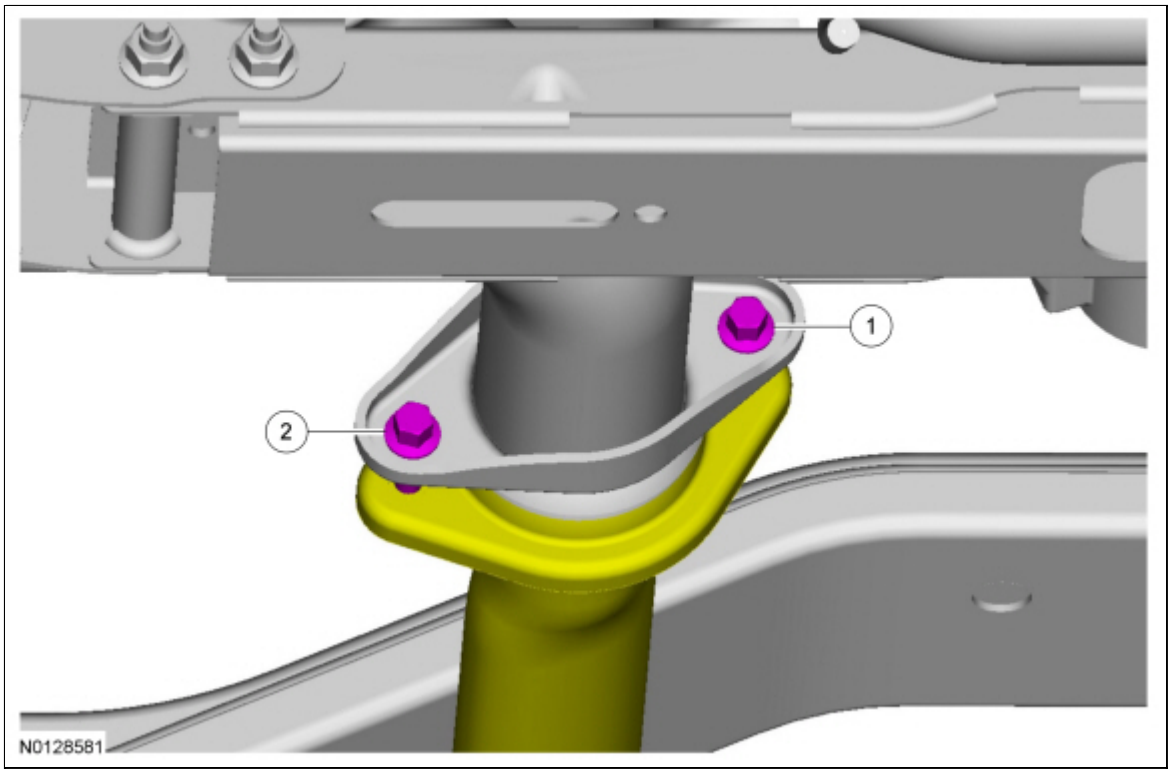


repair4less



7. Loosely install 2 new LH catalytic converter-to-exhaust manifold nuts.

8. Tighten the 2 new RH catalytic converter-to-exhaust manifold nuts in the following sequence.
    1. Tighten the RH lower catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).
    2. Tighten the RH upper catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).

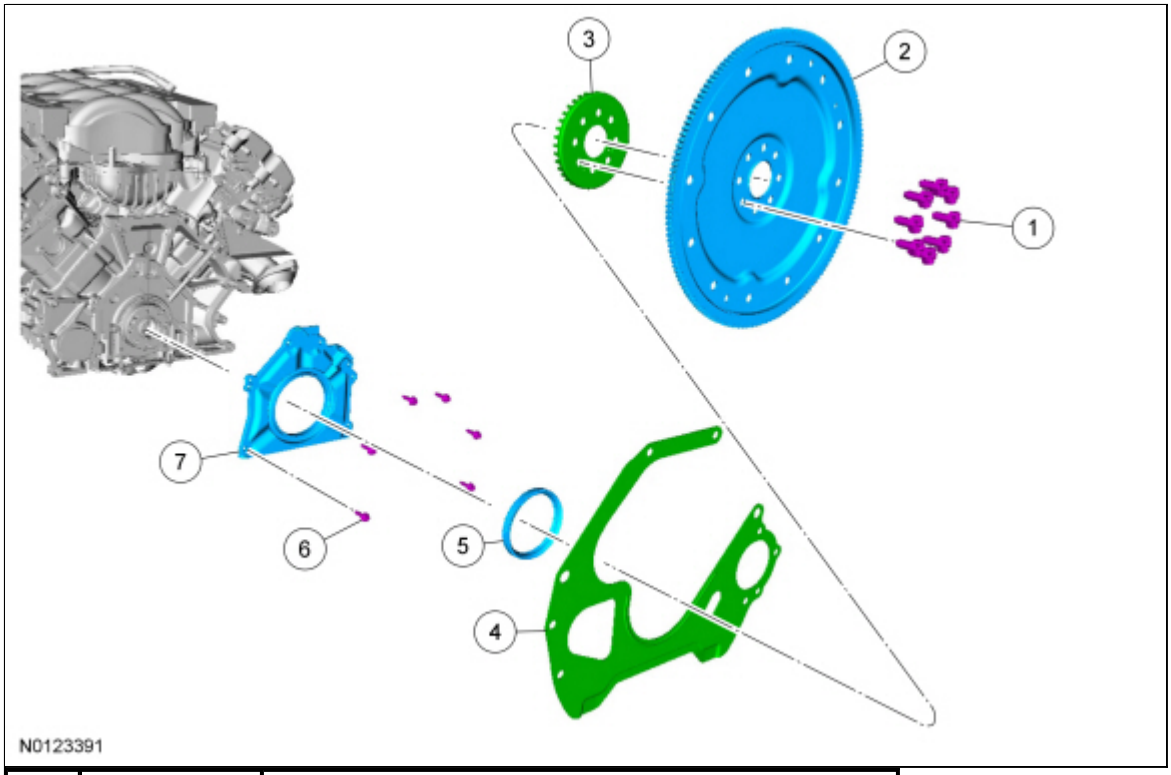


9. Tighten the 2 new LH catalytic converter-to-exhaust manifold nuts in the following sequence.
    1. Tighten the LH outer catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).
    2. Tighten the LH inner catalytic converter-to-exhaust manifold nut to 40 Nm (30 lb-ft).

10. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.

repair4less

1. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
2. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



11. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).

12. Connect the battery ground cable. For additional information, refer to Section 414-01 .

13. Install the A/C compressor. For additional information, refer to Section 412-01 .

repair4less

Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View

Item	Part Number	Description
1	6379	Flexplate bolt (8 required)
2	6375	Flexplate
3	12A227	Crankshaft sensor ring
4	6A373	Separator plate
5	6701	Crankshaft rear seal
6	W714962	Crankshaft rear seal retainer plate bolt (6 required)
7	6K318	Crankshaft rear seal retainer plate

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

repair4less

Flexplate

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal and Installation

1. Remove the transmission. For additional information, refer to Section 307-01 .

2. **NOTE:** The flexplate bolts are torque-to-yield design and are not reusable.

   Remove the 8 bolts and the flexplate.
   - Discard the bolts.
   - To install, tighten in the sequence shown in 2 stages.
     - Stage 1: Tighten to 20 Nm (177 lb-in).
     - Stage 2: Tighten an additional 60 degrees.

3. To install, reverse the removal procedure.
   - After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

repair4less

Hydraulic Lash Adjuster

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

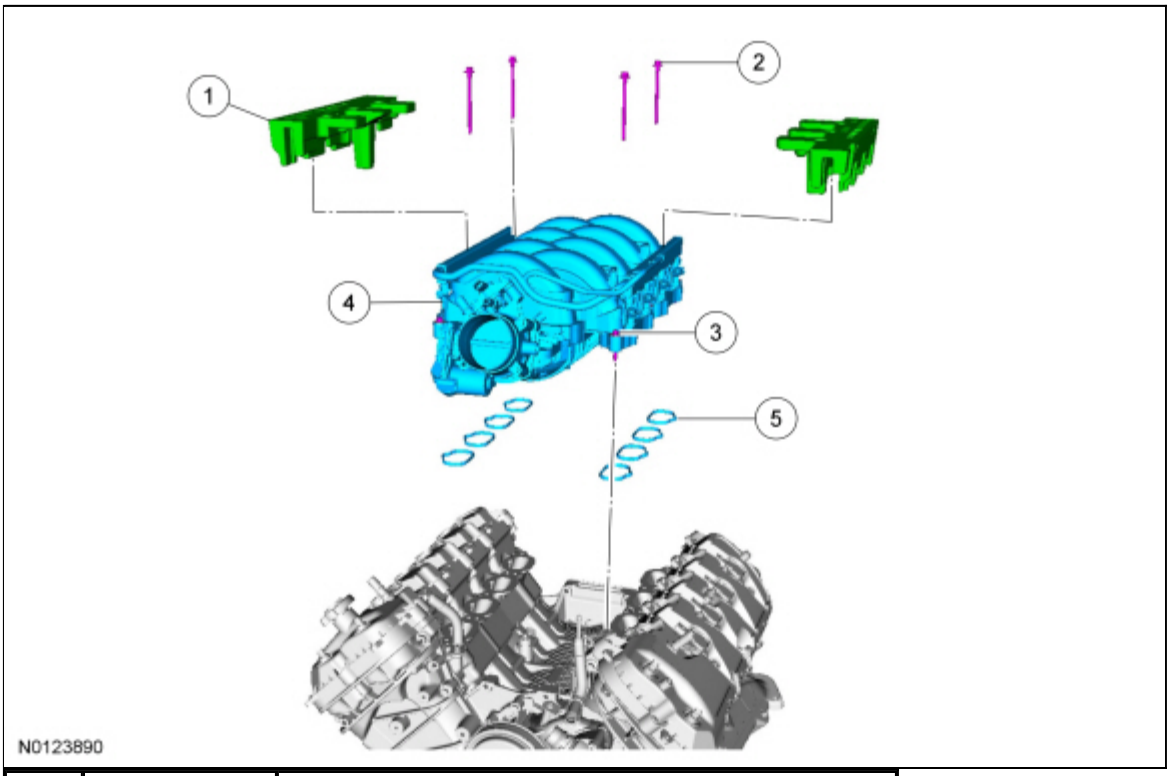
1. Remove the camshaft for the hydraulic lash adjuster being serviced. For additional information, refer to Camshaft — RH and/or Camshaft — LH in this section.

2. Remove the camshaft roller follower and hydraulic lash adjuster as an assembly.

3. Separate the hydraulic lash adjuster from the spring clip on the camshaft roller follower.

4. To install, reverse the removal procedure.
   - Lubricate the camshaft roller follower and hydraulic lash adjuster assembly with clean engine oil prior to installation.

repair4less



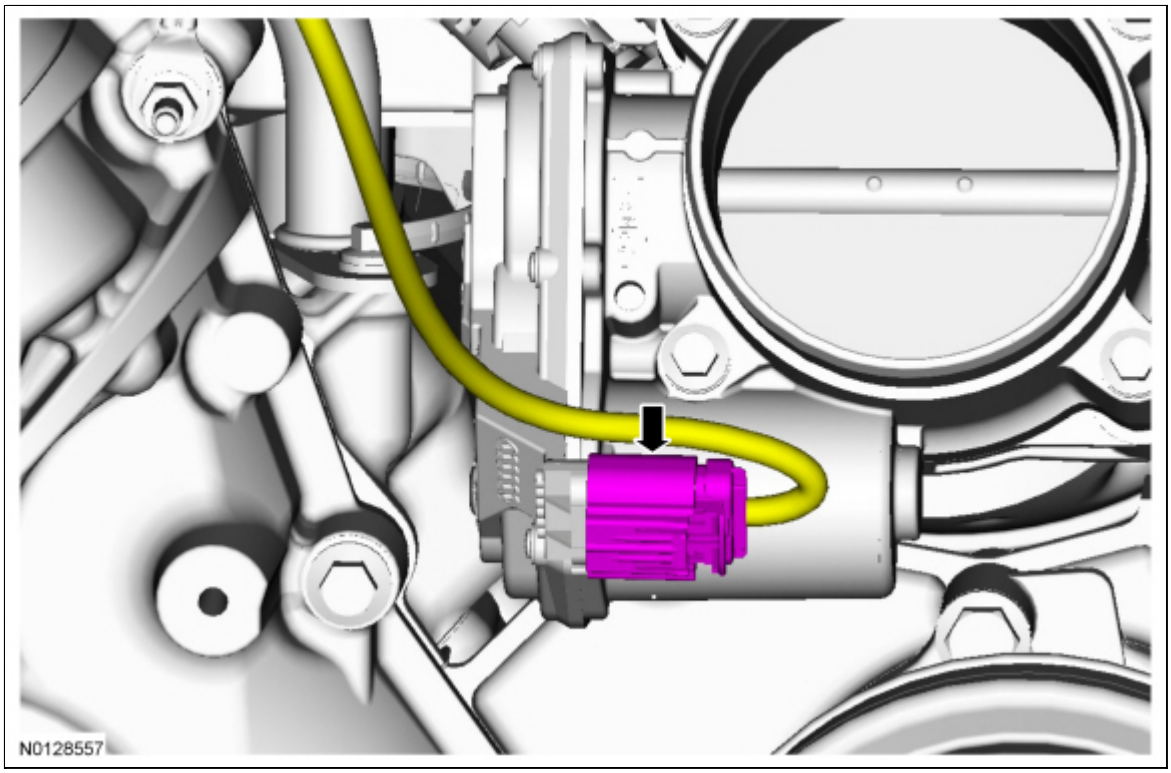
Intake Manifold

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

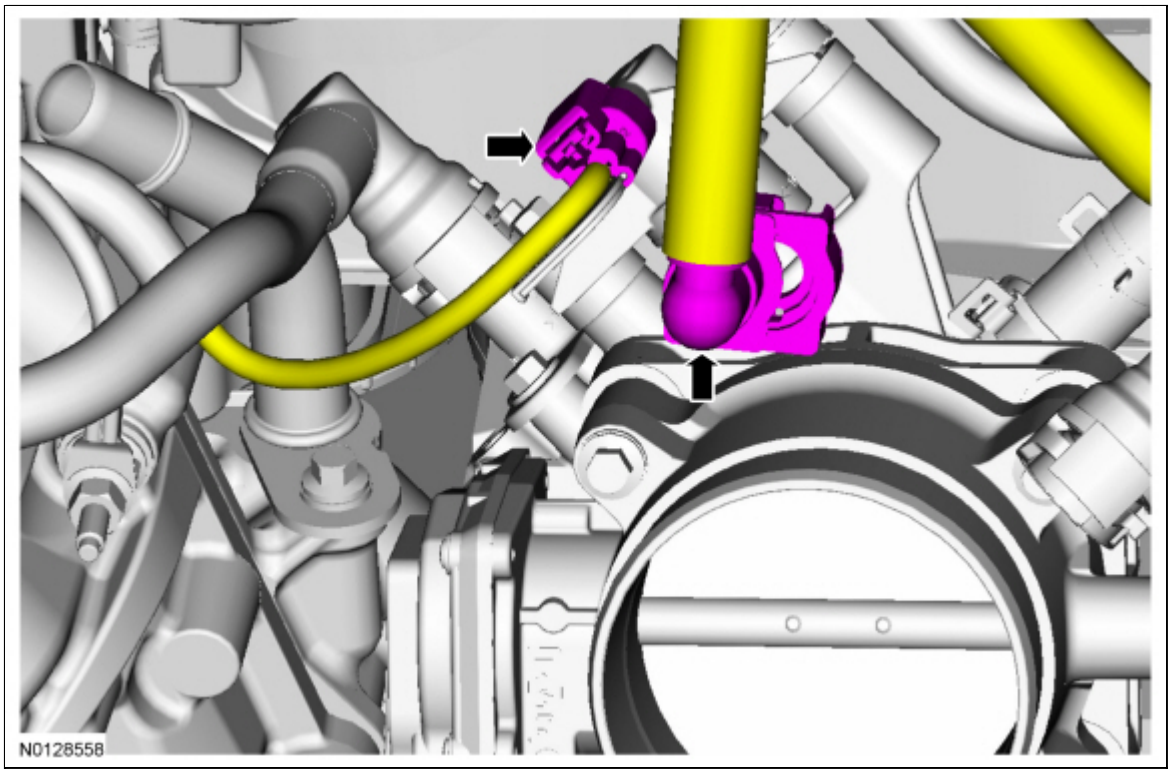
NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.



Item	Part Number	Description
1	6P013	Fuel rail insulator (2 required)
2	W714864	Fuel rail bolt (4 required)
3	9Y450	Intake manifold bolt (part of 9424) (6 required)
4	9424	Intake manifold
5	9439	Intake manifold gasket

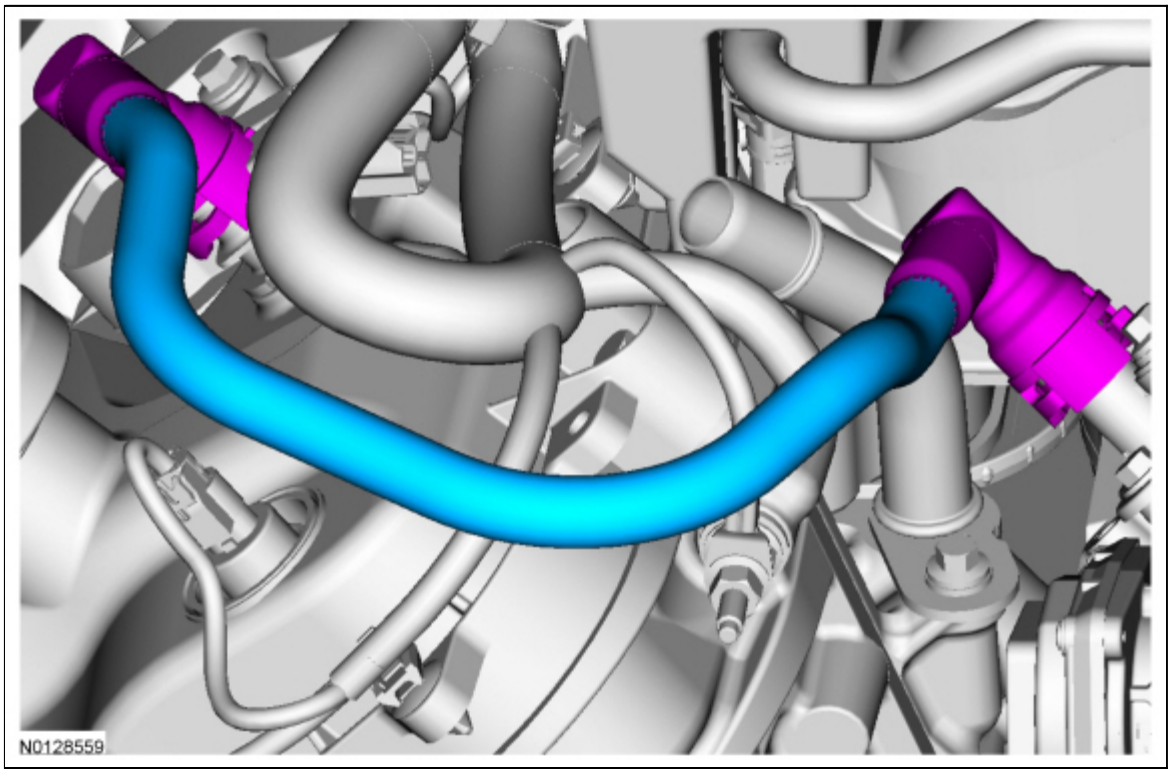
Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

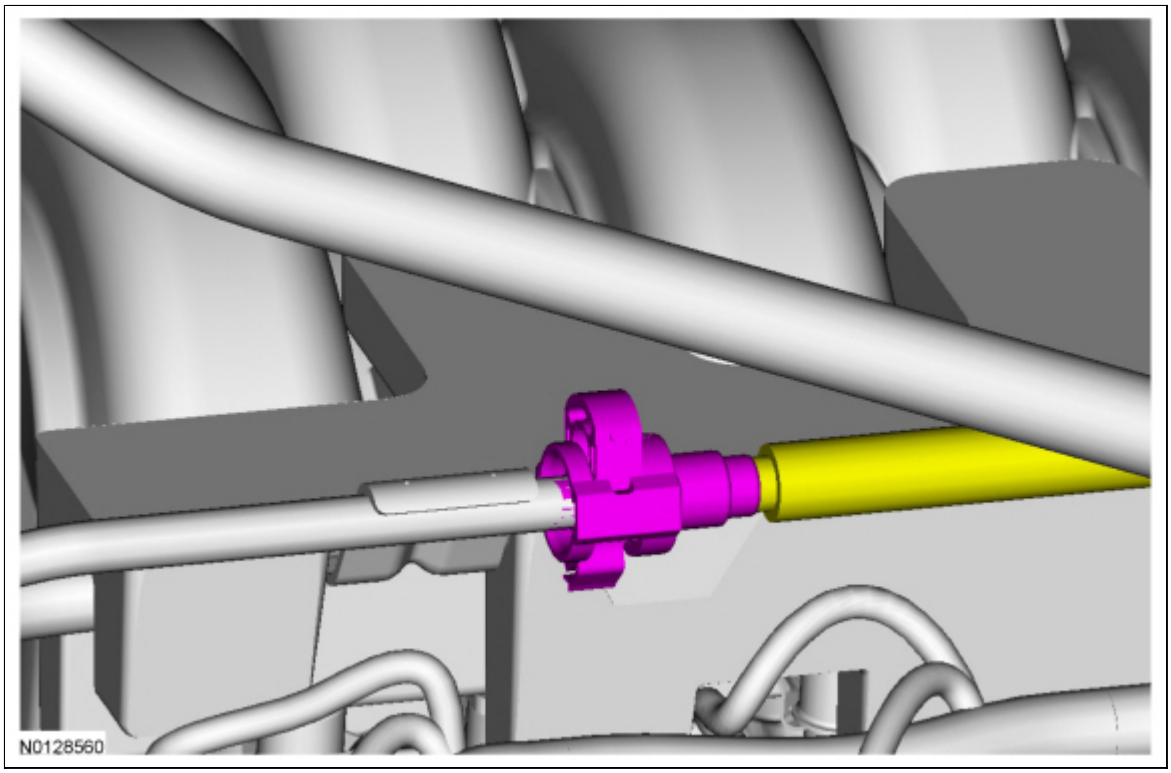


WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

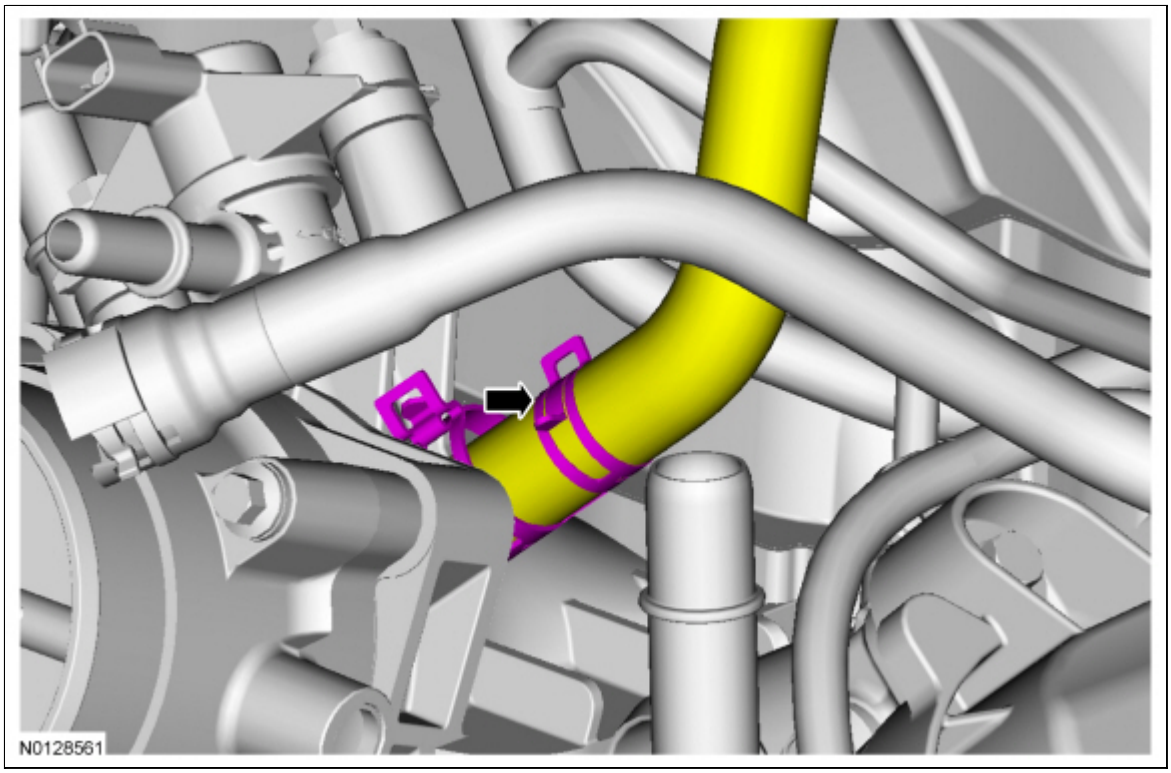
1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
3. Disconnect the Throttle Body (TB) electrical connector.



4. Disconnect the Evaporative Emission (EVAP) canister purge valve tube and electrical connector. For additional information, refer to the quick connect coupling procedure in Section 310-00 .
   - Detach the EVAP tube retainer from the fuel rail.

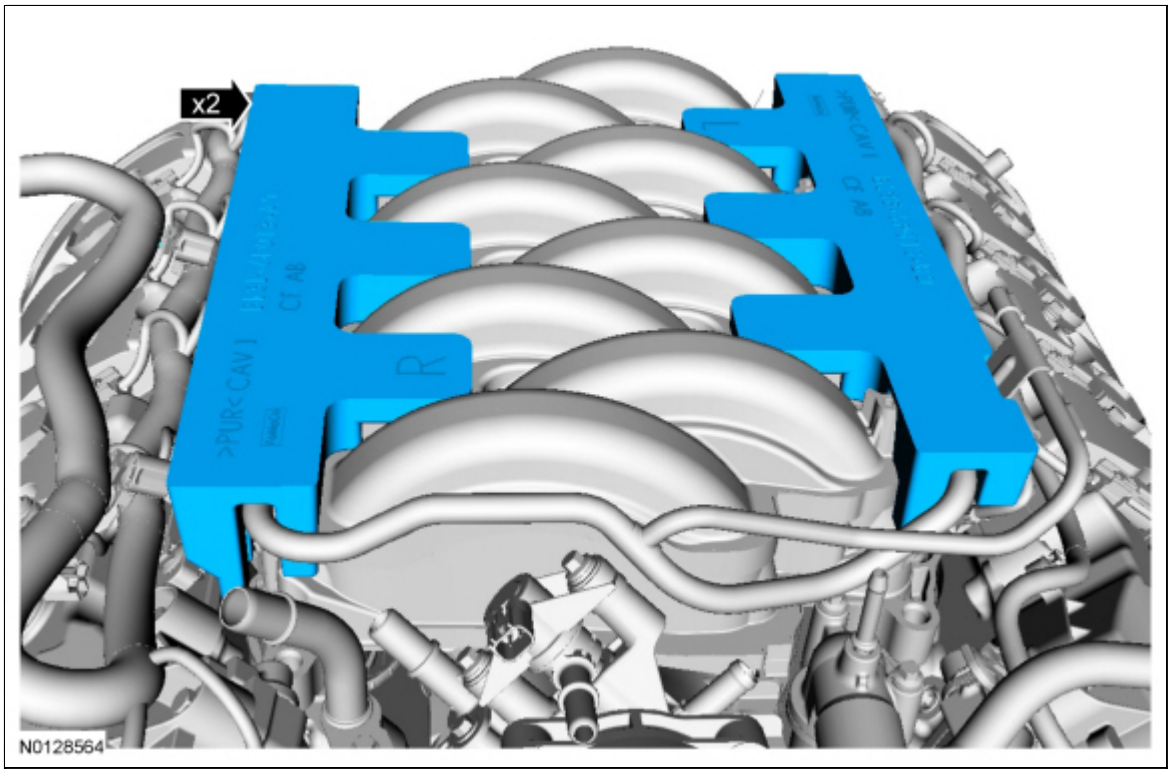


repair4less

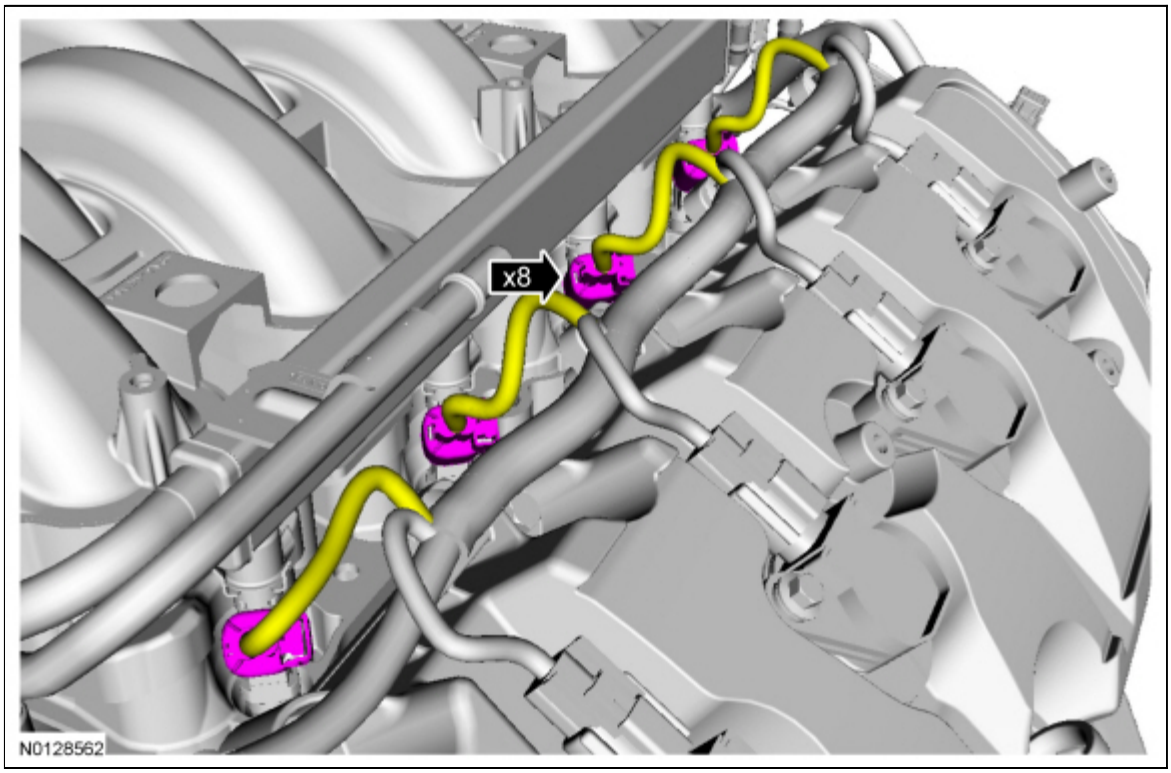


5. Remove the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .

6. Disconnect the fuel supply tube. For additional information refer to the quick connect procedure in Section 310-00 .

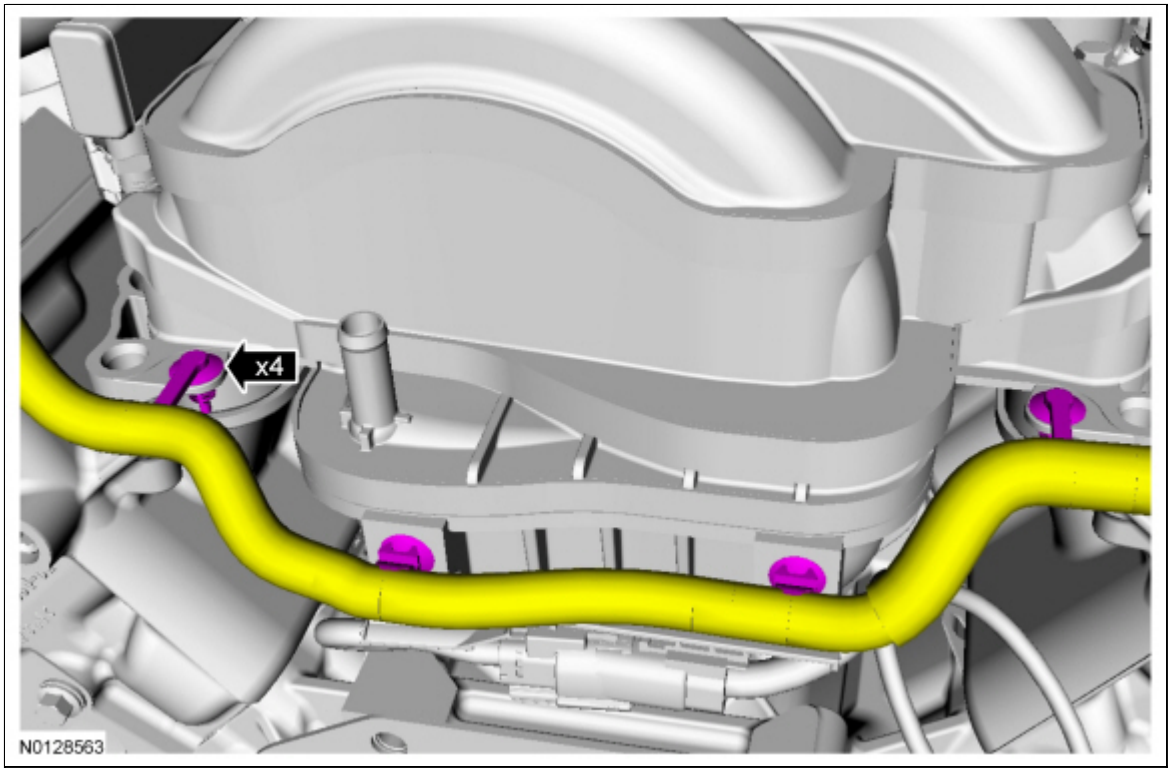


7. Release the clamp and disconnect the vacuum tube from the intake manifold.



8. Remove the LH and RH fuel rail insulators.

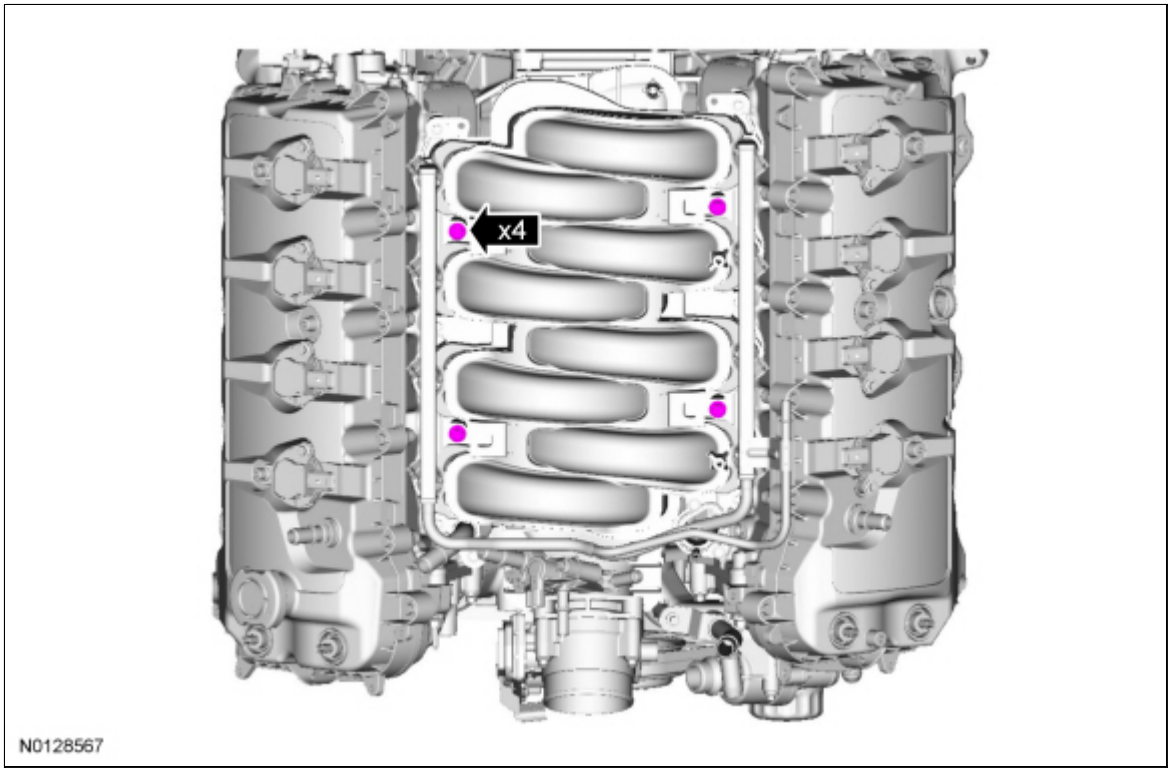
repair4less



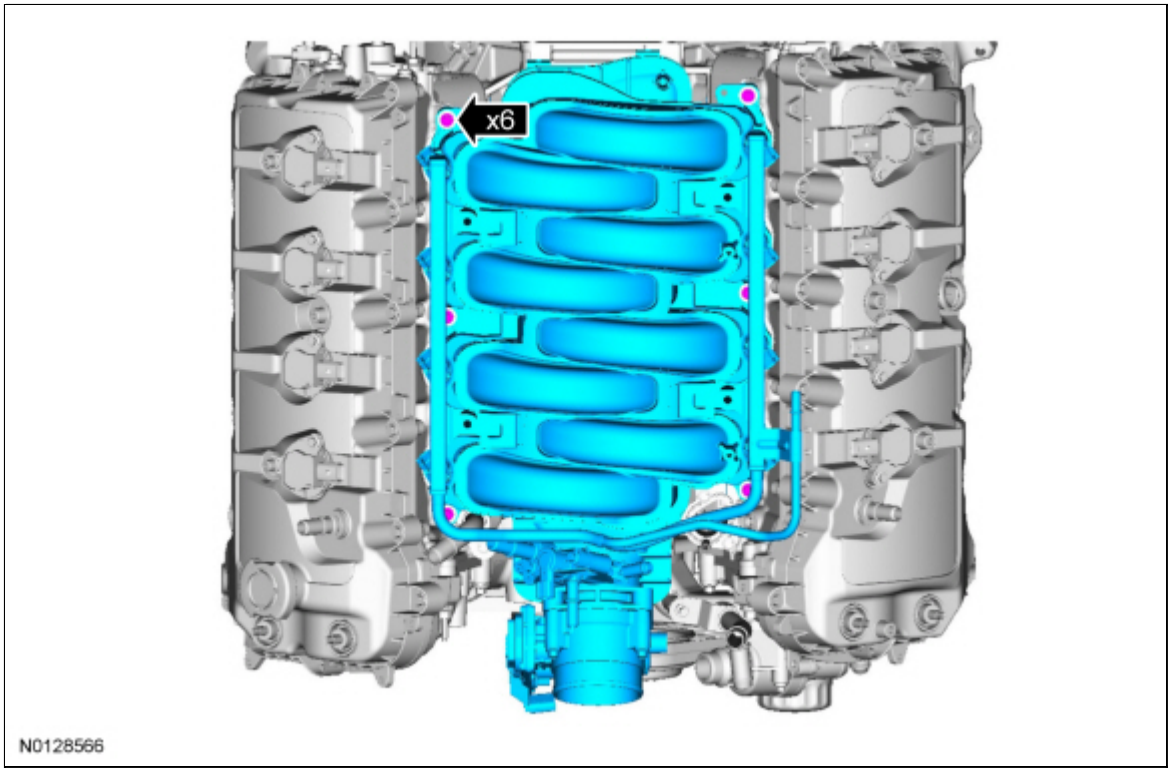
9. **NOTE:** The 4 LH fuel injector electrical connectors are shown, the 4 RH fuel injector electrical connectors are similar.

   Disconnect the 8 fuel injector electrical connectors.

10. Detach the 4 wiring harness retainers from the rear of the intake manifold.



11. Detach the heater hose retainer and position the heater hose aside.

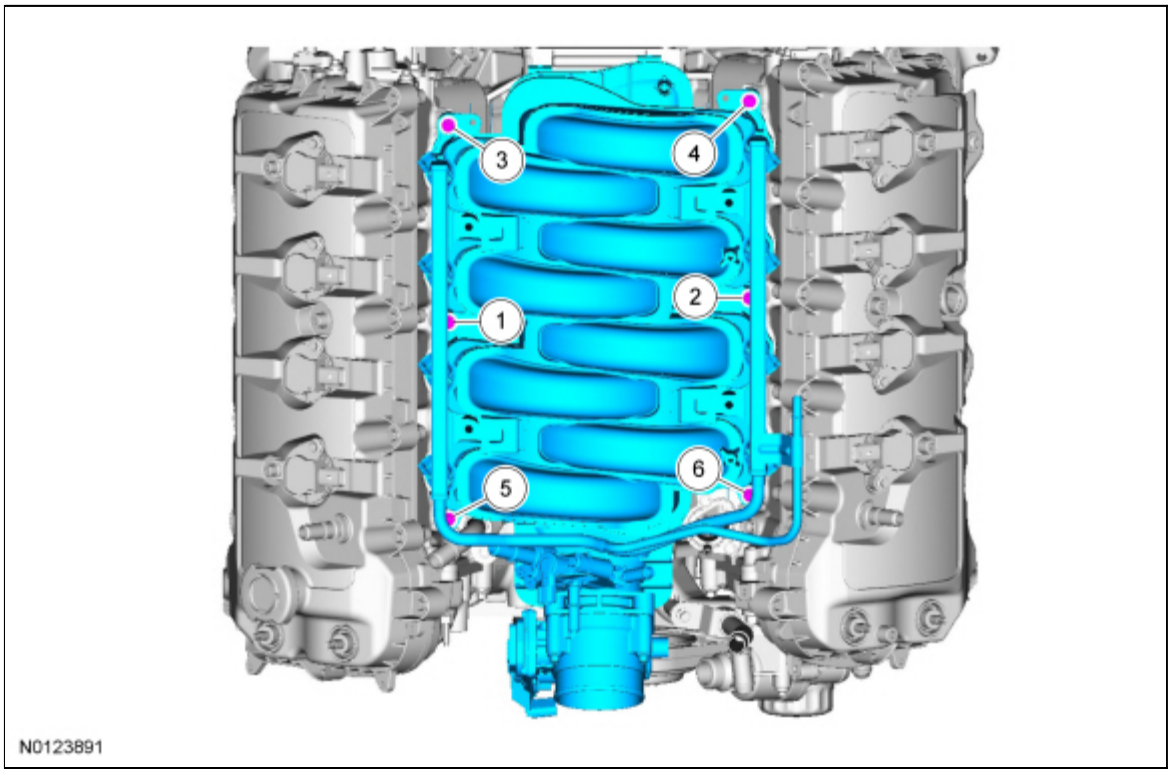


12. **NOTE:** It is not necessary to remove the fuel rail from the intake manifold assembly.

repair4less

Remove the 4 fuel rail bolts.

13. Loosen the 6 bolts and remove the intake manifold.
    - Discard the gaskets.

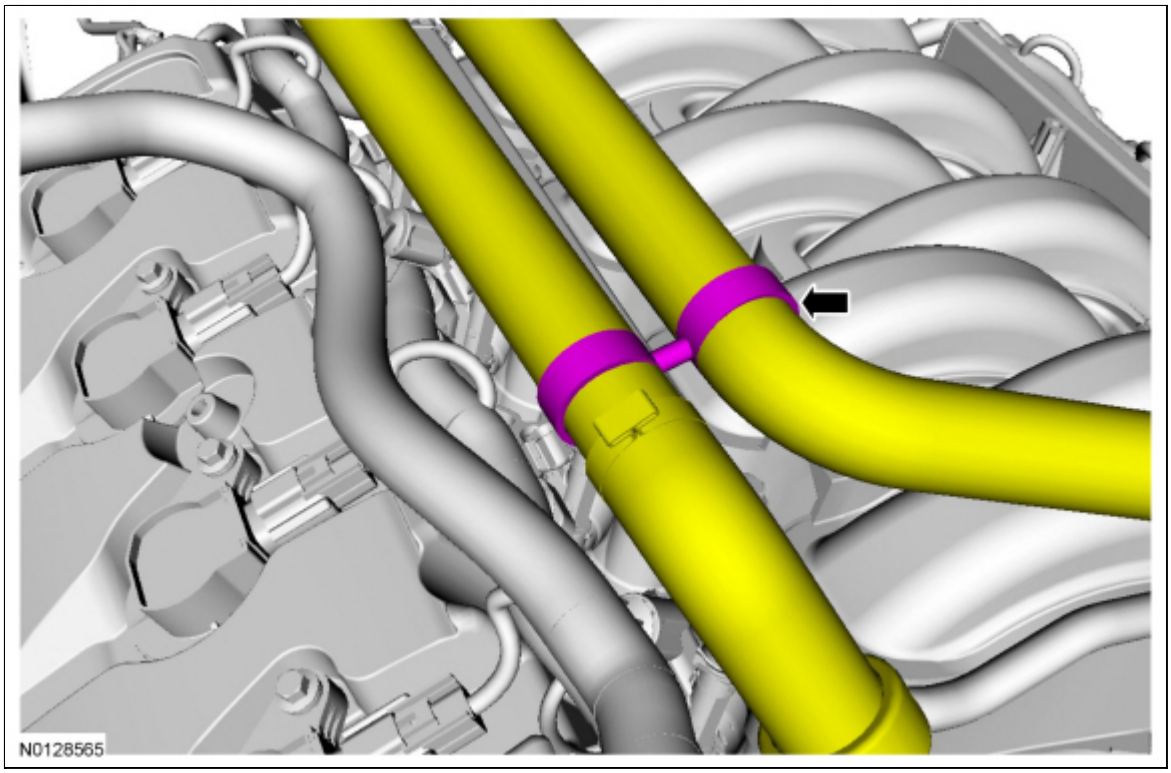


Installation

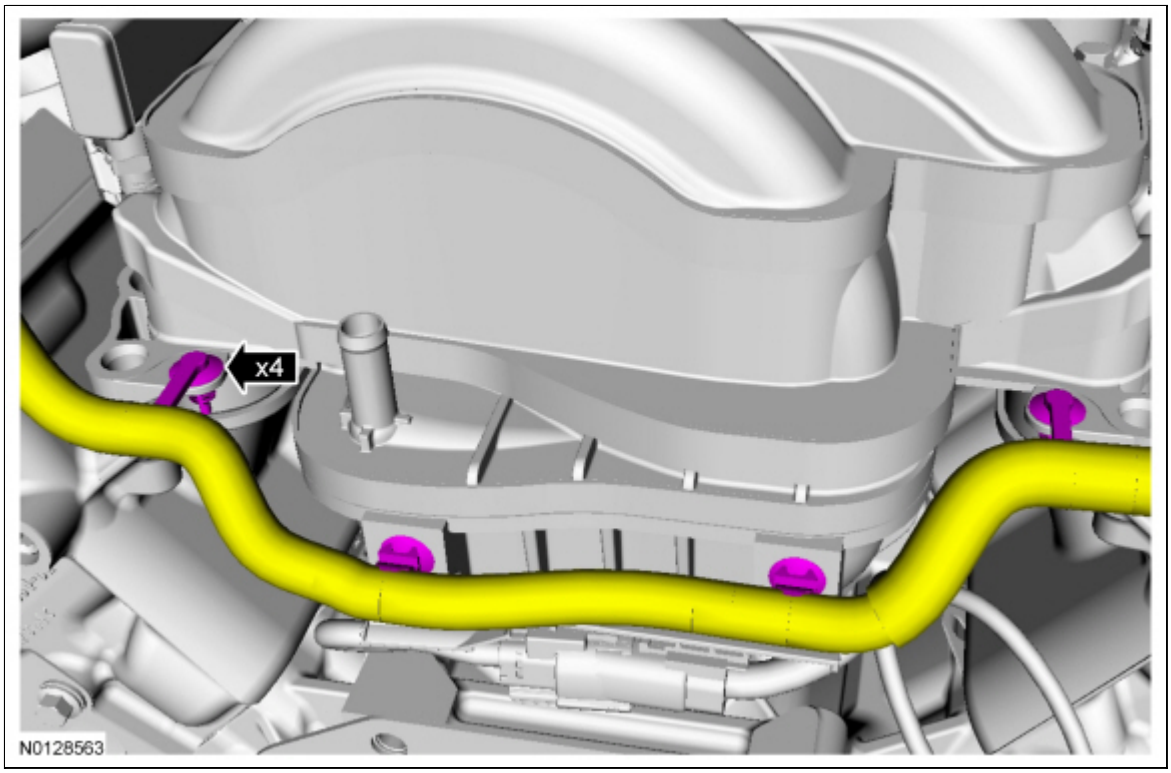
1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris if found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   NOTE: Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

   Using new gaskets, install the intake manifold.
   - Tighten the 6 intake manifold bolts in the sequence shown in 2 stages.
     - Stage 1: Tighten to 10 Nm (89 lb-in).
     - Stage 2: Tighten an additional 45 degrees.

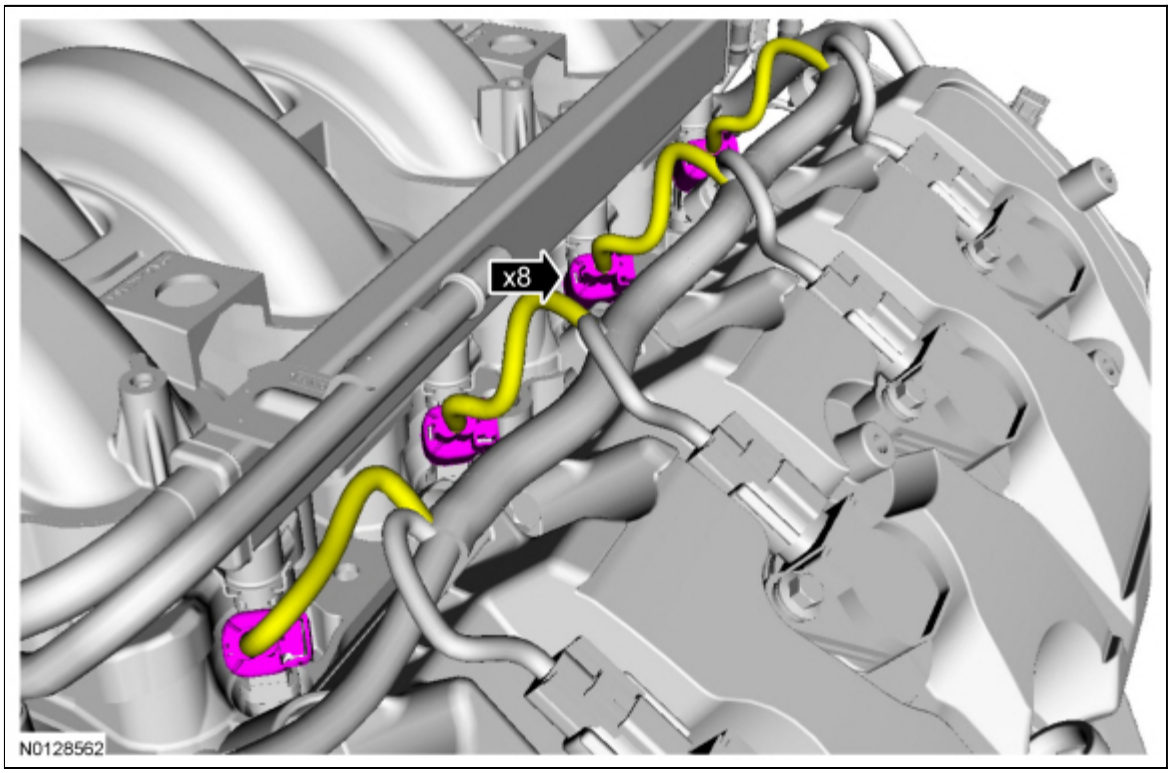


2. Install the 4 fuel rail bolts.
   - Tighten in the sequence shown in 3 stages.
     - Stage 1: Hand tighten.
     - Stage 2: Tighten to 10 Nm (89 lb-in).
     - Stage 2: Tighten an additional 90 degrees.

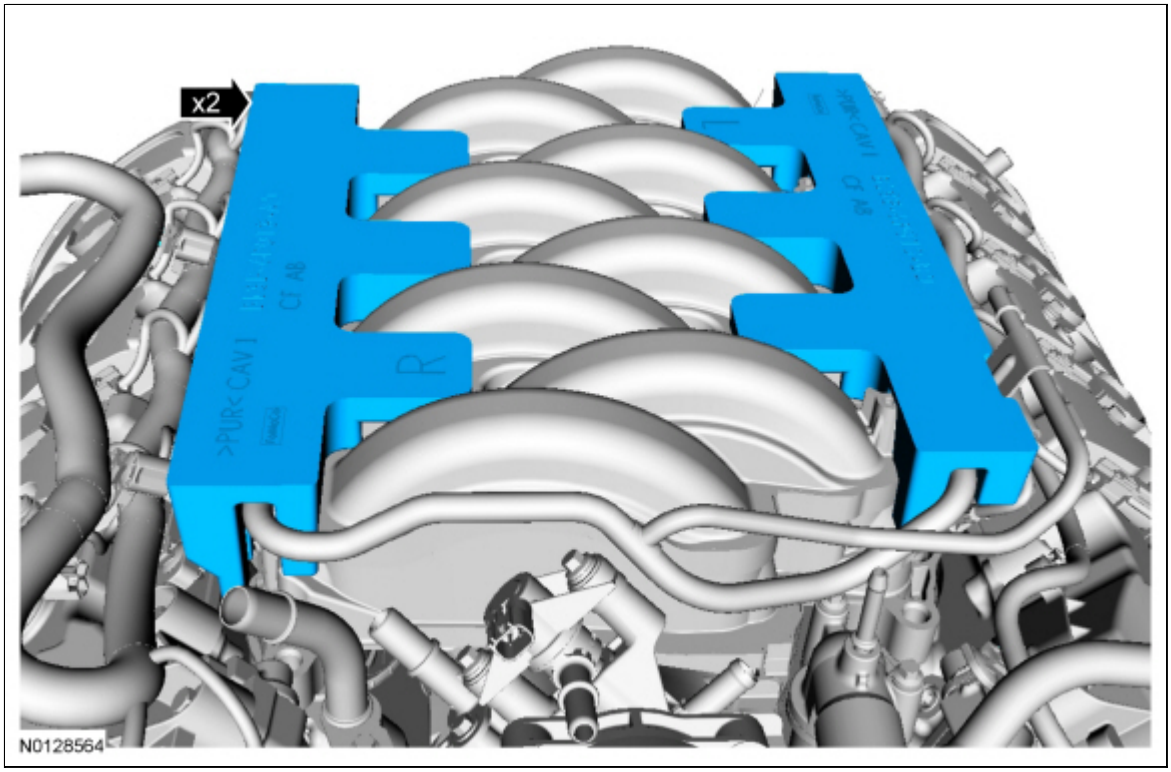


repair4less

3. Position the heater hoses and attach the heater hose retainer.

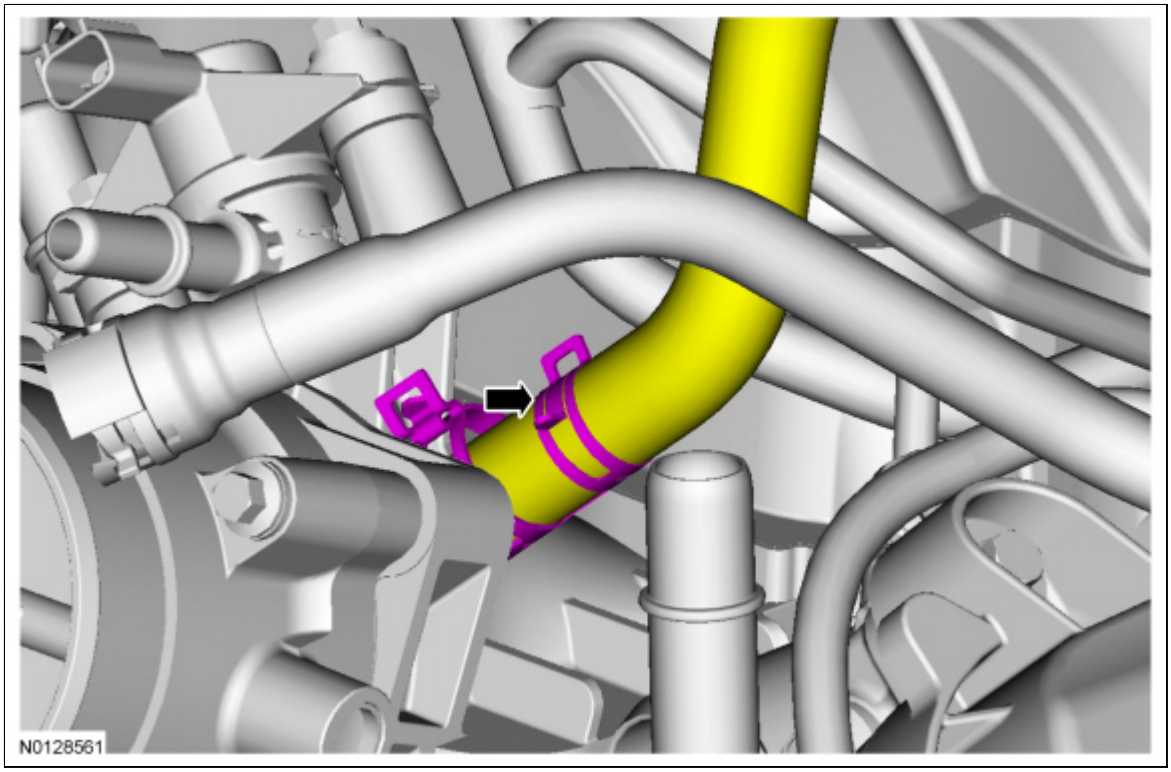


4. Attach the 4 wiring harness retainers to the rear of the intake manifold.



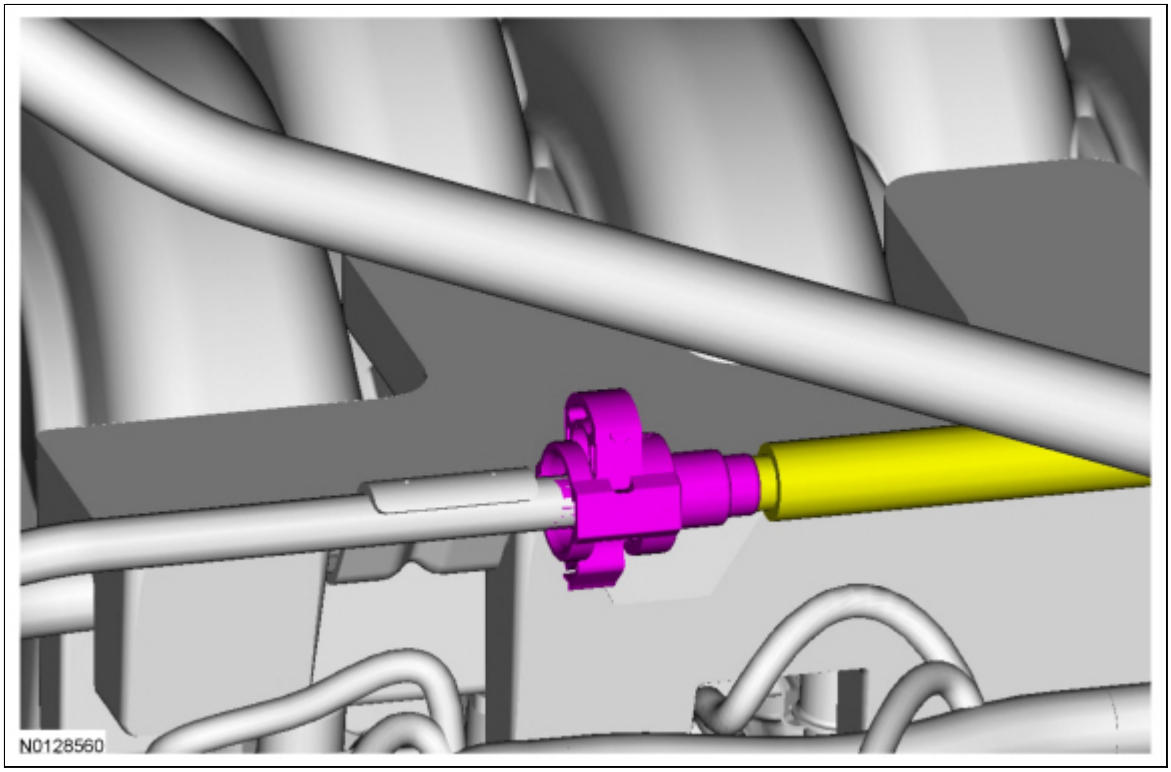
5. **NOTE:** The 4 LH fuel injector electrical connectors are shown, the 4 RH fuel injector electrical connectors are similar.

   Connect the 8 fuel injector electrical connectors.

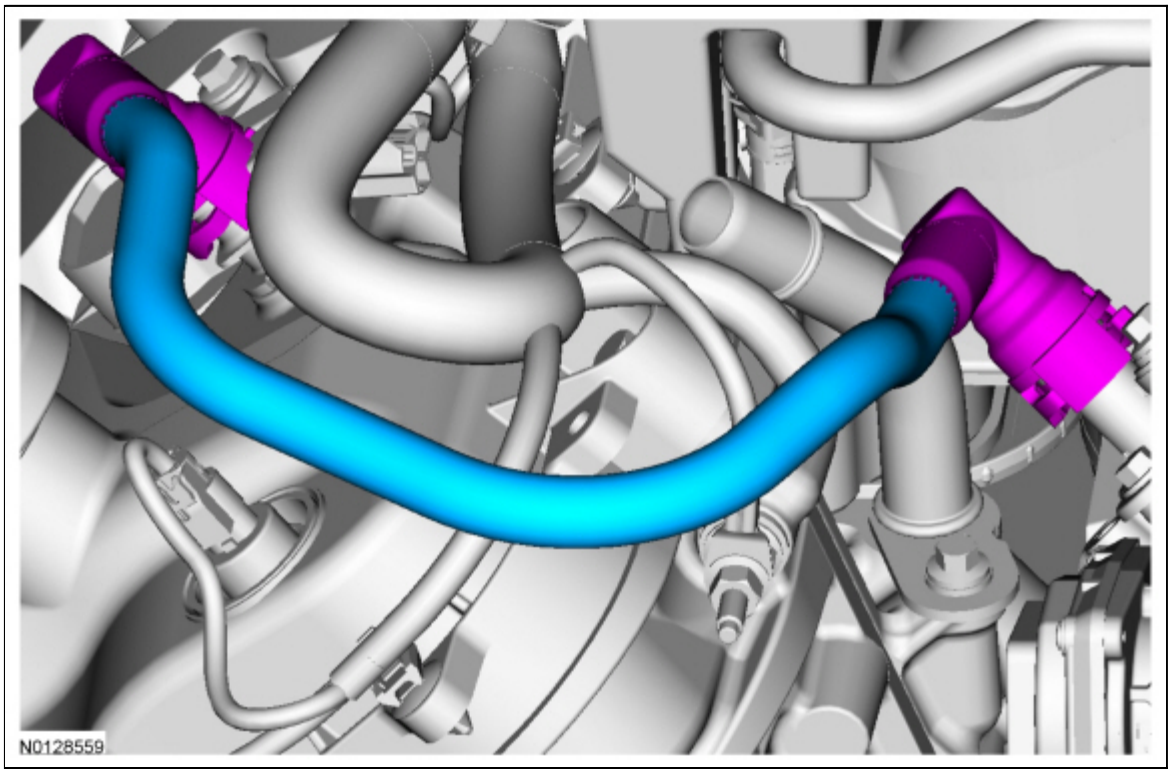


repair4less

6. Install the LH and RH fuel rail insulators.

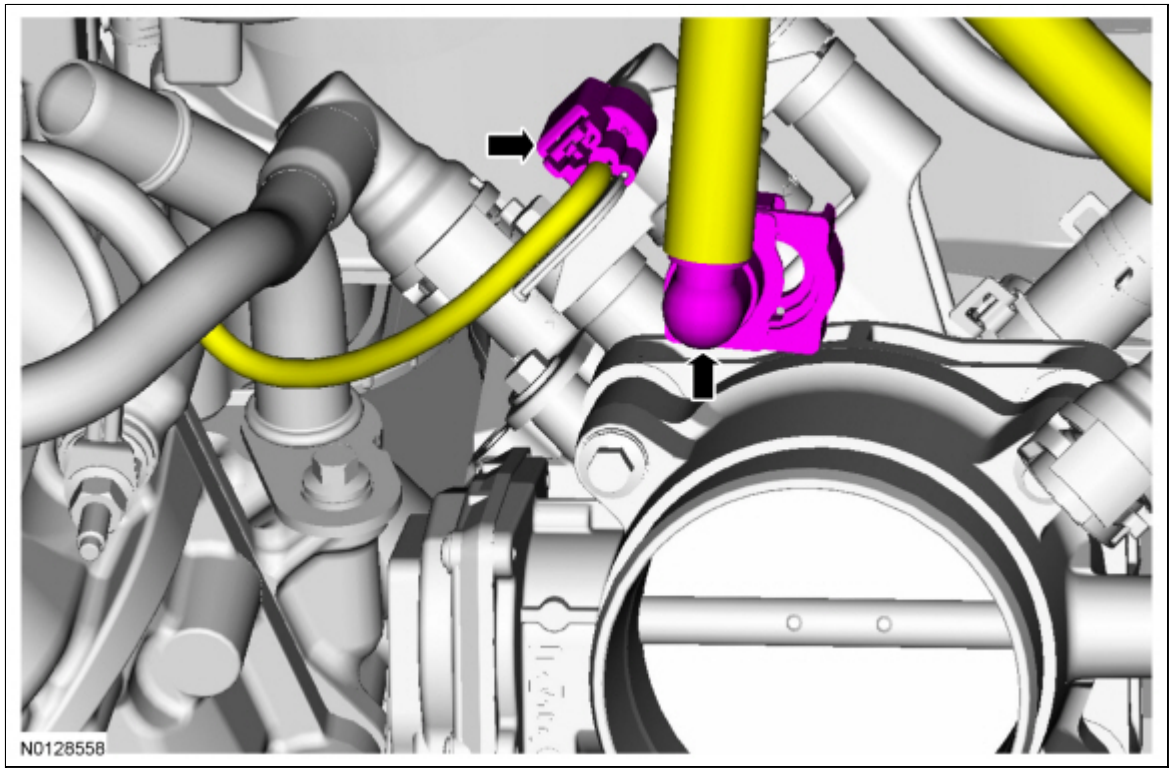


7. Connect the vacuum tube to the intake manifold.

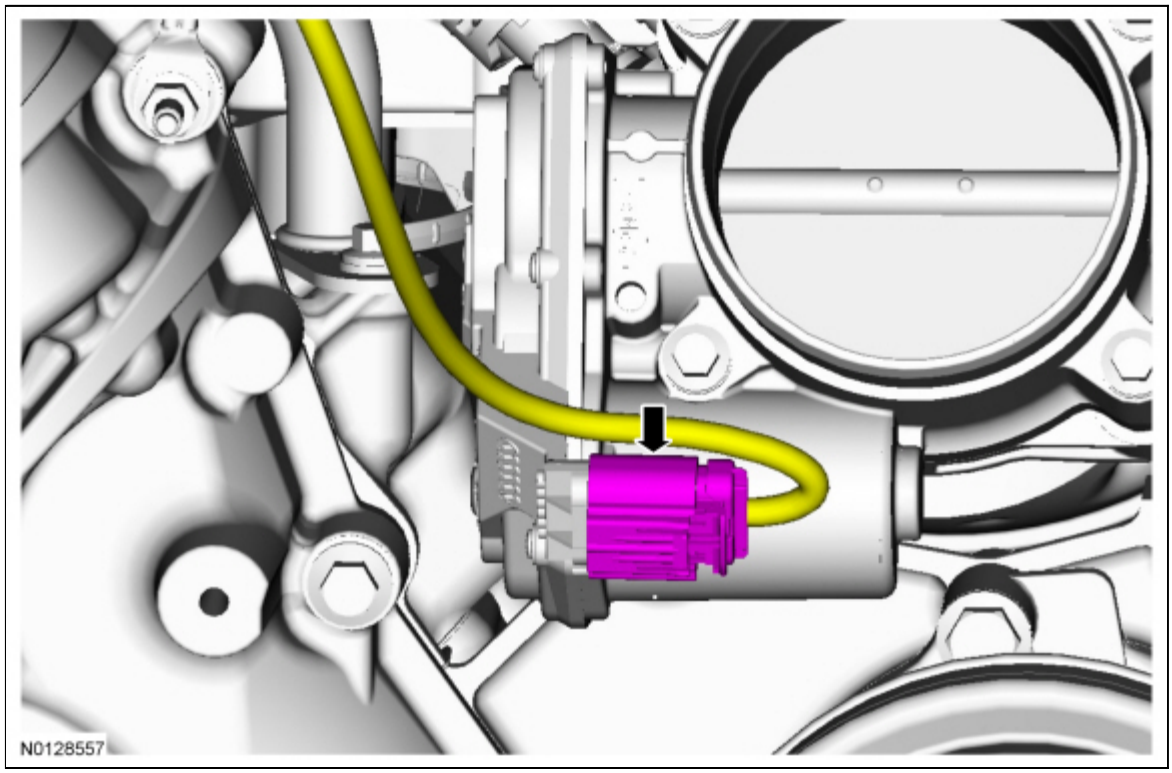


8. Connect the fuel supply tube. For additional information, refer to the quick connect coupling

procedure in Section 310-00 .



9. Install the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .



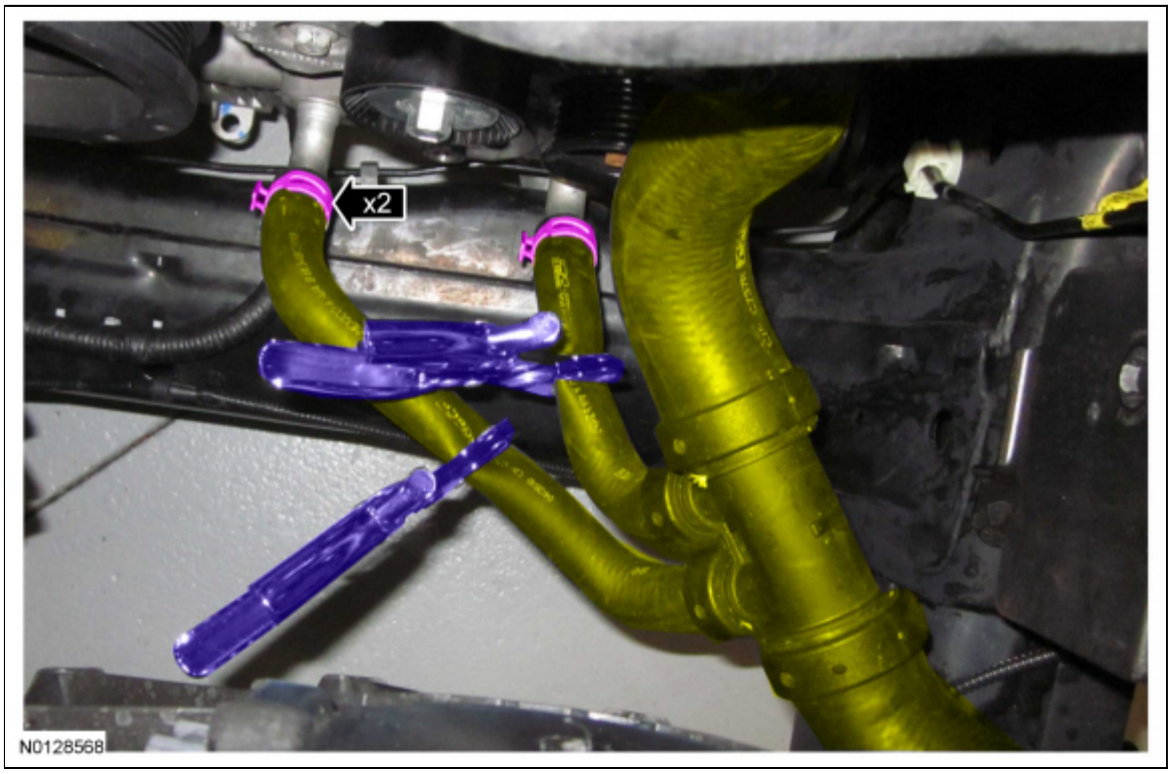
repair4less

10. Connect the Evaporative Emission (EVAP) purge valve tube and electrical connector. For additional information, refer to the quick connect coupling procedure in Section 310-00 .
    - Attach the EVAP tube retainer to the fuel rail.

11. Connect the TB electrical connector.

12. Install the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

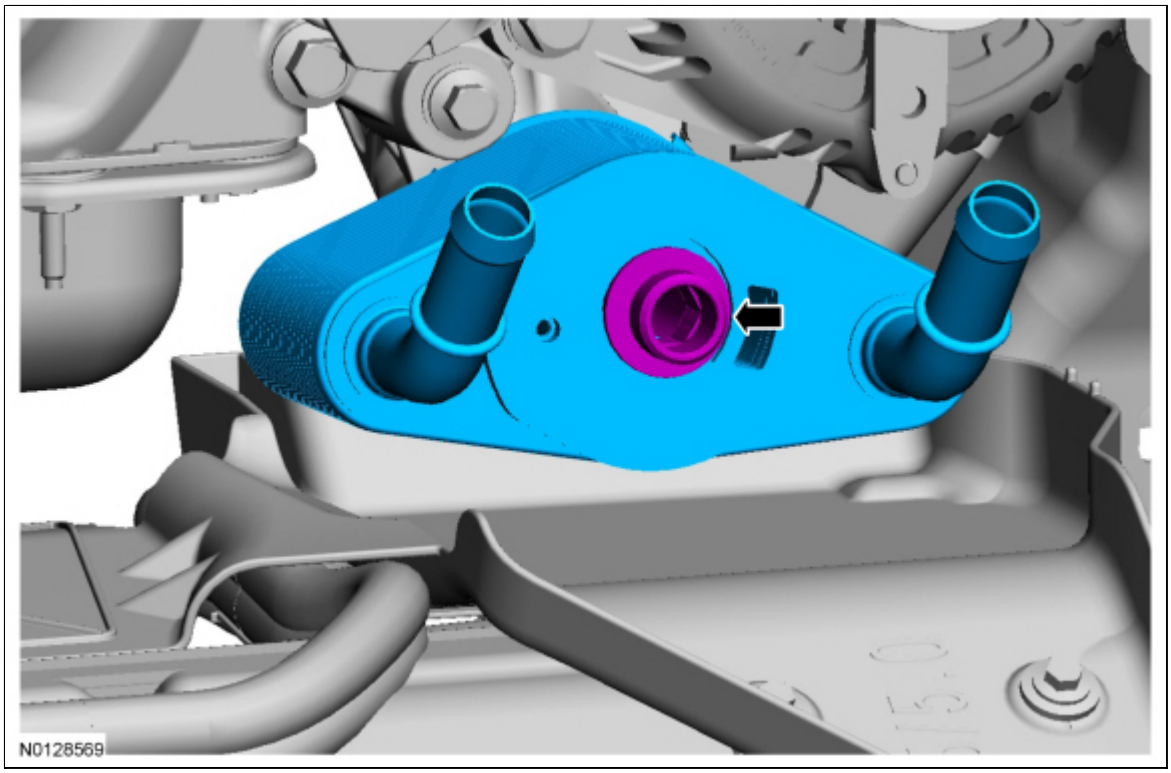
repair4less



Oil Cooler

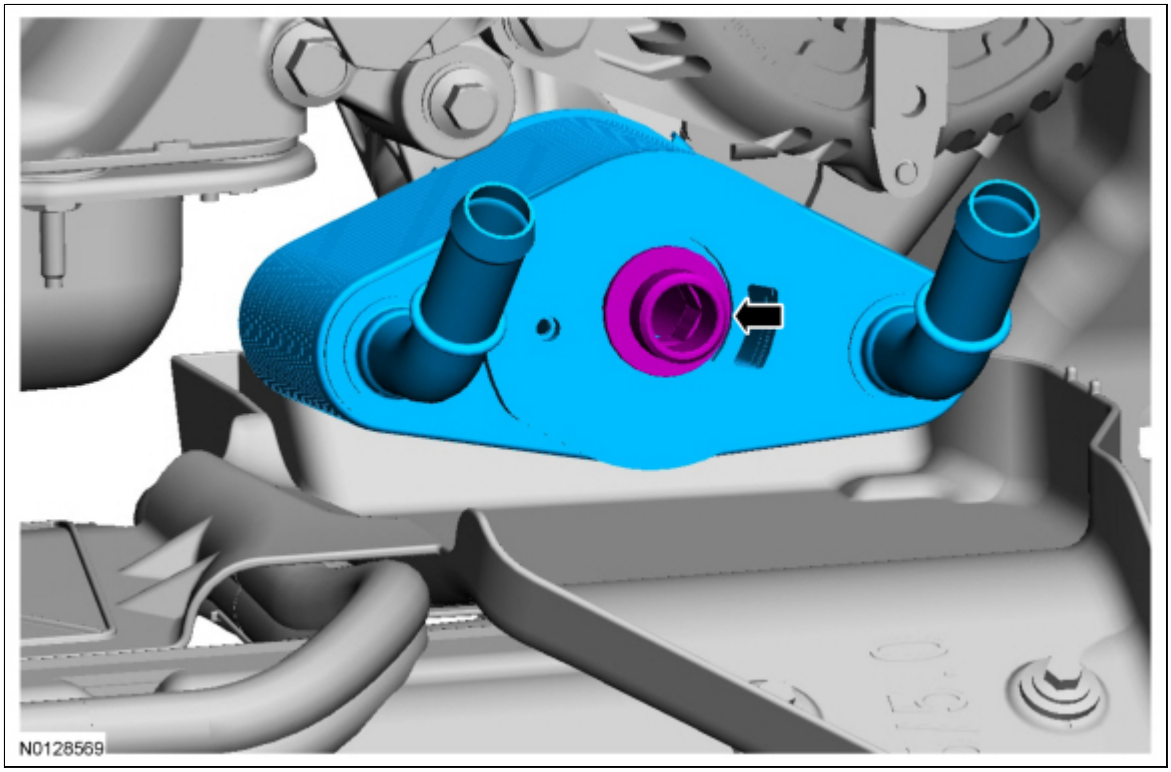
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



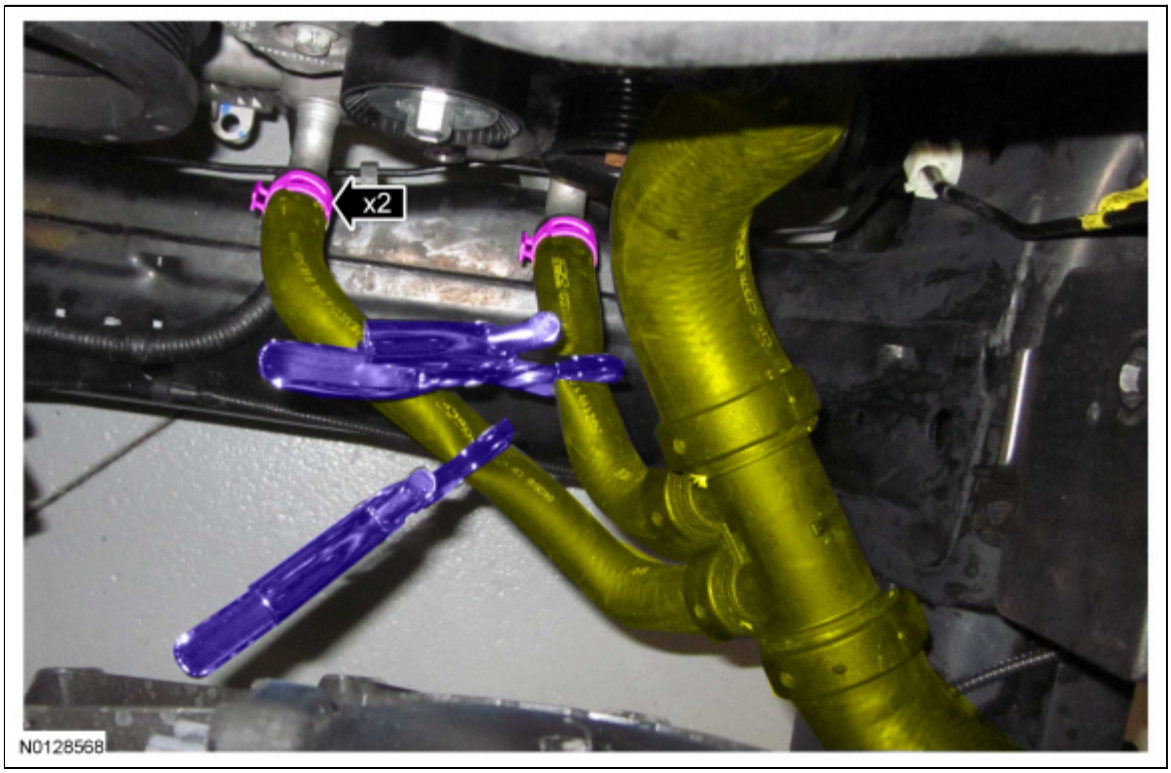
2. Remove and discard the engine oil filter.

3. Using hose clamp pliers, clamp the 2 oil cooler coolant hoses.
   - Disconnect the 2 coolant hoses from the oil cooler.



4. ***NOTICE:*** **If metal or aluminum material is present in the oil cooler, mechanical concerns exist. Failure to correct these concerns may cause engine failure. To diagnose mechanical concerns, refer to Section 303-00 .**

   Remove the oil cooler threaded insert and the oil cooler.



Installation

1. Install the oil cooler and threaded insert.
    - Tighten to 57 Nm (42 lb-ft).

repair4less

2. Connect the 2 coolant hoses.
    - Release the hose clamp pliers.

3. **NOTE:** Do not lubricate the O-ring seal.

   Install a new oil filter.
    - Tighten to 16 Nm (142 lb-in).

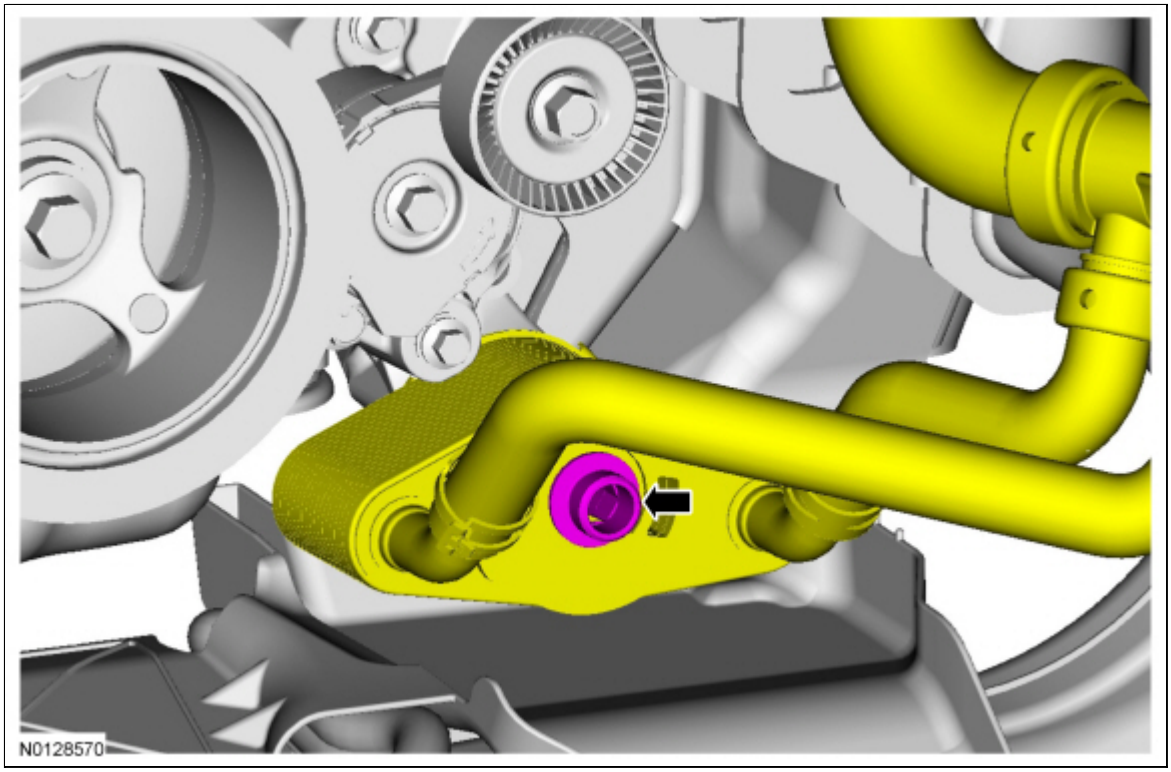
repair4less

Oil Filter Adapter

Removal

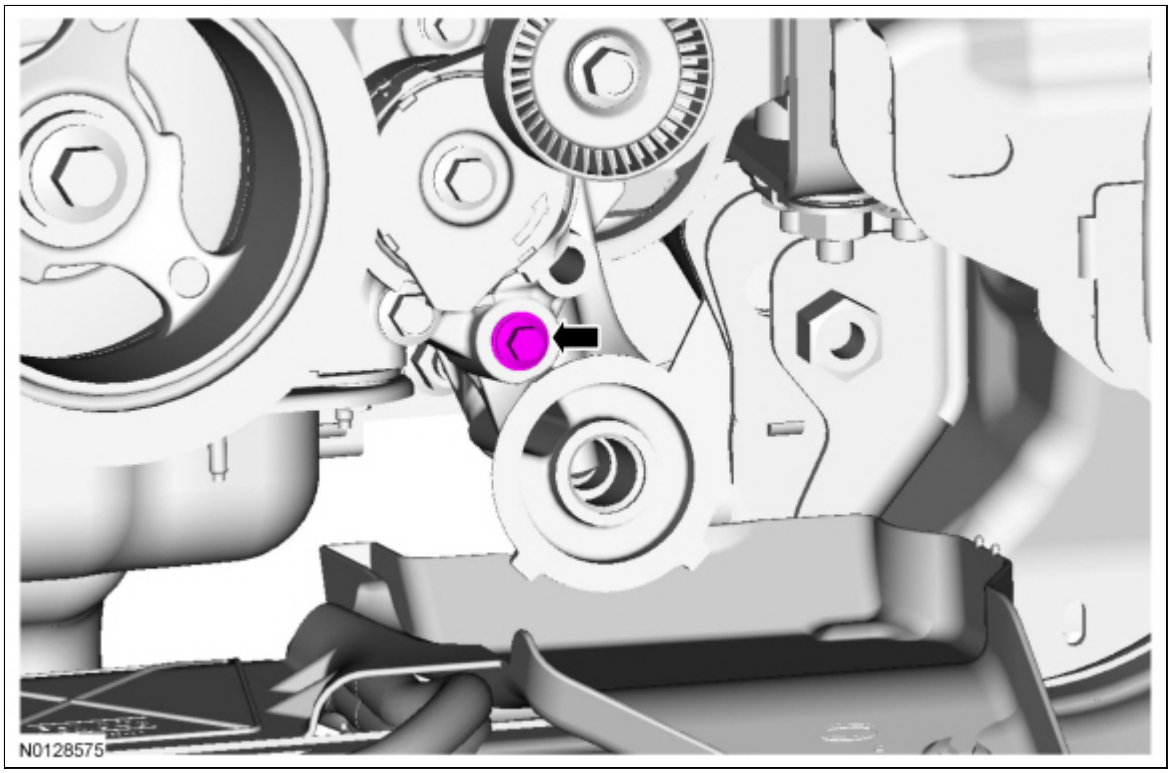
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTICE: **The engine front cover-to-oil filter adapter bolt must be removed and the engine front cover-to-oil filter adapter jackscrew loosened before removing the oil filter adapter**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the generator. For additional information, refer to Section 414-00 .

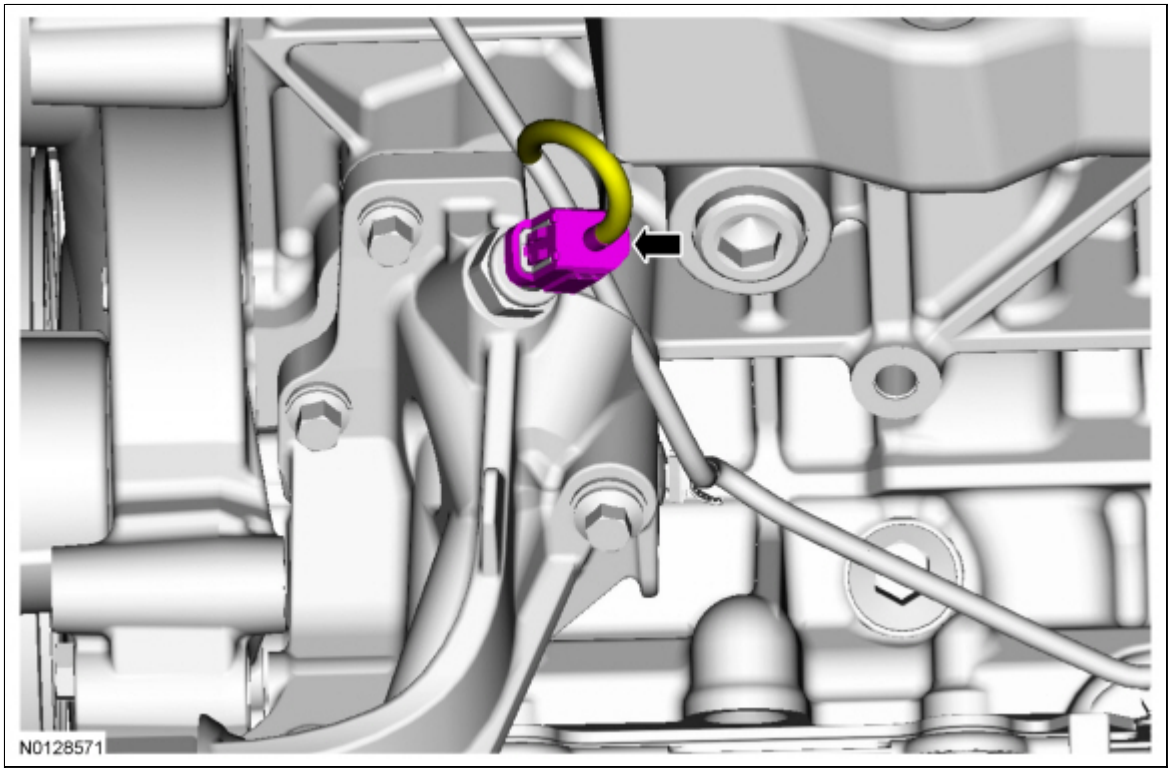


3. Remove and discard the engine oil filter.

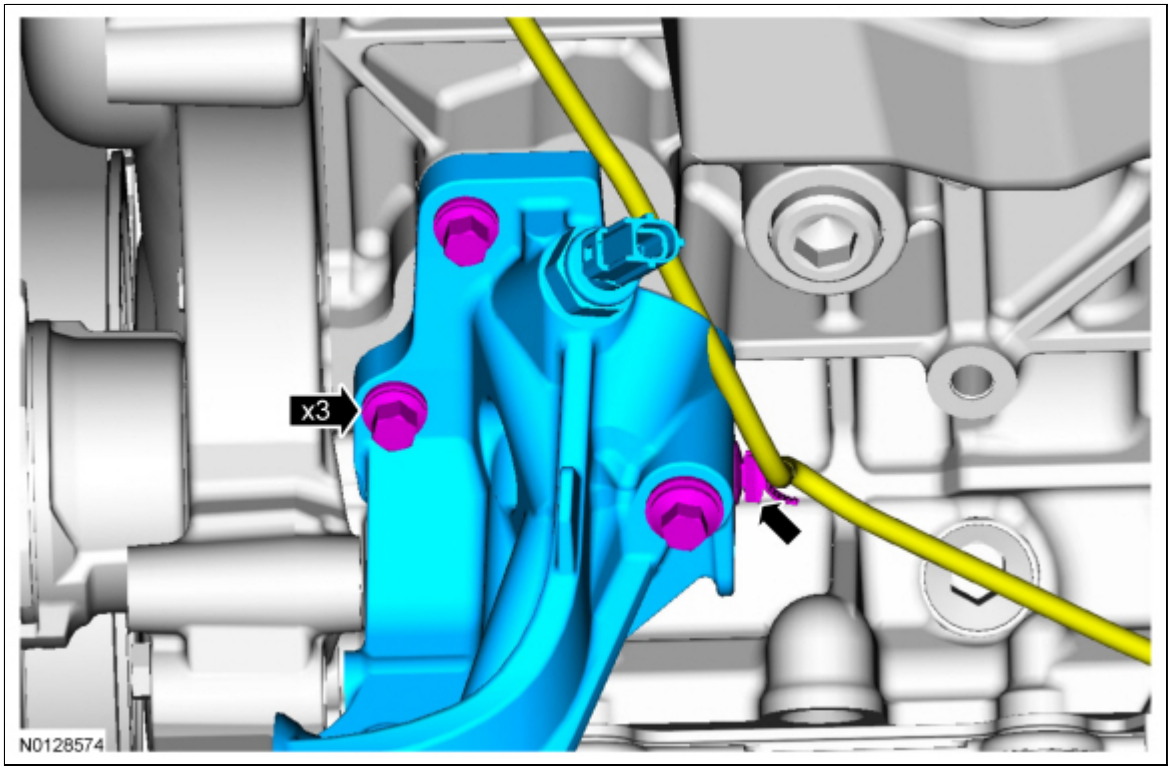
4. ***NOTICE:*** **If metal or aluminum material is present in the oil cooler, mechanical concerns exist. Failure to correct these concerns may cause engine failure. To diagnose mechanical concerns, refer to Section 303-00 .**

   Remove the oil cooler threaded insert and position the oil cooler and hoses aside.

5. Remove the engine front cover-to-oil filter adapter bolt.



6. Using a 10 mm (0.393 in) Hex Bit loosen the engine front cover-to-oil filter adapter jack screw.

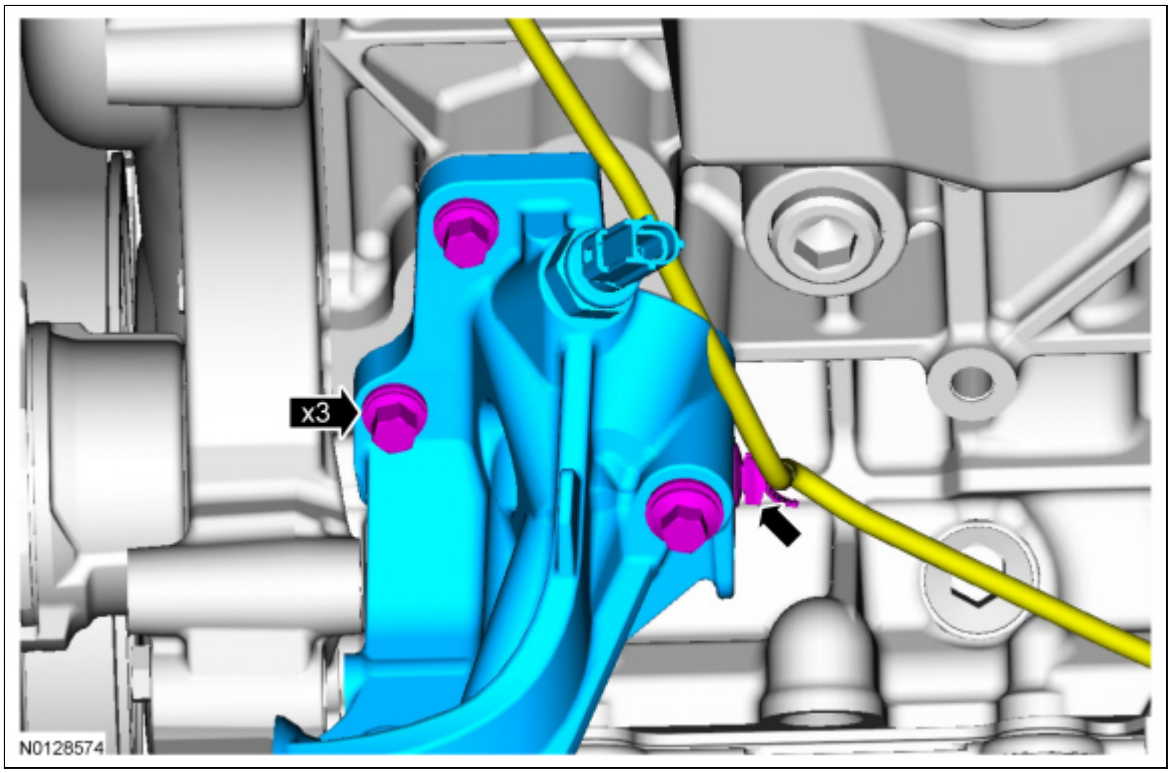


7. Disconnect the engine oil pressure switch electrical connector.

repair4less

8. **NOTE:** On 4x4 vehicles, the rear bolt must be removed with the oil filter adapter.

   Remove the 3 oil filter adapter bolts .
   - Position the oil filter adapter aside and detach the wiring harness retainer.
   - Remove the oil filter adapter and discard the gasket.

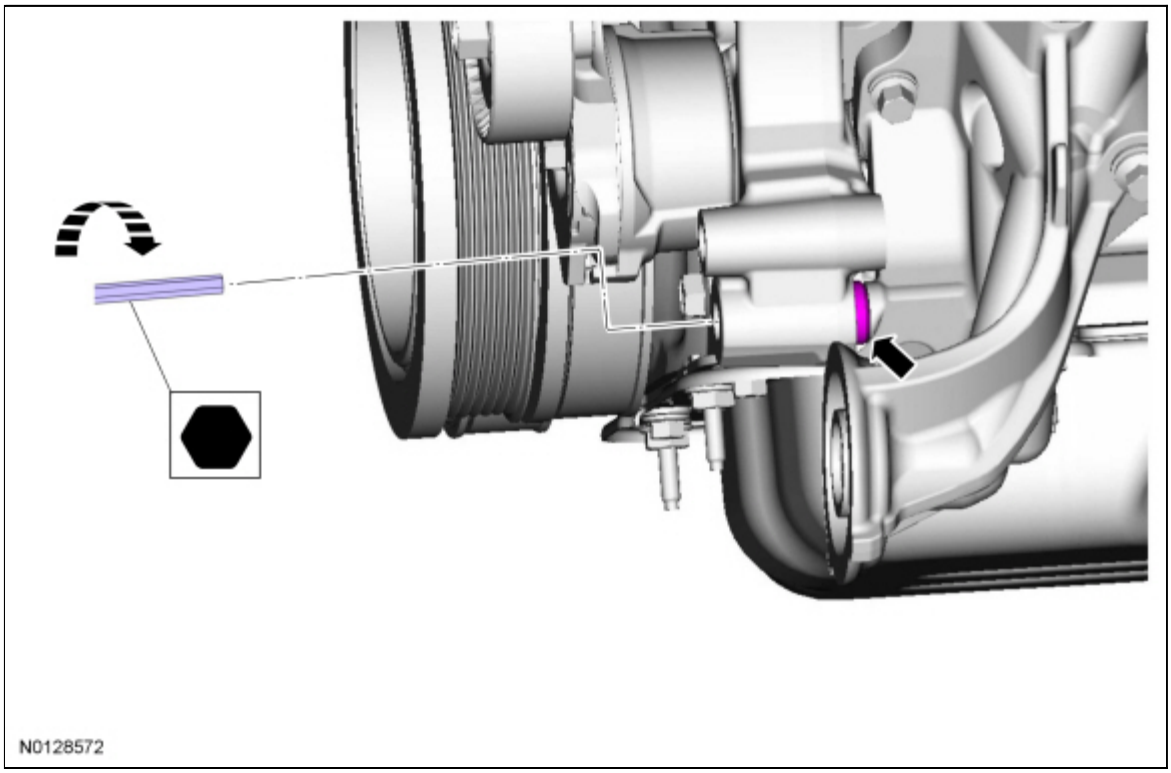


Installation

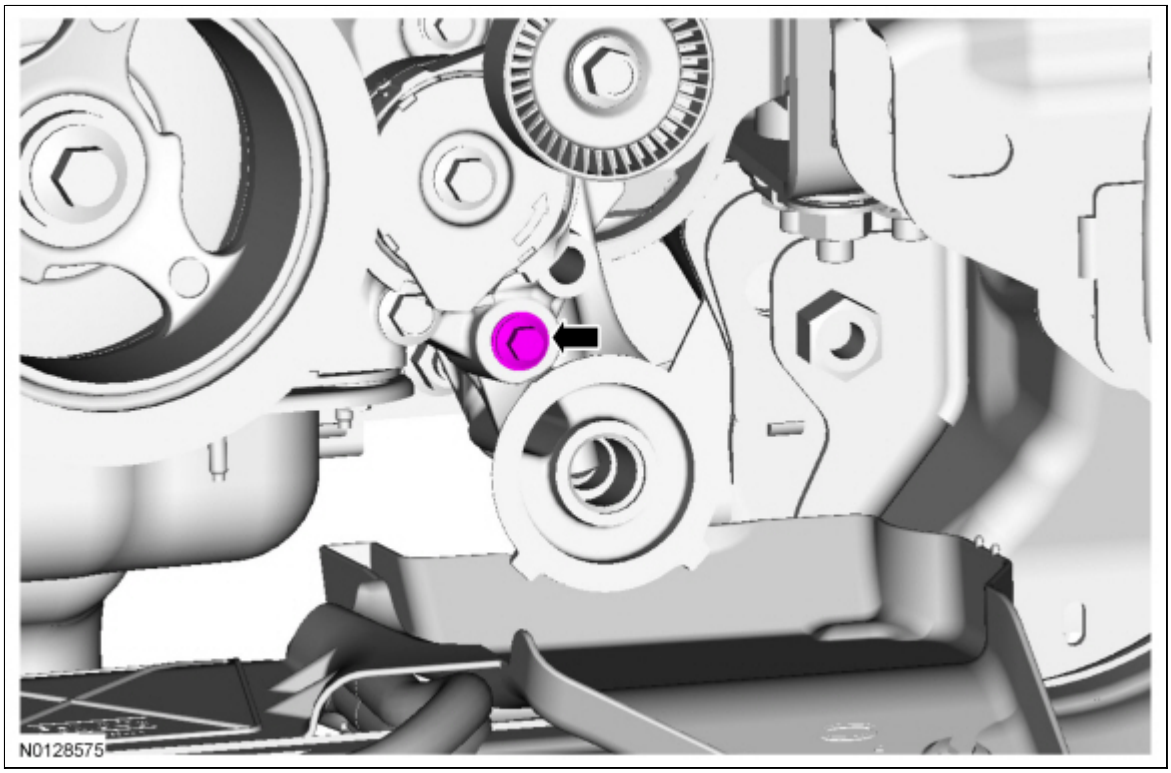
1. **NOTE:** Install a new oil filter adapter gasket.

   NOTE: On 4x4 vehicles, the rear bolt must be positioned with the oil filter adapter.

   Using a new gasket, position the oil filter adapter and attach the wiring harness retainer.
   - Install the 3 bolts and tighten to 20 Nm (177 lb-in) plus an additional 60 degrees.

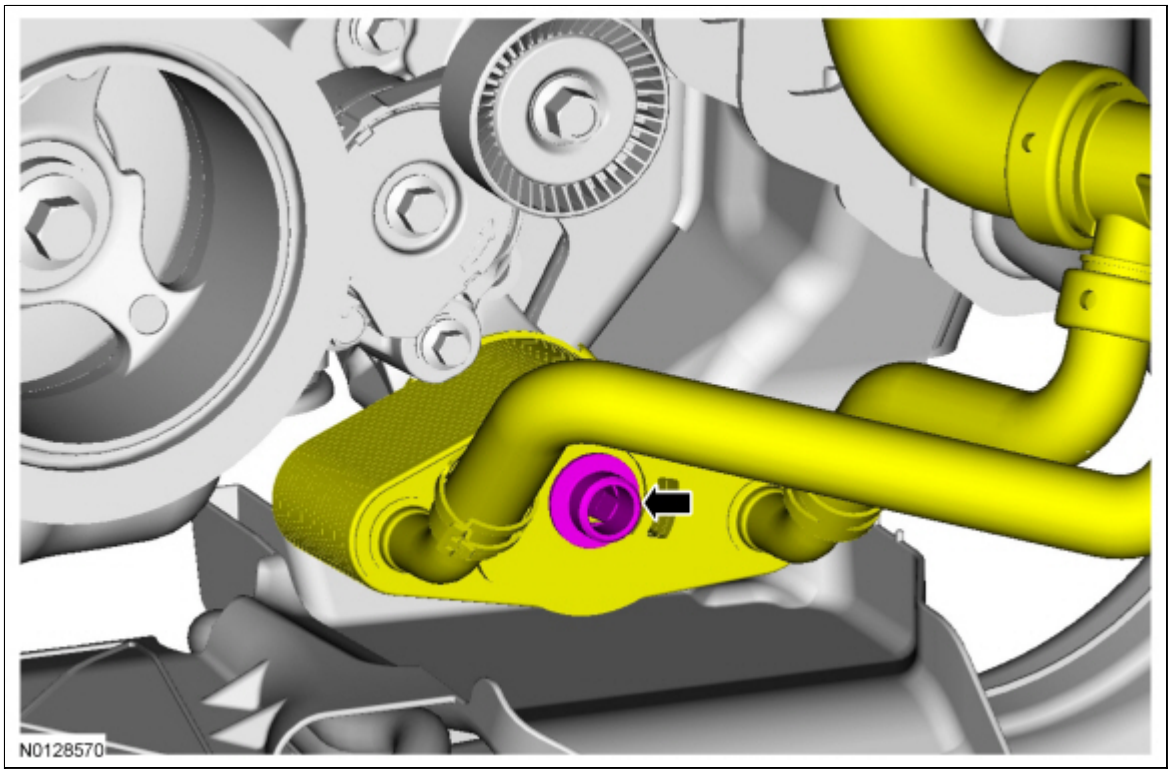


2. Connect the engine oil pressure switch electrical connector.



repair4less

3. Using a 10 mm Hex Bit, rotate the engine front cover jackscrew into contact with the oil filter adapter to 5 Nm (44 lb-in).



4. Tighten the engine front cover-to-oil filter adapter bolt to 25 Nm (18 lb-ft) plus an additional 60 degrees.

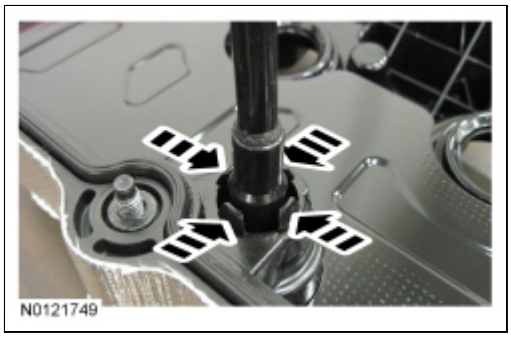
5. ***NOTICE:*** **If metal or aluminum material is present in the oil cooler, mechanical concerns exist. Failure to correct these concerns may cause engine failure. To diagnose mechanical concerns, refer to Section 303-00 .**

   Position the oil cooler and hoses and install the oil cooler threaded insert.
   - Tighten to 57 Nm (42 lb-ft).

repair4less

6. **NOTE:** Do not lubricate the O-ring seal.

   Install a new oil filter.
   - Tighten to 16 Nm (142 lb-in).



7. Install the generator. For additional information, refer to Section 414-00 .

Oil Level Indicator and Tube

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. Remove the LH valve cover. For additional information, refer to Valve Cover — LH in this section.
2. Depress the 4 tabs and remove the oil level indicator tube.

Installation

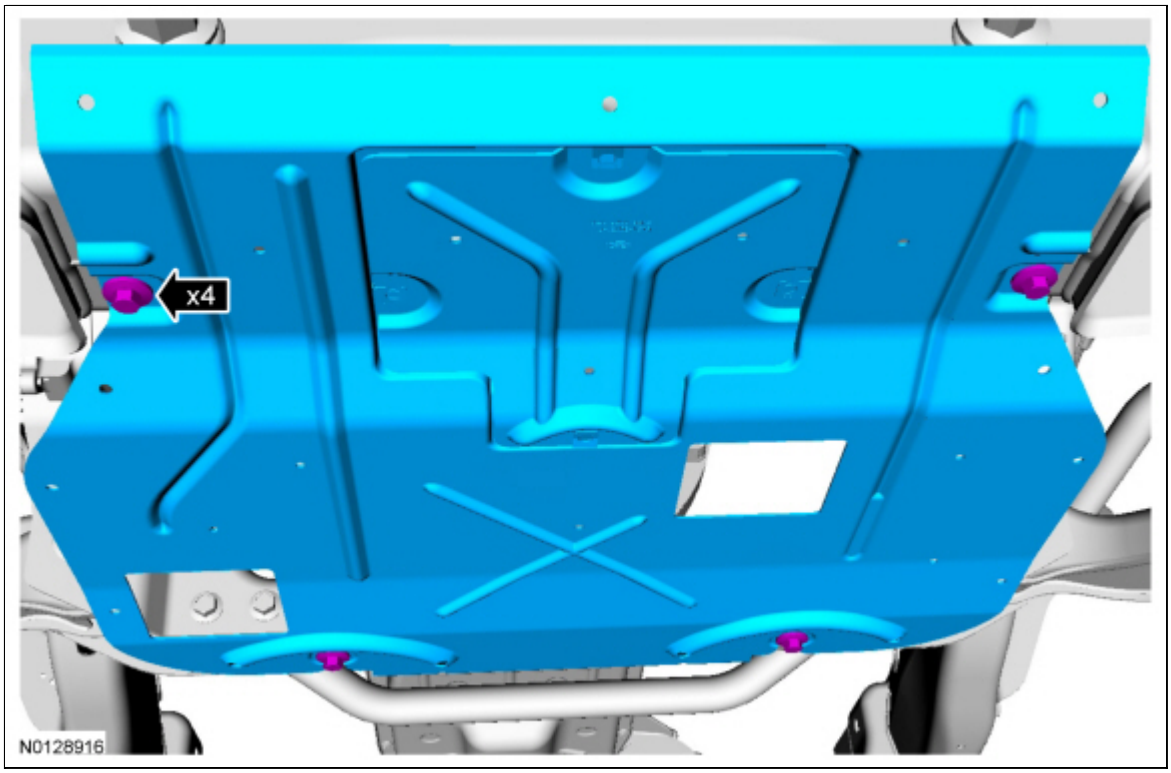
1. Install the oil level indicator tube.
    - Push the oil level indicator tube into the valve cover until it clicks into place.
2. Install the LH valve cover. For additional information, refer to Valve Cover — LH in this section.

repair4less

Oil Pan

Material

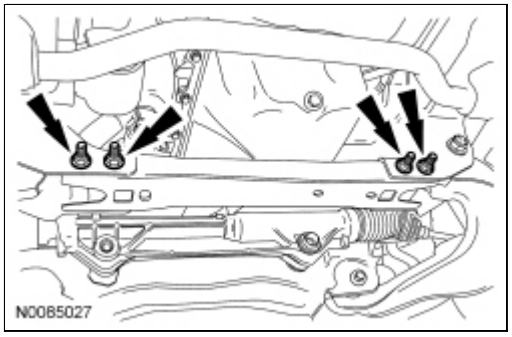
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Removal

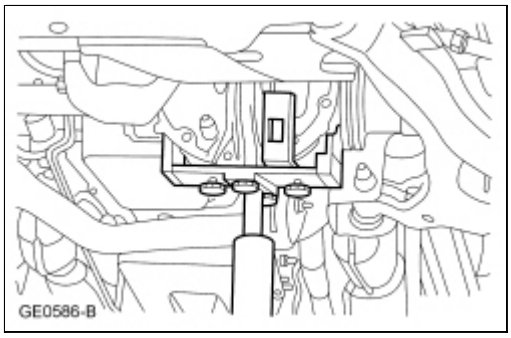
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

All vehicles



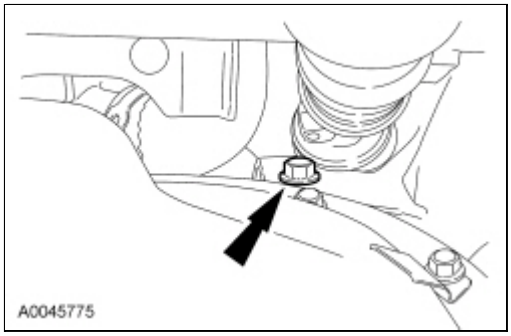
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the oil level indicator.
4. If equipped, remove the 4 bolts and the skid plate.

repair4less

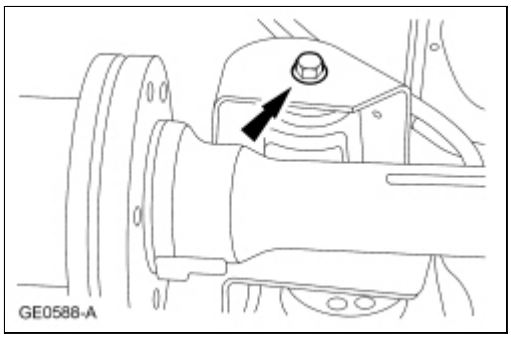


5. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 26 Nm (19 lb-ft).

6. Remove the 4 nuts and bolts and the crossmember.

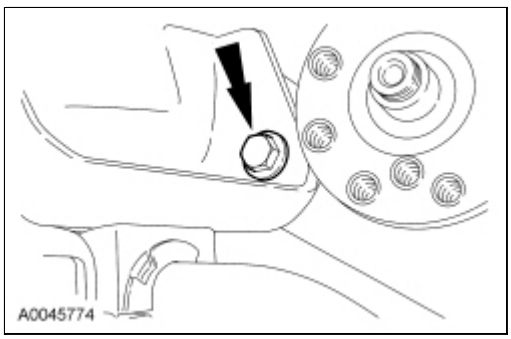


Four Wheel Drive (4X4) vehicles



7. Position a suitable hydraulic jack under the front axle.
    - Securely strap the jack to the axle.

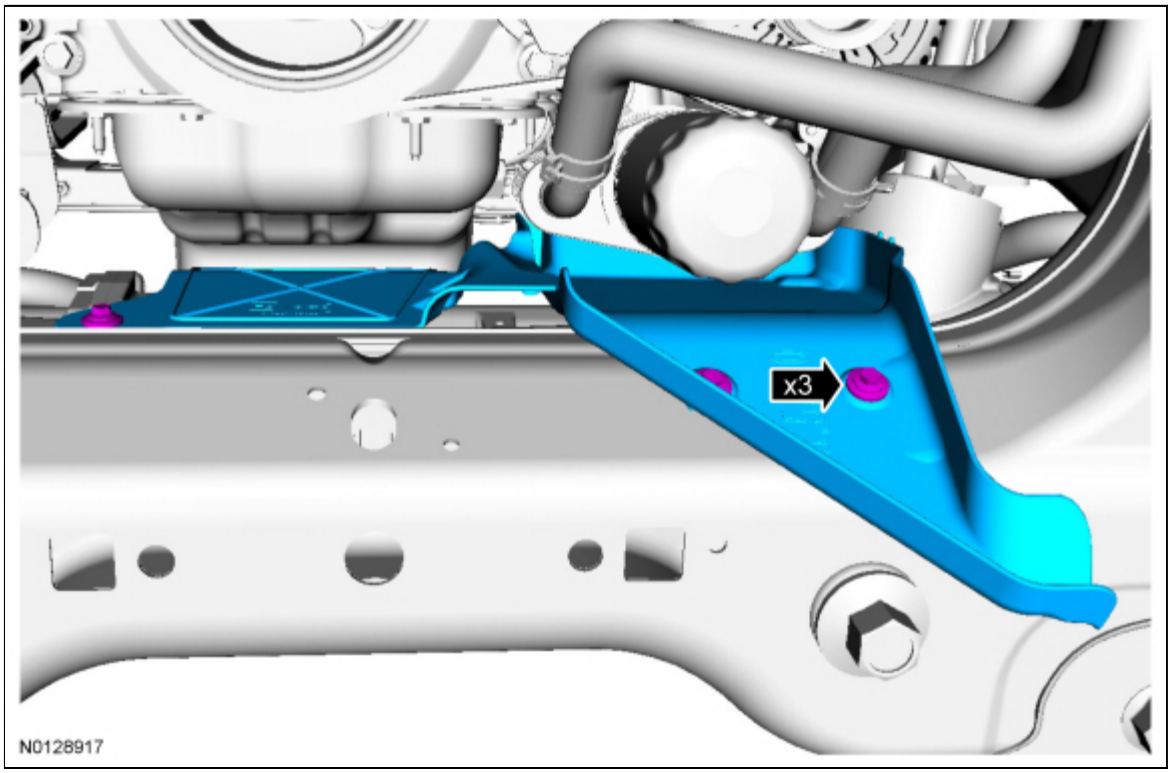
8. Remove the upper front axle carrier mounting bushing bolt.



9. Remove the axle shaft housing carrier bushing bolt.

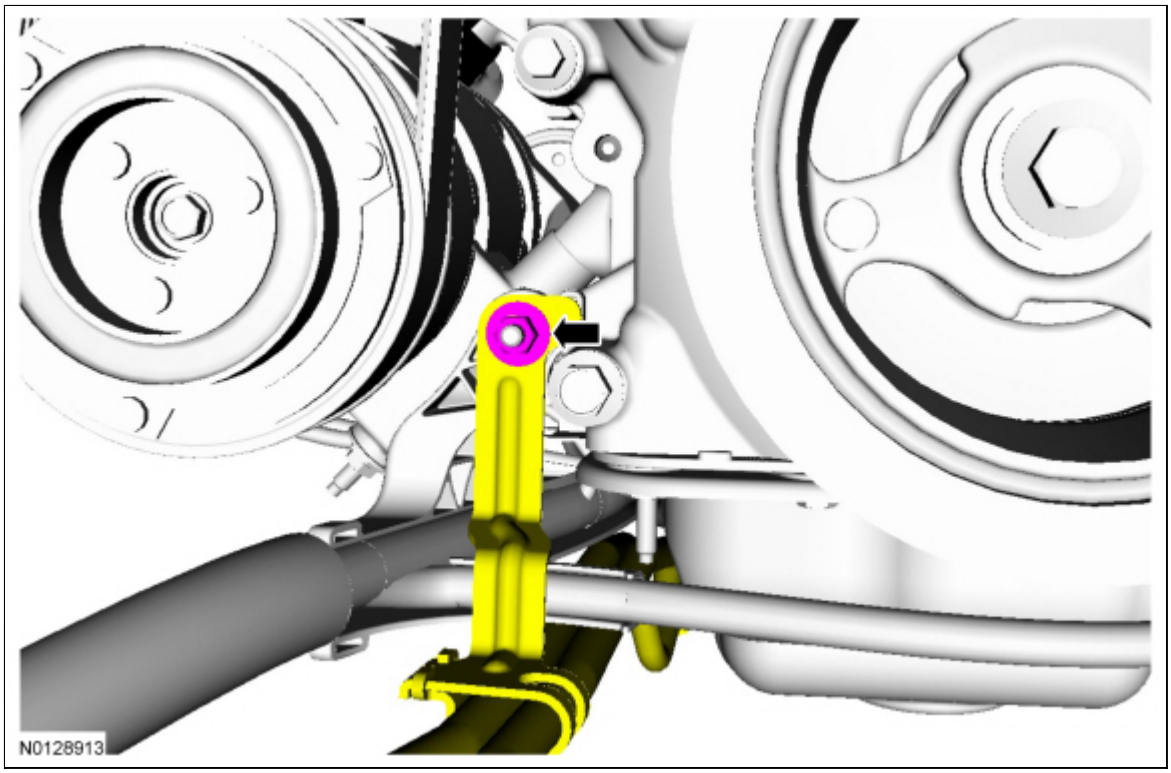
10. **NOTE:** Front driveshaft removed for clarity only.

    Remove the lower front axle carrier mounting bushing bolt.



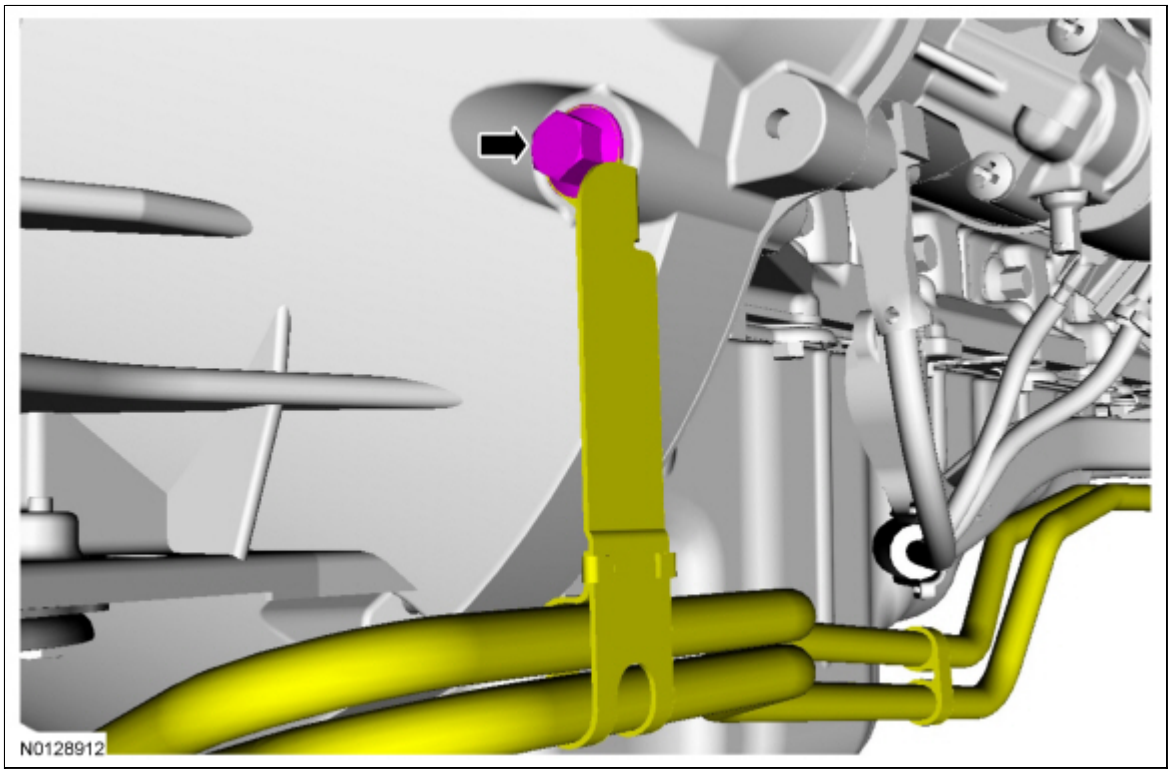
11. ***NOTICE:*** **Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

repair4less



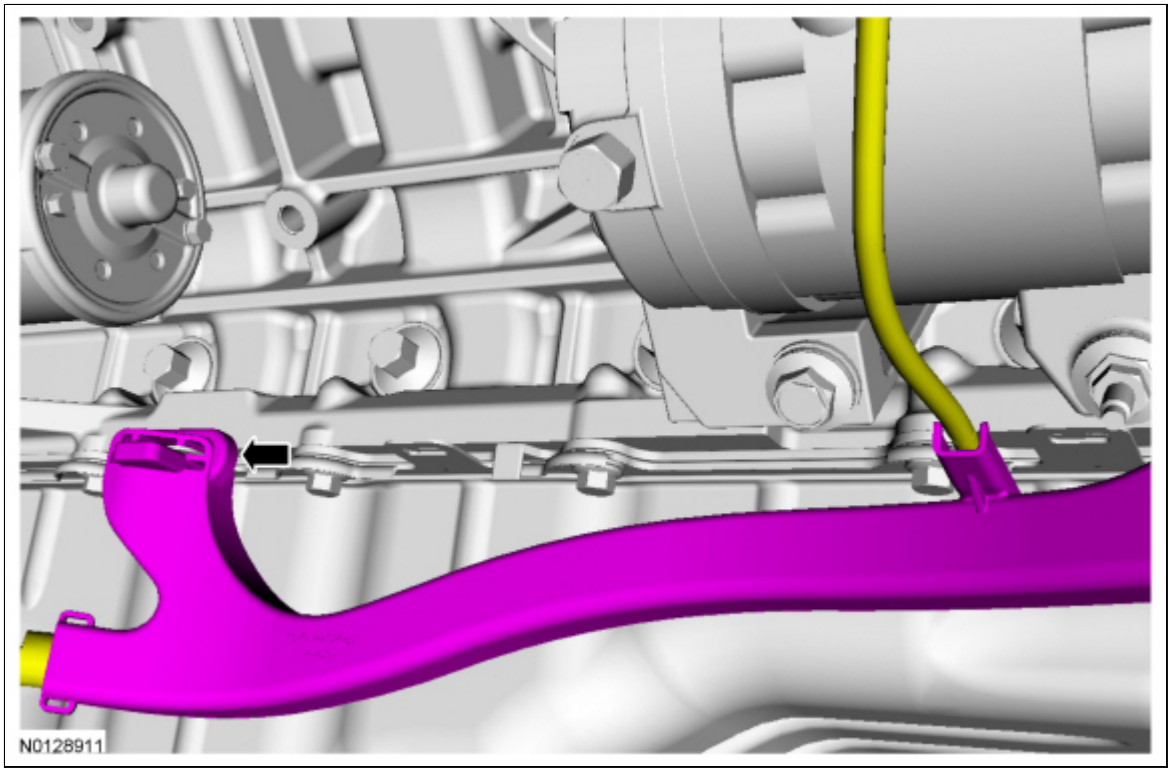
Lower the axle to allow clearance for the oil pan to be removed.

All vehicles

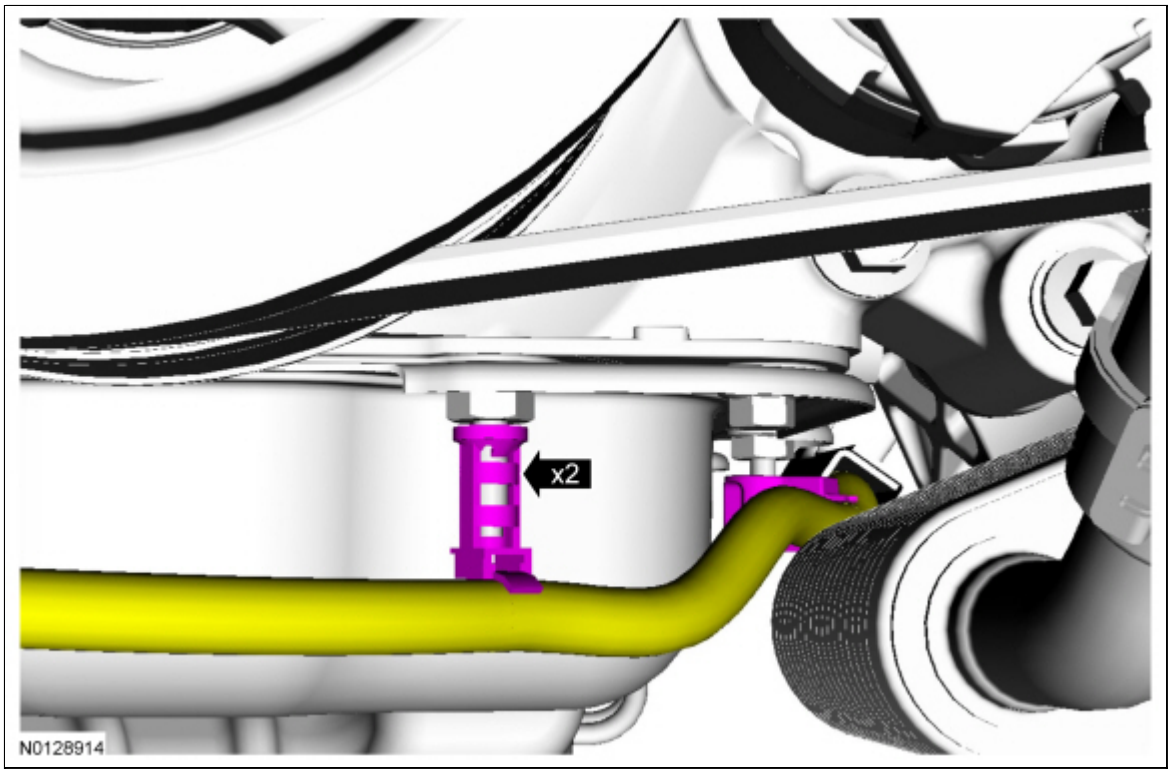


12. Remove the 3 bolts and the oil drain gutter.

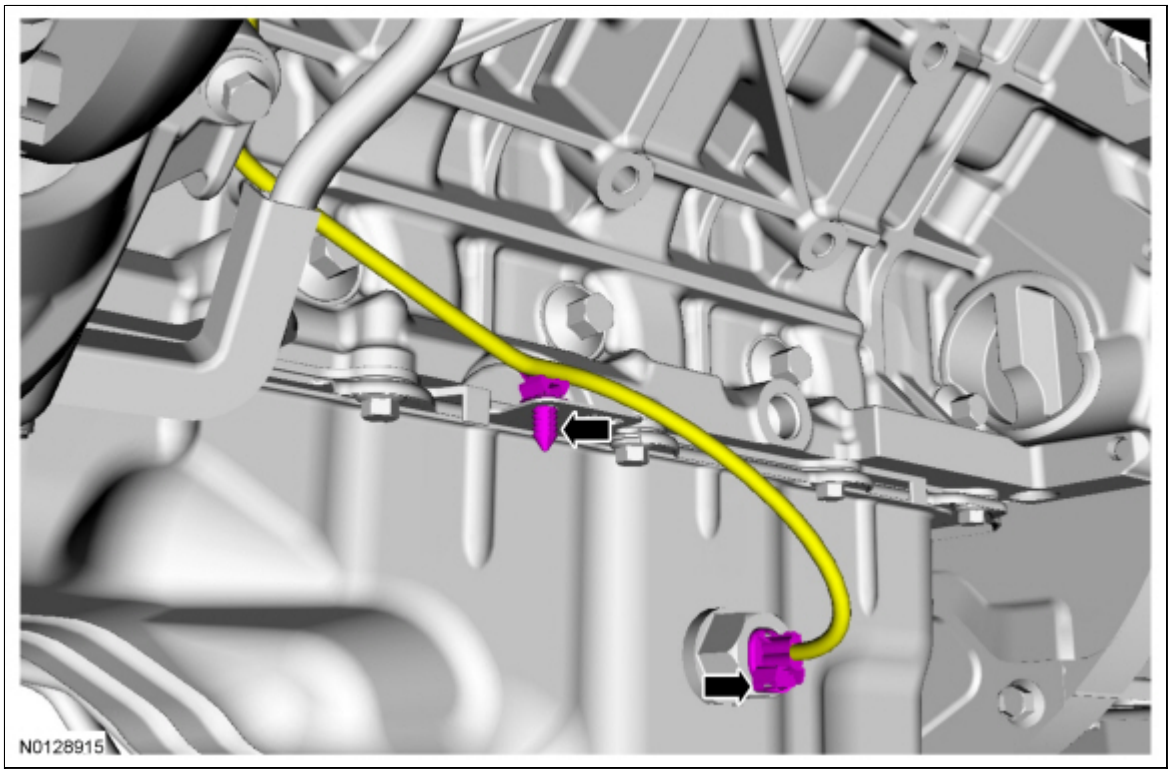
13. Remove the nut and the transmission cooler tube bracket from the engine front cover stud bolt.



14. Remove the bolt and the transmission cooler tube bracket from the bellhousing.



15. Detach the starter motor wiring harness retainer from the oil pan.



repair4less

16. Detach the 2 wiring harness retainers from the oil pan stud bolts.

17. Disconnect the oil level sensor electrical connector and wiring harness retainer.

18. Remove the 3 stud bolts, the 13 bolts and the oil pan.

Installation

All vehicles

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

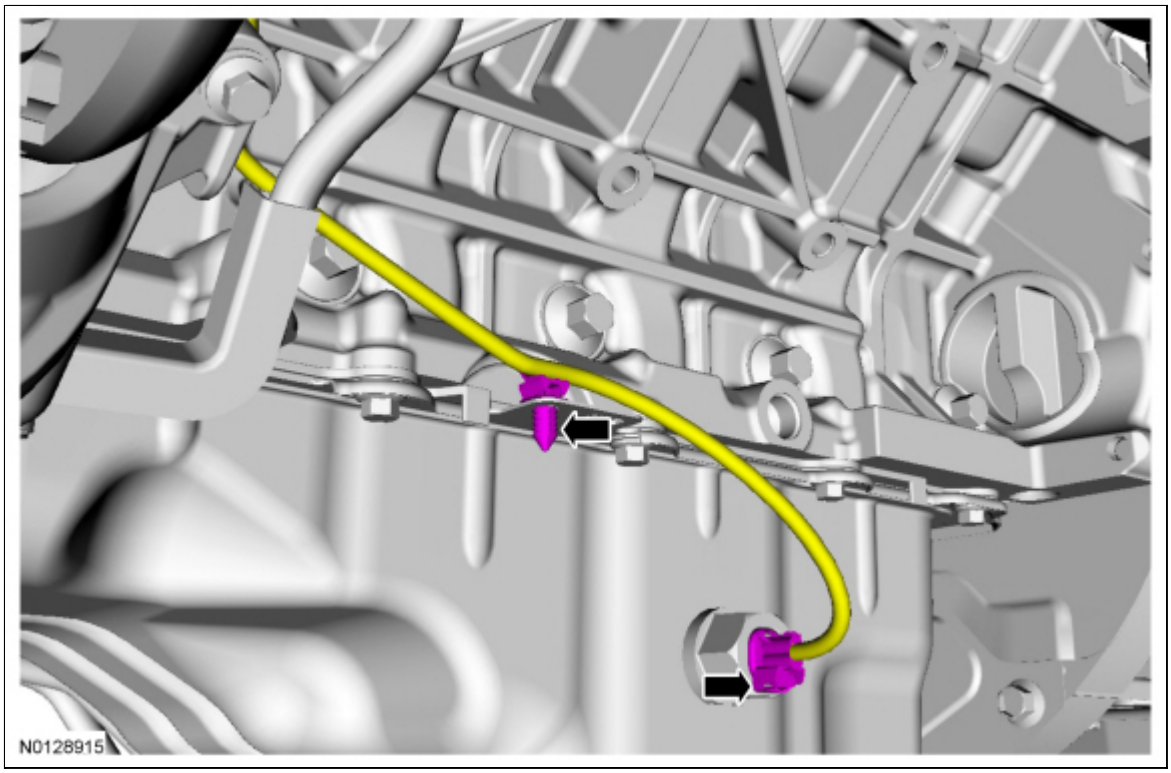
   Inspect the oil pan and engine sealing surfaces. Clean the mating surfaces of the engine and oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

2. **NOTE:** If the oil pan is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage. If this timing cannot be met, tighten fasteners 7, 8, 9 and 10 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer and final torque all of the fasteners within 1 hour of applying the sealer.

   NOTE: If the engine front cover has been removed, it is only necessary to apply sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces.

   Apply an 8 mm (0.31 in) bead of silicone sealant to the crankshaft rear seal retainer plate-to-cylinder block sealing surfaces and the engine front cover-to-cylinder block sealing surfaces.

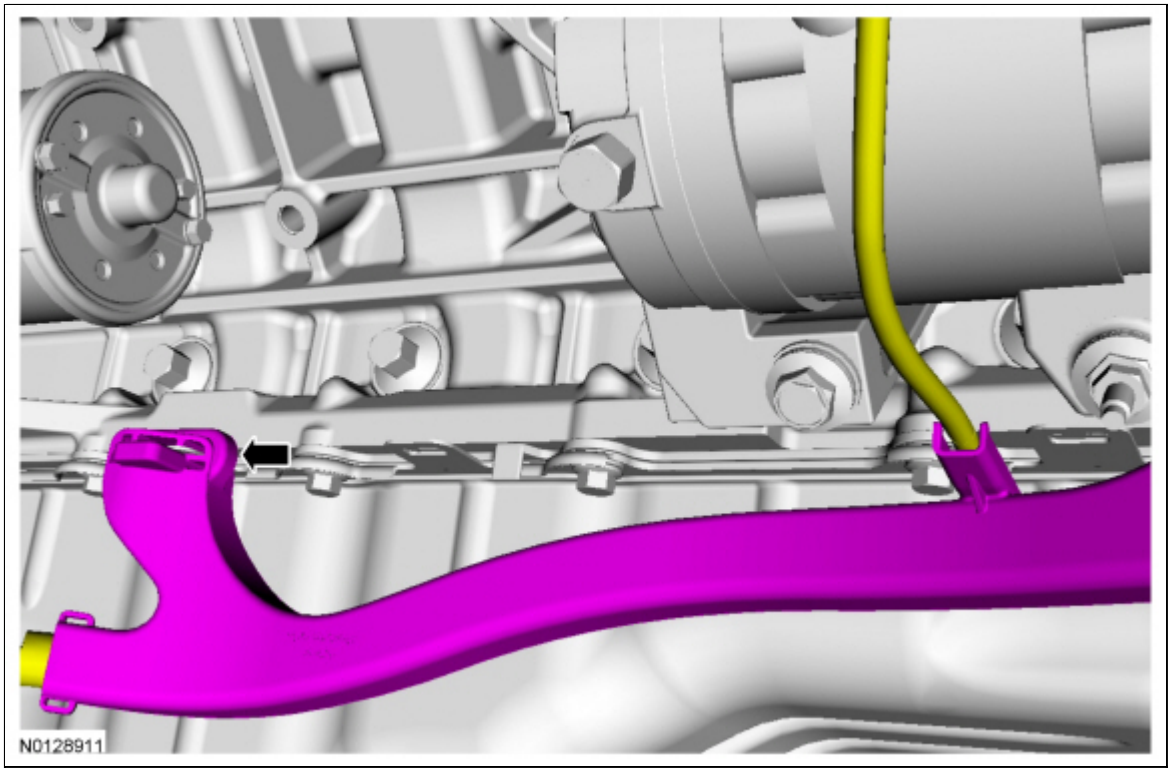
repair4less



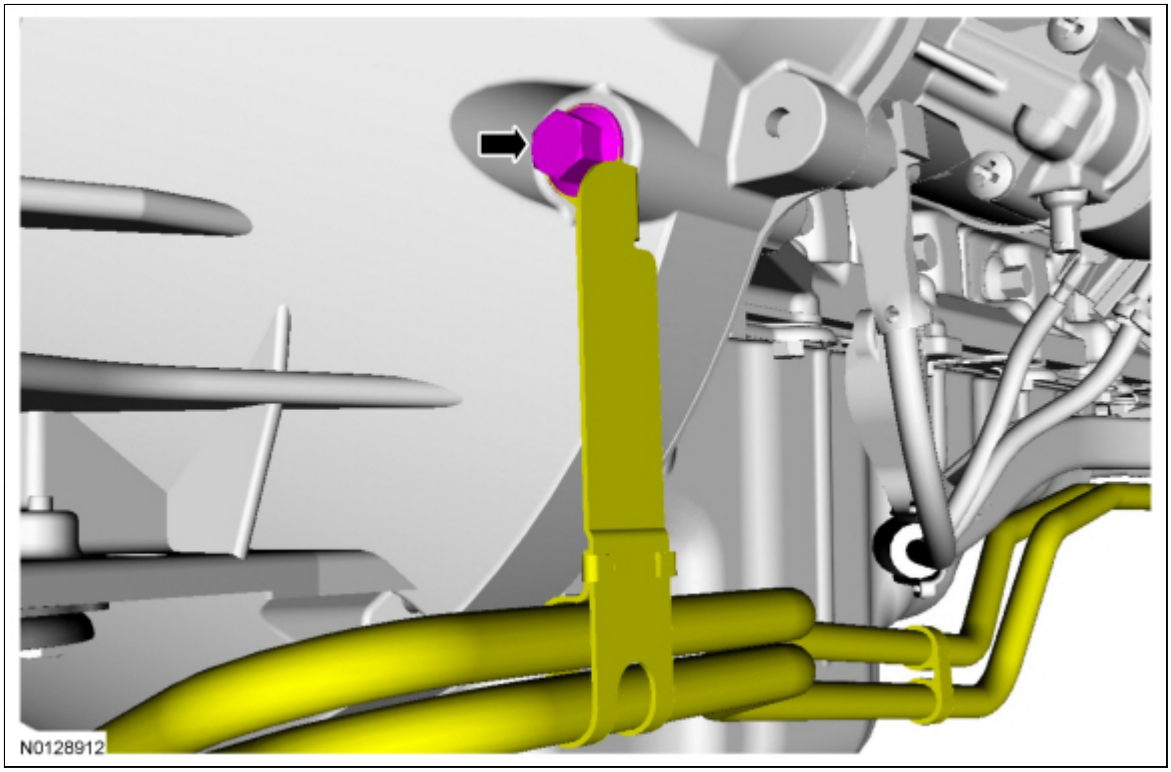
3. **NOTE:** Fastener locations 7, 13 and 16 are stud bolts.

   Using a new gasket, install the oil pan and tighten the fasteners in sequence in 3 stages.
   - Stage 1: Tighten to 2 Nm (18 lb-in)
   - Stage 2: Tighten to 10 Nm (89 lb-in).
   - Stage 3: Tighten an additional 45 degrees.

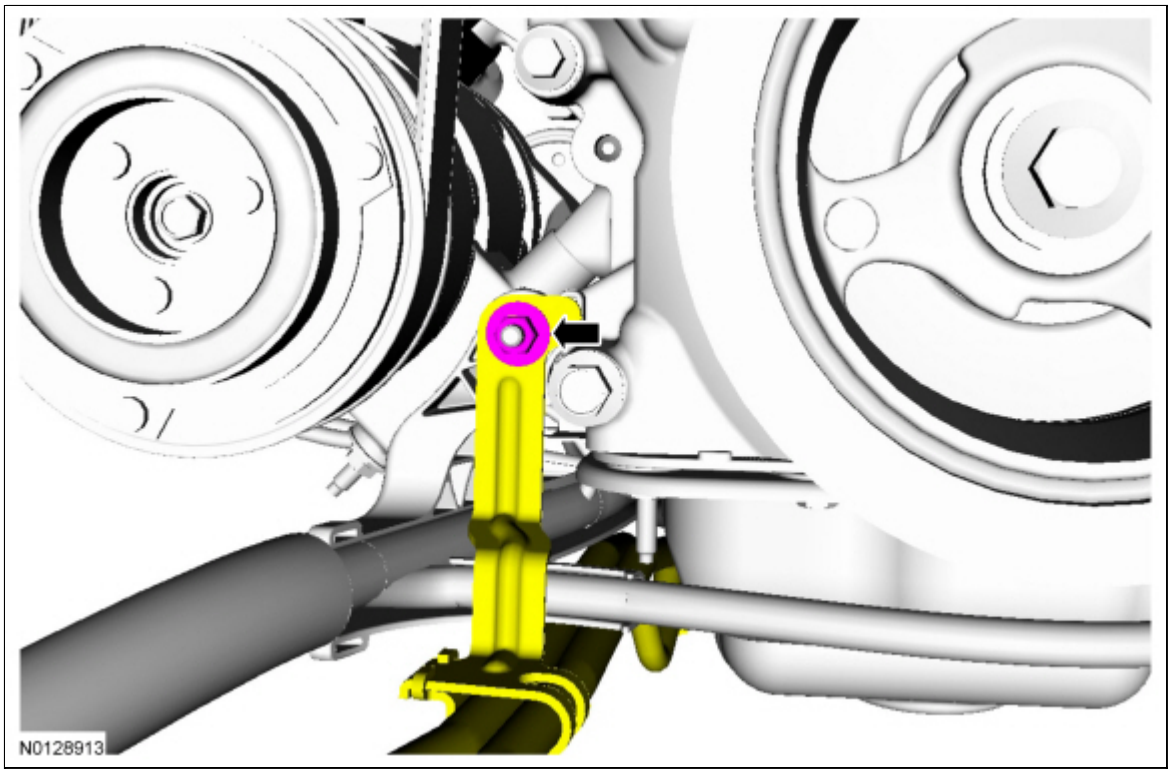
4. Connect the oil level sensor electrical connector and wiring harness retainer.



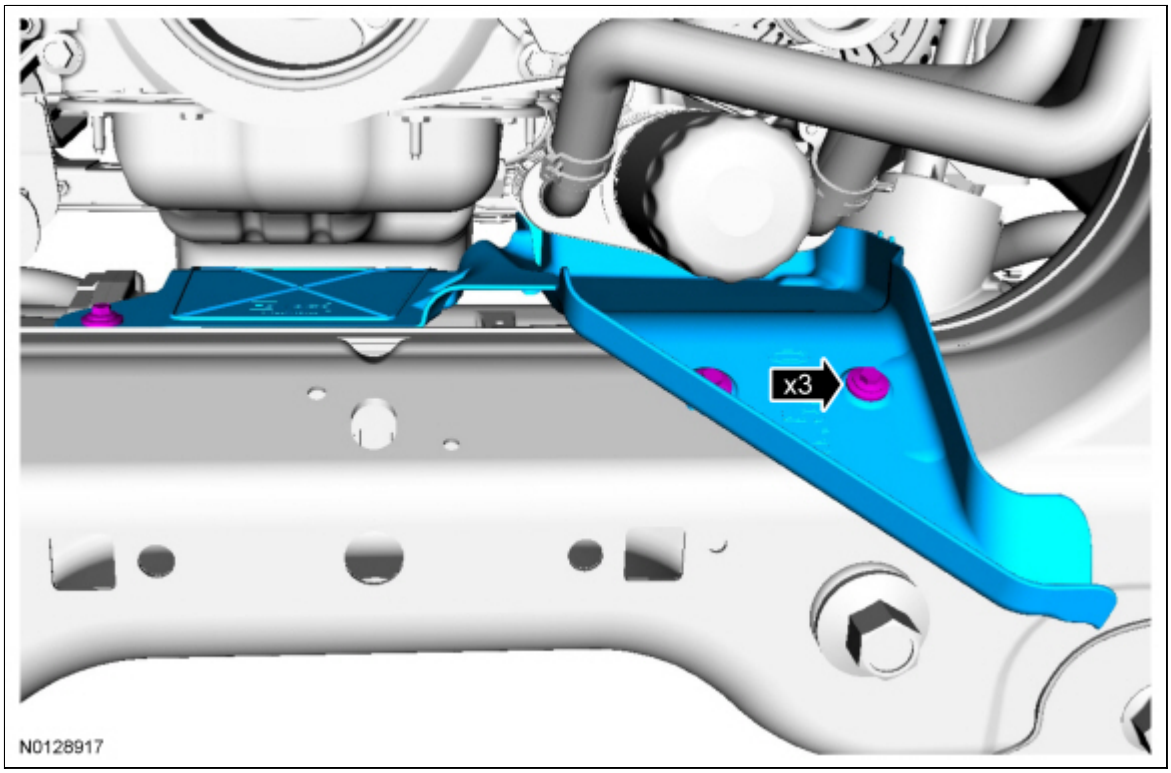
5. Attach the 2 wiring harness retainers to the oil pan stud bolts.



6. Attach the starter motor wiring harness retainer to the oil pan.



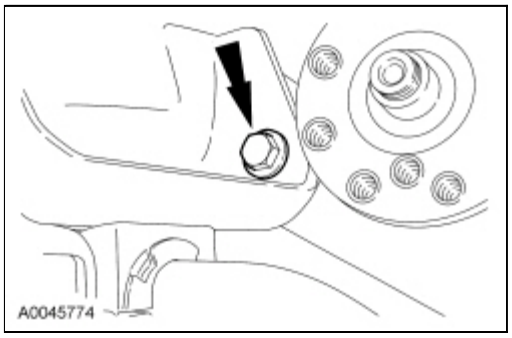
repair4less



7. Install the transmission cooler tube bracket and the bolt onto the bellhousing.
    - Tighten to 48 Nm (35 lb-ft).

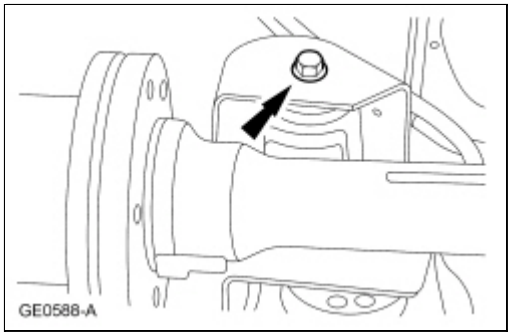
8. Install the transmission cooler tube bracket and the nut onto the engine front cover stud bolt.
    - Tighten to 13 Nm (115 lb-in).

9. Install the oil drain gutter and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



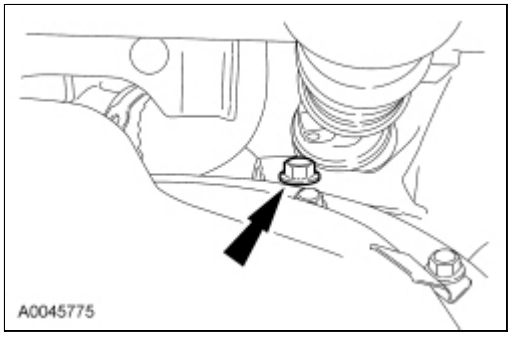
Four Wheel Drive (4X4) vehicles

repair4less



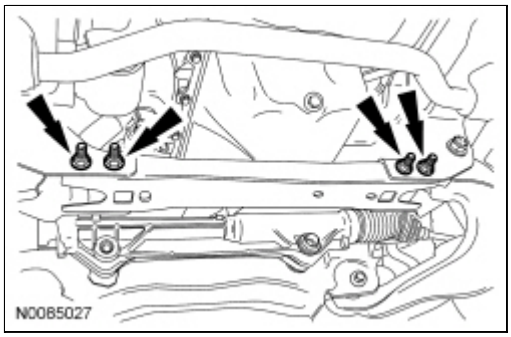
10. ***NOTICE:*** **Use care when positioning the front axle housing, or the vacuum tubes to the axle solenoid may become disconnected or damaged.**

    Raise the front axle carrier into position.

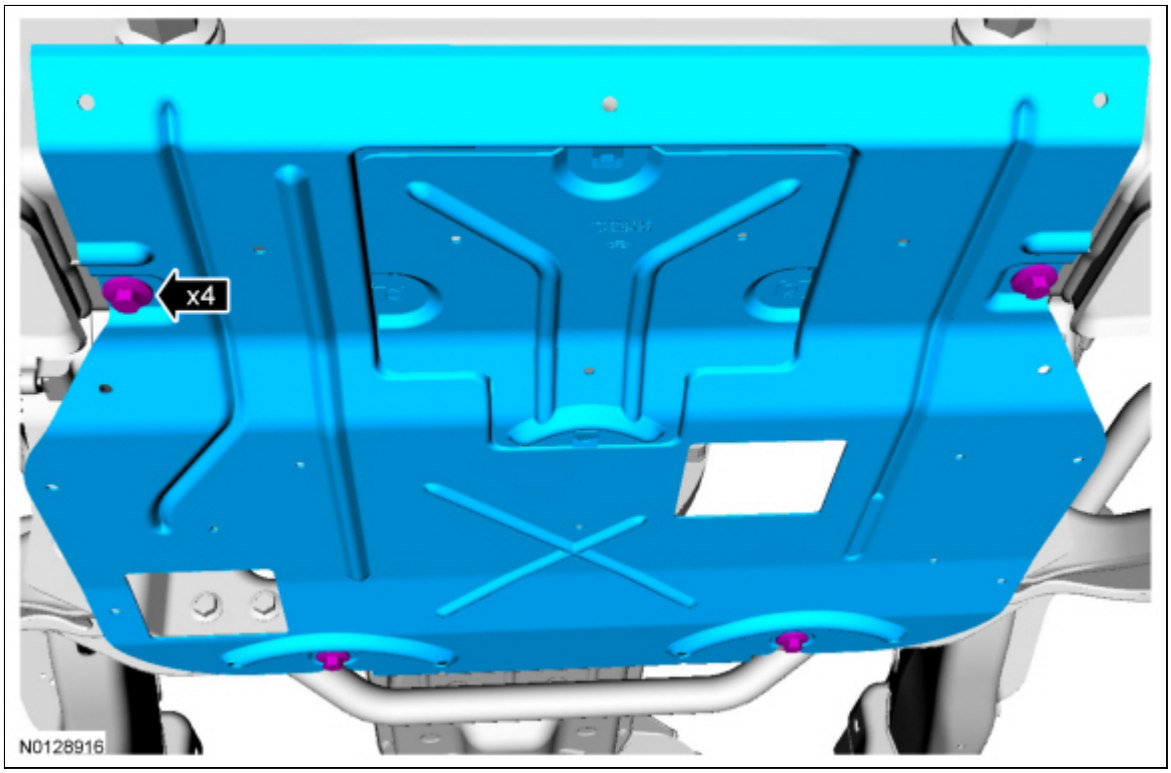


11. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

12. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



13. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



All vehicles

14. Position the crossmember and install the 4 nuts and bolts.
    - Tighten to 90 Nm (66 lb-ft).

15. If equipped, install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

16. Install the oil level indicator.
17. Fill the engine with clean engine oil.
18. Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less

Oil Pump Screen and Pickup Tube

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil pan. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pan in this section.

3. Remove the 3 bolts and the oil pump screen and pickup tube assembly.
   - Discard the O-ring seal.

Installation

1. **NOTE:** The 2 oil pump screen and pickup tube-to-oil pump bolts must be tightened prior to tightening the oil pump screen and pickup tube-to-spacer bolt.

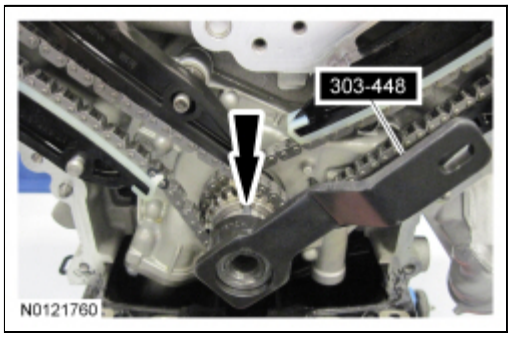
   Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts. Tighten the 2 oil pump screen and pickup tube-to-oil pump bolts in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

2. Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).

3. Install the oil pan. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pan in this section.

repair4less

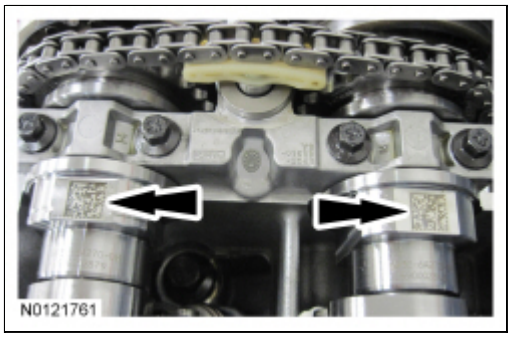
Oil Pump



Special Tool(s)

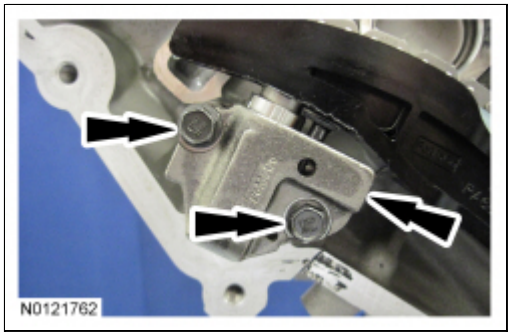
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

Removal



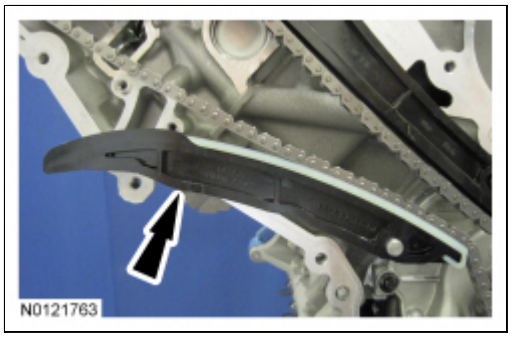
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
3. Using the crankshaft holding tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

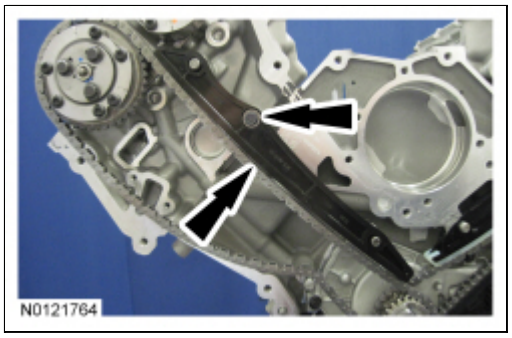


4. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.

repair4less

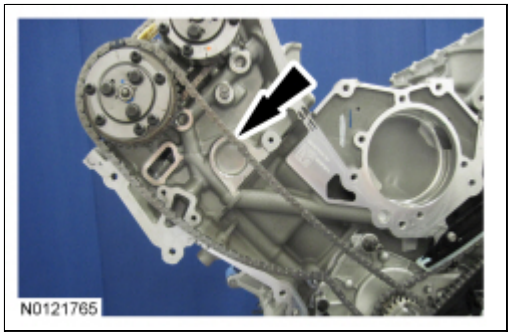


5. Remove the 2 bolts and the RH primary timing chain tensioner.



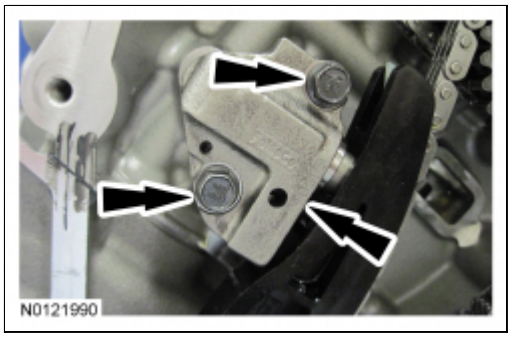
6. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

   Remove the RH timing chain tensioner arm.



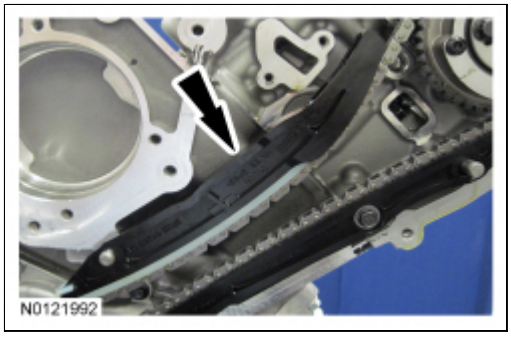
7. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

   Remove the bolt and the RH timing chain guide.



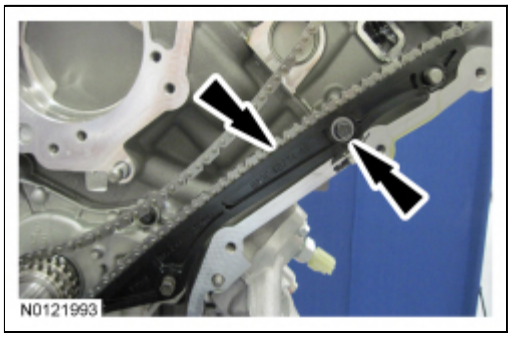
8. Remove the RH primary timing chain.

9. Using the crankshaft holding tool, rotate the crankshaft counterclockwise until the crankshaft keyway is at the 9 o'clock position.



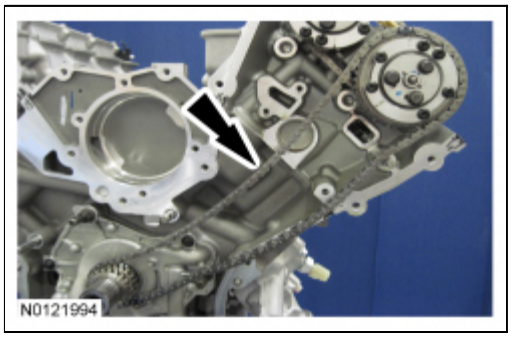
10. Remove the 2 bolts and the LH primary timing chain tensioner.

11. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain tensioner arm.



repair4less

Remove the LH timing chain tensioner arm.



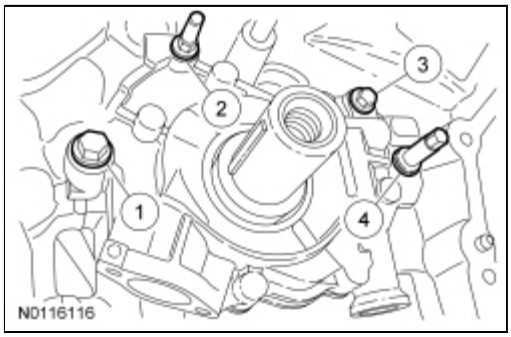
12. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain guide.

    Remove the bolt and the LH timing chain guide.

13. Remove the LH primary timing chain.

14. Remove the crankshaft sprocket.

15. Remove the oil pump screen and pickup tube. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pump Screen and Pickup Tube in this section.



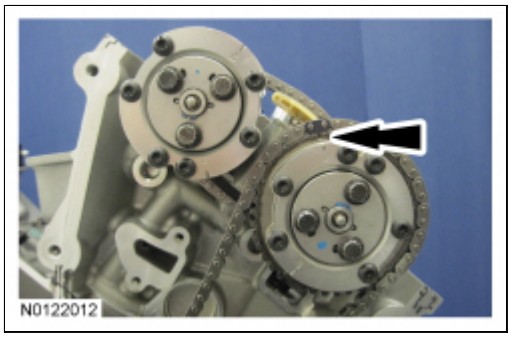
16. Remove the 2 bolts, the 2 stud bolts and the oil pump.

Installation

1. Rotate the inner rotor of the oil pump assembly to align the flats on the crankshaft and slip the oil pump over the crankshaft until seated against the block.
    - Rotate the oil pump until the bolt holes are aligned to the block and install the fasteners.

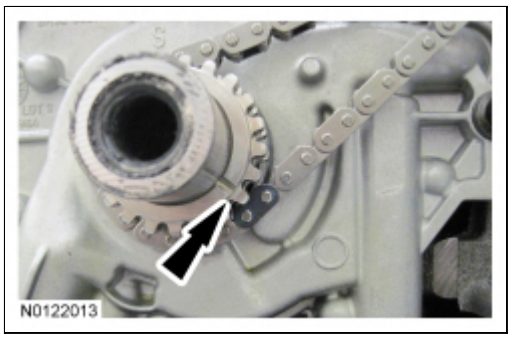
2. **NOTE:** Oil pump must be held against the cylinder block until all bolts are tightened.

   Tighten the fasteners in the sequence shown in 3 stages:
    - Stage 1: Hand tighten.
    - Stage 2: Tighten the bolt (1) to 10 Nm (89 lb-in), the stud bolt (2) to 25 Nm (18 lb-ft), the bolt (3) to 10 Nm (89 lb-in) and the stud bolt (4) to 20 Nm (177 lb-in).
    - Stage 3: Tighten the bolt (1) an additional 45 degrees, the stud bolt (2) an additional 75 degrees, the bolt (3) an additional 45 degrees and the stud bolt (4) an additional 60 degrees.



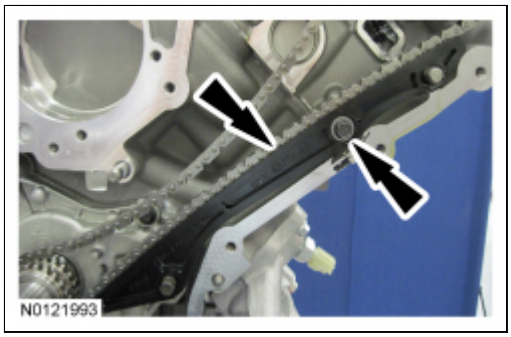
3. Install the oil pump screen and pickup tube. For additional information, refer to Engine Lubrication Components — Exploded View and Oil Pump Screen and Pickup Tube in this section.

4. Install the crankshaft sprocket with the flange facing forward.

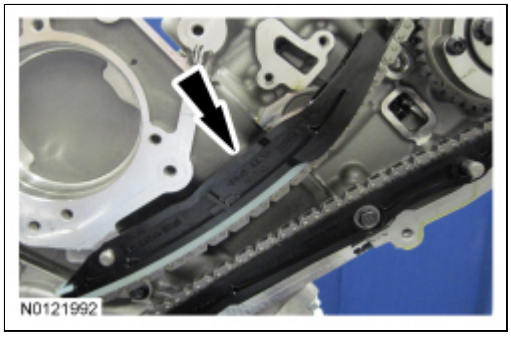


repair4less

5. Install the LH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the LH VCT assembly.



6. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



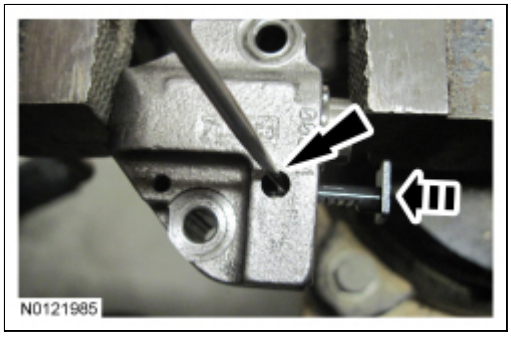
7. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain guide.

    Install the LH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

8. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain tensioner arm.

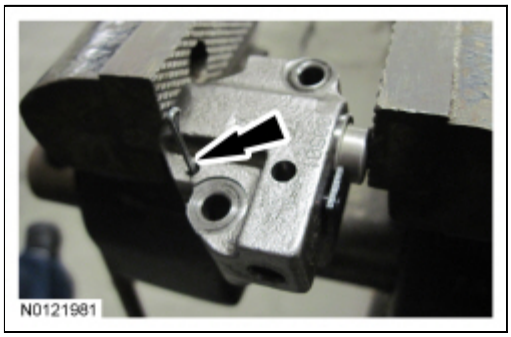
   Install the LH timing chain tensioner arm.

NOTE: Complete the following 3 steps on both the LH and RH primary timing chain tensioners.

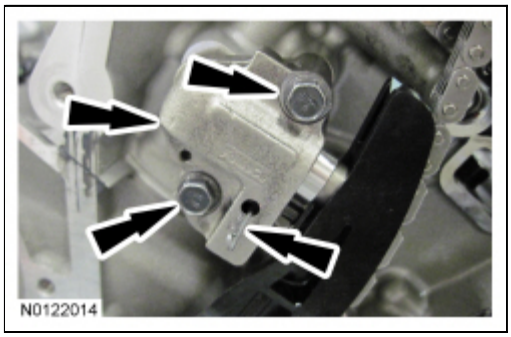


9. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

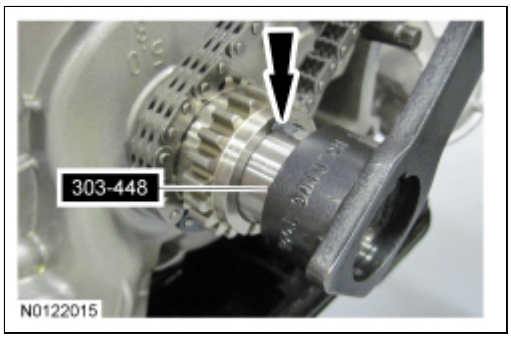
   Compress the primary timing chain tensioner plunger, using an edge of a vise.



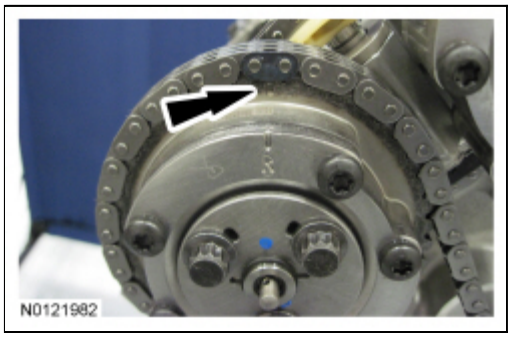
10. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.



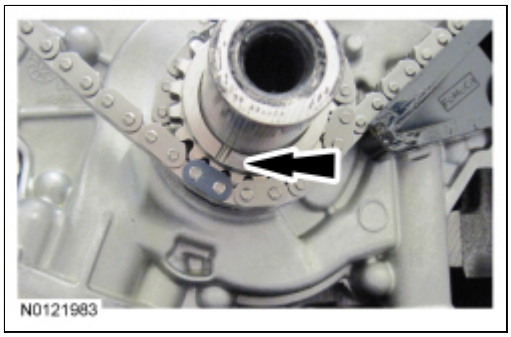
repair4less



11. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.

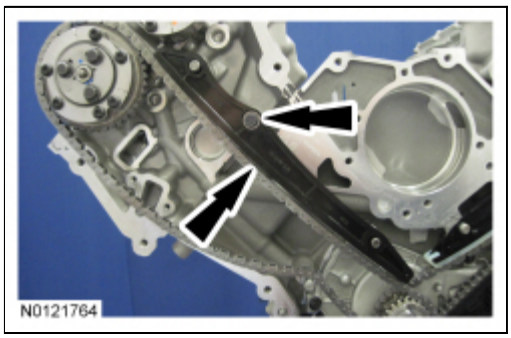


12. Install the LH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.



13. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.

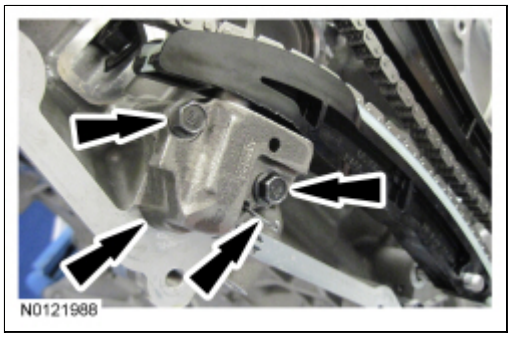
14. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.



15. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

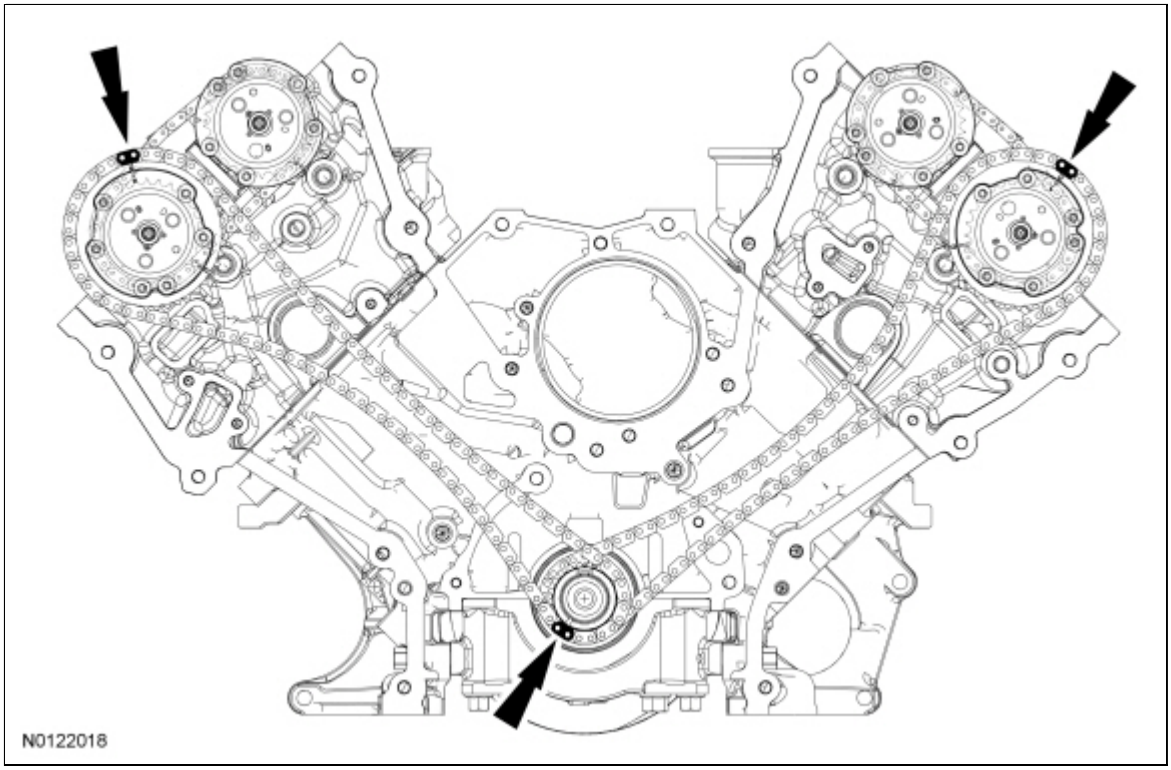
16. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).



17. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

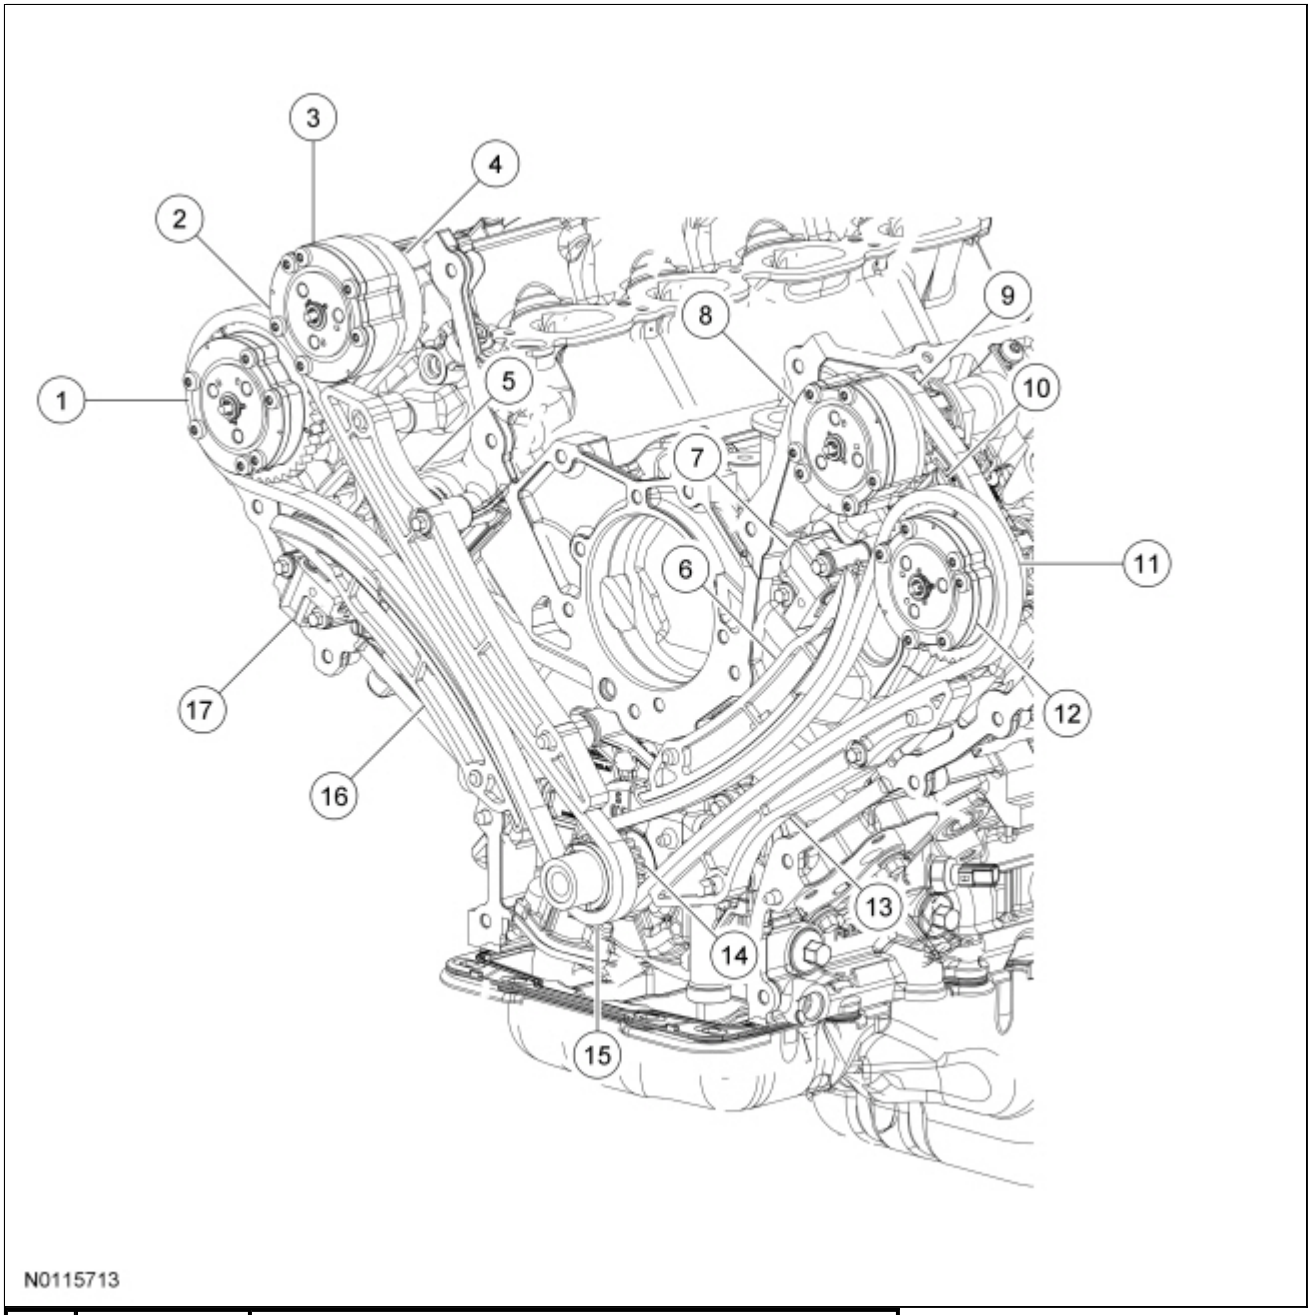
    Install the RH timing chain tensioner arm.



repair4less

18. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

19. With the crankshaft keyway still at the 12 o'clock position, verify the timing mark alignment is correct.



20. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

repair4less

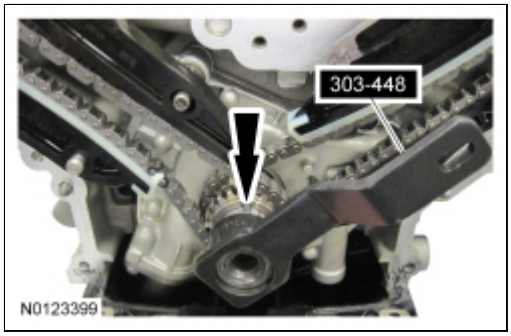
Timing Drive Components

Special Tool(s)

 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

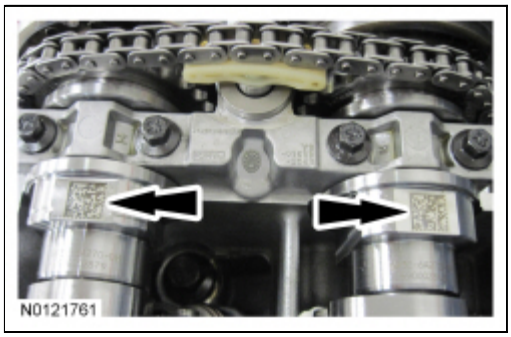
N0115713

Item	Part Number	Description
1	6256	RH exhaust camshaft Variable Camshaft Timing (VCT)
2	6K254	RH secondary tensioner
3	6256	RH intake camshaft VCT
4	6268	RH secondary timing chain
5	6M256	RH timing chain guide
6	6K255	LH timing chain tensioner arm
7	6L266	LH primary tensioner
8	6256	LH intake camshaft VCT



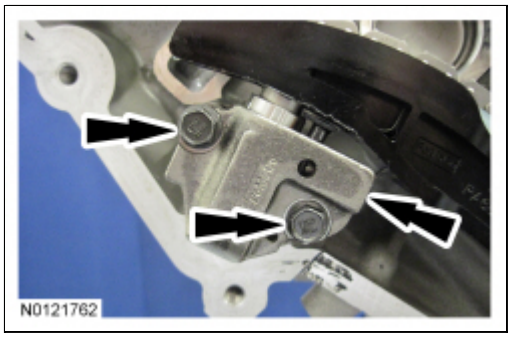
repair4less

9	6268	LH secondary timing chain
10	6K254	LH secondary tensioner
11	6268	LH primary timing chain
12	6256	LH exhaust camshaft VCT
13	6B274	LH timing chain guide
14	6306	Crankshaft sprocket
15	6268	RH timing chain
16	6K255	RH timing chain tensioner arm
17	6L266	RH primary tensioner



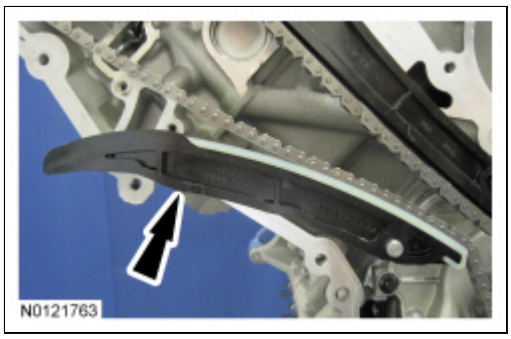
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

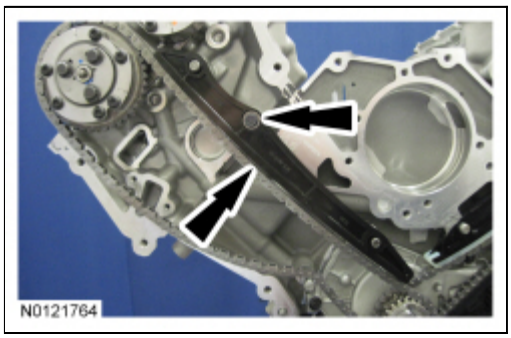


1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Using the crankshaft holding tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

3. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.

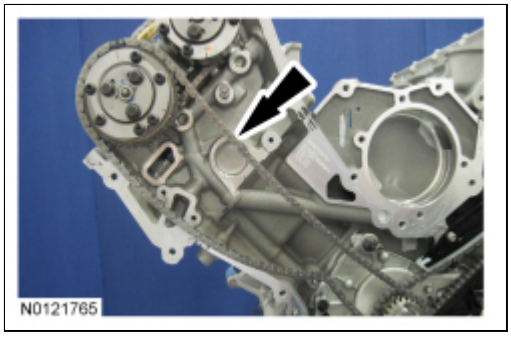


4. Remove the 2 bolts and the RH primary timing chain tensioner.



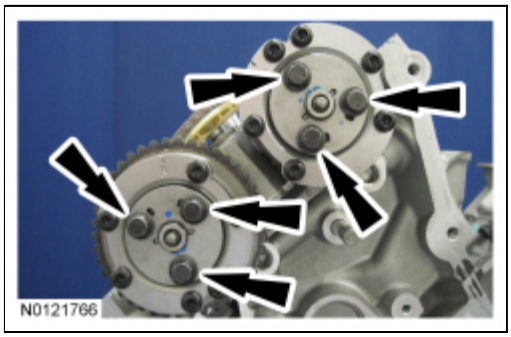
5. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

   Remove the RH timing chain tensioner arm.

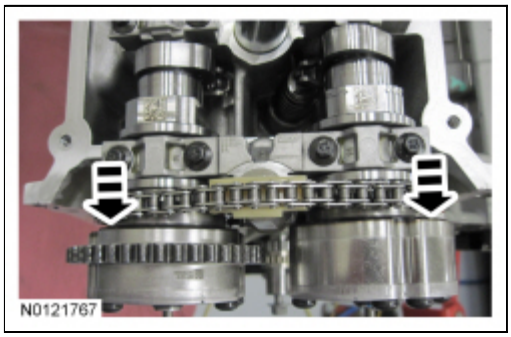


6. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

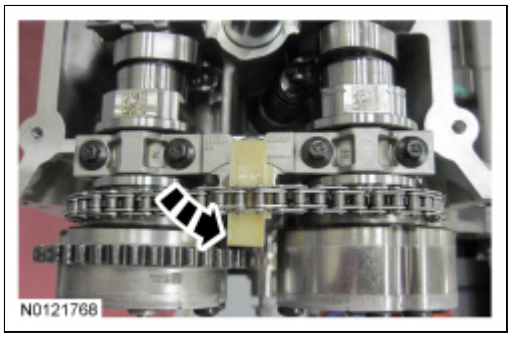
   Remove the bolt and the RH timing chain guide.



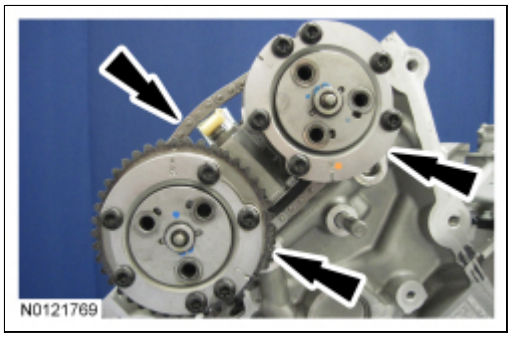
7. Remove the RH primary timing chain.



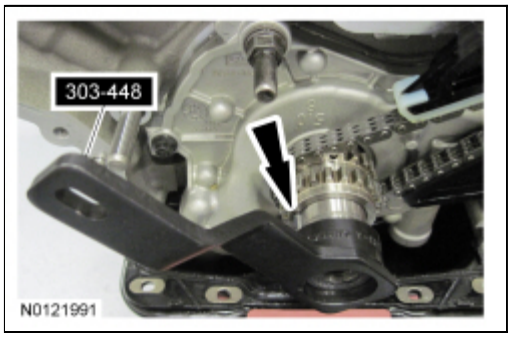
repair4less



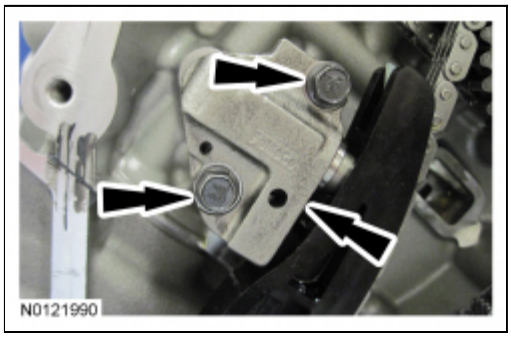
8. Remove the 3 RH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 RH exhaust VCT assembly bolts.



9. Slide the RH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

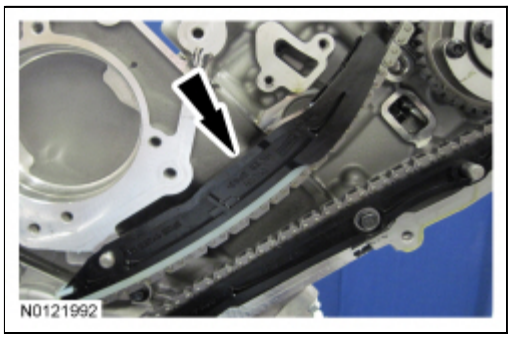


10. Depress the RH secondary timing chain tensioner and turn the tensioner 90 degrees.



11. Remove the RH VCT assemblies and the RH secondary timing chain.

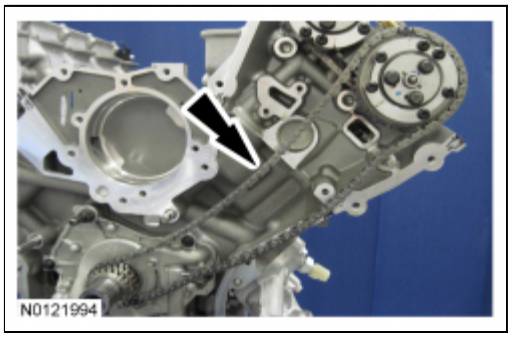
12. Using the crankshaft holding tool, rotate the crankshaft counterclockwise until the crankshaft keyway is at the 9 o'clock position.



13. Remove the 2 bolts and the LH primary timing chain tensioner.

14. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain tensioner arm.

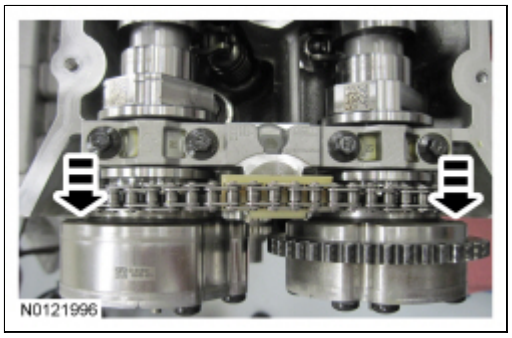
    Remove the LH timing chain tensioner arm.



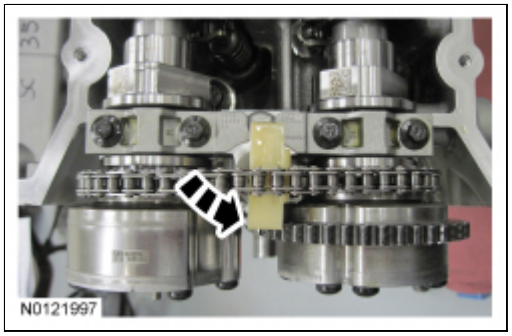
repair4less

15. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain guide.

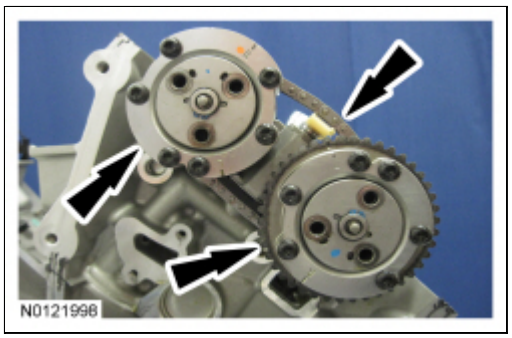
    Remove the bolt and the LH timing chain guide.



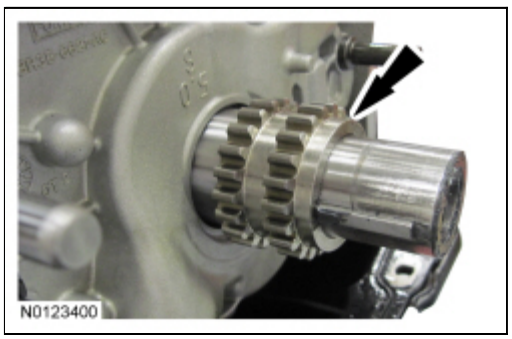
16. Remove the LH primary timing chain.



17. Remove the 3 LH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 LH exhaust VCT assembly bolts.

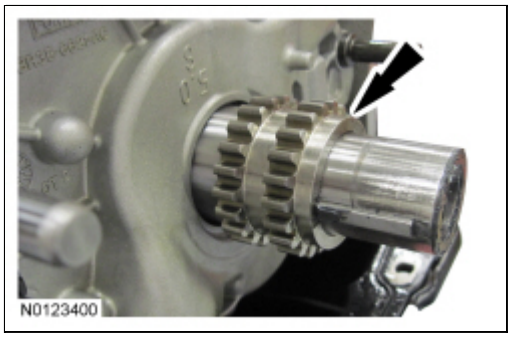


18. Slide the LH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

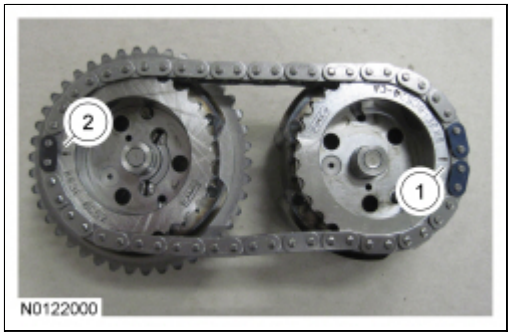


19. Depress the LH secondary timing chain tensioner and turn the tensioner 90 degrees.

20. Remove the LH VCT assemblies and the LH secondary timing chain.

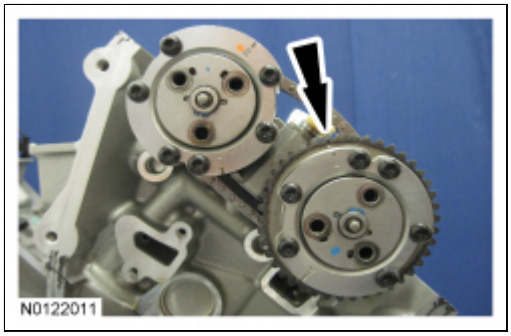


21. Remove the crankshaft sprocket.



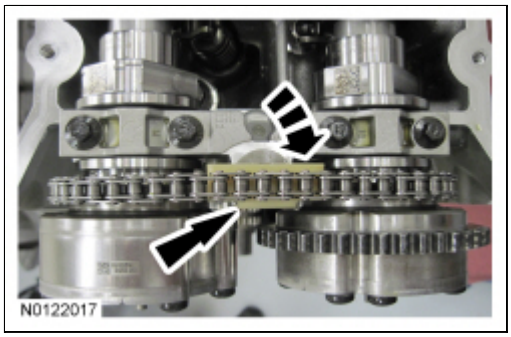
Installation

1. Install the crankshaft sprocket with the flange facing forward.

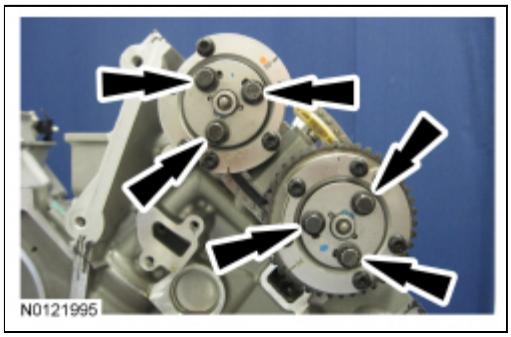


repair4less

2. Install the secondary timing chain onto the LH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

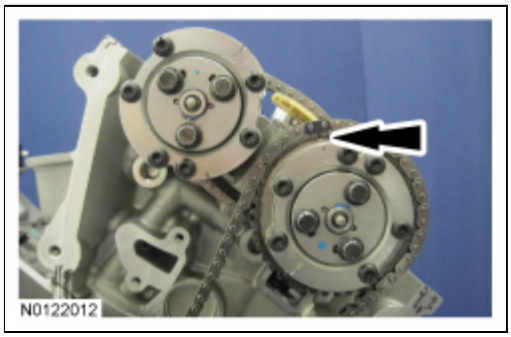


3. Install the LH VCT assemblies and the secondary timing chain onto the LH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 11 o'clock position.



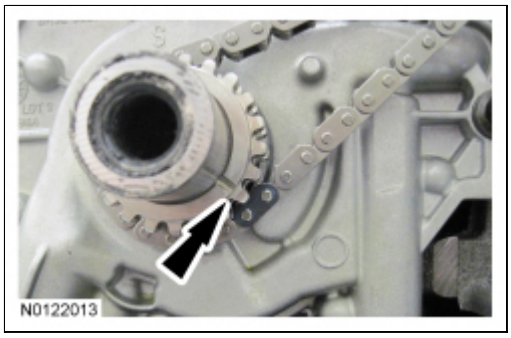
4. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.

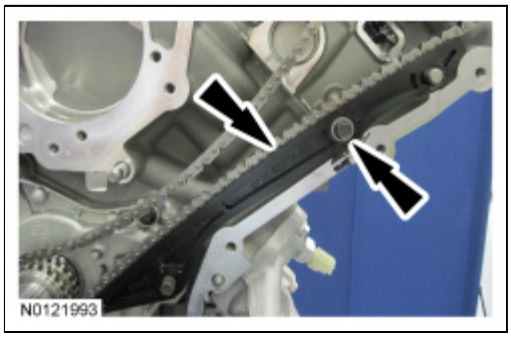


5. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

   Install the 3 LH intake VCT assembly bolts and the 3 LH exhaust VCT assembly bolts.
   - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

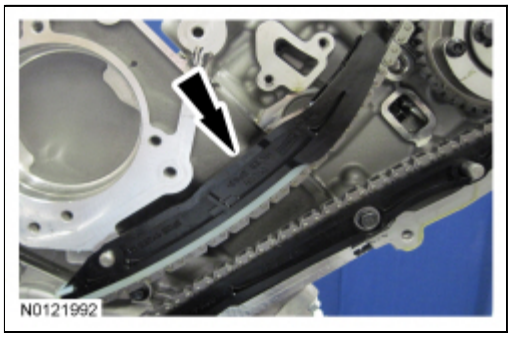


6. Install the LH primary timing chain.
   - Align the colored link on the timing chain with the timing mark on the LH VCT assembly.



7. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

repair4less

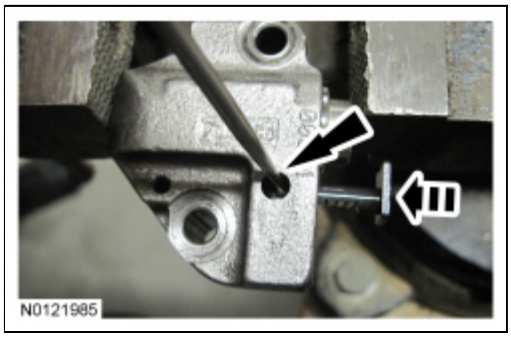


8. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain guide.

   Install the LH timing chain guide and bolt.
   - Tighten to 10 Nm (89 lb-in).

9. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain tensioner arm.

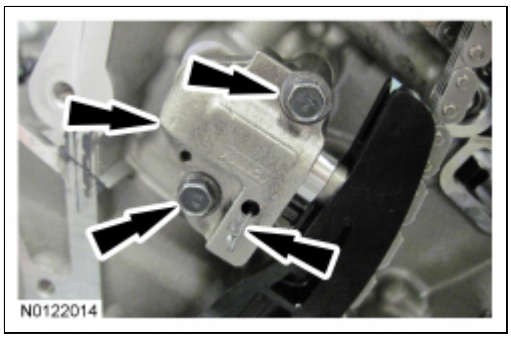
   Install the LH timing chain tensioner arm.



NOTE: Complete the following 3 steps on both the LH and RH primary timing chain tensioners.

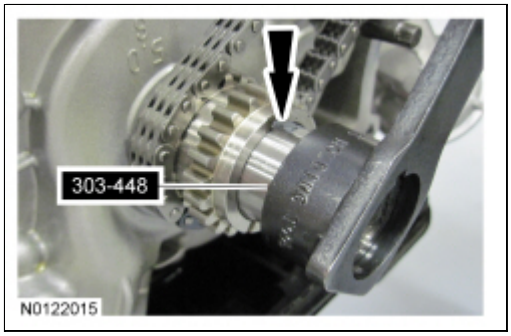
10. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

    Compress the primary timing chain tensioner plunger, using an edge of a vise.

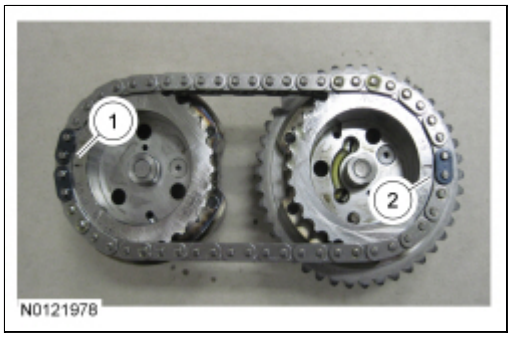


11. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.

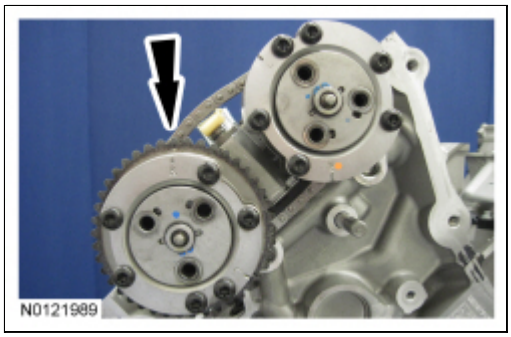
12. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.



13. Install the LH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

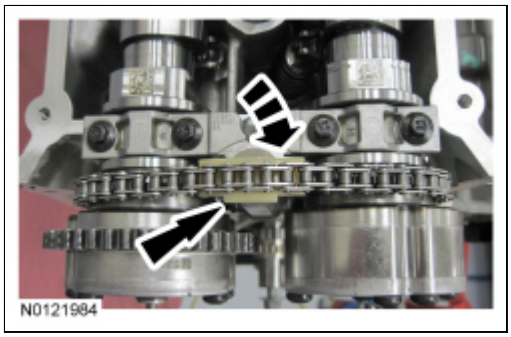


repair4less

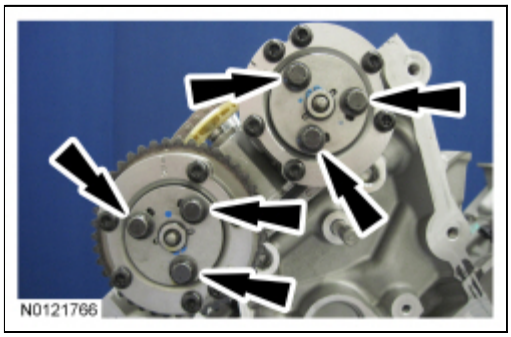


14. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.

15. Install the secondary timing chain onto the RH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

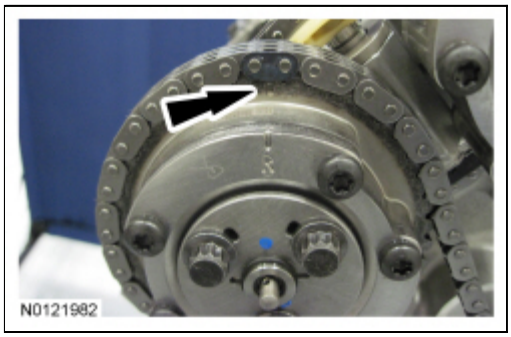


16. Install the RH VCT assemblies and the secondary timing chain onto the RH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 1 o'clock position.



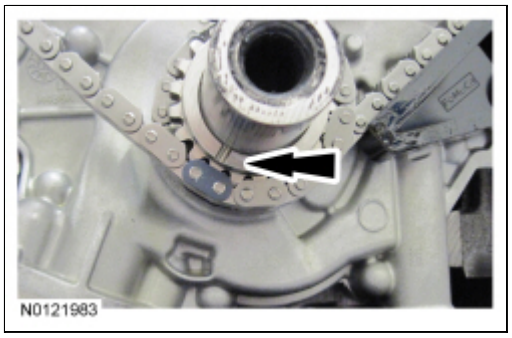
17. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.

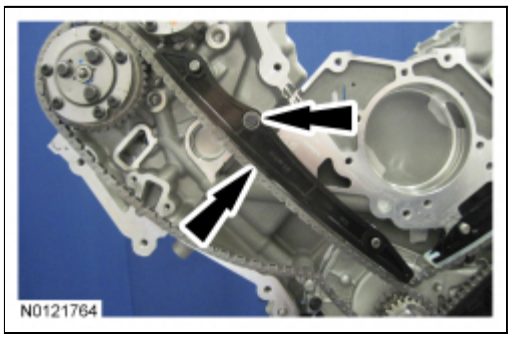


18. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

    Install the 3 RH intake VCT assembly bolts and the 3 RH exhaust VCT assembly bolts.
    - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

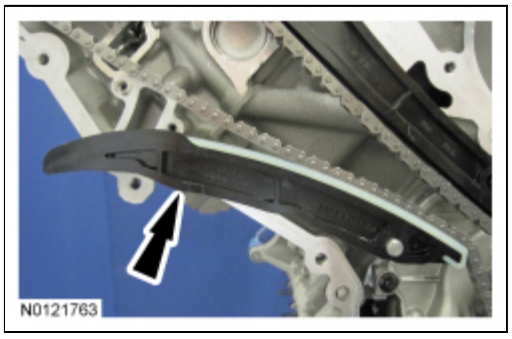


19. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.



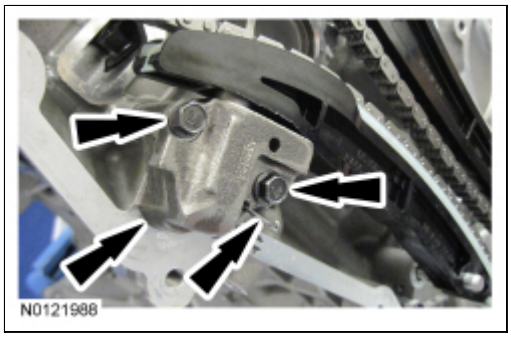
20. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

repair4less



21. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).



22. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

    Install the RH timing chain tensioner arm.

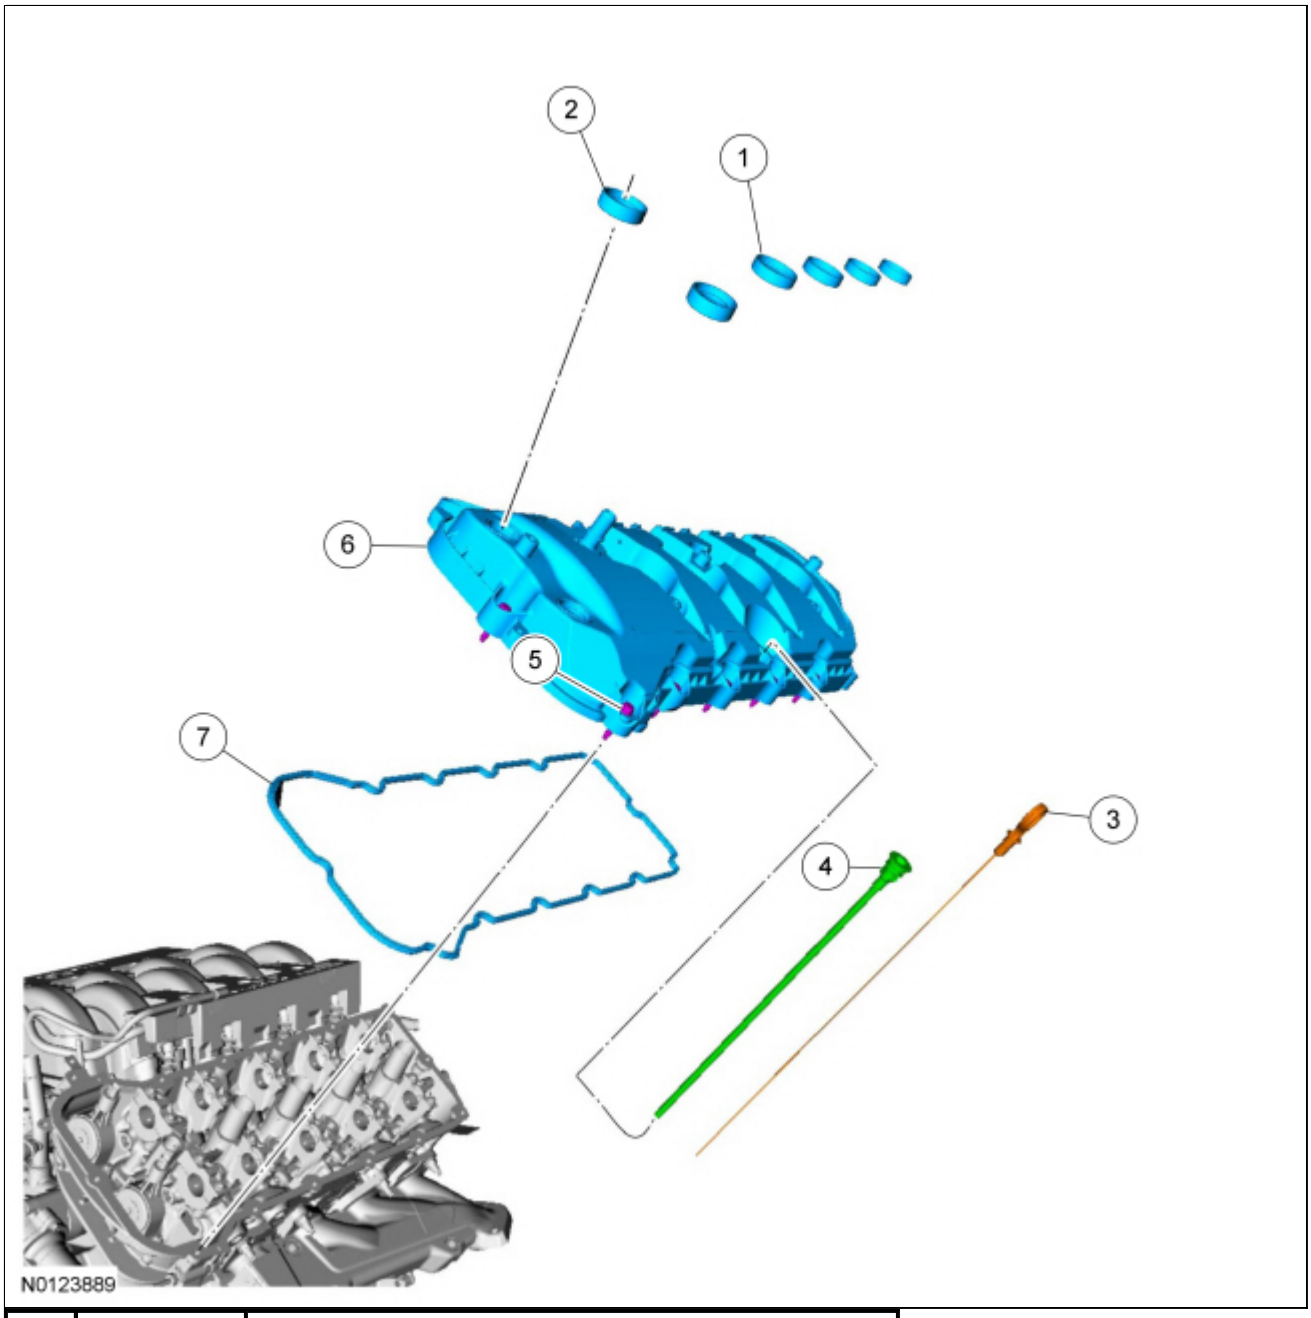
23. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

24. With the crankshaft keyway still at the 12 o'clock position, verify the timing mark alignment is correct.

25. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

repair4less

Valve Cover — LH



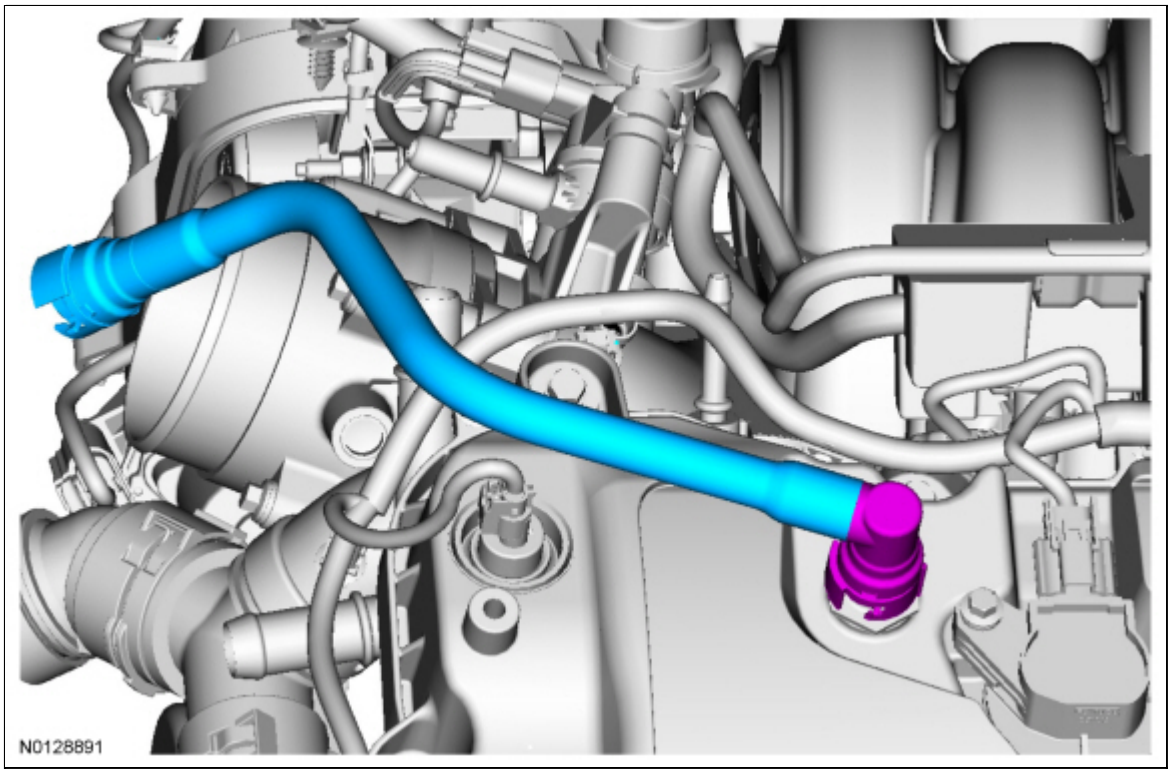
Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2212-A	Installer, Differential Bearing Cone 205-142 (T80T-4000-J)
 ST2983-A	Installer, Spark Plug Tube Seal 303-1247/2
 ST2982-A	Remover, Spark Plug Tube Seal 303-1247/1

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

repair4less

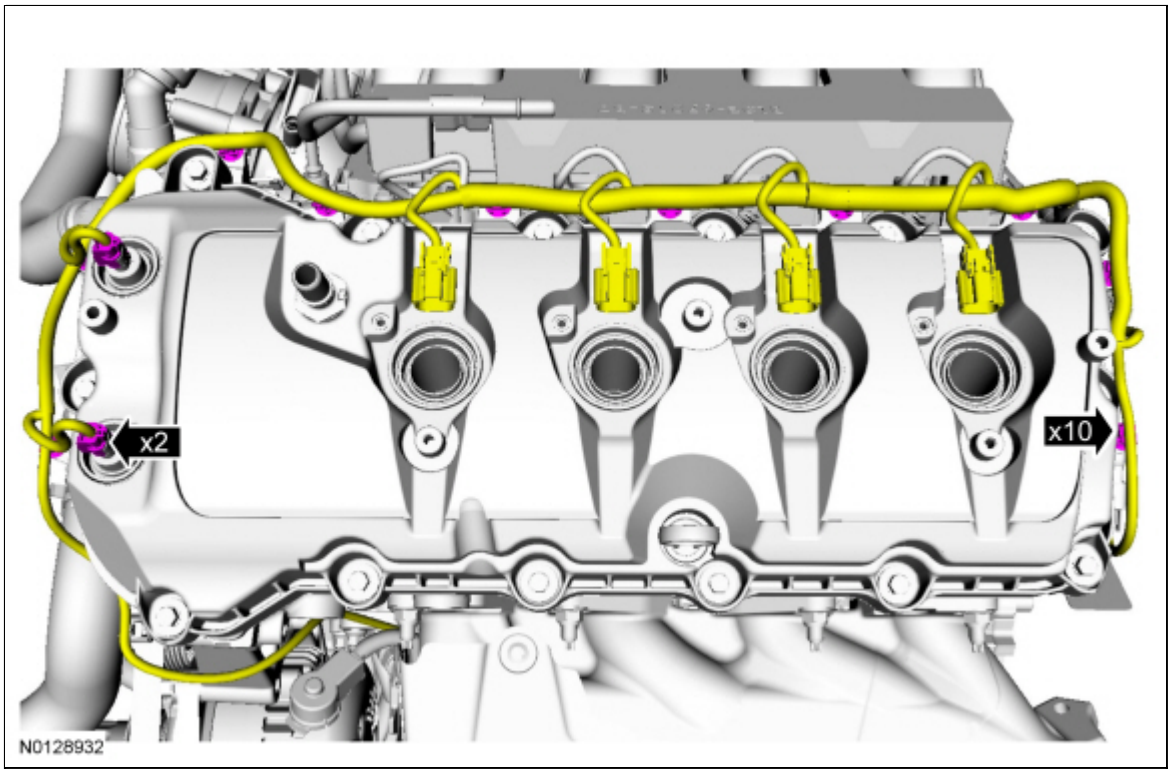


Item	Part Number	Description
1	6C535	Spark plug tube seal (4 required)
2	6C535	Variable Camshaft Timing (VCT) solenoid seal (2 required)
3	6750	Oil level indicator
4	6754	Oil level indicator tube
5	6C519	Valve cover bolt (part of 6582) (14 required)
6	6582	LH valve cover
7	6584	LH valve cover gasket

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. Remove the Air Cleaner (ACL) outlet pipe and the ACL cover as an assembly. For additional information, refer to Section 303-12 .

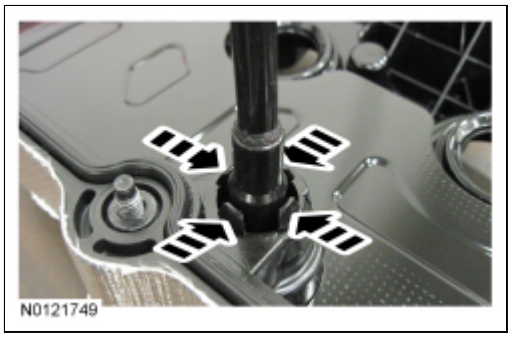


2. Remove the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .

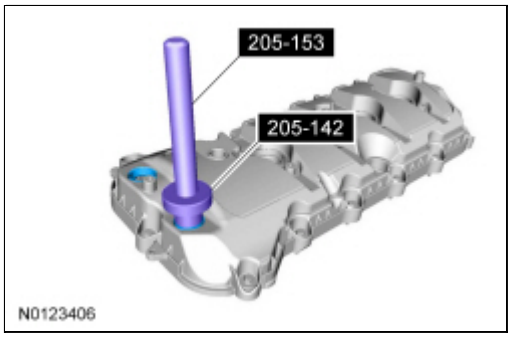
3. Remove the LH ignition coils. For additional information, refer to Section 303-07C .

4. Disconnect the 2 LH Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.
    - Detach the 10 wiring harness retainers.

repair4less

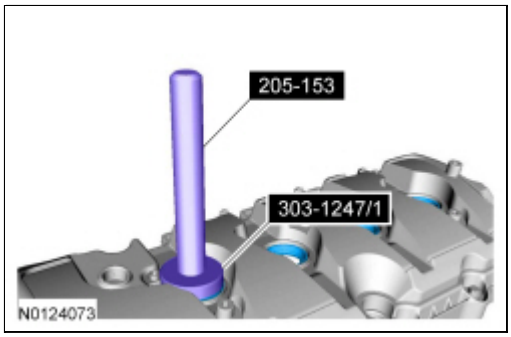


5. Remove the oil level indicator.



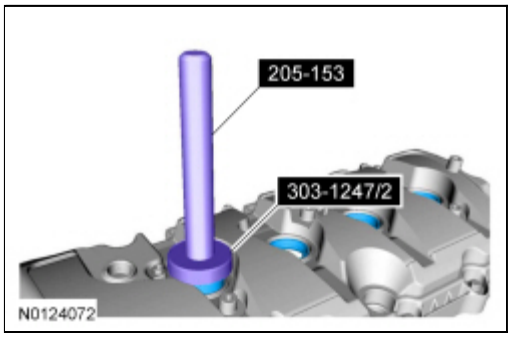
6. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Loosen the 14 bolts and remove the LH valve cover and gasket.
   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



7. Depress the 4 tabs and remove the oil level indicator tube.

8. Inspect the 2 VCT variable force solenoid seals. Remove any damaged seals.
   - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).



9. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

Installation

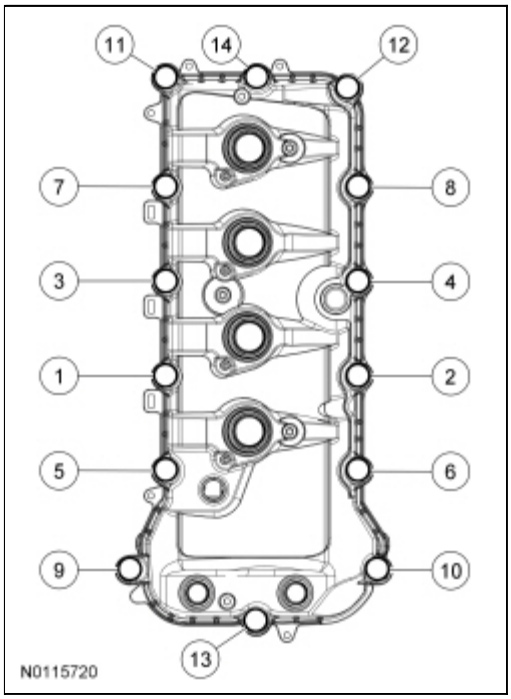
1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

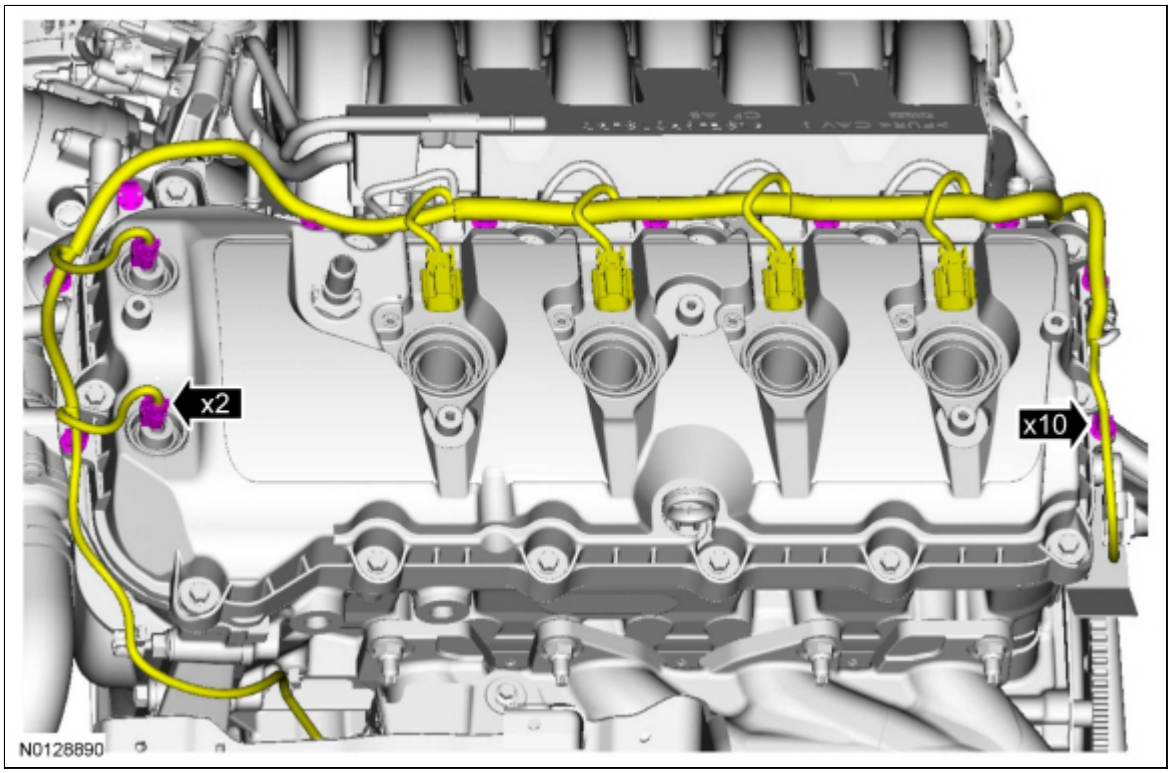
   Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).

repair4less



3. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

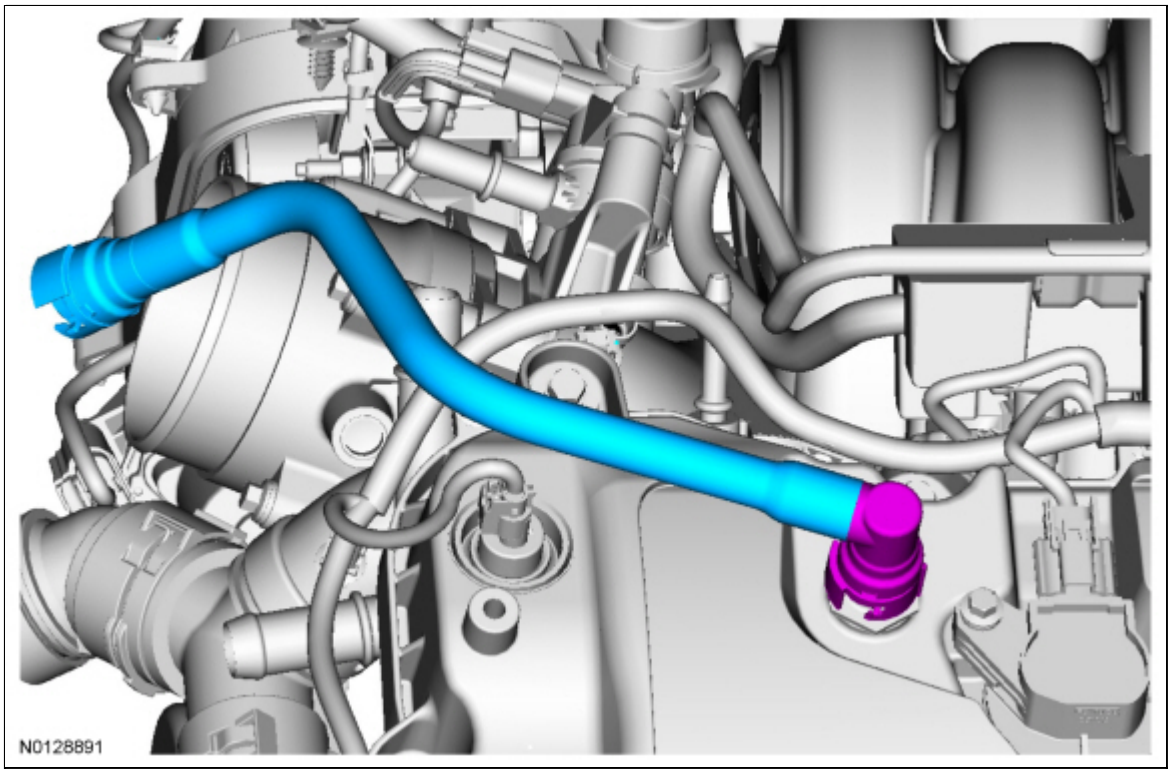
   Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-LH cylinder head joints.



4. Position the LH valve cover and new gasket on the cylinder head.
   - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).

5. Install the oil level indicator tube.
    - Push the oil level indicator tube into the valve cover until it clicks into place.

6. Install the oil level indicator.



7. Connect the 2 LH VCT variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers.

8. Install the LH ignition coils. For additional information, refer to Section 303-07C .

9. Install the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .

repair4less

10. Install the Air Cleaner (ACL) outlet pipe and ACL cover assembly. For additional information, refer to Section 303-12 .

Valve Cover — RH

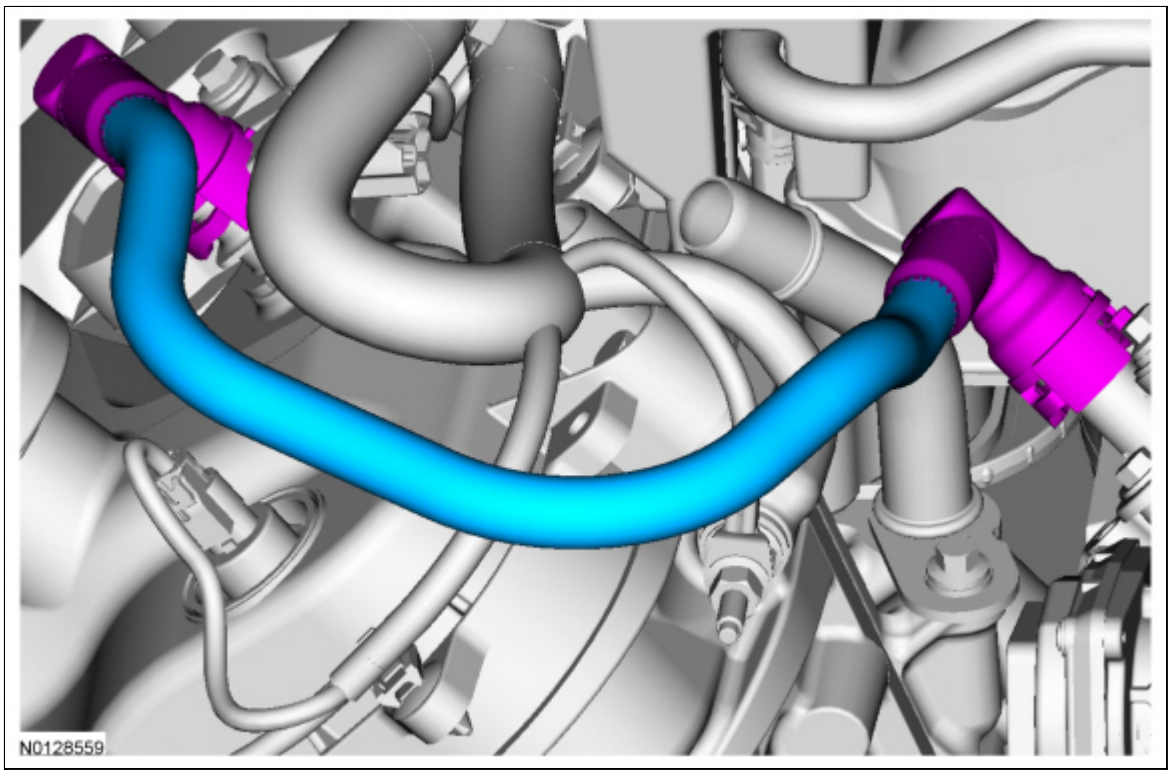
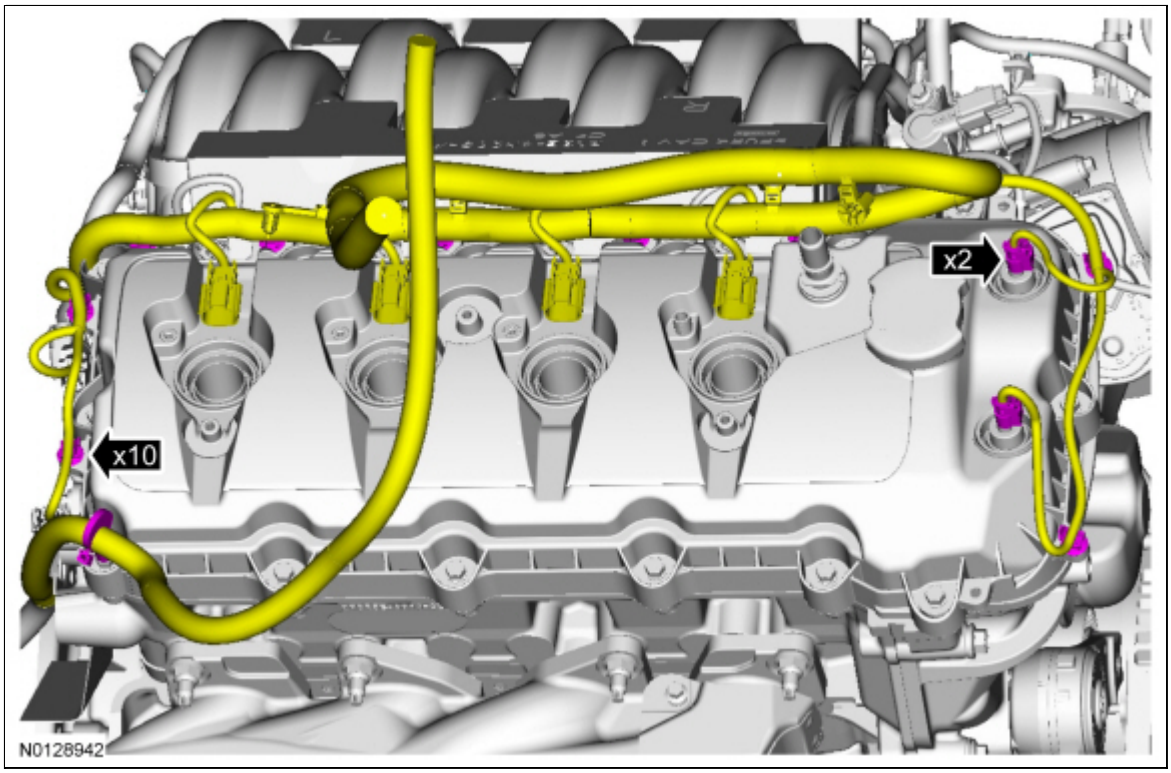
3	—	Valve cover bolt (part of 6582) (14 required)
4	6582	RH valve cover
5	6584	RH valve cover gasket



Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material,**

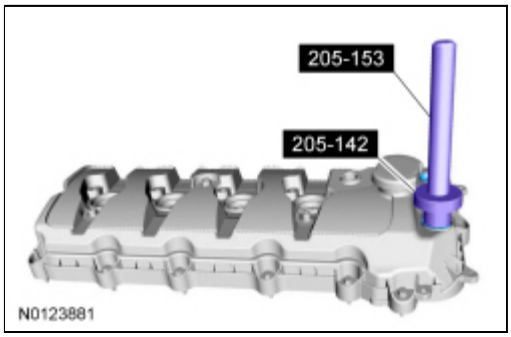
including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.



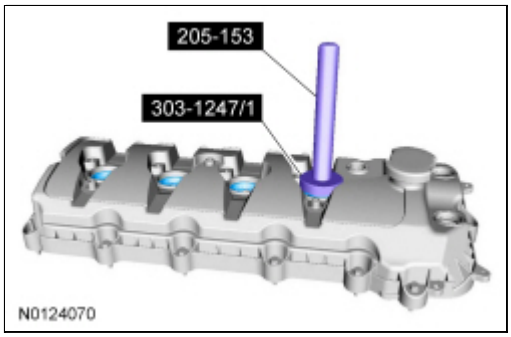
1. Remove the RH ignition coils. For additional information, refer to Section 303-07C .

2. Remove the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .

3. Disconnect the 2 RH Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.
    - Detach the 10 wiring harness retainers.



repair4less

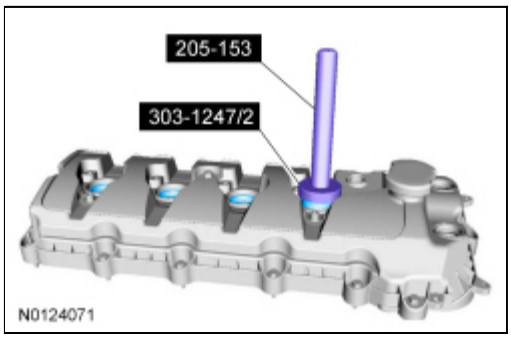


4. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Loosen the 14 fasteners and remove the RH valve cover and gasket.
   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

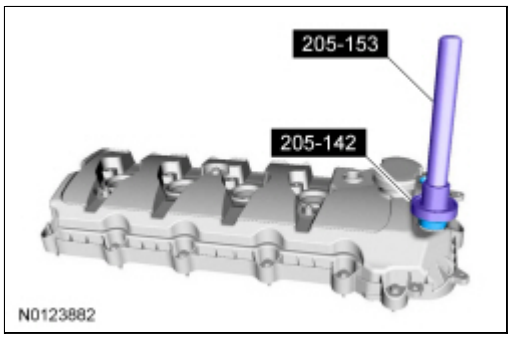
5. Inspect the 2 VCT variable force solenoid seals. Remove any damaged seals.
   - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

6. Inspect the spark plug tube seals. Remove any damaged seals.
   - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



7. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

Installation

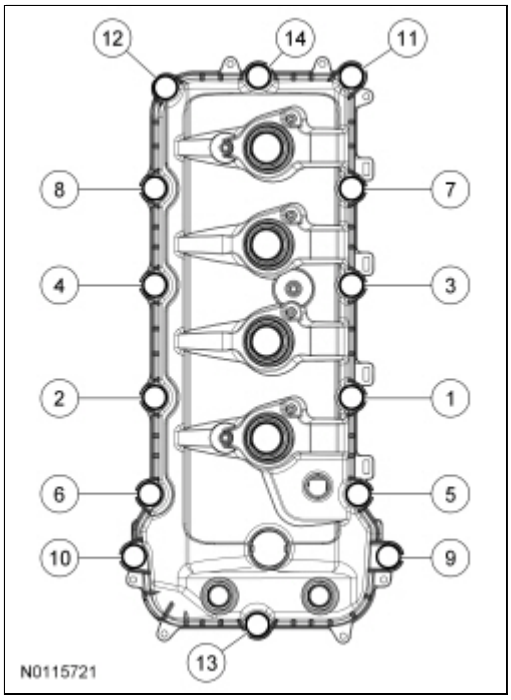


1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

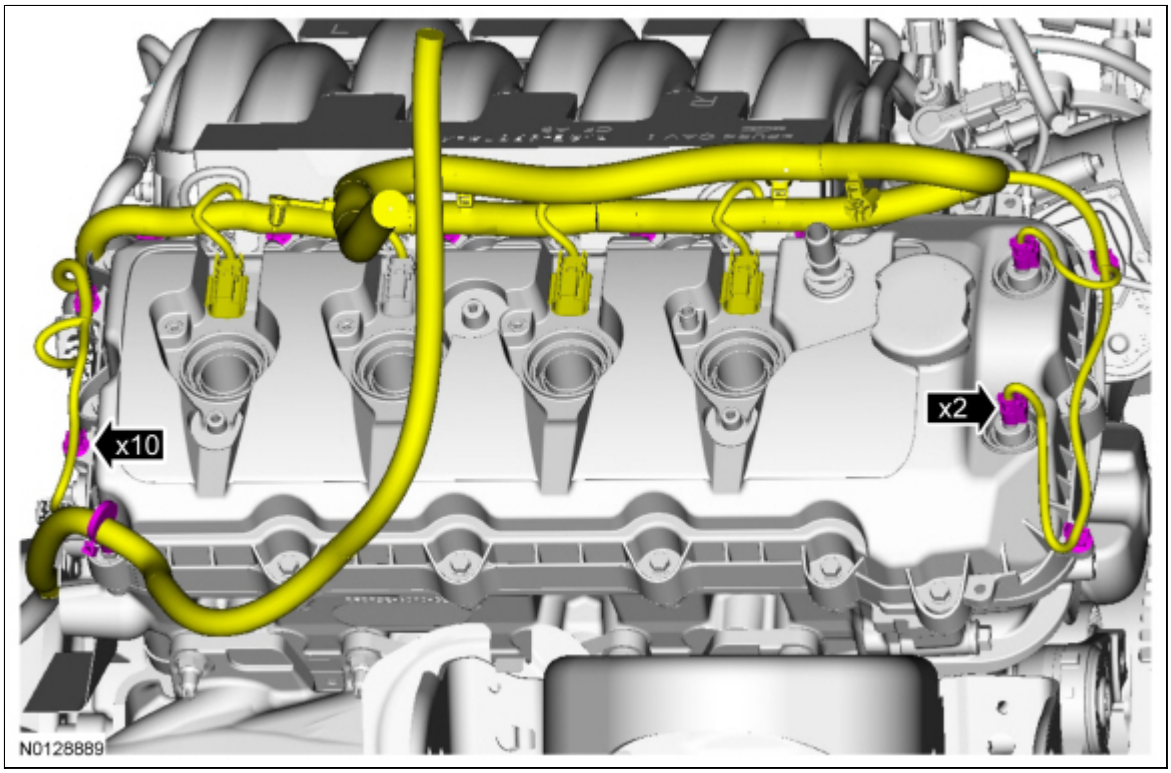
2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

   Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).

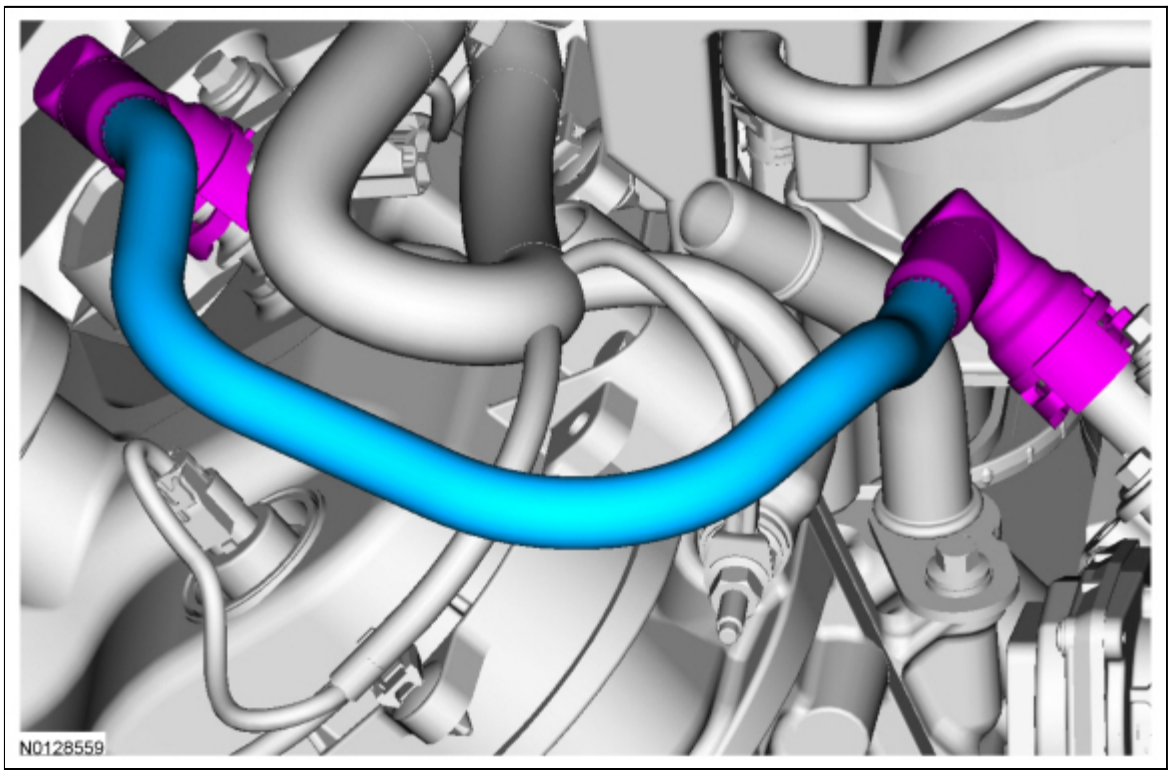


3. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-RH cylinder head joints.



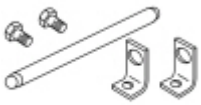
repair4less

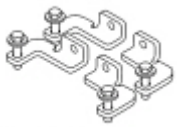


4. Position the RH valve cover and new gasket on the cylinder head.
    - Tighten the fasteners in the sequence shown to 10 Nm (89 lb-in).

5. Connect the 2 RH VCT variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers.

6. Install the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .





7. Install the RH ignition coils. For additional information, refer to Section 303-07C .

repair4less

Valve Seals

Special Tool(s)

 ST1902-A	Compressor, Valve Spring 303-1418
 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

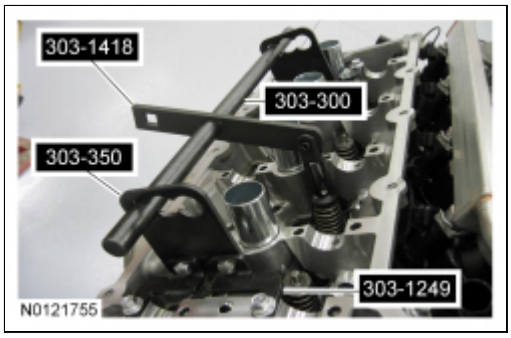
Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

repair4less

1. Remove the camshaft for the valve seal being serviced. For additional information, refer to Camshaft — RH and/or Camshaft — LH in this section.



2. Remove the roller follower and hydraulic lash adjuster assembly for the valve seal being serviced.

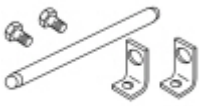
3. ***NOTICE:*** **If air pressure must be removed, support the valve prior to removal or engine damage may occur.**

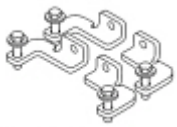
   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Pressurize the cylinder using compressed air.

4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

5. Remove and discard the valve seal.





6. To install, reverse the removal procedure.
   - Lubricate the valve seal and the roller follower and hydraulic lash adjuster assembly with clean engine oil prior to installation.

repair4less

Valve Springs

Special Tool(s)

 ST1902-A	Compressor, Valve Spring 303-1418
 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249

Material

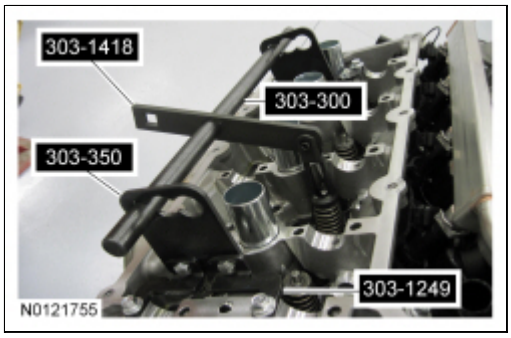
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original locations. Mark the components for installation into their original locations.

1. Remove the camshaft for the valve spring being serviced. For additional information, refer to Camshaft — RH and/or Camshaft — LH in this section.



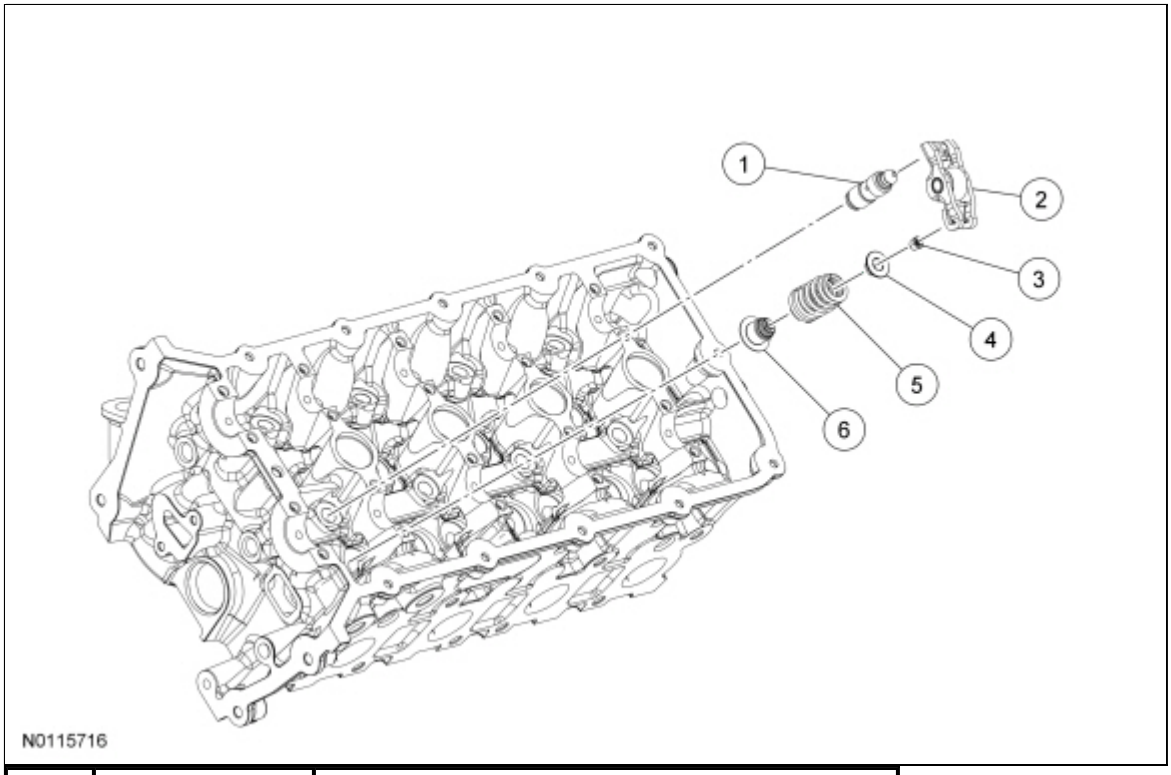
2. Remove the roller follower and hydraulic lash adjuster assembly for the valve spring being serviced.

3. ***NOTICE:*** **If air pressure must be removed, support the valve prior to removal or engine damage may occur.**

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Pressurize the cylinder using compressed air.

4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

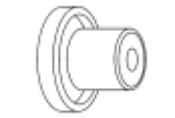


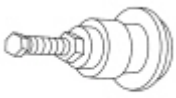
5. To install, reverse the removal procedure.
   - Lubricate the roller follower and hydraulic lash adjuster assembly with clean engine oil prior to installation.

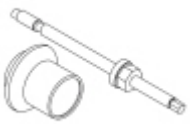
repair4less

Valve Train Components — Exploded View

NOTE: LH cylinder head shown, RH cylinder head similar.







Item	Part Number	Description
1	6500	Hydraulic lash adjuster (32 required)
2	6564	Camshaft roller follower (32 required)
3	6518	Valve spring retainer key (64 required)
4	6514	Valve spring retainer (32 required)
5	6513	Valve spring (32 required)
6	6571	Valve seal (32 required)

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

repair4less

Cylinder Head

Special Tool(s)

 ST2806-A	Alignment Pins, Cylinder Head 303-1040 (SR-015486)

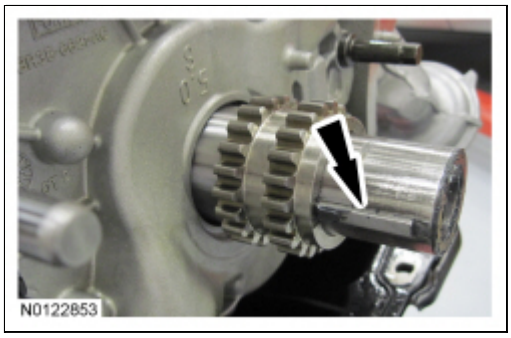
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)
 ST2212-A	Installer, Differential Bearing Cone 205-142 (T80T-4000-J)
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A2 plate only)
 ST3249-A	Installer, Front Crank Seal and Damper 303-1531
	Installer, Spark Plug Tube Seal 303-1247/2

 ST2983-A	
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® SAE 5W-50 Full Synthetic Motor Oil XO-5W50-QGT or equivalent	WSS-M2C931-B
Motorcraft® Silicone Gasket Remover ZC-30	—
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Installation

NOTE: The Boss® 302 requires Motorcraft® SAE 5W-50 Full Synthetic Motor Oil, all other 5.0L (4V) engines require Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil.

All cylinder heads

1. Verify the crankshaft keyway is in the 9 o'clock position.

repair4less

2. ***NOTICE:*** **Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore. Failure to follow these instructions may result in engine damage.**

   NOTICE: **The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry. Failure to follow these instructions may result in future oil leakage.**

   NOTICE: **The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.**

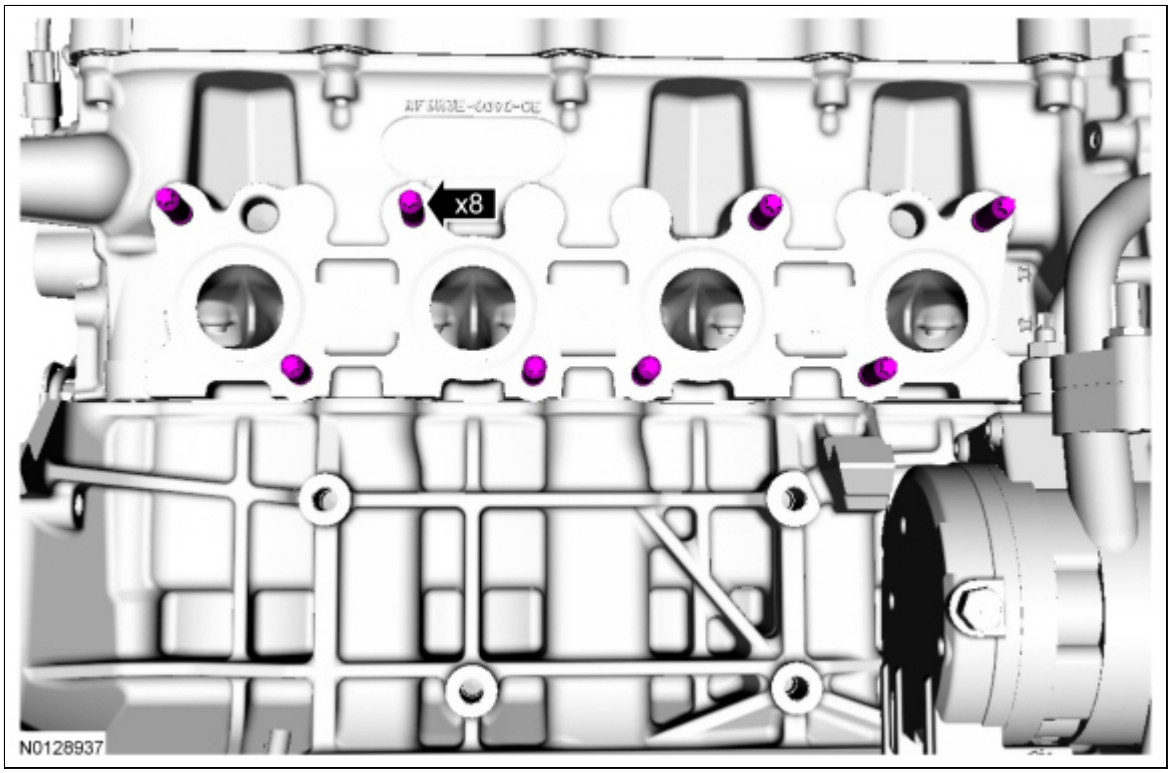
   NOTE: Do not turn the crankshaft until instructed to do so.

   NOTE: LH shown, RH similar.

   Using the Cylinder Head Alignment Pins, position the cylinder head gaskets and cylinder heads over the dowels and install the cylinder head bolts loosely.

RH cylinder head

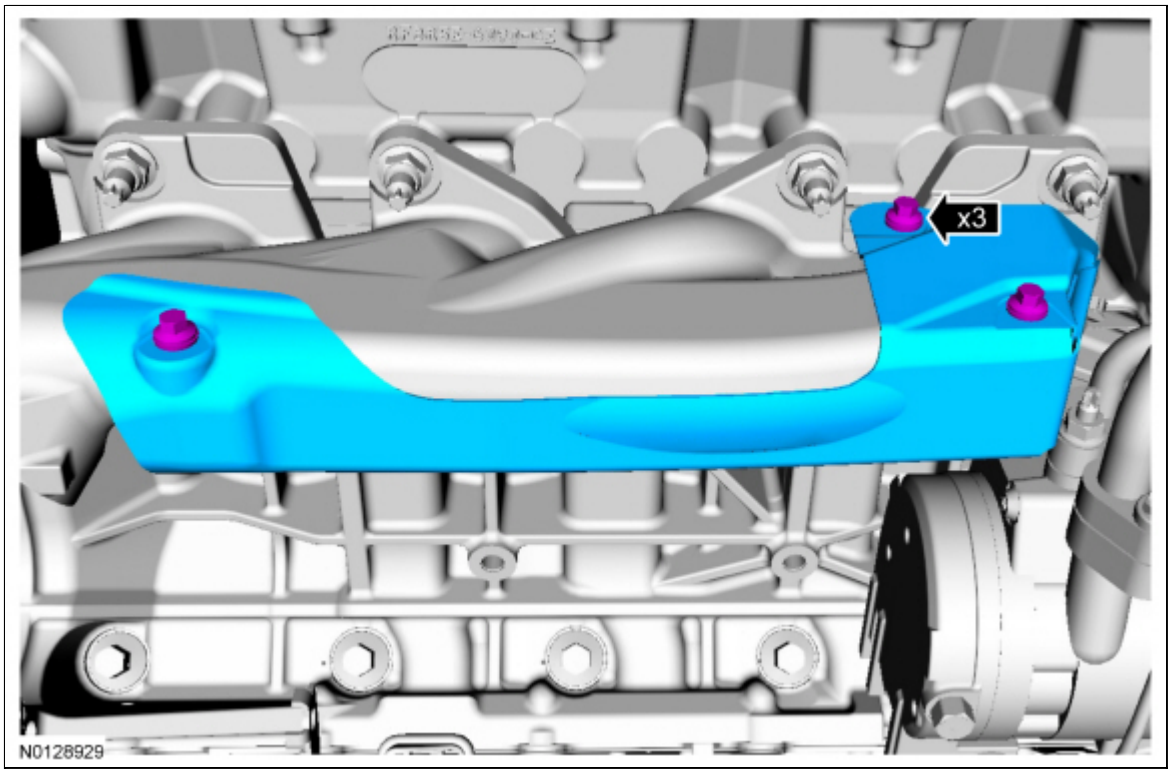
3. Tighten the new RH cylinder head bolts in 4 stages in the sequence shown.
   - Stage 1: Tighten to 25 Nm (18 lb-ft).
   - Stage 2: Tighten to 40 Nm (30 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.
   - Stage 4: Tighten an additional 90 degrees.



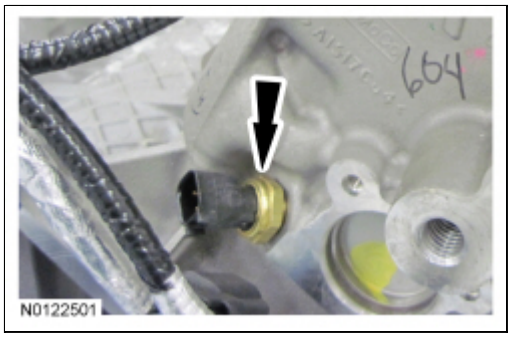
4. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

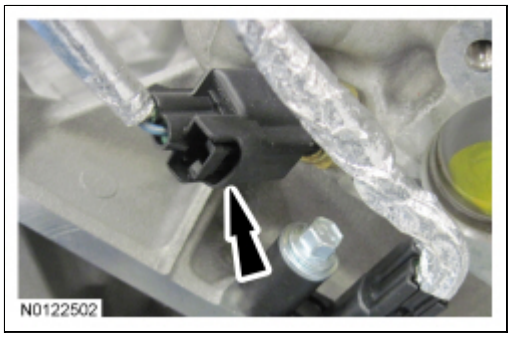
5. Install 8 new RH exhaust manifold studs.
   - Tighten to 25 Nm (18 lb-ft).



repair4less

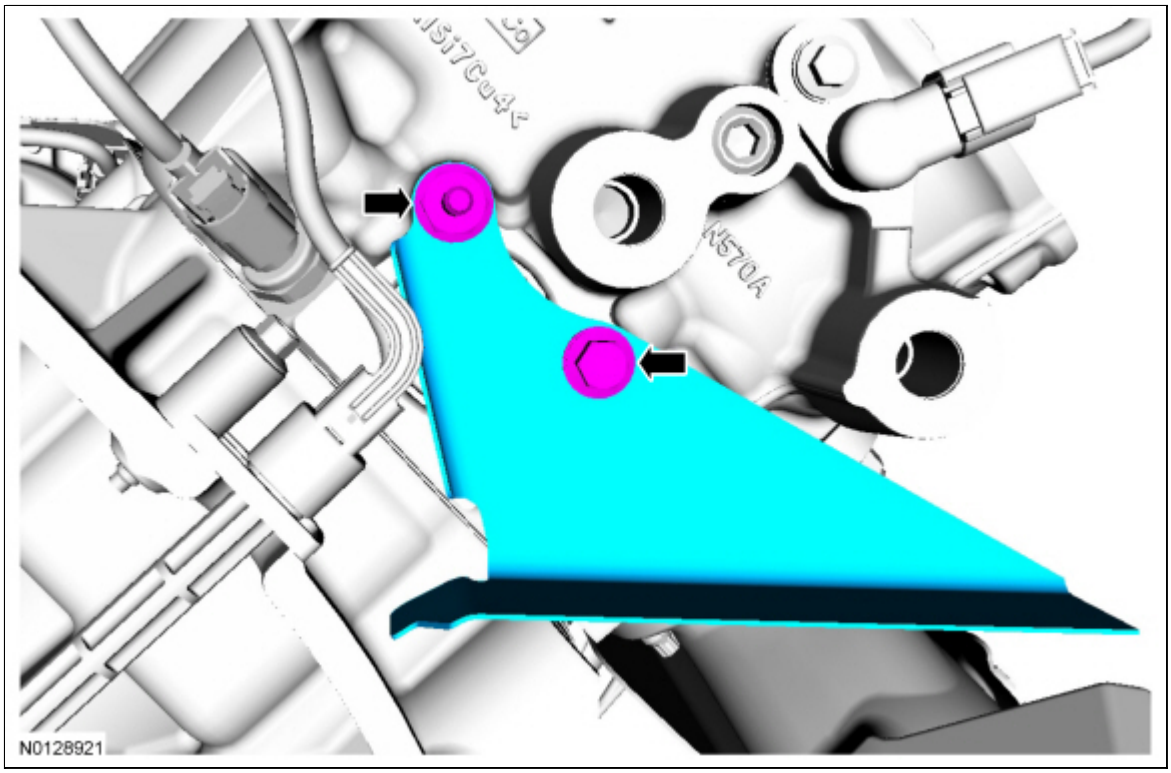


6. Install a new gasket, the RH exhaust manifold and 8 new nuts.
    - Tighten the nuts in the sequence shown in 2 stages.
        - Stage 1: Tighten to 24 Nm (18 lb-ft).
        - Stage 2: Tighten to 32 Nm (24 lb-ft).

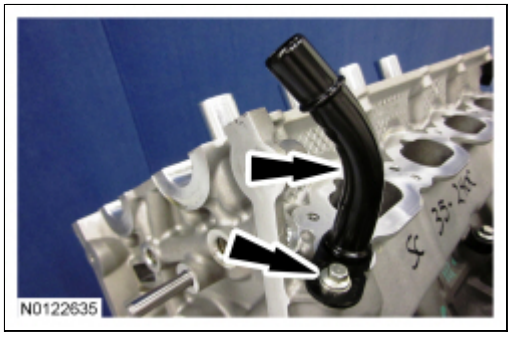


7. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).

8. Install the Cylinder Head Temperature (CHT) sensor.
    - Tighten to 11 Nm (97 lb-in).

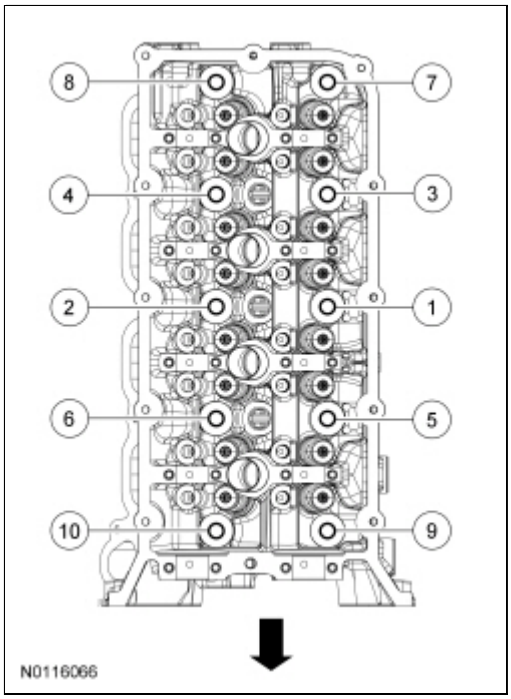


9. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.



10. Install the heat shield, the bolt and the stud bolt on the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

repair4less

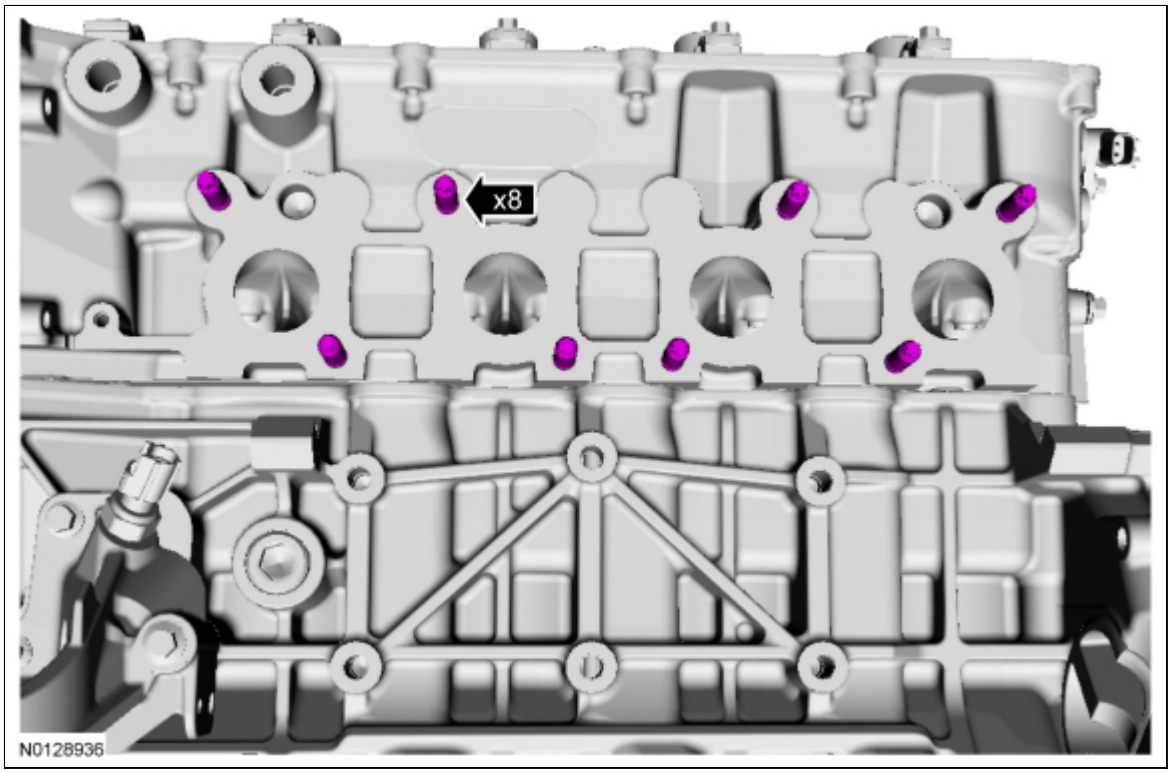


11. ***NOTICE:*** **Lubricate the O-ring seal with clean engine coolant prior to installing.**

    Using a new O-ring seal, install the coolant outlet pipe.
    - Tighten to 10 Nm (89 lb-in).

LH cylinder head

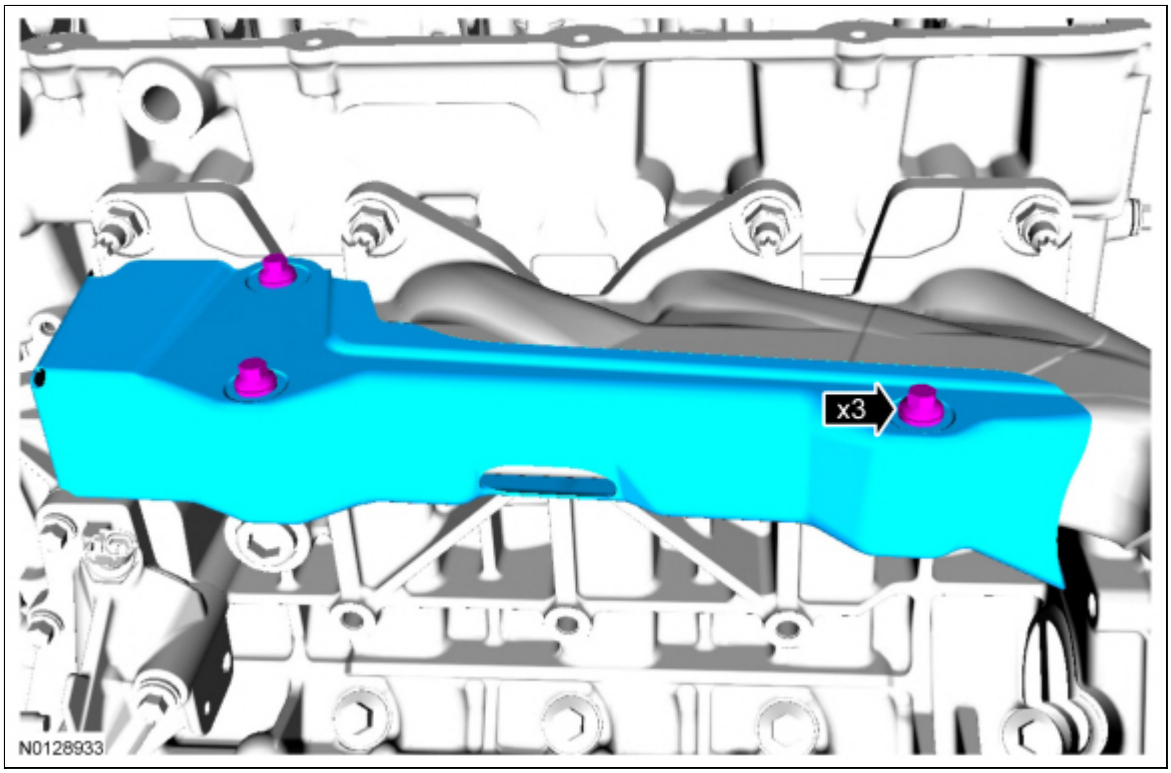
12. Tighten the new LH cylinder head bolts in 4 stages in the sequence shown.
    - Stage 1: Tighten to 25 Nm (18 lb-ft).
    - Stage 2: Tighten to 40 Nm (30 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.
    - Stage 4: Tighten an additional 90 degrees.



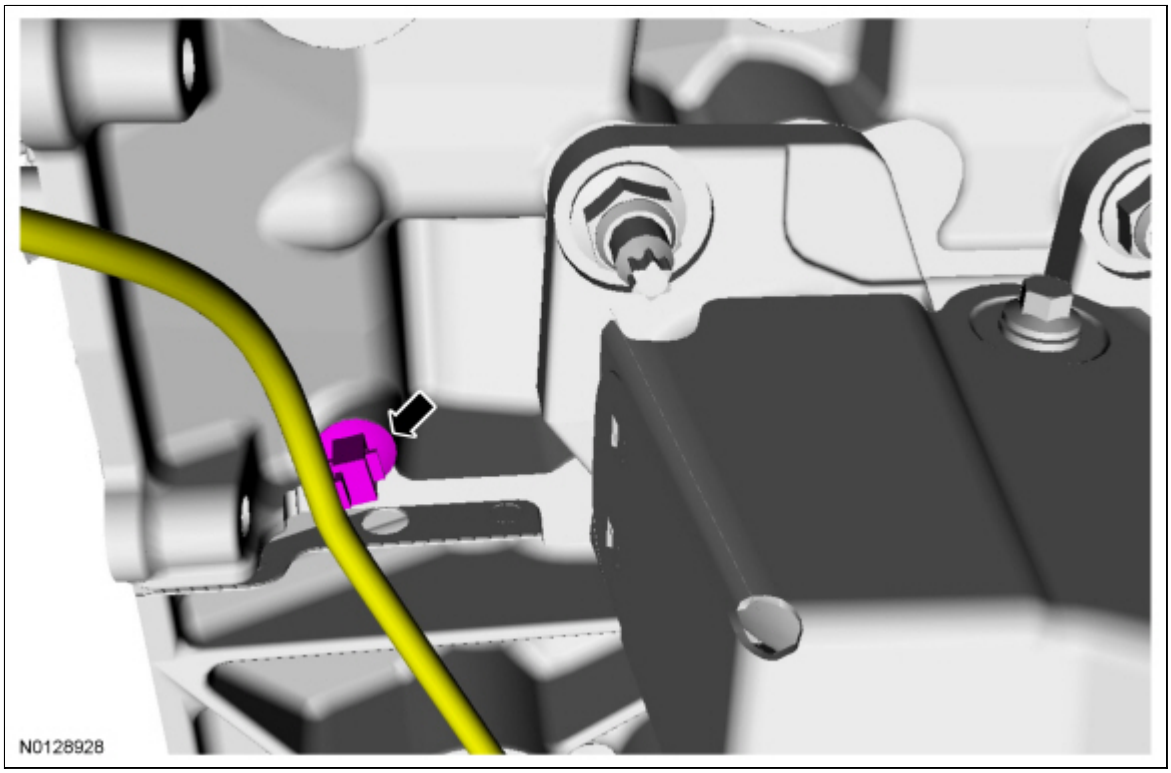
13. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

14. Install 8 new LH exhaust manifold studs.
    - Tighten to 25 Nm (18 lb-ft).

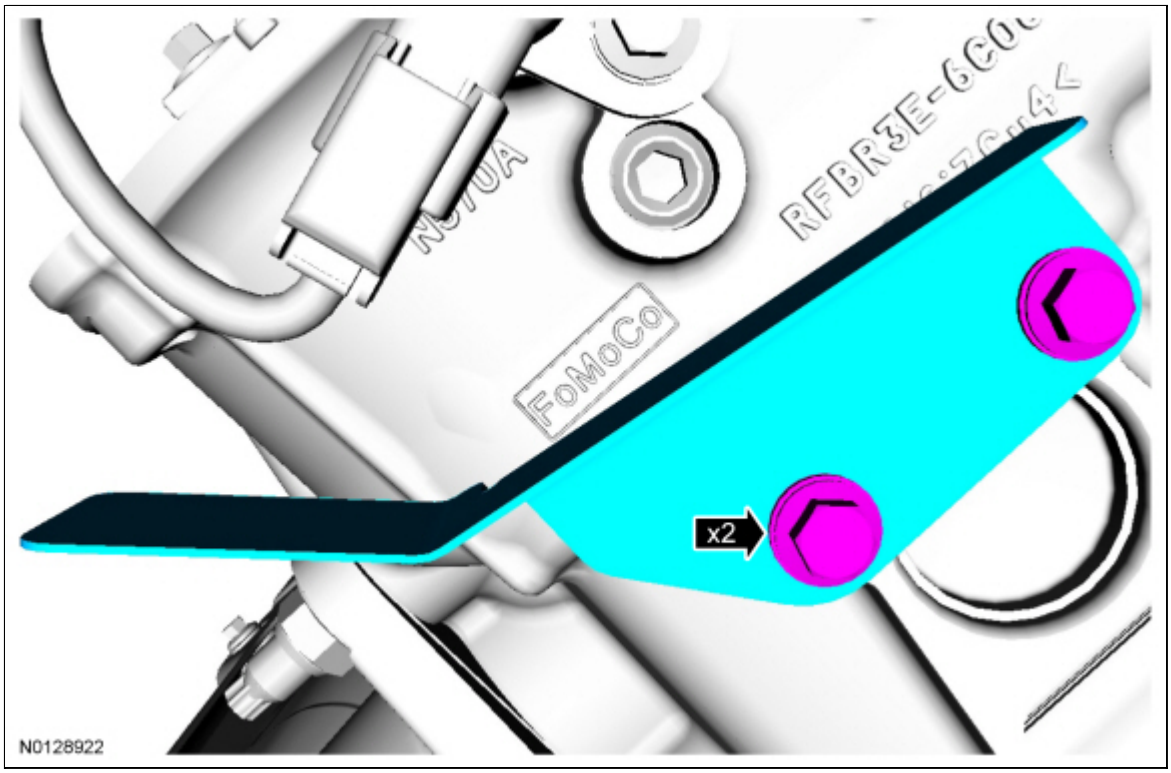


repair4less

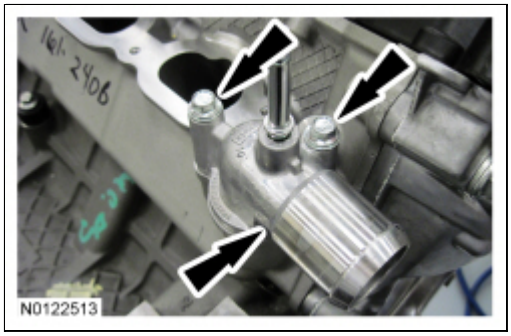


15. Install a new gasket, the LH exhaust manifold and 8 new nuts.
    - Tighten in the sequence shown in 2 stages.
        - Stage 1: Tighten to 24 Nm (18 lb-ft).
        - Stage 2: Tighten to 32 Nm (24 lb-ft).

16. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 12 Nm (106 lb-in).

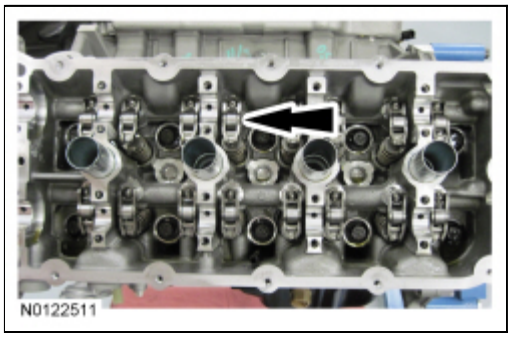


17. Attach the wiring harness retainer to the LH cylinder head.

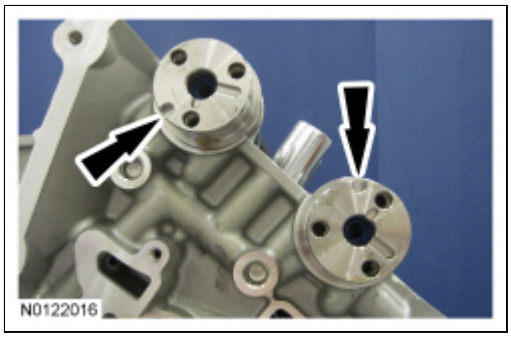


18. Install the heat shield and the 2 bolts to the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

repair4less

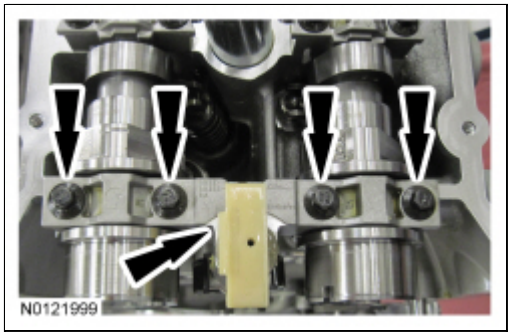


19. Using a new gasket, install the coolant outlet and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



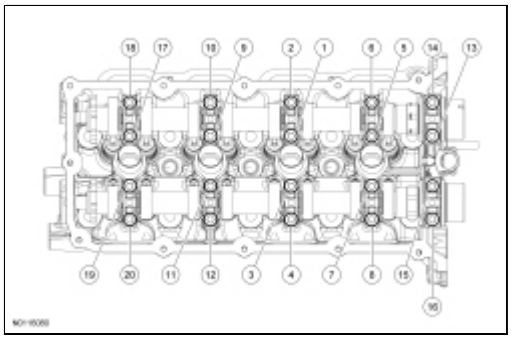
20. **NOTE:** Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil prior to installation.

    Install the 16 camshaft roller follower and hydraulic lash adjuster assemblies.



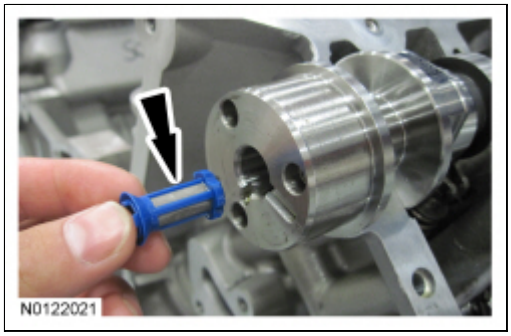
21. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

    Install the LH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.

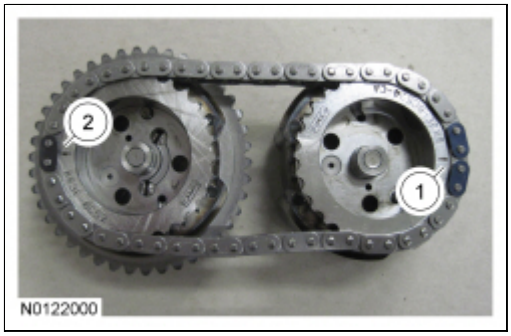


22. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.

23. Install the LH front camshaft bearing mega cap and the 4 bolts. Do not tighten the bolts at this time

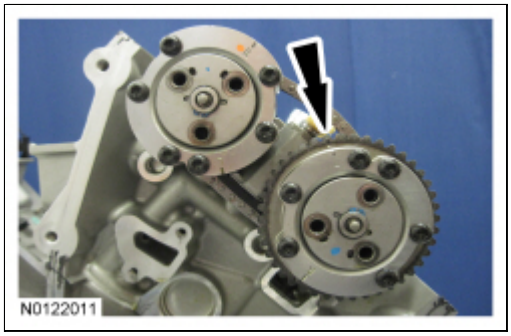


24. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 6 Nm (53 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



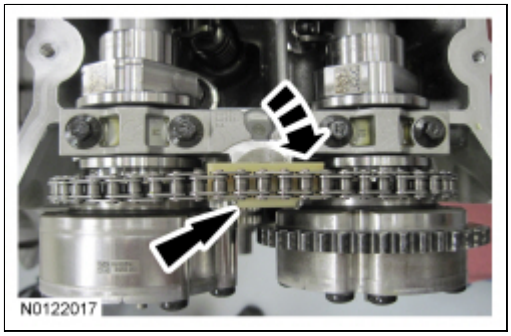
25. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Install the Variable Camshaft Timing (VCT) system oil filter in the intake and exhaust camshafts.

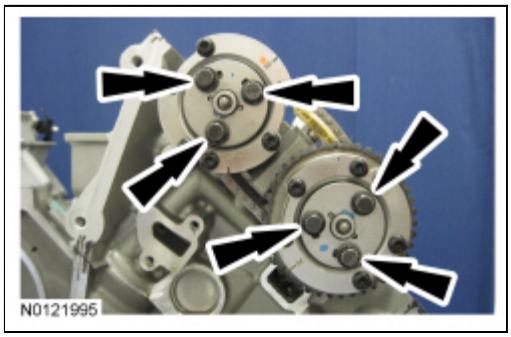


repair4less

26. Install the secondary timing chain onto the LH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.

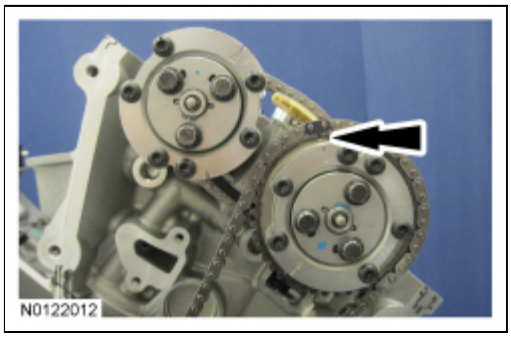


27. Install the LH VCT assemblies and the secondary timing chain onto the LH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 11 o'clock position.



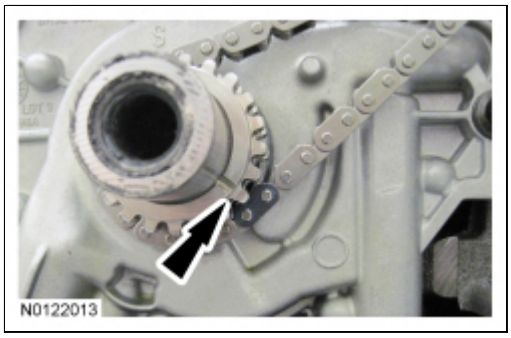
28. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.

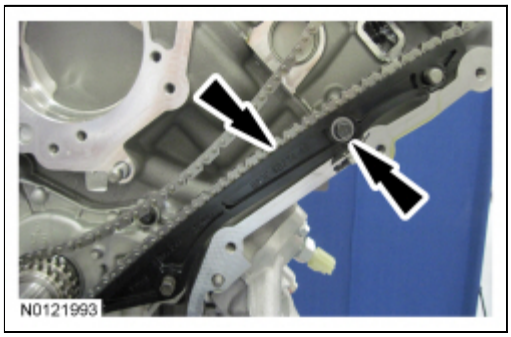


29. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

    Install the 3 LH intake VCT assembly bolts and the 3 LH exhaust VCT assembly bolts.
    - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.

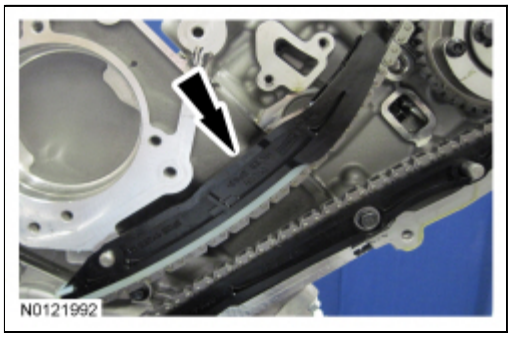


30. Install the LH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the LH VCT assembly.



31. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.

repair4less

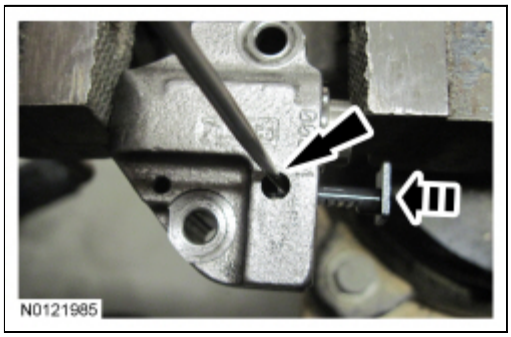


32. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain guide.

    Install the LH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

33. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after installing the LH timing chain tensioner arm.

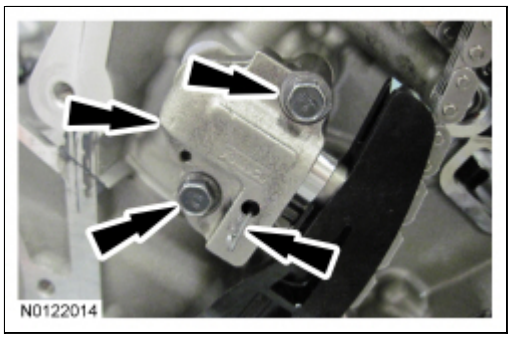
    Install the LH timing chain tensioner arm.



NOTE: Complete the following 3 steps on both the LH and RH primary timing chain tensioners.

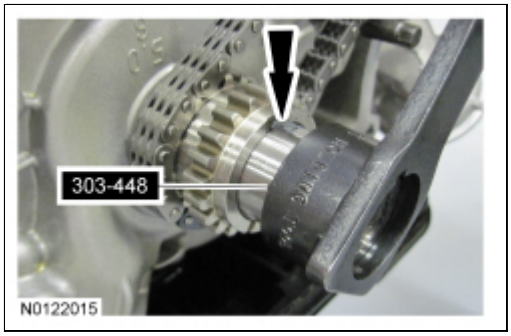
34. ***NOTICE:*** **Do not compress the ratchet assembly or damage to the tensioner will occur.**

    Compress the primary timing chain tensioner plunger, using an edge of a vise.

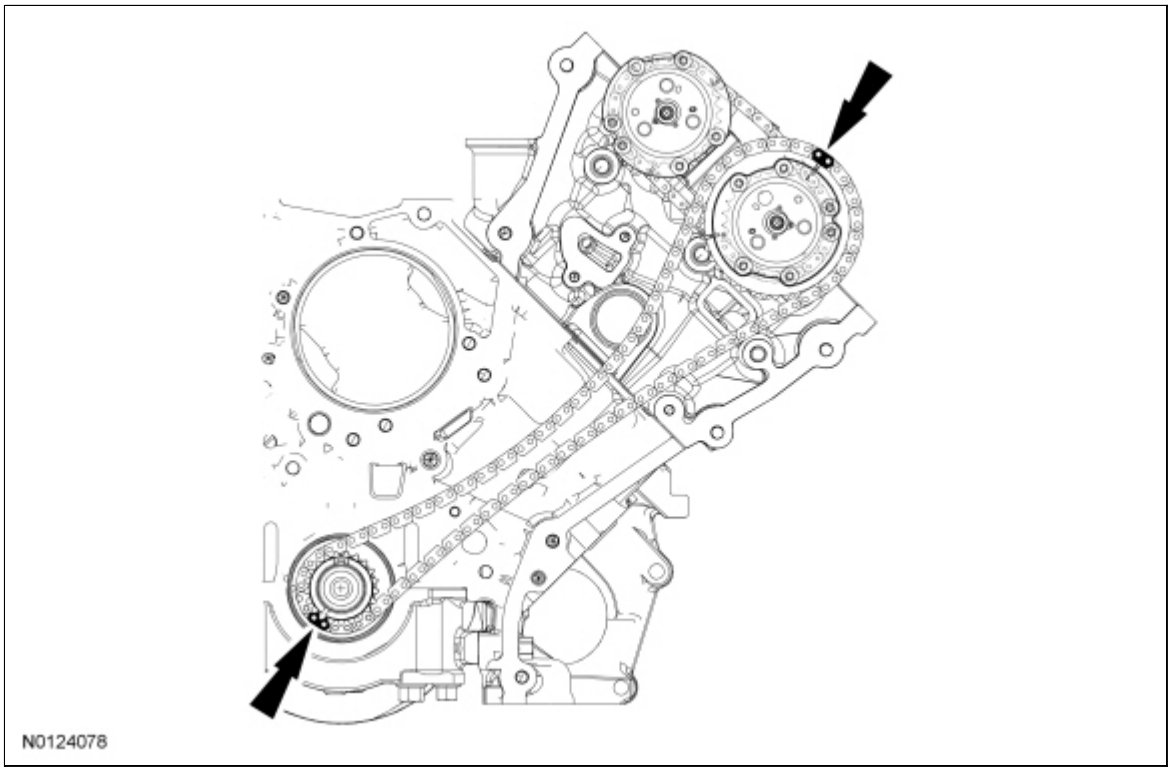


35. Using a small screwdriver or pick, push back and hold the ratchet mechanism, then push the ratchet arm back into the tensioner housing.

36. Install a suitable pin into the hole of the tensioner housing to hold the ratchet assembly and plunger in place during installation.

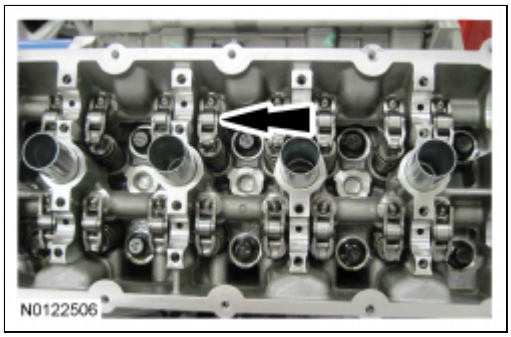


37. Install the LH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.



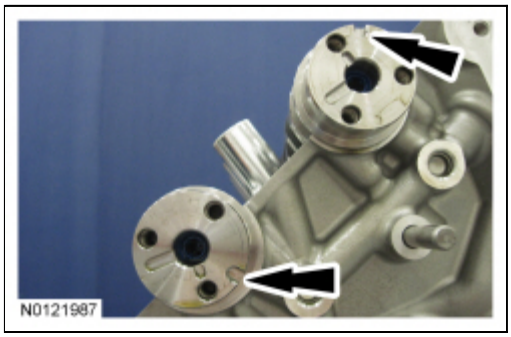
repair4less

38. Using the crankshaft holding tool, rotate the crankshaft clockwise until the crankshaft keyway is at the 12 o'clock position.



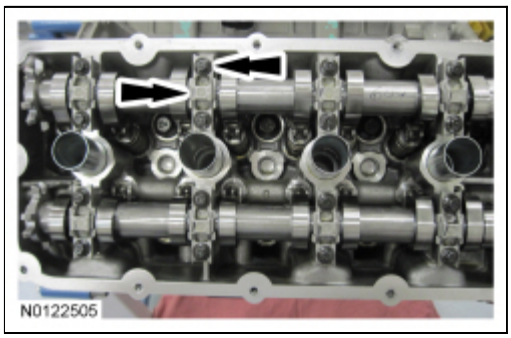
39. With the crankshaft keyway at the 12 o'clock position, verify the timing mark alignment is correct.

RH cylinder head



40. **NOTE:** Lubricate the camshaft roller follower and hydraulic lash adjuster assemblies with clean engine oil prior to installation.

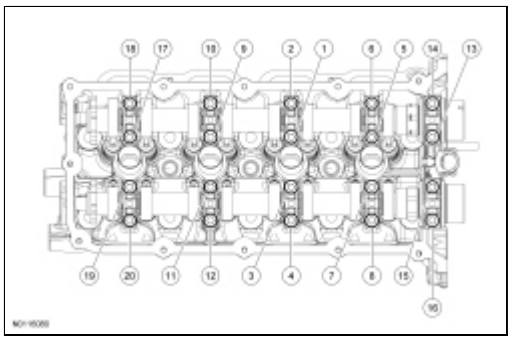
    Install the 16 camshaft roller follower and hydraulic lash adjuster assemblies.



41. **NOTE:** Lubricate the camshafts with clean engine oil prior to installation.

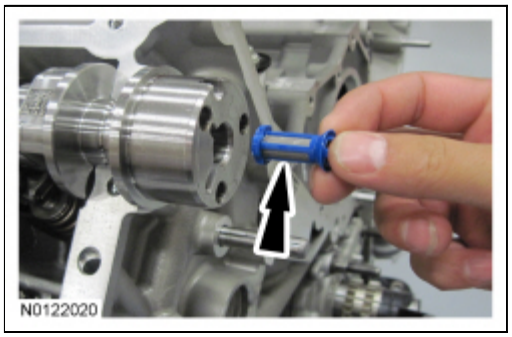
    Install the RH intake and exhaust camshafts in the neutral position. Align the D-slots as shown in the illustration.

42. Install the 8 camshaft bearing caps and the 16 bolts. Do not tighten the bolts at this time.



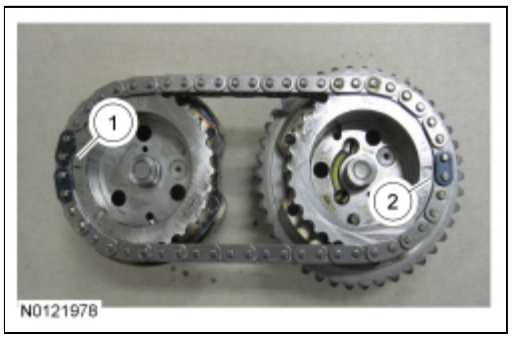
43. Install the RH front camshaft bearing mega cap and the 4 bolts. Do not tighten at this time

44. Tighten the bolts in the sequence shown in 2 stages.



repair4less

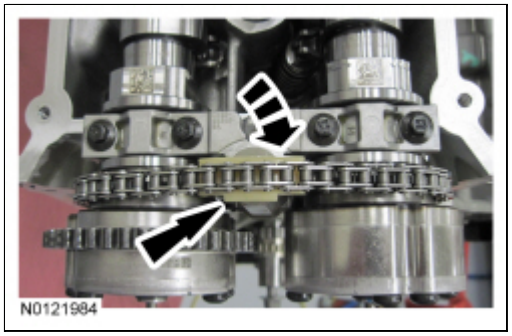
- Stage 1: Tighten to 6 Nm (53 lb-in).
- Stage 2: Tighten an additional 45 degrees.



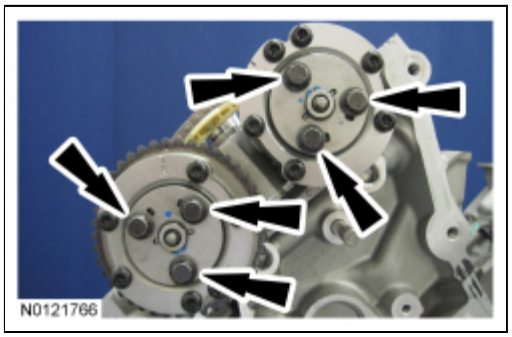
45. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Install the VCT system oil filter in the intake and exhaust camshafts.

46. Install the secondary timing chain onto the RH VCT assemblies. Align the colored links on the secondary timing chain with the timing marks on the VCT assemblies as shown in the illustration.
    1. The timing mark on the intake VCT assembly should align between the 2 consecutive colored links.
    2. The timing mark on the exhaust VCT assembly should align with the single colored link.



47. Install the RH VCT assemblies and the secondary timing chain onto the RH camshafts to a position 2 mm (0.078 in) from fully seated. The timing mark on the exhaust VCT assembly should be in the 1 o'clock position.

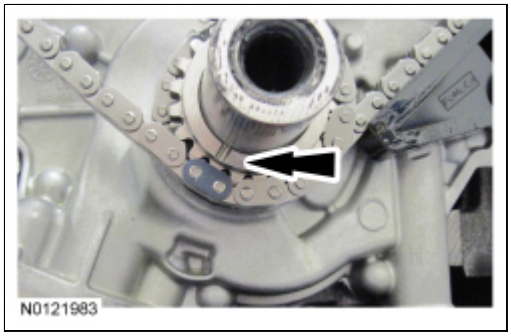


48. **NOTE:** It may be necessary to rotate the exhaust camshaft slightly (using a wrench on the flats of the camshaft) to seat the VCT assemblies onto the camshafts.

    Rotate the secondary timing chain tensioner 90 degrees so the ramped area is facing forward and fully seat the VCT assemblies onto the camshafts.
    - If the secondary timing chain is not centered over the tensioner, reposition the VCT assemblies until they are fully seated on the camshafts.

49. **NOTE:** Use a wrench on the flats of the camshaft to hold the camshafts while tightening the VCT assembly bolts.

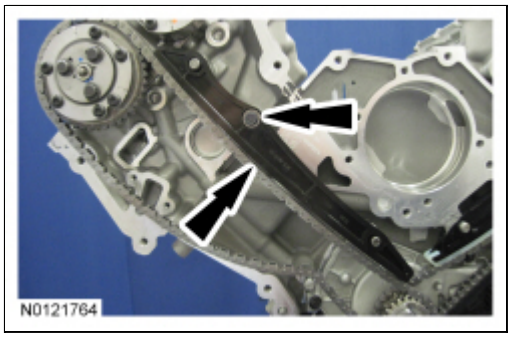
    Install the 3 RH intake VCT assembly bolts and the 3 RH exhaust VCT assembly bolts.
    - Tighten to 15 Nm (133 lb-in) plus an additional 90 degrees.



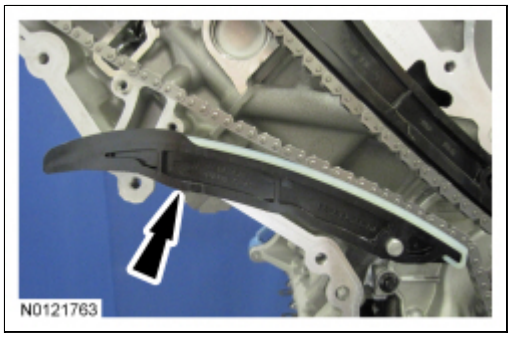
All cylinder heads

50. Install the RH primary timing chain.
    - Align the colored link on the timing chain with the timing mark on the RH VCT assembly.

repair4less

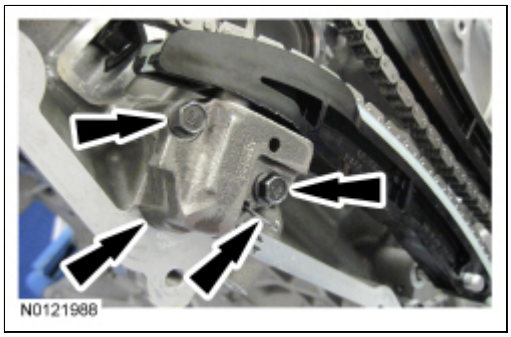


51. Align the remaining colored link on the timing chain with the timing mark on the crankshaft sprocket.



52. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain guide.

    Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

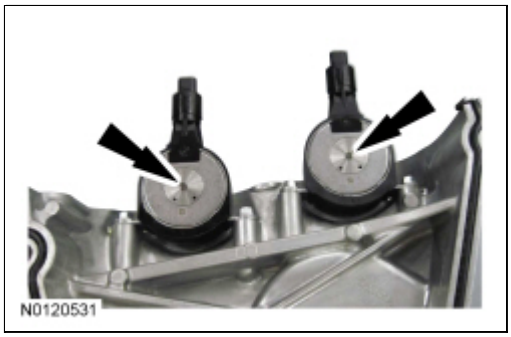


53. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to install the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after installing the RH timing chain tensioner arm.

    Install the RH timing chain tensioner arm.

54. Install the RH primary timing chain tensioner and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the holding pin from the tensioner.

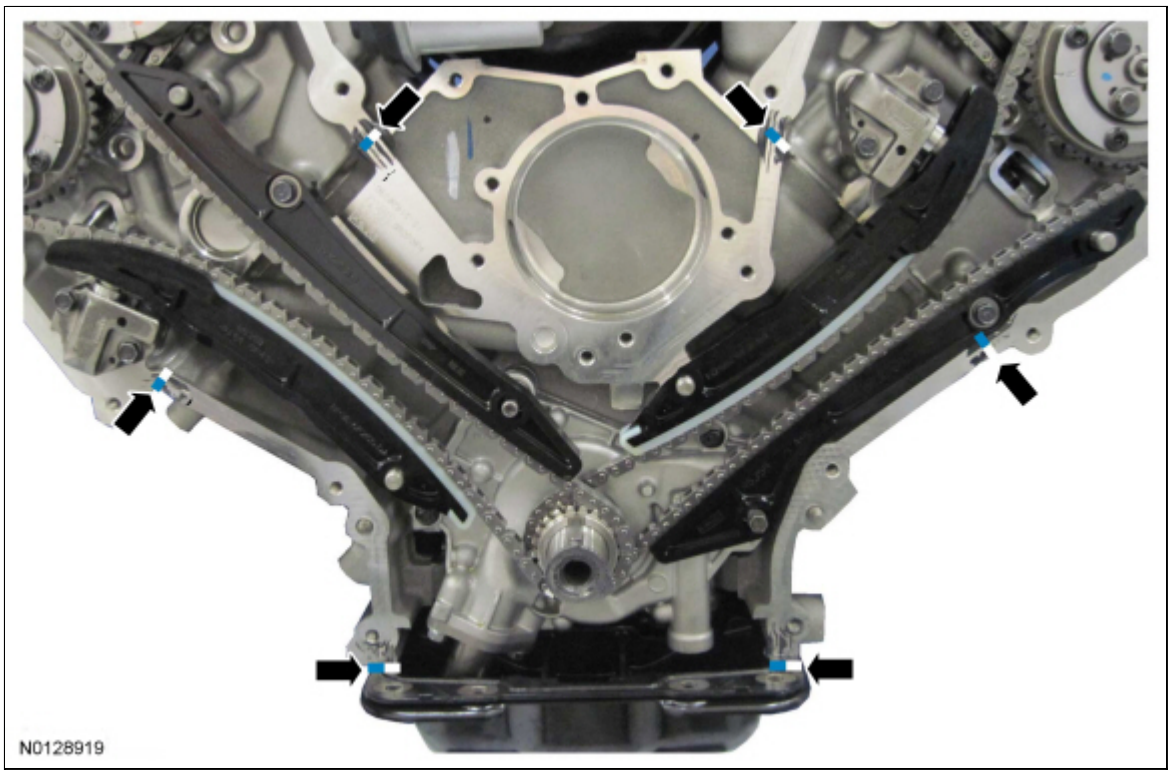
55. With the crankshaft keyway still at the 12 o'clock position, verify the timing mark alignment is correct.



56. ***NOTICE:*** **The Variable Camshaft Timing (VCT) variable force solenoid pins must be fully**

repair4less

depressed to avoid interference with the VCT valve tips when installing the engine front cover. Failure to follow these instructions can result in damage to the engine.

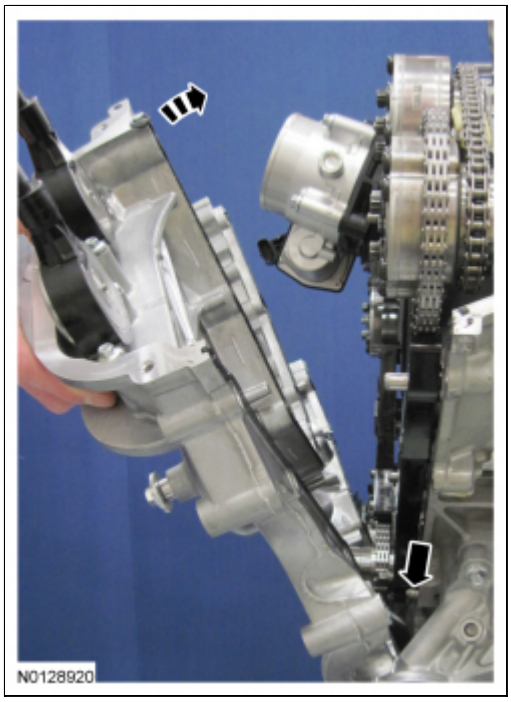


NOTE: LH shown, RH similar.

Fully depress the VCT variable force solenoid pins.

57. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply a bead of silicone gasket and sealant to the cylinder head-to-cylinder block joints and the oil pan-to-cylinder block joints as illustrated.

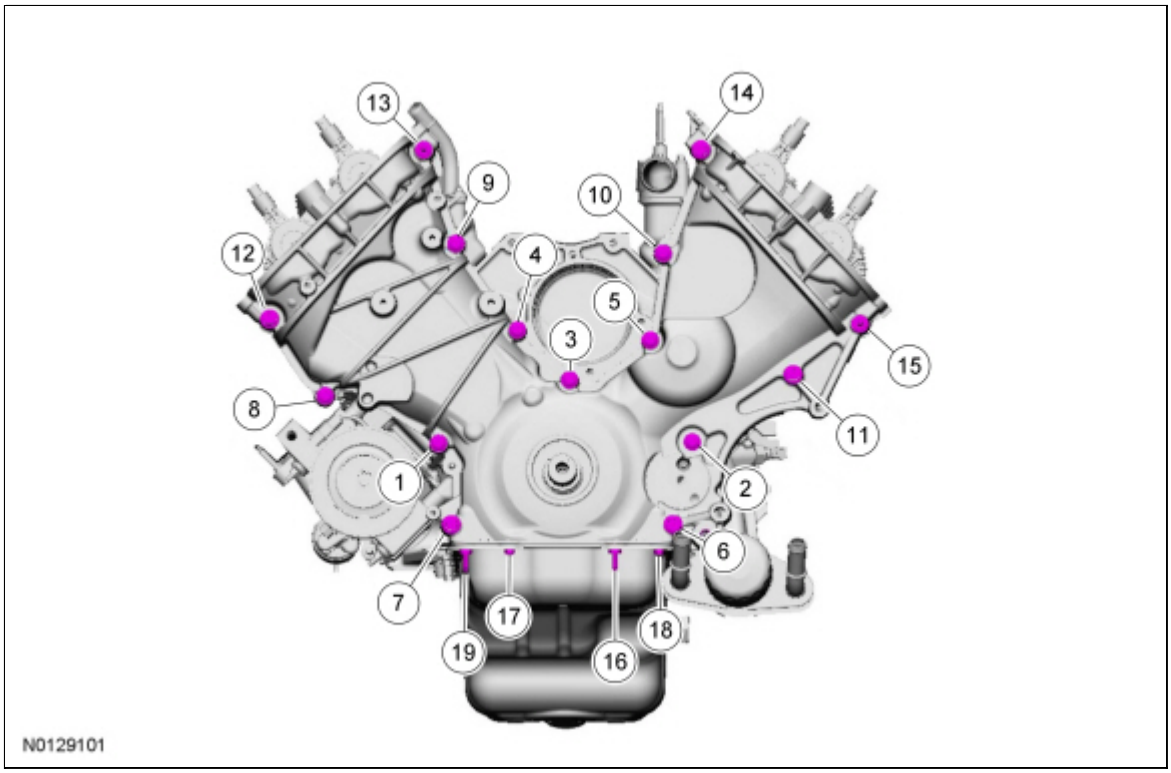


58. **NOTE:** Make sure that the engine front cover gasket is in place on the engine front cover before

installation.

Using new gaskets, position the engine front cover onto the dowels.

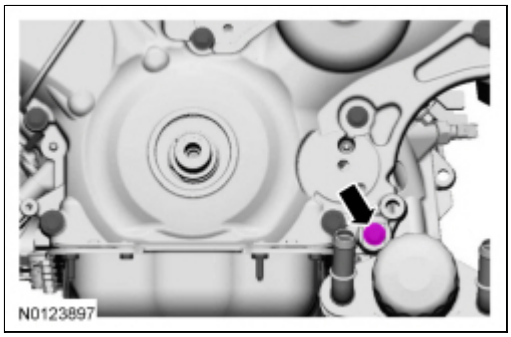
- Install the 13 engine front cover bolts, 2 stud bolts, 2 oil pan-to-engine front cover bolts and 2 oil pan-to-engine front cover stud bolts finger-tight.



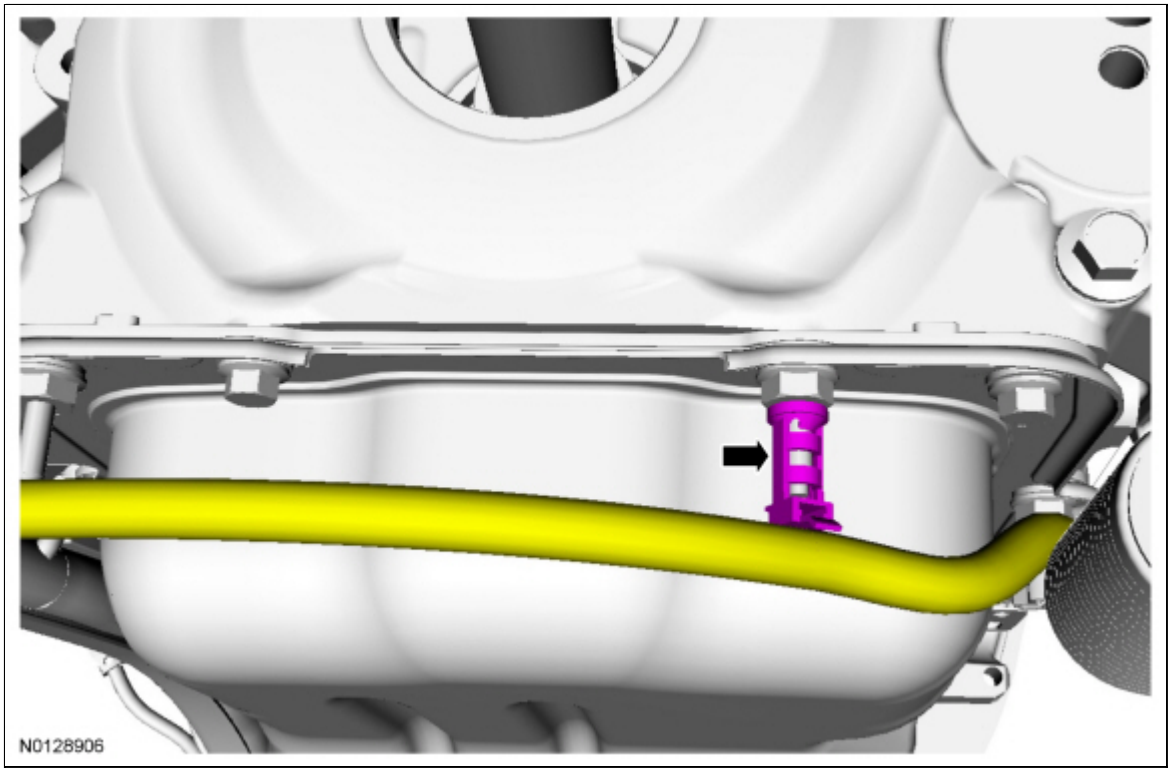
59. **NOTE:** The engine front cover must be installed and all fasteners final tightened within 5 minutes of applying the sealer. If this cannot be accomplished, install the engine front cover and tighten fasteners 6, 7, 8, 9, 10 and 11 to 8 Nm (71 lb-in) within 5 minutes of applying the sealer. All of the fasteners must then be final tightened within 1 hour of applying the sealer. If this time limit is exceeded, all sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Tighten the bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten bolts 1-15 to 25 Nm (18 lb-ft) and bolts 16-19 to 10 Nm (89 lb-in).
    - Stage 2: Tighten bolts 1-15 an additional 60 degrees and bolts 16-19 an additional 45 degrees.

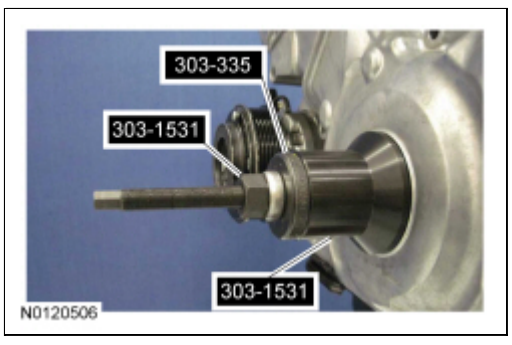


repair4less



60. Using a 10 mm Hex Bit, rotate the engine front cover jackscrew into contact with the oil filter adapter to 5 Nm (44 lb-in).

61. Install the engine front cover-to-oil filter adapter bolt and tighten to 25 Nm (18 lb-ft) plus an additional 60 degrees.



62. Position the wiring harness and install the wiring harness retainer to the oil pan stud bolt.

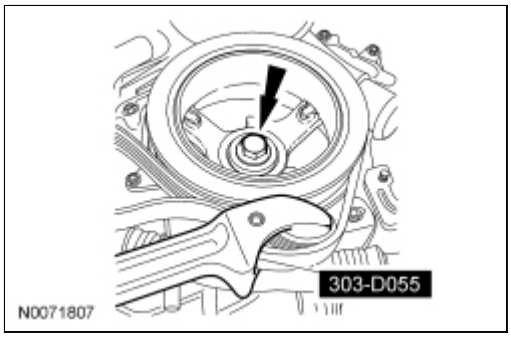
63. **NOTE:** Lubricate the engine front cover bore and the crankshaft front oil seal inner lip with clean engine oil.

    Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft front oil seal.

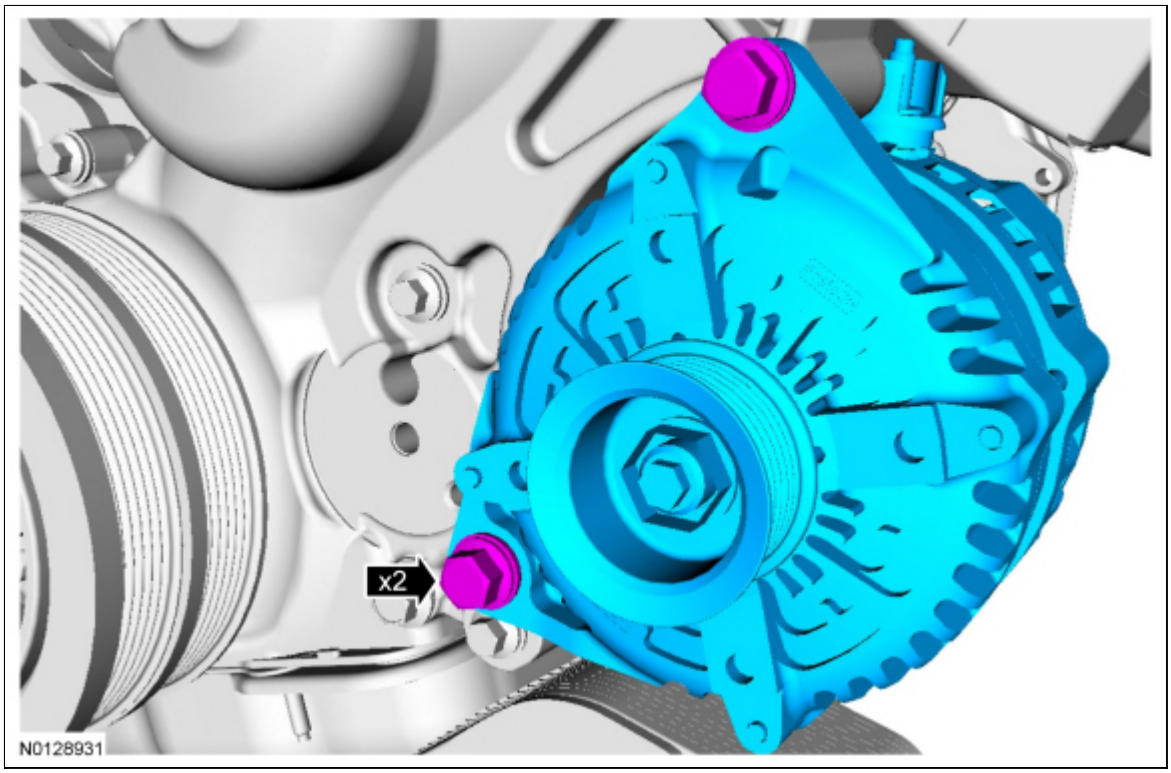
repair4less

64. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

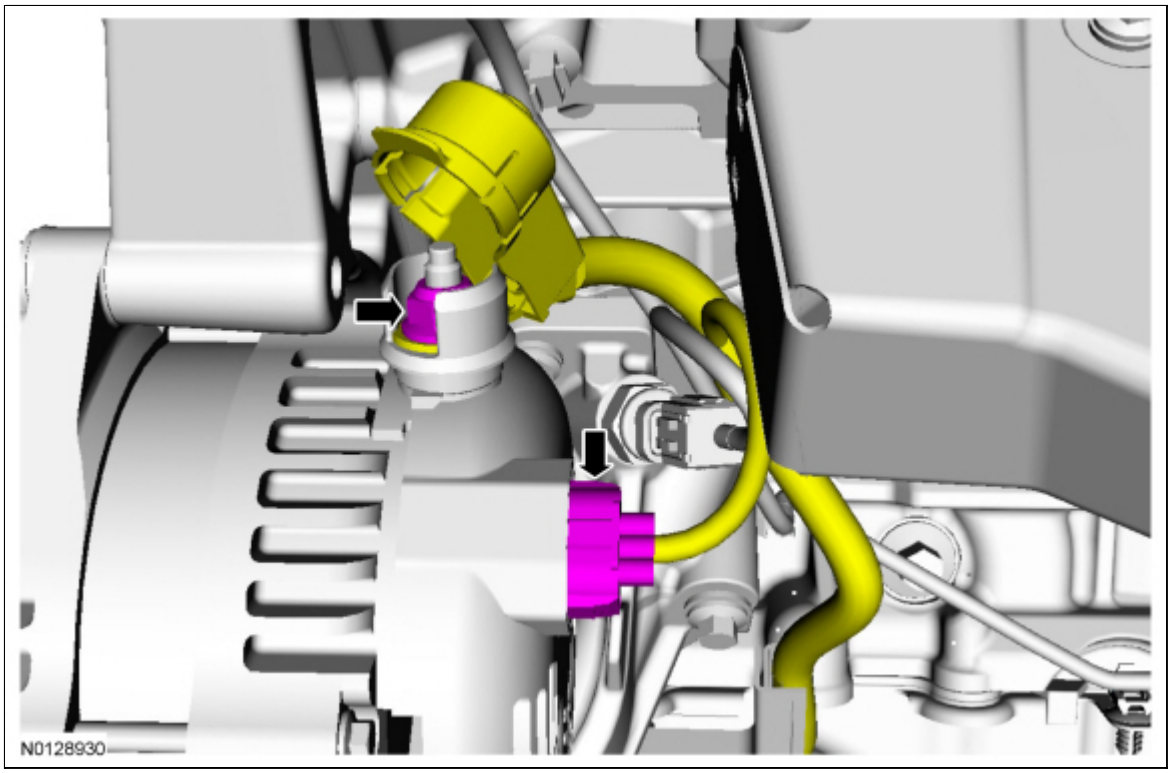


65. Lubricate the crankshaft pulley sealing surface with clean engine oil prior to installation.

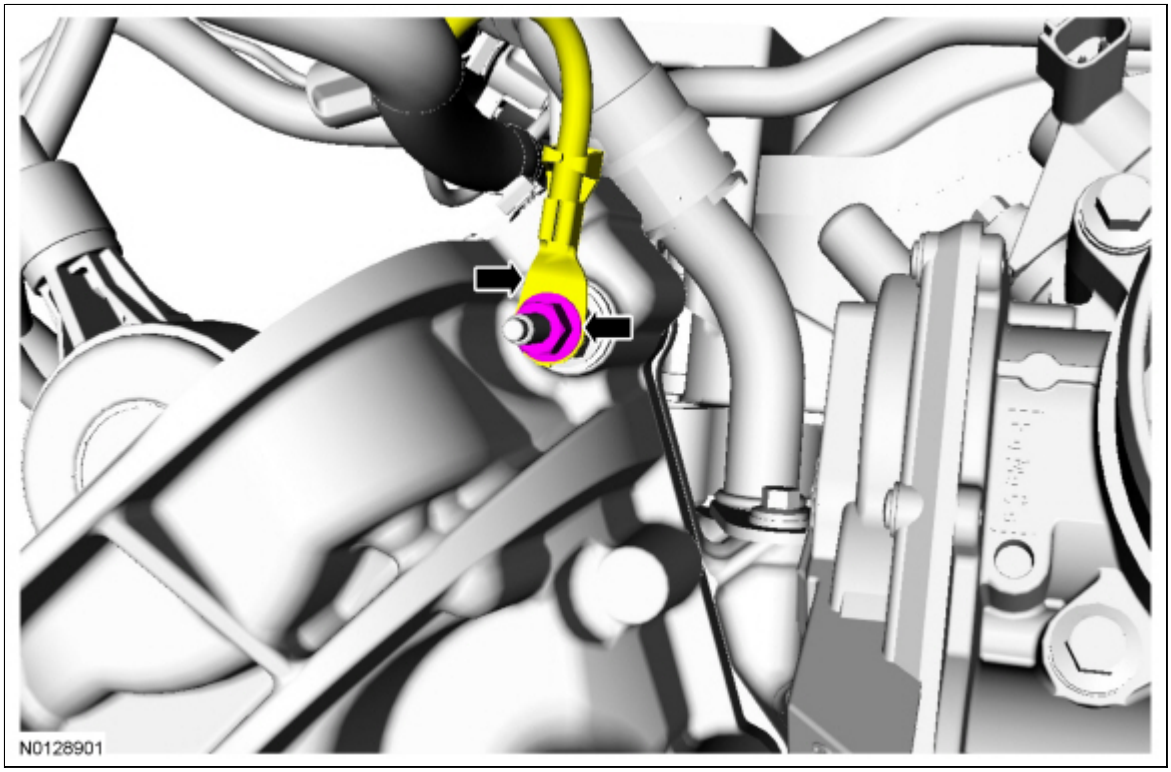


66. Using the Front Crank Seal and Damper Installer and the Front Cover Oil Seal Installer (plate only), install the crankshaft pulley.

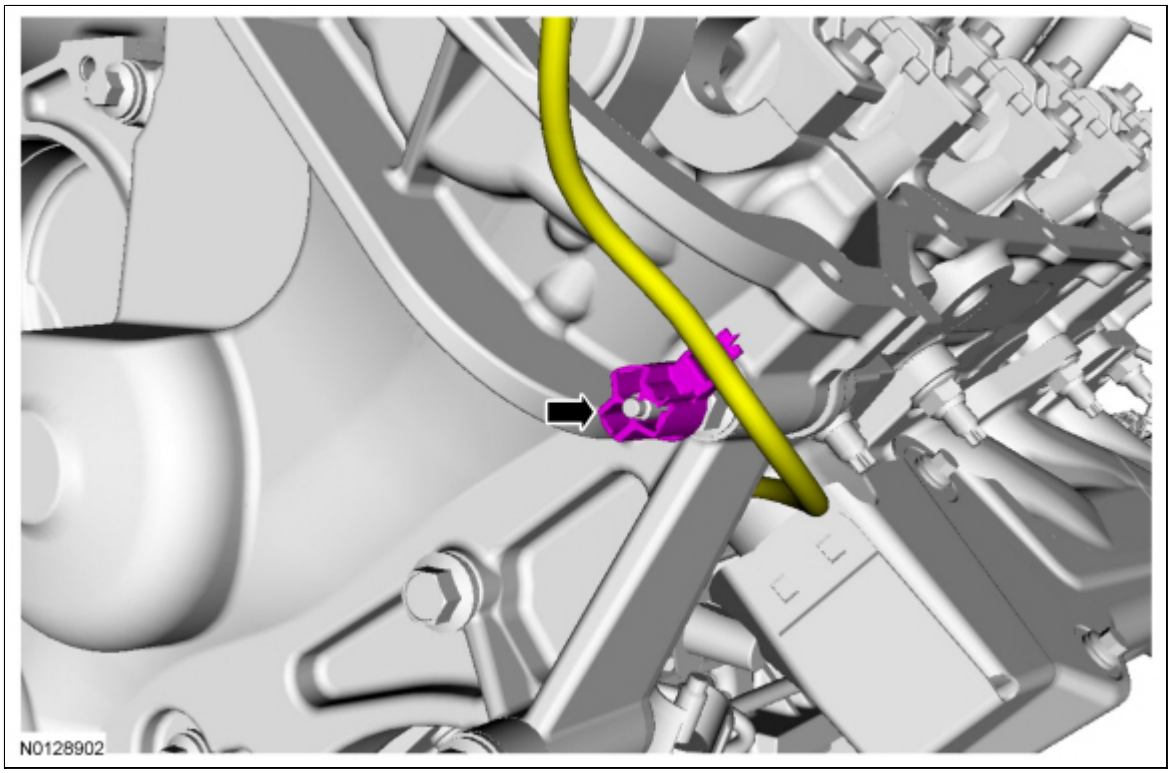
67. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 4 stages:
    - Stage 1: Tighten to 140 Nm (103 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 100 Nm (74 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



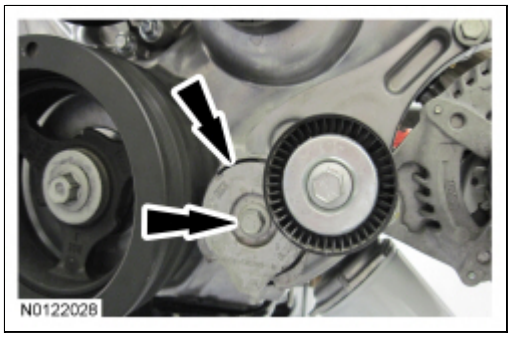
68. Install the generator and the 2 bolts.
    - Tighten to 48 Nm (35 lb-ft).



69. Connect the wiring harness connector to the generator.
    - Install the B+ wire and nut onto the generator.
        - Tighten to 17 Nm (150 lb-in).

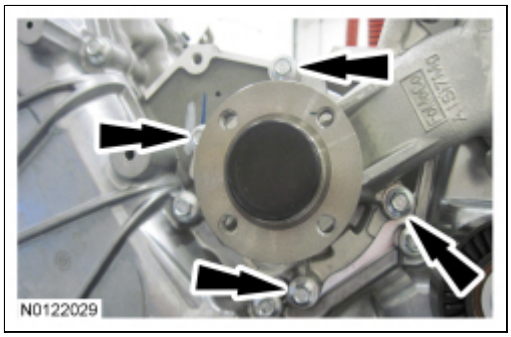


repair4less

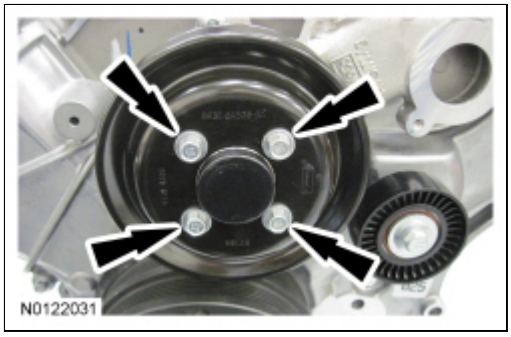


70. Install the ground wire and nut to the engine front cover stud bolt.
    - Tighten to 10 Nm (89 lb-in).

71. Attach the wiring harness retainer to the engine front cover stud bolt.

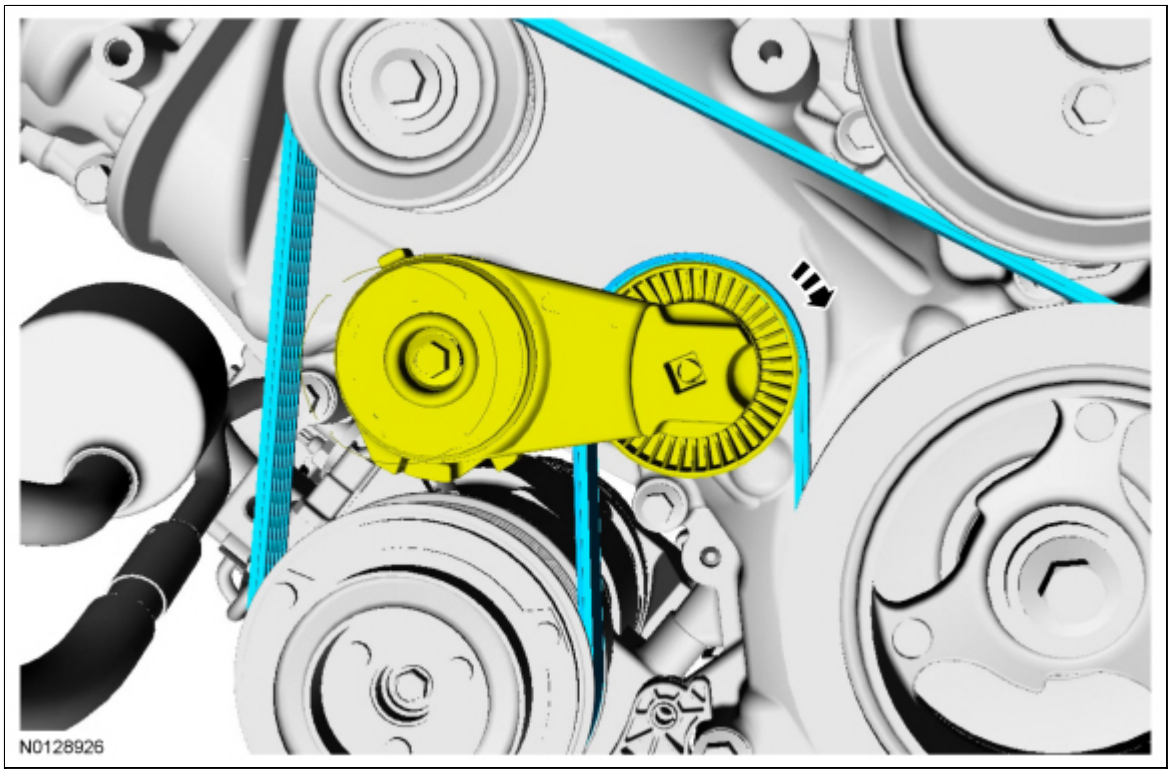


72. Install the accessory drive belt tensioner and the bolt.
    - Tighten to 48 Nm (35 lb-ft).

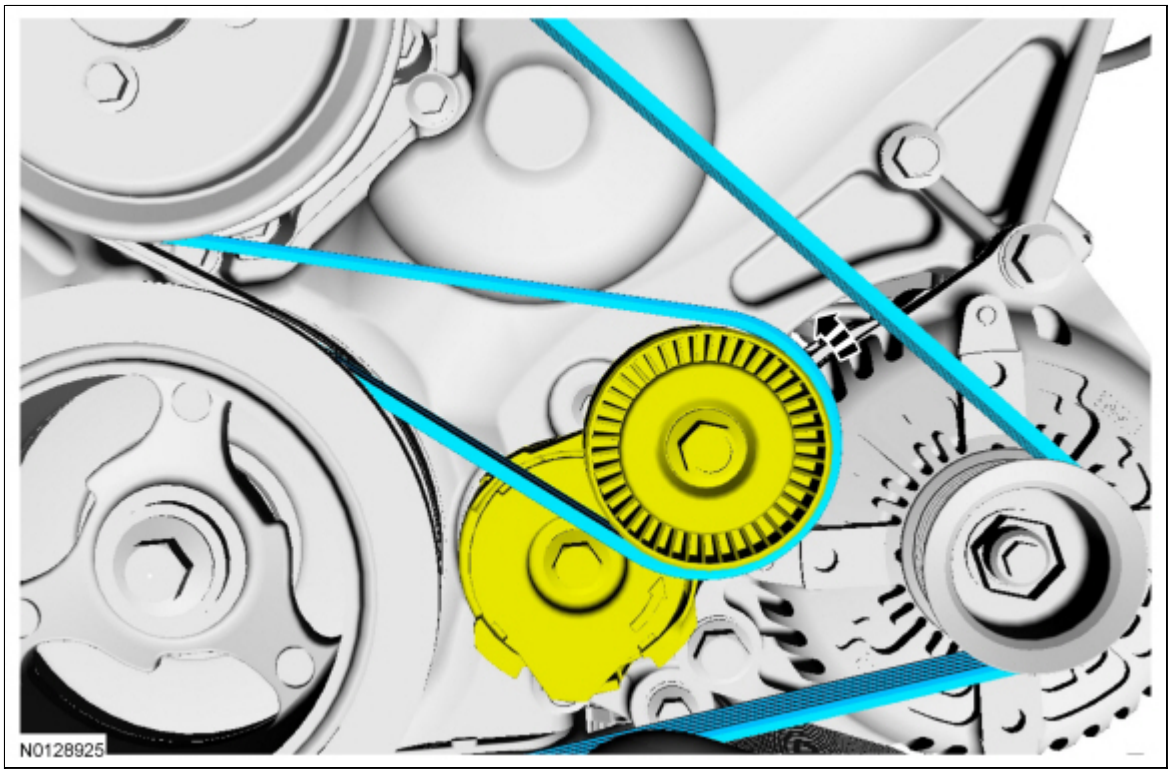


73. **NOTE:** Lubricate the new coolant pump O-ring seal with clean engine coolant.

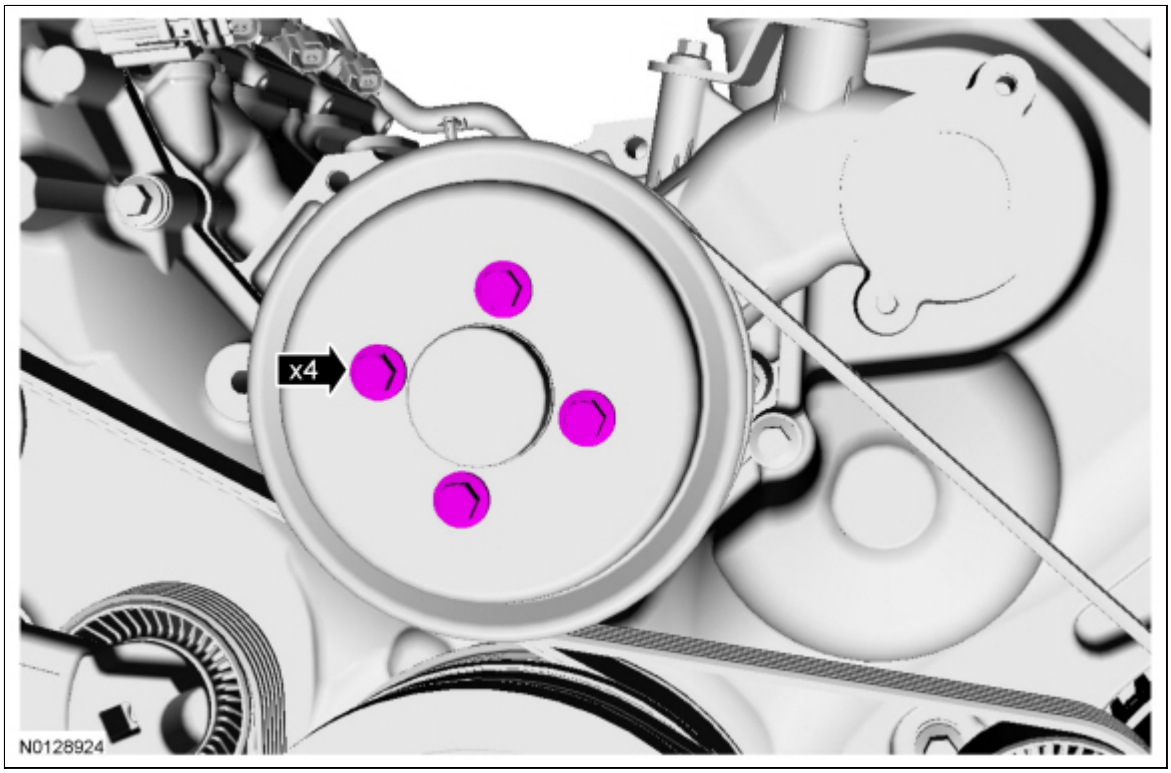
    Using a new O-ring seal, install the coolant pump and the 4 bolts.
    - Tighten to 20 Nm (177 lb-in) plus an additional 60 degrees.



repair4less



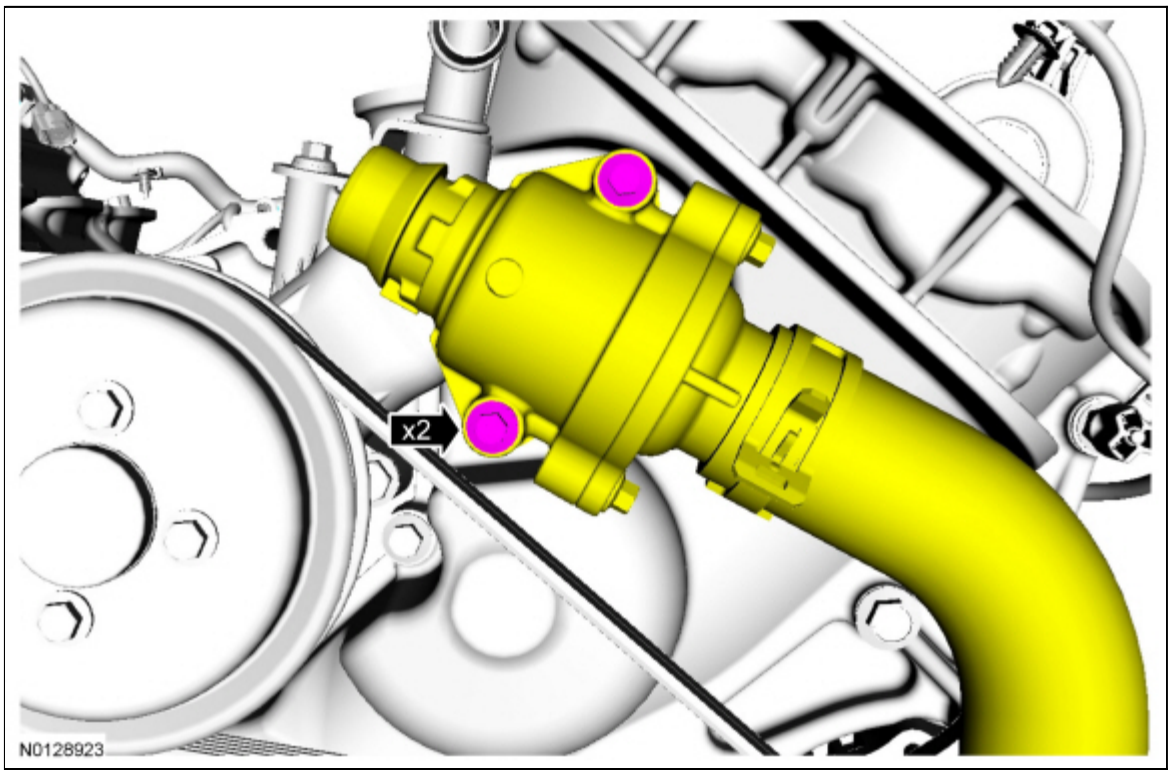
74. Install the coolant pump pulley and the 4 bolts.



75. Rotate the A/C compressor belt tensioner clockwise and install the A/C compressor belt.

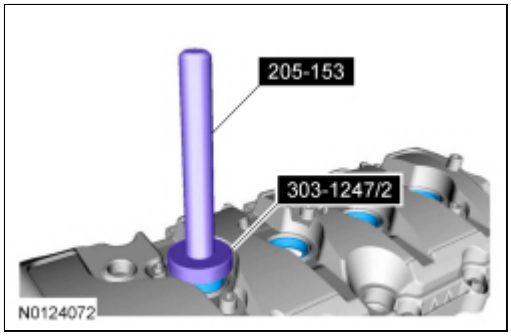
76. Rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.

77. Tighten the 4 coolant pump pulley bolts to 25 Nm (18 lb-ft).



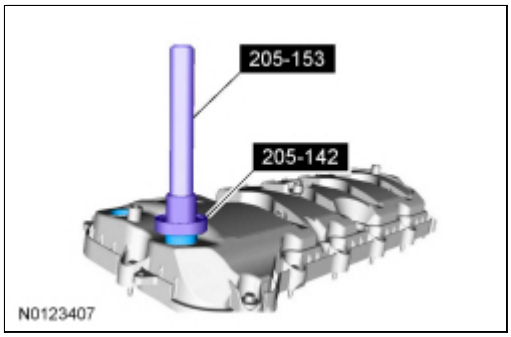
78. **NOTE:** Lubricate the new thermostat housing O-ring seal with clean engine coolant.

    Using a new thermostat housing O-ring seal, install the thermostat housing and the 2 bolts.



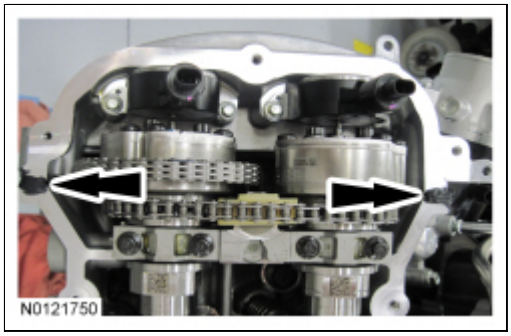
repair4less

- Tighten to 10 Nm (89 lb-in).



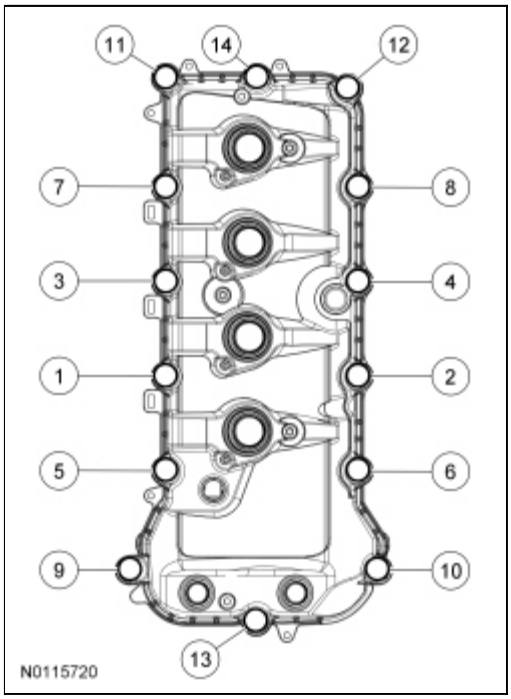
79. **NOTE:** Installation of new seals is only required if damaged seals were removed.

    Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.



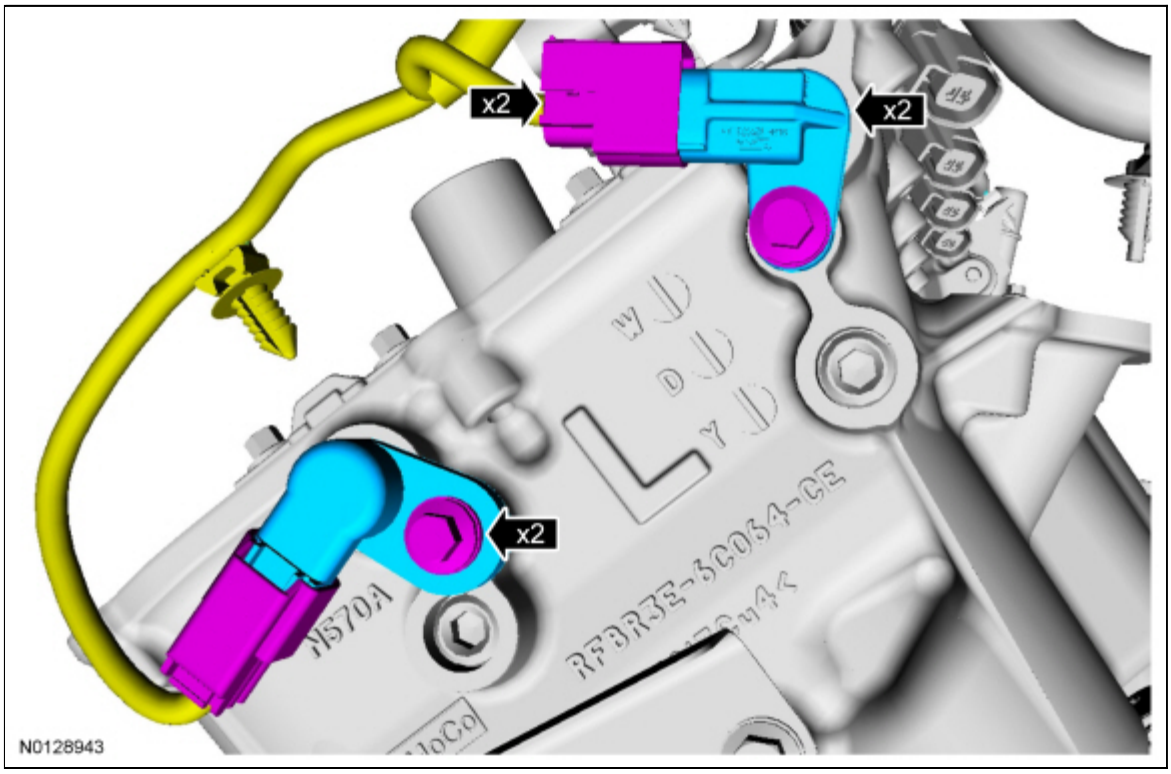
80. **NOTE:** Installation of new seals is only required if damaged seals were removed.

    Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).



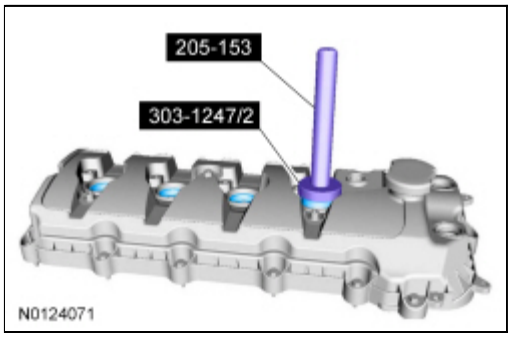
81. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-LH cylinder head joints.



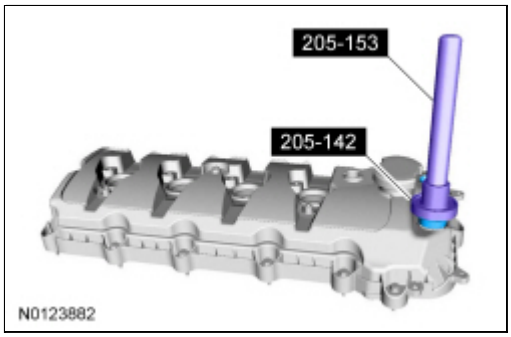
82. Position the LH valve cover and new gasket on the cylinder head.
    - Tighten the fasteners in the sequence shown to 10 Nm (89 lb-in).

repair4less



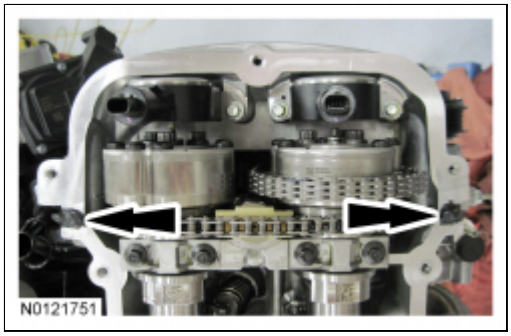
83. Install the oil level indicator.

84. If removed, install the LH intake and exhaust Camshaft Position (CMP) sensors and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Connect the LH intake and exhaust CMP sensor electrical connectors.



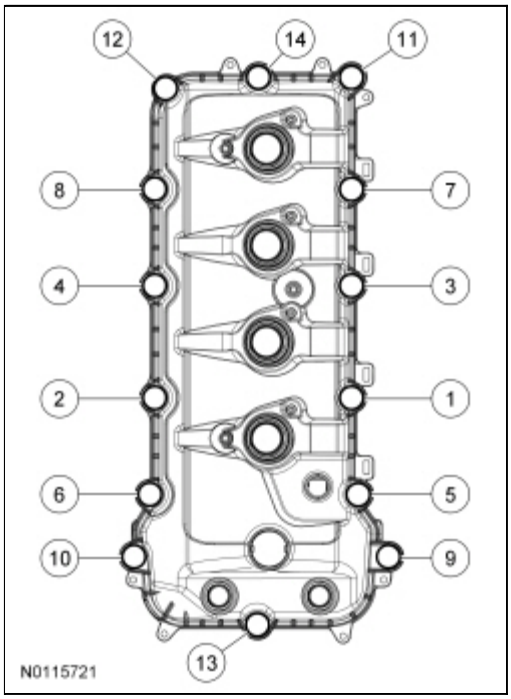
85. **NOTE:** Installation of new seals is only required if damaged seals were removed.

    Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.



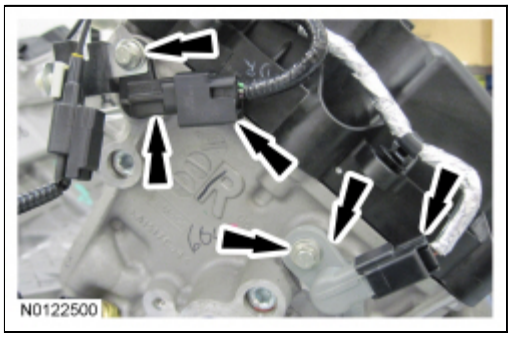
86. **NOTE:** Installation of new seals is only required if damaged seals were removed.

    Using the Differential Bearing Cone Installer and Handle, install new VCT variable force solenoid seal (s).

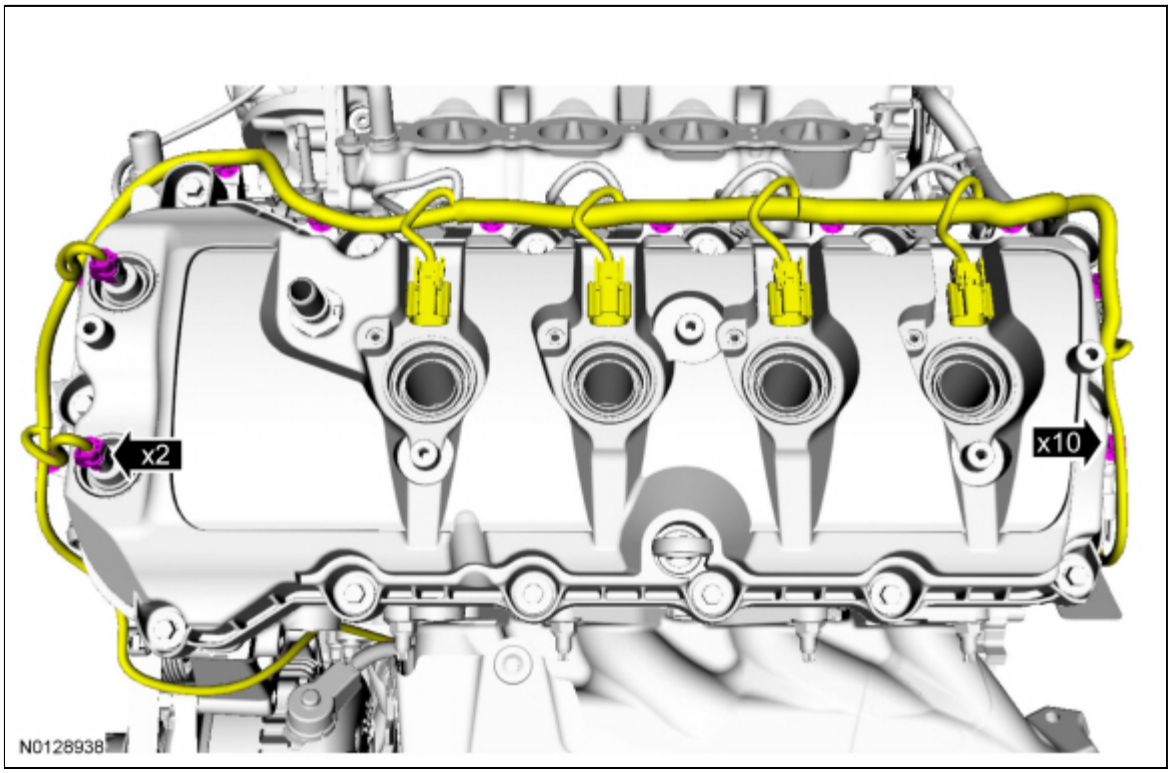


87. **NOTE:** If the valve cover is not installed and the fasteners tightened within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

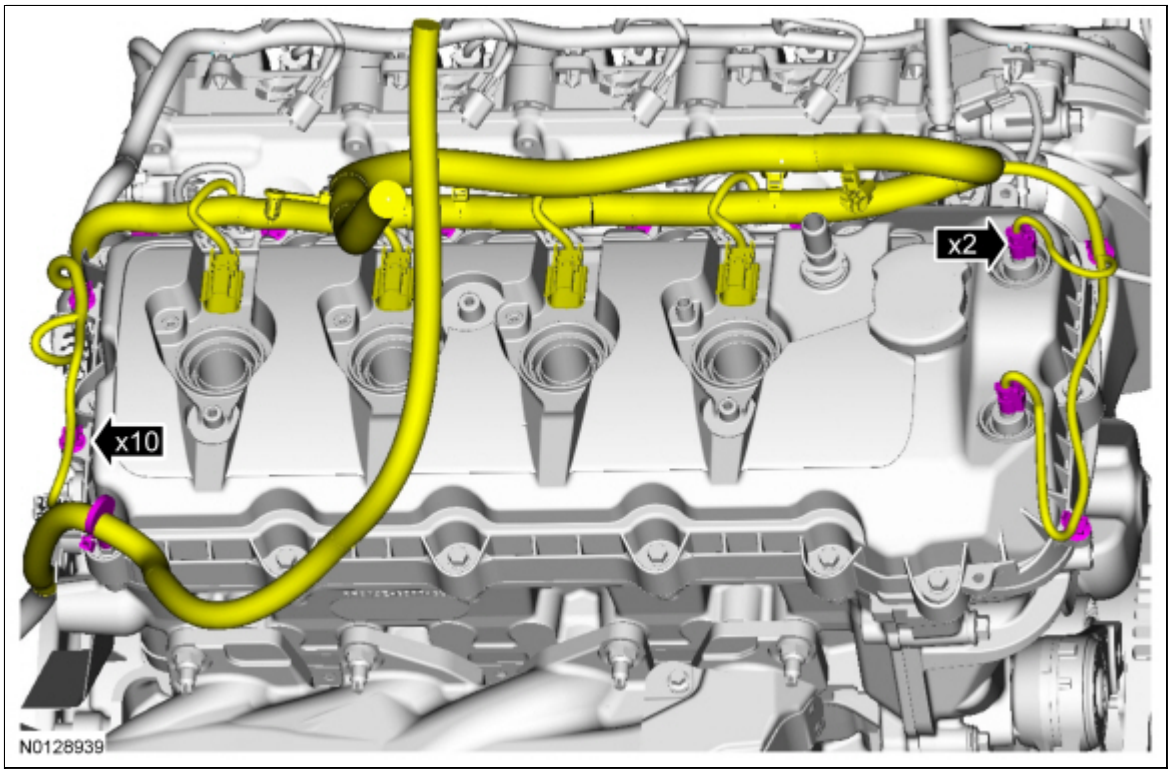
    Apply an 8 mm (0.31 in) bead of silicone gasket and sealant to the engine front cover-to-RH cylinder head joints.



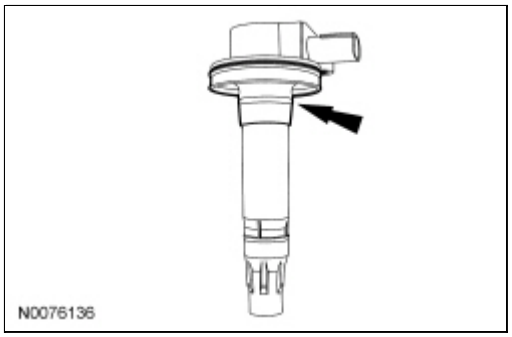
88. Position the RH valve cover and new gasket on the cylinder head.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



repair4less



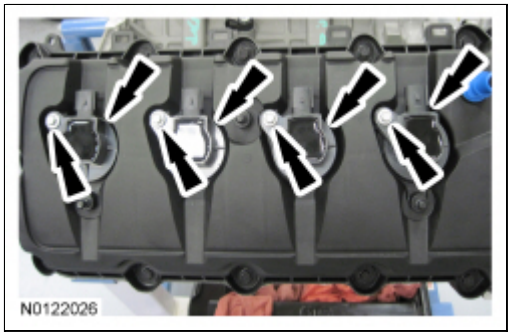
89. If removed, install the RH intake and exhaust CMP sensors and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Connect the RH intake and exhaust CMP sensor electrical connectors.



90. Connect the 2 VCT variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers to the LH valve cover.

91. Connect the 2 Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.
    - Attach the 10 wiring harness retainers to the RH valve cover.

92. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
    - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.



93. **NOTE:** RH shown, LH similar.

    NOTE: Apply a small amount of dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs. RH shown, LH similar.

    Install the 8 ignition coils and 8 bolts.
    - Tighten to 6 Nm (53 lb-in).

repair4less

94. **NOTE:** RH shown, LH similar.

    Connect the 8 ignition coil electrical connectors.

95. Install the engine. For additional information, refer to Engine in this section.

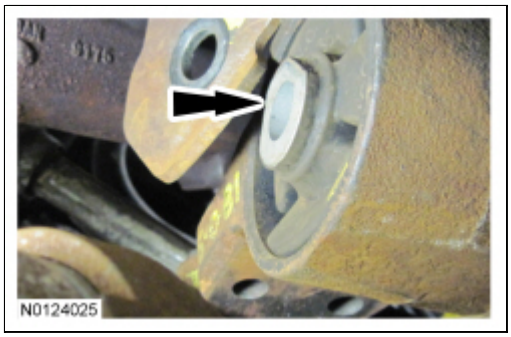
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Threadlock 262 TA-26	WSK-M2G351-A6

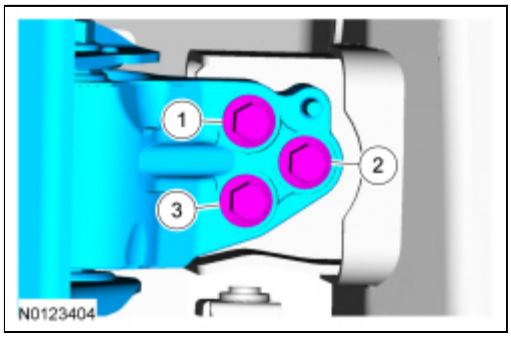
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. Using the Heavy Duty Floor Crane and the Engine Lifting Bracket, position the engine in the engine compartment leaving access to the LH engine support insulator bolts.

repair4less

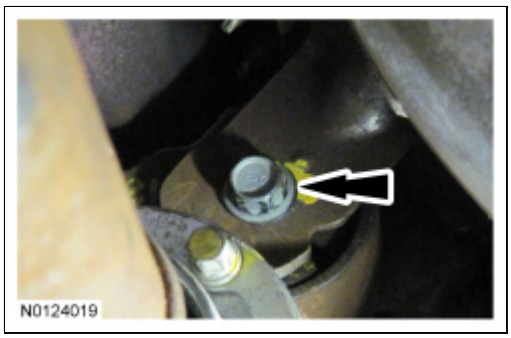


2. **NOTE:** Clean the LH and RH engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

   Install the LH engine support insulator from under the vehicle.

3. **NOTE:** Apply threadlock to the bolt threads prior to installation.

   Using a suitable floor crane, raise the engine assembly to gain access to install the 3 LH engine support insulator bolts.
   - Tighten the 3 LH engine support insulator bolts in the sequence shown to 175 Nm (129 lb-ft).



4. Lower the engine.

5. ***NOTICE:*** **Use only hand tools when installing the LH engine support insulator through bolt or the engine support insulator may be damaged.**

   NOTE: Apply threadlock to the bolt threads prior to installation.

   Install the LH engine mount through bolt.
   - Tighten to 350 Nm (258 lb-ft).

6. ***NOTICE:*** **Use only hand tools when installing the RH engine support insulator studs or the engine support insulator may be damaged.**

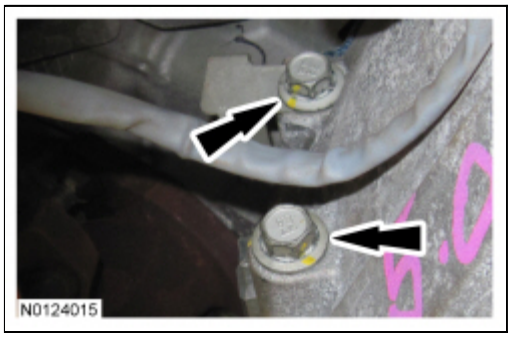
   NOTE: Apply threadlock to the stud threads prior to installation.

   Install the 2 RH engine support insulator studs.
   - Tighten to 15 Nm (133 lb-in).

7. ***NOTICE:*** **Use only hand tools when installing the RH engine support insulator nuts or the engine support insulator may be damaged.**

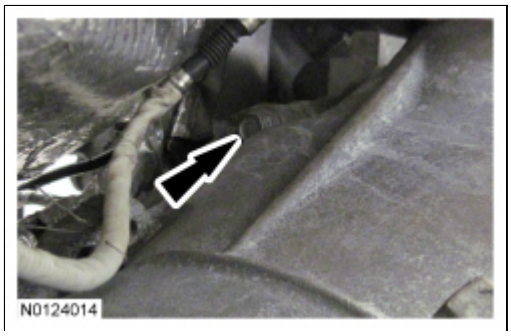
   NOTE: Apply threadlock to the nut threads prior to installation.

   Install the 2 RH engine support insulator nuts.
   - Tighten to 175 Nm (129 lb-ft).

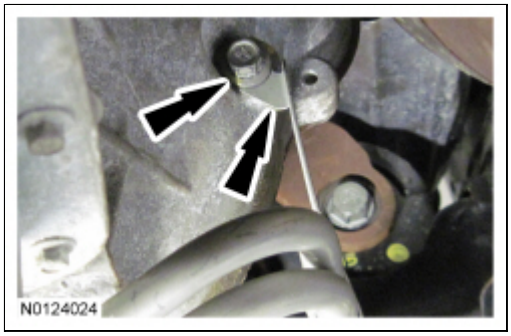


8. **NOTE:** The 2 upper transmission-to-engine bolt will be installed later.

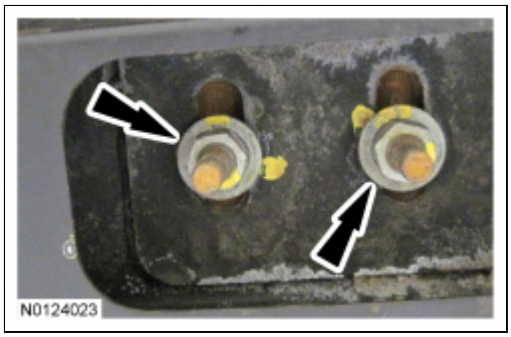
   Install the lower transmission-to-engine bolt.
   - Tighten to 48 Nm (35 lb-ft).



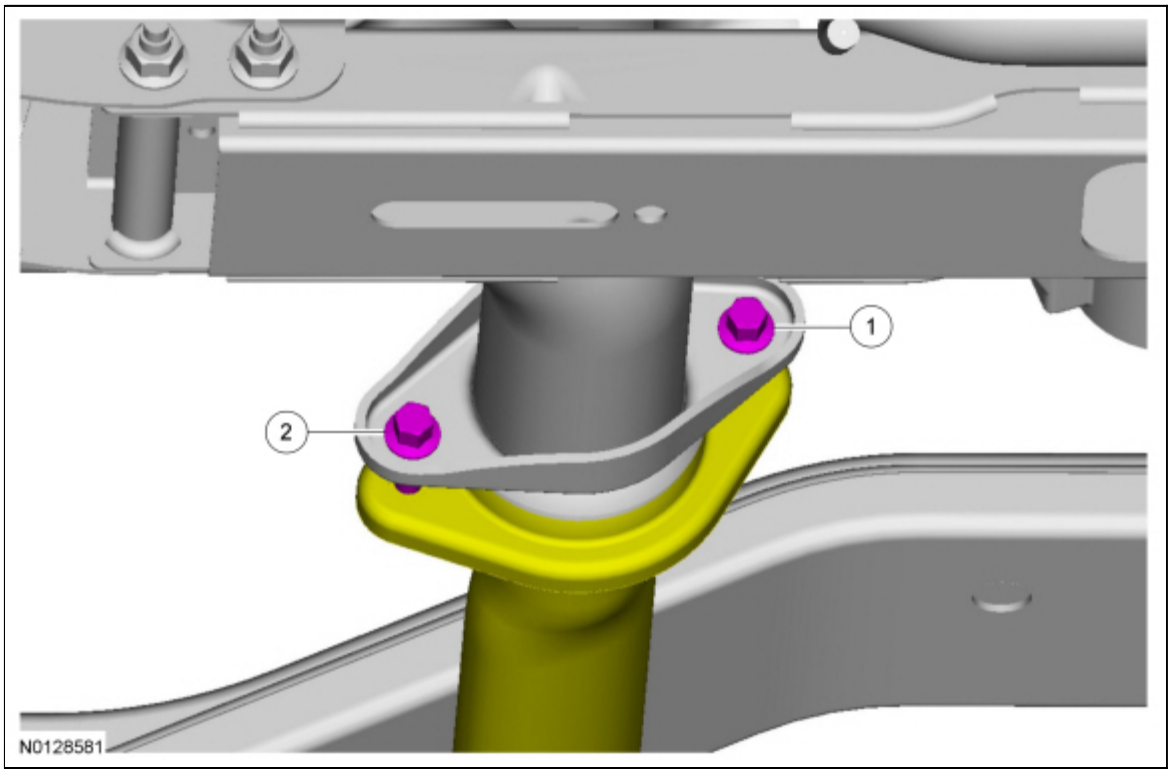
repair4less



9. Install the 2 lower transmission-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

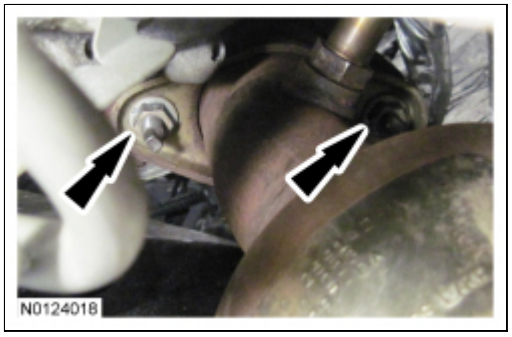


10. Install the lower transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

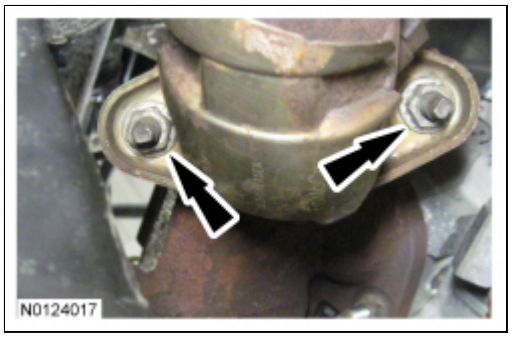


11. Install the transmission cooler tube support bracket and the transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

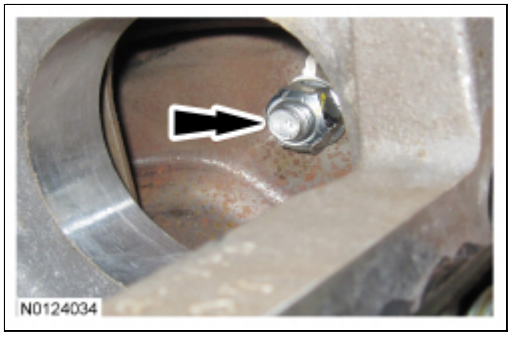
12. Tighten the 2 transmission mount-to-crossmember nuts.
    - Tighten to 25 Nm (18 lb-ft).



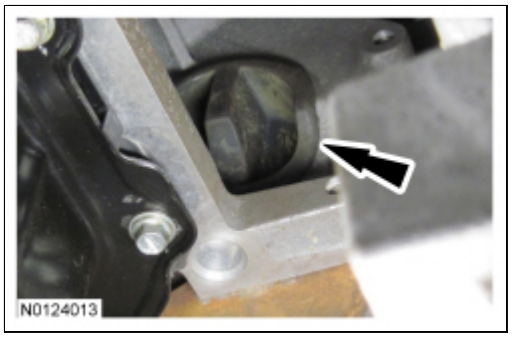
13. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    1. Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    2. Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



14. Install 2 new RH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 40 Nm (30 lb-ft).

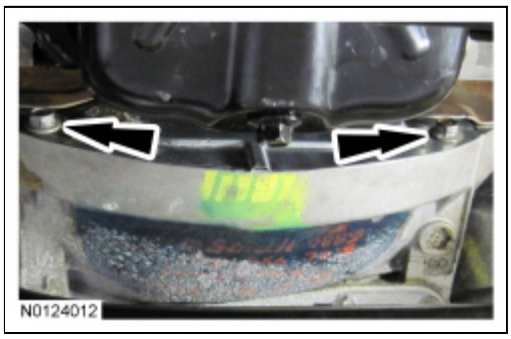


repair4less



15. Install 2 new LH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 40 Nm (30 lb-ft).

16. Install 4 new torque converter-to-flexplate nuts.
    - Tighten to 35 Nm (26 lb-ft).



17. Install the cylinder block opening cover.

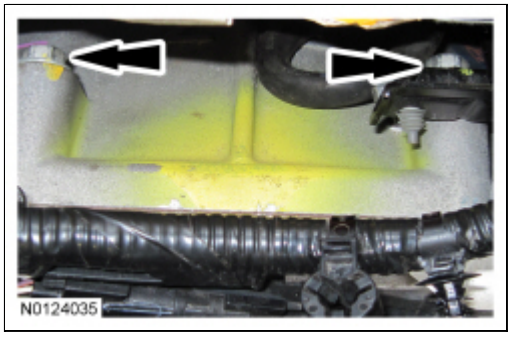
18. Install the flexplate inspection cover and the 2 bolts.

- Tighten to 35 Nm (26 lb-ft).

19. **NOTE:** Do not lubricate the O-ring seal.

    Install a new oil filter.
    - Tighten to 16 Nm (142 lb-in).

20. Connect the oil level sensor electrical connector.

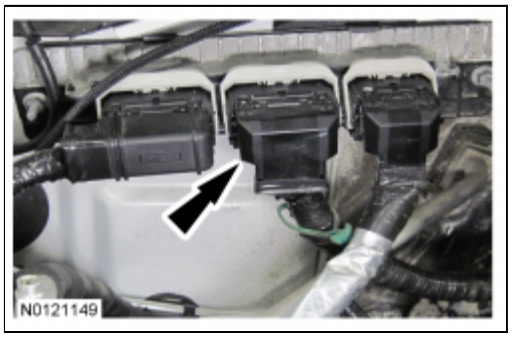


21. Install the starter. For additional information, refer to Section 303-06 .

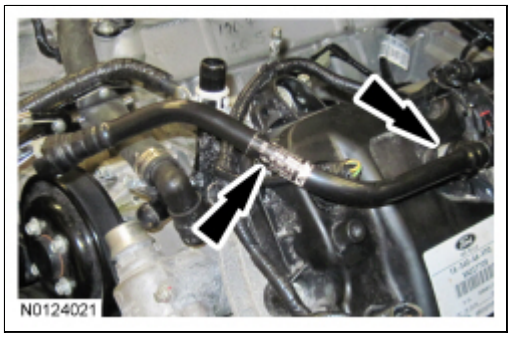
22. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .

23. Install the 2 upper transmission-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

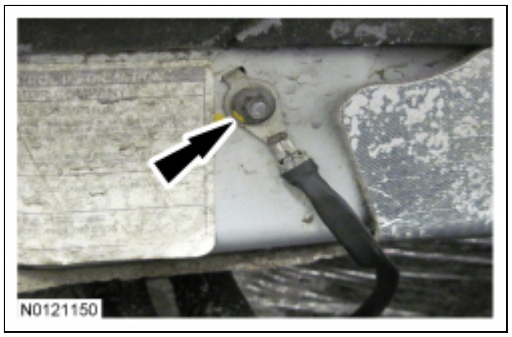
repair4less



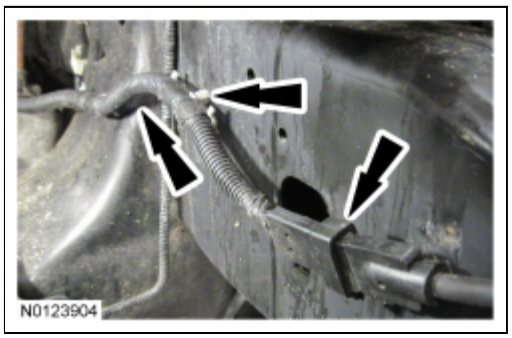
24. Attach the PCM wiring harness retainer to the valve cover bolt stud.



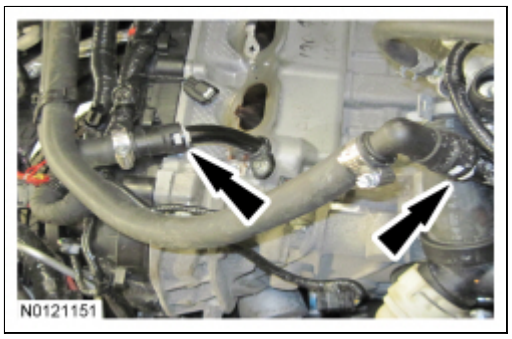
25. Attach and connect the engine harness electrical connector.



26. Connect the middle PCM electrical connector.

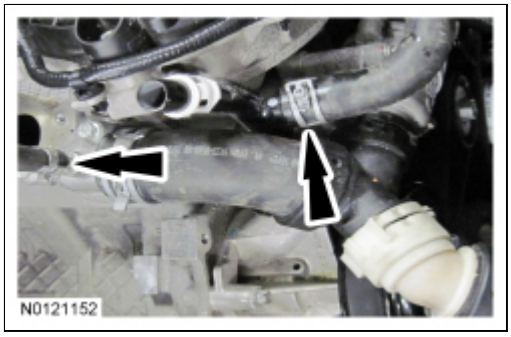


27. Install the crankcase ventilation tube. For additional information, refer to the quick connect coupling procedure in Section 310-00 .

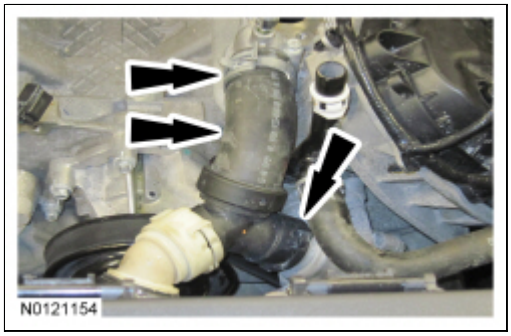


28. Install the ground strap and bolt to the cowl.
    - Tighten to 10 Nm (89 lb-in).

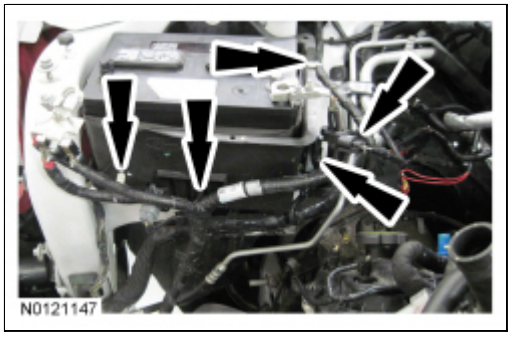
29. If equipped, attach and connect the block heater electrical connector and the 2 wiring harness retainers.



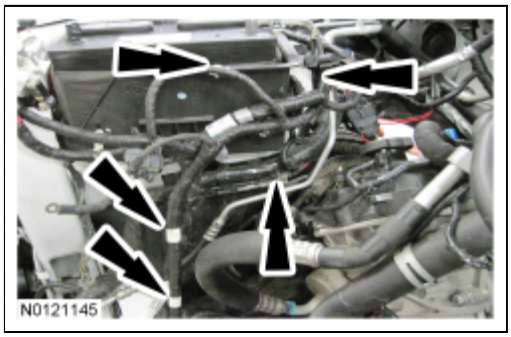
30. Connect the 2 heater hose quick connect couplings. For additional information, refer to Section 412-00 .



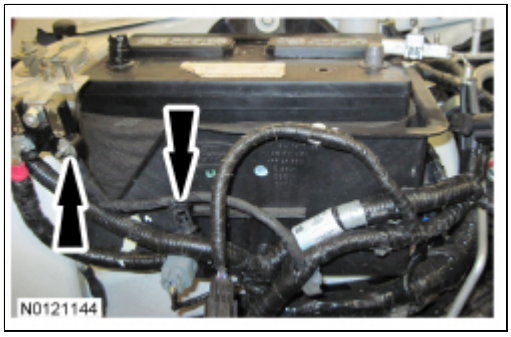
31. Connect the 2 coolant hoses.



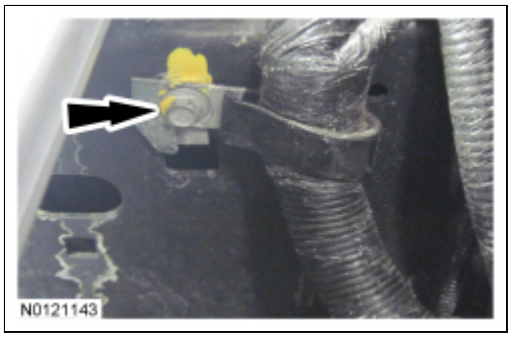
repair4less



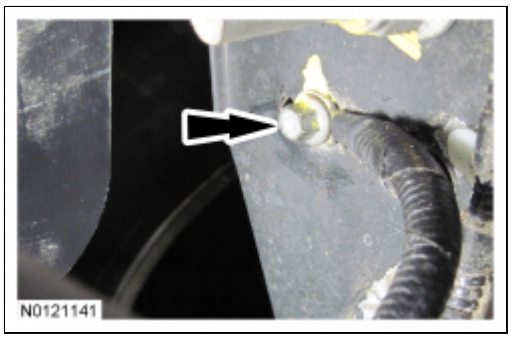
32. Install the spring clip, the clamp and connect the coolant bypass T assembly to the engine.



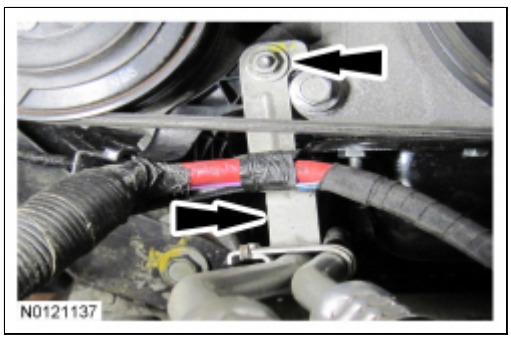
33. Connect the 2 wiring harness connectors and attach the 3 wiring harness retainers.



34. Attach the 5 wiring harness retainers.

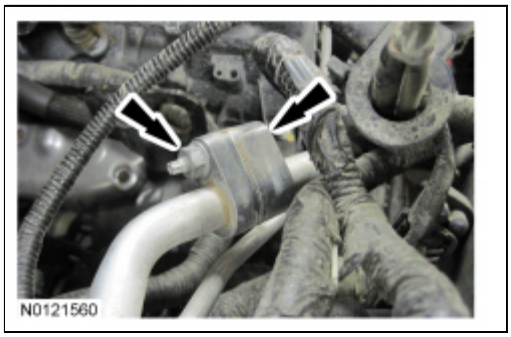


35. Connect the B+ wire and nut.
    - Tighten to 17 Nm (150 lb-in).
    - Attach the wiring harness retainer to the battery tray.

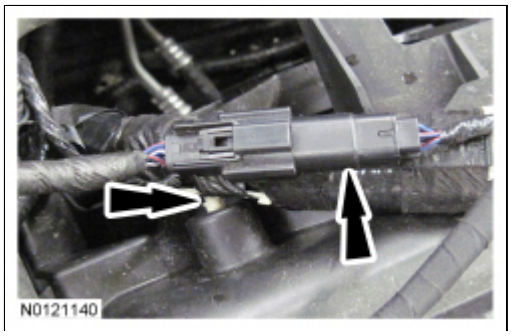


36. Install the wiring harness bracket and the bolt to the RH frame rail.
    - Tighten to 20 Nm (177 lb-in).

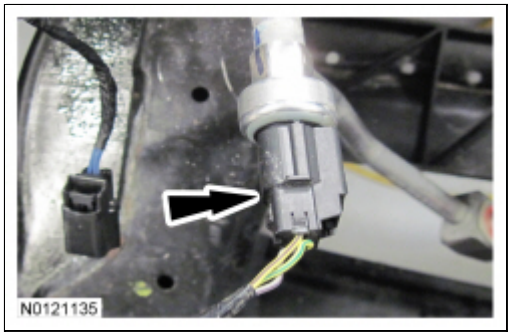
37. Install the ground wire and the bolt to the RH frame rail.
    - Tighten to 12 Nm (106 lb-in).



38. Install the transmission cooler line bracket and the nut to the engine front cover stud bolt.
    - Tighten to 13 Nm (115 lb-in).

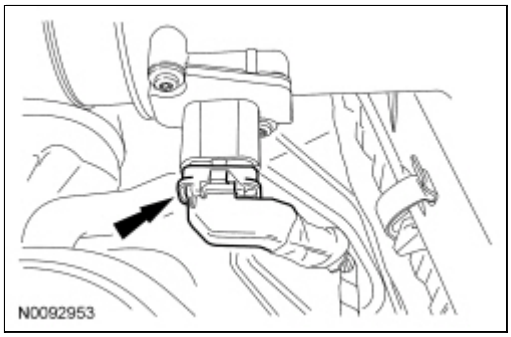


repair4less



39. Using a new O-ring seal and gasket, install the A/C tube and the nut.
    - Tighten to 15 Nm (133 lb-in).

40. Connect the wiring harness electrical connector and pin-type retainer.
    - Position the Power Distribution Box (PDB) and wiring harness toward the engine.



41. Connect the A/C pressure transducer electrical connector.

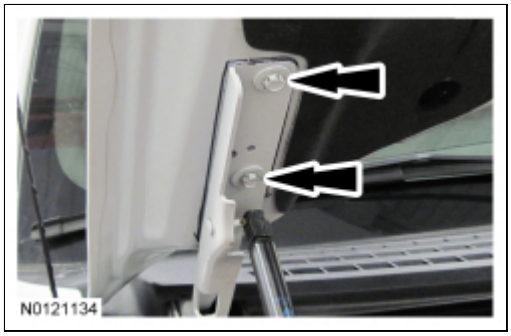
42. Install the cooling module. For additional information, refer to Section 303-03 .

43. Install the Air Cleaner (ACL) element and ACL upper tray. For additional information, refer to Section 303-12

44. Connect the Mass Air Flow (MAF) sensor electrical connector.

45. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Install the intake manifold. For additional information, refer to Intake Manifold in this section.



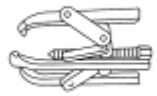
46. Fill the engine with clean engine oil.

47. Connect the battery ground cable. For additional information, refer to Section 414-01 .

48. **NOTE:** Align the index marks made during hood removal.

    NOTE: RH shown, LH similar.

    Install the hood and the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).



49. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

repair4less

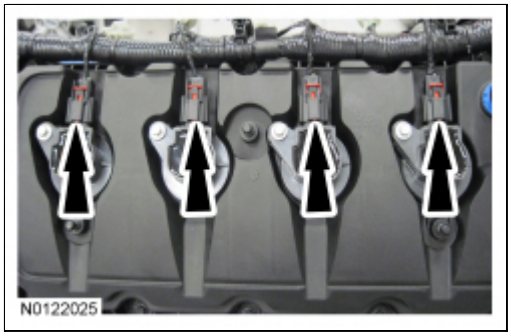
Motorcraft® Silicone Gasket Remover ZC-30	—

Removal



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: If the components are to be reinstalled, they must be installed in their original location. Mark the components for installation into their original location.

All cylinder heads

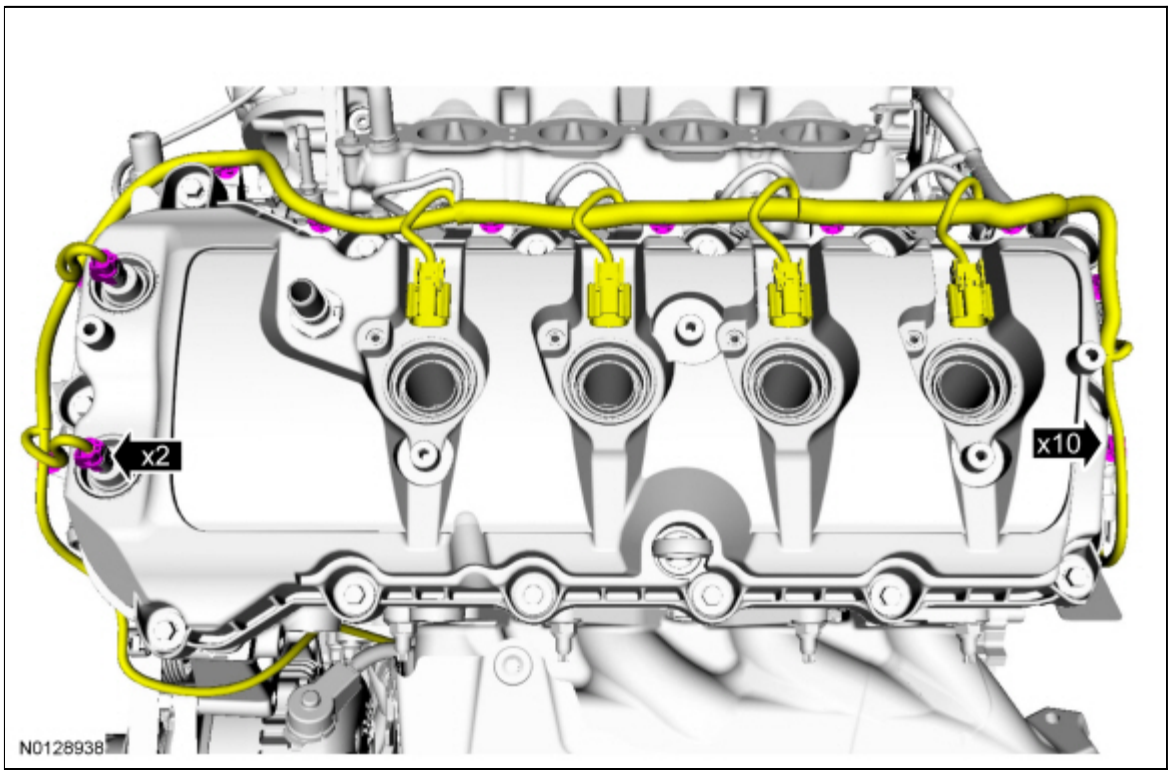
1. Remove the engine. For additional information, refer to Engine in this section.
2. Mount the engine on a work stand.
3. **NOTE:** RH shown, LH similar.

   Disconnect the 8 ignition coil electrical connectors.

4. **NOTE:** RH shown, LH similar.

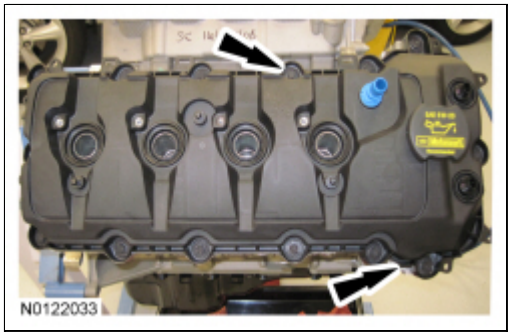
   NOTE: When removing the ignition coils, a slight twisting motion will break the seal and ease removal. RH shown, LH similar.

   Remove the 8 bolts and the 8 ignition coils.



5. Disconnect the 2 Variable Camshaft Timing (VCT) variable force solenoid electrical connectors.

- Detach the 10 wiring harness retainers from the RH valve cover.



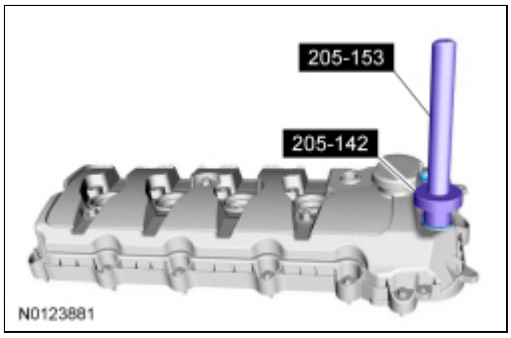
6. Disconnect the 2 VCT variable force solenoid electrical connectors.
    - Detach the 10 wiring harness retainers from the LH valve cover.

repair4less

7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

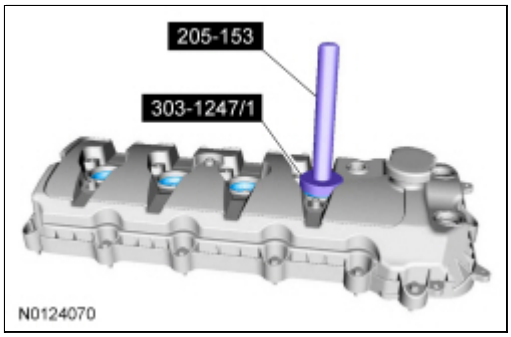
   Loosen the 14 fasteners and remove the RH valve cover and gasket.
   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

8. Remove the oil level indicator.



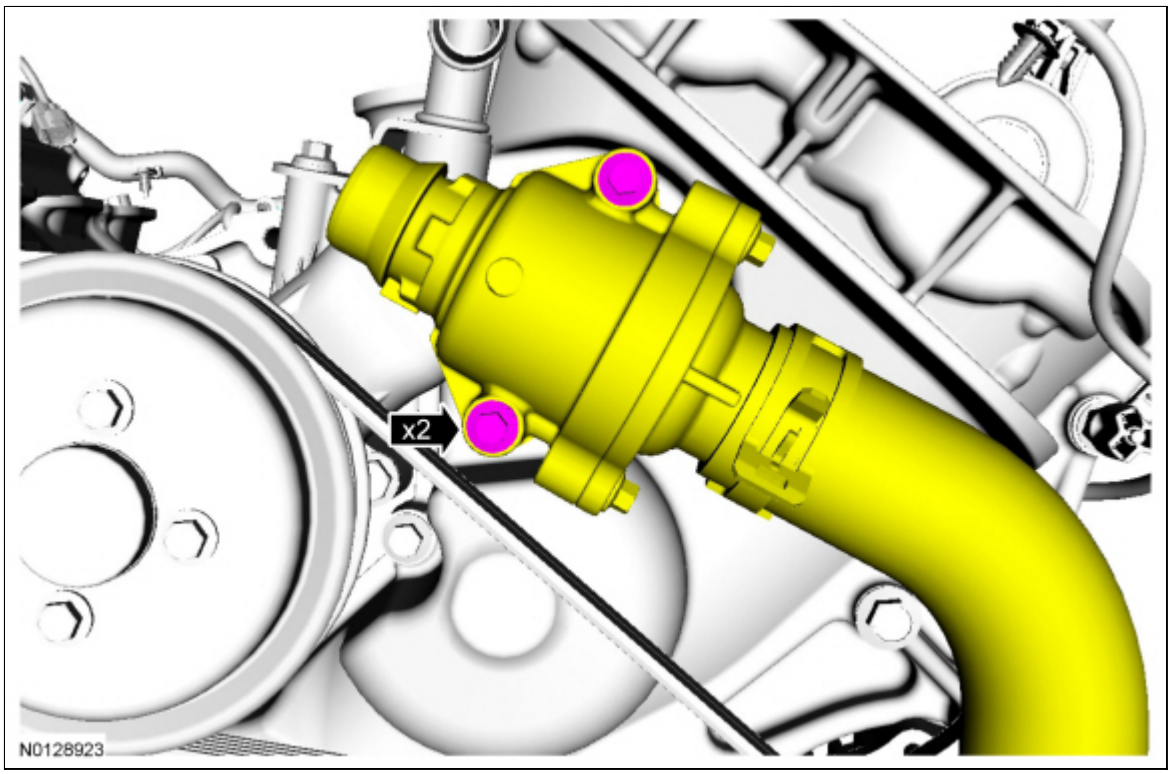
9. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Loosen the 14 fasteners and remove the LH valve cover and gasket.
   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



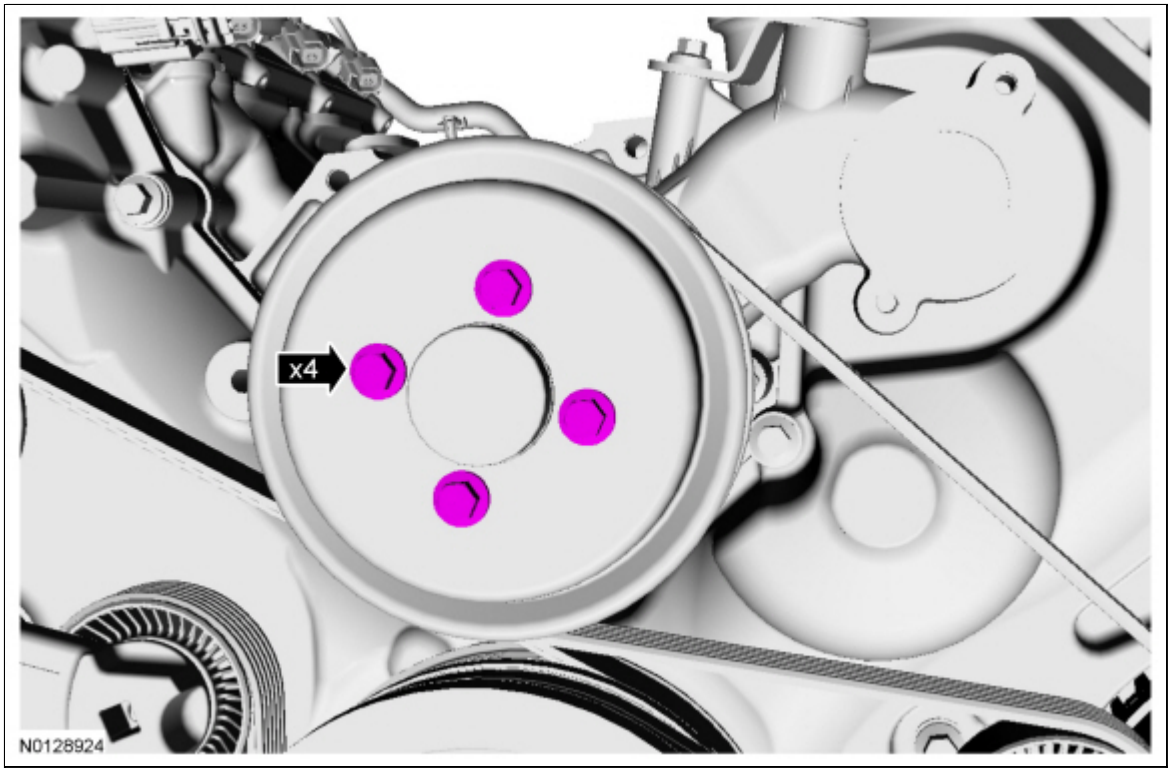
10. **NOTE:** RH shown, LH similar.

    Inspect the 2 VCT variable force solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

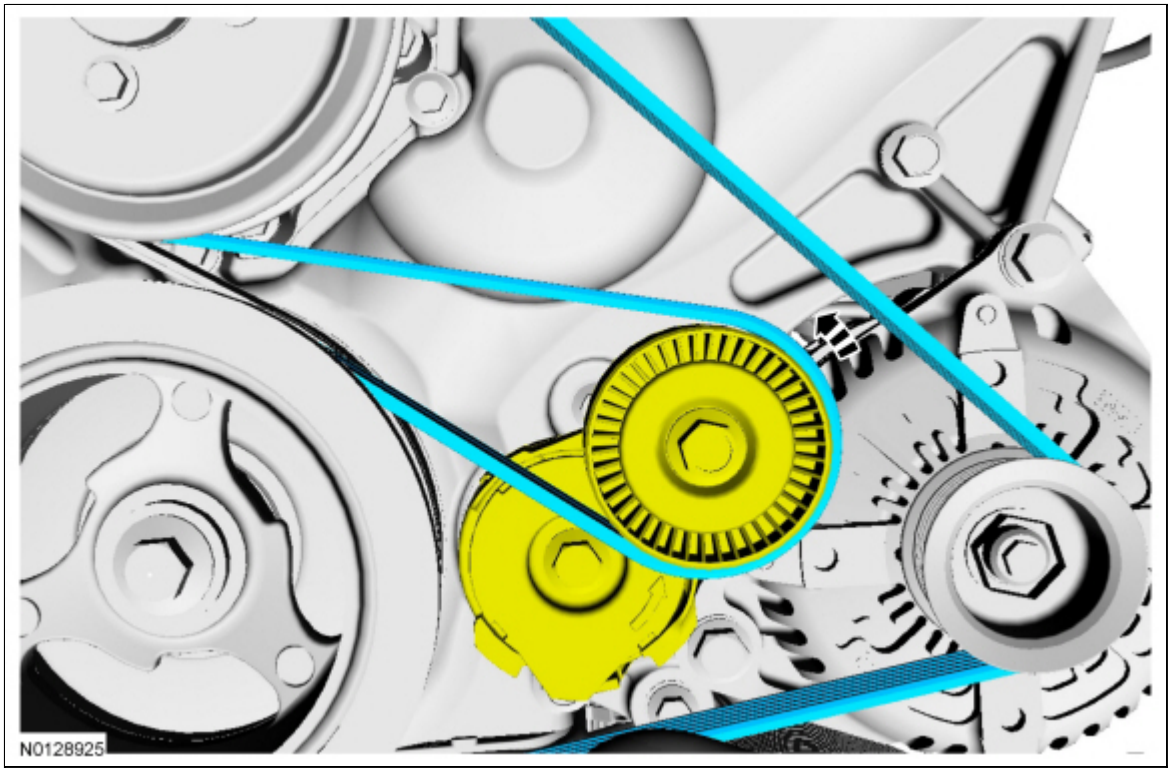


11. **NOTE:** RH shown, LH similar.

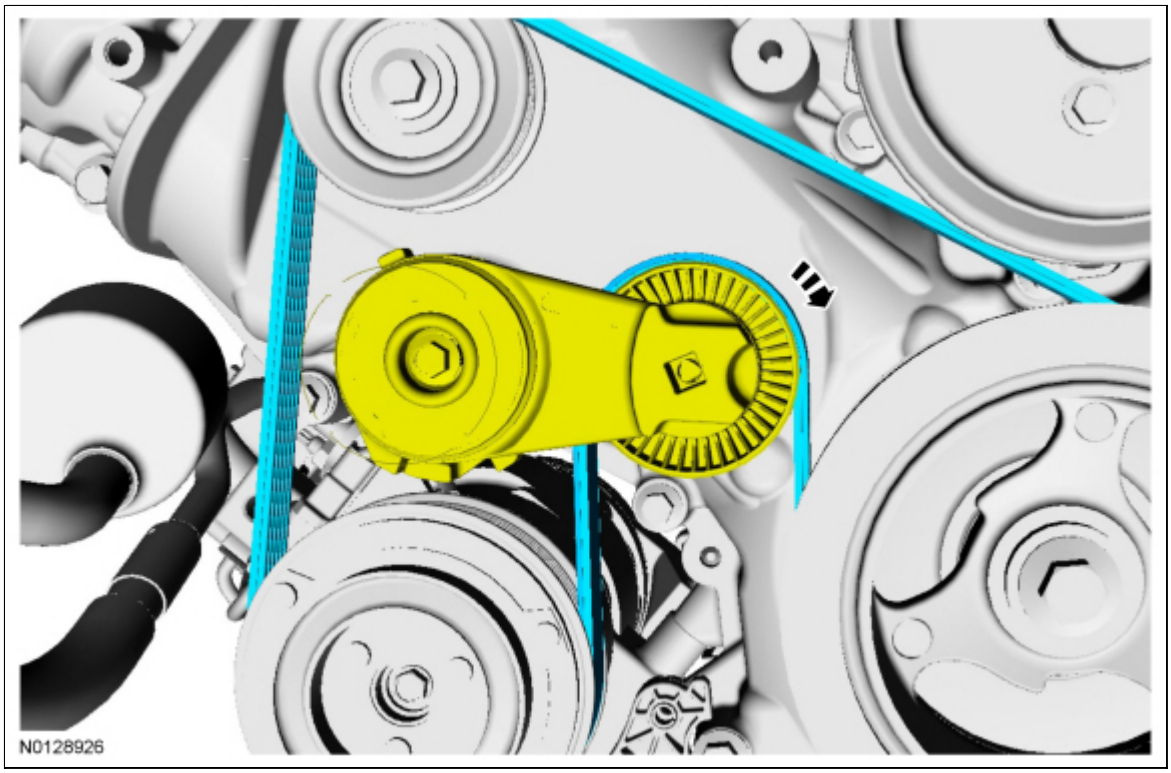
    Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



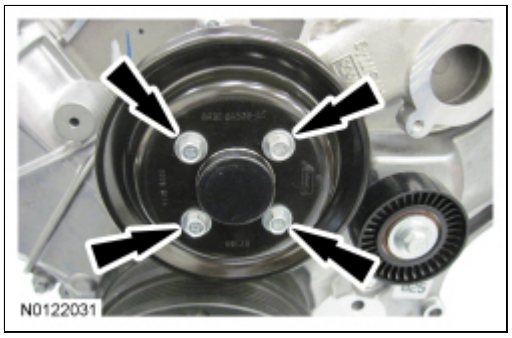
12. Remove the 2 bolts and position the thermostat housing and lower radiator hose aside.
    - Remove and discard the thermostat housing O-ring seal.



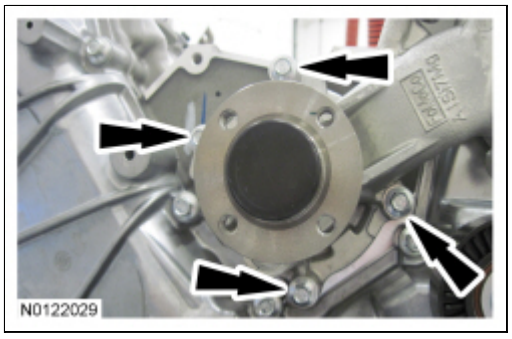
repair4less



13. Loosen the 4 coolant pump pulley bolts.

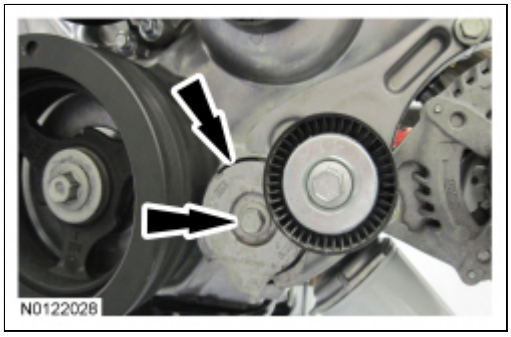


14. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.

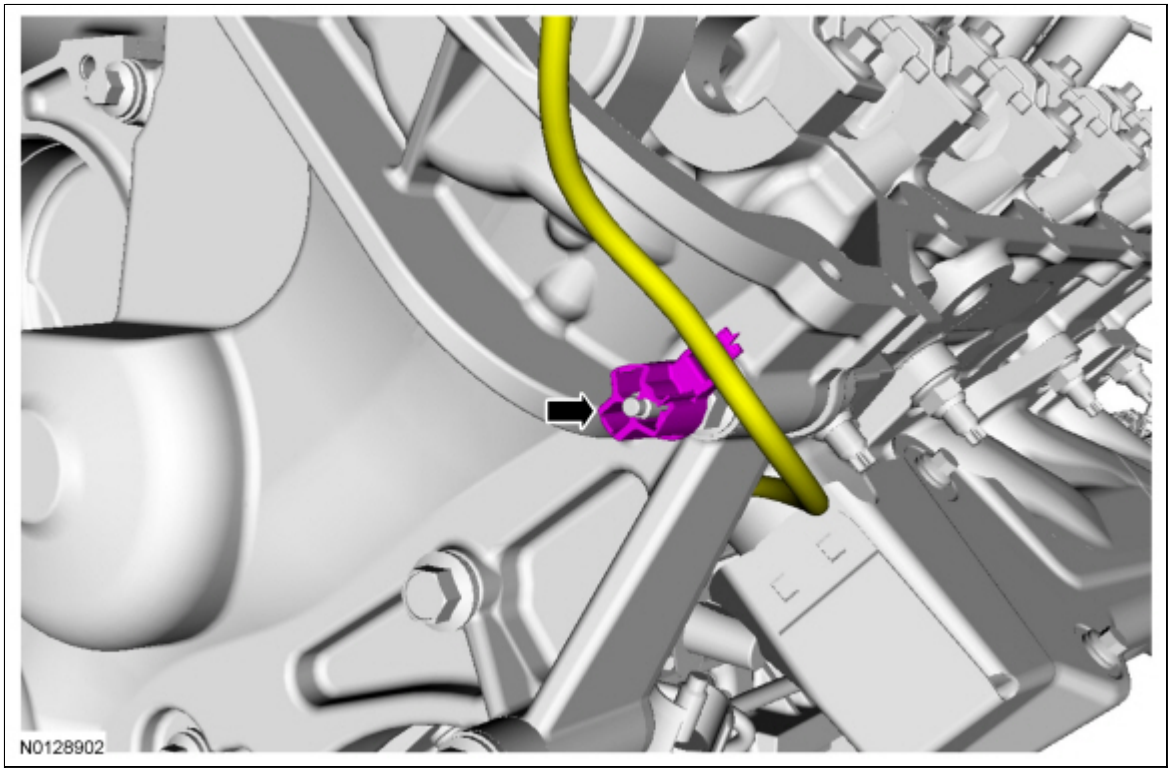


15. Rotate the A/C compressor belt tensioner clockwise and remove the A/C compressor belt.

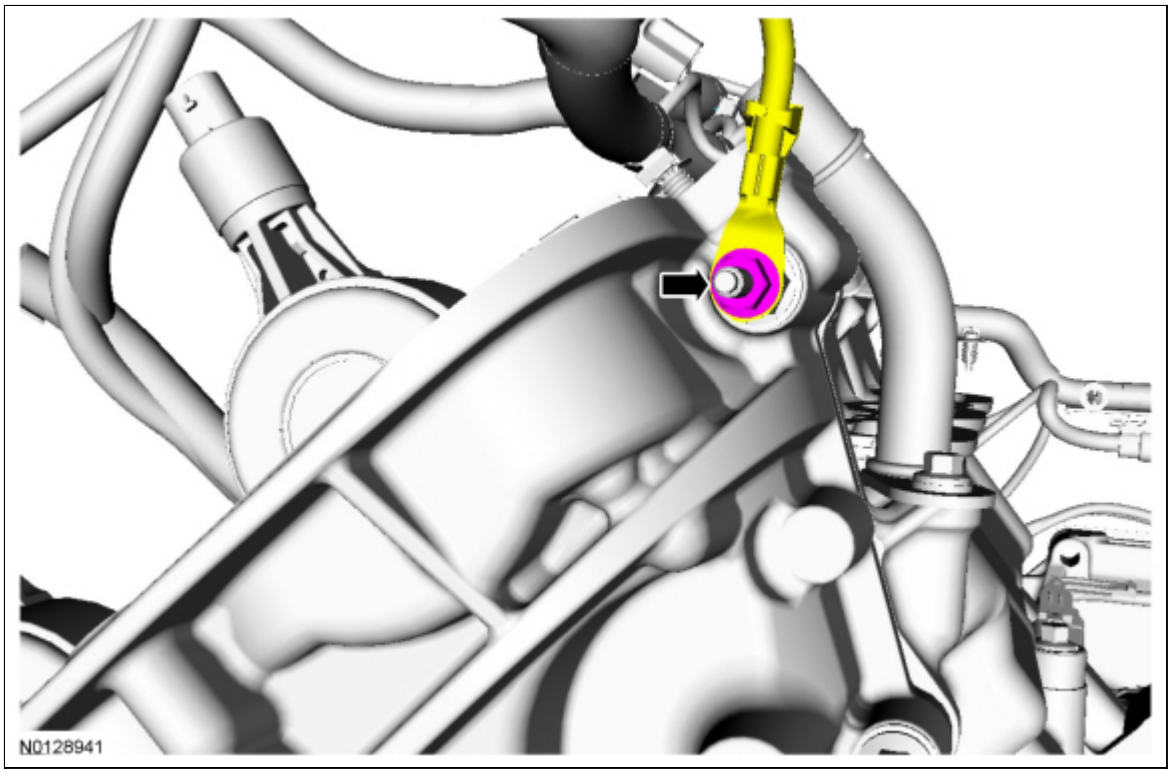
16. Remove the 4 bolts and the coolant pump pulley.



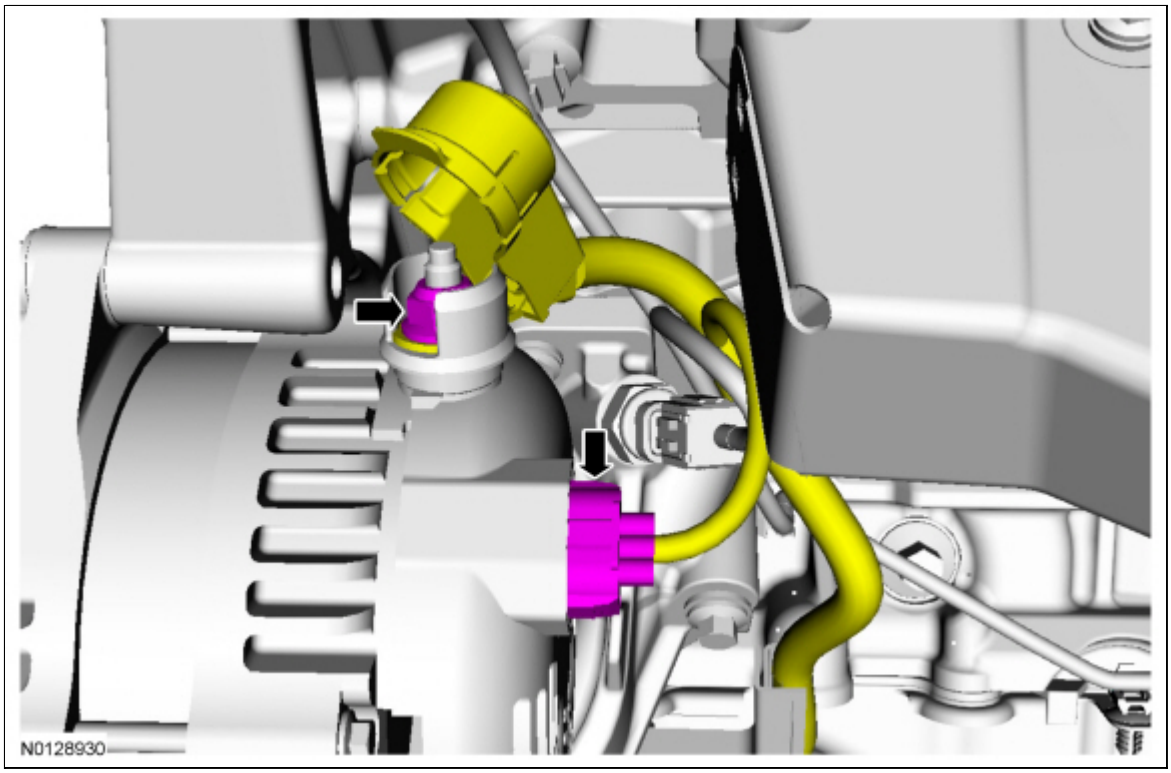
17. Remove the 4 bolts and the coolant pump.
    - Remove and discard the O-ring seal.



18. Remove the bolt and the accessory drive belt tensioner.

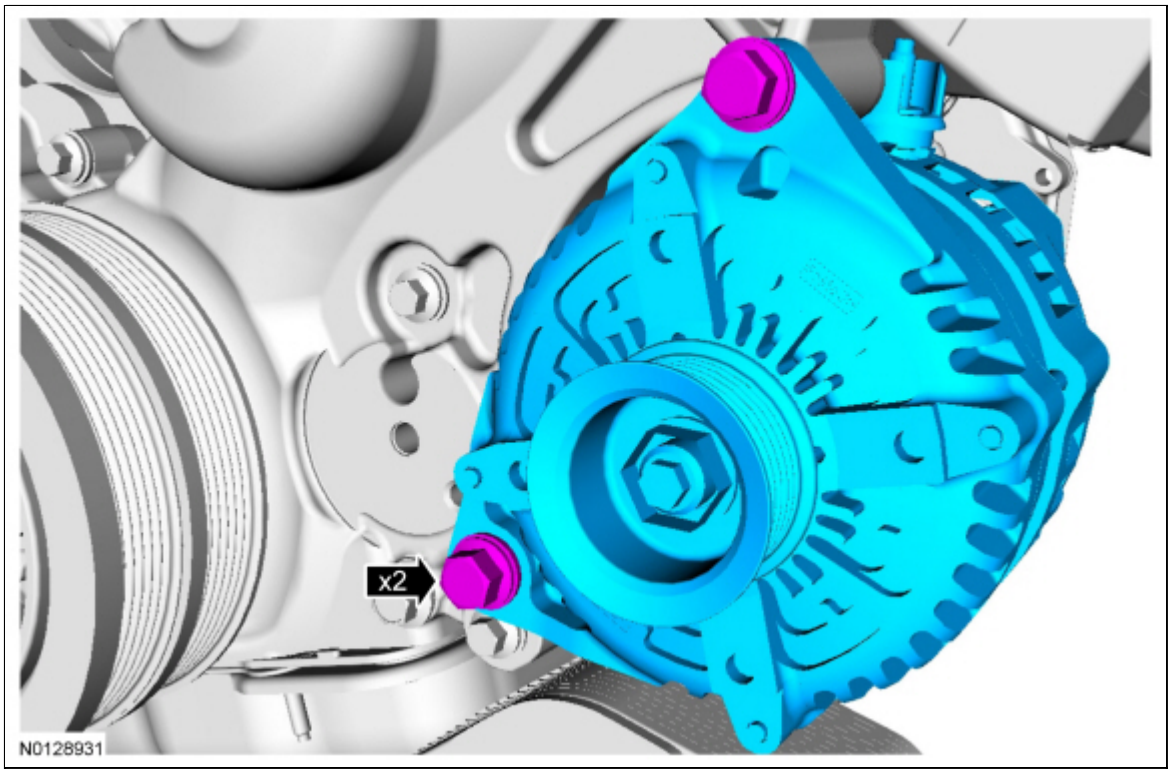


repair4less

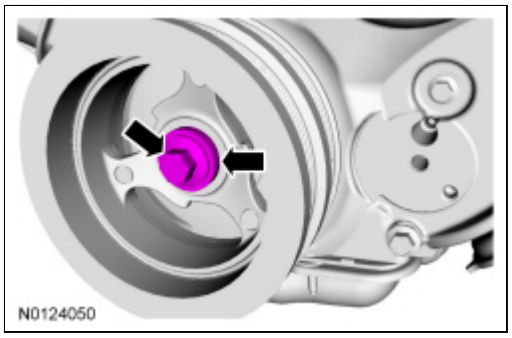


19. Detach the wiring harness retainer from the engine front cover stud bolt.

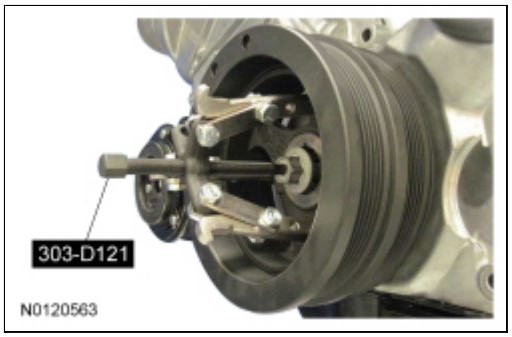
20. Remove the nut and the ground wire from the engine front cover stud bolt.



21. Remove the nut and the B+ wire from the generator.
    - Disconnect the wiring harness connector from the generator.

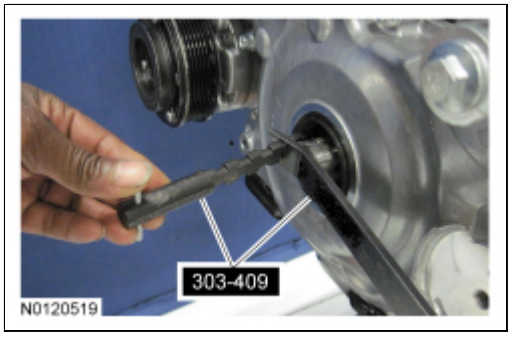


22. Remove the 2 bolts and the generator.

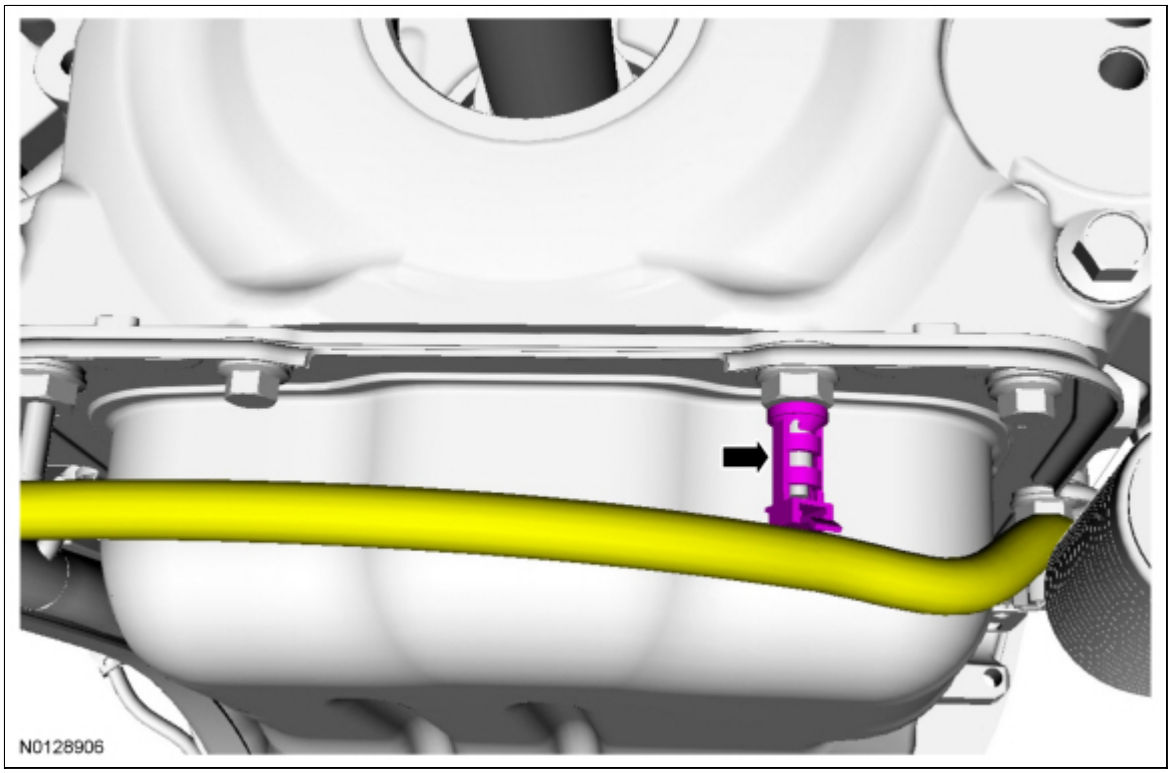


repair4less

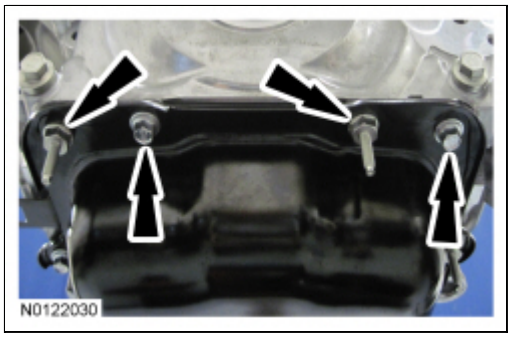
23. Remove the crankshaft pulley bolt and washer.



24. Using the 3 Jaw Puller and the crankshaft pulley bolt, remove the crankshaft pulley.
    - Discard the crankshaft pulley bolt.

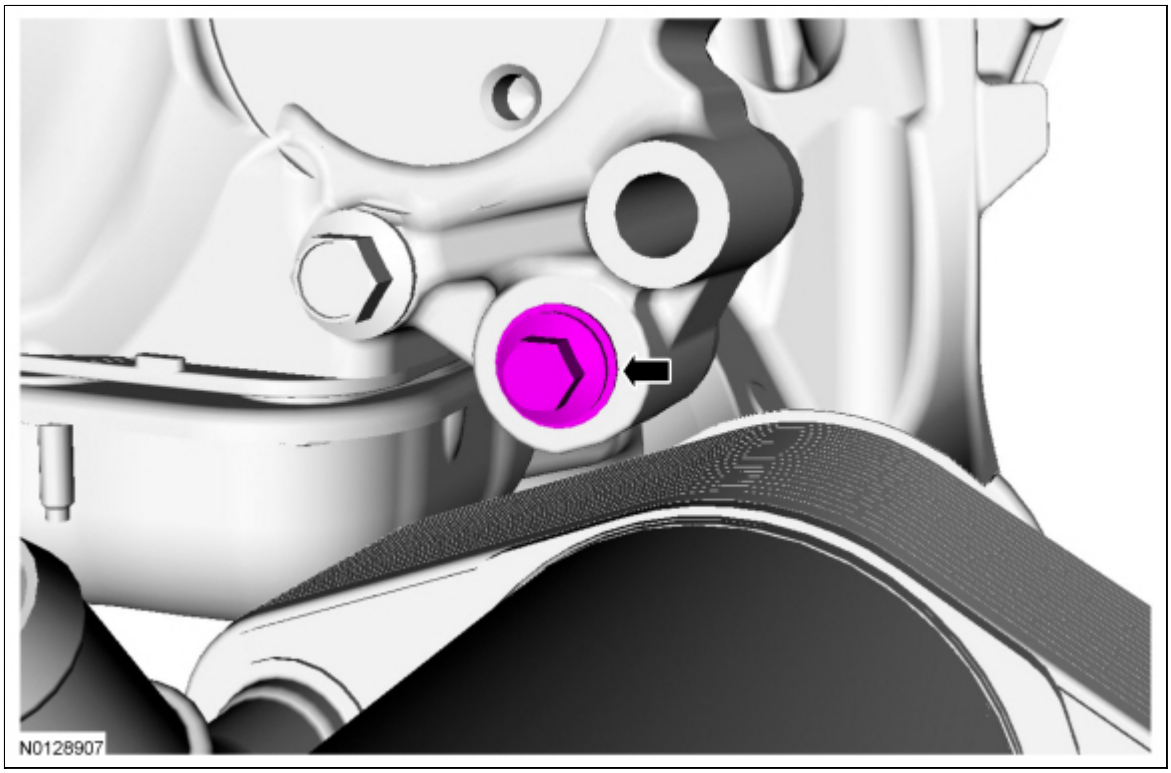


25. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

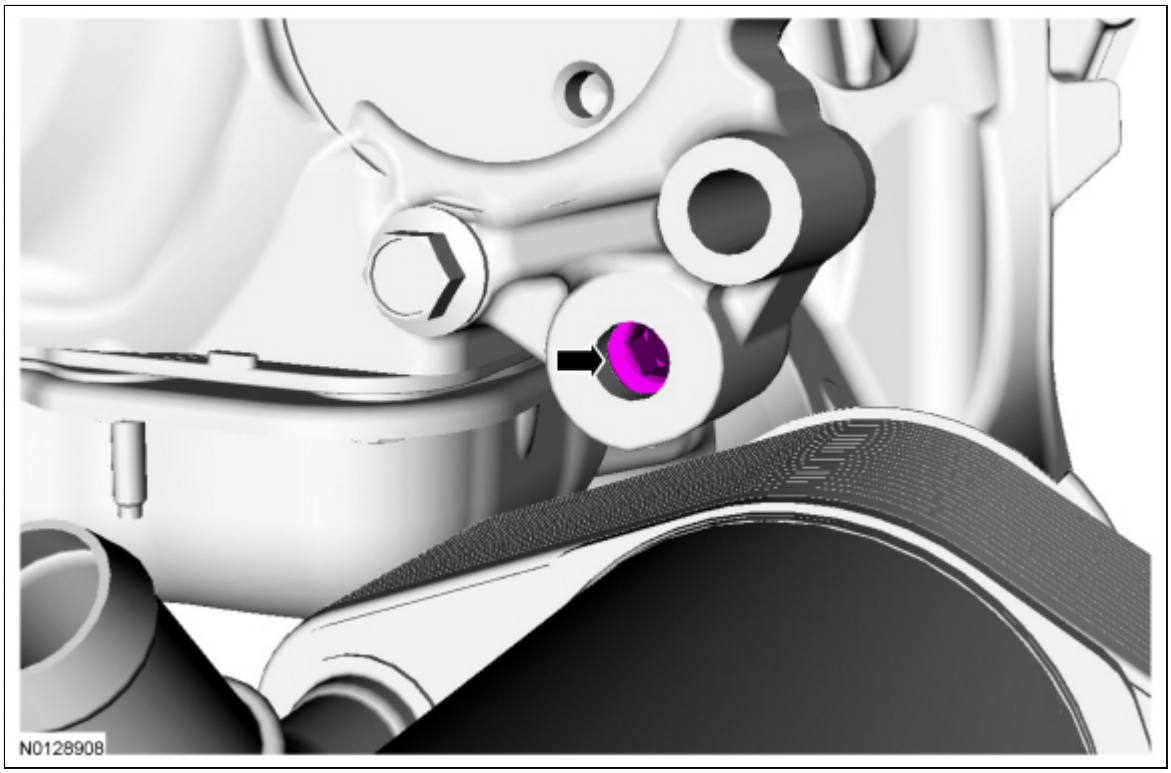


Using the Oil Seal Remover, remove the crankshaft front oil seal.

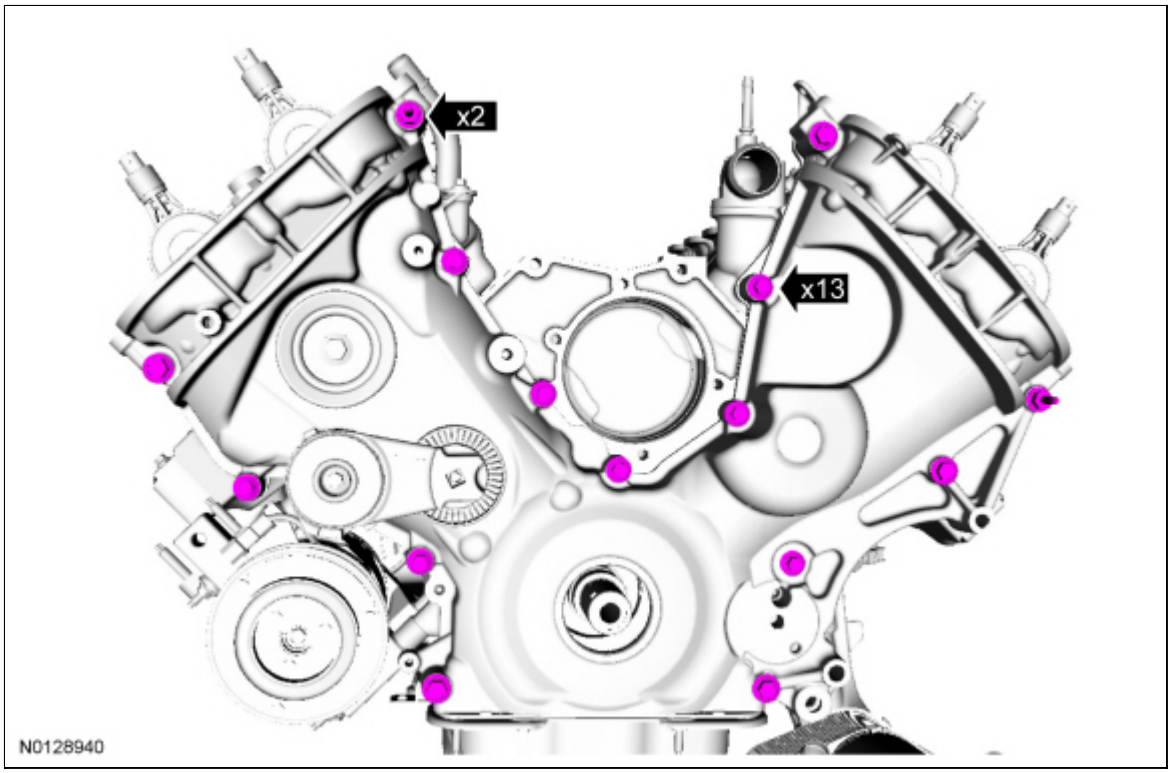
26. Detach the wiring harness retainer from the oil pan stud bolt.



27. Remove the 2 front oil pan stud bolts and 2 front oil pan bolts.

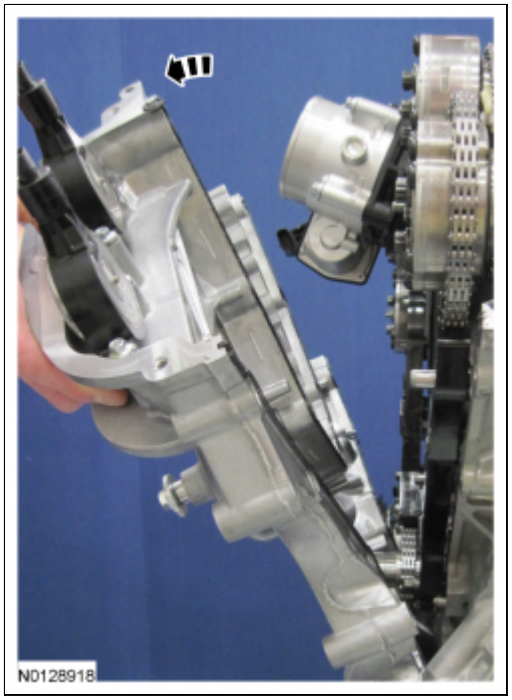


28. Remove the engine front cover-to-oil filter adapter bolt.

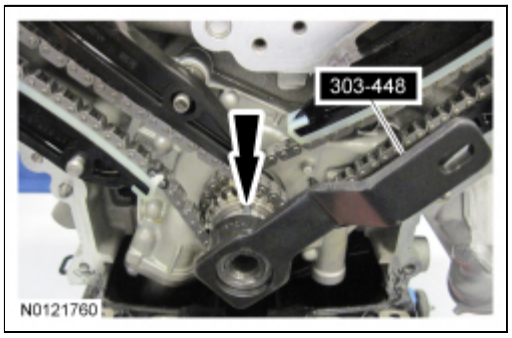


repair4less

29. Using a 10 mm (0.393 in) Hex Bit loosen the engine front cover-to-oil filter adapter jack screw.

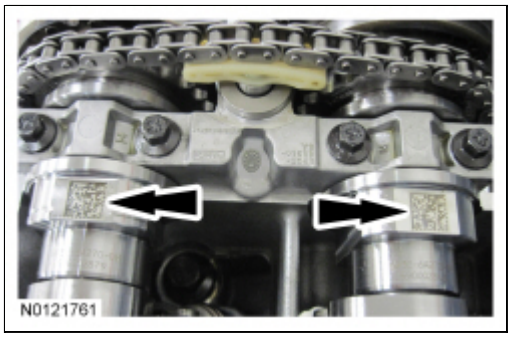


30. Remove the 13 engine front cover bolts and the 2 stud bolts.

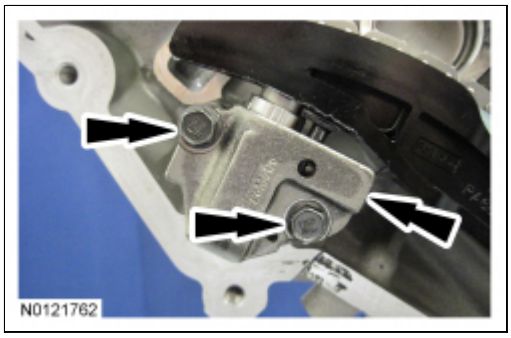


31. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove the engine front cover.
    - Remove and discard the engine front cover gaskets.
    - Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the mating surfaces.

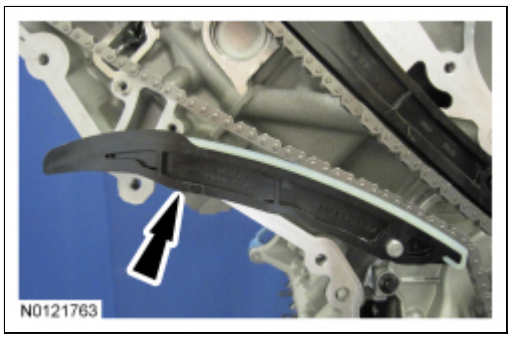


repair4less

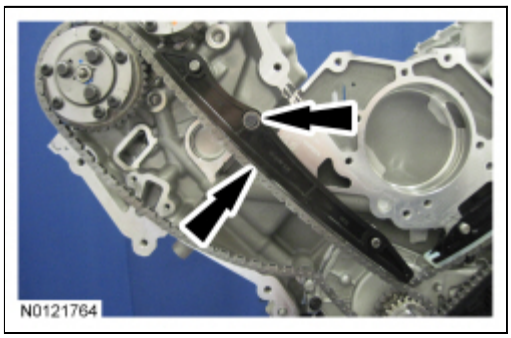


32. Using the crankshaft holding tool, rotate the crankshaft clockwise until the keyway is at the 12 o'clock position.

33. Verify the data matrix on the camshafts is facing up, if not, rotate the crankshaft clockwise one revolution.

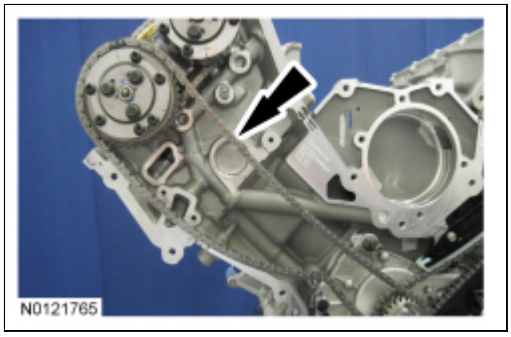


34. Remove the 2 bolts and the RH primary timing chain tensioner.



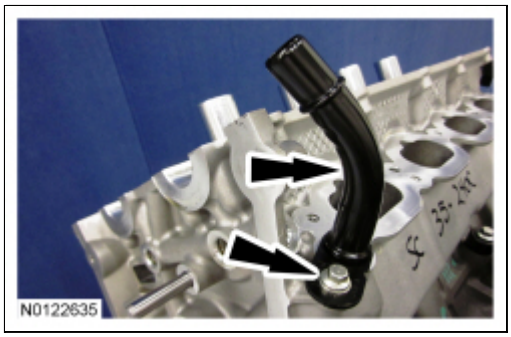
35. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain tensioner arm. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain tensioner arm.

    Remove the RH timing chain tensioner arm.



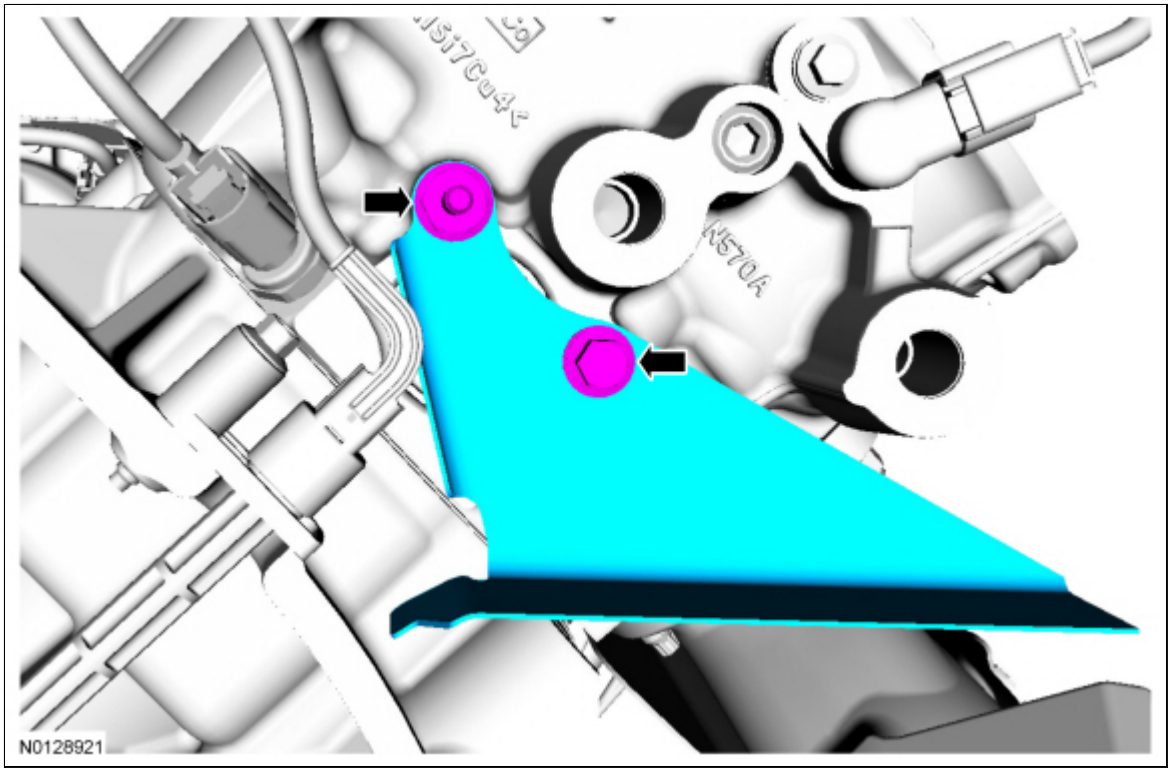
36. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the RH timing chain guide. Return the crankshaft keyway to the 12 o'clock position after removing the RH timing chain guide.

    Remove the bolt and the RH timing chain guide.

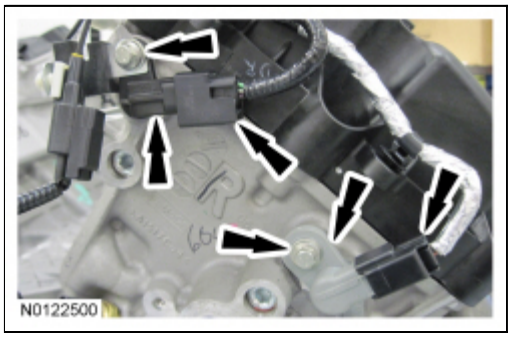


37. Remove the RH primary timing chain.

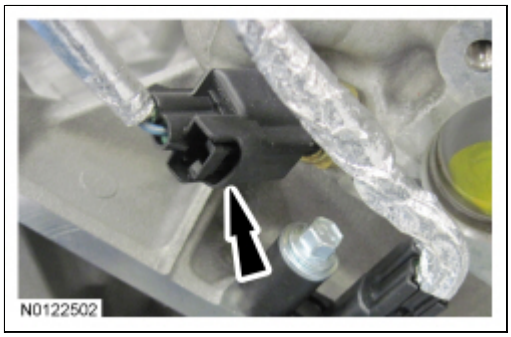
repair4less



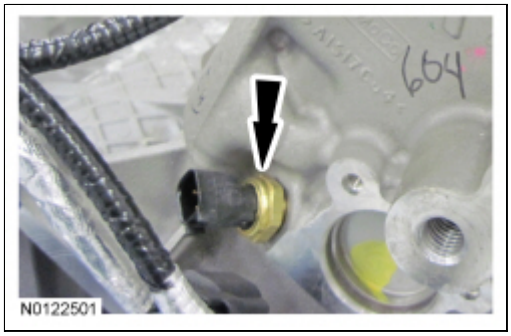
RH cylinder head



38. Remove the bolt and the coolant outlet pipe from the RH cylinder head.
    - Remove and discard the O-ring seal.

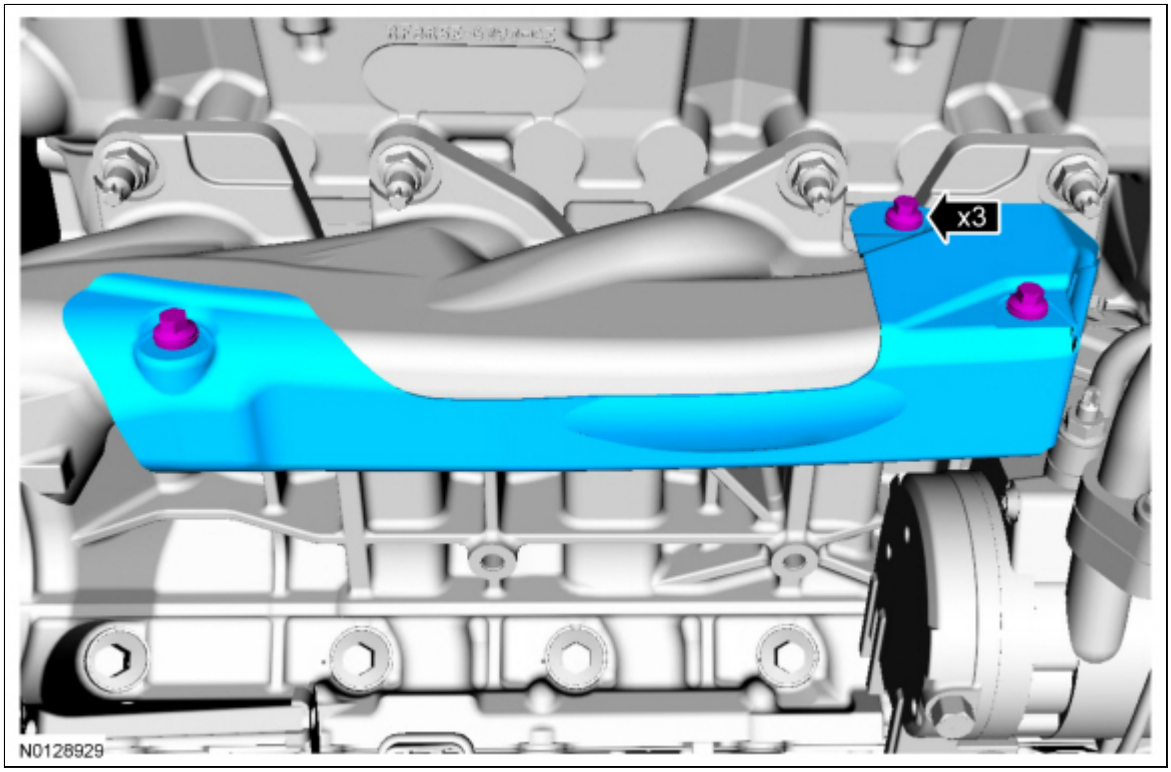


39. Remove the bolt, stud bolt and heat shield from the RH cylinder head.

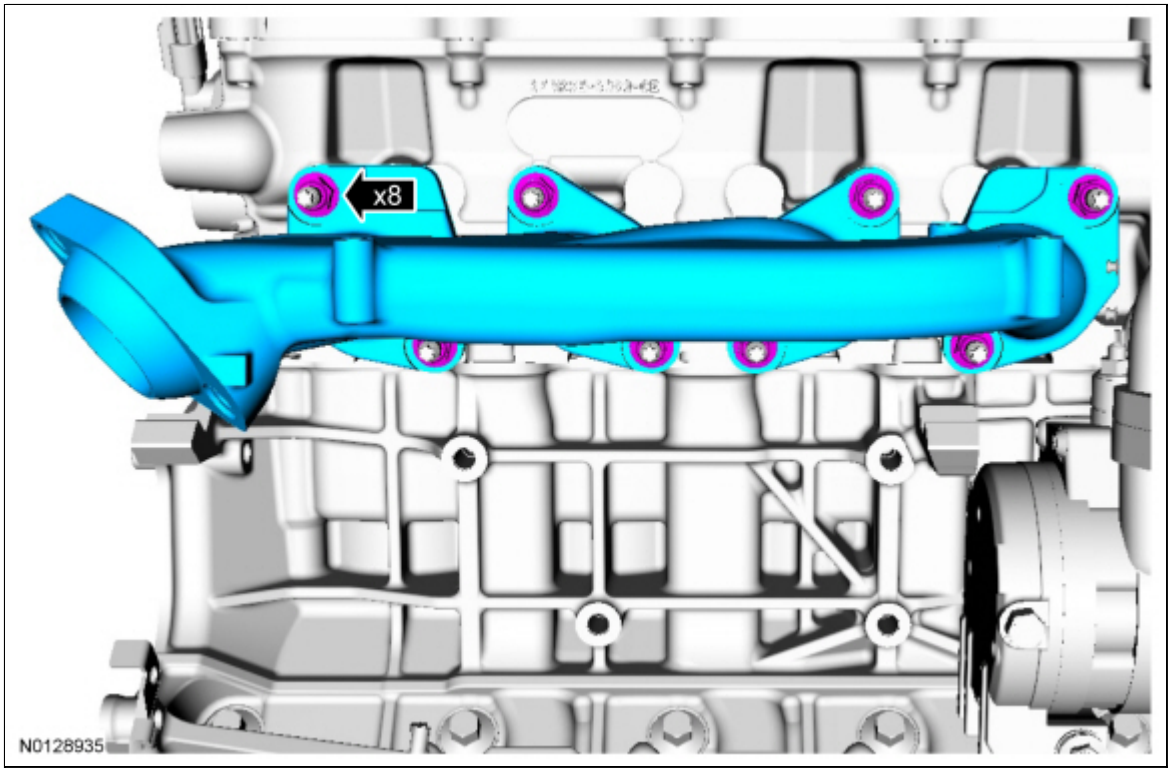


40. Disconnect the RH intake and exhaust Camshaft Position (CMP) sensor electrical connectors.
    - Remove the 2 bolts and the RH intake and exhaust CMP sensors.

41. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

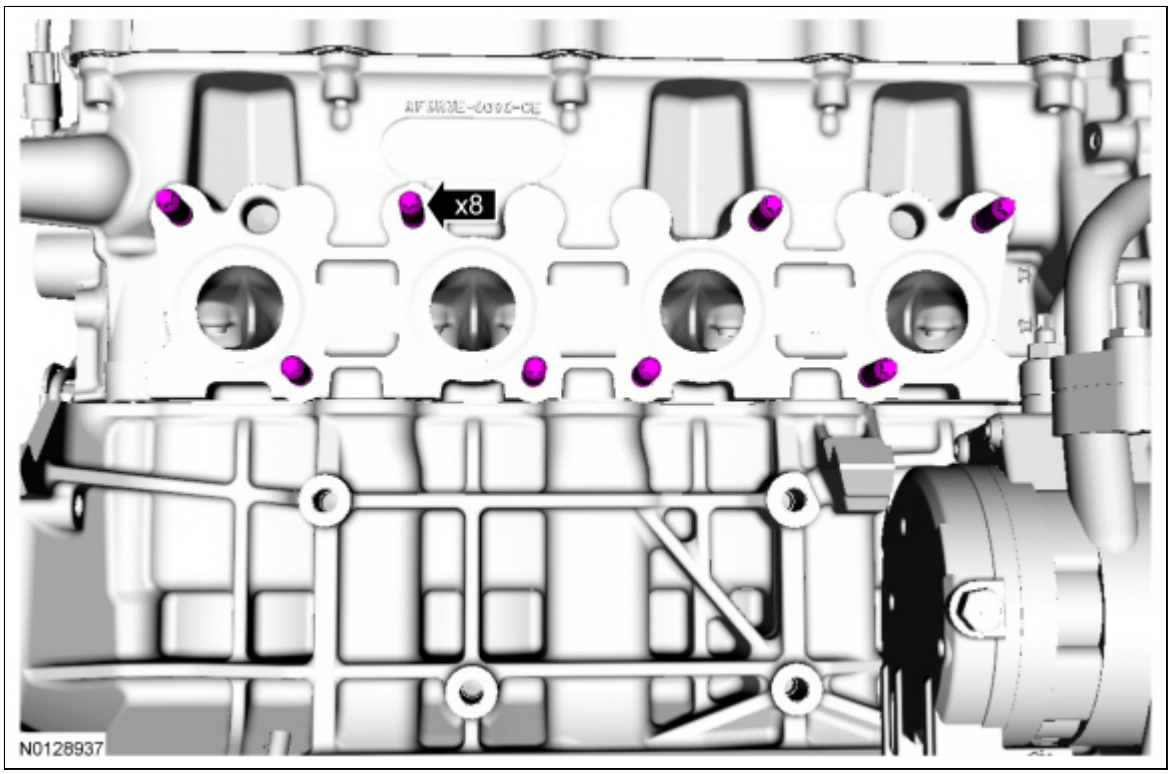


42. Remove the CHT sensor.

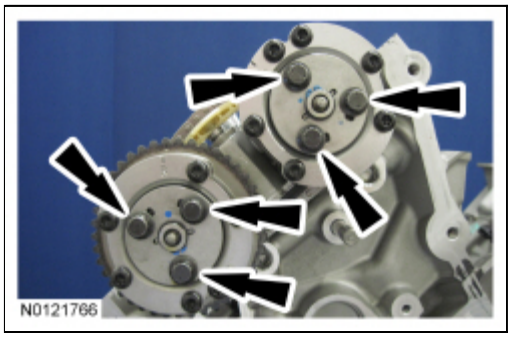


43. Remove the 3 bolts and the RH exhaust manifold heat shield.

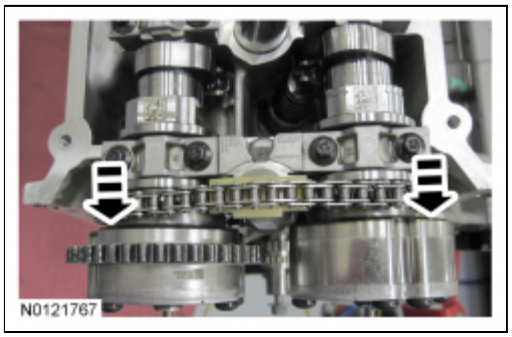
repair4less



44. Remove the 8 nuts and the RH exhaust manifold.
    - Discard the gasket.

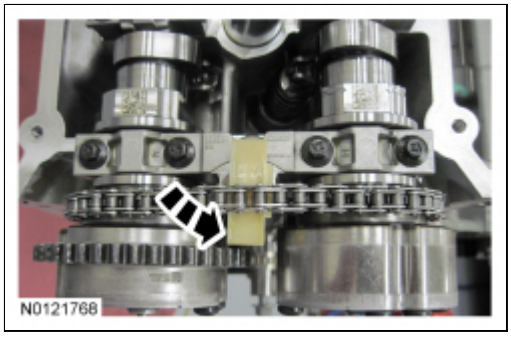


45. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

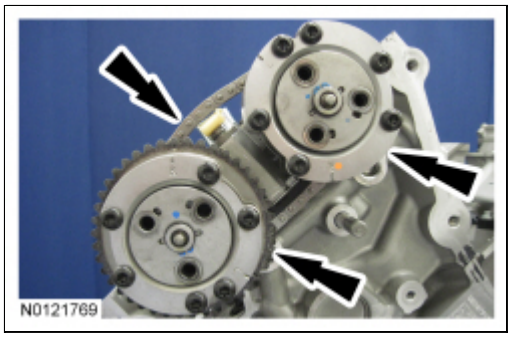


46. Remove and discard the 8 RH exhaust manifold studs.

47. Remove the 3 RH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 RH exhaust VCT assembly bolts.

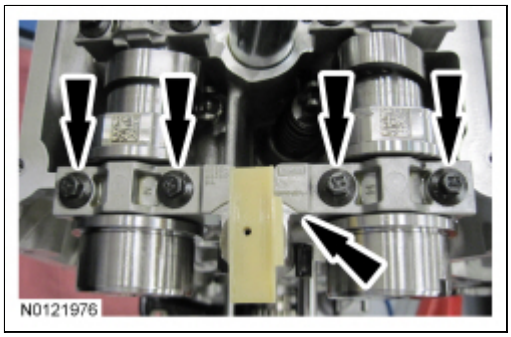


48. Slide the RH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

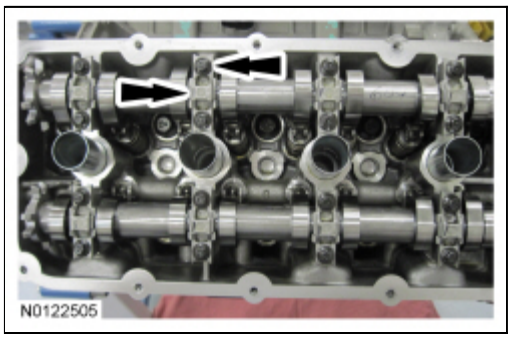


repair4less

49. Depress the RH secondary timing chain tensioner and turn the tensioner 90 degrees.

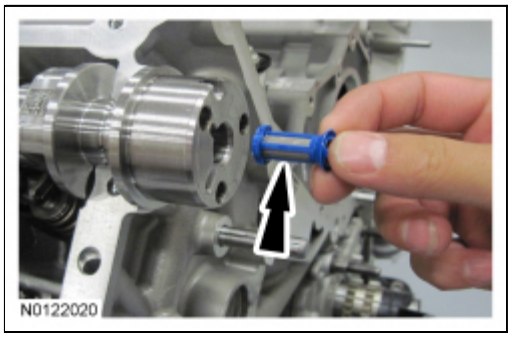


50. Remove the RH VCT assemblies and the RH secondary timing chain.

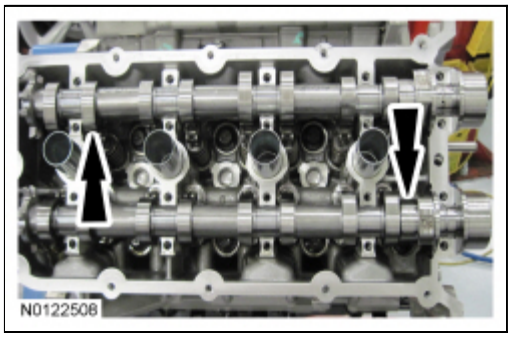


51. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the RH front camshaft bearing mega cap.



52. Remove the 16 bolts and the 8 camshaft bearing caps.



53. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

    Remove the VCT system oil filter from the intake and exhaust camshafts.

54. Remove the RH intake and exhaust camshafts.

55. Remove the 16 camshaft roller follower and hydraulic lash adjuster assemblies.

56. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

    NOTICE: **The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

repair4less

NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

Remove the 10 bolts and the RH cylinder head.

- Discard the bolts and the cylinder head gasket.

57. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or notices and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

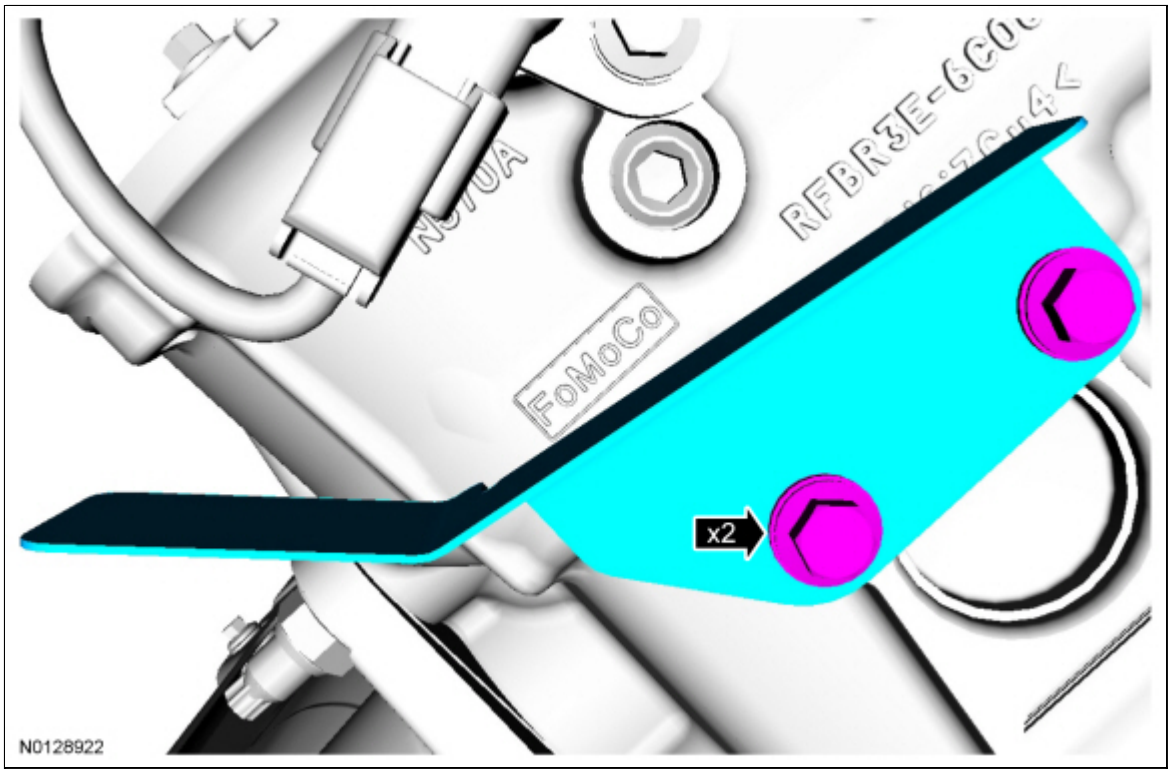
    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

58. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

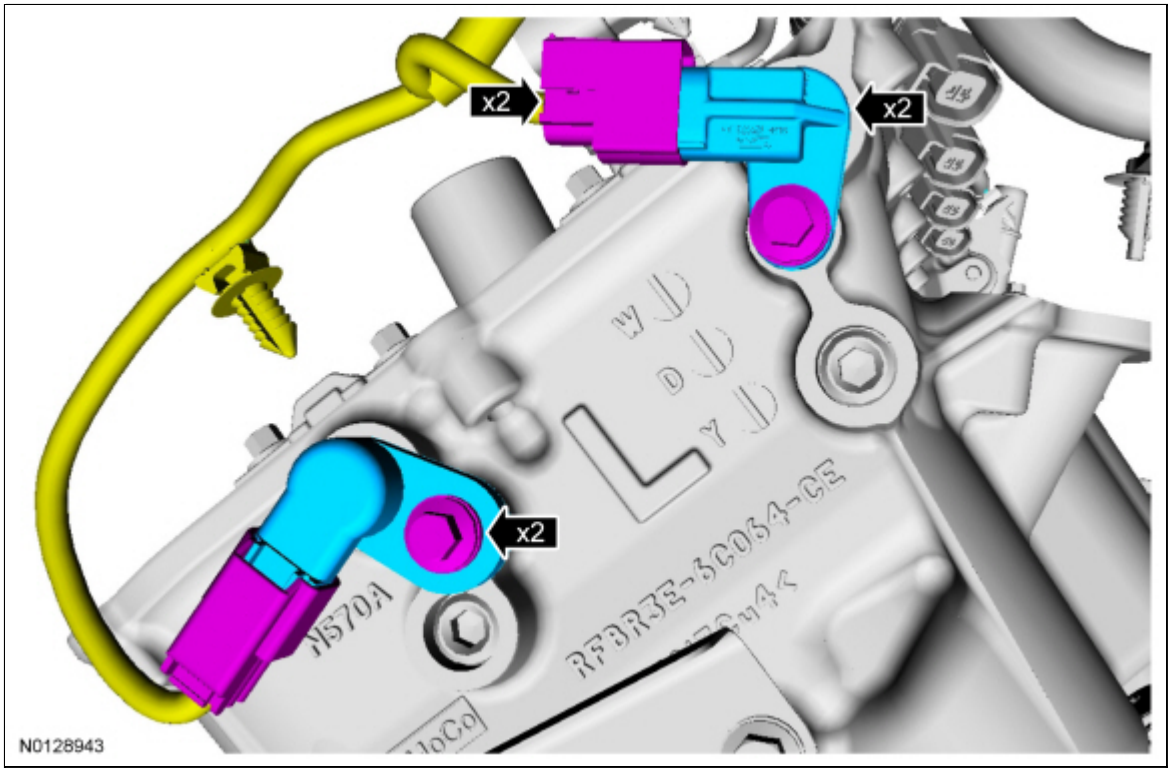
    NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

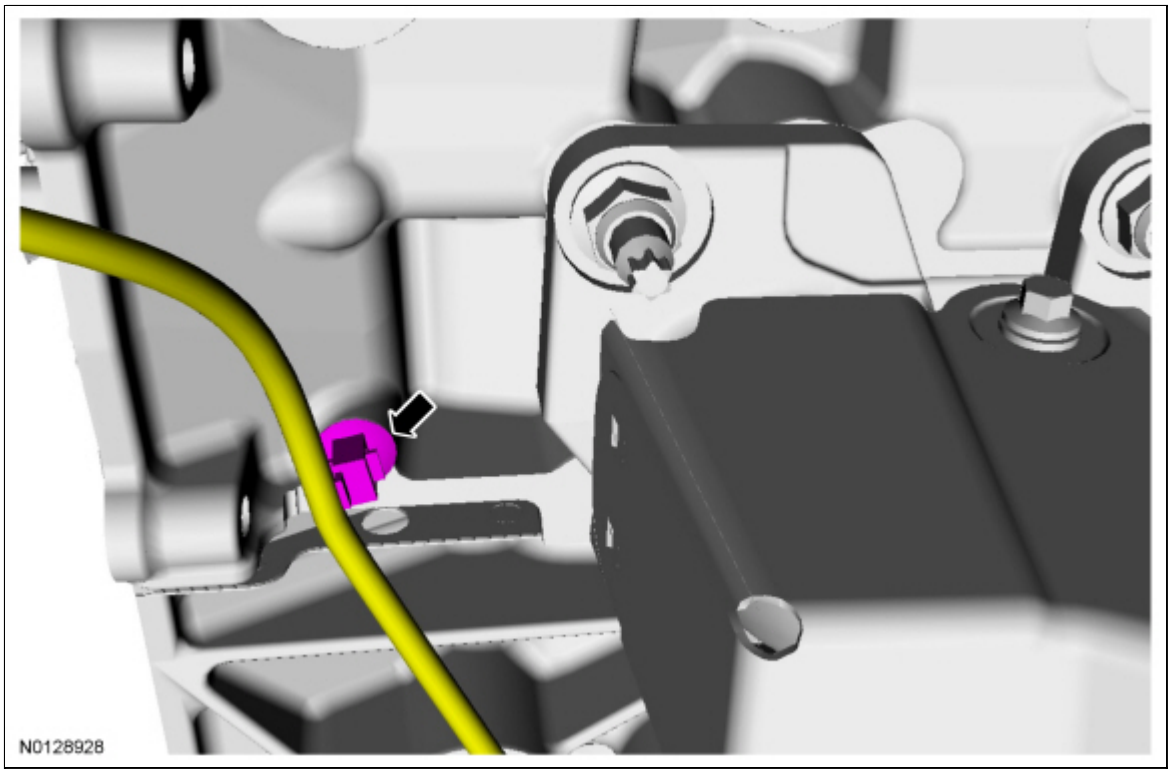


LH cylinder head

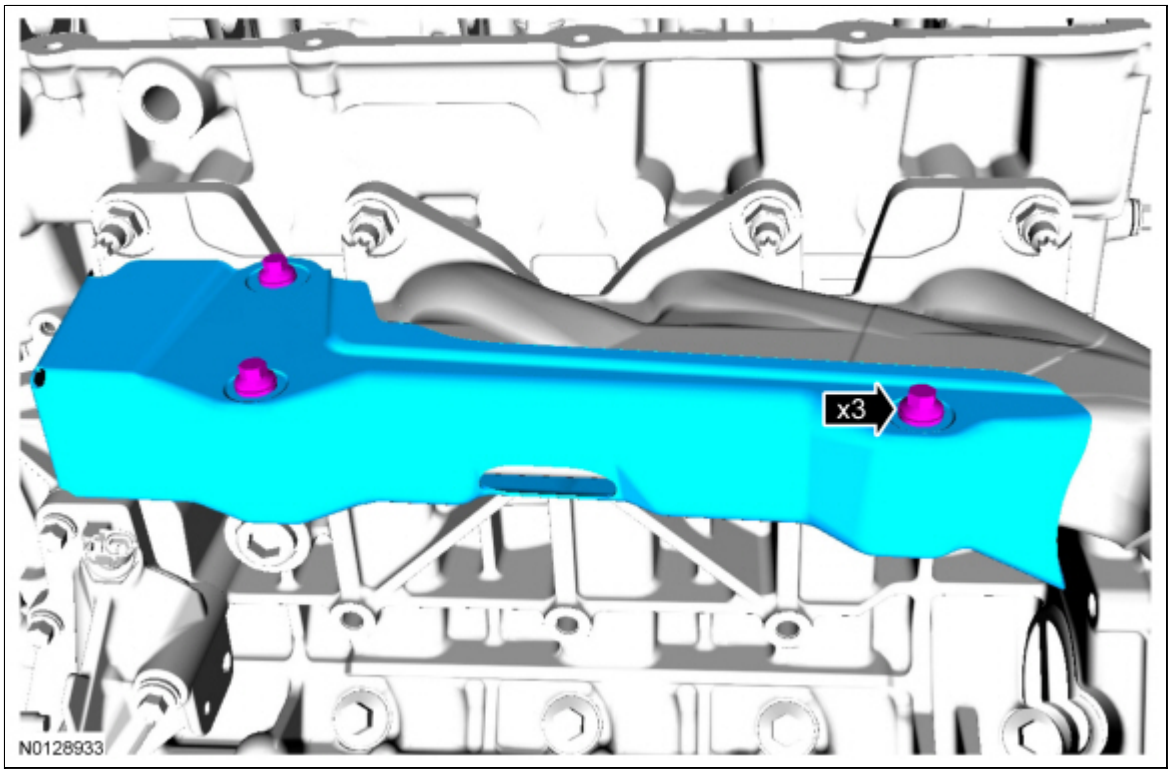
59. Remove the 2 bolts and the coolant outlet from the LH cylinder head.
    - Remove and discard the gasket.



60. Remove the 2 bolts and the heat shield from the LH cylinder head.

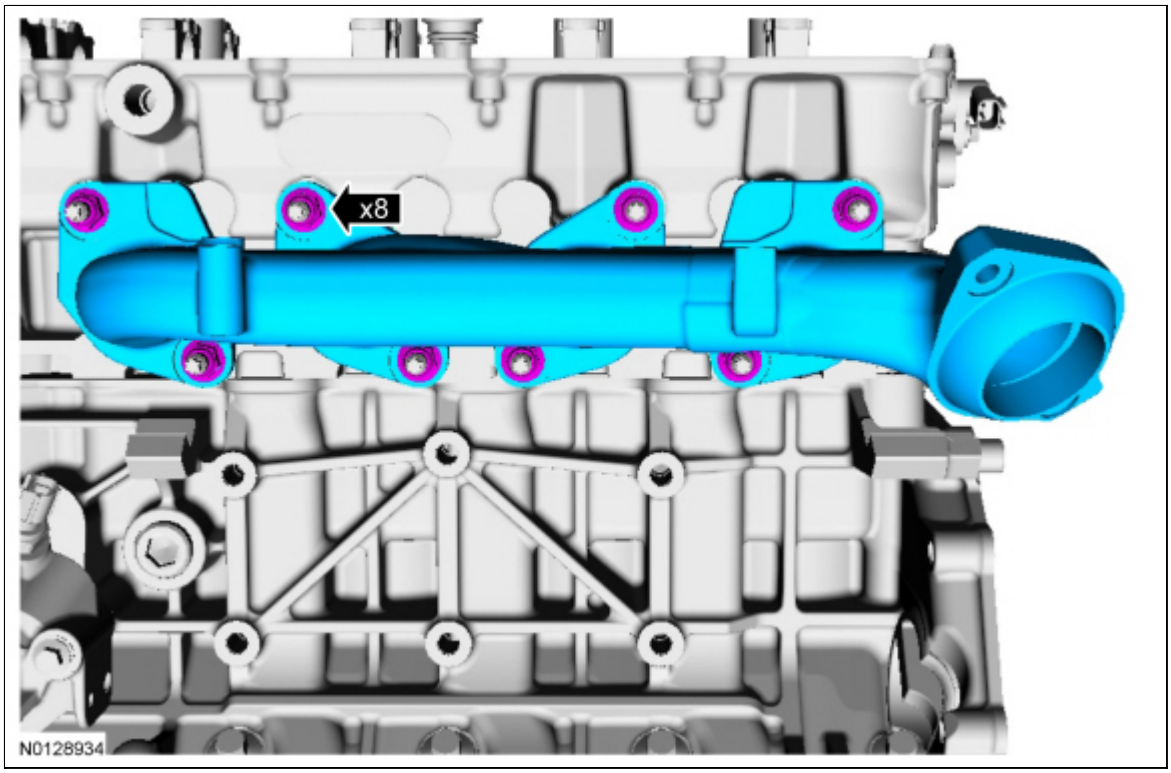


repair4less

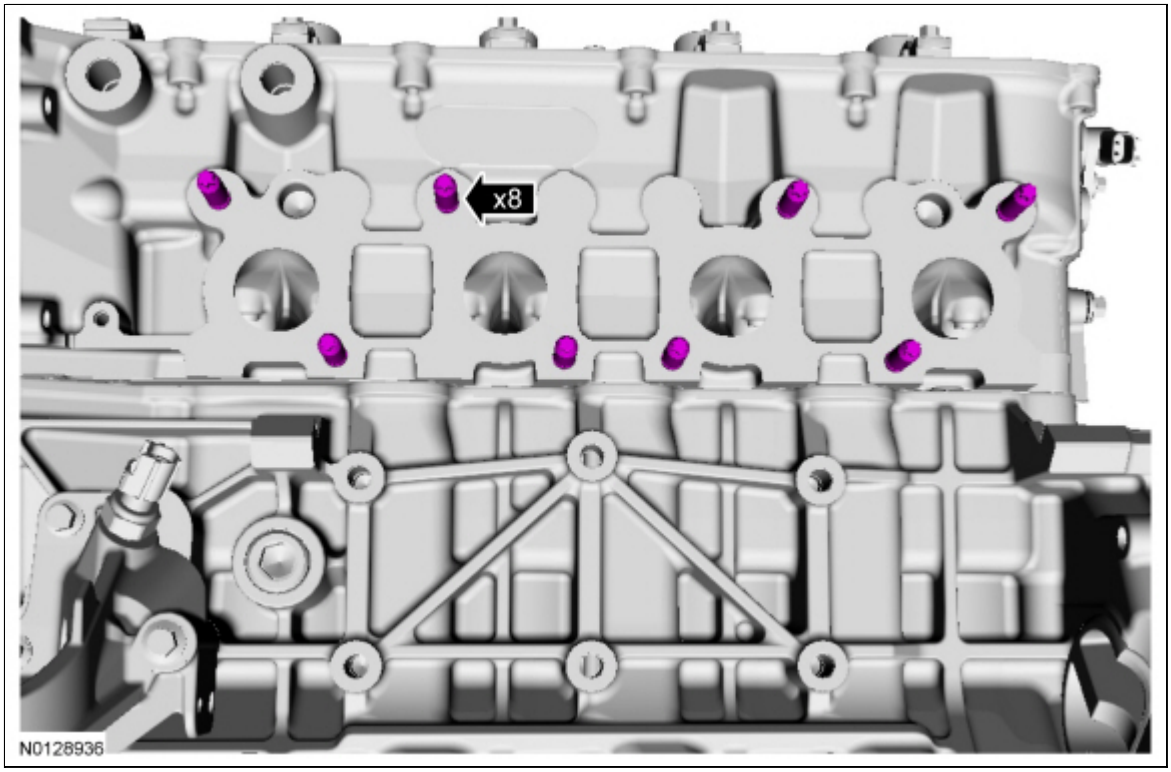


61. Disconnect the LH intake and exhaust Camshaft Position (CMP) sensor electrical connectors.
    - Remove the 2 bolts and the LH intake and exhaust CMP sensors.

62. Detach the wiring harness retainer from the LH cylinder head.

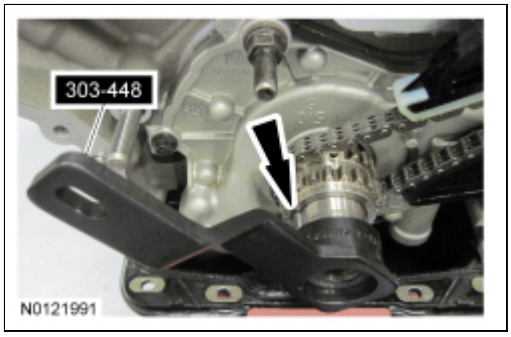


63. Remove the 3 bolts and the LH exhaust manifold heat shield.



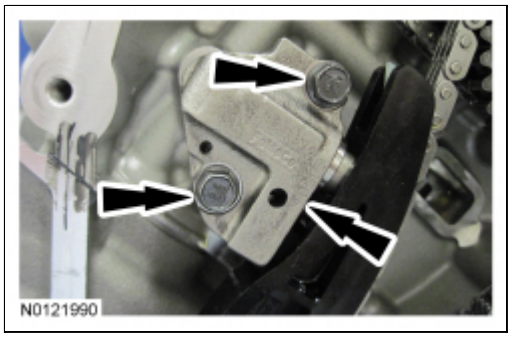
64. Remove the 8 nuts and the LH exhaust manifold.
    - Discard the gasket.

repair4less



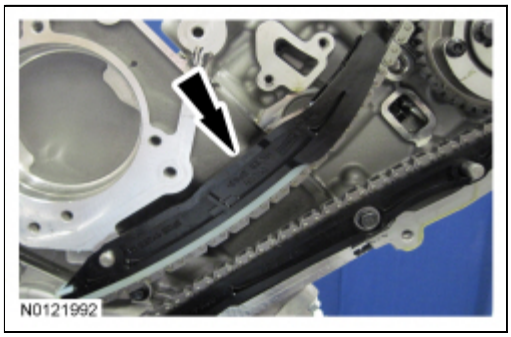
65. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

66. Remove and discard the 8 LH exhaust manifold studs.



67. Using the crankshaft holding tool, rotate the crankshaft counterclockwise until the crankshaft keyway

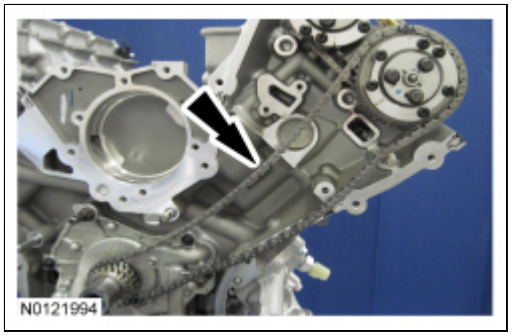
is at the 9 o'clock position.



68. Remove the 2 bolts and the LH primary timing chain tensioner.

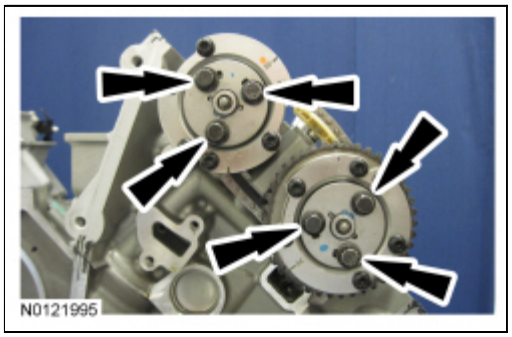
69. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain tensioner arm. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain tensioner arm.

    Remove the LH timing chain tensioner arm.

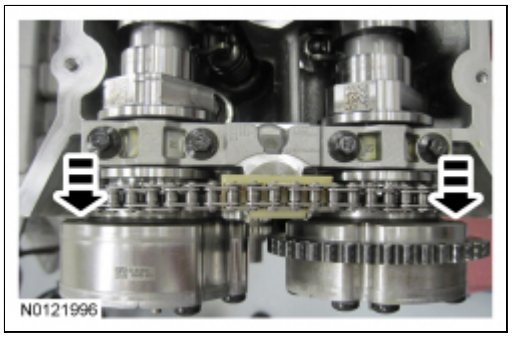


70. **NOTE:** It may be necessary to rotate the crankshaft slightly to provide enough slack in the chain to remove the LH timing chain guide. Return the crankshaft keyway to the 9 o'clock position after removing the LH timing chain guide.

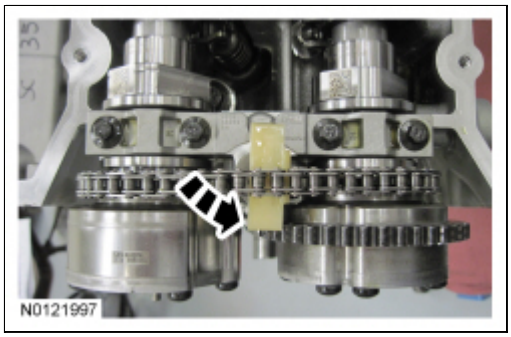
    Remove the bolt and the LH timing chain guide.



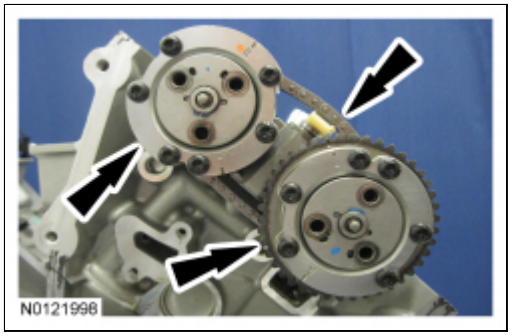
repair4less



71. Remove the LH primary timing chain.

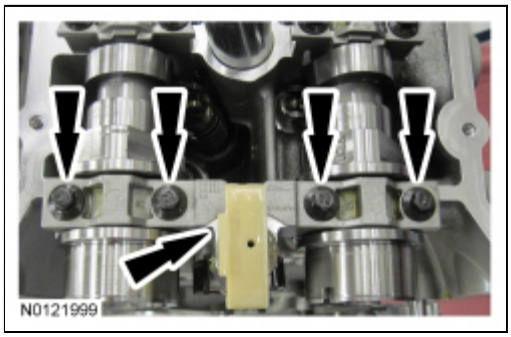


72. Remove the 3 LH intake Variable Camshaft Timing (VCT) assembly bolts and the 3 LH exhaust VCT assembly bolts.

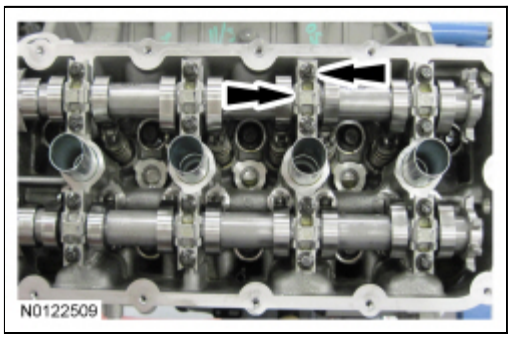


73. Slide the LH VCT assemblies and secondary timing chain forward 2 mm (0.078 in).

74. Depress the LH secondary timing chain tensioner and turn the tensioner 90 degrees.

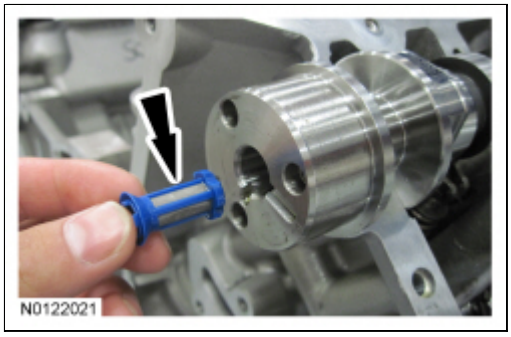


75. Remove the LH VCT assemblies and the LH secondary timing chain.

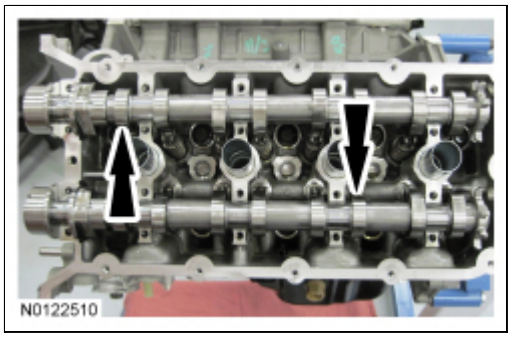


76. ***NOTICE:*** **The front camshaft bearing mega cap must be removed first and then the remaining camshaft bearing caps. Failure to follow this direction may result in damage to the engine.**

    Remove the 4 bolts and the LH front camshaft bearing mega cap.

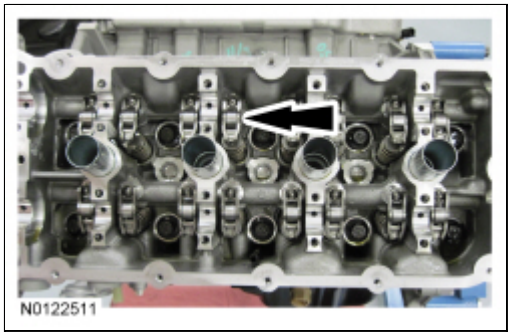


77. Remove the 16 bolts and the 8 camshaft bearing caps.



78. **NOTE:** Intake camshaft shown, exhaust camshaft similar.

repair4less



Remove the VCT system oil filter from the intake and exhaust camshafts.

79. Remove the LH intake and exhaust camshafts.

80. Remove the 16 camshaft roller follower and hydraulic lash adjuster assemblies.

81. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

    NOTICE: **The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

Remove the 10 bolts and the LH cylinder head.

- Discard the bolts and the cylinder head gasket.

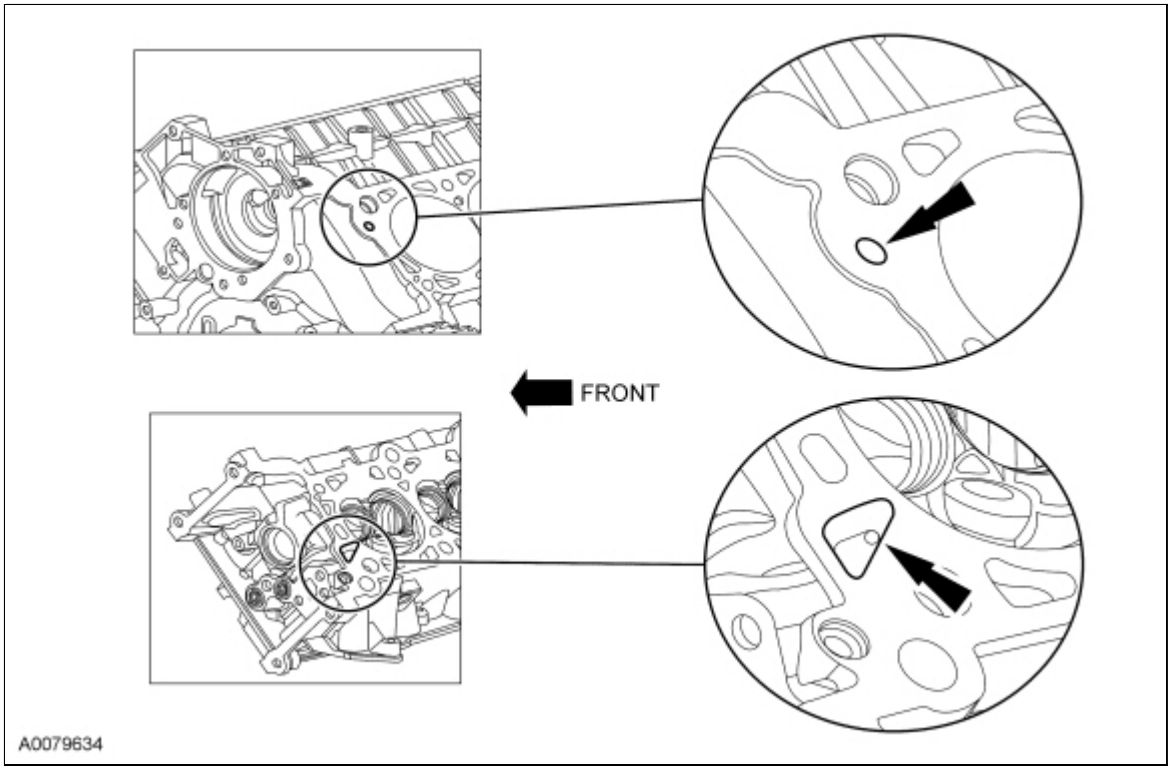
82. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or notices and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.



83. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, RTV, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

    NOTE: Use a straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot length. For example, if the straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

    Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area.

repair4less

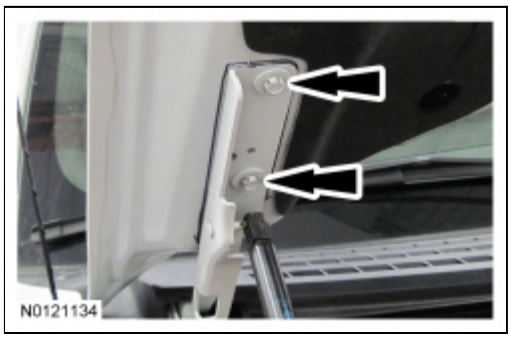
For additional information, refer to Section 303-00 .

Engine

Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E
 ST1377-A	Lifting Bracket, Engine 303-F047 (014-00073)

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

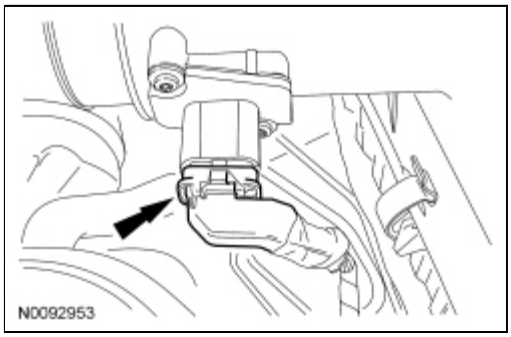
2. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

   NOTE: RH shown, LH similar.

   Remove the 4 bolts (2 shown) and the hood.

   
   N0121134

3. Release the fuel system pressure. For additional information, refer to Section 310-00 .

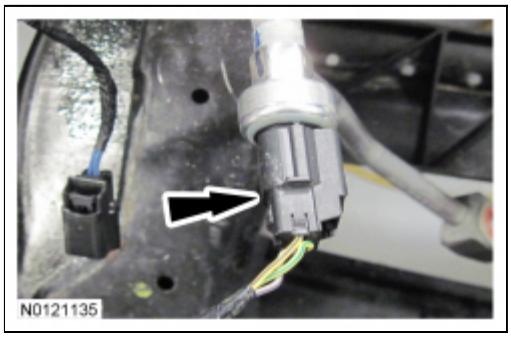


repair4less

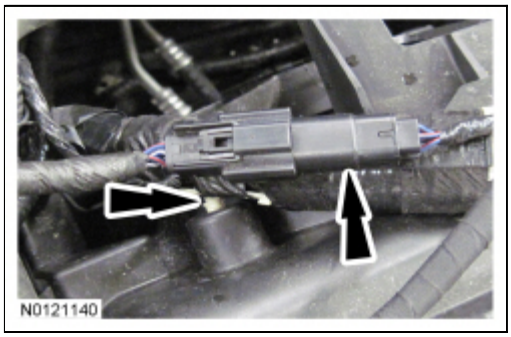
4. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

5. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Remove the intake manifold. For additional information, refer to Intake Manifold in this section.

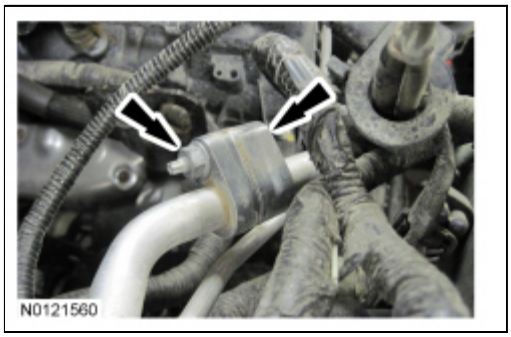


6. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

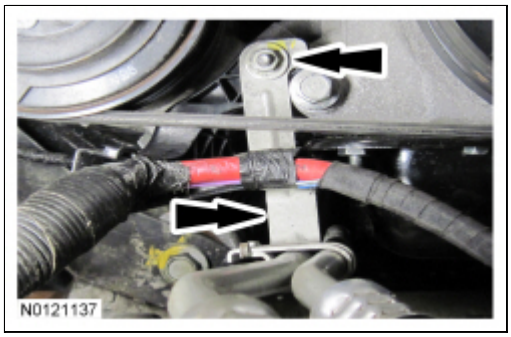


7. Remove the Air Cleaner (ACL) upper tray and the ACL element. For additional information, refer to Section 303-12 .

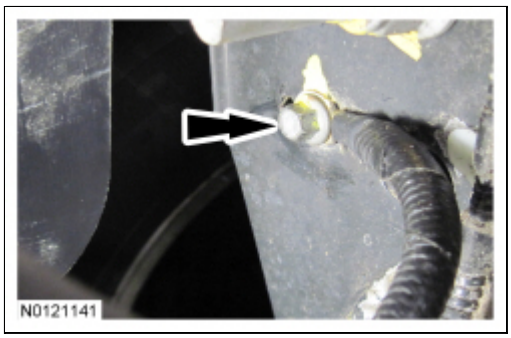
8. Remove the cooling module. For additional information, refer to Section 303-03 .



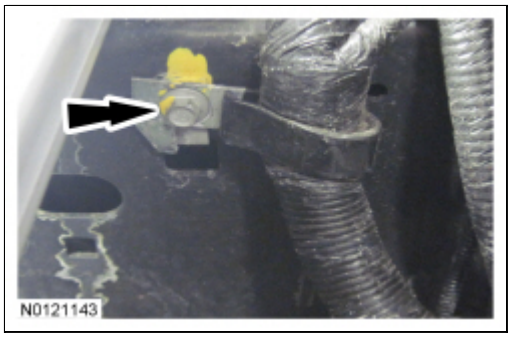
9. Disconnect the A/C pressure transducer electrical connector.



10. Disconnect the wiring harness electrical connector and pin-type retainer.
    - Position the Power Distribution Box (PDB) and wiring harness aside.

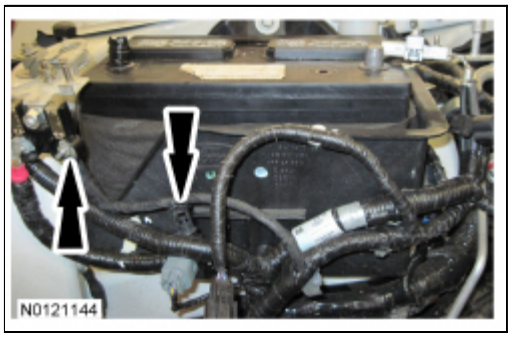


11. Remove the nut and disconnect the A/C tube.
    - Discard the O-ring seal and gasket.

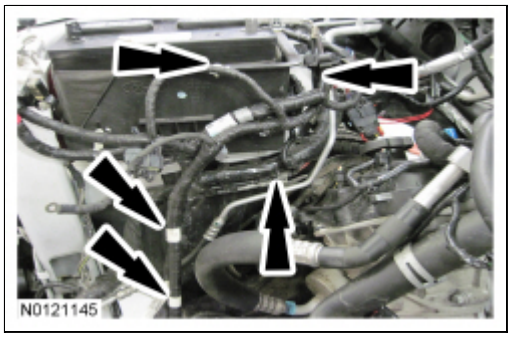


12. Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.

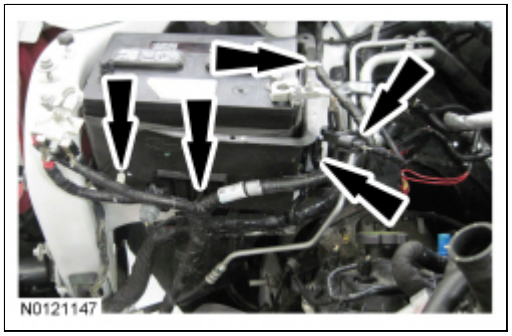
13. Remove the bolt and the ground wire from the RH frame rail.



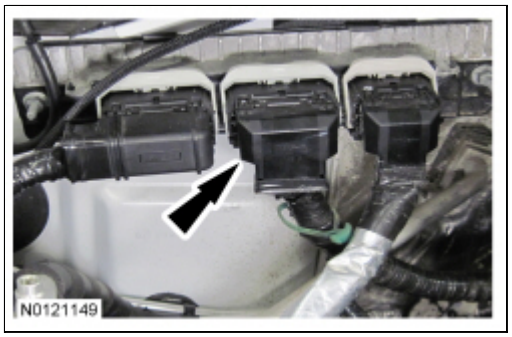
14. Remove the bolt and the wiring harness bracket from the RH frame rail.



repair4less



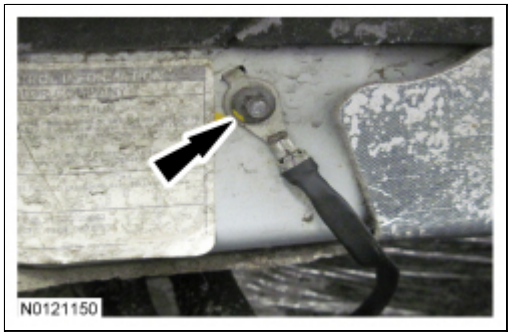
15. Remove the nut and disconnect the B+ wire.
    - Detach the wiring harness retainer from the battery tray.



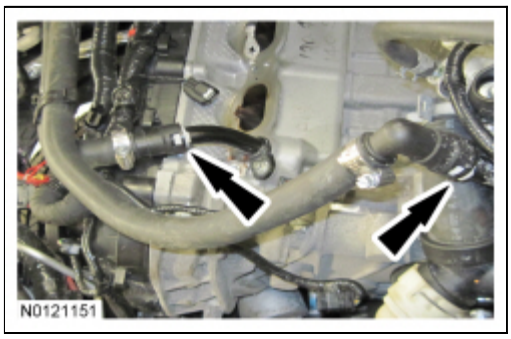
16. Detach the 5 wiring harness retainers.

17. Disconnect the 2 wiring harness connectors and detach the 3 wiring harness retainers.

18. Disconnect the middle PCM electrical connector.

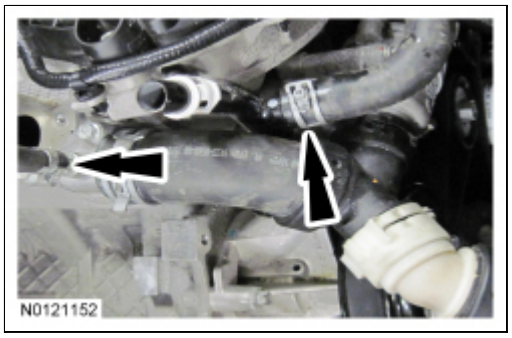


19. Detach and disconnect the engine harness electrical connector.

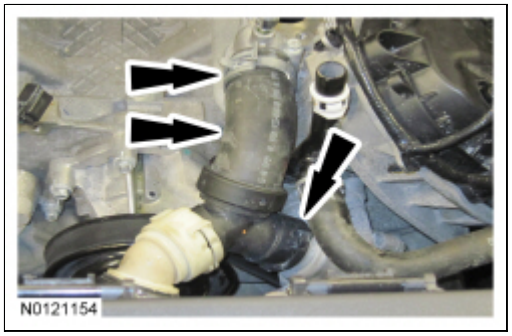


20. Detach the PCM wiring harness retainer from the valve cover bolt stud.

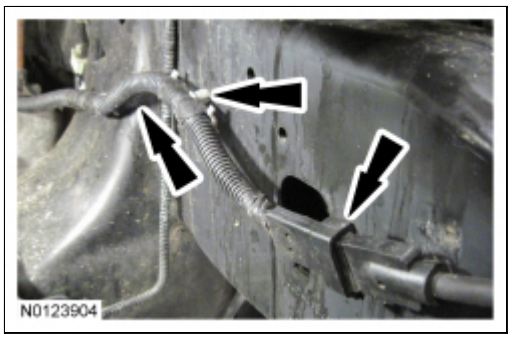
21. Remove the bolt and the ground strap from the cowl.



22. Disconnect the 2 heater hose quick connect couplings. For additional information, refer to Section 412-00 .



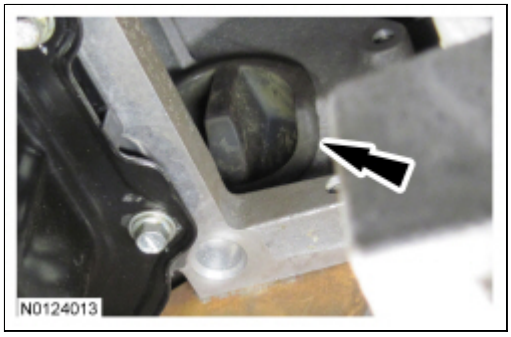
23. Disconnect the 2 coolant hoses and position aside.



repair4less

24. Remove the spring clip, the clamp and disconnect the coolant bypass T assembly from the engine.

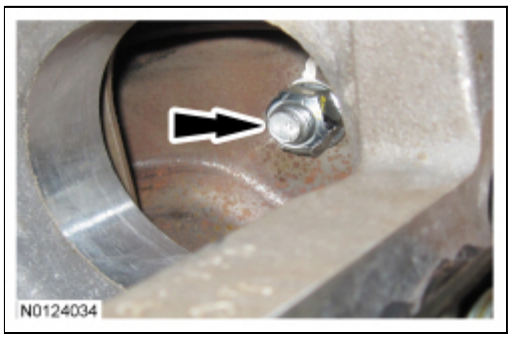
25. If equipped, disconnect the block heater electrical connector and the 2 wiring harness retainers.



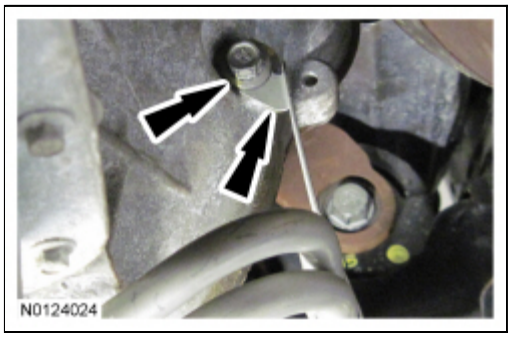
26. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .

27. Remove the starter. For additional information, refer to Section 303-06 .

28. Remove the 2 bolts and the flexplate inspection cover.

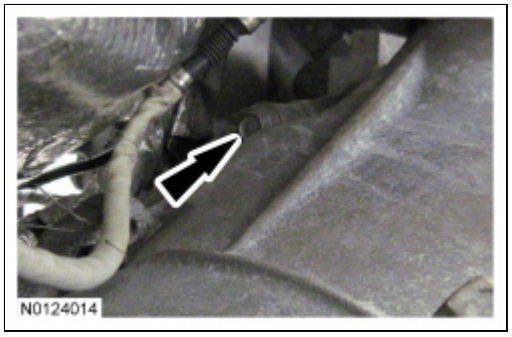


29. Remove the cylinder block opening cover.



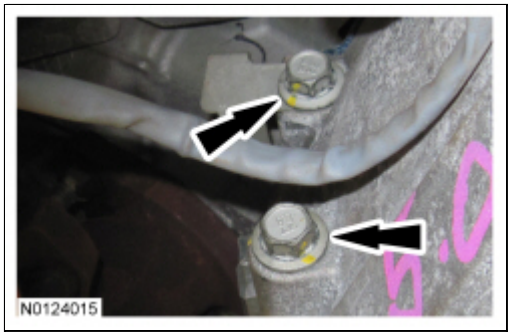
30. **NOTE:** Index-mark the end of one torque converter stud and the flexplate for installation.

    Remove the 4 torque converter-to-flexplate nuts.
    - Discard the nuts.

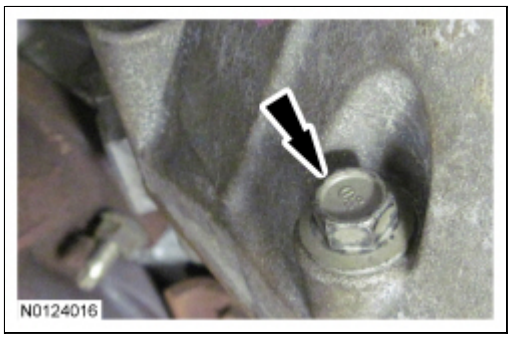


31. **NOTE:** The 2 upper transmission-to-engine bolts will be removed later.

    Remove the transmission-to-engine bolt and transmission cooler tube support bracket.



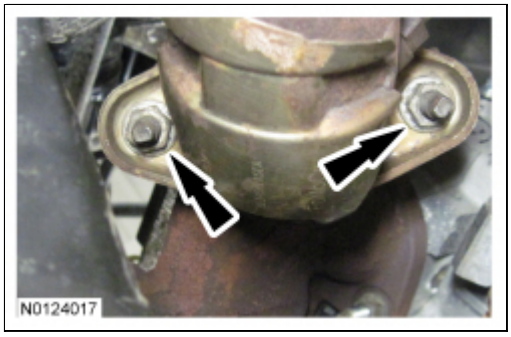
32. Remove the lower transmission-to-engine bolt.



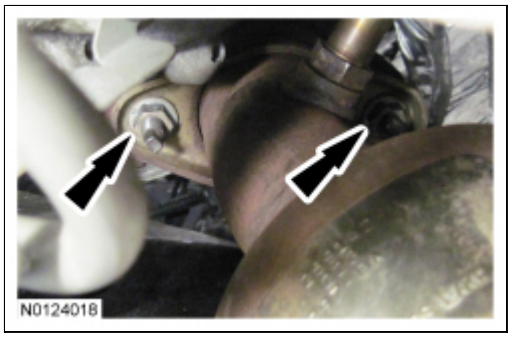
repair4less

33. Remove the 2 lower transmission-to-engine bolts.

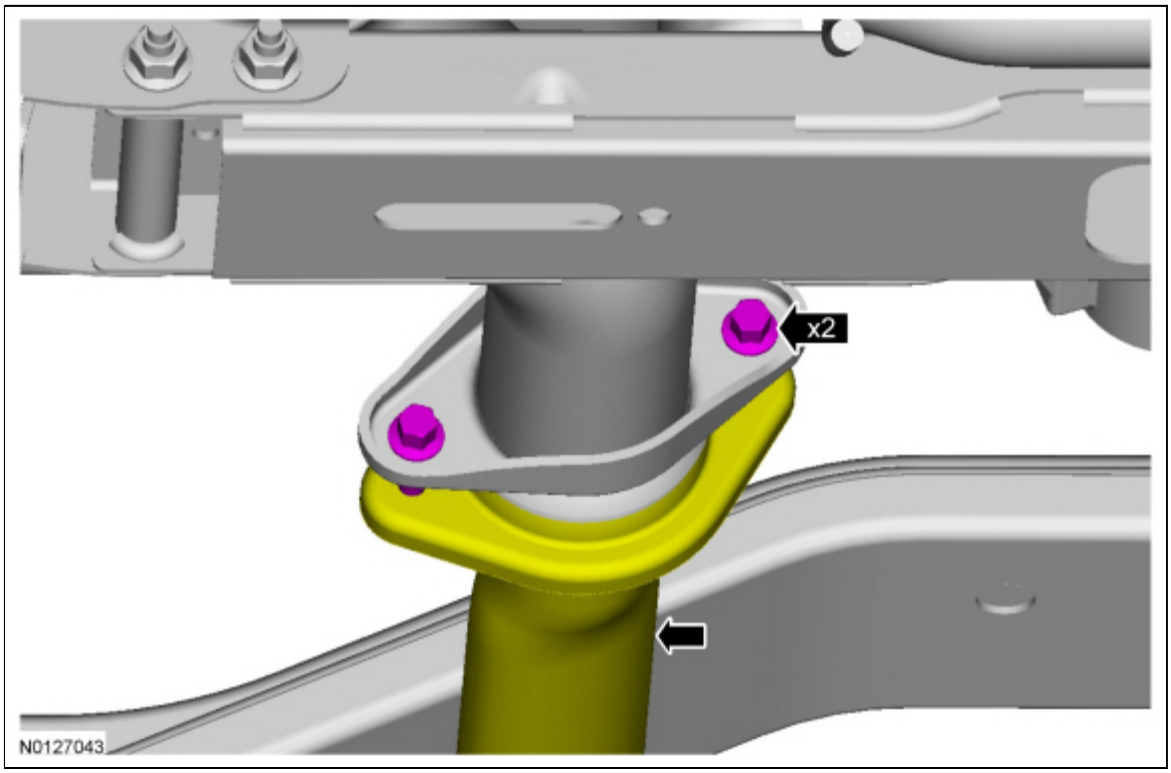
34. Remove the lower transmission-to-engine bolt.



35. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 26 Nm (19 lb-ft).



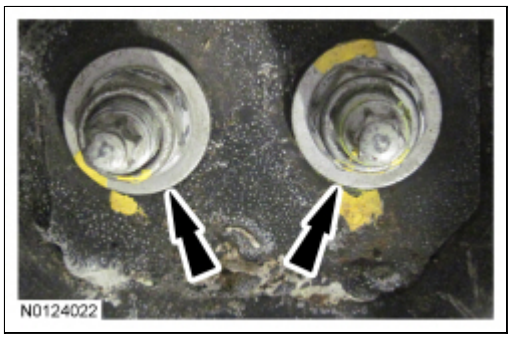
36. Remove and discard the engine oil filter.



37. Remove and discard the 2 LH catalytic converter-to-exhaust manifold nuts.

38. Remove and discard the RH catalytic converter-to-exhaust manifold nut.

39. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.

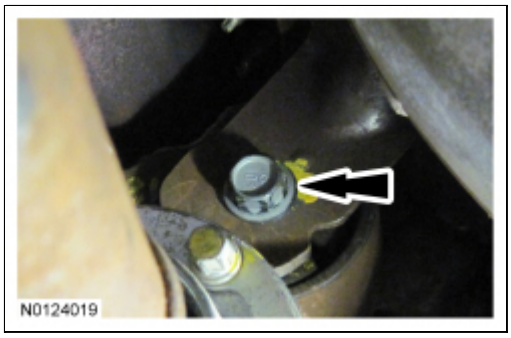


repair4less

40. ***NOTICE:*** **Only use hand tools when removing the engine support insulator nuts or the engine support insulator may be damaged.**

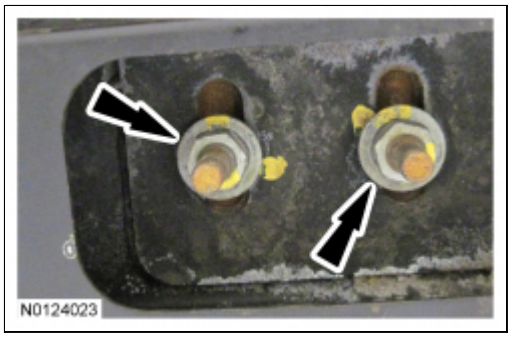
    NOTE: If during nut removal the stud is extracted from the engine support insulator, separate the nut from the stud prior to installing the stud.

    Remove the 2 RH engine support insulator nuts.



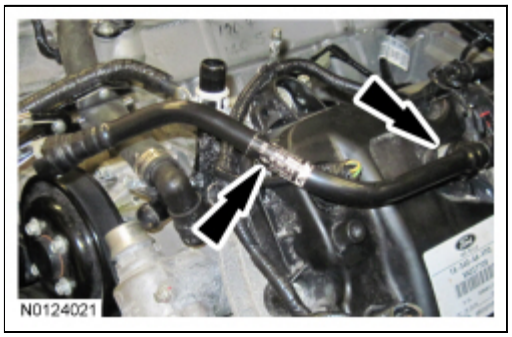
41. ***NOTICE:*** **Only use hand tools when removing the engine support insulator stud or the engine support insulator may be damaged.**

    Remove the 2 RH engine support insulator studs.



42. ***NOTICE:*** **Only use hand tools when loosening the engine support insulator through bolt or the engine support insulator may be damaged.**

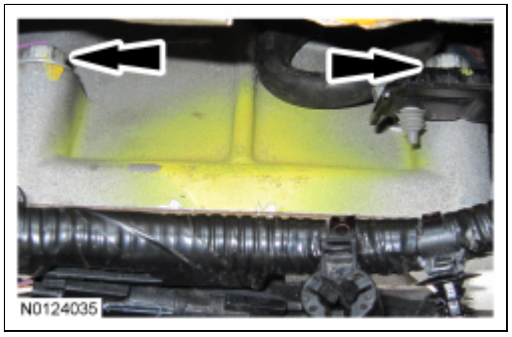
    Remove the LH engine support insulator bolt.



43. Loosen the 2 transmission mount-to-crossmember nuts.

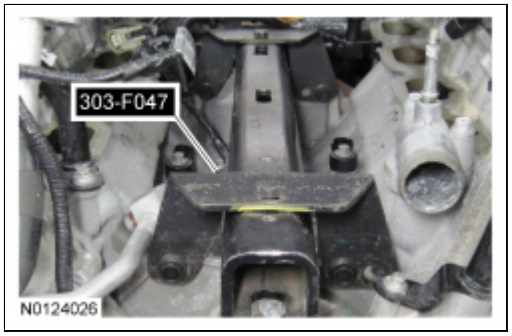
44. Disconnect the oil level sensor electrical connector.

45. Disconnect the quick connect coupling and remove the crankcase ventilation tube. For additional information, refer to Section 310-00 .



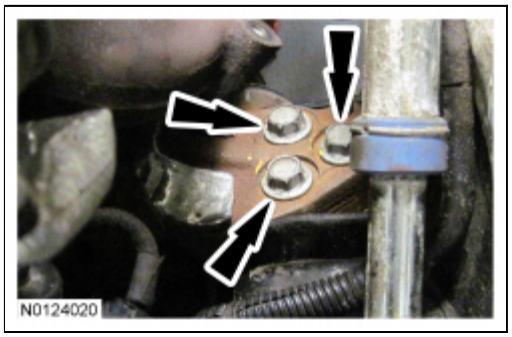
46. ***NOTICE:*** **Do not support the transmission by the fluid pan, failure to follow this instruction may result in serious damage to the transmission.**

    Support the bellhousing of the transmission with a suitable floor jack and a block of wood.

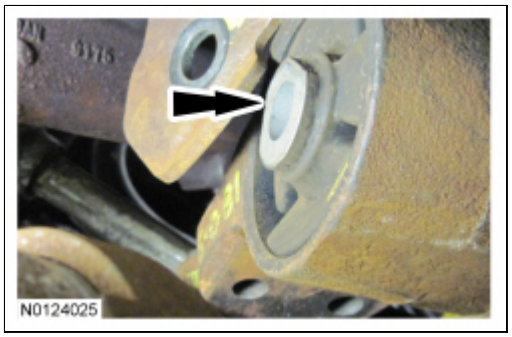


47. **NOTE:** On Four-Wheel Drive (4WD) vehicles, it may be necessary to reposition the transfer case vent hose to access the bolts.

    Remove the upper 2 transmission-to-engine bolts.



repair4less



48. Install the Engine Lifting Bracket.

49. Using the Heavy Duty Floor Crane and the Engine Lifting Bracket, raise the engine assembly to gain access to the 3 LH engine support insulator bolts.

50. Remove the LH engine support insulator from under the vehicle.

51. Using the Heavy Duty Floor Crane and the Engine Lifting Bracket, remove the engine assembly from the vehicle.

repair4less

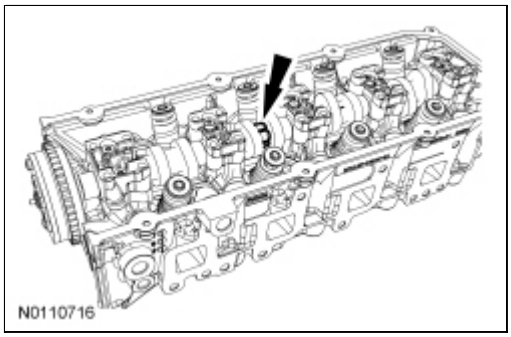
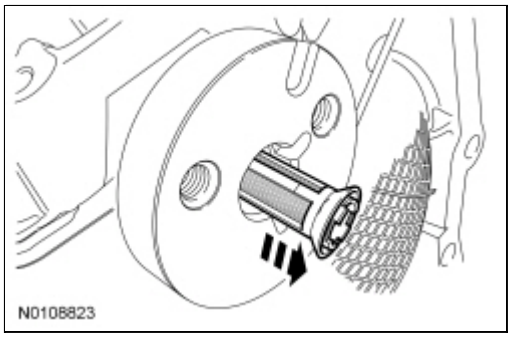
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, remove the 3 LH camshaft phaser and sprocket bolts and the camshaft phaser and sprocket.
   - Discard the 3 camshaft phaser and sprocket bolts.

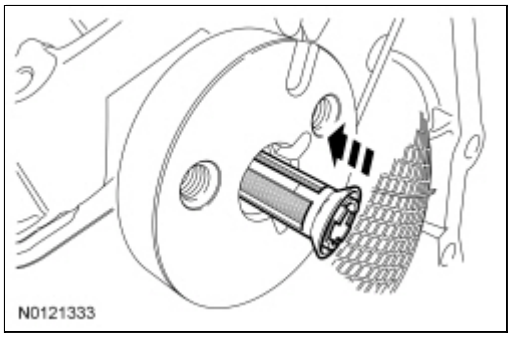
3. Remove and discard the Variable Camshaft Timing (VCT) system oil filter.

4. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

   Remove the 10 bolts and remove the 5 camshaft bearing caps.

5. Remove the camshaft.
   - Inspect the camshaft. For additional information, refer to Section 303-00 .

Installation

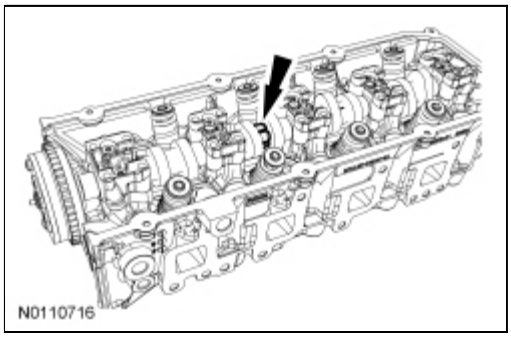


1. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. Position the 5 camshaft bearing caps in their original locations and install the 10 bolts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 6 Nm (53 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

3. Install a new VCT system oil filter with the open end facing the front of the engine.

repair4less



4. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Position the camshaft phaser and sprocket with the alignment pin in the alignment slot of the camshaft and install 3 new camshaft phaser and sprocket bolts finger-tight.

5. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, tighten the 3 new LH camshaft phaser and sprocket bolts in 2 stages.
   - Stage 1: Tighten to 9 Nm (80 lb-in).
   - Stage 2: Tighten an additional 90 degrees.

6. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

repair4less

Camshaft — RH

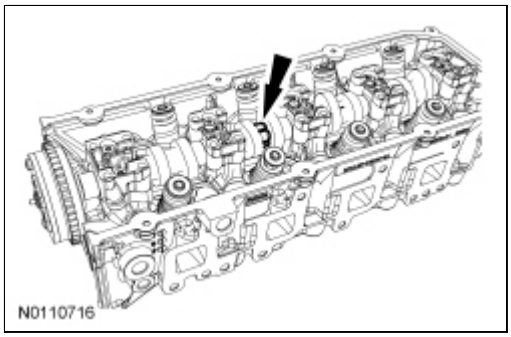
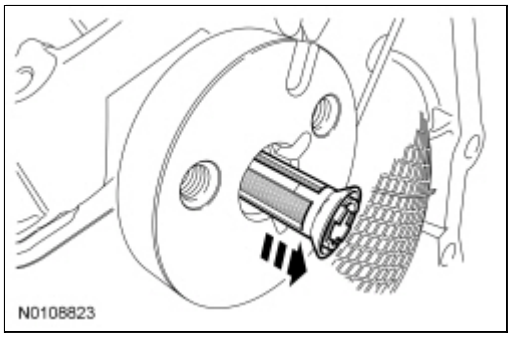
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, remove the 3 RH camshaft phaser and sprocket bolts and the camshaft phaser and sprocket.
   - Discard the 3 camshaft phaser and sprocket bolts.

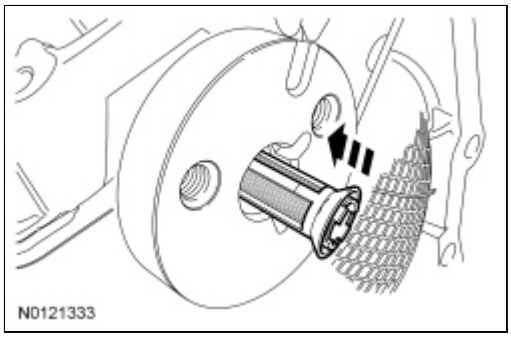
3. Remove and discard the Variable Camshaft Timing (VCT) system oil filter.

4. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

   Remove the 10 bolts and remove the 5 camshaft bearing caps.

5. Remove the camshaft.
   - Inspect the camshaft. For additional information, refer to Section 303-00 .

Installation



1. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. Position the 5 camshaft bearing caps in their original locations and install the 10 bolts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 6 Nm (53 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

3. Install a new VCT system oil filter with the open end facing the front of the engine.

4. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Position the camshaft phaser and sprocket with the alignment pin in the alignment slot of the camshaft and install 3 new camshaft phaser and sprocket bolts finger-tight.

5. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

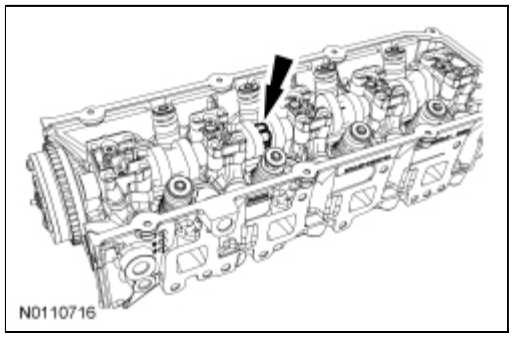
   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, tighten the 3 new LH camshaft phaser and sprocket bolts in 2 stages.
   - Stage 1: Tighten to 9 Nm (80 lb-in).
   - Stage 2: Tighten an additional 90 degrees.

6. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

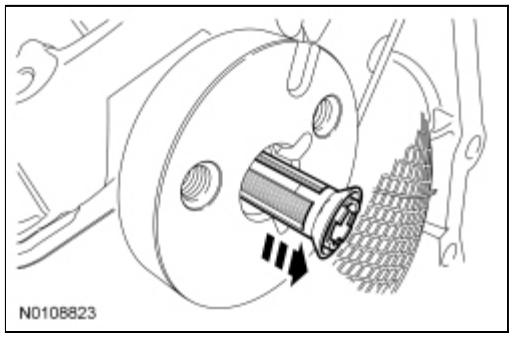
repair4less

Camshaft Phaser and Sprocket — LH



Removal

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, remove the 3 LH camshaft phaser and sprocket bolts and the camshaft phaser and sprocket.
   - Discard the 3 camshaft phaser and sprocket bolts.

3. Remove and discard the Variable Camshaft Timing (VCT) system oil filter.

Installation

1. Install a new VCT system oil filter with the open end facing the front of the engine.

2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Position the camshaft phaser and sprocket with the alignment pin in the alignment slot of the

camshaft and install 3 new camshaft phaser and sprocket bolts finger-tight.

3. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

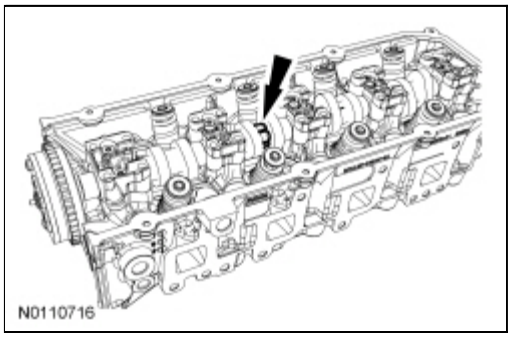
   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, tighten the 3 new LH camshaft phaser and sprocket bolts in 2 stages.
   - Stage 1: Tighten to 9 Nm (80 lb-in).
   - Stage 2: Tighten an additional 90 degrees.

4. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

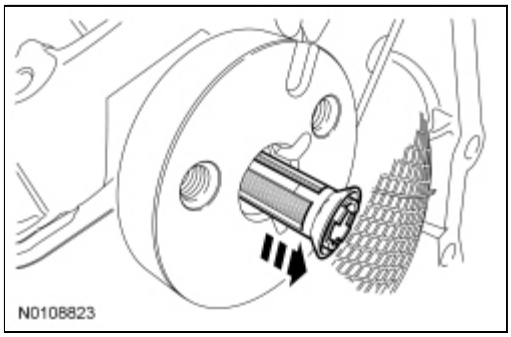
repair4less

Camshaft Phaser and Sprocket — RH



Removal

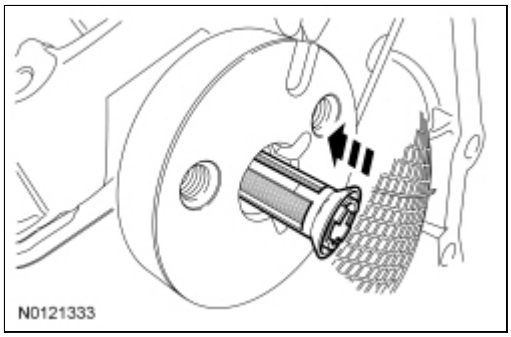
1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

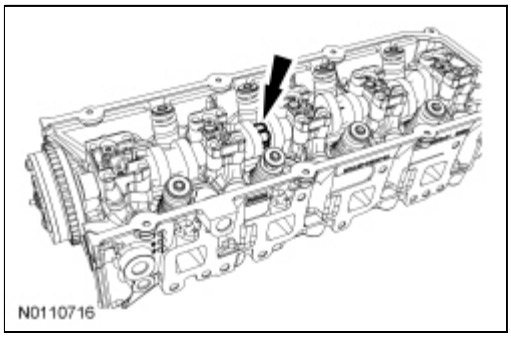
   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, remove the 3 RH camshaft phaser and sprocket bolts and the camshaft phaser and sprocket.
   - Discard the 3 camshaft phaser and sprocket bolts.



3. Remove and discard the Variable Camshaft Timing (VCT) system oil filter.

Installation

1. Install a new VCT system oil filter with the open end facing the front of the engine.



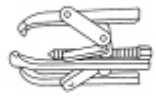
2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

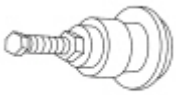
   Position the camshaft phaser and sprocket with the alignment pin in the alignment slot of the camshaft and install 3 new camshaft phaser and sprocket bolts finger-tight.

3. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using a 26 mm (1.023 in) wrench on the flats of the camshaft to secure the camshaft, tighten the 3 new LH camshaft phaser and sprocket bolts in 2 stages.
   - Stage 1: Tighten to 9 Nm (80 lb-in).
   - Stage 2: Tighten an additional 90 degrees.





4. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

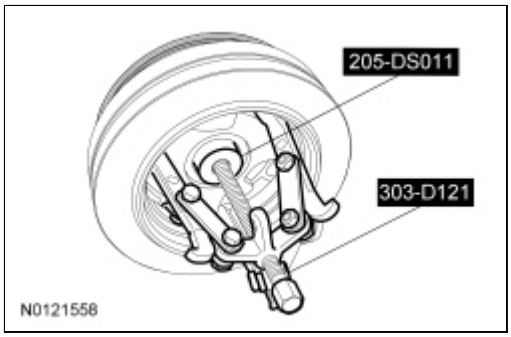
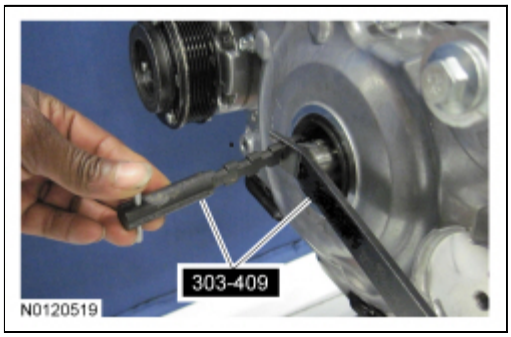
Material



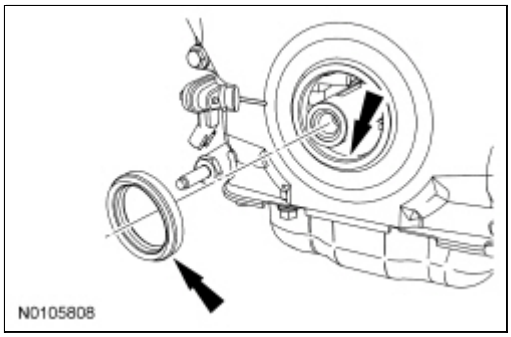
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Rotate the tensioner clockwise and remove the accessory drive belt from the crankshaft pulley.

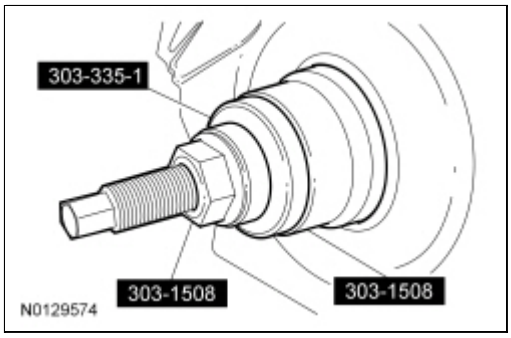


3. Remove and discard the crankshaft pulley bolt.
4. Using the 3 Jaw Puller and Step Plate, remove the crankshaft pulley.



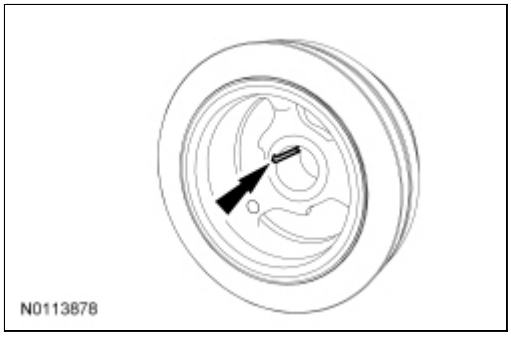
5. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

   Using the Oil Seal Remover, remove the crankshaft front oil seal.



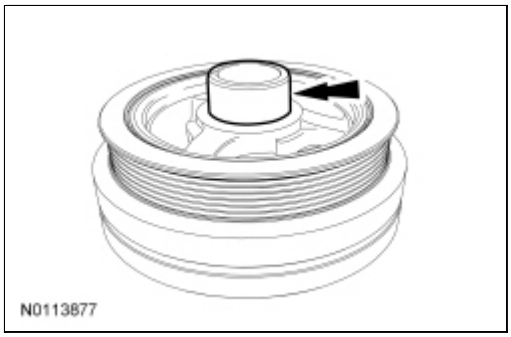
Installation

1. Lubricate the engine front cover and the new crankshaft seal inner lip with clean engine oil.



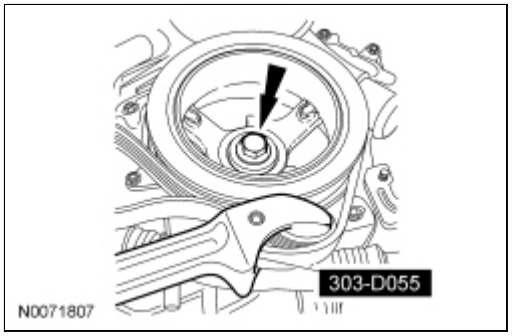
2. Using the Crankshaft Damper and Crankshaft Front Seal Installer and the Front Cover Oil Seal Installer, install the new crankshaft front seal into the engine front cover.

repair4less

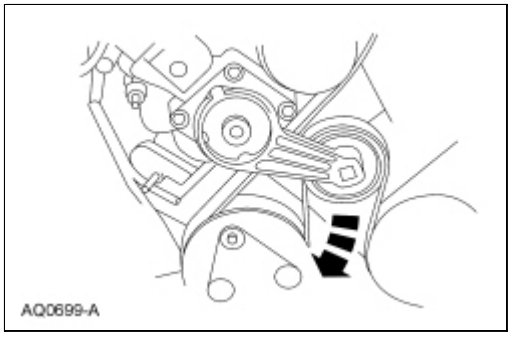


3. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.



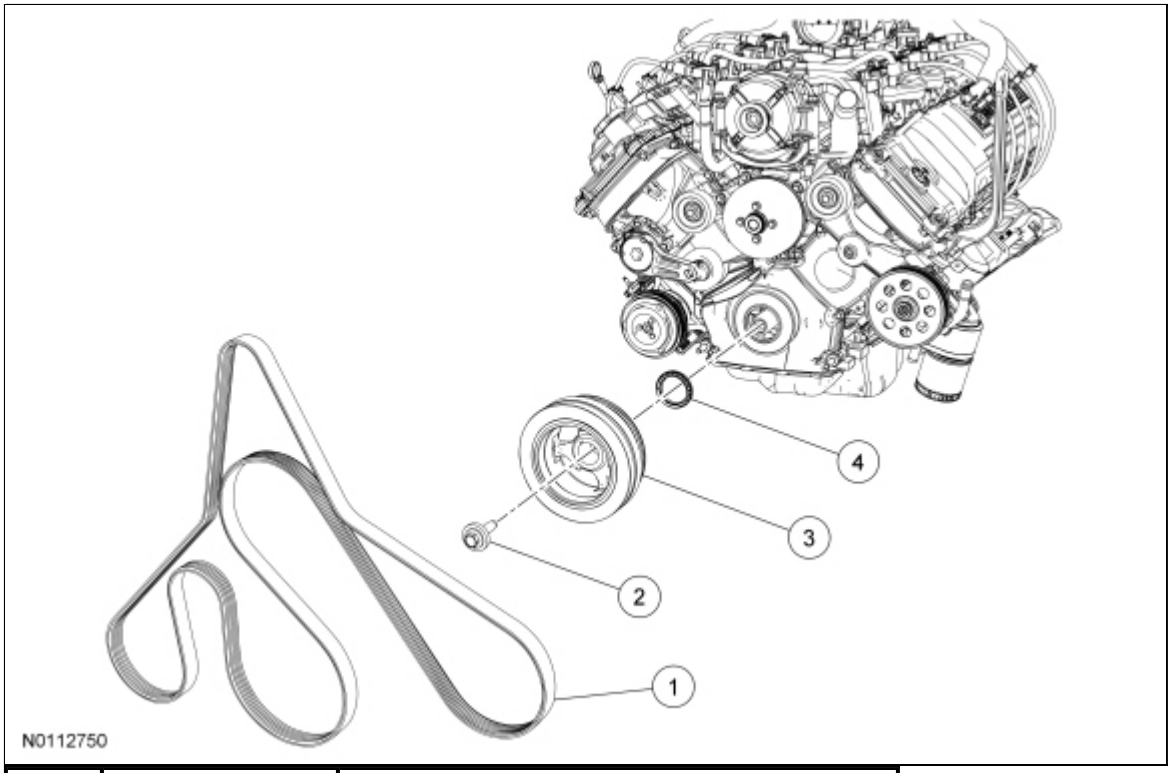
4. Lubricate the crankshaft pulley sealing area with clean engine oil prior to installation.



5. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

6. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 2 stages:
    - Stage 1: Tighten to 175 Nm (129 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

7. Rotate the tensioner clockwise and install the accessory drive belt onto the crankshaft pulley.



8. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	—

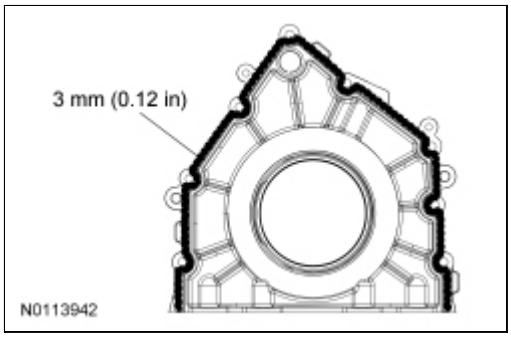
Removal

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.
2. Remove the flexplate. For additional information, refer to Flexplate in this section.
3. Remove the engine rear cover plate.
4. **NOTE:** Inspect the ignition pulse ring for damage. If the ignition pulse ring has been dropped or has any visual damage, it must be discarded.

   Remove the crankshaft ignition pulse ring.
5. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
6. Remove the bolt and the CKP sensor.
7. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear seal.

8. Remove the 8 bolts and the crankshaft rear seal retainer plate.

Installation



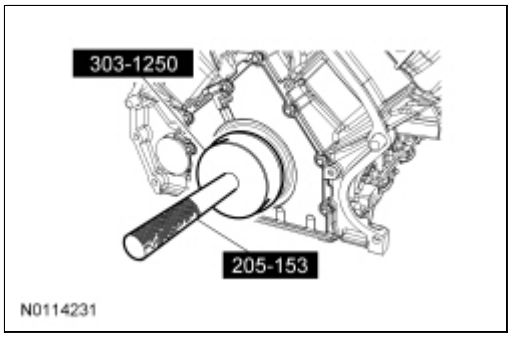
1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

   Clean and inspect the mating surface.
2. **NOTE:** If the rear crankshaft seal retaining plate is not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever

is longer. Failure to follow this procedure may cause future oil leaks.

Apply a bead of silicone gasket and sealant around the groove along the rear of crankshaft rear seal retainer plate sealing surface.



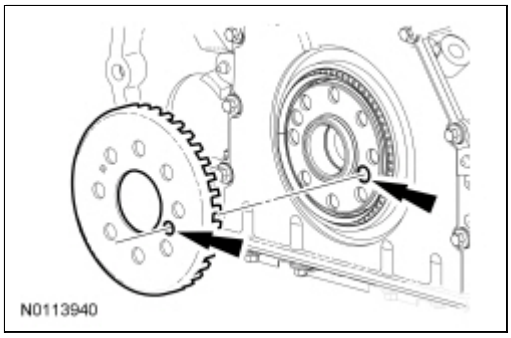
3. Install the crankshaft rear seal retainer plate and the 8 bolts in the sequence shown, in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

4. **NOTE:** Lubricate the crankshaft rear seal with clean engine oil prior to installation.

   Using the Rear Main Seal Installer and Handle, install a new crankshaft rear seal.

5. ***NOTICE:*** **The Crankshaft Position (CKP) sensor must be positioned into the fitting on the crankshaft rear seal retainer plate and be flush against the boss on the engine block before the bolt is installed. If the CKP sensor is installed incorrectly, the CKP sensor can be damaged.**

   Position the CKP sensor and install the bolt.
   - Tighten to 10 Nm (89 lb-in).



repair4less

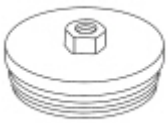
6. Connect the CKP sensor electrical connector.

7. **NOTE:** Inspect the ignition pulse ring for damage. If the ignition pulse ring has been dropped or has any visual damage, it must be discarded.

   With the inset hole on the crankshaft ignition pulse ring aligned with the inset hole on the crankshaft flange, install the crankshaft ignition pulse ring.

8. Install the engine rear cover plate.

9. Install the flexplate. For additional information, refer to Flexplate in this section.



10. Install the oil pan. For additional information, refer to Oil Pan in this section.

11. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

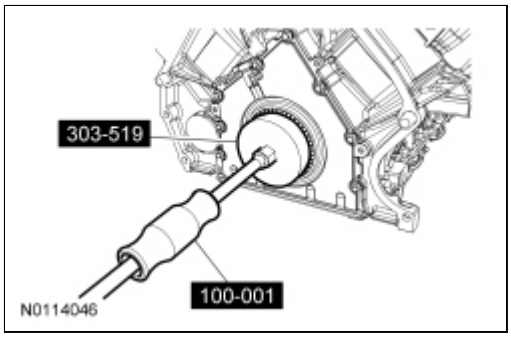
Crankshaft Rear Seal

Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2980-A	Installer, Rear Main Seal 303-1250
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

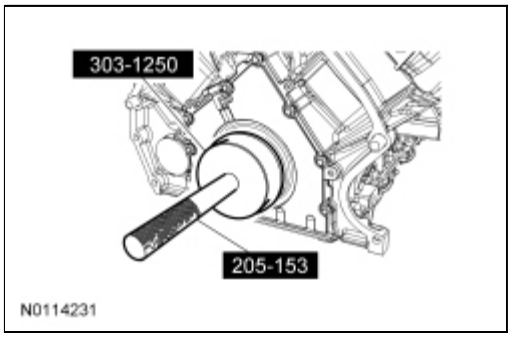


Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

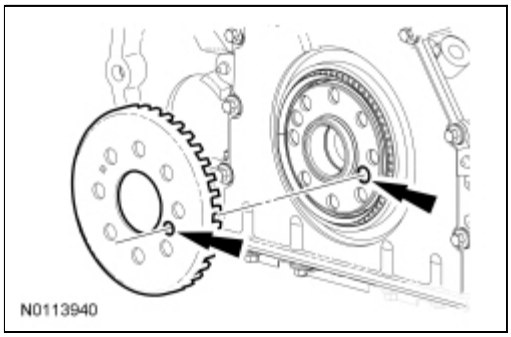
1. Remove the flexplate. For additional information, refer to Flexplate in this section.
2. Remove the engine rear cover plate.
3. **NOTE:** Inspect the ignition pulse ring for damage. If the ignition pulse ring has been dropped or has any visual damage, it must be discarded.

Remove the crankshaft ignition pulse ring.



4. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear seal.

Installation

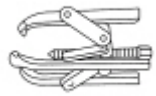


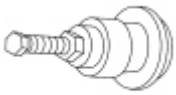
1. **NOTE:** Lubricate the crankshaft rear seal with clean engine oil prior to installation.

   Using the Rear Main Seal Installer and Handle, install a new crankshaft rear seal.

2. **NOTE:** Inspect the ignition pulse ring for damage. If the ignition pulse ring has been dropped or has any visual damage, it must be discarded.

   With the inset hole on the crankshaft ignition pulse ring aligned with the inset hole on the crankshaft flange, install the crankshaft ignition pulse ring.





3. Install the engine rear cover plate.

4. Install the flexplate. For additional information, refer to Flexplate in this section.

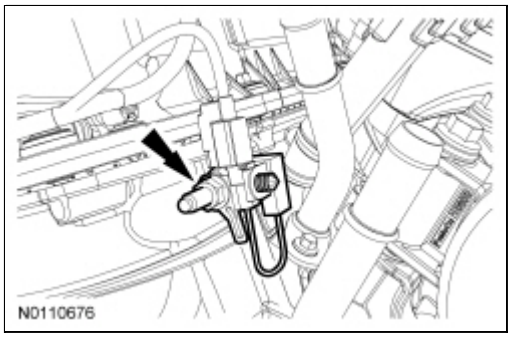
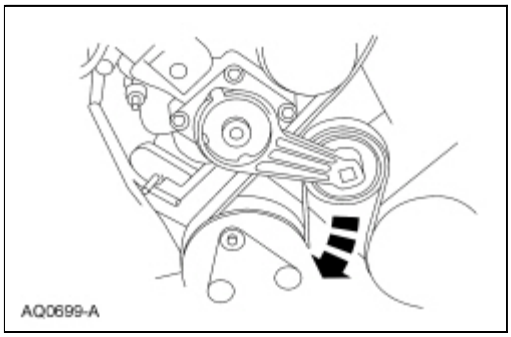
Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-

repair4less

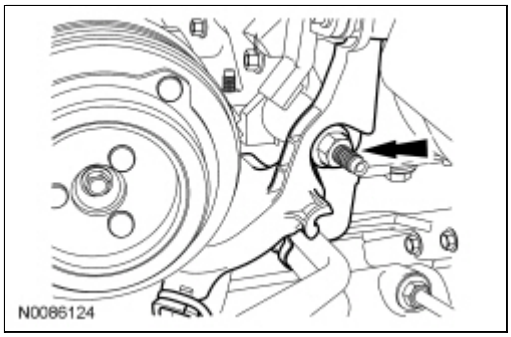
02 .



2. Remove the RH and LH Variable Camshaft Timing (VCT) variable force solenoids. For additional information, refer to Section 303-14 .

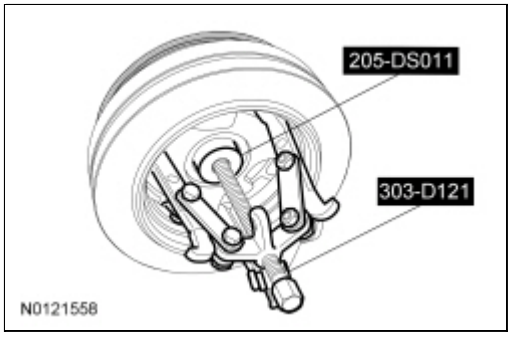
3. Remove the nut and the position the radio ignition interference capacitor aside.

4. Loosen the 4 coolant pump pulley bolts.



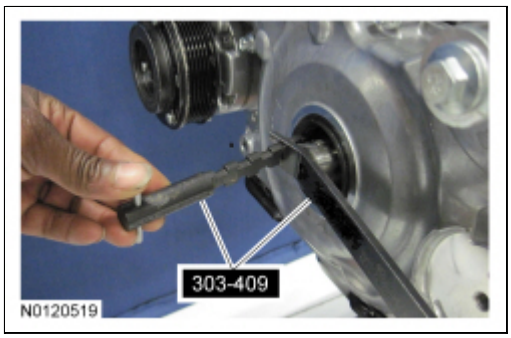
5. Rotate the tensioner clockwise and remove the accessory drive belt.

6. Remove the 4 bolts and the coolant pump pulley.



7. Drain the engine oil.

8. Remove the nut and position aside the transmission cooler tube support bracket and the starter wiring harness support bracket.



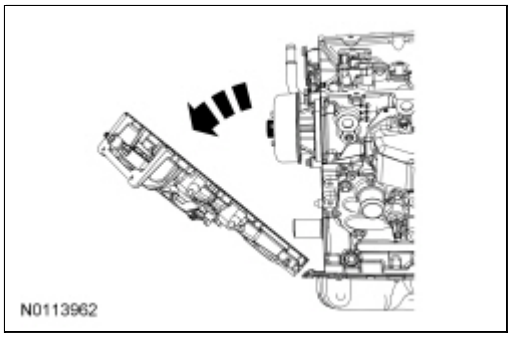
9. Remove the crankshaft pulley bolt.
    - Discard the crankshaft pulley bolt.

10. Using the 3 Jaw Puller and Step Plate, remove the crankshaft pulley.

11. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

    Using the Oil Seal Remover, remove the crankshaft front oil seal.

12. Remove the 2 bolts and the 2 accessory drive idler pulleys.



13. Remove the 3 bolts and the accessory drive belt tensioner.

14. Remove the 4 front oil pan bolts.

15. Remove the power steering pump. For additional information, refer to Section 211-02 .

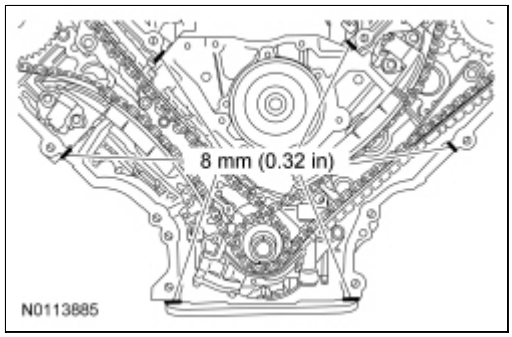
16. Remove the 17 bolts and the 3 studs.

17. Remove the engine front cover from the front cover-to-cylinder block dowel.
    - Remove and discard the engine front cover gaskets.

repair4less

18. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the mating surfaces.



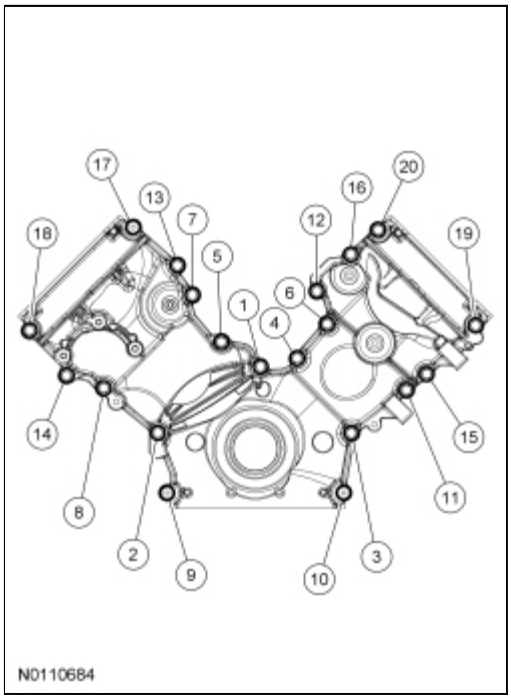
Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: If the engine front cover is not secured within 5 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

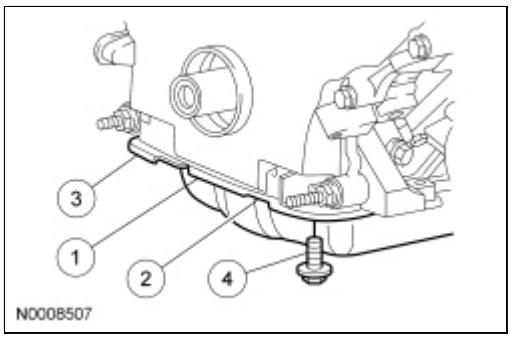
   NOTE: Make sure that the engine front cover gasket is in place on the engine front cover before installation.

   Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.



2. Install new engine front cover gaskets on the engine front cover. Position the engine front cover onto the dowels. Install the fasteners finger-tight.

3. Tighten the 20 engine front cover fasteners in the sequence shown in 2 stages.
   Stage 1: Tighten all fasteners to 10 Nm (89 lb-in).
   Stage 2: Tighten all fasteners to 20 Nm (177 lb-in).
   Stage 3: Tighten all fasteners an additional 45 degrees.



Item	Part Number	Description
1	W713261	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 33
2	W713261	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 33

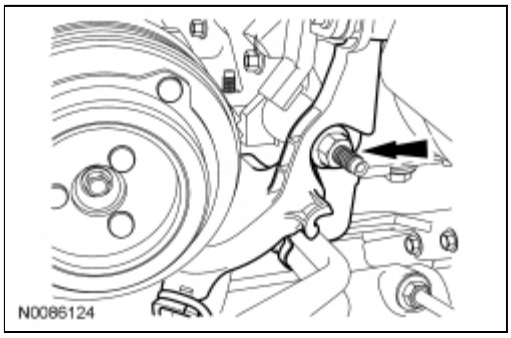
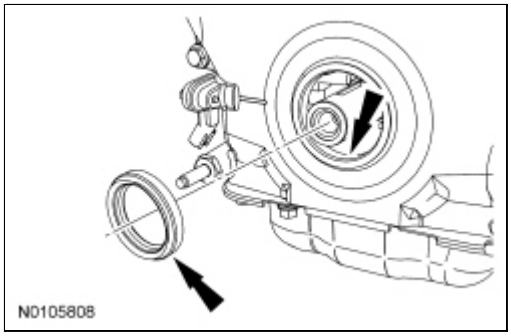
20	W713261	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 33

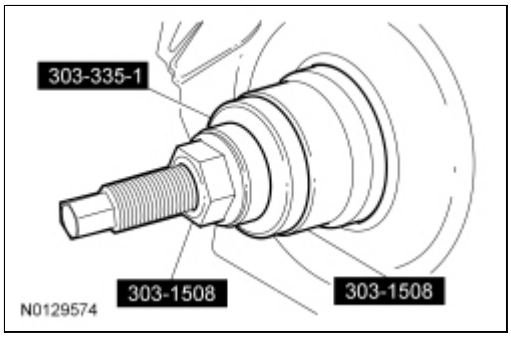


4. Loosely install the 4 bolts, then tighten in 2 stages, in the sequence shown.

repair4less

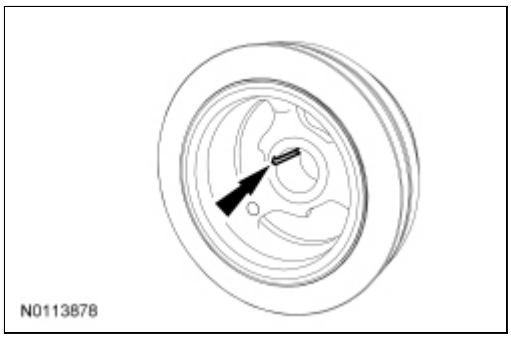


- Stage 1: Tighten to 10 Nm (89 lb-in).
- Stage 2: Tighten an additional 45 degrees.

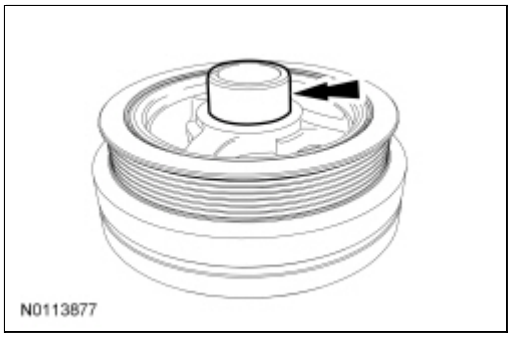


5. Position the starter wiring harness support bracket and the transmission fluid cooler tube support bracket and tighten the nut.
    - Tighten to 10 Nm (89 lb-in).

6. Lubricate the engine front cover and the crankshaft seal inner lip with clean engine oil.



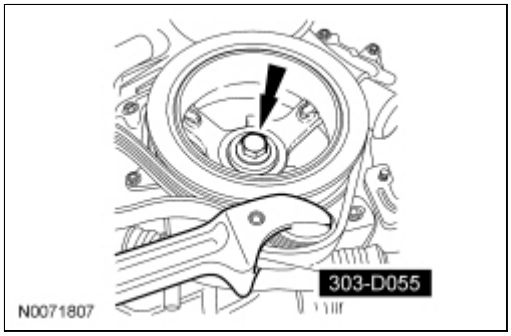
7. Using the Crankshaft Damper and Crankshaft Front Seal Installer and the Front Cover Oil Seal Installer, install a new crankshaft front seal into the engine front cover.



8. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

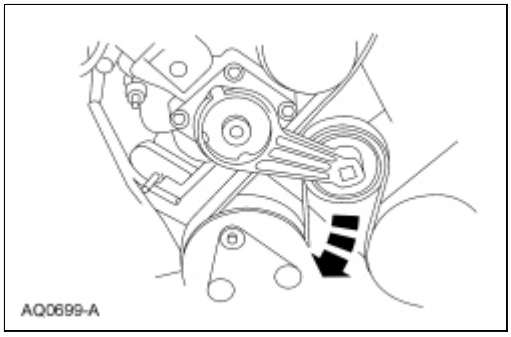
9. Lubricate the crankshaft pulley sealing area with clean engine oil prior to installation.



10. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

repair4less

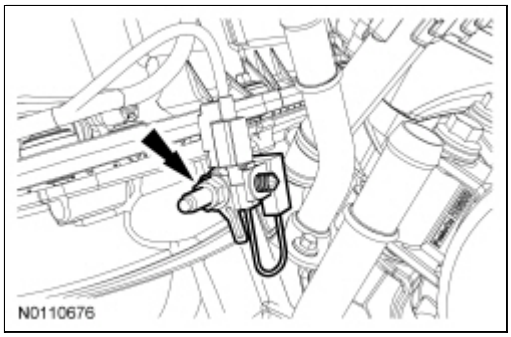
11. Using the Strap Wrench, install a new crankshaft pulley bolt and the original washer, tighten the bolt in 2 stages:
    - Stage 1: Tighten to 175 Nm (129 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



12. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

13. Install the 2 accessory drive idler pulleys and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

14. Position the coolant pump pulley and install the 4 bolts finger-tight.

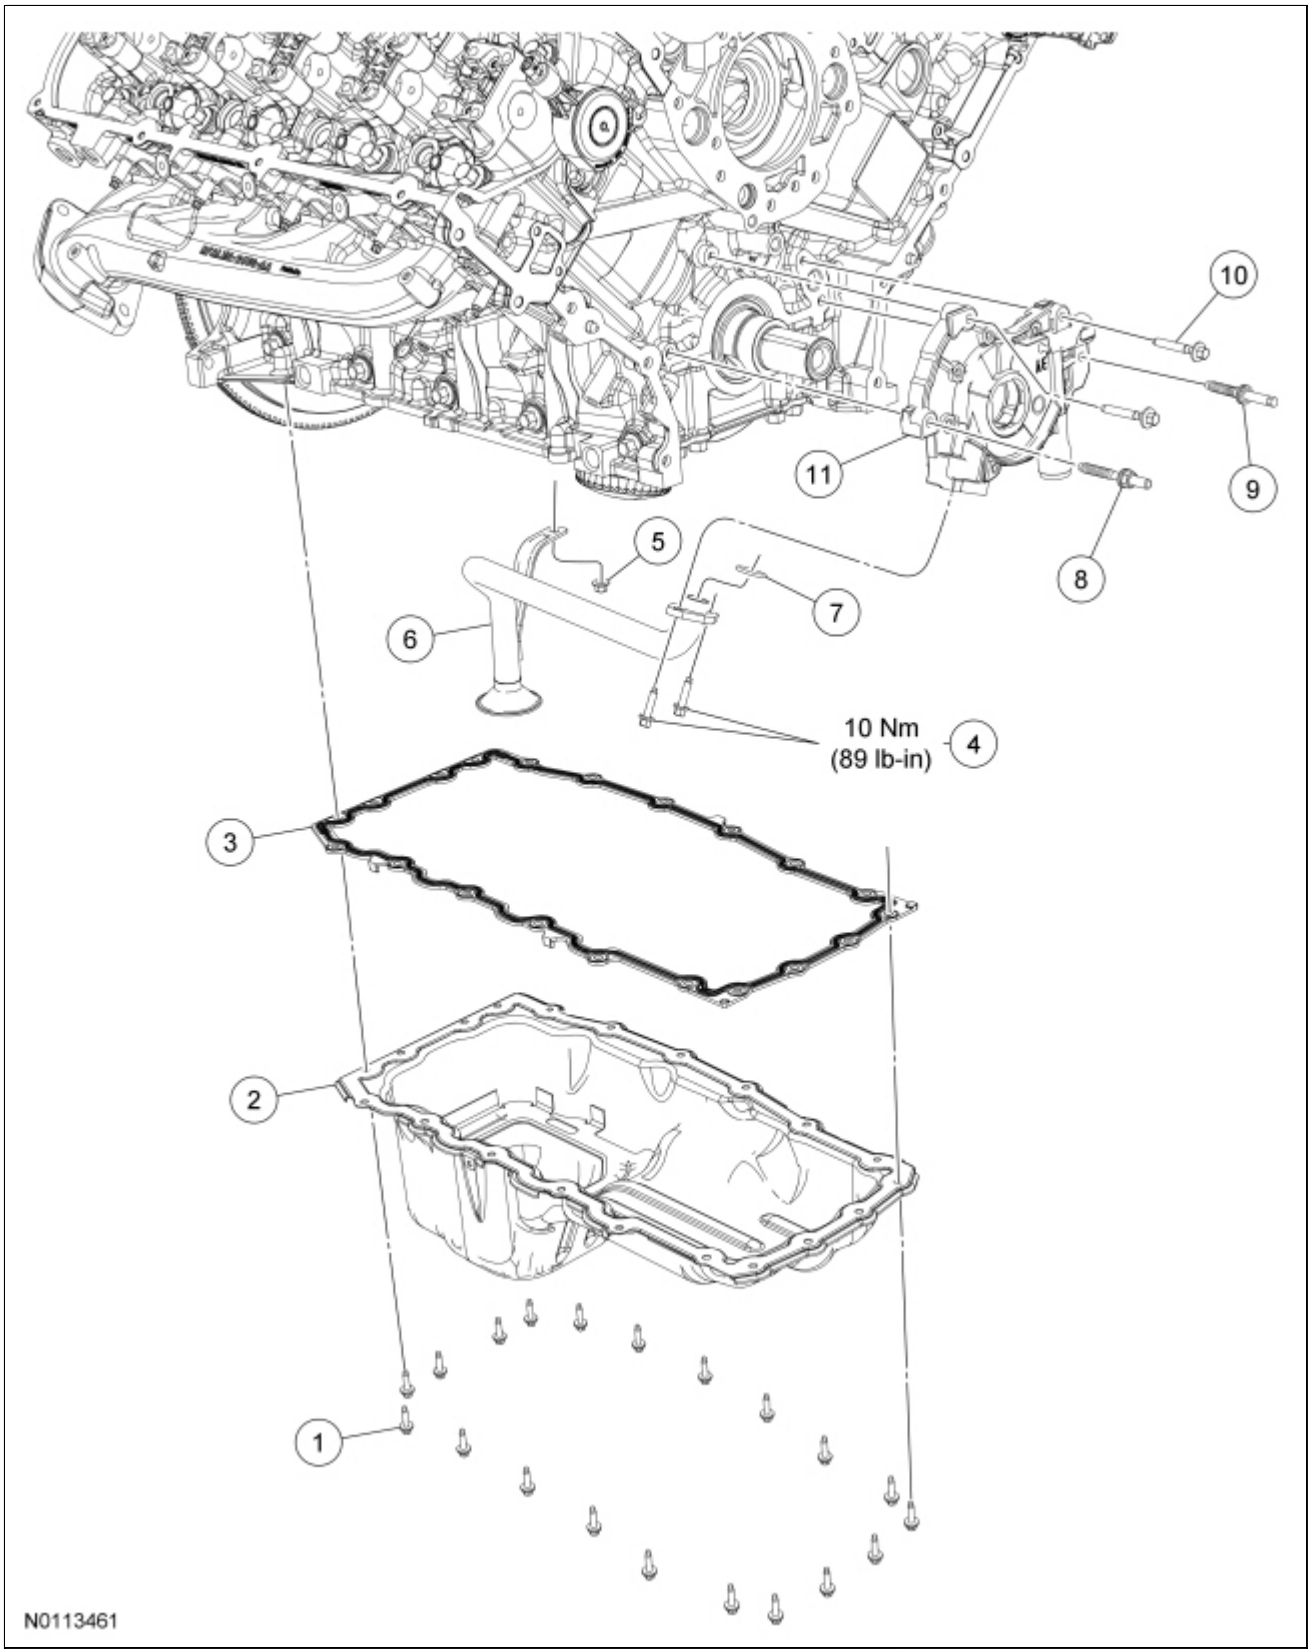


15. Install the power steering pump. For additional information, refer to Section 211-02 .

16. Rotate the tensioner clockwise and install the accessory drive belt.

17. Tighten the 4 coolant pump pulley bolts.
    - Tighten to 25 Nm (18 lb-ft).

18. Position the radio ignition interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).



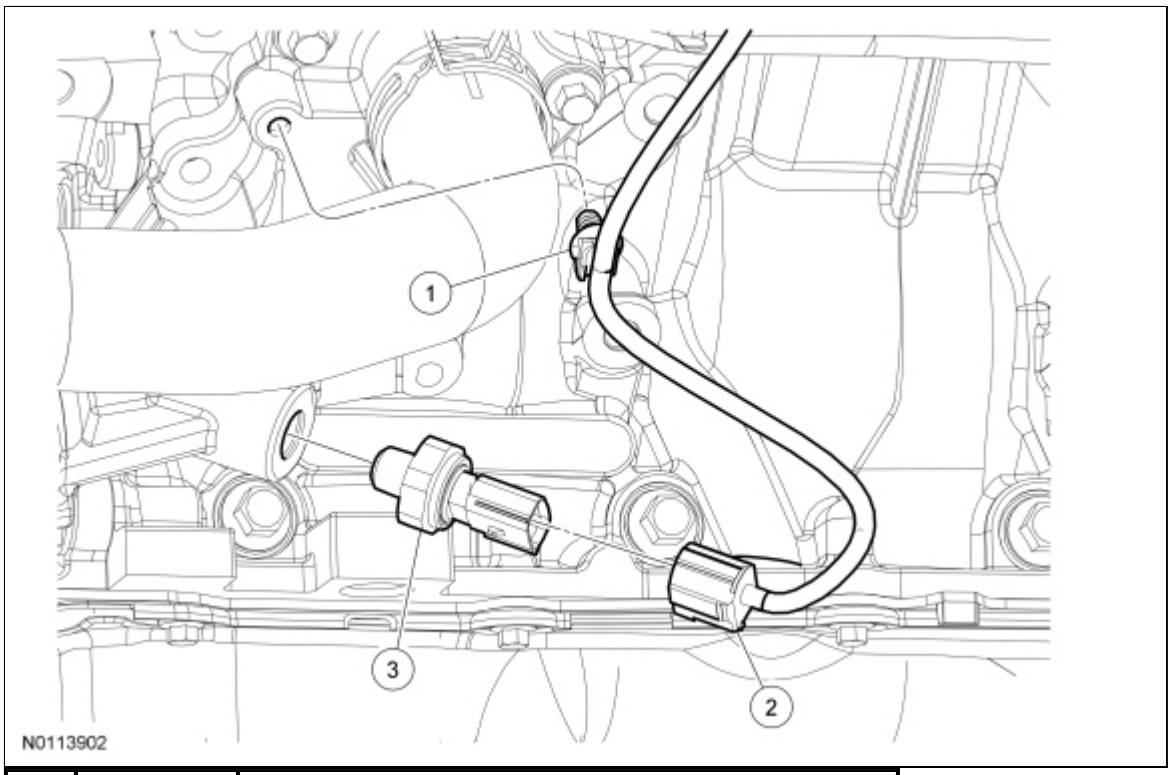
19. Install the RH and LH VCT variable force solenoids. For additional information, refer to Section 303-14 .

20. Fill the crankcase with clean engine oil.

---

repair4less

Engine Lubrication Components — Exploded View



Item	Part Number	Description
1	W503276	Oil pan bolt (20 required)

repair4less

2	6675	Oil pan
3	6710	Oil pan gasket
4	N503276	Oil pump screen and pickup tube-to-oil pump bolts (2 required)

Engine Oil Pressure (EOP) Switch

Item	Part Number	Description
1	—	Engine Oil Pressure (EOP) switch electrical connector (part 12C508)
2	—	EOP switch wiring harness retainer (part 12C508)
3	9278	EOP switch

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the Engine Oil Pressure (EOP) switch wiring harness retainer and the electrical connector.
3. Remove the EOP switch.

Installation

1. Install the EOP switch.
   - Stage 1: Tighten to 14 Nm (124 lb-in).
   - Stage 2: Tighten an additional 180 degrees.

repair4less

2. Connect the EOP switch electrical connector and attach the wiring harness retainer.

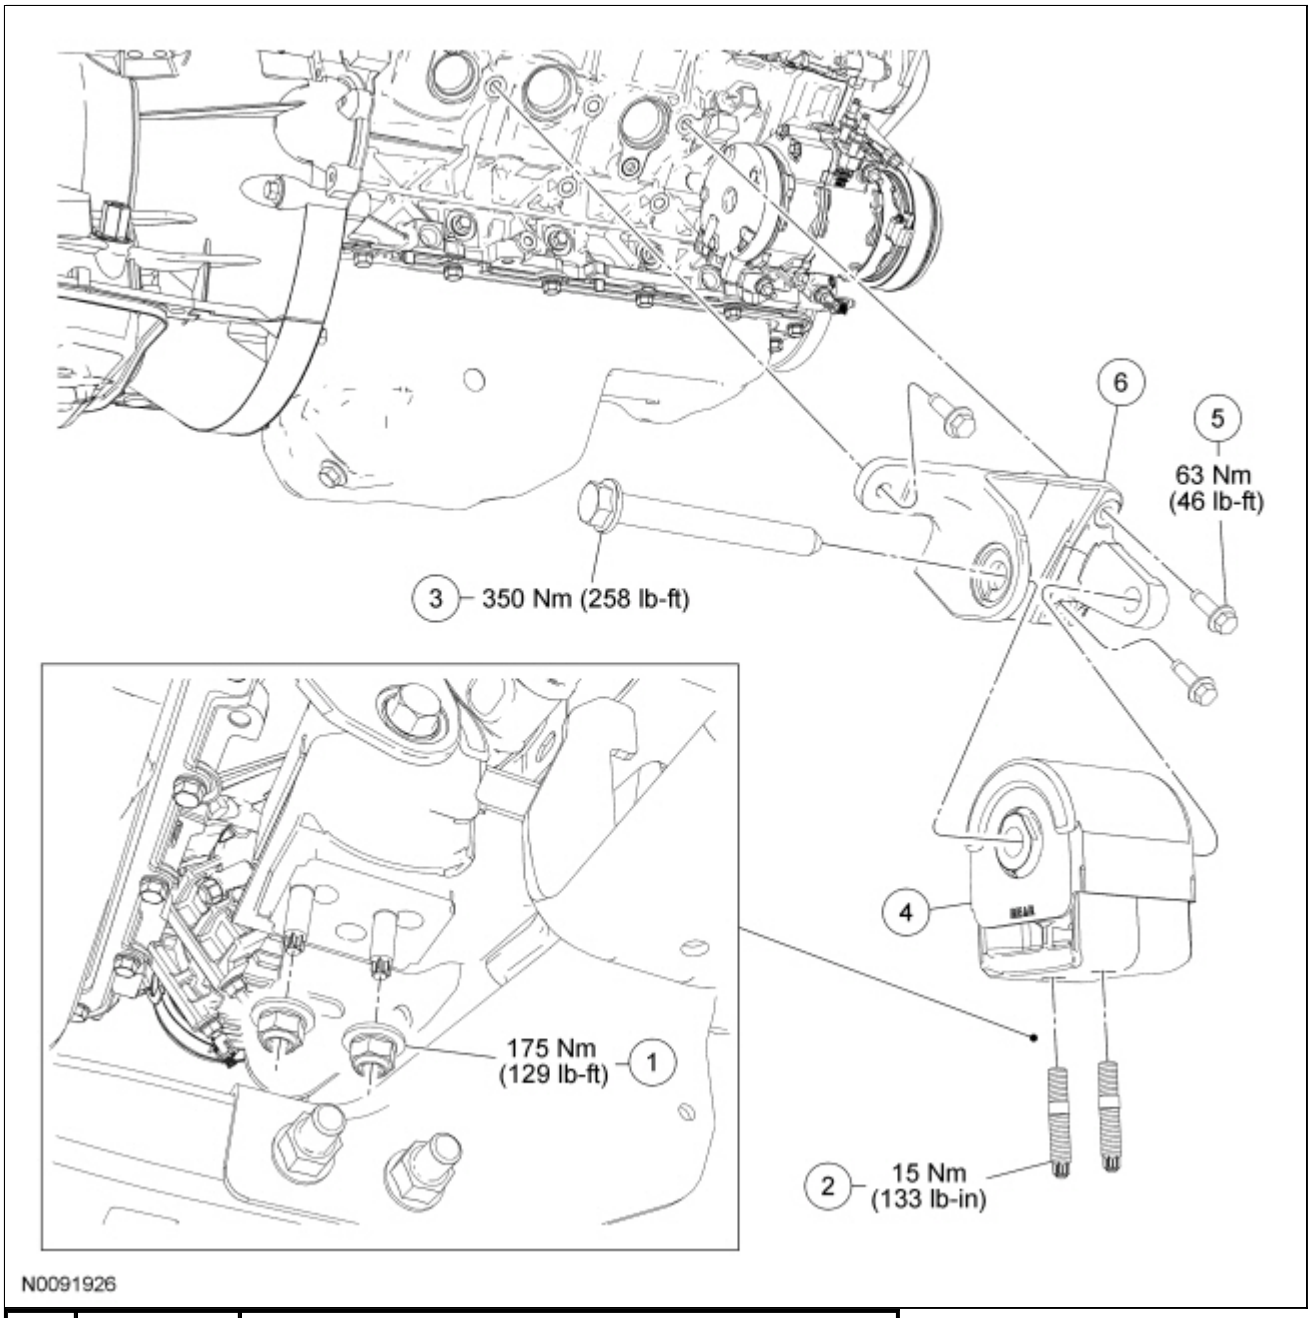
Engine Support Insulators

Special Tool(s)

 ST2176-B	Support Bar, Engine 303-F070
 ST3110-A	Support Brackets, Engine 303-1507 or equivalent

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

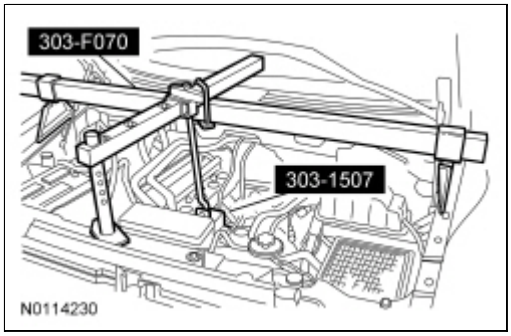


LH Engine Support Insulator

repair4less

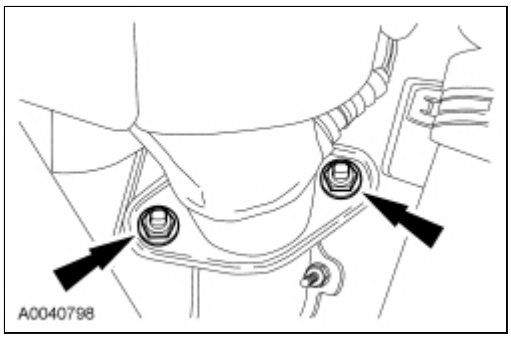
Item	Part Number	Description
1	W712805	LH engine support insulator-to-frame bolt (3 required)
2	W711142	LH engine support insulator through bolt
3	6B032	LH engine support insulator
4	W711141	LH engine support insulator-to-cylinder block bracket bolt (3 required)
5	6061	LH engine support insulator-to-cylinder block bracket

RH Engine Support Insulator



Item	Part Number	Description
1	W707251	RH engine support insulator-to-frame nut (2 required)
2	W711144	RH engine support insulator-to-frame stud bolt (2 required)
3	W711142	RH engine support insulator through bolt
4	6H028	RH engine support insulator
5	W711141	RH engine support insulator-to-cylinder block bracket bolt (3 required)
6	—	RH engine support insulator-to-cylinder block bracket

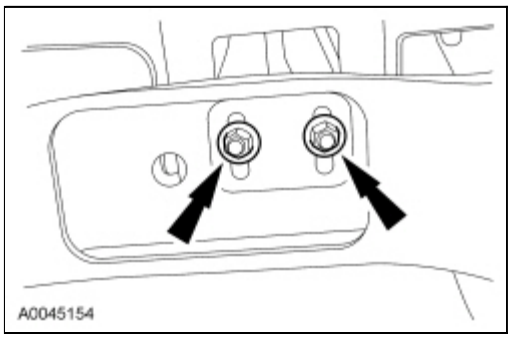
Removal



repair4less

All engine support insulators

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
3. Remove the starter. For additional information, refer to Section 303-06 .
4. Remove the front drive shaft. For additional information, refer to Section 205-01 .
5. Install the Engine Support Bar and Engine Support Bracket.



6. Remove the 4 Y-pipe flange nuts (2 RH and 2 LH).

7. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

   Loosen the 2 transmission mount-to-crossmember nuts.

RH engine support insulator

8. ***NOTICE:*** **Only use hand tools when loosening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

   Loosen the LH engine support insulator through bolt.

9. ***NOTICE:*** **Only use hand tools when removing the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

   Remove the RH engine support insulator through bolt.

10. ***NOTICE:*** **Only use hand tools when removing the engine support insulator nuts or damage to the engine support insulator can occur.**

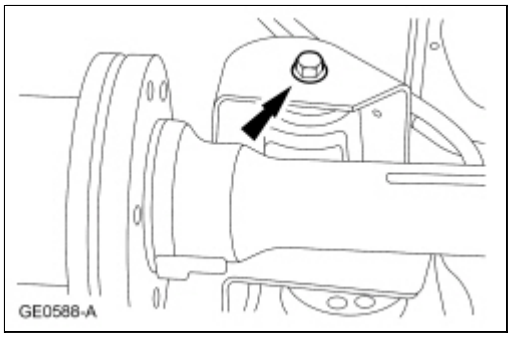
    NOTE: If during nut removal the stud bolt is extracted from the engine support insulator, separate the nut from the stud bolt prior to stud bolt installation.

    Remove the 2 RH engine support insulator nuts.

11. ***NOTICE:*** **Only use hand tools when removing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

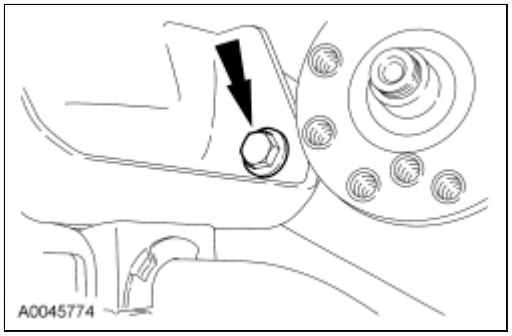
    Remove the 2 RH engine support insulator stud bolts.

12. Position a suitable hydraulic jack under the front axle. Securely strap the jack to the axle.



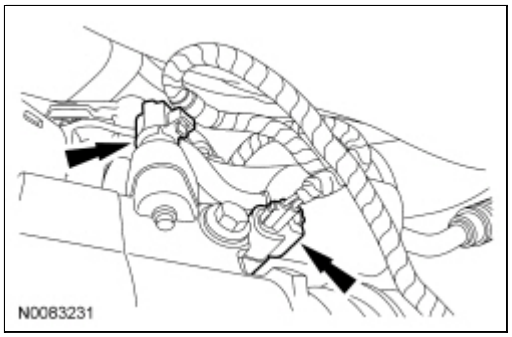
13. **NOTE:** Rotate the steering column so the pinch bolt for the steering column coupling allows clearance for the isolator bolt.

    Remove the upper front axle carrier mounting bushing bolt.

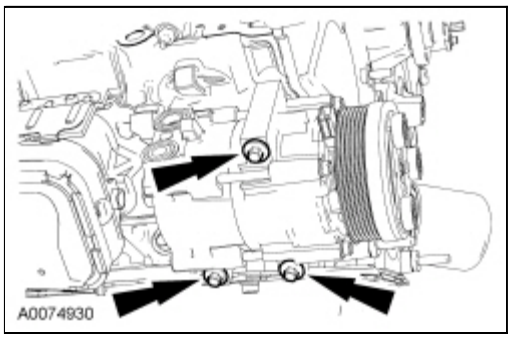


14. Remove the axle shaft housing carrier bushing bolt.

repair4less

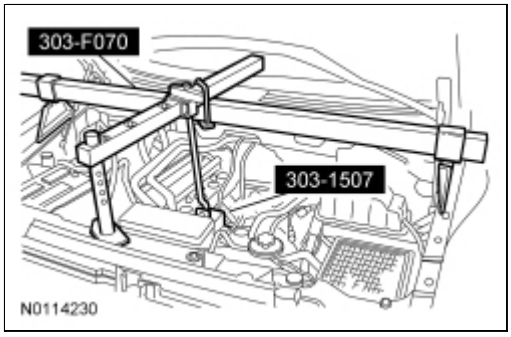


15. Remove the lower front axle carrier mounting bushing bolt.



16. ***NOTICE:*** **Use care when lowering the front axle housing or when vacuum lines to the axle solenoid may become disconnected or damaged.**

    Lower the axle to allow clearance to the RH lower front mount bracket bolt.



17. Disconnect the A/C compressor electrical connector and the wiring harness retainer.

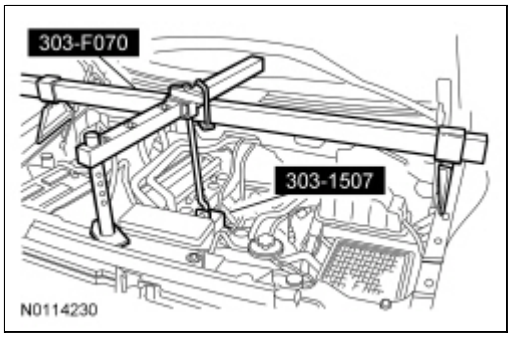
18. Remove the 3 bolts and position the A/C compressor aside.

19. Using the Engine Support Bar and Engine Support Bracket, raise the engine.

20. Remove the 3 bolts and the RH engine support insulator-to-cylinder block bracket.

21. Remove the RH engine support insulator.

LH engine support insulator



22. ***NOTICE:*** **Only use hand tools when loosening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Loosen the RH engine support insulator through bolt.

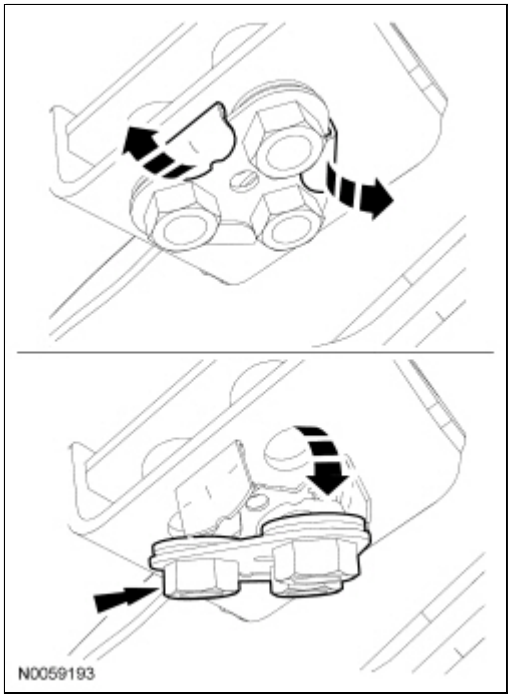
23. ***NOTICE:*** **Only use hand tools when removing the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove the LH engine support insulator through bolt.

24. Using the Engine Support Bar and Engine Support Bracket, raise the engine.

25. ***NOTICE:*** **Only use hand tools when removing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

    Remove the 3 engine support insulator-to-frame bolts.
    - Discard the 3 bolts.



26. Remove the 3 bolts and the LH engine support insulator-to-cylinder block bracket.

27. Remove the LH engine support insulator.

28. Inspect the engine support insulator-to-frame nut plate for thread damage. If the nut plate is damaged, bend 2 tabs back and remove the nut plate. Replace the nut plate with service part number

repair4less

56190 and bend the 2 tabs back to the original position.

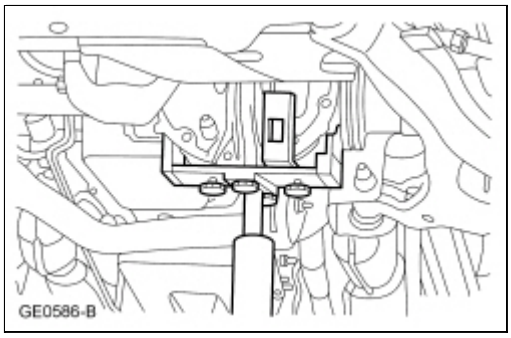
Installation

RH engine support insulator

1. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

2. ***NOTICE:*** **Only use hand tools when installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

   Position the RH engine support insulator into the vehicle and install the 2 stud bolts.
   - Tighten to 15 Nm (133 lb-in).



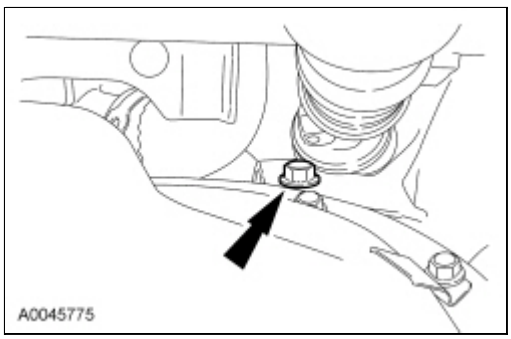
3. Position the RH engine support insulator-to-cylinder block bracket and install the 3 bolts.
   - Tighten to 63 Nm (46 lb-ft).

4. ***NOTICE:*** **Only use hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

   Install the 2 RH engine support insulator nuts.
   - Tighten to 175 Nm (129 lb-ft).

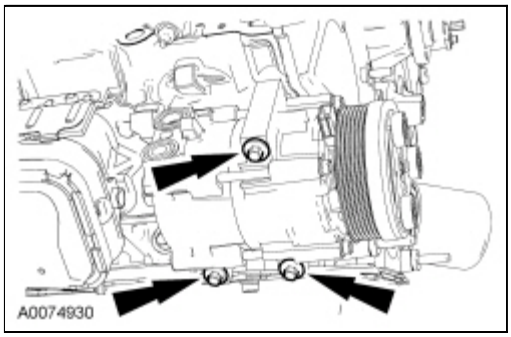
5. ***NOTICE:*** **Use care when positioning the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

   Raise the front axle carrier into position.

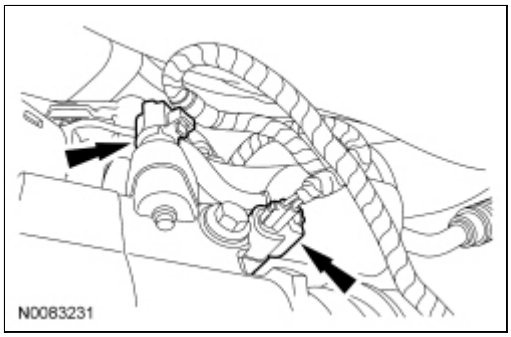


6. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

7. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



8. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

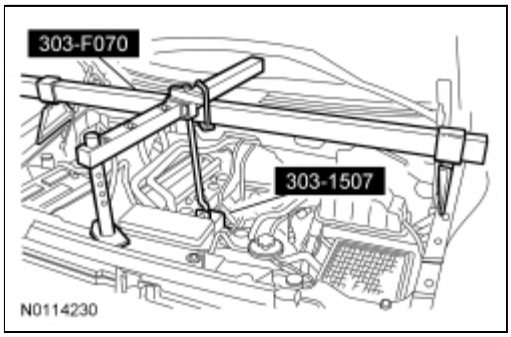


repair4less

9. Position the A/C compressor and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

10. Connect the A/C compressor electrical connector and the wiring harness retainer.

LH engine support insulator



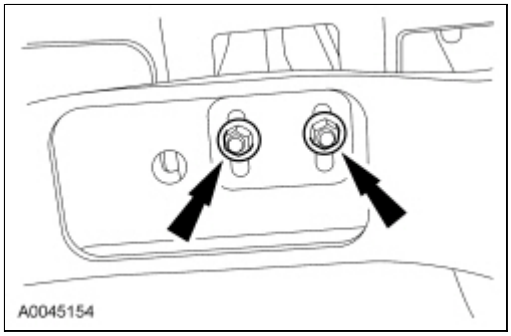
11. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

12. Position the LH engine support insulator and hand start the 3 new engine support insulator-to-frame bolts.
    - Tighten to 175 Nm (129 lb-ft).

13. Position the LH engine support insulator-to-cylinder block bracket and install the 3 bolts.
    - Tighten to 63 Nm (46 lb-ft).

All engine support insulators

14. Using the Engine Support Bar and Engine Support Bracket, lower the engine into position.



15. ***NOTICE:*** **Only use hand tools when installing the engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Install the LH and RH engine support insulator through bolts.
    - Apply threadlock to the bolt threads prior to installation.
    - Tighten to 350 Nm (258 lb-ft).

16. ***NOTICE:*** **Only use hand tools when installing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

    Install the transmission mount-to-crossmember nuts.
    - Tighten to 103 Nm (76 lb-ft).

17. Position the Y-pipe and install the 4 nuts (2 RH and 2 LH).
    - Tighten to 40 Nm (30 lb-ft).

18. Remove the Engine Support Bar and Engine Support Bracket.

19. Install the starter. For additional information, refer to Section 303-06 .

repair4less

20. Install the front driveshaft. For additional information, refer to Section 205-01 .

21. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

Exhaust Manifold — LH

Special Tool(s)

 ST2176-B	Support Bar, Engine 303-F070 or equivalent

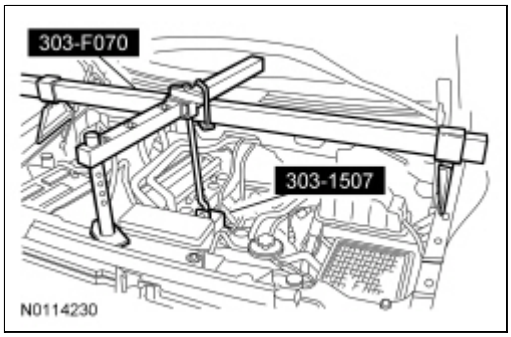
Exhaust Manifold — LH

repair4less

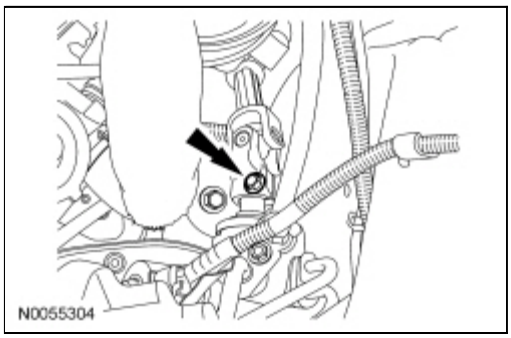
Item	Part Number	Description
1	W705443	Exhaust Y-pipe flange nuts (2 required)
2	W714870	LH exhaust manifold nut (8 required)
3	9431	LH exhaust manifold
4	9448	LH exhaust manifold gasket (2 required)
5	W714869	Exhaust manifold-to-cylinder head stud (8 required)



Removal

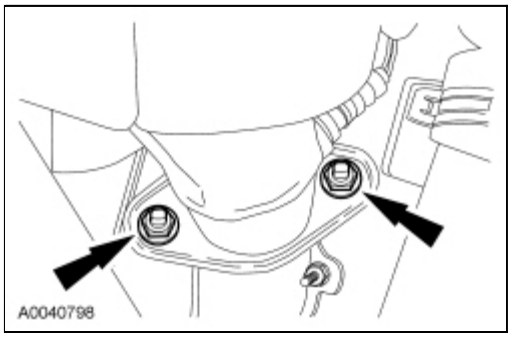
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-



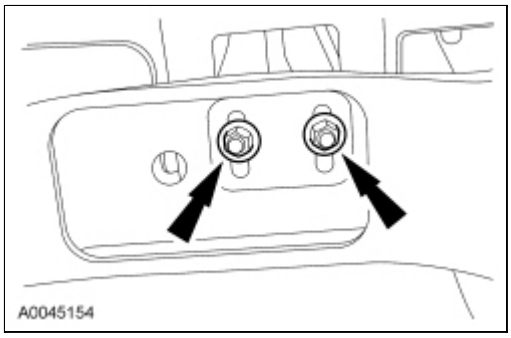
02 .

2. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
3. Remove the LH inner fenderwell. For additional information, refer to Section 501-02 .
4. Install the Engine Support Bar and the Engine Support Bracket.



5. ***NOTICE:*** **Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

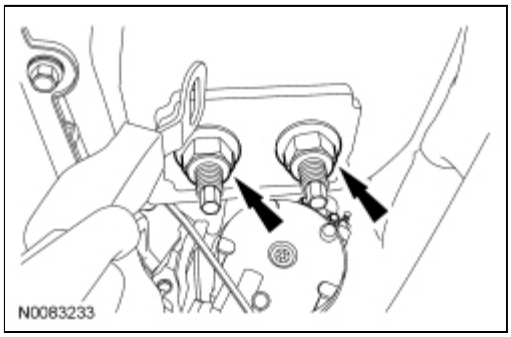
   Remove the bolt and disconnect the steering shaft and position aside.



6. Remove the 4 exhaust manifold-to-catalytic converter nuts (2 LH and 2 RH).

7. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

   Loosen the 2 transmission mount-to-crossmember nuts.

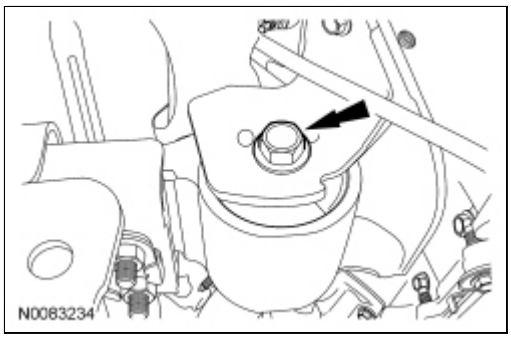


repair4less

8. ***NOTICE:*** **Only use hand tools when removing the engine support insulator nuts or the engine support insulator may be damaged.**

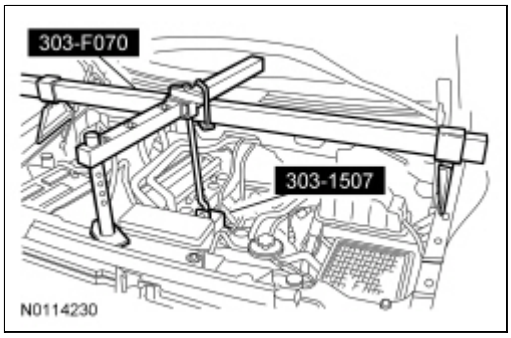
   NOTE: If during nut removal the stud bolt is extracted from the engine support insulator, separate the nut from the stud bolt prior to stud bolt installation.

   Remove the 2 RH engine support insulator nuts.



Four-Wheel Drive (4WD) vehicles

9. Remove the front driveshaft. For additional information, refer to Section 205-01 .



All vehicles

10. ***NOTICE:*** **Only use hand tools when removing the engine support insulator through bolt or the engine support insulator may be damaged.**

    Remove the LH engine support insulator bolt.

11. Using the Engine Support Bar and Engine Support Bracket, raise the engine.

12. Remove the 2 bolts and the exhaust shield.

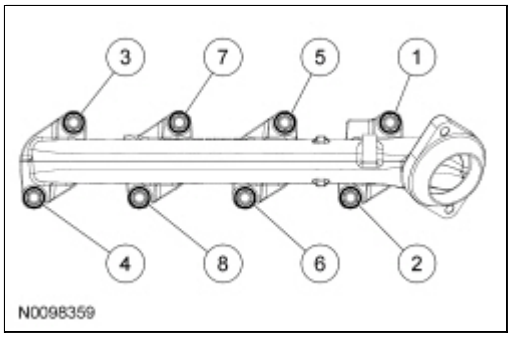
13. Remove the 8 exhaust manifold nuts, the 8 studs, the exhaust manifold and the 2 exhaust manifold gaskets.
    - Discard the exhaust manifold nuts, studs and gaskets.

14. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

    NOTE: Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.

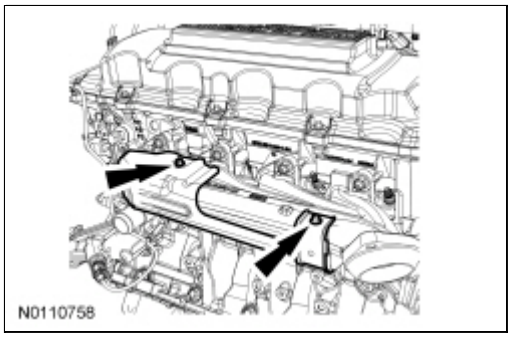
    Remove and discard the 2 exhaust manifold gaskets. Clean the sealing surfaces with metal surface prep.

15. Inspect the exhaust manifold. For additional information, refer to Section 303-00 .



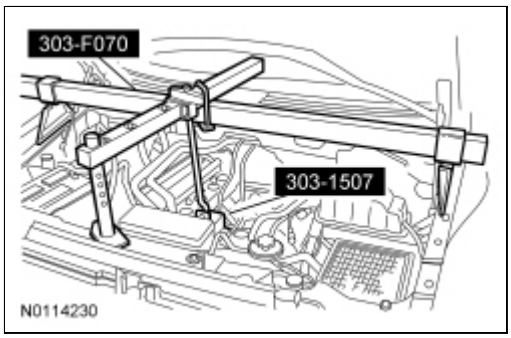
Installation

All vehicles



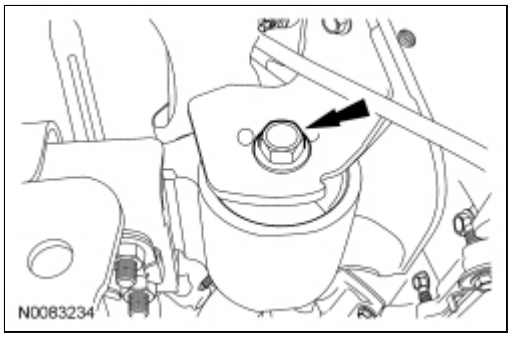
1. Using 2 new exhaust manifold gaskets and 8 new studs, position the 2 gaskets and exhaust manifold and install the 8 studs.
    - Tighten to 25 Nm (18 lb-ft).

2. Using new exhaust manifold nuts, install the 8 nuts in 2 stages in the sequence shown.
    - Stage 1: Tighten to 25 Nm (18 lb-ft).
    - Stage 2: Tighten to 32 Nm (24 lb-ft).



repair4less

3. Position the exhaust manifold heat shield and install the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).

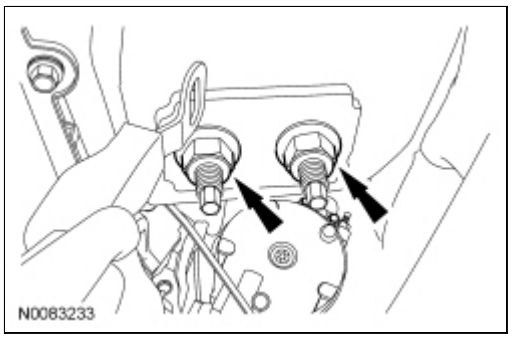


4. Using the Engine Support Bar and Engine Support Bracket, lower the engine.

5. ***NOTICE:*** **Only use hand tools when tightening the engine support insulator through bolt or the engine support insulator may be damaged.**

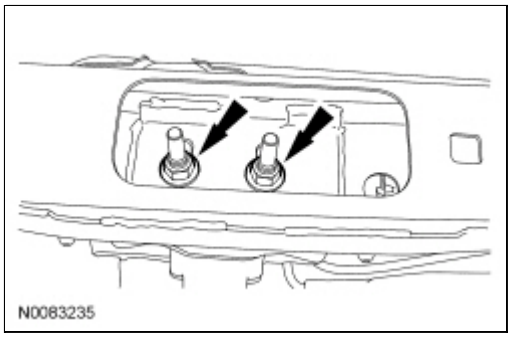
   Apply threadlock to the bolt threads and install the LH engine support insulator bolt.
    - Tighten to 350 Nm (258 lb-ft).

Four-Wheel Drive (4WD) vehicles



6. Install the front driveshaft. For additional information, refer to Section 205-01 .

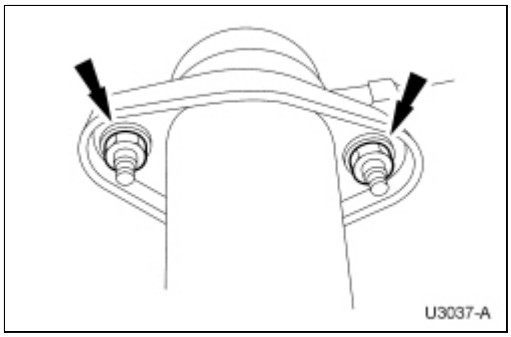
All vehicles



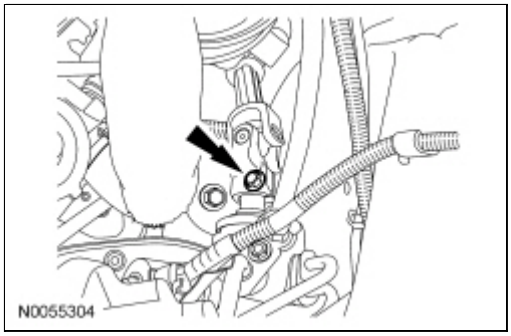
7. ***NOTICE:*** **Only use hand tools when tightening the engine support insulator nuts or the engine support insulator may be damaged.**

   NOTE: Make sure the RH engine support insulator mating surfaces and the washer mating surface are free of foreign material and corrosion before installation. Install a new washer.

   Apply threadlock to the stud threads and install the RH engine support insulator washer and nuts.
   - Tighten to 175 Nm (129 lb-ft).

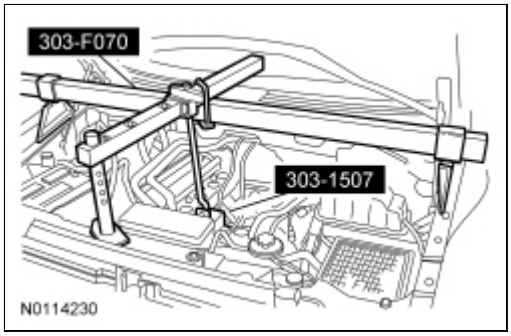


8. Tighten the 2 transmission mount nuts.
   - Tighten to 103 Nm (76 lb-ft).



9. Install the 4 exhaust Y-pipe flange nuts (2 RH and 2 LH).
   - Tighten to 40 Nm (30 lb-ft).

repair4less



10. ***NOTICE:*** **Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Connect the steering shaft and install the bolt.
    - To install, tighten to 30 Nm (22 lb-ft).

11. Install the LH inner fenderwell. For additional information, refer to Section 501-02 .

12. Remove the Engine Support Bar and Engine Support Bracket.

13. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

repair4less

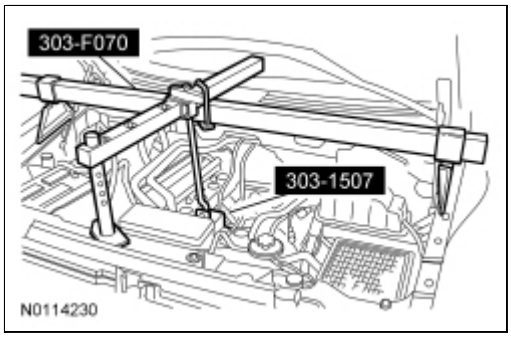
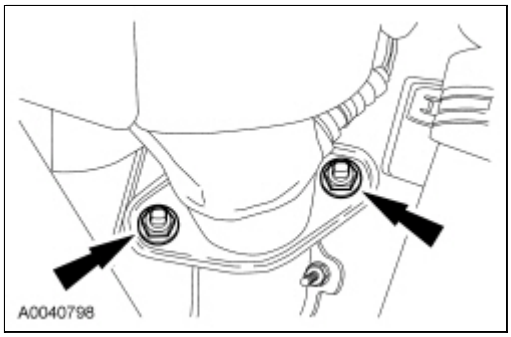
5	W707747	Exhaust manifold stud (8 required)

Removal



All vehicles

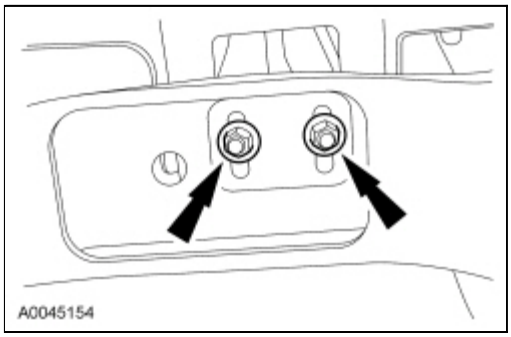
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-



repair4less

02 .

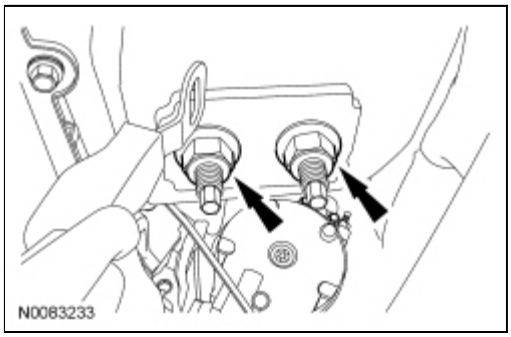
2. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
3. Remove the RH inner fenderwell. For additional information, refer to Section 501-02 .
4. Install the Engine Support Bar and the Engine Support Bracket.



5. Remove the starter. For additional information, refer to Section 303-06 .
6. Remove the 4 exhaust manifold-to-catalytic converter nuts (2 LH and 2 RH).

7. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

   Loosen the 2 transmission mount-to-crossmember nuts.

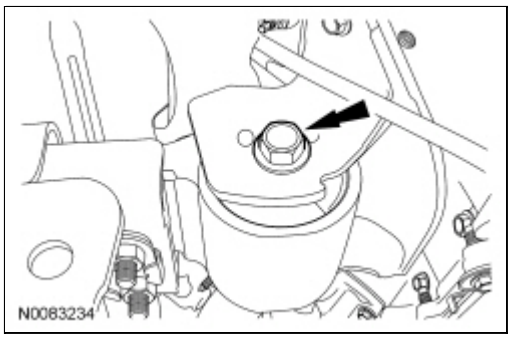


8. ***NOTICE:*** **Only use hand tools when removing the engine support insulator nuts or the engine support insulator may be damaged.**

   NOTE: If during nut removal the stud bolt is extracted from the engine support insulator, separate the

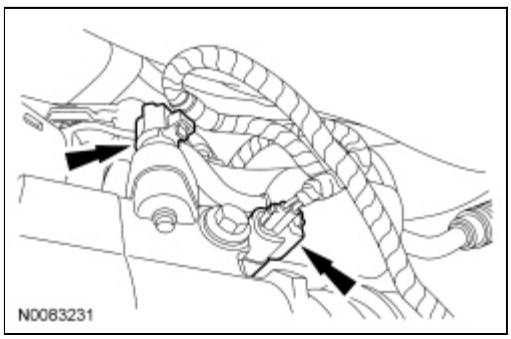
nut from the stud bolt prior to stud bolt installation.

Remove the 2 RH engine support insulator nuts.



Four-Wheel Drive (4WD) vehicles

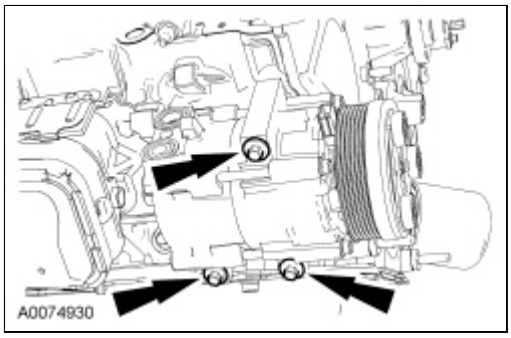
9. Remove the front drive shaft. For additional information, refer to Section 205-01 .



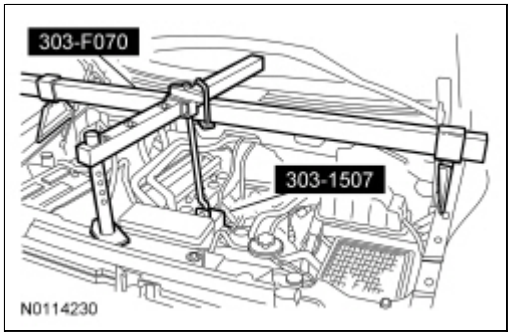
All vehicles

10. ***NOTICE:*** **Only use hand tools when removing the engine support insulator through bolt or the engine support insulator may be damaged.**

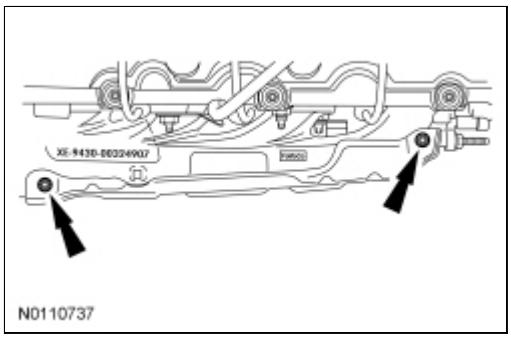
    Remove the LH engine support insulator bolt.



11. Disconnect the A/C compressor electrical connector and the wiring harness retainer.



12. Remove the 3 bolts and position the A/C compressor aside.



repair4less

13. Using the Engine Support Bar and Engine Support Bracket, raise the engine.

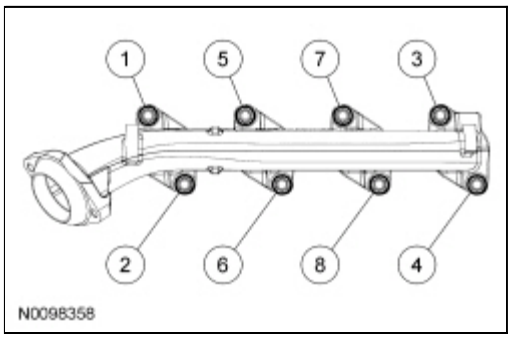
14. Remove the 2 bolts and the exhaust shield.

15. Remove the 8 exhaust manifold nuts, the 8 studs, the exhaust manifold and the 2 exhaust manifold gaskets.
    - Discard the exhaust manifold nuts, studs and gaskets.

16. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

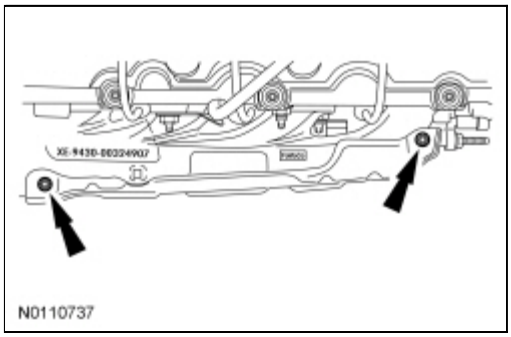
    NOTE: Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging.

    Remove and discard the 2 exhaust manifold gaskets. Clean the sealing surfaces with metal surface prep.



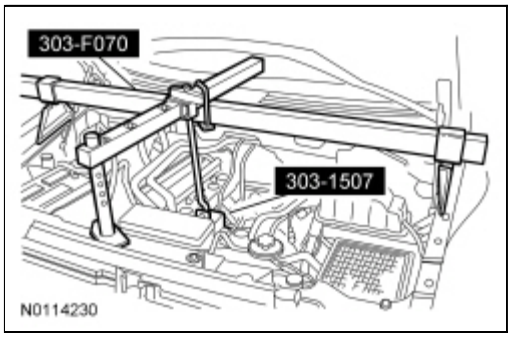
17. Inspect the exhaust manifold. For additional information, refer to Section 303-00 .

Installation



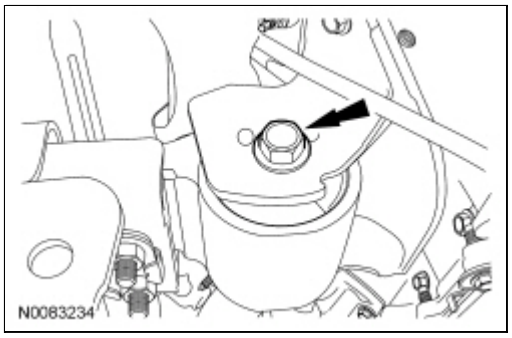
All vehicles

1. Using 2 new exhaust manifold gaskets and 8 new studs, position the 2 gaskets and exhaust manifold and install the 8 studs.
    - Tighten to 25 Nm (18 lb-ft).



2. Using new exhaust manifold nuts, install the 8 nuts in 2 stages in the sequence shown.
    - Stage 1: Tighten to 25 Nm (18 lb-ft).
    - Stage 2: Tighten to 32 Nm (24 lb-ft).

3. Position the exhaust manifold heat shield and install the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).



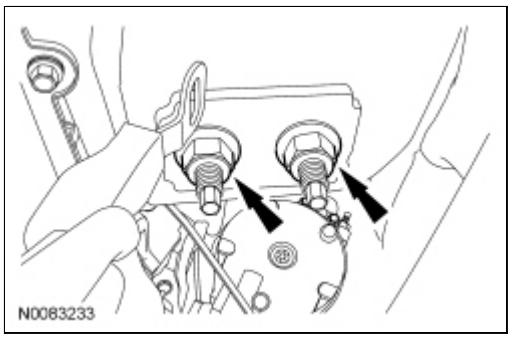
4. Using the Engine Support Bar and Engine Support Bracket, lower the engine.

5. ***NOTICE:*** **Only use hand tools when tightening the engine support insulator through bolt or the engine support insulator may be damaged.**

   Apply threadlock to the bolt threads and install the LH engine support insulator bolt.
    - Tighten to 350 Nm (258 lb-ft).

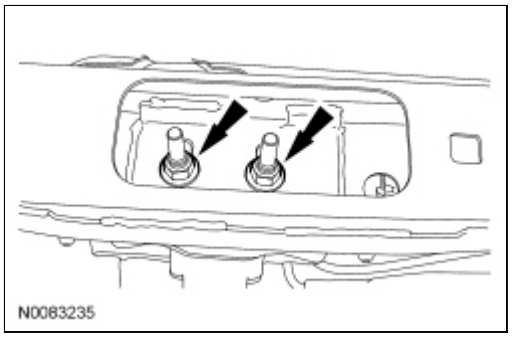
repair4less

Four-Wheel Drive (4WD) vehicles



6. Install the front drive shaft. For additional information, refer to Section 205-01 .

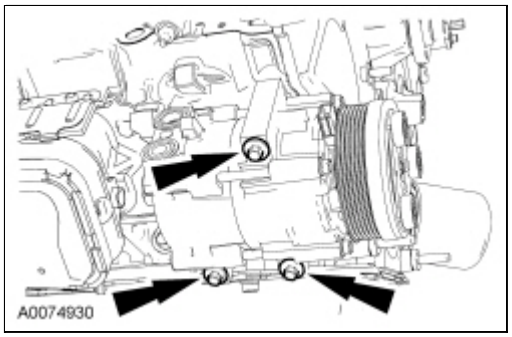
All vehicles



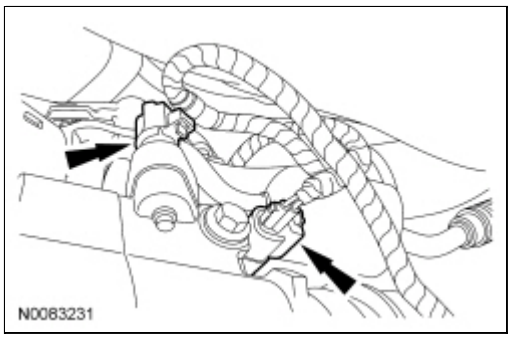
7. ***NOTICE:*** **Only use hand tools when tightening the engine support insulator nuts or the engine support insulator may be damaged.**

   NOTE: Make sure the RH engine support insulator mating surfaces and the washer mating surface are free of foreign material and corrosion before installation. Install a new washer.

   Apply threadlock to the stud threads and install the RH engine support insulator washer and nuts.
   - Tighten to 175 Nm (129 lb-ft).

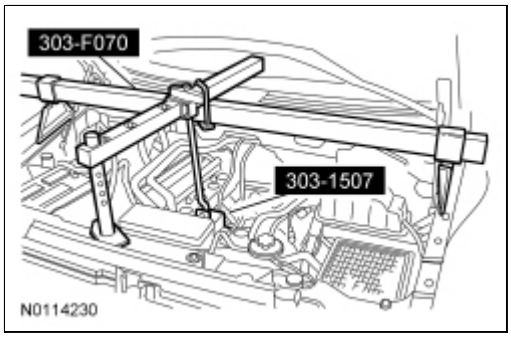


8. Tighten the 2 transmission mount nuts.
   - Tighten to 103 Nm (76 lb-ft).

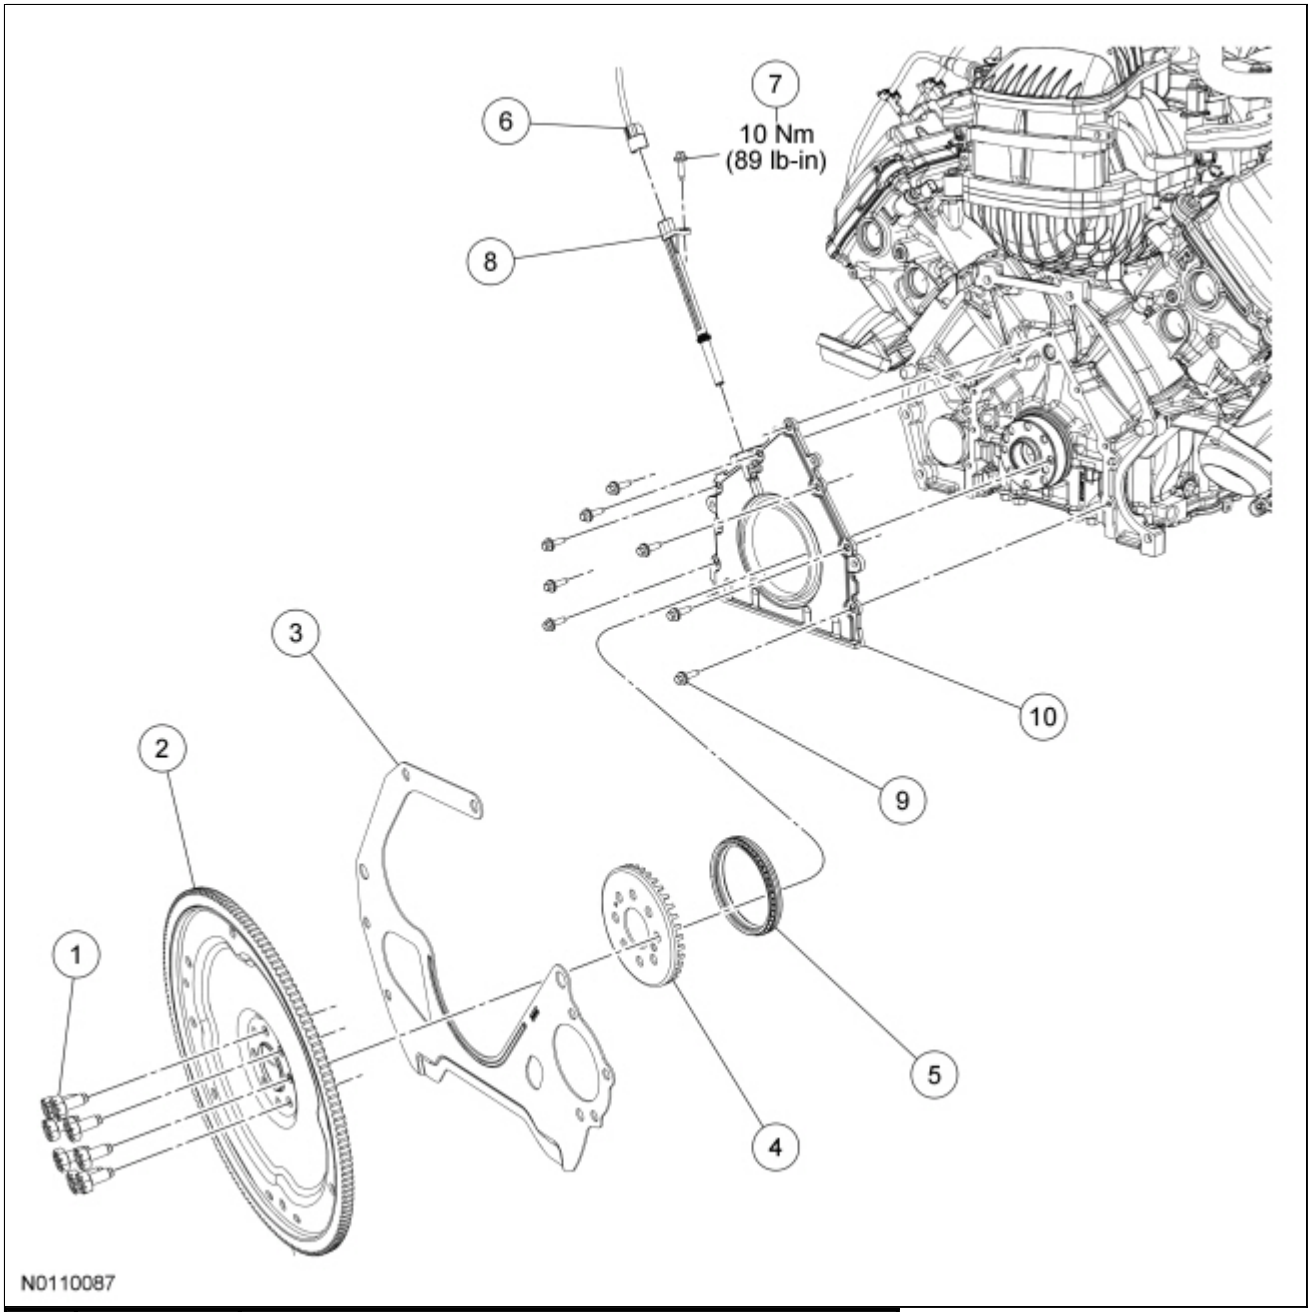


9. Install the 4 exhaust Y-pipe flange nuts (2 RH and 2 LH).
   - Tighten to 40 Nm (30 lb-ft).

10. Position the A/C compressor and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



11. Connect the A/C compressor electrical connector and the wiring harness retainer.



12. Install the starter. For additional information, refer to Section 303-06 .
13. Install the RH inner fenderwell. For additional information, refer to Section 501-02 .
14. Remove the Engine Support Bar and Engine Support Bracket.

repair4less

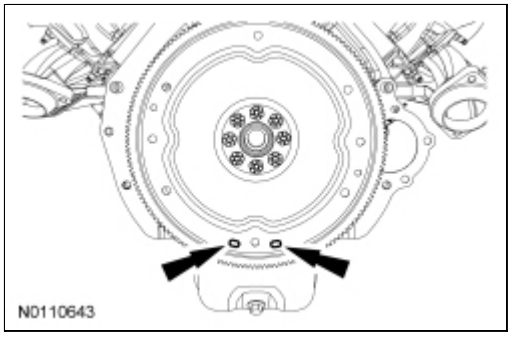
15. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

Flexplate or Flywheel and Crankshaft Rear Seal — Exploded View

Item	Part Number	Description
1	6379	Flexplate bolt (8 required)
2	6375	Flexplate
3	6A373	Rear cover plate
4	12A227	Ignition pulse ring

repair4less

5	6701	Crankshaft rear seal
6	—	Crankshaft Position (CKP) sensor electrical connector (part of 12C508)
7	W503276	CKP sensor bolt
8	6C315	CKP sensor
9	W503276	Crankshaft rear seal retainer plate bolt (6 required)
10	6K318	Crankshaft rear seal retainer plate

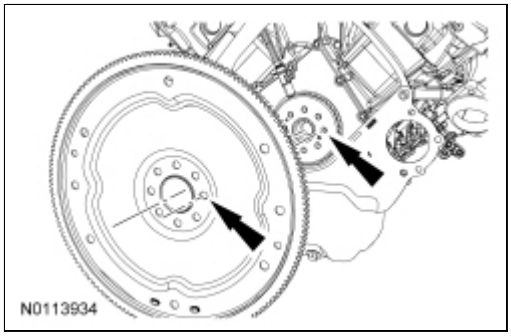


1. For additional information, refer to the procedures in this section.

Flexplate

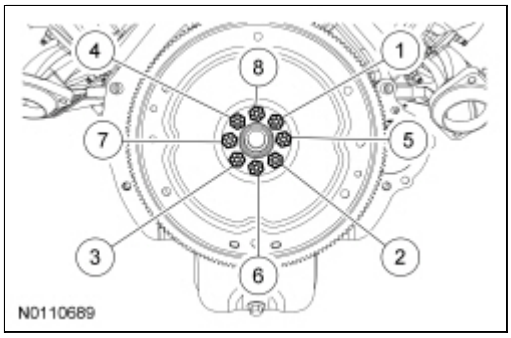
Removal and Installation

1. Remove the transmission. For additional information, refer to Section 307-01 .



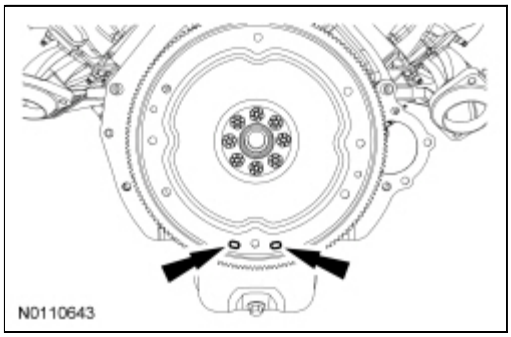
2. Rotate the engine clockwise until the 2 slotted holes on the flexplate are at the 6 o'clock position as shown.

3. Remove the 8 bolts and the flexplate.
   - Discard the 8 flexplate bolts.



Installation

1. With the offset hole on the crankshaft ignition pulse ring aligned with the offset hole on the flexplate, position the flexplate and install 8 new bolts finger-tight.



2. Tighten the 8 new bolts in 6 stages.
   - Stage 1: Tighten fasteners 1 through 4 in sequence to 20 Nm (177 lb-in).
   - Stage 2: Tighten fasteners 1 through 4 in sequence to 35 Nm (26 lb-ft).
   - Stage 3: Tighten fasteners 1 through 4 sequence an additional 60 degrees.
   - Stage 4: Tighten fasteners 5 through 8 in sequence to 20 Nm (177 lb-in).
   - Stage 5: Tighten fasteners 5 through 8 in sequence to 35 Nm (26 lb-ft).
   - Stage 6: Tighten fasteners 5 through 8 in sequence an additional 60 degrees.

repair4less

3. Verify that the 2 flexplate slotted holes are at the 6 o'clock position as shown prior to transmission installation.

4. Install the transmission. For additional information, refer to Section 307-01 .

Removal

repair4less

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

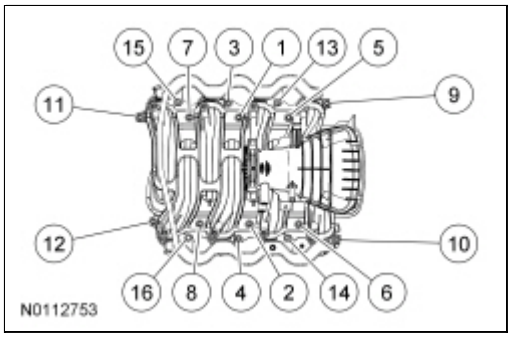
1. Release the fuel pressure. For additional information, refer to Section 310-00 .
2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove the generator. For additional information, refer to Section 414-00 .
4. Remove the 2 bolts, position aside the thermostat housing.
   - Discard the O-ring seal.
5. Remove the 8 ignition coils. For additional information, refer to Section 303-07D .
6. Remove the 4 bolts and the generator support bracket.
7. Disconnect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
8. Disconnect the Electronic Throttle Control (ETC) electrical connector and wiring harness retainer.
9. Remove the 4 bolts and the Throttle Body (TB).
   - Inspect the TB O-ring seal and install a new O-ring seal if necessary.
10. Disengage the clamp and disconnect the brake booster vacuum hose from the intake manifold.
11. Disconnect the Evaporative Emission (EVAP) tube quick connect coupling from the EVAP canister purge valve. For additional information, refer to Section 310-00 .
12. Disconnect the EVAP canister purge valve electrical connector and detach wiring harness retainer.
13. Disconnect the quick connect couplings and remove the PCV tube. For additional information, refer to Section 310-00 .
14. Disconnect the 8 fuel injector electrical connectors.
15. **NOTE:** The fuel rail is removed with the intake manifold as an assembly.

    Remove the 4 fuel rail bolts.
16. Disconnect the 4 wiring harness retainers from the rear of the intake manifold.
17. Loosen the 12 intake manifold bolts.
18. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make**

leak paths. Use a plastic scraping tool to remove all traces of old sealant.

Remove the intake manifold.

- Clean and inspect the cylinder head sealing surfaces with metal surface prep. Follow the directions on the packaging.
- Inspect the 8 intake manifold gaskets for damage and install new gaskets if necessary.



Installation

1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Position the intake manifold onto the engine.

2. Loosely install the 4 fuel rail bolts.

3. Tighten the 12 intake manifold bolts and install the 4 fuel rail bolts in 4 stages in the sequence shown.
   - Stage 1: Tighten the 12 intake manifold bolts to 10 Nm (89 lb-in).
   - Stage 2: Tighten the 12 intake manifold bolts an additional 45 degrees.
   - Stage 3: Tighten the 4 fuel rail bolts to 10 Nm (89 lb-in).
   - Stage 4: Tighten the 4 fuel rail bolts an additional 90 degrees.

4. Connect the 4 wiring harness retainers to the rear of the intake manifold.

5. Connect the 8 fuel injector electrical connectors.

6. Position the PCV tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

7. Attach wiring harness retainer, connect the electrical connector and the EVAP tube quick connect coupling to the EVAP canister purge valve. For additional information, refer to Section 310-00 .

8. Position the TB and tighten the 4 bolts in 2 stages.
   - Stage 1: Tighten to 12 Nm (106 lb-in).
   - Stage 2: Tighten an additional 60 degrees.

9. Connect the ETC electrical connector and wiring harness retainer.

10. Connect the brake booster vacuum hose to the intake manifold and install the clamp.

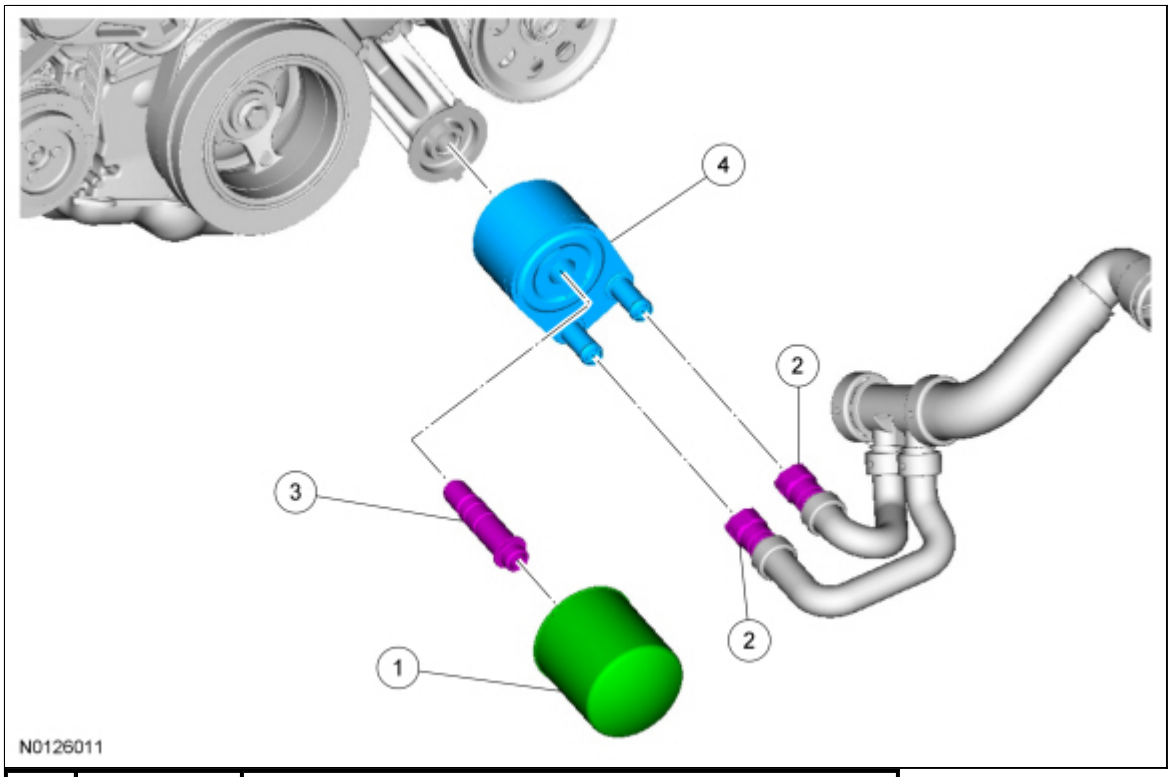
repair4less

11. Connect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .

12. Position the generator support bracket and install the 4 bolts.
    - Stage 1: Tighten to 20 Nm.
    - Stage 2: Tighten an addition 45 degrees.

13. Install the 8 ignition coils. For additional information, refer to Section 303-07D .

14. Position back thermostat housing.
    - Install a new O-ring seal.
    - To install, tighten to 10 Nm (89 lb-in).



15. Install the generator. For additional information, refer to Section 414-00 .

16. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .

Oil Cooler

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	6714	Oil filter
2	—	Oil cooler coolant hose quick connect couplings (part of 8B273)
3	6L626	Oil cooler threaded shaft
4	6A642	Oil cooler

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-

repair4less

02 .

2. Drain the engine cooling system. For additional information, refer to Section 303-03 .

3. Remove and discard the oil filter.

4. Disconnect the oil cooler coolant hose quick connect couplings and position aside. For additional information, refer to Section 310-00 .

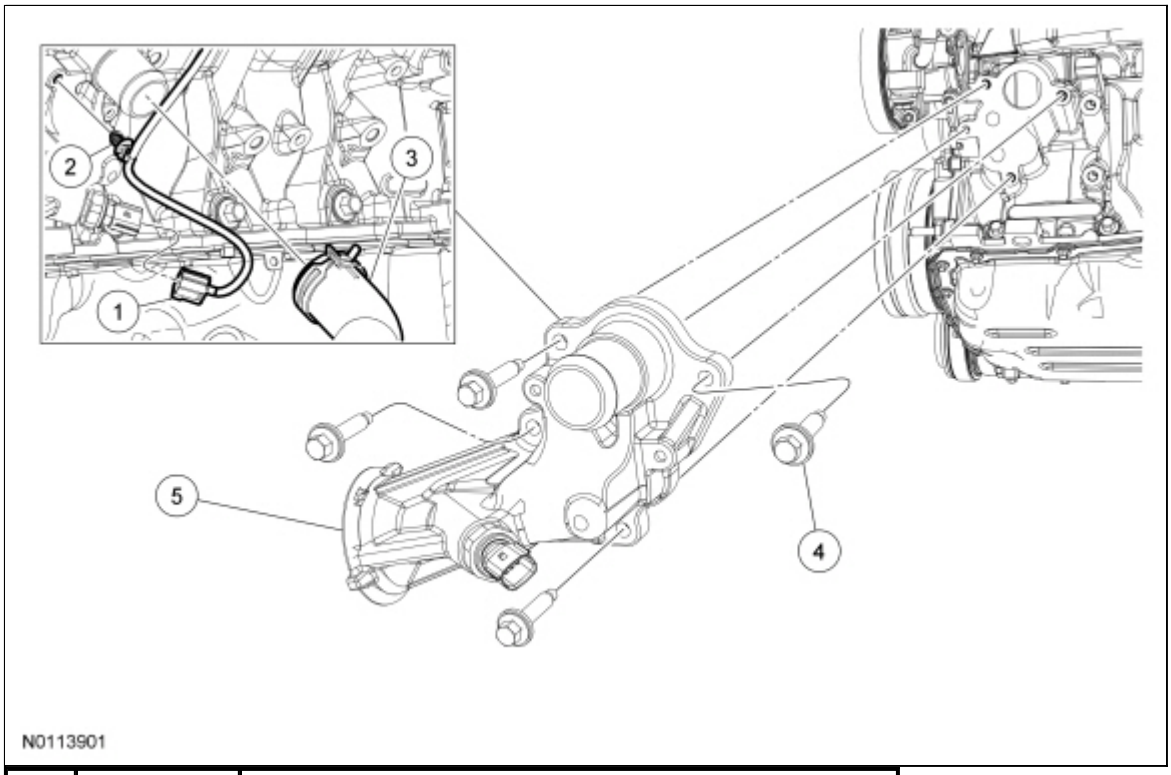
5. ***NOTICE:*** **If metal foreign material is present in the oil cooler, mechanical concerns exist. To diagnose mechanical concerns, refer to Section 303-00 .**

   Remove the threaded shaft and the oil cooler. Inspect the engine oil cooler.

Installation

1. Position the oil cooler and install the threaded shaft.
   - Tighten to 58 Nm (43 lb-ft).

2. Connect the oil cooler coolant hose quick connect couplings. For additional information, refer to Section 310-00 .



3. Install a new oil filter in 2 stages.
   - Stage 1: Tighten to 5 Nm (44 lb-in).
   - Stage 2: Tighten an additional 180 degrees.

4. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Oil Filter Adapter

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	—

Item	Part Number	Description
1	—	Engine Oil Pressure (EOP) switch electrical connector (part of 12B637)
2	—	EOP switch wiring harness retainer (part of 12B637)
3	8B273	Lower radiator hose

repair4less

4	W705128	Oil filter adapter bolt (4 required)
5	6881	Oil filter adapter

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the engine oil cooler. For additional information, refer to Oil Cooler in this section.

3. Drain the engine oil.
   - Install the drain plug and tighten to 23 Nm (17 lb-ft).

4. Disconnect the Engine Oil Pressure (EOP) switch wiring harness retainer and the electrical connector.

5. Disconnect the lower radiator hose and position it aside.

6. Remove the 4 bolts and the oil filter adapter.

7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

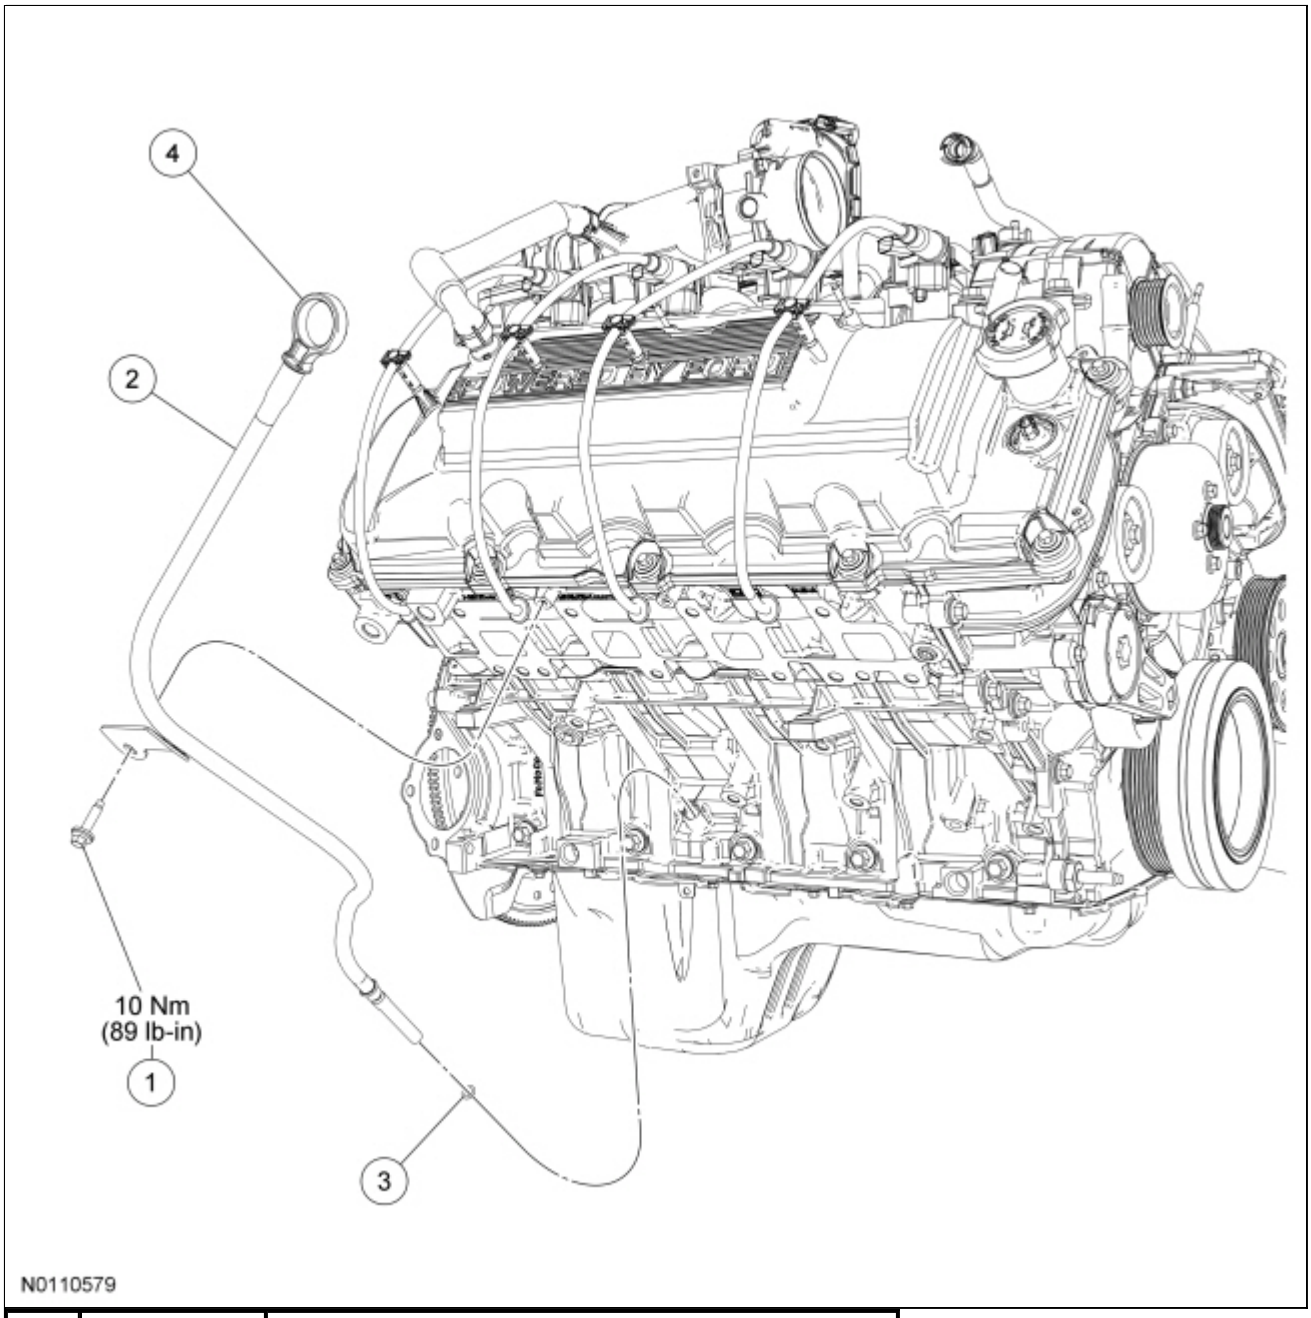
   Inspect the 3 gaskets for damage and install new gaskets if necessary.
   - Clean and inspect the cylinder block sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

Installation

1. Position the oil filter adapter and install the 4 bolts in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 1: Tighten an additional 60 degrees.

2. Connect the EOP switch electrical connector and attach the wiring harness retainer.

3. Connect the lower radiator hose.



4. Install the engine oil cooler. For additional information, refer to Oil Cooler in this section.

repair4less

Oil Level Indicator and Tube

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	W503276	Oil level indicator and tube bolt
2	6B667	Oil level indicator tube
3	—	Oil level indicator tube O-ring seal (part of 6B667)
4	—	Oil level indicator

Removal and Installation

1. Remove the RH exhaust manifold. For additional information, refer to Exhaust Manifold — RH in this section.

2. Remove the oil level indicator from the oil level indicator tube.

repair4less

3. Remove the oil level indicator and tube bolt.
    - To install, tighten to 10 Nm (89 lb-in).

4. Remove the oil level indicator tube from the cylinder block.
    - Discard the O-ring seal.

5. **NOTE:** Lubricate the new oil level indicator tube O-ring seal with clean engine oil prior to installation.

   To install, reverse the removal procedure.
    - Install a new O-ring seal.

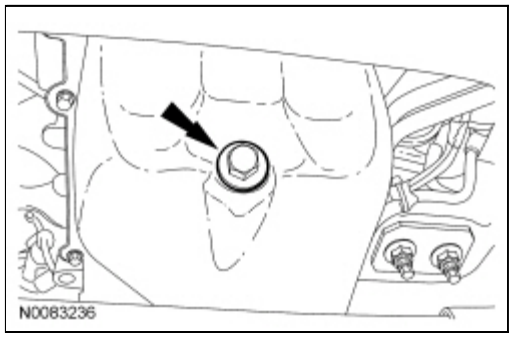
Oil Pan

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	—

Removal

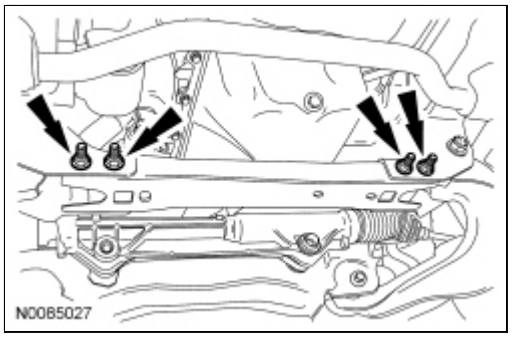
All vehicles



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

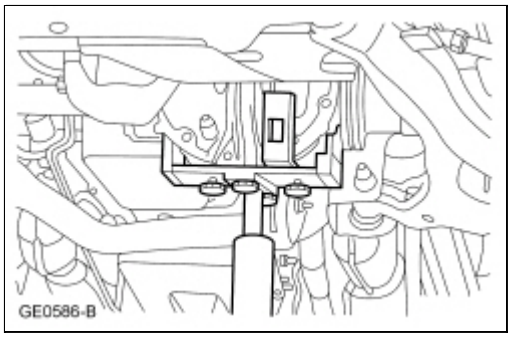
Four-Wheel Drive (4WD) vehicles

2. Remove the 4 bolts and the skidplate.



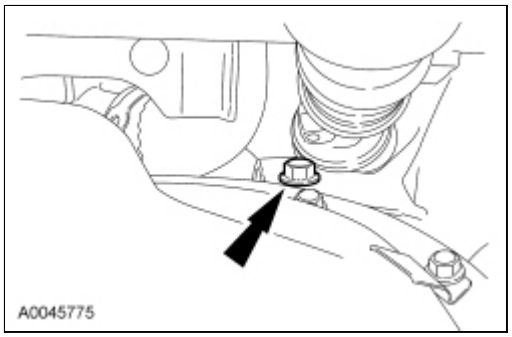
All vehicles

3. Remove the oil drain plug and drain the engine oil. Install the drain plug when finished.
   - Tighten to 23 Nm (17 lb-ft).



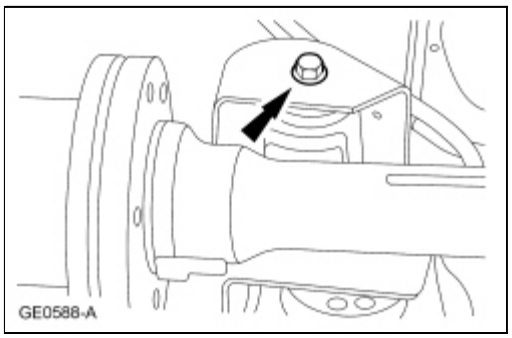
4. Remove the 4 nuts, the 4 bolts and the crossmember.

repair4less



Four-Wheel Drive (4WD) vehicles

5. Position a suitable hydraulic jack under the front axle. Securely strap the jack to the axle.

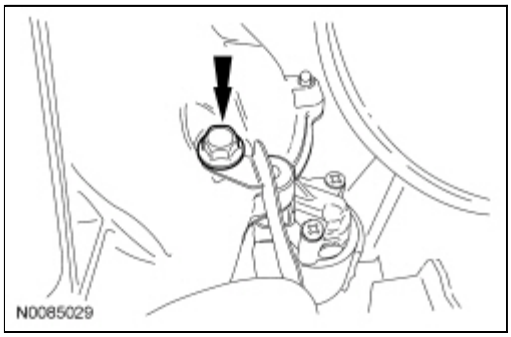


6. **NOTE:** Rotate the steering column so the pinch bolt for the steering column coupling allows clearance for the isolator bolt.

   Remove the upper front axle carrier mounting bushing bolt.

7. Remove the axle shaft housing carrier bushing bolt.

8. Remove the lower front axle carrier mounting bushing bolt.

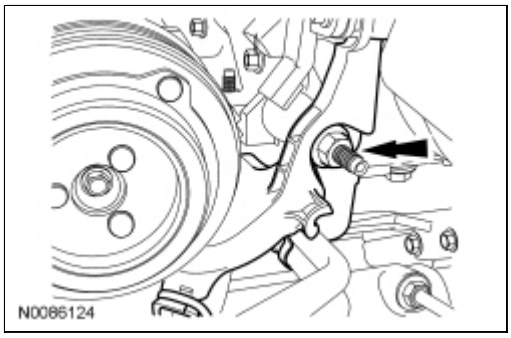


9. ***NOTICE:*** **Use care when lowering the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

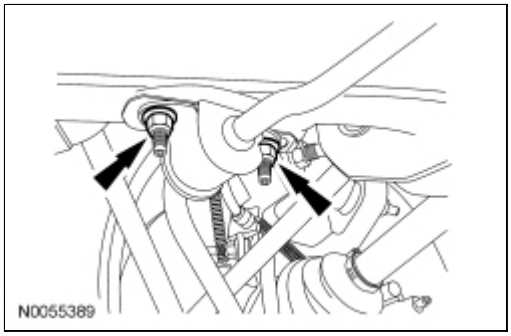
   Lower the axle to allow clearance for the oil pan to be removed.

All vehicles

10. Remove the bolt and position the transmission fluid cooling tubes rear support bracket aside.



11. Remove the starter wiring harness rear support bracket pushpin.



12. Remove the nut and position the starter wiring harness and the transmission fluid cooler tubes aside.

repair4less

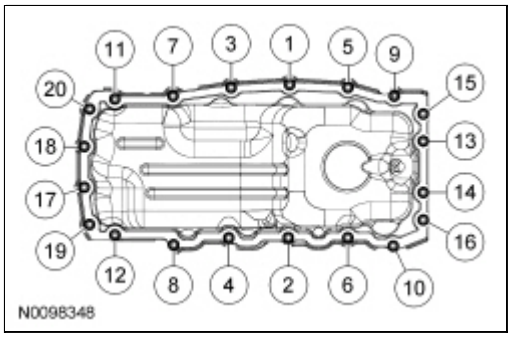
13. Remove and discard the 4 stabilizer bar bracket nuts and allow the stabilizer bar to swing downward.

14. Remove the 20 bolts, the oil pan and the gasket.
    - Discard the gasket.

15. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Inspect the oil pan. Clean the gasket mating surfaces of the oil pan and engine block with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

Installation

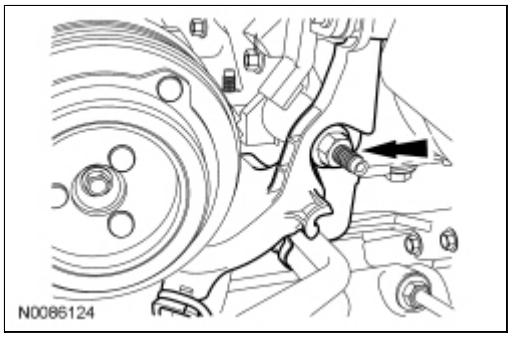


All vehicles

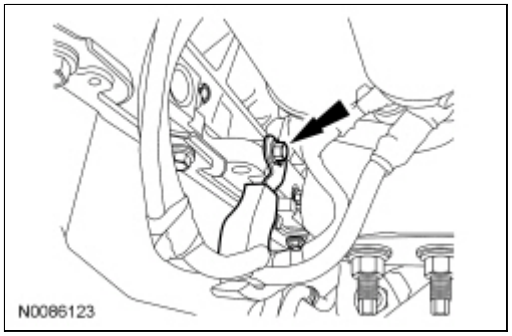
1. **NOTE:** If not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the crankshaft rear seal retainer plate-to-cylinder block sealing surface and at the engine front cover-to-cylinder block sealing surface.

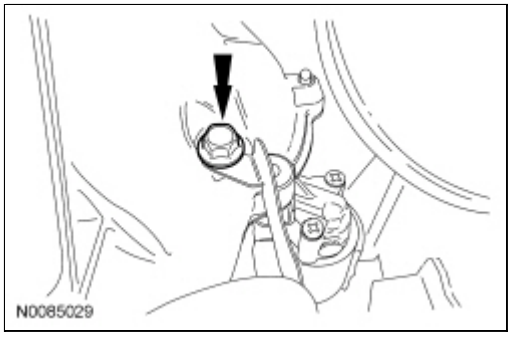
2. Position a new gasket and the oil pan and install the 20 bolts.
    - Tighten the bolts in the sequence shown in 3 stages.
        - Stage 1: Tighten to 2 Nm (18 lb-in).
        - Stage 2: Tighten to 10 Nm (89 lb-in).
        - Stage 3: Tighten an additional 45 degrees.



3. Postion the swaybar and install the 4 new stabilizer bar brackets nuts.
    - Tighten to 55 Nm (41 lb-ft).

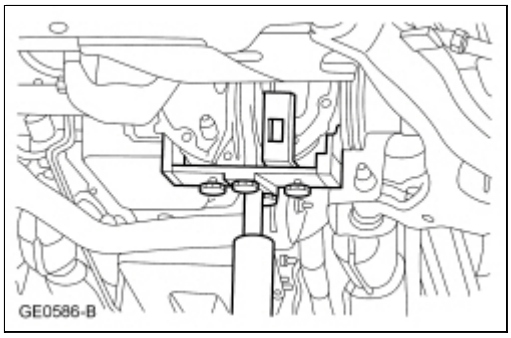


4. Position the transmission fluid cooler tube support bracket, the starter wiring harness support bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).

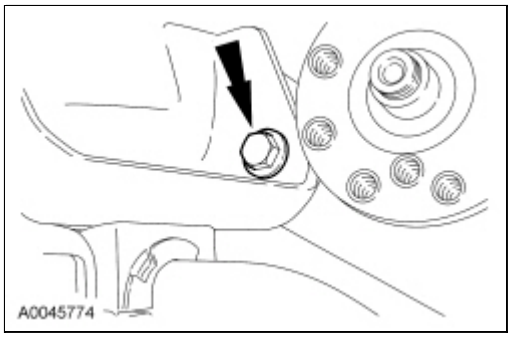


repair4less

5. Position the starter wiring harness and install the starter wiring harness rear support bracket pushpin.



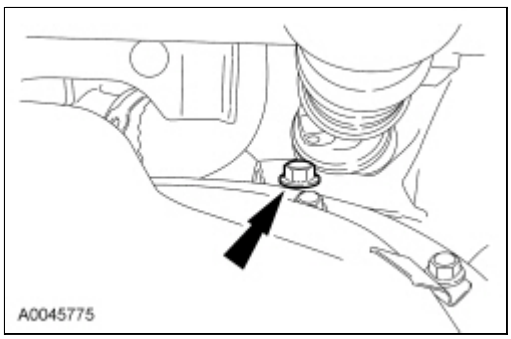
6. Install the transmission fluid cooling tubes rear support bracket bolt.
    - Tighten to 48 Nm (35 lb-ft).



Four-Wheel Drive (4WD) vehicles

7. ***NOTICE:*** **Use care when positioning the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

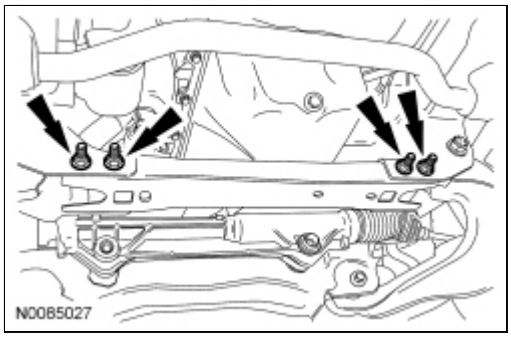
    Raise the front axle carrier into position.



8. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

9. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

10. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



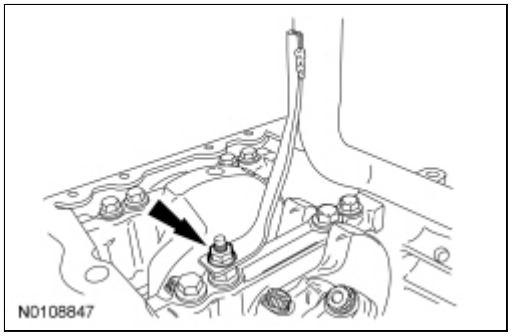
repair4less

11. Install the skid plate and 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

All vehicles

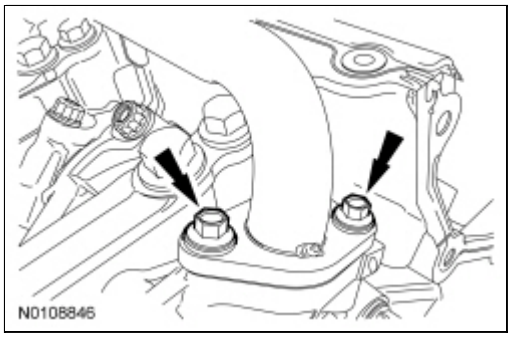
12. Position the crossmember and Install the 4 bolts and the 4 nuts.
    - Tighten to 90 Nm (66 lb-ft).

13. Fill the engine with clean engine oil.



Oil Pump Screen and Pickup Tube

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.
2. Remove the oil pump screen and pickup tube support bracket nut.

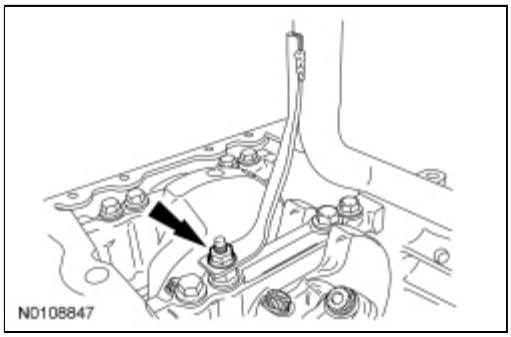
3. Remove the 2 bolts and the oil pump screen and pickup tube.

Installation

1. ***NOTICE:*** **Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with

repair4less



clean engine oil prior to installation.

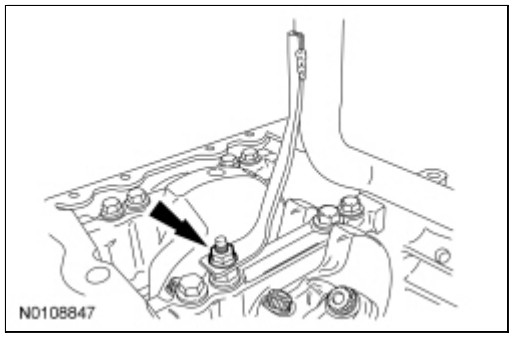
Position the oil pump screen and pickup tube and install the 2 front bolts.

- Tighten to 10 Nm (89 lb-in).

2. Install the oil pump screen and pickup tube support bracket nut.
   - Tighten to 24 Nm (18 lb-ft).

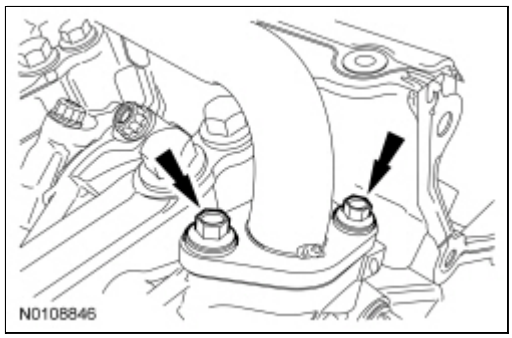
3. Install the oil pan. For additional information, refer to Oil Pan in this section.

repair4less



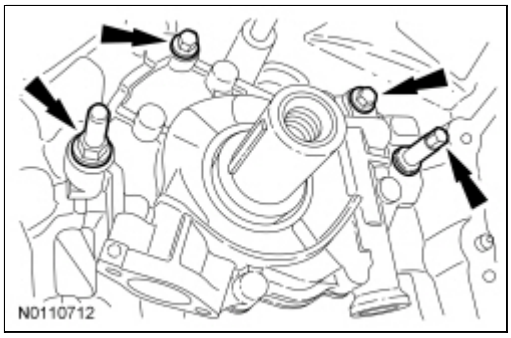
Oil Pump

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

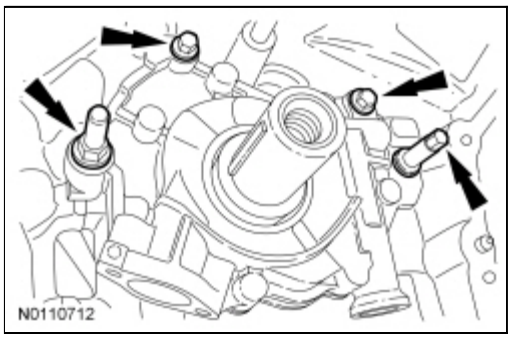
Removal



1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.
2. Remove the oil pan. For additional information, refer to Oil Pan in this section.
3. Remove the oil pump screen and pickup tube support bracket nut.

4. Remove the 2 bolts and the oil pump screen and pickup tube.

5. Remove the 2 upper bolts, the 2 lower stud bolts and the oil pump.

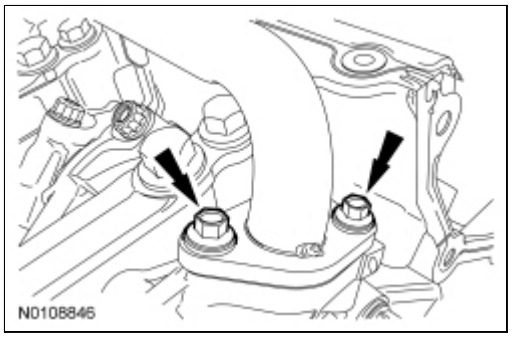


Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

2. Position the oil pump and install the 2 upper bolts and the 2 lower stud bolts in 5 stages.
   - Stage 1: Tighten all fasteners to 2 Nm (18 lb-in).
   - Stage 2: Tighten the 2 upper bolts to 10 Nm (89 lb-in).
   - Stage 3: Tighten the 2 lower stud bolts to 20 Nm (177 lb-in).
   - Stage 4: Tighten the 2 upper bolts an additional 45 degrees.
   - Stage 5: Tighten the 2 lower stud bolts an additional 60 degrees.



3. ***NOTICE:*** **Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with clean engine oil prior to installation.

   Position the oil pump screen and pickup tube and install the 2 front bolts.
   - Tighten to 10 Nm (89 lb-in).

repair4less

4. Install the oil pump screen and pickup tube support bracket nut.
    - Tighten to 24 Nm (18 lb-ft).

5. Install the oil pan. For additional information, refer to Oil Pan in this section.

6. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

Rocker Arm

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal

LH cylinder head rocker arm shafts

NOTICE: **If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

1. Remove the LH valve cover. For additional information, refer to Valve Cover — LH in this section.
2. Disconnect the 4 LH ignition wires from the LH cylinder head 4 lower spark plugs.
3. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

   Remove the 4 lower spark plugs from the LH cylinder head.
4. Rotate the engine clockwise until the No. 6 cylinder camshaft intake valve is open.
5. Remove the 10 bolts and the LH intake rocker arm shaft assembly.
6. Rotate the engine clockwise until the No. 6 cylinder camshaft exhaust valve is open.
7. Remove the 10 bolts and the LH exhaust rocker arm shaft assembly.

RH cylinder head rocker arm shafts

8. Remove the RH valve cover. For additional information, refer to Valve Cover — RH in this section.
9. Disconnect the 4 LH ignition wires from the RH cylinder head 4 lower spark plugs.

repair4less

10. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

    NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

    Remove the 4 lower spark plugs from the RH cylinder head.

11. Rotate the engine clockwise until the No. 1 cylinder camshaft lobe intake valve is closed.

12. Remove the 10 bolts and the RH intake rocker arm shaft assembly.

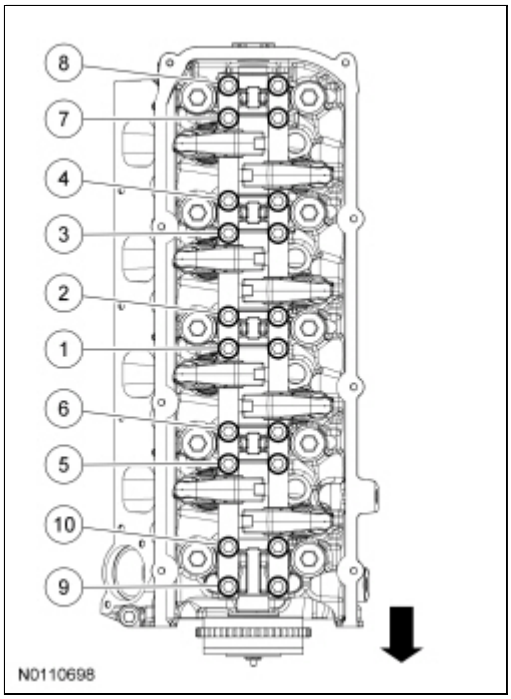
13. Rotate the engine clockwise until the No. 1 cylinder camshaft lobe exhaust valve is closed.

14. Remove the 10 bolts and the RH exhaust rocker arm shaft assembly.

Installation

NOTICE: **If the components are to be reinstalled, they must be installed in the same positions. Failure to follow this instruction may result in engine damage.**

All rocker arm shafts

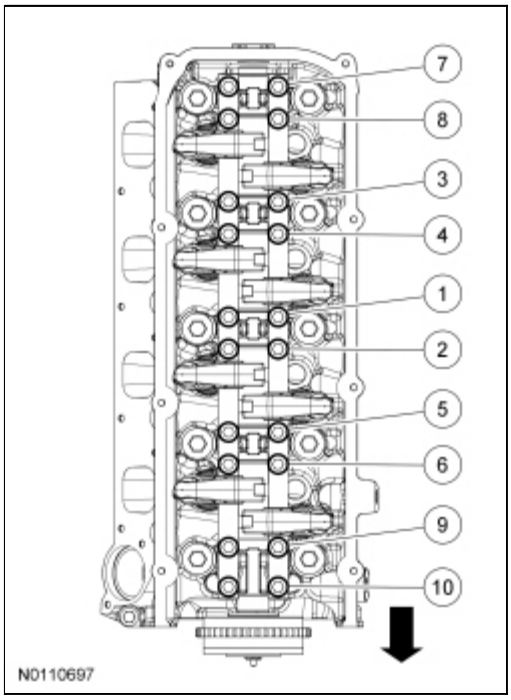


1. Lubricate the rocker arm shaft-to-valve tip and rocker arm-to-camshaft lobe contact area with clean engine oil prior to installation.

LH cylinder head rocker arm shafts

2. Rotate the engine clockwise until the No. 6 cylinder camshaft intake lobe is positioned so that the intake valve would be fully opened.

3. Position the LH intake rocker arm shaft assembly and install the bolts finger-tight.



4. Tighten the 10 LH intake rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.

5. Rotate the engine clockwise until the No. 6 cylinder camshaft exhaust lobe is positioned so that the exhaust valve would be fully opened.

6. Position the LH exhaust rocker arm shaft assembly and install the bolts finger-tight.

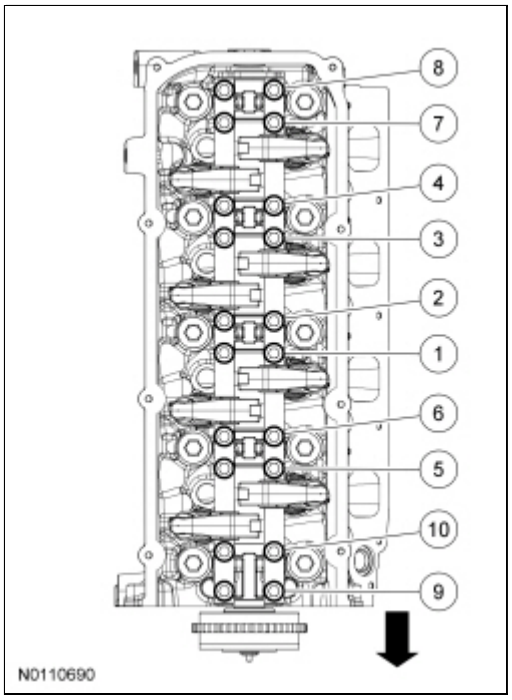
7. Tighten the 10 LH exhaust rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten to 20 Nm (177 lb-in).
   - Stage 3: Tighten an additional 60 degrees.

repair4less

8. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   Install the LH cylinder head lower 4 spark plugs.
   - Tighten to 18 Nm (159 lb-in).

9. Connect the 4 LH cylinder head ignition wires to the LH cylinder head lower 4 spark plugs.
   - Apply a light coat of dielectric compound to the inside of the ignition wire boots prior to installation.



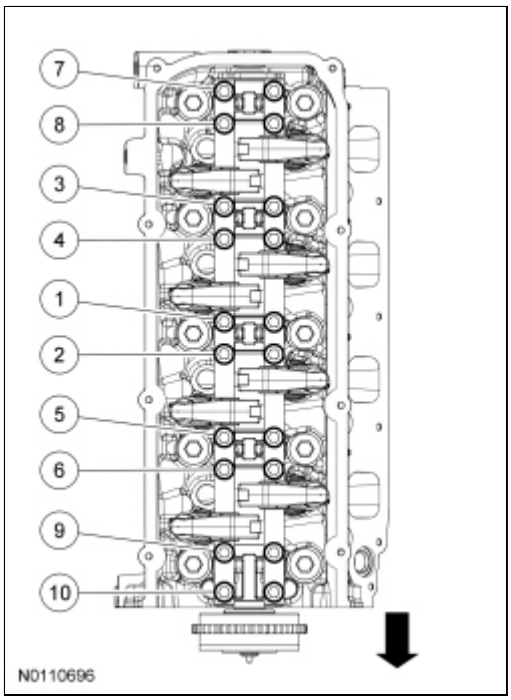
10. Install the LH valve cover. For additional information, refer to Valve Cover — LH in this section.

RH cylinder head rocker arm shafts

11. Rotate the engine clockwise until the No. 1 cylinder camshaft intake lobe is positioned so that the intake valve would be fully closed.

12. Position the RH intake rocker arm shaft assembly and install the bolts finger-tight.

13. Tighten the 10 RH intake rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.



14. Rotate the engine clockwise until the No. 1 cylinder camshaft exhaust lobe is positioned so that the exhaust valve would be fully closed.

15. Position the RH exhaust rocker arm shaft assembly and install the bolts finger-tight.

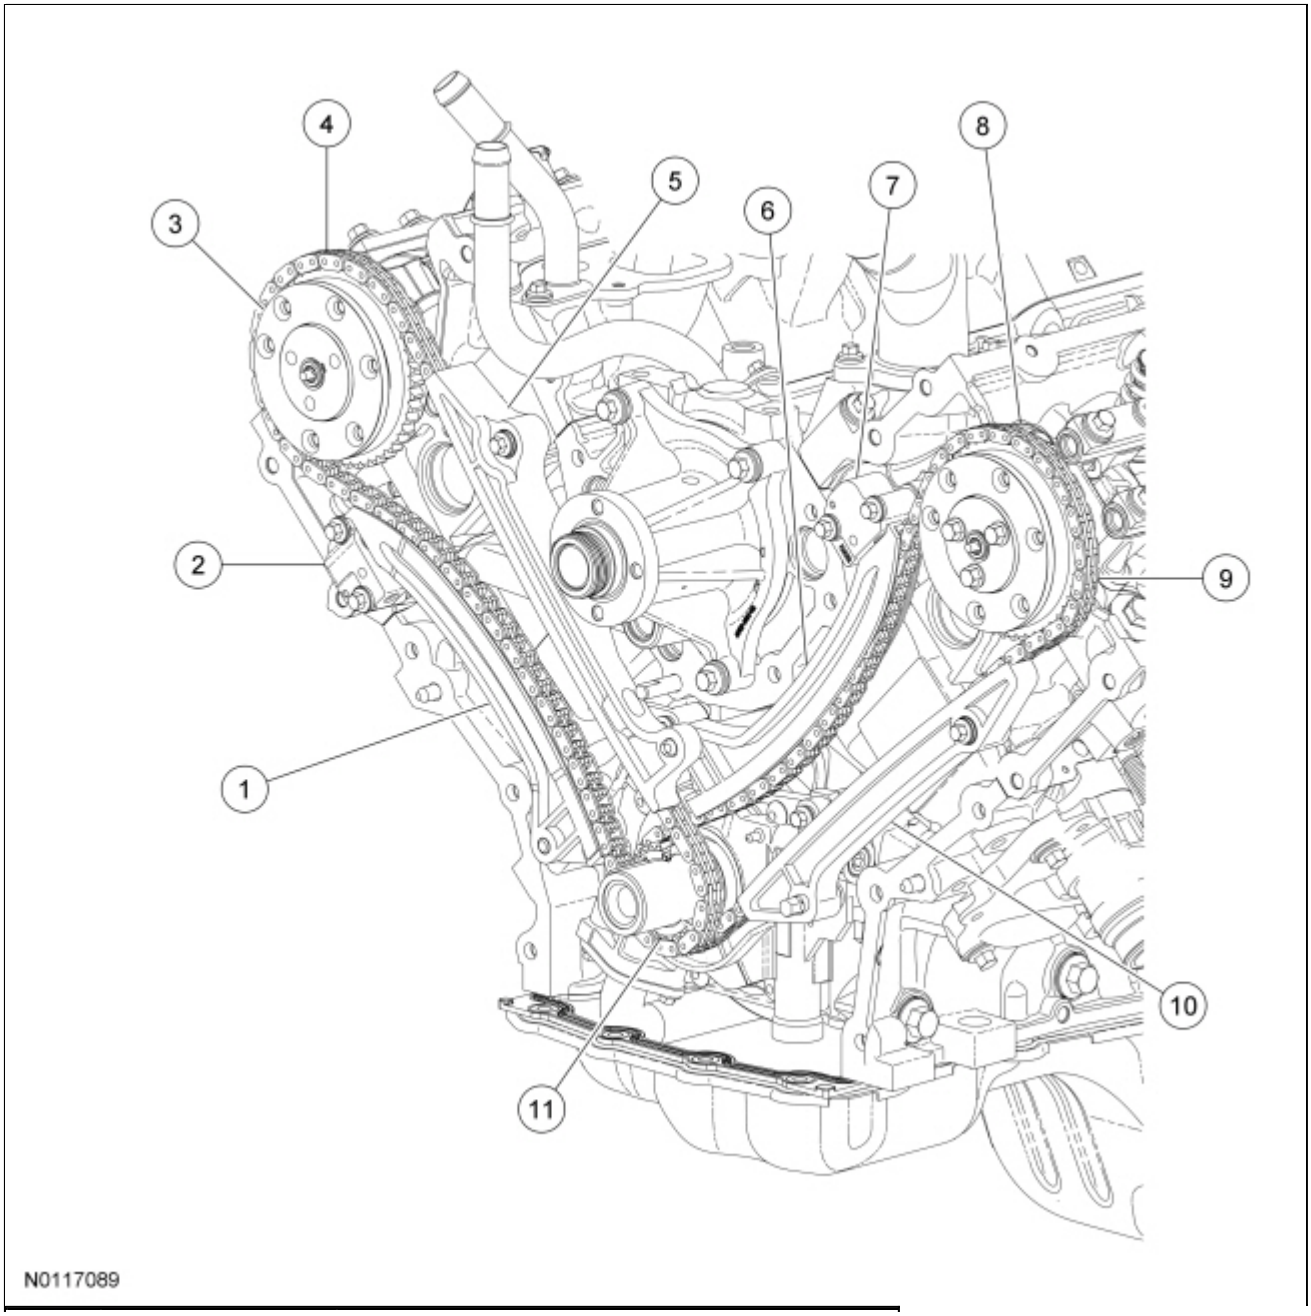
16. Tighten the 10 RH exhaust rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).

- Stage 2: Tighten to 20 Nm (177 lb-in).
- Stage 3: Tighten an additional 60 degrees.

17. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

    Install the RH cylinder head lower 4 spark plugs.
    - Tighten to 18 Nm (159 lb-in).

18. Connect the 4 RH cylinder head ignition wires to the RH cylinder head lower 4 spark plugs.
    - Apply a light coat of dielectric compound to the inside of the ignition wire boots prior to installation.



19. Install the RH valve cover. For additional information, refer to Valve Cover — RH in this section.

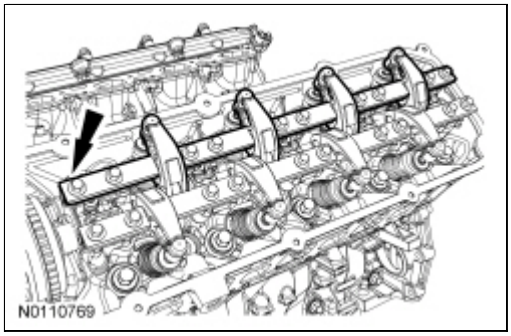
repair4less

Timing Drive Components

Material

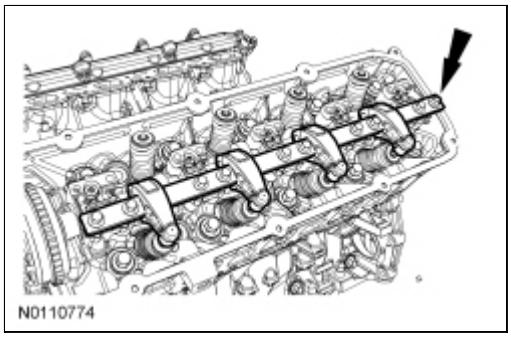
Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

repair4less



Item	Part Number	Description
1	6K255	RH timing chain tensioner arm
2	6L266	RH timing chain tensioner
3	6256	RH camshaft phaser and sprocket
4	6268	RH timing chain
5	6M256	RH timing chain guide
6	6K255	LH timing chain tensioner arm
7	6L266	LH timing chain tensioner
8	6268	LH timing chain
9	6256	LH camshaft phaser and sprocket
10	6B274	LH timing chain guide
11	6306	Crankshaft sprocket

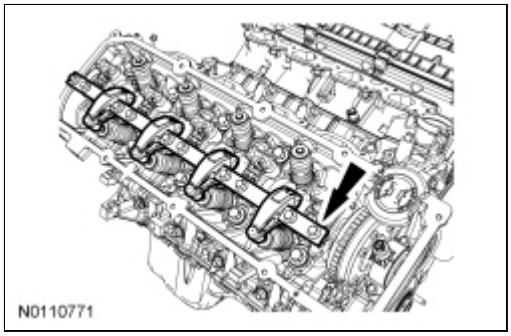
Removal



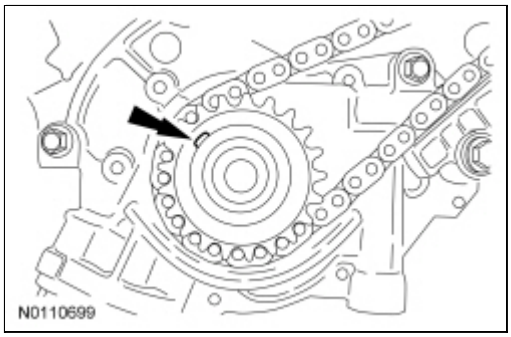
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Disconnect the 8 ignition wires from the lower 8 spark plugs.
3. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

   Remove the lower 8 spark plugs.
4. Rotate the engine clockwise until the No. 1 intake valve is open.
5. Remove the 10 bolts and the LH intake rocker arm shaft assembly.

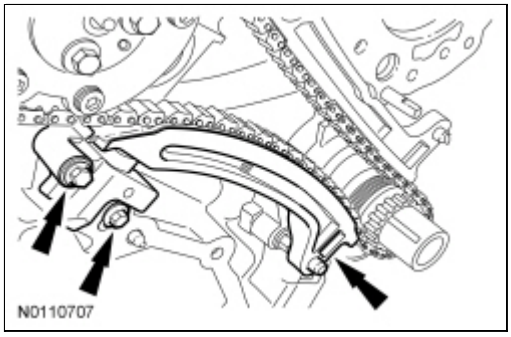


6. Rotate the engine clockwise until the No. 1 exhaust valve is open.
7. Remove the 10 bolts and the LH exhaust rocker arm shaft assembly.

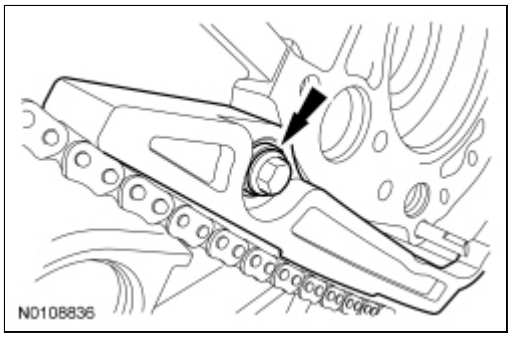


8. Rotate the engine clockwise until the No. 1 intake valve is closed.
9. Remove the 10 bolts and the RH intake rocker arm shaft assembly.

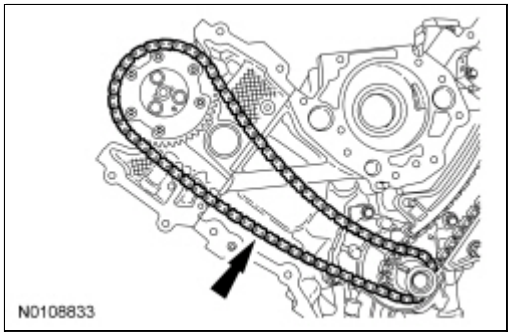
10. Rotate the engine clockwise until the No. 1 exhaust valve is closed.
11. Remove the 10 bolts and the RH exhaust rocker arm shaft assembly.



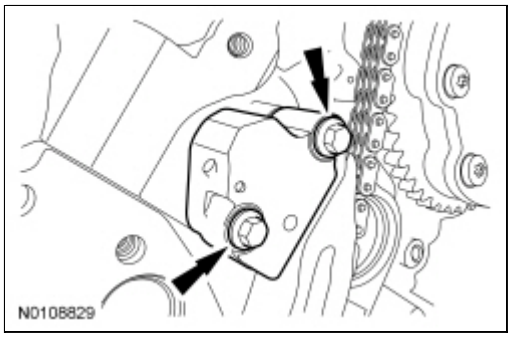
12. Position the crankshaft keyway at the 11 o'clock position.



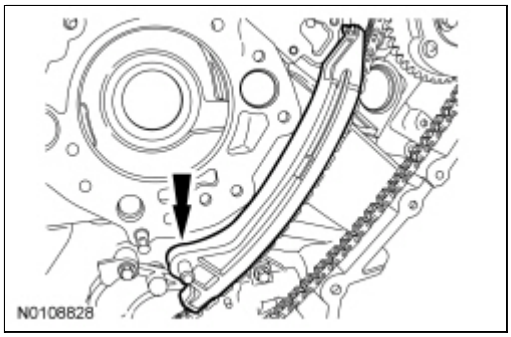
repair4less



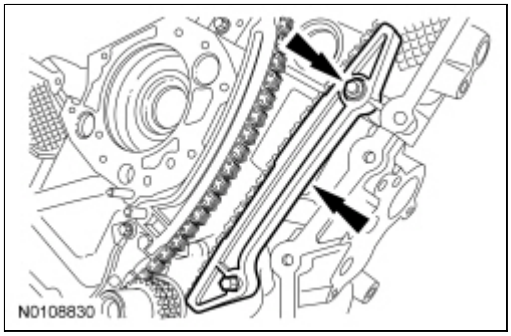
13. Remove the 2 bolts, the RH timing chain tensioner and tensioner arm.



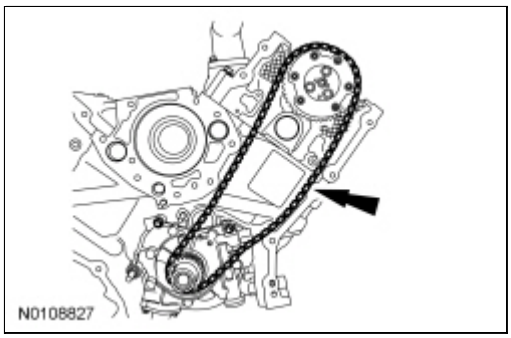
14. Remove the bolt and the RH timing chain guide.



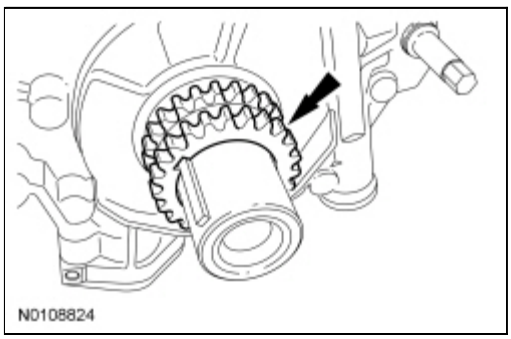
15. Remove the RH timing chain.



16. Remove the 2 bolts and the LH timing chain tensioner.



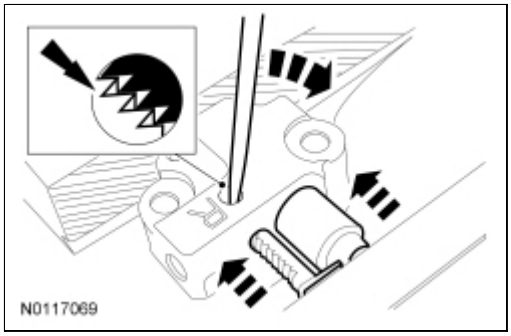
17. Remove the LH timing chain tensioner arm.



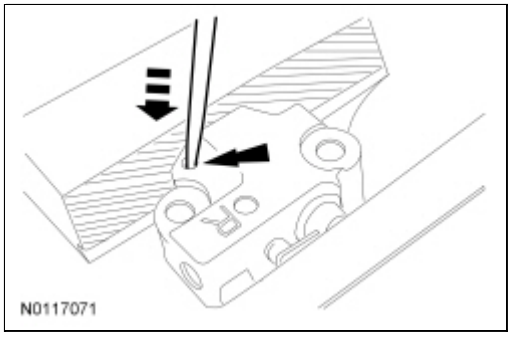
18. Remove the bolt and the LH timing chain guide.

19. Remove the LH timing chain.

20. Remove the crankshaft sprocket.



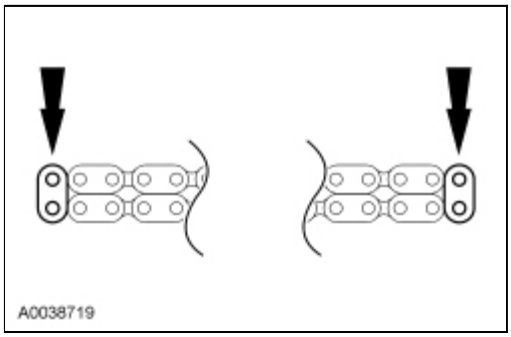
Installation



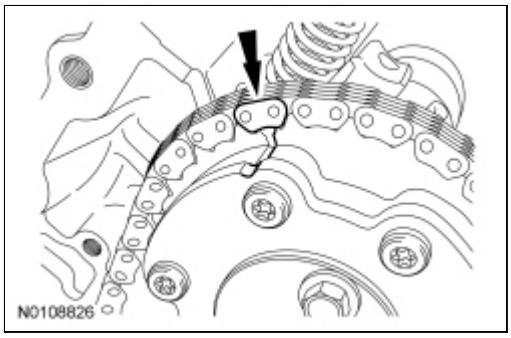
NOTICE: **Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

repair4less

1. Using a small pick, carefully push the tensioner rack pawl retainer away from the rack pawl and compress the tensioner plunger and rack using a vise.

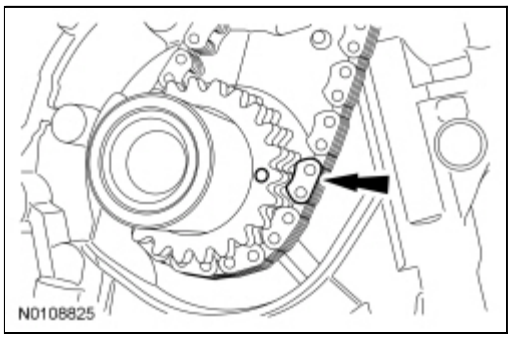


2. Install a small pick into the tensioner to hold the rack pawl and plunger in the seated position for tensioner installation.



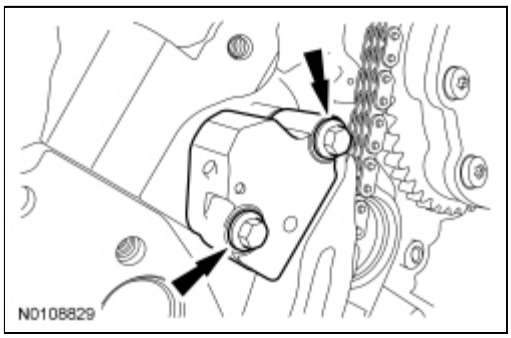
3. Remove the tensioner from the vise.

4. If the blue links are not visible, mark 2 links on each end, and use as timing marks.



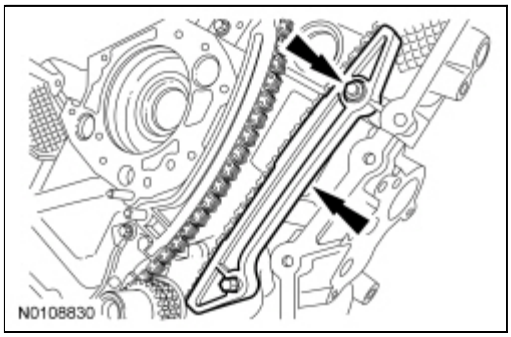
5. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel and above the chain guide pin.

   Position the upper end of the LH (inner) timing chain on the LH camshaft phaser and sprocket, aligning the timing mark on the outer flange of the camshaft phaser and sprocket with the single blue (marked) link on the chain.

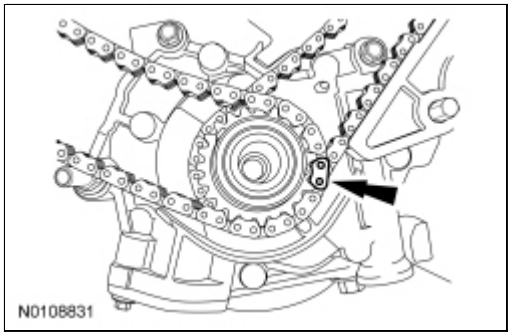


6. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single blue (marked) link on the chain and install the crankshaft sprocket onto the crankshaft and verify the crankshaft keyway is at the 11 o'clock position.

7. Install the LH timing chain tensioner arm.

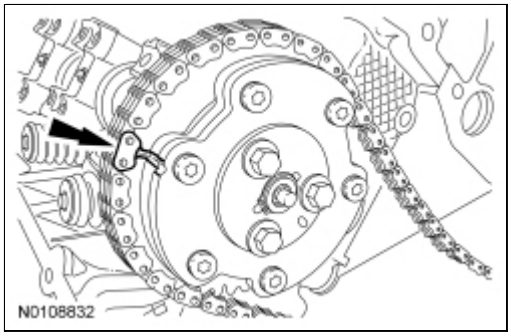


8. Position the LH timing chain tensioner and install the 2 bolts in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

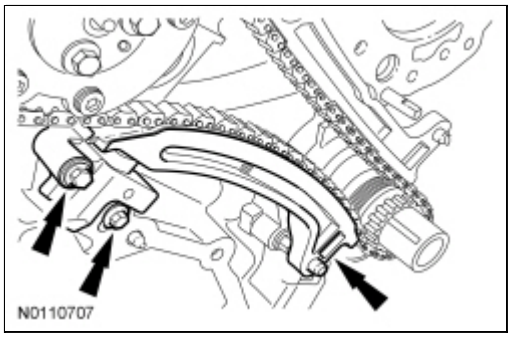


repair4less

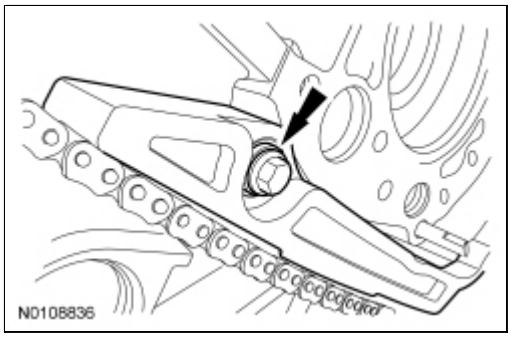
9. Position the LH timing chain guide and install the bolt in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



10. Remove the retaining clip from the LH timing chain tensioner.

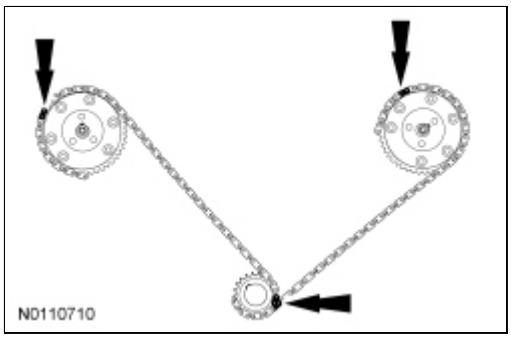


11. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single blue (marked) chain link.



12. Position the upper end of the RH (outer) timing chain on the RH camshaft phaser and sprocket, aligning the timing mark on the outer flange of the camshaft phaser and sprocket with the single blue (marked) link on the chain.

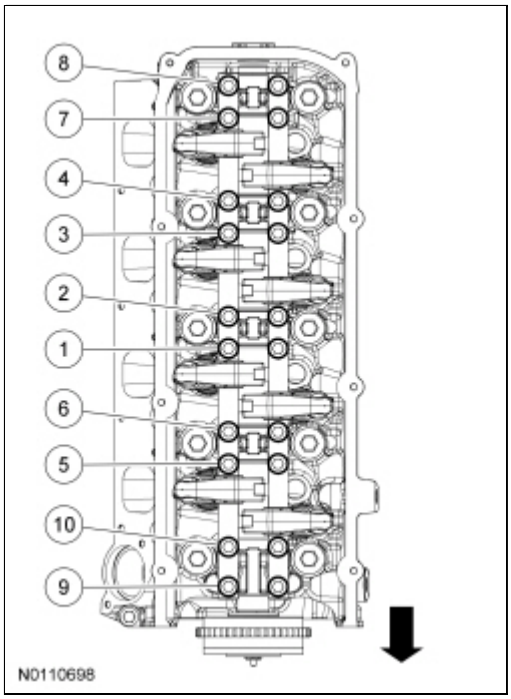
13. Position the RH timing chain tensioner arm on the dowel pin and the RH timing chain tensioner and install the 2 bolts in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



14. Position the RH timing chain guide and install the bolt in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

15. Remove the retaining clip from the RH timing chain tensioner.

16. As a post-check, verify correct alignment of all timing marks.

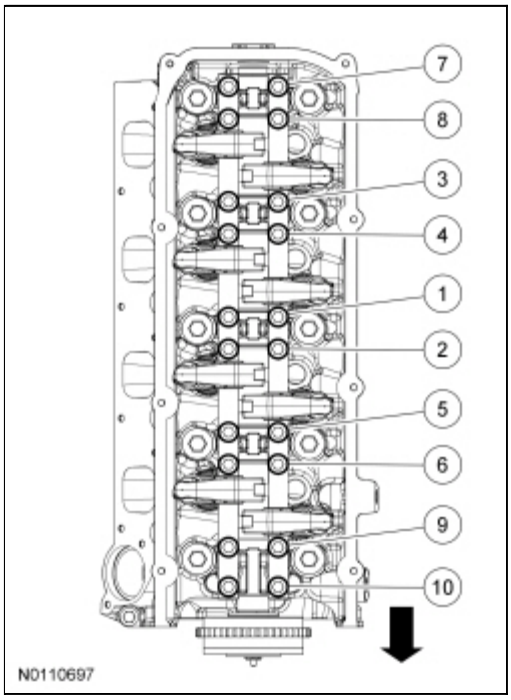


17. Lubricate the rocker arm shaft-to-valve tip and rocker arm-to-camshaft lobe contact area with clean engine oil prior to installation.

18. Rotate the engine clockwise until the No. 1 cylinder camshaft intake lobe is positioned so that the intake valve would be fully opened.

19. Position the LH intake rocker arm shaft assembly and install the bolts finger-tight.

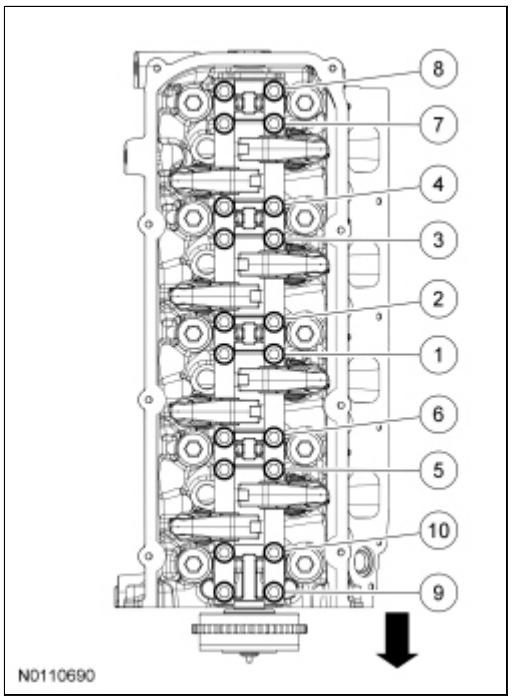
20. Tighten the 10 LH intake rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.



repair4less

21. Rotate the engine clockwise until the No. 1 cylinder camshaft exhaust lobe is positioned so that the exhaust valve would be fully opened.

22. Position the LH exhaust rocker arm shaft assembly and install the bolts finger-tight.

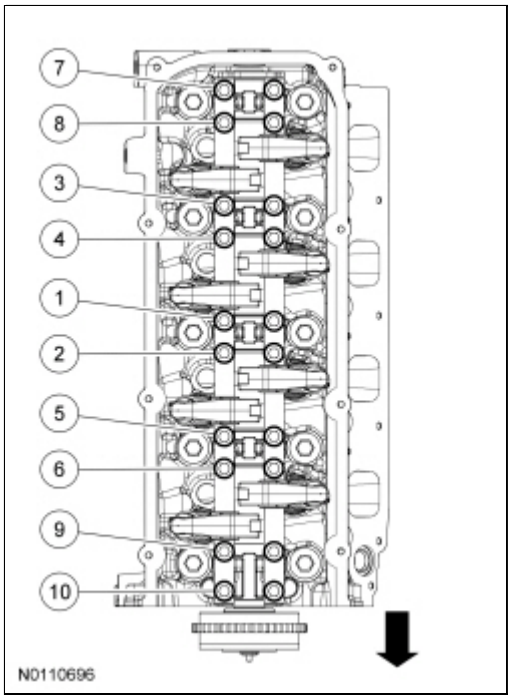


23. Tighten the 10 LH exhaust rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.

24. Rotate the engine clockwise until the No. 1 cylinder camshaft intake lobe is positioned so that the intake valve would be fully closed.

25. Position the RH intake rocker arm shaft assembly and install the bolts finger-tight.

26. Tighten the 10 RH intake rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.



27. Rotate the engine clockwise until the No. 1 cylinder camshaft exhaust lobe is positioned so that the exhaust valve would be fully closed.

28. Position the RH exhaust rocker arm shaft assembly and install the bolts finger-tight.

29. Tighten the 10 RH exhaust rocker arm shaft assembly bolts in the sequence shown, in 3 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.

repair4less

30. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

    Install the lower 8 spark plugs.
    - Tighten to 18 Nm (159 lb-in).

31. Connect the 8 ignition wires to the lower 8 spark plugs.
    - Apply a light coat of dielectric compound to the inside of the ignition wire boots prior to installation.

32. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

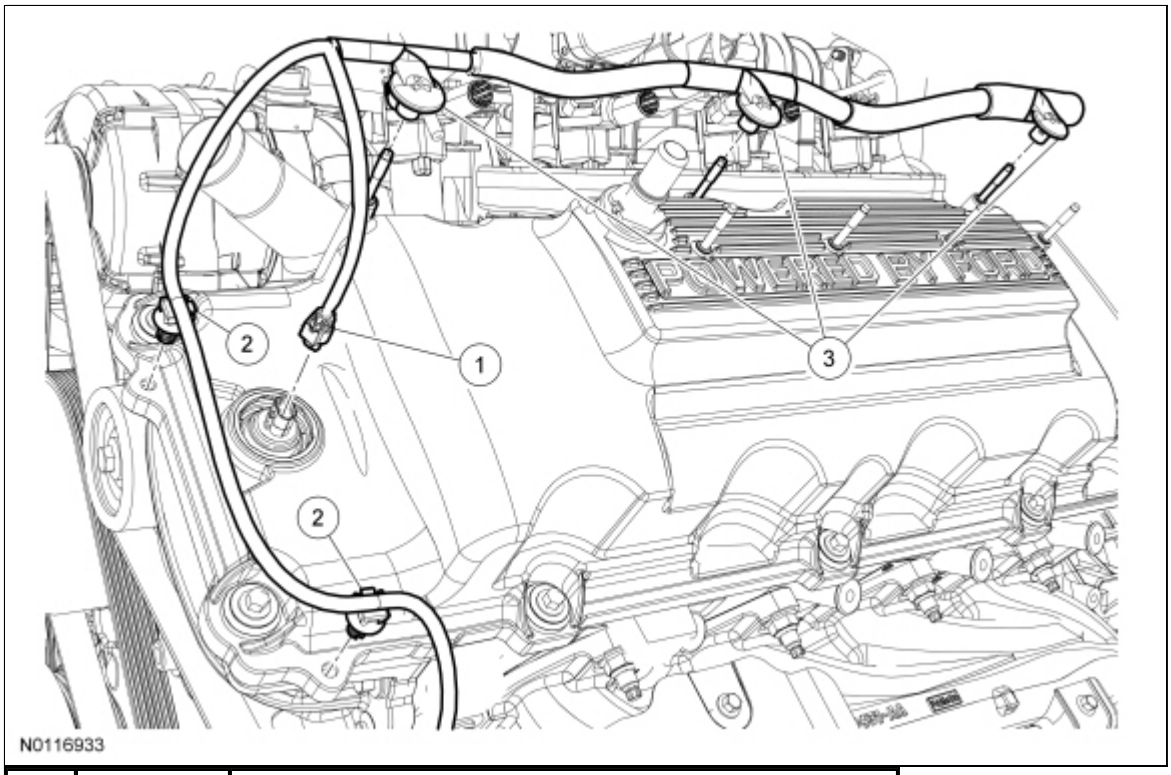
Valve Cover — LH

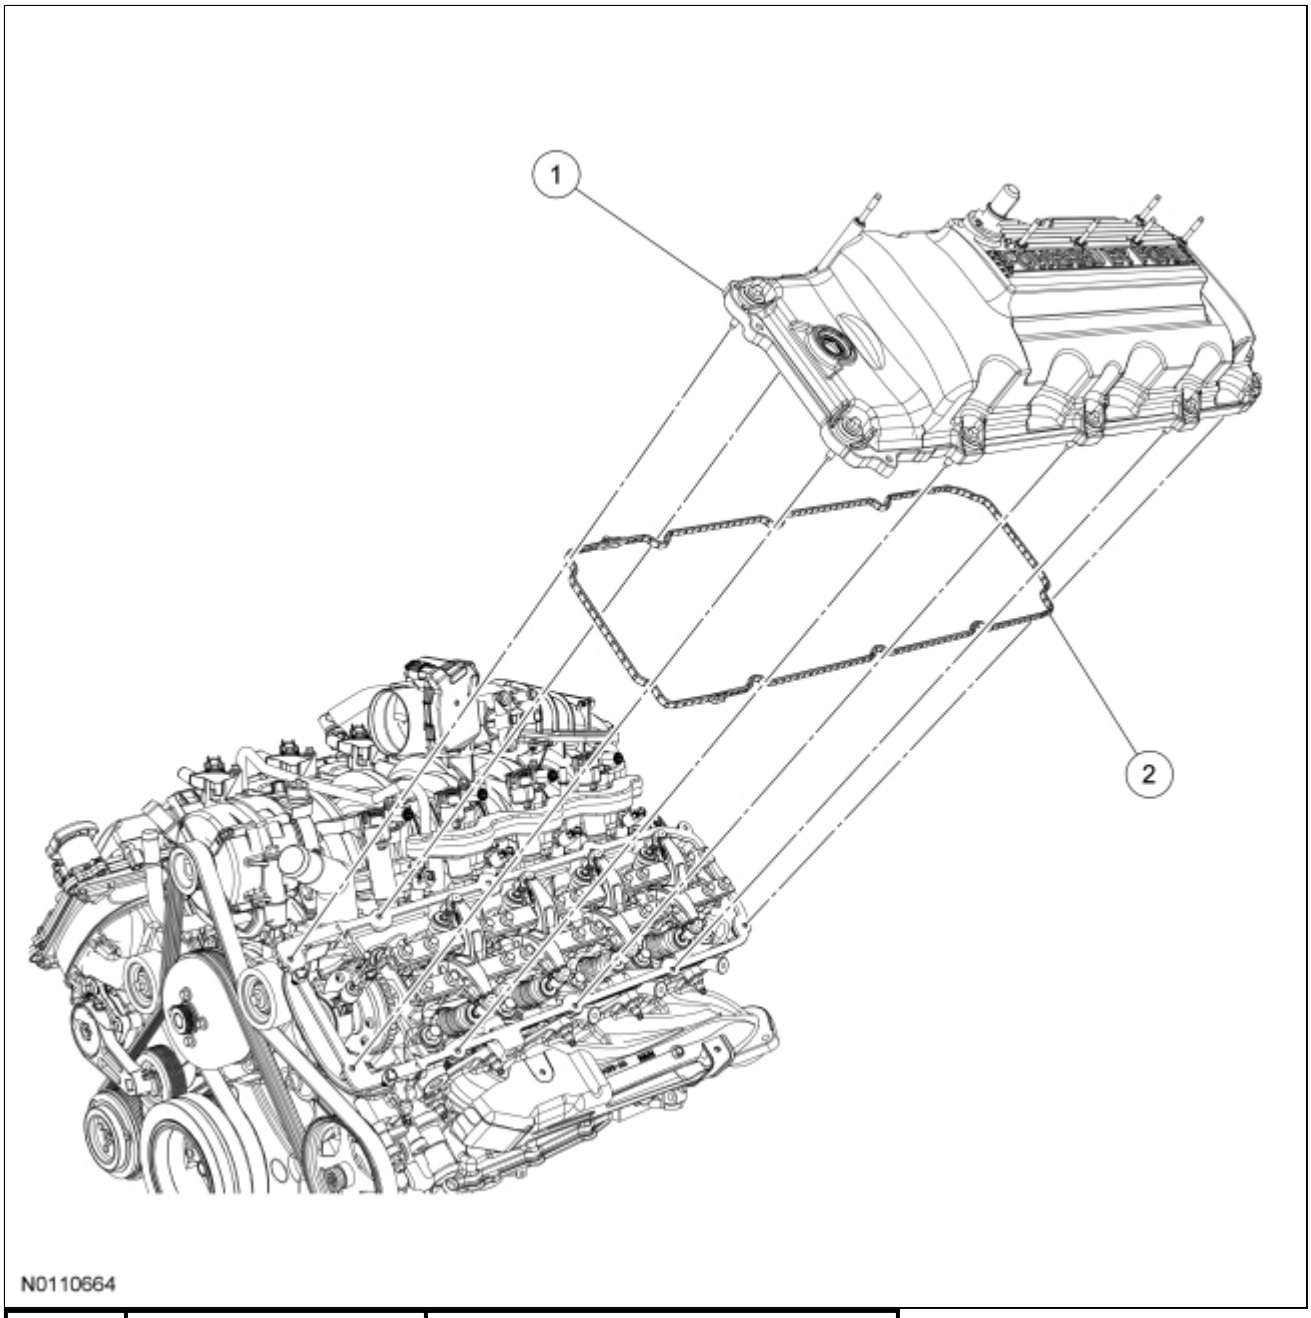
Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	—

PCV Tube and LH Ignition Wires

Item	Part Number	Description
1	6K817	Crankcase ventilation tube
2	12286	Ignition wire (4 required)



LH Variable Camshaft Timing (VCT) Electrical Connector and Engine Wiring Harness Retainers

Item	Part Number	Description
1	—	LH Variable Camshaft Timing (VCT) solenoid electrical connector (part of 12C508)
2	—	Engine wiring harness-to-LH valve cover retainers (part of 12C508) (2 required)
3	—	Engine wiring harness-to-LH valve cover retainers (part of 12C508) (3 required)

LH Valve Cover and Gasket

repair4less

Item	Part Number	Description
1	6762	LH valve cover
2	6584	LH valve cover gasket

Removal

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the quick connect couplings and remove the crankcase ventilation tube. For additional information, refer to Section 310-00 .
3. Disconnect the 4 LH ignition wires from the 4 LH ignition coils.

4. Disconnect the 4 LH ignition wire retainers from the valve cover.

5. Disconnect the LH Variable Camshaft Timing (VCT) variable force solenoid electrical connector.

6. Disconnect the 2 wiring harness retainers from the front and the 3 wiring harness retainers from the top of the LH valve cover.

7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTICE: **When removing the valve cover, make sure to avoid damaging the Variable Camshaft Timing (VCT) variable force solenoid.**

   NOTE: The fasteners are part of the valve cover and should not be removed.

   Loosen the 10 fasteners and remove the LH valve cover and gasket.
   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation

1. **NOTE:** If the valve cover is not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.

2. ***NOTICE:*** **When installing the valve cover, make sure to avoid damaging the Variable Camshaft Timing (VCT) variable force solenoid.**

   Position the LH valve cover and new gasket on the cylinder head and tighten the 10 fasteners in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

repair4less

3. Connect the 3 wiring harness retainers to the top and the 2 wiring harness retainers to the front of the LH valve cover.
4. Connect the LH VCT solenoid electrical connector.
5. Connect the 4 LH ignition wire retainers to the valve cover.
6. Connect the 4 LH ignition wires to the 4 LH ignition coils.
7. Position the crankcase ventilation tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .
8. Install the ACL outlet pipe. For additional information, refer to Section 303-12 .

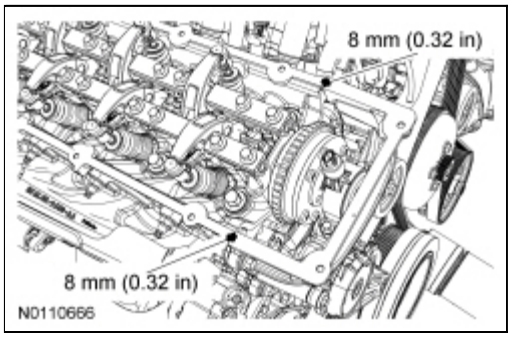
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the quick connect couplings and remove the PCV tube. For additional information, refer to Section 310-00 .
3. Disconnect the 4 RH ignition wires from the 4 RH ignition coils.
4. Disconnect the 4 RH ignition wire retainers from the valve cover.
5. Disconnect the RH Variable Camshaft Timing (VCT) solenoid electrical connector.
6. Disconnect the 6 wiring harness retainers from the RH valve cover.
7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTICE: **When removing the valve cover, make sure to avoid damaging the Variable Camshaft Timing (VCT) solenoid.**

   NOTE: The fasteners are part of the valve cover and should not be removed.



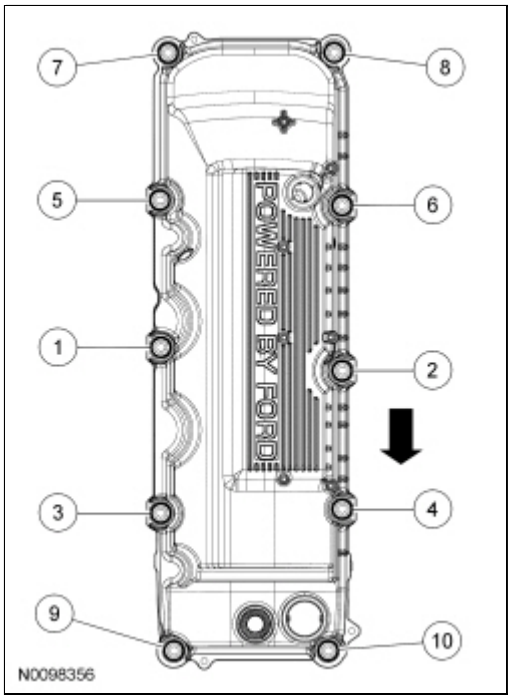
Loosen the 10 fasteners and remove the RH valve cover and gasket.

- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Discard the valve cover gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation

1. **NOTE:** If the valve cover is not secured within 5 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Allow to dry until there is no sign of wetness, or 5 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



2. ***NOTICE:*** **When installing the valve cover, make sure to avoid damaging the Variable Camshaft Timing (VCT) solenoid.**

   Position the RH valve cover and new gasket on the cylinder head and tighten the 10 fasteners in the sequence shown.

   - Tighten to 10 Nm (89 lb-in).

repair4less

3. Connect the 6 wiring harness retainers to the RH valve cover.
4. Connect the RH VCT solenoid electrical connector.
5. Connect the 4 RH ignition wire retainers to the valve cover.
6. Connect the 4 RH ignition wires to the 4 RH ignition coils.
7. Position the PCV tube and connect the quick connect couplings. For additional information, refer to Section 310-00 .

Valve Seals

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

1. Remove the rocker arm shaft assembly from the cylinder head being serviced. For additional information, refer to Rocker Arm in this section.

2. Remove the lower spark plug for the cylinder being serviced. For additional information, refer to Section 303-07D.

3. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.

4. Use compressed air in the cylinder being serviced to hold both valves in position.
   - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

5. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal. If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using a valve spring compressor, compress the valve spring and remove the valve spring retainer keys.

6. Remove the valve spring retainer, the valve spring and the valve seal.
   - Discard the valve seal.

7. Inspect the components. For additional information, refer to Section 303-00.

Installation

1. **NOTE:** Lubricate the valve seal and valve stem with clean engine oil prior to installation.

   Position a new valve seal onto the valve stem.

2. Using a valve stem oil seal installer, install the new valve seal.

3. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in the same positions. Failure to follow this instruction may result in engine damage.**

   Using a valve spring compressor, install the valve spring, the valve spring retainer and the valve spring retainer keys.

4. Relieve the air pressure from the cylinder.

5. Install the lower spark plug. For additional information, refer to Section 303-07D .

6. Install the rocker arm shaft assembly onto the cylinder head being serviced. For additional information, refer to Rocker Arm in this section.

---

Valve Springs

Removal

1. Remove the rocker arm shaft assembly from the cylinder head being serviced. For additional information, refer to Rocker Arm in this section.

2. Remove the lower spark plug for the cylinder being serviced. For additional information, refer to Section 303-07D .

3. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.

4. Use compressed air in the cylinder being serviced to hold both valves in position.
   - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

5. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal. If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using a valve spring compressor, compress the valve spring and remove the valve spring retainer keys.

6. Remove the valve spring retainer and the valve spring.

7. Inspect the valve spring. For additional information, refer to Section 303-00 .

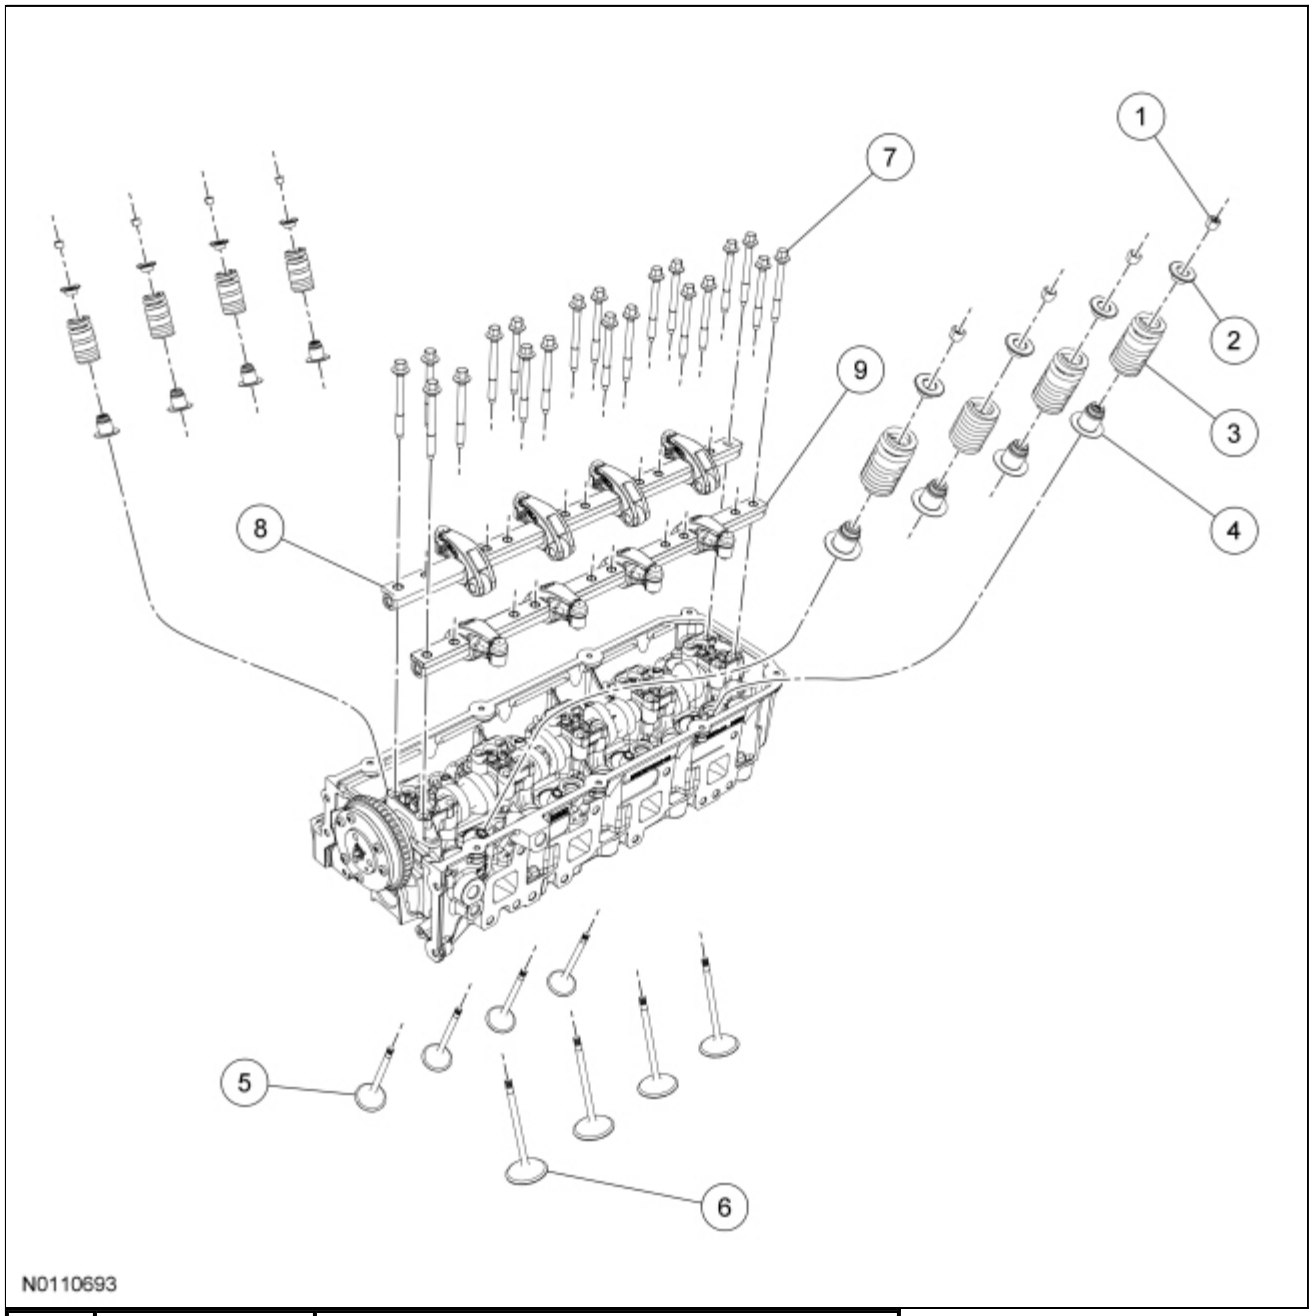
Installation

1. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in the same positions. Failure to follow this instruction may result in engine damage.**

   Using a valve spring compressor, install the valve spring, the valve spring retainer and the valve spring retainer keys.

2. Relieve the air pressure from the cylinder.

3. Install the lower spark plug. For additional information, refer to Section 303-07D .



4. Install the rocker arm shaft assembly onto the cylinder head being serviced. For additional information, refer to Rocker Arm in this section.

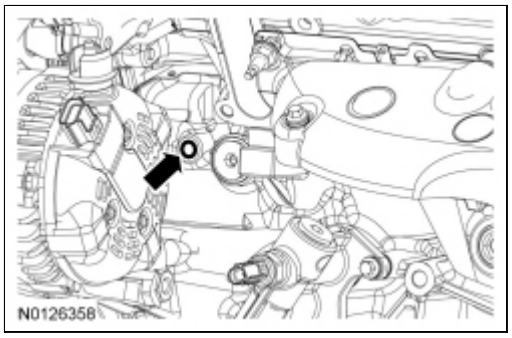
Engine Cooling

NOTICE: **Vehicle cooling systems are filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTE: During normal vehicle operation, Motorcraft® Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

The cooling system consists of the following components:



- Block heater (located in the thermostat housing for 3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L engines, the LH front of the 5.0L engine cylinder block and the LH rear of the 6.2L engine cylinder block.)
- Coolant expansion tank (6.2L engine)
- Degas bottle (3.5L GTDI , 3.7L and 5.0L engines)
- Electric cooling fan and shroud assembly
- Radiator
- Pressure relief cap (located on the radiator for the 6.2L engine and on the degas bottle for the 3.5L GTDI , 3.7L and 5.0L engines)
- Radiator draincock (located in the RH corner of the radiator)
- Upper and lower radiator hoses
- Coolant pump
- Coolant thermostat

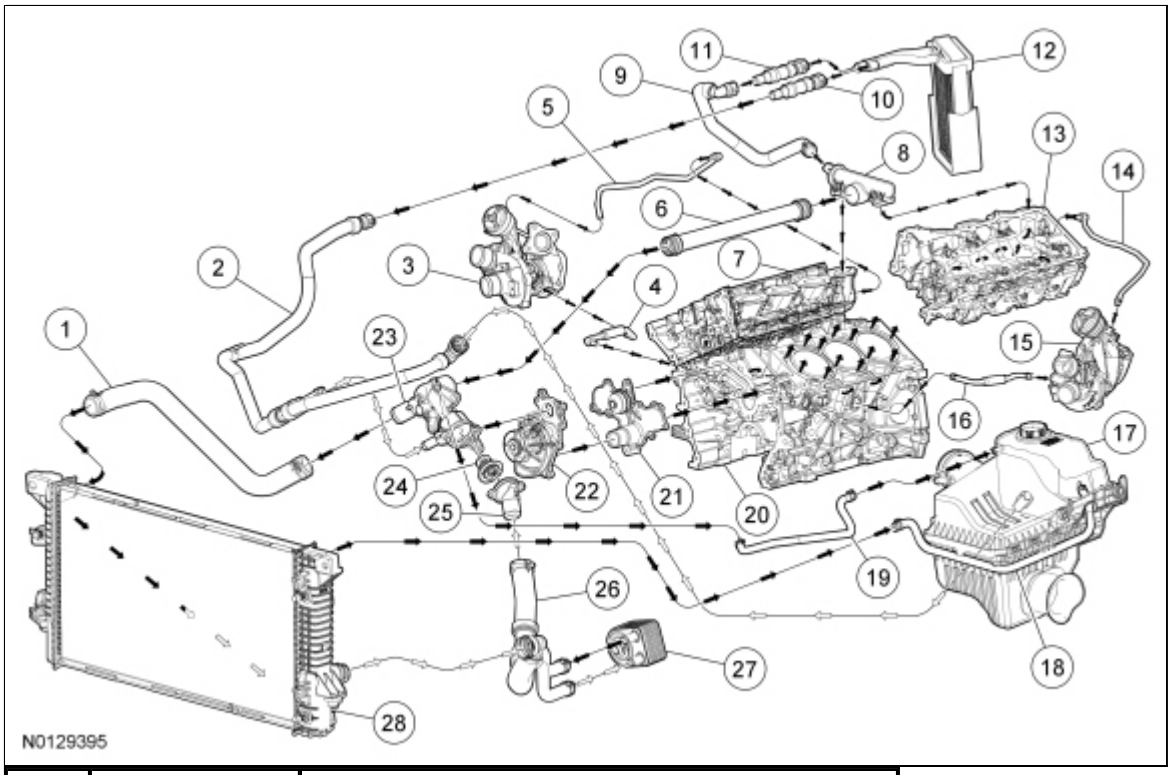
Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle or coolant expansion tank.

When adding engine coolant, use a 48/52 to 50/50 mixture of engine coolant and distilled water, which equates to a freeze point between -31°C (-30°F) and -37°C (-34°F).

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Orange Antifreeze/Coolant or equivalent.
- Do not add/mix any other engine coolant. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Do not mix with recycled coolant. Use of such coolants may harm the engine and cooling system components. Do not mix coolant types.

On 3.5L GTDI and 3.7L engines, a channel cover plate is located behind the front cover. It contains a timing chain idler and press in place gaskets separating engine coolant and engine oil. A weep hole is provided on the front left side of the engine behind the generator. If oil or coolant is leaking from the weep hole, then a gasket has failed and must be replaced. Refer to Section 303-01A for 3.5L GTDI engines or Section 303-01B for 3.7L engines.



The 3.5L GTDI , 3.7L and 5.0L engines use a cold side thermostat. This means the thermostat controls the flow of cooled radiator coolant into the warmer engine cooling circuit. The thermostat is located at the lower radiator hose connection to the engine. During initial warm-up, the engine coolant increases in temperature, causing the thermostat to open. The cooler coolant from the radiator mixes with the warm engine coolant, causing the thermostat to close. The thermostat opens and closes several times before the engine coolant is warm enough to allow the thermostat to remain open. The engine must run much longer than a vehicle with a hot side thermostat before the thermostat remains fully opened.

The 6.2L engine uses a typical hot side thermostat.

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated	WSS-M97B44-D

repair4less

VC-3-B (US); CVC-3-B2 (Canada)	
Motorcraft® Orange Antifreeze/Coolant Prediluted VC-3DIL-B (US); CVC-3DIL-B (Canada)	WSS-M97B44-D2

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

The degas bottle (3.5L GTDI, 3.7L and 5.0L engines) removes air from the cooling system. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the location for service fill.

The coolant expansion tank (6.2L engines) holds surplus coolant, allows for coolant expansion and replenishes coolant to the cooling system. It is equipped with a non-pressurized cap which allows coolant to be added to the tank to keep it filled to prescribed levels.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set and the Malfunction Indicator Lamp (MIL) is illuminated.

Inspection and Verification

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTICE: **The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of Motorcraft® Orange Antifreeze/Coolant. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTE: During normal vehicle operation, Motorcraft Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

1. Verify the customer concern.
2. Visually check the engine coolant level at the degas bottle when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the PCM DTC Chart in this section for DTC descriptions.
5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.
6. **NOTE:** For the coolant flow diagram, refer to Engine Cooling in the Description and Operation portion of this section.

   Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Leaks or weeps at: ▪ Hoses ▪ Tubes ▪ Clamp joints ▪ Gaskets ▪ O-rings ▪ Thermostat housing ▪ Radiator ▪ Pressure relief cap ▪ Coolant pump ▪ Heater core (wet floor or coolant odor in vehicle) ▪ Coolant crossover manifold assembly (if equipped) ▪ Oil filter adapter (if equipped) ▪ Oil cooler (if equipped) ▪ Coolant expansion tank (if equipped) ▪ Degas bottle (if equipped) ▪ Cylinder block core plugs ▪ Cylinder head core plugs ▪ Block heater (if equipped) ▪ Turbochargers (if equipped)	• Inoperative or damaged: ▪ Electric cooling fan ▪ Wiring, connectors, relays or modules ▪ Cylinder Head Temperature (CHT) sensor ▪ Vehicle Speed Sensor (VSS)
• Cracked or damaged: ▪ Hoses ▪ Tubes ▪ Hose clamps ▪ Thermostat housing ▪ Radiator ▪ Pressure relief cap ▪ Cooling fan ▪ Coolant pump ▪ Coolant expansion tank (if equipped)	

repair4less

▪ Degas bottle (if equipped) ▪ Oil filter adapter (if equipped) ▪ Oil cooler (if equipped) ▪ Coolant crossover manifold assembly (if equipped) ▪ Cylinder block core plugs ▪ Cylinder head core plugs ▪ Block heater (if equipped) ▪ Tirbochargers (if equipped) • Restricted airflow through the A/C condenser/radiator • Drive belt loose, worn or installed incorrectly • Broken or weak drive belt tensioner • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid • Automatic transmission fluid in coolant	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. Inspect the coolant condition.
    1. Inspect the coolant color.
        - Discoloration may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow in color) coolant degrades the corrosion protection of Motorcraft® Orange Antifreeze/Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Gold Antifreeze/Coolant, however, may not change the color or appearance of the orange colored coolant. Detection of contamination with Motorcraft® Gold Antifreeze/Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Gold Antifreeze/Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the nitrite testing directions in the kit to determine if nitrite is present in the system. If nitrite is present, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant. Refer to Cooling System Flushing in this section.
        - A darker orange with the presence of debris could indicate a commercially available stop leak may have been used and could result in loss of coolant flow to critical parts of the engine. If sediment is present in the coolant sample, flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant. Refer to Cooling System Flushing in this section.
        - A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant. Refer to Cooling System Flushing in this section.
        - An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For engine diagnosis, refer to Section 303-00 . Flush the cooling system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant. Refer to Cooling System Flushing in this section.
        - A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to the Component Tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. For engine diagnosis, refer to Section 303-00 . Flush the cooling system and refill with the correct mixture of distilled water and Motorcraft® Orange Antifreeze/Coolant. Refer to Cooling System Flushing in this section.
    2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. Maintain the coolant concentration within 48% to 50%, which equates to a freeze point between -31˚C and -37˚C (-30˚F and -34˚F). If the vehicle is

driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 48/52 to 50/50 (freeze protection -31°C [-30°F] to -34°C [-34°F]) engine coolant to distilled water.
    - Maximum coolant concentration is 60/40 for cold weather areas.
    - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
    - If coolant is low, add specified coolant mixture only.
    - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
    - If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

    If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

    If the scan tool does not communicate with the VCM:
    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM.
    - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
    - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

14. Clear the CMDTCs and carry out the self-test diagnostics for the PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other PCM DTCs, refer to Section 303-14.

16. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Loss of coolant	• Coolant hoses or tubes • Hose clamps • Coolant pump O-ring seal • Thermostat O-ring seal • Thermostat housing • Radiator • Transmission fluid cooler (in radiator) (may leak internally or externally) • Coolant expansion tank • Degas bottle • Pressure relief cap • Coolant pump leaking from weep hole • Cylinder block coolant pump hole cover • Heater core • Coolant crossover manifold assembly • Engine gaskets (may leak internally or externally) • Oil filter adapter (may leak internally or externally) • Oil cooler (may leak internally or externally) • Cylinder block core plugs • Cylinder head core plugs • Block heater (if equipped) • Turbochargers (if equipped)	• GO to Pinpoint Test A .

• The engine overheats	• Low coolant level • External engine coolant leak • Airlock in system • Pressure relief cap installation • Restricted airflow through the A/C condenser/radiator • Internal engine coolant leak • Coolant condition/concentration • Accessory drive components • Non-OEM engine enhancement components • Electric cooling fan • Radiator • Thermostat • Temperature gauge • Cylinder Head Temperature (CHT) sensor • Coolant pump • Coolant flow restriction	• GO to Pinpoint Test B .
• The engine does not reach normal operating temperature	• Low coolant level • Thermostat • Electric cooling fan always on • ECT gauge • CHT sensor	• GO to Pinpoint Test C .
• The block heater does not operate correctly	• Block heater power cable • Block heater	• CHECK continuity in all 3 power cable circuits. If any circuit measures more than 5 ohms, INSTALL a new power cable. • CHECK the resistance of the block heater. If the resistance does not measure between 12.5 and 17.0 ohms, INSTALL a new block heater.
• The electric cooling fan is inoperative in one or more speeds or does not operate correctly	• Wiring • Relays • Fuses • Cooling fan motor	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• The electric cooling fan stays on all the time	• Wiring • Relays	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Noisy electric cooling fan	• Foreign material contamination • Fan motor	• REMOVE the foreign material from the cooling fan and shroud. TEST the system for normal

repair4less

		operation. If still noisy, INSTALL a new cooling fan assembly.
	• Fan blade detached from fan motor	• INSTALL a new cooling fan assembly.

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system providing for coolant expansion and contraction as well as changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal
- Coolant pump gasket or O-ring seal
- Thermostat housing
- Radiator
- Transmission fluid cooler (in radiator)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Cylinder block coolant pump hole cover
- Heater core
- Coolant crossover manifold assembly
- Engine gaskets (may leak internally or externally)
- Oil filter adapter (may leak internally or externally)
- Oil cooler (may leak internally or externally)
- Coolant expansion tank
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)
- Turbochargers (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew

the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION • Carry out the inspection and verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2.
A2 CHECK THE ENGINE COOLANT LEVEL **NOTE:** Allow the engine to cool before checking the engine coolant level. • Ignition OFF. • Visually inspect the engine coolant level at the coolant expansion tank. • **Is the engine coolant level within specifications?**	**Yes** GO to A3. **No** ADJUST the engine coolant level as necessary. GO to A3.
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM • Pressure test the engine cooling system. For 3.5L GTDI, 3.7L or 5.0L engines, refer to Component Tests, Cooling System Pressure Test - Degas Bottle Systems in this section. For 6.2L engines, refer to Component Tests, Cooling System Pressure Test - Coolant Expansion Tank Systems in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to A4.
A4 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK • Inspect the engine coolant in the degas bottle or the coolant expansion tank and the radiator for signs of engine oil or transmission fluid. • **Is engine oil or transmission fluid evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. TEST the system for normal operation. **No** GO to A5.
A5 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT • Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00. If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure.

repair4less

	No GO to A6 .
A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system maintains the engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a pulley driven by the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the proper rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine generated heat to the outside air through the radiator.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0217 (Engine Coolant Over Temperature Condition) — Indicates an engine overheat condition was detected by the Cylinder Head Temperature (CHT) sensor.
- DTC P1285 (Cylinder Head Over Temperature Condition) — Indicates an engine overheat condition was sensed by the CHT sensor.
- DTC P1299 (Cylinder Head Over Temperature Protection Active) — Indicates an engine overheat condition was detected by the CHT sensor. A failure mode effects management strategy called fail-safe cooling was activated to cool the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components

- Electric cooling fan
- Temperature gauge
- CHT sensor
- Coolant pump
- Coolant flow restriction
- Radiator
- Thermostat

PINPOINT TEST B: THE ENGINE OVERHEATS

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the inspection and verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2.
B2 CHECK FOR DTCs	
• Check for DTC P0217, P1285 or P1299. • **Is DTC P0217, P1285 or P1299 present?**	**Yes** GO to B3. **No** Actual engine overheating has not been verified. CHECK the engine coolant temperature gauge operation. REFER to Section 413-01. If any other PCM DTCs are retrieved, REFER to Section 303-14.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Check the radiator or A/C condenser for an obstruction such as leaves or cardboard. • **Is an obstruction present?**	**Yes** REMOVE the obstruction. TEST the system for normal operation. **No** GO to B4.
B4 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the coolant level. • Ignition OFF. • Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** GO to B5. **No** ADJUST the engine coolant level as necessary. GO to B5.

repair4less

B5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. For 3.5L GTDI, 3.7L or 5.0L engines, refer to Component Tests, Cooling System Pressure Test - Degas Bottle System in this section. For 6.2L engines, refer to Component Tests, Cooling System Pressure Test - Coolant Expansion Tank System in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** For 6.2L engines, GO to B6 . For 3.5L GTDI, 3.7L or 5.0L engines, GO to B7 .
B6 CHECK THE PRESSURE RELIEF CAP	
• Carry out the Pressure Relief Cap Pressure Test. Refer to Component Test, Pressure Relief Cap Pressure Test in this section. • **Is the pressure relief cap OK?**	**Yes** GO to B7 . **No** INSTALL a new pressure relief cap. TEST the system for normal operation.
B7 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the degas bottle or the coolant expansion tank and the radiator for signs of engine oil or transmission fluid. • **Is engine oil or transmission fluid evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. TEST the system for normal operation. **No** GO to B8 .
B8 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. **No** GO to B9 .
B9 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B10 .
B10 CHECK COOLANT CONDITION	

• Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** GO to B11 . **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B11 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Start the engine. • Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position. • **Did the electric cooling fan operate?**	**Yes** GO to B12 . **No** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B12 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B13 . **No** INSTALL a new coolant pump. TEST the system for normal operation.
B13 CHECK THE THERMOSTAT OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes (6.2L engines) or 30 minutes (3.5L GTDI, 3.7L or 5.0L engines). Feel the upper radiator hose. • **Is the upper radiator hose hot?**	**Yes** CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . **No** GO to B14 .
B14 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system maintains engine temperature during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a pulley driven by the accessory drive belt, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit

repair4less

and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the cooling fans operate all of the time. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

- DTC P0125 (Insufficient Coolant Temperature For Closed Loop Fuel Control) — Indicates the Cylinder Head Temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat [Coolant Temperature Below Thermostat Regulating Temperature]) — Indicates the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- Temperature gauge
- Electric cooling fan always on
- Cylinder Head Temperature (CHT) sensor

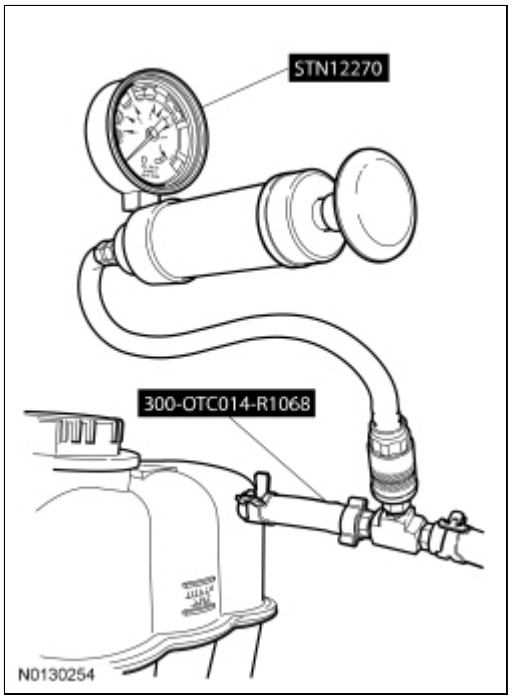
PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
C1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the inspection and verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK FOR DTC P0125 or P0128	
• Check for DTC P0125 or P0128. • **Is DTC P0125 or P0128 present?**	**Yes** GO to C3 . **No** The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant

	temperature gauge operation. REFER to Section 413-01 . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00 . If any other PCM DTCs are retrieved, REFER to Section 303-14 .
C3 CHECK THE ELECTRIC COOLING FAN OPERATION • Allow the engine to cool. • Make sure the A/C switch is OFF. • Start the engine. • Check the electric cooling fan. • **Is the electric cooling fan on all the time?**	**Yes** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C4 .
C4 CHECK THE COOLANT LEVEL • **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** GO to Pinpoint Test A to diagnose a coolant leak.

Component Tests



Cooling System Pressure Test - Degas Bottle Systems

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles equipped with a degas bottle system have the pressure relief cap on the degas bottle and no radiator cap. The pressure relief cap is tested as part of the cooling system pressure test.

1. Turn the engine off.
2. Check the engine coolant level. Adjust the coolant level as necessary.
3. Attach the D-Gas Adapter to the degas bottle nipple and overflow hose. Install the Radiator Tester to the quick connect fitting of the D-Gas Adapter.

repair4less

4. ***NOTICE:*** **Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section or cooling system components may be damaged.**

   NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading results.

   Slowly press the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

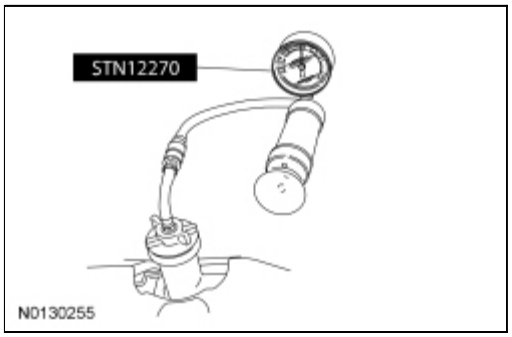
5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all of the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.

6. Pressurize the engine cooling system as described in Step 4. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops, inspect for leaks and repair as necessary.

7. If no leaks are found and the pressure drops, the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.

8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

9. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.



Coolant System Pressure Test - Coolant Expansion Tank Systems

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles equipped with a coolant expansion tank have the pressure relief cap on the radiator. The pressure relief cap is tested separately.

1. Turn the engine off.

2. Remove the pressure relief cap. Fill the radiator with coolant if needed.

3. Fit the Radiator Tester to the radiator fill neck.

4. ***NOTICE:*** **Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section, or cooling system components can be damaged.**

   NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading results.

   Slowly press the plunger of the pressure test pump to the maximum allowed pressure and hold for 2 minutes. If the pressure drops within this time, inspect for leaks and repair as necessary.

5. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler. Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

6. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

Pressure Relief Cap Pressure Test

1. Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.

2. Using the correct adapter, fit the pressure relief cap to the Radiator Tester.

3. **NOTE:** If the plunger of the pressure tester is pressed to fast, an incorrect pressure reading results.

   Slowly press the plunger of the pressure test pump until the pressure gauge stops increasing and note the highest pressure reading. Release the pressure and repeat the test. Install a new pressure relief cap if the pressure is not within the pressure listed in the Specifications table in this section.

repair4less

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
    - Valve not fully seated (light visible through the valve)
    - Foreign material lodged in the main valve
    - Bent or broken frame or flange
    - Bent or broken spring
    - Bent or broken valve or valve stem
    - Wax leaking from wax reservoir or a bulge in the reservoir
    - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

    If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

Radiator Leak Test, Removed From Vehicle

NOTICE: **Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.**

NOTE: Always install plugs in the transmission fluid cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the Specifications.

repair4less

Cooling System Draining, Filling and Bleeding

Special Tool(s)

 ST2818-A	Air Lift Cooling System Tester UVU550000 or equivalent

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D
Motorcraft® Orange Antifreeze/Coolant Prediluted VC-3DIL-B (US); CVC-3DIL-B (Canada)	WSS-M97B44-D2

Draining

WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTICE: **The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly. Failure to follow these instructions may result in engine or cooling system damage.**

NOTE: Less than 80% of the coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

NOTE: During normal vehicle operation, Motorcraft Orange Antifreeze/Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Make sure the engine is cool.
3. Wrap a thick cloth around the pressure relief cap. Slowly turn the cap counterclockwise until the

pressure begins to release.

4. Step back while the pressure releases.

5. When sure all the pressure has been released, use the cloth to turn and remove the cap.

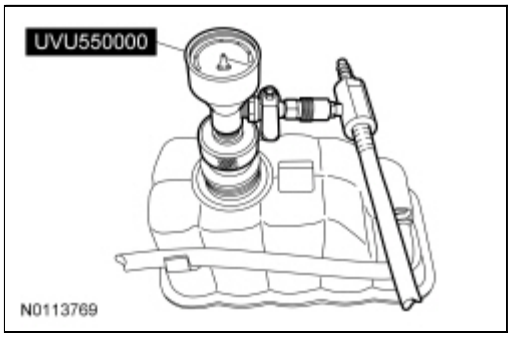
6. Place a suitable container below the radiator draincock. Drain the coolant.
    - Tighten the radiator draincock when finished.

Filling and Bleeding with a Vacuum Cooling System Filler - Degas Bottle Systems

NOTICE: **The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

To maintain the integrity of the coolant and the cooling system:



- **Add Motorcraft® Orange Antifreeze/Coolant or equivalent. Do not mix coolant types.**
- **Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.**

1. Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the cooling system.
   When adding or topping of the engine coolant:
    1. Measure the coolant concentration in the vehicle using the Coolant/Battery Refractometer 300-ROB75240 or equivalent.
    2. Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.
    3. Add/top off or adjust coolant as follows:
        - For concentrations measured 48/52 to 50/50 (equates to a freeze point between -31°C [-30°F] and -34°C [-37°F]), use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.
        - For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.
        - When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.
    4. Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]).
    5. For extremely cold climates (less than -37°C [-34°F]):
        - It may be necessary to increase the coolant concentration above 50%.
        - NEVER increase the coolant concentration above 60%.
        - Maximum coolant concentration is 60/40 for cold weather areas.

repair4less

- A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
- Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.

6. For extremely hot climates:
   - It is still necessary to maintain the coolant concentration above 40%.
   - NEVER decrease the coolant concentration below 40%.
   - Minimum coolant concentration is 40/60 for warm weather areas.
   - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
   - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
7. Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 mixture of engine coolant and distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]) for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler - Degas Bottle Systems

NOTICE: **The engine cooling system is filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft® Orange Antifreeze/Coolant or equivalent. Do not mix coolant types.**
- **Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.**

1. Fill the radiator through the degas bottle until the coolant level is between the COOLANT FILL LEVEL marks.
   When adding or topping of the engine coolant:
   1. Measure the coolant concentration in the vehicle using the Coolant/Battery Refractometer 300-ROB75240 or equivalent.
   2. Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold

operating conditions.

3. Add/top off or adjust coolant as follows:
    - For concentrations measured 48/52 to 50/50 (equates to a freeze point between -31°C [-30°F] and -34°C [-37°F]), use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.
    - For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.
    - When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.
4. Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]).
5. For extremely cold climates (less than -37°C [-34°F]):
    - It may be necessary to increase the coolant concentration above 50%.
    - NEVER increase the coolant concentration above 60%.
    - Maximum coolant concentration is 60/40 for cold weather areas.
    - A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
    - Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
6. For extremely hot climates:
    - It is still necessary to maintain the coolant concentration above 40%.
    - NEVER decrease the coolant concentration below 40%.
    - Minimum coolant concentration is 40/60 for warm weather areas.
    - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
    - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
7. Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 mixture of engine coolant and distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]) for optimum cooling system and engine protection.

2. Select the maximum heater temperature and blower motor speed settings. Position the control to discharge air at A/C vents in instrument panel.

3. Start the engine and allow to idle. While engine is idling, feel for hot air at A/C vents.

4. ***NOTICE:*** **If the air discharge remains cool and the Engine Coolant Temperature (ECT) gauge does not move, the engine coolant level is low and must be filled. Stop the engine, allow the engine to cool and fill cooling system. Failure to follow these instructions may result in damage to the engine.**

   Start the engine and allow it to idle until normal operating temperature is reached. Hot air should discharge from A/C vents. The Engine Coolant Temperature (ECT) gauge should maintain a stabilized reading in the middle of the NORMAL range. The upper radiator hose should feel hot to the touch.

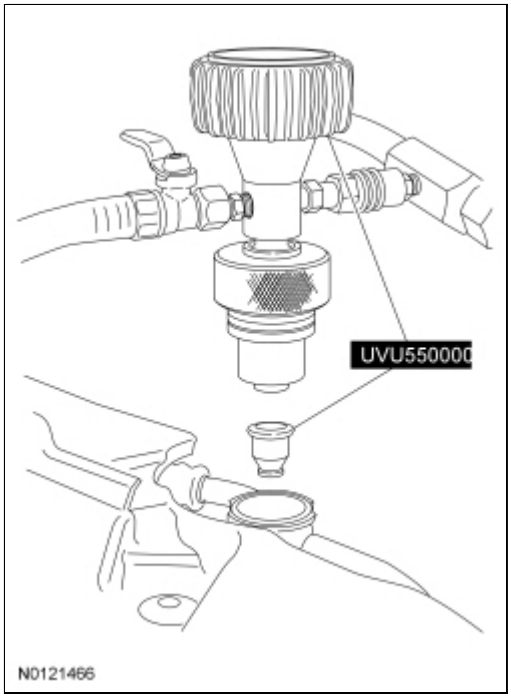
5. Shut the engine off and allow the engine to cool.

6. Check the engine coolant level in the degas bottle and fill as necessary.

7. Repeat the previous 4 steps as necessary.

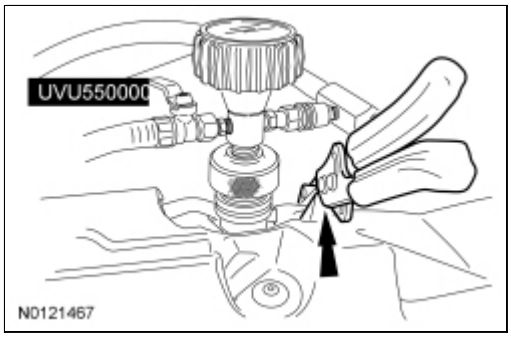
Filling and Bleeding with a Vacuum Cooling System Filler - Coolant Expansion Tank System

repair4less



NOTICE: **Vehicle cooling systems are filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level. Failure to follow these instructions may damage the engine or cooling system.**



To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft® Orange Antifreeze/Coolant or equivalent. Do not mix coolant types.**
- **Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.**

1. Connect the vacuum cooling system filler and the appropriate rubber adapter to the radiator.

2. Clamp the radiator-to-coolant expansion tank hose near the radiator.

3. Follow the vacuum cooling system filler manufacturer's instructions to fill and bleed the cooling system.
   When adding or topping of the engine coolant:
   1. Measure the coolant concentration in the vehicle using the Coolant/Battery Refractometer 300-ROB75240 or equivalent.
   2. Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.
   3. Add/top off or adjust coolant as follows:
      - For concentrations measured 48/52 to 50/50 (equates to a freeze point between -31°C [-30°F] and -34°C [-37°F]), use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.
      - For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.
      - When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.
   4. Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]).
   5. For extremely cold climates (less than -37°C [-34°F]):
      - It may be necessary to increase the coolant concentration above 50%.
      - NEVER increase the coolant concentration above 60%.
      - Maximum coolant concentration is 60/40 for cold weather areas.
      - A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
      - Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
   6. For extremely hot climates:
      - It is still necessary to maintain the coolant concentration above 40%.
      - NEVER decrease the coolant concentration below 40%.
      - Minimum coolant concentration is 40/60 for warm weather areas.
      - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
      - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
   7. Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 mixture of engine coolant and distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]) for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler - Coolant Expansion Tank Systems

NOTICE: **Vehicle cooling systems are filled with Motorcraft® Orange Antifreeze/Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

repair4less

NOTICE: **Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level. Failure to follow these instructions may damage the engine or cooling system.**

To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft® Orange Antifreeze/Coolant or equivalent. Do not mix coolant types.**
- **Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.**
- **Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Orange Antifreeze/Coolant since a Ford-approved recycling process is not yet available.**

Vehicles equipped with a 6.2L engine

1. **NOTE:** For coolant flow diagrams, refer to Engine Cooling in Description and Operation in this section.

   Release the clamp and disconnect the heater inlet hose from the heater inlet tube.

2. Fill the radiator through the radiator fill neck until engine coolant flows from the heater inlet tube. When adding or topping of the engine coolant:
   1. Measure the coolant concentration in the vehicle using the Coolant/Battery Refractometer 300-ROB75240 or equivalent.
   2. Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.
   3. Add/top off or adjust coolant as follows:
      - For concentrations measured 48/52 to 50/50 (equates to a freeze point between -31°C [-30°F] and -34°C [-37°F]), use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.
      - For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.
      - When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.
   4. Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]).
   5. For extremely cold climates (less than -37°C [-34°F]):
      - It may be necessary to increase the coolant concentration above 50%.
      - NEVER increase the coolant concentration above 60%.
      - Maximum coolant concentration is 60/40 for cold weather areas.
      - A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
      - Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
   6. For extremely hot climates:
      - It is still necessary to maintain the coolant concentration above 40%.
      - NEVER decrease the coolant concentration below 40%.
      - Minimum coolant concentration is 40/60 for warm weather areas.
      - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
      - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
   7. Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 mixture of

engine coolant and distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]) for optimum cooling system and engine protection.

3. Connect the heater inlet hose to the heater inlet tube and position the clamp.

All vehicles

4. Fill the radiator through the radiator fill neck until the coolant level is at the bottom of the filler neck. When adding or topping of the engine coolant:
    1. Measure the coolant concentration in the vehicle using the Coolant/Battery Refractometer 300-ROB75240 or equivalent.
    2. Determine the concentration desired based on the vehicle duty cycle of extreme hot or cold operating conditions.
    3. Add/top off or adjust coolant as follows:
        - For concentrations measured 48/52 to 50/50 (equates to a freeze point between -31°C [-30°F] and -34°C [-37°F]), use Motorcraft® Orange Antifreeze/Coolant Prediluted to maintain a coolant concentration in this same range.
        - For all other concentrations, use Motorcraft® Orange Antifreeze/Coolant Concentrated and/or distilled water to get to the desired concentration.
        - When refilling the engine coolant after a flush procedure, use a mixture of Motorcraft® Orange Antifreeze/Coolant Concentrated and distilled water to get to the desired concentration.
    4. Recommended coolant concentration is 48/52 to 50/50 engine coolant to distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]).
    5. For extremely cold climates (less than -37°C [-34°F]):
        - It may be necessary to increase the coolant concentration above 50%.
        - NEVER increase the coolant concentration above 60%.
        - Maximum coolant concentration is 60/40 for cold weather areas.
        - A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
        - Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
    6. For extremely hot climates:
        - It is still necessary to maintain the coolant concentration above 40%.
        - NEVER decrease the coolant concentration below 40%.
        - Minimum coolant concentration is 40/60 for warm weather areas.
        - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
        - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
    7. Vehicles driven year-round in non-extreme climates should use a 48/52 to 50/50 mixture of engine coolant and distilled water (freeze protection -31°C [-30°F] to -34°C [-37°F]) for optimum cooling system and engine protection.

5. Install the radiator cap.

6. Fill the coolant expansion tank until the coolant reaches the COLD FILL mark.

7. Select the maximum heater temperature and blower motor speed settings. Position the control to discharge air at A/C vents in instrument panel.

8. ***NOTICE:*** **If the air discharge remains cool and the engine coolant temperature gauge does not move, the engine coolant level is low in the engine and must be filled. Stop the engine, allow it to cool and fill the cooling system. Failure to follow this instruction may result in damage to the engine.**

    Run the engine at idle until it reaches normal operating temperature.

repair4less

9. Turn the engine off and allow it to cool.

10. Add the correct coolant mixture to the coolant expansion tank until the coolant level is at the COLD FILL mark.

11. Start the engine and allow it to idle until it reaches normal operating temperature. While the engine is idling, feel for hot air from the A/C vents.
    - Hot air should discharge from the A/C vents. The engine coolant temperature gauge should maintain a stabilized reading in the middle of the NORMAL range and the upper radiator hose should feel hot to the touch.

12. Check the engine coolant level in the coolant expansion tank and fill it as necessary.

13. Repeat the previous 5 steps as necessary.

Cooling System Flushing

Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

1. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

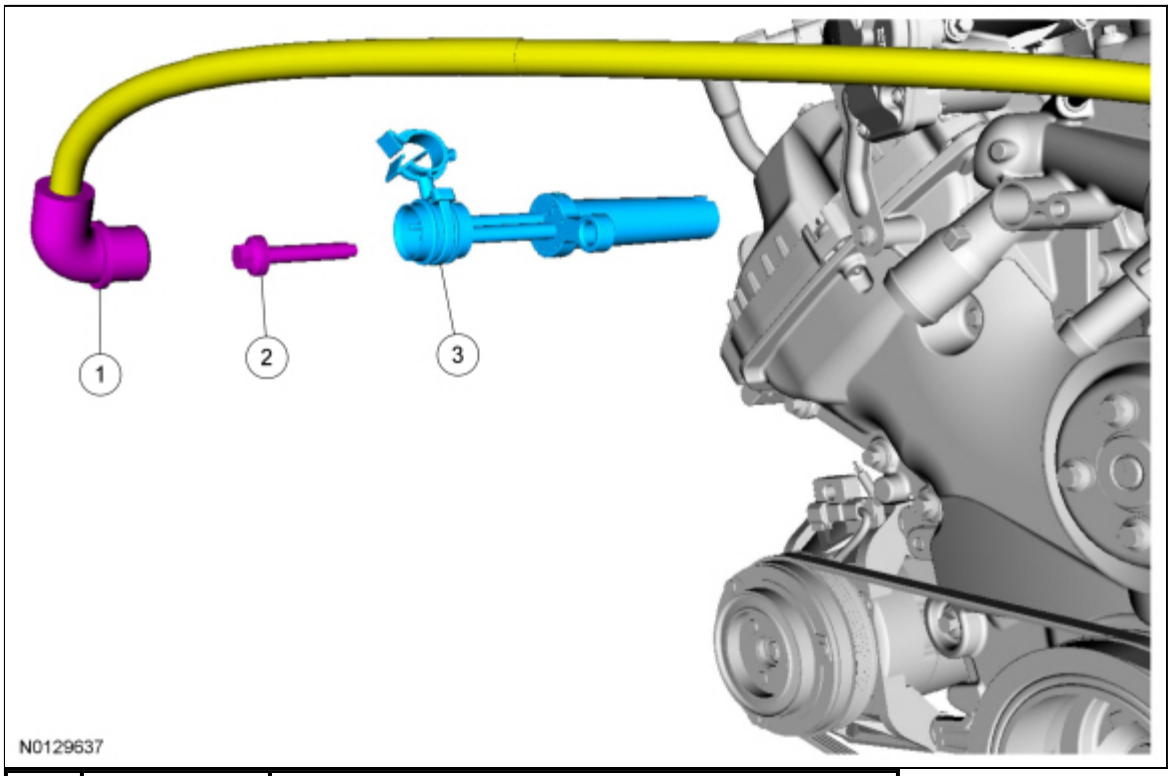
   Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat. For additional information, refer to Thermostat — 3.5L GTDI, Thermostat — 3.7L, Thermostat — 5.0L or Thermostat — 6.2L in this section.

3. Install the coolant inlet connection (3.5L GTDI, 3.7L or 5.0L engines) or the coolant outlet connection (6.2L engines) without the thermostat.

4. **NOTE:** Refer to the cooling system flusher manufacturer's operating instructions for specific vehicle hook-up.

   Use a cooling system flusher to flush the engine and radiator.
   - Use Motorcraft® Premium Cooling System Flush and follow the directions on the packaging.

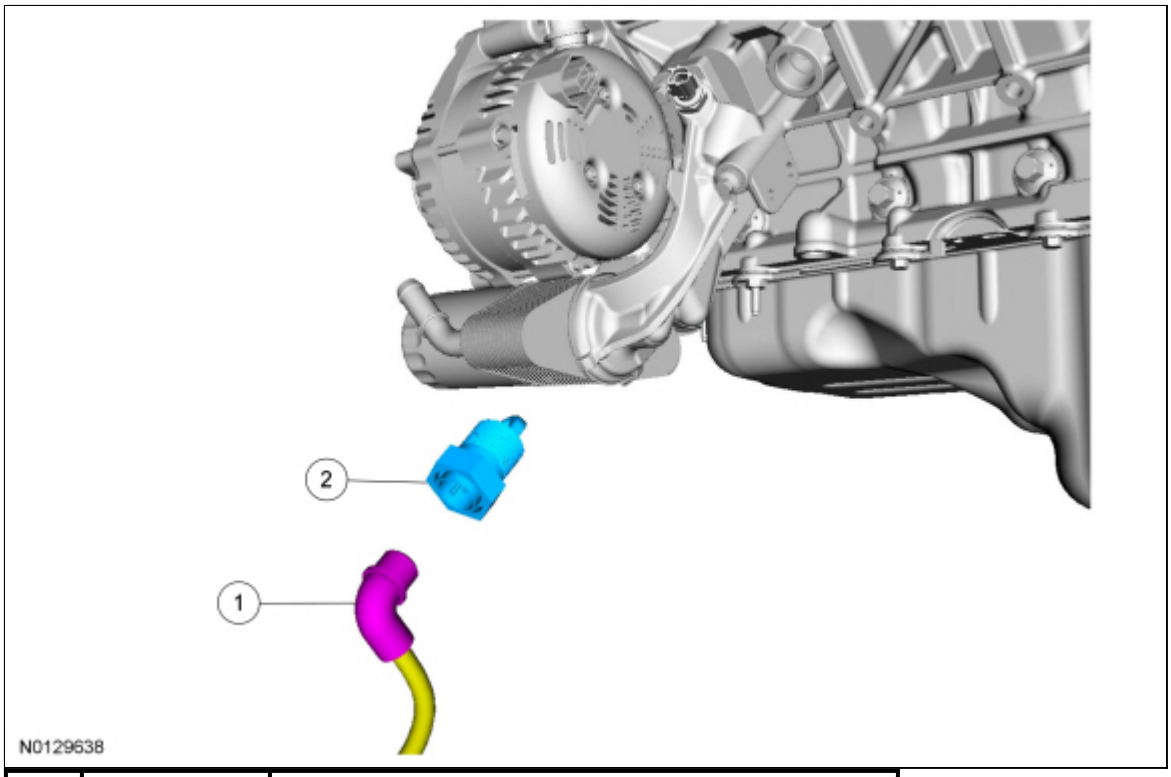


5. Install the thermostat. For additional information, refer to Thermostat — 3.5L GTDI, Thermostat — 3.7L, Thermostat — 5.0L or Thermostat — 6.2L in this section.

6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

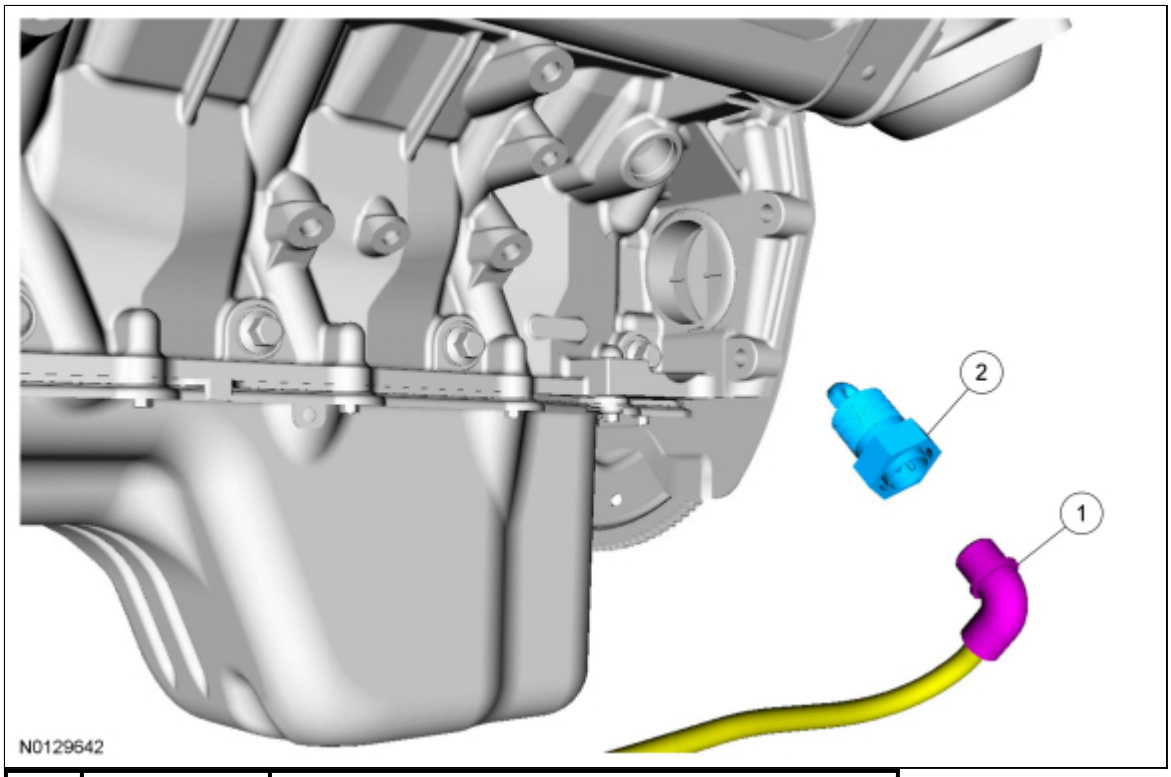
repair4less

Block Heater



3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L Engines

Item	Part Number	Description
1	—	Block heater electrical connector (part of 6B018)
2	W503277	Block heater bolt - 6 Nm (53 lb-in)
3	6A051	Block heater



5.0L Engine

repair4less

Item	Part Number	Description
1	—	Block heater electrical connector (part of 6B018)
2	6A051	Block heater - 40 Nm (30 lb-ft).

6.2L Engine

Item	Part Number	Description
1	—	Block heater electrical connector (part of 6B018)
2	6A051	Block heater - 40 Nm (30 lb-ft).

Removal and Installation

5.0L and 6.2L engines

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L engines

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

All engines

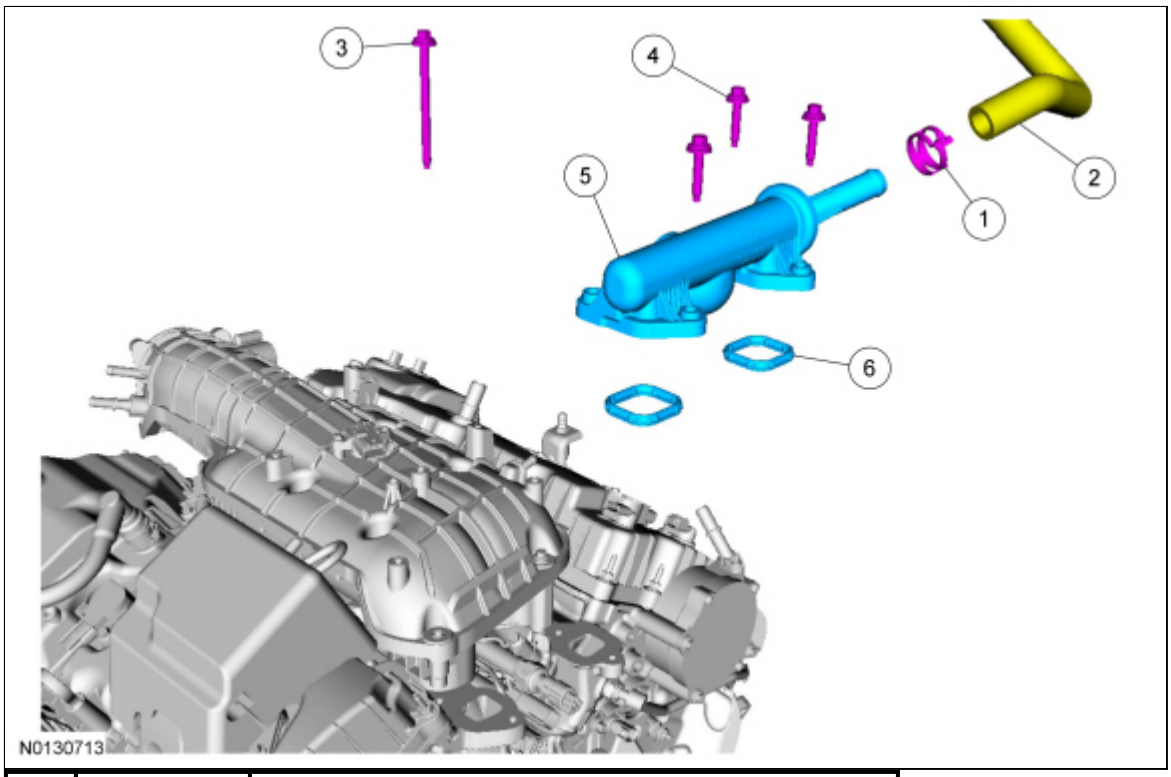
3. ***NOTICE:*** **To install, route the block heater power cable away from hot or rotating components, or the cable can be damaged.**

   Disconnect the block heater electrical connector.

3.5L GTDI and 3.7L engines

4. Remove the bolt and the block heater.
   - To install, tighten to 6 Nm (53 lb-in).

5.0L and 6.2L engines



repair4less

5. Remove the block heater.
    - To install, tighten to 40 Nm (30 lb-ft).

All engines

6. To install, reverse the removal procedure.

Coolant Crossover Manifold Assembly — 3.5L GTDI

Item	Part Number	Description
1	W527362	Heater hose clamp
2	18472	Heater hose
3	W714988	Intake manifold bolt
4	W503279	Coolant crossover manifold assembly bolt (3 required)
5	8C368	Coolant crossover manifold assembly
6	9439	Coolant crossover manifold assembly gasket (2 required)

Removal

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Release the clamp and disconnect the heater hose from the coolant crossover manifold assembly.
3. Remove the LH rear intake manifold bolt.
4. Remove the 3 bolts and the coolant crossover manifold assembly.

repair4less

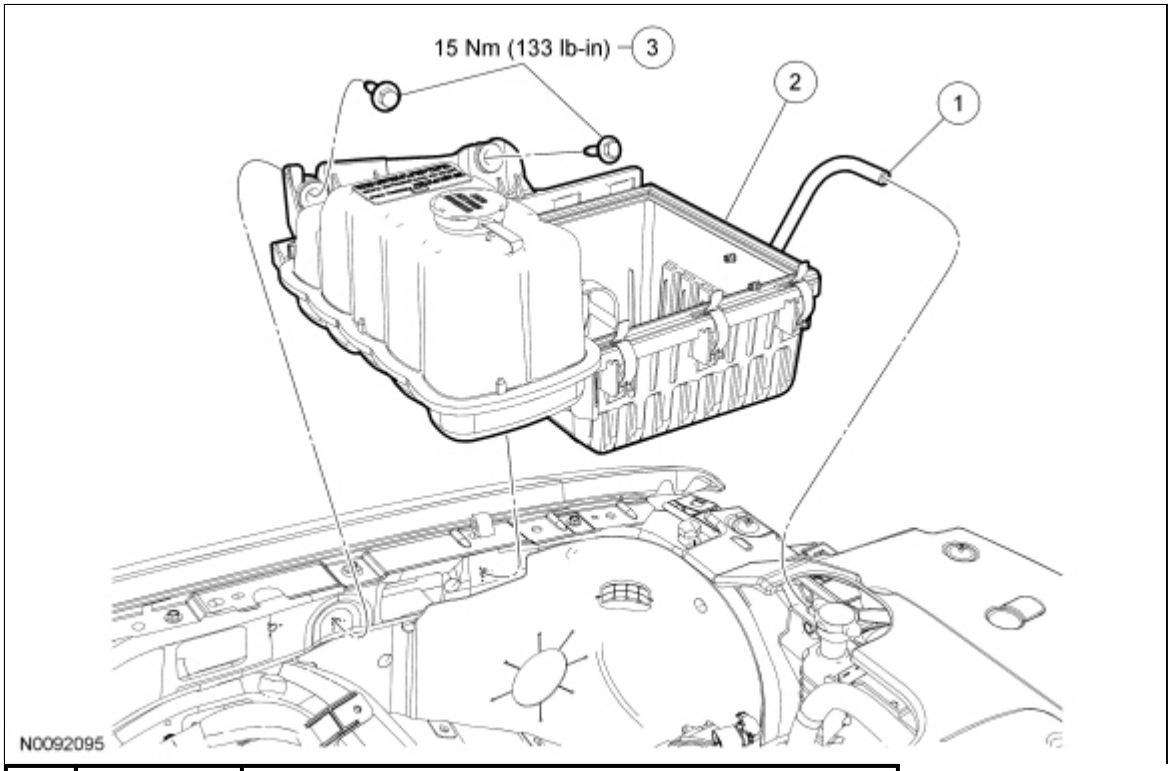
- Remove and discard the gaskets.

Installation

1. Install new gaskets, position the coolant crossover manifold assembly and install the bolts finger tight.

2. Tighten the bolts in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

3. Install the LH rear intake manifold bolt.
   - Tighten to 10 Nm (89 lb-in).



4. Connect the heater hose and position the clamp.

5. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Expansion Tank — 6.2L

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	8N029	Coolant overflow hose
2	8A080	Coolant expansion tank/lower Air Cleaner (ACL) housing assembly
3	W701835	Coolant expansion tank bolts (2 required)

Removal and Installation

1. ***NOTICE:*** **Allow the engine to cool before removing the coolant expansion tank. The radiator draws coolant from the coolant expansion tank as the engine cools. If the coolant expansion tank is removed before the engine cools, the radiator will draw air into the system, resulting in possible engine damage.**

   NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change

repair4less

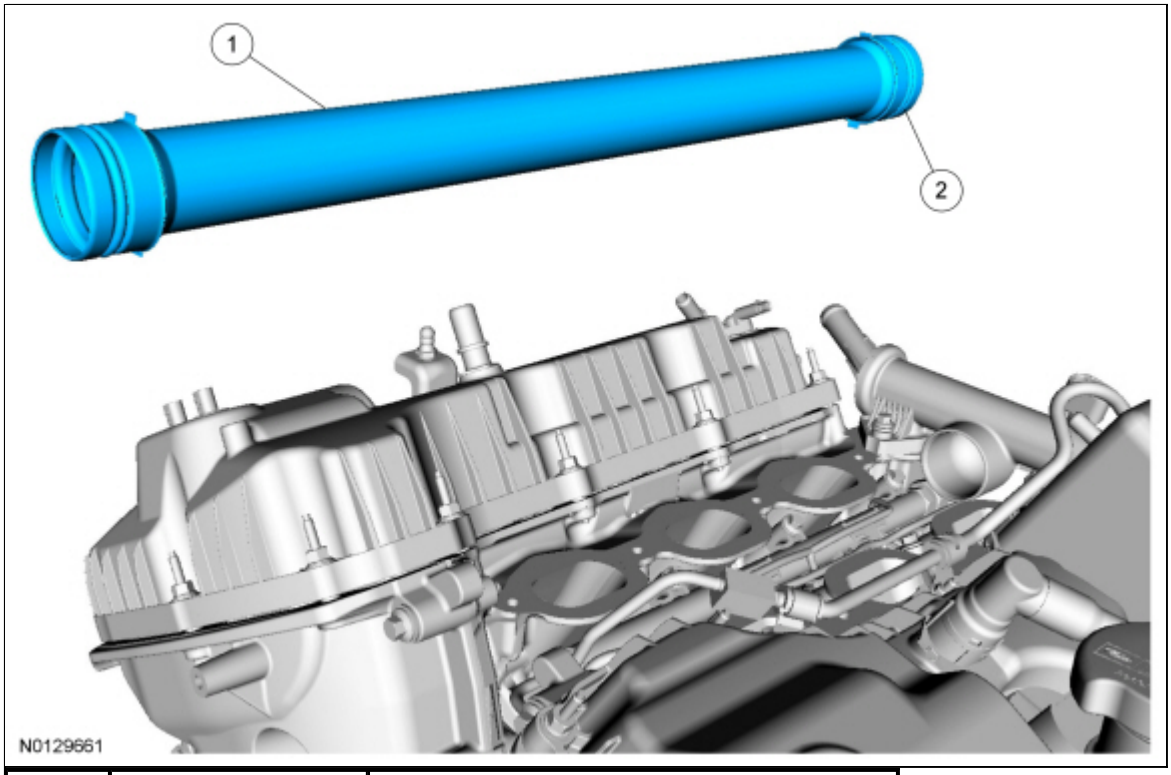
color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

Using a suitable suction device, siphon the coolant from the coolant expansion tank.

2. Remove the Air Cleaner (ACL) element. For additional information, refer to Section 303-12 .

3. Disconnect the coolant overflow hose from the radiator.

4. Remove the 2 bolts and the coolant expansion tank/lower ACL housing assembly.
   - To install, tighten to 15 Nm (133 lb-in).



5. To install, reverse the removal procedure.
   - Fill the coolant expansion tank with a 50/50 mixture of coolant and distilled water.

Coolant Inlet Pipe — 3.5L GTDI

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

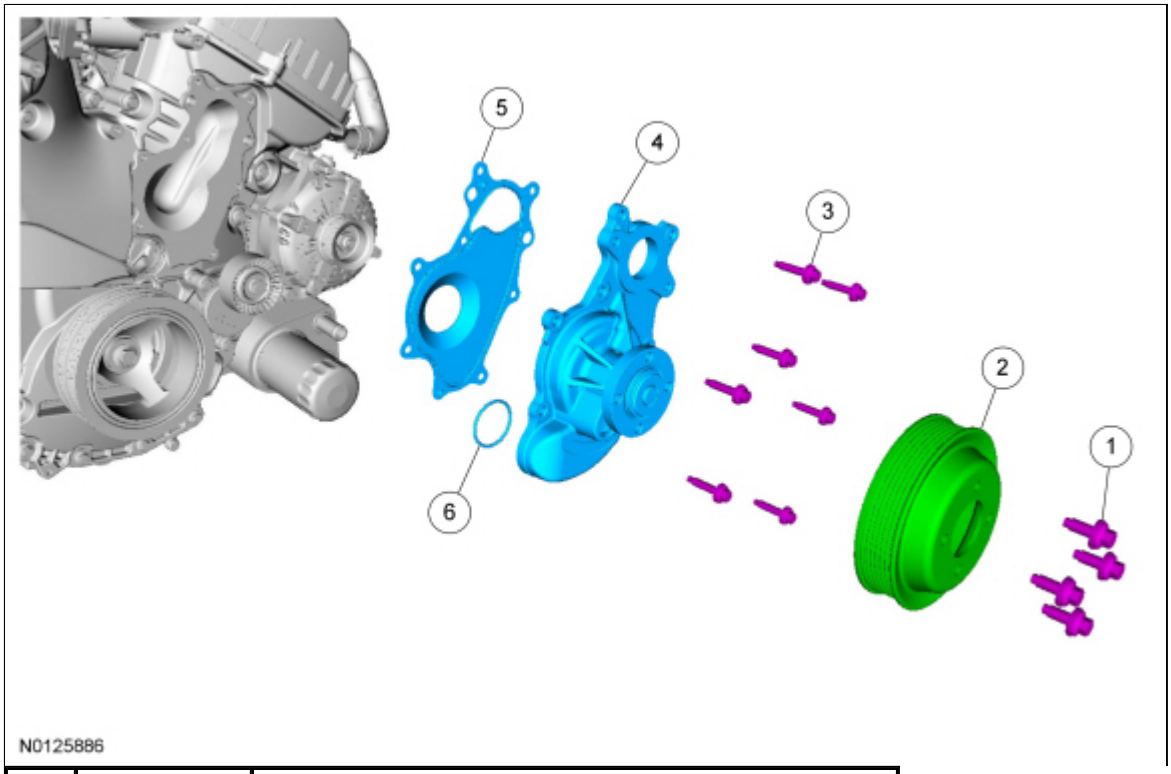
NOTE: Intake manifold removed for clarity.

Item	Part Number	Description
1	8A505	Coolant inlet pipe
2	8527	Coolant inlet pipe O-ring seal

Removal and Installation

1. Remove the thermostat housing. For additional information, refer to Thermostat Housing — 3.5L GTDI in this section.
2. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud .
3. Remove the coolant inlet pipe.

repair4less



- Remove and discard the O-ring seal.

4. To install, reverse the removal procedure.
    - Install a new O-ring seal and lubricate it with clean engine coolant.

Coolant Pump — 3.5L GTDI, 3.7L

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	W503291	Coolant pump pulley bolt - 25 Nm (18 lb-ft) (4 required)
2	8A528	Coolant pump pulley
3	W503278	Coolant pump bolt (7 required)
4	8501	Coolant pump
5	8507	Coolant pump gasket (part of 8501)
6	8565	Coolant pump O-ring seal (part of 8501)

Removal

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

repair4less

2. Loosen the 4 coolant pump pulley bolts.

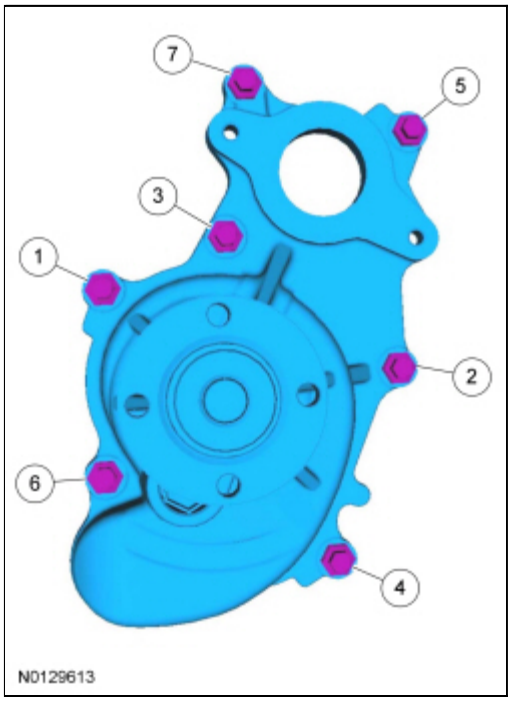
3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

4. ***NOTICE:*** **Cover the A/C compressor belt to prevent coolant contamination of the belt.**

   Completely cover the A/C compressor belt with waterproof plastic.

5. Remove the thermostat housing. For additional information, refer to Thermostat Housing — 3.5L GTDI or Thermostat Housing — 3.7L in this section.

6. Remove the 4 bolts and the coolant pump pulley.



7. Remove the 7 bolts and the coolant pump.
   - Remove and discard the gasket and the O-ring seal in the coolant pump.

Installation

1. Install a new O-ring seal in the coolant pump and lubricate it with clean engine coolant.

2. Position a new gasket, press the coolant pump over the channel cover plate snout protruding from the engine front cover and install the 7 bolts finger tight.

3. Tighten the coolant pump bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

4. Position the coolant pump pulley and install the 4 bolts finger tight.

5. Install the thermostat housing. For additional information, refer to Thermostat Housing — 3.5L GTDI or Thermostat Housing — 3.7L in this section.

6. Remove the plastic from the A/C compressor belt.

7. Install the accessory drive belt. For additional information, refer to Section 303-05 .

8. Tighten the 4 coolant pump pulley bolts.
   - Tighten to 25 Nm (18 lb-ft).

9. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

10. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

repair4less

Coolant Pump — 5.0L

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	18472	Heater outlet hose
2	—	Degas bottle-to-engine hose clamp (part of 8C350)
3	8C350	Degas bottle-to-engine hose
4	N806282	Coolant pump pulley bolt (4 required)
5	8509	Coolant pump pulley
6	W503277	Heater outlet tube bolt - 10 Nm (89 lb-in)
7	18663	Heater outlet tube
8	8565	Heater outlet tube O-ring seal
9	W714925	Coolant pump bolt (4 required)

10	8501	Coolant pump
11	8507	Coolant pump O-ring seal (part of 8501)

Removal

All vehicles

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Loosen the 4 coolant pump pulley bolts.
4. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

Vehicles with an A/C compressor belt tensionser

5. ***NOTICE:*** **Remove the A/C compressor belt to prevent coolant contamination of the belt.**

   Remove the A/C compressor belt.

Vehicles without an A/C compressor belt tensioner

6. ***NOTICE:*** **Cover the A/C compressor belt to prevent coolant contamination of the belt.**

   Completely cover the A/C compressor belt with waterproof plastic.

All vehicles

7. Remove the thermostat housing. For additional information, refer to Thermostat Housing — 5.0L in this section.
8. Remove the bolts and the coolant pump pulley.
9. Disconnect the heater outlet hose from the heater outlet tube.
10. Release the clamp and disconnect the degas bottle-to-engine hose from the heater outlet tube.
11. Remove the 4 bolts and the coolant pump.
12. If a new coolant pump is being installed, remove the bolt and the heater outlet tube.
    - Remove and discard the O-ring seal.

Installation

All vehicles

1. If a new coolant pump is being installed, install a new O-ring seal on the heater outlet tube and lubricate it with clean engine coolant.
2. Install the heater outlet tube and the bolt.

repair4less

- Tighten to 10 Nm (89 lb-in).

3. Inspect the sealing surfaces and clean with metal surface prep. Follow the directions on the packaging.

4. ***NOTICE:*** **Align the bolt holes with the bosses prior to insertion of the coolant pump and insert the pump straight into the coolant pump cavity. Do not rotate the coolant pump once installed in the coolant pump cavity or the O-ring seal can be damaged, causing the coolant pump to leak.**

   NOTE: Install a new O-ring seal and lubricate it with clean engine coolant.

   Install the coolant pump and the bolts
   - Tighten the coolant pump bolts in 2 stages.
     - Stage 1: Tighten to 20 Nm (177 lb-in).
     - Stage 2: Tighten an additional 60 degrees.

5. Connect the degas bottle-to-engine hose to the heater outlet tube and position the clamp.

6. Connect the heater outlet hose to the heater outlet tube.

7. Position the coolant pump pulley and install the bolts finger tight.

8. Install the thermostat housing. For additional information, refer to Thermostat Housing — 5.0L in this section.

Vehicles without an A/C compressor belt tensioner

9. Remove the plastic from the A/C compressor belt.

Vehicles with an A/C compressor belt tensioner

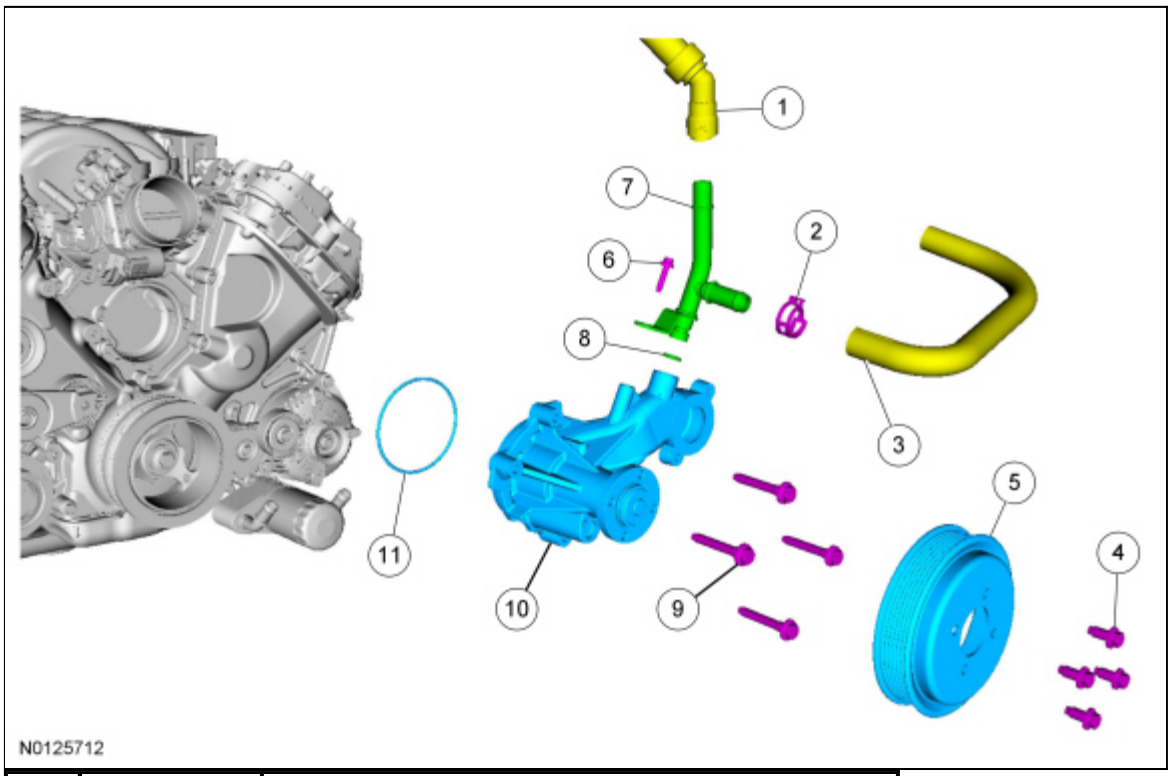
10. Install the A/C compressor belt. For additional information, refer to Section 303-05 .
    - Rinse off any coolant from the accessory drive pulleys using clear water prior to belt installation.

All vehicles

11. Install the accessory drive belt. For additional information, refer to Section 303-05 .
    - Rinse off any coolant from the accessory drive pulleys using clear water prior to belt installation.

12. Tighten the coolant pump pulley bolts in a criss-cross pattern.
    - Tighten to 25 Nm (18 lb-ft).

13. Install the air cleaner outlet tube. For additional information, refer to Section 303-12 .



14. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

repair4less

Coolant Pump — 5.0L

9	W714925	Coolant pump bolt (4 required)

10	8501	Coolant pump
11	8507	Coolant pump O-ring seal (part of 8501)

Removal

All vehicles

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Loosen the 4 coolant pump pulley bolts.
4. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

Vehicles with an A/C compressor belt tensionser

5. ***NOTICE:*** **Remove the A/C compressor belt to prevent coolant contamination of the belt.**

   Remove the A/C compressor belt.

Vehicles without an A/C compressor belt tensioner

6. ***NOTICE:*** **Cover the A/C compressor belt to prevent coolant contamination of the belt.**

   Completely cover the A/C compressor belt with waterproof plastic.

All vehicles

7. Remove the thermostat housing. For additional information, refer to Thermostat Housing — 5.0L in this section.
8. Remove the bolts and the coolant pump pulley.
9. Disconnect the heater outlet hose from the heater outlet tube.
10. Release the clamp and disconnect the degas bottle-to-engine hose from the heater outlet tube.
11. Remove the 4 bolts and the coolant pump.
12. If a new coolant pump is being installed, remove the bolt and the heater outlet tube.
    - Remove and discard the O-ring seal.

Installation

All vehicles

1. If a new coolant pump is being installed, install a new O-ring seal on the heater outlet tube and lubricate it with clean engine coolant.
2. Install the heater outlet tube and the bolt.

repair4less

- Tighten to 10 Nm (89 lb-in).

3. Inspect the sealing surfaces and clean with metal surface prep. Follow the directions on the packaging.

4. ***NOTICE:*** **Align the bolt holes with the bosses prior to insertion of the coolant pump and insert the pump straight into the coolant pump cavity. Do not rotate the coolant pump once installed in the coolant pump cavity or the O-ring seal can be damaged, causing the coolant pump to leak.**

   NOTE: Install a new O-ring seal and lubricate it with clean engine coolant.

   Install the coolant pump and the bolts
   - Tighten the coolant pump bolts in 2 stages.
     - Stage 1: Tighten to 20 Nm (177 lb-in).
     - Stage 2: Tighten an additional 60 degrees.

5. Connect the degas bottle-to-engine hose to the heater outlet tube and position the clamp.

6. Connect the heater outlet hose to the heater outlet tube.

7. Position the coolant pump pulley and install the bolts finger tight.

8. Install the thermostat housing. For additional information, refer to Thermostat Housing — 5.0L in this section.

Vehicles without an A/C compressor belt tensioner

9. Remove the plastic from the A/C compressor belt.

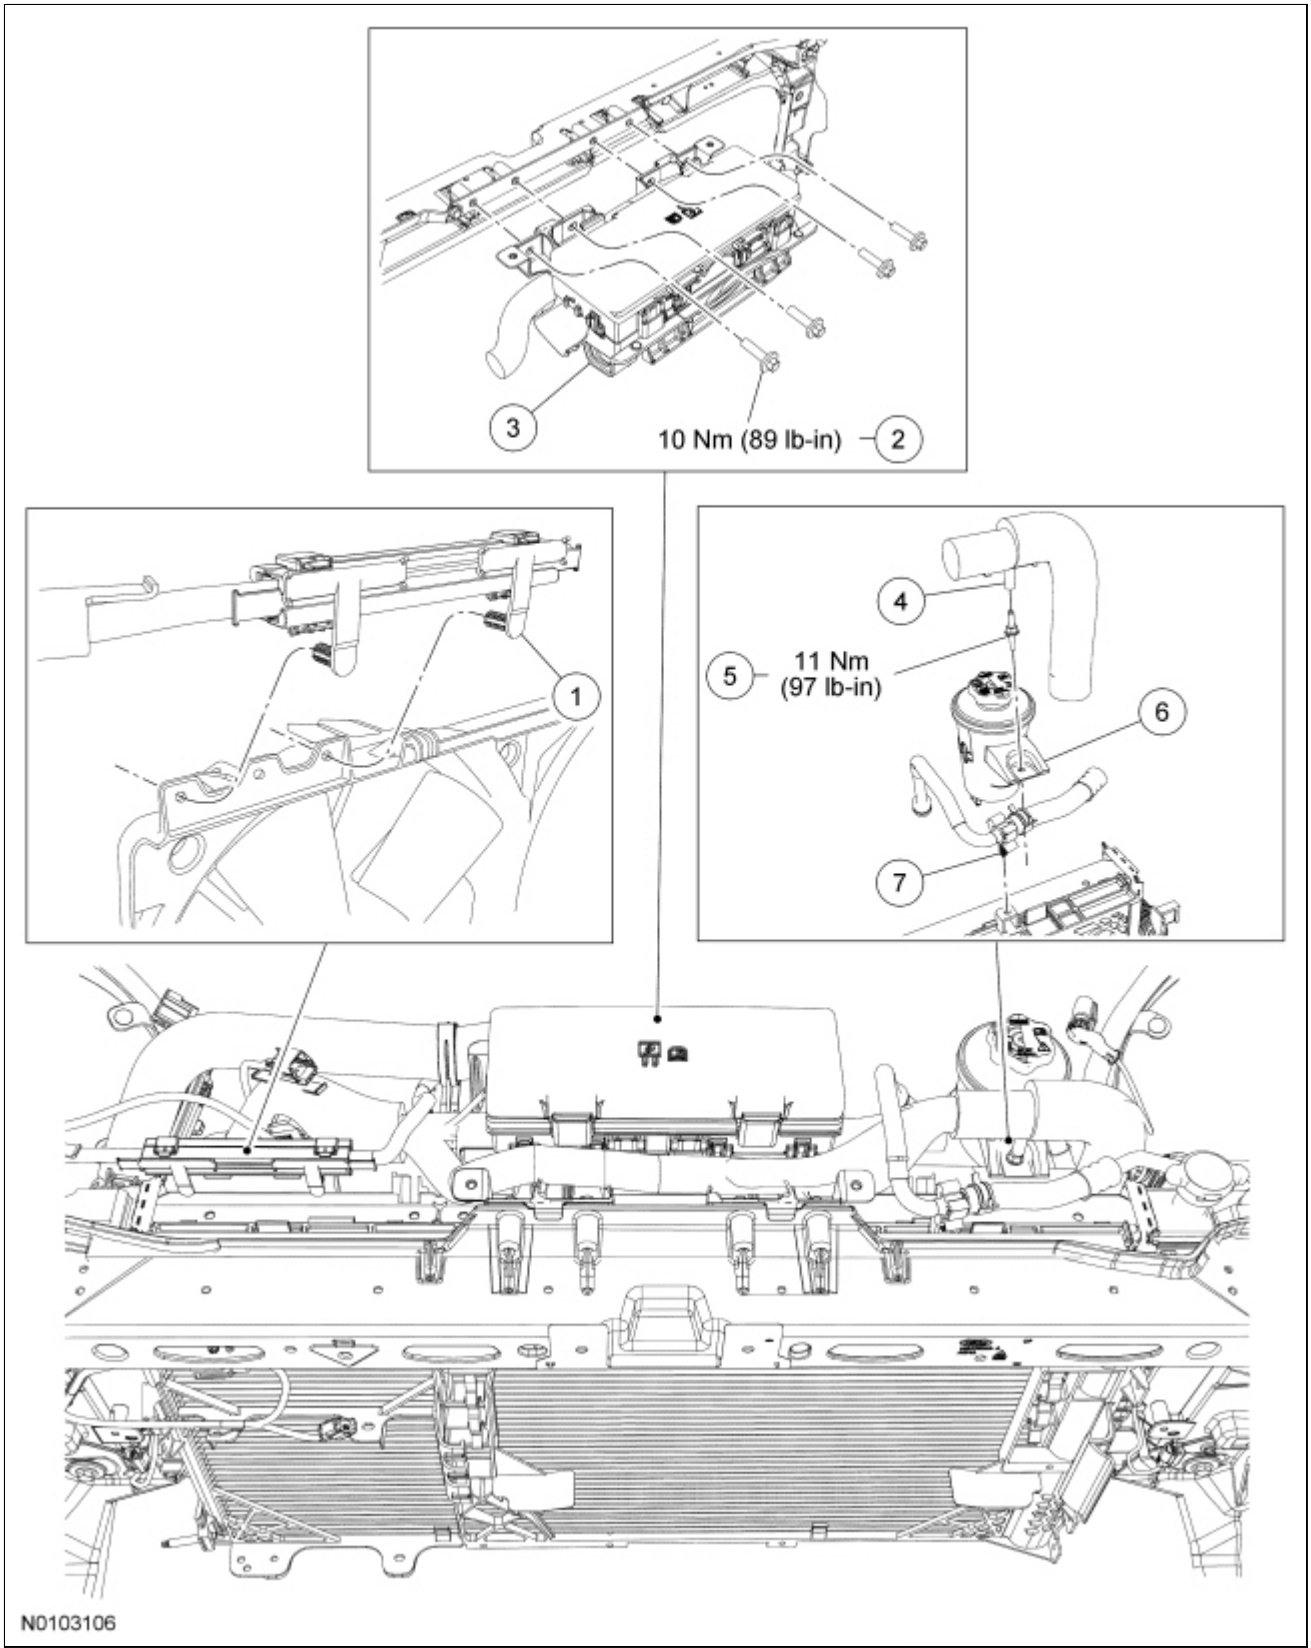
Vehicles with an A/C compressor belt tensioner

10. Install the A/C compressor belt. For additional information, refer to Section 303-05 .
    - Rinse off any coolant from the accessory drive pulleys using clear water prior to belt installation.

All vehicles

11. Install the accessory drive belt. For additional information, refer to Section 303-05 .
    - Rinse off any coolant from the accessory drive pulleys using clear water prior to belt installation.

12. Tighten the coolant pump pulley bolts in a criss-cross pattern.
    - Tighten to 25 Nm (18 lb-ft).



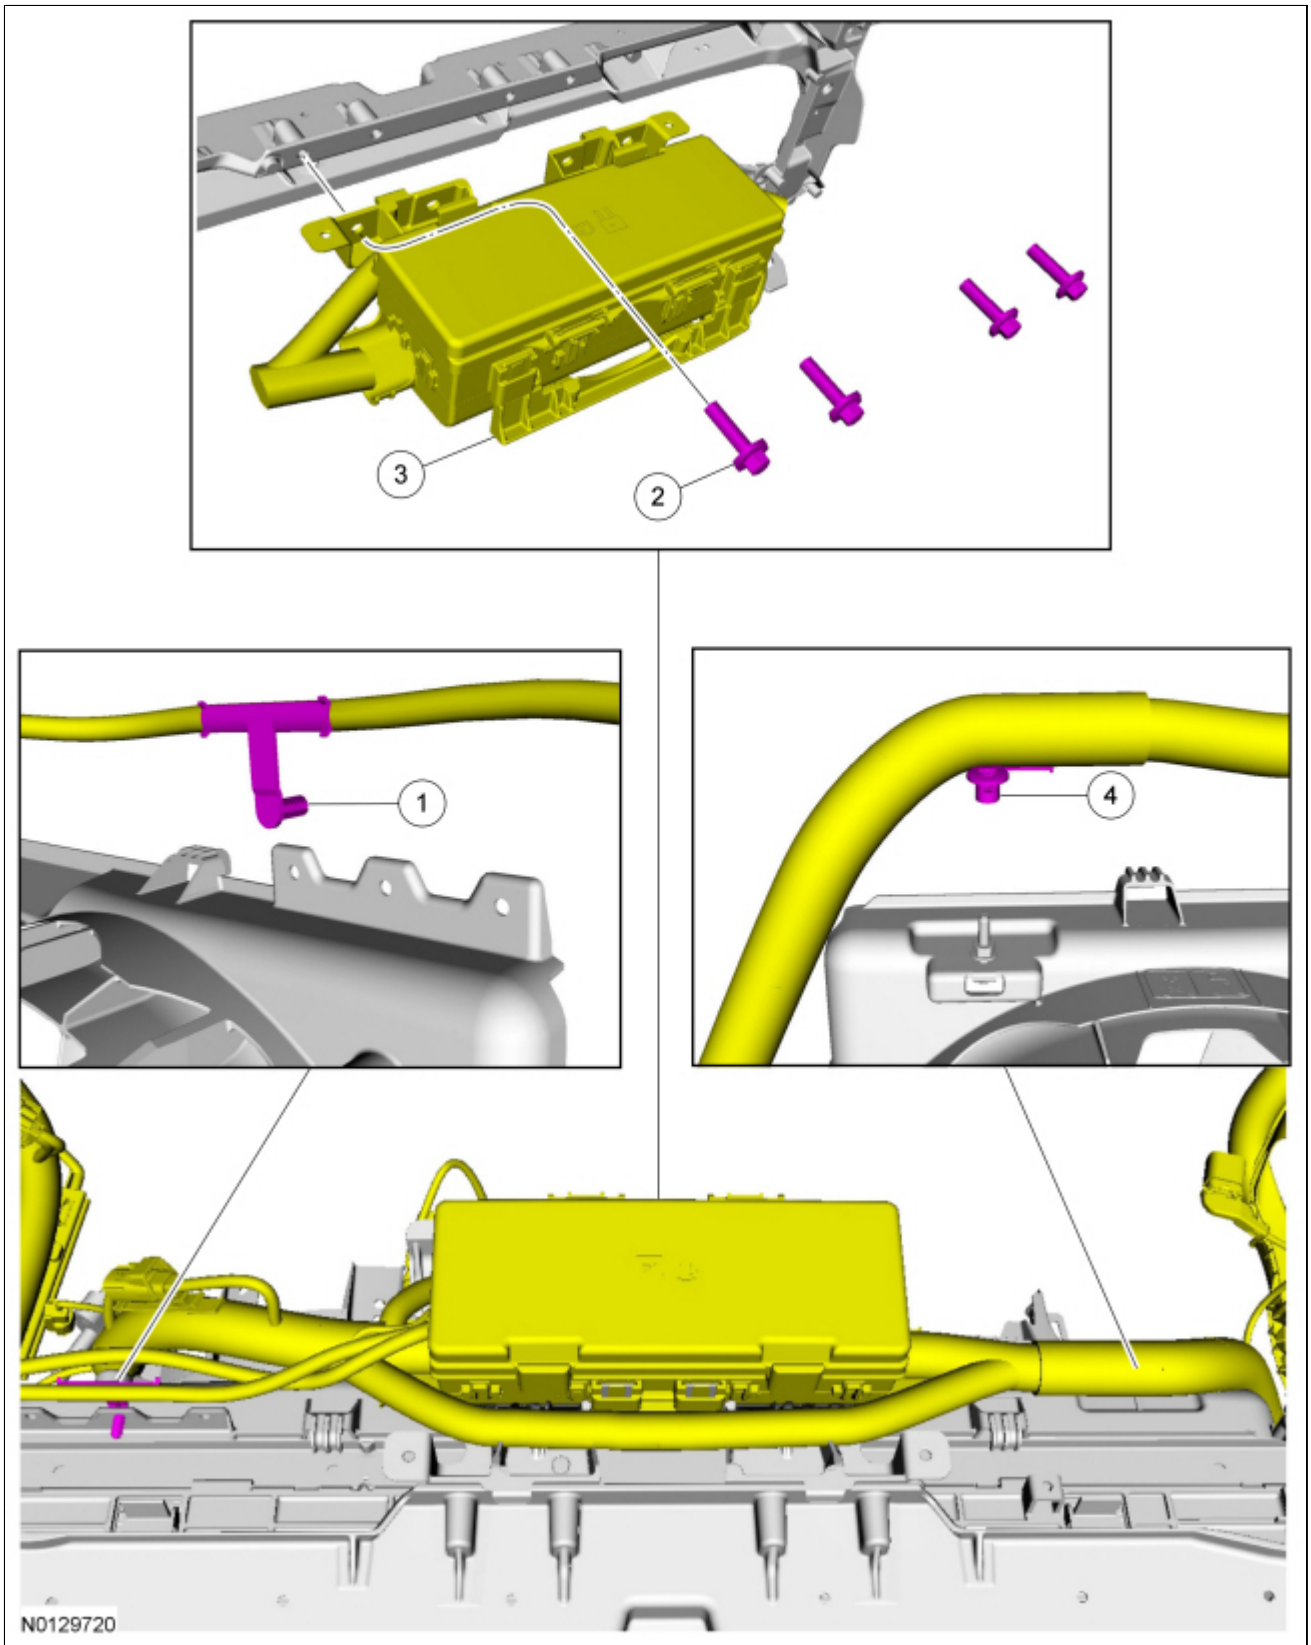
13. Install the air cleaner outlet tube. For additional information, refer to Section 303-12 .

14. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

repair4less

Cooling Fan Motor and Shroud

Wiring Harness and Power Steering Fluid Reservoir - 6.2L Engine

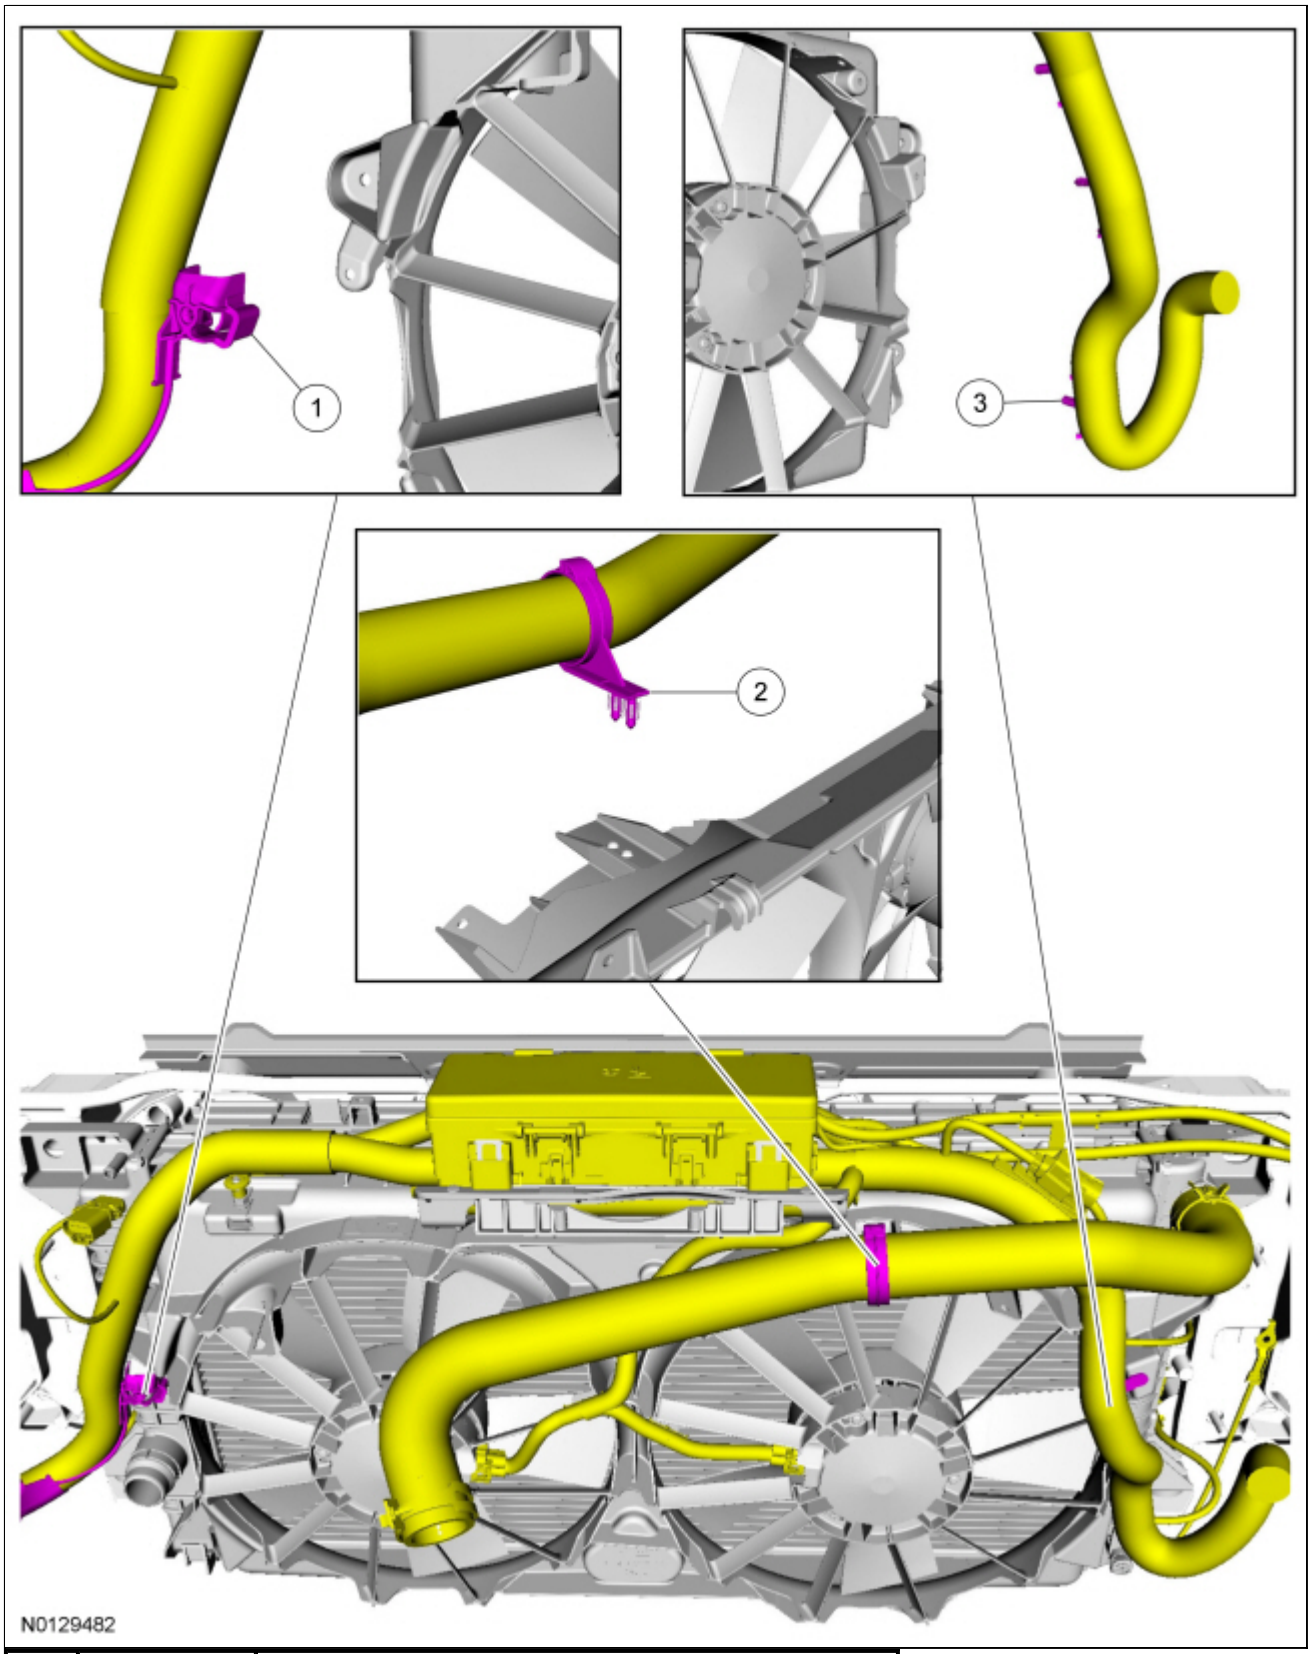


Item	Part Number	Description
1	—	Generator battery positive cable retainer (part of

repair4less

		14305)
2	W711851	Battery Junction Box (BJB) bracket bolt (4 required)
3	14A65	BJB bracket
4	—	Wiring harness retainer (part of 12A581)
5	W710897	Power steering fluid reservoir stud bolt (6.2L engine only)
6	3E764	Power steering fluid reservoir (6.2L engine only)
7	—	Power steering fluid cooler hose retainer (part of 3A713) (6.2L engine only)

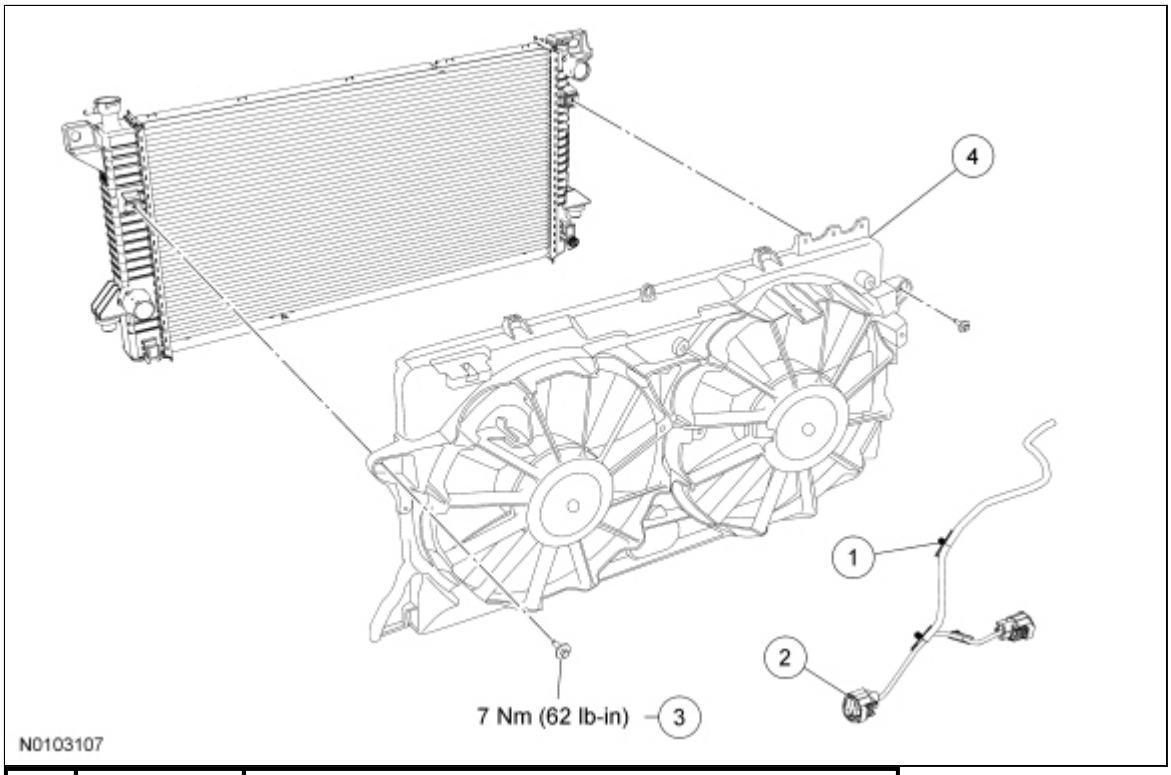
3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L Engines



Item	Part Number	Description
1	—	Battery positive cable retainer (part of 14305)
2	W711851	Battery Junction Box (BJB) bracket bolt (4 required)

repair4less

3	14A65	BJB bracket
4	—	Wiring harness retainer (part of 12A581)

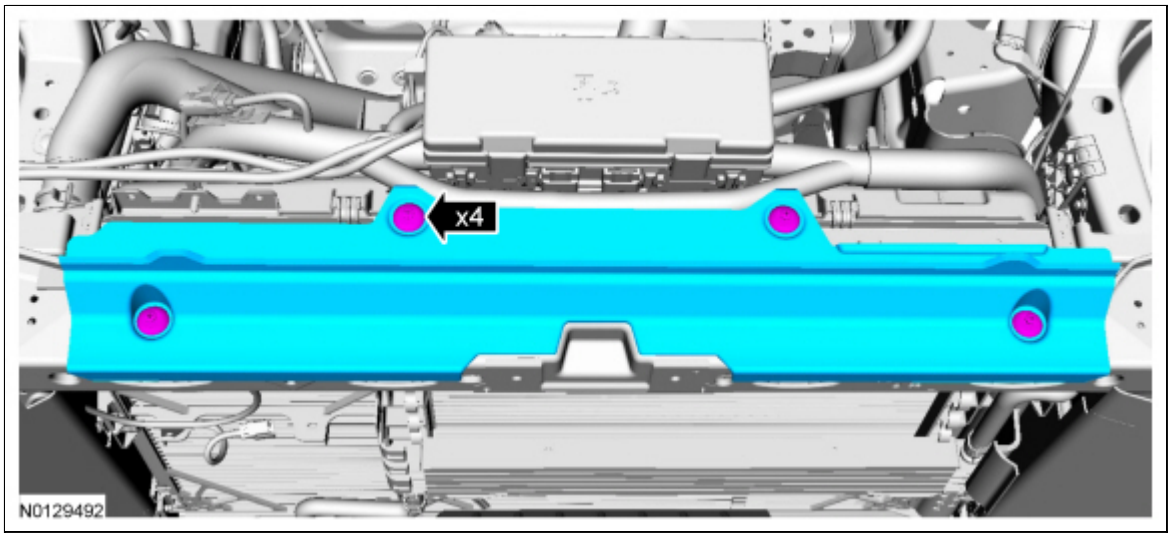


Wiring Harness and Radiator Hose Retainers

Item	Part Number	Description
1	—	Wiring harness retainer (part of 12A581)
2	8W287	Upper radiator hose retainer (6.2L only)

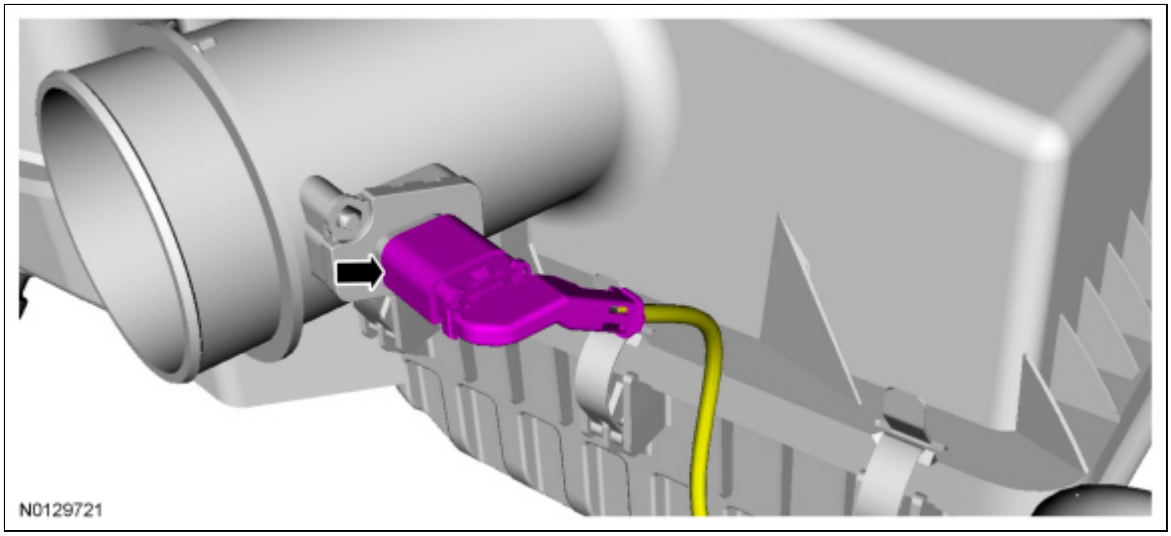
repair4less

3	—	Wiring harness retainer (part of 12A581) (3 required)



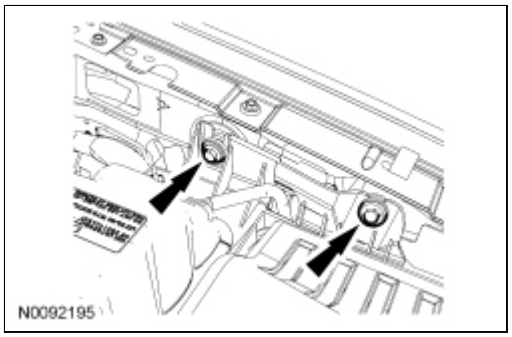
Item	Part Number	Description
1	—	Cooling fan wiring harness retainer (part of 12A581) (3 required)
2	—	Cooling fan electrical connector (part of 12A581) (2 required)
3	W503924	Cooling fan motor and shroud bolt (2 required)
4	8600	Cooling fan motor and shroud

Removal and Installation



All engines

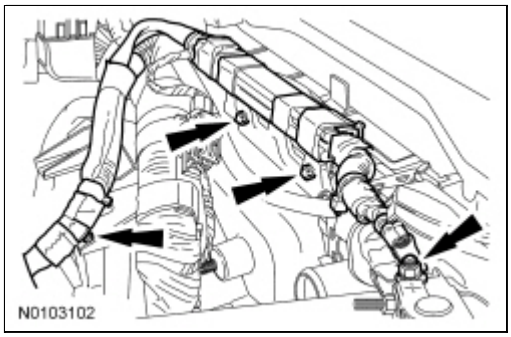
1. Disconnect the battery negative cable. For additional information, refer to Section 414-01 .
2. Remove the Air Cleaner (ACL) outlet tube. For additional information, refer to Section 303-12 .
3. Remove the 4 pushpins and the upper radiator air deflector.



6.2L engines

4. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

5. Remove the 2 bolts and position the coolant expansion tank aside.



6. Detach the power steering fluid cooler hose retainer from the cooling fan motor and shroud.

repair4less

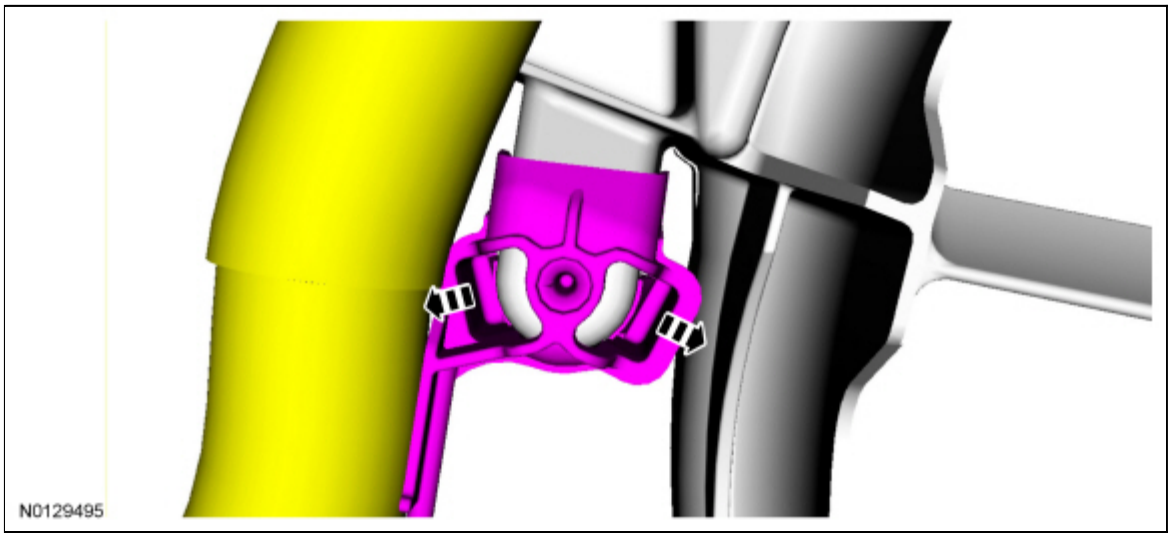
7. Detach the wiring harness retainer from the power steering fluid reservoir stud bolt.

8. Remove the nut, detach the generator battery positive cable from the positive battery terminal, detach the 3 wiring harness retainers from the cooling fan shroud and position the wiring harness aside.
    - To install, tighten to 9 Nm (80 lb-in).

9. Detach the upper radiator hose retainer from the cooling fan motor and shroud.

3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L engines

10. Detach the wiring harness retainer from the stud bolt on the LH side of the cooling fan shroud.



11. Disconnect the positive battery cable. For additional information, refer to Section 414-01 .

12. Detach the battery cable retainer from the cooling fan shroud.

All engines

13. **NOTE:** Push the 2 LH wiring harness retainer tabs outward to release.

    Detach the LH wiring harness retainer and the 3 RH wiring harness pushpins.

14. Disconnect the 2 cooling fan electrical connectors.

15. Detach the 3 cooling fan wiring harness retainers.

16. Remove the 4 Battery Junction Box (BJB) bracket bolts.
    - To install, tighten to 10 Nm (89 lb-in).

3.5L GTDI , 3.7L and 5.0L Engines

17. Position the wiring harness aside.

6.2L engines

18. Remove the power steering fluid reservoir stud bolt and position the power steering fluid reservoir and the wiring harness aside.
    - To install, tighten to 11 Nm (97 lb-in).

All engines

19. Remove the 2 bolts and the cooling fan motor and shroud.
    - To install, tighten to 7 Nm (62 lb-in).

20. To install, reverse the removal procedure.

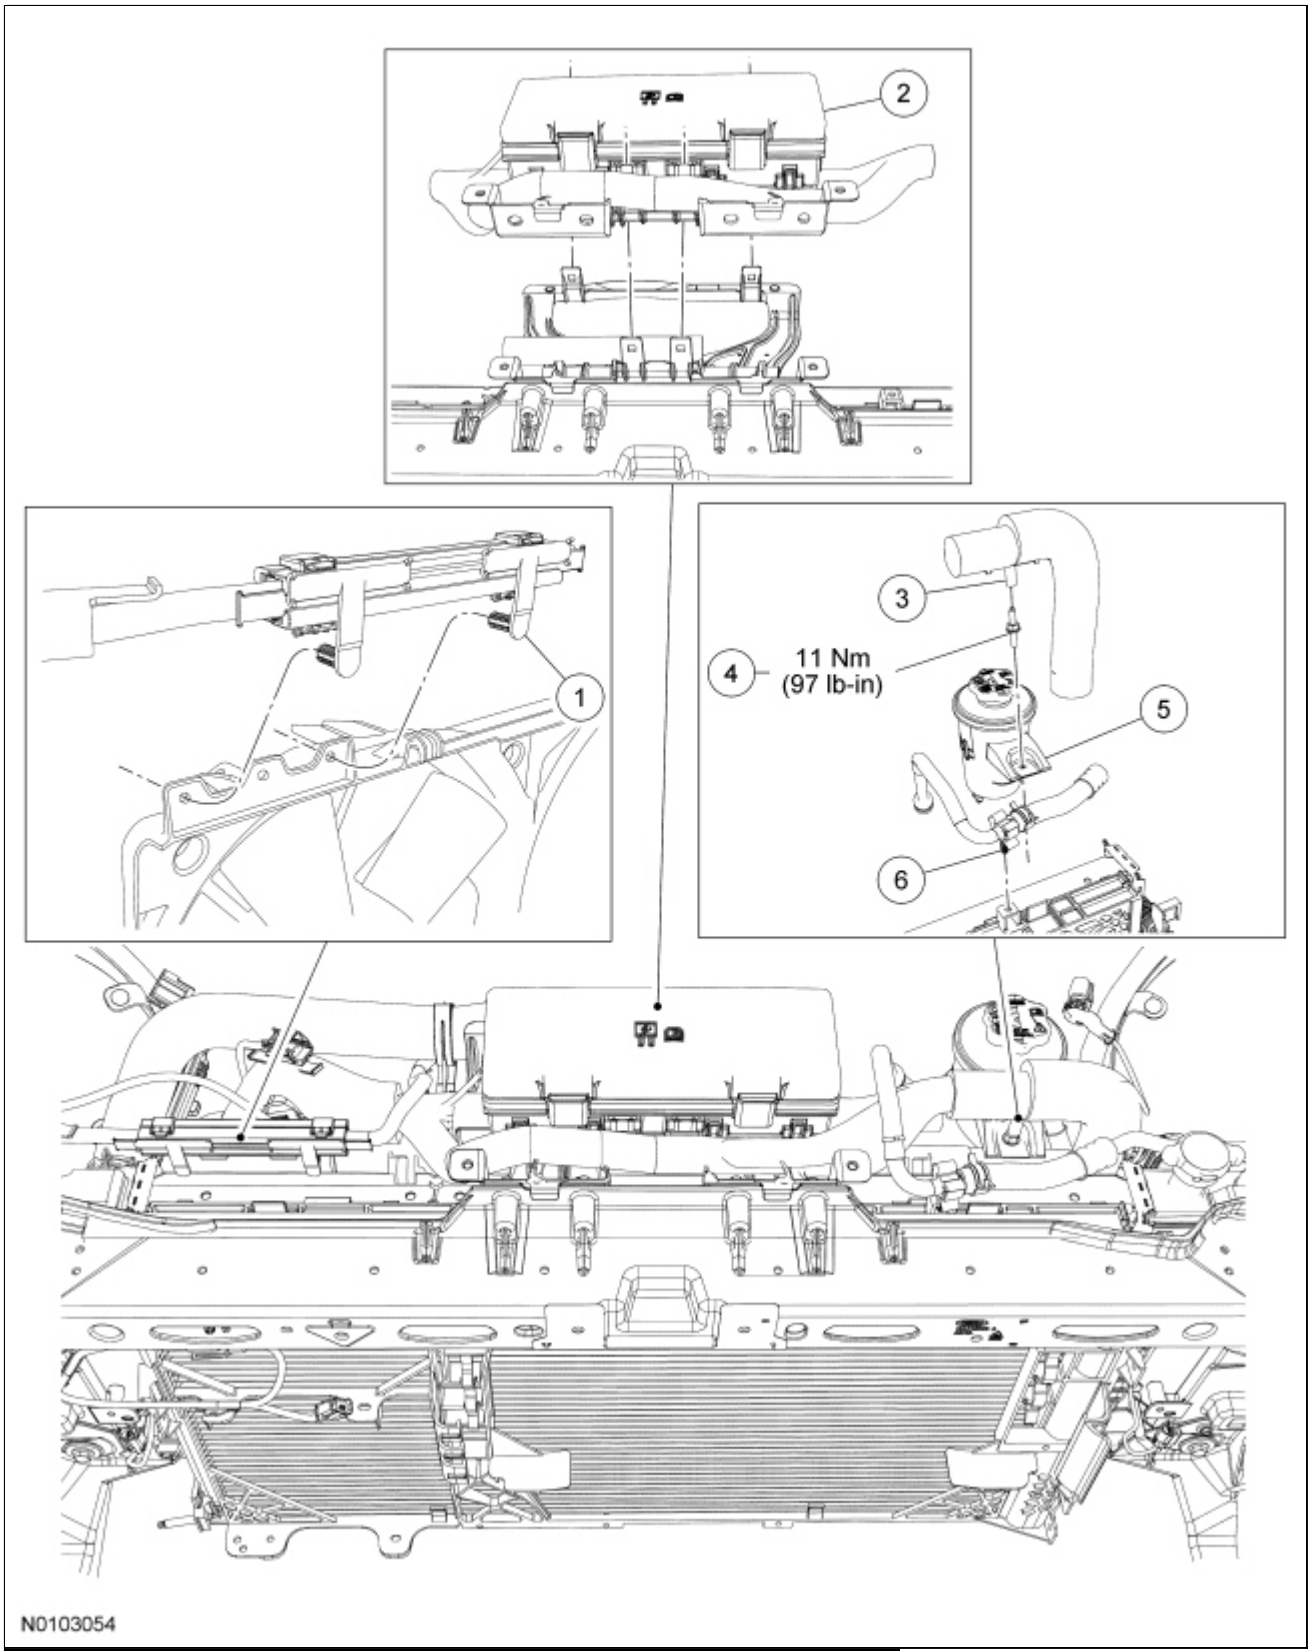
Cooling Module

Special Tool(s)

 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

Hood Latch, Transmission Cooler Tubes, Power Steering Cooler Tubes (6.2L) and Cooling Module Bolts



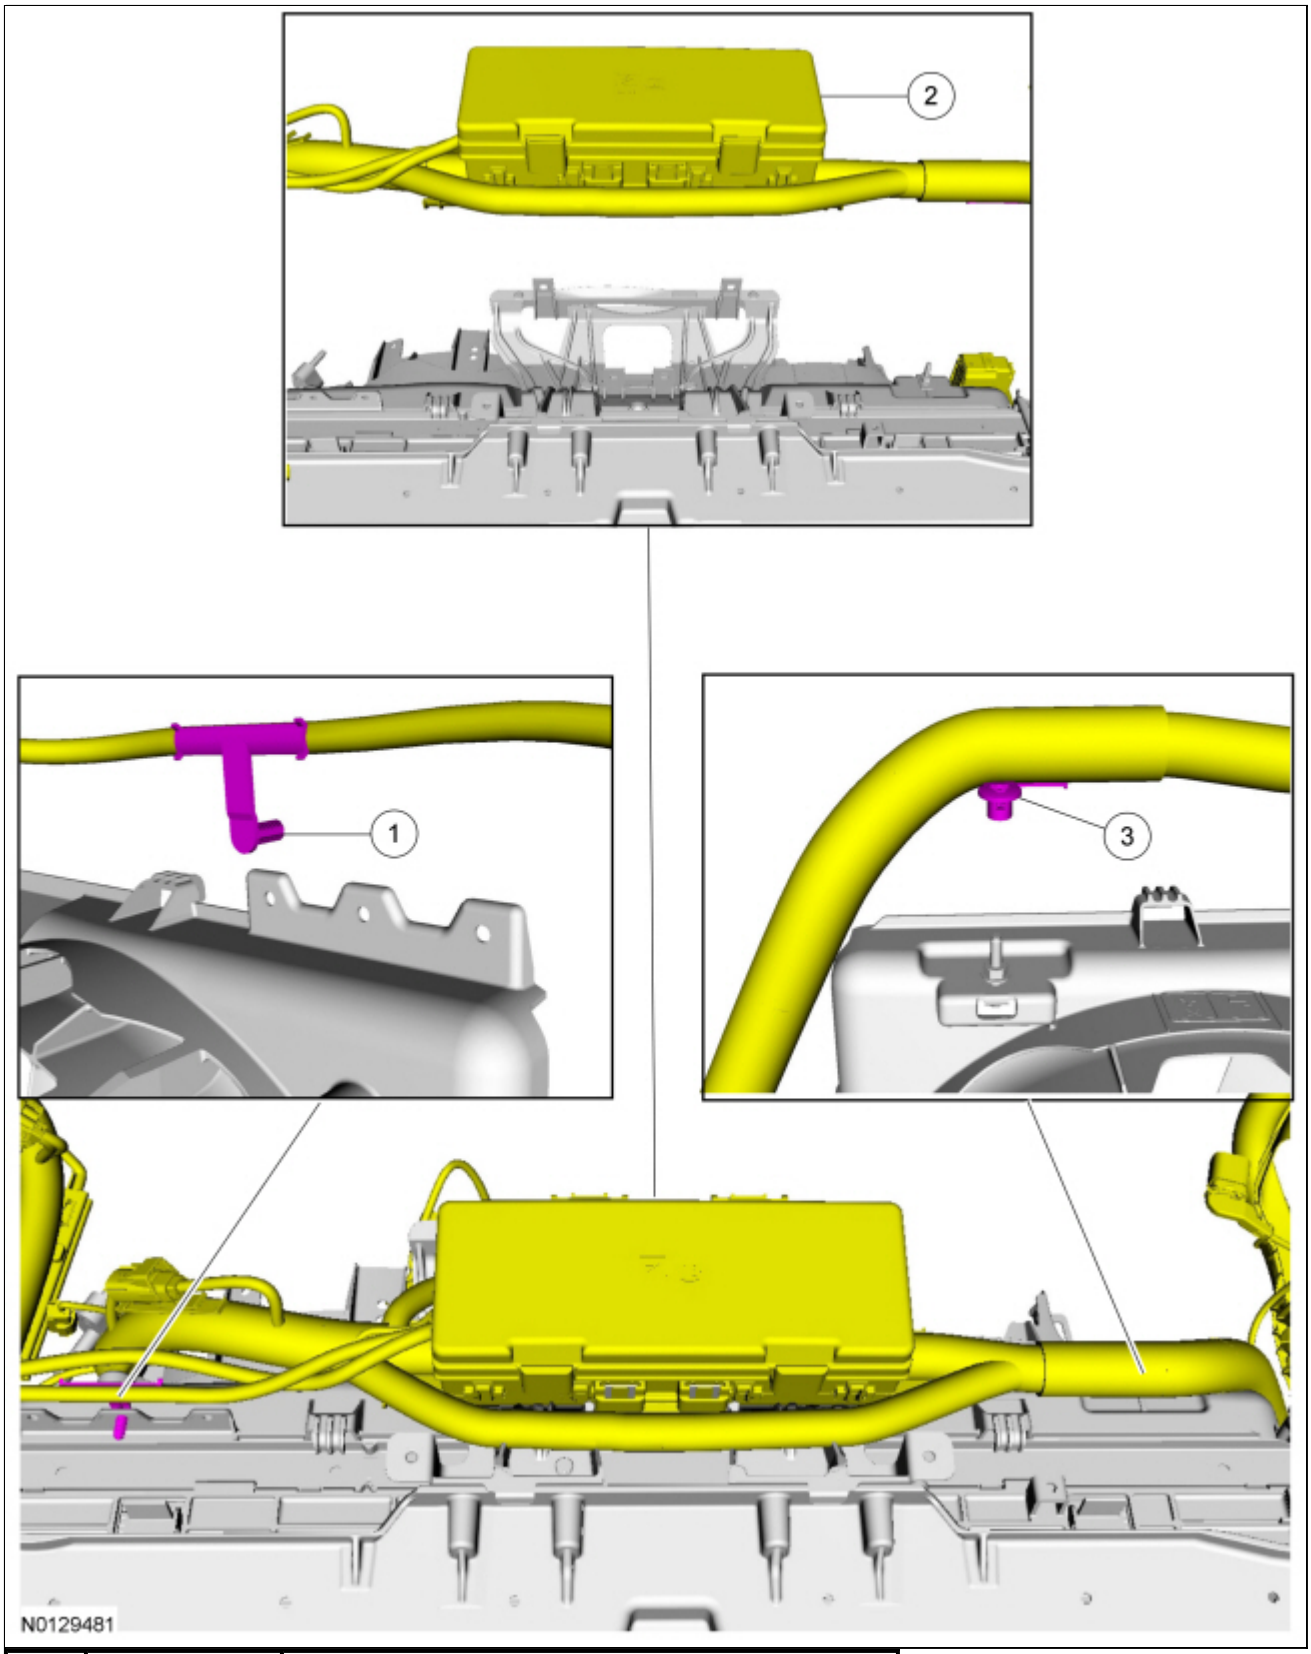
N0092960

Item	Part Number	Description
1	16B975	Hood latch assembly cable retainer

repair4less

2	W711848	Hood latch assembly bolts (2 required)
3	6100	Hood latch assembly
4	7J801	Transmission fluid cooler tube secondary latch (2 required) (6.2L shown, 3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L similar)
5	7H420	Transmission fluid cooler tube (2 required) (6.2L shown, 3.5L GTDI, 3.7L and 5.0L similar)
6	—	Power steering fluid cooler hose clamp (2 required) (6.2L only)
7	3A713	Power steering gear-to-fluid cooler return hose (6.2L only)
8	W701835	Cooling module upper bolt (2 required)
9	W701835	Cooling module front bolt (4 required)

Wiring Harness and Power Steering Fluid Reservoir - 6.2L

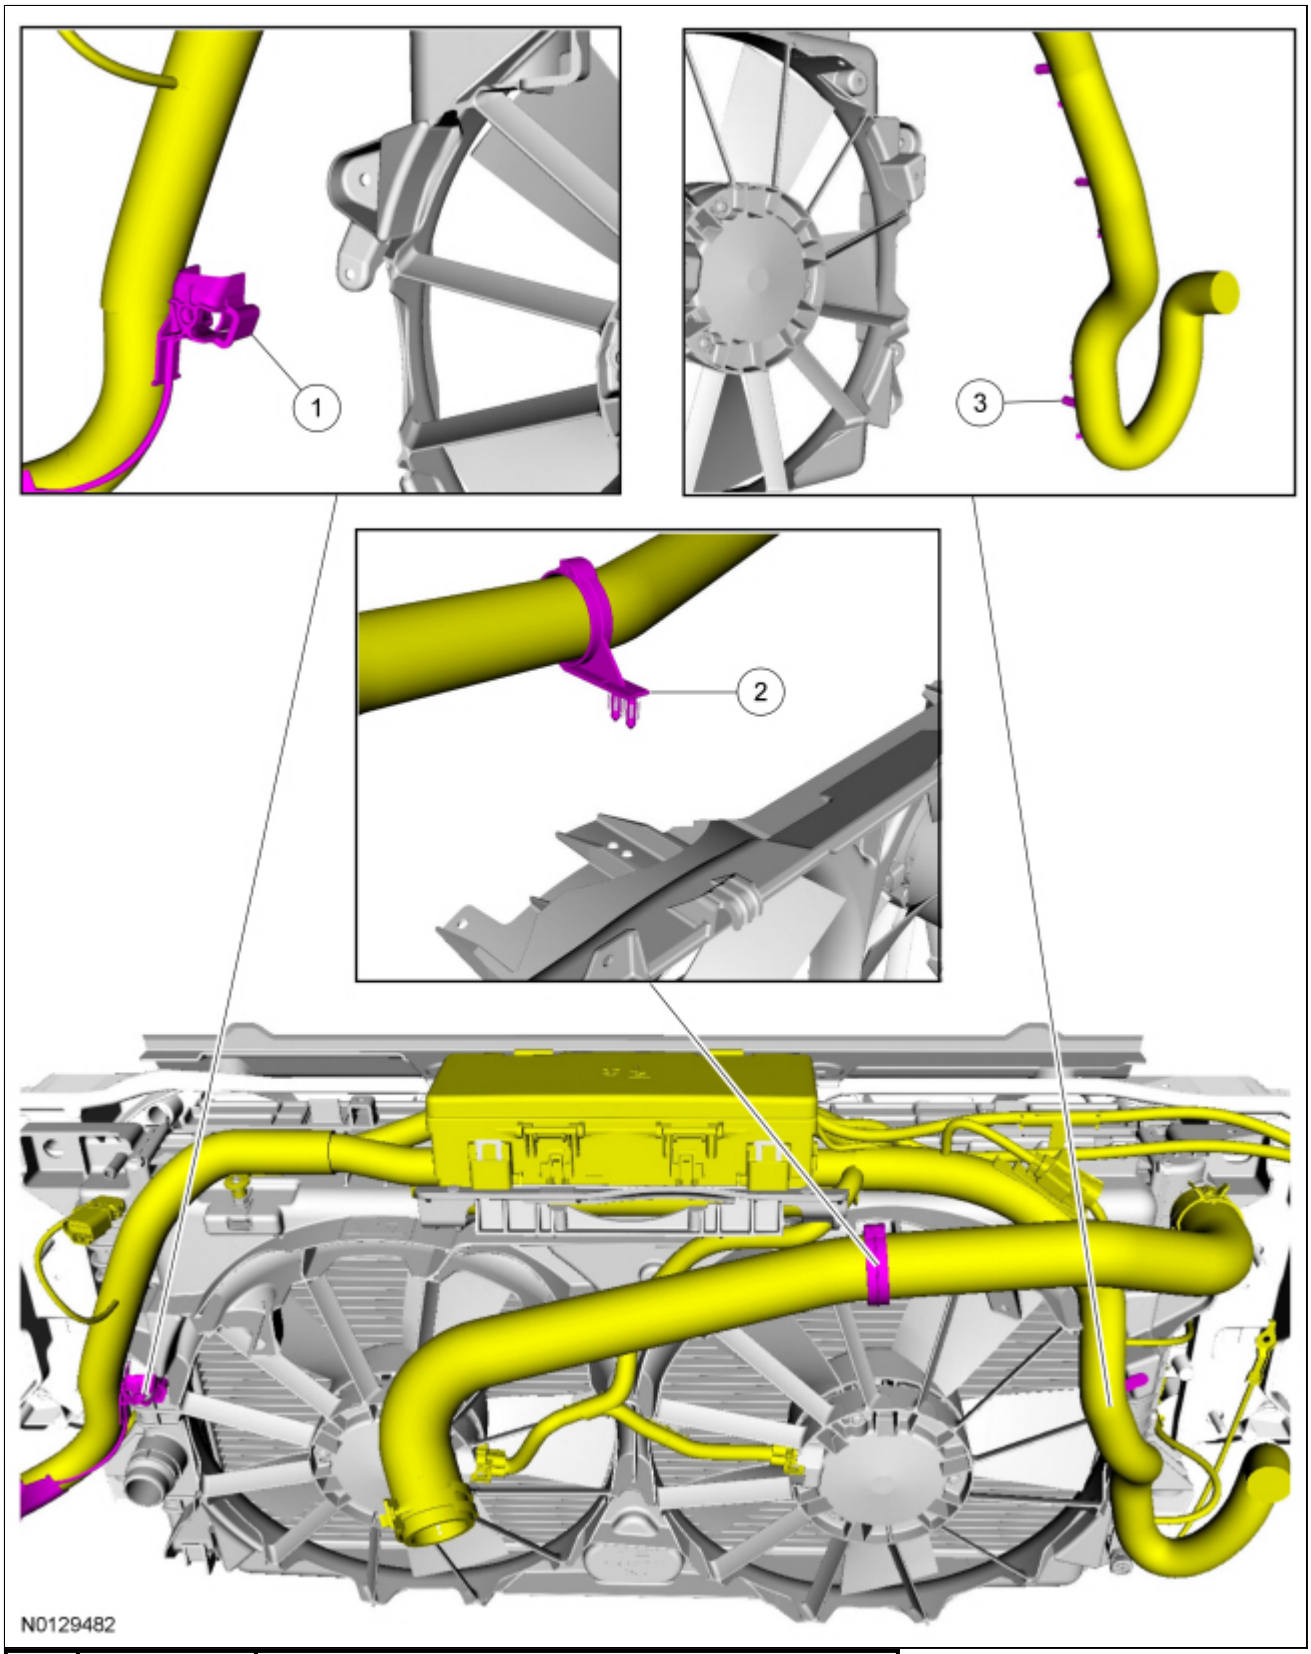


Item	Part Number	Description
1	—	Generator battery positive cable retainer (part of

repair4less

		14305)
2	—	Battery Junction Box (BJB) (part of 12A581)
3	—	Wiring harness retainer (part of 12A581)
4	W710897	Power steering fluid reservoir stud bolt (6.2L only)
5	3E764	Power steering fluid reservoir (6.2L only)
6	—	Power steering fluid cooler hose retainer (part of 3A713) (6.2L only)

Wiring Harness - 3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L

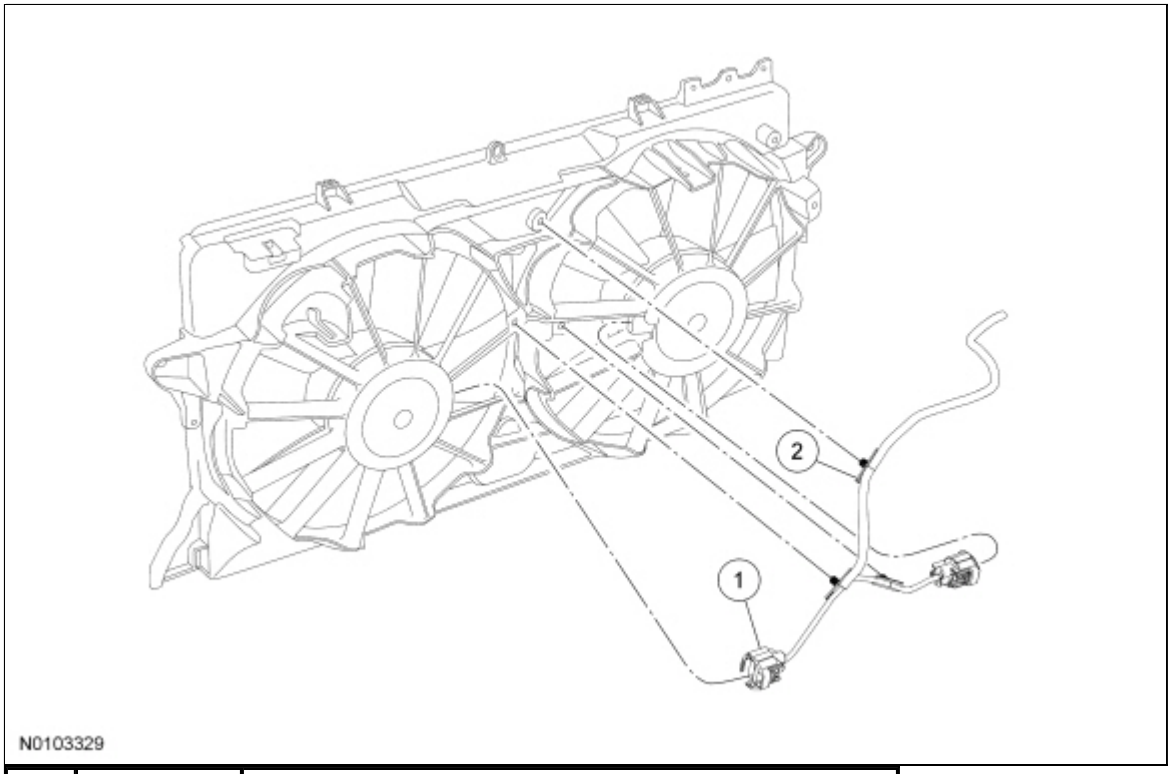


Item	Part Number	Description
1	—	Battery positive cable retainer (part of 14305)
2	—	Battery Junction Box (BJB) (part of 12A581)

repair4less

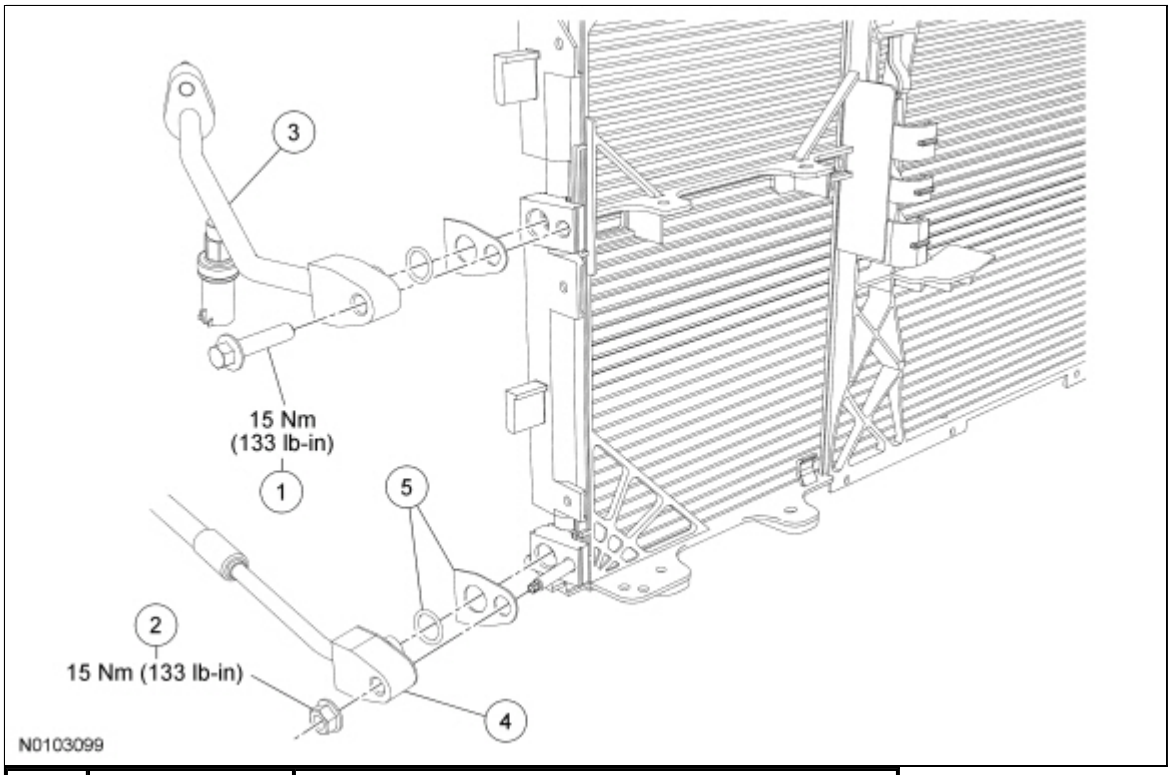
3	—	Wiring harness retainer (part of 12A581)

Wiring Harness and Radiator Hose Retainers



Item	Part Number	Description
1	—	Wiring harness retainer (part of 12A581)
2	8W287	Upper radiator hose retainer (6.2L only)

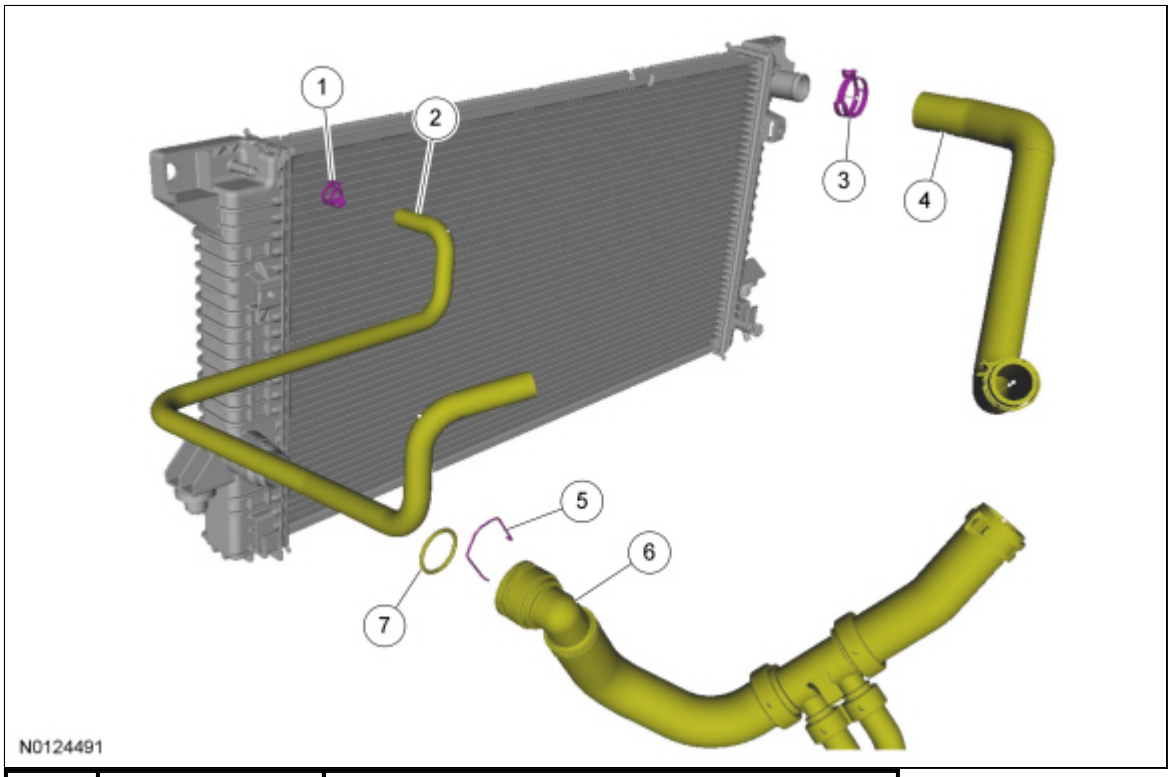
repair4less



3	—	Wiring harness retainer (part of 12A581) (3 required)

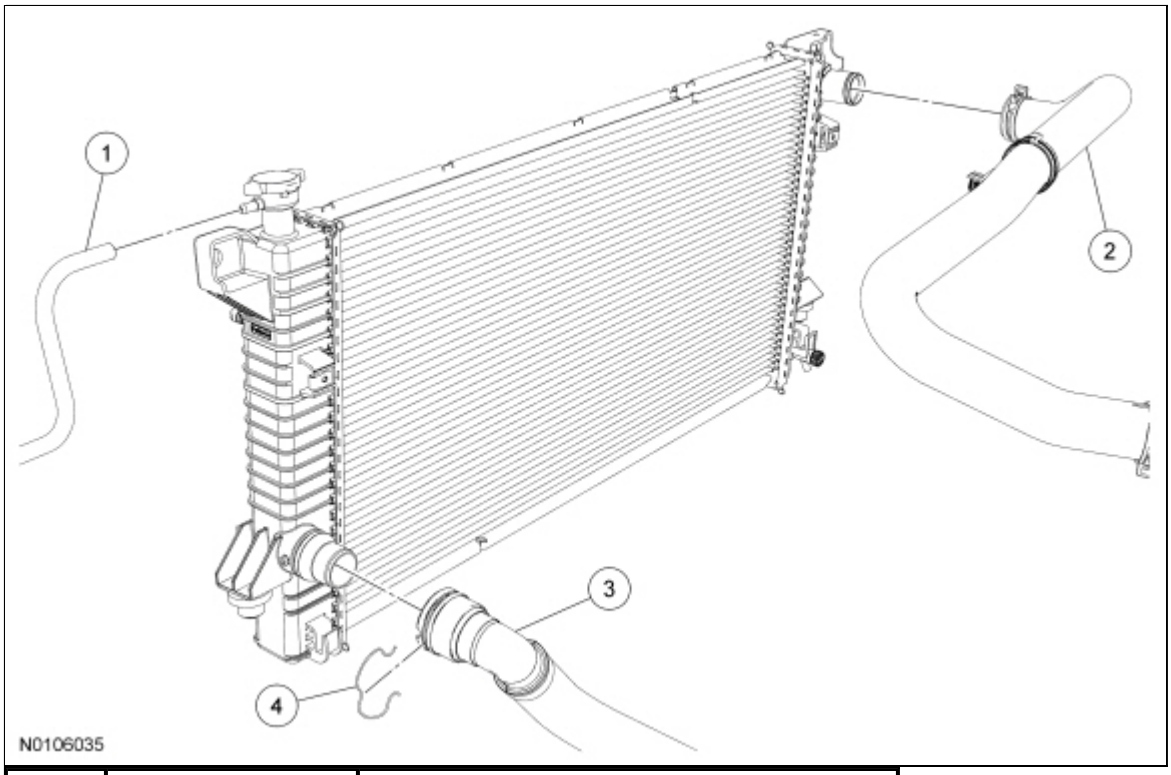
Cooling Fan Wiring

Item	Part Number	Description
1	—	Cooling fan electrical connector (part of 12A581) (2 required)
2	—	Cooling fan wiring harness retainer (part of 12A581) (3 required)



A/C Fittings

Item	Part Number	Description
1	W500110	Condenser inlet fitting bolt
2	W520413	Condenser outlet fitting nut
3	19E558	Condenser inlet jumper line fitting
4	—	Condenser outlet fitting (part of 19A834)
5	19B596	O-ring seal and gasket seal kit (2 required)

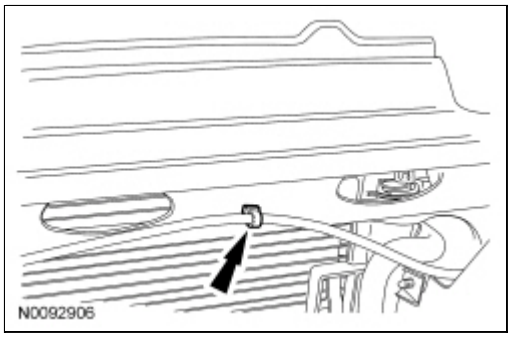


Radiator Hoses - 3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L

repair4less

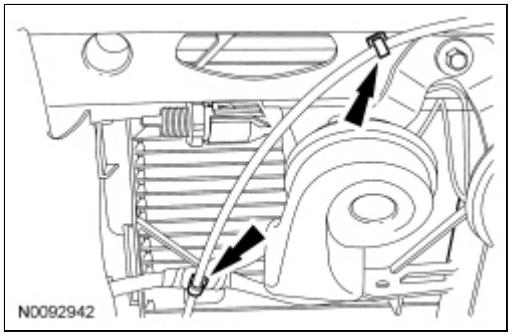
Item	Part Number	Description
1	15161	Radiator-to-degas bottle hose clamp
2	8W005	Radiator-to-degas bottle hose
3	15161	Upper radiator hose clamp
4	8260	Upper radiator hose
5	8D037	Lower radiator hose spring clip
6	8286	Lower radiator hose
7	8D038	Lower radiator hose O-ring seal

Radiator Hoses - 6.2L



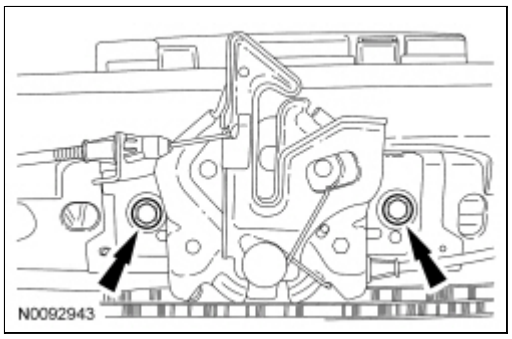
Item	Part Number	Description
1	8N029	Radiator overflow hose
2	8B274	Upper radiator hose
3	8B273	Lower radiator hose
4	8B365	Lower radiator hose spring clip

Removal

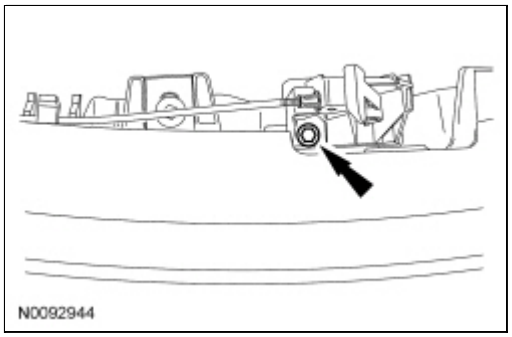


All engines

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Evacuate the A/C system. For additional information, refer to Section 412-00 .
4. Disconnect the battery ground. For additional information, refer to Section 414-01 .
5. Remove the headlights. For additional information, refer to Section 417-01 .
6. Detach the LH hood latch cable retainer.

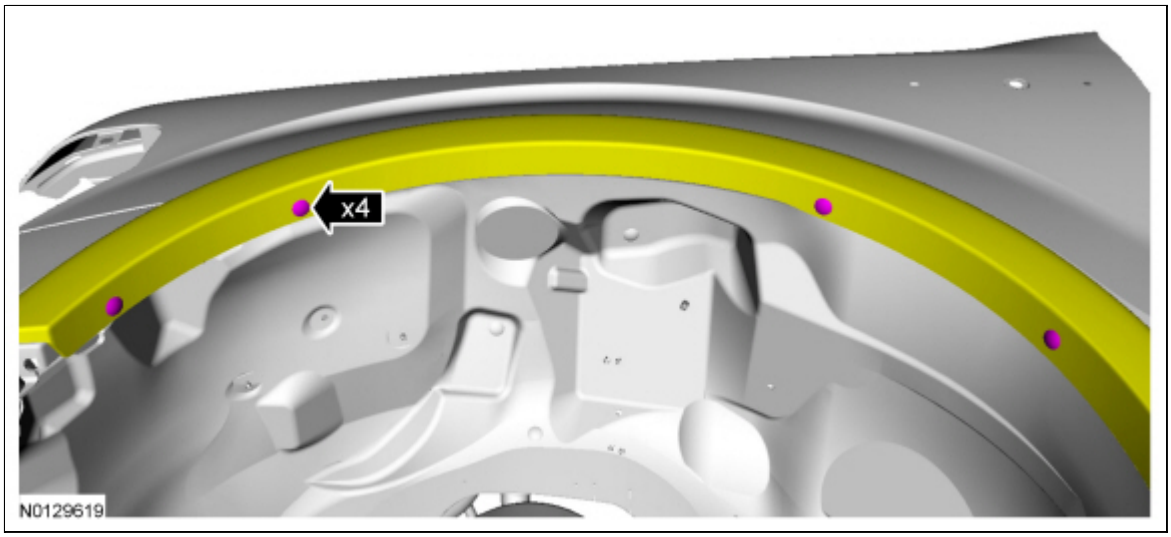


repair4less

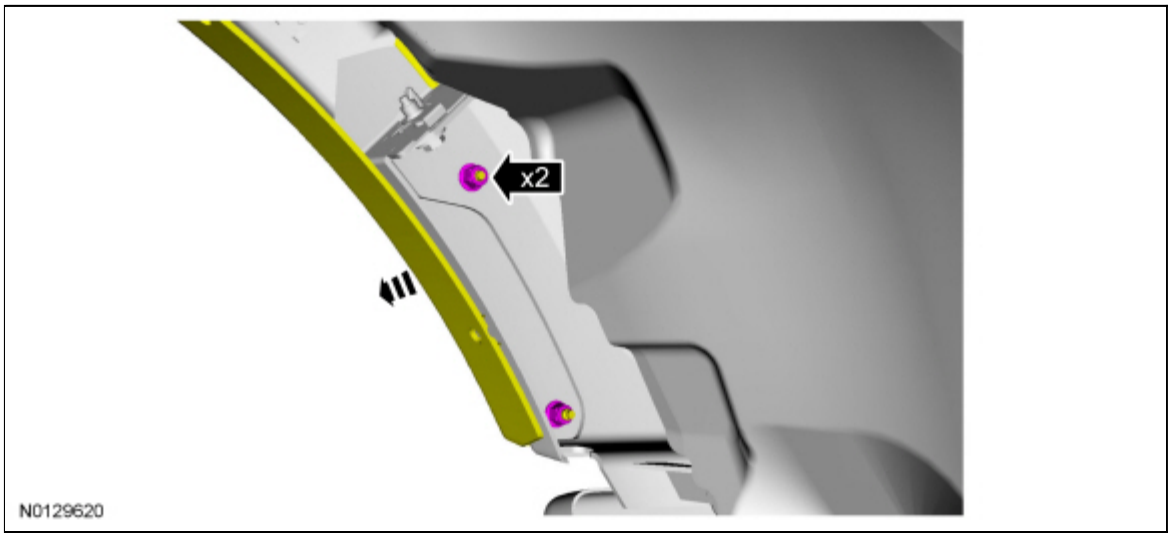


7. Detach the 2 RH hood latch cable retainers.

8. Remove the bolts and position the hood latch aside.



9. Remove the bolt, detach the hood latch release handle and the cable from the front bumper cover, and position the hood latch release handle aside.

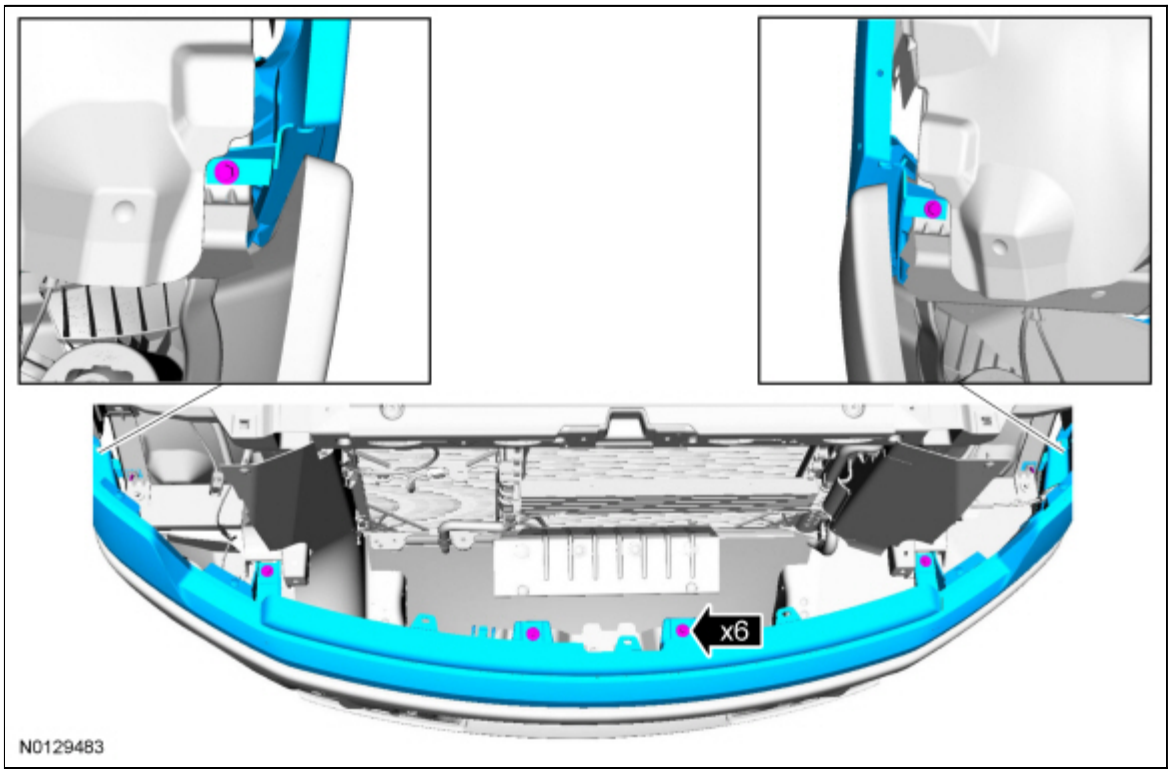


10. **NOTE:** LH shown, RH similar.

    If equipped, remove the 4 LH and 4 RH front wheel moulding pushpins.

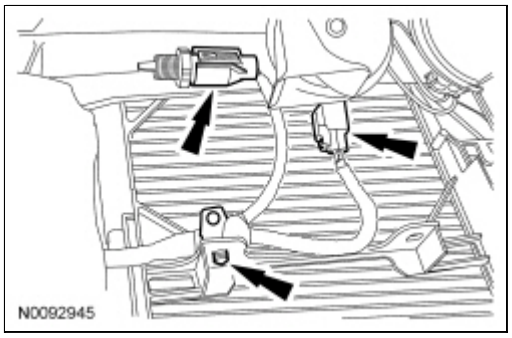
11. **NOTE:** LH shown, RH similar.

    If equipped, remove the 2 LH and 2 RH front wheel moulding nuts and detach the front wheel mouldings far enough to remove the front bumper cover.

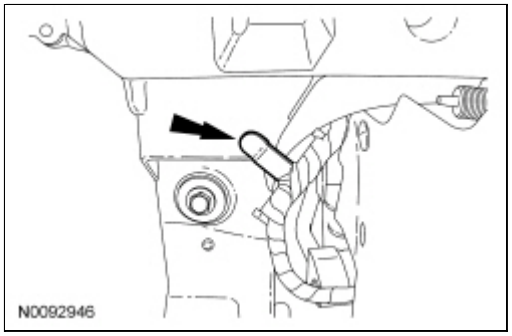


12. **NOTE:** LH shown, RH similar.

    Remove the 3 LH and 3 RH bumper cover-to-fender bolts.

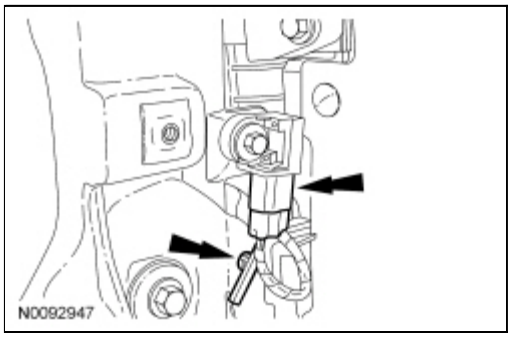


repair4less



13. Remove the 6 bumper cover bracket bolts and remove the bumper cover and the brackets as an assembly.

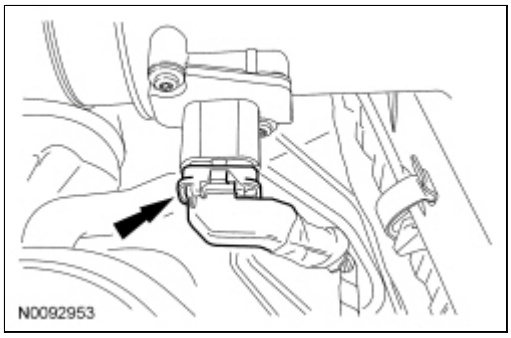
14. Disconnect the horn electrical connector and detach the wiring harness and ambient temperature sensor retainers. Position the wiring harness aside.



15. Detach the wiring harness retainer from the RH side of the radiator grille support.

16. **NOTE:** RH shown, LH similar.

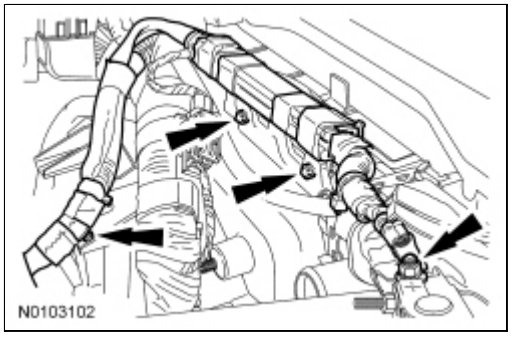
    Disconnect the RH and LH front impact severity sensor electrical connectors and 2 wiring harness retainers. Position the wiring harnesses aside.



17. Release the clamp and disconnect the upper radiator hose from the radiator.

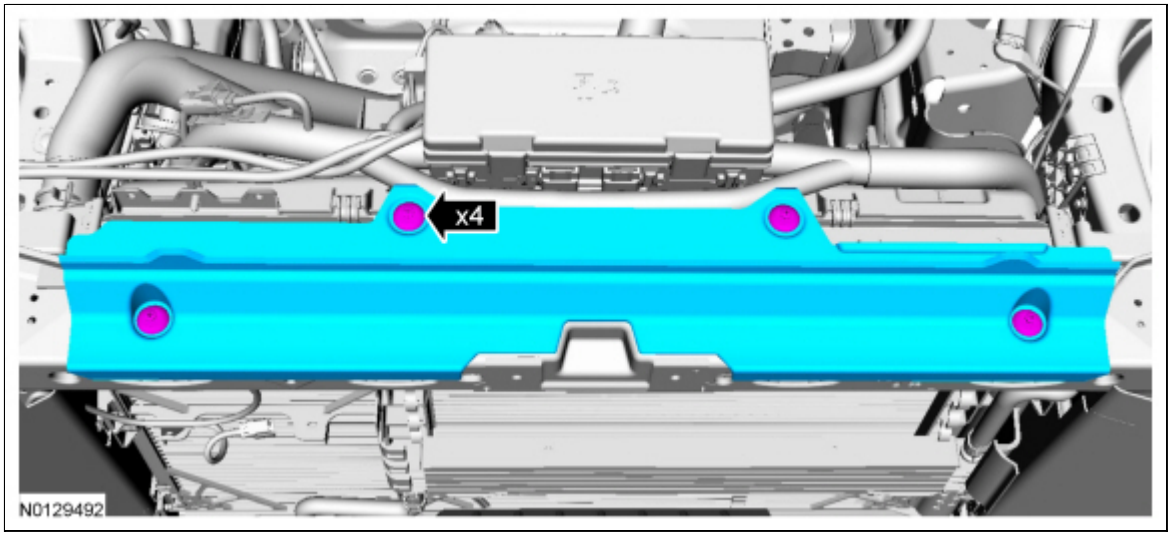
18. Remove the Air Cleaner (ACL) outlet tube. For additional information, refer to Section 303-12 .

19. Disconnect the Mass Air Flow (MAF) sensor electrical connector.



repair4less

6.2L engines



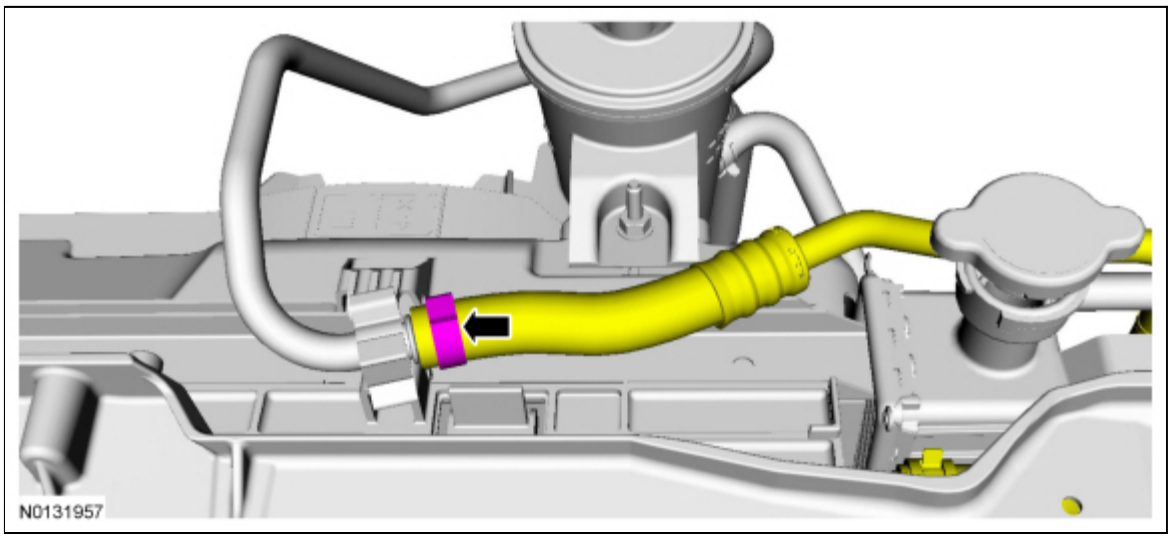
20. Detach the upper radiator hose retainer from the cooling fan motor and shroud.

21. Remove the nut, detach the generator battery positive cable, detach the 3 wiring harness retainers from the cooling fan shroud and position the wiring harness aside.

3.5L GTDI , 3.7L and 5.0L engines

22. Remove the 4 pushpins and the upper radiator air deflector.

23. Detach the wiring harness retainer from the stud bolt on the LH side of the cooling fan shroud.



24. Disconnect the positive battery cable. For additional information, refer to Section 414-01 .

25. Detach the battery cable retainer from the cooling fan shroud.

6.2L engines

26. Detach the power steering fluid cooler hose retainer and position the hose aside.

27. Syphon the power steering fluid from the power steering reservoir, release the clamp and disconnect the power steering fluid cooler return hose on top of the radiator.

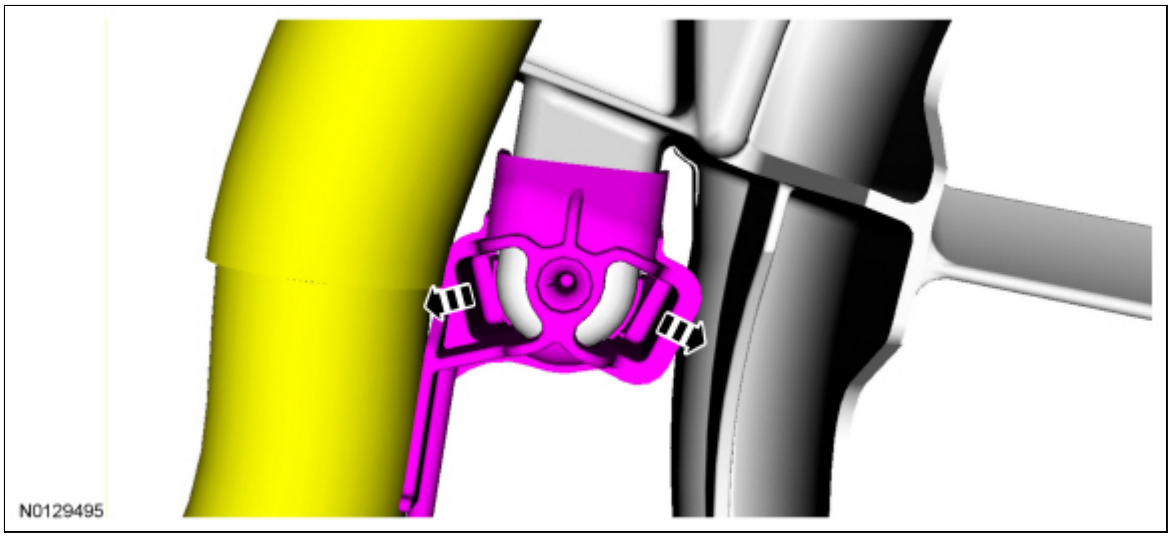
28. Detach the wiring harness retainer from the power steering fluid reservoir stud bolt.

29. Remove the power steering fluid reservoir stud bolt and position aside the reservoir.

All engines

30. If equipped, cut the block heater tie strap.

31. Remove the bolt and nut, and disconnect the A/C tube fittings from the A/C condenser.
    - Discard the O-ring seals and gaskets.



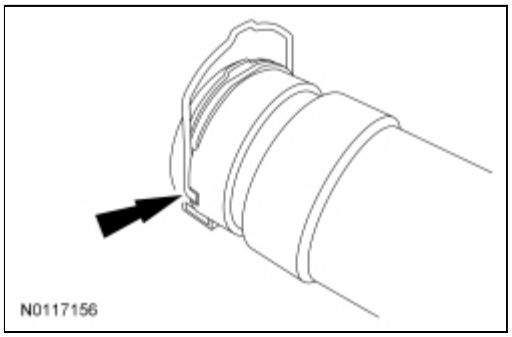
32. Disconnect the 2 cooling fan electrical connectors and detach the 3 cooling fan wiring harness retainers.

33. Release the 4 Battery Junction Box (BJB) retaining tabs and detach the BJB from the bracket.

34. **NOTE:** Push the 2 LH wiring harness retainer tabs outward to release.

    Detach the LH wiring harness retainer and the 3 RH wiring harness pushpins and position the BJB , the wiring harness.

repair4less

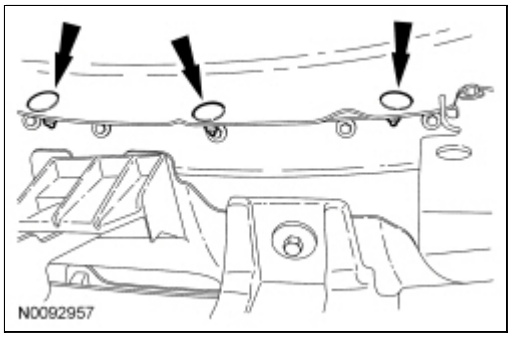


3.5L GTDI , 3.7L and 5.0L engines

35. Release the clamp and disconnect the radiator-to-degas bottle hose from the radiator.

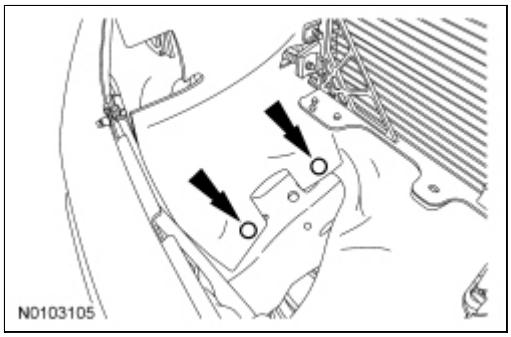
36. **NOTE:** The quick connect coupling illustrated is to show the spring clip release location only. The quick connect coupling on the hose may differ.

    Pull the lower radiator hose spring clip up until the end of the clip is in the detent on the quick connect coupling and disconnect the lower radiator hose from the radiator.



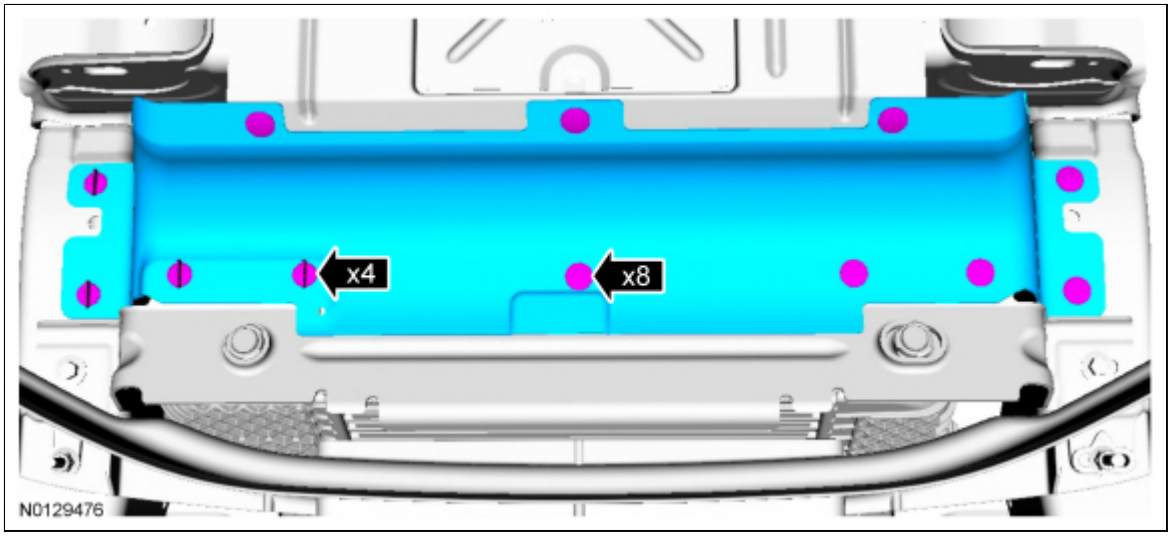
6.2L engines

37. Remove the spring clip and disconnect the lower radiator hose from the radiator.



38. Disconnect the radiator overflow hose from the radiator.

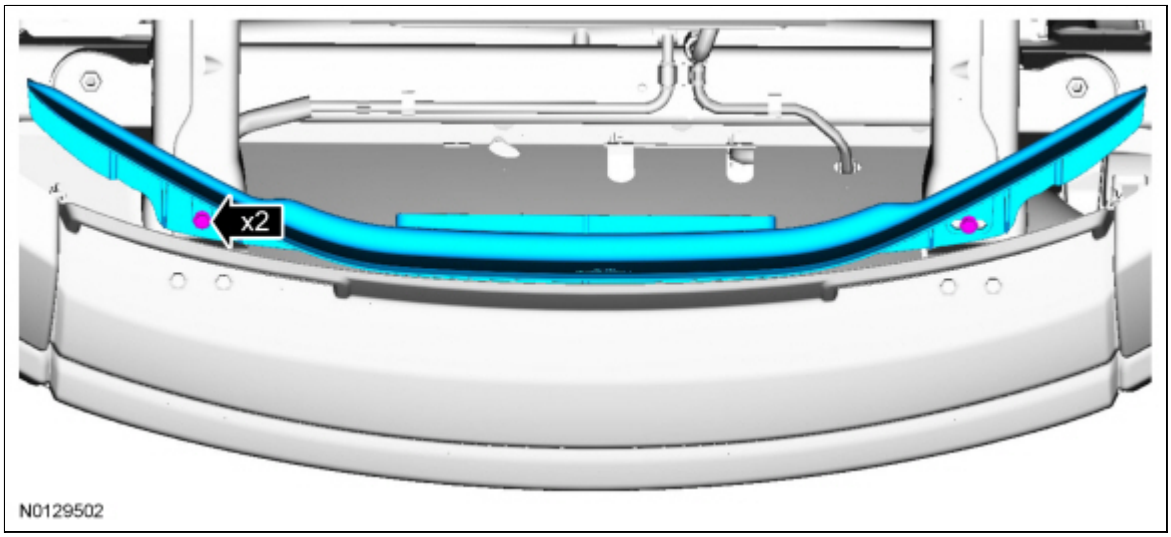
39. Remove the 3 front air deflector-to-bumper pushpins.



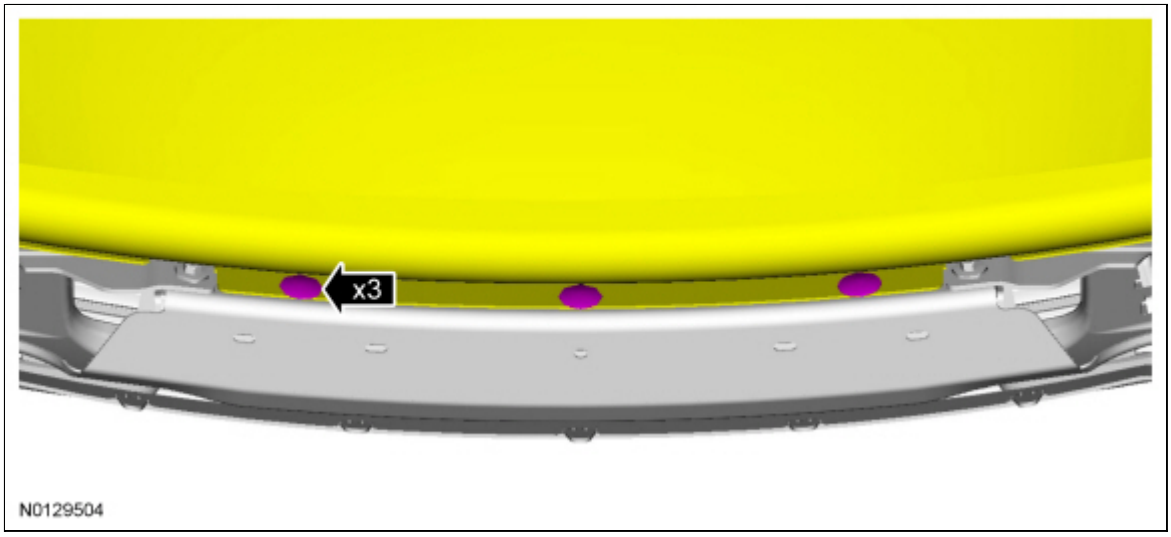
All engines

40. Remove the 2 RH air deflector-to-frame rail pushpins.

3.5L GTDI engines



41. Turn the 4 quarter-turn retainers, detach the 8 pushpins and remove the lower air deflector.

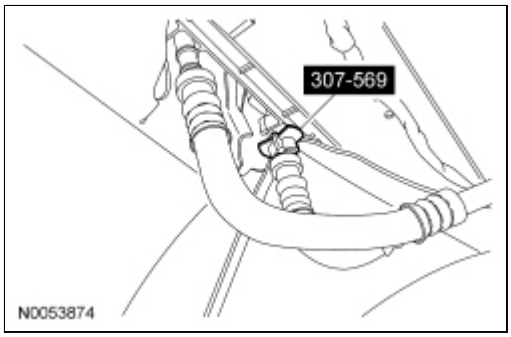


3.7L and 5.0L engines

42. Remove the 2 air dam bolts and the air dam.

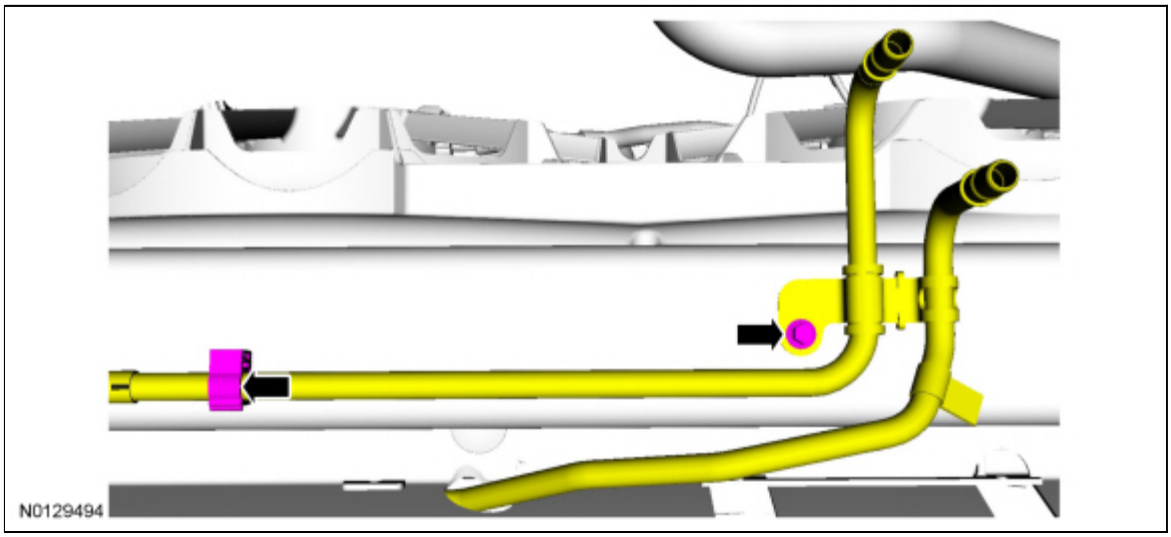
repair4less

43. Remove the 3 front air deflector-to-bumper pushpins.



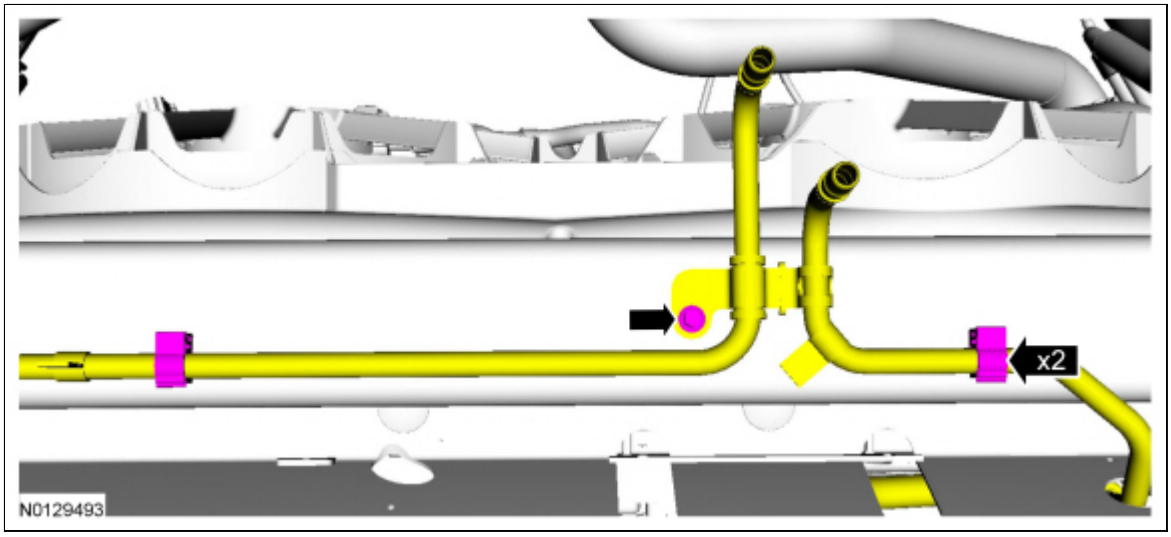
All engines

44. Remove the 2 transmission cooler tube latch assemblies.



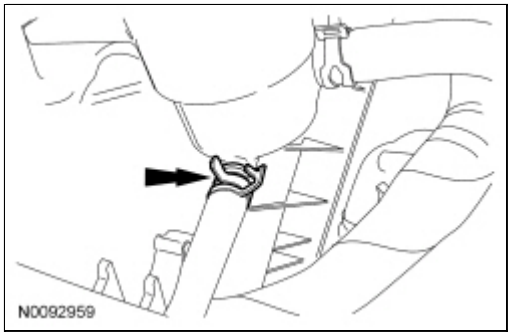
45. **NOTE:** 6.2L shown, 3.5L GTDI , 3.7L and 5.0L similar.

    Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes.



3.5L GTDI , 3.7L and 5.0L engines

46. For vehicles without an auxiliary transmission fluid cooler, remove the transmission cooler tube bracket bolt and detach the transmission cooler tube retainer from the crossmember.



47. For vehicles with an auxiliary transmission fluid cooler, remove the transmission cooler tube bracket bolt and detach the 2 transmission cooler tube retainers from the crossmember.

6.2L engines

repair4less

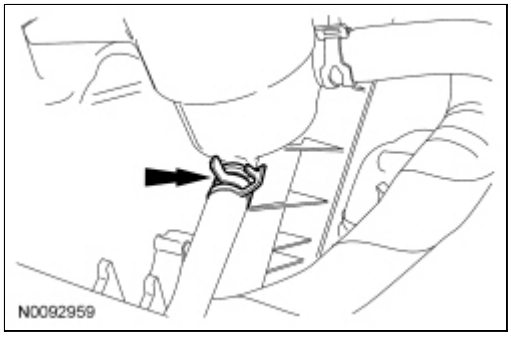
48. Disconnect the power steering cooler-to-power steering fluid reservoir hose from the power steering fluid reservoir.

All engines

49. Remove the 6 cooling module bolts.

50. Remove the cooling module.

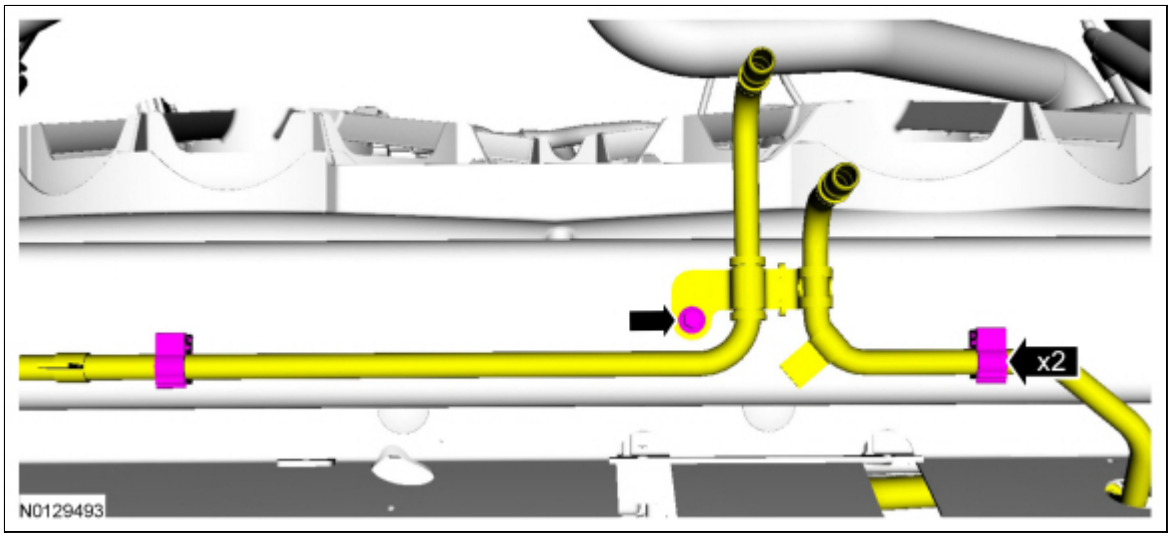
Installation



All engines

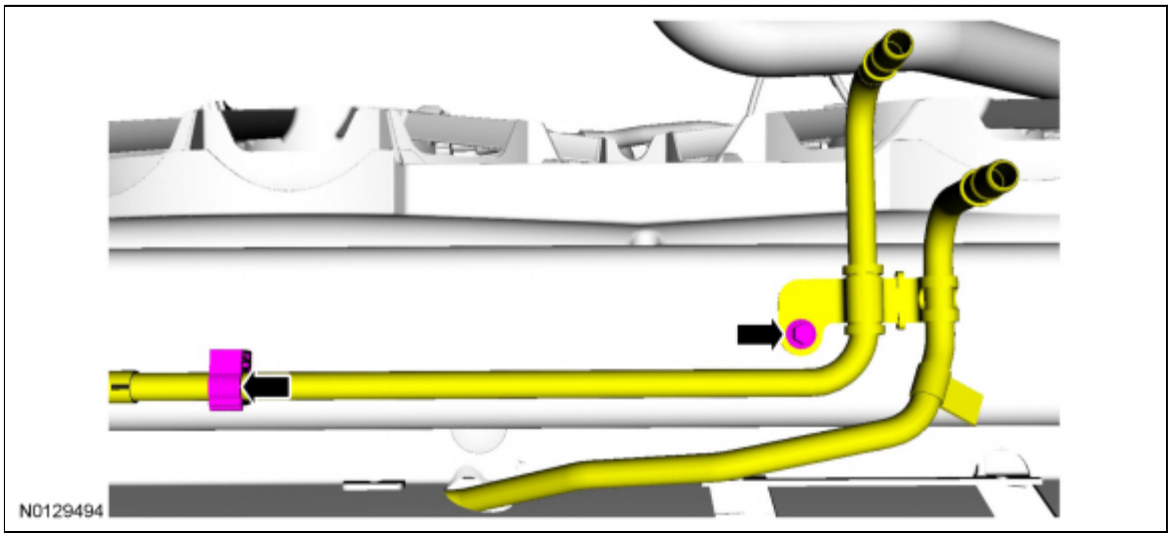
1. Position the cooling module into the vehicle.

2. Install the 6 cooling module bolts.
    - Tighten to 30 Nm (22 lb-ft).



6.2L engines

3. Connect the power steering cooler-to-power steering fluid reservoir hose at the power steering reservoir.

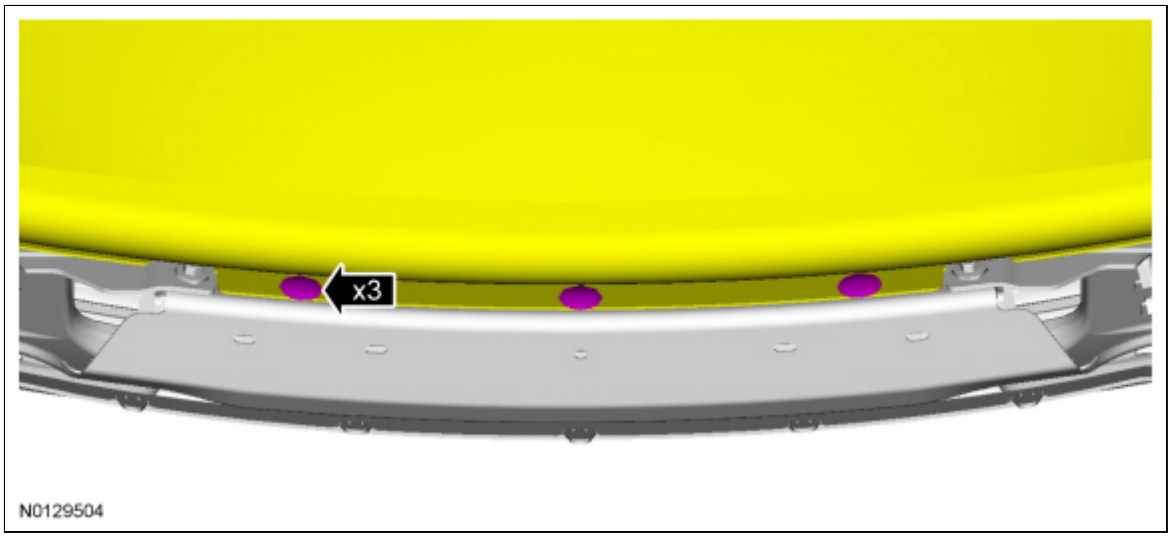


3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L engines

4. For vehicles with an auxiliary transmission fluid cooler, attach the 2 transmission cooler tube retainers and install the transmission cooler tube bracket bolt.
    - Tighten to 12 Nm (106 lb-in).

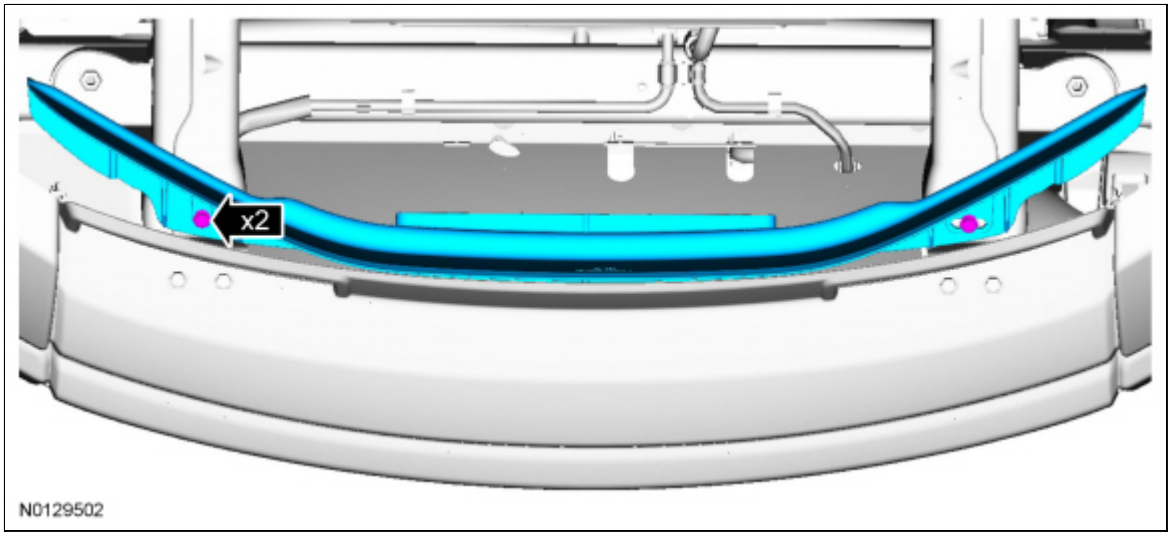
5. For vehicles without an auxiliary transmission fluid cooler, attach the transmission cooler tube retainer and install the transmission cooler tube bracket bolt.
    - Tighten to 12 Nm (106 lb-in).

All vehicles



6. Connect the transmission cooler tubes.

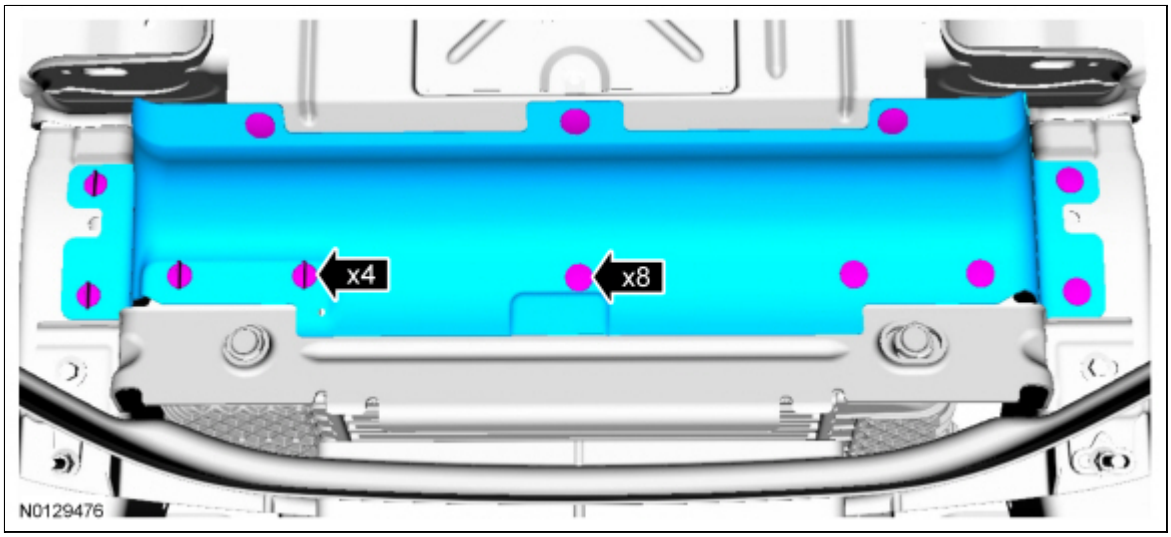
7. Install the transmission cooler tube latch assemblies.



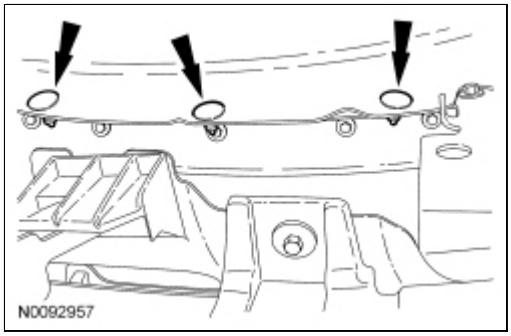
3.7L and 5.0L engines

8. Install the 3 air deflector-to-front bumper pushpins.

repair4less

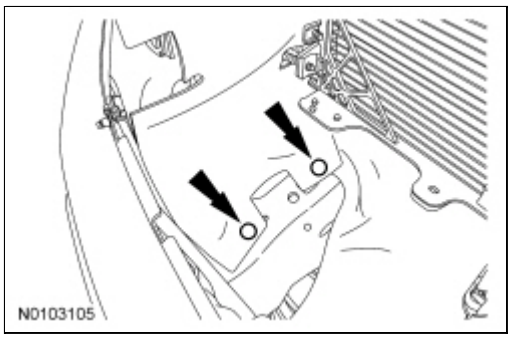


9. Position the air dam and install the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).



3.5L GTDI engines

10. Position the lower air deflector, attach the 8 pushpins and turn the 4 quarter-turn retainers.



6.2L engines

11. Install the 3 front air deflector-to-bumper pushpins.

All engines

12. Install the 2 RH air deflector-to-frame rail pushpins.

3.5L GTDI , 3.7L and 5.0L engines

13. Push the spring clip in place and connect the lower radiator hose quick connect coupling to the radiator, making sure the coupling is secure.

14. Connect the radiator-to-degas bottle hose to the radiator and position the clamp.

repair4less

6.2L engines

15. Connect the radiator overflow hose to the radiator.

16. Connect the lower radiator hose to the radiator and install the spring clip.

All engines

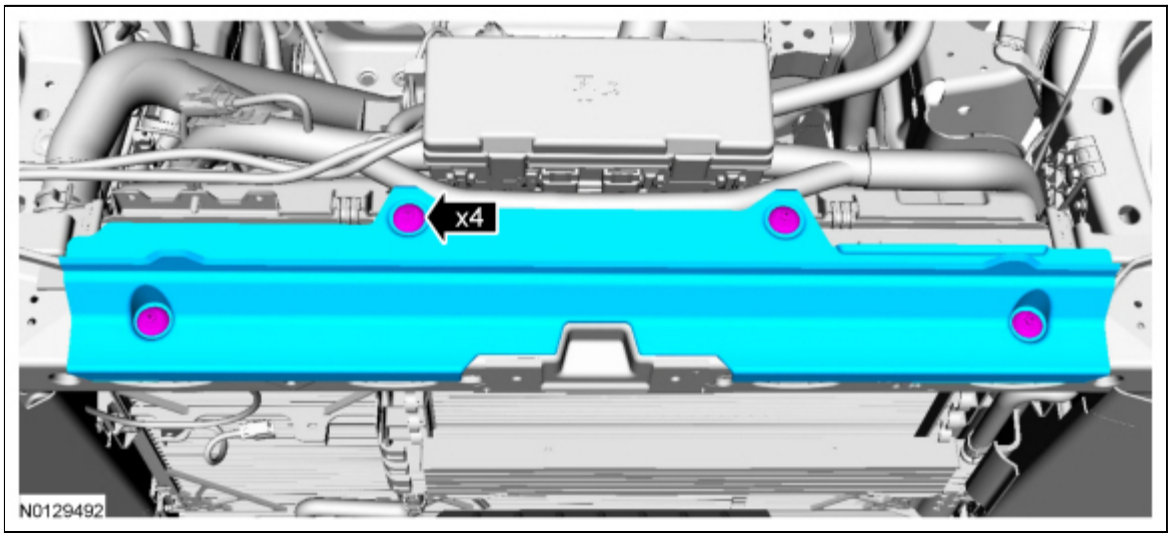
17. Position the BJB and wiring harness into place, connect the BJB retaining tabs, and attach the LH wiring harness retainer and the 3 RH wiring harness pushpins.

18. Attach the 3 cooling fan wiring harness retainers and connect the 2 cooling fan electrical connectors.

19. Install new O-ring seals and gaskets on the A/C condenser fittings.

20. Connect the A/C fittings to the A/C condenser and install the bolt and the nut.
    - Tighten to 15 Nm (133 lb-in).

21. If equipped, install a new block heater tie strap.



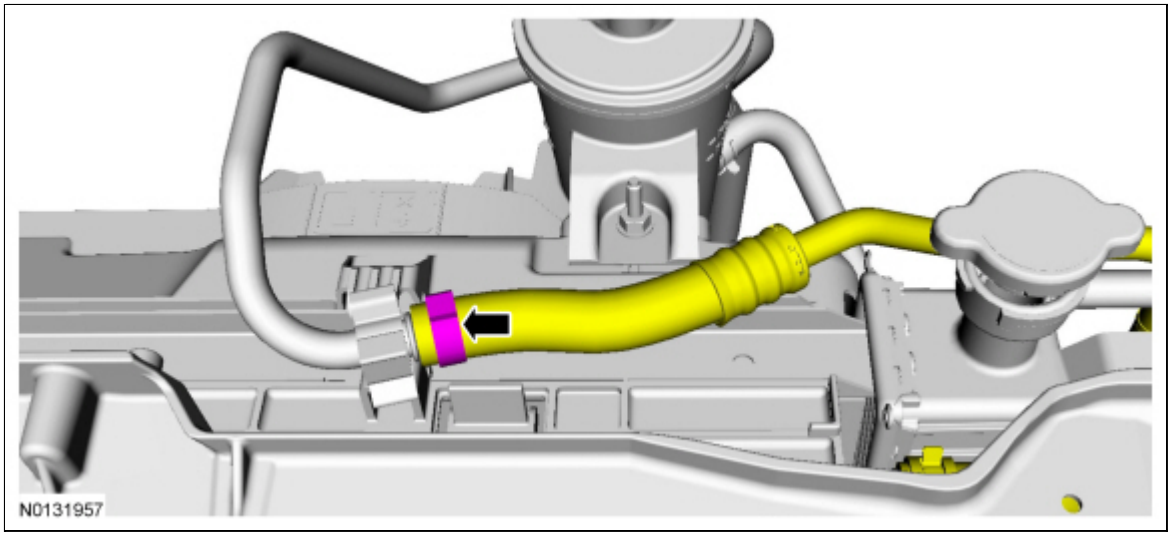
3.5L GTDI, 3.7L and 5.0L engines

22. Attach the wiring harness retainer to the stud bolt on the LH side of the cooling fan shroud.

23. Connect the battery positive cable. For additional information, refer to Section 414-01.

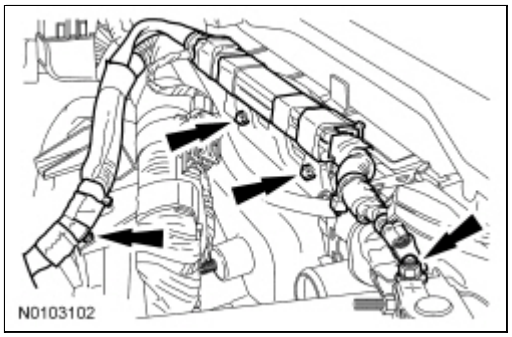
24. Attach the battery cable retainer to the cooling fan shroud.

25. Install the upper radiator air deflector and install the 4 pushpins.



6.2L engines

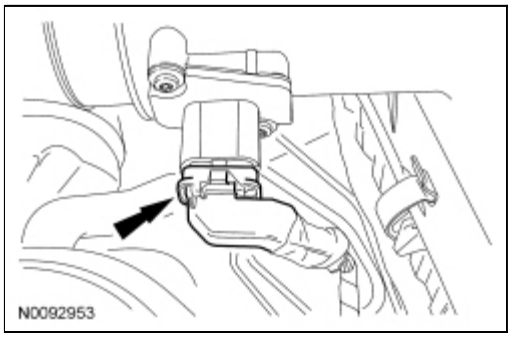
26. Position the power steering fluid reservoir and install the stud bolt.
    - Tighten to 11 Nm (97 lb-in).



27. Attach the wiring harness retainer to the power steering fluid reservoir stud bolt.

28. Connect the power steering fluid cooler return hose on top of the radiator.

29. Connect the power steering fluid cooler hose retainer.

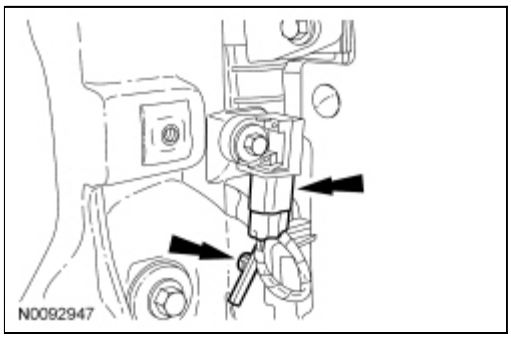


30. Position the wiring harness, attach the 3 wiring harness retainers to the cooling fan shroud, attach the generator battery positive cable and install the nut.
    - Tighten to 9 Nm (80 lb-in).

31. Attach the upper radiator hose retainer to the cooling fan motor and shroud.

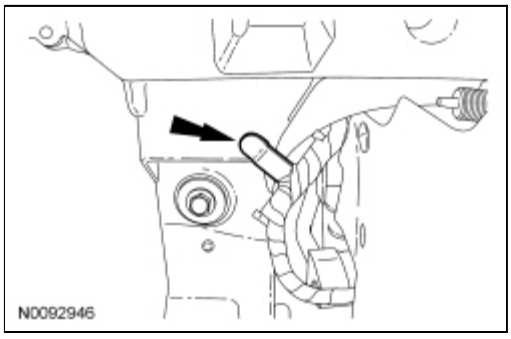
All engines

32. Connect the MAF sensor electrical connector.



repair4less

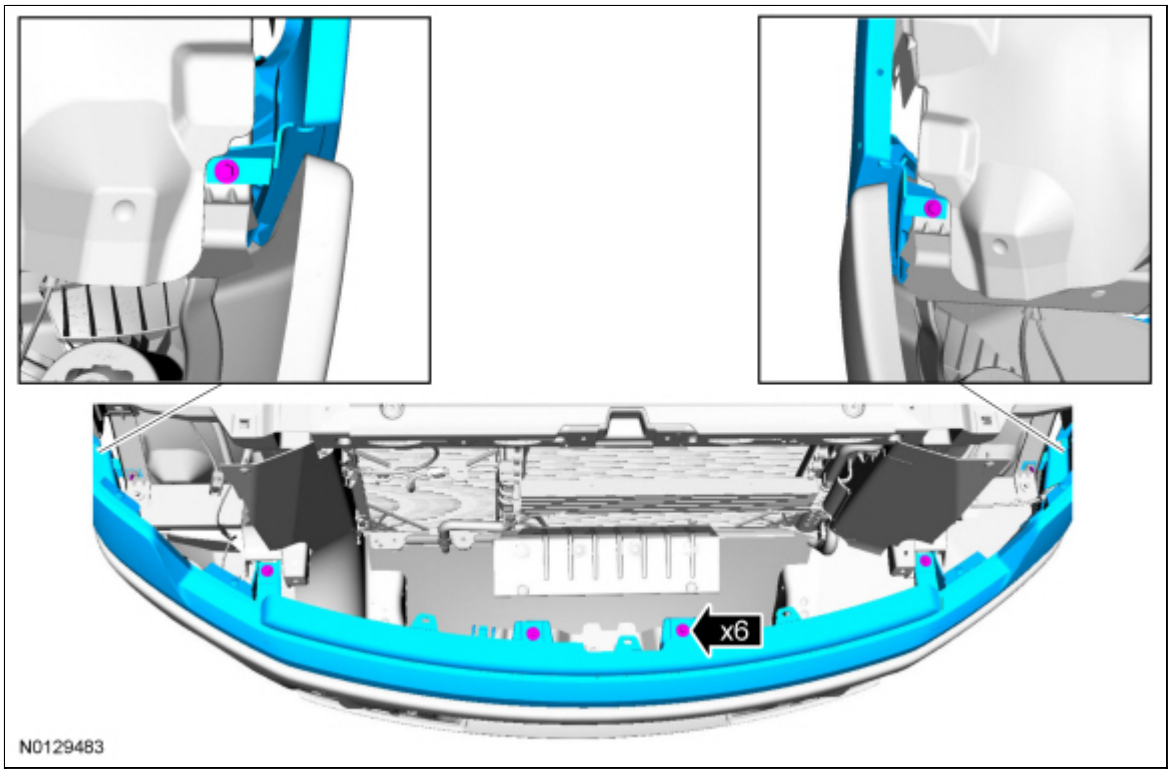
33. Install the ACL outlet tube. For additional information, refer to Section 303-12 .



34. Connect the upper radiator hose to the radiator and install the clamp.

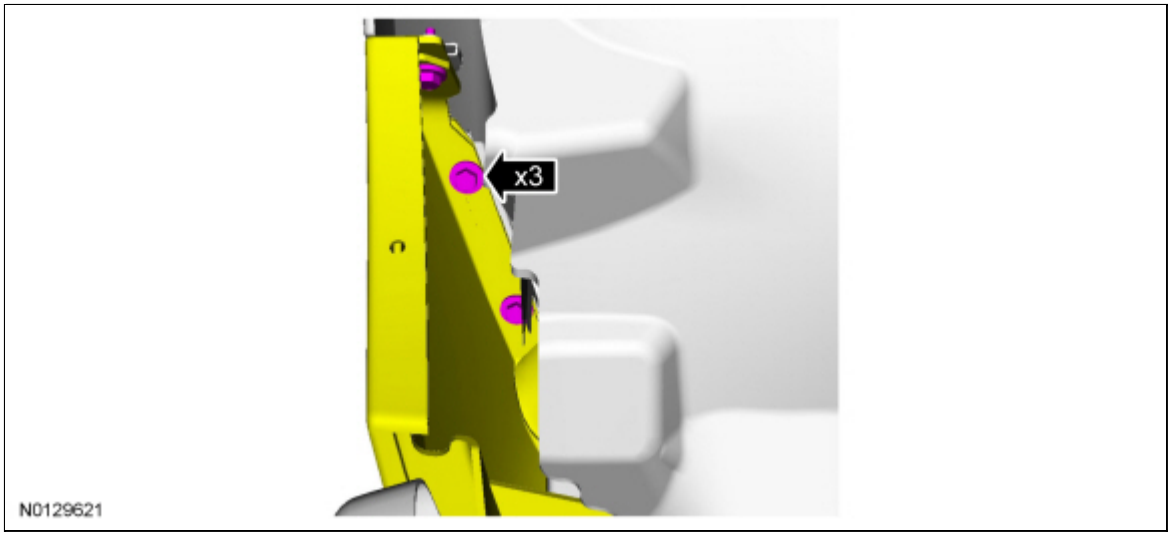
35. **NOTE:** RH shown, LH similar.

    Position the wiring harness into place and connect the RH and LH front impact severity sensor electrical connectors and wiring harness pushpin retainers.



36. Attach the wiring harness retainer to the RH side of the radiator grille support.

37. Position the wiring harness into place and connect the horn and ambient temperature sensor electrical connectors and attach the pushpin retainer.



38. Position the front bumper cover and the brackets as an assembly and install the 6 bumper cover bracket bolts.
    - Tighten to 3 Nm (27 lb-in).

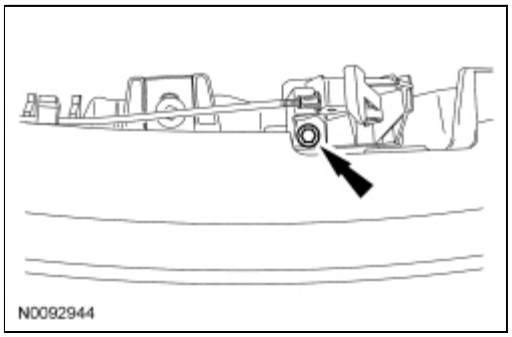
39. **NOTE:** LH shown, RH similar.

    Install the 3 LH and 3 RH bumper cover-to-fender bolts.
    - Tighten to 3 Nm (27 lb-in).

40. **NOTE:** LH shown, RH similar.

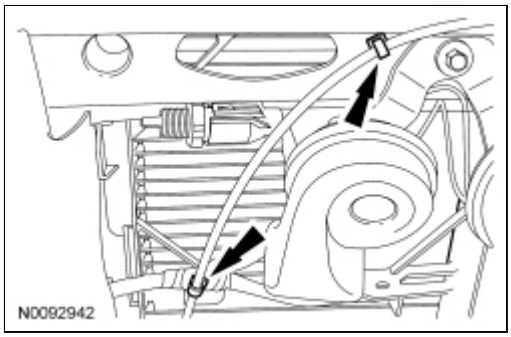
    If equipped, attach the front wheel mouldings and install the 2 LH and 2 RH nuts.
    - Tighten to 3 Nm (27 lb-in).

repair4less

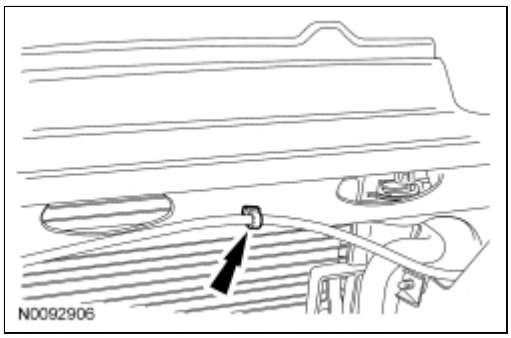


41. **NOTE:** LH shown, RH similar.

    If equipped, install the 4 LH and 4 RH front wheel moulding pushpins.



42. Position and attach the hood latch release handle and cable onto the front bumper cover and install the bolt.
    - Tighten to 8 Nm (71 lb-in).



43. Position the hood latch into place and install the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

44. Attach the 2 RH hood latch cable pushpin retainers.

45. Attach the LH hood latch cable pushpin retainers.

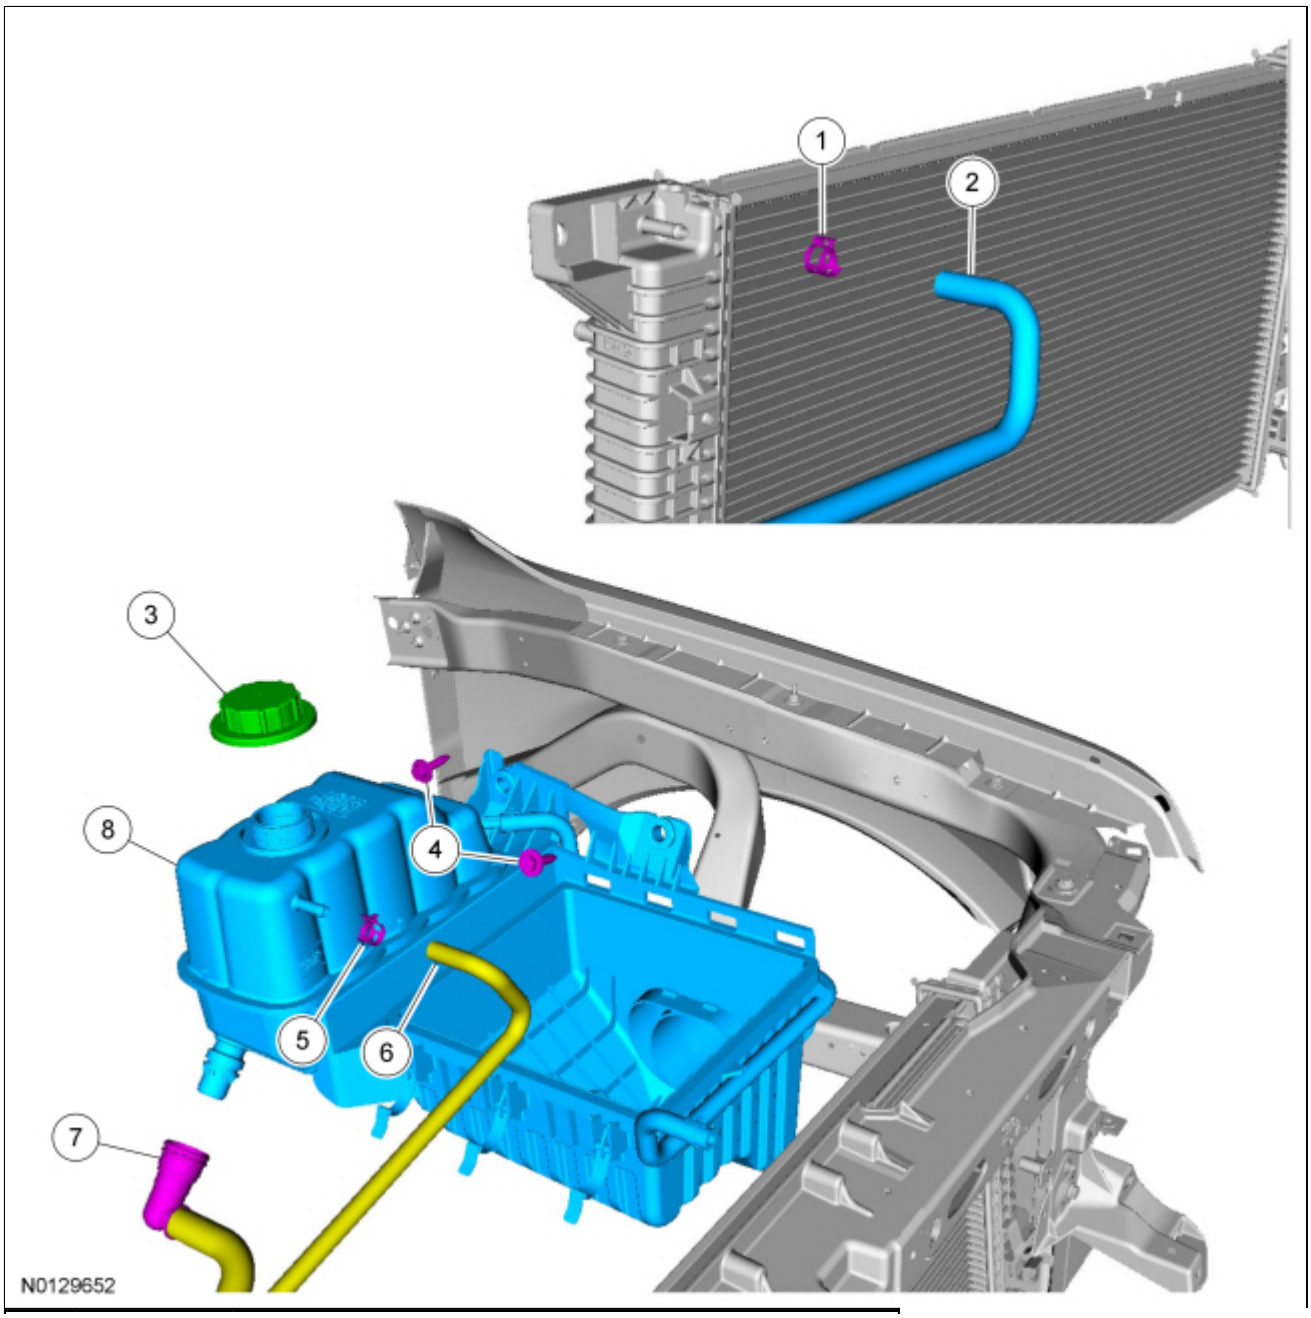
46. Install the headlights. For additional information, refer to Section 417-01 .

47. Connect the battery ground cable. For additional information, refer to Section 414-01 .

48. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

49. Recharge the A/C system. For additional information, refer to Section 412-00 .

50. If equipped, fill the power steering system. For additional information, refer to Section 211-00B .



51. Check the transmission fluid and fill as necessary. For additional information, refer to Section 307-01 .

repair4less

Degas Bottle — 3.5L GTDI, 3.7L, 5.0L

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

repair4less

Item	Part Number	Description
1	—	Radiator-to-degas bottle hose clamp (part of 8075)
2	8075	Radiator-to-degas bottle hose
3	8101	Pressure relief cap
4	W707108	Degas bottle/lower air cleaner tray bolts - 17 Nm (150 lb-in) (2 required)
5	—	Thermostat housing-to-degas bottle hose clamp (part of 8276)
6	8276	Thermostat housing-to-degas bottle hose
7	18472	Heater outlet hose (3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L engines)
7	8C350	Degas bottle-to-heater outlet tube hose (5.0L engines)
8	8A080	Degas bottle/lower air cleaner tray assembly

Removal and Installation

1. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

   Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

2. Using hose pinch pliers, clamp the heater outlet hose near the degas bottle.

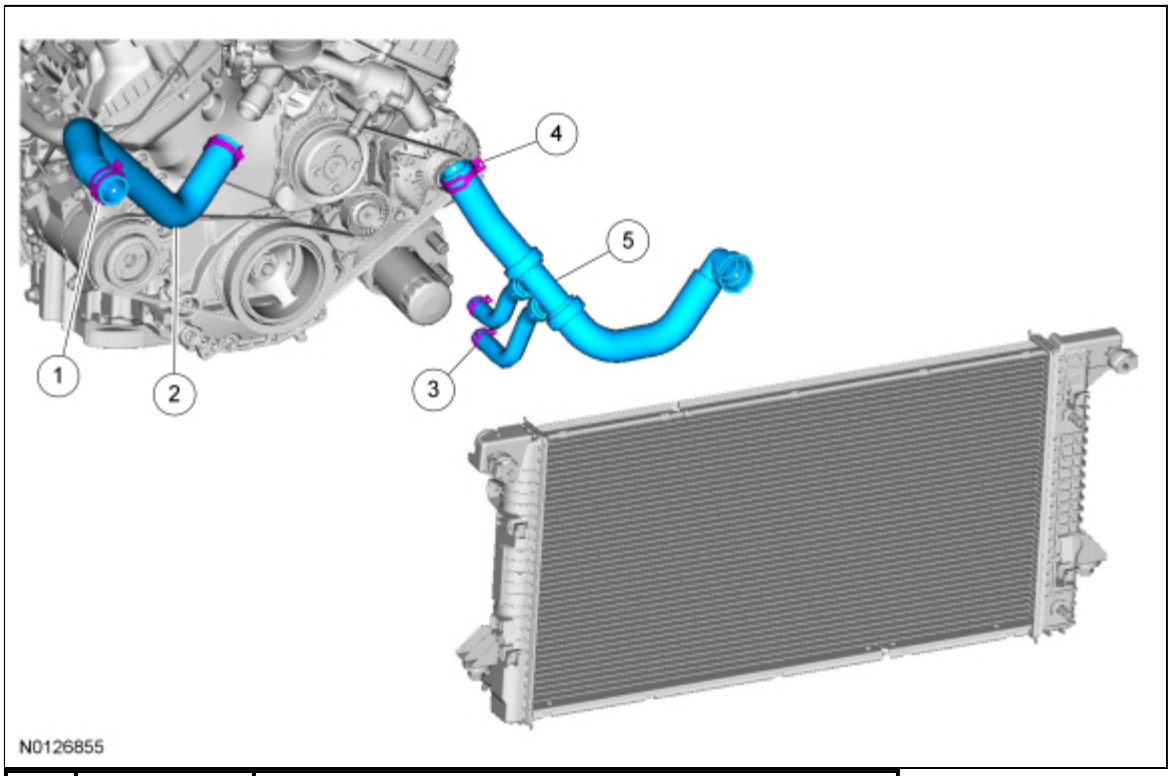
3. Using a suitable suction device, siphon the coolant from the degas bottle.

4. Release the clamp and disconnect the radiator-to-degas bottle from the radiator.

5. Release the clamp and disconnect the thermostat housing-to-degas bottle hose from the degas bottle.

6. Remove the spring clip and disconnect the heater outlet hose (3.5L GTDI or 3.7L engines) or the degas bottle-to-heater outlet tube hose (5.0L engines) from the degas bottle.

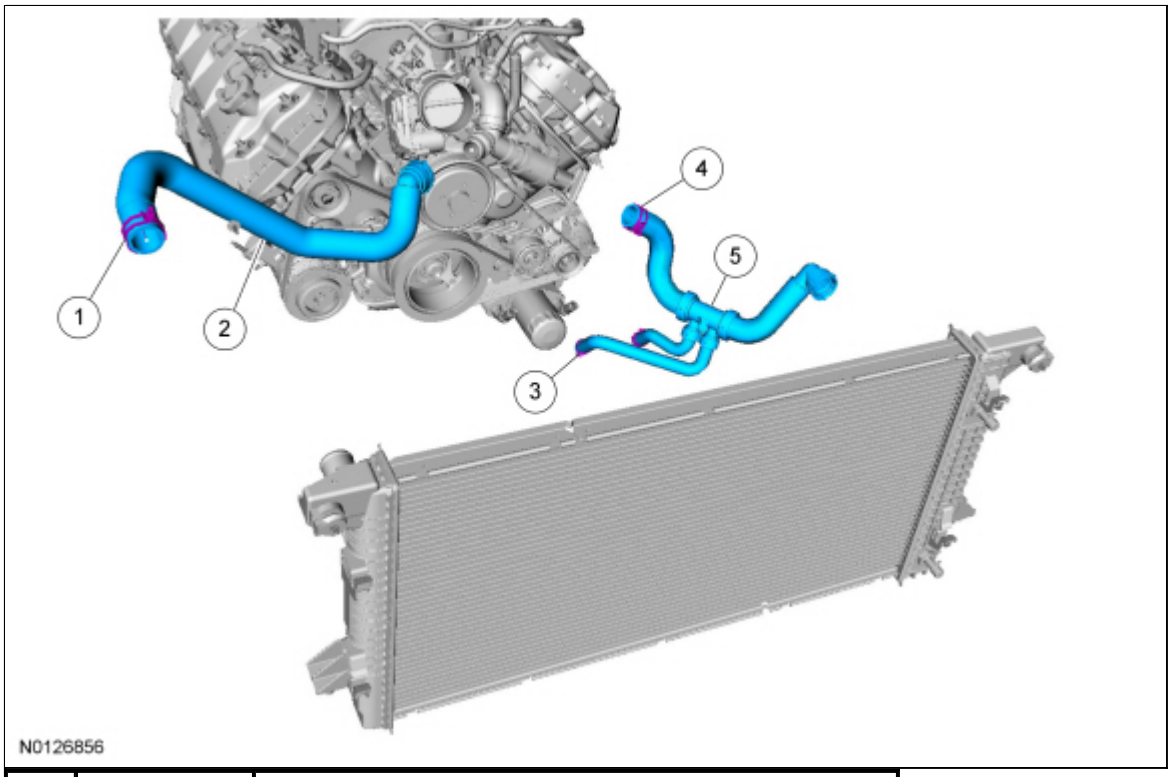
7. Remove the 2 bolts and the degas bottle/lower air cleaner tray assembly.
   - To install, tighten to 17 Nm (150 lb-in).



8. To install, reverse the removal procedure.

9. Fill the degas bottle with a 50/50 mixture of coolant and distilled water.

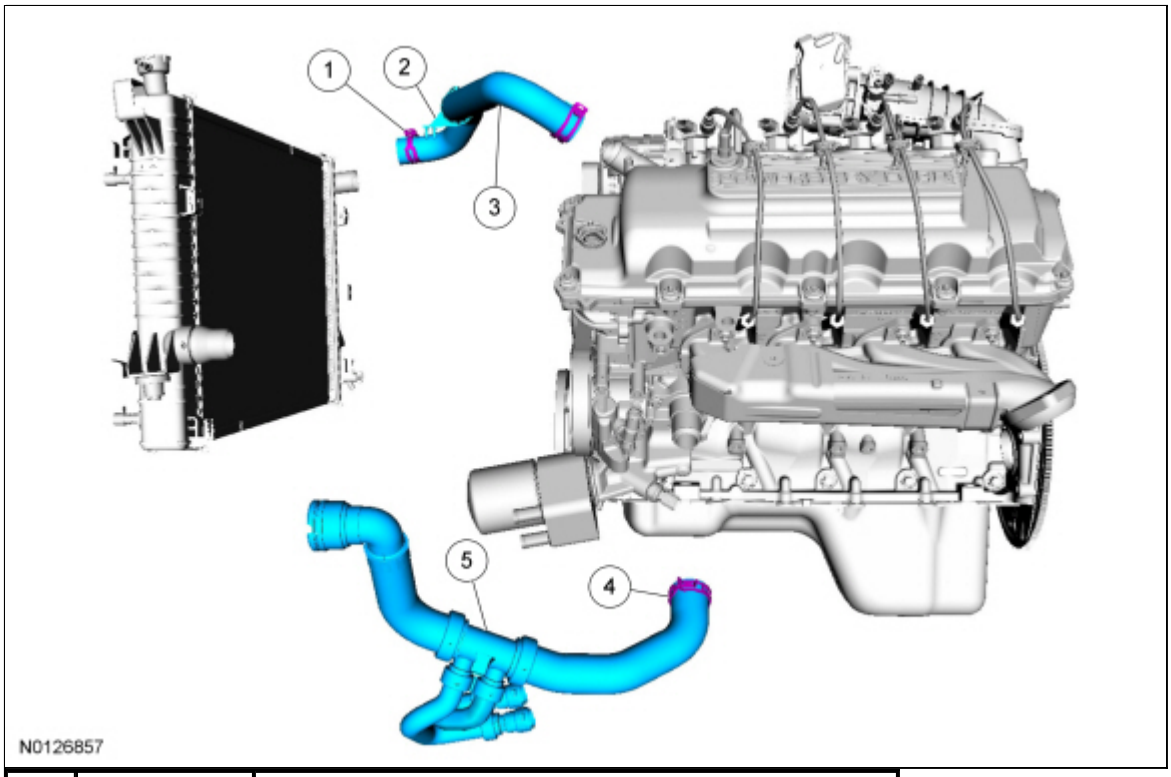
repair4less



Radiator Hose

3.5L GTDI and 3.7L Engines

Item	Part Number	Description
1	—	Upper radiator hose clamp (2 required) (part of 8260)
2	8260	Upper radiator hose
3	—	Oil cooler hose clamp (2 required) (part of 8286)
4	—	Lower radiator hose clamp (part of 8286)
5	8286	Lower radiator hose

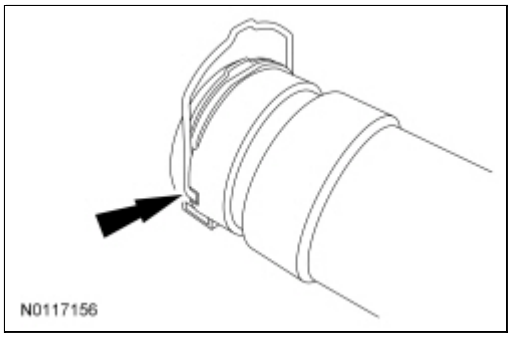


5.0L Engine

Item	Part Number	Description
1	—	Upper radiator hose clamp (2 required) (part of 8260)
2	8260	Upper radiator hose
3	—	Oil cooler hose clamp (2 required) (part of 8286)
4	—	Lower radiator hose clamp (part of 8286)
5	8286	Lower radiator hose

6.2L Engine

repair4less



Item	Part Number	Description
1	—	Upper radiator hose clamp (2 required) (part of 8260)
2	8W287	Upper radiator hose retainer (part of 8286)
3	8260	Upper radiator hose
4	—	Lower radiator hose clamp (part of 8286)
5	8286	Lower radiator hose

1. ***NOTICE:*** **Cover the accessory drive belts to prevent coolant contamination of the belts.**

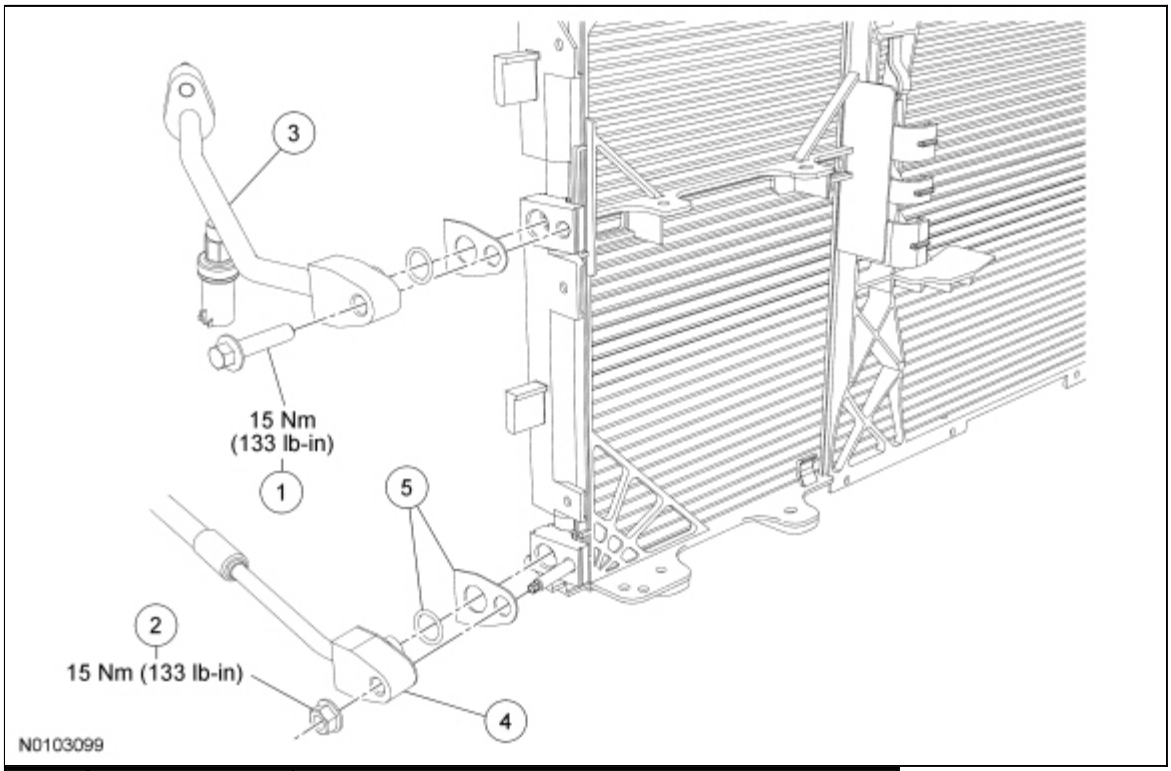
   For 3.5L GTDI, 3.7L and 5.0L engines, completely cover the accessory drive belts with waterproof plastic.

2. **NOTE:** The quick connect coupling illustrated is to show the spring clip release location only. The quick connect coupling on the hose may differ.

   For radiator hose quick connect couplings, pull the radiator hose spring clip up until the end of the clip is in the detent on the quick connect coupling and disconnect the radiator hose.
   - To install, push the spring clip in place and connect the radiator hose quick connect coupling, making sure the coupling is secure.

repair4less

Radiator

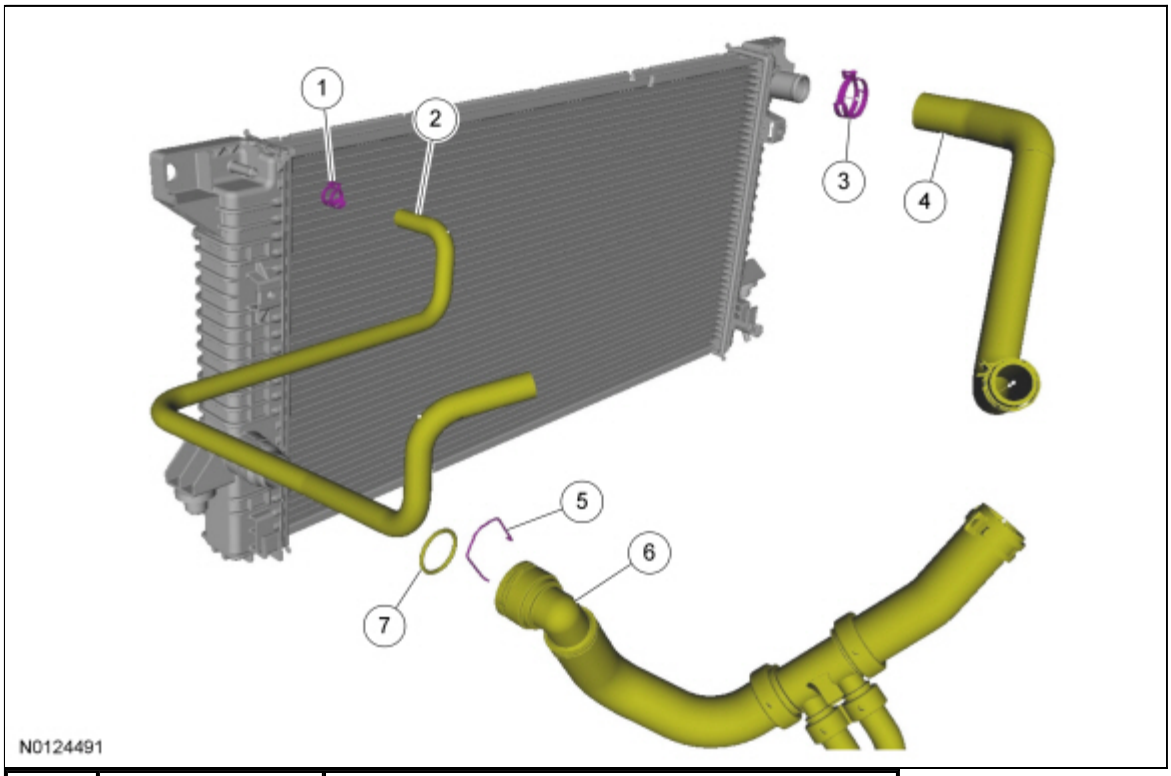


Special Tool(s)

 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

Material

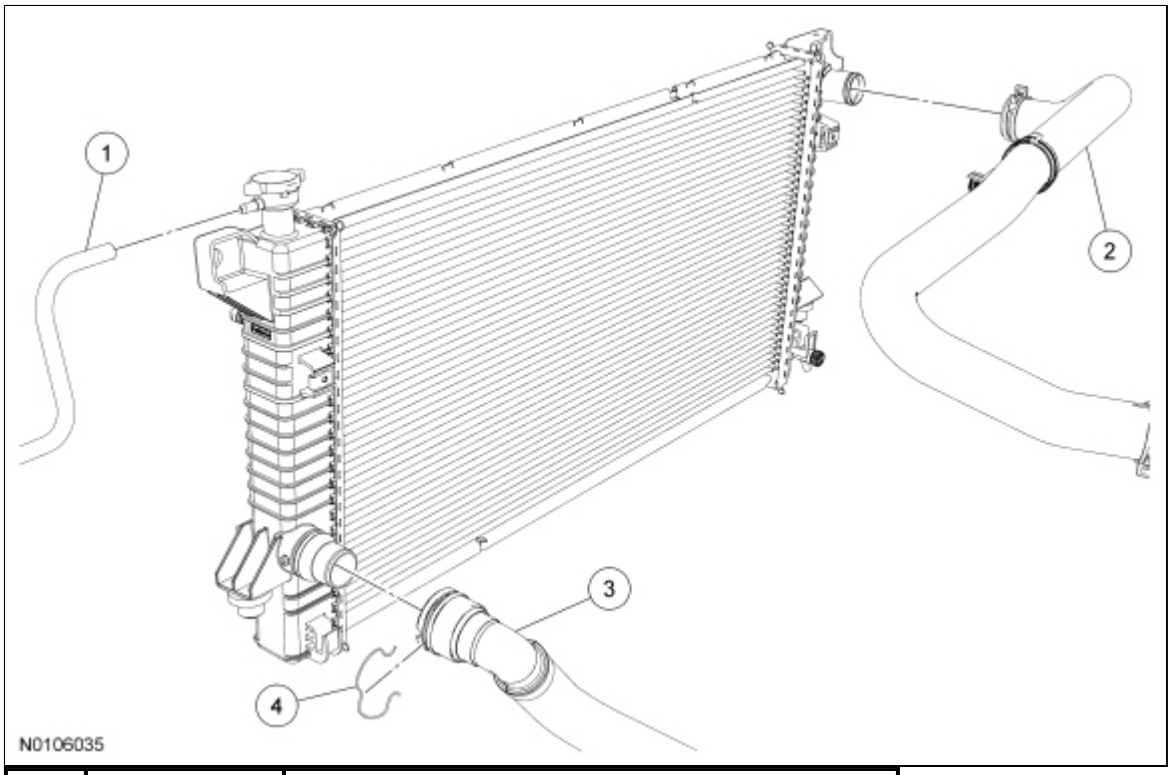
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



A/C Condenser Fittings

Item	Part Number	Description

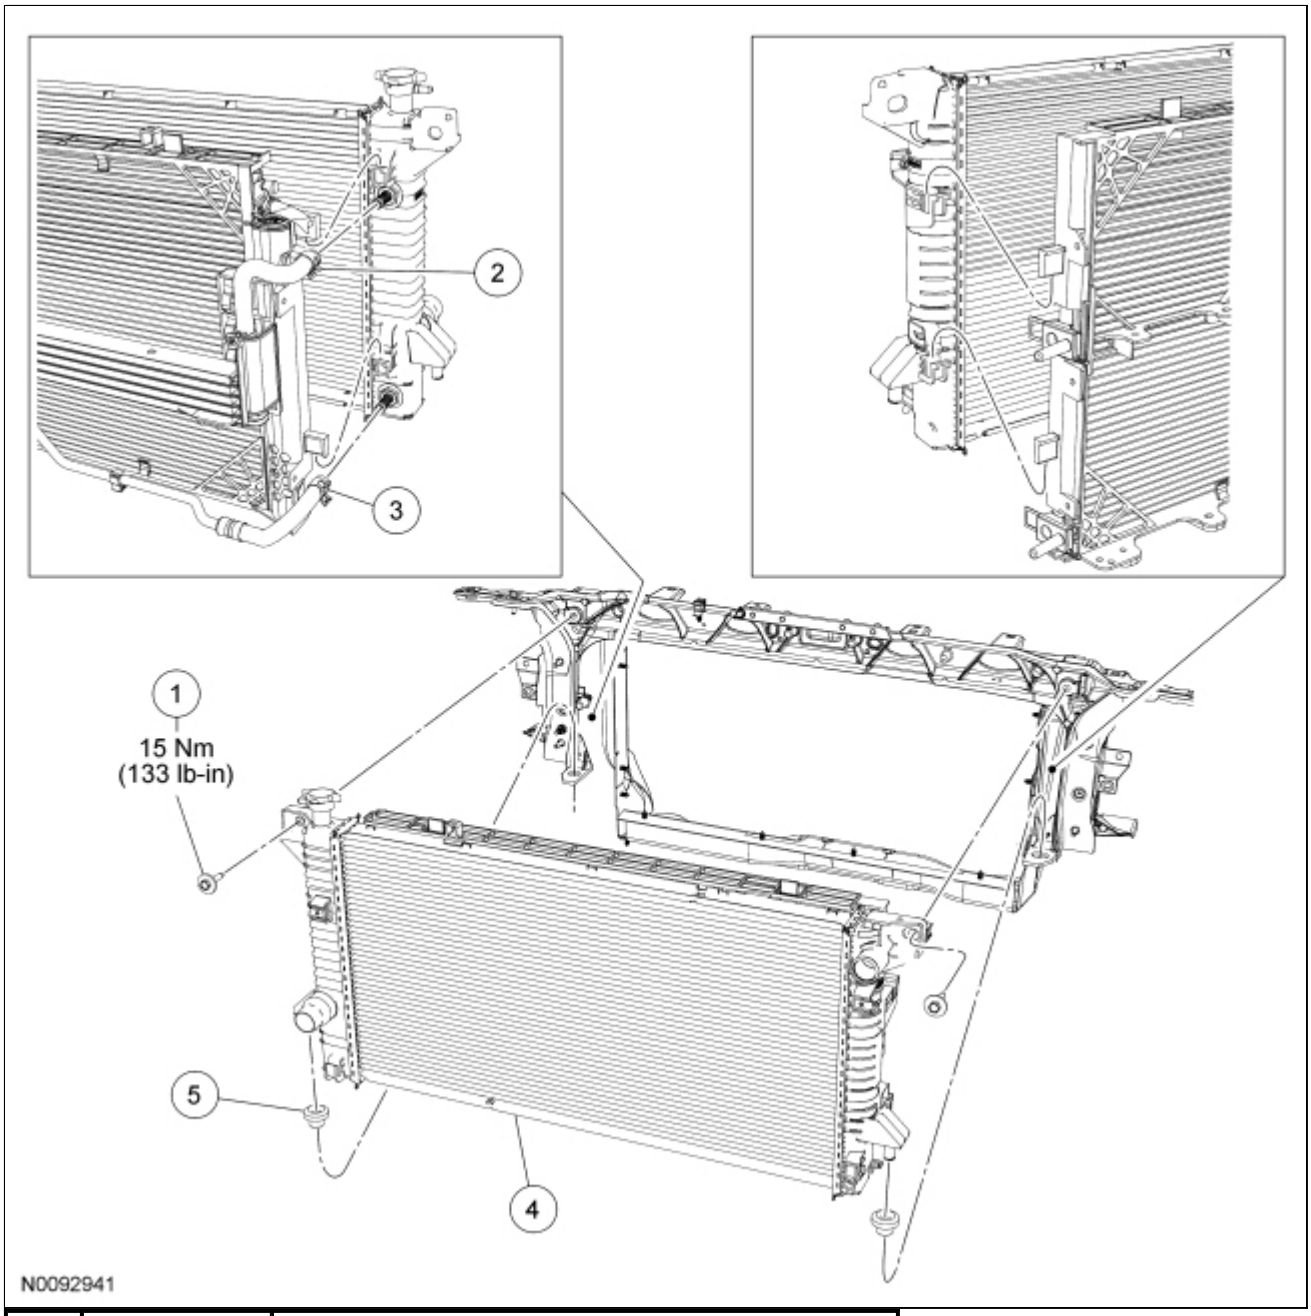
1	W500110	Condenser inlet fitting bolt
2	W520413	Condenser outlet fitting nut
3	19E558	Condenser inlet jumper line fitting
4	—	Condenser outlet fitting (part of 19A834)
5	19B596	O-ring seal and gasket seal kit (2 required)



Radiator Hoses - 3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L

Item	Part Number	Description
1	15161	Radiator-to-degas bottle hose clamp
2	8W005	Radiator-to-degas bottle hose
3	15161	Upper radiator hose clamp
4	8260	Upper radiator hose
5	8D037	Lower radiator hose spring clip
6	8286	Lower radiator hose
7	8D038	Lower radiator hose O-ring seal

Radiator Hoses 6.2L



repair4less

Item	Part Number	Description
1	8N029	Radiator overflow hose
2	8D037	Lower radiator hose spring clip (part of 8286)
3	8286	Lower radiator hose
4	8260	Upper radiator hose

Radiator

NOTE: 6.2L shown, 3.5L GTDI GTDI , 3.7L and 5.0L similar.

Item	Part Number	Description
1	W503924	Radiator bolt (2 required)
2	7F113	Transmission fluid cooler-to-radiator upper hose
3	7B028	Transmission fluid cooler-to-radiator lower hose
4	8005	Radiator
5	8B204	Radiator insulator (2 required)

Removal

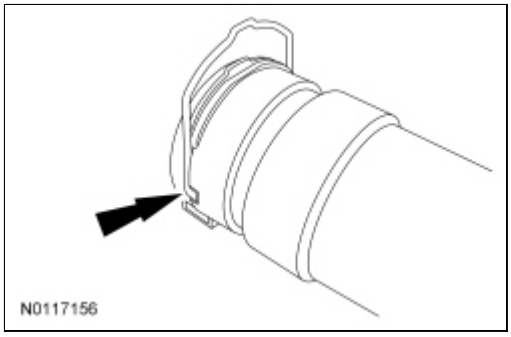
All engines

1. Recover the A/C system. For additional information, refer to Section 412-00 .

repair4less

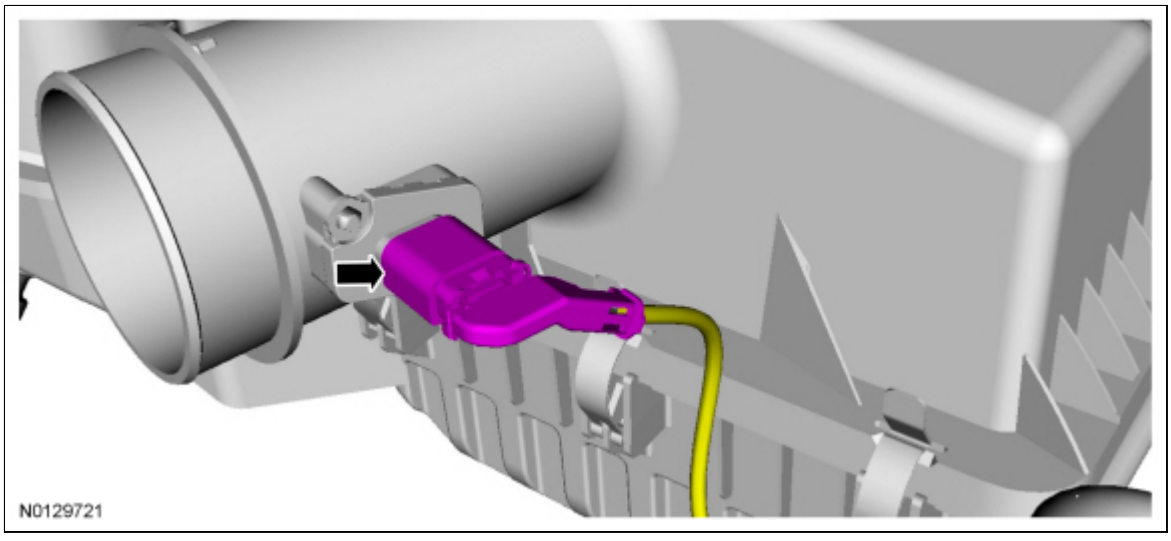
2. Drain the cooling system.

3. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.



3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L engines

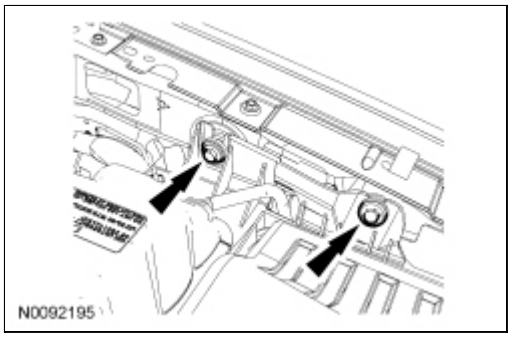
4. Release the clamp and disconnect the upper radiator hose from the radiator.



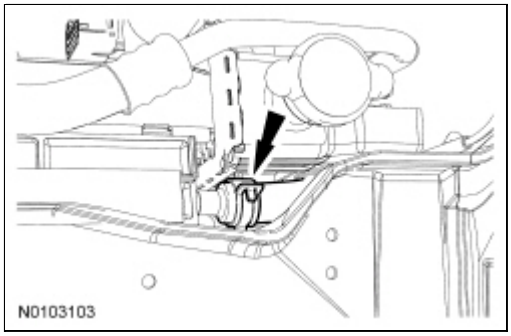
5. Release the clamp and disconnect the radiator-to-degas bottle hose from the radiator.

6. **NOTE:** The quick connect coupling illustrated is to show the spring clip release location only. The quick connect coupling on the hose may differ.

   Pull the lower radiator hose spring clip up until the end of the clip is in the detent on the quick connect coupling and disconnect the lower radiator hose from the radiator.



7. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

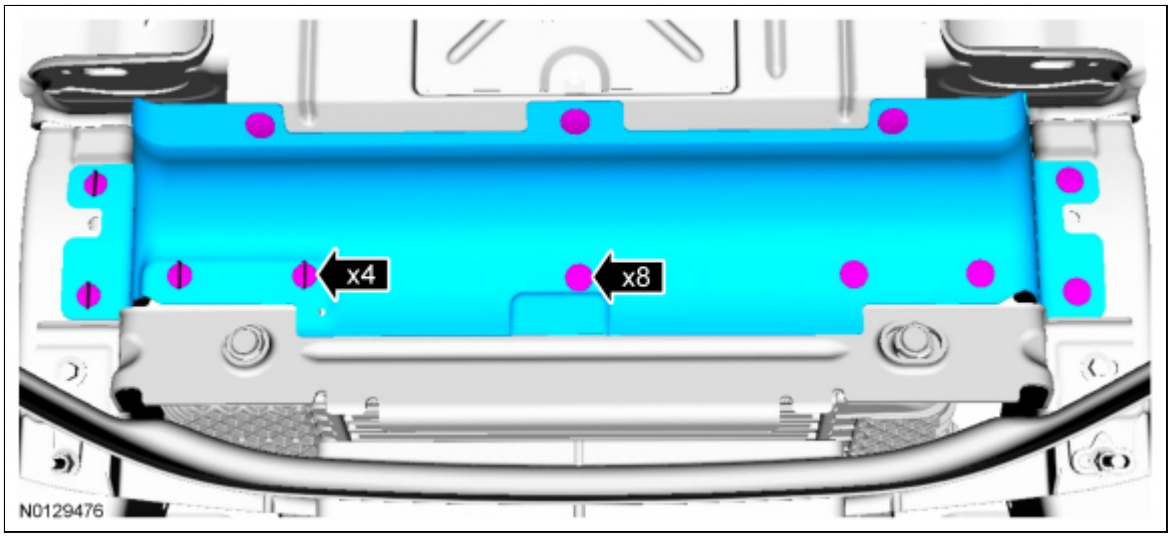


8. **NOTE:** 6.2L shown, 3.5L GTDI, 3.7L and 5.0L similar.

   Remove the 2 bolts and position the coolant expansion tank (6.2L) or the degas bottle (3.5L GTDI, 3.7L and 5.0L) aside.

6.2L engines

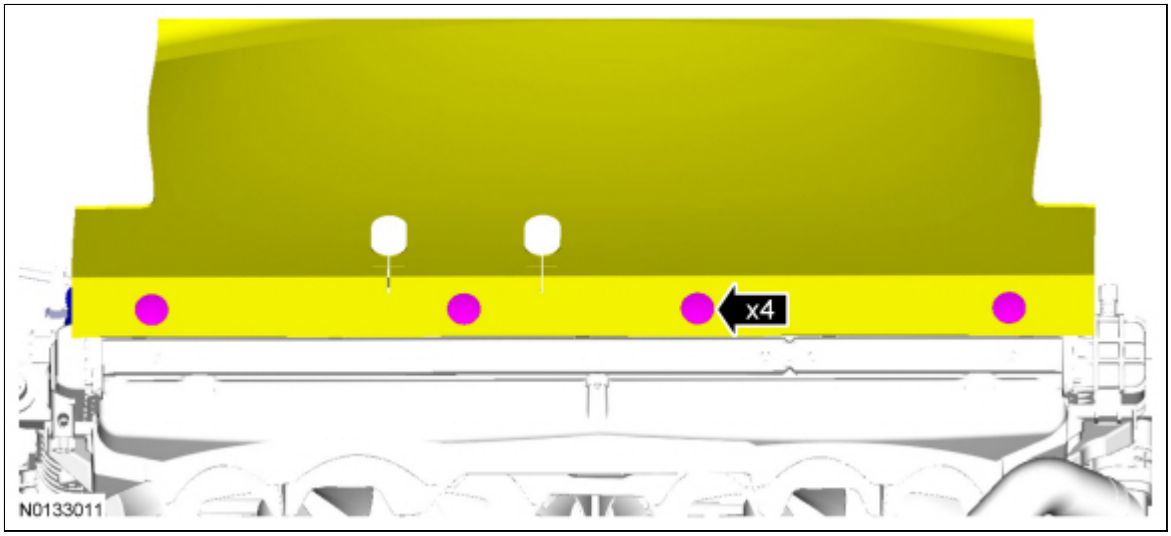
9. Release the clamp and disconnect the upper radiator hose from the radiator.
10. Disconnect the overflow hose from the radiator.
11. Remove the spring clip and disconnect the lower radiator hose from the radiator.
12. Release the clamp and disconnect the power steering cooler hose from the power steering cooler.



All engines

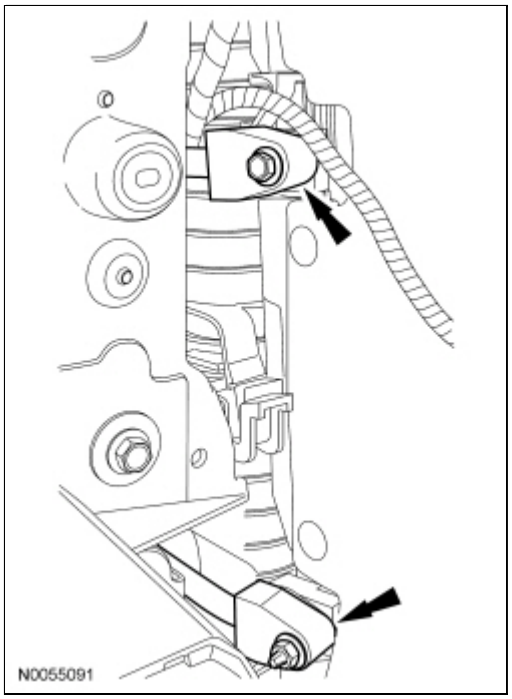
13. Disconnect the 3 RH and 2 LH air deflector-to-condenser pushpin retainers.

3.5L GTDI engines



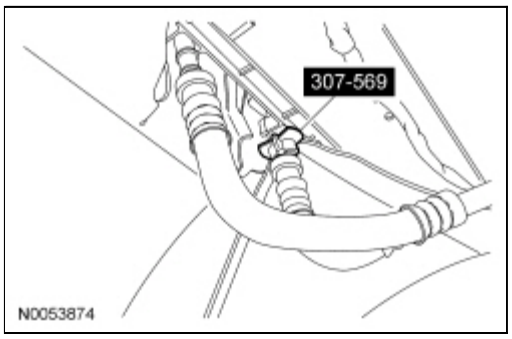
14. Turn the 4 quarter-turn retainers, detach the 8 pushpins and remove the lower air deflector.

repair4less



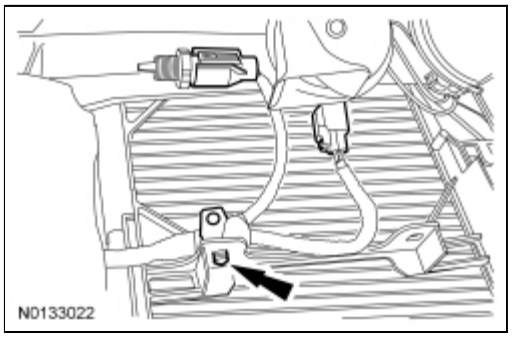
3.7L, 5.0L and 6.2L engines

15. Remove the 4 lower radiator air deflector-to-A/C condenser pushpins.



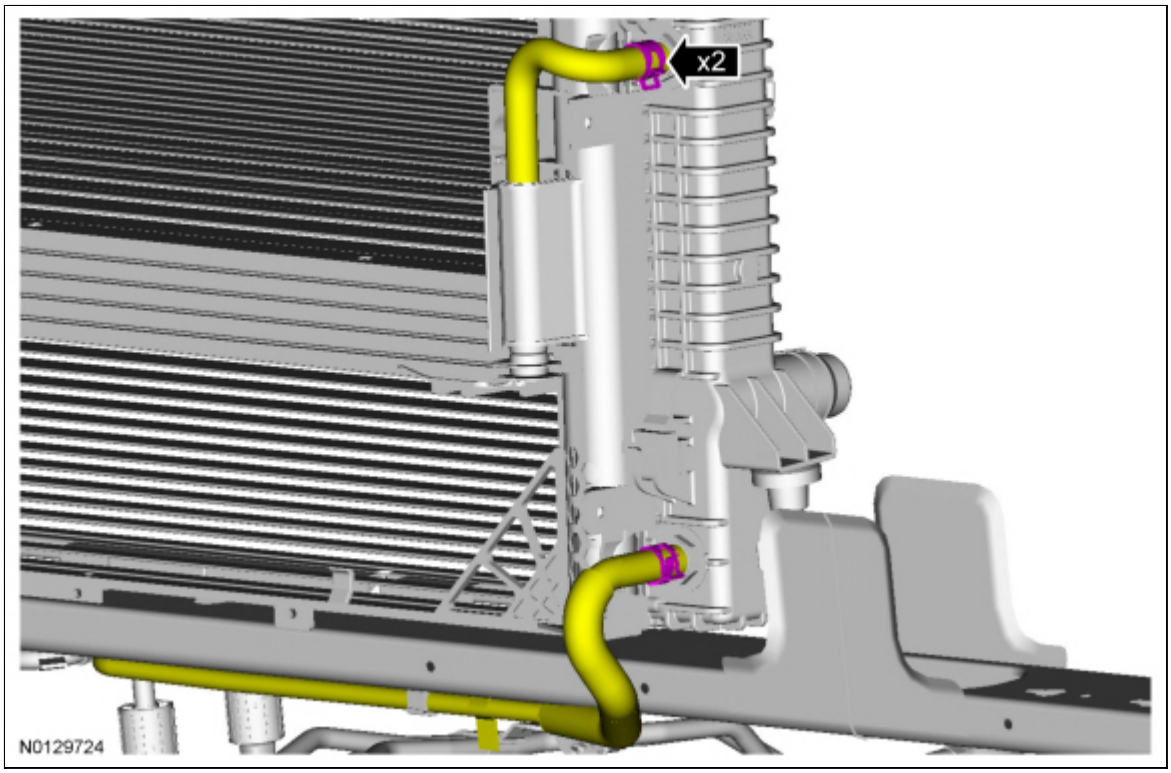
All engines

16. Remove the bolt and the nut and disconnect the A/C condenser fittings.
    - Discard the gasket seals and the O-ring seals.



17. Remove the transmission cooler tube secondary latches.

18. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes.



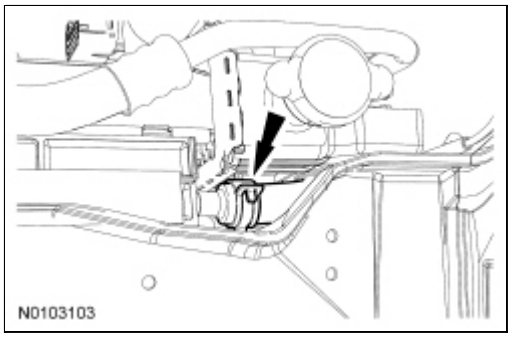
19. Detach the wiring harness retainer.

20. **NOTE:** Hoses with an auxiliary transmission fluid cooler shown, hoses without an auxiliary transmission fluid cooler similar.

    Disconnect the 2 transmission fluid cooler hoses from the radiator.

repair4less

3.5L GTDI , 3.7L and 5.0L engines



21. If equipped, detach the auxiliary transmission fluid cooler from the A/C condenser and position aside.

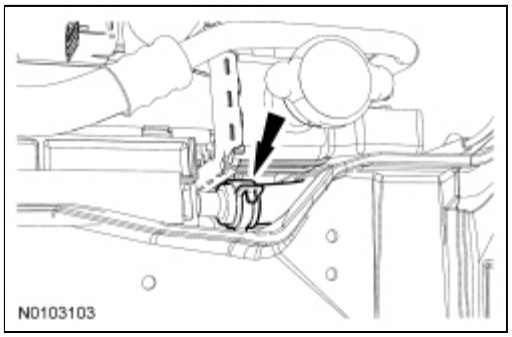
6.2L engine

22. Using a suction device, syphon the power steering fluid from the power steering fluid reservoir.

23. Release the clamp and disconnect the power steering fluid cooler hose from the power steering fluid cooler.

All engines

24. Remove the radiator/condenser core as an assembly.
25. Release the lock tabs and separate the radiator from the condenser core.



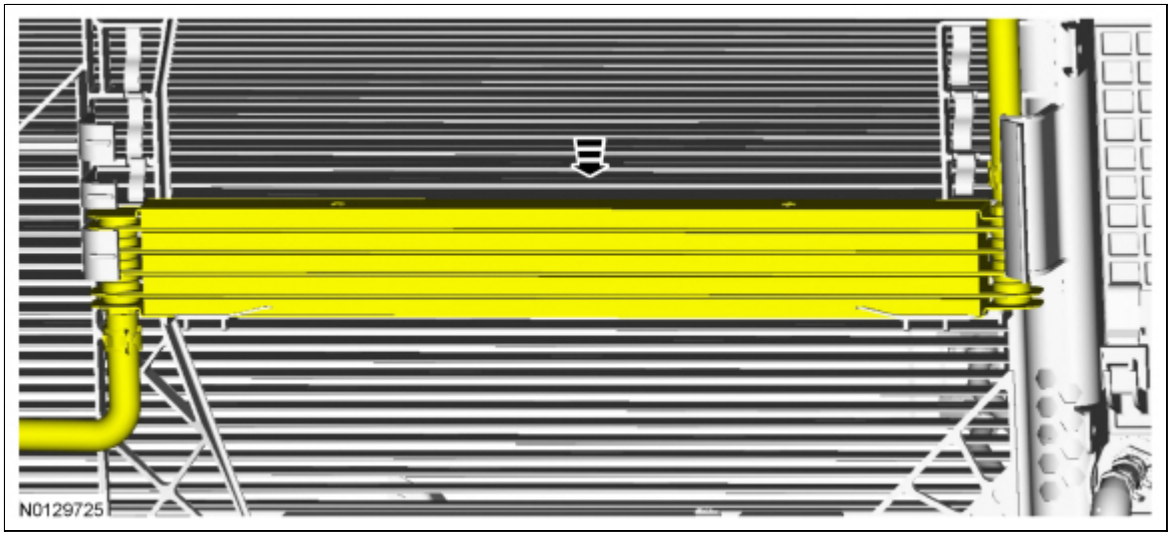
Installation

All engines

1. Position the condenser core into the radiator locking tabs.
2. Position the radiator/condenser core assembly into the vehicle and onto the radiator insulators.

6.2L engine

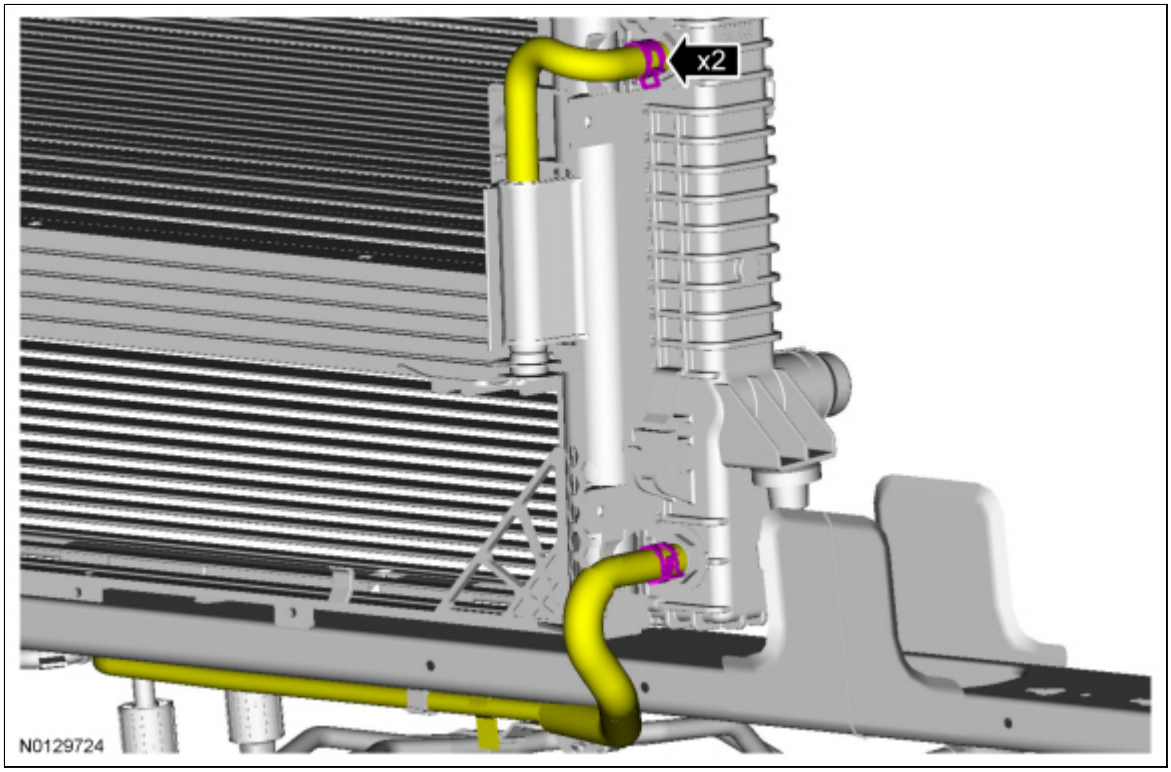
3. Connect the power steering cooler hose to the power steering cooler and position the clamp.



All engines

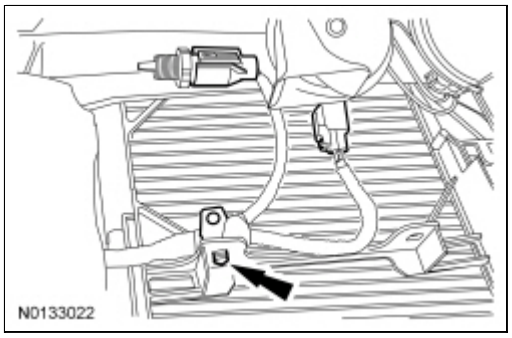
4. Install the 2 radiator bolts.
    - Tighten to 15 Nm (133 lb-in).

3.5L GTDI , 3.7L and 5.0L engines



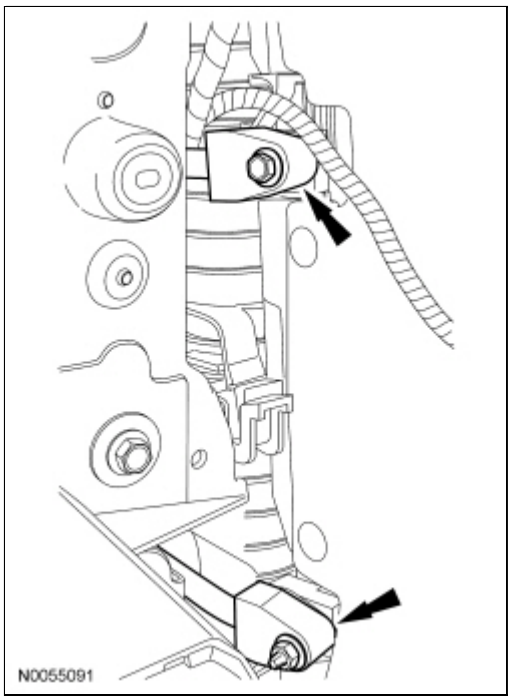
5. If equipped, attach the auxiliary transmission fluid cooler to the A/C condenser.

repair4less



All engines

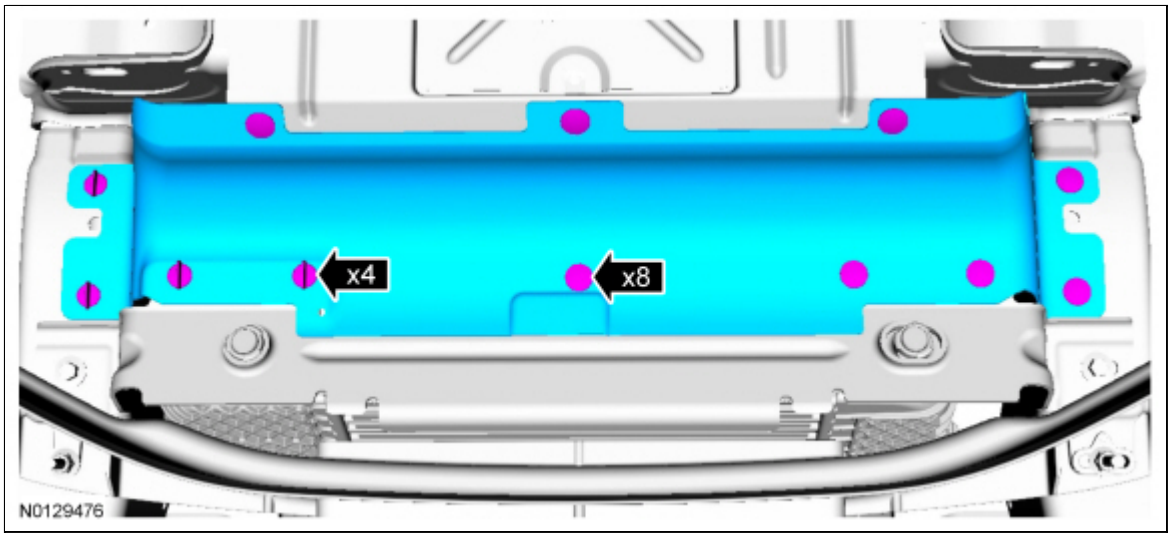
6. Connect the transmission fluid cooler hoses to the radiator.



7. Connect the wiring harness retainer.

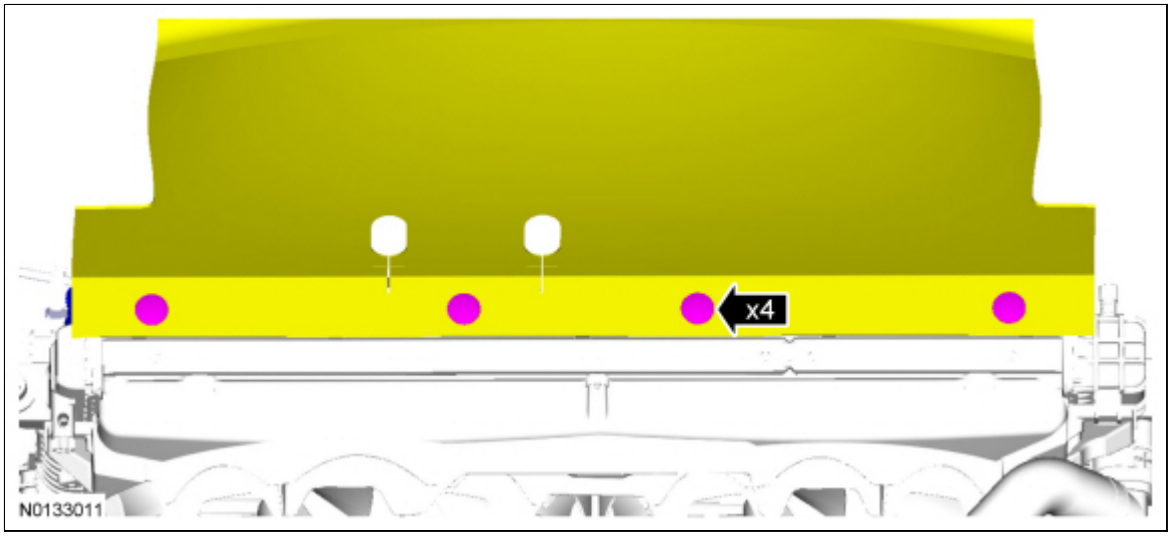
8. Connect the transmission fluid cooler tubes.

9. Install the transmission cooler tube secondary latches.



10. Using new gasket seals and O-ring seals, connect the A/C condenser fittings and install the bolt and nut.
    - Tighten to 15 Nm (133 lb-in).

3.5L GTDI engines

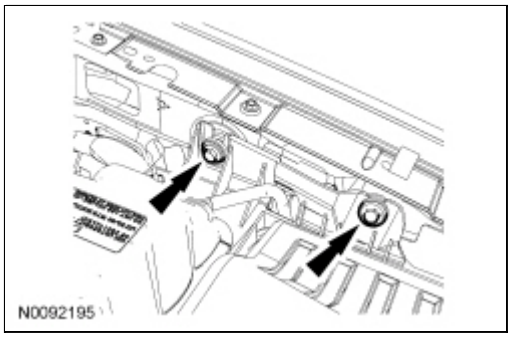


11. Position the lower air deflector, attach the 8 pushpins and turn the 4 quarter-turn retainers.

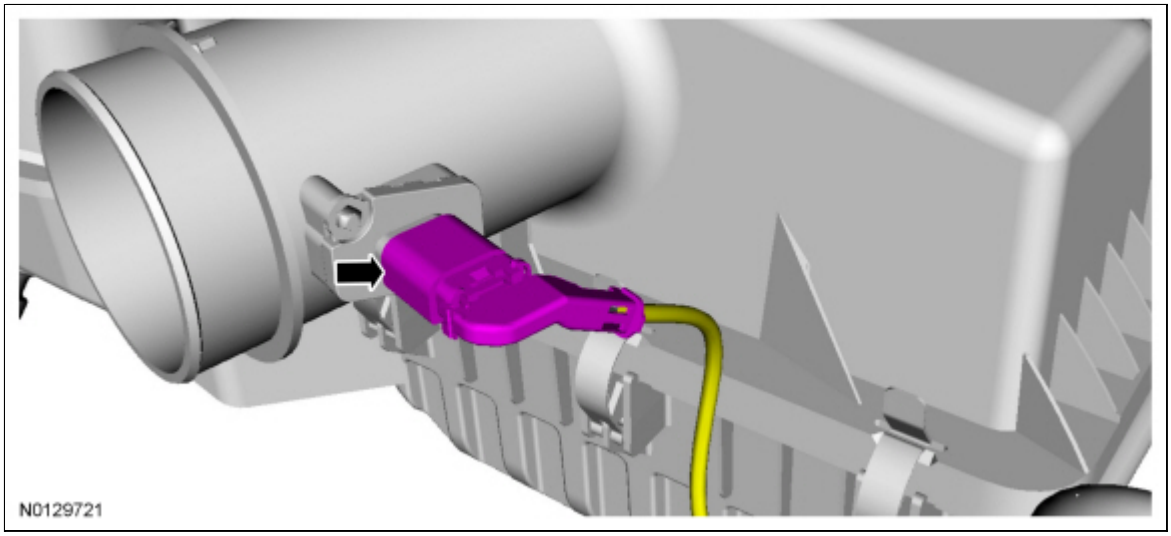
repair4less

3.7L, 5.0L and 6.2L engines

12. Install the 4 lower radiator air deflector-to-condenser pushpins.



All vehicles



13. Connect the 3 RH and 2 LH air deflector-to-condenser pushpin retainers.

3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L engines

14. Install the degas bottle and the 2 bolts.
    - Tighten to 17 Nm (150 lb-in).

15. Connect the MAF sensor electrical connector.

16. Push the spring clip in place and connect the lower radiator hose quick connect coupling to the radiator, making sure the coupling is secure.
17. Connect the radiator-to-degas bottle hose to the radiator and position the clamp.
18. Connect the upper radiator hose to the radiator and position the clamp.

6.2L engines

19. Install lower radiator hose and the spring clip.
20. Connect the radiator overflow hose.
21. Connect the upper radiator hose and position the clamp.

All engines

22. Install the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.

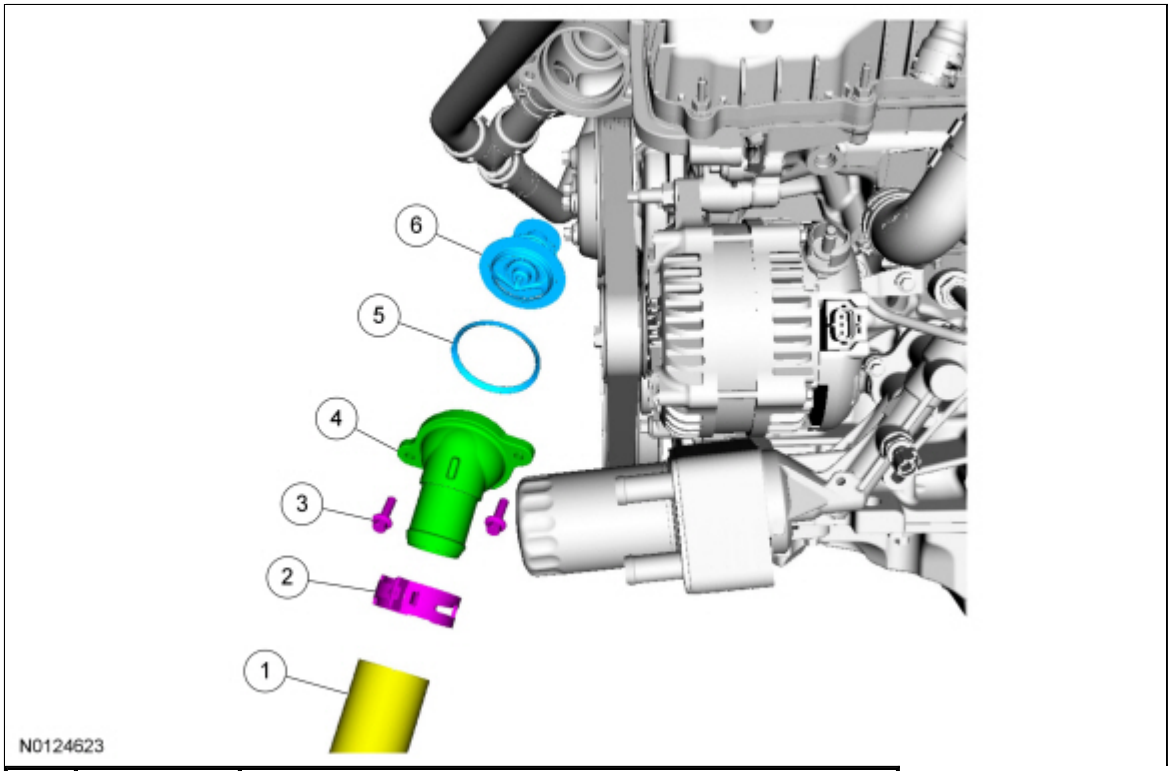
6.2L engine

23. Fill the power steering fluid reservoir with MERCON® V.

repair4less

All engines

24. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



25. Recharge the A/C system. For additional information, refer to Section 412-00 .

26. Check the transmission fluid and fill as necessary. For additional information, refer to Section 307-01 .

Thermostat — 3.5L GTDI

Material

Bleeding in this section.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

3. ***NOTICE:*** **Remove the accessory drive belt to prevent coolant contamination of the belt.**

   Remove the accessory drive belt. For additional information, refer to Section 303-05 .
   - To install, rinse off any coolant from the accessory drive pulleys using clear water.

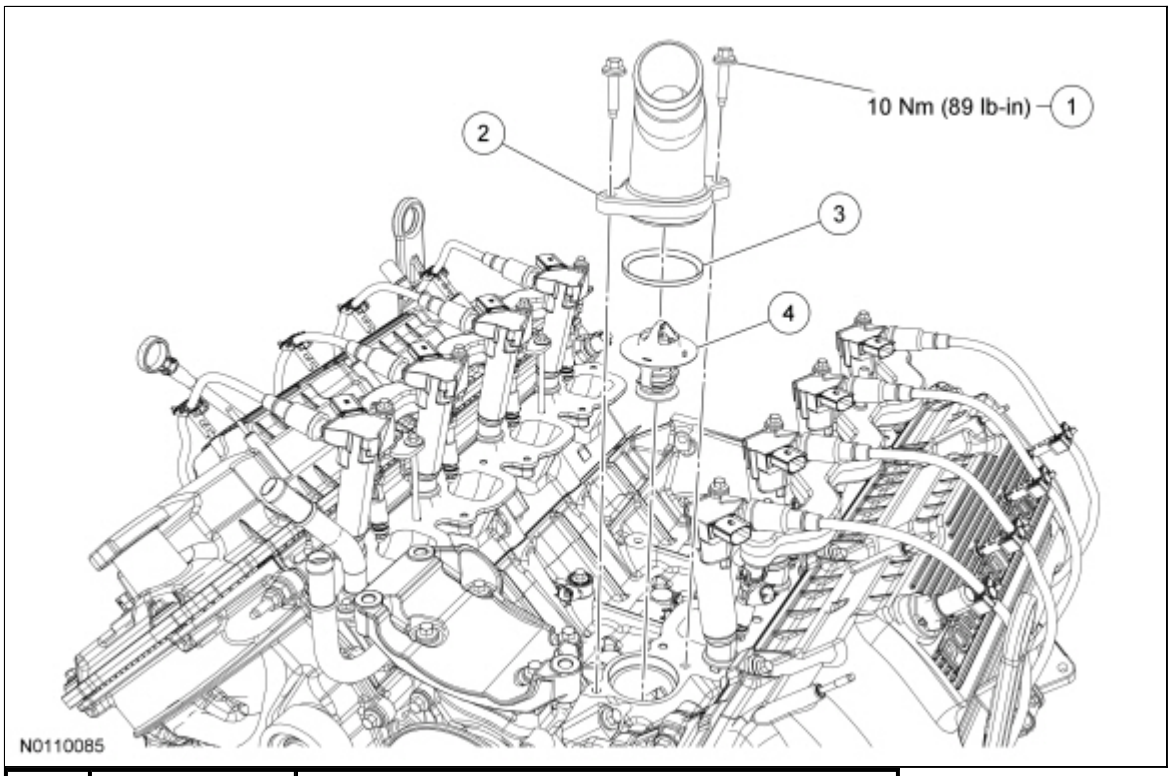
4. ***NOTICE:*** **Cover the A/C compressor drive belt to prevent coolant contamination of the belt.**

   Completely cover the A/C compressor drive belt with waterproof plastic.

5. If installing a new coolant inlet connection, release the clamp and disconnect the lower radiator hose.

6. Remove the bolts and the coolant inlet connection.
   - To install, tighten to 10 Nm (89 lb-in).

7. Remove the thermostat and the O-ring seal.
   - Discard the O-ring seal.



8. To install, reverse the removal procedure.
   - Use a new O-ring seal and lubricate it with clean engine coolant.

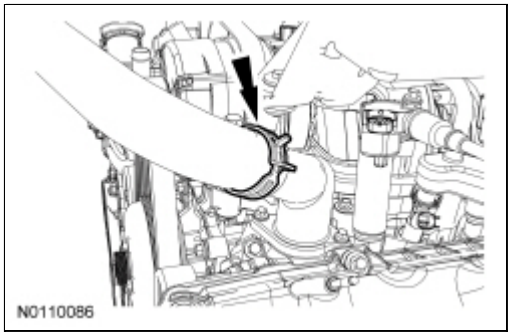
9. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat — 6.2L

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—

Item	Part Number	Description
1	W503278	Coolant outlet connection bolt (2 required)
2	8594	Coolant outlet connection
3	N806807	O-ring seal
4	8575	Thermostat



Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12 .

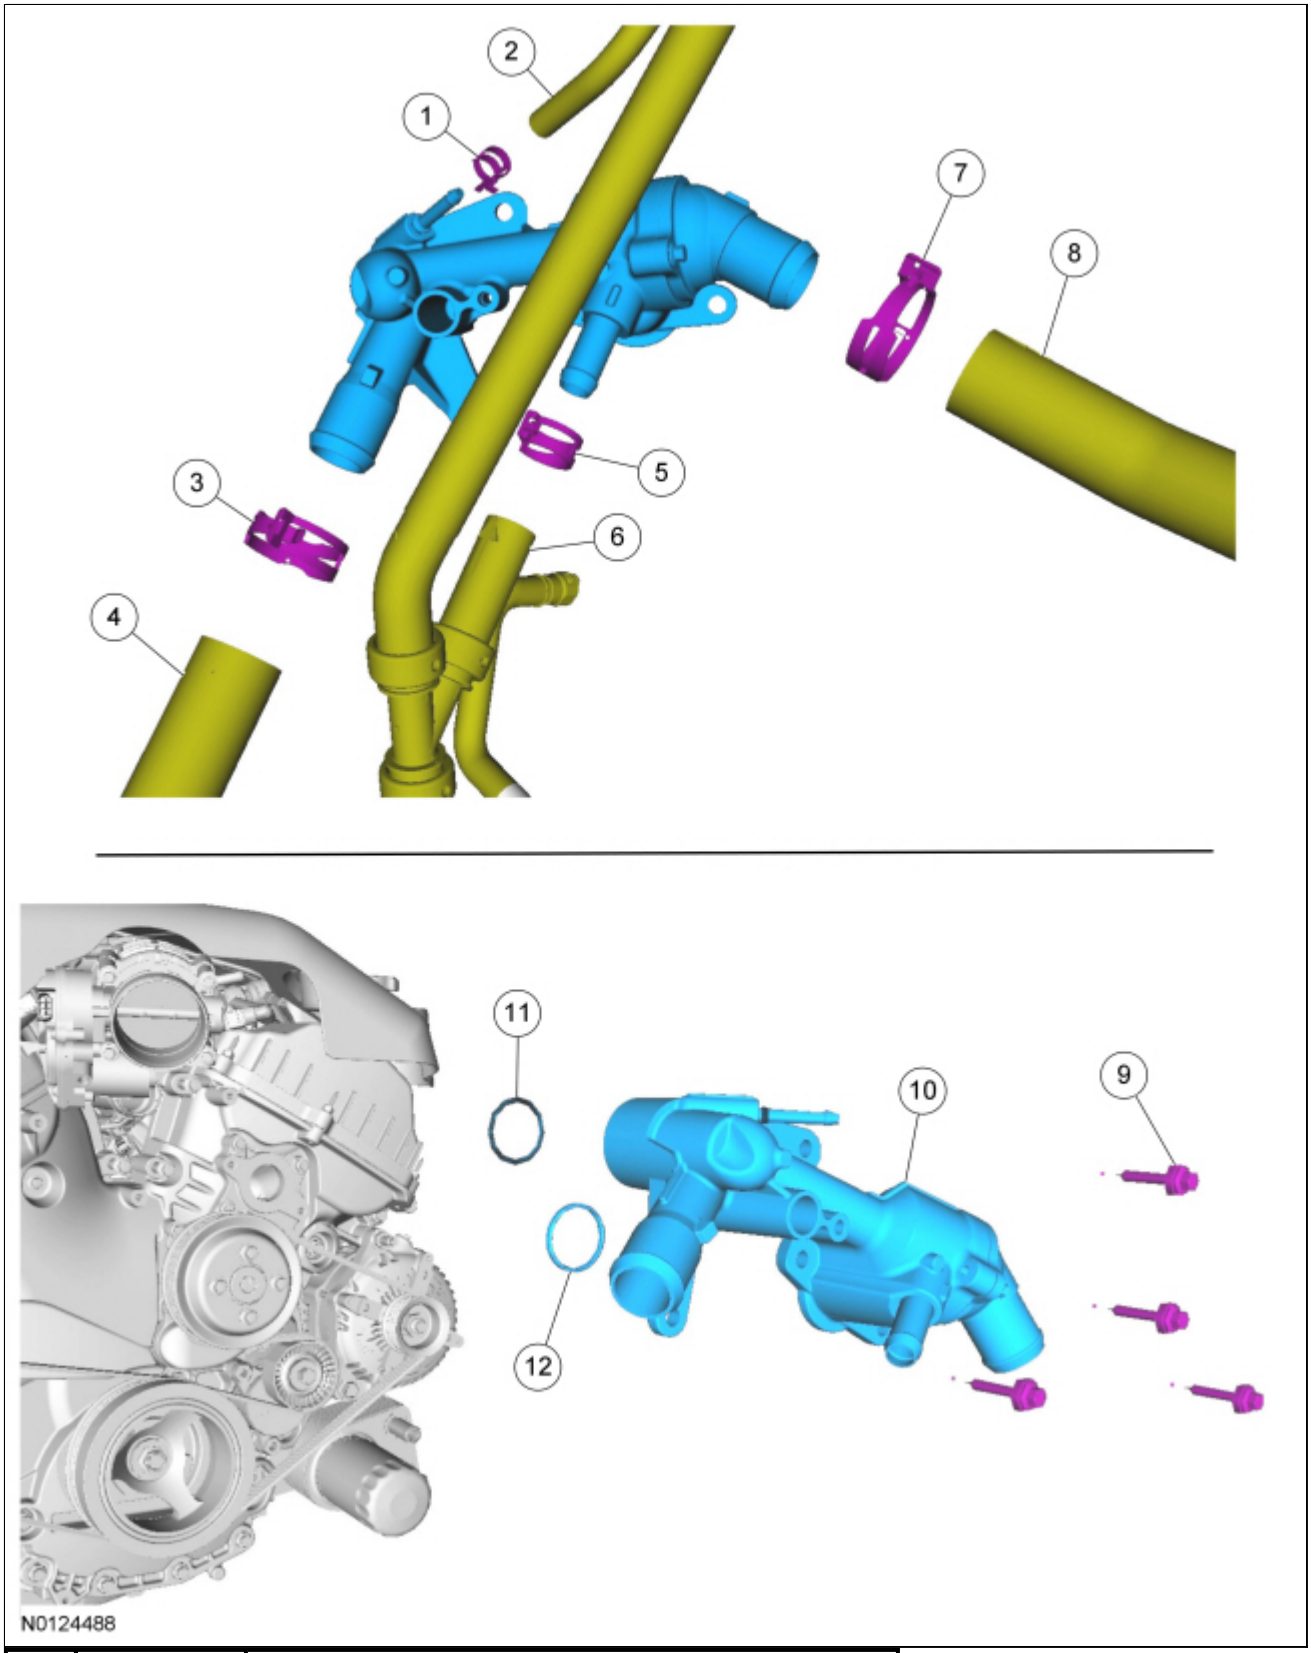
repair4less

3. If a new coolant outlet connection is being installed, release the clamp and disconnect the upper radiator hose.

4. Remove the 2 bolts, the thermostat housing and the thermostat. Discard the O-ring seal.
    - Inspect the mating surfaces. Clean the sealing surfaces with metal surface prep and silicone gasket remover. Follow the directions on the packaging.
    - If necessary, install a new thermostat with the spring facing down.
    - Install a new O-ring seal.
    - **NOTE:** Make sure the thermostat housing is seated evenly by hand tightening the 2 coolant outlet connection bolts prior to final tightening.

      To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.



6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat Housing — 3.5L GTDI

Material

Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

repair4less

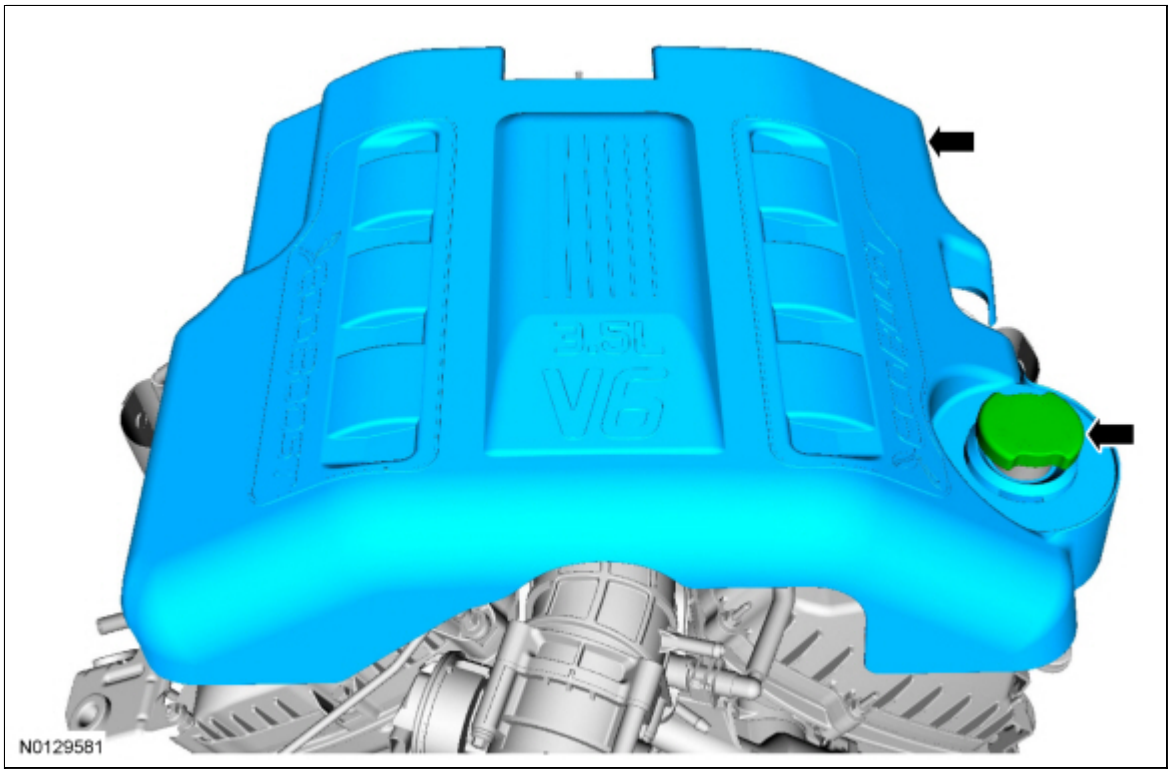
Item	Part Number	Description
1	—	Thermostat housing-to-degas bottle hose clamp (part

		of 8276)
2	8276	Thermostat housing-to-degas bottle hose
3	—	Upper radiator hose clamp (part of 8260)
4	8260	Upper radiator hose
5	—	Heater outlet hose clamp (part of 18472)
6	18472	Heater outlet hose
7	—	Lower radiator hose clamp (part of 8286)
8	8286	Lower radiator hose
9	W714841	Thermostat housing bolts
10	8592	Thermostat housing
11	8527	Coolant inlet tube O-ring seal
12	8590	Thermostat housing inlet gasket (part of 8592)

Removal

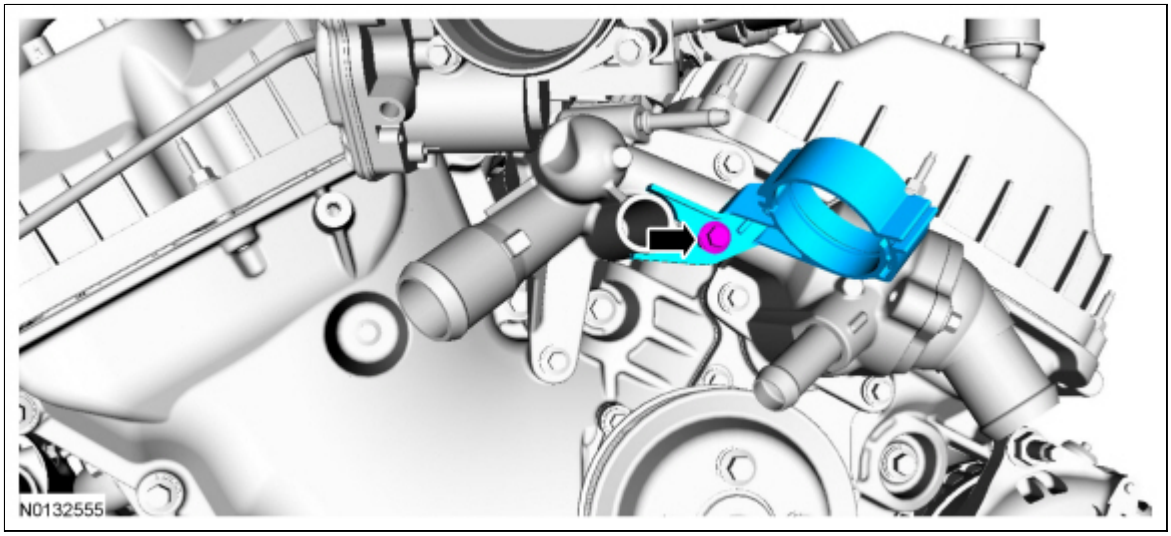
1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the Air Cleaner (ACL) outlet pipe, the ACL outlet pipe-to-LH turbocharger pipe and the LH turbocharger-to-Charge Air Cooler (CAC) pipe. For additional information, refer to Section 303-12 .



3. ***NOTICE:*** **Cover the accessory drive belts to prevent coolant contamination of the belts.**

   Completely cover the accessory drive belts with waterproof plastic.



4. ***NOTICE:*** **Install the oil fill cap to prevent debris from falling into the engine.**

   Remove the oil fill cap and the engine appearance cover.
   - Install the oil fill cap.

repair4less

5. If equipped, disconnect the block heater electrical connector.
6. Remove the bolt and the LH turbocharger-to CAC tube bracket.

7. Release the clamp and disconnect the degas bottle-to-thermostat housing hose from the thermostat housing.
8. Release the clamp and disconnect the lower radiator hose from the thermostat housing.
9. Release the clamp and disconnect the heater outlet hose from the thermostat housing.
10. Release the clamp and disconnect the upper radiator hose from the thermostat housing.

11. Remove the 4 thermostat housing bolts.

12. ***NOTICE:*** **Do not allow the coolant inlet pipe to come out of the coolant crossover manifold assembly or the coolant inlet pipe O-ring seal may be damaged.**

    NOTE: Use the ear on the top of the coolant inlet pipe to prevent the coolant pipe from coming out of the coolant crossover manifold assembly.

    Remove the thermostat housing.

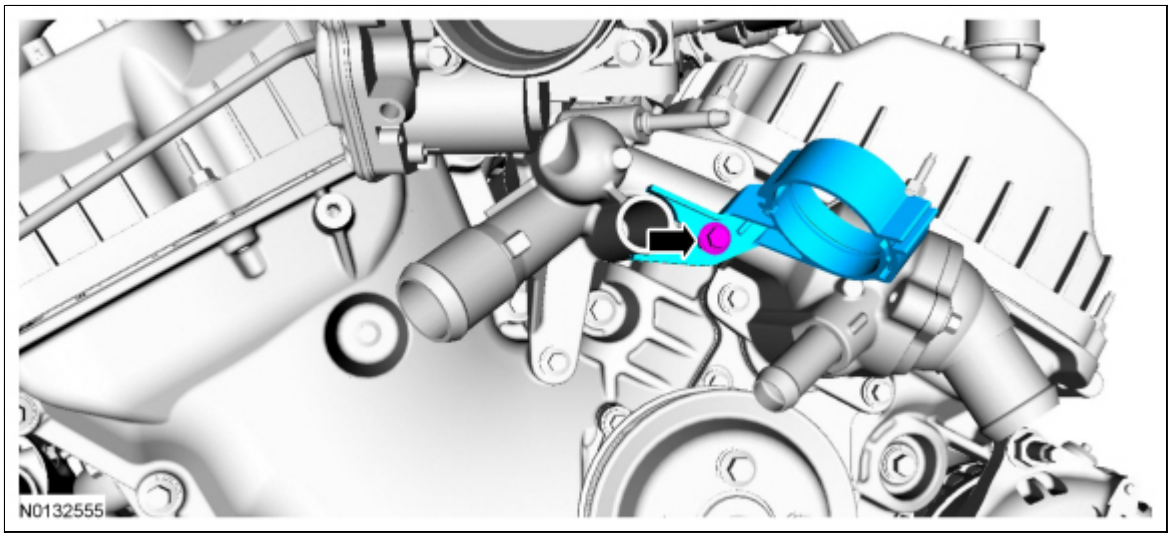
13. Remove and discard the gasket and the O-ring seal.

Installation

1. Install a new gasket and a new O-ring seal.
    - Lubricate the O-ring seal with clean engine coolant.

2. Position the thermostat housing, install the 4 bolts and tighten the 4 bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in)
    - Stage 2: Tighten an additional 45 degrees.

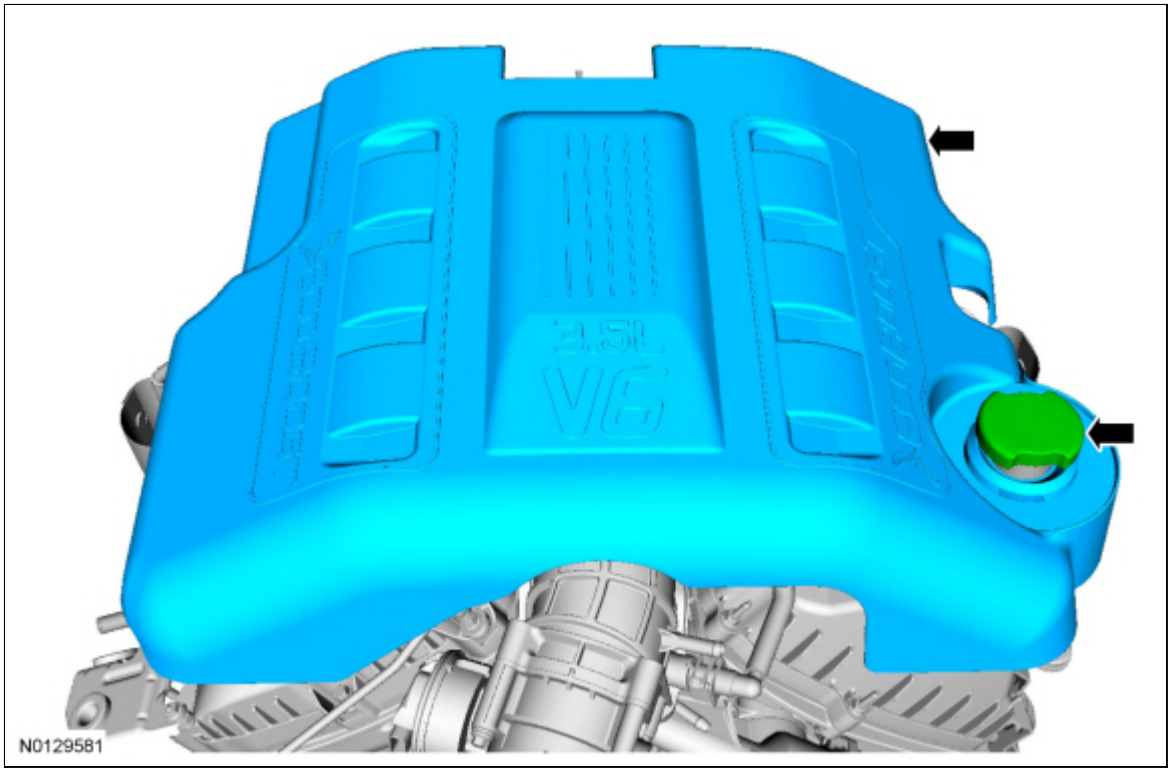
3. Connect the upper radiator hose to the thermostat housing and position the clamp.



4. Connect the heater outlet hose to the thermostat housing and position the clamp.

5. Connect the lower radiator hose to the thermostat housing and position the clamp.

6. Connect the degas bottle-to-thermostat housing hose to the thermostat housing and position the clamp.

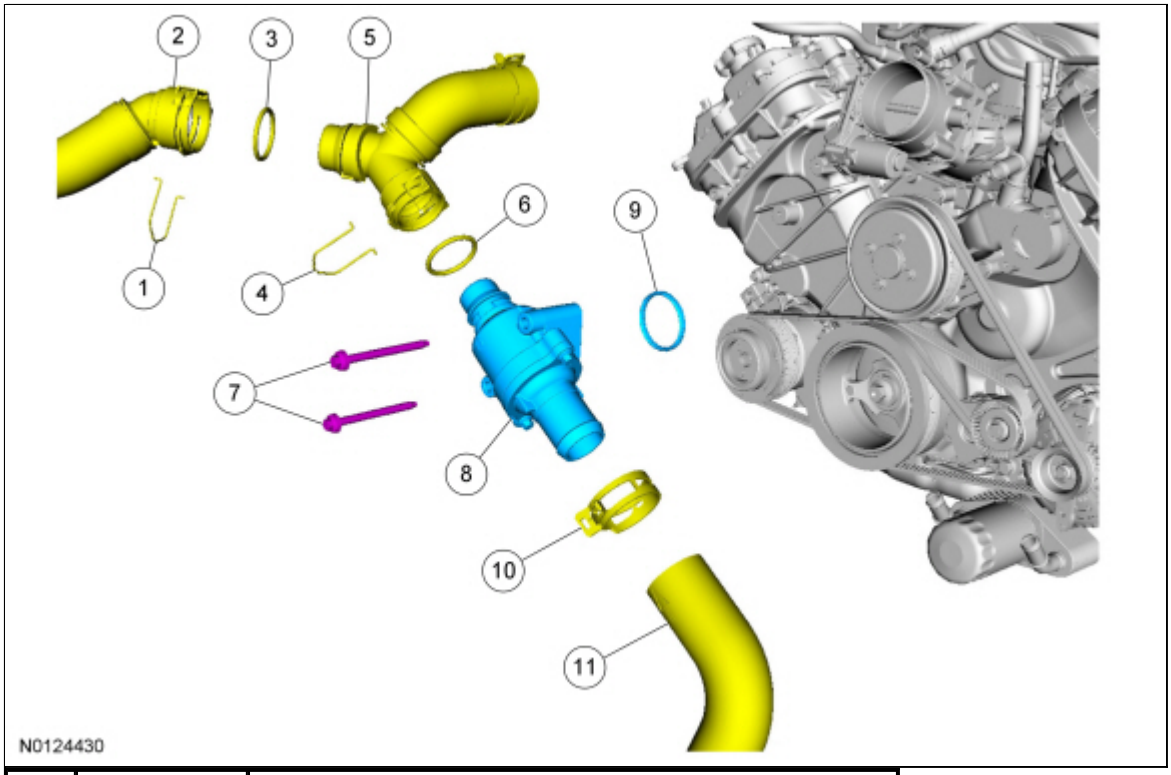


7. Install the LH turbocharger-to- CAC tube bracket and the bolt.
    - Tighten to 6 Nm (53 lb-in).

repair4less

8. If equipped, connect the block heater electrical connection.

9. Remove the oil fill cap and install the engine appearance cover.
   - Install the oil fill cap.



10. Remove the waterproof plastic from the accessory drive belts.

11. Install the LH turbocharger-to-Charge Air Cooler (CAC) pipe, the ACL outlet pipe-to-LH turbocharger pipe and the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

12. Fill and bleed the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

repair4less

Thermostat Housing — 5.0L

Item	Part Number	Description
1	8B365	Upper radiator hose spring clip (part of 8260)
2	8260	Upper radiator hose
3	8590	Upper radiator hose O-ring seal (part of 8260)
4	8B365	Upper radiator hose T-connector spring clip (part of 8566)
5	8590	Upper radiator hose T-connector O-ring seal (part of 8566)
6	8566	Upper radiator hose T-connector
7	W713197	Thermostat housing bolts - 10 Nm (89 lb-in) (2 required)
8	8592	Thermostat housing
9	8590	Thermostat housing gasket (part of 8592)
10	—	Lower radiator hose clamp (part of 8286)
11	8286	Lower radiator hose

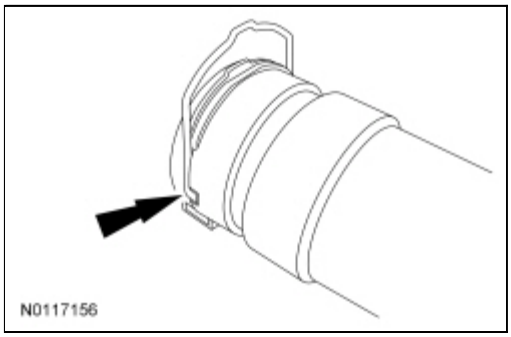
Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and

Bleeding in this section.

2. ***NOTICE:*** **Remove the accessory drive belt to prevent coolant contamination of the belt.**

   Remove the accessory drive belt. For additional information, refer to Section 303-05 .
   - To install, rinse off any coolant from the accessory drive pulleys using clear water.



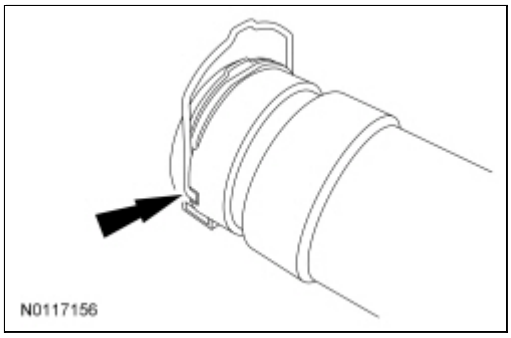
3. ***NOTICE:*** **Cover the A/C compressor drive belt to prevent coolant contamination of the belt.**

   Completely cover the A/C compressor belt with waterproof plastic.

4. Release the clamp and disconnect the lower radiator hose from the coolant inlet connection.

5. **NOTE:** The quick connect coupling illustrated is to show the spring clip release location only. The quick connect coupling on the hose may differ.

   Pull the upper radiator hose spring clip up until the end of the clip is in the detent on the quick connect coupling and disconnect the upper radiator hose from the upper radiator hose T-connector.
   - To install, push the spring clip in place and connect the upper radiator hose quick connect coupling, making sure the coupling is secure.



6. Remove the thermostat housing bolts.
   - To install, tighten to 10 Nm (89 lb-in).

7. **NOTE:** The quick connect coupling illustrated is to show the spring clip release location only. The quick connect coupling on the hose may differ.

   Pull the upper radiator hose T-connector spring clip up until the end of the clip is in the detent on the quick connect coupling and remove the thermostat housing from the upper radiator hose T-connector.
   - Remove and discard the thermostat housing gasket.
   - To install, align the tab on the thermostat housing with the slot in the upper radiator hose T-connector.
   - To install, push the spring clip in place and connect the thermostat housing to the upper radiator hose T-connector quick connect coupling, making sure the coupling is secure.

repair4less

8. To install, reverse the removal procedure.
    - Use a new thermostat housing gasket.

9. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Fuel Charging and Controls

3.5L Gasoline Turbocharged Direct Injection (GTDI)

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

The fuel charging and controls system consists of the:

- fuel injectors.
- fuel injection pump.
- Fuel Pump Control Module (FPCM).
- fuel rails.
- Throttle Body (TB).

The fuel charging and controls system is:

- a Gasoline Turbocharged Direct Injection (GTDI) system.
- Pulse Width Modulated (PWM).

Fuel is metered directly into the combustion chamber. Fuel injectors pulse to follow engine firing order, in accordance with engine demand.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Fuel Injectors

NOTICE: **Handle the fuel injectors and fuel rail with extreme care to prevent damage to the fuel inlet of the fuel rail, fuel injector sealing areas, and sensitive fuel-metering orifices.**

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel directly into the combustion chamber.
- are deposit resistant.

Fuel Injection Pump

repair4less

The fuel injection pump is a single piston and a delivery-on-demand design. The pump is driven from an eccentric on the LH intake camshaft. It can raise fuel pressure from 448 kPa (65 psi) to anywhere between 1,516 and 14,823 kPa (220 and 2,150 psi). The fuel is then supplied to the fuel injectors for distribution into the cylinders.

Fuel Pump Control Module (FPCM)

The FPCM is electronically operated by the PCM and controls the voltage to the FP depending on engine load.

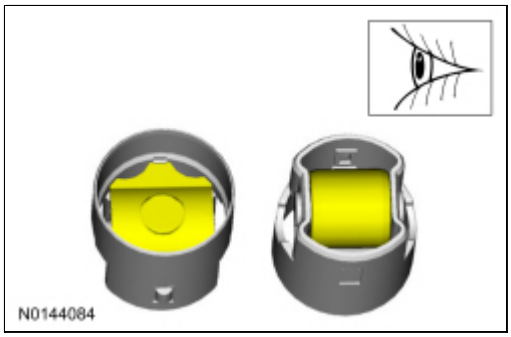
Fuel Rails

NOTICE: **Handle the fuel injectors and fuel rail with extreme care to prevent damage to the fuel inlet of the fuel rail, fuel injector sealing areas, and sensitive fuel-metering orifices.**

The fuel rails:

- receive and store high pressure fuel from the fuel injection pump.
- deliver fuel to the fuel injectors.

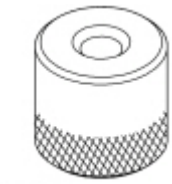
Throttle Body (TB)



The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

repair4less



Fuel Injection Pump Roller Tappet Inspection

1. Inspect the fuel injection pump tappet for flat spots or scoring. If any damage is found, inspect the fuel injection pump and the fuel injection pump tappet drive lobe. Install new components as necessary.

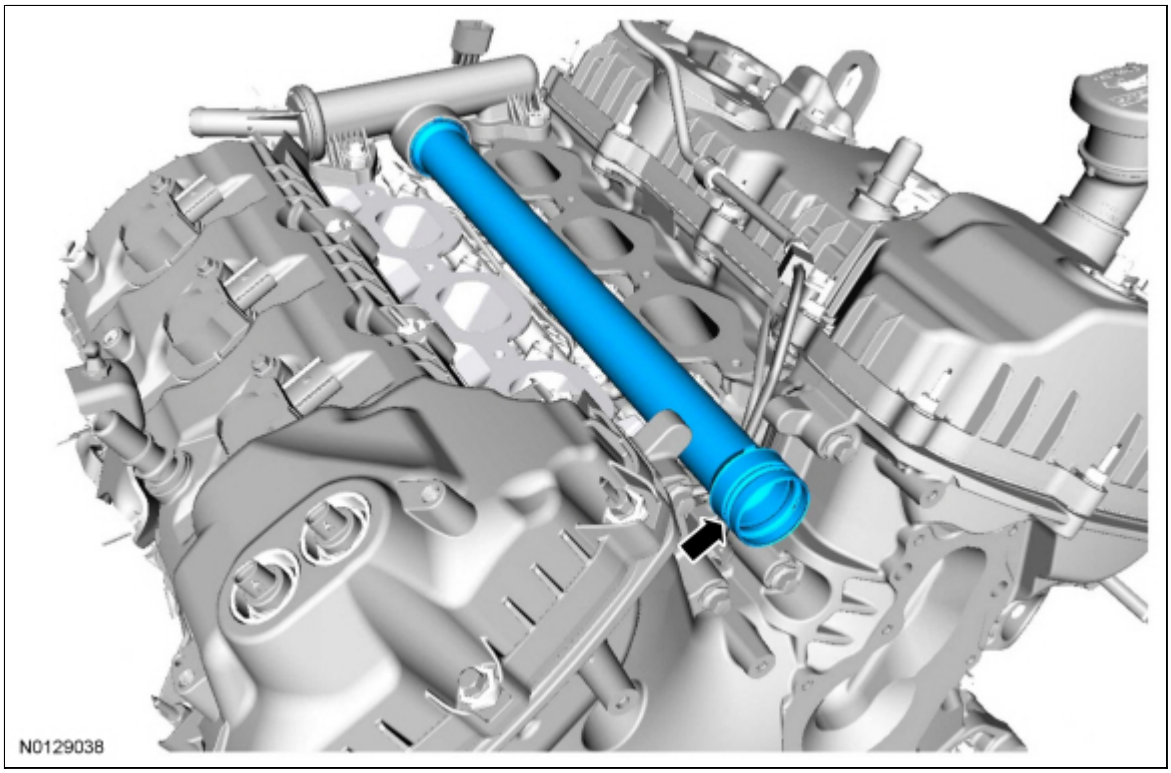
Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

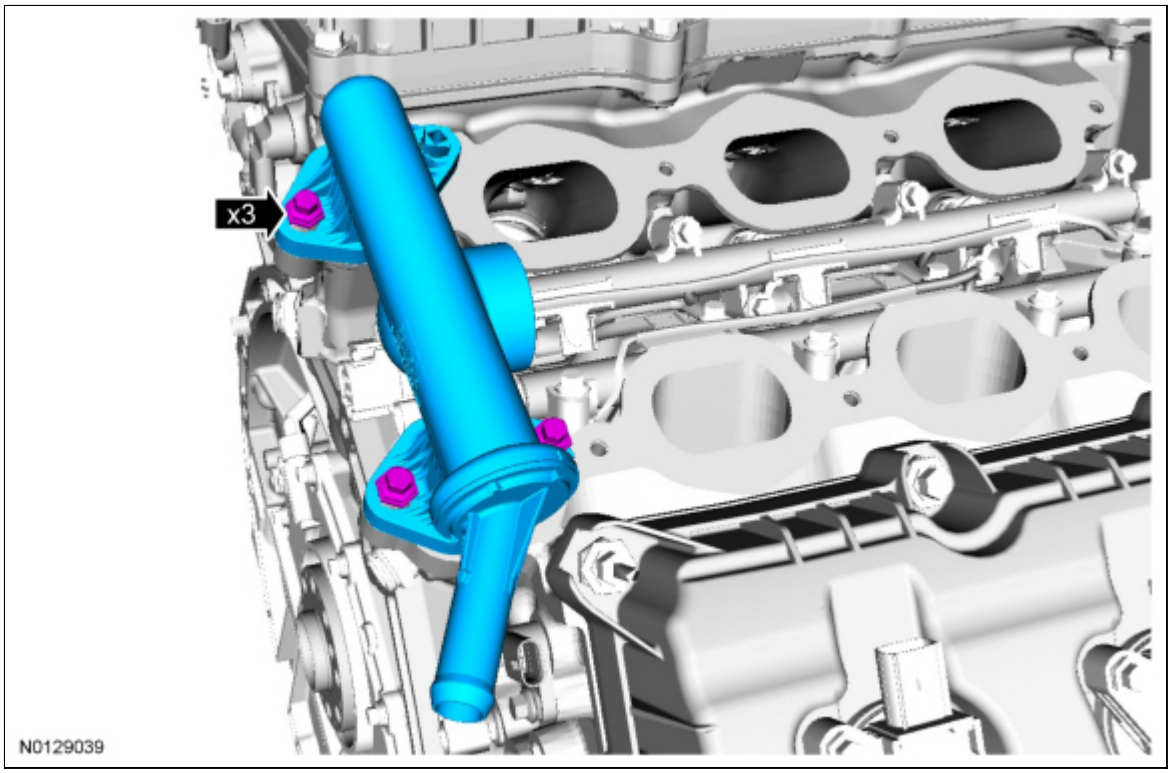
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

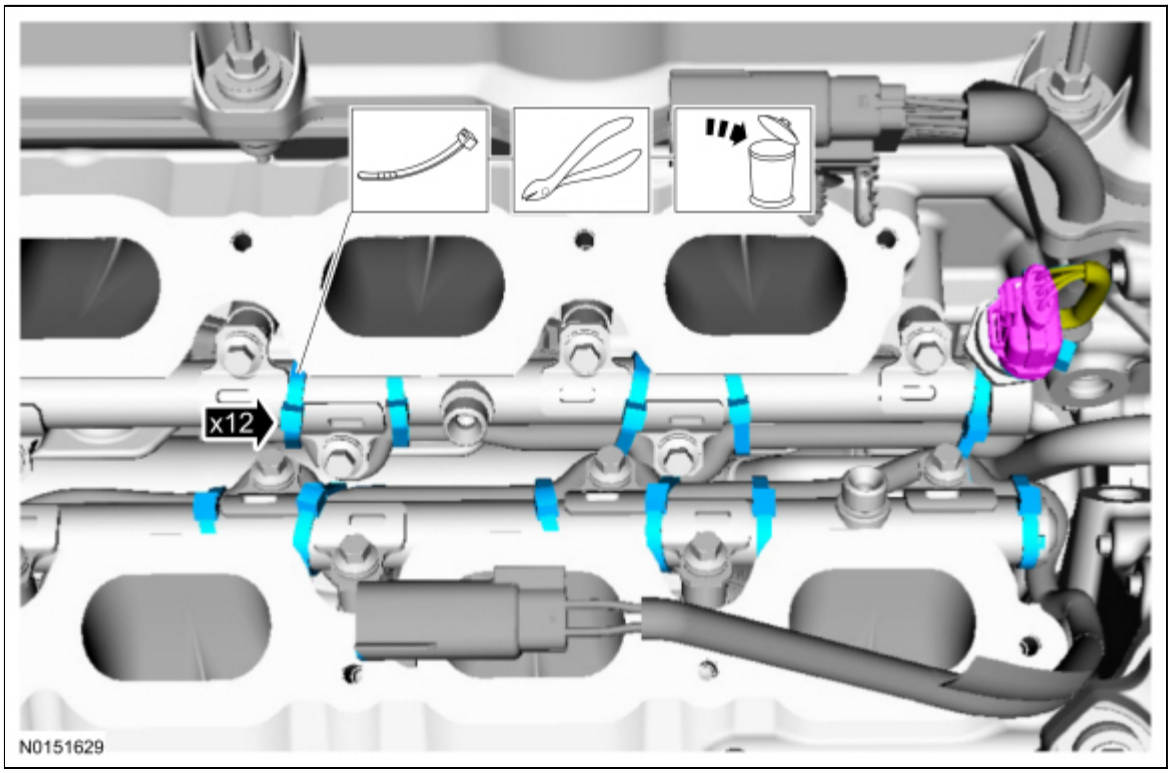


WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Remove the intake manifold. For additional information, refer to Section 303-01A .
3. Remove the thermostat housing. For additional information, refer to Section 303-03 .
4. Remove the coolant inlet pipe.
   - Remove and discard the coolant inlet pipe O-ring seals.

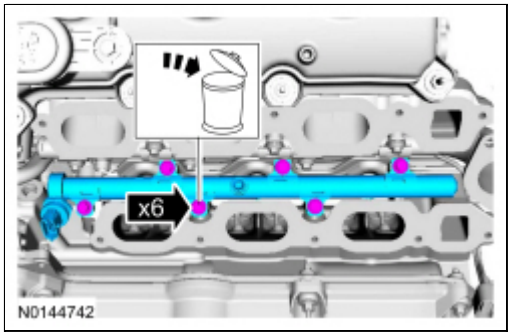
5. Remove the 3 bolts and position aside the coolant crossover assembly.
    - Remove and discard the 2 gaskets.



6. Remove the high-pressure fuel tube bracket bolt.

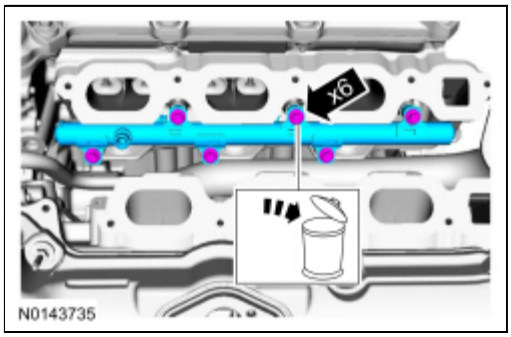
repair4less

7. Loosen the 2 flare nuts, remove and discard the high-pressure fuel tube.



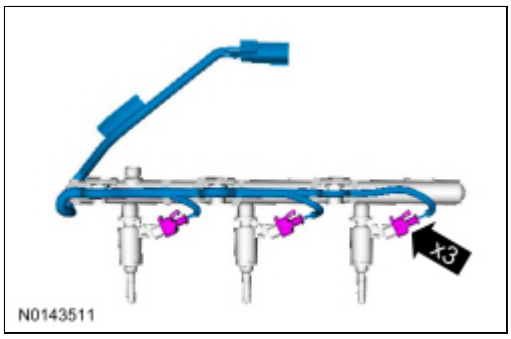
8. ***NOTICE:*** **It is very important to note the routing of the fuel charge wire harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation.**

   NOTE: Use compressed air and remove any dirt or foreign material from the cylinder head, block and general surrounding area of the fuel rail and injectors.

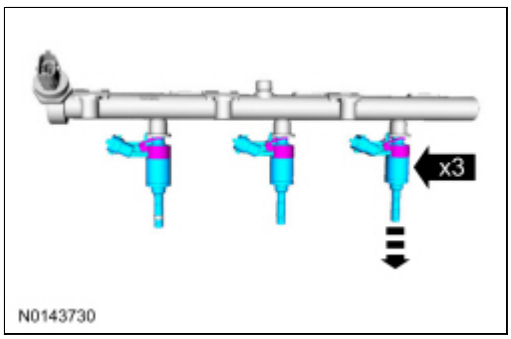


9. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

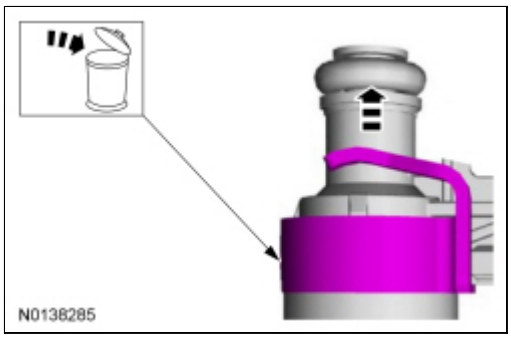
   NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.



10. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

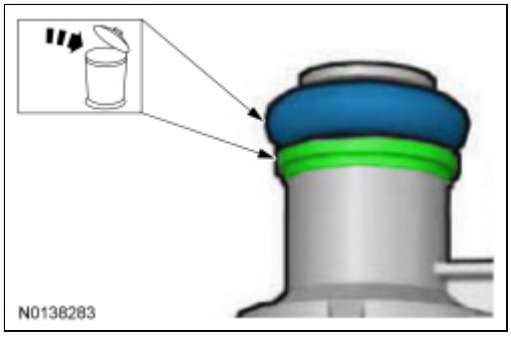


NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.

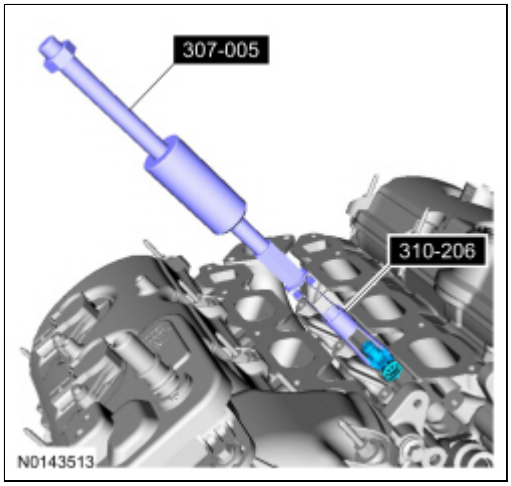


11. **NOTE:** RH shown, LH similar.

12. **NOTE:** LH shown, RH similar.



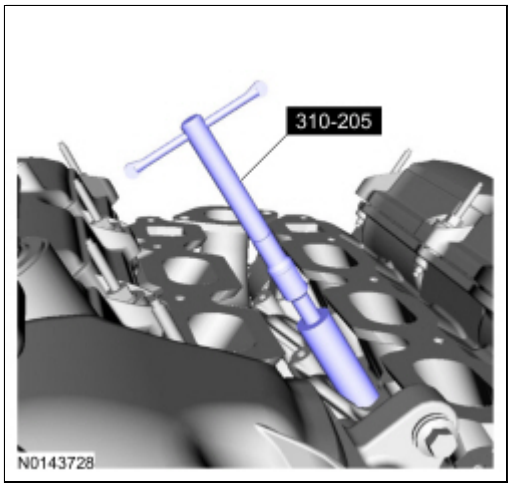
13.



repair4less

14.

15. Using the Slide Hammer and the Fuel Injector Remover, remove any of the fuel injectors that remained in the cylinder head.
    - Special Tool(s): Slide Hammer 307-005 (T59L-100-B) or equivalent.
    - Special Tool(s): Remover, Fuel Injector 310-206.

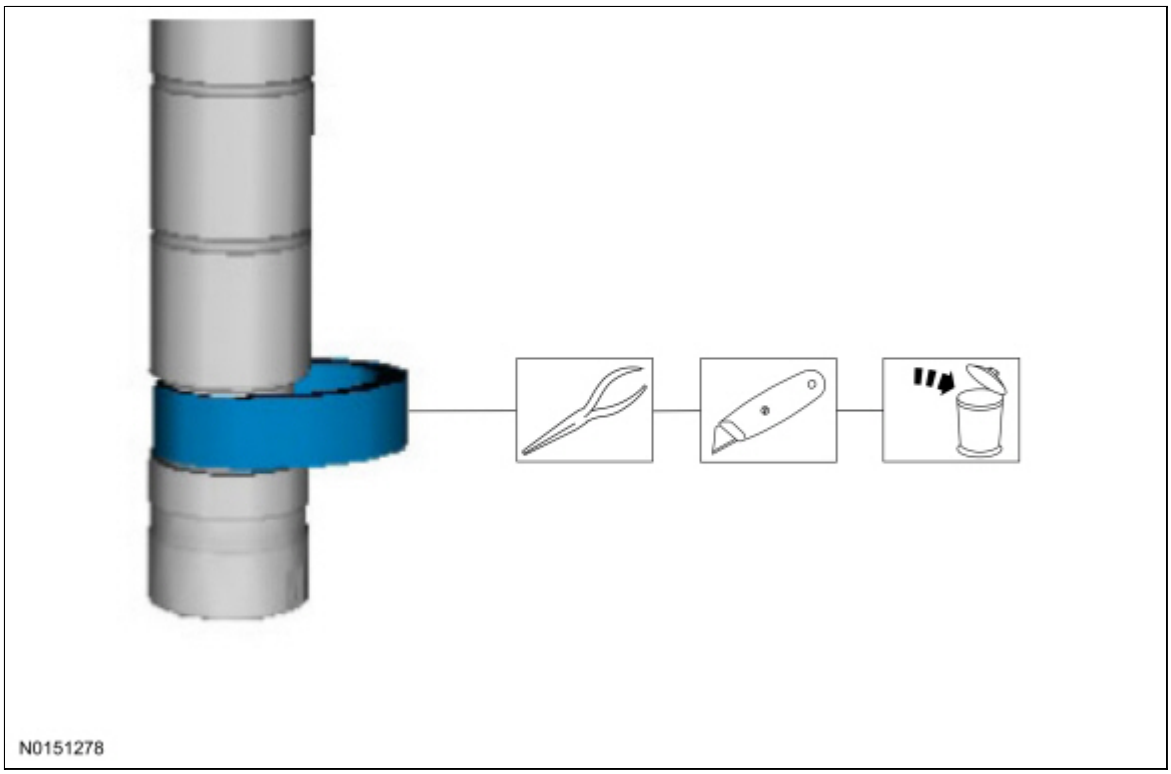


16. **NOTE:** Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and the general surrounding area of the fuel rails and injectors.

    NOTE: Do not use compressed air to clean the tip of the fuel injector.

    NOTE: Do not use a brush to clean the tip of the fuel injector.

    Using the Fuel Injector Brush, clean the fuel injector bore in the cylinder head. Special Tool(s): 310-205.



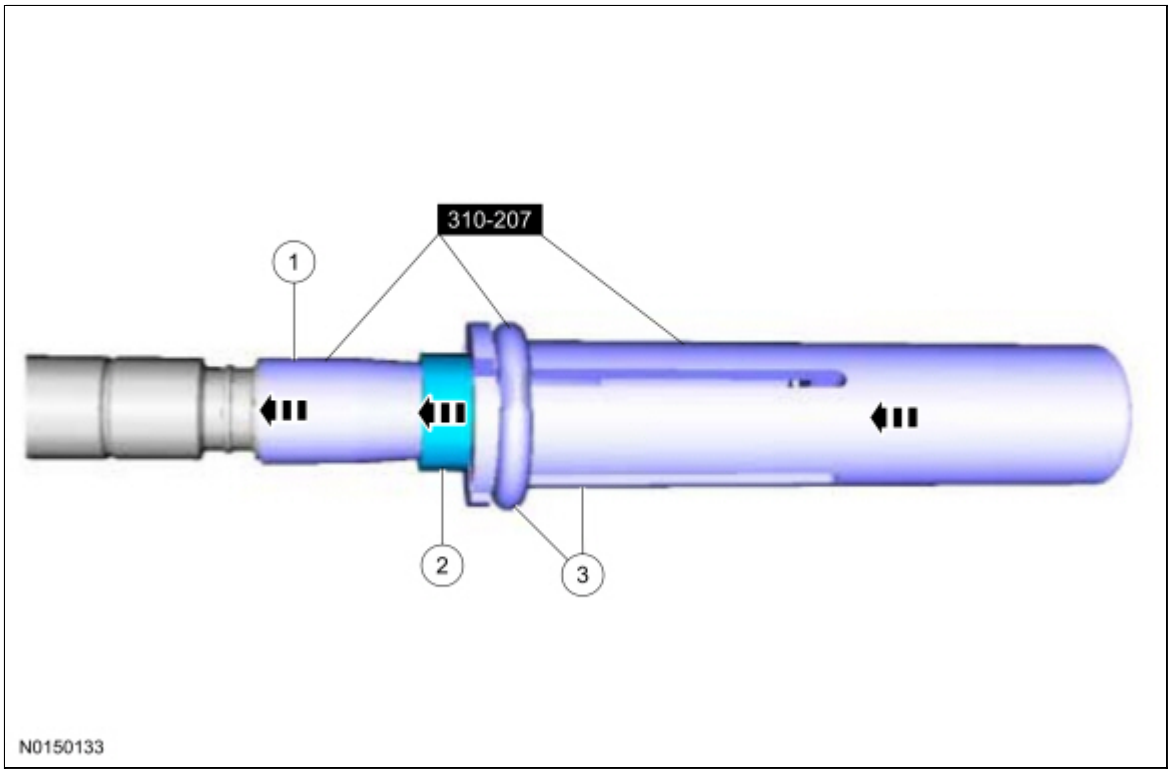
Installation

NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. ***NOTICE:*** **Do not attempt to cut the lower Teflon® seal without first pulling it away from the fuel injector or damage to the injector may occur.**

   NOTICE: **Use care when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.**

   1. Pull the lower Teflon® seal away from the injector.
   2. Carefully cut and discard the lower fuel injector Teflon® seals.



2. **NOTE:** Do not lubricate the new lower Teflon® fuel injector seals.

repair4less

1. Special Tool(s): 310-207.
2. ***NOTICE:*** **Once the Teflon® seal is installed on the Teflon® Seal Guide 310-207 (part of the Fuel Injector Seal Installer), it should immediately be installed onto the fuel injector to avoid excessive expansion of the Teflon® seal.**

   NOTE: Make sure that new lower fuel injector Teflon® seals are installed.

   Special Tool(s): 310-207.
3. Using the Pusher Tool 310-207 (part of the Fuel Injector Seal Installer), slide the Teflon® seals off of the Teflon® Seal Guide and into the groove on the fuel injectors. Special Tool(s): 310-207.

3. ***NOTICE:*** **Install the fuel injectors into the cylinder head within 15 minutes of sizing the seals due to Teflon® seal expansion.**

   1. **NOTE:** Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the Teflon® seal.

      Some Teflon® seal massaging with your fingers before the Teflon® seal sizer tool is installed will aid in installing the Teflon® seal sizer tool.
   2. Position the Teflon® seal sizer tool 303-1567 with the larger opening towards the Teflon® seal. Push while turning the Teflon® seal sizer tool 180 degrees. Special Tool(s): 303-1567.
   3. Once the Teflon® seal sizer tool 303-1567 is installed, check and make sure the Teflon® seal is in the sizing portion of the Teflon® seal sizer tool. After one minute, turn the Teflon® seal sizer tool back 180 degrees and remove.

4. ***NOTICE:*** **Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Make sure that new upper fuel injector O-ring seals, upper fuel injector O-ring seal support rings and fuel injector retainer clips are installed.

   Material: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada); or equivalent.

5. **NOTE:** LH shown, RH similar.

   NOTE: The anti-rotation finger of the fuel injector clip must slip into the groove of the fuel rail cup.

repair4less

6. ***NOTICE:*** **It is very important to note the routing of the fuel charge wiring harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation. The illustration details the correct fuel charge wire harness routing and tie strap positioning for installation.**

   Install the fuel charge wire harnesses and tie straps to the index-marked locations on the fuel rails. Start by attaching the first tie strap farthest down the wire harness and continue to the connector end of the harness, leaving ample slack between the fuel injectors.

7. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

Tighten the 6 fuel rail bolts in the following 3 stages.

- Stage 1: Push down on the fuel rail face above the injectors.
- Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
- Stage 2: Tighten an additional 45 degrees in the sequence shown.

8. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

   Tighten the 6 fuel rail bolts in the following 3 stages.

   - Stage 1: Push down on the fuel rail face above the injectors.
   - Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
   - Stage 2: Tighten an additional 45 degrees in the sequence shown.

9. **NOTE:** Apply clean engine oil to the threads of the 3 high-pressure fuel tube flare nuts.

   Position the new high-pressure fuel tube and hand start the flare nuts in 3 stages.

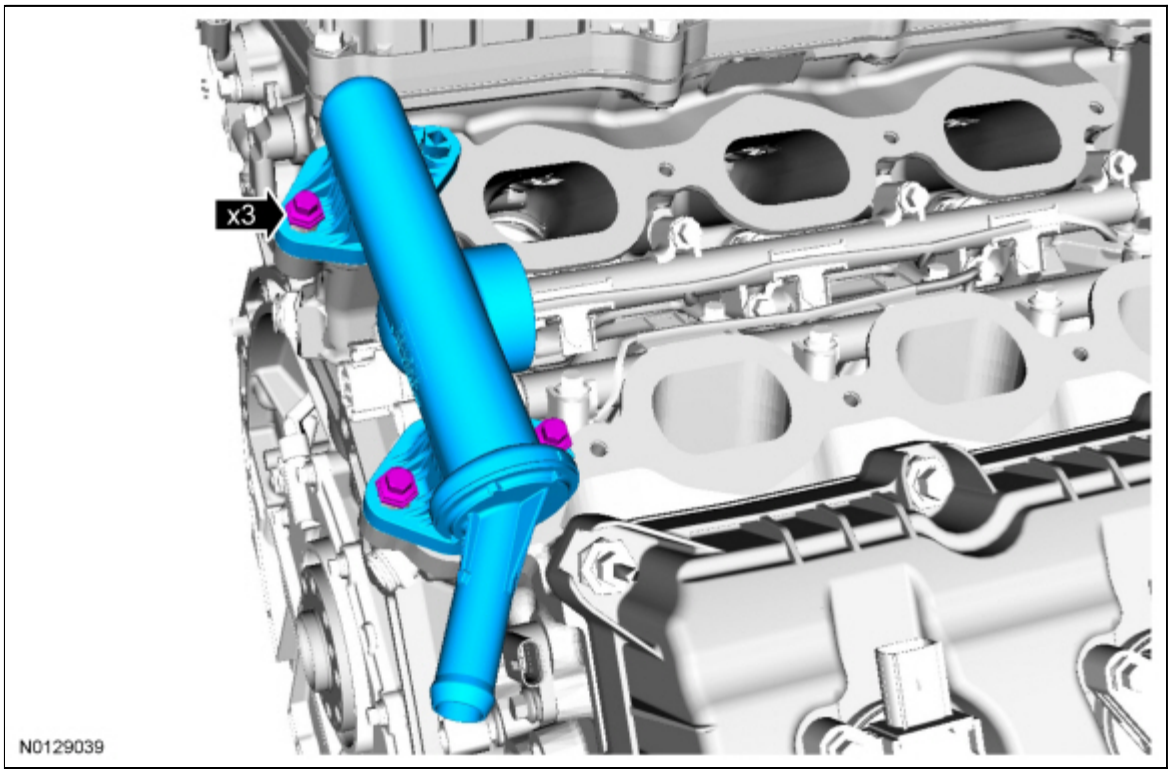
   - Stage 1: Hand tighten the high-pressure fuel tube-to-RH fuel rail flare nut.
   - Stage 2: Hand tighten the high-pressure fuel tube-to-LH fuel rail flare nut.
   - Stage 3: Hand tighten the high-pressure fuel tube-to-fuel injection pump flare nut.

10. Loosely install the new high-pressure fuel tube bracket nut and bolt.

11. Tighten the 3 high-pressure fuel tube flare nuts in 9 stages:

repair4less

- Stage 1: Tighten the high-pressure fuel tube-to-RH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 2: Tighten an additional 30 degrees.
- Stage 3: Tighten to 32 Nm (24 lb-ft).
- Stage 4: Tighten the high-pressure fuel tube-to-LH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 5: Tighten an additional 30 degrees.
- Stage 6: Tighten to 32 Nm (24 lb-ft).
- Stage 7: Tighten the high-pressure fuel tube-to-fuel injection pump flare nut to 15 Nm (133 lb-in).
- Stage 8: Tighten an additional 30 degrees.
- Stage 9: Tighten to 32 Nm (24 lb-ft).



12. Tighten the high-pressure fuel tube bracket bolt in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

13. Tighten the high-pressure fuel tube bracket nut.
    - Tighten to 8 Nm (71 lb-in).

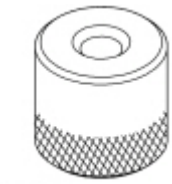
14. **NOTE:** Use care when installing the fuel injection pump noise insulator. Spreading the openings will aid in installing the fuel injection pump noise insulator and reduce the risk of damage.

    Install the fuel injection pump noise insulator shield.

15. Using new gaskets, position back the coolant crossover manifold assembly and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

16. **NOTE:** Lubricate the O-ring seals with clean engine coolant.

Using new O-ring seals, install the coolant inlet pipe.



17. Install the thermostat housing. For additional information, refer to Section 303-03 .
18. Install the intake manifold. For additional information, refer to Section 303-01A .

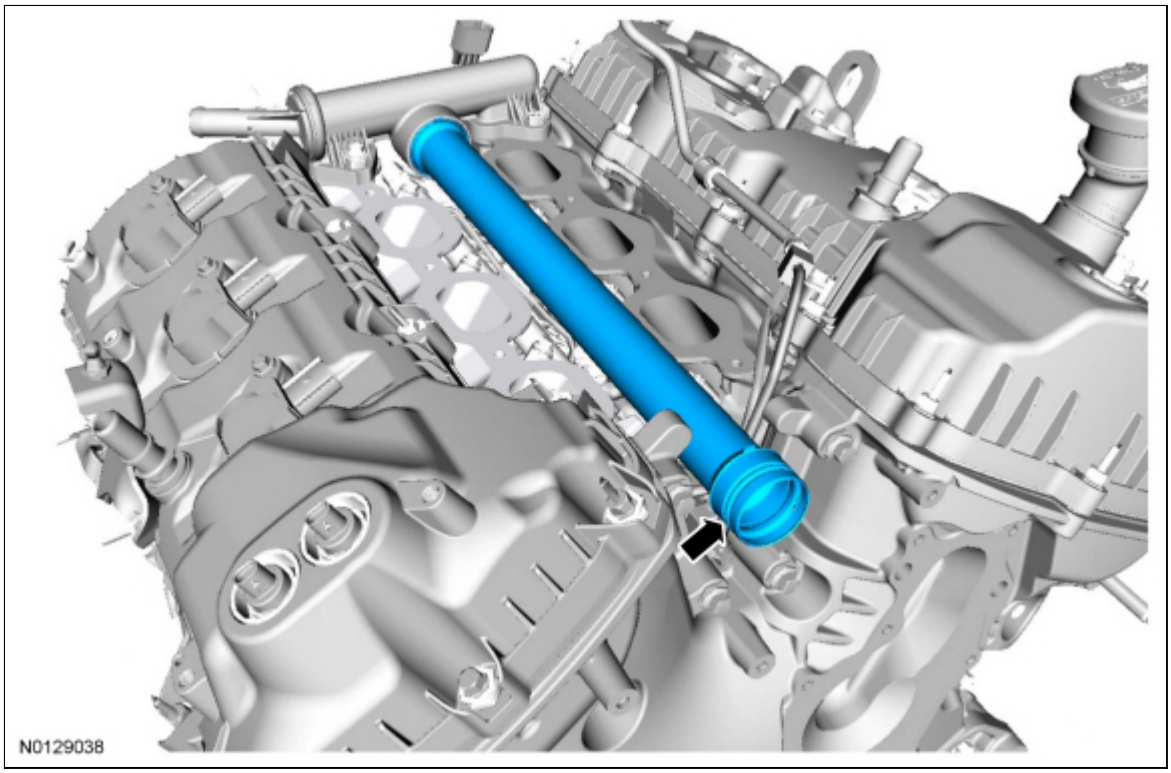
Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

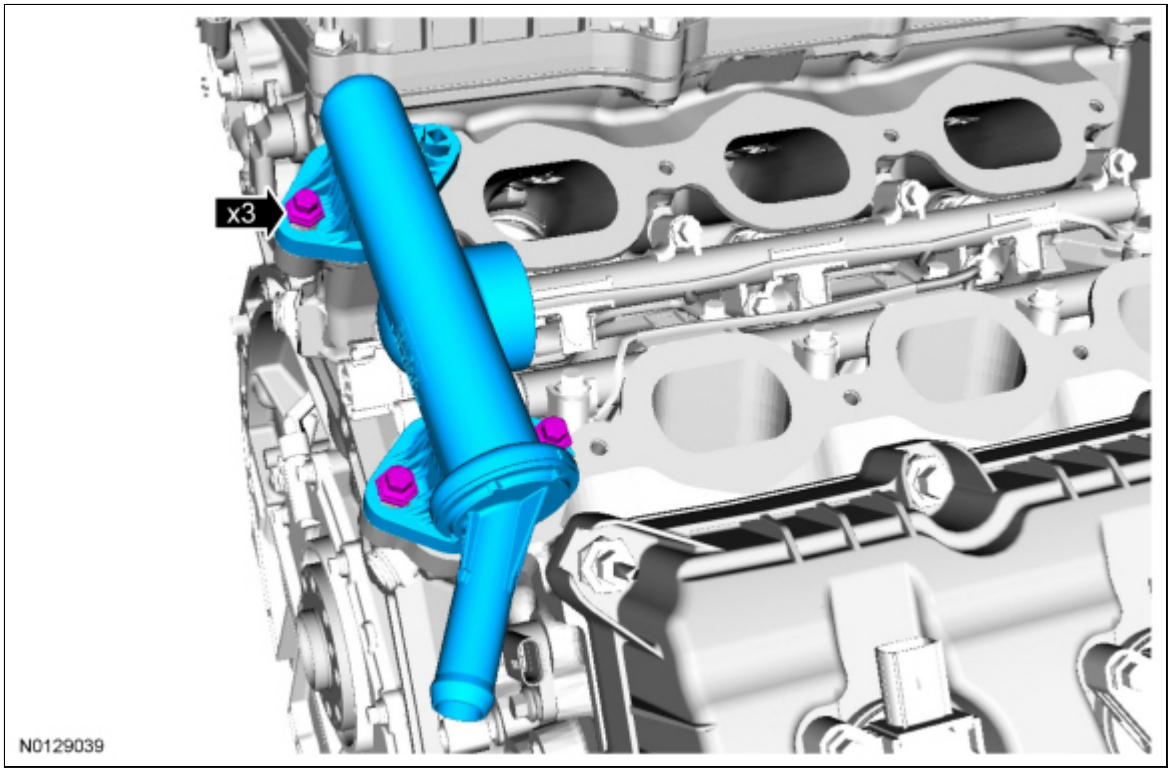
WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

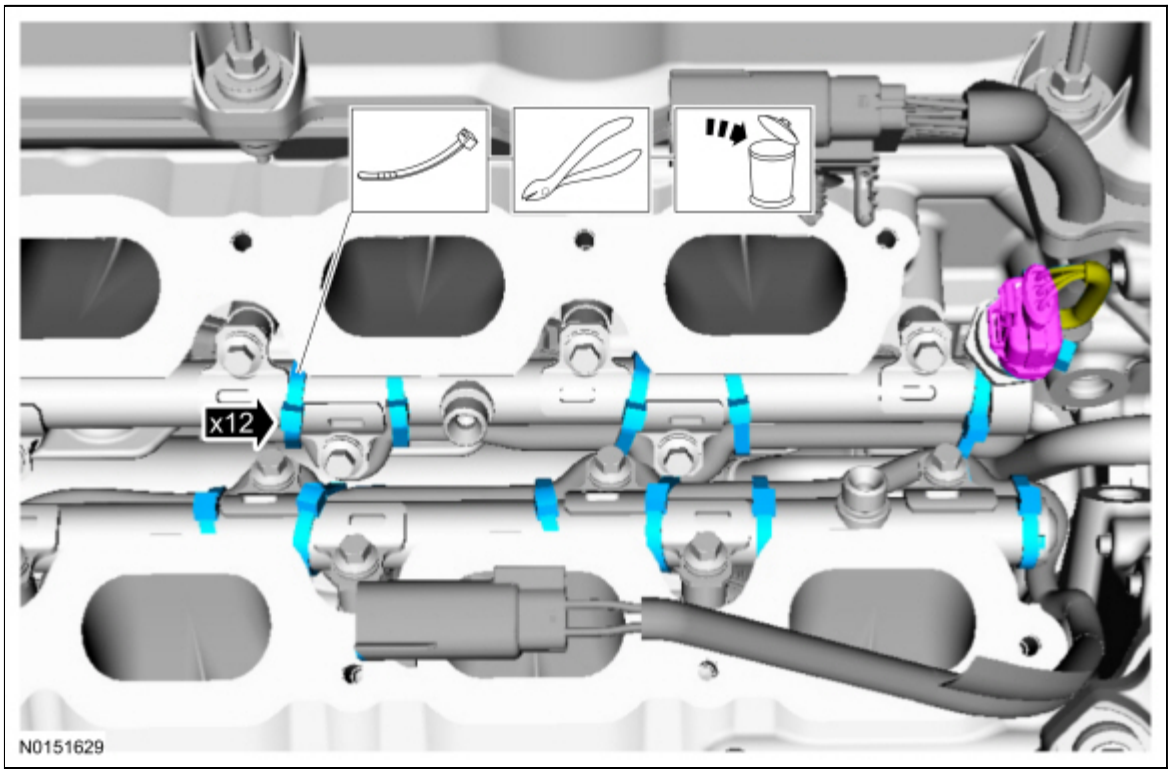


NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Remove the intake manifold. For additional information, refer to Section 303-01A .
3. Remove the thermostat housing. For additional information, refer to Section 303-03 .
4. Remove the coolant inlet pipe.
   - Remove and discard the coolant inlet pipe O-ring seals.

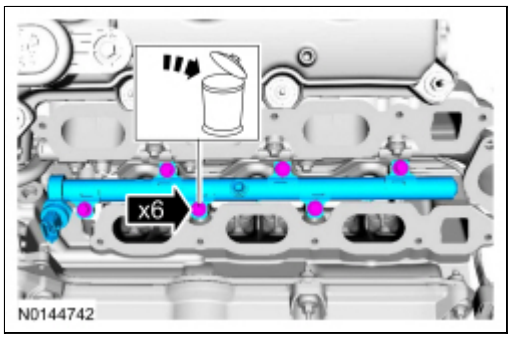
repair4less

5. Remove the 3 bolts and position aside the coolant crossover assembly.
    - Remove and discard the 2 gaskets.



6. Remove the high-pressure fuel tube bracket bolt.

7. Loosen the 2 flare nuts, remove and discard the high-pressure fuel tube.

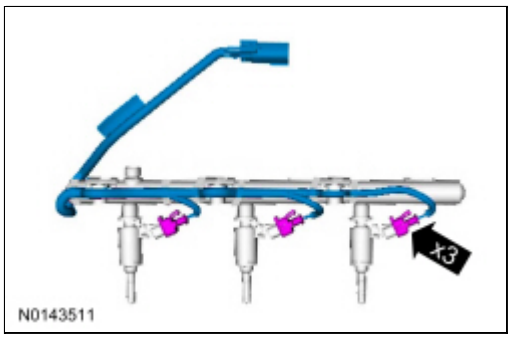


8. ***NOTICE:*** **It is very important to note the routing of the fuel charge wire harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation.**

   NOTE: Use compressed air and remove any dirt or foreign material from the cylinder head, block and general surrounding area of the fuel rail and injectors.

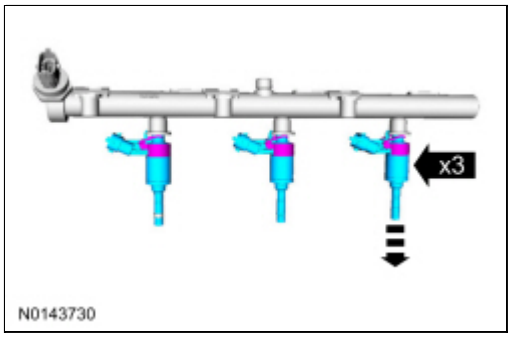
9. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

   NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.

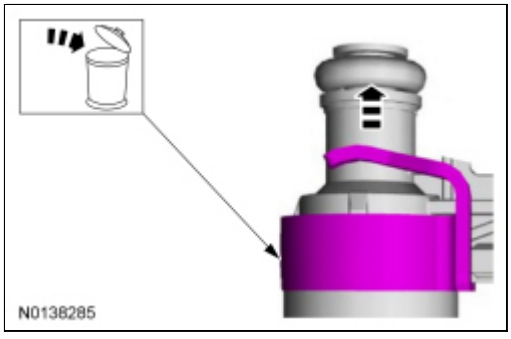


10. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

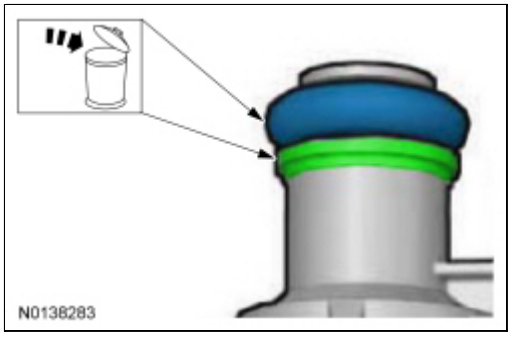
repair4less



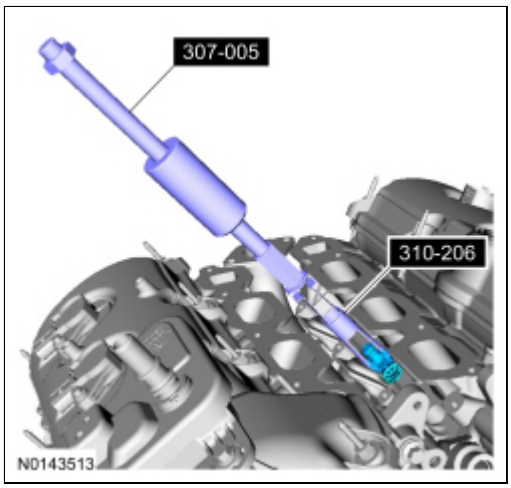
NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.



11. **NOTE:** RH shown, LH similar.



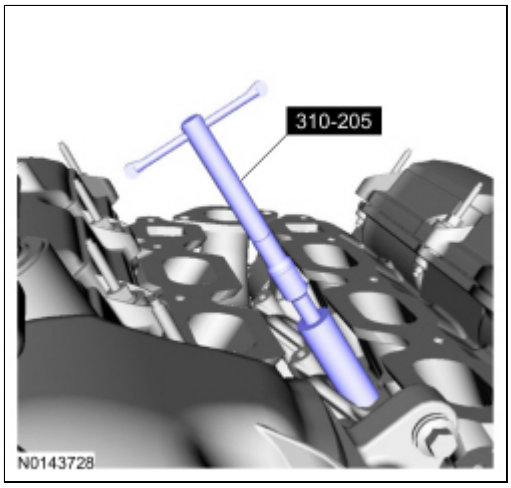
12. **NOTE:** LH shown, RH similar.



13.

14.

15. Using the Slide Hammer and the Fuel Injector Remover, remove any of the fuel injectors that remained in the cylinder head.
    - Special Tool(s): Slide Hammer 307-005 (T59L-100-B) or equivalent.
    - Special Tool(s): Remover, Fuel Injector 310-206.



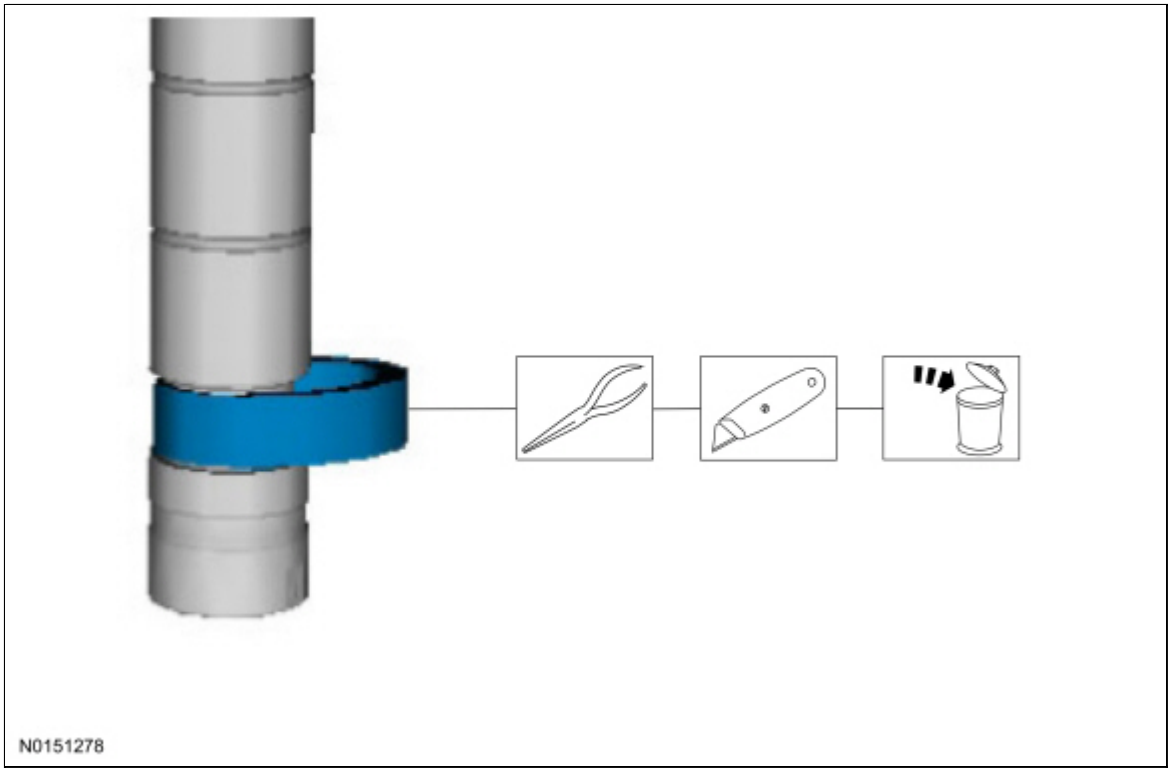
16. **NOTE:** Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and the general surrounding area of the fuel rails and injectors.

    NOTE: Do not use compressed air to clean the tip of the fuel injector.

    NOTE: Do not use a brush to clean the tip of the fuel injector.

    Using the Fuel Injector Brush, clean the fuel injector bore in the cylinder head. Special Tool(s): 310-205.

repair4less



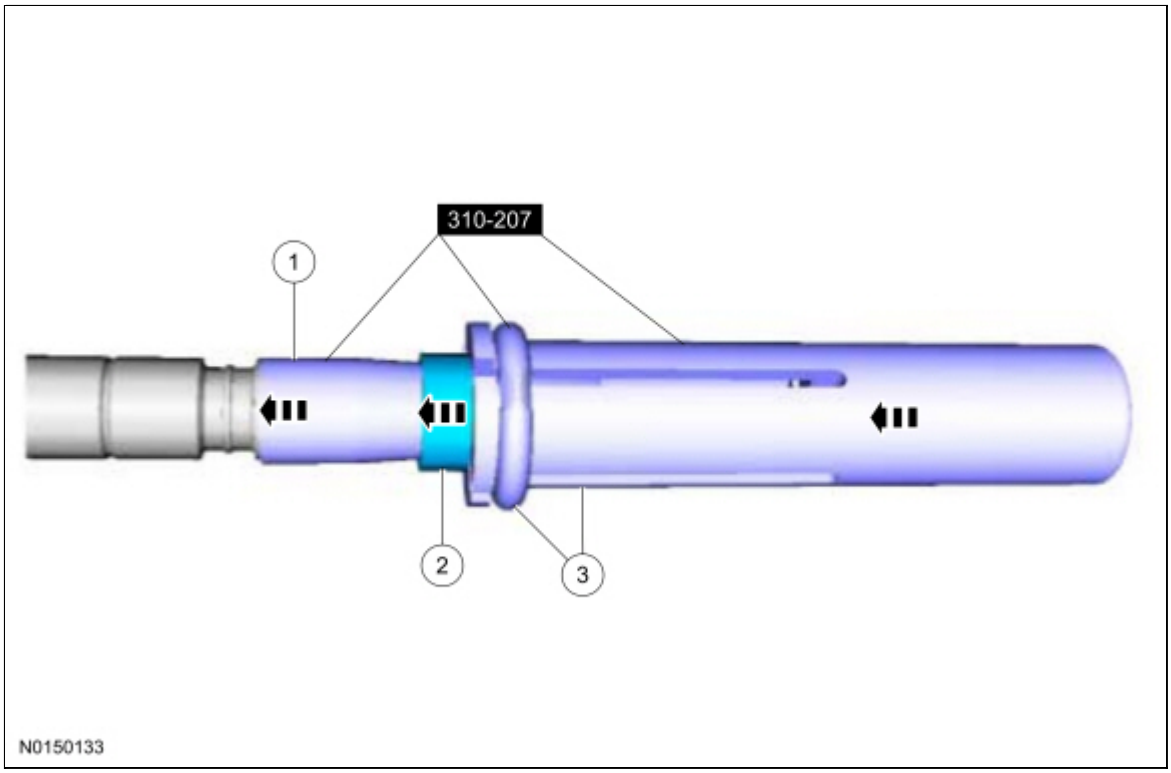
Installation

NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. ***NOTICE:*** **Do not attempt to cut the lower Teflon® seal without first pulling it away from the fuel injector or damage to the injector may occur.**

   NOTICE: **Use care when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.**

   1. Pull the lower Teflon® seal away from the injector.
   2. Carefully cut and discard the lower fuel injector Teflon® seals.

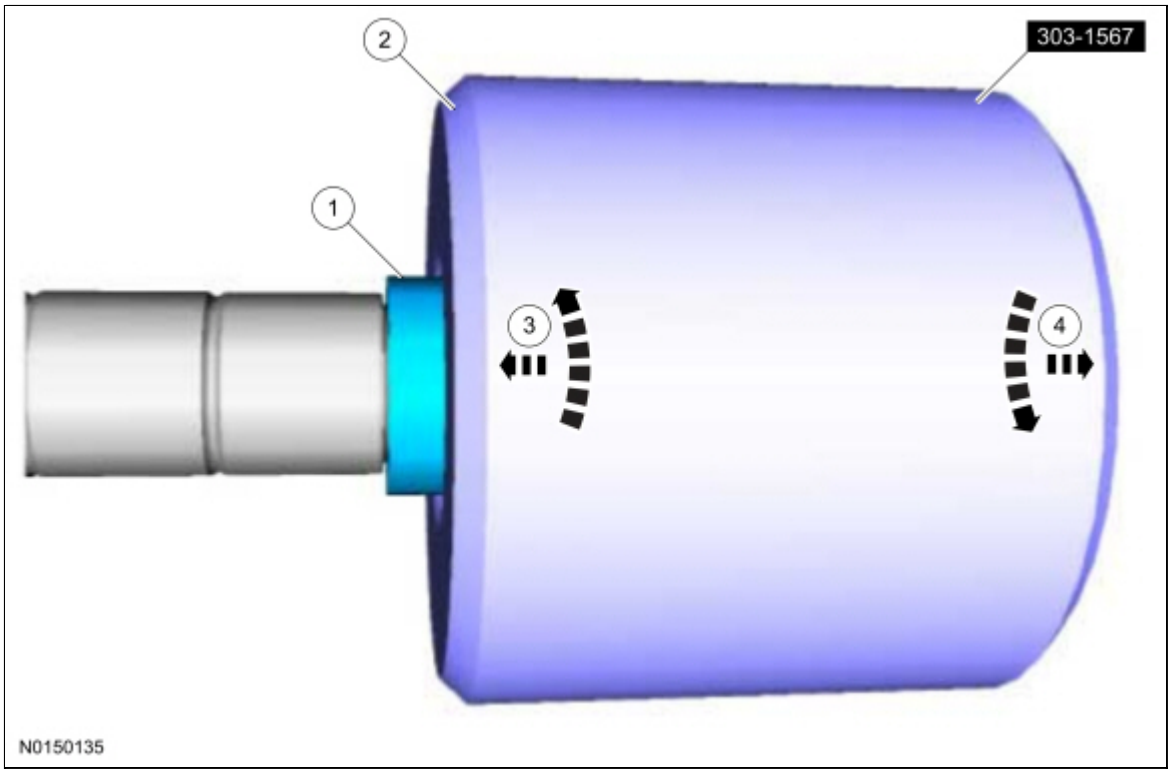


2. **NOTE:** Do not lubricate the new lower Teflon® fuel injector seals.

1. Special Tool(s): 310-207.
2. ***NOTICE:*** **Once the Teflon® seal is installed on the Teflon® Seal Guide 310-207 (part of the Fuel Injector Seal Installer), it should immediately be installed onto the fuel injector to avoid excessive expansion of the Teflon® seal.**

   NOTE: Make sure that new lower fuel injector Teflon® seals are installed.

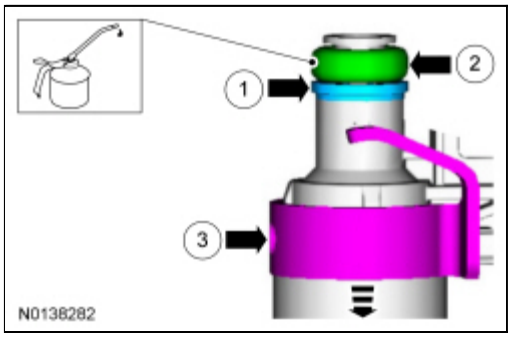
   Special Tool(s): 310-207.
3. Using the Pusher Tool 310-207 (part of the Fuel Injector Seal Installer), slide the Teflon® seals off of the Teflon® Seal Guide and into the groove on the fuel injectors. Special Tool(s): 310-207.



3. ***NOTICE:*** **Install the fuel injectors into the cylinder head within 15 minutes of sizing the seals due to Teflon® seal expansion.**

   1. **NOTE:** Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the Teflon® seal.

      Some Teflon® seal massaging with your fingers before the Teflon® seal sizer tool is installed will aid in installing the Teflon® seal sizer tool.
   2. Position the Teflon® seal sizer tool 303-1567 with the larger opening towards the Teflon® seal. Push while turning the Teflon® seal sizer tool 180 degrees. Special Tool(s): 303-1567.
   3. Once the Teflon® seal sizer tool 303-1567 is installed, check and make sure the Teflon® seal is in the sizing portion of the Teflon® seal sizer tool. After one minute, turn the Teflon® seal sizer tool back 180 degrees and remove.

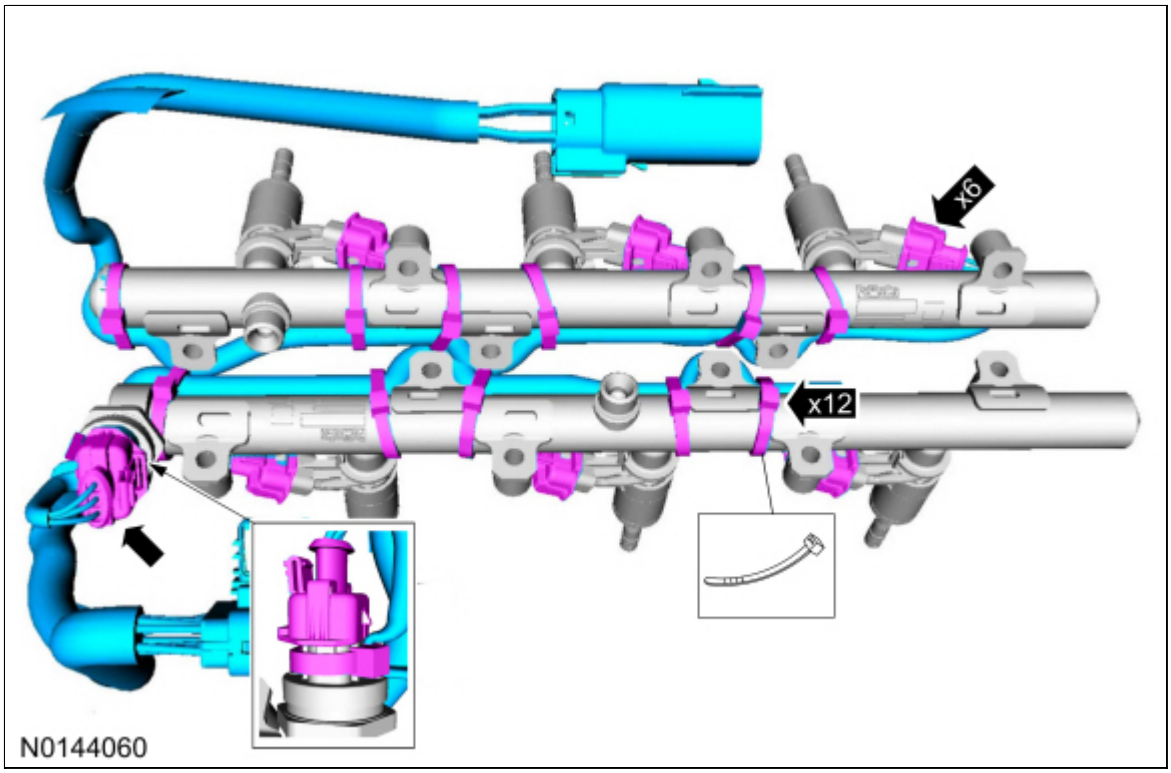


repair4less

4. ***NOTICE:*** **Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Make sure that new upper fuel injector O-ring seals, upper fuel injector O-ring seal support rings and fuel injector retainer clips are installed.

   Material: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada); or equivalent.



5. **NOTE:** LH shown, RH similar.

   NOTE: The anti-rotation finger of the fuel injector clip must slip into the groove of the fuel rail cup.

6. ***NOTICE:*** **It is very important to note the routing of the fuel charge wiring harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation. The illustration details the correct fuel charge wire harness routing and tie strap positioning for installation.**

   Install the fuel charge wire harnesses and tie straps to the index-marked locations on the fuel rails. Start by attaching the first tie strap farthest down the wire harness and continue to the connector end of the harness, leaving ample slack between the fuel injectors.

7. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

repair4less

Tighten the 6 fuel rail bolts in the following 3 stages.

- Stage 1: Push down on the fuel rail face above the injectors.
- Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
- Stage 2: Tighten an additional 45 degrees in the sequence shown.

8. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

   Tighten the 6 fuel rail bolts in the following 3 stages.

   - Stage 1: Push down on the fuel rail face above the injectors.
   - Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
   - Stage 2: Tighten an additional 45 degrees in the sequence shown.

9. **NOTE:** Apply clean engine oil to the threads of the 3 high-pressure fuel tube flare nuts.

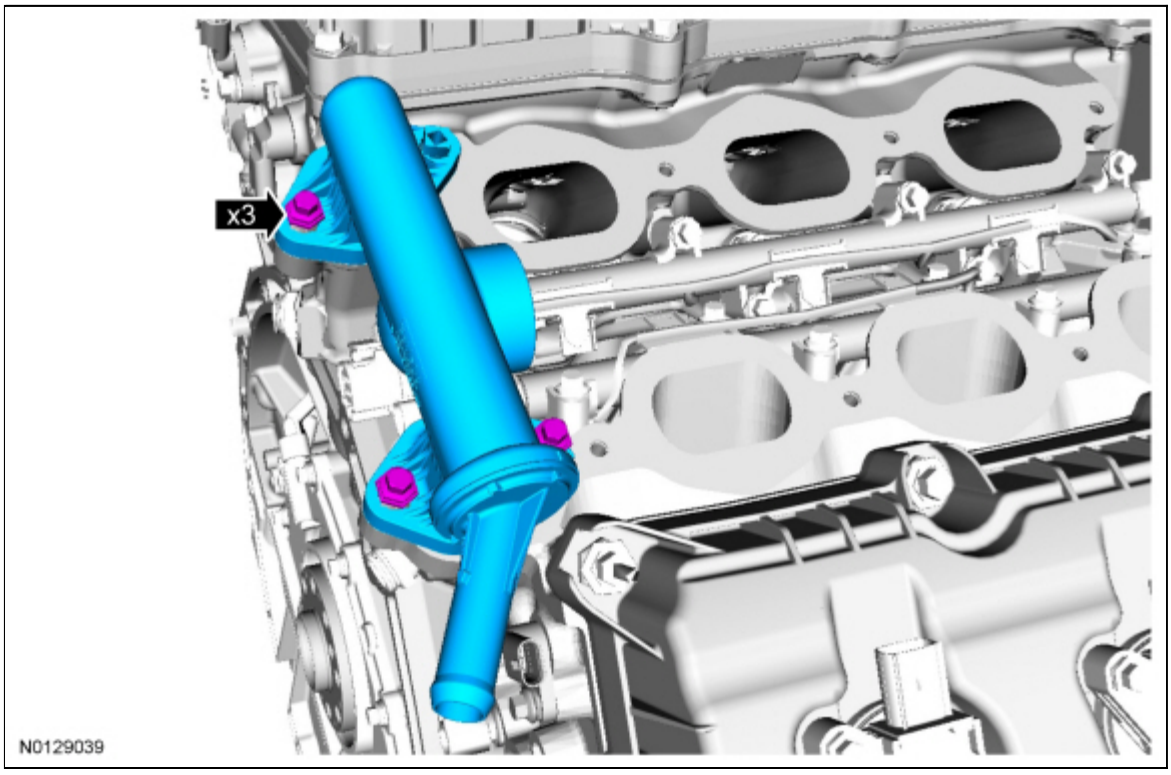
   Position the new high-pressure fuel tube and hand start the flare nuts in 3 stages.

   - Stage 1: Hand tighten the high-pressure fuel tube-to-RH fuel rail flare nut.
   - Stage 2: Hand tighten the high-pressure fuel tube-to-LH fuel rail flare nut.
   - Stage 3: Hand tighten the high-pressure fuel tube-to-fuel injection pump flare nut.

10. Loosely install the new high-pressure fuel tube bracket nut and bolt.

11. Tighten the 3 high-pressure fuel tube flare nuts in 9 stages:

- Stage 1: Tighten the high-pressure fuel tube-to-RH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 2: Tighten an additional 30 degrees.
- Stage 3: Tighten to 32 Nm (24 lb-ft).
- Stage 4: Tighten the high-pressure fuel tube-to-LH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 5: Tighten an additional 30 degrees.
- Stage 6: Tighten to 32 Nm (24 lb-ft).
- Stage 7: Tighten the high-pressure fuel tube-to-fuel injection pump flare nut to 15 Nm (133 lb-in).
- Stage 8: Tighten an additional 30 degrees.
- Stage 9: Tighten to 32 Nm (24 lb-ft).

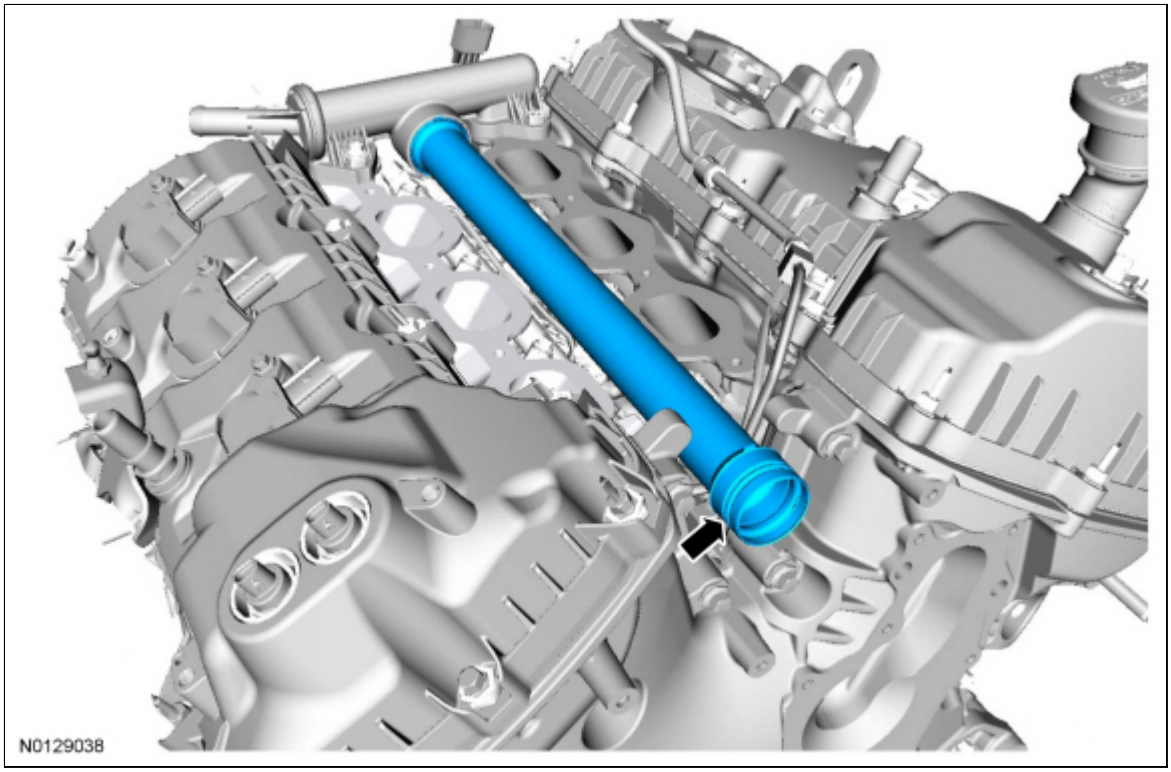


12. Tighten the high-pressure fuel tube bracket bolt in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

13. Tighten the high-pressure fuel tube bracket nut.
    - Tighten to 8 Nm (71 lb-in).

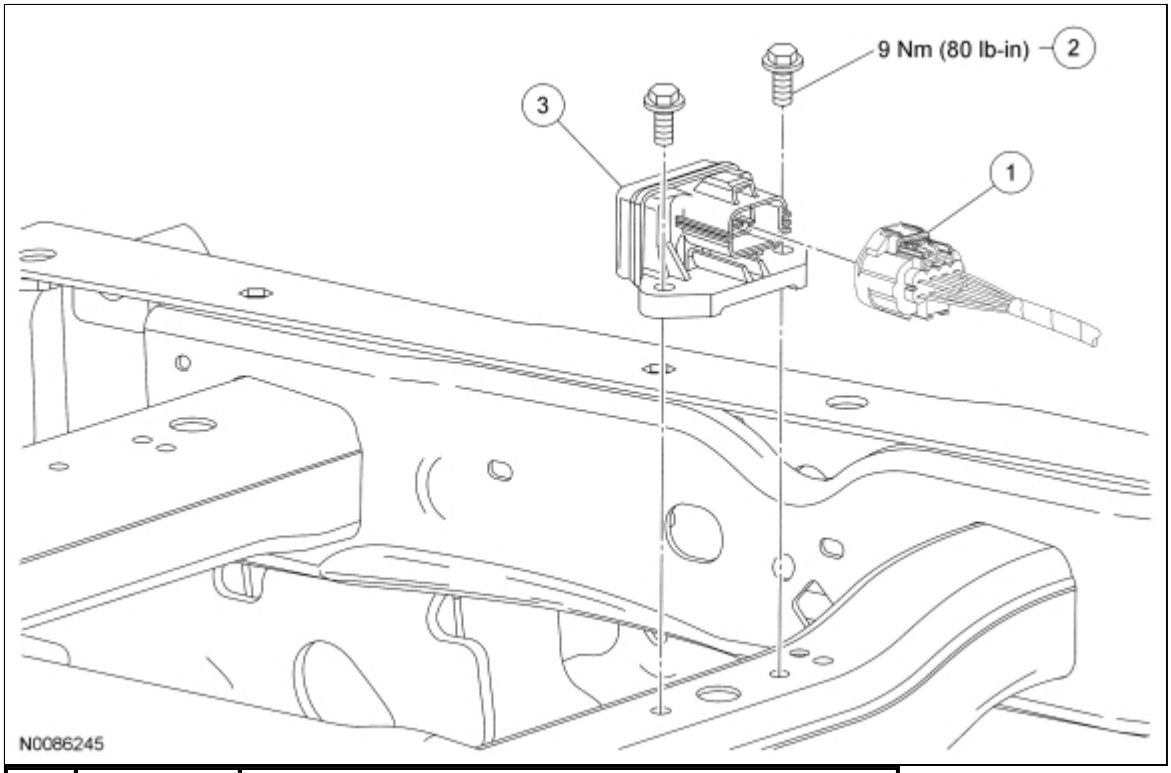
14. **NOTE:** Use care when installing the fuel injection pump noise insulator. Spreading the openings will aid in installing the fuel injection pump noise insulator and reduce the risk of damage.

    Install the fuel injection pump noise insulator shield.



15. Using new gaskets, position back the coolant crossover manifold assembly and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

16. **NOTE:** Lubricate the O-ring seals with clean engine coolant.



repair4less

Using new O-ring seals, install the coolant inlet pipe.

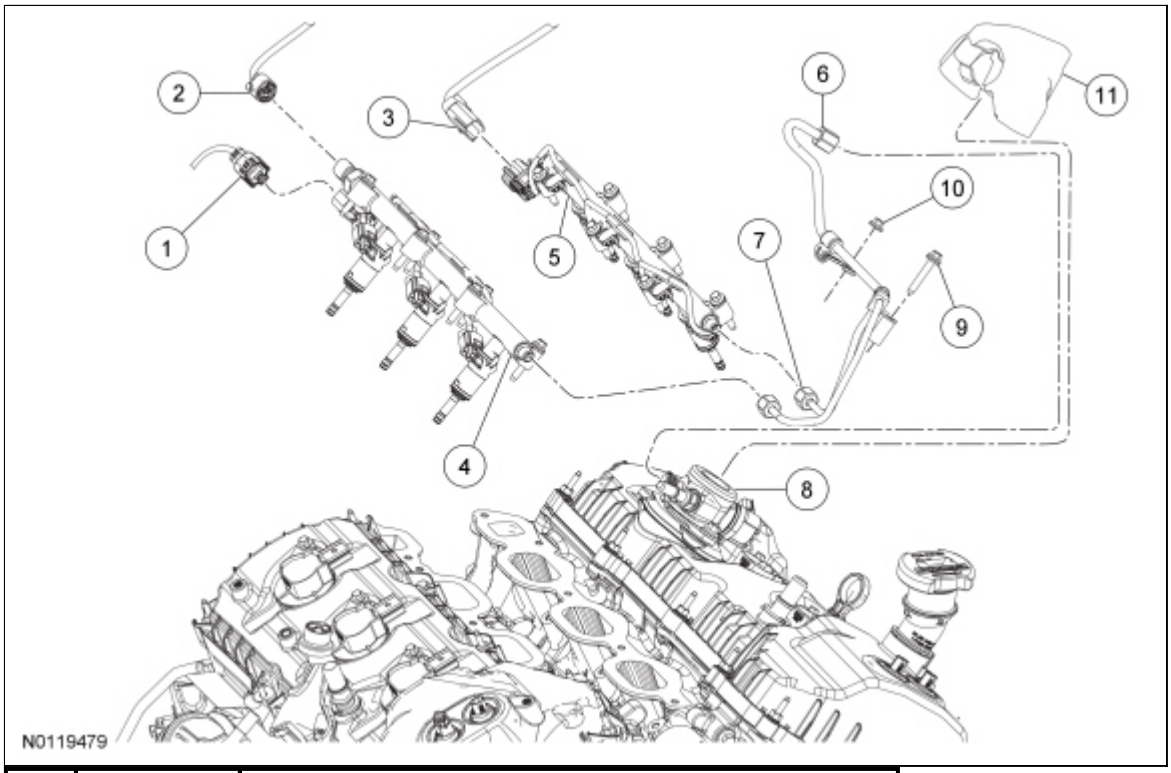
17. Install the thermostat housing. For additional information, refer to Section 303-03 .
18. Install the intake manifold. For additional information, refer to Section 303-01A .

Fuel Pump Control Module

Item	Part Number	Description
1	—	Fuel Pump Control Module (FPCM) electrical connector (part of 14404)
2	W706027	FPCM bolt (2 required)
3	9345	FPCM

Removal and Installation

1. Disconnect theFuel Pump Control Module (FPCM) electrical connector.



2. Remove the 2 bolts and the FPCM .
   - To install, tighten to 9 Nm (80 lb-in).

3. To install, reverse the removal procedure.

repair4less

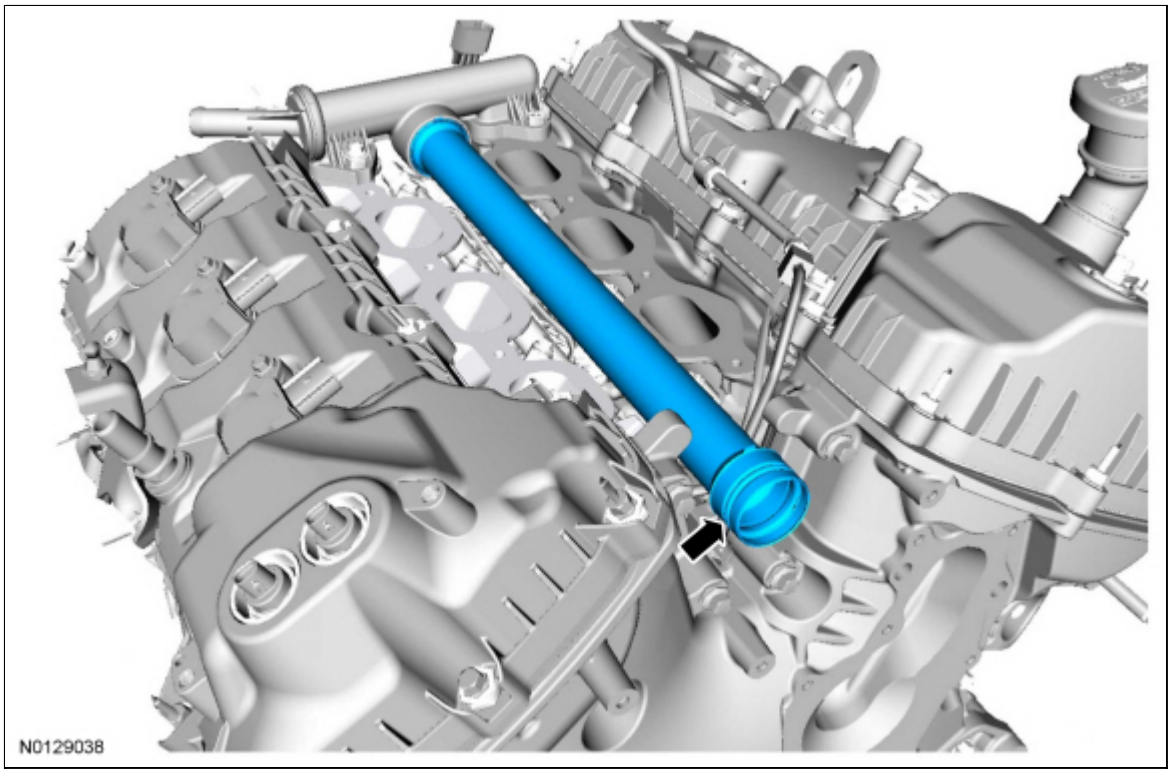
Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

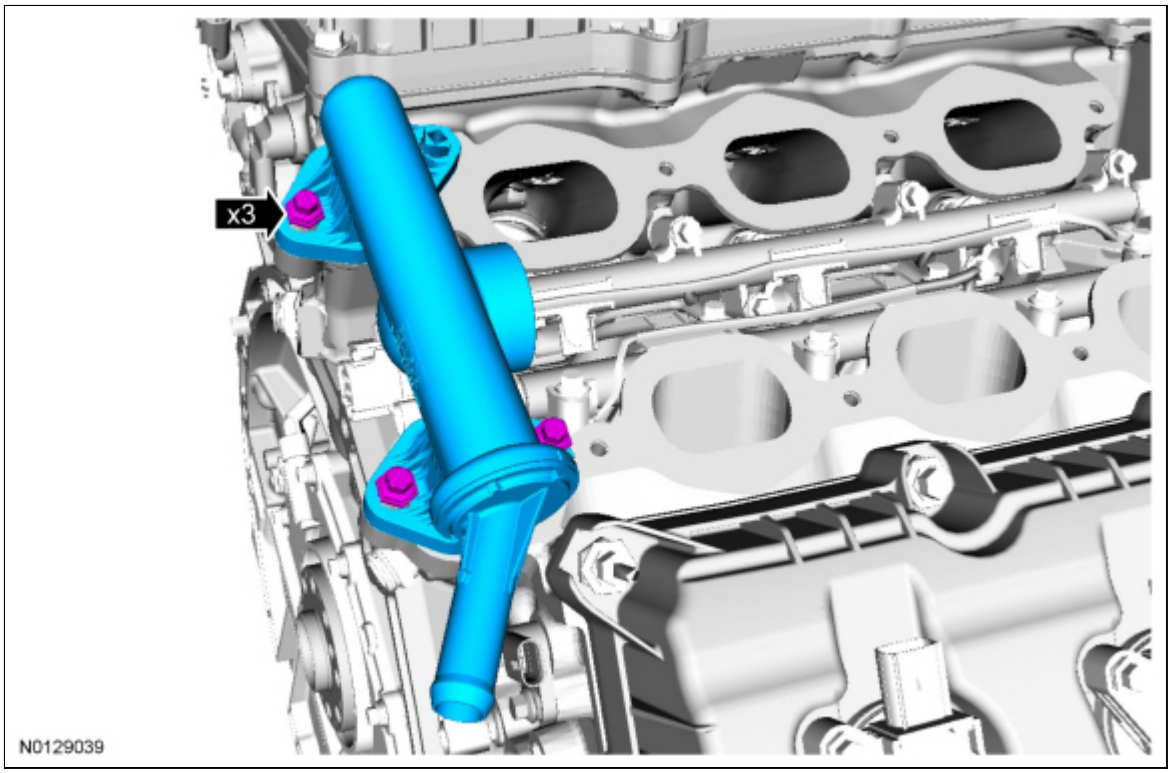
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

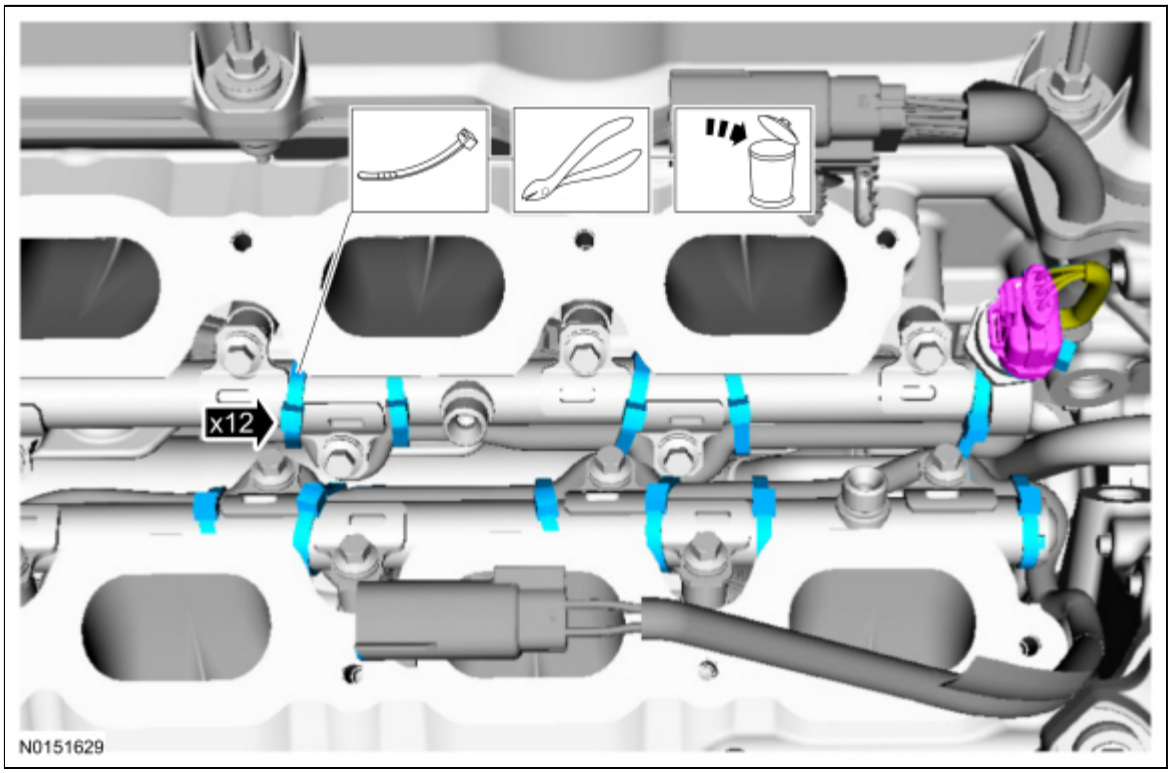


WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Remove the intake manifold. For additional information, refer to Section 303-01A .
3. Remove the thermostat housing. For additional information, refer to Section 303-03 .
4. Remove the coolant inlet pipe.
   - Remove and discard the coolant inlet pipe O-ring seals.

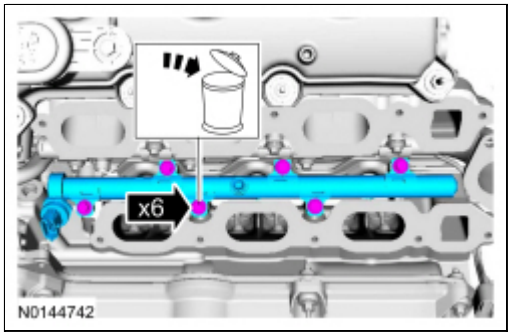
5. Remove the 3 bolts and position aside the coolant crossover assembly.
    - Remove and discard the 2 gaskets.



6. Remove the high-pressure fuel tube bracket bolt.

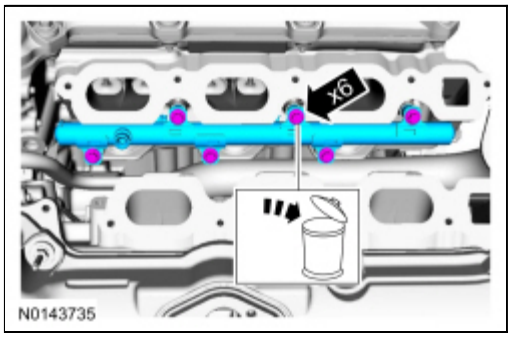
repair4less

7. Loosen the 2 flare nuts, remove and discard the high-pressure fuel tube.



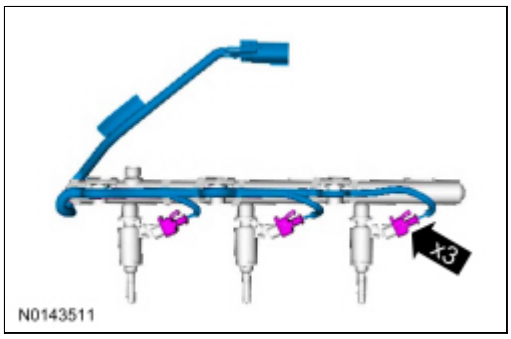
8. ***NOTICE:*** **It is very important to note the routing of the fuel charge wire harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation.**

   NOTE: Use compressed air and remove any dirt or foreign material from the cylinder head, block and general surrounding area of the fuel rail and injectors.

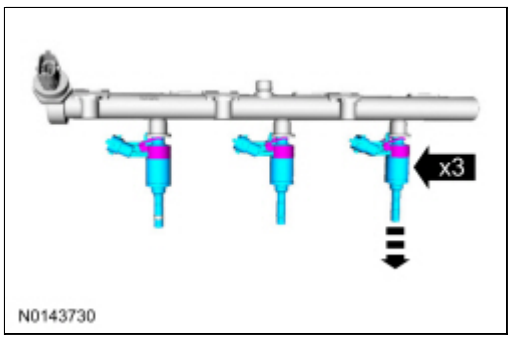


9. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

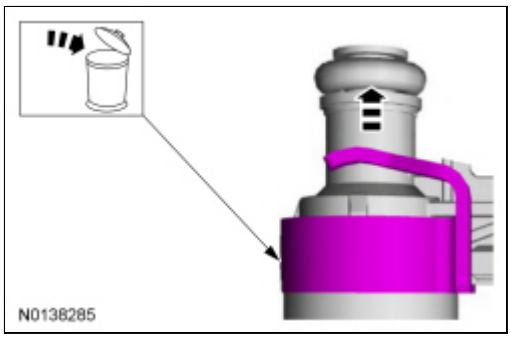
   NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.



10. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors.**

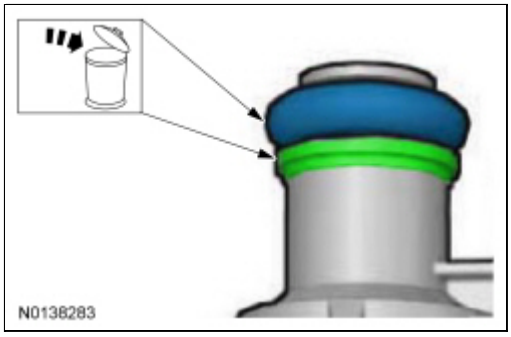


NOTE: When removing the fuel rails, the fuel injectors may remain in the cylinder heads and require the use of a Fuel Injector Remover tool to extract. Wiggling the injector by hand to break it loose may allow the injector to be removed by hand.

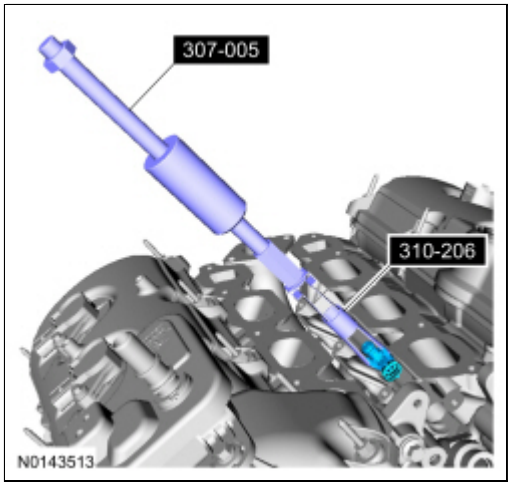


11. **NOTE:** RH shown, LH similar.

12. **NOTE:** LH shown, RH similar.



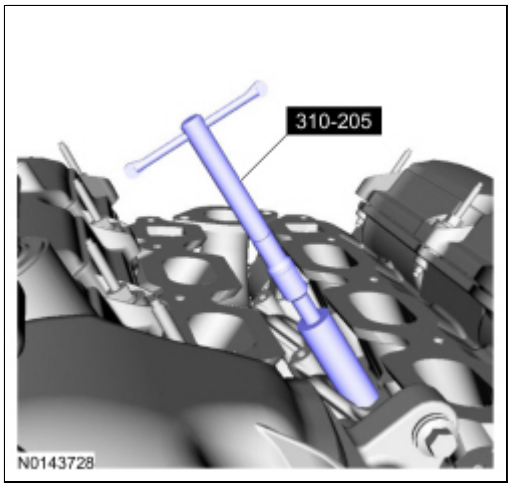
13.



repair4less

14.

15. Using the Slide Hammer and the Fuel Injector Remover, remove any of the fuel injectors that remained in the cylinder head.
    - Special Tool(s): Slide Hammer 307-005 (T59L-100-B) or equivalent.
    - Special Tool(s): Remover, Fuel Injector 310-206.

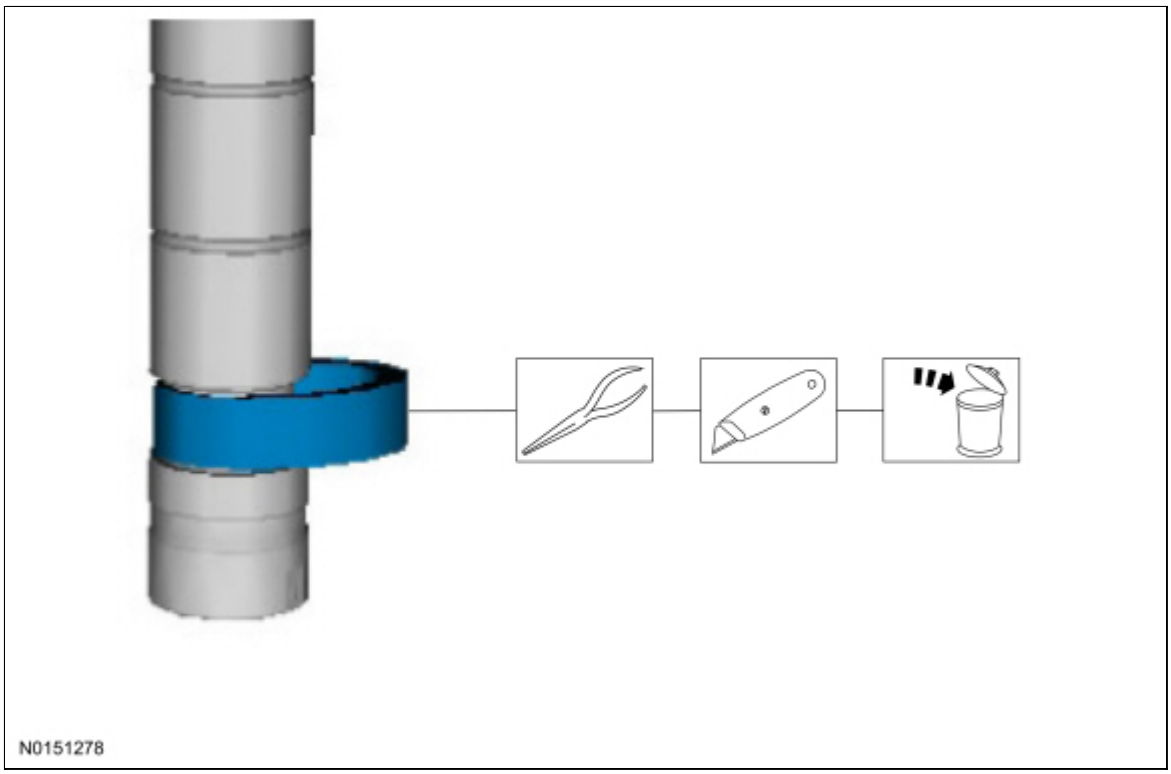


16. **NOTE:** Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and the general surrounding area of the fuel rails and injectors.

    NOTE: Do not use compressed air to clean the tip of the fuel injector.

    NOTE: Do not use a brush to clean the tip of the fuel injector.

    Using the Fuel Injector Brush, clean the fuel injector bore in the cylinder head. Special Tool(s): 310-205.



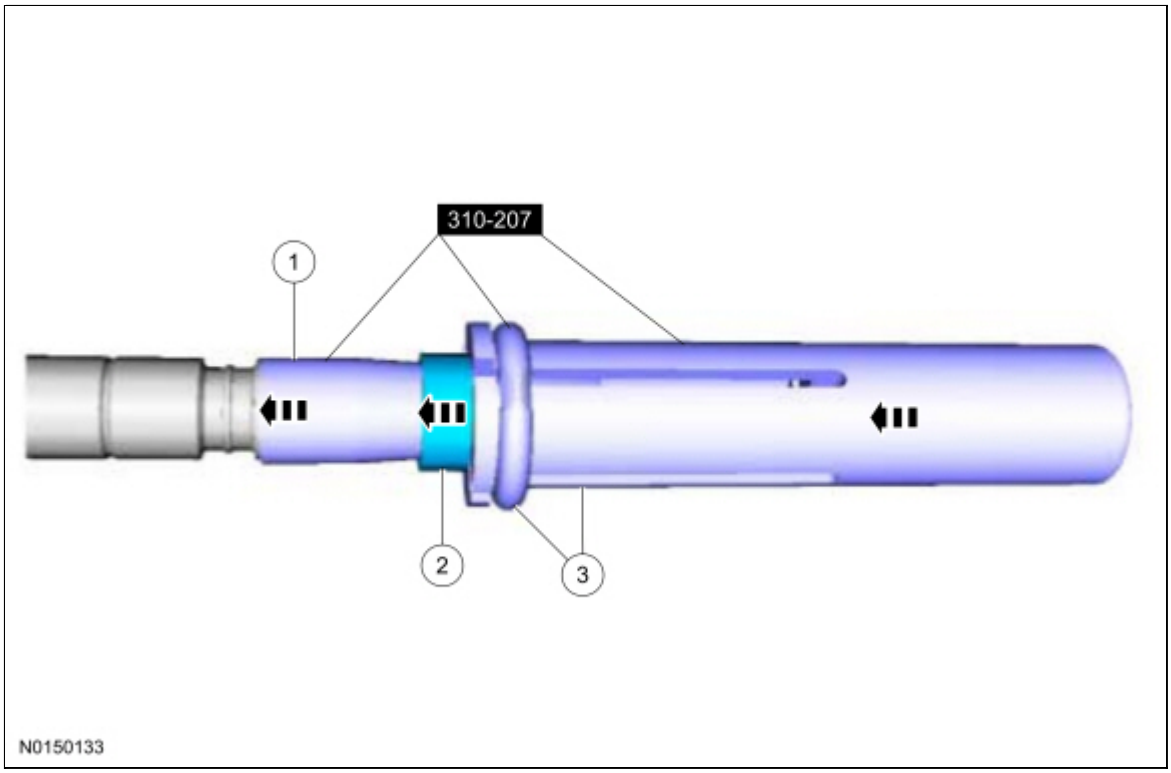
Installation

NOTE: A clean working environment is essential to prevent dirt or foreign material contamination.

1. ***NOTICE:*** **Do not attempt to cut the lower Teflon® seal without first pulling it away from the fuel injector or damage to the injector may occur.**

   NOTICE: **Use care when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.**

   1. Pull the lower Teflon® seal away from the injector.
   2. Carefully cut and discard the lower fuel injector Teflon® seals.



2. **NOTE:** Do not lubricate the new lower Teflon® fuel injector seals.

repair4less

1. Special Tool(s): 310-207.
2. ***NOTICE:*** **Once the Teflon® seal is installed on the Teflon® Seal Guide 310-207 (part of the Fuel Injector Seal Installer), it should immediately be installed onto the fuel injector to avoid excessive expansion of the Teflon® seal.**

   NOTE: Make sure that new lower fuel injector Teflon® seals are installed.

   Special Tool(s): 310-207.
3. Using the Pusher Tool 310-207 (part of the Fuel Injector Seal Installer), slide the Teflon® seals off of the Teflon® Seal Guide and into the groove on the fuel injectors. Special Tool(s): 310-207.

3. ***NOTICE:*** **Install the fuel injectors into the cylinder head within 15 minutes of sizing the seals due to Teflon® seal expansion.**

   1. **NOTE:** Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the Teflon® seal.

      Some Teflon® seal massaging with your fingers before the Teflon® seal sizer tool is installed will aid in installing the Teflon® seal sizer tool.
   2. Position the Teflon® seal sizer tool 303-1567 with the larger opening towards the Teflon® seal. Push while turning the Teflon® seal sizer tool 180 degrees. Special Tool(s): 303-1567.
   3. Once the Teflon® seal sizer tool 303-1567 is installed, check and make sure the Teflon® seal is in the sizing portion of the Teflon® seal sizer tool. After one minute, turn the Teflon® seal sizer tool back 180 degrees and remove.

4. ***NOTICE:*** **Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Make sure that new upper fuel injector O-ring seals, upper fuel injector O-ring seal support rings and fuel injector retainer clips are installed.

   Material: Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada); or equivalent.

5. **NOTE:** LH shown, RH similar.

   NOTE: The anti-rotation finger of the fuel injector clip must slip into the groove of the fuel rail cup.

repair4less

6. ***NOTICE:*** **It is very important to note the routing of the fuel charge wiring harnesses on the fuel rails and index-mark the location of the tie straps prior to removal or damage may occur to the wire harnesses during installation. The illustration details the correct fuel charge wire harness routing and tie strap positioning for installation.**

   Install the fuel charge wire harnesses and tie straps to the index-marked locations on the fuel rails. Start by attaching the first tie strap farthest down the wire harness and continue to the connector end of the harness, leaving ample slack between the fuel injectors.

7. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

Tighten the 6 fuel rail bolts in the following 3 stages.

- Stage 1: Push down on the fuel rail face above the injectors.
- Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
- Stage 2: Tighten an additional 45 degrees in the sequence shown.

8. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

   NOTICE: **Do not lubricate the new lower Teflon® fuel injector seals.**

   NOTE: Make sure that 6 new fuel rail bolts are installed.

   NOTE: Tighten the bolts in a method that draws the fuel rail evenly to the head, preventing a rocking motion.

   Tighten the 6 fuel rail bolts in the following 3 stages.

   - Stage 1: Push down on the fuel rail face above the injectors.
   - Stage 1: Tighten to 10 Nm (89 lb-in) in the sequence shown.
   - Stage 2: Tighten an additional 45 degrees in the sequence shown.

9. **NOTE:** Apply clean engine oil to the threads of the 3 high-pressure fuel tube flare nuts.

   Position the new high-pressure fuel tube and hand start the flare nuts in 3 stages.

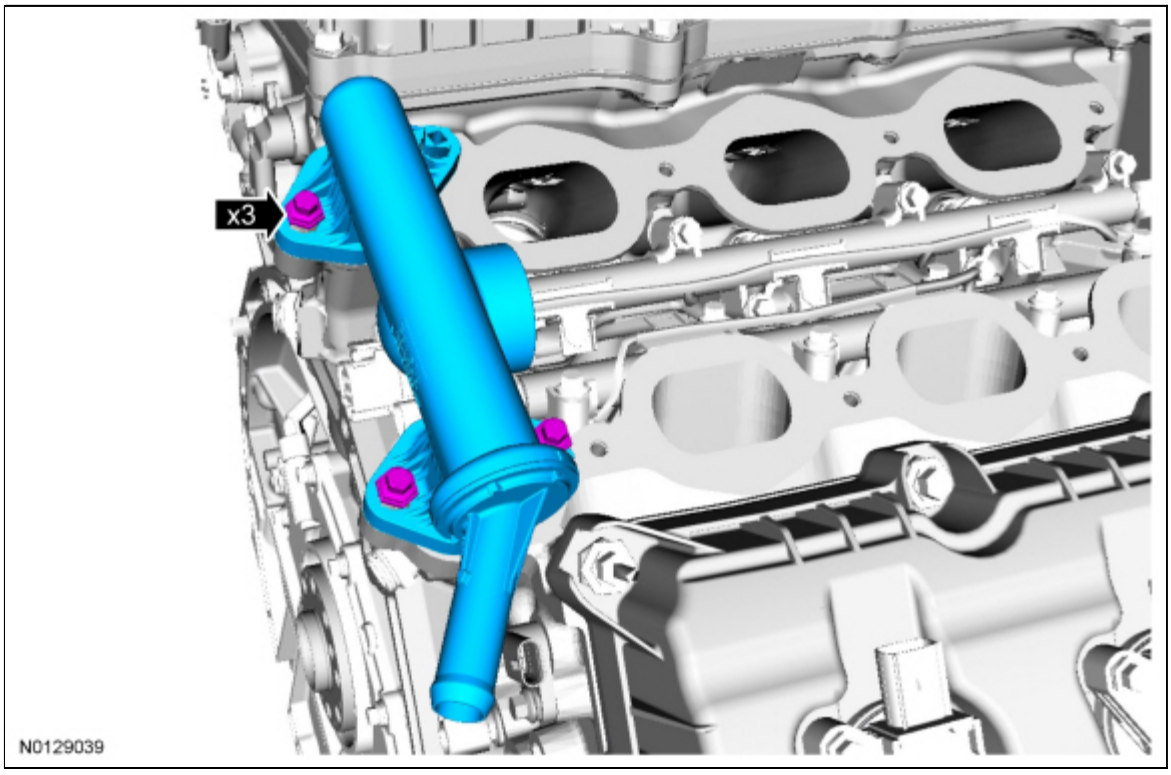
   - Stage 1: Hand tighten the high-pressure fuel tube-to-RH fuel rail flare nut.
   - Stage 2: Hand tighten the high-pressure fuel tube-to-LH fuel rail flare nut.
   - Stage 3: Hand tighten the high-pressure fuel tube-to-fuel injection pump flare nut.

10. Loosely install the new high-pressure fuel tube bracket nut and bolt.

11. Tighten the 3 high-pressure fuel tube flare nuts in 9 stages:

repair4less

- Stage 1: Tighten the high-pressure fuel tube-to-RH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 2: Tighten an additional 30 degrees.
- Stage 3: Tighten to 32 Nm (24 lb-ft).
- Stage 4: Tighten the high-pressure fuel tube-to-LH fuel rail flare nut to 15 Nm (133 lb-in).
- Stage 5: Tighten an additional 30 degrees.
- Stage 6: Tighten to 32 Nm (24 lb-ft).
- Stage 7: Tighten the high-pressure fuel tube-to-fuel injection pump flare nut to 15 Nm (133 lb-in).
- Stage 8: Tighten an additional 30 degrees.
- Stage 9: Tighten to 32 Nm (24 lb-ft).



12. Tighten the high-pressure fuel tube bracket bolt in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

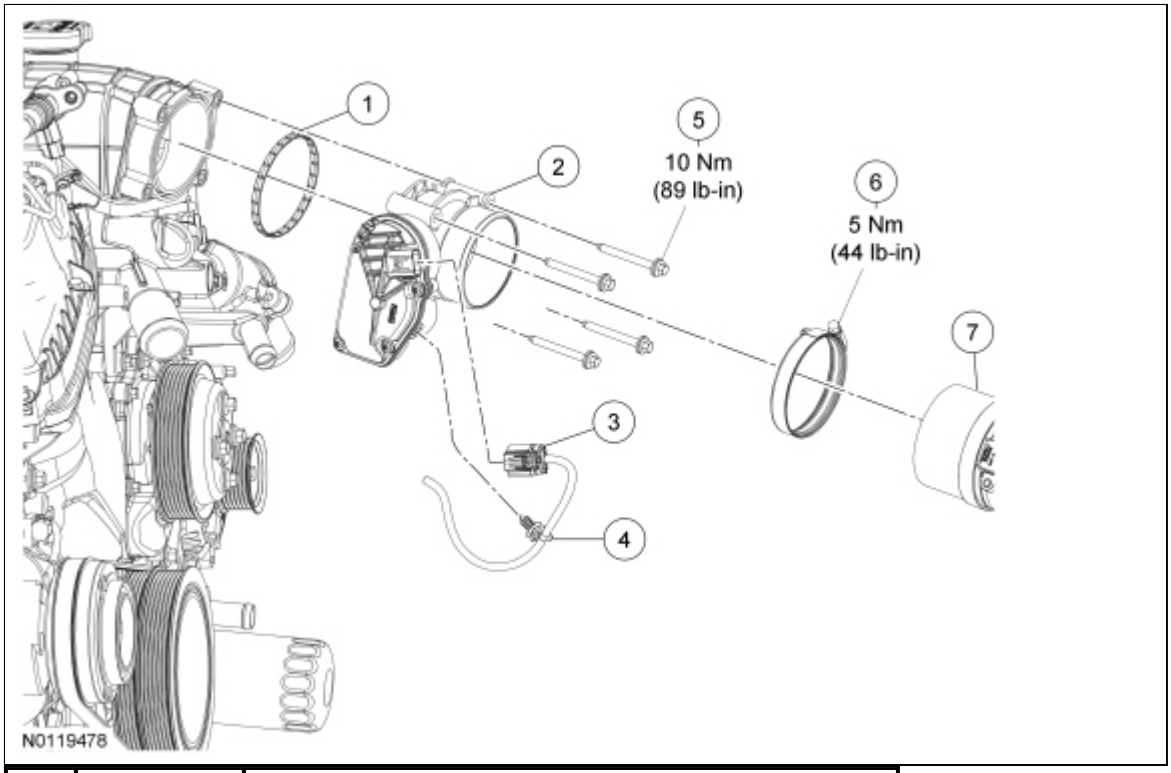
13. Tighten the high-pressure fuel tube bracket nut.
    - Tighten to 8 Nm (71 lb-in).

14. **NOTE:** Use care when installing the fuel injection pump noise insulator. Spreading the openings will aid in installing the fuel injection pump noise insulator and reduce the risk of damage.

    Install the fuel injection pump noise insulator shield.

15. Using new gaskets, position back the coolant crossover manifold assembly and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

16. **NOTE:** Lubricate the O-ring seals with clean engine coolant.



Using new O-ring seals, install the coolant inlet pipe.

17. Install the thermostat housing. For additional information, refer to Section 303-03 .
18. Install the intake manifold. For additional information, refer to Section 303-01A .

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

The fuel charging and controls system consists of the:

- electronic Throttle Body (TB).
- fuel injectors.
- fuel rail.
- Fuel Pump Control Module (FPCM).

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand, on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plates.
- is not adjustable.

Fuel Rail

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

repair4less

Fuel Injectors

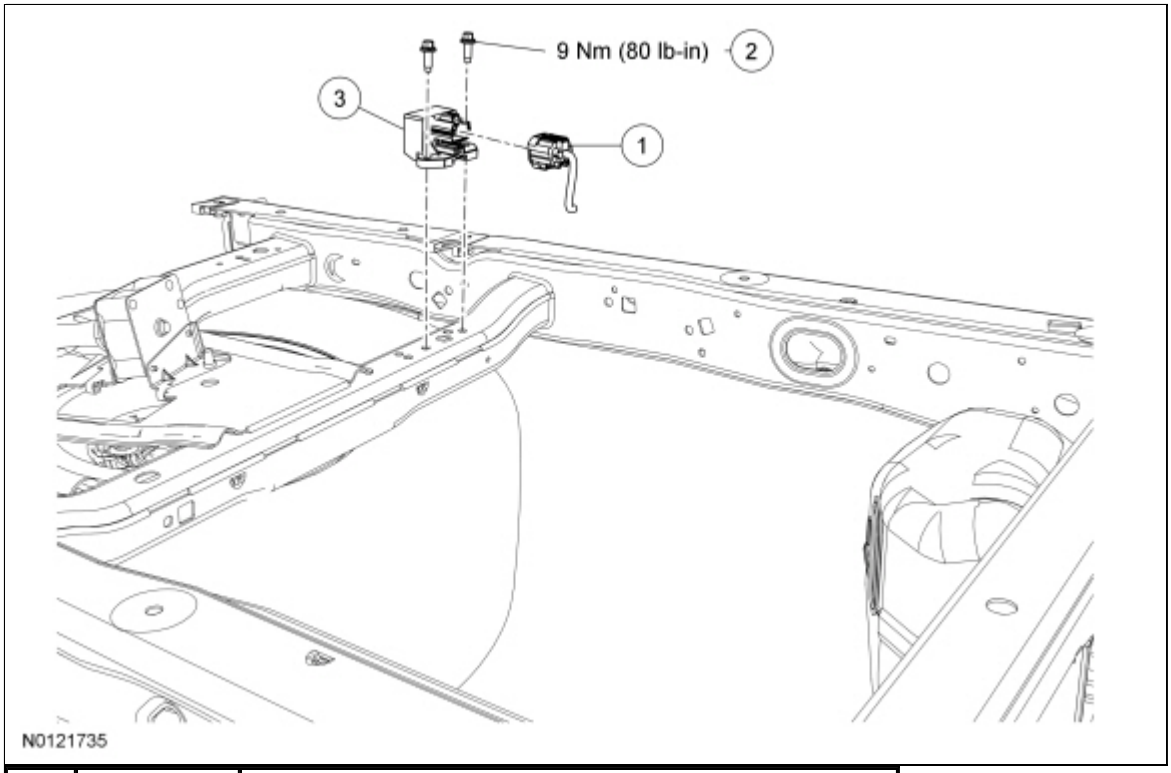
The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid which opens a needle valve to inject fuel into the intake manifold.
- are deposit-resistant.

Fuel Pump Control Module (FPCM)

The FPCM :

- is electronically operated by the PCM.
- controls voltage (10 or 12 volts) to the FPCM depending on load.



Fuel Injectors

Removal and Installation

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the upper intake manifold. For additional information, refer to Section 303-01B .
4. Disconnect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .

5. Remove the LH and RH fuel rail noise insulator shields.

6. Disconnect the 6 fuel injector electrical connectors.

7. Remove the 4 fuel rail bolts.

8. Remove the fuel rail and injectors as an assembly.

9. Remove the 6 fuel injector clips and the 6 fuel injectors.
    - Remove and discard the 12 fuel injector O-ring seals.

Installation

1. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings may cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: The upper and lower fuel injector O-ring seals are similar in appearance, but are not interchangeable.

   Install the new O-ring seals onto the fuel injectors and lubricate them with clean engine oil.

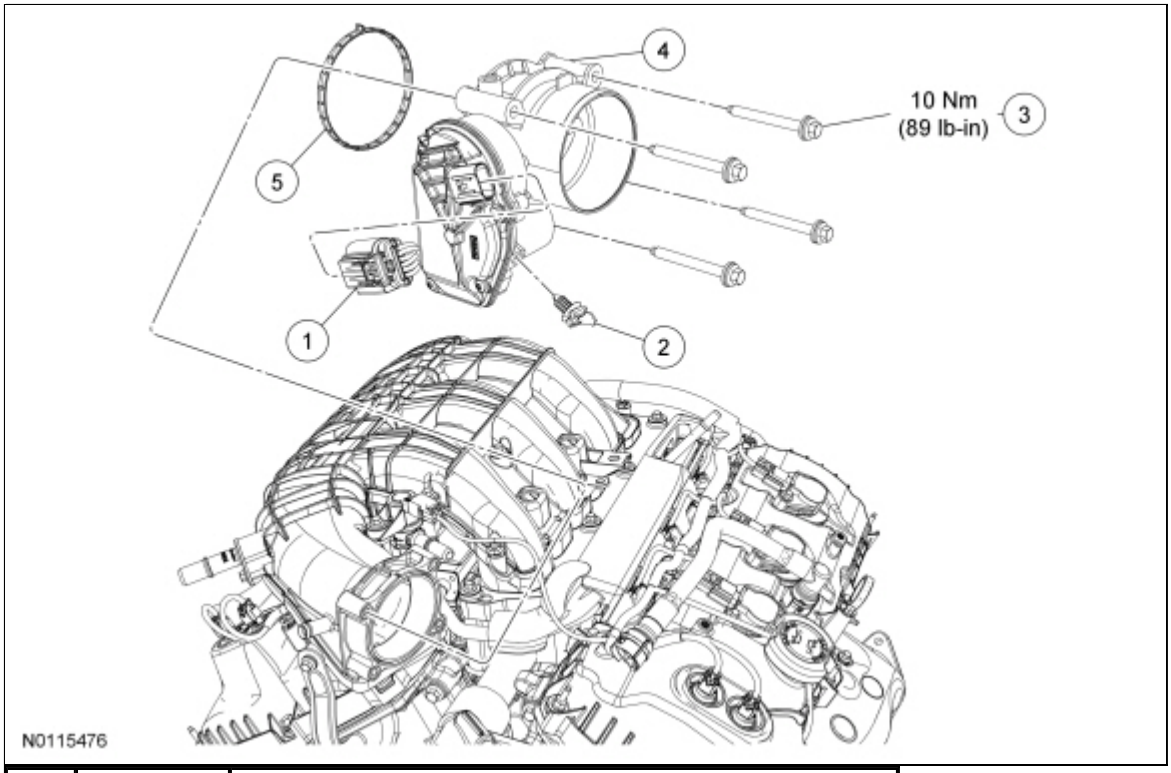
2. Install the 6 fuel injectors and the 6 fuel injector clips into the fuel rail.

3. Install the fuel rail and fuel injectors as an assembly.

4. Install the 4 fuel rail bolts.
    - Tighten to 10 Nm (89 lb-in).

5. Connect the 6 fuel injector electrical connectors.

6. Install the LH and RH fuel rail noise insulator shields.



7. Connect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .

8. Install the upper intake manifold. For additional information, refer to Section 303-01B .

9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

The fuel charging and controls system consists of the:

- electronic Throttle Body (TB).
- fuel injectors.
- fuel rail.
- fuel pump control module.

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand, on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

Fuel Rail

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

Fuel Injectors

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid which opens a needle valve to inject fuel into the intake manifold.
- are deposit-resistant.

Fuel Pump Control Module

The fuel pump control module:

- controls the voltage to the Fuel Pump (FP) based on the duty cycle request from the PCM.

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Release the fuel system pressure. For additional information refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the 2 Evaporative Emission (EVAP) tube retaining clips from the fuel rail.
4. Remove the LH and RH fuel rail insulators.
5. Disconnect the 8 fuel injector electrical connectors.

repair4less

6. Disconnect the fuel supply tube. For additional information, refer to the quick connect procedure in Section 310-00 .

7. Remove the 4 fuel rail bolts.

8. Remove the fuel rail and fuel injectors as an assembly from the intake manifold.

9. Remove the retaining clips and fuel injectors from the fuel rail.

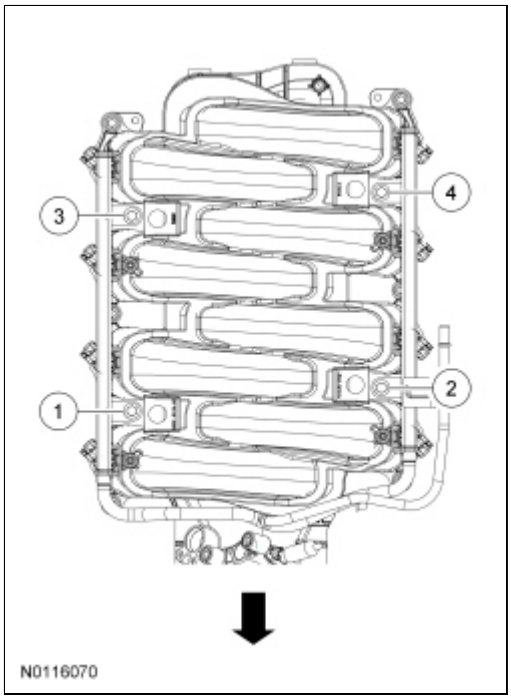
10. ***NOTICE:*** **Do not reuse the O-ring seals. Failure to follow this direction may cause the fuel system to leak.**

    Remove and discard the fuel injector O-ring seals.

Installation

1. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-ring seals may cause the fuel system to leak.**

   Install new O-ring seals on the fuel injectors.

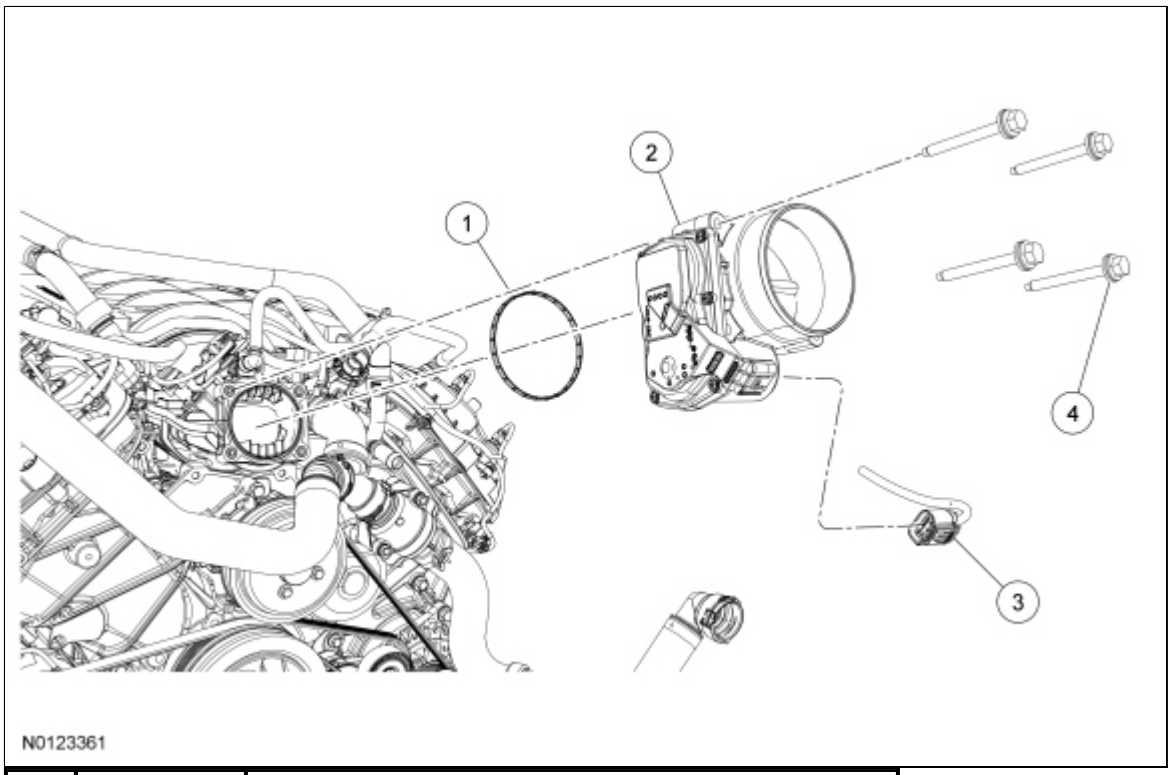


2. **NOTE:** The fuel injector clip can be reused if it is not damaged during removal. If the clip is reused, the 2 sides of the clip should be squeezed back into shape by placing it between index finger and thumb.

   NOTE: Lubricate the upper and lower fuel injector O-ring seals with clean engine oil prior to installation.

   Install the fuel injectors and retaining clips onto the fuel rail.

3. Install the fuel rail and fuel injectors as an assembly onto the intake manifold.



4. Install the 4 bolts and tighten in the sequence shown in 3 stages.
   - Stage 1: Hand tighten.
   - Stage 2: Tighten to 10 Nm (89 lb-in).
   - Stage 3: Tighten an additional 90 degrees.

5. Connect the fuel supply tube. For additional information, refer to the quick connect procedure in Section 310-00 .
6. Connect the 8 fuel injector electrical connectors.
7. Install the LH and RH fuel rail insulators.
8. Connect the 2 EVAP tube retaining clips to the fuel rail.
9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less

Throttle Body

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

The fuel charging and controls system consists of the following:

- Throttle Body (TB)
- Fuel injectors
- Fuel rail

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand, on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

Refer to Throttle Body in this section.

Fuel Injectors

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in the cylinder head.
- are deposit resistant.

For removal and installation, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

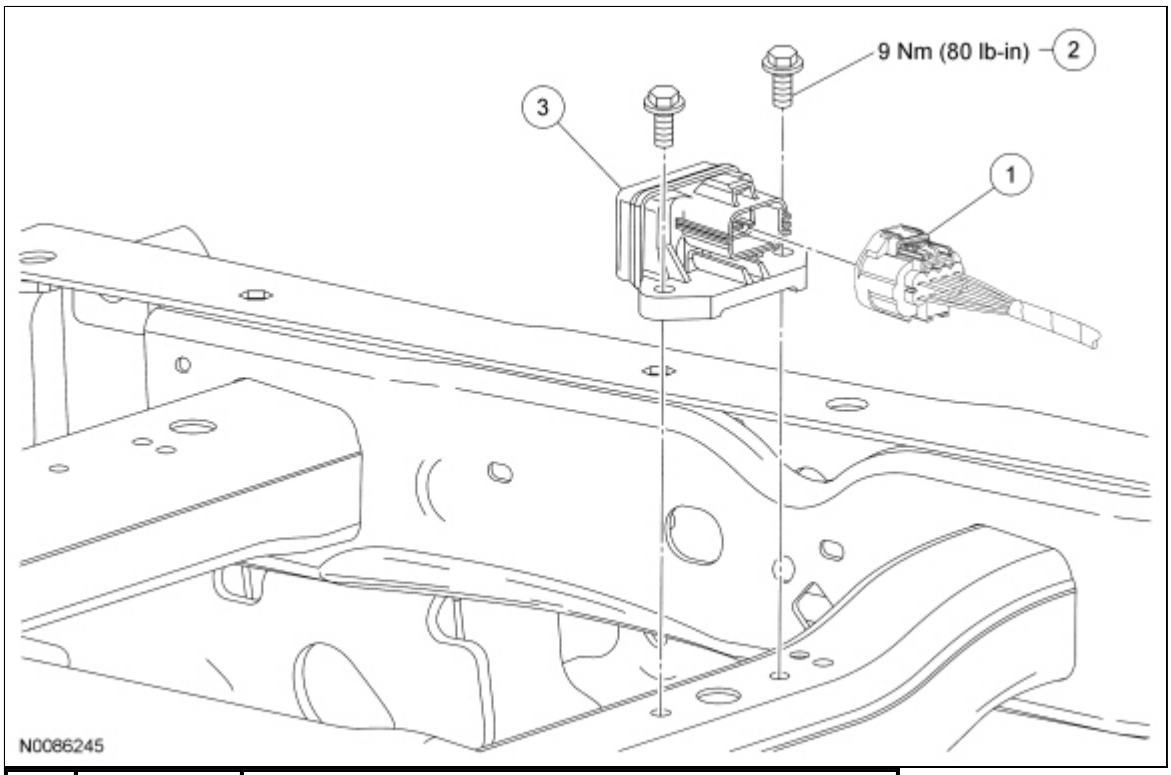
Fuel Rail

NOTICE: **The fuel injectors and the fuel rail must be handled with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.**

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

For removal and installation, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.



---

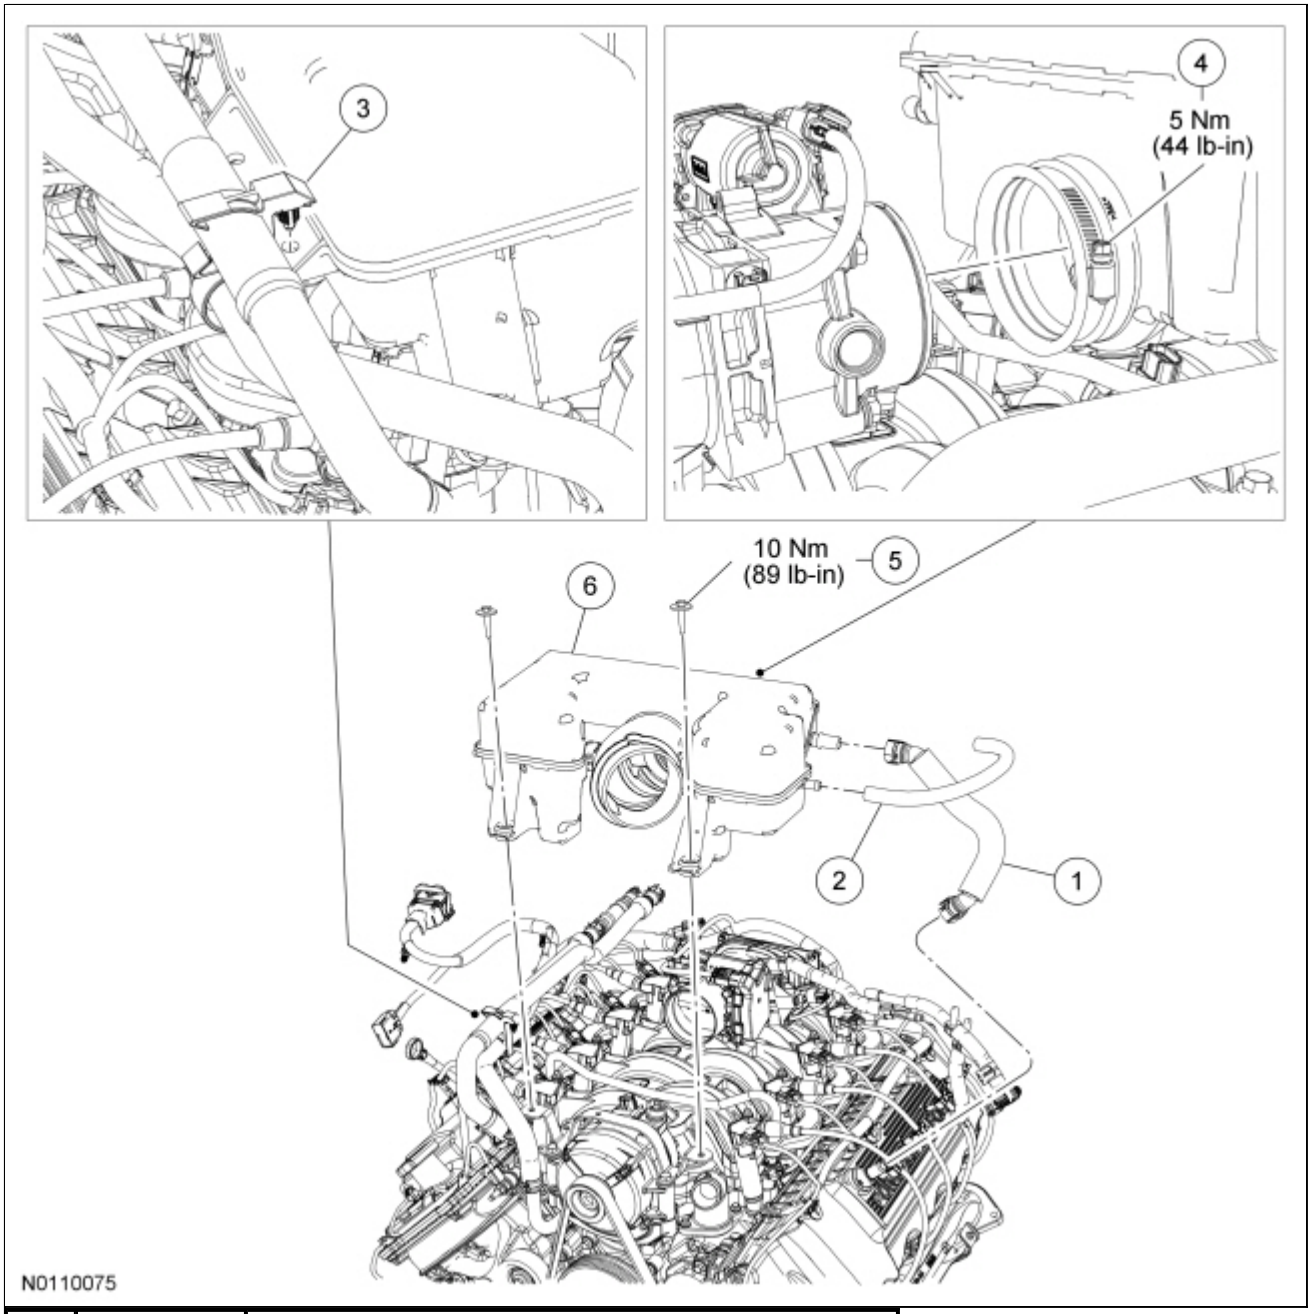
Fuel Injector

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector — Exploded View and Fuel Rail in this section.

Fuel Pump Control Module

Item	Part Number	Description
1	14A464	Fuel Pump (FP) control module electrical connector (part of 14404)
2	W705549	FP control module bolt (2 required)
3	9D412	FP control module



Removal and Installation

1. Disconnect the Fuel Pump (FP) control module electrical connector.
2. Remove the 2 bolts and the FP control module.
   - To install, tighten to 9 Nm (80 lb-in).
3. To install, reverse the removal procedure.

Fuel Rail

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.**

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.**

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the Air Cleaner (ACL) outlet tube. For additional information, refer to Section 303-12 .
3. Disconnect the heater coolant hose retainer from the ACL outlet pipe-to-Throttle Body (TB) adapter.
4. Disconnect the crankcase ventilation tube quick connect fitting from the ACL outlet pipe-to- TB adapter. For additional information, refer to Section 310-00 .
5. Disconnect the brake booster vacuum hose from the ACL outlet pipe-to- TB adapter.
6. Loosen the clamp and disconnect the TB adapter from the TB .
7. Remove the 2 bolts and the ACL outlet pipe-to- TB adapter.
8. Disconnect the fuel tube quick connect coupling. For additional information, refer to Section 310-00 .

9. Disconnect the 8 ignition coil electrical connectors.
10. Disconnect the 8 ignition wires from the 8 ignition coils.
11. Disconnect the 8 fuel injector electrical connectors.
12. Remove the 4 fuel rail bolts and the fuel rail and injectors as an assembly.
13. Remove the fuel injector-to-fuel rail locks and separate the 8 fuel injectors from the fuel rail.
    - Discard the upper and lower fuel injector O-ring seals.

Installation

1. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak.**

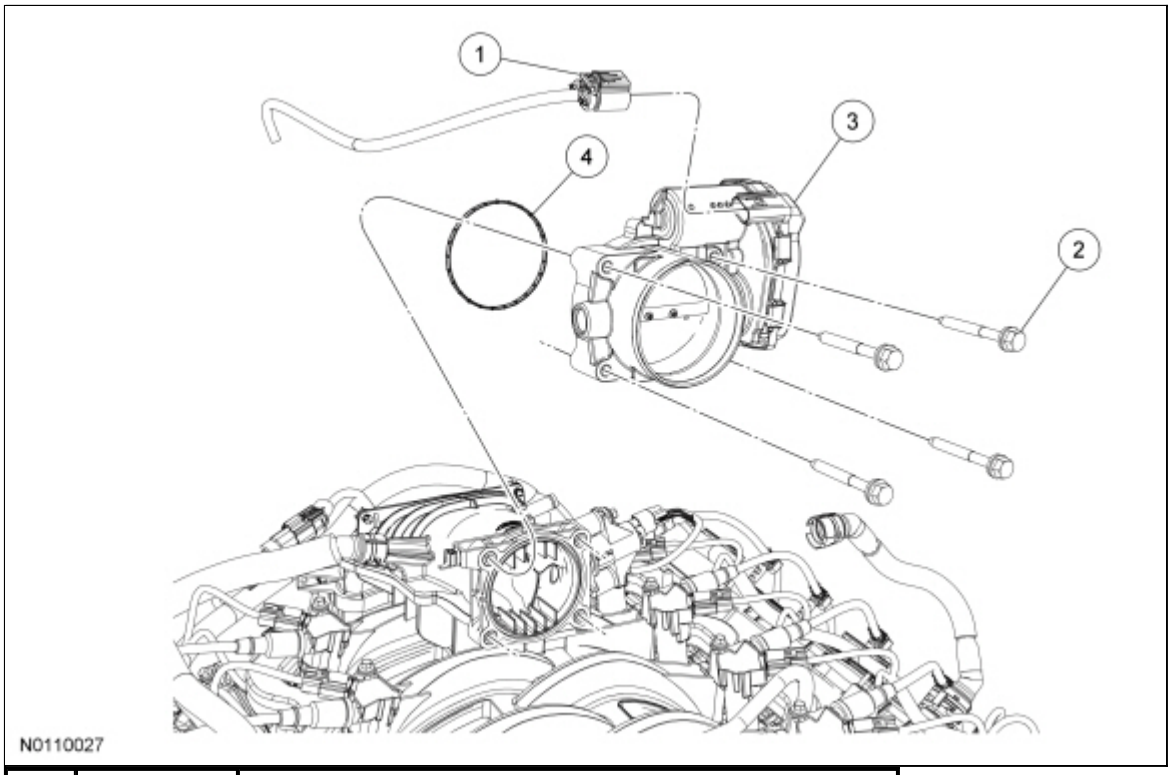
   NOTE: Lubricate the new O-ring seals with clean engine oil prior to installation.

   Install 16 new O-ring seals on each of the fuel injectors.
2. Assemble the 8 fuel injectors onto the fuel rail and install the 8 fuel injector retaining clips.
3. Install the fuel rail and fuel injectors as an assembly onto the intake manifold.
4. Install the 4 fuel rail bolts in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 90 degrees.
5. Connect the 8 fuel injector electrical connectors.
6. Connect the 8 ignition wires to the 8 ignition coils.
7. Connect the 8 ignition coil electrical connectors.
8. Connect the fuel tube quick connect coupling. For additional information, refer to Section 310-00 .
9. Position the ACL outlet pipe-to- TB adapter and install the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).
10. Tighten the TB adapter-to- TB clamp.
    - Tighten to 5 Nm (44 lb-in).
11. Connect the brake booster vacuum hose from the ACL outlet pipe-to- TB adapter.
12. Connect the crankcase ventilation tube quick connect fitting to the ACL outlet pipe-to- TB adapter. For additional information, refer to Section 310-00 .
13. Connect the heater coolant hose retainer to the ACL outlet pipe-to- TB adapter.
14. Install the ACL outlet tube. For additional information, refer to Section 303-12 .
15. Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less

Throttle Body

Air Cleaner (ACL) Outlet Pipe-to-Throttle Body (TB) Adapter



Item	Part Number	Description
1	6758	Crankcase ventilation tube
2	9C490	Brake booster vacuum hose

repair4less

3	—	Heater coolant hose position retainer
4	—	Throttle Body (TB) adapter-to- TB clamp (part of 9F805)

6	9A589	ACL outlet pipe-to- TB adapter

Throttle Body (TB)

Item	Part Number	Description
1	—	Electronic Throttle Control (ETC) electrical connector (part of 12B637)
2	N709168	Throttle Body (TB) bolt (4 required)
3	9F991	TB
4	9E936	TB O-ring seal

Removal

1. Remove the Air Cleaner (ACL) outlet tube. For additional information, refer to Section 303-12 .
2. Disconnect the heater coolant hose retainer from the ACL outlet pipe-to-Throttle Body (TB) adapter.
3. Disconnect the crankcase ventilation tube quick connect fitting from ACL outlet pipe-to- TB adapter. For additional information, refer to Section 310-00 .

4. Disconnect the brake booster vacuum hose from the ACL outlet pipe-to- TB adapter.

5. Remove the 2 bolts and the ACL outlet pipe-to- TB adapter.

6. Loosen the clamp and disconnect the TB adapter from the TB .

7. Disconnect the Electronic Throttle Control (ETC) electrical connector.

8. Remove the 4 bolts and the TB assembly.
    - Discard the TB O-ring seal.

Installation

1. Using a new O-ring seal, position the TB and tighten the 4 bolts in 2 stages.
    - Stage 1: Tighten to 12 Nm (106 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

2. Connect the ETC electrical connector.

3. Position the TB adapter onto the TB and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

4. Tighten the TB adapter-to- TB clamp.
    - Tighten to 5 Nm (44 lb-in).

5. Connect the crankcase ventilation tube quick connect coupling to the ACL outlet pipe-to- TB adapter. For additional information, refer to Section 310-00 .

6. Connect the brake booster vacuum hose to the ACL outlet pipe-to- TB adapter.

7. Connect the crankcase ventilation tube quick connect fitting to the ACL outlet pipe-to- TB adapter. For additional information, refer to Section 310-00 .

8. Connect the heater coolant hose retainer to the ACL outlet pipe-to- TB adapter.

9. Install the ACL outlet tube. For additional information, refer to Section 303-12 .

Turbocharger

NOTICE: **When removing the turbocharger air intake system components, cover the open ports to prevent debris from entering the system. The turbocharger compressor blades are susceptible to damage from even small particles. Inspect and clean all components if necessary, prior to installation or reassembly.**

The turbocharger assembly consists of LH and RH turbochargers.

The turbocharger is an exhaust-driven centrifugal air compressor used to increase power output by supplying compressed air to the engine. The internal components are oil, coolant and air cooled. Engine oil and coolant are circulated through the center housing which acts as a heat barrier between the hot turbine and the cold compressor. Bearings are sleeve type and lubricated by engine oil. Oil is circulated to the turbocharger center housing and returned to the sump through an oil drain in the center housing.

Expanding exhaust gases drive the turbine shaft assembly to speeds ranging from 10,000 to 185,000 rpm. Filtered air entering the compressor side of the turbocharger is compressed and delivered through a Charge Air Cooler (CAC). The very hot compressed air is cooled, then continues on to fill the intake manifold at a higher pressure than atmospheric pressure. Because more air is forced into the intake manifold, the results are increased power, fuel efficiency and the ability to maintain power at higher altitudes.

The EcoBoost™ twin turbochargers are used in a parallel arrangement with one turbocharger connected to each cylinder bank. This configuration improves engine responsiveness due to the reduced inertia of 2 small turbochargers. This also leads to an improved turbocharger package and better utilization of heat energy from the compact exhaust manifolds. The compact design of the system allows the catalysts to be located very close to the turbocharger outlet for improved emissions.

repair4less

Turbocharger

Principles of Operation

The turbocharger is an exhaust-driven centrifugal air compressor used to increase power output by supplying compressed air to the engine. The internal components are oil, coolant and air cooled. Engine oil and coolant are circulated through the center housing which acts as a heat barrier between the hot turbine and the cold compressor. Bearings are sleeve type and lubricated by engine oil. Oil is circulated to the turbocharger center housing and returned to the sump through an oil drain in the center housing.

Expanding exhaust gases drive the turbine shaft assembly to speeds ranging from 10,000 to 185,000 rpm. Filtered air entering the compressor side of the turbocharger is compressed and delivered through a Charge Air Cooler (CAC). The very hot compressed air is cooled, then continues on to fill the intake manifold at a higher pressure than atmospheric pressure. Because more air is forced into the intake manifold, the results are increased power, fuel efficiency and the ability to maintain power at higher altitudes.

Inspection and Verification

NOTE: This section provides mechanical diagnosis of the turbocharger assembly. If there is a Malfunction Indicator Lamp (MIL) illuminated, or DTCs are present, these should be diagnosed prior to performing turbocharger mechanical diagnosis. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

1. Verify the customer concern.

2. Inspect the entire turbocharger system for obvious signs of damage or other mechanical concerns, using the following chart.

   Visual Inspection Chart

Mechanical
• Oil inlet pipe and connection • Oil outlet pipe and connection • Compressor housing inlet circuit and piping • Compressor housing outlet circuit and piping • Turbine housing inlet circuit and piping • Turbine housing outlet circuit and piping • Turbocharger actuator tubing or linkage • Wastegate actuator rod

3. If the concern(s) remains after the inspection, GO to Symptom Chart.

4. If a driveability condition still exists, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Loss of power/performance	• Clogged Air Cleaner (ACL) element	• INSTALL a new ACL element. REFER to Section 303-12 . TEST the system for normal operation.
	• Loose connections or damage to air intake hoses and tubes	• TIGHTEN the hose clamps. INSPECT for damage and REPAIR as necessary.
	• Malfunctioning fuel system	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Poor fuel quality	• DRAIN and FILL with fresh fuel.
	• Engine wear (piston rings, valve guides)	• REPAIR as required.
	• Turbocharger turbine or compressor wheel damage	• INSPECT the turbocharger. REFER to the Check for Free Rotation — Off Vehicle in this section.
	• Damaged exhaust or exhaust leaks at turbocharger housing or exhaust manifolds	• INSPECT for leaks. Leaks can usually be detected audibly or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as required.
	• Malfunctioning turbocharger bypass valve	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Obstructed wastegate actuator linkage	• INSPECT the suspect turbocharger wastegate linkage for obstruction. REPAIR as necessary.
	• Damaged wastegate actuator linkage	• INSPECT the suspect turbocharger wastegate linkage for damage. INSTALL a new turbocharger.
	• Wastegate actuator operation	• TEST the wastegate actuator operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• PCM — DTCs	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED)

repair4less

		manual.
• Excessive oil consumption	• Incorrect type or grade of oil	• DRAIN and FILL with specified oil.
	• Oil in exhaust manifolds	• REPAIR as required.
	• Clogged ACL element	• INSTALL a new ACL element. REFER to Section 303-12 . TEST the system for normal operation.
	• Blocked or restricted turbocharger oil drain pipes	• INSPECT the turbocharger oil drain pipes. REPAIR as necessary.
	• Damaged or collapsed air intake hoses and tubes	• TIGHTEN hose clamps. INSPECT for damage and REPAIR as necessary.
	• Damaged exhaust or exhaust leaks at turbocharger housing or exhaust manifolds	• INSPECT for leaks. Leaks can usually be detected audibly or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as required.
	• Turbocharger oil seals leaking	• REFER to Turbocharger Internal Oil Leak Test in this section.
	• Damaged crankcase ventilation system	• Visually INSPECT the crankcase ventilation system.
• Excessive noise	• Turbocharger compressor air intake pipe leaking	• REPAIR or INSTALL a new pipe as required.
	• Loose connections or damage to air intake hoses and tubes	• TIGHTEN hose clamps. INSPECT for damage and REPAIR as necessary.
	• Air leaks at turbine housing, blown joints or damaged exhaust	• INSPECT for leaks. Leaks can usually be detected audibly or visually, by a discoloration caused by escaping hot exhaust gases. REPAIR as required.
	• Carbon build up in the turbine housing causing contact with turbine wheel	• INSPECT the turbocharger. REFER to the Check for Free Rotation — Off Vehicle in this section.
	• Turbocharger imbalance due to foreign object/damage	• REPAIR as required.
	• Turbine bearing failure	• INSPECT the turbocharger. REFER to the Check for Free Rotation — Off Vehicle in

		this section.
	• Change to the wastegate nut location	• INSPECT the turbocharger paint mark location. If the paint marks are not aligned, INSTALL a new turbocharger.
	• Inoperative turbocharger bypass valve	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Engine emits excessive smoke (black/blue/white)	• Clogged ACL element	• INSTALL a new ACL element. REFER to Section 303-12 . TEST the system for normal operation.
	• Incorrect type or grade of oil	• DRAIN and FILL with specified oil.
	• Blocked or restricted turbocharger oil drain pipes	• INSPECT the turbocharger oil drain pipes. REPAIR as necessary.
	• Damaged/restricted or leaking turbocharger compressor air intake pipe	• REPAIR or INSTALL a new pipe as required.
	• Engine wear (piston rings, valve guides)	• REPAIR as required.
	• Plugged crankcase ventilation system	• Visually INSPECT the crankcase ventilation system.
	• Turbocharger oil seals leaking	• REFER to Turbocharger Internal Oil Leak Test in this section.

Component Tests

Turbocharger Internal Oil Leak Test

NOTE: Some engine oil may be present in the turbocharger compressor inlet and in the air inlet components due to the crankcase breather system.

Check the turbocharger compressor inlet for evidence of oil. If excessive oil is present, this indicates that the failure could be in the engine or turbocharger. Refer to Section 303-00 or the following turbocharger check. If excessive oil is found in the turbocharger compressor outlet, check the Charge Air Cooler (CAC) for oil contamination. If contamination is present, flush the CAC . Refer to Section 303-12 .

Check the turbocharger turbine outlet for evidence of oil. If excess oil is present in the outlet, remove the turbocharger from the engine and examine the oil supply and return passages in the turbocharger and engine block for restriction. If no restriction is found, install a new turbocharger.

repair4less

Check for Free Rotation — Off Vehicle

NOTE: Pre-oil the turbocharger before carrying out this check.

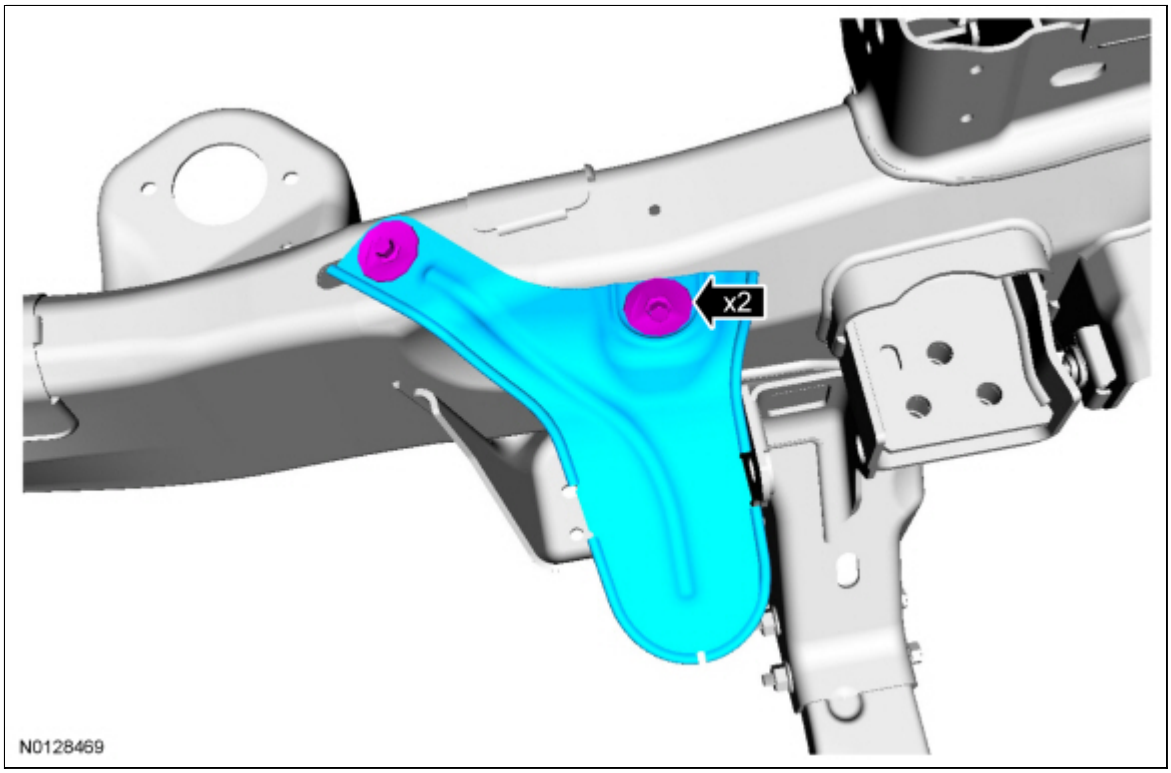
NOTE: Turbine and compressor wheels must spin freely when turned by hand. No housing contact is permitted.

Inspect the turbocharger compressor and turbine blades for damage. If the compressor or turbine wheel blades are damaged, replace the turbocharger.

Press and rotate the turbocharger shaft, then repeat from the opposite side. If either the compressor or the turbine wheel blades contact the housing, the bearings are worn or damaged and a new turbocharger must be installed.

Turbocharger — LH

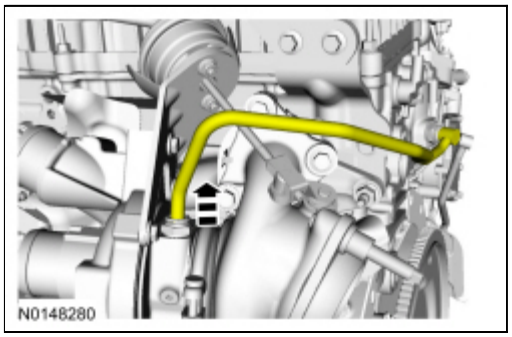
Material



Item	Specification
Motorcraft® High Temperature Nickel Anti-Seize Lubricant XL-2	—
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A

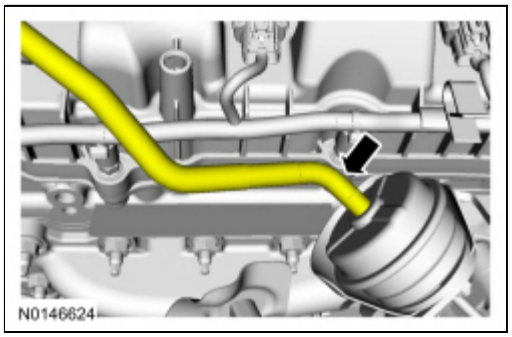
Removal

NOTICE: **Whenever turbocharger air intake system components are removed, always cover open ports to protect from debris. It is important that no foreign material enter the system. The turbocharger compressor blades are susceptible to damage from even small particles. All components should be inspected and cleaned, if necessary, prior to installation or reassembly.**



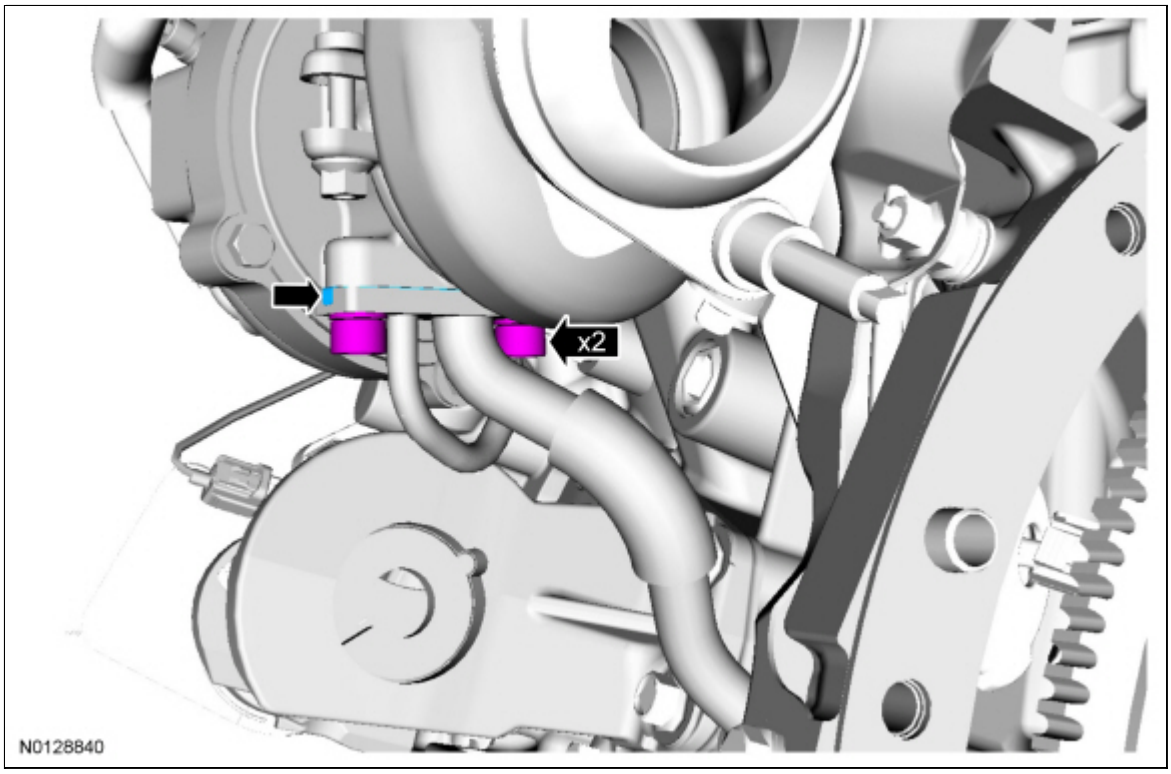
1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Drain the engine cooling system. Refer to Section 303-03 .
3. Remove the Air Cleaner (ACL) outlet pipe, LH ACL pipe-to-turbocharger pipe, LH turbocharger bypass hose and the LH turbocharger-to-Charge Air Cooler (CAC) pipe. Refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .
4. Remove the LH catalytic converter. Carry out the exhaust Y-pipe - dual catalytic converter procedure. Refer to Section 309-00 .
5. If equipped, remove the 2 exhaust system heat shield bolts and the exhaust system heat shield.

repair4less

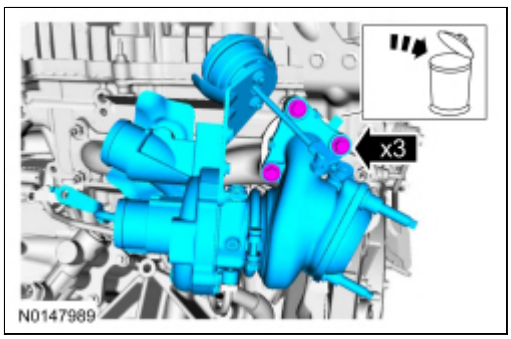


6. **NOTE:** Position a drain pan prior to disconnecting the turbocharger coolant supply tube.

   Using a commercially available quick disconnect tool, disconnect the turbocharger coolant supply tube at the turbocharger.
   - Position the coolant supply tube aside.

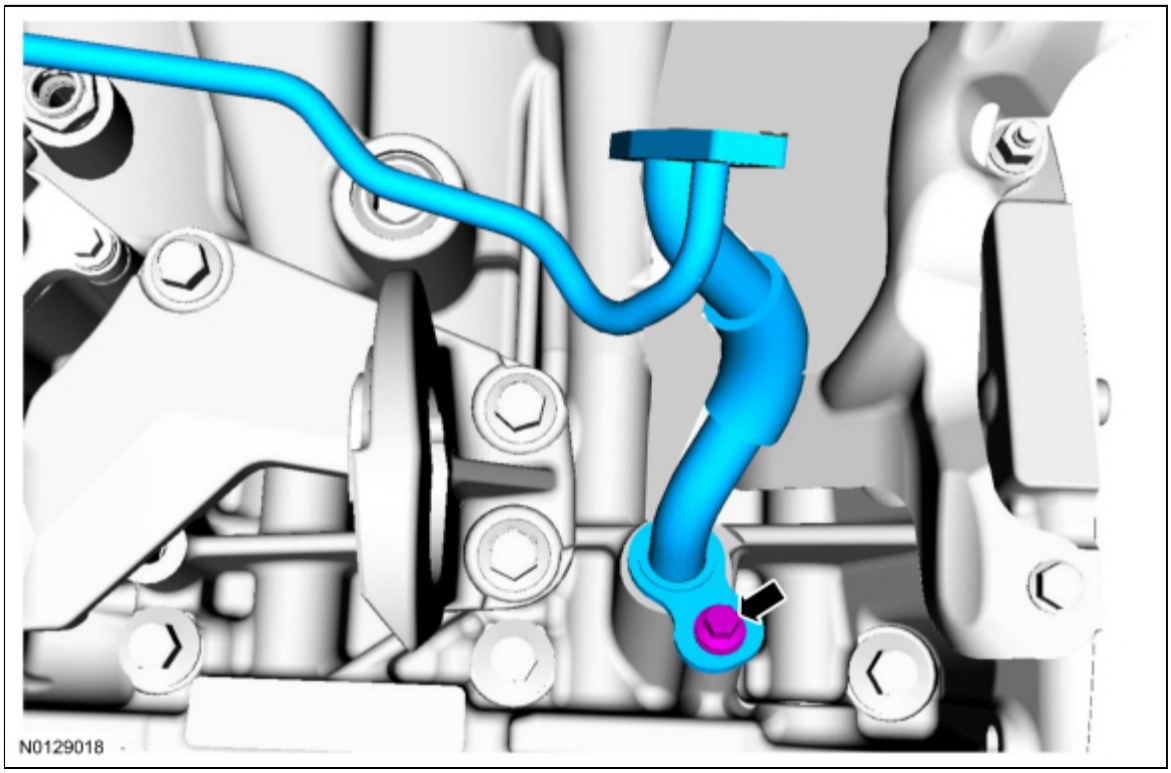


7. Disconnect the wastegate hose.

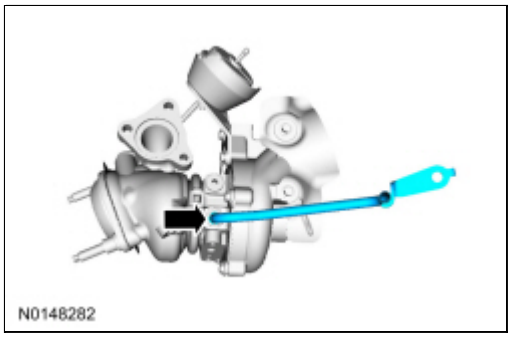


8. Remove the bolt for the LH turbocharger coolant and oil tubes.

9. Remove the 2 bolts at the LH turbocharger oil return tube.
    - Remove and discard the turbocharger oil return tube assembly gasket.

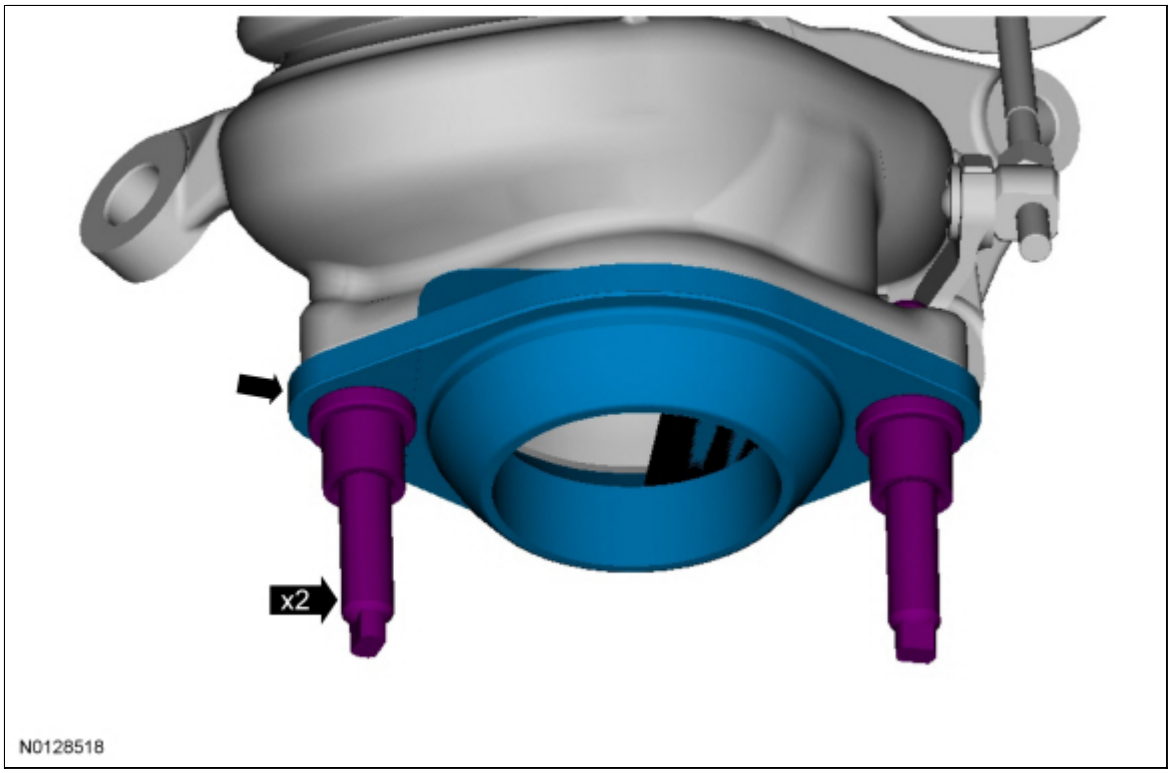


10. Remove the 3 turbocharger mounting bolts and the turbocharger.
    - Discard the turbocharger exhaust manifold gasket.



repair4less

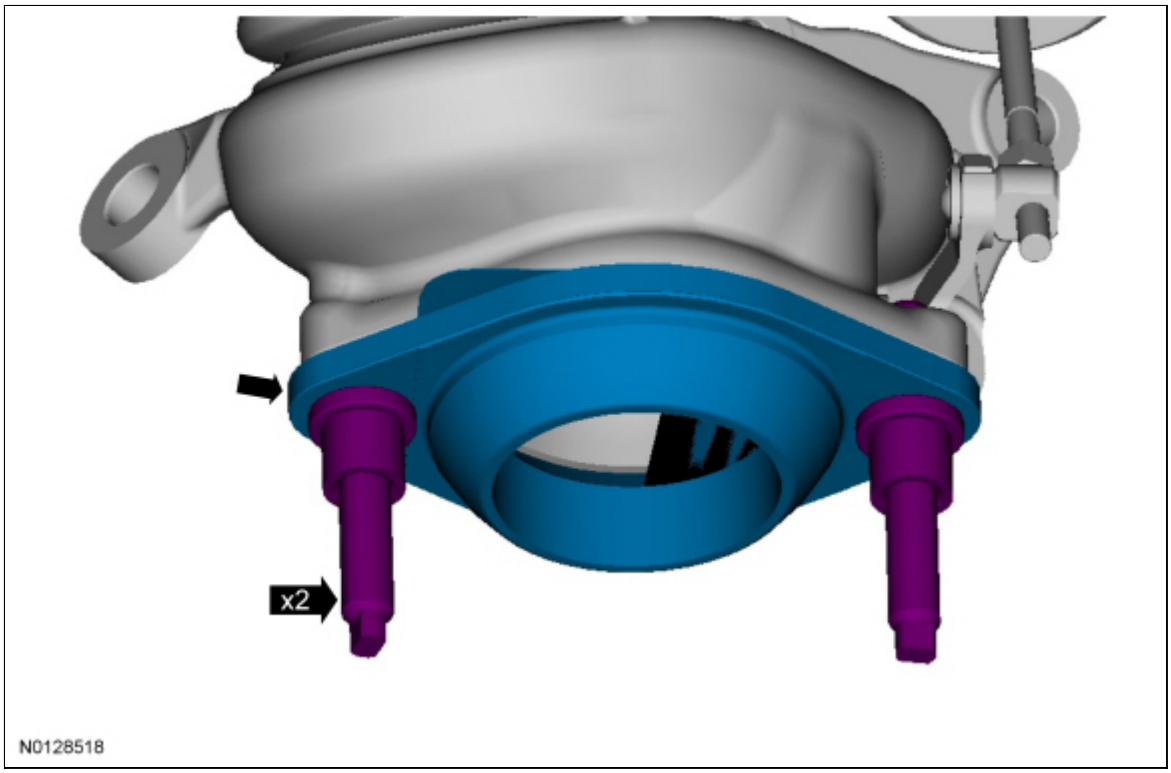
11. Remove the bolt and the turbocharger oil return tube assembly.
    - Remove and discard the turbocharger oil return tube O-ring seal.



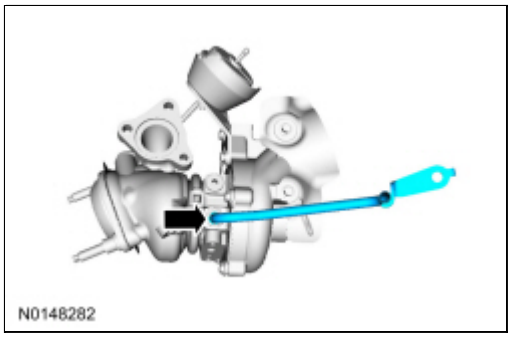
12. **NOTE:** If it is necessary to remove the turbocharger coolant tube, use a commercially available quick disconnect tool to disconnect the turbocharger coolant tube at the turbocharger.

    If necessary, remove the turbocharger coolant tube.

13. If necessary, remove the 2 turbocharger exhaust flange stud bolts and the turbocharger exhaust flange.
    - Discard the 2 turbocharger exhaust flange stud bolts and the turbocharger exhaust flange gasket.



Installation

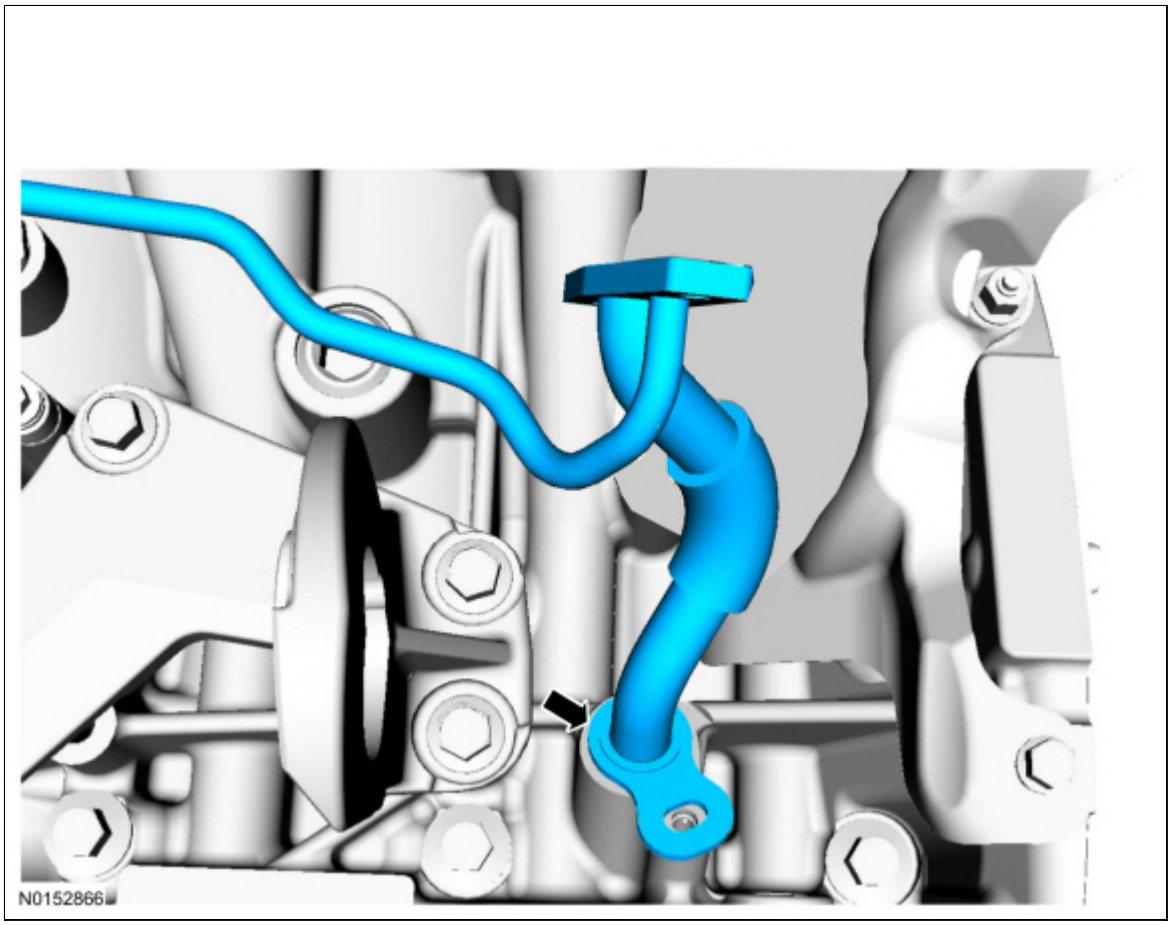


1. **NOTE:** Apply high temperature nickel anti-seize lubricant to the turbocharger exhaust flange stud bolt threads prior to installation of the turbocharger exhaust flange.

   If removed, using a new turbocharger exhaust flange gasket, install the turbocharger exhaust flange and the 2 new turbocharger exhaust flange stud bolts.
   - Tighten to 40 Nm (30 lb-ft).

repair4less

2. If removed, install the turbocharger coolant tube.

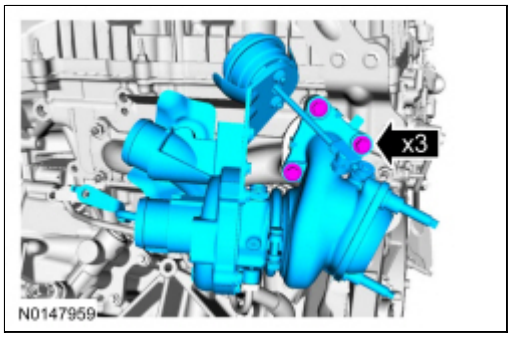


3. **NOTE:** Lubricate the cylinder block bore with clean engine oil.

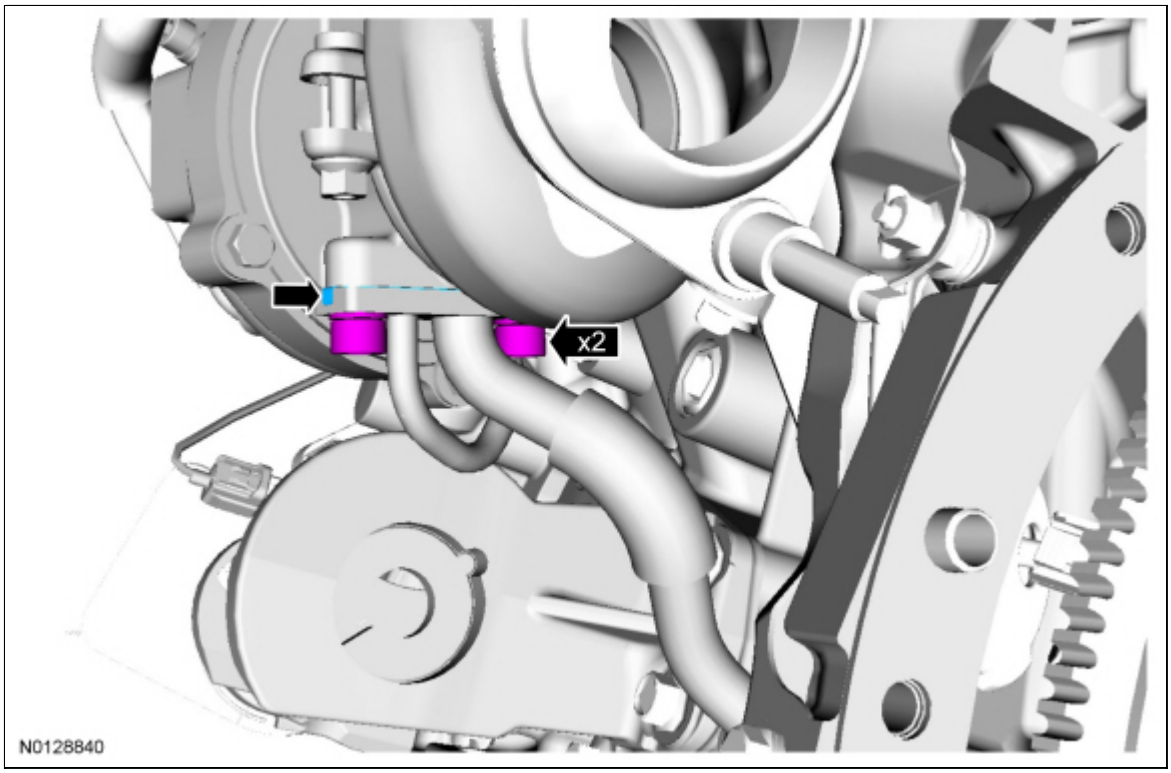
   NOTE: Apply clean engine oil to the turbocharger oil return tube O-ring seal.

   NOTE: Make sure the turbocharger oil supply tube is positioned in the cylinder block during the installation of the turbocharger oil return tube assembly.

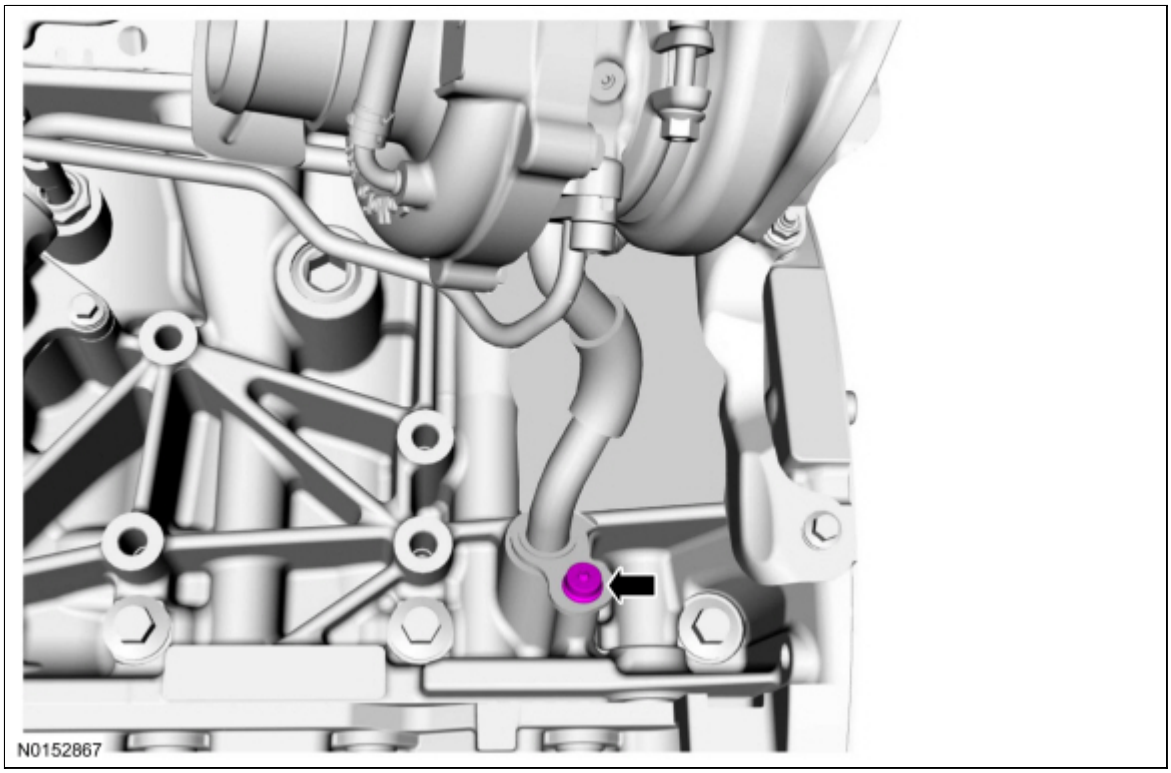
   Using a new turbocharger oil return tube O-ring seal, install the turbocharger oil return tube assembly.



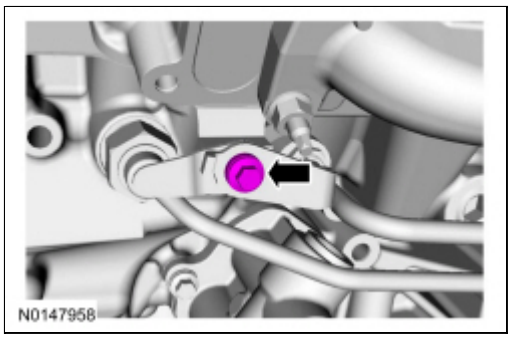
4. Using a new turbocharger exhaust manifold gasket, install the LH turbocharger and the 3 turbocharger mounting bolts.
    - Tighten finger tight.



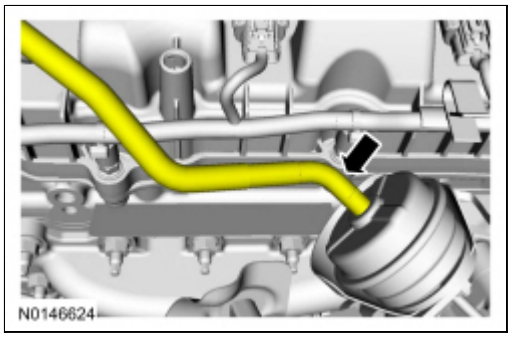
5. Tighten the 3 turbocharger mounting bolts.
    - Tighten to 32 Nm (24 lb-ft).



repair4less

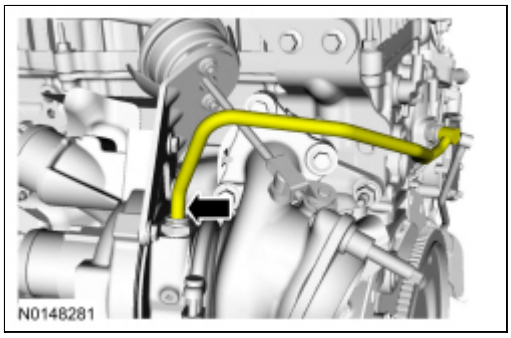


6. Using a new turbocharger oil return tube gasket, install the 2 turbocharger center housing bolts at the turbocharger. Tighten in the following stages:
    - Stage 1: Install the bolt for the oil pressure tube side halfway.
    - Stage 2: Install the bolt for the oil drain tube side and tighten to 10 Nm (89 lb-in).
    - Stage 3: Tighten the bolt for the oil drain tube side an additional 30 degrees.
    - Stage 4: Tighten the bolt for the oil pressure tube side to 10 Nm (89 lb-in).
    - Stage 5: Tighten the bolt for the oil pressure tube side an additional 30 degrees.

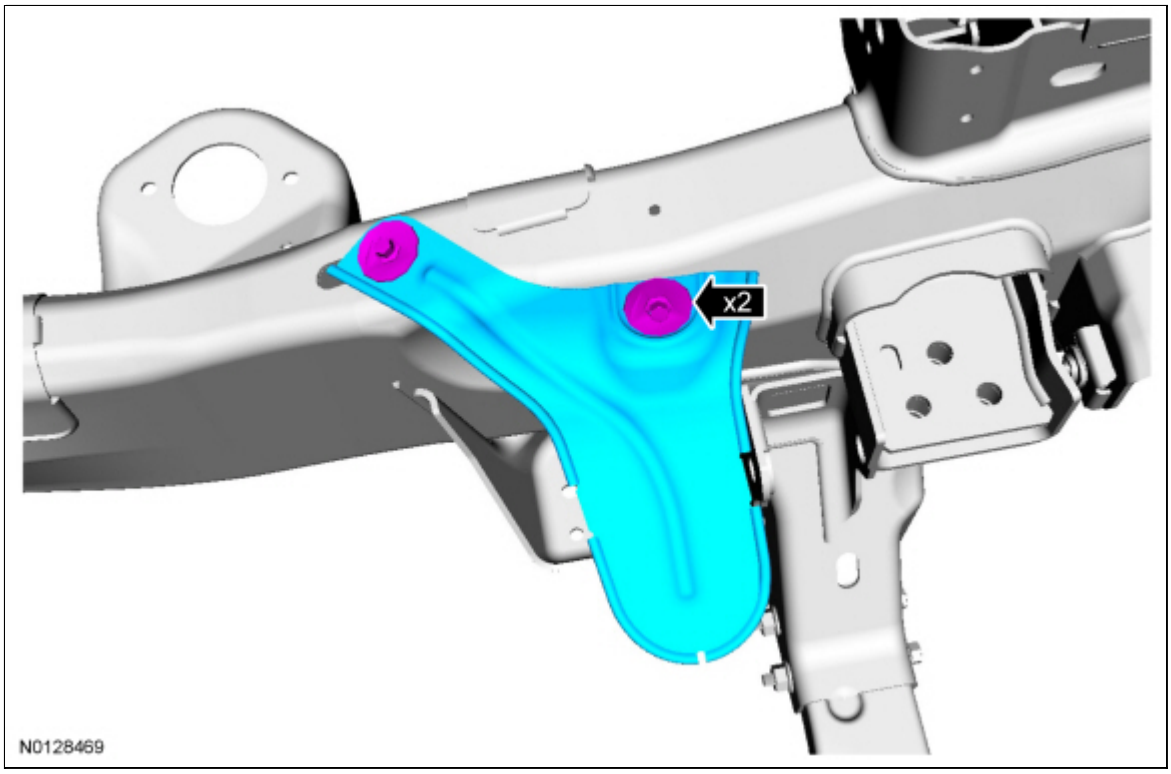


7. Install the turbocharger oil return tube bolt at the cylinder block. Tighten in the following stages:
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

8. Install the bolt for the LH turbocharger coolant and oil tubes. Tighten in the following stages:
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.



9. Connect the wastegate hose.



10. Connect the turbocharger coolant supply tube to the turbocharger.

repair4less

11. If equipped, install the exhaust system heat shield and the 2 exhaust system heat shield bolts.
    - Tighten to 20 Nm (177 lb-in).

12. Install the LH catalytic converter. Carry out the exhaust Y-pipe - dual catalytic converter procedure. Refer to Section 309-00 .

13. Install the ACL outlet pipe, LH ACL pipe to-turbocharger pipe, LH turbocharger bypass hose and the LH turbocharger-to- CAC pipe. Refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

14. Fill the engine cooling system. Refer to Section 303-03 .

repair4less

Turbocharger — RH

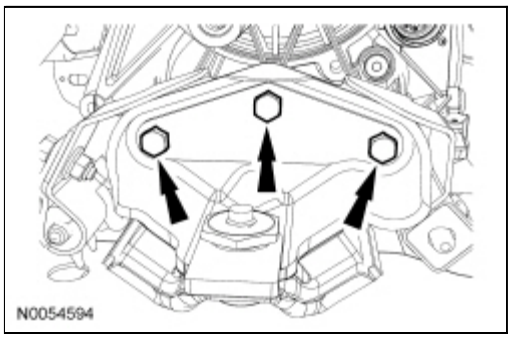
Removal

NOTICE: **Whenever turbocharger air intake system components are removed, always cover open ports to protect from debris. It is important that no foreign material enter the system. The turbocharger compressor blades are susceptible to damage from even small particles. All components should be inspected and cleaned, if necessary, prior to installation or reassembly.**

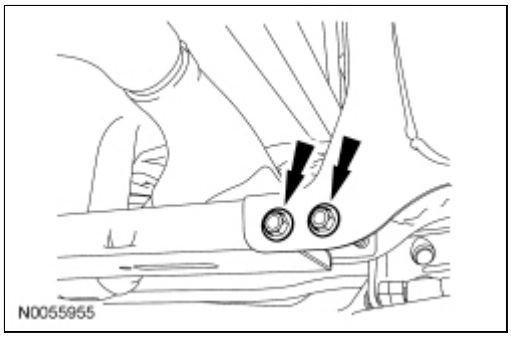
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Drain the engine cooling system. Refer to Section 303-03 .
3. Remove the Air Cleaner (ACL) outlet pipe, RH ACL pipe to-turbocharger pipe, RH turbocharger bypass hose and the RH turbocharger-to-Charge Air Cooler (CAC) pipe. Refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .
4. Remove the Air Conditioning (A/C) compressor belt. Refer to Section 303-05 .
5. Remove the 3 A/C compressor bolts and position the A/C compressor aside.



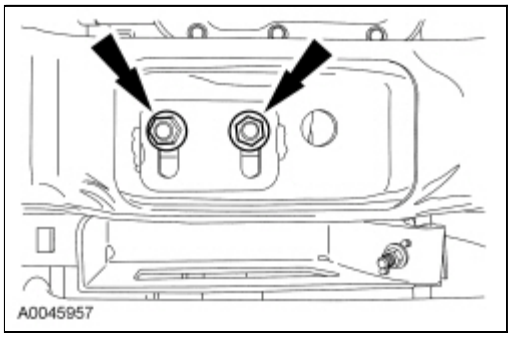
6. Remove the exhaust Y-pipe - dual catalytic converter. Refer to Section 309-00 .

Rear Wheel Drive (RWD) vehicles



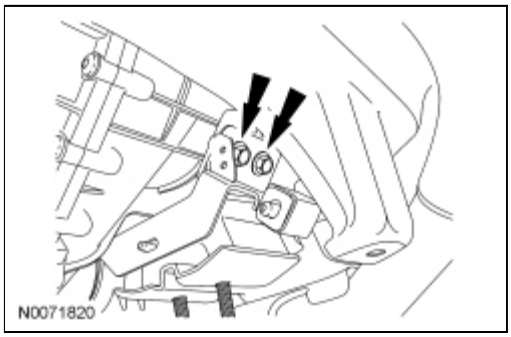
NOTE: The exhaust Y-pipe - dual catalytic converter procedure requires the removal of the transmission insulator and retainer and the transmission crossmember. The transmission insulator and retainer and the transmission crossmember must be installed to continue the procedure.

7. Install the transmission insulator and retainer and the 3 transmission insulator and retainer bolts.
   - Tighten to 90 Nm (66 lb-ft).

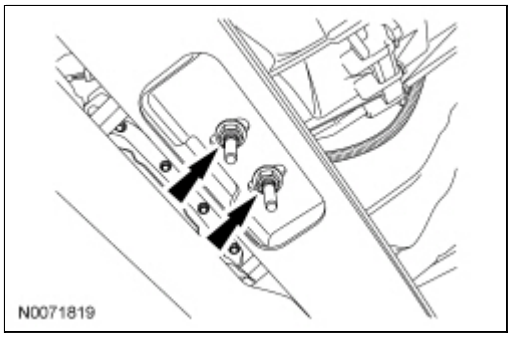


8. Install the transmission crossmember and the 4 transmission crossmember nuts and bolts (2 each side).
   - Tighten to 90 Nm (66 lb-ft).

repair4less

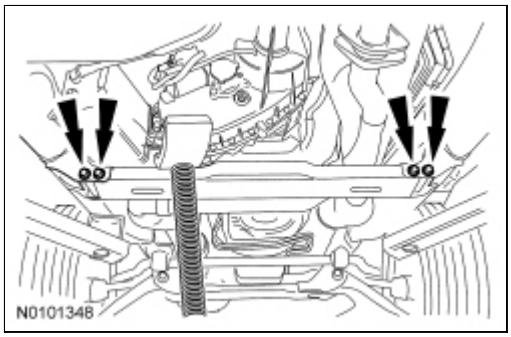


9. Lower the transmission onto the transmission crossmember and install the 2 transmission insulator and retainer nuts.
    - Tighten to 103 Nm (75 lb-ft).



Four-Wheel Drive (4WD)

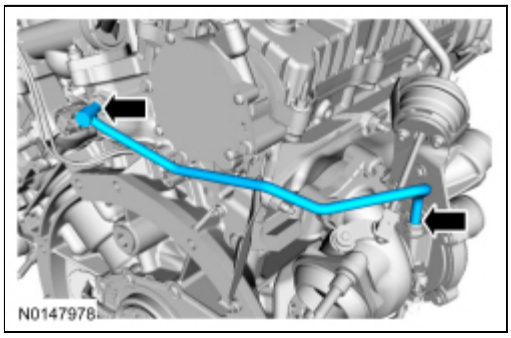
NOTE: The exhaust Y-pipe - dual catalytic converter procedure requires the removal of the transmission insulator and retainer and the transmission crossmember. The transmission insulator and retainer and the transmission crossmember must be installed to continue the procedure.



10. Loosely install the transmission insulator and retainer and the 4 transmission insulator and retainer bolts.

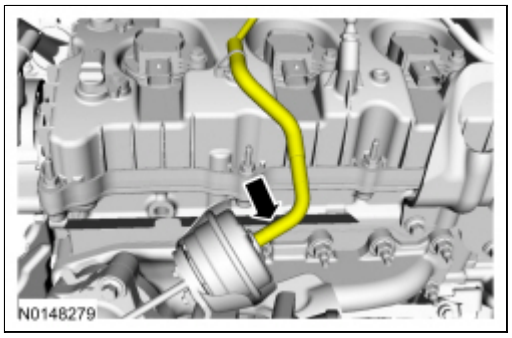
11. Position the transmission crossmember and loosely install the 2 transmission insulator and retainer nuts.

12. Install the 4 transmission crossmember bolts and nuts.
    - Tighten the transmission insulator and retainer bolts to 90 Nm (66 lb-ft).
    - Tighten the transmission crossmember bolts and nuts to 90 Nm (66 lb-ft).
    - Tighten the transmission insulator and retainer nuts to 103 Nm (75 lb-ft).



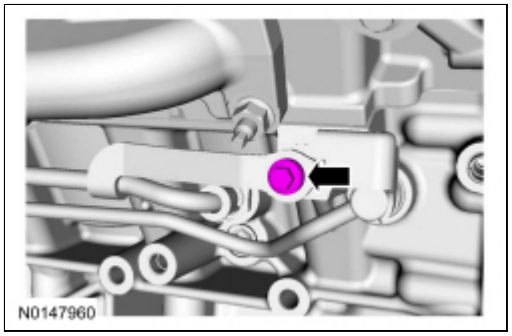
All vehicles

13. Remove the starter. Refer to Section 303-06 .

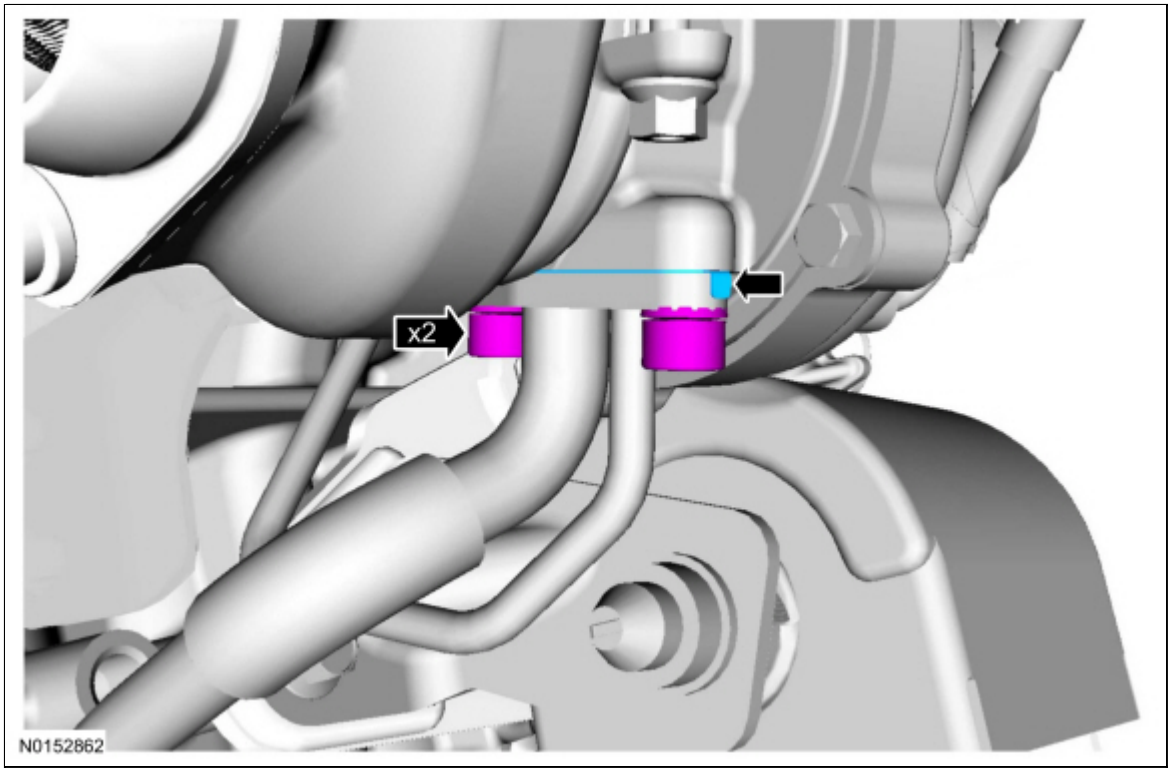


14. **NOTE:** Position a drain pan prior to disconnecting the turbocharger coolant supply tube.

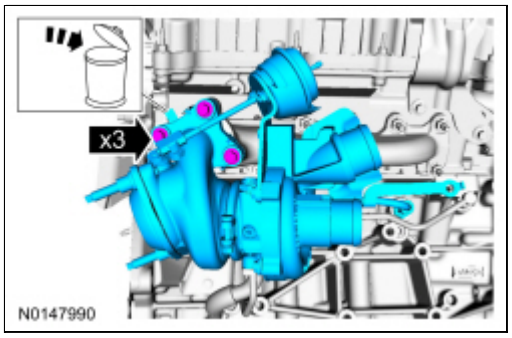
    Using a commercially available quick disconnect tool, remove the turbocharger coolant supply tube.



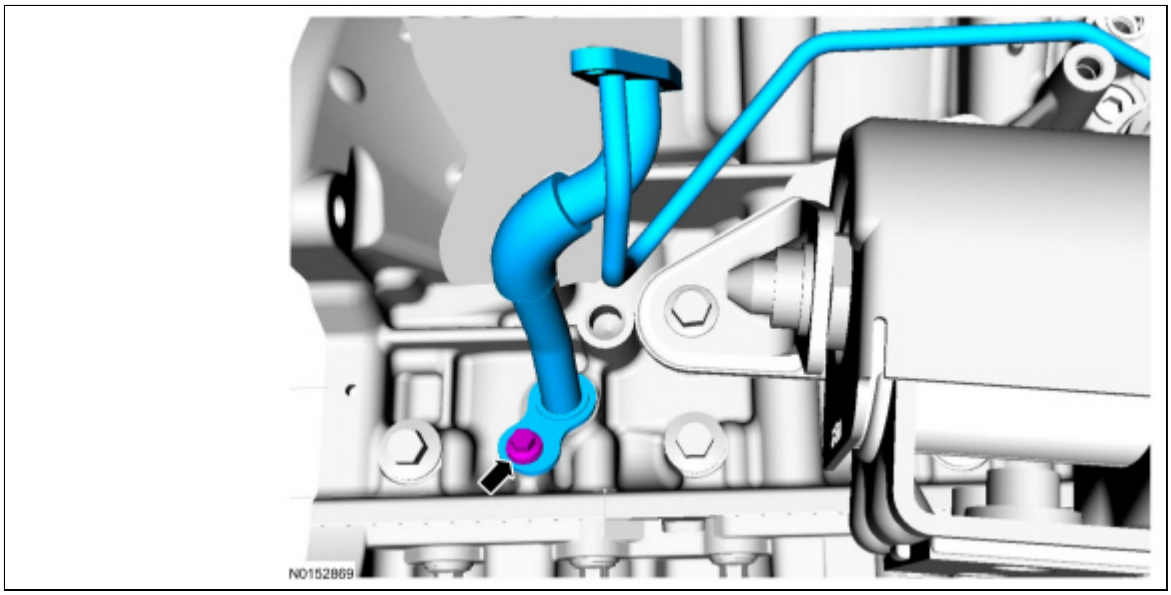
15. Disconnect the wastegate hose.



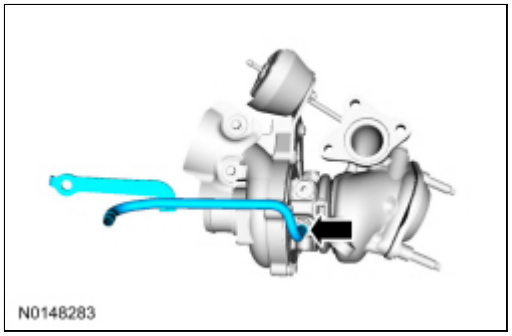
repair4less



16. Remove the bolt for the RH turbocharger coolant and oil tubes.

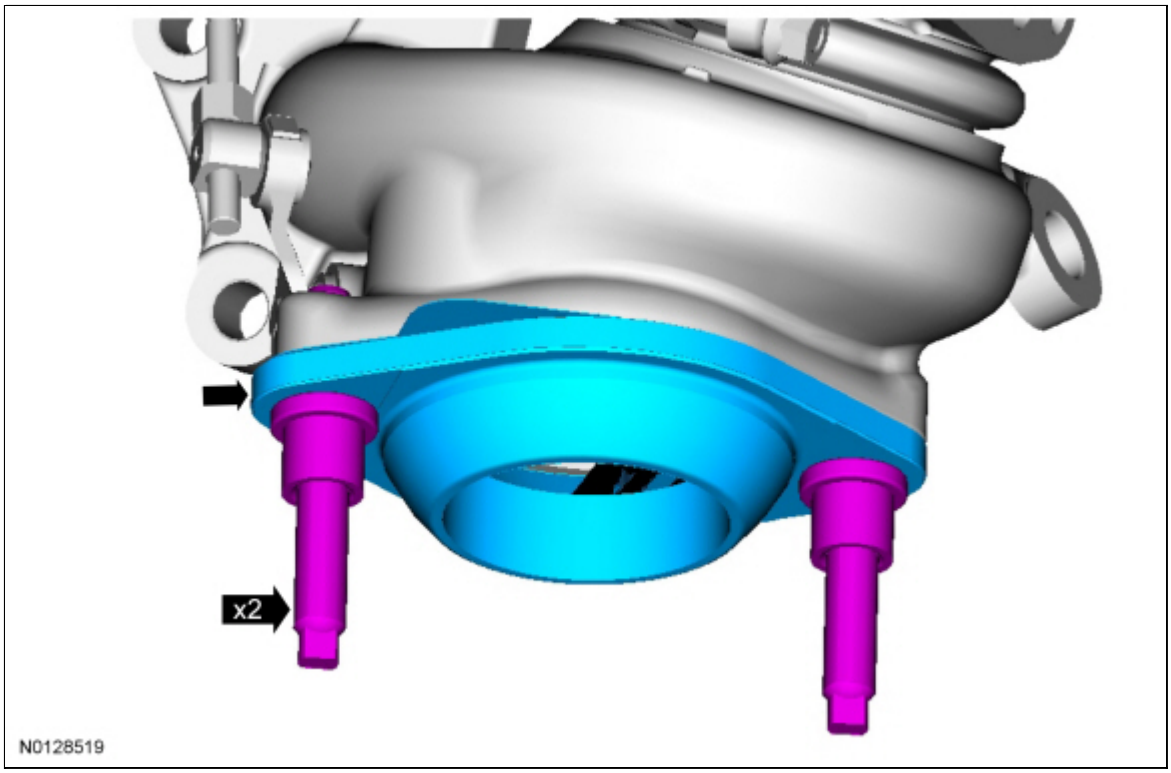


17. Remove the 2 bolts for the turbocharger oil return tube assembly.
    - Remove and discard the turbocharger oil return tube gasket.



18. Remove the 3 turbocharger mounting bolts and the turbocharger.
    - Discard the turbocharger exhaust manifold gasket.

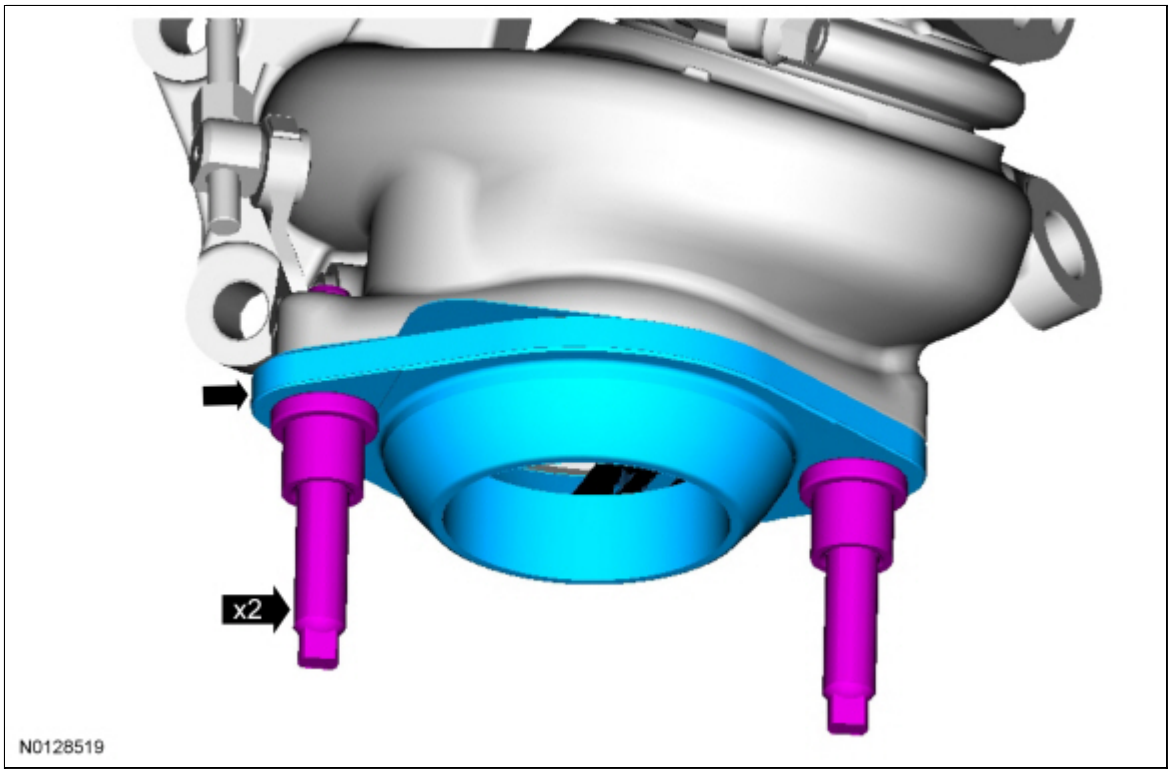
19. Remove the bolt and the RH turbocharger oil return tube.
    - Remove and discard the turbocharger oil return tube O-ring seal.



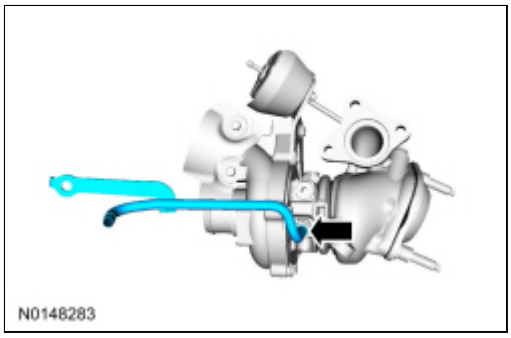
20. If necessary, using a commercially available quick disconnect tool, remove the turbocharger coolant tube.

21. If necessary, remove the 2 turbocharger exhaust flange stud bolts and the turbocharger exhaust flange.
    - Discard the 2 turbocharger exhaust flange stud bolts and the turbocharger exhaust flange gasket.

repair4less



Installation

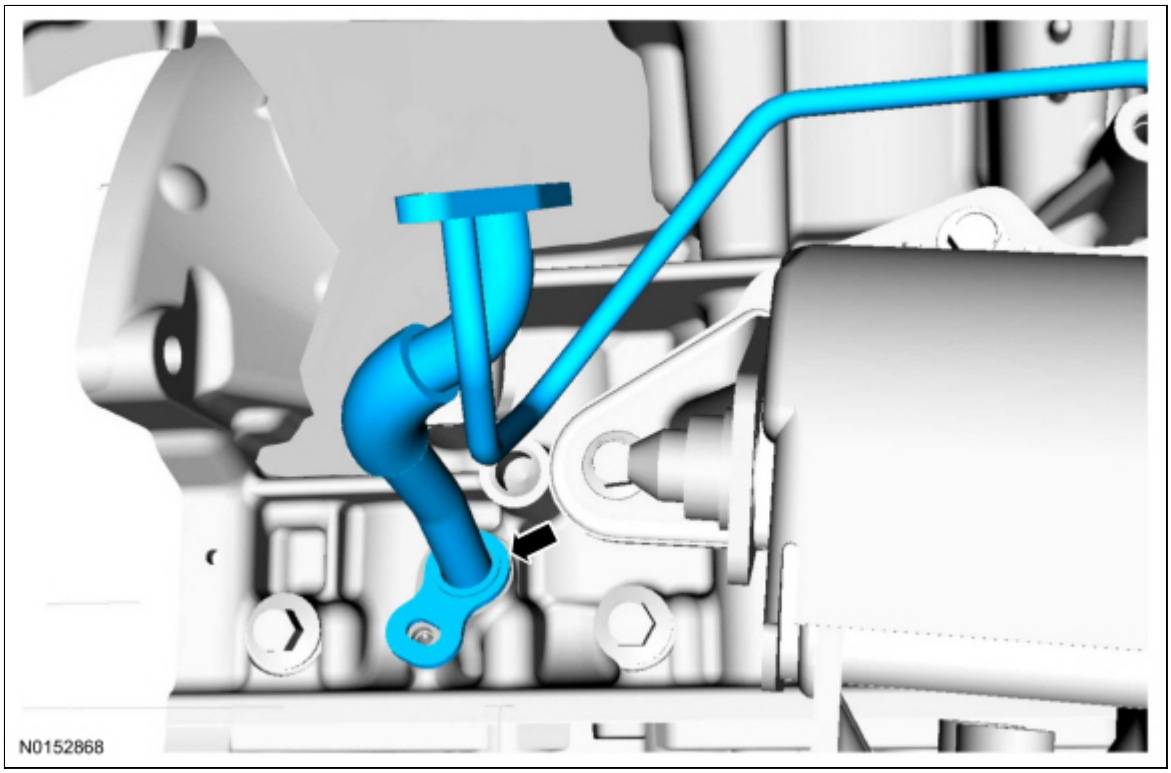


All vehicles

1. **NOTE:** Apply high temperature nickel anti-seize lubricant to the turbocharger exhaust flange stud bolt threads prior to installation of the turbocharger exhaust flange.

   If removed, using a new turbocharger exhaust flange gasket, install the turbocharger exhaust flange and the 2 new turbocharger exhaust flange stud bolts.
   - Tighten to 40 Nm (30 lb-ft).

2. If removed, install the turbocharger coolant tube.

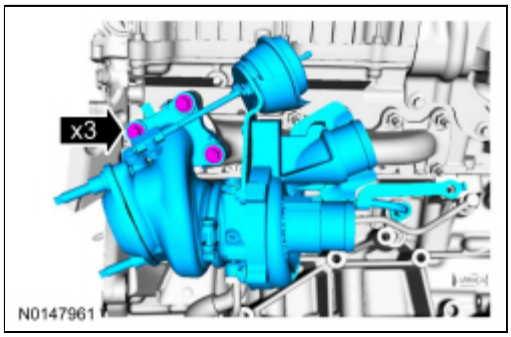


3. **NOTE:** Lubricate the cylinder block bore with clean engine oil.

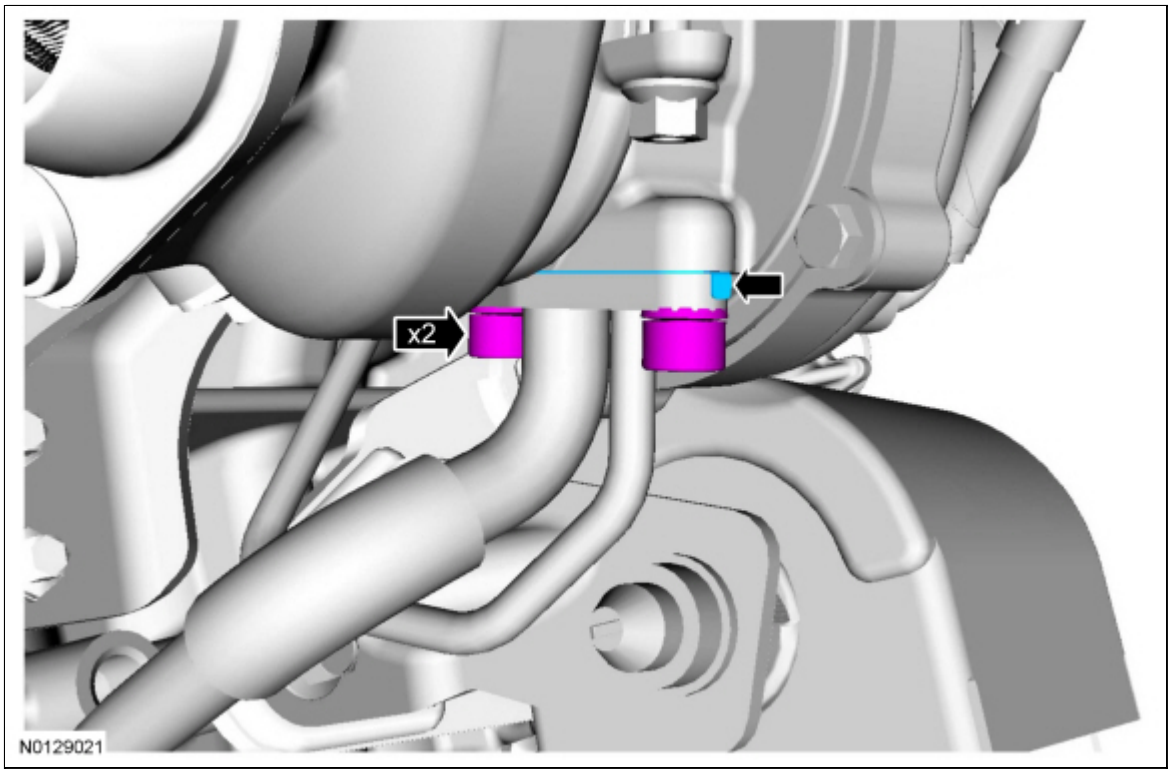
   NOTE: Apply clean engine oil to the turbocharger oil return tube O-ring seal.

   NOTE: Make sure the turbocharger oil supply tube is positioned in the cylinder block during the installation of the turbocharger oil return tube assembly.

   Using a new turbocharger oil return tube O-ring seal, install the turbocharger oil return tube assembly.

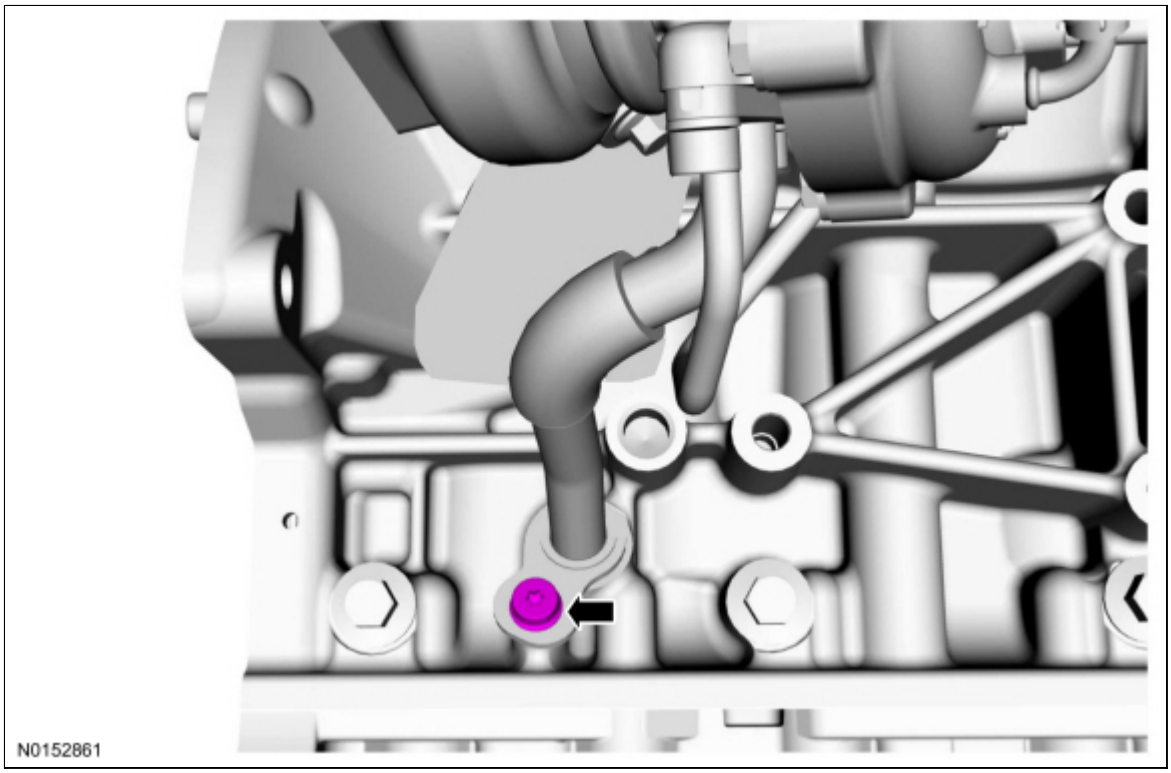


repair4less

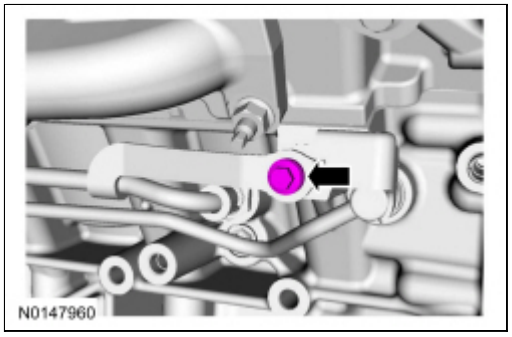


4. Using a new turbocharger exhaust manifold gasket, install the RH turbocharger and the 3 turbocharger mounting bolts.
    - Tighten finger tight.

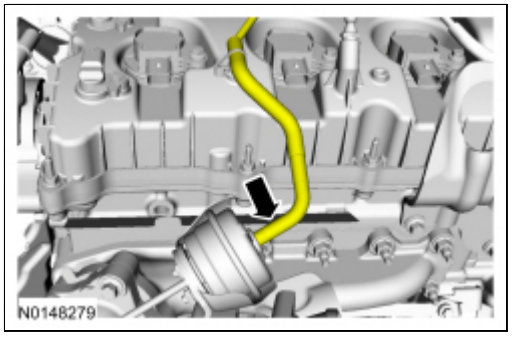
5. Tighten the 3 turbocharger mounting bolts.
    - Tighten to 32 Nm (24 lb-ft).



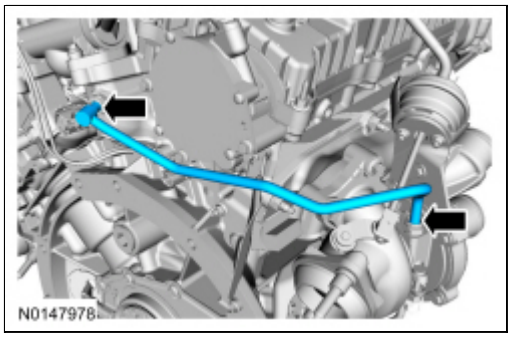
6. Using a new turbocharger oil return tube gasket, install the 2 turbocharger center housing bolts at the turbocharger. Tighten in the following stages:
    - Stage 1: Install the bolt for the oil pressure tube side halfway.
    - Stage 2: Install the bolt for the oil drain tube side and tighten to 10 Nm (89 lb-in).
    - Stage 3: Tighten the bolt for the oil drain tube side an additional 30 degrees.
    - Stage 4: Tighten the bolt for the oil pressure tube side to 10 Nm (89 lb-in).
    - Stage 5: Tighten the bolt for the oil pressure tube side an additional 30 degrees.



7. Install the turbocharger oil return tube bolt at the cylinder block. Tighten in the following stages:
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

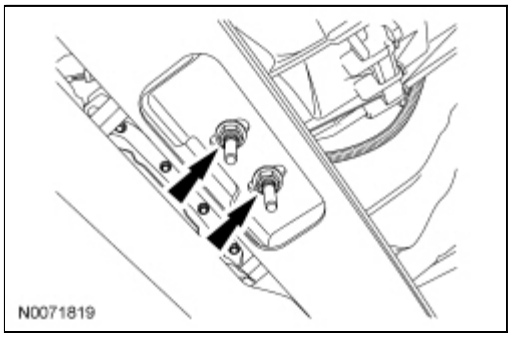


repair4less



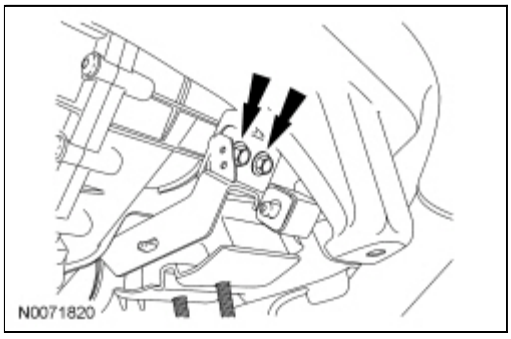
8. Install the bolt for the RH turbocharger coolant and oil tubes. Tighten in the following stages:
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

9. Connect the wastegate hose.



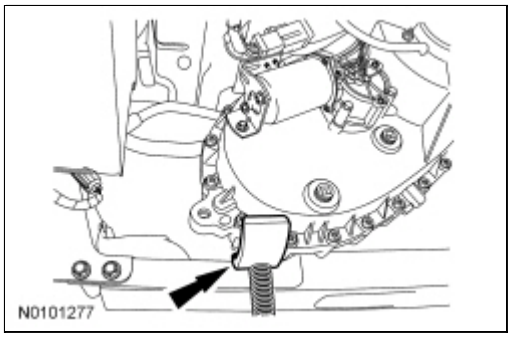
10. Install the turbocharger coolant supply tube.

11. Install the starter. Refer to Section 303-06 .



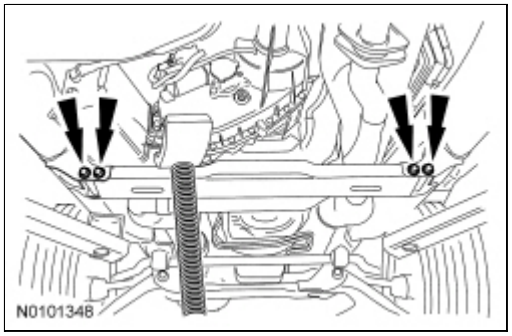
4WD vehicles

12. Remove the 2 transmission insulator and retainer nuts.



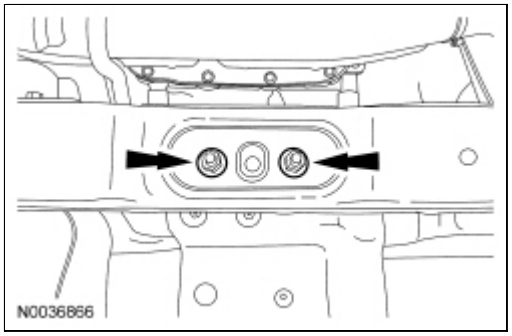
13. **NOTE:** Right side shown, left side similar. Transmission crossmember removed for clarity.

    Remove the 4 transmission insulator and retainer bolts.



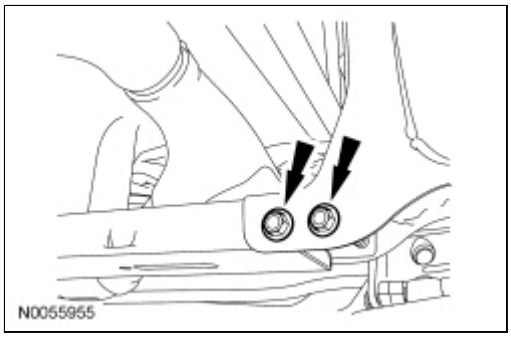
14. Support the transfer case.

repair4less



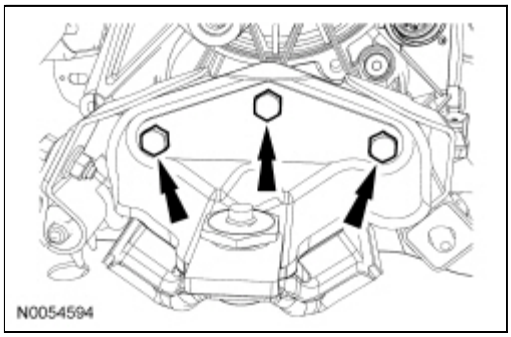
15. Remove the 4 transmission crossmember nuts and bolts.

16. Remove the transmission insulator and retainer.



RWD

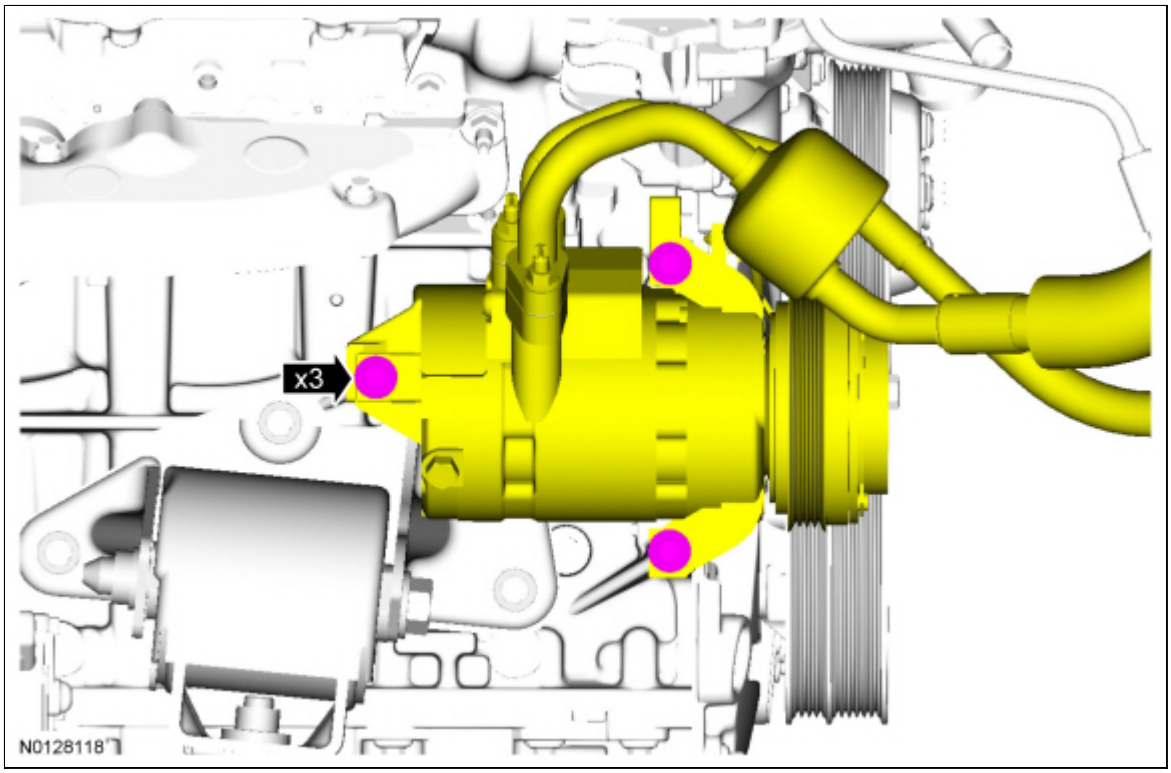
17. Remove the 2 transmission insulator and retainer nuts.



18. Position a suitable high-lift transmission jack under the transmission.

19. Remove the 4 transmission crossmember nuts and bolts (2 each side) and remove the transmission crossmember.

20. Remove the 3 transmission insulator and retainer bolts and remove the transmission insulator and retainer.



All vehicles

21. Install the exhaust Y-pipe - dual catalytic converter. Refer to Section 309-00 .

22. Position the A/C compressor and install the 3 A/C compressor bolts.
    - Tighten to 25 Nm (18 lb-ft).

repair4less

23. Install the A/C compressor belt. Refer to Section 303-05 .

24. Install the ACL outlet pipe, RH ACL pipe to-turbocharger pipe, RH turbocharger bypass hose and the RH turbocharger-to- CAC pipe. Refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

25. Fill the engine cooling system. Refer to Section 303-03 .

repair4less

General Specifications

Item	Specification

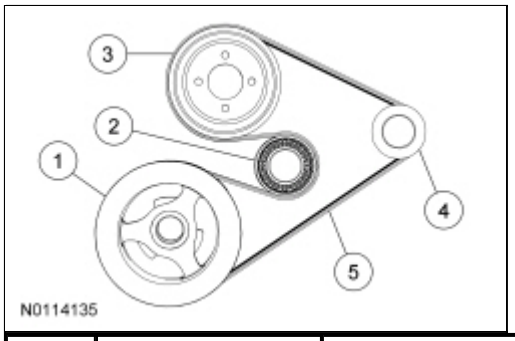
Accessory drive belt tensioner bolts — 6.2L (2V)	25	18	—
Accessory drive belt idler pulley bolt — 6.2L (2V)	25	18	—

Accessory Drive

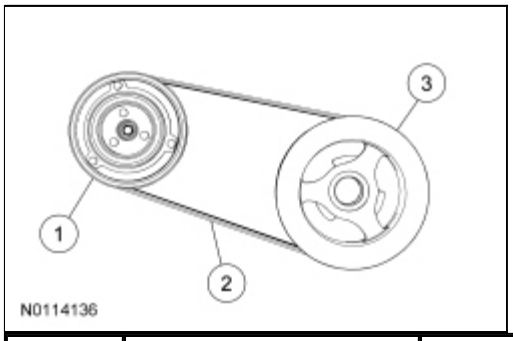


The accessory drive system:

- has a serpentine drive belt with 6 ribs.
- has a A/C compressor drive belt (3.5L, 3.7L and 5.0L only).
- has an automatic drive belt tensioner and idler pulley for the A/C compressor drive belt (5.0L).
- has an automatic drive belt tensioner for the accessory drive belt.
- has 2 or more idler pulleys (6.2L only).
- is not adjustable.

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. One or more idler pulleys may be provided to facilitate belt routing and alignment. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging, or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

Accessory Drive Belt Routing



Front End Accessory Drive (FEAD) — 3.5L and 3.7L

Item	Part Number	Description
1	6316	Crankshaft pulley

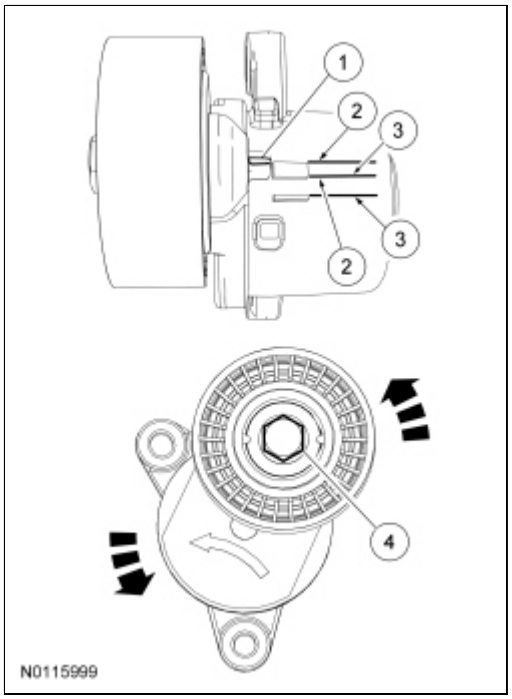
Accessory Drive

Inspection and Verification

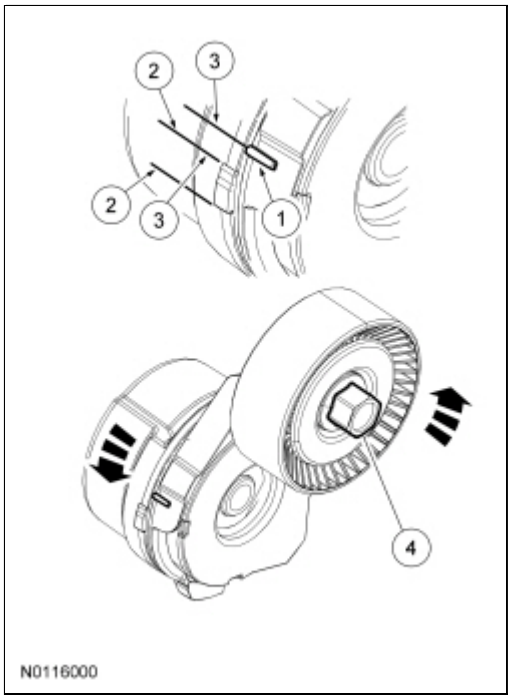
NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**



1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
● Drive belt cracking/chunking/wear ● Belt/pulley contamination ● Incorrect accessory drive belt ● Incorrectly routed accessory drive belt ● Pulley misalignment or excessive pulley runout ● Loose or mislocated hardware ● Loose accessory drive belt ● Damaged pulleys ● Tensioner arm misalignment

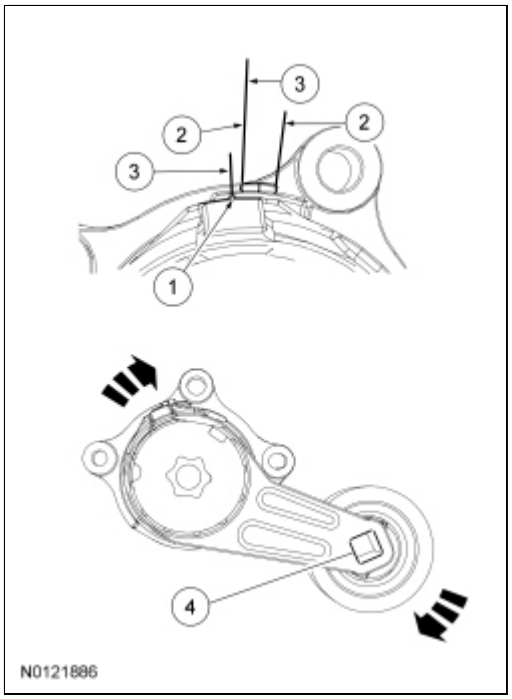


Belt Tensioner With Belt Length Indicator — 3.5L and 3.7L

repair4less

Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

Belt Tensioner With Belt Length Indicator — 5.0L



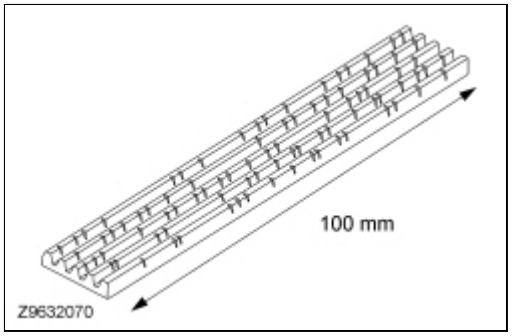
Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

Belt Tensioner With Belt Length Indicator — 6.2L

NOTE: 6.2L (2V) accessory drive belt tensioner shown, other accessory drive belt tensioners similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

repair4less



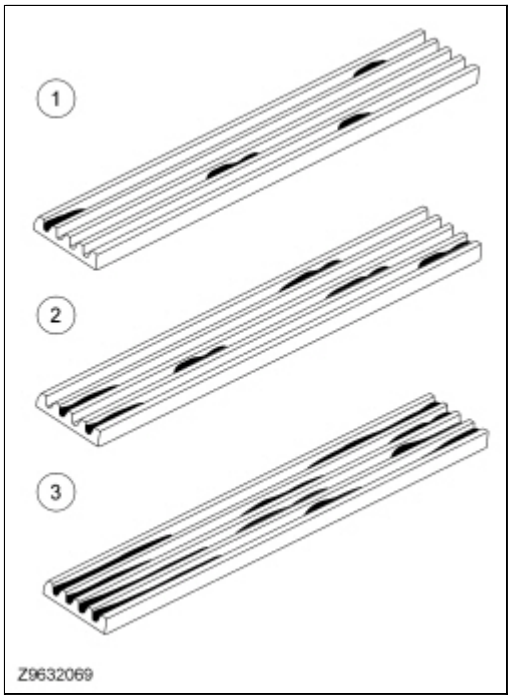
Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

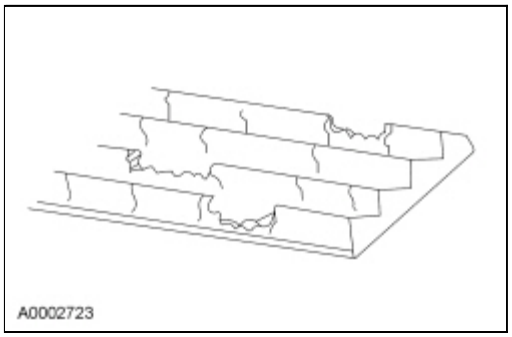
5. If a concern is found, correct the condition before proceeding to the next step.

V-Ribbed Serpentine Drive Belt With Cracks Across Ribs



6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be

considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

repair4less

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to Inspection and Verification in this section. INSTALL a new accessory drive belt as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
• Accessory drive belt noise, squeal, chirping or flutter	• Defective/worn or incorrect accessory drive belt • Misaligned pulley (s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of accessory drive belt or pulleys	• REFER to Component Tests, Drive Belt — Noise/Flutter in this section. REPAIR or INSTALL new parts as necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to Component Tests, Belt Tensioner — Mechanical and Belt Tensioner — Dynamics in this section. INSTALL a new accessory drive belt tensioner as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt	• REFER to Component Tests, Drive Belt — Noise/Flutter and Drive Belt — Incorrect

	• Misaligned pulley (s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	Installation in this section. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Component Tests

Drive Belt — Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

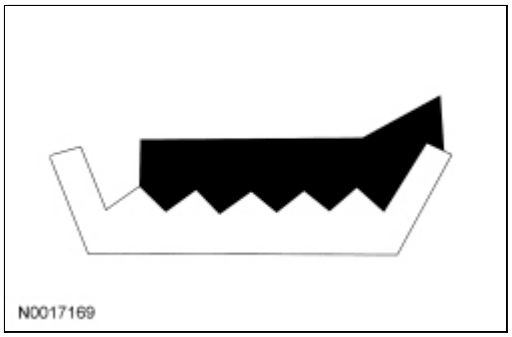
These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
  - the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been

repair4less

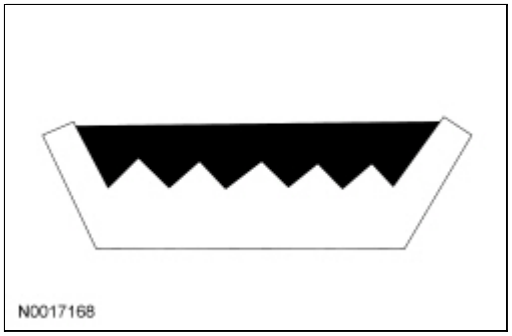
exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.

- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.



Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt — Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner — Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:
   - Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.
   - Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
   - Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.

4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner — Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

repair4less

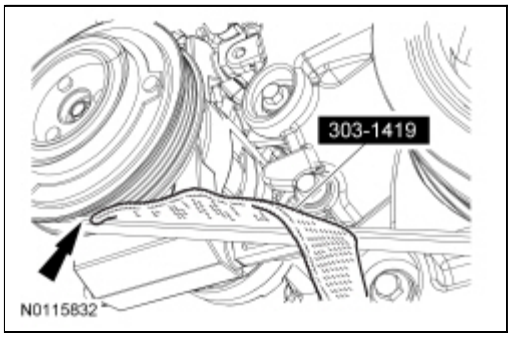
Air Conditioning (A/C) Compressor Belt — 3.5L GTDI, 3.7L, 5.0L

Special Tool(s)

 ST3085-A	Remover, Stretchy Belt 303-1419

Removal

NOTICE: **Under no circumstances should the A/C compressor belt, accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the A/C compressor belt, accessory drive belt or pulleys.**

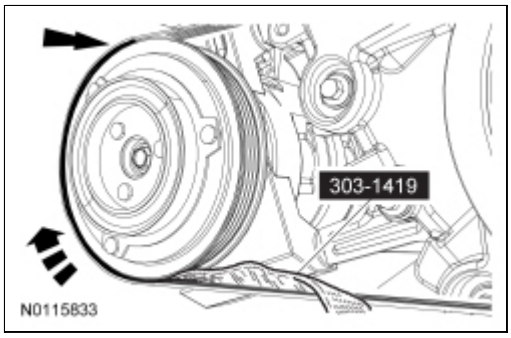


All Engines

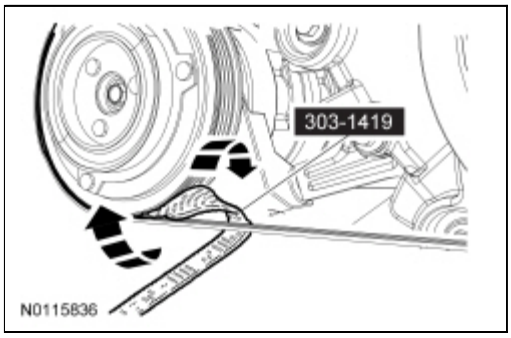
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Front End Accessory Drive (FEAD) — Exploded View in this section.

3.5L and 3.7L Engines



3. Position the Stretchy Belt Remover on the A/C compressor belt as shown.

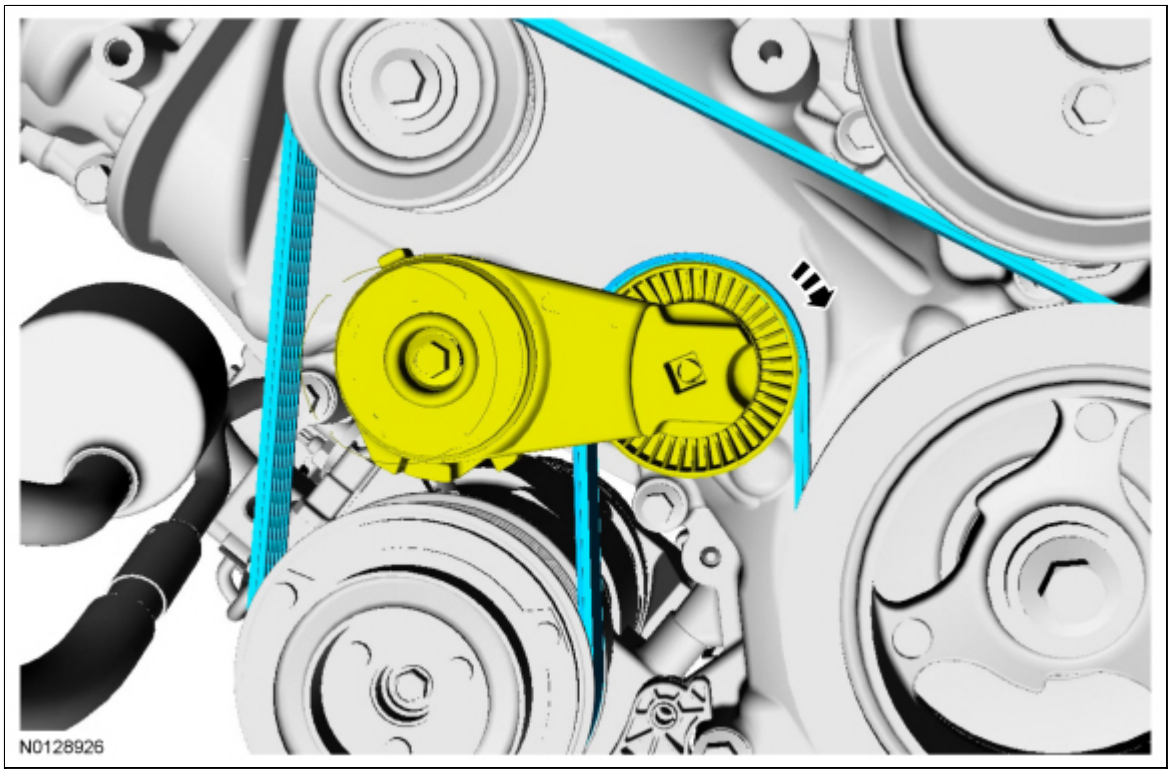


4. **NOTE:** Feed the Stretchy Belt Remover on to the A/C compressor pulley approximately 180 degrees.

   Turn the crankshaft clockwise and feed the Stretchy Belt Remover evenly between the A/C compressor pulley and the A/C compressor belt as shown.

repair4less

5. Remove the A/C compressor belt.
    - Fold the Stretchy Belt Remover around the inside of the A/C compressor belt as shown.
    - In one quick motion, firmly pull the Stretchy Belt Remover from below the vehicle and remove the A/C compressor belt.

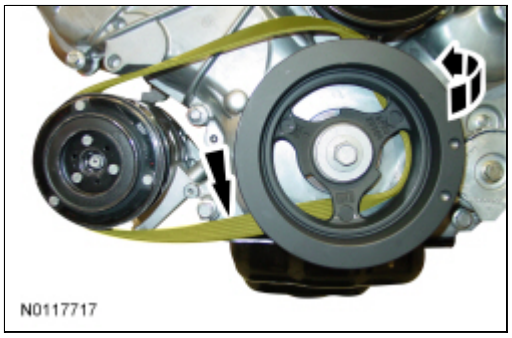


5.0L (4V) Early Build Vehicles

6. Cut the A/C compressor belt and discard the belt.

5.0L (4V) Late Build Vehicles

7. Rotate the drive belt tensioner clockwise and detach the A/C compressor drive belt from the idler pulley and remove the A/C compressor drive belt.



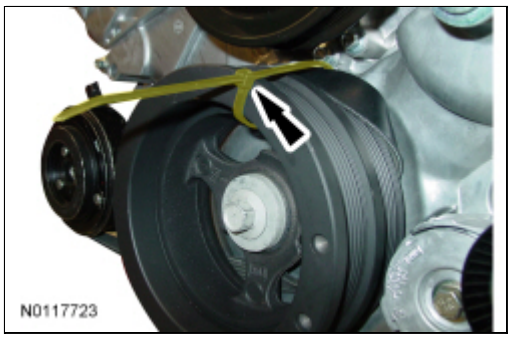
Installation

3.5L GTDI, 3.7L, 5.0L (4V) Early Build Vehicles

1. **NOTE:** 5.0L (4V) engine shown, 3.5L and 3.7L engines similar.

   Position the A/C compressor belt in 2 stages.
   - Stage 1: Slide the A/C compressor belt between the crankshaft pulley and the accessory drive belt tensioner.
   - Stage 2: Position the A/C compressor belt behind the crankshaft pulley with the accessory drive belt ribs facing towards the front of the vehicle.
   - **NOTE:** Make sure the A/C compressor belt is correctly seated on the A/C compressor pulley.

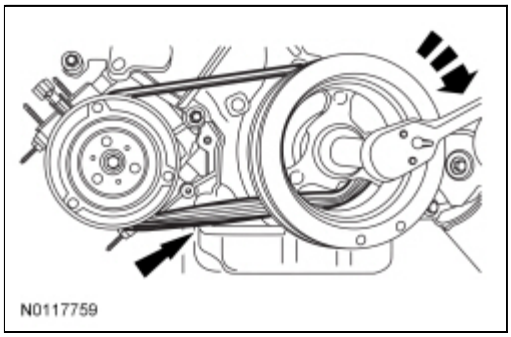
     Stage 3: Position the A/C compressor belt onto the A/C compressor pulley with the lower portion of the accessory drive belt ribs facing towards the front of the vehicle and above the oil pan as shown.



2. **NOTE:** 5.0L (4V) engine shown, 3.5L and 3.7L engines similar.

repair4less

NOTE: After installation, make sure the A/C compressor belt is correctly seated on the crankshaft and A/C compressor pulleys.



Position the A/C compressor belt onto the top of the crankshaft pulley and feed a tie strap with a minimum width of 3 mm (0.12 in) through the crankshaft pulley spokes, up and over the A/C compressor belt and tighten the tie strap.

3. ***NOTICE:*** **The A/C compressor belt must be above the oil pan flange or damage to the A/C compressor belt and engine can occur.**

   NOTE: 5.0L (4V) engine shown, 3.5L and 3.7L engines similar.

   With the A/C compressor belt positioned above the oil pan flange, rotate the crankshaft by hand clockwise until the tie strap is at the 6 o'clock position.

4. **NOTE:** 5.0L (4V) engine shown, 3.5L and 3.7L engines similar.

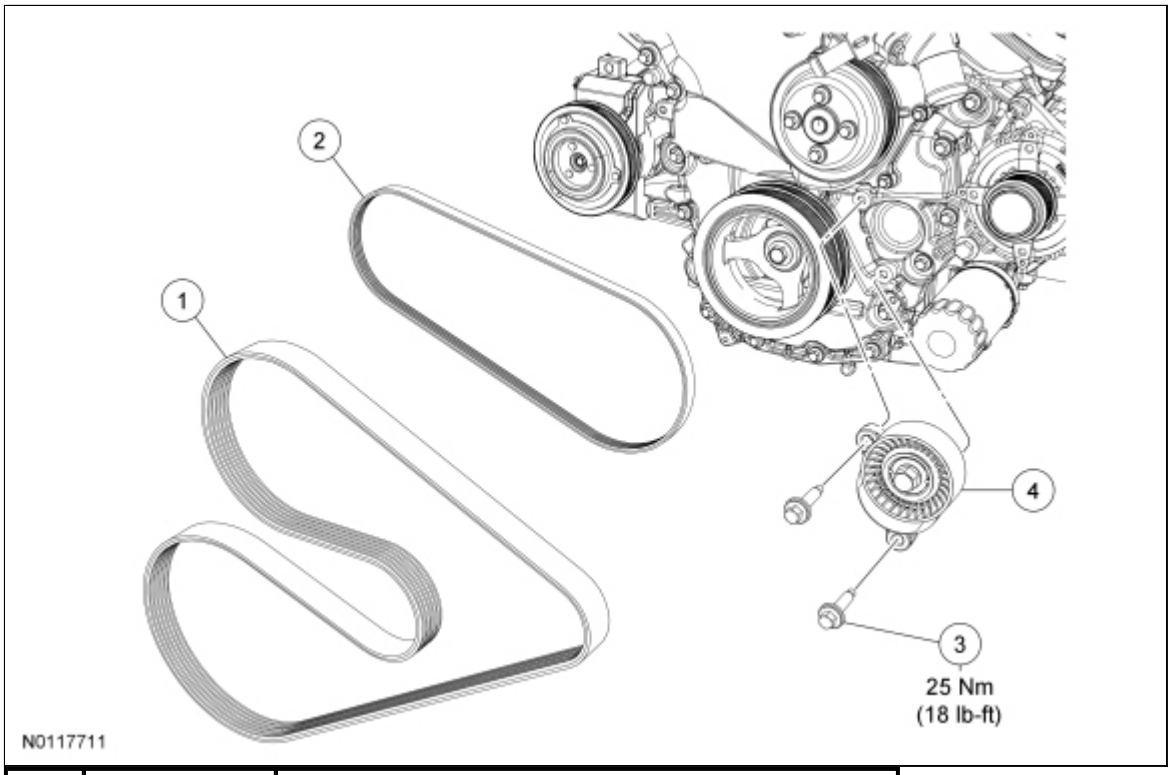
   NOTE: After installation, make sure the A/C compressor belt is correctly seated on the crankshaft and A/C compressor pulleys.

   Remove the tie strap and rotate the crankshaft clockwise 1 full rotation to verify the A/C compressor belt has correctly seated onto the crankshaft and A/C compressor pulleys.

5.0L (4V) Late Build Vehicles

5. Position the A/C drive belt and rotate the drive belt tensioner clockwise and attach the A/C compressor drive belt to the idler pulley.

All Engines



6. Install the accessory drive belt. For additional information, refer to Front End Accessory Drive (FEAD) — Exploded View in this section.

repair4less

Starting System

The starting system consists of the following:

- Fuse(s)
- Battery
- Battery cables
- Ignition switch
- Starter motor
- Run/start relay (located in the Battery Junction Box (BJB))
- Starter relay (located in the Battery Junction Box (BJB))
- PCM (located on the RH side of cowl)
- Body Control Module (BCM)
- Transmission Range (TR) sensor (located inside the transmission)
- Integrated Keyhead Transmitter (IKT)
- Tire Pressure Monitor Module (TPM) (TPM is standard equipment, also used for optional remote start feature)
- External antenna (if equipped with remote start)
- Hood switch (hood switch is standard equipment, also used for optional remote start feature)

repair4less

Starting System

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: This vehicle is equipped with Passive Anti-Theft System (PATS) that disables the engine from cranking and starting if an unprogrammed PATS key is used or an invalid PCM ID is received. PATS is controlled by the Body Control Module (BCM). If there is a PATS concern that causes the engine to disabled, the Instrument Panel Cluster (IPC) displays "STARTING SYSTEM FAULT" in the message center. Refer to Section 419-01B to diagnose a PATS concern.

The starter system controls the cranking of the engine. The starter motor is enabled by the starter relay when the relay is activated by the PCM. The starting system is electronically controlled by the PCM. The PCM requires the following inputs:

- Ignition switch request to start the engine
- Run/start relay voltage
- PATS enable status from the BCM
- Correct transmission PARK or NEUTRAL input from the Transmission Range (TR) sensor

Under normal operation when the ignition is turned to the START position, the BCM generates a key verification message. It sends this message to the PATS transceiver. The transceiver reads the key and sends a key verification message back to the BCM . If the message received does not match the key verified in the BCM memory, the engine is disabled and does not crank and start. Once the BCM determines the correct programmed key is in the ignition, the BCM sends the PCM a valid PATS message. When the PCM receives the message, it generates a response and sends it back to the BCM . If the response from the PCM does not match the response in the BCM memory, PATS is not enabled and the engine does not crank. If

both the key verification and PCM ID pass, PATS is enabled. The PCM recognizes the correct electronically coded passive key and provides voltage and ground to the starter relay coil. The starter relay coil is energized causing the relay contacts to close providing voltage to the starter solenoid, allowing the starter motor to crank and start the engine. The PCM disengages the starter once an engine rpm threshold is reached, a set crank time is exceeded or the ignition is turned OFF. The BCM also enables the Run/start relay which sends voltage to the PCM. If the PCM does not receive this voltage the engine will not crank.

The TR sensor prevents operation of the starter motor unless the transmission is in NEUTRAL or PARK.

Remote Start

The factory remote start system (if equipped) does not operate if the ignition is in the RUN/START position or the hood is not closed.

The remote start system can be enabled or disabled by the customer. When enabled, the customer can set the engine run time for 5, 10 or 15 minutes. For information on setting the engine run time, refer to the Owner's Literature or Section 413-01 .

The remote start system enables the engine to be started from up to 100 m (328 ft) away, by pressing a sequence of buttons on the Integrated Keyhead Transmitter (IKT). The remote start system is activated by pressing the lock button on the IKT , to make sure the doors are locked, followed by 2 presses of the remote start button. The 3 button presses must occur within 3 seconds. The system acknowledges the start request by flashing the exterior lights twice. Once started, the engine runs for 10 minutes (default run time is 10 minutes; the time can be programmed by the customer to 5, 10 or 15 minutes) and the parking lights remain illuminated until the cycle is complete. The remote start duration can also be extended by initiating remote start while the first timer is still running or by initiating a completely independent start cycle when the first has completed. No more than 2 remote start sequences can occur within a one hour period, unless the ignition is set to the RUN/START position between the remote start requests. During the remote start cycle the power windows are inhibited and the radio will not turn on automatically but may be switched on manually from inside the vehicle. If the remote start system fails to start the horn chirps twice.

To transition from remote start mode to drive mode, use a programmed IKT to switch the ignition to the RUN position. If a programmed IKT is not used, the engine shuts off.

To deactivate the remote start system, press the remote start button once. When deactivating the remote start system the parking lights turn off to give a visual indication that the engine and climate control features have turned off. It may be necessary to be closer to the vehicle to deactivate the remote start feature than it was to initiate it due to ground deflections and added noise from the engine running.

The remote start system conditions the cabin temperature during remote start based on the outside temperature. For information on cabin temperature conditioning during remote start, refer to Section 412-00 .

Inspection and Verification

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: Make sure the anti-theft system is functioning correctly before carrying out a logical starting system diagnosis. Address anti-theft system concerns before continuing. Refer to Section 419-01B .

1. Verify the customer concern by operating the starting system.

repair4less

2. Check the battery condition and state of charge. Section 414-01 .

3. Remove the accessory drive belt. Refer to Section 303-05 . Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.

4. If any aftermarket accessories have been added to the vehicle, make sure they are properly wired.

5. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Starter motor • Starter motor bolts	• Battery • Battery cables • Battery Junction Box (BJB) Starter relay • Battery Junction Box (BJB) Run/start relay • Battery Junction Box (BJB) fuse 13 (30A) • Body Control Module (BCM) fuse 28 (15A) • Loose or corroded connections

6. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.

7. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

8. **NOTE:** The LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no communication with the scan tool.

10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, proceed with module self-test diagnostics.

11. Carry out the self-test diagnostics for the BCM , PCM and Tire Pressure Monitor Module (TPM) (TPM is standard equipment, also used for optional remote start feature).

12. If the DTCs retrieved are related to the concern, go to DTC Charts.

13. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

PCM DTC Chart

DTC	Description	Action
P0512	Starter Request Circuit — Circuit has Power With the Ignition in the OFF Position	CARRY OUT the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to voltage.
P0705	Transmission Range Sensor A Circuit (PRNDL Input): No Sub Type Information	REFER to Section 307-01 to diagnose the Transmission Range (TR) sensor concern.
P0706	Transmission Range Sensor "A" Circuit Range/Performance: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P0707	Transmission Range Sensor "A" Circuit Low: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P0708	Transmission Range Sensor "A" Circuit High: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P0709	Transmission Range Sensor "A" Circuit Intermittent: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P161A	Incorrect Response From Immobilizer Control Module	REFER to Section 419-01B .
P1702	Transmission Range Sensor Circuit Intermittent: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P1705	Transmission Range Circuit Not Indicating Park/Neutral During Self Test: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P1921	Transmission Range Signal: No Sub Type Information	REFER to Section 307-01 to diagnose the TR sensor concern.
P2532	Ignition Switch Run Position Circuit High	GO to Pinpoint Test G .
P2535	Ignition Switch Run/Start Position Circuit High	GO to Pinpoint Test G .
All other PCM DTCs	—	REFER to Section 303-14 .

Body Control Module (BCM) DTC Chart

repair4less

DTC	Description	Action
B1305:01	Hood Switch: General Electrical Failure	REFER to Section 419-01A .
C113A:11	Wake up Control: Circuit Short to Ground	GO to Pinpoint Test C .
C113A:15	Wake up Control: Circuit Short to Battery or Open	GO to Pinpoint Test C .
U1000:00	Solid State Driver Protection Activated - Driver Disabled: No Sub Type Information	The Body Control Module (BCM) has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The BCM cannot enable the output until the cause of the short is corrected. ADDRESS all other DTCs first. After the cause of the concern is corrected, CLEAR the DTCs. REPEAT the self-test.
All other DTCs	—	REFER to Section 419-10 .

Tire Pressure Monitor (TPM) Module DTC Chart

DTC	Description	Action
B1D55:01	Antenna #2: General Electrical Failure	GO to Pinpoint Test D .
All other DTCs	—	REFER to Section 204-04 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The engine does not crank	• Battery • Battery cables • Fuses • Starter motor • PCM • Starter relay • Run/start relay • Ignition switch • Transmission Range (TR) sensor • Passive Anti-Theft System (PATS) • Body Control Module (BCM) • Wiring, terminals or connectors	• GO to Pinpoint Test A .
• Unusual starter noise	• Starter motor • Starter motor mounting	• GO to Pinpoint Test B .

	• Starter motor engagement • Flexplate ring gear	
• The engine cranks slowly	• Battery • Battery cables • Starter motor • Wiring, terminals or connectors	• CARRY OUT the Starter Motor — Feed Circuit and Starter Motor — Ground Circuit Tests. REFER to Component Tests in this section.
• The engine cranks but does not start.	• Fuses • PCM • Fuel pump • Fuel pump relay	• Powertrain Control/Emissions Diagnosis (PC/ED) manual
• The starter spins but the engine does not crank	• Damaged flexplate • Starter motor	• REFER to Starter Motor Drive Gear and Flywheel Ring Gear Inspection in this section to continue diagnosis.
• The starter does not disengage from the flexplate	• Starter motor • Wiring, terminal or connectors • Starter relay	• REFER to Starter Motor Drive Gear and Flywheel Ring Gear Inspection in this section to continue diagnosis. • REMOVE the starter relay, if the engine stops cranking INSTALL a new relay. If the engine continues to crank, REPAIR circuit CDC25 (BN/GN) for a short to voltage.
• The remote start system operates with reduced range	• Wiring, terminals or connectors • External antenna • Tire Pressure Monitor Module (TPM)	• GO to Pinpoint Test D .
• The remote start is inoperative	• Wiring, terminals or connectors • Remote start feature not enabled • Integrated Keyhead Transmitter (IKT) • Hood switch • PCM	• GO to Pinpoint Test E .
• One-Touch Integrated Start (OTIS) is inoperative	• OTIS not enabled	• Using a scan tool, ENABLE OTIS .

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

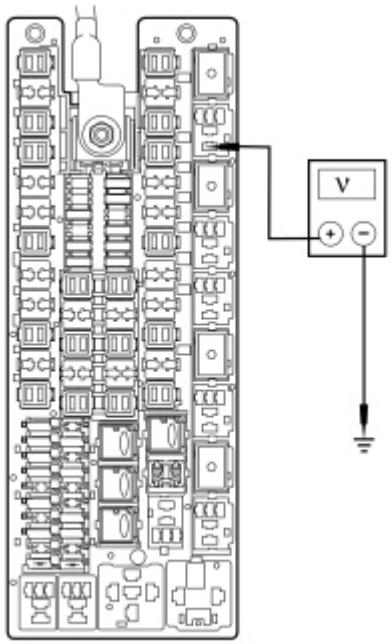
repair4less

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

When the ignition switch is turned to the START position, the Body Control Module (BCM) and PCM receive a request to start the engine. When the PCM receives the correct coded key ID messages from the BCM , voltage from the Run/start relay, and the correct input from the Transmission Range (TR) sensor that the gear selector is in PARK or NEUTRAL, voltage and ground is supplied to the starter relay coil. When the starter relay is energized the relay contacts close. Voltage is then supplied from Battery Junction Box (BJB) fuse 13 (30A) to the starter relay contacts which supplies voltage to the starter solenoid. The starter solenoid is grounded at the starter motor. Energizing the starter solenoid engages the starter drive into the ring gear and closes the starter solenoid contacts allowing voltage directly from the battery to the starter motor to crank the engine. The PCM disengages the starter once an RPM threshold is reached, a set crank time is exceeded or the ignition switch is turned to the OFF position.

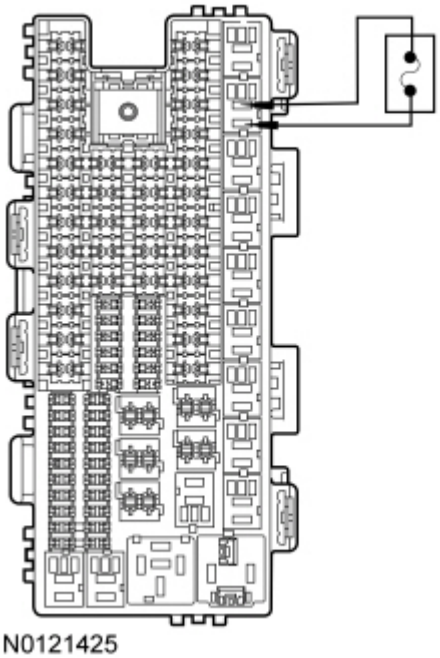
This pinpoint test is intended to diagnose the following:



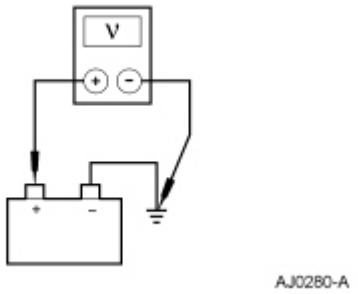
- Battery
- Battery cables
- Fuses
- Ignition switch
- PCM
- Starter motor
- Starter relay
- TR sensor
- Passive Anti-Theft System (PATS)
- BCM
- Wiring, terminals or connectors

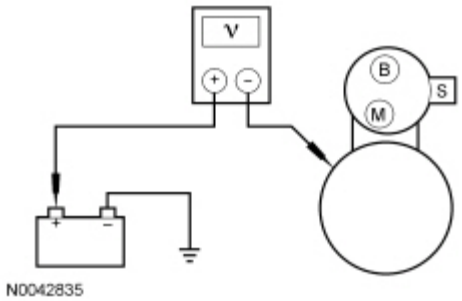
PINPOINT TEST A: THE ENGINE DOES NOT CRANK

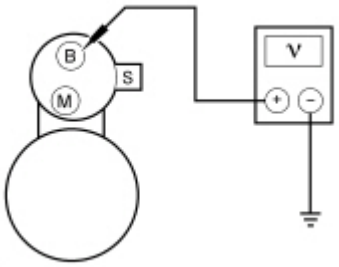
Test Step	Result / Action to Take
A1 PERFORM INSPECTION AND VERIFICATION	**Yes** Correct the cause as necessary. **No** GO to A2 .
NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test. **NOTE:** If it is necessary to leave the battery charger connected during testing, do not leave it on its highest setting. The highest and boost settings can occasionally exceed 16 volts, resulting in false test results and setting DTCs. • Perform the Inspection and Verification procedure in this section. • **Was an obvious cause for an observed or reported concern found?**	
A2 CHECK FOR ANY MESSAGES IN THE MESSAGE CENTER	**Yes** REFER to Section 419-01B . **No** GO to A3 .
• Ignition ON. • Check the message center with the ignition key in the RUN position. • **Is STARTING SYSTEM FAULT displayed in the message center?**	
A3 VERIFY BCM AND PCM PASS THE NETWORK TEST	



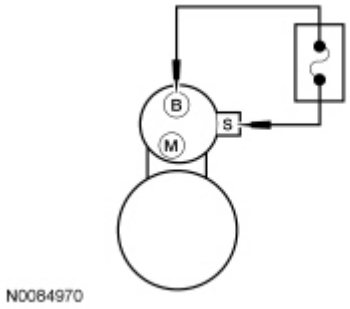
• Ignition ON. • Using a diagnostic scan tool, perform the Network Test. • **Did the BCM and PCM pass the Network Test?**	**Yes** GO to A4 . **No** REFER to Section 418-00 .
A4 RETRIEVE BCM AND PCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM — Self-Test. • Enter the following diagnostic mode on the scan tool: PCM — Self-Test. • **Were DTCs retrieved during the self-test?**	**Yes** REFER to the DTC Charts in this section. **No** GO to A5 .
A5 CHECK THE PCM TRANSMISSION RANGE TR SENSOR PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • While observing the TR PID, place the gear selector in PARK and then NEUTRAL. • **Does the PID match the selector lever position?**	**Yes** GO to A6 . **No** REFER to Section 307-01 , to diagnose the TR sensor concern.
A6 CHECK THE BCM IGN_SW_STATE PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — BCM. • While holding the key in the START position, monitor the BCM IGN_SW_STATE PID. • **Does the PID change from OFF to START?**	**Yes** GO to A7 . **No** DIAGNOSE No power in Start. REFER to Section 211-05 .
A7 CHECK THE STARTER MOTOR RELAY	
• Swap the starter relay with a known good relay and attempt to crank the engine. • **Does the engine crank?**	**Yes** INSTALL a new starter relay. **No** GO to A8 .
A8 CHECK THE VOLTAGE TO THE STARTER RELAY	
• Ignition OFF. • Disconnect: Starter Relay. • Measure the voltage between starter relay socket 3, circuit SBB13 (GY/RD) and ground.	**Yes** GO to A9 . **No** VERIFY BJB fuse 13 (30A) is OK. If OK, REPAIR circuit SBB13 (GY/RD) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.







repair4less



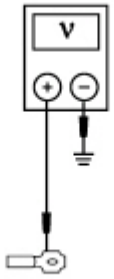
N0121935

- **Is the voltage greater than 11 volts?**

A9 CHECK THE STARTER MOTOR	
• With the transmission in PARK, connect one end of a fused jumper wire to starter relay socket 3, circuit SBB13 (GY/RD) and momentarily connect the other end of the fused jumper wire to starter relay socket 5, circuit CDC25 (BN/GN).  N0121425 • **Did the starter motor engage and the engine crank?**	**Yes** GO to A15 . **No** GO to A10 .
A10 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and	**Yes**

the battery ground cable connection at the engine.  AJ0280-A • **Is the voltage greater than 11 volts?**	GO to A11 . **No** INSTALL new battery cables. REFER to Section 414-01 . TEST the system for normal operation.
A11 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the positive battery post and the starter motor case.  N0042835 • **Is the voltage greater than 11 volts?**	**Yes** GO to A12 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A12 CHECK THE VOLTAGE TO THE STARTER MOTOR	
• Measure the voltage between the starter solenoid C197A-1, circuit SDC02 (RD) and ground.  N0042836 • **Is the voltage greater than 11 volts?**	**Yes** GO to A13 . **No** INSTALL new battery cables. REFER to Section 414-01 . TEST the system for normal operation.
A13 CHECK THE STARTER MOTOR	
• Connect one end of a fused jumper wire to starter solenoid C197A-1, circuit SDC02 (RD) and momentarily connect the other end of the fused jumper wire to starter solenoid C197B-1, circuit CDC25 (BN/GN).	**Yes** GO to A14 . **No** INSTALL a new starter motor. REFER to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section. TEST the system for

repair4less



N0084970

- **Did the starter engage and the engine crank?**

normal operation.

A14 CHECK FOR START INPUT AT THE STARTER

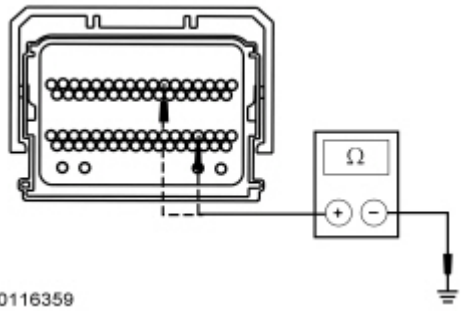
- Connect: Starter Relay.
- Disconnect: Starter Solenoid C197B.
- Measure the voltage between the starter solenoid C197B-1, circuit CDC25 (BN/GN) and ground, while holding the key in the START position.

AJ0285-A

- **Is the voltage greater than 11 volts?**

Yes
CLEAN the starter solenoid "S" terminal and C197B. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation.

No
REPAIR circuit CDC25 (BN/GN) for an open. TEST the system for normal operation.

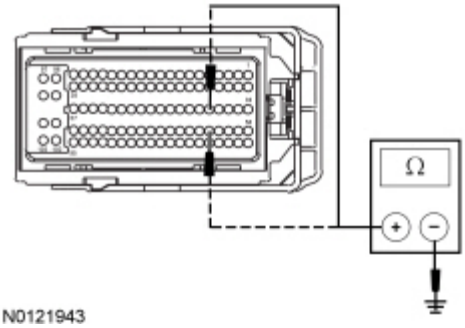


A15 CHECK THE PCM START CIRCUITS FOR A SHORT TO GROUND

- Disconnect: PCM C175B (5.0L and 6.2L), C1381B (3.7L) or C1551B (3.5L).
- Measure the resistance between the PCM C175B (5.0L and 6.2L) or C1381B (3.7L), harness side and ground, using the following chart:

PCM Connector-Pin	Circuit
C175B-7 (5.0L and 6.2L) or C1381B-7 (3.7L)	CDC12 (YE)
C175B-37 (5.0L and 6.2L) or C1381B-37 (3.7L)	CDC54 (WH/GN)

Yes
GO to A16 .



No
REPAIR the affected circuit. TEST the system for normal operation.

N0116359

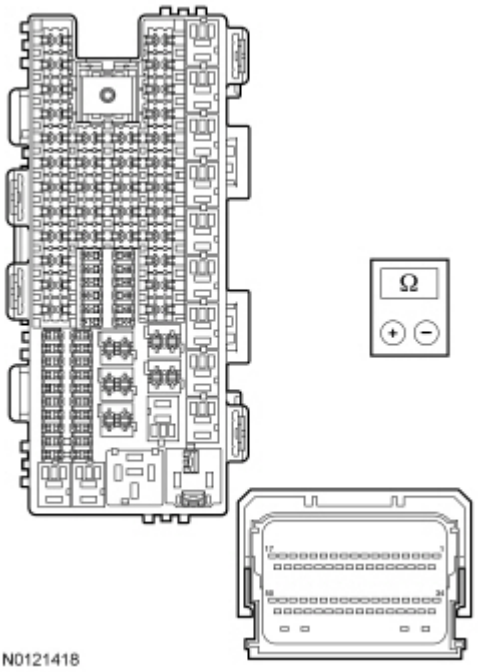
- Measure the resistance between the PCM C1551B (3.5L), harness side and ground, using the following chart:

PCM Connector-Pin	Circuit
C1551B-43 (3.5L)	CDC12 (YE)
C1551B-62 (3.5L)	CDC54 (WH/GN)

N0121943

- **Are the resistances greater than 10,000 ohms?**

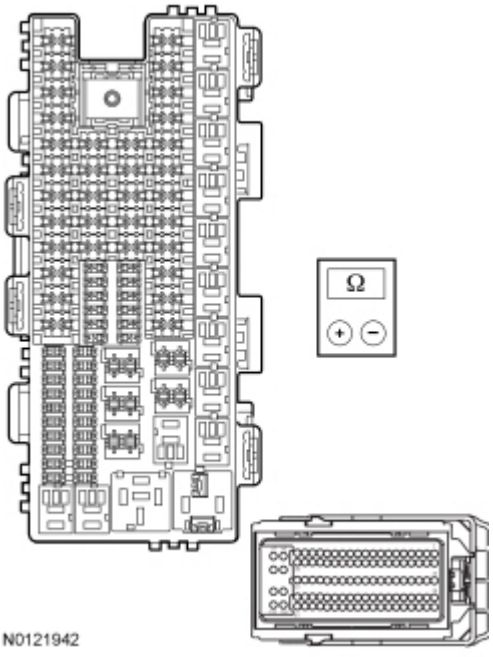
A16 CHECK THE PCM START CIRCUITS FOR AN OPEN



- Measure the resistance between the PCM C175B (5.0L and 6.2L) or C1381B (3.7L), harness side and the starter relay using the following chart:

PCM Connector-Pin	Circuit	Starter Relay Socket
C175B-7 (5.0L and 6.2L) or C1381B-7 (3.7L)	CDC12 (YE)	2
C175B-37 (5.0L and 6.2L) or C1381B-37 (3.7L)	CDC54 (WH/GN)	1

Yes
INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.



No
REPAIR the affected circuit. TEST the system for normal operation.

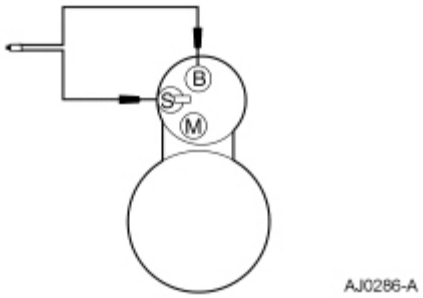
repair4less

- Measure the resistance between the PCM C1551B (3.5L), harness side and the starter relay using the following chart:

PCM Connector-Pin	Circuit	Starter Relay Socket
C1551B-43 (3.5L)	CDC12 (YE)	2
C1551B-62 (3.5L)	CDC54 (WH/GN)	1

• **Are the resistances less than 5 ohms?**	

Pinpoint Test B: Unusual Starter Noise



Normal Operation

Correct starter operation relies on correct mounting of the starter to the engine, alignment of the starter ring gear to the flexplate and correct functioning of the starter assembly (internal gears, bearings).

This pinpoint test is intended to diagnose the following:

- Starter motor
- Starter motor mounting
- Starter motor engagement
- Flexplate ring gear

PINPOINT TEST B: UNUSUAL STARTER NOISE

Test Step	Result / Action to Take
B1 CHECK THE STARTER MOUNTING	
• Inspect the starter motor mounting bolts for looseness. • **Is the starter motor mounted correctly?**	**Yes** GO to B2 . **No** INSTALL the starter motor correctly. REFER to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section. TEST the system for normal operation.
B2 CHECK FOR STARTER NOISE	
• Ignition OFF. • Connect a remote starter switch between the starter solenoid C197A-1 and C197B-1.  • Engage the starter and verify the noise is due to starter operation. • **Is the noise due to the starter engagement?**	**Yes** REFER to Starter Motor Drive Gear and Flywheel Ring Gear Inspection in this section to continue diagnosis. **No** REFER to Section 303-00 , Symptom Chart — Engine NVH to continue diagnosis.

Pinpoint Test C: DTC C113A:11 or C113A:15

repair4less

Refer to Wiring Diagrams Cell 112 , Passive Anti-Theft System for schematic and connector information.

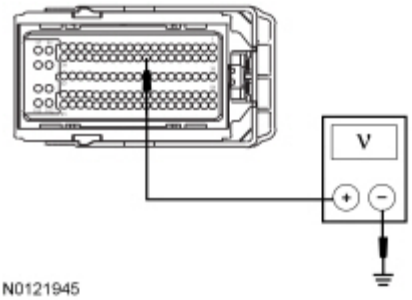
Normal Operation

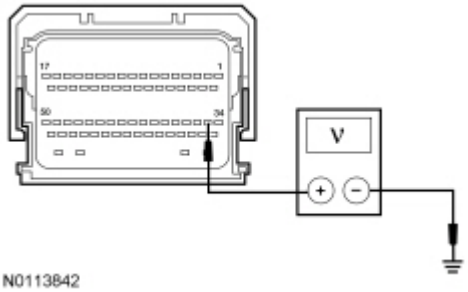
The wake up control circuit is used to wake up the PCM prior to engine cranking. The PCM needs to wake up prior to a crank request so that it has time to go through its own initialization. The wake up control circuit also powers the Passive Anti-Theft System (PATS) transceiver. The wake up control circuit is controlled by the Body Control Module (BCM) and receives voltage from fuse 18 (10A). The BCM uses a Field-Effect Transistor (FET) to control the wake up control circuit. A DTC sets and the wake up control circuit is disabled via the FET if a fault is detected. Once the condition that caused the DTC to set is repaired, the BCM must pass a self-test in order for the DTC to clear and the system to resume normal operation.

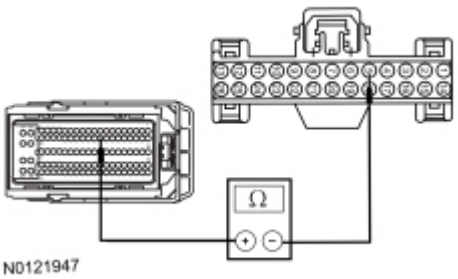
The BCM activates the wake up control circuit when:

- the driver door is opened.
- a remote start request is received (if equipped with factory remote start).
- the brake pedal is pressed.
- a key is inserted into the ignition.
- the ignition is in the RUN or START position.

- DTC C113A:11 (Wake up Control: Circuit Short To Ground) — sets when the BCM detects a short to ground on the wake up control circuit.
- DTC C113A:15 (Wake up Control: Circuit Short To Battery or Open) — sets when the BCM detects a short to voltage or an open on the wake up control circuit.

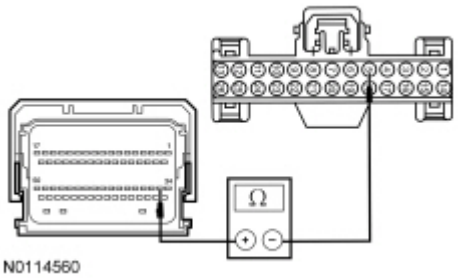






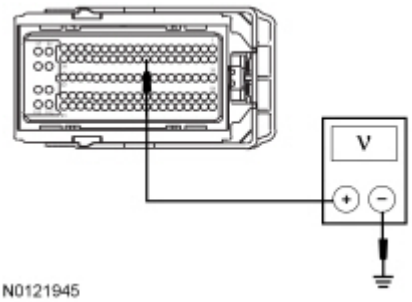
This pinpoint test is intended to diagnose the following:

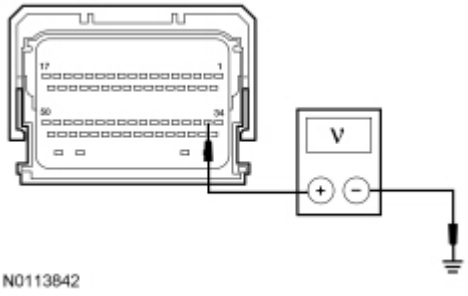
- Wiring, terminals or connectors
- PATS transceiver
- PCM
- BCM



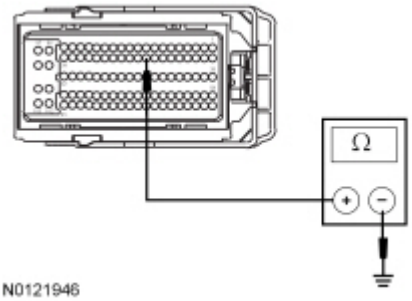
PINPOINT TEST C: DTC C113A:11 OR C113A:15

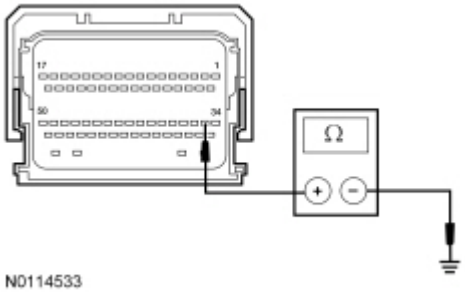
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**





Test Step	Result / Action to Take
C1 RETRIEVE THE BCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM — Self-Test. • **Is DTC C113A:15 on demand during the self-test?**	**Yes** GO to C2 . **No** GO to C5 .
C2 CHECK THE WAKE UP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280F. • Disconnect: PATS Transceiver C252. • Disconnect: PCM C175B (5.0L and 6.2L), C1381B	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.





(3.7L) or C1551B (3.5L). • Ignition ON. • Measure the voltage between the PCM C1551B-28 (3.5L), circuit CE436 (VT/OG), harness side and ground.  N0121945 • Measure the voltage between the PCM C175B-35 (5.0L and 6.2L) or C1381B-35 (3.7L), circuit CE436 (VT/OG), harness side and ground.  N0113842 • **Is any voltage present?**	**No** GO to C3 .
C3 CHECK THE WAKE UP CONTROL CIRCUIT FOR AN OPEN • Ignition OFF. • Measure the resistance between the PCM C1551B-28 (3.5L), circuit CE436 (VT/OG), harness side and BCM C2280F-5, circuit CE436 (VT/OG), harness side.  N0121947 • Measure the resistance between the PCM C175B-35 (5.0L and 6.2L) or C1381B-35 (3.7L), circuit CE436 (VT/OG), harness side and BCM C2280F-5, circuit CE436 (VT/OG), harness side.	**Yes** GO to C4 . **No** REPAIR circuit CE436 (VT/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

- **Is the resistance less than 5 ohms?**

C4 CHECK THE BCM AND PCM FOR CORRECT OPERATION	
• Connect: BCM C2280F. • Ignition ON. • Measure the voltage between PCM C1551B-28 (3.5L), circuit CE436 (VT/OG), harness side and ground.  • Measure the voltage between the PCM C175B-35 (5.0L and 6.2L) or C1381B-35 (3.7L), circuit CE436 (VT/OG), harness side and ground.  • **Is the voltage greater than 11 volts?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** VERIFY BCM fuse 18 (10A) is OK. If OK, INSTALL a new BCM . REFER to Section 419-10 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE WAKE UP CONTROL CIRCUIT DTC FOR A FAULT STATUS CHANGE (SHORT TO GROUND INDICATED)	
• Enter the following diagnostic mode on the scan tool: Clear BCM Continuous DTCs. • Ignition OFF. • Disconnect: PATS Transceiver C252. • Connect: PCM C175B (5.0L and 6.2L), C1381B (3.7L) or C1551B (3.5L). • Ignition ON. • Enter the following diagnostic mode on the scan tool:	**Yes** GO to C6 . **No** GO to C7 .

BCM — Self-Test. • **Was DTC C113A:11 retrieved on demand during self-test?**	
C6 CHECK THE WAKE UP CONTROL CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Disconnect: BCM C2280F. • Measure the resistance between the PCM C1551B-28 (3.5L), circuit CE436 (VT/OG), harness side and ground.  N0121946 • Measure the resistance between the PCM C175B-35 (5.0L and 6.2L) or C1381B-35 (3.7L), circuit CE436 (VT/OG), harness side and ground.  N0114533 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new BCM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C7 CHECK THE PCM FOR CORRECT OPERATION • Enter the following diagnostic mode on the scan tool: Clear BCM Continuous DTCs. • Ignition OFF. • Connect: PCM C175B (5.0L and 6.2L), C1381B (3.7L) or C1551B (3.5L). • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM — Self-Test. • **Was DTC C113A:11 retrieved on-demand during self-test?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PATS transceiver. REFER to Section 419-01B. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTC B1D55:01

Normal Operation

repair4less

An external antenna connected to the Tire Pressure Monitor Module (TPM) receives a signal from the Integrated Keyhead Transmitter (IKT) to enable activation of the remote start function from a distance of up to 100 meters (328 feet). If the external antenna fails, the remote start operates with a reduction in the range of operation.

- DTC B1D55:01 (Antenna #2: General Electrical Failure) — this DTC is set if the vehicle is equipped with remote start but the system feedback circuit does not detect an external antenna.

This pinpoint test is intended to diagnose the following:

- External antenna
- External antenna lead
- TPM

PINPOINT TEST D: DTC B1D55:01

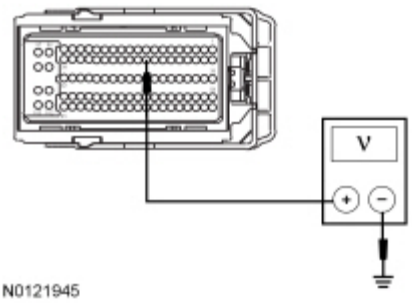
Test Step	Result / Action to Take
D1 CHECK THE EXTERNAL ANTENNA CONNECTION • Check the connections at the external antenna and TPM . • **Are the connections loose or disconnected?**	**Yes** REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D2 .
D2 CHECK THE EXTERNAL ANTENNA • INSTALL a new external antenna. • ATTEMPT to start the vehicle using the IKT from a distance of 100 meters (328 feet) from the vehicle. • **Does the vehicle start from this distance?**	**Yes** System is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK THE EXTERNAL ANTENNA CABLE • INSTALL a new external antenna cable. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. • ATTEMPT to start the vehicle using the IKT from a distance of 100 meters (328 feet) from the vehicle • **Does the vehicle start from this distance?**	**Yes** System is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new TPM . REFER to Section 204-04 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint test E: The Remote Start Is Inoperative

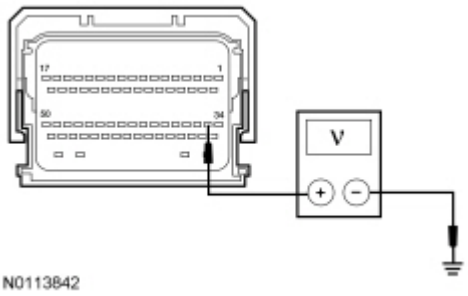
Normal Operation

The factory equipped remote start system enables the engine to be started from up to 100 meters (328 feet) away by pressing the Integrated Keyhead Transmitter (IKT) lock button followed by 2 presses of the remote

start button. The 3 button presses must occur within 3 seconds. The IKT signal is received through an external antenna attached to the Tire Pressure Monitor Module (TPM) module and communicated over the Medium Speed Controller Area Network (MS-CAN) to initiate the vehicle start.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Remote start feature disabled
- IKT
- Hood switch
- PCM

PINPOINT TEST E: THE REMOTE START IS INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK THE OPERATION OF THE IKT • Press all buttons on the IKT and check for the correct operation. • **Is the remote start the only function that is inoperative?**	**Yes** GO to E2. **No** REFER to Section 501-14 to DIAGNOSE and REPAIR the Remote Keyless Entry (RKE) system.
E2 CHECK THE VEHICLE STARTING • Attempt to start the vehicle. • **Did the vehicle start?**	**Yes** GO to E3. **No** This is not a remote start issue. GO to Symptom Chart to diagnose the no crank condition.
E3 CHECK FOR ILLUMINATED ENGINE WARNING LAMPS • With the engine running check the instrument cluster for illuminated warning lamps. • **Are any engine warning lamps illuminated?**	**Yes** CARRY OUT a self test of the PCM. DIAGNOSE and REPAIR any present DTCs. REFER to Section 303-14 or Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to E4.
E4 RETRIEVE BCM AND TPM DTCs • Enter the following diagnostic mode on the scan tool: BCM — Self-Test. • Enter the following diagnostic mode on the scan tool: TPM — Self-Test. • **Are any DTCs present?**	**Yes** For BCM DTCs C113A:11 or C113A:15, GO to Pinpoint Test C. For BCM DTC B1305:01, REFER to Section 419-01A. For TPM DTCs U0140:87 or U0422:68, REFER to Section 204-04.

repair4less

	For all other DTCs, REFER to Section 419-10 . **No** GO to E5 .
E5 CONFIRM THE REMOTE START FUNCTION IS ENABLED • Ignition ON. • Check the message center and confirm the remote start function is enabled. Refer to the Owner's Literature or Section 413-01 . • **Is the remote start function enabled?**	**Yes** GO to E6 . **No** ENABLE the remote start function. TEST the system for normal operation.
E6 CHECK THE BCM LAST RECEIVED RKE TRANSMITTER BUTTON PRESS (LST_RKE_xMTR) TRANSMITTER PID • Enter the following diagnostic mode on the scan tool: DataLogger — BCM . • Press the remote start button on the IKT and note the PID status. • **Does the selected PID indicate the remote start button was the last button pressed?**	**Yes** GO to E7 . **No** INSTALL and PROGRAM a new IKT . REFER to Section 419-01B . TEST the system for normal operation.
E7 CHECK THE PCM WAKE UP CIRCUIT • Ignition OFF. • Disconnect: PCM C175B (5.0L and 6.2L), C1381B (3.7L) or C1551B (3.5L). • Ignition ON. • Measure the voltage between the PCM C1551B-28 (3.5L), circuit CE436 (VT/OG), harness side and ground.  N0121945 • Measure the voltage between the PCM C175B-35 (5.0L and 6.2L) or C1381B-35 (3.5L), circuit CE436 (VT/OG), harness side and ground.	**Yes** GO to E8 . **No** VERIFY BCM fuse 18 (10A) is OK. If OK, REPAIR circuit CE436 (VT/OG) for an open. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

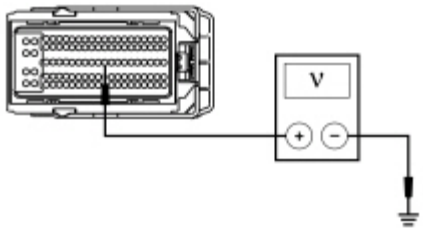
 • **Is the voltage greater than 11 volts?**	
E8 CHECK THE REMOTE START PRECONDITIONS FOR CORRECT OPERATION	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** CARRY OUT the required precondition as necessary. TEST the system for normal operation.
NOTE: The Body Control Module (BCM) acknowledges the remote start request and that all preconditions have been met by providing 2 short flashes of the turn indicators and a system complete chirp. • Make sure that the following preconditions for remote start have been met: ▪ Hood is closed with no DTC present. ▪ Ignition must be off ▪ Vehicle must be in PARK. ▪ Remote start feature is configured ON. ▪ Number of remote start events does not exceed allowed time (2 events in a 1 hour duration). ▪ Attempt to carry out a remote start. • **Is the remote start system still inoperative?**	

Pinpoint Test G: DTC P2532 And P2535

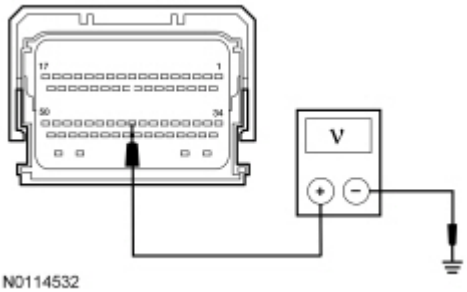
Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

When the ignition key is turned to the RUN or START position, the ignition switch supplies voltage to the PCM logic through the ignition circuit inputs to the BCM . The PCM then provides a ground to the START/RUN relay control circuit to activate the RUN/START relay. When the relay contacts close voltage is supplied to the PCM through Battery Junction Box (BJB) fuse 52 (10A) on the RUN/START bus and circuit.

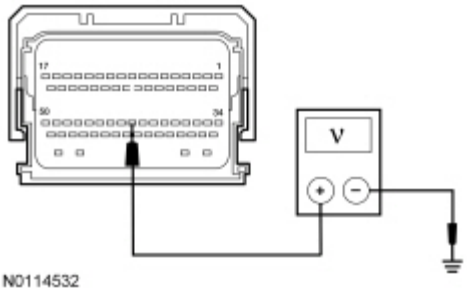


- DTC P2532 (Ignition Switch Run Position Circuit High) — sets when the PCM detects a voltage from the ACC/RUN bus when the ignition key is not in the START or RUN position.
- DTC P2535 (Ignition Switch Run/Start Position Circuit High) — sets when the PCM detects a voltage from the RUN/START bus when the ignition key is not in the START or RUN position.



This pinpoint test is intended to diagnose the following:

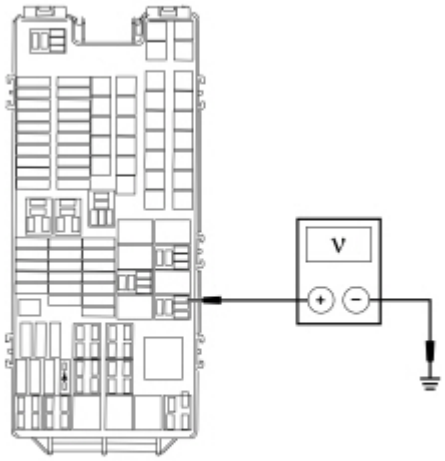
- Wiring, terminals or connectors
- Starter relay
- BJB
- BCM
- PCM



repair4less

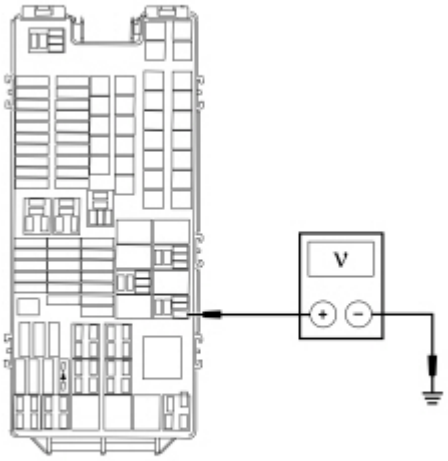
PINPOINT TEST G: DTC P2532 AND P2535

Test Step	Result / Action to Take
G1 CHECK THE PCM FOR DTCS	
• Ignition ON. • Check the PCM for DTCs. • **Are any DTCs present?**	**Yes** **For DTC P2532** ,GO to G2 . **For DTC P2535** ,GO to G3 . For all other PCM DTCs, REFER to Section 303-14 . **No** The system is operating correctly at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G2 CHECK THE RUN START CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM . • Ignition ON. • **NOTE:** Voltage is present **ONLY** when the ignition switch is in the START or RUN position. • **For 3.5L equipped vehicles** , measure the voltage between the PCM C1551B-48, circuit CBB53 (GY/BN), harness side and ground.  N0146611 • Ignition ON. • **NOTE:** Voltage is present **ONLY** when the ignition switch is in the START or RUN position. • **For 3.7L equipped vehicles** , measure the voltage between PCM C175B-42, circuit CBB53 (GY/BN), harness side and ground	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. REPAIR any concern found. REPEAT the self-test. TEST the system for normal operation. If DTC returns. INSTALL a new PCM. REFER to Section 303-14 .



- Ignition ON.
- **NOTE:** Voltage is present **ONLY** when the ignition switch is in the START or RUN position.
- **For 5.0L and 6.2L equipped vehicles** , measure the voltage between PCM C1381B-42, circuit CBB53 (GY/BN), harness side and ground

- **Is any voltage present?**



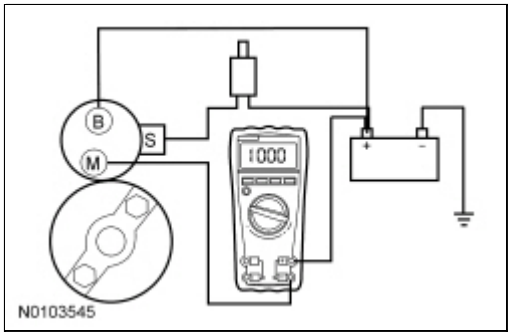
G3 CHECK THE START MOTOR REQUEST CIRCUIT	
• Start the engine. • Disconnect: Starter Motor Relay . • Measure the voltage between BJB starter relay socket pin 2, circuit CDC26 (GY/OG) and ground.	**Yes** GO to G4 . **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

repair4less

N0146535

- **Is any voltage present?**

G4 CHECK THE START MOTOR REQUEST CIRCUIT FOR A SHORT VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between BJB starter relay socket pin 1, circuit CDC12 (YE) and ground.  N0146536 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.



Component Tests

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

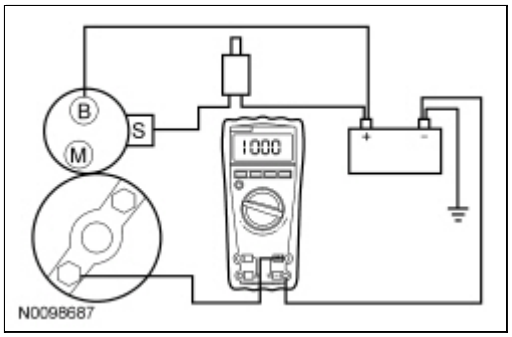
Always make the Digital Multimeter connections at the component terminal rather than at the wiring end of the connector. Making a connection at the wiring end of the connector could result in false readings because the meter will not pick up high resistance between the wiring connector and component.

Starter Motor — Feed Circuit Test

1. Make sure the battery is fully charged; carry out a battery Drain test. Refer to Section 414-01 .
2. Connect a remote starter switch between the starter solenoid C197B and the battery positive terminal.
3. Connect the Digital Multimeter positive lead to the battery positive post. Connect the negative lead to the starter solenoid "M" terminal.

4. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.
5. If the voltage reading is 0.5 volt or less, go to the starter motor-ground circuit component test.
6. If the voltage reading is greater than 0.5 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the Digital Multimeter negative lead to the starter solenoid C197A and repeat the test. If the voltage reading at starter solenoid C197A is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.
7. Remove the cables from starter solenoid C197A, C197B and "M" terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the "M" terminal or less than 0.5 volt when checked at C197A, the concern is in the solenoid contacts. Install a new starter motor. Refer to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section.
8. If the voltage reading taken at starter solenoid C197A is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the battery cable connection or in the positive battery cable itself.
9. Clean the positive battery cable connection. If this does not solve the problem, install a new battery

repair4less



cables. Refer to Section 414-01 .

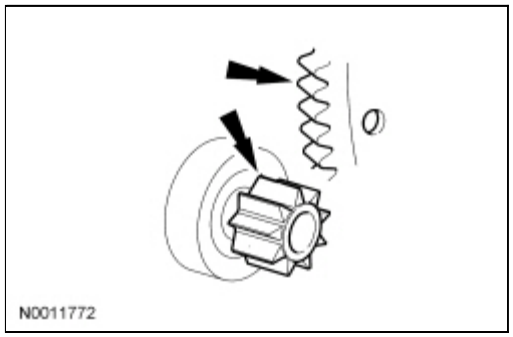
Starter Motor — Ground Circuit Test

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect a remote starter switch between the starter solenoid C197B and the battery positive terminal.

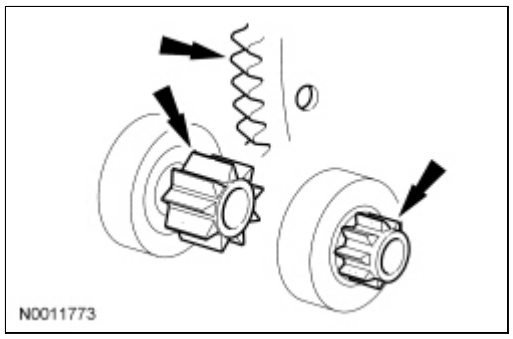
2. Connect the Digital Multimeter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative battery terminal.

3. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.



4. If the voltage drop is greater than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connection. Retest.

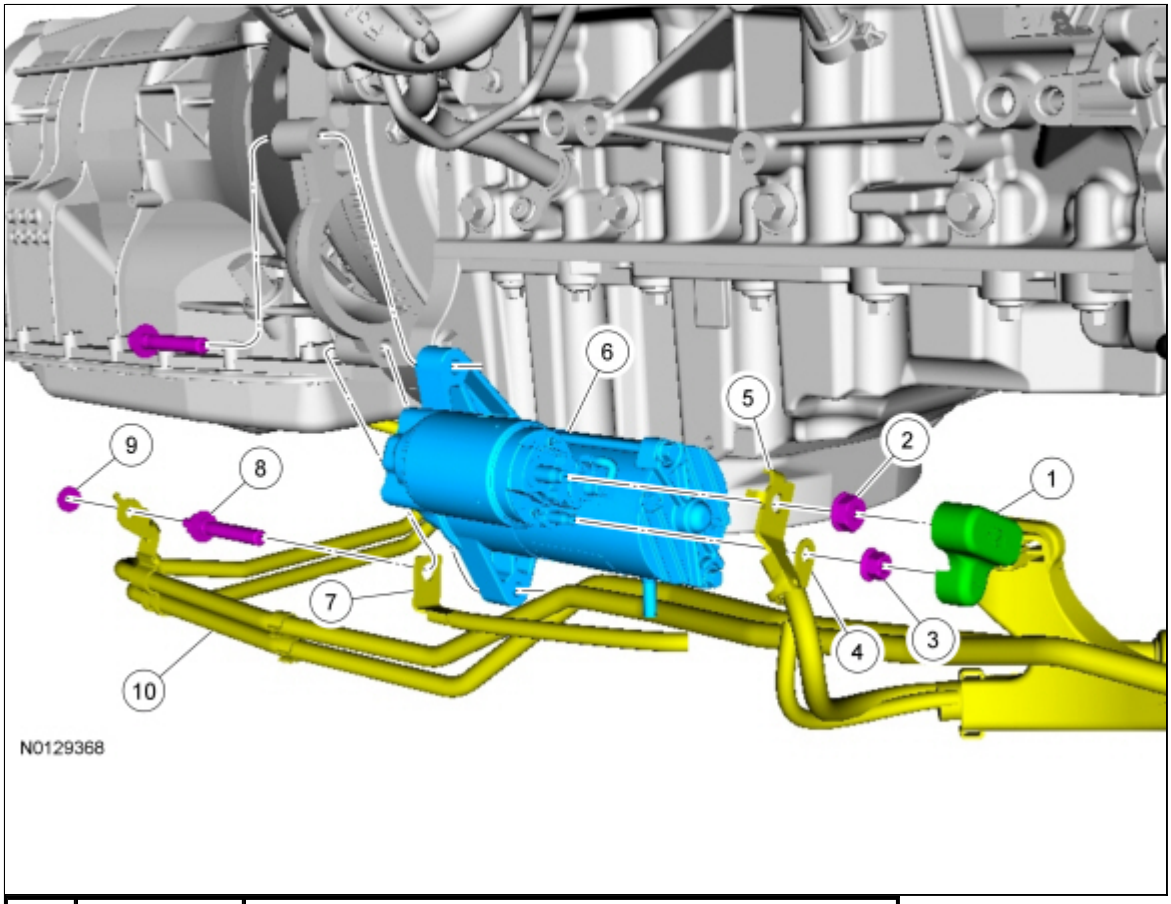
5. If the voltage drop is greater than 0.5 volt, install new cables. Refer to Section 414-01 . If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor. Refer to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section.



repair4less

Starter Motor Drive Gear and Flywheel Ring Gear Inspection

1. Check the wear patterns on the starter drive and the flexplate ring gear. If the wear pattern is not normal, install a new starter motor. For additional information, refer to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section.



2. If the starter drive gear and the flywheel ring gear are not fully meshing or the gears are milled or damaged, install a new starter motor. For additional information, refer to Starter Motor — 3.5L GTDI, 3.7L or Starter Motor — 5.0L (4V), 6.2L (2V) in this section. Install a new flexplate. For additional information, refer to Section 303-01A , Section 303-01B , Section 303-01C or Section 303-01D .

Starter Motor — 3.5L GTDI, 3.7L

Item	Part Number	Description
1	11N087	Starter solenoid terminal cover
2	W706414	Starter solenoid B+ terminal nut - 12 Nm (106 lb-in)
3	W705790	Starter solenoid S-terminal nut - 5 Nm (44 lb-in)
4	14463	Starter solenoid S-terminal eyelet
5	14463	Starter solenoid B+ terminal eyelet
6	11002	Starter motor
7	14463	Starter motor ground cable eyelet
8	W714290	Starter motor mounting stud bolts (2 required) - 48 Nm (35 lb-ft)
9	W709450	Transmission fluid cooler tube bracket nut - 12 Nm (106 lb-in)
10	7R081	Transmission fluid cooler inlet and outlet tubes

Removal and Installation

WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

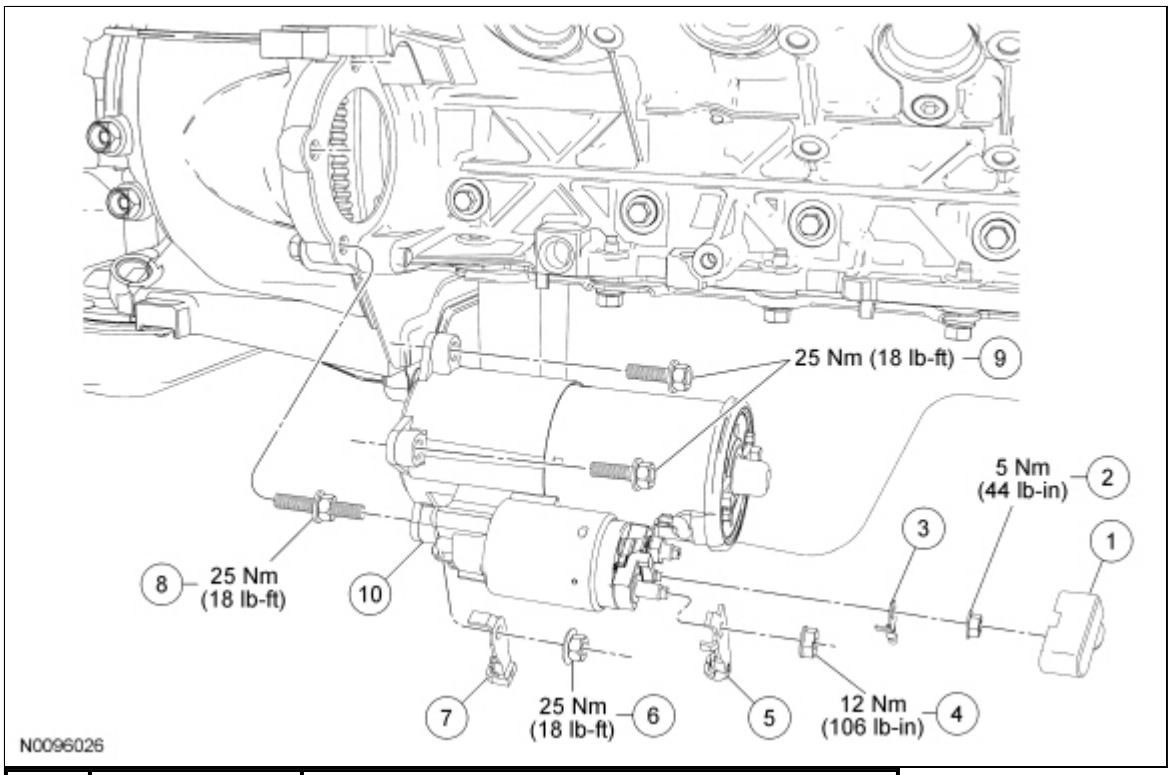
3. Remove the terminal cover.

4. Remove the nut and disconnect the starter solenoid B+ terminal eyelet.
   - To install, tighten to 12 Nm (106 lb-in).

5. Remove the nut and disconnect the starter solenoid S-terminal eyelet.
   - To install, tighten to 5 Nm (44 lb-in).

6. Remove the transmission fluid cooler tube bracket nut and position the transmission cooler inlet and outlet tubes aside.
   - To install, tighten to 12 Nm (106 lb-in).

7. Remove the lower stud bolt and position starter motor ground cable eyelet aside.
   - To install, tighten to 48 Nm (35 lb-ft).



8. **NOTE:** Tighten the upper bolt before tightening the lower fasteners.

   Remove the upper stud bolt and the starter motor.
   - To install, tighten to 48 Nm (35 lb-ft).

9. To install, reverse the removal procedure.

1. Remove the ignition coil-on-plug. For additional information, refer to Ignition Coil-On-Plug in this section.

Lower spark plugs

2. Disconnect the ignition wire from the lower spark plug.

All spark plugs

3. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

   Remove the spark plug.

4. Inspect the spark plug. For additional information, refer to Section 303-00 .

Installation

All spark plugs

1. Adjust the spark plug gap as necessary. For the correct spark plug gap specification, refer to Specifications in this section.

repair4less

2. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   Install the spark plug.
   - Tighten to 18 Nm (159 lb-in).

Lower spark plugs

3. Connect the ignition wire from the lower spark plug.

Upper spark plugs

4. Install the ignition coil-on-plug. For additional information, refer to Ignition Coil-On-Plug in this section.

Engine Emission Control

NOTE: Do not permanently remove or render inoperative any part of the vehicle emission control system including related hardware. Failure to comply may violate applicable state and federal law.

NOTE: The vehicle emission vacuum routing diagrams are contained in the Description and Operation subsection of the Evaporative Emissions section. Refer to Section 303-13 .

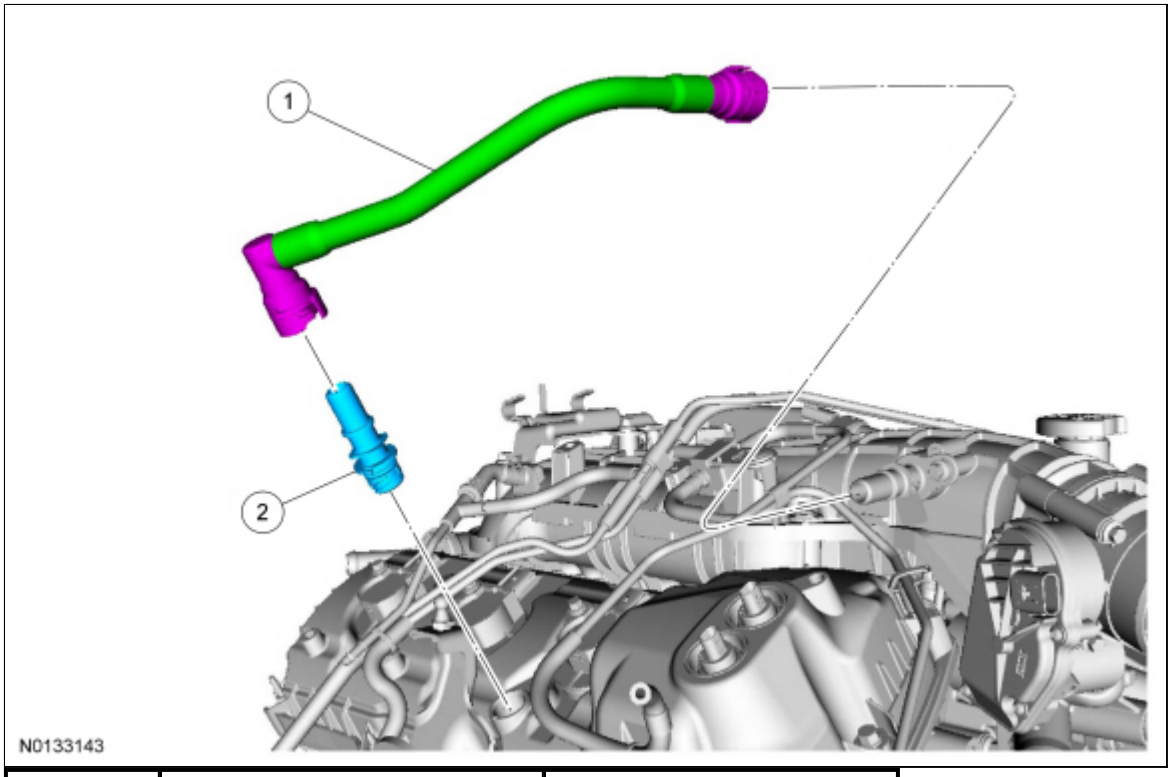
The engine emission control system consists of the:

- PCV system.

PCV System

The PCV system:

- uses intake manifold vacuum to ventilate blow-by gases from the crankcase.
- returns the gases to the intake manifold for combustion.



The PCV valve:

- varies the amount of blow-by gases returned to the intake manifold based on available engine vacuum.

Intake Air Distribution and Filtering

The intake air system consists of the:

- Engine Air Cleaner (ACL).
- ACL element.
- ACL outlet pipe.
- Mass Air Flow (MAF) sensor.
- Manifold Absolute Pressure (MAP) sensor.
- Charge Air Cooler (CAC) - 3.5L Gasoline Turbocharged Direct Injection (GTDI).
- CAC pipes and tubes - 3.5L GTDI .
- turbocharger intake pipes - 3.5L GTDI .
- turbocharger intake tubes - 3.5L GTDI .

The intake air system:

- cleans intake air with a replaceable, dry-type ACL element.
- measures airflow and air temperature with a MAF sensor. Refer to Section 303-14 .
- measures manifold vacuum with a MAP sensor (3.5L GTDI engine) and converts it to an electronic signal. This provides the PCM information on the engine load. Refer to Section 303-14 .

The engine ACL contains an ACL element made of treated, pleated paper. A new ACL element must be installed periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the ACL element is reached. The ACL housing is an integral part of the degas bottle (3.5L Gasoline Turbocharged Direct Injection (GTDI), 3.7L and 5.0L engines) or the coolant expansion tank (6.2L engines) and cannot be serviced separately. Refer to Section 303-03 .

The CAC subsystem (3.5L GTDI engine) cools and increases the density of the compressed turbocharged air.

repair4less

Charge Air Cooler (CAC) Cleaning

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	—

Charge Air Cooler (CAC) Cleaning

1. Remove the Charge Air Cooler (CAC). For additional information, refer to Charge Air Cooler in this section.

2. ***NOTICE:*** **Do not use a high-pressure power washer to clean the Charge Air Cooler (CAC) or the CAC may be damaged.**

   NOTE: Drain all contaminates such as coolant, fuel and oil prior to cleaning the Charge Air Cooler (CAC).

   NOTE: Thoroughly clean the joint clamp areas as well as the turbocharger connections and the engine connection using metal brake parts cleaner.

   Lay the CAC flat with the inlet and outlet ports pointing up.

3. **NOTE:** Plug or cap the CAC openings prior to agitating.

   Add an appropriate amount of commercially available detergent cleaner such as Simple Green® Pro HD, or equivalent, to the CAC . Follow the manufacturer's directions for cleaning. Fill the CAC to 40% of its volume with water.

4. Raise one end of the CAC and agitate it by hand for at least 5 minutes.

5. Raise the opposite end of the CAC and agitate it by hand for at least 5 minutes.

6. Drain the CAC .

7. Flush the CAC thoroughly with clean water.

8. Repeat Steps 1 through 6 until no contaminates are found in the flush water.

9. Allow the CAC to air dry.

10. **NOTE:** The following leak test steps must be performed prior to installing the CAC .

    NOTE: Use a commercially available kit, such as the SPX/OTC Charged Air Cooler Tester No. 5039, or equivalent.

Install the commercially available CAC cooler tester on the CAC following the manufacturer's installation instructions.

- Tighten the clamps to 5 Nm (44 lb-in).

11.  **WARNING: Never exceed the specified pressure. Excessive pressure may cause the test adapter to blow off or may damage the charge air cooler (CAC). Failure to follow this instruction may result in serious personal injury.**

    Slowly apply air pressure to 150 kPa (22 psi).

12. Let the CAC stand for a few minutes and note any loss in pressure.
    - Release the air pressure.

13. Repeat Steps 11 and 12 as many times as necessary to verify the readings. The reading is considered verified when 3 consecutive tests show approximately the same pressure drop.
    - If the pressure loss exceeds 20 kPa (3 psi) per minute, install a new CAC . For additional information, refer to Charge Air Cooler in this section.

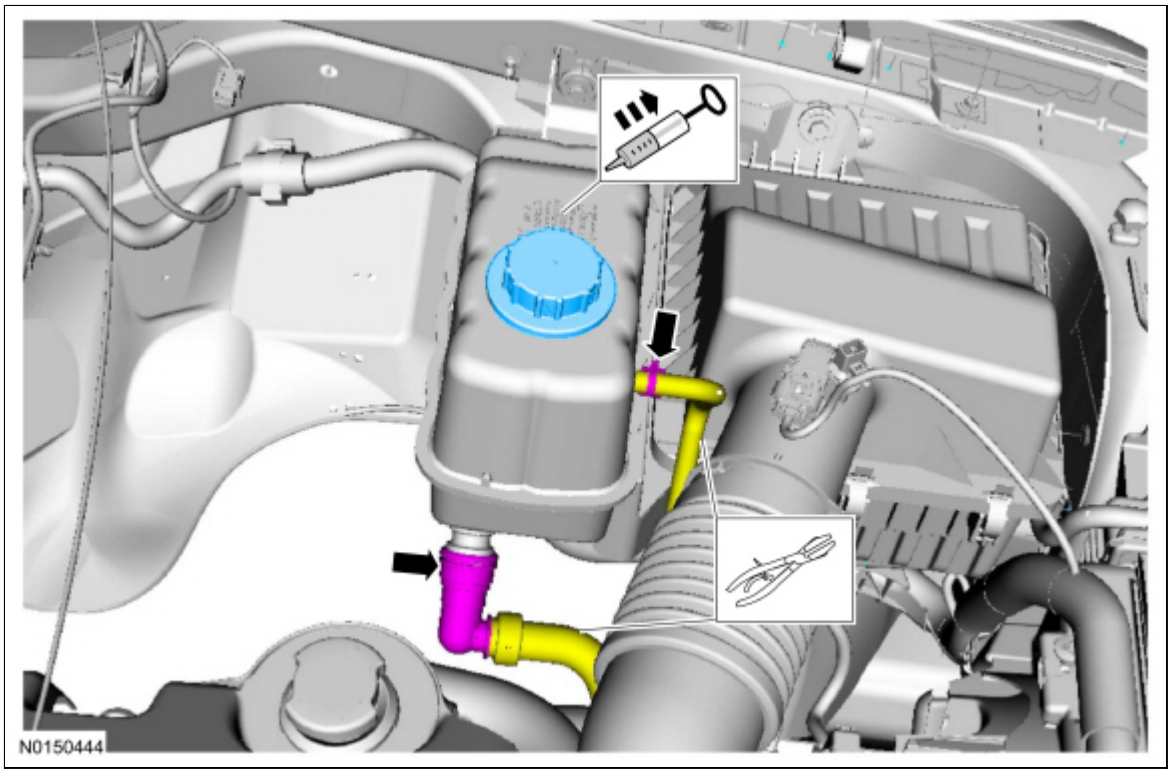
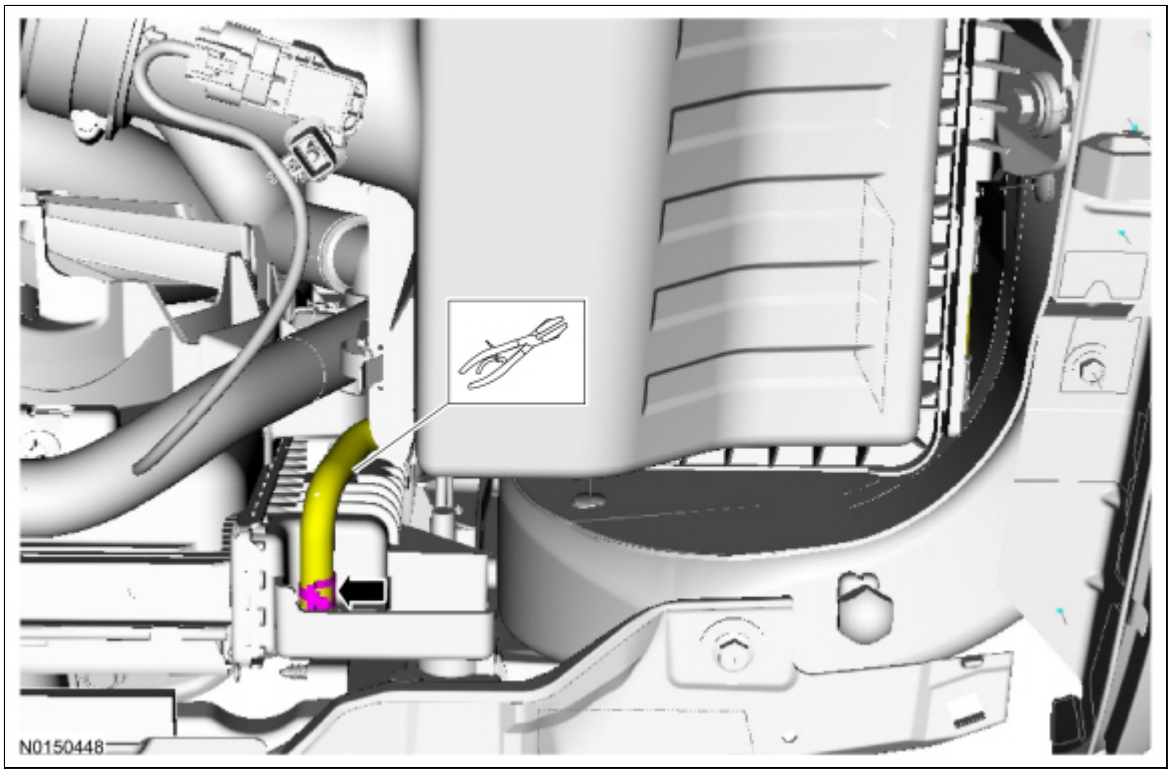
Air Cleaner — 3.5L GTDI

Material



Item	Specification
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D

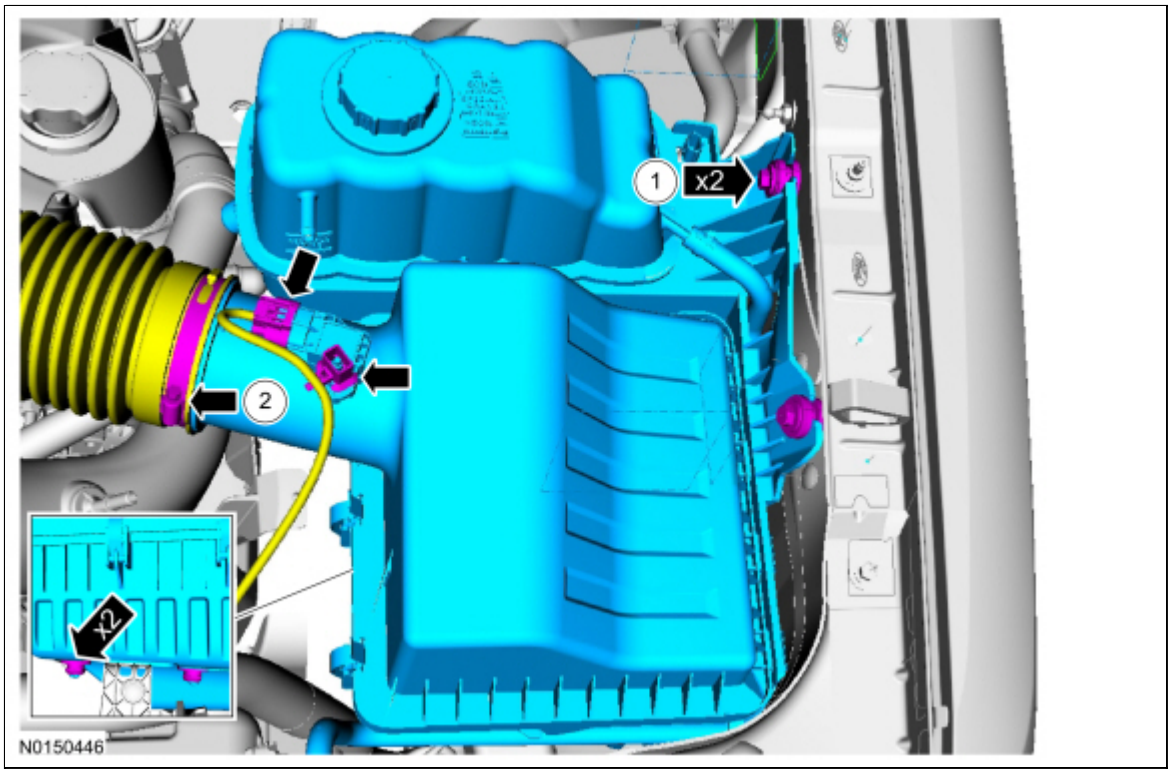
NOTICE: **Whenever turbocharger air intake system components are removed, always cover open ports to protect from debris. It is important that no foreign material enter the system. The turbocharger compressor vanes are susceptible to damage from even small particles. All components should be inspected and cleaned, if necessary, prior to installation or reassembly.**



1. **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

2.



3.

4.

1. Tighten to 17 Nm (150 lb-in).

Torque Specifications

Description	Nm	lb-in
Evaporative Emission (EVAP) canister assembly bracket-to- EVAP canister assembly bolts	6	53
EVAP canister assembly-to-frame bolts	13	115
EVAP canister purge valve-to-intake manifold bolts	10	89

Evaporative Emissions

The Evaporative Emission (EVAP) system consists of the following components:

- EVAP canister (located in front of the fuel tank)
- EVAP canister purge valve (located on the intake manifold)
- Dual check valve (3.5L Gasoline Turbocharged Direct Injection (GTDI) engine) (part of the canister purge valve)
- Vapor ejector (3.5L GTDI engine) (located in front of the engine)
- EVAP canister vent solenoid and dust separator assembly (located on the front of the EVAP canister)
- Fuel Tank Pressure (FTP) sensor and vapor tube assembly (located on top of the fuel tank)
- Vapor tubes
- Fresh air hose (located on top of the transmission)

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the PCM which, using various sensor inputs, calculates the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.

The fuel vapors are routed:

- from the fuel tank through the fill limit valve and fuel vapor vent valve. The fuel vapor vent valves are part of the fuel tank assembly and cannot be serviced separately.
- to the EVAP canisters through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The EVAP canister:

- contains activated carbon.
- stores fuel vapors.

The EVAP canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canister.
- is controlled by the PCM.

The dual check valve (3.5L GTDI engine):

- routes fuel vapors to the intake manifold when the intake manifold is not pressurized.
- routes fuel vapors to the vapor ejector when the intake manifold is pressurized.

repair4less

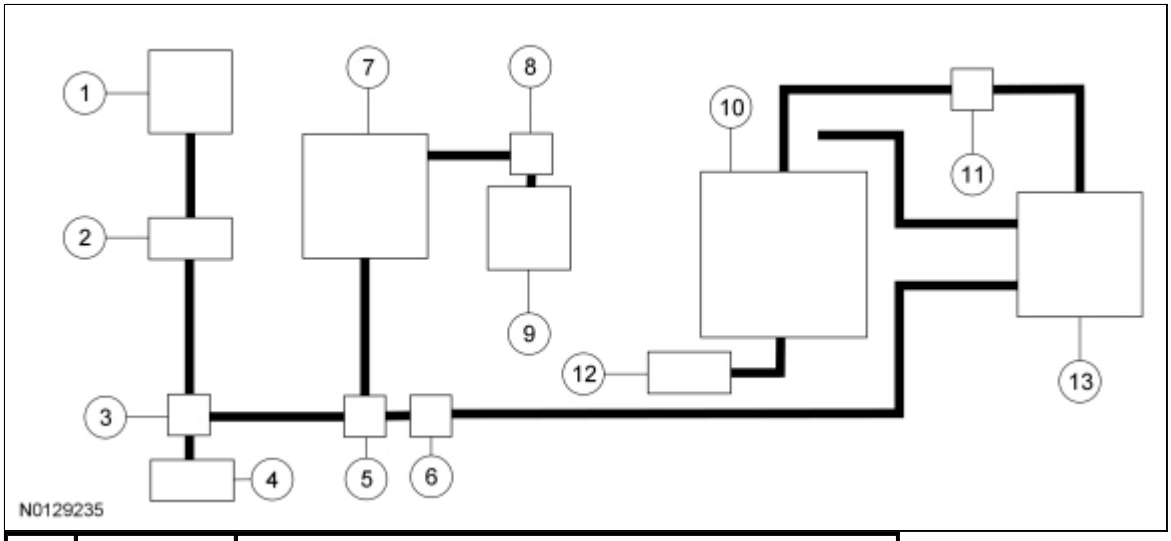
The vapor ejector (3.5L GTDI engine):

- is a venturi valve.
- uses pressurized air from the RH turbocharger-to-Charge Air Cooler (CAC) tube to route fuel vapors to the Air Cleaner (ACL) outlet tube-to-LH turbocharger tube.

The EVAP canister vent solenoid:

- is controlled by the PCM.
- is normally open.
- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBD II leak and pressure tests.

The EVAP dust separator:



- prevents suspended dust and dirt particles from entering the EVAP system.
- is serviced as a separate item.

The FTP sensor:

- measures the pressure levels in the fuel tank continuously.
- serves as an input to the PCM.

Evaporative Emission System Leak Test

Special Tool(s)

 ST2817-A	VACUTEC Smoke Machine Fuel Evaporative Emission System Tester 218-0002 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Phase 1 — Leak Verification

1. Run the EVAP Test with the scan tool.

2. **NOTE:** Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

   If the Evaporative Emission (EVAP) system failed the EVAP Test, then proceed to Phase 2.

Phase 2 — System Leak Check

1. Disconnect the upper vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .

2. Connect the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to the upper EVAP canister purge valve fitting. For additional information, refer to the manufacturer's instructions.

3. **NOTE:** The battery ground cable was previously disconnected in the vapor tube quick connect coupling procedure.

   Connect the battery ground cable. For additional information, refer to Section 414-01 .

4. **NOTE:** In the scan tool, the EVAP canister purge valve is referred to as the EVAP vapor management valve.

   Open the EVAP canister purge valve with the scan tool.

5. Close the canister vent solenoid with the scan tool.

6. **NOTE:** The supplemental refueling adapter is located with the vehicle jack.

Install the supplemental refueling adapter into the Easy Fuel ^{TM} (capless) fuel tank filler pipe assembly.

7. **NOTE:** If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.

   Introduce smoke from the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

8. Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

9. Continue to enter smoke into the system for 60 seconds to obtain pressure.

10. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.

11. Use the halogen light provided with the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

12. Repair any leaks as necessary.

13. Repeat the EVAP Leak Test until the system passes.

---

2	W520100	Evaporative Emission (EVAP) vapor ejector and hose assembly bracket nut - 6 Nm (53 lb-in)
3	9G297	Evaporative Emission (EVAP) vapor ejector and hose assembly

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

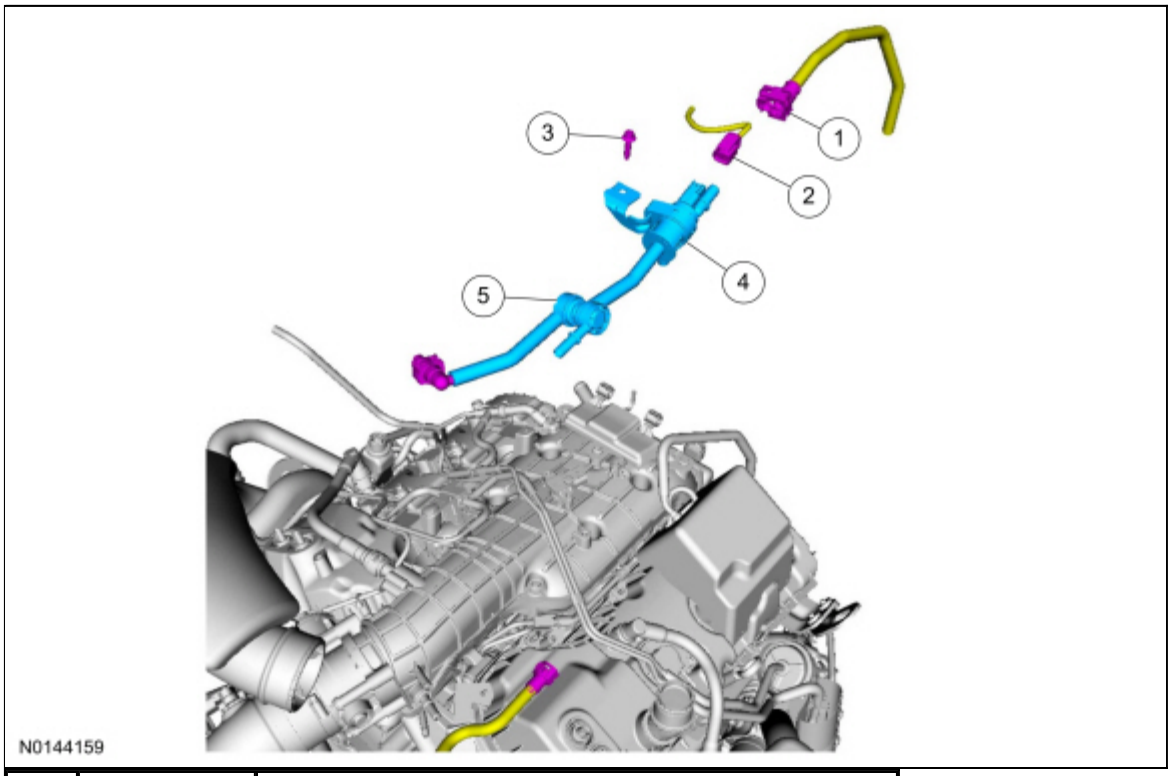
WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an

evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the battery ground cable. Refer to Section 414-01 .
2. Remove the Air Cleaner (ACL) outlet pipe. Refer to Section 303-12 .
3. Remove the Charge Air Cooler (CAC)-to-Throttle Body (TB) pipe. Refer to Section 303-12 .
4. Disconnect the 3 Evaporative Emission (EVAP) vapor ejector and hose assembly quick-connect fittings.
5. Remove the nut and the Evaporative Emission (EVAP) vapor ejector and hose assembly.
    - To install, tighten to 6 Nm (53 lb-in).

Installation



1. To install, reverse the removal steps.
    - Carry out the Evaporative Emission System Leak Test. Refer to Evaporative Emission System Leak Test .

Removal and Installation

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

All engines

repair4less

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

3.5L Gasoline Turbocharged Direct Injection (GTDI) engine

3. Disconnect the 3 purge valve and hose assembly vapor hose quick-connect fittings.

4. Remove the bolt and the purge valve and hose assembly.
   - To install, tighten to 10 Nm (89 lb-in).

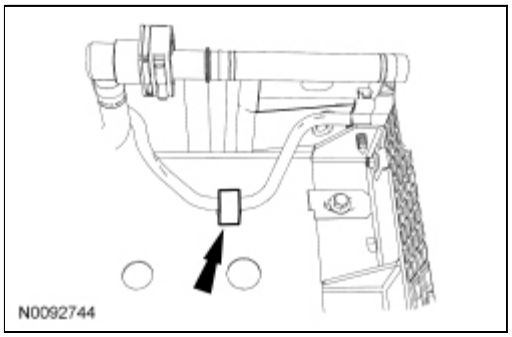
3.7L, 5.0L and 6.2L engines

5. Disconnect the EVAP canister-to- EVAP canister purge valve vapor tube quick connect coupling from the valve. For additional information, refer to Section 310-00 .

6. Remove the 2 EVAP canister purge valve bolts and remove the valve.
   - To install, tighten to 10 Nm (89 lb-in).

All engines

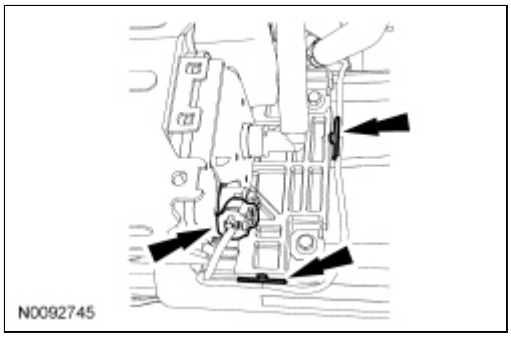
7. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.



Evaporative Emission Canister Vent Solenoid

Removal and Installation

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the Fuel Tank Pressure (FTP) sensor and vapor tube assembly-to-Evaporative Emission (EVAP) canister vapor tube quick connect coupling. For additional information, refer to Section 310-00 .
4. Disconnect the fuel tank supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
5. Disconnect the front fuel supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
6. Disconnect the front vapor tube-to- EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
7. Remove the vapor hose from the EVAP canister vent solenoid.
8. Disconnect the center fuel supply tube-to-frame pushpin retainer.

9. Disconnect the EVAP canister vent solenoid electrical connector and 2 pushpin retainers.

repair4less

10. Remove the 4 EVAP canister assembly bolts and remove the EVAP canister from the vehicle.
    - To install, tighten to 13 Nm (115 lb-in).

11. Place the EVAP canister assembly on a workbench.

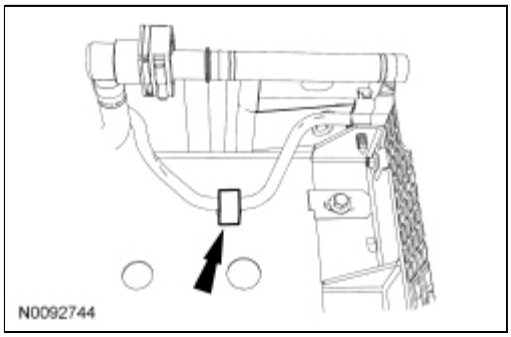
12. Open the front retainer and position the center fuel supply tube out of the retainer.

13. **NOTE:** Before tightening the front bracket bolts, extend the front bracket as far forward as possible.

    Remove the 2 bolts and the EVAP canister assembly front bracket from the EVAP canister.
    - To install, tighten to 9 Nm (80 lb-in).

14. Remove the canister vent solenoid and dust box from the EVAP canister.

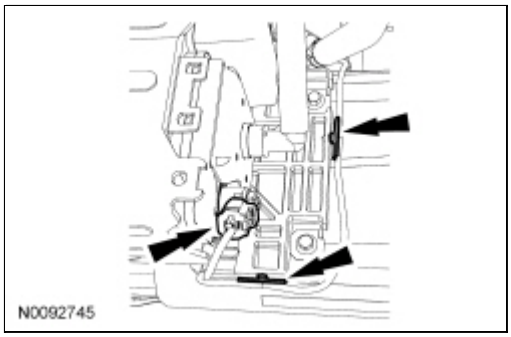
15. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.



Evaporative Emission Canister

Removal and Installation

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the Fuel Tank Pressure (FTP) sensor and vapor tube assembly-to-Evaporative Emission (EVAP) canister vapor tube quick connect coupling. For additional information, refer to Section 310-00 .
4. Disconnect the fuel tank supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
5. Disconnect the front fuel supply tube-to-center fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .
6. Disconnect the front vapor tube-to- EVAP canister quick connect coupling. For additional information, refer to Section 310-00 .
7. Remove the vapor hose from the EVAP canister vent solenoid.
8. Disconnect the center fuel supply tube-to-frame pushpin retainer.

9. Disconnect the EVAP canister vent solenoid electrical connector and 2 pushpin retainers.

repair4less

10. Remove the 4 EVAP canister assembly bolts and remove the EVAP canister from the vehicle.
    - To install, tighten to 13 Nm (115 lb-in).

11. Place the EVAP canister assembly on a workbench.

12. Disconnect the center vapor tube quick connect coupling from the EVAP canister and remove from the EVAP canister assembly. For additional information, refer to Section 310-00 .

13. Open the 2 center fuel supply tube retainers and remove the center fuel supply tube from the EVAP canister assembly.

14. **NOTE:** Before tightening the front bracket bolts, extend the front bracket as far forward as possible.

    Remove the 5 bolts and the EVAP canister assembly brackets from the EVAP canister.
    - To install, tighten to 9 Nm (80 lb-in).

15. Remove the canister vent solenoid and dust box from the EVAP canister.

16. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

repair4less

Fuel Tank Pressure Sensor

Item	Part Number	Description
1	—	Fuel Tank Pressure (FTP) sensor and vapor tube assembly-to-fuel tank vent valve quick connect coupling (part of 9J279)
2	—	FTP sensor and vapor tube assembly-to-fuel pump module quick connect coupling (part of 9J279)
3	—	FTP sensor (part of 9J279)
4	9J279	FTP sensor and vapor tube assembly
5	—	FTP sensor and vapor tube assembly-to-fuel tank vent valve quick connect coupling (part of 9J279)

Removal and Installation

WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and

may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the fuel tank. For additional information, refer to Section 310-01 .

2. Disconnect the 2 Fuel Tank Pressure (FTP) sensor and vapor tube assembly-to-fuel tank vent valve quick connect couplings. For additional information, refer to Section 310-00 .

3. Disconnect the FTP sensor and vapor tube assembly-to-fuel pump module quick connect coupling. For additional information, refer to Section 310-00 .

4. Remove the FTP sensor and vapor tube assembly from the fuel tank.

5. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Electronic Engine Controls

The electronic engine controls consist of the following:

- Camshaft Position (CMP) Sensor
- Catalyst Monitor Sensor (CMS)
- Crankshaft Position (CKP) Sensor
- Cylinder Head Temperature (CHT) Sensor
- Fuel Rail Pressure (FRP) Sensor — 3.5L Gasoline Turbocharged Direct Injection (GTDI)
- Heated Oxygen Sensor (HO2S)
- Intake Air Temperature (IAT) Sensor — 3.5L GTDI
- Knock Sensor (KS)
- Manifold Absolute Pressure (MAP)/Intake Air Temperature 2 (IAT2) Sensor — 3.5L GTDI
- Mass Air Flow (MAF) Sensor — 3.7L, 5.0L (4V) and 6.2L (2V)
- PCM
- Turbocharger Boost Pressure (TCBP)/Charge Air Cooler (CAC) Sensor — 3.5L GTDI
- Variable Camshaft Timing (VCT) Oil Control Valve — 3.5L GTDI and 3.7L
- VCT Variable Force Solenoid — 5.0L (4V) and 6.2L (2V)

The CHT sensor:

- is mounted to the wall of the cylinder head and is not connected to any coolant passages.
- sends the PCM a signal indicating cylinder head temperature.

The CKP sensor:

- is mounted to the wall of the cylinder block.
- sends the PCM a signal indicating crankshaft position and engine speed.

The CMP sensor:

- is mounted to the cylinder head.
- sends the PCM a signal indicating camshaft position.

The CMS :

- is mounted to the catalytic converter.
- sends the PCM a signal indicating oxygen content in the exhaust after the exhaust leaves the catalytic converter.

The FRP sensor (3.5L GTDI):

- is mounted to the fuel rail.
- measures the pressure of the fuel rail and sends these signals to the PCM .

The HO2S :

- is mounted to the exhaust Y-pipe.
- sends the PCM a signal indicating oxygen content in the exhaust before the exhaust enters the catalytic converter.

The IAT sensor (3.5L GTDI):

- is mounted on the Air Cleaner (ACL).
- sends the PCM a signal indicating the temperature of the air entering the engine.

The KS :

- is mounted to the wall of the cylinder block.
- sends a signal to the PCM indicating engine detonation.

The MAF sensor:

- is mounted on the ACL .
- sends the PCM a signal indicating mass airflow rate of air entering the engine.

The MAP / IAT2 Sensor (3.5L GTDI):

- is mounted on the top of the intake manifold.
- is a combination sensor.
- measures manifold pressure and converts it to an electrical signal. This provides the PCM information on engine load.
- sends the PCM a signal indicating the temperature of the air entering the cylinders after passing through the CAC .

The TCBP / CAC Sensor (3.5L GTDI only):

- is mounted to the CAC outlet tube.
- is a combination sensor.
- measures turbocharger boost pressure and sends this information to the PCM .
- measures the temperature of the charge air exiting the CAC and sends this information to the PCM .

The VCT Oil Control Valve (3.5L GTDI and 3.7L only)

- is mounted to the cylinder head.
- is an electronic solenoid that supplies force to actuate the VCT oil control valve. When the PCM transmits a signal based on the engine speed and load, the solenoid moves the VCT oil control valve activating either the advance circuit, retard circuit or hold position. The camshaft is then repositioned in relation to crankshaft timing to allow for optimum engine performance with lower emissions and reduced fuel consumption.

The VCT Variable Force Solenoid [5.0L (4V) and 6.2L (2V) only]:

- is mounted to the engine front cover.
- is an electronic solenoid that supplies force to actuate the VCT oil control valve. The PCM transmits a

repair4less

signal based on the engine speed and load, the solenoid will move the VCT oil control valve activating either the advance circuit, retard circuit or hold position. The camshaft is then repositioned in relation to crankshaft timing to allow for optimum engine performance with lower emissions and reduced fuel consumption.

Camshaft Position (CMP) Sensor — 3.5L GTDI

Removal

NOTE: Removal steps in this procedure may contain installation details.

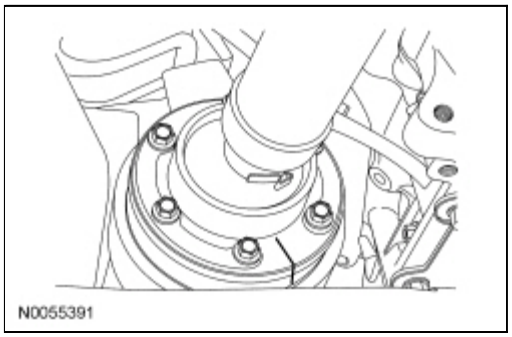
1.
    - To install, tighten to 10 Nm (89 lb-in).

Installation

1. To install, reverse the removal steps.

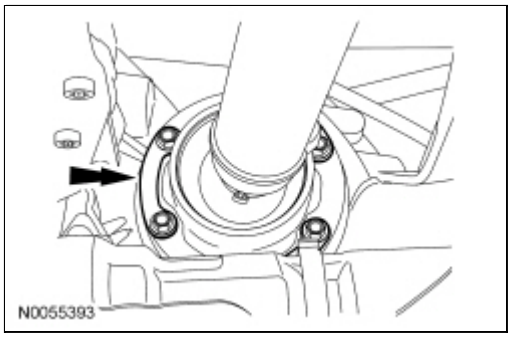
repair4less

Camshaft Position (CMP) Sensor — 5.0L (4V)



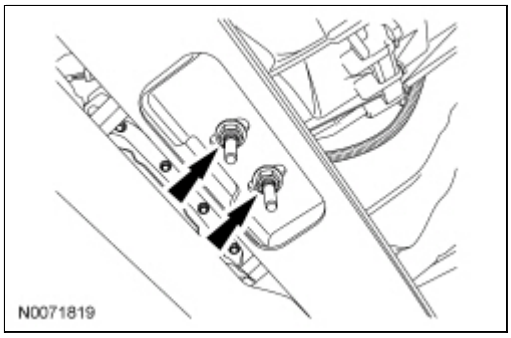
Removal

Both RH and LH intake Camshaft Position (CMP) sensors and RH exhaust CMP sensor



1. Disconnect the Camshaft Position (CMP) sensor electrical connector.
2. Remove the bolt and the CMP sensor.

LH exhaust Camshaft Position (CMP) sensor



3. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
4. If equipped with 4 wheel drive, index-mark the front flange to the pinion flange.

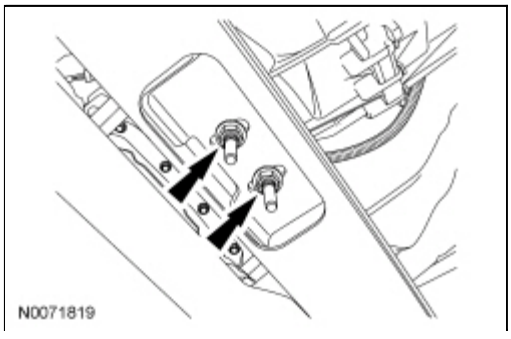
5. If equipped with 4 wheel drive, remove the 6 front flange-to-pinion flange bolts and 2 washers and position the driveshaft aside.
   - Discard the 6 bolts and 2 washers

6. Remove the 2 bolts and the LH heat shield from the rear of the LH cylinder head.
7. Disconnect the CMP sensor electrical connector.
8. Remove the 2 transmission support insulator nuts.

9. Remove the CMP bolt.

10. **NOTE:** Make sure the transmission jack contacts the outer ribs of the transmission fluid pan.

    Position a suitable high-lift transmission jack under the transmission. Raise the transmission until the CMP sensor can be removed.
    - Remove the CMP sensor.



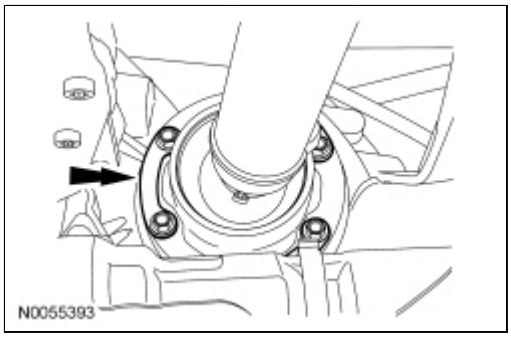
Installation

LH exhaust Camshaft Position (CMP) sensor

1. **NOTE:** The bolt must be torqued while the transmission is raised

   Position the Camshaft Position (CMP) sensor and install the bolt.
   - Tighten to 10 Nm (89 lb-in).

2. Using the suitable high-lift transmission jack, lower the transmission and install the 2 transmission support insulator nuts.
   - Tighten to 103 Nm (75 lb-ft).



3. Connect the CMP sensor electrical connector.

4. Position the LH heat shield onto the rear of the LH cylinder head and install the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

5. If equipped with 4 wheel drive, position back the driveshaft, align the index mark and install 2 washers and 6 new bolts.
   - Tighten to 55 Nm (41 lb-ft).

repair4less

Both RH and LH intake CMP sensors and RH exhaust CMP sensor

6. Position the CMP sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

7. Connect the CMP sensor electrical connector.

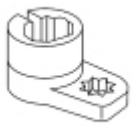
Crankshaft Position (CKP) Sensor — 5.0L (4V)

Removal

1. Remove the intake manifold. For additional information, refer to Section 303-01C .
2. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.
3. Disconnect theCrankshaft Position (CKP) sensor electrical connector.
4. **NOTE:** The Crankshaft Position (CKP) sensor bolt is part of the CKP sensor and cannot be removed.

   Loosen the bolt and remove the CKP sensor.

Installation



1. **NOTE:** The Crankshaft Position (CKP) sensor bolt is part of the CKP sensor and cannot be removed.

   Position the CKP sensor and tighten the bolt.
   - Tighten to 10 Nm (89 lb-in).
2. Connect the CKP sensor electrical connector.
3. Connect the CHT sensor electrical connector.
4. Install the intake manifold. For additional information, refer to Section 303-01C .

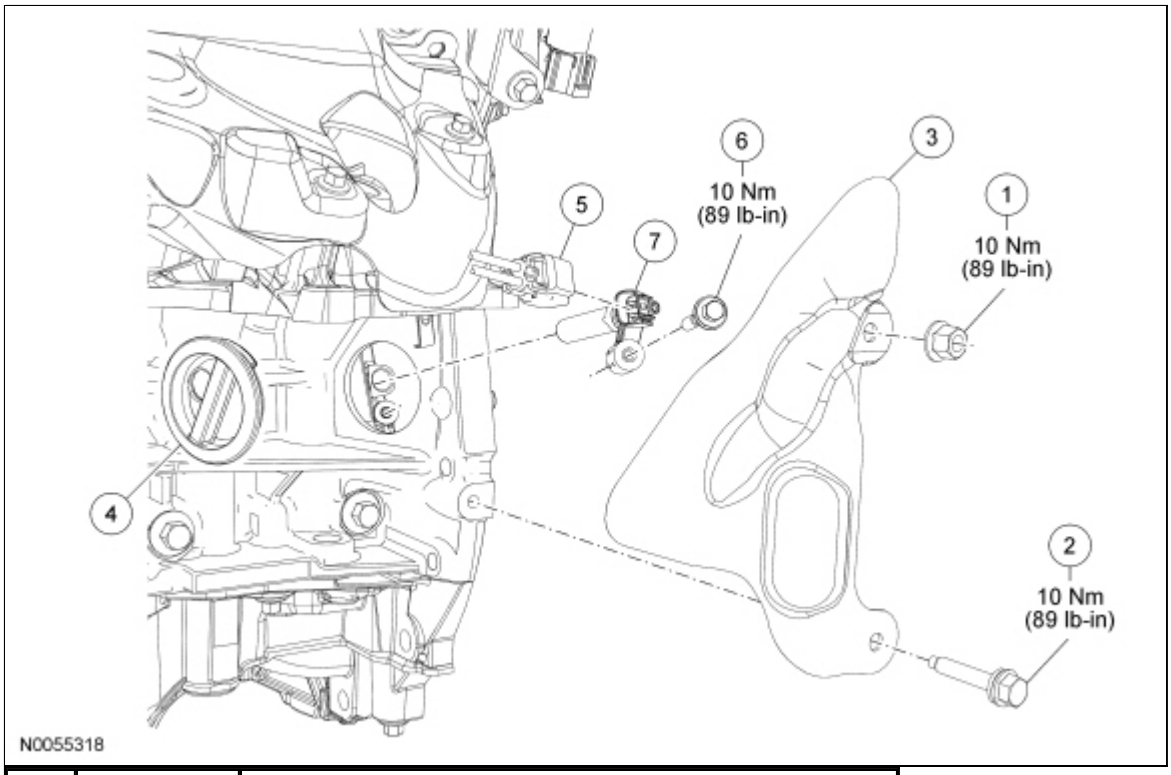
Engine Control Components — Exploded View, 3.5L GTDI

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

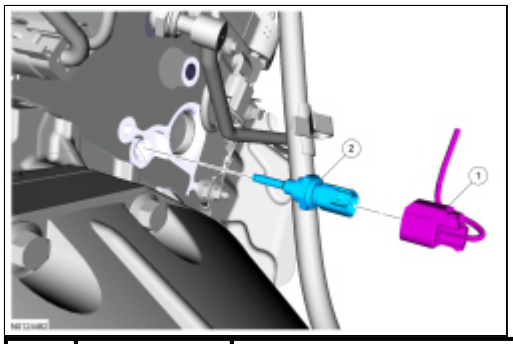


Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	—
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	—

Crankshaft Position (CKP) Sensor

NOTE: It is necessary to remove the LH turbo charger to access the Crankshaft Position (CKP) sensor. For additional information, refer to Section 303-04E .

NOTE: After installing the Crankshaft Position (CKP) sensor, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

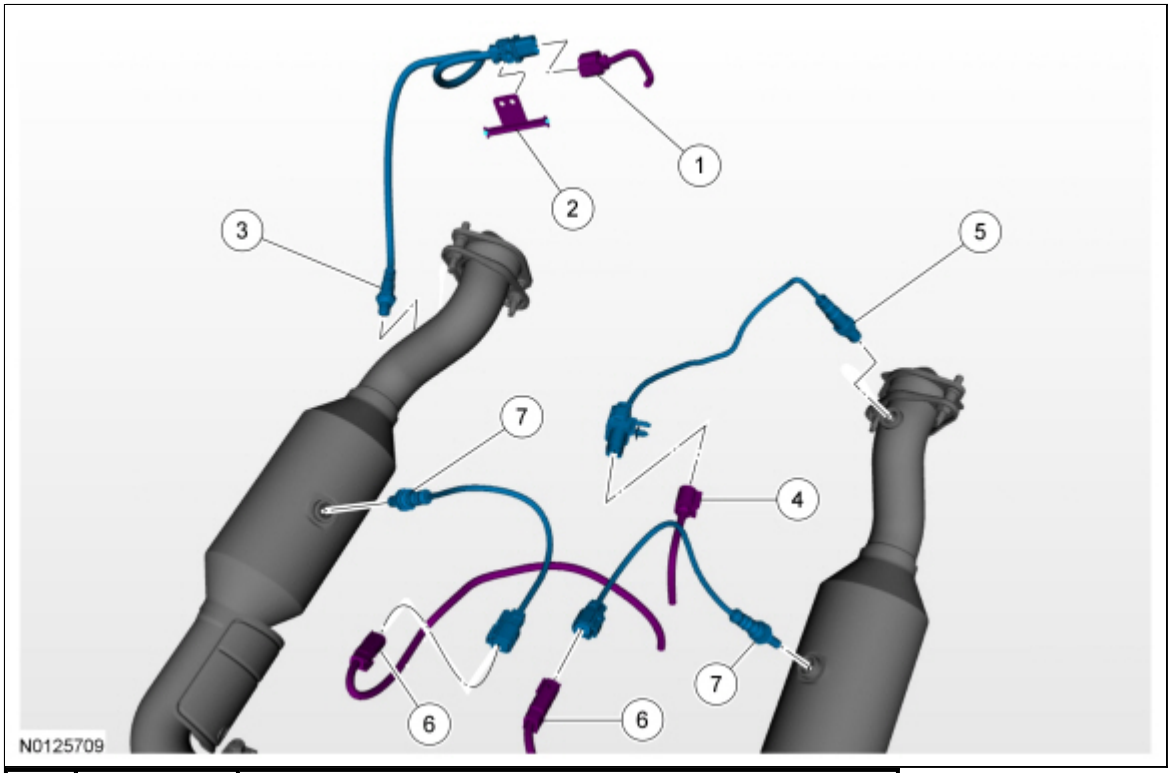


repair4less

Item	Part Number	Description
1	W701542	Heat shield nut
2	W701669	Heat shield bolt
3	6K342	Heat shield
4	6C070	Rubber grommet cover
5	—	Crankshaft Position (CKP) sensor electrical connector (part of 12C508)
6	W712315	CKP sensor bolt (part of 6D327)
7	6C315	CKP sensor (part of 6D327)

Cylinder Head Temperature (CHT) Sensor

NOTE: It is necessary to remove the RH fender splash shield to access the Cylinder Head Temperature (CHT) sensor. For additional information, refer to Section 501-02 .



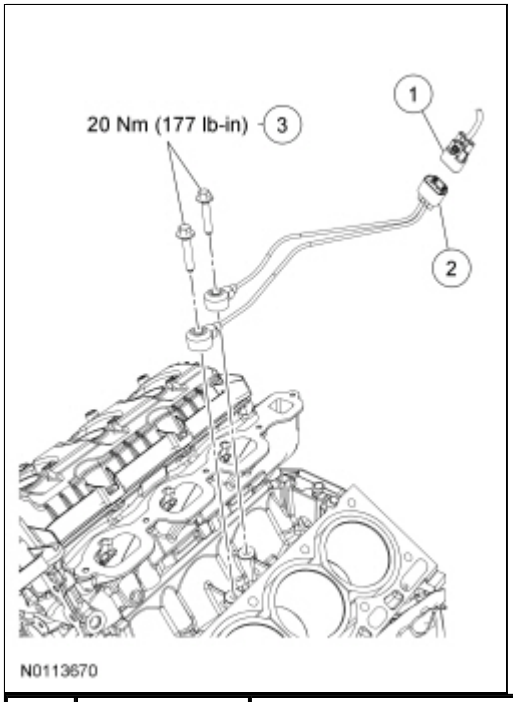
Item	Part Number	Description
1	—	Cylinder Head Temperature (CHT) sensor electrical connector (part of 12C508)
2	6G004	CHT sensor - 10 Nm (89 lb-In)

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor (CMS)

NOTE: If necessary, lubricate the Heated Oxygen Sensor (HO2S) and/or Catalyst Monitor Sensor (CMS) with penetrating and lock lubricant to assist in removal.

NOTE: Apply anti-seize to the threads of the HO2S and/or CMS prior to installing.

NOTE: The correct torque wrench setting must be calculated when using the Exhaust Gas Oxygen Sensor Socket to install the HO2S and/or CMS . Refer to the Torque Wrench Adapter Formulas in the Appendix.



repair4less

Item	Part Number	Description
1	—	Heated Oxygen Sensor (HO2S) electrical connector (part of 12C508)
2	—	HO2S wiring harness electrical connector retainer (part of 12C508)
3	9F472	HO2S
4	—	HO2S electrical connector (part of 15525)
5	9F472	HO2S
6	—	Catalyst Monitor Sensor (CMS) electrical connectors (part of 15525)
7	9G444	CMS

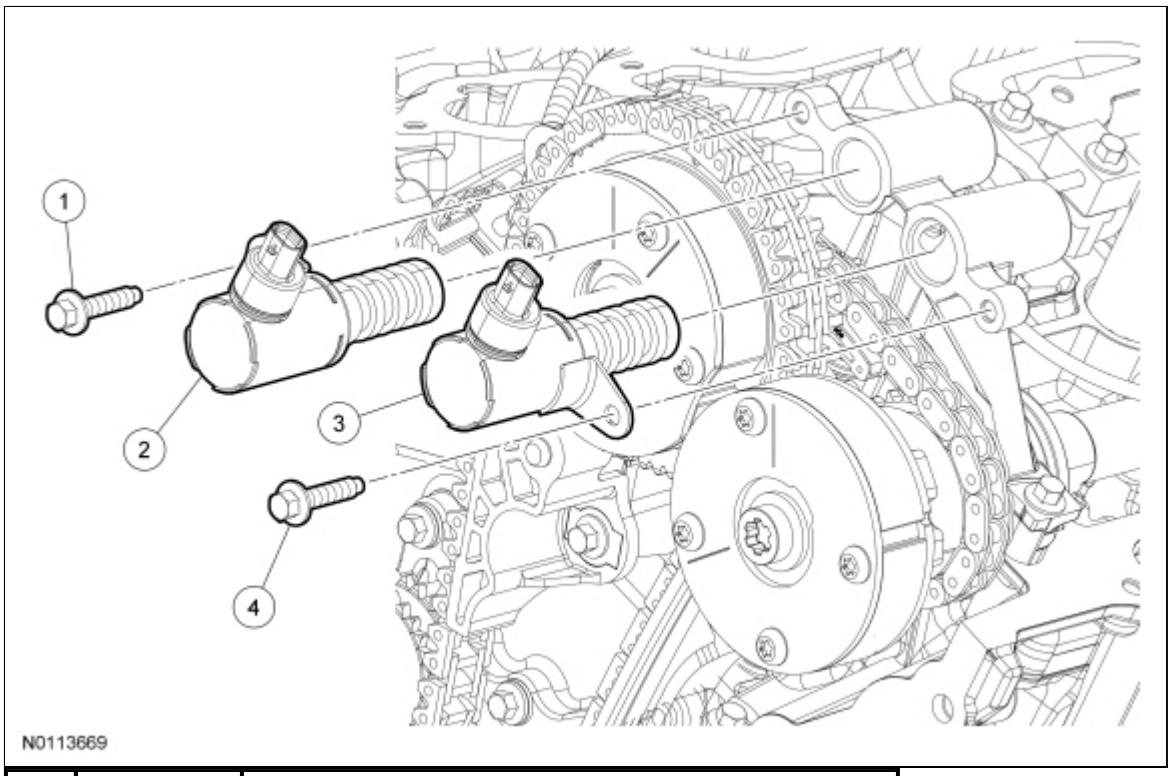
Knock Sensor (KS)

NOTE: It is necessary to remove the lower intake manifold to access the Knock Sensor (KS). For additional information, refer to Section 303-01A .

NOTE: LH cylinder head removed in graphic for clarity.

Item	Part Number	Description
1	—	Knock Sensor (KS) electrical connector (part of 12C508)
2	12A699	KS

3	W704749	KS bolt (2 required)



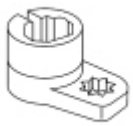
Variable Camshaft Timing (VCT) Oil Control Solenoid

NOTE: It is necessary to remove the RH or LH valve cover to access the Variable Camshaft Timing (VCT) oil control solenoid. For additional information, refer to Section 303-01A .

NOTE: Position the VCT oil control solenoid and tighten the bolts in 2 stages.

- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 20 degrees.

NOTE: LH shown, RH similar.



Item	Part Number	Description
1	W500215	LH intake Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6B297	LH intake VCT oil control solenoid
3	6B297	LH exhaust VCT oil control solenoid
4	W500215	LH exhaust VCT oil control solenoid bolt

Fuel Rail Pressure (FRP) Sensor — 3.5L GTDI

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

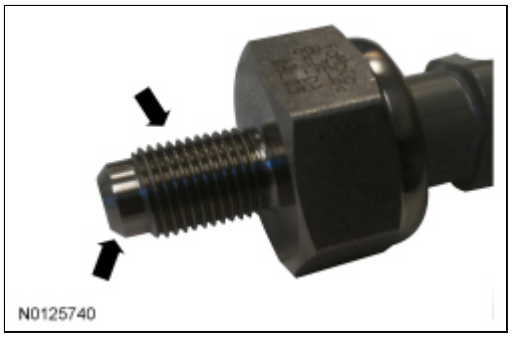
Item	Part Number	Description
1	—	Fuel Rail Pressure (FRP) sensor electrical connector (part of 12C508)
2	9G756	FRP sensor

Removal

WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

repair4less

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the intake manifold. For additional information, refer to Section 303-01A .
4. Disconnect the Fuel Rail Pressure (FRP) sensor electrical connector.
5. ***NOTICE:*** **During repair procedure, cleanliness is extremely important. Any foreign material, including any material created while cleaning or removing components that enters the fuel supply passages may cause engine failure.**

   NOTE: Use compressed air to remove any foreign material from around the FRP sensor area before removal.

   Remove and discard the FRP sensor.

Installation

1. Lubricate the tip and thread area of the new FRP sensor with clean engine oil prior to installation.

2. ***NOTICE:*** **During repair procedure, cleanliness is extremely important. Any foreign material, including any material created while cleaning or removing components that enters the fuel supply passages may cause engine failure.**

   Install the FRP sensor.
   - To install, tighten to 33 Nm (24 lb-ft).
3. Connect the FRP sensor electrical connector.
4. Install the intake manifold. For additional information, refer to Section 303-01A .
5. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Manifold Absolute Pressure (MAP) / Intake Air Temperature 2 (IAT2) Sensor — 3.5L GTDI

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

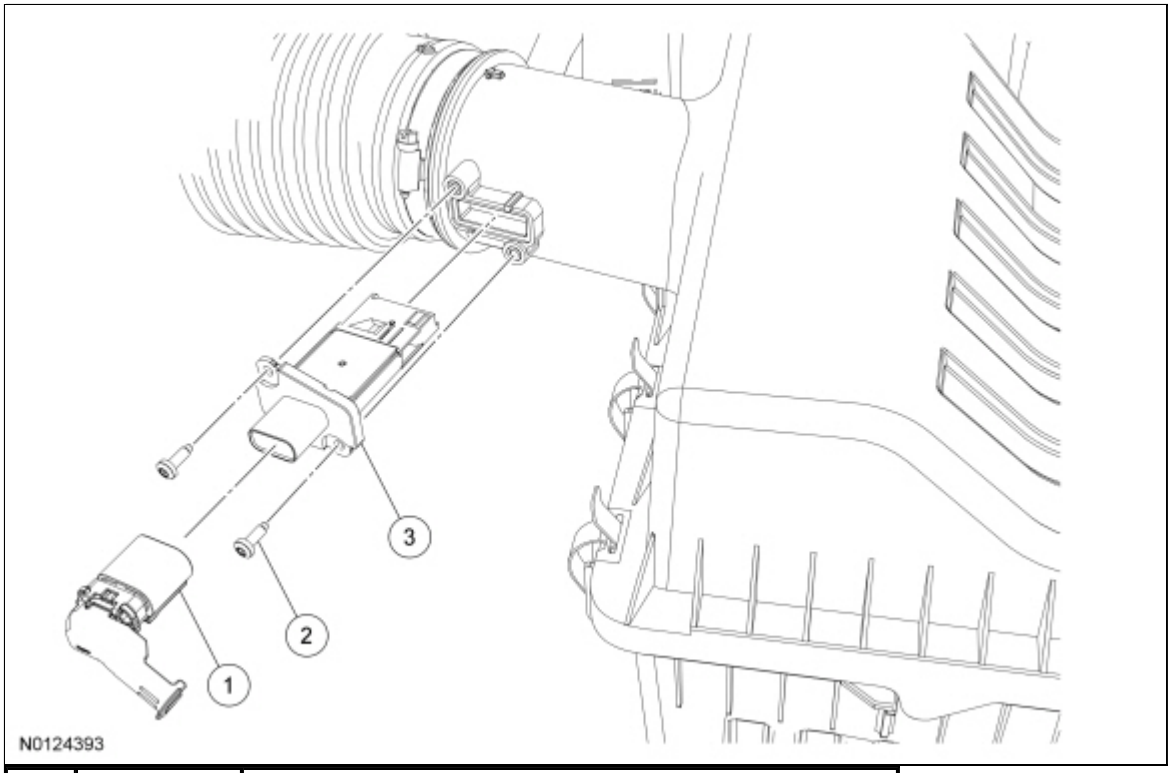
Item	Part Number	Description
1	—	MAP / IAT2 sensor electrical connector (part of 12A581)
2	W505565	Manifold Absolute Pressure (MAP)/ Intake Air Temperature 2 (IAT2) sensor bolt - 6 Nm (53 lb-in)
3	9F479	MAP / IAT2 sensor

Removal

NOTE: The Turbocharger Boost Pressure (TCBP)/Charge Air Cooler Temperature (CACT) sensor and the

Manifold Absolute Pressure (MAP)/ Intake Air Temperature 2 (IAT2) sensor are not interchangeable.

1. Disconnect the MAP / IAT2 sensor electrical connector.
2. Remove the bolt and the MAP / IAT2 sensor.



Installation

1. Lubricate the MAP / IAT2 sensor O-ring seal with clean engine oil.
2. Install the MAP / IAT2 sensor and the bolt.
    - Tighten to 6 Nm (53 lb-in).
3. Connect the MAP / IAT2 sensor electrical connector.

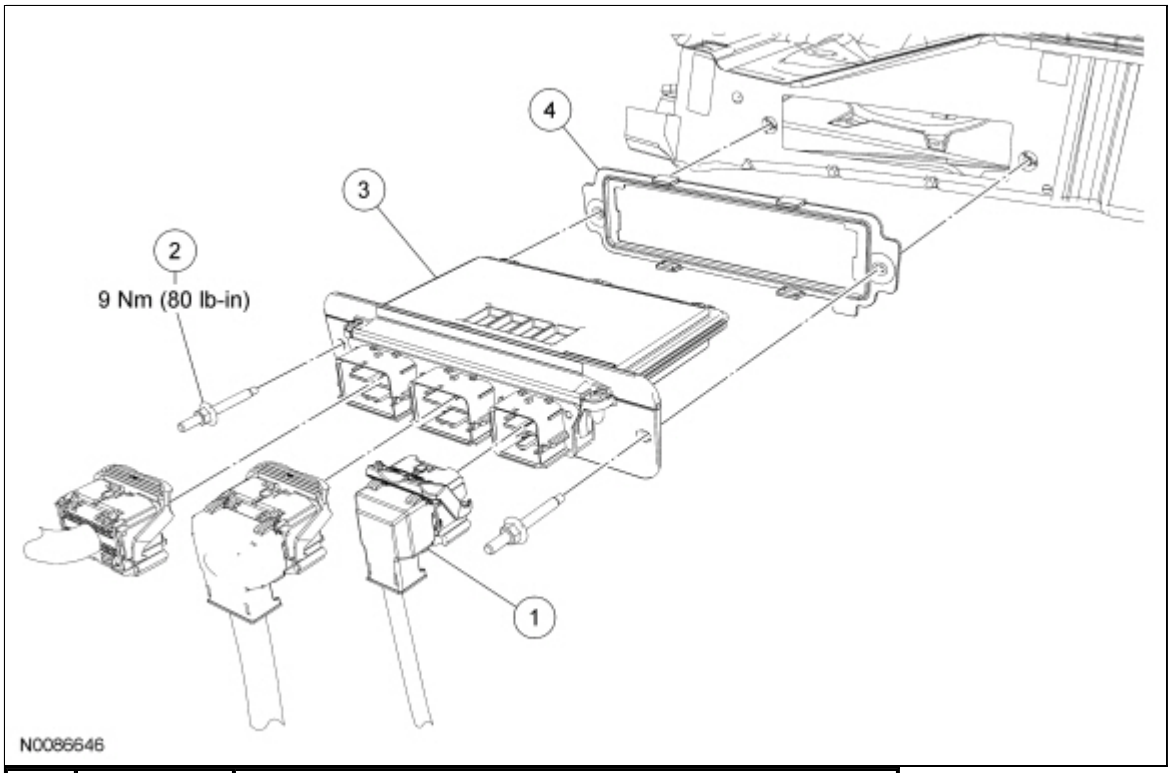
Powertrain Control Module (PCM)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



3.5L Gasoline Turbocharged Direct Injection (GTDI) Powertrain Control Module (PCM)

Item	Part Number	Description
1	—	Powertrain Control Module (PCM) electrical connector (part of 14A464)
2	—	PCM electrical connector (part of 12A581)
3	—	PCM cover (part of 12A692)
4	W705790	Ground cable nut - 9 Nm (80 lb-in)
5	—	Ground cable (part of 12A581)
6	W711897	PCM stud bolt (2 required) - 9 Nm (80 lb-in)
7	12A692	PCM support bracket
8	N605894	PCM -to- PCM support bracket bolt - 9 Nm (80 lb-in)

		(2 required)
9	12B684	PCM

3.7L, 5.0L (4V) and 6.2L (2V) Powertrain Control Module (PCM)

Item	Part Number	Description
1	—	Powertrain Control Module (PCM) electrical connectors (part of 14A464 and 12A581)
2	W711897	PCM stud bolt (2 required)
3	12A650	PCM
4	12A696	PCM gasket

Removal

All engines

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

Vehicles equipped with a 3.5L Gasoline Turbocharged Direct Injection (GTDI) engine

2. Disconnect the 2 Powertrain Control Module (PCM) electrical connectors.

3. Disengage and remove the PCM cover.

repair4less

4. Remove the 2 PCM -to- PCM support bracket bolts and the PCM .

5. If the PCM support bracket is damaged, remove the nut and position the ground cable aside and remove the 2 PCM stud bolts and slide the PCM support bracket out of the bulkhead.

Vehicles equipped with a 3.7L, 5.0L (4V) or 6.2L (2V) engine

6. Disconnect the Powertrain Control Module (PCM) electrical connectors.

7. Remove the stud bolts, the PCM and the gasket.

Installation

Vehicles equipped with a 3.7L, 5.0L (4V) or 6.2L (2V) engine

1. Install the gasket, the PCM and the 2 stud bolts.
   - Tighten to 9 Nm (80 lb-in).

2. Connect the PCM electrical connectors.

Vehicles equipped with a 3.5L Gasoline Turbocharged Direct Injection (GTDI) engine

3. If the PCM support bracket was removed, position the support bracket assembly into the bulkhead and install the 2 stud bolts.
   - Tighten to 9 Nm (80 lb-in).

4. If the PCM support bracket was removed, position the ground cable and install the nut.
   - Tighten to 9 Nm (80 lb-in).

5. Position the PCM onto the support bracket and install the 2 bolts.
   - Tighten to 9 Nm (80 lb-in).

6. Install the PCM cover.

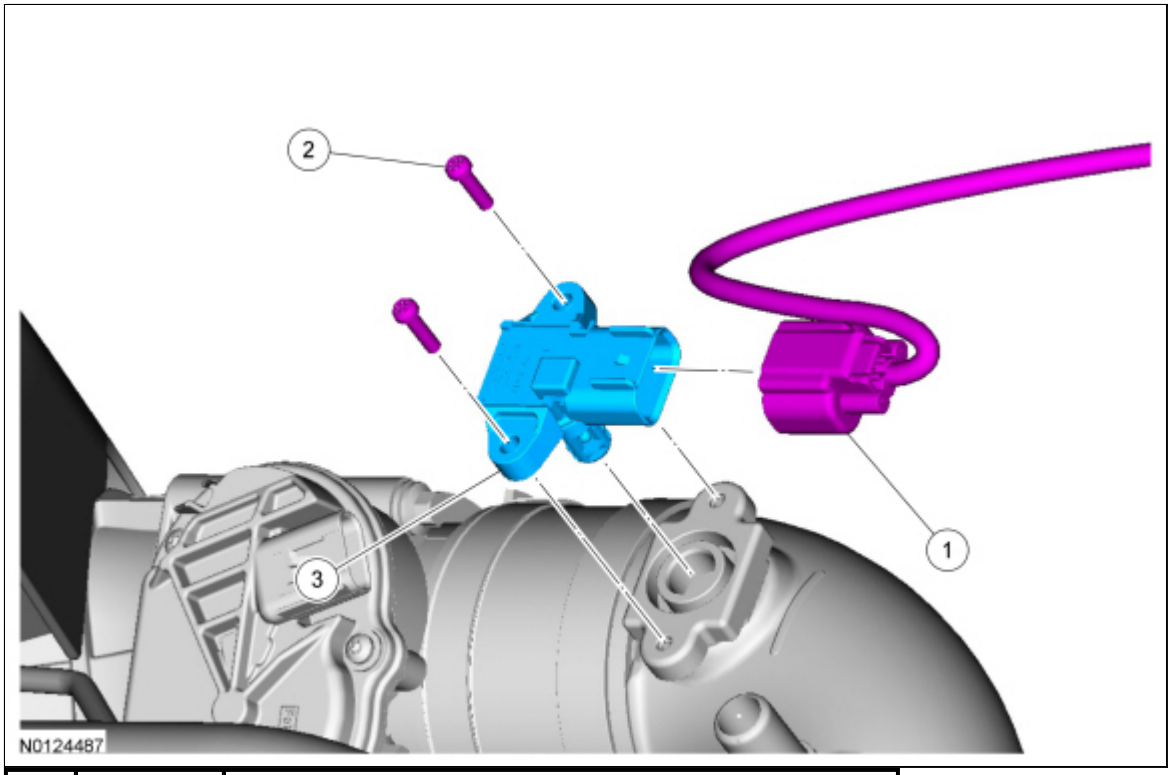
7. Connect the 2 PCM electrical connectors.

All engines

8. Carry out the transmission solenoid body strategy identification. For additional information, refer to Section 307-01 .

9. **NOTE:** If the Programmable Module Installation (PMI) procedure was not successful in downloading the data from the vehicles original PCM, then the oil life data of the vehicle is lost. If this occurs, and the oil life cannot be determined through service history or customer interview, it is recommended the vehicle engine oil and filter be changed and the oil change minder reset.

   Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .



10. Perform the Passive Anti-Theft System (PATS) Parameter Reset procedure. For additional information, refer to Section 419-01B .

11. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the

on-screen instructions.

repair4less

Turbocharger Boost Pressure (TCBP) / Charge Air Cooler Temperature (CACT) Sensor — 3.5L GTDI

Item	Part Number	Description
1	—	Turbocharger Boost Pressure (TCBP)/ Charge Air Cooler Temperature (CACT) sensor electrical connector (part of 12A581)
2	W506843	TCBP / CACT sensor screws - 3 Nm (27 lb-in)
3	9F479	TCBP / CACT sensor

Removal

NOTE: Turbocharger Boost Pressure (TCBP)/ Charge Air Cooler Temperature (CACT) sensor and the Manifold Absolute Pressure (MAP)/Intake Air Temperature 2 (IAT2) sensor are not interchangeable.

1. Remove the ACL outlet tube. For additional information, refer to Section 303-12 .
2. Disconnect the Turbocharger Boost Pressure (TCBP)/Charge Air Cooler Temperature (CACT) sensor electrical connector.
3. Remove the 2 screws and the TCBP / CACT sensor.

Installation

1. Install the TCBP / CACT sensor and the 2 screws.
    - Tighten to 3 Nm (27 lb-in).

2. Connect the TCBP / CACT sensor electrical connector.

3. Install the ACL outlet tube. For additional information, refer to Section 303-12 .

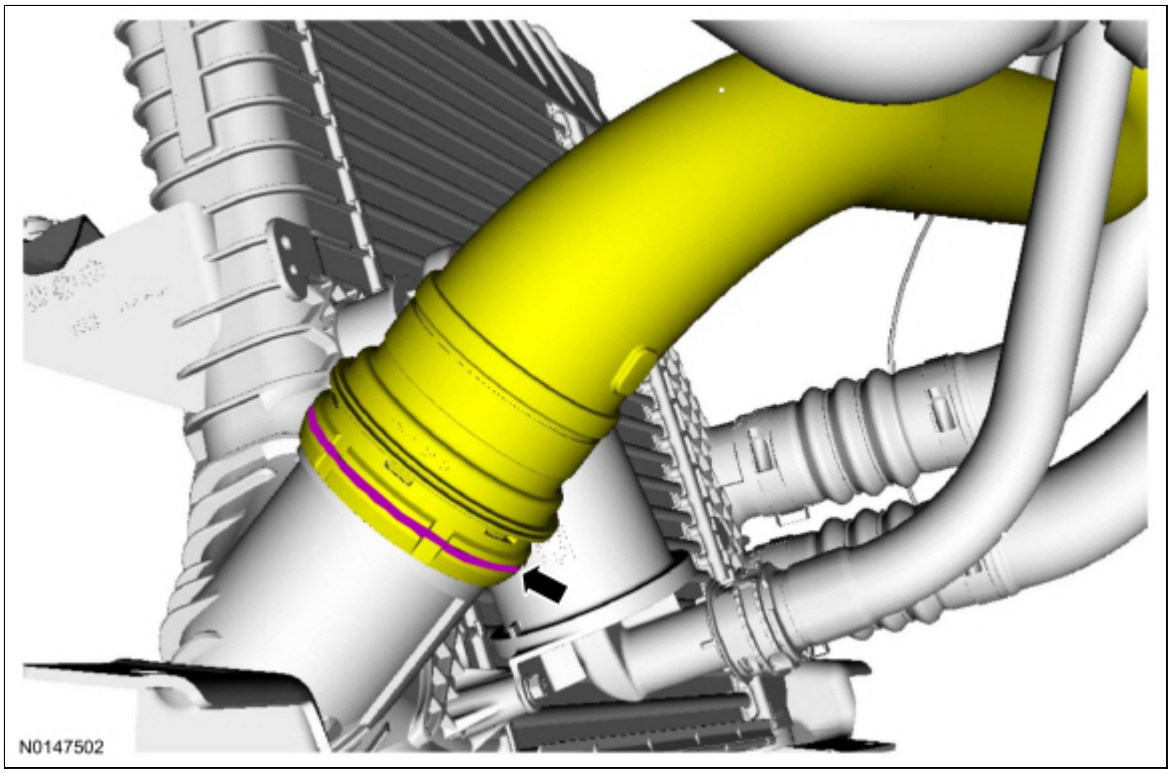
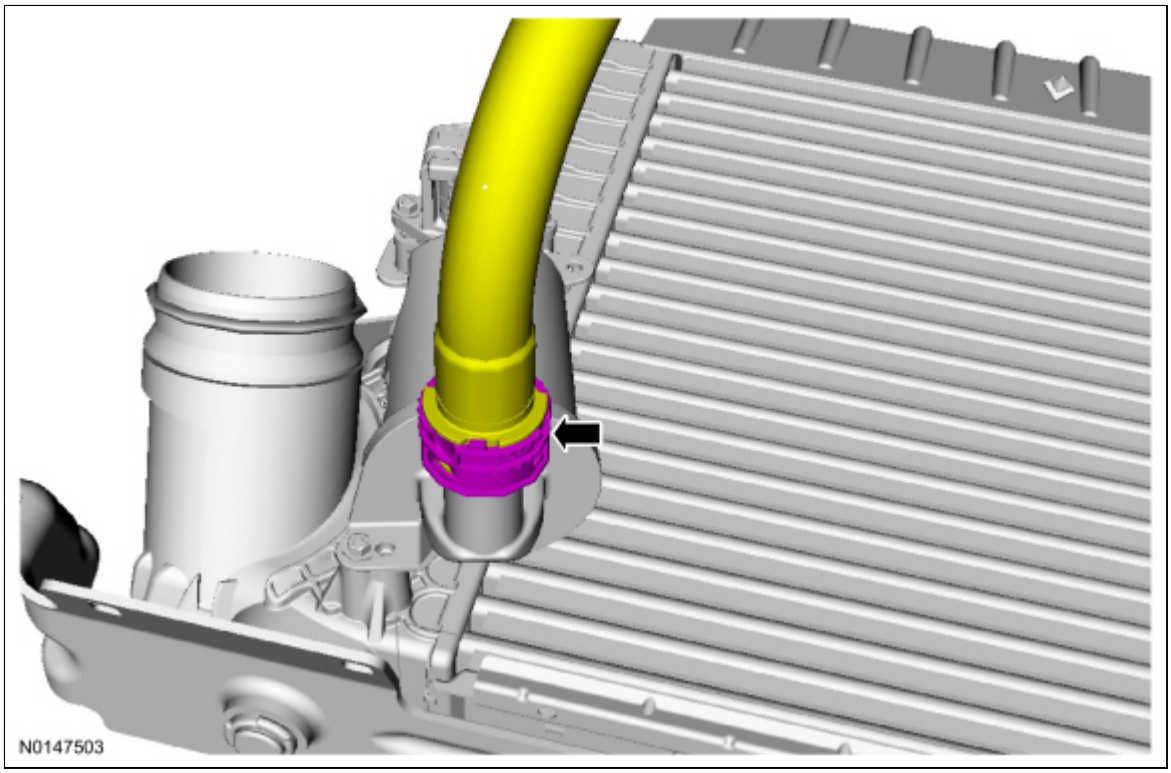
repair4less

Turbocharger Bypass Valve



Removal

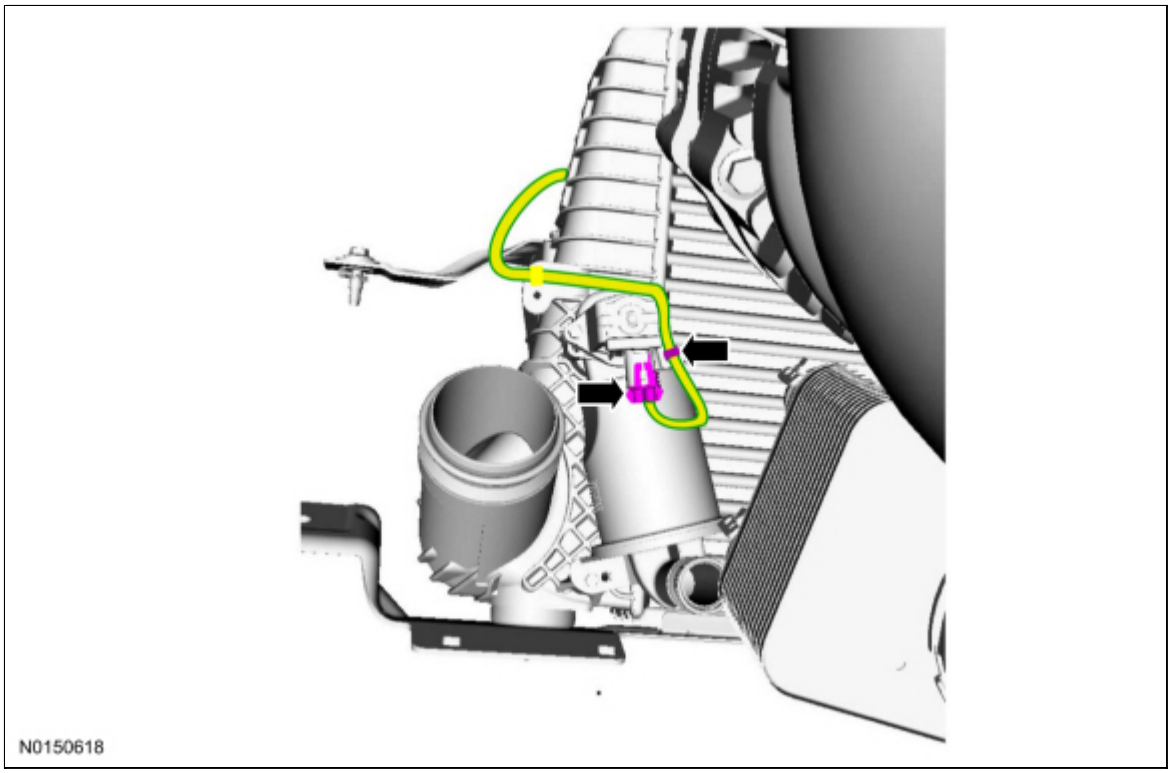
NOTICE: **Whenever turbocharger air intake system components are removed, always cover open ports to protect from debris. It is important that no foreign material enter the system. The turbocharger compressor vanes are susceptible to damage from even small particles. All components should be inspected and cleaned, if necessary, prior to installation or reassembly.**



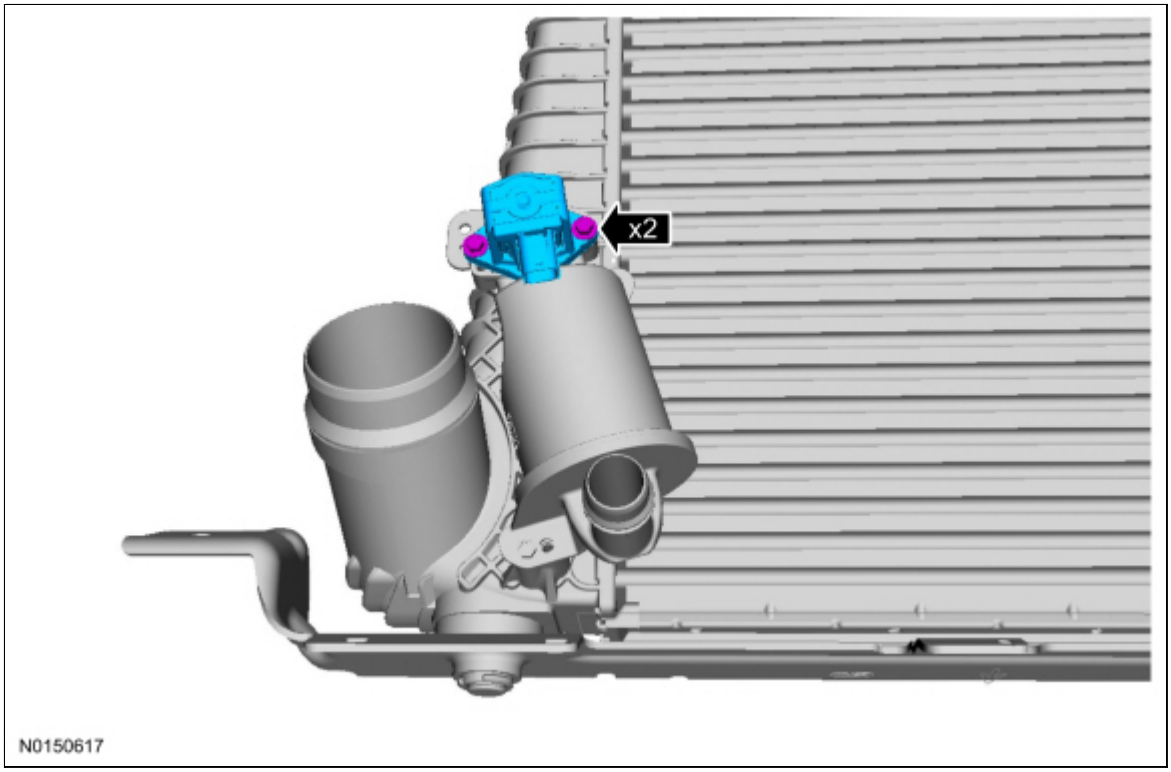
NOTE: Removal steps in this procedure may contain installation details.

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. 

3.



4.



5.

repair4less

6.

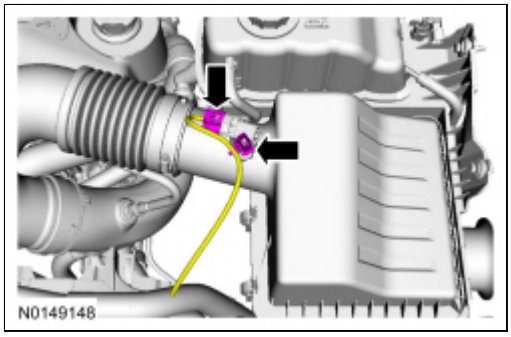
- To install, tighten to 6 Nm (53 lb-in).

Installation

1. To install, reverse the removal procedure.

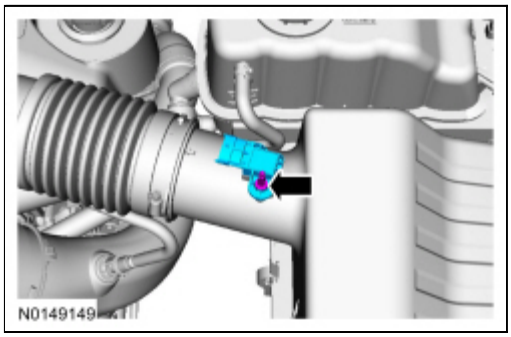
---

repair4less



Turbocharger Intake Pressure and Temperature Sensor (TCIPT) — 3.5L GTDI

Removal



NOTE: Removal steps in this procedure may contain installation details.

1. **WARNING: Before beginning any service procedure in this manual, refer to health and safety warnings in section 100-00 General Information. Failure to follow this instruction may result in serious personal injury.**

   For additional information, refer to Section 100-00 .

2. 

3. - To install, tighten to 3 Nm (27 lb-in).

Installation

1. To install, reverse the removal procedure.

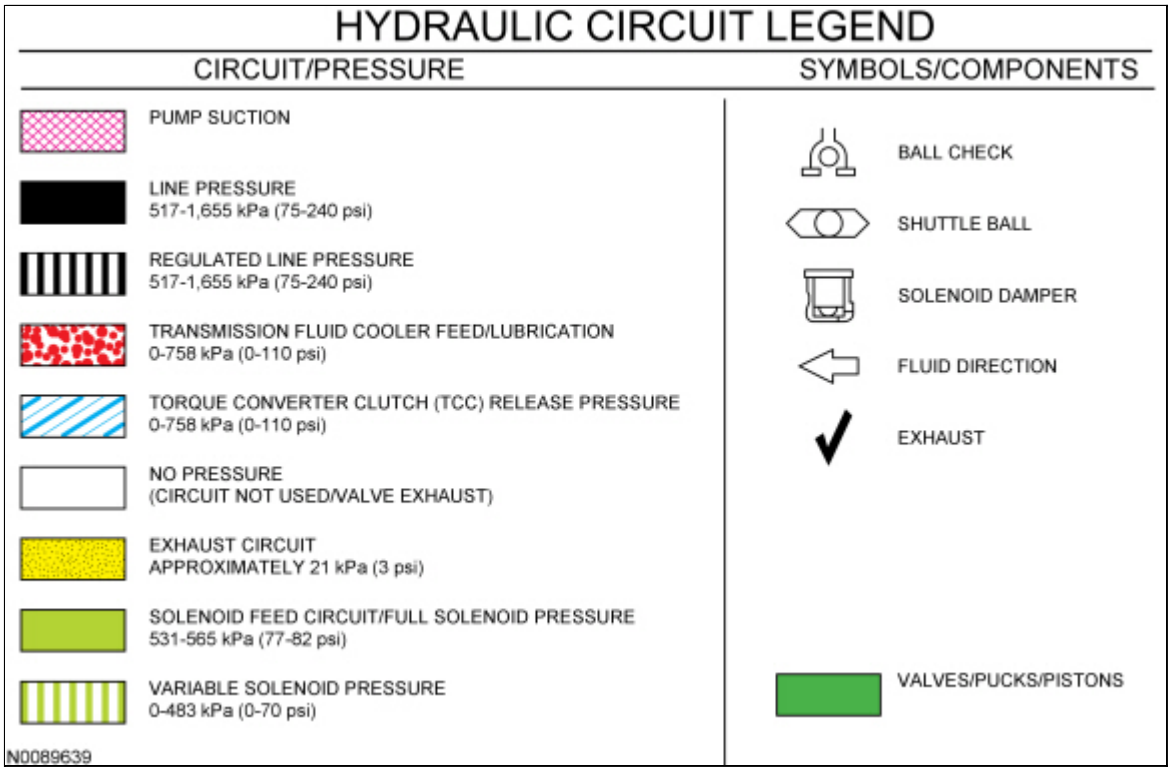
Gear Ratios



Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Clutches are used to hold and drive certain combinations of gearsets. This results in 6 forward ratios and one reverse ratio which are transmitted to the rear planetary ring gear (output shaft). The planetary gearsets of this transmission provide the following ratios:

- Reverse:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 2.24:1 (reverse direction)
  - Total ratio of 3.40:1 (reverse direction)
- 1st gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 2.74:1
  - Total ratio of 4.17:1
- 2nd gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 1.54:1
  - Total ratio of 2.34:1
- 3rd gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 1:1
  - Total ratio of 1.52:1
- 4th gear:
  - Front planetary gearset provides ratios of 1:1 and 1.52:1 to different rear planetary gearset members
  - Rear planetary gearset ratio of 1.14:1
  - Total ratio of 1.14:1
- 5th gear:
  - Front planetary gearset provides ratios of 1:1 and 1.52:1 to different rear planetary gearset members
  - Rear planetary gearset ratio of 0.87:1
  - Total ratio of 0.87:1
- 6th gear:
  - Front planetary gearset ratio of 1:1
  - Rear planetary gearset ratio of 0.69:1
  - Total ratio of 0.69:1

Hydraulic Circuits

Hydraulic Circuit Identification and Function

Hydraulic Circuit Identification Chart

Circuit Name	Description
BREVA	BREV5 pressure from the drive enable valve to the clutch A regulator valve.
BREV5	BREV 5F pressure from the clutch A latch valve to the drive enable valve and the No. 2 shuttle ball.
BREV 5F	Regulated line pressure from the CL B circuit directed to the A clutch latch valve by the B clutch latch valve.
BREV5/SS1	BREV5 or SS1 pressure from the No. 2 shuttle ball to the solenoid multiplex valve.
CAPLY	Apply circuit to the torque converter, also the return circuit during Torque Converter Clutch (TCC) release.
CAPLY EX	TCC release pressure from the bypass clutch control regulator valve to the converter release regulator valve.
CAPLY F	Line pressure from the PUMP circuit directed to the bypass clutch control regulator valve by the main regulator valve.
CL A	Regulated line pressure from the clutch A regulator valve to the clutch A latch valve and the

repair4less

	forward (A) clutch to apply the clutch.
CLA FB	Regulated line pressure from the clutch A latch valve that feeds back to the clutch A regulator valve.
CL B	Regulated line pressure from the clutch B regulator valve to the clutch B latch valve and the direct (B) clutch to apply the clutch.
CLB FB	Regulated line pressure from the clutch B latch valve that feeds back to the clutch B regulator valve.
CL C	Regulated line pressure from the clutch C regulator valve to the intermediate (C) clutch to apply the clutch.
CL D1	Regulated line pressure from the clutch D1 regulator valve to the clutch D1 latch valve and the low/reverse (D) clutch to apply the clutch.
CL D1 FB	Regulated line pressure from the clutch D1 latch valve that feeds back to the clutch D1 regulator valve.
CL DC	Regulated solenoid output pressure from Shift Solenoid D (SSD) directed by the solenoid multiplex valve to the D1 and D2 regulator and latch valves to apply the low/reverse (D) clutch.
CLE	Regulated line pressure from the clutch E regulator valve to the clutch E latch valve and the overdrive (E) clutch to apply the clutch.
CLEC	Regulated solenoid output pressure from the CLEC F circuit directed by the drive enable valve to the clutch E regulator and latch valves to apply the clutch.
CLEC F	Regulated solenoid output pressure from the VFS4 circuit directed to the drive enable valve by the solenoid multiplex valve to move the clutch E regulator and latch valves to apply the overdrive (E) clutch.
CLE FB	Regulated line pressure from the clutch E latch valve that feeds back to the clutch E regulator valve.
CL EXH	Line pressure regulated to approximately 21 kPa (3 psi) by the D2 latch valve that supplies exhaust pressure to the A, B, C, D1 and E clutch when the clutches are released.
COOLF	Pressure from the lubrication control valve to the oil cooler or the thermal bypass valve that feeds the lubrication circuit.
CREL	Pressure supplied to the torque converter by the converter release regulator valve to release the TCC .
CREL F	Line pressure from the main regulator valve that supplies the converter release regulator valve and the lubrication control valve.
DBACK	CAPLY EX pressure directed to the drain back valve by the converter release regulator valve.
DRIVE	Line pressure directed by the manual valve to the A, C and E clutch regulator valves and the No. 1 shuttle ball.
LUBE	Transmission lubrication circuit supplied by the COOLF circuit after the fluid circulates the transmission fluid cooler or is returned by the cooler bypass valve.
PUMP	Line pressure supplied by the pump to the manual valve, solenoid pressure regulator valve, main regulator valve, clutch D1 regulator valve, clutch D2 regulator valve and clutch D2 latch valve.
REV	Line pressure from the manual valve to the No. 1 shuttle ball and the solenoid multiplex valve.
REV/DRIVE	REV or DRIVE pressure from the No. 1 shuttle ball to the clutch B regulator valve.
SCHG	Line pressure from the main regulator valve to the pump suction port.
SREG	Line pressure from the solenoid regulator valve that supplies pressure to the 7 solenoids

	Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), SSD , Shift Solenoid E (SSE), TCC solenoid and Line Pressure Control (LPC) solenoid.
SS1	Solenoid output pressure from SSE to the drive enable valve and to shuttle ball No. 2. to direct SSD output pressure to clutch E regulator and latch valves to apply the overdrive (E) clutch.
VFS1	Solenoid output pressure from SSA to the A clutch regulator and latch valve to apply the forward (A) clutch.
VFS2	Solenoid output pressure from SSB to the B clutch regulator and latch valve to apply the direct (B) clutch and is also routed to the D1 latch valve.
VFS2D	SSB output pressure from the VFS2 circuit directed to the clutch B regulator valve by the D1 latch valve.
VFS3	Solenoid output pressure from SSC to the C clutch regulator valve to apply the intermediate (C) clutch and is also routed to the clutch E latch valve.
VFS3E	SSC output pressure from the VFS3 circuit directed to the clutch C regulator valve by the clutch E latch valve.
VFS4	Solenoid output pressure from SSD to the solenoid multiplex valve to apply either the D or E clutch.
VFS5	Solenoid output pressure from the LPC solenoid to the main regulator valve to control line pressure.
VFS6	Solenoid output pressure from the TCC solenoid to the bypass clutch control regulator valve and the converter release regulator valve to control the TCC .

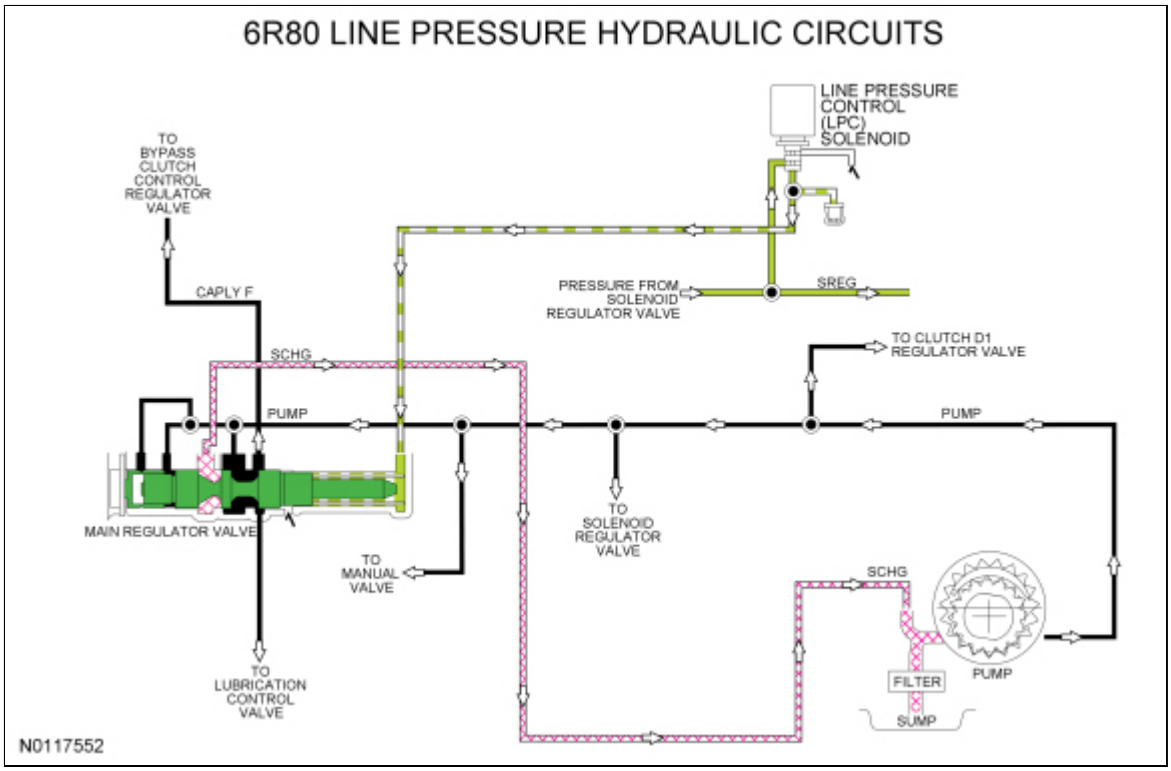
SEPARATOR PLATE PASSAGES
(LOWER VALVE BODY SIDE)

repair4less

LOWER VALVE BODY PASSAGES



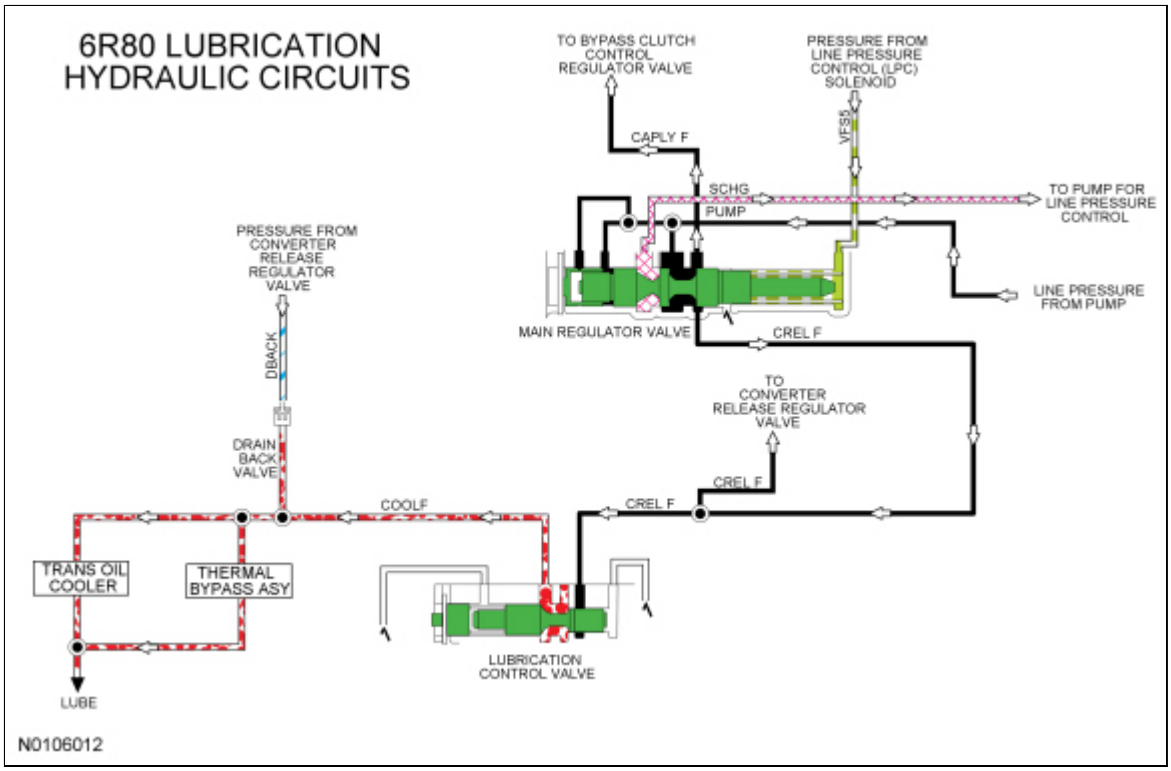
Line Pressure Hydraulic Circuits

The PCM controls line pressure with the Line Pressure Control (LPC) solenoid. Varying pressure from the LPC solenoid effects shift feel while allowing sufficient pressure for clutch application.

When the engine is running, the pump supplies pressure to the main regulator valve through the PUMP circuit. The position of the main regulator valve controls line pressure (in the PUMP circuit). Pressure from the LPC through the VFS5 circuit controls the position of the main regulator valve.

The main regulator valve varies pressure in the SCHG circuit. The higher the pressure in the SCHG circuit, the lower the line pressure (PUMP circuit) is. As SCHG pressure decreases, line pressure (PUMP circuit) increases.

repair4less

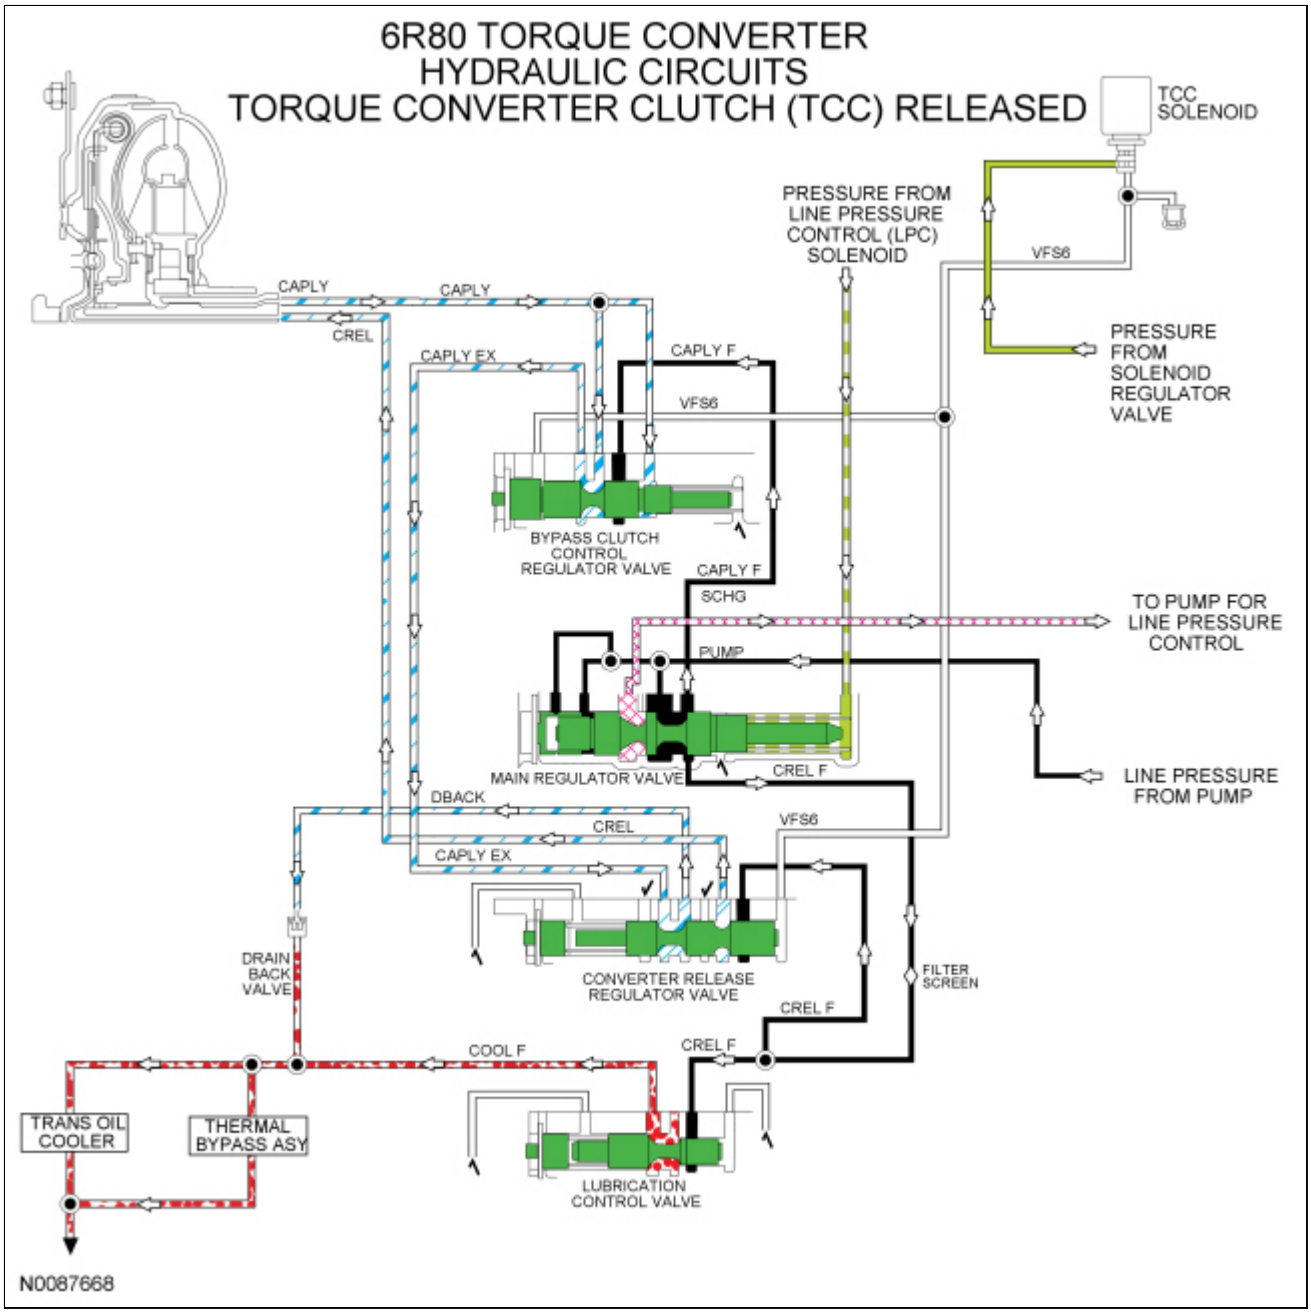


Lubrication Hydraulic Circuits

The main regulator valve supplies pressure to the lubrication control valve through the CREL F circuit. When the Torque Converter Clutch (TCC) is applied, the lubrication control valve supplies the transmission lubrication through the COOLF circuit to the LUBE circuit.

When the TCC is released, return fluid from the torque converter is supplied to the LUBE circuit through the CAPLY, CAPLY EX and DBACK circuits.

Pressure in the LUBE circuit either circulates through the thermal bypass valve when Transmission Fluid Temperature (TFT) is below operating temperature or through the transmission fluid cooler when the transmission fluid is at or above operating temperature. Return fluid from the thermal bypass valve or the transmission fluid cooler enters the input shaft through the pump assembly and flows through passages in the input shaft, intermediate shaft and output shaft to provide lubrication for the transmission.

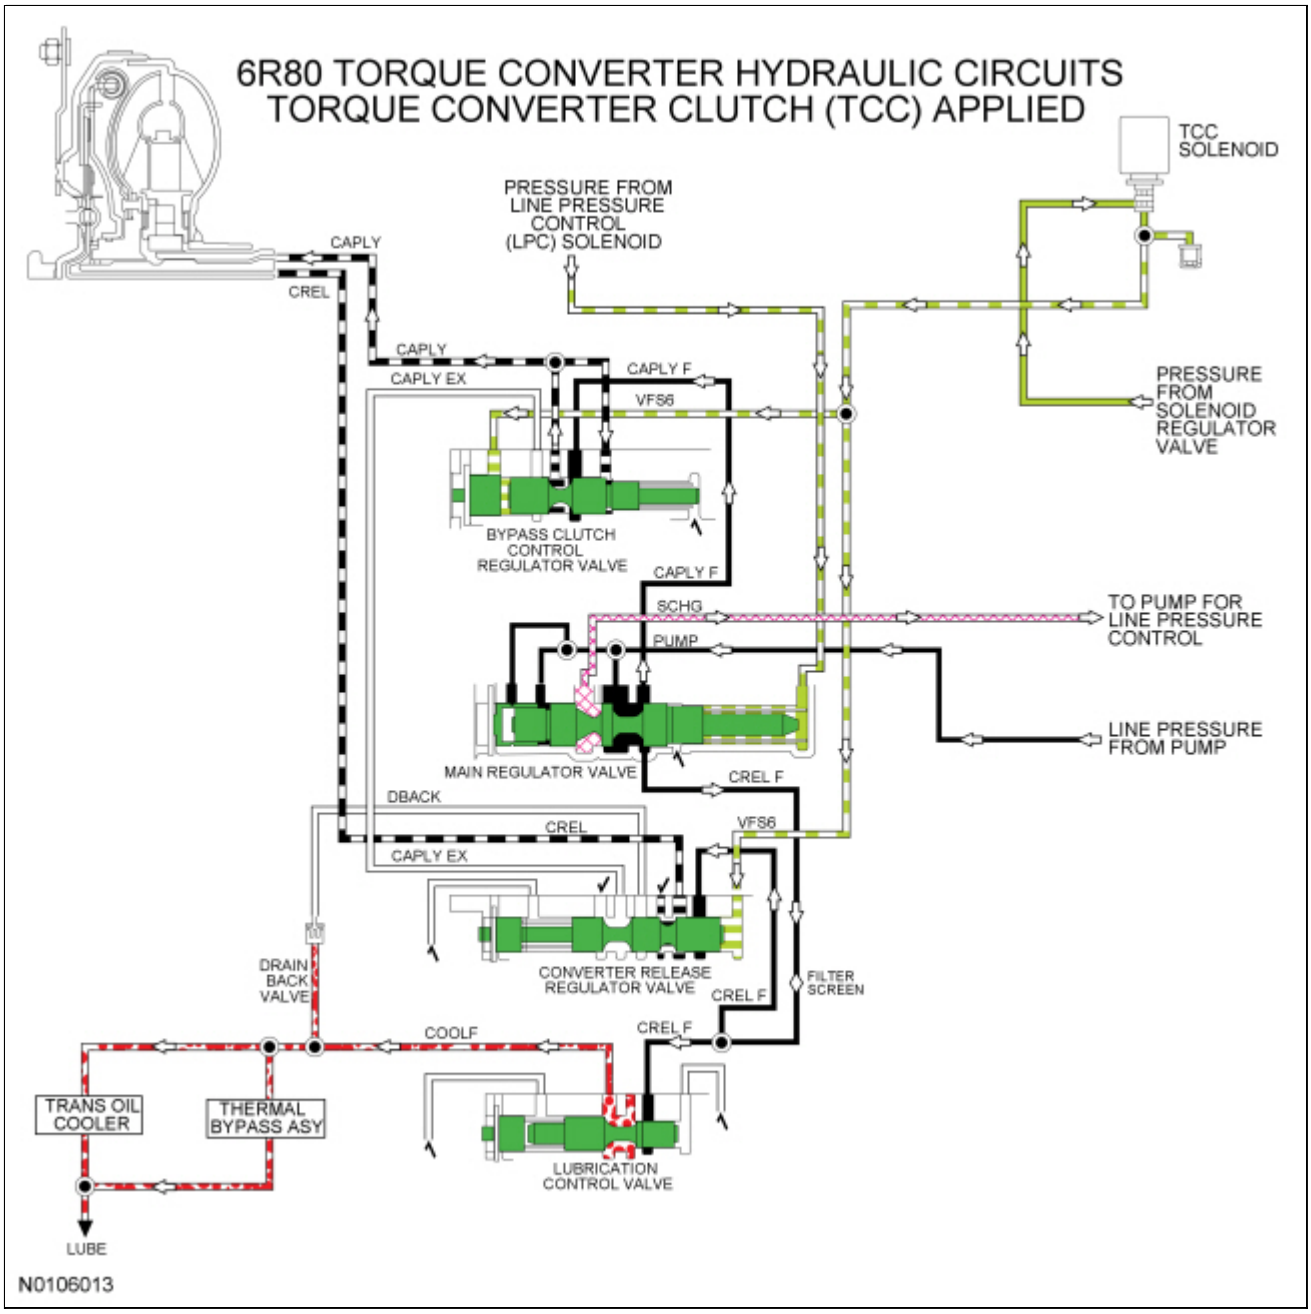


Torque Converter Hydraulic Circuits

When the TCC is released, line pressure is supplied to the converter release regulator valve from the lubrication control valve through the CREL F circuit. The converter release regulator valve supplies pressure to the torque converter through the CREL circuit to release the torque converter.

CREL pressure exits the torque converter through the CAPLY circuit and goes to the bypass clutch control regulator valve. The bypass clutch control regulator valve directs the fluid back to the converter release regulator valve through the CAPLY EX circuit. The converter release regulator valve directs the fluid to the DBACK circuit where it supplies lubrication in the LUBE circuit.

repair4less



When the TCC is applied, the TCC solenoid applies hydraulic pressure to the bypass clutch control regulator valve and the converter release regulator valve through the VFS6 circuit to position the valves to apply the TCC .

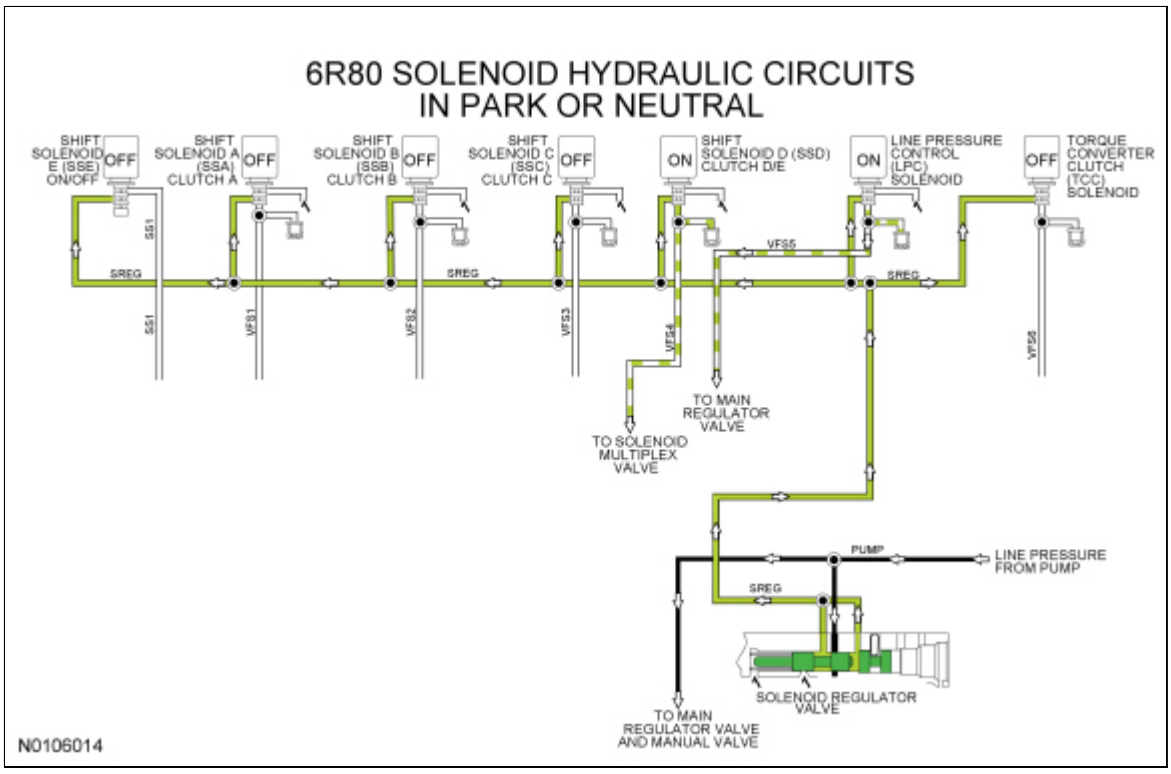
Line pressure is supplied to the bypass clutch control regulator valve from the main regulator valve. The bypass clutch control regulator valve directs regulated line pressure to the TCC through the CAPLY circuit to apply the TCC .

CAPLY pressure exits the torque converter through the CREL circuit and goes to the converter release regulator valve.

For torque converter description and function, refer to Torque Converter in this section.

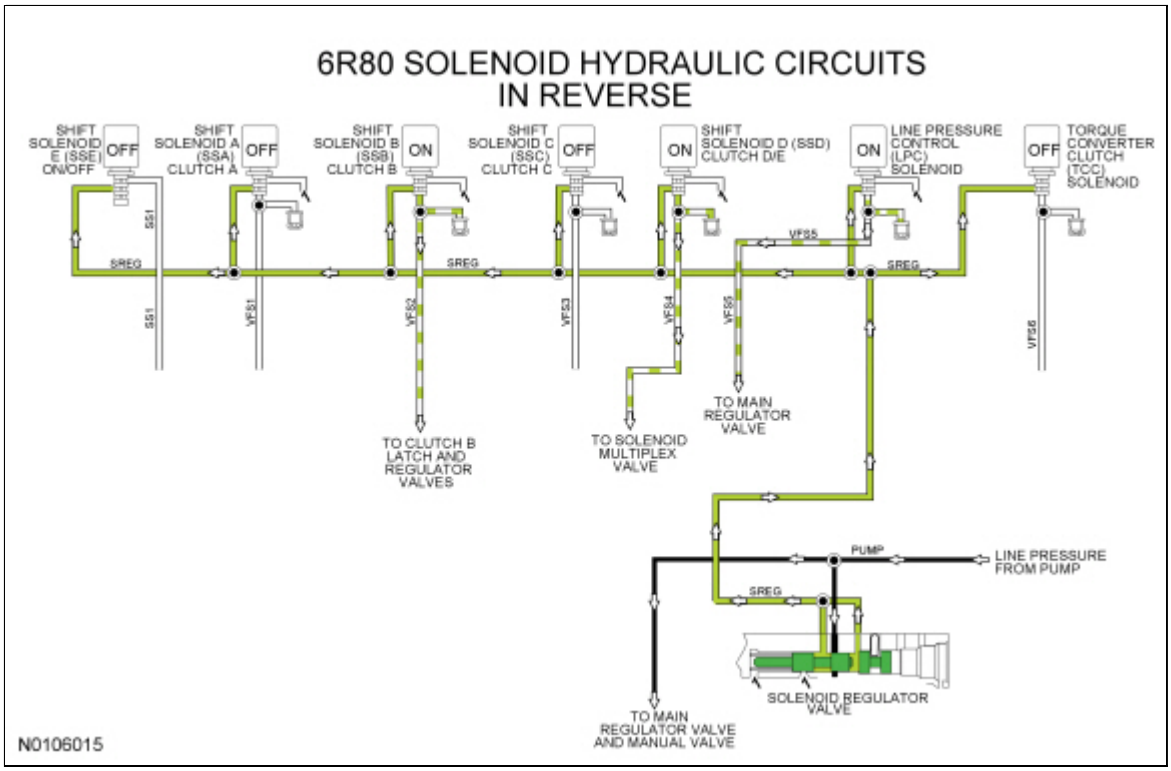
Solenoid Hydraulic Circuits

LINE pressure from the pump is directed to the individual shift, TCC solenoid and LPC solenoid by the solenoid regulator valve through the SREG circuit. The PCM controlled solenoids, direct full or regulated SREG pressure to the valves that they control.



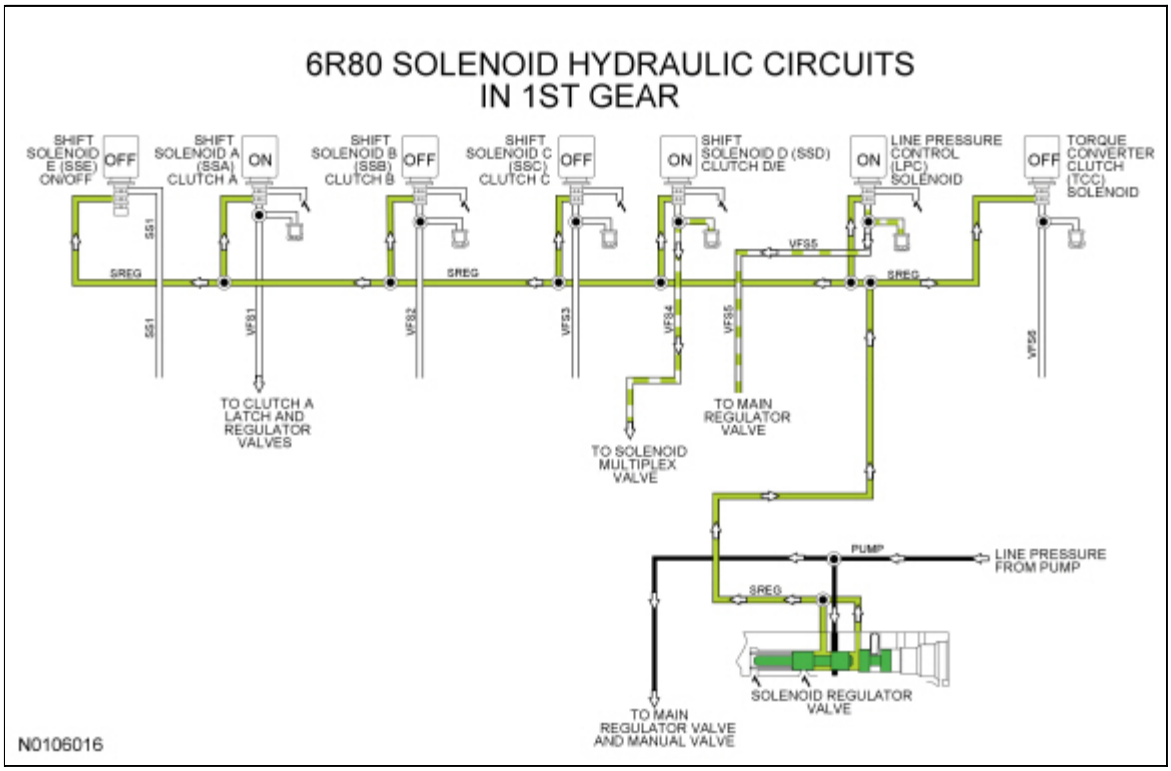
For electrical operation of the solenoids, refer to Transmission Electronic Control System in this section.

The LPC solenoid sends varying pressure to the main regulator valve to control line pressure.



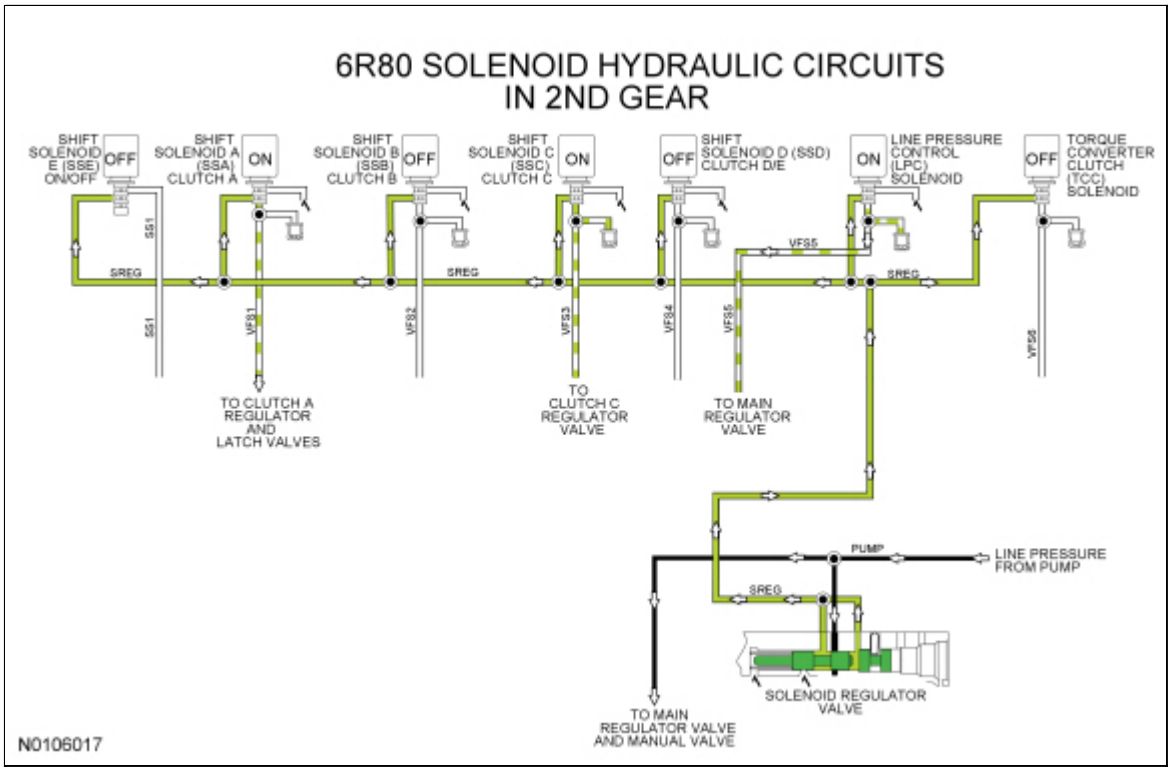
In the PARK and NEUTRAL position, the PCM supplies low current to Shift Solenoid D (SSD) to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 regulator and latch

repair4less

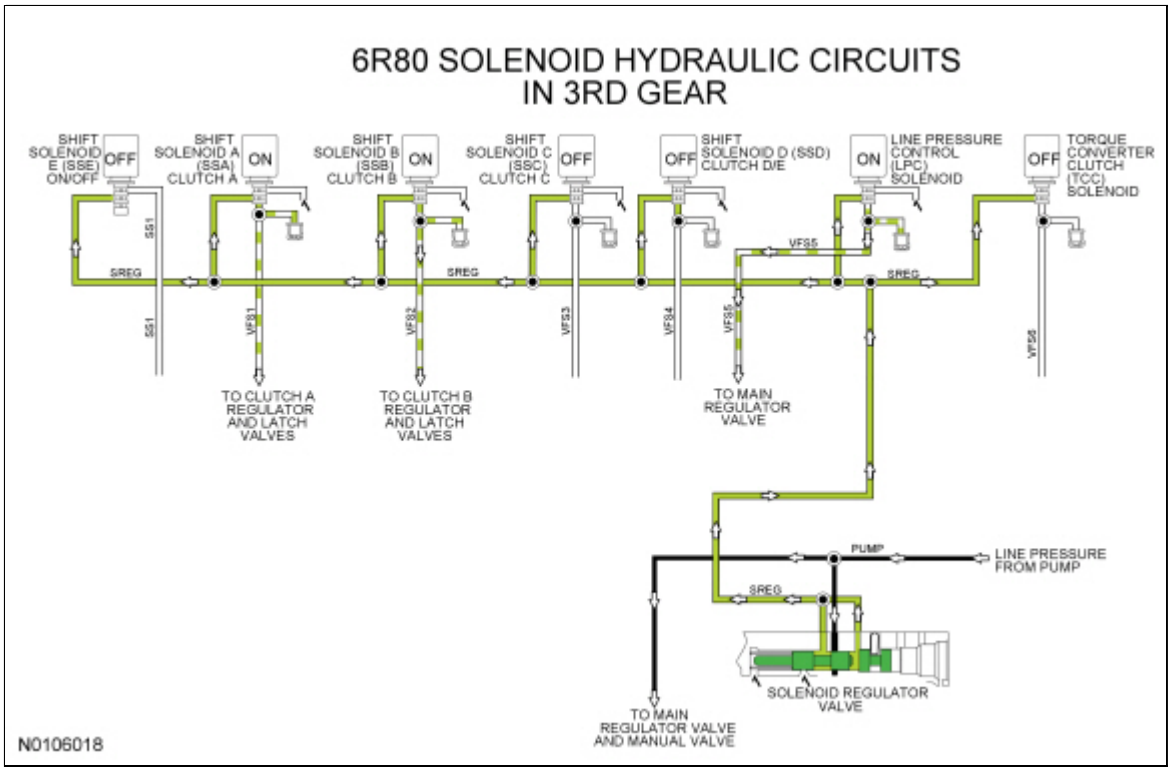


valves to apply the low/reverse clutch (D).

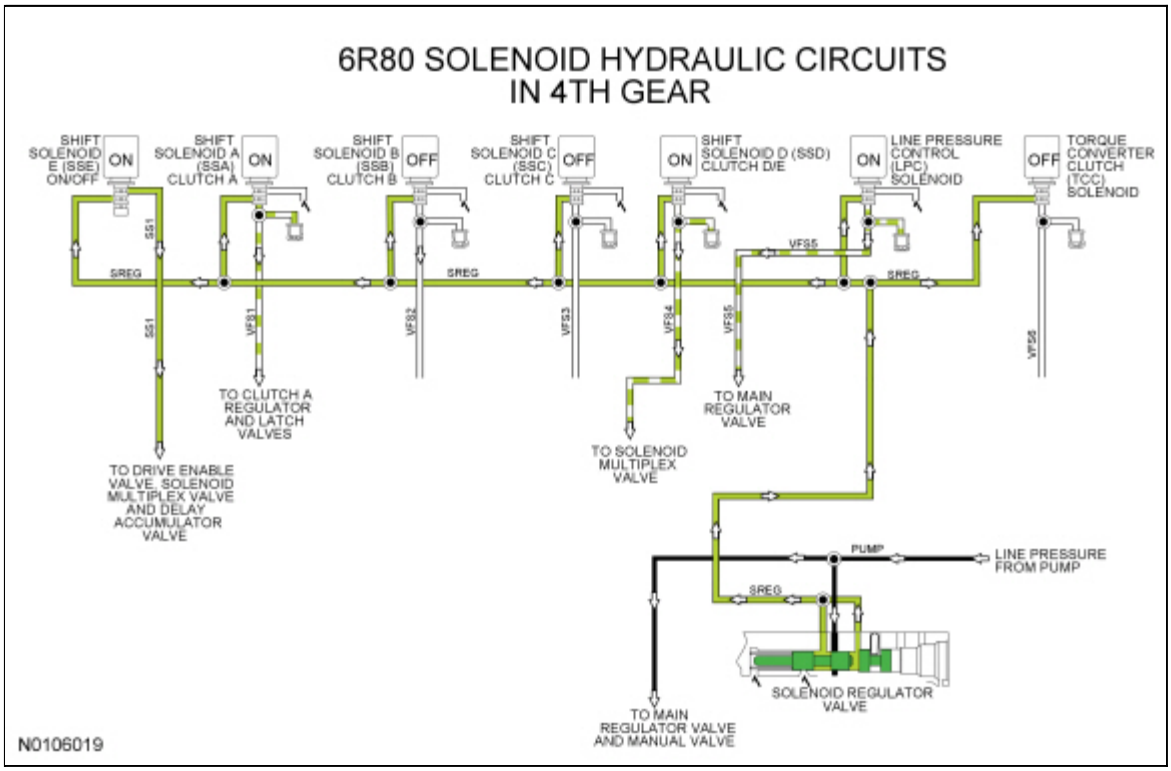
In the REVERSE position, the PCM supplies low current to Shift Solenoid B (SSB) to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B). The PCM also supplies low current to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 regulator and latch valves to apply the low/reverse clutch (D).



In 1st gear, the PCM supplies high current to Shift Solenoid A (SSA) to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The PCM also supplies low current to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 regulator and latch valves to apply the low/reverse clutch (D).

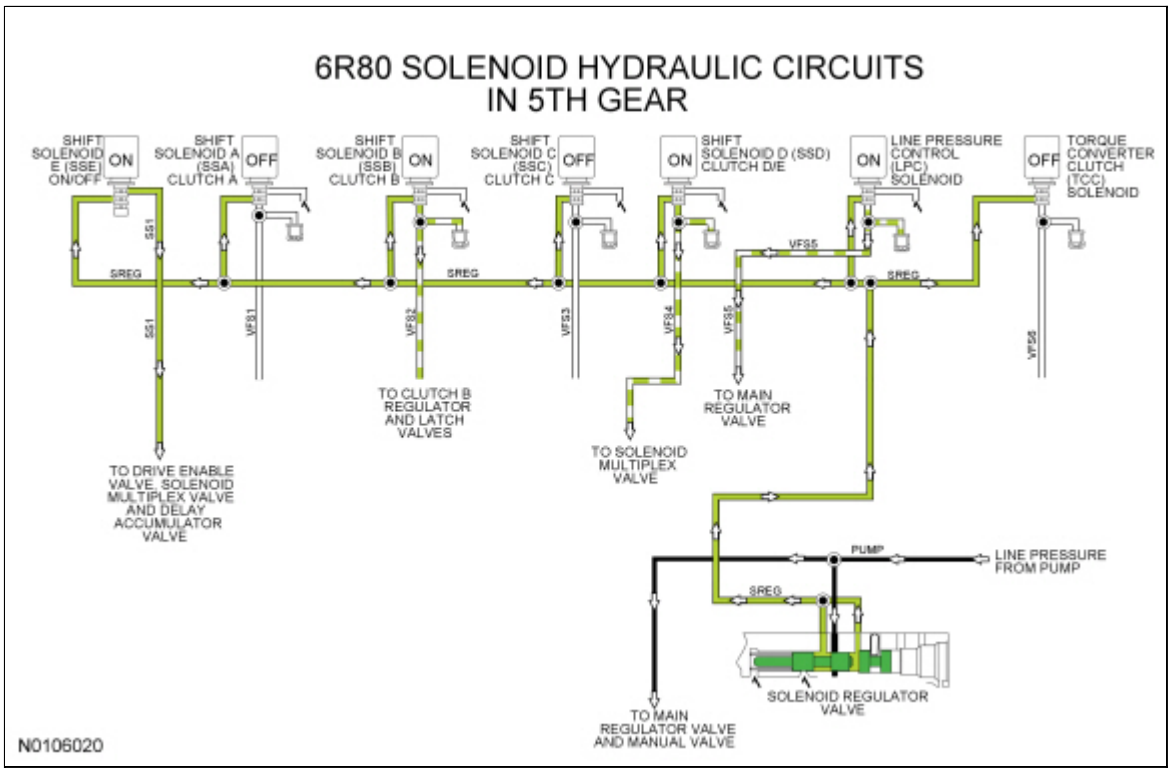


repair4less

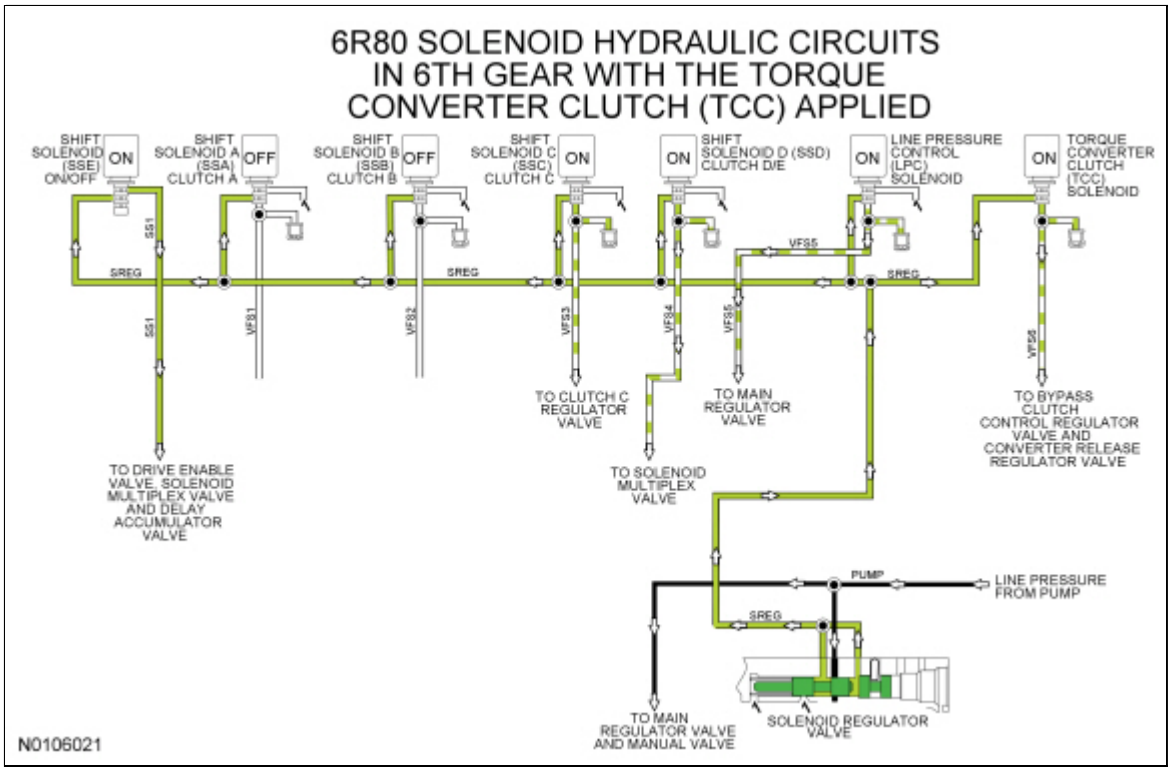


In 2nd gear, the PCM supplies high current to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The PCM also supplies high current to Shift Solenoid C (SSC) to apply high-regulated pressure to the clutch C regulator valve to apply the intermediate clutch (C).

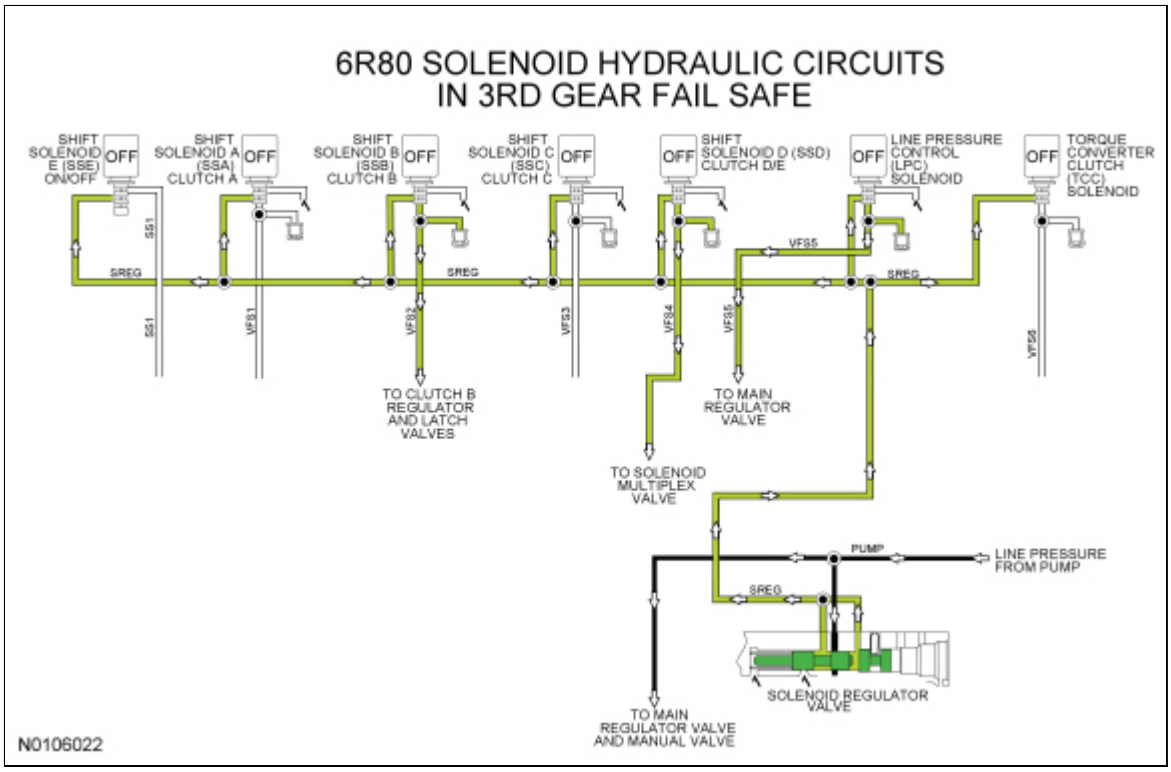
In 3rd gear, the PCM supplies high current to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The PCM also supplies low current to Shift Solenoid B (SSB) to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B).



In 4th gear, the PCM supplies high current to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The PCM also supplies low current to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the overdrive clutch (E). The PCM turns on Shift Solenoid E (SSE) to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves.



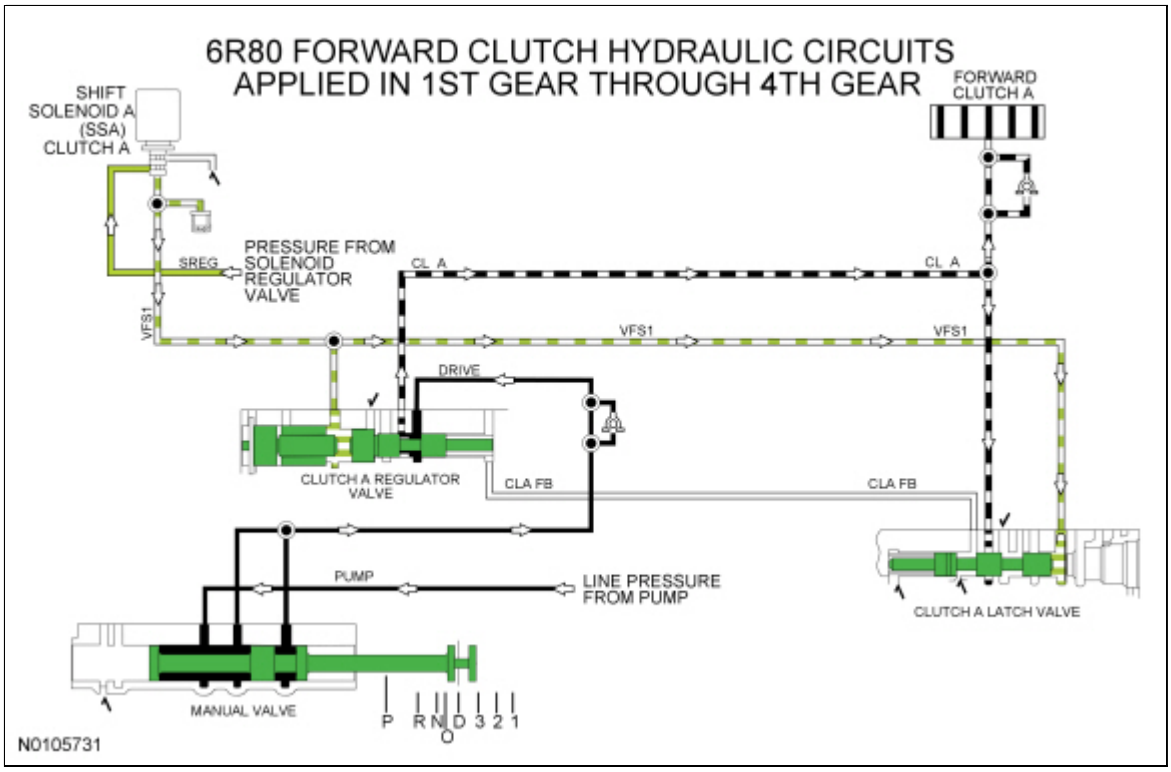
repair4less



In 5th gear, the PCM supplies low current to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the overdrive clutch (E). The PCM turns on SSE to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves. The PCM also supplies low current to SSB to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B).

In 6th gear, the PCM supplies low current to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the overdrive clutch (E). The PCM turns on SSE to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves. The PCM also supplies high current to SSC to apply high-regulated pressure to the clutch C regulator valve to apply the intermediate clutch (C). To apply the TCC , the PCM supplies high current to the TCC solenoid to apply high-regulated pressure to the converter release regulator valve and the bypass clutch control regulator valve to apply the TCC .

In 3rd gear fail safe, all solenoids are off. SSB , in the off position, applies high pressure to the clutch B regulator and latch valves to apply the direct clutch (B). The forward clutch (A) is hydraulically applied in 3rd gear fail safe. PCA provides maximum solenoid pressure to the main regulator valve for maximum line pressure. Also, SSD is on which applies high pressure to the solenoid multiplex valve which is directed to the drive enable valve where it is blocked.

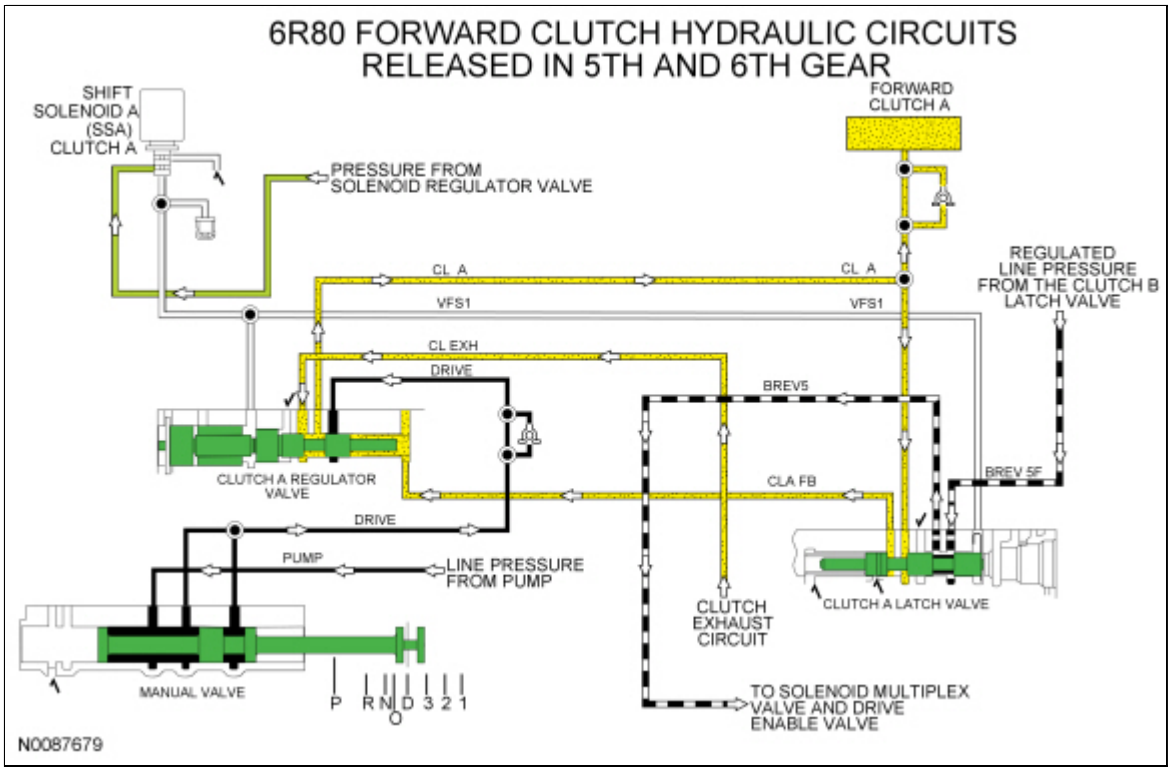


repair4less

Forward Clutch (A) Hydraulic Circuits

To apply the forward clutch (A), the manual valve must be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch A regulator valve through the DRIVE circuit.

For the forward clutch (A) to apply, SSA provides regulated solenoid pressure from the SREG circuit to the clutch A regulator and latch valves through the VFS1 circuit to position the valves to apply the forward clutch (A). As the forward clutch is applied, SSA increases pressure to the clutch A regulator and latch valves.

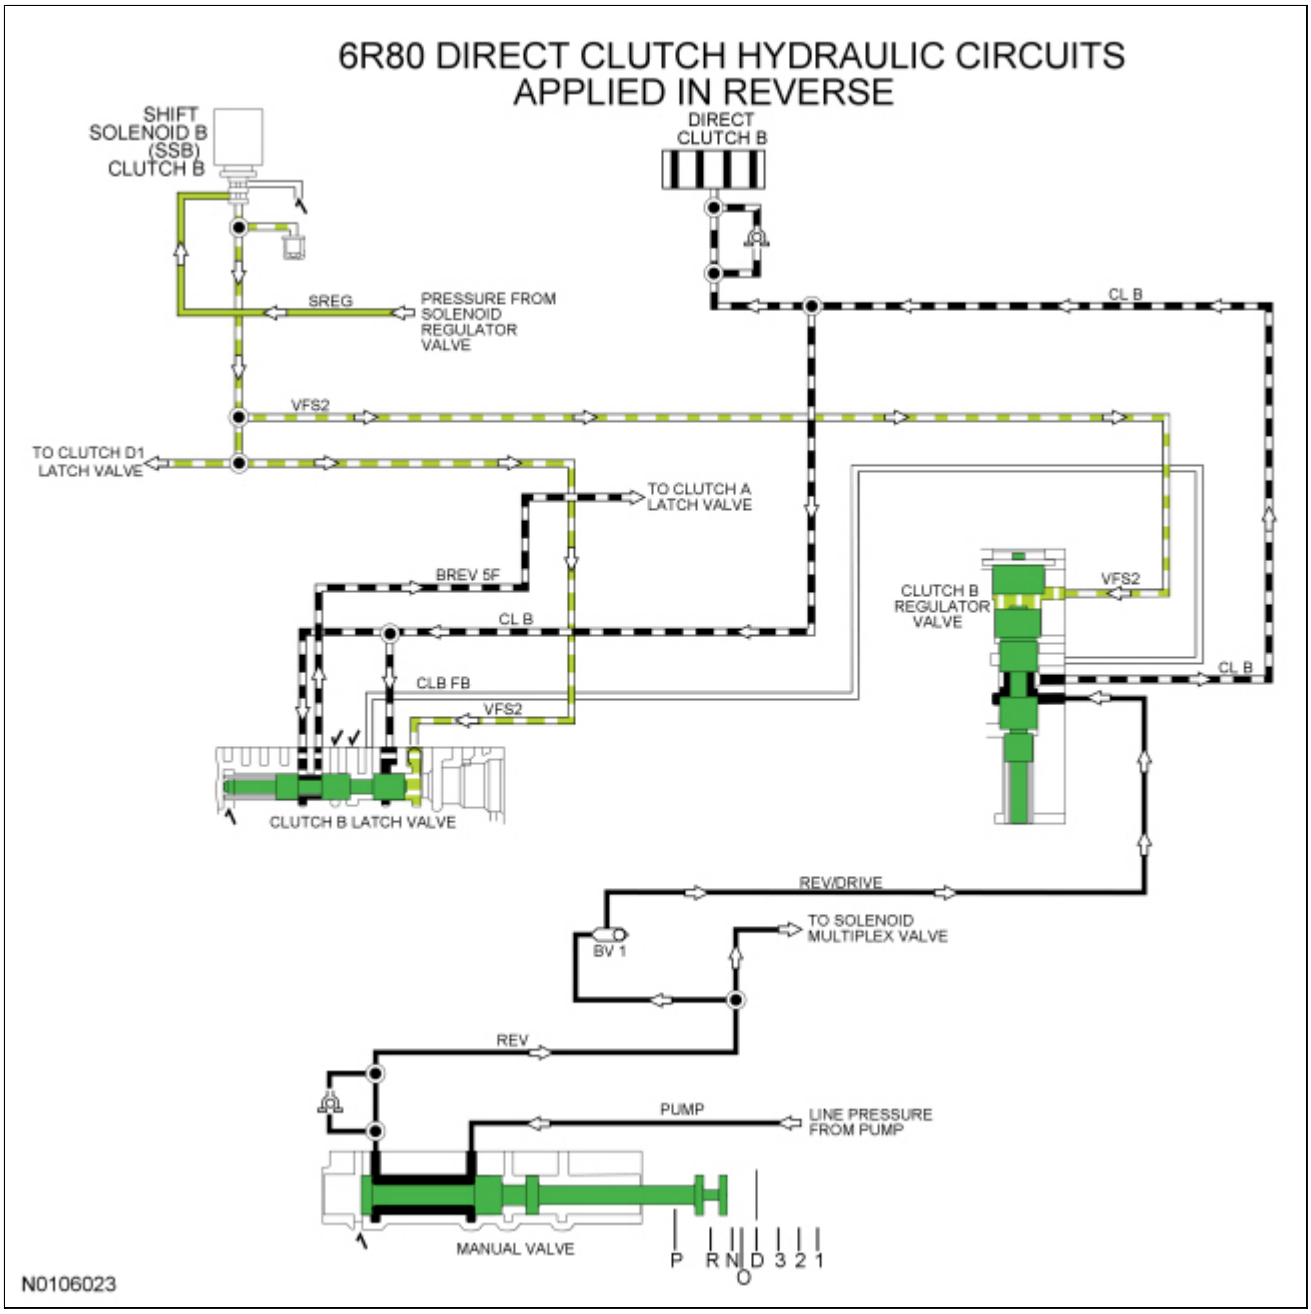


The clutch A regulator valve provides regulated line pressure to the CL A circuit to apply the forward clutch (A).

The forward clutch (A) is released when the manual valve is in the NEUTRAL, REVERSE or PARK position or the when the manual valve is in the DRIVE position with the transmission in 5th or 6th gear.

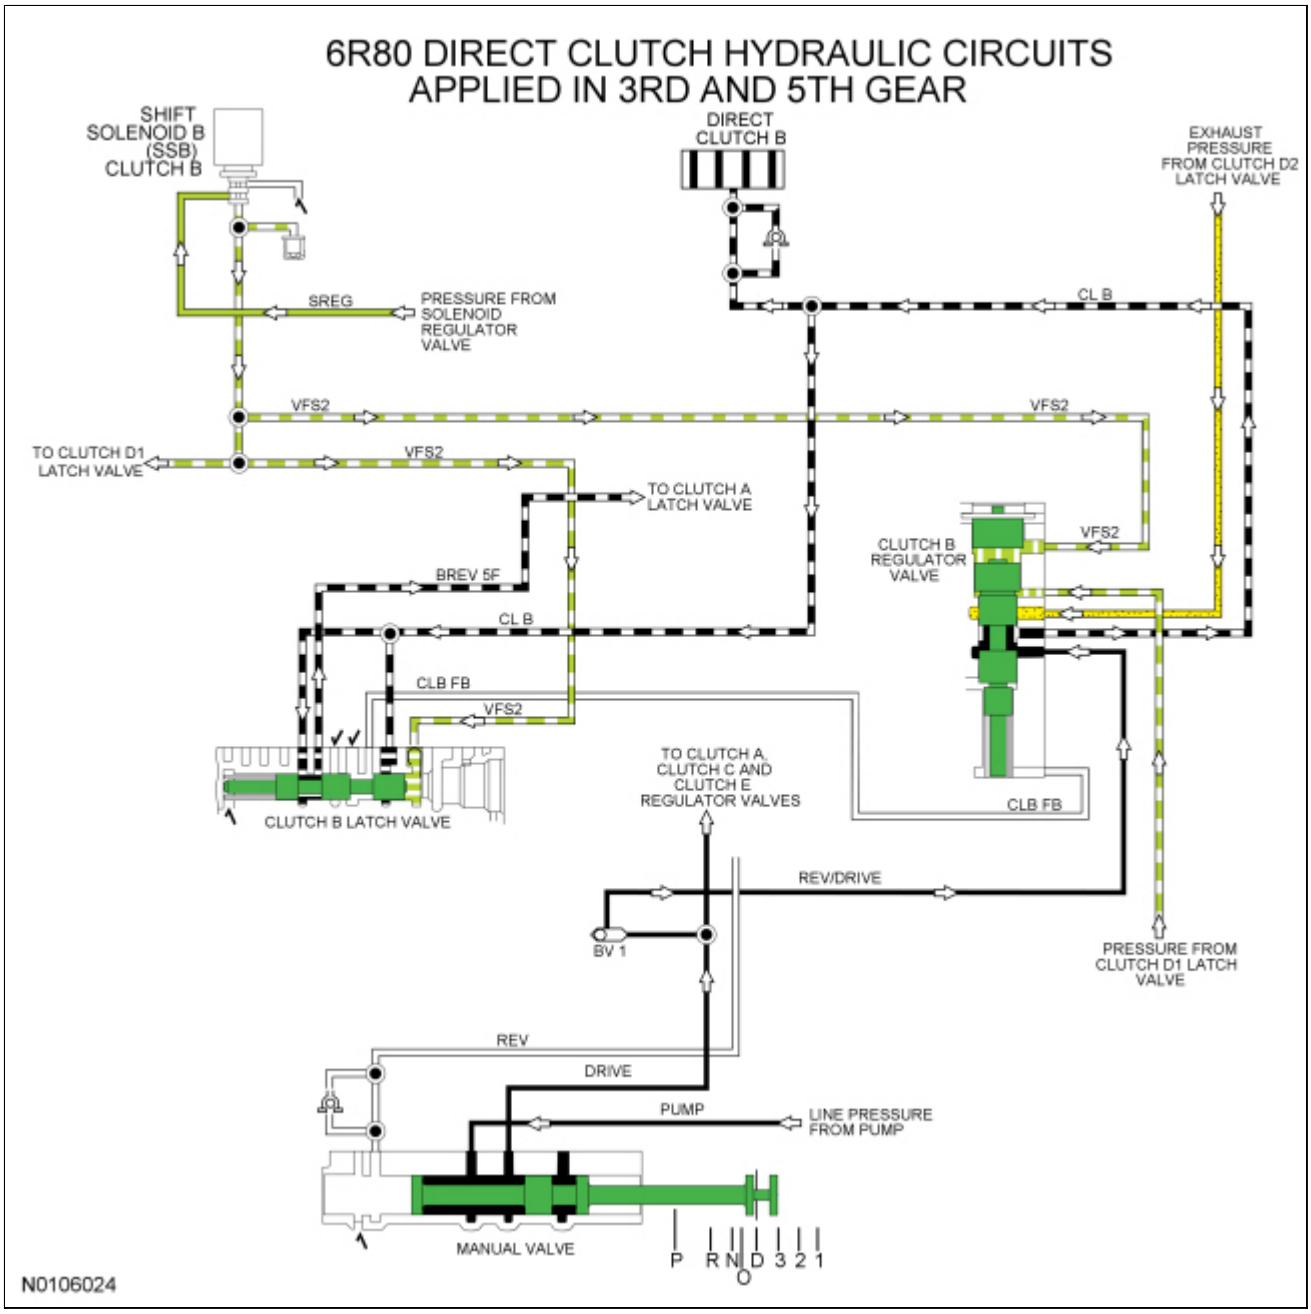
SSA lowers pressure to the clutch A regulator and latch valve to position the valves to lower the regulated line pressure in the CL A circuit to release the clutch.

When the forward clutch (A) is released, the clutch A regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL A circuit to fill the circuit and the forward clutch (A) with fluid at low pressure, approximately 21 kPa (3 psi).



Direct Clutch (B) Hydraulic Circuits

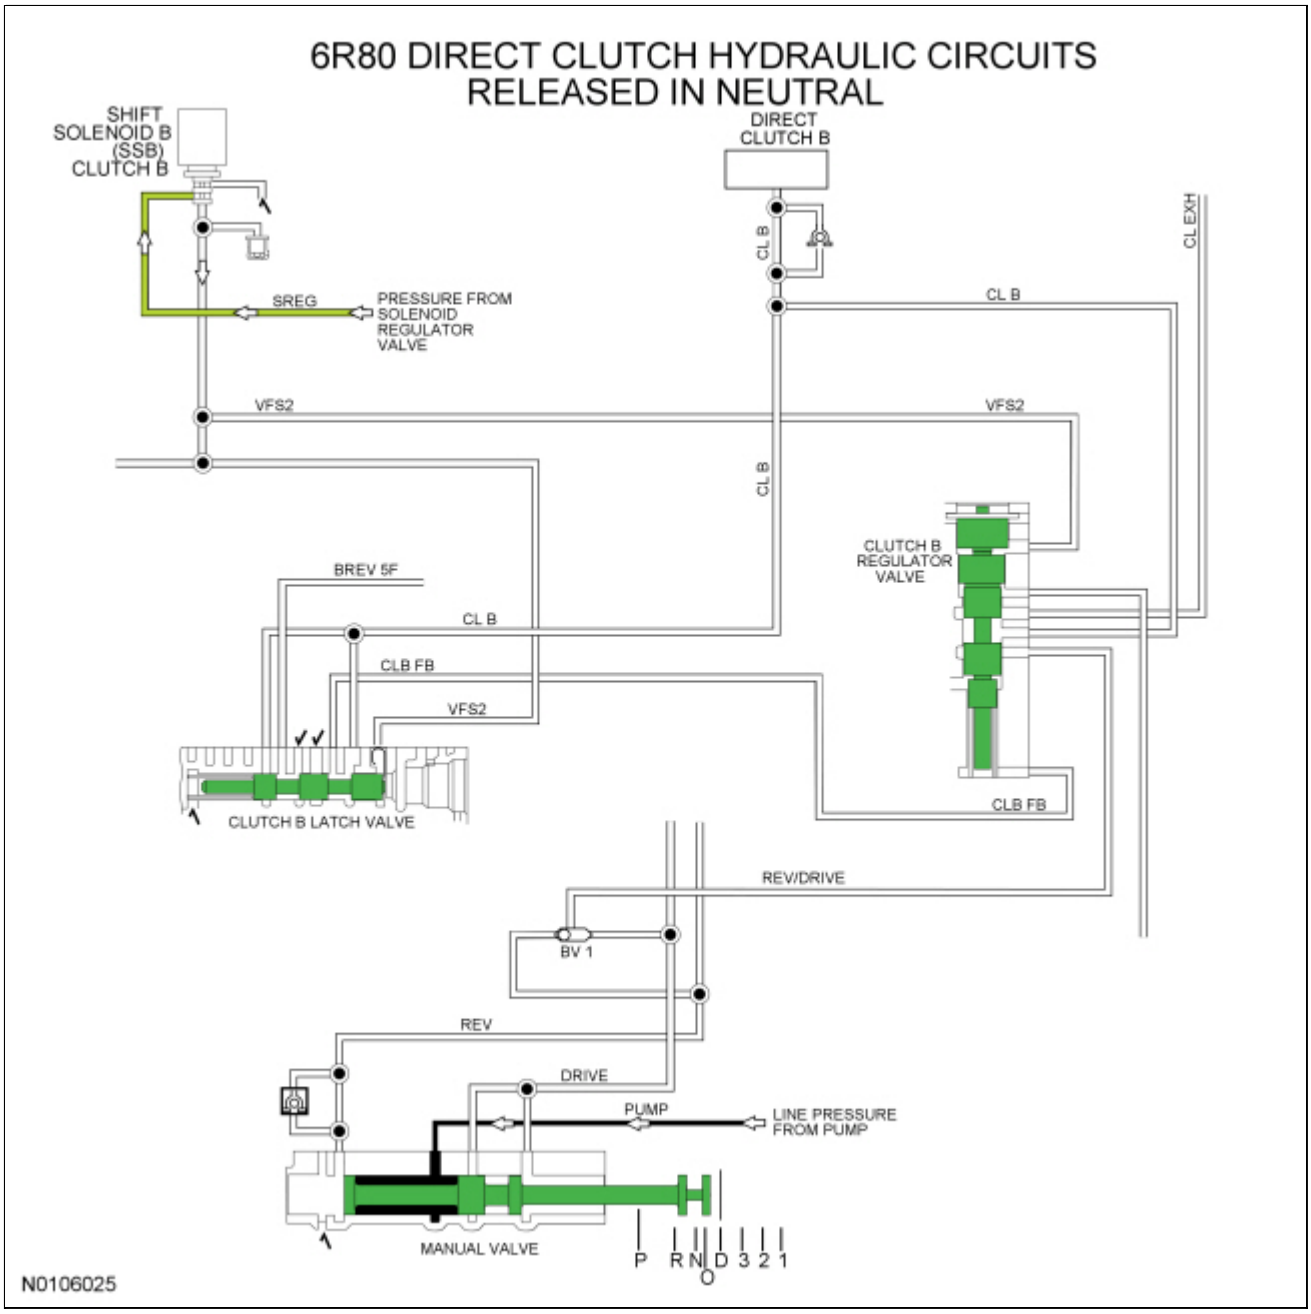
To apply the direct clutch (B), the manual valve can be in the REVERSE, DRIVE, 3, 2 or 1 position to provide line pressure to the clutch B regulator valve through the REV/DRIVE circuit.



For the direct clutch (B) to apply in reverse, SSB provides regulated solenoid pressure from the SREG circuit to the clutch B regulator and latch valves through the VFS2 circuit to position the valves to apply the direct clutch (B). As the direct clutch is applied, SSB increases pressure to the clutch B regulator and latch valves.

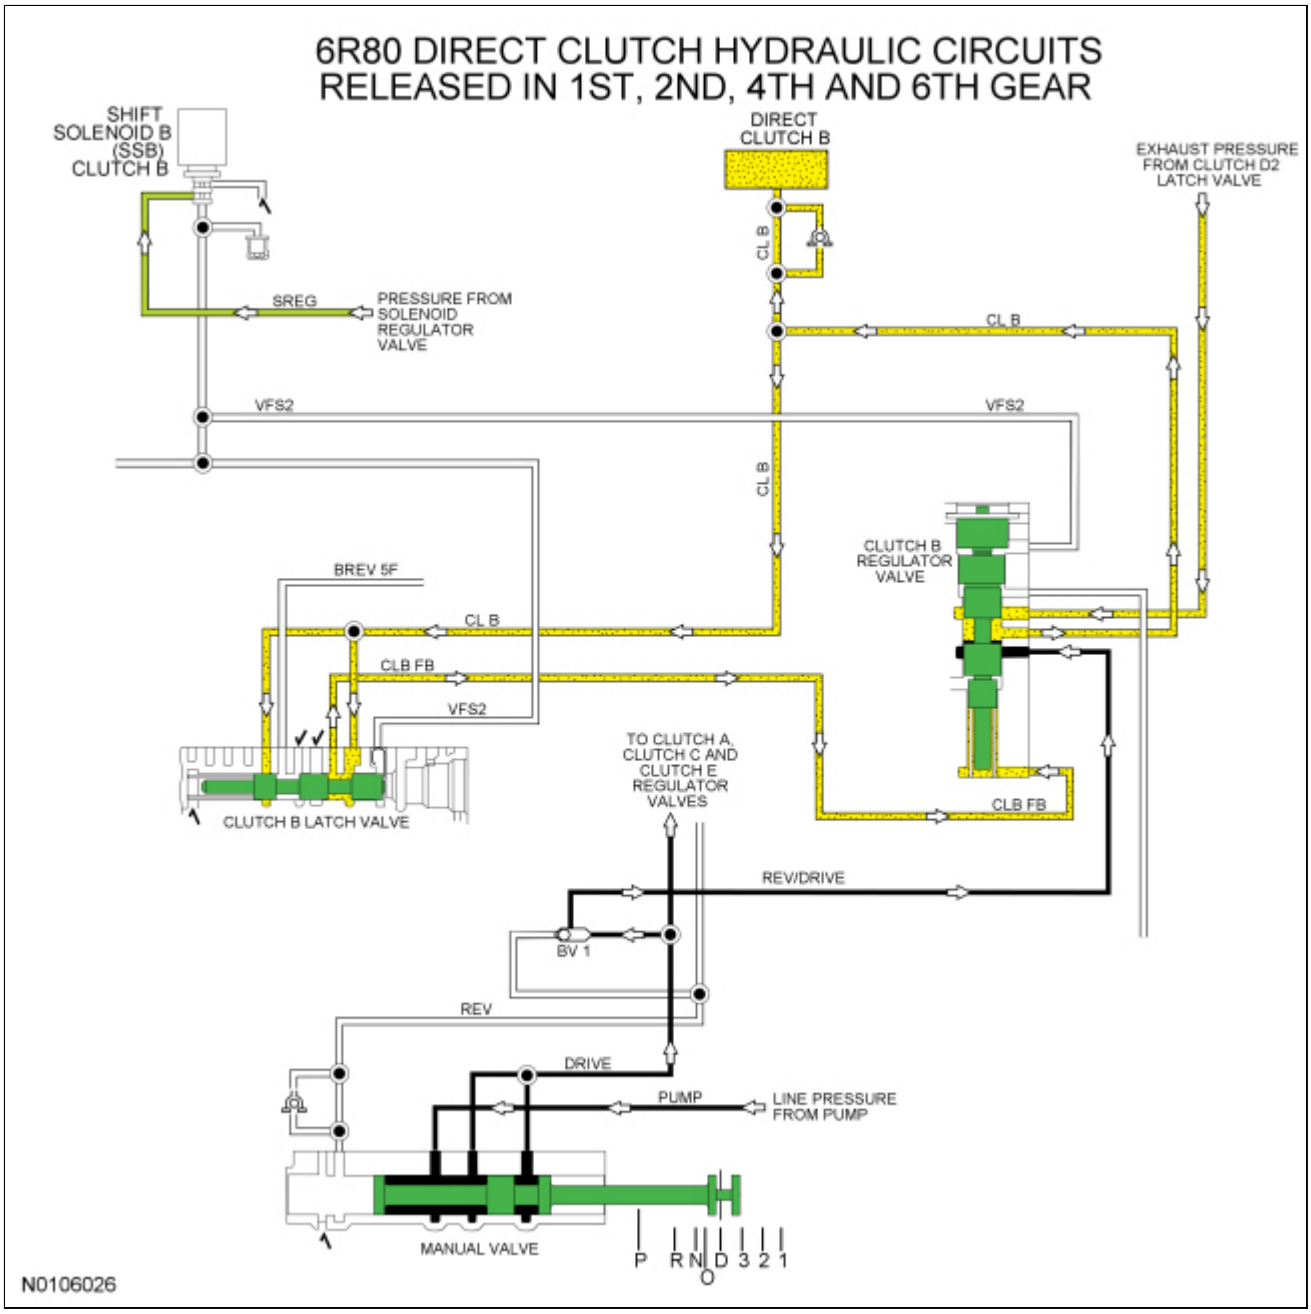
The clutch B regulator valve provides regulated line pressure to the CL B circuit to apply the direct clutch (B).

repair4less



When the direct clutch (B) is applied in 3rd and 5th gear, regulated solenoid pressure from the D1 latch valve is supplied to the clutch B regulator valve through the VFS2D circuit and opposes pressure from the VFS2 circuit for clutch B valve positioning.

The direct clutch (B) is released when the manual valve is in the PARK or NEUTRAL position or when the manual valve is in the DRIVE position with the transmission in 1st, 2nd, 4th or 6th gear.



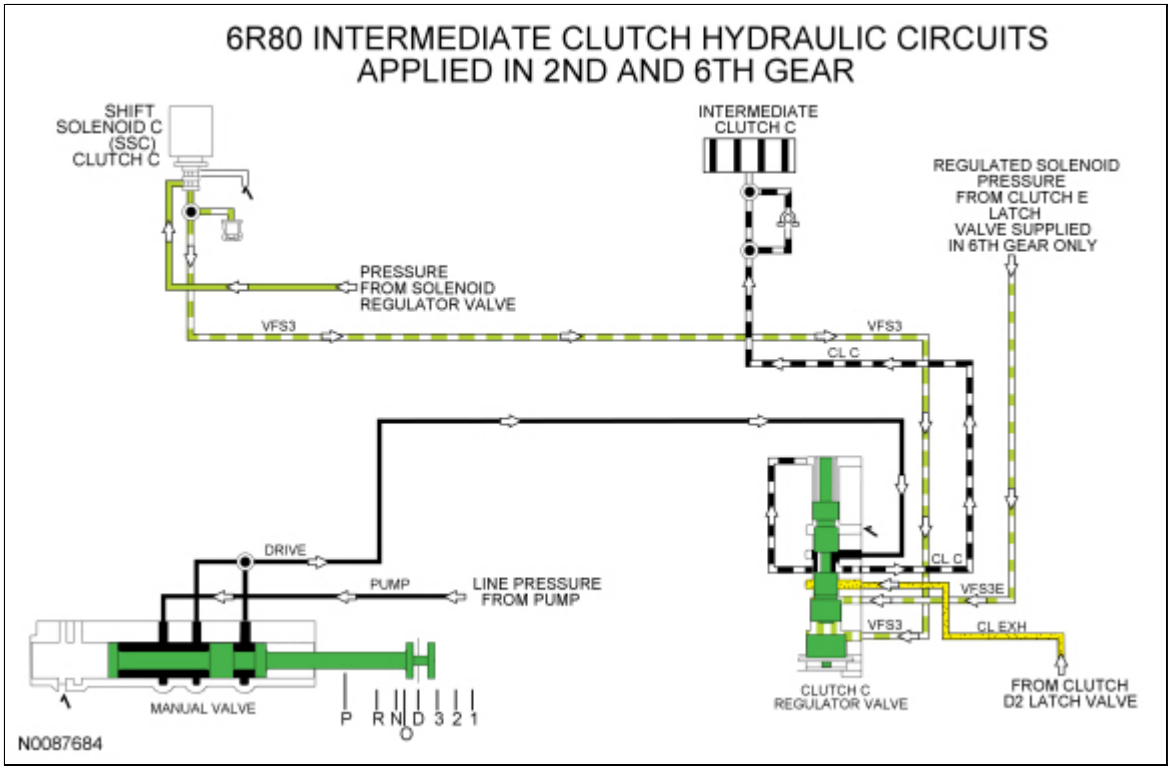
In NEUTRAL or PARK, the manual valve does not supply line pressure to the clutch B regulator valve. SSB lowers pressure to the clutch B regulator and latch valve to position the valves to lower the regulated line pressure in the CL B circuit to release the clutch.

repair4less

In 1st, 2nd, 4th or 6th gear, the manual valve supplies line pressure to the clutch B regulator valve. SSB lowers pressure to the clutch B regulator and latch valve to position the valves to lower the regulated line pressure in the CL B circuit to release the clutch.

When the direct clutch (B) is released in 1st, 2nd, 4th or 6th gear, the clutch (B) regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL B circuit to fill the circuit and the direct clutch (B) with fluid at low pressure, approximately 21 kPa (3 psi).

Intermediate Clutch (C) Hydraulic Circuits

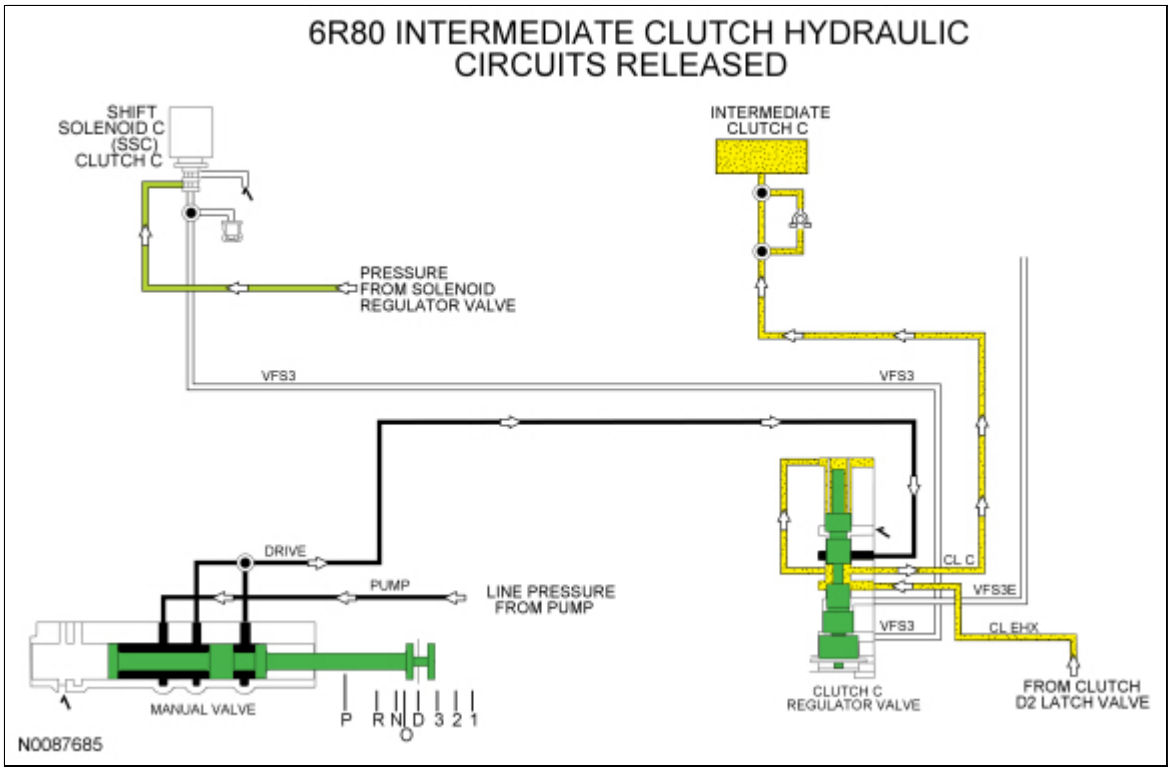


To apply the intermediate clutch (C), the manual valve can be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch C regulator valve through the DRIVE circuit.

SSC provides regulated solenoid pressure from the SREG circuit to the clutch C regulator valve through the VFS3 circuit to position the valve to apply the intermediate clutch (C). As the intermediate clutch (C) is applied, SSC increases pressure to the clutch C regulator valve.

The clutch C regulator valve provides regulated line pressure to the CL C circuit to apply the intermediate clutch (C).

repair4less

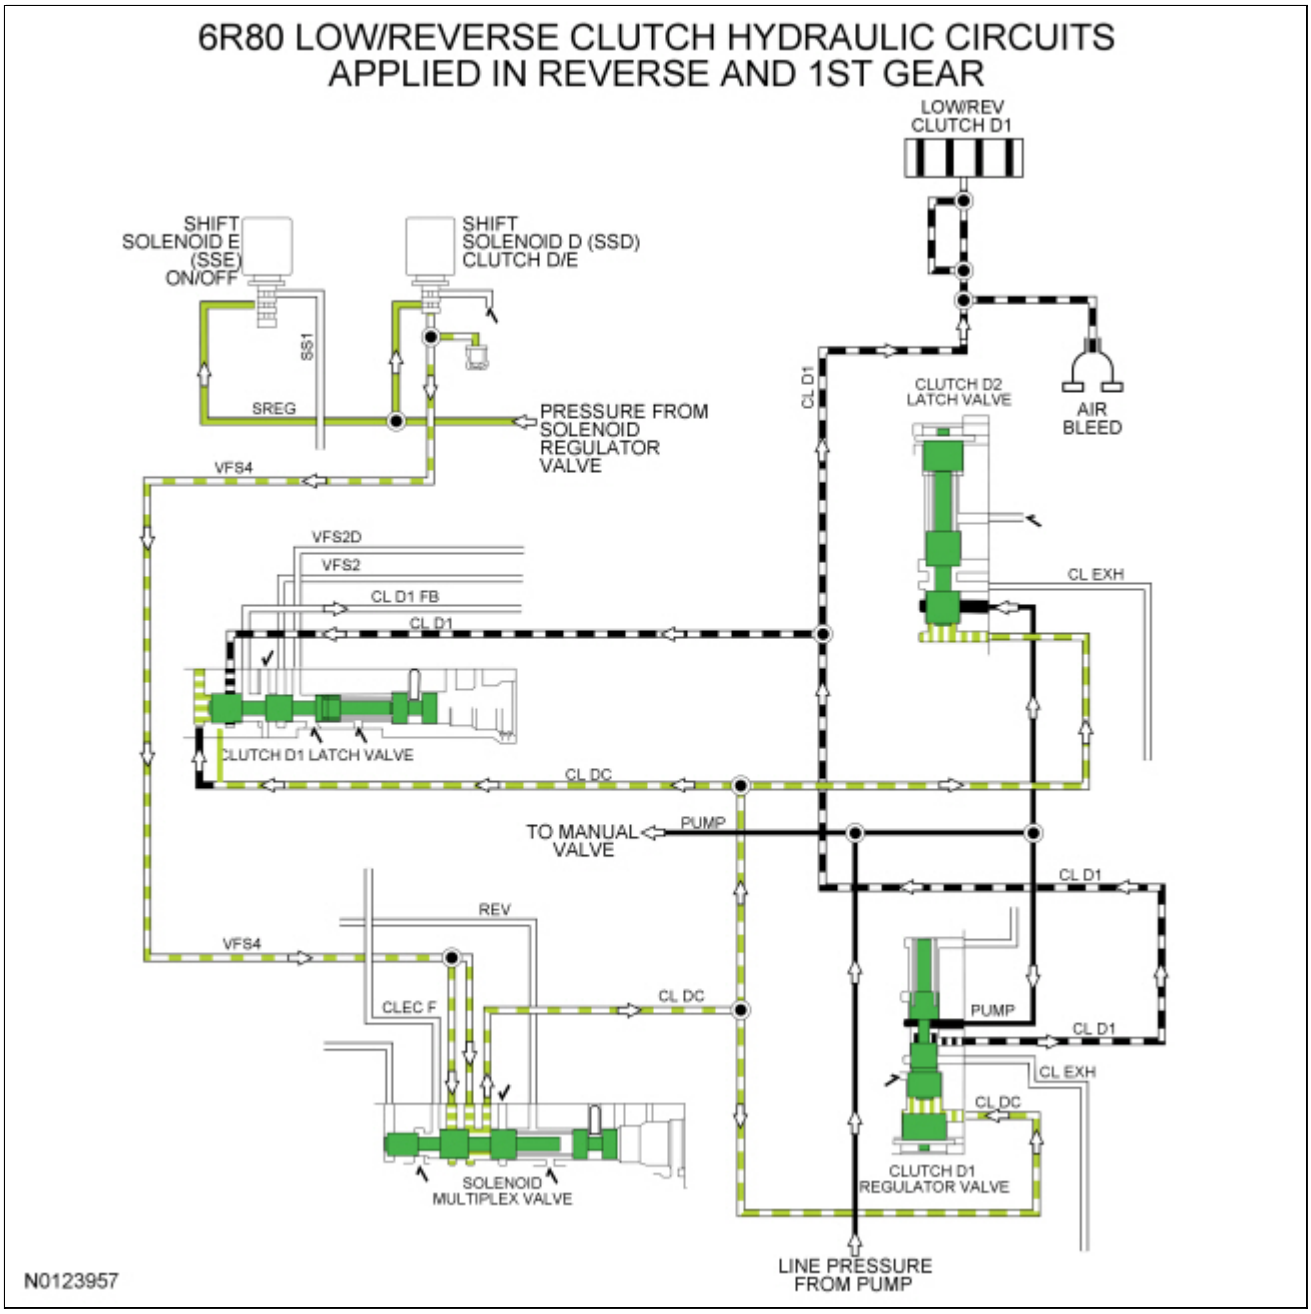


Regulated solenoid pressure from the clutch E latch valve is supplied to the clutch C regulator valve through the VFS3E circuit and opposes VFS3 pressure for clutch C regulator valve positioning in 6th gear only.

To release the intermediate clutch (C) when the manual valve is in the DRIVE, 3, 2 or 1 position SSC lowers pressure to the clutch C regulator valve to position the valve to lower the regulated line pressure in the CL C circuit to release the clutch.

When the intermediate clutch (C) is released, the clutch C regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL C circuit to fill the CL C circuit and the intermediate clutch (C) with fluid at low pressure, approximately 21 kPa (3 psi).

In PARK, REVERSE or NEUTRAL, the manual valve does not supply line pressure to the clutch C regulator valve.

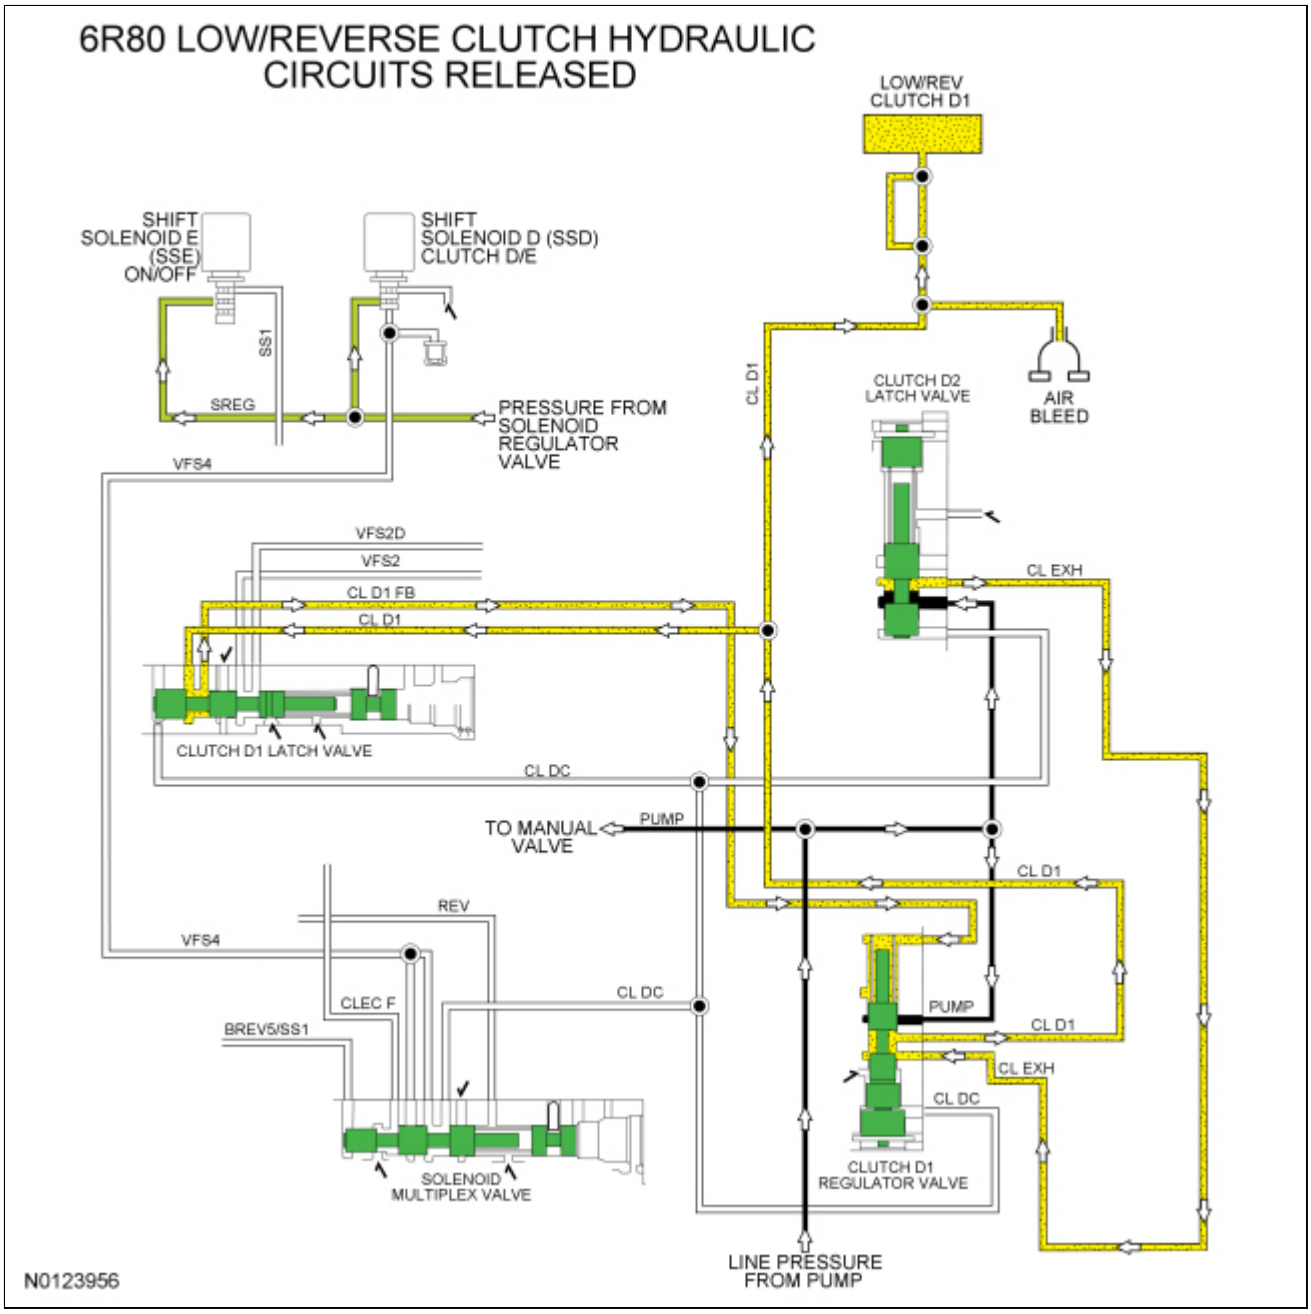


Low/Reverse Clutch (D) Hydraulic Circuits

To apply the low/reverse clutch (D), the manual valve can be in any position. Line pressure is supplied to the D1 regulator and latch valves by the pump through the PUMP circuit.

SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit where it is directed to the D1 regulator and latch valves through the CL DC circuit to position the valves to apply the low/reverse clutch (D). As the low/reverse clutch (D) is applied, SSD increases pressure to the D1 clutch regulator and latch valves.

The clutch D1 regulator valve provides regulated line pressure from the PUMP circuit to the CL D1 circuit to apply the low/reverse clutch (D).

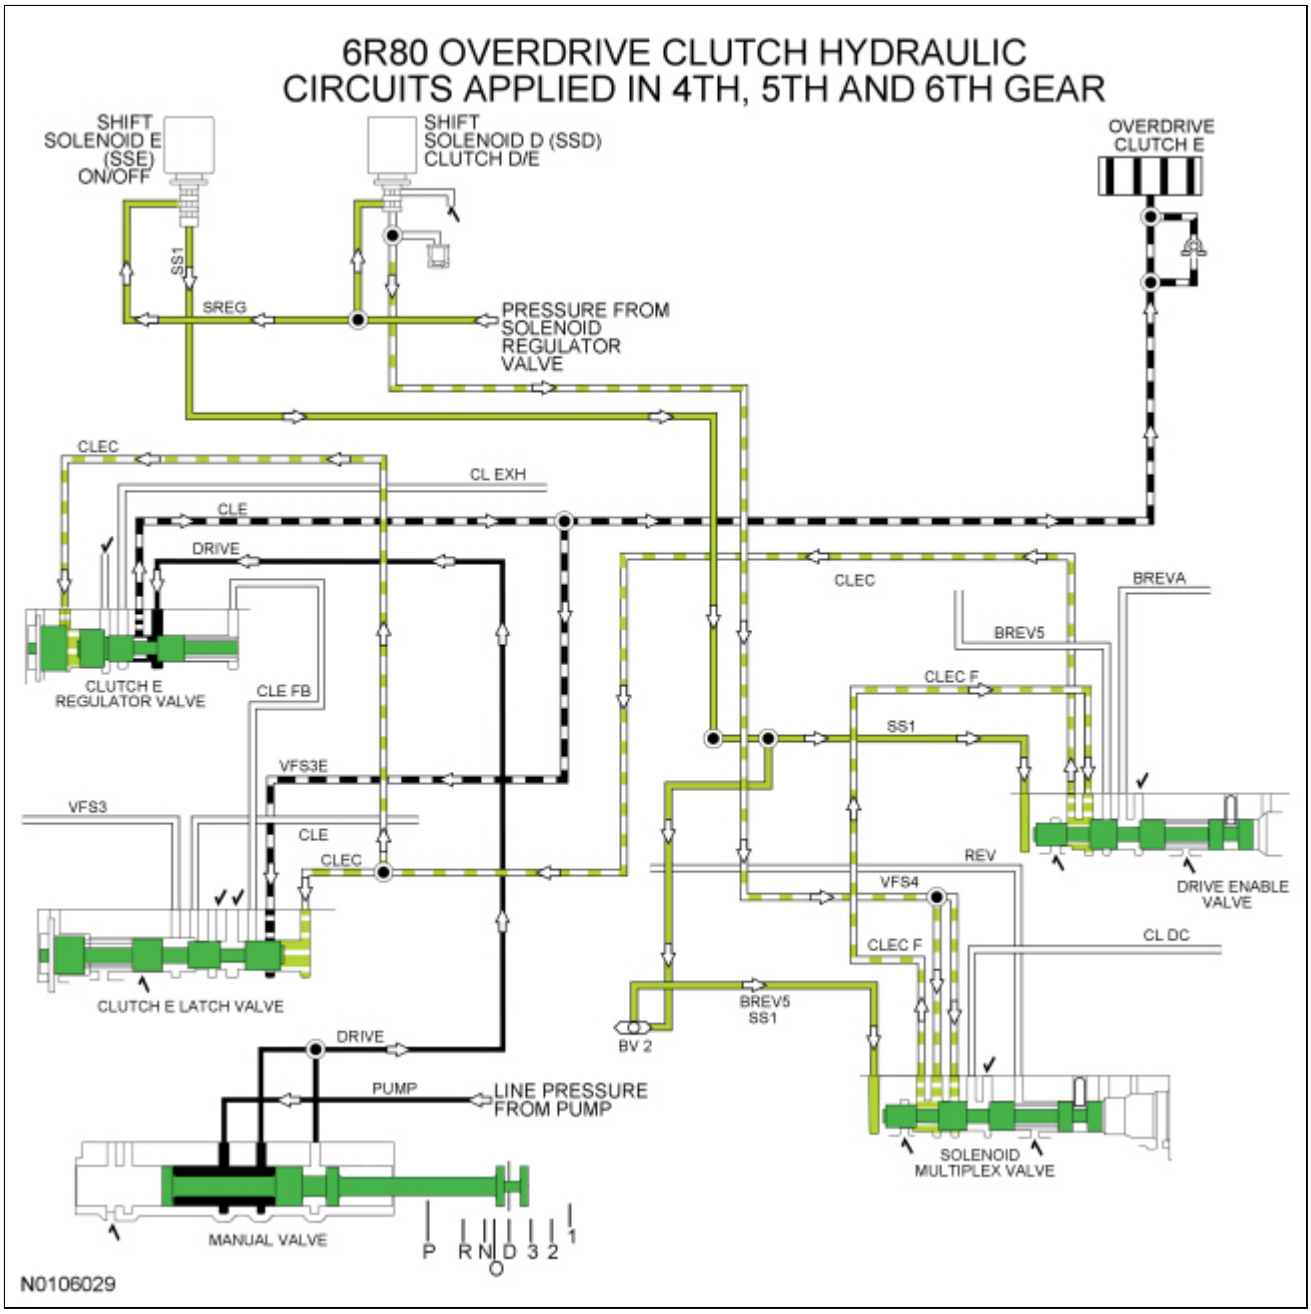


repair4less

To release the low/reverse clutch (D), the manual valve can be in the DRIVE, 3 or 2 position. SSD lowers pressure to the VFS4 circuit which lowers pressure in the CL DC circuit to position the D clutch regulator and latch valves to lower pressure in the CL D1 circuit and release the low/reverse clutch (D).

When the low/reverse clutch (D) is released, the clutch D2 latch valve directs line pressure regulated to approximately 21 kPa (3 psi) to the CL EXH circuit which fills the volume of the unused clutches and circuits.

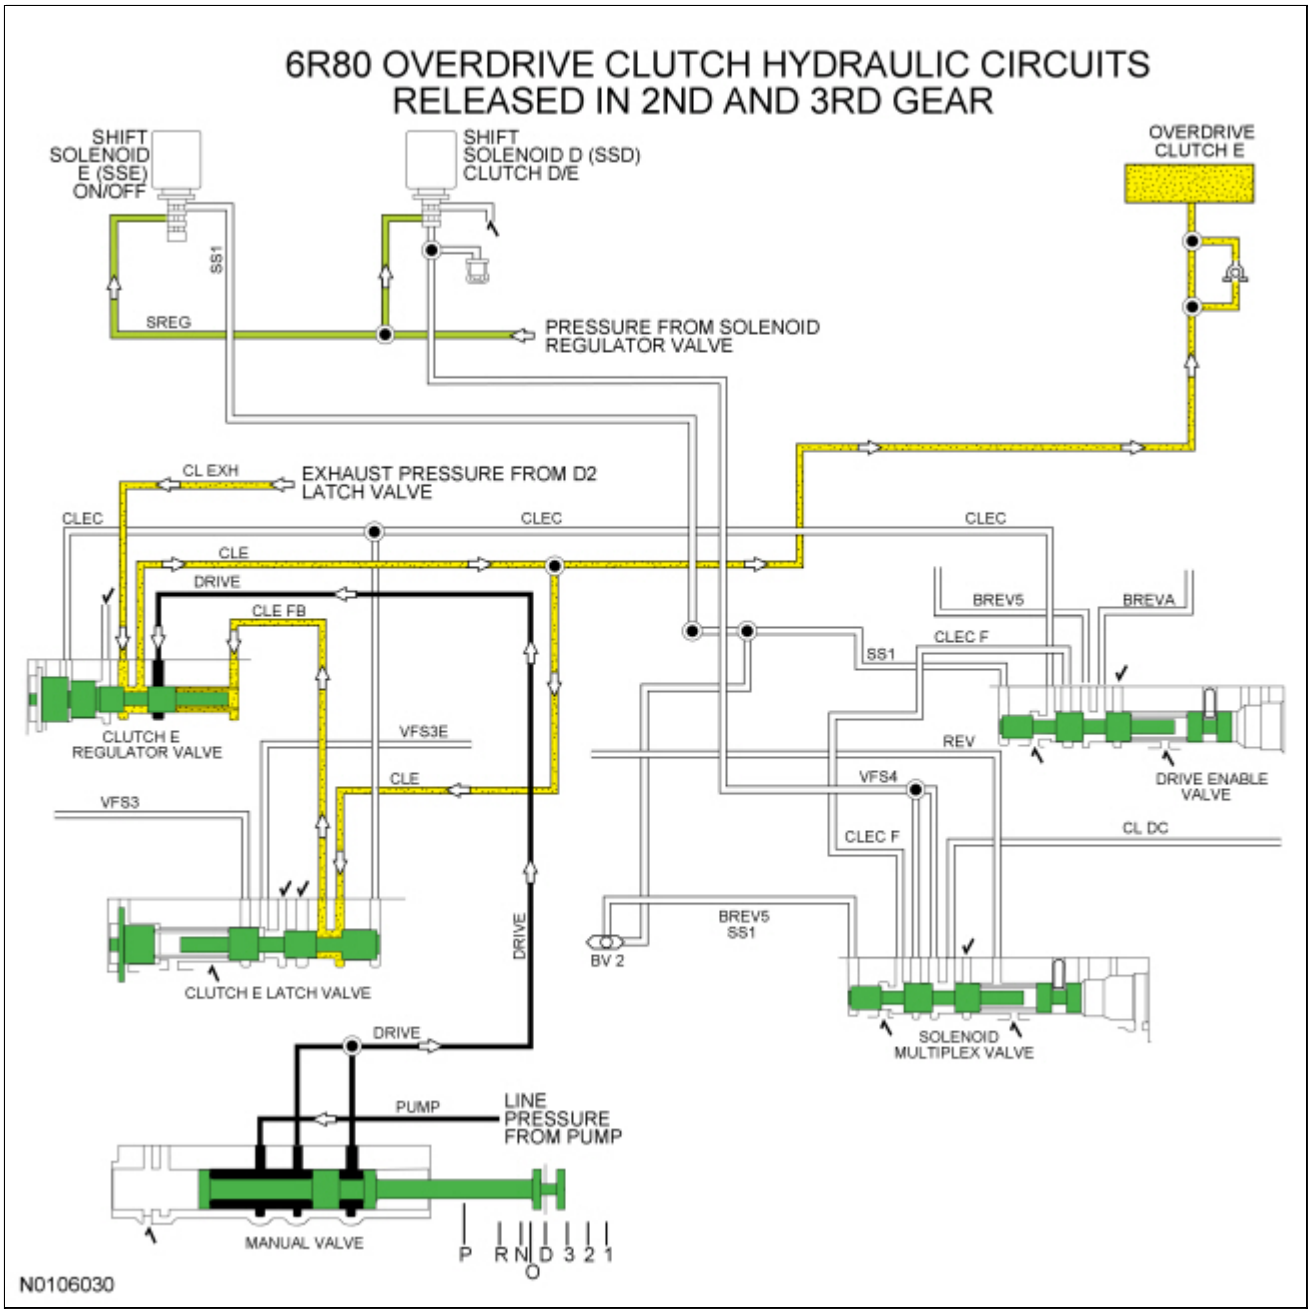
When the low/reverse clutch (D) is released, the CL EXH circuit supplies the D1 regulator valve which fills the CL D1 circuit and the low/reverse (D) clutch.



Overdrive Clutch (E) Hydraulic Circuits

To apply the overdrive clutch (E), the manual valve must be in the DRIVE position. Line pressure is supplied to the clutch E regulator valve.

SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit. SSE supplies pressure to the solenoid multiplex valve and the drive enable valve to position the valves to direct pressure from the VFS4 circuit to the CLEC F and CLEC circuits to position the clutch E regulator and latch valves to apply the overdrive clutch (E). As the overdrive clutch (E) is applied, SSD increases pressure to the clutch E regulator and latch valve.



The clutch E regulator valve provides regulated line pressure from the DRIVE circuit to the CLE circuit to apply the overdrive clutch (E).

repair4less

To release the overdrive clutch (E), the manual valve can be in any position. SSD lowers pressure to the VFS4 circuit which lowers pressure in the CLEC and CLEC F circuits and releases the overdrive clutch (E). SSE blocks SREG pressure to the solenoid multiplex valve and the drive enable valve to allow SSD to control low/reverse clutch (D) operation.

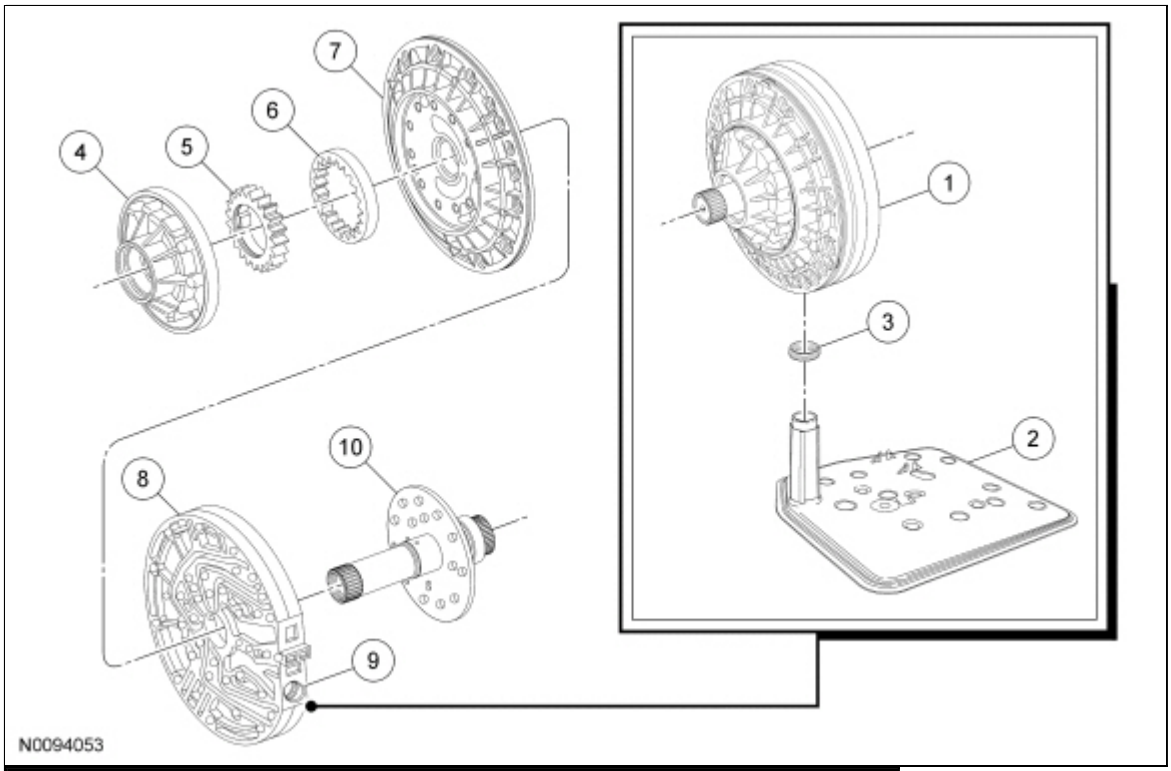
When the overdrive clutch (E) is released, the clutch E regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL E circuit to fill the circuit and the clutch with fluid at low pressure, approximately 21 kPa (3 psi).

repair4less

Hydraulic System

Pump Assembly and Transmission Fluid Filter

This transmission has a gear type pump that supplies transmission fluid pressure to the hydraulic system.



The inner (drive) gear is turned by the torque converter hub.

The transmission fluid pump has the following parts:

- Pump body, with inner (drive) and outer (driven) gears
- Centering plate
- Intermediate plate
- Stator shaft

The transmission fluid pump draws transmission fluid from the sump area, formed by the transmission fluid pan, through the transmission fluid filter, which is installed into the intermediate plate portion of the pump assembly and sealed by a rubber seal. A magnet attached to the transmission fluid pan collects any metallic material in the transmission fluid.

Transmission Fluid Level Indicator

A removable dipstick-type fluid level indicator is located on the right front area of the transmission case. It is held in by an external fluid fill plug. The transmission fluid level indicator is removed with the transmission fluid fill plug. The transmission fluid level indicator is removed from the fill plug to check the transmission fluid level.

The transmission fluid level is correctly checked when the transmission is at normal operating temperature, 89ºC-102ºC (193ºF-215ºF), and the vehicle is on a level surface.

The correct transmission fluid level is at the upper level of the crosshatch marks on the transmission fluid level indicator.

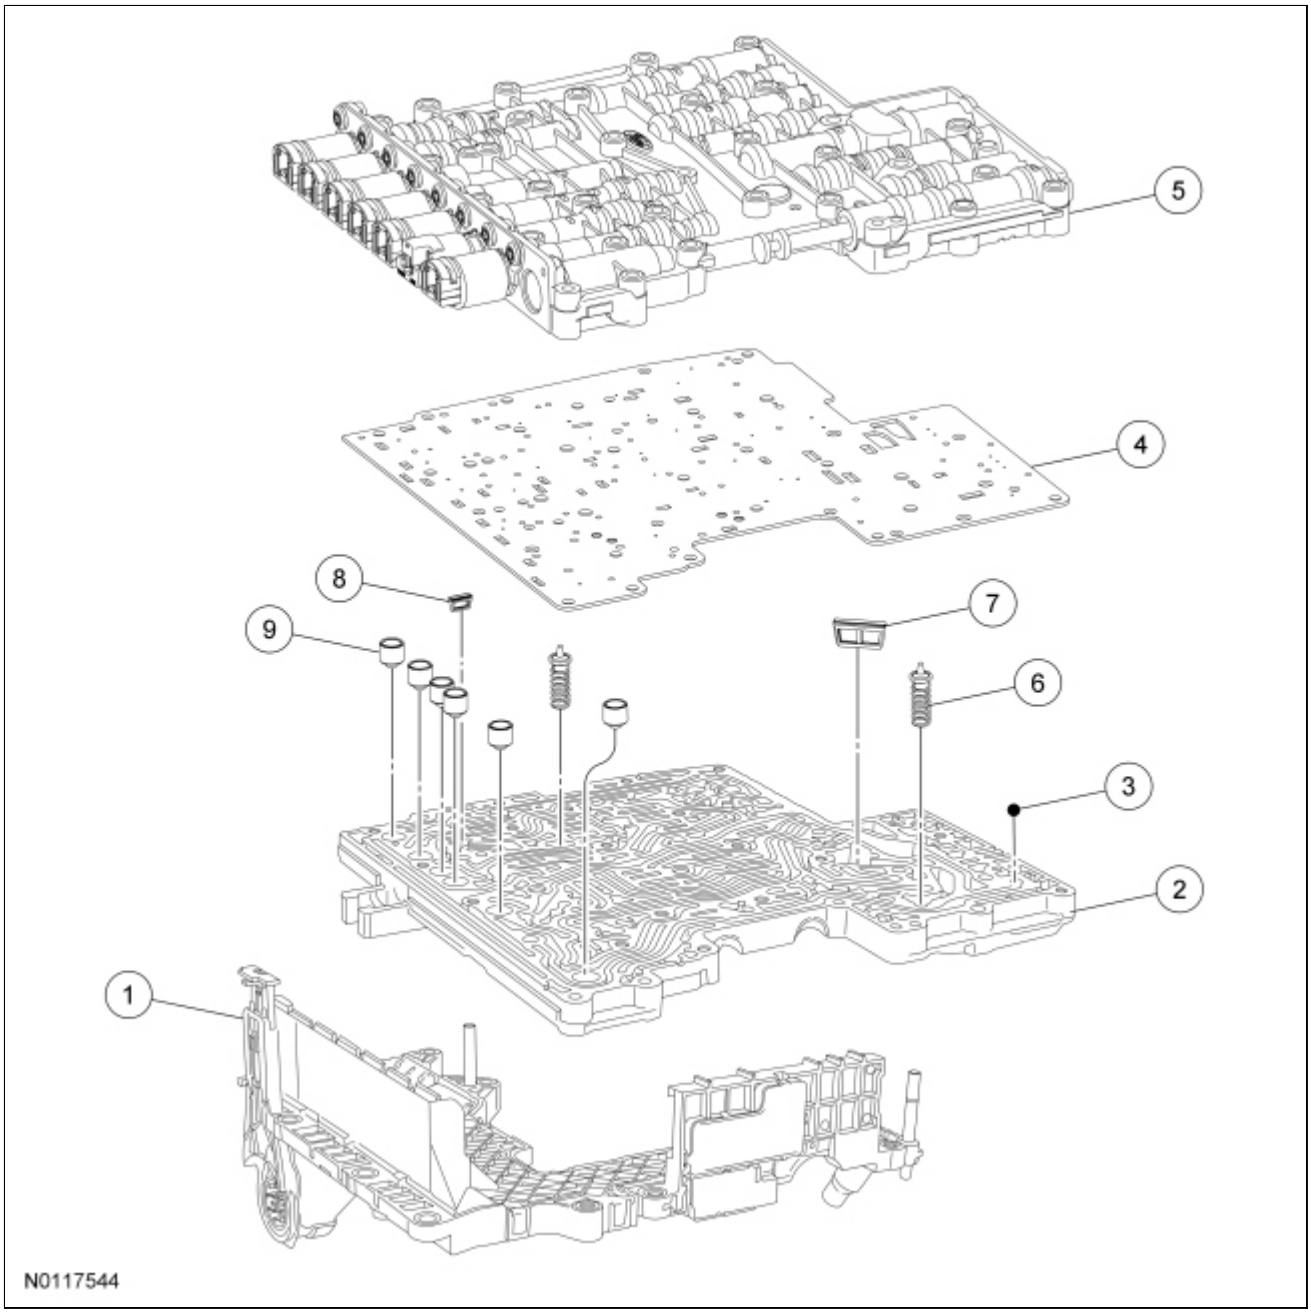
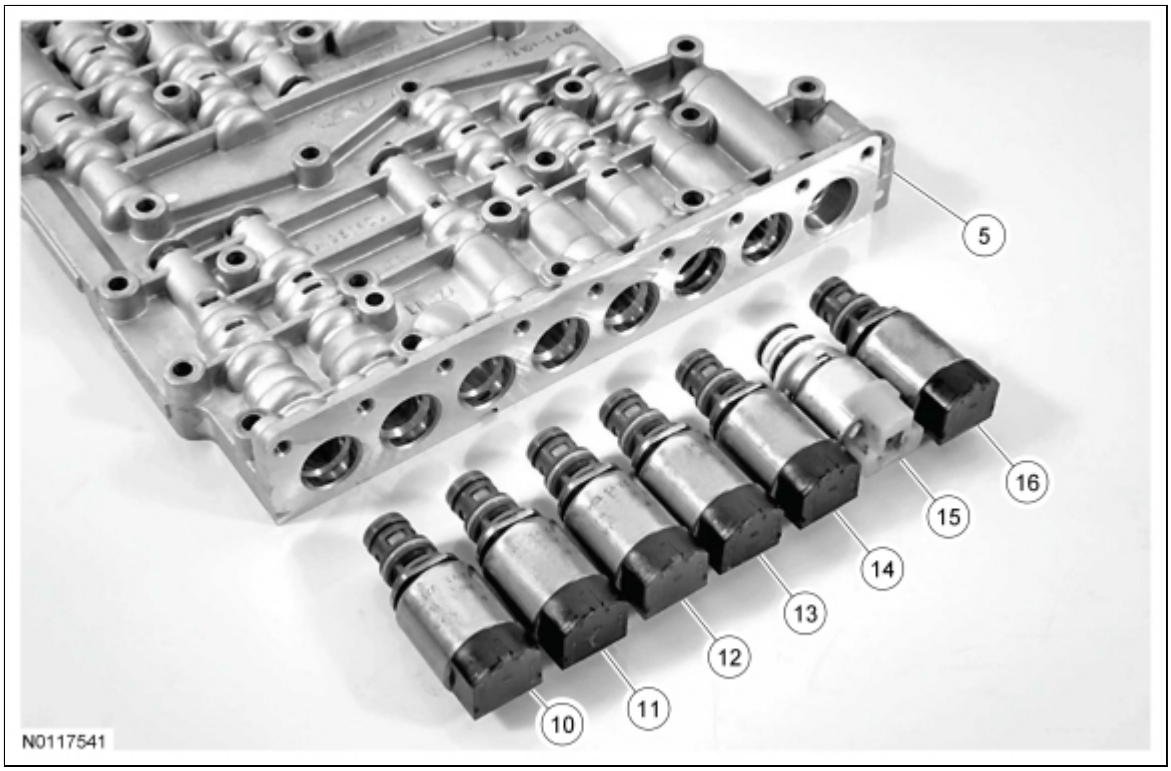
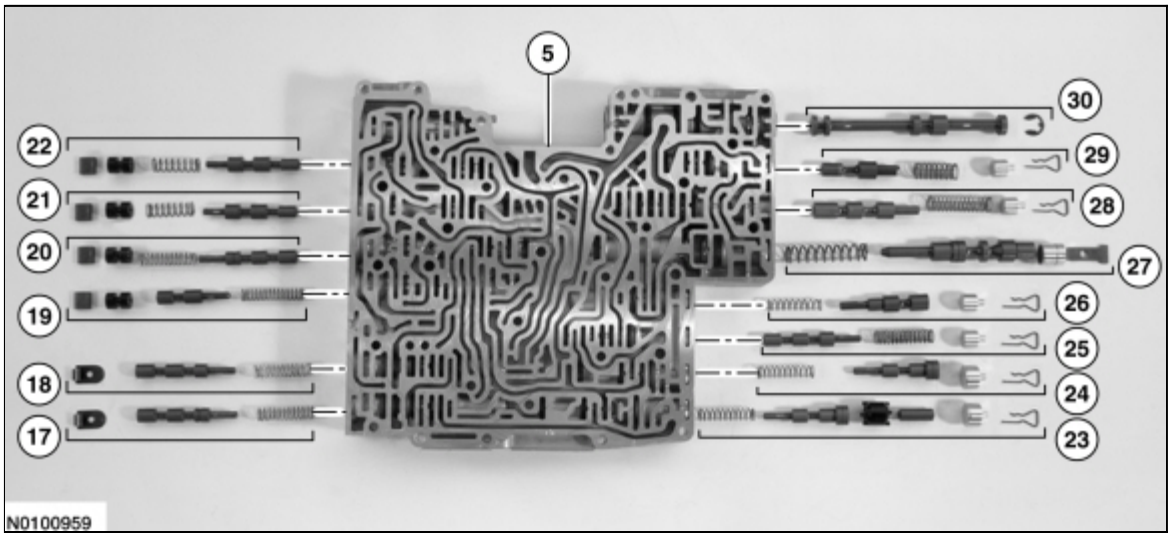
Main Control Assembly



The hydraulic system of this transmission includes the fluid pump, a main control assembly and fluid passages in the transmission case and center support to apply the clutches.



The main control assembly has an upper valve body assembly, a separator plate and a lower valve body assembly. The lower valve body assembly has 7 solenoids to control the valves in the main control.



TheTurbine Shaft Speed (TSS), Output Shaft Speed (OSS), Transmission Range (TR) and Transmission Fluid Temperature (TFT) sensors are all part of the main control assembly leadframe.

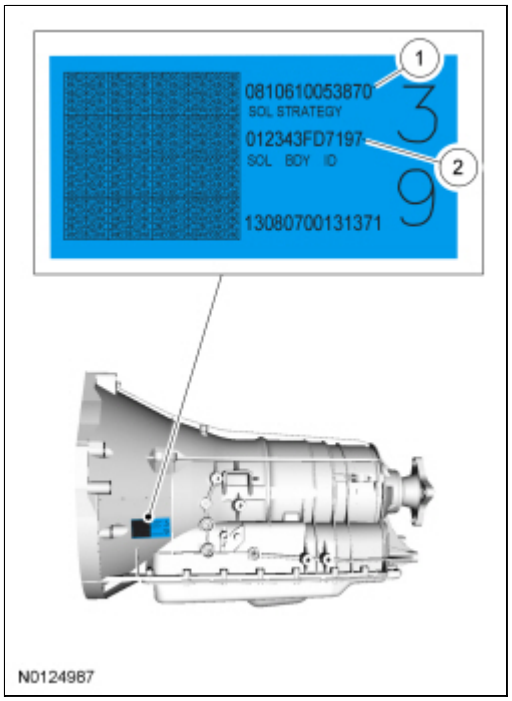
Identification Tags

All vehicles come equipped with a Safety Compliance Certification Label. The location on the label marked TR is reserved for the transmission code. To determine the correct transmission for this vehicle, refer to the Owner's Literature, Transmission Code Designations. All transmissions are equipped with an identification tag located on the transmission case. For transmission part number, serial number and build date, refer to the transmission identification tag located on the transmission case.

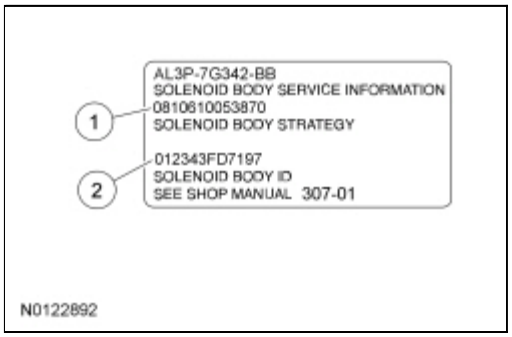


Item	Description
1	Part number
2	Build date
3	Serial number

Solenoid Strategy Identification Tag

NOTE: Letters are not used in the 13 digit solenoid body strategy. The characters consist of all numbers.

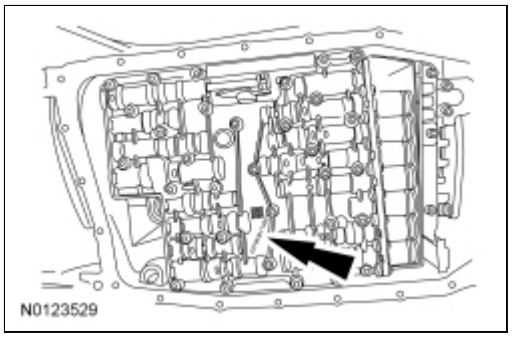
PCM controlled transmissions have a solenoid strategy identification tag located on the left side of the transmission case. Compare the 13 digit number on the tag with the 13 digit number displayed on the scan tool to determine the correct solenoid strategy for the transmission. If the scan tool matches the service tag then the solenoid strategy is correct. If the solenoid strategy retrieved from the scan tool does not match the solenoid strategy identification tag, the transmission fluid pan must be removed to compare what the scan tool displays to the solenoid strategy number etched on the main control. Refer to Fluid Pan, Gasket and Filter in this section. If the solenoid strategy identification etched on the main control matches what the scan tool displays, then the solenoid strategy is correct. If the solenoid strategy identification etched on the main control does not match the scan tool, then a Solenoid Strategy Data Download is required. Refer to Solenoid Body Strategy for the download procedure in this section.



Original Solenoid Body Tag

Item	Description
1	13 digit solenoid strategy
2	12 digit solenoid body identification

A replacement solenoid body tag is provided when the main control is serviced. The replacement solenoid body tag is placed over the original solenoid body tag.



Replacement Solenoid Body Tag

Item	Description
1	13 digit solenoid strategy
2	12 digit solenoid body identification

Main Control Solenoid Body Strategy Identification

repair4less

If the solenoid body strategy etched on the main control does not match what the scan tool displays, the solenoid body strategy must be downloaded into the PCM or harsh shifts will result.

Major Components

Major Components

This transmission has the following major components:

- Transmission case with integral torque converter housing
- Torque converter
- Fluid pump
- Three drive clutches:
  - Forward clutch (A)
  - Direct clutch (B)
  - Overdrive clutch (E)
- Three brake clutches:
  - Intermediate clutch (C)
  - Low/reverse clutch (D)
  - One-Way Clutch (OWC)
- Two planetary gearsets:
  - Front single planetary gearset (1 sun gear, 1 carrier, 1 ring gear)
  - Rear ravigneaux planetary gearset (2 sun gears, 1 carrier with 2 sets of pinion gears and 1 ring gear)
- Main control:
  - Upper valve body
  - Lower valve body
  - Transmission Range (TR) sensor
  - Turbine Shaft Speed (TSS) sensor
  - Output Shaft Speed (OSS) sensor
  - Transmission Fluid Temperature (TFT) sensor
  - Line Pressure Control (LPC) solenoid
  - Torque Converter Clutch (TCC) solenoid
  - Five electronically controlled shift solenoids

In addition to the torque converter, the other shift elements are:

- three rotating multi-plate clutches: forward (A), direct (B) and overdrive (E).
- two fixed multi-disc brakes: intermediate (C) and low/reverse (D).

All gear shifts from 1st to 6th or from 6th to 1st are power-on overlapping shifts. That is, during the shift, one of the clutches must continue to transmit the drive at lower main pressure until the other clutch is able to accept the input torque.

The shift elements, clutches or brakes are engaged hydraulically. The transmission fluid pressure builds up between the cylinder and the piston, pressing the clutches together.

The purpose of these shift elements is to carry out in-load shifts with no interruption to traction.

repair4less

Multi-plate clutches; forward, direct and overdrive, supply power from the engine to the planetary geartrain. Multi-disc brakes, intermediate and low/reverse, press against the transmission housing in order to achieve a torque reaction effect.

Multi-Plate Clutch

Clutches; overdrive (E), forward (A) and direct (B) are balanced in terms of dynamic pressure. That is, their pistons are exposed to the transmission fluid flow on both sides, in order to prevent pressure buildup in the clutch as speed increases. This equalization process is achieved by a baffle plate and pressure-free transmission fluid supplied by a lubricating passage, through which the space between piston and baffle plate is filled with transmission fluid.

The advantages of this dynamic pressure equalization are:

- reliable clutch engagement and release in all speed ranges.
- improved shift refinement.

Shift Overlap Control

The electro-hydraulic shift action is obtained by means of various valves in the main control valve body, actuated by pressure regulators. They engage or disengage the relevant clutches or brakes at the correct moments.

Hydraulic Systems

Fluid Pump

The torque converter is supported in the fluid pump by a needle roller bearing. The fluid pump is driven directly from the engine by the torque converter shell and supplies transmission fluid to the transmission and the hydraulic control unit.

The fluid pump draws in transmission fluid through a transmission fluid filter and delivers it at high pressure to the main pressure valve in the main control valve body unit. The valve adjusts the pressure and returns excess transmission fluid to the transmission fluid pan.

Fluid Filter

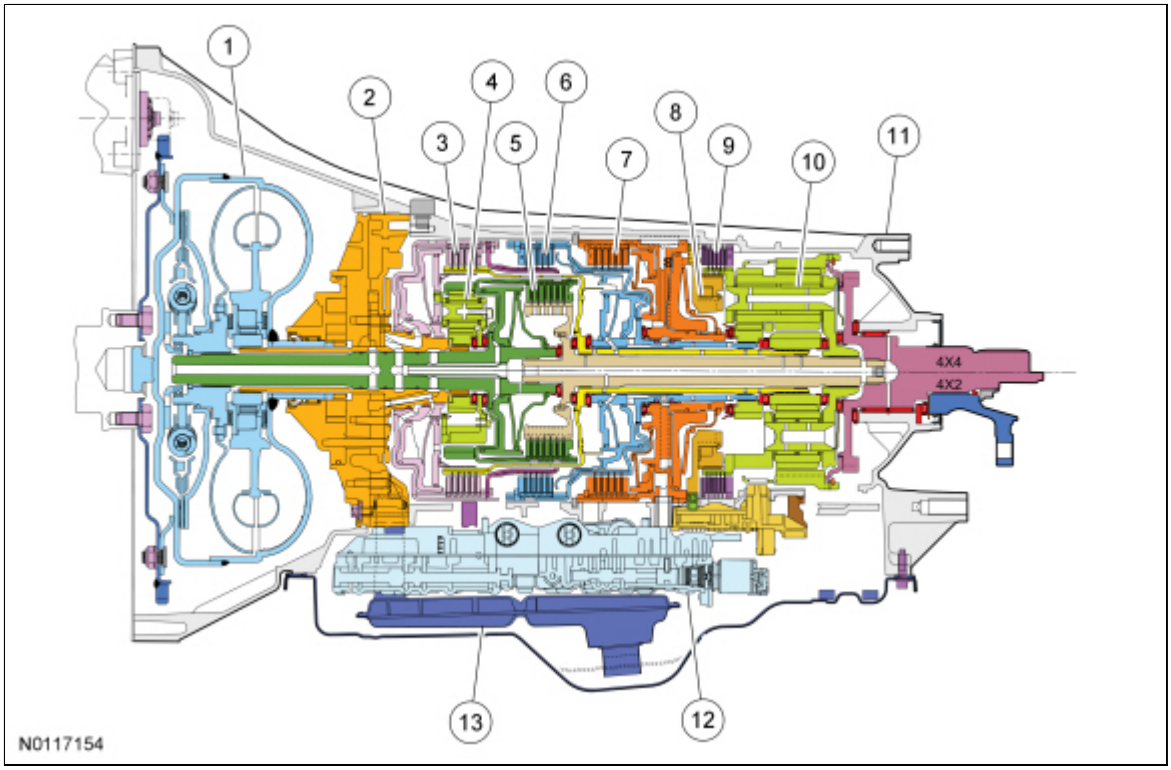
All transmission fluid that is picked up from the transmission fluid pan passes through the transmission fluid filter. The transmission fluid filter and its accompanying seal are part of the transmission fluid path from the pan to the transmission fluid pump.

Single Planetary Gearset

The single planetary gear overdrive carrier is driven by the input shaft. The single planetary gear set consists of the following components:

- One sun gear
- Four planetary gears meshing with the sun gear
- One planetary carrier
- One ring gear

Ravigneaux Planetary Gearset



The ravigneaux planetary gearset is splined to the output shaft and consists of the following components:

- Two sun gears of different sizes
- Three long planetary gear pinions meshing with the large sun gear and the ring gear
- Three short planetary gear pinions meshing with the small sun gear and the long pinions
- One planetary carrier
- One ring gear

Output Shaft

The output shaft provides torque to the driveshaft and rear axle assembly. It is splined to the ring gear of the rear/ravigneaux planetary gearset.

Mechanical Components and Functions

Planetary Gearset

This transmission has 2 planetary gearsets (front and rear) to provide operation in reverse and 6 forward speeds.

The front planetary gearset is a single planetary gearset and has the following components:

- Front planetary No. 1 sun gear
- Front planetary carrier
- Front planetary ring gear (part of the input shaft assembly)

The input shaft rotates the front ring gear as a driving member. The front sun gear is connected to the fluid pump and is held stationary. The front ring gear rotates the front planetary carrier assembly with a reduction ratio of 1.52:1.

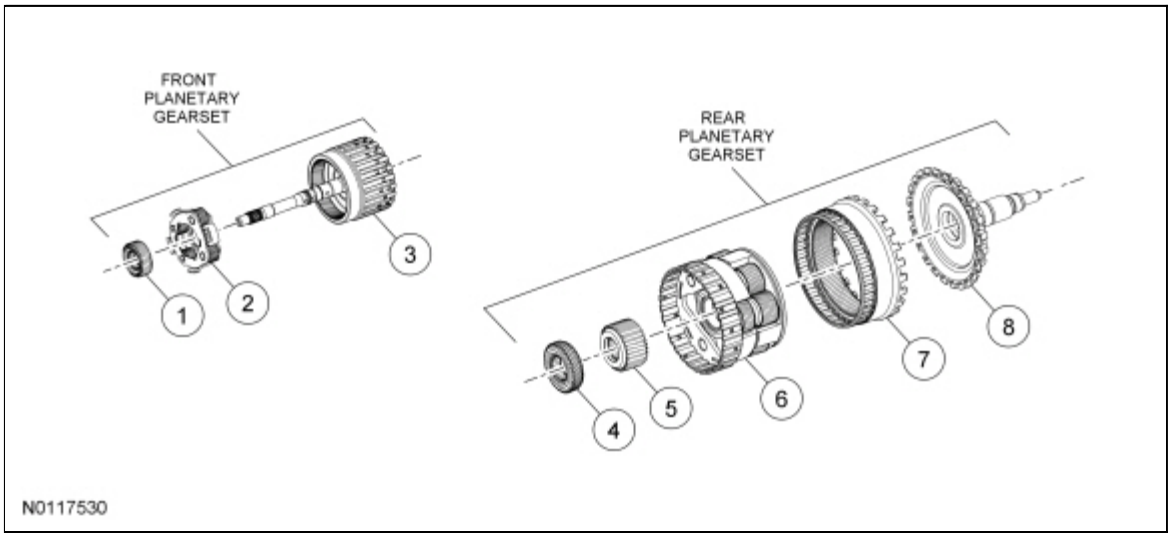
The front planetary carrier assembly is the only output member of the front planetary gearset in reverse, 1st, 2nd and 3rd gear. The front planetary gearset provides a 1.52:1 gear ratio to the rear planetary gearset.

In 4th and 5th gear, both the front ring gear and front planetary carrier assembly are output members of the front planetary gearset. The front planetary gearset provides both a 1:1 and 1.52:1 gear ratio to different members of the rear planetary gearset.

In 6th gear, the front ring gear is the only output member of the front planetary gearset. The front planetary gearset provides a 1:1 gear ratio to the rear planetary gearset.

The rear planetary gearset is a ravigenaux planetary gearset and has the following components:

- Rear planetary No. 2 sun gear
- Rear planetary No. 3 sun gear
- Rear planetary carrier assembly (2 sets of pinion gears)
- Rear planetary ring gear assembly



Power flow through the rear planetary gearset is as follows:

- In reverse, rear sun gear No. 2 is driven, the rear planetary carrier is held and the ring gear is the output (2.24:1 with reverse direction)
- In 1st gear, sun gear No. 3 is driven, the rear planetary carrier is held and the ring gear is the output (2.74:1)
- In 2nd gear, sun gear No. 3 is driven, sun gear No. 2 is held and the ring gear is the output (1.54:1)
- In 3rd gear, sun gear No. 3 and sun gear No. 2 are driven and the ring gear is the output (1:1)
- In 4th gear, sun gear No. 3 and the rear planetary carrier are driven and the ring gear is the output (1.14:1)
- In 5th gear, sun gear No. 2 and the rear planetary carrier are driven and the ring gear is the output (0.87:1)
- In 6th gear, the rear planetary carrier is driven, sun gear No. 2 is held and the ring gear is the output

repair4less

Forward Clutch (A)

The forward clutch (A) connects the front planetary carrier to the rear No. 3 sun gear. This provides a gear reduction ratio of 1.52:1 from the input shaft to rear sun gear No. 3. The forward clutch (A) is applied in 1st, 2nd, 3rd and 4th gears.

Regulated hydraulic pressure from the regulator valve in the valve body pushes the forward clutch (A) piston against the forward clutch (A) pack to apply the clutch. The front planetary carrier and the rear No. 3 sun gear are connected as a result of the clutch being applied.

Forward Clutch (A) Exploded View

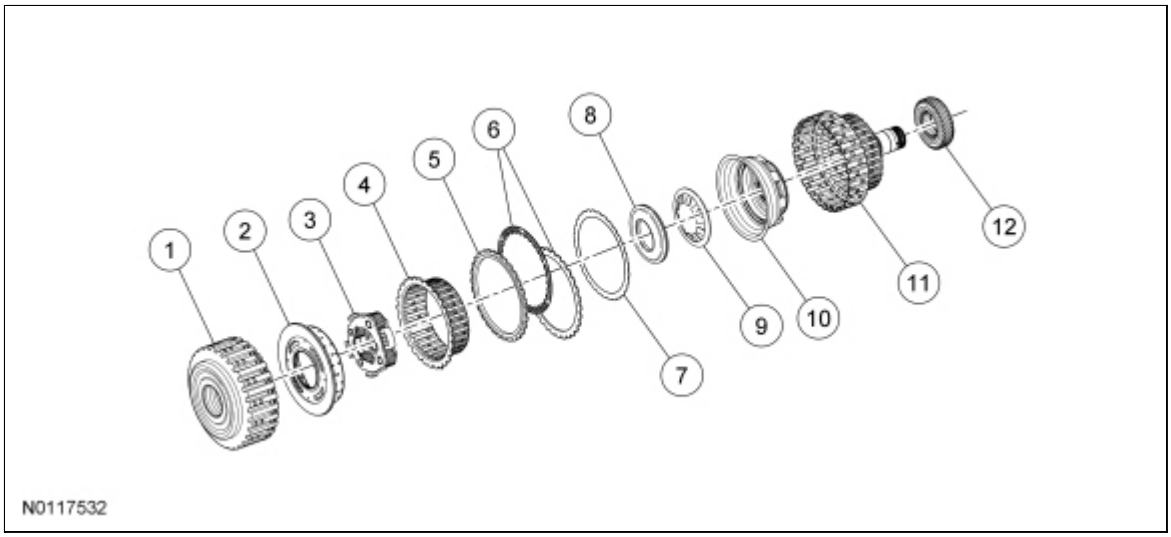
10	Rear planetary No. 3 sun gear



Direct Clutch (B)

The direct clutch (B) connects the front planetary carrier to the rear No. 2 sun gear. This provides a gear reduction ratio of 1.52:1 from the input shaft to rear sun gear No. 2. The direct clutch (B) is applied in reverse, 3rd and 5th gears.

Regulated hydraulic pressure from the regulator valve in the valve body pushes the direct clutch (B) piston against the direct clutch (B) pack to apply the clutch. The front planetary carrier and the rear No. 2 sun gear are connected as a result of the clutch being applied.

Direct Clutch (B) Exploded View

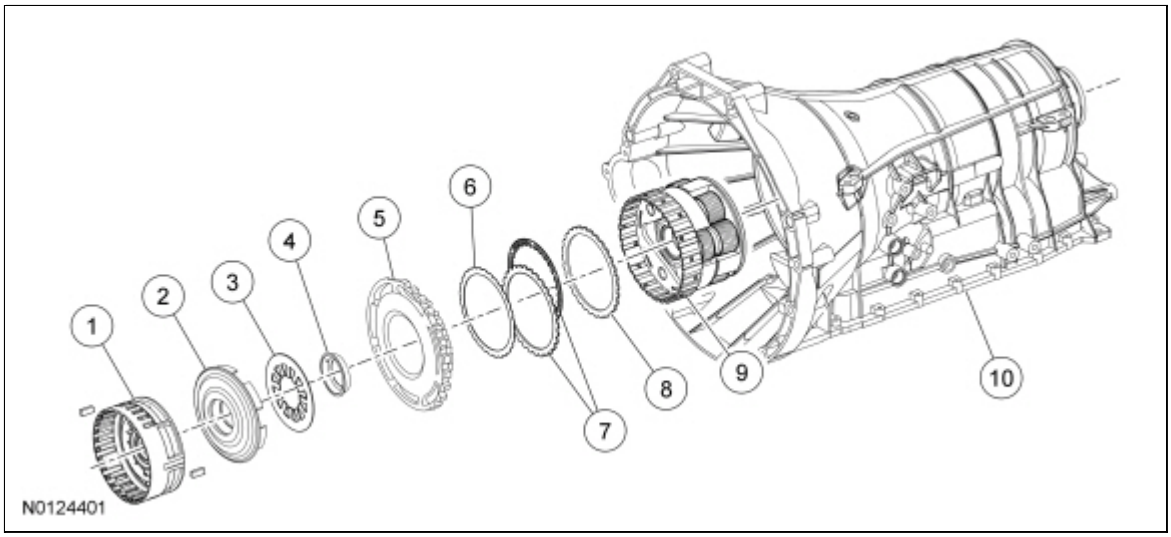
9	Transmission case

Low/Reverse Clutch (D) and Low/One-Way Clutch (OWC)



The low/reverse clutch (D) holds the rear planetary carrier stationary to the transmission case. The low/reverse clutch (D) is applied in park, reverse, neutral and 1st gear below 5 kph (3 mph).

Regulated hydraulic pressure from the regulator valve in the valve body pushes the low/reverse clutch (D) piston against the low/reverse clutch (D) pack to apply the clutch.

The low/ OWC is a brake clutch that holds the rear planetary carrier in one direction and allows it to freewheel in the opposite direction eliminating engine braking in 1st gear when the transmission is in drive, above 5 kph (3 mph) only.

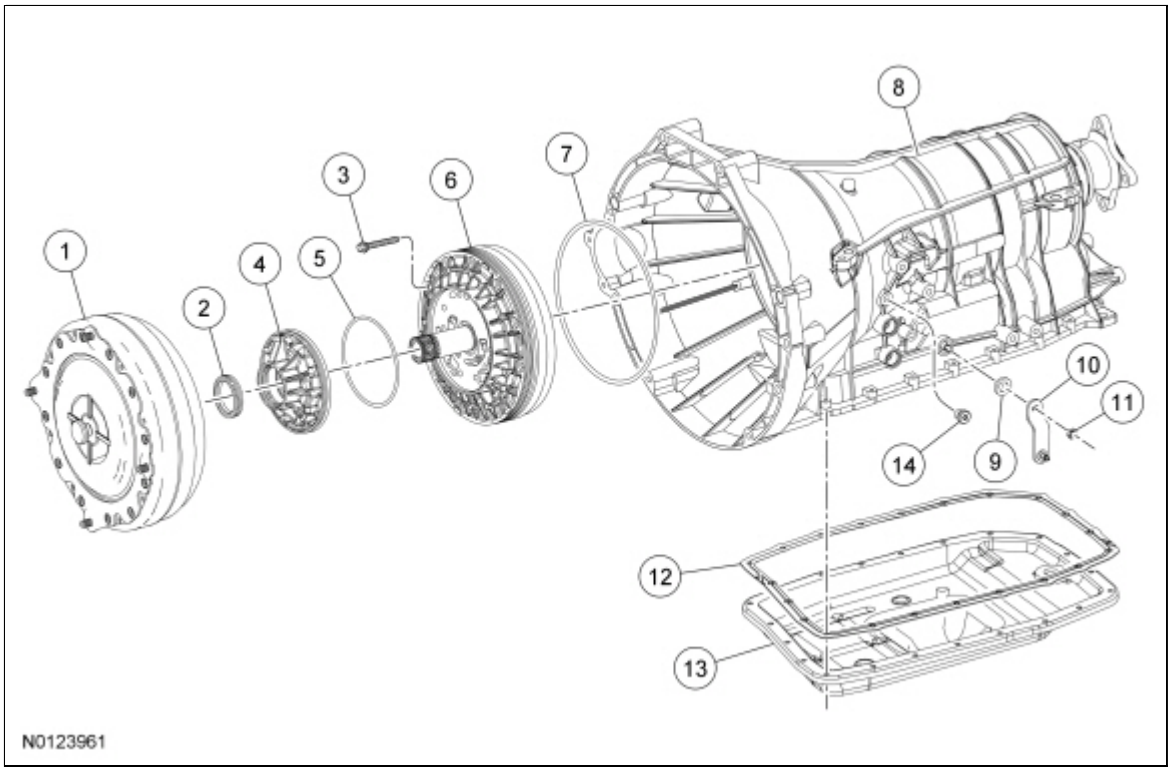
External Sealing

The pump assembly has a lip-type seal for the torque converter impeller hub. The pump assembly uses a large O-ring to seal the transmission case. The pump bolts also seal the pump to the transmission case.

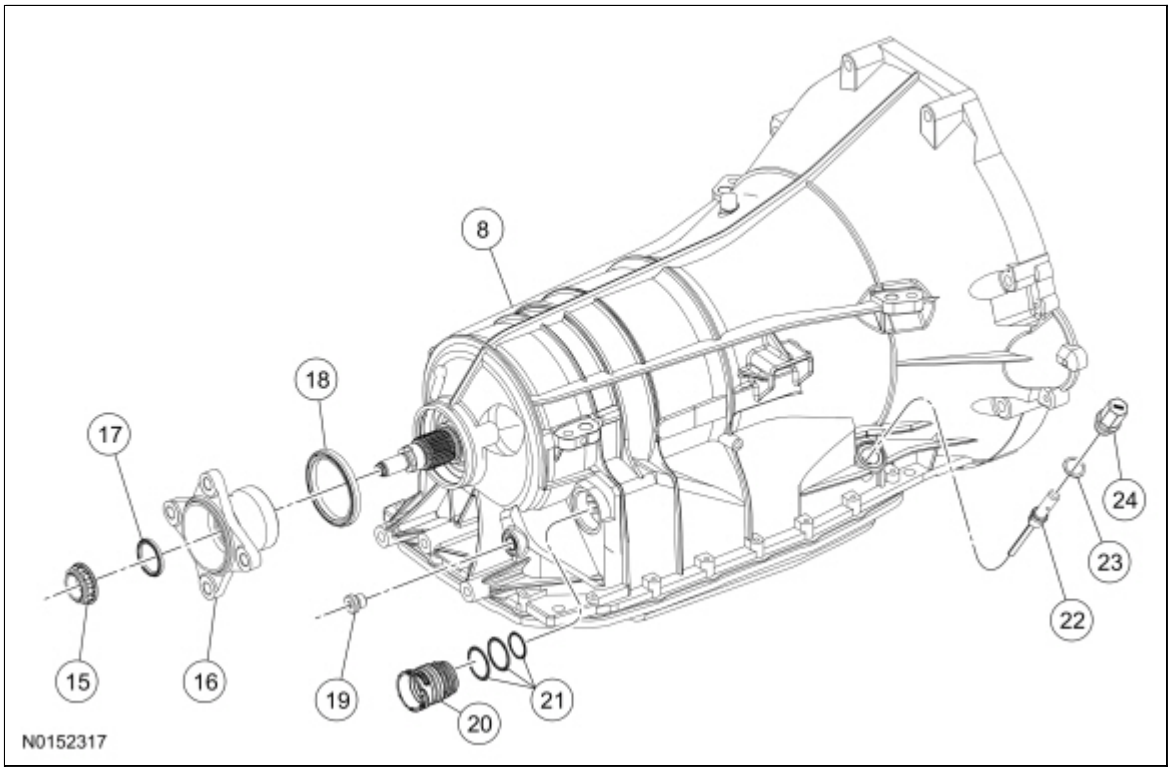
The manual control lever shaft has a lip seal for its bore in the transmission case.

The transmission fluid pan uses a reusable gasket.

The output shaft flange has a lip-type seal that seals the flange to the transmission case.



The transmission case plug provides access to the park pawl shaft. The plug has a seal that is serviced as an assembly with the plug.



The transmission bulkhead connector sleeve has seals for the transmission case bore.

The plug for the fluid level indicator uses an O-ring seal.

Bushings, Bearings and Thrust Washer Locations

This transmission supports the rotating components of the transmission with bushings, bearings and thrust washers.

The pump assembly support thrust washer controls the amount of end play for components between the pump assembly and the center support (forward/overdrive clutch assembly, direct clutch cylinder).

The T8 thrust bearing outer race controls the amount of end play for components between the center support and the rear of the transmission case (rear planetary gearset assembly, output shaft assembly).

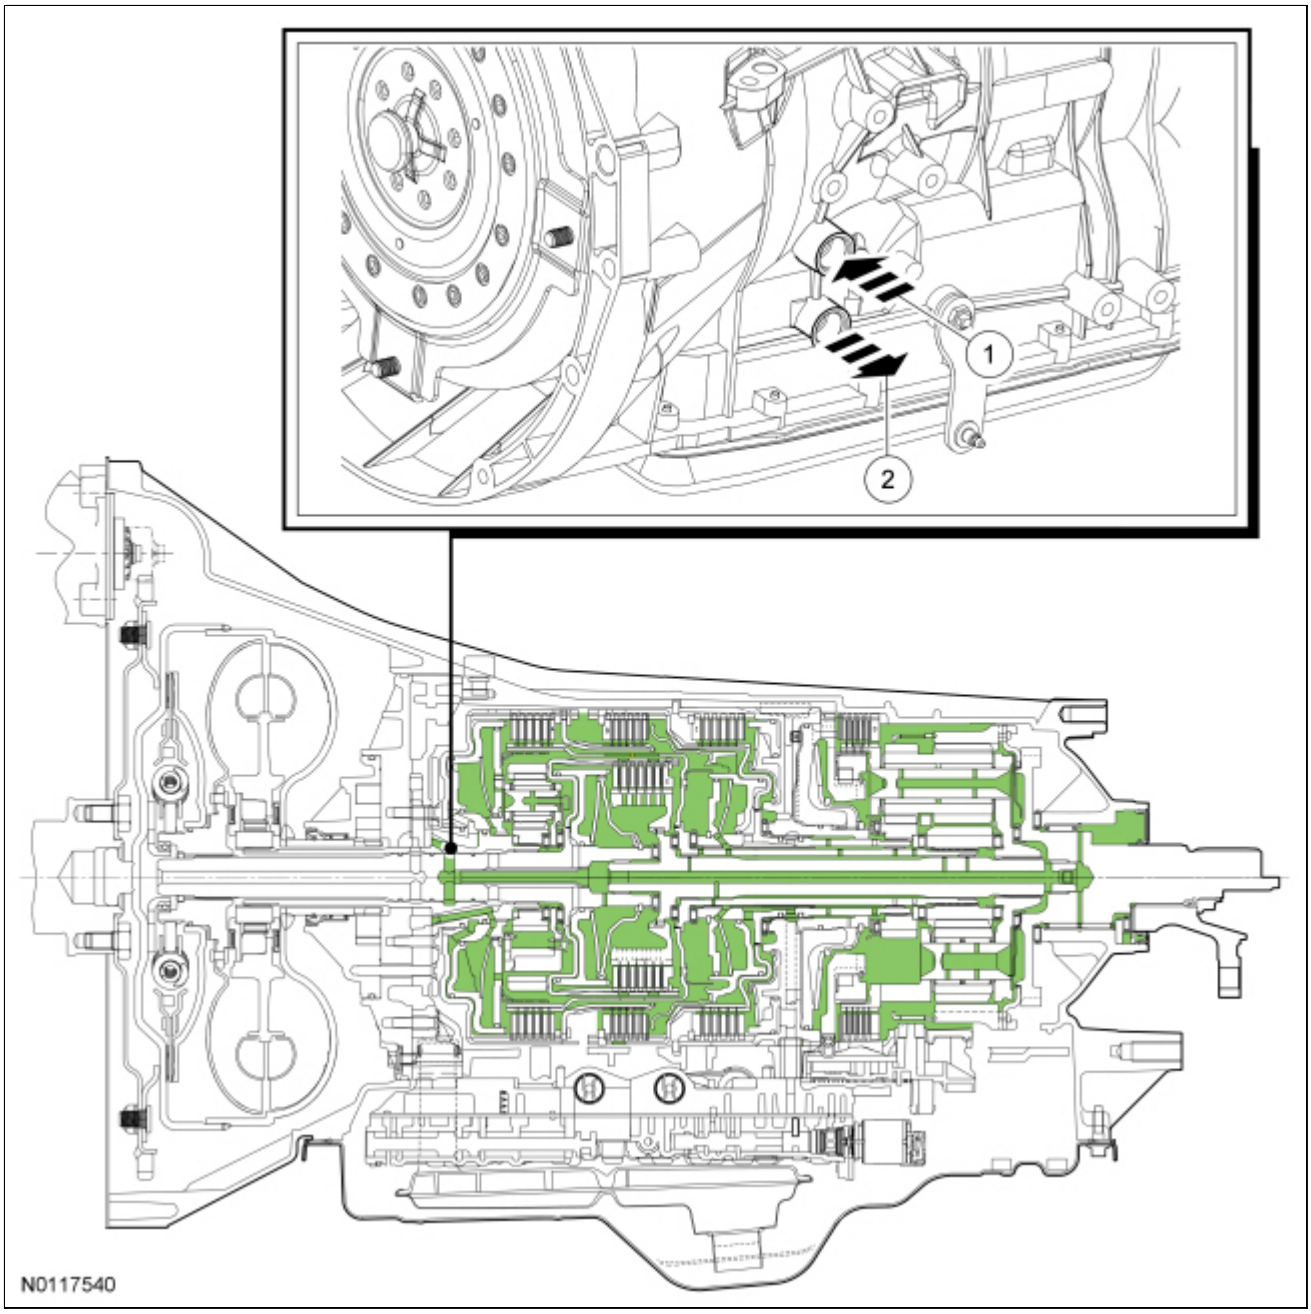
21	Thrust bearing T12 (early build RWD)

Lubrication

This transmission provides lubrication for rotating mechanical components through one main hydraulic circuit. The general flow of lubrication moves from the front of the transmission, through the input and intermediate shafts, to the rear of the transmission.

Transmission fluid from the pump assembly and the torque converter exit the transmission case to go to the transmission fluid cooler through the bottom of the transmission fluid cooler tube and returns to the transmission through the top of the transmission fluid cooler tube.



With lower transmission fluid temperatures, the thermal bypass valve in the transmission case bypasses the transmission fluid cooler tubes and redirects the fluid to the lubrication circuit. As transmission fluid temperature increases, the thermal bypass valve directs the fluid to the transmission fluid cooler.

Transmission fluid from the transmission fluid cooler or the thermal bypass valve enters the main lubrication circuit from the top of the transmission fluid cooler tube port.

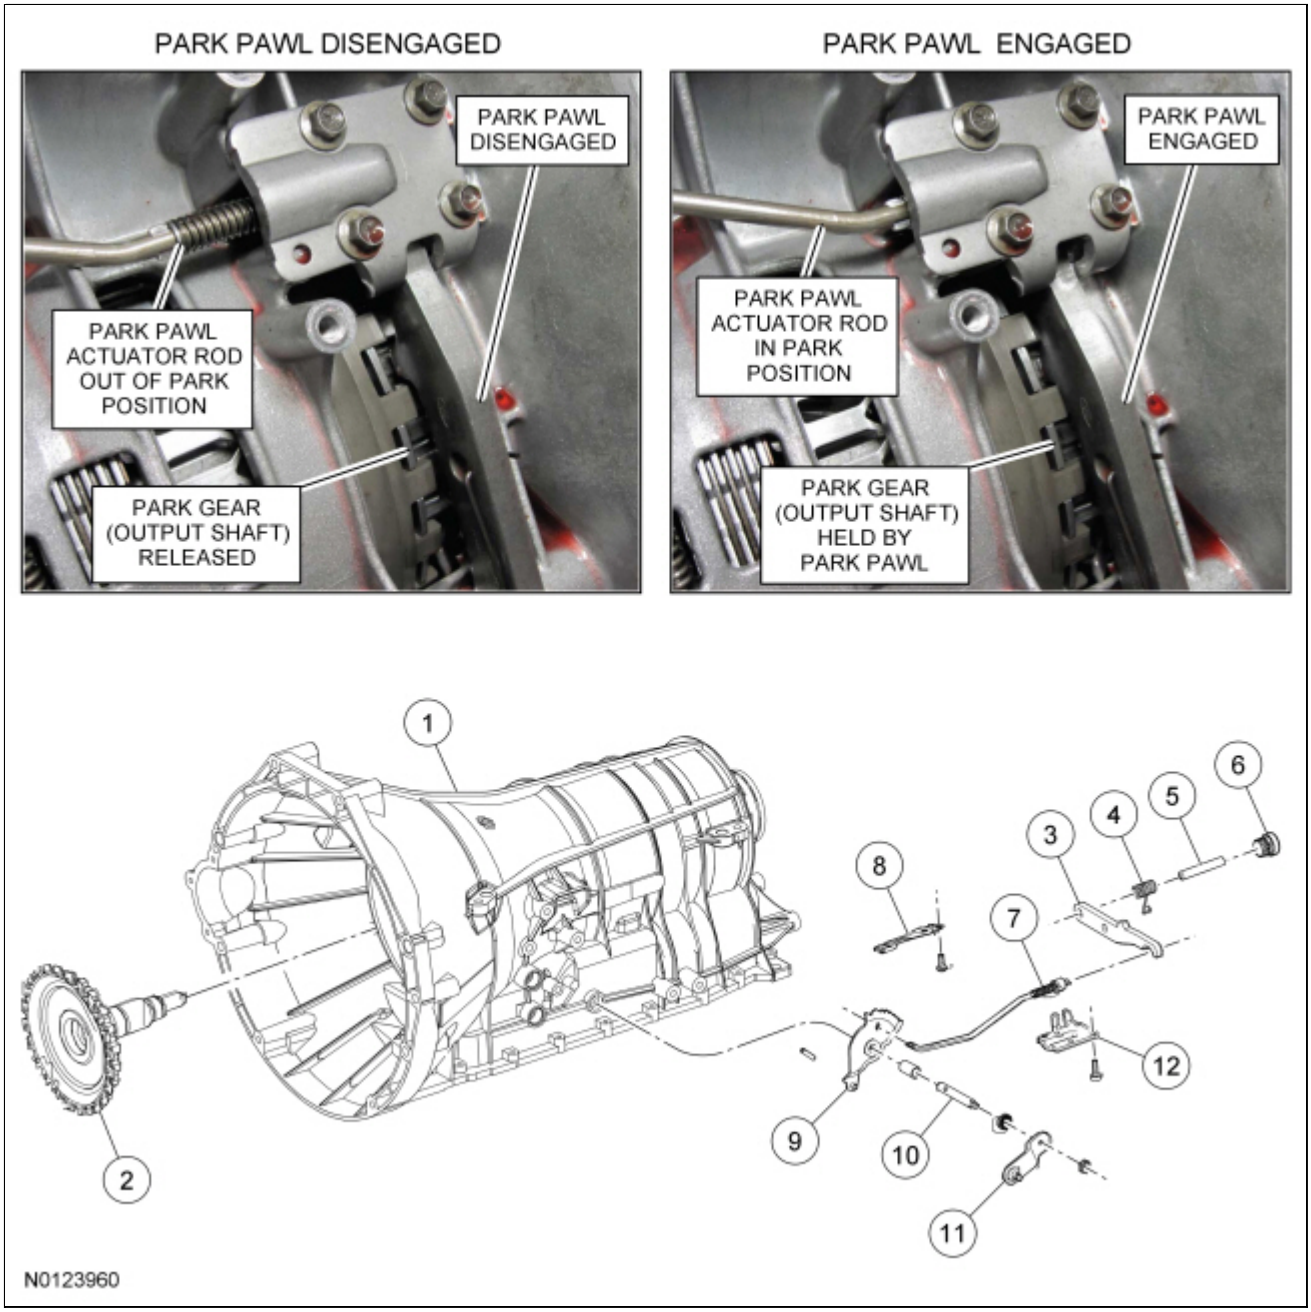
Transmission fluid in the lubrication circuit flows to each of the balance pistons for the forward (A), direct (B) and overdrive (E) clutches. The balance pistons prevent unwanted clutch application when the clutch cylinder rotates at high speeds and hydraulic controls have released the clutch.

Lubrication Passages

repair4less

Item	Description
1	Transmission fluid cooler return (inlet from the transmission fluid cooler)
2	Transmission fluid cooler pressure (outlet to the transmission fluid cooler)

Park



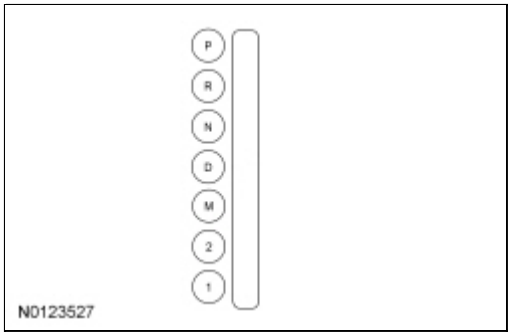
The park gear is part of the output shaft assembly. The park gear has lugs on its overdrive surface that the park pawl engages to lock the output shaft.

The park lock prevents the vehicle wheels from rotating by allowing the transmission case to hold the output

shaft stationary through the park pawl. When the park pawl is engaged in the park gear, the output shaft is held stationary.

When the manual control lever is rotated to the PARK position, the park lock works as follows:

- The detent assembly (connected to the manual control shaft) rotates and pushes the park pawl actuator rod into the park pawl. The actuator rod is spring loaded.
- The actuator rod is guided into the park pawl by the park pawl abutment.
- When the park pawl actuator rod is pushed into the park pawl, the park pawl pivots into the park gear and engages with the lugs.
- The park pawl holds the output shaft to the transmission case.



repair4less

12	Park rod actuating plate

Range Selection

The transmission has 7 range positions: P, R, N, D, M, 2 and 1.

Park

In the PARK position:

- there is no power flow through the transmission.
- the park pawl locks the output shaft to the case.
- the engine can be started.
- the ignition key can be removed.

Reverse

In the REVERSE position:

- the vehicle can be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine can be started.

D Position

repair4less

The D is the normal position for most forward driving.

The D position provides:

- automatic shifts 1-6 and 6-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.
- engine braking in all gears.

Position M — SelectShift™

This position provides:

- manual control of the transmission.
- engine braking.

Position 3— 3rd Gear (column-shift only) (For vehicles without SST)

This position provides:

- manual 3rd gear.

Position 2 — 2nd Gear

This position provides:

- manual 2nd gear.

Position 1 — 1st Gear

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

Gear Availability

MANUAL LEVER POSITION	TRANSMISSION GEAR OPERATION	DESCRIPTION
P	Park	Forward or reverse gears not available. Output shaft is held to the transmission case.
R	Reverse	Transmission allows reverse only.
N	Neutral	Forward or reverse gears not available. Output shaft moves freely.
D		6 forward gears are available. Gears are dependent on vehicle speed and throttle position with coast braking.
D Tow/Haul		1st through 6th gears are available. The shift scheduling is altered for higher shift speeds for a given throttle position. Transmission provides engine braking.
D Range Select		All gears available. Driver has the option to lockout higher gears by pressing "–" on the selector lever. Driver can also enable higher gears that have been locked out by pressing "+". Transmission automatically shifts through lower gears that have not been locked out.
M SelectShift™		All gears available upon driver request. Driver has the ability to shift the transmission using the "+" "–" switches on the selector lever.
2		2nd gear hold, no upshift. Downshift to 2nd gear when 2 position is selected above a calibrated speed.
1		1st gear hold with engine braking, no upshift. The transmission downshifts to 1st gear when 1 is selected above a calibrated speed under minimum to moderate accelerator pedal position.

N0123952

repair4less

Shift Patterns

Downshifts

Under certain conditions, the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

repair4less

Torque Converter

The torque converter is a 4-element unit containing a 2-plate clutch. The clutch can be controlled and engaged in any gear, 2nd through 6th. Calibration parameters may be set to allow lockup in a higher gear only. The clutch is applied by removing fluid pressure from one side of the plate. The torque converter transmits and multiplies torque. The torque converter includes the following 4 elements:

- Impeller assembly
- Turbine assembly
- Reactor assembly
- Torque Converter Clutch (TCC)

Rotation of the torque converter housing and impeller set the transmission fluid in motion by driving the impeller blades and pump.

The turbine is driven by the transmission fluid from the impeller and transmits power to the input shaft.

The reactor redirects transmission fluid flow returned from the turbine to the impeller so that it rotates in the same direction as the impeller. This action assists in torque multiplication.

The reactor has a One-Way Clutch (OWC) to hold it stationary during torque multiplication and allows it to rotate at higher vehicle speeds.

Torque Converter Clutch (TCC)

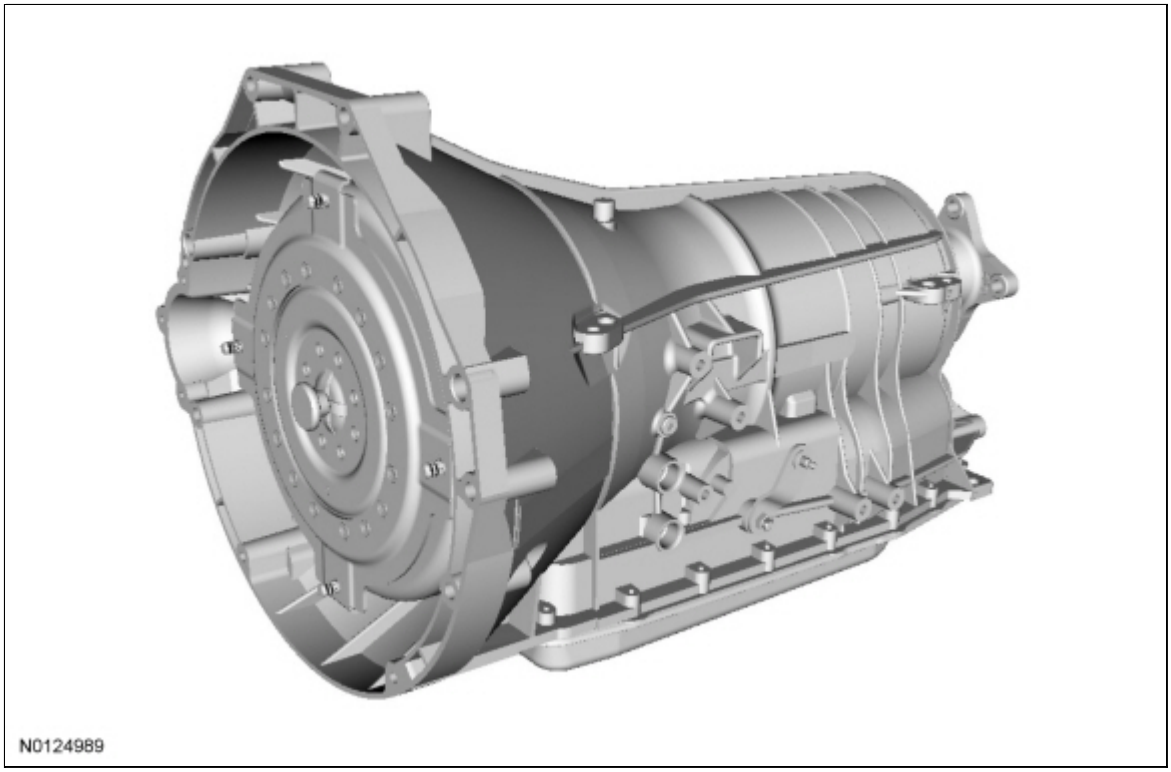
The TCC has a cover assembly with a 2-plate clutch and a turbine and damper assembly that connects to the transmission input shaft.

The TCC connects the cover to the turbine when the TCC is applied.

During TCC release, transmission fluid flows through the torque converter in one direction to release the 2-plate clutch.

During TCC apply, transmission fluid flows through the torque converter in the opposite direction to apply the 2-plate clutch.

The TCC operates in 3 stages:



- Full release
- Controlled modulation
- Full apply

The PCM controls TCC operation using the TCC solenoid. TCC solenoid operation provides the modulation of hydraulic pressure to change the position of the bypass clutch control regulator valve. The valve changes the pressure and direction of transmission fluid flow in the torque converter. TCC may be applied in forward gears, 2nd through 6th.

repair4less

Transmission Description

6R80 Transmission

N0124989

This transmission has the following features:

- Six forward speeds
- Torque converter with an integral converter clutch
- Electronic shift and pressure controls
- Single planetary gear set
- Double planetary gear set
- Two fixed multi-disc clutches
- Three multi-plate clutches
- One-Way Clutch (OWC)

Hydraulic functions are directed by electronic solenoids to control the following:

- Engagement feel
- Shift feel
- Shift scheduling
- Modulated Torque Converter Clutch (TCC) applications

The 6R80 transmission has a main control assembly which contains:

repair4less

- Turbine Shaft Speed (TSS) sensor
- Output Shaft Speed (OSS) sensor
- An internal Transmission Range (TR) sensor
- Transmission Fluid Temperature (TFT) sensor
- Line Pressure Control (LPC)
- TCC solenoid
- Five electronically controlled shift solenoids

Engine power reaches the transmission by a torque converter with an integral converter clutch. The 6 forward gears and one reverse gear are obtained from 2 planetary gearsets.

This 6-speed electronically controlled automatic transmission is comprised of a PCM, main control valve body assembly, torque converter, 1 solenoid valve and 6 pressure regulators. Gear selection is achieved by controlling transmission fluid to operate various internal clutches. The PCM operates the electrical components and provides for the control of gear selection and shift pressure, which increases refinement and torque converter slip.

In the event of a system fault, the PCM also provides for Failure Mode Effect Management to maintain maximum functional operation of the transmission with a minimum power reduction. In the event of a total loss of control or electrical power, the basic transmission functions park, reverse, neutral and drive are retained. Also 3rd or 5th gear is retained by the transmissions hydraulic system. The default gear retained is dependent upon the gear selected at the time of a failure.

Transmission Electronic Control System

Powertrain Control System

The PCM controls the electronic functions of this transmission. A plastic molded leadframe is bolted to the main control assembly. The leadframe contains the Turbine Shaft Speed (TSS), Output Shaft Speed (OSS), Transmission Fluid Temperature (TFT) and Transmission Range (TR) sensors.

The PCM receives input signals from engine and transmission sensors and uses these inputs to control line pressure, shift time, Torque Converter Clutch (TCC), and shift solenoids. The PCM also provides power and ground for the reverse lamp relay coil and provides a PARK/NEUTRAL start enable signal.

The following is a list of direct engine and driver inputs to the PCM along with module information from the vehicle Controller Area Network (CAN):

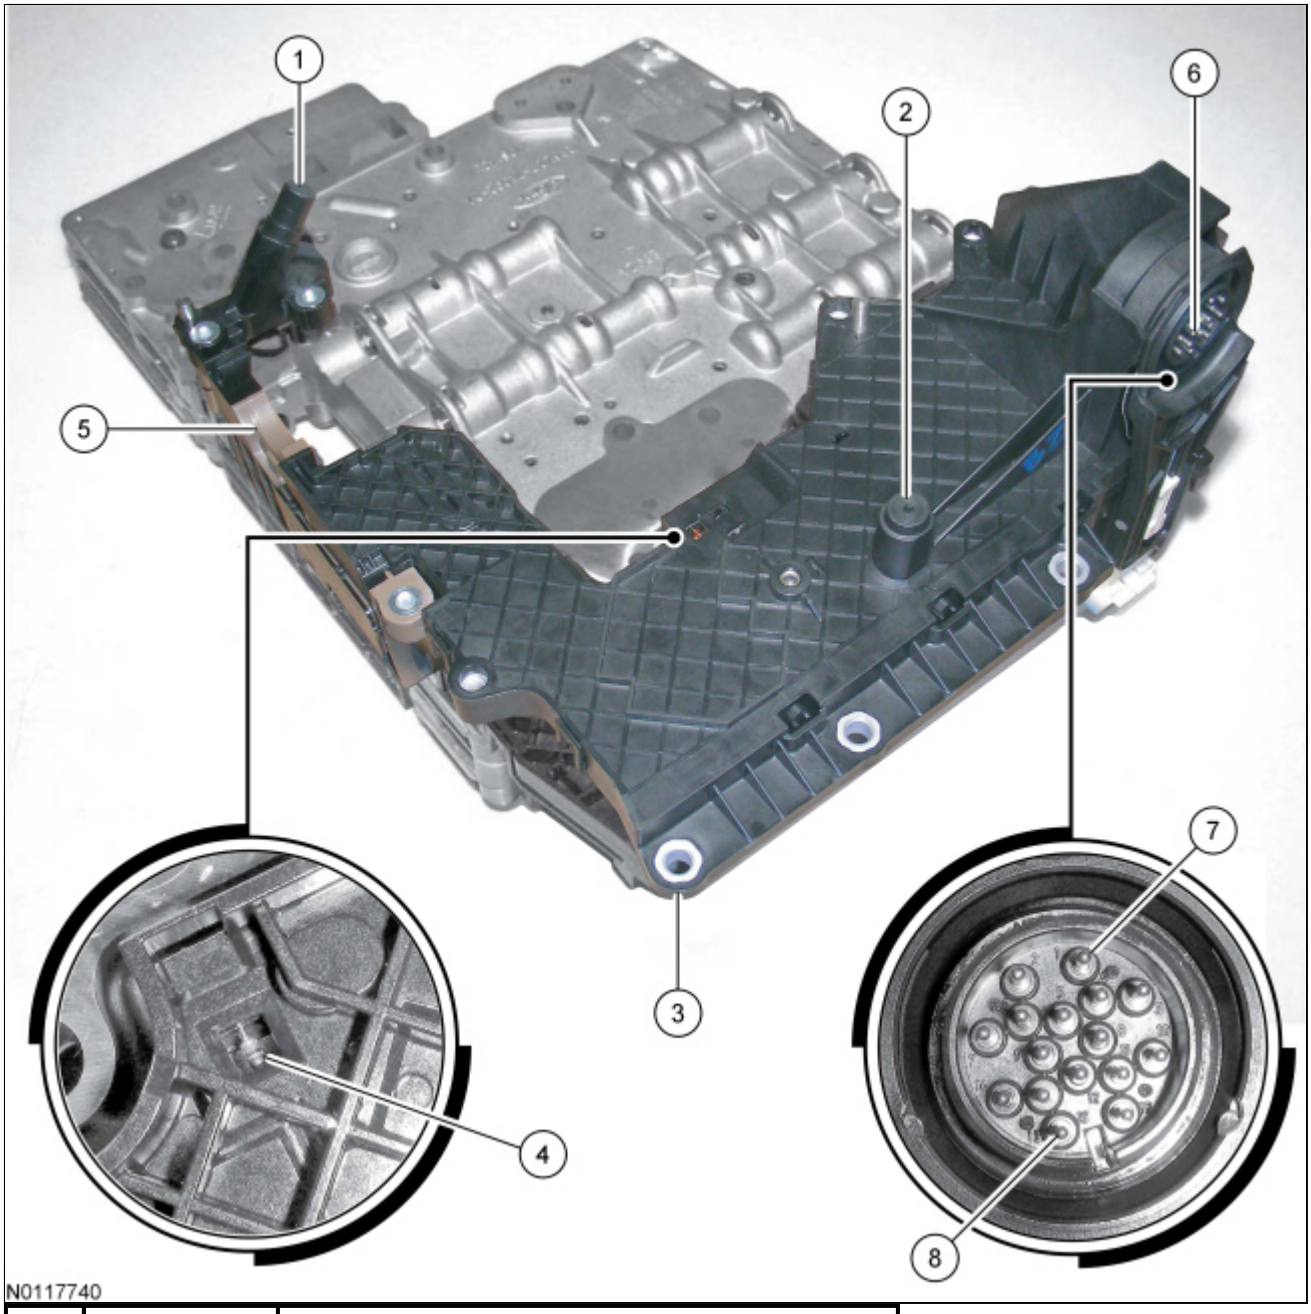
- Engine speed
- Engine torque
- Engine coolant temperature
- Throttle position
- Accelerator pedal
- Brake pedal
- ABS wheel speed
- Traction control status

The PCM also:

- monitors inputs and outputs for the presence of faults.
- stores DTCs related to detected faults.
- provides outputs on the CAN for transmission range, output shaft speed, turbine shaft speed, transmission fluid temperature, current gear and A/C inhibit.
- provides On-Board Diagnostic (OBD) information using the CAN to illuminate the Malfunction Indicator Lamp (MIL) or Transmission Control Indicator Lamp (TCIL).
- provides diagnostic information to a scan tool through the Data Link Connector (DLC).

If the PCM detects a system or component fault, it substitutes a default value or signal using Failure Mode and Effect Management strategies.

The PCM also uses Failure Mode and Effect Management strategies to compensate for electrical or mechanical shift solenoid and apply component faults that result in alternate shift patterns.



If the transmission loses complete electronic control, it operates in a fail-safe mode with:

- Maximum line pressure in all transmission ranges
- Functional PARK, REVERSE and NEUTRAL positions
- Operation in 3rd or 5th gear (depending on the failure conditions) when the selector lever is in the DRIVE, 3, 2 or 1 position

repair4less

- TCC is released in all transmission ranges and gears

Molded Leadframe

CB = Clutch brake

NC = Normally closed

NH = Normally high

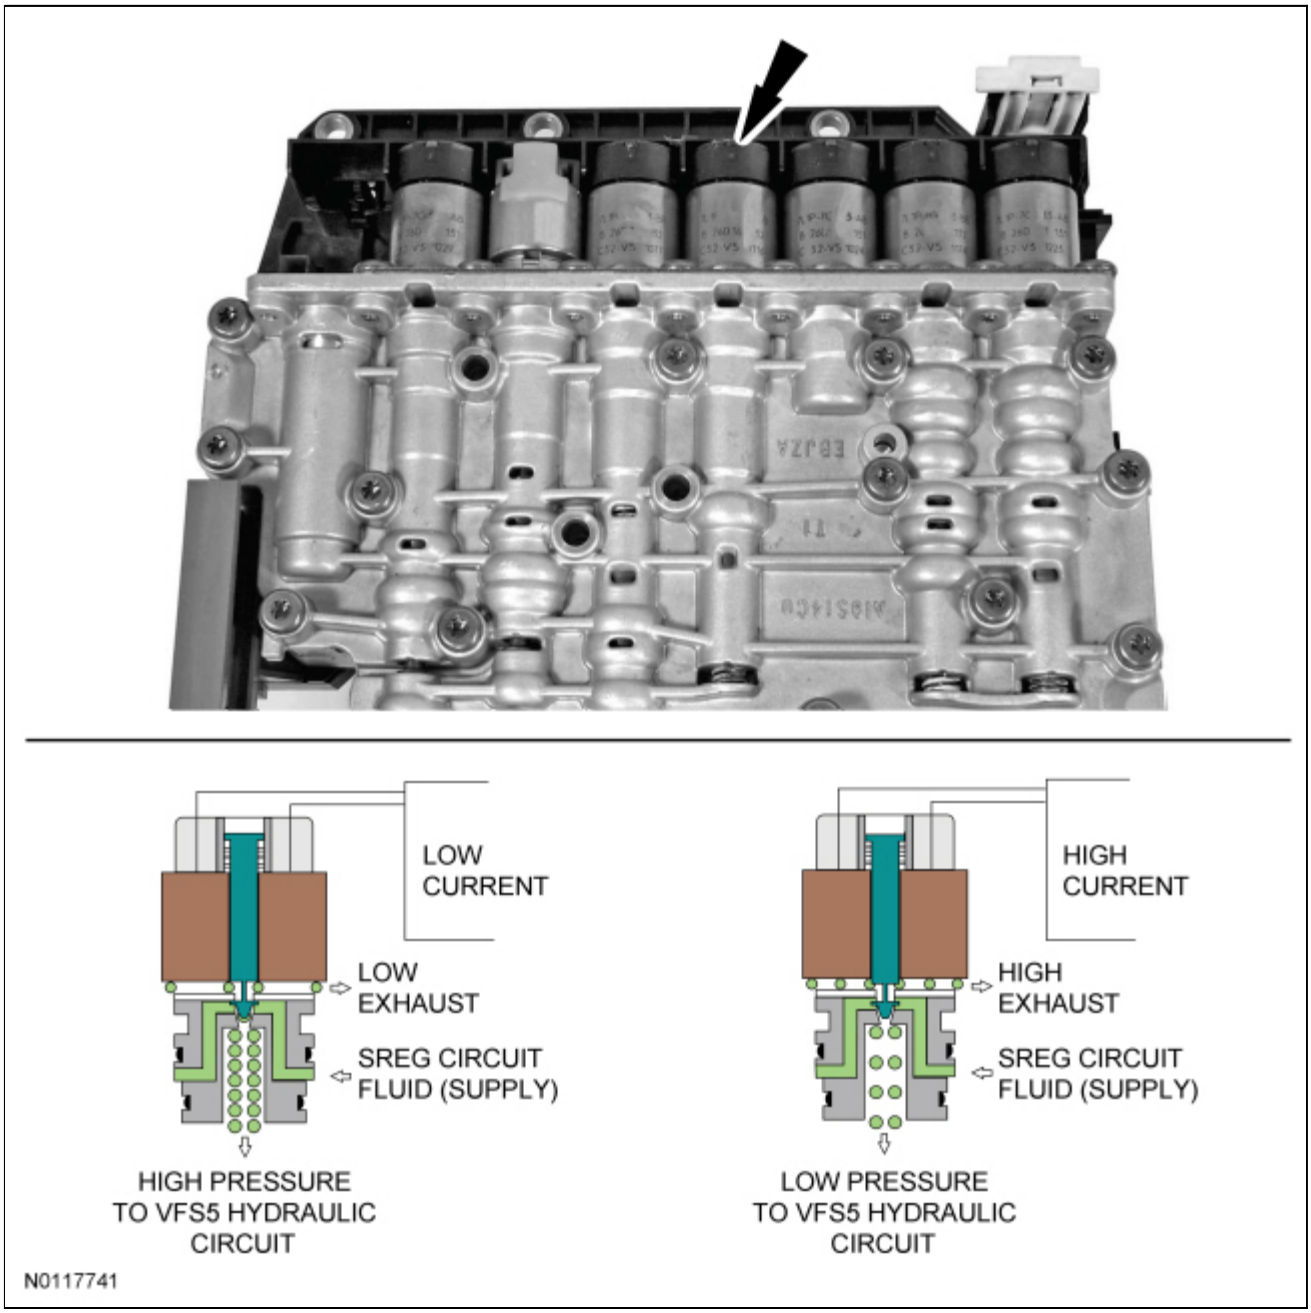
NL = Normally low

The following are brief descriptions of the sensors and actuators used to control transmission operation.

Line Pressure Control (LPC) Solenoid

The Line Pressure Control (LPC) solenoid, is a Variable Force Solenoid (VFS) that varies hydraulic pressure by actuating a hydraulic valve.

The PCM applies variable current to the LPC solenoid which varies pressure in the VFS5 hydraulic circuit to the main regulator valve. Refer to Hydraulic Circuits in this section.



The LPC solenoid uses inversely proportional operation. As the current from the PCM decreases, the pressure from the solenoid increases. As the current from the PCM increases, the pressure from the solenoid decreases. The LPC solenoid is supplied hydraulic pressure from the SREG circuit.

With zero current, the LPC solenoid fully opens the hydraulic valve which applies the maximum amount of hydraulic pressure to the main regulator valve through the VFS5 hydraulic circuit and applies maximum line

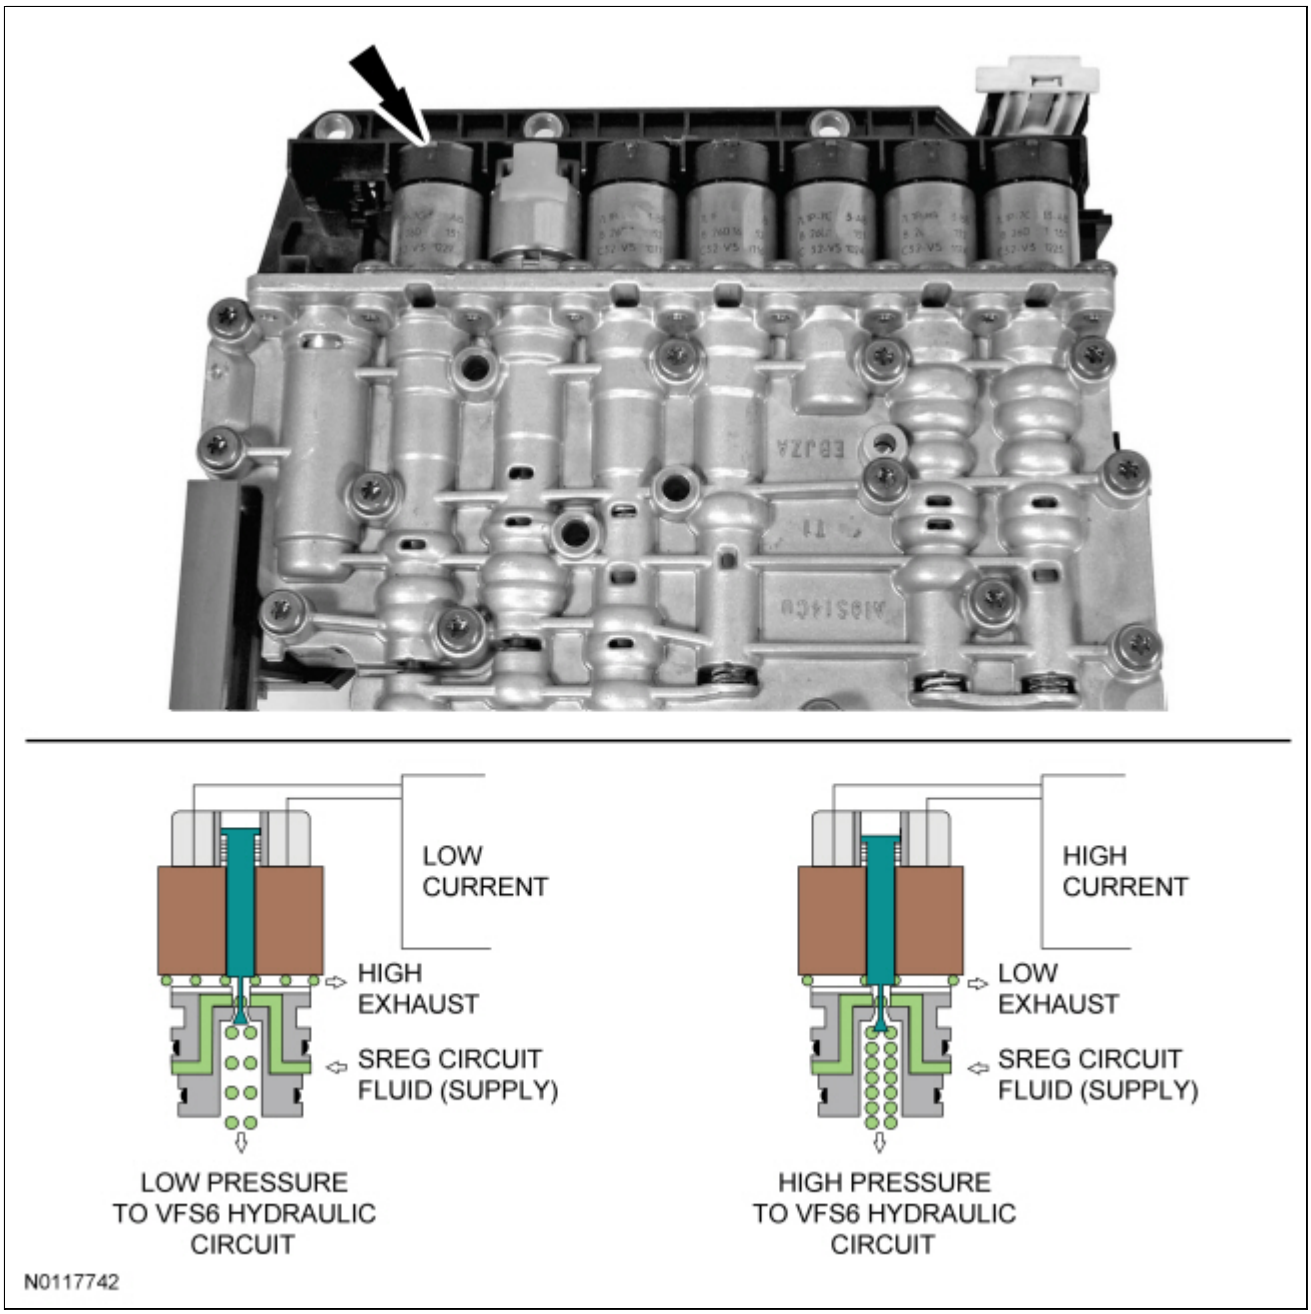
repair4less

pressure in the PUMP hydraulic circuit. With maximum current to the solenoid, the hydraulic valve fully closes the outlet port for minimum pressure to the VFS5 hydraulic circuit, lowering the line pressure in the PUMP hydraulic circuit.

LPC Inversely Proportional VFS

Torque Converter Clutch (TCC) Solenoid

The TCC solenoid is a VFS that varies hydraulic pressure by actuating a hydraulic valve.



The PCM applies variable current to the TCC solenoid which varies pressure in the VFS6 hydraulic circuit to the converter release regulator valve and the bypass clutch control regulator valve. Refer to Hydraulic

Circuits in this section.

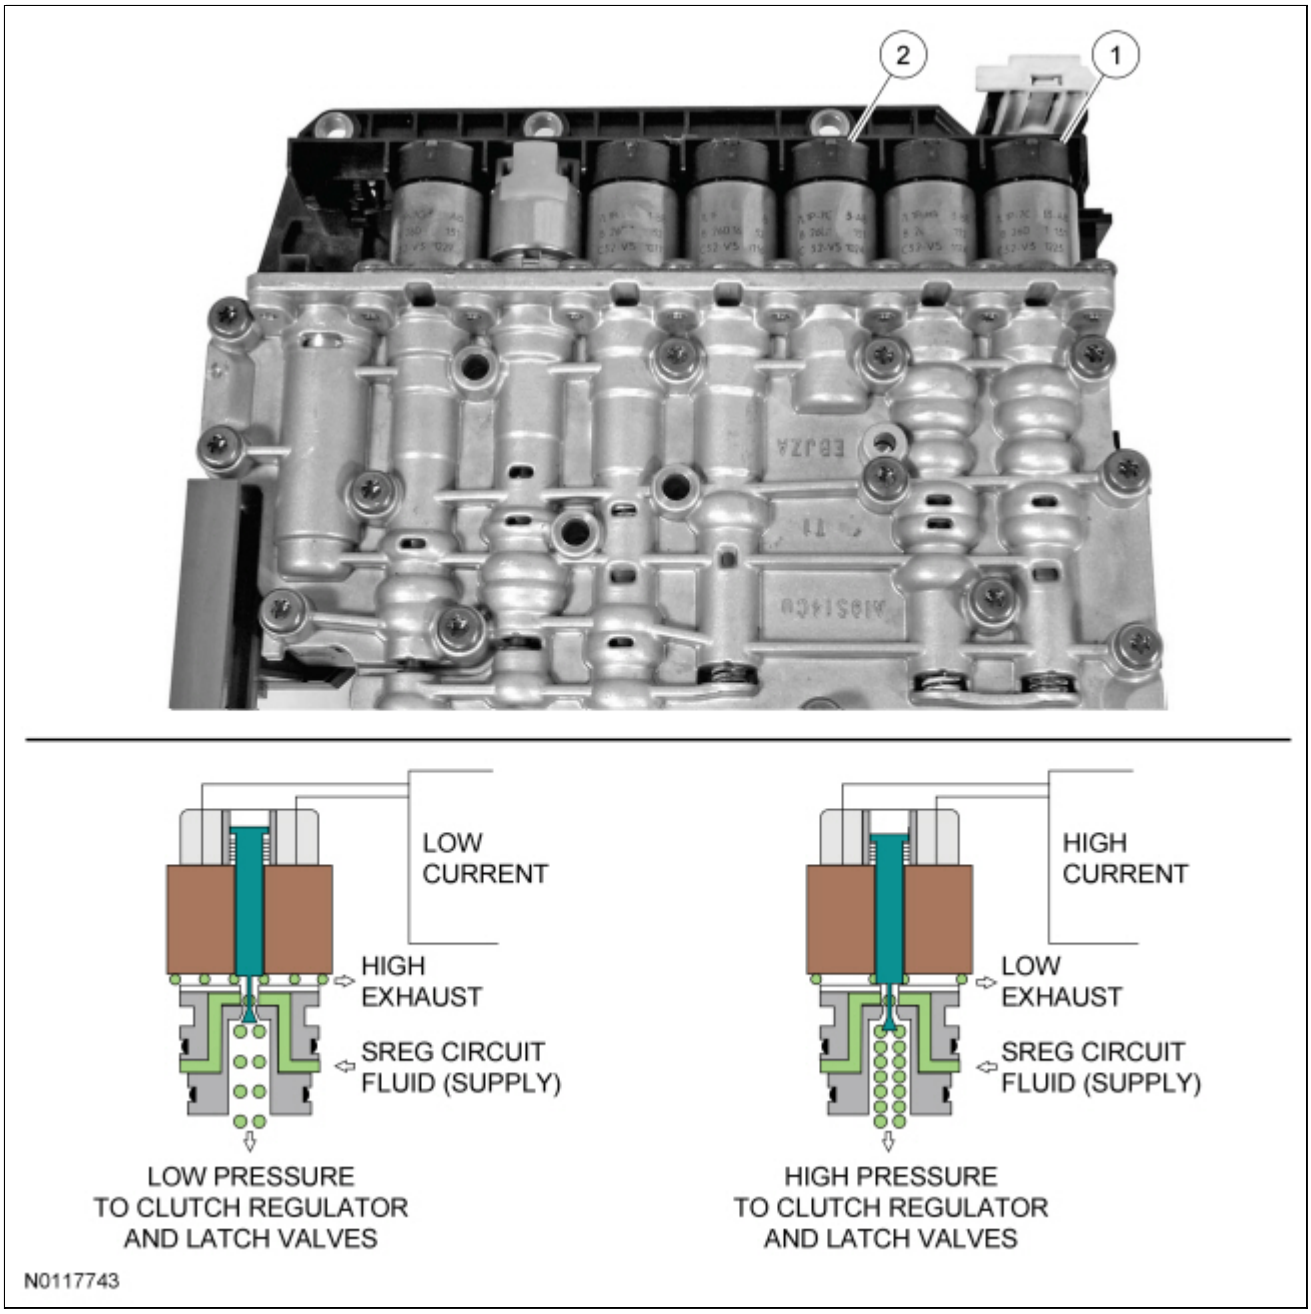
The TCC solenoid uses proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. The TCC solenoid is supplied hydraulic pressure from the SREG circuit.

With zero current, the TCC solenoid fully closes the hydraulic valve which applies the minimum amount of hydraulic pressure to the converter release regulator valve and the bypass clutch control regulator valve through the VFS6 hydraulic circuit and releases the TCC . With maximum current to the solenoid, the hydraulic valve fully opens the outlet port for maximum pressure to the VFS6 hydraulic circuit to apply the TCC .

Torque Converter Clutch (TCC) Proportional VFS

repair4less

Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC) and Shift Solenoid D (SSD)



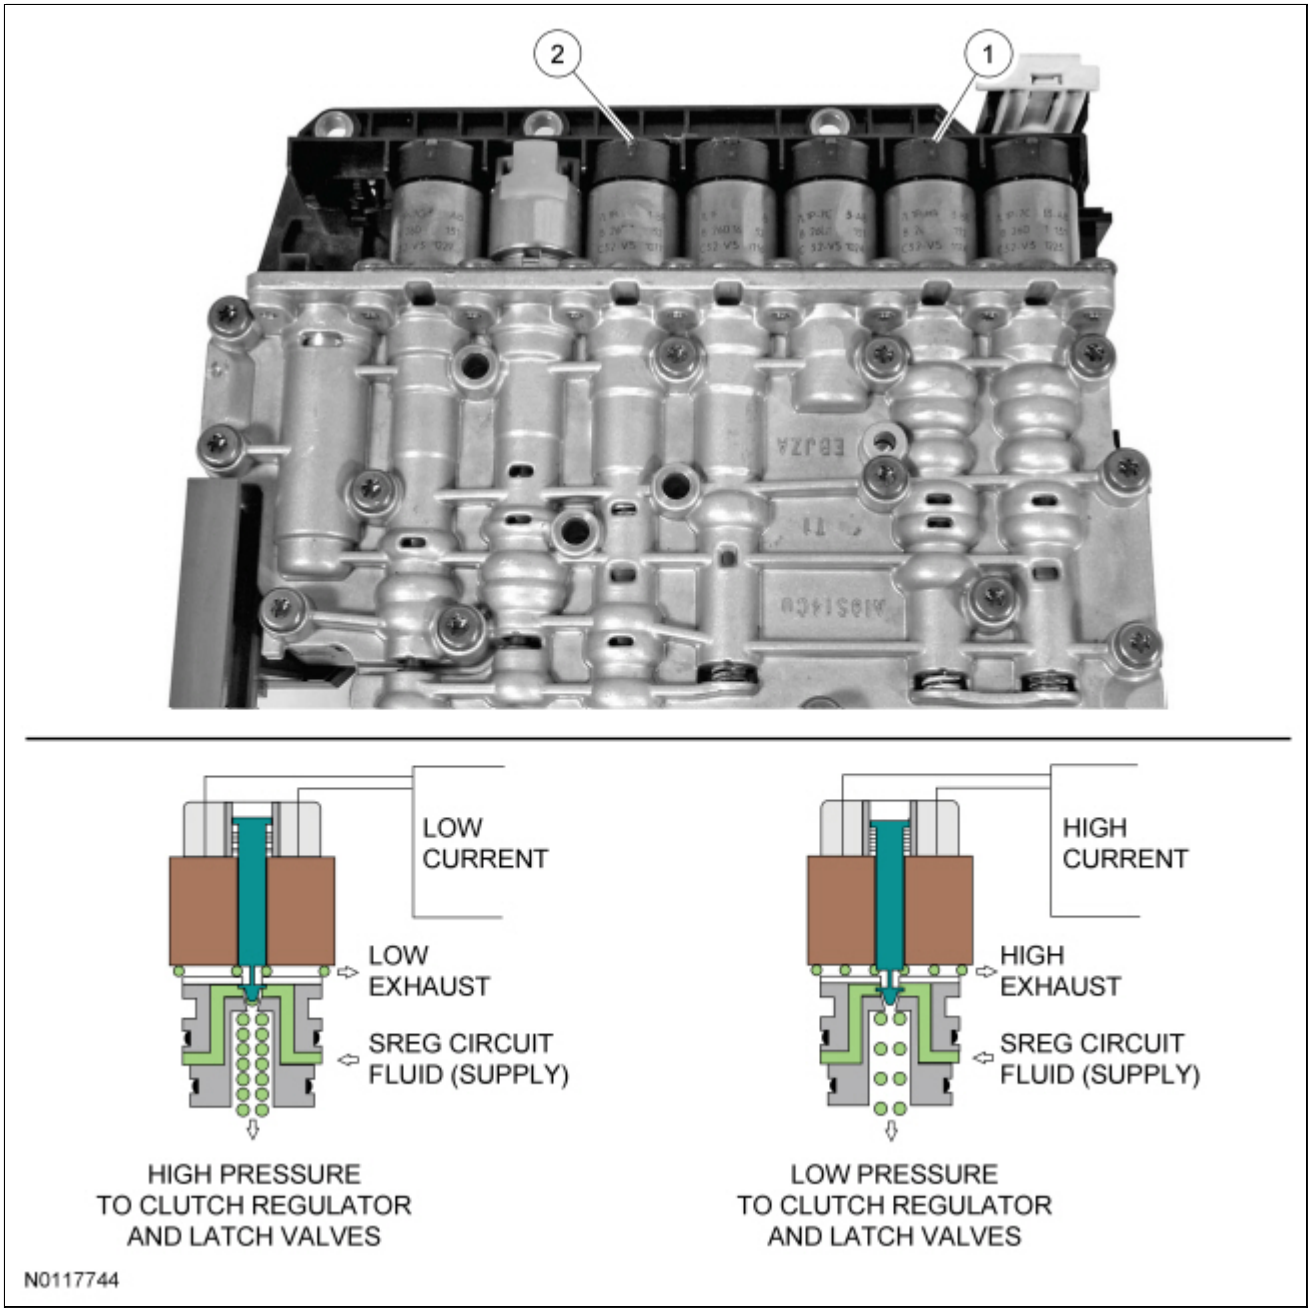
Shift solenoids A through D are VFS that vary hydraulic pressure by actuating a hydraulic valve.

The PCM applies variable current to the shift solenoids which varies pressure in the hydraulic circuit to the regulator and latch valves of the clutch that it controls. Refer to Hydraulic Circuits in this section.

SSA and SSC use proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. SSA and SSC are supplied hydraulic pressure from the SREG circuit.

With zero current, SSA and SSC fully close the hydraulic valves which applies zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch. With maximum current to the solenoids, the hydraulic valves fully open for maximum pressure to the regulator and latch valves to apply the clutch.

Shift Solenoid A (SSA) and Shift Solenoid C (SSC) Proportional VFS



Item	Description
1	Shift Solenoid A (SSA) Variable Force Solenoid (VFS)
2	Shift Solenoid C (SSC) VFS

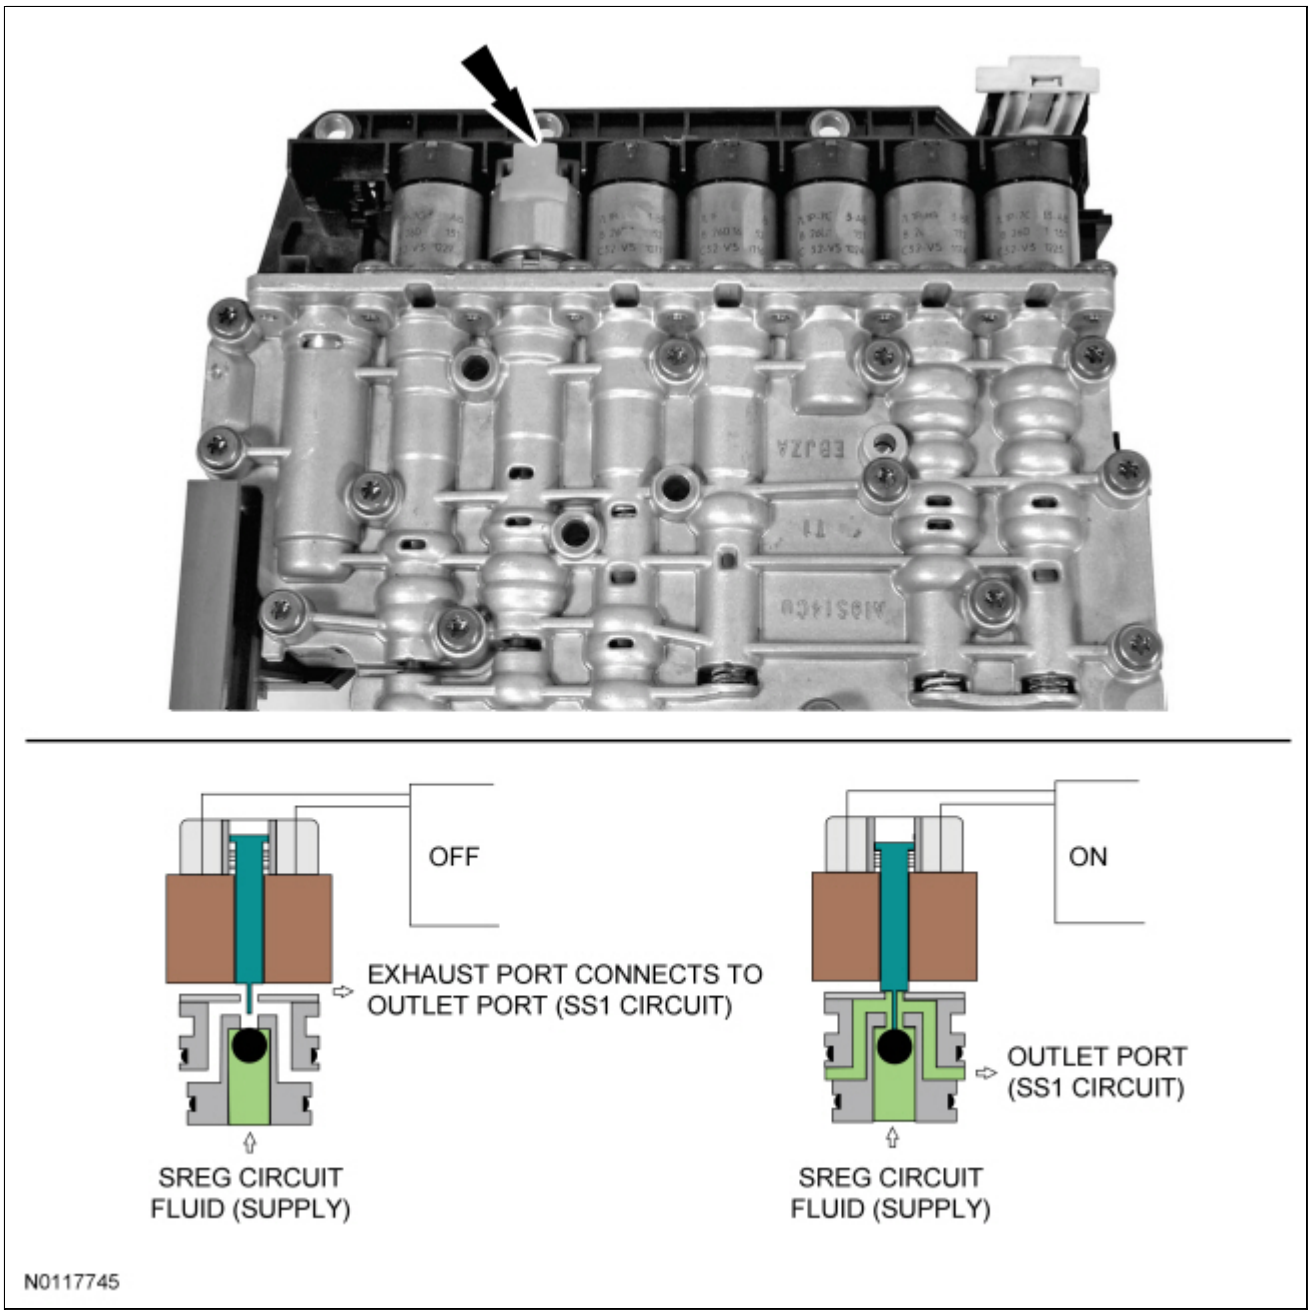
SSB and SSD use inverse proportional operation. As the current from the PCM decreases, the pressure from the solenoid increases. As the current from the PCM increases, the pressure from the solenoid decreases. SSB and SSD are supplied hydraulic pressure from the SREG circuit.

With zero current, SSB and SSD fully open the hydraulic valves which applies maximum hydraulic pressure to the regulator and latch valves to apply the clutch that it controls. With maximum current to the solenoids, the hydraulic valve fully closes to apply zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch.

repair4less

Shift Solenoid B (SSB) and Shift Solenoid D (SSD) Inverse Proportional VFS

Item	Description
1	Shift Solenoid B (SSB) Variable Force Solenoid (VFS)
2	Shift Solenoid D (SSD) VFS



Shift Solenoid E (SSE)

SSE is an ON/OFF solenoid. When SSE is in the OFF position, SSD controls the regulator and latch valves to apply the low/reverse clutch. When SSE is in the ON position, SSD controls the regulator and latch valves

to apply the overdrive (456) clutch. Refer to Hydraulic Circuits in this section.

SSE is supplied hydraulic pressure from the SREG circuit. When SSE is OFF, the solenoid supply is blocked and the outlet port (SS1 circuit) is connected to the exhaust port. When SSE is ON, the exhaust port is blocked and the solenoid supply is connected to the outlet port (SS1 circuit).

Shift Solenoid E (SSE) ON/OFF Solenoid

Turbine Shaft Speed (TSS) Sensor

The TSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the forward (1,2,3,4) clutch cylinder varies.

repair4less

The PCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter.

The PCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The PCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the TSS sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TSS sensor.

Output Shaft Speed (OSS) Sensor

The OSS sensor is a Hall-effect type sensor that provides a signal to the PCM that changes in frequency as the rotating speed of the output shaft ring gear varies.

The PCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The PCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The PCM also uses the OSS sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the OSS sensor.

Transmission Fluid Temperature (TFT) Sensor

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area.

The PCM monitors the voltage across the TFT sensor, which changes as transmission fluid temperature varies.

The PCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TFT sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TFT sensor.

Transmission Range (TR) Sensor

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependant on the PARK, REVERSE, NEUTRAL, DRIVE, 3, 2 or 1 position of the manual valve.

The TR sensor also provides signals for the starting system and the reverse lights.

The PCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The PCM also uses the TR sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TR sensor.

Transmission Operation

Transmission Operation Overview

Transmission operation is controlled by the PCM.

Torque Converter

This transmission uses a torque converter with the following elements:

- Impeller
- Turbine
- Reactor
- Torque Converter Clutch (TCC)

For component information, refer to Torque Converter in this section.

Planetary Gearsets

Operation of this transmission involves the use of 2 planetary gearsets that have the following components:

- Front (single planetary gearset)
  - One sun gear
  - One planetary carrier with 4 gears
  - One ring gear
- Rear (ravigneaux planetary gearset)
  - Two sun gears of different sizes
  - Three short planetary gear pinions meshing with the sun gears
  - Three long planetary gear pinions meshing with the sun gears
  - One planetary carrier
  - One ring gear

Apply Clutches

This transmission uses the following clutches to operate the 2 planetary gearsets:

- Forward clutch (A)
- Direct clutch (B)
- Intermediate clutch (C)
- Low/reverse clutch (D)
- Overdrive clutch (E)
- Low One-Way Clutch (OWC)

For information about planetary gearsets or the apply clutches, refer to Mechanical Components and Functions in this section.

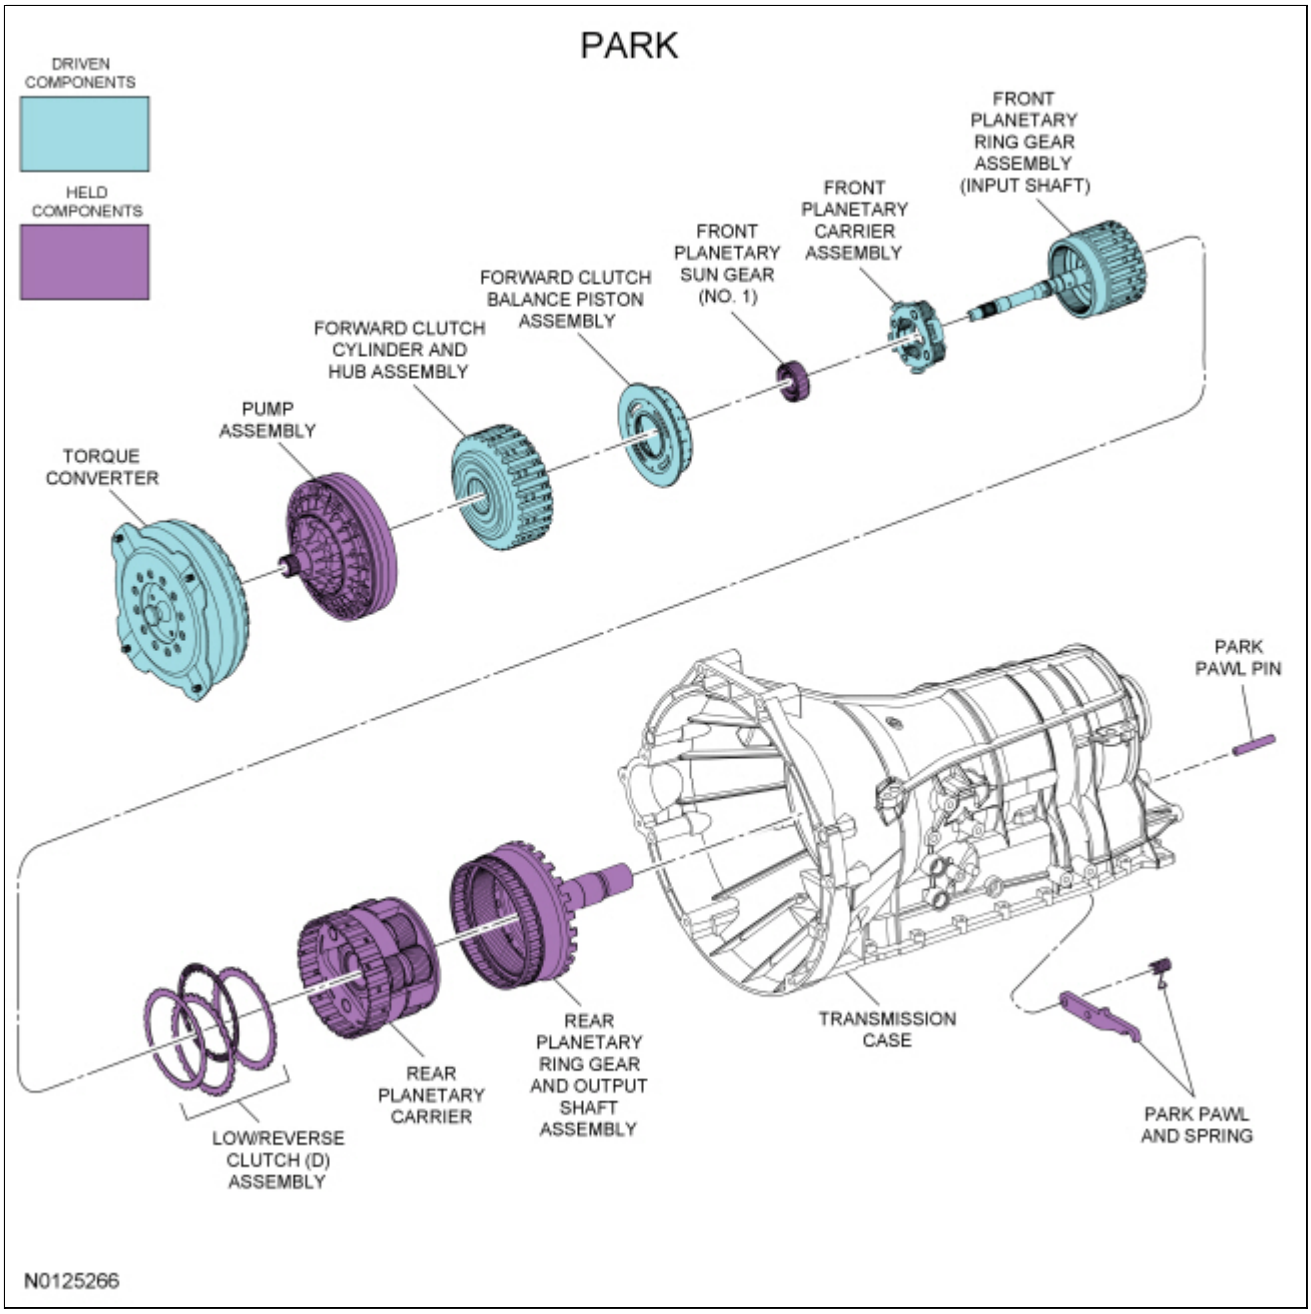
Hydraulic System

The hydraulic operation of this transmission includes the following components:

- Main control assembly
- Pump assembly with filter
- Torque converter
- Apply components (clutches)

For component information, refer to Hydraulic System in this section.

Electronic Operation



The PCM controls the operation of this transmission with the following solenoids:

- Line Pressure Control (LPC) solenoid
- Shift Solenoid A (SSA)
- Shift Solenoid B (SSB)
- Shift Solenoid C (SSC)
- Shift Solenoid D (SSD)
- Shift Solenoid E (SSE)
- TCC solenoid

For solenoid information, refer to Transmission Electronic Control System in this section.

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CL DC circuit to position the valves for low/reverse clutch (D) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 latch and regulator valves.
- Regulated line pressure from the D1 regulator valve is supplied to the low/reverse clutch (D) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In reverse, the manual valve directs line pressure to the No. 1 shuttle valve and the solenoid multiplex valve through the REV circuit.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission

repair4less

lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoid through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- Below 5 kph (3 mph), SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit. Above 5 kph (3 mph), amperage to SSD is increased to decrease pressure to the solenoid multiplex valve and clutch D1 regulator valve to release the low/reverse clutch (D).
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 latch and regulator valves through the CLDC circuit to position the valves for low/reverse clutch (D) application.
- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 latch and regulator valves.
- Below 5 kph (3 mph), regulated line pressure from the D1 regulator valve is supplied to the low/reverse clutch (D) to apply the clutch. Above 5 kph (3 mph) the D1 regulator valve exhausts to release the low/reverse clutch and the Low/ OWC continues to hold the rear planetary carrier with no engine braking.
- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission

lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoid through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.
- SSC supplies pressure to the clutch C regulator valve to position the valve for intermediate clutch (C) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.
- Regulated line pressure from the clutch C regulator valve is supplied to the intermediate clutch (C) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is applied, the bypass clutch control regulator valve applies pressure to the torque converter through the CAPLY circuit to apply the TCC.
- CAPLY pressure exits the torque converter through the CREL circuit to the converter release regulator valve.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- The TCC solenoid supplies pressure to the converter release regulator valve and the bypass clutch control regulator valve to move the position of the valves for TCC application.
- SSC supplies pressure to the clutch C regulator valve to position the valve for intermediate clutch (C) application.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for overdrive clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch C regulator valve is supplied to the intermediate clutch (C) to apply the clutch.
- Regulated line pressure from the clutch E regulator valve is supplied to the overdrive clutch (E) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission

repair4less

lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies line pressure to the shift, LPC and TCC solenoid through the SREG hydraulic circuit.
- The LPC solenoid applies full solenoid output pressure to the main regulator valve through the VFS5 hydraulic circuit. With full solenoid output pressure, the main regulator valve provides maximum line pressure during fail safe.
- SSB supplies maximum solenoid output pressure to the clutch B regulator valve to position the valve for direct clutch (B) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to, apply the clutch. Regulated line pressure from the clutch B regulator valve is also supplied to the clutch A latch valve from the clutch B latch valve through the BREV 5F circuit.
- The clutch A latch valve directs the regulated line pressure to the drive enable valve through the BREV5 circuit.
- The drive enable valve directs the BREV5 pressure to the BREVA circuit which supplies the clutch A regulator valve to position the valve to apply the forward clutch (A) with 81% of line pressure.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Electrical Operation

Solenoid operation: In failsafe, voltage is removed from all solenoids and the solenoids default to their normal position. If a solenoid is a normally low (NL) solenoid, the solenoid will not supply pressure to the regulator valve, releasing the clutch that it controls. If a solenoid is a normally high (NH) solenoid, the solenoid will provide high pressure to the regulator valve, applying the clutch that it controls.

Diagnosis By Symptom

The Diagnosis by Symptom gives the technician diagnostic information and direction, and suggests possible components using a symptom as a starting point. All routines start out with any potential electrical components that can cause or contribute to the symptom described. The routines then list all possible hydraulic or mechanical components that can cause or contribute the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom, select the condition that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. preliminary inspections.
    2. verifications of condition.
    3. checking the fluid levels.
    4. carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a DTC. Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

   NOTE: When the battery is disconnected or a new battery is installed, certain transmission operating parameters can be lost. The PCM must relearn these parameters. During this learning process, the vehicle may exhibit slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

   Begin Diagnosis by Symptoms with the Routines, if indicated. Follow the reference or action required statements. Always perform the self-tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, proceed to the Hydraulic/Mechanical Routine listed.

5. The list contains only possible hydraulic or mechanical components that may cause or contribute to the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure that repairs are complete.

Possible Component	Reference/Action
201 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section. • INSTALL a new filter assembly.
• Fluid filter and seal assembly — plugged, damaged	
Selector Lever Linkage	
• Selector lever linkage — damage or incorrectly adjusted	• INSPECT and REPAIR as required. VERIFY transmission selector lever cable adjustment. REFER to Section 307-05 . ADJUST transmission selector lever cable as necessary.
Powertrain Control System	
• PCM, external vehicle harness, main control molded leadframe or Shift Solenoid A (SSA).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . INSPECT and CLEAN the SSA terminals on the molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
Main Control	
• Defective manual valve	• INSPECT manual valve linkage.
• Defective clutch (A) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section. • INSTALL a new front pump adapter seal.
• Front pump adapter seal — cracked, leaking or damaged	
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Low One-Way Clutch (OWC) assembly — failure	• INSPECT the OWC assembly for damage. The OWC must rotate counterclockwise and lock clockwise. REPLACE the OWC . REFER to Transmission — Early Build or Transmission — Late Build in this section.
Pump	
• Pump gear — failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Engagement Concerns: No Reverse

Possible Component	Reference/Action

repair4less

202 — ROUTINE	
Transmission Fluid • Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Powertrain Control System • PCM, external vehicle harness, main control leadframe or Shift Solenoid B (SSB).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . INSPECT and CLEAN the shift solenoid terminals on the molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
Main Control • Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates • Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
Pump • Pump gear — failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Engagement Concerns: Harsh Reverse

Possible Component	Reference/Action
203 — ROUTINE	
Transmission Fluid • Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Driveline • Engine driveline looseness in the driveshaft, U-joints or the engine mounts	• REPAIR as required.
Powertrain Control System • PCM, external vehicle harness, main control leadframe or Shift Solenoid B (SSB).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . INSPECT and CLEAN the shift solenoid terminals on the molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
Main Control • Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	

• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.

Engagement Concerns: Harsh Forward

Possible Component	Reference/Action
204 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Driveline	
• Engine driveline looseness in the driveshaft, U-joints or the engine mounts	• REPAIR as required.
Powertrain Control System	
• PCM, external vehicle harness, main control leadframe or Shift Solenoid A (SSA).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . INSPECT and CLEAN the shift solenoid terminals on the molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
Main Control	
• Defective clutch (A) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (A) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (A) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.

206 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section. • INSTALL a new filter assembly.
• Fluid filter and seal assembly — plugged, damaged	
Powertrain Control System	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
• PCM, external vehicle harness, main control leadframe or a defective Shift Solenoid A (SSA).	
Main Control	
• Defective clutch (A) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section. • INSTALL a new front pump adapter seal.
• Front pump adapter seal — cracked, leaking or damaged	
Clutch Plates	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Forward clutch (A) friction and steel plate — failure	

Engagement Concerns: No Forward and No Reverse

Possible Component	Reference/Action
207 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Selector Lever Linkage (Internal/External)	
• Damaged, out of aadjustment	• INSPECT for damage, repair as required.
Transmission Filter and Seal Assembly	
• Not seated, damaged or plugged	• INSPECT for position, damage and restriction. INSTALL a new filter and seal assembly. .
• Pump adapter Seal	• INSPECT for crack or damage. INSTALL new as required.
Main Controls	
• Manual Valve	• INSPECT for damage. Replace as required.
• Mounting bolt torque	• INSPECT for loose main control to transmission bolts. Tighten to specification.
• Solenoid Pressure Regulator Valve	• INSPECT for valve stuck in spring compressed position or broken spring. CLEAN or REPLACE main control as required. Main Control
Pump Assembly	
• Gear	• INSPECT for damage. REPLACE as required.
• Sun gear hub/splines	• INSPECT for damage. REPLACE as required.
Other Possible Components	
• Turbine shaft	• INSPECT for damage. REPAIR as required.
• Front planetary gear set	• INSPECT for damage. REPAIR as required.
• Forward clutch drum	• INSPECT for damage. REPAIR as required.
• Output shaft/ring gear	• INSPECT for damage. REPAIR as required.

Engagement Concerns: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.

repair4less

• Fluid filter and seal assembly — plugged, damaged	• INSTALL a new filter assembly.
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses, main control molded leadframe, Transmission Range (TR) sensor, Shift Solenoid A (SSA) or Line Pressure Control (LPC)	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . If engine control DTCs return, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Multiple shift missing (more than one gear)	• If some shifts are missing, DETERMINE which shifts do not occur. REFER to Clutch and Solenoid Application Charts in this section. MONITOR appropriate PIDs as listed in Diagnostic Parameters Identification (PID) Chart. REFER to Routine 210.
• Gears 4-6 default to 5th gear and gears 1-3 default to 3rd gear	• RETRIEVE DTCs.

Engagement Concerns: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly.
Powertrain Control System	
• PCM, external vehicle wiring harnesses or molded leadframe	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. INSPECT and CLEAN the shift solenoid terminals on the molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
Main Control	
• Front pump adapter seal — cracked, leaking or damaged	• INSTALL a new front pump adapter seal.

Shift Concerns: Some/All Shifts Missing

Possible Component	Reference/Action
210 — ROUTINE	
Transmission Fluid	

• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Selector Lever Linkage Damaged or Incorrectly Adjusted	
• Selector lever cable	• INSPECT and REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05 . ADJUST selector lever cable as necessary.
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses, main control molded leadframe, Transmission Range (TR) sensor, Shift Solenoid A (SSA) or Line Pressure Control (LPC)	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A . If engine control DTCs return, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Multiple shift missing (more than one gear)	• If some shifts are missing, DETERMINE which shifts do not occur. REFER to clutch and solenoid application charts in this section. MONITOR appropriate PIDs as listed in Diagnostic Parameters Identification (PID) Chart.
Main Control	
• Leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
• Defective clutch (A) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (A) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (C) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (E) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (E) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure or Low One-Way Clutch (OWC) assembly — failure	• For 1st, 2nd, 3rd or 4th gear concerns, INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section. For the One-Way Clutch (OWC), INSPECT for damage. One-Way Clutch (OWC) must rotate counterclockwise and lock clockwise. REFER to

repair4less

	Transmission — Early Build or Transmission — Late Build in this section.
• Direct clutch (B) friction and steel plate — failure	• For 3rd or 5th gear concerns, INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Intermediate clutch (C) friction and steel plate — failure	• For 2nd or 6th gear concerns, INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.
• Overdrive clutch (E) assembly — failure	• For 4th, 5th or 6th gear concerns, INSPECT the overdrive clutch for damage. REPLACE the overdrive clutch. REFER to Overdrive Clutch Assembly in this section.

Shift Concerns: Timing — Early/Late

Possible Component	Reference/Action
211 — ROUTINE	
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses or main control molded leadframe	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If engine control DTCs return, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section.
• Engine driveability concerns	• REFER to Section 303-00 .
Main Control	
• Bolts not tightened to specification	• TIGHTEN to specification.
• Main control unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• REFER to Main Control in this section.
Incorrect Pressures	
• Application pressures are incorrect	• Incorrect application pressures may be due to non-transmission components, main control assembly or internal transmission damage. REPAIR all non-transmission components then continue with this routine.
Other	
• Tire size change, axle ratio change	• VERIFY the vehicle has the original equipment. REFER to the certification label. Changes in tire size and axle ratio will affect shift timing.

Shift Concerns: Timing — Erratic/Hunting

Possible Component	Reference/Action
212 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Condition	• CARRY OUT the fluid level check in Transmission Fluid Level Check in this section. • REFER to Routine 257 Transmission Overheating.
• Transmission fluid over temperature condition	
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses or main control leadframe	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If engine control DTCs return, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
Torque Converter Concerns	
• Torque converter	• REFER to torque converter operation concern: Cycling/Chatter.

Feel Concerns: Soft/Slipping (Some or All)

Possible Component	Reference/Action
213 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses, main control molded leadframe or Transmission Fluid Temperature (TFT) sensor.	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test B .
Main Control	
• Main control molded leadframe	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
• Front pump adapter seal — cracked, leaking or damaged	• INSTALL a new front pump adapter seal.
• Bolts not tightened to	• TIGHTEN to specification.

repair4less

specification	
• Main control contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stick or bore damaged	• INSPECT for damage. If damaged, INSTALL a new main control assembly. REFER to Main Control in this section.

Feel Concerns: Harsh (Some or All)

Possible Component	Reference/Action
214 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM electrical inputs/outputs, external vehicle wiring harnesses, main control molded leadframe or solenoid body information does not match PCM information	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If solenoid body and PCM information does not match, REPROGRAM the PCM with the latest calibration. PERFORM the Solenoid Body Strategy Data Download. REFER to Solenoid Body Strategy in this section. PERFORM Road Test — Adaptive Drive Cycle, REFER to Shift Point Road Test in this section. ROAD TEST and CHECK for DTCs.
Main Control	
• Bolts not tightened to specification	• TIGHTEN bolts to specification.
• Main control contaminated, solenoid(s) damaged, solenoids stuck or bore damaged	• INSPECT for damage. If damaged, INSTALL a new main control assembly. REFER to Main Control in this section.
• Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, INSTALL a new main control assembly. REFER to Main Control in this section.

Feel Concerns: No 1st Gear, Engages in a Higher Gear

Possible Component	Reference/Action
215 — ROUTINE	
Powertrain Control System	
• PCM, external vehicle wiring harnesses or main control molded leadframe	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs.

Clutch Plates	
• Low One-Way Clutch (OWC) assembly — failure	• INSPECT the OWC assembly for damage. The OWC must rotate counterclockwise and lock clockwise. REPLACE the OWC . REFER to Transmission — Early Build or Transmission — Late Build in this section.
Incorrect Gear	
• Transmission failure	• DETERMINE which gear the transmission is in. REFER to the Clutch and Solenoid Application Charts in this section.

Feel Concerns: No Manual 1st Gear

Possible Component	Reference/Action
216 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Selector Lever Linkage	
• Selector lever cable system — damaged, misaligned	• INSPECT and REPAIR as necessary. VERIFY selector lever cable adjustment. REFER to Section 307-05 .
Powertrain Control System	
• PCM, external vehicle harness, main control molded leadframe or Shift Solenoid A (SSA).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and Manual for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination., REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate — failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
• Low One-Way Clutch (OWC) assembly — failure	• If no 1st gear above 3 mph, INSPECT the OWC assembly for damage. The OWC must rotate counterclockwise and lock clockwise. REPLACE the OWC . REFER to Transmission — Early Build or Transmission — Late Build in this section.
Pump	

repair4less

• Pump gear — failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No Manual 2nd Gear

Possible Component	Reference/Action
217 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly.
Selector Lever Linkage	
• Selector lever cable system — damaged, misaligned	• INSPECT and REPAIR as necessary. VERIFY selector lever cable adjustment. REFER to Section 307-05 .
Powertrain Control System	
• PCM, external vehicle wiring harnesses, main control molded leadframe or Shift Solenoid A (SSA)	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Intermediate clutch (C) friction and steel plate — failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.
Pump	
• Pump gear — failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No Manual 3rd Gear

Possible Component	Reference/Action
218 — ROUTINE	

Selector Lever Linkage	
• Selector lever cable system — damaged, misaligned	• INSPECT and REPAIR as necessary. VERIFY selector lever cable adjustment. REFER to Section 307-05 .
Powertrain Control System	
• PCM, external vehicle wiring harnesses, main control molded leadframe or Shift Solenoid B (SSB).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
Pump	
• Pump gear — failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No 1-2 Shift

Possible Component	Reference/Action
220 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly — plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM, external vehicle wiring harnesses, main control molded leadframe, Shift Solenoid C (SSC) or Shift Solenoid D (SSD).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs.

repair4less

	ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (C) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Intermediate clutch (C) friction and steel plate — failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate — failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
• Low One-Way Clutch (OWC) assembly — failure	• INSPECT the OWC assembly for damage. The OWC must rotate counterclockwise and lock clockwise. REPLACE the OWC . REFER to Transmission — Early Build or Transmission — Late Build in this section.

Feel Concerns: No 2-3 Shift

Possible Component	Reference/Action
221 — ROUTINE

INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
• Defective clutch (E) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (E) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Solenoid multiplex valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Drive enable valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Overdrive clutch (E) friction and steel plate — failure	• INSPECT the overdrive clutch assembly for damage. REPAIR as required. REFER to Overdrive Clutch Assembly in this section.

Feel Concerns: No 3-2 Shift

Possible Component	Reference/Action
224 — ROUTINE	
Powertrain Control System	
• PCM, external vehicle wiring harnesses, main control molded leadframe, Shift Solenoid B (SSB) or Shift Solenoid C (SSC).	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic

	contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A.
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (C) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Intermediate clutch (C) friction and steel plate — failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.

Feel Concerns: No 2-1 Shift

Possible Component	Reference/Action
225 — ROUTINE	
Powertrain Control System	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A.
• PCM, external vehicle wiring harnesses, main control molded leadframe or Shift Solenoid C (SSC).	
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A.
• Defective clutch (C) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Direct clutch (C) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate — failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
• Low One-Way Clutch (OWC) assembly — failure	• INSPECT the OWC assembly for damage. The OWC must rotate counterclockwise and lock clockwise. REPLACE the OWC. REFER to Transmission — Early Build or Transmission — Late Build in this section.

Torque Converter Operation Concerns: No Apply

Possible Component	Reference/Action
240 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Fluid condition	• CHECK transmission fluid condition. REFER to Preliminary Inspection in this section.
Powertrain Control System	
• PCM, external vehicle wiring harnesses, main control molded leadframe or Torque Converter Clutch (TCC) solenoid.	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the TCC solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .
• Main control assembly contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new main control assembly. REFER to Main Control in this section.
• Defective torque converter apply regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective torque converter release regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Main control assembly bolts — not tightened to specification	• TIGHTEN to specification.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. INSTALL a new or remanufactured torque converter. REFER to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Torque Converter Operation Concerns: Cycling/Chatter

Possible Component	Reference/Action
241 — ROUTINE	

Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Fluid condition	• CHECK transmission fluid condition. REFER to Preliminary Inspection in this section.
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe, Torque Converter Clutch (TCC) solenoid or Transmission Fluid Temperature (TFT) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A for TCC solenoid diagnosis and GO to Pinpoint Test B for TFT sensor diagnosis.
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the TCC solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A to diagnosis the Torque Converter Clutch (TCC) or GO to Pinpoint Test B to diagnosis the Transmission Fluid Temperature (TFT) sensor.
• Main control assembly contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new main control assembly. REFER to Main Control in this section.
• Defective torque converter apply regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Main control assembly bolts — not tightened to specification	• TIGHTEN to specification.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. INSTALL a new or remanufactured torque converter. REFER to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Torque Converter Operation Concerns: Always Applied/Stalls Vehicle

Possible Component	Reference/Action
242 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.

repair4less

• Fluid condition	• CHECK transmission fluid condition. REFER to Preliminary Inspection in this section.
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe, Torque Converter Clutch (TCC) solenoid or Transmission Fluid Temperature (TFT) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A for TCC solenoid diagnosis and GO to Pinpoint Test B for TFT sensor diagnosis.
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the TCC solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A to diagnosis the Torque Converter Clutch (TCC) or GO to Pinpoint Test B to diagnosis the Transmission Fluid Temperature (TFT) sensor.
• Main control assembly contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new main control assembly. REFER to Main Control in this section.
• Main control assembly bolts — not tightened to specification	• TIGHTEN to specification.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. INSTALL a new or remanufactured torque converter. REFER to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission case vent — damaged, case porosity	• REPAIR as necessary.
• Leakage at gaskets, seals, electrical connector	• REFER to Leakage Inspection , Fluid Leakage in Torque Converter Area and Leak Check Test with A Black Light in this section. REMOVE all traces of lubricant on exposed surface of the transmission. REPAIR as necessary.

Fluid Cooler Tubes	
• Cooler tube fittings	• LOCATE leak source. REPAIR as required. REFER to Section 307-02 .
• Cooler tube O-rings, cooler tubes	• LOCATE leak source. REPAIR as required. REFER to Section 307-02 .
Torque Converter	
• Torque converter studs	• INSTALL a new torque converter. If a new or remanufactured torque converter is installed, use the scan tool and follow the on-screen instructions and perform the Misfire Monitor Neutral Profile Correction procedure.
• Torque converter hub seal	• INSTALL a new torque converter hub seal.
• Torque converter weld	• INSTALL a new torque converter. If a new or remanufactured torque converter is installed, use the scan tool and follow the on-screen instructions and perform the Misfire Monitor Neutral Profile Correction procedure.
Transmission Case	
• Case — leaking	• INSTALL a new transmission case. REFER to Transmission — Early Build or Transmission — Late Build in this section.
• Transmission vehicle harness connector	• INSTALL a new transmission vehicle harness connector O-ring.
• Transmission fluid fill plug	• INSTALL a new transmission fluid fill plug.
• Output shaft seal	• INSTALL a new seal. REFER to Output Shaft Seal in this section.
• Manual control lever seal	• INSTALL a new seal.
• Transmission fluid pan gasket	• INSTALL a new gasket.
Fluid Pump	
• Fluid pump O-ring	• INSTALL a new O-ring. REFER to Pump Assembly in this section.
• Fluid pump seal ring	• INSTALL a new seal ring. REFER to Pump Assembly in this section.

Other Concerns: Noise/Vibration in Forward or Reverse

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Possible Component	Reference/Action
254 — ROUTINE	
Transmission Fluid	
• Incorrect level (low) pump cavitation	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level

repair4less

	Check in this section.
Fluid Cooler Tubes • Cooler tubes grounding out	• ADJUST or REPOSITION cooler tubes.
Torque Converter • Check the torque converter components/balance weight	• LOCATE source of disturbance. REPAIR as required. If a new or remanufactured torque converter is installed, use the scan tool and follow the on-screen instructions and perform the Misfire Monitor Neutral Profile Correction procedure.
Engine Driveline • Engine drive accessories	• REFER to Section 303-00 .

Other Concerns: Engine Will Not Crank

Possible Component	Reference/Action
255 — ROUTINE	
Selector Lever Cable System • Selector lever cable system — damaged, misaligned	• INSPECT and REPAIR as necessary. REFER to Section 307-05 .
Powertrain Control System • PCM, vehicle wiring harnesses, engine starting and charging system, main control molded leadframe or Transmission Range (TR) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test C .
Torque Converter • Flexplate — damaged	• REPAIR as necessary.
Vehicle Starter • Starter system concerns	• INSPECT and REPAIR as necessary. REFER to Section 303-06 .
Transmission Range (TR) Sensor Assembly • TR sensor assembly — damaged	• INSPECT and REPAIR as necessary.
Fluid Pump Assembly • Internal parts seized	• REPAIR as necessary.

Other Concerns: No Park (P) Range

Possible Component	Reference/Action
256 — ROUTINE	
Selector Lever Cable	
• Selector lever cable system — damaged, misaligned	• INSPECT and REPAIR as necessary. REFER to Section 307-05 for additional information.

• Manual control lever assembly damaged, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged, park pawl pin loose or damaged, park rod actuating plate loose, damaged or missing	• INSPECT for damage. REPAIR as necessary.
• Transmission case	• INSPECT for damage. If damaged, REPAIR as necessary.
• Park gear, park pawl, park pawl return spring, part or guide, park actuating rod, park pawl shaft, manual lever	• INSPECT for damage. If damaged, REPAIR as necessary.
• External linkages/brackets — damaged	• INSPECT for damage. REPAIR as necessary.
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe or Transmission Range (TR) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test C .
Transmission Range (TR) Sensor Assembly Damaged	
• Manual lever detent spring	INSPECT for damage. REPAIR as necessary.
• TR sensor assembly	• INSTALL a new main control assembly. REFER to Main Control in this section.

Other Concerns: Transmission Overheating

Possible Component	Reference/Action
257 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Fluid condition	• CHECK transmission fluid condition. REFER to Preliminary Inspection in this section.
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe, Torque Converter Clutch (TCC) solenoid or Transmission Fluid Temperature (TFT) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A for TCC solenoid diagnosis and GO to Pinpoint Test B for TFT sensor diagnosis.
Torque Converter Not Engaging	
• Torque converter	• INSTALL a new torque converter. If a new or remanufactured torque converter is installed, use the scan tool and follow the on-screen instructions and perform the Misfire Monitor Neutral Profile Correction procedure.

repair4less

Case Vent Damaged	
• Transmission case	• INSPECT for damage. If damaged, REPAIR as necessary.
Other	
• Restriction in transmission cooling system	• CHECK transmission cooling system efficiency. REFER to Section 307-02 for automatic transmission cooling system diagnostic procedures.
• Excessive trailer tow load	• REFER to the Owner's Literature for specifications on trailer towing.
• Vehicle heat shield — missing or damaged	• INSPECT for damage. REPAIR as necessary.
• Vehicle airflow is restricted	• INSPECT for damage. REPAIR as necessary.
• Thermal bypass valve — missing or damaged	• INSPECT for damage. REPAIR as necessary. REFER to Main Control in this section.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
261 — ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Case Vent Damaged	
• Transmission case	• INSPECT for damage. If damaged, REPAIR as necessary.

Feel Concerns: Shift Concerns: No 4-5 Shift

Possible Component	Reference/Action
270 — ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe, Shift Solenoid A (SSA) solenoid or Shift Solenoid B (SSB) sensor	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A .
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A .

• Defective clutch (A) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (A) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.

Feel Concerns: No 5-4 Shift (Automatic)

Possible Component	Reference/Action
271 — ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, main control molded leadframe or Shift Solenoid B (SSB)	• If DTCs are set, CLEAR the DTCs. CARRY OUT the Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER) self-test. ROAD TEST the vehicle and CHECK for DTCs. If the DTCs return, GO to Pinpoint Test A.
Main Control	
• Molded leadframe — contamination	• REMOVE the main control assembly, REFER to Main Control in this section. INSPECT and CLEAN the shift solenoid terminals on the main control molded leadframe for metallic contamination, REFER to Shift Solenoids (SS) in this section. INSTALL the main control assembly. CLEAR the DTCs. ROAD TEST the vehicle. If the symptom returns, GO to Pinpoint Test A.
• Defective clutch (B) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (B) latch valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
• Defective clutch (A) regulator valve	• INSPECT main control assembly for stuck valves or contamination. REFER to Main Control in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate — failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Forward clutch (A) friction and steel plate — failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.

Feel Concerns: No 5-6 Shift (Automatic)

Diagnostic Parameters Identification (PID) Chart

The following is a list of output state control parameters and their corresponding PIDs:

Diagnostic PID Chart

PID Name	PID Description	Units
AXLE	Axle Ratio	Ratio
BOO1	Brake ON/OFF Switch	On/Off
BOO2	Brake ON/OFF Switch	On/Off
CHT	Cylinder Head Temperature	Temperature
DTCCNT	Continuous Codes	Number
GEAR	Gear Commanded by Module	Mode
GEAR_OSC#	Gear Commanded by Output State Control	Mode
GEAR_RAT	Gear Ratio Commanded	Ratio
HRSH_SHFT#	Firm Shift	On/Off
IN_GEAR	In Gear-Transmission is Applying a Load to Engine	In Gear
ISS_F	Input Shaft Speed Sensor Fault	No Fault/Yes Fault
ISS_SRC	Input Shaft Speed Sensor	rpm
LINEDSD#	Line Pressure Control Desired	Pressure
LOAD	Engine Load	Percentage
OSS_F	Output Shaft Speed Reliable	No Fault/Yes Fault
OSS_SRC	Unfiltered Output Shaft Speed	rpm
PARK_BRK	Park Brake Switch	On/Off
LPC	Line Pressure Control (LPC) solenoid	Pressure
LPC_AMP#	LPC solenoid current	Current
LPC_F	LPC solenoid fault status	No Fault/Yes Fault
RLC_F	Reverse Control Lamp Status	No Fault/Yes Fault
RPM#	Engine Revolutions Per Minute	rpm
SHIFT_DROP	Shift rpm Drop in Input Shaft Speed Below Expected	rpm
SHIFT_FLRE	Shift rpm Rise in Input Shaft Speed Above Expected	rpm
SHIFT_ID	Shift Identification of Shift PIDs Lag, Time, Flair and Drop	rpm
SHIFT_LAG	Shift Time Elapsed From 1% to 9% Complete	Time
SHIFT_TIME	Shift Time From Commanded to 10% Complete	Time
SHIFT_TYPE	Shift Type	Type
SSA_AMP#	Shift Solenoid Pressure Control A (SSPCA)	Current

SSB_AMP#	Shift Solenoid Pressure Control B (SSPCB)	Current
SSC_AMP#	Shift Solenoid Pressure Control C (SSPCC)	Current
SSD_AMP#	Shift Solenoid Pressure Control D (SSPCD)	Current
SSE_AMP#	Shift Solenoid Pressure Control E (SSPCE)	Current
SSPCA	SSPCA	Pressure
SSPCA_F	SSPCA Status	No Fault/Yes Fault
SSPCB	SSPCB	Pressure
SSPCB_F	SSPCB Status	No Fault/Yes Fault
SSPCC	SSPCC	Pressure
SSPCC_F	SSPCC Status	No Fault/Yes Fault
SSPCD	SSPCD	Pressure
SSPCD_F	SSPCD Status	No Fault/Yes Fault
SSPCE_F	SSPCE Status	No Fault/Yes Fault
TCC	Torque Converter Clutch (TCC) Solenoid	Pressure
TCC AMP#	Converter Pressure Control	Current
TCC_F	TCC Fault	No Fault/Yes Fault
TCC_OSC#	Output State Control of Torque Converter	Locked/Unlocked
TCC_RAT	Transmission Slip Ratio	Ratio
TCIL	Transmission Control Indicator Lamp (TCIL)	On/Off
TCS_DEPRES	Transmission Control Switch (TCS) Pressed	Yes/No
TCS_STATE	TCS Requested State	On/Off
TC_SLIPACT	Torque Converter Slip Actual	rpm
TC_SLIPDSD	Torque Converter Slip Desired	rpm
TFT	Transmission Fluid Temperature (TFT)	Temperature
TFTV	TFT Volts	Volts
TFT_F	TFT Status	No Fault/Yes Fault
TIRESIZE	Tire Size	Rev Per Mile
TP	Throttle Position (TP) Sensor	Percentage
TP1	TP Sensor 1	Volts
TP2	TP Sensor 2	Volts
TR	Transmission Range (TR)	Mode
TRANS_VOLT_A	Transmission Supply Voltage Control State	On/Off
TRAN_RAT	Transmission Gear ratio	Ratio
TRN_N_F	Neutral Output Status	On/Off
TRN_P_F	Park Output Status	On/Off
TR_CRANK	TR Input Allowing Input Start	Yes/No
TR_DC	TR Duty Cycle	Percentage
TR_F	TR Status	No Fault/Yes Fault
TR_FREQ	TR Frequency	Frequency

repair4less

	Turbine Shaft Speed (TSS) Reliable	No Fault/Yes Fault
TSS_SRC	Unfiltered Turbine Shaft Speed	rpm
VPWR	Module Supply Voltage	Volts
VREF	Reference Voltage	Volts
VSOUT_F	Vehicle Speed Output Status	No Fault/Yes Fault
VSS	Vehicle Speed Sensor (VSS)	Speed

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- On-Line Automotive Service Information System (OASIS)
- TSBs
- Wiring Diagrams manual

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer concern.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for non-factory add-on items.
- Check selector lever cable for correct adjustment.
- Check TSBs regarding the concern.

Diagnostics

- Carry out On-Board Diagnostic (OBD) procedures, Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all DTCs.
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Clear all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only codes that have passed are obtained, refer to Diagnosis By Symptom in this section for additional information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

repair4less

Diagnostic Trouble Code (DTC) Charts

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Using a scan tool to retrieve DTCs, begin with and repair all non-transmission related DTCs. Start with the U-DTCs (communication link codes) then repair transmission related DTCs.

The PCM will command a default gear to protect the engine and transmission when certain faults occur. Default or (limp-home mode) depends on the actual gear the vehicle was in when the fault occurred.

- For gears 1-3, the default will be 3rd gear.
- For gears 4-6, the default will be 5th gear.

The default gear is held until the vehicle is placed in reverse, park or the vehicle is restarted. After these action(s) the vehicle will default to 3rd gear.

DTC Chart

DTC	Component	Description	Condition	Symptom	Action
B2572	Brake Shift Interlock Actuator (BSIA)	BSIA open or shorted circuit	The BSIA system a malfunction.	• BSIA inoperative	REFER to Section 307-05 .
P0657	PCM	Actuator supply voltage A circuit open	The Transmission Solenoid Power Control (TSPC) relay failed open.	• Malfunction Indicator Lamp (MIL) ON • Maximum line pressure • Default to 5th gear	Power is routed through the transmission solenoid power control (TSPC) relay (inside the PCM) to all solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically off. CHECK for open, short to ground or the transmission

repair4less

					connector disconnected. The TSPC relay also disables power to the transmission solenoids when certain transmission DTCs are set. REPAIR as required. CLEAR the DTC. GO to Pinpoint Test A .
P0701	PCM	Transmission control system range/performance	The PCM detected an intermittent clutch ON fault.	• Vehicle decelerates during upshift or hangs in gear • DTCs P2700 (A) clutch, P2701 (B) clutch, P2702 (C) clutch, P2703 (D) clutch and/or P2704 (E) clutch may set	CLEAR the DTCs. TEST the system for normal operation. If the DTCs return, REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P0702	Battery	Battery voltage out of range	The PCM detected a voltage level above or below the accepted voltage range.	• Wrench light illuminated • Maximum line pressure • DTCs P0882 and/or P0883 may set	REPAIR the more specific DTC first. CLEAR the DTCs. TEST the system for normal operation. REFER to Section 414-00 .
P0705	Transmission Range (TR) sensor	TR sensor failure	The PCM detected a TR sensor signal duty cycle is within range but does not match the calibrated bit pattern.	• MIL ON • Engine will not crank • Default to 3rd or 5th gear if DTC sets after engine running • Maximum line pressure • DTC P1702 may set	REPAIR the more specific DTC first. CLEAR the DTCs. GO to Pinpoint Test C .
P0706	TR sensor	TR sensor A circuit range/performance	The PCM detected a TR sensor signal duty cycle is out of range.	• MIL ON • Engine will not crank • Default to 3rd or 5th gear if DTC sets after engine running • Maximum line pressure • DTC P1705	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is greater or less than commanded by 50Hz. GO to Pinpoint Test C .

				may set	
P0707	TR sensor	TR sensor A circuit low	The PCM detected a TR sensor signal duty cycle is out of range.	• MIL ON • Engine will not crank • Default to 5th gear if DTC sets after engine is running • Maximum line pressure • DTC P1702 may set	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is 8% less than commanded. GO to Pinpoint Test C .
P0708	TR sensor	TR sensor A circuit high	The PCM detected a TR sensor signal duty cycle is out of range.	• MIL ON • Engine will not crank • Default to 5th gear if DTC sets after engine running • Maximum line pressure • DTC P1702 may set	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is 92% greater than commanded. GO to Pinpoint Test C .
P0709	TR sensor	TR sensor A circuit intermittent	The PCM detected a TR sensor signal duty cycle is not out of range but is invalid.	• Wrench light illuminated • Engine may not crank • Default to 5th gear if DTC sets after engine running • Maximum line pressure • DTC P1702 may set	The TR sensor outputs a duty cycle indicating manual lever position. This DTC sets when the duty cycle is within range but is in the dead band between the design position, an in-range but invalid duty cycle. GO to Pinpoint Test C .
P0710	Transmission Fluid Temperature (TFT) sensor	TFT sensor A circuit	The PCM detected a voltage drop across the TFT sensor exceeds scale.	• Wrench light illuminated • DTC P0712 and/or P0713 may set	REPAIR the more specific DTC first. GO to Pinpoint Test B .
P0711	TFT sensor	TFT sensor A circuit range/performance	The PCM detected no TFT sensor change during operation. The TFT sensor is stuck below 21° C (70°F) or above 107°C (225°F) or the temperature did not change by 8°F during a drive cycle.	• MIL ON • Default to 1st or 3rd gear	CLEAR the DTC. If the DTC returns, GO to Pinpoint Test B .

repair4less

P0712	TFT sensor	TFT sensor A circuit low	The PCM detected a temperature greater than 171° C (340°F) for at least 2.5 seconds (grounded circuit).	• MIL ON • Default to 1st gear • DTC P0710 may set	REPAIR the more specific DTC first. CLEAR the DTCs. If the DTC returns, GO to Pinpoint Test B.
P0713	TFT sensor	TFT sensor A circuit high	The PCM detected a temperature less than -45°C (-50° F) for at least 2.5 seconds (open circuit).	• MIL ON • Default to 1st gear • DTC P0710 may set	REPAIR the more specific DTC first. CLEAR the DTCs. If the DTC returns, GO to Pinpoint Test B.
P0715	Turbine Shaft Speed (TSS) sensor	TSS sensor A circuit	The PCM indicated no rpm input from the TSS sensor when the Output Shaft Speed (OSS) sensor indicated rpm greater than 0.	• MIL ON • Default to 5th gear • Maximum line pressure • DTC P0717 may set	REPAIR the more specific DTC first. CLEAR the DTCs. If the DTC returns, GO to Pinpoint Test D.
P0717	TSS sensor	TSS sensor A circuit no signal	The PCM has not detected a TSS sensor signal during operation.	• Wrench light illuminated • Default to 5th gear • Maximum line pressure • DTC P0715 may set	This DTC sets when DTC P0715 is set. REFER to DTC P0715.
P0718	TSS sensor	TSS sensor A circuit intermittent	The PCM has detected an intermittent (noise) in the TSS sensor signal during operation.	• Wrench light illuminated • Poor shift quality	CLEAR the DTC. If the DTC returns, GO to Pinpoint Test D.
P0720	OSS sensor	OSS sensor circuit	The PCM indicated no rpm input from the OSS sensor when the TSS sensor indicated rpm greater than 0.	• MIL ON • Default to 5th gear • Maximum line pressure • DTC P0722 may set	REPAIR the more specific DTC first. CLEAR the DTCs. If the DTC returns, GO to Pinpoint Test E.
P0721	OSS sensor	OSS sensor circuit intermittent	The PCM has detected and unrealistic rpm change in the OSS sensor.	• Wrench light illuminated • Poor shift quality	CLEAR the DTC. If the DTC returns, GO to Pinpoint Test E.
P0722	OSS sensor	OSS sensor no signal	The PCM indicated no rpm input from the OSS sensor when the TSS sensor indicated rpm	• Wrench light illuminated • Default to 5th gear • Maximum line pressure	This DTC sets when DTC P0720 is set. REFER to DTC P0720.

			greater than 0.	• DTC P0720 may set	
P0729	Transmission	Gear 6 incorrect ratio	The PCM did not detect a 6th gear ratio when commanded.	• Wrench light illuminated • No 6th gear • Flair or neutral condition • Hangs in gear	Intermediate clutch (C) or overdrive clutch (E) failed to apply. REFER to the Clutch Application Chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0731	Transmission	Gear 1 incorrect ratio	The PCM did not detect a 1st gear ratio when commanded.	• Wrench light illuminated • No 1st gear • Flair or neutral condition • Hangs in gear	Forward clutch (A) or low/reverse clutch (D) slip of clutch (D) failed to apply or OWC failed to hold. REFER to the Clutch Application Chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0732	Transmission	Gear 2 incorrect ratio	The PCM did not detect a 2nd gear ratio when commanded.	• Wrench light illuminated • No 2nd gear • Flair or neutral condition • Hangs in gear	Forward clutch (A) or intermediate clutch (C) slip or clutch (C) failed to apply. REFER to the Clutch Application Chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0733	Transmission	Gear 3 incorrect ratio	The PCM did not detect a 3rd gear ratio when commanded.	• Wrench light illuminated • No 3rd gear • Flair or neutral condition • Hangs in gear	Forward clutch (A) or direct clutch (B) slip or clutch (B) failed to apply. REFER to the Clutch Application Chart located in

repair4less

					Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0734	Transmission	Gear 4 incorrect ratio	The PCM did not detect a 4th gear ratio when commanded.	• Wrench light illuminated • No 4th gear • Flair or neutral condition • Hangs in gear	Forward clutch (A) or overdrive clutch (E) slip or clutch (A) or (E) failed to apply. REFER to the Clutch Application Chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0735	Transmission	Gear 5 incorrect ratio	The PCM did not detect a 5th gear ratio when commanded.	• Wrench light illuminated • No 5th gear • Flair or neutral condition • Hangs in gear	Direct clutch (B) or overdrive clutch (E) slip or clutch (B) or (E) failed to apply. REFER to the Clutch Application Chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0740	Torque Converter Clutch (TCC) solenoid	TCC solenoid circuit/open	The PCM detected that the TCC solenoid control circuit failed open.	• MIL ON • TCC is disabled • DTC P0743 may set	GO to Pinpoint Test A .
P0741	TCC solenoid	TCC solenoid circuit performance/stuck OFF	The TCC failed to apply after 3 consecutive commands from the PCM.	• MIL ON • TCC is disabled • TCC regulator apply valve stuck in the release position • TCC control valve stuck in the release	DTC P0741 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Torque Converter Operation Concerns, No Apply in Diagnosis By Symptom in this

				position • DTC P0751 may set	section.
P0742	TCC solenoid	TCC solenoid circuit stuck ON	The PCM detected the TCC solenoid control circuit is shorted to ground.	• MIL ON • TCC is disabled • Poor launch performance • Default to 3rd or 5th gear • DTC P0743 may set	GO to Pinpoint Test A .
P0743	TCC solenoid	TCC solenoid circuit electrical	The PCM detected that the TCC solenoid circuit is open, shorted to ground or an intermittent.	• Wrench light illuminated • TCC is disabled • Poor launch performance • Default to 5th gear • DTCs P0740, P0742 and/or P0744 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0744	TCC solenoid	TCC solenoid circuit intermittent	The PCM detected that the TCC solenoid control circuit is shorted to power.	• MIL ON • TCC is disabled • DTC P0743 may set	GO to Pinpoint Test A .
P0748	Line Pressure Control (LPC)	LPC electrical	The PCM sets this DTC along with one or more specific electrical DTCs.	• Wrench light illuminated • Maximum line pressure • May default to 5th gear • DTCs P0960, P0962 and/or P0963 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0750	Shift Solenoid A (SSA)	SSA	The PCM detected that the SSA circuit failed open or shorted to power.	• MIL ON • 5th and 6th gear only • DTC P0753 may set	GO to Pinpoint Test A .
P0751	SSA	SSA performance/stuck OFF	The PCM commanded SSA ON but detected a ratio error. Forward clutch (A) failed OFF.	• MIL ON • 5th and 6th gear only • Harsh reverse engagement • Neutral or flair condition • Clutch A regulator valve stuck in default position	DTC P0751 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Hydraulic Circuits in this section.

repair4less

				• Clutch A latch valve stuck in default position • DTC P2700 may set	
P0752	SSA	SSA stuck ON	The PCM commanded SSA OFF but detected a ratio error. Forward clutch (A) stuck ON.	• MIL ON • Disable 5th and 6th gear • Erratic shifts • Stuck in 4th gear • Clutch A regulator valve stuck in spring compressed position • DTC P2700 may set	DTC P0752 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Forward Clutch Assembly in this section.
P0753	SSA	SSA electrical	The PCM sets this DTC along with one or more specific electrical DTCs.	• Wrench light illuminated • 5th and 6th gear only • DTCs P0750, P0973 and/or P0974 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0754	SSA	SSA intermittent	The PCM sets this DTC when an intermittent condition (open, short to power or ground) occurs 3 times for less than 5 seconds with each occurrence.	• Unexpected upshifts, downshifts, flairs or neutral conditions	CLEAR the DTC. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .
P0755	Shift Solenoid B (SSB)	SSB	The PCM detected that the SSB circuit failed open or shorted to power.	• MIL ON • Default to 3rd or 5th gear • Harsh 1-3 shift • DTC P0756 may set	GO to Pinpoint Test A .
P0756	SSB	SSB performance/stuck OFF	The PCM commanded SSB ON but detected a ratio error. Direct clutch (B) failed OFF.	• MIL ON • Default to 3rd or 5th gear • Neutral or flair condition • Transmission hangs in 2nd gear on acceleration • Clutch B regulator	DTC P0756 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Hydraulic Circuits in this section.

				valve stuck in default position • Clutch B latch valve stuck in default position • DTC P0757 may set	
P0757	SSB	SSB stuck ON	The PCM commanded SSB OFF but detected a ratio error. Direct clutch (B) stuck ON.	• MIL ON • Default to 3rd or 5th gear • Harsh 1-3 shift • Erratic shifts • Clutch B regulator valve stuck in spring compressed position • DTC P0758 may set	DTC P0757 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Direct Clutch Assembly in this section.
P0758	SSB	SSB electrical	The PCM sets this DTC along with one or more specific electrical DTCs.	• Wrench light illuminated • Default to 3rd or 5th gear • Maximum line pressure • DTCs P0755, P0976 and/or P0977 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0759	SSB	SSB intermittent	The PCM sets this DTC when an intermittent condition (open, short to power or ground) occurs 3 times for less than 5 seconds with each occurrence.	• Unexpected upshifts, downshifts, flairs or neutral conditions	CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .
P0760	Shift Solenoid C (SSC)	SSC	The PCM detected the SSC circuit has failed open.	• MIL ON • Disable 2nd and 6th gear • Erratic or harsh 1-3 shift • DTC P0763 may set	GO to Pinpoint Test A .
P0761	SSC	SSC performance/stuck OFF	The PCM commanded SSC ON but detected a ratio error. Intermediate	• MIL ON • Disable 2nd and 6th gear • Neutral or flair condition	DTC P0761 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If

repair4less

			clutch (C) failed OFF.	• Clutch C regulator valve stuck in default position • DTC P2702 may set	the DTC returns, REFER to Intermediate Clutch Assembly in this section.
P0762	SSC	SSC stuck ON	The PCM commanded SSC OFF but detected a ratio error. Intermediate clutch (C) stuck ON.	• MIL ON • 2nd and 6th upshift only • Harsh reverse engagement • Erratic shift or stuck in 6th • Clutch C regulator valve stuck in spring compressed position • DTC P2702 may set	DTC P0762 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Intermediate Clutch Assembly in this section.
P0763	SSC	SSC electrical	The PCM sets this DTC along with one or more specific electrical DTCs.	• Wrench light illuminated • Disable 2nd and 6th gear • DTCs P0760, P0979 and/or P0980 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0764	SSC	SSC intermittent	The PCM sets this DTC when an intermittent condition (open, short to power or ground) occurs 3 times for less than 5 seconds with each occurrence.	• Unexpected upshifts, downshifts, flairs or neutral conditions	CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .
P0765	Shift Solenoid D (SSD)	SSD	The PCM detected that SSD circuit has failed open.	• MIL ON • Disable 1st, 2nd and 3rd gears • Poor launch performance • DTC P0768 may set	GO to Pinpoint Test A .
P0766	SSD	SSD performance/stuck OFF	The PCM commanded SSD ON but detected a ratio error. The low/reverse clutch (D) and overdrive clutch (E) have both failed OFF.	• MIL ON • 3rd gear only • Delayed or no reverse engagement • Neutral or flair condition • DTCs P2703	REPAIR the more specific DTC first. DTC P0766 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns,

				and/or P2704 may set	REFER to Hydraulic Circuits in this section.
P0767	SSD	SSD stuck ON	The PCM commanded SSD OFF but detected a ratio error. Overdrive clutch (E) failed to release.	• MIL ON • 4th, 5th and 6th gear only • Early upshifts • Stuck in 4th • DTC P2704 may set	DTC P0767 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0768	SSD	SSD electrical	The PCM sets this DTC along with one or more specific electrical DTCs.	• Wrench light illuminated • Default to 3rd gear • DTCs P0765, P0982 and/or P0983 may set	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0769	SSD	SSD intermittent	The PCM sets this DTC when an intermittent condition (open, short to power or ground) occurs 3 times for less than 5 seconds with each occurrence.	• Unexpected upshifts, downshifts, flairs or neutral conditions	CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .
P0770	Shift Solenoid E (SSE)	SSE	The PCM detected that the SSE circuit failed open, shorted to ground or shorted to power.	• MIL ON • No TCC • If 1st, 2nd and 3rd gears are achieved than circuit is open or shorted to power (no pressure) • If 5th gear launch than circuit is shorted to ground (pressure) • DTC P0773 may set	GO to Pinpoint Test A .
P0771	SSE	SSE performance/stuck OFF	The PCM commanded SSE ON but detected a ratio error (mechanical failure).	• MIL ON • 1st, 2nd and 3rd gear only • Solenoid multiplex valve stuck in default position	DTC P0771 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this

repair4less

				• DTC P0984 may set	section.
P0772	SSE	SSE stuck ON	The PCM commanded SSE OFF but detected a ratio error (mechanical failure).	• MIL ON • No 1st gear • 4th gear launch • Solenoid multiplex valve stuck in spring compressed position • DTC P0984 may set	DTC P0772 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0773	SSE	SSE electrical	The PCM sets this DTC along with one other specific electrical DTC. SSE circuit may be open, short to power or ground.	• Wrench light illuminated • If 1st, 2nd and 3rd gears are achieved than circuit is open or shorted to power (no pressure) • If 5th gear launch than circuit is shorted to ground (pressure) • DTC P0770 may set	REFER to DTC P0770.
P0774	SSE	SSE intermittent	The PCM sets this DTC when an intermittent condition (open, short to power or ground) occurs but does not set DTC P0770.	• Wrench light illuminated • Transmission hangs in 1st gear or may be stuck in 3rd gear	CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .
P07A8	Transmission	Transmission friction element D performance/stuck OFF	The low/reverse clutch failed OFF.	• Wrench light illuminated • Delay or no reverse engagement • Disable 1st gear • Erratic shifts	DTC P07A8 is a non-electrical DTC. CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REFER to Low/Reverse Clutch Assembly in this section.
P07A9	Transmission	Transmission friction element D stuck ON	The low/reverse One-Way Clutch (OWC) is failed ON.	• Wrench light illuminated • No TCC • 1st gear only • High engine rpm	DTC P07A9 is a non-electrical DTC. CLEAR the DTC. TEST the system for normal operation. If the DTC returns,

					REFER to Low/Reverse Clutch Assembly in this section.
P07AA	Transmission	Transmission friction element E performance/stuck off	The PCM detected a ratio error. Overdrive clutch (E) failed OFF.	• Wrench light illuminated • 1st, 2nd and 3rd gears only • Neutral or flair condition • High engine rpm • Erratic shifts	DTC P07AA is a non-electrical DTC. CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REFER to Overdrive Clutch Assembly in this section.
P0815	SelectShift™ switch	Upshift switch circuit	The upshift and downshift switches are open in PARK, REVERSE and NEUTRAL. The PCM sets this DTC when it detects an upshift switch is closed (short to ground).	• Wrench light illuminated • Disable SelectShift™ scheduling to automatic shift scheduling • Upshifts request ignored • Unexpected upshifts	REFER to Section 307-05 .
P0816	SelectShift™ switch	Downshift switch circuit	The upshift and downshift switches are open in PARK, REVERSE and NEUTRAL. The PCM sets this DTC when it detects a downshift switch is closed (short to ground).	• Wrench light illuminated • Disable SelectShift™ scheduling to automatic shift scheduling • Upshifts request ignored • Unexpected downshifts	REFER to Section 307-05 .
P0826	SelectShift™ switch	Up and Down switch circuit	The upshift and downshift switches are open in PARK, REVERSE and NEUTRAL. The PCM sets this DTC when it detects the select switch inputs do not match the selector lever position.	• Wrench light illuminated • Default to automatic shift scheduling • Upshifts and downshift request ignored	REFER to Section 307-05 .
P0882	Battery	PCM power input signal low	The battery voltage is out of range low. At low	• MIL ON • Default to 3rd or 5th gear	CLEAR the DTC. TEST the system for normal operation. If

repair4less

			volts the solenoid drivers may no longer be able to achieve desired current so the transmission solenoid power control relay will be turned OFF.	depending vehicle speed and gear • Battery voltage below 9 volts • Maximum line pressure	the DTC returns, REFER to Section 414-00 .
P0883	Battery	PCM power input signal high	The battery voltage is out of range high. Greater than 21 volts.	• MIL ON • Default to 3rd or 5th gear depending vehicle speed and gear • Battery voltage above 21 volts • Maximum line pressure • May set DTC P0702	CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REFER to Section 414-00 .
P0960	LPC	LPC control circuit/open	The PCM detected 0 volts on the LPC circuit.	• MIL ON • Maximum line pressure • May default to 5th gear • DTC P0748 may set	GO to Pinpoint Test A .
P0961	LPC	LPC control circuit range/performance	The PCM detected that the LPC control circuit is shorted to ground but not long enough to set DTC P0962.	• Intermittent condition • Minimum line pressure	GO to Pinpoint Test A .
P0962	LPC	LPC control circuit low	The PCM detected 0 volts on the LPC circuit. Short to ground detected.	• MIL ON • Default to 5th gear • Maximum line pressure • DTC P0748 may set	GO to Pinpoint Test A .
P0963	LPC	LPC control circuit high	The PCM detected voltage on the LPC circuit. Short to power detected.	• MIL ON • Maximum line pressure • DTC P0748 may set	GO to Pinpoint Test A .
P0973	SSA	SSA control circuit low	The PCM detected 0 volts on the SSA circuit. Short to ground detected.	• MIL ON • Default to 5th gear • Default to 3rd only, when the selector lever is shifted into	GO to Pinpoint Test A .

				Reverse then back into Drive • Maximum line pressure • DTC P0753 may set	
P0974	SSA	SSA control circuit high	The PCM detected voltage on the SSA circuit. Short to power or open circuit detected.	• MIL ON • 5th and 6th gear only • DTC P0753 may set	GO to Pinpoint Test A .
P0976	SSB	SSB control circuit low	The PCM detected 0 volts on the SSB circuit. Short to ground detected.	• MIL ON • Default to 5th gear • Default to 3rd only, when the selector lever is shifted into REVERSE then back into DRIVE • Maximum line pressure • DTC P0753 may set	GO to Pinpoint Test A .
P0977	SSB	SSB control circuit high	The PCM detected voltage on the SSB circuit. Short to power or open circuit.	• MIL ON • Default to 3rd and 5th gear • Harsh 1st to 3rd shift • Maximum line pressure • DTC P0758 may set	GO to Pinpoint Test A .
P0979	SSC	SSC control circuit low	The PCM detected 0 volts on the SSC circuit. Short to ground detected.	• MIL ON • Default to 5th gear • Maximum line pressure • DTC P0763 may set	GO to Pinpoint Test A .
P0980	SSC	SSC control circuit high	The PCM detected voltage on the SSC circuit. Short to power detected.	• MIL ON • 2nd and 6th gears disabled • Harsh 1st to 3rd shift • Maximum line pressure • DTC P0763 may set	GO to Pinpoint Test A .
P0982	SSD	SSD control circuit low	The PCM detected 0 volts	• MIL ON • Default to 5th	GO to Pinpoint Test A .

repair4less

			on the SSD circuit. Short to ground detected.	gear • Default to 3rd only, when the selector lever is shifted into REVERSE then back into DRIVE • Maximum line pressure • DTC P0768 may set	
P0983	SSD	SSD control circuit high	The PCM detected voltage on the SSD circuit. Short to power detected.	• MIL ON • Disable 1st, 2nd and 3rd gear • Poor launch performance • Maximum line pressure • DTC P0768 may set	GO to Pinpoint Test A .
P0984	SSE	SSE control circuit range/performance	The PCM commanded SSE ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0771 and/or P0772 will set	DTC P0984 is a non-electrical DTC. CLEAR the DTCs. REPAIR the more specific DTC first. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P1001	PCM	Key ON Engine Running (KOER) not able to complete, KOER aborted	The KOER self-test was unable to complete and aborted.	• —	REFER to, Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1397	PCM	System voltage out of self-test range	The PCM detected that system voltage is out of self-test range of 11 to 18 volts, during the Key ON Engine OFF (KOEO) or KOER .	• —	CLEAR the DTC. RERUN the KOEO and KOER self test. If the DTC returns, REFER to Section 414-00 .
P1501	PCM	Vehicle Speed Sensor (VSS) out of self-test range	The PCM detected a VSS signal during the self-test.	• Self-test aborted	CLEAR the DTC. With the selector lever in the Park position, RERUN the self-test. If the DTC returns, REFER to Powertrain

					Control/Emissions Diagnosis (PC/ED) manual.
P1502	PCM	VSS intermittent	Intermittent VSS fault keeps disabling engine monitors.	• Can not complete engine monitors	REFER to, Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1635	PCM	Tire/Axle out of acceptable range	The tire, axle or the combination of tire and axle are out of the certified range. Calibration was not updated.	• MIL ON • PCM will use a default tire and axle calibration	REFER to, Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1636	PCM	Inductive signature chip communication error	The PCM lost communication with an internal chip that controls the solenoid states and fault reporting.	• MIL ON • Default to 3rd or 5th gear • Maximum line pressure • Poor launch performance	REPLACE the PCM, REFER to Section 303-14 . After installing the new PCM, PROGRAM it with the latest calibration and PERFORM the Solenoid Body Strategy Data Download. REFER to Solenoid Body Strategy in this section. ROAD TEST the vehicle and PERFORM the Adaptive Drive Cycle, REFER to Shift Point Road Test in this section.
P163E	PCM	PCM programming error	The PCM has detected an invalid checksum.	• MIL ON • Default to 1st or 3rd gear • Maximum line pressure	REPROGRAM the original PCM with the latest calibration. CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REPLACE the PCM. REFER to Section 303-14 . After installing the new PCM, PROGRAM it with the latest calibration and PERFORM the Solenoid Body Strategy Data Download. REFER to Solenoid Body Strategy in this section. ROAD TEST the vehicle

repair4less

					and PERFORM the Adaptive Drive Cycle, REFER to Shift Point Road Test in this section.
P163F	PCM	Transmission ID block corrupted, not programmed	The PCM has detected an invalid transmission identification.	• MIL ON • Default to 1st or 3rd gear • Maximum line pressure	REPROGRAM the original PCM with the latest calibration. CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REPLACE the PCM. REFER to Section 303-14 . After installing the new PCM, PROGRAM it with the latest calibration and PERFORM the Solenoid Body Strategy Data Download. REFER to Solenoid Body Strategy in this section. ROAD TEST the vehicle and PERFORM the Adaptive Drive Cycle, REFER to Shift Point Road Test in this section.
P1700	Transmission	Transmission intermittent failure (failed to neutral)	Main control body issue where the multiplex valve reverse pressure bleeds off to slow and causes the multiplex valve to get stuck in the wrong state.	• Wrench light illuminated • Neutral condition when 1st gear commanded	DTC P1700 is a non-electrical DTC. CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P1702	TR sensor	TR sensor circuit intermittent	The PCM detected a TR sensor signal duty cycle is not out of range but is invalid.	• Wrench light illuminated • DTC P0705, P0706, P0707, P0708 and/or P0709 may set	REPAIR the more specific DTC first. GO to Pinpoint Test C .
P1705	TR sensor	TR sensor circuit did not indicate PARK/NEUTRAL during the self-test.	The TR sensor circuit did not indicate PARK/NEUTRAL during KOEO or KOER self-test.	• —	CLEAR the DTC. RERUN the KOEO and KOER self test. If DTC returns. GO to Pinpoint Test C .
P1711	TFT sensor	TFT sensor out of	The PCM did not	• —	CLEAR the DTC.

		self-test range	receive a TFT sensor input during the KOEO or KOER self-test that was within -1.11°C to 104°C (30°F to 220°F) during the self-test.		RERUN the KOEO and KOER self-test. If DTC returns GO to Pinpoint Test B .
P1744	TCC	TCC solenoid circuit	The PCM detected that the TCC solenoid is stuck ON or stuck OFF.	• Wrench light illuminated • DTC P0741 and/or P2758 may set	DTC P1744 is a non-electrical DTC. REPAIR the more specific DTC first. CLEAR the DTCs. TEST the system for normal operation. If the DTCs return, REFER to Diagnosis By Symptom in this section.
P1780	Transmission Control Switch (TCS)	TCS (Tow/Haul) circuit out of self-test range	The PCM did not receive a TCS input during the KOER self-test.	• Disable Tow/Haul function	CLEAR the DTC. RERUN KOER self-test. If DTC returns, REFER to Section 307-05 .
P1783	Transmission	Transmission overtemperature condition	The PCM detected a transmission temperature greater than 135° C (275°F) for more than 5 seconds.	• Wrench light illuminated • TCC commanded on early	CLEAR the DTC. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P1921	TR sensor	TR signal	The PCM detected a TR sensor signal duty cycle out of range.	• Engine will not crank • DTCs P1705, P0706, P0707, P0708 and/or P0709 may set	REPAIR the more specific DTC first. GO to Pinpoint Test C .
P2700	Transmission	Transmission friction element A apply time range/performance	The PCM commanded SSA ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0751 and/or P0752 will set	DTC P2700 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2701	Transmission	Transmission friction element B apply time range/performance	The PCM commanded SSB ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0756 and/or P0757 will set	DTC P2701 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.

repair4less

P2702	Transmission	Transmission friction element C apply time range/performance	The PCM commanded SSC ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0761 and/or P0762 will set	DTC P2702 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2703	Transmission	Transmission friction element D apply time range/performance	The PCM commanded SSD ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0766 and/or P2704 will set	DTC P2703 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2704	Transmission	Transmission friction element E apply time range/performance	The PCM commanded SSE ON or OFF but detected a ratio error (mechanical failure).	• Wrench light illuminated • DTC P0766 and/or P0767 will set	DTC P2704 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2705	Transmission	Transmission friction element F apply time range/performance	The One-Way Clutch (OWC) failed OFF (OWC failure).	• Wrench light illuminated • Neutral condition when 1st gear is commanded • Poor launch performance • Harsh engagements	DTC P2704 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2758	TCC	TCC pressure control solenoid stuck ON	The PCM commanded the TCC solenoid OFF but the TCC did not release (mechanical error).	• Wrench light illuminated • Engine stalls or is lugging • DTC P1744 may set	DTC P2758 is a non-electrical DTC. REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2760	TCC	TCC pressure control solenoid intermittent	The TCC solenoid control circuit shorted to ground 3 times without setting DTC P0742.	• TCC disabled • Poor launch performance • Default to 5th gear	CLEAR the DTC. TEST the system for normal operation. If the DTC returns, GO to Pinpoint Test A .

repair4less

Diagnostics

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. The most important things to remember is there is a definite procedure to follow. Do not take shortcuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostic (OBD) with Scan Tool

These self-tests should be used to diagnose the PCM and should be carried out in order.

NOTE: Make sure the latest software version is loaded on the scan tool.

1. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC to the VCM .

2. If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No power to the scan tool.

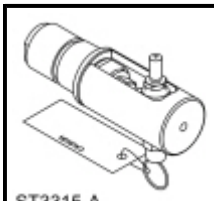
3. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the RUN position.
   - verify scan tool operation with a known good vehicle.
   - refer to Section 418-00 , The PCM does not respond to the scan tool.

4. Carry out the network test:

- If the scan tool responds with no communication from one or more modules, refer to Section 418-00 , No High Speed Controller Area Network (CAN) communication, all modules are not responding.
- If the network test passes, retrieve and record the continuous memory DTCs.

5. Clear the continuous DTCs and carry out the PCM self-test.

6. If DTCs retrieved are related to the concern, GO to the DTC Chart.



7. If no DTCs related to the concern are retrieved, REFER to Diagnosis By Symptom in this section.

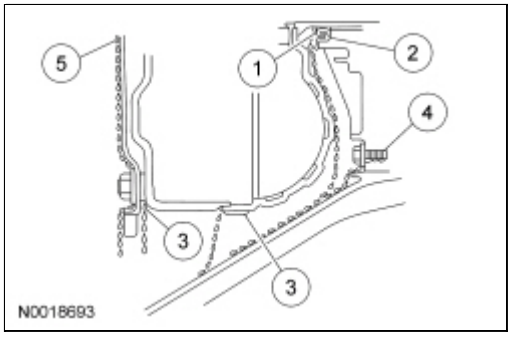
Leakage Inspection

Special Tool(s)

 ST3315-A	Leak Tester, Torque Converter 307-691

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	—



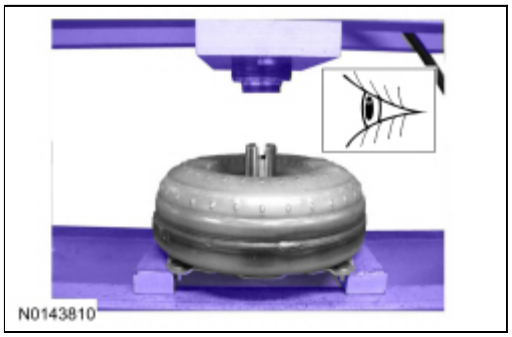
Leak Check Test

NOTE: When diagnosing transmission leaks, the source of the leak must be positively identified prior to repair. If the vehicle is driven extensively between adding the fluorescent additive and performing the leak test, the leaking oil can spread and make identifying the location of the leak difficult.

1. Clean off any transmission fluid from the top and bottom of the torque converter housing, the front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a nonflammable solvent and blow dry with compressed air.

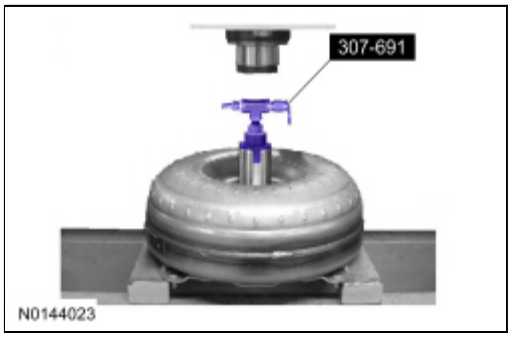
2. Add Dye-Lite® ATF Power Steering Fluid Leak Detection Dye to the transmission fluid. Use one 30 ml (1 fl. oz) of dye solution for every 3.8 L (4 qt) of transmission fluid.

3. Start and run the engine until the transmission reaches its normal operating temperature. Raise the vehicle on a hoist and run the engine occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transmission. Using a black light, observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Run the engine until transmission fluid leakage is evident and the probable source of leakage can be determined.



4. If the source of the leak is obvious, repair as required. Leaks from the torque converter housing can originate from several locations. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 steps following correspond with the numbers in the illustration.
    1. Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure, transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.
    2. Transmission fluid leakage by the outside diameter of the converter impeller hub seal and the case will follow the same path that leaks by the ID of the converter hub seal follow.
    3. Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.
    4. Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.
    5. Engine oil leaks from the rear main oil.

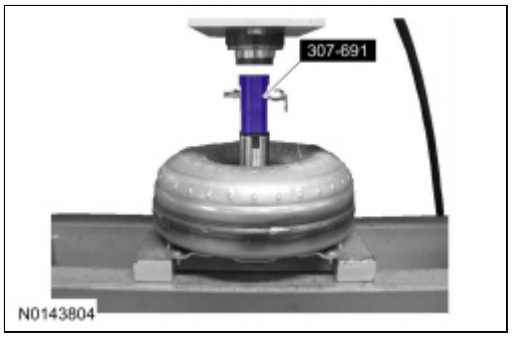
5. Remove the torque converter.



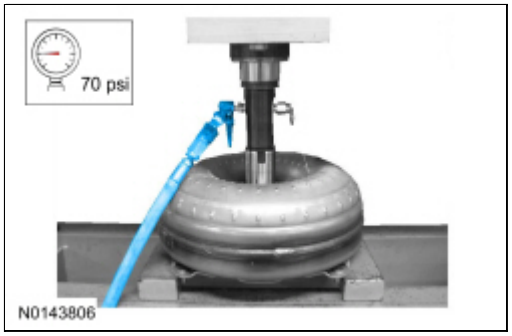
6. Using a black light, observe the torque converter housing. Inspect for evidence of dye from the pump bolts, pump seal, and torque converter hub seal. Repair as required.

7. If the source of the leak is not evident, continue with this procedure to leak test the torque converter.

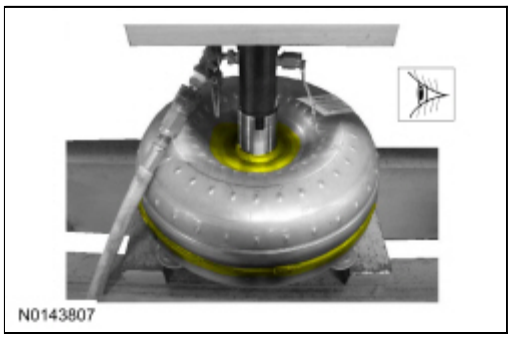
8. Install the torque converter in the arbor press. Support the torque converter on the mounting pads.



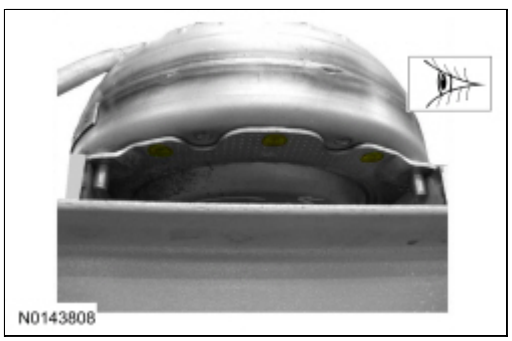
9. Install the Leak Tester, Torque Converter 307-691 into the torque converter hub. Tighten to 25 Nm.



10. Secure the press. Only apply enough force from the press to seal the Leak Tester, Torque Converter 307-691 into the torque converter hub.



repair4less



11. Connect a compressed air supply to the Leak Tester, Torque Converter 307-691.

12. With air pressure applied to valve, inspect for leaks at the converter hub weld and seams. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

13. With air pressure applied to valve, inspect for leaks at the stud or mounting pad and balance weight welds. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

14. After leaks are repaired, clean the remaining transmission fluid dye from serviced areas.

---

repair4less

Output State Control (OSC) Mode

On-Board Diagnostic (OBD)

Output state control allows the technician to take control of certain parameters to function the transmission.

Output state control allows the technician to shift the transmission when commanding a gear change.

Another example of the output state control features is, the technician can command the torque converter ON or OFF to check operation.

This transmission output state control has one mode of operation; DRIVE. This mode has a unique set of operating requirements that the technician must meet before allowed to operate the torque converter or select gears.

Pinpoint Tests — OSC Equipped Vehicle

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

When the electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

Power is routed through the Transmission Solenoid Power Control (TSPC) relay (inside the PCM) to all transmission solenoids. If the power circuit to the transmission solenoids or the TSPC relay fails open, then all solenoids are failed electrically OFF. CHECK for open, short to ground or the transmission connector disconnected. The TSPC relay will disable power to the transmission solenoids when certain transmission DTCs are set.

Shift Solenoid Pre-Diagnosis

Solenoid Operation Chart

Selector Lever Position	PCM Commanded Gear	Shift Solenoid					TCC NL
		SSA NL (1,2,3,4)	SSB NH (3,5,R)	SSC NL (CB 2,6)	SSD NH (CB L,R/C 4,5,6)	SSE NC

[a] Solenoid state will change if vehicle is moving forward with the selector lever in the NEUTRAL position.
[b] Solenoid is On when vehicle is above 3 mph.
[c] All gears available upon driver request.

CB = Clutch brake

NC = Normally closed

NH = Normally high

NL = Normally low

Pinpoint Tests

Refer to Wiring Diagrams Cell 30 for schematic and connector information.

NOTE: Refer to all TSBs and On-Line Automotive Service Information System (OASIS) messages that pertain to the transmission concern and follow the procedure as described.

NOTE: Vehicles equipped with a 3.7L engine use PCM C175T.

NOTE: Vehicles equipped with a 5.0L or 6.2L engine use PCM C1381T.

NOTE: Vehicles equipped with a 3.5L engine use PCM C1551E.

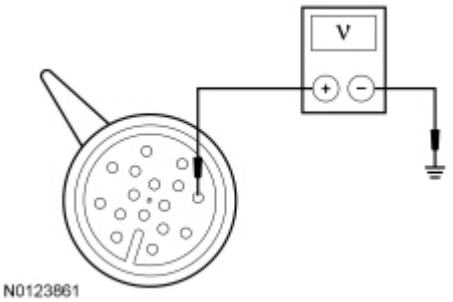
PINPOINT TEST A: TRANSMISSION CONTROL SOLENOIDS

NOTE: Refer to the Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to the Transmission Leadframe Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: If the scan tool is unable to access the transmission PIDs, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: Read and record all DTCs.



NOTE: Without a voltage signal return to the PCM, the Transmission Solenoid Power Control (TSPC) relay is commanded OFF. By using a fused jumper between a transmission solenoid control circuit and the signal return circuit, the TSPC relay circuit will supply power to the transmission solenoids when the ignition is cycled from OFF to ON. Do not use a solenoid control circuit that may be at fault, refer to Diagnostic Trouble Code (DTC) Charts in this section for a fault listing.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

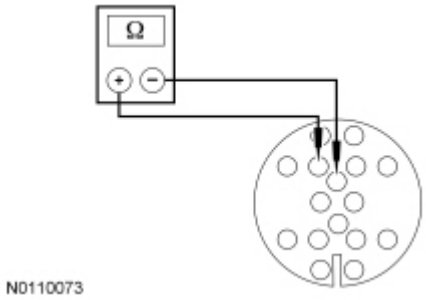
NOTE: Refer to the Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to the Transmission Leadframe Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: If the scan tool is unable to access the transmission PIDs, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.



NOTE: Read and record all DTCs.

Test Step	Result / Action to Take
C1 VERIFY DTCs	
• Ignition OFF. • Select PARK. • Connect the scan tool. • Carry out the Key ON Engine OFF (KOEO) then the Key ON Engine Running (KOER) test. DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and P1921 cannot be set by an incorrectly adjusted selector lever cable. • **Are Transmission Range (TR) sensor DTCs present?**	**Yes** GO to C3. **No** GO to C2.
C2 VERIFY SELECTOR LEVER CABLE/LINKAGE ADJUSTMENT	
• Verify the selector lever cable is correctly adjusted. Refer to Section 307-05. • **Is the selector lever cable correctly adjusted?**	**Yes** GO to C3. **No** ADJUST the selector lever cable. REFER to Section 307-05.
C3 CHECK TR SENSOR ELECTRICAL OPERATION	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: TR PIDs: TR_DC and TR_FREQ . • Move the selector lever into each range and stop. • Observe the following PIDs: TR_DC and TR_FREQ while wiggling the harness or driving the vehicle. • Compare the PID: TR_DC to the selector lever position duty cycle, using the following chart. **Selector Lever Position / Range (% Duty Cycle)** P: 8.0 — 25.8 R: 30.50 — 39.31 N: 40.54 — 52.49 D: 54.35 — 71.15 M: 65.15 — 82 2: 70.55 — 85.61 1: 75.25 — 88.91 • **Is the TR_FREQ between 100 to 150 Hz?** **Is the TR_DC within range?** **Does the TR_DC and TR_FREQ remain steady when the harness is wiggled or the vehicle driven?**	**Yes** The problem is not in the TR sensor system. REFER to Diagnosis By Symptom in this section for further diagnosis. **No** GO to C4 .
C4 CHECK TR SENSOR VPWR CIRCUIT FOR POWER • Ignition OFF. • Disconnect: Transmission Vehicle Harness C1575 . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Ignition ON. • Measure the voltage between the transmission vehicle harness C1575-12, circuit LE111 (VT/GN) harness side and ground.  • **Is the voltage less than 9.5 volts?**	**Yes** INSPECT and REPAIR the transmission vehicle harness circuit LE111 (VT/GN) for an open. If an open circuit is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. CLEAR the DTCs. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK TR SENSOR SIGNAL CIRCUIT • Measure the voltage between the transmission vehicle harness C1575-4, circuit VET32 (VT) harness side and ground.	**Yes** GO to C6 . **No**

repair4less

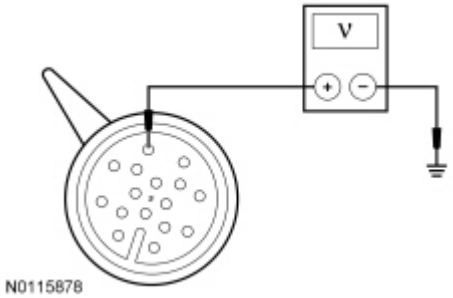
 N0115875 • **Is the voltage greater than 4.8 volts?**	INSPECT and REPAIR vehicle harness circuit VET32 (VT) for an open. If an open circuit is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. CLEAR the DTCs. TEST the system for normal operation.
C6 CHECK TR SENSOR GROUND CIRCUIT	
• Measure the voltage between the transmission vehicle harness C1575-4 circuit VET32 (VT) and C1575-11 circuit RET24 (BN/BU).  N0115876 • **Is the voltage greater than 4.8 volts?**	**Yes** GO to C7 . **No** INSPECT and REPAIR transmission vehicle harness circuit RET24 (BN/BU) for an open. If an open circuit is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. CLEAR the DTCs. TEST the system for normal operation.
C7 CHECK TR SENSOR POWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175T . • Disconnect: PCM C1381T . • Disconnect: PCM C1551E . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Measure the resistance between the transmission vehicle harness C1575-4 circuit VET32 (VT) and ground.  N0122442 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C8 . **No** REPAIR transmission vehicle harness circuit VET32 (VT) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
C8 CHECK TR SENSOR CIRCUITS FOR A SHORT TO POWER	

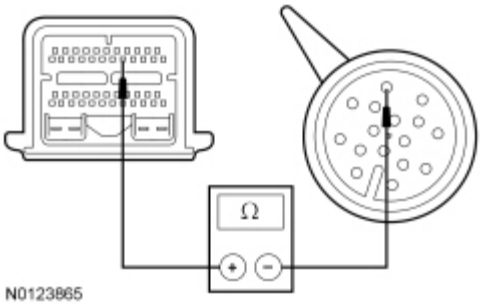
• Connect: PCM C175T . • Connect: PCM C1381T . • Connect: PCM C1551E . • Ignition ON. • Measure the voltage between the transmission vehicle harness C1575-4, circuit VET32 (VT) and C1575-11, circuit RET24 (BN/BU) to ground.  • **Is voltage greater than 9.8 volts?**	**Yes** REPAIR the transmission vehicle harness circuit which measured greater than 9.8 volts. CLEAR the DTCs. TEST the system for normal operation. **No** GO to C9 .
C9 CHECK TR SENSOR TO MANUAL VALVE	
• Drain the transmission fluid and remove the transmission fluid pan. Refer to Fluid Pan, Gasket and Filter in this section. • Check the connection between the TR sensor and the manual control valve. Refer to Transmission — Early Build or Transmission — Late Build in this section. • Inspect the molded leadframe for metallic contamination, refer to Shift Solenoids (SS) . • **Is the TR sensor connected to the manual control valve shaft?**	**Yes** REPLACE molded leadframe. REFER to Shift Solenoids in this section. **No** CONNECT the TR sensor to the manual control valve, REFER to Transmission — Early Build or Transmission — Late Build in this section. CLEAN any debris from the molded leadframe. RUN the Key ON Engine OFF (KOEO) self-test. If DTCs return, REPLACE the molded leadframe, REFER to Shift Solenoids (SS) in this section.

PINPOINT TEST D: TSS SENSOR

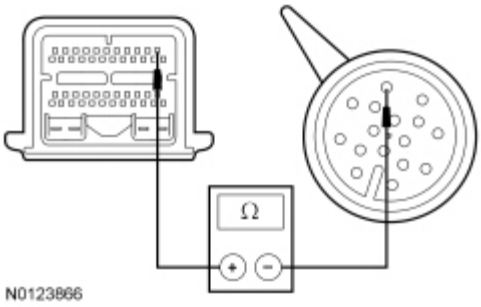
NOTE: Refer to the Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

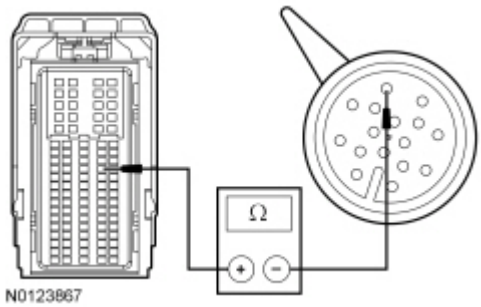
NOTE: Refer to the Transmission Leadframe Connector illustration within the Transmission Connector Layouts procedure in this section.

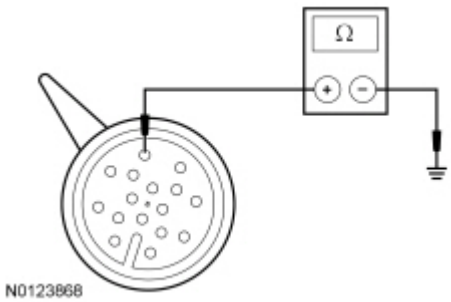




NOTE: If the scan tool is unable to access the transmission PIDs, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

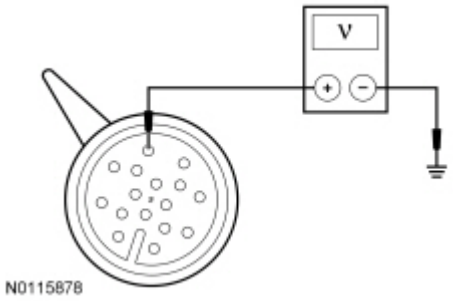


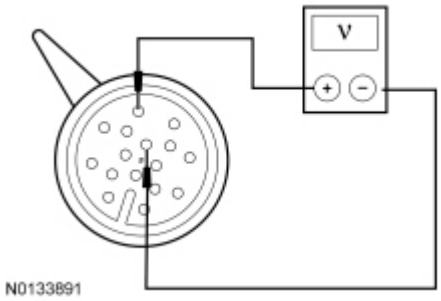




NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: Read and record all DTCs.





NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

repair4less

Test Step	Result / Action to Take
D1 DRIVE CYCLE TEST	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: TSS PID: TSS_SRC . • Monitor the TSS_SRC PID while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears. • **Does the TSS sensor rpm increase and decrease with engine rpm and vehicle speed?**	**Yes** REFER to Shift Point Road Test in this section for further diagnosis. **No** GO to D2 .
D2 CHECK TSS SENSOR SIGNAL CIRCUIT FOR POWER	
• Ignition OFF. • Disconnect: Transmission Vehicle Harness C1575 . • Ignition ON. • Measure the voltage between the transmission vehicle harness C1575-1 and ground.  • **Is the voltage less than 4.8 volts?**	**Yes** GO to D3 . **No** GO to D6 .
D3 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175T . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Vehicles equipped with a 3.7L engine, measure the resistance between the transmission vehicle harness C1575-1 circuit VET33 (WH/OG) and PCM C175T-16.  • Disconnect: PCM C1381T . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or	**Yes** GO to D4 . **No** INSPECT and REPAIR transmission vehicle harness TSS signal circuit for an open. If an open circuit is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation.

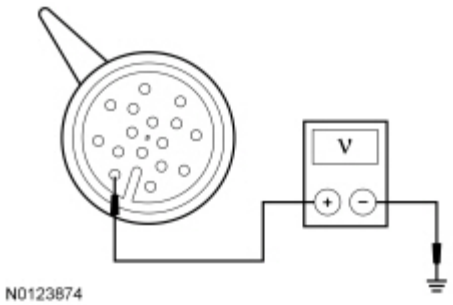
damaged seals. • Vehicles equipped with a 5.0L or 6.2L engine, measure the resistance between the transmission vehicle harness C1575-1 circuit VET33 (WH/OG) and PCM C1381T-1.  • Disconnect: PCM C1551E . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Vehicles equipped with a 3.5L engine, measure the resistance between the transmission vehicle harness C1575-1 circuit RET33 (WH/VT) and PCM C1551E-27.  • **Is the resistance less than 5 ohms?**	
D4 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the transmission vehicle harness C1575-1 and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D5 . **No** INSPECT and REPAIR transmission vehicle harness TSS signal circuit for a short to ground. If a short to ground is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation.
D5 CHECK THE TSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO POWER	

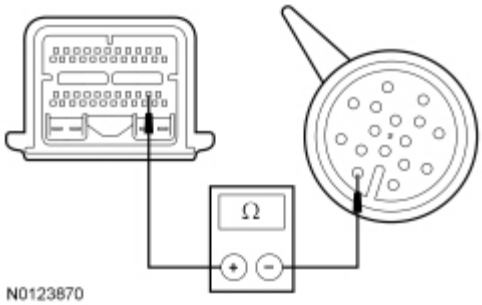
repair4less

• Connect: PCM C175T . • Connect: PCM C1381T . • Connect: PCM C1551E . • Ignition ON. • Measure for voltage between the transmission vehicle harness C1575-1, and ground.  • **Is voltage greater than 5.1 volts?**	**Yes** INSPECT and REPAIR transmission vehicle harness TSS signal circuit for a short to power. If a short to power is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation. **No** GO to D6 .
D6 CHECK THE TSS SENSOR GROUND CIRCUIT	
• Measure the voltage between the transmission vehicle harness C1575-1 and C1575-5.  • **Is voltage less than 4.8 volts?**	**Yes** REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, REPLACE the PCM, REFER to Section 303-14 . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation. **No** REPLACE the molded leadframe, REFER to Shift Solenoids (SS) in this section. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST E: OSS SENSOR

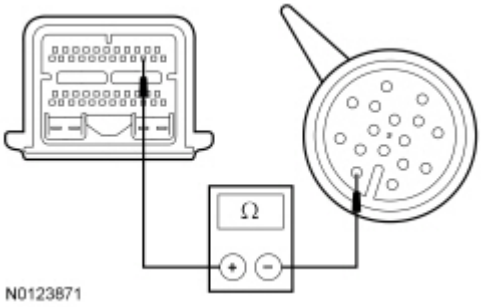
NOTE: Refer to the Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

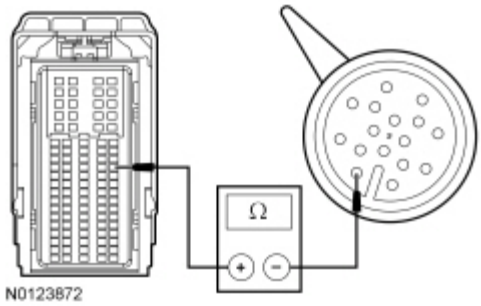


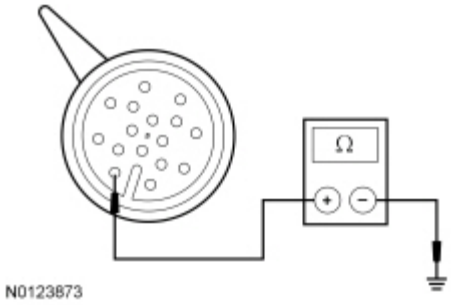


NOTE: Refer to the Transmission Leadframe Connector illustration within the Transmission Connector Layouts procedure in this section.

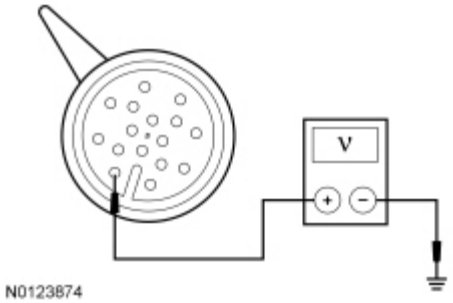
NOTE: If the scan tool is unable to access the transmission PIDs, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

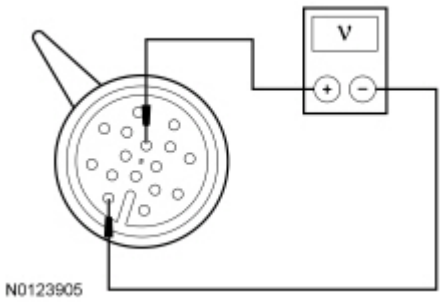






NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.





NOTE: Read and record all DTCs.

NOTE: If DTCs P0705, P0706, P0707, P0708, P0709, P1702, P1705 and/or P1921 are set, diagnose those DTCs first.

Test Step	Result / Action to Take
E1 DRIVE CYCLE TEST	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: OSS PID: OSS_SRC . • Monitor the Output Shaft Speed (OSS) sensor PID while road testing the vehicle. Drive the vehicle so the transmission upshifts and downshifts through all the gears. • **Does the OSS sensor rpm increase and decrease with engine rpm and vehicle speed?**	**Yes** REFER to Shift Point Road Test in this section for further diagnosis. **No** GO to E2 .
E2 CHECK OSS SENSOR SIGNAL CIRCUIT FOR POWER	
• Ignition OFF. • Disconnect: Transmission Vehicle Harness C1575 . • Ignition ON. • Measure the voltage between the transmission vehicle harness C1575-15 and ground.  N0123874 • **Is the voltage less than 4.8 volts?**	**Yes** GO to E3 . **No** GO to E6 .
E3 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175T . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Vehicles equipped with a 3.7L engine, measure the resistance between the transmission vehicle harness C1575-15 circuit VET26 (BN/GN) and PCM C175T-25.  N0123870 • Disconnect: PCM C1381T . • Inspect the connector for damaged or pushed out	**Yes** GO to E4 . **No** INSPECT and REPAIR transmission vehicle harness OSS signal circuit for an open. If an open circuit is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation.

repair4less

terminals, corrosion, loose wires and missing or damaged seals. • Vehicles equipped with a 5.0L or 6.2L engine, measure the resistance between the transmission vehicle harness C1575-15 circuit VET26 (BN/GN) and PCM C1381T-14.  • Disconnect: PCM C1551E . • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Vehicles equipped with a 3.5L engine, measure the resistance between the transmission vehicle harness C1575-15 circuit RET04 (YE/OG) and PCM C1551E-12.  • **Is the resistance less than 5 ohms?**	
E4 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the transmission vehicle harness C1575-15 and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E5 . **No** INSPECT and REPAIR transmission vehicle harness OSS signal circuit for a short to ground. If a short to ground is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation.
E5 CHECK THE OSS SENSOR SIGNAL CIRCUIT FOR	

A SHORT TO POWER	
• Connect: PCM C175T . • Connect: PCM C1381T . • Connect: PCM C1551E . • Ignition ON. • Measure for voltage between the transmission vehicle harness C1575-15, and ground.  • **Is voltage greater than 5.1 volts?**	**Yes** INSPECT and REPAIR transmission vehicle harness OSS signal circuit for a short to power. If a short to power is not found, REPLACE the PCM, REFER to Section 303-14 . PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation. **No** GO to E6 .
E6 CHECK THE OSS SENSOR GROUND CIRCUIT	
• Measure the voltage between the transmission vehicle harness C1575-15 and C1575-5.  • **Is voltage less than 4.8 volts?**	**Yes** REPAIR the transmission vehicle harness signal return circuit for an open. If an open is not found, REPLACE the PCM, REFER to Section 303-14 . PROGRAM the PCM with the latest calibration level. PERFORM the Solenoid Body Strategy Data Download procedure. REFER to Solenoid Body Strategy in this section. TEST the system for normal operation. **No** REPLACE the molded leadframe, REFER to Main Control in this section. CLEAR the DTCs. TEST the system for normal operation.

repair4less

Preliminary Inspection

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

Check the following items prior to beginning the diagnostic procedures:

Know and Understand the Concern

To correctly diagnose a concern, first understand the customer concern or condition. Customer contact may be required to understand the conditions, including when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to Verification of Condition.

Verification of Condition

This section provides information that must be used in determining the actual cause of customer concerns and carrying out the appropriate procedures.

Use the following procedures when verifying customer concerns for the transmission.

Determine Customer Concern

repair4less

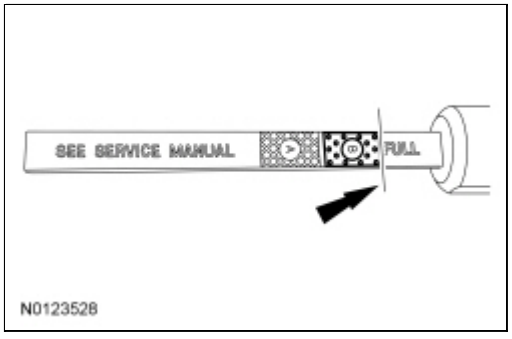
Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperature
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshifting
- Downshifting
- Coasting
- Engagement
- Noise/vibration — check for engine rpm, vehicle speed, shift, gear, range or temperature dependencies.

Check Transmission Fluid Level and Condition

Transmission Fluid Level Check

NOTICE: **The vehicle should not be driven if the transmission fluid level is low. Internal transmission failure could result.**



NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTE: If the vehicle is operated for an extended period at high highway speeds, in city traffic, during hot weather, or while pulling a trailer, allow the transmission fluid to cool down to obtain an accurate reading.

NOTE: If the transmission starts to slip, shifts slowly, or shows signs of transmission fluid leaking, check the transmission fluid level.

This transmission is equipped with an internal thermal bypass located in the case. This internal thermal bypass valve shuts off transmission fluid flowing to the transmission fluid cooler if the transmission fluid temperature falls below normal operating temperature. Refer to Transmission Fluid Level Check in this section.

The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched area (labeled A) and a dotted area (labeled B). Use the dotted (labeled B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted marks on the transmission fluid level indicator.

High Transmission Fluid Level

NOTICE: **Transmission fluid level that is too high can cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This may cause erratic control pressure, foaming, loss of transmission fluid through the vent tube, and possible transmission failure.**

If an overfill reading is indicated on the transmission fluid level indicator, remove the excess transmission fluid. Refer to Transmission Fluid Level Check in this section.

Low Transmission Fluid Level

Low transmission fluid level can result in poor transmission engagement, slipping, or failure. This may also indicate a leak in one of the transmission seals or gaskets.

Adding Transmission Fluid

NOTICE: **The use of any type of transmission fluid other than specified can result in transmission failure.**

NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTICE: **The vehicle should not be driven if the transmission fluid level is low. Internal failure could result.**

Add transmission fluid using the refill procedure. Refer to Transmission Fluid Drain and Refill in this section.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Remove the transmission fluid fill plug and transmission fluid level indicator, allowing the transmission fluid to drip onto a facial tissue. Examine the stain.
3. Observe the color and the odor.
4. If evidence of solid material is found, remove the transmission fluid pan for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transmission. Inspect the engine cooling system at this time.
6. If transmission fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, disassemble and completely clean the transmission. This includes the torque converter and transmission fluid cooler tubes. Refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

Water in Transmission Fluid

To correctly repair an automatic transmission that has had water or coolant introduced into the system, completely disassemble, clean, and replace the following parts:

repair4less

- All internal and external seals
- All friction material
- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

Prior to installing the transmission, flush and clean the transmission fluid cooler(s) and the transmission fluid cooler tubes and hoses. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

Shift Point Road Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

This test verifies the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with the selector lever in the D position.
3. Apply minimum throttle and observe speeds when an upshift occurs. Refer to the Shift Speeds chart in this section.
4. With the selector lever in the D position and speed above 80 km/h (50 mph) and less than half throttle, move the selector lever from the D position to manual 2 position and release the accelerator pedal. The transmission should downshift into 2nd gear. With the transmission remaining in the manual 2 position, move the selector lever into the manual 1 position and release the accelerator pedal. The transmission should downshift into 1st gear at speeds below approximately 45-56 km/h (28-35 mph).
5. If the transmission fails to upshift/downshift, refer to Diagnosis By Symptom in this section.

Shift Speeds

Throttle Position	Shift	Km/H	MPH
Light Throttle	1-2	13-21	8-13
Throttle Position (TP) Sensor	2-3	26-34	16-21
Voltage @ 1.25 Volts	3-4	35-43	22-27
	4-5	56-64	35-40
	5-6	71-79	44-49
Closed Throttle	6-5	56-64	35-40
	5-4	40-48	25-30
	4-3	13-21	8-13
	3-2	3-11	2-7
	2-1	2-6	1-4
Wide Open Throttle (WOT)	1-2	45-53	28-33

repair4less

	2-3	87-95	54-59
	3-4	140-148	87-92

Road Test — Adaptive Drive Cycle

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

1. Connect the scan tool to the Data Link Connector (DLC).

2. **NOTE:** Disconnecting the battery will not clear the Keep Alive Memory (KAM).

   NOTE: Do not clear the PCM KAM .

   Using the scan tool, clear the adaptive table before conducting an adaptive drive cycle test.

3. Verify the transmission fluid is at normal operating temperature, between 91°-102°C (195°-215°F). If the transmission fluid is not at operating temperature, drive the vehicle until the operating temperature is reached.

4. **NOTE:** The transmission fluid must be at operating temperature before proceeding to this step.

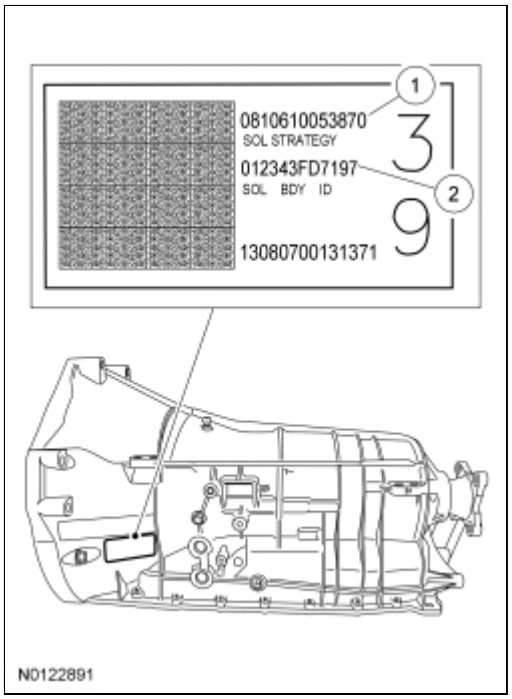
   Drive the vehicle on a level road surface performing the adaptive drive cycle.
   1. Accelerate from a stop with light throttle to 24 km/h (15 mph) then release the accelerator pedal.
   2. Gently brake and bring the vehicle to a stop and hold the brake for 6 seconds.
   3. Repeat substeps 1 and 2 an additional 5 times.
   4. Accelerate from a stop with light throttle so the 1-2, 2-3 and 3-4 shifts occur with engine rpm between 1,700-2,000.
   5. Continue accelerating until the vehicle speed reaches 80 km/h (50 mph) or the 5-6 upshift is reached.
   6. Gently brake and bring the vehicle to a stop and hold the brake for 10 seconds.
   7. Repeat substeps 4, 5 and 6 an additional 3 times.

repair4less

Solenoid Body Strategy

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

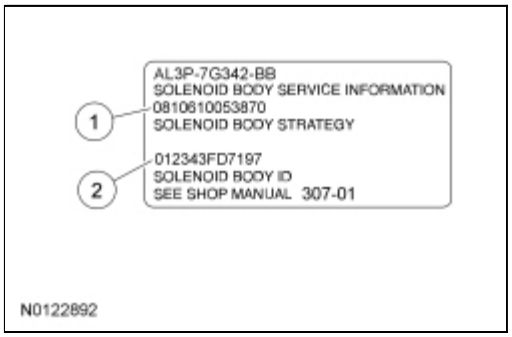


Solenoid Body Identification Procedure

1. Using the scan tool, select Powertrain, Transmission and Transmission Solenoid Body Identification from the toolbox icon and follow the instructions displayed on the scan tool.
   The solenoid body identification screen displays solenoid body identification information:
   - Solenoid body strategy 13-digits
   - Solenoid body identification 12-digits
     The next screen displays the current solenoid body identification and strategy data file stored in the PCM. If the solenoid body strategy field is blank, the module contains a partial transmission solenoid body strategy. This is due to a corrupt or missing file at the time the programmable parameters were completed.

NOTE: The 13-digit solenoid body strategy number consists of only numbers. Letters are not used.

2. Compare the solenoid body identification and strategy to the solenoid body identification tag located on the left side of the transmission case.



Solenoid Strategy Identification Tag

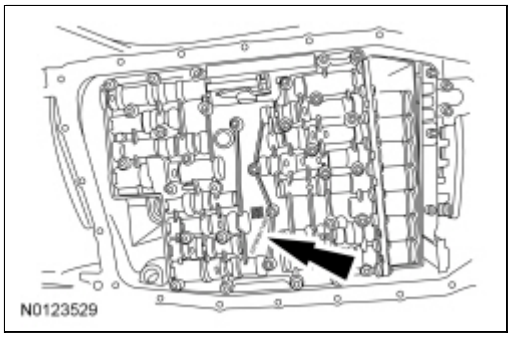
Item	Description
1	13-digit solenoid body strategy
2	12-digit solenoid body identification

3. If the solenoid body identification and strategy displayed on the scan tool match the solenoid body identification tag or replacement tag, then the solenoid body identification and strategy are correct for this transmission and a solenoid body strategy data download is not required. If the solenoid body identification tag or replacement tag is missing or damaged so it is not readable or does not match the identification or strategy displayed on the scan tool, remove the transmission fluid pan and filter and locate the 13-digit solenoid body strategy etched on the main control casting. For additional information, refer to Fluid Pan, Gasket and Filter in this section.

Replacement Solenoid Strategy Identification Tag

Item	Description
1	13-digit solenoid body strategy
2	12-digit solenoid body identification

4. ***NOTICE:*** **The 13-digit solenoid body strategy number displayed on the scan tool must match**



repair4less

the solenoid body strategy number etched on the main control. If the numbers do not match, damage to the transmission or driveability concerns can occur.

NOTICE: **If the new main control was not supplied with a replacement solenoid strategy identification tag, DO NOT INSTALL the main control as all required programming information will be missing.**

Compare the solenoid body strategy identification etched on the main control to the solenoid strategy identification tag on the transmission case. If the solenoid body strategy identification etched on the main control does not match the solenoid strategy identification tag then a solenoid body strategy data download is required. If the solenoid body strategy etched on the main control does match the solenoid strategy identification tag on the transmission case but does not match the solenoid body identification and strategy displayed on the scan tool, then a solenoid body strategy data download is also required.

Main Control Solenoid Body Strategy

Solenoid Body Strategy Data Download

1. Using the scan tool, select Module Programming and Programmable Parameters under the toolbox icon then select transmission. Follow the instructions displayed on the scan tool.
   There are fields to enter the 12-digit solenoid body identification and 13-digit solenoid body strategy recorded from the solenoid body.

2. ***NOTICE:*** **If the solenoid body information is not correct, transmission damage or driveability concerns can occur.**

   Enter the solenoid body identification and strategy.
   The scan tool verifies the numbers entered are valid and displays a message if the information is not valid.
   The scan tool checks to see if the file is present on the scan tool. If the file is present, the technician may proceed with downloading the file to the PCM. If the file is not present, the scan tool will need to be connected to the Professional Technician Society (PTS) server to download the file onto the scan tool.

3. Verify the file is present on the scan tool. If the file is present, go to Step 8. If the file is not present, continue with this procedure.

4. Connect the scan tool to the PTS server.

5. Follow the instructions on the network to download the strategy file to the scan tool.

6. If the scan tool cannot connect to the PTS server, download the file from www.motorcraft.com.

If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

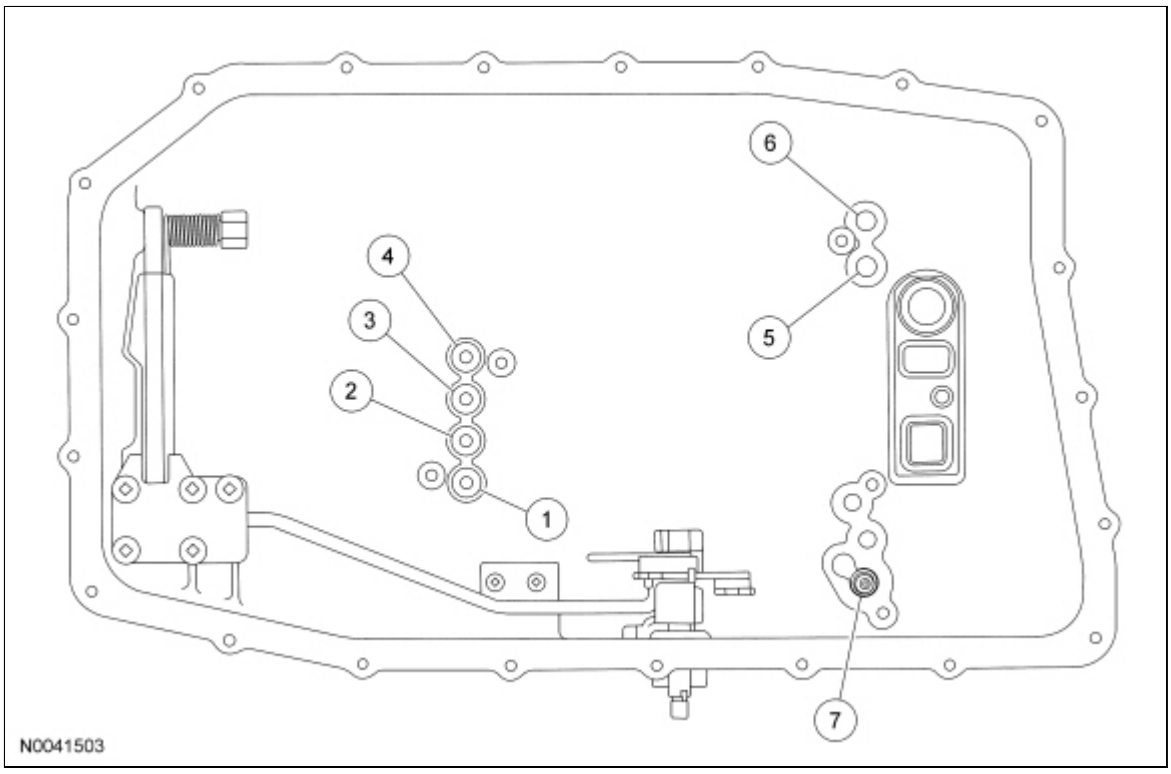
7. Reconnect the scan tool to the vehicle.

8. Follow the instructions displayed on the scan tool.

9. If a new solenoid body was installed, compare the 12-digit identification and the 13-digit strategy fields from the solenoid body to the replacement solenoid body tag provided with the solenoid body service kit and place it over the existing identification tag.
The scan tool automatically downloads the strategy file or partial strategy file to the PCM. The scan tool displays a message when it is finished downloading the data that states that the file was downloaded successfully.

10. ***NOTICE:*** **The customer may feel erratic shifts and driveability concerns if the adaptive drive cycle has not been performed.**

    Road test the vehicle following the Adaptive Drive Cycle. For additional information, refer to Shift Point Road Test in this section.



---

repair4less

Special Testing Procedures

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission.

Air Pressure Test

Item	Description
1	Intermediate clutch (C) port
2	Low/reverse clutch (D1) port
3	Not used
4	Direct clutch (B) port
5	Overdrive clutch (E) port
6	Forward clutch (A) port
7	Thermal bypass valve

A no-drive condition can exist with correct transmission fluid pressure because of inoperative clutches. Refer to the Clutch Application Chart to determine the appropriate elements. A clutch concern can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the concern.

Example: When the selector lever is in a forward gear range, a no-drive condition may be caused by an inoperative clutch.

1. Drain the transmission fluid. Remove the transmission fluid pan.

2. Remove the transmission fluid filter, seal assembly and mechatronic unit.

3. Locate the inoperative clutches by applying air pressure into the appropriate clutch port.

4. Apply air pressure to the appropriate clutch port. A dull thud may be heard or movement felt when a clutch piston is applied. If the clutch seals or check ball are leaking, a hissing sound may be heard.

5. If the clutches fail to operate during the air check:
    - the piston seals are not seated, damaged or installed incorrectly.
    - plugged feed holes for clutch apply in the case and/or clutch cylinder.
    - damaged piston and/or clutch cylinder.

6. Service as required and recheck.

---

repair4less

Torque Converter Diagnosis

Special Tool(s)

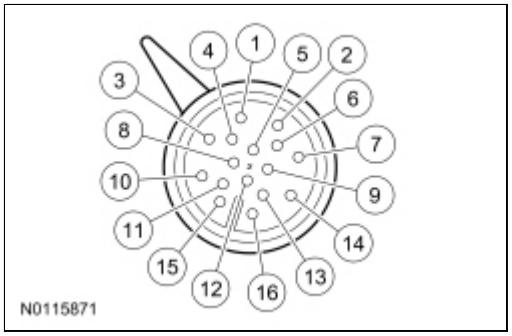
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: If the torque converter is replaced, use the scan tool and follow the on-screen instructions and perform the Misfire Monitor Neutral Profile Correction procedure.

Perform all diagnostic procedures prior to torque converter installation. This prevents the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Torque Converter Operation Test

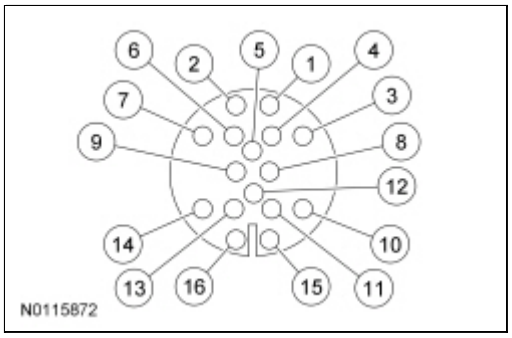
NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.



The Torque Converter Operation Test verifies the Torque Converter Clutch (TCC) control system and the torque converter are operating correctly.

1. Connect a scan tool to the vehicle.
2. Perform a self-test and check for DTCs.
3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds in the D position.
4. After normal operating temperature is reached, maintain a constant speed of about 56 km/h (35 mph) in 5th gear for 10 seconds.
5. Release the accelerator pedal and monitor the scan tool TP1 PID voltage to approximately 1.25 volts or 25% throttle.
6. Monitor the TCC_OSC# and RPM# PID. The torque converter should release and engine rpm should increase before the 5-4 shift occurs.

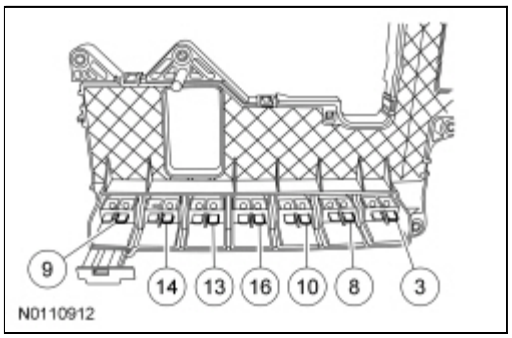
repair4less



Transmission Connector Layouts

Transmission Vehicle Harness

Item	Description
1	Turbine Shaft Speed (TSS) sensor
2	NOT USED
3	TCC control
4	Transmission Range (TR) sensor
5	Signal return
6	Transmission Fluid Temperature (TFT) sensor power
7	Ignition voltage
8	Shift Solenoid E (SSE) control
9	Shift Solenoid A (SSA) control
10	Shift Solenoid D (SSD) control
11	TR sensor signal return
12	Battery voltage
13	Shift Solenoid C (SSC) control
14	Shift Solenoid B (SSB) control
15	Output Shaft Speed (OSS) sensor
16	LPC solenoid control



Transmission Leadframe Connector

Item	Description
1	Turbine Shaft Speed (TSS) sensor
2	NOT USED
3	TCC control
4	Transmission Range (TR) sensor
5	Signal return
6	Transmission Fluid Temperature (TFT) sensor power
7	Ignition voltage
8	Shift Solenoid E (SSE) control
9	Shift Solenoid A (SSA) control
10	Shift Solenoid D (SSD) control
11	TR sensor signal return
12	Battery voltage
13	Shift Solenoid C (SSC) control
14	Shift Solenoid B (SSB) control
15	Output Shaft Speed (OSS) sensor
16	LPC solenoid control

Molded Leadframe

NOTE: Terminal 7 of the transmission leadframe connector is the common power feed to the solenoids listed in the following chart.

repair4less

Item	Description
3	Torque Converter Clutch (TCC) control
8	Shift Solenoid E (SSE) control
10	Shift Solenoid D (SSD) control
16	LPC solenoid control
13	Shift Solenoid C (SSC) control
14	Shift Solenoid B (SSB) control
9	Shift Solenoid A (SSA) control

Transmission Drive Cycle Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for a shift error DTC to set, and 5 times consecutively for continuous Torque Converter Clutch (TCC) DTCs to set.

NOTE: Refer to the Solenoid Application Chart for solenoid operation while performing the Transmission Drive Cycle Test.

After performing the self-test, follow the transmission drive cycle test for checking codes.

1. Record then clear the DTCs.
2. Warm the engine to normal operating temperature.
3. Make sure the transmission fluid level is correct.
4. With the selector lever in Overdrive (O/D), moderately accelerate from stop to 80 km/h (50 mph) allowing the transmission to shift into 6th gear. Keep vehicle speed and throttle steady for a minimum of 15 seconds.
5. With the transmission in 6th gear and maintaining steady speed and throttle, lightly apply and release the brake pedal to operate the stop lamps. Then, hold vehicle speed and throttle steady for a minimum of 5 seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat steps 4 through 6 at least 5 times.
8. Perform a self-test and record DTCs.

repair4less

- If DTCs are present, refer to the DTC Chart. Repair all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the self-test and the road test to verify the correction. Clear the DTCs. Perform the transmission drive cycle test and repeat the self-test after completing the repair.
- If the tests pass and a concern is present, refer to Diagnosis By Symptom in this section, OASIS messages and TSBs for concerns.

After On-Board Diagnostic (OBD)

NOTE: The vehicle wiring harness, PCM and non-transmission sensors may affect transmission operations. Repair these concerns first.

Repair all DTCs after the On-Board Diagnostic (OBD) test procedures are completed.

Begin with non-transmission related DTCs, then repair transmission related DTCs. Use the DTC Chart for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Diagnosis the vehicle wiring harness and the PCM as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual aids in diagnosing non-transmission electronic components.

Visual Inspection

A visual inspection identifies modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items
- Vehicle modification

PCM or transmission function is affected if add on devices, wiring splices, abnormal tire size or axle ratio changes are made.

- If leaks are present; refer to Leakage Inspection in this section.
- Correct selector lever adjustments; refer to Section 307-05 .

Selector Lever Check

Check for misadjustment in the selector lever by matching the detents in the selector lever with those of the manual control lever in the transmission. Refer to Section 307-05 for selector lever cable adjustment.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 for selector lever cable adjustment.

Check TSBs and On-Line Automotive Service Information System (OASIS)

Refer to all TSB and On-Line Automotive Service Information System (OASIS) messages that pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostic (OBD) Key ON Engine OFF (KOEO), Key ON Engine Running (KOER)

After a road test, with the engine and transmission warm and before disconnecting any connectors, use the scan tool and perform a self-test.

repair4less

Torque Converter Contamination Inspection

Material

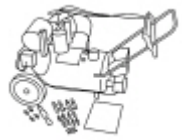
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - The torque converter stud or studs, impeller hub or bushing are damaged.
    - The torque converter exhibits external discoloration (due to overheating).
    - There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes.
        - Major metallic failure
        - Multiple clutch plates or band failures
        - Sufficient component wear which results in metallic contamination
        - Water or antifreeze contamination

2. If none of the above conditions are present, continue with the following fluid inspection.

3. Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.

4. Examine the fluid for contaminants. The fluid must be free of metallic contaminants.



5. ***NOTICE:*** **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur.**

   If the fluid passed inspection:
    - drain the remaining fluid from the torque converter.
    - using only the recommended transmission fluid, add 1.9L (2 qt) of clean fluid into the converter and agitate by hand.
    - thoroughly drain the fluid.

repair4less

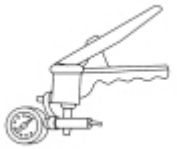
Transmission Fluid Cooler Backflushing and Cleaning

Special Tool(s)

 ST2971-A	Transmission Heated Cooler Line Flusher 222-00007, 222-00004 or equivalent

NOTICE: **Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail; this will affect the operation of the transmission.**

NOTE: Transmission fluid cooler backflushing and cleaning will be performed using the Transmission Heated Cooler Line Flusher or equivalent. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.



NOTE: If the Transmission Heated Cooler Line Flusher or equivalent is not available, install a new transmission fluid cooler and/or an auxiliary transmission fluid cooler.

1. Check and top off the fluid level of the cooler line flusher with transmission fluid.
2. Allow the transmission fluid in the cooler line flusher 15-30 minutes to heat up to 60°C (140°F) before using.
3. Install the line adapters into the transmission fluid cooler tubes.
4. Attach the cooler line flusher red line to the transmission fluid cooler pressure tube quick connect fitting.
5. Attach the cooler line flusher blue line to the transmission fluid cooler return tube quick connect fitting.
6. Follow the equipment instructions to purge the transmission fluid cooler tubes and cooler prior to starting the flushing procedure.
7. Allow the transmission fluid cooling system to backflush for 10-15 minutes, then flush the transmission fluid cooler in a normal flow direction for an additional 10-15 minutes.

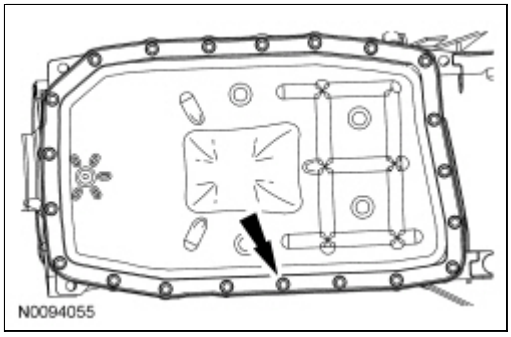
repair4less

Transmission Fluid Drain and Refill

Special Tool(s)

 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
 ST2933-A	Transmission Fluid Fill Tube 307-570
 ST2715-A	Transporter Fluid Evacuator/Injector 307-D465 or equivalent
 ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

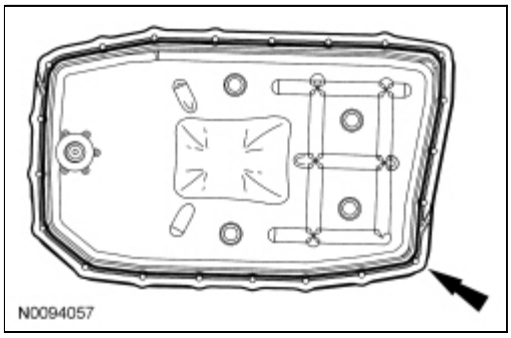
Material



Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

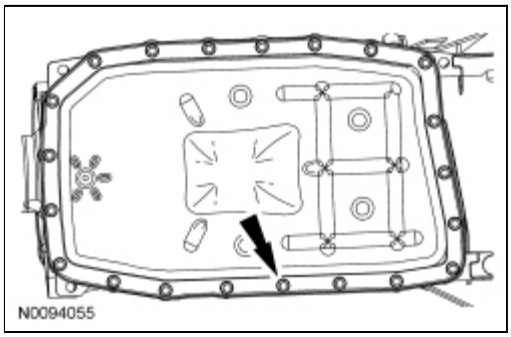
Drain

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .



repair4less

2. Remove the transmission fluid pan and allow the transmission fluid to drain.



3. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

   Install a new transmission fluid pan gasket, if required.

4. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.
   - Tighten to 9 Nm (80 lb-in).

Refill

NOTICE: **This procedure contains the air purge steps required to purge air from the transmission fluid cooling system. This procedure is NOT intended for use with the Transmission Fluid Level Check.**

NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal failure could result.**

NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be**

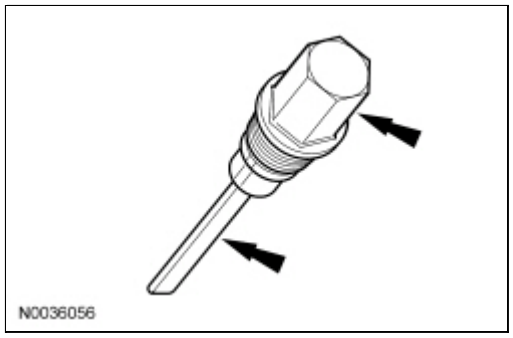
extremely hot during this procedure.

NOTICE: **The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

NOTE: If the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

NOTE: Here is an overview of the Transmission Fluid Drain and Refill procedure.

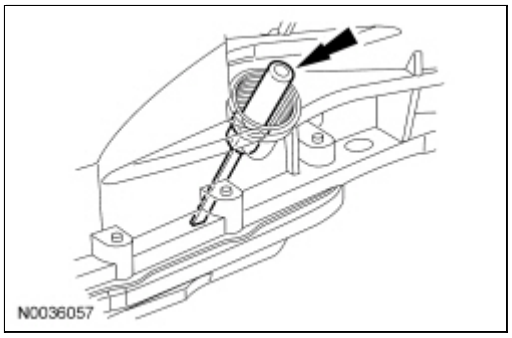
- Adding 3.3L (3.5 qt) of transmission fluid to the transmission is an initial fill enabling the engine to be started.
- The cold level range shown in the procedure allows the vehicle to be driven.
- The vehicle should be driven to allow the TFT to reach 91ºC-102ºC (195ºF-215ºF) in order to purge the air from the transmission fluid cooling system.
- Fill the transmission fluid to the fill range on the transmission fluid level indicator at the normal operating range 91ºC-102ºC (195ºF-215ºF).



1. **NOTE:** The transmission will need 3.3L (3.5 qt) of transmission fluid added to the transmission as an initial fill if:
   - a new mechatronic assembly has been installed.
   - the transmission fluid pan or transmission fluid filter have been removed.

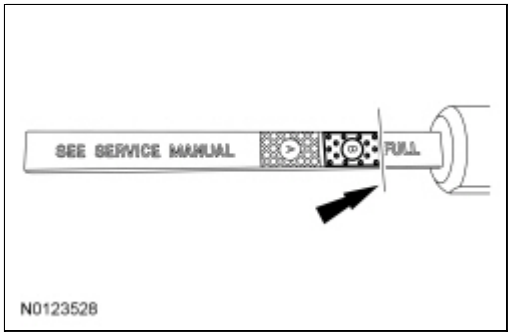
   NOTE: The transmission will need 11.35L (12 qt) of transmission fluid added to the transmission as an initial fill if the transmission has been overhauled.

   Using the Transmission Fluid Fill Tube, add the transmission fluid to the transmission through the transmission fluid fill hole. For additional information, refer to Adding Additional Transmission Fluid in this procedure.



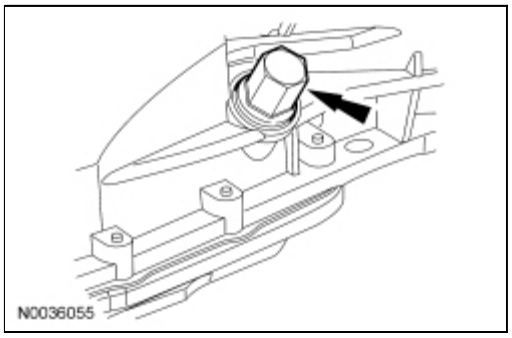
2. Check the transmission fluid level cold.
   - The vehicle is safe to drive if the transmission fluid is in the cold level range 32°C-43°C (90°F-110°F).
   - Using the scan tool and with the engine running, place the selector lever in each gear position and hold approximately 5 seconds. Place the selector lever in PARK, with the engine at idle (600-750 rpm).

3. Separate the transmission fluid level indicator from the transmission fluid fill plug.



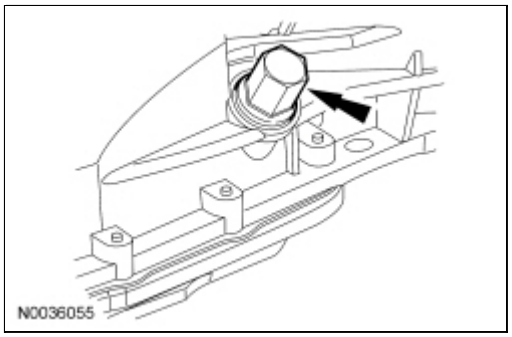
4. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.

repair4less

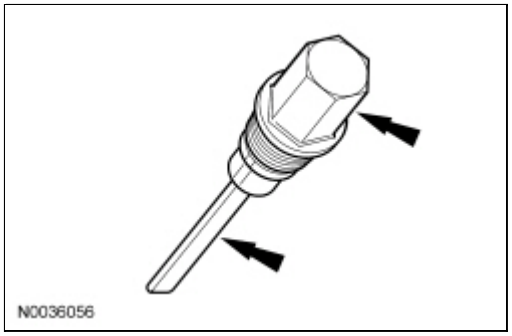


5. **NOTE:** The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the dotted area to check the transmission fluid level.

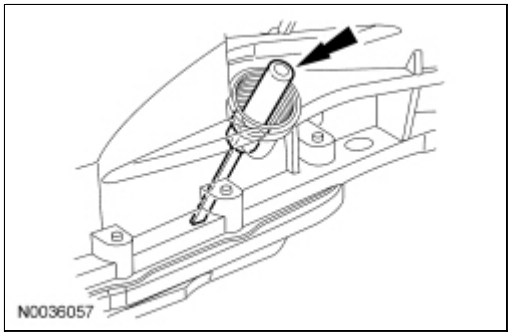
   Using the scan tool, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF). Do not overfill the transmission. The transmission fluid level must be at the upper level of the dotted (B) marked area on the transmission fluid level indicator.



6. Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

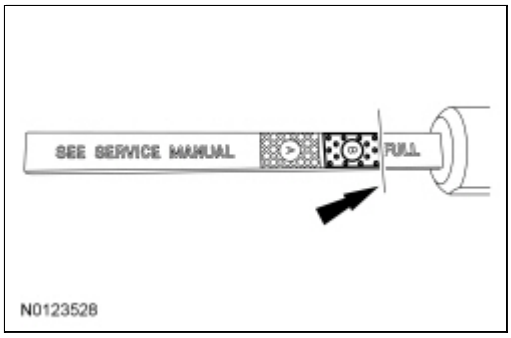


7. While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 91°C (195°F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.
   - With the engine idling (600-750 rpm) in PARK, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF).



8. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case.

9. Separate the transmission fluid level indicator from the transmission fluid fill plug.



10. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.

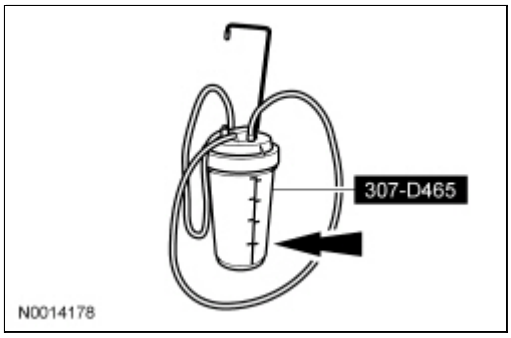
11. **NOTE:** The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the dotted (labeled B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted marks on the transmission fluid level indicator.

    Using the scan tool verify that the TFT is between 91ºC-102ºC (195ºF-215ºF). The transmission fluid level must be at the upper level of the dotted (B) mark.

repair4less

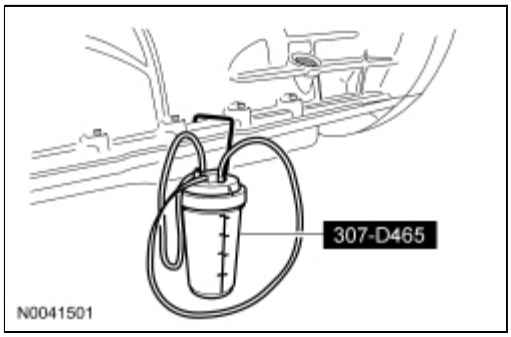
12. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid in this procedure.

    Install the transmission fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

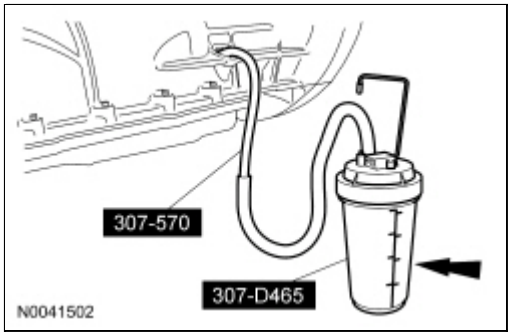


Adding Additional Transmission Fluid

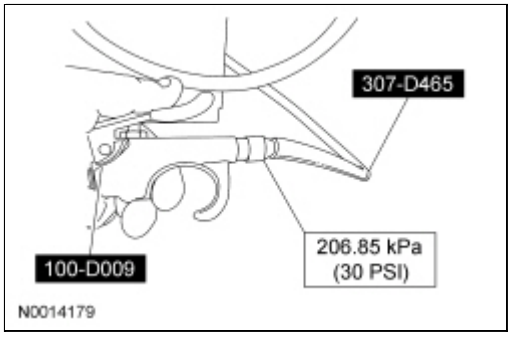
NOTE: To get an accurate transmission fluid level reading the engine should be idling (600-750 rpm) in PARK.



1. Install the Transmission Fluid Fill Tube into the transmission fluid fill hole.

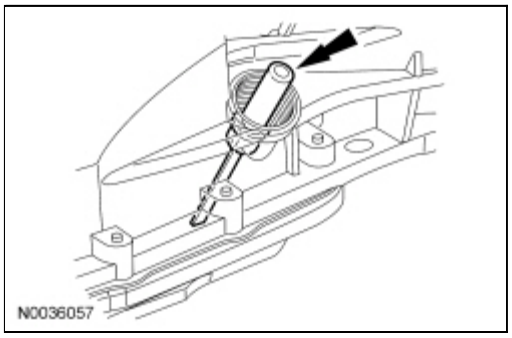


2. Fill the Transporter Fluid Evacuator/Injector with approximately 0.47L (1 pt) of transmission fluid.



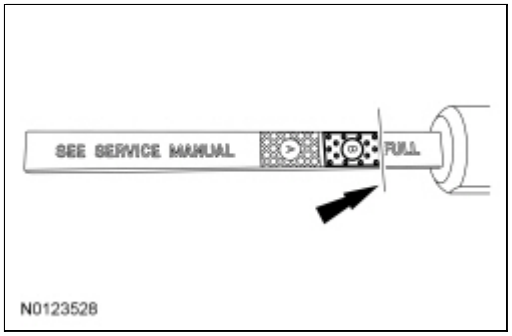
3. Hang the Transporter Fluid Evacuator/Injector under the vehicle, upright and close to the transmission.

4. Connect the Transporter Fluid Evacuator/Injector and Transmission Fluid Fill Tube.
    - Connect the open end of the fluid hose from the Transporter Fluid Evacuator/Injector onto the Transmission Fluid Fill Tube from the transmission case.



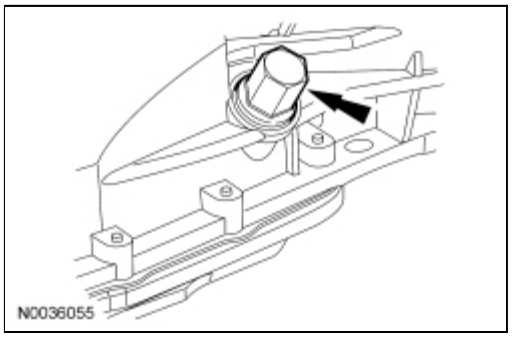
5. Use a Rubber Tip Air Nozzle to apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the Transporter Fluid Evacuator/Injector. Transmission fluid will immediately start flowing out of the Transporter Fluid Evacuator/Injector into the transmission.

repair4less



6. **NOTE:** Do not overfill the transmission. The transmission fluid level must be at the upper level of the dotted mark.

   Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.



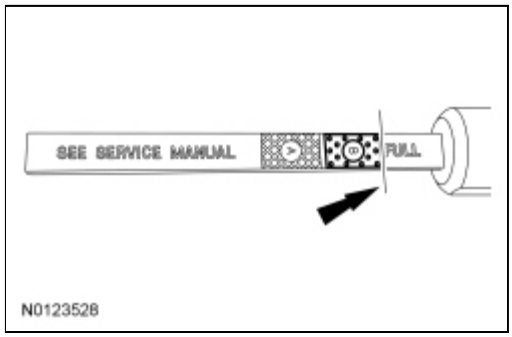
7. **NOTE:** The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the dotted (labeled B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted marks on the transmission fluid level indicator.

   Using the scan tool, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF). The transmission fluid level must be at the upper level of the dotted (B) mark.

8. **NOTE:** If the transmission fluid is over full, follow the steps for Removing Transmission Fluid in this procedure.

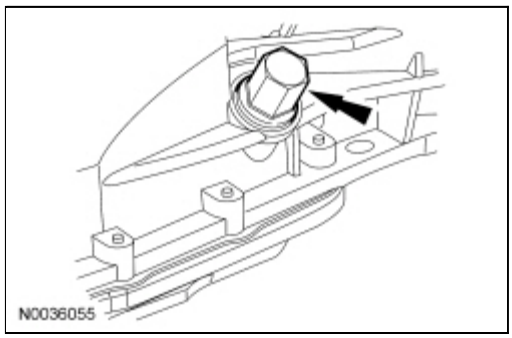
   Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

Removing Transmission Fluid



NOTE: To get an accurate transmission fluid level reading the engine should be idling (600-750 rpm) in PARK.

1. If the transmission is overfilled, transmission fluid must be removed to the correct level. Use the Transporter Fluid Evacuator/Injector and the Vacuum Pump Kit to extract any excessive transmission fluid.



2. **NOTE:** The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the dotted (labeled B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted marks on the transmission fluid level indicator.

   Using the scan tool, verify that the TFT is between 91ºC-102ºC (195ºF-215ºF). The transmission fluid level must be at the upper level of the dotted (B) mark.

3. Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

repair4less

Transmission Fluid Exchange

Special Tool(s)

 ST3088-A	ATF Fluid Exchanger W/Power Steering Fluid Exchanger 199-00059 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

NOTICE: **Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

NOTE: For best results, perform the transmission cooler backflush and cleaning procedure before exchanging the fluid.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Connect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger to the transmission fluid cooler tube after the transmission fluid cooler on the return tube. This will help remove any foreign material trapped in the transmission fluid coolers.
3. Perform the transmission fluid exchange using the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Follow the manufacturer's instructions included with the machine.
4. Once the transmission fluid exchange is completed, disconnect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Reconnect any disconnected transmission fluid cooler tubes.
5. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 91ºC-102ºC (195ºF-215ºF). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

repair4less

Transmission Fluid Level Check

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

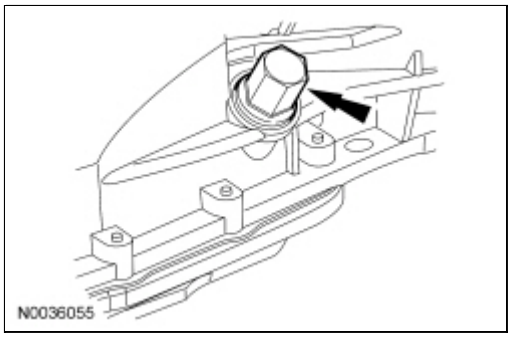
NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal failure could result.**

NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the transmission fluid must cool down to obtain an accurate reading.

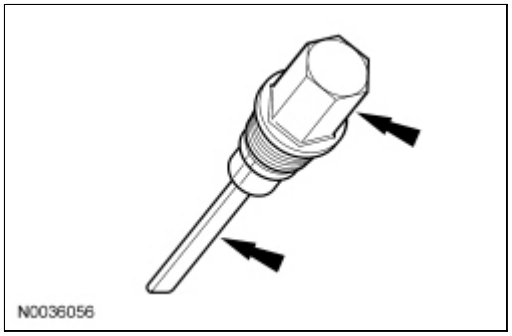
NOTE: If the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

NOTE: Do not overfill the transmission. The transmission fluid level must be at the upper level of the crosshatch mark.



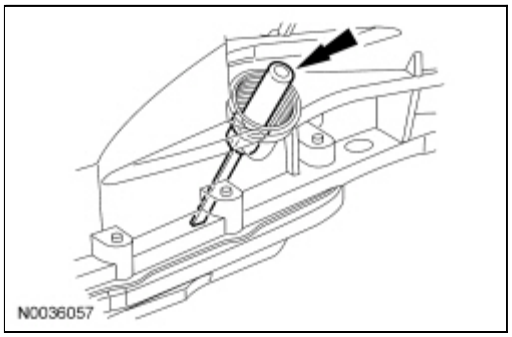
NOTE: If the installation of a new transmission fluid cooler or transmission fluid cooler tubes has been carried out, the vehicle must be driven to get the transmission fluid to a temperature of 89°C (193°F) in order to purge the air from the transmission fluid cooling system.

1. With the engine running, place the transmission selector lever in each gear position and hold approximately 5 seconds. Place the transmission selector lever in PARK.



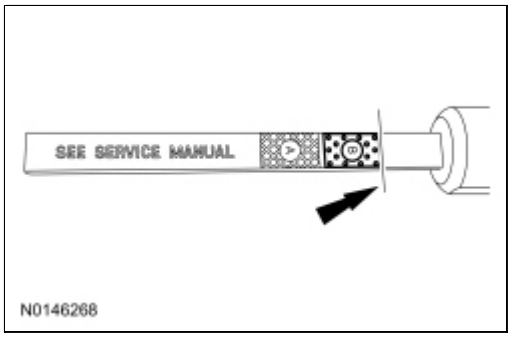
2. With the engine idling (600-750 rpm) in PARK, position it on a hoist. For additional information, refer to Section 100-02.

3. Remove the transmission fluid fill plug transmission fluid level indicator assembly, located on the passenger side front portion of the transmission case.

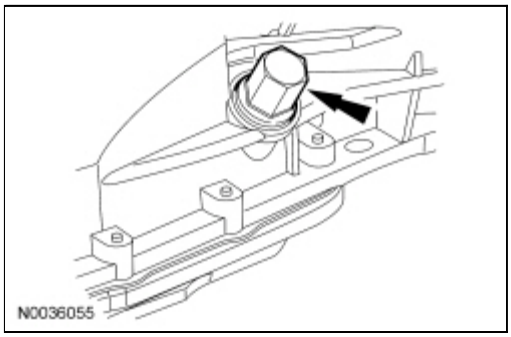


repair4less

4. Separate the transmission fluid level indicator from the transmission fluid fill plug.



5. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level.



6. **NOTE:** The transmission fluid level indicator has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the dotted (labeled B) area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the dotted marks on the transmission fluid level indicator.

   Using the scan tool verify that the TFT is between 89ºC-102ºC (193ºF-215ºF). The transmission fluid level must be at the upper level of the dotted (B) mark.

7. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

   Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

repair4less

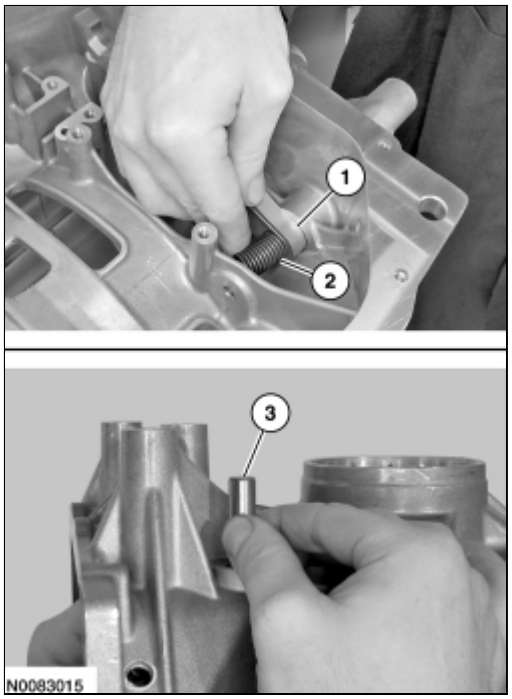
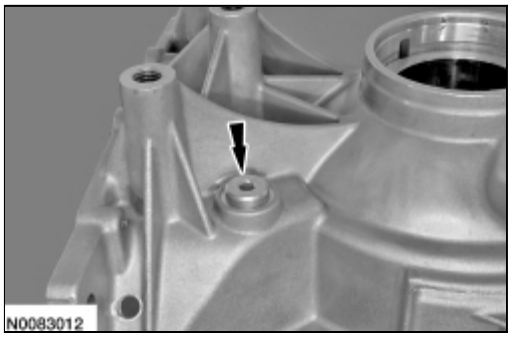
161	7A191	Transmission fluid pan gasket
162	7A194	Transmission fluid pan
163	W500214-S437	Transmission fluid pan bolt

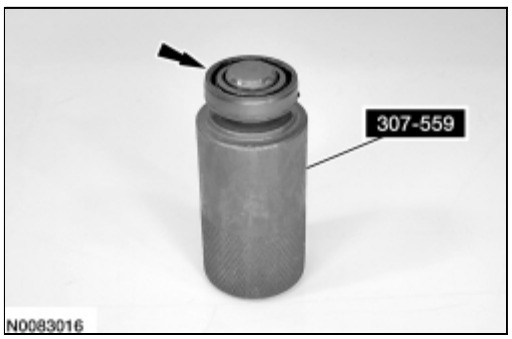


NOTE: Clutch plate quantity is model dependant based on engine displacement. Refer to Clutch Plate Quantity chart in the Specifications portion of this section.

All vehicles

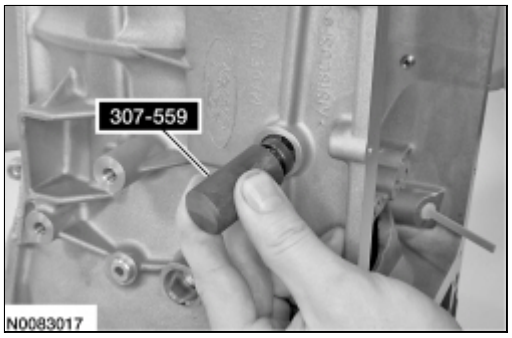


1. Install the park detent spring and the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).



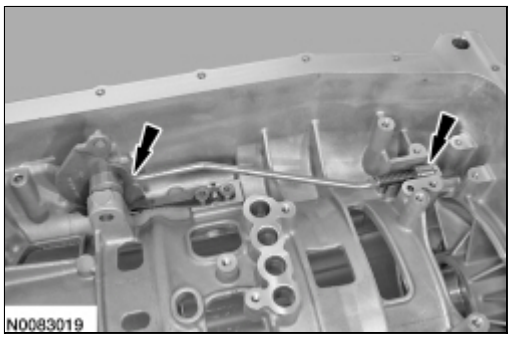
2. Position the park pawl and spring into the case and install the park pawl pin.
    1. Park pawl
    2. Park pawl return spring
    3. Park pawl pin

3. Install the park pawl pin bolt.
    - Tighten to 23 Nm (17 lb-ft).

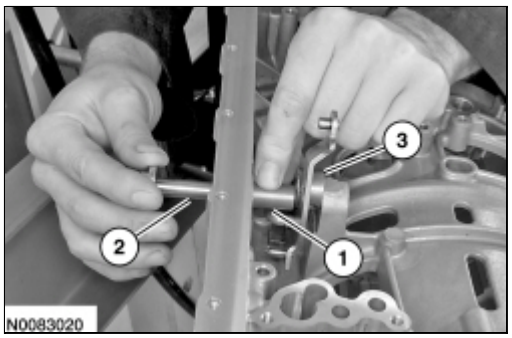


4. Install a new manual control lever shaft seal on the Shifter Fluid Seal Installer.

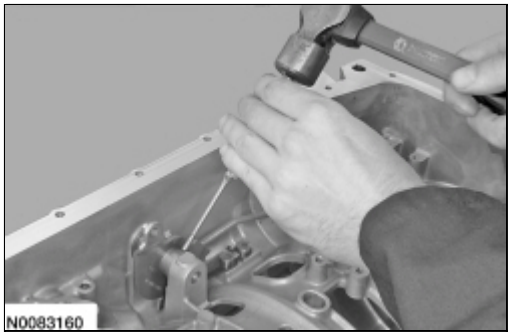
5. Using the Shifter Fluid Seal Installer, install the manual control lever shaft seal.



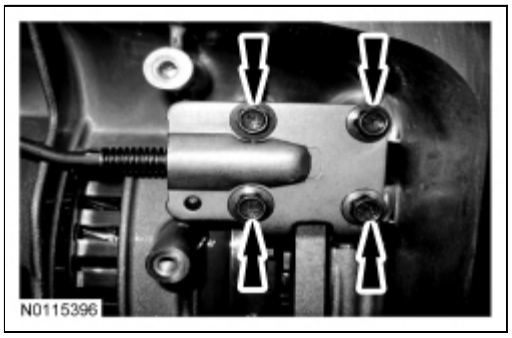
repair4less



6. Assemble the manual control lever detent plate assembly and park pawl actuator rod.

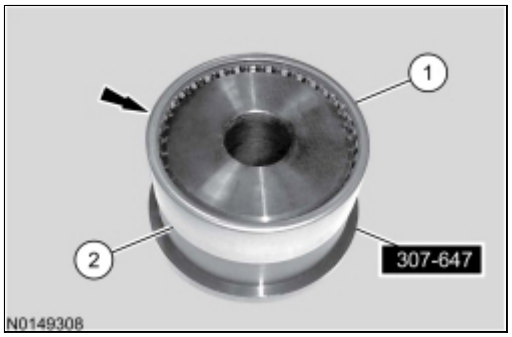


7. Position the manual valve detent lever and park pawl actuator rod assembly in the transmission case.

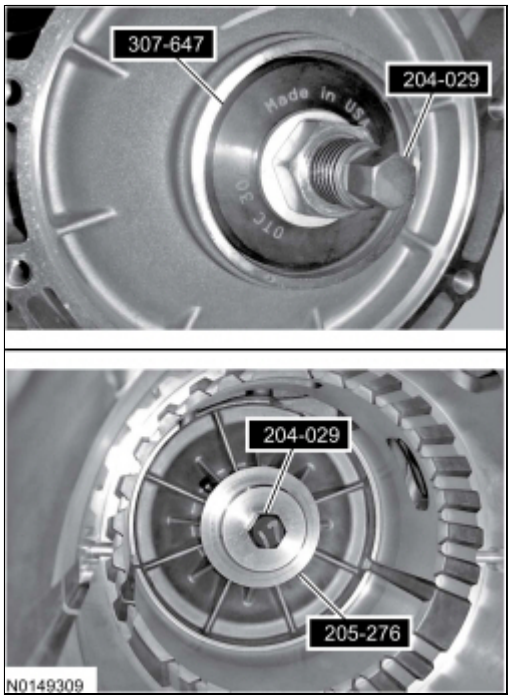


8. Position the manual control lever spacer in place and slide the manual control lever shaft into the case and the manual lever detent plate.
    1. Manual control lever spacer
    2. Manual control lever shaft
    3. Manual control lever detent plate

9. Align the roll pin hole in the manual control lever detent plate with the roll pin hole in the manual control lever shaft and install a new roll pin.

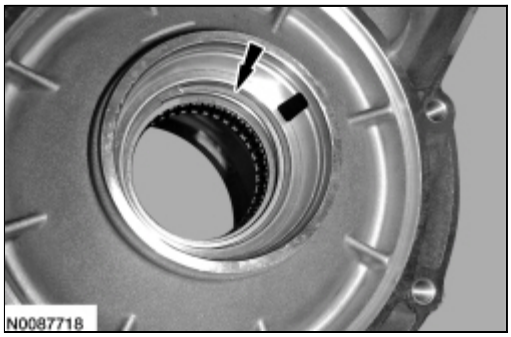


10. Install the park rod actuating plate and the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).



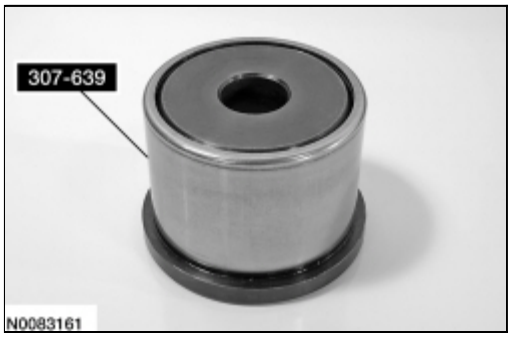
Four-Wheel Drive (4WD) vehicles

11. If removed, position a new bearing on the Output Shaft Bearing Installer. Install the bearing with the flat bearing surface facing down and the rounded bearing surface facing up so that when installed, the flat surface is on the snap ring side and the rounded surface is on the transmission case side.
    1. Rounded bearing surface facing up
    2. Flat bearing surface facing down

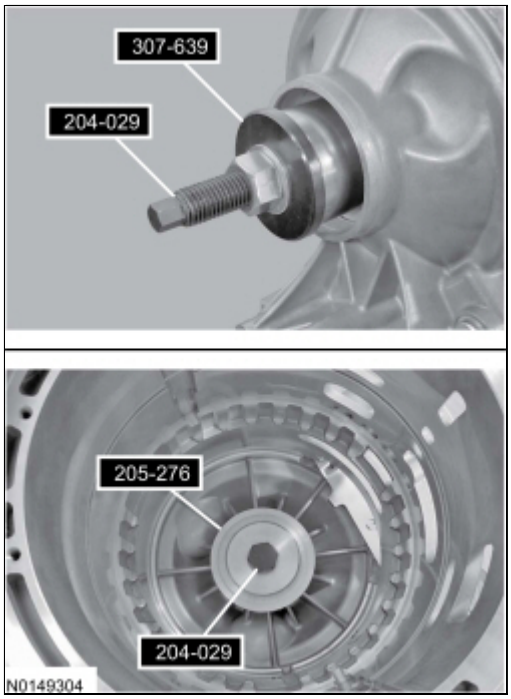


12. Using the Output Shaft Bearing Installer, the Drawbar and the Front Wheel Hub Oil Seal Installer, install the bearing in the transmission case.

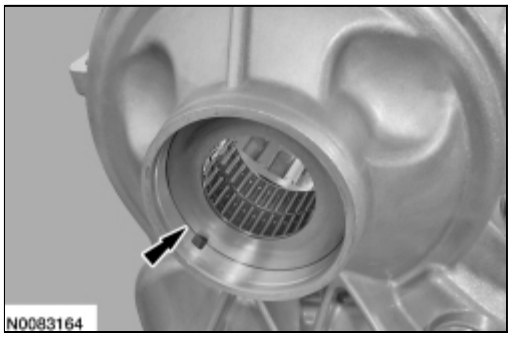
repair4less



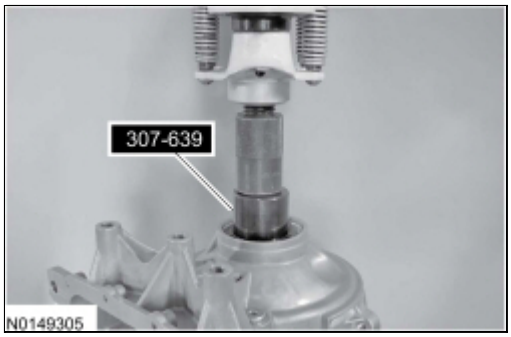
13. Install the snap ring.



Rear Wheel Drive (RWD) vehicles

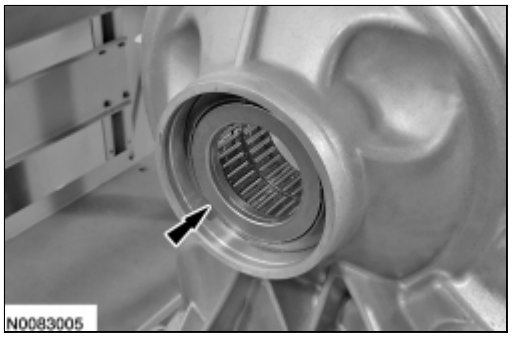


14. Install the bearing on the 6R80 Rear Bearing Remover/Installer.

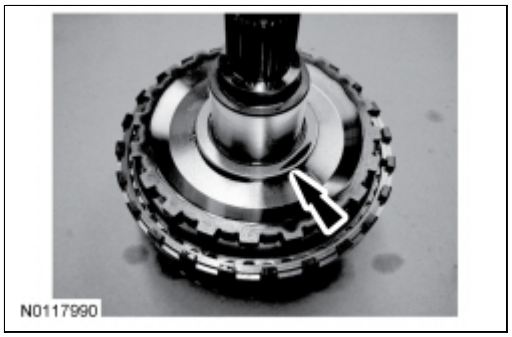


15. Assemble the Front Wheel Hub Oil Seal Installer and the 6R80 Rear Bearing Remover/Installer on the Drawbar and install the bearing in the transmission case.

16. Position the thrust bearing spacer.

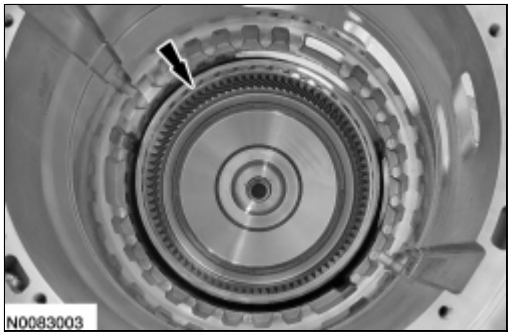


17. Using the 6R80 Rear Bearing Remover/Installer and a press, press the thrust bearing spacer in place.

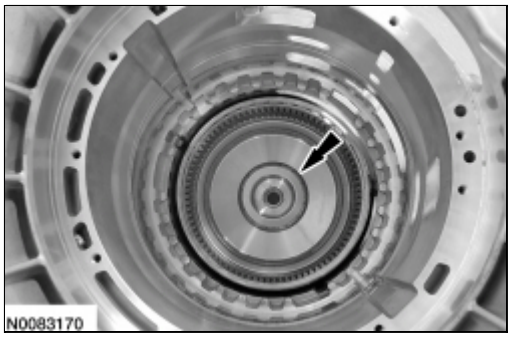


18. Install the T12 thrust bearing.

repair4less

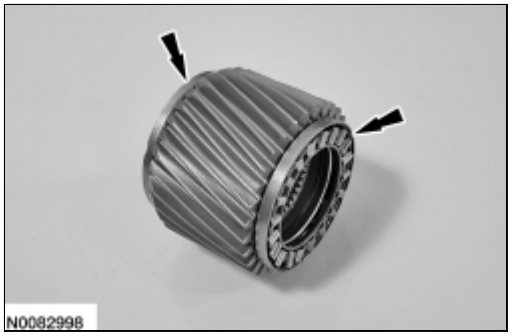


All vehicles



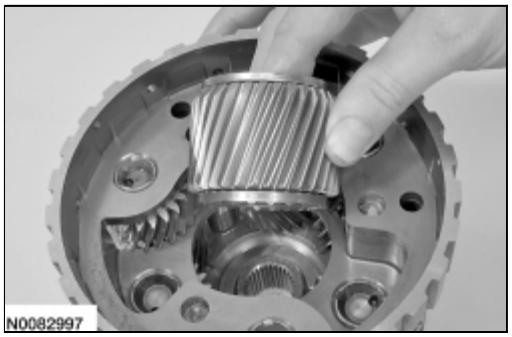
19. Install the T11 bearing, on the planetary ring gear and output shaft assembly.

20. Install the rear planetary ring gear and output shaft assembly.



21. Install the T10 thrust bearing on the output shaft assembly.

22. Install the T9 roller bearing race into the bottom of the carrier.



23. Install the top T8 and the bottom T9 roller bearings onto the sun gear.

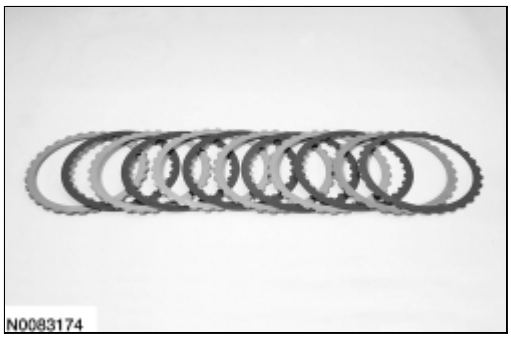
24. **NOTE:** When installing the sun gear, make sure that the TAPERED EDGE is facing UP toward the torque converter housing.

    Install the sun gear into the planetary assembly.

25. **NOTE:** Be sure the bearing race is installed in the sun gear.

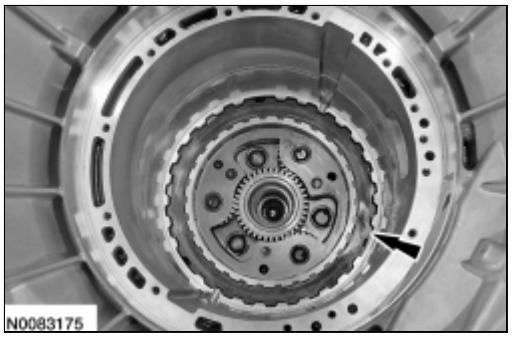
    Install the low/reverse sun gear and bearing race into the planetary carrier with the race side facing down.
    1. Low/reverse sun gear
    2. Bearing race

repair4less



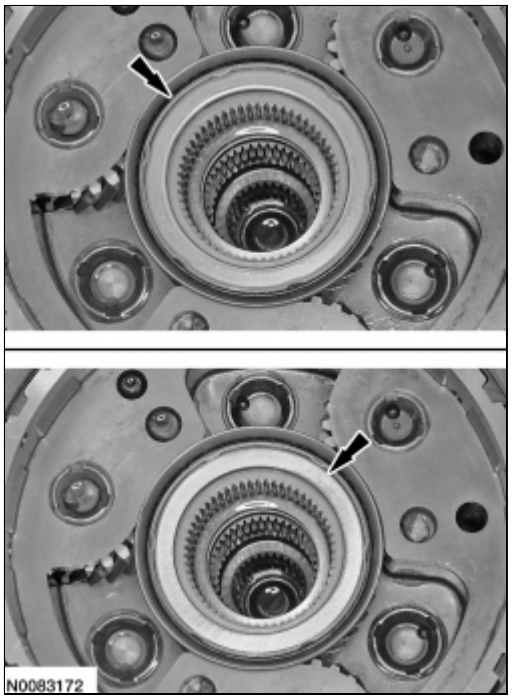
26. **NOTE:** Place the manual control lever in PARK when installing the rear planetary gearset to hold the rear ring gear stationary.

    Install the planetary carrier.



27. **NOTE:** Friction and steel plate quantity are model dependent and vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

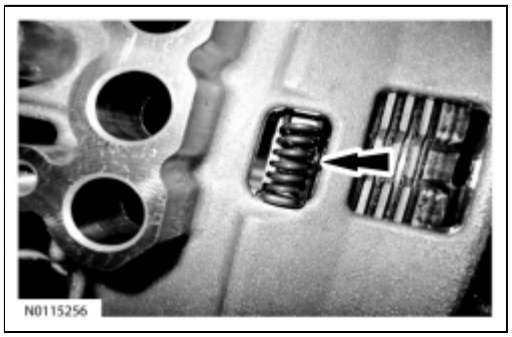
    Soak the low/reverse clutch plates in clean automatic transmission fluid.



28. Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates and ending with the wave spring plate on the top.

29. **NOTE:** Inspect the T7 thrust bearing and selective shim for damage or scoring.

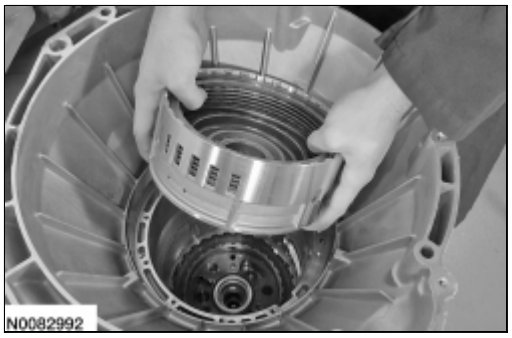
    Install the T7 thrust bearing and the selective shim.



30. **NOTE:** Align the OWC in the transmission case so the bias spring fits into the transmission case.

    Install the OWC as shown so the bias spring can be installed as shown.

repair4less

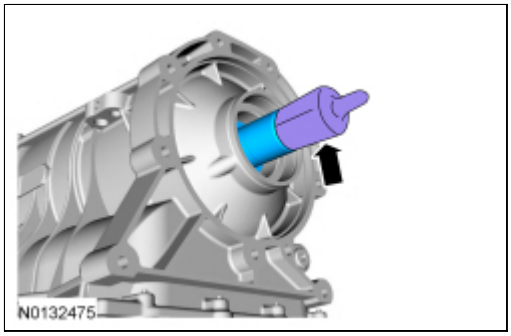


31. Install the bias spring.

32. **NOTE:** Make sure that when installing the center support the feed holes on the center support are lined up with the feed holes in the case.

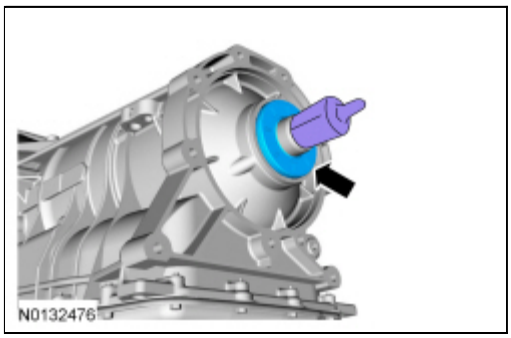
    Install the center support into the case.

33. ***NOTICE:*** **Install the snap ring with the beveled surface facing up and the snap ring gap in the 3 o'clock or the 9 o'clock position.**



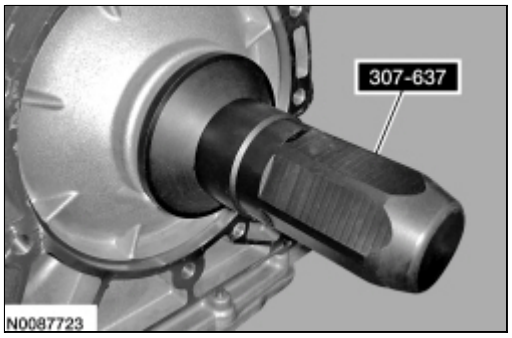
NOTE: Rotate the case to a horizontal position.

Using the Retaining Ring Pliers, install the center support snap ring. Make sure the snap ring is fully seated.

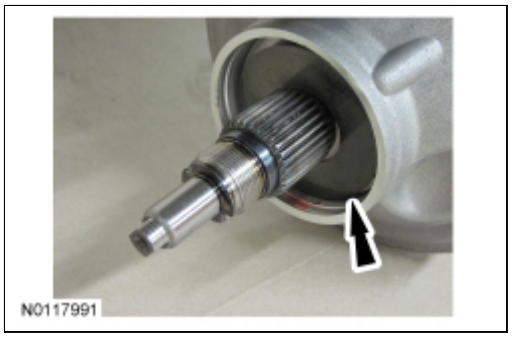


Four-Wheel Drive (4WD) vehicles

34. Install the seal protector provided with the new output shaft seal on the output shaft.

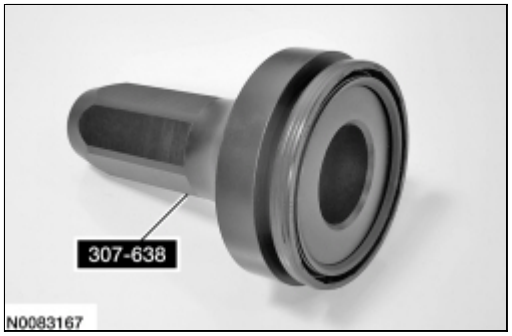


35. Slide the output shaft seal over the output shaft seal protector onto the output shaft. Remove the output shaft seal protector.

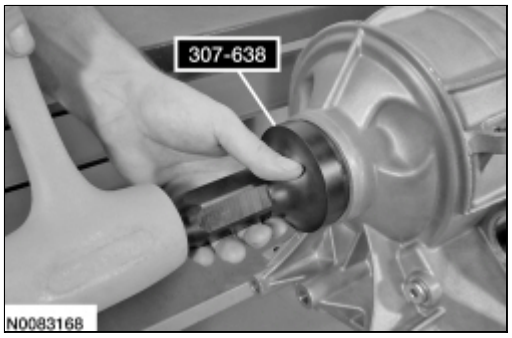


36. Using the 6R80 Rear Seal 4X4 Installer, install the output shaft seal.

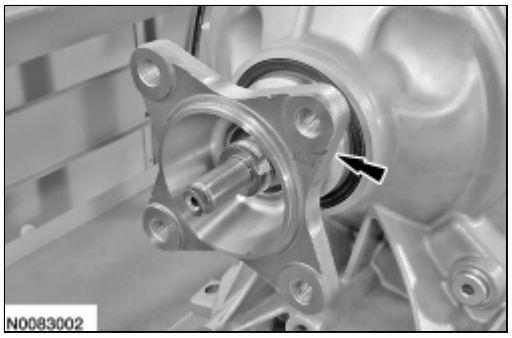
repair4less



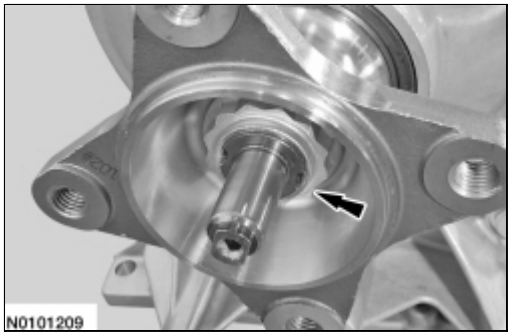
Rear Wheel Drive (RWD) vehicles



37. Rotate the transmission to the vertical position and install the slip plane washer.

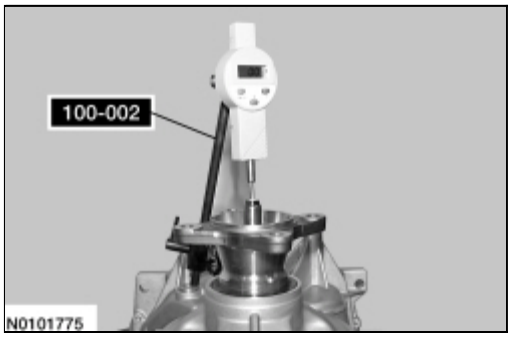


38. Position a new output shaft seal on the 6R80 4X2 Rear Seal Installer.



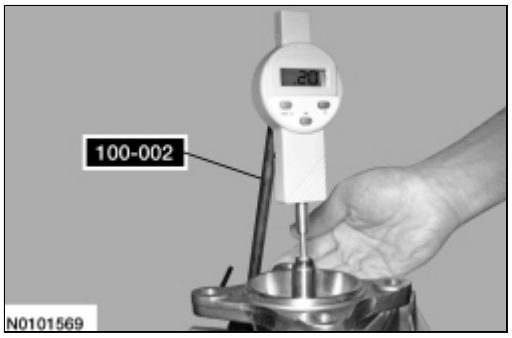
39. Using the 6R80 Rear Seal 4X2 Installer, install the output shaft seal.

40. Install the output shaft flange and the output shaft flange seal.

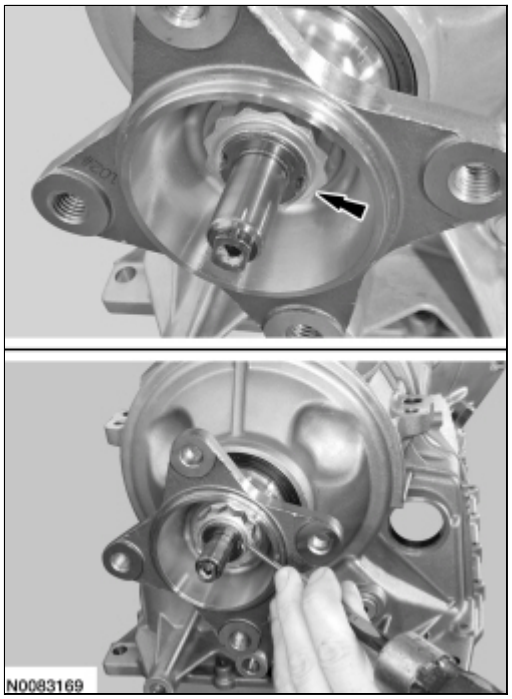


41. Loosely install a new output shaft flange retaining nut.

Rear Wheel Drive (RWD) vehicles



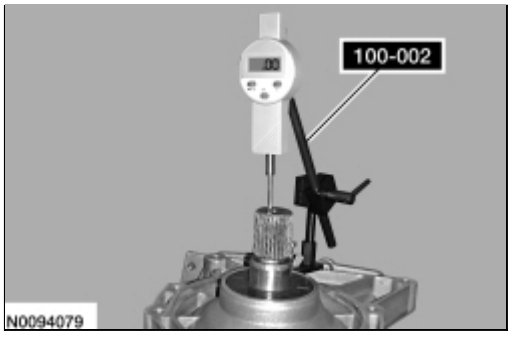
42. Install the Dial Indicator Gauge with Holding Fixture on the transmission case and position the plunger on the output shaft flange.



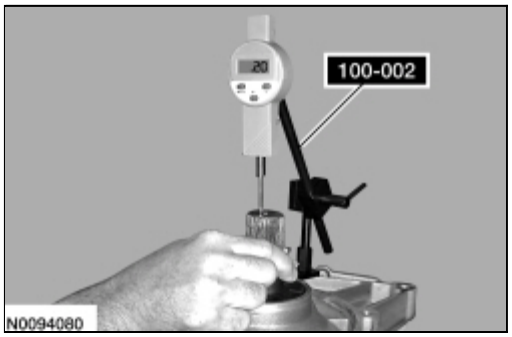
43. **NOTE:** Loosely install the flange nut or an inaccurate reading may be recorded.

    Using the Dial Indicator Gauge with Holding Fixture, lift up on the output shaft flange and record the reading. The reading should be within 0.6-0.9 mm (0.024-0.035 in).
    - If the reading is not within specification, install a different (either thinner or thicker) selective shim.

repair4less

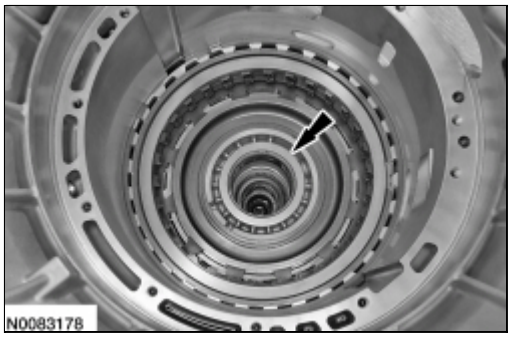


44. Tighten the output shaft flange retaining nut.
    - Tighten to 80 Nm (59 lb-ft).
    - After installing the new output shaft flange retaining nut, stake the slots to prevent it from coming loose.

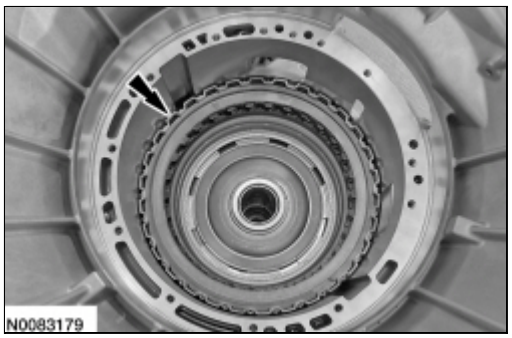


Four-Wheel Drive (4WD) vehicles

45. Install the Dial Indicator Gauge with Holding Fixture on the transmission case and position the plunger on the output shaft.

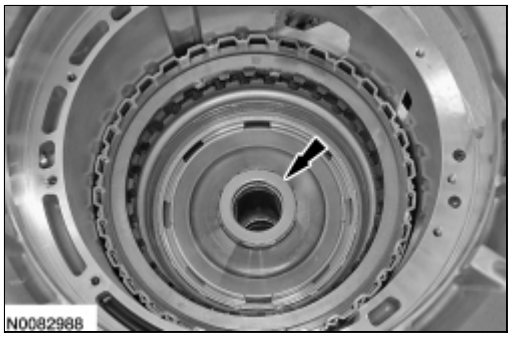


46. Using the Dial Indicator Gauge with Holding Fixture, lift up on the output shaft and record the reading. The reading should be within 0.15-0.35 mm (0.005-0.013 in).
    - If the reading is not within the specification, install a different (either thinner or thicker) select fit thrust gear shim.

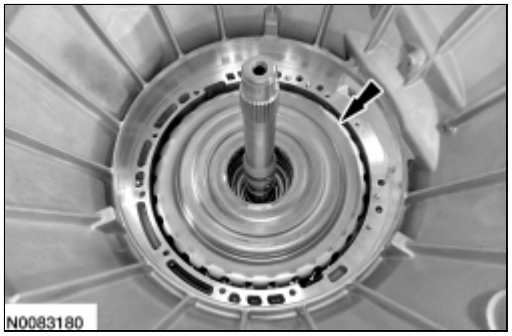


All vehicles

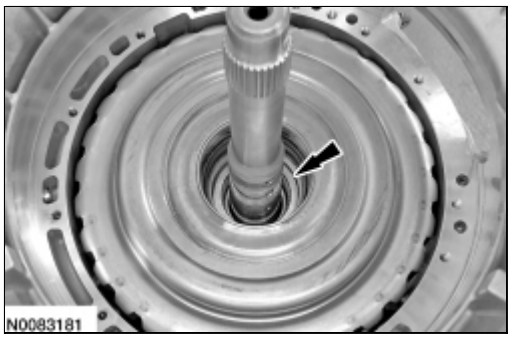
47. Rotate the transmission in the vertical position with the torque converter housing facing up and install the T6 bearing.



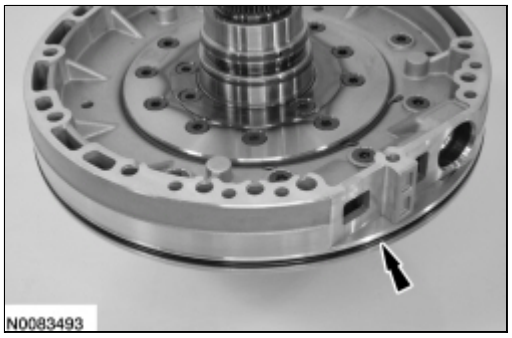
48. Install the direct (B) clutch assembly.



49. Install the T5 roller bearing on the direct (B) clutch assembly.

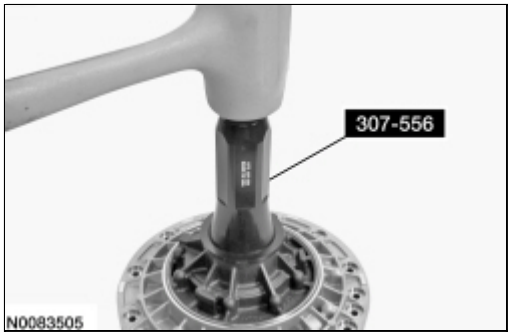


repair4less



50. Install the forward (A)/overdrive (E) clutch assembly.

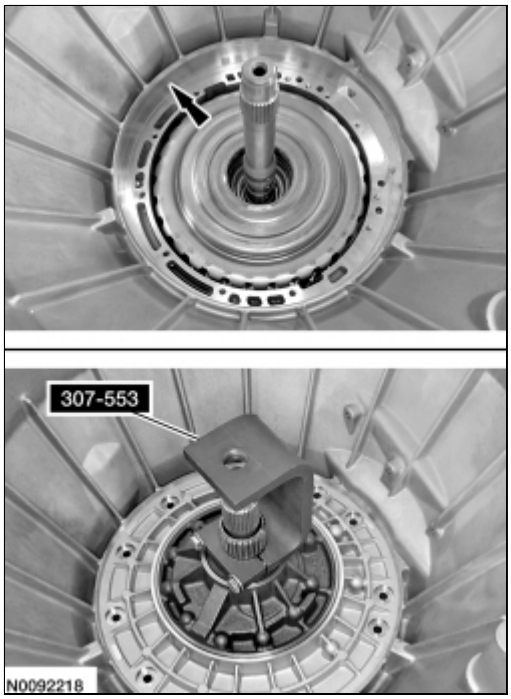
51. Install the selective shim.



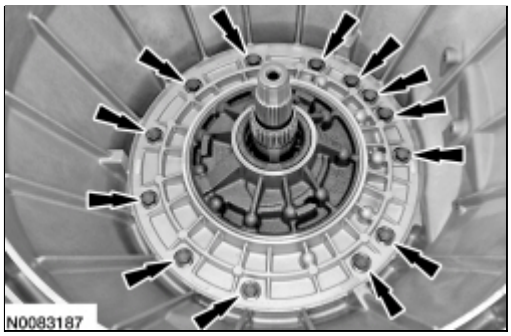
52. If the front pump was not disassembled and assembled, install a new front pump O-ring seal and lubricate it with petroleum jelly.

53. Install a new front pump seal on the Fluid Pump Seal Installer.

54. Using the Fluid Pump Seal Installer, install the front pump seal.

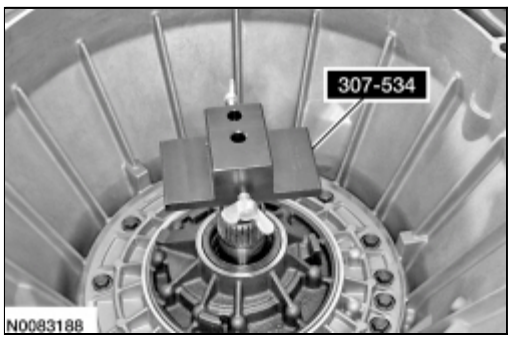


55. Install the Transmission Fluid Pump Remover on the front pump.



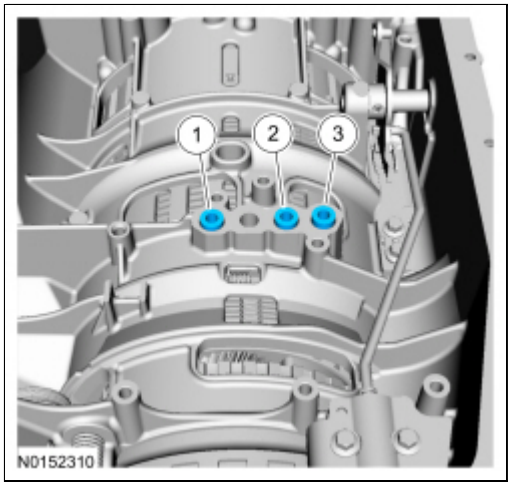
56. Lubricate the transmission case pump bore with petroleum jelly. Using the Transmission Fluid Pump Remover, position the pump assembly in the case and rotate the pump to insert the pump splines into the front planetary sun gear. Rotate the pump to align the pump-to-case bolts and push the pump into the case.

repair4less



57. **NOTE:** Failure to replace the fasteners will result in transmission fluid leakage.

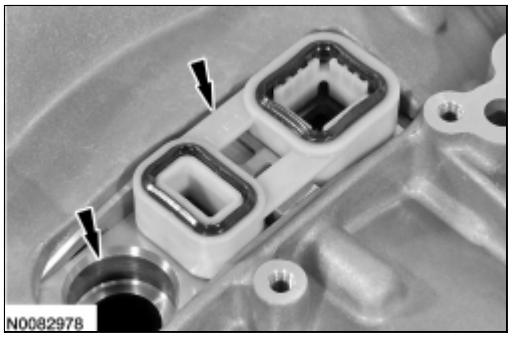
    Install 13 new front pump-to-case bolts and washers. Tighten in a crisscross pattern.
    - Tighten pump fasteners with washers to 10 Nm (89 lb-in).
    - Tighten fasteners without washers to 10 Nm (89 lb-in).



58. Install the Transmission End Play Gauge on the input shaft to measure the end play.
    - Tighten the wing nut.

59. Install the Dial Indicator Gauge with Holding Fixture on the Transmission End Play Gauge.
    - Push down on the Transmission End Play Gauge and zero the Dial Indicator Gauge.
    - Lift up on the Transmission End Play Gauge and record the measurement on the Dial Indicator Gauge. The measurement should be between 0.2-0.4 mm (0.008-0.015 in). If the measurement is not within specification, install a new selective front pump shim.
    - Measure the original shim, install a thinner or a thicker shim to achieve the correct measurement.

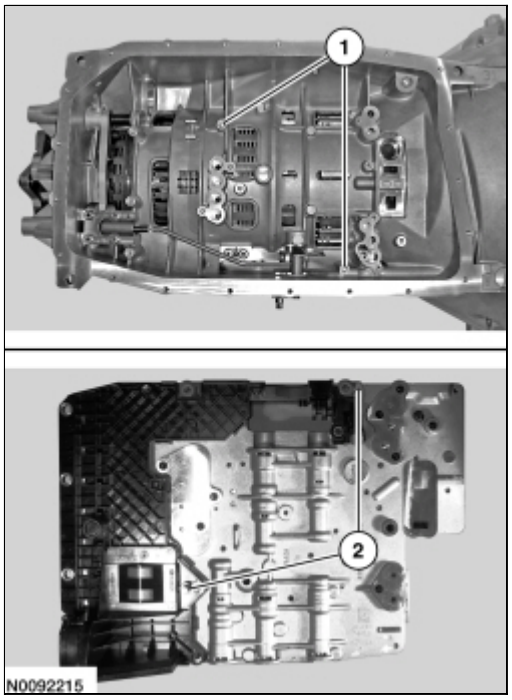
60. Rotate the transmission in the horizontal position with the main control area facing up and install 3 new center support feed tube seals.
    1. Center support feed tube seal (7G199 Black)
    2. Center support feed tube seal (7G087 Green)
    3. Center support feed tube seal (7G084 Blue)



61. **NOTE:** Make sure the transmission fluid filter seal has been removed. If it has not, use a suitable pick and remove the seal.

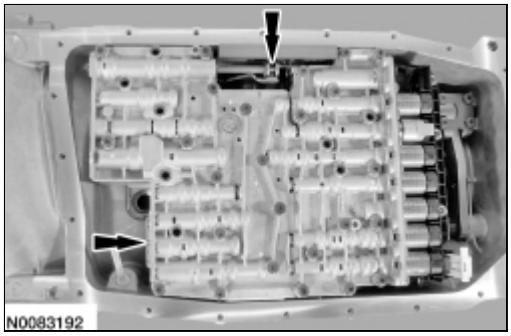
    NOTE: Add 0.118L (4 oz) of clean transmission fluid to prime the pump.

    Install the front pump adapter seal and prime the fluid pump.

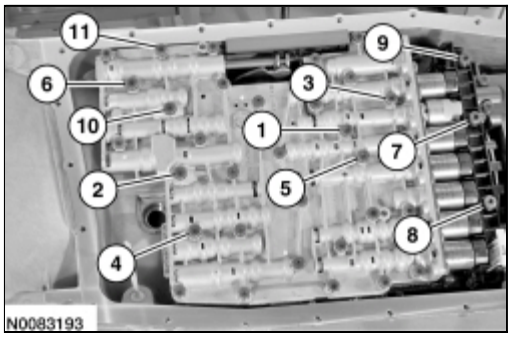


repair4less

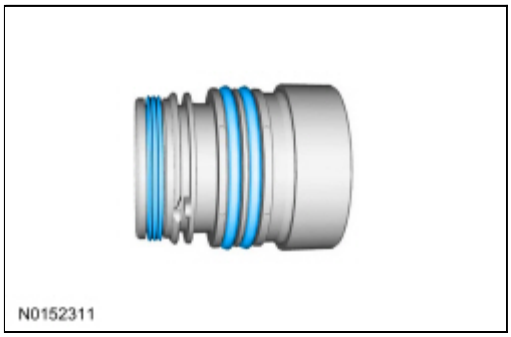
62. Install the thermal bypass valve into the case.



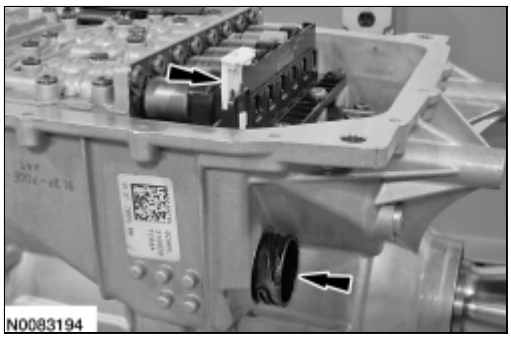
63. Align the guide pins in the alignment holes in the transmission case and position the mechatronic assembly in place.
    1. Alignment holes
    2. Guide pins



64. **NOTE:** The mechatronic assembly will not lay flush on the case, this is a normal condition with the rubber feed tubes, the bolts will pull the mechatronic assembly down.

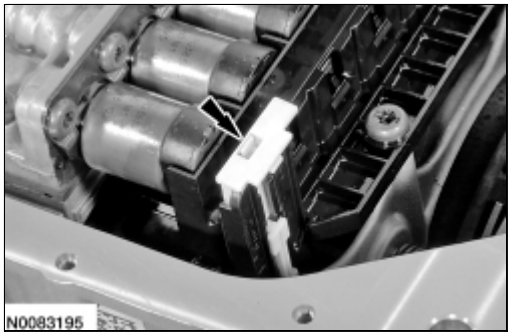


Slightly lift the mechatronic assembly and align the manual valve in the manual valve linkage and position the mechatronic in place.

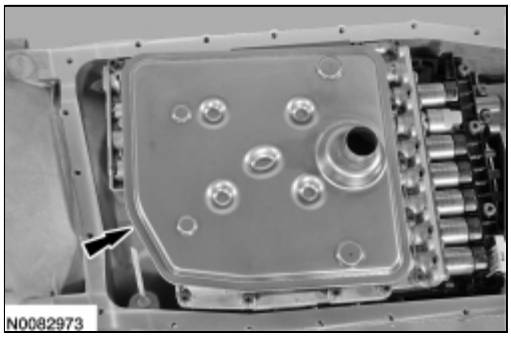


65. Install the 11 mechatronic assembly bolts and tighten in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

66. If removed, install the bulkhead connector sleeve seals.

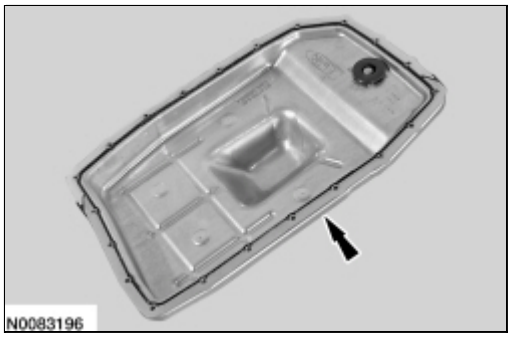


67. With the release tab up and unlocked, push the outer shell of the bulkhead connector sleeve into the transmission. Make sure the bulkhead connector sleeve is fully seated into the molded leadframe.

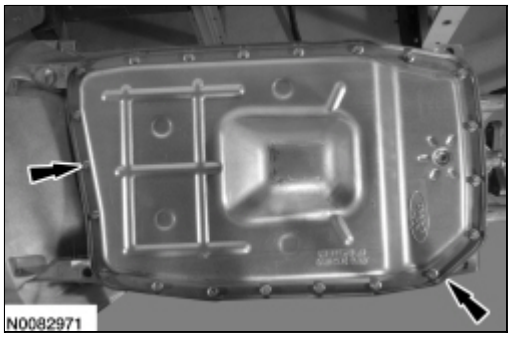


repair4less

68. Press down on the tab and lock the outer shell of the bulkhead connector sleeve in place. Make sure the locking tab is securely locked.



69. Install a new transmission fluid filter.

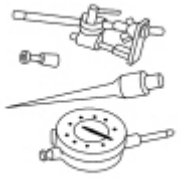


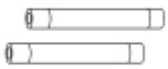
70. **NOTE:** The fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket if required.

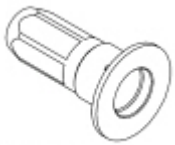
71. Install the transmission fluid pan and transmission fluid pan bolts. Tighten in a crisscross pattern.
    - Tighten to 9 Nm (80 lb-in).

72. Using the Torque Converter Handle, install the torque converter.





73. If the Overdrive clutch FRICTIONS were replaced, install 1 6R ATF Additive Kit XL-16.



---

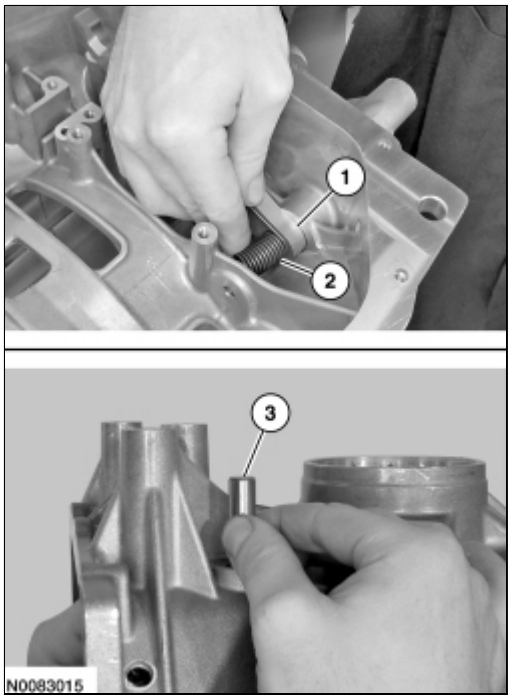
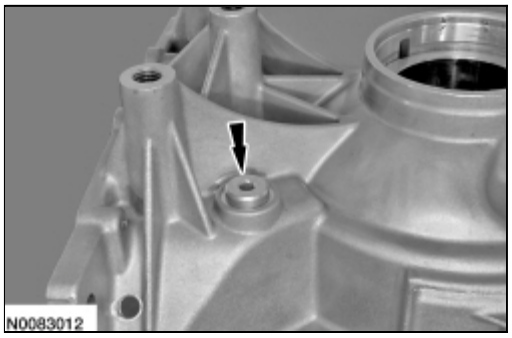
155	7G276	Bulkhead connector sleeve
156	7A248	Bulkhead connector sleeve seals
157	—	Transmission fluid filter seal (part of 7A098)
158	7A098	Transmission fluid filter
159	—	Transmission fluid pan magnet
160	7A191	Transmission fluid pan gasket
161	7A194	Transmission fluid pan
162	W500214-S437	Transmission fluid pan bolt

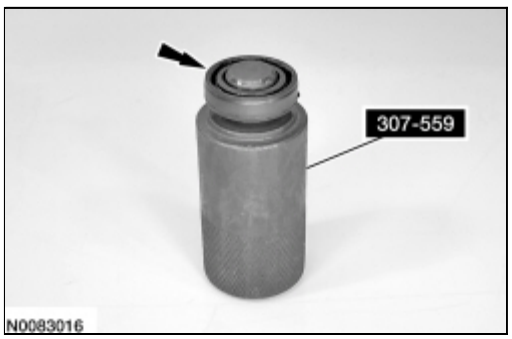


NOTE: Clutch plate quantity is model dependant based on engine displacement. Refer to Clutch Plate Quantity chart in the Specifications portion of this section.

All vehicles

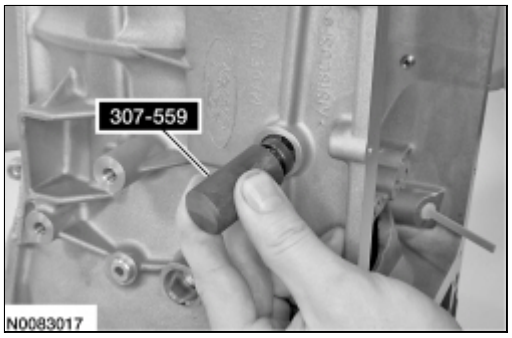


1. Install the park detent spring and the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).



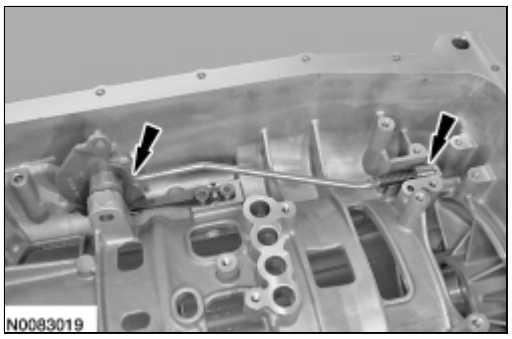
2. Position the park pawl and spring into the case and install the park pawl pin.
   1. Park pawl
   2. Park pawl return spring
   3. Park pawl pin

3. Install the park pawl pin bolt.
    - Tighten to 23 Nm (17 lb-ft).

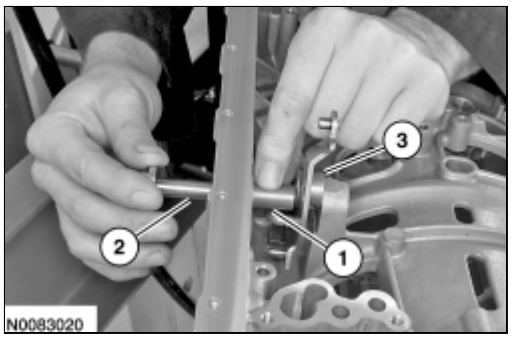


4. Install a new manual control lever shaft seal on the Shifter Fluid Seal Installer.

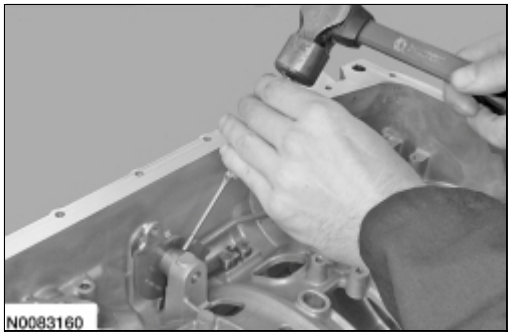
5. Using the Shifter Fluid Seal Installer, install the manual control lever shaft seal.



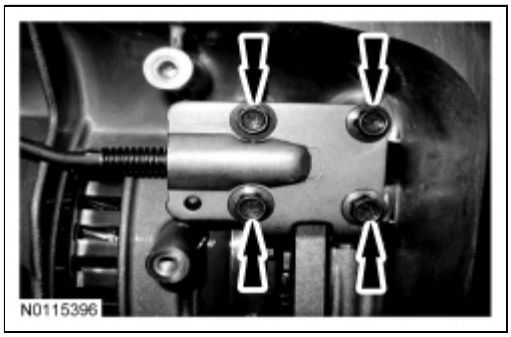
repair4less



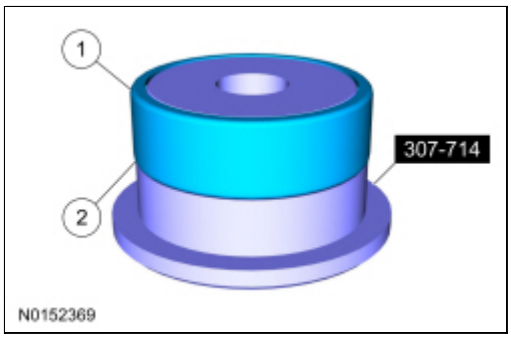
6. Assemble the manual control lever detent plate assembly and park pawl actuator rod.



7. Position the manual valve detent lever and park pawl actuator rod assembly in the transmission case.

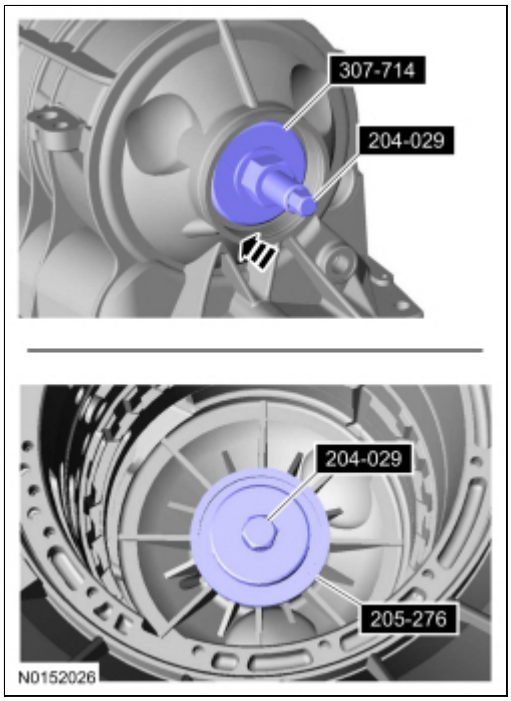


8. Position the manual control lever spacer in place and slide the manual control lever shaft into the case and the manual lever detent plate.
    1. Manual control lever spacer
    2. Manual control lever shaft
    3. Manual control lever detent plate



9. Align the roll pin hole in the manual control lever detent plate with the roll pin hole in the manual control lever shaft and install a new roll pin.

10. Install the park rod actuating plate and the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).

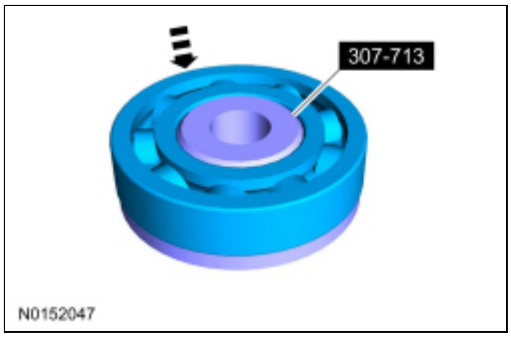


11. If removed, position a new bearing on the Needle Bearing Installer. Install the bearing with the flat bearing surface facing down and the rounded bearing surface facing up so that when installed, the flat surface is on the snap ring side and the rounded surface is on the transmission case side.
    1. Rounded bearing surface facing up
    2. Flat bearing surface facing down

12. **NOTE:** RWD case shown, 4WD case similar.

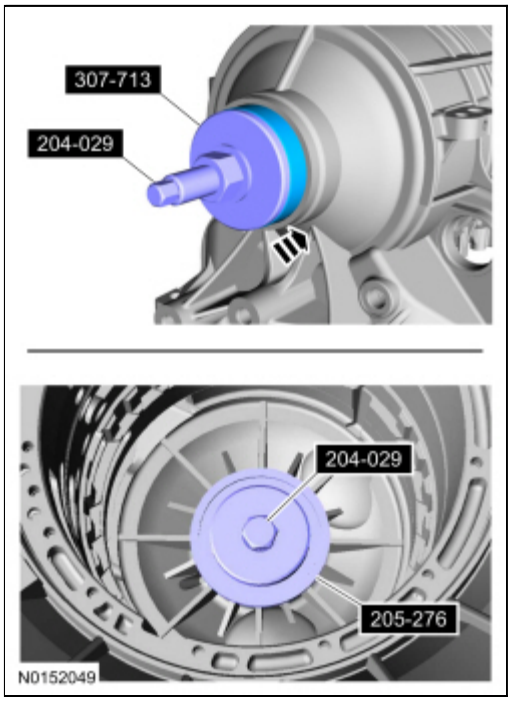
    Assemble the Front Wheel Hub Oil Seal Installer and the Needle Bearing Installer on the Drawbar and install the bearing in the transmission case.

repair4less

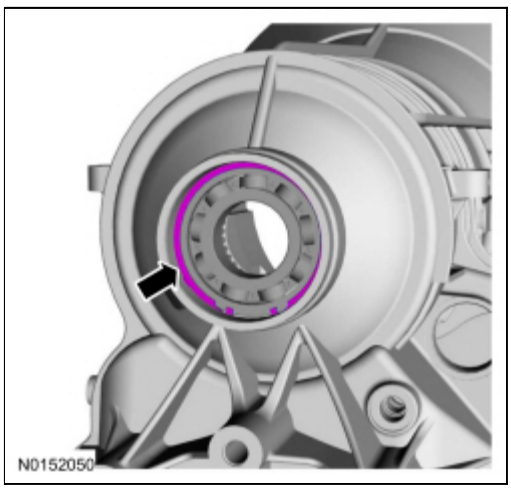


13. **NOTE:** RWD case shown, 4WD case similar.

    Install the snap ring.

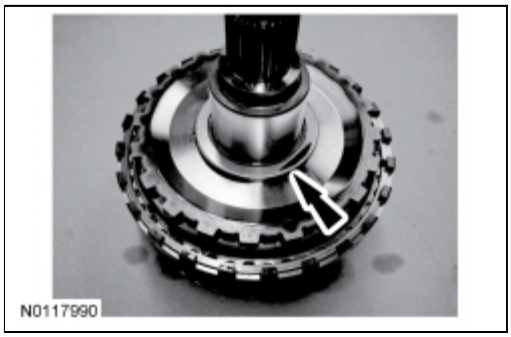


Rear Wheel Drive (RWD) vehicles

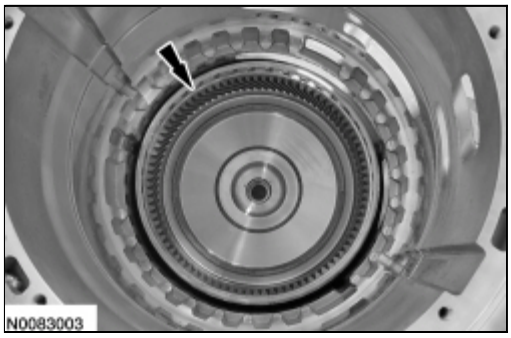


14. Install the bearing on the Roller Bearing Installer.

15. Assemble the Front Wheel Hub Oil Seal Installer and the Roller Bearing Installer on the Drawbar and install the bearing in the transmission case.

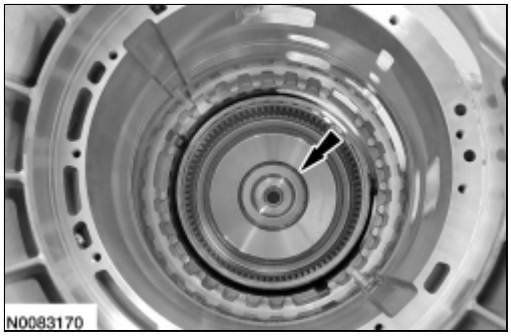


16. Install the snap ring.



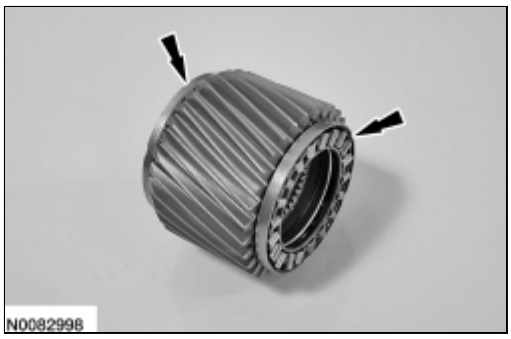
repair4less

All vehicles



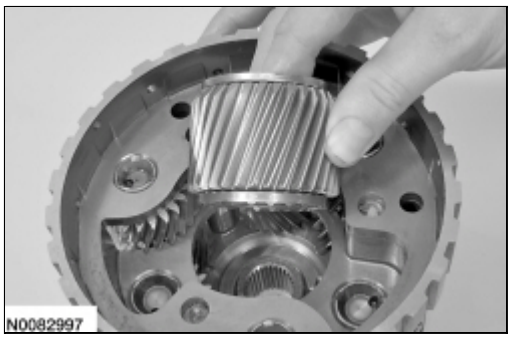
17. Install the T11 bearing, on the planetary ring gear and output shaft assembly.

18. Install the rear planetary ring gear and output shaft assembly.

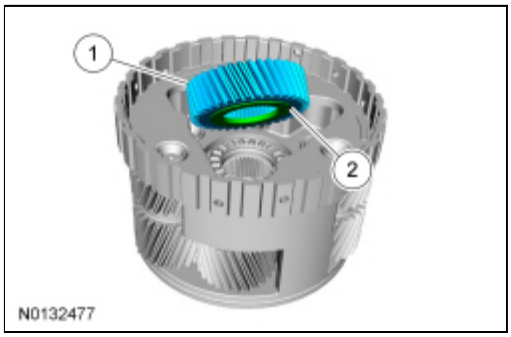


19. Install the T10 thrust bearing on the output shaft assembly.

20. Install the T9 roller bearing race into the bottom of the carrier.



21. Install the top T8 and the bottom T9 roller bearings onto the sun gear.



22. **NOTE:** When installing the sun gear, make sure that the TAPERED EDGE is facing UP toward the torque converter housing.

    Install the sun gear into the planetary assembly.

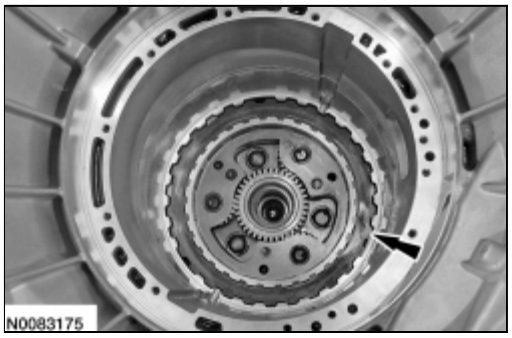
23. **NOTE:** Be sure the bearing race is installed in the sun gear.

    Install the low/reverse sun gear and bearing race into the planetary carrier with the race side facing down.
    1. Low/reverse sun gear
    2. Bearing race

24. **NOTE:** Place the manual control lever in PARK when installing the rear planetary gearset to hold the rear ring gear stationary.

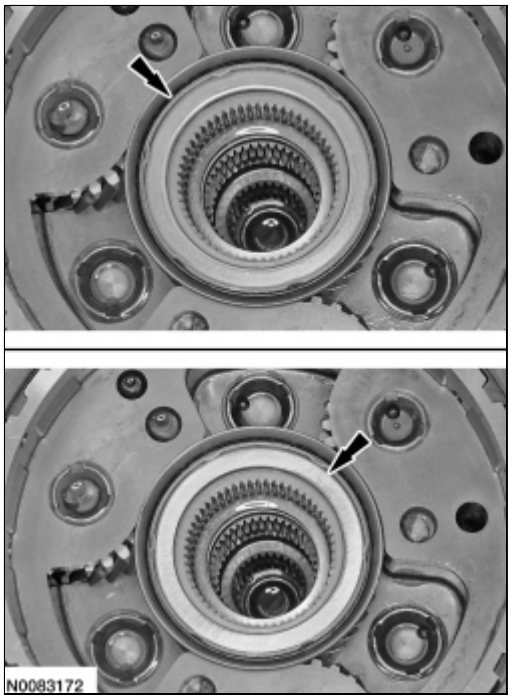
    Install the planetary carrier.

repair4less

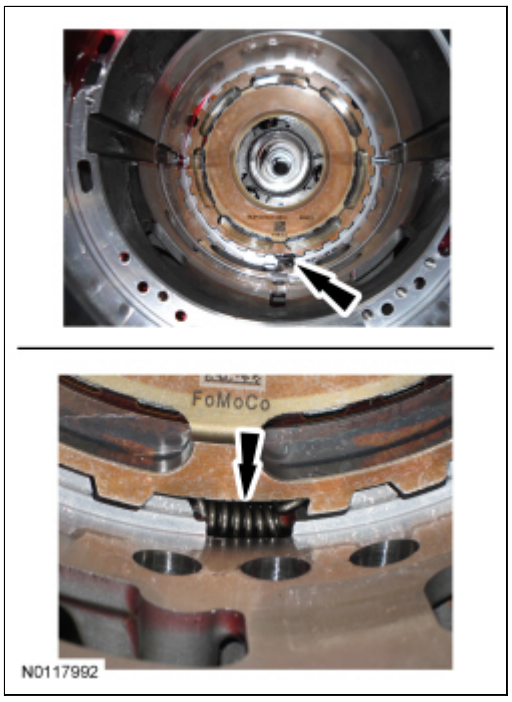


25. **NOTE:** Friction and steel plate quantity are model dependent and vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

    Soak the low/reverse clutch plates in clean automatic transmission fluid.

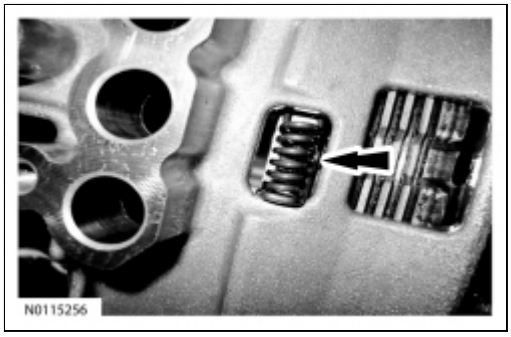


26. Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates and ending with the wave spring plate on the top.



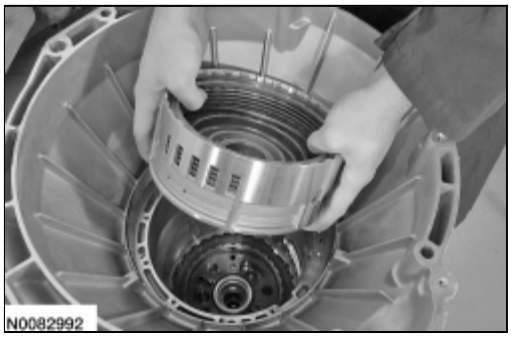
27. **NOTE:** Inspect the T7 thrust bearing and selective shim for damage or scoring.

    Install the T7 thrust bearing and the selective shim.



28. **NOTE:** Align the OWC in the transmission case so the bias spring fits into the transmission case.

    Install the OWC as shown so the bias spring can be installed as shown.



29. Install the bias spring.

repair4less

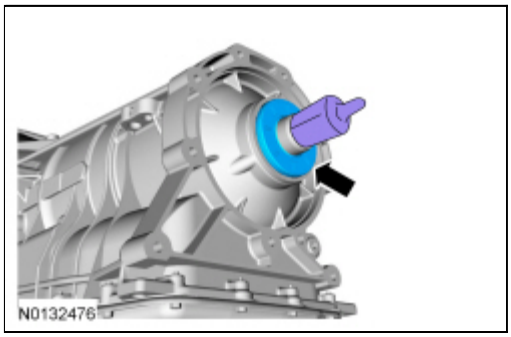
30. **NOTE:** Make sure that when installing the center support the feed holes on the center support are lined up with the feed holes in the case.

    Install the center support into the case.

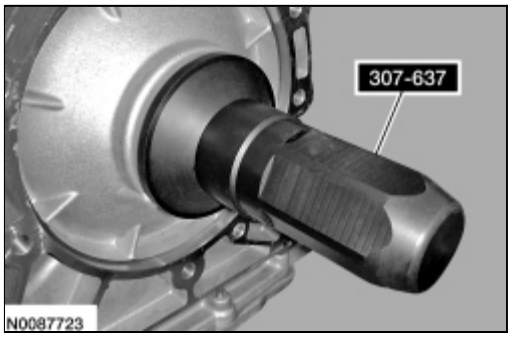
31. ***NOTICE:*** **Install the snap ring with the beveled surface facing up and the snap ring gap in the 3 o'clock or the 9 o'clock position.**

    NOTE: Rotate the case to a horizontal position.

    Using the Retaining Ring Pliers, install the center support snap ring. Make sure the snap ring is fully seated.

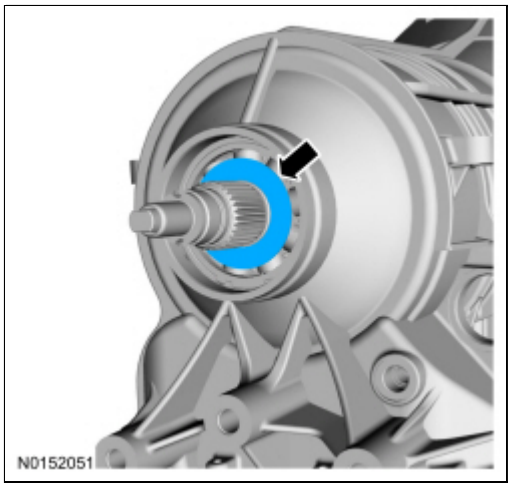


Four-Wheel Drive (4WD) vehicles

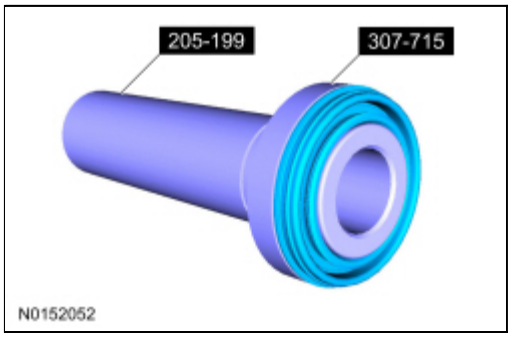


32. Install the seal protector provided with the new output shaft seal on the output shaft.

33. Slide the output shaft seal over the output shaft seal protector onto the output shaft. Remove the output shaft seal protector.

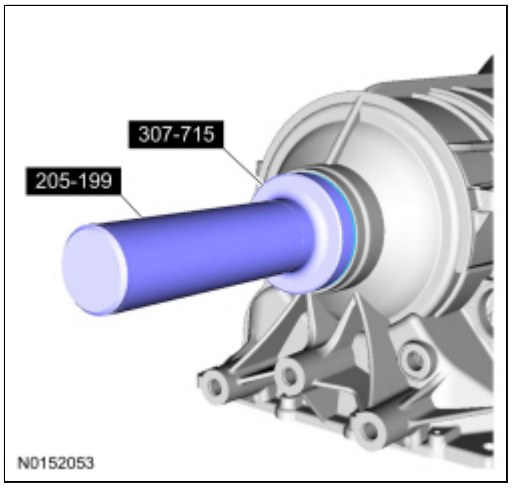


34. Using the 6R80 Rear Seal 4X4 Installer, install the output shaft seal.

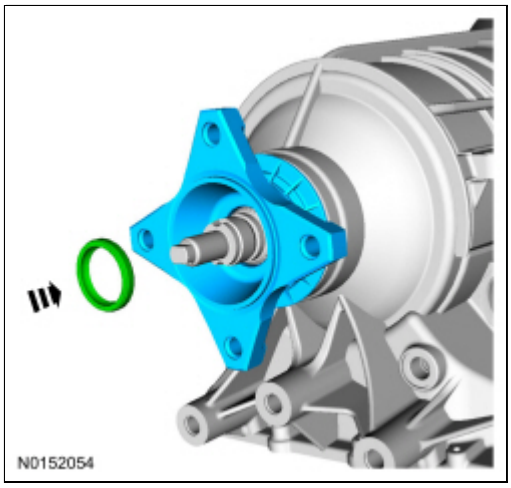


Rear Wheel Drive (RWD) vehicles

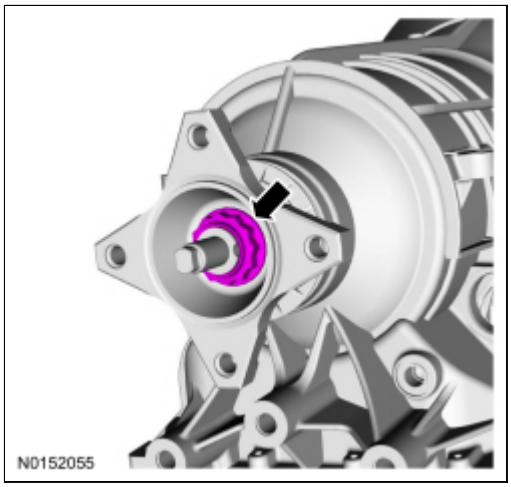
35. Rotate the transmission to the vertical position and install the slip plane washer.



repair4less

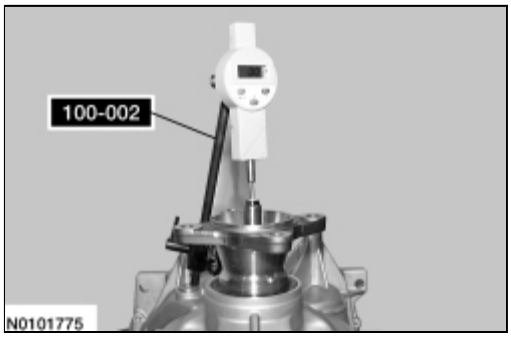


36. Position a new output shaft seal on the Output Seal (4X2) Installer and Spindle/Axle Shaft Installer.



37. Using the Output Seal (4X2) Installer and Spindle/Axle Shaft Installer, install the output shaft seal.

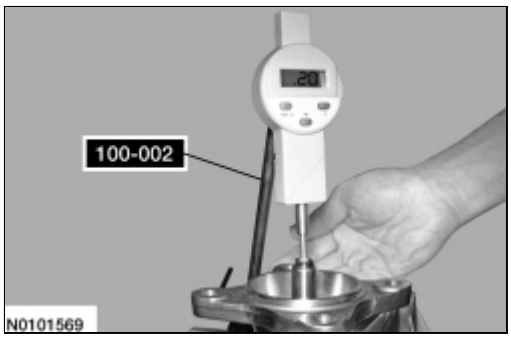
38. Install the output shaft flange and the output shaft flange seal.



39. Loosely install a new output shaft flange retaining nut.

Rear Wheel Drive (RWD) vehicles

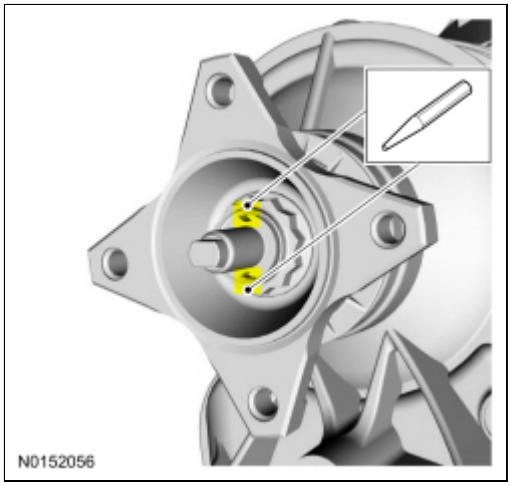
40. Install the Dial Indicator Gauge with Holding Fixture on the transmission case and position the plunger on the output shaft flange.



41. **NOTE:** Loosely install the flange nut or an inaccurate reading may be recorded.

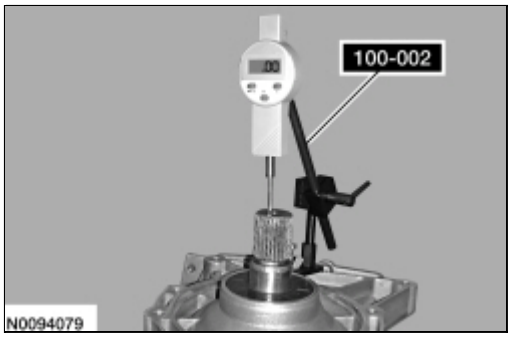
    Using the Dial Indicator Gauge with Holding Fixture, lift up on the output shaft flange and record the reading. The reading should be within 0.6-0.9 mm (0.024-0.035 in).
    - If the reading is not within specification, install a different (either thinner or thicker) selective

repair4less

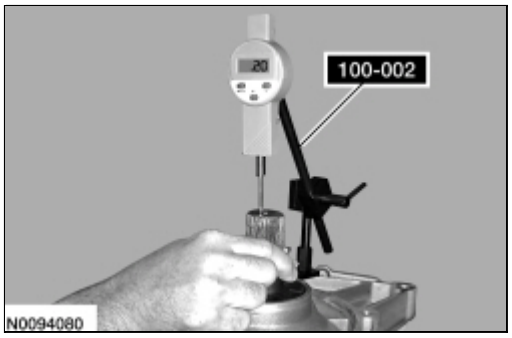


shim.

42. Tighten the output shaft flange retaining nut.
    - Tighten to 80 Nm (59 lb-ft).

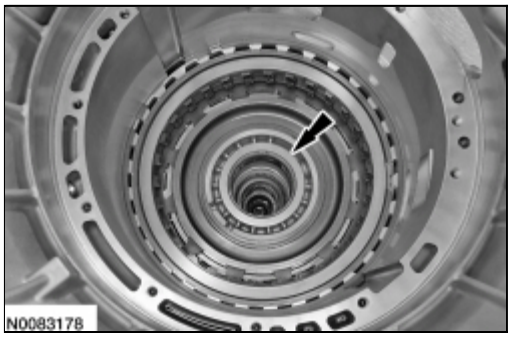


43. After installing the new output shaft flange retaining nut, stake the slots to prevent it from coming loose.

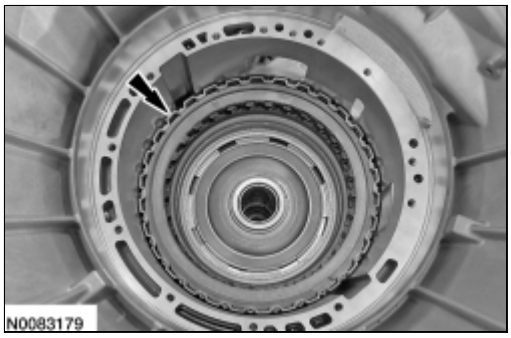


Four-Wheel Drive (4WD) vehicles

44. Install the Dial Indicator Gauge with Holding Fixture on the transmission case and position the plunger on the output shaft.

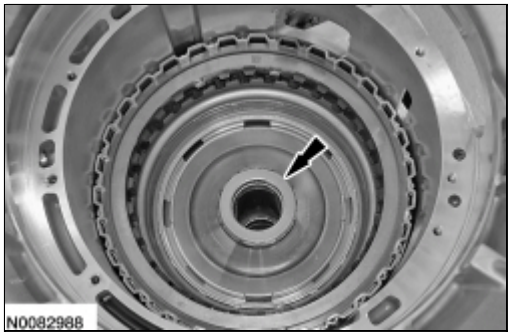


45. Using the Dial Indicator Gauge with Holding Fixture, lift up on the output shaft and record the reading. The reading should be within 0.15-0.35 mm (0.005-0.013 in).
    - If the reading is not within the specification, install a different (either thinner or thicker) select fit thrust gear shim.

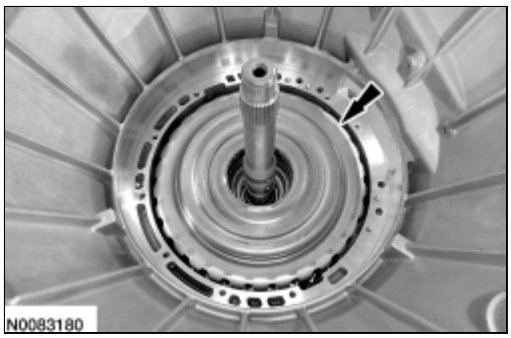


All vehicles

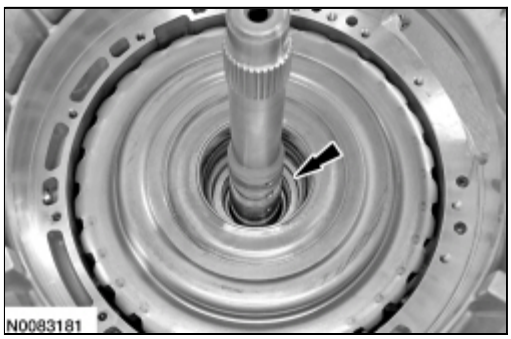
46. Rotate the transmission in the vertical position with the torque converter housing facing up and install the T6 bearing.



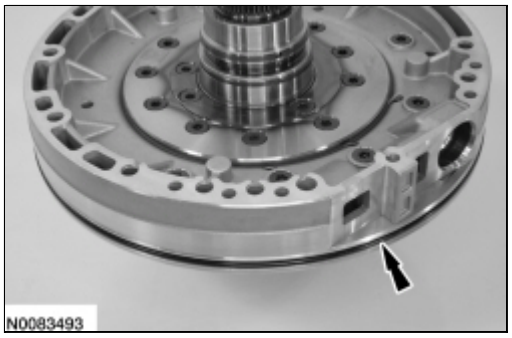
47. Install the direct (B) clutch assembly.



repair4less



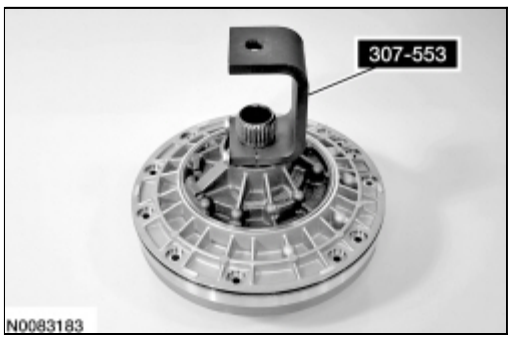
48. Install the T5 roller bearing on the direct (B) clutch assembly.



49. Install the forward (A)/overdrive (E) clutch assembly.

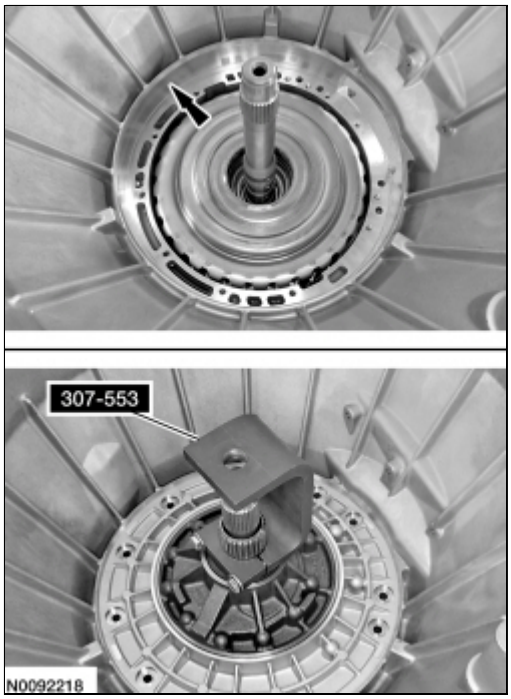
50. Install the selective shim.

51. If the front pump was not disassembled and assembled, install a new front pump O-ring seal and lubricate it with petroleum jelly.

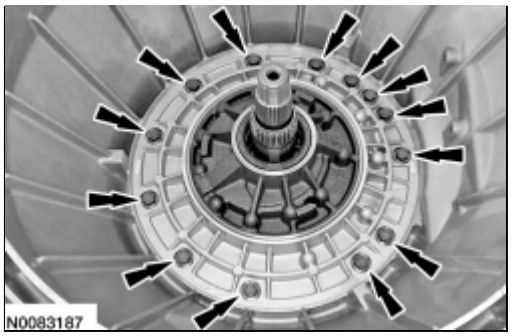


52. Install a new front pump seal on the Fluid Pump Seal Installer.

53. Using the Fluid Pump Seal Installer, install the front pump seal.

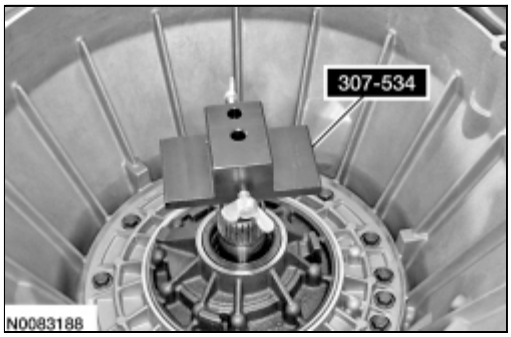


54. Install the Transmission Fluid Pump Remover on the front pump.



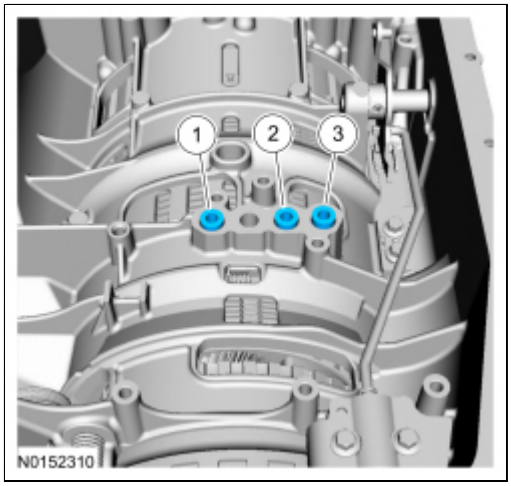
55. Lubricate the transmission case pump bore with petroleum jelly. Using the Transmission Fluid Pump Remover, position the pump assembly in the case and rotate the pump to insert the pump splines into the front planetary sun gear. Rotate the pump to align the pump-to-case bolts and push the pump into the case.

repair4less



56. **NOTE:** Failure to replace the fasteners will result in transmission fluid leakage.

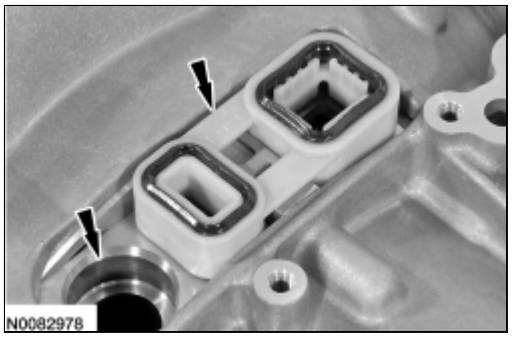
    Install 13 new front pump-to-case bolts and washers. Tighten in a crisscross pattern.
    - Tighten pump fasteners with washers to 10 Nm (89 lb-in).
    - Tighten fasteners without washers to 10 Nm (89 lb-in).



57. Install the Transmission End Play Gauge on the input shaft to measure the end play.
    - Tighten the wing nut.

58. Install the Dial Indicator Gauge with Holding Fixture on the Transmission End Play Gauge.
    - Push down on the Transmission End Play Gauge and zero the Dial Indicator Gauge.
    - Lift up on the Transmission End Play Gauge and record the measurement on the Dial Indicator Gauge. The measurement should be between 0.2-0.4 mm (0.008-0.015 in). If the measurement is not within specification, install a new selective front pump shim.
    - Measure the original shim, install a thinner or a thicker shim to achieve the correct measurement.

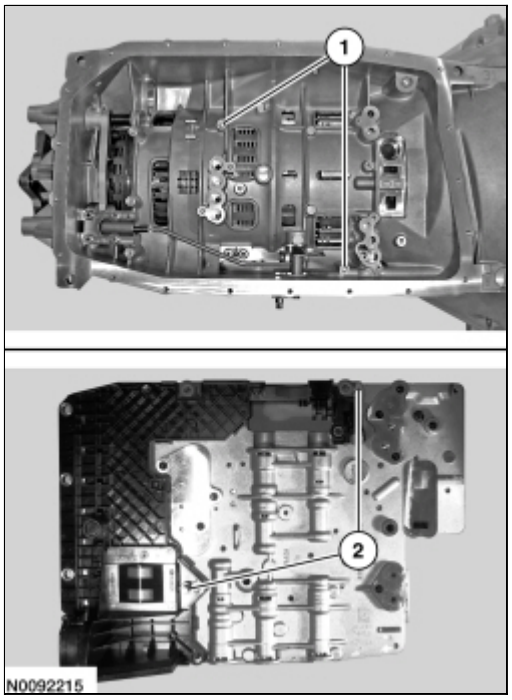
59. Rotate the transmission in the horizontal position with the main control area facing up and install 3 new center support feed tube seals.
    1. Center support feed tube seal (7G199 Black)
    2. Center support feed tube seal (7G087 Green)
    3. Center support feed tube seal (7G084 Blue)



60. **NOTE:** Make sure the transmission fluid filter seal has been removed. If it has not, use a pick and remove the seal.

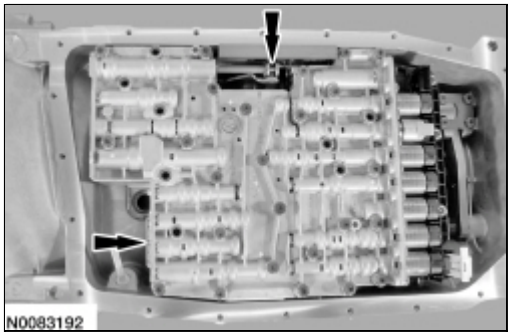
    NOTE: Add 0.118L (4 oz) of clean transmission fluid to prime the pump.

    Install the front pump adapter seal and prime the fluid pump.

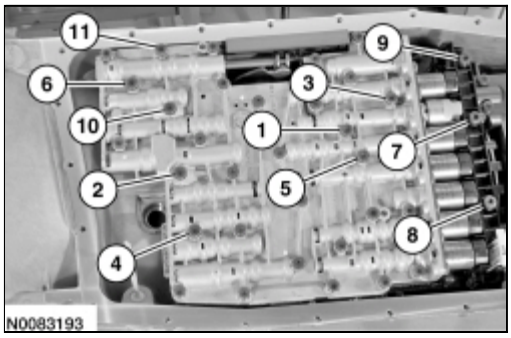


repair4less

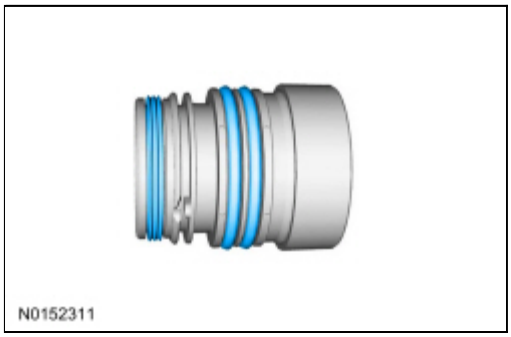
61. Install the thermal bypass valve into the case.



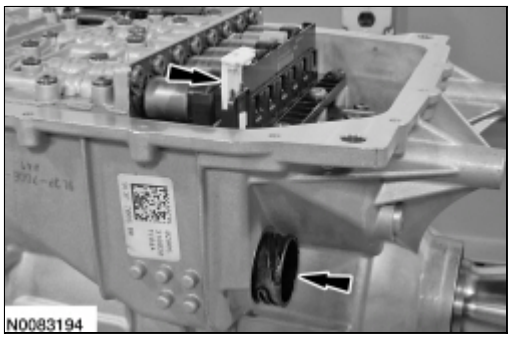
62. Align the guide pins in the alignment holes in the transmission case and position the mechatronic assembly in place.
    1. Alignment holes
    2. Guide pins



63. **NOTE:** The mechatronic assembly will not lay flush on the case, this is a normal condition with the rubber feed tubes, the bolts will pull the mechatronic assembly down.

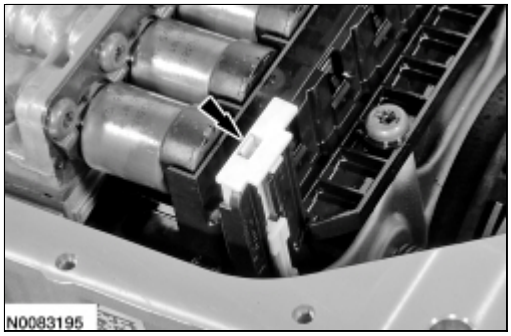


Slightly lift the mechatronic assembly and align the manual valve in the manual valve linkage and position the mechatronic in place.

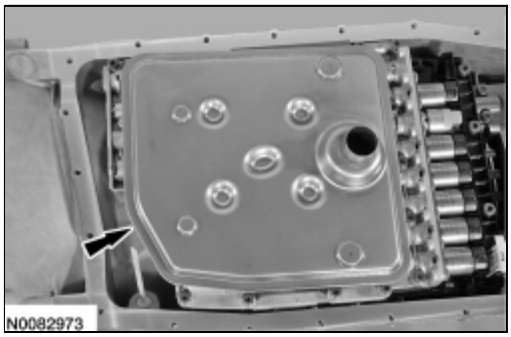


64. Install the 11 mechatronic assembly bolts and tighten in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

65. If removed, install the bulkhead connector sleeve seals.

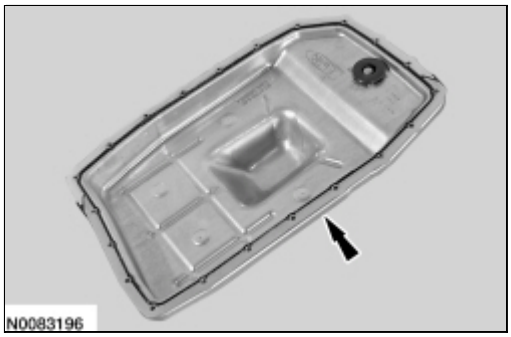


66. With the release tab up and unlocked, push the outer shell of the bulkhead connector sleeve into the transmission. Make sure the bulkhead connector sleeve is fully seated into the molded leadframe.

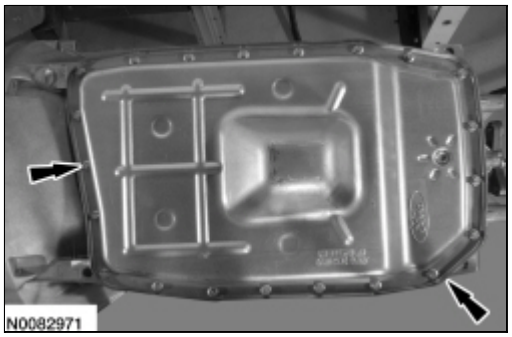


repair4less

67. Press down on the tab and lock the outer shell of the bulkhead connector sleeve in place. Make sure the locking tab is securely locked.



68. Install a new transmission fluid filter.

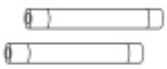


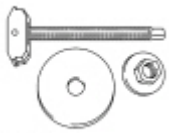
69. **NOTE:** The fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket if required.

70. Install the transmission fluid pan and transmission fluid pan bolts. Tighten in a crisscross pattern.
    - Tighten to 9 Nm (80 lb-in).

71. Using the Torque Converter Handle, install the torque converter.





72. If the Overdrive clutch FRICTIONS were replaced, install 1 6R ATF Additive Kit XL-16.

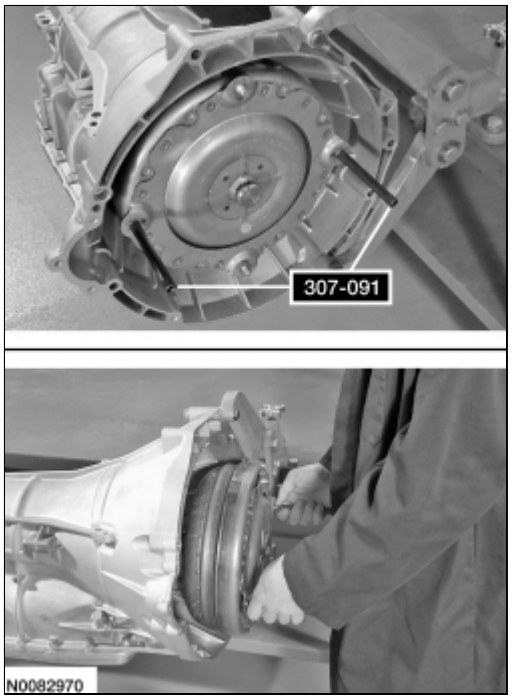
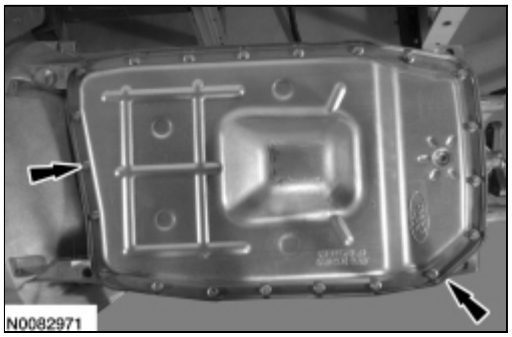
 ST1433-B	Installer, Front Wheel Hub Oil Seal 205-256
 ST2381-A	Remover, Input Shaft Oil Seal 308-375
 E173280	Remover, Koastal Sleeve 307-717
 ST2932-A	Remover, Needle Bearing 307-562 (includes 307-562/1 and 307-562/2)
	Remover, Pilot Bearing 308-001 (T58L-101-B)

 ST1282-A	
 ST2891-A	Remover, Transmission Fluid Pump 307-553
 ST1104-B	Retaining Ring Pliers 307-343 (T95P-77001-AHR)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

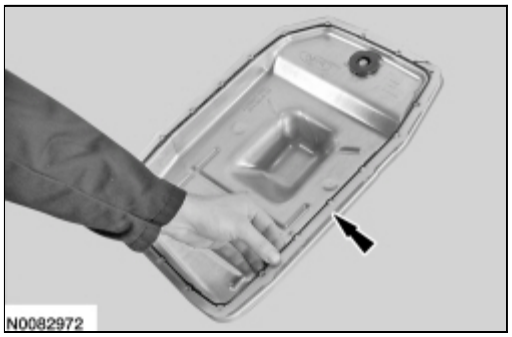


All vehicles

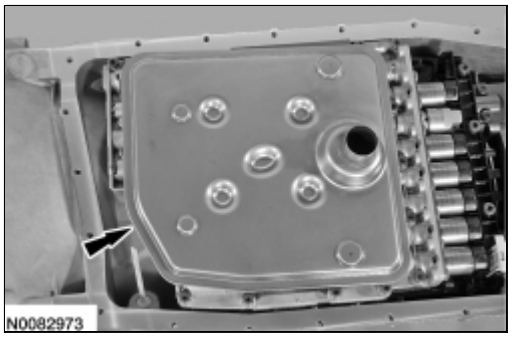
1. Install the Transmission Holding Fixture on the torque converter housing and install the transmission on a bench.



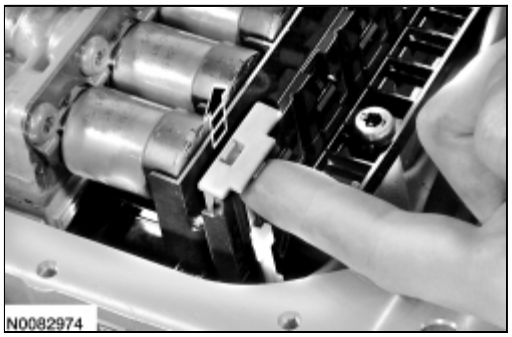
2. Using the Torque Converter Handle, remove the torque converter.



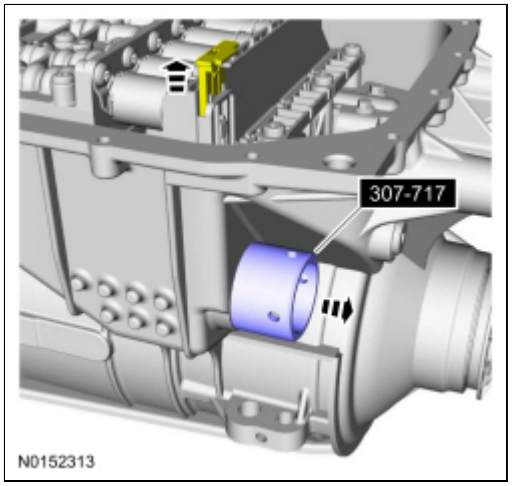
repair4less



3. Remove the transmission fluid pan bolts and the transmission fluid pan.

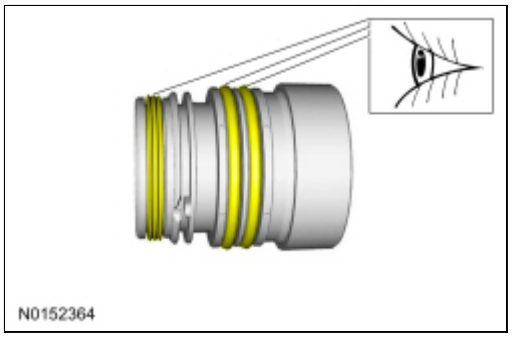


4. Remove the transmission fluid pan gasket.

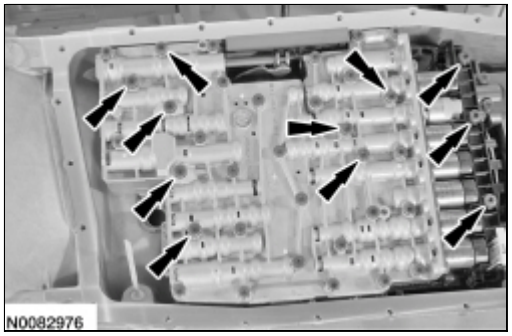


5. Remove and discard the transmission fluid filter.

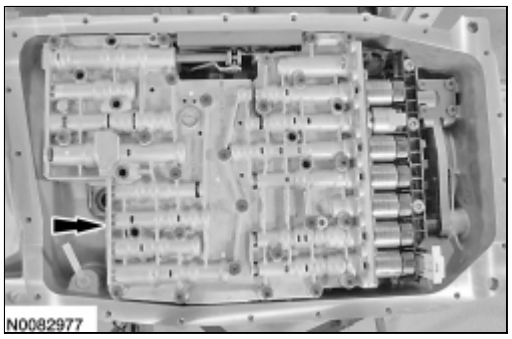
6. Press the release tab and lift up on the bulkhead connector sleeve retainer to release the bulkhead connector sleeve shell.



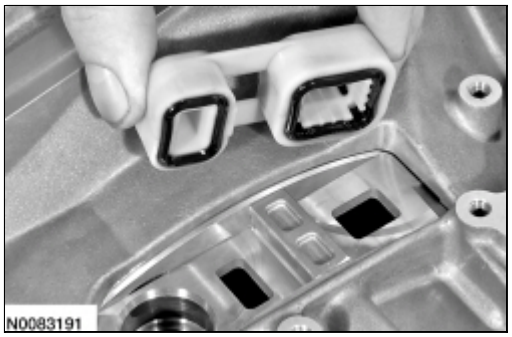
7. With the transmission bulkhead connector sleeve retainer released, use the Koastal Sleeve Remover to pull the outer shell of the bulkhead connector sleeve out of the transmission.



8. Inspect the bulkhead connector sleeve seals.
    - If necessary, replace the seals.

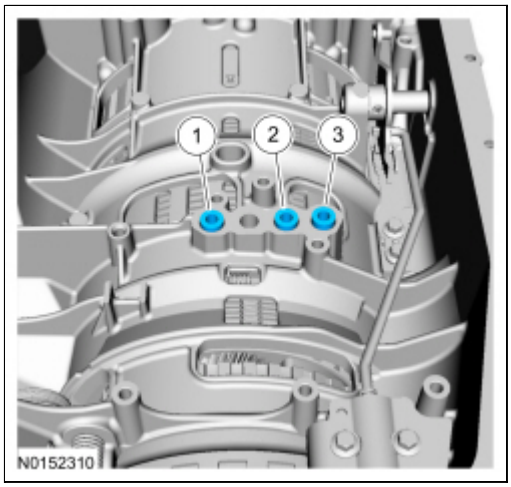


repair4less

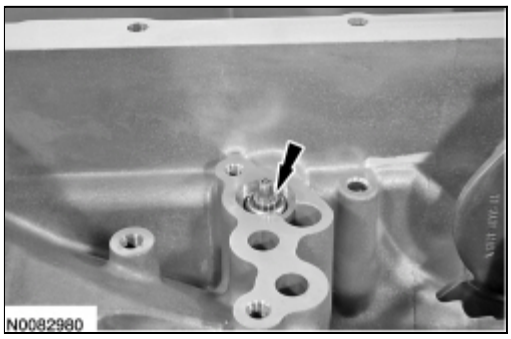


9. Remove the 11 bolts from the main control assembly.

10. Remove the main control assembly.

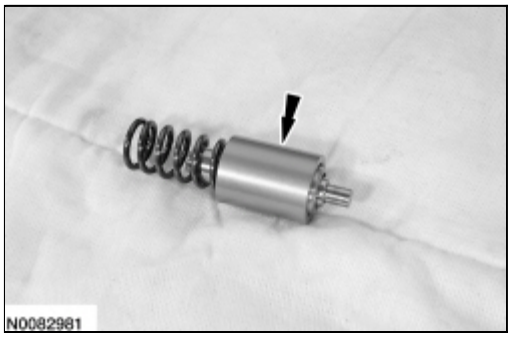


11. Remove the front pump adapter seal and the transmission fluid filter seal. Inspect for cracks or damage.



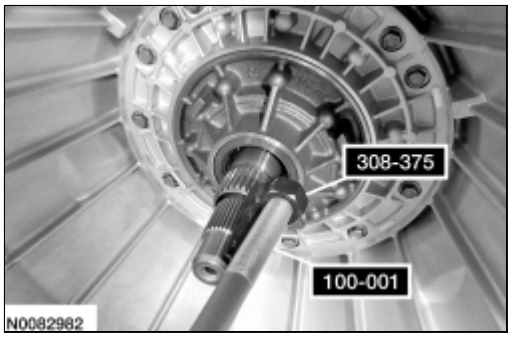
12. **NOTE:** Note the color, size and location while removing for correct assembly.

    Remove and discard the 3 center support feed tube seals.

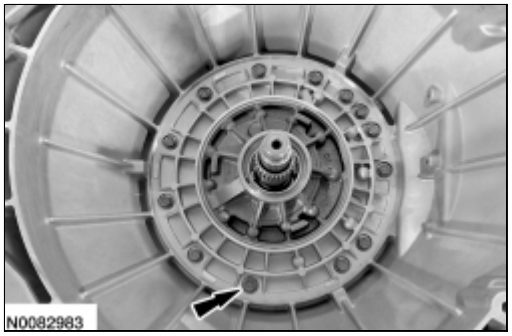


1. Center support feed tube seal (7G199 Black)
2. Center support feed tube seal (7G087 Green)
3. Center support feed tube seal (7G084 Blue)

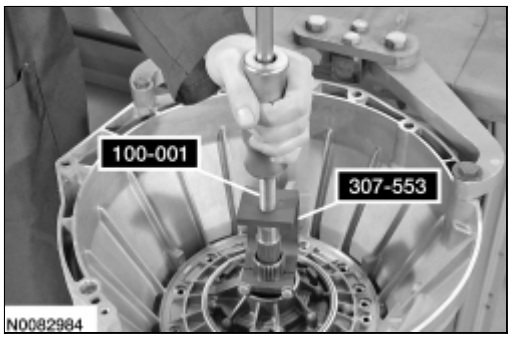
13. Remove the thermal bypass valve from the case.



14. Inspect the thermal bypass valve for damage and install a new valve if damaged.

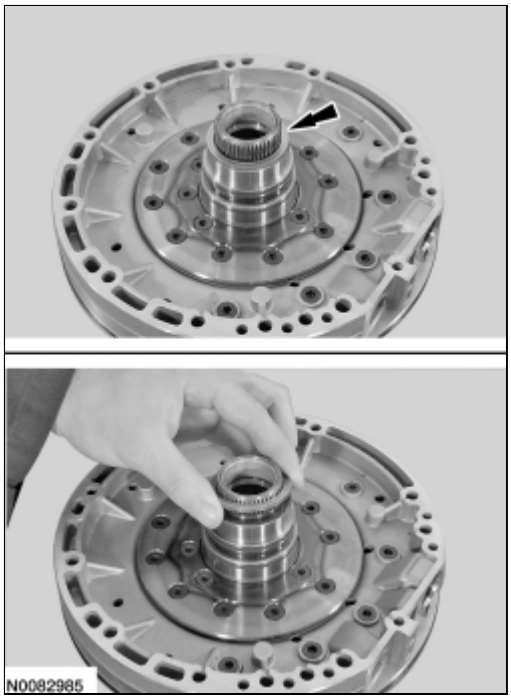


15. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove and discard the front pump seal.

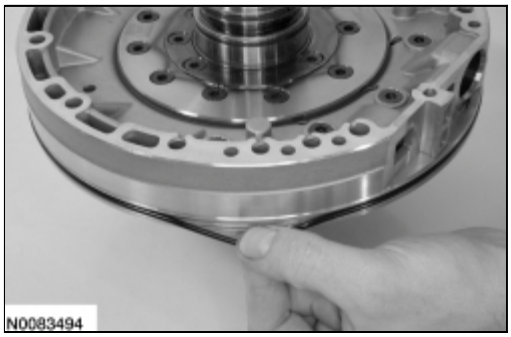


repair4less

16. Remove and discard the 13 front pump-to-case bolts and washers.

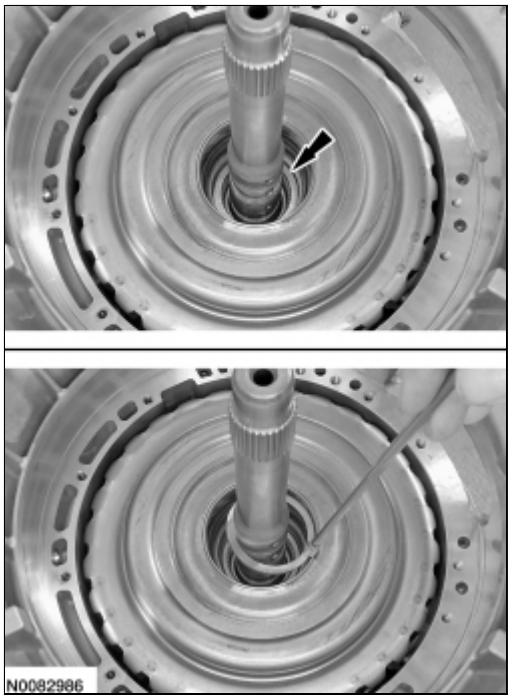


17. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the front pump support.

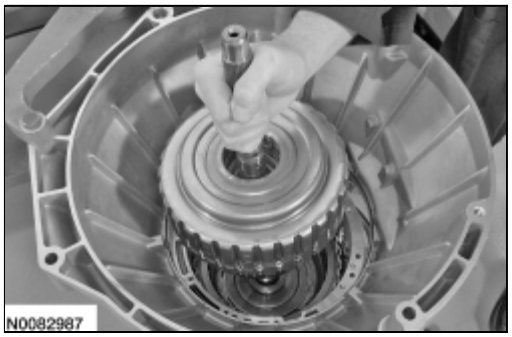


18. **NOTE:** The selective shim may come out while removing the front pump.

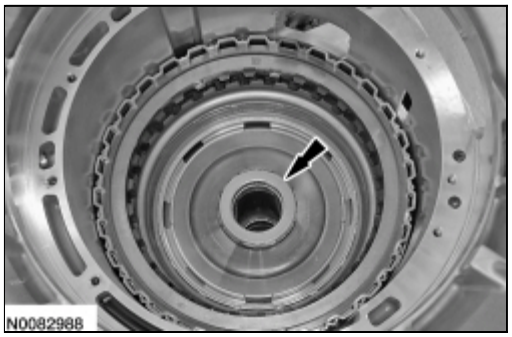
    Inspect the back of the front pump for the selective shim and remove If necessary.



19. Remove and discard the front pump O-ring seal.

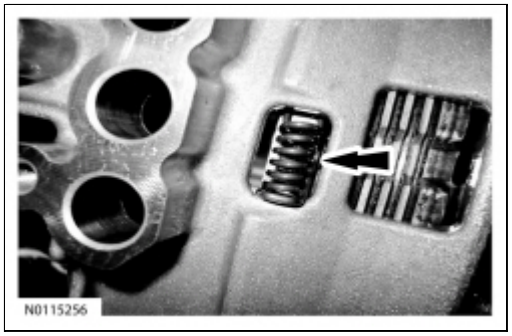


20. If the selective shim is not on the pump, using a magnet, remove it from the forward (A)/overdrive (E) clutch assembly.

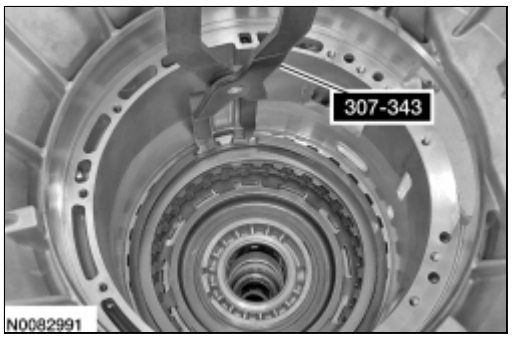


repair4less

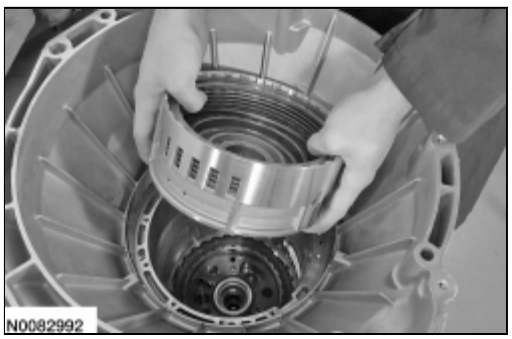
21. Remove the forward (A)/overdrive (E) clutch assembly.



22. Remove the caged T5 roller bearing from the direct (B) clutch assembly.

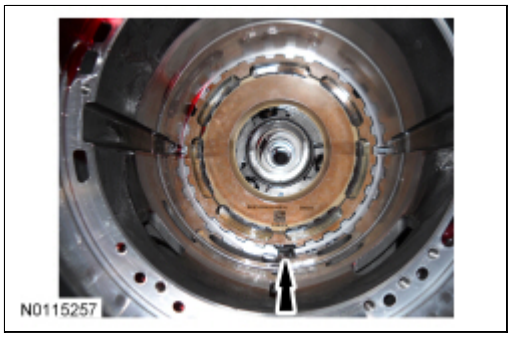


23. Remove the direct (B) clutch assembly.



24. Remove the bias spring.

25. Using the Retaining Ring Pliers, remove the center support snap ring.

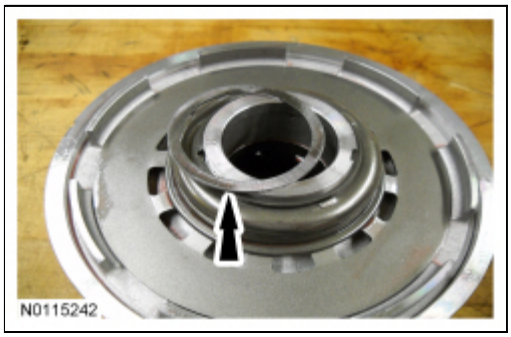


26. Remove the center support and T6 bearing.

27. **NOTE:** When removing the OWC , note the position for assembly.

    Remove the OWC .

repair4less

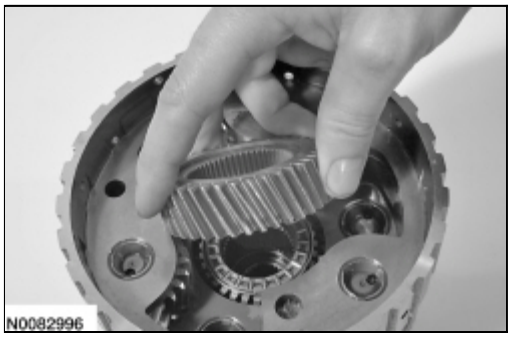


28. **NOTE:** The selective shim might stick to the T7 thrust bearing during removal of the center support.

    Remove the selective shim and the T7 thrust bearing.

29. **NOTE:** The selective shim might stick to the back of the center support assembly during removal.

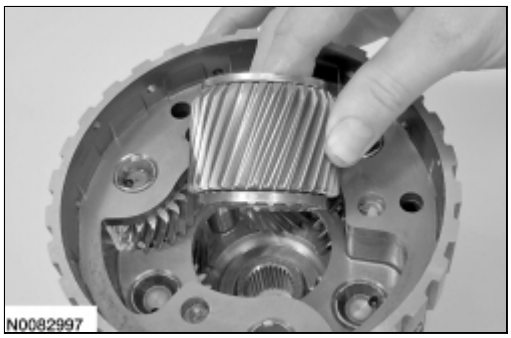
    Remove the selective shim from the center support assembly.



30. **NOTE:** Some of the clutch plates may stay in the case when removing the planetary carrier and the low/reverse clutch pack. Remove any clutch plates from the transmission that were not removed with

the carrier and keep the clutch plates together.

Remove the planetary carrier and the low/reverse clutch pack as an assembly.



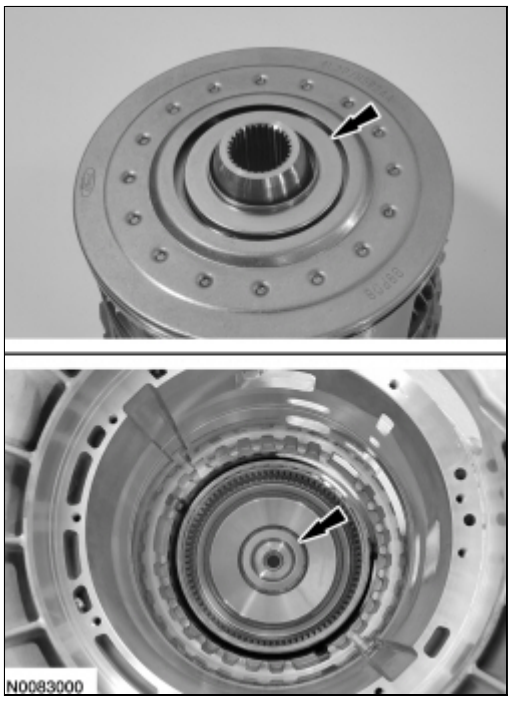
31. Remove the No. 2 sun gear and race.

32. **NOTE:** Remove the bearings with the sun gear.

    NOTE: When removing the sun gear, note that the tapered edge is facing up toward the torque converter housing.

    Remove the No. 3 sun gear from the planetary assembly.

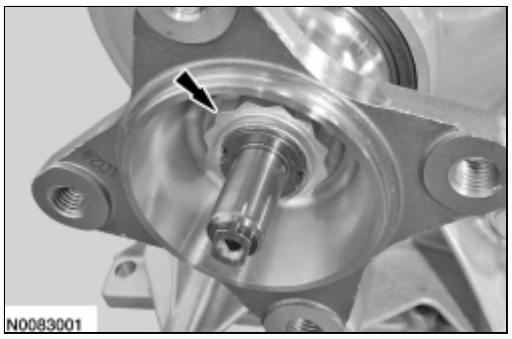
33. Remove the top T8 and the bottom T9 roller bearings from the sun gear.



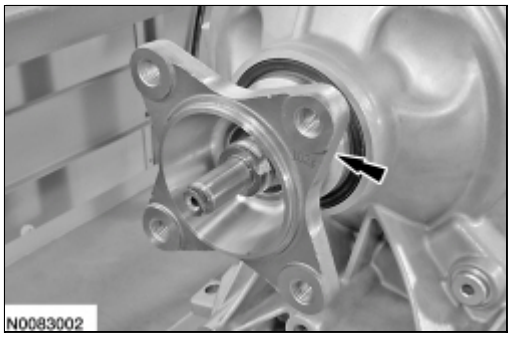
repair4less

34. Remove the T9 roller bearing race from the bottom of the carrier.

35. Remove the T10 thrust bearing from either the rear planetary carrier or the output shaft assembly.

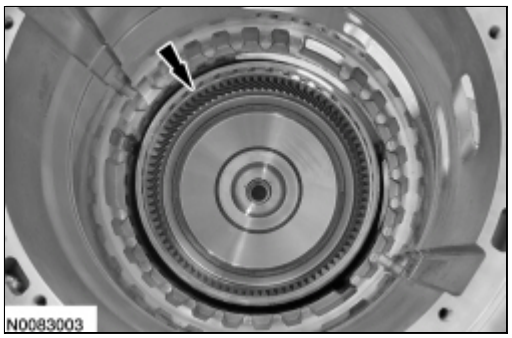


Rear Wheel Drive (RWD) vehicles

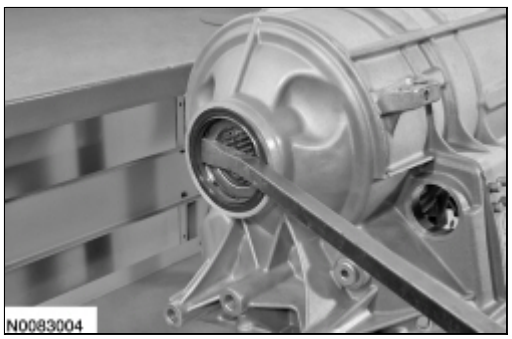


36. ***NOTICE:*** **The output shaft flange retaining nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.**

    Place the manual control lever in the PARK position and remove and discard the output shaft flange

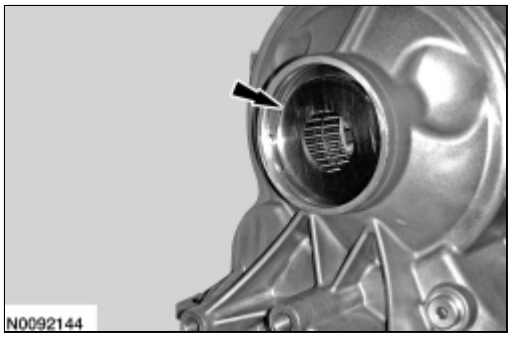


retaining nut.

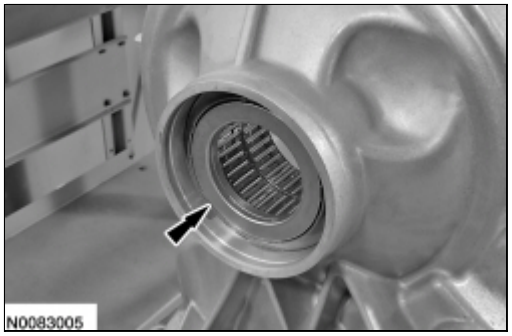


37. Remove the output shaft flange seal and the output shaft flange.

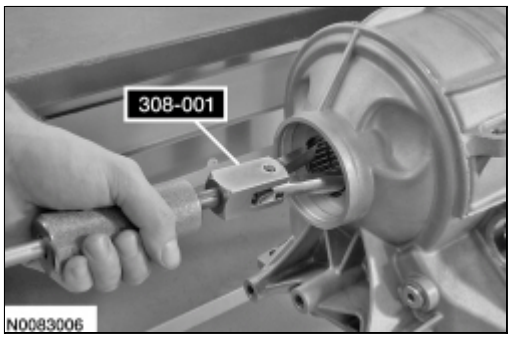
38. Remove the planetary carrier hub, output shaft assembly and T11 bearing.



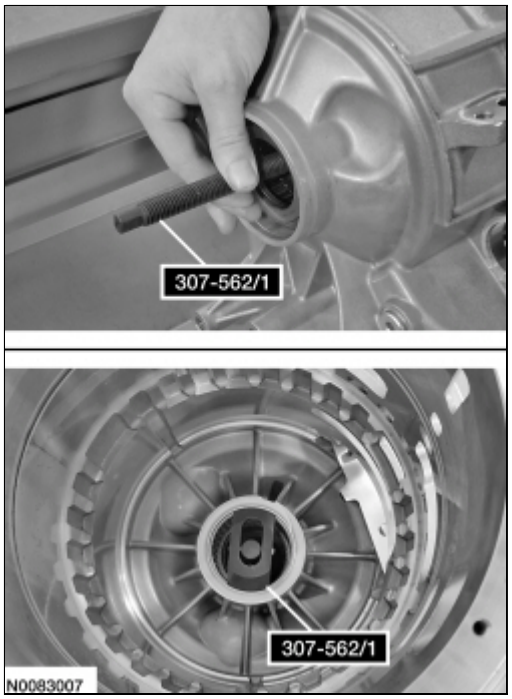
39. Remove and discard the output shaft seal.



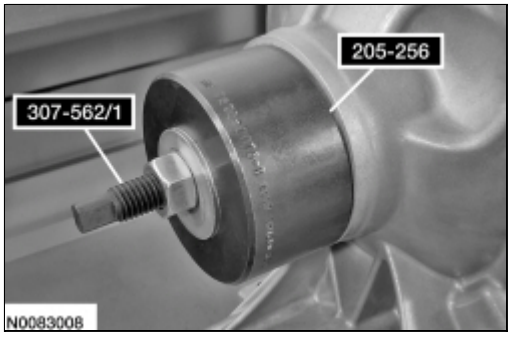
40. Remove the slip plane washer.



repair4less

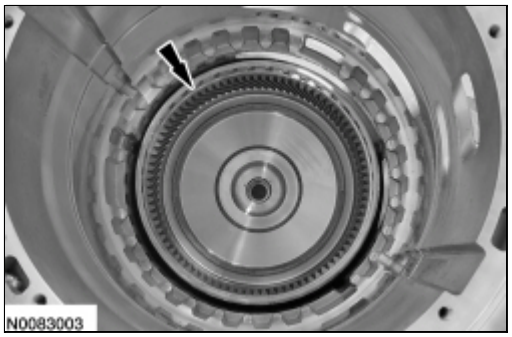


41. Remove the T12 thrust bearing.

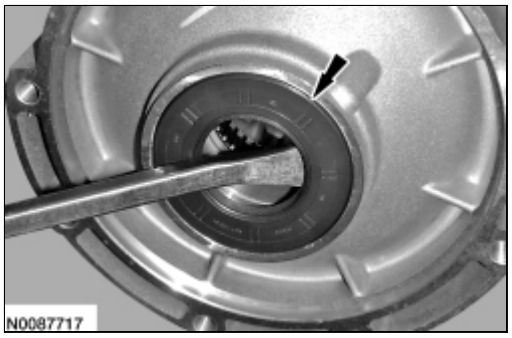


42. Using the Pilot Bearing Remover, remove the thrust bearing spacer.

43. Install the Needle Bearing Remover on the bearing.

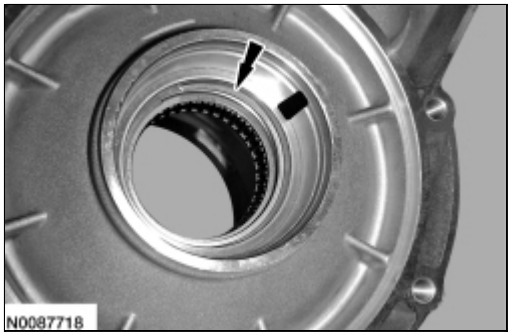


44. Install the Front Wheel Hub Oil Seal Installer on the Needle Bearing Remover and remove the bearing.



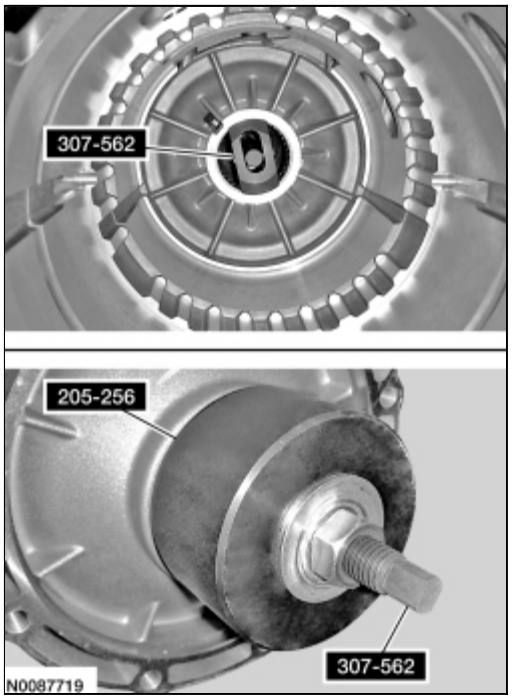
Four-Wheel Drive (4WD) vehicles

45. Remove the planet carrier hub, output shaft assembly and T11 bearing.

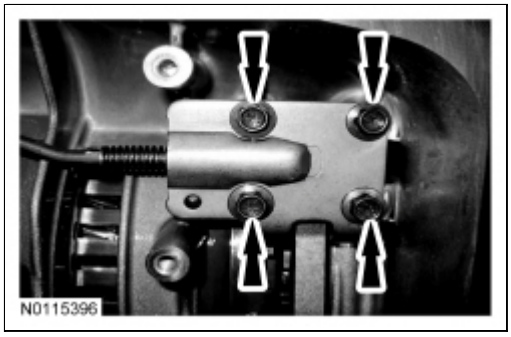


46. Remove and discard the output shaft seal.

repair4less

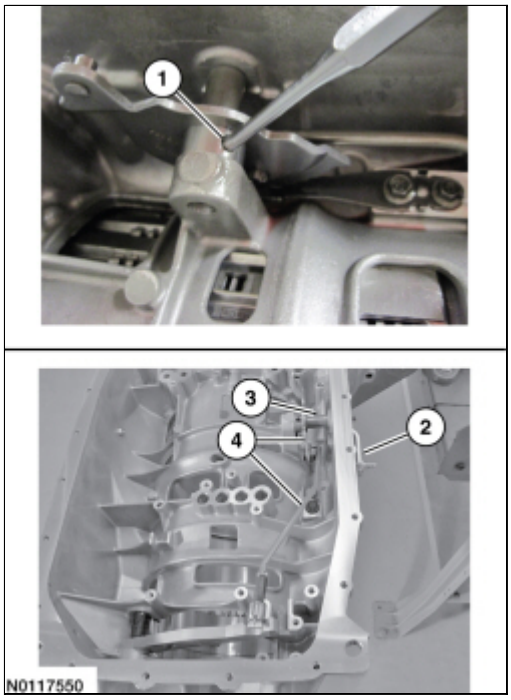


47. Remove the snap ring from the case.

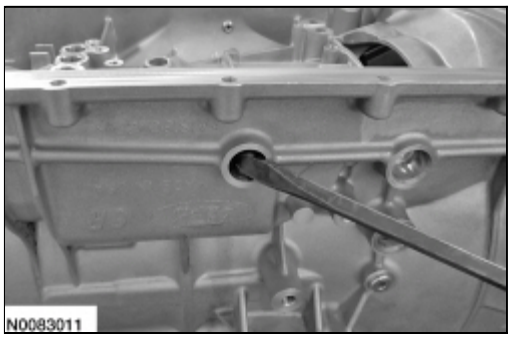


48. ***NOTICE:*** **Use care when installing the Needle Bearing Remover. Look inside the transmission case to make sure that the Needle Bearing Remover contacts the bearing only and not the lip of the case, or damage to the case will occur.**

    Using the Needle Bearing Remover and the Front Wheel Hub Oil Seal Installer, remove the bearing assembly.

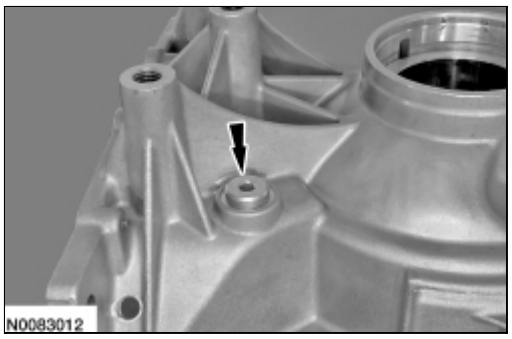


All vehicles

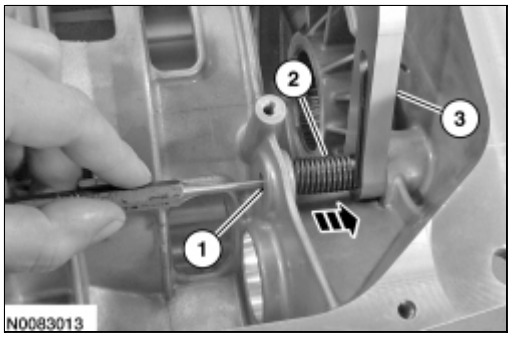


49. Remove and discard the 4 park rod actuating plate bolts and the park rod actuating plate.

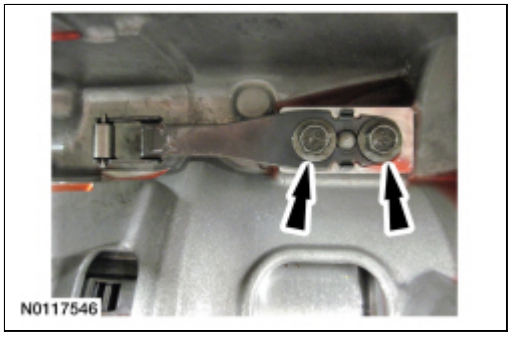
50. Remove the manual control lever detent plate and park pawl actuator rod from the transmission case.
    1. Remove and discard the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the manual control lever spacer to keep it from falling into the case.
    4. Remove the manual valve detent lever and park pawl actuator rod as an assembly.



51. Remove and discard the manual control lever shaft seal.

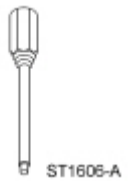


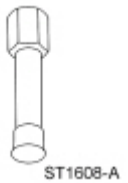
repair4less

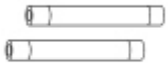


52. Remove the bolt from the back of the case to gain access to the park pawl pin.

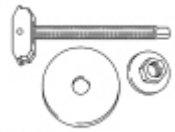
53. From the inside of the case, push the park pawl pin out toward the back side of the case while holding the park pawl return spring and the park pawl. Remove the park pawl pin then remove the park pawl and spring.
    1. Park pawl pin
    2. Park pawl return spring
    3. Park pawl





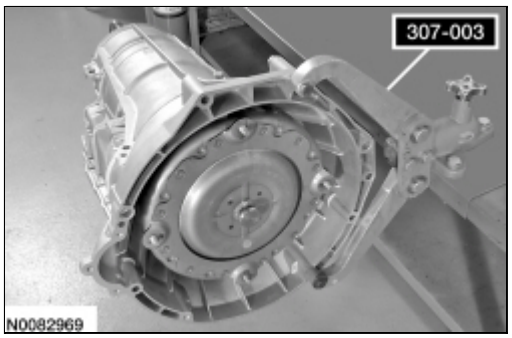


54. Remove and discard the 2 bolts and the park detent spring.



repair4less

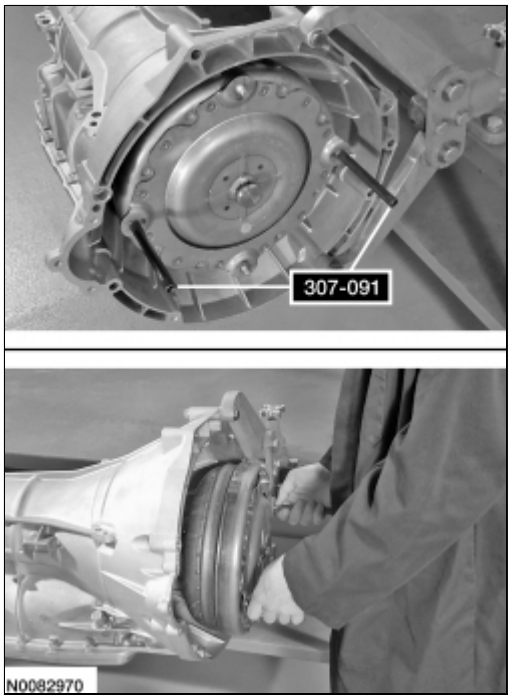
Transmission — Late Build



Special Tool(s)

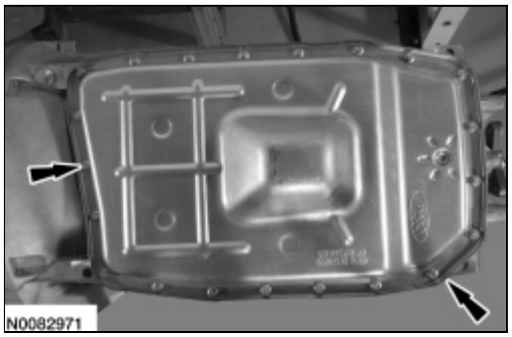
 ST1606-A	Actuator Pin 303-D012 (D80L-100-H)
 ST1608-A	Collet, 1 1/4 Inch to 1 1/2 Inch 303-D022 (D80L-100-T)
 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 **ST1433-B**	Installer, Front Wheel Hub Oil Seal 205-256
 ST2381-A	Remover, Input Shaft Oil Seal 308-375
	Remover, Koastal Sleeve 307-717

 E173280	
 ST2932-A	Remover, Needle Bearing 307-562 (includes 307-562/1 and 307-562/2)
 ST2891-A	Remover, Transmission Fluid Pump 307-553
 ST1104-B	Retaining Ring Pliers 307-343 (T95P-77001-AHR)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

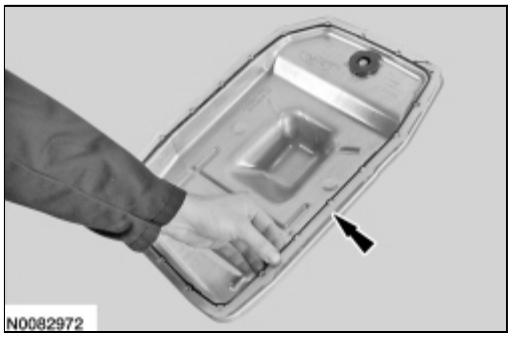


All vehicles

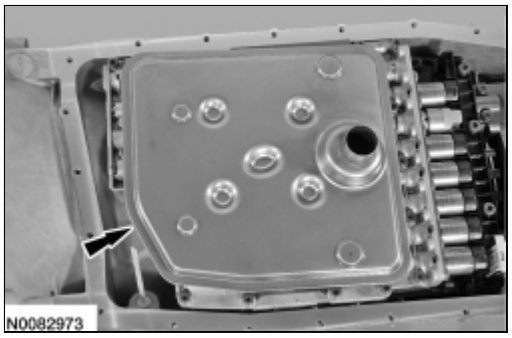
1. Install the Transmission Holding Fixture on the torque converter housing and install the transmission on a bench.



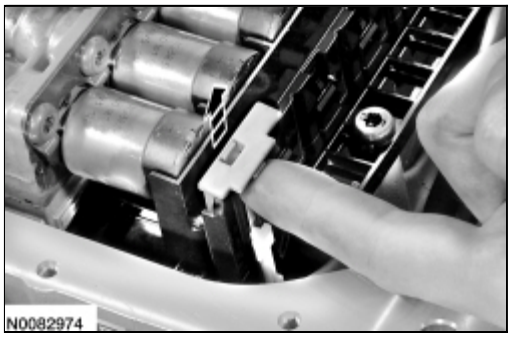
2. Using the Torque Converter Handle, remove the torque converter.



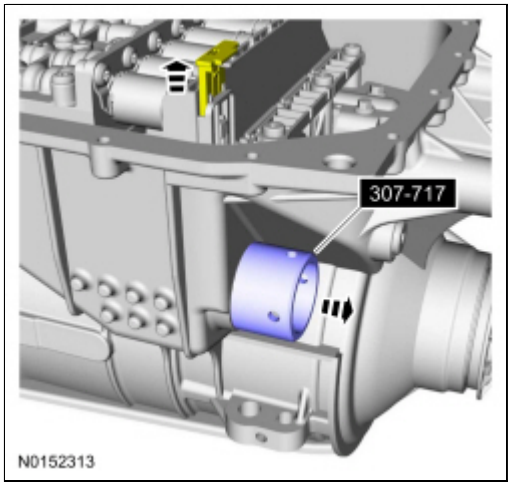
repair4less



3. Remove the transmission fluid pan bolts and the transmission fluid pan.

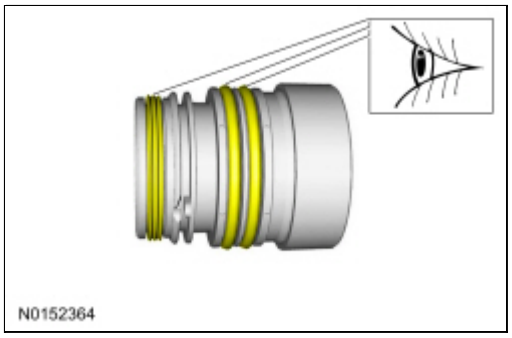


4. Remove the transmission fluid pan gasket.

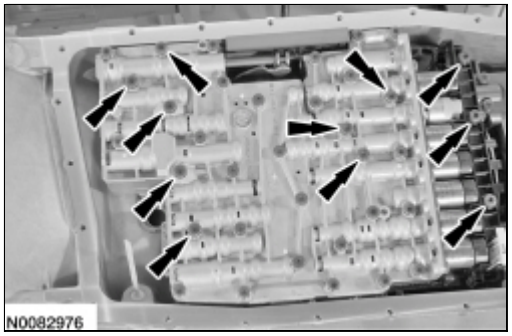


5. Remove and discard the transmission fluid filter.

6. Press the release tab and lift up on the bulkhead connector sleeve retainer to release the bulkhead connector sleeve shell.



7. With the transmission bulkhead connector sleeve retainer released, use the Koastal Sleeve Remover to pull the outer shell of the bulkhead connector sleeve out of the transmission.



8. Inspect the bulkhead connector sleeve seals.
    - If necessary, replace the seals.
