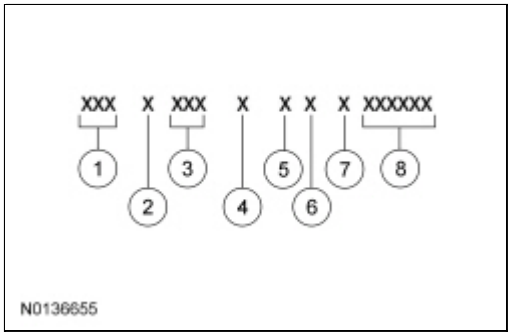
Identification Codes



Vehicle Identification Number (VIN)

Vehicle Identification Number (VIN) Tag Locator

The Vehicle Identification Number (VIN) is a 17-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted on the instrument panel, top upper left of the dash. The VIN is also found on the Vehicle Certification (VC) label.

If the VIN plate requires replacement, authorized dealers must contact their respective regional office.

Item	Description
1	World Manufacturer Identifier (WMI)
2	Brake type and Gross Vehicle Weight Rating (GVWR)
3	Vehicle line and body type
4	Engine type
5	Check digit
6	Model year
7	Assembly plant
8	Production sequence number

World Manufacturer Identifier (WMI)

The first 3 VIN positions are the World Manufacturer Identifier (WMI).

- 1FT - Ford Motor Company, USA, truck (completed vehicle)
- 5LT - Lincoln, USA, truck (Mexico only)

Brake Type and Gross Vehicle Weight Rating (GVWR)

The fourth VIN position is the vehicle brake type and Gross Vehicle Weight Rating (GVWR) code, all vehicles use hydraulic brakes. This code may also identify the vehicle safety restraint system.

- E - 6,001-7,000 pound GVWR , active safety belts (all positions), driver and front passenger air bags, side inflatable restraint (first and second row)
- F - 7,001-8,000 pound GVWR , active safety belt (all positions), driver and front passenger air bags, side inflatable restraint (first and second row)
- M - 6,001-7,000 pound GVWR , active safety belts (all positions), driver and front passenger air bags, side inflatable restraint (first row)
- N - 7,001-8,000 pound GVWR , active safety belts (all positions), driver and front passenger air bags, side inflatable restraint (first row)
- P - 8,001-8,500 pound GVWR , active safety belts (all positions), driver and front passenger air bags, side inflatable restraint (first row)
- V - 8,001-8,500 pound GVWR , active safety belts (all positions), driver and front passenger air bags, side inflatable restraint (first and second row)

Line and Body Type

VIN positions 5 through 7 indicate the vehicle line and body type.

- F1C - Ford F-150, Rear Wheel Drive (RWD), regular cab, 5.5 ft, 6.5 ft or 8 ft styleside
- F1E - Ford F-150, Four-Wheel Drive (4WD), regular cab, 5.5 ft, 6.5 ft or 8 ft styleside
- J1G - Lincoln Mark LT, RWD , Crew Cab, styleside (Mexico only)
- J1J - Lincoln Mark LT, 4WD , Crew Cab, styleside (Mexico only)
- W1C - Ford F-150, RWD , Crew Cab, 5.5 ft or 6.5 ft styleside
- W1E - Ford F-150, 4WD , Crew Cab, 5.5 ft or 6.5 ft styleside
- W1R - Ford F-150, 4WD , Crew Cab, styleside, SVT
- X1C - Ford F-150, RWD , SuperCab, 5.5 ft, 6.5 ft or 8 ft styleside
- X1E - Ford F-150, 4WD , SuperCab, 5.5 ft, 6.5 ft or 8 ft styleside

repair4less

- X1R - Ford F-150, 4WD , SuperCab, styleside, SVT

Engine Type

The eighth VIN position is the engine type (displacement and number of cylinders).

- F - 5.0L, 4-valve, Dual Overhead Camshaft (DOHC), V8, electronic fuel injection, Flex-fuel
- M - 3.7L, 4-valve, V6, port fuel injection, Flex-fuel
- T - 3.5L, DOHC , V6, gas
- 6 - 6.2L, 2-valve, V8, electronic fuel injection

Additional engine information can be obtained from the engine tag. Refer to Section 303-01A , Section 303-01B , Section 303-01C or Section 303-01D .

Check Digit

The ninth VIN position is a government-assigned, computer-generated check digit.

Model Year

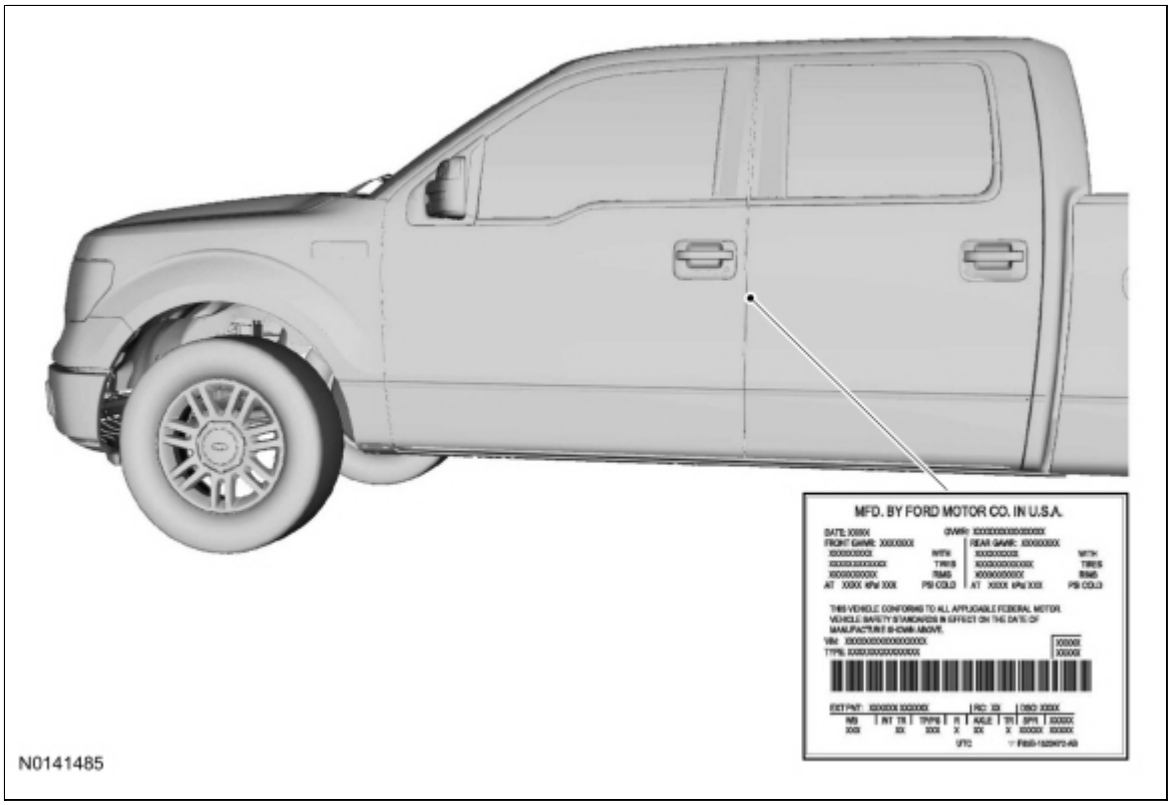
The tenth VIN position is the model year code.

- E - 2014

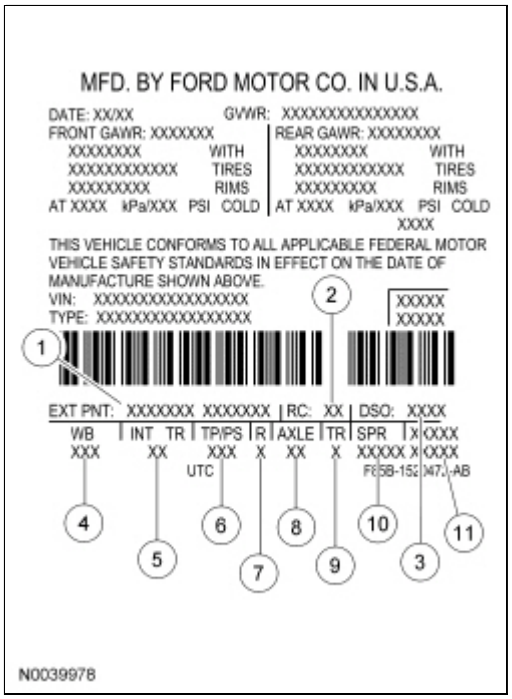
Assembly Plant

The eleventh VIN position is the assembly plant code.

- F - Dearborn (Dearborn, Michigan, USA)
- K - Kansas City (Claycomo, Missouri, USA)



Build Sequence



VIN positions 12 through 17 are an alphanumeric code for the vehicle build sequence. This is also the vehicle serial and warranty number. The serial number can also be found on the engine block, transmission and frame.

- A00001-F99999 - Ford
- J00001-L99999 - Lincoln

Vehicle Certification (VC) Codes

Vehicle Certification (VC) Label Locator

Item	Description
1	Exterior paint code
2	Region code
3	District Special Order (DSO)
4	Wheelbase code

repair4less

5	Interior trim code
6	Tape/paint stripe code
7	Radio code
8	Axle code
9	Transmission code
10	Spring code
11	Powertrain calibration information

The Vehicle Certification (VC) label contains information on the manufacturer name, the month and year of manufacture, the certification statement and the Vehicle Identification Number (VIN). This label also includes Gross Vehicle Weight Rating (GVWR) information.

If a vehicle requires replacement of the VC label and is 4 years old or less, an authorized dealer must submit the VIN to their respective regional office. The regional office will submit a web form to the assembly plant for the replacement label. Once the label has been printed, a representative from the regional office will deliver the label to the dealer and witness installation on the vehicle. If a vehicle is more than 4 years old and requires a replacement label, the dealer must submit a request to the Department of Motor Vehicles.

Exterior Paint

Exterior paint codes may be listed as a 2-part code. The first set of characters identify the primary body color. The second set of characters (if applicable) identify the vehicle accent or 2-tone body color. All colors are base coat/clear coat.

Primary Exterior Color Codes

- Blank - No paint
- D7 - Sunset
- E4 - Vermilion Red
- J1 - Kodiak Brown #2
- LQ - Pale Adobe Metallic
- N1 - Blue Jeans Metallic
- PQ - Race Red
- RR - Ruby Red (tri-coat)
- UG - White Platinum (tri-coat)
- UH - Tuxedo Black Metallic
- UJ - Sterling Gray Metallic
- UX - Ingot Silver Metallic
- VA - Terrain
- W6 - Green Gem #2
- YZ - Oxford White

Exterior Accent Color Codes

- LQ - Pale Adobe Metallic
- UX - Ingot Silver Metallic

Wheelbase

- 126 - 3,200 mm (126 in)
- 133 - 3,378 mm (133 in)
- 145 - 3,683 mm (145 in)
- 157 - 3,988 mm (157 in)

- 163 - 4,140 mm (163 in)

Interior Trim

Interior trim codes are listed as a 2-part code. The first character identifies the interior trim type. The second character identifies the interior trim color.

Interior Trim Type

- 3 - Brick Red accent SVT mini-perforated leather, F-150 SVT
- 4 - Blue accent SVT mini-perforated leather, F-150 SVT
- 5 - Milled pebble leather, captains chairs, F-150 FX
- 6 - Sport leather, F-150 FX
- 7 - Mini perforated leather, 40/console/40 split bench seat, F-150 SVT
- 9 - Leather, 40/console/40 split bench seat, F-150 Platinum
- A - Structure vinyl, 40/20/40 split bench seat, F-150
- C - Lucas cloth, 40/20/40 split bench seat, F-150
- D - Speck cloth, 40/20/40 split bench seat, F-150
- E - Milled pebble leather, 40/20/40 split bench seat, F-150
- G - Luxury leather, 40/console/40 split bench seat, F-150
- H - Milled pebble perforated leather, captains chairs, F-150
- K - Leather, captains chairs, F-150 King Ranch
- M - Premium Lucas cloth, 40/20/40 individual seats, F-150
- P - Micro perforated leather #1 captains chairs, F-150 Platinum
- R - Carbonite cloth, sport bucket seats, F-150
- S - STX Sport cloth bucket seats, F-150
- T - Micro perforated leather #2, captains chairs, F-150 Limited
- U - Lucas cloth, captains chairs, F-150
- V - Leather, 40/20/40 bucket seats, Mark LT

Interior Trim Color

- A - Adobe
- B - Charcoal Black
- S - Steel Gray

Tape/Paint Stripe

Tape and paint stripe codes do not apply.

Radio Type

- A - Amplitude Modulation/Frequency Modulation (AM/FM) stereo with clock – less human machine interface
- B - AM/FM stereo, Compact Disc (CD) player with clock – human machine interface 1
- C - AM/FM stereo, CD player, SYNC® - human machine interface 2
- D - AM/FM stereo, CD player, Liquid Crystal Display (LCD), SYNC® - human machine interface 3
- E - AM/FM stereo, CD player, LCD and SYNC®
- F - AM/FM stereo, CD player, LCD , SYNC®, dual-zone Electronic Automatic Temperature Control (EATC) – human machine interface 5
- G - Sony AM/FM stereo, CD player, SYNC®, human machine interface 6

Axle Type

repair4less

The following lists the available axle ratios:

- 15 - 3.15 non-limited slip
- 19 - 3.55 non-limited slip
- 26 - 3.73 non-limited slip
- 27 - 3.31 non-limited slip
- B6 - 3.73 limited slip
- H9 - 3.55 limited slip
- L3 - 3.31 electronic locking differential
- L4 - 4.10 electronic locking differential
- L5 - 3.15 electronic locking differential
- L6 - 3.73 electronic locking differential
- L9 - 3.55 electronic locking differential

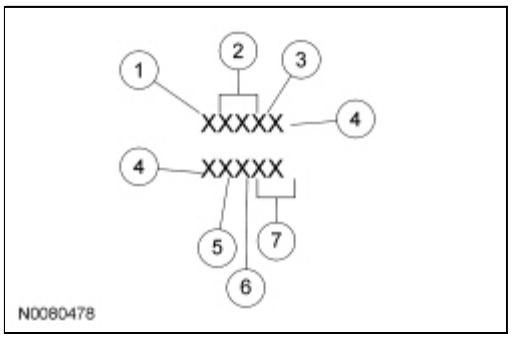
Transmission Type

- 6 - 6-speed automatic, 6R80

Additional transmission information is available on the transmission tag. Refer to Section 307-01 .

Spring Code

Spring codes are listed as a 2-part code. The first 2 characters listed identify the front springs. The second 2 characters listed identify the rear springs.



- Front spring base part number - 5310
- Rear spring base part number - 5560

Powertrain Calibration Information

NOTE: Powertrain calibration information is limited to a maximum of 5 characters per line on the VC label. Because of this, calibration identification consisting of more than 5 characters will wrap to the second line on the VC label.

Powertrain calibration information is printed in the lower right corner of the VC label. Only base calibration information is printed. Revision levels will not appear, however, they can be obtained through a scan tool using the most current software revision.

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Vehicle code
3	Transmission code
4	Unique calibration (designates different hardware to similar vehicles), example: tires or drive ratios
5	Fleet code (describes fleet to which the vehicle belongs), example: 6 - Evaporative Emission (EVAP)
6	Certification region (lead region where multiple regions are included in one calibration), example: A - U.S. federal
7	Revision level (will advance as revisions occur), not printed on label

Model Year

- 1 - 2001
- 2 - 2002
- 3 - 2003
- 4 - 2004
- 5 - 2005
- 6 - 2006
- 7 - 2007
- 8 - 2008
- 9 - 2009
- A - 2010
- B - 2011
- C - 2012
- D - 2013
- E - 2014

Vehicle Line

- F6 - F-150
- F6 - Mark LT (Mexico only)

Transmission

repair4less

- 1 - Automatic transmission

Unique Calibration

The Emissions/Corporate Average Fuel Economy/CO2 Compliance Department is responsible for assigning these calibration numbers. Unique calibration identifications are assigned to cover similar vehicles to differentiate tires, drive configurations, final drive ratios and other calibration-significant factors.

These 2 characters are chosen by the analyst to provide identifiable information unique to each calibration. For example, using the number 2 to denote a 2-valve engine versus using the number 4 to denote a 4-valve engine, offers an easily identifiable difference.

Fleet Code

- 1 - Heavy duty gas engine/Dyno
- 2 - Fast - Automobile Manufacturers' Association, US
- 3 - Alternative durability protocol, US
- 4 - Not assigned
- 5 - Not assigned
- 6 - Evaporative Emission (EVAP)
- 7 - Mileage accumulation, aging endurance durability
- 8 - On-Board Diagnostic (OBD)
- 9 - Not assigned

Certification Region

- 5 - US 50 states
- A - US federal, including altitude, may include Canada and/or Mexico
- B - US California, includes US green states
- C - Canada
- D - China
- E - European Community (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden, United Kingdom)
- F - Extended European Community (E plus Croatia, Czech Republic, Estonia, Hungary, Norway, Poland, Romania, Russian Federation, Slovakia, Slovenia, Switzerland, Yugoslavia)
- G - Gulf Cooperative Council (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, United Arab Emirates)
- H - Hong Kong
- J - Japan
- K - Korea
- L - Malaysia
- M - Mexico
- N - New Zealand
- P - Australia
- Q - South America (Brazil)
- S - Singapore
- T - Taiwan
- V - Vietnam
- X - Rest Of World (ROW)
- Y - Military
- Z - Israel

Revision Level (not printed on label)

- 91-99 - Hardware calibration levels

- 01-04 - Preliminary levels
- 00 - Job 1 production (initial calibration)
- 05-09 - Pre-job 1 revisions to calibrations
- 10-89 - Post-job 1 revisions to calibrations
- 0B - Durability test level
- BD - OBD intermediate level (pre-05)

---

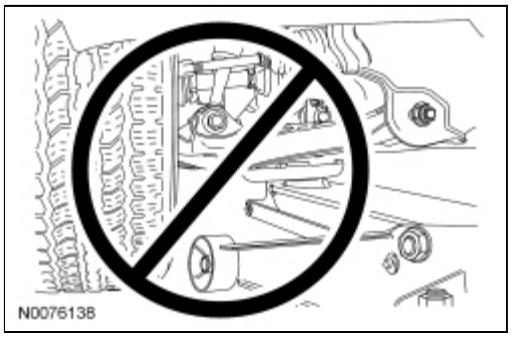
repair4less

Jacking and Lifting

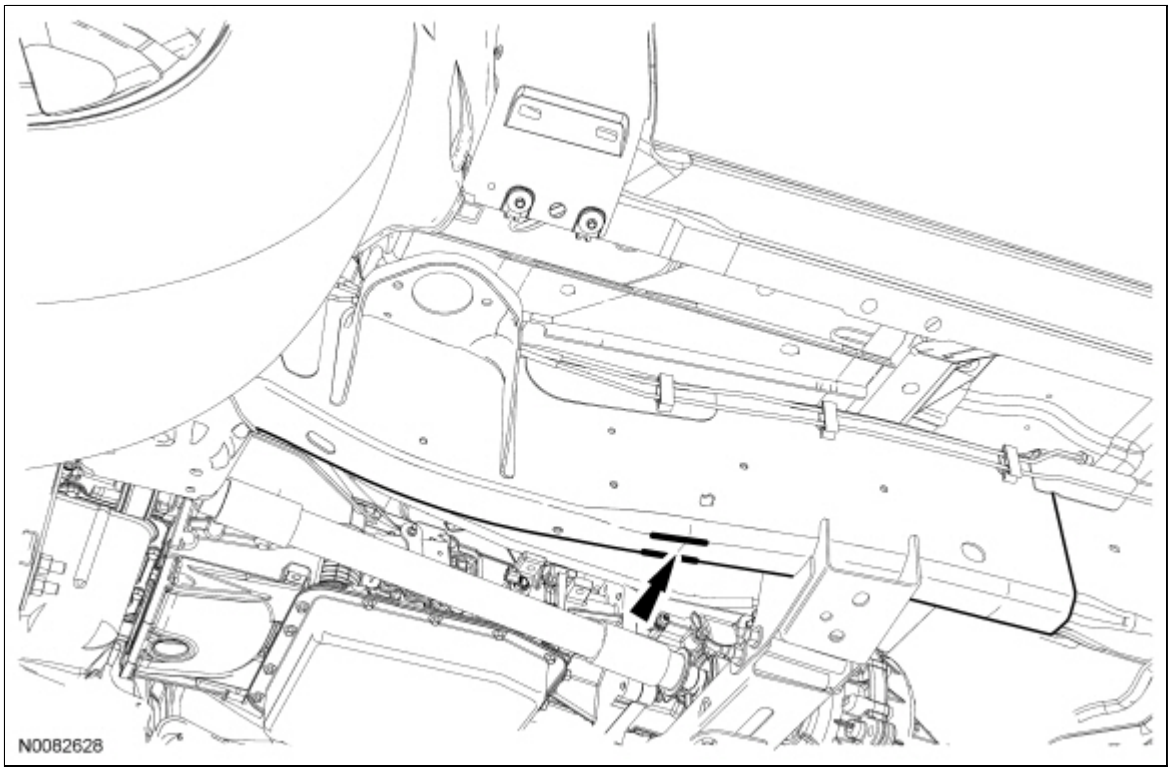
WARNING: Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

WARNING: Turn off (disable) the power running boards (if equipped) before jacking, lifting or placing any object under the vehicle. Never place your hand between the power running board and the vehicle. Extended power running boards will retract when doors are closed. Failure to follow these instructions may result in serious personal injury.

WARNING: Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.



WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

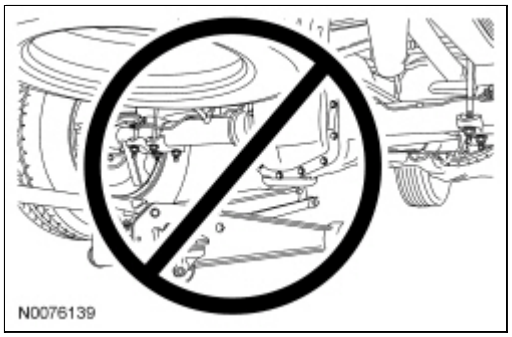


WARNING: When jacking or lifting the vehicle, block all wheels remaining on the ground. Set the parking brake if the rear wheels will remain on the ground. These actions help prevent unintended vehicle movement. Failure to follow these instructions may result in serious personal injury.

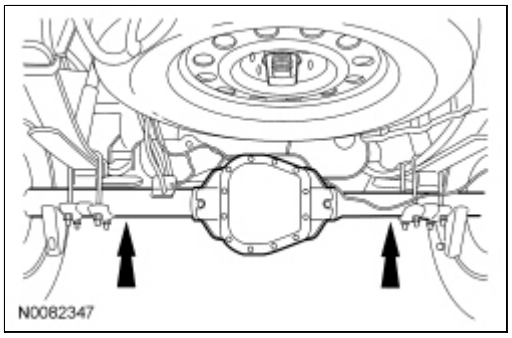
WARNING: Position the hoist lift arms as shown in the illustration. Incorrect positioning could result in vehicle slipping or falling from the hoist. Failure to follow this instruction may result in serious personal injury.

Jacking Points — Front

NOTICE: **Do not use the control arm as a jacking point. Damage to the vehicle may occur.**

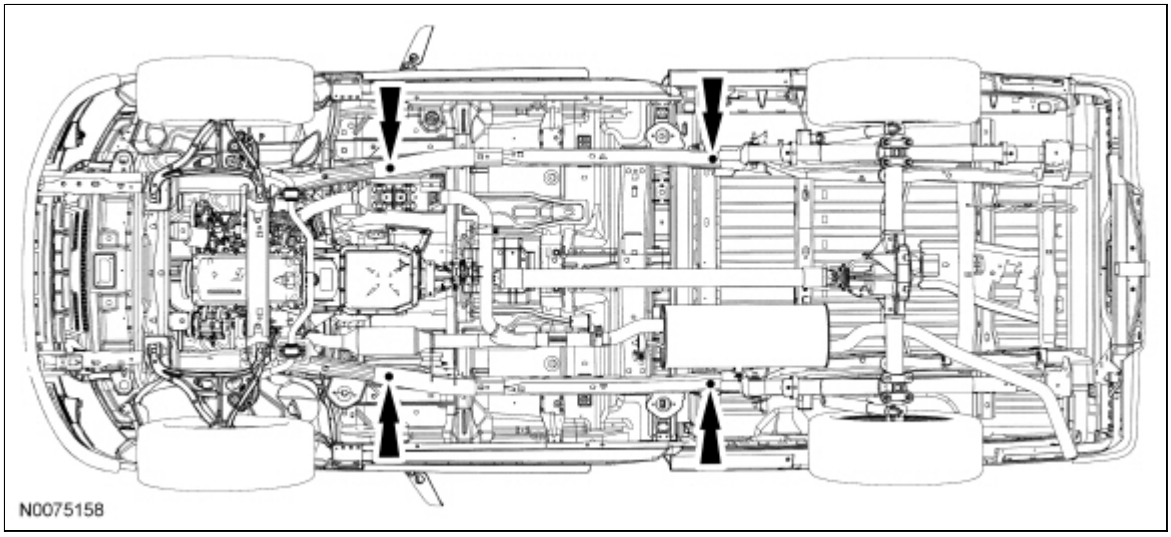


The jacking point is a flat portion on the frame, located behind the front tire and wheel and right below the arrow marked on the frame.



Jacking Points — Rear

NOTICE: **Do not use the differential housing as a lift point. Leaks or damage to the rear axle cover and adjoining differential housing surface may occur if a floor jack or any lifting device is allowed to contact the cover at any point where the cover joins the housing.**



The rear jacking points are located on the rear axle.

repair4less

Frame Lifting Points

Noise, Vibration and Harshness (NVH)

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. NVH is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although a certain level of NVH caused by road and environmental conditions is normal, this section is designed to aid in the diagnosis, testing and repair of NVH symptoms.

Acceptable NVH

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH symptoms and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

Glossary of Terms

Amplitude

The quantity or amount of energy produced by a vibrating component (G-force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude. See Intensity.

Boom

Low frequency or low pitched noise often accompanied by a vibration. Also refer to Drumming.

Buffet/Buffeting

Strong noise fluctuations caused by gusting winds. An example would be wind gusts against the side glass.

Buzz

A low-pitched sound like that from a bee. Often a metallic or hard plastic humming sound. Also describes a high-frequency vibration. Vibration feels similar to an electric razor.

Chatter

A pronounced series of rapidly repeating rattling or clicking sounds.

Chirp

A short-duration, high-pitched noise associated with a slipping drive belt.

repair4less

Chuckle

A repetitious, low-pitched sound. A loud chuckle is usually described as a knock.

Click

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

Clonk

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

Clunk/Driveline Clunk

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

Conductor

The components that carry (transmit) a vibration frequency from the originator to the reactor.

Cycles Per Second

Cycles per second. Same as hertz (Hz).

Cracks

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

Creak

A metallic squeak.

Cycle

The process of a vibrating component going through a complete range of motion and returning to the starting point.

Decibel (dB)

A unit of measurement, referring to sound pressure level, abbreviated dB.

Drone

A low-frequency, steady sound, like a freezer compressor. Also described as a moan.

Drumming

A cycling, low-frequency, rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom or rolling thunder.

Flutter

Mid to high intermittent sound due to air flow. Similar to a flag flapping in the wind.

Frequency

The rate at which a cycle occurs within a given time.

G-force

The additional load or weight produced in an object during acceleration. When measuring the level or amplitude of a vibration without sound, the unit G is added to associate the force of the vibration to gravity. This is similar to measuring the weight of an object, which is also a function of gravity.

Gravelly Feel

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

Grind

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

Hertz (Hz)

A unit of measure used to describe noise and vibration concerns expressed in cycles per second.

Hiss

Steady, high-frequency noise. Vacuum leak sound.

Hoot

A steady, low-frequency tone, sounds like blowing over a long neck bottle.

Howl

A mid-range frequency noise between drumming and whine. Also described as a hum.

Hum

Mid-frequency steady sound, like a small fan motor. Also described as a howl.

Intensity

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The higher the sound's amplitude, the higher the intensity and vice versa. See Amplitude.

Knock

A heavy, loud, repetitious sound, like a knock on the door.

Moan

A constant, low-frequency tone. Also described as a hum.

repair4less

Ping

A short-duration, high-frequency sound, which has a slight echo.

Pitch

The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

Pumping Feel

A slow, pulsing movement.

Rattle

A random and momentary or short-duration noise.

Reactor

The component, or part, that receives a vibration from an originator and conductor and reacts to the vibration by moving.

Roughness

A medium-frequency vibration. A slightly higher frequency than a shake. This type of vibration is usually related to drivetrain components.

Rustling

Intermittent sound of varying frequency, sounds similar to shuffling through leaves.

Shake

A low-frequency vibration, usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

Shimmy

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

Shudder

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

Slap

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

Squeak

A high-pitched transient sound, similar to rubbing fingers against a clean window.

Squeal

A long-duration, high-pitched noise.

Tap

A light, rhythmic or intermittent hammering sound, similar to tapping a pencil on a table edge.

Thump

A dull beat caused by 2 items striking together.

Tick

A rhythmic tap, similar to a clock noise.

Tip-In Moan

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

Transient

A noise or vibration that is momentary, a short duration.

Vibration

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

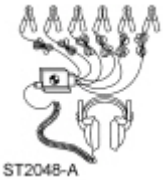
Whine

A constant, high-pitched noise. Also described as a screech.

Whistle

High-pitched noise with a very narrow frequency band. Examples of whistle noises are a turbocharger or air flow around an antenna.

Wind Noise



Any noise caused by air movement in, out or around the vehicle.

Noise, Vibration and Harshness (NVH)

Special Tool(s)

 ST2311-A	Electronic Vibration Analyzer (EVA) 100-F027 (014-00344) or equivalent
 ST2312-A	EngineEAR 107-R2100 or equivalent
 ST2048-A	EngineEAR/ChassisEAR 107-R2102 or equivalent
 ST3025-A	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) 257-00018 or equivalent
 ST3108-A	Squeak and Rattle Repair Kit 164-R4900
 ST2314-A	Ultrasonic Leak Detector 134-R0135 or equivalent

Diagnostic Theory

The shortest route to an accurate diagnosis results from:

repair4less

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of NVH symptoms requires:

- a road or system test to determine the exact nature of the symptom.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any symptoms found.
- a road test or system test to make sure the cause has been corrected or brought back to within an acceptable range.

Diagnostic Procedure Overview

Qualifying the symptom by the particular sensation present can help narrow down the cause. Always use the "symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom" using the diagnostic tools described in this section.
- After determining the possible "system(s)", refer to the appropriate section in this manual to identify the worn or damaged "components".
- After identifying the "components", identify the "cause" of the failure.

Tools and Techniques

The diagnostic tools allow for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration/noise to emanate from another receiving component (reactor), due to contact with other components (transfer path). For the best results, carry out the test as follows:

a. Test drive the vehicle with the vibration sensor inside the vehicle.
b. Place the sensor in the vehicle according to feel.
    - If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
    - A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
c. Record the readings. Also note when the condition begins, when it reaches maximum intensity and if it tends to diminish above/below a certain speed.
    - If a vibration symptom is vehicle speed related, the tire and wheel rpm/frequency and driveshaft frequency should be calculated.
    - If a vibration symptom is engine speed related, the engine, engine accessory and engine firing frequencies should be calculated.
    - Frequencies with an amplitude reading of 0.06 Gs or less are barely perceptible NVH levels.

No corrective action is necessary.

d. Place the vibration sensor on or near the suspect area outside the vehicle.
e. Continue the road test, driving the vehicle at the speed the symptom occurs and take another reading.
f. Compare the readings.
    - A match in frequency indicates the problem component or area.
    - An unmatched test could indicate the symptom is caused by the engine, torque converter or engine accessory. Use the diagnostic tools in the rpm mode and check if symptom is rpm related.

The following diagnostic tools and techniques can be used separately or in conjunction with each other to aid in the diagnosis of NVH symptoms. They are listed in order of preference for ease in their use for locating these symptoms.

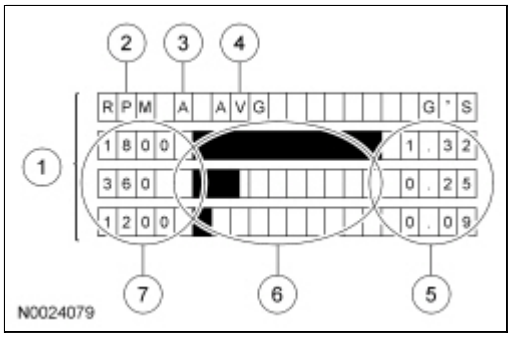
NVH Analyzer (Vetronix)

The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers are tools to aid in the identification and isolation of a noise, vibration or harshness symptom in a vehicle. They measure noise and vibration data and compare it with data obtained from the vehicle's PCM as well as vehicle variants that were entered by the user such as pulley size, axle ratio and tire size in order to provide possible sources. The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 have the following characteristics:

- Interface with the vehicle's computer system
- Support and store vibration data input from 1 or 2 accelerometers
- Support and store noise data input from 2 microphones
- Provide a photo-tachometer for operation of the driveshaft balancing function
- Provide a strobe output capable of driving a standard timing light
- Contain a real-time clock circuit that provides time and date information which is used for tagging test data
- Have the capability to print to an external printer and interface with a PC
- Can be powered from a variety of power sources: cigarette lighter, AC power or the internal battery pack

The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers have 4 main operating modes. The first is for vibration diagnosis. This mode measures data from 1 or 2 accelerometers simultaneously while obtaining data from the vehicle. Then it carries out a frequency analysis on the accelerometer information and compares the vibration frequencies with the frequencies associated with various rotating components within the vehicle. The data can be presented in 4 different display modes: principle component, bar chart, frequency spectrum or waterfall. All display mode formats contain the same common elements, such as amplitude.

The second is for noise diagnosis. This mode measures noise from 1 or 2 microphones simultaneously. All noise measurements are in decibels (dBs). All frequency bands used for noise measurements are the same as for the vibration measurements, up to 1,000 Hz.



The third is driveshaft balancing. Driveshaft balancing is done using 1 or 2 accelerometers and a photo-tachometer. The accelerometers measure the vibration at both ends of the driveshaft, while the photo-tachometer measures the rotation speed and position reference. Refer to Section 205-00.

The fourth is the strobe. A strobe or standard timing light can be connected to an analyzer, to provide a means for measuring rotation speed. The strobe function is used for isolating the source of a vibration.

Electronic Vibration Analyzer (EVA)

repair4less

The Electronic Vibration Analyzer (EVA) is a hand-held electronic scan tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the 3 most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G-force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.

Item	Description
1	Electronic Vibration Analyzer (EVA) screen
2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode
5	G-force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

Record the readings taken with the diagnostic tool.

- Frequencies should be read in the "average" mode.
- Frequencies have a range of plus or minus 2 Hz. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.

Vibrate Software®

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration symptom:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency rpm and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency rpm reading and the engine rpm reading intersect indicates the specific component group causing the symptom.

    - A frequency measurement tool capable of measuring vibration frequency and engine rpm will be needed.
- Provides graphics of diagnostic procedures to aid in testing components.

Reed Tachometer

The Reed tachometer is a hand-held vibration sensor which will assist in locating the source of unacceptable vibrations. The vibration sensor can be placed anywhere in the vehicle for testing purposes. The Reed tachometer contains several reeds that are tuned to vibrate or resonate at different frequencies ranging from 10 to 80 Hz or 600 to 4,800 rpm. Though the Reed tachometer is able to measure multiple frequencies, it does not measure amplitude.

Sirometer

The Sirometer measures frequency in hertz and rpm. To use the Sirometer, place it on any vibrating component and slowly scroll the wire out by turning the knob. As the length of wire changes, so does its natural frequency. Find the length of wire that vibrates with the highest amplitude. This frequency will match that of the vibrating component. Read the frequency for that length of wire.

Combination EngineEAR/ChassisEAR

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The ChassisEARs can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

EngineEAR Basic Unit

An electronic listening device used to detect even the faintest noises. The EngineEARs can detect the noise of damaged/worn bearings in generators, coolant pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

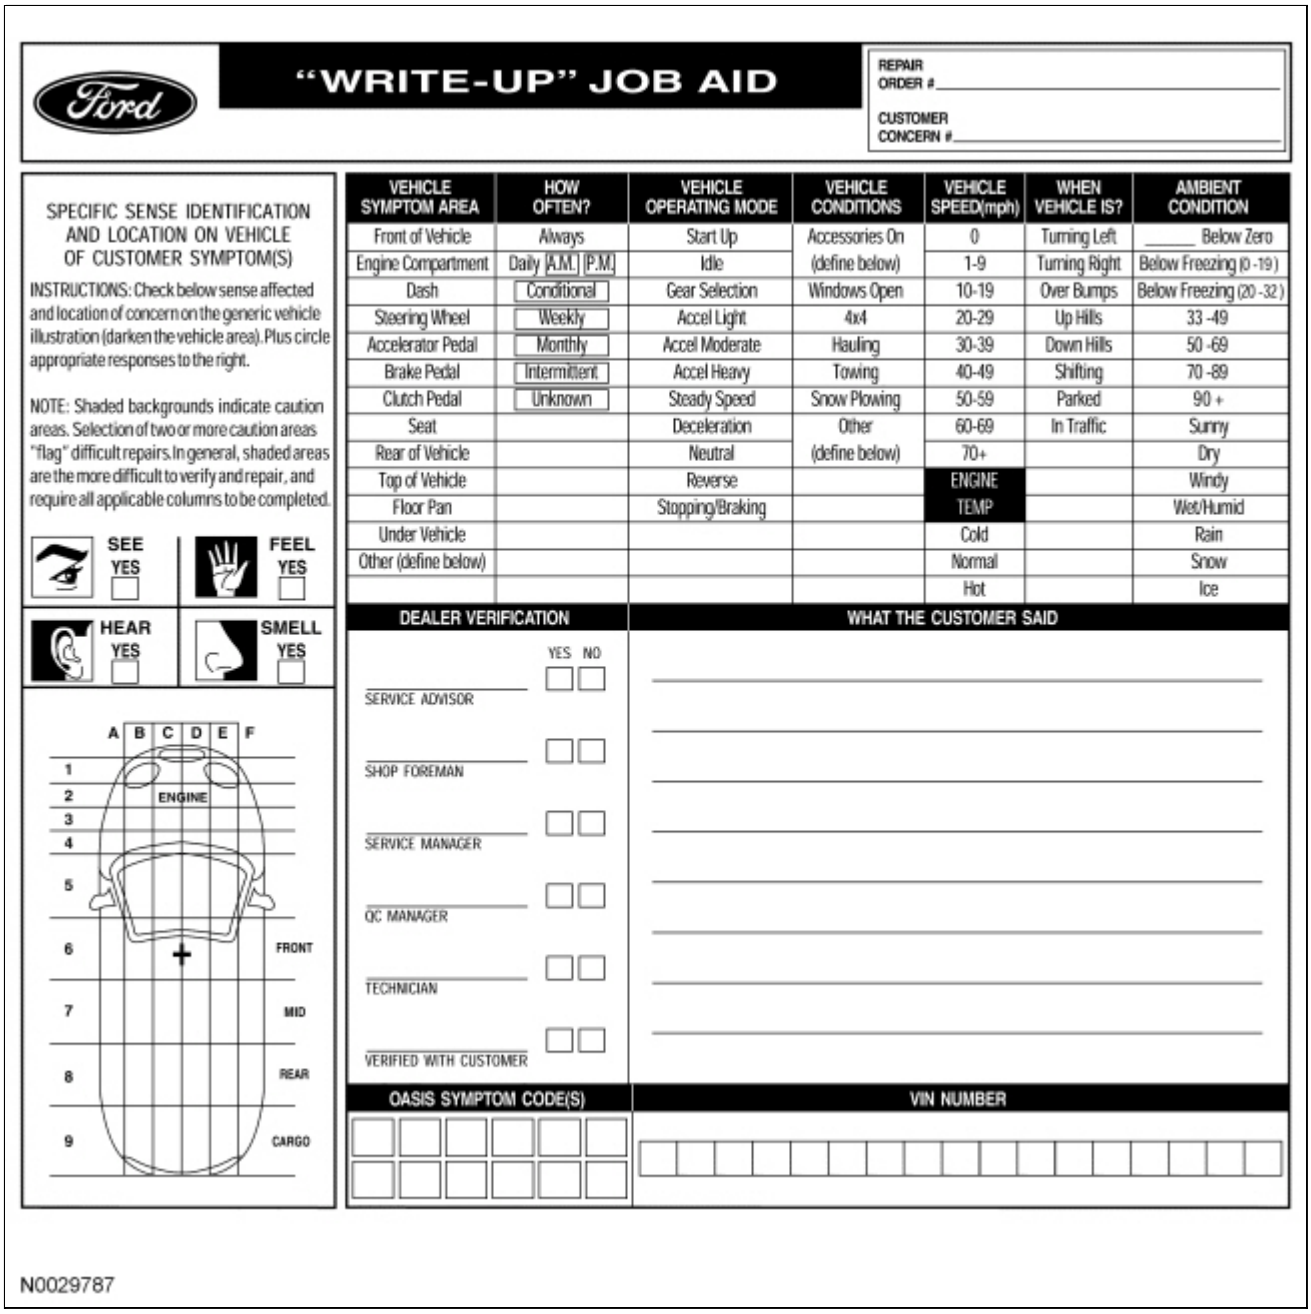
Mechanic's Stethoscope

A mechanic's stethoscope is an inexpensive tool for locating noises in engines and other moving parts. It can be used to help diagnose piston slap, worn gears, faulty valves, coolant pump failure, damaged gaskets, defective bearings and body squeaks.

Squeak and Rattle Repair Kit

The Squeak and Rattle Repair Kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:

- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube



repair4less

Ultrasonic Leak Detector

The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weatherstripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.

Write-Up Job Aid

To assist the service advisor and the technician, a Write-Up Job Aid used during the interview process is included with this material. The Write-Up Job Aid serves as a place to record all important symptom information.

"WRITE-UP" JOB AID

REPAIR ORDER #

CUSTOMER CONCERN #

SPECIFIC SENSE IDENTIFICATION AND LOCATION ON VEHICLE OF CUSTOMER SYMPTOM(S)

INSTRUCTIONS: Check below sense affected and location of concern on the generic vehicle illustration (darken the vehicle area). Plus circle appropriate responses to the right.

NOTE: Shaded backgrounds indicate caution areas. Selection of two or more caution areas "flag" difficult repairs. In general, shaded areas are the more difficult to verify and repair, and require all applicable columns to be completed.

WHAT THE CUSTOMER SAID

OASIS SYMPTOM CODE(S)

VIN NUMBER

N0029787

1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the symptom and take a test drive with the customer. There are many ways a customer will describe NVH symptoms and this will help minimize confusion arising from descriptive language differences. It is important that the symptom is correctly interpreted and the customer descriptions are recorded. During the interview, complete the write-up job aid and ask the following questions:

- When was it first noticed?
- Did it appear suddenly or gradually?
- Did any abnormal occurrence coincide with or precede its appearance?

repair4less

Use the information gained from the customer to accurately begin the diagnostic process.

2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs/adjustments before taking the vehicle on the road.

3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the write-up job aid. It is important to know the specific symptom the customer has with the vehicle.
- Do not be misled by the reported location of the noise/vibration. The cause can actually be some distance away.
- Conduct the road test on a quiet street where it is safe to duplicate the vibration/noise. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- While observing that they are not related to the symptom, eliminate the following:
    - If possible, lower the radio antenna in order to minimize turbulence.
    - Identify anything that could potentially make noise or be a source of wind noise.
    - Inspect the vehicle for add-on items that create vibration/noise.
    - Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect a diagnostic tool, Vetronix, or an accurate tachometer to the engine, even if the vehicle has a tachometer. This will make sure of an exact engine speed reading.

4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test or both.

The decision to carry out a road test, an engine run-up test or both depends on the type of NVH symptom. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A Drive Engine Run-Up (DERU) or a Neutral Engine Run-Up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

5: Road Test

NOTE: It may be necessary to have the customer ride along or drive the vehicle to point out the symptom. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH symptom, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the symptom is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the symptom is vehicle speed-related.
- The Downshift Speed Test helps to determine if the symptom is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related symptom.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Engine Run-Up (NERU) Test and the Drive Engine Run-Up (DERU) Load Test. These tests help to determine if the symptom is engine speed-related.
- The Neutral Engine Run-Up (NERU) Test is used as a follow-up test to the Downshift Speed Test when the symptom occurs at idle.
- The Drive Engine Run-Up (DERU) Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related symptoms that cannot be duplicated when carrying out the Neutral Engine Run-Up (NERU) Test or the Neutral Coast Down Test.
- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related symptoms.
- The Vehicle Cold Soak Procedure helps to identify symptoms occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

Slow Acceleration Test

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported symptom occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the symptom is coming.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Heavy Acceleration Test

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).
- Decelerate in a lower gear.
- The symptom is torque-related if duplicated while carrying out this test.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

repair4less

Neutral Coast Down Speed Test

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the symptom occurred when carrying out the Slow Acceleration Test.
- Place the transmission in NEUTRAL and coast down past the speed where the symptom occurs.
- The symptom is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the symptom was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the symptom is engine speed related.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Downshift Speed Test

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the symptom occurs.
- The symptom is engine speed related if duplicated while carrying out this test. This eliminates the tires, wheels, brakes and the suspension components as sources.
- If necessary, repeat this test using other gears and NEUTRAL to verify the results.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Steering Input Test

To carry out this test, proceed as follows:

- Drive at the speed where the symptom occurs, while making sweeping turns in both directions.
- If the symptom goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of Four-Wheel Drive (4WD) applications), and tire tread wear are all possible sources.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Brake Test

To carry out this test, proceed as follows:

- With the brake released, accelerate the vehicle. While coasting (brake pedal released) to a stop in NEUTRAL, note any abnormal rate of deceleration. Abnormal deceleration could indicate a parking

brake or service brake that is not fully releasing.

- Warm the brakes by slowing the vehicle a few times from 80-32 km/h (50-20 mph) using light braking applications.
- Accelerate to 89-97 km/h (55-60 mph). Moderately apply the brakes and slow the vehicle to a stop.
- A brake vibration can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and should diminish when the brake is released. For vehicles with separate park brake shoes, noise or vibration from the parking brake system will not be affected by applying the hydraulic brakes. On these systems, the parking brake system requires inspection if a parking brake concern is suspected.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate brake section(s) for further diagnosis and repair. If the source has not been identified, continue with the road test.

Road Test Over Bumps

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Neutral Engine Run-Up (NERU) Test

To carry out this test, proceed as follows:

- Install a tachometer.
- Increase the engine rpm up from an idle to approximately 4,000 rpm while in PARK on Front Wheel Drive (FWD) vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the symptom is coming from.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Drive Engine Run-Up (DERU) Load Test

To carry out this test, proceed as follows:

WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not carry out the Engine Load Test for more than 5 seconds or damage to the transmission or transaxle may result.**

repair4less

- Block the front and rear wheels.
- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2,000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.
- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the symptom is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Engine Accessory Test

To carry out this test, proceed as follows:

 **WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **Limit engine running time to one minute or less with belts removed or serious engine damage will result.**

NOTE: Use a frequency measurement tool to pinpoint accessory vibrations. A listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

- Remove the accessory drive belt(s).
- Increase the engine rpm to where the symptom occurs.
- If the vibration/noise is duplicated when carrying out this test, the belt(s) and accessories are not sources.
- If the vibration/noise was not duplicated when carrying out this test, install the accessory belt(s), one at a time, to locate the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Vehicle Cold Soak Procedure

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the vibration/noise duration with a watch for up to 3 minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the symptom temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key on, but do not start the engine. Listen for the fuel pump, ABS and air suspension system

noises.

- Start the engine.
- Isolate the vibration/noise by carefully listening. Move around the vehicle while listening to find the general location of the vibration/noise. Then, search for a more precise location by using a stethoscope or EngineEAR.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Classify NVH Symptom

For NVH concerns, it is necessary to classify the customer's concern into one of the 3 categories: noise, vibration or harshness. The reason for this is that a customer concern may consist of a combination of symptoms involving noise and vibration, or vibration and harshness. In cases where there are combination symptoms, determine which diagnostic path to follow: noise, vibration or harshness. For example, if a customer has a concern involving a noise and a vibration, and it is determined that it is vehicle speed-related, follow the vibration diagnostic path.

Noise Symptoms

Once a symptom is classified as a noise, the particular conditions under which the noise occurs need to be identified. These conditions are identified and verified during the road test. For example, a noise may only occur while turning. The next step is to determine which systems on the vehicle are related to that condition. In this case, the steering system and wheel/tire system may be suspect. After identifying possible systems, a preliminary inspection of these systems should be done. If the source of noise is still unidentified, use a listening device (such as the ChassisEAR) to pinpoint the source. Once the source has been identified, determine if this source is related to the suspected system previously identified. If it is related, then complete the repair to resolve the customer concern. If it is unrelated, then it is possible that the source of the noise is a reactor to a noise being transmitted through a transfer path. If this is the case, repairing the reactor will not resolve the customer concern. The transfer path must be identified and a determination made if the noise is normal, but accentuated by the transfer path (conductor), or if the originator is the fault causing excessive noise to transfer to another component through a conductor. There is a relationship between systems identified as related to conditions and the noise transfer path. In some cases, the condition under which the noise occurs has nothing to do with the identified source. This relationship is important in the diagnosis of noise concerns. It is the first clue that the identified source of noise might be a reactor and that further investigation is needed to diagnose a possible noise transfer path concern. Based on the results from the road test, make a determination of which action in the symptom chart to take first.

Vibration Symptoms

Most vibrations consist of movements back and forth or up and down that repeat. Every time the vibrating component goes through its complete range of motion and returns to the starting point is called a cycle. The rate at which these cycles occur within a given time is called the frequency. Frequency is measured in cycles per second or Hertz (Hz). One cycle per second equals one Hz. Once the frequency of a vibration is known, calculations can be done to determine the system that is the source of the concern.

Order of Vibration

repair4less

The order of a vibration refers to how often the vibration is present in one revolution of the component. For example, a vibration that is present once each revolution of a component would be a first order vibration. A vibration present twice each revolution of the component would be a second order vibration. Vibration orders do not have to be whole numbers, they can have decimal values such as 1.5 order vibration or 3.08 order vibration.

The concept of order of vibration is important to remember when the measured frequency of a vibration does not seem to match the frequency calculations of any of the likely systems or components. As the order increases, the frequency of the vibration will also increase by a multiple of that number.

For example, vibration may be present where the frequency is measured at 14 Hz. After doing the necessary calculations it is determined the first order tire and wheel frequency is 7 Hz and the first order driveshaft frequency is 22 Hz. Based on this information it can be determined the vibration is most likely a second order tire and wheel vibration: 7 Hz (first order tire and wheel frequency) multiplied by 2 (second order) equals 14 Hz (second order tire and wheel frequency).

Relationship of Vibration Frequency to Order of Vibration

After carrying out the road test as described in this section, the vibration was determined to be either vehicle-speed related or engine-speed related. That determination will identify the vibration frequency calculations that should be done.

Vibration Type	Calculate
Vehicle-speed related	Tire-speed vibration frequency Driveshaft-speed vibration frequency
Engine-speed related	Engine vibration frequency Engine accessory vibration frequency Engine firing vibration frequency

In calculating and using frequency readings, it is important to remember the direct relationship between Hz and rpm. One Hz is equal to 60 rpm. This is easy to remember; think of Hz as cycles per second. There are 60 seconds in a minute, therefore multiply Hz reading by 60 to get rpm. Conversely, divide rpm by 60 to get Hz.

Use the Frequency and RPM Calculations Worksheet to calculate system/component frequencies. The worksheet provides the necessary steps to determine each system/component group frequency.

Frequency Calculations

Calculating Tire and Wheel Frequency

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire and

wheel rpm and frequency by carrying out the following:

- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
- If the vehicle speed is not listed, calculate the tire and wheel frequency as follows:
    - Divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by the 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60.
    - For example, if calculating the frequency based on vehicle speed in km/h for a 64 km/h vibration with 835 mm tires, divide 64 km/h by 16 km/h = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 64 km/h.
    - If calculating the frequency based on vehicle speed in mph for a 40 mph vibration with 33 inch tires, divide 40 mph by 10 mph = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 40 mph.
    - The calculated frequency of 7 Hz is the first order tire and wheel vibration; the second order tire and wheel vibration would be twice this number at 14 Hz; the third order tire and wheel vibration would be 21 Hz; and so on.

Tire Speed and Frequency Chart

Tire Diameter	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz
mm (in)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)
483 (19)	182	910/15	1,092/18	1,274/21
508 (20)	173	865/14	1,038/17	1,211/20
533 (21)	165	825/14	990/16	1,155/19
560 (22)	158	790/13	948/16	1,106/18
585 (23)	151	755/13	906/15	1,057/18
610 (24)	145	725/12	870/14	1,015/17
635 (25)	139	695/12	834/14	973/16
660 (26)	134	670/11	804/13	938/16
685 (27)	129	645/11	774/13	903/15
710 (28)	124	620/10	744/12	868/14
735 (29)	119	595/10	714/12	833/14
760 (30)	115	575/10	690/11	805/13
785 (31)	111	555/9	666/11	777/13
810 (32)	108	540/9	648/11	756/13
835 (33)	105	525/9	630/10	735/12
864 (34)	102	510/8	612/10	714/12

Calculating Driveshaft Frequency

repair4less

Knowing the tire and wheel frequency allows for easy calculation of driveshaft frequency. The driveshaft drives the tires through the rear axle. Therefore, to determine driveshaft frequency, multiply tire and wheel frequency by the ratio of the rear axle. Calculate driveshaft frequency by performing the following steps:

- Obtain the axle ratio of the vehicle. Suppose the vehicle has a vibration problem at 64 km/h (40 mph) and a rear axle ratio of 2.93:1.
- Multiply the tire and wheel frequency of 7 Hz (calculated previously) with the rear axle ratio of 2.93:1. This results in a driveshaft frequency of 21 Hz at a vehicle speed of 64 km/h (40 mph).

The calculated frequency of 21 Hz is the first order driveshaft frequency; the second order frequency of the driveshaft is twice this number, or 42 Hz; and so on.

Calculating Engine Frequency

Use the engine rpm where the vibration symptom occurs to determine engine frequency. Calculate engine frequency by dividing the engine rpm by 60 (the number of seconds in a minute). For example, if the corresponding engine rpm of a vibration concern on a vehicle is 2,400 rpm, the resulting engine frequency is 40 Hz. Therefore, a 40 Hz vibration is a first order engine vibration. For purposes of vibration diagnosis, the engine also includes the torque converter and exhaust system.

Calculating Engine Accessory Frequency

Belt-driven engine accessories often produce vibrations at different frequencies than the engine itself. This is because the drive ratio created by the different size pulleys causes them to rotate at different speeds. Determining engine accessory frequency is comparable to calculating driveshaft frequency.

Calculate engine accessory frequency by performing the following steps:

- Determine the size ratio factor between the accessory pulley and the crankshaft pulley. For example, if the diameter of the crankshaft pulley is 6 inches and the accessory pulley diameter is 2 inches, the accessory pulley rotates 3 times for every crankshaft rotation (6 divided by 2).
- Multiply the engine rpm where the vibration condition occurs by the number of times the accessory pulley is rotating per crankshaft revolution. For example, if the engine rpm is 2,400 rpm, the accessory is rotating at 7,200 rpm (2,400 rpm multiplied by 3).
- Divide the accessory rpm by 60 (the number of seconds in a minute). In this example, the engine accessory frequency is 120 Hz (7,200 divided by 60).

Calculating Engine Firing Frequency

Engine firing frequency is a term used to describe the pulses an engine creates from the firing of the cylinders. Engine firing frequency depends on how many cylinders an engine has. The number of times an engine fires a cylinder with each crankshaft revolution is equal to one-half the number of cylinders. A 4-cylinder engine fires 2 cylinders with each crankshaft revolution. Two revolutions of the crankshaft fire all 4 cylinders. A 6-cylinder engine fires 3 cylinders with each crankshaft revolution. An 8-cylinder engine fires 4 cylinders for each crankshaft revolution.

Calculate engine firing frequency by performing the following steps:

- Multiply the engine rpm where the vibration symptom occurs by the number of cylinders fired with

each crankshaft revolution. For example, a vehicle with a 6-cylinder engine experiences a vibration concern at 2,400 rpm. The engine is firing the cylinders at 7,200 times per minute (3 multiplied by 2,400).

- Divide this number by 60 (the number of seconds in a minute) to obtain the engine firing frequency. In this example, the engine firing frequency is 120 Hz (7,200 divided by 60) at 2,400 rpm.

FREQUENCY AND RPM CALCULATIONS

TIRE AND WHEEL

Vibration occurs at _____ mph (km/h)

Tire diameter _____

Tire speed RPM and frequency from chart	_____ RPM	_____ Hz

DRIVESHAFT

Tire/wheel frequency _____ x axle ratio =	_____ Hz
Tire/wheel RPM _____ x axle ratio =	_____ RPM

ENGINE FREQUENCIES AND ASSOCIATED RPMS

Engine RPM divided by 60 equals 1st order frequency	_____ Hz
1st order RPM x 2 = 2nd order RPM (normal for 4 cylinder engines) Cylinders fired per engine revolutions	_____ RPM
1st order Hz x 2 = 2nd order Hz (normal for 4 cylinder engines)	_____ Hz

1st order RPM x 3 = 3rd order RPM (normal for 6 cylinder engines)

1st order Hz x 3 = 3rd order Hz (normal for 6 cylinder engines)
x 4 = 4th order vibrations (normal for 8 cylinder engines)
x 5 = 5th order, x 6 = 6th order, etc.

Order of vibration x engine RPM equals cylinders fired per minute	_____ RPM
Order of vibration (2nd, 3rd, 4th etc.) x 1st order Hz equals	_____ Hz

ENGINE ACCESSORY FREQUENCIES AND RPMS

Crankshaft pulley diameter _____ divided by accessory pulley diameter _____ = _____ pulley size ratio

Engine speed _____ RPM x pulley ratio = accessory _____ RPM

Accessory pulley _____ RPM divided by 60 = _____ Hz

N0067079

Harshness is customer perception which gives the impression of no isolation from the tire/wheel and suspension system. Harshness may be caused by road conditions, temperature changes, component damage and/or incorrect customer modifications on original components/specifications. Customers usually experience harshness when the vehicle is driving over bumps or potholes and in cold weather conditions. Harshness can also be experienced with excessive tire pressure, sporty tires, heavy-duty springs and shocks, or other vehicle modifications. Some aftermarket tires, even with the correct size, may change vehicle behavior and produce customer concerns. The first step in diagnosing a harshness concern is to determine if the concern was experienced only in certain specific operating conditions, such as large potholes or extremely cold weather. In these cases, harshness should be considered normal. A known good vehicle can be driven under the same conditions and the rides can be compared to determine whether the concern is normal or vehicle specific. The second step is to check tire pressure and make sure it was set within vehicle specifications. The third step is to inspect for aftermarket or modified components and determine if they are the cause of the harshness complaint. If the harshness concern persists after the above steps, it is possible that some components are damaged. Based on the results from the road test, make a determination of which action in the symptom chart to take first.

NVH Symptom Chart Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the symptom and possible system categories as follows:

- Identify the operating condition that the vehicle is exhibiting.
- Match the operating condition to the symptom.
- Verify the symptom.
- Calculate the frequency and order of the symptom.
- Identify which category or system(s) could cause the symptom.
- Refer to the section indicated to identify and diagnose the symptom or confirm that the system is not the source of the condition.

Use the diagnostic instructions in this section along with the necessary listed tools to identify the vibration order and to isolate the symptom and the possible systems associated with that symptom. Then based on the results from the road test, make a determination of which action in the symptom chart to take first. Since it is possible any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type diagnostic approach to pinpoint the concern. Refer to the section(s) indicated to identify and isolate the cause or rule that system out as being the causal system for the symptom.

Vehicle-Speed Related Vibrations

NOTE: Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

When a vehicle-speed related vibration is present, both tire-speed related vibration and driveshaft-speed related vibration calculations should be carried out.

Symptom Chart — Tire-Speed Related Vibrations

Symptom Chart — Tire-Speed Related Vibrations

Condition	Possible Sources	Action

repair4less

• First order tire vibration	• Tire or wheel • Wheel bearings • Drive axle • Halfshaft • Brake rotor or drum	• REFER to Section 204-04 . • REFER to Section 204-00 . • REFER to Section 205-00 . • REFER to Section 205-00 . • REFER to Section 206-00 .
• Second order tire vibration	• Tire or wheel	• REFER to Section 204-04 .
• Third order tire vibration	• Tire or wheel • Drive axle • Driveshaft • Halfshaft	• REFER to Section 204-04 . • REFER to Section 205-00 . • REFER to Section 205-00 . • REFER to Section 205-00 .

Symptom Chart — Driveshaft-Speed Related Vibrations

Symptom Chart — Driveshaft-Speed Related Vibrations

NOTE: Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

Condition	Possible Sources	Action
• First order driveshaft vibration	• Driveshaft • Rear drive axle/differential	• REFER to Section 205-00 . • REFER to Section 205-00 .
• Second order driveshaft vibration	• U-joint • Output shaft bushing in transmission/transaxle	• REFER to Section 205-00 . • Refer to the appropriate section in Group 307 for the procedure. Refer to the appropriate section in Group 308 for the procedure. GO to the Symptom Chart in the appropriate section.
• Third order driveshaft vibration	• Rear drive axle/differential	• REFER to Section 205-00 .

Symptom Chart — Engine-Speed Related Vibrations

Symptom Chart — Engine-Speed Related Vibrations

NOTE: When an engine-speed related vibration is present, engine, engine accessory and engine firing calculations should be carried out.

NOTE: Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

NOTE: Some engine-speed related vibrations are normal though they should not be felt in the passenger compartment.

Condition	Possible Sources	Action
• 0.5 order engine vibration	• Engine	• REFER to Section 303-00 .
• First through sixth order engine vibration	• Engine	• REFER to Section 303-00 .
	• Transmission/transaxle	• Refer to the appropriate section in Group 307 for the procedure. Refer to the appropriate section in Group 308 for the procedure. GO to the Symptom Chart in the appropriate section.
	• Engine mounts	• REFER to Section 303-00 .
	• Transmission/transaxle mounts	• Refer to the appropriate section in Group 307 for the procedure. Refer to the appropriate section in Group 308 for the procedure. GO to the Symptom Chart in the appropriate section.
	• Exhaust system	• REFER to Section 309-00 .
• Belt driven accessory speed vibration	• Engine pulley	• REFER to Section 303-00 .
	• Coolant pump	• REFER to Section 303-00 .
	• Generator	• REFER to Section 414-00 .
	• A/C compressor	• REFER to Section 412-00 .
	• Power steering pump	• REFER to Section 211-00B .
	• Vacuum pump	• REFER to Section 303-00 .
	• Accessory drive belt	• REFER to Section 303-00 .

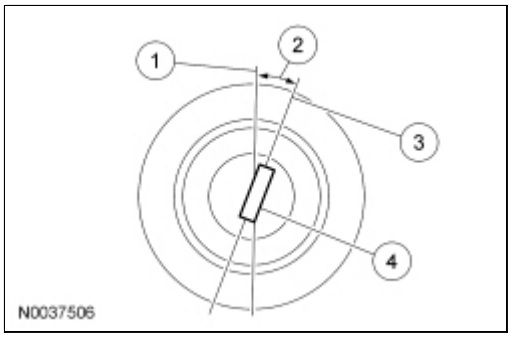
Cam bolts	350	258
Stabilizer bar bracket nuts	55	41
Stabilizer bar link lower nuts	80	59
Tie-rod jam nuts	103	76

Wheel Alignment Angles

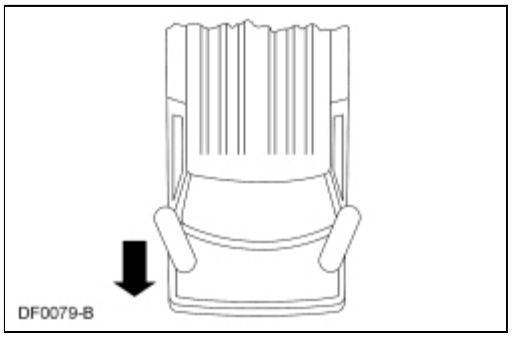


Camber

Negative and Positive Camber

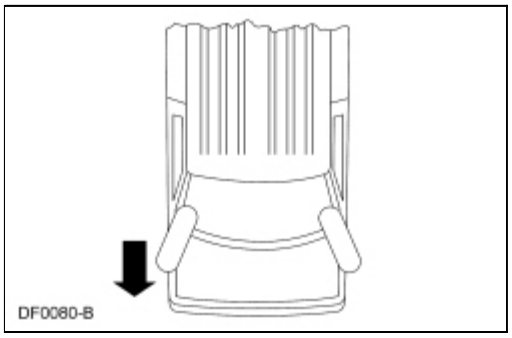
Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

Caster



Item	Description
1	True vertical
2	Positive caster
3	Ball joint centerline
4	Pivot centerline

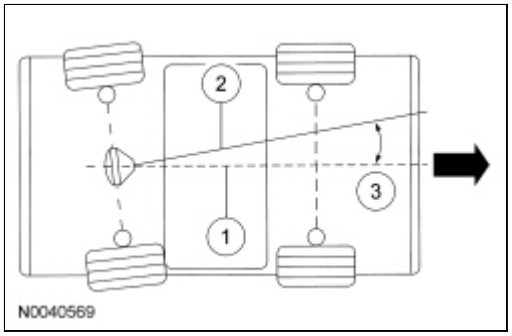
Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.



repair4less

Toe

Positive Toe (Toe In)



Negative Toe (Toe Out)

The vehicle toe setting affects tire wear and directional stability.

Incorrect Thrust Angle (Dogtracking)

Item	Description
1	Vertical centerline
2	Axle centerline
3	Thrust angle

Incorrect thrust angle (dogtracking) is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph) and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to Section 204-04 .

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to described the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (for example: wind, road crown).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center".

repair4less

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

Suspension System

Inspection and Verification

1. Road test.
   - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .

2. Inspect tires.
   - Check the tire pressure with all normal loads in the vehicle and the tires cold. Refer to the Vehicle Certification (VC) label.
   - Verify that all tires are sized to specification. Refer to the VC label.
   - Inspect the tires for incorrect wear and damage. Install new tires as necessary.

3. Inspect chassis and underbody.

4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition, heavy duty, etc.). The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Incorrect spring usage • Damaged or sagging spring(s) • Damaged or leaking shock absorber(s) • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.

6. If the fault is not visually evident, GO to Symptom Chart - Suspension System or GO to Symptom Chart - NVH .

Symptom Chart — Suspension System

repair4less

Symptom Chart — Suspension System

Condition	Possible Sources	Action
• Incorrect thrust angle (dogtracking)	• Rear suspension components	• INSPECT the rear suspension system. CHECK the rear alignment for the correct thrust angle. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-02 .
• Vehicle drifts/pulls	• Unevenly loaded or overloaded vehicle • Tires/tire pressure • Alignment is not within specification • Brake drag • Steering components	• GO to Pinpoint Test A .
• Front bottoming or riding low	• Worn, damaged or incorrect springs	• MEASURE the ride height. REFER to Ride Height Measurement in this section. INSTALL new springs as necessary. Refer to the appropriate section in Group 204 for the procedure.
	• Worn front shock absorbers	• INSTALL new shock absorbers as necessary. Refer to the appropriate section in Group 204 for the procedure.
• Abnormal/incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear)	• ADJUST the tire pressure. REFER to the Vehicle Certification (VC) label. REFER to Section 204-04 Diagnosis and Testing for further tire wear diagnosis.
	• Incorrect tire rotation intervals	• REFER to Section 100-03 .
	• High-speed cornering • Excessive front or rear toe (inner or outer edge wear) • Excessive negative or positive camber (inner or outer edge wear)	• REFER to Section 204-04 Diagnosis and Testing for further tire wear diagnosis.
	• Front or rear suspension components	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. Refer to the appropriate section in Group 204 for the procedure.

• Sticky steering, poor returnability	• Binding ball joints • Steering components • Caster out of specification	• REFER to the Ball Joint Inspection Component Test in this section. • INSPECT the steering system. INSTALL new components as necessary. REFER to Section 211-02 . • CHECK the wheel alignment. REFER to Camber and Caster Adjustment in this section. ADJUST as necessary.
• Steering wheel off-center	• Unequal front toe setting (side-to-side) • Steering components	• CHECK the wheel alignment. REFER to Toe Adjustment — Front in this section. ADJUST as necessary. • INSPECT the steering system. INSTALL new components as necessary. For vehicles equipped with Electronic Power Assist Steering (EPAS), refer to Section 211-00A . For vehicles equipped with Hydraulic Power Assist Steering (HPAS), refer to Section 211-00B .
• Sway or roll	• Overloaded, unevenly or incorrectly loaded vehicle • Loose wheel nut (s) • Shock absorber (s) • Loose stabilizer bracket-to-frame bolts • Worn stabilizer bar bushings or links • Damaged or broken stabilizer bar • Damaged spring (s)	• NOTIFY the customer of incorrect vehicle loading. • TIGHTEN the wheel nut(s) to specification. REFER to Section 204-04 . • INSTALL new shock absorbers as necessary. Refer to the appropriate section in Group 204 for the procedure. • TIGHTEN the bolts to specification. Refer to the appropriate section in Group 204 for the procedure. • INSTALL new stabilizer bar bushings or links as necessary. Refer to the appropriate section in Group 204 for the procedure. • INSTALL a new stabilizer bar as necessary. Refer to the appropriate section in Group 204 for the procedure. • INSTALL new springs as necessary. Refer to the appropriate section in Group 204 for the procedure.
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle • Front or rear	• NOTIFY the customer of incorrect vehicle loading. • MEASURE the ride height. REFER

repair4less

	suspension components	to Ride Height Measurement in this section. If the ride height is not within specification, INSPECT the front and rear suspension systems. INSTALL new suspension components as necessary. Refer to the appropriate section in Group 204 for the procedure.
• Wander	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Ball joint(s)	• INSPECT the ball joints. REFER to the Ball Joint Inspection Component Test in this section.
	• Loose, worn or damaged front wheel bearing(s)	• INSPECT the wheel bearings. INSTALL new wheel bearings as necessary.
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. Refer to the appropriate section in Group 204 for the procedure.
	• Loose suspension fasteners	• INSPECT the suspension fasteners. TIGHTEN to specification. Refer to the appropriate section in Group 204 for the procedure.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. For vehicles equipped with Electronic Power Assist Steering (EPAS), refer to Section 211-00A . For vehicles equipped with Hydraulic Power Assist Steering (HPAS), refer to Section 211-00B .
	• Wheel alignment (excessive total front toe out)	• ADJUST as necessary. REFER to Toe Adjustment — Front in this section.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Squeak or grunt — noise	• Front stabilizer	• Under these conditions, the

from the front or rear suspension, occurs more in cold ambient temperature with or without the presence of moisture. More noticeable over rough roads or when turning	bar insulators • Leaf spring bushings	noise is acceptable.
• Clunk — noise from the front suspension, occurs in and out of turns	• Loose front suspension	• INSPECT for loose nuts or bolts. TIGHTEN to specification. Refer to the appropriate section in Group 204 for the procedure.
• Clunk — noise from the rear suspension, occurs when shifting from REVERSE to DRIVE	• Loose rear suspension components	• INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. REFER to Section 204-02 .
• Click or pop — noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joint(s)	• CARRY OUT a ball joint inspection. INSTALL new ball joint(s) or control arm(s) as necessary. REFER to Section 204-00 .
• Front suspension noise — a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Front suspension components • Loose or damaged shock absorber(s) or shock absorber bushing(s) • Damaged spring or spring mount(s) • Damaged or worn control/radius arm bushing(s) • Worn or damaged stabilizer bar bushings or link (s)	• INSPECT the front suspension. INSTALL new components as necessary. Refer to the appropriate section in Group 204 for the procedure.
• Rear suspension noise — a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or damaged rear shock absorber (s) or shock absorber bushing(s) • Rear leaf spring tip isolator or bushing • Damaged leaf spring or leaf spring mount(s) • Worn or	• INSPECT the rear suspension. INSTALL new components as necessary. REFER to Section 204-02 .

repair4less

	damaged stabilizer bar bushing(s) or link(s) • Rear leaf spring or bushing contaminated with dirt, sand or mud	• **NOTE:** To avoid the re-occurrence of noise, make sure that all contamination and moisture trapped between the individual leaf spring components have been completely removed. • **NOTE:** Do not apply any lubricant or grease to the leaf springs as this will attract dirt and moisture. PRESSURE WASH the leaf springs between the individual spring leafs and the gaps between the spring bushings, mounting brackets and shackles to remove any trapped debris. USE compressed (shop) air to remove any remaining debris and to completely dry between all of the individual spring components.
• Shudder — occurs during acceleration from a slow speed or stop	• Incorrect ride height causing incorrect driveline angle	• REFER to Section 205-00 for driveline angle diagnosis.
• Shimmy	• Loose wheel nut (s) • Loose front suspension fastener(s) • Loose front wheel bearing (s) • Shock absorber (s)	• TIGHTEN the nut(s) to specification. REFER to Section 204-04 . • TIGHTEN the fastener(s) to specification. Refer to the appropriate section in Group 204 for the procedure. • INSPECT the front wheel bearing(s). INSTALL new bearing(s) as necessary. Refer to the appropriate section in Group 204 for the procedure. • INSTALL new shock absorbers as necessary. Refer to the appropriate section in Group 204 for the procedure.
• Shimmy — most noticeable on coast/deceleration. Also hard steering condition	• Excessive positive caster	• CHECK the wheel alignment. REFER to Camber and Caster Adjustment in this section. ADJUST as necessary.

• Rough/harsh ride	• Incorrect tire pressure • Shock absorber (s) • Spring(s) • Loose, worn or damaged suspension component(s)	• ADJUST the tire pressure. REFER to the VC label. • INSTALL new shock absorbers as necessary. Refer to the appropriate section in Group 204 for the procedure. • MEASURE the ride height. REFER to Ride Height Measurement in this section. INSTALL new springs as necessary. Refer to the appropriate section in Group 204 for the procedure. • INSTALL new suspension component(s) as necessary. Refer to the appropriate section in Group 204 for the procedure.

Pinpoint Tests

Pinpoint Test A: Vehicle Drifts/Pulls

This pinpoint test is intended to diagnose the following:

- Unevenly loaded vehicle
- Tire pressure
- Tire forces
- Brake drag
- Incorrect vehicle alignment
- Steering system

PINPOINT TEST A: VEHICLE DRIFTS/PULLS

Test Step	Result / Action to Take
A1 CHECK FOR UNEVENLY LOADED VEHICLE	
• Visually check the vehicle for an uneven loading condition. • **Is the vehicle unevenly loaded?**	**Yes** ADVISE the customer of uneven loading condition. **No** GO to A2.
A2 CHECK THE TIRE PRESSURES AND TIRE CONDITIONS	
• Check the tire pressures. Refer to the Vehicle Certification (VC) label located on the driver door jamb. Check the tires for	**Yes** GO to A3.

repair4less

uneven/abnormal wear. Refer to Diagnosis and Testing — Wheels and Tires in Section 204-04 . • **Are the tire pressures and tire conditions OK?**	**No** ADJUST the tire pressures to the specified pressure or INSTALL new tires as necessary.
A3 ISOLATE TIRE DRIFT/PULL CONDITION • Cross the front wheel and tire assemblies from left-to-right. Refer to Section 204-04 . • **Does the vehicle drift/pull?**	**Yes** If the vehicle drifts/pulls in the opposite direction, tire forces are causing the drift/pull. ROTATE the wheel and tire assemblies front-to-rear. REFER to Section 204-04 . If the vehicle drifts/pulls in the same direction, GO to A4 . **No** Tire forces were causing the drift/pull and the concern has been corrected.
A4 CHECK FOR BRAKE DRAG • Spin all 4 wheel and tire assemblies by hand and check for brake drag. • **Do the wheels spin freely?**	**Yes** GO to A5 . **No** REFER to Section 206-00 to diagnose brake drag condition.
A5 CHECK THE WHEEL ALIGNMENT • Using alignment equipment and the manufacturer's instructions, check the wheel alignment. • **Is the wheel alignment out of specification?**	**Yes** ADJUST the alignment as necessary. REFER to General Procedures in this section. **No** REFER to Section 211-00A or Section 211-00B to diagnose steering system drift/pull/wander condition.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Refer to Section 100-04 .

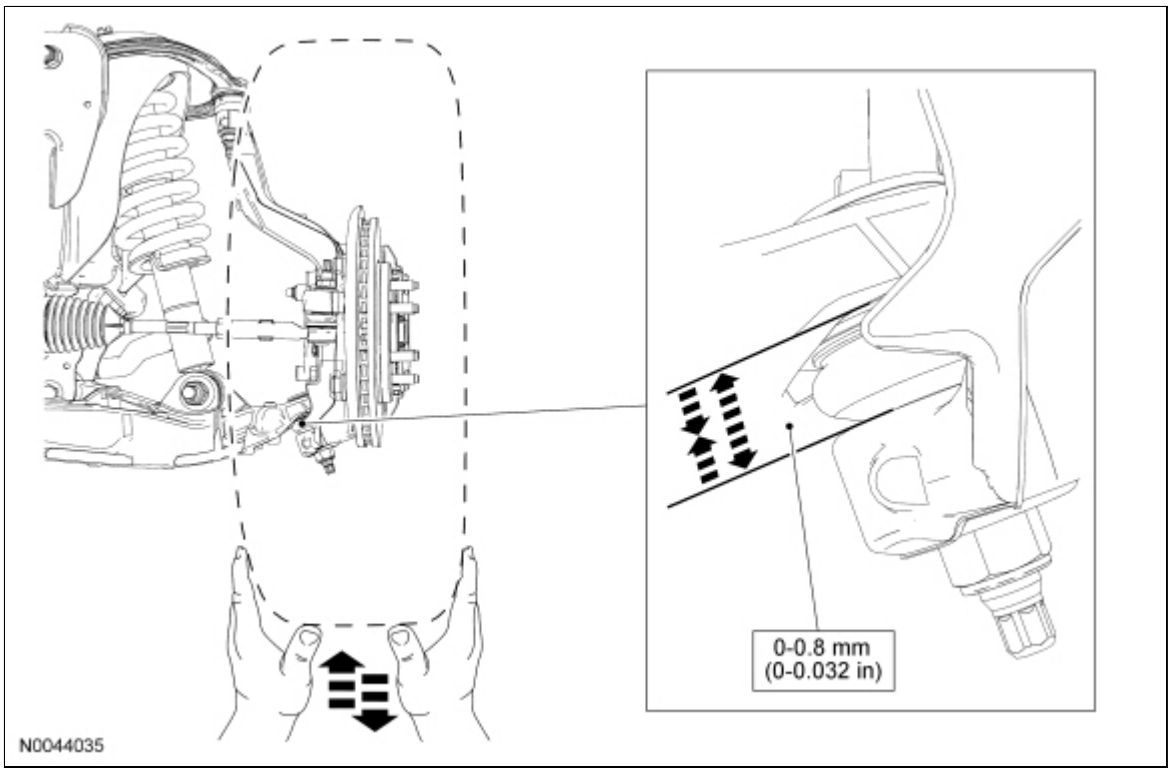
2. **NOTE:** In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

   Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.

3. Inspect the ball joint and ball joint boot for damage.
   - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to Section 204-01A for Rear Wheel Drive (RWD) vehicles and Section 204-01B for Four-Wheel Drive (4WD) vehicles.

NOTE: Carry out Steps 4 through 6 to inspect the lower ball joint. Carry out Steps 7 through 9 to inspect the

upper ball joint.



4. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage can occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   NOTE: The weight of the wheel and tire assembly must be overcome to obtain an accurate measurement on the dial indicator.

   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the wheel and tire assembly by hand. Note any relative vertical movement between the wheel knuckle and lower arm at the lower ball joint.
   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
   - If relative movement is found, continue with Step 5.

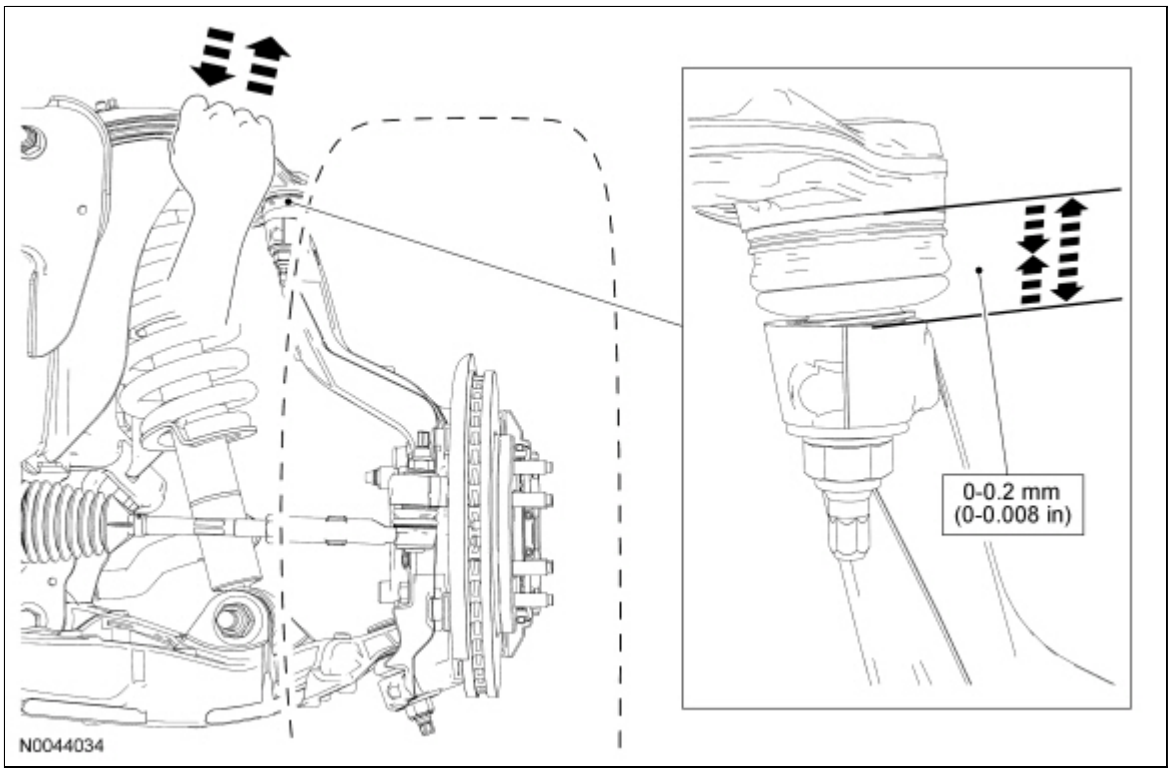
5. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of the ball joint.

   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower control arm and the wheel knuckle or ball joint stud.

6. Measure the ball joint deflection while an assistant pushes up and pulls down on the wheel and tire assembly, by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
   - If the deflection meets or is below the specification, continue with the procedure.

7. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage can**

repair4less



occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper control arm by hand. Note any relative vertical movement between the wheel knuckle and upper arm at the upper ball joint.

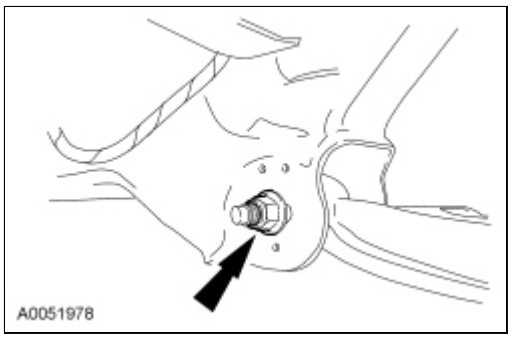
- If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
- If relative movement is found, continue with Step 8.

8. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis of the ball joint.

   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper control arm and the wheel knuckle or ball joint stud.

9. Measure the ball joint deflection while an assistant pushes up and then pulls down on the upper control arm, by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
   - If the deflection meets or is below the specification, no further action is required.

repair4less

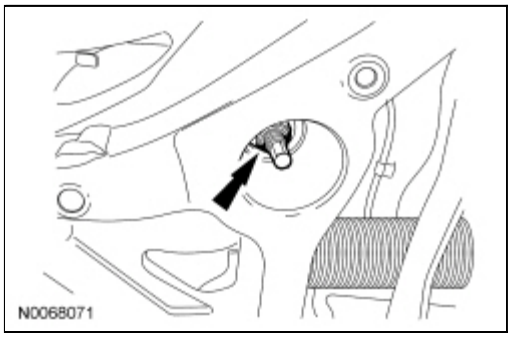


Camber and Caster Adjustment

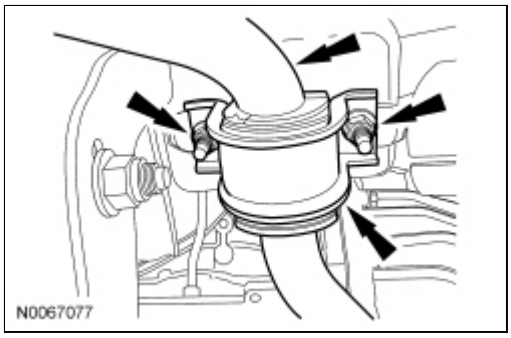
NOTICE: **Do not remove the stabilizer bar brackets until the stabilizer links have been disconnected or damage to the stabilizer bar links may occur.**

NOTE: To allow for adjustment of the lower arm in the frame slots, the lower arm bolts and nuts must be removed and discarded. They are replaced with cam bolt kit 3C333. The vehicle should be supported by the frame to ease movement of the lower arm in the slot.

1. Using alignment equipment and the manufacturers instructions, measure the front caster and camber.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the caster and camber values are not within specification, go to the next step.



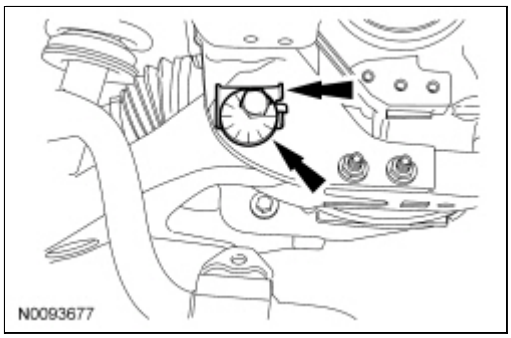
2. Remove and discard the lower arm front and rear nuts and bolts.



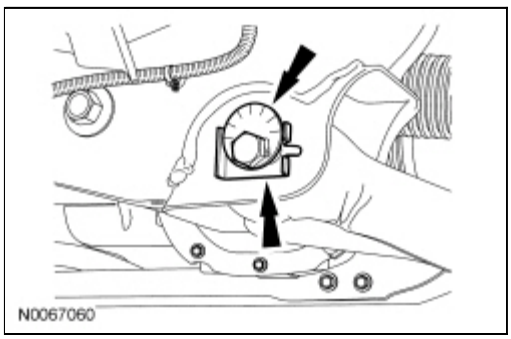
3. ***NOTICE:*** **Do not hold the stabilizer link boot with any tool as damage to the boot will occur.**

   NOTE: Use the hex-holding feature to prevent the stud from turning while removing the nuts.

   Remove and discard the stabilizer bar link lower nuts.



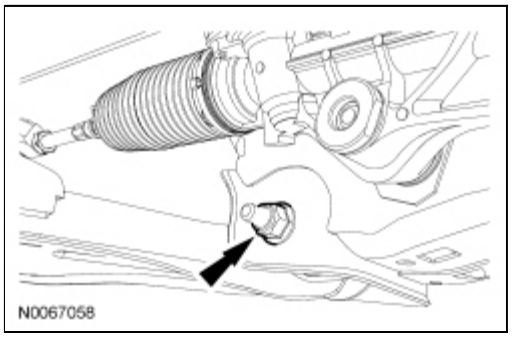
4. Remove the 4 stabilizer bar bracket nuts, 2 stabilizer bar brackets and position the stabilizer bar aside.
   - Discard the nuts.



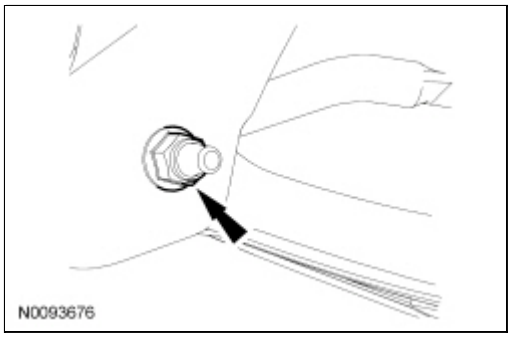
5. Remove the stabilizer bar bracket bolts and plate assembly.

6. Install the front cam bolt kit and loosely install the nut.

7. Install the rear cam bolt kit and loosely install the nut.

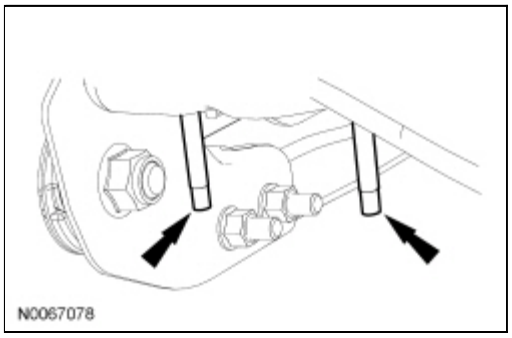


8. To adjust the caster and camber, refer to the following chart.
    - Adjustments that require moving the front and the rear of the lower arm should be made equally.



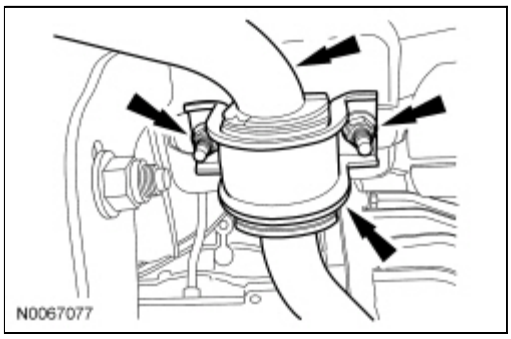
repair4less

Adjustment	Front of Lower Arm	Rear of Lower Arm
Increase caster	In	Out
Decrease caster	Out	In
Increase camber	In	In
Decrease camber	Out	Out
Increase caster and camber simultaneously	In	—
Decrease caster and camber simultaneously	Out	—



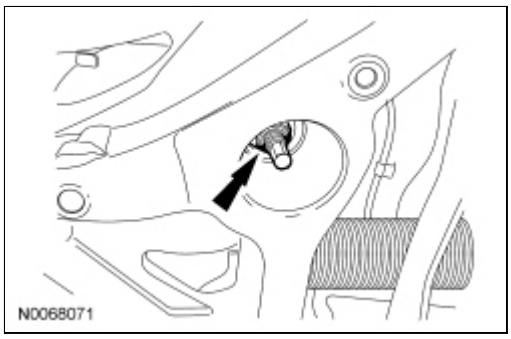
9. With the weight of the vehicle resting on the wheel and tire assemblies, hold the front cam bolt and tighten the nut to 350 Nm (258 lb-ft).

10. With the weight of the vehicle resting on the wheel and tire assemblies, hold the rear cam bolt and tighten the nut to 350 Nm (258 lb-ft).



11. Install the 2 stabilizer bar bracket bolts and plate assembly.

12. Position the stabilizer bar, install the 2 stabilizer bar brackets and the 4 new stabilizer bar bracket nuts.

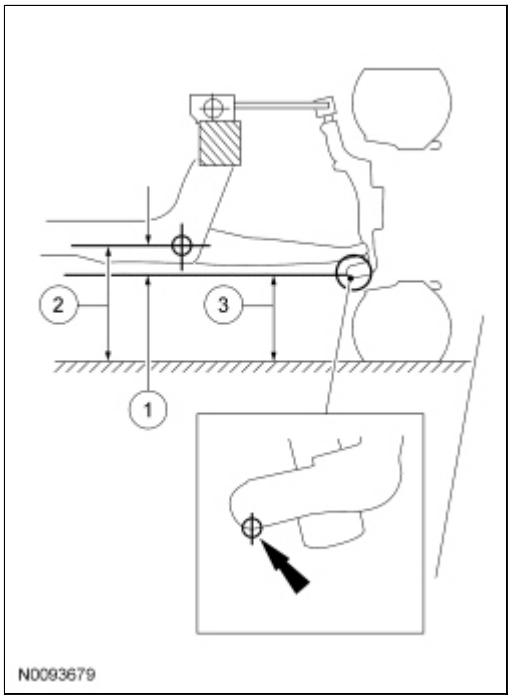


- Tighten the nuts to 55 Nm (41 lb-ft).

13. ***NOTICE:*** **Do not hold the stabilizer link boot with any tool as damage to the boot will occur.**

    NOTE: Use the hex-holding feature to prevent the stud from turning while installing the nuts.

    Install the 2 new stabilizer bar link lower nuts.
    - Tighten the nuts to 80 Nm (59 lb-ft).

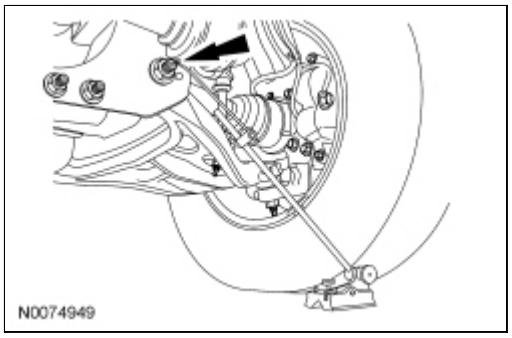


14. Check and, if necessary, adjust the front toe. For additional information, refer to Toe Adjustment — Front in this section.

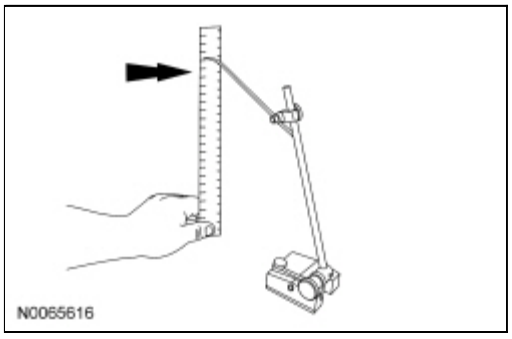
repair4less

Ride Height Measurement

Front Ride Height Measurement

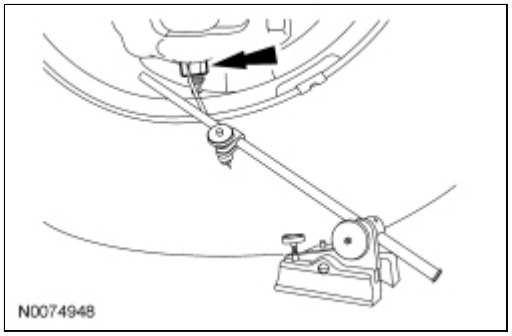


Item	Description
1	Ride height = 2 - 3
2	Measurement 2
3	Measurement 3

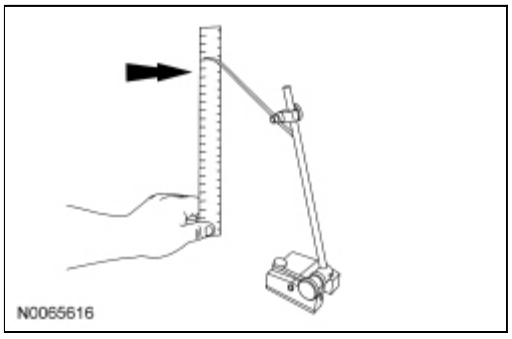


NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have at least one-half tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge) on a flat, level surface and adjust the gauge arm until the scriber point is located in the center of the rearward lower arm bolt.
    - Lock the surface gauge in this position.

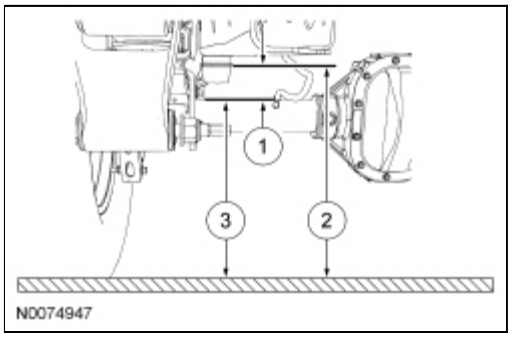


repair4less



2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 2).

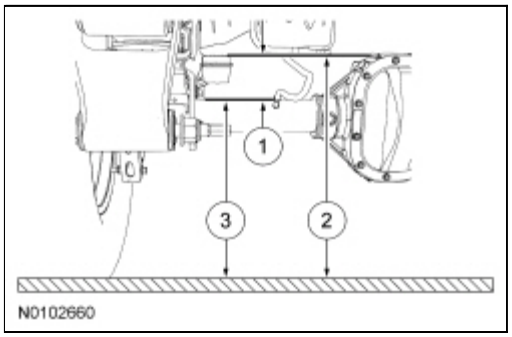
3. Position the surface gauge on the same flat, level surface as used in Step 1 and adjust the gauge arm until the scriber point is located at the lowest point on the wheel knuckle.
    - Lock the surface gauge in this position.



4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 3).

5. Subtract measurement 3 from measurement 2 to obtain the front ride height.
    - Refer to Specifications in this section.

Rear Ride Height Measurement (All Except SVT Raptor)



Item	Description
1	Ride height
2	Rear axle jounce stop
3	Top of the rear axle tube

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have at lease one-half tank of fuel.

1. Measure the distance between the rear axle jounce stop (Item 2) and the top of the rear axle tube (Item 3) to obtain the rear ride height (Item 1).

Rear Ride Height Measurement (SVT Raptor)

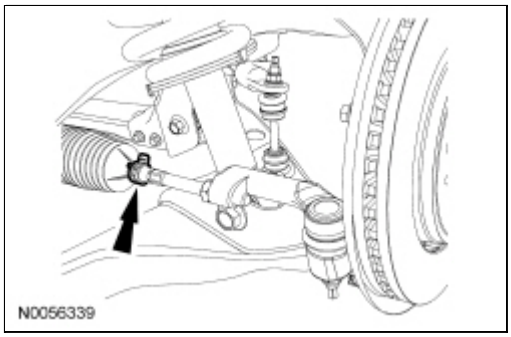
Item	Description
1	Ride height
2	Rear frame rail
3	Top of the rear axle tube

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the

repair4less

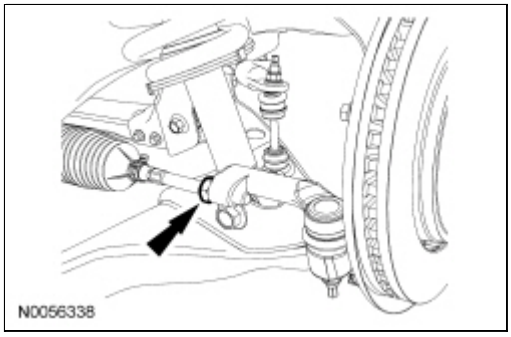
correct pressure. Vehicle should have at lease one-half tank of fuel.

1. Measure the distance between the rear frame rail (Item 2) and the top of the rear axle tube (Item 3) to obtain the rear ride height (Item 1).



Toe Adjustment — Front

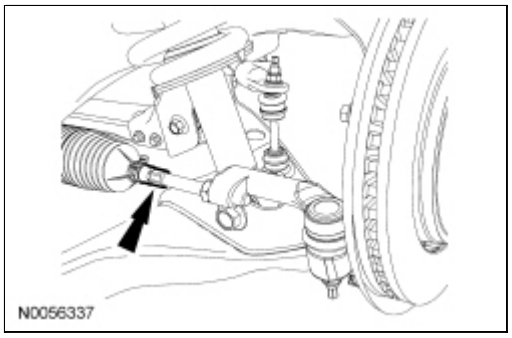
1. Using alignment equipment and the manufacturer's instructions, measure the front toe.
   - Refer to Alignment Specifications in the Specifications portion of this section for optimal alignment settings.
   - If the front toe values are not within specification, go to the next step.



2. Start the engine and center the steering wheel.

3. Turn the engine off and, using a suitable steering wheel holding device, lock the steering wheel in the straight-ahead position.

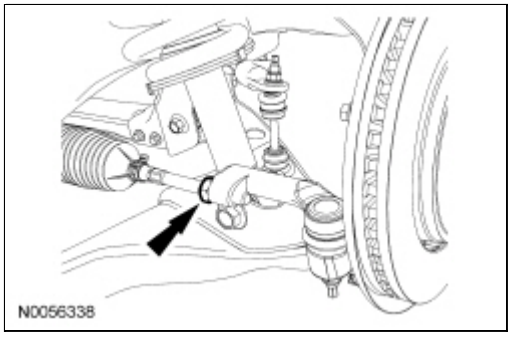
4. Remove the steering gear bellows clamp(s).



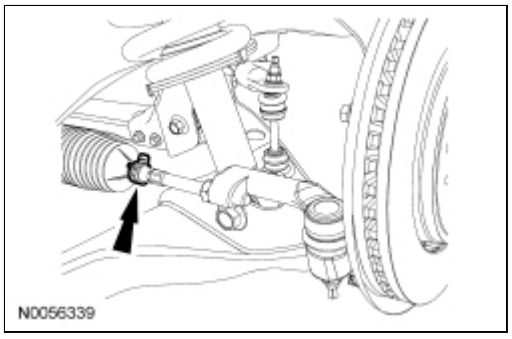
5. Loosen the tie-rod end jam nut(s).

6. **NOTE:** Do not allow the steering gear bellows to twist while rotating the tie rod.

   Rotate the tie rod(s) to achieve the desired toe setting.



repair4less



7. ***NOTICE:*** **Make sure to hold the tie-rod end stationary while tightening the jam nut or damage to the boot may occur.**

   NOTE: Make sure that the toe settings are not disturbed while tightening the jam nuts.

   Tighten the tie-rod end jam nut(s) to 103 Nm (76 lb-ft).

8. Install the steering gear bellows clamp(s).

repair4less

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake disc shield bolts	17	—	150
Brake hose bracket bolt	12	—	106
Lower arm forward and rearward nuts	350	258	—
Lower ball joint nut	175	129	—
Shock absorber lower nuts	90	66	—
Shock absorber upper mount nuts	63	46	—
Shock rod nut	55	41	—
Stabilizer bar bracket nuts	55	41	—
Stabilizer bar link nuts	70	52	—
Tie-rod end nut	115	85	—
Upper arm-to-frame nuts	150	111	—
Upper ball joint nut	115	85	—
Wheel bearing and wheel hub bolts	175	129	—
Wheel speed sensor bolt	18	—	159
Wheel speed sensor harness bracket bolt	12	—	106

Front Suspension

The Rear Wheel Drive (RWD) front suspension consists of the following components:

- Lower ball joints
- Lower control arms
- Shock absorber and coil spring assemblies
- Stabilizer bar and links
- Upper control arms
- Wheel bearings and wheel hubs
- Wheel knuckles
- Wheel studs

The vehicle is equipped with a front coil spring suspension. This independent-type suspension utilizes a stabilizer bar to aid in vehicle stability. The wheel hub and wheel bearing are sealed units and are serviced as assemblies. The lower ball joints can be serviced independently from the lower arms.

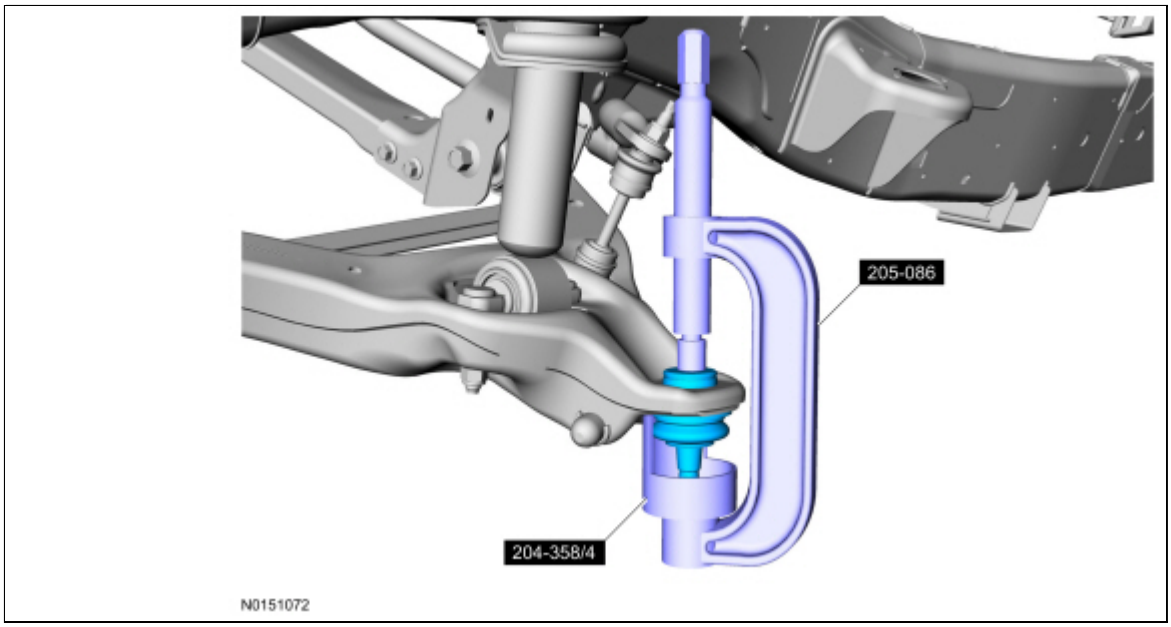
Ball Joint — Lower

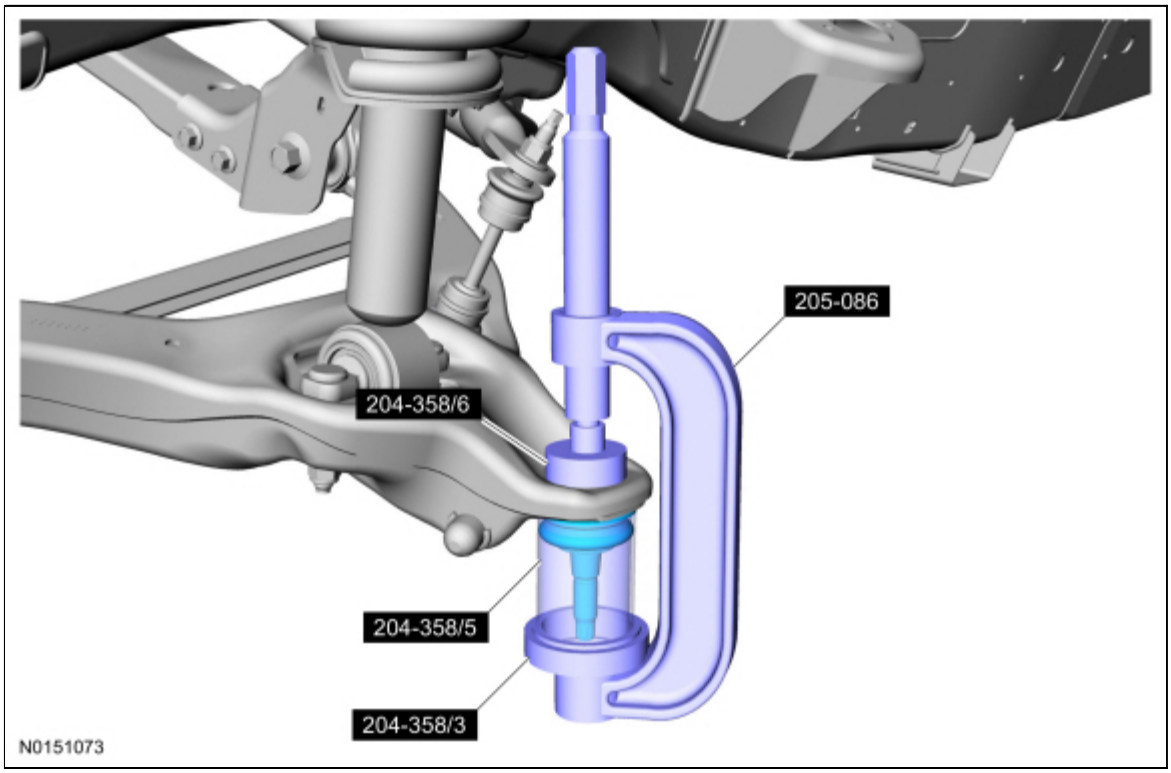


Special Tool(s)

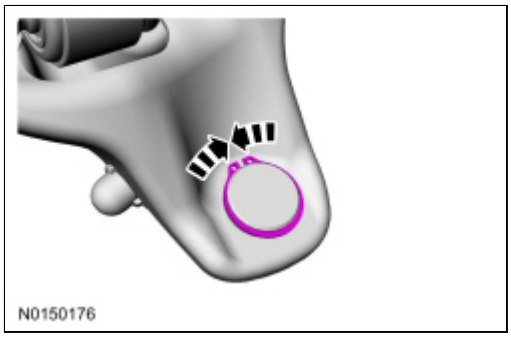
 ST2929-A	Installer/Remover, Ball Joint 204-358
 ST1172-A	Installer/Remover, C-Frame and Screw 205-086

Removal

1. Remove the wheel knuckle. Refer to Wheel Knuckle .
2.  N0150175
3. Special Tool(s): Installer/Remover, C-Frame and Screw 205-086. Remover, Ball Joint 204-358/4.



repair4less



Installation

1. ***NOTICE:*** **Do not damage the lower ball joint boot when installing the C-Frame and Screw Installer/Remover and Ball Joint Installer/Remover or premature failure of the ball joint may occur.**

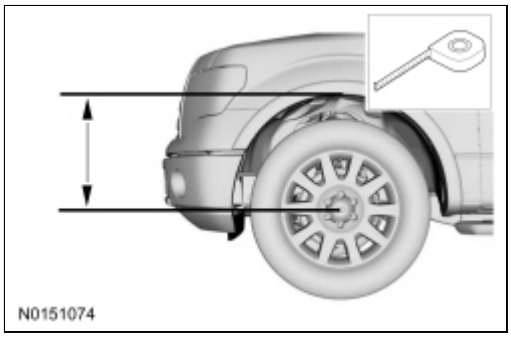
   Special Tool(s): Installer/Remover, C-Frame and Screw 205-086. Remover, Ball Joint 204-358/3. Remover, Ball Joint 204-358/5. Remover, Ball Joint 204-358/6.

2. **NOTE:** Make sure the ball joint snap ring is fully seated.

3. Install the wheel knuckle. Refer to Wheel Knuckle .

repair4less

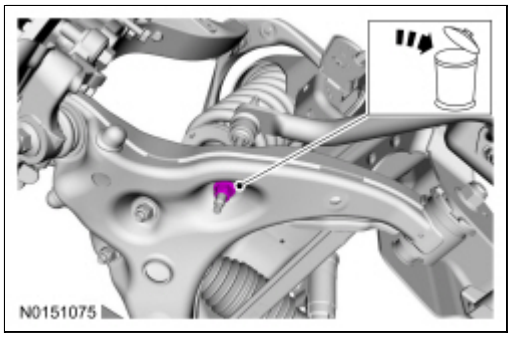
Lower Arm



Special Tool(s)

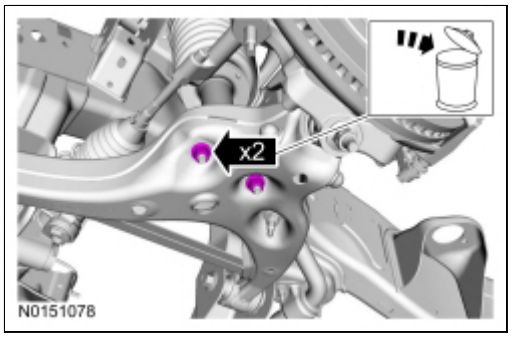
 ST2945-A	Separator, Ball Joint 204-592

Removal

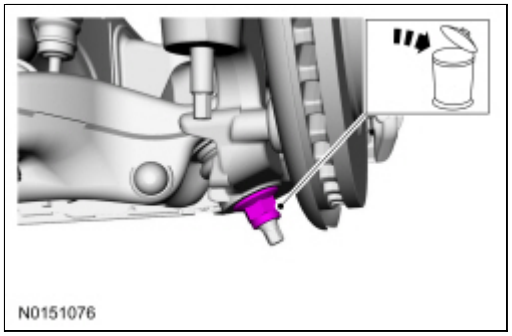


NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

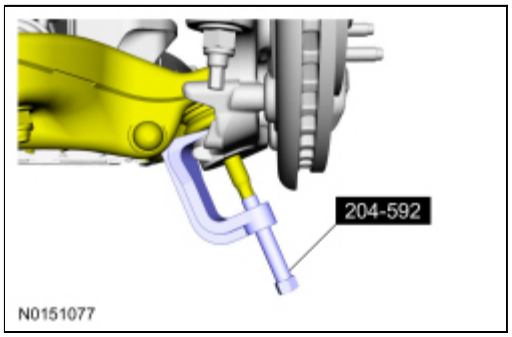


2. Remove the wheel and tire. Refer to Section 204-04 .

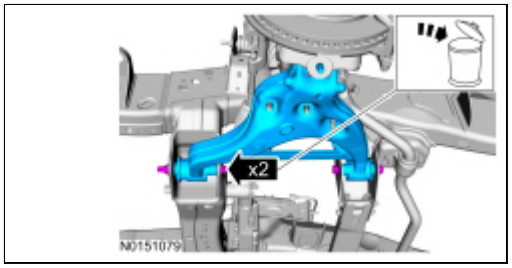


3. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

4.



5.

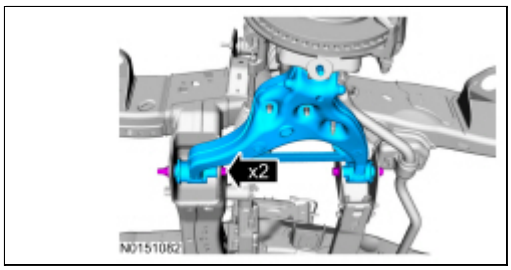


6. ***NOTICE:*** **Do not use a prying device or separator fork between the ball joint and the wheel knuckle. Damage to the ball joint or ball joint seal may result.**

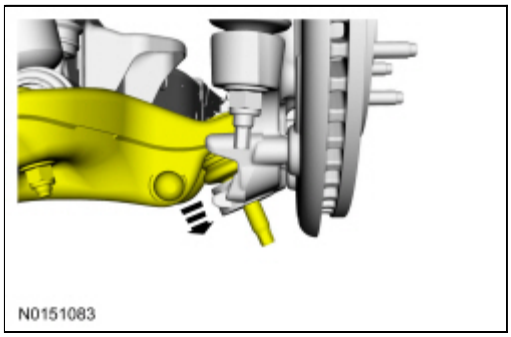
   NOTICE: **Use care when releasing the lower arm and wheel knuckle into the resting position or damage to the ball joint seal may occur.**

   Special Tool(s): Separator, Ball Joint 204-592.

7.



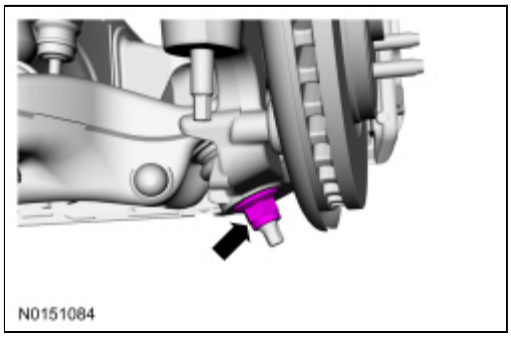
repair4less



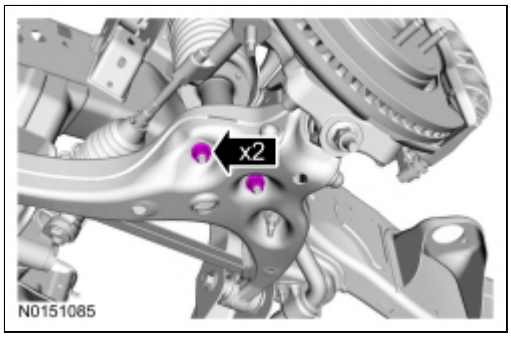
Installation

1. ***NOTICE:*** **Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.**

   Finger tight at this stage.

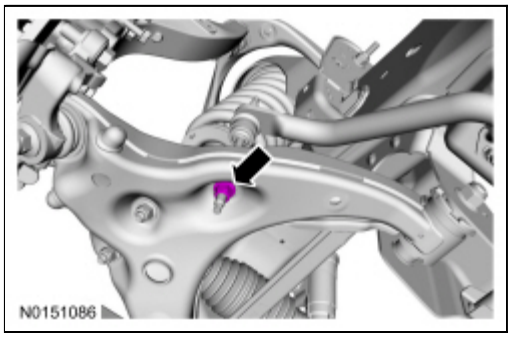


2.



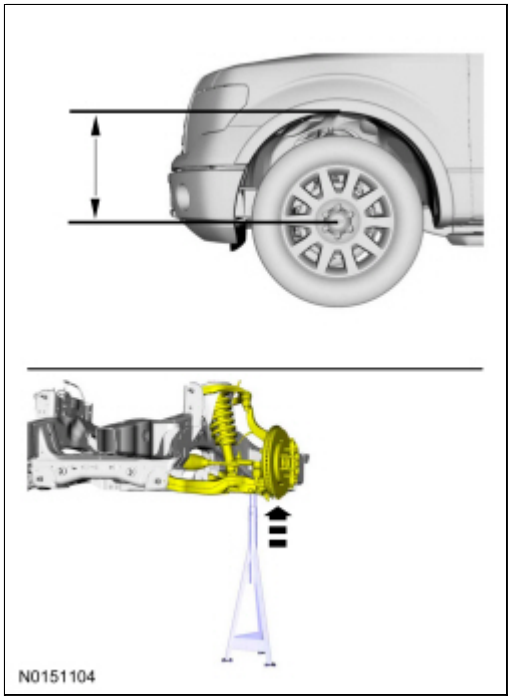
3.

   - Tighten to 175 Nm (129 lb-ft).



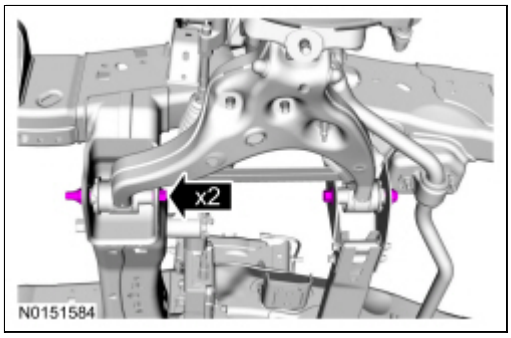
4.

   - Tighten to 90 Nm (66 lb-ft).



5. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

    - Tighten to 70 Nm (52 lb-ft).



6. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken during removal (curb height).

7.

    - Tighten to 350 Nm (258 lb-ft).

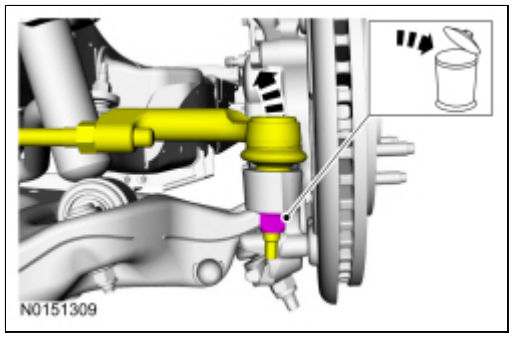
repair4less

8. Install the wheel and tire. Refer to Section 204-04 .
9. Check and, if necessary, align the front end. Refer to Section 204-00 .

Shock Absorber and Spring Assembly

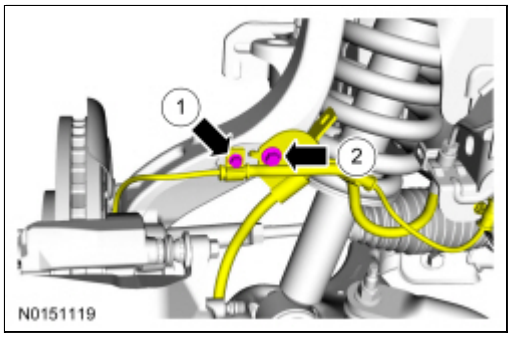
Special Tool(s)

 ST2945-A	Separator, Ball Joint 204-592



Removal

NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**



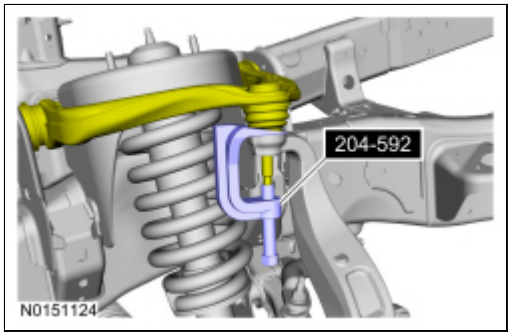
1. Remove the wheel and tire. Refer to Section 204-04 .
2. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

   NOTICE: **Use care when installing the tie rod separator or damage to the outer tie-rod end boot may occur.**

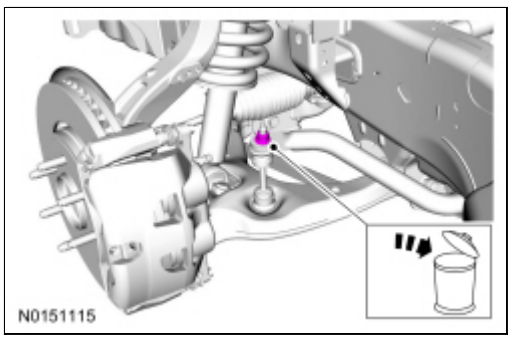
   General Equipment: Tie-rod Separator.

   
   N0151309
3.

repair4less

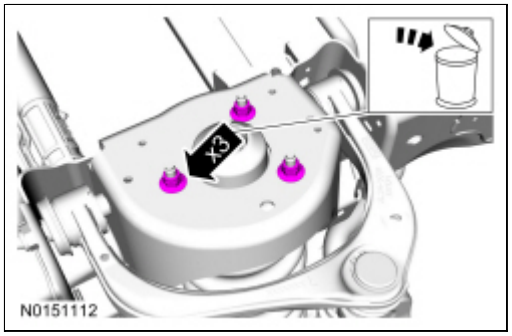


4.

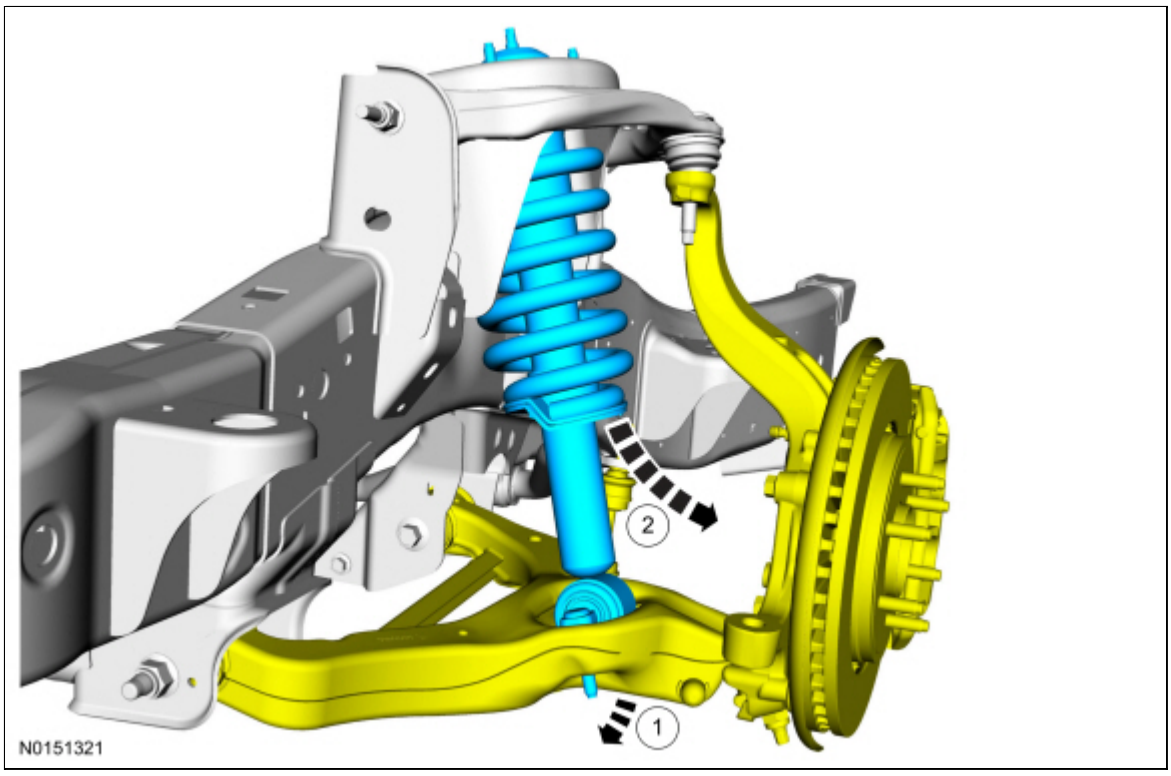


5. **NOTE:** Be sure not to damage the ball joint boot when installing the Ball Joint Separator.

   Special Tool(s): Separator, Ball Joint 204-592.



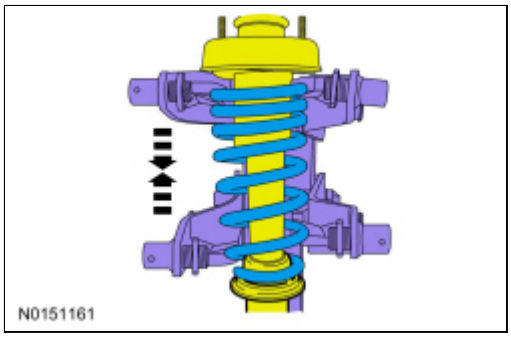
6. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.



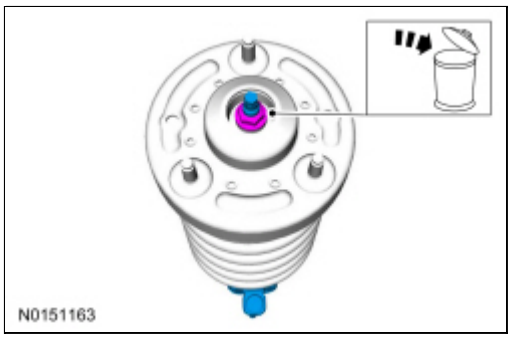
7.

8.

9.

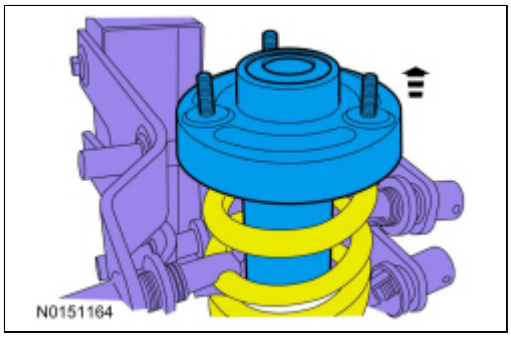


10. **NOTE:** If the individual spring and/or shock components are not being serviced, continue to the installation procedure.



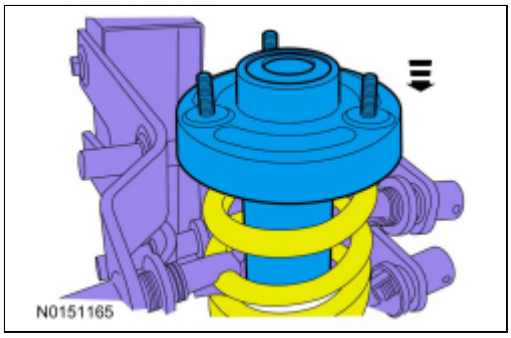
repair4less

NOTE: For reference during assembly, index the upper mount, spring and shock absorber.

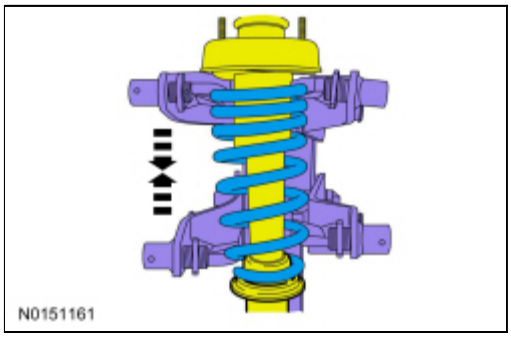


Compress the spring until the tension is released from the shock absorber.
General Equipment: Spring Compressor.

11. **NOTE:** Use the hex-holding feature to prevent the shock rod from turning while removing the nut.

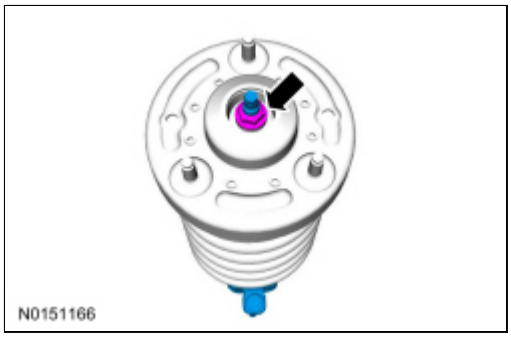


12.



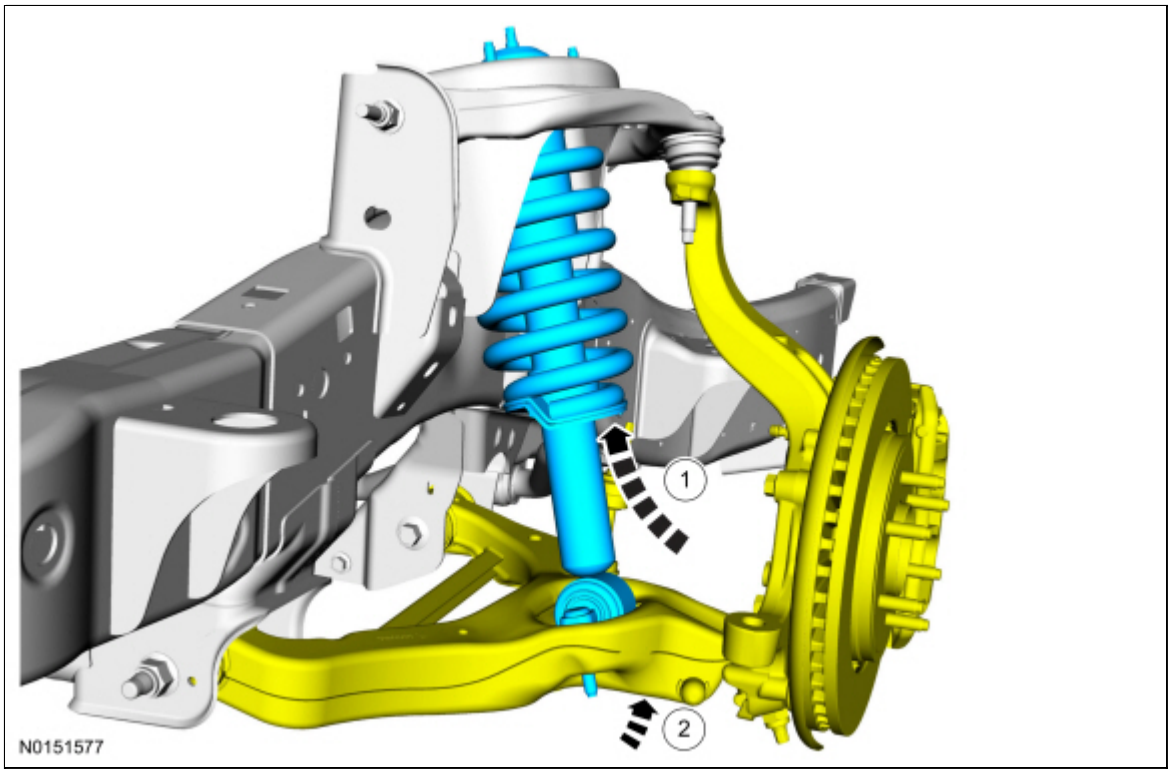
Installation

1.



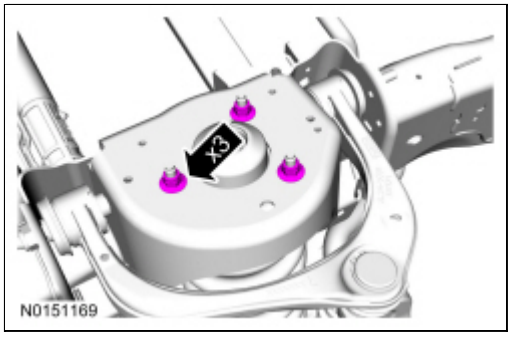
2. **NOTE:** Align the index marks made during disassembly.

   Compress the spring until the tension is released from the shock absorber.
   General Equipment: Spring Compressor.



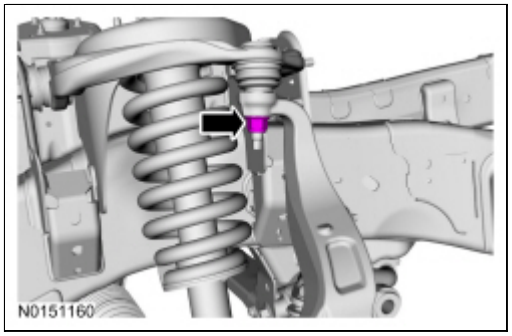
3. **NOTE:** Use the hex-holding feature to prevent the shock rod from turning while installing the nut.

   While holding the shock rod, install the new shock absorber and the shock rod nut.
   - Tighten to 55 Nm (41 lb-ft).



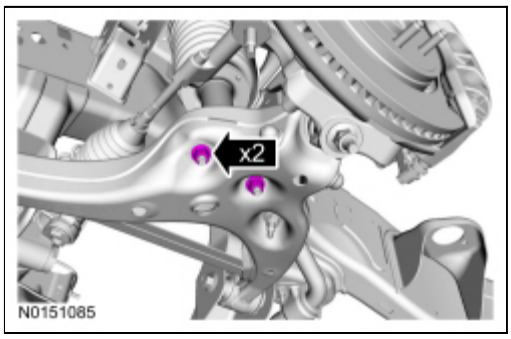
4.

repair4less



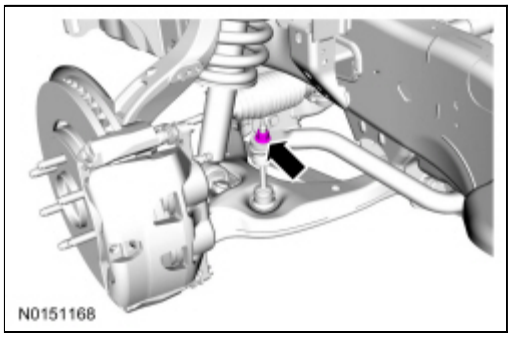
5.

- Tighten to 63 Nm (46 lb-ft).



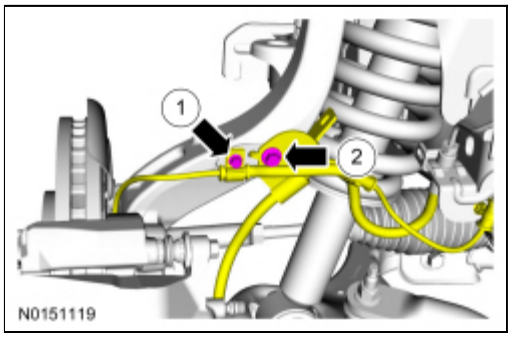
6.

- Tighten to 115 Nm (85 lb-ft).



7.

- Tighten to 90 Nm (66 lb-ft).



8. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

    - Tighten to 70 Nm (52 lb-ft).

9.

    - Tighten to 12 Nm (106 lb-in).

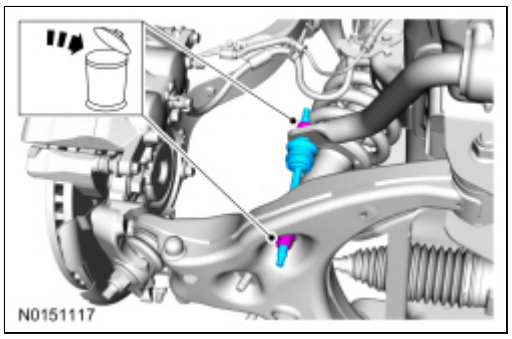
10.

    - Tighten to 115 Nm (85 lb-ft).

repair4less

11. Install the wheel and tire. Refer to Section 204-04 .

Stabilizer Bar and Link



Removal and Installation

NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

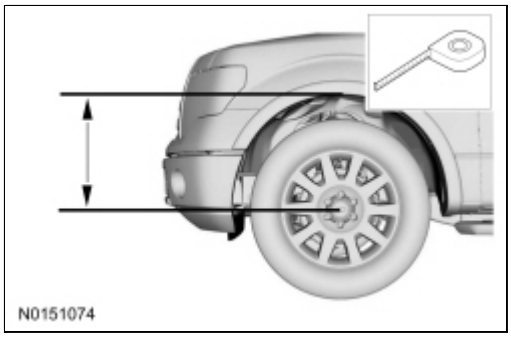
2. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

   On both sides.
   - To install, tighten to 70 Nm (52 lb-ft).

3. ***NOTICE:*** **The raised ring on the stabilizer bar must be encapsulated inside the inner groove of the stabilizer bar bushing on the driver side of the vehicle for proper installation.**

   On both sides.
   - To install, tighten to 63 Nm (46 lb-ft).

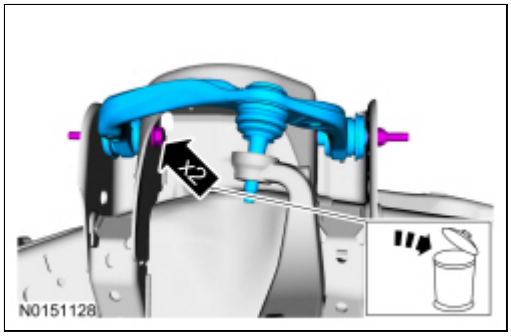
repair4less



4. Inspect and, if necessary, install new stabilizer bar bushings.
5. To install, reverse the removal procedure.

Upper Arm

Removal

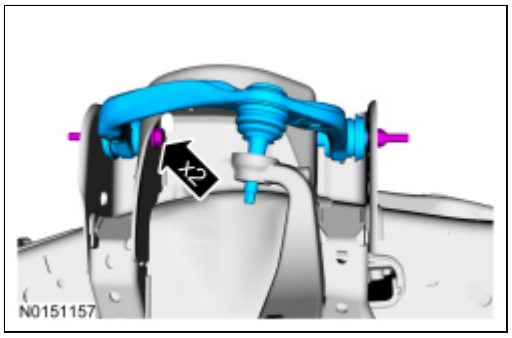


NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove the shock absorber and spring assembly. Refer to Shock Absorber and Spring Assembly .

3.

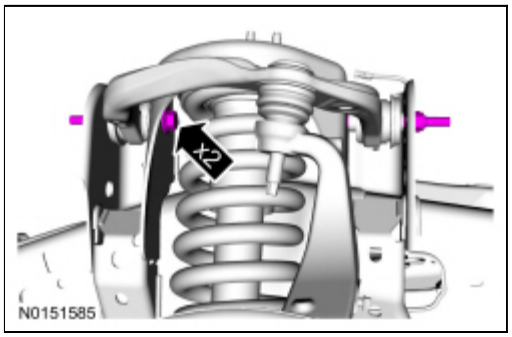


Installation

1. ***NOTICE:*** **Tighten the suspension bushing fasteners with the suspension loaded or with the weight of the vehicle resting on the wheels and tires, otherwise incorrect clamp load and bushing damage may occur.**

   Finger tight at this stage.

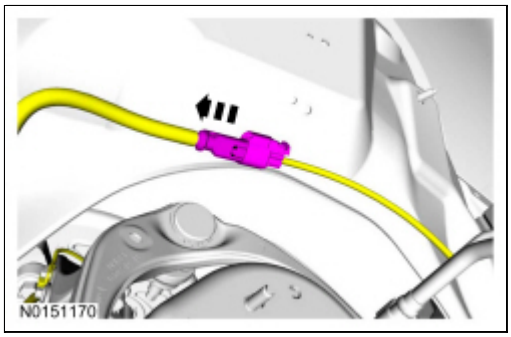
repair4less



2. Install the shock absorber and spring assembly. Refer to Shock Absorber and Spring Assembly .

3. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken during removal (curb height).

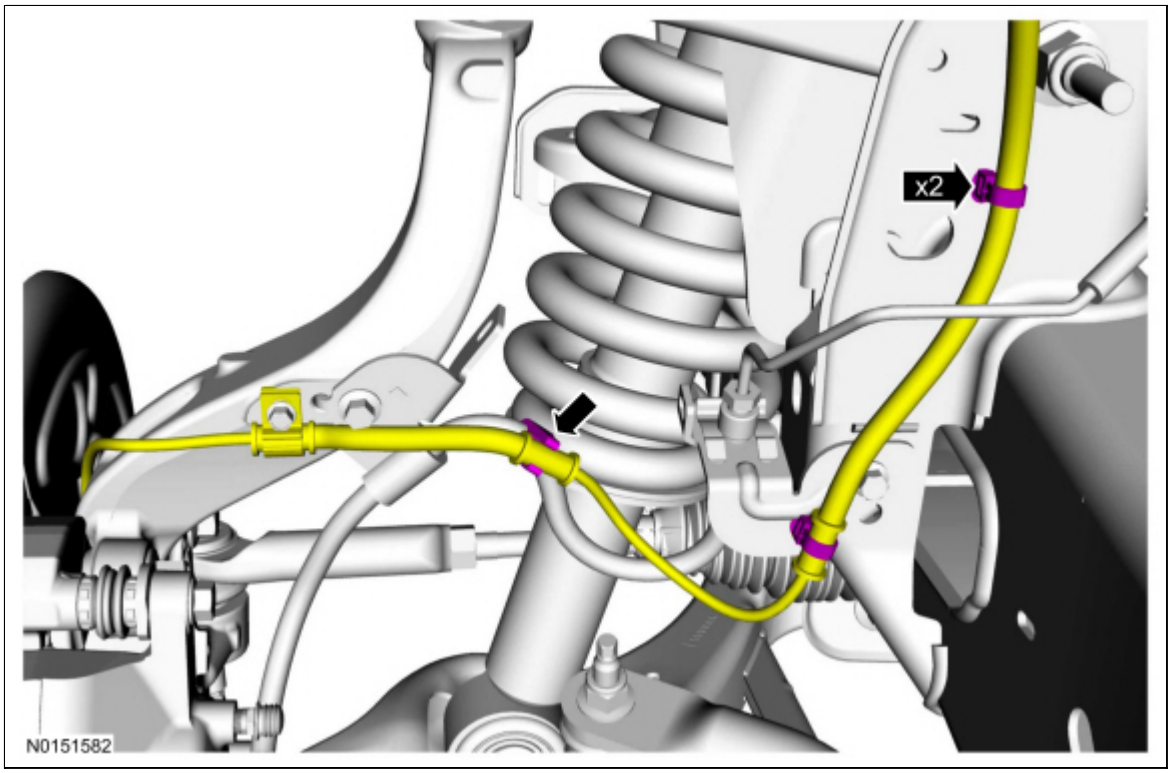
4.
   - Tighten to 150 Nm (111 lb-ft).



repair4less

Wheel Bearing and Wheel Hub

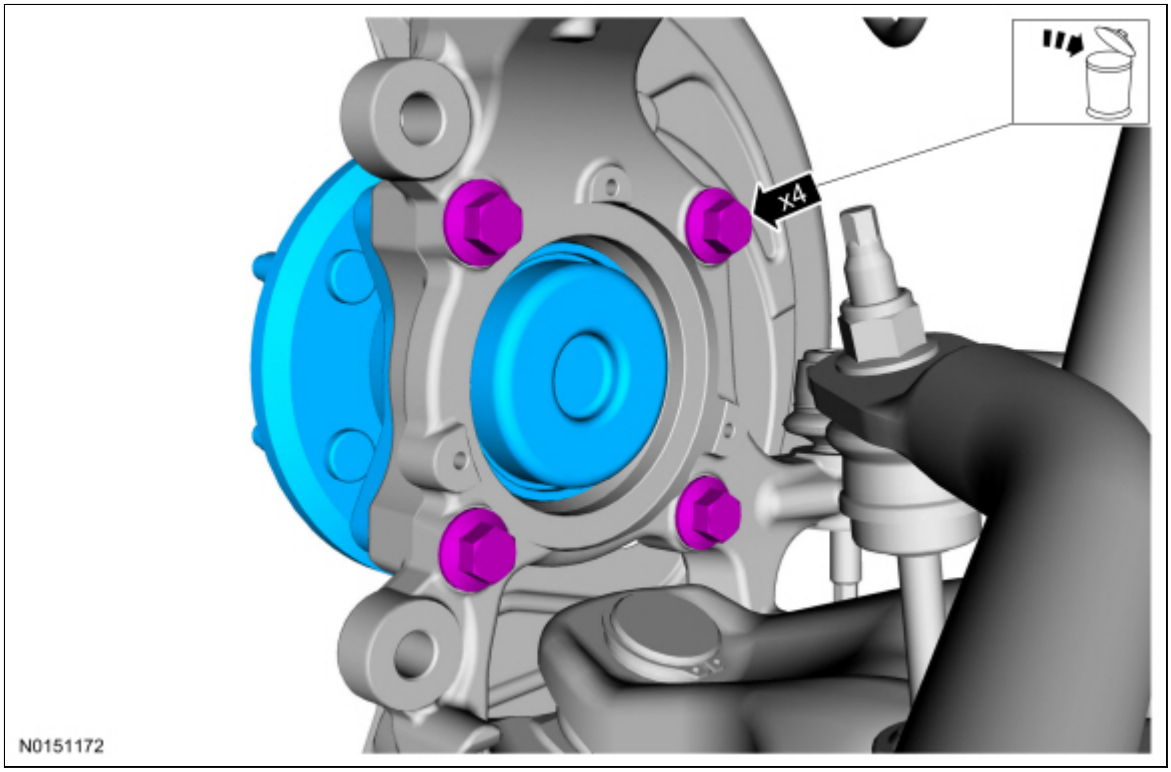
Removal and Installation



NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. **NOTE:** The wheel speed sensor electrical connector is located in the engine compartment secured to the fender apron.

2. Remove the wheel and tire. Refer to Section 204-04 .



3.
   - To install, tighten to 12 Nm (106 lb-in).

4. Remove the brake disc. Refer to Section 206-03 .

5.

- To install, tighten to 175 Nm (129 lb-ft).

repair4less

6. To install, reverse the removal procedure.

Removal

NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

1. Remove the brake disc. Refer to Section 206-03 .
2. Special Tool(s): Installer/Remover, C-Frame and Screw 211-023.

Installation

1. **NOTE:** Make sure to use washers that have an ID that is larger than the OD of the wheel stud serrations. Use enough washers (approximately 3 to 4) to allow the wheel stud to fully seat against the hub flange.

    - Tighten the wheel nut until the wheel stud is seated against the hub flange.
    - Discard the wheel nut.

2. Install the brake disc. Refer to Section 206-03 .

Front Suspension

The Four-Wheel Drive (4WD) front suspension consists of the following components:

- Ball joints
- Coil springs
- Lower control arms
- Shock absorbers
- Stabilizer bar and links
- Upper control arms
- Wheel bearing and wheel hubs
- Wheel knuckles
- Wheel studs

The vehicle is equipped with a front coil spring suspension. This independent-type front suspension utilizes a stabilizer bar to aid in vehicle stability. The wheel hub and wheel bearing are sealed units and are serviced as an assembly. The lower ball joints can be serviced independently from the lower arm.

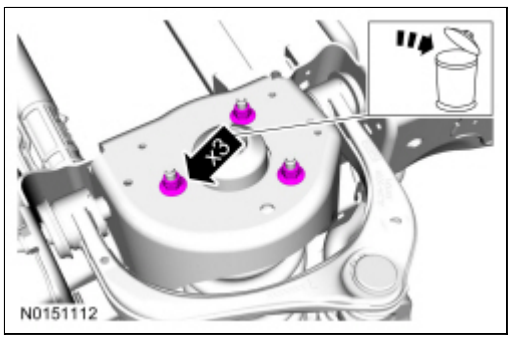
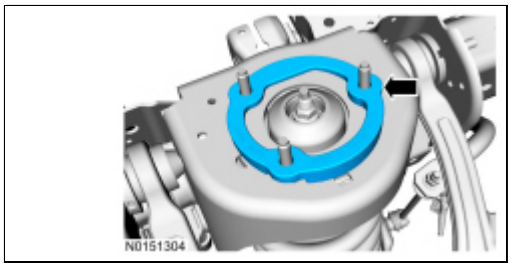
 ST2945-A	Separator, Ball Joint 204-592



Removal

NOTICE: **Suspension fasteners are critical parts that affect the performance of vital components and systems. Failure of these fasteners may result in major service expense. Use the same or equivalent parts if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Tighten fasteners as specified.**

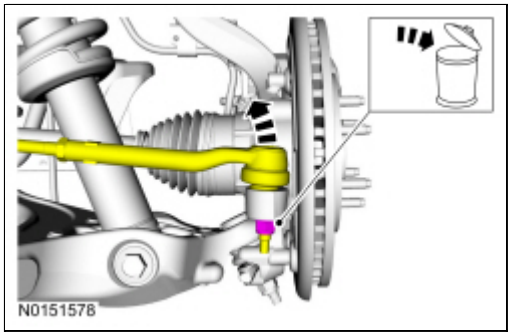
1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).



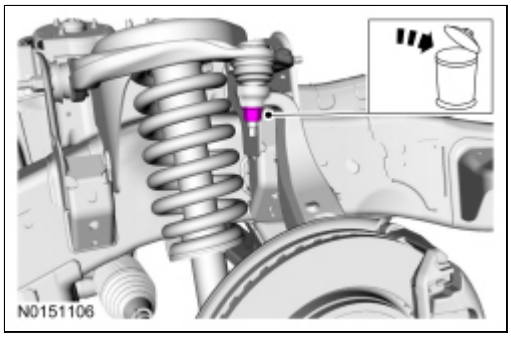
2.

3.

repair4less



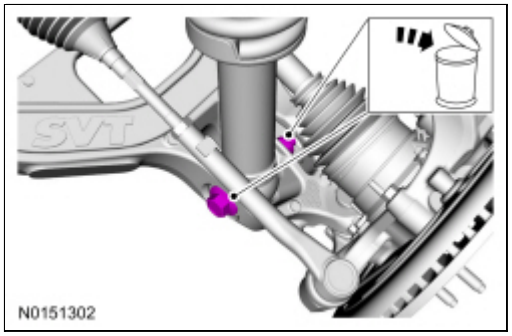
4. Remove the wheel bearing and wheel hub. Refer to Wheel Bearing and Wheel Hub .



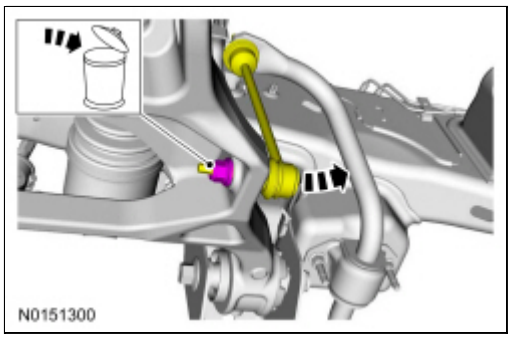
5. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

   NOTICE: **Use care when installing the tie rod separator or damage to the outer tie-rod end boot may occur.**

   General Equipment: Tie-rod Separator.

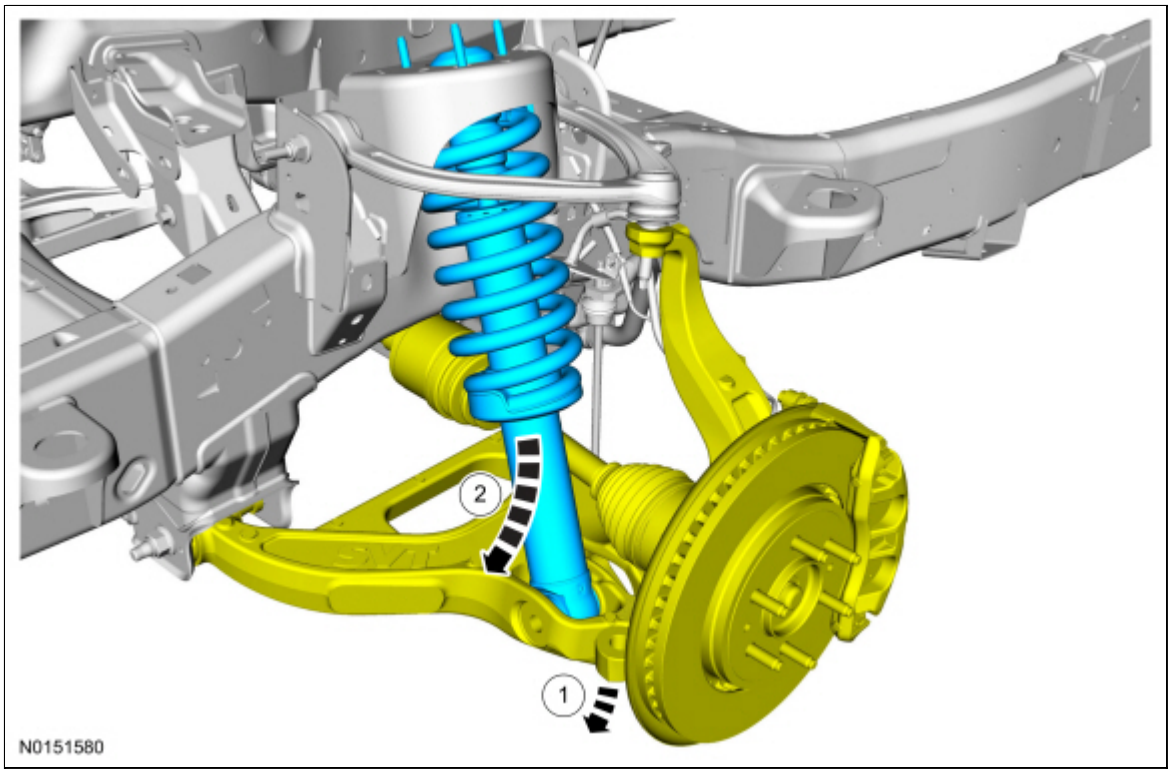


6.

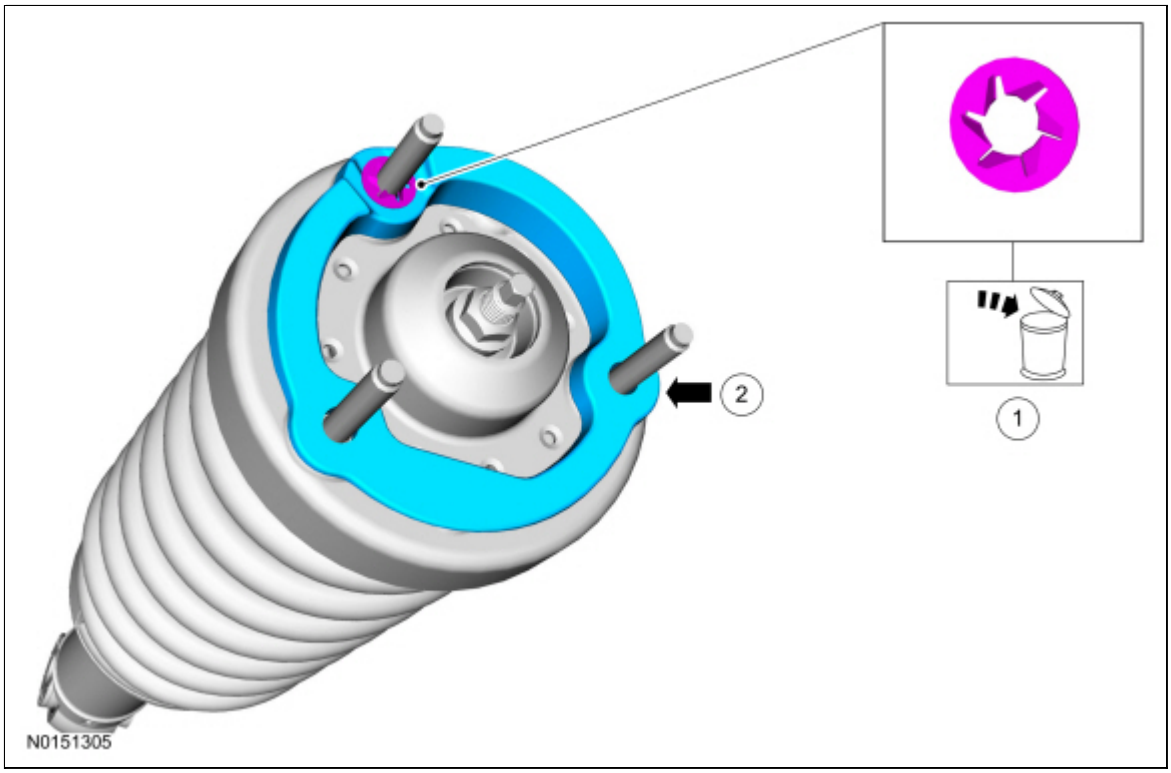


7. Special Tool(s): Separator, Ball Joint 204-592.

8.

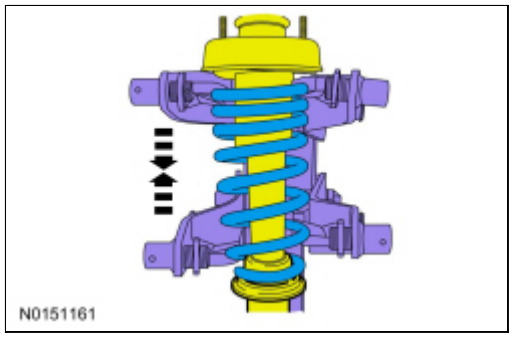


9. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

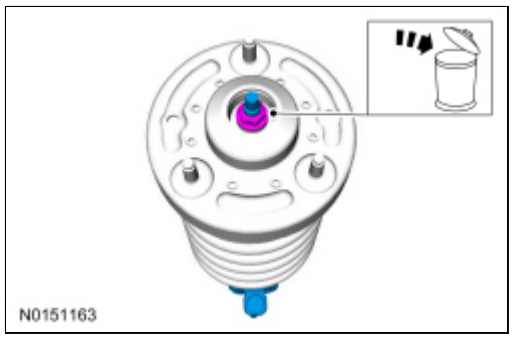


10. **NOTE:** SVT Raptor similar.

repair4less

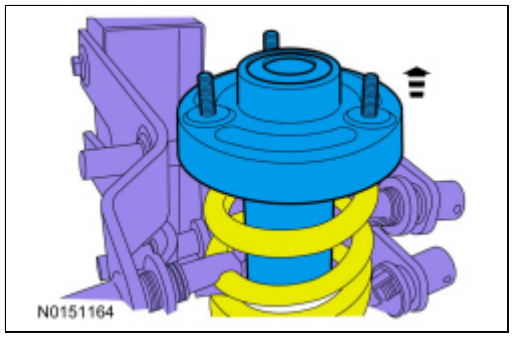


11.



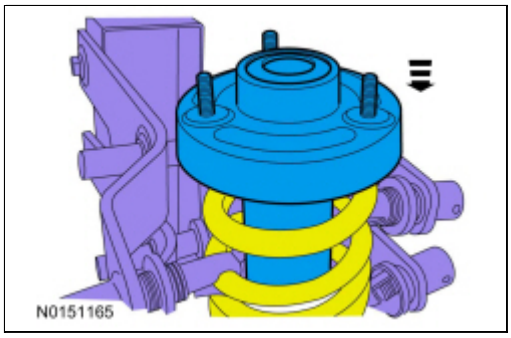
12. **NOTE:** If the individual spring and/or shock components are not being serviced, continue to the installation procedure.

NOTE: For reference during assembly, index the upper mount, spring and shock absorber.



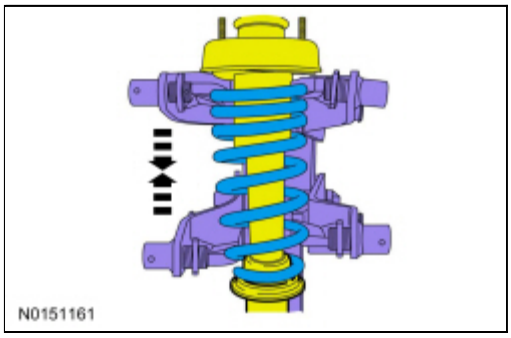
Compress the spring until the tension is released from the shock absorber.
General Equipment: Spring Compressor.

13. **NOTE:** Use the hex-holding feature to prevent the shock rod from turning while removing the nut.



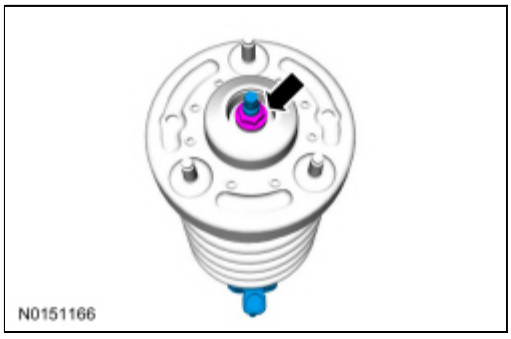
14.

Installation



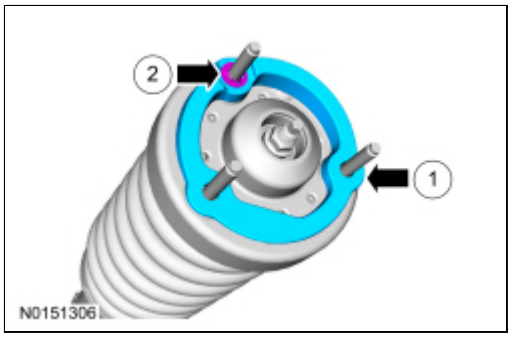
1.

repair4less



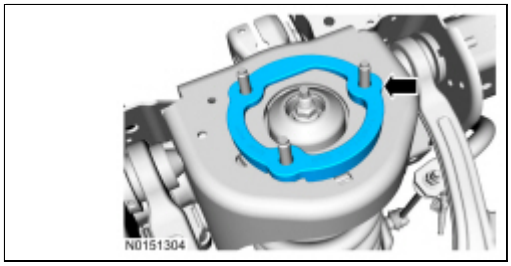
2. **NOTE:** Align the index marks made during disassembly.

   Compress the spring until the tension is released from the shock absorber.
   General Equipment: Spring Compressor.



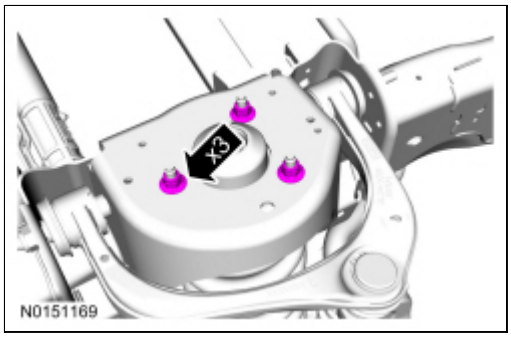
3. **NOTE:** Use the hex-holding feature to prevent the shock rod from turning while installing the nut.

   - Tighten to 55 Nm (41 lb-ft).



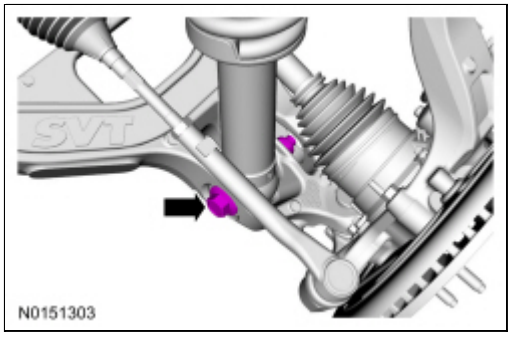
4.

5. **NOTE:** SVT Raptor similar



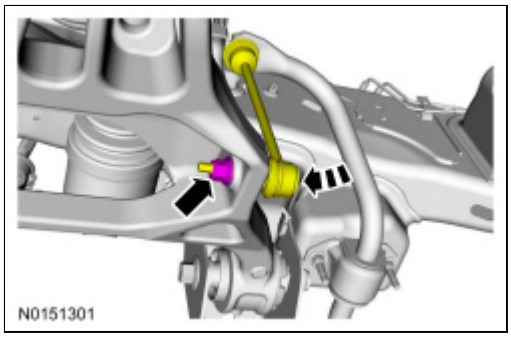
6.

7.



- Tighten to 40 Nm (30 lb-ft).

repair4less



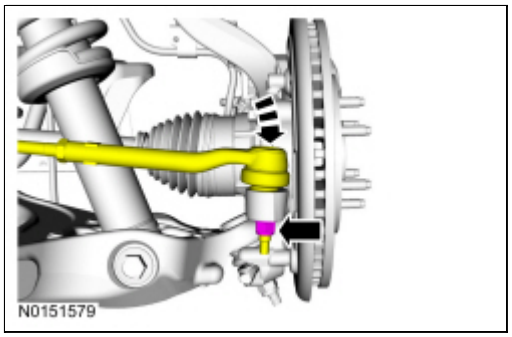
8. ***NOTICE:*** **SVT Raptor: Do not tighten the lower shock nut until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies or incorrect clamp load and bushing damage may occur.**

   Finger tight at this stage.

9. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut.

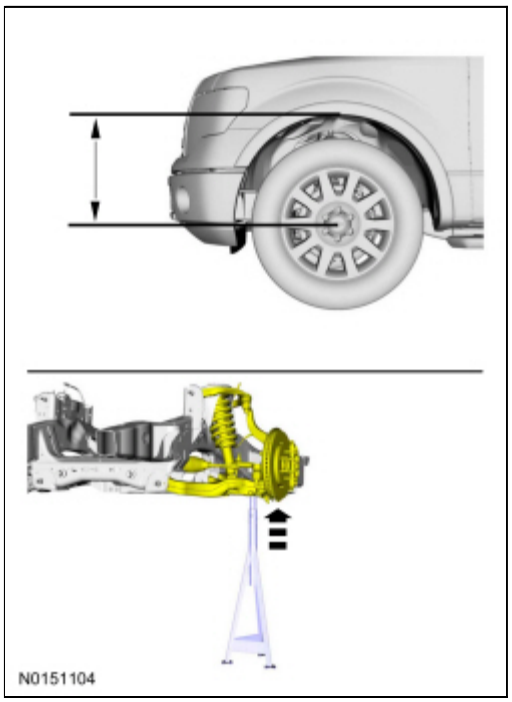
   - Tighten to 80 Nm (59 lb-ft).

10. Install the wheel bearing and wheel hub. Refer to Wheel Bearing and Wheel Hub .



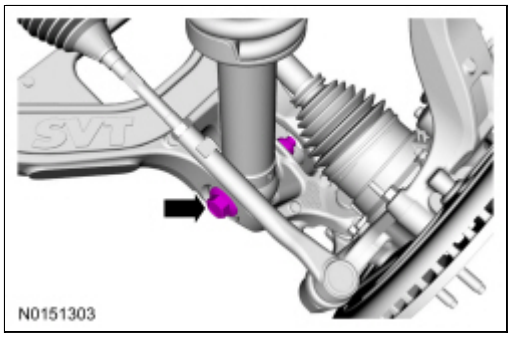
11.

    - Tighten to 115 Nm (85 lb-ft).



12.

- Tighten to 115 Nm (85 lb-ft).



13. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken during removal (curb height).

14.

- Tighten to 550 Nm (406 lb-ft).

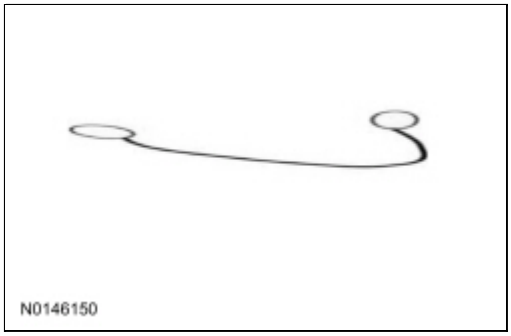
Leaf Spring Tip Isolator



1. Position and lift the vehicle on a hoist to unload the leaf spring assembly. Refer to Section 100-02 .

2. **NOTE:** It is very important to use a non-metallic wedge or corrosion protection can be compromised.

   Use a non-metallic wedge (such as a rubber door stop or rubber coated pry bar) near the leaf tip insulator and wedge the leaf spring apart.

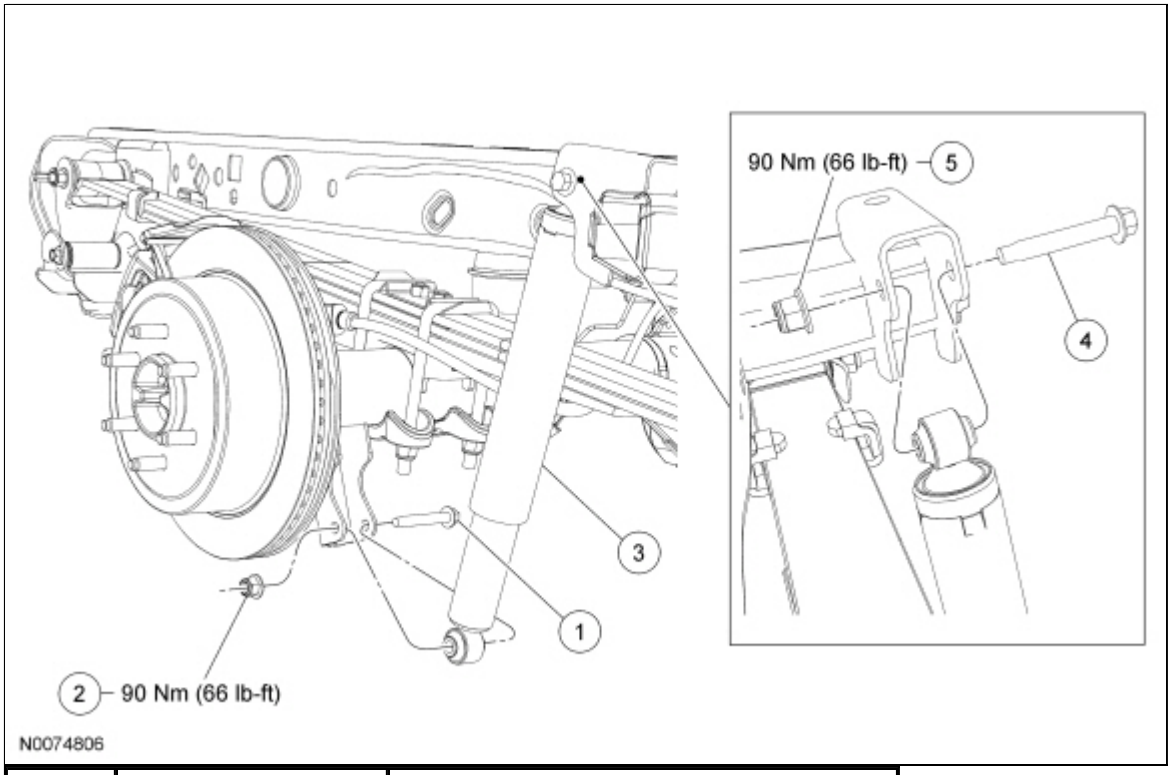
3. Using a locally obtained pvc cable saw, cut the top of the leaf tip insert off and remove the insert.

4. Thoroughly rinse the leaf tip insert area with brake clean and a clean shop rag to remove debris from the leaf tip insert seating area.

5. If required trim service tip insert post to aid installation between the leaves.

6. Once dry, install the new leaf spring tip insert and remove the non-metallic wedge.

7. Repeat steps 2-6 for remaining leaf tip inserts.



8. Lower the vehicle and wash the leaf spring assembly to remove any remaining dirt or debris using a power washer or direct stream of water.

9. Using shop air, dry the leaf spring assembly thoroughly.

WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

WARNING: Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All vehicles

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. Using a suitable jack, support the axle.
3. Remove the shock absorber lower nut and bolt.
   - Discard the nut and bolt.
4. Remove the 4 U-bolt nuts, the U-bolt plate and the 2 U-bolts.

- Discard the nuts and the U-bolts.

5. For the LH spring, lower the fuel tank to gain access to the spring shackle-to-frame bolt. For additional information, refer to Section 310-01 .

6. For the RH spring, remove the muffler to gain access to the spring-to-frame bolt. For additional information, refer to Section 309-00 .

7. Remove and discard the spring-to-frame nut and bolt.

8. Remove and discard the spring shackle-to-frame nut and bolt.

9. **NOTE:** Only lower the axle enough to gain access to remove the spring.

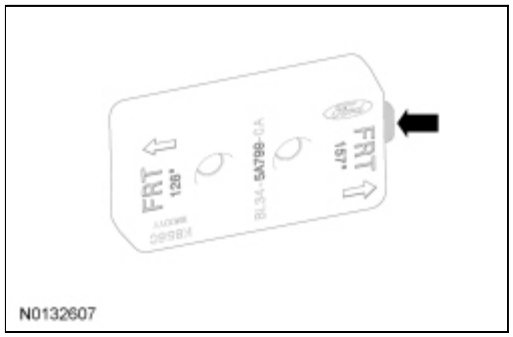
   Lower the jack and remove the spring and shackle assembly.

10. If necessary, remove the spring-to-shackle nut, bolt and spring shackle.
    - Discard the nut and bolt.

Four-Wheel Drive (4WD) vehicles

11. Remove the Four-Wheel Drive (4WD) spring spacer.

Installation



4WD vehicles

NOTE: The SVT Raptor spring spacer must be positioned with the jounce bumper pad inboard and the arrow facing the front of the vehicle.

All other vehicles, the arrow on the spring spacer must face toward the front of the vehicle according to the wheelbase application. Use specifications on spring spacer.

1. **NOTE:** The protrusion on the spring spacer should face toward the front of the vehicle on 157 inch wheelbase applications and face toward the rear on 126 inch wheelbase applications.

   Position the spring spacer and make sure that it is correctly seated between the axle and spring with the arrow pointed to the front of the vehicle according to the wheelbase application.

All vehicles

2. If necessary, install a new shackle-to-spring bolt and nut.

repair4less

- Tighten until snug.

3. Position the spring and install a new spring shackle-to-frame bolt and nut.
   - Tighten until snug.

4. Position the U-bolt plate and install the new U-bolts and nuts.
   - Tighten until snug.

5. Install a new spring-to-frame bolt and nut.
   - Tighten until snug.

6. Install a new shock absorber lower bolt and nut.
   - Tighten until snug.

7. Install the wheel and tire. For additional information, refer to Section 204-04 .

8. Lower the vehicle until the weight of the vehicle is resting on the wheels and tires (curb height).

9. Tighten the spring shackle-to-frame nut to 185 Nm (136 lb-ft).

10. Tighten the spring-to-frame nut to 350 Nm (258 lb-ft).

11. If necessary, tighten the spring-to-shackle nut to 185 Nm (136 lb-ft).

12. For the LH spring, raise the fuel tank. For additional information, refer to Section 310-01 .

13. For the RH spring, install the muffler. For additional information, refer to Section 309-00 .

14. Tighten the U-bolt nuts in 4 stages.
    - Stage 1: Tighten in a cross pattern to 35 Nm (26 lb-ft).
    - Stage 2: Tighten in a cross pattern to 70 Nm (52 lb-ft).
    - Stage 3: Tighten in a cross pattern to 100 Nm (74 lb-ft).
    - Stage 4: Tighten in a cross pattern to 133 Nm (98 lb-ft).

15. Tighten the shock absorber lower nut to 90 Nm (66 lb-ft).

Wheels And Tires

Safety Precautions

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

WARNING: Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).

WARNING: Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.

WARNING: Replacement wheels must be equivalent to the original equipment wheels in:

- **load carrying capacity.**
- **diameter, width and offset.**
- **pilot hole and bolt circle.**

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

WARNING: Wear eye and ear protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

WARNING: Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious personal injury.

WARNING: Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an

increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.

NOTICE: **Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents. Damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-37-A or -B or equivalent.**

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Tire Pressure Monitoring System (TPMS)

The Tire Pressure Monitoring System (TPMS) includes:

- the Body Control Module (BCM), located behind the passenger side kick panel.
- the Tire Pressure Monitor (TPM) module, located behind the instrument panel on the RH side near the glove box.
- four valve stem mounted tire pressure sensors.
- an Instrument Panel Cluster (IPC) warning indicator.
- message center warnings.

Tire Pressure Monitor (TPM) Module

The TPM module is a radio receiver that collects the tire pressure data from the TPMS tire pressure sensors. The TPM module passes the tire pressure data to the BCM , where the BCM applies a predetermined pass/fail criteria.

The BCM compares the information of each tire pressure message against a pressure limit. If the BCM determines that the tire pressure has fallen below the minimum pressure, the BCM communicates this to the IPC on the vehicle communication network.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

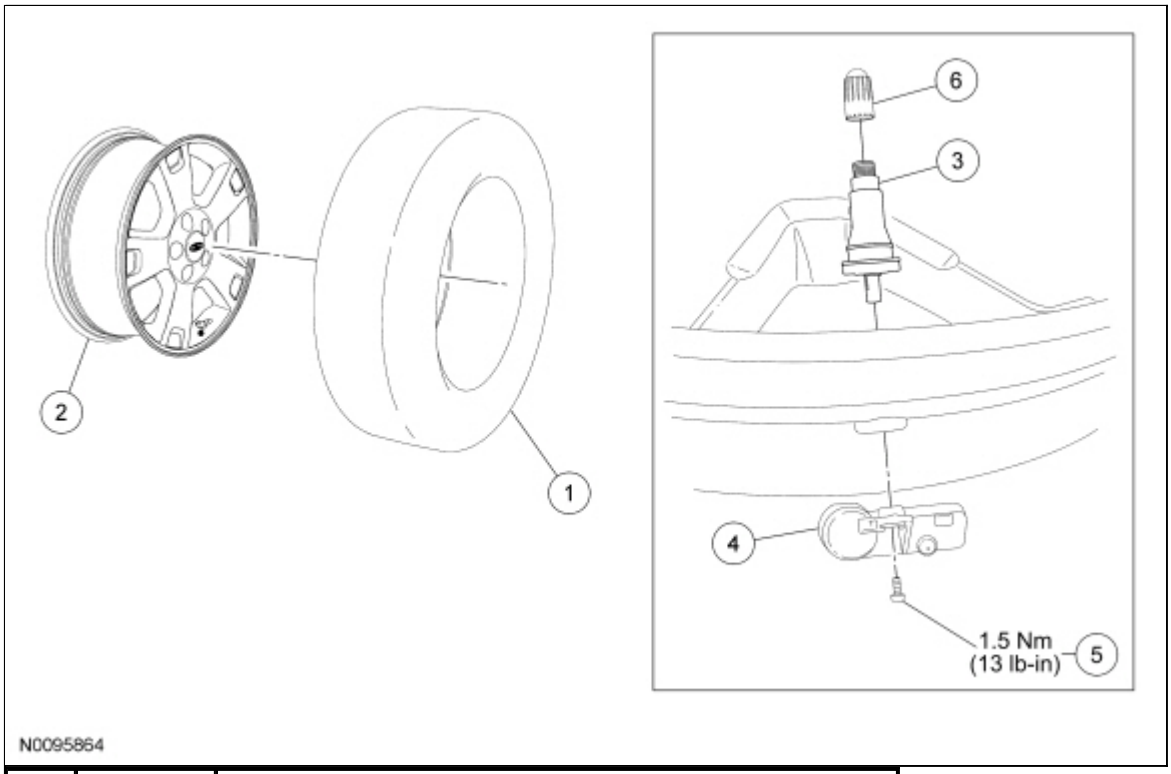
The BCM uses tire pressure sensors to monitor the tire pressure in the 4 road tires. The sensors transmit radio frequency signals to the BCM approximately once every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and mounted to the valve stem.

Instrument Panel Cluster (IPC) and Message Center

The IPC illuminates the TPMS warning indicator when it receives a TPMS warning indicator on request from

repair4less



the BCM and displays the appropriate message(s) in the message center.

For additional information on the IPC and message center, refer to Section 413-01 .

Wheel and Tire

Special Tool(s)

 ST2869-A	Digital Tire Pressure Gauge 204-354

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel
3	1700	Valve stem and screw (also part of 1A189)
4	1A189	Tire Pressure Monitoring System (TPMS) sensor (a new sensor assembly includes W714266 screw and 1700 valve stem and cap)
5	—	Valve stem-to- TPMS sensor screw (part of 1700)
6	1A163	Valve stem cap (also part of 1A189)

Disassembly

repair4less

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

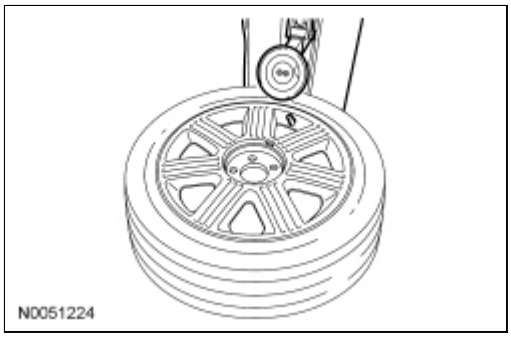
NOTICE: **The Tire Pressure Monitoring System (TPMS) sensor is mounted to the valve stem. Removal of the valve stem requires dismounting the tire from the wheel and removal of the TPMS sensor.**

NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

1. Remove the wheel and tire. For additional information, refer to Wheel and Tire in this section.

2. ***NOTICE:*** **The valve stem is connected to the Tire Pressure Monitoring System (TPMS) sensor. Do not pull the valve stem from the wheel, or damage to the sensor will occur.**

   Remove the valve stem core and fully deflate all air from the tire.
   - If a new Tire Pressure Monitoring System (TPMS) sensor is being installed, remove and discard the valve stem-to-sensor screw and the sensor.



NOTICE: **Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.**

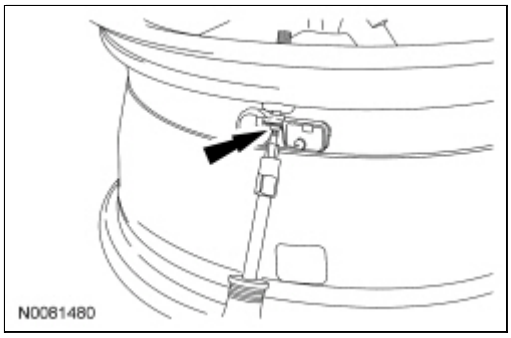
3. ***NOTICE:*** **Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator.**

   NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

   Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.
   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.

4. **NOTE:** Index-mark the valve stem and wheel weight positions on the tire.

   Place the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.



5. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

6. **NOTE:** A new valve stem must be installed whenever a new tire or wheel is installed.

   Remove the TPMS sensor in the following sequence.
   1. Using a T10 Torx, remove the valve stem-to- TPMS sensor screw.
   2. Carefully and firmly, pull the sensor straight down and separate it from the valve stem.

repair4less

7. ***NOTICE:*** **Use care not to damage the wheel surface when removing the valve stem.**

   Using a suitable valve stem puller and a wood block, remove the valve stem from the wheel.

8. **NOTE:** When installing a new wheel, always install a new valve stem and sensor screw. Reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused.

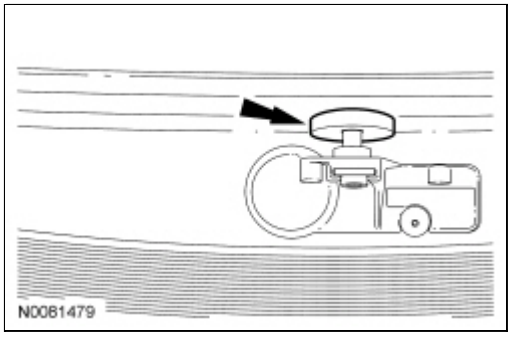
   If the TPMS sensor is being reused, inspect the TPMS sensor for damage and install a new sensor as necessary.

Assembly

NOTICE: **Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.**

1. ***NOTICE:*** **To prevent Tire Pressure Monitoring System (TPMS) sensor and valve stem damage, the valve stem must be installed onto the TPMS sensor and then installed into the wheel as an assembly.**

   Install a new valve stem onto the TPMS sensor.
   - Tighten the new valve stem-to- TPMS sensor screw to 1.5 Nm (13 lb-in).



2. ***NOTICE:*** **It is important to pull the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly through the wheel rim hole in a direction parallel to the valve stem hole axis. If the assembly is pulled through at an angle, damage to the valve stem and sensor assembly may occur.**

   NOTICE: **Use care not to damage the wheel surface when installing the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly.**

   Lubricate the valve stem with soapy water and install the valve stem and TPMS sensor assembly into the wheel using a block of wood and a suitable valve stem installer.

3. Make sure the valve stem rubber is fully seated against the wheel.

4. **NOTE:** Lubricate the tire beads using a suitable fast-drying, corrosion-inhibiting tire bead lubricant.

   NOTE: Do not mount the tire at this time.

   Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.

5. Position the wheel to align the valve stem with the machine arm, at the 6 o'clock position, and mount

repair4less

the bottom bead of the tire.

6. Reposition the wheel to align the valve stem with the machine arm at the 6 o'clock position, and mount the top bead of the tire.

7. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to make sure that accurate values are obtained.

   Inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.
   - Proceed to Step 8 if the tire beads do not seat at the specified inflation pressure.

8. **WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire in order to seat the beads, follow all steps listed below. Failure to follow these steps may result in serious personal injury.**

   The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.
   1. Relubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.
   3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.
   4. Inflate the tire using the remote valve and tire gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
   5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
   6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

9. Install the wheel and tire. For additional information, refer to Wheel and Tire in this section.

repair4less

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

1. **NOTE:** The Tire Pressure Monitoring System (TPMS) sensor cannot be removed without disassembly of the wheel and tire.

   Disassemble the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS)

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2869-A	Digital Tire Pressure Gauge 204-354
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

The Tire Pressure Monitor (TPM) module monitors the tire pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit signals via radio frequency to the TPM module. The TPM module is a radio receiver that collects the tire pressure data from the tire pressure sensors. The TPMS sensor radio transmissions are sent once approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The data is then sent to the Body Control Module (BCM) where a predetermined pass/fail criteria is applied. The BCM compares each TPMS sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the BCM communicates this on the vehicle communication bus to the Instrument Panel Cluster (IPC). The IPC then illuminates the TPMS warning indicator and displays the appropriate message(s) in the message center.

Ambient Temperature Change and Tire Pressure

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification

repair4less

when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and activate the TPMS warning indicator.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified Vehicle Certification (VC) label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]

** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.

-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

Tire Pressure Monitoring System (TPMS) Warning Indicator and Message Center Messages

The TPMS warning indicator and vehicle message center sometimes display faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Warning Indicator Illuminates Continuously

NOTE: When directed to train or re-train any TPMS sensors, use **only** the sensor training procedure outlined in Tire Pressure Monitoring System (TPMS) Sensor Training . Do not use the TPMS reset procedure outlined in the Owner's Literature as this procedure **will not** program new sensors to the module.

The TPMS warning indicator remains on continuously and the message center displays LOW TIRE PRESSURE when any of the tire pressures are low. When this condition exists, adjust the tire pressure to the recommended cold pressure indicated on the VC label.

NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it is necessary to wake up the sensors so that they transmit the latest tire pressure information to the TPM module.

If the vehicle has been stationary for more than 30 minutes, carry out the Tire Pressure Monitoring System (TPMS) Sensor Activation procedure in this section.

TPMS Warning Indicator Flashes

The TPMS warning indicator flashes for 70 seconds, then remains ON continuously when the ignition switch is turned to the ON position and 1 or more of the following conditions exists:

- Tire Pressure Sensor Fault — The message center displays TIRE PRESSURE SENSOR FAULT when a TPMS sensor is malfunctioning. GO to Symptom Chart .
- No communication with the BCM . The TPMS indicator is illuminated when the IPC has not received any signals from the BCM for more than 5 seconds. The message center displays TIRE PRESSURE MONITOR FAULT. GO to Symptom Chart .
- Tire Pressure Monitor Fault — The message center displays TIRE PRESSURE MONITOR FAULT when the TPMS is malfunctioning or communication with the IPC has been lost. GO to Symptom Chart .

The TP_STAT PID can be used to determine why the TPMS warning indicator is flashing.

Tire Pressure Monitoring System (TPMS) PID Definitions and Intermittent Troubleshooting

TPMS Status PID

The TPM monitors the TPMS status. The current status can be viewed by accessing the TPMS status PID : TPMS_STAT using the scan tool. This helps identify the current system status and may aid in diagnosing the system. The PID has 4 valid states:

1. TPMS_STAT = SENSOR FAULT.
    - If the module has not received the tire pressure status from 1 to 3 TPMS sensors for 20 minutes when the vehicle speed is above 32 km/h (20 mph), the PID displays SENSOR FAULT.

repair4less

2. TPMS_STAT = SYSTEM FAULT.
    - If the module has not received the tire pressure status from all 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph), the PID displays SYSTEM FAULT.

3. TPMS_STAT = LOW.
    - If the module has detected that at least 1 TPMS sensor is reporting low tire pressure, the PID displays LOW.

4. TPMS_STAT = SYSTEM ACTIVE.
    - If the TPMS is functioning normally, the PID displays SYSTEM ACTIVE.

TPMS Last Warning Event PID Definitions

The TPMS uses the TPMS last warning event PIDs to store detailed information about the last 5 times the TPMS warning indicator was activated. These PIDs can be used to acquire more information about a particular TPMS event, but must be used carefully.

EVT1_AGE_IGN through EVT5_AGE_IGN

The number of key cycles since the TPMS indicator was activated. This PID cycles from zero to 255. Default is $00, this can be used to determine how long ago a TPMS event occurred and the time (in key cycles) between events.

EVT1_TR_LOC through EVT5_TR_LOC

This is the last programmed location for the sensor identifier causing each TPMS event. Due to tire rotation, the sensor may no longer be at the original location. It is suggested that all the PIDs be recorded, the system retrained, and then the sensor identifier PIDs be used to pinpoint the actual location of each sensor.

EVT1_PRESS through EVT5_PRESS

This is the tire pressure associated with each TPMS warning indicator event. This can be used along with the function code to clearly identify the TPMS events that were strictly due to low pressure. It can also be used to determine when a sensor is transmitting inaccurate tire pressure.

EVT1_SNSR_ST through EVT5_SNSR_ST

Describes the warning status of each TPMS event by using the information received from the TPMS status (TPMS_STAT) PID . If there is a communication issue, the status could be Normal.

- Unknown
- Normal (normal operation)
- Low (low pressure event)
- Fault (sensor fault or system fault)

EVT1_SNSR_ID through EVT5_SNSR_ID

This is the identifier of the sensor involved in each TPMS event. EVT1 is the most recent event that triggered the TPMS warning indicator. Default is $ 00 00 00 00.

Wheel Rotation and Sensor Training Techniques

Moving a Problem Sensor/Wheel to a Different Position

If a sensor in a certain location has caused several events, yet the sensor trains and seems to operate normally, moving that particular wheel to a different location on the vehicle is a good way to isolate the issue to a certain sensor/wheel location. Rotate the wheels and road test the vehicle. This can be done in an attempt to replicate the issue. This determines if the issue followed the sensor or remained in the original sensor location.

Training Sensors in a Different Order

This is a technique to get past a left front sensor that may not be responding to determine if the remaining sensors train to the module. This can help save time determining if other sensors are having issues or if the module is experiencing training difficulties with a certain location.

Training Known Good Sensors From Another Vehicle

Training known good sensors from another vehicle cannot differentiate between a faulted module and Radio Frequency Interference (RFI), as some noise source could be preventing the TPM module from receiving the tire pressure status from the original sensors as well as the known good sensors. This technique can be used to differentiate between a sensor and module issue. If the TPM module cannot train any of the sensors on the same vehicle, and likewise cannot train known good sensors from another vehicle, then the issue is with the TPM module or RFI and not with the original sensors. The original sensors should not be replaced.

Items That Cause RFI

Non-OEM Equipment

The following equipment has been found to sometimes cause RFI :

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS .
- Car alarms (even those installed by dealerships) have been found to create enough RFI to cause the TPMS to malfunction or lose considerable range. These car alarms can sometimes be difficult to locate, as they are usually hidden somewhere out of the way for reduced accessibility.
- Many different in-vehicle cell phone chargers have been found to cause considerable RFI . The vehicles with the power point closest to the TPM module are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all the time. This depends on the state of charge of the cell phone battery. The phone must be almost completely discharged in some cases.
- Power supplies and DC/AC inverters typically create a lot of RFI . Most consumer grade equipment has very little filtering or shielding.

OEM Modules

In some cases, the RFI may actually be caused by a module or ground on the vehicle. Depending on the severity of the issue, a dirty ground, improperly built ground shield or module can disable the system. Modules that have microcontrollers using clock circuits to create the timing pulses for the microprocessor may radiate RFI .

Using Customer's Electronics to Pinpoint the Radio Frequency Interference (RFI) Source

This can be a way to determine the cause of an issue well before the sensors and module are replaced with little or no affect on the system performance. Since this takes more up-front work, it relies on working with the customer to determine what equipment was being used at the time of the event.

Options for Eliminating Intermittent TPMS Conditions Caused by RFI

- If an OEM component or customer device is causing an RFI issue, replace the device.

repair4less

- If a phone charger is causing an RFI issue, the customer should consult their cell phone provider to acquire a different phone charger.
- If a device such as a dealer-installed alarm is causing an RFI issue, move the device to another location on the vehicle. In the case of a portable device, move the power cord to another power point location.

In summary, if the RFI source is present and cannot be moved or replaced, the intermittent issue remains. The TPMS system must accept RFI and the unwanted system operation it can cause.

Inspection and Verification

1. Verify the customer concern. Keep the following items in mind when diagnosing any TPMS related issue:
    - The tire pressure sensors are not designed to be used with aftermarket wheels. The use of run-flat tires (tires with steel body cord plies in the tire sidewall) that are not originally equipped, may block the TPMS signal and are not recommended.
    - Non-OEM modifications made to the vehicle may result in false TPMS warnings.
    - Swapping wheels on vehicles with the same TPMS sensors sets a fault if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
    - The tire pressure calibrations in the TPM for the system cannot be changed to use lower tire pressures than those listed on the Vehicle Certification (VC) label.
    - Certain non-OEM electronic equipment may cause RFI and false TPMS warnings. To aid in diagnosis, obtain information from the owner regarding any equipment that has been added or was in use at the time the TPMS fault occurred.
    - It may be necessary to disconnect any electronic add-on equipment to verify its impact on TPMS operation. For intermittent cases, it may be necessary to ask the customer to provide portable electronic equipment to verify its impact on the system.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Low tire pressure • Spare tire installed as a road wheel • Sensors not trained after a tire rotation • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires or rigid sidewall tires (19.5" steel carcass heavy-duty tires) installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Body Control Module (BCM) fuse 26 (5A) • Wiring, terminals or connectors • TPM missing or damaged • Aftermarket electronic accessories (in-car chargers or supplies, DC/AC inverters, video screens, car alarms)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00, The PCM Does Not Respond To the Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the BCM and the TPM module.

9. If the DTCs retrieved are related to the concern, go to the BCM DTC Chart or the TPM Module DTC Chart. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

DTC Charts

Body Control Module (BCM) DTC Chart

DTC	Description	Action
B1182:00	Tire Pressure Monitoring System (TPMS): No Sub Type Information	GO to Pinpoint Test F.
B1182:55	Tire Pressure Monitoring System (TPMS): Not Configured	This DTC is only present when a new BCM is installed, the BCM is flashed or is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B124D:02	Tire Pressure Sensor: General Signal Failure	**NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors go into sleep mode to conserve battery power. It may be necessary to wake them up so they transmit the latest tire pressure information to the TPM module. ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

repair4less

		REPEAT the self-test. If DTC B124D:02 is retrieved again, GO to Pinpoint Test F .
B1251:00	Tire Pressure Sensor Low Battery: No Sub Type Information	GO to Pinpoint Test H .
B1254:51	Right Rear (Outside on Dual Wheel) Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, the BCM is flashed or reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B1255:51	Left Rear (Outside on Dual Wheel) Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, the BCM is flashed or reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
C1A56:51	Left Front Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, the BCM is flashed or reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
C1A58:51	Right Front Tire Pressure Sensor and Transmitter Assembly: Not Programmed	This DTC is only present when a new BCM is installed, the BCM is flashed or reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
All other DTCs	—	REFER to Section 419-10 .

Tire Pressure Monitor (TPM) Module DTC Chart

DTC	Description	Action
B1D55:01	Antenna #2: General Electrical Failure	REFER to Section 303-06 .
U0140:87	Lost Communication with Body Control Module: Missing Message	GO to Pinpoint Test I .
U0422:68	Invalid Data Received from Body Control Module (BCM): Event Information	RETRIEVE and REPAIR all non-network DTCs in the BCM . REFER to Section 419-10 .

Symptom Chart

Symptom Chart

NOTE: For vehicles with different front and rear tire pressures, the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors results in a false low tire pressure event, causing the Tire Pressure Monitoring System (TPMS) indicator to illuminate.

For vehicles with the same tire pressure for front and rear tires, training the sensors is not necessary after a tire rotation.

Failure of a TPMS component may not cause the message center to display a fault message or store a DTC. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Condition	Possible Sources	Action
• The Tire Pressure Monitoring System (TPMS) warning indicator is on continuously and the message center displays LOW TIRE PRESSURE	• Spare tire currently in use • Tire pressure not set to specifications listed on the Vehicle Certification (VC) label • TPMS sensors not trained following tire rotation • TPMS sensor(s)	• GO to Pinpoint Test D .
• The Body Control Module (BCM) cannot enter sensor training mode when using the TPMS sensor training procedure	• Stoplamp switch concern • Ignition switch concern • BCM	• GO to Pinpoint Test E .
• The TPMS warning indicator illuminates with DTCs present	• Not all TPMS sensors are installed • TPMS sensors not trained • TPMS sensor(s) • Intermittent TPMS operation due to Radio Frequency Interference (RFI) • TPM module wiring • TPM module • BCM wiring • BCM	• GO to Pinpoint Test F .
• The TPMS warning indicator illuminates with no DTCs present	• Communication network concern • Instrument Panel Cluster (IPC)	• REFER to Section 413-01 to diagnose the TPMS warning indicator is always on.
• One or more TPMS sensors do not train and DTCs are present	• TPMS sensor(s) • Vehicle communication issue • Intermittent TPMS operation due to RFI • TPM module wiring • TPM module • BCM wiring • BCM	• FOLLOW the diagnostics for the DTC(s) retrieved. REFER to DTC Charts in this section.
• One or more TPMS sensors do not train and no DTCs are present	• TPMS sensor(s) • Radio Frequency Interference (RFI)	• GO to Pinpoint Test G .

Pinpoint Tests

repair4less

Pinpoint Test D: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is ON Continuously and The Message Center Displays LOW TIRE PRESSURE

Normal Operation

The Tire Pressure Monitor (TPM) module monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit data via radio frequency signals to the TPM module. The TPM module is a radio receiver that collects the air pressure data from the Tire Pressure Monitoring System (TPMS) tire pressure sensors. The data is then sent to the Body Control Module (BCM) where a predetermined pass/fail criteria is applied. The TPMS sensor radio transmissions are sent approximately once every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The BCM compares each TPMS sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the BCM communicates this on the vehicle communication bus to the Instrument Panel Cluster (IPC). The IPC then illuminates the TPMS warning indicator and displays the appropriate message(s) in the message center .

This symptom can also be caused by a spare tire currently being used in place of a road tire. Make sure that the spare tire is not currently in use. On vehicles with different front and rear tire pressures, if the sensors are not trained following a tire rotation, this symptom may result. Advise the customer that on vehicles with different front and rear tire pressures, the sensors must be trained as directed in the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Spare tire currently in use
- Tire pressure not set to specifications listed on the Vehicle Certification (VC) label
- TPMS sensors not trained following tire rotation
- TPMS sensor(s)

PINPOINT TEST D: THE TPMS WARNING INDICATOR IS ON CONTINUOUSLY AND THE MESSAGE CENTER DISPLAYS LOW TIRE PRESSURE

NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

Test Step	Result / Action to Take
D1 CHECK FOR LOW TIRE PRESSURE • Using the Digital Tire Pressure Gauge, measure and record the air pressure in all 4 tires. • Adjust the pressure for those found to be below the specification listed on the VC label. • Activate each sensor at least twice with the training tool or customer activation tool to make sure the TPM module gets the latest air pressure data. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation or drive the vehicle for at least 2 minutes above 32 km/h (20 mph) to clear the low pressure warning. Do not train the sensors at this time. • **Has the TPMS warning indicator gone out?**	**Yes** The system is operating correctly at this time. The concern was caused by low tire pressure. **No** GO to D2.
D2 CHECK FOR SPARE TIRE IN USE **NOTE:** The spare tire is not programmable even if it is	**Yes** REPAIR and REMOUNT the

equipped with a TPMS sensor. If a damaged road wheel is located in the cargo area, the sensor may still be recognized by the TPMS as low. Make sure the spare tire is not currently in use. To restore TPMS functionality, repair the damaged road wheel and re-mount it to the vehicle. • Check spare tire location. • **Is the spare tire in use?**	wheel to the vehicle. REFER to Wheel and Tire in this section. ADJUST tire pressures to the required pressure as defined on the VC label located in the driver door jam. **No** GO to D3.
D3 CHECK IF THE TIRES WERE ROTATED WITHOUT TPMS SENSOR TRAINING	

NOTE: If the TPMS sensors at the front of the vehicle are still trained in the rear positions but inflated to the front air pressures, the TPMS warning indicator illuminates continuously.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: DataLogger — BCM.
• Monitor and record the following BCM PIDs:
  ▪ Left Front Tire Pressure (TPM_PRES_LF)
  ▪ Right Front Tire Pressure (TPM_PRES_RF)
  ▪ Left Rear Tire Pressure (TPM_PRES_LRO)
  ▪ Right Rear Tire Pressure (TPM_PRES_RRO)
• **Do the rear PIDs show front air pressures and the front PIDs show rear air pressures?**
	Yes
	The tires have been rotated without training the sensors. TRAIN the sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
	
	No
	GO to D4.

D4 CHECK FOR STUCK TPMS SENSOR	

• Monitor and record the following BCM PIDs:
  ▪ Left Front Tire Pressure (TPM_PRES_LF)
  ▪ Right Front Tire Pressure (TPM_PRES_RF)
  ▪ Left Rear Tire Pressure (TPM_PRES_LRO)
  ▪ Right Rear Tire Pressure (TPM_PRES_RRO)
• Using the Digital Tire Pressure Gauge, measure the actual tire pressures.
• Compare the air pressure PIDs with the actual air pressures.
• **Do the compared tire pressure values match within ± 5 psi?**
	Yes
	REFER to Section 413-01 to diagnose the TPMS warning indicator is always on.
	
	No
	INSTALL a new TPMS sensor (s) for the sensor(s) in question. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test E: The Body Control Module (BCM) Cannot Enter Sensor Training Mode When Using the Tire Pressure Monitoring System (TPMS) Sensor Training Procedure

Normal Operation

For the Body Control Module (BCM) to enter Tire Pressure Monitoring System (TPMS) sensor training mode, the BCM must receive valid inputs from the stoplamp switch (off) and ignition switch (run), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]). Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- Stoplamp switch concern
- Ignition switch concern
- BCM

repair4less

PINPOINT TEST E: THE BCM CANNOT ENTER SENSOR TRAINING MODE WHEN USING THE TPM SENSOR TRAINING PROCEDURE

Test Step	Result / Action to Take
E1 CHECK THE STOPLAMP OPERATION • Ignition ON. • Press and release the brake pedal while monitoring the stoplamps. • **Do the stoplamps operate properly?**	**Yes** GO to E2. **No** REFER to Section 417-01 to continue diagnosis of the stoplamp switch.
E2 CHECK THE IGNITION SWITCH INPUT • Ignition ON. • Enter the following diagnostic mode on the scan tool: BCM DataLogger. • Monitor the BCM ignition switch PID (IGN_SW_STATE) with the ignition in the RUN position. • **Does the PID indicate the correct ignition switch position?**	**Yes** GO to E3. **No** REFER to Section 211-05 to continue diagnosis of the ignition switch.
E3 CHECK FOR VEHICLE SPEED-RELATED DTCs IN THE BCM • Carry out the BCM self-test. • **Are any vehicle speed-related DTCs present?**	**Yes** REFER to the BCM DTC Chart in Section 419-10. **No** GO to E4.

E4 CHECK FOR CORRECT BCM OPERATION
• Disconnect all the BCM connectors.
• Check the connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the BCM connectors and make sure that they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Tire Pressure Monitoring System (TPMS) Warning Indicator Illuminates With DTCs Present

Normal Operation

If there is a fault with 1, 2 or 3 of the Tire Pressure Monitoring System (TPMS) sensors, DTC B124D:02 sets. The TPMS warning indicator flashes for 70 seconds and then remains on continuously when the ignition switch is turned to the ON position and the message center displays TIRE PRESSURE SENSOR FAULT.

If the TPM module does not get a response from all 4 of the TPMS sensors and transfers that information to

the BCM , DTC B1182:00 sets and the message center displays TIRE PRESSURE MONITOR FAULT.

It should be noted that TPMS sensor communication to the TPM module can be interrupted by radio frequency noise, which can cause intermittent issues that are not vehicle concerns. Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment. Anytime the TPMS sensor training procedure is performed successfully, the warning indicator is extinguished and the vehicle must be driven for 18-20 minutes before the TPM module sets a fault.

- DTC B1182:00 (Tire Pressure Monitoring System (TPMS): No Sub Type Information) — set by the BCM when **all 4** of the tire pressure sensors are faulted, not responding or not heard by the TPM module.
- DTC B124D:02 (Tire Pressure Sensor: General Signal Failure) — set by the BCM when 1, 2 or 3 of the tire pressure sensors are faulted, not responding or not heard by the TPM module.
- TPMS_STAT PID = SENSOR FAULT — when the BCM does not receive the tire pressure status for 1 to 3 TPMS sensors from the TPM module for 20 minutes with vehicle speed above 32 km/h (20 mph).
- TP_STAT PID = SYSTEM FAULT when the BCM does not receive a signal transmission from **all 4** TPMS sensors from the TPM module for 20 minutes with vehicle speed above 32 km/h (20 mph).

This pinpoint test is intended to diagnose the following:

- Not all TPMS sensors are installed
- TPMS sensors not trained
- TPMS sensor(s)
- TPM module wiring
- TPM module
- BCM wiring
- BCM

PINPOINT TEST F: THE TPMS WARNING INDICATOR ILLUMINATES WITH DTCs PRESENT

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors go into a "sleep mode" to conserve battery power. It is necessary to wake them up so that they transmit the latest tire pressure information to the TPM module.

Test Step	Result / Action to Take
F1 VERIFY TPM MODULE COMMUNICATION	
• Ignition ON. • Using a scan tool, carry out the Network Test. • **Does the TPM module pass the Network Test?**	**Yes** GO to F2 . **No** REFER to Section 418-00 to diagnose the TPM module does not respond to the scan tool.
F2 CHECK THE SENSOR IDENTIFIER PIDs AND SYSTEM STATUS PID	
• Enter the following diagnostic mode on the scan tool: DataLogger —	**Yes** GO to F3 .

repair4less

BCM . • Read and record the following PIDs : ▪ Left Front Tire Transmitter Identifier (TPM_S_ID_LF) ▪ Right Front Tire Transmitter Identifier (TPM_S_ID_RF) ▪ Left Rear Tire Transmitter Identifier (TPM_S_ID_LRO) ▪ Right Rear Tire Transmitter Identifier (TPM_S_ID_RRO) • Monitor the TPMS system status (TPMS_STAT) PID . • **Does the TPMS_STAT PID display SENSOR FAULT?**	**No** If the TPMS_STAT PID displays SYSTEM FAULT, GO to F4 .
F3 CARRY OUT THE SENSOR TRAINING PROCEDURE (SENSOR FAULT)	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the TPM module?**	**Yes** Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the BCM module. COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete. DOCUMENT all TPMS sensor identifiers on the applicable warranty claim. TEST the system for normal operation. **No** **Before installing a new sensor(s)** : If a sensor does not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open. If the sensor(s) fails to train a second time, INSTALL a new TPMS sensor (s) for the sensor(s) in question. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.
F4 CARRY OUT THE SENSOR TRAINING PROCEDURE (SYSTEM FAULT)	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the TPM module?**	**Yes** Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the BCM module. COMPARE these values to those recorded prior to the Tire Pressure Monitoring System (TPMS) Sensor Training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete. DOCUMENT all TPMS sensor identifiers on the applicable warranty claim. TEST the system for normal operation.

	No **Before installing a TPM module** : If sensors do not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensors again. If the sensors still fail to train, ATTEMPT to train the sensors with the vehicle doors open. If the sensors still fail to train, INSTALL a new TPM module. REFER to Tire Pressure Monitor (TPM) Module in this section. TEST the system for normal operation. If the concern is still present, GO to F5.
F5 CHECK FOR CORRECT BCM OPERATION • Disconnect all the BCM electrical connectors. • Check the connectors for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the BCM connectors and make sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** **NOTE:** The TPMS sensors may not be present. DISMOUNT the tire. REFER to Wheel and Tire in this section. VERIFY the TPMS sensors are present and mounted to the wheels. If missing, INSTALL new TPMS sensors. If the TPMS sensors are present, INSTALL a new BCM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: One Or More TPMS Sensors Do Not Train And No DTCs Are Present

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors go into a sleep mode to conserve battery power. It becomes necessary to wake them up so they transmit the latest tire pressure information to the TPM module. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

Normal Operation

The TPM module monitors the tire pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit signals via radio frequency to the Tire Pressure Monitor (TPM) module. The TPM module is a radio receiver that collects the tire pressure data from the tire pressure sensors. The TPMS sensor radio transmissions are sent approximately once every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The BCM learns the position on the vehicle of each TPMS sensor through the training process. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- TPMS sensors
- Radio Frequency Interference (RFI)

PINPOINT TEST G: ONE OR MORE TPMS SENSORS DO NOT TRAIN AND NO DTCs ARE PRESENT

repair4less

Test Step	Result / Action to Take
G1 ATTEMPT TO TRAIN THE TPMS SENSORS **NOTE:** Banded TPMS sensors are not compatible with the valve mounted TPMS sensor system. **NOTE:** The BCM has a 2-minute time limit between sensor responses. If the BCM does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn sounds twice, the message center displays TIRE NOT TRAINED REPEAT, and the entire procedure must be repeated. • Train all 4 TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Do all of the TPMS sensors train?**	**Yes** The system is operating correctly at this time. The concern may have been caused by RFI . **No** If one or more TPMS sensors trained, GO to G2 . If none of the TPMS sensors trained, GO to Pinpoint Test E .
G2 CHECK FOR RADIO FREQUENCY INTERFERENCE • Ignition ON. • Move the vehicle to rotate the wheels at least one-fourth turn. • Train all 4 TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did the TPMS sensor(s) train?**	**Yes** The system is operating correctly at this time. The concern may have been caused by RFI . **No** ATTEMPT to train the TPMS sensor(s) with the doors open. If the TPMS sensor(s) still do not train INSTALL a new TPMS sensor(s) for the sensor(s) in question. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section. TEST the system for normal operation.

Pinpoint Test H: DTC B1251:00

Normal Operation

- DTC B1251:00 (Tire Pressure Sensor Low Battery: No Sub Type Information) — This DTC sets in continuous memory in the Body Control Module (BCM) when there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing TPMS sensor(s), or when attempting to train a TPMS sensor(s) with a low battery. The TPMS warning indicator flashes for 70 seconds then illuminates continuously when the ignition switch is turned to the ON position. The message center also displays TIRE PRESSURE SENSOR FAULT.

This pinpoint test is intended to diagnose the following:

- TPMS sensor(s)

PINPOINT TEST H: DTC B1251:00

Test Step	Result / Action to Take
H1 TRAIN THE TPMS SENSORS TO DETERMINE THE INOPERATIVE SENSOR	

• Train all 4 TPMS sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the TPMS sensors transmit correctly when each TPMS sensor transmitted to the TPM module?**	**Yes** CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** If the TPMS sensors fail to train, REFER to **Wheel Rotation And Sensor Training Techniques** in this section. If the TPMS sensor(s) fails to train a second time, INSTALL a new TPMS sensor(s) for the sensor(s) in question. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test I: DTC U0140:87

Normal Operation

- DTC U0140:87 (Lost Communication With Body Control Module: Missing Message) — This DTC is set by the Tire Pressure Monitor (TPM) module in continuous memory if data messages received from the BCM are missing.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- TPM module
- BCM

PINPOINT TEST I: DTC U0140:87

Test Step	Result / Action to Take
I1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to I2. **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
I2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Using a scan tool, carry out the Network Test. • **Do both the BCM and the TPM module pass the Network Test?**	**Yes** GO to I3. **No** If either module does not pass the Network Test, REFER to Section 418-00 to diagnose the BCM does not respond to the scan tool or the TPM module does not respond to the scan tool.
I3 CHECK THE TPM MODULE	

repair4less

CMDTCs	
• Using a scan tool, carry out the TPM module self-test. • Using a scan tool, clear the TPM module DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Using a scan tool, carry out the TPM module self-test. • **Is DTC U0140:87 retrieved again?**	**Yes** GO to I4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
I4 CHECK FOR DTCs IN THE BCM	
• Using a scan tool, carry out the BCM self-test. • **Is DTC U3003:16 or U3003:17 present?**	**Yes** TPM module DTC U0140:87 may have been set due to a voltage issue in the BCM . REFER to the BCM DTC Chart in Section 419-10 . **No** GO to I5 .
I5 CHECK FOR DTC U0140, U0140:00, OR U0140:87 SET IN OTHER MODULES	
• Clear the CMDTCs from all modules. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Using a scan tool, retrieve the CMDTCs from all modules. • **Is DTC U0140, U0140:00, or U0140:87 set in more than one module?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . CLEAR all continuous DTCs. REPEAT the self-test. **No** INSTALL a new TPM module. REFER to Tire Pressure Monitor (TPM) Module in this section. TEST the system for normal operation.

repair4less

Wheels And Tires

Special Tool(s)

 ST2869-A	Digital Tire Pressure Gauge 204-354
 ST3058-A	Hunter Road Force® Wheel Balancer GSP9700 Series

Inspection and Verification

WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, GO to Symptom Chart - NVH .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.

- tire clearance between the body and chassis.
- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

Use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and for the appropriate repair action to be carried out.

2. Check the tires for:
    - cuts.
    - stone bruises.
    - abrasions.
    - blisters.
    - embedded objects.

3. Check the valve stems for:
    - cracks.
    - cuts.

Install a new valve stem when damage is found or any time a new tire is installed.

4. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than 2/32 inch.

Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

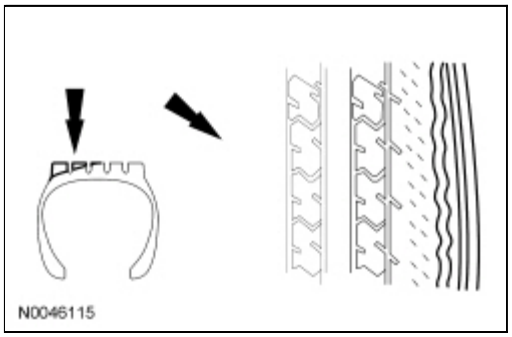
Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread wear indicators.

repair4less

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread, creating performance-related issues.

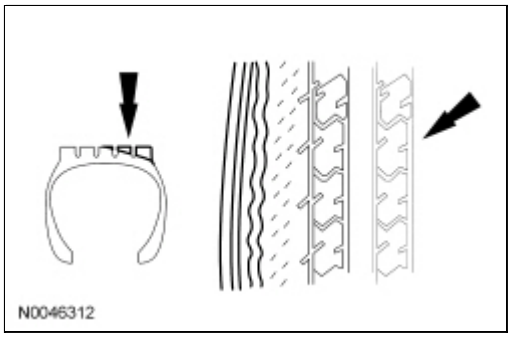


Abnormal/incorrect tire wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 2/32 inch and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and the appropriate repair action to be carried out.

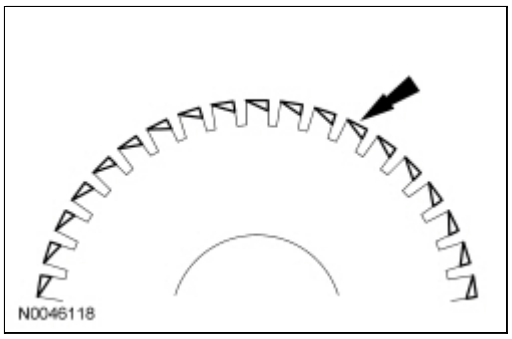
Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. Visually inspect the tires to determine whether the tires have this type of wear. In some instances, the tread depth of each rib may need to be measured and compared it to that of the shoulder.



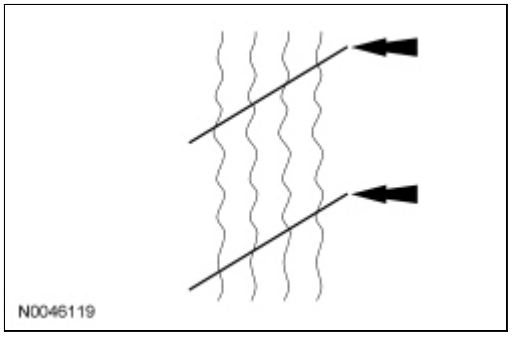
NOTE: RF tire shown, others similar.

Outer Edge/Shoulder Wear



Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. Visually inspect the tires to determine whether the tires have this type of wear. In some instances, the tread depth of each rib may need to be measured and compared to that of the shoulder.

NOTE: RF tire shown, others similar.



Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. Visually inspect the tires in both the inside and outside shoulder ribs to determine whether the tires have this type of wear. In some instances, the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib may need to be measured.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

Symptom Chart — Tire Wear

Symptom Chart — Tire Wear

repair4less

NOTE: For suspension system and additional alignment diagnosis, refer to Section 204-00 .

Condition	Possible Sources	Action
• Inner edge/shoulder wear	• Excessive toe out and/or negative camber	• GO to Pinpoint Test A .
	• Incorrect wheel and tire assembly rotation intervals	• GO to Pinpoint Test A .
	• High-speed cornering	• GO to Pinpoint Test A .
• Outer edge/shoulder wear	• Excessive toe in and/or positive camber	• GO to Pinpoint Test B .
	• Incorrect wheel and tire assembly rotation intervals	• GO to Pinpoint Test B .
	• High-speed cornering	• GO to Pinpoint Test B .
• Heel/toe wear	• Excessive toe in/out • Incorrect wheel and tire assembly rotation intervals	• ROTATE the wheel and tire assemblies. REFER to Wheel and Tire Rotation in this section. CHECK the alignment, ADJUST as necessary.
• Diagonal wear	• Excessive toe in/out	• GO to Pinpoint Test C .
	• Incorrect tire rotation intervals	• GO to Pinpoint Test C .
	• Loose, worn or damaged suspension components	• REFER to Section 204-00 .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Wobble or shimmy	• Bent wheel	• INSTALL a new wheel as necessary.
	• Damaged tire	• INSTALL a new tire as necessary.
	• Loose wheel nuts	• TIGHTEN to specification.

• High-speed shake	• Tires/wheels	• REFER to Wheel and Tire Runout Component Tests in this section.
• Vehicle vibration	• Tires/wheels	• REFER to Wheel and Tire Runout Component Tests in this section.

Pinpoint Tests

For a description of the various tire wear patterns, refer to Inspection and Verification.

For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), adjust the tire pressures and train he tire pressure sensors following a tire rotation. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. Failure to train the sensors results in a false low tire pressure event, causing the Tire Pressure Monitoring System (TPMS) indicator to illuminate.

For vehicles with the same tire pressure for front and rear tires, tire rotation does not affect the system.

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe out and/or negative camber
- Incorrect wheel and tire assembly rotation intervals
- High-speed cornering

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
A1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. REFER to Wheel and Tire Rotation in this section. CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe in and/or positive camber
- Incorrect wheel and tire assembly rotation intervals
- High-speed cornering

repair4less

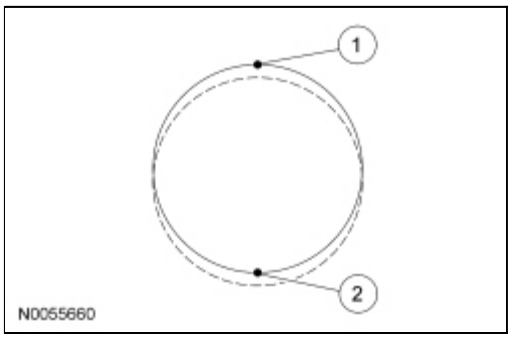
PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
B1 MEASURE THE TREAD DEPTH • Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. REFER to Wheel and Tire Rotation in this section. CHECK and ADJUST the toe to nominal -0.15 degrees (toe out). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:

- Incorrect tire rotation intervals
- Excessive toe in/out
- Loose, worn or damaged suspension components



PINPOINT TEST C: DIAGONAL WEAR

Test Step	Result / Action to Take
C1 MEASURE THE TREAD DEPTH • Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern. • **Is the tread depth greater than 2/32 inch?**	**Yes** If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. REFER to Wheel and Tire Rotation in this section. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. REFER to Wheel and Tire Rotation in this section. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 .

Component Tests

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular to the circumference. On a wheel and tire assembly, this means measuring the center tire tread rib. The center rib is indicative of the condition of the tire as a whole. Total runout is the difference between the maximum-to-minimum gauge reading. The high spot is the location of maximum runout.

Item	Description
1	High spot
2	Low spot

Loaded Runout Measurement (Hunter Road Force® 9700 Series Wheel Balancer)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) correct themselves after the tires have been in service for 320 km (200 mi).

This procedure is intended to assist with the diagnosis of wheel and tire assembly runout and/or force variation issues.

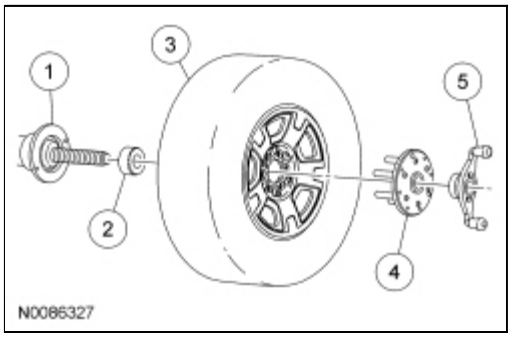
The Hunter Road Force® 9700 Series Wheel Balancer measures the wheel and tire assembly's loaded runout and the tire's radial spring rate. The balancer then converts the runout into pounds of force (termed as Road Force®). Measuring loaded runout (Road Force®) is more effective than measuring unloaded runout using a dial indicator.

1. Using a tire crayon, record the vehicle position on the inner sidewall of all 4 tires.

2. Remove the wheel and tire assemblies. For additional information, refer to Wheel and Tire in this section.

3. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure the tire pressures are set to the correct pressure as indicated on the Vehicle Certification (VC) label.



4. ***NOTICE:*** **Make sure the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

repair4less

NOTE: Make sure the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 414 kPa (60 psi) or above.

Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.

Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5. Measure the Road Force®.
    - Temporarily mark the high spot and the Road Force® value on the sidewall of the tire. If the wheel and tire assembly Road Force® value is not within specification, carry out the Match Mounting procedure to optimize the wheel and tire assembly.
    - If the wheel and tire assembly Road Force® value is within specification, permanently mark the high spot and the Road Force® value on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

Vehicle	Maximum allowable Road Force® value
F-150 with P-metric tires	11 kg (25 lb)
F-150 with LT-metric tires	16 kg (35 lb)

Runout Measurement (Dial Indicator)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) correct themselves after the tires have been in service for 320 km (200 mi).

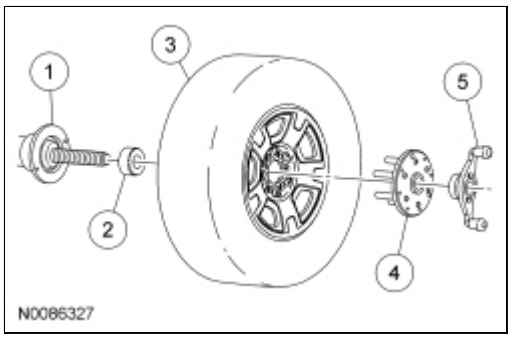
NOTE: Loaded runout measurements are the preferred method for verifying tire serviceability. While a dial indicator can be used to optimize the position of the tire on the wheel, the unloaded runout measurement cannot accurately determine if the tire should be removed from service.

Use the following procedures if normal diagnostics leads to a potential runout issue.

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Radial runout measurements can be taken using a dial indicator and should be measured with the wheel and tire assembly mounted on a suitable wheel balancer. Make sure the dial indicator is mounted securely to eliminate gauge movement when measuring runout.

1. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure the tire pressures are set to the correct pressure as indicated on the VC label.



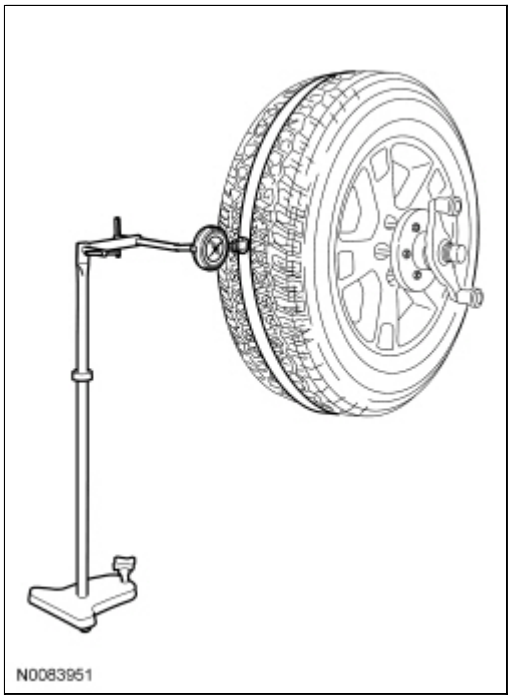
2. Using a tire crayon, record the vehicle position on the inner sidewall of all 4 tires.

3. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.

4. ***NOTICE:*** **Make sure the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.



Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

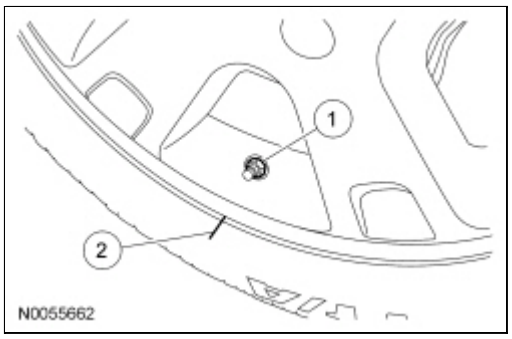
5. **NOTE:** Apply masking tape on the center tread rib to allow for a smoother measuring surface. Some fluctuation of the gauge reading is expected. Observe the overall sweep of the gauge from the highest to the lowest spot on the tire.

   Position the dial indicator and stand with the dial indicator on the center tread rib.

repair4less

- Rotate the wheel and tire assembly (or wheel) to locate the low spot.
- Adjust the runout gauge to read 0.
- Rotate the wheel and tire assembly one complete revolution to make sure the low spot has been found and the dial indicator returns to 0.

6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.
    - Note the variance (runout) from 0 on the dial of the gauge.
    - If the runout reading of a wheel and tire assembly is greater than 1.14 mm (0.045 in), locate and temporarily mark the high spot and runout reading on the sidewall of the tire and carry out the Match Mounting procedure to optimize the wheel and tire assembly.
    - If the runout reading of a wheel and tire assembly is 1.14 mm (0.045 in) or less, permanently mark the high spot and the runout reading on the inner sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.



Match Mounting

NOTE: Road Force® values in illustrations are shown in pounds.

Match mounting is a technique used to reduce radial runout or Road Force® on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel.

1. Position the wheel and tire assembly on a tire machine and put a reference mark on the tire sidewall at the valve stem position.

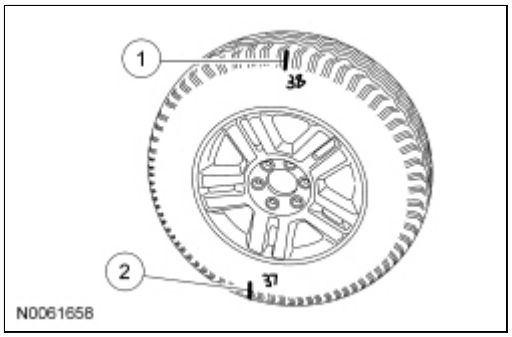
Item	Description
1	Valve stem
2	Reference mark

2. ***NOTICE:*** **For tires equipped with a Tire Pressure Monitoring System (TPMS), the sensor may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in component damage.**

   NOTE: Always make sure that the final high spot and measurement values are permanently marked on the inner sidewall of the tire for reference during future wheel and tire service.

   Using a suitable tire machine, separate the tire beads from the wheel.
   - Lubricate the tire beads using a suitable fast drying, corrosion inhibiting tire bead lubricant.
   - Position the tire 180 degrees (halfway around) on the rim so the valve stem reference mark is opposite the valve stem.

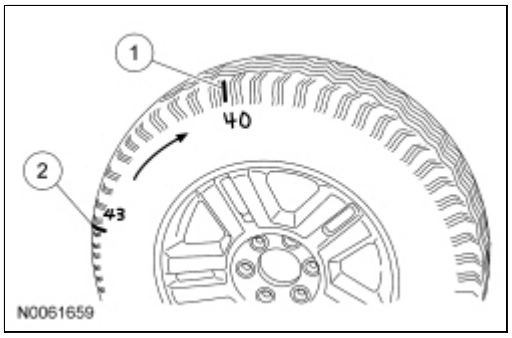
3. Reinflate the wheel and tire assembly to the specified air pressure and measure the assembly again using the dial indicator or Hunter Road Force® 9700 Series Wheel Balancer. Mark the second high spot on the tire.
   - If the runout or Road Force® is reduced to within specifications, the concern has been resolved. Balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.



4. If the second runout or Road Force® measurement is still not within specification and both high spots are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire (the high spot followed the tire).
   - To be sure the tire is causing the high runout, it is necessary to have 2 runout or Road Force® measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. If the tire is the cause, install a new tire, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.
   - If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

repair4less

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

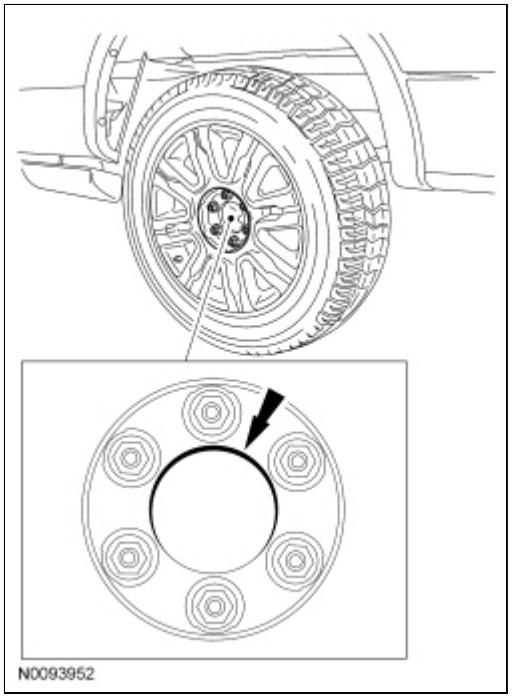


5. If the second high spot is still above specification and within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. If the wheel runout exceeds 1.14 mm (0.045 in), install a new wheel, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

6. **NOTE:** If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

   Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).
   - Separate the tire beads from the wheel and rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.



Item	Description
1	First high spot on the tire
2	Second high spot on the tire

Wheel-to-Hub Optimization

Wheel-to-hub optimization is important. Use the clearance between the wheel and hub to offset or neutralize the Road Force® or runout of the wheel and tire assembly. For every 0.001 inch of wheel-to-hub clearance, the Road Force® can be affected between 1 and 3 pounds depending on the tire stiffness.

NOTE: The example below illustrates how the clearance between the wheel and the hub can be used to offset the high spot of radial runout or Road Force®. Following the procedure will make sure of the best optimization.

1. Position the wheel and tire assembly on the vehicle so the high spot location is at the 6 o'clock position and install the wheel nuts by hand until snug.

2. **NOTE:** Do not allow the full weight of the vehicle to rest on the tires while tightening the wheel nuts.

repair4less

Lower the vehicle until the tires make contact with the ground, slightly loading the suspension. Tighten the wheel nuts as described in this section.

Tire Pressure Monitoring System (TPMS) Sensor Activation

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363, or Customer Activation Tool, Tire Pressure Monitor

NOTE: The tire pressure sensors will go into a "sleep mode" when a vehicle is stationary to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position.

2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall at the tire valve stem.

3. **NOTE:** The Tire Pressure Monitor Activation Tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. This feedback may not always be present, do not rely on it as a confirmation that the module heard a particular sensor.

   NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

   Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor. Activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires.

5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart in Diagnosis and Testing in this section.

repair4less

Tire Pressure Monitoring System (TPMS) Sensor Training

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the BCM . For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

NOTE: The Tire Pressure Monitoring System (TPMS) Training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with a Tire Pressure Monitoring System (TPMS).

Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

NOTE: The BCM has a 2-minute time limit between sensor responses. If the BCM does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

NOTE: Refer to Description and Operation, Push Button Start System Ignition Modules in Section 211-05 to review the procedures for achieving the various ignition states on vehicles with this feature.

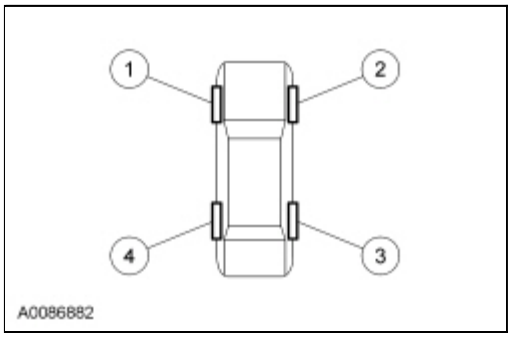
1. **NOTE:** An animated version of this procedure is available on-line.

   Turn the ignition switch to the OFF position, then press and release the brake pedal.

repair4less

2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

3. Press and release the brake pedal.



4. Turn the ignition switch to the OFF position.

5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
   - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. **NOTE:** It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire Pressure Monitor Activation Tool must remain in place at the valve stem.

   Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall at the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the BCM .

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall at the valve stem and press and release the test button to train the RF tire pressure sensor.

8. **NOTE:** Do not wait more than 2 minutes between training each sensor or the BCM will time out and the entire procedure must be repeated.

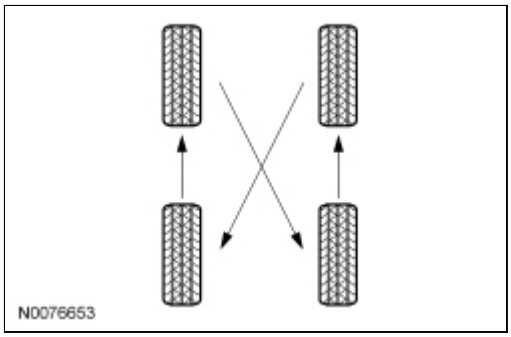
   Repeat Step 7 for the RR and LR tires.
   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.
   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the BCM and document them on the applicable warranty claim.

10. **NOTE:** This step is required to clear DTC C2780, cause the BCM to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed BCM .

    If the sensors are being trained due to the installation of a new BCM , clear any DTCs and carry out the BCM On-Demand Self Test.

repair4less



Wheel and Tire Rotation

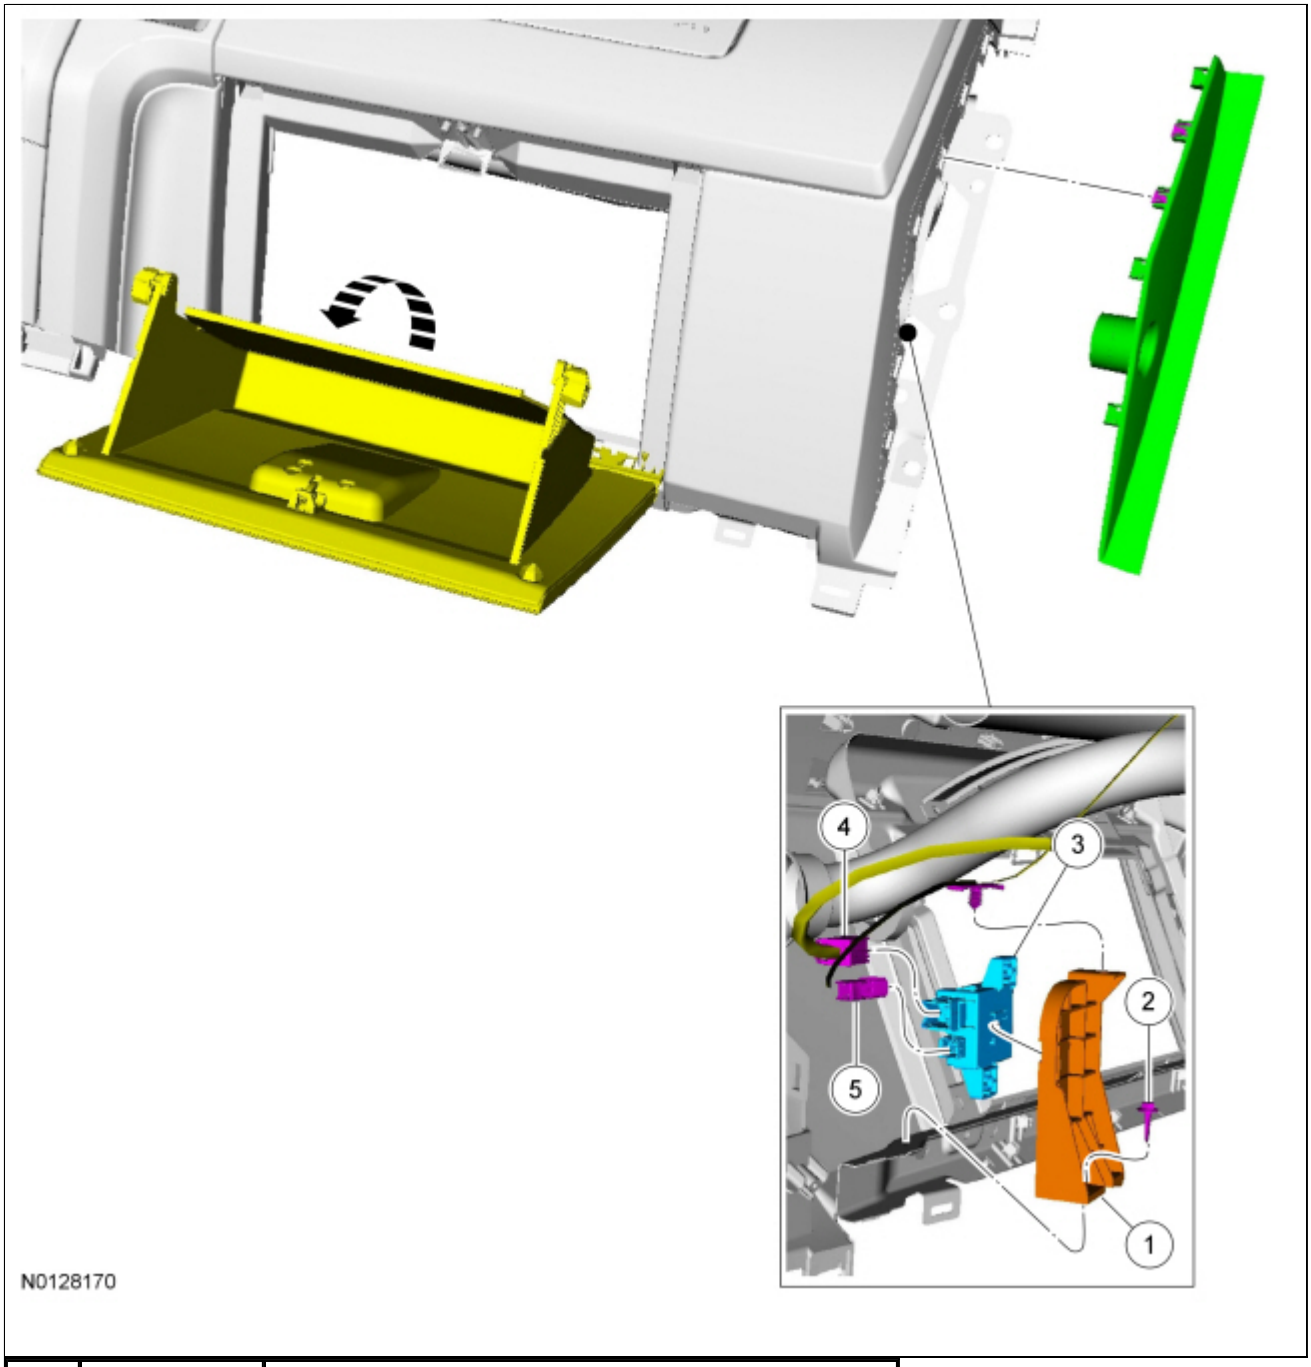
NOTE: This procedure is intended for vehicles equipped with Tire Pressure Monitoring System (TPMS) and different front and rear tire pressures.

1. Remove the wheel and tire assemblies. For additional information, refer to Wheel and Tire in this section.

2. **NOTE:** The front tires are shown at the top of the illustration.

   Rotate the wheel and tire assemblies as shown.
   - Cross the front tires and move them to the rear of the vehicle.
   - Move the rear tires (without crossing) to the front of the vehicle.

3. Install the wheel and tire assemblies. For additional information, refer to Wheel and Tire in this section.



4. Adjust the tire pressures. For additional information, refer to the Vehicle Certification (VC) label located on the driver door jamb.

5. **NOTE:** The tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the TPMS indicator to illuminate.

   Train the TPMS sensors. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

repair4less

Tire Pressure Monitor (TPM) Module

Item	Part Number	Description
1	19A435	TPMS module mounting bracket
2	W707628	TPMS screw (1 required)
3	15K602	Tire Pressure Monitoring System (TPMS) module

4	—	TPMS module electrical connector (part of 14401)
5	—	External antenna coax connector

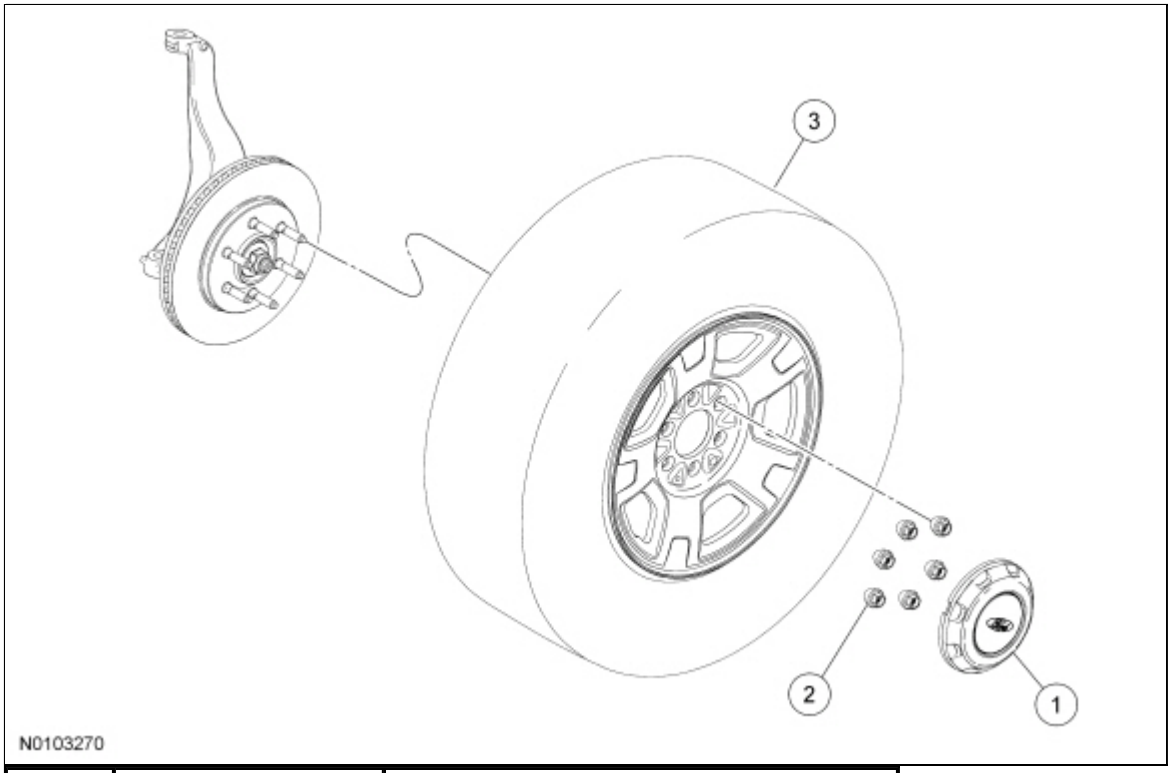
Removal

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

1. Remove the RH instrument panel side finish panel.
2. Open the glove compartment door and while pushing in on the glove compartment tab, position the glove compartment downwards.
3. Remove the screw from the TPMS module mounting bracket.
4. Disconnect the TPMS module electrical connector and the external antenna connector.
5. Separate the TPMS module from the TPMS module mounting bracket.

Installation

1. To install, reverse the removal procedure.



repair4less

Wheel and Tire

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	—

NOTE: Typical 6 lug wheel shown, 7 lug similar.

Item	Part Number	Description
1	1130	Center cap (if equipped)
2	1012	Wheel nut (6 or 7 required)
3	—	Wheel and tire assembly

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. ***NOTICE:*** **Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.**

Remove the 6 or 7 wheel nuts.

3. Remove the wheel and tire assembly.

Installation

1.  **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).**

   NOTICE: **Make sure to apply a thin coat of anti-seize lubrication only to the interface between the wheel pilot bore and the hub pilot. Do not allow the anti-seize to make contact with the wheel-to-brake disc/drum mounting surface, wheel studs, wheel nuts, brake pads or brake disc friction surfaces or damage to components may occur.**

   Clean the wheel mounting surfaces and apply a thin coat of anti-seize to the wheel hub pilot surface (wheel only).

2. Install the wheel and tire assembly.

3.  **WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTICE: **Failure to tighten the wheel nuts in a star/cross pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

   NOTE: The wheel nut torque specification is for clean, dry wheel stud and wheel nut threads.

   Install the 6 or 7 wheel nuts by hand.
   - Tighten the wheel nuts in a star/cross pattern.
   - Tighten to 204 Nm (150 lb-ft).

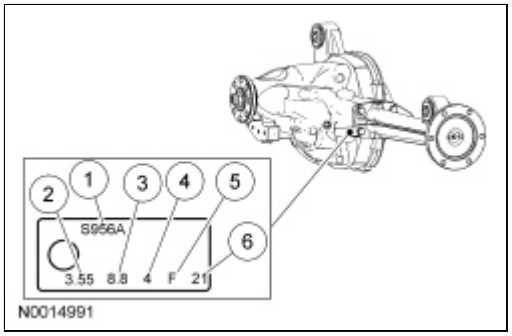
Driveline System

The driveline consists of the following:

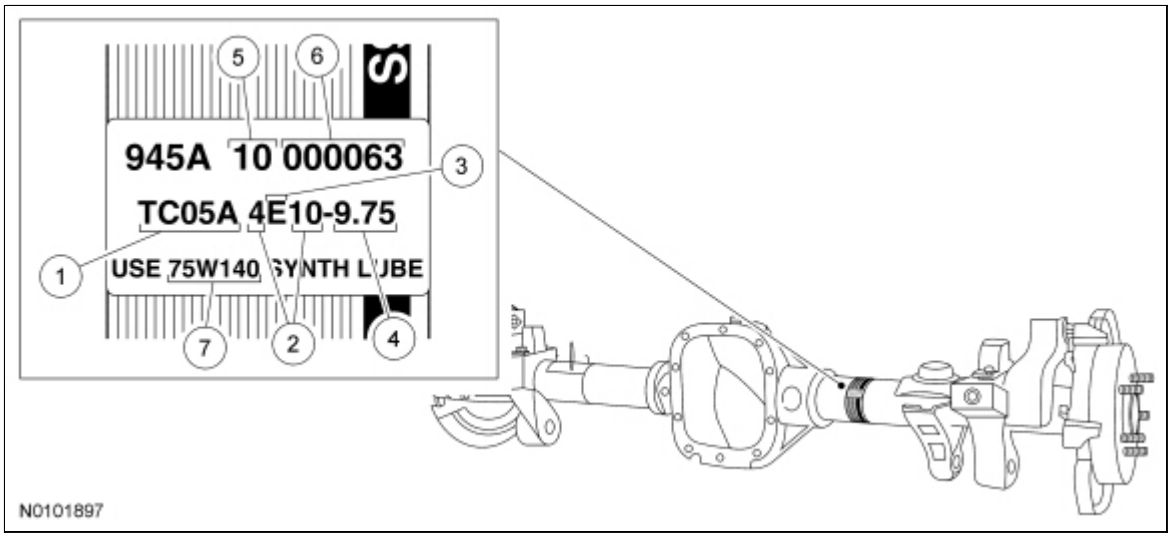
- Front drive axle
- Rear drive axle
- Front axle halfshafts
- Front driveshaft
- Rear driveshaft
- Center support bearings
- CV joints
- U-joints and flanges
- Flex couplers



The source of the drivetrain power is generated by the engine and delivered to the transmission. The driveline transfers the engine torque through the driveshaft to the axle. The rear driveshaft is connected to the output shaft of the transmission or transfer case and to the rear axle. The front driveshaft is connected to the transfer case and to the front axle. Slip yokes are used to allow for any changes to the length of the driveshaft. Changes in length are self-adjusted up in the driveshaft slip mechanism. The engine torque enters the axle through the drive pinion, which rotates the ring gear. The ring gear is mounted to the differential case, which contains the gears that transmit power to the rear axle shafts or front halfshafts. These shafts and halfshafts rotate the drive wheels. The Electronic Locking Differential (ELD) rear axle assembly, except for the differential case and its internal components, is identical to the conventional rear axle. The ELD employs an electronically operated magnetic coil to engage the unit. The Traction-Lok rear axle assembly, except for the differential case and its internal components, is identical to the conventional rear axle. The Traction-Lok employs 2 multi-disc differential clutch packs to control differential action. The mounting distance of the differential side gear is controlled by plates on each side, friction and steel. Also included is a steel selective shim to control the position of the differential side gear, and a spring which provides initial preload to the clutch pack. The steel clutch plates are splined to the axle shafts. The friction plates are contained in the case by matching slots, thus providing continuous engagement of the differential clutch packs. The Torsen® front differential case houses the parallel axis planetary helical side gears to which the axle shafts are splined. The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage.

Vehicle Certification (VC) Label Example

The Vehicle Certification (VC) label is located in the driver door jamb. The first 2 digits of the axle code indicate the rear axle and the third digit refers to the front axle, if equipped. For information on the VC label, refer to Section 100-01 .



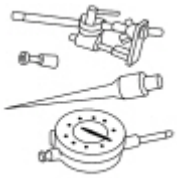
Front Axle Identification Tag

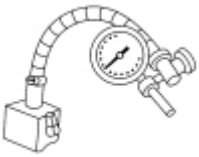
Item	Description
1	Plant code
2	Axle ratio
3	Ring gear diameter (inch)
4	Build year
5	Build month
6	Build day

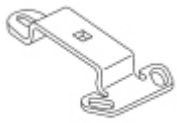
Rear Axle Identification Tag

repair4less

Item	Description
1	Plant code
2	Axle ratio
3	Differential type C= Open/conventional L= Limited slip E= Electronic Locking Differential (ELD)
4	Ring gear diameter (inch)
5	Build year
6	Axle serial number
7	Lubricant type







NOTE: The axle identification tag is the official service identifier. Do not damage the tag.

The axle identification tag identifies a particular axle design, a specific ratio, and if it is a conventional or limited slip type. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design change. If, however, an internal design change takes place during the production life of the axle and that internal change affects the interchangeability of the components, a dash and numerical suffix is added to the plant code. This means that, as an assembly, both axles are interchangeable; however, internally they are different. Therefore, each requires different internal components at the time of repair.

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

Principles of Operation

The driveline system enables the power generated by the engine and transferred through the transmission and, if applicable, transfer case, to place the vehicle in motion. Rotational torque received from the transmission or transfer case is delivered to the front and rear drive axles by way of the driveshafts. The U-

joints or CV joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the axle drive pinion which drives the differential ring gear. The ring gear is bolted to the differential case flange on the differential. The differential divides the torque between the right and left halfshaft while permitting the halfshafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• U-joints • CV joints • Center bearings • Driveshaft tubes • Mounting brackets • Flanges • Housing and cover damage • Differential bearings • Differential gear sets • Pinion bearings

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Driveline or GO to Symptom Chart - NVH .

Condition	Possible Sources	Action
• Traction-Lok does not work in snow, mud or on ice	• Differential	• CARRY OUT the Traction-Lok Differential Operation Check in this section. REPAIR as necessary. REFER to Section 205-02A or Section 205-02B .
• Torsen® differential does not work in snow, mud or on ice	• Differential	• CARRY OUT the Torsen Differential Operation Check in this section. REPAIR as necessary. REFER to Section 205-03 .
• Lubricant leaking	• Vent	• CLEAN the axle housing vent.

repair4less

from the pinion seal, axle shaft oil seals or support arm to the housing	• Damage in the seal contact area or dust slinger on the pinion flange dust shield	• INSTALL a new pinion flange and the pinion seal if damage is found.
• The vehicle does not shift between the different modes correctly	• Mode switch • Wiring/relays • Shift motor • Transfer case • Generic Electronic Module (GEM) or 4x4 control module	• REFER to Section 308-07A .
• Front axle will not engage	• Switches • Wiring • GEM or 4x4 control module • Shift motor • Integrated Wheel End (IWE)	• REFER to Section 308-07A .
• Front axle will not disengage	• Switches • Wiring • GEM or 4x4 control module • Shift motor • IWE	• REFER to Section 308-07A .
• Electronic Locking Differential (ELD) does not engage in snow, mud or on ice	• Mode switch • Differential • Transfer Case Control Module (TCCM) • Wiring	• REFER to Section 308-07A .
• Differential side gears/pinion gears are scored	• Insufficient lubrication • Incorrect or contaminated lubricant type	• INSTALL new gears. FILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 . • INSTALL new gears. CLEAN and REFILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Axle overheating	• Lubricant level too low • Incorrect or contaminated lubrication type • Bearing preload adjusted too tight	• CHECK the lubricant level. FILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 . • INSPECT the axle for damage. REPAIR as necessary. CLEAN and REFILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 . • CHECK the ring and pinion for damage. INSPECT the ring and pinion wear pattern. ADJUST the preload as

		necessary.
	• Excessive gear wear	• INSPECT all the axle gears for wear or damaged. INSTALL new components as necessary.
	• Incorrect ring gear backlash	• INSPECT the ring gear for scoring. INSPECT the ring and pinion wear pattern. ADJUST the ring gear backlash as necessary.
• Broken gear teeth on the ring gear or pinion	• Overloading the vehicle	• INSTALL a new ring and pinion. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Halfshaft broken	• Overloading the vehicle • Misaligned axle halfshaft	• INSTALL a new axle halfshaft. REFER to Section 205-04 . • INSPECT the axle for damage. CHECK axle halfshaft alignment. INSTALL a new axle halfshaft. REFER to Section 205-04 .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Axle howling or whine — front or rear axle	• Axle lubricant low	• CHECK the lubricant level. FILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 .

	• Loose or missing fasteners	• CHECK all driveline fasteners for proper torque. REFER to Section 205-01 , Section 205-02A , Section 205-02B or Section 205-03 .
• Driveline clunk — occurs as the vehicle starts to move forward following a stop	• Worn driveshaft CV joint or U-joints with excessive play	• INSPECT the CV joint and U-joints for a worn condition. INSTALL a new driveshaft or U-joints as necessary. REFER to Section 205-01 .
	• Loose axle mount	• CHECK the axle for loose bolts. TIGHTEN to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
	• Loose or missing fasteners	• CHECK all driveline fasteners for proper

		torque. REFER to Section 205-01 , Section 205-02A , Section 205-02B or Section 205-03 .
• Driveline clunk — occurs during acceleration or from cruise to coast/deceleration	• Damaged or worn CV joint • Loose or missing fasteners	• INSPECT the CV joint and boot. INSTALL a new CV joint as necessary. REFER to Section 205-04 . • CHECK all driveline fasteners for proper torque. REFER to Section 205-01 , Section 205-02A , Section 205-02B or Section 205-03 .
• Clicking, popping or grinding — occurs while the vehicle is turning	• Inadequate or contaminated lubrication in the CV joints • Another component contacting the halfshaft	• CHECK the CV boots and joints for wear or damage. INSTALL new components as necessary. REFER to Section 205-04 . • CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
• High pitched chattering — noise from the axle when the vehicle is turning	• Incorrect or contaminated lubricant • Damaged or worn differential (differential side gears and pinion gears)	• CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). CLEAN and REFILL the axle to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 . • REPAIR or INSTALL new differential side gears or pinion gears as necessary. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Buzz — buzzing noise is the same at cruise or coast/deceleration	• Incorrect driveline angles	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
• Rumble or boom — noise occurs at coast/deceleration, usually driveshaft speed-related and noticeable over a wide range of speeds	• Driveshaft is out-of-balance • U-joints are binding or seized	• CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to Driveshaft Runout and Balancing in this section. • ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints or driveshaft as

repair4less

		necessary. REFER to Section 205-01 .
	• Misalignment of yellow dot on driveshaft-to-yellow dot on pinion flange plus or minus 1 bolt hole	• REINSTALL driveshaft with yellow dots aligned plus or minus 1 bolt hole. REFER to Section 205-01 .
	• Worn or damaged driveshaft center bearing support	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
• Grunting — normally associated with a shudder experienced during acceleration from a complete stop	• Driveshaft CV joint binding	• CLEAN the CV joint and INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
	• Loose axle mount bolts or suspension fasteners	• INSPECT the rear suspension and axle. TIGHTEN the fasteners to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Howl — can occur at various speeds and driving conditions. Affected by acceleration and deceleration	• Incorrect ring and pinion contact, incorrect bearing preload or gear damage	• INSPECT and REPAIR as necessary. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Chuckle — heard at coast/deceleration. Also described as a knock	• Incorrect ring and pinion contact or damaged teeth on the coast side of the ring and pinion	• INSPECT and REPAIR as necessary. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Knock — noise occurs at various speeds. Not affected by acceleration or deceleration	• Gear tooth damage to the drive side of the ring and pinion	• INSTALL a new ring and pinion. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Scraping noise — a continuous low pitched noise starting at low speeds	• Worn or damaged pinion bearings	• INSPECT and REPAIR or INSTALL new pinion bearings. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Driveline shudder — occurs during acceleration from a slow speed or stop (vehicle unloaded)	• Drive axle assembly mispositioned	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. REFER to Section 205-02A , Section 205-02B or

		Section 205-03 .
	• Loose axle bolts	• CHECK the axle for loose bolts. TIGHTEN the bolts to specification. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
	• Loose or missing fasteners	• CHECK all driveline fasteners for proper torque. REFER to Section 205-01 , Section 205-02A , Section 205-02B or Section 205-03 .
	• Driveline angles out of specification	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline Angle Adjustment .
	• U-joints binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint and coupling shaft for wear or damage. INSTALL a new driveshaft as necessary. REPAIR as necessary. REFER to Section 205-01 .
	• Transfer case	• REFER to Section 308-07A .
• Driveline shudder — occurs during acceleration from a slow speed or stop (vehicle loaded)	• Driveline angle out of specification due to loaded condition	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline Angle Adjustment .
• Take-off shudder — with 1-piece driveshaft (loaded or unloaded)	• Driveline angle out of specification	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline Angle Adjustment . • If concern is still present lower axle pinion using 1 degree shim with thick end forward. REFER to, Driveline Angle Adjustment .
• Take-off shudder — with 1-piece driveshaft (loaded or	• Driveline angle out of	• Lower axle pinion replacing 1 degree shim

unloaded) after driveline angle adjustment using 1 degree shim	specification	with a 2 degree shim with thick end forward. REFER to, Driveline Angle Adjustment .
• Driveline vibration or moan — occurs on deceleration (coast down) above 45 mph with 1-piece driveshaft (loaded or unloaded)	• Driveline angle out of specification	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline Angle Adjustment . • If concern is still present raise axle pinion using 1 degree shim with thick end rearward. REFER to, Driveline Angle Adjustment .
• Driveline vibration or moan — occurs on deceleration (coast down) above 45 mph with 1-piece driveshaft (loaded or unloaded) after driveline angle adjustment using 1 degree shim	• Driveline angle out of specification	• Raise axle pinion replacing 1 degree shim with a 2 degree shim with thick end rearward. REFER to, Driveline Angle Adjustment .
• Shudder on acceleration from 10-25 mph under medium to heavy throttle — with 2-piece driveshaft (loaded or unloaded)	• Driveline angle out of specification	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline Angle Adjustment . • If concern is still present lower axle pinion using 1 degree shim with thick end forward. REFER to, Driveline Angle Adjustment .
• Shudder on acceleration from 10-25 mph under medium to heavy throttle — with 2-piece driveshaft (loaded or unloaded) after driveline angle adjustment using 1 degree shim	• Driveline angle out of specification	• Lower axle pinion replacing 1 degree shim with a 2 degree shim with thick end forward. REFER to, Driveline Angle Adjustment .
• Driveline vibration or moan — occurs on deceleration above 45 mph with 2-piece driveshaft (loaded or unloaded), after driveline angle adjustment using 1 degree shim is installed with the thick end forward	• Driveline angle out of specification	• Lower the center bearing. Driveline Angle Adjustment .
• Driveline vibration or moan — occurs on deceleration above 45 mph with 2-piece driveshaft (loaded or unloaded)	• Driveline angle out of specification	• MEASURE and ADJUST the driveline angles as necessary. REFER to Driveline Angle Measurement , Driveline

		Angle Adjustment . • If concern is still present raise axle pinion using 1 degree shim with thick end rearward. REFER to, Driveline Angle Adjustment .
• Driveline vibration or moan — occurs on deceleration above 45 mph with 2-piece driveshaft (unloaded), after driveline angle adjustment using 1 degree shim is installed with the thick end rearward	• Driveline angle out of specification	• Raise axle pinion replacing 1 degree shim with a 2 degree shim with thick end rearward. REFER to, Driveline Angle Adjustment .
• Shudder on acceleration from 10-25 mph under medium to heavy throttle — after driveline angle adjustment using 1 degree shim is installed with the thick end rearward — with 2-piece driveshaft (unloaded)	• Driveline angle out of specification	• Lower the center bearing. Driveline Angle Adjustment .
• Driveline vibration — occurs at cruising speeds	• Worn U-joints	• CHECK for wear or incorrect seating. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
	• Misalignment of yellow dot on driveshaft-to-yellow dot on pinion flange plus or minus 1 bolt hole	• REINSTALL driveshaft with yellow dots aligned plus or minus 1 bolt hole. REFER to Section 205-01 .
	• Worn or damaged driveshaft center bearing support	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
	• Loose driveshaft-to-axle pinion or transmission flange bolts	• INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to Section 205-01 .
	• Excessive axle pinion flange runout	• CARRY OUT a runout check. REPAIR as necessary. REFER to Component Test in this section.
	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance

repair4less

		weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to Driveshaft Runout and Balancing in this section.
	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint for wear or damage. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
	• Excessive driveshaft runout	• CARRY OUT a runout check. REFER to Driveshaft Runout and Balancing in this section.
	• Driveline angles out of specification	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
	• Incorrectly seated CV joint in the wheel hub	• CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to Section 205-04 .
	• Damage or missing driveshaft slip yoke damper (163 in wheelbase and 133 in wheelbase 4.6L 4x2 do not get dampers)	• INSTALL a new driveshaft as necessary. REFER to Section 205-01 .

Analysis of Leakage

Clean the leaking area enough to identify the exact source.

A plugged axle housing vent can cause excessive pinion seal lip wear due to internal pressure buildup.

Verify the lubricant level is at least 3-5 mm (1/8-3/16 in) below the bottom of the fill hole.

Axle Vent

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. If the vent cannot be cleared, install a new vent.

Drive Pinion Seal

Leaks at the drive pinion seal originate from the following causes:

- Damaged seal
- Worn seal journal surface

Any damage to the seal bore (dings, dents, gouges or other imperfections) distorts the seal casing and allows leakage past the outer edge of the drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed correctly. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow fluid to pass the lip.

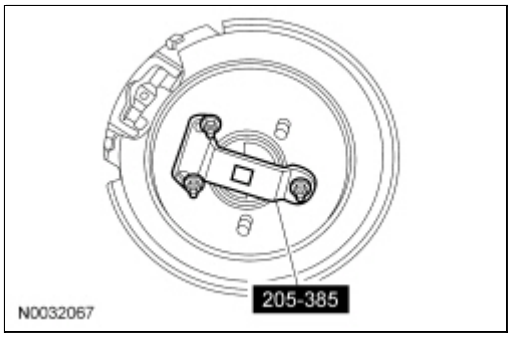
Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the drive pinion flange and result in pinion seal wear.

When a seal leak occurs, install a new drive pinion seal and check the vent to make sure it is clean and free of foreign material.

A new drive pinion flange must be installed if any of these conditions exist.

Drive Pinion Nut

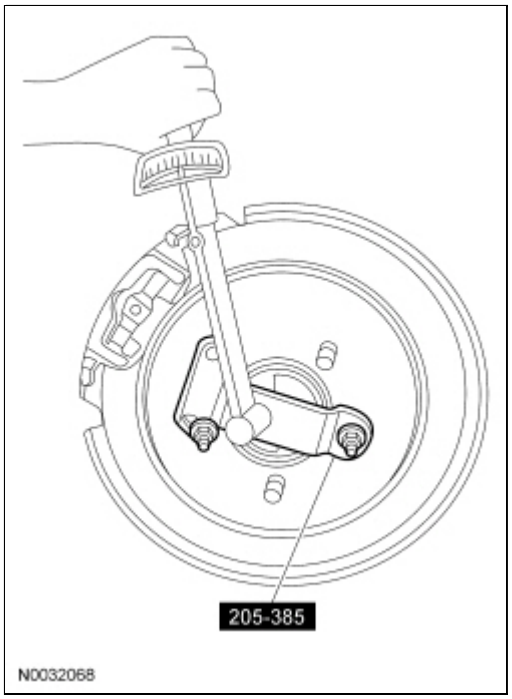
NOTICE: **Install the drive pinion nut to the correct torque specifications or damage to the differential components may occur.**



On some high-mileage vehicles, oil may leak through the threads of the drive pinion nut. This condition can be corrected by installing a new nut and applying threadlock and sealer on the threads and nut face.

Component Tests

Traction-Lok Differential Operation Check



A Traction-Lok differential can be checked for correct operation without removing it from the rear axle housing.

Raise and remove only one rear wheel. Install the Differential Gauge (Traction-Lok) on the wheel bolts.

Use a torque wrench with the capacity of at least 271 Nm (200 lb-ft) to rotate the axle shaft. Make sure that the transmission is in NEUTRAL, and that one rear wheel is on the floor while the other rear wheel is raised off the floor. The breakaway torque required to start rotation must be at least 27 Nm (20 lb-ft). The initial breakaway torque may be higher than the continuous turning torque.

repair4less

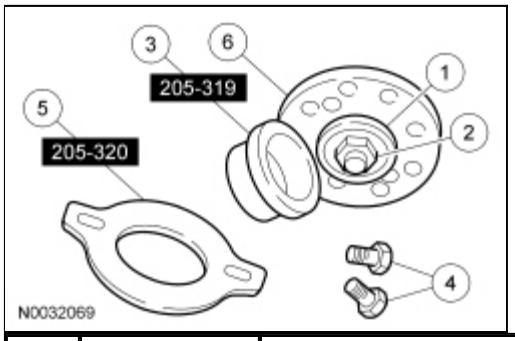
The axle shaft must turn with even pressure throughout the check without slipping or binding. If the torque reading is less than specified, check the differential case for incorrect assembly.

Traction-Lok Differential Check Road Test

1. Place one wheel on a dry surface and the other wheel on ice, mud or snow.
2. Gradually open the throttle to obtain maximum traction prior to break away. The ability to move the vehicle demonstrates correct performance of a Traction-Lok rear axle assembly.
3. When starting with one wheel on an excessively slippery surface, a slight application of the parking brake may be necessary to help energize the Traction-Lok feature of the differential. Release the brake when traction is established. Use light throttle on starting to provide maximum traction.
4. If, with unequal traction, both wheels slip, the limited slip rear axle has done all it can possibly do.
5. In extreme cases of differences in traction, the wheel with the least traction may spin after the Traction-Lok has transferred as much torque as possible to the non-slipping wheel.

Torsen® Differential Check Road Test

1. Place one wheel on a dry surface and the other wheel on ice, mud or snow.
2. Gradually open the throttle to obtain maximum traction prior to break away. The ability to move the vehicle demonstrates correct performance of a Torsen® front axle assembly.
3. When starting with one wheel on an excessively slippery surface, a slight application of the parking brake may be necessary to help energize the Torsen® feature of the differential. Release the brake

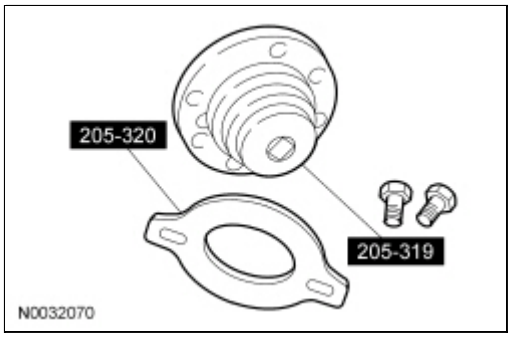


when traction is established. Use light throttle on starting to provide maximum traction.

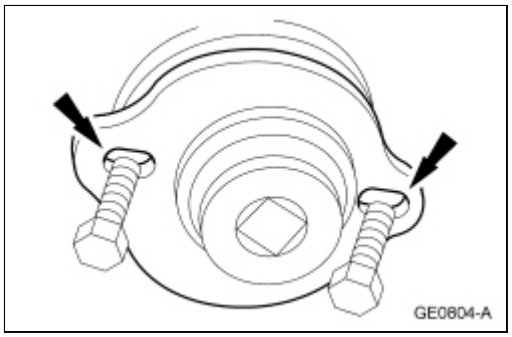
4. If, with unequal traction, both wheels slip, the limited slip front axle has done all it can possibly do.
5. In extreme cases of differences in traction, the wheel with the least traction may spin after the Torsen® has transferred as much torque as possible to the non-slipping wheel.

Pinion Flange Runout Check — Circular

NOTICE: **Pinion bearing preload must be reset if the pinion nut has been loosened or removed for pinion flange reindexing or replacement or damage to the component may occur.**

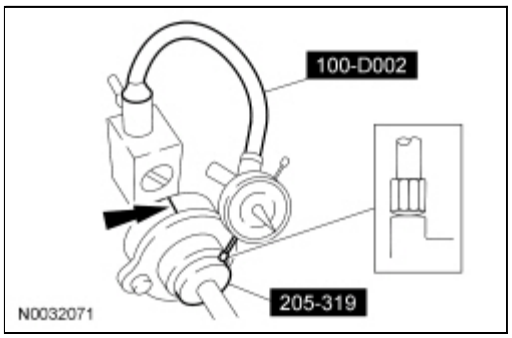


1. Raise the vehicle on a twin-post hoist that supports the rear axle.
2. Remove the driveshaft. Refer to Section 205-01 .
3. Check the pinion flange for damage.
4. Position the Driveshaft Clamp Plate and Drive Pinion Flange Runout Gauge on the pinion flange.



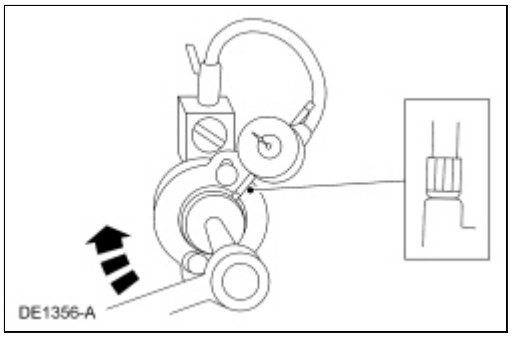
Item	Part Number	Description
1	—	Pilot (part of 205-319) (T92L-4851-B)
2	354845	Pinion nut
3	205-319	Gauge, Drive Pinion Flange Runout (T92L-4851-B)
4	—	Bolts (2 required) (part of 205-320) (T92L-4851-C)
5	205-320	Plate, Driveshaft Clamp (T92L-4851-C)
6	4851	Pinion flange

5. Position the Driveshaft Clamp Plate and Drive Pinion Flange Runout Gauge onto the pinion flange.



repair4less

6. Align the holes on the clamp plate with the holes in the pinion flange and install the bolts. Snug the bolts evenly.



7. Position the Dial Indicator Gauge with Holding Fixture as shown. Turn the Dial Indicator Gauge, and locate and mark the high spot on the pinion flange with yellow paint.

If the flange runout exceeds 0.25 mm (0.010 in), remove the pinion flange, reindex the flange one-half turn on the pinion, and reinstall it. Refer to Section 205-02A , Section 205-02B or Section 205-03 for the flange removal and installation procedures.

8. Check the runout again. If necessary, rotate the flange until an acceptable runout is obtained. If the flange runout is still more than 0.25 mm (0.010 in), install a new pinion flange.

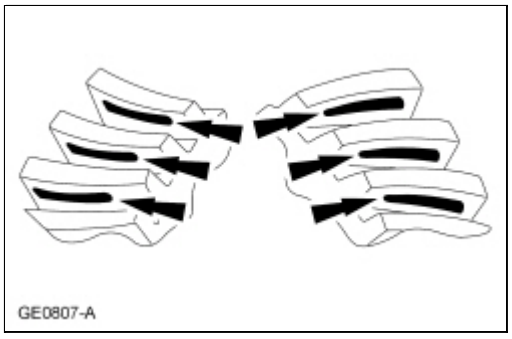
9. If excessive runout is still evident after replacement of the pinion flange, install a new ring and pinion. Repeat the above checks until the runout is within specifications.

10. Install the driveshaft. Refer to Section 205-01 .

Tooth Contact Pattern Check — Gearset

1. To check the gear tooth contact, paint the gear teeth with a suitable marking compound. A mixture that is too wet will run and smear; a mixture that is too dry cannot be pressed out from between the teeth.

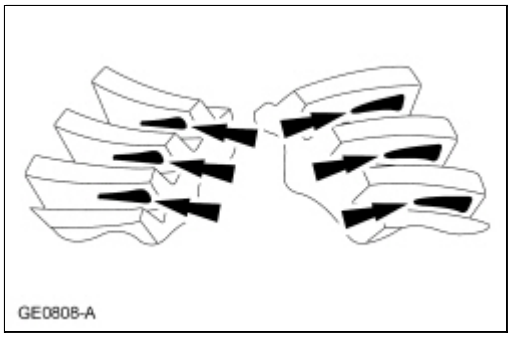
2. Use a box wrench on the ring gear bolts as a lever to rotate the ring gear several complete revolutions in both directions or until a clear tooth contact pattern is obtained.



3. Certain types of gear tooth contact patterns on the ring gear indicate incorrect adjustment. Incorrect adjustment can be corrected by readjusting the ring gear or the pinion.

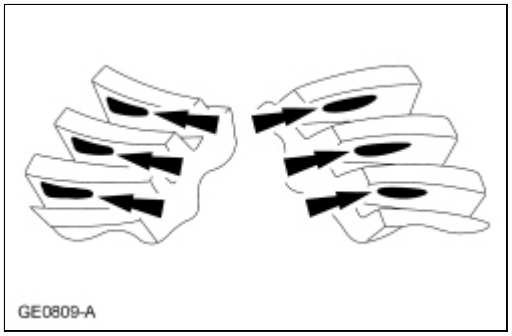
Contact Pattern Location

In general, desirable ring gear tooth patterns must have the following characteristics:

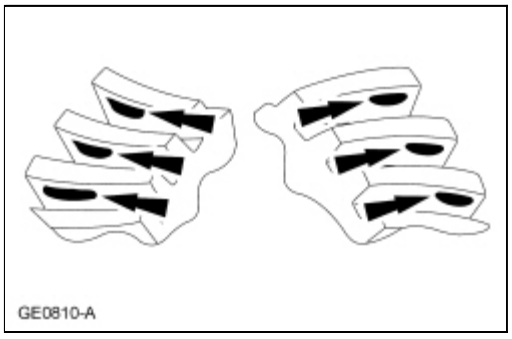


- Drive pattern on the drive side ring gear well centered on the tooth.
- Coast pattern on the coast side ring gear well centered on the tooth.
- Clearance between the pattern and the top of the tooth.
- No hard lines where the pressure is high.

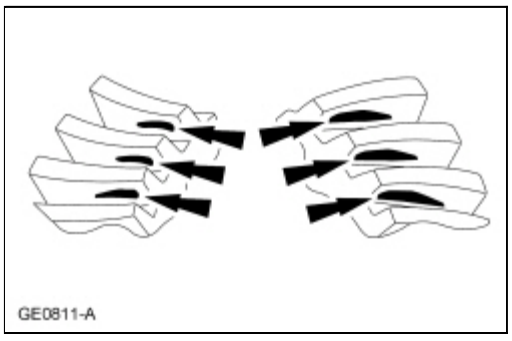
Acceptable ring gear tooth patterns for all axles.



Correct backlash with a thinner pinion position shim required.



repair4less



Correct backlash with a thicker pinion position shim required.

Correct pinion position shim that requires a decrease in backlash.

Correct pinion position shim that requires an increase in backlash.

repair4less

Driveline Angle Adjustment

NOTE: Some vehicles may exhibit a drive-away shudder or vibration under moderate to heavy acceleration from a stop, especially when heavily loaded or when towing a trailer. It is important to confirm how the vehicle is driven the majority of the time (loaded or unloaded), as adjusting the driveline angle in one condition (loaded or unloaded) may result in a shudder or vibration with the vehicle in the opposite condition (loaded or unloaded).

NOTE: Verify suspension is not modified from the original configuration. Aftermarket leveling kits and rear leaf spring shackle kits change ride height, which affects pinion angle and other critical driveline related operating angles. Vehicle must be at Original Equipment Manufacturer (OEM) specifications before accurate evaluation and diagnosis can be performed.

NOTE: The driveline angle must be measured with the vehicle in the same condition as the concern (loaded or unloaded) to determine the amount of adjustment necessary to correct the condition.

1. Measure the driveline angle. For additional information, refer to Driveline Angle Measurement in this section.
    - If the driveline does not have an optimum 3.5 degree operating range, proceed to the following adjustment steps using the parts listed in the table below.

Part Number	Part Name
5A313	1 degree pinion angle shim
5A313	2 degree pinion angle shim
00812	Upper u-bolt center plate bolt (4 required)
5705	U-bolt (4 required)
W520215	U-bolt nut (8 required)
W713078	Center bearing support bolt
W713649	Center bearing support nut
4A209	Center bearing support shim
506545	Shock absorber lower bolt
W520214	Shock absorber lower nut

NOTE: The driveline angle on these vehicles can be changed by adding 1 degree or 2 degree pinion angle shims.

2. Remove and discard the shock absorber lower nut and bolt.

3. **NOTE:** To change the pinion angle.

   Using a suitable jack to support the rear axle, remove and discard the 8 u-bolt nuts and the 4 u-bolts. For additional information, refer to Section 204-02 .

4. **NOTE:** Replace one bolt at time.

   Replace the upper u-bolt center plate bolts. For additional information, refer to Section 204-02 .

- Install the new bolts and tighten to 102 Nm (75 lb-ft).

5. **NOTE:** Never use more then 1 shim on a side at a time.

   Install desired shim on the axle spring seat, or on top of the 4x4 spacer block.
   - Lower the axle pinion using the thick edge of the shim forward, to decrease pinion angle.
   - Raise the axle pinion using the thick edge of the shim rearward, to increase pinion angle.

6. Install 4 new u-bolts and 8 new u-bolt nuts. With the suspension at curb height, tighten the new u-bolt nuts evenly in a cross-type pattern in 4 stages. For additional information, refer to Section 204-02 .
   - Stage 1: Tighten in a cross pattern to 35 Nm (26 lb-ft).
   - Stage 2: Tighten in a cross pattern to 70 Nm (52 lb-ft).
   - Stage 3: Tighten in a cross pattern to 100 Nm (74 lb-ft).
   - Stage 4: Tighten in a cross pattern to 133 Nm (98 lb-ft).

7. Install a new shock absorber lower nut and bolt. For additional information, refer to Section 204-02 .
   - Tighten the new nut and bolt to 90 Nm (66 lb-ft).

8. **NOTE:** If adjusting axle pinion angle to reduce/eliminate driveline vibration or moan causes an issue with shudder on acceleration, then the pinion angle must be adjusted to optimize the balance between perceived vibration/moan and perceived shudder.

   NOTE: Shims can be used to lower the center bearing support and minimize this condition. Up to 3 shims may be installed. The center bearing support bolts must be replaced using the part listed in the table or new grade 10.9 bolts. The bolts should be long enough to extend at least 3 threads past the nuts.

   Measure the driveline angle again. For additional information, refer to Driveline Angle Measurement in this section.
   - If necessary, remove and discard the 2 center bearing support bolts and install shims in 1/4 inch increments to lower the center bearing support.
   - Install 2 new bolts and tighten to 48 Nm (35 lb-ft).

---

repair4less

Driveline Angle Measurement

Special Tool(s)

 ST1622-A	Anglemaster II Driveline Inclinometer/Protractor 164-R2402 or equivalent

NOTE: This procedure does not apply to CV joints, flex couplers or double cardan joints that are used in some driveshafts. This check is for single-cross and roller-style joints found in the driveshafts.

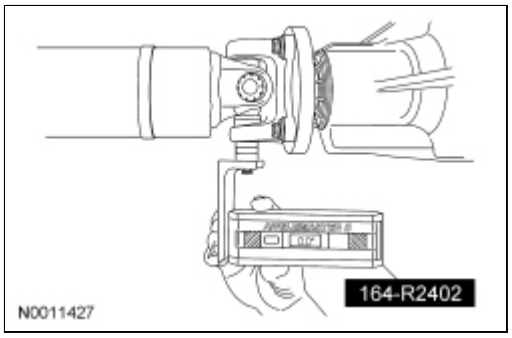
NOTE: Prior to checking driveline angularity, inspect the U-joints for correct operation.

NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to Section 100-04 .

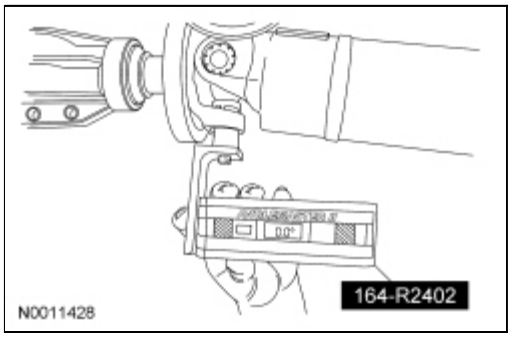
NOTE: Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.

All vehicles

1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Calibrate the Anglemaster II Driveline Inclinometer/Protractor by placing it on a clean, flat level section of the frame rail and press the ALT-ZERO button.



Vehicles with flat-flanged, split-pin or slip-flanged U-joints



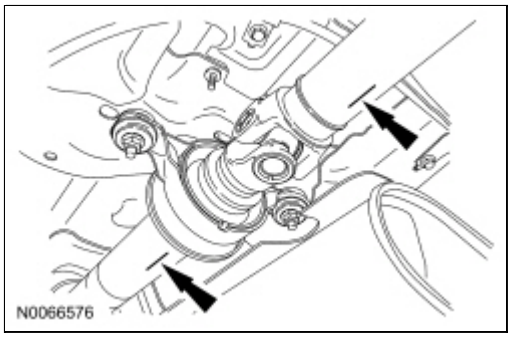
2. **NOTE:** If equipped, remove the snap ring to allow access to the base of the U-joint cup. Make sure the Anglemaster II Driveline Inclinometer/Protractor is seated against the U-joint cup.

   NOTE: Rotate the driveshaft until the flange U-joint cup is parallel with the floor. This will simplify taking measurements.

   To check the U-joint operating angle, install the Anglemaster II Driveline Inclinometer/Protractor. Check and record the flange angle as angle A.

repair4less

3. Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the connecting component. Record the measurement of the component angle as angle B.



Multiple piece driveshafts

4. **NOTE:** Repeat this step for each center support bearing on the driveshaft.

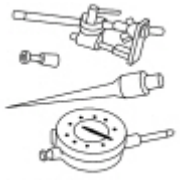
   NOTE: It is not necessary to remove the U-joint snap ring, if equipped, for these measurements.

   Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the components in front and behind the center support bearing U-joint in the area indicated. Record the front component as angle A and the rear component as angle B.

All vehicles

5. **NOTE:** When 2 connected components slope in the same direction, subtract the smallest number from the larger number to find the U-joint operating angle. When 2 connected components slope in the opposite direction, add the measurements to find the U-joint operating angle.

   Calculate the difference in the slope of the components to determine the U-joint operating angle.
   - The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each connection of the driveshaft must:
     - be equal or within one degree of each other.
     - have a 3 degree maximum operating angle.
     - have at least one-half of one degree continuous operating angle.



6. If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the engine mounts, transmission mounts, center support bearing mounting, rear suspension, rear axle, rear axle mounting or the frame for wear or damage.

---

repair4less

Driveshaft Runout and Balancing

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST3025-A	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) 257-00018 or equivalent

Driveshaft Inspection

NOTE: Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is noticed at various speeds. Driveline vibration can be perceived as a tremor in the floorpan or heard as a rumble, hum or boom.

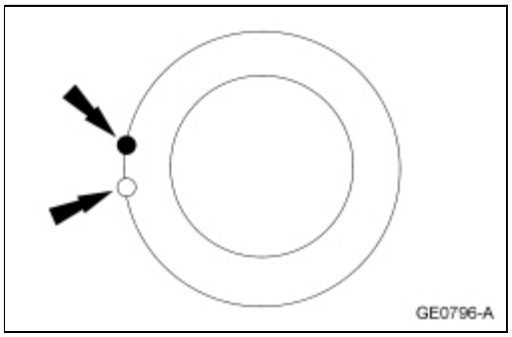
NOTE: Refer to Specifications in this section for all runout specifications.

1. **NOTE:** Do not make any adjustments before carrying out a road test. Do not change the tire pressure or the vehicle load.

   Carry out a visual inspection of the vehicle. Operate the vehicle and verify the condition by reproducing it during the road test.
   - The concern should be directly related to vehicle road speed, not affected by acceleration or deceleration or could not be reduced by coasting in NEUTRAL.

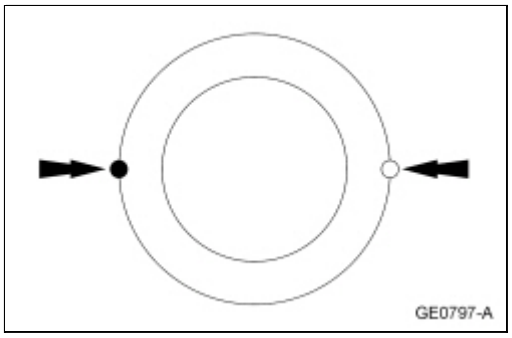
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
   - The driveshaft should be kept at an angle equal to or close to the curb-weighted position. Use a twin-post hoist or a frame hoist with jackstands.

3. Inspect the driveshaft for damage, undercoating or incorrectly seated U-joints. Rotate the driveshaft slowly by hand and feel for binding or end play in the U-joint trunnions. Remove the driveshaft. For additional information, refer to Section 205-01 . Inspect the slip yoke splines for any galling, dirt, rust or incorrect lubrication. Clean the driveshaft or install new U-joints as necessary. Install a new driveshaft if damaged. After any corrections or new components are installed, recheck for the vibration at the road test speed.
   - If the vibration is gone, test drive the vehicle.
   - If the vibration persists or the driveshaft passes visual inspection, measure the driveshaft runout.



Driveshaft Runout

1. Install the Dial Indicator Gauge with Holding Fixture. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft.
    - If the runout exceeds 1 mm (0.040 in) at the front or center, install a new driveshaft.
    - If the front and center is within 1 mm (0.040 in), but the rear runout is not, index-mark the rear runout high point and proceed to Step 2.
    - If the runout is within 1 mm (0.040 in) at all points, recheck for vibration at road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

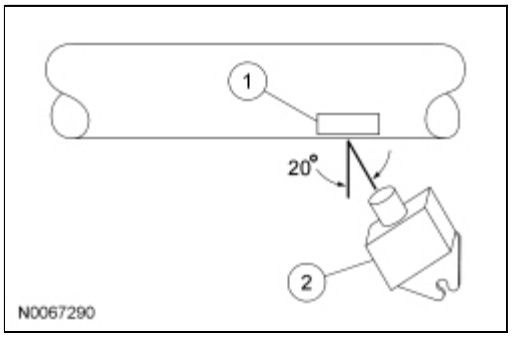


2. **NOTE:** Circular pinion flanges can be turned in 90 degree or one-fourth increments. Half-round pinion flanges are limited to 2 positions.

   Index-mark the driveshaft to the pinion flange. Disconnect the driveshaft and rotate it 180 degrees. Reconnect the driveshaft. Recheck the runout at the rear of the driveshaft.
    - If the runout is still over specification, mark the high point and proceed to Step 3.
    - If the runout is within specification, check for the vibration at the road test speed. If the vibration is still present, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

3. Excessive driveshaft runout can originate in the driveshaft itself or from the pinion flange. To find the source, compare the 2 high points previously determined.
    - If the index marks are close together, within 25 mm (1 in), the driveshaft is eccentric. Install a new driveshaft.
    - If the marks are on opposite sides of the driveshaft, 180 degrees apart, the slip yoke or pinion flange is responsible. Check the pinion flange runout. If the pinion flange runout exceeds specifications, a bent pinion is indicated.
    - If the pinion flange and pinion runouts are within specifications, road test and check for the vibration at the road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

repair4less

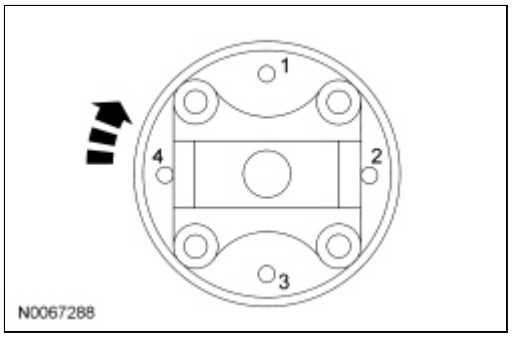


Driveshaft Balancing — Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)

All vehicles

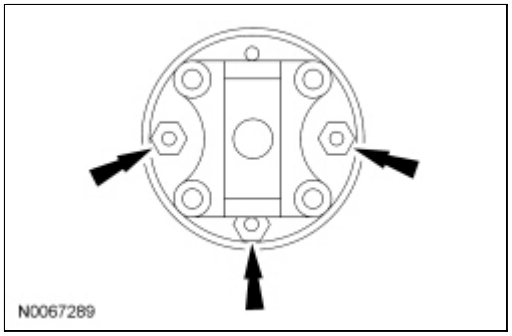
1. Install the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) to the vehicle.

2. Working under the vehicle, install an accelerometer. The accelerometer can be attached and mounted near either the transmission or differential end of the driveshaft.



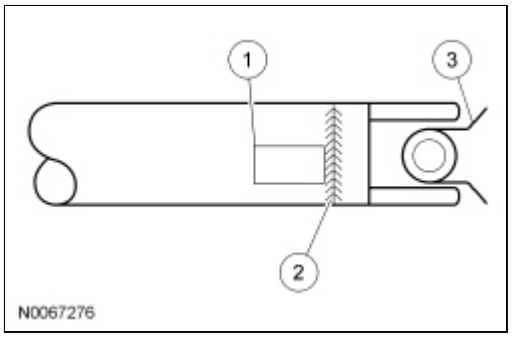
3. Clean an area of the driveshaft and install the reflective tape, then install the photo-tachometer sensor. The sensor should be placed at approximately a 20-degree angle from perpendicular to the surface of the reflective tape. Make sure the sensor does not get moved during the balance procedure.
    1. Reflective tape.
    2. Photo-tachometer sensor.

4. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a driveshaft balance test with the driveshaft unmodified.



Vehicles with tapped pinion flanges

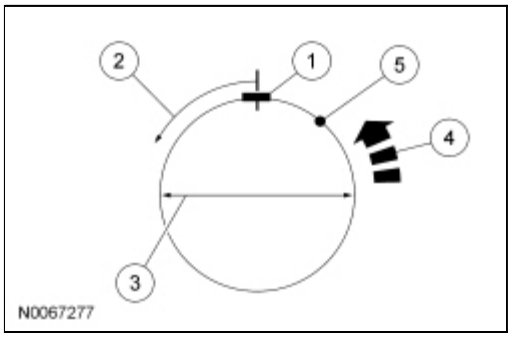
5. Label the tapped holes in the pinion flange numerically, starting at the top hole as 1. Mark the remaining holes 2, 3 and 4. Label in the direction of rotation.



6. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with the 12 mm (0.47 in) test weight set screw in the No. 1 hole, previously marked on the pinion flange.

7. Remove the test weight, then install the weight combination directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix).

Vehicles without tapped pinion flanges

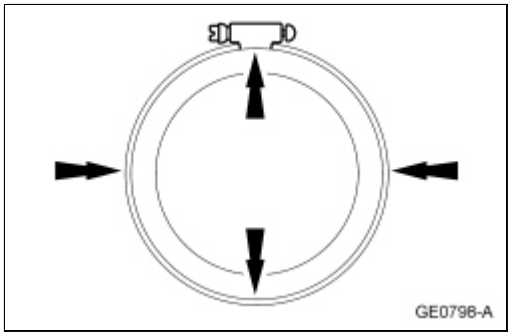


8. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with a test weight. Using a metal band, secure the test weight to the end of the driveshaft. The weight should be placed at the end of the driveshaft tube, as close to the tube-to-yoke weld seam as possible. Mark the location of the test weight on the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Tube-to-yoke weld seam.
    3. Driveshaft pinion flange.
    - Select the test weight based on driveshaft size. Larger driveshafts use 10 g (0.353 oz). Smaller driveshafts use 5 g (0.176 oz).

9. Remove the test weight, then install the recommended weight at the position directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix). Using a metal band and epoxy, secure the test weight to the driveshaft, as shown in the figure below.

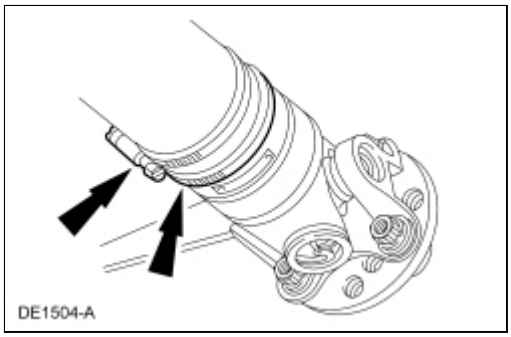
repair4less

1. Test weight.
2. Measure in this direction.
3. Driveshaft diameter.
4. Directional rotation.
5. Balance weight relative to test weight centerline.
   - The results are displayed with respect to the location to where the test weight was placed.



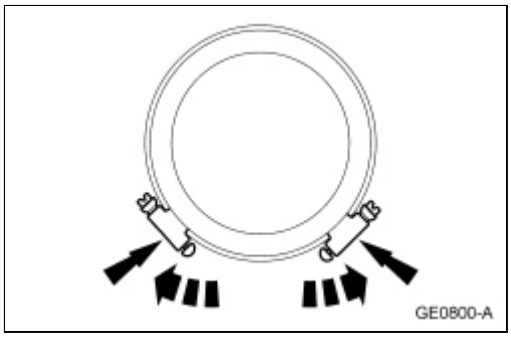
All vehicles

10. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a third test to verify the repair.



Driveshaft Balancing — Hose Clamp Method

1. Install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined through trial and error.



2. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1, as shown in the figure below. Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

3. If the vibration persists, add a second clamp at the same position and recheck for vibration.

4. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 2. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.

5. Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

Driveshaft Universal Joint — Snap Ring Type

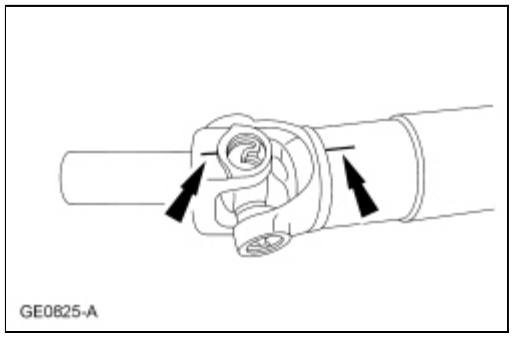
Special Tool(s)

 ST1172-A	Installer/Remover, C-Frame and Screw 205-086 (T74P-4635-C)

Item	Part Number	Description
1	4841	Driveshaft slip yoke
2	4635	U-joint assembly
3	—	Snap rings (part of 4635)
4	4602	Driveshaft assembly
5	4782	Driveshaft flange

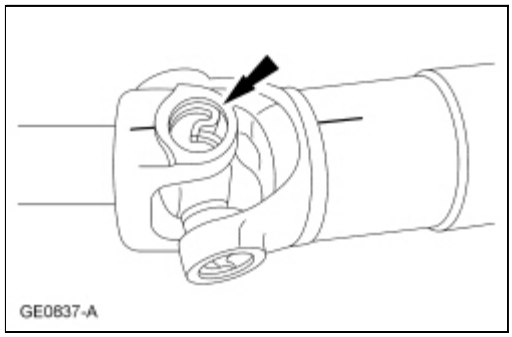
Disassembly

1. Remove the driveshaft. Refer to Driveshaft — Front , Driveshaft — Rear, One-Piece or Driveshaft — Rear, Two-Piece in this section.



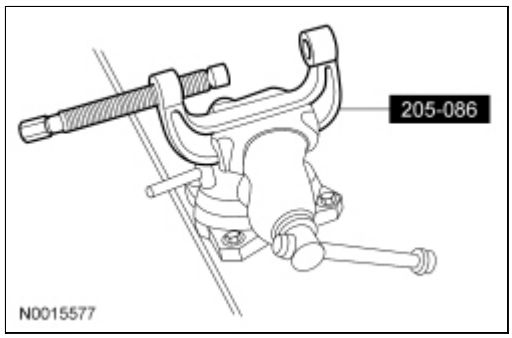
2. ***NOTICE:*** **Do not, under any circumstance, clamp the driveshaft assembly in the jaws of a vise or similar holding fixture. Denting or localized fracturing may result, causing driveshaft failure during vehicle operation.**

   Place the driveshaft on a suitable workbench. Do not damage the tube.



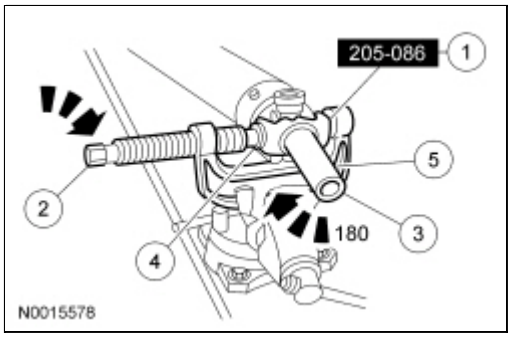
3. **NOTE:** If the components are not marked and therefore installed incorrectly, driveshaft imbalance can

occur.

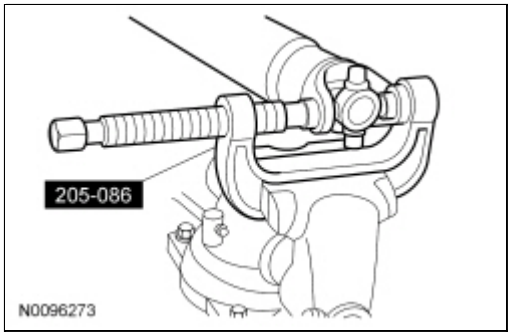


Index-mark the driveshaft components.

4. Remove and discard all 4 of the snap rings.



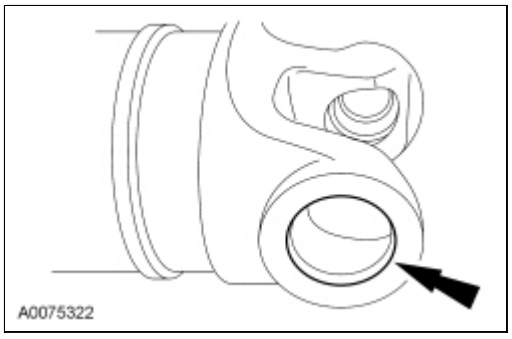
5. Place the C-Frame and Screw Remover/Installer in a vise.



6. **NOTE:** If necessary, use a pair of pliers to remove a bearing cup that fails to press out all the way.

   Remove the bearing cups and the driveshaft slip yoke.
   1. Position the driveshaft slip yoke in the C-Frame and Screw Remover/Installer.
   2. Press out a bearing cup.
   3. Rotate the driveshaft slip yoke 180 degrees.
   4. Press on the U-joint spider to remove the remaining bearing cup.
   5. Remove the driveshaft slip yoke.

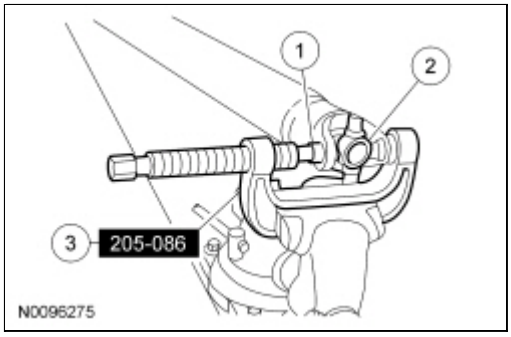
repair4less



7. Repeat steps to remove the remaining bearing cups and the U-joint spider from the driveshaft yoke.

8. **NOTE:** Inspect the bearing cup bores and retaining ring grooves. Remove any rust or other surface irregularities.

   Inspect the bearing cup bores of the driveshaft slip yoke and driveshaft yoke. Make sure that the bearing cup bores are clean and smooth.



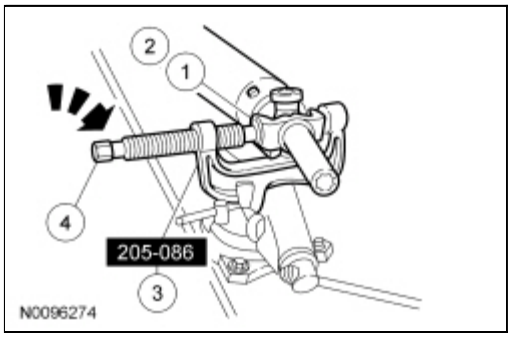
Assembly

1. **NOTE:** Install the U-Joint Kits as complete assemblies only. Do not mix components from other U-Joint Kits.

   NOTE: Lubricate the driveshaft slip yoke and driveshaft yoke bearing cup bores with grease from part kit # KT9L3P-M1C111-AA before installing the bearing cups.

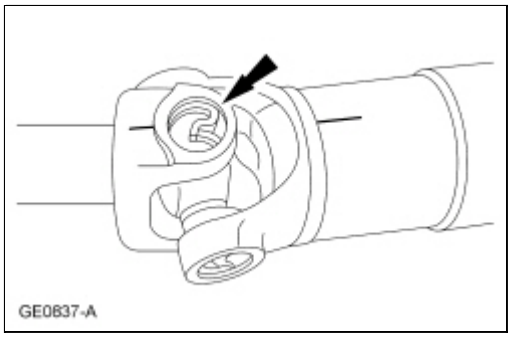
   Install a new U-joint spider and bearing cup.
   1. Start a new bearing cup in the driveshaft yoke.
      - Check the needle bearings for correct positioning.
   2. Position the new U-joint spider in the driveshaft yoke.
   3. Press the bearing cup to just below the snap ring groove using the C-Frame and Screw

Remover/Installer.



2. **NOTE:** Never mix yellow and black snap rings on opposing sides.

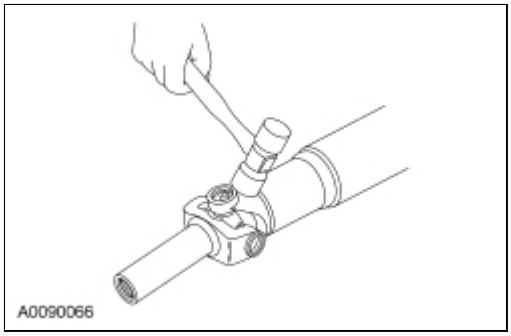
   Remove the shaft from the C-Frame and Screw Remover/Installer and install a new yellow snap ring.



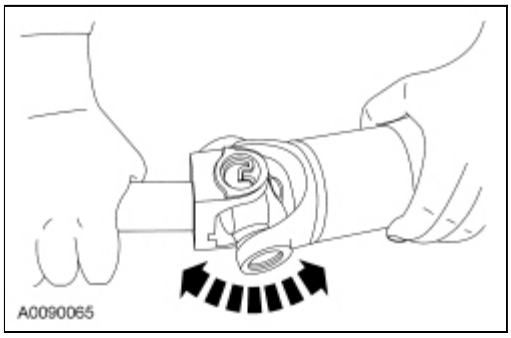
3. Repeat steps to install the new bearing cup and snap ring on the opposite side of the driveshaft yoke.
   - If the yellow snap ring will not seat in the snap ring groove, install the black snap rings.

4. Install the driveshaft slip yoke and new bearing cup.
   1. Align the index marks made during disassembly and install the driveshaft slip yoke on the U-joint spider.
   2. Start a new bearing cup in the driveshaft slip yoke.
      - Check the needle bearings for correct positioning.
   3. Position the assembly in the C-Frame and Screw Remover/Installer.
   4. Press the bearing cup to just below the snap ring groove using the C-Frame and Screw Remover/Installer.

5. Remove the driveshaft from the C-Frame and Screw Remover/Installer and install a new yellow snap ring.



repair4less



6. **NOTE:** Never mix yellow and black snap rings on opposing sides.

   Repeat steps to install the new bearing cup and snap ring on the opposite side of the driveshaft slip yoke.
   - If the yellow snap ring will not seat in the snap ring groove, install the black snap rings.

7. A sharp rap on the driveshaft yoke with a brass or plastic hammer will seat the bearing cups.

8. Rotate the driveshaft yoke to make sure the U-joints are free to rotate easily, without binding, before installing the driveshaft.

9. Install the driveshaft. Refer to Driveshaft — Front , Driveshaft — Rear, One-Piece or Driveshaft — Rear, Two-Piece in this section.

repair4less

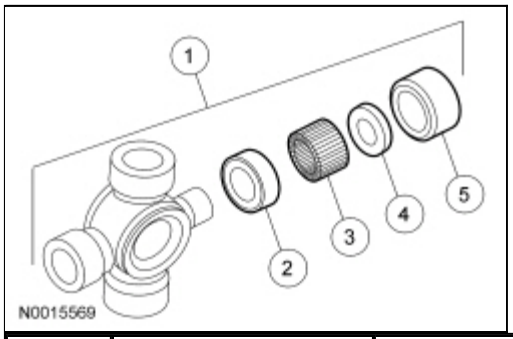
Driveshaft

NOTE: All driveshafts are balanced. If undercoating the vehicle, protect the driveshaft and U-joints to prevent overspray of any undercoating material.

Vehicles have the following types of driveshafts:

- Front driveshaft with CV joints at the front and rear ends of the driveshaft. The only serviceable part of the front driveshaft is the mounting hardware. The front driveshaft can be balanced by methods described in the General Driveline section. Refer to Section 205-00 .
- One-piece rear driveshafts with a rear U-joint flange and a slip yoke
- Two-piece rear driveshafts with a front flanged U-joint or slip yoke, center bearing with a slip joint and a flanged U-joint at the rear

Driveshafts are used to transfer movement from the transmission or transfer case to the front or rear axle. The driveshaft is composed of the U-joints, CV joints, connecting shafts and the attaching yokes. Some vehicles are equipped with a center support bearing. The center support bearing is prelubricated and sealed for the life of the bearing.



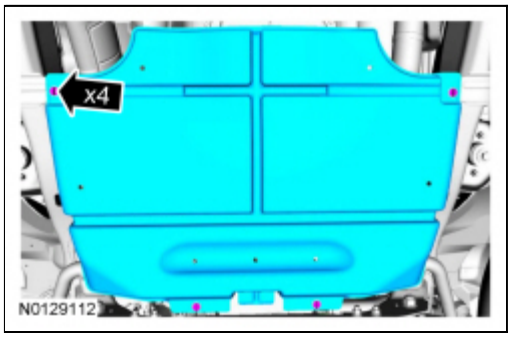
Driveshafts differ in length, diameter and type of yoke to accommodate various wheelbase and powertrain combinations.

Universal Joints

U-joints have the following features:

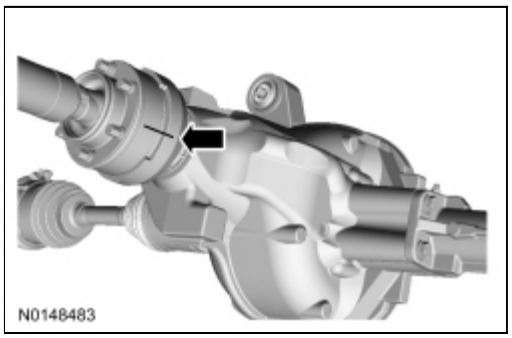
- Lubed-for-life design and require no lubrication
- Equipped with nylon thrust washers (located at each base of the bearing cup) which control end play, position the needle bearing and improve grease movement
- Held in place by snap rings

The U-joints allow the speeding up and slowing down of the driveshafts as the angularity of the driveshaft changes.



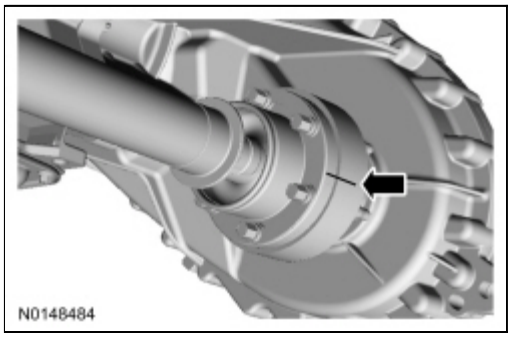
Item	Part Number	Description
1	4635	U-joint
2	—	Grease seal (part of 4635)
3	—	Needle rollers (part of 4635)
4	—	Thrust washer (part of 4635)
5	—	Bearing cup (part of 4635)

repair4less



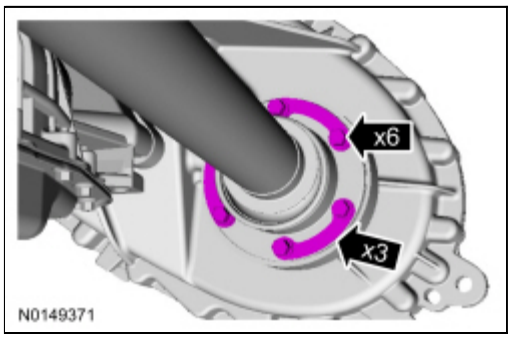
Driveshaft — Front

Removal



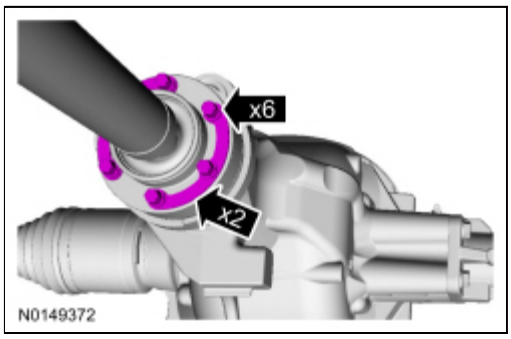
1. With the vehicle in NEUTRAL, position the vehicle on a hoist. Refer to Section 100-02 .
2. If equipped.

3.



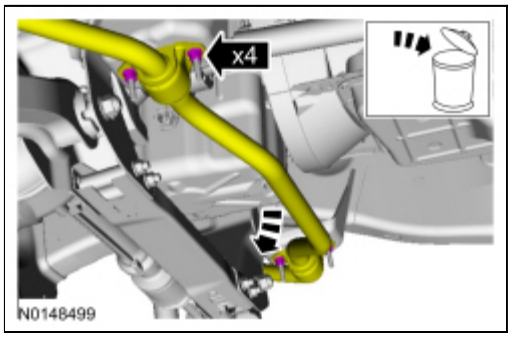
4.

5. **NOTE:** If new bolts are not available, the old bolts and washers can be reused if they are not damaged. When reusing old bolts, the threads need to be cleaned and loctite has to be used on the threads of each bolt.



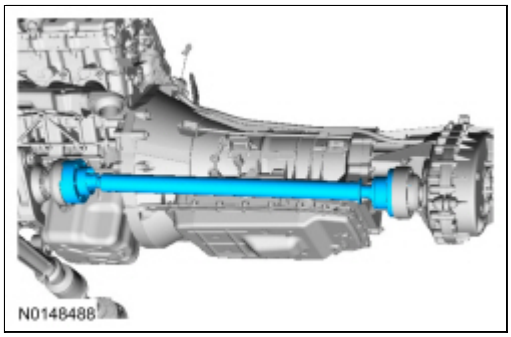
repair4less

- To install, tighten to 55 Nm (41 lb-ft).



6. **NOTE:** If new bolts are not available, the old bolts and washers can be reused if they are not damaged. When reusing old bolts, the threads need to be cleaned and loctite has to be used on the threads of each bolt.

    - To install, tighten to 55 Nm (41 lb-ft).



7.

    - To install, tighten to 55 Nm (41 lb-ft).

8.

Installation

1. To install, reverse the removal procedure.

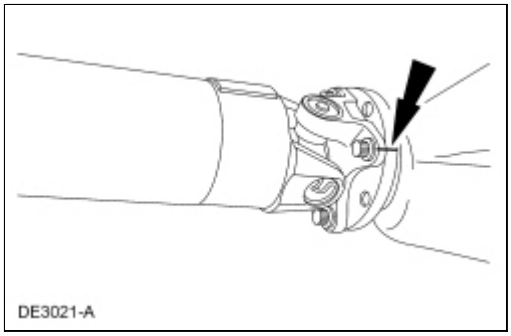
Driveshaft — Rear, One-Piece

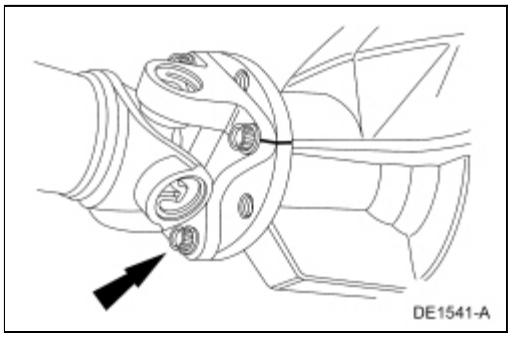
Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



Item	Part Number	Description
1	4841	Driveshaft slip yoke
2	N800594	Driveshaft flange-to-pinion bolts (4 required)
3	4782	Rear driveshaft flange
4	4851	Pinion flange
5	4602	Driveshaft assembly

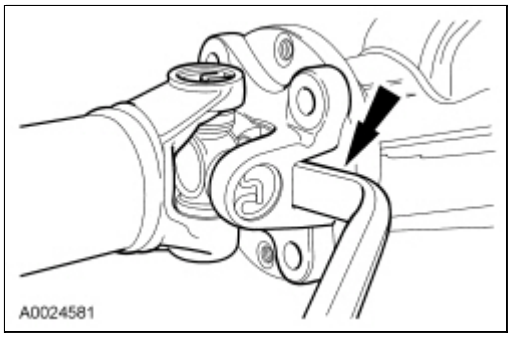
Removal and Installation



NOTE: For automatic transmissions, when installing a new driveshaft, match the yellow dots on the driveshaft to the yellow dots on the pinion flange and the output shaft to maintain balance during installation.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Index-mark the driveshaft flange to the pinion flange and the driveshaft flange to the transmission flange to maintain alignment during installation.



3. Remove and discard the 4 driveshaft flange bolts.
    - To install, tighten the 4 new bolts to 103 Nm (76 lb-ft).

4. ***NOTICE:*** **The driveshaft flange fits tightly on the flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft flange from the flange pilot. Pry only in the area shown with a suitable tool to disconnect the driveshaft flange from the flange pilot or damage to the driveshaft flange can occur.**

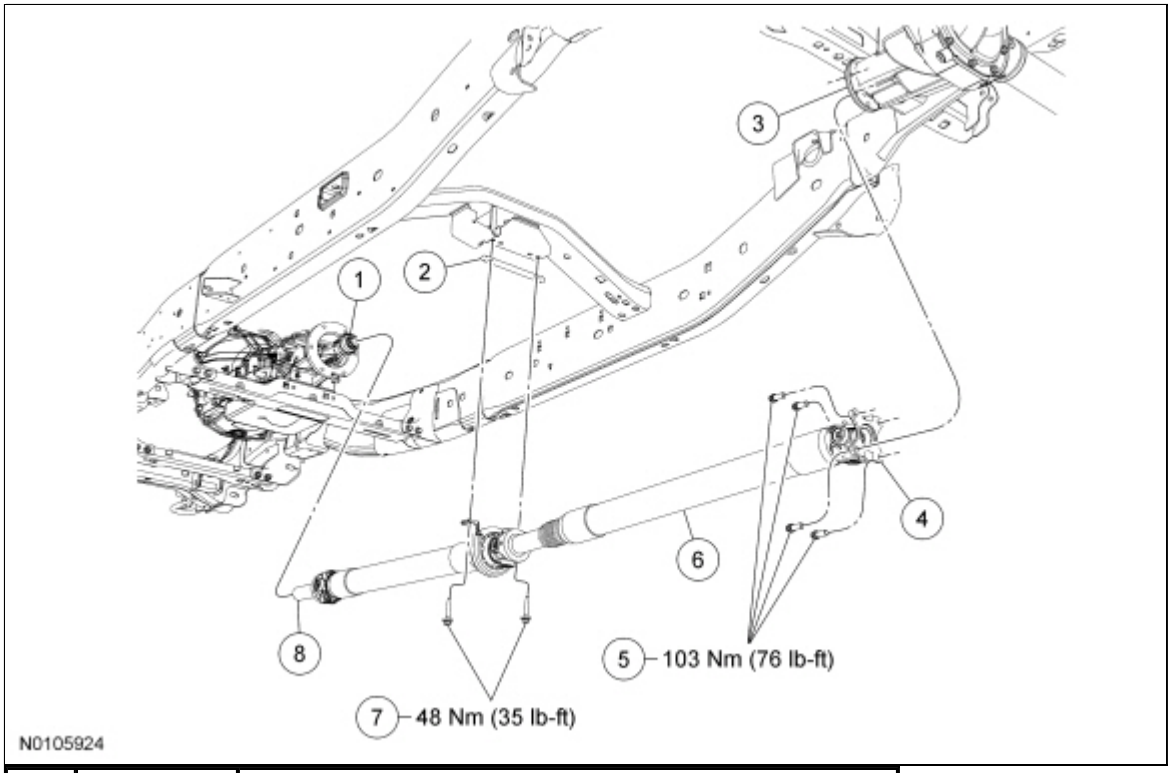
    Using a suitable tool as shown, disconnect the driveshaft flange from the flange pilot and remove the driveshaft.

5. ***NOTICE:*** **The driveshaft flange fits tightly on the pinion flange pilots. To make sure that the driveshaft flanges seat squarely on the pinion flange pilots, tighten the driveshaft flange bolts evenly in a cross pattern or damage to the flanges can occur.**

    NOTE: If new bolts are not available, coat the threads of the original driveshaft flange bolts with threadlock and sealer.

repair4less

NOTE: Align the index marks made during removal.



To install, reverse the removal procedure.

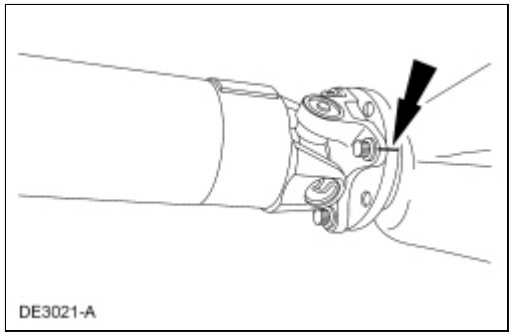
Driveshaft — Rear, Two-Piece

Material

Item	Specification
Motorcraft® Threadlock and Sealer TA-25	WSK-M2G351-A5

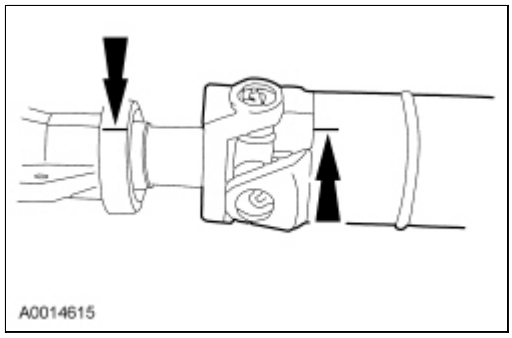
NOTE: Front slip yoke shown, front fixed flange similar.

Item	Part Number	Description
1	7A309	Transmission extension housing
2	4A209	Center bearing shim (if equipped)
3	4858	Pinion flange
4	4782	Driveshaft flange
5	N800594	Driveshaft flange-to-pinion bolts (4 required) (front fixed flange [8 required])
6	4R602	Driveshaft assembly
7	W713078	Driveshaft center bearing bolts (2 required)
8	4841	Driveshaft slip yoke



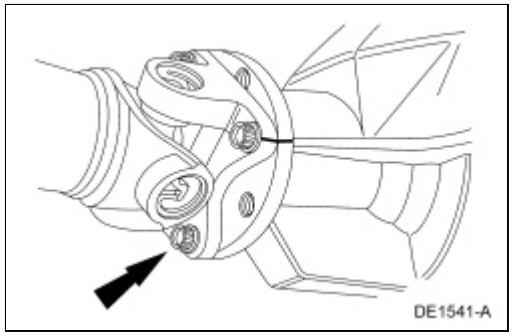
repair4less

Removal and Installation



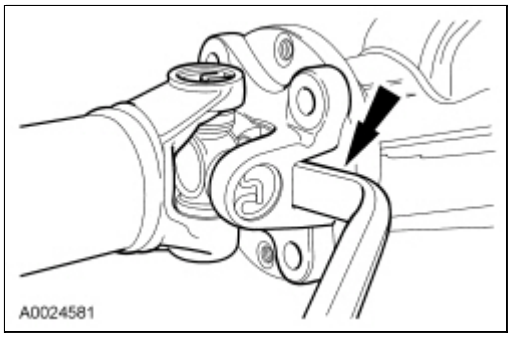
NOTE: For automatic transmissions, when installing a new driveshaft, match the yellow dots on the driveshaft to the yellow dots on the pinion flange and the output shaft to maintain balance during installation.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Index-mark the driveshaft flange to the pinion flange to maintain alignment during installation.

3. Index-mark the driveshaft to the extension housing to maintain alignment during installation.



4. Remove and discard the 4 driveshaft flange bolts.
   - To install, tighten the 4 new bolts to 103 Nm (76 lb-ft).

5. ***NOTICE:*** **The driveshaft flange fits tightly on the flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft flange from the flange pilot. Pry only in the area shown with a suitable tool, to disconnect the driveshaft flange from the flange pilot or damage to the driveshaft flange can occur.**

   Using a suitable tool as shown, disconnect the driveshaft flange from the flange pilot.

6. Remove the driveshaft in the following sequence.
    1. Remove the 2 driveshaft center bearing bolts.
    2. Lower the driveshaft and slide the driveshaft slip yoke rearward off of the output shaft.
        - To install, tighten to 48 Nm (35 lb-ft).

7. Plug the extension housing to prevent fluid loss.

8. ***NOTICE:*** **The driveshaft flange fits tightly on the pinion flange pilots. To make sure that the driveshaft flanges seat squarely on the pinion flange pilots, tighten the driveshaft flange bolts evenly in a cross pattern or damage to the driveshaft flange can occur.**

    NOTE: If new bolts are not available, coat the threads of the original driveshaft flange bolts with threadlock and sealer.

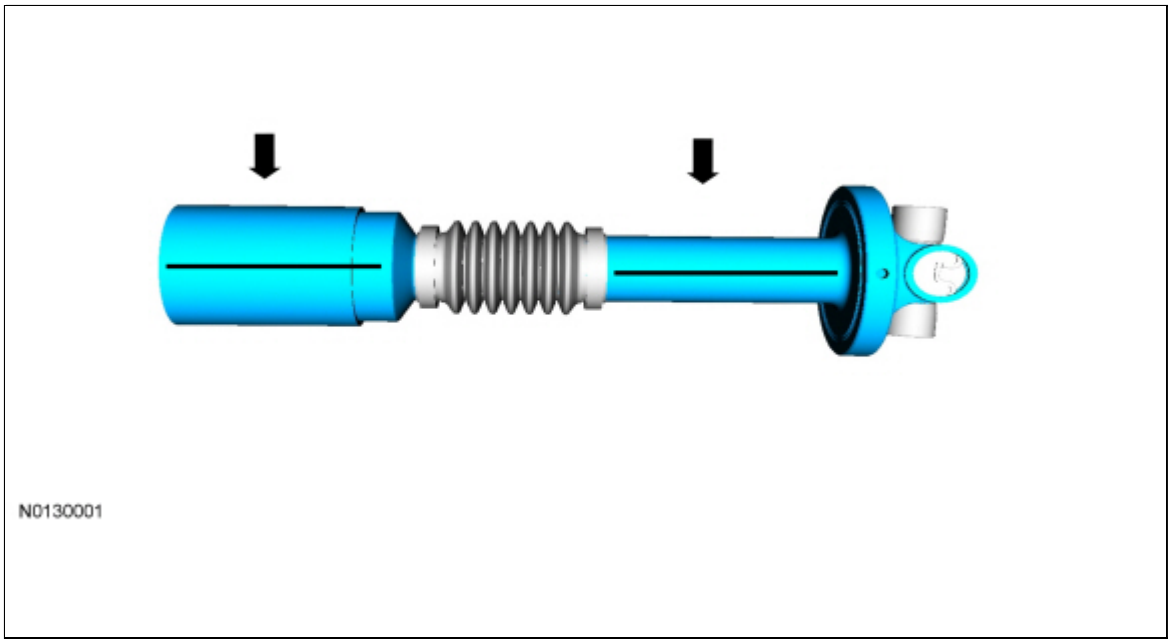
    NOTE: Align the index marks made during removal.

    NOTE: Clean any residual lubricant from the component.

    To install, reverse the removal procedure.

repair4less

Driveshaft Slip Yoke Boot



Item	Part Number	Description
1	4R602	Driveshaft assembly
2	3B478	Driveshaft slip-yoke boot clamps (2 required)(large clamp also part of kit M1C111)
3	4421	Driveshaft slip-yoke boot
4	4A335	Slip yoke

Removal

1. ***NOTICE:*** **The driveshaft and slip yoke have to be reassembled in the same phase as it was before disassembly. If the driveshaft and slip yoke isn't assembled in the same phase, a vibration can result.**

   Mark a straight line down the slip yoke and driveshaft, to help align for reassembly.

2. Remove the driveshaft. Refer to Driveshaft — Front or Driveshaft — Rear, Two-Piece in this section.

3. ***NOTICE:*** **Do not, under any circumstance, clamp the driveshaft in the jaws of a vise or similar holding fixture. Denting or localizing fracture can result, causing driveshaft failure during vehicle operation.**

   Place the driveshaft on a suitable workbench. Do not damage the tubes.

4. Remove the driveshaft slip yoke from the driveshaft in the following sequence.
   1. Remove and discard the front driveshaft slip-yoke boot clamp.
   2. Remove the driveshaft slip yoke from the driveshaft.

5. Remove the slip-yoke boot from the driveshaft.
   - Inspect the boot for damage. Replace the boot as necessary.

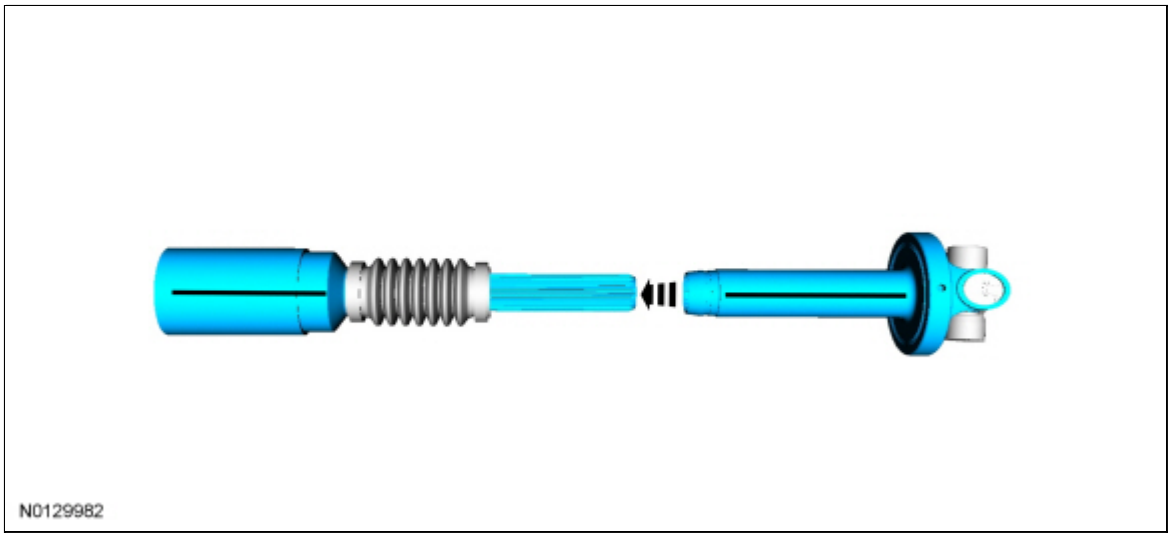
6. Inspect the lubricant on the driveshaft splines and in the driveshaft slip yoke for contamination. If contaminated, inspect the driveshaft splines and the driveshaft slip yoke for wear. Install new components as necessary.

Installation

1. Using a clean, dry lint free shop towel, thoroughly clean old grease from slip yoke splines.

2. Position the new small driveshaft slip-yoke boot clamp on the driveshaft stub shaft.

3. Slide the small opening end of the slip-yoke boot on the driveshaft stub shaft, as far as it will travel.



4. Using boot clamp pliers, crimp the driveshaft slip-yoke boot clamp.

5. ***NOTICE:*** **The driveshaft and slip yoke have to be reassembled in the same phase as before disassembly. If the driveshaft and slip yoke aren't assembled in the same phase, a vibration can result.**

   Install the driveshaft slip-yoke on the driveshaft.

repair4less

1. Lubricate the driveshaft splines with long-life grease supplied in part # KT9L3P-M1C111-AA.
2. Pull the slip-yoke boot toward the driveshaft.
3. Position the new large slip-yoke boot clamp supplied in part # KT9L3P-M1C111-AA.
4. Align the marks from disassembly, and install the driveshaft slip yoke on the driveshaft.

6. Set the driveshaft assembled length to specification.
    1. Remove any excess grease from the slip-yoke boot and driveshaft slip-yoke surfaces.
    2. Position the slip-yoke boot in the slip-yoke boot groove.
    3. Set the driveshaft assembled length to specification.
        - Measure from the stub shaft weld to the U-joint centerline.
    4. Bleed the air from the slip-yoke boot.

7. Using boot clamp pliers, crimp the large driveshaft slip-yoke boot clamp.

8. Install the driveshaft. Refer to Driveshaft — Front or Driveshaft — Rear, Two-Piece in this section.

repair4less

Rear Drive Axle and Differential

The rear axle assembly consists of the following:

- Integral-type housing hypoid gear design (center of the pinion set below the centerline of the ring gear)
- Hypoid differential ring gear and pinion consists of an 8.8-inch ring gear and an overhung drive pinion that is supported by 2 opposed tapered roller bearings
- Axle housing assembly that consists of a cast center section with 2 steel tube assemblies and a stamped differential housing cover
- Differential pinion shaft is retained by a threaded differential pinion shaft lock bolt attached to the differential case
- Differential case is mounted in the rear axle housing between 2 opposing differential bearings that are retained in the rear axle housing by 2 removable bearing caps

The rear drive axle receives rotational torque from the driveshaft. The direction of the rotation determines movement of the vehicle. The rotation enters the rear drive axle through the drive pinion flange, turning the drive pinion and rotating the ring gear. The ring gear is bolted to the differential case. The differential case houses the pinion shaft upon which the differential pinion gears ride. The pinion gears are in mesh with the differential side gears to which the axle shafts are splined. It is the unique arrangement of the differential that allows the axle shafts to be driven at different speed when needed, such as when driving around corners. A Traction-Lok differential is also available that introduces a series of clutch plates and discs behind the differential side gears to deliver as much torque as possible to each axle shaft when the traction at the rear wheels is not equal. The Traction-Lok differential requires a friction modifier that must be installed with the axle lubricant for the plates and discs to be functional.

Rear Drive Axle and Differential

Refer to Section 205-00 .

Ring Gear Backlash Adjustment

Special Tool(s)

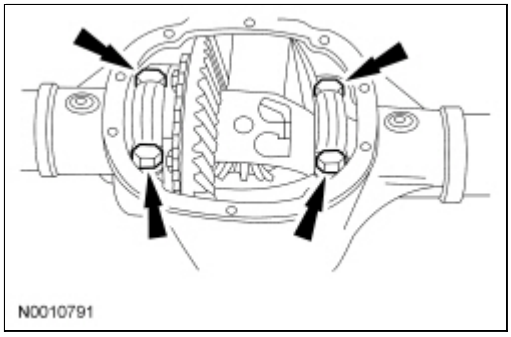
 ST1214-A	Dial Indicator Gauge With Holding Fixture 100-002 (TOOL-4201-C)
 ST1485-A	Installer, Differential Shim 205-220 (T85L-4067-AH)

Material

Item	Specification
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	—

1. Remove the differential housing cover. For additional information, refer to Differential Housing Cover in this section.

2. Install the Dial Indicator Gauge with Holding Fixture and measure the ring gear backlash.
   - If a zero backlash condition occurs or the backlash is not within specification, proceed to Step 3.
   - If the backlash is within specification, proceed to Step 14.



3. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.

4. **NOTE:** Index-mark the position of the differential bearing caps, as arrows may not be visible. The differential bearing caps must be installed in their original locations and positions.

repair4less

Remove the 4 bearing cap bolts and 2 caps.

5. If a zero backlash condition has occurred, add 0.50 mm (0.020 in) to the RH side shim and subtract 0.50 mm (0.020 in) from the LH side shim to allow a backlash indication. Install the 2 bearing caps and 4 bolts.
    - Tighten to 112 Nm (83 lb-ft).
    - Go back to Step 2.

6. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002

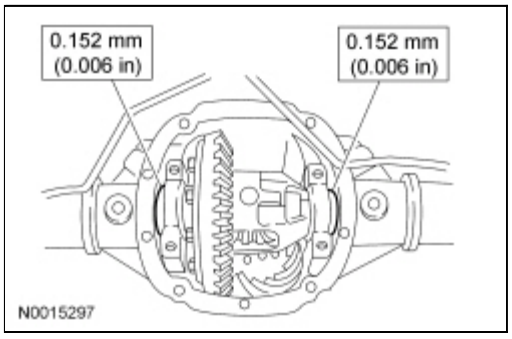
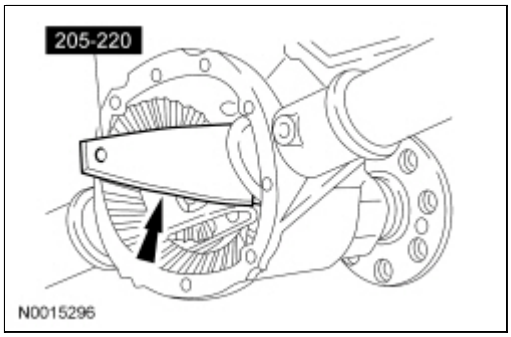
7. Install the 2 bearing caps and 4 bolts.
    - Tighten to 112 Nm (83 lb-ft).

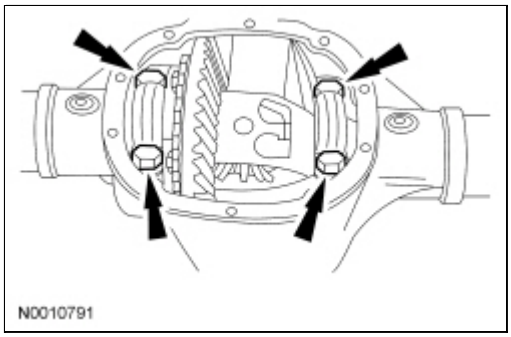
repair4less



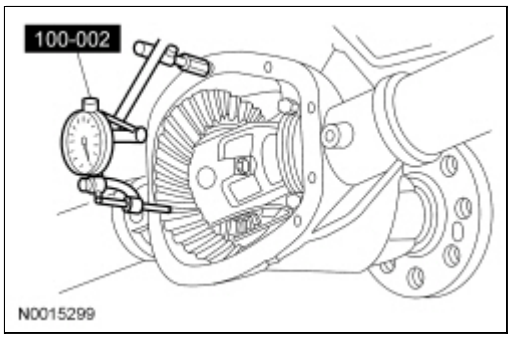
8. Using the Dial Indicator Gauge with Holding Fixture, recheck the ring gear backlash.
    - If backlash is now within specification, proceed to Step 9.
    - If backlash is not within specification, go back to Step 4.



9. Remove the 4 bearing cap bolts and 2 bearing caps.



10. To establish differential bearing preload, increase both LH and RH differential bearing shim size by the thickness shown.



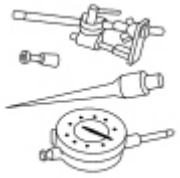
11. Using the Differential Shim Installer, fully seat the differential bearing shims. Make sure the assembly rotates freely.

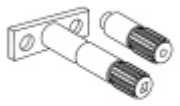
12. Install the 2 bearing caps and 4 bolts.
    - Tighten to 112 Nm (83 lb-ft).

13. Using the Dial Indicator Gauge with Holding Fixture, do a final check of the ring gear backlash.

14. Apply marking compound and rotate the differential assembly 5 complete revolutions.

15. Verify an acceptable pattern check. For additional information, refer to Tooth Contact Pattern Check in Section 205-00 .





16. Install the axle shafts. For additional information, refer to Axle Shaft in this section.

17. Install the differential housing cover. For additional information, refer to Differential Housing Cover in this section.

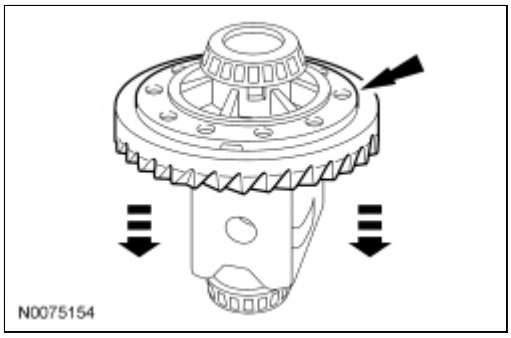
10	4204	Differential case
11	4216	Differential ring gear bolt (10 required)
12	4221	Differential bearings
13	4222	Differential bearing cups

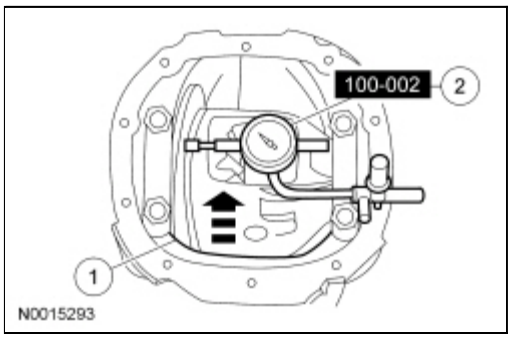
Initial disassembly

NOTE: If the differential ring gear backlash between teeth is greater than specification, remove the ring gear to check the differential case flange runout. Do not disassemble the differential carrier assembly.



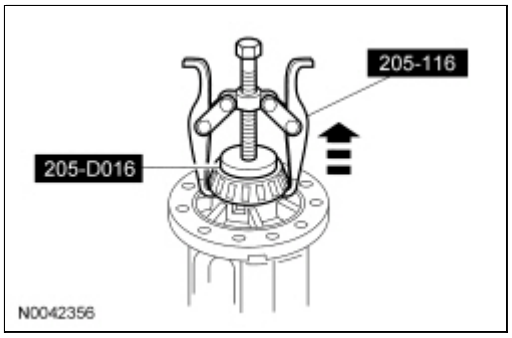
1. Remove the differential carrier. Tag the differential shims and bearing cups for location. For additional information, refer to Differential Carrier in this section.

2. Remove and discard the 10 differential ring gear bolts.

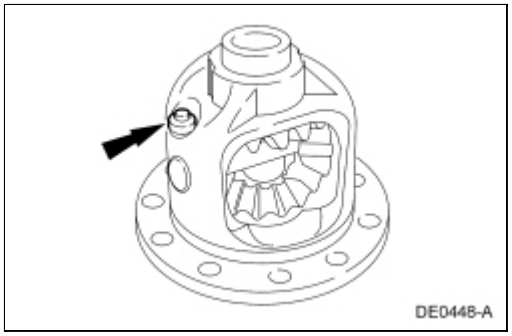


3. ***NOTICE:*** **Care should be taken not to damage the differential ring gear bolt hole threads.**

   Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

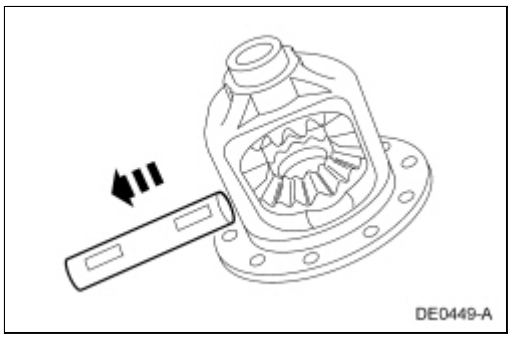


4. If checking differential case flange runout, install the bearing cups in their original location and install the differential assembly.
   1. Install the bearing caps and differential shims.
      - Rotate the differential assembly to verify the bearings have seated.
   2. Install the Dial Indicator Gauge With Holding Fixture and record the differential case runout.

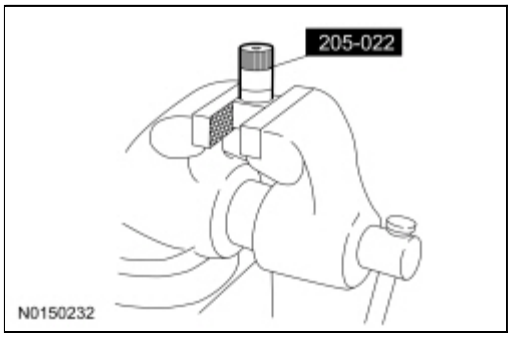


Final disassembly

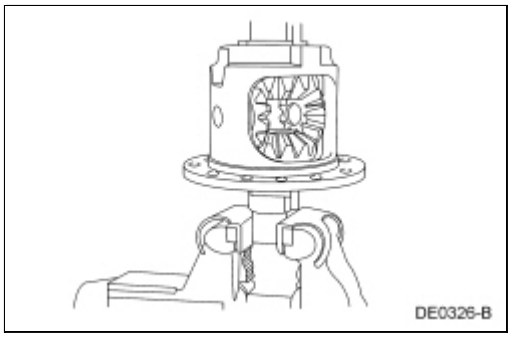
5. Using the Differential Bearing Remover and Step Plate, remove the differential bearings.



repair4less

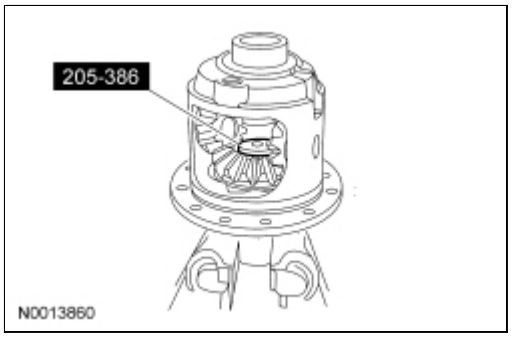


6. Remove the differential pinion shaft lock bolt.

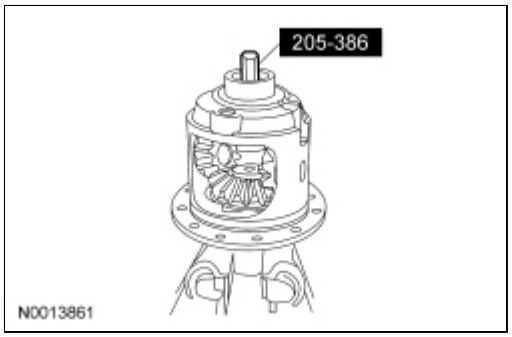


7. Remove the differential pinion shaft.

8. Install the Differential Gauge in a suitable vise.



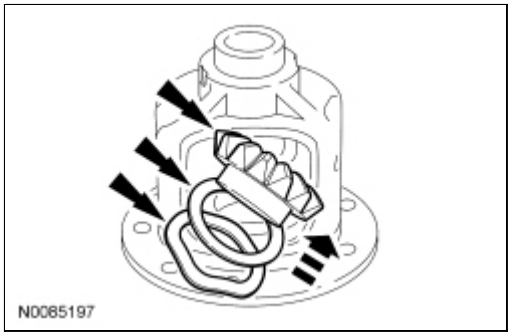
9. Install the differential case on the Differential Gauge.



10. **NOTE:** Apply a small amount of grease to the centering hole of the Differential Gauge.

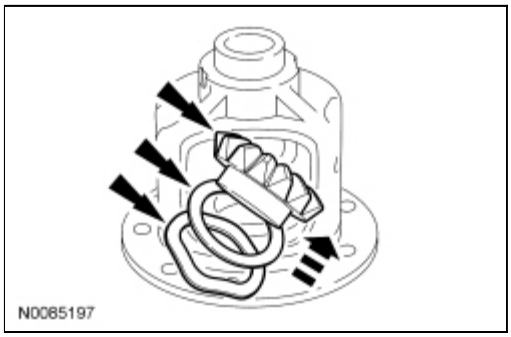
    Install the Differential Gauge step plate in the bottom differential side gear.

11. Install the Differential Gauge nut in the upper differential side gear. Hold the nut in position while installing the Differential Gauge hex screw. Tighten the hex-head screw until contact is made with the Step Plate.

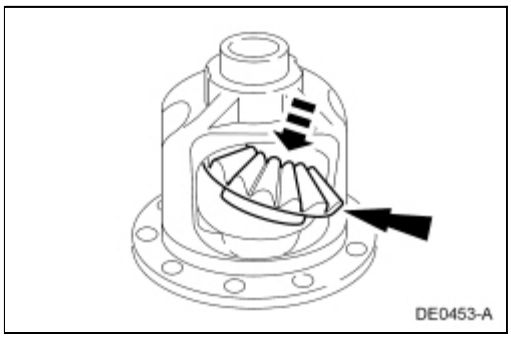


12. Rotate and remove the differential pinion gears and differential pinion gear thrust washers.

repair4less



13. Remove the differential side gears, the differential side gear washers and the differential side gear wave washers.

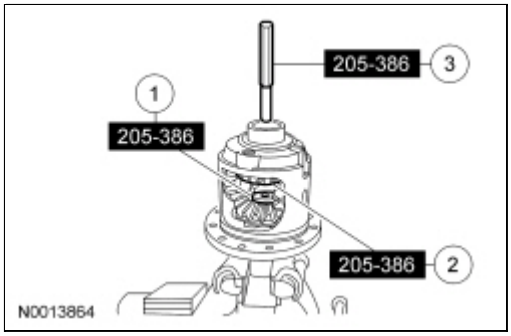


Assembly

1. **NOTE:** Lubricate the differential side gear thrust washers, wave washers and the side gear journals with axle lubricant.

   Position the differential side gear thrust washers and wave washers on the differential side gears.

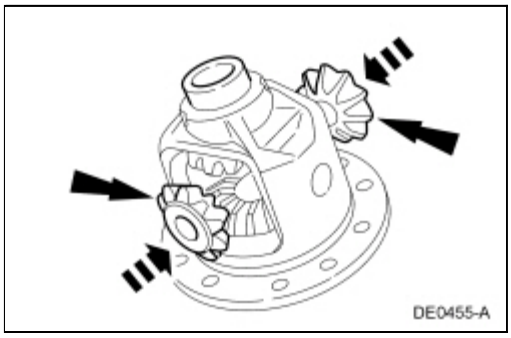
2. Install the differential side gears.



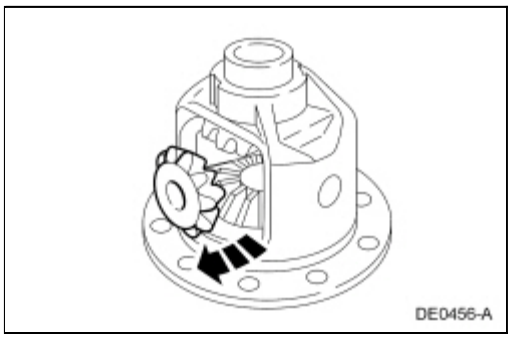
3. **NOTE:** Apply a small amount of grease to the Step Plate bore.

   NOTE: If necessary, insert the Differential Gauge dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

   Assembly the Differential Gauge to the differential case.
   1. Position the Differential Gauge step plate in the bottom differential side gear.
   2. Position the Differential Gauge hex screw plate in the top differential side gear and hold it in place.

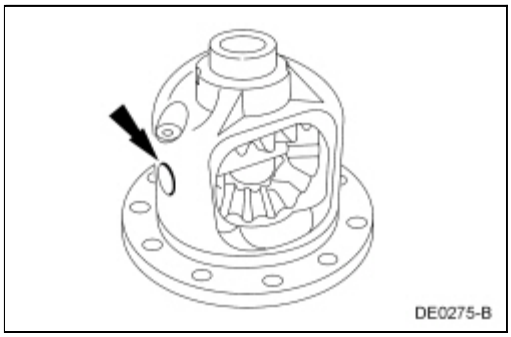


3. Install the Differential Gauge hex screw and tighten it 2 turns after it contacts the bottom Step Plate.

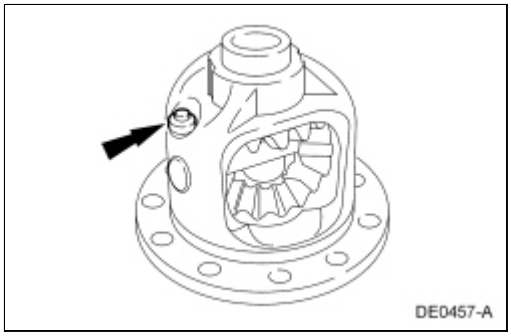


4. Use axle lubricant to lubricate the differential pinion gear thrust washers and the differential pinion gears.

5. Install the differential pinion gears and differential pinion gear thrust washers opposite the differential side gears.

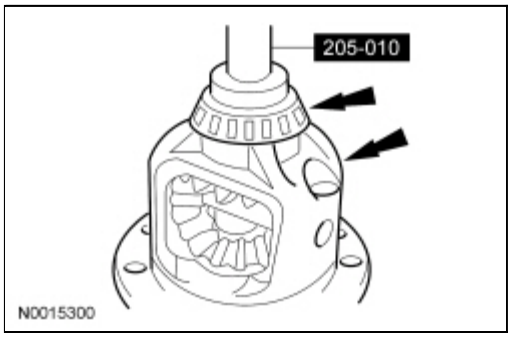


6. Rotate the differential pinion gears to align with the differential pinion shaft bore.



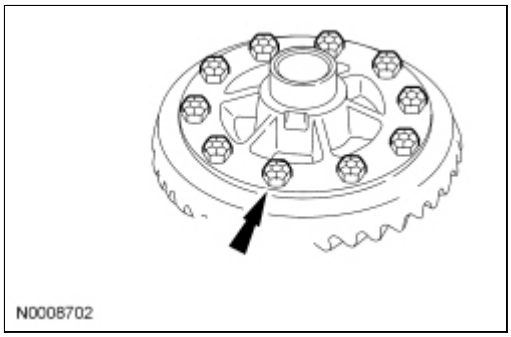
repair4less

7. Install the differential pinion shaft.
    - Align the hole in the differential pinion shaft with the hole in the differential case.



8. **NOTE:** If a new pinion shaft lock bolt is unavailable, coat the threads with threadlock and sealer prior to installation.

    Install a new differential pinion shaft lock bolt and tighten finger-tight.

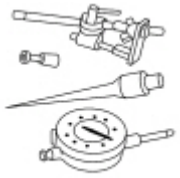


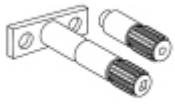
9. Using the Differential Side Bearing Installer, install the new differential bearings on the differential case.

10. Position the differential ring gear on the differential case. Align the bolt holes by starting 2 bolts through the holes in the differential case and into the differential ring gear.

11. Using a shop press, press the ring gear on the differential case.

12. Install the 10 new differential ring gear bolts. Tighten in 2 stages.
    - Stage 1: Tighten to 60 Nm (44 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.





13. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

repair4less

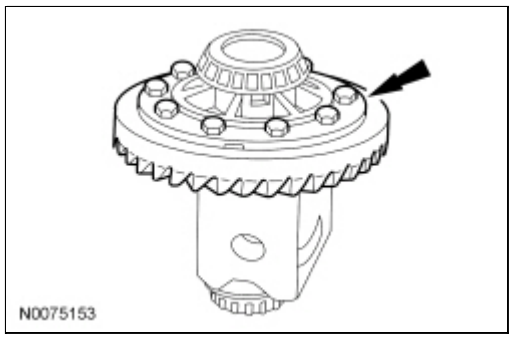
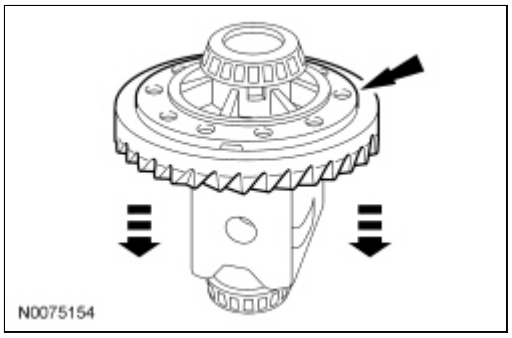
Item	Part Number	Description
1	4204	Differential case
2	4241	Differential pinion shaft lock bolt
3	4236	Differential side gear
4	—	Retainer clip (part of 4880)
5	4230	Differential pinion thrust washer
6	4215	Differential pinion gear
7	—	Plate preload spacer (part of 4880)
8	—	Clutch disc (part of 4880)
9	—	Clutch plate (part of 4880)
10	4211	Differential pinion shaft
11	—	Selective shim (part of 4880)



Initial disassembly

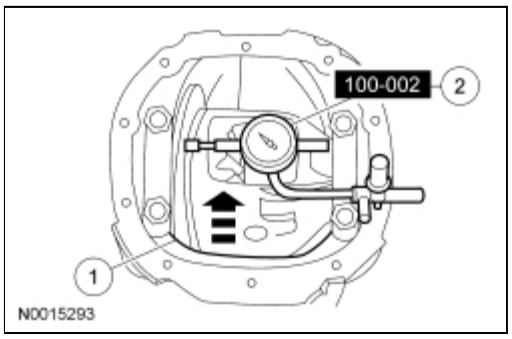
NOTE: If the Diagnostic Chart directed the servicing of the Traction-Lok clutch packs, it is not necessary to remove the differential carrier assembly from the axle housing. Proceed to Step 7.

NOTE: If the differential ring gear backlash between teeth is greater than specification, remove the ring gear to check the differential case flange runout. Do not disassemble the differential carrier assembly.



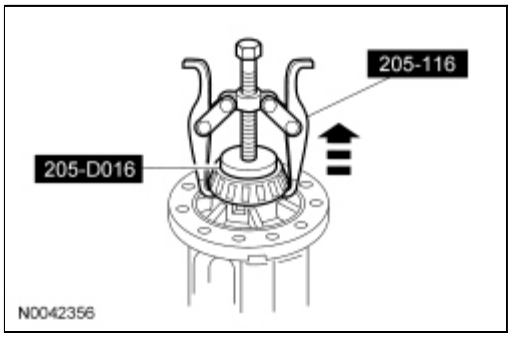
1. Remove the differential carrier. Tag the differential shims and bearing cups for location. For additional information, refer to Differential Carrier in this section.

2. Remove and discard the 10 differential ring gear bolts.

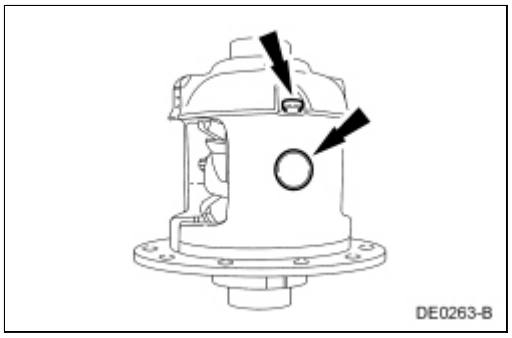


3. ***NOTICE:*** **Care should be taken not to damage the differential ring gear bolt hole threads.**

   Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

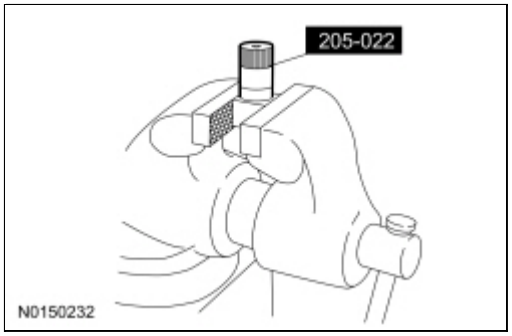


4. If checking differential case flange runout, install the bearing cups in their original location and install the differential assembly.
    1. Install the bearing caps and differential shims.
        - Rotate the differential assembly to verify the bearings have seated.
    2. Install the Dial Indicator Gauge With Holding Fixture and record the differential case runout.

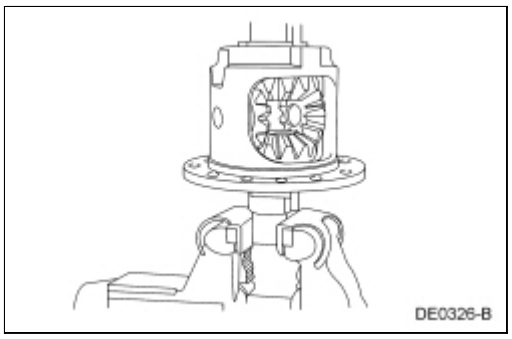


Final disassembly

5. Using the Differential Bearing Remover and Step Plate, remove the differential bearings.

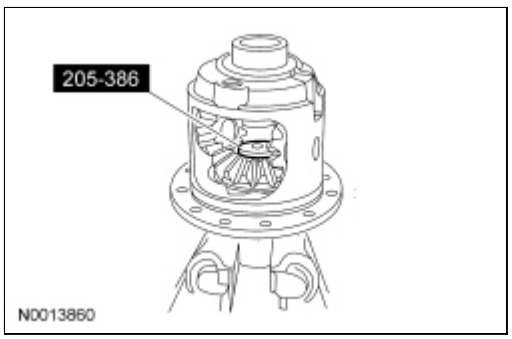


6. Remove the differential pinion shaft lock bolt and remove the differential pinion shaft.

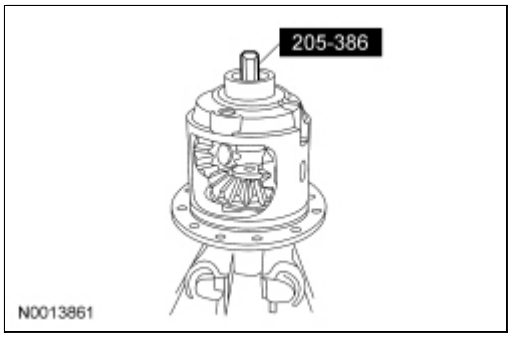


repair4less

7. Install the Differential Gauge in a suitable vise.

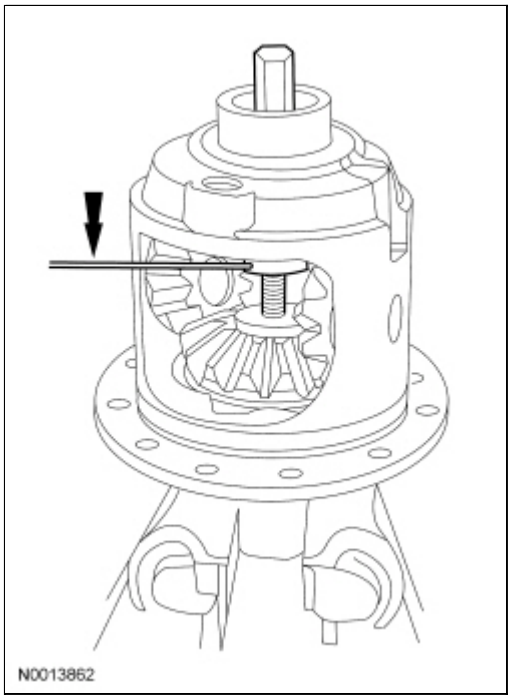


8. Install the differential case on the Differential Gauge.

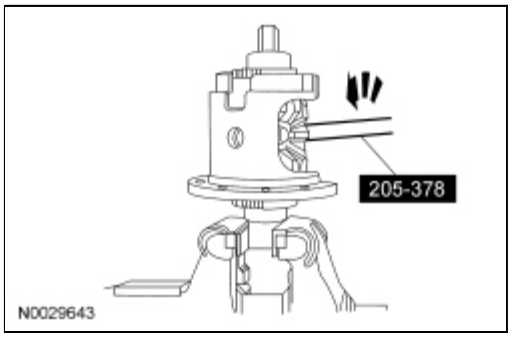


9. **NOTE:** Apply a small amount of grease to the centering hole of the Differential Gauge.

   Install the Differential Gauge step plate in the bottom differential side gear.

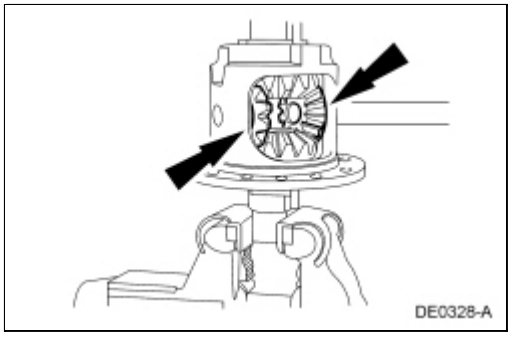


10. Install the nut in the upper differential side gear. Hold the nut in position while installing the hex screw. Tighten the hex-head screw until contact is made with the Differential Gauge step plate.



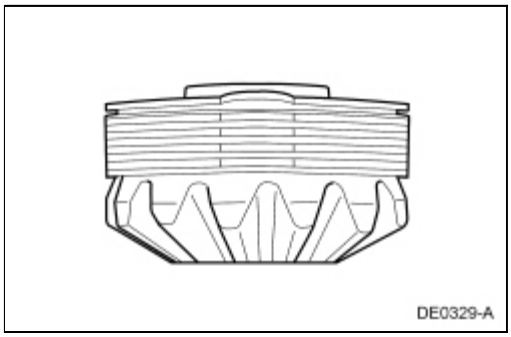
11. **NOTE:** The dowel bar is used to keep the nut from turning when the forcing screw is tightened.

    Insert a suitable dowel bar in the hole of the nut. Tighten the forcing screw to force the differential side gears away from the differential pinion gears.



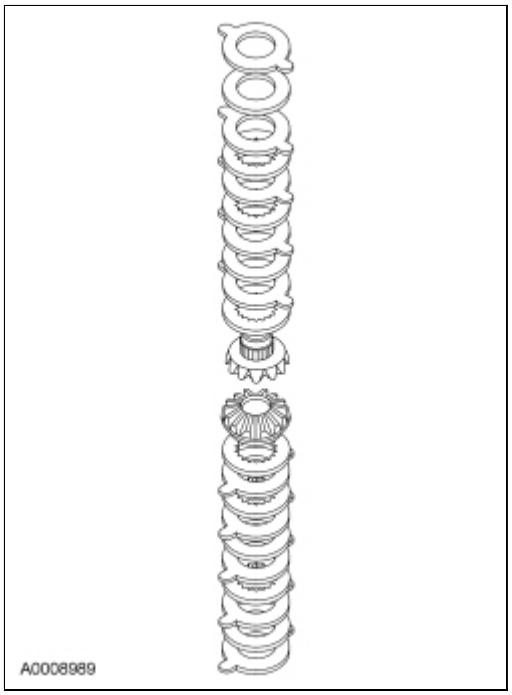
12. **NOTE:** Differential pinion gear thrust washers cannot be removed independently of the differential pinion gears.

    Insert the Differential Rotator in the pinion shaft bore, and turn the differential case to "walk" the differential pinion gears and differential case windows.



repair4less

13. Remove the differential pinion gears and differential pinion gear thrust washers.



14. Remove the differential side gears and differential clutch packs with the selective shim and Belleville spring, tag them RH and LH.

15. ***NOTICE:*** **Do not use acids or solvents when cleaning the differential clutch pack or damage to the components can result. Wipe components with a clean, lint-free cloth only.**

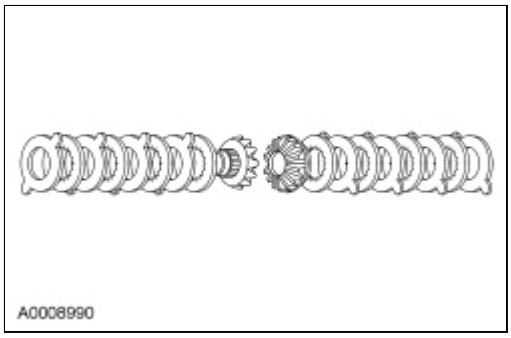
    NOTE: When separating the clutch plates and clutch disc, note the sequence in which they are disassembled. They must be reassembled in the same sequence.

    Separate the differential clutch disc and clutch plates for cleaning and inspection.

Assembly

1. **NOTE:** Use 118 ml (4 oz) of the specified friction modifier in the axle.

   Pre-lubricate each steel clutch plate and soak all friction plates with friction modifier for at least 15 minutes.

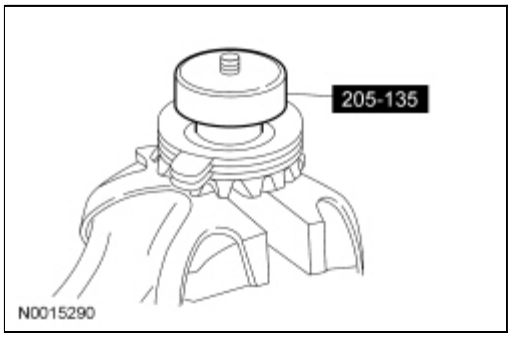


2. **NOTE:** Do not mix the differential clutch packs or selective shims from one side with the other.

   NOTE: The Belleville spring is a dished plate.

   Assemble the differential clutch packs (without the selective shims and Belleville spring) on the respective differential side gears.

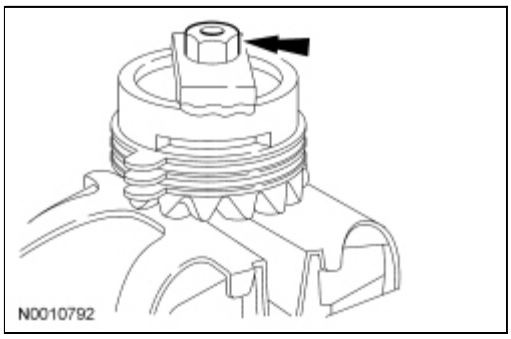
repair4less



3. **NOTE:** Make sure the correct mandrel is used with the Differential Clutch Gauge.

   Place the base portion of the Differential Clutch Gauge in a vise. Install the differential clutch pack and differential side gear (without the selective shim or Belleville spring) on the gauge.

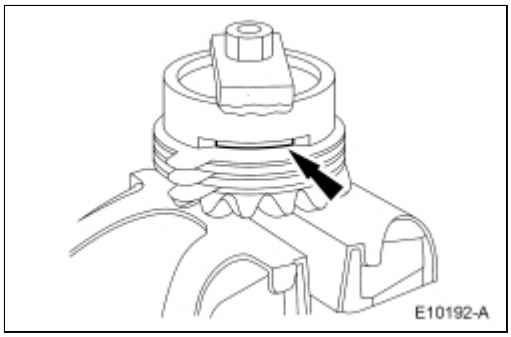
4. Position the Differential Clutch Gauge hand-tight on top of the differential clutch pack.



5. Install the Differential Clutch Gauge over the disc and differential clutch pack.

6. Install the nut of the gauge over the top and base stud.

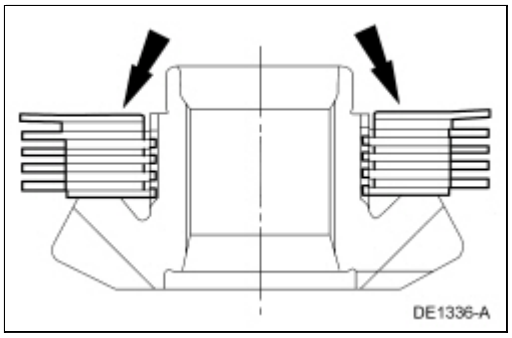
- Tighten to 7 Nm (62 lb-in).



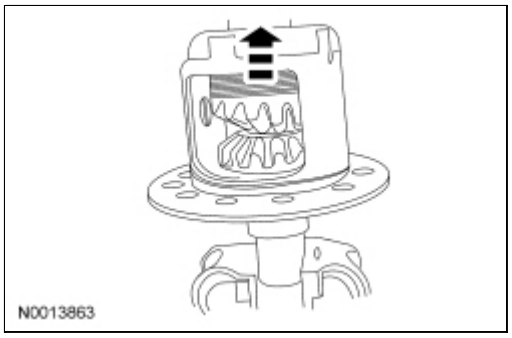
7. **NOTE:** Selective shims shown are available as part of the Clutch Pack Replacement Kit.

   Use the feeler gauge and select the thickest blade that will enter between the tool and the differential clutch pack. Refer to the chart to determine which shim to use.

   Selective Shims



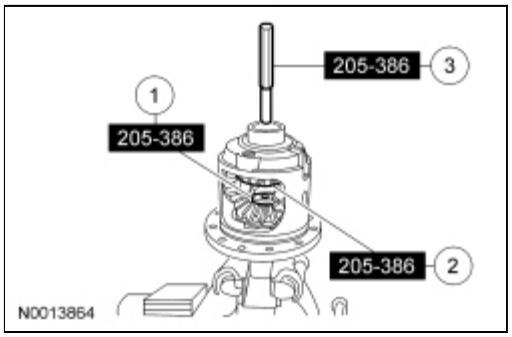
Feeler Gauge	Part Number	Description
0.096-0.104	E0AZ-4A324-G	0.025 in
0.105-0.109	E0AZ-4A324-H	0.030 in
0.110-0.114	E0AZ-4A324-C	0.035 in
0.115-0.190	E0AZ-4A324-D	0.040 in
0.120-0.125	E0AZ-4A324-F	0.045 in



8. Remove the Differential Clutch Gauge from the clutch pack and differential side gear assembly.

9. Place the selective shim and Belleville spring on the differential clutch pack.
   - The dished or concave side of the Belleville spring must face up against the thrust face of the differential case.

repair4less

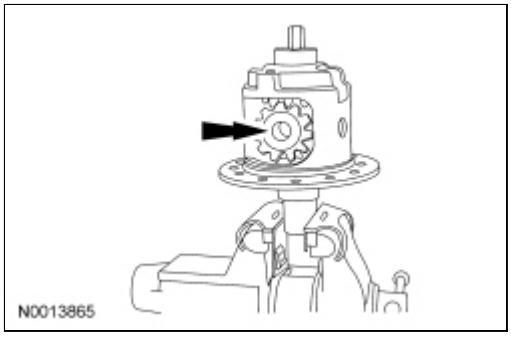


10. Install the differential side gears with the differential clutch packs, selective shims and Belleville spring into the differential case.
    - Hold the differential side gear assembly in place to prevent it from falling out of the differential case.

11. **NOTE:** Apply a small amount of grease to the step plate bore.

    NOTE: If necessary, insert the dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

    Assemble the Differential Gauge to the differential case.
    1. Position the Differential Gauge step plate in the bottom differential side gear.
    2. Position the Differential Gauge in the top differential side gear and hold it in place.
    3. Install the Differential Gauge and tighten it 2 turns after it contacts the bottom step plate.



12. **NOTE:** Lubricate both sides of the differential pinion gear thrust washers with axle lubricant.

    NOTE: Make sure the differential pinion gears are 180 degrees apart so they will align correctly with the pinion shaft bore.

    Position the differential pinion gears and differential pinion gear thrust washers in the window of the

differential case so they mesh with the differential side gear teeth.

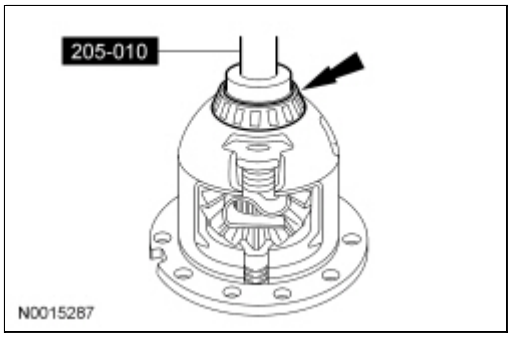
13. **NOTE:** It will probably be necessary to loosen or tighten the forcing screw to allow the differential pinion gears and differential side gears to rotate.

    Inspect the Differential Rotator into the pinion shaft bore, and turn the differential case. This will cause the differential pinion gears to engage the differential side gear and "walk" into the differential case. Rotate the differential case until the pinion shaft mating holes are lined up exactly with the holes in the differential pinion gears.

14. Remove the special tools.

15. **NOTE:** If a new differential pinion shaft lock bolt is unavailable, coat the threads of the original differential pinion shaft lock bolt with threadlock prior to installation.

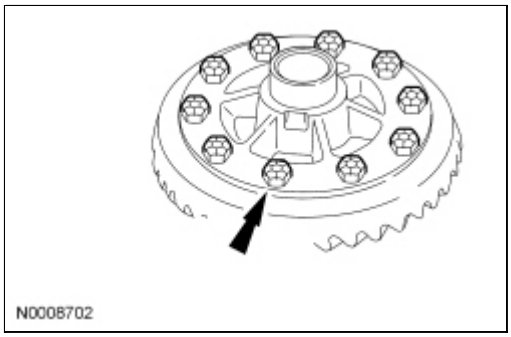
    Install the differential pinion shaft, then a new differential pinion shaft lock bolt finger-tight.



16. Check the torque required to rotate one differential side gear.
    - Mount the differential assembly and Differential Clutch Gauge in a vise.
    - The initial minimum break-away torque, if original clutch plates are used, must be within specification. The minimum rotating torque required to keep the differential side gear turning

repair4less

with new clutch plates may vary.



17. Using the Differential Side Bearing Installer, install the 2 differential bearings on the differential case.

18. Position the differential ring gear and the differential case. Align the bolt holes by hand-starting 2 new bolts through the holes in the differential case and into the differential ring gear.

19. Hand-start the 8 remaining new differential ring gear bolts. Tighten the 10 bolts in 2 stages.
    - Stage 1: Tighten to 60 Nm (44 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

20. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

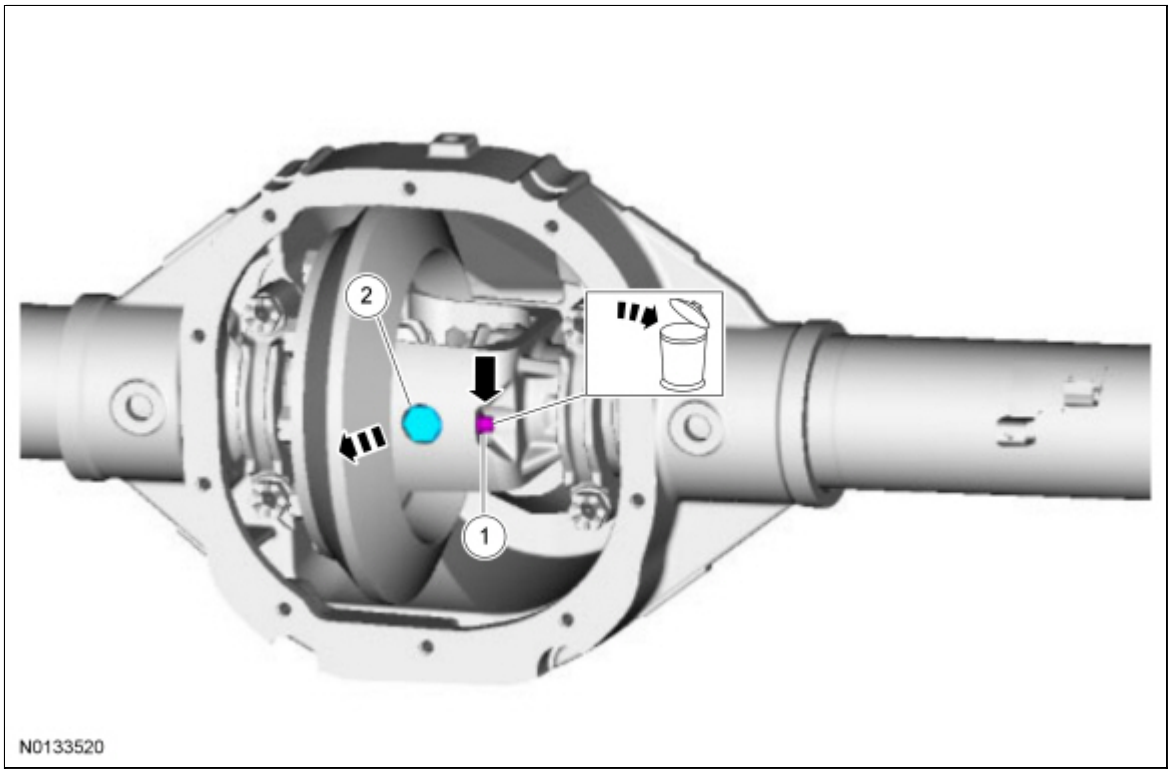
Axle Shaft

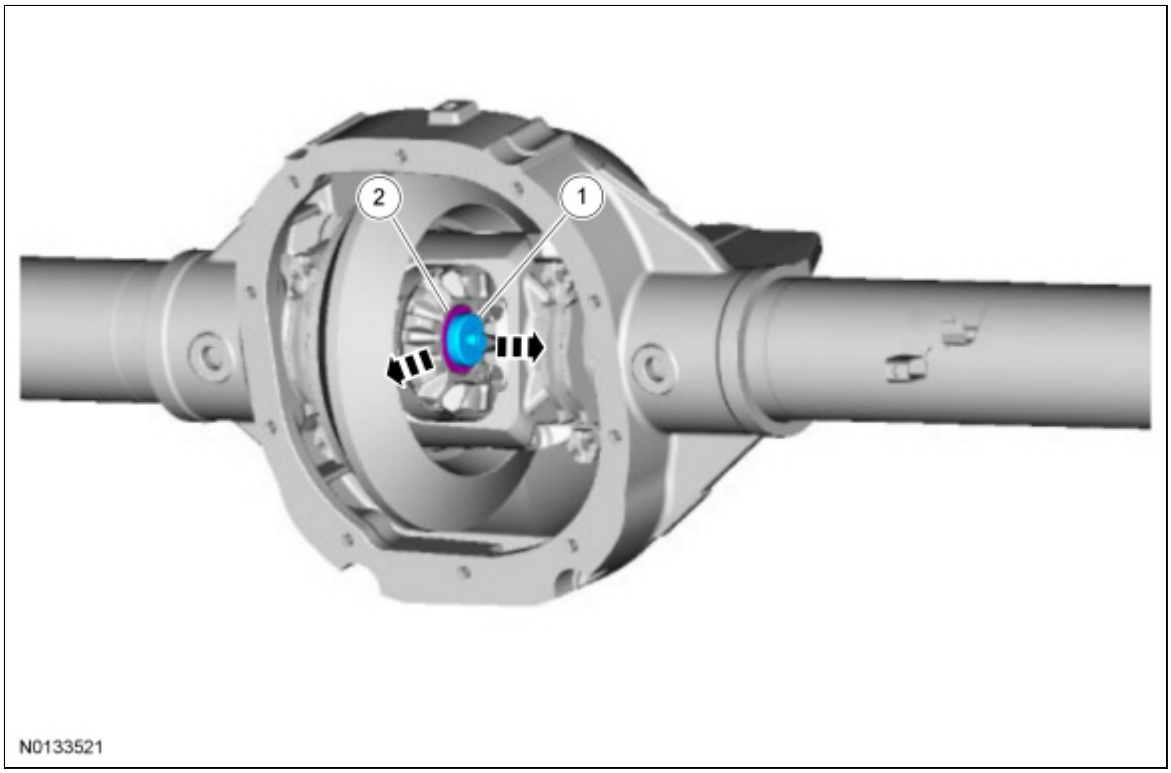
Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Threadlock and Sealer TA-25	WSK-M2G351-A5



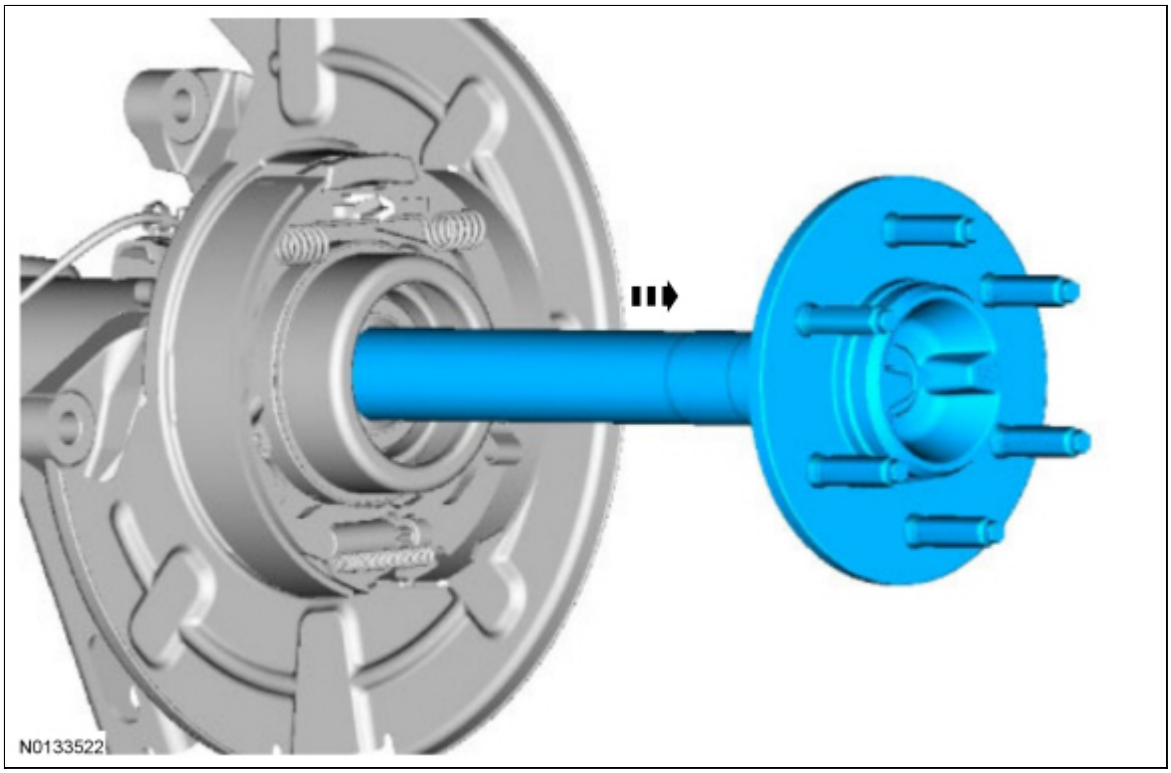
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire. For additional information, refer to Section 204-04 .
3. Remove the rear brake disc. For additional information, refer to Section 206-04 .
4.
   - To install, tighten to 15 Nm (133 lb-in).



5. Remove the differential housing cover and drain the lubricant. For additional information, refer to Differential Housing Cover in this section.

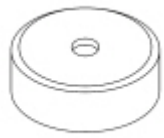
6. Discard the specified component. Follow local disposal regulations.
    - To install, tighten to 30 Nm (22 lb-ft).

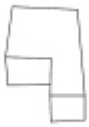


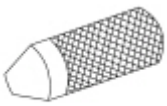
7.

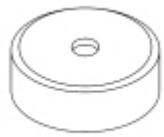
repair4less

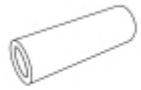
8.

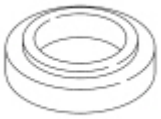


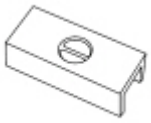


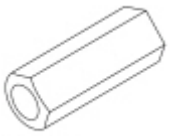


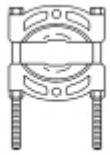












9. To install, reverse the removal procedure.
    - Inspect and lubricate the lip of the wheel bearing oil seal with grease.

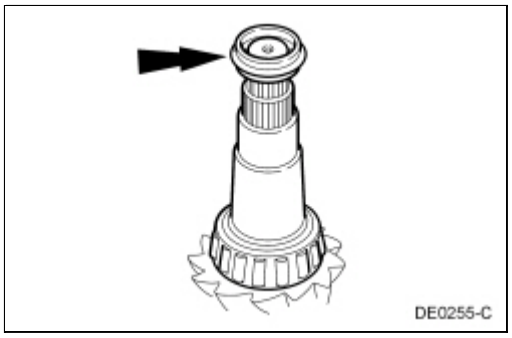
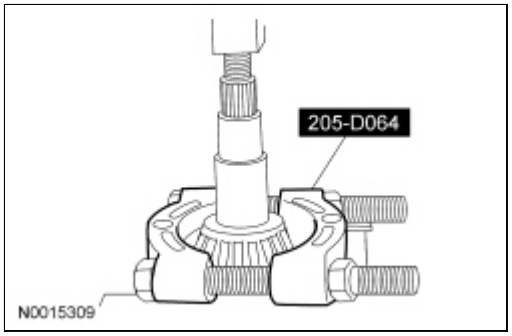
4	—	Differential bearing caps (part of 4010) (2 required)
5	4067	Differential bearing shims (2 required)
6	4222	Differential bearing cups (2 required)
7	4221	Differential bearings (2 required)
8	4216	Ring gear bolt (10 required)

9	4204	Differential assembly
10	4209	Ring gear
10	4209	Drive pinion
11	4663	Pinion bearing alignment shim
12	—	Inner pinion bearing cup (part of 4625)
13	4625	Inner pinion bearing
14	4662	Collapsible spacer (part of 4320)
15	—	Outer pinion bearing cup (part of 4621)
16	4621	Outer pinion bearing
17	4670	Oil slinger
18	4676	Drive pinion oil seal
19	4851	Drive pinion flange
20	4C121	Drive pinion nut (part of 4320)

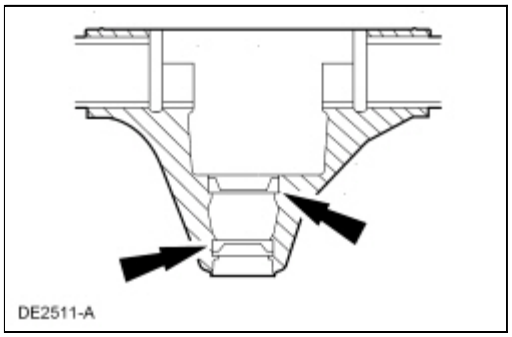


Removal

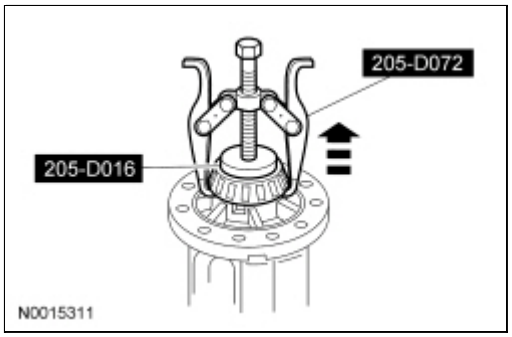
1. Remove the drive pinion seal. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.
2. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.
3. Remove the axle drive pinion shaft oil slinger.
4. Using the Drive Pinion Thread Protector and a soft-faced hammer, drive the pinion assembly out of the outer pinion bearing and remove it through the rear of the differential housing.



5. Remove the outer pinion bearing.
6. Remove the drive pinion collapsible spacer and discard it.



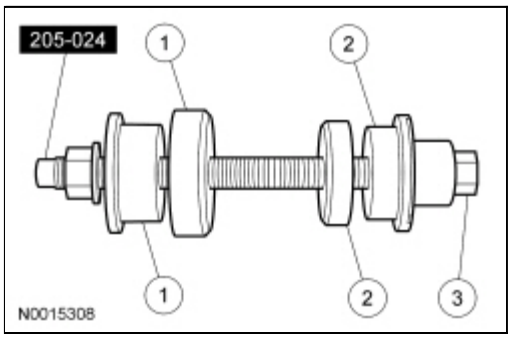
repair4less



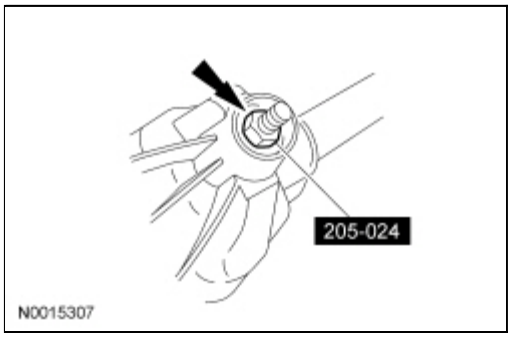
7. Using the Bearing Puller and a suitable press, remove the inner pinion bearing.

8. Using a brass drift, remove the pinion bearing cups by tapping alternately on opposite sides of the bearing cups.

9. Using the 2 Jaw Puller and Step Plate, remove the 2 differential bearings.



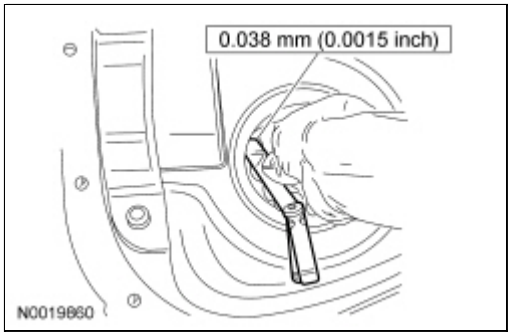
Installation



1. Position the Drive Pinion Bearing Cup Installer and the inner and outer bearing cups in their

respective bores.

1. After placing the inner and outer bearing cups in their respective bores, place the Drive Pinion Bearing Cup Installer on the inner bearing cup.
2. Place the Drive Pinion Bearing Cup Installer on the outer bearing cup.
3. Install the Drive Pinion Bearing Cup Installer.



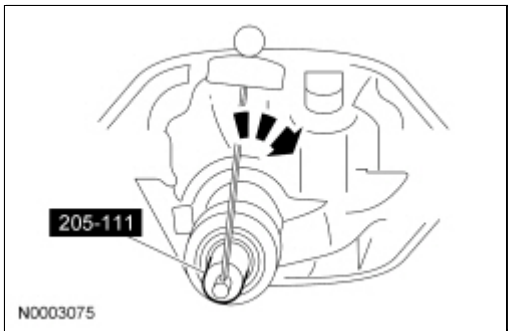
2. Tighten the Drive Pinion Bearing Cup Installer to seat the pinion bearing cups in their bores.

3. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

   Make sure the differential pinion bearing cups are correctly seated.

4. **NOTE:** Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Assemble and position the Adapters.

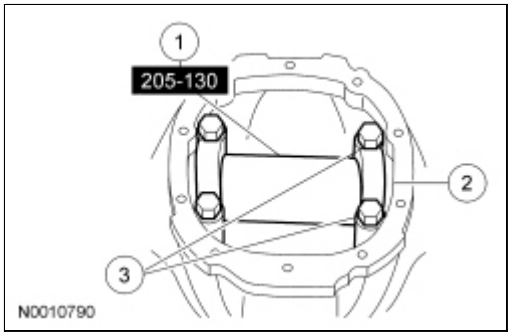


repair4less

Item	Part Number	Description
1	205-105	Adapter for 205-S127 (1.612 in OD) (T76P-4020-A3)
2	205-111	Adapter for 205-S127 (T76P-4020-A11)
3	4621	Drive pinion bearing (outer)
4	205-109	Adapter for 205-S127 (T76P-4020-A9)
5	4630	Drive pinion bearing (inner)
6	205-129	Adapter for 105-S127 (1.1884 in thick) (T79P-4020-A18)
7	205-110	Adapter for 205-S127 (1.7 in thick) (T76P-4020-A10)

5. **NOTE:** This step duplicates final drive pinion bearing preload.

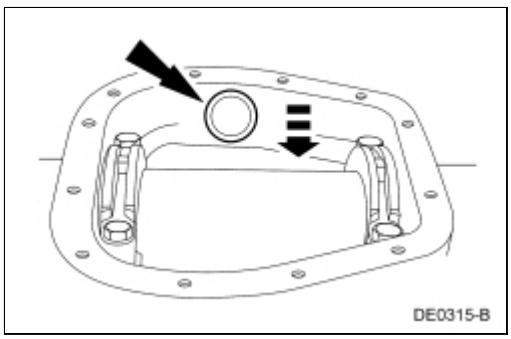
   Tighten the Adapter.
   - Tighten to 2.2 Nm (20 lb-in) rotational torque.



6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

   Rotate the Adapter several half turns to make sure of correct seating of the drive pinion bearings and

position the Adapter.

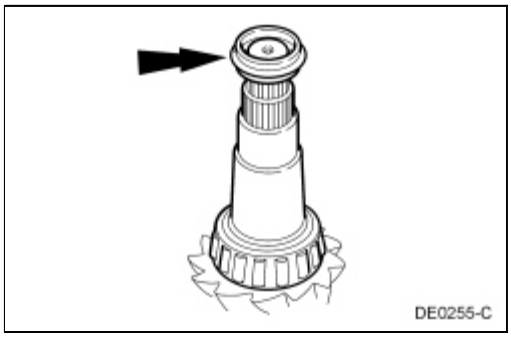


7. Install the Adapter.
    1. Position the gauge tube.
    2. Install the 2 differential bearing caps.
    3. Install the 4 differential bearing cap bolts.
        - Tighten to 112 Nm (83 lb-ft).

8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

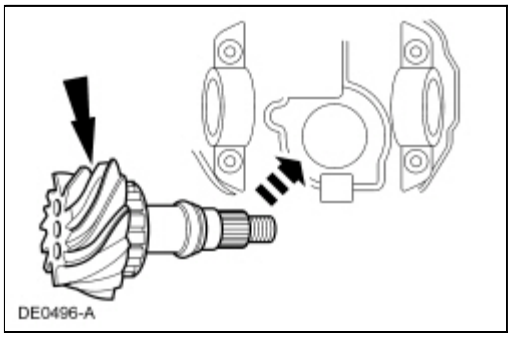
    NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between Adapter and gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

    Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.
    - After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the Adapters.



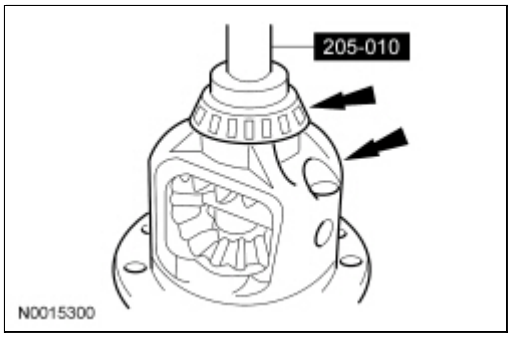
9. Using the Shaft Bearing Cone Installer and Bearing Oil Seal Plate and a shop press, drive the inner

repair4less



drive pinion bearing and drive pinion bearing adjustment shim until they are firmly seated on the pinion shaft.

10. Install a new drive pinion collapsible spacer on the pinion shaft against the pinion shaft shoulder.

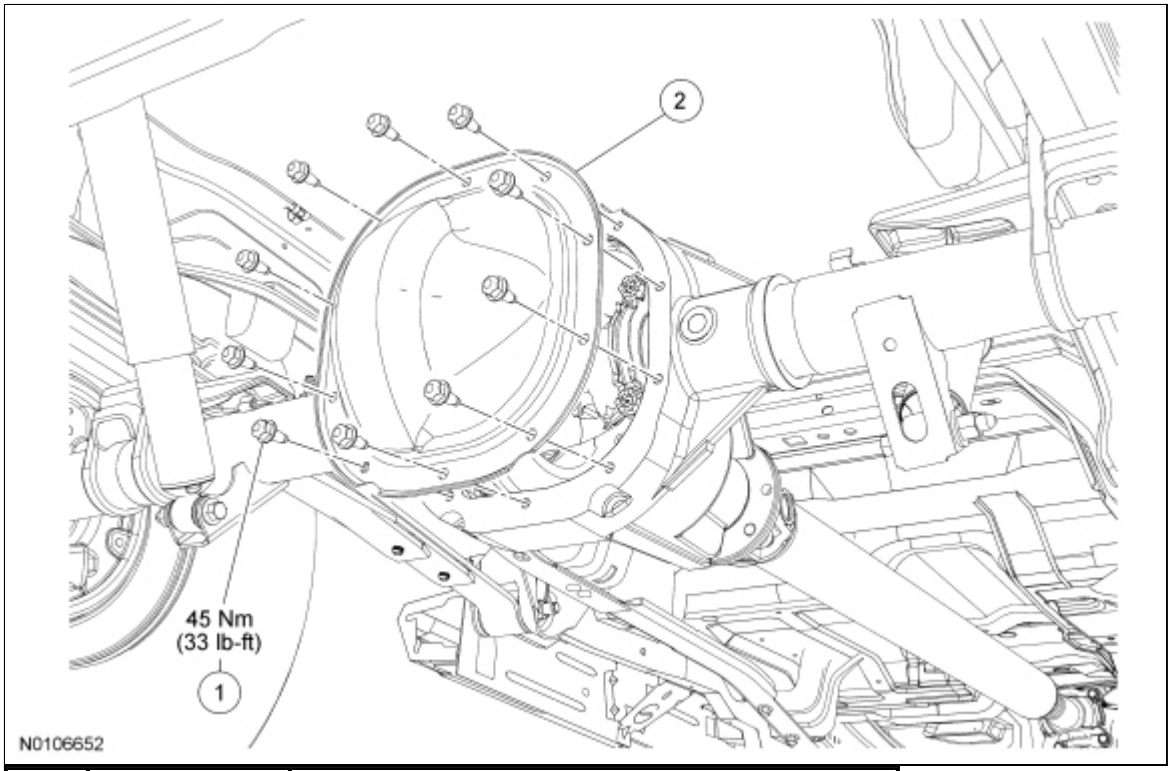


11. Install the drive pinion assembly into the axle housing.

12. Install the outer drive pinion bearing and the drive pinion shaft oil slinger.

13. Install the drive pinion seal and flange. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.

14. Using the Differential Side Bearing Installer, install the 2 new differential bearings.



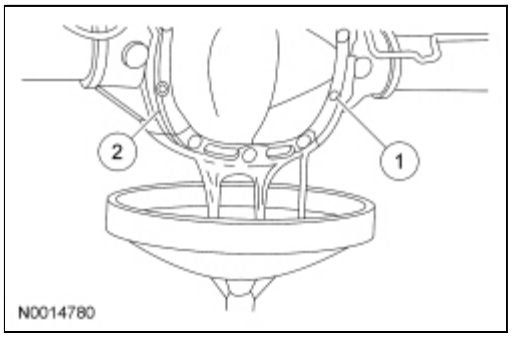
15. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

repair4less

Differential Housing Cover

Material

Item	Specification
Additive Friction Modifier XL-3 (US); CXL-3 (Canada)	EST-M2C118-A
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

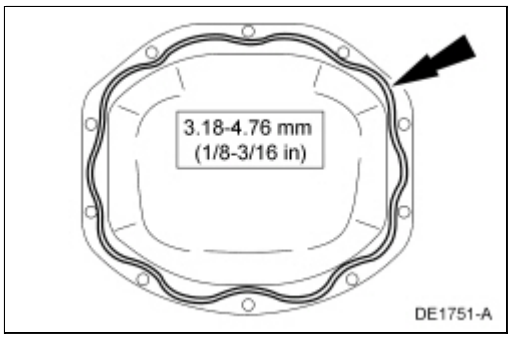


Item	Part Number	Description
1	4346	Differential housing cover bolt (10 required)
2	4033	Differential housing cover

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the differential housing cover.
    1. Remove the 10 differential housing cover bolts and drain the lubricant from the axle housing.
    2. Remove the differential housing cover.



Installation

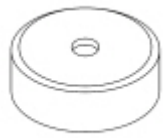
1. **NOTE:** The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the silicone sealant. Cover the inside of the rear axle prior to cleaning the machined surface to prevent contamination.

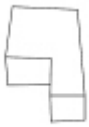
   Clean the gasket mating surfaces.

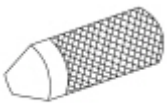
2. Apply a new continuous bead of sealant to the differential housing cover.

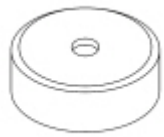
3. **NOTE:** The differential housing cover must be installed within 15 minutes of application of the silicone sealant, or new sealant must be applied. If possible, allow one hour before filling the axle housing with axle lubricant to make sure the silicone sealant has correctly cured.

   Install the differential housing cover and the 10 differential housing cover bolts.
   - Tighten to 45 Nm (33 lb-ft).









repair4less

4. **NOTE:** When filling a Traction-Lok axle with new lubricant, first fill the axle with 118 ml (4 oz) of friction modifier.

   Remove the filler plug, fill the axle with 2.8L (6.0 pt) of axle lubricant and install the filler plug.
   - Tighten to 52 Nm (38 lb-ft).

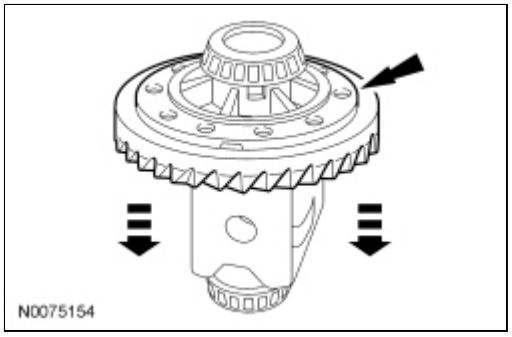
18	4676	Drive pinion oil seal
19	4851	Drive pinion flange
20	4C121	Drive pinion nut (part of 4320)

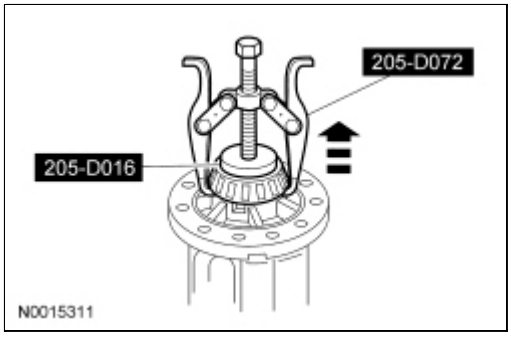
Removal

1. Remove the drive pinion flange seal. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.



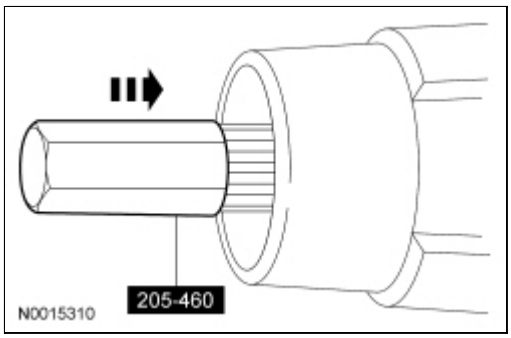
2. Remove the differential carrier assembly. For additional information, refer to Differential Carrier in this section.

3. Remove and discard the 10 differential ring gear bolts.

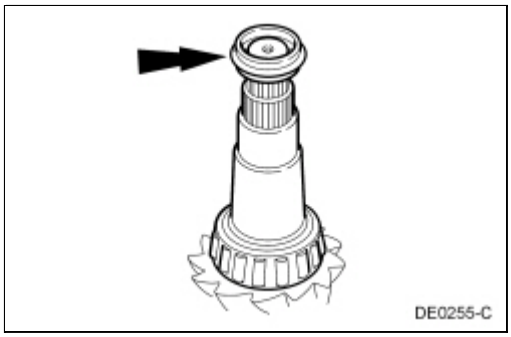


4. **NOTE:** Care should be taken not to damage the differential ring gear bolt hole threads.

   Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

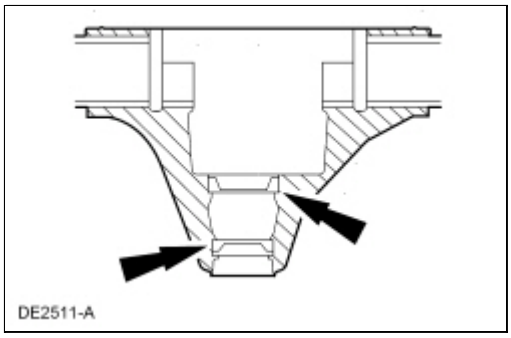


5. Using the 2 Jaw Puller and Step Plate, remove the differential bearings.

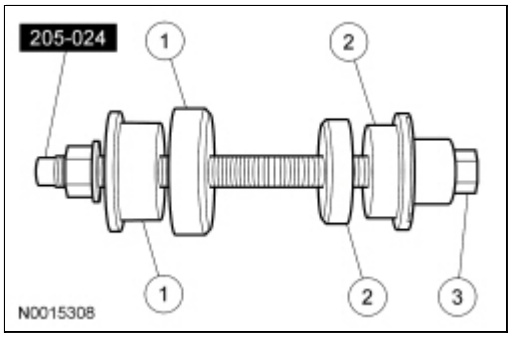


6. Remove the drive pinion shaft oil slinger and the outer drive pinion bearing.

7. Install the Drive Pinion Thread Protector. Using a soft-faced hammer, drive the pinion assembly out of the axle housing.

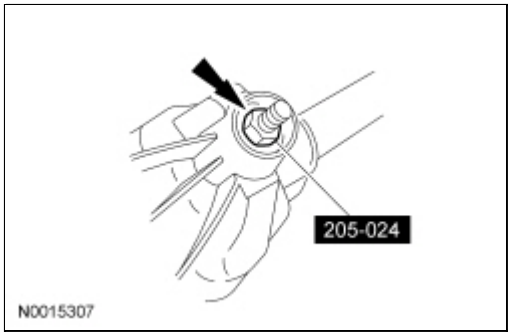


8. Remove and discard the drive pinion collapsible spacer.



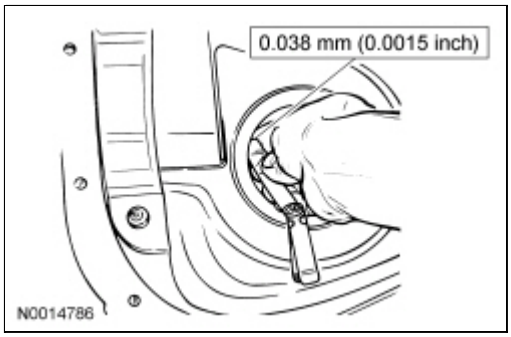
9. Using a brass drift, remove the drive pinion bearing cups by tapping alternately on opposite sides of the drive pinion bearing cups.

repair4less

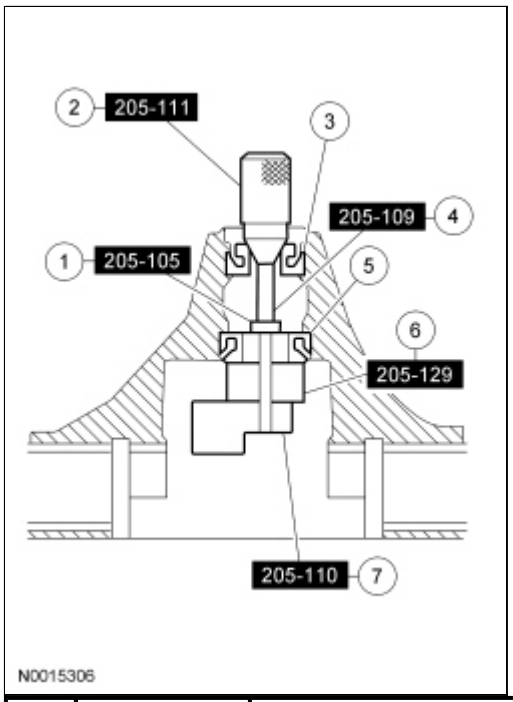


Installation

1. Position the Drive Pinion Bearing Cup Installer and the inner and outer drive pinion bearing cups in their respective bores.
    1. After placing the inner and outer drive pinion bearing cups in their bores, place the Drive Pinion Bearing Cup Installer (inner) on the inner drive pinion bearing cup.
    2. Place the Drive Pinion Bearing Cup Installer (outer) on the outer drive pinion bearing cup.
    3. Install the Drive Pinion Bearing Cup Installer.



2. Tighten the Drive Pinion Bearing Cup Installer to seat the drive pinion bearing cups into their bores.

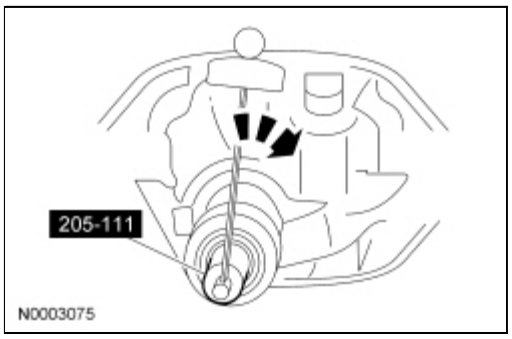


3. **NOTE:** If a feeler gauge can be inserted between a drive pinion bearing cup and the bottom of its bore at any point around the drive pinion bearing cup, the drive pinion bearing cup is not correctly seated.

   Make sure the drive pinion bearing cups are correctly seated in their bores.

4. **NOTE:** Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

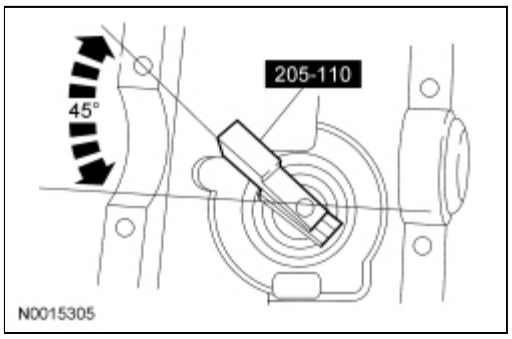
   Assemble and position the Adapters.



Item	Part Number	Description
1	205-105	Adapter for 205-S127 (1.612 in OD) (T76P-4020-A3)
2	205-111	Adapter for 205-S127 (T76P-4020-A11)
3	4621	Drive pinion bearing (outer)
4	205-109	Adapter for 205-S127 (T76P-4020-A9)
5	4630	Drive pinion bearing (inner)
6	205-129	Adapter for 105-S127 (1.1884 in thick) (T79P-4020-A18)
7	205-110	Adapter for 205-S127 (1.7 in thick) (T76P-4020-A10)

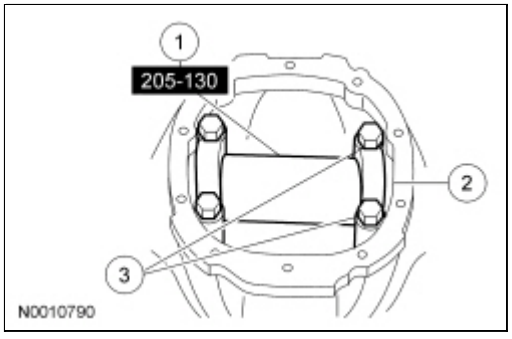
5. **NOTE:** This step duplicates final drive pinion bearing preload.

   Tighten the Adapter.



repair4less

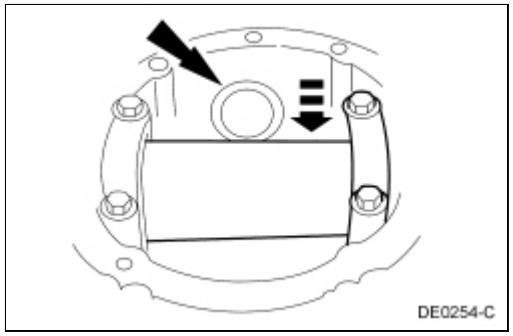
- Tighten to 2.2 Nm (20 lb-in) rotational torque.



6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

   Rotate the Adapter several half-turns to make sure of correct seating of the drive pinion bearings and position the Adapter.

7. Install the Adapter.
   1. Position the Adapter.
   2. Install the 2 differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 112 Nm (83 lb-ft).

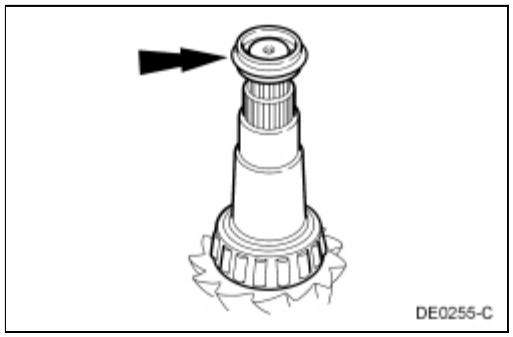


8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

   NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the Adapter and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

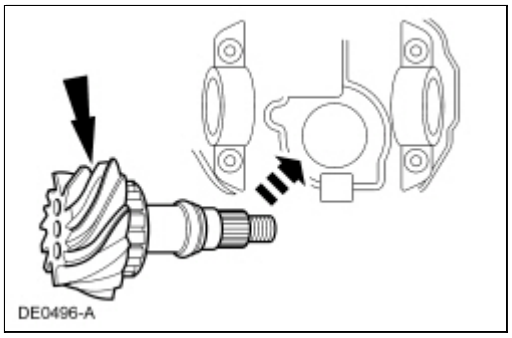
   Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim

selection.

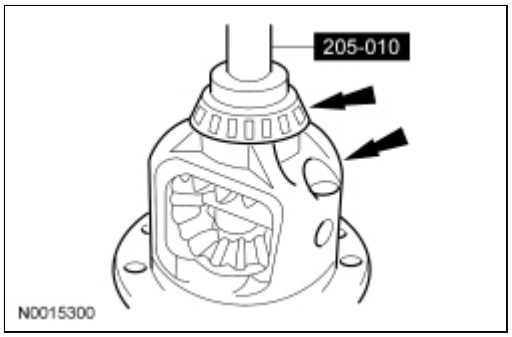


- After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

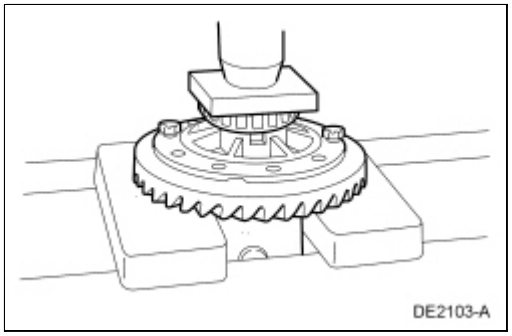
9. Using the Shaft Bearing Cone Installer and Bearing Oil Seal Plate and a shop press, drive the inner drive pinion bearing and the selected drive pinion bearing adjustment shim until they are firmly seated on the pinion shaft.



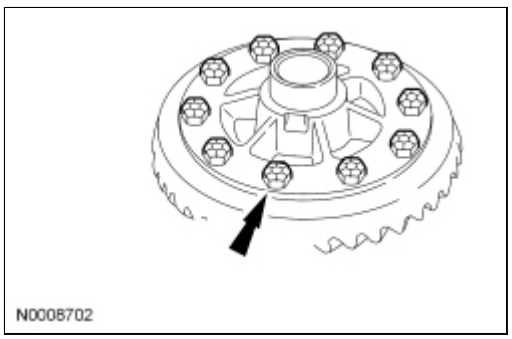
10. Install a new drive pinion collapsible spacer on the pinion shaft against the pinion shaft shoulder.



11. Install the drive pinion assembly into the axle housing.



repair4less

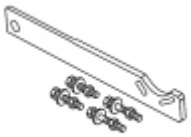


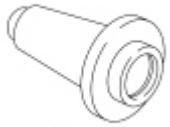
12. Install the outer drive pinion bearing and the drive pinion shaft oil slinger.
13. Using the Differential Side Bearing Installer, install the 2 new differential bearings.

14. Using 2 ring gear bolts as a guide, press the ring gear on the differential assembly.

15. Install the 10 new differential ring gear bolts. Tighten in 2 stages.
    - Stage 1: Tighten to 60 Nm (44 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

16. Install the drive pinion seal and flange. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.





17. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

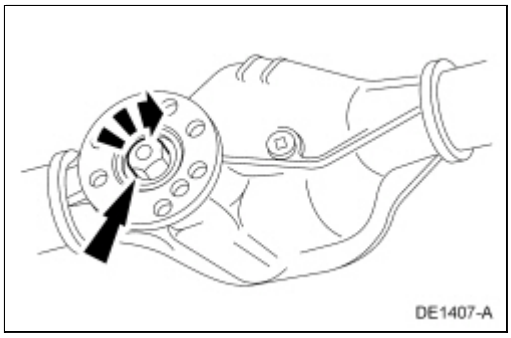
Drive Pinion Flange and Drive Pinion Seal

Special Tool(s)

 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E)
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

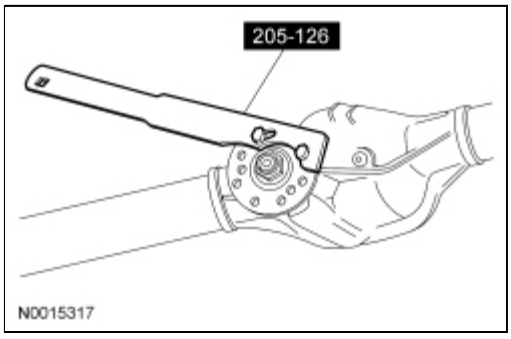
Material

Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



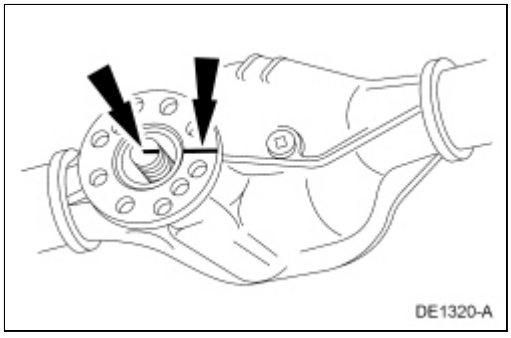
Item	Part Number	Description
1	389546	Drive pinion nut
2	4851	Drive pinion flange
3	4676	Drive pinion oil seal

Removal

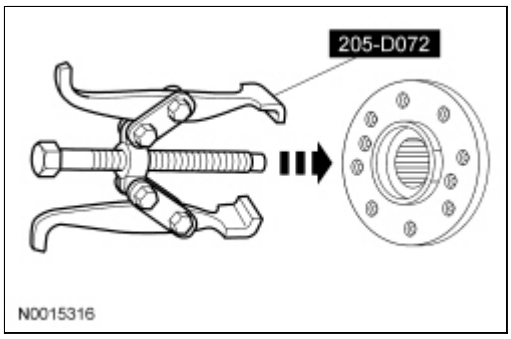


NOTICE: **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**

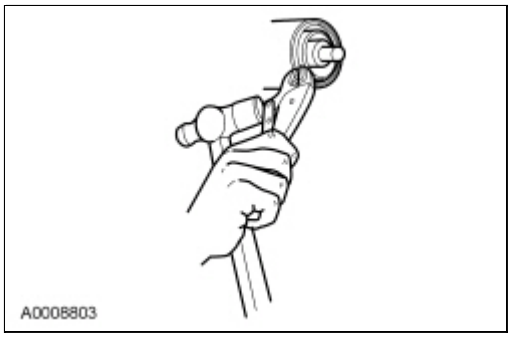
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the brake disc. For additional information, refer to Section 206-04 .
3. Remove the driveshaft. For additional information, refer to Section 205-01 .
4. Using a Nm (lb-in) torque wrench on the pinion nut, record the torque required to maintain rotation of the pinion gear through several revolutions.



repair4less

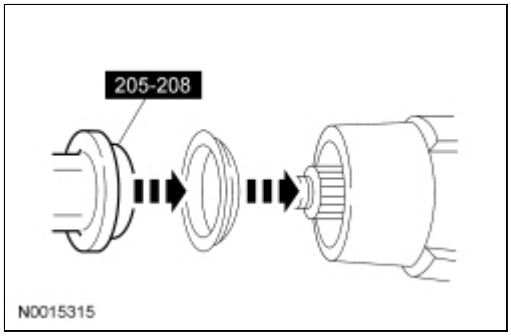


5. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut.



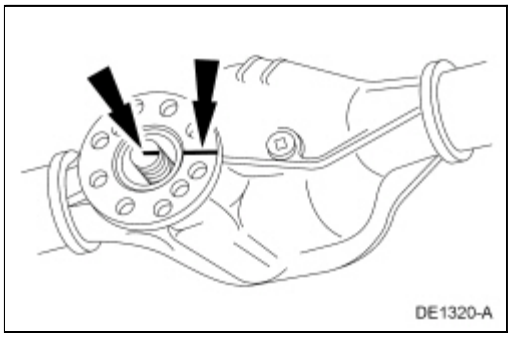
6. Index-mark the pinion flange in relation to the drive pinion stem to make sure of correct alignment during installation.

7. Using the 2 Jaw Puller, remove the pinion flange.



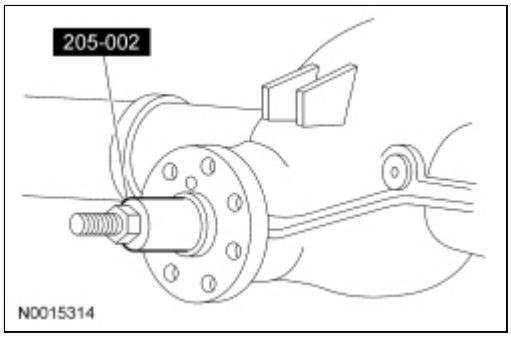
8. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the drive pinion seal is removed.

Installation



1. Lubricate the new drive pinion seal with grease.
2. **NOTE:** If the new drive pinion seal becomes misaligned during installation, remove the drive pinion seal and install a new drive pinion seal.

   Using the Drive Pinion Oil Seal Installer, install a new drive pinion seal.

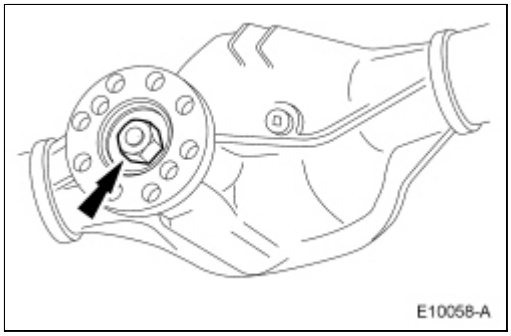


3. Lubricate the pinion flange splines with axle lubricant.
4. **NOTE:** Disregard the scribe marks if a new pinion flange is being installed.

   Align the pinion flange with the drive pinion shaft.

5. Using the Drive Pinion Flange Installer, install the pinion flange.

repair4less

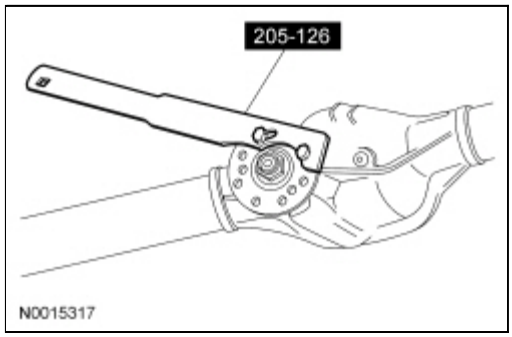


6. ***NOTICE:*** **Install a new pinion nut with the same color as the original if not replacing the collapsible spacer. If a new collapsible spacer is installed, install the nut in the kit or damage to the component may occur.**

   Position the new pinion nut.

   8.8-In Drive Pinion Nut

Part Number	Color Description	Application
389546-S100	Orange	Axles built before 7/16/07
4320	Purple	Axles built after 7/16/07
4C121	Purple	Kit with spacer for all 223.52 mm (8.8 in) axles



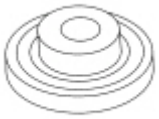
7. ***NOTICE:*** **Under no circumstances is the pinion nut to be backed off to reduce drive pinion bearing preload. If reduced drive pinion bearing preload is required, a new drive pinion collapsible spacer and pinion nut must be installed or damage to the component may occur.**

   NOTICE: **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**

   NOTE: Remove the Drive Pinion Flange Holding Fixture while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

   Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the pinion nut.
   - Rotate the drive pinion occasionally to make sure the drive pinion bearings are seating correctly.
   - Install a Nm (lb-in) torque wrench on the pinion nut.
   - Rotating the drive pinion through several revolutions, take frequent drive pinion bearing preload readings until the original recorded drive pinion bearing preload reading is obtained.

- If the original recorded drive pinion bearing preload is lower than specifications, tighten to the appropriate specifications for used drive pinion bearings. If the drive pinion bearing preload is higher than specification, tighten the pinion nut to the original reading as recorded. For additional information, refer to Specifications in this section.



8. Install the driveshaft. For additional information, refer to Section 205-01 .
9. Install the brake disc. For additional information, refer to Section 206-04 .

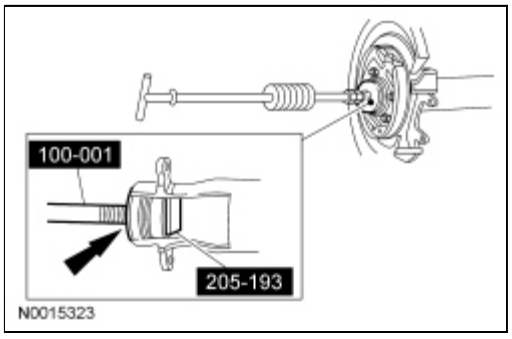
Rear Wheel Bearing and Axle Shaft Seal

Special Tool(s)

 ST1326-A	Adapter For 303-224 (Handle) 205-153 (T80T-4000-W)
 ST1322-A	Installer, Axle Bearing 205-194 (T83T-1225-B)
 ST1736-A	Installer, Axle Oil Seal 205-381 (T97T-1177-A)
 ST1283-A	Remover, Axle Bearing 205-193 (T83T-1225-A)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



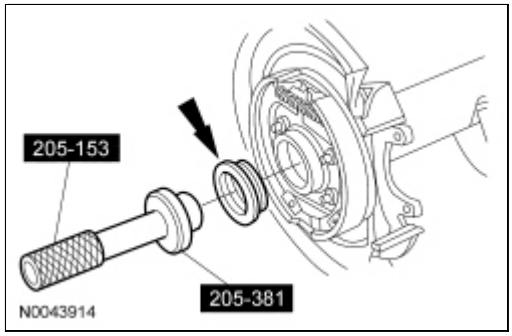
Item	Part Number	Description
1	1177	Axle shaft oil seal
2	1225	Axle shaft bearing

Removal

1. Remove the axle shaft. For additional information, refer to Axle Shaft in this section.
2. **NOTE:** If the axle shaft oil seal is leaking, the axle housing vent may be plugged with foreign material.

   NOTE: Use care to avoid damaging the axle shaft oil seal bore.

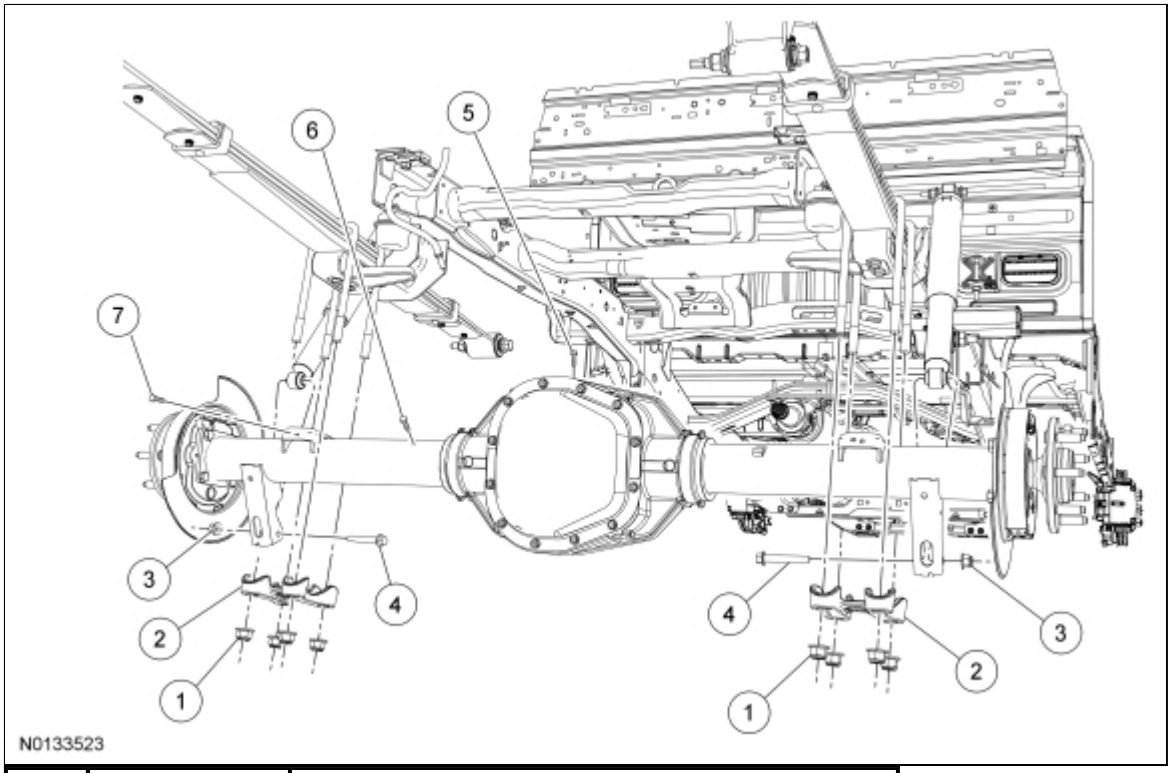
   Using a suitable seal remover, remove and discard the axle shaft oil seal.
3. Inspect the rear wheel bearing and axle shaft for wear or damage.
4. If necessary, using the Axle Bearing Remover and Slide Hammer, remove the rear wheel bearing.



repair4less

Installation

1. If removed, lubricate the new rear wheel bearing with axle lubricant.
2. If removed, use the Axle Bearing Installer and Handle to install the rear wheel bearing.



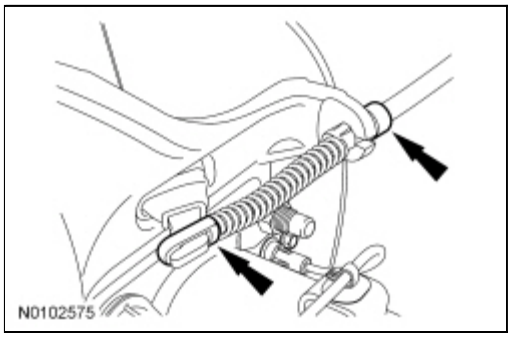
3. Lubricate the lip of the new axle shaft oil seal with grease.
4. Using the Axle Oil Seal Installer and Handle, install the new axle shaft oil seal.

5. Install the axle shaft. For additional information, refer to Axle Shaft in this section.

repair4less

Axle Assembly

Item	Part Number	Description
1	W705518	U-bolt nuts (8 required)
2	5798	U-bolt plates (2 required)
3	W520214	Lower shock absorber nuts (2 required)
4	W506545	Lower shock absorber bolts (2 required)
5	57632	Brake tube/parking brake cable bracket bolt
6	4022	Axle vent
7	W712215	Brake hose bracket bolt

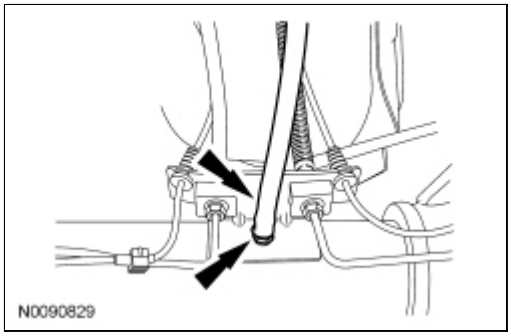


Removal and Installation

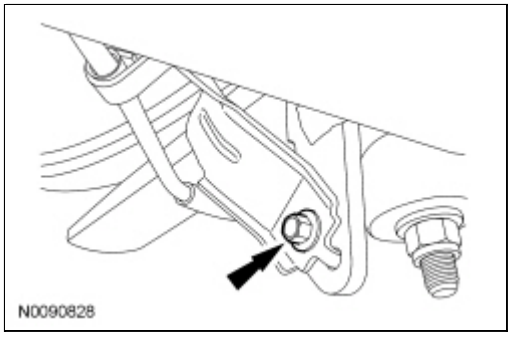
NOTICE: **Suspension fasteners are critical components because they affect performance of vital components and systems and their failure can result in major service expense. Install new components with the same component number or an equivalent component if installation is necessary. Do not use an installation component of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these components.**

1. Remove the driveshaft. For additional information, refer to Section 205-01 .
2. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.

3. Release the parking brake cable tension. For additional information, refer to Section 206-05 .



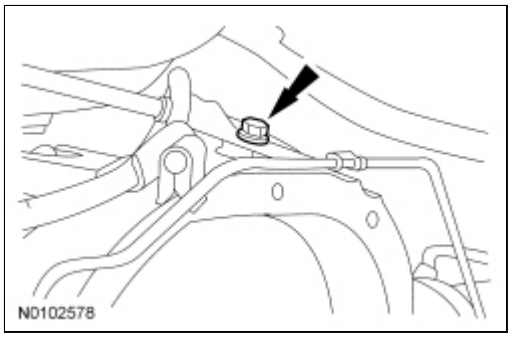
4. Disconnect the parking brake cables.



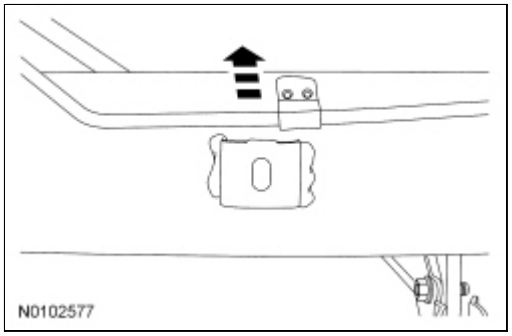
5. Disconnect the wheel speed sensor harness retainers from the axle.

NOTE: If the vent hose is disconnected from the vehicle body, a new retainer must be installed.

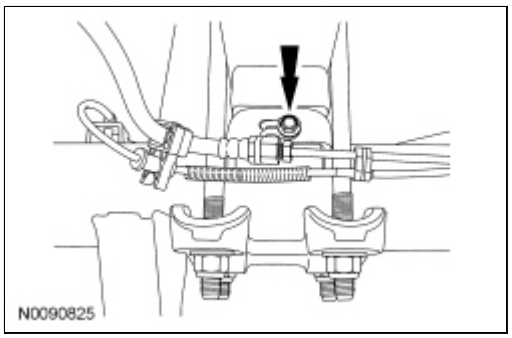
6. Disconnect the vent hose and remove the axle vent.
    - To install, tighten to 18 Nm (159 lb-in).



7. Remove the RH parking brake cable bracket bolt.
    - To install, tighten to 30 Nm (22 lb-ft).

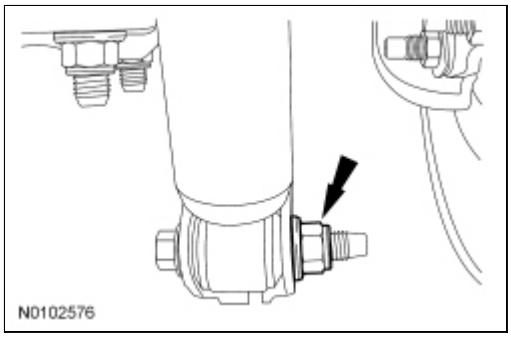


8. Remove the brake tube/parking brake cable bracket bolt.
    - To install, tighten to 25 Nm (18 lb-ft).



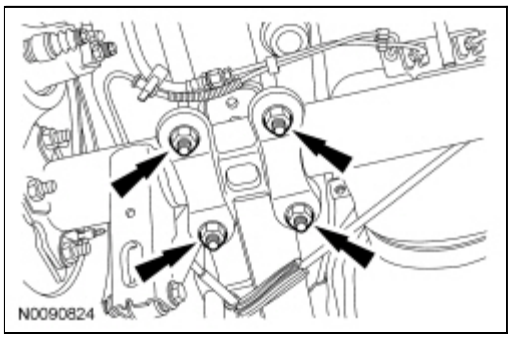
repair4less

9. Disconnect the brake tube from the brake tube retaining clip.



10. Remove the 2 brake hose bracket bolts.
    - To install, tighten to 30 Nm (22 lb-ft).

11. Support the axle with a suitable transmission jack.



12. **WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.**

    Remove and discard the 2 lower shock absorber nuts and 2 bolts.
    - To install, tighten the new nuts to 90 Nm (66 lb-ft).

13. ***NOTICE:*** **Final tightening of the U-bolt nuts must be done with the suspension at curb height or incorrect clamp load may occur.**

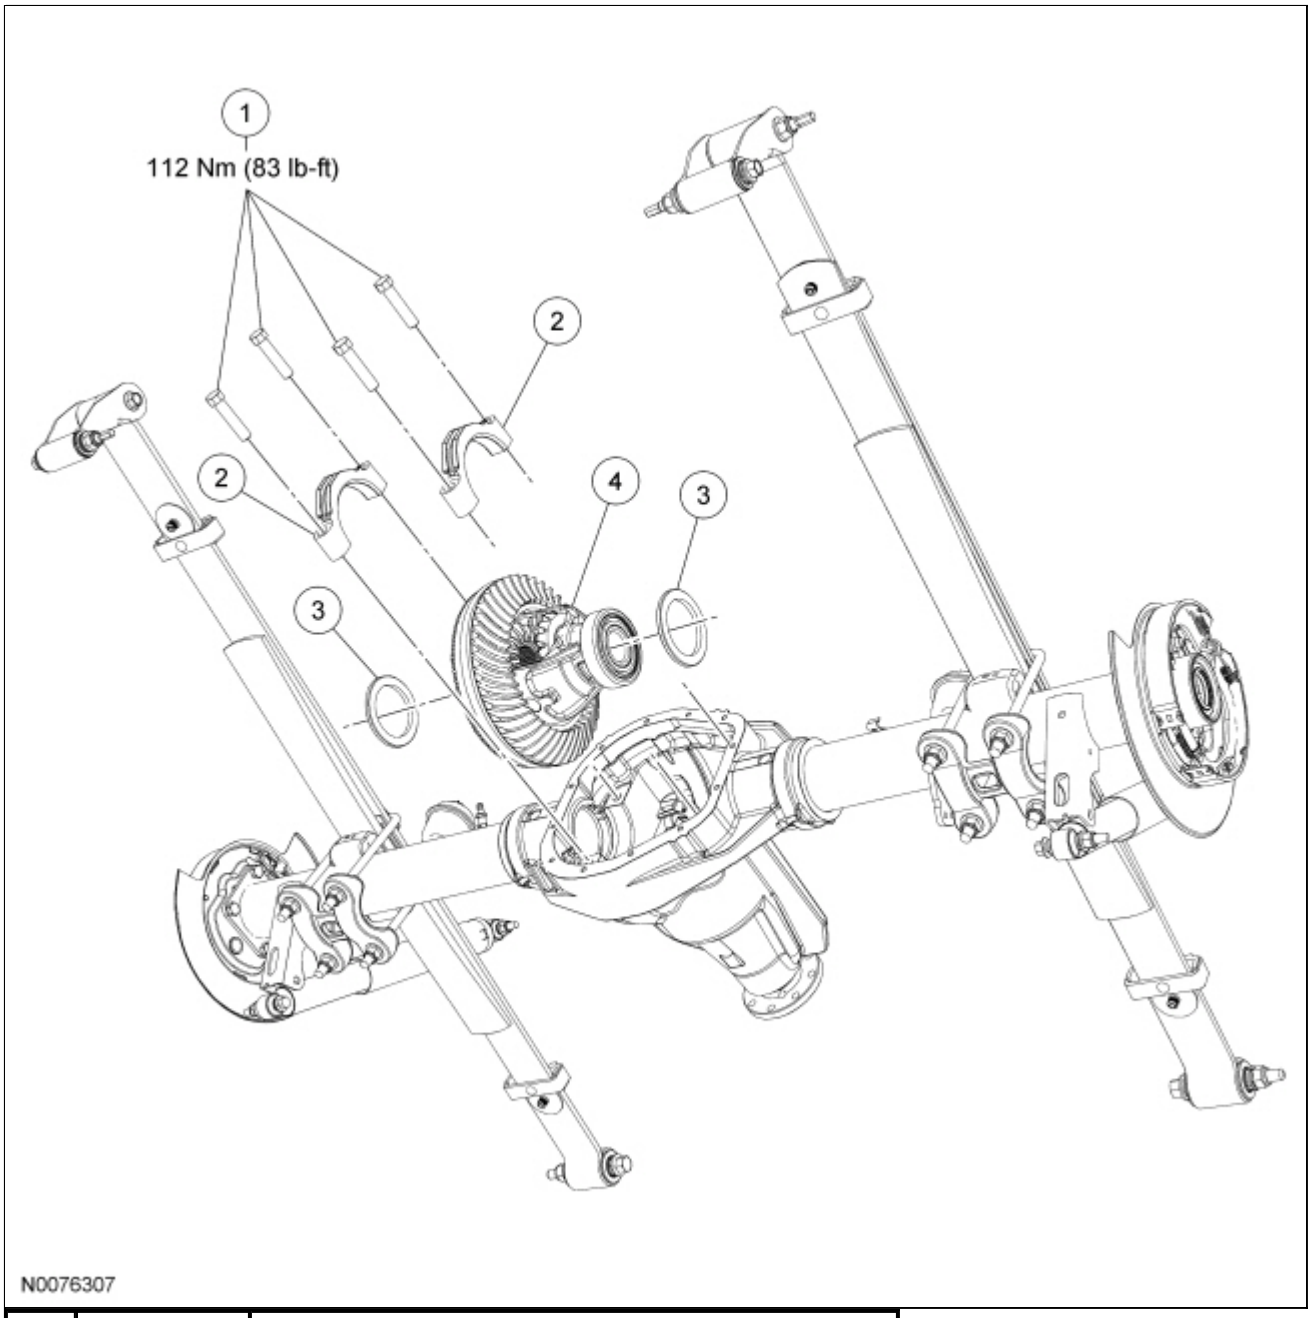
    Remove and discard the 8 U-bolt nuts and the 4 U-bolts.
    - To install, with the suspension at curb height, tighten the new nuts evenly in a cross-type pattern in 4 stages.
        - Stage 1: Tighten to 35 Nm (26 lb-ft).
        - Stage 2: Tighten to 70 Nm (52 lb-ft).
        - Stage 3: Tighten to 100 Nm (74 lb-ft).
        - Stage 4: Tighten to 133Nm (98 lb-ft).

14. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    Lower and remove the axle assembly.

15. To install the original assembly, reverse the removal procedure.

16. Check the rear axle fluid level after installation.



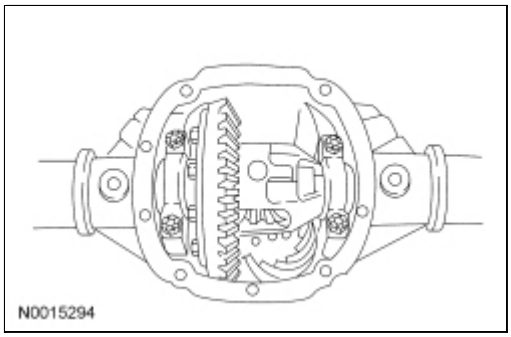
repair4less

Differential Carrier

Special Tool(s)

 ST1485-A	Shim Driver 205-220 (T85L-4067-AH)

repair4less



Item	Part Number	Description
1	—	Differential bearing cap bolts (part of 4010) (4 required)
2	—	Differential bearing caps (part of 4010) (2 required)
3	4067	Differential carrier bearing shims (2 required)
4	4204	Differential assembly

Removal

1. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.

2. **NOTE:** Index-mark the position of the differential bearing caps, as arrows may not be visible. The differential bearing caps must be installed in their original locations and positions.

   Remove the 4 differential bearing cap bolts and the 2 differential bearing caps.

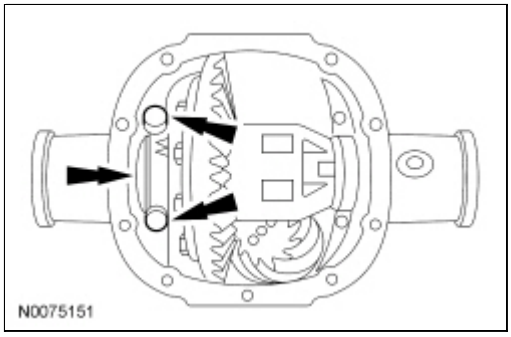
3. ***NOTICE:*** **Place a wood block between the pry bar and the axle housing to protect the machined surface from damage.**

   NOTE: Index-mark the position of the differential bearing shims. The differential bearing shims must be installed in their original locations and positions.

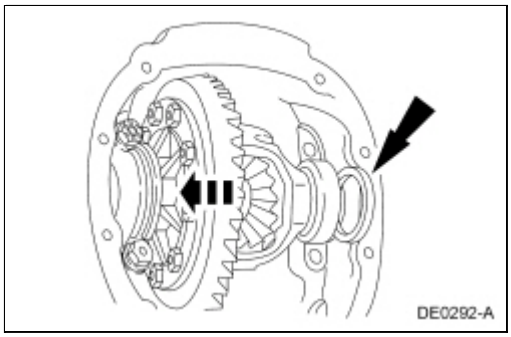
   Using pry bars and wood blocks, remove the differential carrier assembly from the axle housing.

Installation

1. Position the differential assembly in the axle housing.

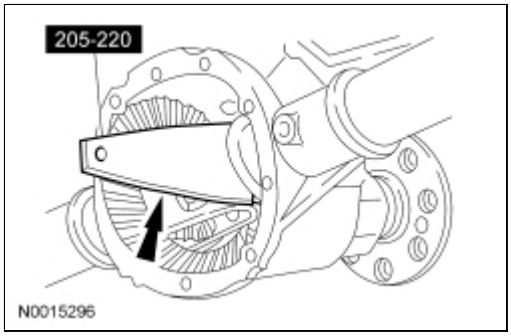


2. Install the originally removed differential bearing shim on the LH side.

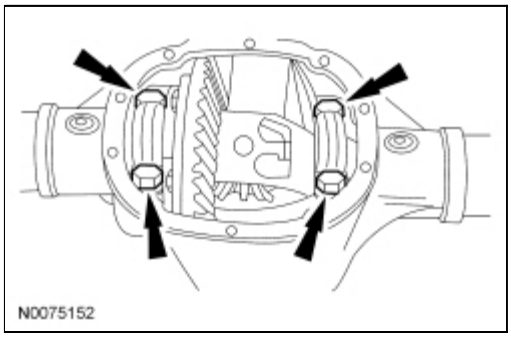


3. **NOTE:** Apply pressure toward the LH side to make sure the LH differential bearing cap is seated.

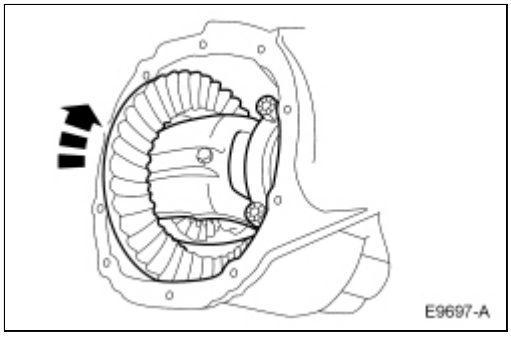
repair4less



Install the LH differential bearing cap and loosely install the 2 differential bearing cap bolts.



4. Install the original differential bearing shim on the RH side.



5. Using the Shim Driver, fully seat the differential bearing shims.

6. Install the RH side differential bearing cap and tighten the 4 LH side and RH side differential bearing cap bolts.
    - Tighten to 112 Nm (83 lb-ft).

7. Rotate the differential assembly to make sure it rotates freely.

8. Adjust the ring and pinion backlash. For additional information, refer to Ring Gear Backlash Adjustment in this section.

9. Install the axle shafts. For additional information, refer to Axle Shaft in this section.

Rear Drive Axle and Differential

The rear axle assembly consists of the following:

- Integral-type housing hypoid gear design (center of the pinion set below the centerline of the ring gear)
- Hypoid differential ring gear and pinion consisting of a 9.75-inch ring gear and an overhung drive pinion that is supported by 2 opposed tapered roller bearings
- Pinion bearing preload that is maintained by a drive pinion collapsible spacer on the differential pinion shaft and adjusted by the pinion nut
- Cast center section with 2 steel tube assemblies and a stamped differential housing cover
- Differential housing cover using silicone sealant as a gasket
- Differential pinion shaft that is retained by a threaded differential pinion shaft lock bolt attached to the differential case
- Differential case that is mounted in the rear axle housing between 2 opposing differential bearings that are retained in the rear axle housing by 2 removable bearing caps
- Differential bearing preload and ring gear backlash which are adjusted by differential bearing shims that are located between the differential bearing cups and the rear axle housing

The rear drive axle receives rotational torque from the driveshaft. The direction of the rotation determines movement of the vehicle. The rotation enters the rear drive axle through the drive pinion flange, turning the drive pinion and rotating the ring gear. The ring gear is bolted to the differential case. The differential case houses the pinion shaft upon which the differential pinion gears ride. The pinion gears are in mesh with the differential side gears to which the axle shafts are splined. It is the unique arrangement of the differential that allows the axle shafts to be driven at different speed when needed, such as when driving around corners. A Traction-Lok differential is available that introduces a series of clutch plates and discs behind the differential side gears to deliver as much torque as possible to each axle shaft when the traction at the rear wheels is not equal. The Traction-Lok differential requires a friction modifier that must be installed with the axle lubricant for the plates and discs to be functional. An Electronic Locking Differential (ELD) is also available which electronically locks the differential side gears to the differential case which will allow maximum torque to both rear wheels. The operator controls the differential with a dash mounted switch.

The ELD system consists of the following components:

- ELD coil, located at the rear differential
- Rear differential
- Mode Select Switch (MSS) (unique for ELD equipped vehicles), located on instrument panel

The ELD system, which is optional on Electronic Shift-On-The-Fly (ESOF) equipped vehicles, allows the operator to lock the rear differential side gears when in 4H or 4L mode. ELD operation is requested by pulling out on the MSS when in 4H or 4L mode.

The operator can switch between 4H mode without ELD or 4H mode with ELD at speeds up to 30 km/h (19 mph). In 4H, the ELD will disengage at speeds above 40 km/h (25 mph) and will automatically reengage at speeds below 30 km/h (19 mph).

To engage or disengage the ELD while in 4L range, the vehicle speed must be less than 90 km/h (56 mph).

Ring Gear Backlash Adjustment

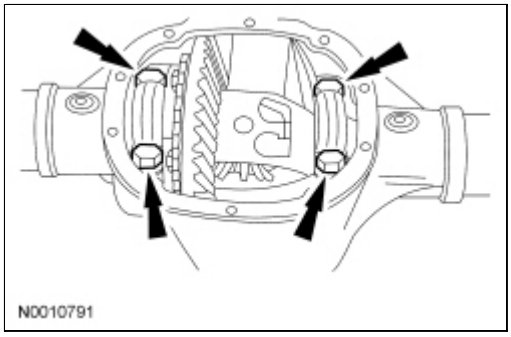
Special Tool(s)

 ST1214-A	Dial Indicator Gauge With Holding Fixture 100-002 (TOOL-4201-C)
 ST1485-A	Installer, Differential Shim 205-220 (T85L-4067-AH)

Material

Item	Specification
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	—

1. Remove the differential housing cover. For additional information, refer to Differential Housing Cover in this section.



2. Install the Dial Indicator Gauge with Holding Fixture and measure the ring gear backlash.
   - If a zero backlash condition occurs or the backlash is not within specification, proceed to Step 3.
   - If the backlash is within specification, proceed to Step 14.

3. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.

4. **NOTE:** Index-mark the position of the differential bearing caps, as arrows may not be visible. The differential bearing caps must be installed in their original locations and positions.

Remove the 4 bearing cap bolts and 2 caps.

5. If a zero backlash condition had occurred, add 0.50 mm (0.020 in) to the RH side shim and subtract 0.50 mm (0.020 in) from the LH side shim to allow a backlash indication. Install the 2 bearing caps and 4 bolts.
    - Tighten to 105 Nm (77 lb-ft).
    - Go back to Step 2.

6. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch

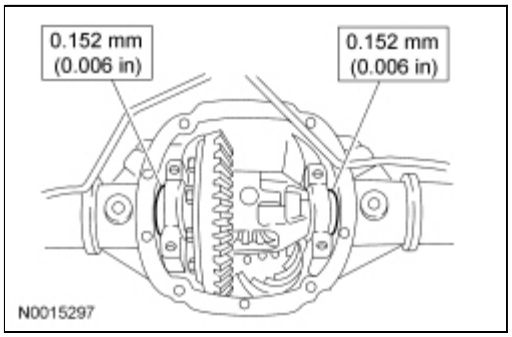
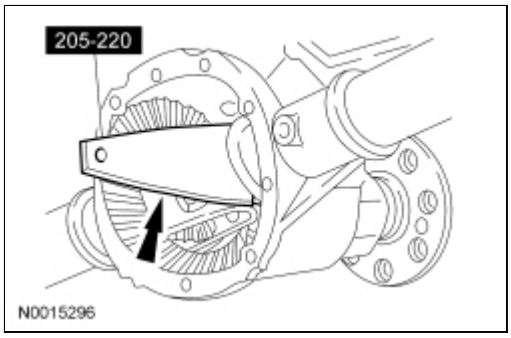
7. Install the 2 bearing caps and 4 bolts.
    - Tighten to 105 Nm (77 lb-ft).

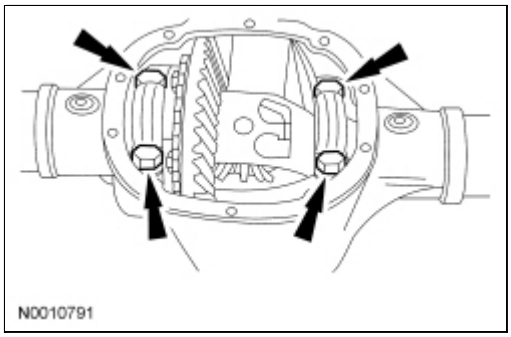


8. Using the Dial Indicator Gauge with Holding Fixture, recheck the ring gear backlash.
    - If backlash is now within specification, proceed to Step 9.
    - If backlash is not within specification, go back to Step 4.

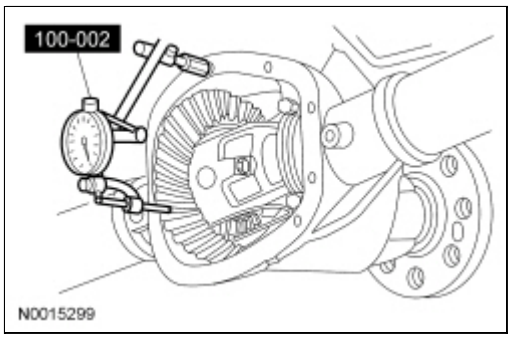


9. Remove the 4 bearing cap bolts and 2 bearing caps.

10. To establish differential bearing preload, increase both LH and RH differential bearing shim size by the thickness shown.



11. Using the Differential Shim Installer, fully seat the differential bearing shims. Make sure the assembly rotates freely.



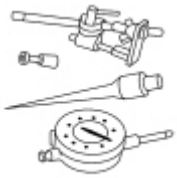
repair4less

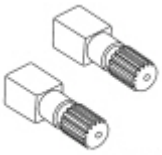
12. Install the 2 bearing caps and 4 bolts.
    - Tighten to 105 Nm (77 lb-ft).

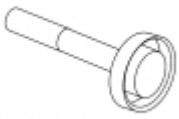
13. Using the Dial Indicator Gauge with Holding Fixture, do a final check of the ring gear backlash.

14. Apply marking compound and rotate the differential assembly 5 complete revolutions.

15. Verify an acceptable pattern check. For additional information, refer to Tooth Contact Pattern Check in Section 205-00 .







16. Install the axle shafts. For additional information, refer to Axle Shaft in this section.

17. Install the differential housing cover. For additional information, refer to Differential Housing Cover in this section.

repair4less

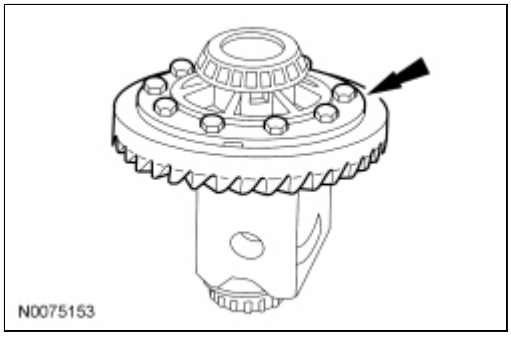
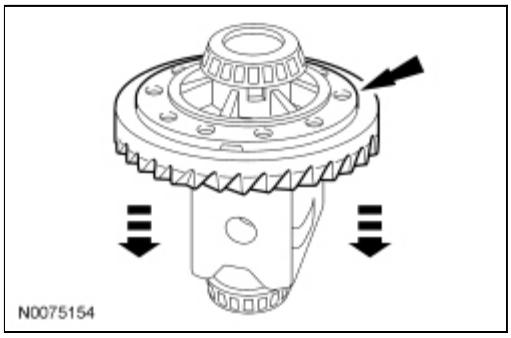
Loctite® 638™	
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5



Item	Part Number	Description
1	—	Differential side gears (part of 4215)
2	4228	Differential side gear thrust washers
3	4214	Differential side gear wave washers
4	4215	Differential pinion gear
5	4230	Differential pinion thrust washer (also part of 4215)
6	4N237	Axle shaft U-washer
7	4209	Differential ring gear
8	4241	Differential pinion shaft lock bolt (also part of 4215)
9	4211	Differential pinion shaft
10	4204	Differential case
11	4216	Differential ring gear bolts (12 required)
12	4220	Differential bearings
13	—	Differential bearing cups (part of 4220)

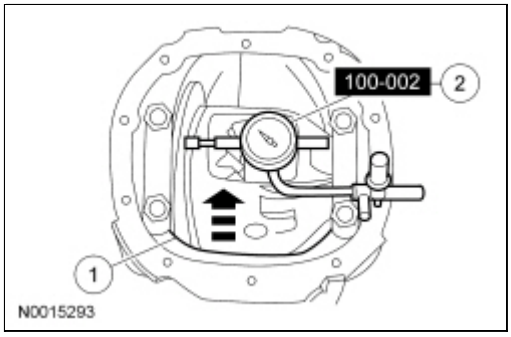
Disassembly

1. Remove the differential carrier. Tag the differential shims and bearing cups for location. For additional information, refer to Differential Carrier in this section.



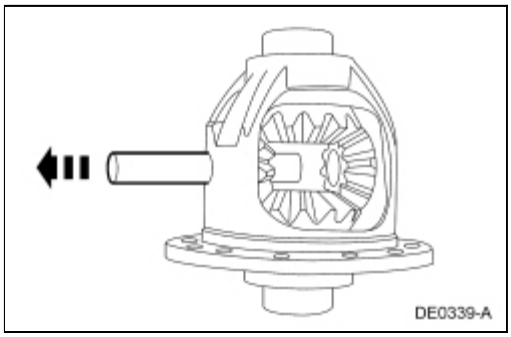
repair4less

2. Remove and discard the 12 differential ring gear bolts.

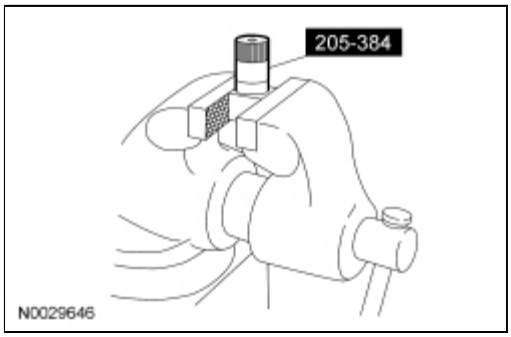


3. ***NOTICE:*** **Care should be taken not to damage the differential ring gear bolt hole threads.**

   Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.

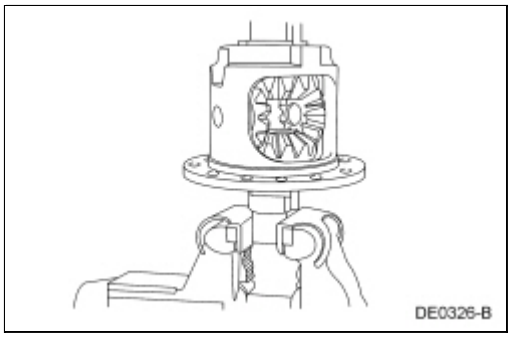


4. If checking differential case flange runout, install the bearing cups in their original location and install the differential assembly.
   1. Install the bearing caps and differential shims.
      - Rotate the differential assembly to verify the bearings have seated.
   2. Install the Dial Indicator Gauge With Holding Fixture and record the differential case runout.

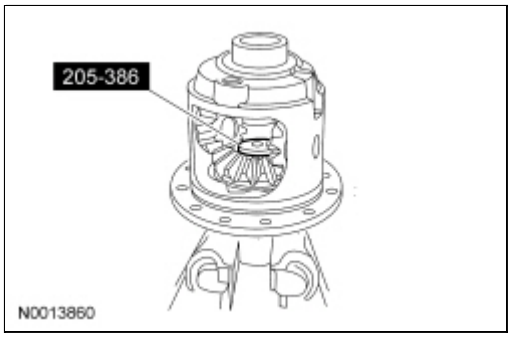


5. If necessary, remove the differential bearings with the 2 Jaw Puller and Step Plate.

6. Remove the differential pinion shaft lock bolt and the differential pinion shaft.

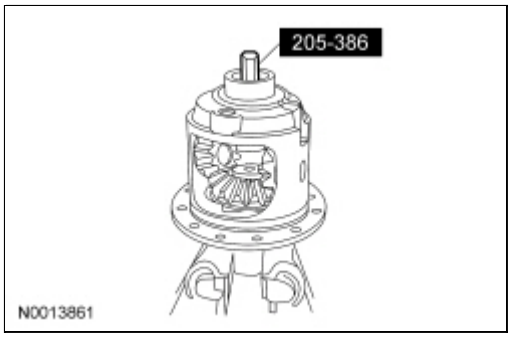


7. Install the Differential Gauge in a suitable vise.



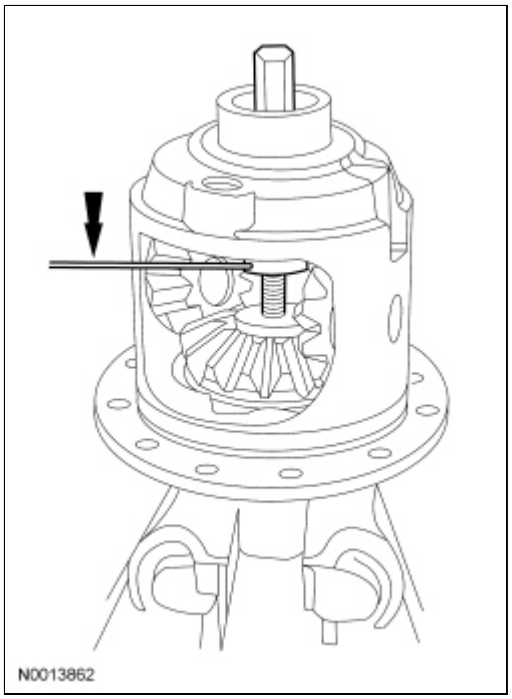
8. Install the differential case on the Differential Gauge.

repair4less

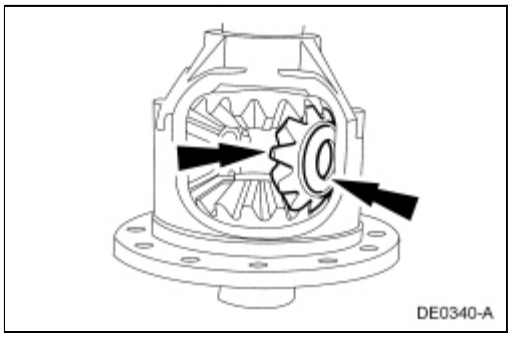


9. **NOTE:** Apply a small amount of grease to the centering hole of the Differential Gauge step plate.

   Install the Differential Gauge step plate in the bottom differential side gear.



10. Install the Differential Gauge nut in the upper differential side gear. Hold the nut in position while installing the Differential Gauge hex screw. Tighten the hex-head screw until contact is made with the Step Plate.



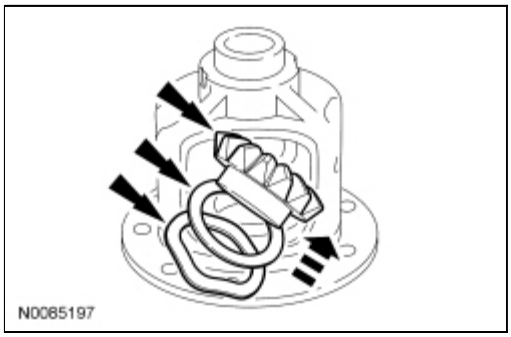
11. **NOTE:** The dowel bar is used to keep the nut from turning when the forcing screw is tightened.

    Insert a suitable dowel bar in the hole of the nut. Tighten the forcing screw to force the differential side gears away from the differential pinion gears.

12. Rotate and remove the differential pinion gears and differential pinion gear thrust washers.

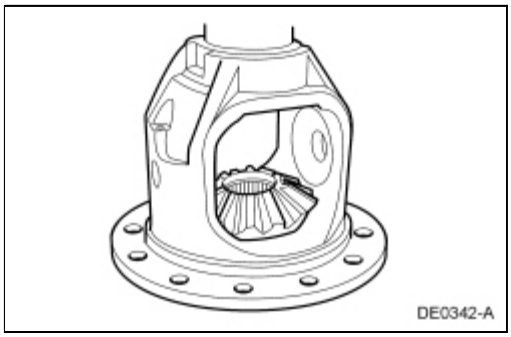
13. Remove the differential side gears, the differential side gear thrust washers and the differential side gear wave washers.

Assembly



All vehicles

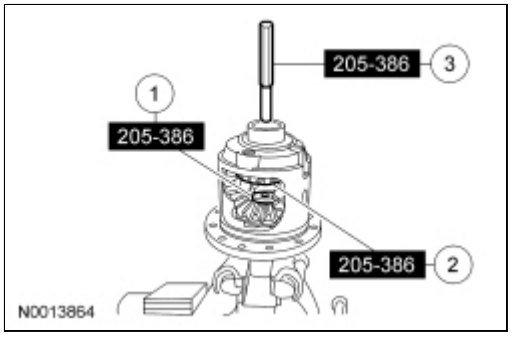
1. **NOTE:** Lubricate the differential side gear thrust washers, wave washers and the side gear journals



repair4less

with axle lubricant.

Position the differential side gear thrust washers and wave washers on the differential side gears.

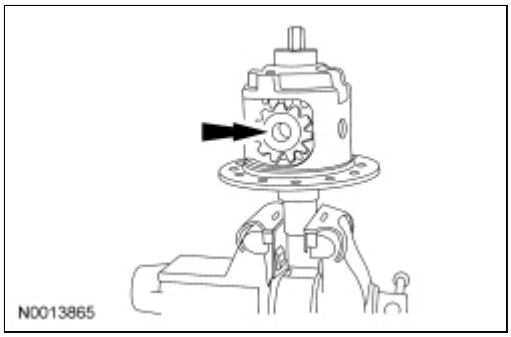


2. Position the differential side gears.

3. **NOTE:** Apply a small amount of grease to the step plate bore.

   NOTE: If necessary, insert the dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

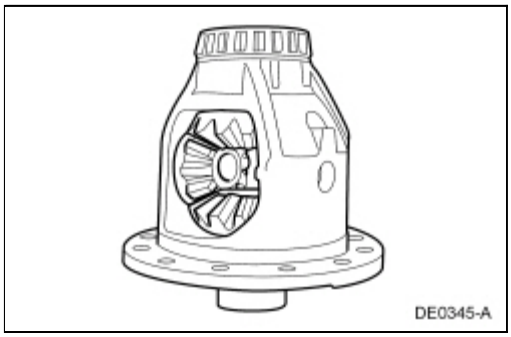
   Assemble the Differential Gauge to the differential case.
   1. Position the Differential Gauge step plate in the bottom differential side gear.
   2. Position the Differential Gauge hex screw plate in the top differential side gear and hold it in place.
   3. Install the Differential Gauge hex screw and tighten it 2 turns after it contacts the bottom step plate.



4. **NOTE:** Lubricate both sides of the differential pinion gear thrust washers with axle lubricant.

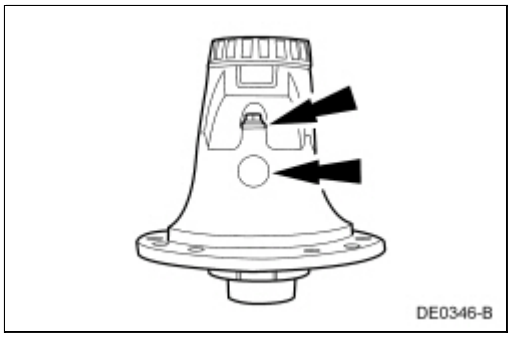
   NOTE: Make sure the differential pinion gears are 180 degrees apart so they will align correctly with

the pinion shaft bore.

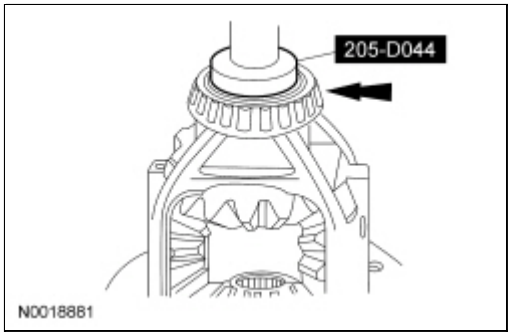


Position the differential pinion gears and differential pinion gear thrust washers in the window of the differential case so they mesh with the differential side gear teeth.

5. Engage the differential pinion gears opposite the differential side gears.



6. Rotate the differential pinion gears to align the differential pinion shaft bore.

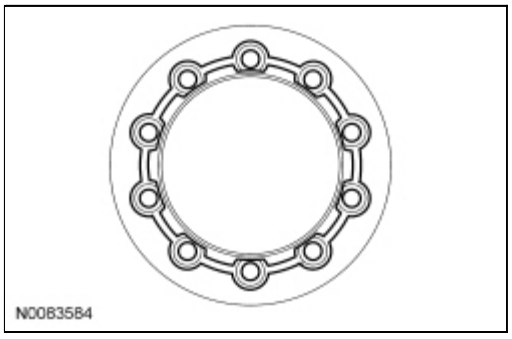


7. Remove the Differential Gauges after verifying the differential pinion shaft bore alignment.

8. Insert the differential pinion shaft, and install a new differential pinion shaft lock bolt finger-tight.

repair4less

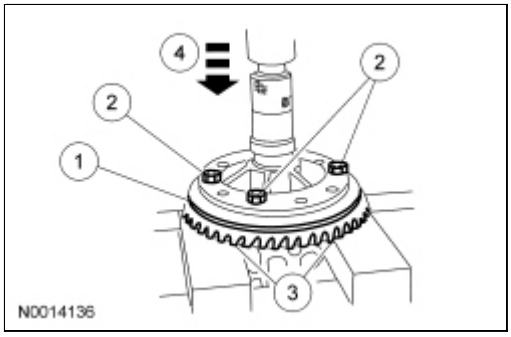
9. If removed, use the Differential Carrier Bearing Installer to install the differential bearings.



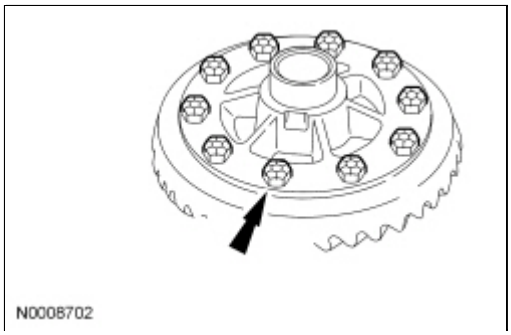
Electronic Locking Differential (ELD) equipped vehicles and all vehicles equipped with 3.55, 3.73, and 4.10 ratio gear sets

10. **NOTE:** The differential flange and ring gear flange must be free of any old retaining compound material. Make sure both surfaces are clean and free of oil, dust and debris. Failure to clean the surfaces can result in ring gear runout concerns.

    Clean all traces of the old retaining compound material from the differential flange.
    - Use solvent and Scotch-Brite® pads to remove.



11. Apply a one-eighth inch bead of maximum strength retaining compound on the rear face of the ring gear in the pattern shown.

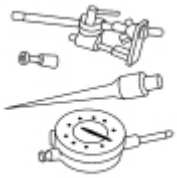


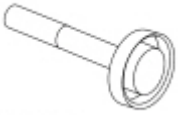
All vehicles

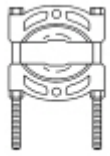
12. Install the ring gear.
    1. Place the ring gear on the differential assembly.
    2. Hand-start 3 new ring gear bolts to align the holes in the ring gear and the differential case.
    3. Using a suitable press, position the ring gear.

4. Press the ring gear into place.

13. Hand-start the remaining 9 new differential ring gear bolts. Tighten the 12 bolts in 2 stages.
    - Stage 1: Tighten to 60 Nm (44 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.







14. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

repair4less

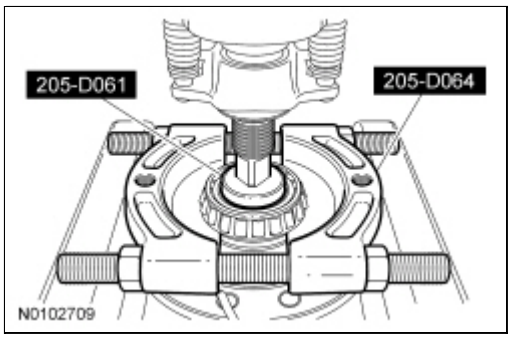
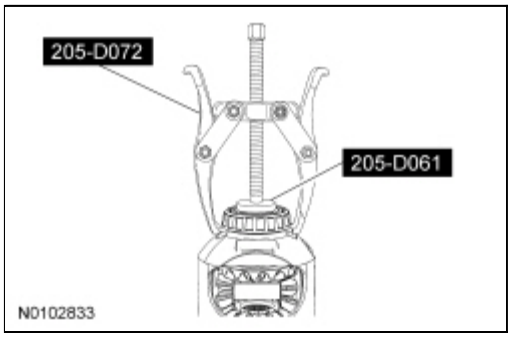
Disassembly

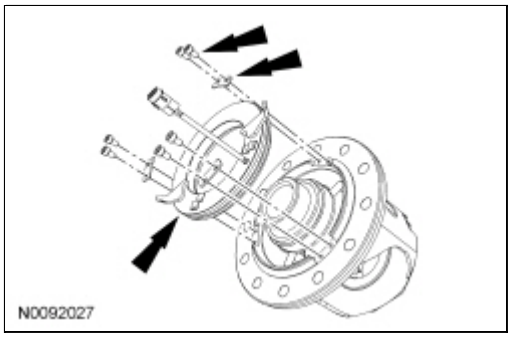
1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.
2. Remove and discard the 12 differential ring gear bolts.



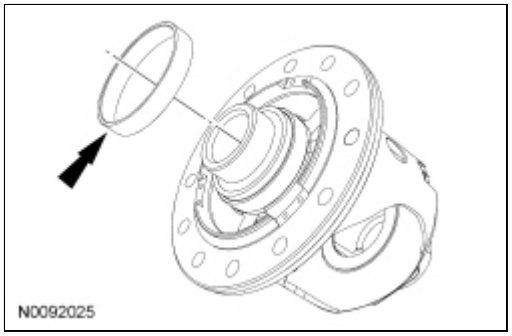
repair4less



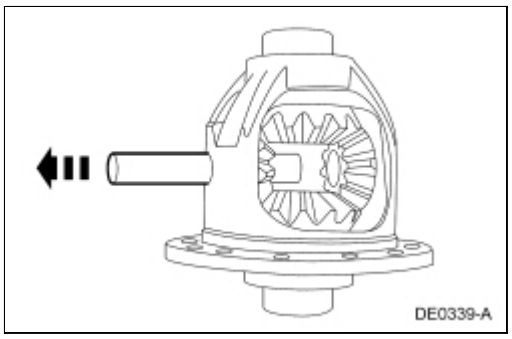
3. Insert a punch in the differential ring gear bolt holes and drive the differential ring gear off.



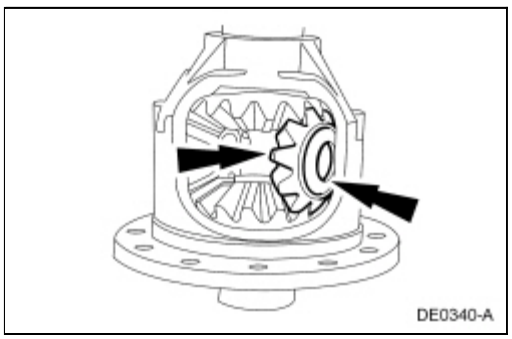
4. Using the Bearing Puller plate, Step Plate and a suitable press, remove the LH differential bearing.



5. Using the 2 Jaw Puller and Step Plate, remove the RH differential bearing.

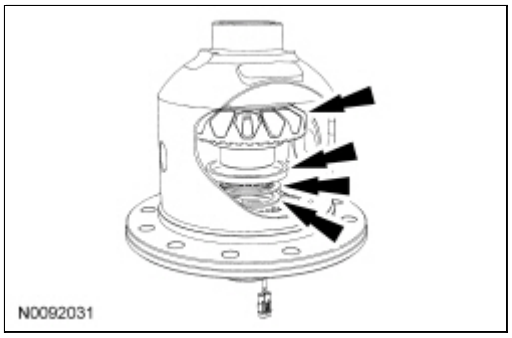


6. Remove and discard the 6 screws and 3 stoppers that hold the Electronic Locking Differential (ELD) coil in place and remove the coil.

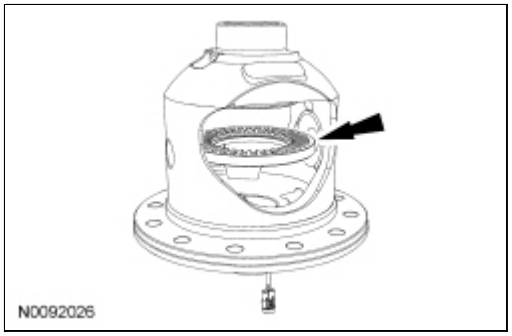


7. Remove the plunger assembly.

8. Remove the differential pinion shaft lock bolt and the differential pinion shaft.

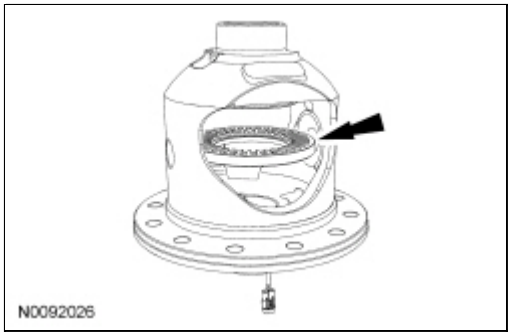


9. Rotate and remove the differential pinion gears and differential pinion gear thrust washers.



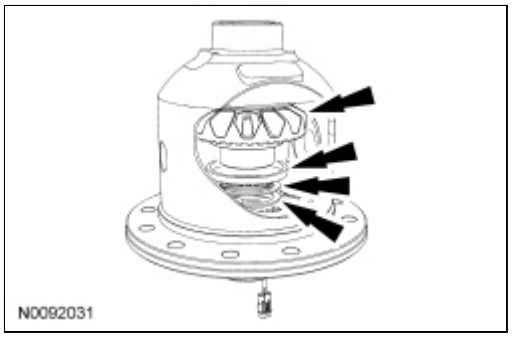
10. Remove the differential side gears, the differential side gear thrust washers and spring.

repair4less



11. Remove the cam-ring.

Assembly

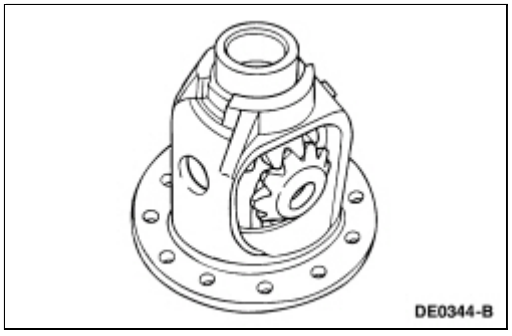


All vehicles

1. Install the cam-ring.

2. **NOTE:** Start by using the thickest thrust washers. If the gears do not assemble using the thickest thrust washers, back down in thickness until the gears will assemble.

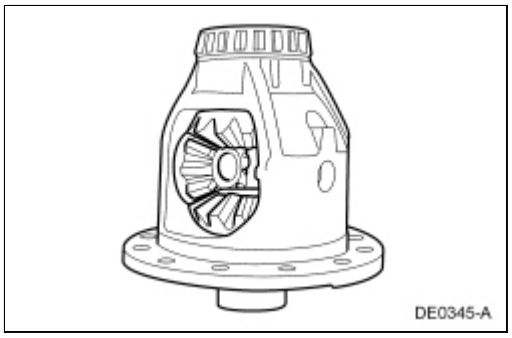
   Position the 2 LH differential side gear thrust washers and spring on the lower differential side gear and install the gear.
   - Lubricate the differential side gear thrust washers and the differential side gear journals with axle lubricant.



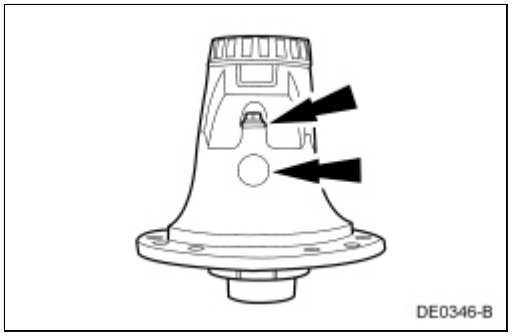
3. **NOTE:** Start by using the thickest thrust washer. If the gears do not assemble using the thickest thrust washers, back down in thickness until the gears will assemble.

   Position the differential side gear thickest thrust washer on the RH differential side gear and install the gear.
   - Lubricate the differential side gear thrust washers and the differential side gear journals with axle lubricant.

4. Assemble the differential pinion gear thrust washers and the differential pinion gears.
   - Lubricate the washers and gears with rear axle lubricant.

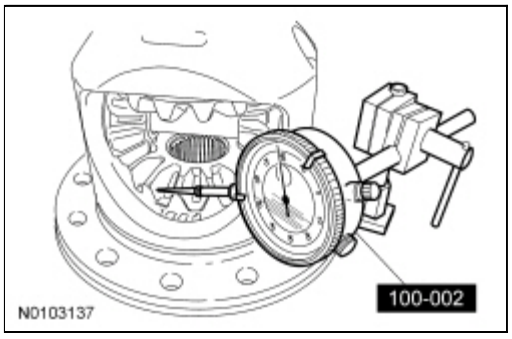


5. Engage the differential pinion gears opposite the differential side gears.

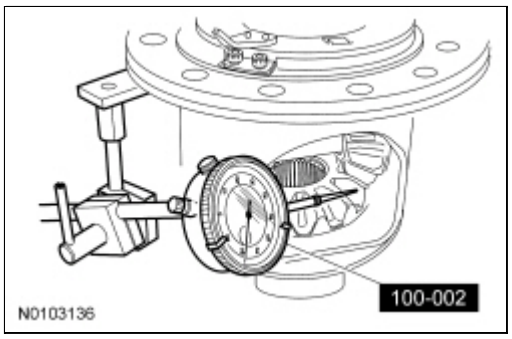


6. Rotate the differential pinion gears to align the differential pinion shaft bore.

repair4less

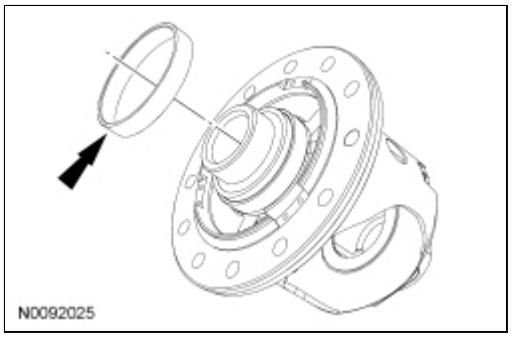


7. Insert the differential pinion shaft, and install a new differential pinion shaft lock bolt finger-tight.



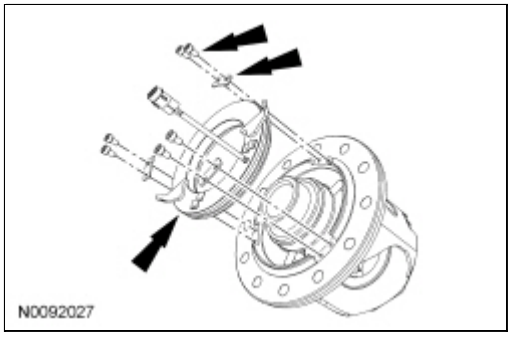
8. Install the Dial Indicator Gauge With Holding Fixture.
    - While pulling up on the RH differential gear, measure the backlash of the LH differential gear.
    - Backlash should be 0.001-1.000 mm (0.004-0.040 in).
    - If backlash is incorrect, install a thicker LH thrust washer to reduce backlash, or a thinner washer to increase backlash.

Part Number	Thickness (mm)	Thickness (in)	Quantity
Part of kit 4880	1.4	0.05	2
Part of kit 4880	1.6	0.06	2
Part of kit 4880	1.8	0.07	2



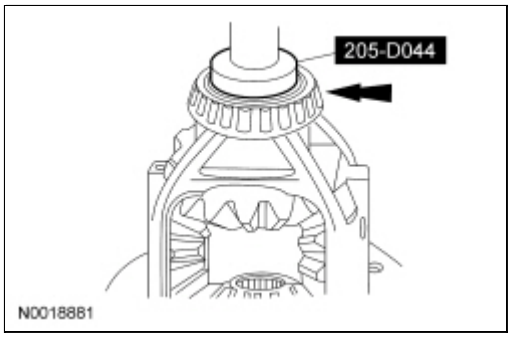
9. Turn the differential over and reposition the Dial Indicator Gauge With Holding Fixture.
    - While pulling up on the LH differential gear, measure the backlash of the RH differential gear.
    - Backlash should be 0.001-1.000 mm (0.004-0.040 in).
    - If backlash is incorrect, install a thicker RH thrust washer to reduce backlash, or a thinner washer to increase backlash.

Part Number	Thickness (mm)	Thickness (in)	Quantity
Part of kit 4880	1.1	0.04	1
Part of kit 4880	1.3	0.05	1
Part of kit 4880	1.5	0.06	1



10. Tighten the differential pinion shaft lock bolt to 30 Nm (22 lb-ft).

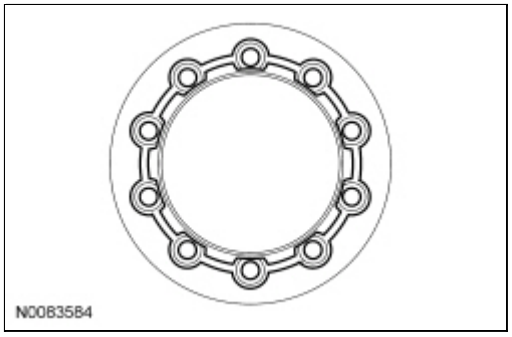
11. Install the plunger assembly.



12. Install the ELD coil, 3 new stoppers and 6 new screws that hold the coil in place.
    - Tighten to 5 Nm (44 lb-in).

13. Use the Differential Carrier Bearing Installer to install the 2 differential bearings.

repair4less

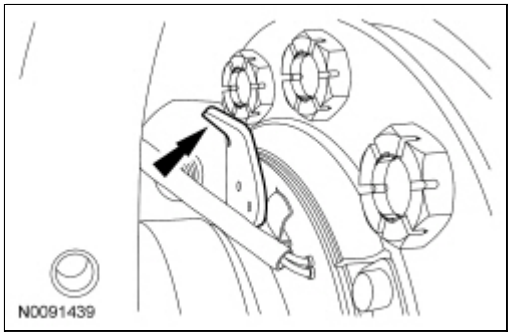


Electronic Locking Differential (ELD) equipped vehicles and all vehicles equipped with 3.55, 3.73, and 4.10 ratio gear sets

14. **NOTE:** The differential flange and ring gear flange must be free of any old retaining compound material. Make sure both surfaces are clean and free of oil, dust and debris. Failure to clean the surfaces can result in ring gear runout concerns.

    Clean all traces of the old retaining compound material from the differential flange.
    - Use solvent and Scotch-Brite® pads to remove.

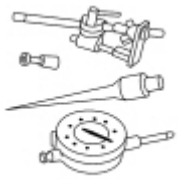
15. Apply a one-eighth inch bead of maximum strength retaining compound on the rear face of the ring gear in the pattern shown.

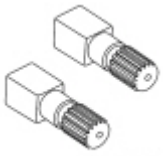


All vehicles

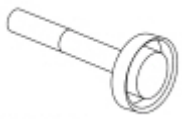
16. Install the ring gear and the 12 new differential ring gear bolts. Tighten in 2 stages.
    - Stage 1: Tighten to 60 Nm (44 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

17. **NOTE:** Install the differential with the tabs on the ELD coil up against the differential bearing cap mounting surface.





Install the differential carrier in the axle housing. For additional information, refer to Differential Carrier in this section.



repair4less

Differential Case and Ring Gear — Traction-Lok

Special Tool(s)

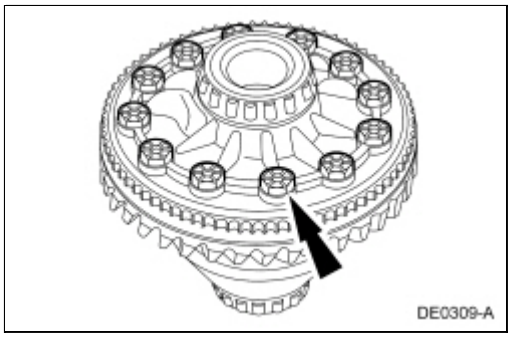
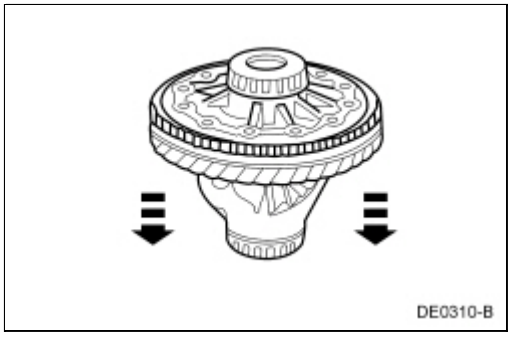
Traction-Lok Differential Assembly

repair4less



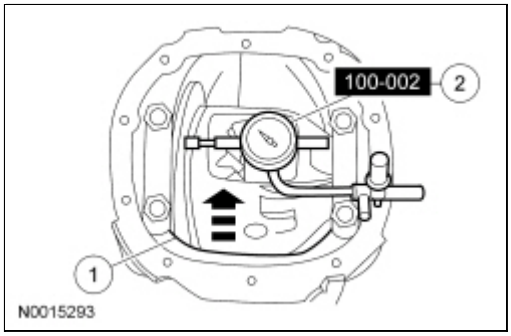
Item	Part Number	Description
1	4204	Differential case
2	4241	Differential pinion shaft lock bolt (part of 4215)
3	—	Differential side gear (part of 4215)
4	—	Retainer clip (part of 4947)
5	4230	Differential pinion thrust washer (part of 4215)
6	—	Differential pinion gear (part of 4215)
7	—	Plate preload spacer (part of 4947)
8	—	Clutch disc (part of 4947)
9	—	Clutch plate (part of 4947)
10	4211	Differential pinion shaft

Disassembly



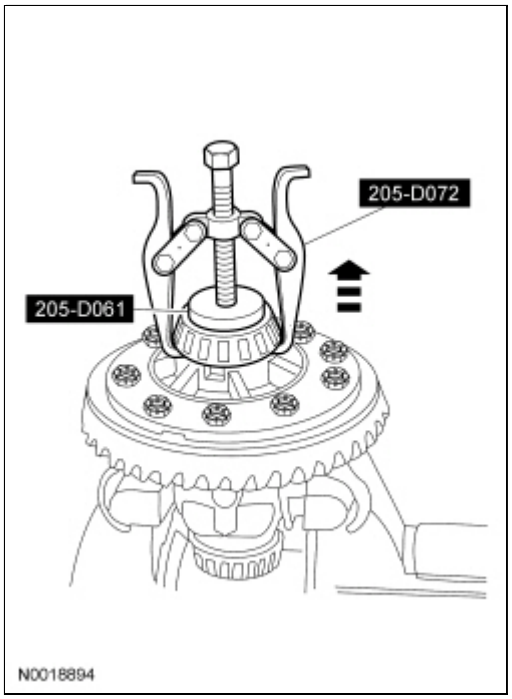
1. Remove the differential carrier. Tag the differential shims and bearing cups for location. For additional information, refer to Differential Carrier in this section.

2. Remove and discard the 12 differential ring gear bolts.

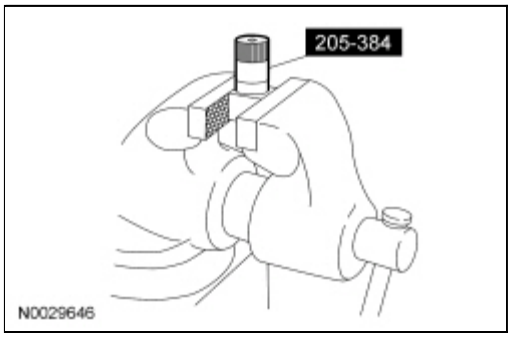


3. ***NOTICE:*** **Care should be taken not to damage the differential ring gear bolt hole threads.**

Insert a punch in the differential ring gear bolt holes. Drive off the differential ring gear.

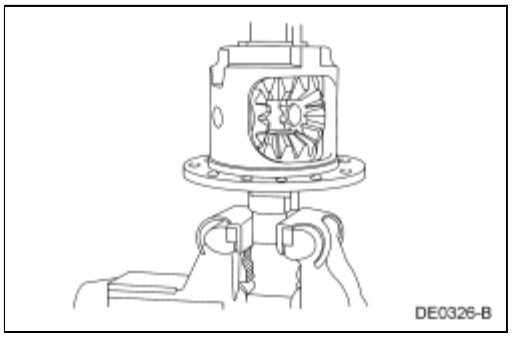


4. If checking differential case flange runout, install the bearing cups in their original location and install the differential assembly.
    1. Install the bearing caps and differential shims.
        - Rotate the differential assembly to verify the bearings have seated.
    2. Install the Dial Indicator Gauge With Holding Fixture and record the differential case runout.



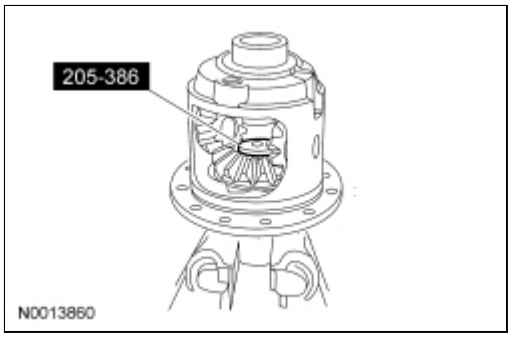
5. **NOTE:** The differential bearings need not be removed to overhaul the Ford limited slip differential.

    If necessary, use the 2 Jaw Puller and Step Plate to remove the differential bearings.

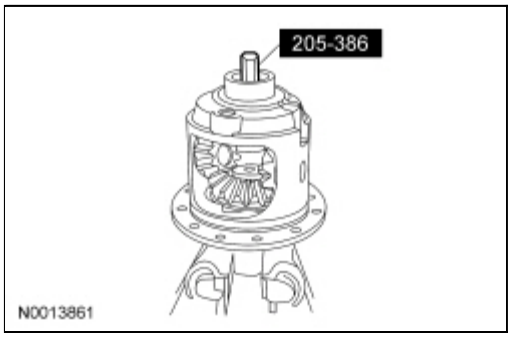


repair4less

6. Install the Differential Gauge in a suitable vise.

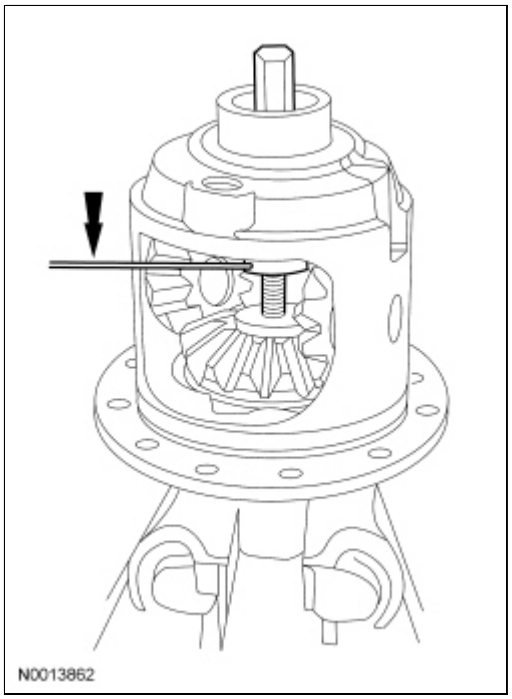


7. Install the differential case on the Differential Gauge.



8. **NOTE:** Apply a small amount of grease to the centering hole of the Differential Gauge.

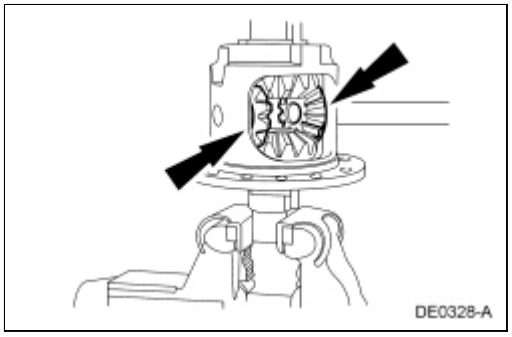
   Install the Differential Gauge in the bottom differential side gear.



9. Install the nut in the upper differential side gear. Hold the nut in position while installing the hex screw. Tighten the hex-head screw until contact is made with the Step Plate.

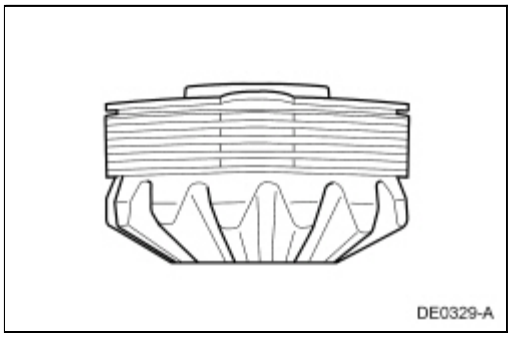
10. **NOTE:** The dowel bar is used to keep the nut from turning when the forcing screw is tightened.

    Insert a suitable dowel bar in the hole of the nut. Tighten the forcing screw to force the differential side gears away from the differential pinion gears.



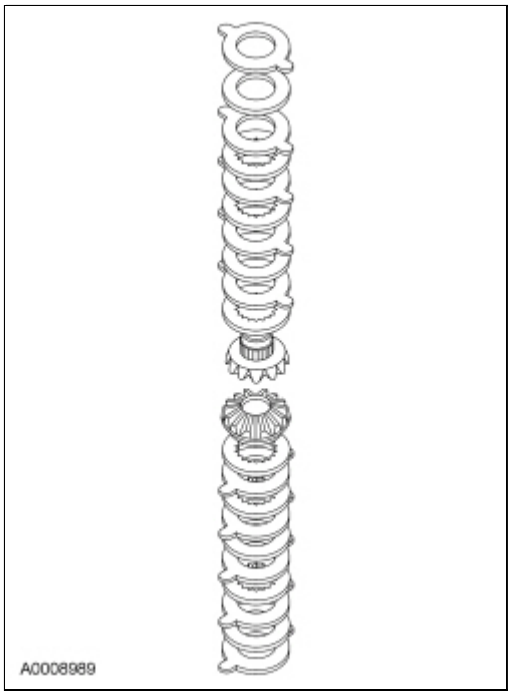
11. **NOTE:** Differential pinion gear thrust washers cannot be removed independently of the differential pinion gears.

repair4less



Insert the Differential Rotator in the pinion shaft bore, and turn the differential case to "walk" the differential pinion gears and differential pinion gear thrust washers out to the differential case windows.

12. Remove the differential pinion gears and differential pinion gear thrust washers.



13. Remove the differential side gears and differential clutch packs with the selective shim and Belleville spring, tag them RH and LH.

14. **NOTE:** When separating the clutch plates and clutch discs, note the sequence in which they are disassembled. They must be reassembled in the same sequence.

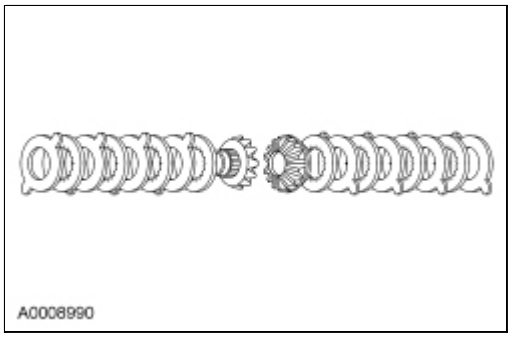
    NOTE: Do not use acids or solvents when cleaning the differential clutch pack. Wipe components with a clean, lint-free cloth only.

    Separate the differential clutch discs and clutch plates for cleaning and inspection.

Assembly

All vehicles

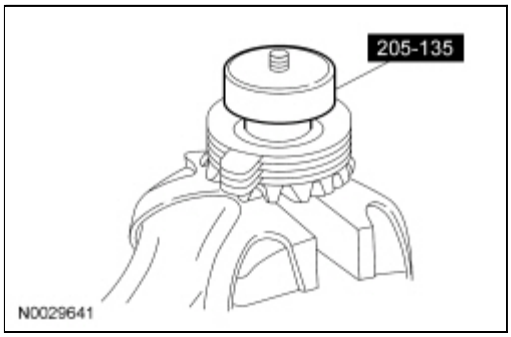
1. Lubricate each steel clutch plate and soak all friction plates with friction modifier for at least 15 minutes.



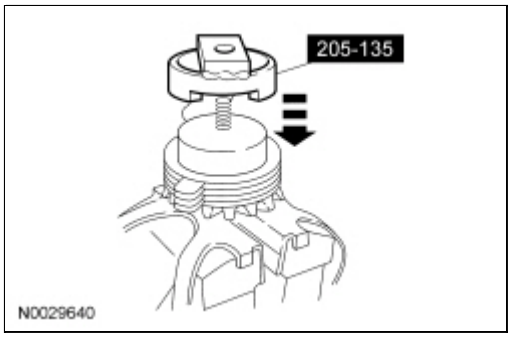
2. **NOTE:** Do not mix the differential clutch packs or selective shims from one side with the other.

   NOTE: The Belleville spring is a dished plate.

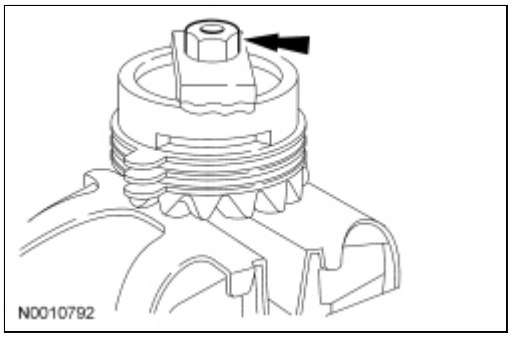
   Assemble the differential clutch packs (without the selective shims and Belleville springs) on their respective differential side gears.



repair4less

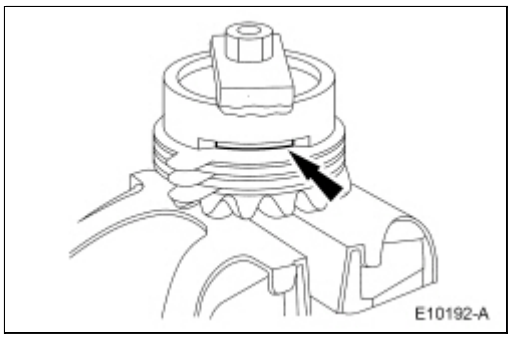


3. Clamp the bolt head of the Differential Gauge in a vise. Install the differential clutch pack and the differential side gear (without the selective shim or the Belleville spring) on the Differential Gauge.

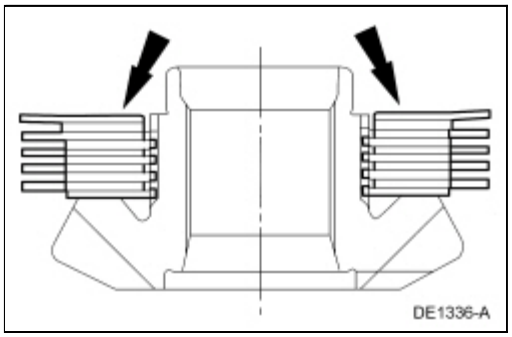


4. Position the Differential Clutch Gauge on top of the differential clutch pack.

5. Install the Differential Gauge over the disc and differential clutch pack.

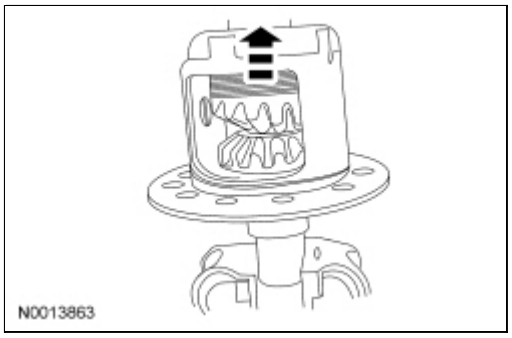


6. Install the nut over the top and base stud.
    - Tighten to 7 Nm (62 lb-in).



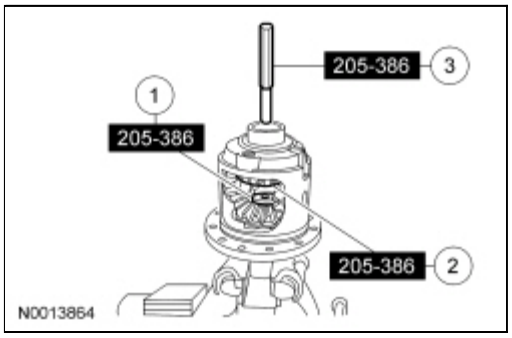
7. **NOTE:** Selective shims shown are available as part of the Clutch Pack Replacement Kit.

   Use the feeler gauge and select the thickest blade that will enter between the tool and the differential clutch pack. Subtract 0.0075" from the reading, Then select the closest thinner thickness selective shim, that will be the new selective shim that should be used.



8. Place the selective shim and Belleville spring on the differential clutch pack.
   - The dished or concave side of the Belleville spring must face up against the thrust face of the differential case.

9. Install the differential side gears with the differential clutch packs, selective shims and Belleville spring into the differential case.
   - Hold the differential side gear assembly in place to prevent it from falling out of the differential case.



repair4less

10. **NOTE:** Apply a small amount of grease to the step plate bore.

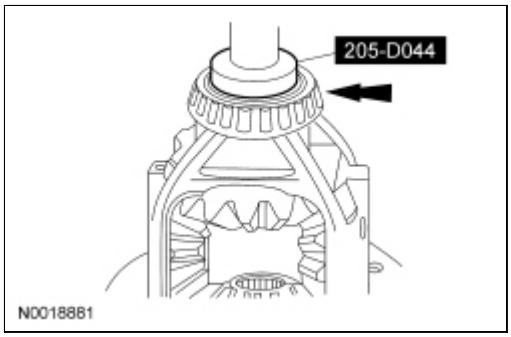
    NOTE: If necessary, insert the dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

    Assemble the Differential Gauge to the differential case.
    1. Position the Differential Gauge in the bottom differential side gear.
    2. Position the Differential Gauge in the top differential side gear and hold it in place.
    3. Install the Differential Gauge and tighten it 2 turns after it contacts the bottom step plate.

11. **NOTE:** Lubricate both sides of the differential pinion gear thrust washers with axle lubricant.

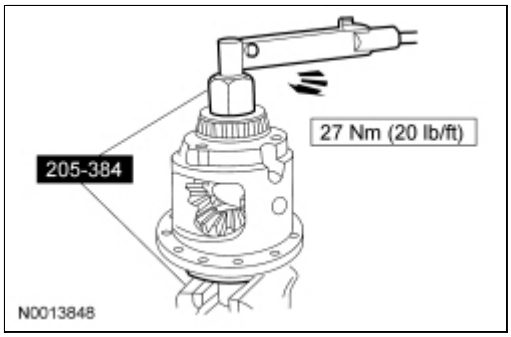
    NOTE: Make sure the differential pinion gears are 180 degrees apart so they will align correctly with the pinion shaft bore.

    Position the differential pinion gears and differential pinion gear thrust washers in the window of the differential case so they mesh with the differential side gear teeth.



12. **NOTE:** It will probably be necessary to loosen or tighten the forcing screw to allow the differential pinion gears and differential side gears to rotate.

Insert the Differential Rotator into the pinion shaft bore, and turn the differential case. This will cause the differential pinion gears to engage the differential side gears and "walk" into the differential case. Rotate the differential case until the pinion shaft mating holes are lined up exactly with the holes in the differential pinion gears.

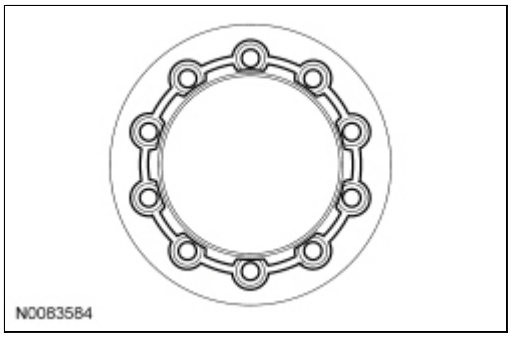


13. Remove the Differential Gauge.

14. Install the 2 new differential bearings using the Differential Carrier Bearing Installer.

15. Check the torque required to rotate one differential side gear.
    - Install the Differential Gauge with the 1/2-inch drive hole as shown.
    - The initial break-away torque, if original clutch plates are used, must be at least the minimum specification. The rotating torque required to keep the differential side gear turning with new clutch plates may vary.

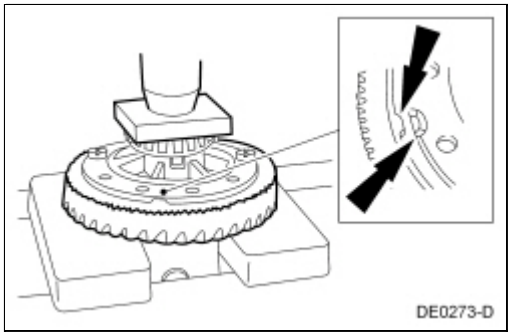
Electronic Locking Differential (ELD) equipped vehicles and all vehicles equipped with 3.55, 3.73, and 4.10 ratio gear sets



16. **NOTE:** The differential flange and ring gear flange must be free of any old retaining compound material. Make sure both surfaces are clean and free of oil, dust and debris. Failure to clean the surfaces can result in ring gear runout concerns.

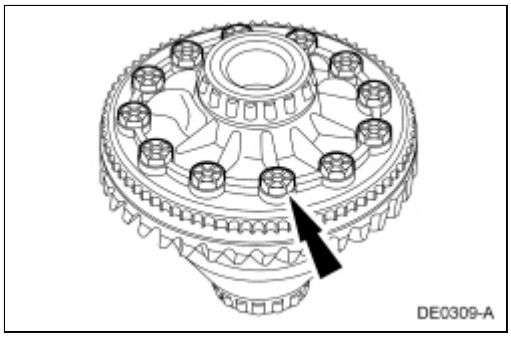
repair4less

Clean all traces of the old retaining compound material from the differential flange.



- Use solvent and Scotch-Brite® pads to remove.

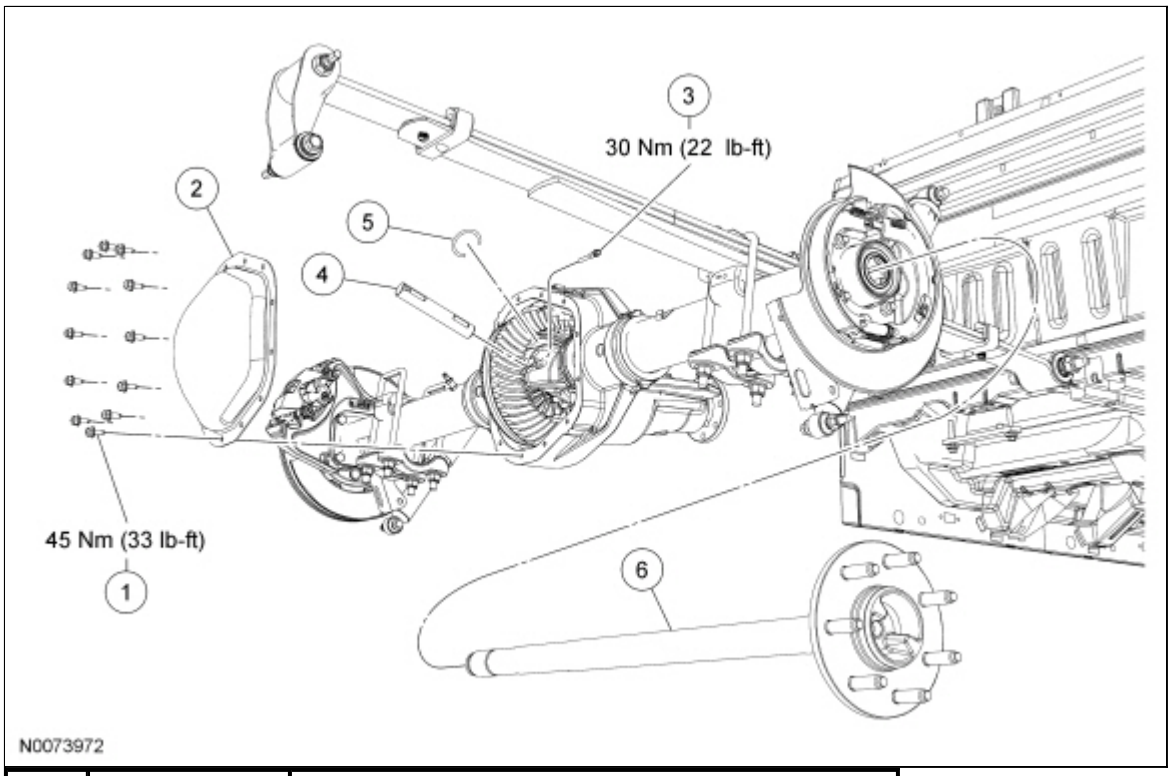
17. Apply a one-eighth inch bead of maximum strength retaining compound on the rear face of the ring gear in the pattern shown.



All vehicles

18. Using a suitable press, install the differential ring gear.

19. Install the new 12 differential ring gear bolts.
    - Tighten to 150 Nm (111 lb-ft).



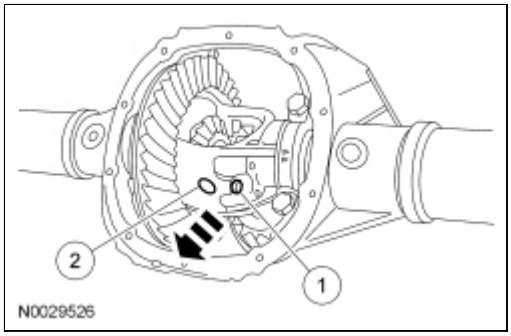
20. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

repair4less

Axle Shaft

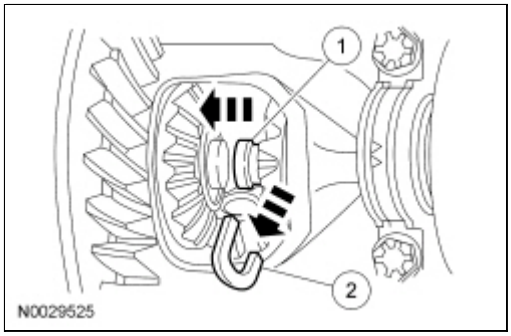
Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Threadlock and Sealer TA-25	WSK-M2G351-A5



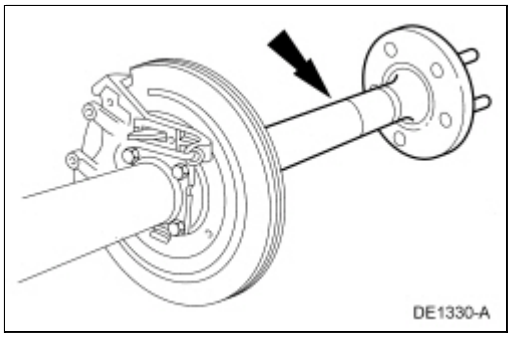
Item	Part Number	Description
1	4346	Differential housing cover bolt (12 required)
2	4033	Differential housing cover
3	4241	Differential pinion shaft locking bolt
4	4211	Differential pinion shaft
5	4N237	Axle shaft C-washer
6	4234	Axle shaft

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-

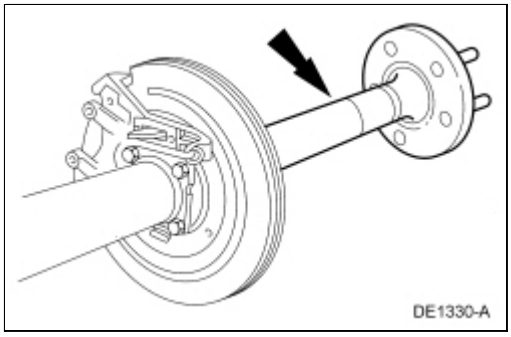
02 .



2. Remove the differential housing cover. For additional information, refer to Differential Housing Cover .
3. Remove the rear brake disc. For additional information, refer to Section 206-04 .
4. Remove the bolt and position aside the wheel speed sensor.
5. Remove the differential pinion shaft.
    1. Remove and discard the differential pinion shaft lock bolt.
    2. Remove the differential pinion shaft.

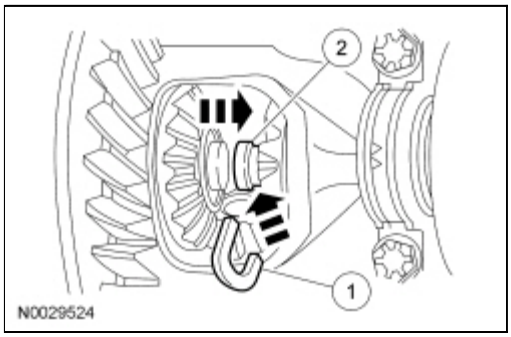
6. Remove the U-washer.
    1. Push in on the axle shaft.
    2. Remove the U-washer.

7. Remove the axle shaft.



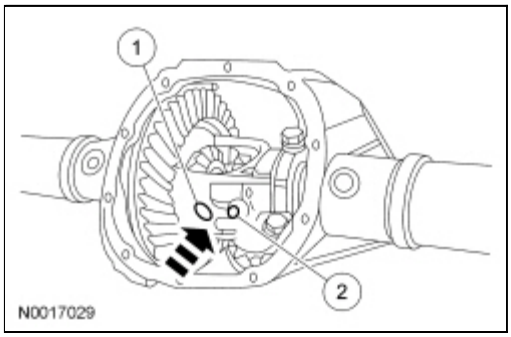
Installation

1. Lubricate the lip of the axle shaft oil seal with grease.



repair4less

2. Install the axle shaft.



3. **NOTE:** Do not damage the rubber O-rings in the U-washer grooves.

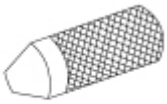
   Install the U-washer.
   1. Position the U-washer on the button end of the axle shaft.
   2. Pull the axle shaft outward.

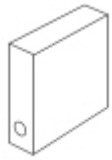
4. **NOTE:** If a new differential pinion shaft lock bolt is unavailable coat the threads of the original differential pinion shaft lock bolt with threadlock prior to installation.

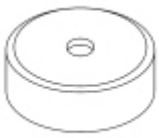
   Install the differential pinion shaft.
   1. Align the hole in the differential pinion shaft with the differential case lock bolt hole.
   2. Install a new differential pinion shaft lock bolt.
      - Tighten to 30 Nm (22 lb-ft).

5. Install the wheel speed sensor and the bolt.
   - Tighten to 15 Nm (133 lb-in).

6. Install the rear brake disc. For additional information, refer to Section 206-04 .







7. Install the differential housing cover. For additional information, refer to Differential Housing Cover .

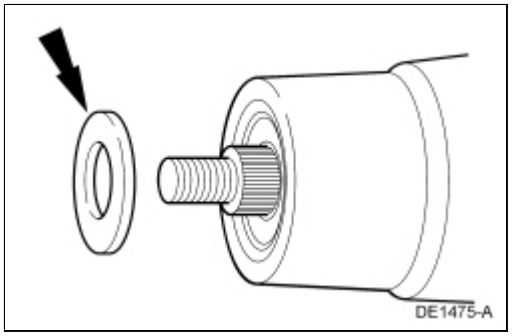
Material

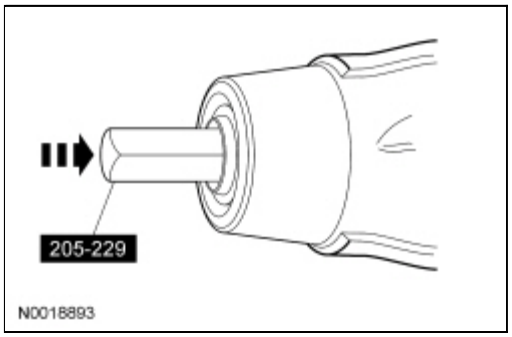
Item	Specification
Motorcraft® Premium Long-Life Grease XG-1-C (US); CXG-1-C (Canada)	ESA-M1C75-B

Item	Part Number	Description
1	389546	Drive pinion nut
2	4851	Drive pinion flange
3	4676	Drive pinion oil seal
4	4670	Pinion oil slinger
5	4621	Outer pinion bearing
6	—	Outer pinion bearing cup (part of 4621)
7	—	Inner pinion bearing cup (part of 4630)
8	4662	Collapsible spacer



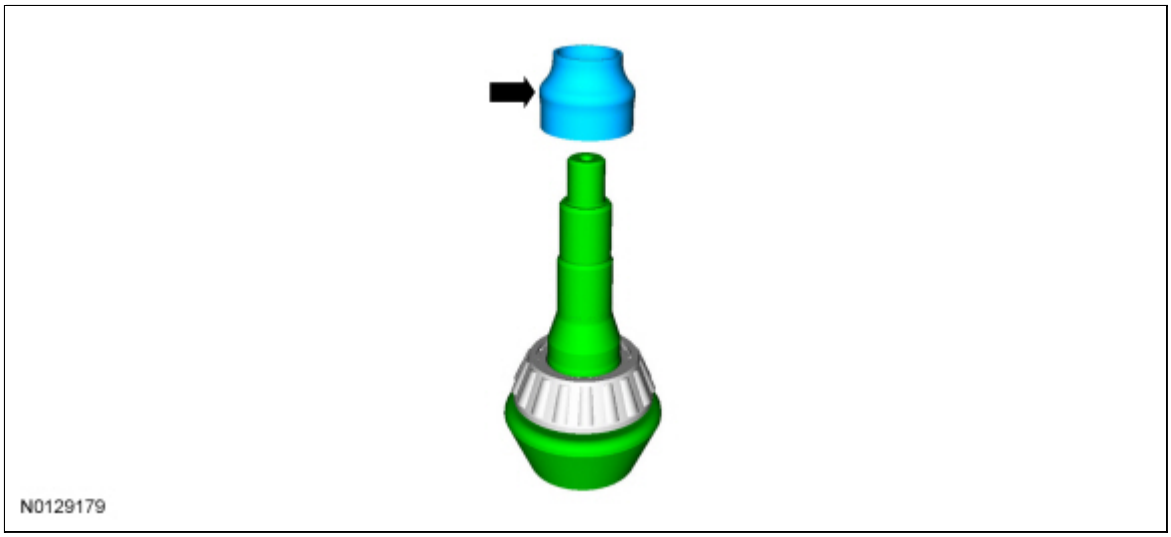
repair4less

9	4630	Inner pinion bearing
10	4663	Pinion bearing adjustment shim
11	4209	Drive pinion
12	4204	Differential assembly
13	4220	Differential carrier bearings (2 required)
14	—	Differential carrier bearing cups (Part of 4220) (2 required)
15	4067	Differential carrier bearing shims (2 required)
16	—	Differential bearing cap (part of 4010) (2 required)
17	—	Differential bearing cap bolts (part of 4010) (4 required)

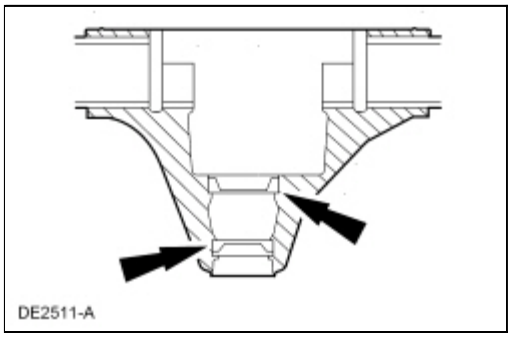


Removal

All vehicles

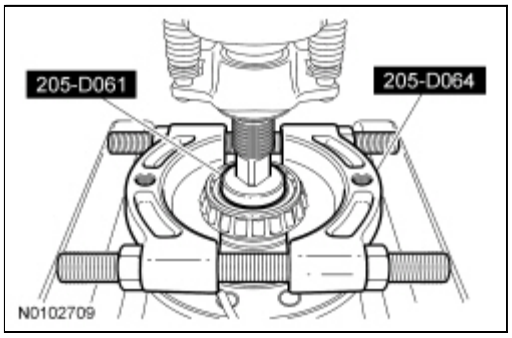


1. Remove the drive pinion seal. Refer to Drive Pinion Flange and Drive Pinion Seal in this section.
2. Remove the differential carrier assembly. Refer to Differential Carrier in this section.
3. Remove the drive pinion shaft oil slinger.



4. Install the Drive Pinion Thread Protector, then use a soft-faced hammer to drive the pinion gear out of the outer drive pinion bearing and remove the pinion gear.

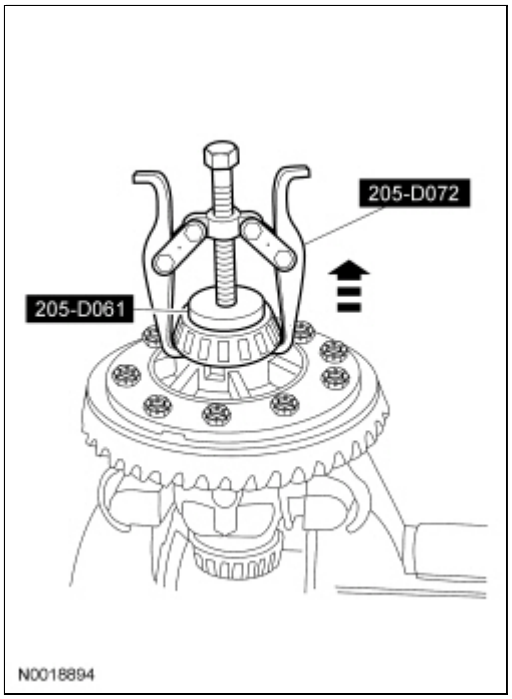
5. Remove and discard the drive pinion collapsible spacer.



6. Using a brass drift, remove the 2 drive pinion bearing cups by tapping alternately on opposite sides of the 2 drive pinion bearing cups.

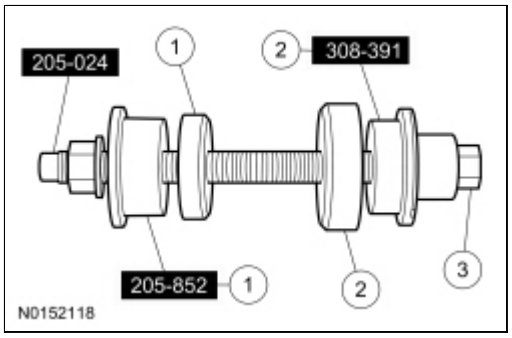
Electronic Locking Differential (ELD) equipped vehicles

7. Using the Bearing Puller plate, Step Plate and a suitable press, remove the LH differential bearing.



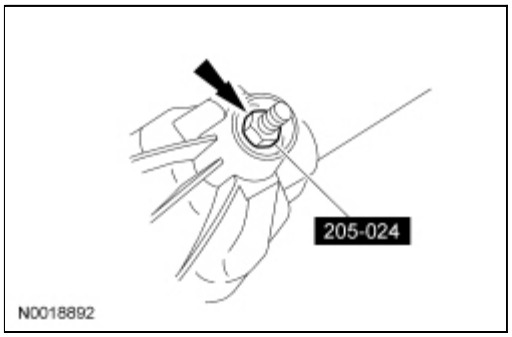
8. Using the 2 Jaw Puller and Step Plate, remove the RH differential bearing.

Non- ELD equipped vehicles



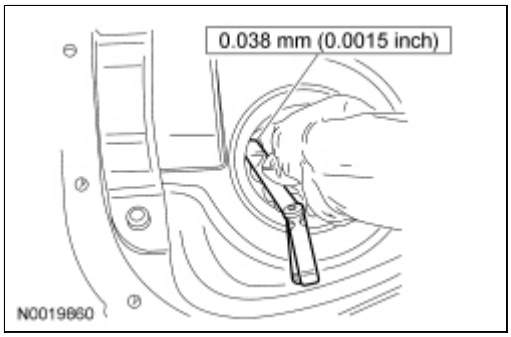
9. Remove the 2 differential bearings with the 2 Jaw Puller and Step Plate.

repair4less



Installation

1. Position the Drive Pinion Bearing Cup Installer and the inner and outer drive pinion bearing cups in their respective bores.
    1. Place the Rear Axle Pinion Bearing Cup Installer on the outer drive pinion bearing cup.
    2. Place the Rear Axle Pinion Bearing Cup Installer on the inner drive pinion bearing cup.
    3. Install the Drive Pinion Bearing Cup Installer.



2. Tighten the Drive Pinion Bearing Cup Installer to fully seat the 2 differential drive pinion bearing cups.

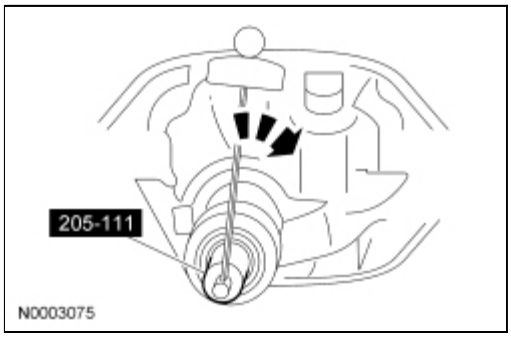
3. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

   Make sure the differential pinion bearing cups are correctly seated.

4. ***NOTICE:*** **Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly or damage to the component may occur.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

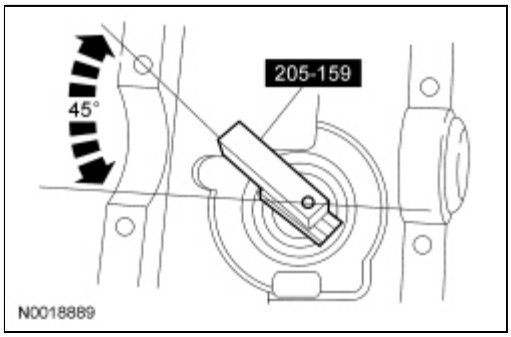
   Install the new drive pinion bearings and Adapters as shown.



Item	Part Number	Description
1	4621	Outer pinion bearing
2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S127

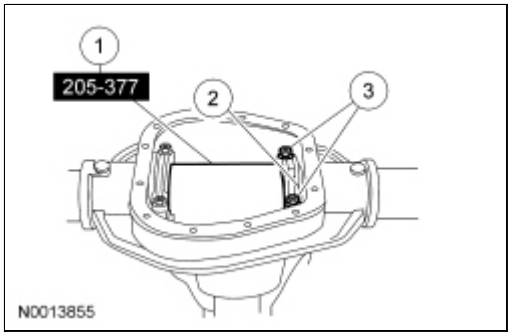
repair4less

6	205-377	Drive Pinion Gauge Tube
7	205-226	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing outer (front) pinion bearing
9	205-111	Adapter for 205-S127



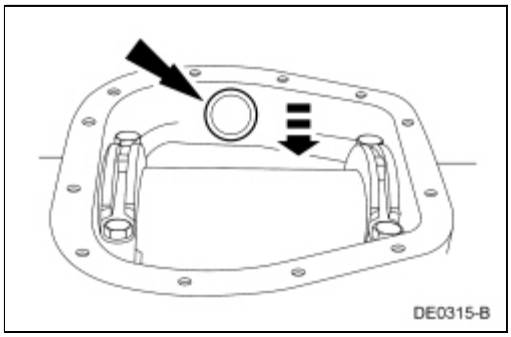
5. **NOTE:** This step duplicates final drive pinion bearing preload.

   Tighten the Adapter.
   - Tighten to 2.2 Nm (20 lb-in).

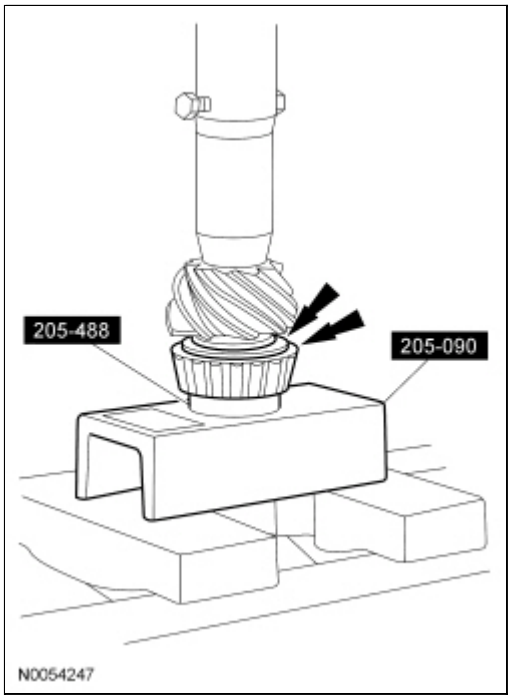


6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

   Rotate the Adapter several half-turns to make sure of correct seating of the drive pinion bearings.



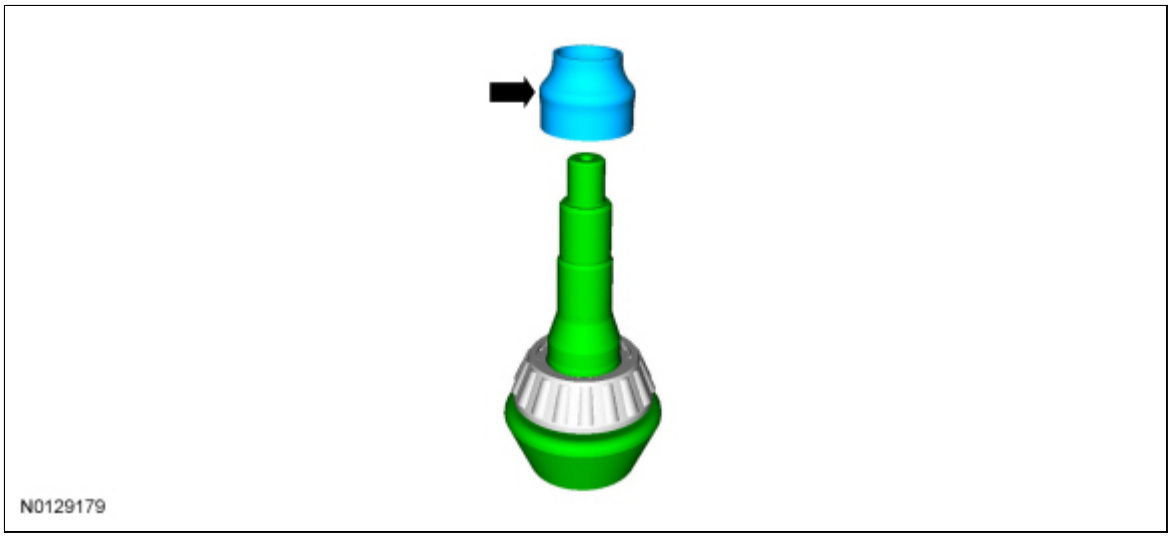
7. Install the Drive Pinion Gauge Tube.
   1. Position the Drive Pinion Gauge Tube.
   2. Install the 2 differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 105 Nm (77 lb-ft).



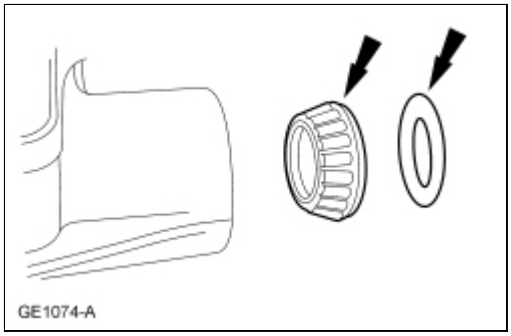
8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

   NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in the final assembly of integral axle assemblies.

   Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.
   - After the correct drive pinion bearing adjustment shim thickness has been determined, remove the Adapters.

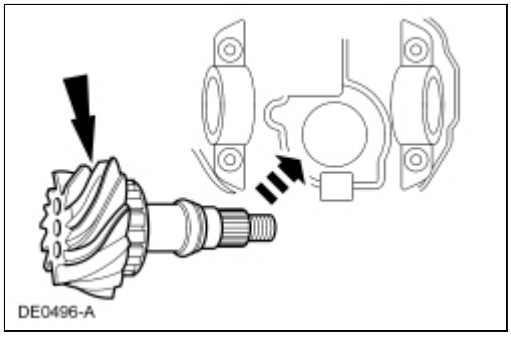


9. Using the Bearing/Oil Seal Plate and Drive Pinion Bearing Cone Installer, press the drive pinion bearing and selected drive pinion bearing adjustment shim until they are firmly seated on the pinion gear.

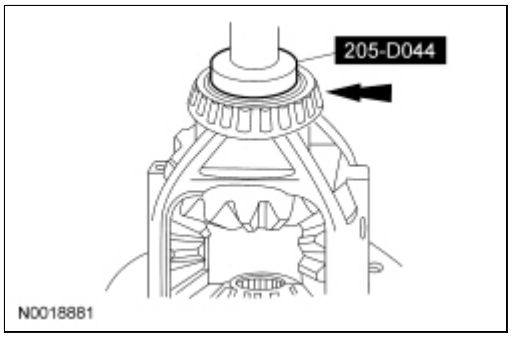


10. Place a new drive pinion collapsible spacer on the pinion gear against the pinion gear shoulder.

repair4less



11. Install the outer drive pinion bearing and drive pinion shaft oil slinger.



12. Lubricate the pinion flange splines with grease.

13. Install the pinion gear in the pinion gear bore from inside the axle housing.

14. Using the Differential Carrier Bearing Installer, press the LH and RH differential bearing on the differential assembly.

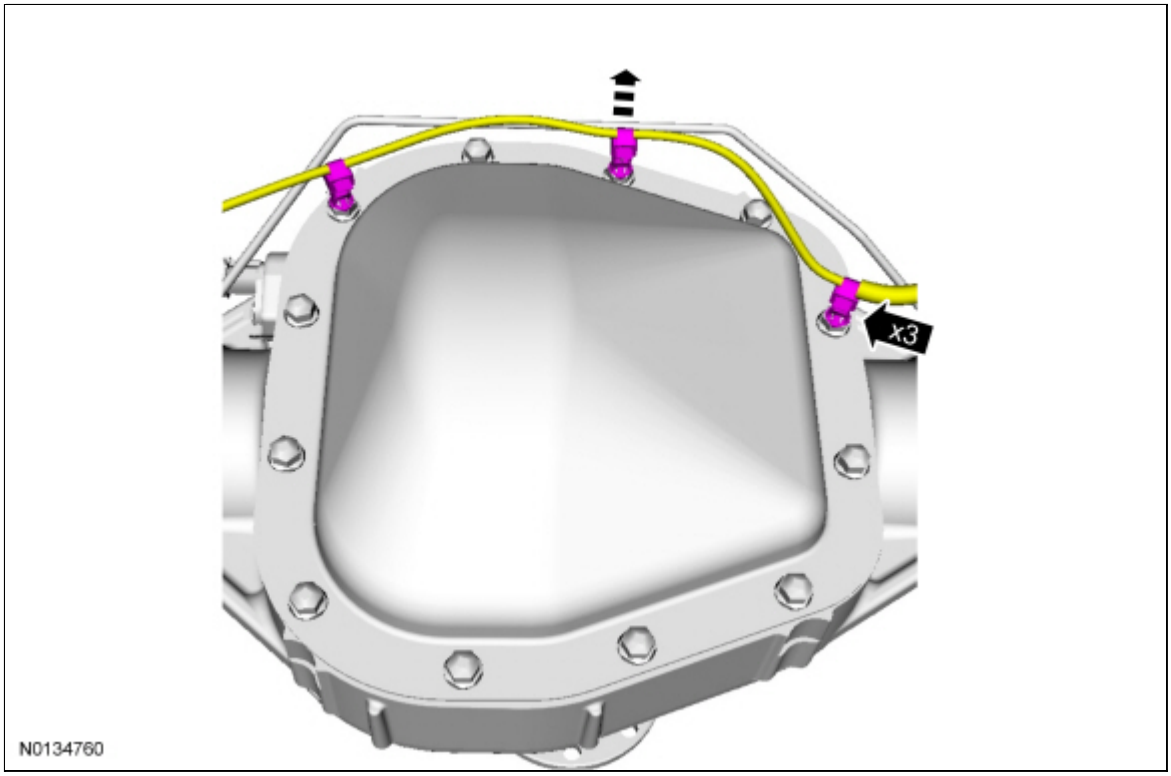
15. Install the differential carrier. Refer to Differential Carrier in this section.

16. Install the drive pinion seal and flange. Refer to Drive Pinion Flange and Drive Pinion Seal in this section.

---

repair4less

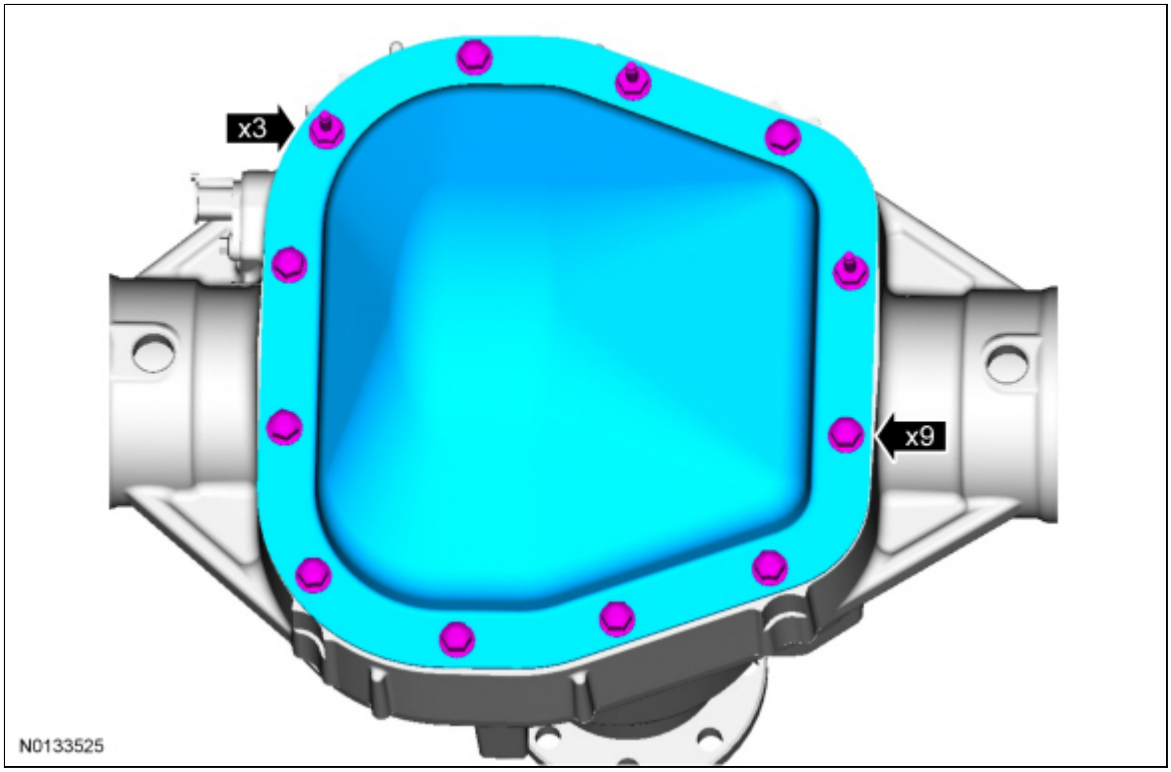
Differential Housing Cover



Material

Item	Specification
Additive Friction Modifier XL-3 (US); CXL-3 (Canada)	EST-M2C118-A
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal and Installation

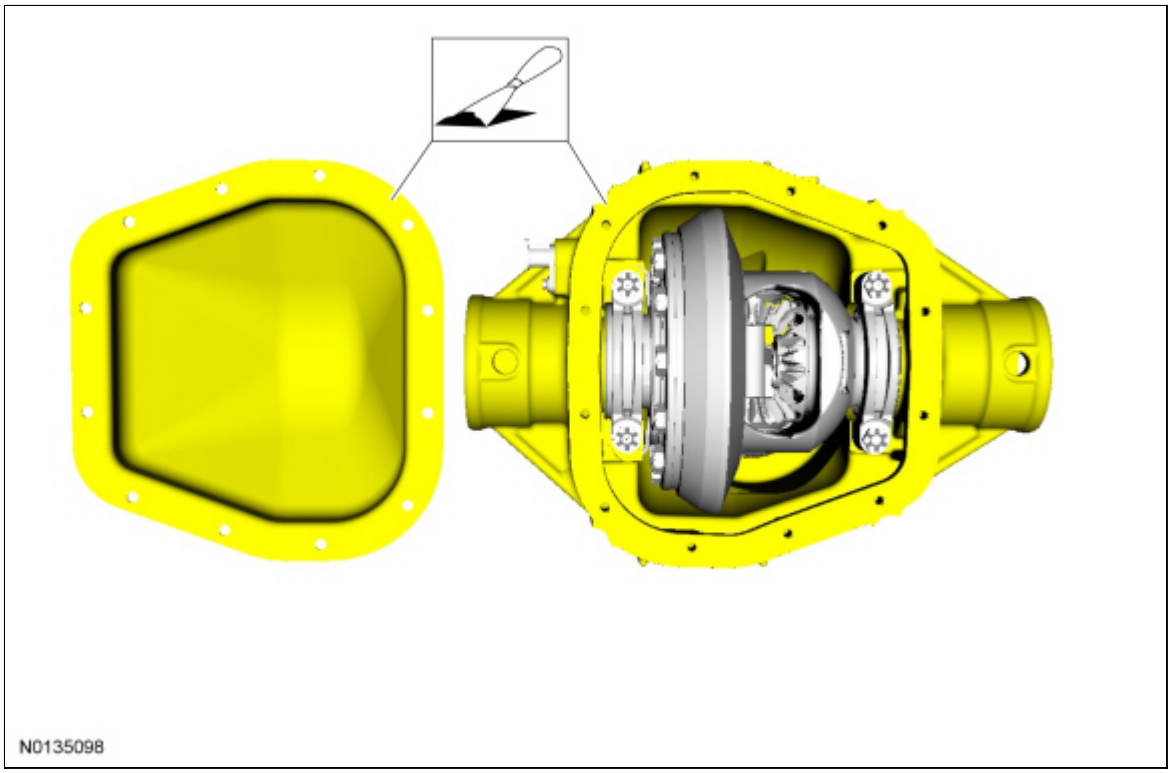


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

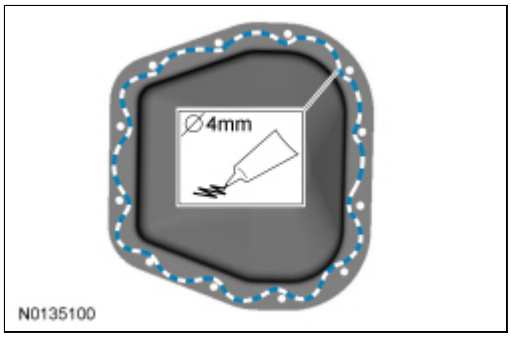
2. Separate the 3 brake tube fasteners from the differential housing cover stud bolts.

3. Remove the differential housing cover.
    1. Remove the 9 differential housing cover bolts and the 3 differential housing cover stud bolts, and drain the lubricant from the axle housing.

2. Remove the differential housing cover.



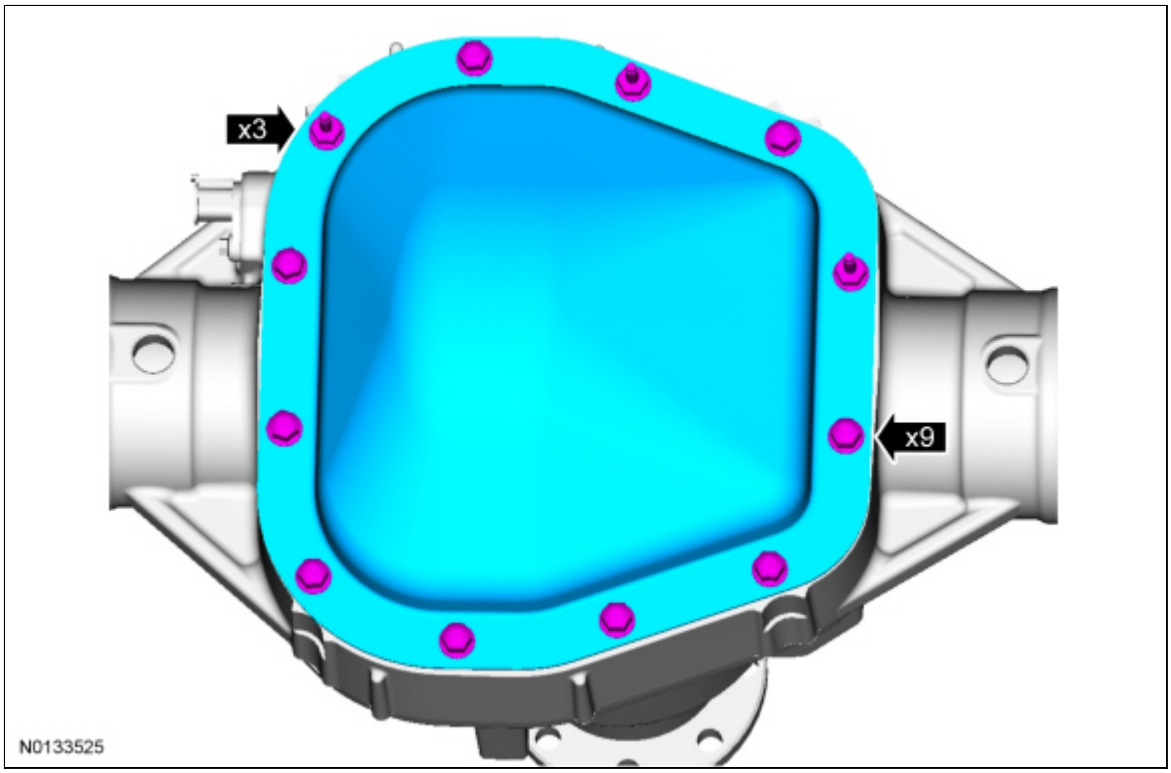
Installation



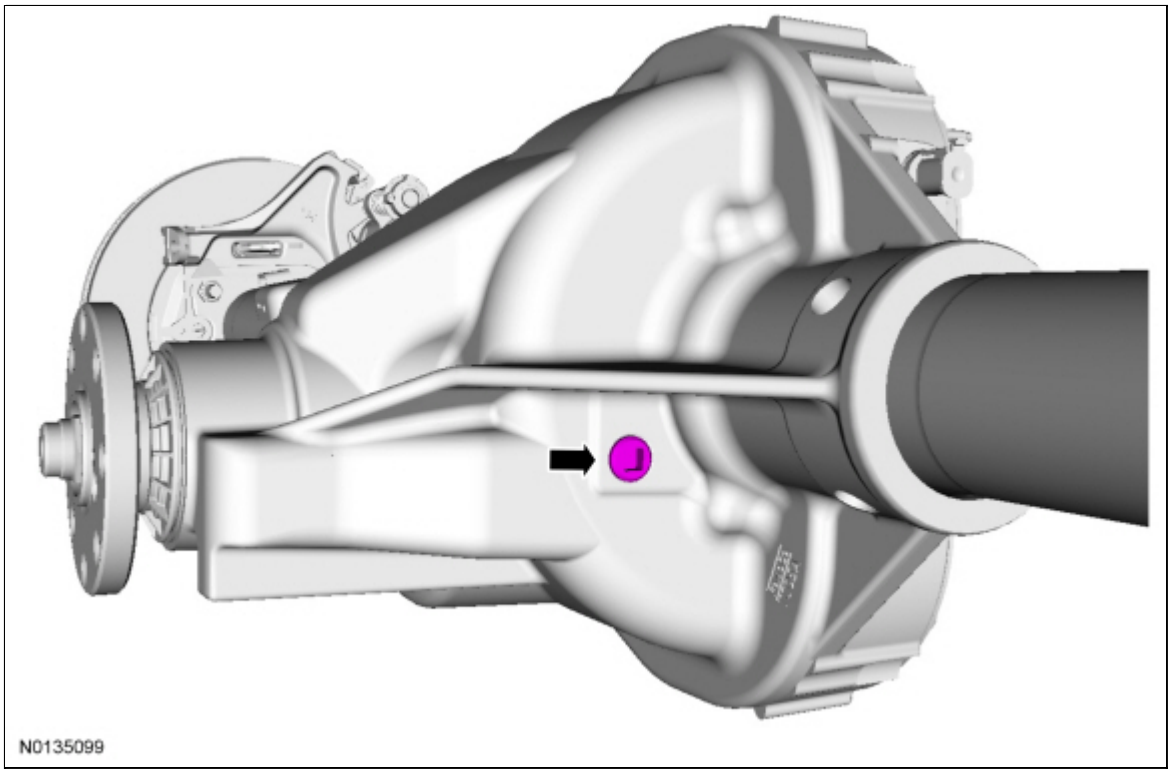
1. **NOTE:** Remove all of the silicone gasket and make sure the surfaces are free of oil before applying the new silicone gasket.

   Clean the gasket mating surface of the axle and the differential housing cover.

repair4less



2. Apply a new, continuous bead of sealant to the differential housing cover as shown.

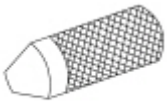


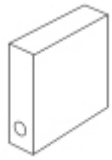
3. **NOTE:** The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

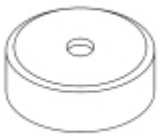
   Install the differential housing cover and the 9 differential housing cover bolts and the 3 differential housing cover stud bolts.
   - Tighten to 45 Nm (33 lb-ft).

4. Remove the fill plug.

5. **NOTE:** If equipped with Traction-Lok axles, first fill the axle with 118 ml (4 oz) of friction modifier. No friction modifier is used on Electronic Locking Differential (ELD) axles.

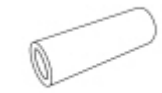


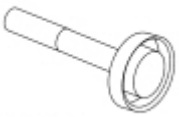


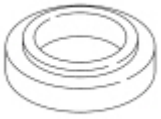


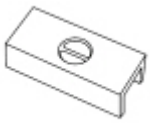
repair4less

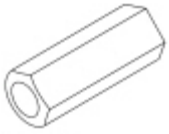
Fill the axle with the specified amount of axle lubricant and install the fill plug.











- Tighten to 30 Nm (22 lb-ft).

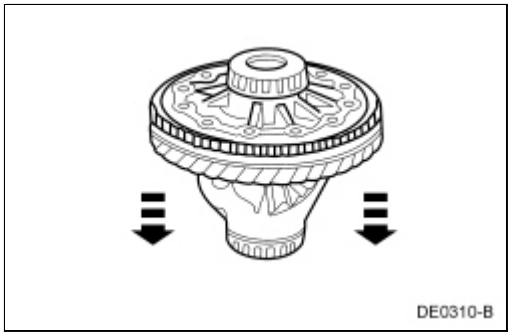
Removal

All vehicles

1. Remove the drive pinion flange seal. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.

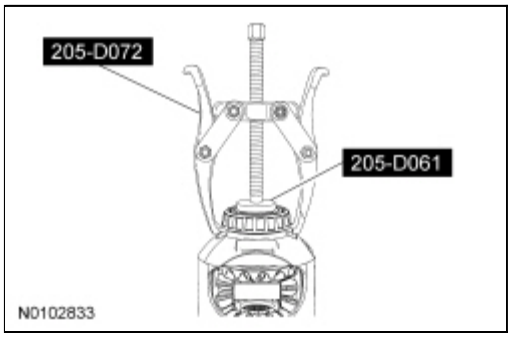


2. Remove the differential carrier assembly. For additional information, refer to Differential Carrier in this section.

3. Remove and discard the 12 ring gear bolts.

4. **NOTE:** Do not damage the ring gear bolt hole threads.

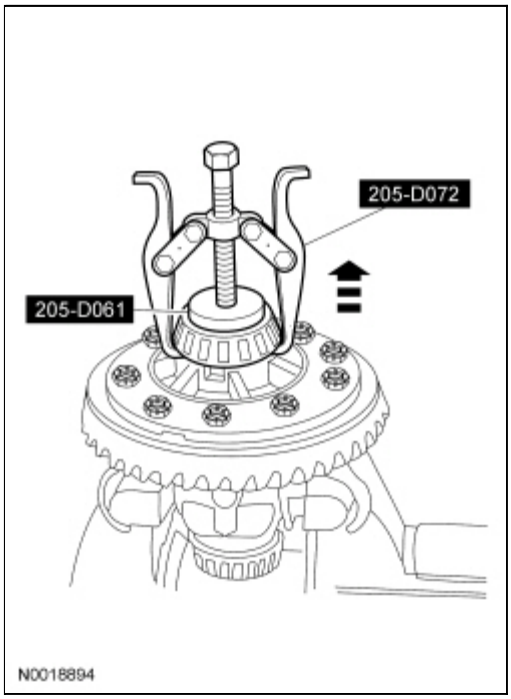
   Insert a punch in the ring gear bolt holes and drive the differential ring gear off.



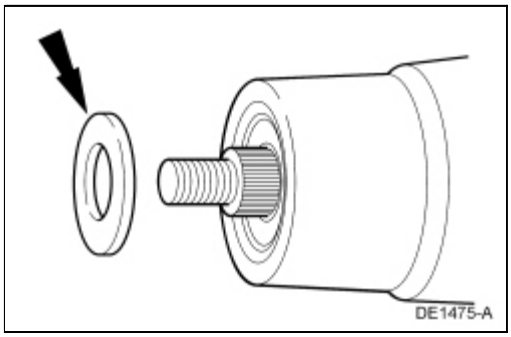
repair4less

Electronic Locking Differential (ELD) equipped vehicles

5. Using the Bearing Puller plate, Step Plate and a suitable press, remove the LH differential bearing.

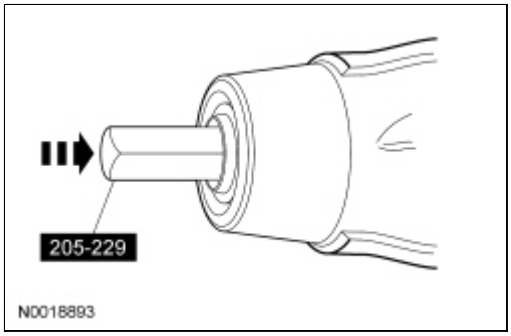


6. Using the 2 Jaw Puller and Step Plate, remove the RH differential bearing.

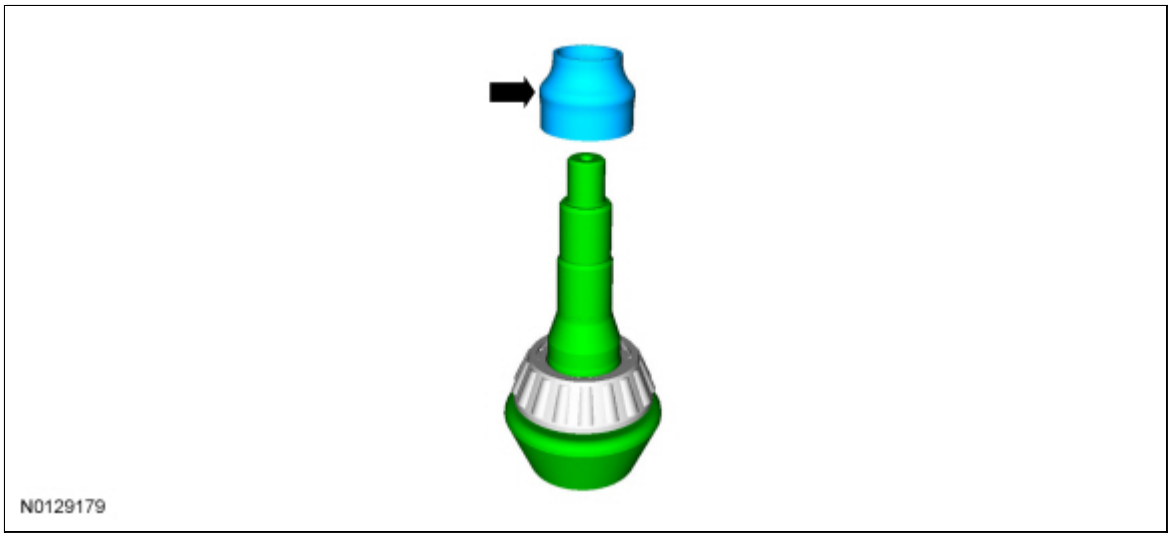


Non- ELD equipped vehicles

7. Remove the 2 differential bearings with the 2 Jaw Puller and Step Plate.

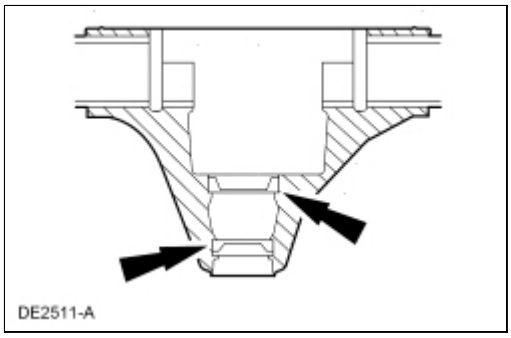


All Vehicles



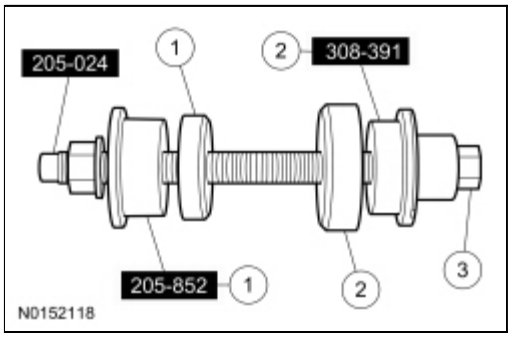
8. Remove the drive pinion shaft oil slinger.

9. Install the Drive Pinion Thread Protector, then use a soft-faced hammer to drive the pinion gear out of the outer drive pinion bearing and remove the pinion gear.

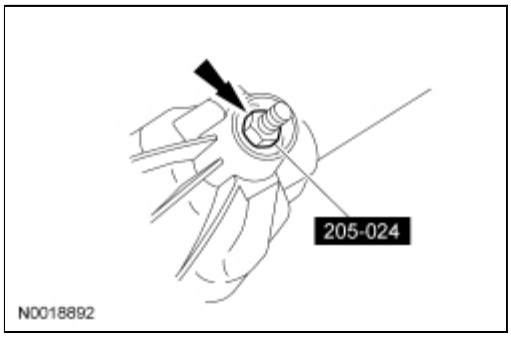


10. Remove and discard the drive pinion collapsible spacer.

11. Using a brass drift, remove the 2 drive pinion bearing cups by tapping alternately on opposite sides of the 2 drive pinion bearing cups.



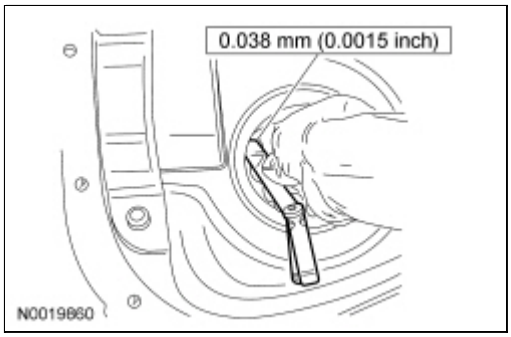
repair4less



Installation

All vehicles

1. Position the Drive Pinion Bearing Cup Installer and the inner and outer drive pinion bearing cups in their respective bores.
    1. Place the Rear Axle Pinion Bearing Cup Installer on the outer drive pinion bearing cup.
    2. Place the Rear Axle Pinion Bearing Cup Installer on the inner drive pinion bearing cup.
    3. Install the Drive Pinion Bearing Cup Installer.



2. Tighten the Drive Pinion Bearing Cup Installer to fully seat the 2 differential drive pinion bearing cups.

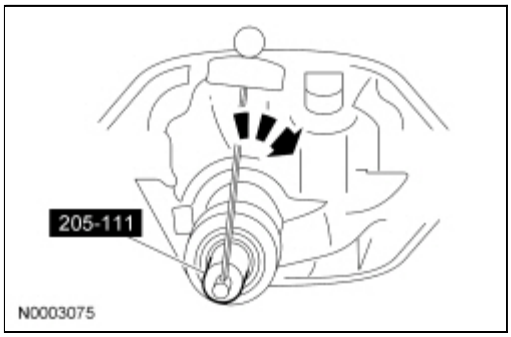
3. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

   Make sure the differential pinion bearing cups are correctly seated.

4. ***NOTICE:*** **Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly or damage to the component may occur.**

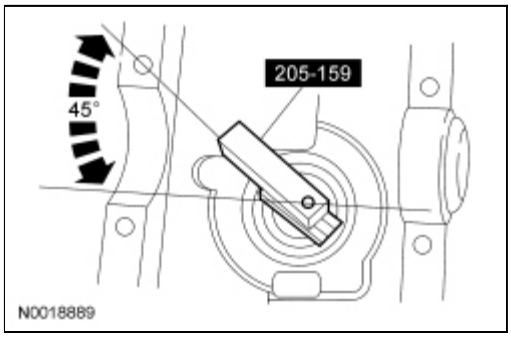
   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Install the new drive pinion bearings and Adapters as shown.



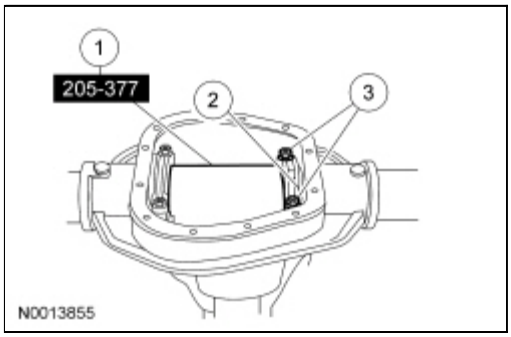
Item	Part Number	Description
1	4621	Outer pinion bearing
2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S127
6	205-377	Drive Pinion Gauge Tube
7	205-937	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing outer (front) pinion bearing

repair4less



9	205-111	Adapter for 205-S127

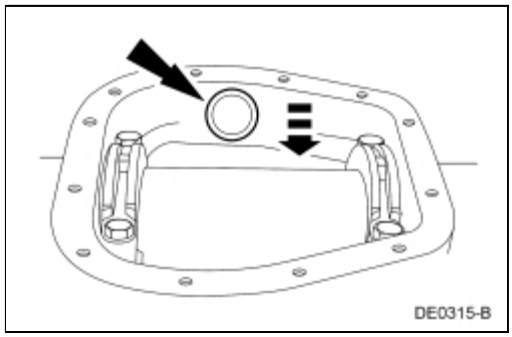
5. Tighten the Adapter to the specified rotational torque.
    - Tighten to 2.2 Nm (20 lb-in).



6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

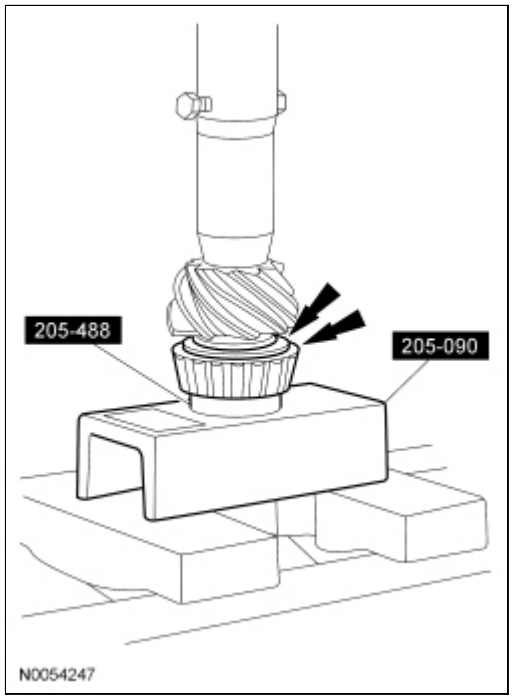
   Rotate the Adapter several half-turns to make sure of correct seating of the drive pinion bearings.

7. Install the Drive Pinion Gauge Tube.
    1. Position the Drive Pinion Gauge Tube.
    2. Install the 2 differential bearing caps.
    3. Install the 4 differential bearing cap bolts.
        - Tighten to 105 Nm (77 lb-ft).



8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

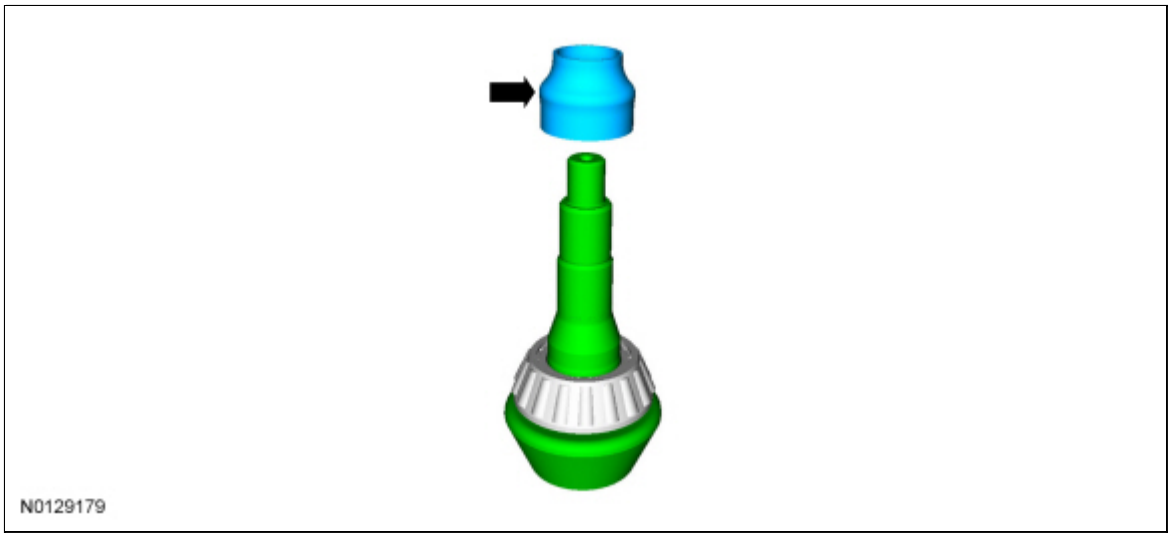
   NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required,



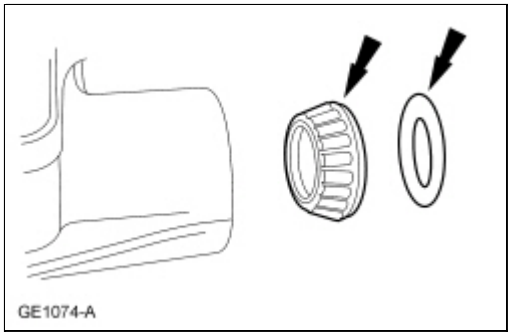
which results in a deep tooth contact in the final assembly of integral axle assemblies.

Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.

- After the correct drive pinion bearing adjustment shim thickness has been determined, remove the Adapters.

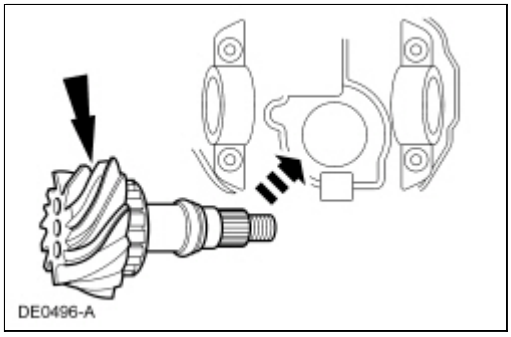


9. Using the Bearing/Oil Seal Plate and Drive Pinion Bearing Cone Installer, press the drive pinion bearing and selected drive pinion bearing adjustment shim until they are firmly seated on the pinion gear.

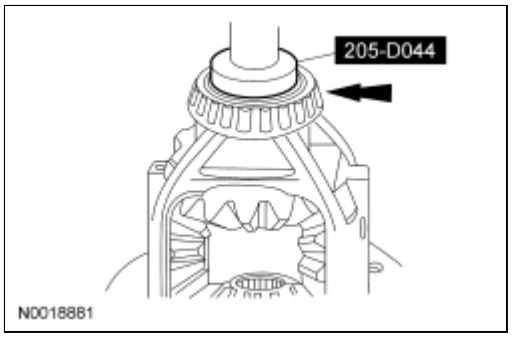


10. Place a new drive pinion collapsible spacer on the pinion gear against the pinion gear shoulder.

repair4less



11. Install the outer drive pinion bearing and drive pinion shaft oil slinger.

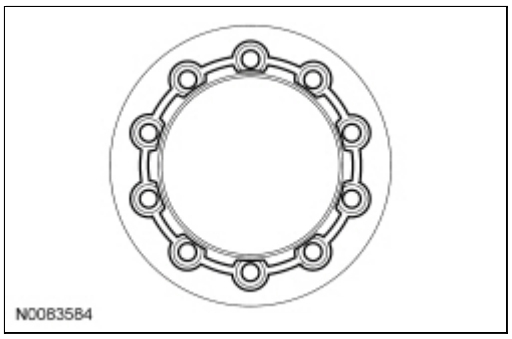


12. Lubricate the pinion flange splines with grease.

13. Install the pinion gear in the pinion gear bore from inside the axle housing.

14. Install the drive pinion seal and flange. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.

15. Using the Differential Carrier Bearing Installer, press the LH and RH differential bearing on the differential assembly.

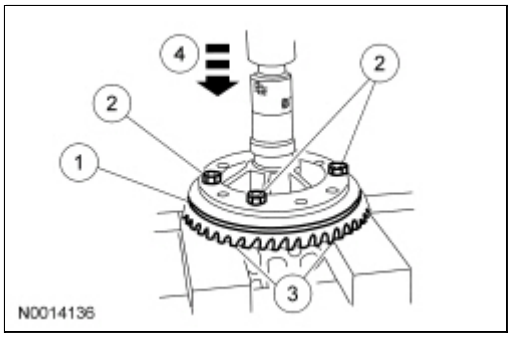


Electronic Locking Differential (ELD) equipped vehicles and all vehicles equipped with 3.55, 3.73, and 4.10 ratio gear sets

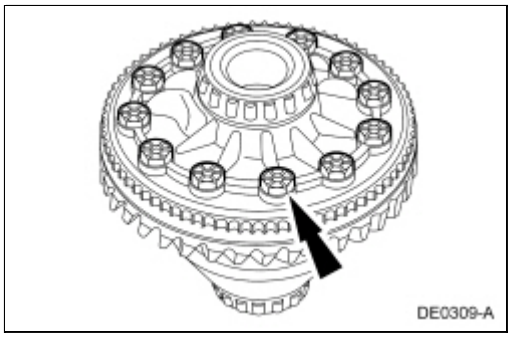
16. **NOTE:** The differential flange and ring gear flange must be free of any old retaining compound material. Make sure both surfaces are clean and free of oil, dust and debris. Failure to clean the surfaces can result in ring gear runout concerns.

    Clean all traces of the old retaining compound material from the differential flange.
    - Use solvent and Scotch-Brite® pads to remove.

17. Apply a one-eighth inch bead of maximum strength retaining compound on the rear face of the ring gear in the pattern shown.



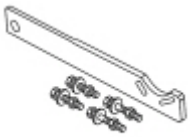
All vehicles

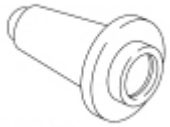


18. **NOTE:** If removed, press the speed sensor ring on with the differential ring gear.

    Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 new ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential assembly and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.

repair4less

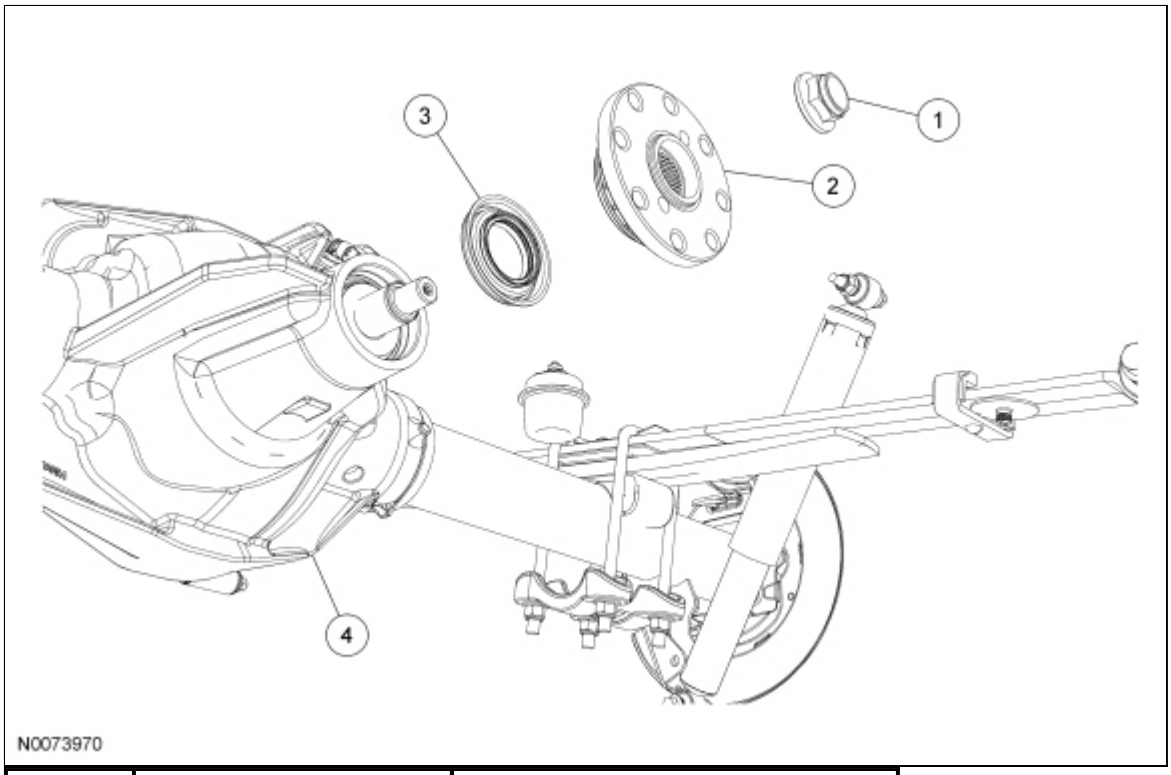




19. Install the remaining 9 new differential ring gear bolts.
    - Tighten to 150 Nm (111 lb-ft).

20. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

Drive Pinion Flange and Drive Pinion Seal



Special Tool(s)

 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
	Installer, Drive Pinion Flange 205-233 (T85T-4851-AH)
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Material

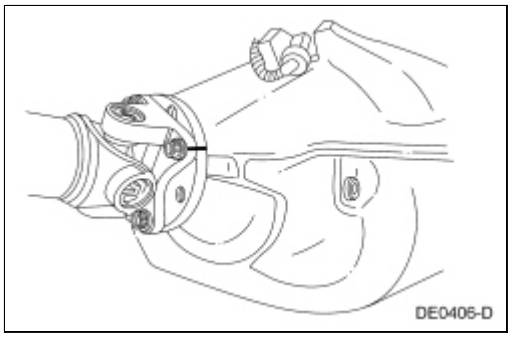
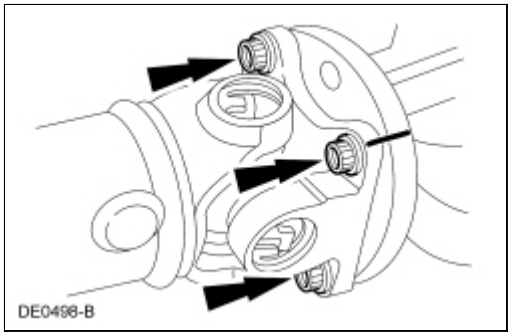
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5
Motorcraft® Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

repair4less



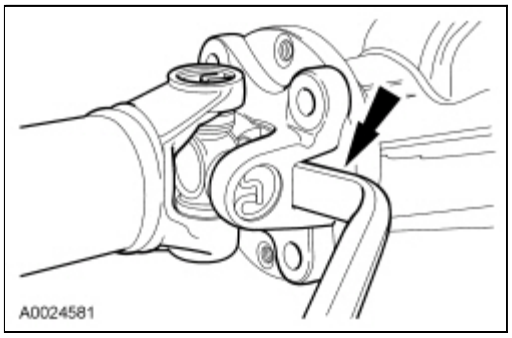
Item	Part Number	Description
1	4320	Drive pinion nut
2	4851	Drive pinion flange
3	4676	Drive pinion oil seal
4	4010	Differential housing



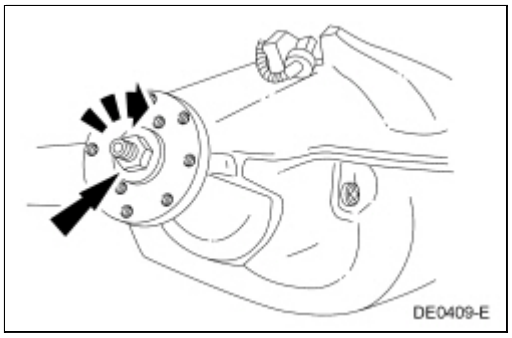
Removal

NOTICE: **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the brake disc. For additional information, refer to Section 206-04 .
3. Index-mark the driveshaft flange and pinion flange for correct alignment during installation.

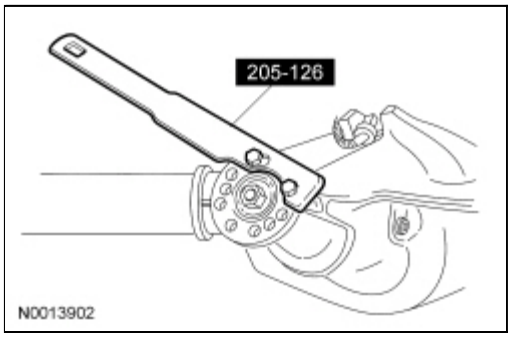


4. Remove the 4 driveshaft flange bolts.

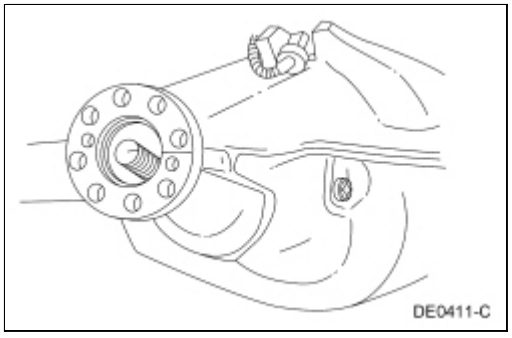


5. **NOTE:** The driveshaft centering socket yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft centering socket yoke from the pinion flange. Pry only in the area shown with a suitable tool to disconnect the driveshaft centering socket yoke from the pinion flange.

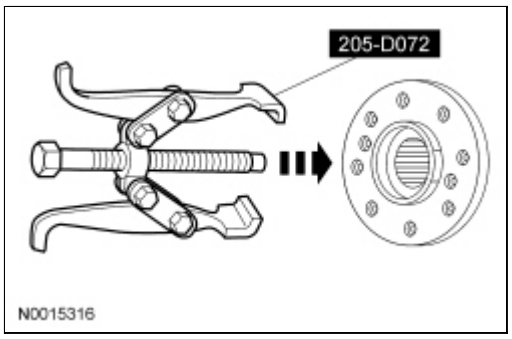
   Using a suitable tool as shown, disconnect the driveshaft centering socket yoke from the pinion flange.
   - Using mechanic's wire, position the driveshaft aside.



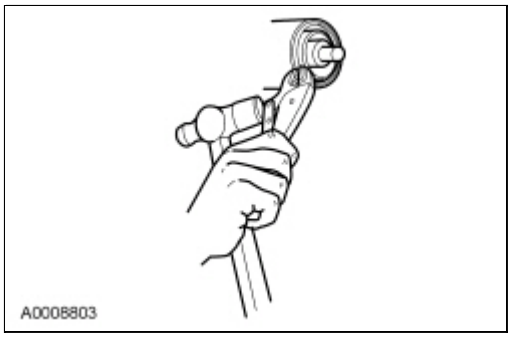
6. Using a Nm (lb-in) torque wrench on the pinion nut, record the torque required to maintain rotation of the pinion gear through several revolutions.



repair4less

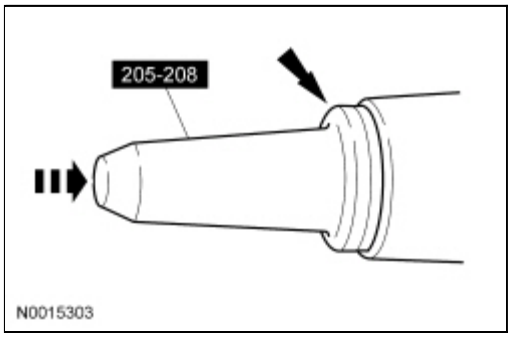


7. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut.

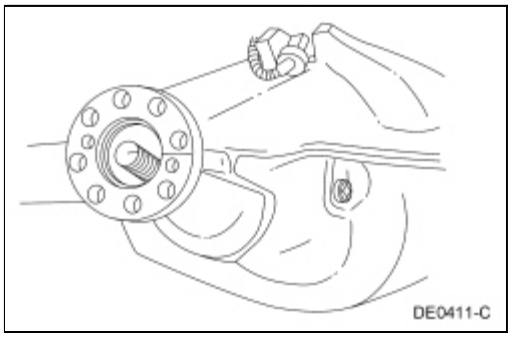


8. Index-mark the pinion flange in relation to the drive pinion stem to make sure of correct alignment during installation.

9. Using the 2 Jaw Puller, remove the pinion flange.

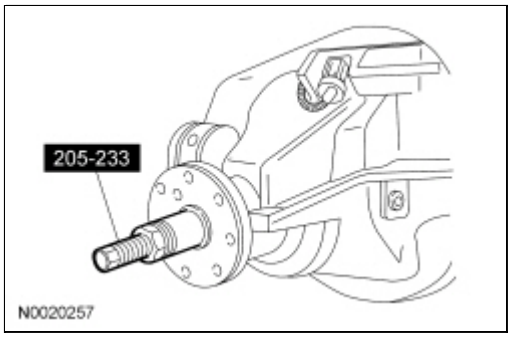


10. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the drive pinion seal is removed.



Installation

1. Lubricate the new drive pinion seal with grease.
2. Using the Drive Pinion Oil Seal Installer, install a new drive pinion seal.

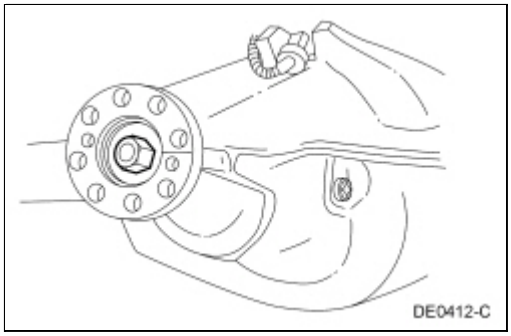


3. Lubricate the pinion flange splines with axle lubricant.
4. **NOTE:** Disregard the scribe marks if a new pinion flange is being installed.

   Align the pinion flange with the drive pinion shaft.

5. Using the Drive Pinion Flange Installer, install the pinion flange.

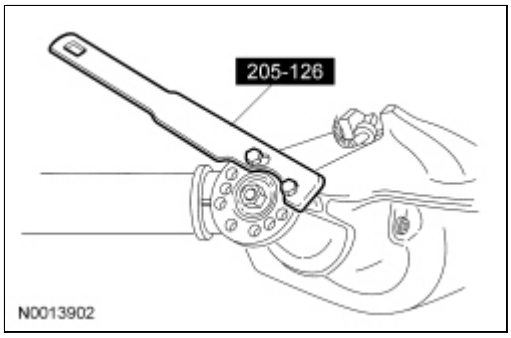
repair4less



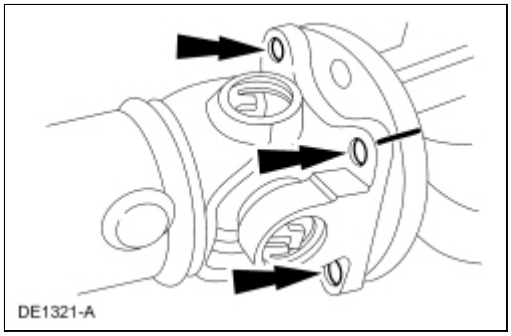
6. ***NOTICE:*** **Install a new pinion nut with the same color as the original if not replacing the collapsible spacer. If a new collapsible spacer is installed, install the nut in the kit, as indicated in the chart below, or damage to the component may occur.**

   Position the new pinion nut.

   9.75 Inch Drive Pinion Nut



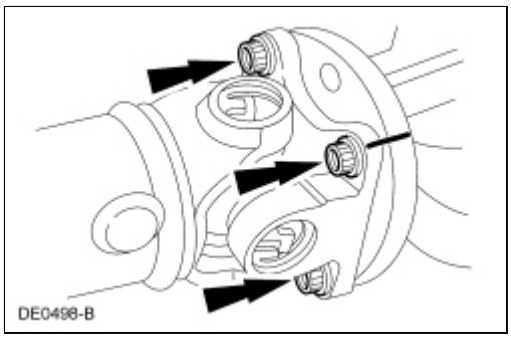
Part Number	Color Description	Application
19G405	Green	Axles built before 7/16/07
4320	White	Axles built after 7/16/07
4C121	White	Kit with spacer for all 9.75-in axles



7. ***NOTICE:*** **Under no circumstances is the pinion nut to be backed off to reduce drive pinion bearing preload. If reduced drive pinion bearing preload is required, a new drive pinion collapsible spacer and pinion nut must be installed or damage to the component may occur.**

   NOTE: Remove the Drive Pinion Flange Holding Fixture while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

   Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the pinion nut.
   - Rotate the drive pinion occasionally to make sure the drive pinion bearings are seating correctly.
   - Install a Nm (lb-in) torque wrench on the pinion nut.
   - Rotating the drive pinion through several revolutions, take frequent drive pinion bearing preload readings until the original recorded drive pinion bearing preload reading is obtained.
   - If the original recorded drive pinion bearing preload is lower than specification, tighten to the appropriate specification for used drive pinion bearings. If the drive pinion bearing preload is higher than specification, tighten the pinion nut to the original reading as recorded. For additional information, refer to the Specification portion of this section.

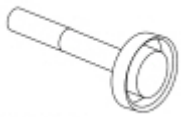


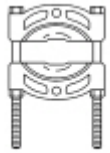
8. Position the driveshaft and align the index mark on the pinion flange.

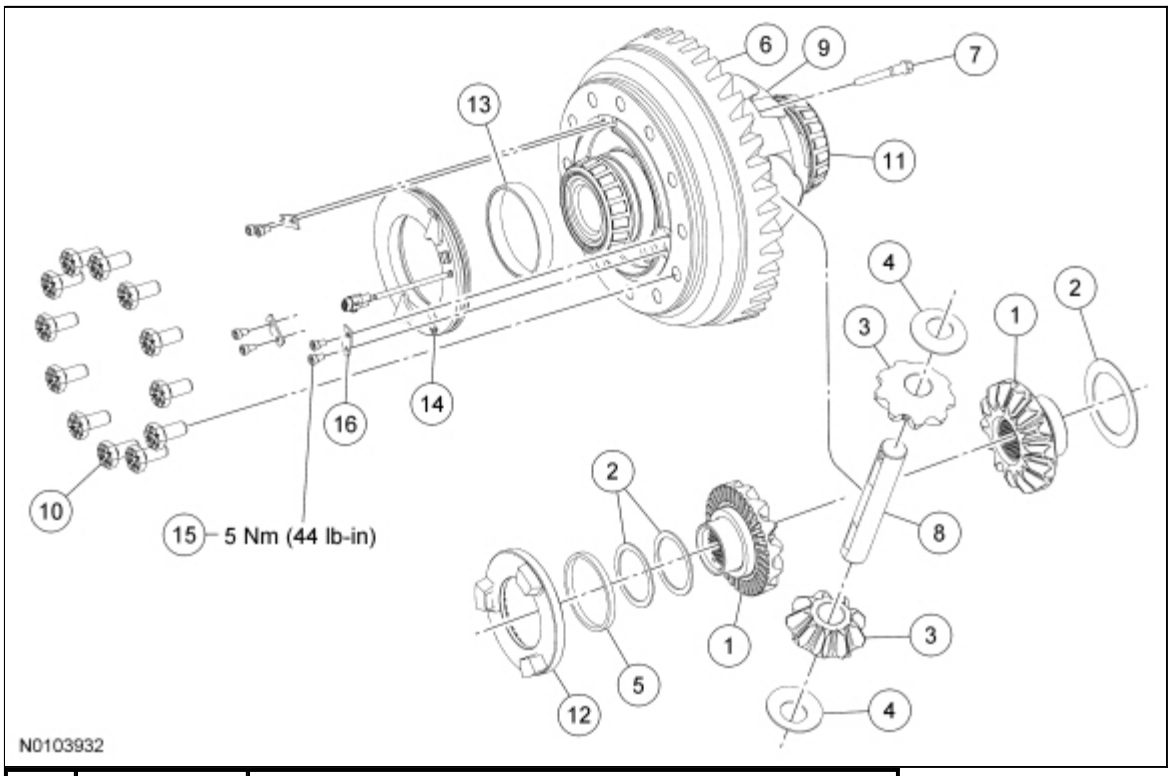
9. **NOTE:** The driveshaft centering socket yoke fits tightly on the pinion flange pilot. To make sure that the driveshaft centering socket yoke seats squarely on the pinion flange, tighten the driveshaft flange bolts evenly in a cross pattern.

   NOTE: If new bolts are not available, coat the threads of the original driveshaft flange bolts with threadlock and sealer.

   Install the 4 new driveshaft flange bolts.
   - Tighten to 103 Nm (76 lb-ft).







10. Install the rear brake disc. For additional information, refer to Section 206-04 .

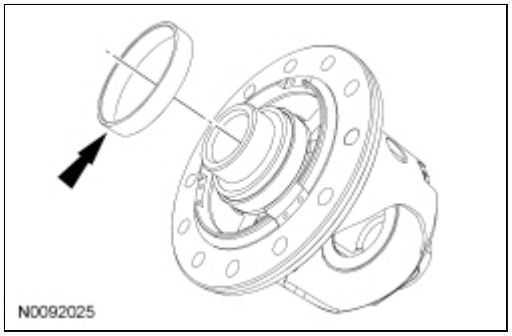
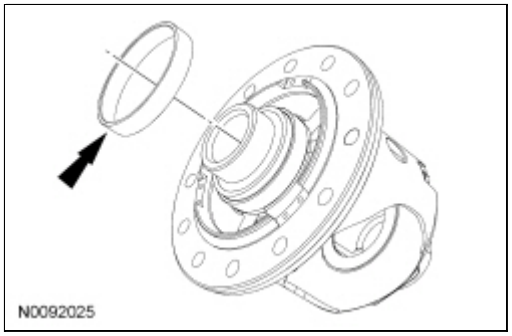
15	—	ELD coil screw (part of kit 4880) (6 required)
16	—	Stopper (part of kit 4880) (3 required)

Removal

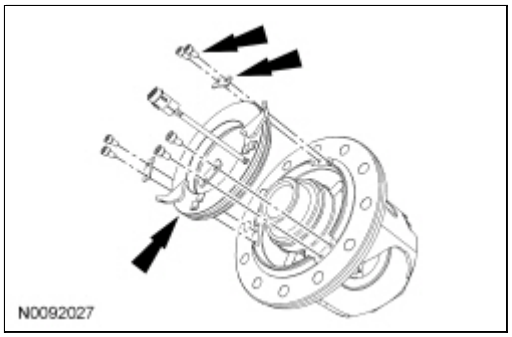


1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.
2. Using the Bearing Puller plate, Step Plate and a suitable press, remove the LH differential bearing.

3. Remove and discard the 6 screws and 3 stoppers that hold the Electronic Locking Differential (ELD) coil in place and remove the coil.

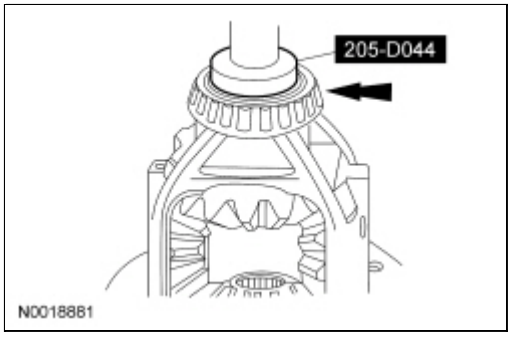


4. Remove and discard the plunger assembly.



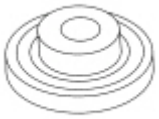
Installation

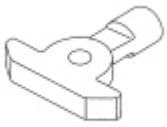
1. Install a new plunger assembly.



2. Install the new ELD coil, 3 stoppers and 6 screws that hold the coil in place.
    - Tighten to 5 Nm (44 lb-in).

repair4less





3. Use the Differential Carrier Bearing Installer to install the LH differential bearing.

4. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

Rear Wheel Bearing and Axle Shaft Seal

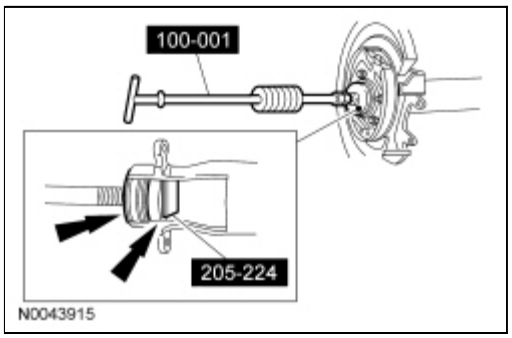
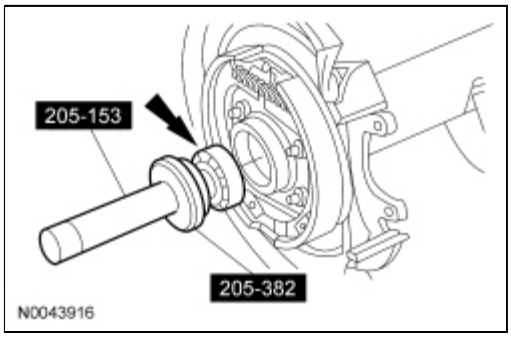
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

repair4less



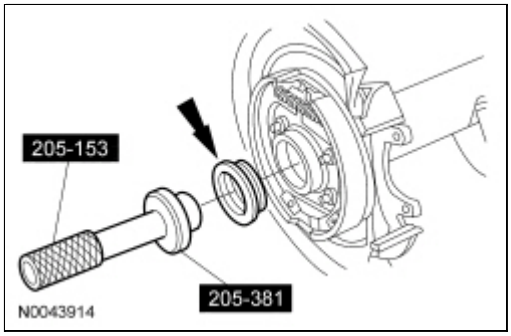
Item	Part Number	Description
1	1177	Axle shaft oil seal
2	1225	Axle shaft bearing
3	4010	Differential housing

Removal



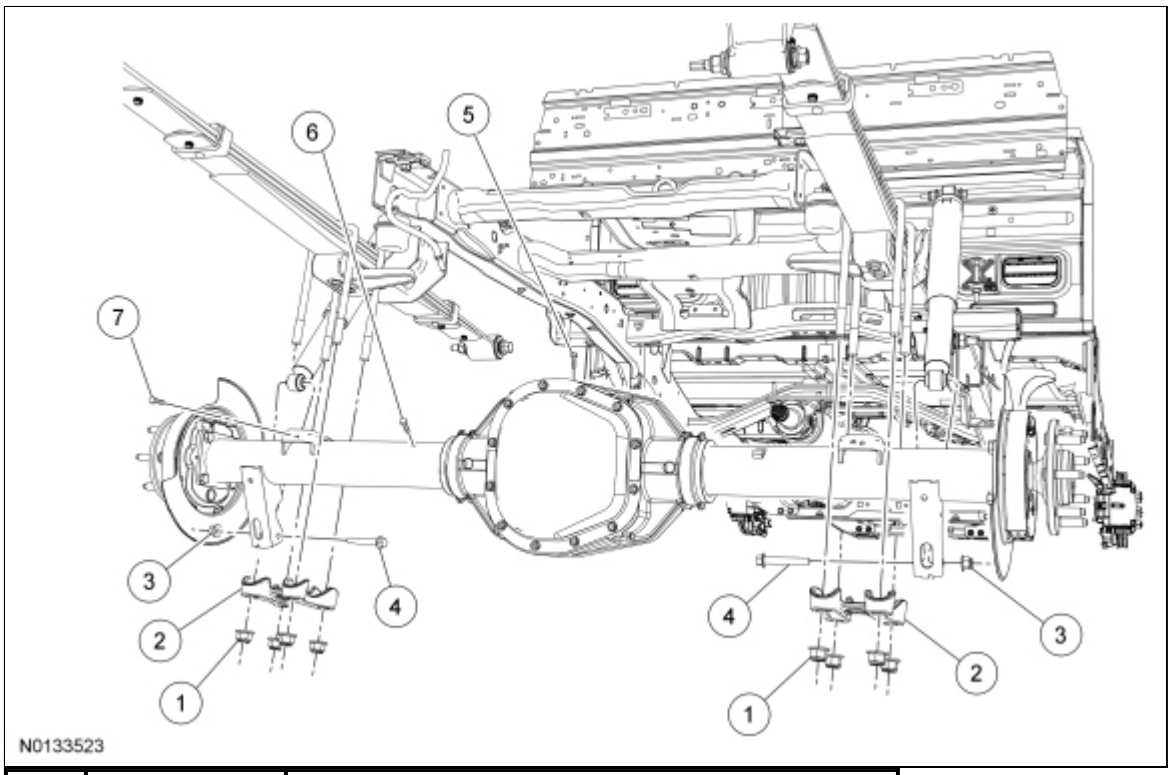
1. Remove the axle shaft. For additional information, refer to Axle Shaft in this section.
2. **NOTE:** If only a new axle shaft oil seal needs to be installed, use care to avoid damaging the axle shaft oil seal bore.

   Using a suitable seal remover, remove and discard the axle shaft oil seal.
3. Inspect the rear wheel bearing and axle shaft for wear or damage.
4. Using the Axle Bearing Remover and Slide Hammer, remove the rear wheel bearing.



Installation

1. Lubricate the new rear wheel bearing with axle lubricant.
2. Using the Axle Bearing Installer and Handle, install the rear wheel bearing.



3. Lubricate the lip of the new axle shaft oil seal with grease.
4. Using the Axle Oil Seal Installer and Handle, install the new axle shaft oil seal.

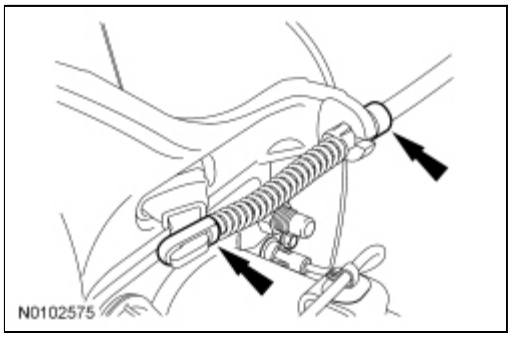
5. Install the axle shaft. For additional information, refer to Axle Shaft in this section.

repair4less

Axle Assembly

Item	Part Number	Description
1	W705518	U-bolt nuts (8 required)
2	5798	U-bolt plates (2 required)
3	W520214	Lower shock absorber nuts (2 required)
4	W506545	Lower shock absorber bolts (2 required)
5	57632	Brake tube/ parking brake cable bracket bolt
6	4022	Axle vent
7	W712215	Brake hose bracket bolt (2 required)

Removal and Installation



All vehicles

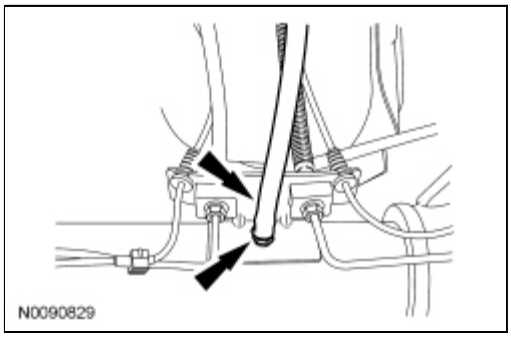
NOTICE: **Suspension fasteners are critical components because they affect performance of vital components and systems and their failure can result in major service expense. Install new components with the same component number or an equivalent component if installation is necessary. Do not use an installation component of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these components.**

1. Remove the driveshaft. For additional information, refer to Section 205-01 .

repair4less

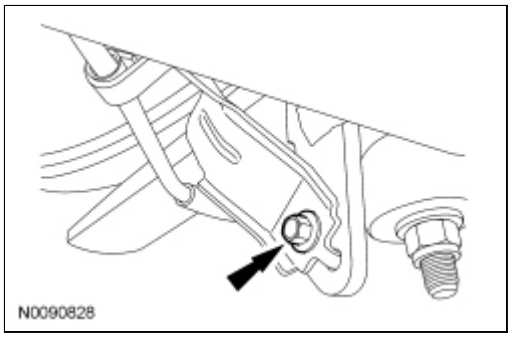
2. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.
3. Release the parking brake cable tension. For additional information, refer to Section 206-05 .
4. Disconnect the parking brake cables.

5. Disconnect the wheel speed sensor harness retainers from the axle.



Vehicles with Electronic Locking Differential (ELD)

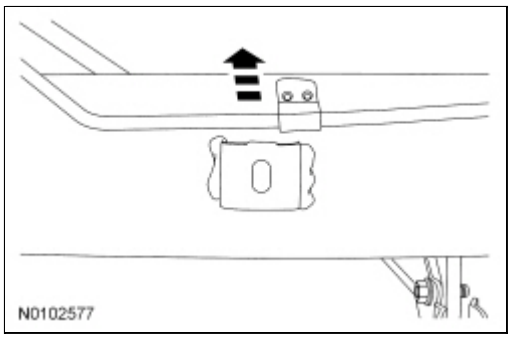
6. Disconnect the ELD electrical connector.



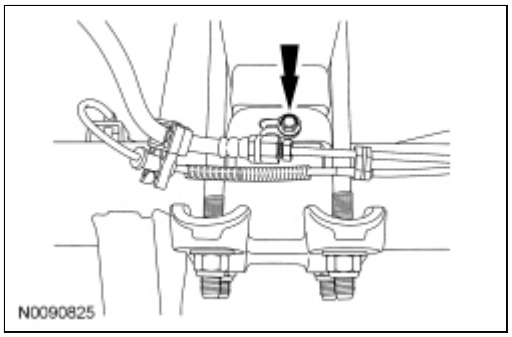
All vehicles

7. **NOTE:** If the vent hose is disconnected from the vehicle body, a new retainer must be installed.

   Disconnect the vent hose and remove the axle vent.
   - To install, tighten to 18 Nm (159 lb-in).



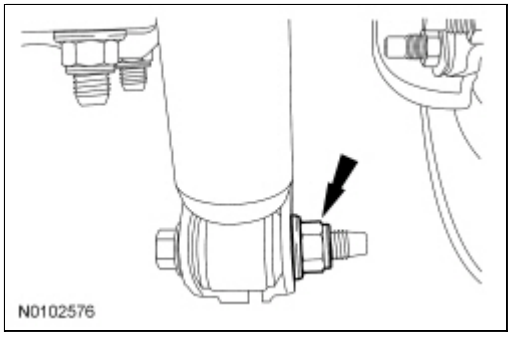
8. Remove the RH parking brake cable bracket bolt.
   - To install, tighten to 30 Nm (22 lb-ft).



9. Remove the brake tube/parking brake cable bracket bolt.
    - To install, tighten to 25 Nm (18 lb-ft).

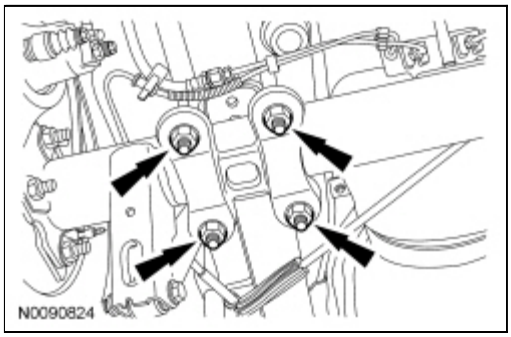
10. Disconnect the brake tube from the brake tube retaining clip.

11. Remove the 2 brake hose bracket bolts.
    - To install, tighten to 30 Nm (22 lb-ft).



12. Support the axle with a suitable transmission jack.

repair4less



13. **WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.**

    Remove and discard the 2 lower shock absorber nuts and 2 bolts.
    - To install, tighten the new nuts to 90 Nm (66 lb-ft).

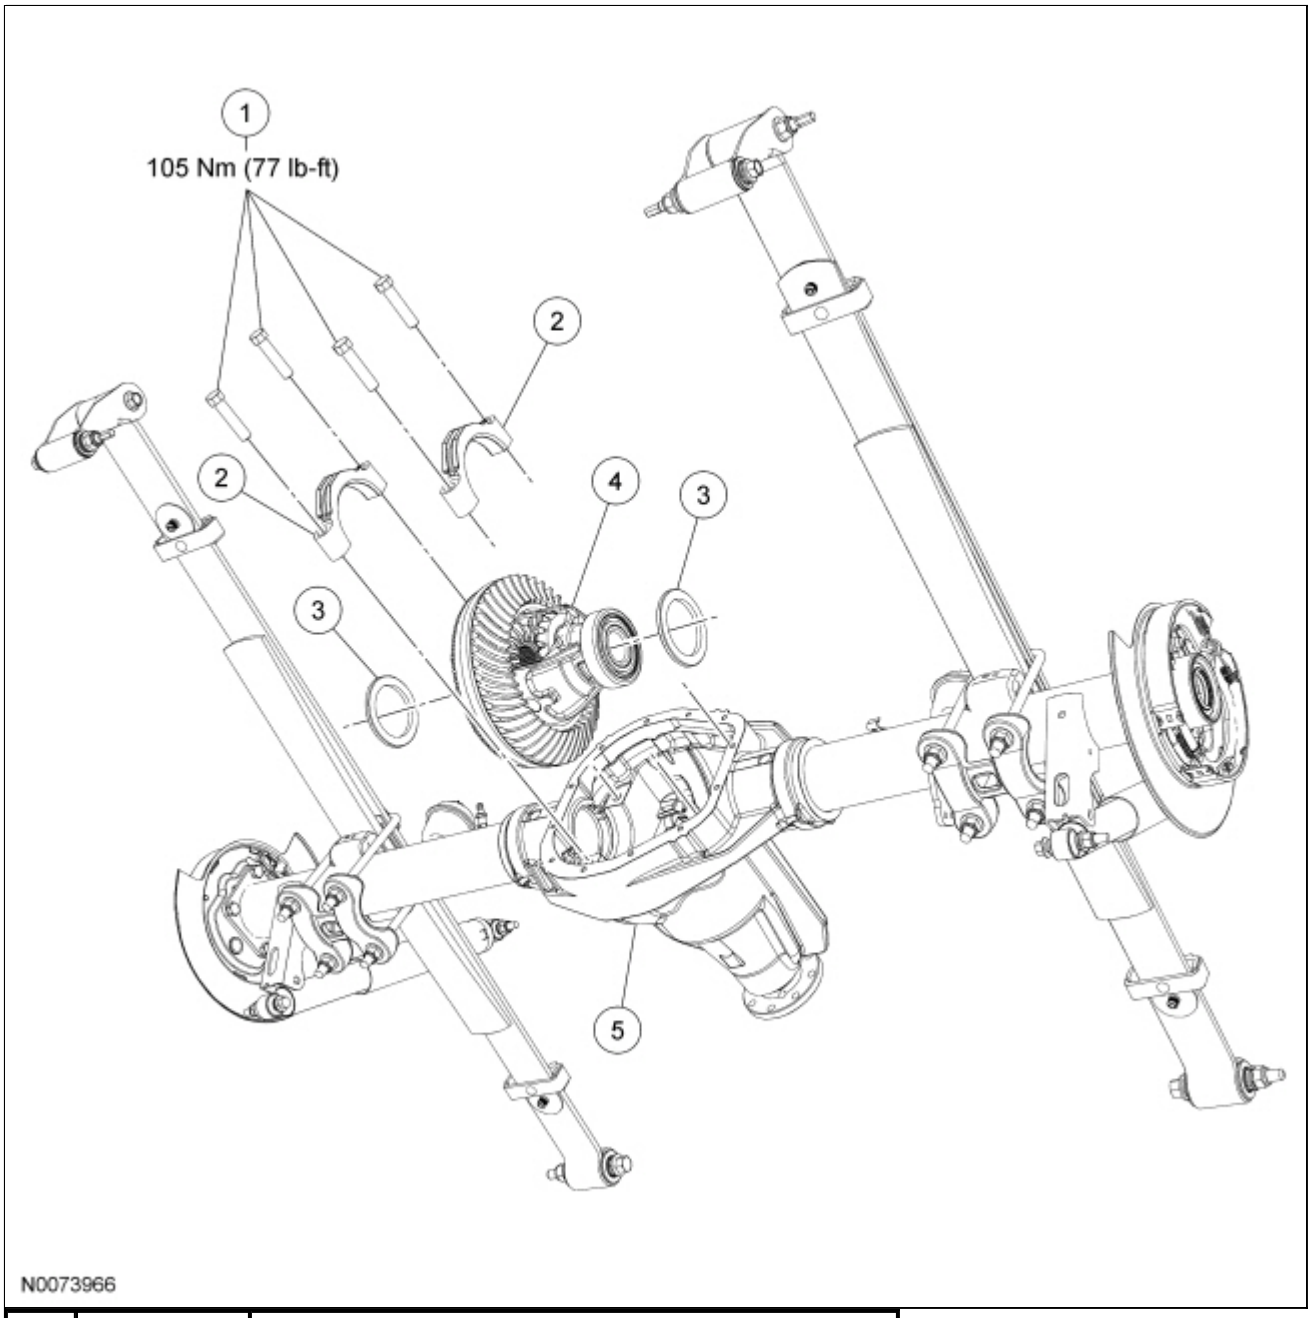
14. ***NOTICE:*** **Final tightening of the U-bolt nuts must be done with the suspension at curb height or incorrect clamp load may occur.**

    Remove and discard the 8 U-bolt nuts and the 4 U-bolts.
    - To install, with the suspension at curb height, tighten the new nuts evenly in a cross-type pattern in 4 stages.
        - Stage 1: Tighten to 35 Nm (26 lb-ft).
        - Stage 2: Tighten to 70 Nm (52 lb-ft).
        - Stage 3: Tighten to 100 Nm (74 lb-ft).
        - Stage 4: Tighten to 133 Nm (98 lb-ft).

15. **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    Lower and remove the axle assembly.

16. To install the original assembly, reverse the removal procedure.



17. Check the rear axle fluid level after installation.

repair4less

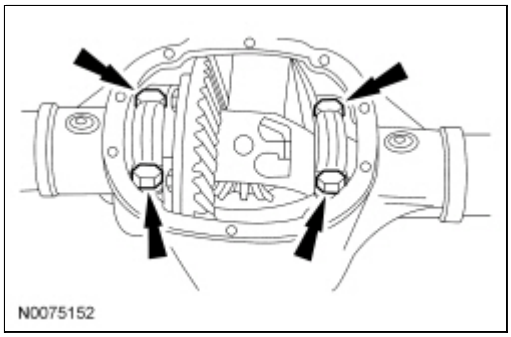
Differential Carrier

Special Tool(s)

 ST1485-A	Shim Driver 205-228 (T85T-4067-AH)

Item	Part Number	Description
1	—	Differential bearing cap bolts (part of 4010) (4 required)
2	—	Differential bearing caps (part of 4010) (2 required)
3	4067	Differential carrier bearing shims (2 required)
4	4204	Differential assembly
5	4010	Differential housing

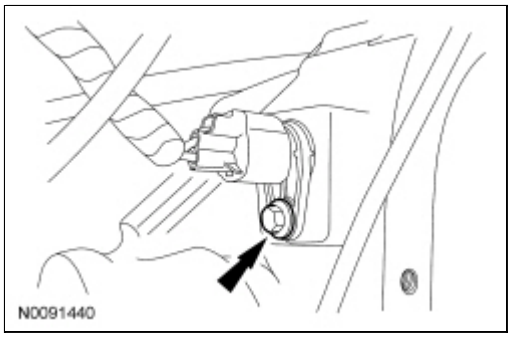
Removal



All vehicles

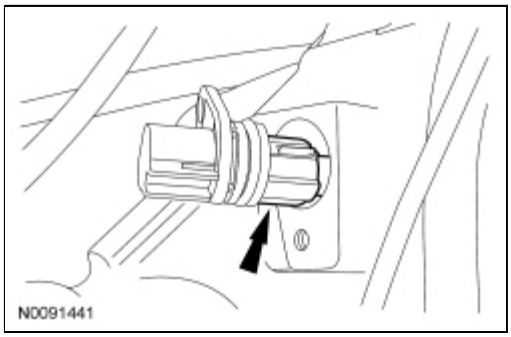
repair4less

1. Remove the axle shafts. For additional information, refer to Axle Shaft in this section.



2. **NOTE:** Index-mark the position of the differential bearing caps, as arrows may not be visible. The differential bearing caps must be installed in their original locations and positions.

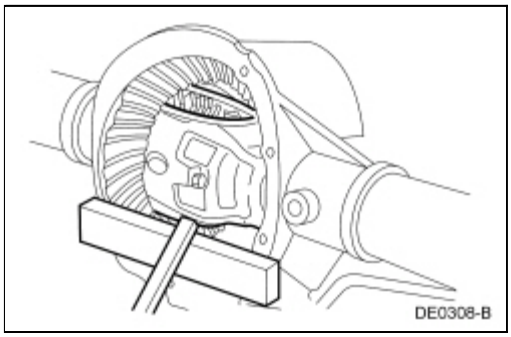
   Remove the 4 differential bearing cap bolts and the 2 differential bearing caps.



Electronic Locking Differential (ELD) equipped vehicles

3. Disconnect the Electronic Locking Differential (ELD) electrical connector and remove the bolt that holds the connector adapter to the housing.

4. Pull the connector adapter out and disconnect the ELD coil electrical connector from the connector adapter. Discard the adapter.

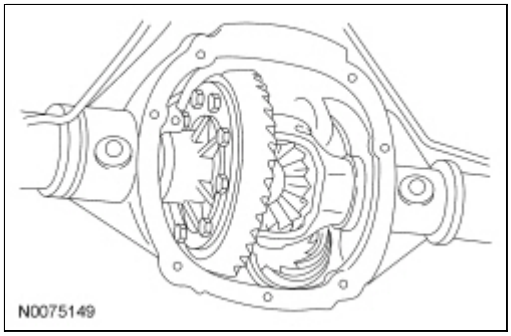


All vehicles

5. ***NOTICE:*** **Place a wood block between the pry bar and the axle housing to protect the machined surface from damage.**

   NOTE: Index-mark the position of the differential bearing shims. The differential bearing shims must

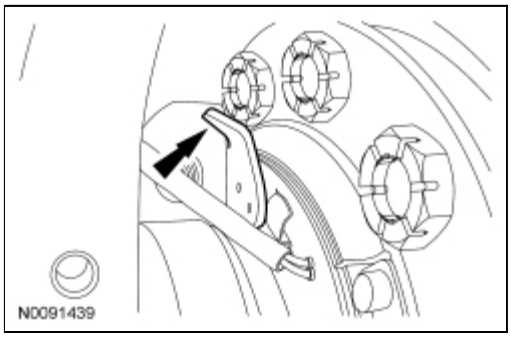
be installed in their original locations and positions.



Using pry bars and wood blocks, remove the differential carrier assembly from the axle housing.

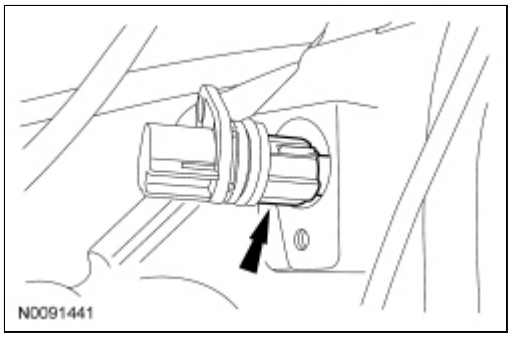
Installation

All vehicles



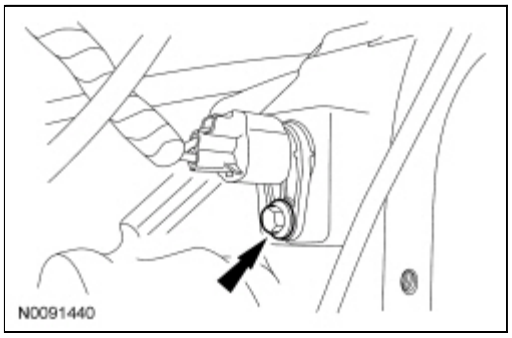
1. Position the differential assembly in the axle housing.

2. Install the original differential bearing shim on the LH side.



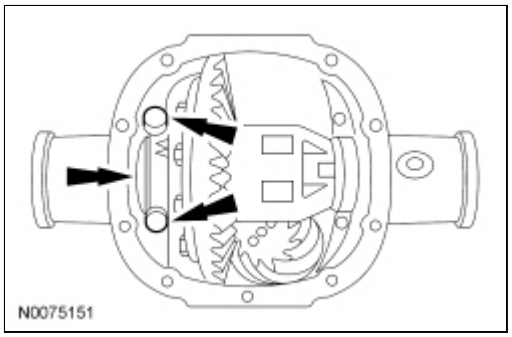
ELD equipped vehicles

3. Install the differential with the tabs on the ELD coil up against the differential bearing cap mounting surface.

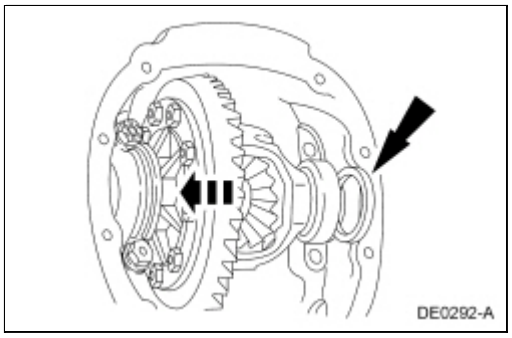


4. Push the ELD coil electrical connector through the differential case and connect the connector to the new adapter.

repair4less



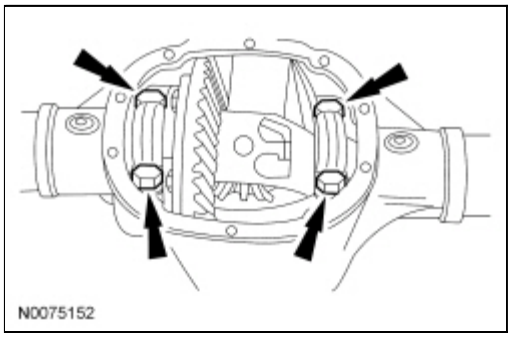
5. Seat the connector adapter into the differential housing and install the bolt. Connect the electrical connector.
    - Tighten to 7 Nm (62 lb-in).



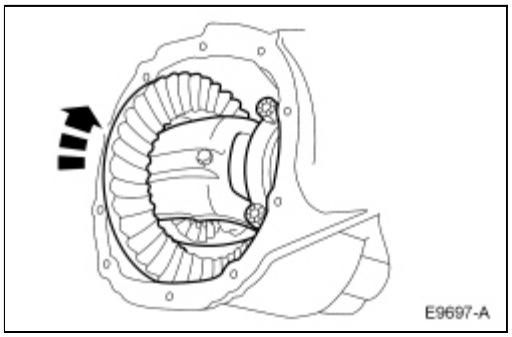
All vehicles

6. **NOTE:** Apply pressure toward the LH side to make sure the LH differential bearing cap is seated.

   Install the LH differential bearing cap and loosely install the 2 differential bearing cap bolts.



7. Install the original differential bearing shim on the RH side.



8. Using the Shim Driver, fully seat the differential bearing shims.

9. Install the RH side differential bearing cap and tighten the 2 LH side and 2 RH side differential bearing cap bolts.
   - Tighten to 105 Nm (77 lb-ft).

10. Rotate the differential assembly to make sure it rotates freely.

11. Adjust the ring and pinion backlash. For additional information, refer to Ring Gear Backlash Adjustment in this section.

repair4less

12. Install the axle shafts. For additional information, refer to Axle Shaft in this section.

[a] Refer to the procedure in this section.

Front Drive Axle and Differential

The front drive axle consists of:

- a cast-aluminum center section, a removable cast-aluminum axle housing tube and a differential housing cover. Both the axle housing tube and the differential housing cover use silicone sealant as a gasket.
- a hypoid-design gearset of an 8.8-inch ring gear and a pinion gear. Two opposed tapered roller bearings support the drive pinion in the axle housing.
- a drive pinion collapsible spacer, located on the pinion shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- differential bearing shims, located between the differential bearing cups and the axle housing, adjust the differential bearing preload and the ring gear backlash.
- a differential case, a 1-piece design with 2 openings to allow for assembly of the internal components and lubricant flow. Two opposed tapered roller bearings (differential bearings) support the differential case in the axle housing. Removable differential bearing caps retain the differential assembly in the axle housing.
- inside the differential case, the differential pinion shaft supports 2 differential pinion gears. The pinion gear speed is synchronized by a differential clutch spring. The pinion gears engage the differential side gears, to which the left axle shaft and the right axle shaft are splined. The differential pinion shaft bolt retains the differential pinion shaft in the differential case.
- The bar code tag located on the differential cover contains the axle information.

The front drive axle receives input from the transfer case by way of the front driveshaft. Rotational torque is transferred through the drive pinion to the ring gear, which in turn drives the differential case. Inside the differential case are the pinion gears which rotate on the stationary pinion shaft and the side gears which are splined to the axle shafts. The differential assembly is a gear arrangement that allows the drive wheels to be driven at different speeds and divides the input torque of the pinion gear between the axle halfshafts. The front axle transmits torque only and carries no vehicle load. CV joints located at each end of the halfshafts allow the axle to remain stationary in relationship to front wheels, yet articulate at the knuckle. These CV joints permit the wheels to be driven and turned at the same time. Lack of lubrication is among the most common causes of CV joint concerns. It is essential that all CV boots and clamps be inspected for damage or signs of leakage. Refer to Section 205-04 .

The Torsen® front differential case houses the parallel axis planetary helical side gears to which the axle halfshafts are splined. It is the unique arrangement of the differential that allows the continuous, uninterrupted torque output and allows the axle halfshafts to be driven at different speed when needed, such as when driving around corners. There are no clutch plates or discs in this axle design. The Torsen® differential requires 4.0 oz of friction modifier to be added with the axle lubricant. The axle shafts are retained in this differential with the circlips.

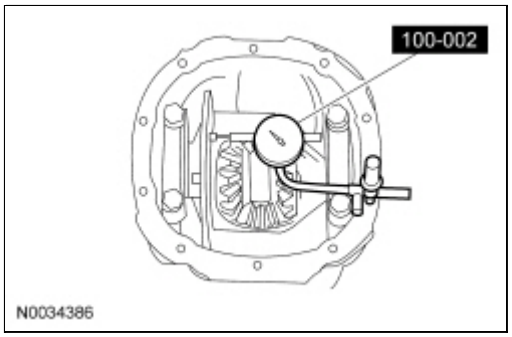
Differential Case Runout Check

Special Tool(s)

 ST1321-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1214-A	Dial Indicator Gauge With Holding Fixture 100-002 (TOOL-4201-C)
 ST1437-A	Installer, Differential Side Bearing 205-010 (T57L-4221-A2)
 ST1259-A	Spreader, Differential Carrier 205-001 (TOOL-4000-E)
 ST2043-A	Step Plate 205-D061 (D83T-4205-C2)

1. Remove the differential carrier. For additional information, refer to Differential Carrier in this section.
2. **NOTE:** Use a drift punch to separate the ring gear from the differential case.

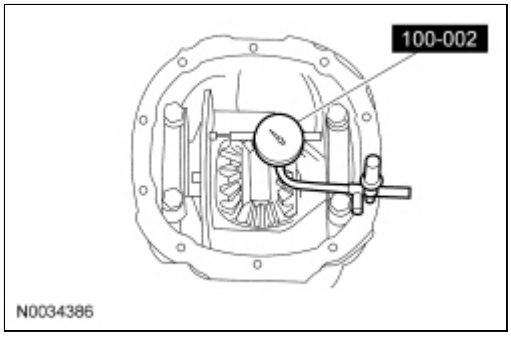
   Remove and discard the 10 bolts. Remove the ring gear.



3. **NOTE:** Visually inspect the differential bearing cups and cones for discoloration indicating bearing overheating or failure.

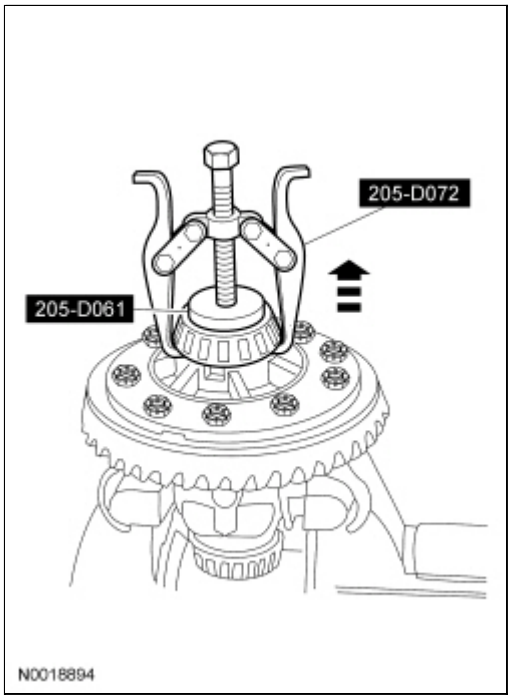
   NOTE: It may be necessary to use the Differential Carrier Spreader to carry out this step.

   Install the differential case with the bearing cups and all the shims in the housing.
   1. Position the differential case with the bearing cups and shims in their original location.
   2. Install the 2 bearing caps.
   3. Install the 4 bolts.
      - Tighten to 105 Nm (77 lb-ft).
   4. Rotate the differential case to make sure the bearings have seated correctly.



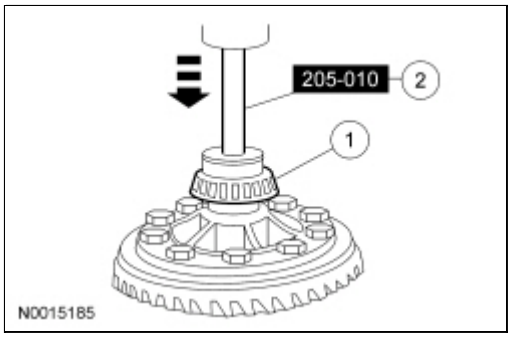
4. Install the Dial Indicator Gauge with Holding Fixture.

5. Rotate the differential case and check the differential case runout using the Dial Indicator Gauge with Holding Fixture.
   - If the runout does not exceed the specification, install a new ring gear and pinion.
   - If runout exceeds the specification, the ring gear is true and the condition is due to differential case/differential bearing damage.
     - Inspect the differential bearings and the differential case. Always install new differential bearings when installing a new differential case, or if a bearing condition is



repair4less

questionable.

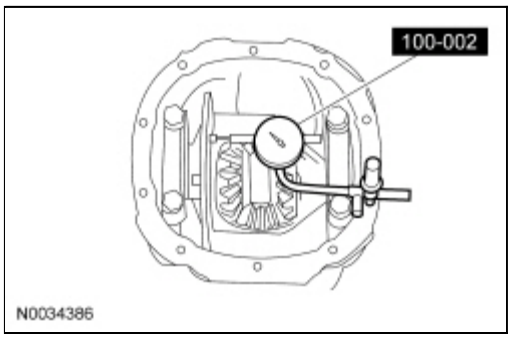


6. Remove the bearing caps and the differential case with the bearing cups and shims from the housing.

7. If necessary, using the 2 Jaw Puller and Step Plate, remove the differential bearings.

8. ***NOTICE:*** **Press against the differential bearing inner cone only or damage to the component may occur.**

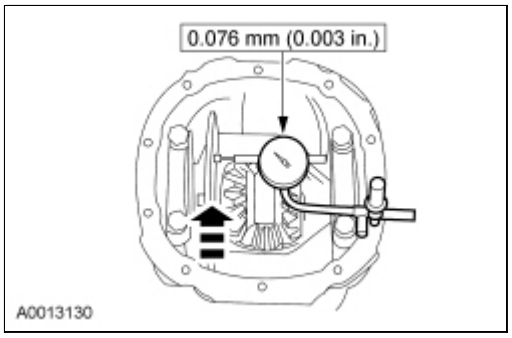
   Install the new differential bearings.
   1. Position the appropriate differential bearing (RH or LH).
   2. Using a suitable press and the Differential Side Bearing Installer, install the differential bearing.
      - Repeat the steps for the other differential bearing.



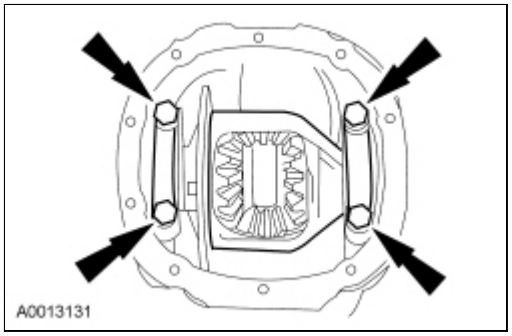
9. **NOTE:** It may be necessary to use the Differential Carrier Spreader to carry out this step.

   NOTE: Recheck the flange runout.

   Install the differential case with the bearing cups and the shims in the housing.
   1. Position the differential case with the bearing cups and shims in their original locations.
   2. Install the 2 bearing caps.
   3. Install the 4 bolts.
      - Tighten to 105 Nm (77 lb-ft).
   4. Rotate the differential case to make sure the bearings have seated correctly.

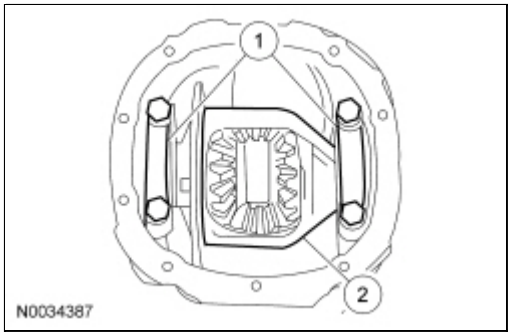


10. Install the Dial Indicator Gauge with Holding Fixture.

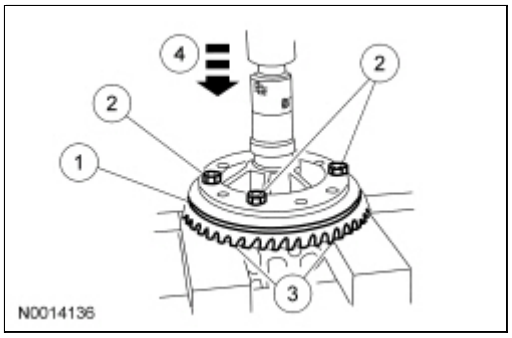


11. **NOTE:** If the runout is still excessive, install a new differential case.

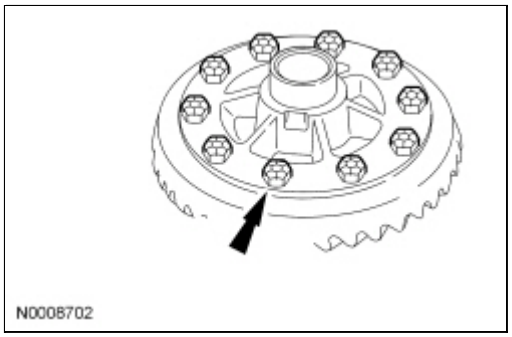
    Using the Dial Indicator Gauge with Holding Fixture, check the runout with the new differential bearings. If the runout does not exceed the specification, use the new differential bearings for assembly.



repair4less



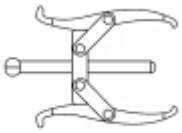
12. Remove the 4 bolts.

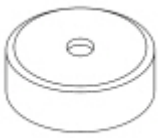


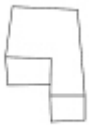
13. Remove the differential case with the bearing cups and the shims from the housing.
    1. Remove the 2 bearing caps.
    2. Remove the differential case with the bearing cups and the shims from the housing.

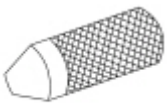
14. Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 new ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential carrier and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.

15. Install the 10 new ring gear bolts.
    - Tighten to 128 Nm (95 lb-ft).









16. Install the differential carrier. For additional information, refer to Differential Carrier in this section.

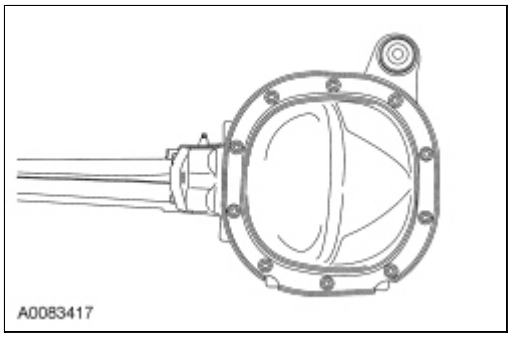
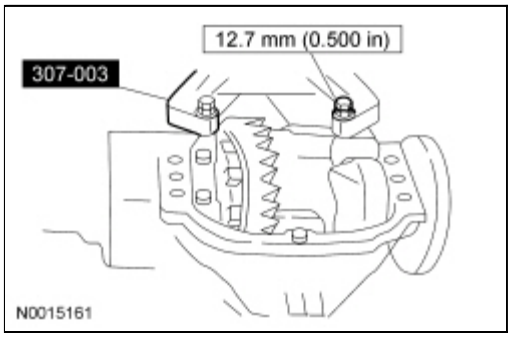
Front Axle Assembly — Disassembled View

repair4less



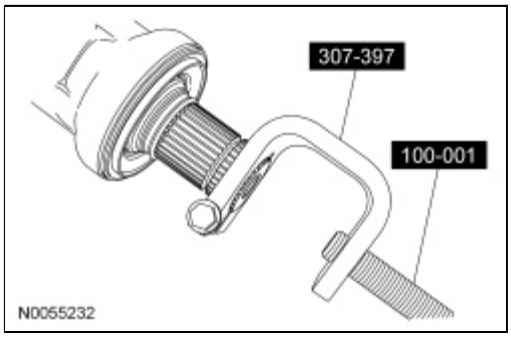
Item	Part Number	Description
1	3C202	Differential carrier assembly
2	4338	Axle housing vent
3	4B422	Circlips
4	3N136	Differential housing cover
5	390919	Differential housing cover bolt (10 required)
6	3A380	Intermediate shaft
7	3B210	Axle housing tube
8	4B413	Axle shaft bearing assembly (outer)
9	4B416	Axle shaft dust seal
10	5638	Front axle support mounting bushings (3 required)
11	N808703	Axle housing tube bolt (4 required)
12	4121	Axle identification tag
13	373098	Fill plug
14	4369	O-ring

Disassembly



1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

2. Remove the 10 bolts and the differential housing cover.
   - Drain the fluid.
   - Remove the bolts.
   - Remove the differential housing cover.

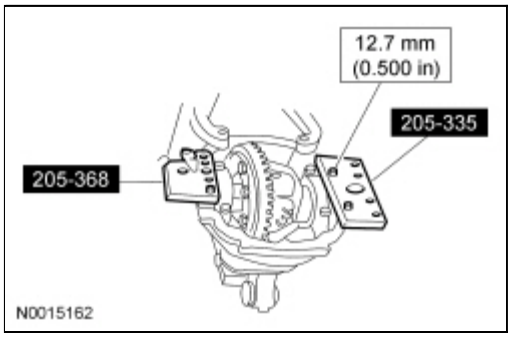


3. ***NOTICE:*** **The fixture mounting bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

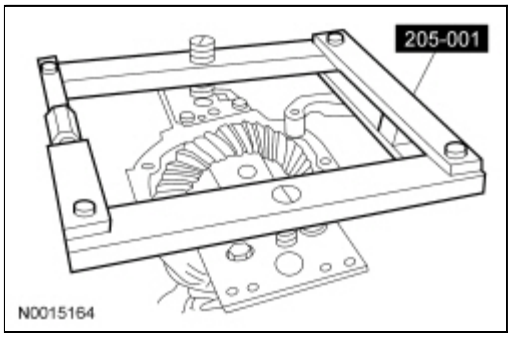
   Install the Transmission Holding Fixture.

4. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the intermediate shaft.

5. Remove the 4 bolts and the axle housing tube.

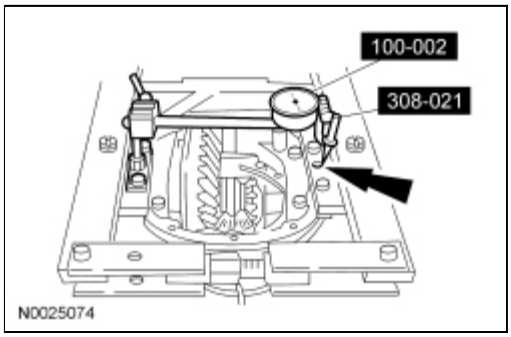


6. ***NOTICE:*** **The housing spreader adapter bolts must have the minimum specified thread**



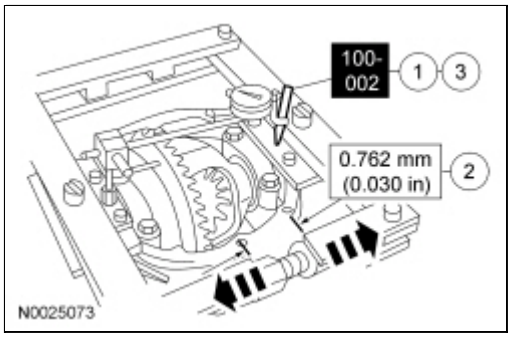
repair4less

engagement in the carrier or damage to the component may occur.



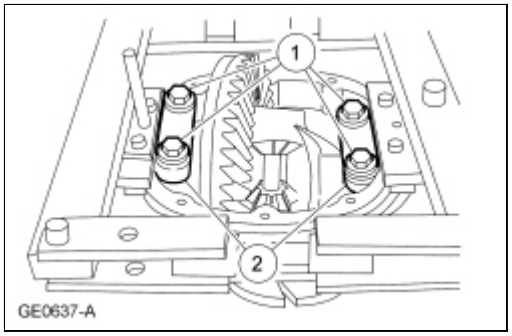
Install the Differential Housing Spreader Plate and Adapter for Differential Housing Spreader.

7. Position the Differential Carrier Spreader on the spreader adapters.



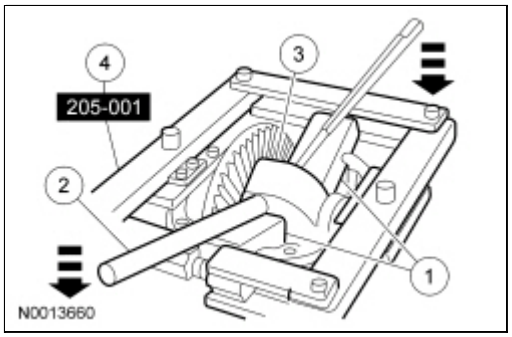
8. Install the Dial Indicator Gauge with Holding Fixture and Clutch Holding Gauge.
    - Position the adapter tip in the spreader adapter hole.

9. ***NOTICE:*** **Overspreading may damage the axle housing.**



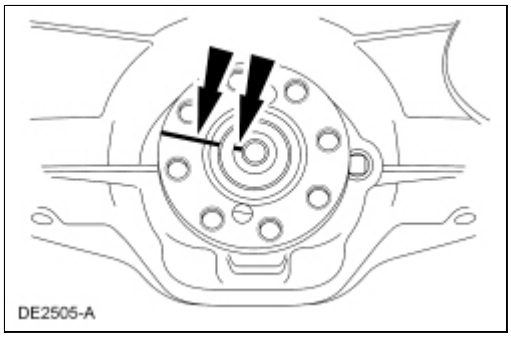
Spread the axle housing to the specification.

1. Adjust the Dial Indicator Gauge to zero.
2. Tighten the housing spreader screw to spread the axle housing to the specification.
3. Remove the Dial Indicator Gauge with Holding Fixture.



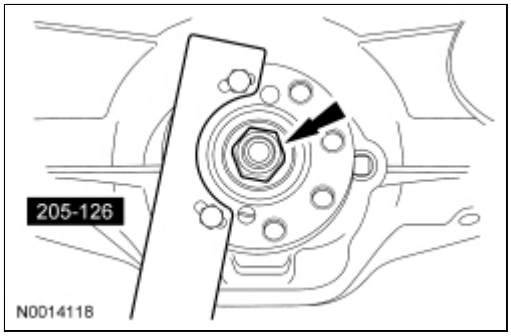
10. **NOTE:** Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the bearing caps in their original place and position.

    Mark and remove the 2 differential bearing caps.
    1. Remove the bolts.
    2. Remove the differential bearing caps.

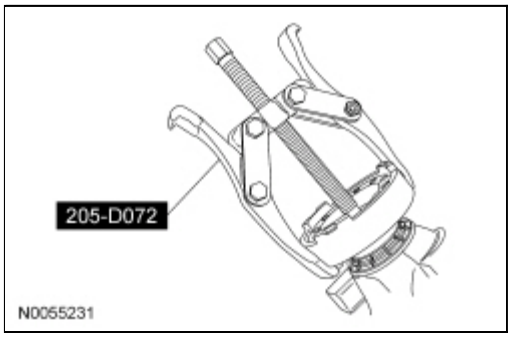


11. ***NOTICE:*** **Use wood blocks to avoid axle housing damage.**

    Remove the differential assembly from the axle housing.
    1. Position the wood blocks.
    2. Position and push down on the 2 pry bars.
    3. Remove the differential assembly.
    4. Remove the Differential Carrier Spreader.

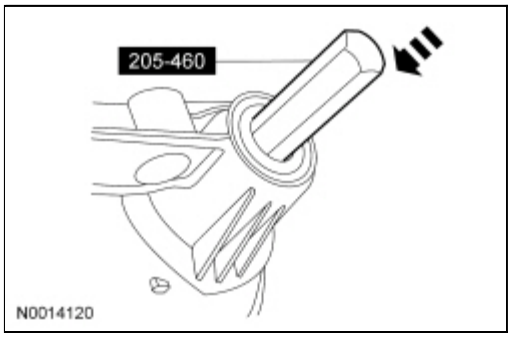


12. Index-mark the axle U-joint flange to the pinion stem.

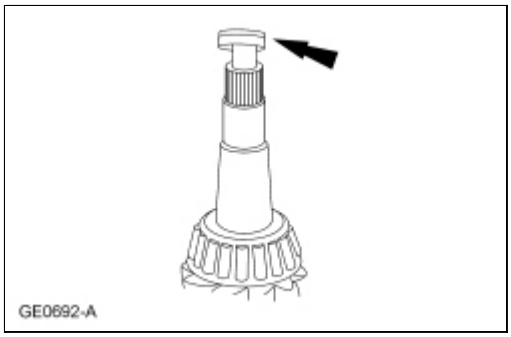


repair4less

13. Install the Drive Pinion Flange Holding Fixture and loosen, but do not remove, the pinion nut.

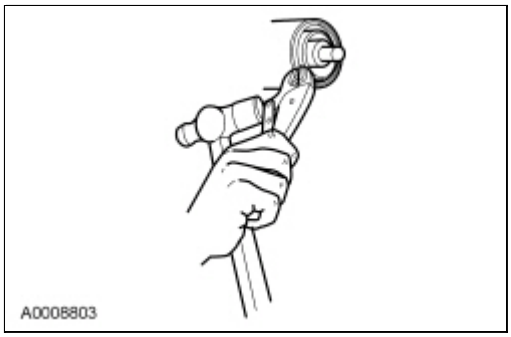


14. With the pinion nut still engaged by a few threads, use the 2 Jaw Puller to separate the axle U-joint flange from the pinion gear.

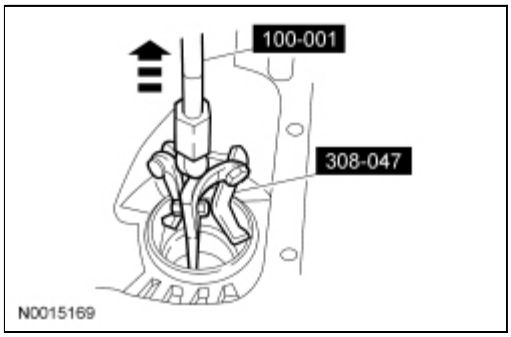


15. Remove the nut and the flange.

16. Using the Drive Pinion Thread Protector and a soft hammer, remove the pinion gear.



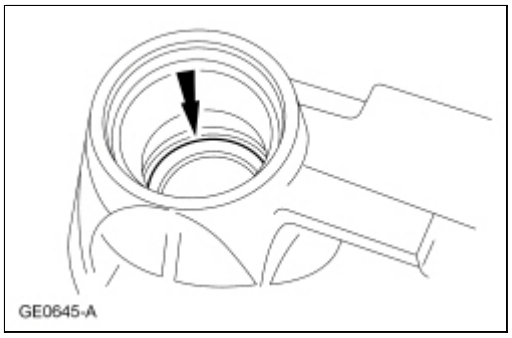
17. Discard the drive pinion collapsible spacer.



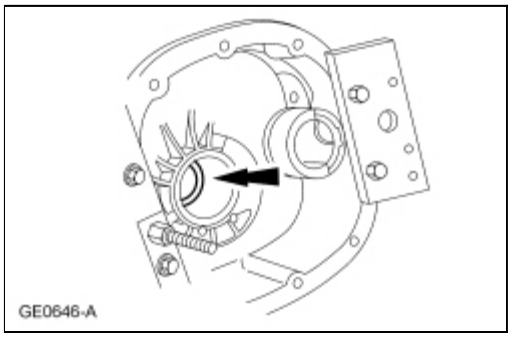
18. ***NOTICE:*** **Do not damage the carrier housing while removing the pinion seal.**

    Remove the pinion seal and slinger.
    - Pry up on the seal flange. Install gripping pliers, and strike with a hammer to remove the seal.

19. Remove the outer pinion bearing.

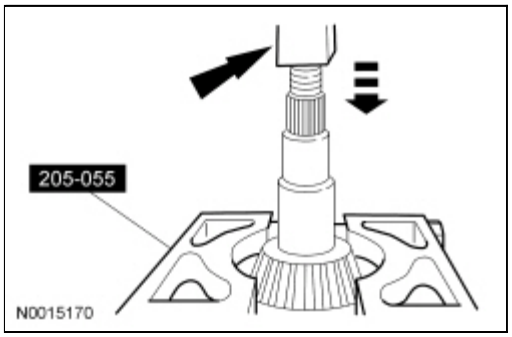


20. Using the Bearing Cup Remover and Slide Hammer, remove the inner pinion bearing cup.



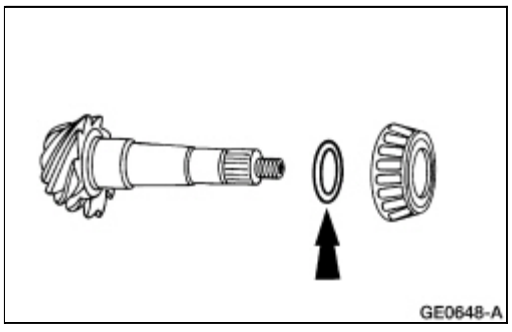
21. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

    If necessary, remove the pinion bearing oil baffle.

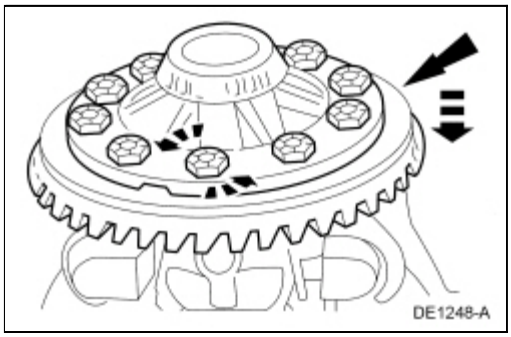


repair4less

22. Remove the outer pinion bearing cup by tapping alternately on each side to prevent the cup from cocking.

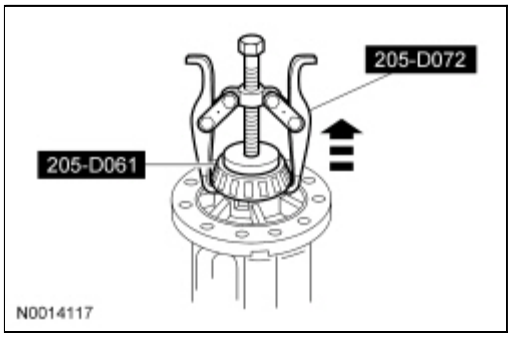


23. Using the Bearing Remover and a suitable press, remove the pinion bearing.



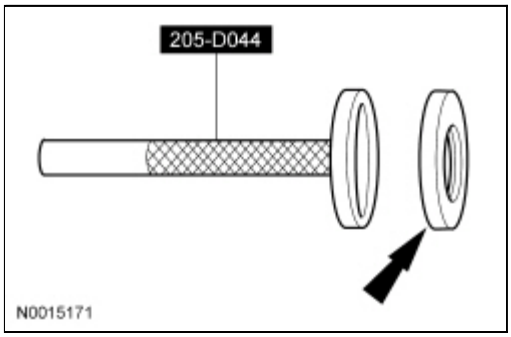
24. **NOTE:** A drive pinion bearing adjustment shim sits under the pinion bearing. Use a micrometer to measure the shim thickness. Record the measurement for comparison to the shim gauge reading taken prior to installing the pinion bearing.

    Remove and measure the drive pinion bearing adjustment shim.



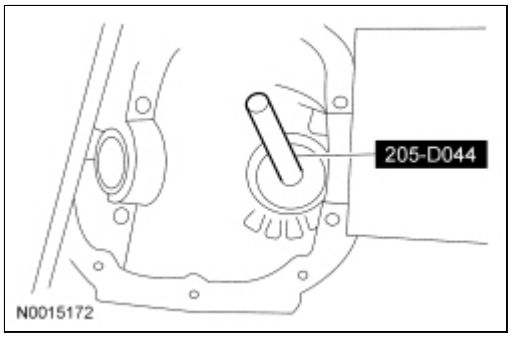
25. **NOTE:** Use a drift punch to separate the ring gear from the differential case.

    Remove and discard the 10 bolts and remove the ring gear.



26. Using the 2 Jaw Puller and Step Plate, remove the differential bearings.

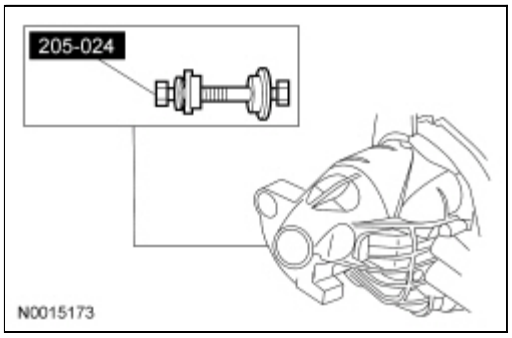
Assembly



1. ***NOTICE:*** **Do not omit the pinion bearing oil baffle; bearing failure may result.**

    If removed, position the baffle on the Drive Carrier Bearings Installer.

2. Using the Drive Carrier Bearings Installer, install the baffle.

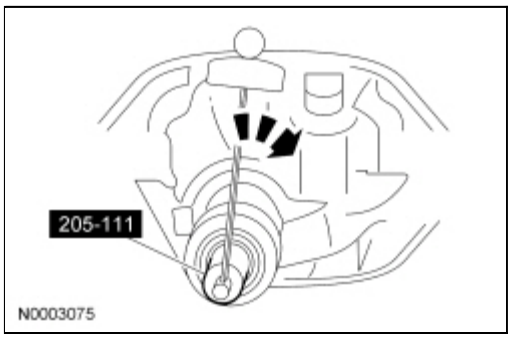


repair4less

3. **NOTE:** Always install new pinion bearings when installing new pinion bearing cups.

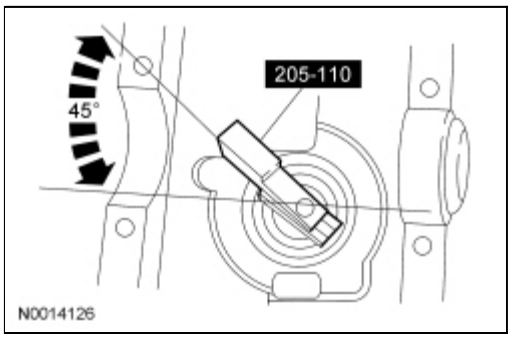
   Lightly oil the new pinion bearing cups and pinion bearings with front axle lubricant.

4. Using the Drive Pinion Bearing Cup Installer, install the bearing cups.



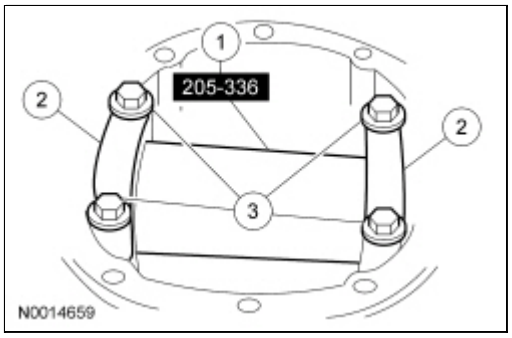
5. **NOTE:** The pinion bearings assembled in this procedure step must be used at final assembly.

   Assemble and position the Adapters and the pinion bearings in the carrier housing.
   1. Position the screw adapter.
   2. Position the aligning adapter.
   3. Position the pinion bearing.
   4. Position the gauge disc adapter.
   5. Position the gauge block adapter.
   6. Position the pinion bearing.
   7. Thread on the handle adapter.



6. **NOTE:** This step duplicates final pinion bearing preload.

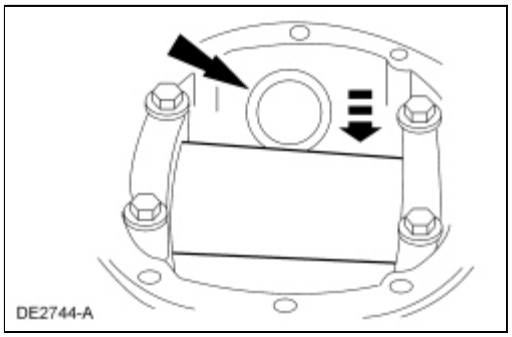
   Tighten the Adapter to simulate bearing preload.
   - Tighten to 2.2 Nm (20 lb-in).



7. **NOTE:** Offset the gauge block adapter to obtain an accurate reading.

   Rotate the gauge block Adapter several half-turns to make sure the pinion bearings seat correctly and position the gauge block adapter.

repair4less

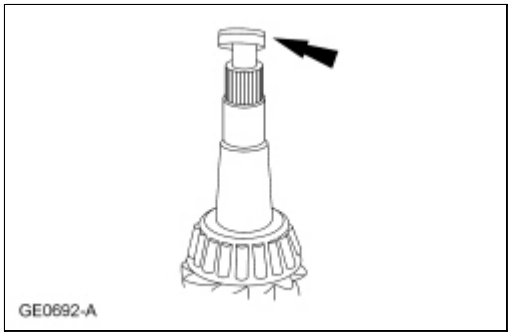


8. Install the Drive Pinion Gauge Tube.
    1. Position the Drive Pinion Gauge Tube.
    2. Install the 2 differential bearing caps.
    3. Install the 4 bolts.
        - Tighten to 105 Nm (77 lb-ft).

9. **NOTE:** Use only flat, clean drive pinion bearing adjustment shims.

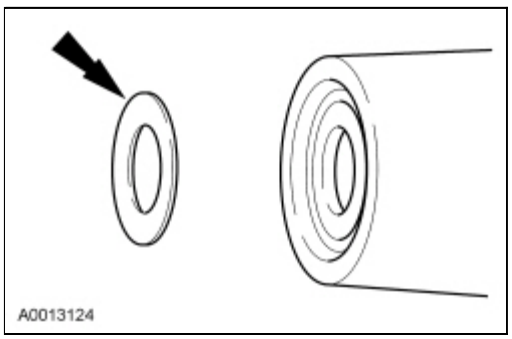
    NOTE: Do not attempt to force the shim between the gauge block adapter and the gauge tube adapter. A slight drag indicates correct shim selection.

    Use a drive pinion bearing adjustment shim as a gauge for shim selection.
    - Check the adjustment shim thickness between the gauge block adapter and the gauge tube adapter.
    - After determining the correct shim thickness, remove the Drive Pinion Gauge Tube.



10. **NOTE:** The same pinion bearings from the previous steps must be used.

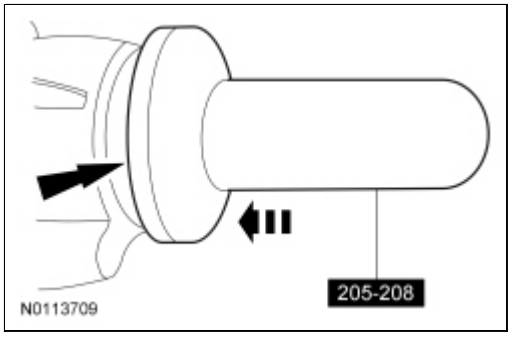
    Install the pinion bearing.
    - Place the drive pinion bearing adjustment shim on the pinion gear.
    - Using a suitable press and the Drive Pinion Bearing Cone Installer, press the pinion bearing until it is firmly seated on the pinion gear.



11. Place a new drive pinion collapsible spacer on the pinion stem.

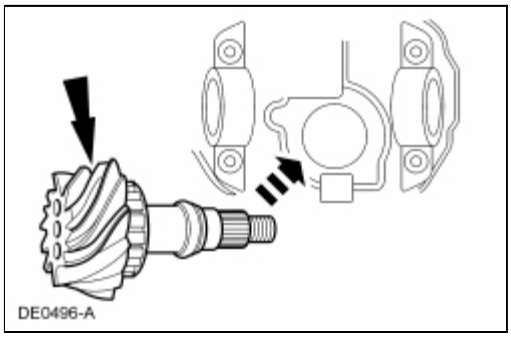
12. Install the outer pinion bearing.

13. Install the slinger.



14. **NOTE:** Coat the lips of the pinion seal with front axle lubricant.

    Place the pinion seal on the Drive Pinion Oil Seal Installer.

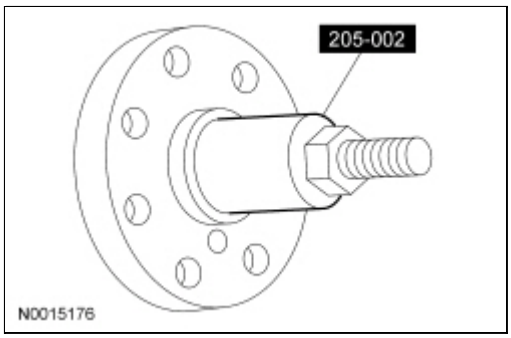


repair4less

15. Place the Drive Pinion Oil Seal Installer and seal in the pinion seal bore and drive the seal into place.

16. Lightly lubricate the pinion gear splines with front axle lubricant.

17. Position the drive pinion in the housing.

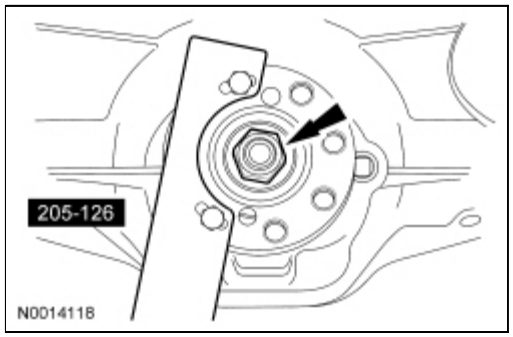


18. ***NOTICE:*** **Never install the drive pinion U-joint flange with a hammer or power tools.**

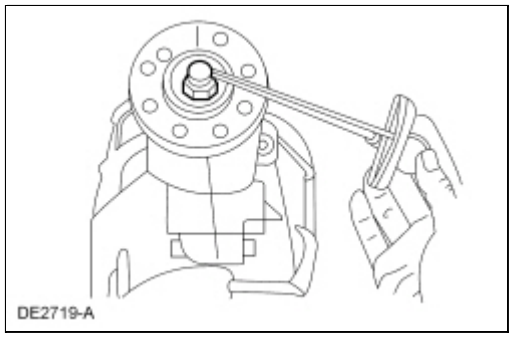
    NOTE: Disregard the scribe marks if installing a new flange.

    Align the index marks and position the U-joint flange on the drive pinion.

19. Using the Drive Pinion Flange Installer, install the drive pinion U-joint flange.

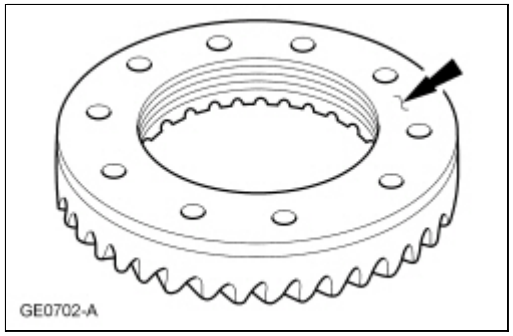


20. Apply a small amount of lubricant to the washer side of the new pinion nut, and install the nut.



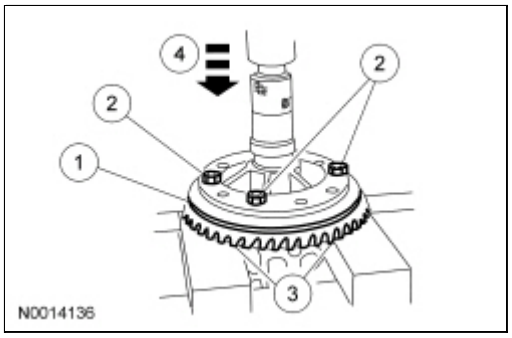
21. ***NOTICE:*** **Do not loosen the pinion nut to reduce preload under any circumstance. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and pinion nut or damage to the component may occur.**

    Install the Drive Pinion Flange Holding Fixture and tighten the pinion nut. Refer to the torque

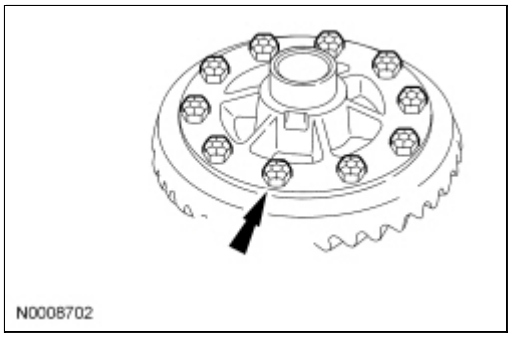


specifications in the Specifications portion of this section.

- Rotate the pinion gear occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing torque preload readings by rotating the pinion gear with a Nm (lb-in) torque wrench.

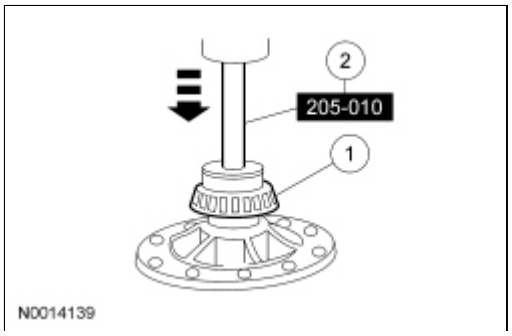


22. Use a fine flat file to remove any burrs or nicks from the ring gear mounting surface.

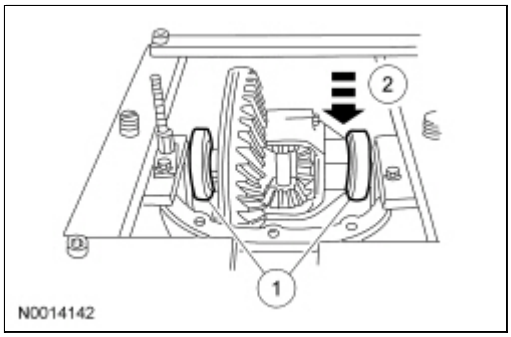


23. Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential carrier and differential ring gear onto the press bed blocks with the differential gear teeth facing downward.
    4. Press the differential ring gear into place.

repair4less



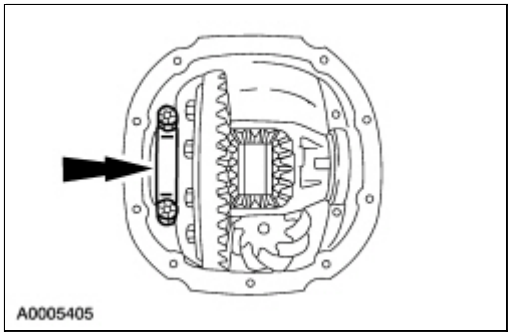
24. Install the remaining new bolts.
    - Tighten to 128 Nm (95 lb-ft).



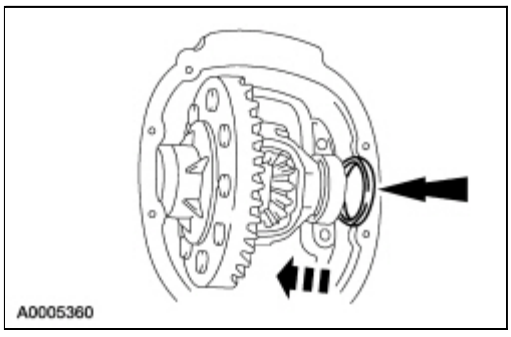
25. **NOTE:** Press against the bearing inner core only.

    Using a suitable press and the Differential Side Bearing Installer, install the differential bearings.
    1. Position the appropriate differential bearing (RH or LH).
    2. Using a suitable press and the Differential Side Bearing Installer, install the differential bearing.
       - Repeat the procedure for the other differential bearing.

26. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.



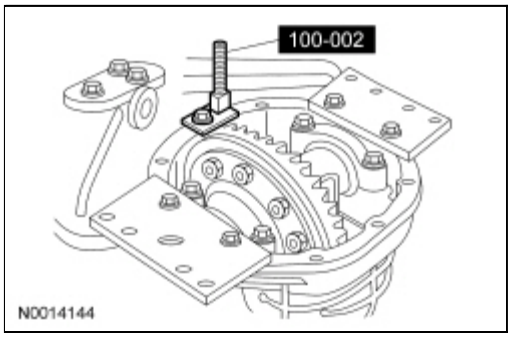
27. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.



28. **NOTE:** Apply pressure to the left side to make sure the left bearing cup is seated.

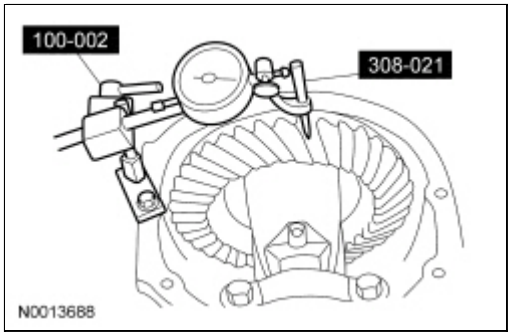
    Install the left bearing cap and loosely install the 2 bearing cap bolts.

29. Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.



30. Install the right bearing cap and 2 bolts.

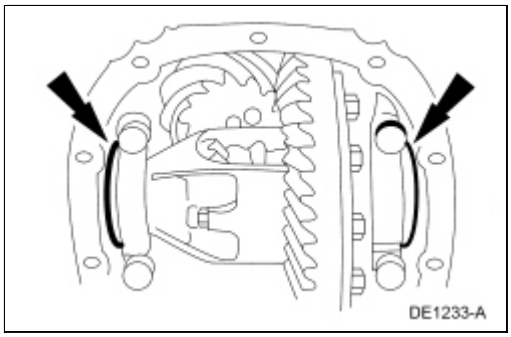
repair4less



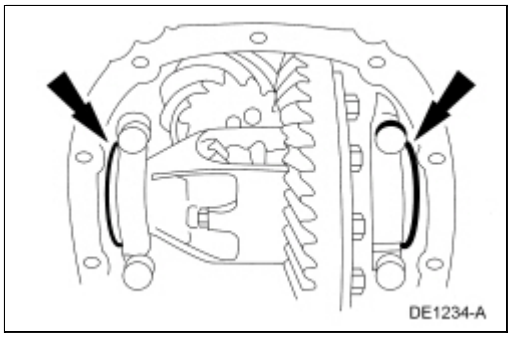
31. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).

32. Rotate the differential carrier to make sure it turns freely.

33. Install the Dial Indicator Gauge with Holding Fixture.



34. Using the Dial Indicator Gauge with Holding Fixture and the Clutch Housing Gauge, measure the ring gear backlash at 4 places to obtain a consistent reading.



35. **NOTE:** If the backlash is not within the specifications, correct it by increasing the thickness of one differential bearing shim and decreasing the thickness on the other differential bearing shim by the same amount.

    To increase the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.

36. To decrease the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.

37. Select the appropriate shim by the thickness or the stripe color.

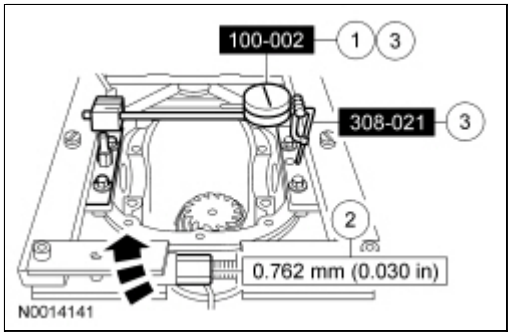
38. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.

39. Measure the thickness of the selected right and left bearing shims.

40. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

41. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.

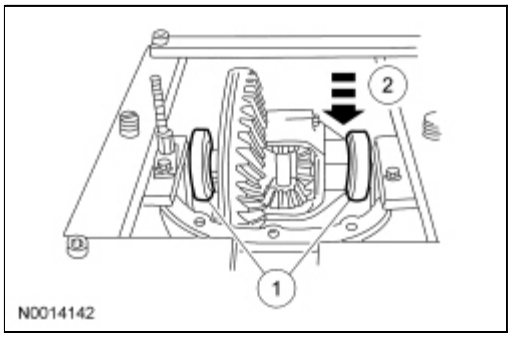


repair4less

42. ***NOTICE:*** **Overspreading may damage the differential housing.**

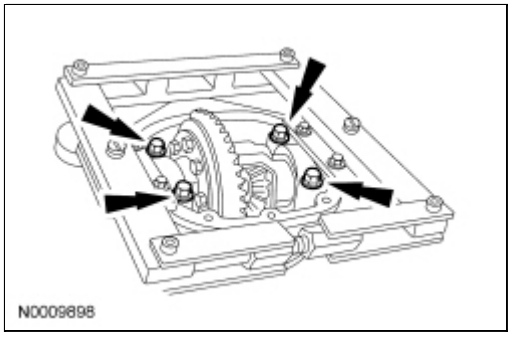
    NOTE: Tighten and loosen the differential carrier spreader adapters to normalize the housing adapters prior to taking the final Dial Indicator reading.

    Spread the differential housing to the specification.
    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the screw until spreading the differential housing to the specifications.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

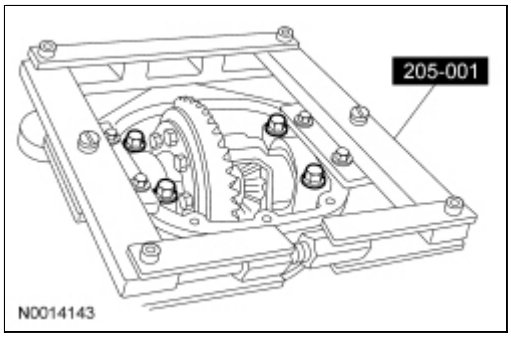


43. ***NOTICE:*** **To avoid galling the case, insert the shims with a light coating of grease before installing the differential carrier.**

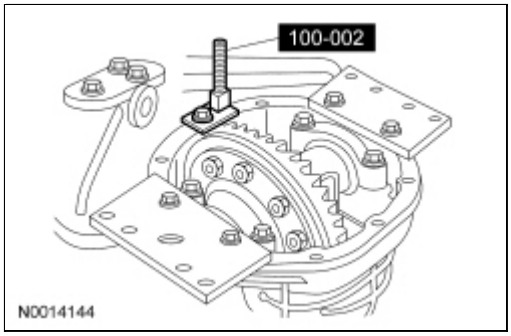
    Place the differential bearing shims in the differential housing.



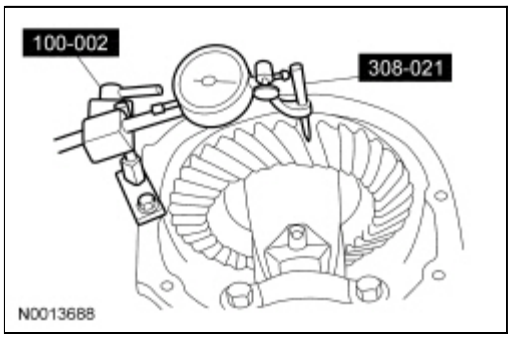
44. Install the differential carrier.
    1. Position the 2 differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.



45. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the Differential Carrier Spreader.



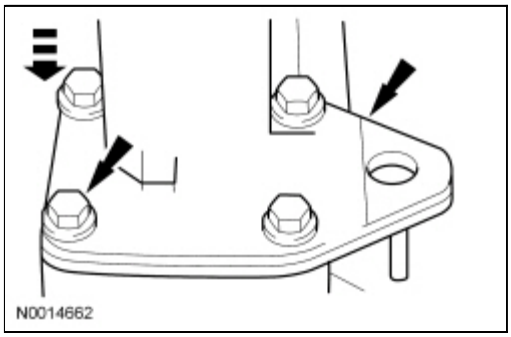
Install the 2 differential bearing caps and 4 bolts in their original location.



46. Loosen and remove the Differential Carrier Spreader.

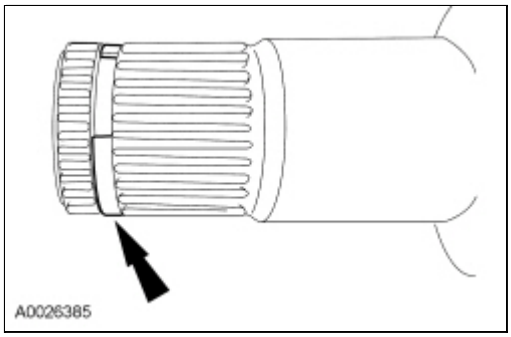
47. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

48. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, recheck the ring gear backlash.



49. Apply marking compound and rotate the differential assembly 5 complete revolutions.

repair4less

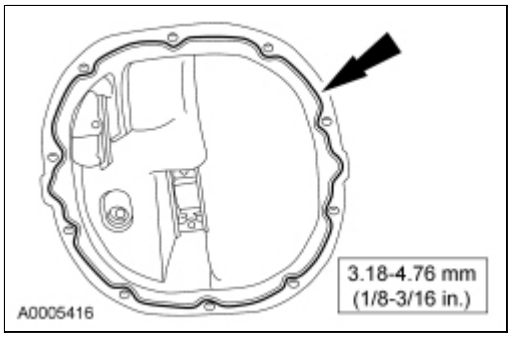


50. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

51. Assemble the axle housing tube.
    - Align the bolt holes and position the axle tube.
    - Position the axle identification tag.
    - Install the 4 bolts.
        - Tighten to 73 Nm (54 lb-ft).

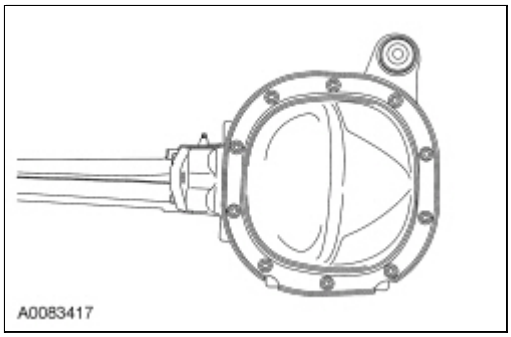
52. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

53. Install a new circlip on the intermediate shaft end.



54. Insert the intermediate shaft and engage the circlip with the side gears.

55. Remove the axle assembly from the Holding Fixture and place it on the bench.



56. **NOTE:** Remove all of the silicone gasket and make sure the surfaces are free of oil before applying the new silicone gasket.

    NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

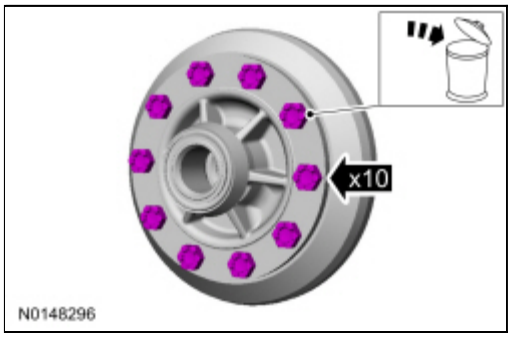
    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown in the illustration.
    - Use silicone gasket and sealant.

57. Install the differential housing cover and the 10 cover bolts.
    - Tighten to 32 Nm (24 lb-ft).

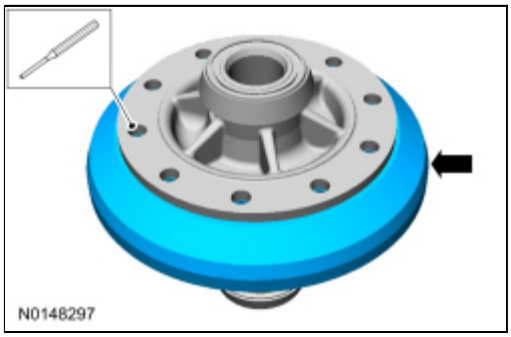
58. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

59. Remove the fill plug and fill the axle assembly with the specified type and amount of lubricant.
    - Tighten the fill plug to 25 Nm (18 lb-ft).

repair4less

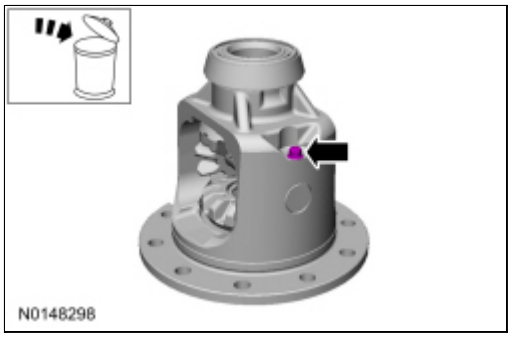


Differential Case



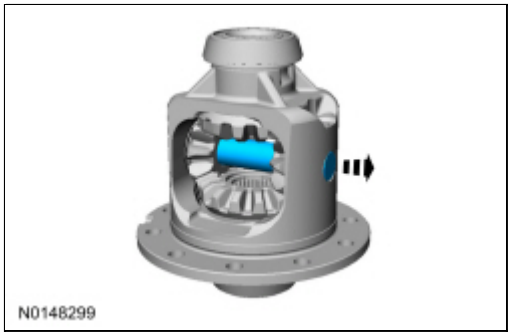
Material

Item	Specification
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A
Threadlock and Sealer TA-25	WSK-M2G351-A5



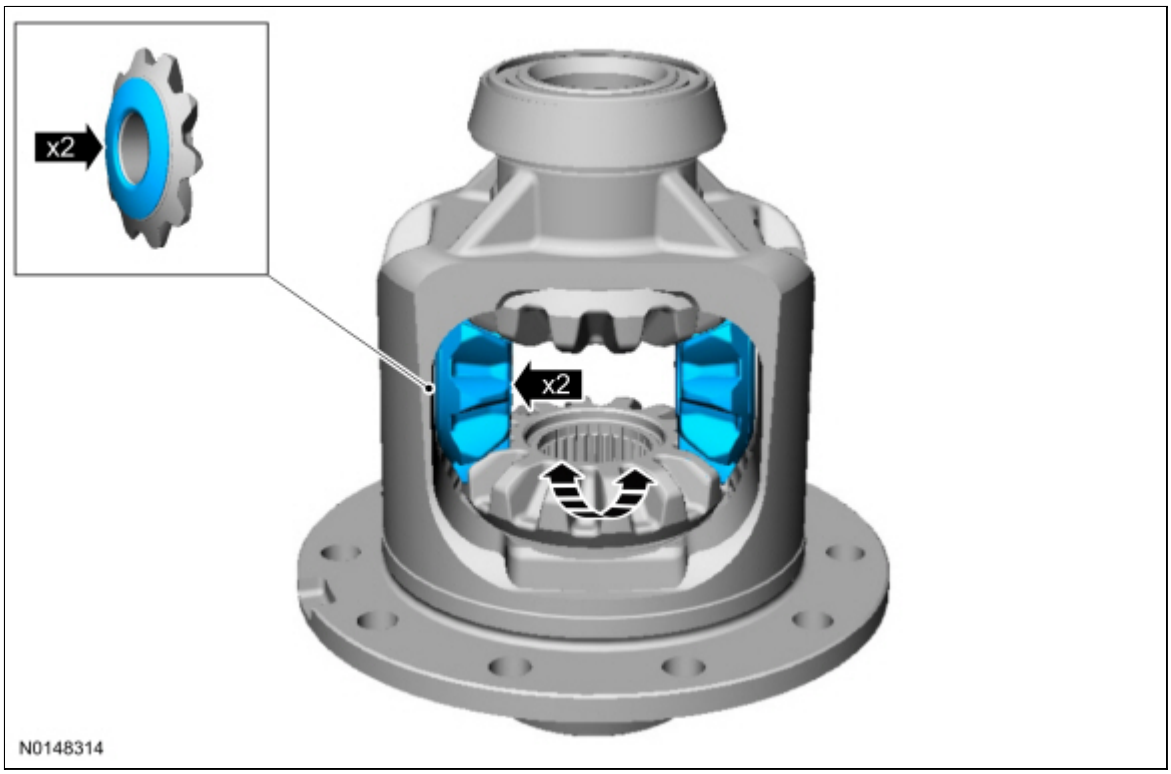
Disassembly

NOTE: The Torsen® differential should be replaced as a unit only. Do not attempt to rebuild.



1. Remove the differential carrier. Refer to Differential Carrier .
2. 

3. 



4.

5.

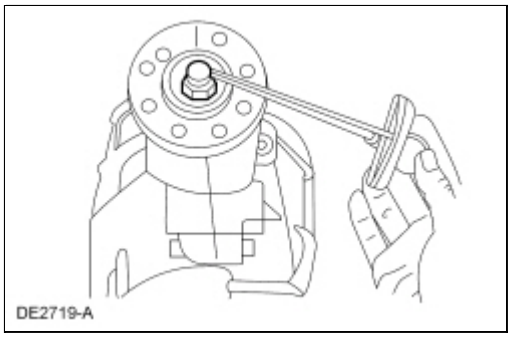
 ST1800-A	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E)
 ST1358-A	Installer, Drive Pinion Oil Seal 205-208 (T83P-4676-A)

Material

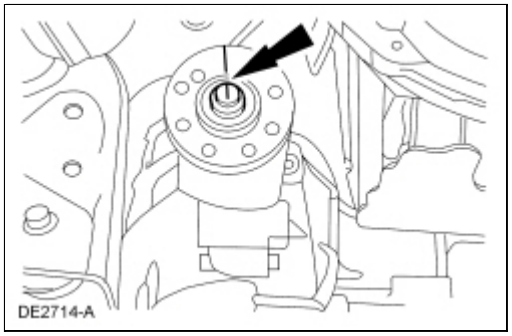
Item	Specification
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A

Item	Part Number	Description
1	389546	Pinion nut and washer
2	4858	Pinion flange
3	3N134	Drive pinion oil seal
4	3C202	Axle housing



Removal

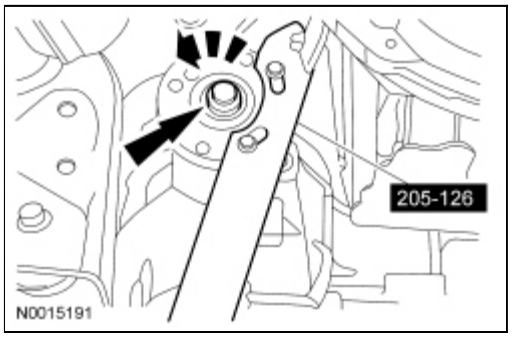
NOTICE: **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation as the original. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**



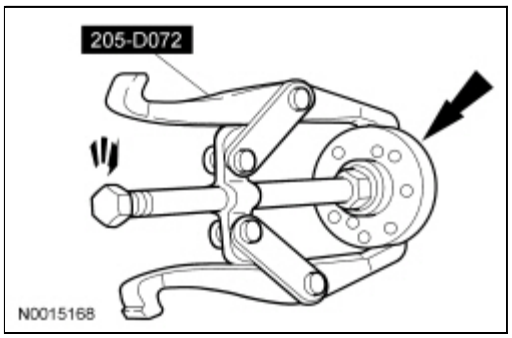
NOTICE: **This operation disturbs the pinion bearing preload. Carefully reset the pinion bearing preload during assembly.**

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
2. Remove the front brake pads. Refer to Section 206-03 .
3. Remove the front driveshaft. Refer to Section 205-01 .
4. Measure and record the pinion bearing preload.
   - Using a Nm (lb-in) torque wrench, rotate the pinion gear. Measure the torque required to maintain pinion gear rotation.

repair4less

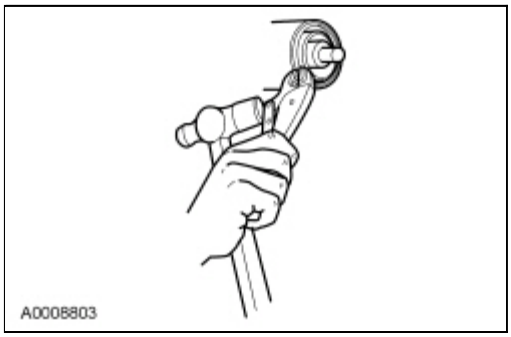


5. Index-mark the pinion flange and the drive pinion gear.



6. ***NOTICE:*** **Install a new pinion nut with the same color as the original if not replacing the collapsible spacer. If a new collapsible spacer is installed, install the nut in the kit or damage to the component may occur.**

   Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut and washer.



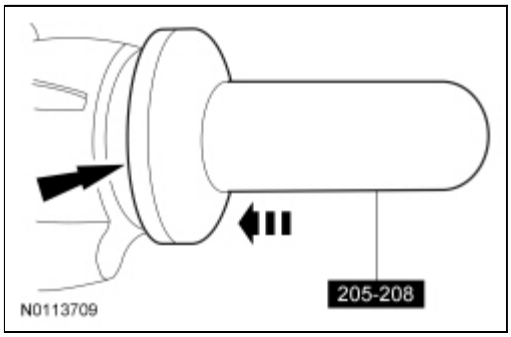
7. Using the 2 Jaw Puller, remove the pinion flange.

8. Inspect the pinion flange for burrs and damage. Inspect the end of the pinion flange that contacts the pinion bearing cone, pinion nut counterbore and drive pinion seal surface for nicks. Discard the pinion flange if damaged.

9. ***NOTICE:*** **Do not damage the axle housing.**

   Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer to remove the drive pinion seal.

10. Verify the splines on the drive pinion gear are free of burrs. If burrs are evident, remove them with a fine crocus cloth.



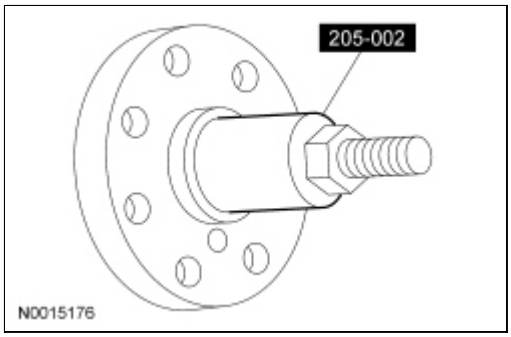
11. Clean the drive pinion seal bore.

Installation

1. **NOTE:** Lubricate the drive pinion seal lips with axle lubricant.

   NOTE: Drive pinion seal must be fully seated all the way around or drive pinion seal damage will occur.

   Using the Drive Pinion Oil Seal Installer, install the drive pinion seal.



2. ***NOTICE:*** **Never use a hammer or install the pinion flange with power tools.**

   NOTE: Lubricate the pinion flange splines with axle lubricant.

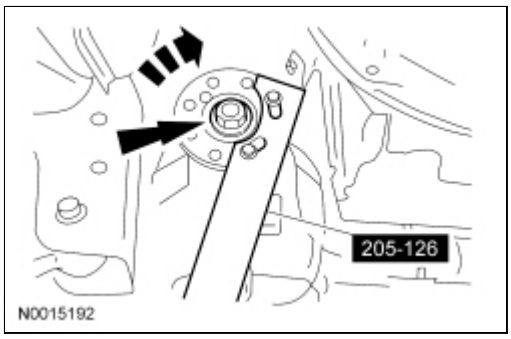
   Align the index marks made during removal and, using the Drive Pinion Flange Installer, install the pinion flange.

repair4less

3. ***NOTICE:*** **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation as the original. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**

   Select the correct pinion nut for installation.

   8.8 In. Drive Pinion Nut



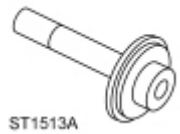
Part Number	Color Description	Part Description
389546-S100	Orange	Pinion nut
4320	Purple	Pinion nut
4C121	Purple	Kit with spacer for all 223.52 mm (8.8 in) axles

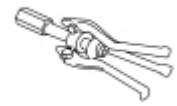
4. ***NOTICE:*** **Install a new pinion nut with the same color as the original if not replacing the collapsible spacer or damage to the component may occur.**

   Install the new washer and pinion nut. Only hand-tighten the pinion nut at this time.

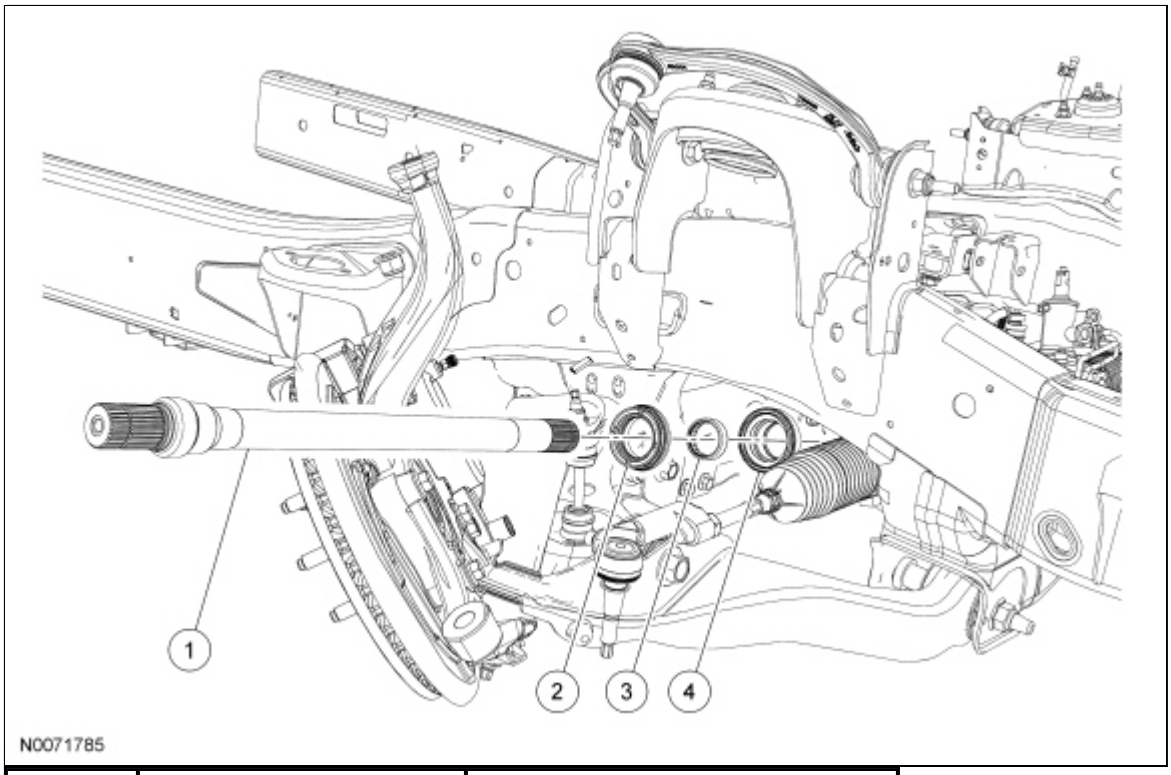
5. ***NOTICE:*** **Do not loosen the pinion nut to reduce drive pinion bearing preload. Install a new drive pinion collapsible spacer and pinion nut if drive pinion bearing preload reduction is necessary. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer or damage to the component may occur.**

   Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the pinion nut to set the drive pinion bearing preload.
   - Tighten the pinion nut, rotating the pinion occasionally to make sure the drive pinion bearings are seating correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench. The final reading must be 0.56 Nm (5 lb-in) more than the initial reading taken during removal.





6. Install the front driveshaft. Refer to Section 205-01 .



7. Install the disc brake pads. Refer to Section 206-03 .

repair4less

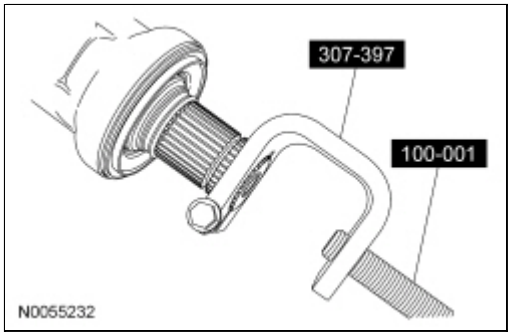
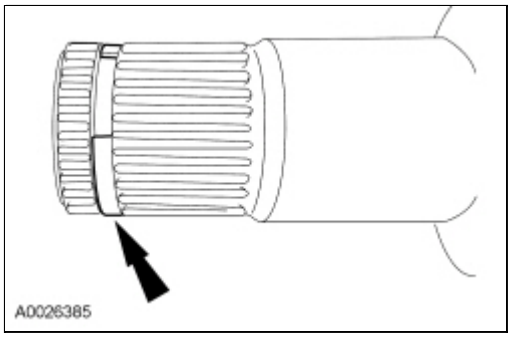
 ST2369-A	Installer, Wheel Speed Sensor Ring 206-034 (T88P-20202-B)
 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
 ST2418-A	Remover, Transmission Fluid Pump 307-397
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)



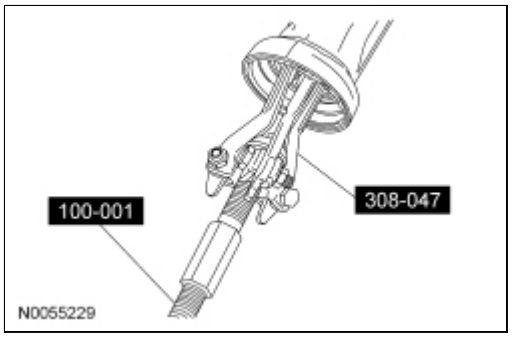
Item	Part Number	Description
1	3A380	Intermediate shaft
2	3B112	Stub shaft seal
3	4B413	Stub shaft bearing
4	3B210	Axle housing tube

Removal



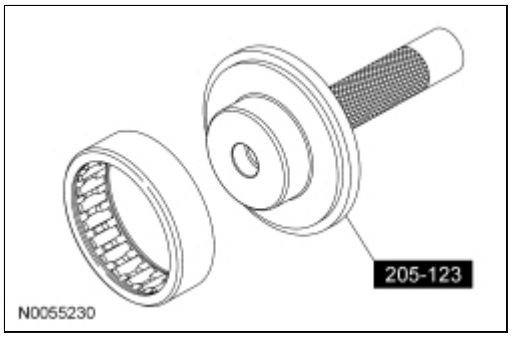
NOTE: Install a new stub shaft seal whenever a halfshaft is removed.

1. Remove the halfshafts. For additional information, refer to Section 205-03 .
2. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the intermediate shaft.

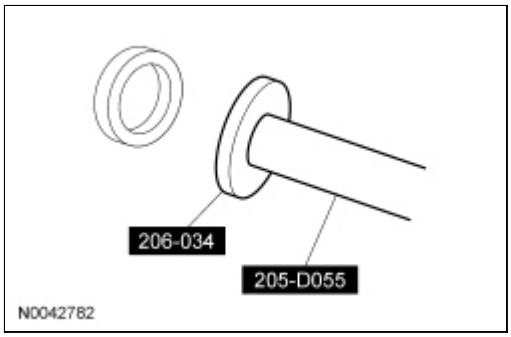


3. Remove and discard the intermediate shaft circlip.

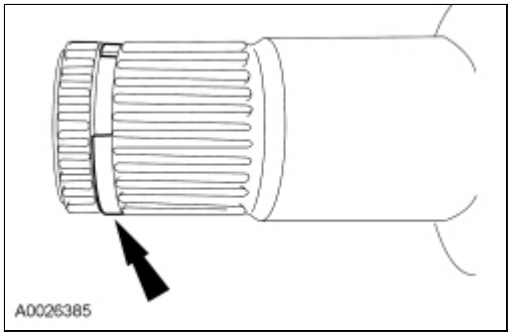
repair4less



4. Using a suitable seal remover, remove and discard the stub shaft pilot bearing oil seal.
5. Using the Bearing Cup Remover and Slide Hammer, remove and discard the stub shaft pilot bearing.

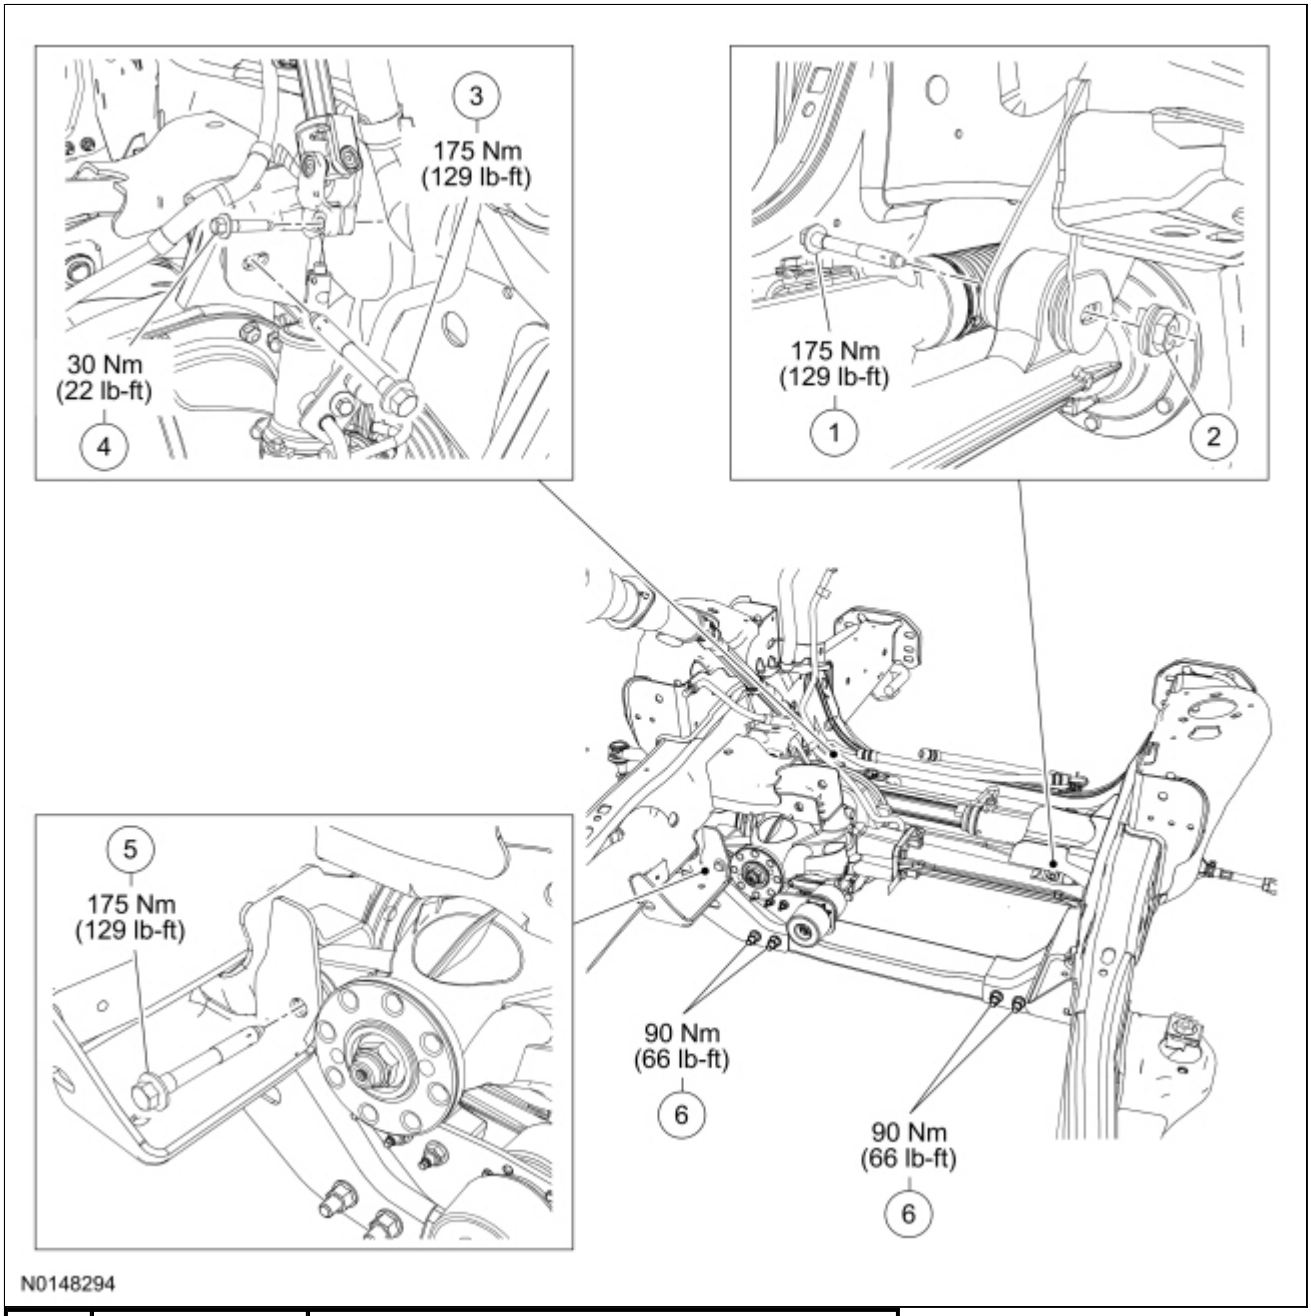


Installation



1. Position the stub shaft pilot bearing in the axle tube or differential housing bore and using the Axle Shaft Oil Seal Installer, install the bearing.

2. Carefully align the stub shaft pilot bearing oil seal with the housing bore and install the stub shaft bearing oil seal flush in the housing using the Wheel Speed Sensor Ring Installer and Handle.

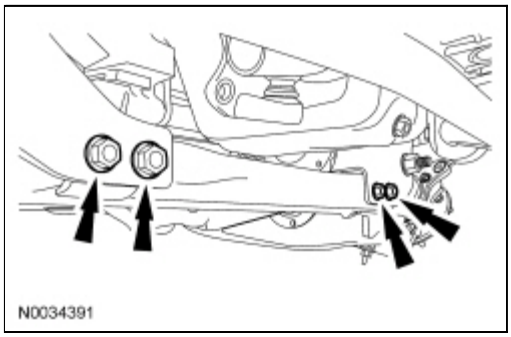


3. Install a new circlip on the intermediate shaft end.

4. Insert the intermediate shaft and engage the circlip with the differential side gear.
5. Install the halfshafts. For additional information, refer to Section 205-04 .

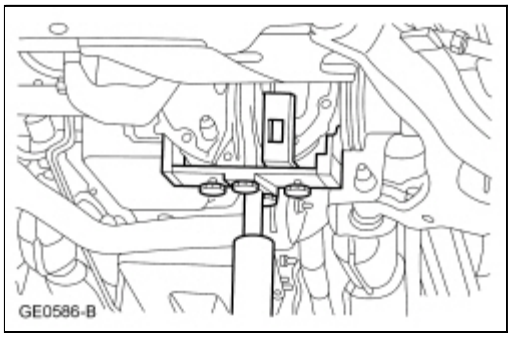
repair4less

Axle Assembly



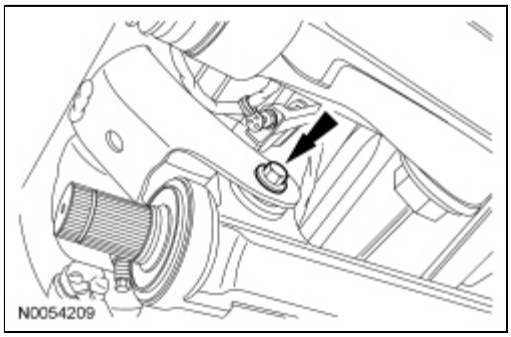
N0148294

Item	Part Number	Description
1	W712724	Axle tube bushing bolt
2	W712723	Axle tube bushing flagnut
3	W712724	Rear axle housing bushing bolt
4	N808684	Steering column coupler bolt



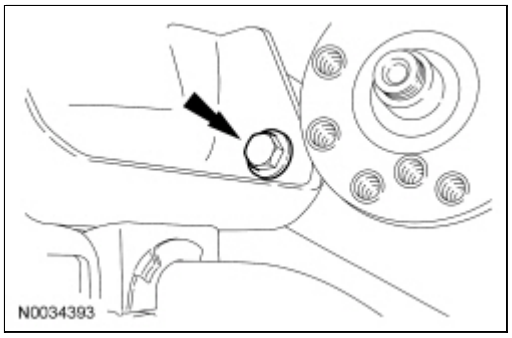
5	W712743	Front axle housing bushing support bolt
6	636893	Crossmember nuts (4 required)

Removal and Installation

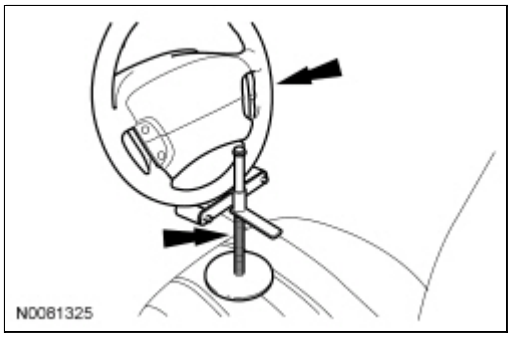


1. Remove the front driveshaft. Refer to Section 205-01 .
2. Remove the halfshafts. Refer to Section 205-04 .
3. Remove the 4 crossmember nuts and bolts and the crossmember.
   - To install, tighten to 90 Nm (66 lb-ft).

4. Use a high-lift jack to support the axle assembly.

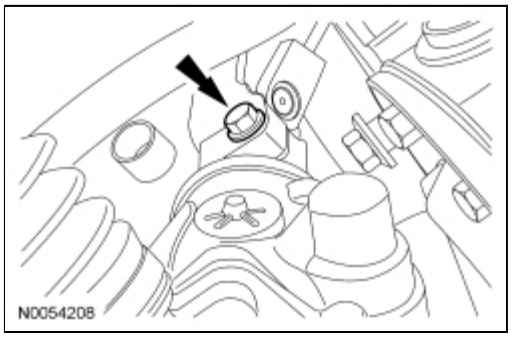


5. Remove the axle tube bushing bolt and flagnut.
   - To install, tighten to 175 Nm (129 lb-ft).



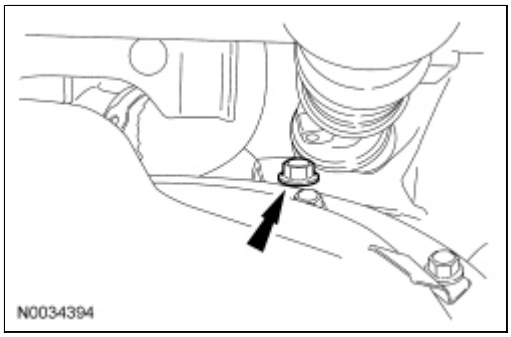
6. Remove the front axle housing bushing bolt.
   - To install, tighten to 175 Nm (129 lb-ft).

repair4less



7. **NOTE:** Use a steering wheel holding device (such as a Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.



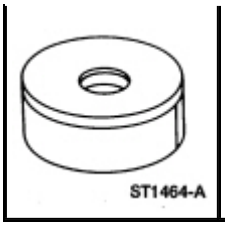
8. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. Refer to Section 501-20B .**

   Remove and discard the steering column shaft-to-steering gear bolt and disconnect the shaft from the steering gear.
   - To install, tighten the new bolt to 30 Nm (22 lb-ft).

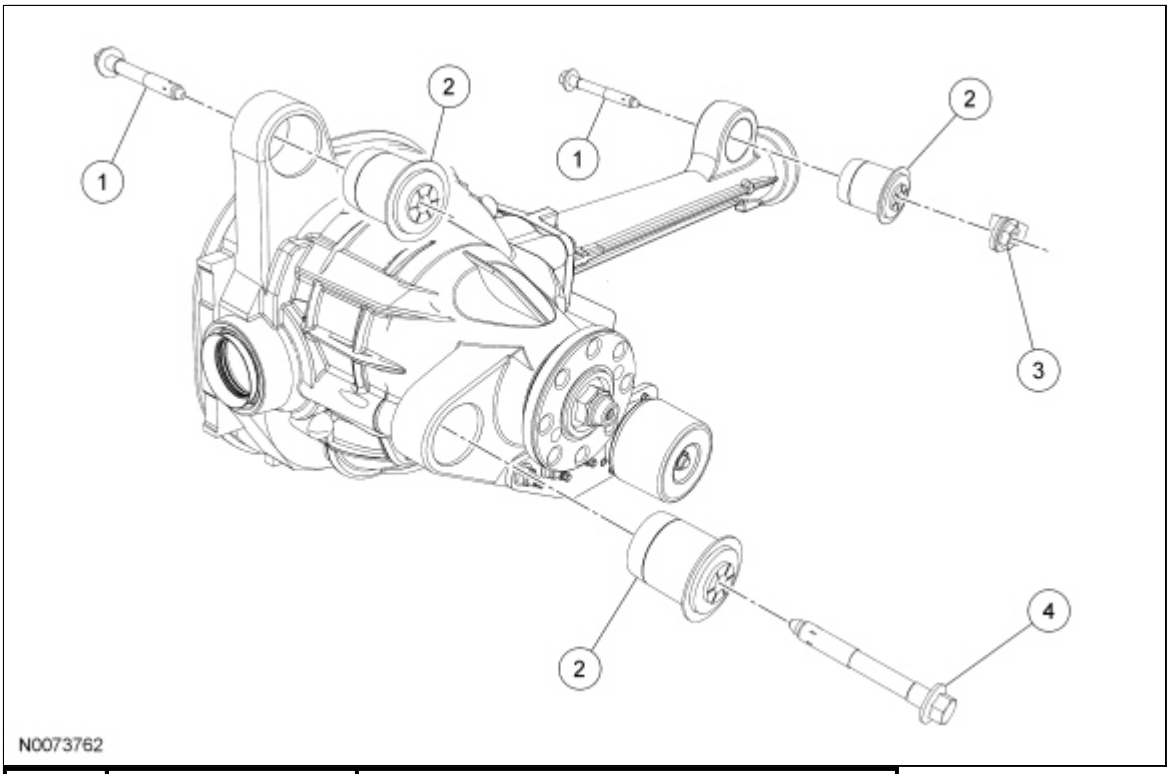
9. Remove the rear axle housing bushing bolt.
   - To install, tighten to 175 Nm (129 lb-ft).

10. Carefully lower the front drive axle assembly.
11. Disconnect the vent hose from the axle vent barbed fitting.
12. **NOTE:** Make sure the axle vent hose is connected.

    To install, reverse the removal procedure.



---



repair4less

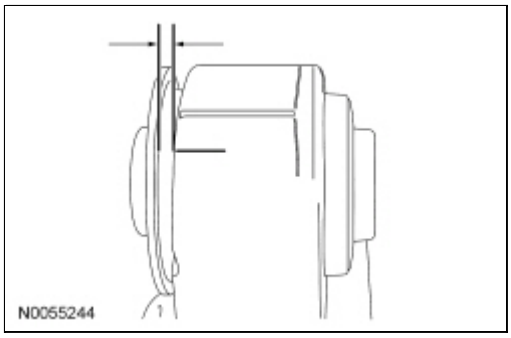
Axle Carrier Bushing

Special Tool(s)

 ST1162-A	Installer, Front Axle Mounting Bushing Drawbolt 205-374 (T96T-5638-H)
 ST2586-A	Installer, Front Differential Mounting Bushing 204-187 (T95T-5638-AH)
 ST2265-A	Installer, Wheel Hub Dust Seal 205-289 (T89P-1249-A)
 ST1159-A	Remover, Front Axle Mounting Bushing Cup 205-371 (T96T-5638-E)
 ST1155-A	Remover, Front Axle Mounting Bushing 205-376 (T96T-5638-K)
 ST2587-A	Remover, Front Differential Housing Bushing 204-186 (T95T-5638-AH)
	Remover/Installer, Front Differential Housing Bushing 205-527/1

Item	Part Number	Description
1	W712724	Axle bushing bolts (2 required)
2	5638	Axle bushings (3 required)
3	W712723	Axle bushing flagnut
4	W712743	Axle bushing bolt

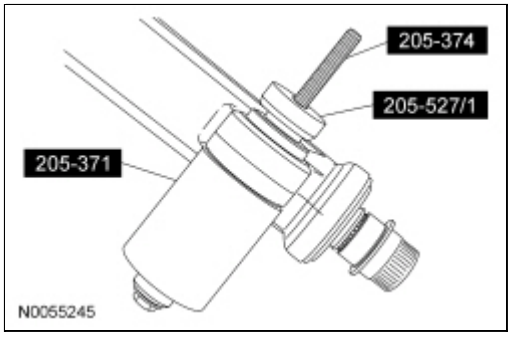
Removal



All bushings

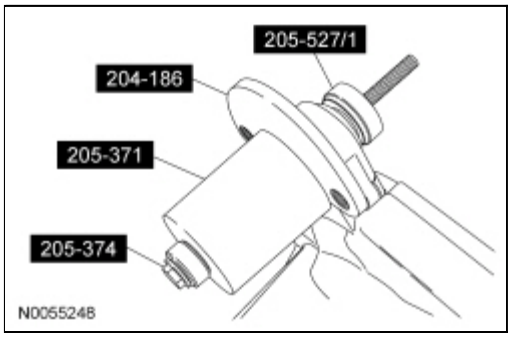
1. **NOTE:** It is not necessary to remove the axle assembly from the jack.

   Remove the axle assembly. For additional information, refer to Axle Assembly in this section.



2. Measure and record the width of the gap between the bushing front lip and the housing. Mark the housing at the point where the measurement was taken.

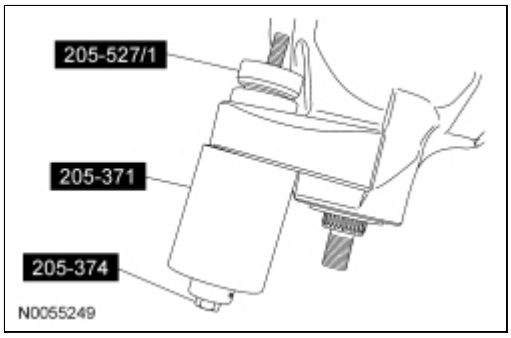
repair4less



Axle tube bushing

3. Position the Front Axle Mounting Bushing Cup Remover, Front Differential Housing Bushing Remover/Installer and Front Axle Mounting Bushing Drawbolt Installer as shown. Turn in the drawbar to remove the bushing.

Rear housing bushing

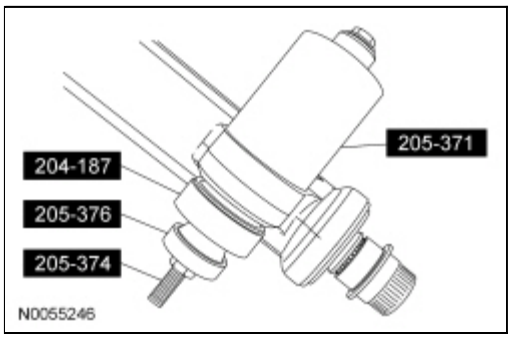


4. Position the Front Differential Housing Bushing Remover, Front Axle Mounting Bushing Cup Remover, Front Differential Housing Bushing Remover/Installer and Front Axle Mounting Bushing Drawbolt Installer as shown. Turn in the drawbar to remove the bushing.

Front housing bushing

5. Remove the pinion flange. For additional information, refer to Drive Pinion Flange and Seal in this section.

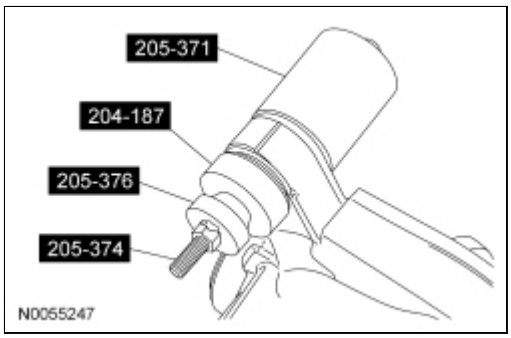
6. Position the Front Axle Mounting Bushing Cup Remover, Front Differential Housing Bushing Remover/Installer and Front Axle Mounting Bushing Drawbolt Installer as shown. Turn in the drawbar to remove the bushing.



All bushings

7. Inspect the bushing bores for wear or damage.

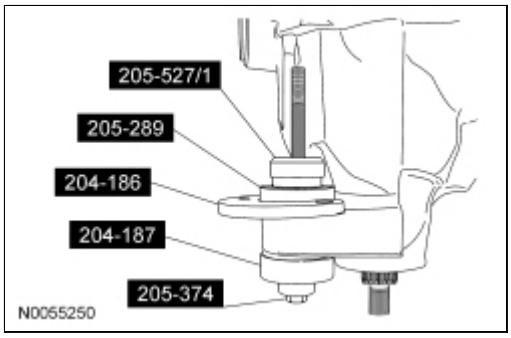
Installation



Axle tube bushing

1. Position the bushing and the Front Axle Mounting Bushing Remover, Front Differential Mounting Bushing Installer, Front Axle Mounting Bushing Cup Remover and Front Axle Mounting Bushing Drawbolt Installer as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.

Rear housing bushing

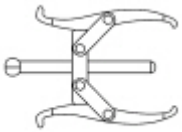


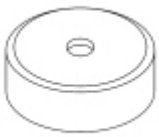
2. Position the bushing and the Front Axle Mounting Bushing Remover, Front Differential Mounting Bushing Installer, Front Axle Mounting Bushing Cup Remover and Front Axle Mounting Bushing Drawbolt Installer as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.

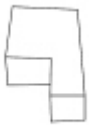
Front housing bushing

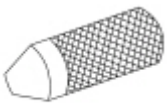
repair4less

3. Position the bushing and the Front Differential Housing Bushing Remover/Installer, Wheel Hub Dust Seal Installer, Front Differential Housing Bushing Remover, Front Differential Mounting Bushing Installer and Front Axle Mounting Bushing Drawbolt Installer as shown. Draw the bushing into the bushing bore to the same depth and point measured before removal.



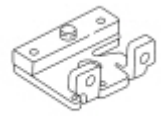


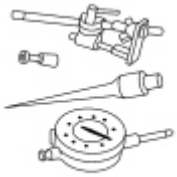


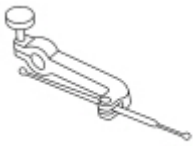


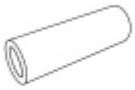
4. Install the U-joint flange. For additional information, refer to Drive Pinion Flange and Seal in this section.

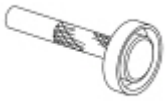
All bushings











5. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

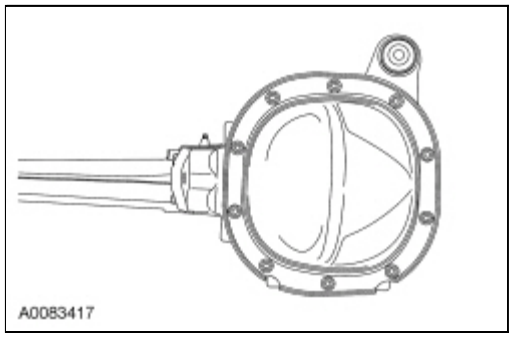
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	—
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

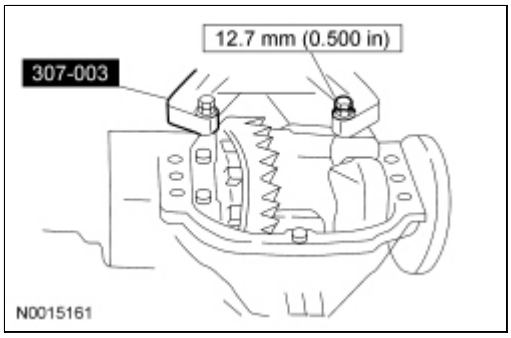
Item	Part Number	Description
1	390919	Differential housing cover bolt (10 required)



repair4less

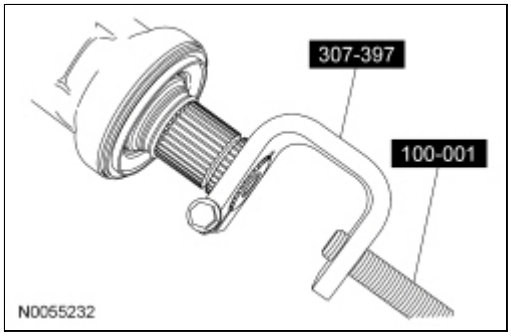
2	3N136	Differential housing cover
3	—	Differential bearing cap bolt (part of 3A412) (4 required)
4	—	Differential bearing cap (part of 3A412) (2 required)
5	3C202	Differential assembly
6	4221	Differential bearings (2 required)
7	4221	Differential bearing cups (2 required)
8	4A451	Differential bearing shims (2 required)
9	—	Pinion gear (part of 4209)
10	4663	Drive pinion bearing adjustment shim
11	4628	Inner drive pinion bearing cup
12	4630	Inner drive pinion bearing
13	4662	Drive pinion collapsible spacer
14	3A380	Intermediate axle shaft
15	3A412	Differential housing
16	4631	Drive pinion oil baffle
17	4616	Drive pinion outer bearing cup
18	4621	Drive pinion outer bearing
19	386989	Drive pinion oil slinger
20	3N134	Drive pinion oil seal
21	4858	Drive pinion flange
22	389546	Drive pinion nut and washer

Removal



1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

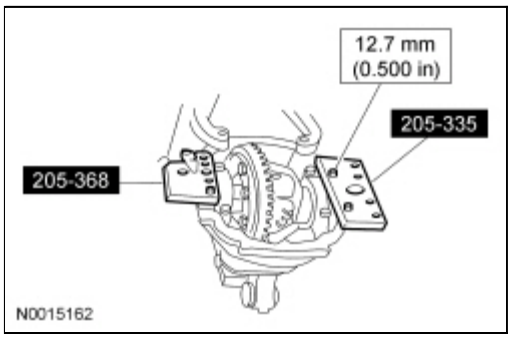
2. Remove the 10 bolts and the differential housing cover.
   - Drain the fluid.



3. ***NOTICE:*** **The fixture mounting bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

   Install the Transmission Holding Fixture.

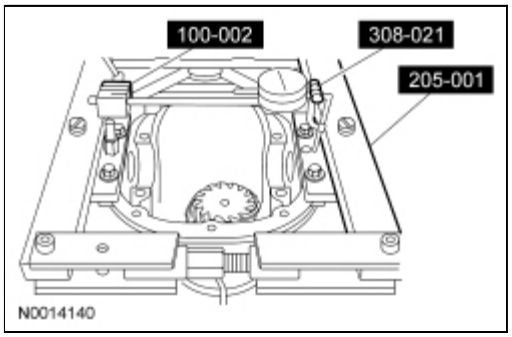
4. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the intermediate shaft.



5. Remove the 4 bolts and the axle housing tube.

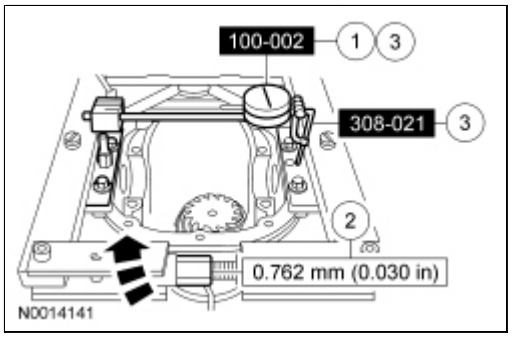
6. ***NOTICE:*** **The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

   Install the Differential Housing Spreader Plate and Adapter for Differential Housing Spreader.



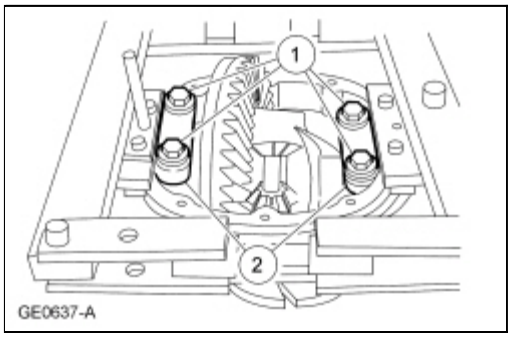
7. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier

repair4less



Spreader.

- Position the adapter tip in the spreader adapter hole.

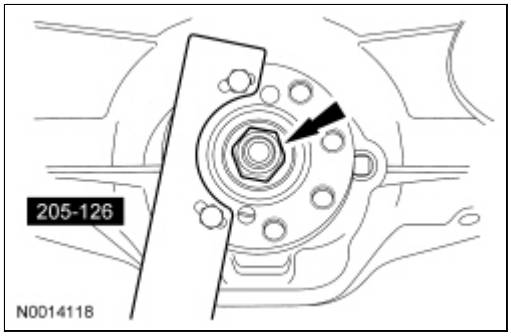


8. ***NOTICE:*** **Overspreading may damage the axle housing.**

   Spread the axle housing to the specification.
   1. Adjust the Dial Indicator Gauge to zero.
   2. Tighten the housing spreader screw to spread the axle housing to the specification.
   3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

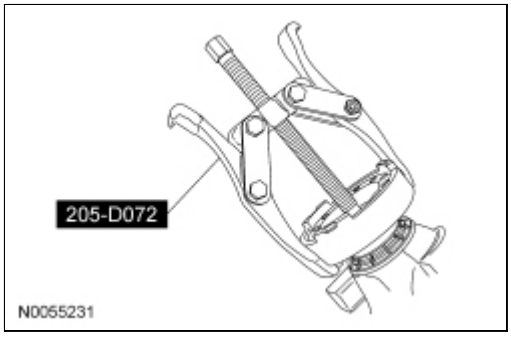
9. ***NOTICE:*** **Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the bearing caps in their original location and position or damage to the component may occur.**

   Mark and remove the 2 differential bearing caps.
   1. Remove the 4 bolts.
   2. Remove the 2 differential bearing caps.



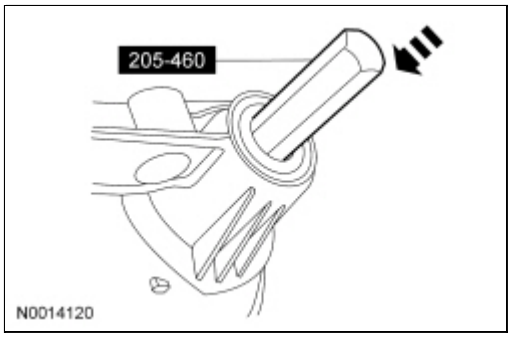
10. **NOTE:** Use wood blocks to avoid axle housing damage.

    Remove the differential assembly from the axle housing.

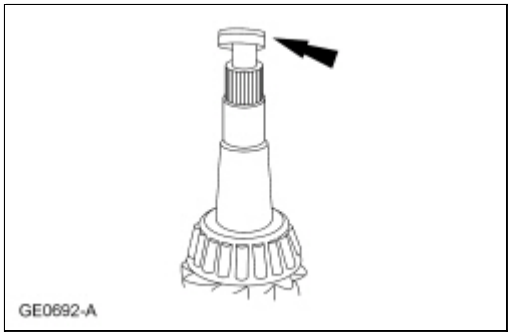


1. Position the wood blocks.
2. Position and push down on the 2 pry bars.
3. Remove the differential assembly.
4. Remove the Differential Carrier Spreader.

11. Install the Drive Pinion Flange Holding Fixture and loosen, but do not remove, the pinion nut.

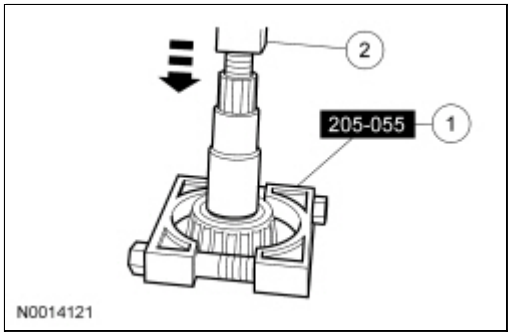


12. With the pinion nut still engaged by a few threads, use the 2 Jaw Puller to separate the axle U-joint flange from the pinion gear.



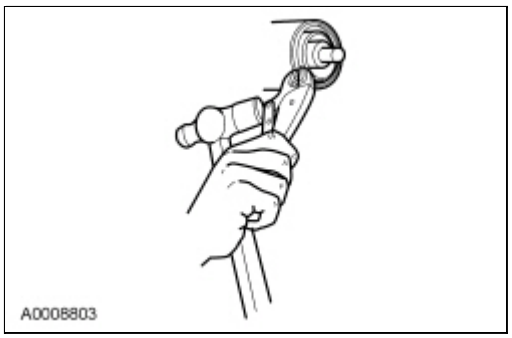
13. Remove the nut and the flange.

14. Using the Drive Pinion Thread Protector and a soft hammer, remove the pinion gear.

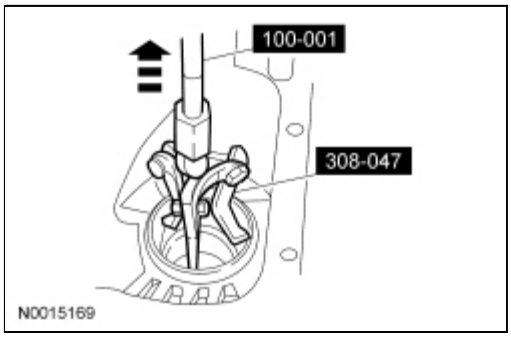


repair4less

15. Remove and discard the drive pinion collapsible spacer.

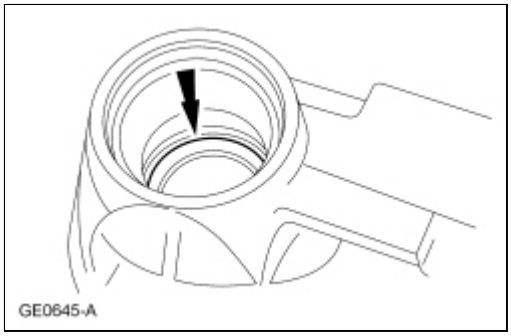


16. Using the Bearing Remover and a press, remove the drive pinion inner bearing.
    1. Position the Bearing Remover under the drive pinion inner bearing.
    2. Using a press, remove the inner drive pinion bearing and shim.



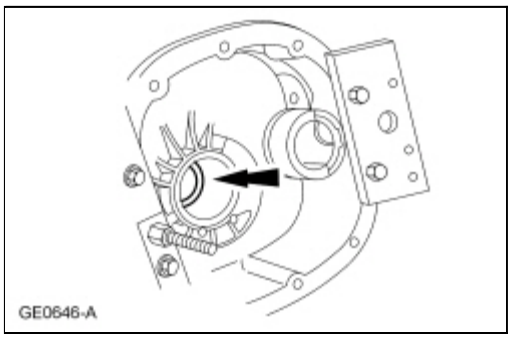
17. **NOTE:** Do not damage the carrier housing while removing the pinion seal.

    Remove the pinion seal and slinger.
    - Pry up on the seal flange. Install gripping pliers and strike with a hammer to remove the seal.



18. Remove the outer pinion bearing.

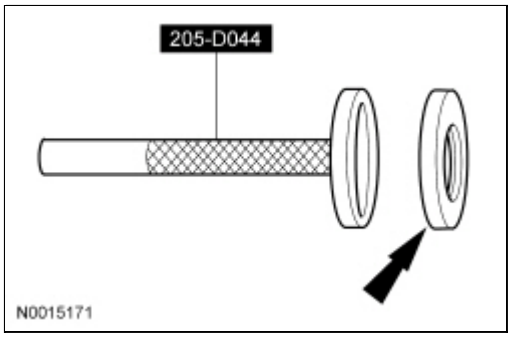
19. Using the Bearing Cup Remover and Slide Hammer, remove the inner drive pinion bearing cup.



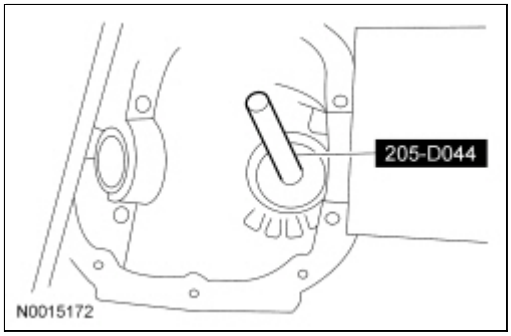
20. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

    If necessary, remove the pinion bearing oil baffle.

21. Remove the outer drive pinion bearing cup by tapping alternately on each side to prevent the drive pinion bearing cup from becoming misaligned.

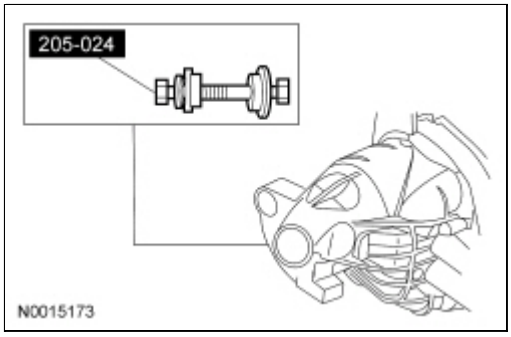


Installation



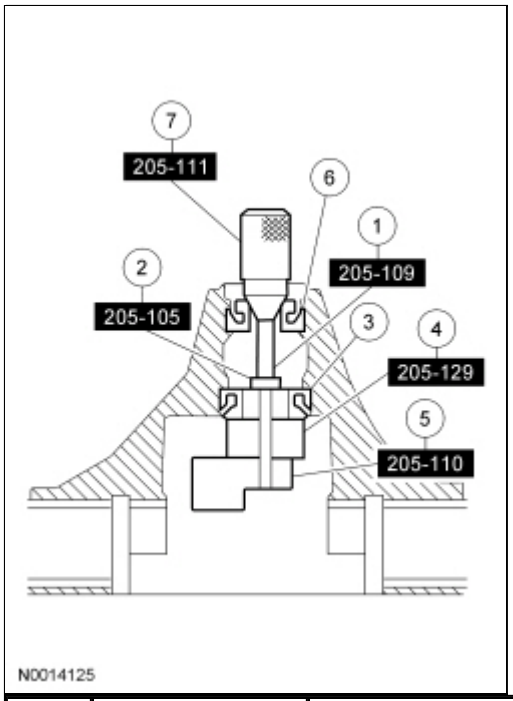
1. ***NOTICE:*** **Do not omit the drive pinion bearing oil baffle or drive pinion bearing failure may result.**

   If removed, position the drive pinion bearing oil baffle on the Differential Carrier Bearing Installer.



repair4less

2. Using the Differential Carrier Bearing Installer, install the drive pinion bearing oil baffle.



3. Using the Drive Pinion Bearing Cup Installer, install the drive pinion bearing cups.

4. ***NOTICE:*** **Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly or damage to the component may occur.**

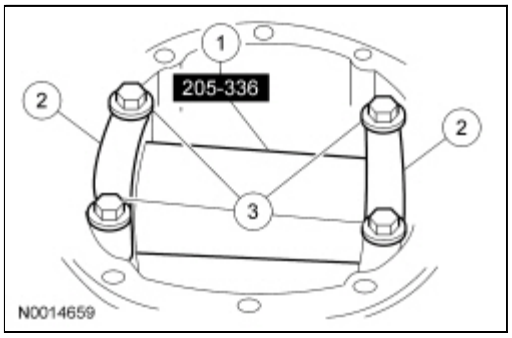
   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Assemble and position the Adapters.

Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-105	Adapter for 205-S127 (T76P-4020-A3)
3	4630	Drive pinion bearing (inner)
4	205-129	Adapter for 105-S127 (T79P-4020-A18)
5	205-110	Adapter for 205-S127 (T76P-4020-A10)
6	4621	Drive pinion bearing (outer)
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

5. **NOTE:** This step duplicates final drive pinion bearing preload.

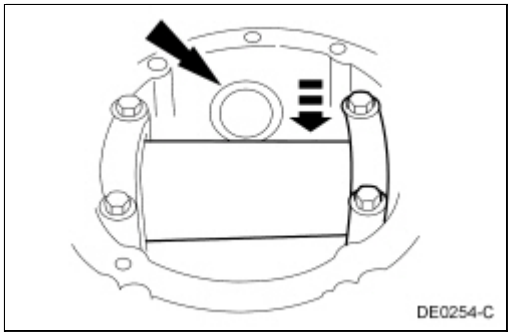
   Tighten the Adapter.
   - Tighten to 2.2 Nm (20 lb-in).



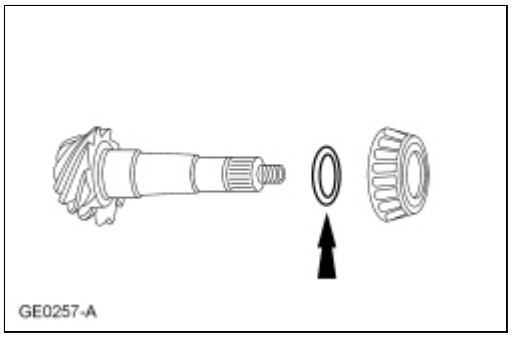
6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

   Rotate the Adapter several half-turns to make sure of correct seating of the drive pinion bearings and position the Adapter.

repair4less



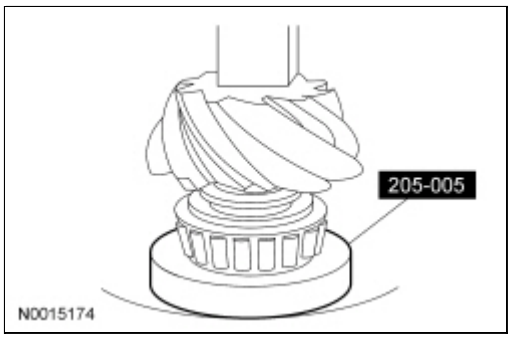
7. Install the Drive Pinion Gauge Tube.
    1. Position the Drive Pinion Gauge Tube.
    2. Install the 2 differential bearing caps.
    3. Install the 4 differential bearing cap bolts.
        - Tighten to 105 Nm (77 lb-ft).



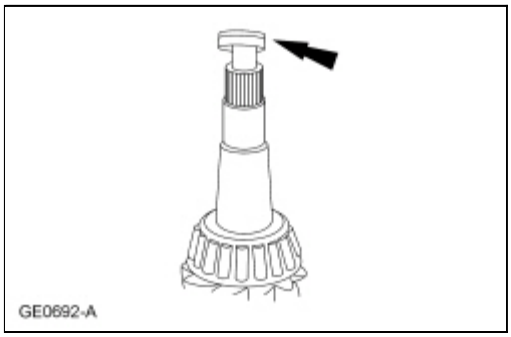
8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

    NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required, which results in a deep tooth contact in final assembly of integral axle assemblies.

    Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.
    - After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the Adapters.

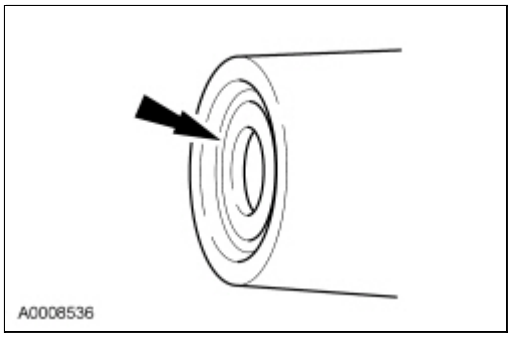


9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.

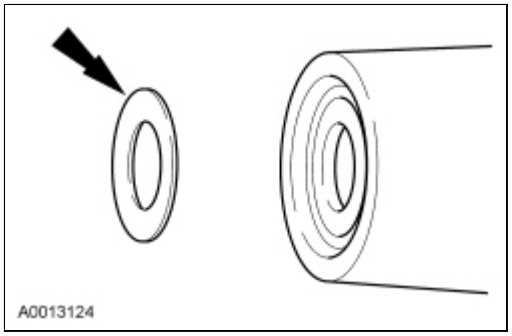


10. **NOTE:** The same drive pinion bearing from the previous steps must be used.

    Install the inner drive pinion bearing.
    - Place the drive pinion bearing adjustment shim on the drive pinion gear.
    - Using a suitable press and the Drive Pinion Bearing Cone Installer, press the inner drive pinion bearing until it is firmly seated on the pinion gear.



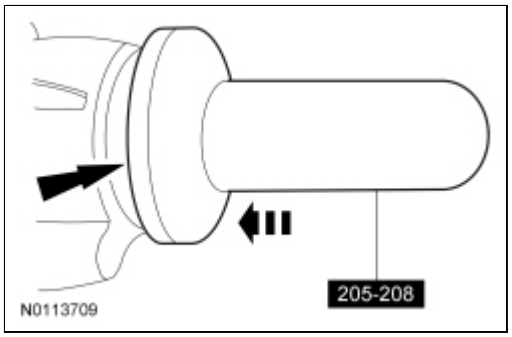
11. Place a new drive pinion collapsible spacer on the drive pinion gear.



12. Install the outer drive pinion bearing.

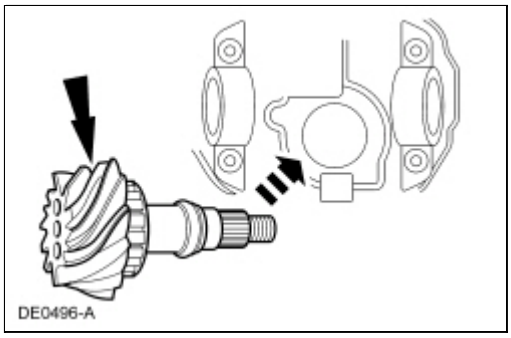
repair4less

13. Install the drive pinion oil slinger.



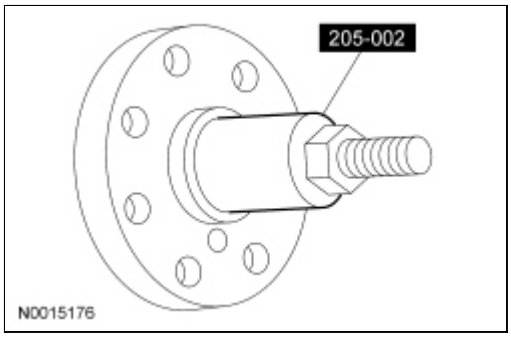
14. **NOTE:** Coat the drive pinion seal lips with long-life grease.

    Install the drive pinion seal on the Drive Pinion Oil Seal Installer.



15. **NOTE:** If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

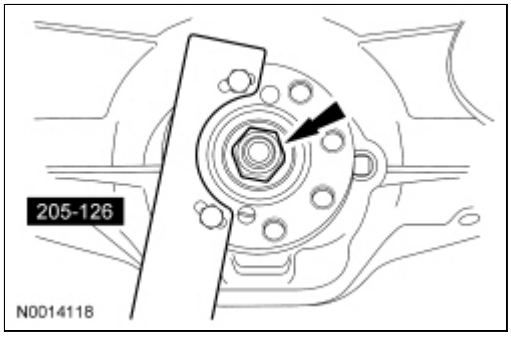
    Using the Drive Pinion Oil Seal Installer, install the drive pinion seal.



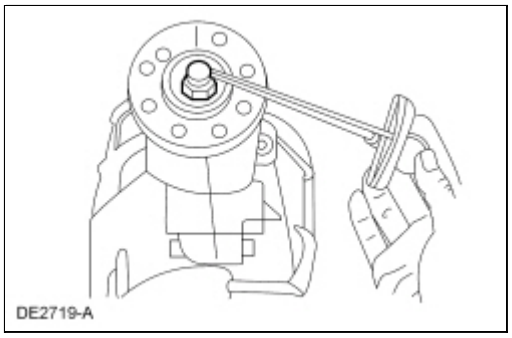
16. Lightly lubricate the drive pinion gear splines with rear axle lubricant.

17. Position the drive pinion gear in the axle housing.

18. Position the pinion flange.



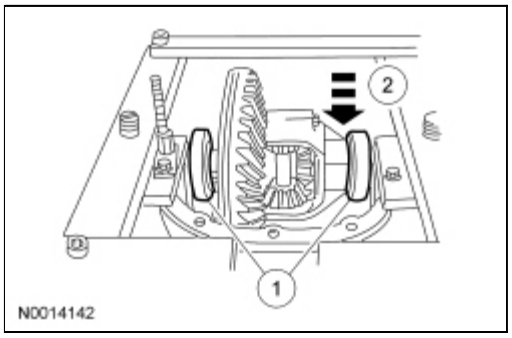
19. Using the Drive Pinion Flange Installer, install the pinion flange.



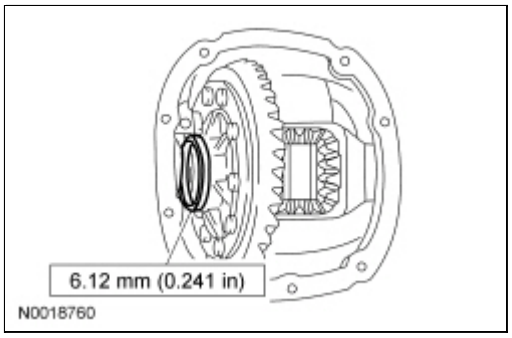
20. Apply a small amount of axle lubricant to the washer side of the new pinion nut and install the new pinion nut.

21. ***NOTICE:*** **Do not loosen the pinion nut to reduce drive pinion bearing preload under any circumstance. If it is necessary to reduce drive pinion bearing preload, install a new drive pinion collapsible spacer and pinion nut or damage to the component may occur.**

    Install the Drive Pinion Flange Holding Fixture and tighten the pinion nut. Refer to the torque specifications in the Specifications portion of this section.
    - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings are seating correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.

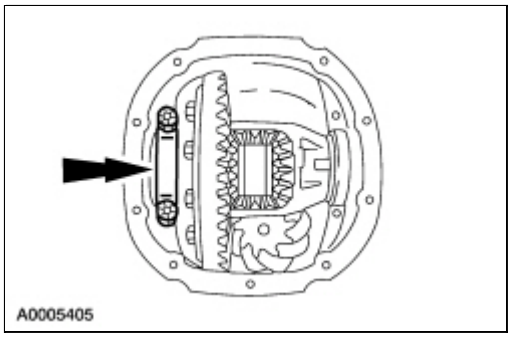


repair4less

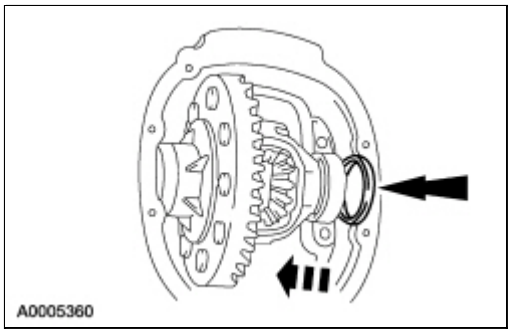


22. Press the left and right differential bearing on the differential case.
    1. Position the differential bearing.
    2. Using the Differential Side Bearing Installer, press the differential bearing on the differential case.
       - Repeat for the other side.

23. Install the differential carrier.
    1. Position the 2 differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.



24. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.

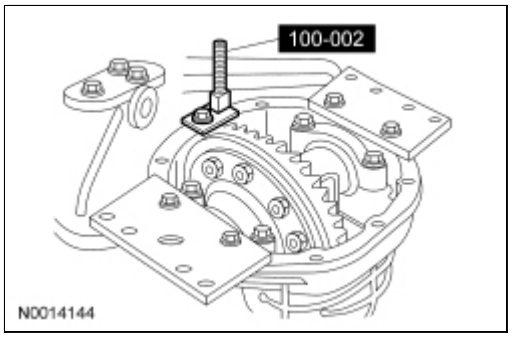


25. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the 2 bearing cap bolts.

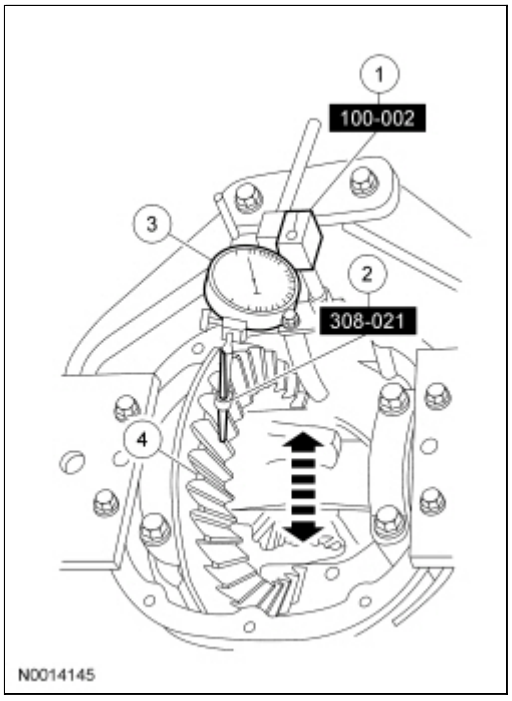
26. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.



27. Install the right bearing cap and 2 bolts.

28. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



29. Rotate the differential carrier to make sure it turns freely.

30. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

repair4less

31. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
    2. Position the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge tip centrally on a drive tooth.
    3. Zero the Dial Indicator.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is 0.203 mm (0.008 in) to 0.305 mm (0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured.
        - To correct for a high or low backlash, proceed as follows.

32. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002

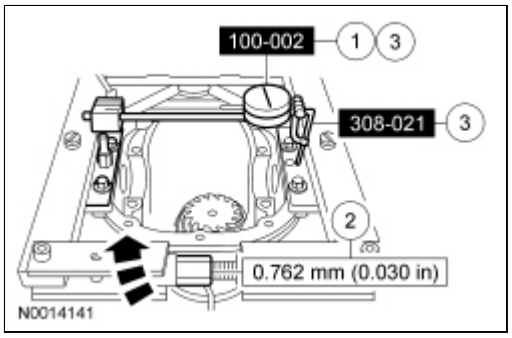
33. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.

34. Measure the thickness of the selected right and left bearing shims.

35. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

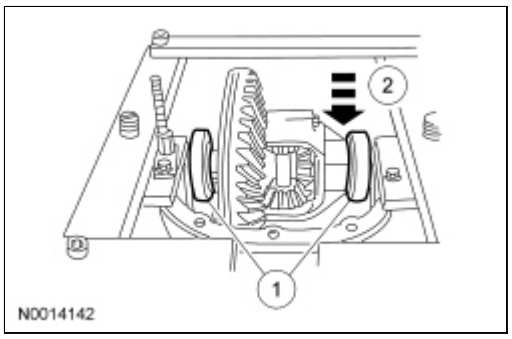


36. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.

37. ***NOTICE:*** **Overspreading may damage the differential housing.**

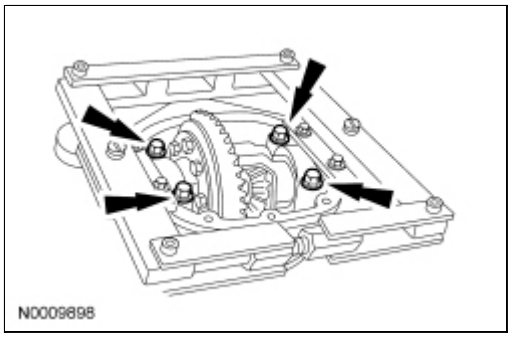
    NOTE: Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator reading.

    Spread the differential housing to the specification.
    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the screw until spreading the differential housing to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

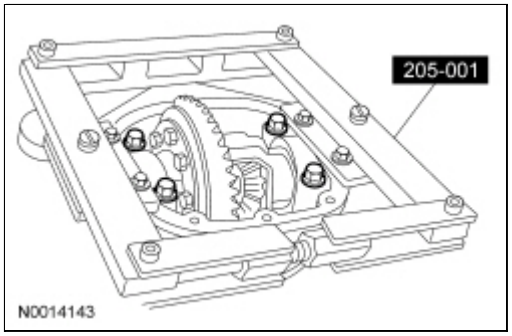


38. ***NOTICE:*** **To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly. If not carried out in this order, the aluminum housing can be damaged.**

    Place the differential bearing shims in the differential housing.



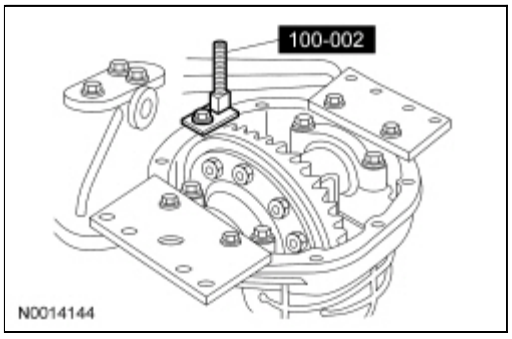
39. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.



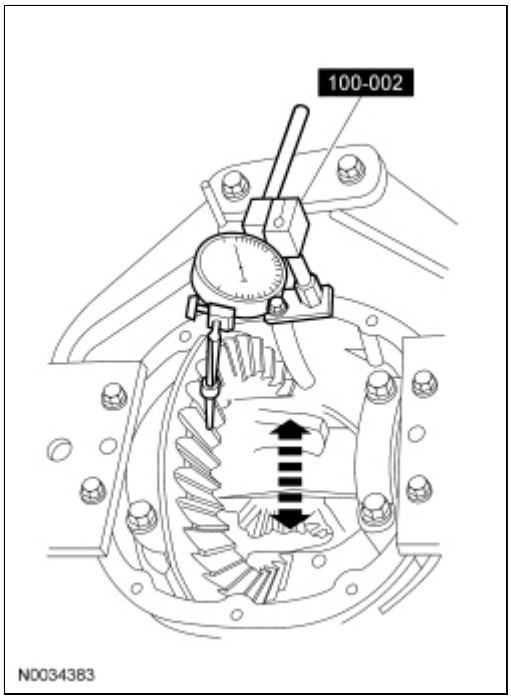
40. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the Differential Carrier Spreader.

    Install the 2 differential bearing caps and the 4 differential bearing cap bolts in their original locations and positions.

repair4less



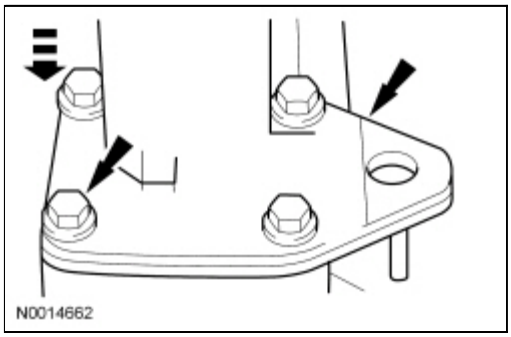
41. Loosen and remove the Differential Carrier Spreader.



42. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).

43. Rotate the differential carrier to make sure it turns freely.

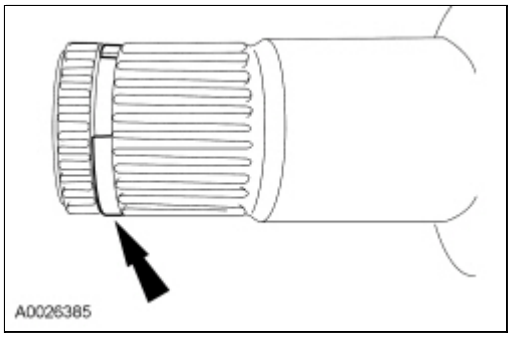
44. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.



45. Using the Dial Indicator Gauge with Holding Fixture, recheck the ring gear backlash.

46. Apply marking compound and rotate the differential assembly 5 complete revolutions.

47. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

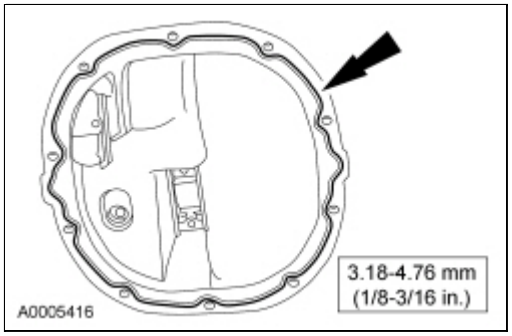


48. Install the axle housing tube and the 4 bolts.
    - Tighten to 73 Nm (54 lb-ft).

49. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

50. Install a new circlip on the intermediate shaft end.

repair4less



51. Insert the intermediate shaft and engage the circlip with the differential side gear.

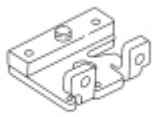
52. Remove the axle assembly from the Transmission Holding Fixture and place it on the bench.

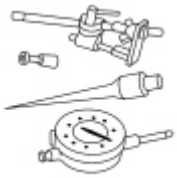
53. **NOTE:** Remove all of the silicone gasket and make sure the surfaces are free of oil before applying the new silicone gasket.

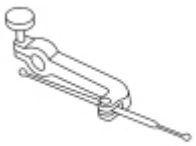
    NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown in the illustration.
    - Use silicone gasket and sealant.

54. Install the differential housing cover and the 10 bolts.
    - Tighten to 32 Nm (24 lb-ft).







55. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

56. Remove the fill plug and fill the axle assembly with the specified type and amount of axle lubricant.
    - Tighten the fill plug to 25 Nm (18 lb-ft).

repair4less

Differential Carrier

Special Tool(s)

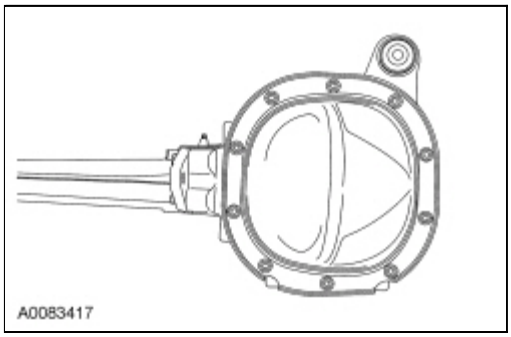
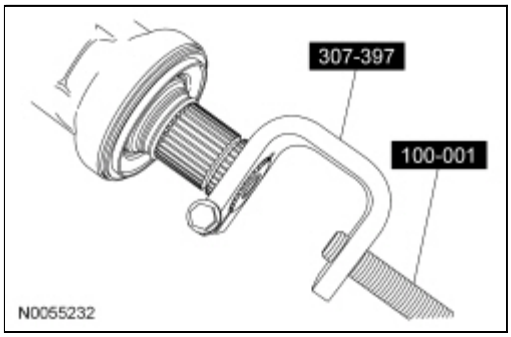
Item	Specification
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

repair4less

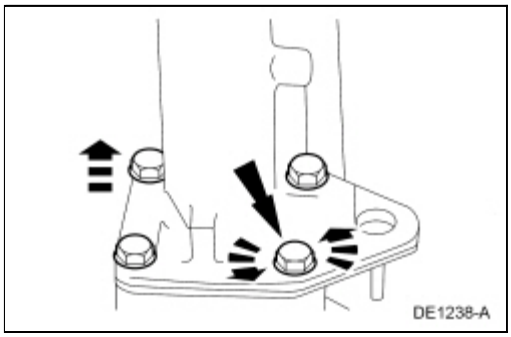


Item	Part Number	Description
1	390919	Differential housing cover bolt (10 required)
2	3N136	Differential housing cover
3	—	Differential bearing cap bolt (part of 3A412) (4 required)
4	—	Differential bearing cap (part of 3A412) (2 required)
5	3C202	Differential assembly
6	3A380	Intermediate axle shaft
7	3A412	Differential housing



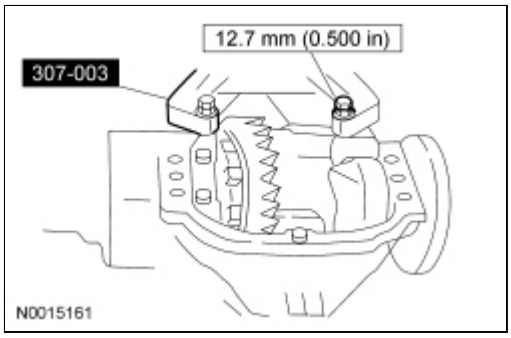
Removal

1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.



2. Remove the 10 bolts and the differential housing cover.
   - Drain the fluid.

3. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the intermediate shaft.

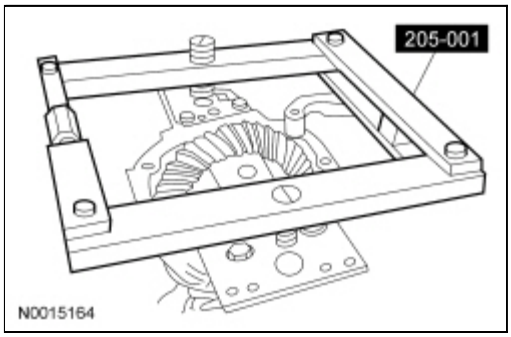


4. Remove the 4 bolts and the axle housing tube.

5. ***NOTICE:*** **The fixture mounting bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

   Install the Transmission Holding Fixture.

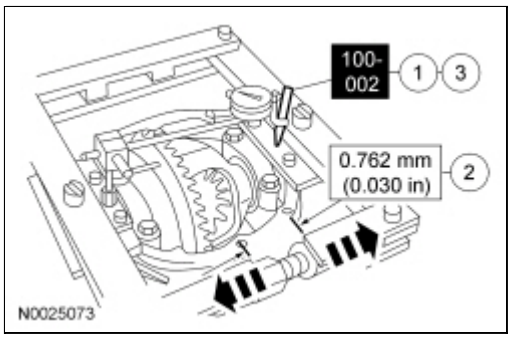
repair4less



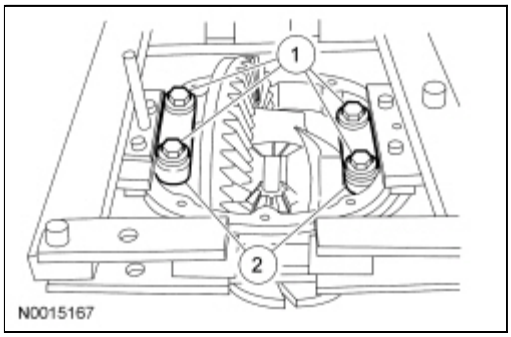
6. ***NOTICE:*** **The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

   Install the Differential Housing Spreader Plate and Adapter for Differential Housing Spreader.

7. Position the Differential Carrier Spreader on the spreader adapters.



8. Install the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
   - Position the adapter tip in the spreader adapter hole.

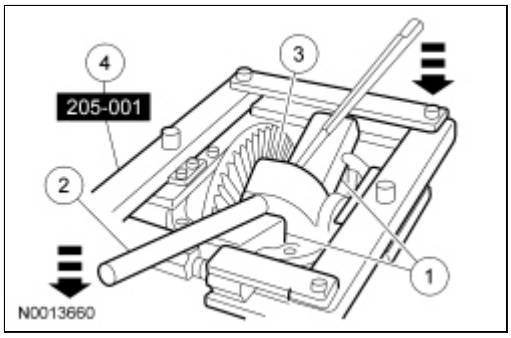


9. ***NOTICE:*** **Overspreading may damage the component.**

   Spread the axle housing to the specification.
   1. Adjust the Dial Indicator Gauge to zero.
   2. Tighten the housing spreader screw to spread the axle housing to the specification.
   3. Remove the Dial Indicator Gauge with Holding Fixture.

10. ***NOTICE:*** **Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the differential bearing caps in their original positions or damage to the component may occur.**

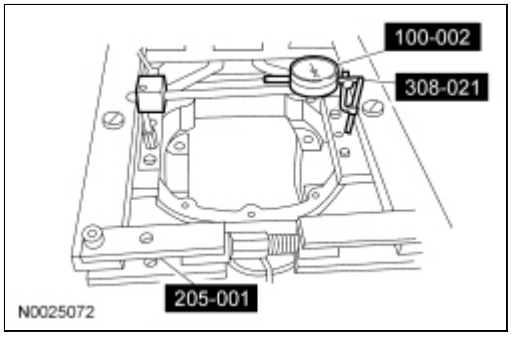
    Mark and remove the 2 differential bearing caps.
    1. Remove the 4 differential bearing cap bolts.
    2. Remove the 2 differential bearing caps.



11. **NOTE:** Use wood blocks to avoid axle housing damage.

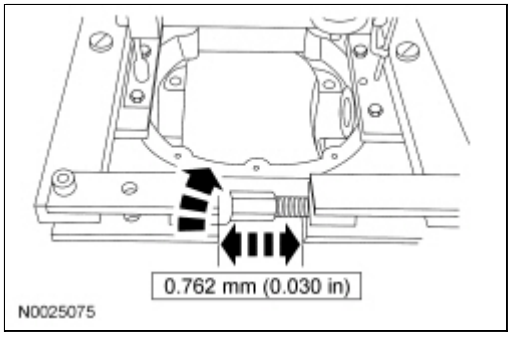
    NOTE: Index-mark the position of the differential bearing shims. The differential bearing shims must be installed in their original locations and positions.

    Remove the differential carrier from the axle housing.
    1. Position the wood blocks.
    2. Position and push down on the 2 pry bars.
    3. Remove the differential carrier.
    4. Remove the Differential Carrier Spreader.



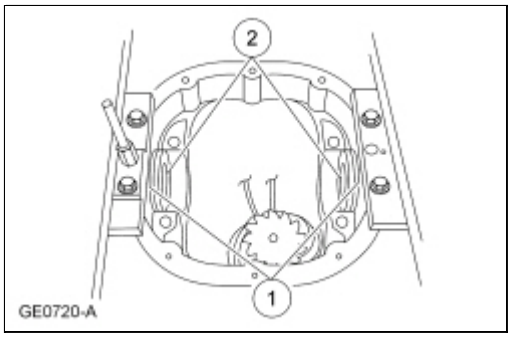
repair4less

Installation



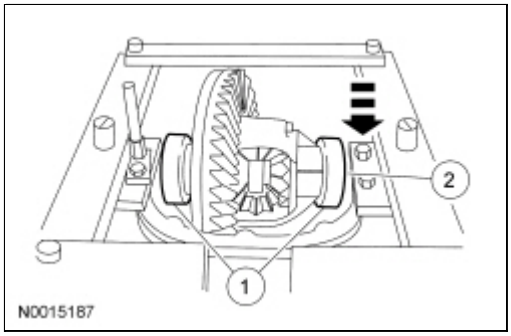
1. **NOTE:** Make sure the Dial Indicator needle is in the spreader adapter hole.

   Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.



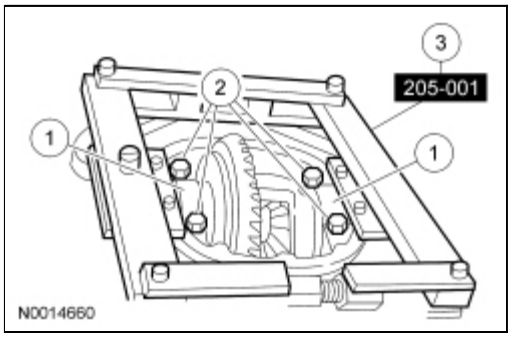
2. ***NOTICE:*** **Overspreading may damage the component.**

   Spread the axle housing to the specification.
   - Remove the Dial Indicator.



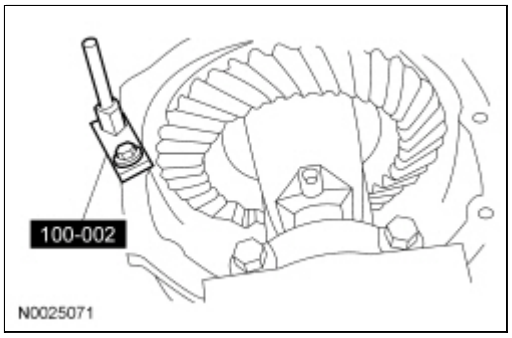
3. ***NOTICE:*** **Never attempt to drive the differential bearing shim in place. Permanent damage to the machined axle housing surfaces may occur.**

   Position the differential bearing shims.
   1. Apply a light coating of grease to one side of the differential bearing shims to help hold them in place.
   2. Position the differential bearing shims.

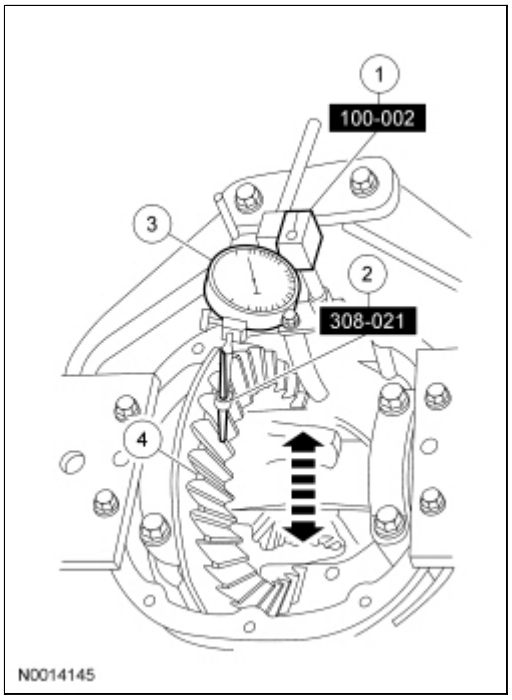


4. **NOTE:** Push the differential carrier downward to fully seat the differential bearing cups in the axle housing.

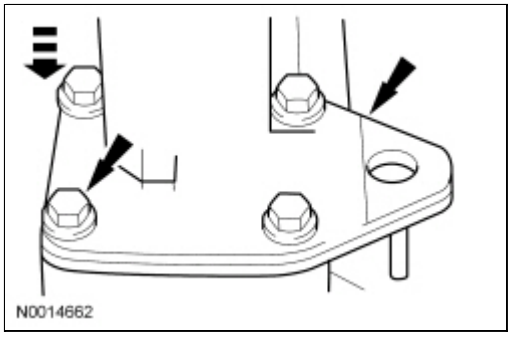
   Position the differential carrier.
   1. Position the differential bearing cups on the differential bearings.
   2. Lower the differential assembly in place between the differential bearing shims.



5. Install the differential bearing caps in their original positions and tighten with the housing still spread.
   1. Position the 2 differential bearing caps.
   2. Install the 4 differential bearing cap bolts.
      - Tighten to 105 Nm (77 lb-ft).
   3. Remove the Differential Carrier Spreader.

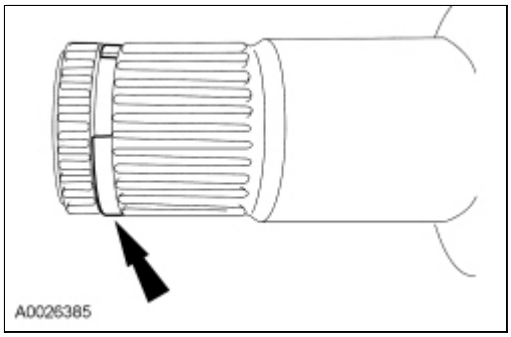


6. Install the Dial Indicator Gauge with Holding Fixture.



repair4less

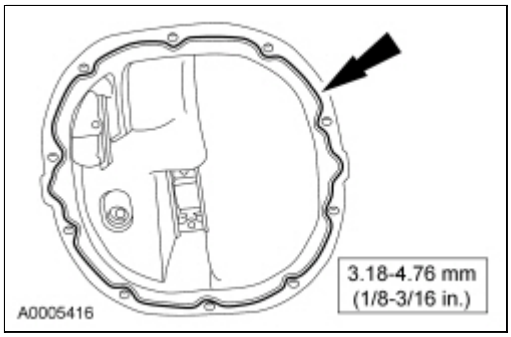
7. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the Dial Indicator Gauge with Holding Fixture.
    2. Position the Clutch Housing Gauge tip centrally on a drive tooth.
    3. Zero the Dial Indicator.
    4. Turn the differential ring gear without turning the drive pinion gear.



8. Install the axle housing tube and the 4 bolts.
    - Tighten to 73 Nm (54 lb-ft).

9. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

10. Install a new circlip on the intermediate shaft end.



11. Insert the intermediate shaft and engage the circlip with the differential side gear.

12. Remove the axle assembly from the Transmission Holding Fixture and place it on the bench.

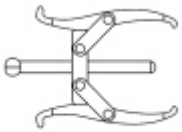
13. **NOTE:** Remove all of the silicone gasket and make sure the surfaces are free of oil before applying the new silicone gasket.

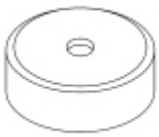
    NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

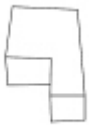
    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown in the illustration.
    - Use silicone gasket and sealant.

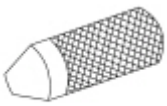
14. Install the differential housing cover and the 10 differential housing cover bolts.
    - Tighten to 32 Nm (24 lb-ft).

repair4less

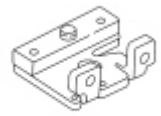


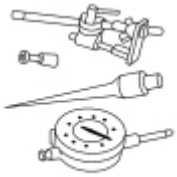


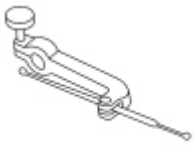


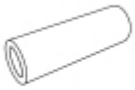


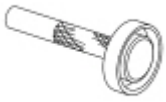
15. Install the axle assembly. For additional information, refer to Axle Assembly in this section.











16. Remove the fill plug and fill the axle assembly with the specified type and amount of axle lubricant.
    - Tighten the fill plug to 25 Nm (18 lb-ft).

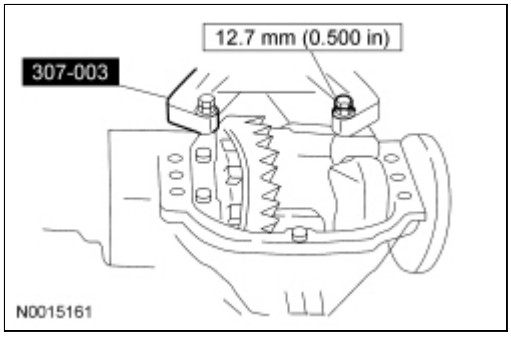
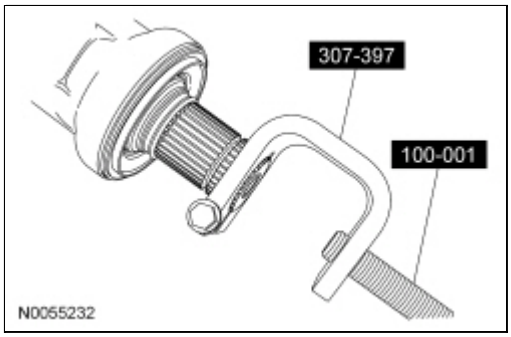
21	3N134	Drive pinion oil seal
22	4858	Drive pinion flange
23	389546	Drive pinion nut and washer

Removal

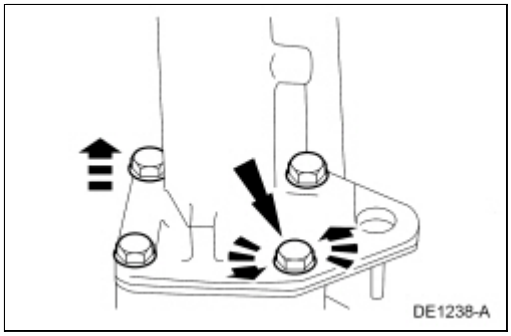


1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

2. Remove the 10 bolts and the differential housing cover.
   - Drain the fluid.

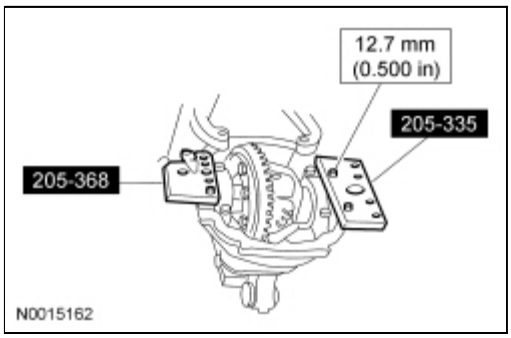


3. ***NOTICE:*** **The fixture mounting bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

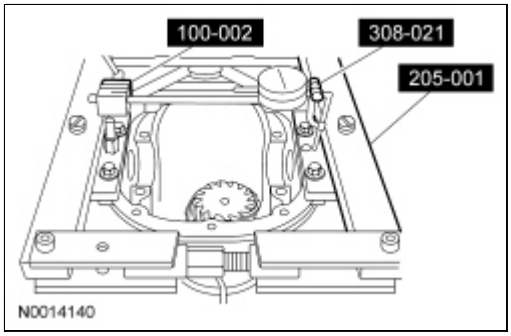


Install the Transmission Holding Fixture.

4. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the intermediate shaft.

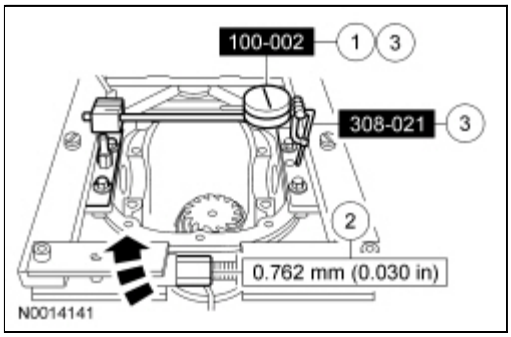


5. Remove the 4 bolts and the axle housing tube.



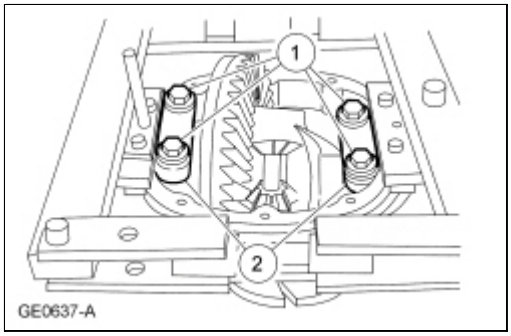
6. ***NOTICE:*** **The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier or damage to the component may occur.**

   Install the Adapter for Differential Housing Spreader and Differential Housing Spreader Plate.



repair4less

7. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.
    - Position the adapter tip in the spreader adapter hole.

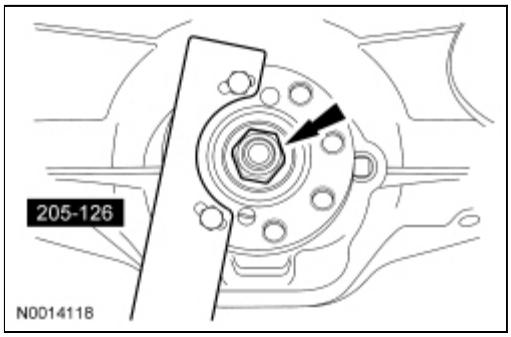


8. ***NOTICE:*** **Overspreading may damage the axle housing.**

    Spread the axle housing to the specification.
    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the housing spreader screw to spread the axle housing to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

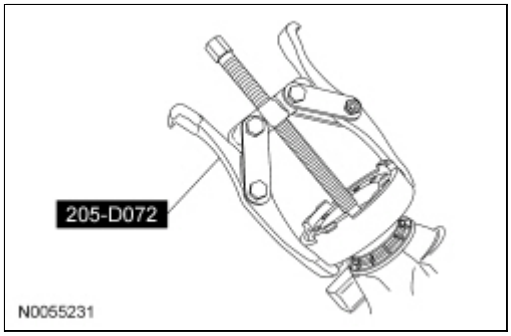
9. ***NOTICE:*** **Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the bearing caps in their original location and position or damage to the component may occur.**

    Mark and remove the 2 differential bearing caps.
    1. Remove the 4 bolts.
    2. Remove the 2 differential bearing caps.



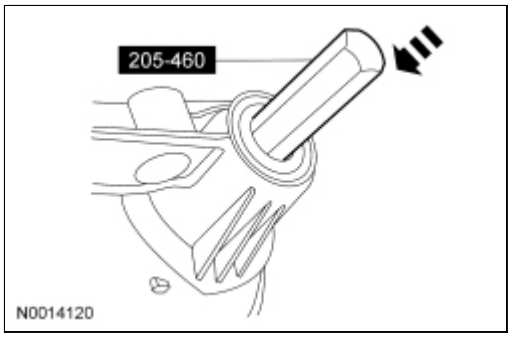
10. ***NOTICE:*** **Use wood blocks to avoid axle housing damage.**

Remove the differential assembly from the axle housing.

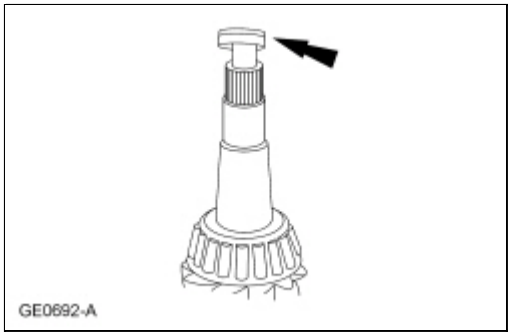


1. Position the wood blocks.
2. Position and push down on the 2 pry bars.
3. Remove the differential assembly.
4. Remove the Differential Carrier/Spreader.

11. Install the Drive Pinion Flange Holding Fixture and loosen, but do not remove, the pinion nut.



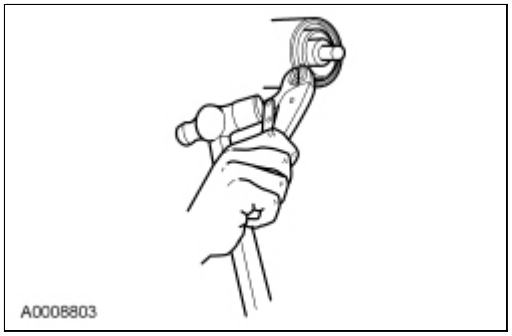
12. With the pinion nut still engaged by a few threads, use the 2 Jaw Puller to separate the axle U-joint flange from the pinion gear.



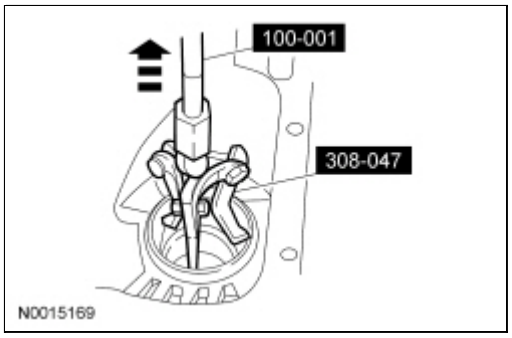
13. Remove the nut and the flange.

14. Using the Drive Pinion Thread Protector and a soft hammer, remove the pinion gear.

repair4less

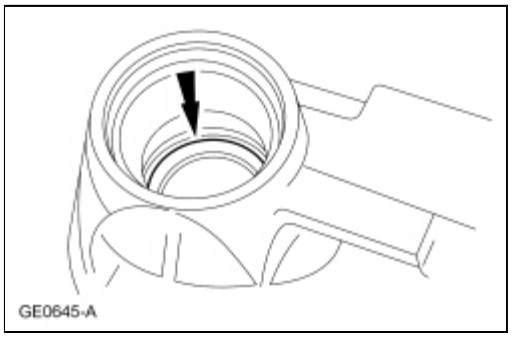


15. Discard the drive pinion collapsible spacer.



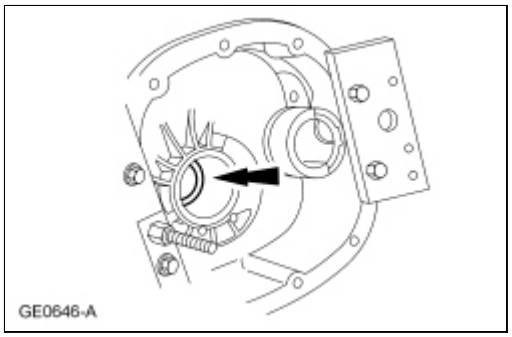
16. ***NOTICE:*** **Do not damage the carrier housing while removing the pinion seal.**

    Remove the pinion seal and slinger.
    - Pry up on the seal flange. Install gripping pliers and strike with a hammer to remove the seal.



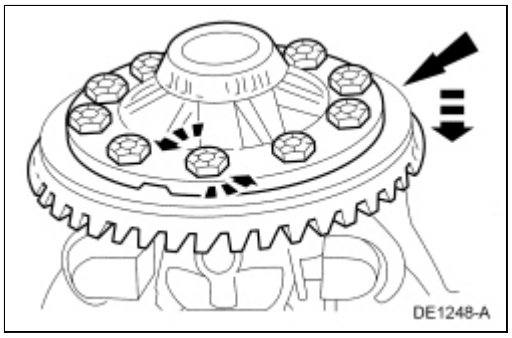
17. Remove the outer pinion bearing.

18. Using the Bearing Cup Remover and Slide Hammer, remove the inner pinion bearing cup.

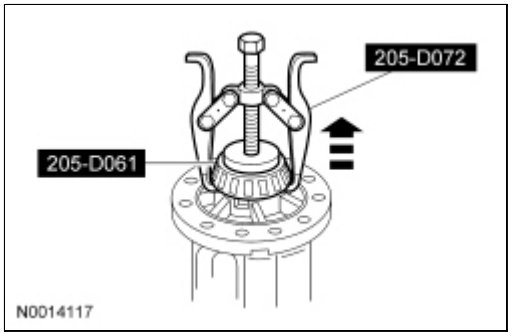


19. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

    If necessary, remove the pinion bearing oil baffle.



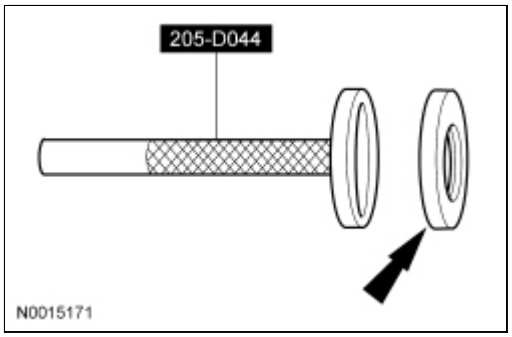
20. Remove the outer pinion bearing cup by tapping alternately on each side to prevent the cup from cocking.



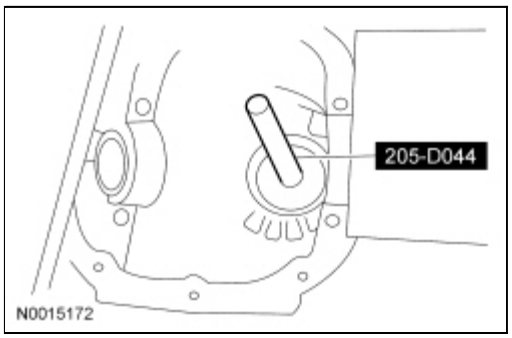
21. **NOTE:** Use a drift punch to separate the differential ring gear from the differential case.

    Remove and discard the 10 differential ring gear bolts and remove the differential ring gear.

repair4less



22. Using the 2 Jaw Puller and Step Plate, remove the 2 differential bearings.

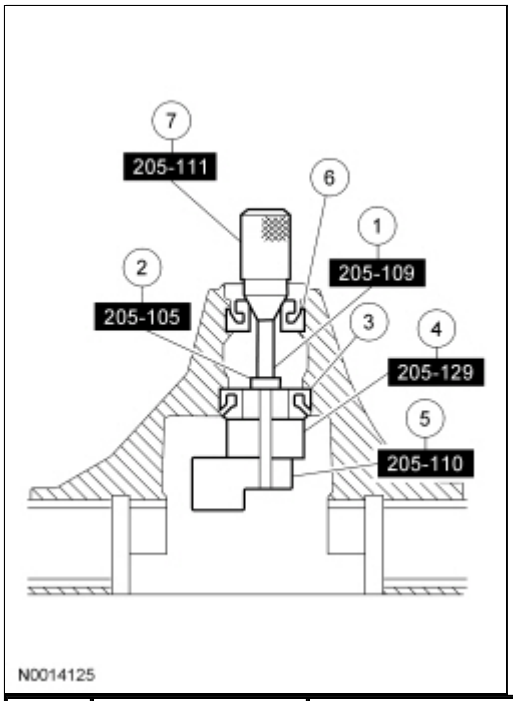


Installation

1. ***NOTICE:*** **Do not omit the drive pinion bearing oil baffle or damage to the component may occur.**

   If removed, position the drive pinion bearing oil baffle on the Differential Carrier Bearings Installer.

2. Using the Differential Carrier Bearings Installer, install the drive pinion bearing oil baffle.

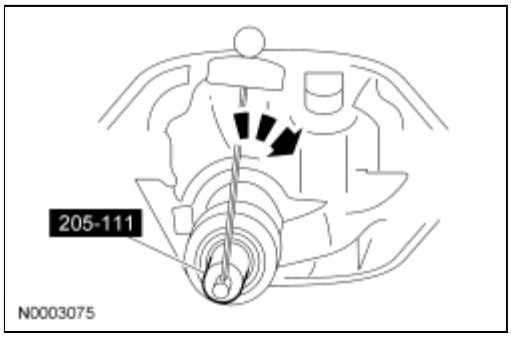


3. Using the Drive Pinion Bearing Cup Installer, install the drive pinion bearing cups.

4. ***NOTICE:*** **Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly or damage to the component may occur.**

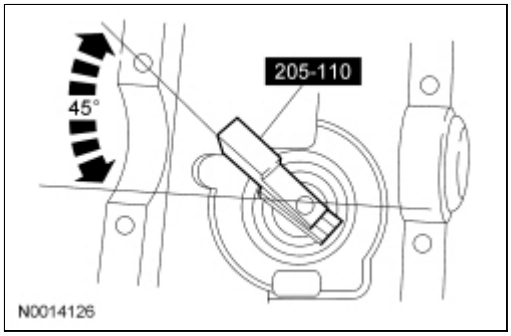
   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Assemble and position the Adapters.



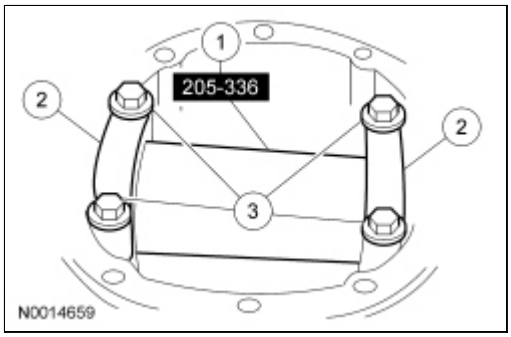
Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-105	Adapter for 205-S127 (T76P-4020-A3)
3	4630	Drive pinion bearing (inner)
4	205-129	Adapter for 105-S127 (T79P-4020-A18)
5	205-110	Adapter for 205-S127 (T76P-4020-A10)
6	4621	Drive pinion bearing (outer)
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

repair4less



5. **NOTE:** This step duplicates final drive pinion bearing preload.

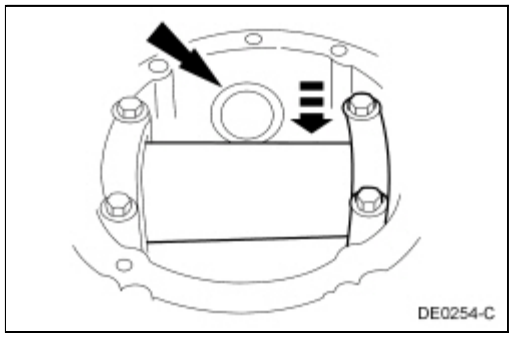
   Tighten the Adapter.
   - Tighten to 2.2 Nm (20 lb-in).



6. **NOTE:** The Adapter must be offset to obtain an accurate reading.

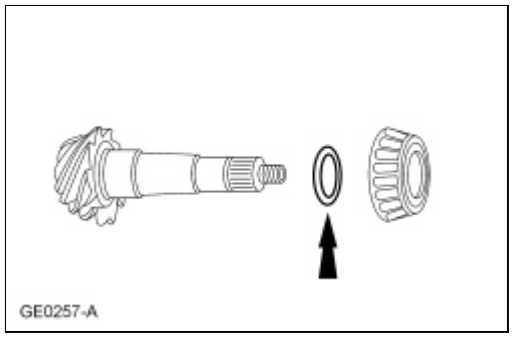
   Rotate the Adapter several half-turns to make sure of correct seating of the drive pinion bearings and position the Adapter.

7. Install the Drive Pinion Gauge Tube.
   1. Position the Drive Pinion Gauge Tube.
   2. Install the 2 differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 105 Nm (77 lb-ft).



8. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

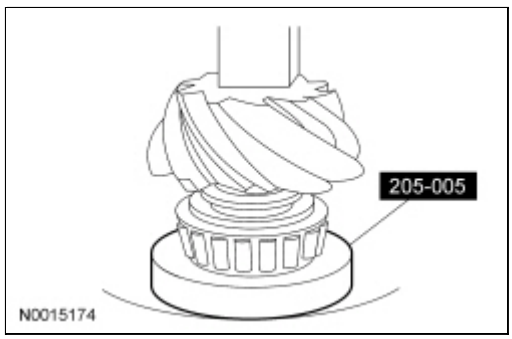
   NOTE: A slight drag should be felt for correct drive pinion bearing adjustment shim selection. Do not attempt to force the drive pinion bearing adjustment shim between the gauge block and the gauge tube. This will minimize selection of a drive pinion bearing adjustment shim thicker than required,



which results in a deep tooth contact in final assembly of integral axle assemblies.

Use a drive pinion bearing adjustment shim as a gauge for drive pinion bearing adjustment shim selection.

- After the correct drive pinion bearing adjustment shim thickness has been determined, remove all of the special tools.

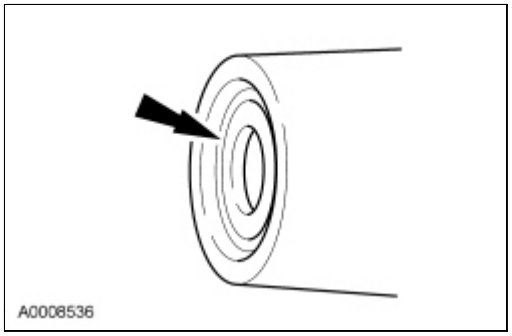


9. Position the drive pinion bearing adjustment shim and the inner pinion bearing on the new drive pinion gear stem.

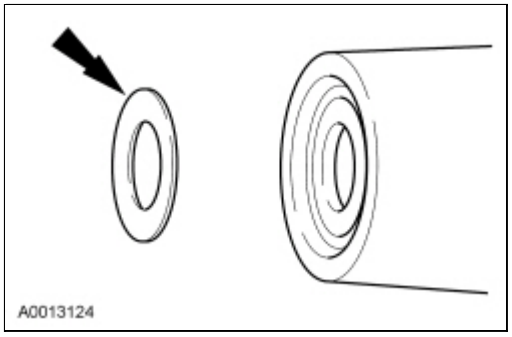
10. **NOTE:** The same drive pinion bearings from the previous steps must be used.

    Install the inner drive pinion bearing.

    - Place the drive pinion bearing adjustment shim on the drive pinion gear.
    - Using a suitable press and the Drive Pinion Bearing Cone Installer, press the inner drive pinion bearing until it is firmly seated on the pinion gear.



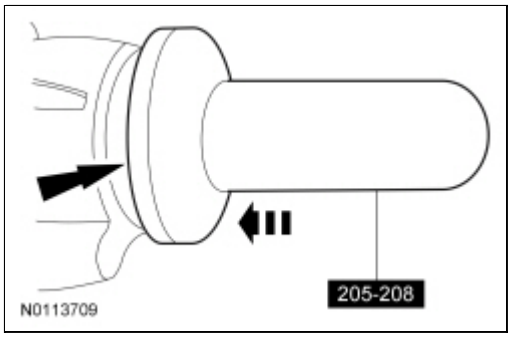
11. Place a new drive pinion collapsible spacer on the drive pinion gear.



repair4less

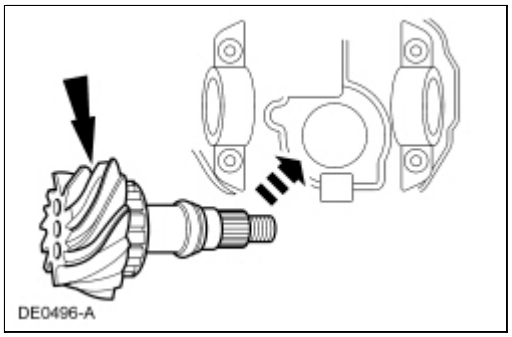
12. Install the outer drive pinion bearing.

13. Install the drive pinion oil slinger.



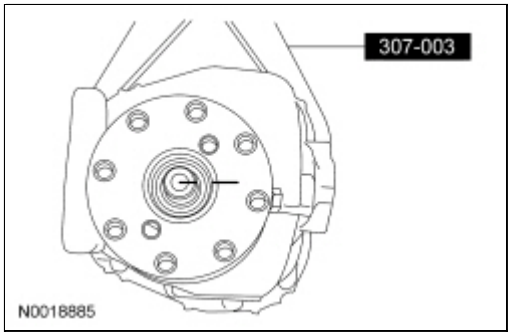
14. **NOTE:** Coat the drive pinion seal lips with long-life grease.

    Install the drive pinion seal on the Drive Pinion Oil Seal Installer.

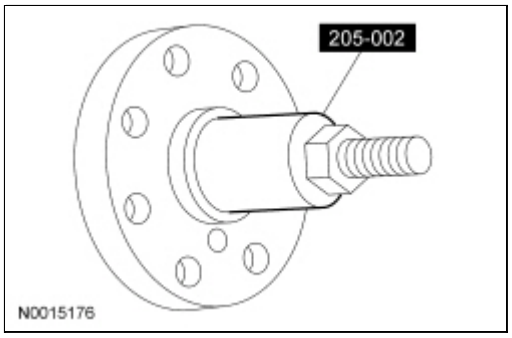


15. **NOTE:** If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

    Using the Drive Pinion Oil Seal Installer, install the drive pinion seal.



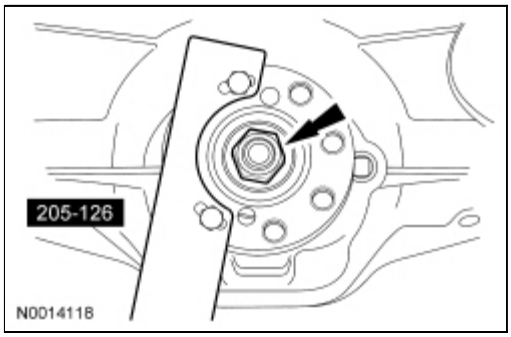
16. Lightly lubricate the drive pinion gear splines with axle lubricant.

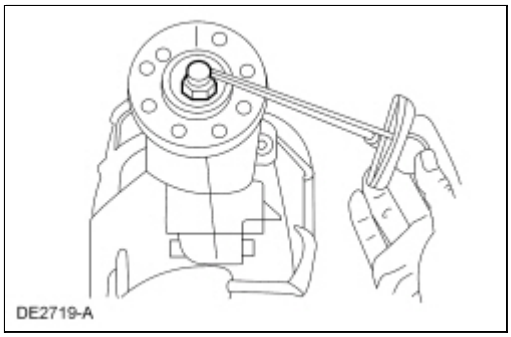


17. Position the drive pinion gear in the axle housing.

18. Position the pinion flange onto the pinion shaft while mounted on the Transmission Holding Fixture.

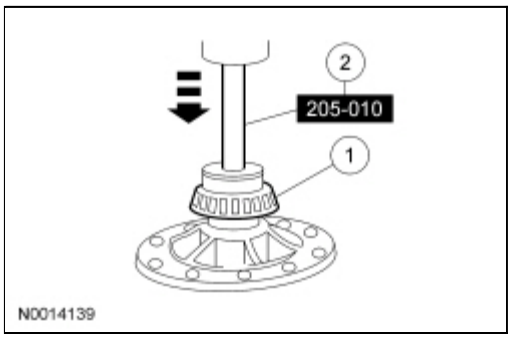
19. Using the Drive Pinion Flange Installer, install the pinion flange.





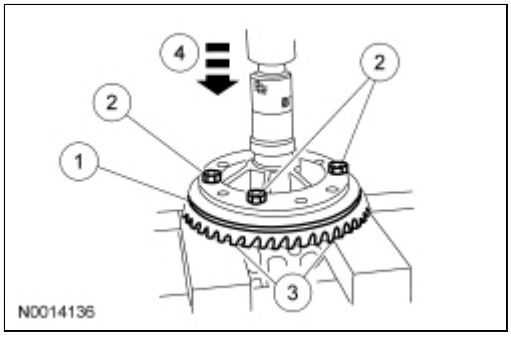
20. Apply a small amount of axle lubricant to the washer side of the new pinion nut and install the new pinion nut.

repair4less

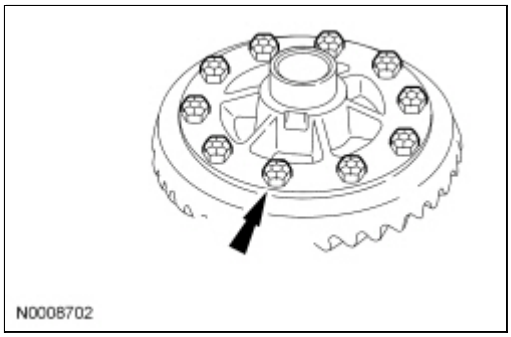


21. ***NOTICE:*** **Do not loosen the pinion nut to reduce drive pinion bearing preload under any circumstance. If it is necessary to reduce drive pinion bearing preload, install a new drive pinion collapsible spacer and pinion nut or damage to the component may occur.**

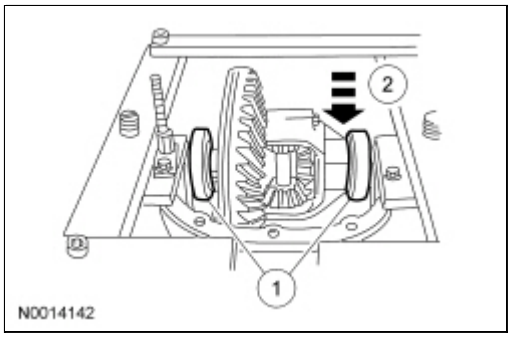
    Install the Drive Pinion Flange Holding Fixture and tighten the pinion nut. For additional information, refer to the torque specifications in the Specifications portion of this section.
    - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings are seating correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.



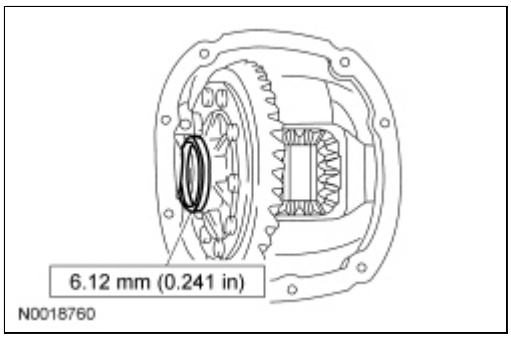
22. Press the left and right differential bearing on the differential carrier.
    1. Position the differential bearing.
    2. Using the Differential Side Bearing Installer, press the differential bearing on the differential carrier.
       - Repeat for the other side.



23. Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 new ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential carrier and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.

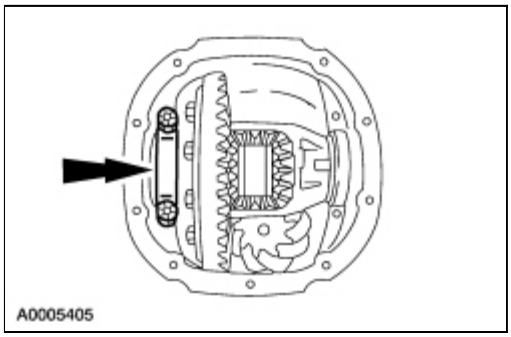


4. Press the differential ring gear into place.



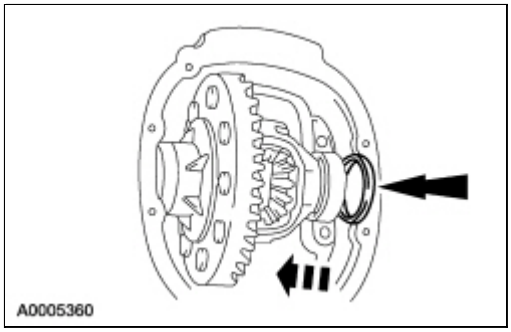
24. Install the 10 new ring gear bolts.
    - Tighten to 128 Nm (95 lb-ft).

25. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place.



26. Install a differential bearing shim of the thickness shown on the LH side of the differential bearing.

repair4less

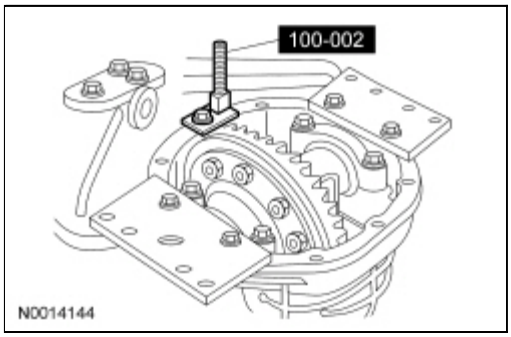


27. **NOTE:** Apply pressure toward the left side to make sure the left bearing cup is seated.

    Install the left bearing cap and loosely install the 2 bearing cap bolts.

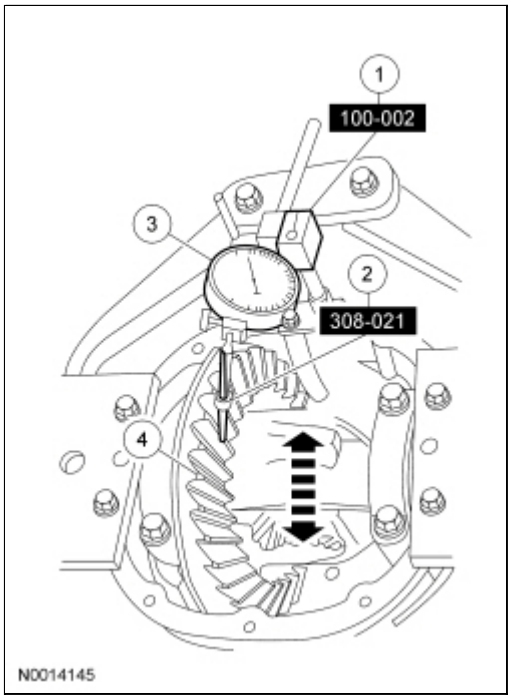
28. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.



29. Install the right bearing cap and 2 bolts.

30. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).



31. Rotate the differential carrier to make sure it turns freely.

32. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

33. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

2. Position the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge tip centrally on a drive tooth.
3. Zero the Dial Indicator.
4. Turn the differential ring gear without turning the drive pinion gear. Record the indicator reading. The allowable backlash is 0.203 mm (0.008 in) to 0.305 mm (0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured. A backlash variation of more than 0.101 mm (0.004 in) between points checked indicates gear/case runout.
    - To correct for a high or low backlash, proceed as follows.

34. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002

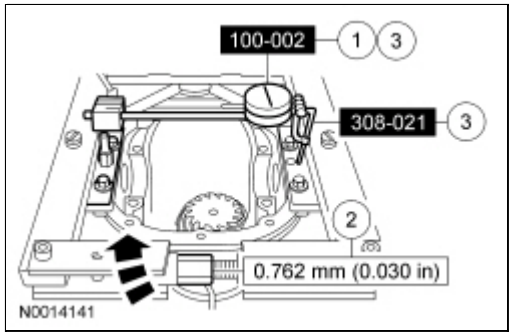
35. Remove the 4 differential bearing cap bolts.
    - Remove the differential carrier.

36. Measure the thickness of the selected right and left bearing shims.

37. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

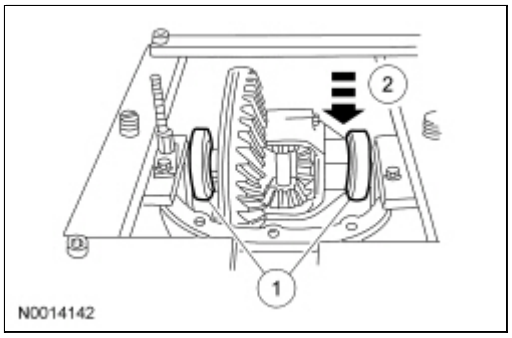


38. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.

39. ***NOTICE:*** **Overspreading may damage the differential housing.**

    NOTE: Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator reading.

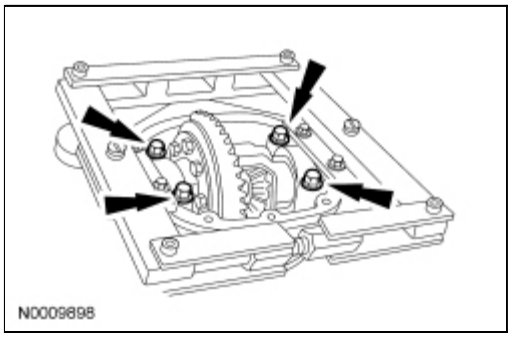
    Spread the differential housing to the specification.
    1. Adjust the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge to zero.
    2. Tighten the screw until spreading the differential housing to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.



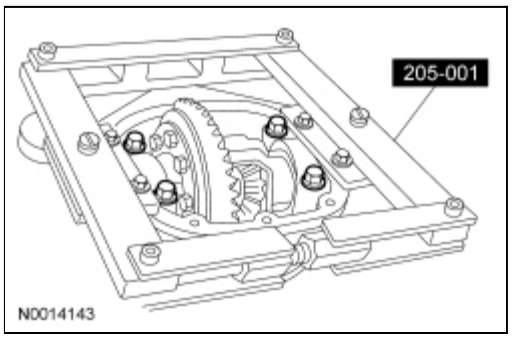
40. ***NOTICE:*** **To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly. If not carried out in this order, the aluminum housing may be damaged.**

    Place the differential bearing shims in the differential housing.

repair4less

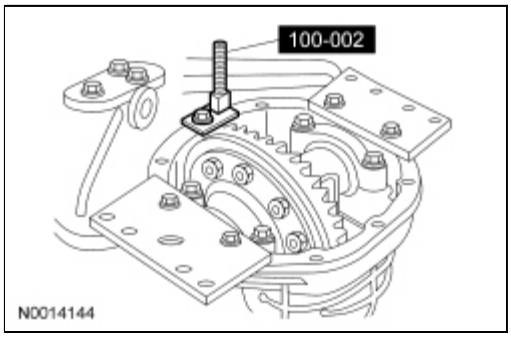


41. Install the differential carrier.
    1. Position the differential bearing cups on the differential bearings.
    2. Lower the differential carrier in place between the differential bearing shims.

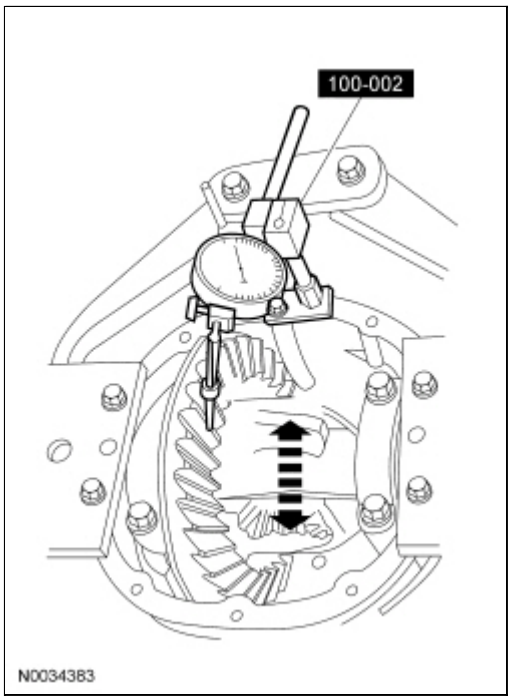


42. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the carrier spreader.

    Install the 2 differential bearing caps and the 4 differential bearing cap bolts in their original locations and positions.



43. Loosen and remove the Differential Carrier Spreader.

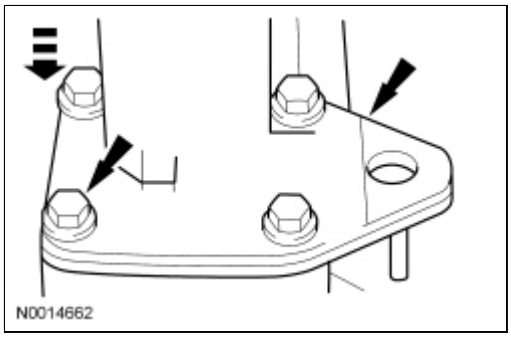


44. Tighten the 4 differential bearing cap bolts.
    - Tighten to 105 Nm (77 lb-ft).

45. Rotate the differential carrier to make sure it turns freely.

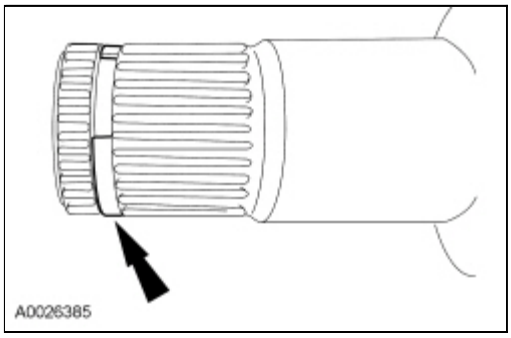
46. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

47. Using the Dial Indicator Gauge with Holding Fixture, recheck the ring gear backlash.



48. Apply marking compound and rotate the differential assembly 5 complete revolutions.

49. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

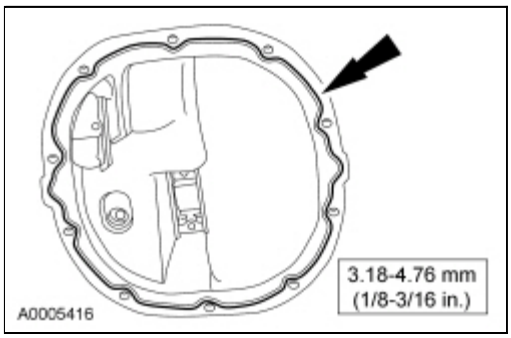


50. Install the 4 bolts and the axle housing tube.
    - Tighten to 73 Nm (54 lb-ft).

repair4less

51. Install a new stub shaft seal. For additional information, refer to Stub Shaft Pilot Bearing and Seal in this section.

52. Install a new circlip on the intermediate shaft end.



53. Insert the intermediate shaft and engage the circlip with the differential side gear.

54. Remove the axle assembly from the Transmission Holding Fixture and place it on the bench.

55. **NOTE:** Remove all of the silicone gasket and make sure the surfaces are free of oil before applying the new silicone gasket.

    NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown in the illustration.
    - Use silicone gasket and sealant.

56. Install the differential housing cover and 10 bolts.

- Tighten to 32 Nm (24 lb-ft).

57. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

58. Remove the fill plug and fill the axle assembly with the specified amount and type of axle lubricant.
    - Tighten the fill plug to 25 Nm (18 lb-ft).

Front Drive Halfshafts

The front drive halfshafts consist of the following:

- Inner CV joints
- Outer CV joints
- Interconnecting shafts
- Convoluted CV joint boots
- CV joint boot clamps
- Special CV high-temperature grease
- Tripod joint housings
- Ball and cage housings
- A circlip stopper that holds the cross-groove inboard race assembly (inboard CV joint) together
- A circlip that retains the splined inboard CV joint to the differential side gear

The front drive halfshafts link the front axle to the front wheel hubs. The CV joints allow the halfshafts to rotate smoothly through the required changes in angles between the stationary axle and the varying angles of the front wheels including jounce and rebound plus changes while turning. The CV joints are either tri-lobed style or the caged ball type depending on inboard or outboard. New halfshaft components are available as kits containing grease, boots and clamps.

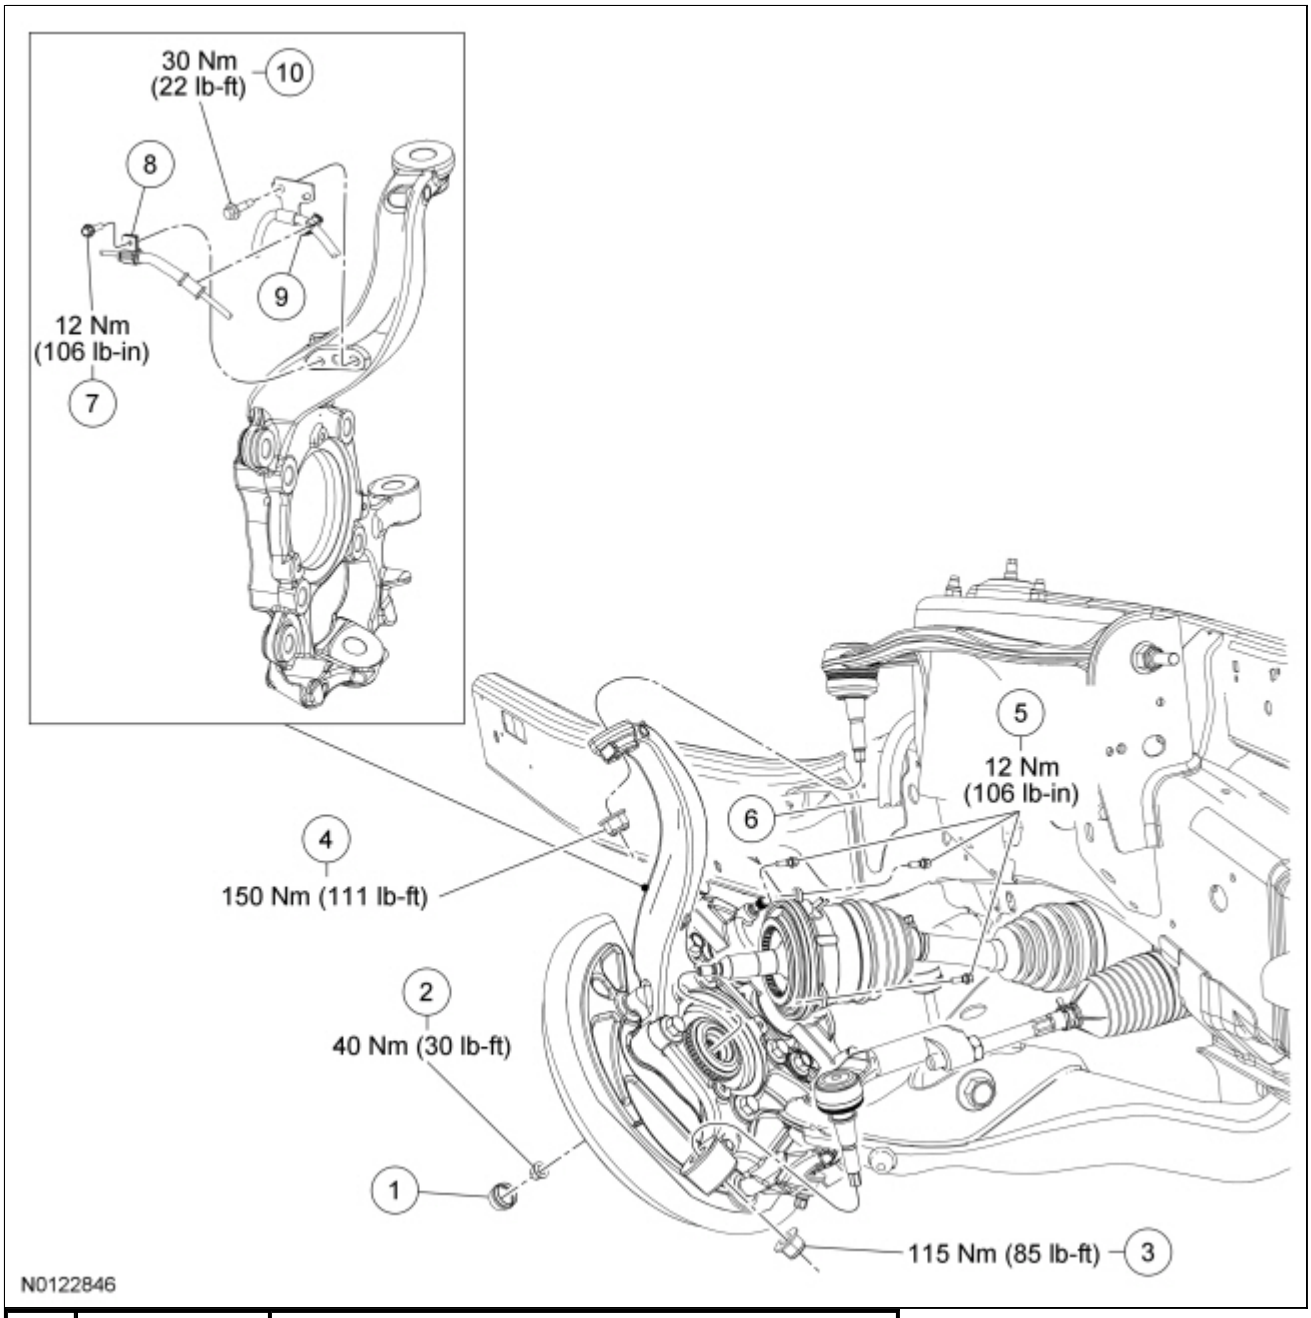
Halfshaft Handling

Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures.

- Never pick up or hold the halfshaft only by the inboard or outboard CV joint.
- Do not overangle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts from the hub.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only.
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.
- Do not remove the outer CV joint by pulling on the interconnecting shaft.
- Inspect all machined surfaces and splines for damage.

repair4less

Front Drive Halfshafts



Refer to Section 205-00 .

2	N802827-S100	Wheel hub nut
3	W520215	Tie-rod end nut
4	W520215	Upper ball joint nut
5	W505211	Integrated Wheel End (IWE) bolts (3 required)
6	—	Vacuum vent and apply tube
7	—	Wheel speed sensor harness bracket bolt
8	—	Wheel speed sensor harness bracket (part of 2C204)

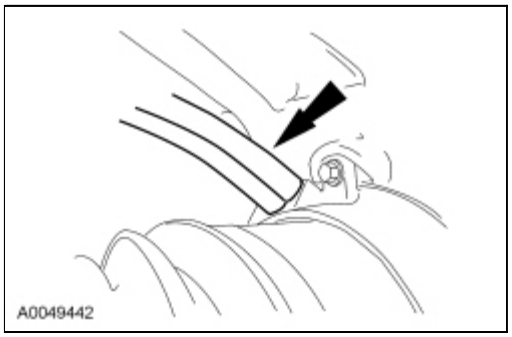
9	—	Brake flexible hose retainer (part of 2078)
10	W611633	Brake flexible hose bracket bolt

Removal and Installation

NOTICE: **Whenever a halfshaft is removed, install a new circlip and stub shaft pilot bearing seal or damage to the component may occur.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the dust cap.



3. Remove and discard the wheel hub nut.
   - To install, tighten the new wheel hub nut to 40 Nm (30 lb-ft).

4. Remove the wheel speed sensor harness bracket bolt and position the wheel speed sensor harness aside.
   - To install, tighten to 12 Nm (106 lb-in).

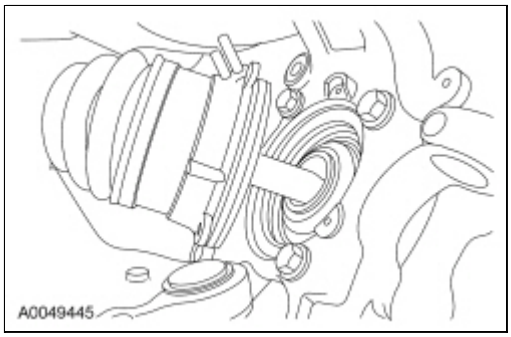
5. Detach the brake flexible hose retainer from the wheel speed sensor harness.

6. Remove the brake flexible hose bracket bolt and disconnect the brake flexible hose bracket from the wheel knuckle.
   - To install, tighten to 30 Nm (22 lb-ft).

7. Remove the vacuum vent and apply tube at the vacuum vent and apply tube port of the Integrated Wheel End (IWE) disconnect.

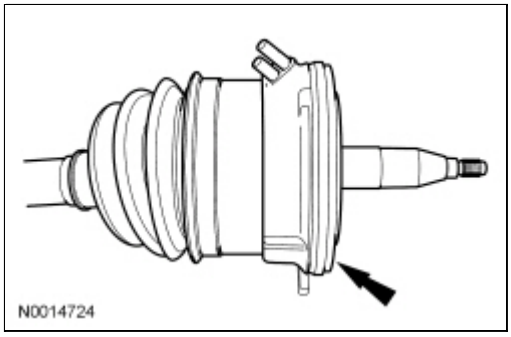
8. Remove the 3 IWE bolts.
   - To install, tighten to 12 Nm (106 lb-in).

9. Remove and discard the tie-rod end nut.
   - Disconnect the tie-rod end from the wheel knuckle.
   - To install, tighten the new tie-rod end nut to 115 Nm (85 lb-ft).



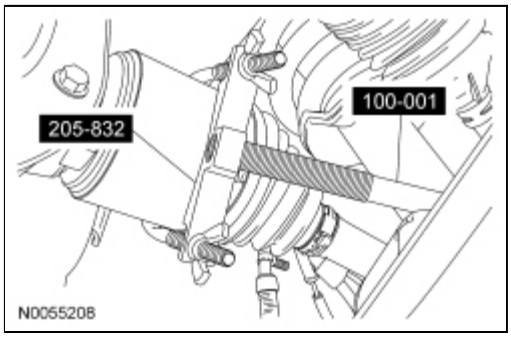
10. Remove and discard the upper ball joint nut.
    - Disconnect the upper ball joint from the wheel knuckle.
    - To install, tighten the new upper ball joint nut to 150 Nm (111 lb-ft).

11. **NOTE:** Do not damage the hub seal.



repair4less

NOTE: Allow the steering knuckle to swing outboard while keeping the CV shaft pushed inboard.



Once clearance is available, remove the CV shaft joint outboard end and IWE disconnect from the steering knuckle hub bearing.

12. Remove the IWE disconnect from the outboard CV joint housing.

13. Using the Halfshaft Remover and Slide Hammer, remove the halfshaft from the differential and the intermediate shaft.

14. Remove and discard the circlip and the stub shaft seal. For additional information, refer to Section 205-03 .

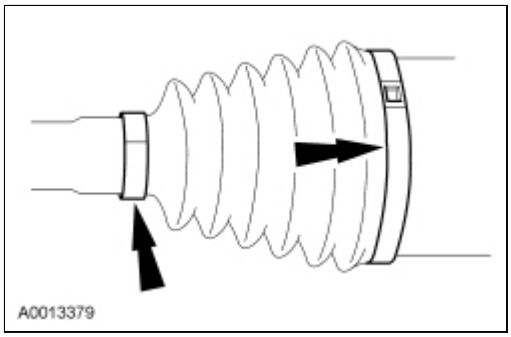
15. ***NOTICE:*** **Verify the spline engagement by checking for spline lash before installing the halfshaft nut or component damage may occur.**

    To install, reverse the removal procedure.

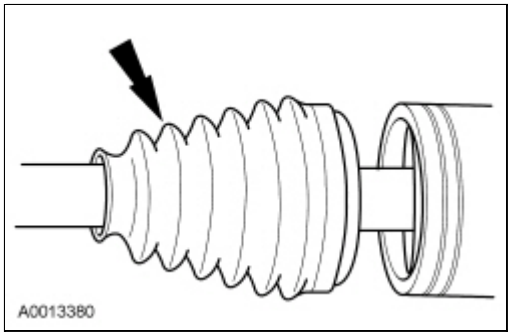
repair4less

Halfshaft

Material

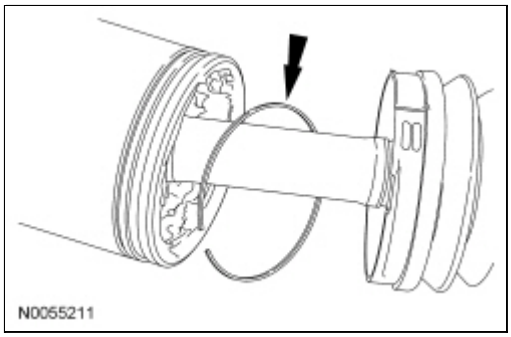


Item	Specification
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1



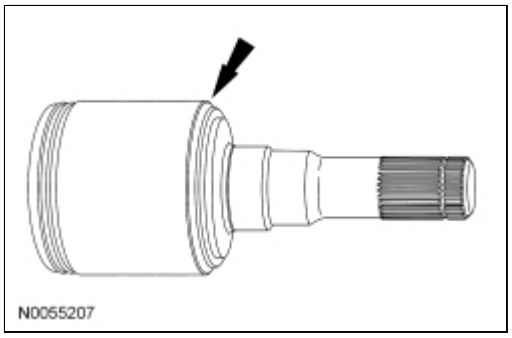
Item	Part Number	Description
1	3B436B	Outboard CV joint and interconnecting shaft assembly
2	3A331A	Outboard CV boot
3	3A331B	Inboard CV boot
4	4B422	Snap ring
5	3B414	Inboard CV joint housing
6	—	Inner race (part of 3B436 RH/ 3B437 LH)
7	—	Ball (8 required) (part of 3B436 RH/ 3B437 LH)
8	—	Ball cage (part of 3B436 RH/ 3B437 LH)
9	3B426	Retaining ring (part of 3B436 RH/ 3B437 LH)

Disassembly

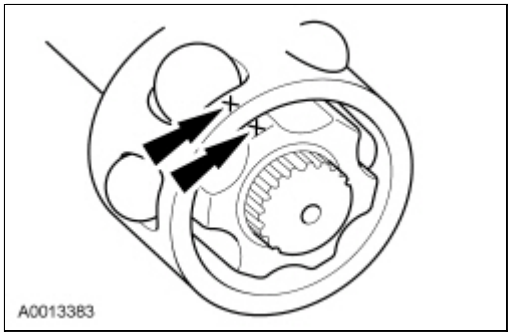


1. Remove the halfshaft from the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.
2. Remove the 2 boot clamps.

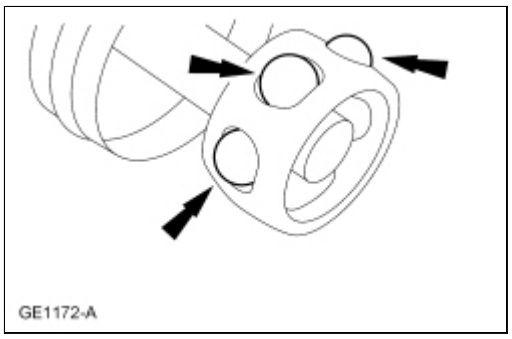
3. Separate the boot from the inboard CV joint housing.



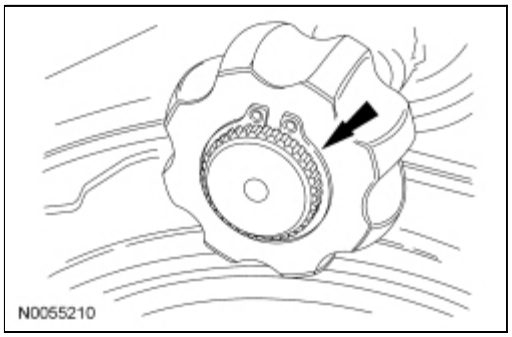
4. Remove the retaining ring.



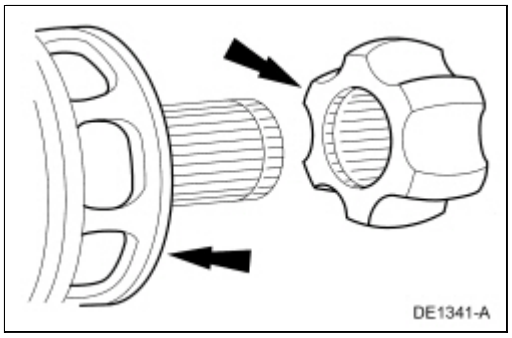
5. Remove the inboard CV joint housing.



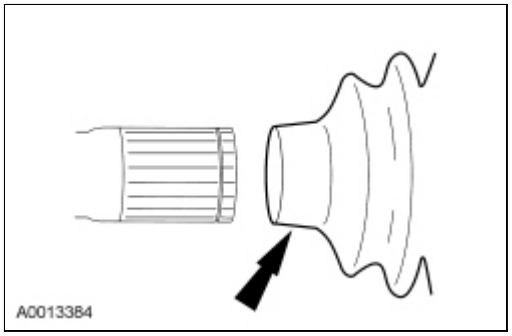
repair4less



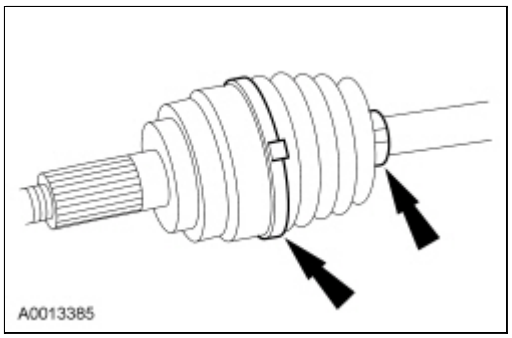
6. Index-mark the inner race and ball cage.



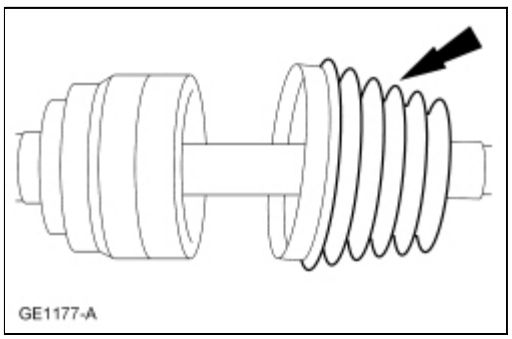
7. Remove the 6 balls.



8. Remove the snap ring.



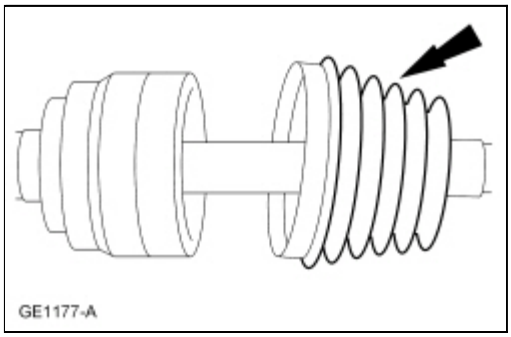
9. Remove the inner race and the ball cage.



10. Remove the inboard boot.

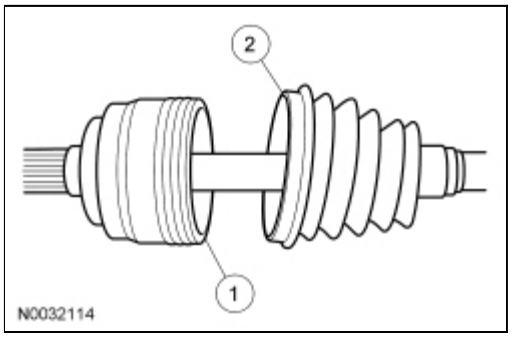
11. Remove the 2 boot clamps.

12. Remove the outboard boot.



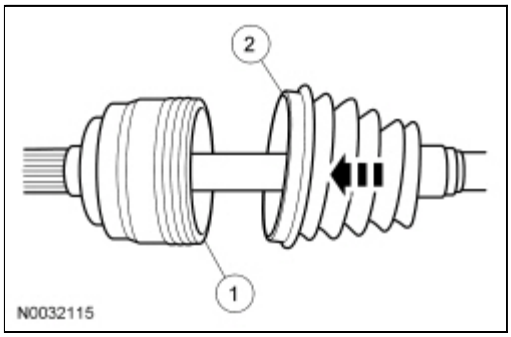
13. **NOTE:** If the grease is contaminated, clean and inspect the joint for wear. Install a new outboard CV joint and interconnecting shaft assembly if worn/damaged.

    Check the CV joint grease for contamination.

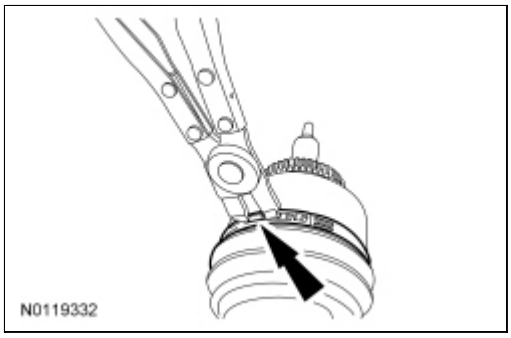


repair4less

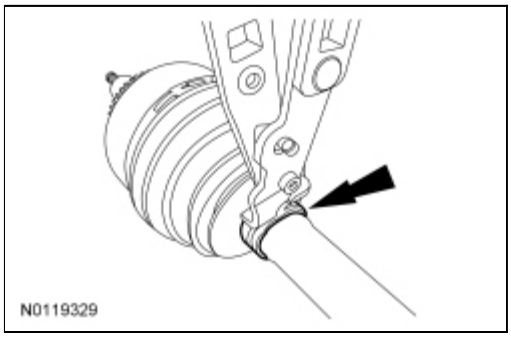
Assembly



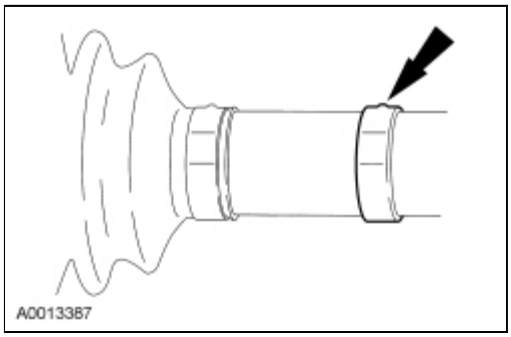
1. Position the outboard boot on the shaft.



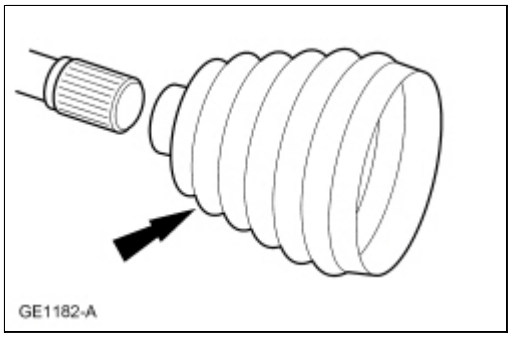
2. Pack the outboard CV joint with 165 g (5.82 oz) of grease.
    1. Use CV joint grease or equivalent provided in the boot kit.
    2. Spread any remaining grease from the kit evenly inside the boot.



3. Install the outboard boot.
    1. Clean the boot mounting surface.
    2. Seat the boot in the joint boot groove.

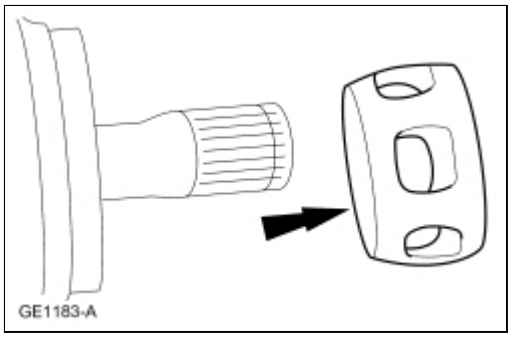


4. Using a suitable boot clamp installer (such as Snap-On® stock #YA3050 or equivalent) install the large boot clamp.

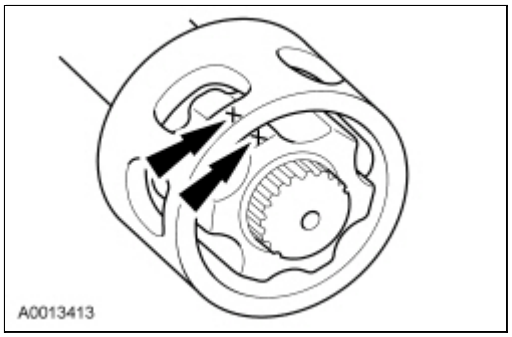


5. Using a suitable boot clamp installer (such as Snap-On® stock #YA3080 or equivalent) install the small boot clamp.

6. Position the boot clamp on the shaft.

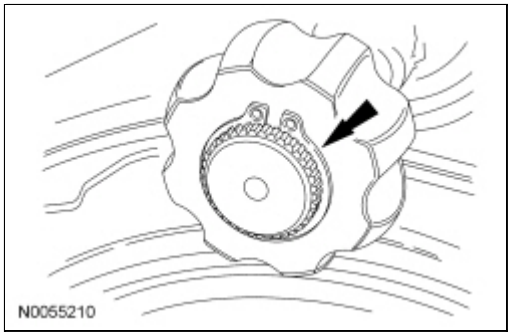


7. Position the inboard boot on the shaft.



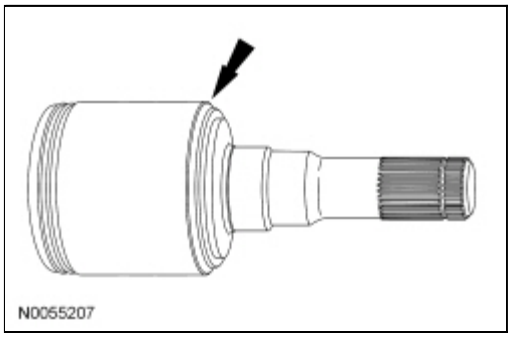
8. Position the ball cage on the shaft with the tapered end facing the boot.

repair4less

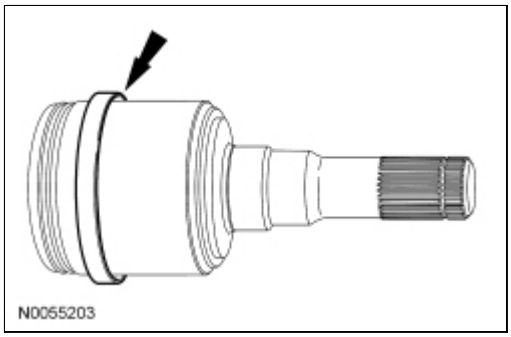


9. **NOTE:** Align the index marks.

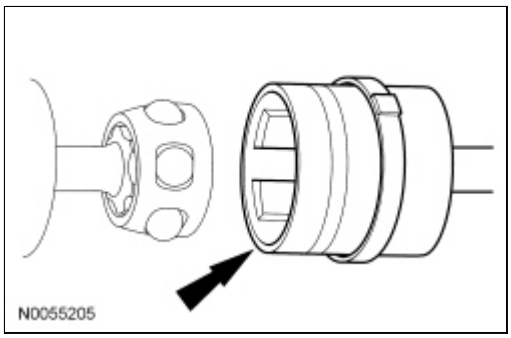
   Position the inner race on the shaft with the counterbored end facing the boot.



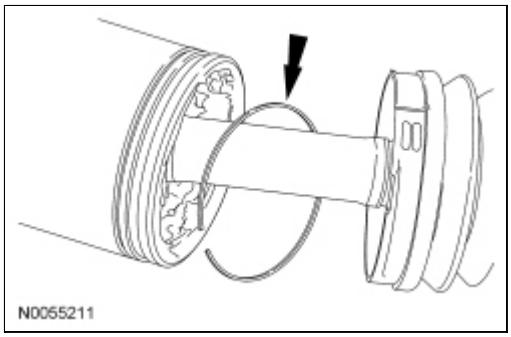
10. Install the snap ring.



11. Lubricate and position the 6 balls.
    - Use CV joint grease or equivalent provided in the boot kit.

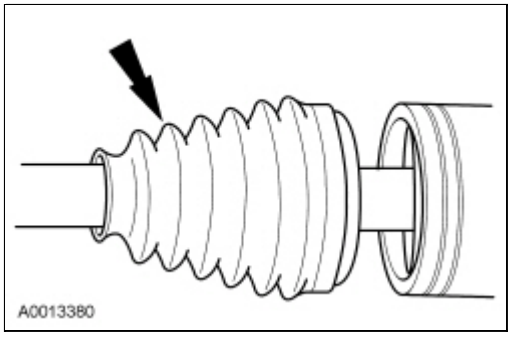


12. Fill the inboard CV joint housing with 235 g (8.29 oz) of grease.
    - Use CV joint grease or equivalent provided in the boot kit.

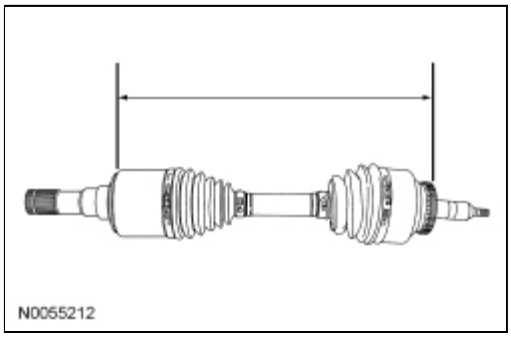


13. Position the boot clamp on the inboard CV joint housing.

14. Position the inboard CV joint housing on the ball and race assembly.

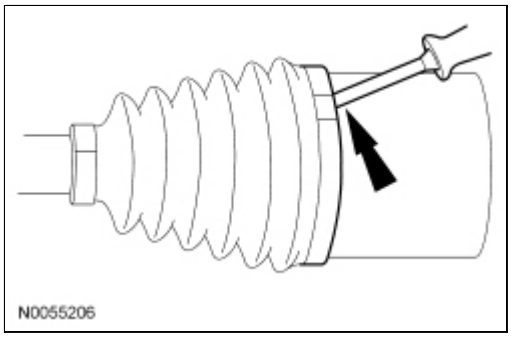


15. Install the retaining ring.

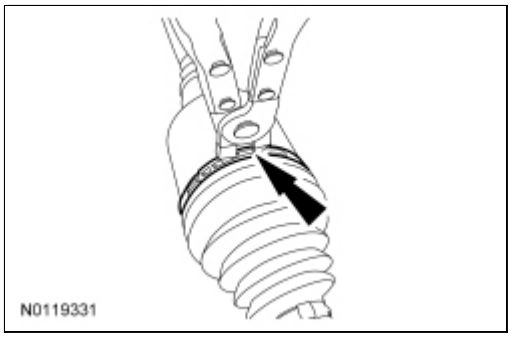


repair4less

16. Remove any excess grease from the mating surface. Seat the boot in the joint boot groove.



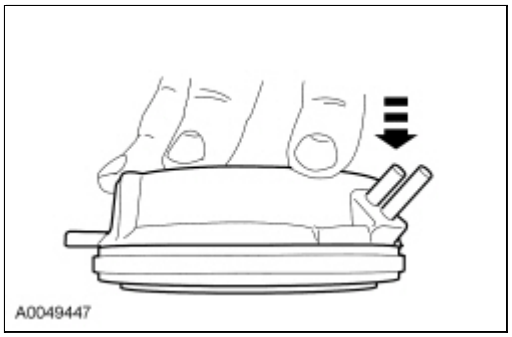
17. Set the halfshaft assembled length to specification. For additional information, refer to Specifications in this section.



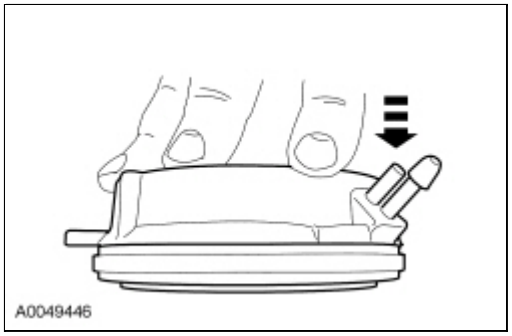
18. ***NOTICE:*** **Use care when inserting the screwdriver or damage to the boot may occur.**

    Insert a dull screwdriver blade under the boot to release the pressure.

19. Using a suitable boot clamp installer (such as Snap-On® stock #YA3050 or equivalent) install the large boot clamp.

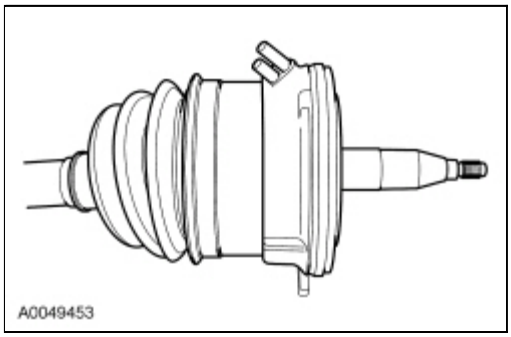


20. Using a suitable boot clamp installer (such as Snap-On® stock #YA3080 or equivalent) install the small boot clamp.



21. **NOTE:** Maintain a clean work surface.

    Compress the Integrated Wheel End (IWE) disconnect on the bench to collapse the vacuum chamber.



22. While the IWE disconnect is collapsed, install a vacuum cap on the vacuum port.

repair4less

23. ***NOTICE:*** **Do not install the Integrated Wheel End (IWE) end disconnect in the knuckle. It must be installed on the outer Constant Velocity (CV) joint housing or damage to the component may occur.**

    Install the IWE disconnect on the outer CV joint housing.

24. ***NOTICE:*** **Verify the spline engagement by checking for spline lash before installing the halfshaft nut or damage to the component may occur.**

    Install the halfshaft in the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.

Brake System

The brake system consists of the following components:

- Front and rear disc brakes
- Cable/drum-in-hat actuated parking brake
- Brake master cylinder and fluid reservoir
- Vacuum-assisted power brake booster
- Four-wheel ABS
- Red brake warning indicator

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the double-walled steel tubes and flexible hoses to the front and rear disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear disc brake caliper pistons and brake pads to the unapplied position.

For information on the following:

- Front disc brakes, refer to Section 206-03 .
- Rear disc brakes, refer to Section 206-04 .
- Parking brake actuation, refer to Section 206-05 .
- Hydraulic brake actuation, refer to Section 206-06 .
- Vacuum-assisted power brake booster, refer to Section 206-07 .
- ABS, refer to Section 206-09 .

repair4less

Component Tests

Brake Booster

1. Disconnect the brake booster vacuum sensor/check valve from the brake booster and connect a suitable vacuum/pressure tester to the booster side of the vacuum sensor/check valve.

2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
   - Allow the engine to reach normal operating temperature.

3. **NOTE:** Subtract approximately 3.38 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

   Verify that vacuum is available at the vacuum sensor/check valve with engine running at normal idle speed.
   - The vacuum gauge should read between 51-74 kPa (15-22 in-Hg).
   - If specified vacuum is available, stop the engine, connect the vacuum sensor/check valve and continue with Step 5.
   - If specified vacuum is not available, continue with Step 4.

4. Disconnect the vacuum sensor/check valve from the vacuum hose and verify that the specified vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If specified vacuum is available, stop the engine, install a new vacuum sensor/check valve and continue with Step 5.
   - If specified vacuum is not available, stop the engine, connect the vacuum hose to the vacuum sensor/check valve and refer to Section 303-00 to diagnose the no/low vacuum condition.
   - On vehicles equipped with a brake vacuum pump, if specified vacuum is not available, inspect the vacuum hose and install new as necessary. If vacuum hose is OK, install a new brake vacuum pump. Refer to Section 206-07 .

5. Apply the brake pedal several times to exhaust all vacuum from the system.

6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly.
   - If the brake pedal does not move, install a new brake booster. Refer to Section 206-07 .

7. Operate the engine a minimum of 20 seconds at idle. Stop the engine and let the vehicle stand for 10 minutes, then apply the brake pedal. The brake pedal feel should be the same as that noted with the engine operating.
   - If the brake pedal feels hard (no power assist), install a new brake booster vacuum sensor/check valve and retest.
   - If condition still exists, install a new brake booster. Refer to Section 206-07 .
   - If the brake pedal feels the same as noted with the engine operating, the vacuum sensor/check valve is functioning properly.

repair4less

Brake Master Cylinder — Bypass Condition

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. Disconnect the brake tubes from the master cylinder.

3. Plug the outlet ports of the master cylinder.

4. **NOTE:** Make sure that the outlet port plugs do not show signs of leakage.

   Lightly apply the brakes and hold for 10 seconds. Release the brakes and then reapply with heavy force. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.
   - If brake pedal height is maintained, reinstall brake tubes and tighten to specifications. Refer to Specifications in this section. After installation, bleed the brake system. Refer to Brake System Bleeding in this section.

Brake Master Cylinder — Compensator Port

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

3. Apply and release the brakes.

4. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at multiple wheels, continue to Step 5.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.

5. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied.

6. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.

7. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to Section 206-07 .
   - If the brake drag is still present, install a new master cylinder. Refer to Section 206-06 .

repair4less

Inspection And Verification

Material

Item	Specification
Motorcraft® High Performance DOT 3 Motor Vehicle Brake Fluid (US) / Motorcraft® Brake Fluid - Heavy Duty DOT 3 (Canada) PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Blistering or swelling of rubber brake components can indicate contamination of the brake fluid by a petroleum-based substance. The entire hydraulic brake system must be flushed with clean, specified brake fluid and contaminated rubber components must be replaced to prevent recontamination.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the Instrument Cluster (IC) and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. If multiple wheels are locked, check the brake pedal free play to verify brake pedal is not partially applied. These operations may release the brakes, but will not correct the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

1. Verify the customer concern.
   - For parking brake concerns, refer to Section 206-05 .
   - For ABS concerns, refer to Section 206-09 .
   - For adjustable pedal concerns, refer to Section 206-06 .
   - For all other concerns, continue with the next step.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Brake fluid level and condition • Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper, guide pins and anchor plate • Brake disc • Brake pads • Brake pedal, bracket and booster linkage • Aftermarket modifications	• Parking brake switch • Brake fluid level switch • Wiring, terminals or connectors

3. Visually inspect the suspension system and tires for obvious signs of wear or damage.
    - For suspension system concerns, refer to Section 204-00 .
    - For tire concerns, refer to Section 204-04 .

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, GO to Symptom Chart - Brake System or GO to Symptom Chart - NVH in this section.

---

repair4less

Pinpoint Tests

Pinpoint Test A: Vibration When the Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the Hydraulic Control Unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble when the brakes are applied (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE — LIGHT BRAKING	
• Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4. **No** GO to A2.
A2 ROAD TEST THE VEHICLE — MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to A3. **No** The concern is not present at this time.
A3 CHECK ABS OPERATION	
• **NOTE:** During moderate to heavy braking, noise from the HCU and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct operation of the ABS. Pedal pulsation or steering wheel nibble with the frequency proportional to vehicle speed indicates a concern with a brake or suspension component. • Road test the vehicle and apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel). • **Is the vibration/shudder only present on a wet, snowy or loose surface?**	**Yes** This is a normal operating condition of the ABS. **No** GO to A5.
A4 ISOLATE BRAKE VIBRATION	
• **NOTE:** This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed	**Yes** GO to A7.

to the next test step. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. • Apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	**No** GO to A5.
A5 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-00. • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A6. **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT BRAKE DISCS	
• Inspect the front brake discs. Refer to Brake System Inspection in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to A7. **No** The concern has been repaired.
A7 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-00. • **Are all the suspension components in satisfactory condition?**	**Yes** INSPECT the rear brake discs. REFER to Brake System Inspection in this section. **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

repair4less

Principles of Operation

Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster, which through the use of vacuum, boosts the force of the rod and then transmits this force to the primary piston in the master cylinder. This produces hydraulic pressure in the master cylinder. This pressure builds in the master cylinder and brake tubes as the brake pedal is applied further. The pressure between the primary and secondary piston forces the secondary piston to compress, building pressure in its circuit. The hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS Hydraulic Control Unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop, depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Brake Master Cylinder Compensator Ports

The purpose of the compensator ports in the brake master cylinder is to supply additional brake fluid from the master cylinder reservoir when needed by the brake system due to brake lining wear and allow brake fluid to return to the master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The Instrument Cluster (IC) performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the ABS (if the yellow ABS warning indicator is also illuminated). To diagnose red brake warning indicator concerns, refer to Section 413-01.

repair4less

Symptom Chart

Symptom Chart — Brake System

Symptom Chart — Brake System

Condition	Possible Sources	Action
• The red brake warning indicator and the yellow ABS warning indicator are illuminated	• DTCs in the ABS module	• REFER to Section 206-09 to diagnose the ABS.
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors • Instrument Cluster (IC) • Smart Junction Box (SJB) • Vacuum sensor • Electronic Brake Distribution (EBD)	• REFER to Section 413-01 to diagnose the red brake warning indicator.
• Vehicle pulls or drifts during braking	• Tires • Brake calipers and/or guide pins • Brake flexible hose • Brake pads • Brake discs • Suspension component(s) and/or wheel alignment	• REFER to Section 204-04 to diagnose tire concerns. • INSPECT the brake system components. REFER to Brake System Inspection in this section. • REFER to Section 204-00 to diagnose suspension system.
• Brake pedal goes down fast or eases down slowly	• Brake fluid leaks and/or air in the system • Brake master cylinder • Hydraulic Control Unit (HCU)	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section. • CARRY OUT the Brake Master Cylinder — Bypass Condition Component Test in this section. • REFER to Section 206-09 to diagnose the HCU .
• Brakes lock up	• Brake pads	• INSPECT the brake system

repair4less

under light brake pedal force	• Brake flexible hose • Brake disc • Brake calipers and/or guide pins	components. REFER to Brake System Inspection in this section.
	• ABS	• REFER to Section 206-09 to diagnose the ABS.
• Excessive brake pedal travel (low/spongy pedal)	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to Brake System Bleeding in this section.
	• Brake master cylinder	• CARRY OUT the Brake Master Cylinder — Bypass Condition Component Test in this section.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins. REFER to Brake System Inspection in this section.
	• Brake flexible hose	• INSPECT the brake flexible hoses during brake application. REFER to Brake System Inspection in this section.
	• HCU	• REFER to Section 206-09 to diagnose the HCU.
• Erratic brake pedal travel	• Brake pedal	• INSPECT the brake pedal for binding, obstructions and correct connection to booster rod. REPAIR as necessary. CHECK the brake pedal fasteners for correct torque. REFER to Specifications in Section 206-06.
	• ABS	• REFER to Section 206-09 to diagnose the ABS.
• Brakes drag	• Stoplamp switch	• VERIFY correct installation of the stoplamp switch. REFER to Section 417-01.
	• Parking brake component	• REFER to Section 206-05 to diagnose the parking brake system.
	• Brake caliper and/or guide pins	• INSPECT the brake caliper and guide pins. REFER to Brake System Inspection in this section.
	• Brake booster/Master cylinder	• CARRY OUT the Brake Master Cylinder — Compensator Port Component Test in this section.
	• HCU	• REFER to Section 206-09 to diagnose the HCU.
• Excessive brake pedal effort	• Insufficient engine vacuum for brake booster operation • Brake booster manifold vacuum hose • Brake booster	• CARRY OUT the Brake Booster Component Test in this section. • If any DTCs are retrieved for the brake vacuum pump, resolve them first before attempting any base brake repairs.

	• Brake booster vacuum sensor/check valve • Brake vacuum pump • Brake pads	• INSPECT the brake pads. REFER to Brake System Inspection in this section.

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration when the brakes are applied	• Brake disc(s) • Suspension components	• GO to Pinpoint Test A .
• Brake vibration/shudder — occurs when the brake pedal is released	• Brake drag	• GO to Symptom Chart - Brake System .
• Rear brake noise — occurs when the brake pedal is unapplied	• Parking brake component	• INSPECT the parking brake components. REFER to Section 206-05 .
• Rattling noise	• Caliper guide pins or guide pin bolts • Missing or damaged anti-rattle clips or springs • Loose brake disc shield	• CHECK the caliper guide pins and guide pin bolts. REFER to Brake System Inspection in this section. • CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes. • TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Squealing noise — occurs on first (morning) brake application	• Brake pads	• Acceptable condition. Caused by humidity and low brake pad temperature.
• Squealing noise — a	• Brake pads	• INSPECT the brake pads.

repair4less

continuous squeal		REFER to Brake System Inspection in this section.
• Squealing noise — an intermittent squeal	• Brake pads	• Acceptable condition. Caused by cold, heat, water, mud or snow.
• Groaning noise — occurs at low speeds with brake lightly applied (creeping)	• Brake pads	• Acceptable condition.
• Grinding/moaning noise — continuous	• Brake pads • Brake disc	• INSPECT the brake pads, brake discs and attaching hardware. VERIFY brake components are within specifications. REFER to Brake System Inspection in this section.

Brake Disc Machining

NOTE: Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification and a runout measurement is not necessary after machining.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specification.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper to hang from the brake hose or damage to the hose may occur.**

   Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.
   - Support the brake caliper using mechanic's wire.

3. Install the hub adapter using:
   - four wheel nuts on a 4-stud wheel hub.
   - five wheel nuts on a 5-stud wheel hub.
   - six wheel nuts on a 6-stud wheel hub.
   - four wheel nuts on a 7- or 8-stud wheel hub.
   - five wheel nuts on a 10-stud wheel hub.

4. Install the cutting lathe.

5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).

6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

7. **NOTE:** The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

   Machine the brake disc.

8. Remove the lathe and the silencer.

9. Remove the wheel nuts and hub adapter.

10. Remove the metal shavings.

repair4less

11. Measure the brake disc thickness.
    - If the measurement is below the minimum specification, install a new brake disc. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

12. **NOTE:** It is not required to install new brake pads if friction material is within specifications. For additional information, refer to Specifications in this section.

    Position the brake caliper or brake caliper and anchor plate assembly.
    - Install the bolts.
    - For fastener torque specifications, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

13. Install the wheel and tire. For additional information, refer to Section 204-04 .

Brake System Bleeding

General Equipment

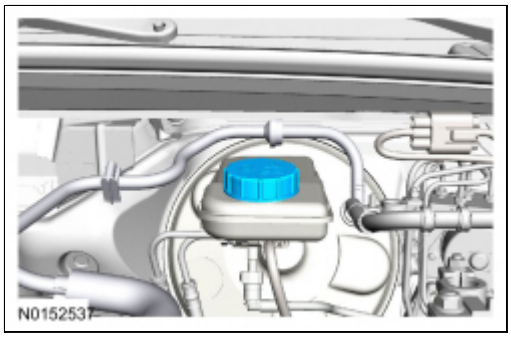
Brake/Clutch System Pressure Bleeder/Filler
Fluid Container and Hose

Pressure

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

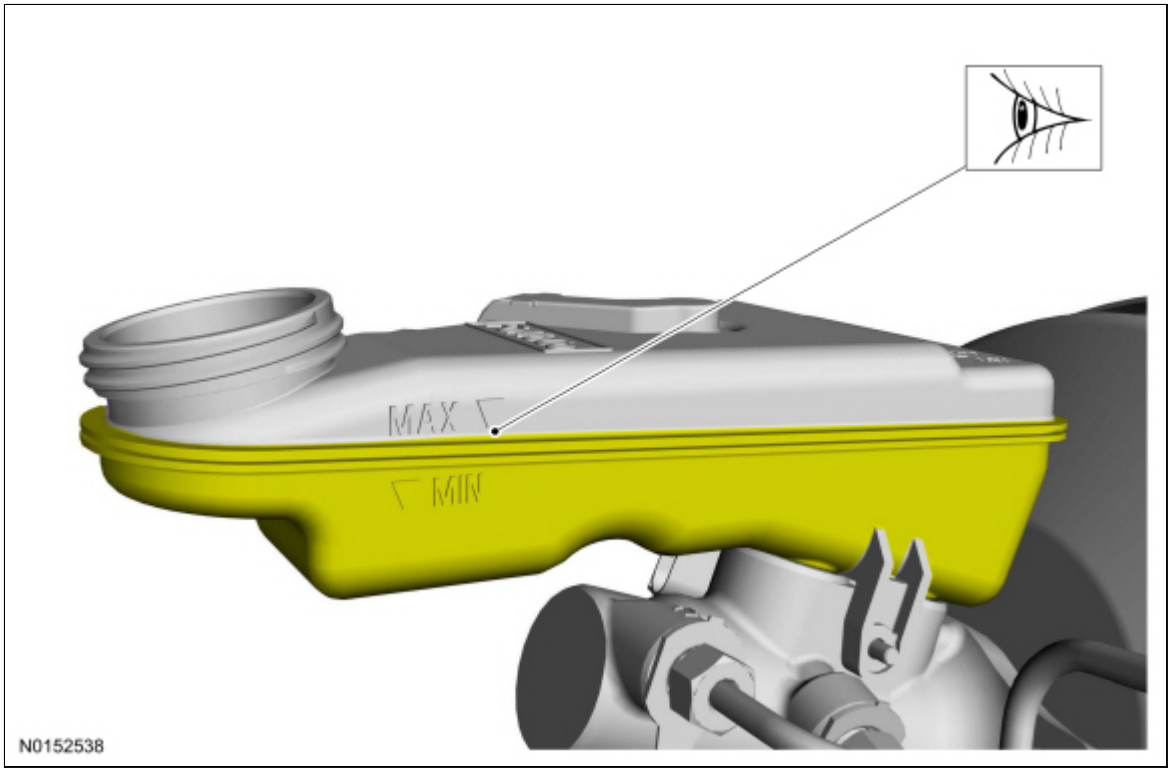
WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.



***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

NOTE: The HCU bleeding procedure must be carried out if a new HCU has been installed.



All Vehicles

1. **NOTE:** Make sure the area around the master cylinder cap is clean and free of foriegn material.

repair4less

2. Fill the reservoir with clean, specified brake fluid. Refer to Specifications in this section.

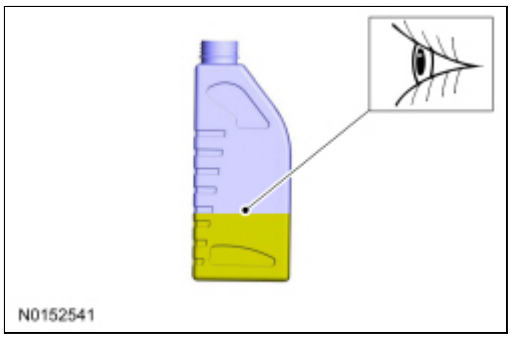
3. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

4. **NOTE:** Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation. Refer to Specifications in this section.

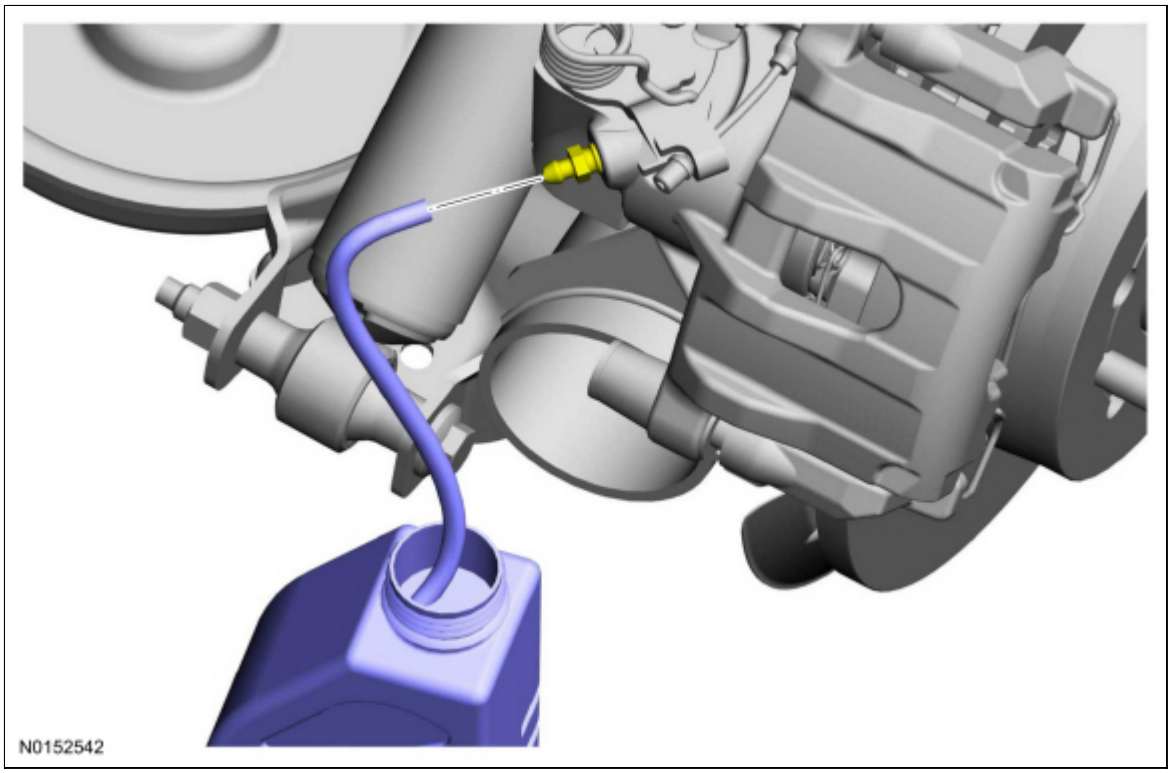
   Open the valve on the bleeder tank.
   - Apply 207-345 kPa (30-50 psi) to the brake system.

5. With the vehicle in NEUTRAL, position it on a hoist. Section 100-02 .

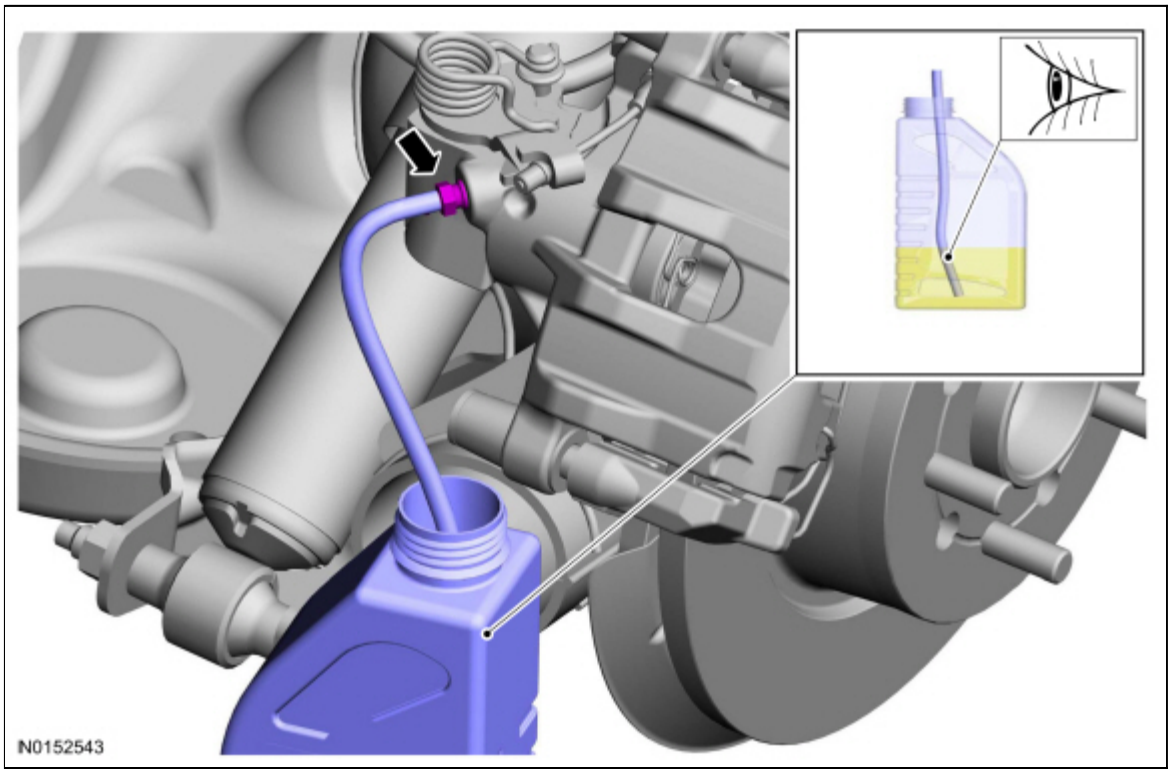


6. Bleeding steps must be followed in the order indicated in the graphic.

7.

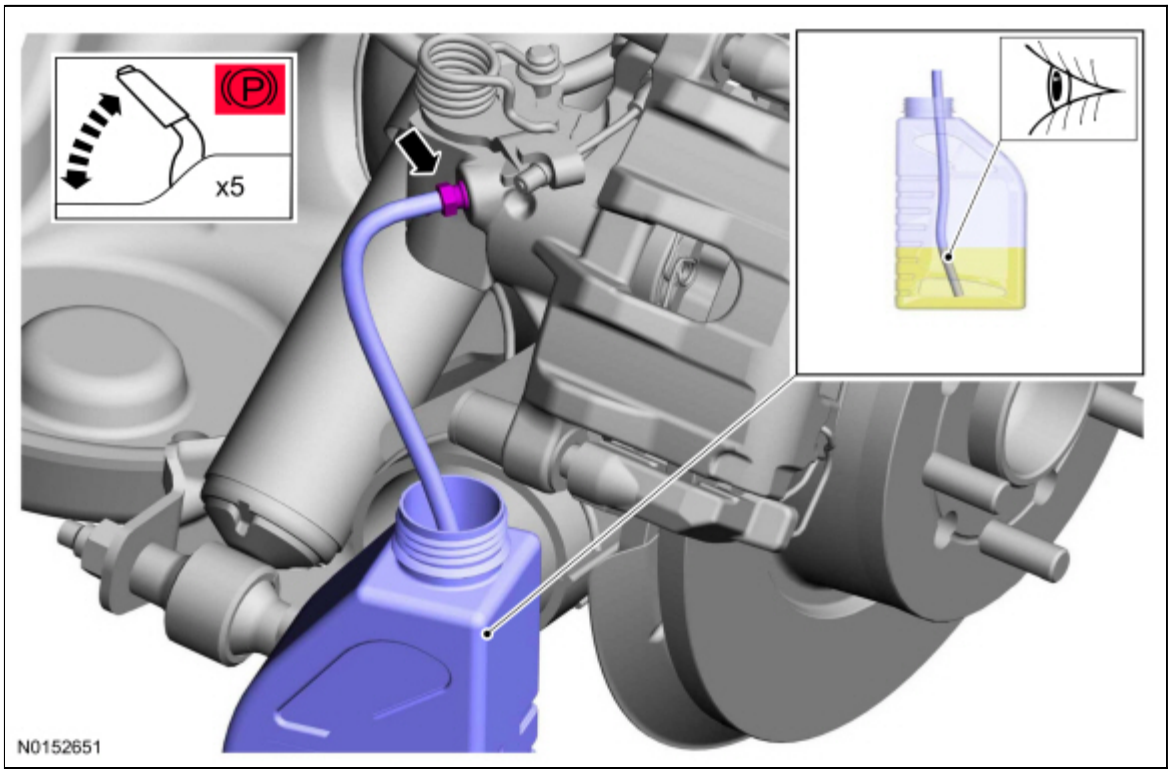


8.



9.

repair4less

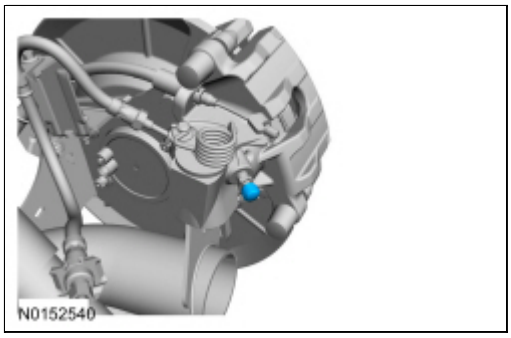


10. Loosen the bleeder screw 180° and leave open until clear bubble free brake fluid flows and then tighten the bleeder screw.

Vehicles with rear integral parking brake calipers

11. **NOTE:** Due to the complexity of the fluid path within the rear integral parking brake calipers, it is necessary to press and release the parking brake during the bleed procedure.

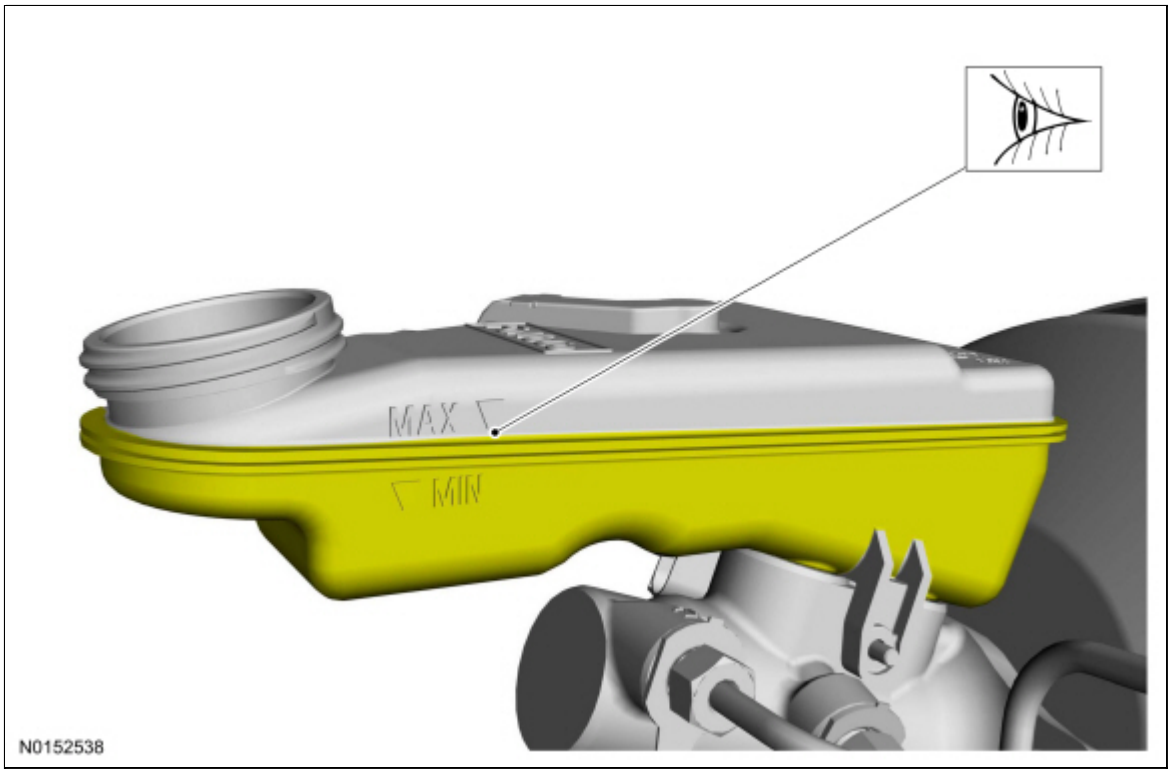
    Apply and release the parking brake 5 times. Loosen the rear bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the rear bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.



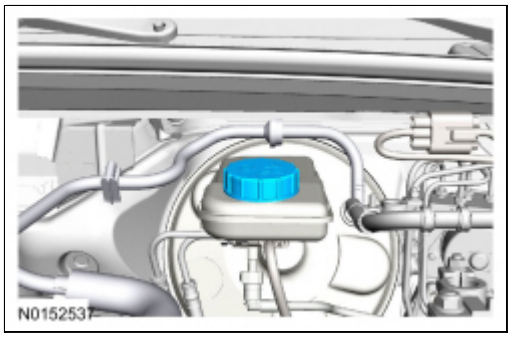
All vehicles

12. Tighten the bleeder screw to specification. Refer to Specifications in this section.
    - Remove the fluid container and hose.

repair4less



13.



14. Repeat steps 7-13 at the remaining wheel ends.

15. Close the bleeder tank valve and release the pressure. Remove the tank hose from the adapter and remove the adapter.

16. Fill the reservoir with clean, specified brake fluid. Refer to Specifications in this section.

17.

Hydraulic Control Unit (HCU) Bleeding

NOTE: The HCU bleeding procedure must be carried out if a new HCU has been installed.

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Follow the pressure bleeding or manual bleeding procedure steps to bleed the system.
2. Connect the diagnostic scan tool and follow the ABS Service Bleed instructions.
3. Repeat the pressure bleeding or manual bleeding procedure steps to bleed the system.

repair4less

Brake System Inspection

Material

Item	Specification
Motorcraft® Metal Brake Parts Cleaner (US) / Motorcraft® Brake Parts Cleaner (Canada) PM-4-A or PM-4-B (US); CPM-4 (Canada)	—
Motorcraft® Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Brake Pads

NOTE: It is not required to install new brake pads when the brake discs are machined.

1. Inspect the brake pad friction material for contamination.
   - If the friction material shows evidence of contamination, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.

2. Inspect and measure the thickness of the brake pad friction material. For additional information, refer to Specifications in this section.
   - Minor surface cracks do not require pad replacement, however, if there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the thickness of the friction material is less than the specified thickness, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the friction material shows taper wear that is not within specifications, install new brake pads and verify the caliper guide pins are functioning correctly. For additional information, refer to Brake Caliper Guide Pins inspection.

Brake Discs

NOTICE: **Using an impact tool without a torque socket will lead to unevenly tightened wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.**

1. Inspect the brake discs and measure the brake disc thickness. Record the measurement. Refer to Specifications in this section.
   - If the brake disc is cracked or otherwise damaged, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.
   - If the measurement is below the minimum thickness specification, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.

repair4less

- If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. For additional information, refer to Specifications and Brake Disc Machining in this section.

Brake Calipers

1. Inspect the brake calipers for leaks, damage to seals and piston corrosion or binding.
    - If the brake caliper is leaking or otherwise damaged, install a new brake caliper. For additional information, refer to Section 206-03 for front brake calipers or Section 206-04 for rear brake calipers.

Brake Caliper Guide Pins

1. The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, carry out the following steps.
    - Disassemble the brake caliper guide pins and inspect the guide pins and guide pin bores for wear, damage and corrosion. If the bore is worn or damaged, replace the damaged component.
    - Use a wire brush, rolled-up sandpaper or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean any remaining foreign material from the bores with brake parts cleaner and compressed air.
    - Assemble the caliper seals, boots and guide pins. Use an ample amount of the specified grease to lubricate the bores and guide pins.
    - Inspect the brake pads. For additional information, refer to Brake Pads inspection in this section.

Brake Flexible Hoses and Tubes

NOTICE: **Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.**

NOTE: Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.

1. Inspect brake tubes for corrosion, cracks, leaks or any other signs of damage.
    - If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
    - When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

2. Inspect the brake flexible hoses for cracks, leaks and swelling during brake application or any other signs of damage.
    - Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage. For additional information, refer to Section 206-03 for the front brake flexible hose or Section 206-04 for the rear brake flexible hose.

Brake Master Cylinder

NOTE: During normal operation of the brake master cylinder, the returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release. The net fluid level (such as after brake application and release) will remain unchanged. Fluid level will decrease with pad wear.

NOTE: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

1. Inspect the brake master cylinder for fluid leaks.
    - Install a new master cylinder or brake fluid reservoir if signs of excessive leaking are present. For additional information, refer to Section 206-06 .
    - To check for correct brake master cylinder operation, refer to Component Tests in this section.

Brake Booster

1. Inspect the brake booster for excessive corrosion or damage. Inspect the vacuum hoses for leaks and kinks.
    - Install a new brake booster if signs of excessive corrosion or damage is found. For additional information, refer to Section 206-07 .
    - Repair or replace vacuum hoses as necessary.
    - To check for correct brake booster operation, refer to Component Tests in this section.

Front Disc Brake

The front brake disc system consists of the following components:

- Brake pads
- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake disc shield
- Brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.

Front Disc Brake

Refer to Section 206-00 .

1. To install, reverse the removal procedure.
    - Bleed the brake caliper. For additional information, refer to Component Bleeding in Section 206-00 .

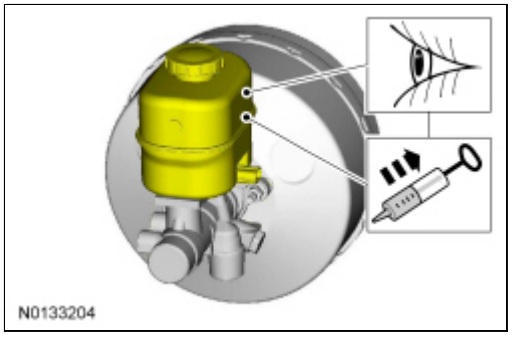
Brake Pads

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Removal

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.



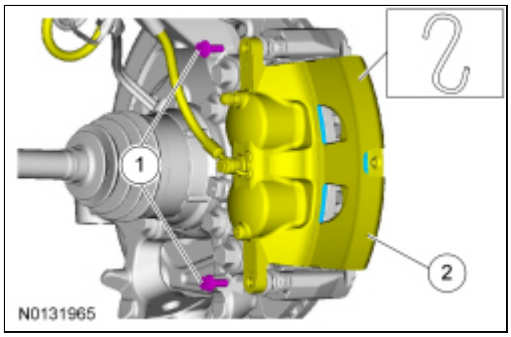
WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

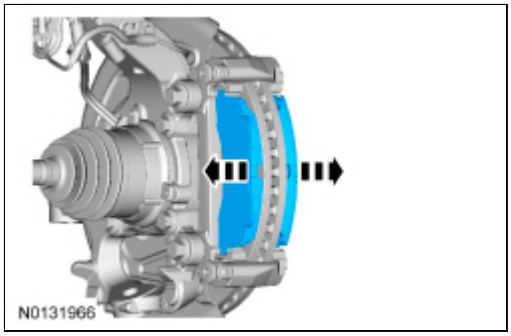
***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Removal steps in this procedure may contain installation details.

1. Visual check. Extract the fluid with a syringe.
   If necessary, remove fluid until the brake master cylinder reservoir is half full.



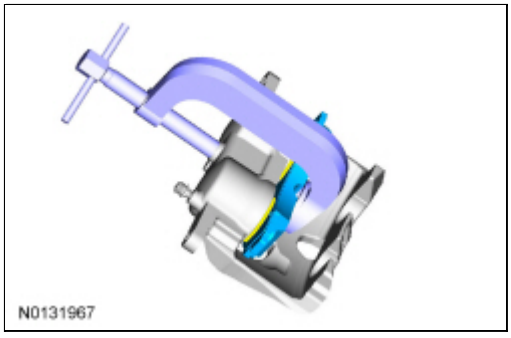
2. Remove the wheel and tire. For additional information, refer to Section 204-04 .



repair4less

3. ***NOTICE:*** **Do not allow the caliper to hang from the brake hose or damage to the hose can occur.**

   Relocate and support the component.
   - To install, tighten to 37 Nm (27 lb-ft).



4.

5. **NOTE:** Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to the piston or boots may occur.

   If installing new brake pads, Use a C-clamp and a worn brake pad to compress the disc brake caliper pistons into the brake caliper bore.

Installation

NOTE: If installing new brake pads, make sure to install all new hardware and specified lubricant supplied with the brake pad kit. Refer to the brake pad instruction sheet when applying lubricant.

1. To install, reverse the removal procedure.
   1. Fill the master cylinder with clean, specified brake fluid.

2. Apply brakes several times to verify correct brake operation.

Rear Disc Brake

The rear disc brake system consists of the following components:

- Brake caliper
- Brake caliper support bracket
- Brake disc
- Brake pads
- Inner brake flexible hose
- Outer brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing or stopping of wheel rotation and the vehicle.

Rear Disc Brake

Refer to Section 206-00 .

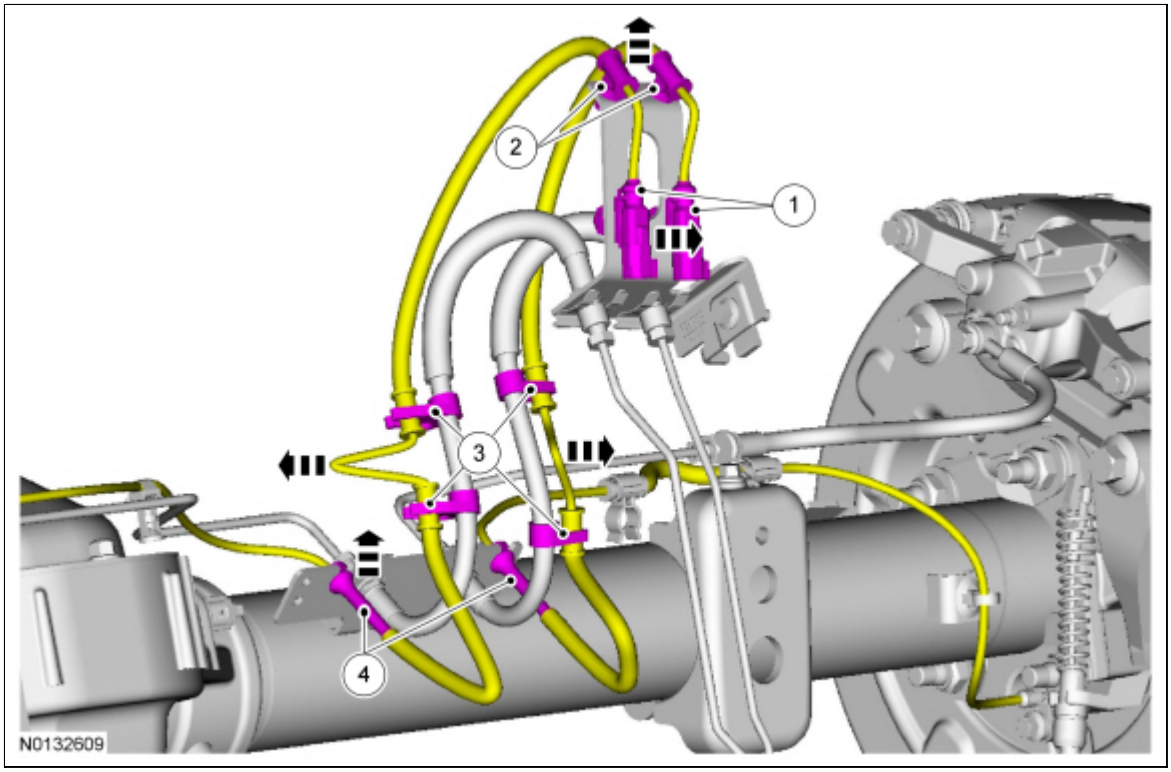
Brake Flexible Hose — Inner

Removal

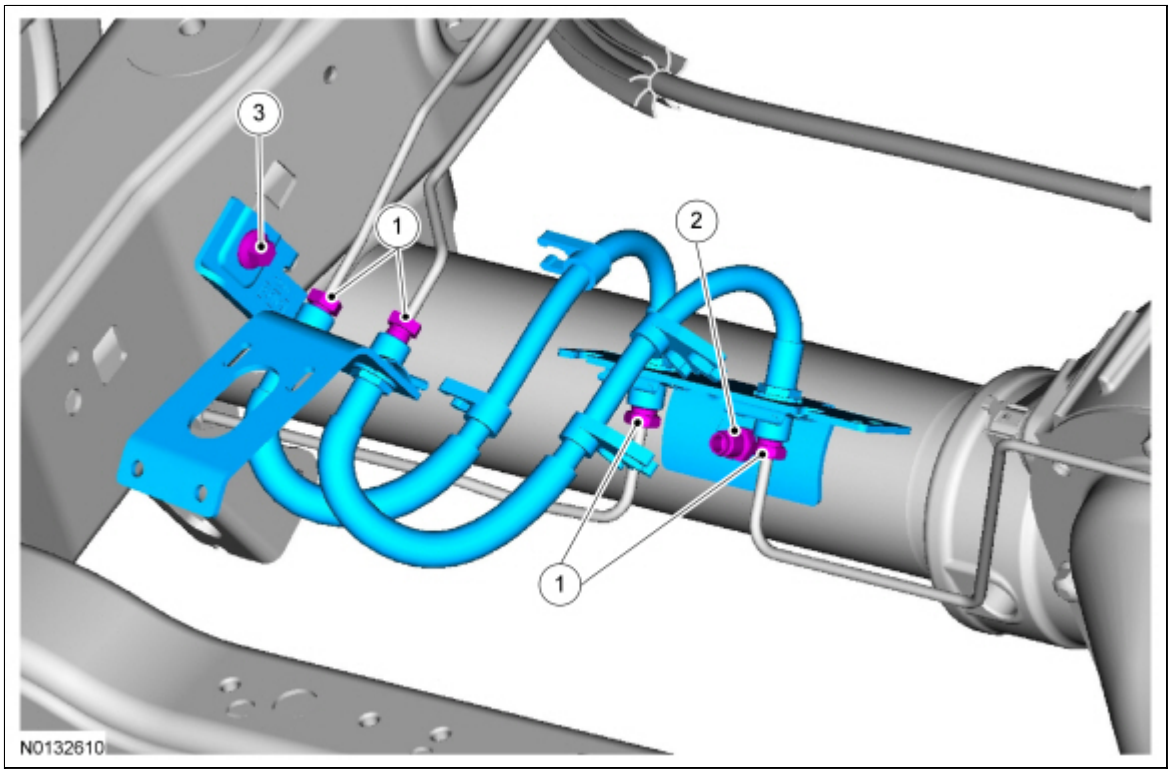
WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.



WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Removal steps in this procedure may contain installation details.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2.

3.

1. To install, tighten to 17 Nm (150 lb-in).
2. To install, tighten to 18 Nm (159 lb-in).
3. To install, tighten to 17 Nm (150 lb-in).

Installation

1. To install, reverse the removal procedure.
2. Bleed the brake calipers. For additional information, refer to Component Bleeding in Section 206-00 .

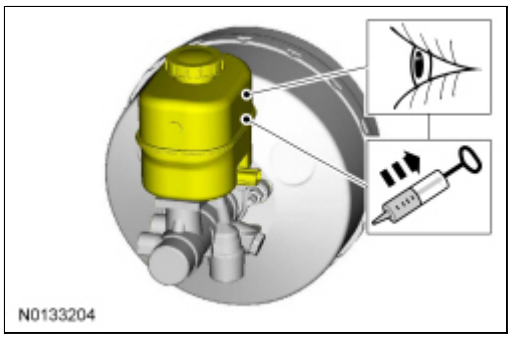
Brake Pads

Material

Item	Specification
Molykote® M77 8U7Z-19A506-A	—

Removal

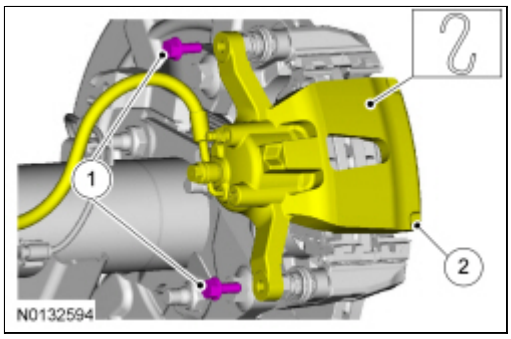


WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

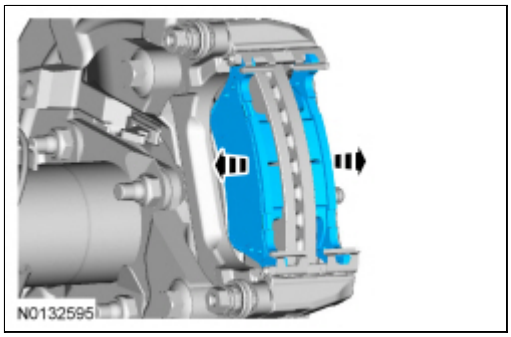
WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

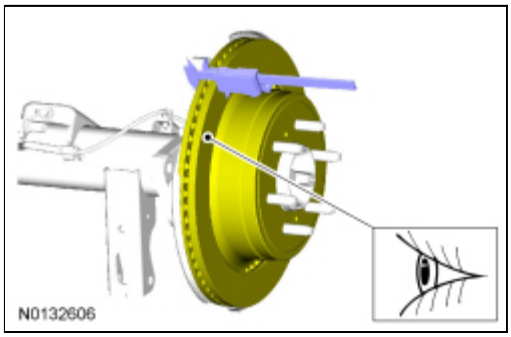


1. Visual check. Extract the fluid with a syringe.
   If necessary, remove fluid until the brake master cylinder reservoir is half full.

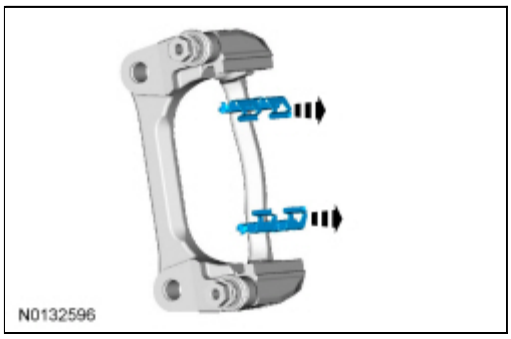


2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. ***NOTICE:* Do not allow the caliper to hang from the brake hose or damage to the hose can occur.**



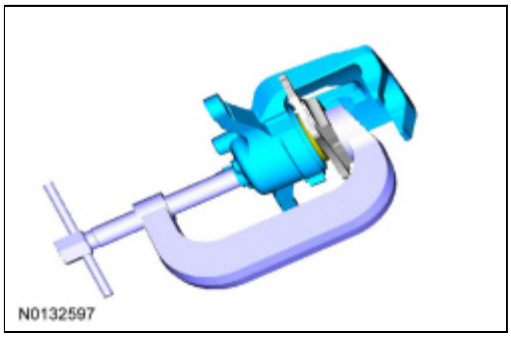
Relocate and support the component.



4.

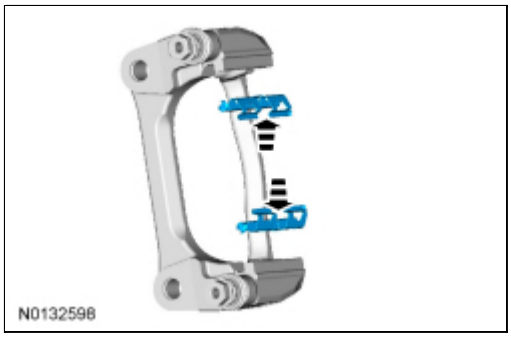
5. Visual check.
Measure the brake disc thickness and install a new brake disc if it is not within specification.

6.



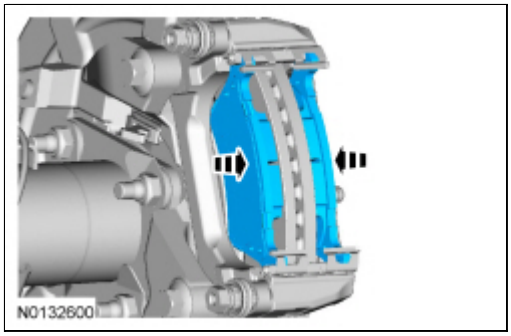
Installation

repair4less



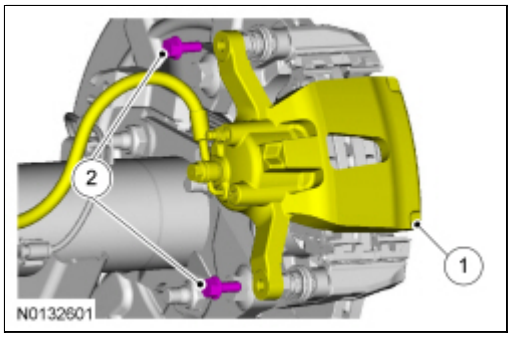
NOTE: If installing new brake pads, make sure to install all new hardware and specified lubricant supplied with the brake pad kit. Refer to the brake pad instruction sheet when applying lubricant.

1. ***NOTICE:*** **Protect the caliper pistons and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.**



2. ***NOTICE:*** **Do not allow grease, oil, brake fluid or other contaminants to contact the pad lining material or damage to components may occur. Do not install contaminated pads.**

   NOTE: Install all new hardware supplied with the pad kit.



3.

4.

   - Tighten to 33 Nm (24 lb-ft).

5. Fill the master cylinder with clean specified brake fluid.
    - Apply brakes several times to verify correct brake operation.

6. Install the wheel and tire. For additional information, refer to Section 204-04 .
    - Apply brakes several times to verify correct brake operation.

Parking Brake

The parking brake and actuation system consists of the following components:

- Parking brake cables
- Parking brake control
- Parking brake shoes
- Red brake warning indicator

The parking brake system is a foot-operated/cable-actuated system that applies a drum-in-hat assembly within each rear brake disc. A red brake warning indicator is located in the instrument cluster and will illuminate when the system is actuated to alert the driver that the parking brakes are applied.

repair4less

Parking Brake

Principles of Operation

Parking Brake System

The parking brake system is an independent, cable-actuated system controlled by an foot-operated parking brake control that is self adjusting. The parking brake control applies tension to the front parking brake cable and conduit. The front parking brake cable is coupled to the LH rear parking brake cable and conduit which is coupled to the RH rear parking brake cable. The parking brake cable and conduits actuate the parking brake levers, engaging the parking brake shoes with the parking brake drum-in-hat assembly. The system is returned to the released position by pulling the parking brake control release handle. Springs in the parking brake system apply the necessary force to return the system to the unapplied position. The parking brake warning indicator is located in the instrument cluster. It illuminates to signal the driver that the parking brake is applied or to signal a low brake fluid condition. The warning indicator system is diagnosed in Section 413-01.

Inspection and Verification

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to Section 413-01.

The first indication that something may be wrong in the brake system is a change in the feeling through the parking brake control. The parking brake not holding on an incline or dragging after being released are also indicators of system concerns.

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Check the rear brake adjustment or carry out the brake system diagnosis.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Parking brake cable(s) • Parking brake control • Parking brake control release handle • Parking brake shoes and hardware

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors • Instrument cluster • Smart Junction Box (SJB) • Vacuum sensor	• REFER to Diagnosis and Testing in Section 413-01 .
• The parking brake does not apply	• Parking brake cable(s) • Parking brake control • Parking brake shoes and hardware	• GO to Pinpoint Test A .
• The parking brake does not release and/or parking brake shoes drag	• Parking brake cable(s) • Parking brake control • Parking brake shoes and hardware	• GO to Pinpoint Test B .

Pinpoint Tests

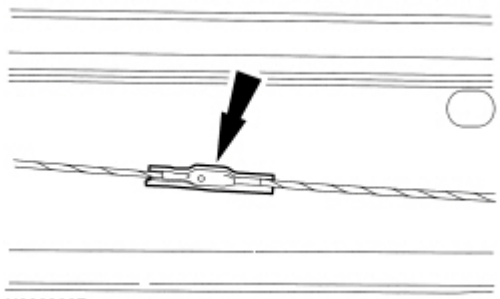
Pinpoint Test A: The Parking Brake Does Not Apply

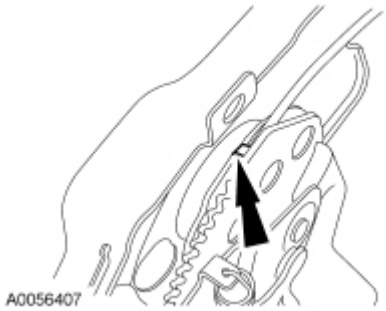
Normal Operation

When the parking brake control is pressed, tension is applied to the front parking brake cable. This tension pulls on the RH rear parking brake cable, which is attached to the RH rear parking brake shoe actuator and applies the RH rear brake shoes. At the same time, the tension in the RH rear cable causes the RH rear conduit to attempt to straighten out. This straightening effect causes the RH rear conduit to pull on the LH rear parking brake cable, which is attached to the LH rear parking brake shoe actuator and applies the LH rear brake shoes.

This pinpoint test is intended to diagnose the following:

repair4less





- Parking brake cable(s)
- Parking brake control
- Parking brake shoes and hardware

PINPOINT TEST A: THE PARKING BRAKE DOES NOT APPLY

Test Step	Result / Action to Take
A1 CHECK THE PARKING BRAKE CONTROL	
• Press the parking brake control pedal. • **Does the parking brake control pedal move?**	**Yes** GO to A2 . **No** GO to A5 .
A2 CHECK FOR BROKEN CABLES	

• Have an assistant press and release the parking brake pedal to help isolate disconnected cables or cables that do not move.
• Inspect the following items for damage and correct connections.
  ▪ Front cable and conduit
  ▪ LH rear cable and conduit
  ▪ RH rear cable and conduit
  ▪ Rear cable brackets
• **Are the cables in good condition?**
	Yes
	GO to A3 .
	
	No
	CONNECT the cable(s) or INSTALL new parking brake component(s) as necessary. TEST the system for normal operation.

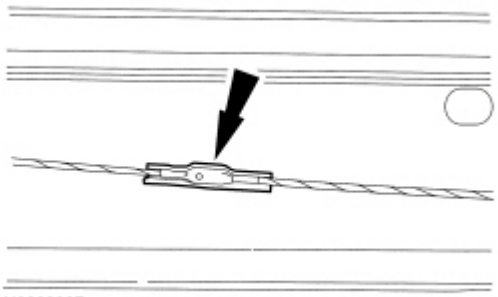
A3 CHECK THE PARKING BRAKE SHOES, ACTUATOR LEVERS AND HARDWARE	
• Remove the rear brake disc, refer to Section 206-04 . Inspect the parking brake shoes, actuator levers and hardware. • **Are the parking brake shoes, actuator levers and hardware in good condition?**	**Yes** GO to A4 . **No** INSTALL new components as necessary. REFER to Parking Brake Shoes in this section. TEST the system for normal operation.
A4 CHECK THE PARKING BRAKE SHOE ADJUSTMENT	
• Check the parking brake shoe adjustment. Refer to Parking Brake Shoe Adjustment in this section. • **Are the parking brake shoes adjusted to specification?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** ADJUST the rear parking brake shoes. REFER to Parking Brake Shoe Adjustment in this section.
A5 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE	
• Disconnect the front parking brake cable from the RH rear parking brake cable at the cable union.	**Yes** GO to A6 . **No**

 N0002007 • Press the parking brake control pedal. • **Does the parking brake control pedal move?**	GO to A7 .
A6 ISOLATE THE REAR PARKING BRAKE CABLES	
• Disconnect the LH cable from the RH conduit equalizer. • Disconnect the rear parking brake cables from the parking brake actuating levers. • While holding the cable conduit, attempt to slide the cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSPECT the parking brake shoes, hardware and backing plate. INSTALL new components as necessary. REFER to Parking Brake Shoes in this section. TEST the system for normal operation. **No** INSTALL new rear brake cable(s). REFER to Parking Brake Cable — Rear, LH or Parking Brake Cable — Rear, RH in this section. TEST the system for normal operation.
A7 ISOLATE THE FRONT PARKING BRAKE CABLE	
• **NOTE:** The parking brake control take-up spool tab may need to be bent aside to allow the cable to be removed. • Disconnect the front parking brake cable and conduit from the parking brake control.  A0056407 • While holding the cable conduit, attempt to slide the cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** INSTALL a new front parking brake cable. REFER to Parking Brake Cable — Front in this section. TEST the system for normal operation.

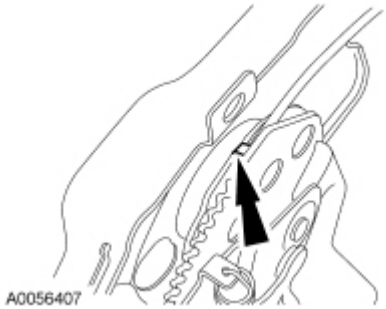
Pinpoint Test B: The Parking Brake Does Not Release and/or Parking Brake Shoes Drag

Normal Operation

When the parking brake release handle is pulled, the ratchet mechanism and return spring in the parking



repair4less



brake control release the tension on the parking brake cables and conduits. The cable conduits, cable springs and parking brake shoe springs provide the force necessary to return the parking brake system to the released position.

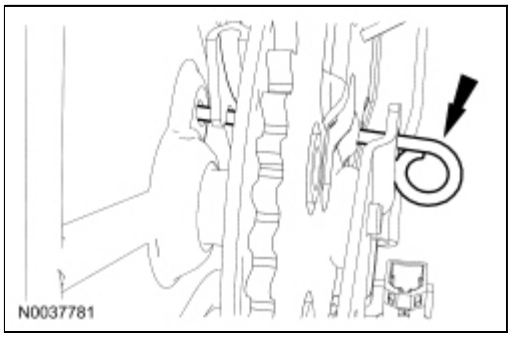
This pinpoint test is intended to diagnose the following:

- Parking brake cable(s)
- Parking brake control
- Parking brake control release handle
- Parking brake shoe actuators
- Parking brake shoes and hardware

PINPOINT TEST B: THE PARKING BRAKE DOES NOT RELEASE AND/OR PARKING BRAKE SHOES DRAG

Test Step	Result / Action to Take
B1 CHECK THE PARKING BRAKE CONTROL RELEASE HANDLE AND CABLE	
• Verify that the release handle and cable are connected to the parking brake control. • **Are the release handle and cable connected?**	**Yes** GO to B2. **No** CONNECT the handle and cable. TEST the system for normal operation.
B2 CHECK THE REAR PARKING BRAKE CABLES	
• Disconnect the LH cable from the RH conduit equalizer. • Disconnect the front parking brake cable from the RH rear parking brake cable at the cable union.  N0002007 • Disconnect the rear parking brake cables from the parking brake actuating levers. • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** GO to B3. **No** INSTALL new rear brake cable(s). REFER to Parking Brake Cable — Rear, LH or Parking Brake Cable — Rear, RH in this section. TEST the system for normal operation.
B3 CHECK THE REAR PARKING BRAKE SHOES AND HARDWARE	
• Remove the rear brake disc. Refer to Section 206-04. • Inspect the parking brake shoes, hardware and backing plate. • **Are the shoes, hardware and backing plate in good condition?**	**Yes** GO to B4. **No** INSTALL new components as

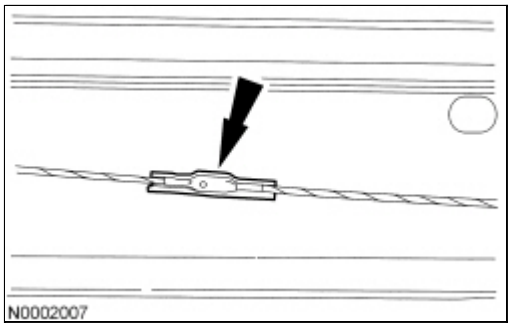
	necessary. REFER to Parking Brake Shoes in this section. TEST the system for normal operation.
B4 ISOLATE THE FRONT PARKING BRAKE CABLE • **NOTE:** The parking brake control take-up spool tab may need to be bent aside to allow the cable to be removed. • Disconnect the front parking brake cable and conduit from the parking brake control.  A0056407 • While holding the cable conduit, attempt to slide the cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** INSTALL a new front cable. TEST the system for normal operation.



repair4less

Parking Brake Cable Tension Release

1. Release the parking brake.



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. With an assistant, release the parking brake cable tension by pulling down on the intermediate cable at the cable-to-cable union until the parking brake control sector rotates to its stop and a 4 mm (0.15 in) x 150 mm (5.9 in) retainer pin can be inserted.

4. Disconnect the cable at the cable-to-cable union.

5. To reload the tension on the parking brake cable, follow the release procedure in reverse.
   - Inspect the parking brake system for correct operation.

repair4less

Parking Brake Shoe Adjustment

Special Tool(s)

 ST1468-A	Brake Adjusting Gauge 206-D002 (D81L-1103-A) or equivalent

1. **NOTE:** Make sure the parking brake is fully released.

   Using the release handle, release the parking brake control.

2. Remove the rear brake disc. For additional information, refer to Section 206-04 .

3. Using the Brake Adjusting Gauge, measure the ID of the drum portion of the rear brake disc and set the locking screw.
   - Record the measurement.

4. Place the Brake Adjusting Gauge over the widest diameter of the parking brake shoes.

5. Adjust the parking brake shoe clearance to 0.59 mm (0.023 in) less than the ID of the drum portion of the rear brake disc.
   - Rotate the parking brake shoe adjuster to achieve the correct parking brake shoe-to-brake disc

clearance.

6. Install the rear brake disc. For additional information, refer to Section 206-04 .
7. Test the parking brake for normal operation.

Hydraulic Brake Actuation

Hydraulic Brakes

The hydraulic brake actuation system consists of the following components:

- Brake master cylinder and fluid reservoir
- Brake tubes and hoses
- Brake pedal and bracket
- Hydraulic Control Unit (HCU) (part of ABS)

Adjustable Pedals

Adjustable pedals are available as an optional feature on this vehicle. Two systems are available, with or without memory and consist of the following components:

- Adjustable brake pedal and bracket
- Adjustable accelerator pedal with motor and attached cable
- Adjustable pedal switch
- Steering Column Control Module (SCCM)
- Memory SET switch (with memory feature only)
- Driver Seat Module (DSM) (with memory feature only)
- Body Control Module (BCM) (with memory feature only)
- Remote Keyless Entry (RKE) (with memory feature only)

Inspection And Verification

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Adjustable Pedals

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart — Without Memory Feature

Mechanical	Electrical
● Adjustable accelerator pedal and motor with cable attached ● Adjustable brake pedal and bracket ● Foreign objects or material	● Wiring, terminals or connectors ● Body Control Module (BCM) fuse(s): ■ 23 (15A) ■ 24 (15A) ● Steering Column Control Module (SCCM) ● Brake pedal control switch

Visual Inspection Chart — With Memory Feature

Mechanical	Electrical
● Adjustable accelerate pedal and motor with cable attached ● Adjustable brake pedal and bracket ● Foreign objects or material	● BCM fuse(s): ■ 23 (15A) ■ 24 (15A) ● Memory SET switch ● Remote Keyless Entry (RKE) transmitter ● SCCM ● Wiring, terminals or connectors ● Brake pedal control switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

repair4less

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, proceed with module self-test diagnostics.

8. Carry out the self-test diagnostics for the SCCM, BCM and Driver Seat Module (DSM).

9. If the DTCs retrieved are related to the concern, go to SCCM DTC Chart. For all other SCCM DTCs, refer to Section 211-05. For DSM DTCs, refer to Section 501-10. For BCM and all other DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Tests

Pinpoint Test A: The Adjustable Pedals Are Inoperative/Does Not Operate Correctly — Using the Brake Pedal Control Switch

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

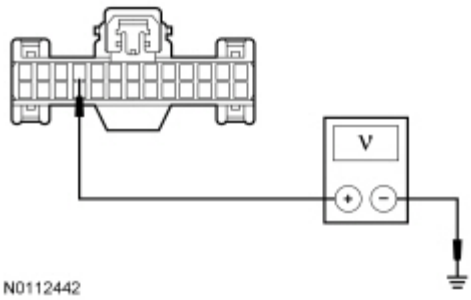
Normal Operation

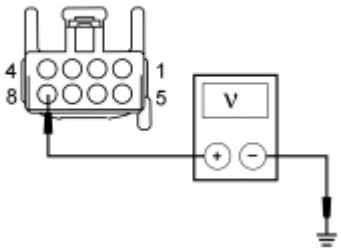
The Steering Column Control Module (SCCM) receives fused battery voltage from Body Control Module (BCM) fuses 23 (15A) and 24 (15A).

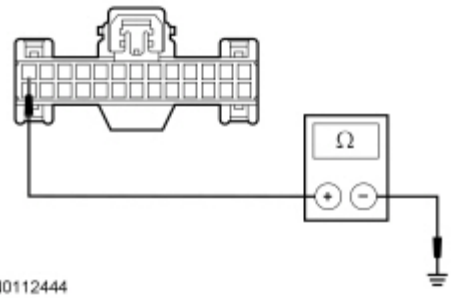
When the brake pedal control switch is pressed, the SCCM sends current to the adjustable pedals motor along one circuit and the current returns to the SCCM along another circuit, which is grounded through the SCCM to move the pedals in the desired direction.

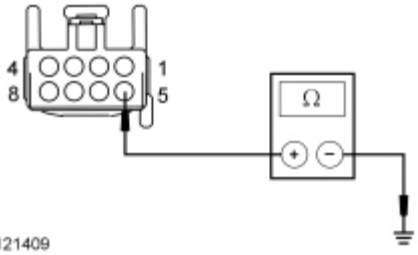
repair4less

- DTC B137D:18 (Pedal Adjustment Motor: Circuit Current Below Threshold) — This DTC sets if the SCCM senses current flow to the adjustable pedals motor below a preset limit while the brake pedal control switch is pressed, or if there is an open or high resistance in the adjustable pedals motor circuits when the ignition is ON.
- DTC B137D:19 (Pedal Adjustment Motor: Circuit Current Above Threshold) — This DTC sets if the SCCM senses current flow to the adjustable pedals motor above a preset limit while the brake pedal control switch is pressed, or if there is a short to ground in the adjustable pedals motor circuits when the ignition is ON.
- DTC B137D:71 (Pedal Adjustment Motor: Actuator Stuck) — This DTC sets if the SCCM senses current flow to the adjustable pedals motor within a specific range but above a preset limit while the brake pedal control switch is pressed when the ignition is ON.









This pinpoint test is intended to diagnose the following:

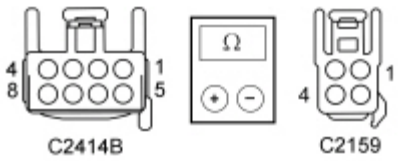
- Wiring, terminals or connectors
- Foreign objects or material
- Brake pedal control switch
- Adjustable accelerator pedal and motor with attached cable
- Adjustable brake pedal and bracket
- SCCM

PINPOINT TEST A: THE ADJUSTABLE PEDALS ARE INOPERATIVE/DOES NOT OPERATE CORRECTLY — USING THE BRAKE PEDAL CONTROL SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK THE ADJUSTABLE PEDALS MOTOR AND CABLE INSTALLATION	
• Check the adjustable pedals motor and cable for correct installation. • **Is the motor and cable correctly installed?**	**Yes** GO to A2 . **No** CORRECT the adjustable pedals motor installation. REFER to Section 310-02 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal and accelerator assemblies for foreign material causing a binding condition. • **Are the pedal assemblies free from foreign material?**	**Yes** GO to A3 . **No** REMOVE the foreign material. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK FOR VOLTAGE AT THE SCCM	
• Disconnect: SCCM C2414A and C2414B.	**Yes**

• Measure the voltage between SCCM C2414A-10, circuit SBP23 (WH/RD), harness side and ground.  N0112442 • Measure the voltage between SCCM C2414B-8, circuit SBP24 (VT/RD), harness side and ground.  N0121410 • **Is the voltage greater than 10 volts?**	GO to A4 . **No** VERIFY BCM fuses 23 (15A) and 24 (15A) are OK. If OK, REPAIR the affected circuit (s). If not OK, REFER to the Wiring Diagrams manual to identify the cause for the circuit(s) short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A4 CHECK THE SCCM GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between SCCM C2414A-13, circuit GD133 (BK), harness side and ground.  N0112444 • Measure the resistance between SCCM C2414B-5, circuit GD138 (BK/WH), harness side and ground.  N0121409	**Yes** GO to A5 . **No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

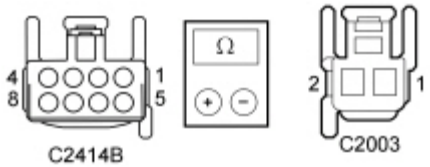


repair4less

- **Are the resistances less than 5 ohms?**

A5 CHECK THE ADJUSTABLE PEDALS MOTOR CIRCUITS FOR AN OPEN

- Disconnect: Adjustable Pedals Motor C2159 (vehicles with memory) or C2003 (vehicles without memory).
- Vehicles with memory, measure the resistance between SCCM C2414B, harness side and adjustable pedals motor C2159, harness side as follows:



SCCM	Circuit	Adjustable Pedals Motor
C2414B-4	CPP01 (WH/OG)	C2159-2
C2414B-7	CPP02 (BN)	C2159-1

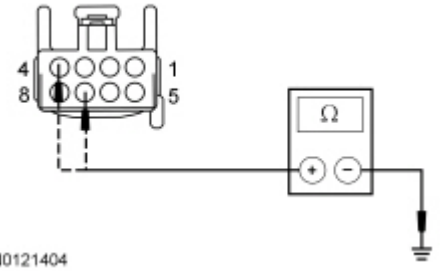
N0121359

- Vehicles without memory, measure the resistance between SCCM C2414B, harness side and adjustable pedal motor C2003, harness side as follows:

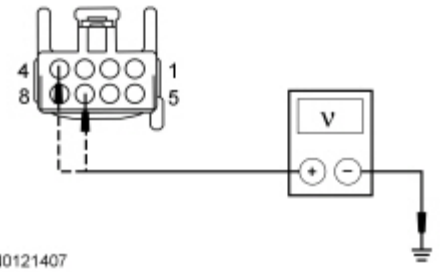
SCCM	Circuit	Adjustable Pedals Motor
C2414B-4	CPP01 (WH/OG)	C2003-2
C2414B-7	CPP02 (BN)	C2003-1

N0121408

- **Are the resistances less than 5 ohms?**



Yes
GO to A6.



No
REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A6 CHECK THE ADJUSTABLE PEDALS MOTOR CIRCUITS FOR A SHORT TO GROUND

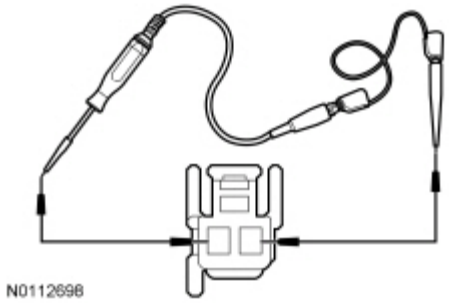
- Measure the resistance between ground and:
  - SCCM C2414B-4, circuit CPP01 (WH/OG), harness side.
  - SCCM C2414B-7, circuit CPP02 (BN), harness side.

Yes
GO to A7.

 • **Are the resistances greater than 10,000 ohms?**	**No** REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A7 CHECK THE ADJUSTABLE PEDALS MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition ON.
• Measure the voltage between ground and:
  ▪ SCCM C2414B-4, circuit CPP01 (WH/OG), harness side.
  ▪ SCCM C2414B-7, circuit CPP02 (BN), harness side.

• **Is any voltage present?**
	Yes
	REPAIR the affected circuit (s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	GO to A8.



A8 CHECK FOR SCCM OUTPUT	

• Ignition OFF.
• Connect: SCCM C2414A and C2414B.
• ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.**
• **NOTE:** When the adjustable pedals electrical connector is disconnected, the SCCM only supplies voltage to the adjustable pedals motor in 1 second intervals due to the open on the Hall-effect sensor circuits.
• Vehicles with memory, connect the test light as follows:
  ▪ Connect one lead on the test light to C2159-1, circuit CPP02 (BN), harness side.
  ▪ Connect the other lead on the test light to C2159-2, circuit CPP01 (WH/OG), harness side.
	Yes
	GO to A9.
	
	No
	GO to A10.

repair4less

- Vehicles without memory, connect the test light as follows:
  - Connect one lead on the test light to C2003-1, circuit CPP02 (BN), harness side.
  - Connect the other lead on the test light to C2003-2, circuit CPP01 (WH/OG), harness side.

- Press the brake pedal control switch in the forward and rearward positions and verify the test light illuminates.
- **Does the test light illuminate when the brake pedal control switch is pressed in each direction?**

A9 CHECK THE ADJUSTABLE BRAKE PEDALS CABLE OPERATION	
• Connect: Adjustable Pedals Motor C2159 (vehicles with memory feature) or C2003 (vehicles without memory feature). • Disconnect the adjustable brake pedals cable from the adjustable brake pedal and bracket. • Operate the brake pedal control switch and observe the cable in the conduit. • **Does the adjustable brake pedals cable turn in the conduit?**	**Yes** INSTALL a new brake pedal assembly. REFER to Brake Pedal and Bracket in this section. CLEAR the DTCs. REPEAT the self test. TEST the system for normal operation. **No** INSTALL a new adjustable accelerator pedal and motor with attached cable. REFER to Accelerator Pedal — Adjustable, Exploded View in Section 310-02 . CLEAR the DTCs. REPEAT the self test. TEST the system for normal operation.
A10 CHECK THE SCCM ADJUSTABLE PEDALS ACTIVE COMMANDS	
• Select PARK.	**Yes**

• Connect: Adjustable Pedals Motor C2159 (vehicles with memory feature) or C2003 (vehicles without memory feature). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — SCCM . • **NOTE:** Toggling the active command ON causes the pedal to move in the commanded direction for 2 seconds and then the pedal stops. • Toggle the pedals forward (PEDAL_IN) active command ON. • Toggle the PEDAL_IN active command OFF. • Toggle the pedals rearward (PEDAL_OUT) active command ON. • Toggle the PEDAL_OUT active command OFF. • **Do the adjustable pedals respond correctly to the corresponding active commands?**	INSTALL a new brake pedal control switch. REFER to Brake Pedal Control Switch in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A11 .
A11 CHECK THE SCCM FOR CORRECT OPERATION	

• Disconnect: SCCM C2414A and C2414B.
• Check SCCM C2414A and SCCM C2414B for:
  ▪ corrosion.
  ▪ pushed-out pins.
  ▪ spread terminals.
• Connect: SCCM C2414A and C2414B.
• Connect: Adjustable Pedals Motor C2159 (vehicles with memory feature) or C2003 (vehicles without memory feature).
• Make sure the connectors seat correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM . REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: The Adjustable Pedals Are Inoperative/Does Not Operate Correctly — Using the Memory SET Switch or the Remote Keyless Entry (RKE) Transmitter

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

When the desired memory position is selected using the memory SET switch or the Remote Keyless Entry (RKE) transmitter, the Driver Seat Module (DSM) communicates the desired pedals position in a message on the Medium Speed Controller Area Network (MS-CAN) bus to the Body Control Module (BCM). The BCM acts as a gateway module, relaying the message to the Steering Column Control Module (SCCM) over the High Speed Controller Area Network (HS-CAN) bus. The SCCM then sends current in one direction to the adjustable pedals motor to move the pedals forward and in another direction (reversed polarity) to move the pedals rearward.

The SCCM uses a Hall-effect sensor that is integral to the pedals motor to identify the current pedal position. The SCCM sends a reference voltage along one circuit, through the sensor and back to the SCCM along the signal return circuit.

If the vehicle is equipped with the memory feature but the SCCM is incorrectly configured, memory recall may not function correctly when the memory SET switch or the RKE transmitter is used to adjust the pedal position.

repair4less

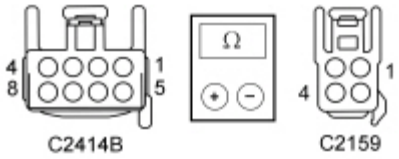
This pinpoint test is intended to diagnose the following:

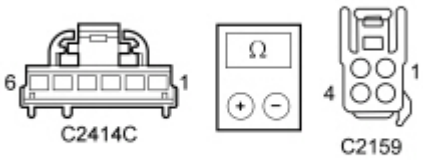
- Wiring, terminals or connectors
- Foreign objects or material
- Adjustable accelerator pedal and motor with attached cable
- Adjustable brake pedal and bracket
- RKE transmitter
- DSM
- SCCM
- Incorrect SCCM configuration
- BCM

PINPOINT TEST B: THE ADJUSTABLE PEDALS ARE INOPERATIVE/DOES NOT OPERATE CORRECTLY — USING THE MEMORY SET SWITCH BUTTONS OR THE RKE TRANSMITTER

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

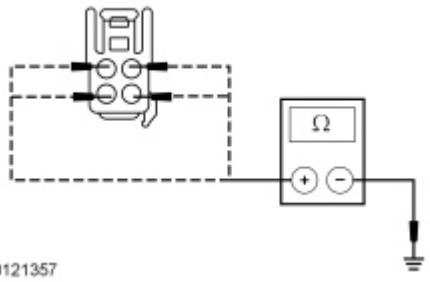
Test Step	Result / Action to Take
B1 CHECK THE ADJUSTABLE PEDALS OPERATION WITH THE BRAKE PEDAL CONTROL SWITCH	
• Press the brake pedal control switch in each direction for more than one second and observe the pedals. • **Do the pedals operate for more than one second in the direction selected using the switch?**	**Yes** GO to B2. **No** If the pedals do not move using the brake pedal control switch, GO to Pinpoint Test A. If the pedals only move in one second intervals regardless of button operation, GO to Pinpoint Test C.
B2 CHECK THE MEMORY SYSTEM OPERATION	





• Set a memory position for the driver seat, exterior mirrors and adjustable pedals to memory SET switch button 1. Refer to Memory Position Programming in Section 501-10.
• Select PARK.
• Press the memory SET switch button 1 and observe the following items:
  ▪ Driver seat
  ▪ Exterior mirrors
  ▪ Adjustable pedals
• **Do all 3 items move when the button is pressed?**
	Yes
	GO to B3.
	
	No
	If all 3 items do not move, REFER to Diagnosis and Testing in Section 501-10 to diagnose the memory SET switch.
	
	If **only** the adjustable pedals do not move, GO to B4.
	
	If **only** the driver seat does not move, REFER to Diagnosis and Testing in Section 501-10.
	
	If **only** the exterior mirrors do not move, REFER to Diagnosis and Testing in Section 501-09.

B3 CHECK THE RKE TRANSMITTER OPERATION	



• Set a memory position in the RKE transmitter for the driver seat, exterior mirrors and adjustable pedals. Refer to Remote Memory Activation in Section 501-14 .
• Select PARK.
• Press the unlock button on the RKE transmitter and observe the following items:
  ▪ Driver seat
  ▪ Exterior mirrors
  ▪ Adjustable pedals
• **Do all 3 items move when the button is pressed?**
	Yes
	GO to B4 .
	
	No
	If all 3 items do not move, REFER to Diagnosis and Testing in Section 501-14 to diagnose the RKE transmitter.
	
	If **only** the adjustable pedals do not move, GO to B4 .
	
	If **only** the driver seat does not move, REFER to Diagnosis and Testing in Section 501-10 .
	
	If **only** the exterior mirrors do not move, REFER to Diagnosis and Testing in Section 501-09 .

B4 CHECK THE ADJUSTABLE PEDALS MOTOR AND CABLE INSTALLATION	
• Check the adjustable pedals motor and cable for correct installation. • **Are the motor and cable correctly installed?**	**Yes** GO to B5 . **No** CORRECT the adjustable pedals motor installation. REFER to Section 310-02 . TEST the system for normal operation.
B5 INSPECT FOR FOREIGN OBJECTS OR MATERIAL	
• Inspect the adjustable brake pedal and accelerator assemblies for foreign material causing a binding condition. • **Are the pedal assemblies free from foreign material?**	**Yes** GO to B6 . **No** REMOVE the foreign material. TEST the system for normal operation.
B6 CHECK FOR DSM OR BCM DTCs	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self-Test — DSM . • Enter the following diagnostic mode on the scan tool: Self-Test — BCM . • Record any DTCs retrieved from the DSM or the BCM . • **Was DTC U0140 retrieved from the DSM or was DTC U0212:87 retrieved from the BCM ?**	**Yes** If DTC U0140 is retrieved from the DSM , REFER to Section 501-10 to diagnose the lost communication concern. If DTC U0212:87 is retrieved from the BCM , REFER to Section 419-10 to diagnose the lost communication concern. **No** GO to B7 .
B7 CHECK THE ADJUSTABLE PEDALS MOTOR AND HALL-EFFECT SENSOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Adjustable Pedals Motor C2159. • Disconnect: SCCM C2414B. • Measure the resistance between SCCM C2414B,	**Yes** GO to B8 . **No**

repair4less

harness side and adjustable pedals motor C2159, harness side as follows: **SCCM** / **Circuit** / **Adjustable Pedals Motor** C2414B-4 / CPP01 (WH/OG) / C2159-2 C2414B-7 / CPP02 (BN) / C2159-1  N0121359 • Disconnect: SCCM C2414C. • Measure the resistance between SCCM C2414C, harness side and adjustable pedals motor C2159, harness side as follows **SCCM** / **Circuit** / **Adjustable Pedals Motor** C2414C-3 / RPP06 (GN) / C2159-3 C2414C-6 / LPP06 (YE/BU) / C2159-4  N0121358 • **Are the resistances less than 5 ohms?**	REPAIR the affected circuit(s). TEST the system for normal operation.
B8 CHECK THE ADJUSTABLE PEDALS MOTOR AND HALL-EFFECT SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ adjustable pedals motor C2159-1, circuit CPP02	**Yes** GO to B9 .

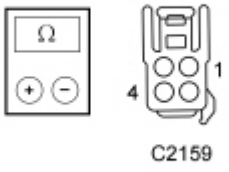
(BN), harness side.
- adjustable pedals motor C2159-2, circuit CPP01 (WH/OG), harness side.
- adjustable pedals motor C2159-4, circuit LPP06 (YE/BU), harness side.
- adjustable pedals motor C2159-3, circuit RPP06 (GN), harness side.

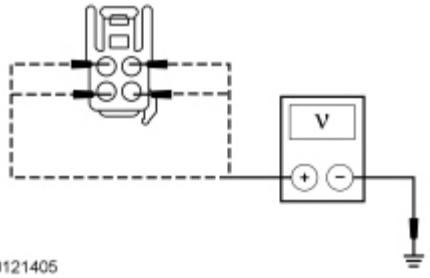
N0121357

- **Are the resistances greater than 10,000 ohms?**

No
REPAIR the affected circuit(s). TEST the system for normal operation.

B9 CHECK THE ADJUSTABLE PEDALS MOTOR AND HALL-EFFECT SENSOR CIRCUITS FOR A SHORT TOGETHER





- Measure the resistance between adjustable pedals motor C2159, harness side as follows:

Adjustable Pedals Motor	Circuit	Adjustable Pedals Motor	Circuit
C2159-4	LPP06 (YE/BU)	C2159-2	CPP01 (WH/OG)
C2159-4	LPP06 (YE/BU)	C2159-3	RPP06 (GN)
C2159-4	LPP06 (YE/BU)	C2159-1	CPP02 (BN)
C2159-2	CPP01 (WH/OG)	C2159-3	RPP06 (GN)
C2159-2	CPP01 (WH/OG)	C2159-1	CPP02 (BN)
C2159-3	RPP06 (GN)	C2159-1	CPP02 (BN)

Yes
GO to B10 .

No
REPAIR the affected circuit(s). TEST the system for normal operation.

repair4less

 N0121355 • **Are the resistance greater than 10,000 ohms?**	
B10 CHECK THE ADJUSTABLE PEDALS MOTOR AND HALL-EFFECT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ▪ adjustable pedals motor C2159-2, circuit CPP01 (WH/OG), harness side. ▪ adjustable pedals motor C2159-4, circuit LPP06 (YE/BU), harness side. ▪ adjustable pedals motor C2159-3, circuit RPP06 (GN), harness side. ▪ adjustable pedals motor C2159-1, circuit CPP02 (BN), harness side.  N0121405 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** CONFIGURE the SCCM using As-Built data. TEST the system for normal operation. If the adjustable pedals do not operate correctly, INSTALL a new adjustable pedals motor and bracket assembly. REFER to Accelerator Pedal — Adjustable, Exploded View in Section 310-02 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: The Adjustable Pedals Only Move in 1 Second Intervals

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

The Steering Column Control Module (SCCM) uses a Hall-effect sensor integral to the motor to identify the current pedal position. The SCCM sends a reference voltage along the sensor feed circuit, through the Hall-effect sensor and back to the SCCM along the signal return circuit.

When the following DTCs are set, the adjustable pedals enters a "jog mode". When the pedals are in jog mode, the memory system recall does not function from either the Remote Keyless Entry (RKE) transmitter or memory SET switch. When the pedals are activated using the brake pedal control switch, the motor moves the pedals for one second regardless of the length of time the button is pressed.

If the vehicle is not equipped with memory and the SCCM is incorrectly configured, the SCCM expects to receive pedal position information when the vehicle is not equipped to provide it. If this happens, the adjustable pedals enters a "jog mode" similar to if a fault were present in the adjustable pedals position sensor circuits.

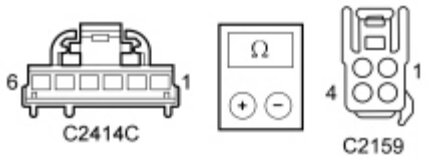
- DTC B1368:11 (Adjustable Pedal Position Feedback Sensor: Circuit Short to Ground) — This DTC sets if the SCCM detects a short to ground on the Hall-effect sensor feed and/or return circuits when the ignition is ON.
- DTC B1368:12 (Adjustable Pedal Position Feedback Sensor: Circuit Short to Battery) — This DTC sets if the SCCM detects a short to voltage on the Hall-effect sensor feed and/or return circuits when the ignition is ON.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Adjustable accelerator pedal and motor with attached cable
- SCCM
- Incorrect SCCM configuration

PINPOINT TEST C: THE ADJUSTABLE PEDALS ONLY MOVE IN 1 SECOND INTERVALS

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**



<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE SCCM DTCs</td><td rowspan="2">Yes
GO to C2.

	No
	INSTALL a new adjustable accelerator pedal and motor with attached cable. REFER to Accelerator Pedal — Adjustable, Exploded View in Section 310-02 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If DTC B1368:11 or B1368:12 return, INSTALL a new SCCM . REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

Principles of Operation

Hydraulic Brakes

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is forced through the double-walled steel tubes and flexible hoses to the Hydraulic Control Unit (HCU). The brake fluid is then distributed to the front and rear brake calipers. The fluid enters the caliper, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation of the brake disc. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear brake caliper pistons and brake pads to the unapplied position.

To diagnose hydraulic brake concerns, refer to Section 206-00 .

For information on the HCU , refer to Section 206-09 .

Adjustable Pedals Without Memory Feature

The adjustable pedals without memory are controlled by the brake pedal control switch and the Steering Column Control Module (SCCM). The adjustable pedals motor is attached to the accelerator pedal bracket and controls the accelerator pedals directly. It operates forward and rearward, depending on which direction the switch is pressed. The adjustable brake pedals is connected to the motor by a cable that rotates inside a sleeve. This allows both the brake and accelerator pedals to move together as an assembly. When the brake pedal control switch is pressed, voltage is applied from the SCCM to the adjustable pedals motor. The end of the motor that is attached to the accelerator pedal bracket rotates the pinion of a worm gear set and causes the accelerator pedal to move. At the same time, the other end of the motor rotates the cable inside the sleeve which causes the brake pedal adjuster to move through the use of a worm gear set. The pedals can be adjusted with the ignition switch in the OFF, ACC or RUN position, regardless of gear selector position.

The SCCM monitors the adjustable pedals motor and circuits for faults. If a fault is detected, the SCCM is capable of setting DTCs.

Adjustable Pedals With Memory Feature

The adjustable pedals with memory are controlled by the SCCM , Body Control Module (BCM) and Driver Seat Module (DSM). The pedals can be adjusted in 3 different ways:

- Using the brake pedal control switch.
- Using the memory SET switch.
- Using the Remote Keyless Entry (RKE) transmitter.

The SCCM monitors the position of the pedals using a Hall-effect sensor that is integral to the adjustable pedals motor. When a memory position is recalled through either the memory SET switch or the RKE transmitter, the SCCM monitors the Hall-effect sensor and stops sending voltage to the motor once the

repair4less

commanded memory position is reached. If the SCCM receives a pedals position input during a memory position recall function, the module stops the memory recall and responds to the new pedals position input.

When the RKE transmitter is activated, a message is sent over the Medium Speed Controller Area Network (MS-CAN) to the DSM . When the memory SET switch is pressed, the DSM senses continuity to ground on the switch circuit. When the DSM receives either the MS-CAN message or the ground input through the switch circuit, it sends a message over the MS-CAN to the BCM . The BCM acts as a gateway module, relaying the MS-CAN message that was received from the DSM to the SCCM over the High Speed Controller Area Network (HS-CAN). The SCCM then sends voltage over the appropriate circuit to the adjustable pedals motor to adjust the pedals.

The SCCM continuously monitors the adjustable pedals motor and circuits for faults. If a fault is detected, the SCCM is capable of setting DTCs.

The DSM also controls the driver seat and the exterior mirrors.

For information on setting and recalling a memory pedal position, refer to Memory Position Programming in Section 501-10 .

Symptom Charts

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Steering Column Control Module (SCCM)	• Fuse • Wiring, terminals or connectors • SCCM	• REFER to Section 418-00 .
• Adjustable pedals are inoperative/does not operate correctly — using the brake pedal control switch	• Foreign objects or material • Fuse • Wiring, terminals or connectors • Brake pedal control switch • Adjustable accelerator pedal and motor with attached cable • Adjustable brake pedal and bracket • SCCM	• GO to Pinpoint Test A .
• Adjustable pedals are inoperative/does not operate correctly — using the memory SET switch buttons	• Foreign objects or material • Fuse • Wiring, terminals or connectors • Memory SET switch • Adjustable accelerator pedal and motor with attached cable • Adjustable brake pedal and bracket • Incorrect SCCM configuration • Driver Seat Module (DSM) • SCCM • Body Control Module (BCM)	• GO to Pinpoint Test B .
• Adjustable pedals are inoperative/does not operate correctly — using the Remote Keyless Entry (RKE) transmitter	• Foreign objects or material • Wiring, terminals or connectors • Adjustable accelerator pedal and motor with attached cable • Adjustable brake pedal and bracket • RKE transmitter • DSM	• GO to Pinpoint Test B .

Item	Specification
Motorcraft® High Performance DOT 3 Motor Vehicle Brake Fluid (US) / Motorcraft® Brake Fluid - Heavy Duty DOT 3 (Canada) PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

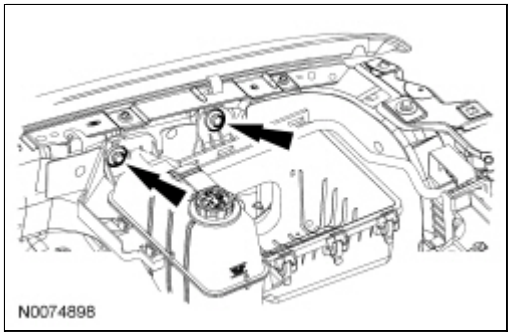
repair4less

Item	Part Number	Description
1	2140	Brake master cylinder and reservoir assembly
2	W520212	Brake master cylinder nut (2 required)
3	—	Primary brake tube fitting (part of 2A040)
4	—	Secondary brake tube fitting (part of 2B253)
5	—	Brake fluid level switch electrical connector (part of 12A581)
6	2152	Brake master cylinder-to-booster seal
7	—	Vacuum sensor electrical connector (part of 12A581)
8	3B476	Front axle vent hose

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Relieve the vacuum in the brake booster by pressing and releasing the brake pedal a minimum of 5 times with the engine not running.

2. Remove the Air Cleaner (ACL) element. For additional information, refer to Air Cleaner Element in Section 303-12 .

3. Remove the nut and position the hood switch and bracket aside.
   - To install, tighten nut to 6 Nm (53 lb-in).

4. Remove the 2 bolts and position the coolant expansion tank/lower ACL housing assembly aside.
   - To install, tighten bolts to 15 Nm (133 lb-in).

5. Disconnect the brake fluid level switch.

6. If equipped, position the vacuum sensor wiring harness and front axle vent hose aside.

7. Loosen the brake tube fittings and disconnect the brake tubes.
   - Plug the master cylinder ports.
   - To install, tighten primary brake tube fitting to 28 Nm (21 lb-ft).
   - To install, tighten secondary brake tube fitting to 20 Nm (177 lb-in).

8. ***NOTICE:*** **When the master cylinder is removed, the piston will be exposed. Do not damage the piston or piston surface or a fluid leak may occur.**

   Remove the 2 brake master cylinder nuts and the brake master cylinder.
   - To install, tighten to 25 Nm (18 lb-ft).

repair4less

9. To install, reverse the removal procedure.
    - If a new brake master cylinder has been installed, bleed the master cylinder. Refer to Component Bleeding in Section 206-00 .
    - If the brake master cylinder was removed to access other components, bleed the brake system. Refer to Brake System Bleeding in Section 206-00 .

Brake Pedal and Bracket

NOTE: Adjustable brake pedal and bracket shown, fixed brake pedal and bracket similar.

Item	Part Number	Description
1	W702368	Brake pedal bracket bolts
2	—	Accelerator pedal-to-brake pedal cable (part of 9F836)

repair4less

3	2450	Brake pedal and bracket
4	W520212	Brake booster-to-pedal bracket nut (4 required)
5	2L523	Brake pedal pin

Removal and Installation

Vehicles equipped with adjustable pedals

1. ***NOTICE:*** **The brake pedal and the accelerator pedal must be in the same position when installing a new cable or a new pedal. The pedals must be all the way forward or all the way rearward or damage to components may occur.**

   Move the pedals to the full forward (away from the driver) position.

2. Disconnect the accelerator pedal-to-brake pedal cable from the adjustable brake pedal gear set.

All vehicles

3. ***NOTICE:*** **Do not service the brake pedal without first removing the stoplamp switch. Remove this switch with the brake pedal in the at-rest position. Attempting to remove the switch when the plunger is extended (during pedal apply) results in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01.

4. **NOTE:** Use an 11 mm, 12-point socket or wrench to compress the 2 tabs on the brake pedal arm pin.

   Remove and discard the brake pedal pin, then disconnect the brake booster push rod from the brake pedal arm.

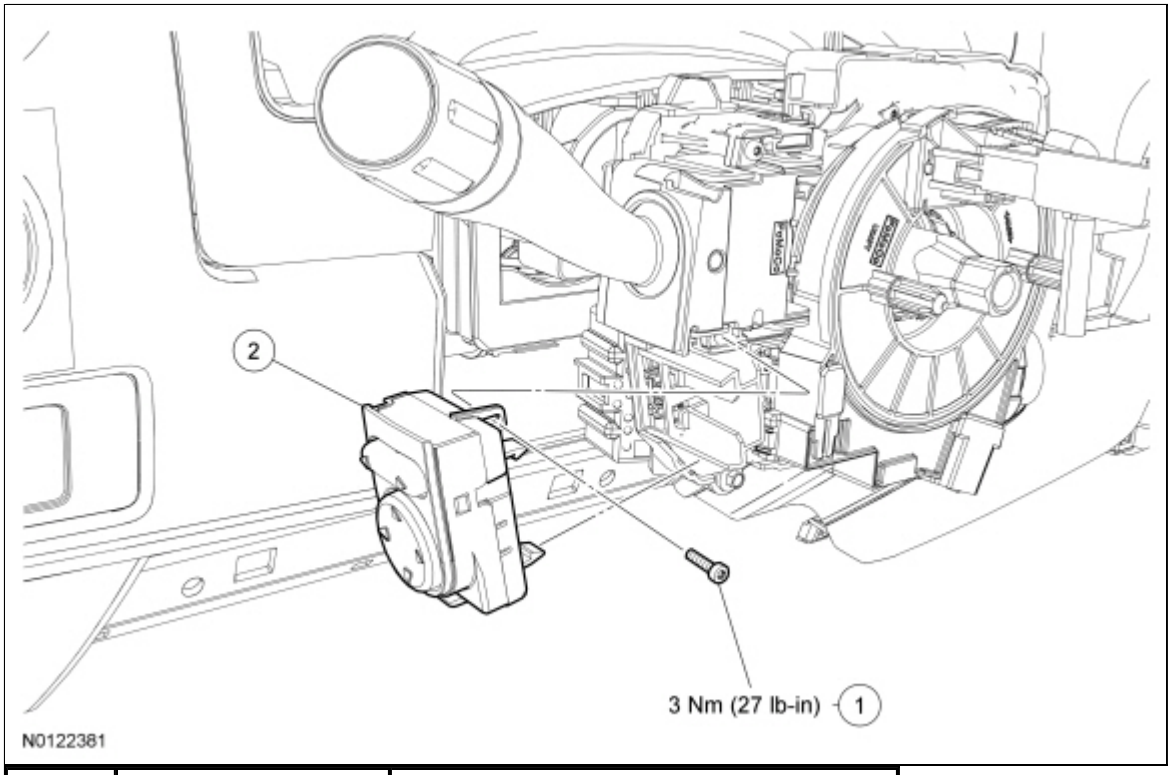
5. Remove the bulkhead sound insulator.

6. Remove the 4 brake booster-to-pedal bracket nuts.
   - To install, tighten to 25 Nm (18 lb-ft) following a clockwise pattern starting with the upper left nut.

7. Remove the 2 brake pedal bracket bolts and remove the brake pedal and bracket.
   - To install, tighten to 25 Nm (18 lb-ft).

8. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. Install this switch with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the pedal in any other position results in incorrect adjustment and damages the switch.**

   To install, reverse the removal procedure.



Vehicles equipped with adjustable pedals

9. Index the pedal assemblies. For additional information, refer to Adjustable Pedal Indexing in this section.

repair4less

Brake Pedal Control Switch

NOTE: Steering wheel removed for clarity.

Item	Part Number	Description
1	W715057	Screw
2	9G604	Brake pedal control switch

Removal and Installation

NOTE: Turn the steering wheel 90 degrees to the left to access the brake pedal control switch screws.

1. Remove the steering column shrouds. For additional information, refer to Section 211-04 .
2. Remove the screw.
   - To install, tighten to 3 Nm (27 lb-in).
3. Using a suitable tool (such as a pocket screwdriver), carefully disengage the control switch locking tabs one at a time, then remove the switch.
4. To install, reverse the removal procedure.

repair4less

Torque Specifications

Brake master cylinder nuts	25	18	—
Brake vacuum pump bolts [a]	—	—	—
Coolant expansion tank/lower Air Cleaner (ACL) housing assembly bolts	15	—	133

[a] Refer to the procedure in this section.

Brake Booster

The power brake actuation system consists of the following components:

- Brake booster
- Brake booster check valve
- Brake booster vacuum sensor
- Brake booster vacuum supply hose
- Brake booster vacuum pump (3.5L GTDI engine only)

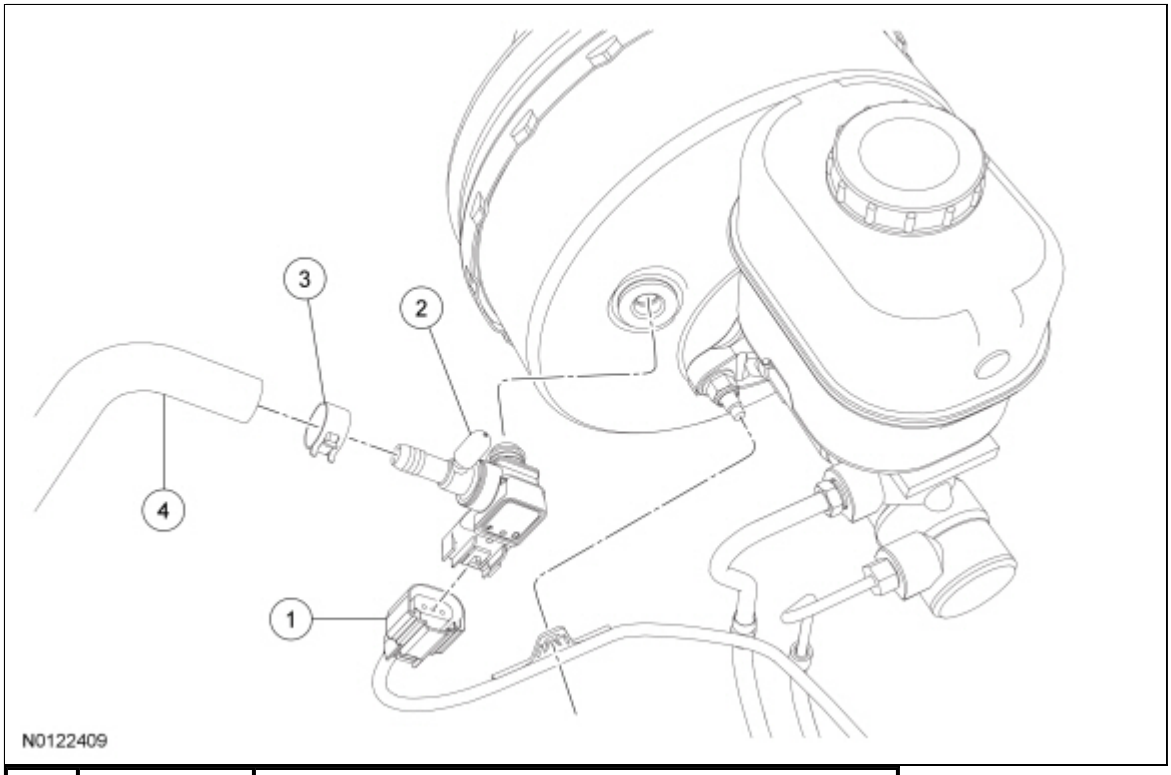
The brake booster uses vacuum from the intake manifold (3.7L and 5.0L) or an engine mounted vacuum pump (3.5L GTDI) to create a partial vacuum inside the vacuum booster on both sides of the diaphragm. When the brake pedal is pressed, the booster rod opens a valve, allowing air to enter the booster on one side of the diaphragm while sealing off the opposite side. This increases pressure on that side of the diaphragm so that it helps push the rod, which in turn pushes the piston in the master cylinder. As the brake pedal is released, the valve seals off the outside air supply while opening the vacuum valve. This restores vacuum to both sides of the diaphragm, allowing everything to return to its original position. The ABS module uses the signals produced by the vacuum sensor to verify the vacuum is maintained in the brake booster.

Brake Booster Vacuum Pump

Vehicles equipped with a 3.5L GTDI engine are also equipped with an engine mounted/cam-driven brake booster vacuum pump. The brake vacuum pump is located on the backside of the RH cylinder head. Refer to Brake Vacuum Pump .

- For vacuum sensor and vacuum pump diagnosis, refer to Section 206-09 .

repair4less



Power Brake System

Refer to Section 206-00 .

Brake Booster Vacuum Sensor

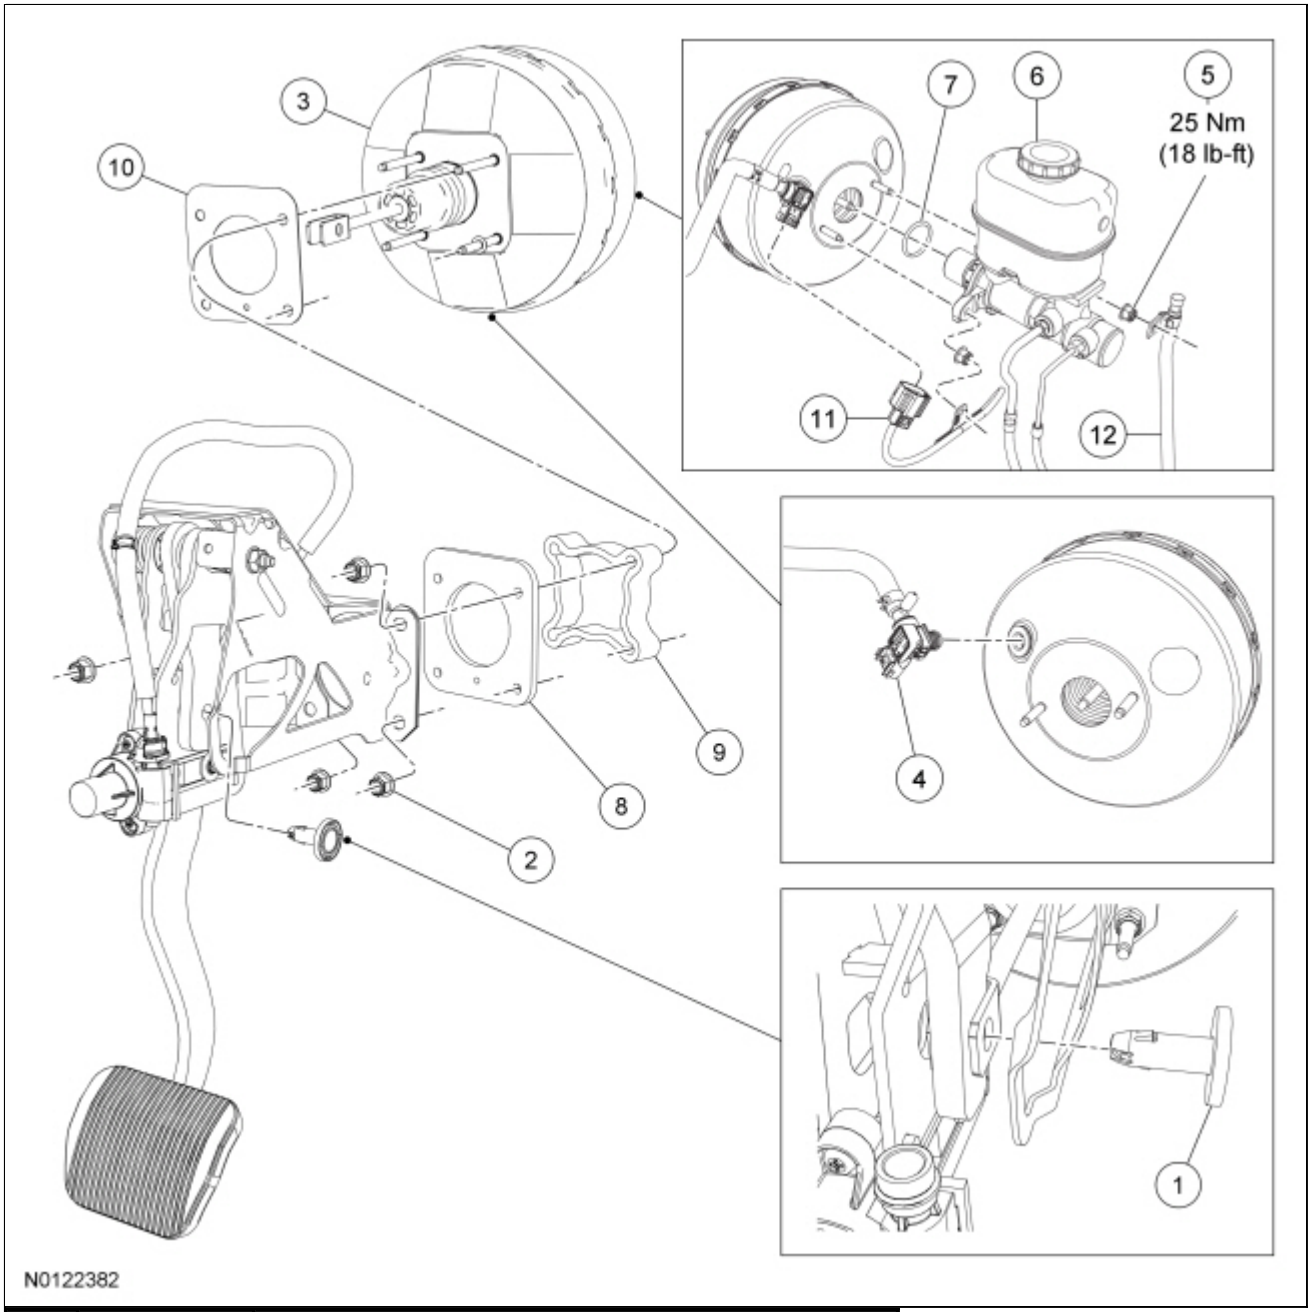
NOTE: Rear Wheel Drive (RWD) shown, Four-Wheel Drive (4WD) similar.

Item	Part Number	Description
1	—	Vacuum sensor electrical connector (part of 12A581)
2	2365	Brake booster vacuum sensor
3	—	Hose clamp (part of 9C490)
4	—	Vacuum supply hose (part of 9C490)

1. Relieve the vacuum in the brake booster by pressing and releasing the brake pedal a minimum of 5 times with the engine not running.

2. Disconnect the vacuum supply hose from the brake booster vacuum sensor.

3. If equipped, disconnect the Four-Wheel Drive (4WD) vacuum reservoir supply hose from the brake booster vacuum sensor.



4. Disconnect the vacuum sensor electrical connector and remove the vacuum sensor.

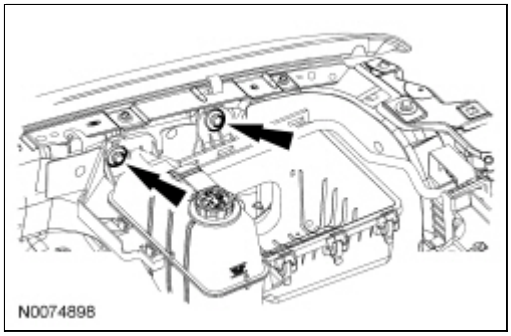
5. **NOTE:** To allow proper drainage of any moisture, the vacuum sensor must be installed in the same position and orientation as removed.

   To install, reverse the removal procedure.

repair4less

Brake Booster

Item	Part Number	Description
1	2L523	Brake pedal pin
2	W520212	Brake booster nut (4 required)
3	2005	Brake booster
4	2365A	Vacuum sensor assembly



5	W520212	Brake master cylinder nut (2 required)
6	2140	Brake master cylinder assembly
7	2152	Brake master cylinder-to-booster seal
8	—	Gasket (part of 2B022)
9	—	Spacer
10	—	Gasket (part of 2B022)
11	—	Vacuum sensor electrical connector (part of 12A581)
12	3B476	Front axle vent hose

Removal and Installation

1. Relieve the vacuum in the brake booster by pressing and releasing the brake pedal a minimum of 5 times with the engine not running.

2. Remove the Air Cleaner (ACL) element. For additional information, refer to Air Cleaner Element in Section 303-12 .

3. Remove the 2 bolts and position the coolant expansion tank/lower ACL housing assembly aside.
   - To install, tighten bolts to 15 Nm (133 lb-in).

4. Disconnect the brake fluid level switch.

5. If equipped, position the vacuum sensor wiring harness and front axle vent hose aside.

6. ***NOTICE:*** **When the master cylinder is removed, the piston will be exposed. Do not damage the piston or piston surface or a fluid leak may occur.**

   Remove the 2 brake master cylinder nuts and position the master cylinder aside.
   - Support the master cylinder with mechanic's wire.
   - To install, tighten the nuts to 25 Nm (18 lb-ft).

7. **NOTE:** To allow proper drainage of any moisture, the vacuum sensor must be installed in the same position and orientation as removed.

   Disconnect the vacuum sensor assembly from the brake booster.

8. ***NOTICE:*** **Do not service the brake pedal or brake booster without first removing the stoplamp switch. This switch must be removed with the brake pedal in the at-rest position. The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.**

repair4less

Remove the stoplamp switch. For additional information, refer to Section 417-01 .

9. **NOTE:** The booster push rod clevis-locking pin is a one-time use only part. Any time the booster push rod clevis-locking pin is removed, a new booster push rod clevis-locking pin should be used.

   NOTE: Remove the clevis-locking pin by squeezing the locking tabs and pulling outward on the opposite end.

   Remove and discard the booster push rod clevis-locking pin.

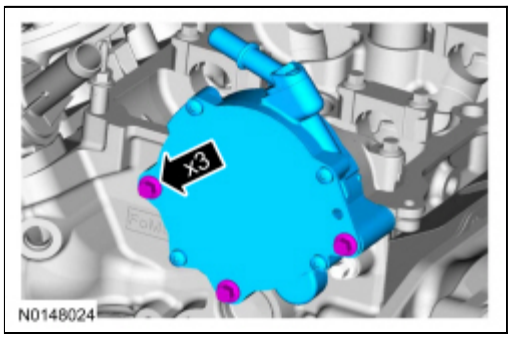
10. Remove the 4 brake booster nuts and remove the brake booster.
    - To access the nuts, fold back the sound insulation.
    - To install, tighten the nuts to 25 Nm (18 lb-ft) following a clockwise pattern starting with the upper left nut.

11. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. This switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the brake pedal in any other position will result in incorrect adjustment and may damage the switch.**

    To install, reverse the removal procedure.

Brake Vacuum Pump

Material



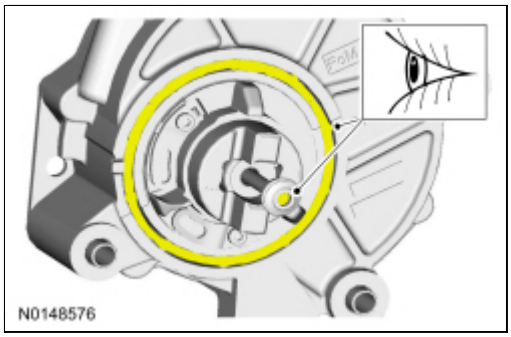
Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—

Removal

1. Remove the RH front fender inner splash shield. Refer to Section 501-02 .
2. 

3. ***NOTICE:*** **Do not use excessive force when removing the vacuum pump or the vacuum pump oil tube may be dilodged from the pump causing internal oil seal damage to the pump. If the oil tube becomes dislodged from the pump, a new vacuum pump must be installed.**

   NOTE: The upper/inboard vacuum pump bolt will remain in the vacuum pump housing when removing the vacuum pump.



Installation

repair4less

1.

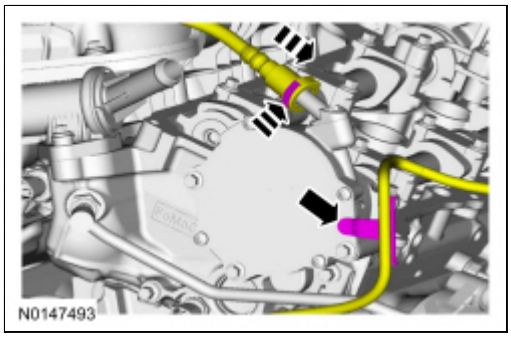
2. ***NOTICE:*** **Make sure the oil tube filter screen is free of contaminants prior to the installation of the pump or damage to components may occur.**

   Visual check. Install a new gasket as necessary.

3. ***NOTICE:*** **If the brake vacuum pump is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Failure to follow this procedure can cause future oil leakage.**

   NOTE: Make sure the mating surfaces are clean and free of foreign material.

   Apply a bead of the specified diameter from the specified tube.



4. **NOTE:** Manually align the brake vacuum pump drive key with the camshaft slot before installation.

   Visual check.
   - Stage 1: Tighten in the sequence shown to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

5.

Anti-Lock Brake System (ABS) and Stability Control

AdvanceTrac® With RSC®

The AdvanceTrac® system is made up of the following systems:

- Anti-lock braking
- Traction control
- ESC

The RSC® system is an optional feature that works in conjunction with AdvanceTrac® to aid in maintaining vehicle stability. AdvanceTrac® with RSC® system consists of the following components:

- ABS module — attached to the Hydraulic Control Unit (HCU), but can be serviced separately from the HCU .
- Front wheel speed sensors — one sensor is located in each front wheel knuckle. The sensors are serviced separately from the knuckle.
- Front wheel speed sensor encoders — one encoder strip is located in each wheel bearing and wheel hub assembly and is serviced with the wheel bearing.
- HCU — contains several valves (inlet, outlet, isolation and dump) and a hydraulic pump motor. It is mounted behind the radiator, below the air cleaner assembly. The HCU is replaced as a unit, including the ABS module.
- Rear wheel speed sensors — one sensor is located in each end of the rear axle housing. The sensors are serviced separately.
- Rear wheel speed sensor tone rings — one tone ring is located on each axle shaft.
- Stability control sensors — located inside the Restraints Control Module (RCM) and consist of the following sensors: yaw rate, roll rate, lateral and longitudinal accelerometers. The sensors are integral to the RCM and cannot be serviced separately.
- Steering wheel rotation sensor (6.2L) — located on the end of the steering column near the intermediate shaft. The sensor is serviced separately from the steering column but the sensor ring is replaced with the column. For all other applications, the steering wheel rotation sensor is part of the EPAS .
- Stability/traction control switch — located in the instrument panel finish panel and is serviced separately from the finish panel.
- Hill Descent Control™ switch — located in the auxiliary switch panel and is serviced separately.
- Brake vacuum pump (3.5L) — a mechanical pump located on the back of the RH cylinder head and driven by the RH exhaust cam shaft.

Electronic Brake Distribution (EBD)

The ABS module and HCU incorporate a strategy called EBD . The EBD strategy uses the HCU as an electronic proportioning valve to create a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking.

A slight bump sensation may be felt in the brake pedal when EBD is active.

Anti-Lock Braking

The conventional ABS aids in the prevention of wheel lock-up during braking events allowing the driver to maintain steering control and stop in the shortest distance possible under most conditions. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper (s).

When the ABS activates, both of the following can occur:

- A rumble or grinding sound may be heard
- If the driver's foot is on the brake pedal, a vibration may be felt in the brake pedal

Supplemental Braking Assist

In addition to preventing wheel lock up during braking events, the ABS module also provides supplemental hydraulic brake assist through the use of the hydraulic pump motor and the HCU . This is done in the event of a severe vacuum loss at the brake booster.

AdvanceTrac® System

Traction Control System

The traction control system aids in the prevention of excessive wheel spin allowing the vehicle to maintain traction during acceleration. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper(s) and by the PCM modulating engine torque.

Electronic Stability Control (ESC) System

The ESC system constantly monitors the vehicle's direction of travel relative to the driver's intended course, except when the vehicle is traveling in reverse, and aids in keeping the vehicle traveling along that course. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper(s) and by the PCM modulating engine torque.

When the AdvanceTrac® system activates, any of the following can occur:

- A rumble or grinding sound may be heard, much like ABS
- If the driver's foot is on the brake pedal, a vibration may be felt in the brake pedal, much like ABS
- A small deceleration or a reduction in the acceleration of the vehicle
- The stability/traction control indicator (sliding car icon) flashes

Roll Stability Control (RSC®) System

The RSC® system constantly monitors vehicle roll motion, except when the vehicle is traveling in reverse, and aids in keeping the vehicle stable during sudden or abrupt maneuvers. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper(s) and by the PCM modulating engine torque. The combination of reduced engine torque and modulated brake fluid pressure

repair4less

aids in reducing the cornering forces and, therefore, the total roll momentum acting on the vehicle.

When the RSC® system activates, the vehicle produces the same noticeable symptoms as it does when the AdvanceTrac® system activates.

Trailer Sway Control

Trailer sway control is a unique function in the AdvanceTrac® with RSC® system that recognizes and aids in reducing trailer sway. The trailer sway control function continually monitors the steering wheel rotation and yaw rate sensors to identify specific, increasing yaw oscillations that occur during a trailer sway event. If the trailer sway event exceeds programmed parameters, the ABS module and the HCU modulate brake fluid pressure to specific brake caliper(s) and the PCM modulates engine torque until the trailer sway is reduced below the programmed parameters.

For vehicles equipped with an optional TBC module, the trailer sway control system utilizes the module to apply the trailer brakes to quickly reduce trailer sway.

When the trailer sway control function activates, the vehicle produces the same noticeable symptoms as it does when the AdvanceTrac® system activates. In addition, the message center displays TRAILER SWAY, REDUCE SPEED and, if the vehicle is equipped with a TBC module, the module shows output to the trailer brakes.

The trailer sway control function only activates when the vehicle speed exceeds 64 km/h (40 mph). The system can be disabled during any key cycle. Refer to the Owner's Literature for information on disabling the system. The system is re-enabled when the ignition is turned to the OFF position and back to the RUN position.

MyKey® Interaction

Through the MyKey® feature, the traction control function of the AdvanceTrac® system can be configured to be always on or to allow the driver to select the traction control function on or off.

When the traction control function is configured to be always on and a MyKey® restricted key is in use, the IPC will ignore any requests made by the driver to disable the traction control function and will not send any traction control disable messages to the ABS module. Refer to the Owner's Literature for additional information on the MyKey® feature and settings.

Hill Start Assist

The hill start assist system is designed to assist the driver during hill-starts. Using the ABS, the hill start assist system holds the vehicle on an incline for a short time, allowing the driver to release the brake pedal and press the accelerator pedal without needing to use the parking brake.

Hill Descent Control™

Hill Descent Control™ maintains vehicle speed on a downhill grade, operating at speeds between 3 km/h (2 mph) and 32 km/h (20 mph). If the vehicle is on flat or uphill terrain, the system goes into standby mode,

remaining activated up to 64 km/h (40 mph). At speeds greater than 64 km/h (40 mph), the Hill Descent Control™ system is deactivated. When Hill Descent Control™ is active, a rumble or grinding sound may be heard and/or felt.

Traction Control Switch

The stability/traction control switch can be used by the driver to disable and enable the traction control, ESC and RSC® functions. Refer to the Owner's Literature for instructions on disabling and enabling the traction control, ESC and RSC® functions.

The conventional ABS cannot be disabled using the stability/traction control switch.

Stability/Traction Control Indicators

The IPC message center is a reconfigurable telltale which is capable of displaying a variety of different messages and indicators such as the stability/traction control indicator (sliding car icon), stability/traction control disabled indicator (sliding car OFF icon), the 4WD mode/range or door open messages. For information about the IPC , refer to Section 413-01 .

There are 2 separate stability/traction control indicators, the sliding car icon and the sliding car OFF icon. Both icons are located in the IPC message center. The sliding car icon is used to alert the driver that a stability/traction event is taking place (flashes twice per second) and to alert the driver of potential concerns in the AdvanceTrac® system (illuminates continuously). The sliding car OFF icon is used to alert the driver that the traction control portion of the AdvanceTrac® system has been disabled by the driver. This icon only illuminates continuously and does not flash.

repair4less

Anti-Lock Brake System (ABS) and Stability Control

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3030-A	Rotunda Active Wheel Speed Sensor Tester 105-R0110
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operations

Anti-Lock Braking

The ABS module continuously monitors brake pedal input, lateral vehicle motion and the rotational speed of each wheel. The PCM sends the brake pedal switch information to the ABS module over the HS-CAN while the RCM sends lateral acceleration sensor information to the ABS module over a private HS-CAN . Wheel speed information is retrieved by the ABS module using 4 active wheel speed sensors. When the ABS module detects an impending wheel lock during a braking event, the ABS module modulates brake pressure to the appropriate brake caliper(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. Once the affected wheel(s) return to the desired speed, the ABS module returns the solenoid valves in the HCU to their normal position.

The ABS module has 2 self-test options, one is carried out after the ignition is turned to the RUN position and the other is carried out after an ABS stop or after an AdvanceTrac® system activation. When the ignition is turned to the RUN position, the ABS module carries out a preliminary electrical check of the wheel speed

sensors and their circuits by sending voltage through the sensor and checking for the voltage to return. When the vehicle is traveling at speeds above 21 km/h (13 mph) and the brake pedal is not being pressed, the HCU pump motor is commanded on for approximately 0.5 second to check pump motor operation. Also, during all phases of operation while the vehicle is in motion, the ABS module checks for correct operation of the wheel speed sensors by comparing wheel speed input to other sensor input. Depending on the nature of the malfunction detected, the ABS module deactivates the anti-lock control system and sends a message over the HS-CAN to the IPC . When the IPC receives this message, it illuminates the yellow ABS warning indicator and the stability/traction control indicator (sliding car icon).

Electronic Brake Distribution (EBD)

On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module then uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle deceleration exceeds a predetermined threshold, the ABS module commands the HCU to close the appropriate isolation valves to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates, the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

If ABS is disabled due to DTCs being present in the ABS module, EBD continues to function unless the DTCs are for wheel speed sensors or the HCU . When EBD is disabled, the red brake warning light, the ABS warning indicator and the stability/traction control indicator (sliding car icon) illuminate.

Supplemental Braking Assist

The ABS module uses the HCU and hydraulic pump motor to aid in bringing the vehicle to a safe, controlled stop in the event of severe vacuum loss at the brake booster. The ABS module continually monitors the vacuum in the brake booster through the use of a vacuum sensor. When the vacuum sensor indicates vacuum is below a predetermined level, a DTC is set in the ABS module. If this occurs during a braking event or if the driver attempts to stop the vehicle with a low vacuum condition in the brake booster, the ABS module activates the hydraulic pump motor in the HCU to assist with vehicle braking.

Traction Control Function

The ABS module continuously monitors and compares the rotational speed of the drive wheels in relation to the non-driven wheels. When the drive wheels begin to spin faster than the non-driven wheels, the ABS module commands the HCU to modulate brake pressure to the appropriate brake caliper. This is accomplished by opening and closing the appropriate solenoid valves inside of the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN that a traction control event is taking place. When the IPC receives this message, it flashes the stability/traction control indicator (sliding car icon). If the event is severe enough, the ABS module sends a message to the PCM over the HS-CAN to assist with traction control. When the PCM receives this message, it adjusts engine timing and decreases fuel injector pulses. Once the affected wheel returns to normal speed, the ABS module returns the solenoid valves in the HCU to their normal position, deactivates the hydraulic pump motor and sends another message over the HS-CAN indicating that the traction event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC turns off the sliding car icon.

Once vehicle speed reaches or exceeds 144 km/h (89 mph), traction control is accomplished only through PCM intervention.

Certain DTCs in the ABS module disable the traction control system. Depending on the DTCs present, the

repair4less

red brake warning light, the yellow ABS warning indicator and the sliding car icon illuminate.

Electronic Stability Control (ESC) and Roll Stability Control (RSC®) Functions

The ESC and RSC® functions are controlled by the ABS module and use the same wheel speed sensors and tone rings used for anti-lock braking. The ESC and RSC® functions also use input from the steering wheel rotation sensor, the stability control sensors (yaw rate, roll rate, longitudinal and lateral accelerometers) which are internal to the RCM and information from other modules sent over the HS-CAN to help maintain vehicle stability.

The ABS module uses the various sensors to continuously monitor vehicle roll motion and direction of travel relative to the driver's intended course. If the ABS module determines from all these inputs that the vehicle is unable to travel in the intended direction or that a condition exists for a potential rollover event, it modulates brake pressure to the appropriate brake caliper(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN that a stability event is taking place. When the IPC receives this message, it flashes the stability/traction control indicator (sliding car icon). During a stability event, conditions may require the involvement of the PCM to limit engine torque like it does for traction control. Once the stability condition has been corrected, the ABS module sends another message over the HS-CAN indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC turns off the sliding car icon.

Certain DTCs being present in the ABS module may disable the ESC and RSC® functions. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding car icon are illuminated.

Trailer Sway Control Function

Trailer sway control is a unique function of the RSC® system that uses information from the steering wheel rotation sensor and the yaw information from the RCM to determine if a trailer sway event is taking place. Trailer sway is the undesirable yaw force a trailer can apply to the towing vehicle. If the ABS module determines that a trailer sway event is taking place, it takes action similar to the action taken for an ESC and an RSC® event. At the same time, the ABS module sends a message over the HS-CAN that a trailer sway event is taking place. When the IPC receives this message, it flashes the stability traction control indicator (sliding car icon) and displays TRAILER SWAY REDUCE SPEED in the message center. If necessary, the PCM reduces engine torque as it does for ESC and RSC® . Once the trailer sway has been corrected, the ABS module sends another message over the HS-CAN indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC turns off the stability traction control indicator (sliding car icon).

If the vehicle is also equipped with a TBC system, the TBC module receives the trailer sway message from the ABS module and takes appropriate action to assist in reducing the trailer sway. Refer to Section 206-10 for information on the TBC system.

Trailer sway control only activates with vehicle speed greater than 64 km/h (40 mph). Any malfunction that disables the RSC® function also disables the trailer sway control function. Trailer sway control can also be disabled through the message center. Refer to the Owner's Literature for the disabling/enabling procedure. Regardless of the chosen state (enabled or disabled), trailer sway control is re-enabled at each ignition key cycle.

Hill Start Assist

The hill start assist system engages automatically when the following conditions are met:

- The driver applies the vehicle brake and the vehicle is at a complete stop.
- Road inclination of approximately 4 degrees or more is detected (as indicated by the stability control sensor information).
- The vehicle transmission information indicates that the driver selects the correct gear, indicating the intention to drive up the hill.
- The parking brake is not engaged.

Once all the above criteria have been met and the driver releases the brake pedal, hill start assist utilizes the valves in the Hydraulic Control Unit (HCU) to hold the car stationary for up to 2 seconds giving the driver time to accelerate the vehicle. As the vehicle accelerates hill start assist gradually releases the brake pressure to make sure that the vehicle is neither rolling back nor driving off until there is sufficient driving torque to accelerate the vehicle forward. Hill start assist also functions if the vehicle is facing downhill if the reverse gear is selected.

Hill Descent Control™ and Hill Descent Control™ Switch

Hill Descent Control™ uses the pump motor and HCU to provide vehicle speed control while descending a downhill grade, information from the RCM to determine whether or not the vehicle is on a downhill grade and wheel speed sensor information to determine vehicle speed. When the Hill Descent Control™ switch is pressed, a ground signal is sent to the IPC indicating that the driver has activated the system. The IPC then sends a message to the ABS module along the HS-CAN requesting system activation. The ABS module uses the input from the RCM and wheel speed sensors to determine the mode of operation (active, stand-by or deactivated). During a hill descent, while the Hill Descent Control™ system is activated, the driver sets vehicle speed through the use of the accelerator and brake pedals. Once the desired speed has been set, the system maintains that speed until one of the following occur:

- The vehicle is no longer on a downhill grade.
- The driver presses the switch again.
- Vehicle speed exceeds 64 km/h (40 mph).
- The system is disabled for cooling.

During periods of sustained use, the Hill Descent Control™ system automatically deactivates in order to cool the brake system. When this occurs, the system notifies the driver with a message in the message center and by sounding a warning chime. At this time the driver needs to provide brake and/or throttle control to maintain the desired descent speed. The system remains disabled until it has sufficiently cooled. The length of time needed for cooling varies depending on operating conditions.

Stability/Traction Control Switch

Unlike conventional ABS, the individual functions of AdvanceTrac® with RSC® can be deactivated by the driver through the stability/traction control switch. The switch is hard-wired to the IPC and when pressed, sends a ground signal to the IPC .

If the stability/traction control switch is pressed and held for more than 30 seconds, a DTC sets in the ABS module.

Once disabled, the system remains in that state until the driver presses the switch again, the ignition is cycled or the vehicle speed reaches or exceeds 56 km/h (35 mph). Once the vehicle speed reaches or exceeds 56 km/h (35 mph), RSC® and ESC are reactivated. Once the vehicle speed drops below 48 km/h

repair4less

(30 mph), traction control returns to the state the driver had originally selected, either on or off.

The functions cannot be disabled when a MyKey® restricted key is in use with the AdvanceTrac® always-on feature configured to on. If an attempt is made to disable the ESC system while a MyKey® restricted key is in use, ADVTRAC ON MY KEY SETTING displays in the IPC message center. For information about MyKey®, refer to Section 419-01B .

Stability/Traction Control Indicators

Both the stability/traction control indicator (sliding car icon) and the stability/traction control disabled indicator (sliding car OFF icon) alert the driver of stability/traction control system status.

When certain stability control system DTC(s) are present, the ABS module sends a message to the IPC over the HS-CAN . Depending on the nature of the DTC(s), the IPC responds by either solidly illuminating 1 or both icons or by flashing the icon(s) once every 2 seconds.

When a stability/traction control event is taking place, the ABS module sends a message to the IPC over the HS-CAN to flash the sliding car icon twice per second.

When the driver disables the stability/traction control system by using the traction control switch, the IPC receives a ground signal from the switch and then sends a message over the HS-CAN indicating that the driver has requested the system be deactivated and illuminates the sliding car OFF icon.

Stability Control Sensors

The stability control sensors provide information to the ABS module for the operation of the ESC function, RSC® function (if equipped), hill start assist system and the Hill Descent Control™ system (if equipped). The stability control sensors are housed in the RCM and are serviced with the module. The sensors used for stability control include the yaw rate sensor, the lateral accelerometer, the longitudinal accelerometer and (if equipped with RSC®) the roll rate sensor. Sensor information is sent to the ABS module over a private HS-CAN .

Steering Wheel Sensor Information

For the 6.2L engine, the steering wheel rotation sensor uses an optical sensor and a slotted wheel to measure the rate of rotation (angle) of the steering wheel. The steering wheel rotation sensor uses the HS-CAN to transmit information to the ABS module about steering wheel turning direction (left or right) and how far the steering wheel is being turned. The steering wheel rotation sensor does not indicate the absolute position of the steering wheel relative to straight-ahead. The ABS module learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The module confirms this position and modifies it as necessary during every new driving cycle.

For all other applications, the steering wheel rotation sensor is part of the EPAS system and is located inside the PSCM . The sensor is serviced with the PSCM . The PSCM uses the HS-CAN to transmit information to the ABS module about steering wheel turning direction (left or right) and how far it is being turned. The PSCM does not indicate the absolute position of the steering wheel relative to straight-ahead. The ABS module learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The ABS module confirms this position and modifies it as necessary during every new driving cycle.

ABS Module Configuration

Module configuration is a scan tool process which configures specific vehicle settings in a new module. If installing a new ABS module and/or a new HCU , the ABS module must be configured. To configure the ABS module, refer to PMI in Section 418-01 .

Inspection and Verification

1. Verify the customer concern.

2. Verify the stoplamps operate correctly by applying and releasing the brake pedal. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.

3. Verify that the PRNDL operates correctly on the IPC . If the PRNDL does not operate correctly, refer to Section 413-01 . If the PRNDL operates correctly, proceed to the next step.

4. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the DLC .

7. **NOTE:** The VCM LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

8. If the scan tool does not communicate with the vehicle:

repair4less

- verify the ignition is ON.
- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

9. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record CMDTCs .

10. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module.

11. If the DTCs retrieved are related to the concern, go to ABS Module DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10 .

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

ABS Module DTC Chart

NOTE: Always retrieve the continuous DTCs after running the self-test.

DTC	Description	Action
B1342	ECU is Defective	***NOTICE:*** **Do not power the Electronic Control Unit (ECU) while it is removed from the HCU . Failure to do so could damage the ECU or cause the ECU to set unrelated DTCs.** **NOTE:** If other DTCs are present, repair them before installing a new component. CLEAR the DTCs. REPEAT the self-test. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.
B1596	Service Continuous Codes	**NOTE:** This DTC does not indicate a malfunction of the ABS. If other DTCs are present, REPAIR them before addressing this DTC. Some DTCs cannot be detected by the ABS module until the ignition is cycled from ON to OFF and back to ON again. When DTCs are cleared using the scan tool, the ignition needs to be cycled in order to clear this DTC and have the ABS module check for other DTCs. DIAGNOSE all other DTCs. CLEAR the DTCs. CYCLE the ignition. RETRIEVE the DTCs. GO to the ABS Module DTC Chart.
B1676	Battery Pack Voltage Out of Range	GO to Pinpoint Test A .
B2477	Module Configuration Failure	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01 . CLEAR the DTCs. REPEAT the self-test.
B2900	VIN Mismatch	GO to Pinpoint Test B .

C109D	Low Vacuum Condition Detected	GO to Pinpoint Test I .
C109E	Vacuum Sensor Circuit Fault	GO to Pinpoint Test I .
C109F	Vacuum Sensor Signal Fault	GO to Pinpoint Test I .
C1145	Wheel Speed Sensor RF Input Circuit Failure	GO to Pinpoint Test D .
C1155	Wheel Speed Sensor LF Input Circuit Failure	GO to Pinpoint Test D .
C1165	Wheel Speed Sensor RR Input Circuit Failure	GO to Pinpoint Test D .
C1175	Wheel Speed Sensor LR Input Circuit Failure	GO to Pinpoint Test D .
C116A	ABS Pressure Transducer / Brake Switch Mismatch	GO to Pinpoint Test G .
C1222	Wheel Speed Mismatch	GO to Pinpoint Test E .
C1266	ABS Valve Power Relay Circuit Failure	GO to Pinpoint Test F .
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	This DTC sets when the steering wheel angle sensor data received over the HS-CAN is out of range and does not agree with other supporting sensor data. For the 6.2L engine, REFER to Section 211-05 to diagnose any SCCM DTCs. For all others, REFER to Section 211-05 to diagnose any SCCM DTCs. If no SCCM DTCs are present, REFER to Section 211-00A to diagnose any PSCM DTCs.
C1280	Yaw Rate Sensor Signal Fault	This DTC indicates a concern with the yaw rate sensor which is integral to the Restraints Control Module (RCM). REFER to Section 501-20B to diagnose all the RCM DTCs. If no RCM DTCs are present, GO to Pinpoint Test P .
C1282	Lateral Accelerometer Signal Fault	This DTC indicates a concern with the lateral accelerometer which is integral to the RCM . REFER to Section 501-20B to diagnose all the RCM DTCs. If no RCM DTCs are present, GO to Pinpoint Test P .
C1288	Pressure Transducer Main/Primary Input Circuit Failure	CLEAR the DTCs. REPEAT the self-test. RETRIEVE the DTCs. If DTC C1288 is retrieved, INSTALL a new Hydraulic Control Unit (HCU). REFER to Hydraulic Control Unit (HCU) . CLEAR the DTCs. REPEAT the self-test.
C1296	Wheel Speed LF Signal Fault	GO to Pinpoint Test E .
C1297	Wheel Speed RF Signal Fault	GO to Pinpoint Test E .
C1298	Wheel Speed RR Signal Fault	GO to Pinpoint Test E .
C1299	Wheel Speed LR Signal Fault	GO to Pinpoint Test E .

repair4less

C1300	ABS Pump Motor Circuit Failure	GO to Pinpoint Test C .
C1440	Pressure Transducer Main/Primary Signal Faulted	GO to Pinpoint Test G .
C1516	Roll Rate Sensor Signal Fault	This DTC indicates a concern with the roll rate sensor which is integral to the RCM . REFER to Section 501-20B to diagnose all the RCM DTCs. If no RCM DTCs are present, GO to Pinpoint Test P .
C1963	Stability Control Inhibit Warning	GO to Pinpoint Test P .
C1975	IVD Plausibility Failure	GO to Pinpoint Test P .
C2770	Longitudinal Acceleration Sensor Plausibility Failure	This DTC indicates a concern with the longitudinal accelerometer which is integral to the RCM . REFER to Section 501-20B to diagnose all the RCM DTCs. If no RCM DTCs are present, GO to Pinpoint Test P .
C2775	TC/AYC ON/OFF Switch Stuck Failure	GO to Pinpoint Test R .
C2809	Hill Descent Control Switch Stuck	GO to Pinpoint Test J .
U0073	Control Module Communication Bus A Off	REFER to Section 418-00 to diagnose the High Speed Controller Area Network (HS-CAN).
U0100	Loss of Communication with ECM/PCM	GO to Pinpoint Test K .
U0114	Lost Communication With Four-Wheel Drive Clutch Control Module	GO to Pinpoint Test L .
U0131	Lost Communication With Power Steering Control Module (VAPS)	GO to Pinpoint Test M . For the 6.2L engine, GO to Pinpoint Test N .
U0140	Lost Communication With Body Control Module (GEM)	GO to Pinpoint Test O .
U0151	Lost Communication With Restraints Control Module	GO to Pinpoint Test P .
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	GO to Pinpoint Test Q .
U0401	Invalid Data Received From ECM/PCM	This DTC sets when the ABS module receives invalid network data from the PCM. RETRIEVE and REPAIR all non-network DTCs in the PCM. REFER to Section 303-14 .
U0414	Invalid Data Received from Four-Wheel Drive Clutch Control Module	This DTC sets when the ABS module receives invalid network data from the Transfer Case Control Module (TCCM). RETRIEVE and REPAIR all non-network DTCs in the TCCM . REFER to Section 308-07A .
U0423	Invalid Data Received From Instrument Panel Control Module	This DTC sets when the ABS module receives invalid network data from the Instrument Panel Cluster (IPC). RETRIEVE and REPAIR all non-network DTCs in the IPC . REFER to Section 413-01 .

U0428	Invalid Data Received from Steering Angle Sensor Module	This DTC sets when the ABS module receives invalid steering angle network data. For vehicles equipped with Hydraulic Power Assist Steering (HPAS), this data is sent from the Steering Column Control Module (SCCM). RETRIEVE and REPAIR all non-network DTCs in the SCCM. REFER to Section 211-05. For vehicles equipped with Electronic Power Assist Steering (EPAS), this data is sent from the Power Steering Control Module (PSCM). RETRIEVE and REPAIR all non-network DTCs in the PSCM. REFER to Section 211-00B.
U0452	Invalid Data Received From Restraints Control Module	This DTC sets when the ABS module receives invalid network data from the RCM. RETRIEVE and REPAIR all non-network DTCs in the RCM. REFER to Section 501-20B. If no RCM DTCs are present, GO to Pinpoint Test P.
U2050	No Application Present	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01. CLEAR the DTCs. REPEAT the self test.
U2051	One or More Calibration Files Missing /Corrupt	CLEAR the DTC. CARRY OUT the ABS module self-test. If DTC U2051 returns, RECONFIGURE the ABS module using as-built data. REFER to PMI Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available in Section 418-01. CLEAR the DTC and REPEAT the self-test. If DTC U2051 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test.
U2152	SCP (J1850) Invalid Data from GEM	This DTC sets when the ABS module receives invalid network data from the Body Control Module (BCM). RETRIEVE and REPAIR all non-network DTCs in the BCM. REFER to Section 419-10.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the ABS module	• Fuse • Wiring, terminals or connectors • ABS module	• REFER to Section 418-00.
• The yellow ABS warning indicator is never on	• Wiring, terminals or connectors • Instrument Panel Cluster (IPC)	• REFER to Section 413-01.
• The stability/traction control indicator (sliding car icon) is never on	• Stability/traction control system • ABS module • IPC	• REFER to Section 413-01.
• Only the red brake warning indicator is always/never on	• Wiring, terminals or connectors • Parking brake switch • Brake fluid level switch	• REFER to Section 413-01.

repair4less

	• Body Control Module (BCM) • IPC	
• The yellow ABS warning indicator is always on	• DTCs in the ABS module • ABS module • IPC	• RETRIEVE and RECORD any ABS module DTCs. GO to the ABS Module DTC Chart. • If there are no DTCs present in the ABS module, REFER to Section 413-01 .
• The sliding car icon is always on	• DTCs in the ABS module • Stability/traction control system • IPC	• RETRIEVE and RECORD any ABS module DTCs. GO to the ABS Module DTC Chart. • If there are no DTCs present in the ABS module, REFER to Section 413-01 .
• All 3 indicators (red brake warning light, yellow ABS warning indicator and the sliding car icon) are always on	• DTCs in the ABS module • Wiring, terminals or connectors • Parking brake switch • Brake fluid level switch • Stability/traction control system • BCM • ABS module • IPC	• RETRIEVE and RECORD any ABS module DTCs. GO to the ABS Module DTC Chart. • If there are no DTCs present in the ABS module, REFER to Section 413-01 .
• Spongy brake pedal with no warning indicator	• Air in the brake hydraulic system • Damaged or incorrectly installed brake components	• BLEED the brake system and the Hydraulic Control Unit (HCU). REFER to Brake System Bleeding in Section 206-00 . • INSPECT the brake pedal, brake booster and master cylinder for correct installation. REFER to Section 206-06 for the brake pedal and master cylinder or Section 206-07 for the brake booster. CORRECT the installation or INSTALL new as necessary. TEST the system for normal operation.
• Poor vehicle tracking during anti-lock function	• Air in the hydraulic brake system • Low tire pressure • HCU • Base brake system concern	• GO to Pinpoint Test S . • REFER to Section 206-00 .
• The stability/traction	• Wiring, terminals or	• GO to Pinpoint Test R .

control system is inoperative	connectors • Stability/traction control switch • ABS module • IPC	
• The stability/traction control system cannot be disabled	• If a MyKey® restricted key is in use with the AdvanceTrac® always on feature configured to on, the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system • Wiring, terminals or connectors • Stability/traction control switch • IPC	• GO to Pinpoint Test R .
• The Hill Descent Control™ system (if equipped) is inoperative	• ABS module DTCs present • Hill Descent Control™ switch • Wiring, terminals or connectors	• CARRY OUT a ABS module self-test. • GO to Pinpoint Test J .

Pinpoint Tests

Pinpoint Test A: DTC B1676

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

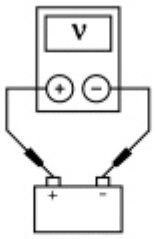
Normal Operation

The voltage required for correct ABS operation is between 10 and 17 volts. Voltage outside of this range causes the ABS module to set DTC B1676.

- DTC B1676 (Battery Pack Voltage Out of Range) — this DTC sets in every ignition cycle if, with the ignition in the RUN position and vehicle speed greater than 6 km/h (4 mph), the battery voltage is less than 10 volts or more than 17 volts. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.

This pinpoint test is intended to diagnose the following:

- Fuse
- Battery condition
- Wiring, terminals or connectors
- ABS module

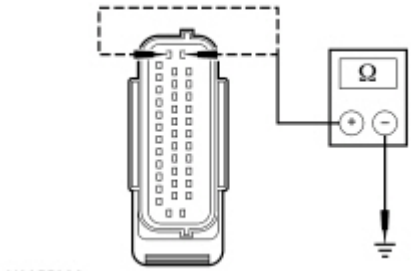


repair4less

PINPOINT TEST A: DTC B1676

NOTE: DTC B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

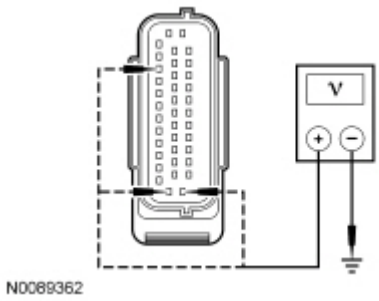
NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.



Test Step	Result / Action to Take
A1 RETRIEVE ALL CMDTC IN ALL MODULES • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC B1317, B1318 or B1676 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to A2 .
A2 CHECK BATTERY CONDITION • Ignition OFF. • Carry out the Battery — Condition Test. Refer to Section 414-01 . • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to A3 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR all CMDTCs . TEST the system for normal operation.
A3 CHECK CHARGING SYSTEM VOLTAGE **NOTE:** Do not allow the engine speed to increase above 2,000 rpm while carrying out this step or the generator can self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle off and restart the engine before carrying out this step. • Start the engine. • Measure the voltage of the battery with and without a load on the charging system as follows: ▪ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ▪ Turn the headlights on and the HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.	**Yes** GO to A4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

AJ0210-A

- **Are the voltages between 13 and 15.2 volts?**



A4 CHECK THE ABS MODULE GROUND CIRCUITS FOR AN OPEN	

• Disconnect: Battery Negative Cable .
• Ignition OFF.
• Disconnect: ABS Module C135 .
• Measure the resistance between ground and:
  ▪ ABS module C135-13, circuit GD121 (BK/YE), harness side.
  ▪ ABS module C135-38, circuit GD121 (BK/YE), harness side.

 	
N0055396
• **Are the resistances less than 0.5 ohm?**
	Yes
	GO to A5 .
	
	No
	REPAIR the affected circuit(s). CLEAR all CMDTCs . REPEAT the self-test.

A5 CHECK FOR VOLTAGE AT THE ABS MODULE	

• Connect: Battery Negative Cable .
• Ignition ON.
• Measure the voltage between ground and:
  ▪ ABS module C135-1, circuit SBB47 (WH/RD), harness side.
  ▪ ABS module C135-25, circuit SBB36 (GN/RD), harness side.
  ▪ ABS module C135-35, circuit CBB54 (VT/OG), harness side.
	Yes
	GO to A6 .
	
	No
	VERIFY that Battery Junction Box (BJB) fuses 36 (30A), 47 (60A), and 54 (5A) are OK. If OK, REPAIR the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test.

repair4less

 N0089362 • **Are the voltages greater than 10 volts?**	
A6 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect: ABS Module C135 .
• Check the connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B2900

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the ignition is turned to the RUN position, the ABS module and the Body Control Module (BCM) share Vehicle Identification Number (VIN) information over the High Speed Controller Area Network (HS-CAN).

- DTC B2900 (VIN Mismatch) — this DTC sets in the ignition cycle if the VIN information stored in the ABS module does not match the information transmitted by the BCM . DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.

This pinpoint test is intended to diagnose the following:

- Module configuration (ABS and BCM)
- ABS module

PINPOINT TEST B: DTC B2900

Test Step	Result / Action to Take
B1 VERIFY BCM VIN	
• Connect the scan tool.	**Yes**

• Ignition ON. • Using the scan tool, carry out the network test. • Enter the following diagnostic mode on the scan tool: Log Viewer . • Compare the VIN in log viewer to the VIN plate. • **Does VIN in log viewer match the VIN plate?**	GO to B2 . **No** RECONFIGURE the BCM . FOLLOW the instructions on the scan tool. CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test.
B2 VERIFY ABS MODULE PART NUMBER	
• Retrieve and record the ABS module part number from log viewer and verify that the vehicle has the correct ABS module installed. • **Is the correct ABS module installed in the vehicle?**	**Yes** CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available in Section 418-01 . CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. CYCLE the ignition key. TEST the system for normal operation.

Pinpoint Test C: DTC C1300

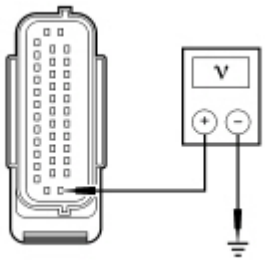
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

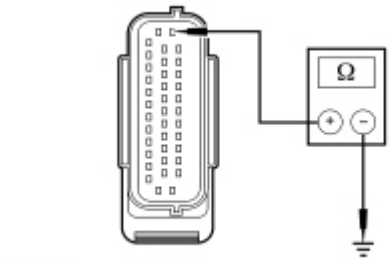
The operating voltage required to run the hydraulic pump motor is between 10 and 17 volts. Fused battery voltage for the hydraulic pump motor is supplied to the ABS module from the Battery Junction Box (BJB). The hydraulic pump motor is internal to the Hydraulic Control Unit (HCU). If a new hydraulic pump motor is needed, a new HCU must be installed.

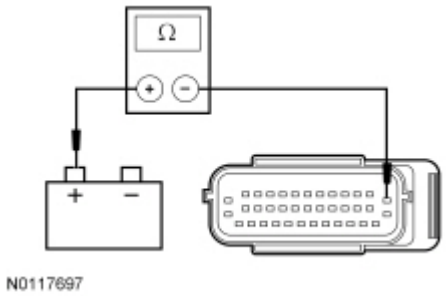
- DTC C1300 (ABS Pump Motor Circuit Failure) — this DTC sets every ignition cycle or in on-demand memory if there are circuit failures such as a short to ground, open, high circuit resistance, damaged motor, blown fuse. The module also checks the motor after every actuation. When the pump is shut off, the ABS module measures the output voltage of the motor. If the voltage drops too quickly, there may be a locked motor. DTC C1300 sets if this fault is detected 3 times. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- HCU
- ABS module





PINPOINT TEST C: DTC C1300

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct**

repair4less

probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK THE ABS PUMP MOTOR	
• Ignition ON. • **Is the ABS pump motor running all the time?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK THE ABS MODULE PUMP MOTOR (PMP_MOTOR) OUTPUT COMMAND	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • Toggle the PMP_MOTOR output command ON. • **Does the ABS pump motor run for approximately 3 seconds?**	**Yes** TOGGLE the PMP_MOTOR output command OFF. CLEAR the DTCs. CHECK the yellow ABS warning indicator while driving the vehicle (the brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1300 is retrieved again, GO to C5 . If the yellow ABS warning indicator does not illuminate, the system is OK. **No** TOGGLE the PMP_MOTOR output command OFF. GO to C3 .
C3 CHECK FOR VOLTAGE TO THE ABS MODULE	
• Ignition OFF. • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between ABS module C135-1, circuit SBB47 (WH/RD), harness side and ground.  N0058091 • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** VERIFY BJB fuse 47 (60A) is OK. If OK, REPAIR open in circuit SBB47 (WH/RD). If not OK, REPAIR the short circuit in circuit SBB47 (WH/RD). CLEAR the DTCs. REPEAT the self-test.
C4 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE	

• Ignition OFF. • Disconnect: Battery Negative Cable . • Measure the resistance between ABS module C135-13, circuit GD121 (BK/YE), harness side and ground.  N0055398 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to C5 . **No** REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE ABS MODULE POWER CIRCUIT FOR CONTINUITY	
• Measure the resistance between the ABS module C135-1, circuit SBB47 (WH-RD), harness side and battery positive.  N0117697 • **Is the resistance less than 0.5 ohms?**	**Yes** GO to C6 . **No** REPAIR the open circuit SBB47 (WH/RD). CLEAR the DTCs. REPEAT the self-test.
C6 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect: ABS Module C135 .
• Check the connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• Connect: Battery Negative Cable .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1145, C1155, C1165 and C1175

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

repair4less

Active wheel speed sensors generate a square wave current signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the wheel speed sensors and their circuitry to determine if they are functional. The front wheel bearings contain a magnetic strip that replaces the tone ring. It functions the same but is not visible for inspection.

Battery voltage and ground are supplied to the active wheel speed sensors from the ABS module.

DTC Description	Fault Trigger Condition
• C1145 — Speed Wheel Sensor RF Input Circuit Failure • C1155 — Speed Wheel Sensor LF Input Circuit Failure • C1165 — Speed Wheel Sensor RR Input Circuit Failure • C1175 — Speed Wheel Sensor LR Input Circuit Failure	These DTCs set in continuous memory if the ABS module detects an open, short to ground or voltage or a damaged wheel speed sensor input circuit, the appropriate DTC sets when the vehicle speed exceeds 6 km/h (4 mph). DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected. DTCs C1165 and C1175 also set on-demand.

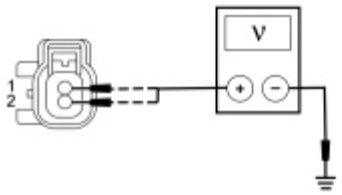
This pinpoint test is intended to diagnose the following:

- Wheel speed sensors
- Wheel bearing magnetic strips, rear tone rings
- Wiring, terminals or connectors
- ABS module

PINPOINT TEST D: DTCs C1145, C1155, C1165 AND C1175

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: If the ignition is turned to the ON position when a wheel speed sensor is disconnected, the ABS module disables the output to that sensor. Make sure all test connections are made at the wheel speed sensor connector before turning the ignition to the ON position.



Test Step	Result / Action to Take
D1 CHECK FOR FAULT REPEATABILITY	
• Connect the scan tool. • Ignition ON.	**Yes** If the Rotunda Active Wheel Speed Sensor Tester is available, GO to D2 . If

• Enter the following diagnostic mode on the scan tool: Clear the Continuous DTCs . • Drive the vehicle at least 16 km/h (10 mph). • Retrieve the Continuous Memory Diagnostic Trouble Codes (CMDTCs). • **Is DTC C1145, C1155, C1165 or C1175 retrieved?**	the Rotunda Active Wheel Speed Sensor Tester is not available, GO to D4 . **No** INSPECT the wheel speed sensors and wheel speed sensor wiring. REPAIR or INSTALL new as necessary. If any other DTCs are retrieved, GO to the ABS Module DTC Chart.
D2 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor . • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Select the correct system polarity on the tester and turn the tester power switch to the ON position. • Ignition ON. • **Is the module output LED illuminated?**	**Yes** GO to D3 . **No** GO to D6 .
D3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current overload level LED is not illuminated and the sensor output LEDs do not illuminate or if the current overload level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current overload level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the outputs LEDs still do not flash when spinning the wheel, INSTALL a new wheel bearing magnetic strip or tone ring (rear). REFER to Section 204-01A , Section 204-01B or Wheel Speed Sensor Ring — Rear in this section.
D4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
NOTE: Check both circuits for each DTC. • Ignition OFF.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

repair4less

- Disconnect: ABS Module C135 .
- Disconnect: Suspect Wheel Speed Sensor .
- Ignition ON.
- Measure the voltage between the suspect wheel speed sensor connector, harness side and ground as follows:

Wheel Speed Sensor	Circuit
C150-1 (LF)	VCA03 (VT/WH)
C150-2 (LF)	RCA17 (YE)
C160-1 (RF)	VCA05 (GY/VT)
C160-2 (RF)	RCA19 (VT)
C426-1 (RR)	VCA06 (WH/OG)
C426-2 (RR)	RCA20 (BN)
C440-1 (LR)	VCA04 (BU/OG)
C440-2 (LR)	RCA18 (BN/GN)

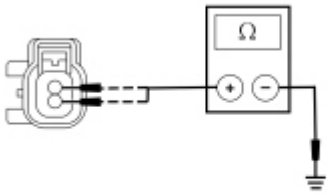
N0120698

- **Is any voltage present?**

No
GO to D5 .

D5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND

NOTE: Check both circuits for each DTC.



- Ignition OFF.
- Measure the resistance between the wheel speed sensor connector, harness side and ground as follows:

Wheel Speed Sensor	Circuit
C150-1 (LF)	VCA03 (VT/WH)
C150-2 (LF)	RCA17 (YE)
C160-1 (RF)	VCA05 (GY/VT)
C160-2 (RF)	RCA19 (VT)
C426-1 (RR)	VCA06 (WH/OG)
C426-2 (RR)	RCA20 (BN)
C440-1 (LR)	VCA04 (BU/OG)

Yes
GO to D6 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

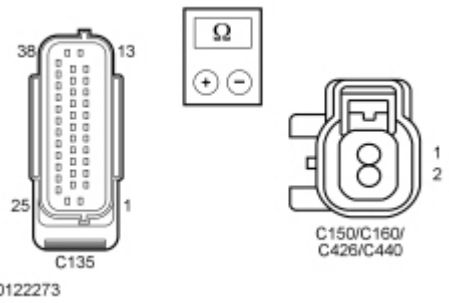
C440-2 (LR)	RCA18 (BN/GN)

N0120699

- **Are the resistances greater than 10,000 ohms?**

D6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Check both circuits for each DTC.



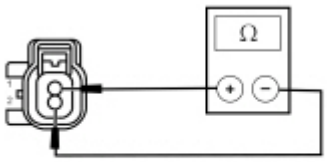
- Ignition OFF.
- Disconnect: ABS Module C135 .
- Disconnect: Suspect Wheel Speed Sensor .
- Measure the resistance between the ABS module connector, harness side and the suspect wheel speed sensor connector, harness side as follows:

ABS Module	Circuit	Wheel Speed Sensor
C135-21	VCA03 (VT/WH)	C150-1 (LF)
C135-34	RCA17 (YE)	C150-2 (LF)
C135-18	VCA05 (GY/VT)	C160-1 (RF)
C135-6	RCA19 (VT)	C160-2 (RF)
C135-19	VCA06 (WH/OG)	C426-1 (RR)
C135-31	RCA20 (BN)	C426-2 (RR)
C135-33	VCA04 (BU/OG)	C440-1 (LR)
C135-20	RCA18 (BN/GN)	C440-2 (LR)

Yes
GO to D7 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the ABS self-test.

repair4less



- **Are the resistances less than 5 ohms?**

D7 CHECK SHORTED WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between the suspect wheel speed sensor connector, harness side as follows:

ABS Module	Circuit	Wheel Speed Sensor
C135-21	VCA03 (VT/WH)	C150-1 (LF)
C135-34	RCA17 (YE)	C150-2 (LF)
C135-18	VCA05 (GY/VT)	C160-1 (RF)
C135-6	RCA19 (VT)	C160-2 (RF)
C135-19	VCA06 (WH/OG)	C426-1 (RR)
C135-31	RCA20 (BN)	C426-2 (RR)
C135-33	VCA04 (BU/OG)	C440-1 (LR)
C135-20	RCA18 (BN/GN)	C440-2 (LR)

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to D8 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

D8 CHECK THE ABS MODULE OUTPUT

NOTE: Make sure all test connections are made at the wheel speed sensor before the ignition key is turned to the ON position.

Yes
INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this

NOTE: Use a meter with a min/max feature and/or recording capabilities to obtain accurate measurements. The ABS module disables the voltage output immediately if the wheel speed sensor is not present. • Ignition OFF. • Connect: ABS Module C135 . • Connect the meter to the suspect wheel speed sensor electrical connector pins, harness side. • Set the meter to measure DC voltage. • Set the meter range to greater than 15 volts. • Enable the min/max or recording feature. • Ignition ON. • Check the maximum recorded voltage on the meter. • **Is the maximum recorded voltage greater than 10 volts?**	section. CLEAR the DTCs. REPEAT the self-test. **No** GO to D9 .
D9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect: ABS Module C135 .
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTCs C1222, C1296, C1297, C1298 and C1299

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and tone ring generate a square wave current signal to the ABS module that is proportional to the wheel speed. The ABS module compares the wheel speed inputs from all the wheel speed sensors to determine an impending wheel lockup. Incorrect tire size or tire pressure can set these DTCs as well. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.

DTC Description	Fault Trigger Condition
• C1222 — Speed Wheel Mismatch	This DTC sets in the ignition cycle when the vehicle speed exceeds 20 km/h (12 mph) or the ABS module detects a difference between wheel speed sensor signals. This DTC can also be set by damaged tone rings, mismatched wheel and/or tire sizes or driving the vehicle on one or more deflated tires.
• C1296 — Wheel Speed LF Signal Fault • C1297 —	These DTCs set in the ignition cycle when the vehicle speed exceeds 20 km/h (12 mph). The appropriate DTC sets if the ABS module does not receive a signal from the wheel speed sensor. These DTCs can also be set by an excessive wheel speed sensor-to-tone ring air gap or a damaged tone ring, mismatched wheel

repair4less

Wheel Speed RF Signal Fault • C1298 — Wheel Speed RR Signal Fault • C1299 — Wheel Speed LR Signal Fault	and/or tire sizes or driving the vehicle on one or more deflated tires.

This pinpoint test is intended to diagnose the following:

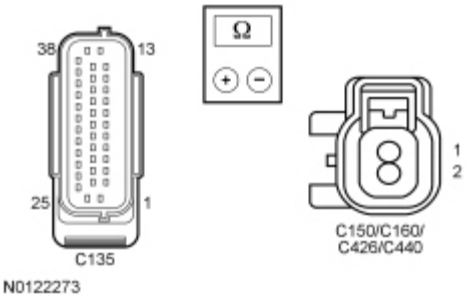
- ABS module
- Wheel speed sensor magnetic strip/tone ring
- Wheel speed sensor

PINPOINT TEST E: DTCs C1222, C1296, C1297, C1298 AND C1299

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: If the ignition is turned to ON when one or more wheel speed sensors are disconnected, the ABS module disables the output to that sensor. Make sure all test connectors are made at the sensor before turning the ignition to ON.

Test Step	Result / Action to Take
E1 CHECK THE ABS MODULE DTCs	
• Review the ABS module DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C1145, C1155, C1165 or C1175 also present?**	**Yes** GO to Pinpoint Test D . **No** GO to E2 .
E2 MONITOR THE WHEEL SPEED SENSOR PIDs	



• Connect the scan tool.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module .
• While driving the vehicle at the speed at which the concern occurred, monitor the following PIDs:
  ▪ Left Front Wheel Speed Sensor (LF_WSPD)
  ▪ Right Front Wheel Speed Sensor (RF_WSPD)
  ▪ Left Rear Wheel Speed Sensor (LR_WSPD)
  ▪ Right Rear Wheel Speed Sensor (RR_WSPD)
• **Are the wheel speed sensor PIDs consistent with the vehicle speed and each other?**
	Yes
	CLEAR the DTCs. DRIVE the vehicle. REPEAT the self-test. RETRIEVE and RECORD any ABS module DTCs.
	
	If DTC C1296, C1297, C1298 or C1299 returns, GO to E11 .
	
	If DTC C1222 is present, GO to E10 .
	
	For all other ABS module DTCs, GO to the ABS Module DTC Chart.
	
	If no DTCs return, INSPECT the ABS module and wheel speed sensor connectors for corrosion, pushed-out pins, or damaged pins and REPAIR if necessary. If all connectors are OK, GO to E7 .

	No If the Rotunda Active Wheel Speed Sensor Tester is available, GO to E3 . If the Rotunda Active Wheel Speed Sensor Tester is not available, GO to E5 .
E3 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor . • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • Ignition ON. • **Is the module output LED illuminated?**	**Yes** GO to E4 . **No** GO to E6 .
E4 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, the concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTCs. REPEAT the self-test.
E5 CHECK THE ABS MODULE OUTPUT	
NOTE: Make sure all test connections are made at the wheel speed sensor before the ignition is turned to the ON position.	**Yes** GO to E7 . **No**

repair4less

NOTE: Use a meter with a min/max feature and/or recording capabilities to obtain accurate measurements. The ABS module disables the voltage output immediately if the wheel speed sensor is not present. • Ignition OFF. • Connect the meter to the suspect wheel speed sensor electrical connector pins, harness side. • Enable the min/max or recording feature. • Ignition ON. • Check the maximum recorded voltage on the meter. • **Is the maximum recorded voltage greater than 10 volts?**	GO to E6 .
E6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN **NOTE:** Check both circuits for each DTC. • Ignition OFF. • Disconnect: ABS Module C135 . • Disconnect: Suspect Wheel Speed Sensor . • Measure the resistance between the ABS module connector, harness side and the suspect wheel speed sensor connector, harness side as follows:	**Yes** GO to E11 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

ABS Module	Circuit	Wheel Speed Sensor
C135-21	VCA03 (VT/WH)	C150-1 (LF)
C135-34	RCA17 (YE)	C150-2 (LF)
C135-18	VCA05 (GY/VT)	C160-1 (RF)
C135-6	RCA19 (VT)	C160-2 (RF)
C135-19	VCA06 (WH/OG)	C426-1 (RR)
C135-31	RCA20 (BN)	C426-2 (RR)
C135-33	VCA04 (BU/OG)	C440-1 (LR)
C135-20	RCA18 (BN/GN)	C440-2 (LR)

• **Are the resistances less than 5 ohms?**	
E7 CHECK THE WHEEL SPEED SENSOR AND MOUNTING	**Yes** GO to E9. **No** TIGHTEN the wheel speed sensor to specification. REFER to Specifications in this section. CLEAR the DTCs. GO to E8.
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • **NOTE:** Use a good light source and carefully examine the wheel speed sensor wire. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the wheel speed sensor for looseness. • **Is the wheel speed sensor and mounting OK?**	
E8 RECHECK THE WHEEL SPEED SENSOR PIDs	**Yes** The vehicle is OK. The concern may have been caused by a loose wheel speed sensor. **No** GO to E9.

• While driving the vehicle at a constant speed, monitor the following PIDs:
  ▪ Left Front Wheel Speed (LF_WSPD)
  ▪ Right Front Wheel Speed (RF_WSPD)
  ▪ Left Rear Wheel Speed (LR_WSPD)
  ▪ Right Rear Wheel Speed (RR_WSPD)
• **Are all the wheel speed sensor PID values similar?**	

E9 CHECK THE WHEEL SPEED SENSOR(S) FOR DAMAGE	**Yes** For DTC C1296 or C1297, INSTALL a new wheel hub and bearing (wheel speed sensor tone rings are part of the wheel hub and bearing assembly). REFER to Section 204-01A or Section 204-01B. For DTC C1298 or C1299, INSTALL a new wheel speed sensor tone ring. REFER to Wheel Speed Sensor Ring — Rear in this section. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. CLEAR the DTC. REPEAT the self-test.
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02. • Remove the wheel speed sensor. Refer to Wheel Speed Sensor — Front or Wheel Speed Sensor — Rear in this section. • **NOTE:** Use a good light source and carefully examine the wheel speed sensor wire. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the wheel speed sensor and attached wire harness for general damage. • **Is the wheel speed sensor and harness OK?**	
E10 CHECK THE ABS MODULE CONFIGURATION	**Yes** GO to E11. **No** The system is operating correctly at this time. The concern may have been caused by an incorrectly configured ABS module.
• Verify that the tires are the correct size for the vehicle and inflated to the specified pressures as indicated on the Vehicle Certification (VC) label. • Carry out the ABS module configuration. Verify that the vehicle data matches the vehicle options. Refer to Programmable Module Installation (PMI) in Section 418-01. • Clear the DTCs. Carry out the ABS module on-demand self-test. • **Is DTC C1222 still present?**	
E11 CHECK FOR CORRECT ABS MODULE OPERATION	

repair4less

• Ignition OFF.
• Disconnect: ABS Module C135 .
• Check ABS module connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSPECT the wheel speed sensor tone rings for damage. INSTALL new components as necessary. If the tone rings are OK, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC C1266

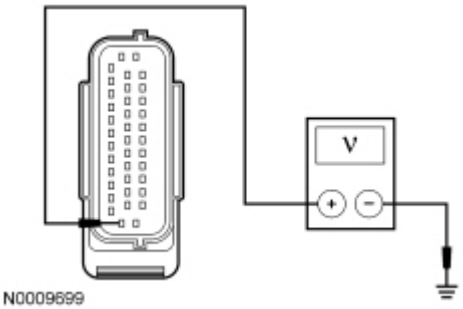
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

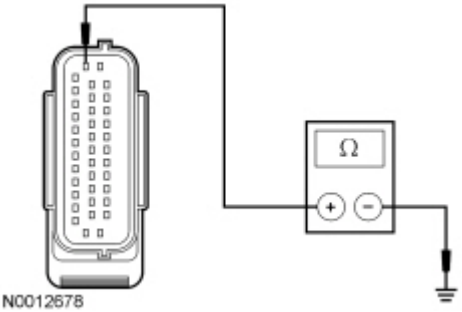
Normal Operation

The operating voltage required for ABS module isolation valve operation is between 10 and 17 volts.

Fused battery voltage is supplied to the ABS module for the valves by the Battery Junction Box (BJB).

- DTC C1266 (ABS Valve Power Relay Circuit Failure) — this DTC sets in the ignition cycle if the ABS module detects an open or a short to ground on the valve power feed circuit. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ABS module

PINPOINT TEST F: DTC C1266

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK FOR VOLTAGE TO THE ABS MODULE	
• Ignition OFF. • Disconnect: ABS Module C135 . • Measure the voltage between ABS module C135-25, circuit SBB36 (GN/RD), harness side and ground.	**Yes** GO to F2 . **No** VERIFY that Battery Junction Box (BJB) fuse 36 (30A) is OK. If OK, REPAIR circuit SBB36 (GN/RD). If not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short.

 N0009699 • **Is the voltage greater than 10 volts?**	CLEAR the DTCs. REPEAT the self-test.
F2 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ABS module C135-38, circuit GD121 (BK/YE), harness side and ground.  N0012678 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to F3 . **No** REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.
F3 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect: ABS Module C135 .
• Check ABS module connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTCs C116A, C1440

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The pressure transducer is integral to the Hydraulic Control Unit (HCU). The pressure transducer sends a signal to the ABS module that varies in relation to the amount of pressure applied to the brake pedal. The more pressure that is applied, the greater the signal sent to the ABS module. If a new pressure transducer is needed, then a new HCU must be installed.

repair4less

When the brake pedal is pressed, the stoplamp switch closes and a voltage is sent to the PCM. The PCM then sends a message over the High Speed Controller Area Network (HS-CAN) to the ABS module indicating that the brake pedal has been pressed. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected.

- DTC C116A (ABS Pressure Transducer / Brake Switch Mismatch) — this DTC sets in every ignition cycle if, during normal operation, the stoplamp switch message does not match the HCU transducer, both signals have to agree about whether the brakes are being applied or not.
- DTC C1440 (Pressure Transducer Main/Primary Signal Faulted) — this DTC sets in every ignition cycle if the signal that the pressure transducer sends to the ABS module does not agree with the stoplamp switch position.

This pinpoint test is intended to diagnose the following:

- HCU
- ABS module

PINPOINT TEST G: DTCs C116A, C1440

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 MONITOR THE ABS MODULE BRAKE ON/OFF (BOO_ABS) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • Press and release the brake pedal while monitoring the BOO_ABS PID. • **Does the PID display ON with the brake pedal applied and OFF with the brake pedal released?**	**Yes** GO to G3 . **No** GO to G2 .
G2 MONITOR THE PCM BRAKE ON/OFF (BOO1) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — PCM . • Press and release the brake pedal while monitoring the BOO1 PID. • **Does the PID display ON with the brake pedal applied and OFF with the brake pedal released?**	**Yes** REFER to Section 418-00 to continue diagnosis of the HS-CAN . **No** REFER to Section 417-01 to continue diagnosis of the stoplamp switch fault.
G3 MONITOR THE INITIAL (BRAKE PEDAL NOT APPLIED) BRAKE PRESSURE USING THE ABS MODULE BRAKE PRESSURE (BRAKPRES) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • With the brake pedal **not** applied, record the pressure displayed by the BRAKPRES PID. • **Is the initial brake pressure less than 275 kPa (40 psi) with the brake pedal not applied?**	**Yes** GO to G4 . **No** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section.

G4 MONITOR THE BRAKPRES PID WHILE APPLYING THE BRAKE PEDAL	
• Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • Firmly press and release the brake pedal while monitoring the BRAKPRES PID. • **Does the PID increase with firm pressure on the brake pedal and then decrease with the brake pedal released?**	**Yes** The system is operating correctly at this time. TEST the system for normal operation. **No** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section.

Pinpoint Test I: DTCs C109D, C109E and C109F

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

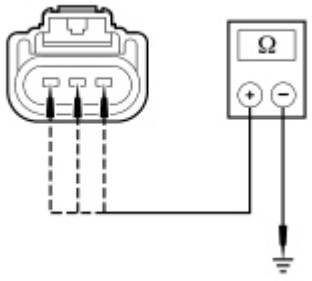
Normal Operation

The ABS module uses the vacuum sensor to determine if hydraulic pump intervention is necessary due to a severe loss of vacuum in the booster. The ABS module sends a 5-volt reference voltage to the sensor and the sensor compares the pressure in the booster to the ambient air pressure in the engine compartment and sends a varying voltage back to the ABS module based on the difference between the pressures. Normally, the pressure in the booster is much lower than ambient air pressure. As the pressure in the booster gets higher (closer to matching ambient air pressure), the lower the voltage sent back to the ABS module becomes.

- DTC C109D (Low Vacuum Condition Detected) — this DTC sets in continuous memory and every ignition cycle when the vacuum in the brake booster goes below a predetermined threshold and does not necessarily indicate a concern with the vacuum sensor, the related wiring or the ABS module. This DTC indicates a vacuum concern in the brake booster, engine and any related vacuum hoses/tubes. High altitude locations with low ambient air temperatures can cause a low vacuum condition to exist in the booster until the engine compartment warms up.
- DTC C109E (Vacuum Sensor Circuit Fault) — this DTC sets in continuous memory and every ignition cycle if during normal operation or the ABS module on-demand self-test, the ABS module detects an open circuit, a short to voltage or a short to ground on the vacuum sensor circuits or a failure of the vacuum sensor.
- DTC C109F (Vacuum Sensor Signal Fault) — this DTC sets in continuous memory and every ignition cycle if the vacuum sensor ambient air pressure inlet ports, or the vacuum sensor ports become restricted or clogged.

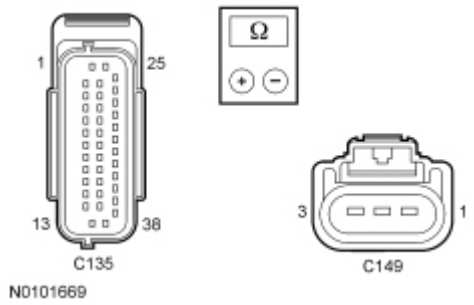
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Vacuum sensor
- ABS module



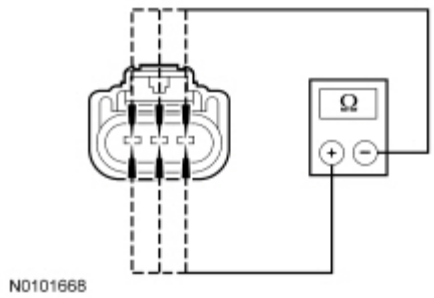
PINPOINT TEST I: DTCs C109D, C109E AND C109F

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take

repair4less



I1 CHECK THE ABS MODULE DTCs • Review the DTCs recorded during Inspection and Verification. • **Was DTC C109D the only recorded DTC?**	**Yes** GO to I2 . **No** If DTC C109E and/or C109F was retrieved, GO to I6 . For all other DTCs, REFER to the ABS Module DTC Chart in this section.
I2 CHECK DTC RETURNABILITY • Using the scan tool, clear the ABS module DTCs. • Ignition OFF. • Disconnect the scan tool. • Start the engine. • **NOTE:** It may take up to 3 minutes for DTC C109D to set. • Allow the vehicle to idle for a minimum of 4 minutes. Apply and release the brake pedal for a minimum of 3 times per minute with normal pedal force for up to 3 minutes • Ignition OFF. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC C109D the only vacuum sensor DTC present?**	**Yes** GO to I3 . **No** If DTC C109E and/or C109F was retrieved, GO to I6 . For all other DTCs, REFER to the ABS Module DTC Chart in this section. If no DTC is set, the system is operating correctly as this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTC. REPEAT the self-test.
I3 CHECK THE ENGINE VACUUM • Carry out the Intake Manifold Vacuum Test, refer to Diagnosis and Testing in Section 303-00 . • Record the vacuum reading. • **Does the vacuum gauge indicate normal vacuum?**	**Yes** GO to I4 . **No** FOLLOW the diagnostic procedure in Section 303-00 .
I4 CHECK THE BRAKE BOOSTER • Carry out the Brake Booster Component Test. Refer to Section 206-00 . • **Do the brake booster and check valve pass the component test?**	**Yes** GO to I5 . **No** REPAIR or INSTALL new as necessary. CLEAR the DTC. REPEAT the self-test.
I5 CHECK THE BRAKE BOOSTER VACUUM LEVEL (BBVACLVL) PID • Connect the scan tool. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • Compare the recorded vacuum reading the brake booster vacuum level PID. • **Does the PID match the recorded vacuum reading of ±3.386 kPa (1 in-Hg)?**	**Yes** REPAIR any vacuum leaks at the vacuum system. For 4x4 vehicles, REPAIR any vacuum leaks from the vacuum hub lock system. REPEAT the ABS module self-test.

	No INSTALL a new brake booster vacuum sensor. REFER to Section 206-07 . CLEAR the DTCs. TEST the system for normal operation.
I6 CHECK THE BRAKE BOOSTER VACUUM SENSOR • Inspect the vacuum sensor ambient air pressure inlet ports. • **Are both ports free of contamination, debris and/or foreign material?**	**Yes** GO to I7 . **No** REPAIR or INSTALL a new vacuum sensor as necessary. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test.
I7 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR A SHORT TO GROUND • Disconnect: ABS Module C135 . • Disconnect: Brake Booster Vacuum Sensor C149 . • Measure the resistance between ground and: ▪ brake booster vacuum sensor C149-1, circuit VCA22 (GN/BN), harness side. ▪ brake booster vacuum sensor C149-2, circuit GD120 (BK/GN), harness side. ▪ brake booster vacuum sensor C149-3, circuit CCA22 (GY/YE), harness side.  N0101670 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I8 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
I8 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR AN OPEN • Measure the resistance between the ABS module C135, harness side and the brake booster vacuum sensor C149, harness side as follows: **ABS Module** | **Circuit** | **Vacuum Sensor** C135-10 | VCA22 (GN/BN) | C149-1 C135-28 | GD120 (BK/GN) | C149-2 C135-2 | CCA22 (GY/YE) | C149-3	**Yes** GO to I9 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

repair4less

- **Are the resistances less than 5 ohms?**

I9 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between: ▪ brake booster vacuum sensor C149-1, circuit VCA22 (GN/BN), harness side and brake booster vacuum sensor C149-2, circuit GD120 (BK/GN), harness side. ▪ brake booster vacuum sensor C149-1, circuit VCA22 (GN/BN), harness side and brake booster vacuum sensor C149-3, circuit CCA22 (GY/YE), harness side. ▪ brake booster vacuum sensor C149-2, circuit GD120 (BK/GN), harness side, and brake booster vacuum sensor C149-3, circuit CCA22 (GY/YE), harness side.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I10 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
I10 CHECK THE ACTIVE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ▪ brake booster vacuum sensor C149-1, circuit VCA22 (GN/BN), harness side. ▪ brake booster vacuum sensor C149-2, circuit GD120 (BK/GN), harness side. ▪ brake booster vacuum sensor C149-3, circuit CCA22 (GY/YE), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to I11 .

 N0101667 • **Is any voltage present?**	

I11 CHECK THE BRAKE BOOSTER VACUUM SENSOR CONNECTOR
• Ignition OFF.
• Check brake booster vacuum sensor connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: Brake Booster Vacuum Sensor C149 .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new vacuum sensor. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test.
	
	If DTC C109E or C109F return, GO to I12 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

I12 CHECK THE ABS MODULE CONNECTORS
• Ignition OFF.
• Disconnect: ABS Module C135 .
• Check ABS module connector for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: ABS Module C135 .
• Make sure the connector seats correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Hill Descent Control System Is Inoperative

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

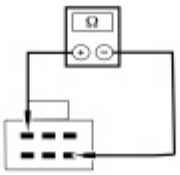
Hill Descent Control™ can be activated by momentarily pressing the Hill Descent Control™ switch at speeds from 3 km/h (2 mph) and 16 km/h (10 mph), but the system stays in control up to 32 km/h (20 mph). At speeds between 32 km/h (20 mph) and 64 km/h (40 mph), Hill Descent Control™ does not set or maintain speeds. Hill Descent Control™ automatically disables itself above 64 km/h (40 mph).

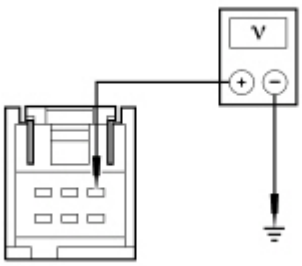
repair4less

When the Hill Descent Control™ switch is pressed, a circuit inside of the switch is closed, ground is provided to the Instrument Panel Cluster (IPC) disabling or enabling the Hill Descent Control™.

DTC C2809 can be set by manually pressing and holding the Hill Descent Control™ switch for more than 30 seconds.

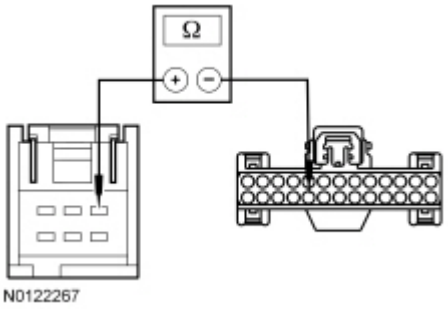
- DTC C2809 (Hill Descent Control Switch Stuck) — this DTC sets if the ABS module receives the HILL_DESC_SW message from the High Speed Controller Area Network (HS-CAN) for greater than 30 seconds.

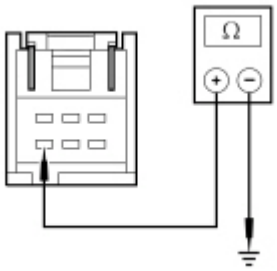




This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Hill Descent Control™ switch
- ABS module





PINPOINT TEST J: THE HILL DESCENT CONTROL SYSTEM IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 CHECK FOR DTCs • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs. • **Are any ABS module, IPC or communication DTCs present?**	**Yes** For ABS module DTC C2809, GO to J2. For all other ABS module DTCs, REFER to the ABS Module DTC Chart. For IPC DTCs, REFER to the Section 413-01. **No** System is operating correctly at this time.
J2 VISUALLY INSPECT THE HILL DESCENT CONTROL™ SWITCH • Inspect the Hill Descent Control™ switch for damage. • Verify that the Hill Descent Control™ switch does not stick. • **Is the Hill Descent Control™ switch damaged or sticking?**	**Yes** INSTALL a new Hill Descent Control™ switch by removing the auxiliary switch assembly. REFER to the exploded view in Section 501-12. PRESS the tab on each side of the switch to remove it from the bezel. After replacing the switch, CLEAR the DTCs and REPEAT the self-test. TEST the system for normal operation. **No** GO to J3.
J3 ISOLATE THE HILL DESCENT CONTROL™ SWITCH	

• Ignition OFF. • Disconnect: Hill Descent Control™ Switch C3394 . • Measure the resistance between Hill Descent Control™ switch pins 1 and 6, component side, while pressing and releasing the switch.  N0122269 • **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**Yes** If DTC C2809 was recorded, GO to J4 . For all other conditions, GO to J5 . **No** INSTALL a new Hill Descent Control™ switch by removing the auxiliary switch assembly. REFER to the exploded view in Section 501-12 . PRESS the tab on each side of the switch to remove it from the bezel. After replacing the switch, CLEAR the DTCs and REPEAT the self-test. TEST the system for normal operation.
J4 CHECK THE HILL DESCENT CONTROL™ SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE • Disconnect: IPC C220 . • Ignition ON. • Measure the voltage between Hill Descent Control™ switch C3394-1, circuit CET59 (GY/VT), harness side and ground.  N0101067 • **Is any voltage present?**	**Yes** REPAIR circuit CET59 (GY/VT). CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST for normal operation.
J5 CHECK THE HILL DESCENT CONTROL™ SWITCH SIGNAL CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: IPC C220 . • Measure the resistance between Hill Descent Control™ switch C3394-1, circuit CET59 (GY/VT), harness side and IPC C220-22, circuit CET59 (GY/VT), harness side.	**Yes** GO to J6 . **No** REPAIR circuit CET59 (GY/VT). TEST the system for normal operation.

repair4less

 N0122267 • **Is the resistance less than 5 ohms?**	
J6 CHECK THE HILL DESCENT CONTROL™ SWITCH GROUND CIRCUIT	**Yes** GO to J7 . **No** REPAIR the open in circuit GD138 (BK/WH). CLEAR the DTCs. REPEAT the self-test.
• Ignition ON. • Measure the resistance between Hill Descent Control™ switch C3394-6, circuit GD138 (BK/WH), harness side and ground.  N0122268 • **Is the resistance less than 5 ohms?**	
J7 CHECK FOR CORRECT IPC OPERATION	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
• Check IPC connector: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test K: DTC U0100

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0100 (Lost Communication With ECM/PCM) — this DTC sets in continuous memory if the brake pedal position switch, and traction control messages that should be received from the ECM/PCM are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- PCM

- ABS module

PINPOINT TEST K: DTC U0100

Test Step	Result / Action to Take
K1 VERIFY THE SCAN TOOL COMMUNICATES WITH THE PCM	
• Connect the scan tool. • Check that a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to K2 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
K2 CHECK THE ABS MODULE CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Clear the DTCs. • Wait 10 seconds. • Repeat the ABS module self-test. • **Is DTC U0100 retrieved again?**	**Yes** GO to K3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
K3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded DTCs from the PCM Key ON Engine OFF (KOEO) self-test. • **Is DTC P0562 or P0563 recorded?**	**Yes** For PCM DTCs, REFER to Section 303-14 . **No** GO to K4 .
K4 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Is DTC B1676 recorded?**	**Yes** GO to Pinpoint Test A . **No** GO to K5 .
K5 CHECK FOR DTC U0100 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100:00 or U0100 set in more than 1 module?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test L: DTC U0114

repair4less

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0114 (Lost Communication with Transfer Case Control Module (TCCM)) — this DTC sets in continuous memory if the Four-Wheel Drive (4WD) message that should be received from the Transfer Case Control Module (TCCM) is missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- TCCM
- ABS module

PINPOINT TEST L: DTC U0114

Test Step	Result / Action to Take
L1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to L2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
L2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out a Network Test. • **Does the TCCM pass the network test?**	**Yes** GO to L3 . **No** REFER to Section 418-00 .
L3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE AND TCCM SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Enter the following diagnostic mode on the scan tool: Self Test — TCCM . • **Is DTC B1676 (or P0562:00) or DTC P0563:00 recorded?**	**Yes** For ABS module DTC B1676, GO to Pinpoint Test A . For TCCM DTCs, REFER to Section 308-07A . **No** GO to L4 .
L4 RECHECK THE ABS MODULE DTCs	
• Clear the DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC U0114 still present?**	**Yes** GO to L5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
L5 CHECK FOR DTC U0114 SET IN OTHER MODULES	

• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0114 set in more than 1 module?**	**Yes** INSTALL a new TCCM . REFER to Section 308-07A . CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test M: DTC U0131

Normal Operation

- DTC U0131 (Lost Communication With Power Steering Control Module (VAPS) — this DTC sets in continuous memory and on-demand if the steering sensor message that should be received from the Power Steering Control Module (PSCM) is missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- PSCM
- ABS module

PINPOINT TEST M: DTC U0131

Test Step	Result / Action to Take
M1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to M2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
M2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out a Network Test. • **Does the PSCM pass the network test?**	**Yes** GO to M3 . **No** REFER to Section 418-00 .
M3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE AND PSCM SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Enter the following diagnostic mode on the scan tool: Self Test — PSCM . • **Is DTC B1676 (or U3003:16) or DTC U3003:17 recorded?**	**Yes** For ABS module DTC B1676, GO to Pinpoint Test A . For PSCM DTCs, REFER to Section 211-00B . **No** GO to M4 .
M4 RECHECK THE ABS MODULE DTCs	

repair4less

• Clear the DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC U0131 still present?**	**Yes** GO to M5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
M5 CHECK FOR DTC U0131 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0131 set in more than 1 module?**	**Yes** INSTALL a new PSCM . REFER to Section 211-00B . CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test N: DTC U0131

Normal Operation

- **NOTE:** Vehicles with a 6.2L engine are equipped with a Steering Column Control Module (SCCM).

DTC U0131 (Lost Communication With Power Steering Control Module (VAPS) — this DTC sets in continuous memory and on-demand if the steering sensor message that should be received from the SCCM is missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- SCCM .
- ABS module

PINPOINT TEST N: DTC U0131

Test Step	Result / Action to Take
N1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to N2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
N2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out a Network Test. • **Does the SCCM pass the network test?**	**Yes** GO to N3 . **No**

	REFER to Section 418-00 .
N3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE AND SCCM SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Enter the following diagnostic mode on the scan tool: Self Test — SCCM . • **Is DTC B1676 (or B11D9:16) or DTC B11D9:17 recorded?**	**Yes** For ABS module DTC B1676, GO to Pinpoint Test A . For SCCM DTCs, REFER to Section 211-05 . **No** GO to N4 .
N4 RECHECK THE ABS MODULE DTCs	
• Clear the DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC U0131 still present?**	**Yes** GO to N5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
N5 CHECK FOR DTC U0131 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0131 set in more than 1 module?**	**Yes** INSTALL a new SCCM . REFER to Section 211-00A . CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test O: DTCs U0140

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0140 (Lost Communication With Body Control Module (GEM)) — this DTC sets in the ABS module if it cannot transmit to or receive messages from the Body Control Module (BCM) over the High Speed Controller Area Network (HS-CAN) for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- ABS module
- BCM

PINPOINT TEST O: DTC U0140

Test Step	Result / Action to Take
O1 VERIFY THE CUSTOMER CONCERN	

repair4less

• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to O2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
O2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Using a scan tool, carry out a Network Test. • **Does the BCM pass the network test?**	**Yes** GO to O3 . **No** REFER to Section 418-00 .
O3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE AND BCM SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Enter the following diagnostic mode on the scan tool: Self Test — BCM . • **Is DTC B1676 (or U3003:16) or DTC U3003:17 recorded?**	**Yes** For ABS module DTC B1676, GO to Pinpoint Test A . For BCM DTCs, REFER to Section 419-10 . **No** GO to O4 .
O4 CHECK FOR DTC U0140 OR U0140:00 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0140 or U0140:00 set in more than 1 module?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . TEST the system for normal operation. CLEAR the DTCs. REPEAT the ABS module self-test **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test P: DTCs C1280, C1282, C1516, C1963, C1975, C2770, U0151 and U0452

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module uses information received from several sensors (wheel speed sensors, steering wheel rotation sensor, stability/traction control system sensors, etc.) to determine if vehicle stability, traction or roll warrants ESC or RSC® interaction. If an event is going to occur, the ABS module adjusts the brake torque at specific wheels and the PCM reduces engine torque to make the vehicle more stable. Once the ABS module has determined that the stability event has been corrected, it returns the brake and engine torque to normal and continues to monitor the vehicle. DTCs set in the ignition cycle can only be cleared by cycling the ignition off and on once the fault has been corrected. The Restraints Control Module (RCM) measures the yaw rate and vehicle acceleration, then sends the signal through a secondary, dedicated Controller Area Network (CAN) to the ABS module. The ABS module uses this information for AdvanceTrac® and RSC® system operation. The ABS module also compares this information to information it receives from other sensors (brake pedal input, steering wheel) to determine how valid the information is and to determine if an instability event is about to occur.

The RCM and the ABS module communicate along circuits VCA23 (BU/WH) and VCA24 (GN/OG). An open circuit or a short to power or ground on any one of these circuits causes the ABS module to set a DTC. Also, if the RCM is not mounted in the correct position, with the electrical connector facing the driver-side of the vehicle, the ABS module also sets DTCs.

DTC Description	Fault Trigger Condition
• C1280 — Yaw Rate Sensor Signal Fault • C1282 — Lateral Accelerometer Signal Fault • C1516 — Roll Rate Sensor Signal Fault • C2770 — Longitudinal Acceleration Sensor Signal Fault	If the ABS module receives a message from the RCM that is out of the normal operating range or one that does not agree with other sensor information, the appropriate signal fault DTC sets.
• C1963 — Stability Control Inhibit Warning • C1975 — IVD Plausibility Failure [a]	If conditions or DTCs exist that prevent the AdvanceTrac® and RSC® systems from operating, DTCs C1963 and/or C1975 sets. This DTC is usually set due to the steering wheel rotation sensor or the RCM being damaged or installed incorrectly. If DTCs are present from the RCM or PSCM , diagnose these DTCs first.
• U0151 — Lost Communication with Restraints Control Module (RCM) • U0452 — Invalid Data Received from RCM	The RCM uses a dedicated communication bus to send information to the ABS module. If, during normal operation, the ABS module does not receive any information from the RCM for more than 250 milliseconds, DTC U0151 or U0452 sets. U0151 monitors both the HS-CAN and the dedicated CAN circuits. If the ABS module does not receive the RCM serial number, over the HS-CAN , DTC U0151 sets. It also sets if the sensor data is not received over the dedicated CAN from the RCM . These DTCs can also be caused by another module software update. CLEAR all module DTCs and carry out another self-test to recheck the system.

[a] Interactive Vehicle Dynamics

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM
- ABS module

PINPOINT TEST P: DTCs C1280, C1282, C1516, C1963, C1975, C2770, U0151 and U0452

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy and cause serious personal injury or death.

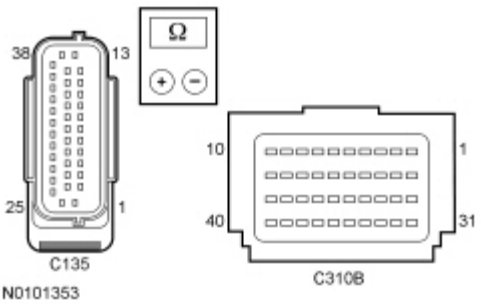
WARNING: Never probe the electrical connectors on airbag, Safety Canopy or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these

repair4less

assemblies, which increases the risk of serious personal injury or death.

WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

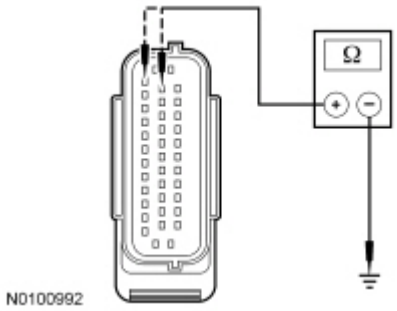
NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

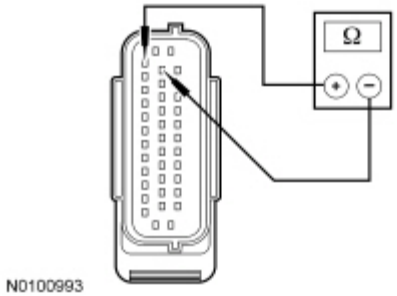


NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

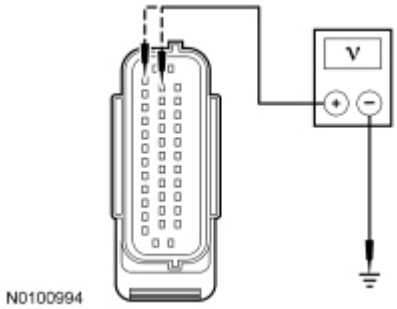
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
P1 CHECK FOR A HS-CAN COMMUNICATION CONCERN WITH THE RCM OR PSCM	
• Connect the scan tool. • Ignition ON. • **NOTE:** The Network Test does not test the dedicated CAN communications between the ABS module and RCM . • Using a scan tool, carry out a Network Test. • **Does the RCM and PSCM pass the Network Test?**	**Yes** GO to P2 . **No** REFER to Section 418-00 to diagnose the High Speed Controller Area Network (HS-CAN) bus.
P2 CHECK FOR RCM AND PSCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — RCM . • Enter the following diagnostic mode on the scan tool: Self Test — PSCM . • **Are any RCM or PSCM DTCs retrieved on-demand self-test?**	**Yes** For RCM DTCs, REFER to Section 501-20B . For PSCM DTCs, REFER to Section 211-00A . **No** If only one of the following ABS module DTCs C1280, C1282, C1516, C2770 was retrieved, GO to P3 . If more than one ABS module DTC C1280, C1282, C1516, C2770 was retrieved, GO to P7 . For DTCs U0151 and U0452, GO to P7 . For all other DTCs, GO to P3 .
P3 CHECK THE ABS MODULE YAW RATE (YAW_RATE_2) PID	
• Enter the following diagnostic mode on the scan tool: Data Logger — ABS Module . • **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the YAW_RATE_2 PID. • **Is the YAW_RATE_2 PID value between -3.5 and 3.5?**	**Yes** GO to P4 . **No** GO to P12 .





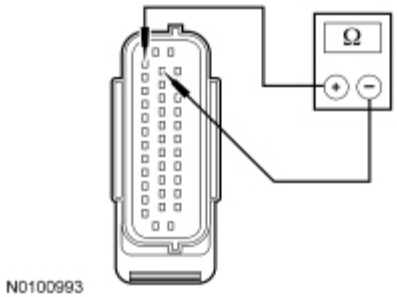
P4 CHECK THE ABS MODULE LATERAL ACCELERATION (LAT_ACCL_2) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LAT_ACCL_2 PID. • **Is the LAT_ACCL_2 PID value between -0.125g and 0.125g?**	**Yes** GO to P5 . **No** GO to P12 .
P5 CHECK THE ABS MODULE LONGITUDINAL ACCELERATION (LONG_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LONG_ACCL PID. • **Is the LONG_ACCL PID value between -0.15g and 0.15g?**	**Yes** GO to P6 . **No** GO to P12 .
P6 CHECK THE ABS MODULE ROLL RATE (ROLLRAT) PID	
NOTE: The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the ROLLRAT PID. • **Is the ROLLRAT PID value between -3.5 and 3.5?**	**Yes** GO to P7 . **No** GO to P12 .
P7 CHECK THE DEDICATED CAN CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Disconnect: ABS Module C135 . • Disconnect: RCM C310A and C310B . • Measure the resistance between the ABS module C135, harness side and the RCM C310B, harness side as indicated in the following chart:	**Yes** GO to P8 . **No** REPAIR the affected circuit(s). REPOWER the SRS . REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . CLEAR all CMDTCs. PERFORM a road test. REPEAT the self-test.



ABS Module	Circuit	RCM
C135-37	VCA23 (BU/WH)	C310B-20
C135-24	VCA24 (GN/OG)	C310B-19

- **Are the resistances less than 5 ohms?**

repair4less



P8 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ ABS module C135-24, circuit VCA24 (GN/OG), harness side. ▪ ABS module C135-37, circuit VCA23 (BU/WH), harness side.  N0100992 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P9. **No** REPAIR the affected circuit(s). REPOWER the SRS. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B. CLEAR all CMDTCs. PERFORM a road test. REPEAT the self test.
P9 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between ABS module C135-24, circuit VCA24 (GN/OG), harness side and ABS module C135-37, circuit VCA23 (BU/WH), harness side.  N0100993 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P10. **No** REPAIR the affected circuit(s). REPOWER the SRS. REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B. CLEAR all CMDTCs. PERFORM a road test. REPEAT the self test.
P10 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO VOLTAGE	
• Repower the SRS. **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B. • Ignition ON. • Measure the voltage between ground and: ▪ ABS module C135-24, circuit VCA24 (GN/OG), harness side. ▪ ABS module C135-37, circuit VCA23 (BU/WH), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR all CMDTCs. PERFORM a road test. REPEAT the self test. **No** GO to P11.

- **Is any voltage present?**

P11 CHECK RCM TERMINATING RESISTOR	

• Ignition OFF.
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B .
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to RCM in Section 501-20B .
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: RCM C310A and C310B .
• Measure the resistance between ABS module C135-37, circuit VCA23 (BU/WH), harness side and C135-24, circuit VCA24 (GN/OG), harness side.
	Yes
	GO to P12 .
	
	No
	INSTALL a new RCM . REFER to Section 501-20B . CLEAR all CMDTCs . PERFORM a road test. REPEAT the self test. If the concern is still present, GO to P14 . If other DTCs are present, REFER to the appropriate DTC chart.

- **Is the resistance between 108 and 132 ohms?**

P12 CHECK THE RCM INSTALLATION AND MOUNTING SURFACE	
• Ignition OFF. • If not previously directed to do so, depower the Supplemental Restraint System (SRS). Refer to	**Yes** GO to P13 .

repair4less

Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Inspect the Restraints Control Module (RCM) installation and make sure that the fasteners are fully seated and tightened correctly. Refer to RCM in Section 501-20B . • Inspect the mounting surface for damage, corrosion or foreign material. • **Is the RCM installed correctly and is the mounting surface clean and free from damage?**	**No** REPAIR or INSTALL new as necessary. REPOWER the SRS . REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . CLEAR all CMDTCs . PERFORM a road test. REPEAT the self test.
P13 CHECK FOR AN INTERMITTENT FAULT	

• Disconnect: RCM C310A and C310B .
• Disconnect: ABS module C135 .
  ▪ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ repair any concerns found.
 	
Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.
 	
• Connect: All Previously Disconnected Component (s)/Connector(s) .
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B .
• Perform a road test.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module .
• **Is the concern still present?**
	Yes
	INSTALL a new RCM . REFER to Section 501-20B . CLEAR all CMDTCs . PERFORM a road test. REPEAT the self test. If the concern is still present, GO to P14 . If other DTCs are present, REFER to the appropriate DTC chart.
	
	No
	The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.**

P14 CHECK THE ABS MODULE FOR CORRECT OPERATION	

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B .
• Prior to reconnecting any previously disconnected SRS component:
  ▪ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ inspect wire harness for any damage, pinched, cut or pierced wires.
  ▪ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to RCM in Section 501-20B .
  ▪ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals.
  ▪ repair any concerns found.
	Yes
	INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component (s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Perform a road test. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is the concern still present?**	

Pinpoint Test Q: DTC U0155

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Module) — this DTC sets in continuous memory and on-demand if the traction control switch information, or other sensor messages from the IPC are not received for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- IPC
- ABS module

PINPOINT TEST Q: DTC U0155

Test Step	Result / Action to Take
Q1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to Q2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
Q2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out a Network Test. • **Does the IPC pass the network test?**	**Yes** GO to Q3 . **No** REFER to Section 418-00 .
Q3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE AND IPC SELF-TESTS	

repair4less

• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Enter the following diagnostic mode on the scan tool: Self Test — IPC . • **Is ABS module DTC B1676 or IPC DTC U3003:16 or DTC U3003:17 received?**	**Yes** For ABS module DTC B1676, GO to Pinpoint Test A . For IPC DTCs, REFER to Section 413-01 . **No** GO to Q4 .
Q4 RECHECK THE ABS MODULE DTCs	
• Clear the DTCs. • Ignition OFF. • Wait 10 seconds. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC U0155 still present?**	**Yes** GO to Q5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
Q5 CHECK FOR DTC U0155 OR U0155:00 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • **Is DTC U0155:00 set in more than 1 module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

Pinpoint Test R: The Stability/Traction Control System is Inoperative or Cannot be Disabled

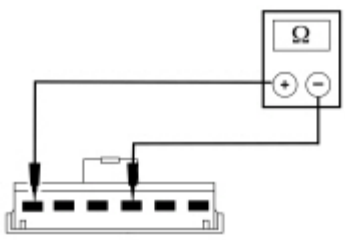
Refer to Wiring Diagrams Cell 42 , Instrument Cluster for schematic and connector information.

Normal Operation

The stability/traction control switch is a normally open switch. When the switch is pressed, the Instrument Panel Cluster (IPC) senses ground through the switch and sends a message to the ABS module along the High Speed Controller Area Network (HS-CAN) to disable the stability/traction control system. The IPC also illuminates the traction control message center indicator.

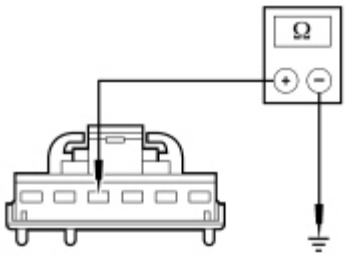
NOTE: If a MyKey® restricted key is in use with the AdvanceTrac® always on feature configured to on, the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system .

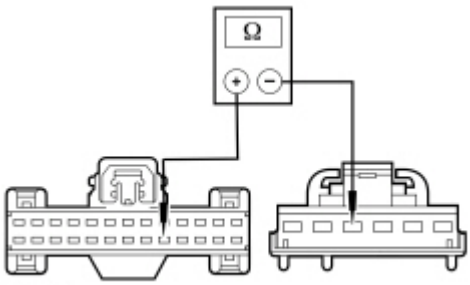
- DTC C2775 (TC/AYC ON/OFF Switch Stuck Failure) — this DTC sets during the key cycle if the IPC senses a short to ground on stability/traction control switch circuit, if the stability/traction control switch is pressed for longer than 30 seconds, or if the stability/traction control switch is pressed during the on-demand self-test.

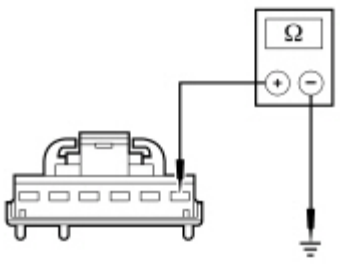


This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- MyKey® restricted key in use
- Stability/traction control switch







- IPC

PINPOINT TEST R: THE STABILITY/TRACTION CONTROL SYSTEM IS INOPERATIVE OR CANNOT BE DISABLED

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
R1 VERIFY THAT THE KEY IN USE IS NOT MYKEY® RESTRICTED	
• Ignition ON. • Attempt to disable the Electronic Stability Control (ESC) system by pressing the stability/traction control switch. • **Is ADVTRAC ON MyKey® SETTING displayed in the message center?**	**Yes** INFORM the customer that the key in use is MyKey® restricted. If necessary, REFER to the Owner's Literature for information regarding the programming of MyKey® features. **No** GO to R2 .
R2 CHECK FOR ABS MODULE DTCs	
• Attempt to disable the ESC system by pressing the stability/traction control switch. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • **Is DTC U0073, U0155 or U0423 present?**	**Yes** For DTC U0073, REFER to Section 418-00 to diagnose the HS-CAN . For DTC U0155, GO to Pinpoint Test Q . For DTC U0423, CARRY OUT a self-test of the IPC . REFER to Section 413-01 to diagnose the IPC concern. **No** GO to R3 .
R3 ISOLATE THE STABILITY/TRACTION CONTROL SWITCH	
• Ignition OFF. • Disconnect: Stability/Traction Control Switch C2355 . • Measure the resistance between stability/traction control switch pins 1 and 4, component side, while pressing and releasing the switch.  N0122274 • **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**Yes** GO to R4 . **No** INSTALL a new stability/traction control switch. REFER to Stability/Traction Control Switch in this section. TEST the system for normal operation.

repair4less

R4 CHECK THE SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Battery Negative Cable . • Disconnect: IPC C220 . • Measure the resistance between stability/traction control switch C2355-4, circuit CCA15 (YE/GY), harness side and ground.  N0089363 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R5 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
R5 CHECK THE SWITCH INPUT CIRCUIT FOR AN OPEN	
• Measure the resistance between stability/traction control switch C2355-4, circuit CCA15 (YE/GY), harness side and IPC C220-18, circuit CCA15 (YE/GY), harness side.  N0120950 • **Is the resistance less than 5 ohms?**	**Yes** GO to R6 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
R6 CHECK THE SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between stability/traction control switch C2355-1, circuit GD133 (BK), harness side and ground.  N0106102 • **Is the resistance less than 5 ohms?**	**Yes** GO to R7 . **No** REPAIR circuit GD133 (BK). TEST the system for normal operation.

R7 CHECK FOR CORRECT IPC OPERATION	

• Check IPC C220 for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the IPC connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IPC. REFER to Section 413-01. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: Poor Vehicle Tracking During Anti-Lock Function

Refer to Wiring Diagrams Cell 42, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module uses input from several different sensors (wheel speed sensors, Brake Pedal Position (BPP) switch, sensor cluster, etc.) to determine if an ABS event is necessary. If an ABS event is necessary, the ABS module commands the hydraulic pump motor on and the Hydraulic Control Unit (HCU) to actuate the appropriate solenoids. During an ABS event, the front and rear end of the vehicle should track true to the direction of travel along the vehicle centerline unless driver input dictates otherwise. Other items that could cause uneven braking during an ABS event are; an internal issue with the HCU, an issue with the base brake system (caliper, brake pads, etc.) or worn out suspension components.

The operating voltage required for ABS module, hydraulic pump and isolation valve operation is between 10 and 17 volts.

This pinpoint test is intended to diagnose the following:

- Air in hydraulic brake system
- Low tire pressure
- Base brake system
- HCU

PINPOINT TEST S: POOR VEHICLE TRACKING DURING ANTI-LOCK FUNCTION

Test Step	Result / Action to Take
S1 VERIFY VEHICLE TRACKING DURING NON-ABS BRAKING	
• **NOTE:** Before road testing the vehicle, check the tire pressure and confirm tire pressures are set to the pressure indicated on the VC label. • Test drive the vehicle and verify vehicle tracking during normal braking. • **Does the vehicle track correctly during normal braking?**	**Yes** GO to S2. **No** The condition can be caused by a base brake concern or vehicle alignment. REFER to Section 206-00 to verify the base brake system and REFER to Section 204-00 to verify suspension components.

repair4less

S2 BLEED THE BRAKE SYSTEM • Bleed the HCU . Refer to Section 206-00 . • Test drive the vehicle and verify vehicle tracking during an ABS stop. • **Does the vehicle track correctly during an ABS stop?**	**Yes** The brake system is operating correctly. The concern may have been caused by air in the hydraulic system or a sticky valve. **No** GO to S3 .
S3 CHECK THE ABS INLET VALVE (CLOSED POSITION) • Connect the scan tool. • Ignition ON. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate all the wheels to make sure they rotate freely (the transmission must be in NEUTRAL). • Apply moderate brake pedal effort. • Enter the following diagnostic mode on the scan tool: DataLogger — ABS Module . • Toggle the left front inlet valve (LF_INLET) active command ON and at the same time, have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** TOGGLE the LF_INLET active command OFF. INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** TOGGLE the LF_INLET active command OFF. GO to S4 .
S4 CHECK THE ABS INLET VALVE (OPEN POSITION) • Apply moderate brake pedal effort. • Have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** GO to S5 .
S5 CHECK THE ABS OUTPUT VALVE (OPEN POSITION) • Apply moderate brake pedal effort. • Toggle the left front outlet valve (LF_OUTLET) and the LF_INLET active commands ON and, at the same time, have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** TOGGLE all active commands OFF. INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** TOGGLE all active commands OFF. GO to S6 .
S6 CHECK THE ABS INLET AND OUTLET VALVE (CLOSED POSITION) • Apply moderate brake pedal effort. • Have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** REPEAT this procedure (GO to S3) for the RF, LR and RR wheels using the appropriate active

	commands. If no failure occurs, the system is operating normally.

repair4less

Anti-Lock Brake System (ABS) Module

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	—	ABS module electrical connector (part of 12A581)
2	2M101	ABS module screw (also part of 2C219) (4 required)
3	2C219	ABS module

Removal and Installation

NOTICE: **Do not connect the wiring connector to the ABS module while it is separated from the HCU , doing so sets DTCs that cannot be cleared.**

NOTICE: **Electronic modules are sensitive to electrical charges. The ABS module can be damaged if exposed to these charges.**

NOTICE: **Do not swap ABS modules between vehicles. Brake fluid pressure sensor calibration varies depending on vehicle configuration. Swapping ABS modules between vehicles with different calibrations causes a DTC to set in the ABS module that cannot be cleared.**

1. If a new ABS module is being installed, connect the scan tool and upload the module configuration information from the ABS module. For additional information on configuration, refer to Programmable Module Installation (PMI) in Section 418-01 .

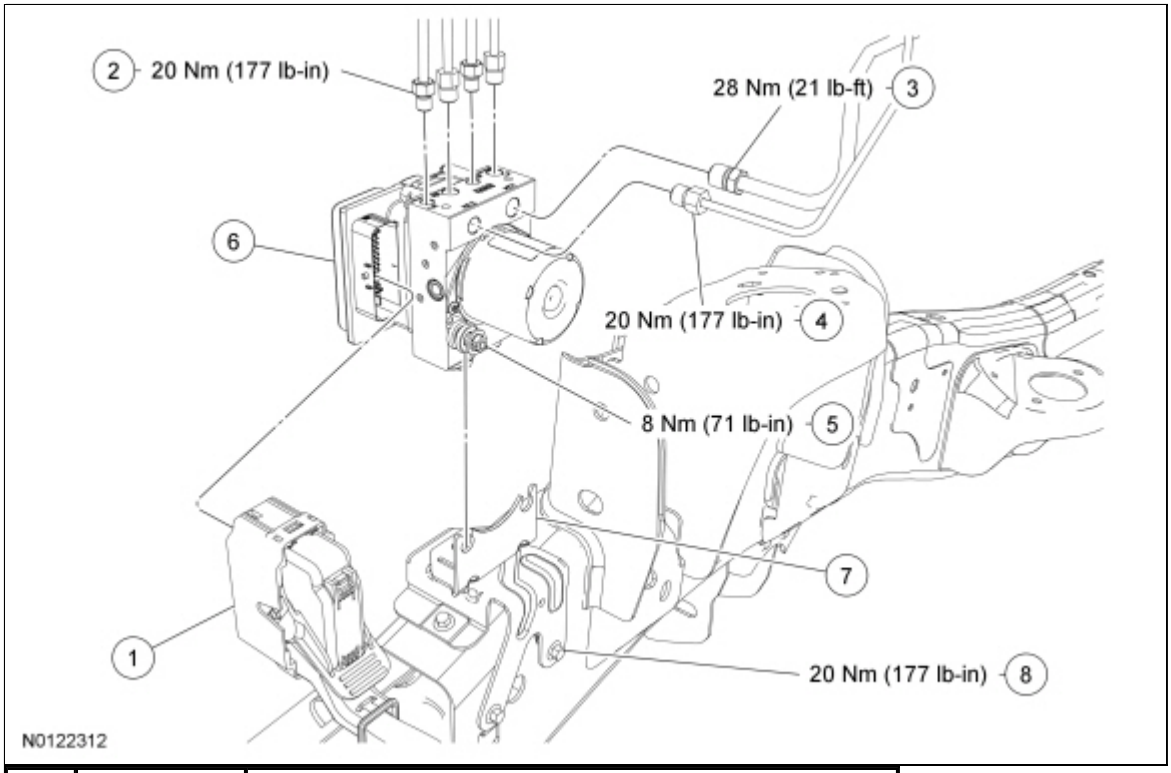
2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

3. Disconnect the ABS module electrical connector.

4. ***NOTICE:*** **Pull the ABS module straight back until the coil packs and motor connector clear the Hydraulic Control Unit (HCU) or damage to the ABS module may result.**

   Remove the 4 ABS module screws and the ABS module.
   - To install, tighten to 3 Nm (27 lb-in).

5. To install, reverse the removal procedure.
   - When installing a new ABS module, it must be configured (using vehicle as-built data or module configuration information retrieved earlier in this procedure). For additional information on configuration, refer to PMI in Section 418-01 .



---

repair4less

Hydraulic Control Unit (HCU)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	—	ABS module electrical connector (part of 12A581)
2	—	Brake tube-to-Hydraulic Control Unit (HCU) fitting (4 required)
3	2A040	Master cylinder primary brake tube-to- HCU fitting
4	2B253	Master cylinder secondary brake tube-to- HCU fitting
5	—	HCU -to-bracket nut (part of kit 2C229) (2 required)
6	2C215	HCU (also part of 2C405)
7	2C304	HCU bracket (also part of 2C405)
8	W506424	HCU bracket bolts (3 required)

Removal and Installation

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTICE: **Electronic modules are sensitive to electrical charges. The ABS module can be damaged if exposed to these charges.**

NOTICE: **Do not allow brake fluid or other contaminates to drip onto the ABS module or into the electrical connector. Contamination may cause a permanent failure to occur.**

NOTE: The Hydraulic Control Unit (HCU) bracket does not have to be removed in order to complete this procedure.

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

2. **NOTE:** The brake tubes must be installed in the same location as removed.

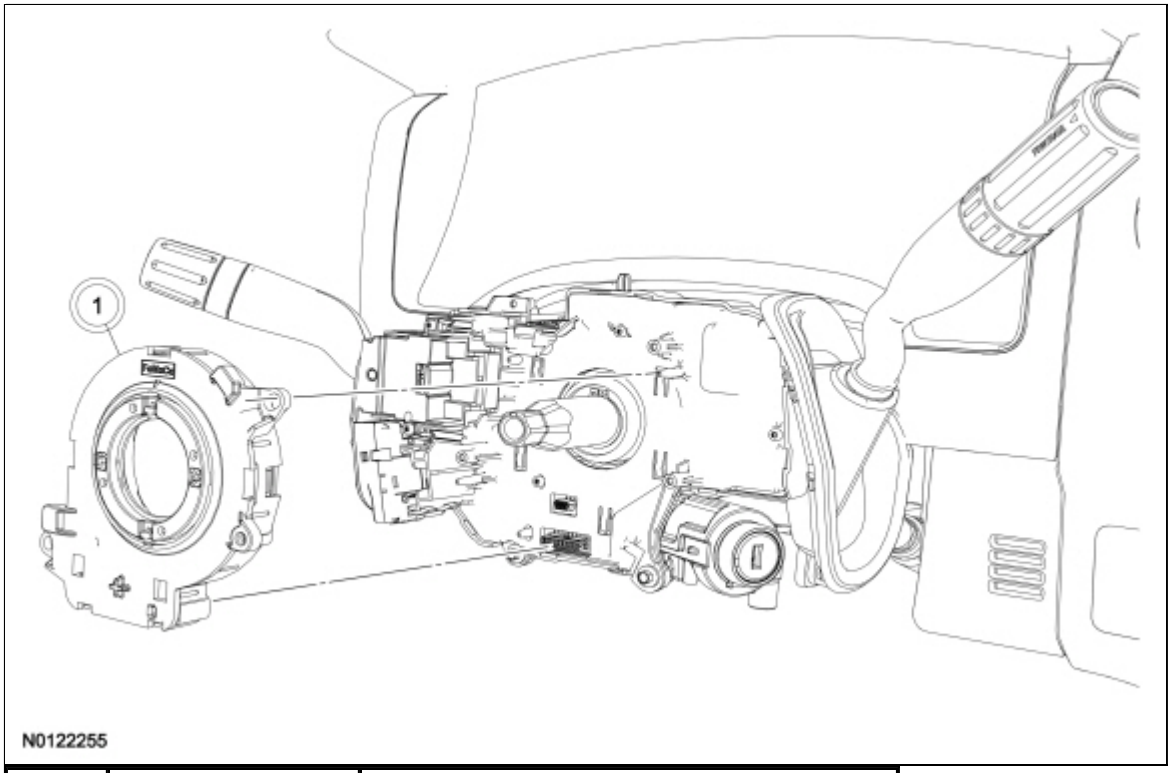
   Remove the 4 brake tube-to- HCU fittings.
   - To install, tighten to 20 Nm (177 lb-in).

3. Disconnect the master cylinder primary and secondary brake tube-to- HCU fittings.
   - To install, tighten the master cylinder primary brake tube-to- HCU fitting to 28 Nm (21 lb-ft).
   - To install, tighten the master cylinder secondary tube brake tube-to- HCU fitting to 20 Nm (177 lb-in).

4. Loosen the 2 HCU -to-bracket nuts and remove the HCU .
   - To install, tighten to 8 Nm (71 lb-in).

5. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to Section 206-00 .

repair4less



Stability/Traction Control Switch

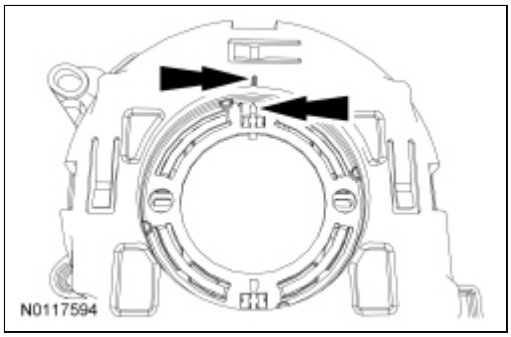
Removal and Installation

1. Refer to Passenger Air Bag Deactivation (PAD) Indicator in Section 501-20B .

repair4less

Steering Wheel Rotation Sensor

Item	Part Number	Description
1	3F818	Steering wheel rotation sensor

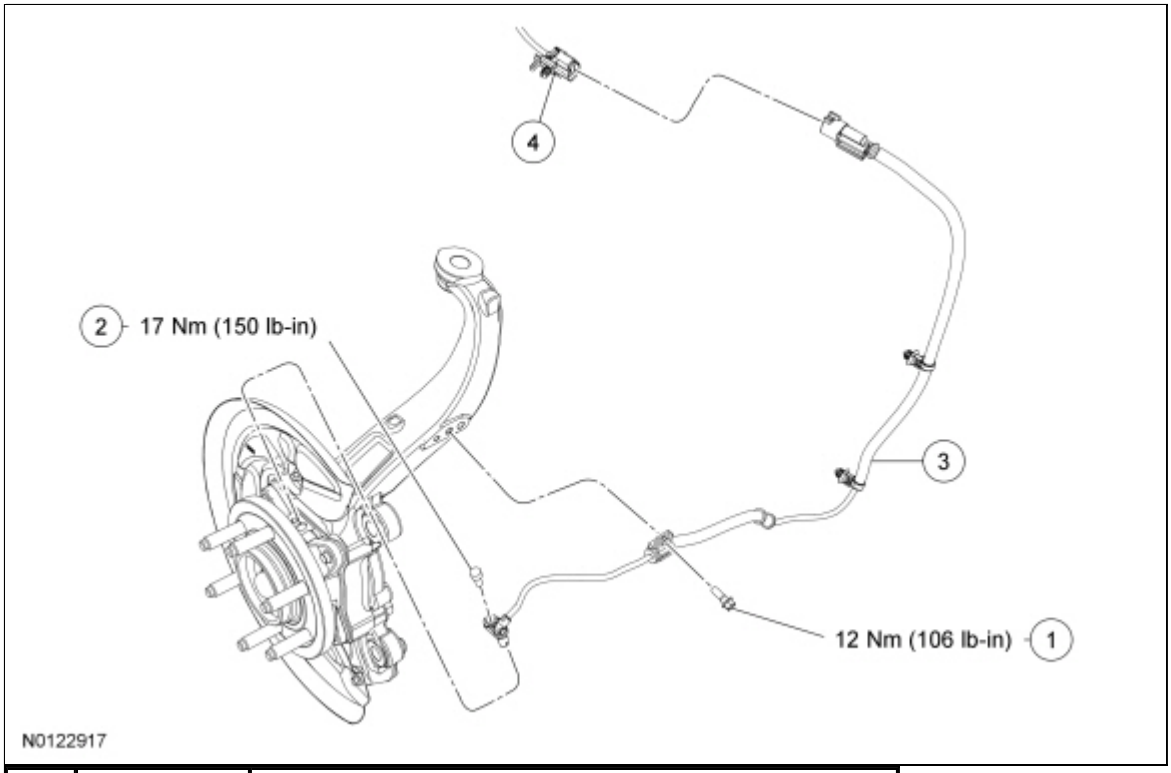


Removal

NOTE: Only available on the 6.2L engine. For all other applications, the sensor is part of the Electronic Power Assist Steering (EPAS) and is not serviced seperatley.

1. Remove the clockspring. For additional information, refer to Section 501-20B .
2. Remove the steering wheel rotation sensor.

Installation



1. Align the arrow on the inner ring of the sensor to the notch on the sensor body.

2. Position the sensor on the Steering Column Control Module (SCCM).
3. Install the clockspring. For additional information, refer to Section 501-20B .

repair4less

Wheel Speed Sensor — Front

Item	Part Number	Description
1	W710279	Wheel speed sensor harness bolt
2	—	Wheel speed sensor bolt (part of 2C204)
3	2C204	Wheel speed sensor
4	—	Wheel speed sensor electrical connector (part of 14250)

Removal and Installation

1. Remove the brake disc. For additional information, refer to Section 206-03 .

2. **NOTE:** The wheel speed sensor harness electrical connector is located in the engine compartment secured to the fender apron.

   Disconnect the wheel speed sensor electrical connector.

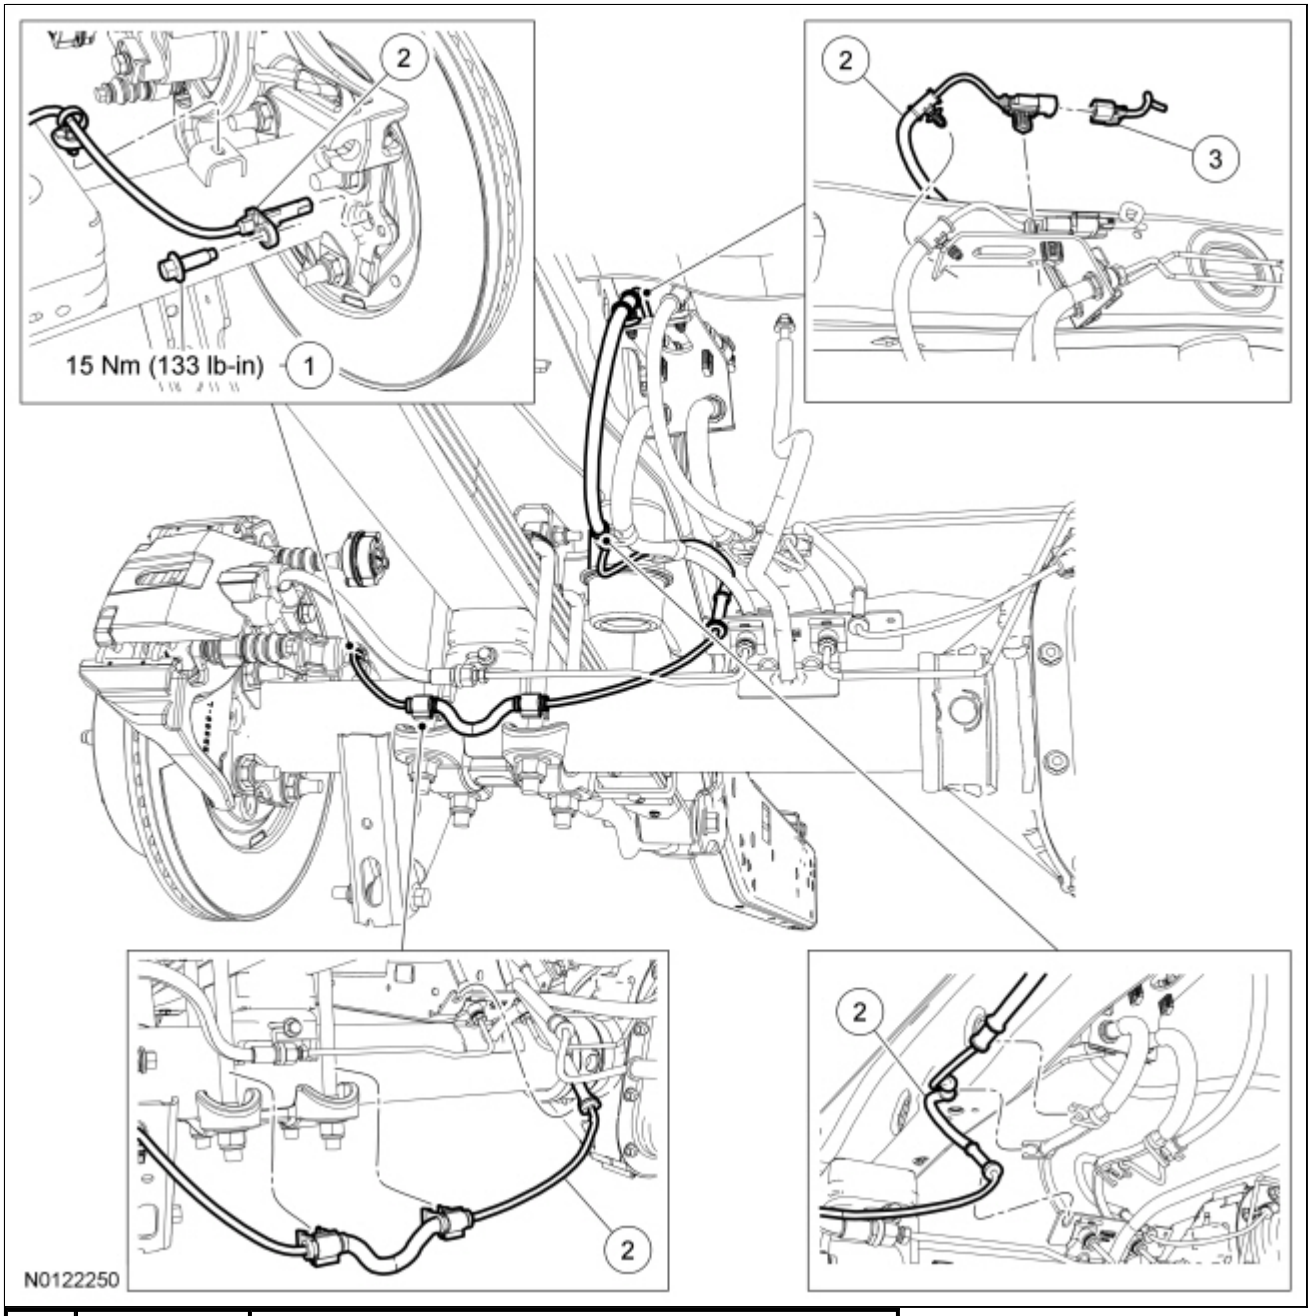
3. Detach the 2 wheel speed sensor harness pushpin retainers.

4. Detach the wheel speed sensor harness retainer from the brake hose.

5. Remove the wheel speed sensor harness bolt.

- To install, tighten to 12 Nm (106 lb-in).

6. Remove the wheel speed sensor bolt and the wheel speed sensor.
    - To install, tighten to 17 Nm (150 lb-in).

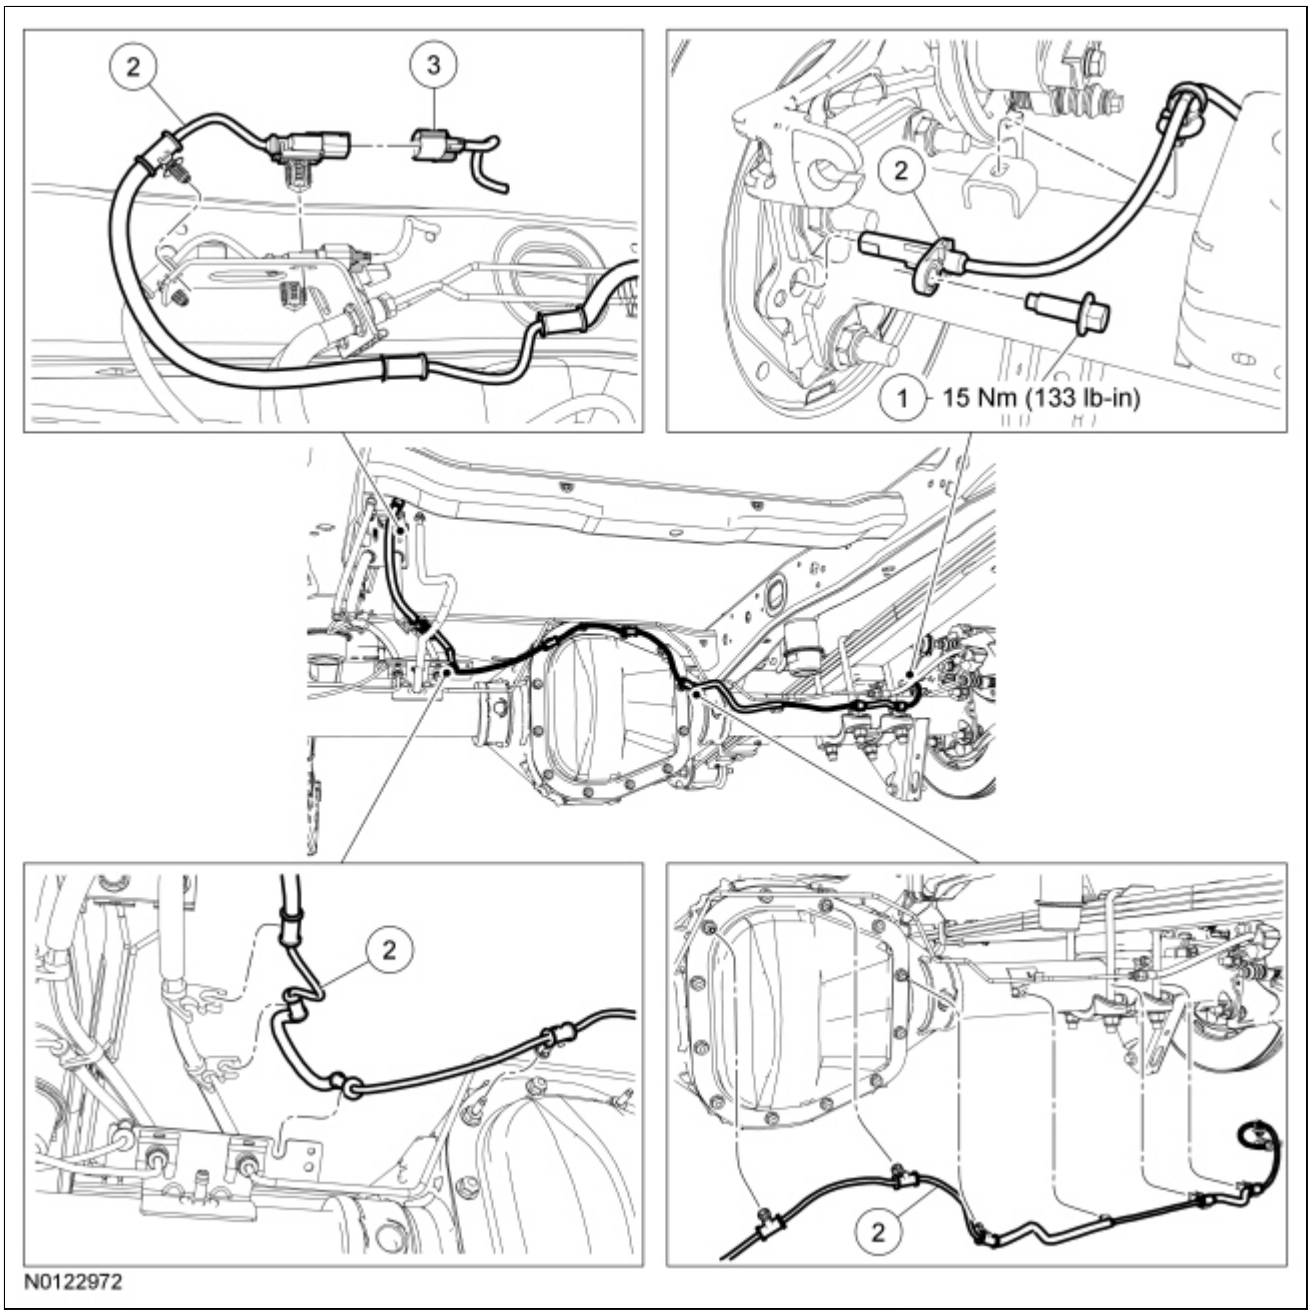


7. To install, reverse the removal procedure.

---

repair4less

Wheel Speed Sensor — Rear



Left Rear Wheel Speed Sensor

Item	Part Number	Description
1	W500223	Wheel speed sensor bolt
2	2C190	Wheel speed sensor

3	—	Wheel speed sensor electrical connector (part of 14405)

Right Rear Wheel Speed Sensor

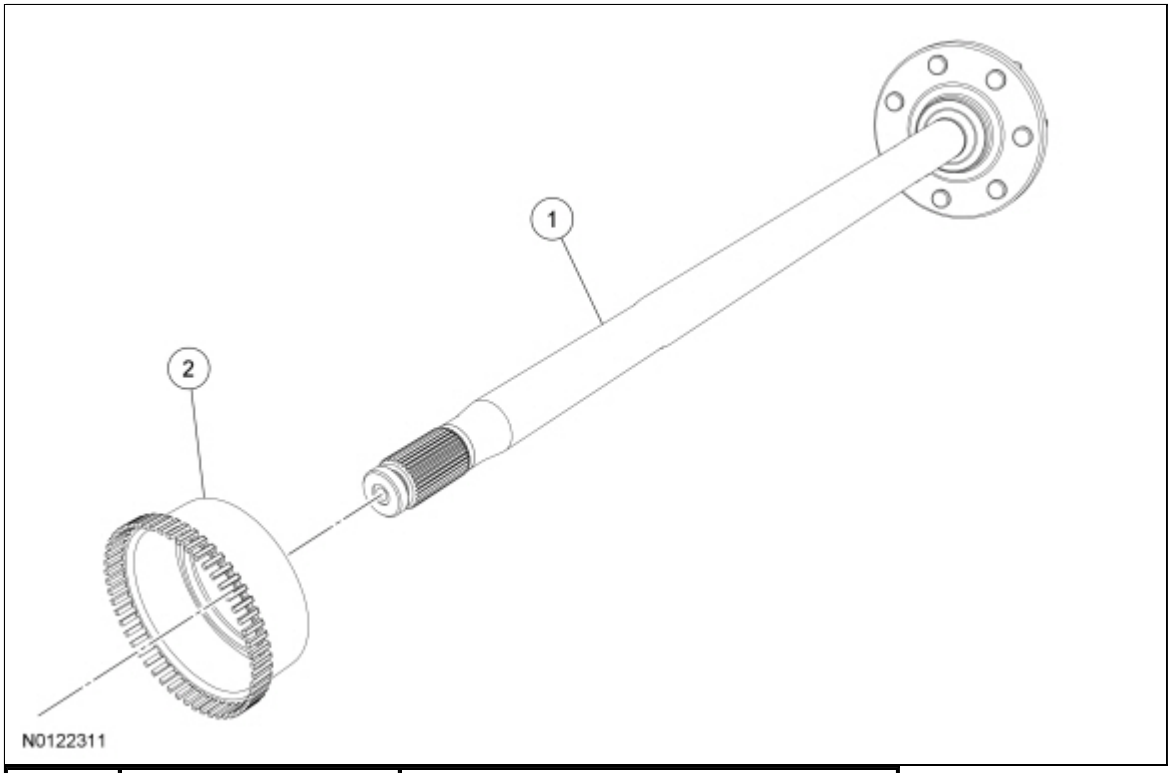
Item	Part Number	Description
1	W500223	Wheel speed sensor bolt
2	2C190	Wheel speed sensor
3	—	Wheel speed sensor electrical connector (part of 14405)

repair4less

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

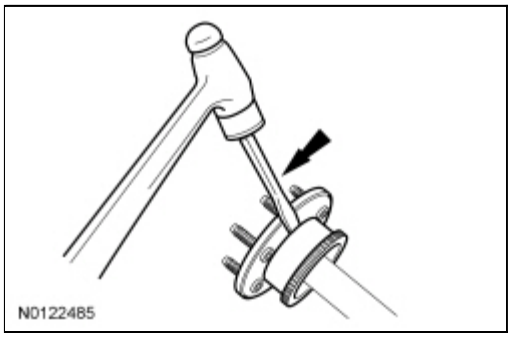
2. Disconnect the wheel speed sensor electrical connector.



3. Detach the wheel speed sensor harness retainers and pushpin retainers.

4. Remove the wheel speed sensor bolt and the wheel speed sensor.
    - To install, tighten to 15 Nm (133 lb-in).

5. To install, reverse the removal procedure.

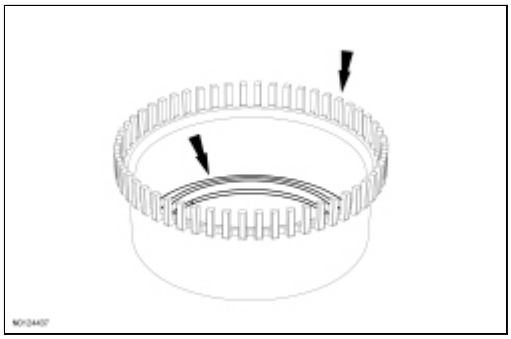


Wheel Speed Sensor Ring — Rear

Removal

Item	Part Number	Description
1	4234	Axle shaft
2	2C189	Wheel speed sensor ring

1. Remove the rear axle shaft. For additional information, refer to Section 205-02A or Section 205-02B .
2. Using a suitable driver, remove the wheel speed sensor ring from the axle shaft and discard the ring.



Installation

repair4less

1. ***NOTICE:*** **Do not apply any amount of force to the tooth area of the wheel speed sensor ring during installation, the sensor teeth are fragile and can be easily damaged. Apply force only to the inner lip area of the wheel speed sensor ring.**

   Using suitable adapters, press the wheel speed sensor ring onto the rear axle shaft.

2. Install the rear axle shaft. For additional information, refer to Section 205-02A or Section 205-02B .

Auxiliary Brake System — Trailer Brake Control (TBC) Module

Trailer Brake Control System

The trailer brake control system consists of the following components:

- Trailer Brake Control (TBC) module, which is mounted in the center of the instrument panel just below the climate controls
- Trailer tow connector
- Instrument Panel Cluster (IPC)

The TBC module has the following driver inputs and outputs:

- Manual slider switch (input)
- Gain buttons (input)
- Gain setting display (output)
- Trailer connectivity icon (output)
- Output bar graph display (output)

The manual slider switch on the TBC module activates the trailer brakes independently from the vehicle brakes. The manual slider is used in conjunction with the gain buttons to adjust and set the trailer brakes. When the manual lever is activated with a trailer connected to the vehicle, the trailer stoplamps and the vehicle stoplamps illuminate. Activating the manual lever without a trailer connected to the vehicle still illuminates the vehicle stoplamps.

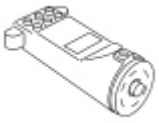
The gain buttons set the TBC system for specific towing conditions such as trailer load, vehicle load, road conditions and weather. The gain is normally set to provide maximum trailer braking while maintaining trailer stability. For information on setting the trailer brake gain, refer to the Owner's Literature.

The gain setting and output bar graph displays provide the driver with TBC system information. Trailer connectivity is provided through the trailer connector icon or message center depending on which IPC the vehicle is equipped with, the gain setting display provides the driver with the current gain setting and the output bar graph shows the amount of power going to the trailer brakes relative to brake pedal or manual lever input (only if a trailer is connected to the vehicle).

TBC System Message Center Messages and Displays

The IPC message center displays the gain setting and relative braking power during a braking event. The message center also indicates trailer connectivity and trailer wiring faults. The following message center messages pertain to the TBC system:

- **NO TRAILER** — This message is displayed whenever the ignition is cycled from OFF to RUN without a trailer connected to the 7-pin trailer connector.
- **TRAILER CONNECTED** — This message is displayed when a correct trailer connection at the 7-pin trailer connector has been made during a given ignition cycle.
- **OUTPUT** — When the vehicle brake pedal is applied, or when the manual control is activated, bar indicators illuminate in the message center to indicate the amount of power going to the trailer brakes



repair4less

relative to the brake pedal or manual control input. One bar indicates the least amount of output with 6 bars indicating maximum output.

- **TRAILER DISCONNECTED** — This message is displayed and accompanied by a single chime when a correct trailer connection was made and then a disconnection has been sensed during a given ignition cycle. This message is also displayed if any of the following occur:
  - the 7-pin trailer connector becomes disconnected while driving
  - an intermittent open circuit occurs in the vehicle wiring from the TBC module to the 7-pin trailer connector or the trailer wiring
  - during manual activation using the manual control lever without a trailer connected (accompanied by a single chime)
- **TRAILER BRAKE MODULE FAULT** — This message is displayed and a DTC is stored when a fault is detected by the TBC module.
- **WIRING FAULT ON TRAILER** — This message is displayed when the trailer brake output circuit is shorted to ground or shorted to voltage. A DTC sets in the TBC module indicating which circuit fault was observed. It is important to determine if a trailer was connected when this message was displayed. If this message is only observed with a trailer connected, the concern is related to the trailer wiring and not the vehicle. If this message is observed without a trailer connected, the concern is with the vehicle wiring from the TBC module to the 7-pin trailer connector.
- **TBC FAULT** — This message is displayed if the Instrument Panel Cluster (IPC) is receiving communications from the TBC module, but has not been configured for a trailer brake system. If the message center displays TBC FAULT and there are no DTCs stored in the TBC module, follow the steps in Programmable Parameters to verify and/or modify the TBC module programmable parameter in the IPC .

Auxiliary Brake System — Trailer Brake Control (TBC) Module

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2954-A	7-Way Trailer Emulator TEK-6562A or equivalent

Principles of Operation

NOTE: A trailer brake emulator tool is available to verify that the Trailer Brake Control (TBC) module and vehicle wiring are functioning correctly. The trailer emulator requires the trailer tow connector ground and 12 volt trailer tow charge circuit to be connected in order to check the electric brake circuit. Battery Junction Box (BJB) fuse 21 (30A) and the Trailer Tow/Battery Charge Relay must be installed for battery voltage to be supplied to the trailer tow connector. The fuse and relay are supplied as loose-shipped items with the vehicle and may not have been installed during Pre-Delivery Inspection (PDI).

The Trailer Brake Control (TBC) module is an integrated electronic control device designed to provide variable braking power to the electric-actuated drum brakes on a towed trailer (1 to 4 axles only). The braking energy provided to the trailer is varied with a Pulse Width Modulated (PWM) signal that switches between 0 volts and battery voltage, the higher the duty cycle the more braking power available.

The TBC module receives information from the stoplamp switch and the PCM. The brake pressure transducer is internal to the ABS module.

The stoplamp switch is mounted on the brake pedal bracket and switches on or off depending on the brake

repair4less

pedal position. The TBC module receives the stoplamp switch and the brake torque information over the High Speed Controller Area Network (HS-CAN) from the PCM.

The TBC module receives information through the HS-CAN . These inputs are from the PCM, the Instrument Panel Cluster (IPC) and the ABS module. The Body Control Module (BCM) also sends ignition state, park lamp status and illumination dimming level data to the TBC module. The information sent from the TBC module is passed to the IPC and is displayed on the message center.

To adjust the gain setting up or down, the TBC module faceplate provides the driver with control buttons which determine the maximum power output. The TBC module faceplate also provides a manual control lever to manually apply the trailer brakes, independent of the vehicle brakes, to calibrate the gain setting to the specific trailer loading and road conditions. When the manual control lever is activated with a trailer connected to the vehicle, the trailer stoplamps and the vehicle stoplamps (except the center high mount stoplamp) illuminate. If a trailer is not connected and the manual control lever is activated, the vehicle still illuminates the vehicle stoplamps (except the center high mount stoplamp).

Trailer Brake Control (TBC) Module Wake Up

NOTE: These conditions require that a trailer **not** be connected to the trailer tow connector.

The following conditions describe the normal operation of the TBC module at start up.

When the ignition key is in the RUN position and the manual lever is set all the way to the left with a gain of 10, the message center should display TRAILER DISCONNECTED. At the same time, with the vehicle stationary, battery voltage should be present at pin 3 of the trailer tow connector.

When not braking the TBC module sends a voltage pulse every 4 seconds to pin 3 of the trailer tow connector to determine whether a trailer is connected to the trailer tow connector.

Instrument Panel Cluster (IPC) Configuration For Trailer Brake Control (TBC) Functionality

The same IPC is used for vehicles with and without the TBC option. TBC functionality is enabled or disabled using the scan tool. If the vehicle is equipped with a TBC module, but the IPC was not configured for TBC , the TBC module shuts down, no TBC information is displayed in the message center and DTC U2202 sets in the TBC module.

If the IPC is configured for TBC , but the vehicle is not equipped with a TBC module, TRAILER BRAKE MODULE FAULT is displayed in the message center. This symptom could occur if a replacement IPC was installed, but not configured correctly. For information on the TBC programmable parameter, refer to Programmable Parameters below.

Programmable Parameters

The message center displays TBC FAULT if it is receiving communications from the TBC module, but has not been configured for a trailer brake system. If the message center displays TBC FAULT and there are no DTCs stored in the TBC module, follow these steps to verify and/or modify the TBC module programmable parameter in the Instrument Panel Cluster (IPC).

1. Identify the vehicle using the normal Integrated Diagnostic System (IDS) process.

2. Select Programming and press the check box.

3. Select Module Programming and press the check box.

4. Select Programmable Parameters and press the check box.

5. Select Personality and press the check box.

6. Follow the on-screen directions.

7. **NOTE:** The scan tool displays either EQUIPPED or NOT EQUIPPED to the left of TBC - IPC .

   Highlight TBC - IPC .

8. If the IPC needs to be configured for a trailer brake system, choose EQUIPPED and press the check box.

9. Clear DTCs from the TBC module, then carry out a self-test on the TBC module. Refer to the Trailer Brake Control (TBC) Module DTC Chart for any DTCs retrieved.

Inspection and Verification

NOTE: Carry out all pinpoint tests **without** a trailer connected to the vehicle.

NOTE: A trailer brake emulator tool is available to verify that the TBC module and vehicle wiring are functioning correctly. The trailer emulator requires the trailer tow connector ground and 12 volt trailer tow charge circuit to be connected in order to check the electric brake circuit.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Base brake system ● Trailer	● Battery Junction Box (BJB) fuse 17 (30A) ● Body Control Module (BCM) fuse 37 (10A) ● Wiring, terminals or connectors ● Trailer Brake Control (TBC) module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.

repair4less

- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 , The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the TBC module.

9. If the DTCs retrieved are related to the concern, go to the Trailer Brake Control (TBC) Module DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Trailer Brake Control (TBC) Module DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test D .
B1318	Battery Voltage Low	GO to Pinpoint Test E .
B1342	ECU is Faulted	INSPECT for a stuck or damaged manual sliding lever and gain control buttons. REPAIR or CLEAR any obstructions or foreign material. REPAIR all other DTCs before repairing B1342. CLEAR the DTCs. TEST the system for normal operation. **NOTE:** It takes 2 minutes for the Trailer Brake Control (TBC) module to set this DTC due to a stuck manual sliding lever or a stuck gain control button. If the DTC returns, INSTALL a new Trailer Brake Control (TBC) module. REFER to Trailer Brake Control (TBC) Module in this section.
B1863	TBC Ground Open Circuit	GO to Pinpoint Test F .
C2806	Trailer Brakes Wiring Circuit Short to Vbatt	GO to Pinpoint Test A .
C2807	Trailer Brakes Wiring Circuit Short to Ground	GO to Pinpoint Test A .
U0100	Lost Communication With ECM /PCM "B"	GO to Pinpoint Test G .

U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	GO to Pinpoint Test H .
U0140	Lost Communication With Body Control Module (GEM)	GO to Pinpoint Test I .
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	GO to Pinpoint Test J .
U0415	Invalid Data Received from Anti-Lock Brake System (ABS) Control Module	This DTC indicates that the TBC module has received the brake pressure information sent from the ABS module, but that information does not agree with other sensor inputs. REFER to Section 206-09 to diagnose the ABS module.
U2202	Invalid Configuration Data Received	The Instrument Panel Cluster (IPC) is not configured for trailer brakes. REFER to Programmable Parameters in this section. CLEAR the DTCs. REPEAT the self-test.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Trailer Brake Control (TBC) module	• Fuse(s) • Wiring, terminals or connectors • TBC module	• REFER to Section 418-00 .
• The trailer brakes are inoperative	• Fuse(s) • Wiring, terminals or connectors • Trailer tow connector • TBC module • Customer trailer	• GO to Pinpoint Test B .
• The trailer brakes are always engaged	• Wiring, terminals or connectors • TBC module • Customer trailer	• GO to Pinpoint Test C .
• The message center intermittently displays TRAILER DISCONNECTED or WIRING FAULT ON TRAILER while towing a trailer	• Wiring, terminals or connectors • Customer trailer	• GO to Pinpoint Test A .
• The message center displays TBC FAULT	• DTCs present	• RETRIEVE and RECORD the DTCs. REFER to the Trailer Brake Control (TBC)

repair4less

		Module DTC Chart.
• The message center displays TRAILER BRAKE MODULE FAULT when the vehicle is not equipped with a TBC module	• Incorrect IPC configuration	• CONFIGURE the IPC. REFER to Programmable Parameters in this section.
• The message center displays WIRING FAULT ON TRAILER	• Wiring, terminals or connectors • TBC module • Customer trailer	• GO to Pinpoint Test A.

Pinpoint Tests

Pinpoint Test A: The Message Center Displays WIRING FAULT ON TRAILER

NOTE: Carry out all pinpoint tests **without** a trailer connected to the vehicle.

Refer to Wiring Diagrams Cell 95, Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The braking energy provided to the trailer is varied with a Pulse Width Modulated (PWM) signal that switches between 0 volts and battery voltage, the higher the duty cycle the more braking power available. The Trailer Brake Control (TBC) module varies the PWM signal based on various inputs such as the brake torque message, the manual slider switch and the gain buttons. With the vehicle stationary and the manual slider switch fully to the left with a gain of 10, there should be more than 10-12 volts supplied to pin 3 of the 7-pin trailer tow connector. When the trailer is connected to the vehicle the Instrument Panel Cluster (IPC) should show the TRAILER CONNECTED message. If the WIRING FAULT ON TRAILER is only message displayed when the trailer is connected, the fault is with the trailer wiring.

Every 4 seconds (when not braking) the TBC module sends a voltage pulse to pin 3 of the 7-pin trailer tow connector to determine whether or not a trailer is connected.

- DTC C2806 (Trailer Brakes Wiring Circuit Short to Vbatt) — this DTC sets in continuous memory when the TBC module detects that the battery voltage is greater than 9 volts while not braking. The TBC module shuts off the trailer brake output and then shuts down.
- DTC C2807 (Trailer Brakes Wiring Circuit Short to Ground) — this DTC sets in continuous memory or on-demand when the TBC module detects that the battery voltage drops by more than 20 percent during a braking event or the trailer brakes are drawing more than 28 amps. The TBC module shuts off the trailer brake output and then shuts down.

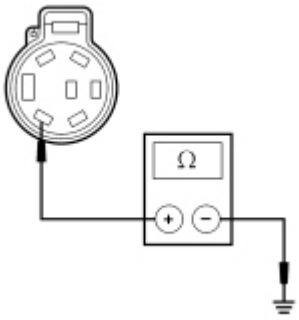
This pinpoint test is intended to diagnose the following:

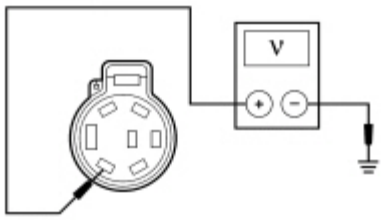
- Wiring, terminals or connectors
- TBC module
- Customer trailer

PINPOINT TEST A: THE MESSAGE CENTER DISPLAYS WIRING FAULT ON TRAILER

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: Make sure the trailer brakes are electric-magnet actuated drum type brakes before proceeding with this pinpoint test.





Test Step	Result / Action to Take

A1 VERIFY TBC MODULE DTCs
• Verify a trailer is **not** connected to the trailer tow connector.
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: TBC Module Self-Test .
• Clear the DTCs.
• Test drive the vehicle in the following manner:
  ▪ maintain a speed greater than 5 km/h (3 mph)
  ▪ turn the headlights ON
  ▪ lightly apply the brakes for more than 5 seconds
  ▪ activate the left and right turn signals
• Ignition OFF.
• Ignition ON.
• Wait at least 10 seconds for all modules to wake up and prove out.
• Enter the following diagnostic mode on the scan tool: TBC Module Self-Test .
• **Is DTC C2806 or C2807 present?**
	Yes
	GO to A2 .
	
	No
	For all other TBC module DTCs, GO to the TBC Module DTC Chart. If no DTCs return, the system is operating correctly at this time. INSPECT the 7-pin trailer tow connector for water intrusion, corrosion, pushed-out pins and spread terminals. REPAIR or INSTALL new as necessary. If the 7-pin trailer tow connector is OK, SEND the trailer to an authorized camper/trailer repair facility.

A2 CHECK THE TRAILER TOW CONNECTOR
• Ignition OFF.
• Disconnect: Trailer Tow C439A .
• Ignition ON.
• Enter the following diagnostic mode on the scan tool: TBC Module Self-Test .
• Clear the DTCs.
• Test drive the vehicle in the following manner:
  ▪ maintain a speed greater than 5 km/h (3 mph)
  ▪ turn the headlights ON
  ▪ lightly apply the brakes for more than 5 seconds
  ▪ activate the left and right turn signals
• Ignition OFF.
• Ignition ON.
• Wait at least 10 seconds for all modules to wake up and prove out.
• Enter the following diagnostic mode on the scan tool: TBC Module Self-Test .
• **Is DTC C2806 or C2807 present?**
	Yes
	For DTC C2806, GO to A4 . For DTC C2807, GO to A3 .
	
	No
	INSTALL a new 7-pin trailer tow connector. CLEAR any DTCs present. TEST the system for normal operation.

A3 CHECK THE TBC MODULE PWM OUTPUT CIRCUIT FOR A SHORT TO GROUND • Ignition OFF. • Connect: Trailer Tow C439A . • Disconnect: TBC Module C2142 . • Measure the resistance between C439A-3, circuit	**Yes** GO to A5 . **No**

repair4less

CAT19 (BU), harness side and ground.  N0009553 • **Is the resistance greater than 10,000 ohms?**	REPAIR circuit CAT19 (BU) for a short to ground. TEST the system for normal operation.
A4 CHECK THE TBC MODULE PWM OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Connect: Trailer Tow C439A . • Disconnect: TBC Module C2142 . • Ignition ON. • Measure the voltage between C439A-3, circuit CAT19, (BU), harness side and ground while operating the following lamps in turn: ▪ Parking lamps ▪ Stop lamps ▪ Reversing lamps  A0025430 • **Is any voltage present?**	**Yes** REPAIR circuit CAT19 (BU) for a short to power. TEST the system for normal operation. **No** GO to A5 .
A5 CHECK FOR CORRECT TBC MODULE OPERATION • Ignition OFF. • Inspect the TBC module connector. • Repair: ▪ corrosion (install a new connector or terminal - clean module pins) ▪ damaged or bent pins - install new terminals or pins ▪ pushed-out pins - install new pins as necessary ▪ spread terminals - install new terminals as necessary • Connect the TBC module connector and make sure that it seats correctly. • Test drive the vehicle in the following manner: ▪ maintain a speed greater than 5 km/h (3	**Yes** INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

mph) ■ turn the headlights ON ■ lightly apply the brakes for more than 5 seconds ■ activate the left and right turn signals • Ignition OFF. • Ignition ON. • Wait at least 10 seconds for all modules to wake up and prove out. • Enter the following diagnostic mode on the scan tool: TBC Module Self-Test . • **Is DTC C2806 or C2807 present?**	

Pinpoint Test B: The Trailer Brakes are Inoperative

NOTE: Carry out all pinpoint tests **without** a trailer connected to the vehicle.

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

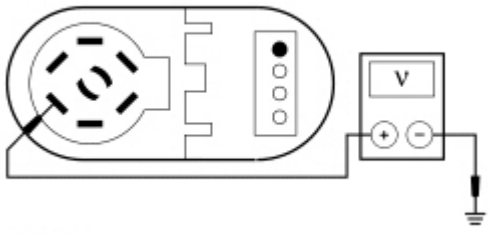
Normal Operation

The braking energy provided to the trailer is varied with a Pulse Width Modulated (PWM) signal that switches between 0 volts and battery voltage, the higher the duty cycle the more braking power available. The Trailer Brake Control (TBC) module varies the PWM signal based on various inputs such as the brake torque message, the manual slider switch and the gain buttons. With the vehicle stationary and the manual slider switch fully to the left with a gain of 10, there should be more than 10-12 volts supplied to the trailer tow connector.

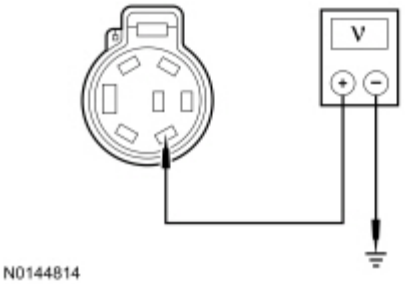
The TBC module receives stoplamp switch information from the PCM and information from the ABS module over the High Speed Controller Area Network (HS-CAN). If there is a problem in the ABS module that is preventing this information from being sent to the TBC module, the TBC module enters a limited operating mode. The TBC module receives fused battery voltage from Battery Junction Box (BJB) fuse 17 (30A) and fused ignition voltage from Body Control Module (BCM) fuse 37 (10A).

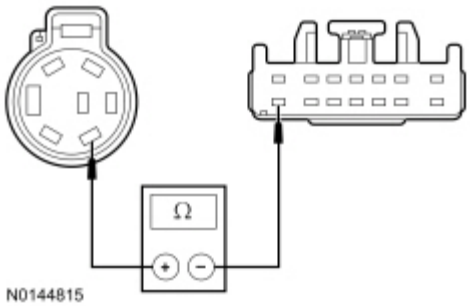
This pinpoint test is intended to diagnose the following:

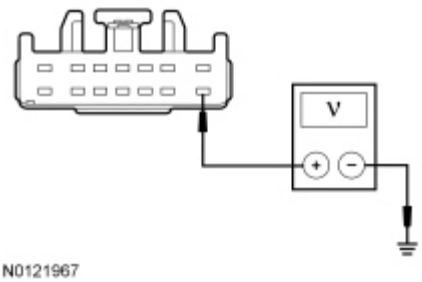
- Fuse(s)
- Wiring, terminals or connectors
- Trailer tow connector
- TBC module
- Customer trailer



PINPOINT TEST B: THE TRAILER BRAKES ARE INOPERATIVE







NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: Make sure the trailer brakes are electric-magnet actuated drum-type brakes before proceeding with this pinpoint test.

Test Step	Result / Action to Take
B1 CHECK FOR ANY PCM DTCs	

repair4less

• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Enter the following diagnostic mode on the scan tool: Self Test — PCM Key ON Engine OFF (KOEO) . • Retrieve and record any PCM DTCs. • **Are any PCM DTCs retrieved?**	**Yes** REFER to Section 303-14 . **No** GO to B2 .
B2 CHECK FOR ANY ABS MODULE DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test — ABS Module . • Retrieve and record any ABS module DTCs. • **Are any ABS module DTCs retrieved?**	**Yes** REFER to Section 206-09 . **No** GO to B3 .
B3 CHECK FOR SCAN TOOL COMMUNICATION WITH THE TBC MODULE	
• Using a scan tool, carry out the network test. • **Did the TBC module pass the network test?**	**Yes** GO to B4 . **No** REFER to Section 418-00 .
B4 CHECK FOR TBC MODULE DTCs	
• Review the DTCs retrieved and recorded during TBC module self-test. • **Are any TBC module DTCs present?**	**Yes** REFER to the Trailer Brake Control (TBC) Module DTC Chart. **No** GO to B5 .
B5 CHECK THE TBC MODULE FOR MAXIMUM OUTPUT	
NOTE: Battery voltage must be greater than 10 volts. • Ignition ON. • Set a gain of 10 in the TBC module. • **NOTE:** If the manual slider switch is held to the full left position for more than 5 to 20 minutes, the TBC module automatically shuts down. • Have an assistant press the manual slider switch fully to the left with a gain of 10 on the TBC module. • Measure the voltage between trailer tow 7-pin trailer tow connector electric brake supply pin, component side and ground.  N0084023 • **Is the voltage greater than 10-12 volts?**	**Yes** The TBC module is operating correctly. SEND the trailer to an authorized camper/trailer repair center for an overload condition. **No** GO to B6 .
B6 CHECK THE TRAILER TOW CONNECTOR FOR AN OPEN	

• Ignition OFF. • Disconnect: Trailer Tow Connector C439A . • Ignition ON. • Have an assistant press the manual slider switch fully to the left with a gain of 10 on the TBC module. • Measure the voltage between the trailer tow connector C439A-3, circuit CAT19 (BU), harness side and ground.  N0144814 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B7 .
B7 CHECK THE TBC MODULE PWM OUTPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the trailer tow connector C439A-3, circuit CAT19 (BU), harness side and TBC module C2142-14, circuit CAT19 (BU), harness side.  N0144815 • **Is the resistance less than 5 ohms?**	**Yes** GO to B8 . **No** REPAIR the circuit. TEST the system for normal operation.
B8 CHECK THE BATTERY VOLTAGE TO THE TBC MODULE	
• Ignition OFF. • Measure the voltage between TBC module C2142-8, circuit SBB17 (RD), harness side and ground.  N0121967 • **Is the voltage greater than 10 volts?**	**Yes** GO to B9 . **No** VERIFY the BJB fuse 17 (30A) is OK. If OK, REPAIR circuit SBB17 (RD) for an open. TEST the system for normal operation.

repair4less

B9 CHECK FOR CORRECT TBC MODULE OPERATION	

• Disconnect the TBC module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TBC module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

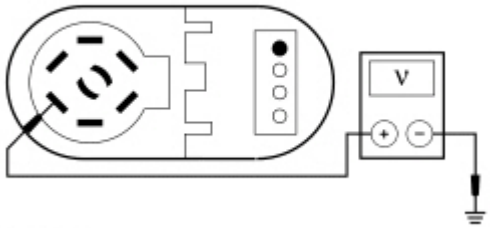
Pinpoint Test C: The Trailer Brakes are Always Engaged

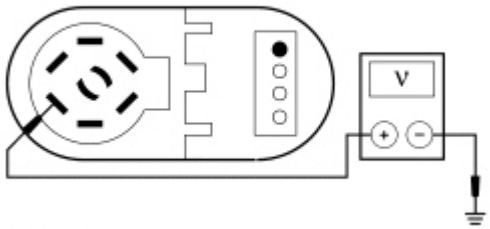
NOTE: Carry out all pinpoint tests **without** a trailer connected to the vehicle.

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The braking energy provided to the trailer is varied with a Pulse Width Modulated (PWM) signal that switches between 0 volts and battery voltage, the higher the duty cycle the more braking power available. With the vehicle stationary and the manual slider switch fully to the left with a gain of 10, there should be more than 10-12 volts supplied to pin 3 of the 7-pin trailer tow connector. The Trailer Brake Control (TBC) module also receives information from the brake pressure switch (also called the speed control deactivation switch) and the stoplamp switch from the PCM over the High Speed Controller Area Network (HS-CAN).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TBC module
- Customer trailer

PINPOINT TEST C: THE TRAILER BRAKES ARE ALWAYS ENGAGED

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 CHECK FOR ANY PCM DTCs	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Enter the following diagnostic mode on the scan tool: Self Test — PCM Key ON Engine OFF (KOEO) . • Retrieve and record any PCM DTCs. • **Are any PCM DTCs retrieved?**	**Yes** REFER to Section 303-14 . **No** GO to C2 .
C2 CHECK FOR ANY TBC MODULE DTCs	

• Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • Retrieve and record any TBC module DTCs. • **Are any TBC module DTCs retrieved?**	**Yes** REFER to DTC Charts in this section. **No** GO to C3 .
C3 OBSERVE THE VEHICLE STOPLAMP OPERATION • Monitor the vehicle stoplamps while pressing and releasing the brake pedal. • **Do the vehicle stoplamps operate correctly?**	**Yes** GO to C4 . **No** REFER to Section 417-01 to diagnose the stoplamp switch.
C4 CHECK THE TBC MODULE OUTPUT **NOTE:** Every 4 seconds a voltage pulse is applied as a trailer connectivity test. • Ignition ON. • Make sure the brake pedal is not pressed and the manual slider switch is not being applied. • Measure the voltage between 7-pin trailer tow connector electric brake supply pin, component side and ground.  N0084023 • **Is the voltage approximately 0.3-0.4 volt?**	**Yes** The TBC module and vehicle wiring are operating correctly. SEND the trailer to an authorized camper/trailer repair center. **No** GO to C5 .
C5 CHECK THE TBC MODULE PWM OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: TBC Module C2142 . • Ignition ON. • Measure the voltage between 7-pin trailer tow connector electric brake supply pin, component side and ground.  N0084023 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to C6 .

repair4less

C6 CHECK FOR CORRECT TBC MODULE OPERATION	

• Disconnect the TBC module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TBC module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test D: DTC B1317

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

Normal Operation

- DTC B1317 (Battery Voltage High) — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module when the TBC module detects that battery voltage has risen above 16 volts on the voltage supply circuit while not braking.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- TBC module

PINPOINT TEST D: DTC B1317

NOTE: DTC B1317 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
D1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to D2 .
D2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring	**Yes** REFER to Section 414-00 to diagnose an overcharging condition.

the battery voltage. • **Does the battery voltage rise to 16 volts or higher?**	**No** GO to D3 .
D3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • Clear the continuous memory DTCs. • Carry out the TBC module self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module module in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test E: DTC B1318

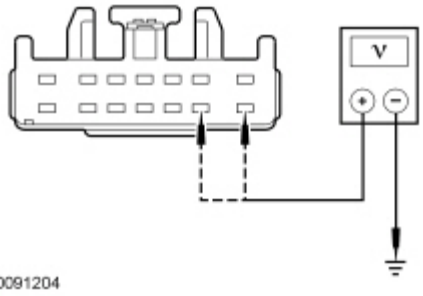
Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

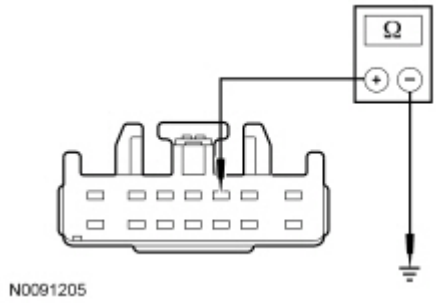
- DTC B1318 (Battery Voltage Low) — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module when the TBC module detects that battery voltage has dropped below 9 volts on the voltage supply circuit while not braking.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Charging system concern
- TBC module



PINPOINT TEST E: DTC B1318



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed results in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 RECHECK THE TBC MODULE DTCs	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • Clear the DTCs. Repeat the TBC module self-test. • **Is DTC B1318 still present?**	**Yes** GO to E2 . **No** The system is operating normally at this time. The DTC may have been set due to a previous low battery voltage condition.
E2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	

repair4less

• Enter the following diagnostic mode on the scan tool: Self Test — PCM Key ON Engine OFF (KOEO) . • **Is DTC P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-01 . **No** GO to E3 .
E3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to E4 . **No** REFER to Section 414-00 .
E4 CHECK THE TBC MODULE VOLTAGE (MODULE_VOLT) PID	
• Ignition ON. • Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: DataLogger — TBC Module . • Monitor the TBC MODULE_VOLT PID. • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to E7 . **No** GO to E5 .
E5 CHECK THE TBC MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: TBC Module C2142 . • Ignition ON. • Measure the voltage between the TBC module C2142-8, circuit SBB17 (RD), harness side and ground; and between the TBC module C2142-9, circuit CBP37 (WH), harness side and ground.  N0091204 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to E6 . **No** REPAIR the circuit. TEST the system for normal operation.
E6 CHECK THE TBC MODULE GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the TBC module C2142-3, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
E7 CHECK FOR CORRECT TBC MODULE OPERATION	

• Disconnect the TBC module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TBC module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: DTC B1863

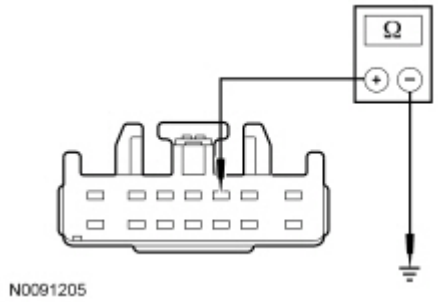
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The Trailer Brake Control (TBC) module receives battery voltage from Battery Junction Box (BJB) fuse 17 (30A) and ignition voltage from Body Control Module (BCM) fuse 37 (10A).

- DTC B1863 (TBC Ground Open Circuit) — this DTC sets in continuous memory or on-demand when the TBC module detects an open circuit in the wiring, a connector condition causes an open in the ground circuit or if an internal failure of the TBC module causes an open in the ground circuit. The TBC module also disables trailer braking and sends a TRAILER BRAKE MODULE FAULT message to the message center. A trailer must be connected for this DTC to set.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- TBC module

PINPOINT TEST F: DTC B1863

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

repair4less

NOTE: A trailer must be connected to the 7-pin trailer connector for DTC B1863 to set during the on-demand self-test.

Test Step	Result / Action to Take
F1 CHECK THE TBC MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: TBC Module C2142 . • Measure the resistance between TBC module C2142-3, circuit GD138 (BK/WH), harness side and ground.  N0091205 • **Is the resistance less than 5 ohms?**	**Yes** GO to F2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F2 CHECK FOR CORRECT TBC MODULE OPERATION	

• Disconnect the TBC module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
  ▪ broken harness wire
  ▪ broken connector
• Connect the TBC module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: DTC U0100

Normal Operation

- DTC U0100 (Lost Communication With ECM/PCM "B") — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module if data messages received (vehicle speed) from the PCM are missing for more than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- PCM
- TBC module

PINPOINT TEST G: DTC U0100

Test Step	Result / Action to Take
G1 VERIFY THE SCAN TOOL CAN COMMUNICATE WITH THE PCM	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Verify that a vehicle session can be established with a scan tool. • **Can a vehicle session be established?**	**Yes** GO to G2 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
G2 CHECK THE TBC MODULE CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • Clear the DTCs. Repeat the TBC module self-test. Record all TBC module DTCs. • **Is DTC U0100 retrieved again?**	**Yes** GO to G3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
G3 RETRIEVE THE RECORDED DTCs FROM THE TBC MODULE SELF-TEST	
• Check for recorded TBC module DTCs from the previous self-test. • **Is DTC B1317 or DTC B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test D . For DTC B1318, GO to Pinpoint Test E . **No** GO to G4 .
G4 RETRIEVE THE RECORDED DTCs FROM THE PCM SELF-TEST	
• Enter the following diagnostic mode on the scan tool: Self Test — PCM Key ON Engine OFF (KOEO) . • **Is DTC P0562 or DTC P0563 recorded?**	**Yes** REFER to Section 303-14 . **No** GO to G5 .
G5 CHECK FOR DTC U0100:00 SET IN OTHER MODULES	

• Using a scan tool, retrieve the continuous memory DTCs from the following modules:
  ▪ Accessory Protocol Interface Module (APIM) (if equipped)
  ▪ BCM
  ▪ Instrument Panel Cluster (IPC)
  ▪ Occupant Classification System Module (OCSM)
  ▪ Power Steering Control Module (PSCM) (if equipped)
  ▪ Restraints Control Module (RCM)
  ▪ Transfer Case Control Module (TCCM) (if equipped)
• **Is DTC U0100:00 set in any of these modules?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.

Pinpoint Test H: DTC U0121

repair4less

Normal Operation

- DTC U0121 (Lost Communication With Anti-Lock Brake System (ABS) Control Module) — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module if data messages such as brake torque information are not received from the ABS module. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ABS module
- TBC module

PINPOINT TEST H: DTC U0121

Test Step	Result / Action to Take
H1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to H2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
H2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to H3 . **No** REFER to Section 418-00 to diagnose the ABS module does not respond to the scan tool.
H3 RETRIEVE ANY DTCs FROM THE TBC MODULE	
• Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • **Is DTC U3003:16 (or B1318) or DTC U3003:17 (or B1317) recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test D . For DTC B1318, GO to Pinpoint Test E . For the ABS module, REFER to Section 206-09 . **No** GO to H4 .
H4 CHECK FOR DTC U0121:00 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Wait at least 5 seconds to allow the TBC module to sleep (power down). • Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Using a scan tool, retrieve the continuous memory DTCs from the following modules:	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the ABS module self-test. **No** INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.

▪ Body Control Module (BCM) ▪ Instrument Panel Cluster (IPC) ▪ Power Steering Control Module (PSCM) (if equipped) ▪ Transfer Case Control Module (TCCM) (if equipped) • **Is DTC U0121:00 set in any of these modules?**	

Pinpoint Test I: DTC U0140

Normal Operation

- DTC U0140 (Lost Communication With Body Control Module (GEM)) — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module if data messages such as ignition state, park lamp status and illumination dimming level data are not received from the Body Control Module (BCM). For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BCM
- TBC module

PINPOINT TEST I: DTC U0140

Test Step	Result / Action to Take
I1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to I2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
I2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out the network test. • **Does the BCM module pass the network test?**	**Yes** GO to I3 . **No** REFER to Section 418-00 .
I3 RETRIEVE ANY DTCs FROM THE TBC MODULE	
• Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • **Is DTC B1317 or DTC B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test D . For DTC B1318, GO to Pinpoint Test E . **No** GO to I4 .
I4 RETRIEVE ANY DTCs FROM THE BCM	

repair4less

• Enter the following diagnostic mode on the scan tool: Self Test — BCM . • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** REFER to Section 419-10 . **No** GO to I5 .
I5 RECHECK THE TBC MODULE DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the TBC module self-test. • **Is DTC U0140 still present?**	**Yes** GO to I6 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
I6 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Wait at least 5 seconds to allow the TBC module to sleep (power down). • Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Using a scan tool, retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in more than one module?**	**Yes** INSTALL a new BCM . REFER to Section 419-10 . REPEAT the BCM self-test. **No** INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.

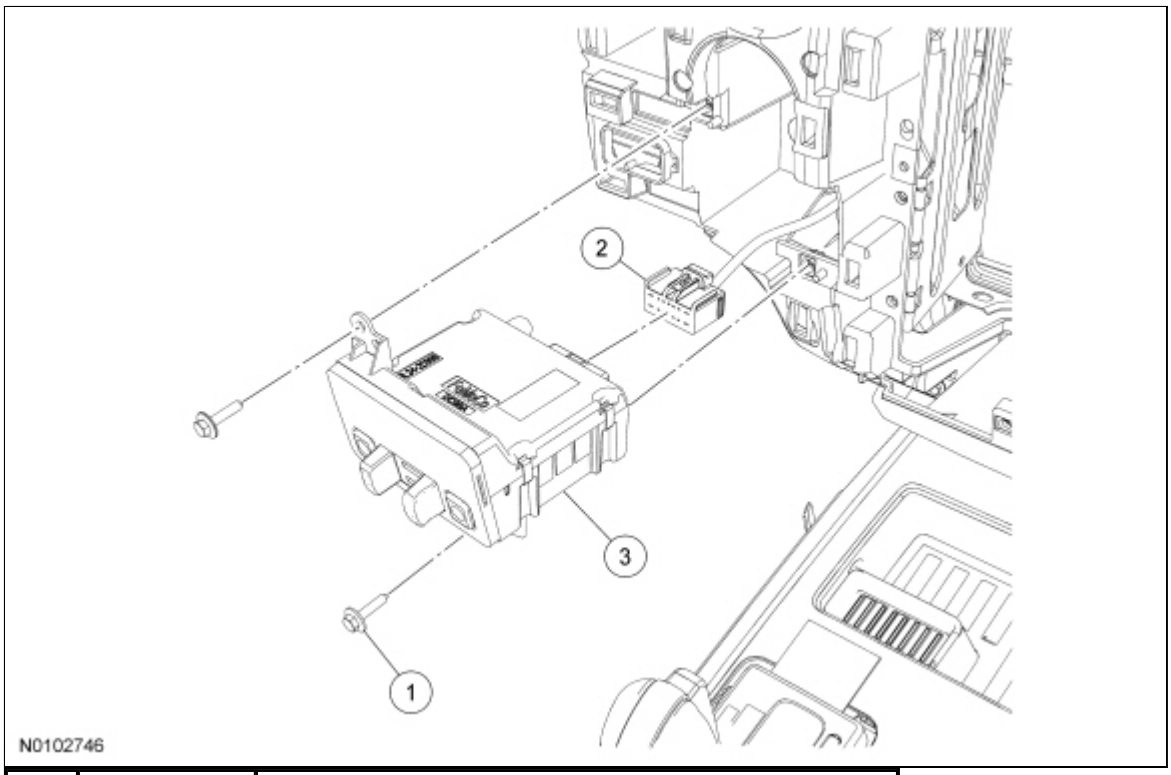
Pinpoint Test J: DTC U0155

Normal Operation

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Module) — this DTC sets in continuous memory or on-demand in the Trailer Brake Control (TBC) module if data messages received from the Instrument Panel Cluster (IPC) are missing. The IPC sends a TRAILER BRAKE CONFIG message to the TBC module. For a complete list of all network messages, refer to Section 413-01 .

This pinpoint test is intended to diagnose the following:

- IPC
- TBC module



PINPOINT TEST J: DTC U0155

Test Step	Result / Action to Take
J1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Verify that there is an observable symptom present. • **Is an observable symptom**	**Yes** GO to J2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an

present?	intermittent fault condition.
J2 CHECK THE COMMUNICATION NETWORK	
• Using a scan tool, carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to J3 . **No** REFER to Section 418-00 .
J3 RETRIEVE THE RECORDED DTCs FROM THE TBC MODULE AND IPC SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: Self Test — TBC Module . • Record the TBC module DTCs. • Enter the following diagnostic mode on the scan tool: Self Test — IPC . • **Is DTC U3003:16 (or B1318) or DTC U3003:17 (or B1317) recorded?**	**Yes** For TBC module DTC B1317, GO to Pinpoint Test D . For TBC module DTC B1318, GO to Pinpoint Test E . For IPC DTCs, REFER to Section 413-01 . **No** GO to J4 .
J4 CHECK FOR DTC U0155 SET IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Wait at least 5 seconds to allow the TBC module to sleep (power down). • Ignition ON. • Allow at least 10 seconds for all modules to wake up and prove out. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155:00 or DTC U0155 set in more than one module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the IPC self-test. **No** INSTALL a new TBC module. REFER to Trailer Brake Control (TBC) Module in this section. TEST the system for normal operation.

repair4less

Trailer Brake Control (TBC) Module

Item	Part Number	Description
1	W707628	Trailer Brake Control (TBC) module bolt (2 required)
2	—	TBC module electrical connector (part of 14401)
3	2C006	TBC module

Removal and Installation

NOTE: The trailer brake system is normally installed at the assembly plant, however, the system can be installed at the dealership but only if the vehicle is equipped with the trailer tow option. This option can be confirmed by verifying the presence of both the 4-pin and the 7-pin connectors at the rear of the vehicle as well as a receiver hitch. If the vehicle is not equipped with these 3 items, then it is not equipped with trailer tow and cannot have the factory Trailer Brake Control (TBC) system installed.

On those vehicles equipped with the trailer tow option, the electrical connector for the TBC module is attached to the 14401 harness behind the steering column opening trim panel. If the system is installed at the dealership, the TBC module will be installed in place of the coin bin/storage tray and the Instrument Panel Cluster (IPC) must be configured to communicate with the TBC module. Refer to the Wiring Diagrams manual, Cell 95 Trailer/Camper Adapter and Cell 151 Component Location Views for connector and wiring information. Refer to Programmable Parameters in the Diagnosis and Testing portion of this section for information on IPC configuration.

1. Remove the LH center instrument panel trim panel. For additional information, refer to Center Instrument Panel Trim Panel in Section 501-12 .

repair4less

2. Remove the 2 TBC module bolts.

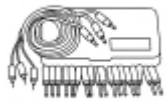
3. Remove the TBC module.
    - Disconnect the electrical connector.

4. To install, reverse the removal procedure.

Steering System

Electronic Power Assist Steering (EPAS) System

The Electronic Power Assist Steering (EPAS) system consists of the following components:



- Power Steering Control Module (PSCM) — the PSCM controls the functions of the EPAS system and communicates with other modules that are on the High Speed Controller Area Network (HS-CAN). The PSCM is attached to the EPAS gear assembly and is not available separately for service.
- Motor — the EPAS gear uses a 12-volt reversible motor to control the steering effort. The motor is connected to the steering rack by a toothed belt and a pulley/bearing assembly. The motor is used by the PSCM to move the rack inside the gear housing. Motor position is used to determine steering wheel angle/position instead of using a separate sensor. The motor is attached to the RH side of the EPAS gear assembly and is not available separately for service.
- EPAS gear assembly — the vehicle has two EPAS steering gear options available, one with a 20:1 steering ratio and one with a 17:1 steering ratio. The steering gear installed to the vehicle is dependant on the wheelbase and trailer tow capacity.
- Steering shaft torque sensor — the steering shaft torque sensor is used by the PSCM to determine how much force is being used to turn the steering wheel. The sensor sends out 2 signals, one for left and one for right. When the steering wheel is turned to the left, the left signal increases while the right signal decreases, likewise when the steering wheel is turned to the right, the right signal increases while the left signal decreases. This allows the PSCM to determine if the driver intends to go left or right in order to spin the motor in the appropriate direction. The sensor is mounted inside the EPAS gear assembly and is not available separately for service.
- Inner tie rod — one inner tie rod is located at each end of the EPAS gear assembly and is available separately for service, refer to Section 211-02 .
- Outer tie rod — one outer tie rod is located at each end of the EPAS gear assembly and is available separately for service, refer to Section 211-02 .
- EPAS gear bellows boot — one bellows boot is located on each side of the EPAS gear assembly. Each boot is held in place with 2 boot clamps. The boots and clamps are available for service, refer to Section 211-02 .
- EPAS gear isolators — there are two rubber isolators (one at each attaching point) on the EPAS gear assembly. These isolators aid in reducing NVH concerns and are not available separately for service.

The EPAS system utilizes a rack-and-pinion type steering gear. Power assist is provided by a motor that is connected to the steering rack by a belt and a pulley and bearing assembly. The steering gear and motor/module are serviced as an assembly. A new steering gear includes inner tie rods, however, the inner and outer tie rods can also be serviced separately. For information on tie-rod end service, refer to Section 211-02 .

Steering System

Special Tool(s)

 ST1138-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Electronic Power Assist Steering (EPAS) System

The Electronic Power Assist Steering (EPAS) system provides power steering assist to the driver by replacing the conventional hydraulic valve system with an electric motor coupled to the steering rack by a toothed belt. The motor is controlled by the Power Steering Control Module (PSCM) that senses steering effort/use through an internally mounted steering shaft torque sensor. Steering assist is provided in proportion to the steering input effort and vehicle speed.

The EPAS system requires a 12-volt, hot at all times feed for system operation. The PSCM is activated when power is applied to the hard-wired ignition/run input. After activation, the PSCM monitors the High Speed Controller Area Network (HS-CAN) bus to determine if the vehicle is operating in a manner capable of supporting the EPAS system.

Once this is determined, vehicle speed sent by the PCM over the HS-CAN bus, steering shaft speed and direction sent by the steering shaft torque sensor and steering wheel angle/position determined by the motor position all provide the necessary information for the PSCM to determine the amount or level of assist provided by the EPAS system.

Assist is primarily based off of vehicle speed. As vehicle speed increases, the amount of assist provided by

repair4less

the system is decreased to improve and enhance road feel at the steering wheel. As vehicle speed decreases, the amount of assist provided by the system is increased to ease vehicle maneuvering. If the vehicle speed is missing or out of range, the PSCM defaults to a safe level of assist for all driving conditions. If the vehicle speed returns to the correct in-range values, the PSCM adjusts the level of assist accordingly. Steering wheel/shaft speed, torque and direction information allows the PSCM to determine how much assist is needed to turn the wheels right and left.

The PSCM continually monitors and adjusts steering efforts based on the torque sensor inputs to enhance the feel of the steering. Compensation is made to reduce the effect of pull or drift that may be experienced when driving on roads with a high degree of camber. Active nibble control is also employed by the PSCM to reduce the vibrating movement felt at the steering wheel that can be caused by driving on rough surfaces or out of balance wheels.

The PSCM is self-monitoring and has the capability of setting and storing DTCs. Depending on the DTC set, the control module enters into a "safe mode" of manual steering. In addition, the PSCM may send a request to the Instrument Panel Cluster (IPC) module over the HS-CAN bus to display a message in the message center to alert the driver of a potential EPAS concern.

Interactive Diagnostics

For diagnosing and testing please refer to the on-line Workshop Manual. If you do not have an on-line subscription, go to www.motorcraftservice.com.

Steering System

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Steering gear
- Power steering lines
- Steering column
- Steering column shaft
- Power steering cooler (if equipped)

The power steering system transfers driver inputs at the steering wheel to the front wheels of the vehicle. The steering column, hydraulic system and linkages that transfer these driver inputs make up the steering system. Gearing and hydraulic assist are used to significantly reduce steering efforts.

For information on the power steering fluid reservoir, power steering pump, power steering lines and steering gear, refer to Section 211-02 .

For information on the steering wheel, steering column and steering column shaft, refer to Section 211-04 .

Principles of Operation

Power Steering

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is trapped between the pump vanes and moved to the high pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Inspection and Verification

NOTICE: **Do not adjust the steering gear pinion preload or steering gear wear and/or damage to the steering gear may occur.**

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage or leaks.

Visual Inspection Chart

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie-rod ends • Suspension components • Steering column shaft U-joints • Intermediate shaft bolts • Power steering reservoir baffle • Power steering reservoir screen • Power steering pressure lines, fittings or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump • Power steering fluid cooler (if equipped)

3. Inspect the power steering fluid for the following conditions:
   - Aeration or foam: Purge the power steering system. Refer to Power Steering System Purging in this section.
   - Overheating or contamination: Flush the power steering system. Refer to Power Steering

repair4less

System Flushing in this section.

4. **NOTE:** It may be necessary to add power steering fluid to achieve the correct level.

   Check the fluid level and clean the power steering components.
   With the ignition OFF:
   - check the power steering fluid level and add fluid as necessary.
   - wipe off any visible signs of fluid or residue build up.
   - ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

     Start the engine and turn the steering wheel from stop-to-stop several times.

5. Visually inspect the power steering hydraulic line/hose connections for damage or leaks.

- If a leak is detected at a threaded fitting or clamp plate joint, tighten to specification. If the leak is still evident, visually inspect the O-rings or Teflon® seals. Install new O-rings or Teflon® seals as necessary. Refer to Section 211-02 .
- If a leak is detected at a constant tension spring clamp, verify that the hose is not damaged and fully installed on the hose fitting. Make sure that the constant tension spring clamp is positioned 2 mm (0.078 in) from the end of the hose. If the leak remains, install a new constant tension spring clamp.
- If a leak is detected at a screw clamp joint, verify that the hose is not damaged and fully installed on the hose fitting and the clamp is positioned 2 mm (0.078 in) from the end of the hose before tightening the screw clamp. If the leak remains, install a new screw clamp. Refer to Section 211-02 .

6. Visually inspect the power steering components for leaks.

- If a leak is detected in the power steering pressure line or return hose, install a new hose. Refer to Section 211-02 .
- If a leak is detected in the steering gear turn tubes, repair or install new turn tubes. Refer to Section 211-02 .
- If a leak is detected in the power steering pump, install a new power steering pump. Refer to Section 211-02 .
- **NOTE:** On vehicles with rack-and-pinion steering gear, it may be necessary to remove the bellows boot clamp from the steering gear bellows boot to inspect for internal steering gear leaks.

  If a leak is detected in the steering gear, repair or install a new steering gear. Refer to Section 211-02 .
- If a leak is detected in the power steering reservoir, install a new reservoir. Refer to Section 211-02 .

7. For information on power steering leak detection, refer to Component Tests in this section.

8. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

9. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Steering System or GO to Symptom Chart - NVH .

Steering System Symptom Definitions

NOTICE: **Do not adjust the steering gear pinion preload or steering gear wear and/or damage to the steering gear may occur.**

Drift/Pull

Pull is described as a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle, such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Lack of Assist or Inconsistent Assist

Lack of assist or inconsistent assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or steering correction is completed.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart — Steering System

Symptom Chart — Steering System

NOTICE: **Do not adjust the steering gear pinion preload or steering gear wear and/or damage to the steering gear may occur.**

Condition	Possible Sources	Action
• Steering has lack of assist or inconsistent assist	• Contaminated power steering fluid • Steering gear • Power steering pump • Restricted power steering lines/hoses	• GO to Pinpoint Test A .
• Excessive steering	• Steering gear	• GO to Pinpoint Test B .

repair4less

wheel play	• Steering column shaft/coupling • Steering linkage	
• Steering system drift/pull/wander	• Steering column shaft/U-joints • Steering gear • Steering gear mounts	• GO to Pinpoint Test C .
• Poor returnability/sticky steering	• Binding steering column shaft/coupling U-joints	• INSTALL a new steering column shaft. REFER to Section 211-04 .
	• Suspension components	• To continue the suspension diagnosis, REFER to Section 204-00 .
	• Binding steering column bearing(s)	• INSTALL a new steering column. REFER to Section 211-04 .
	• Binding dash boot seal	• INSTALL a new dash boot seal. REFER to Section 211-04 .
	• Steering gear turn tube banjo bolts/dampers	• INSTALL new banjo bolt/dampers. REFER to Steering Gear Turn Tubes Removal and Installation in Section 211-02 .
	• Steering gear	• The steering gear cannot be adjusted. INSTALL a new steering gear as necessary. REFER to Section 211-02 .

Symptom Chart — NVH

Symptom Chart — NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Steering system cold start noise	• Blockage in the power steering fluid reservoir filter screen or return ports caused by power steering fluid contamination	• **NOTE:** Some noise during an extremely cold start (-12.2°C [-10°F]) is normal and should improve as the steering system warms up (usually within 60 seconds). • **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir

		filter/screen or to remove blockage in the return ports. CHECK the power steering fluid reservoir filter/screen or return ports for contaminants or blockage. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.
	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section.
• Steering grunt or shudder — occurs when turning into or out of a turn at low speeds (temperature sensitive)	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section.
	• Steering gear or power steering hoses	• GO to Steering Gear Grunt/Shudder Component Test in this section.
• Steering system clonk — hydraulic knocking sound	• Air in the steering hydraulic system (aerated fluid)	• **NOTE:** Some amount of clonk noise is considered acceptable. If in doubt of the acceptability, compare to another vehicle. CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section.
• Power steering pump moan — loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm	• Low fluid and/or air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section. If a pump moan still exists, INSTALL a new power steering pump. REFER to Section 211-02.
	• Blockage in the power steering fluid reservoir filter/screen or return ports caused by power steering fluid contamination	• **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir filter/screen or to remove blockage in the return ports. CHECK the power steering fluid

repair4less

		reservoir filter/screen or return ports for contaminants or blockage. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.
	• Power steering line/hose grounded to chassis	• INSPECT the power steering lines/hoses. REPAIR as necessary.
	• Power steering pump brackets loose or misaligned	• CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to Section 211-02 .
	• Steering gear isolators	• INSPECT the isolators for wear or damage. REPAIR as necessary.
• Steering gear clunk — occurs only while cornering over a bump (can be temperature sensitive)	• Steering gear	• INSPECT the steering gear for loose mounting bolts. TIGHTEN to specification as necessary. REFER to Section 211-02 .
• Feedback (rattle, chuckle or knocking noise in the steering gear) — roughness is felt in the steering wheel when the vehicle is driven over rough surfaces	• Steering column shaft/coupling joints damaged or worn	• INSTALL a new steering column shaft. REFER to Section 211-04 .
	• Loose, damaged or worn tie-rod ends	• INSPECT and INSTALL new tie-rod ends as necessary. GO to Steering Linkage Component Test in this section.
	• Steering gear insulators or mounting bolts loose or damaged	• TIGHTEN the bolts to specification or INSTALL new bolts as necessary. REFER to Section 211-02 .
	• Steering column shaft/coupling bolts are loose	• TIGHTEN the bolts to specification. REFER to Section 211-04 .
	• Steering column damaged or worn	• REPAIR or INSTALL a new steering column as necessary. REFER to Section 211-04 .
• Power steering hiss or whistle	• Steering column shaft/coupling-to-steering gear is binding or misaligned	• REPAIR or INSTALL a new steering column shaft as necessary. REFER to Section 211-04 .
	• Grounded or loose steering column boot at the dash	• REPAIR as necessary.

	panel • Damaged or worn steering gear input shaft and valve • Restricted power steering lines/hoses	 • REPAIR or INSTALL a new steering gear as necessary. REFER to Section 211-02 . • GO to Pinpoint Test A .
• Steering column rattle	• Loose bolts or attaching brackets • Loose, worn or insufficiently lubricated column bearings • Steering shaft insulators damaged or worn • Steering column shaft/coupling compressed or extended	• TIGHTEN the bolts to specification. • LUBRICATE bearings or INSTALL new steering column bearings or steering column as necessary. REFER to Section 211-04 . • INSTALL new insulators. REFER to Section 211-04 . • INSPECT the rubber spider coupling for damage. INSTALL a new intermediate/flexible shaft. REFER to Section 211-04 .
• Steering gear squeak	• Incorrect power steering fluid in system • Steering gear rotary seal • Stone shield (if equipped)	• If incorrect power steering fluid is suspected, FLUSH the power steering system. REFER to Power Steering System Flushing in this section. If noise persists after system flush, INSTALL a new steering gear. REFER to Section 211-02 . • **NOTE:** Use the chassis ears to verify that the steering gear is the source of the noise. It may be necessary to replicate the customer operating conditions (fluid temperature, turning rate of steering wheel) to get the squeak to reoccur. INSTALL a new steering gear as necessary. REFER to Section 211-02 . • MAKE SURE that the stone shield is correctly installed and that it is not making contact with the steering shaft. REPOSITION stone shield or INSTALL a new stone shield as necessary.
• Steering column squeak, cracks or grinds	• Loose or misaligned steering column shrouds • Steering wheel rubbing against	• TIGHTEN or ALIGN the steering column shrouds. • REPOSITION the steering column shrouds.

repair4less

	steering column shrouds	
• Steering column ticking or creaking noise	• Steering column lower bearing	• VERIFY that the noise is coming from the lower bearing and INSTALL a new bearing as necessary. REFER to Disassembly and Assembly — Steering Column in Section 211-04 .
• Power steering pump noisy	• Blockage in the power steering fluid reservoir filter/screen or return ports caused by power steering fluid contamination	• **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir filter/screen or to remove blockage in the return ports. CHECK the power steering fluid reservoir filter/screen or return ports for contaminants or blockage. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.
	• Power steering pump	• INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
• Power steering pump noise (steering wheel turned fully to stop/lock)	• Power steering fluid flow into the bypass valve of the pump valve housing, with fluid temperature below 54°C (130°F)	• Acceptable condition.
• Power steering pump whine noise	• Aerated fluid	• CHECK for a leak in the system. REFER to Power Steering Fluid Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section.
	• Blockage in the power steering fluid reservoir filter/screen or return ports caused by power steering fluid contamination	• **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir filter/screen or to remove blockage in the return ports. CHECK the power steering fluid reservoir filter/screen or return ports for contaminants or blockage. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.
	• Damaged power steering pump	• INSTALL a new power steering pump as necessary. REFER to

		Section 211-02 .
• High speed shake or shimmy — occurs at high speeds	• Worn or damaged steering linkage components	• GO to Steering Linkage Component Test in this section.

Pinpoint Tests

Pinpoint Test A: Steering Has a Lack of Assist or Inconsistent Assist

NOTE: Hard steering or lack of assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn, occur near the end of a turn or differ right to left.

This pinpoint test is intended to diagnose the following:

- Power steering fluid contamination
- Steering gear
- Power steering pump
- Power steering hoses

PINPOINT TEST A: STEERING HAS A LACK OF ASSIST OR INCONSISTENT ASSIST — RWD VEHICLES

Test Step	Result / Action to Take
A1 CHECK FOR POWER STEERING FLUID CONTAMINATION	
• Check the power steering fluid for contamination. • **Is the power steering fluid free of any contamination?**	**Yes** GO to A2 . **No** FLUSH the power steering system. REFER to Power Steering System Flushing in this section. TEST the system for normal operation. If the assist concern is still present, GO to A2 .
A2 CHECK THE STEERING ASSIST WITH THE ENGINE SPEED RAISED	
• ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.** • Set the engine speed to 2,100 rpm and turn the steering wheel fully to the left and right. • **Is steering assist fully restored to normal with the engine speed raised?**	**Yes** INSTALL a new power steering pump. REFER to Section 211-02 . **No** GO to A3 .
A3 CHECK FOR A CHANGE IN ASSIST ON LEFT AND RIGHT TURNS	
• With the engine running at idle, turn the steering	**Yes**

repair4less

wheel fully to the left and to the right. • **Does the steering assist change when turning from right to left?**	INSTALL a new power steering gear. REFER to Section 211-02 . **No** GO to A4 .
A4 CHECK THE STEERING LINES AND HOSES FOR RESTRICTIONS	
• Inspect the steering lines and hoses for damage, kinks or restrictions. • **Are the steering lines and hoses free from any damage, kinks and/or restrictions?**	**Yes** GO to A5 . **No** INSTALL new lines and/or hoses as necessary. TEST the system for normal operation.
A5 MONITOR THE ENGINE SPEED CHANGES	
***NOTICE:* Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.** **NOTE:** Make sure that the vehicle is on a flat dry surface, all accessories are in the OFF position and that the steering system is at normal operating temperature. • Connect the scan tool. • Start the engine. • With the engine running at idle, raise the power steering fluid temperature to 74°-80°C (165°-176°F) by rotating the steering wheel fully to the left and to the right several time. • Enter the following diagnostic mode on the scan tool: DataLogger — PCM. • Monitor the Engine Revolutions Per Minute (RPM) PID while turning the steering wheel quickly to the left stop position and then to the right stop position. • Note the engine rpm during the turns. • **Does the engine speed change (even temporarily) by more than 30 rpm when turning the steering wheel?**	**Yes** INSTALL a new power steering gear. REFER to Section 211-02 . **No** INSTALL a new power steering pump. REFER to Section 211-02 .

Pinpoint Test B: Excessive Steering Wheel Play

This pinpoint test is intended to diagnose the following:

- Steering linkage
- Steering column shaft
- Steering gear

PINPOINT TEST B: EXCESSIVE STEERING WHEEL PLAY

Test Step	Result / Action to Take
B1 CHECK THE STEERING LINKAGE	

• Carry out the Steering Linkage Component Test in this section. • **Is the steering linkage OK?**	**Yes** GO to B2 . **No** INSTALL new steering linkage components as necessary. REFER to Section 211-02 .
B2 CHECK THE STEERING COLUMN SHAFT	
• Inspect the steering column shaft U-joints and fasteners for looseness. • **Are the U-joints and fasteners OK?**	**Yes** INSTALL a new steering gear as necessary. REFER to Section 211-02 . **No** TIGHTEN the steering column shaft fasteners or INSTALL a new steering column shaft. REFER to Section 211-04 .

Pinpoint Test C: Steering System Drift/Pull/Wander

This pinpoint test is intended to diagnose the following:

- Steering column shaft
- Steering gear
- Steering gear mounts
- Steering column shaft U-joints

PINPOINT TEST C: STEERING SYSTEM DRIFT/PULL/WANDER

Test Step	Result / Action to Take
C1 CHECK THE STEERING COLUMN SHAFT	
• **NOTE:** Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to Section 501-20B . • Check the steering column and shaft for grounding. • Disconnect the steering column shaft at the steering column. • Inspect the steering column shaft U-joints for looseness or wear. • **Are the steering column shaft U-joints OK?**	**Yes** GO to C2 . **No** INSTALL new steering column shaft as necessary. REFER to Section 211-04 .
C2 CHECK THE STEERING GEAR MOUNTING	
• Check the steering gear mounts for looseness or wear. • **Are the steering gear mounts OK?**	**Yes** GO to C3 . **No** INSTALL a new steering gear as necessary. REFER to Section 211-02 .
C3 CHECK THE STEERING GEAR	
• Carry out the Steering Gear Valve Component Test in this section. • **Is the steering gear valve OK?**	**Yes** REFER to Section 204-00 to diagnose suspension system drift/pull/wander.

repair4less

	No INSTALL a new steering gear as necessary. REFER to Section 211-02 .

Component Tests

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to Inspection and Verification.

1. Remove the power steering pump reservoir cap and check the power steering fluid level. If necessary, add the specified power steering fluid.

2. Tightly install the Power Steering Evacuation Cap onto the reservoir and connect the Vacuum Pump Kit to the Evacuation Cap.

3. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

4. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), a leak is present.

5. Remove the Vacuum Pump Kit.

6. Start the engine and insert the Dial Thermometer into the Evacuation Cap.

7. ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

   With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.

8. Stop the engine and visually inspect the system for leaks.
   - If a leak is evident, repair as necessary.
   - If a leak is not evident, add the specified UV fluorescent tracer dye to the power steering fluid. Use 14.78 ml (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

9. Start the engine.

10. ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

    With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.

11. Stop the engine and inspect the system for traces of UV dye using the 100W/12 Volt DC UV Lamp. Repair as necessary.

Steering Gear Valve Test

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
   - Raise the vehicle until the front wheels are off the ground.

2. **NOTE:** Do not hold the steering wheel while carrying out this step.

   Start the engine.
   - If the steering wheel rotates in either direction (with no hand input), install a new steering gear. Refer to Section 211-02 .

Steering Gear Grunt/Shudder Test

1. Place a Dial Thermometer in the power steering fluid reservoir.

2. With the engine cold, start the engine and set engine idle speed to 1,200 rpm.

3. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

   Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.

4. Turn the steering wheel another 90 degrees. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.

5. Repeat the test with the power steering fluid at different temperatures until the temperature reaches 74-80°C (165-176°F).

6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.

7. If a loud grunt is heard, or a strong shudder is felt, purge the power steering system. Refer to Power Steering System Purging in this section. If a loud grunt or strong shudder still exists, check the power steering lines/hoses for restrictions or damage and repair as necessary. Refer to Section 211-02 . If the lines/hoses are OK, install a new steering gear. Refer to Section 211-02 .

Steering Linkage Test

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

2. Using hand force only, check the inner and outer tie rods for vertical and lateral movement in the tie-rod ball studs/sockets.
   - If there is any lateral or vertical movement in the tie-rod ball studs/sockets (inner or outer), a new tie-rod must be installed. Refer to the appropriate section in Group 211 for the procedure.

repair4less

Item	Description
1	Power steering fluid reservoir
2	Control valve (vacuum side)
3	Control valve (fluid container side)
4	Fluid container

1. ***NOTICE:*** **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

   Remove the power steering fluid reservoir cap.

2. Install the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit as shown in the illustration.

3. **NOTE:** The Power Steering Fill Adapter Manifold control valves are in the OPEN position when the points of the handles face the center of the Power Steering Fill Adapter Manifold.

   Close the Power Steering Fill Adapter Manifold control valve (fluid side).

4. Open the Power Steering Fill Adapter Manifold control valve (vacuum side).

5. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

6. Observe the Vacuum Pump Kit gauge for 30 seconds.

7. If the Vacuum Pump Kit gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold

and Vacuum Pump Kit before proceeding.

8. **NOTE:** The Vacuum Pump Kit gauge reading will drop slightly during this step.

   Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side) until power steering fluid completely fills the hose and then close the control valve.

9. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

10. Close the Power Steering Fill Adapter Manifold control valve (vacuum side).

11. Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side).

12. Once power steering fluid enters the fluid reservoir and reaches the minimum fluid level indicator line on the reservoir, close the Power Steering Fill Adapter Manifold control valve (fluid side).

13. Remove the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit.

14. Install the reservoir cap.

15. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    NOTE: There will be a slight drop in the power steering fluid level in the reservoir when the engine is started.

    Start the engine and turn the steering wheel from stop-to-stop.

16. Turn the ignition switch to the OFF position.

17. **NOTE:** Do not overfill the reservoir.

    Remove the reservoir cap and fill the reservoir with the specified fluid.

18. Install the reservoir cap.

---

repair4less

Power Steering System Flushing

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

NOTICE: **Do not mix fluid types. Any mixture or any unapproved fluid may lead to seal deterioration and leaks. A leak may ultimately cause loss of fluid, which may result in a loss of power steering assist.**

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Release the clamp and disconnect the return hose from the reservoir.
   - Remove the clamp from the hose and allow the remaining fluid to drain out of the reservoir.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the return hose.
6. **NOTE:** Do not reuse the power steering fluid that has been flushed from the power steering system.

   Place the open end of the extension hose into a suitable container.
7. If equipped with Hydro-Boost®, apply the brake pedal 4 times.
8. **NOTE:** Do not overfill the reservoir.

   Fill the reservoir as needed with the specified fluid.
9. ***NOTICE:*** **Do not allow the power steering pump to run completely dry of power steering fluid. Damage to the power steering pump may occur.**

   Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.
10. **NOTE:** Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.

    NOTE: Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid.

repair4less

11. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.

12. Remove the extension hose from the return hose.

13. Remove the plug from the fluid reservoir inlet port.

14. Install the clamp and connect the power steering return hose to the reservoir.

15. **NOTE:** It is necessary to correctly fill the power steering system to remove any trapped air and completely fill the power steering system components.

    If, after correctly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

    Fill the power steering system. For additional information, refer to Power Steering System Filling in this section.

Power Steering System Purging

Special Tool(s)

 ST2670-A	Evacuation Cap, Power Steering 211-265
 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

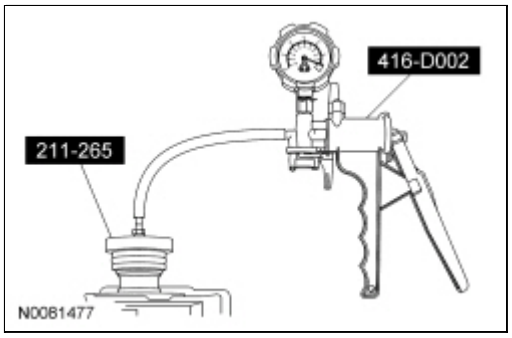
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC (US); CXT-10-LV12 (Canada)	MERCON® LV

NOTICE: **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition may occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**



1. **NOTE:** A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

   Remove the power steering reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. Refer to the appropriate section in Group 100 for the procedure.

3. Tightly insert the Power Steering Evacuation Cap into the reservoir and connect the Vacuum Pump Kit.

repair4less

4. Start the engine.

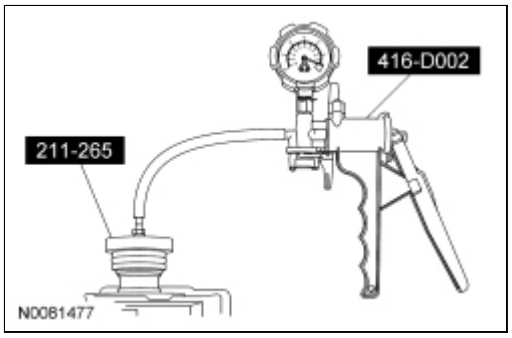
5. Using the Vacuum Pump Kit, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
    - If the Vacuum Pump Kit does not maintain vacuum, check the power steering system for leaks before proceeding. For additional information, refer to Power Steering Fluid Leak Test in this section.

6. If equipped with Hydro-Boost®, apply the brake pedal 4 times.

7. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    Cycle the steering wheel fully from stop-to-stop 10 times.

8. Stop the engine.



9. Release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

10. **NOTE:** Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid.

11. Start the engine.

12. Install the Power Steering Evacuation Cap and the Vacuum Pump Kit. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

13. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    Cycle the steering wheel fully from stop-to-stop 10 times.

14. Stop the engine, release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

15. **NOTE:** Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid and install the reservoir cap.

16. Visually inspect the power steering system for leaks.

Power Steering

Hydraulic Power Assist Steering (HPAS)

The hydraulic power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Power steering pressure and return lines/hoses
- Power steering fluid cooler
- Steering gear
- Inner tie rod
- Outer tie rod

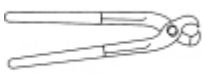
The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Electronic Power Assist Steering (EPAS)

The Electronic Power Assist Steering (EPAS) consists of the following components:

- Steering gear
- Outer tie rod
- Inner tie rod

The EPAS system utilizes a rack-and-pinion type steering gear. Power assist is provided by a motor that is connected to the steering rack by a belt and a pulley and bearing assembly. The steering gear and motor/module are serviced as an assembly. A new steering gear includes inner tie rods, however, the inner and outer tie rods can also be serviced separately.



repair4less

Power Steering

For vehicles equipped with Electronic Power Assist Steering (EPAS), refer to Section 211-00A . For vehicles equipped with Hydraulic Power Assist Steering (HPAS), refer to Section 211-00B .

Item	Part Number	Description
1	3280	Inner tie rod
2	—	Inner bellows boot clamp (part of 3332 service kit)
3	—	Steering gear bellows boot (part of 3332 service kit)
4	—	Outer bellows boot clamp (part of 3332 service kit)
5	W712367	Tie-rod jam nut
6	W520215	Outer tie-rod end nut
7	3A130	Outer tie-rod end

Removal

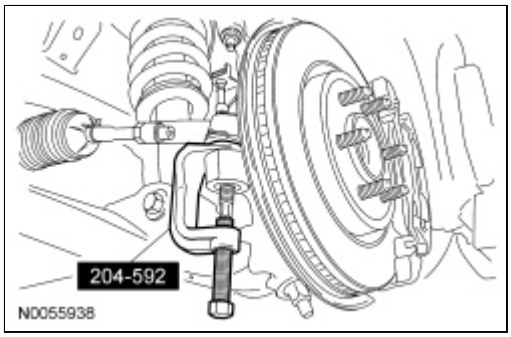
NOTICE: **The steering gear boots and clamps are designed to produce an airtight seal and protect the internal components of the steering gear. If the seal is not airtight, the vacuum generated during turning will draw water and foreign material into the gear, causing damage. Zip ties do not provide an airtight seal and must not be used.**

NOTICE: **When servicing inner tie rods, a new bellows boot and clamps must be installed or a leak may occur causing steering gear damage.**

NOTICE: **The inner tie-rod ball joint grease is not compatible with water. Water trapped in the grease will damage the joint.**

1. ***NOTICE:*** **For vehicles equipped with Electronic Power Assist Steering (EPAS), disconnect the negative battery cable anytime the steering linkage is being serviced or damage to the steering gear internal power relay may occur resulting in steering gear replacement.**

   If equipped with Electronic Power Assist Steering (EPAS), disconnect the battery ground cable. For additional information, refer to Section 414-01 .



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Loosen the tie-rod jam nut.

4. Remove and discard the outer tie-rod end nut.

5. ***NOTICE:*** **Use care when installing the Ball Joint Tool Separator or damage to the tie-rod end boot may occur.**

   Using the Ball Joint Tool Separator, separate the outer tie-rod end from the wheel knuckle.

6. **NOTE:** Note the number of times the outer tie-rod ends turn for reference during assembly.

   Remove the outer tie-rod end.

7. Remove the tie-rod jam nut from the inner tie rod.

8. **NOTE:** New bellows boot clamps must be installed.

   Remove and discard the inner and outer bellows boot clamps.

9. Remove and discard the steering gear bellows boot.

10. **NOTE:** Place the steering gear at the center position. Use an appropriate-sized crowfoot wrench on the flat of the rack gear to resist rotation and to prevent damage during removal and installation of the inner tie rod.

    NOTE: If repairing the RH side, it will be necessary to pull back the LH inner tie-rod boot to hold the steering gear.

    NOTE: An assistant may be needed for removal of the RH inner tie rod.

    While holding the steering gear rack, use an appropriate-sized crowfoot wrench to remove the inner tie rod.

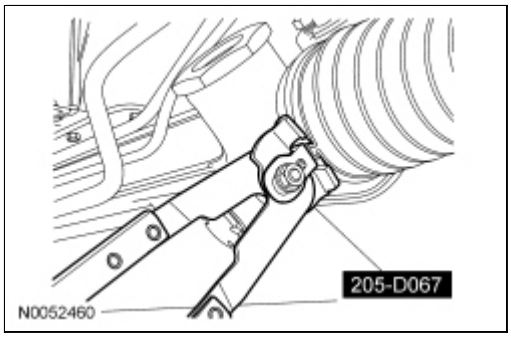
11. Thoroughly clean and inspect all the parts to be reused. Install new parts as necessary.

Installation

1. ***NOTICE:*** **Place the steering gear at the center position. Use an appropriate-sized crowfoot wrench on the flat of the rack gear to resist rotation and to prevent damage during the installation of the inner tie rod.**

   NOTE: An assistant may be needed for installation of the RH inner tie rod.

   Using an appropriate-sized crowfoot wrench, install the inner tie rod.
   - Tighten to 120 Nm (89 lb-ft).



2. **NOTE:** Apply the specified grease to the bellows boot groove on the inner tie rod.

   NOTE: Make sure the steering gear bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

   Install the new steering gear bellows boot.

3. Using the Boot Clamp Pliers, install a new inner bellows boot clamp.

repair4less

4. **NOTE:** Make sure the end of the steering gear bellows is positioned between the 2 grooves on the inner tie rod or an internal leak can result.

   Install a new outer bellows boot clamp.

5. Thread the tie-rod jam nut onto the inner tie rod.

6. **NOTE:** Install the outer tie-rod end the same number of turns as recorded during the removal.

   Install the outer tie-rod end.

7. ***NOTICE:*** **Make sure that the tie-rod end boots are seated correctly on the tie-rod ends or failure may occur.**

   Connect the outer tie-rod end to the wheel knuckle and install a new tie-rod end nut.
   - Tighten the new nut to 115 Nm (85 lb-ft).

8. Tighten the tie-rod jam nut.
   - Tighten to 103 Nm (76 lb-ft).

9. Check and if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

Power Steering Fluid Cooler

Removal and Installation

1. The power steering fluid cooler is integral to the A/C condenser core. For additional information, refer to Section 412-01 .

Power Steering Fluid Reservoir

Item	Part Number	Description
1	W710897	Power steering fluid reservoir stud bolt
2	3E764	Power steering fluid reservoir
3	3691	Power steering fluid reservoir-to-pump supply hose
4	3A713	Power steering fluid cooler-to-power steering fluid reservoir hose
5	—	Wiring harness retainer (part of 14A067)

Removal and Installation

1. ***NOTICE:*** **While repairing the power steering system, care should be taken to prevent the entry of foreign materials or failure of the power steering components may result.**

   Using a suitable suction device, remove the power steering fluid from the fluid reservoir.

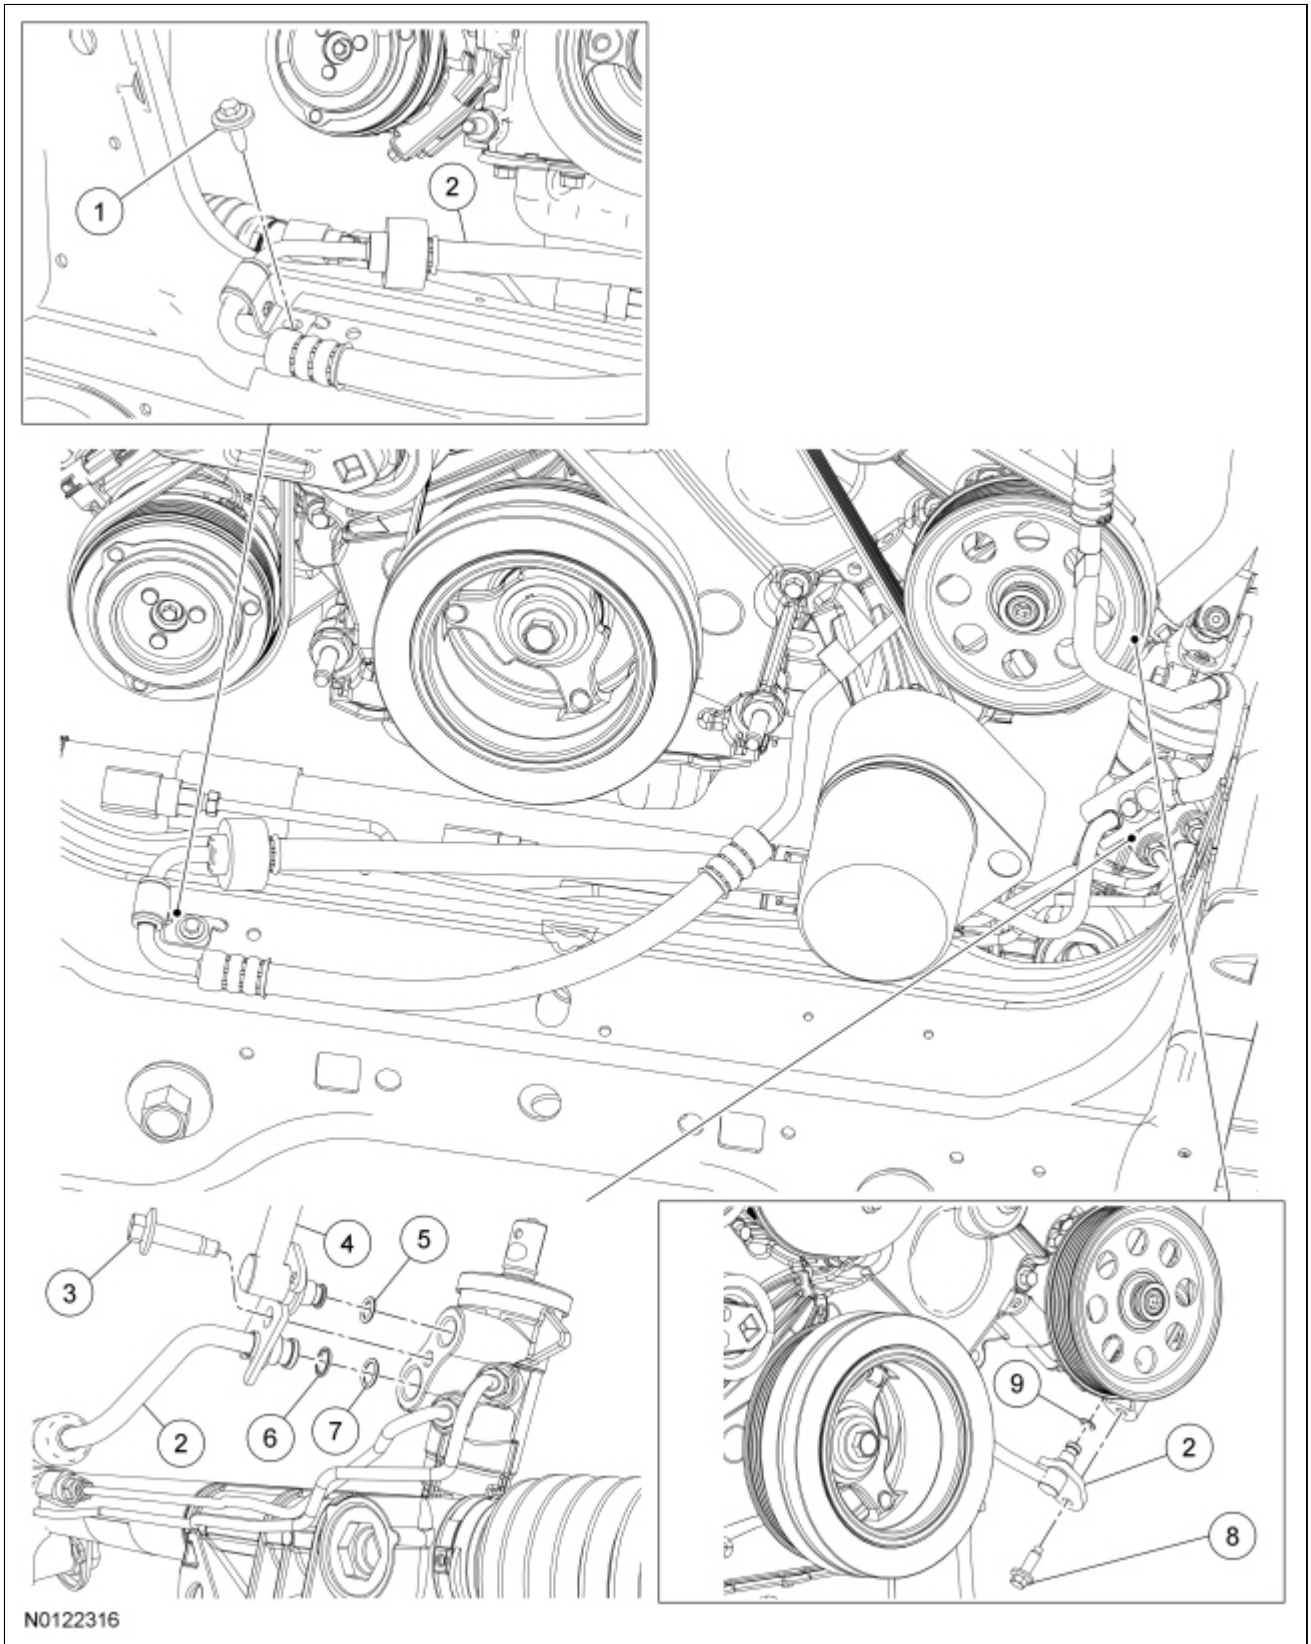
2. Detach the wiring harness retainer from the power steering fluid reservoir stud bolt and position the wiring harness aside.

3. Release the clamp and disconnect the power steering fluid reservoir-to-pump supply hose.

4. Release the clamp and disconnect the power steering fluid cooler-to-power steering fluid reservoir

repair4less

hose.



5. Remove the power steering fluid reservoir stud bolt and the power steering fluid reservoir.
    - To install, tighten to 8 Nm (71 lb-in).

6. To install, reverse the removal procedure.

7. Fill the power steering system. For additional information, refer to Section 211-00B .

Power Steering Pump to Steering Gear Pressure Line

repair4less

Item	Part Number	Description
1	W706681	Pressure line bracket-to-crossmember bolt
2	3A719	Pressure line

3	W712679	Steering line clamp plate-to-steering gear bolt
4	3A713C	Return line
5	3F886	Return line O-ring seal (also part of 3A713C)
6	3B602	Back-up O-ring seal
7	3F886	Pressure line-to-gear O-ring seal (also part of 3A719)
8	W714824	Pressure line clamp plate-to-pump bolt
9	3F887	Pressure line-to-pump O-ring seal

Removal and Installation

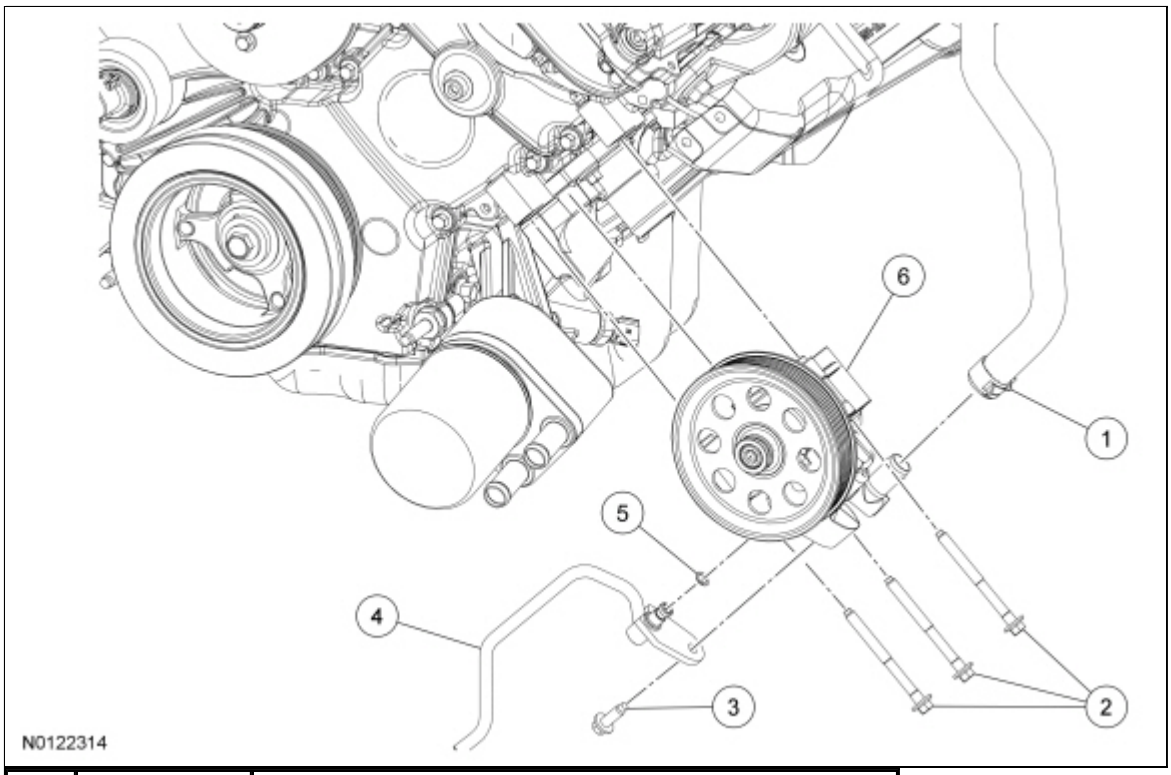
NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Detach the wiring harness retainer from the pressure line.

3. Remove the pressure line clamp plate-to-pump bolt and disconnect the pressure line from the pump.
   - To install, tighten to 25 Nm (18 lb-ft).

4. Remove the pressure line bracket-to-crossmember bolt.
   - To install, tighten to 7 Nm (62 lb-in).



5. Remove the steering line clamp plate-to-steering gear bolt, disconnect the lines from the steering gear and remove the pressure line.
   - To install, tighten the steering line clamp plate-to-steering gear bolt to 23 Nm (17 lb-ft).

6. To install, reverse the removal procedure.

7. Fill the power steering system. For additional information, refer to Section 211-00B .

repair4less

Power Steering Pump

Item	Part Number	Description
1	3691	Power steering pump supply hose
2	W715068	Power steering pump bolt (3 required)
3	W714824	Pressure line clamp plate-to-pump bolt
4	3A719	Pressure line
5	3F887	Pressure line-to-pump O-ring seal (also part of 3A719)
6	3A674	Power steering pump and pulley assembly

Removal and Installation

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

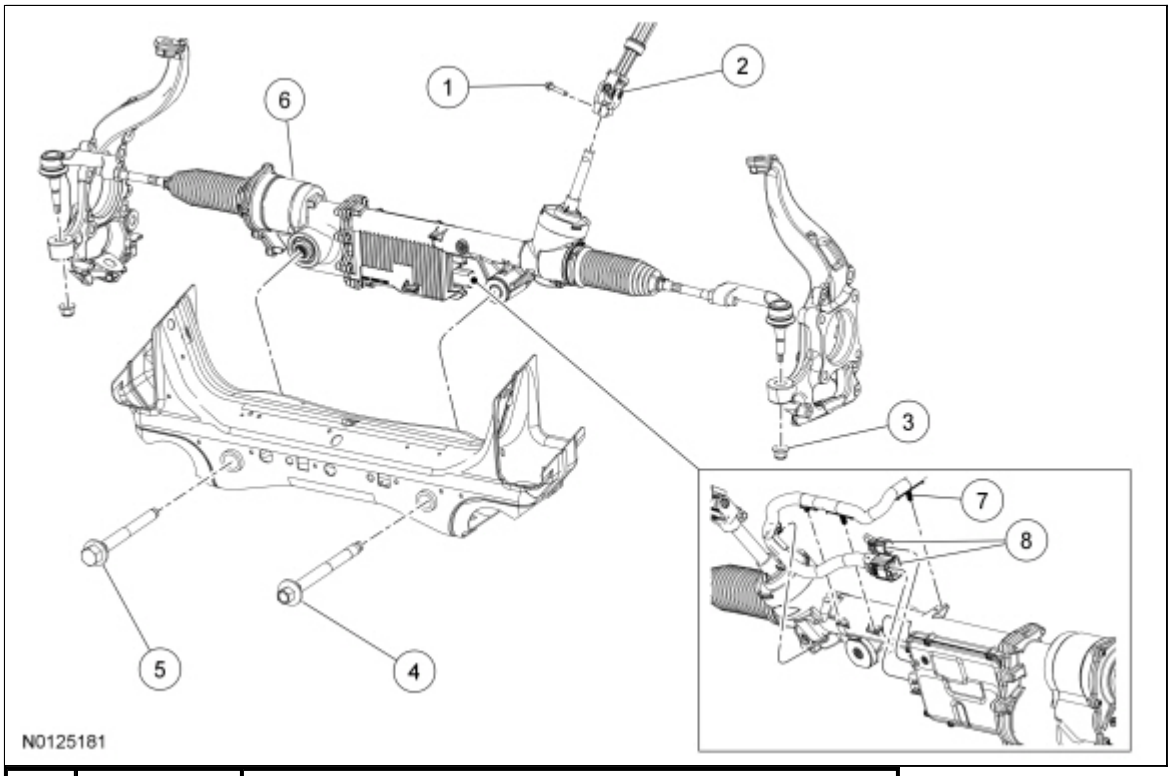
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
3. Release the clamp and disconnect the supply hose.

repair4less

4. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the power steering pump pulley.

5. Remove and discard the pressure line clamp plate-to-pump bolt.
    - Disconnect the pressure line from the pump.
    - To install, tighten to 25 Nm (18 lb-ft).

6. Remove the 3 power steering pump bolts and the power steering pump.
    - To install, tighten to 25 Nm (18 lb-ft).



7. To install, reverse the removal procedure.

8. Fill the power steering system. For additional information, refer to Section 211-00B .

Steering Gear — Electronic Power Assist Steering (EPAS)

Special Tool(s)

 ST2945-A	Separator, Ball Joint Tool 204-592

Item	Part Number	Description

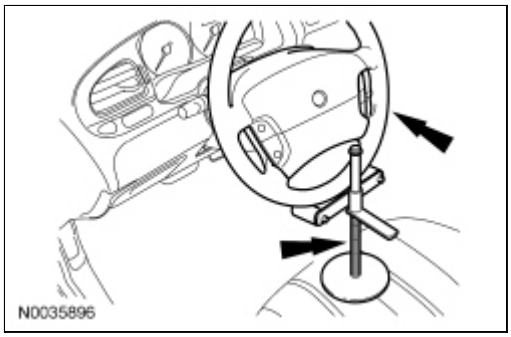
7	—	Steering gear wiring harness retainers (4 required) (part of 3F720)
8	—	Steering gear electrical connectors (2 required) (part

repair4less

		of 3F720)

1. If installing a new steering gear, connect the scan tool and upload the module configuration information from the Power Steering Control Module (PSCM). For additional information, refer to Section 418-01 .



2. ***NOTICE:*** **Disconnect the negative battery cable anytime the steering gear is being serviced or damage to the steering gear internal power relay may occur resulting in steering gear replacement.**

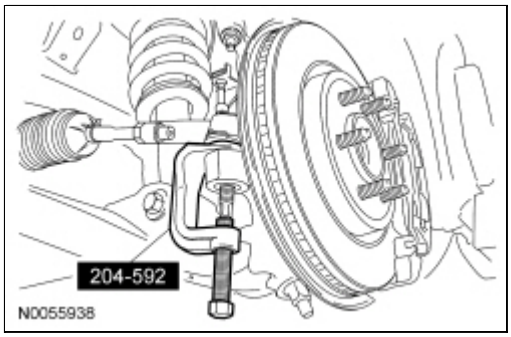
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

4. ***NOTICE:*** **Do not allow the steering column shaft to rotate while disconnected from the gear or damage to the clockspring may occur. If there is evidence that the steering column shaft has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

   Use a suitable holding device to hold the steering wheel in the straight-ahead position.

5. Remove the front wheels and tires. For additional information, refer to Section 204-04 .



6. Disconnect the 2 steering gear electrical connectors, the 4 wiring harness retainers and position the wiring harness aside.

7. If equipped, remove the skid plate bolts and the skid plate.
   - To install, tighten to 25 Nm (18 lb-ft).

8. Remove and discard the outer tie-rod end nuts.
   - To install, tighten to 115 Nm (85 lb-ft).

9. ***NOTICE:*** **Use care when installing the Ball Joint Tool Separator or damage to the tie-rod end boot may occur.**

   Using the Ball Joint Tool Separator, disconnect the tie-rod ends from the wheel knuckles.

10. ***NOTICE:*** **Do not allow the steering column shaft to rotate while disconnected from the gear or damage to the clockspring may occur. If there is evidence that the steering column shaft has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

    Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.
    - To install, tighten to 30 Nm (22 lb-ft).

11. Remove and discard the 2 steering gear-to-crossmember bolts and remove the steering gear.
    - To install, tighten to 440 Nm (325 lb-ft).

12. ***NOTICE:*** **Make sure the tie-rod end boots are seated correctly on the tie-rod ends or tie-rod end failure may occur.**

    To install, reverse the removal procedure.

13. When installing a new steering gear, it must be configured (using vehicle as-built data or module configuration information retrieved earlier in this procedure). For additional information on configuration, refer to Programmable Module Installation (PMI) in Section 418-01 .

14. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

20B .

Remove and discard the steering column shaft-to-steering gear bolt and disconnect the steering column shaft from the steering gear.

- To install, tighten to 30 Nm (22 lb-ft).

8. ***NOTICE:*** **Install new O-ring seals any time the lines are disconnected from the steering gear or a fluid leak may occur.**

   Remove the steering line clamp plate-to-steering gear bolt, and disconnect the power steering lines.
   - Discard the O-ring seals.
   - To install, tighten the steering line clamp plate-to-steering gear bolt to 23 Nm (17 lb-ft).

9. Remove and discard the 2 steering gear-to-crossmember bolts and remove the steering gear.
   - To install, tighten to 440 Nm (325 lb-ft).

10. ***NOTICE:*** **Make sure the tie-rod end boots are seated correctly on the tie-rod ends or tie-rod end failure may occur.**

    To install, reverse the removal procedure.

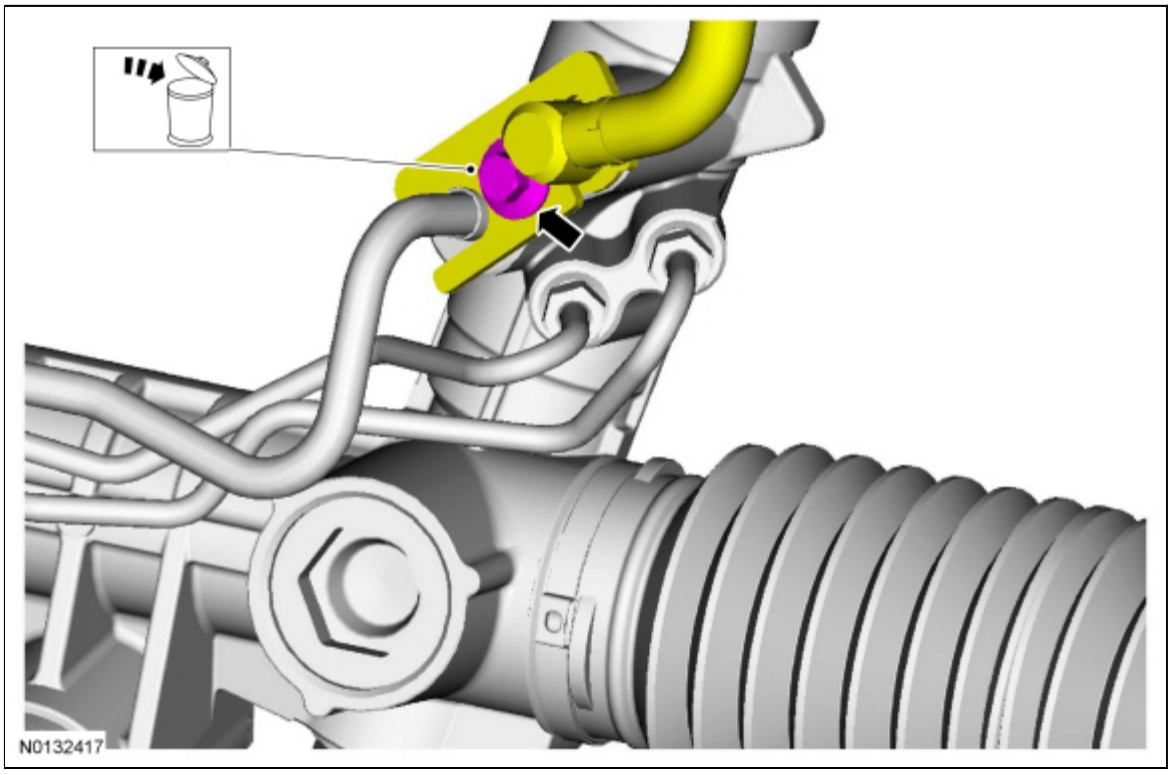
11. Fill the power steering system. For additional information, refer to Section 211-00B .

12. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

Steering Gear to Fluid Cooler Return Hose — From Gear

Removal

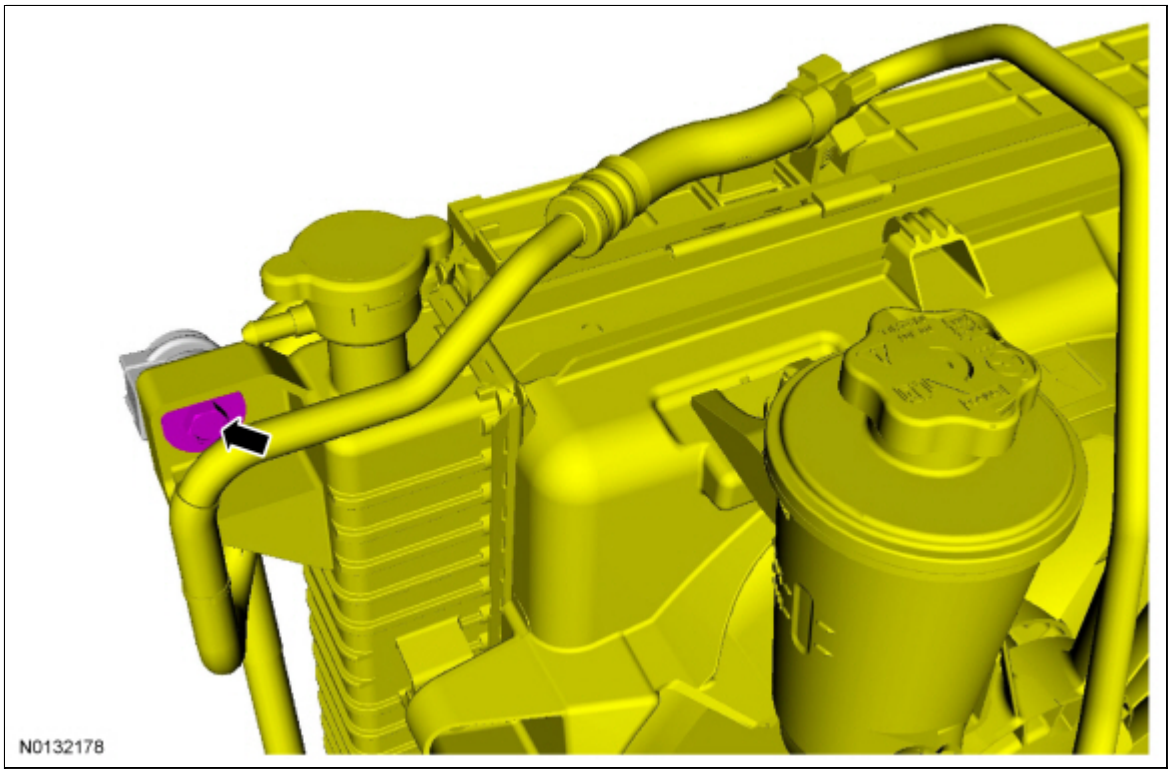
NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**



NOTE: Service the return hose from the gear with the return hose to the cooler.

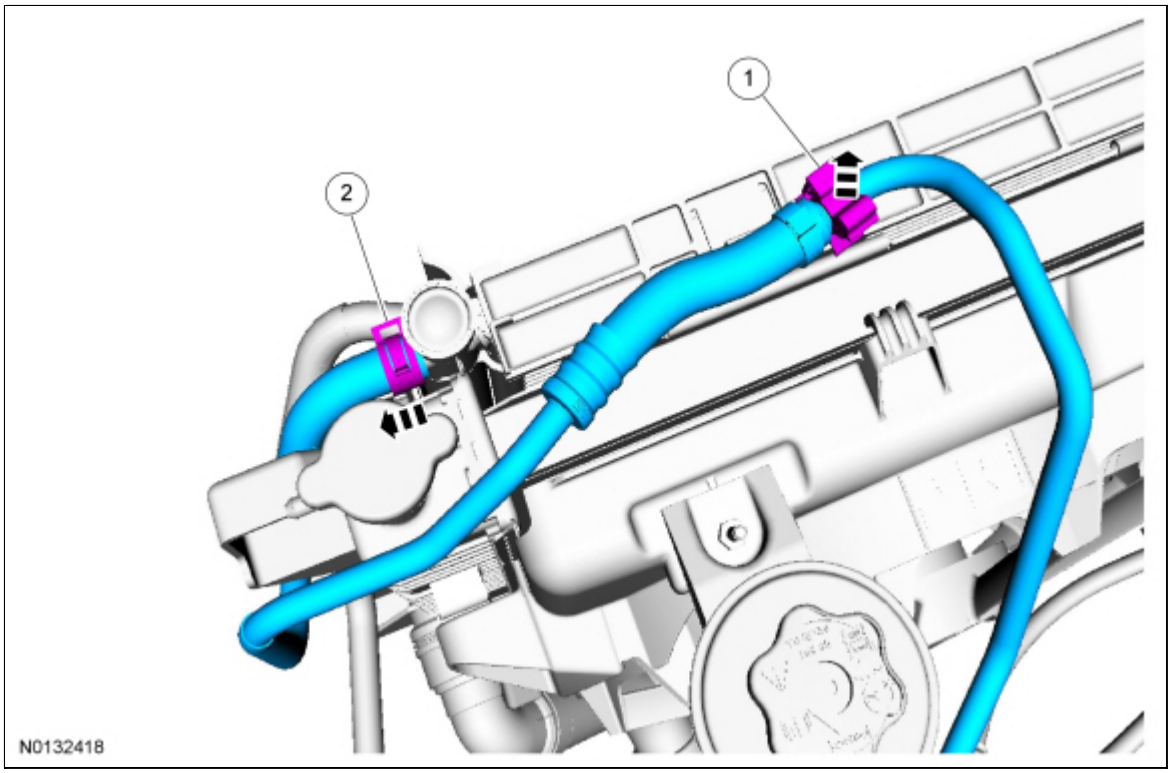
NOTE: Removal steps in this procedure may include installation details.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

3. Discard the specified component. Follow local disposal regulations.
   - To install, tighten to 23 Nm (17 lb-ft).



4. On both sides.
   - To install, tighten to 15 Nm (133 lb-in).

repair4less

5.

Installation

1. To install, reverse the removal procedure.

2. Fill the power steering system. For additional information, refer to Section 211-00B .

Steering Column

The steering column consists of the following:

- Steering wheel
- Steering column
- Upper and lower steering column shafts
- Steering Column Control Module (SCCM)
- Steering column control switch — located on the LH side of the SCCM just below the multifunction switch and can be serviced separately from the module. The steering column control switch and the brake pedal control switch are located in the same position. On vehicles equipped with both features, the 2 switches are combined into a single switch assembly. For additional information, refer to Section 206-06 .
- Steering column tilt motor (if equipped) — located on the steering column and can be serviced separately from the column. For additional information, refer to Steering Column Motor — Tilt in this section.
- Steering column telescopic motor (if equipped) — located on the steering column and can be serviced separately from the column. For additional information, refer to Steering Column Motor — Telescopic in this section.

The steering column is the mechanical linkage between the steering wheel and the steering gear. The steering wheel is mounted to a shaft, which passes through the center of the steering column. The shaft is centered by bearings within the steering column. The steering column shaft then connects the steering column to the steering gear. The upper and lower steering column shaft connections utilize U-joint type couplings.

Manual Tilt/Telescope Steering Column (if equipped)

The manual tilt/telescope function of the steering column is controlled by a mechanical lever on the left side of the steering column to lock and unlock the steering column. When the lever is pulled down, the steering column can be adjusted up or down and in or out to the desired position(s). While holding the steering wheel in the desired position, pulling the lever up to the original position locks the steering column.

Power Adjustable Tilt/Telescope Steering Column (if equipped)

The power tilt and telescope function of the steering column is controlled by the steering column control switch, the memory SET switch or the Remote Keyless Entry (RKE) transmitter. The steering column control switch is a 4-position, normally open, momentary contact switch located on the steering column below the multifunction switch. The steering column control switch moves the adjustable steering column in 4 directions:

- Forward/In (away from the driver)
- Rearward/Out (toward the driver)
- Up
- Down

repair4less

Steering Column

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT 27000 or equivalent 250-300 mA incandescent bulb test lamp
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Power Adjustable Tilt/Telescope Steering Column

The power adjustable tilt/telescope steering column is controlled by the steering column control switch and 2 electric motors that are powered by the Steering Column Control Module (SCCM). The steering column control switch is a 4-position, momentary-contact switch. When the steering column control switch is moved to any of the 4 positions, it sends a signal to the SCCM to tilt the steering column up or down or telescope the steering column forward or rearward.

The SCCM continuously monitors the steering column tilt and telescoping motors and circuits for faults. If a fault is detected, the SCCM is capable of setting DTCs.

Tilt/Telescoping Motor Sensors

The SCCM receives digital signals from Hall-effect type rotation sensors that are integral to the tilt and telescoping motors. The SCCM uses these signals to calculate the location of the steering column in relation to the full forward/rearward and full up/down positions. The SCCM also uses these signals to store and recall memory positions, carry out the easy entry/exit operations and to make sure the tilt and telescoping motors do not stall against the steering column end of travel in the forward/rearward or up/down directions. Both the tilt and telescopic motors can be serviced separately from the steering column.

Jog Mode

If the SCCM loses the signal from either of the motor sensors, the affected steering column motor operates in jog mode. Jog mode allows limited operation of the affected steering column motor using only the steering column control switch. When the steering column control switch is operated in jog mode, the steering column moves in the desired direction for one second, then stops. The steering column control switch must be released, then pressed again in order to move the steering column for an additional second. Jog mode is an indication that there is a tilt or telescoping motor sensor fault. If the adjustable steering column is operating in jog mode, a DTC can set in the SCCM .

Memory Position Programming and Recall

The SCCM monitors steering column position using Hall-effect sensors that are integral to the tilt and telescoping motors. When a memory position is recalled through either the memory SET switch or the Remote Keyless Entry (RKE) transmitter, the SCCM monitors the Hall-effect sensors and stops sending voltage to the steering column motors once the commanded memory position is reached. If the SCCM receives a steering column switch input during a memory position recall function, the module stops the memory recall and responds to the new steering column switch position input.

When the RKE transmitter is activated, a message is sent over the Medium Speed Controller Area Network (MS-CAN) to the Driver Seat Module (DSM). When the memory SET switch is pressed, the DSM senses continuity to ground on the switch circuit. When the DSM receives either the MS-CAN message or the ground input through the switch circuit, it sends a message over the MS-CAN to the Body Control Module (BCM). The BCM acts as a gateway module, relaying the MS-CAN message that was received from the DSM to the SCCM over the High Speed Controller Area Network (HS-CAN). The SCCM then sends voltage over the appropriate circuit to the steering column tilt or telescoping motor to adjust the steering column position.

For information on setting and recalling a memory position, refer to the Owner's Literature or Memory Position Programming in Section 501-10 .

Easy Entry/Exit

The easy entry/exit function moves the steering column to the full inward and upward position when the selector lever is in the PARK position and the ignition switch indicates the ignition key has been removed from the ignition lock cylinder. The SCCM receives an ignition status message over the High Speed Controller Area Network (HS-CAN). When the ignition status message indicates the ignition key has been removed from the lock cylinder, the SCCM commands the steering column to the full upward/forward position. The SCCM cancels this operation if a valid input is received from the steering column control switch or memory position switch.

repair4less

The SCCM records the current steering column position before powering the steering column for an easy exit operation. This recorded position returns the steering column to this position on the next easy entry operation. During easy entry operation, the steering column is returned to the position previous to the easy exit operation.

The easy entry/exit feature can be activated or deactivated using the message center. Refer to driver controls in the Owner's Literature for additional instructions for using the message center.

Power Tilt Steering Column Hard Stop/Soft Stop

A hard stop occurs when the power column physically reaches the end of travel and cannot go any further. A soft stop occurs when the power column stops before physically reaching the end of travel. The hard stop is set by steering column design and cannot be changed or adjusted. The soft stop is set by the SCCM . To prevent unnecessary stress on the power column and motors, the SCCM sets 4 soft stop positions, one for tilt up, one for tilt down, one for telescope out and one for telescope in. The SCCM uses a preset distance from the hard stop to determine where the soft stop occurs.

The soft stops must be relearned by the SCCM whenever a new steering column or SCCM is installed.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. Visually inspect for obstructions preventing column movement.

Visual Inspection Chart

Mechanical	Electrical
• Steering column control switch • Adjustable steering column tilt motor • Adjustable steering column telescope motor • Steering column assembly	• Wiring, terminals or connectors • Steering Column Control Module (SCCM)

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .

- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 , The PCM Does Not Respond To The Scan Tool, to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, proceed with module self-test diagnostics.

9. Carry out the self-test diagnostics for the SCCM .

10. If the DTCs retrieved are related to the concern, go to Steering Column Control Module (SCCM) DTC Chart. For all other SCCM DTCs, refer to the Master DTC Chart in Section 211-05 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Steering Column Control Module (SCCM) DTC Chart

DTC	Description	Action
B1298:09	Steering Column Adjust Up Switch: Component Failure	INSTALL a new steering column control switch. REFER to Brake Pedal Control Switch in Section 206-06 . CLEAR the DTCs. VERIFY correct system operation. REPEAT the self-test. If DTC B1298:09 returns, INSTALL a new Steering Column Control Module (SCCM). REFER to Section 211-05 . CLEAR the DTCs. VERIFY correct system operation. REPEAT the self-test.
B1299:09	Steering Column Adjust Down Switch: Component Failure	INSTALL a new steering column control switch. REFER to Brake Pedal Control Switch in Section 206-06 . CLEAR the DTCs. VERIFY correct system operation. REPEAT the self-test. If DTC B1299:09 returns, INSTALL a new SCCM . REFER to Section 211-05 . CLEAR the DTCs. VERIFY correct system operation. REPEAT the self-test.

• The adjustable steering column is inoperative in one or more directions — using an Remote Keyless Entry (RKE) transmitter	• Wiring, terminals or connectors • RKE transmitter • DSM • SCCM • BCM	• GO to Pinpoint Test B .
• The adjustable steering column is inoperative in one or more directions — using the easy entry/exit feature	• Entry/exit feature is disabled in the message center • Wiring, terminals or connectors • SCCM	• GO to Pinpoint Test B .
• The adjustable steering column operates in one second intervals when using the steering column control switch (jog mode)	• Wiring, terminals or connectors • Adjustable steering column tilt motor • Adjustable steering column telescopic motor • SCCM	• GO to Pinpoint Test C .
• Looseness felt in the steering wheel or tilt mechanism	• Loose tilt motor fastener(s) • Loose steering column assembly fastener(s) • Wore internal steering column component(s) or loose internal fastener/fasteners • Steering column tilt housing fastener(s)	• TIGHTEN fasteners. For additional information, refer to Steering Column Motor — Tilt or Steering Column Motor — Telescopic . • INSTALL a new steering column. For additional information, REFER to Steering Column in this section.

repair4less

Pinpoint Tests

Pinpoint Test A: The Adjustable Steering Column is Inoperative in One or More Directions — Using the Steering Column Control Switch

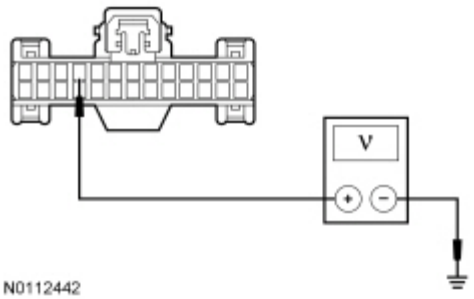
Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

When the steering column control switch is activated, the Steering Column Control Module (SCCM) supplies voltage and ground to the applicable steering column tilt or telescoping motor to move the steering column to the desired position.

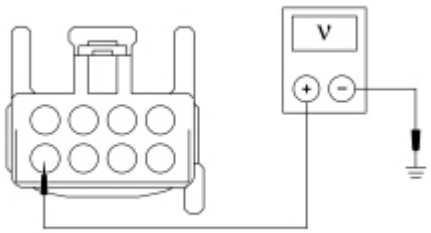
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Steering column control switch
- Adjustable steering column tilt motor
- Adjustable steering column telescopic motor
- SCCM



DTC Description	Fault Trigger Conditions
• B1375:18 — Steering Column Tilt Motor: Circuit Current Below Threshold	This DTC sets when the SCCM senses current flow to the adjustable steering column tilt motor is below a preset limit while the steering column control switch is activated. This may be caused by an open or high resistance in the adjustable steering column tilt motor circuits.
• B1375:19 — Steering Column Tilt Motor: Circuit Current Above Threshold	This DTC sets when the SCCM senses current flow to the adjustable steering column tilt motor is above a preset limit while the steering column control switch is activated. This may be caused by a short to ground in the adjustable steering column tilt motor circuits.
• B1375:71 — Steering Column Tilt Motor: Actuator Stuck	This DTC sets when the SCCM senses current flow to the adjustable steering column tilt motor is within a specific range but above a preset limit during self test.
• B137E:18 — Steering Column Telescope Motor: Current Below Threshold	This DTC sets when the SCCM senses current flow to the adjustable steering column telescope motor is below a preset limit while the steering column control switch is activated. This may be caused by an open or high resistance in the adjustable steering column telescope motor circuits.
• B137E:19 — Steering Column Telescope Motor: Current Above Threshold	This DTC sets when the SCCM senses current flow to the adjustable steering column telescope motor is above a preset limit while the steering column control switch is activated. This may be caused by a short to ground in the adjustable steering column telescope motor circuits.
• B137E:71 — Steering Column Telescope Motor: Actuator Stuck	This DTC sets when the SCCM senses current flow to the adjustable steering column telescope motor is within a specific range but above a preset limit during on-demand self test.

PINPOINT TEST A: THE ADJUSTABLE STEERING COLUMN IS INOPERATIVE IN ONE OR MORE



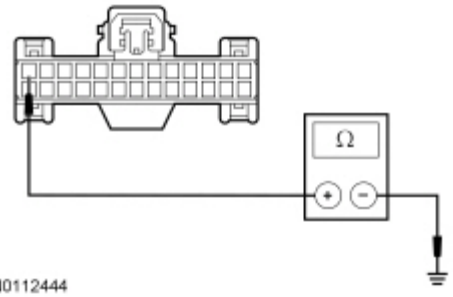
DIRECTIONS — USING THE STEERING COLUMN CONTROL SWITCH

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: If the adjustable steering column only operates in one second intervals when activating the steering column control switch, GO to Pinpoint Test C .

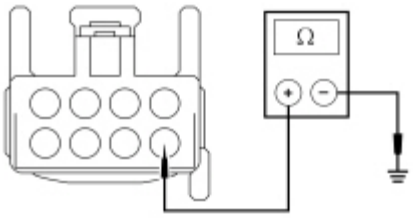
Test Step	Result / Action to Take
A1 CHECK THE OPERATION OF THE ADJUSTABLE COLUMN USING THE STEERING COLUMN CONTROL SWITCH	
• Operate the adjustable steering column in all directions using the steering column control switch. • **Does the steering column operate correctly in at least one direction using the steering column control switch?**	**Yes** GO to A4 . **No** If the steering column does not move in any direction at all using the steering column switch, GO to A2 . If the steering column moves in only one second intervals (jog mode) in one or more directions using the steering column switch, GO to Pinpoint Test C .
A2 CHECK FOR VOLTAGE AT THE SCCM	
• Ignition OFF. • Disconnect: SCCM C2414A. • Disconnect: SCCM C2414B. • Measure the voltage between SCCM C2414A-10, circuit SBP23 (WH/RD), harness side and ground.  N0112442 • Measure the voltage between SCCM C2414B-8, circuit SBP24 (VT/RD), harness side and ground.	**Yes** GO to A3 . **No** VERIFY BCM fuses 23 (15A) and 24 (15A) are OK. If OK, REPAIR the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the cause for the circuit short. TEST the system for normal operation.

repair4less



N0119444

- **Are the voltages greater than 10 volts?**



A3 CHECK THE SCCM GROUND CIRCUITS FOR AN OPEN

- Measure the resistance between SCCM C2414A-13, circuit GD133 (BK), harness side and ground.

N0112444

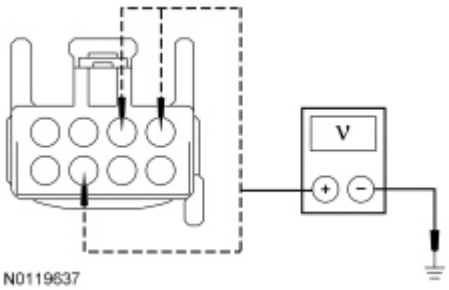
- Measure the resistance between SCCM C2414B-5, circuit GD138 (BK/WH), harness side and ground.

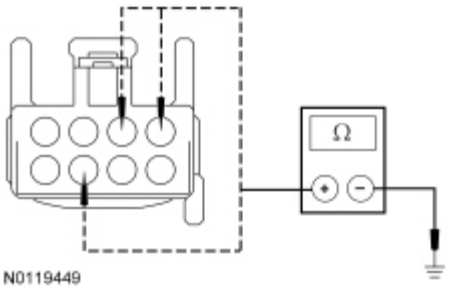
N0119446

- **Are the resistances less than 5 ohms?**

Yes
GO to A4.

No
REPAIR the affected circuit(s). TEST the system for normal operation.





A4 CHECK THE SCCM STEERING COLUMN ADJUST SWITCH (STRCOL_ADJ) PID

- Connect: SCCM C2414A (if previously disconnected).
- Connect: SCCM C2414B (if previously disconnected).
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: DataLogger — SCCM.
- Monitor the STRCOL_ADJ PID while moving the steering column control switch in all directions.
- **Do the PID values agree with the steering column control switch positions?**

Yes
GO to A5.

No
INSTALL a new steering column control switch. REFER to Brake Pedal Control Switch in Section 206-06.

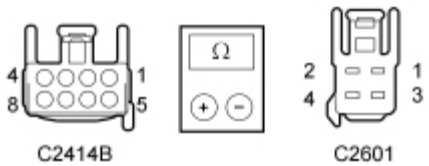
CLEAR the DTCs. VERIFY correct system operation. REPEAT the self-test

	If the concern is still present, INSTALL a new Steering Column Control Module (SCCM). REFER to Section 211-05. TEST the system for normal operation.
A5 CHECK THE ADJUSTABLE STEERING COLUMN MOTOR CIRCUITS FOR A SHORT TO VOLTAGE • Ignition OFF. • Disconnect: SCCM C2414B. • Disconnect: SCCM C2414C. • Ignition ON. • Measure the voltage between ground and: ▪ SCCM C2414B-1, circuit CPP22 (GY/BN), harness side. ▪ SCCM C2414B-2, circuit CPP04 (GY), harness side. ▪ SCCM C2414B-7, circuit CPP02 (BN), harness side.  N0119637 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). TEST the system for normal operation. **No** GO to A6.
A6 CHECK THE ADJUSTABLE STEERING COLUMN MOTOR CIRCUITS FOR A SHORT TO GROUND • Ignition OFF. • Measure the resistance between ground and: ▪ SCCM C2414B-1, circuit CPP22 (GY/BN), harness side. ▪ SCCM C2414B-2, circuit CPP04 (GY), harness side. ▪ SCCM C2414B-7, circuit CPP02 (BN), harness side.  N0119449 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A7. **No** REPAIR the affected circuit(s). TEST the system for normal operation.
A7 CHECK THE ADJUSTABLE STEERING COLUMN MOTOR CIRCUITS FOR AN OPEN • Disconnect: Adjustable Steering Column Tilt Motor C2600 or	**Yes**

repair4less

Adjustable Steering Column Telescope Motor C2601.

- For an inoperative adjustable steering column tilt motor, measure the resistance between SCCM C2414B and adjustable steering column tilt motor C2600 using the following chart:

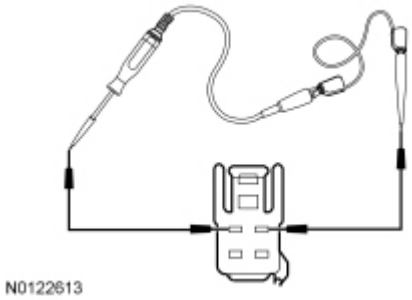


SCCM	Circuit	Adjustable Steering Column Tilt Motor
C2414B-7	CPP02 (BN)	C2600-2
C2414B-2	CPP04 (GY)	C2600-1

N0122534

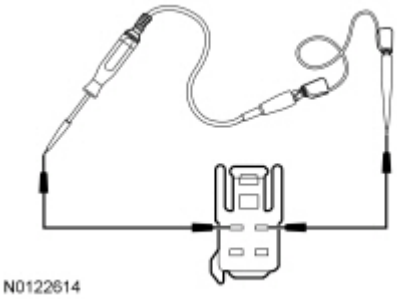
- For an inoperative adjustable steering column telescope motor, measure the resistance between SCCM C2414B and adjustable steering column telescope motor C2601 using the following chart:

SCCM	Circuit	Adjustable Steering Column Telescope Motor
C2414B-7	CPP02 (BN)	C2601-2
C2414B-1	CPP22 (GY/BN)	C2601-1



N0122581

- **Are the resistances less than 5 ohms?**



For a tilt motor that is inoperative/does not operate correctly, GO to A8 . For a telescope motor that is inoperative/does not operate correctly, GO to A9 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

A8 CHECK THE SCCM OUTPUT TO THE ADJUSTABLE STEERING COLUMN TILT MOTOR

• Ignition OFF. • Connect: SCCM C2414B. • Connect: SCCM C2414C. • ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Connect a 12-volt incandescent test light between adjustable steering column tilt motor C2600-1, circuit CPP02 (BN), harness side and C2600-2, circuit CPP04 (GY), harness side.  N0122613 • Ignition ON. • **NOTE:** Because the steering column motor (Hall-effect sensor) is disconnected, the SCCM only activates the output for approximately 1 second each time the steering column control switch is activated (jog mode). • Activate the steering column control switch in both the UP and DOWN positions (release the switch briefly between each switch activation) while observing the test light. • **Does the test light momentarily illuminate when the steering column control switch is activated in both UP and DOWN positions?**	**Yes** INSTALL a new adjustable steering column tilt motor. REFER to Steering Column Motor — Tilt in this section. CLEAR the DTCs. TEST the system for normal operation. REPEAT the self test. **No** GO to A10 .
A9 CHECK THE SCCM OUTPUT TO THE ADJUSTABLE STEERING COLUMN TELESCOPE MOTOR	
• Ignition OFF. • Connect: SCCM C2414B. • Connect: SCCM C2414C. • ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Connect a 12-volt incandescent test light between adjustable steering column telescope motor C2601-2, circuit CPP02 (BN), harness side and C2601-1, circuit CPP22 (GY/BN), harness side.	**Yes** INSTALL a new adjustable steering column telescopic motor. REFER to Steering Column Motor — Telescopic in this section. CLEAR the DTCs. TEST the system for normal operation. REPEAT the self test. **No** GO to A10 .

repair4less

 N0122614 • Ignition ON. • **NOTE:** Because the steering column motor (Hall-effect sensor) is disconnected, the SCCM only activates the output for approximately 1 second each time the steering column control switch is activated (jog mode). • Activate the steering column control switch in both the FORWARD and REARWARD positions (release the switch briefly between each switch activation) while observing the test light. • **Does the test light momentarily illuminate when the steering column control switch is activated in both FORWARD and REARWARD positions?**	

A10 CHECK THE SCCM CONNECTORS
• Check the SCCM electrical connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: Reconnect all previously disconnected electrical connectors.
• Make sure the connectors are seated correctly then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM.
	REFER to Section 211-05.
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: The Adjustable Steering Column is Inoperative in One or More Directions — Using the Memory SET Switch Buttons/Using an RKE Transmitter/Using the Easy Entry/Exit Feature

Refer to Wiring Diagrams Cell 128, Adjustable Steering Column for schematic and connector information.

Normal Operation

When the desired memory position is selected using the memory SET switch or an Remote Keyless Entry (RKE) transmitter, the Driver Seat Module (DSM) communicates the desired steering column position in a message on the Medium Speed Controller Area Network (MS-CAN) to the Body Control Module (BCM). The BCM acts as a gateway module, relaying the message to the Steering Column Control Module (SCCM) over the High Speed Controller Area Network (HS-CAN). The SCCM monitors the position of the adjustable steering column using Hall-effect type rotation sensors that are integral to the tilt and telescoping motors. The sensors provide a digital signal used by the SCCM to calculate the position of the steering column in relation to the full forward/rearward and full up/down positions. The SCCM uses these signals to store and recall memory positions, carry out easy entry/exit operations and to make sure the tilt and telescope motors do not stall against the steering column end of travel. If a tilt or telescope motor sensor DTC sets, the SCCM

does not recall a programmed memory position or automatically position the steering column during the easy entry/exit operation. If a DTC sets for either sensor, the affected adjustable steering column motor operates in jog mode. Jog mode allows limited operation of the affected steering column motor using only the steering column control switch. When the steering column control switch is operated in jog mode, the steering column moves in the desired direction for one second, then stops. The steering column control switch must be released, then pressed again in order to move the steering column for an additional second.

This pinpoint test is intended to diagnose the following:

- Entry/exit feature is disabled in the message center
- Wiring, terminals or connectors
- Memory SET switch
- RKE transmitter
- DSM
- BCM
- SCCM

PINPOINT TEST B: THE ADJUSTABLE STEERING COLUMN IS INOPERATIVE IN ONE OR MORE DIRECTIONS — USING THE MEMORY SET SWITCH BUTTONS/USING AN RKE TRANSMITTER/USING THE EASY ENTRY/EXIT FEATURE

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE ADJUSTABLE COLUMN USING THE STEERING COLUMN CONTROL SWITCH	
• Operate the adjustable steering column in all directions using the steering column control switch. • **Does the steering column move for more than one second in each direction using the steering column control switch?**	**Yes** If the adjustable steering column is inoperative using the easy entry/exit feature, GO to B2. If the adjustable steering column is inoperative using the memory SET switch, GO to B3. If the adjustable steering column is inoperative using an RKE transmitter, GO to B4. **No** If the steering column does not move in any direction at all using the steering column switch, GO to Pinpoint Test A. If the steering column moves in only one second intervals (jog mode) in one or more directions using the steering column switch, GO to Pinpoint Test C.
B2 VERIFY THE EASY ENTRY/EXIT FEATURE IS ENABLED	
• Verify the easy entry/exit feature is enabled using the message center. Refer to the Owner's Literature for additional instructions for using the message center. • **Does the message center indicate that the easy entry/exit feature is enabled?**	**Yes** GO to B5. **No** TOGGLE the easy entry/exit feature on using the message center controls. TEST the system for normal operation.
B3 CHECK THE OPERATION OF THE	

repair4less

MEMORY SEATS, MEMORY MIRRORS AND STEERING COLUMN USING THE MEMORY SET SWITCH	
• Check the operation of the seats, memory mirrors and steering column using the memory SET switch. Refer to the Owner's Literature for additional instructions for programming a memory position. • **Do the seats and mirrors operate properly using the memory SET switch?**	**Yes** If only the adjustable steering column is inoperative using the memory SET switch, GO to B5 . **No** If the seats and mirrors are also inoperative using the memory SET switch, REFER to Section 501-10 .
B4 CHECK THE OPERATION OF THE MEMORY SEATS, MIRRORS AND STEERING COLUMN USING AN RKE TRANSMITTER	
• Check the operation of the seats, mirrors and steering column using an RKE transmitter. Refer to the Owner's Literature for additional instructions for programming a memory position to an RKE transmitter. • **Do the seats and mirrors operate correctly using an RKE transmitter?**	**Yes** If only the adjustable steering column is inoperative using an RKE transmitter, GO to B5 . **No** If the seats and mirrors are also inoperative using an RKE transmitter, REFER to Section 501-10 .
B5 CHECK FOR DSM , BCM AND SCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — DSM . • Enter the following diagnostic mode on the scan tool: Self Test — BCM . • Enter the following diagnostic mode on the scan tool: Self-Test — SCCM . • Record all DTCs retrieved from the DSM , BCM and SCCM . • **Are any symptom or communication related DTCs present?**	**Yes** To diagnose the DSM DTCs, REFER to Section 501-10 . To diagnose the BCM DTCs, REFER to Section 419-10 . To diagnose the SCCM DTCs, REFER to Section 211-05 . **No** INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation.

Pinpoint Test C: The Adjustable Steering Column Operates in One Second Intervals When Using the Steering Column Control Switch (Jog Mode)

Refer to Wiring Diagrams Cell 128 , Adjustable Steering Column for schematic and connector information.

Normal Operation

The Steering Column Control Module (SCCM) monitors the position of the adjustable steering column using of Hall-effect type rotation sensors that are integral to the tilt and telescoping motors. Both the adjustable steering column tilt motor and telescope motor can be serviced separately from the steering column.

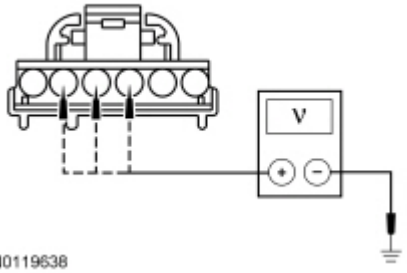
The SCCM sends a reference voltage along the sensor feed circuit through the Hall-effect sensor and back to the SCCM through a shared signal return circuit. The sensors provide a digital signal used by the SCCM to calculate the position of the steering column in relation to the full forward/rearward and full up/down positions. The SCCM uses this signal to store and recall memory positions, to carry out the easy entry/exit operations and to make sure the adjustable steering column tilt and telescope motors do not stall against the steering column end of travel.

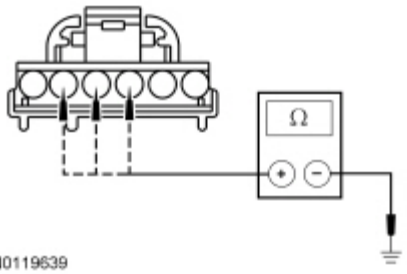
If an adjustable steering column tilt or telescope motor sensor DTC sets (or if either of the sensor circuits

become open), the SCCM does not recall a programmed memory position or automatically position the steering column during the easy entry/exit operations. The affected steering column motor operates in jog mode. Jog mode allows limited operation of the affected steering column motor using only the steering column control switch. When the steering column control switch is operated in jog mode, the steering column moves in the desired direction for one second, then stops regardless of the length of time the switch is actually activated. The steering column control switch must be released, then activated again in order to move the steering column for an additional second.

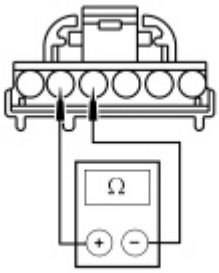
DTC Description	Fault Trigger Conditions
• B1C33:11 — Steering Column Tilt Feedback Signal: Circuit Short To Ground	This DTC sets when the SCCM senses the adjustable steering column tilt motor feedback sensor signal is below 1.5 volts. This may be caused by a short to ground in the sensor signal circuit.
• B1C33:12 — Steering Column Tilt Feedback Signal: Circuit Short To Battery	This DTC sets when the SCCM senses the adjustable steering column tilt motor feedback sensor signal is above 7 volts. This may be caused by a short to voltage in the sensor signal circuit.
• B1C35:11 — Steering Column Telescope Feedback Signal: Circuit Short To Ground	This DTC sets when the SCCM senses the adjustable steering column telescope motor feedback sensor signal is below 1.5 volts. This may be caused by a short to ground in the sensor signal circuit.
• B1C35:12 — Steering Column Telescope Feedback Signal: Circuit Short To Battery	This DTC sets when the SCCM senses the adjustable steering column telescope motor feedback sensor signal is above 7 volts. This may be caused by a short to voltage in the sensor signal circuit.

This pinpoint test is intended to diagnose the following:



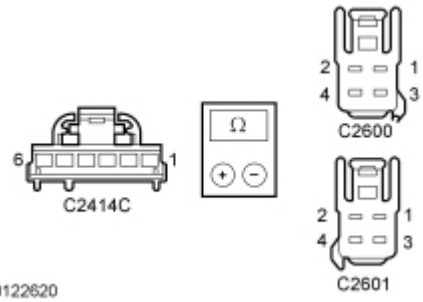


- Wiring, terminals or connectors
- Adjustable steering column tilt motor
- Adjustable steering column telescopic motor
- SCCM



PINPOINT TEST C: THE ADJUSTABLE STEERING COLUMN OPERATES IN ONE SECOND INTERVALS WHEN USING THE STEERING COLUMN CONTROL SWITCH (JOG MODE)

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**



Test Step	Result / Action to Take
C1 CHECK THE TILT/TELESCOPE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SCCM C2414C. • Disconnect: Adjustable Steering Column Tilt Motor C2600. • Disconnect: Adjustable Steering Column Telescope Motor C2601. • Ignition ON. • Measure the voltage between ground and: ▪ SCCM C2414C-3, circuit RPP06 (GN),	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C2 .

repair4less

harness side. ■ SCCM C2414C-4, circuit VPP08 (WH), harness side. ■ SCCM C2414C-5, circuit VPP17 (VT/BN), harness side.  N0119638 • **Is any voltage present?**	
C2 CHECK THE TILT/TELESCOPE SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ■ SCCM C2414C-3, circuit RPP06 (GN), harness side. ■ SCCM C2414C-4, circuit VPP08 (WH), harness side. ■ SCCM C2414C-5, circuit VPP17 (VT/BN), harness side.  N0119639 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C3 CHECK THE TILT/TELESCOPE SENSOR CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between SCCM C2414C-4, circuit VPP08 (WH), harness side and SCCM C2414C-5, circuit VPP17 (VT/BN), harness side.	**Yes** GO to C4 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

- **Is the resistance greater than 10,000 ohms?**

C4 CHECK THE TILT/TELESCOPE SENSOR CIRCUITS FOR AN OPEN	
• Measure the resistance between SCCM C2414C, harness side and adjustable steering column tilt motor C2600; and between SCCM C2414C, harness side and adjustable steering column telescope motor C2601, harness side using the following chart: **SCCM** / **Circuit** / **Adjustable Steering Column Tilt/Telescope Motor** C2414C-3 / RPP06 (GN) / C2600-3 C2414C-3 / RPP06 (GN) / C2601-3 C2414C-4 / VPP08 (WH) / C2600-4 C2414C-5 / VPP17 (VT/BN) / C2601-4  • **Are the resistances less than 5 ohms?**	**Yes** GO to C5 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE SCCM CONNECTOR	
• Check SCCM connector C2414C for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect: SCCM C2414C. • Connect: Adjustable Steering Column Tilt	**Yes** If the adjustable steering column does not operate correctly when the steering column control switch is in the UP/DOWN (tilt) position (s), INSTALL a new adjustable steering column tilt motor. REFER to Steering Column

repair4less

Motor C2600. • Connect: Adjustable Steering Column Telescope Motor C2601. • Ignition ON. • Make sure the connectors are seated correctly then operate the system and verify the concern is still present. • **Is the concern still present?**	Motor — Tilt in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation. If the adjustable steering column does not operate correctly when the steering column control switch is in the FORWARD/REARWARD (telescope) position (s), INSTALL a new adjustable steering column telescopic motor. REFER to Steering Column Motor — Telescopic in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, INSTALL a new SCCM . REFER to Section 211-05 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Steering Wheel Wrap Bonding

Material

Item	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

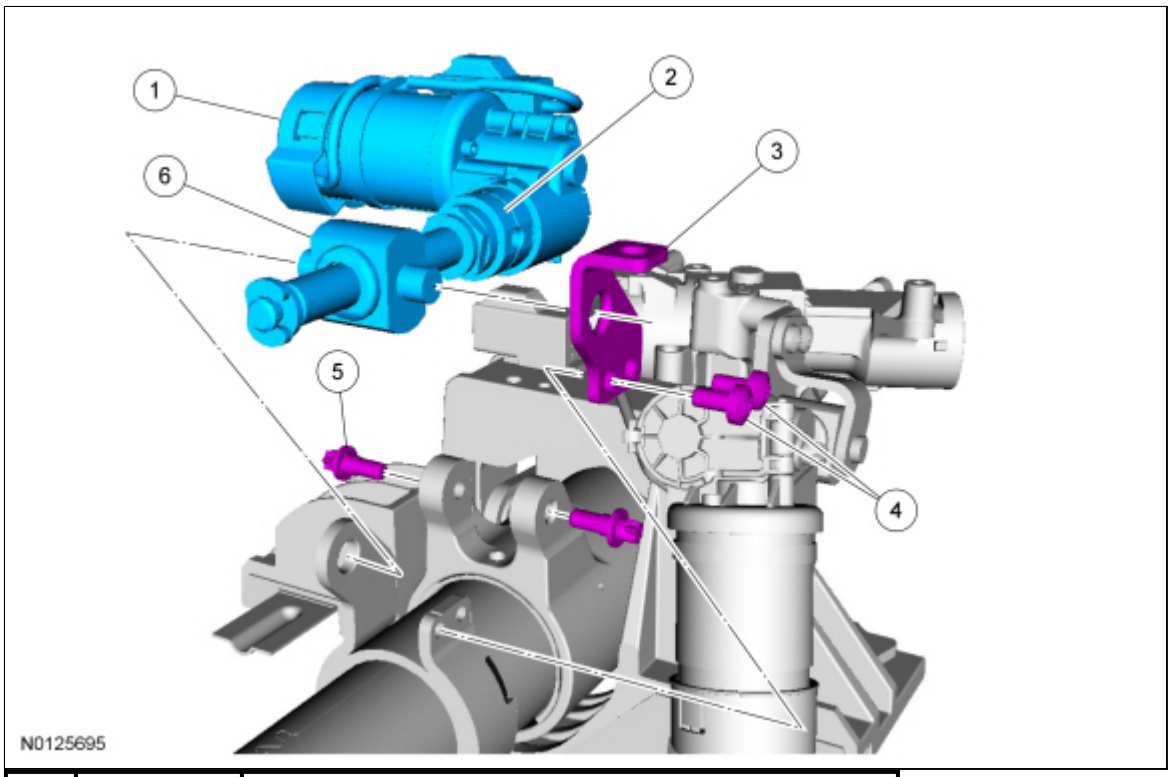
1. **NOTE:** If re-adhering leather to the front side of the steering wheel only, it will not be necessary to remove the steering wheel. Steering wheel removal is necessary only when repairing loose leather on the backside of the steering wheel.

   If necessary remove the steering wheel. For additional information, refer to Steering Wheel in this section.

2. Position the loose leather out of the way.

3. Apply the specificed adhesive evenly over the wheel spoke.

4. Position the loose leather back into the original position.



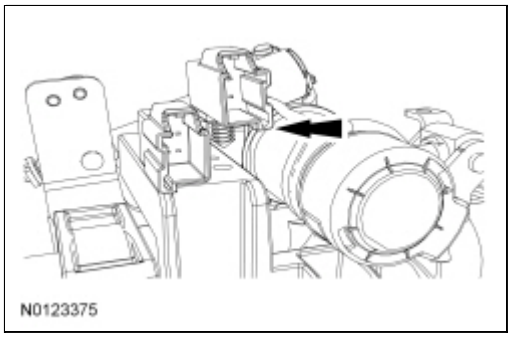
5. **NOTE:** The adhesive should be completely set after 5 minutes. Do not pull on the repair area.

   Smooth the leather and tuck in for neat appearance.
   - Apply pressure (for at least 30 seconds) until the leather is bonded to the wheel spoke.

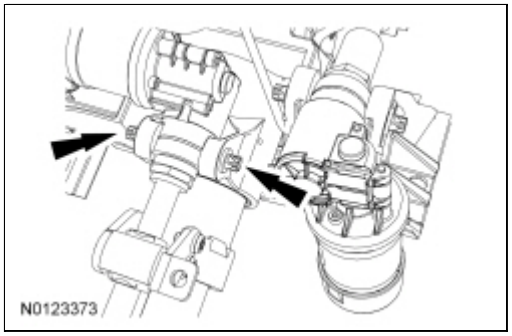
6. If removed, Install the steering wheel. For additional information, refer to Steering Wheel in this section.

repair4less

Steering Column Motor — Telescopic

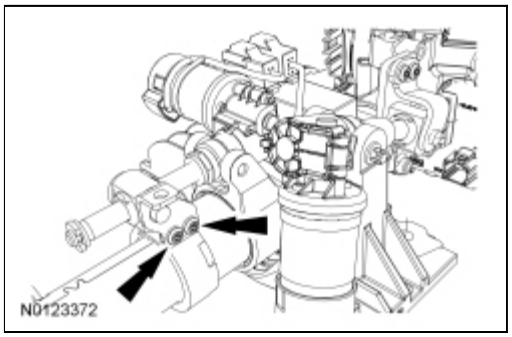


Item	Part Number	Description
1	3F797	Steering column motor (telescopic)
2	—	Leadscrew housing (part of 3F797)
3	—	Trunion nut capture bracket (part of 3C529)
4	—	Trunion nut capture bracket screws (2 required) (part of 3C529)
5	—	Steering column motor screws (2 required) (part of 3C529)
6	—	Trunion nut (part of 3F797)



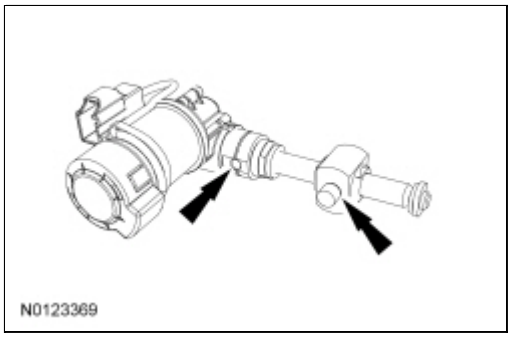
Removal

1. Remove the steering column. For additional information, refer to Steering Column in this section.
2. Place the steering column upside down on a workbench.
3. Detach the electrical connector pin-type retainer from the steering column.



repair4less

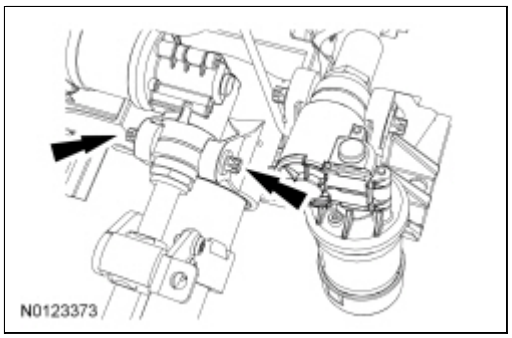
4. Remove the 2 steering column motor screws.



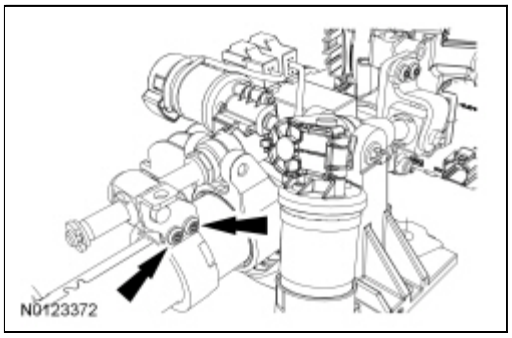
5. Remove the 2 steering column motor trunnion nut capture bracket screws and the trunnion nut capture bracket.

6. Remove the steering column motor.

Installation



1. Apply grease (supplied with the motor) to the trunnion nut axles and the steering column motor leadscrew housing holes.

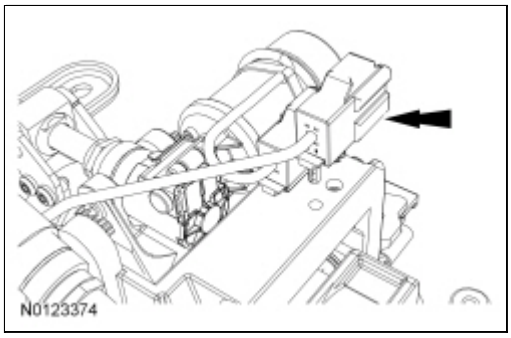


2. **NOTE:** Install the trunnion nut with the axle O-ring facing inward towards the column.

   NOTE: If necessary, make small alignment adjustments by pivoting the tilt bracket.

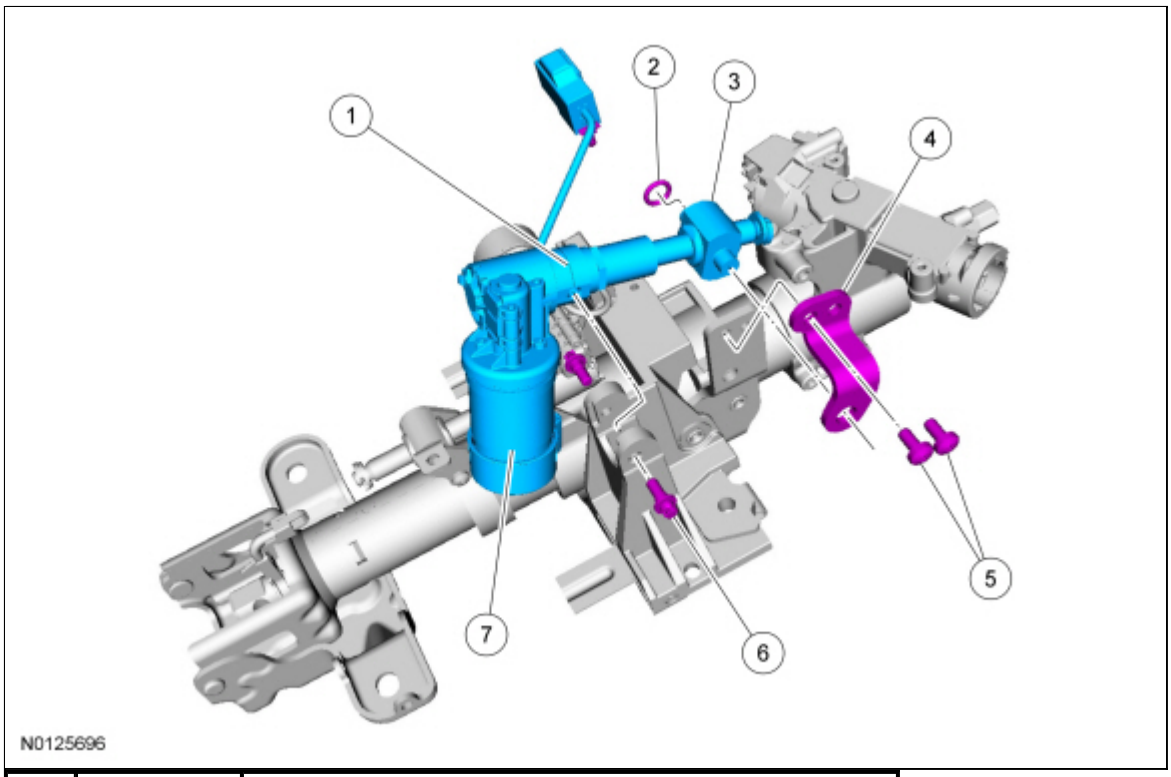
   Rotate the pinion nut until the correct length is achieved to align the leadscrew housing with the threaded holes in the support arm.
   - Loosely install the 2 steering column motor screws.

3. Position the trunnion nut capture bracket and loosely install the 2 steering column motor trunnion nut capture bracket screws.



4. Tighten the 2 steering column motor screws to 6 Nm (53 lb-in).

5. Tighten the 2 steering column motor trunnion nut capture bracket screws to 7 Nm (62 lb-in).

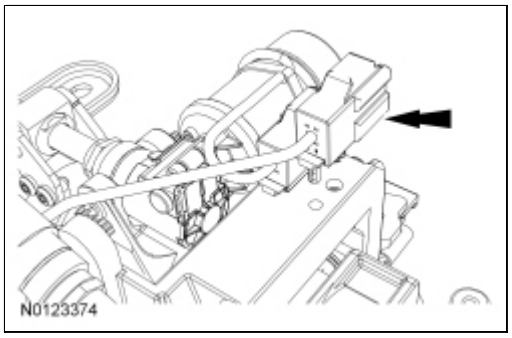


6. Attach the electrical connector pin-type retainer to the steering column.

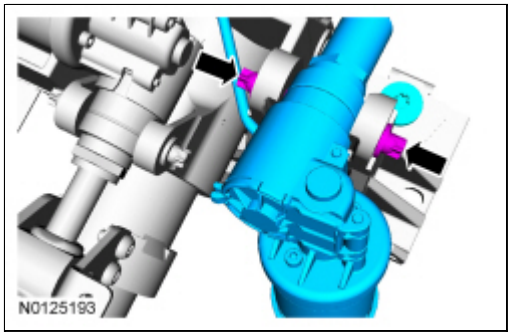
repair4less

7. Install the steering column. For additional information, refer to Steering Column in this section.

Steering Column Motor — Tilt

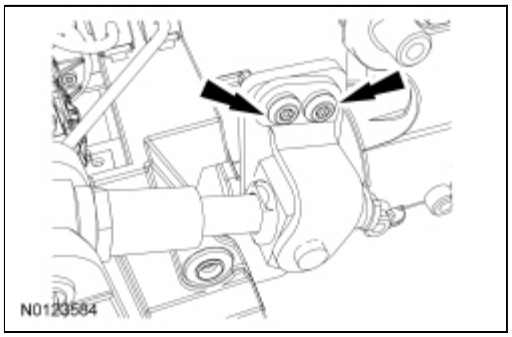


Item	Part Number	Description
1	—	Leadscrew housing (part of 3F797)
2	—	O-ring (part of 3F797)
3	—	Trunion nut (part of 3F797)
4	—	Trunion nut capture bracket (part of 3C529)
5	—	Trunion nut capture bracket screws (2 required) (part of 3C529)
6	—	Steering column motor screws (2 required) (part of 3C529)
7	3F797	Steering column motor (tilt)



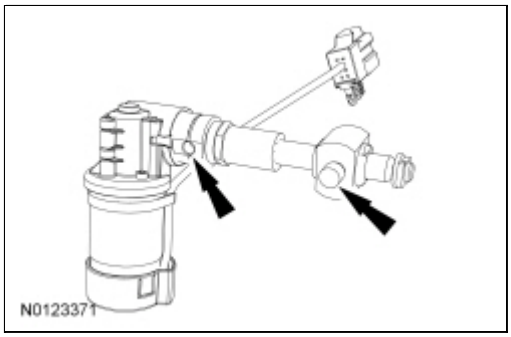
Removal

1. Remove the steering column. For additional information, refer to Steering Column in this section.
2. Place the steering column upside down on a workbench.
3. Detach the electrical connector pin-type retainer from the steering column.



repair4less

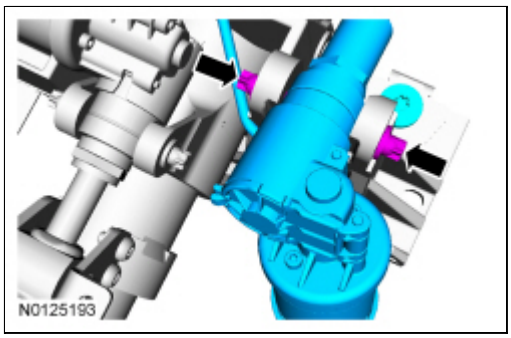
4. Remove the 2 steering column motor screws.



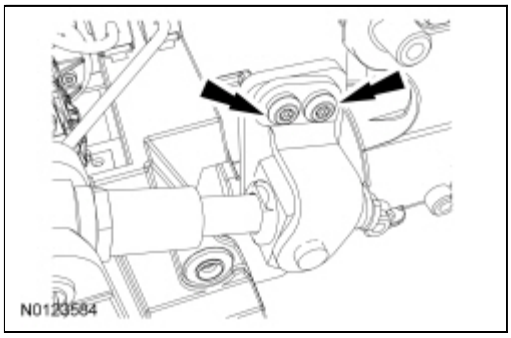
5. Remove the 2 steering column motor trunnion nut capture bracket screws and the trunnion nut capture bracket.

6. Remove the steering column motor.

Installation



1. Apply grease (supplied with the motor) to the trunnion nut axles and the steering column motor leadscrew housing holes.

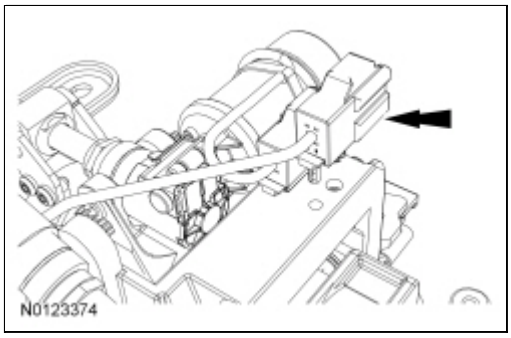


2. **NOTE:** Install the trunnion nut with the axle O-ring facing inward towards the column.

   NOTE: If necessary, make small alignment adjustments by pivoting the tilt bracket.

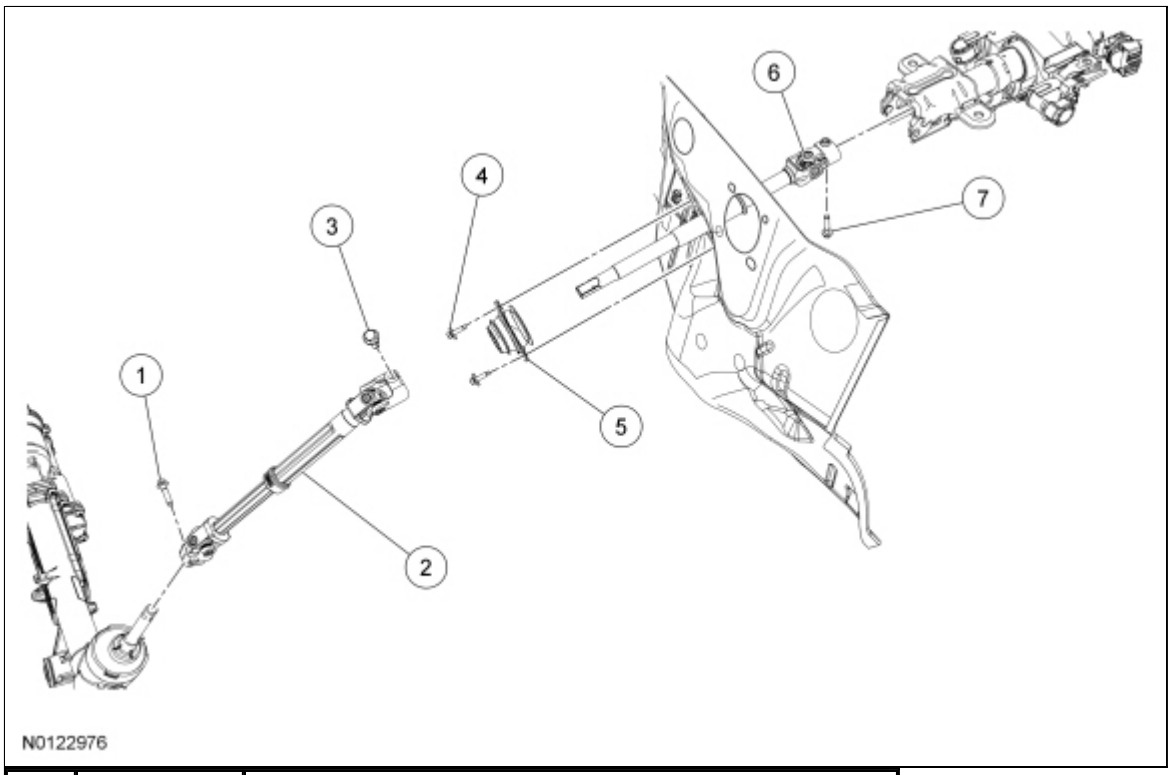
   Rotate the pinion nut until the correct length is achieved to align the leadscrew housing with the threaded holes in the support arm.
   - Loosely install the 2 steering column motor screws.

3. Position the trunnion nut capture bracket and loosely install the 2 steering column motor trunnion nut capture bracket screws.



4. Tighten the 2 steering column motor screws to 6 Nm (53 lb-in).

5. Tighten the 2 steering column motor trunnion nut capture bracket screws to 7 Nm (62 lb-in).

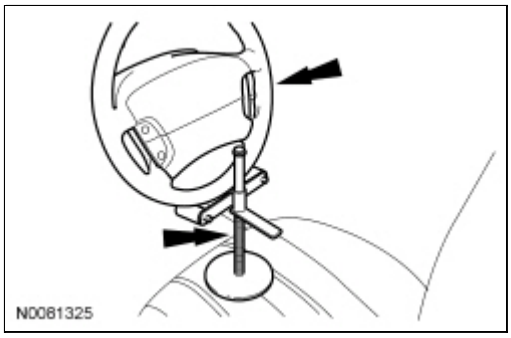


6. Attach the electrical connector pin-type retainer to the steering column.

repair4less

7. Install the steering column. For additional information, refer to Steering Column in this section.

Steering Column Shaft



Item	Part Number	Description
1	N808684	Lower steering column shaft-to-steering gear bolt
2	3B676	Lower steering column shaft
3	W710570	Lower steering column shaft-to-upper steering column shaft bolt
4	W705132	Steering column shaft dash seal bolt (2 required)
5	3D677	Steering column shaft dash seal
6	3E751	Upper steering column shaft
7	W714409	Upper steering column shaft-to-steering column bolt

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Using a suitable holding device, hold the steering wheel in the straight-ahead position.

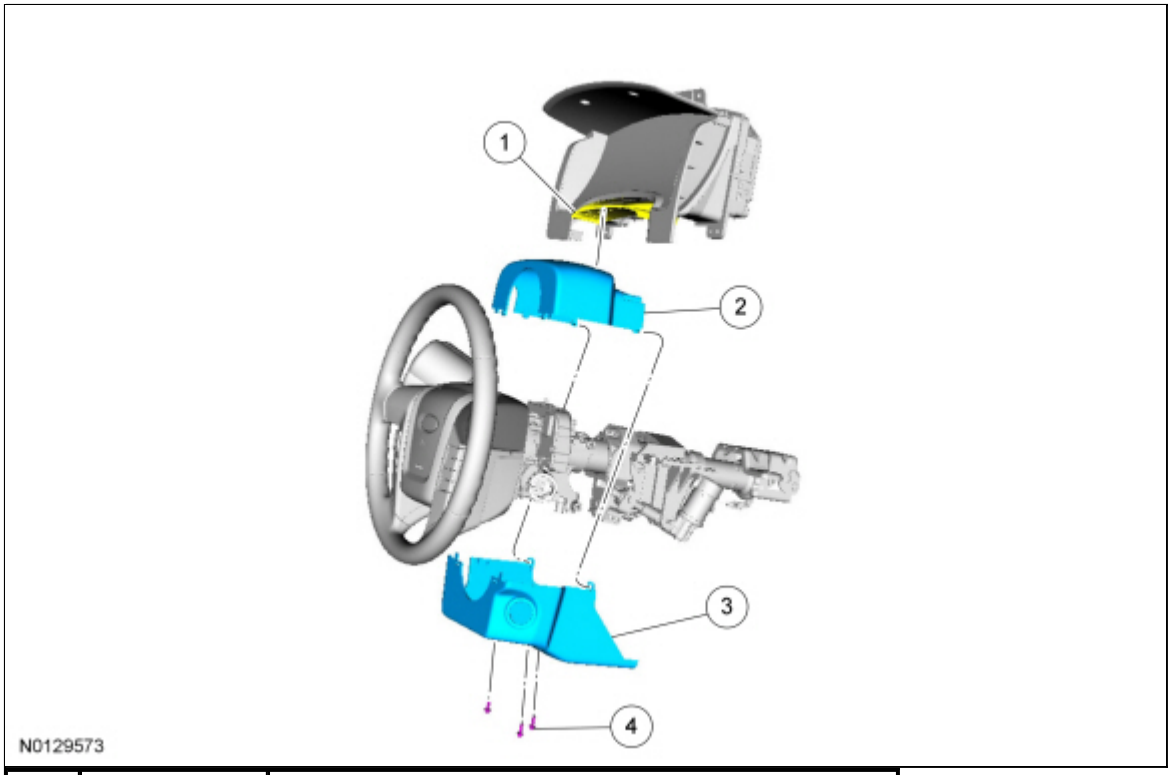
repair4less

3. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the steering column shaft has rotated, remove and recenter the clockspring. For additional information, refer to Section 501-20B .**

   Remove and discard the upper steering column shaft-to-steering column bolt and disconnect the upper steering column shaft from the steering column.
   - To install, tighten the new bolt to 28 Nm (21 lb-ft).

4. Remove and discard the lower steering column shaft-to-upper steering column shaft bolt and disconnect the lower steering column shaft from the upper steering column shaft.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).

5. Remove the 2 steering column shaft dash seal bolts, the steering column shaft dash seal and the upper steering column shaft.
   - To install, tighten to 12 Nm (106 lb-in).



6. Remove and discard the lower steering column shaft-to-steering gear bolt and disconnect the lower steering column shaft from the steering gear.
   - To install, tighten the new bolt to 30 Nm (22 lb-ft).

7. **WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   To install, reverse the removal procedure.

repair4less

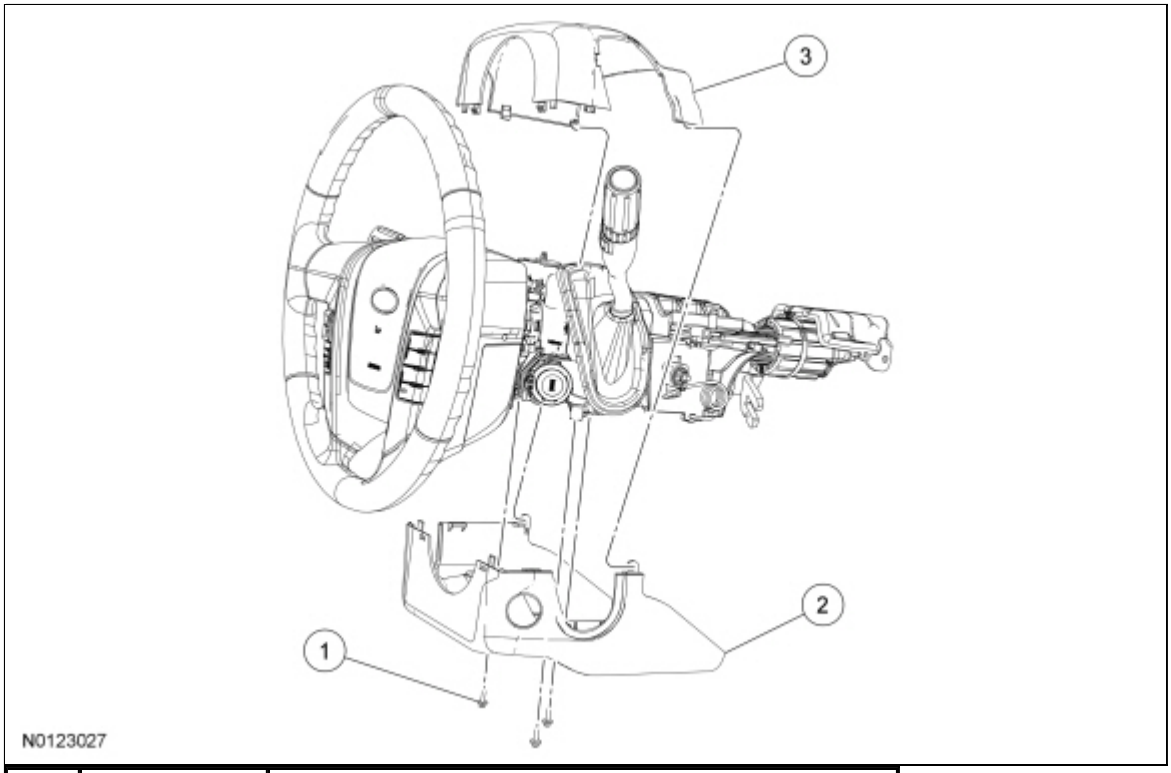
Steering Column Shroud — Floor Shift

Item	Part Number	Description
1	—	Instrument cluster trim (part of 15044D70)
2	3530A	Upper steering column shroud
3	3530B	Lower steering column shroud
4	W710485	Lower steering column shroud screw (3 required)

Removal and Installation

1. Remove the 3 screws and the steering column opening trim panel.

2. Separate the instrument cluster trim from the upper steering column shroud.



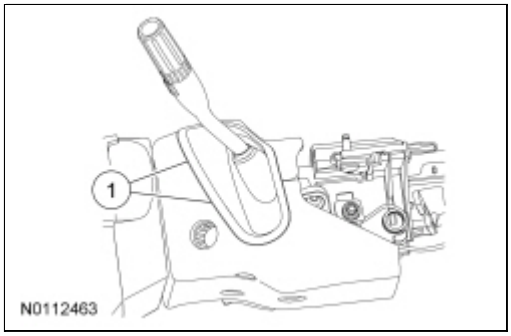
3. Pull upward on the rearward portion of the upper steering column shroud to separate the clips from the lower steering column shroud.
   - Roll the upper steering column shroud upward on the hinge point and then pull straight rearward to remove the upper shroud.

4. Remove the 3 screws and the lower steering column shroud.
   - To install, tighten to 2 Nm (18 lb-in).

5. To install, reverse the removal procedure.

repair4less

Steering Column Shroud



Item	Part Number	Description
1	W710485	Lower steering column shroud screw (3 required)
2	3530B	Lower steering column shroud
3	3530A	Upper steering column shroud

Removal

1. Remove the 3 screws and the steering column opening trim panel.
2. Place transmission selector lever in PARK.
3. Position the steering column in the full downward and rearward position.
4. Apply the parking brake.
5. With the ignition key in the ON position and the brake pedal pressed, shift the transmission selector lever into DRIVE.
6. ***NOTICE:*** **Use care when detaching the transmission selector lever boot clips from steering column shrouds or damage to the selector lever boot may occur causing replacement of the shift lever assembly. The transmission selector lever boot is not serviceable separately.**

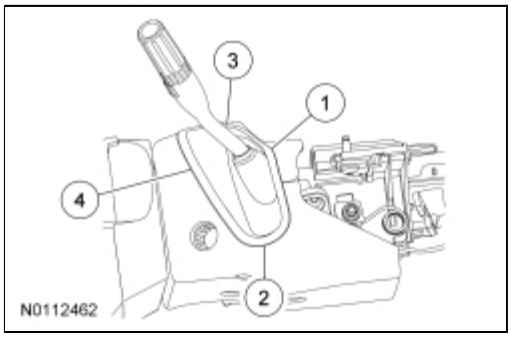
   Position the selector lever boot aside.

1. Push forward on the selector lever boot at the area indicated and separate the boot from the upper and lower steering column shrouds.

7. Pull upward on the rearward portion of the upper steering column shroud to separate the clips from the lower steering column shroud.
    - Roll the upper steering column shroud upward on the hinge point and then pull straight rearward to remove the upper shroud.

8. Shift the shift lever to PARK and remove the ignition key.

9. Remove the 3 screws and the lower steering column shroud.



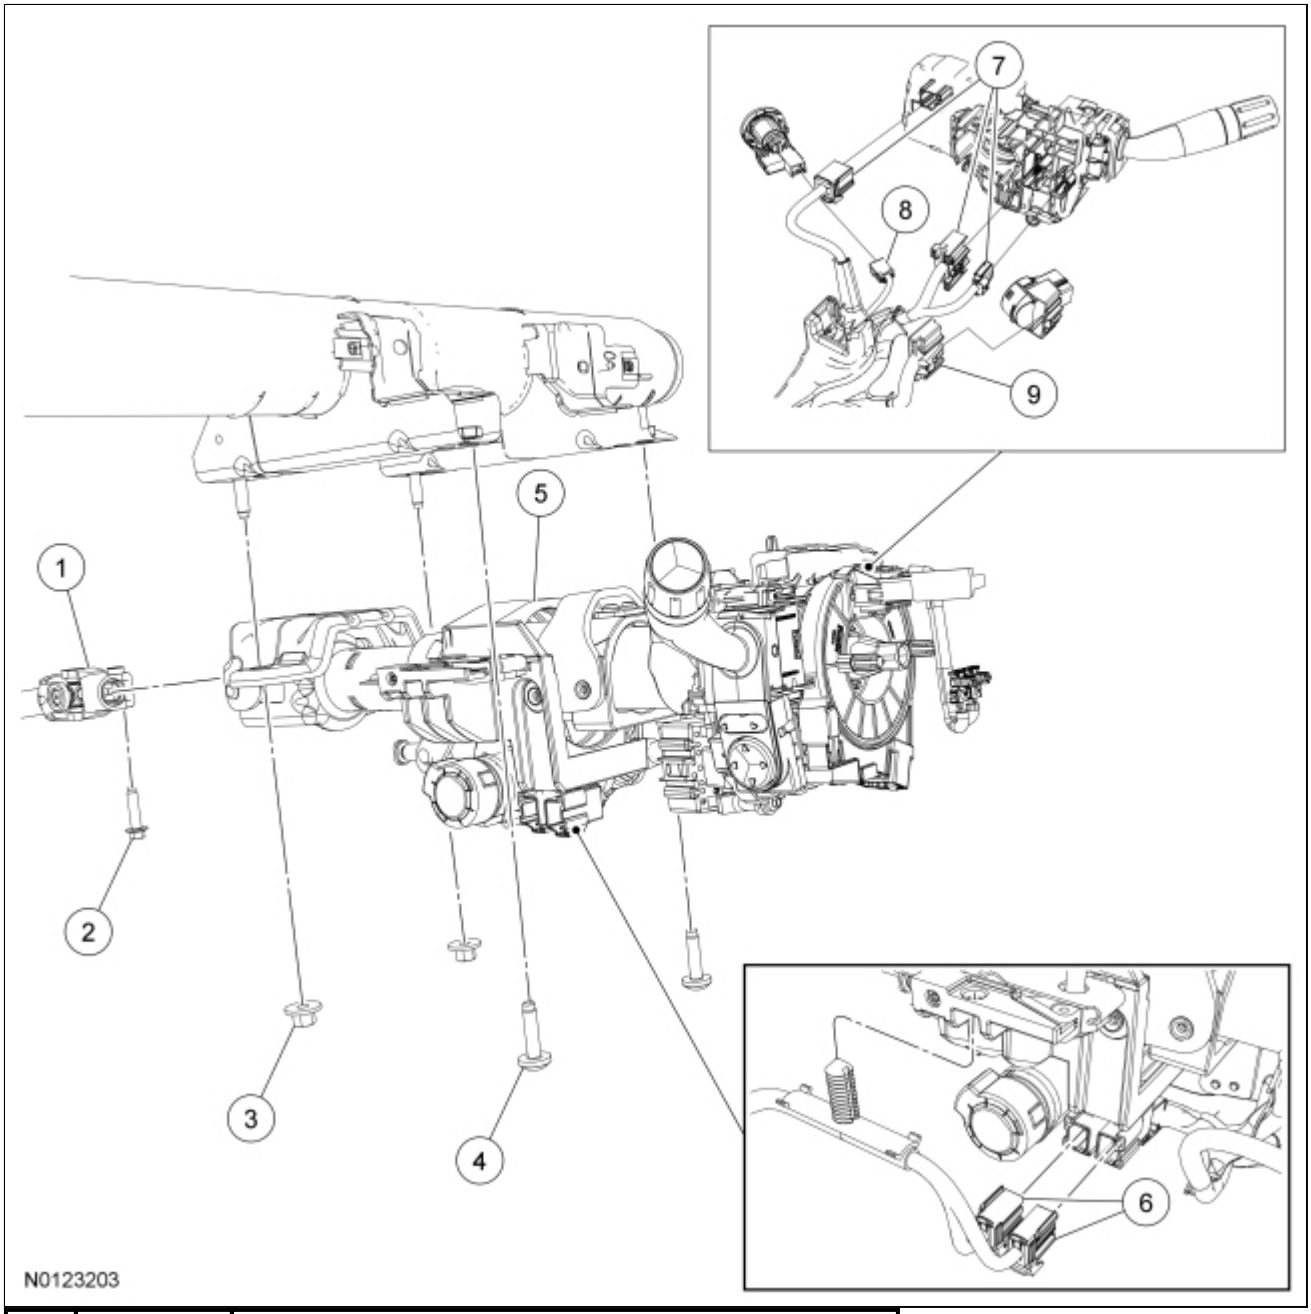
Installation

1. Position the lower steering column shroud and install the 3 screws.
    - Tighten to 2 Nm (18 lb-in).

2. Position the upper steering column shroud onto the lower steering column shroud and secure the front clips.

3. ***NOTICE:*** **Use care and follow the installation sequence when installing the selector lever boot to the steering column shrouds or damage to the boot may occur causing replacement of the selector lever assembly. The selector lever boot is not serviceable separately.**

    Install the selector lever boot in the sequence shown.
    1. Slide the front of the selector lever boot into position.
    2. Slide the bottom of the selector lever boot into position.
    3. Slide the top of the selector lever boot into position and push down.
    4. Push down on the back of the selector lever boot until selector lever boot is fully seated.



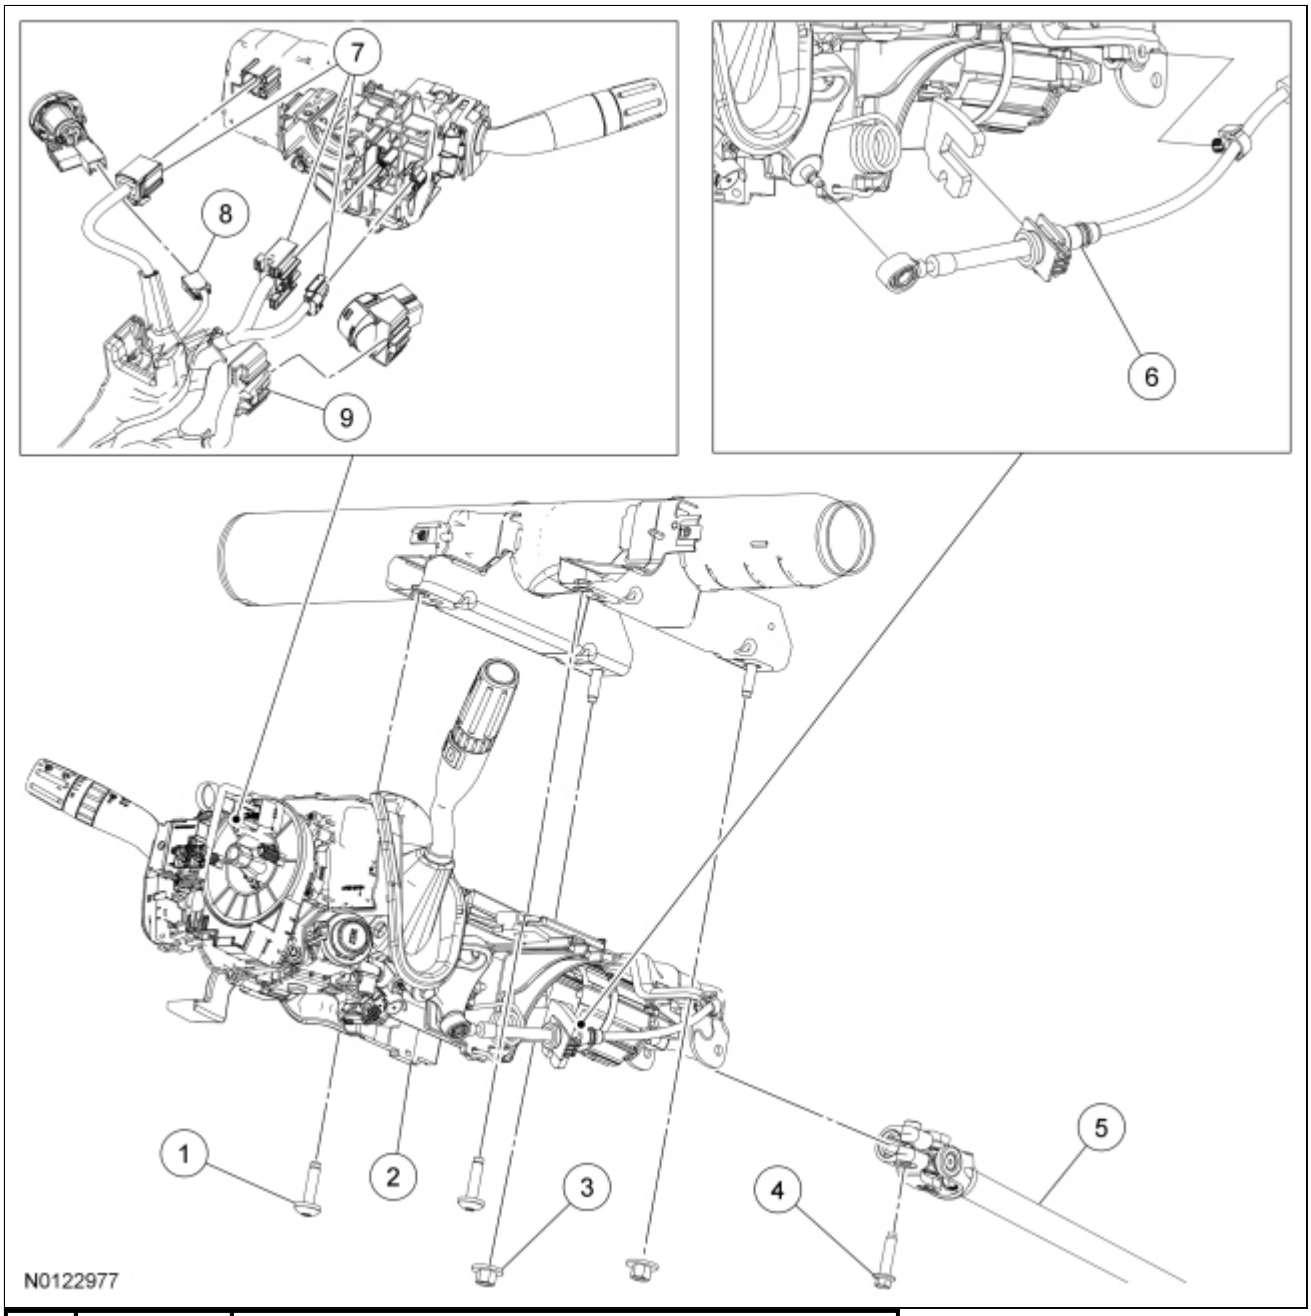
4. Place transmission selector lever in PARK.

repair4less

5. Release the parking brake.
6. Position the steering column opening trim panel and install the 3 screws.

Steering Column

Power Column



Item	Part Number	Description
1	3E751	Upper steering column shaft
2	N808684	Upper steering column shaft-to-steering column bolt

repair4less

3	N806423	Steering column nut (2 required)

7	—	Steering Column Control Module (SCCM) electrical connectors (3 required) (part of 14401)
8	—	Passive Anti-Theft System (PATS) electrical connector (part of 14401)
9	—	Ignition switch electrical connector (part of 14401)

Manual Column

Item	Part Number	Description
1	W715057	Steering column bolt (2 required)
2	3C529	Steering column
3	N806423	Steering column nut (2 required)
4	W714409	Upper steering column shaft-to-steering column bolt
5	3E751	Upper steering column shaft
6	7E395	Selector lever cable (column shift only)
7	—	Steering Column Control Module (SCCM) electrical connectors (3 required) (part of 14401)
8	—	Passive Anti-Theft System (PATS) electrical connector

repair4less

		(part of 14401)
9	—	Ignition switch electrical connector (part of 14401)

Removal and Installation

All vehicles

1. Remove the steering column shrouds. For additional information, refer to Steering Column Shroud — Floor Shift in this section.

2. Remove the steering wheel. For additional information, refer to Steering Wheel in this section.

3. Disconnect the following electrical connectors.
   - Clockspring
   - Passive Anti-Theft System (PATS) transceiver
   - Ignition switch
   - Steering Column Control Module (SCCM) (3 required)
   - Key release interlock actuator (if equipped)

Vehicles with power column

4. Disconnect the 2 steering column motor electrical connectors.

Vehicles with column shift

5. Detach the shift lever cable from the steering column and the bracket.

6. Disconnect the overdrive cancel switch and the Brake Shift Interlock Actuator (BSIA) electrical connectors.

All vehicles

7. Detach the wiring harness retainers from the steering column and position the wiring harness aside.

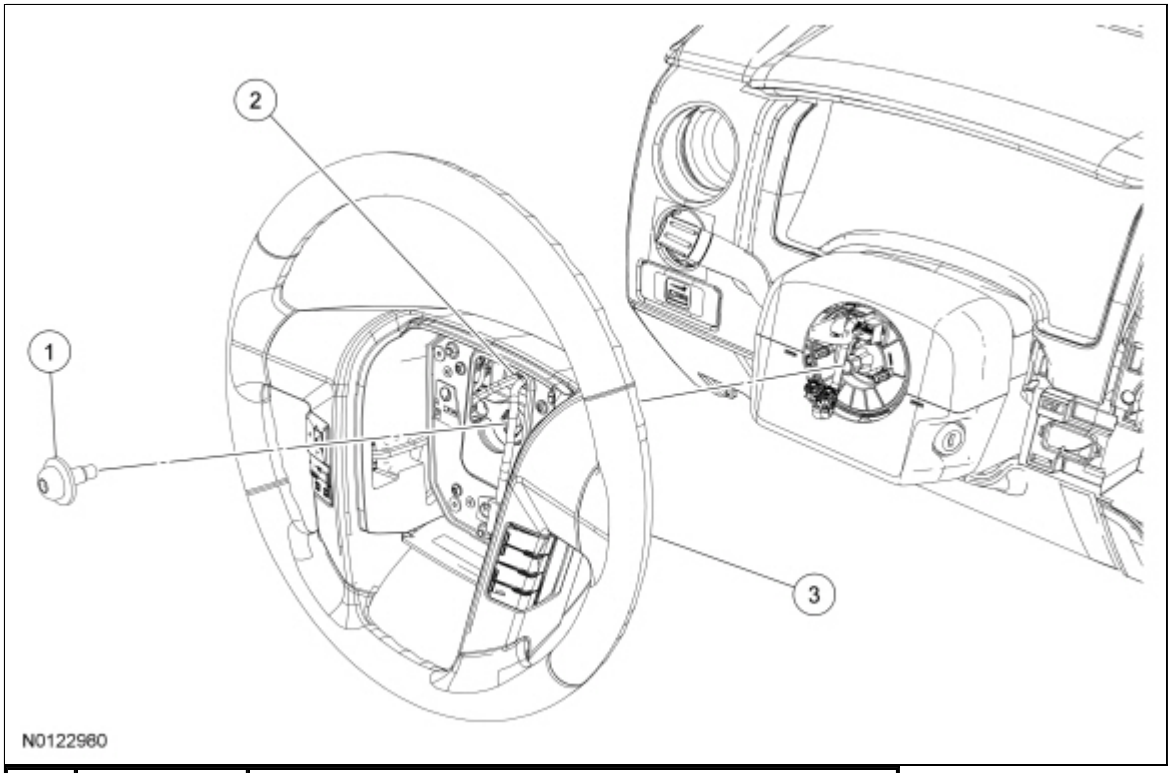
8. **WARNING: Do not reuse steering column shaft bolts. This may result in fastener failure and steering column shaft detachment or loss of steering control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   Remove and discard the upper steering column shaft-to-steering column bolt and detach the upper steering column shaft from the steering column.
   - To install, tighten the new bolt to 28 Nm (21 lb-ft).

9. Remove the 2 steering column nuts, the 2 steering column bolts and the steering column.
   - To install, tighten the new steering column nuts to 30 Nm (22 lb-ft).
   - To install, tighten the new steering column bolts to 28 Nm (21 lb-ft).

10. ***NOTICE:*** **Make sure the steering column support is flush with the instrument panel and the tilt lever (if equipped) is in the locked position before tightening the nuts and bolts or damage to the steering column may occur.**

    NOTICE: **Make sure the electrical wiring harness is routed correctly and secured to the steering column or damage to the wires and/or connectors may occur.**

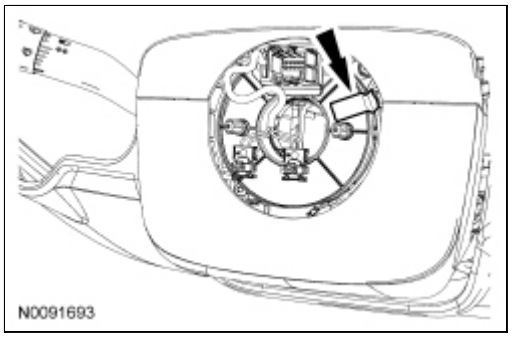


To install, reverse the removal procedure.

Vehicles with power column

11. If a new power steering column has been installed, use the steering column control switch and set the soft stops as follows.
    1. Move the column rearward until it reaches the end of travel and hold the switch for 2 seconds after the column has reached the end of travel.
    2. Move the column in the same direction until it reaches the end of travel again and hold the switch for 2 seconds after the motor has reached the end of travel. This clears any unintended soft stops.
    3. Move the column forward until it reaches the end of travel and hold the switch for 2 seconds after the motor has reached the end of travel.
    4. Move the column in the same direction until it reaches the end of travel and hold the switch for 2 seconds after the motor has reached the end of travel. This clears any unintended soft stops.
    5. Repeat the sequence moving the column up and down.

repair4less



Steering Wheel

Item	Part Number	Description
1	W709344	Steering wheel bolt
2	—	Steering wheel switches electrical connector (part of 3600)
3	3600	Steering wheel

Removal and Installation

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Turn the steering wheel to the straight-ahead position.
3. Remove and discard the steering wheel bolt.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).
4. Disconnect the steering wheel switches electrical connector from the clockspring.
5. Remove the steering wheel while routing the wires from the clockspring through the steering wheel.
6. Tape the clockspring center rotor to the outer housing to prevent it from rotating.

7. To install, reverse the removal procedure.

repair4less

Torque Specifications

Description	Nm	lb-in
Multifunction switch screws	2	18
Steering Column Control Module (SCCM) screws	2	18

Steering Column Switches

The steering column switches consist of the following components:

- Steering Column Control Module (SCCM)
- Ignition switch
- Hazard flasher switch
- Multifunction switch
- Brake pedal control switch (if equipped)
- Steering column control switch (if equipped)
- Steering wheel switches (if equipped)
- Steering wheel rotation sensor (if equipped)

Steering Column Control Module (SCCM)

The SCCM acts as a central hub for the steering column switches and circuits. The hazard flasher switch, multifunction switch, brake pedal control switch and steering column control switch are mounted directly to the SCCM and can be serviced separately from the SCCM .

repair4less

Steering Column Switches

Special Tool(s)

 ST3104-A	Backprobe Pins POM 6411 or equivalent
 ST2574-A	Flex Probe Kit NU105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Ignition Switch

When the ignition lock cylinder is turned using the key, a mechanical connection positions the ignition switch to the desired position. The available ignition switch positions are:

- OFF
- ACC
- RUN
- START

When placed in any position other than OFF, the ignition switch provides fused battery voltage inputs to the Body Control Module (BCM). When placed in the START position, the ignition switch also provides fused battery voltage input to the PCM. The ignition switch contains a key-in-ignition input that allows the BCM to

detect when the key has been inserted in the ignition to initiate the module wake up cycle. This information is also used by the BCM for the brake shift interlock system. For information on the brake shift interlock system, refer to Section 307-05 .

Key Removal Inhibit Solenoid

The key removal inhibit solenoid (also known as the key release interlock actuator) is an electronically controlled solenoid that prevents the ignition lock cylinder from being turned to the OFF position unless the gear selector lever is in the PARK position. The key removal inhibit solenoid is part of the ignition switch.

Steering Column Control Module (SCCM)

The Steering Column Control Module (SCCM) controls various systems and/or features:

- Wiper and washer system, refer to Section 501-16 .
- Exterior lighting, refer to Section 417-01 .
- Interior lighting, refer to Section 417-02 .
- Steering wheel audio controls (if equipped), refer to Refer to the appropriate section in Group 415 for the procedure..
- Steering wheel message center controls (if equipped), refer to Section 413-01 .
- Cruise control, refer to Section 419-03 .
- Adjustable pedals, refer to Section 206-06 .
- Steering column control, refer to Section 211-04 .

The SCCM also provides a pass-through circuit path for various components and/or features:

- Steering wheel switch illumination
- Driver air bag module
- Horn

The multifunction switch, brake pedal control switch (if equipped), hazard flasher switch, steering column control switch (if equipped), and LH/RH steering wheel switches (if equipped) provide inputs to the SCCM . Based on inputs from the various switches, the SCCM communicates over the High Speed Controller Area Network (HS-CAN) or the Local Interconnect Network (LIN) to control the supporting features.

Clockspring

The clockspring is mounted on the front of the SCCM and provides a continuous electrical connection between the driver air bag and the Restraints Control Module (RCM) when the steering wheel is turned. For information on the clockspring and other components of the Supplemental Restraint System (SRS), refer to Section 501-20B .

Steering Wheel Rotation Sensor

The steering wheel rotation sensor is mounted on the front of the SCCM behind the clockspring and provides steering wheel position information to the SCCM . This information is broadcast over the HS-CAN .

repair4less

Multifunction Switch

The multifunction switch is mounted directly to the SCCM and controls the low/high-beam headlamps, flash-to-pass, turn signals, windshield wiper and washer and front camera washer (if equipped), by transferring the driver inputs to the SCCM. The high-beam headlamps, flash-to-pass and turn signals are communicated from the SCCM over the HS-CAN. The windshield wiper and front camera washer signals (if equipped) are communicated from the SCCM to the wiper motor internal module over the LIN. When the BCM receives the correct signal from the SCCM, the BCM activates the required component.

Brake Pedal Control Switch

The brake pedal control switch is mounted directly to the SCCM and controls the forward and rearward movement of the accelerator and brake pedals. The brake pedal control switch functions when the ignition switch is in the OFF, ACC or RUN positions. When the brake pedal control switch is pressed voltage is connected through the SCCM to the adjustable pedals motor.

Hazard Flasher Switch

The hazard flasher switch is mounted directly to the SCCM and operates when the ignition switch is in any position or when the key is removed. One press of the switch supplies a ground signal through the SCCM to the BCM. When the ground signal is sensed by the BCM it turns the directional indicators ON. A second press of the button releases the ground connection and turns the directional indicators OFF.

Steering Wheel Switches

The steering wheel switches are mounted directly to the steering wheel and wired to the SCCM. Depending on what features the vehicle is equipped with, the SCCM sends messages via the HS-CAN to the PCM (cruise control), Instrument Panel Cluster (IPC) (message center) and BCM (entertainment system). The SCCM entertainment system messages are received by the BCM via HS-CAN and gatewayed over the Medium Speed Controller Area Network (MS-CAN) where the messages are received by the applicable entertainment system module(s).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Ignition switch	• Battery Junction Box (BJB) fuse(s): ▪ 31 (15A)

• Key efforts • Steering column shrouds	▪ 42 (5A) • Body Control Module (BCM) fuse(s): ▪ 23 (15A) ▪ 24 (15A) ▪ 28 (15A) ▪ 42 (5A) • Instrument Panel Cluster (IPC) • Steering Column Control Module (SCCM) • Passive Anti-Theft System (PATS) module • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
     - GO to Pinpoint Test A in this section to diagnose no power in all ignition switch positions or GO to Pinpoint Test C to diagnose no power in RUN position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record continuous memory DTCs.

8. Carry out the self-test diagnostics for the BCM and the SCCM.

9. If the DTCs retrieved are related to the concern, refer to the Body Control Module (BCM) DTC Chart, or the Steering Column Control Module (SCCM) DTC Chart. For all other DTCs, refer to Section 419-10.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart.

C0051:17	Steering Wheel Position Sensor: Circuit Voltage Above Threshold	GO to Pinpoint Test I .
U1000:00	Solid State Driver Protection Active-Driver	REPAIR all other SCCM DTCs before addressing this concern. CLEAR the DTCs and REPEAT the self test.

	Disabled: No Sub Type Information	
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CARRY OUT Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available (using As-Built Data) on the SCCM . REFER to Section 418-01 . RETRIEVE SCCM DTCs. If U2100:00 returns, INSTALL a new SCCM . REFER to Steering Column Control Module (SCCM) in this section.
U2101:00	Control Module Configuration Incompatible: No Sub Type Information	This DTC sets if the steering wheel switches do not match the switch function configuration data in the SCCM . CHECK the part numbers in Ford Catalog Advantage™ or equivalent and CONFIRM the correct SCCM and steering wheel control switches are installed to the vehicle.
U3000:49	Control Module: Internal Electronic Failure	INSTALL a new SCCM . REFER to Steering Column Control Module (SCCM) in this section. CLEAR the DTCs. REPEAT the self-test.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the Body Control Module (BCM)	• Wiring, terminals or connectors • BCM	• REFER to Section 418-00 .
• No power in all ignition switch positions	• Fuse • Wiring, terminals or connectors • Ignition switch • BCM	• GO to Pinpoint Test A .
• No power in ACC	• Fuse • Wiring, terminals or connectors • Accessory delay relay • BCM	• GO to Pinpoint Test B .
• No power in RUN	• Fuse • Wiring, terminals or connectors • Run/start relay • Ignition switch • BCM	• GO to Pinpoint Test C .
• No power in START	• Wiring, terminals or connectors • Ignition switch	• GO to Pinpoint Test D .
• The ignition key cannot be returned to the OFF position	• Wiring, terminals or connectors • Ignition lock cylinder • Key removal	• GO to Pinpoint Test G .

repair4less

	• inhibit solenoid (part of the ignition switch) • Park range switch (part of the selector lever)	
• The ignition key can be turned to the OFF position when the selector lever is not in PARK	• Wiring, terminals or connectors • Key release interlock actuator (part of the ignition switch) • Park range switch (part of the selector lever)	• GO to Pinpoint Test H .
• The ignition key is hard to turn	• Ignition key • Ignition lock cylinder • Ignition switch rod • Ignition switch	• REFER to Ignition Switch — Mechanical Component Test in this section.
• The multifunction switch does not operate correctly	• Multifunction switch	• CARRY OUT the SCCM self-test. REFER to the Steering Column Control Module (SCCM) DTC Chart to diagnose any DTCs present. If no DTCs are present, INSTALL a new multifunction switch. REFER to Steering Column Multifunction Switch in this section.
• The wiper/washer switch does not operate correctly	• Wiper/washer switch	• REFER to Section 501-16 .

Pinpoint Tests

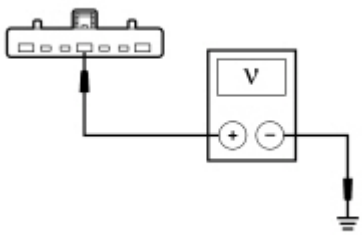
Pinpoint Test A: No Power in All Ignition Switch Positions

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

Normal Operation

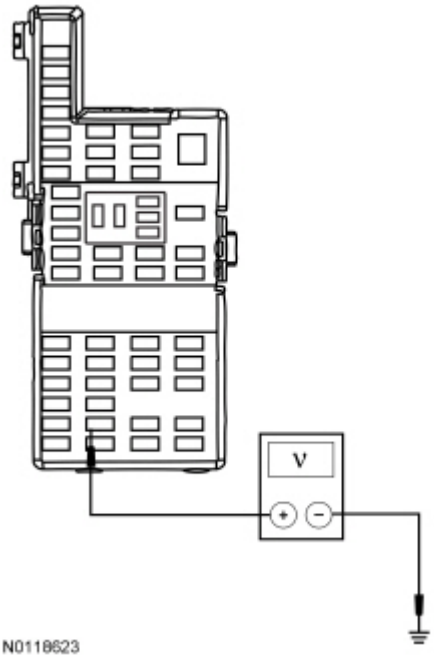
The ignition switch receives fused battery voltage from the Body Control Module (BCM) permanent voltage bus through fuse 28 (15A). In the ACC or ON position, voltage is sent to the BCM . In the START position, voltage is sent to both the BCM and PCM.

When the ignition switch is cycled to the OFF/LOCK position from any other position, the BCM begins a monitoring cycle. The monitoring cycle checks that the voltage supplied to the BCM from the ignition switch through the RUN/ACC, RUN/START and START circuits is delivered correctly for each ignition switch position.



- DTC U300A:01 (Ignition Switch: General Electric Failure) — the BCM continuously monitors the ignition switch position. This DTC sets if the voltage inputs to the BCM do not match the pre-defined configurations for each ignition switch position.

This pinpoint test is intended to diagnose the following:



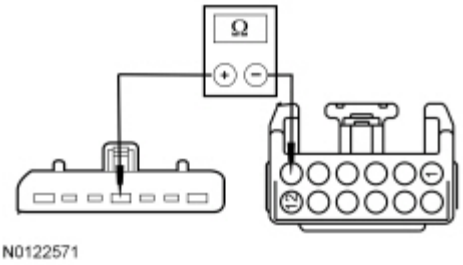
- Fuse
- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK THE IGNITION SWITCH • Ignition OFF. • Disconnect: Ignition Switch C250 . • Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** GO to A2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK FOR VOLTAGE TO THE IGNITION SWITCH • Measure the voltage between ignition switch C250-4, circuit SBP28 (GN/RD), harness side and ground.  A0089808 • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** VERIFY BCM fuse 28 (15A) is OK. If OK, GO to A3 . If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK FOR VOLTAGE TO BCM • Measure the voltage between BCM fuse 28 (15A), circuit SBP28 (GN/RD), and ground.	**Yes** GO to A4 **No** VERIFY fusible links A and B are OK. If OK, REPAIR circuit SDC04 (RD or GY). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. CLEAR the DTC.

repair4less



- **Is the voltage greater than 10 volts?**

REPEAT the self-test. TEST the system for normal operation.

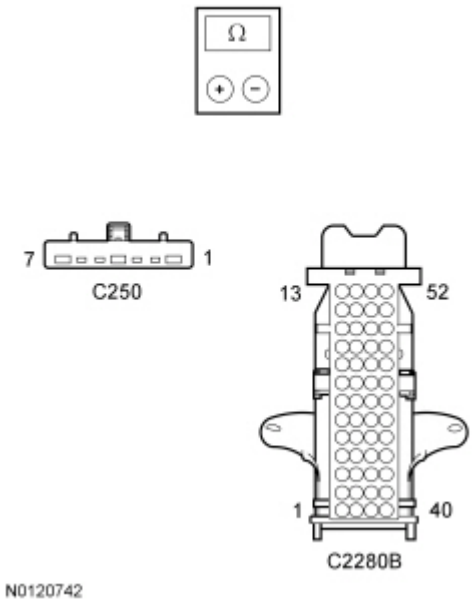
A4 CHECK FOR AN OPEN BETWEEN THE BCM AND IGNITION SWITCH

- Disconnect: BCM C2280A .
- Measure the resistance between BCM C2280A-6 and ignition switch C250-4, circuit SBP28 (GN/RD), harness side.

- **Is the resistance less than 5 ohms?**

Yes
GO to A6 .

No
REPAIR circuit SBP28 (GN/RD) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



A5 CHECK THE IGNITION SWITCH OUTPUT CIRCUITS FOR AN OPEN

- Disconnect: BCM C2280B .
- Measure the resistance between ignition switch C250, harness side and BCM C2280B, harness side as follows:

Ignition Switch	Circuit	BCM
C250-6	CDC33 (VT/GN)	C2280B-35
C250-1	CDC34 (WH/OG)	C2280B-29
C250-7	CDC35 (BU/WH)	C2280B-47

Yes
GO to A6 .

No
REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

- **Are the resistances less than 5 ohms?**

A6 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all BCM connectors.
• Check the connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all BCM connectors and make sure they are seated correctly.
• Connect: Ignition Switch C250 .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

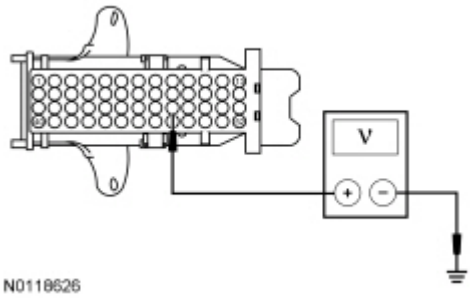
Pinpoint Test B: No Power in ACC

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

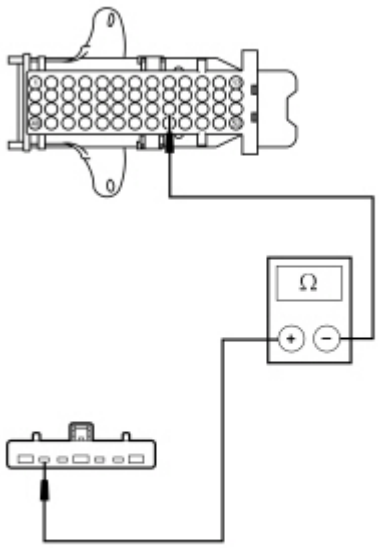
Normal Operation

When in ACC mode, the Body Control Module (BCM) provides ground for the coil (control) side of the run/acc relay located in the BCM . The run/acc relay is serviced with the BCM . The BCM also provides a ground circuit for the coil side of the accessory delay relay located in the BCM . The accessory delay relay can be serviced separately from the BCM .

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors



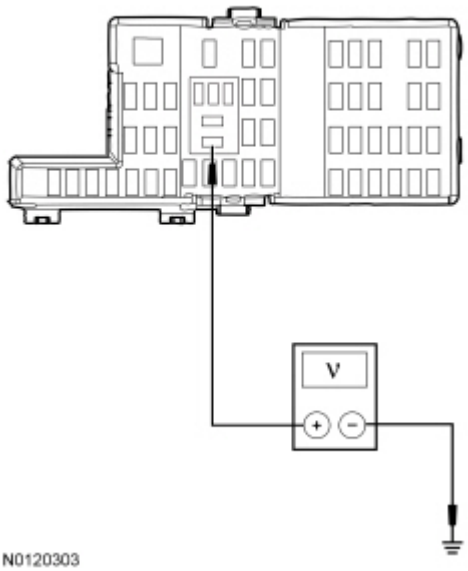
repair4less

- Accessory delay relay
- BCM

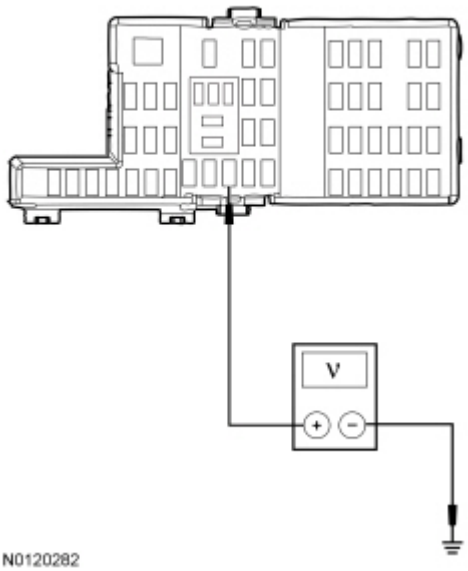
PINPOINT TEST B: NO POWER IN ACC

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

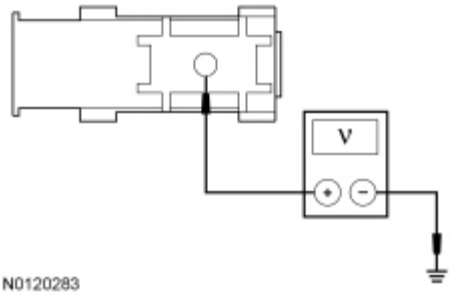
Test Step	Result / Action to Take
B1 CHECK FOR ACC VOLTAGE AT THE BCM	
• Disconnect: BCM C2280B . • Ignition In ACC. • Measure the voltage between BCM C2280B-35, circuit CDC33 (VT/GN), harness side and ground.  N0118626 • **Is the voltage greater than 10 volts?**	**Yes** GO to B3 . **No** GO to B2 .
B2 CHECK THE IGNITION ACC CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Ignition Switch C250 . • Measure the resistance between BCM C2280B-35, circuit CDC33 (VT/GN), harness side and ignition switch C250-6, circuit CDC33 (VT/GN), harness side.	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.



N0118627



- **Is the resistance less than 5 ohms?**



B3 CHECK THE ACCESSORY DELAY RELAY	
• Ignition OFF. • Disconnect: Accessory Delay Relay . • Carry out the appropriate relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the relay pass the test?**	**Yes** GO to B4 . **No** INSTALL a new accessory delay relay. TEST the system for normal operation.
B4 CHECK FOR POWER TO THE ACCESSORY DELAY RELAY	
• Measure the voltage between accessory delay relay cavity 3 and ground.	**Yes** GO to B5 . **No** GO to B6 .

repair4less

- **Is the voltage greater than 10 volts?**

B5 CHECK FOR POWER TO THE RUN/ACC RELAY	
• Disconnect: BCM Fuse 10 (10A) . • Measure the voltage between BCM fuse 10 (10A), input side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B7 . **No** GO to B6 .
B6 CHECK THE BCM BATTERY FEED CIRCUIT FOR AN OPEN	
• Disconnect: BCM C2280G .	**Yes**

• Measure the voltage between BCM C2280G-1, circuit SDC04 (RD or GY), harness side and ground.  • **Is the voltage greater than 10 volts?**	GO to B7. **No** VERIFY fusible links A and B are OK. If OK, REPAIR circuit SDC04 (RD or GY). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. TEST the system for normal operation.
B7 CHECK FOR CORRECT BCM OPERATION	

• Disconnect all BCM connectors.
• Check the connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all BCM connectors and make sure they are seated correctly.
• Connect: BCM Fuse 10 (10A) (if previously disconnected) .
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

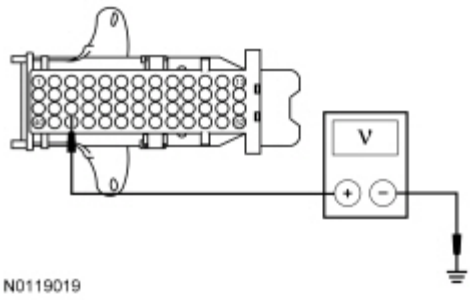
Pinpoint Test C: No Power in RUN

Refer to Wiring Diagrams Cell 13, Power Distribution/BCM for schematic and connector information.

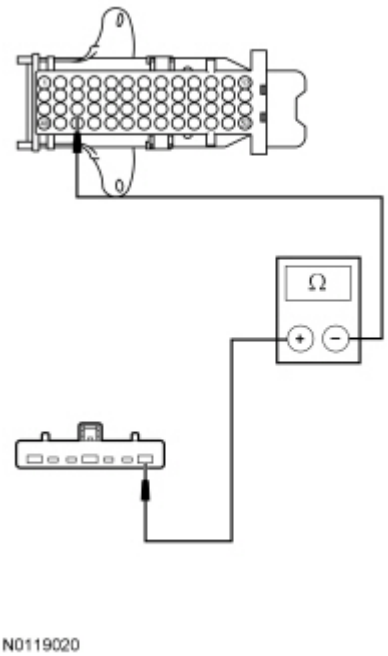
Normal Operation

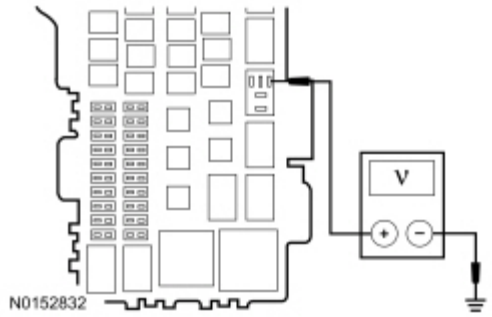
When the ignition switch is turned to the RUN position, a voltage signal is sent to the Body Control Module (BCM). The BCM then activates the run/start relay and the run/acc relay, which distribute fused voltage to various components. The run/acc relay is serviced as part of the BCM.

- DTC B1310:14 (Run/Start Control: Circuit Short to Ground or Open) — the BCM continuously monitors the control side of the run/start relay. This DTC sets if the BCM detects an open or a short to ground on the control circuit. The BCM uses a Field-Effect Transistor (FET) to control the run/start relay. When this DTC sets, the control side of the run/start relay is disabled via the FET. Once the condition that caused the DTC to set is repaired, the BCM must pass a self-test in order for the DTC to clear and the system to resume normal operation.



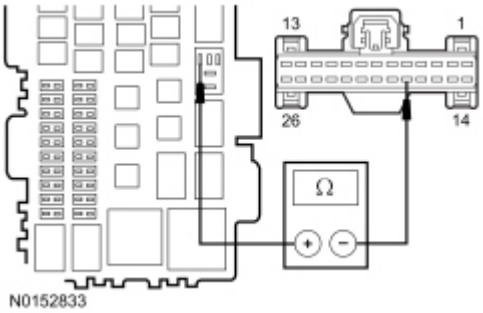
This pinpoint test is intended to diagnose the following:

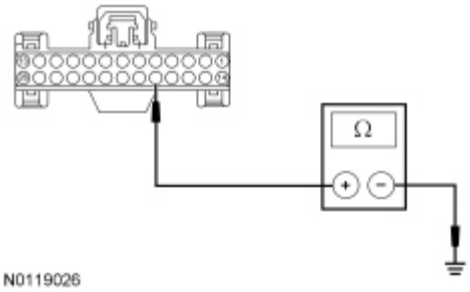




- Fuse
- Wiring, terminals or connectors
- Ignition switch
- Run/start relay
- BCM

repair4less





PINPOINT TEST C: NO POWER IN RUN

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 REVIEW THE BCM DTCs • Review the BCM DTCs retrieved during inspection and verification. • **Is DTC B1310:14 present?**	**Yes** GO to C6 . **No** For all other BCM DTCs, GO to the Body Control Module (BCM) DTC Chart. If no DTCs are present, GO to C2 .
C2 CHECK FOR RUN VOLTAGE AT THE BCM • Ignition OFF. • Disconnect: BCM C2280B . • Ignition ON. • Measure the voltage between BCM C2280B-29, circuit CDC34 (WH/OG), harness side and ground.  N0119019 • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK THE IGNITION RUN CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Ignition Switch C250 . • Measure the resistance between BCM C2280B-29, circuit CDC34 (WH/OG), harness side and ignition switch C250-1, circuit CDC34 (WH/OG), harness side.	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR open circuit CDC34 (WH/OG). TEST the system for normal operation.

 N0119020 • **Is the resistance less than 5 ohms?**	
C4 CHECK THE RUN/START RELAY • Ignition OFF. • Disconnect: Run/Start Relay . • Carry out the appropriate relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the relay OK?**	**Yes** GO to C5 . **No** INSTALL a new run/start relay. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE VOLTAGE TO THE RUN/START RELAY COIL • Measure the voltage between run/start relay cavity 1, circuit SBB31 (WH/RD) and ground.  N0152832 • **Is the voltage greater than 10 volts?**	**Yes** GO to C6 . **No** VERIFY BJB fuse 31 (15A) is OK. If OK, REPAIR circuit SBB31 (WH/RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C6 CHECK THE RUN/START RELAY CONTROL CIRCUIT FOR AN OPEN • Ignition OFF. • Disconnect: Run/Start Relay (if not previously disconnected) .	**Yes** GO to C7 .

repair4less

• Disconnect: BCM C2280F . • Measure the resistance between run/start relay cavity 2, circuit CDC55 (BN/VT) and BCM C2280F-18, circuit CDC55 (BN/VT), harness side.  • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit CDC55 (BN/VT) for an open. CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
C7 CHECK THE RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	**Yes** GO to C8 . **No** REPAIR circuit CDC55 (BN/VT) for short to ground. CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
• Measure the resistance between BCM C2280F-18, circuit CDC55 (BN/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	
C8 CHECK FOR CORRECT BCM OPERATION	**Yes** INSTALL a new BCM . REFER to Section 419-10 . REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

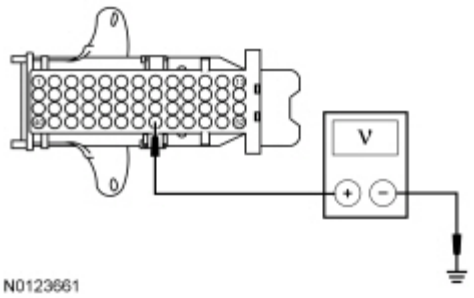
• Check BCM C2280B and C2280F for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: BCM C2280B .
• Connect: BCM C2280F .
• Connect: Run/Start Relay .
• Make sure the connectors are seated correctly, then carry out a BCM self-test.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test D: No Power in START

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

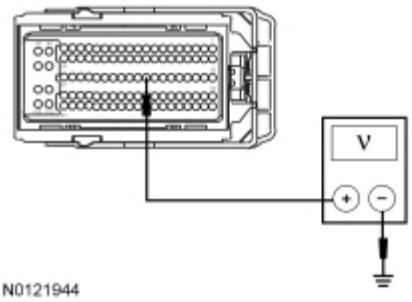
Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

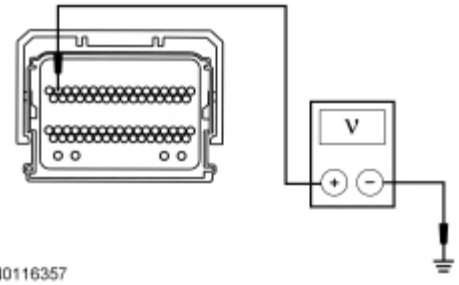
Normal Operation



When the ignition switch is turned to the START position, a voltage signal is sent to the Body Control Module (BCM) and the PCM. The BCM sends out a voltage signal to various modules to indicate a start event and the PCM checks various inputs and bus messages in an effort to start the vehicle.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST D: NO POWER IN START

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
D1 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250 . • Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** REINSTALL the ignition switch and CONNECT the ignition switch connector removed during the component test. GO to D2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
D2 CHECK THE START CIRCUIT TO THE BCM FOR VOLTAGE	
• Ignition OFF. • Disconnect: BCM C2280B . • Measure the voltage between BCM C2280B-47, circuit CDC35 (BU/WH), harness side and ground, while holding the key in the START position.  • **Is the voltage greater than 10 volts?**	**Yes** GO to D3 . **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.
D3 CHECK THE START CIRCUIT TO THE PCM FOR VOLTAGE	
• Ignition OFF. • Disconnect: PCM C1551B (3.5L), C175B (3.7L) or C1381B (5.0L/6.2L) . • For 3.5L, measure the voltage between PCM C1551B-47, circuit	**Yes** REFER to Section 303-06 to diagnose the starting system. TEST the system for normal

repair4less

CDC35 (BU/WH), harness side and ground, while holding the key in the START position.  N0121944 • For 3.7L, 5.0L and 6.2L, measure the voltage between PCM C175B-16 or C1381B-16, circuit CDC35 (BU/WH), harness side and ground, while holding the key in the START position.  N0116357 • **Is the voltage greater than 10 volts?**	operation. **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.

Pinpoint Test E: DTC B1142:29

Refer to Wiring Diagrams Cell 13 , Power Distribution/BCM for schematic and connector information.

Normal Operation

Battery voltage is sent to the ignition switch from the Battery Junction Box (BJB) fuse 28 (15A). When placed in ACC, RUN or START, the ignition switch sends fused battery voltage along 1 of 3 circuits to the Body Control Module (BCM). Microprocessors in the BCM continuously monitor the ignition switch state.

- DTC B1142:29 (Ignition Status 1: Signal Invalid) — this DTC sets when the BCM does not receive a valid ignition state signal during the BCM self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- BCM

PINPOINT TEST E: DTC B1142:29

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
E1 CHECK THE IGNITION SWITCH STATE (IGN_SW_STATE) PID • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger — BCM . • Monitor the IGN_SW_STATE PID while turning the ignition switch through all 4 positions (OFF, ACC, RUN and START). • **Does the PID match each ignition switch position?**	**Yes** GO to E5 . **No** GO to E2 .
E2 CHECK THE ACC CIRCUIT FOR AN OPEN OR SHORT TO VOLTAGE • Ignition In ACC. • Monitor the IGN_SW_STATE PID with the ignition switch in the ACC position. • **Does the PID display "Acc"?**	**Yes** GO to E3 . **No** If the PID displays "Off" or "Unknown", REPAIR circuit CDC33 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the PID displays "Run" or "Start", REPAIR circuit CDC34 (WH/OG) (RUN) or CDC35 (BU/WH) (START) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E3 CHECK THE RUN CIRCUIT FOR AN OPEN OR SHORT TO VOLTAGE • Ignition ON. • Monitor the IGN_SW_STATE PID with the ignition switch in the RUN position. • **Does the PID display "Run"?**	**Yes** GO to E4 . **No** If the PID displays "Off" or "Unknown", REPAIR circuit CDC34 (WH/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the PID displays "Acc" or "Start", REPAIR circuit CDC33 (VT/GN) (ACC) or CDC35 (BU/WH) (START) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E4 CHECK THE START CIRCUIT FOR AN OPEN OR SHORT TO VOLTAGE • Monitor the IGN_SW_STATE PID with the ignition switch in the START position. • **Does the PID display "Start"?**	**Yes** GO to E5 . **No** If the PID displays "Off" or "Unknown", REPAIR circuit CDC35 (BU/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the PID displays "Acc" or "Run", REPAIR circuit CDC33 (VT/GN) (ACC) or CDC34 (WH/OG) (RUN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E5 CHECK FOR CORRECT BCM	

repair4less

OPERATION	

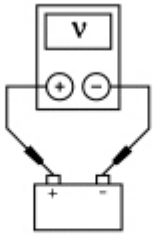
• Disconnect: All BCM Connectors .
• Check BCM connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All BCM Connectors .
• Make sure the connectors are seated correctly, then carry out a BCM self-test.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: DTC B1310:12

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition is placed in RUN mode, the Body Control Module (BCM) module provides a ground for the coil (control) side of the run/start relay located in the Battery Junction Box (BJB). The BCM monitors the run/start relay control circuit and sets the applicable DTC if the circuit is open, shorted to ground or shorted to voltage.



- DTC B1310:12 (Run/Start Control: Circuit Short to Battery) — this DTC sets if the BCM detects a short to battery in the run/start relay control circuit during a BCM self-test or during normal operation.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Run/start relay
- BCM

PINPOINT TEST F: DTC B1310:12

Test Step	Result / Action to Take
F1 CHECK THE RUN/START RELAY	
• Disconnect: Run/Start Relay . • Carry out the appropriate relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the relay OK?**	**Yes** GO to F2 . **No** INSTALL a new run/start relay. CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

F2 CHECK THE RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure and record battery voltage.  AJ0210-A • ***NOTICE:*** **This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults** • Measure the voltage by backprobing between BCM C2280F-18, circuit CDC55 (BN/VT), harness side and ground. • **Is the voltage equal to the recorded battery voltage?**	**Yes** REPAIR circuit CDC55 (BN/VT) for a short to voltage. CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation. **No** GO to F3 .
F3 CHECK FOR CORRECT BCM OPERATION	

• Disconnect: All BCM Connectors .
• Check the connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All BCM Connectors .
• Connect: Run/Start Relay .
• Make sure the connectors are seated correctly, then carry out a BCM self-test.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new BCM . REFER to Section 419-10 . CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CARRY OUT a self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

Pinpoint Test G: The Ignition Key Cannot Be Returned to the OFF/LOCK Position

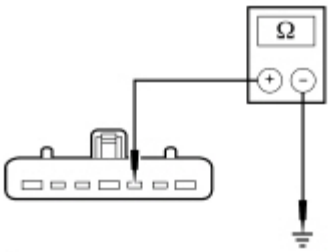
repair4less

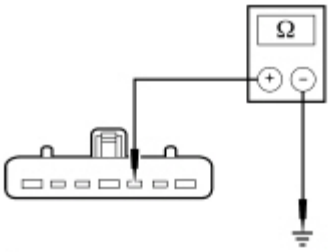
Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

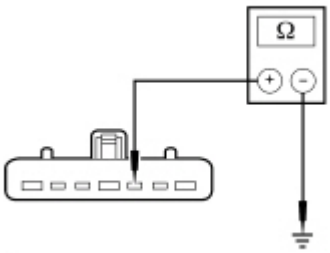
Normal Operation

The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from the Body Control Module (BCM) fuse 28 (15A). When the selector lever is moved out of the PARK position, the park range switch (part of the selector lever) closes, providing a ground circuit to the key removal inhibit solenoid. The key removal inhibit solenoid activates and prevents the ignition lock cylinder from being turned to the OFF position and the key from being removed.

This pinpoint test is intended to diagnose the following:

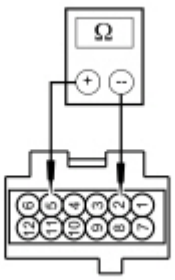






- Wiring, terminals or connectors
- Key removal inhibit solenoid (part of the ignition switch)
- Ignition lock cylinder
- Brake shift interlock solenoid
- Park range switch (part of the selector lever)

PINPOINT TEST G: THE IGNITION KEY CANNOT BE RETURNED TO THE OFF/LOCK POSITION



NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
G1 CHECK FOR AN ENERGIZED KEY REMOVAL INHIBIT SOLENOID	
• Remove BCM fuse 28 (15A). • Attempt to turn the ignition lock cylinder to the RUN position and then back to the OFF/LOCK position and remove the key. • **Can the ignition lock cylinder be turned to the OFF/LOCK position and the key removed?**	**Yes** GO to G3 . **No** GO to G2 .
G2 CHECK THE IGNITION SWITCH FOR MECHANICAL DAMAGE	
• Remove the ignition switch. Refer to Ignition Switch in this section. • Attempt to turn the ignition lock cylinder to the OFF/LOCK position and remove the ignition key. • **Does the ignition lock cylinder turn to the OFF/LOCK position and the key removed?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** INSTALL a new ignition lock cylinder. REFER to Section 501-14 . TEST the system for normal operation.
G3 CHECK THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT FOR A SHORT TO GROUND	
• Select PARK. • Disconnect: Ignition Switch C250 .	**Yes** INSTALL a new ignition switch.

• Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	REFER to Ignition Switch in this section. TEST the system for normal operation. **No** Vehicles with column shift, GO to G4 . Vehicles with floor shift, GO to G5 .
G4 ISOLATE THE BRAKE SHIFT INTERLOCK SOLENOID	
• Disconnect: Brake Shift Interlock Solenoid C2008 . • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new brake shift interlock solenoid. REFER to Section 307-05 . TEST the system for normal operation. **No** REPAIR circuit CDC41 (WH/BN) for a short to ground. TEST the system for normal operation.
G5 ISOLATE THE SHORT TO GROUND IN THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT	
• Disconnect: Floor Shifter C3245 . • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G6 . **No** REPAIR circuit CDC41 (WH/BN) for a short to ground. TEST the system for normal operation.
G6 CHECK THE PARK DETECT SWITCH	
• Measure the resistance between the selector lever C3245-2, component side and selector lever C3245-5, component side with and without the selector lever in the PARK range and the selector lever button released.	**Yes** CHECK the selector lever cable adjustment. REFER to Section 307-05 . INSPECT the selector lever, selector lever knob, and selector

repair4less

 N0151254 • **Is the resistance greater than 10,000 ohms with the selector lever in PARK and less than 5 ohms with the selector lever in REVERSE, NEUTRAL and DRIVE?**	lever cable for damage. INSTALL new components as necessary. REFER to Section 307-05 . TEST the system for normal operation. **No** INSTALL a new selector lever. REFER to Section 307-05 . TEST the system for normal operation.

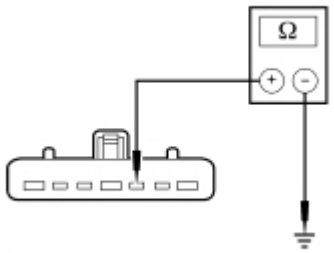
Pinpoint Test H: The Ignition Key Can Be Turned to the OFF/LOCK Position When the Selector Lever is Not In PARK

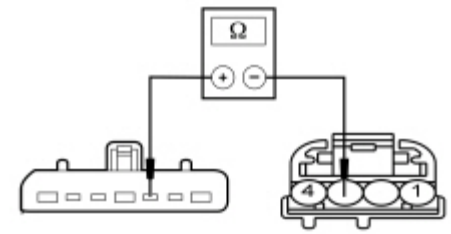
Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

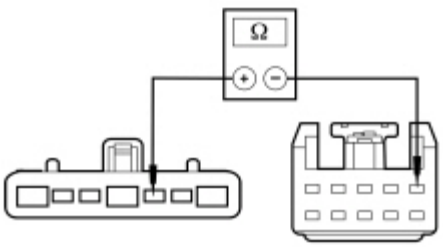
Normal Operation

The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from Body Control Module (BCM) fuse 28 (15A). When the selector lever is moved out of the PARK position, the park range switch (part of the selector lever) closes, providing a ground circuit to the key removal inhibit solenoid. The key removal inhibit solenoid activates and prevents the ignition lock cylinder from being turned to the OFF/LOCK position and the key from being removed.

This pinpoint test is intended to diagnose the following:

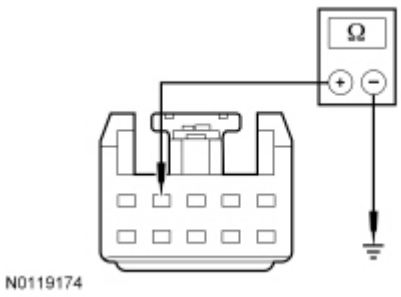


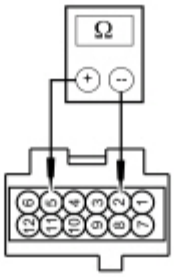




- Wiring, terminals or connectors
- Key release interlock actuator (part of the ignition switch)
- Park range switch (part of the selector lever)

PINPOINT TEST H: THE IGNITION KEY CAN BE TURNED TO THE OFF/LOCK POSITION WHEN THE SELECTOR LEVER IS NOT IN PARK





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
H1 CHECK THE KEY INHIBIT SOLENOID CIRCUIT FOR GROUND	
• Disconnect: Ignition Switch C250 . • Select DRIVE. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.

 N0065439 • **Is the resistance less than 5 ohms?**	**No** Vehicles with column shift, GO to H2 . Vehicles with floor shift, GO to H3 .
H2 CHECK THE KEY INHIBIT SOLENOID CIRCUIT FOR AN OPEN (COLUMN SHIFT)	
• Disconnect: Brake Shift Interlock Solenoid C2008 . • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and brake shift interlock solenoid C2008-3, circuit CDC41 (WH/BN), harness side.  N0122615 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake shift interlock solenoid. REFER to Section 307-05 . TEST the system for normal operation. **No** REPAIR circuit CDC41 (WH/BN) for an open. TEST the system for normal operation.
H3 CHECK THE KEY INHIBIT SOLENOID CIRCUIT FOR AN OPEN (FLOOR SHIFT)	
• Disconnect: Floor Shifter C3245 . • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and floor shifter C3245-1, circuit CDC41 (WH/BN), harness side.  N0122061 • **Is the resistance less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR circuit CDC41 (WH/BN) for an open. TEST the system for normal operation.
H4 CHECK THE FLOOR SHIFTER GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between floor shifter C3245-5, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to H5 .

repair4less

 N0119174 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
H5 CHECK THE PARK DETECT SWITCH	
• Measure the resistance between the selector lever C3245-2, component side and selector lever C3245-5, component side with and without the selector lever in the PARK range and the selector lever button released.  N0151254 • **Is the resistance greater than 10,000 ohms with the selector lever in PARK and less than 5 ohms with the selector lever in REVERSE, NEUTRAL and DRIVE?**	**Yes** CHECK the selector lever cable adjustment. REFER to Section 307-05 . INSPECT the selector lever, selector lever knob, and selector lever cable for damage. INSTALL new components as necessary. REFER to Section 307-05 . TEST the system for normal operation. **No** INSTALL a new selector lever. REFER to Section 307-05 . TEST the system for normal operation.

Pinpoint Test I: DTCs C0051:16 And C0051:17

Normal Operation

The Steering Column Control Module (SCCM) continuously monitors the voltage supplied to the steering wheel rotation sensor (also known as the steering wheel position sensor). If voltage outside of defined limits is detected by the SCCM , the applicable DTC sets.

- DTC C0051:16 (Steering Wheel Position Sensor: Circuit Voltage Below Threshold) — If the SCCM detects voltage to the steering wheel rotation sensor below 10 volts this DTC sets.
- DTC C0051:17 (Steering Wheel Position Sensor: Circuit Voltage Above Threshold) — If the SCCM detects voltage to the steering wheel rotation sensor above 15.5 volts this DTC sets.

This pinpoint test is intended to diagnose the following:

- Steering wheel rotation sensor

PINPOINT TEST I: DTCs C0051:16 AND C0051:17

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals.**

Do not use standard multi-meter probes.

Test Step	Result / Action to Take
I1 CHECK THE SCCM DTCs • Review the SCCM DTCs retrieved and recorded during Inspection and Verification. • **Is DTC B119D:16 and/or B119D:17 present?**	**Yes** DIAGNOSE DTCs B119D:16 and B119D:17 before diagnosing DTCs C0051:16 or C0051:17. For DTC B119D:16, GO to Pinpoint Test J. For DTC B119D:17, GO to Pinpoint Test K. **No** GO to I2.
I2 CHECK THE STEERING WHEEL ANGLE SENSOR STATUS (SW_ANG_SENS) PID • Enter the following diagnostic mode on the scan tool: DataLogger — SCCM. • Monitor the SW_ANG_SENS PID. • **Does the PID display CORRECT?**	**Yes** The condition that caused the DTC to set is not present at this time. CLEAR the DTCs. DRIVE the vehicle for more than 1 minute at a speed greater than 32 km/h (20 mph) and make at least one left turn and one right turn. REPEAT the self-test. If the DTC(s) does not return, RETURN the vehicle to the customer. If the DTC(s) return, GO to I3. **No** If the PID displays FAULT, INSTALL a new steering wheel rotation sensor. REFER to Section 206-09. REPEAT the self-test. TEST the system for normal operation. If the PID displays PSCM NOT INITIALIZED, GO to I3.

I3 CHECK FOR CORRECT SCCM OPERATION
• Ignition OFF.
• Disconnect: All SCCM Connectors .
• Check the SCCM connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All SCCM Connectors .
• Make sure the SCCM connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM. REFER to Steering Column Control Module (SCCM) in this section. CLEAR the DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test J: DTC B119D:16

Refer to Wiring Diagrams Cell 13, Power Distribution/SJB for schematic and connector information.

repair4less

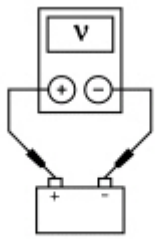
Normal Operation

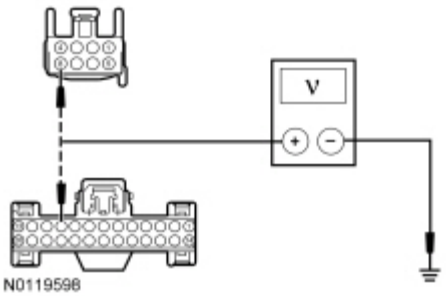
The Steering Column Control Module (SCCM) continuously monitors input voltage for correct operation. If voltage outside of defined limits is detected by the SCCM , the applicable DTC sets.

- DTC B119D:16 (Vehicle Battery: Circuit Below Threshold) — This DTC sets in continuous memory if the SCCM detects battery voltage below 8 volts on the battery voltage supply circuit.

This pinpoint test is intended to diagnose the following:

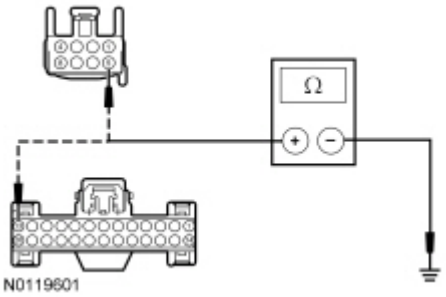
- Fuses
- Wiring, terminals or connectors
- Charging system
- Vehicle battery
- SCCM





NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

NOTE: DTC B119D:16 can set if the vehicle battery has been discharged. The vehicle battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.



PINPOINT TEST J: DTC B119D:16

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
J1 VERIFY THE SCCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — SCCM . • Clear the DTCs and repeat the self-test. • **Is DTC B119D:16 still present?**	**Yes** GO to J2 . **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: Self Test — PCM . • Retrieve and record all continuous memory DTCs from the PCM. • **Are any charging system DTCs present in the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system DTCs. **No** GO to J3 .
J3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF.	**Yes**

• Refer to Section 414-01 and carry out pinpoint test A: Battery Condition Test. • **Is the battery OK and fully charged?**	GO to J4 . **No** REFER to Section 414-00 to diagnose the charging system.
J4 CHECK THE SCCM VOLTAGE SUPPLY	
• Measure and record battery voltage.  AJ0210-A • Disconnect: SCCM C2414A . • Disconnect: SCCM C2414B . • Measure the voltage between ground and: ▪ SCCM C2414A-10, SBP23 (WH/RD), harness side. ▪ SCCM C2414B-8, SBP24 (VT/RD), harness side.  N0119598 • **Are the voltages within 0.2 volt of the recorded battery voltage?**	**Yes** GO to J5 . **No** VERIFY BCM fuses 23 (15A) and 24 (15A) are OK. If OK, REPAIR the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J5 CHECK THE SCCM GROUND CIRCUIT	
• Disconnect the battery negative cable. Refer to Section 414-01 . • Measure the resistance between ground and: ▪ SCCM C2414A-13, GD133 (BK), harness side. ▪ SCCM C2414B-5, GD138 (BK/WH), harness side.	**Yes** CONNECT the battery negative cable. GO to J6 . **No** REPAIR the affected circuit(s). CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

repair4less

 • **Are the resistances less than 5 ohms?**	
J6 CHECK FOR CORRECT SCCM OPERATION	

• Disconnect: All SCCM Connectors .
• Check the SCCM connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All SCCM Connectors .
• Make sure the SCCM connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM . REFER to Steering Column Control Module (SCCM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: DTC B119D:17

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

The Steering Column Control Module (SCCM) continuously monitors input voltage for correct operation. If voltage outside of defined limits is detected by the SCCM , the applicable DTC sets.

- DTC B119D:17 (Vehicle Battery: Circuit Above Threshold) — This DTC sets in continuous memory if the SCCM detects battery voltage above 19 volts on the battery voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Charging system
- SCCM

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

NOTE: DTC B119D:17 can set if the vehicle has been recently jump started or the vehicle battery has been recently charged.

PINPOINT TEST K: DTC B119D:17

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals.**

Do not use standard multi-meter probes.

Test Step	Result / Action to Take
K1 CHECK FOR HIGH BATTERY VOLTAGE AND/OR CHARGING SYSTEM DTC IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — All CMDTCs . • Retrieve and recorded all CMDTCs from all modules. • **Are any high battery voltage and/or charging system DTCs present in other modules?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to K2 .
K2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 16.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to K3 .
K3 RECHECK FOR SCCM DTC B119D:17	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test — SCCM . • Clear the continuous memory DTCs and repeat the self-test. • **Is DTC B119D:17 present in the SCCM ?**	**Yes** GO to K4 . **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
K4 CHECK FOR CORRECT SCCM OPERATION	

• Ignition OFF.
• Disconnect: All SCCM Connectors .
• Check the SCCM connectors for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect: All SCCM Connectors .
• Make sure the SCCM connectors are seated correctly, then operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SCCM . REFER to Steering Column Control Module (SCCM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Component Tests

repair4less

Ignition Switch — Mechanical

The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- Burrs on the lock cylinder key
- Insufficient lube on the lock cylinder
- Binding lock cylinder
- Burrs or foreign material around the rack and pinion actuator in the lock cylinder housing
- Insufficient lube on the actuator (Do not apply lubricant to the inside of the ignition switch.)
- Binding ignition switch

If the steering wheel lock is engaged with the wheels loaded against a curb, high effort is necessary to turn the key from lock. Turn the steering wheel to either side of the lock to unload the system.

Carry out the following test to determine if the ignition switch and lock cylinder are operating correctly.

1. Inspect the ignition key for any burrs, damage or incorrect cut. Replace the ignition key as necessary.

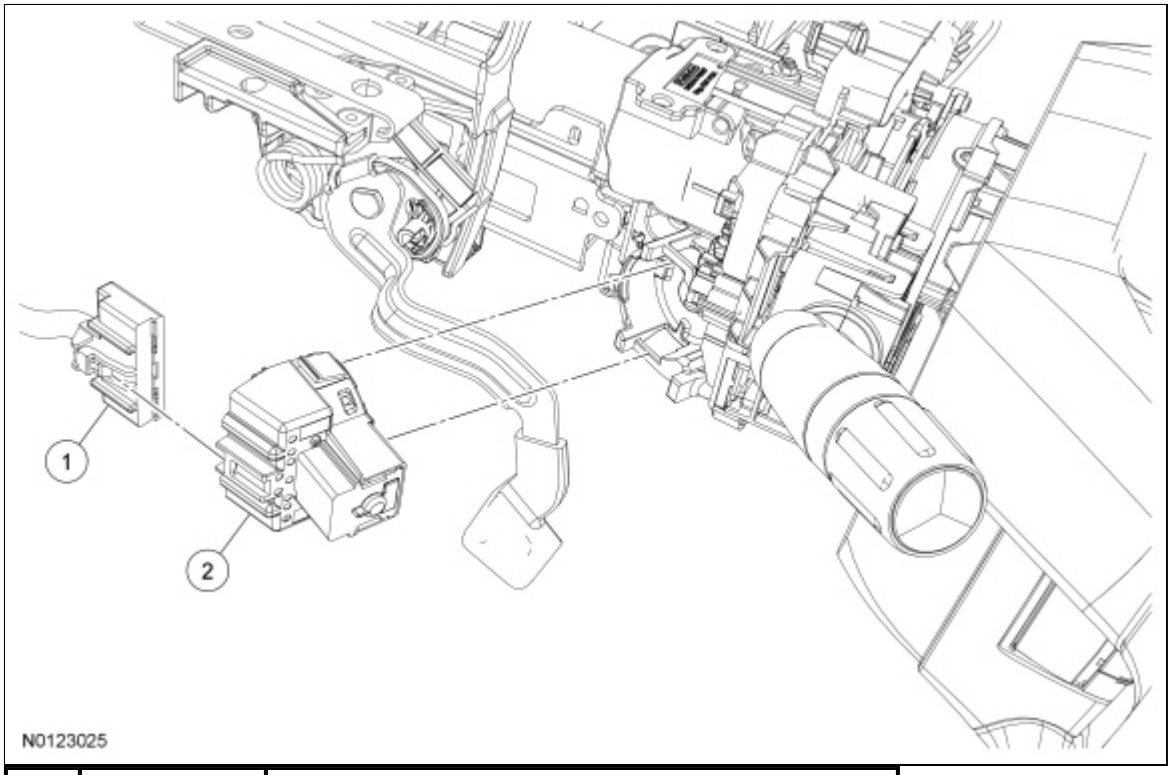
2. **NOTE:** The steering wheel may be locked full left or full right. If the steering wheel is locked, it is necessary to apply turning effort to the steering wheel in the direction of the lock while turning the key.

   Turn the key to the ACC position and then the RUN position.
   - If the ignition key turns to the ACC and RUN position, continue with Step 3.
   - If the ignition key does not turn to the ACC and RUN position, continue with Step 4.

3. **NOTE:** The ignition switch and lock cylinder should return from the START position back to the RUN position without assistance.

   Turn the ignition key to the START position and release the key.
   - If the ignition switch and lock cylinder return from the START position back to the RUN position without assistance, the ignition switch is operating correctly at this time.
   - If the ignition switch and lock cylinder do not return from the START position back to the RUN position without assistance, continue with Step 4.

4. Remove the ignition lock cylinder. Refer to Section 501-14 .



5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, continue with Step 6.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder. Refer to Section 501-14 .

6. Check for binding or sticking ignition switch actuating rod, burrs around the rack-and-pinion actuator in the ignition lock cylinder housing or insufficient lubrication.
   - If there is sufficient lubrication and there are no burrs, binding or sticking conditions, install a new ignition switch. Refer to Ignition Switch in this section.
   - If there is insufficient lubrication, burrs, binding or sticking conditions, repair or lubricate as necessary.

repair4less

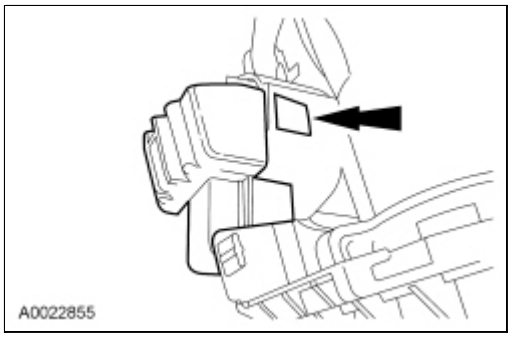
Ignition Switch

NOTE: Manual column shown, power column similar.

Item	Part Number	Description
1	—	Ignition switch electrical connector (part of 14401)
2	11572	Ignition switch

Removal and Installation

Manual and Power Columns

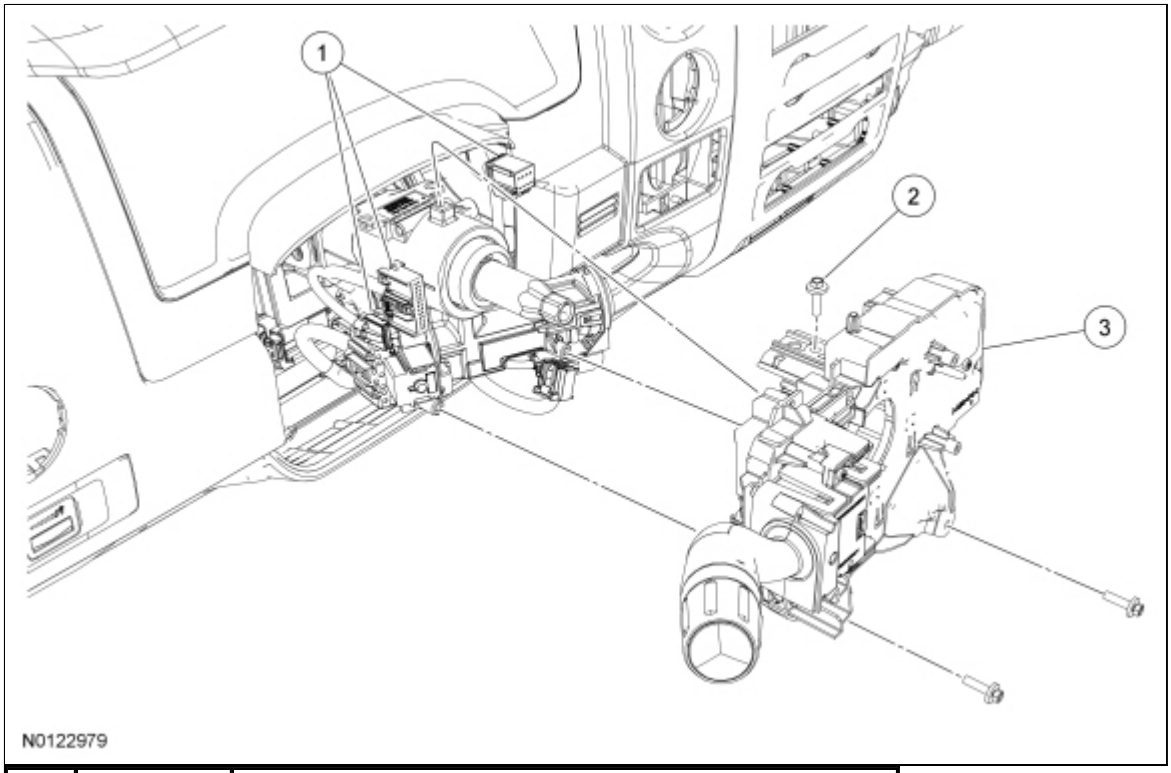


1. Remove the steering column shrouds. For additional information, refer to Section 211-04 .
2. Disconnect the ignition switch electrical connector.

Manual Columns

3. Place the steering column tilt lever in the unlocked position.

Manual and Power Columns



4. Press the 2 locking tabs and remove the ignition switch.

5. To install, reverse the removal procedure.

repair4less

Steering Column Control Module (SCCM)

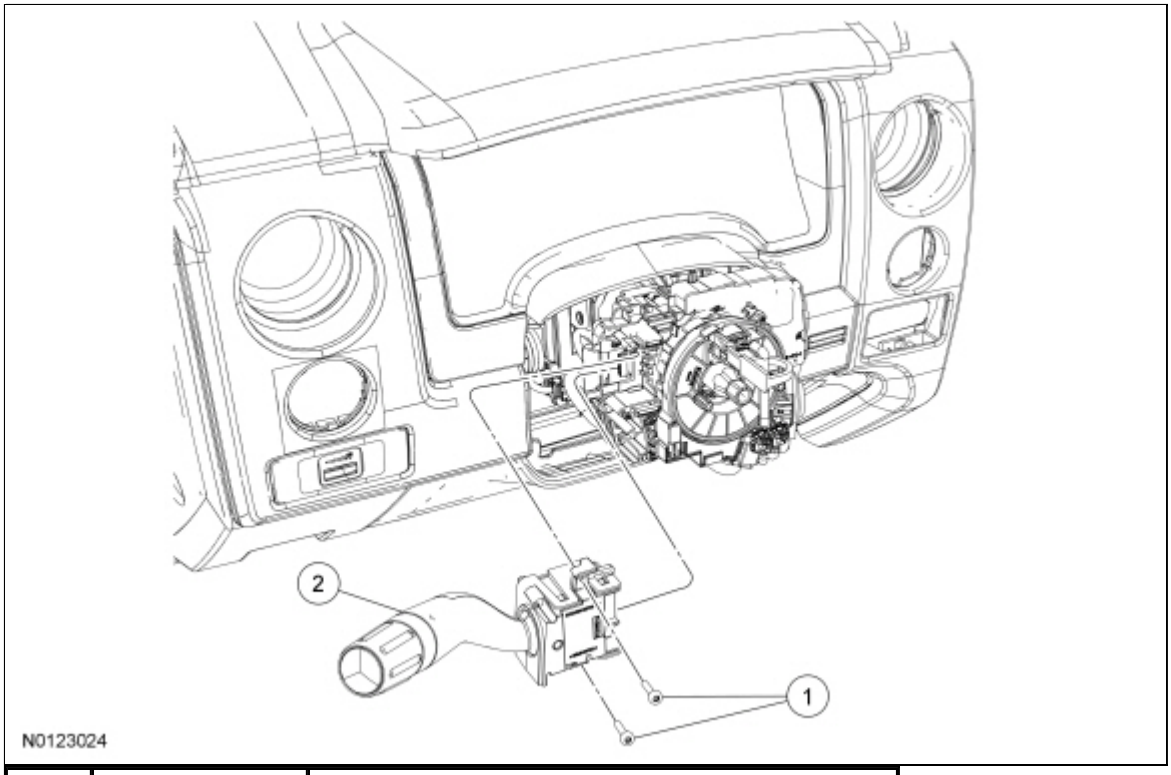
Item	Part Number	Description
1	—	Steering Column Control Module (SCCM) electrical connectors (3 required) (part of 14401)
2	W715057	SCCM bolts (3 required)
3	3F791	SCCM

Removal and Installation

1. Remove the steering wheel rotation sensor. For additional information, refer to Section 206-09 .
2. Disconnect the 3 Steering Column Control Module (SCCM) electrical connectors.
3. Remove the 3 screws and the SCCM .
   - To install, tighten to 2 Nm (18 lb-in).
4. To install, reverse the removal procedure.

repair4less

Steering Column Control Switch



Removal and Installation

1. **NOTE:** The steering column control switch and the brake pedal control switch are serviced as an assembly.

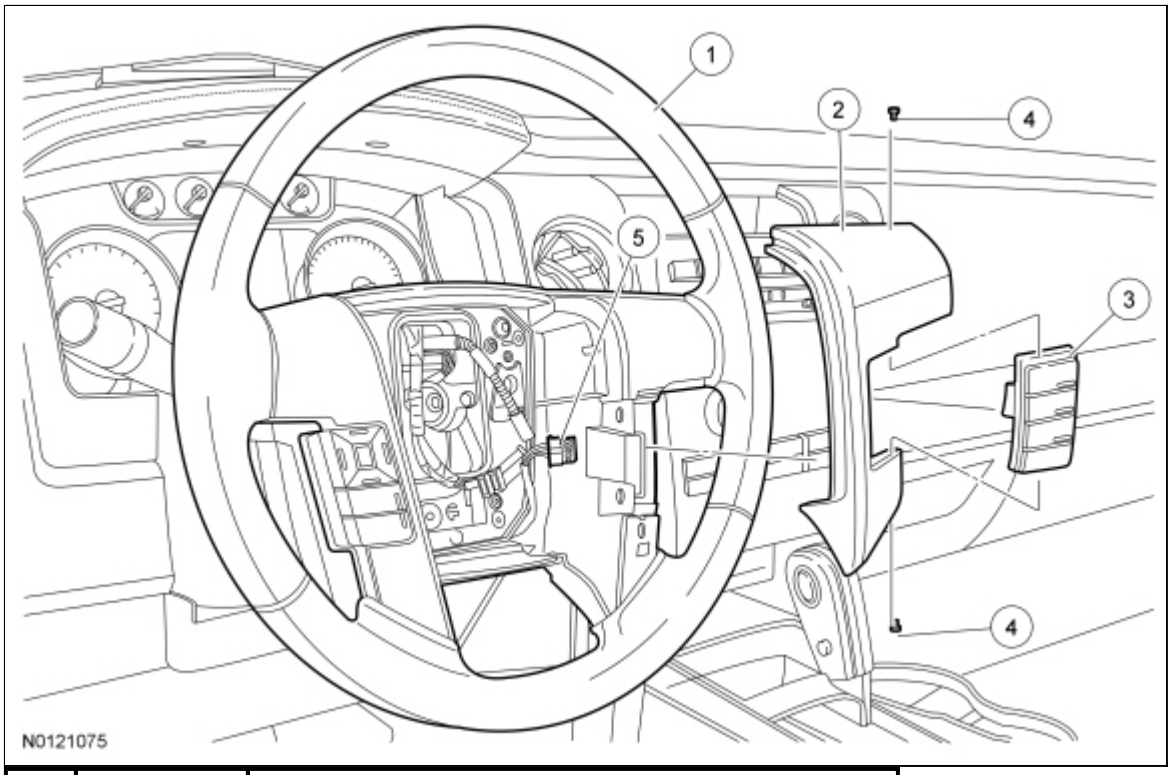
   For additional information, refer to Brake Pedal Control Switch in Section 206-06 .

Steering Column Multifunction Switch

NOTE: Steering wheel removed for clarity.

Item	Part Number	Description
1	W705132	Multifunction switch screws (2 required)
2	13K359	Multifunction switch

Removal and Installation



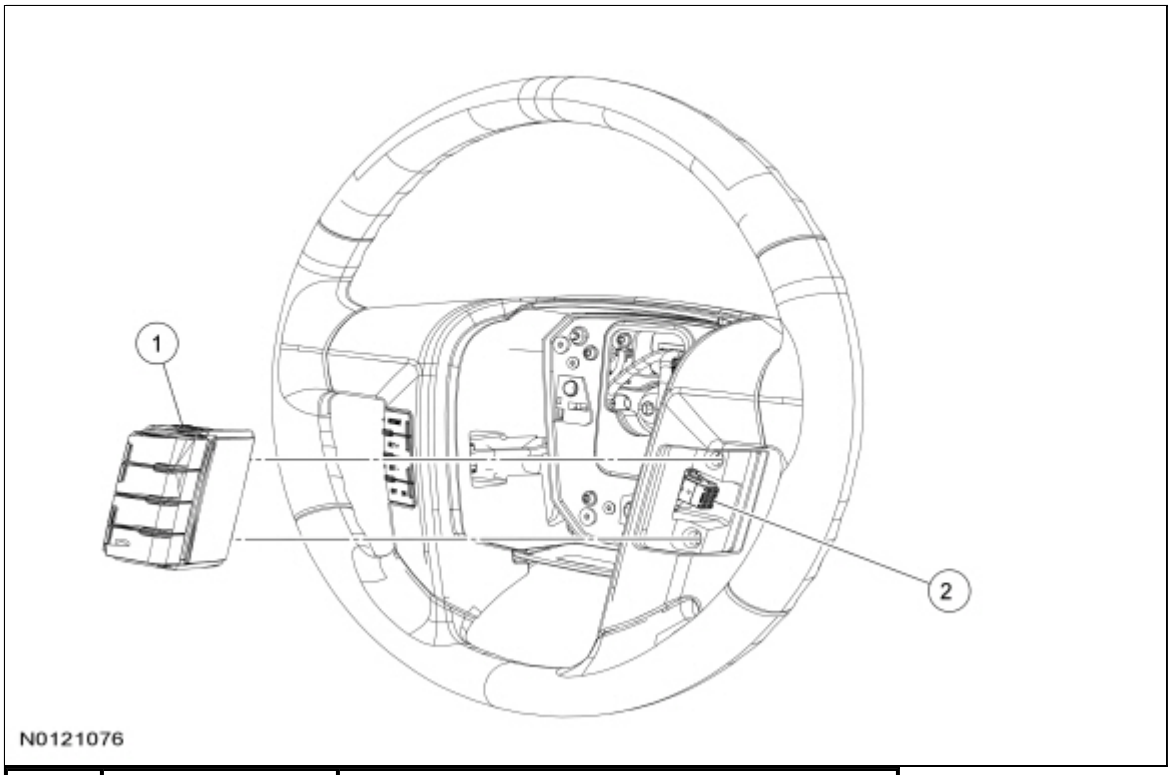
1. Remove the steering column shrouds. For additional information, refer to Section 211-04 .
2. If equipped, remove the steering column control switch. For additional information, refer to Steering Column Control Switch in this section.
3. Turn the steering wheel 90 degrees to the left and remove the 2 screws and the multifunction switch.
   - To install, tighten to 2 Nm (18 lb-in).
4. To install, reverse the removal procedure.

repair4less

Steering Wheel Switch

High Series

NOTE: RH shown, LH similar



Item	Part Number	Description
1	3600	Steering wheel
2	—	Steering wheel control switch bezel (part of 3600)
3	9C888	RH steering wheel switch
4	—	Steering wheel switch screw (2 required) (part of 3600)
5	—	Steering wheel controls electrical connector (part of 3600)

Low Series

NOTE: RH shown, LH similar

repair4less

Item	Part Number	Description
1	9C888	RH steering wheel switch
2	—	Electrical connector (part of 3600)

Removal and Installation

High and Low Series

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .

Low Series

2. Using a suitable flat-bladed tool, detach the steering wheel switch from the steering wheel.
    - Disconnect the electrical connector and remove the switch.

High Series

3. Remove the steering wheel switch bezel.
    - Disconnect the steering wheel switch electrical connector.

4. Remove the 2 screws and the steering wheel switch.

High and Low Series

5. To install, reverse the removal procedure.

Engine

NOTICE: **When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure may occur.**

NOTE: Specifications show the expected minimum or maximum condition. Refer to the appropriate section in Group 303 for the procedure.

NOTE: If a component fails to meet the specifications, it is necessary to refinish it or install a new component. Wear limits are provided as an aid to determine if the component can be refinished. A new component must be installed when any component fails to meet specifications and cannot be refinished.

NOTE: This section contains information, steps and procedures that may not be specific to this engine.

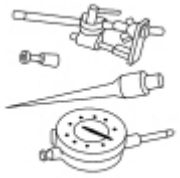
This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

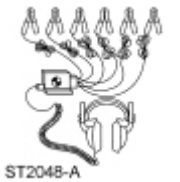
The engine incorporates the following features: Refer to the appropriate section in Group 303 for the procedure.

- Crankcase ventilation or breather system
- Exhaust emission control system
- Evaporative Emission (EVAP) control system

Some engines incorporate a fail-safe cooling system. Refer to the appropriate section in Group 303 for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.





Correct engine identification is required to order parts. Refer to the appropriate section in Group 303 for the procedure.

For complete vehicle and engine identification codes, refer to Section 100-01 .

There are 2 diagnostic paths that can be followed depending on the type of engine concern. Carry out Inspection and Verification — Engine Performance or Inspection and Verification — Engine NVH.

Inspection and Verification — Engine Performance

1. Verify the customer concern by operating the engine to duplicate the condition.

2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

   Visual Inspection Chart

Mechanical
• Engine coolant leaks • Engine oil leaks • Fuel leaks • Damaged or severely worn parts • Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00, No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00.
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the PCM.

9. If the DTCs retrieved are related to the concern, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Engine Performance .

Inspection and Verification — Engine NVH

1. Engine NVH symptoms should be identified using the diagnostic tools and techniques that are available. For a list of these techniques, tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 .

2. Verify the customer concern by operating the engine to duplicate the condition.

3. Inspect the engine for installation of an aftermarket oil filter. Review oil and filter maintenance history to make sure that the vehicle has not gone beyond the standard Ford recommended oil change interval.

4. Check the engine oil level and check the oil for contamination. Low engine oil level or contaminated oil are common causes of engine noise. If the oil is contaminated, the source of the contamination must be identified and repaired as necessary.

5. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

   Visual Inspection Chart

Mechanical
• Loose mounting bolts, studs and nuts • Damaged or leaking powertrain mounts • Damaged or disconnected vacuum hoses • Damaged or disconnected air intake components • Obstruction of cooling fan • Obstruction of Front End Accessory Drive (FEAD)

6. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

7. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

8. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

repair4less

10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record CMDTCs .

11. Clear the CMDTCs and carry out the self-test diagnostics for the PCM.

12. If the DTCs retrieved are related to the concern, refer to Section 419-10 .

13. If no DTCs related to the concern are retrieved, continue the inspection and verification if a noise concern is related to the engine. For vibration concerns and noise concerns such as powertrain mounts, air intake system and starter GO to Symptom Chart - Engine NVH .

In some cases, a noise may be a normal characteristic of that engine type. In other cases the noise may require further investigation. Comparing the noise to a similar year/model vehicle equipped with the same engine will aid in determining if the noise is normal or abnormal.

Once a customer concern has been identified as an abnormal engine noise, it is critical to determine the location of the specific noise. Use the EngineEAR/ChassisEAR or stethoscope (the noise will always be louder closer to the noise source) to isolate the location of the noise to one of the following areas.

- Upper end of engine
- Lower end of engine
- Front of engine
- Rear of engine

Upper end engine noise

Common sources of upper end engine noise (ticking, knocking or rattle) include the fuel injectors, camshaft phaser sprocket(s), camshaft(s) and valve train. Upper end engine noise can be determined using the EngineEAR/ChassisEAR or stethoscope on the valve cover bolts. If the noise is loudest from the valve cover bolts, then the noise is upper end. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder. Removal of the valve covers will be required to pinpoint the source of the noise.

- Fuel Injector Noise
    - A common source of an engine ticking noise can be related to the fuel injector(s). This is normal engine noise that can be verified by listening to another vehicle. If the injector noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to a specific fuel injector.
- Valve Train
    - Lash adjusters/valve tappets can make an engine ticking or tapping noise noticeable at any engine rpm or temperature and is audible through the wheel well or an open hood. However, with the hood down, lash adjuster/valve tappet noise can be heard as a light tapping noise through the wheel well and is considered normal. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder, some disassembly of the engine may be required to inspect for damage or wear.

Lower end engine noise

A common source of lower end engine noise (ticking or knocking) include the crankshaft, connecting rod(s) and bearings. Lower end noises can be determined by using the oil pan or cylinder block lug bosses. If the noise is loudest from these areas then the noise is lower end. If an engine noise is isolated to the lower end, some disassembly of the engine may be required to inspect for damage or wear.

Front of engine noise

A common source of noise from the front of the engine (squeal, chirp, whine or hoot) is the Front End Accessory Drive (FEAD) components. To isolate FEAD noise, carry out the Engine Accessory Test, refer to Section 100-04 .

Some other noises from the front of the engine (ticking, tapping or rattle) may be internal to the engine. Use the EngineEAR/ChassisEAR or stethoscope on the engine front cover to determine if the noise is internal to the engine. Removal of the engine front cover may be necessary to inspect internal engine components.

Rear of engine noise

A common source of noise from the rear of the engine (knocking) is the flywheel/flexplate. Inspection of the flywheel/flexplate will be necessary.

14. After the noise is localized, note the characteristics of the noise, including type of noise, frequency and conditions when the noise occurs and GO to Symptom Chart - Engine NVH .

Symptom Chart — Engine Performance

Symptom Chart — Engine Performance

Condition	Possible Sources	Action
• Difficult starting	• Inoperative or damaged ignition system • Air or vacuum leak • Inoperative or damaged fuel system • Inoperative or damaged starting system	• INSPECT the starting system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged charging system/battery	• REFER to Section 414-00 .
	• Low oil pressure	• CARRY OUT the oil pressure test.
	• Burnt valve	• INSPECT the valve(s) and valve seat (s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn piston	• INSPECT the piston(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn piston rings	• INSPECT the piston ring(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn cylinder	• INSPECT the cylinder block for

repair4less

		damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged head gasket	• INSPECT the cylinder head gasket(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged cooling system	• INSPECT the cooling system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Poor idling	• Vacuum leaks • Malfunctioning or damaged ignition system • Malfunctioning or damaged fuel system	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool.
	• Damaged hydraulic lash adjuster — 5.0L (4V) engine only	• INSPECT the hydraulic lash adjuster (s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged rocker arm and/or shaft — 6.2L (2V) engine only	• INSPECT the rocker arm ahsft assemblies for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Incorrect valve-to-seat contact	• INSPECT the valve(s) and cylinder head(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged head gasket	• INSPECT the cylinder head gasket(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Low oil pressure	• CARRY OUT the oil pressure test.
	• Worn or damaged engine support bracket(s)	• INSPECT the engine support bracket (s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn or damaged engine support insulator(s)	• INSPECT the engine support insulator(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn or damaged transmission	• INSPECT the transmission insulator and retainer for damage. INSTALL

	insulator and retainer	new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Abnormal combustion	• Inoperative or damaged fuel system • Air or vacuum leaks • EGR system fault • Inoperative or damaged cooling system (if equipped, fail-safe cooling invoked) • Inoperative or damaged ignition system	• INSPECT each system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged air intake system	• INSPECT the air intake system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged hydraulic lash adjuster(s) — 5.0L (4V) engine only	• INSPECT the hydraulic lash adjuster (s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged rocker arm(s) — 6.2L (2V) engine only	• INSPECT the rocker arm(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Burnt or sticking valve	• INSPECT the valve(s) and valve seat (s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Weak or broken valve spring	• INSPECT the valve spring(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Carbon accumulation in combustion chamber	• ELIMINATE carbon buildup.
• Excessive oil consumption	• Leaking oil	• REPAIR oil leakage.
	• Malfunctioning PCV system	• INSPECT the PCV system for damage. Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Worn valve stem seal	• INSPECT the valve(s) and valve stem seal(s) for damage. INSTALL new

repair4less

		components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn valve stem or valve guide	• INSPECT the valve(s) and cylinder head(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Sticking piston rings	• INSPECT the piston(s) and cylinder block for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn piston ring groove	• INSPECT the piston(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn piston or cylinder	• INSPECT the piston(s) and cylinder block for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Insufficient power	• Inoperative or damaged ignition system • Air intake system blockage • Lubrication system blockage • Inoperative or damaged fuel system	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Oil level too high	• DRAIN oil to correct level.
	• Incorrect engine oil	• INSTALL correct specification engine oil.
	• Low oil pressure	• CARRY OUT the oil pressure test.
	• Excessive accessory drive belt loading	• INSPECT the accessory drive system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Inoperative or damaged cooling system (if equipped, fail-safe cooling invoked)	• INSPECT the cooling system for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged or plugged exhaust system	• INSPECT the exhaust system for flow and damage. INSTALL new components as necessary. REFER to Section 309-00 .
	• Incorrect tire size	• REFER to Section 204-00 .
	• Dragging brakes	• REFER to Section 206-00 .

	• Slipping transmission	• Refer to the appropriate section in Group 307 for the procedure.
	• Incorrect valve clearance — 3.5L GTDI and 3.7L engines only	• ADJUST valve clearance. Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation after the repair.
	• Worn or damaged valve tappet — 3.5L GTDI and 3.7L engines only	• INSTALL a new valve tappet. TEST the system for normal operation after the repair.
	• Malfunctioning hydraulic lash adjuster — 5.0L (2V) engine only	• INSPECT the hydraulic lash adjuster for wear or damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged rocker arm and/or shaft — 6.2L (2V) engine only	• INSPECT the rocker arm ahsft assemblies for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Compression leakage at valve seat	• INSPECT the valve, valve seat and cylinder head for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Seized valve stem	• INSPECT the valve for wear or damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged valve guide • Compression leakage at valve seat • Seized valve stem	• INSTALL a new cylinder head assembly. TEST the system for normal operation after the repair.
	• Weak or broken valve spring	• INSPECT the valve spring. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn or damaged camshaft	• INSPECT the camshaft for wear or damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Damaged head gasket(s)	• INSPECT the cylinder head gasket(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Cracked or distorted cylinder head(s)	• INSPECT the cylinder head(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

repair4less

	• Damaged, worn or sticking piston ring (s) • Worn or damaged piston	• INSPECT the piston ring(s) for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the piston for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Oil in coolant	• Leaking head gasket • Leaking oil cooler • Leaking oil filter adapter • Damaged cylinder head • Damaged cylinder block	• INSTALL a new head gasket. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the oil filter adapter and seal for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the oil filter adapter and gasket for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the engine components for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the engine components for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Oil in coolant	• Leaking head gasket • Damaged cylinder block • Damaged cylinder head	• INSPECT the engine components. INSTALL new engine components as necessary. Refer to the appropriate section in Group 303 for the procedure. TEST the system for normal operation after the repair.
• Coolant in oil	• Leaking head gasket • Leaking oil cooler (if equipped) • Leaking oil filter adapter • Damaged cylinder head • Damaged cylinder block	• INSPECT the engine components for damage. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.

Symptom Chart — Engine NVH

Symptom Chart — Engine NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible that any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Drone type noise	• Powertrain mount(s)	• CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.
• Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Engine vibration excites the body resonances inducing interior noise	• CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.
• Engine drumming noise — accompanied by vibration	• Powertrain mount(s)	• CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.
• Rattle — occurs at idle or at light acceleration from a stop	• Powertrain mount(s)	• CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
• Whine/moan type noise — pitch increases or changes with vehicle speed	• Powertrain mount(s)	• CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
• Clunk — occurs when shifting from PARK or between REVERSE and DRIVE	• Powertrain mounts • Idle speed is too high	• CHECK the powertrain/drivetrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure. • CHECK for the correct idle speed.

repair4less

• Accessory drive bearing hoot — occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at the first start of the day	• Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and the bearing race	• CARRY OUT the engine cold soak procedure. REFER to Section 100-04 . • PLACE the EngineEAR probe directly on the idler/tensioner center post or bolt to verify which bearing is making the noise. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Accessory drive belt noise, squeal or chirping	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory drive component or idler • Fluid contamination of the accessory drive belt or pulleys • Damaged or worn accessory drive belt tensioner • Damaged pulley grooves	• CARRY OUT the Engine Accessory Test. REFER to Section 100-04 . INSPECT components and INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Clunking noise	• Coolant pump has excessive end play or imbalance	• CHECK the coolant pump for excessive end play. INSPECT the coolant pump for imbalance with the drive belt off. INSTALL a new coolant pump as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Whine or moaning noise	• Air intake system	• CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary.Refer to the appropriate section in Group 303 for the procedure.
• Whistling noise — normally accompanied with poor idle condition	• Air intake system	• CHECK the air intake ducts, Air Cleaner (ACL), Throttle Body (TB) and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary.Refer to the appropriate section in Group 303 for the procedure.
• Hissing noise — occurs during idle or high idle that is apparent with the hood open	• Vacuum leak noise • Vehicles with a	• USE the EngineEAR to locate the source. SCAN the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component. • Acceptable condition. Some

	plastic intake manifold	plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
• Grinding noise — occurs during engine cranking	• Incorrect starter motor mounting	• INSPECT the starter motor for correct mounting. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Starter motor	• CHECK the starter motor. INSTALL a new starter motor as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Incorrect starter motor drive engagement	• INSPECT the starter motor drive for wear or damage. INSTALL a new starter motor as necessary. Refer to the appropriate section in Group 303 for the procedure. • INSPECT the flywheel/flexplate for wear or damage. INSTALL a new flywheel/flexplate as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, front of engine — knocking noise from lower front of engine	• Damaged or separated crankshaft pulley/damper	• CHECK for obvious signs of damage or wobble during operation. INSTALL new as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, front of engine — ticking, tapping or rattling noise from the front of the engine	• Timing drive components	• REMOVE the accessory drive belt. Refer to the appropriate section in Group 303 for the procedure. • USE the EngineEAR to isolate the noise to the engine front cover. • REMOVE the engine front cover and INSPECT the timing drive components. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, upper end — ticking noise near the fuel rail and intake manifold	• Fuel rail clip	• CHECK for loose or damaged fuel rail clip(s). REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Fuel injector	• USE the EngineEAR to isolate the noisy injector(s). INSTALL new injector(s) as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, upper	• Valve train noise	• CARRY OUT the Valve Train

repair4less

end — ticking, knocking or rattle noise that occurs during idle or high idle during the first cold start of the day and may disappear as the engine warms	(bled down lifter/lash adjuster/valve tappet)	Analysis Component Test in this section. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, upper end — occurs mostly with a warm engine at light/medium acceleration	• Worn or damaged spark plugs	• REMOVE the spark plugs. INSPECT and INSTALL new as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Carbon accumulation in combustion chamber	• INSPECT the cylinder using a Bore scope. ELIMINATE carbon buildup.
• Engine noise, upper end — rattling noise from the valve train. Worse when the engine is cold	• Low oil level	• CHECK the oil level. FILL as necessary.
	• Worn valve train components	• CARRY OUT the Valve Train Analysis Component Test in this section. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Worn valve guides	• CARRY OUT the Valve Guide Inner Diameter procedure in this section.
	• Excessive runout of the valve seats on the valve face	• CARRY OUT the Valve Seat Inspection procedure in this section.
• Engine noise, upper end — pinging noise	• Gasoline octane too low	• VERIFY with customer the type of gasoline used. CORRECT as necessary.
	• Knock Sensor (KS) operation	• CHECK the KS . INSTALL a new KS as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Incorrect spark timing	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• High operating temperature	• INSPECT the cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. VERIFY the engine operating temperature is within specifications. REPAIR as

		necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Spark plug	• CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Catalytic converter	• Acceptable noise.
• Engine noise, upper end — knocking or ticking noise, occurs mostly with a warm engine at idle	• Low oil level	• CHECK the oil level. FILL as necessary.
	• Thin or diluted oil	• INSPECT the oil for contamination. If the oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter.
	• Damaged or incorrect oil filter	• INSPECT the oil filter. INSTALL a new oil filter as necessary.
	• Low oil pressure	• CARRY OUT the oil pressure test.
• Engine noise, lower end — ticking or knocking noise near the oil filter adapter	• Oil pump	• USE the EngineEAR to verify the oil pump as the source of the noise at low rpm. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine noise, lower end — light knocking noise, also described as piston slap. Noise is most noticeable when the engine is cold with light to medium acceleration. The noise disappears as the engine warms	• Excessive clearance between the piston and the cylinder wall	• CARRY OUT the Piston To Cylinder Bore Clearance procedure in this section.
• Engine noise, lower end — light double knock or sharp rap sound. Occurs mostly with a warm engine at idle or low speeds in drive. Increases in relation to engine load. Associated with a poor lubrication history	• Excessive clearance between the piston and the piston pin	• CARRY OUT the Piston Pin Bore Diameter procedure and the Piston Pin Diameter procedure in this section.
	• Excessive	• CARRY OUT the Connecting

repair4less

	clearance between the piston pin and the connecting rod bore	Rod Bushing Diameter procedure and the Piston Pin Diameter procedure in this section.
• Engine noise, lower end — light knocking noise. The noise is most noticeable when the engine is warm. The noise tends to decrease when the vehicle is coasting or in NEUTRAL	• Excessive clearance between the connecting rod bearings and the crankshaft	• CARRY OUT the Connecting Rod Bearing Journal-to-Bearing Clearance procedure in this section.
• Engine noise, lower end — deep knocking noise. The noise is most noticeable when the engine is warm, at lower rpm and under a light load and then at float	• Worn or damaged crankshaft main bearings	• CARRY OUT the Crankshaft Main Bearing Journal-to-Bearing Clearance procedure in this section.
• Engine noise, rear of engine — knocking noise at rear of engine	• Damaged flywheel/flexplate	• CARRY OUT the Flexplate Inspection procedure in this section.
• Engine vibration — vibration felt at all times	• Excessive crankshaft pulley runout • Damaged or worn accessory component	• CARRY OUT the Engine Accessory Test. INSTALL a new crankshaft pulley as necessary. Refer to the appropriate section in Group 303 for the procedure. • CARRY OUT the Engine Accessory Test. REPAIR or INSTALL a new component as necessary.
• Engine vibration — at idle, a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan	• Cylinder misfire • Engine or torque converter out of balance	• Using the scan tool, CARRY OUT the cylinder power balance and the relative compression test. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. • VERIFY the torque converter to crankshaft pilot clearance is correct. REPAIR as necessary. RE-INDEX the torque converter on the flexplate by 120 degrees for a 3-bolt converter or 180 degrees for a 4-bolt converter. Refer to the appropriate section in Group 307 for the procedure.
• Engine vibration — is felt with increases	• Powertrain mount(s)	• CHECK the powertrain mounts for damage. INSTALL new

and decreases in engine rpm		mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
	• Engine or transmission contacting the chassis	• INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary.
• Engine vibration — increases intensity as the engine rpm is increased	• Engine out-of-balance	• CARRY OUT the Neutral Engine Run-Up (NERU) Test. REFER to Section 100-04 . ROTATE the torque converter, 120 degrees for 3-bolt or 180 degrees for 4-bolt. INSPECT the torque converter pilot outer diameter to crankshaft pilot inner diameter. REPAIR as necessary. Refer to the appropriate section in Group 307 for the procedure.
• Engine vibration — mostly at coast/neutral coast. Condition improves with vehicle acceleration	• Combustion instability	• CHECK the ignition system. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
• Engine vibration or shudder — occurs with light to medium acceleration above 56 km/h (35 mph)	• Worn or damaged spark plugs	• INSPECT the spark plugs for cracks, high resistance or broken insulators. INSTALL a new spark plug(s) as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Plugged fuel injector	• INSTALL a new fuel injector as necessary. Refer to the appropriate section in Group 303 for the procedure.
	• Contaminated fuel	• INSPECT the fuel for contamination. DRAIN the fuel system and refill.

Pinpoint Tests

Pinpoint Test A: Low Oil Pressure

Normal Operation

Oil is drawn into the oil pump through the oil pump screen and pickup tube in the sump of the oil pan. Oil is

repair4less

pumped through the oil filter and then enters the main gallery where it is distributed to the crankshaft main journals, piston oil coolers and to both cylinder heads. From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly. The cylinder heads are fed from a drilling into the supply passage feeding the main gallery. Main gallery pressure is sent through Variable Camshaft Timing (VCT) circuit and reduced as it enters the cylinder head galleries through fixed serviceable orifices, located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feed the camshaft journals, rocker arm shafts or hydraulic lash adjusters and the primary and/or secondary timing chain tensioners. The camshaft lobe, roller followers, rocker arms and valve tappets are lubricated by splash created through valve train operation.

This pinpoint test is intended to diagnose the following:

- Excessive crankshaft end play
- Excessive main bearing clearance
- Excessive connecting rod bearing clearance
- Excessive camshaft bearing cap clearance
- Loose oil galley plugs
- Loose timing chain tensioner bolts
- Oil pump screen and pickup tube
- Restricted oil flow passages
- Worn or damaged oil pump
- Damaged piston oil coolers

PINPOINT TEST A: LOW OIL PRESSURE

Test Step	Result / Action to Take
A1 CHECK THE CRANKSHAFT END PLAY	
• Check the crankshaft end play. Refer to Crankshaft End Play in this section. • **Is the crankshaft end play within specification?**	**Yes** GO to A2. **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
A2 VERIFY THE CAMSHAFT BEARING CAPS ARE NOT DAMAGED AND TIGHT	
• Check that the camshaft bearing caps are not damaged and the bolts are properly tightened. Refer to the Specification chart in the appropriate engine section. • **Are the camshaft bearing caps loose or damaged?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to A3.
A3 CHECK CAMSHAFT JOURNAL-TO-BEARING CLEARANCE	
• Check the camshaft journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is camshaft journal-to-bearing clearance within specification?**	**Yes** GO to A4. **No** REPAIR as necessary. Refer to the

	appropriate section in Group 303 for the procedure.
A4 CHECK FOR RESTRICTED OIL FLOW	
• Verify the oil supply and return passages are not plugged and clean of debris. Refer to the oil flow chart in the appropriate engine section. • **Is oil flow restricted?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to A5 .
A5 CHECK THE TIMING CHAIN TENSIONERS FOR DAMAGE AND VERIFY THE BOLTS ARE TIGHT	
• Check that the timing chain tensioners are not damaged or the bolts are loose. Refer to the Specification chart in the appropriate engine section. • **Are the timing chain tensioners damaged or bolts loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to A6 .
A6 CHECK THE OIL PUMP PICKUP TUBE AND SCREEN FOR DAMAGE	
• Check that the oil pump pickup tube and screen is not plugged, cracked or that the bolts are loose. Refer to the Specification chart in the appropriate engine section. • **Is the oil pump screen and pickup tube damaged or loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to A7 .
A7 CHECK THE OIL PUMP FOR DAMAGE	
• Verify the oil pump is not damaged. • **Is oil pump damaged?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to A8 .
A8 CHECK CRANKSHAFT MAIN BEARING JOURNAL-TO-BEARING CLEARANCE	
• Check the crankshaft main bearing journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is crankshaft main bearing journal-to-bearing clearance within specification?**	**Yes** GO to A9 . **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
A9 CHECK CONNECTING ROD BEARING JOURNAL-TO-BEARING CLEARANCE	
• Check the connecting rod bearing journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is connecting rod bearing journal-to-bearing clearance within specification?**	**Yes** The concern may have been caused by debris or an incorrect assembly. REPEAT the oil pressure test. **No**

repair4less

	REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.

Component Tests

The following component tests are used to diagnose engine concerns.

Engine Oil Leaks

NOTICE: **If an overnight drive is done, the fan air or road air blast may cause erroneous readings.**

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel with a suitable solvent to remove all traces of oil.

Engine Oil Leaks — Fluorescent Oil Additive Method

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1. Add 29.6 ml (1 oz) of gasoline engine oil dye to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. If the oil is not premixed, the gasoline engine oil dye will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The gasoline engine oil dye must be mixed with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).

2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Diagnostic Inspection Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.

3. At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

Leakage Points — Underhood

Examine the following areas for oil leakage:

- Valve cover gaskets
- Cylinder head gaskets
- Oil cooler, if equipped
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Engine Oil Pressure (EOP) sensor

- Oil passage end plugs

Leakage Points — Under Engine, With Vehicle on Hoist

Examine the following areas for oil leakage:

- Oil pan gaskets
- Oil pan sealer
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear oil seal
- Oil filter adapter and filter body
- Oil cooler, if equipped
- Oil passage end plugs

Leakage Points — With Transmission and Flywheel Removed

Examine the following areas for oil leakage:

- Crankshaft rear seal
- Crankshaft rear seal retainer
- Flexplate mounting bolt holes (with flexplate installed)
- Oil passage end plugs

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the Gasoline Engine Oil Dye method.

Compression Test — Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position.

3. Install a compression gauge in the No. 1 cylinder.

4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test — Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Test — 3.5L Gasoline Turbocharged Direct Injection (GTDI) Engine Only

N0096835

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test — Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty.

2. If compression does not improve, valves are sticking or seating incorrectly.

3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.
   Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest

repair4less

reading is within 75% of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of a cylinder leakage tester will be helpful in pinpointing the exact cause.

The leakage tester is inserted in the spark plug hole, the piston is brought up to Top Dead Center (TDC) on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, the leakage tester gauge will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the Throttle Body (TB). A leak at the exhaust valve can be heard at the tail pipe. Leakage past the piston rings will be audible at the PCV connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator.

Excessive Engine Oil Consumption

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner's Literature. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

Basic Pre-checks

1. For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is past the first recommended drain interval, the OEM production filter should have been changed.

2. Ask how the most current mileage was accumulated. That is, determine whether the vehicle was

driven under the following conditions:

- Extended idling or curbside engine operation
- Stop-and-go traffic or taxi operation
- Towing a trailer or vehicle loaded heavily
- Frequent short trips (engine not up to normal operating temperature)
- Excessive throttling or high engine-rpm driving

3. Verify that there are no external leaks. If necessary, review the diagnostic procedure under Engine Oil Leaks in the Diagnosis and Testing portion of this section.

4. Inspect the crankcase ventilation system for:
   - disconnected hoses at the valve cover or TB .
   - loose or missing valve cover fill cap.
   - missing or incorrectly seated engine oil level indicator.
   - incorrect or dirty PCV valve.
   - a PCV valve grommet unseated in the valve cover (if so equipped).

5. Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings.

6. Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.

7. If the engine is hot or was recently shut down, wait at least 5 minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.

8. Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.

Detailed Pre-checks

1. Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.

2. Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

Oil Consumption Test

Once all of the previous conditions are met, carry out an oil consumption test.

1. Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure the vehicle is positioned on a level surface. Refill the oil pan to a level **1 liter (1 quart) less** than the specified fill level, using manufacturer-specified oil.

2. Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 5-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.

repair4less

3. Add the final 1 L (1 qt) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.

4. After a 5-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location. (Note: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one quart differential between the new marks.) Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.

5. Record the vehicle mileage.

6. Advise the customer that oil level indicator readings must be taken every 320 km (200 mi) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 5-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.

7. When the subsequent indicator readings demonstrate a full quart (liter) has been used, record the vehicle mileage. The mileage driven between the 2 readings should not be less than 4,800 km (3,000 miles). The drive cycle the vehicle has been operated under must be considered when making this calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

Post Checks, Evaluation and Corrective Action

1. If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the Compression Test Chart in this section for pressure range limits.

2. Compression should be consistent across all cylinders. Refer to the Compression Testing portion of this section. If compression tested within the specifications found in this section, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.

3. A cylinder leak detection test can be carried out using a cylinder leakage tester. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

NOTE: An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. See Spark Plug Analysis in this section for details. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.

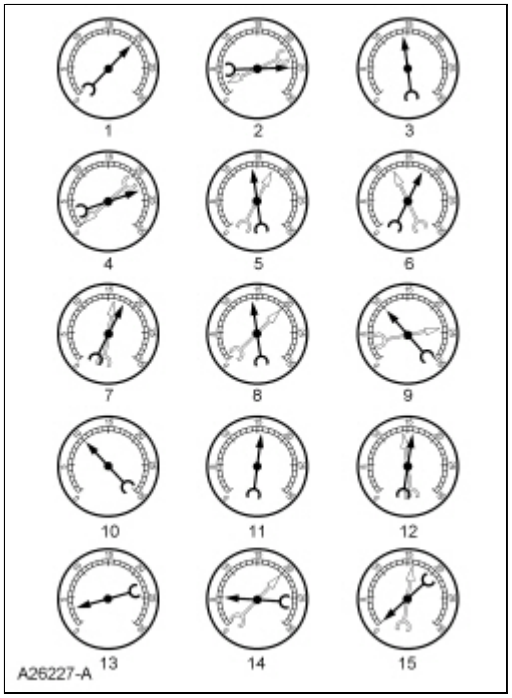
4. If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.

5. Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption results.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.



The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

Intake Manifold Vacuum Test — Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

1. NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg), but will be relatively steady. Some oscillation is normal.

4. WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5. STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum, but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

repair4less

6. BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient hydraulic lash adjuster or hydraulic lash adjuster clearance will also cause this reaction.

7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8. WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady, but somewhat low, reading.

12. INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.

14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.

15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

Oil Pressure Test

NOTICE: **Inspect the engine for installation of an aftermarket oil filter. Review oil and filter maintenance history to make sure that the vehicle has not gone beyond the standard Ford recommended oil change intervals. Check the engine oil level and check the oil for contamination. If the oil is contaminated, engine damage can occur. The source of the contamination must be identified and repaired as necessary.**

1. Disconnect and remove the Engine Oil Pressure (EOP) switch from the engine. Refer to the appropriate section in Group 303 for the procedure.

2. Connect the Oil Pressure Gauge to the oil pressure port.

3. Run the engine until normal operating temperature is reached.

4. With the engine at idle record the gauge reading.

5. The oil pressure should be within specifications; refer to the specifications in the appropriate engine section.

6. If the pressure is not within specification, GO to Pinpoint Test A .

Valve Train Analysis — 3.5L Gasoline Turbocharged Direct Injection (GTDI) and 3.7L

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis — Engine Off, Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis — Camshafts and Valve Tappets

- Check for broken or damaged parts.
- Check for loose mounting bolts on camshaft caps.
- Check for worn or damaged valve tappets.

Valve Train Analysis — Valve Springs, Valve Tappets Removed

- Check for broken or damaged parts.

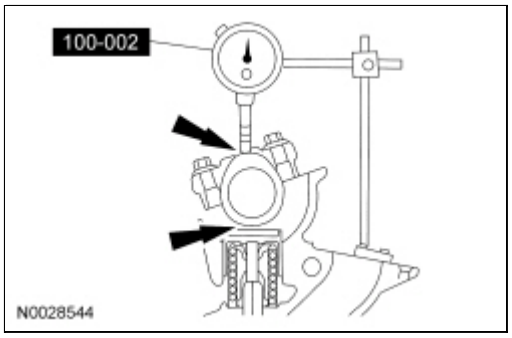
Valve Train Analysis — Valve Spring Retainer and Valve Spring Retainer Keys, Valve Tappets Removed

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis — Valves and Cylinder Head, Valve Tappets Removed

- Check for plugged oil drain-back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged valve stem seals or guide-mounted valve stem seal.
- Check for missing or worn valve spring seats.

Valve Train Analysis — Camshaft Lobe Lift



Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the spark plugs. Refer to Section 303-07A for 3.5L GTDI , or Section 303-07B for 3.7L.

2. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of the dial indicator is on top of the camshaft lobe and on the same plane as the valve tappet.

3. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

repair4less

4. Zero the dial indicator. Continue to rotate the crankshaft until the high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).

5. To check the accuracy of the original dial indicator reading, continue to rotate crankshaft until the base circle is reached. The dial indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.

6. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft valve tappets.

7. Install the spark plugs. Refer to Section 303-07B .

Valve Train Analysis — 5.0L (4V)

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis — Engine Off — Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis — Engine Off, Camshaft Roller Followers and Hydraulic Lash Adjusters, Overhead Camshaft

- Check for plugged oil feed in the camshaft roller followers, hydraulic lash adjusters or cylinder heads.

Valve Train Analysis — Engine Off, Camshaft — Engines

- Check for broken or damaged parts.

Valve Train Analysis — Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis — Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis — Engine Off, Valves and Cylinder Head

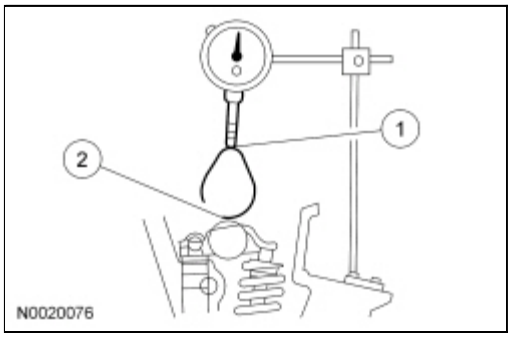
- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check for damaged hydraulic lash adjuster.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis — Engine Running, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for missing or damaged valve stem seals or guide mounted valve stem seals.

If insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1,200 rpm with the transmission in NEUTRAL and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and camshaft roller followers are well oiled. With the valve covers off, some oil splash may overshoot camshaft roller followers.



Valve Train Analysis — Camshaft Lobe Lift

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the spark plugs. Refer to Section 303-07C for 5.0L (4V) engines.

2. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of indicator is on top of the camshaft lobe.

3. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

4. Zero the Dial Indicator Gauge. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).

5. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat the measurement.

6. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers.

repair4less

7. Install the spark plugs. Refer to Section 303-07C for 5.0L (4V) engines.

Valve Train Analysis — 6.2L (2V)

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis — Engine Off — Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis — Engine Off, Rocker Arm and Overhead Camshaft

- Check for loose mounting bolts on rocker arm shafts and camshaft carriers.
- Check for plugged oil feed in the rocker arm shafts and cylinder heads.

Valve Train Analysis — Engine Off, Camshaft

- Check for broken or damaged parts.

Valve Train Analysis — Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis — Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

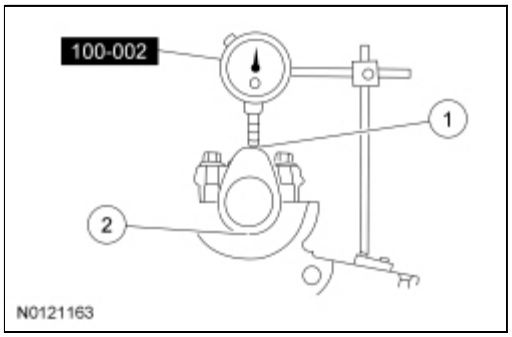
Valve Train Analysis — Engine Off, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis — Engine Running, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for missing or damaged valve stem seals or guide mounted valve stem seals.
- Check for a plugged oil metering orifice in the cylinder head oil reservoir.



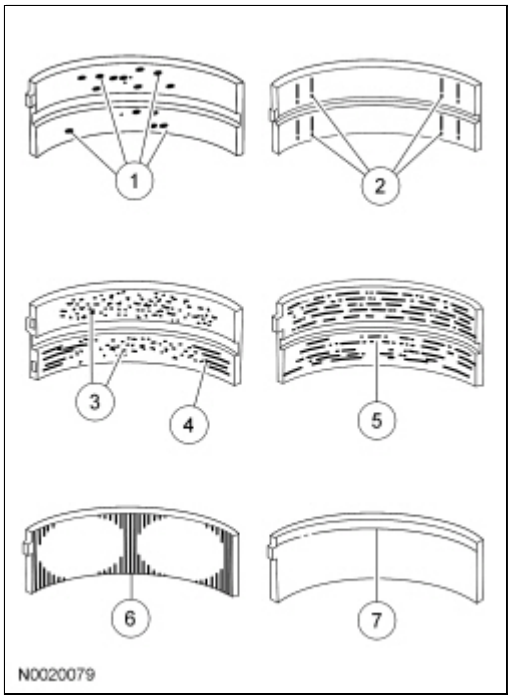
If insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1,200 rpm with the transmission in NEUTRAL and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and camshaft roller followers are well oiled. With the valve

covers off, some oil splash may overshoot camshaft roller followers.

Valve Train Analysis — Camshaft Lobe Lift

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the spark plugs. Refer to Section 303-07D .
2. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of indicator is on top of the camshaft lobe.
3. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

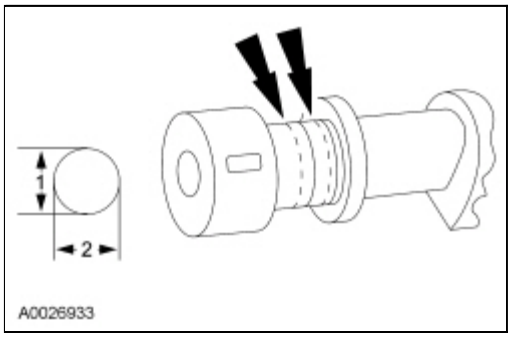


4. Zero the Dial Indicator Gauge. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).
5. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat the measurement.
6. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers.
7. Install the spark plugs. Refer to Section 303-07D .

repair4less

Bearing Inspection

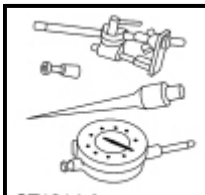
1. Inspect bearings for the following defects:
    1. Cratering — fatigue failure
    2. Spot polishing — incorrect seating
    3. Imbedded dirty engine oil
    4. Scratching — dirty engine oil
    5. Base exposed — poor lubrication
    6. Both edges worn — journal damaged
    7. One edge worn — journal tapered or bearing not seated



repair4less

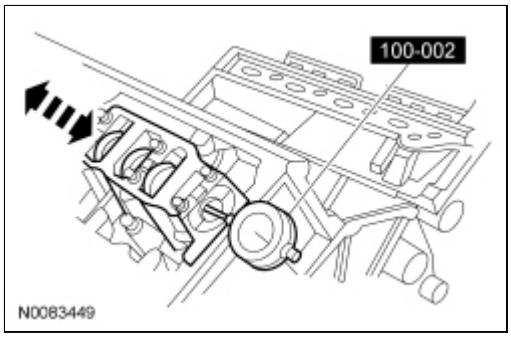
Camshaft Bearing Journal Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Measure each camshaft journal diameter in 2 directions.

repair4less



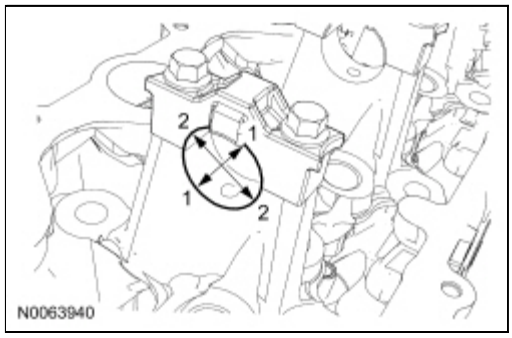
Camshaft End Play — OHC Engines

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

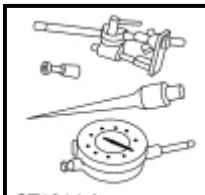
1. Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft end play.
2. Position the camshaft to the rear of the cylinder head.
3. Zero the Dial Indicator Gauge.
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.
    - If camshaft end play exceeds specifications, install a new camshaft and recheck end play.
    - If camshaft end play exceeds specification after camshaft installation, install a new cylinder head.



repair4less

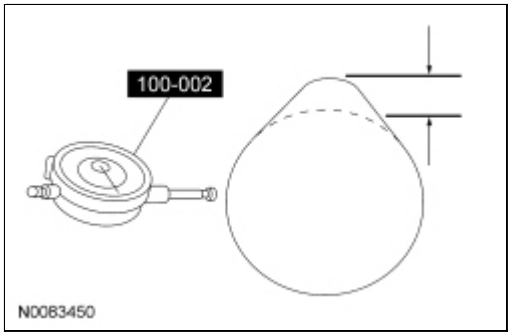
Camshaft Journal to Bearing Clearance — OHC Engines

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. **NOTE:** The camshaft journals must meet specifications before checking camshaft journal clearance.

   Measure each camshaft bearing in 2 directions.
   - Subtract the camshaft journal diameter from the camshaft bearing diameter.

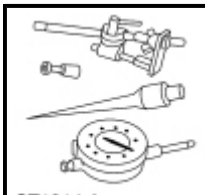


Camshaft Lobe Lift

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

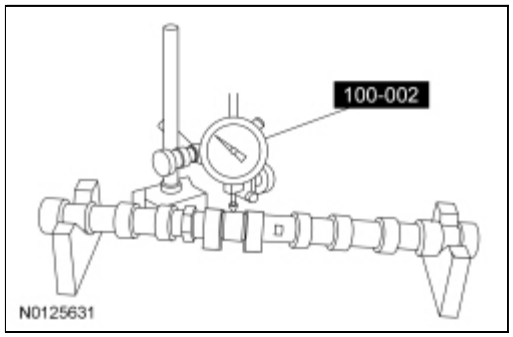
NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Use the Dial Indicator Gauge with Holding Fixture to measure camshaft intake/exhaust lobe lift.
   - Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading to figure the camshaft lobe lift.

repair4less

Camshaft Runout



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

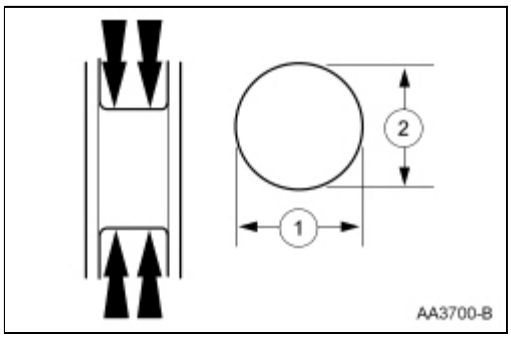
1. **NOTE:** Camshaft journals must be within specifications before checking runout.

   Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft runout.
   - Camshaft must be supported on the first and last camshaft bearing journal.
   - Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading.

repair4less

Camshaft Surface Inspection

1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.

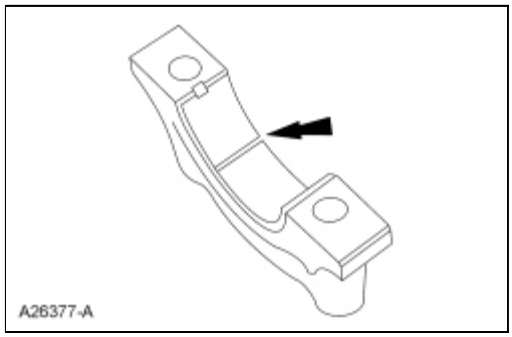


repair4less

Connecting Rod Bearing Journal Taper and Out-of-Round

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the crankshaft connecting rod journal diameters in 2 directions perpendicular to one another at each end of the connecting rod journal. The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.

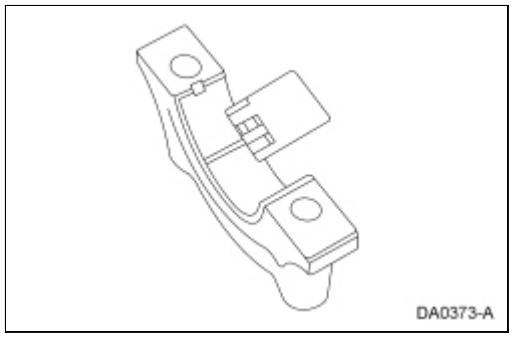


Connecting Rod Bearing Journal-to-Bearing Clearance

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

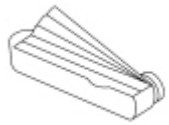
1. Remove the connecting rod bearing cap.



2. Position a piece of Plastigage across the bearing surface.

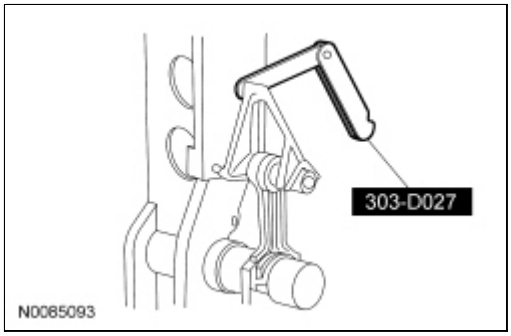
3. **NOTE:** Do not turn the crankshaft during this step.

   Install and tighten to specifications, then remove the connecting rod bearing cap.



4. Measure the Plastigage to get the connecting rod bearing journal clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged connecting rod or connecting rod bearing.

repair4less



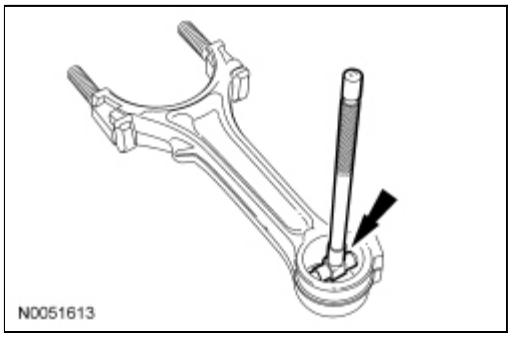
Connecting Rod Bend

Special Tool(s)

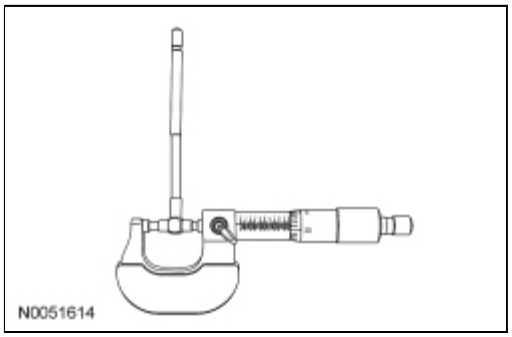
 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement is within specification.



repair4less

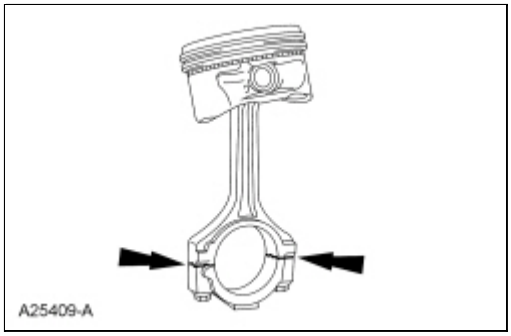


Connecting Rod Bushing Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Use a telescoping gauge to determine the ID of the connecting rod bushing, if equipped.

2. Measure the telescoping gauge with a micrometer. Verify the diameter is within specification.



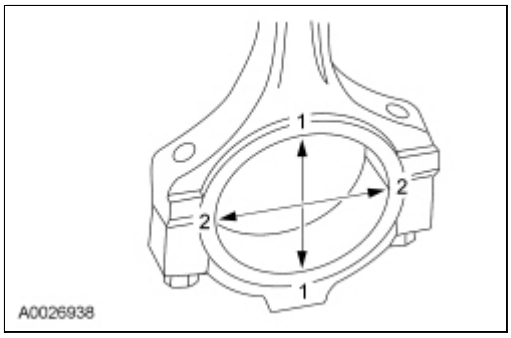
repair4less

Connecting Rod Cleaning

NOTICE: **Do not use a caustic cleaning solution or damage to connecting rods can occur.**

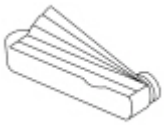
1. **NOTE:** The connecting rod large end is a matched set. The connecting rod cap must be installed on the original connecting rod in the original position. Do not reverse the cap. Parts are not interchangeable.

   Mark and separate the parts and clean with solvent. Clean the oil passages.



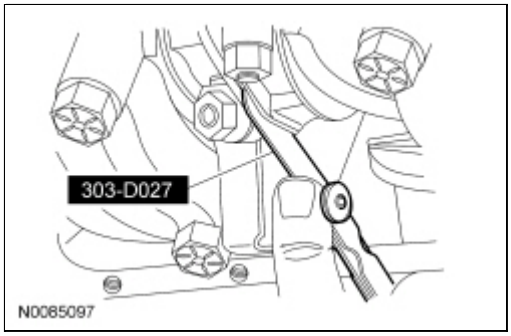
repair4less

Connecting Rod Large End Bore



NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Tighten the bolts to specification, then measure the bore in 2 directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

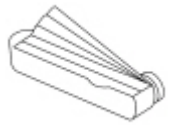


Connecting Rod to Crankshaft Side Clearance

Special Tool(s)

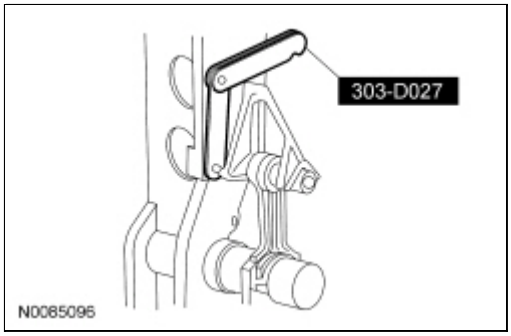
 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Using the Feeler Gauge Set, measure the clearance between the connecting rod and the crankshaft. Verify the measurement is within specification.

repair4less



Connecting Rod Twist

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is within specification.

repair4less

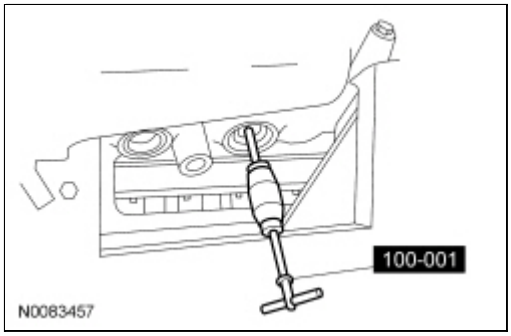
Core Plug Replacement

Special Tool(s)

 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
High Temperature Retaining Compound Loctite® 620™/Permatex® 62050, or equivalent; obtain locally	WSK-M2G349-A9
Threadlock 262 TA-26	WSK-M2G351-A6



NOTICE: **It is necessary to use High Temperature Retaining Compound Loctite® 620™/Permatex® 62050 or equivalent on all 3 valve modular engine cylinder head cup plugs. If not used, the cylinder head cup plugs could leak or seep, causing serious engine damage.**

NOTE: Use threadlock 262 on all other applications.

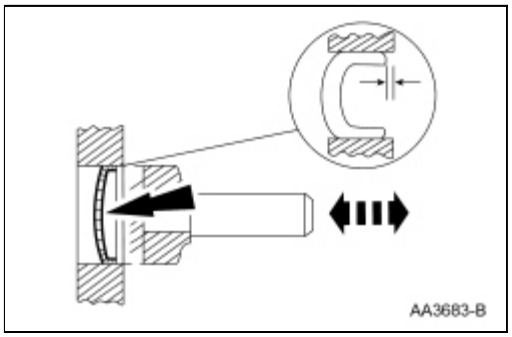
All core plugs

1. **NOTE:** Cylinder block core plug shown, cylinder head core plug similar.

   Use the Slide Hammer and a freeze plug remover to remove the core plug.

2. **NOTE:** Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

   Inspect the core plug bore for any damage that would interfere with the correct sealing of the plug. If the core plug bore is damaged, bore for the next oversize plug.



repair4less

Cup-type

3. ***NOTICE:*** **Use care during this procedure so as not to disturb or distort the cup sealing surface.**

   NOTE: When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

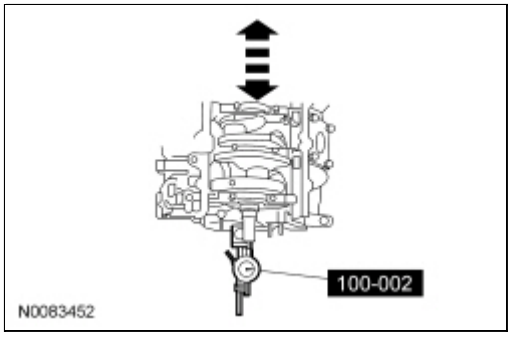
   Coat the cup-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

Expansion-type

4. ***NOTICE:*** **Do not contact the crown when installing an expansion-type core plug. This could expand the plug before seating and result in leakage.**

   Coat the expansion-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

repair4less



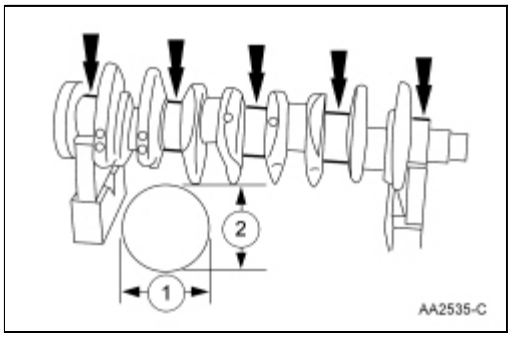
Crankshaft End Play

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

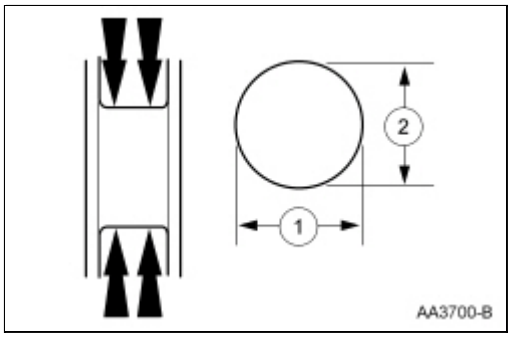
1. Install the Dial Indicator Gauge with Holding Fixture.
2. Position the crankshaft to the rear of the cylinder block.
3. Zero the Dial Indicator Gauge.
4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.



repair4less

Crankshaft Main Bearing Journal Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

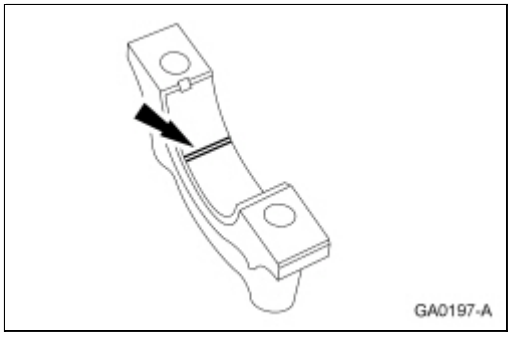


1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions.

Crankshaft Main Bearing Journal Taper and Out-of-Round

NOTE: Refer to the appropriate Section 303-01 for the specification.

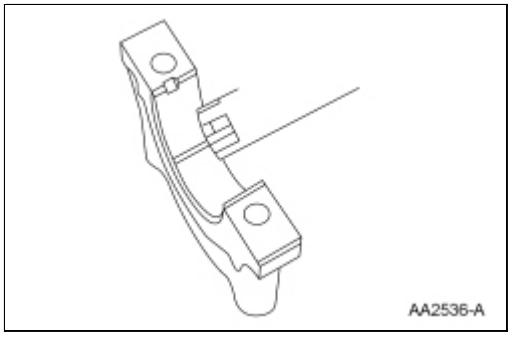
1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions at each end of the main bearing journal.



repair4less

Crankshaft Main Bearing Journal-to-Bearing Clearance

NOTE: Refer to the appropriate Section 303-01 for the specification.



NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.

1. Remove the crankshaft main bearing caps and crankshaft main bearing.
2. Lay a piece of Plastigage across the face of each crankshaft main bearing surface.

3. **NOTE:** Do not turn the crankshaft while carrying out this procedure.

   Install and remove the crankshaft main bearing cap.
4. Verify the crankshaft journal clearance.

repair4less

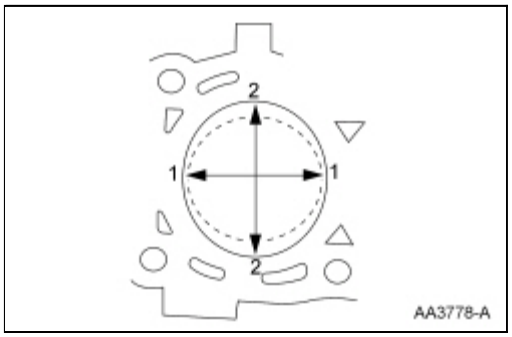
Cylinder Bore Cleaning

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

1. ***NOTICE:*** **If these procedures are not followed, rusting of the cylinder bores may occur.**

   Clean the cylinder bores with soap or detergent and water.



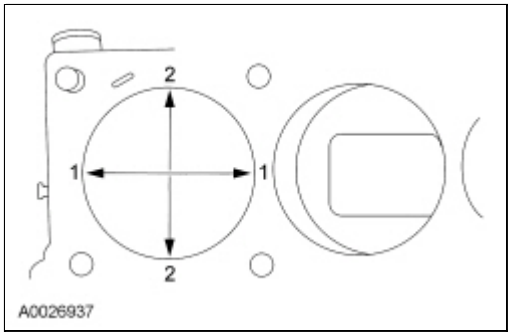
2. Thoroughly rinse with clean water and wipe dry with a clean, lint-free cloth.

3. Use a clean, lint-free cloth and lubricate the cylinder bores.
   - Use clean engine oil meeting Ford specification.

Cylinder Bore Out-of-Round

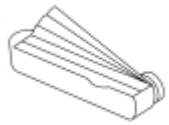
NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the cylinder bore in 2 directions. The difference is the out-of-round.



repair4less

Cylinder Bore Taper



NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the cylinder bore at the top, middle and bottom of piston ring travel in 2 directions as indicated. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. If the cylinder bore taper does not meet specification, bore the cylinder to the next oversize limit.

Cylinder Head Distortion

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, silicone sealant, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

   NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

   Using a Straightedge and a Feeler Gauge Set, inspect the cylinder head for flatness in the sequence shown.

repair4less

Exhaust Manifold Cleaning and Inspection

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

2. **NOTE:** New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

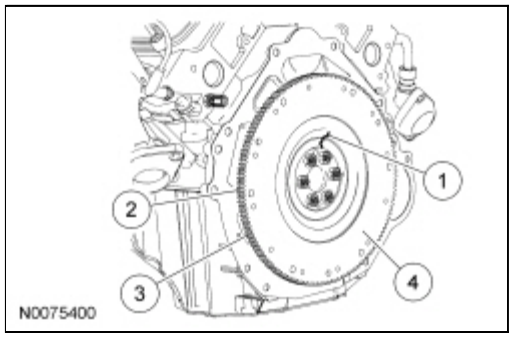
   NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

   Using the Straightedge and a Feeler Gauge Set, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold.

repair4less

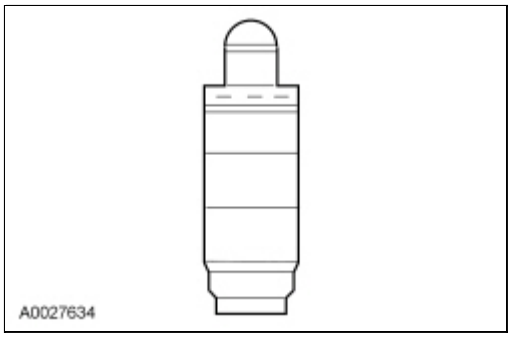
Flexplate Inspection

1. Inspect the flexplate for:
    1. any cracks.
    2. worn ring gear teeth.
    3. chipped or cracked ring gear teeth.



repair4less

Flywheel Inspection

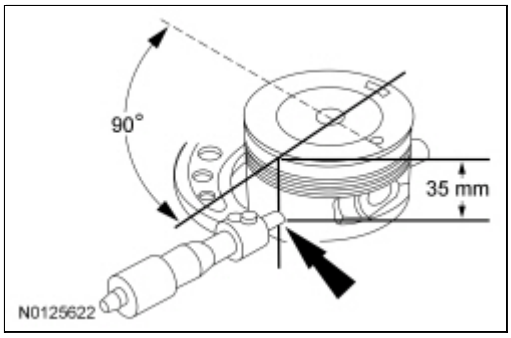


1. **NOTE:** The flywheel cannot be resurfaced, it must be replaced.

   Inspect the flywheel for:
   1. any cracks.
   2. worn ring gear teeth.
   3. chipped or cracked ring gear teeth.
   4. scratches, nicks and discoloration.

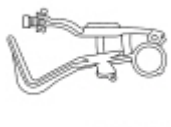
Hydraulic Lash Adjuster Inspection

1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.



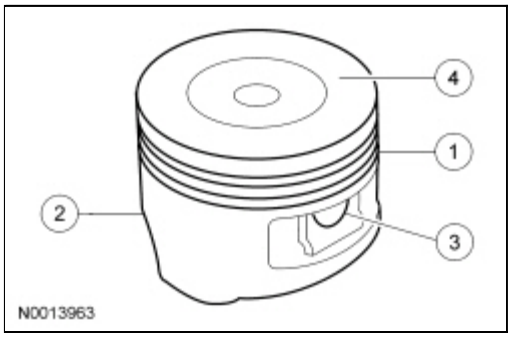
repair4less

Piston Diameter



NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston diameter 90 degrees from the piston pin and 35 mm (1.38 in) down from the top of the piston at the uncoated skirt area point indicated.



Piston Inspection

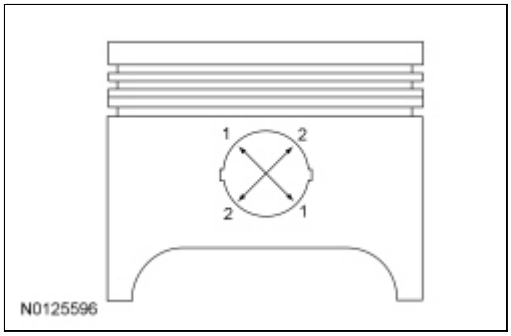
Special Tool(s)

 ST1279-A	Scraper, Piston Ring Groove 303-D033 (D81L-6002-D) or equivalent

NOTICE: **Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.**

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.

2. Use the Piston Ring Groove Scraper to clean the piston ring grooves.
   - Make sure the oil ring holes are clean.



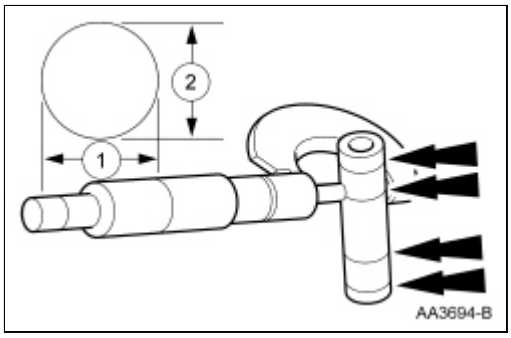
repair4less

Piston Pin Bore Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Piston and piston pins are a matched set and should not be interchanged.

   Measure the piston pin bore diameter in 2 directions on each side. Verify the diameter is within specification.



repair4less

Piston Pin Diameter

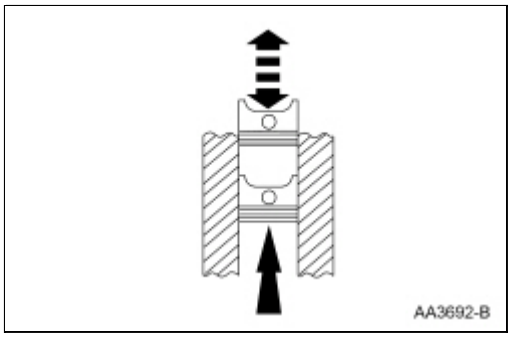
NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston pin diameter in 2 directions at the points shown. Verify the diameter is within specification.

Piston Ring End Gap

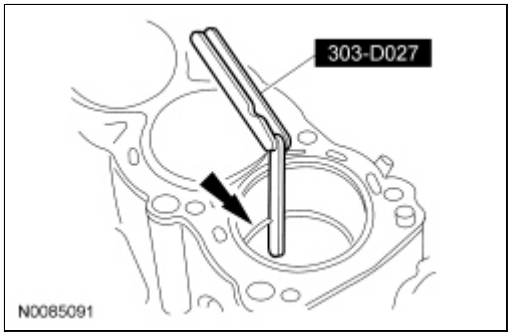
Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent



NOTICE: **Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.**

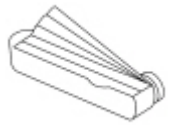
NOTE: Piston rings should not be transferred from one piston to another.



NOTE: Refer to the appropriate Section 303-01 for the specification.

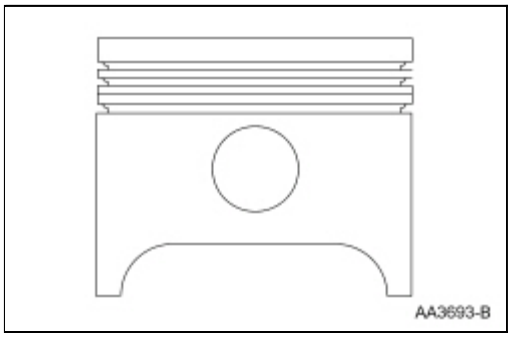
NOTE: The cylinder bore must be within specification for taper and out-of-round.

1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.



2. Use the Feeler Gauge Set to measure the top piston ring end gap and the second piston ring end gap.

repair4less



Piston Ring-to-Groove Clearance

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

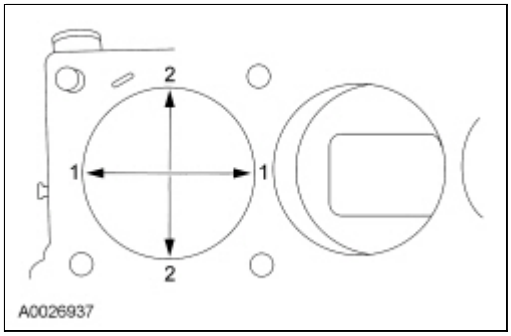
NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Inspect the piston for ring land damage or accelerated wear.

2. Using the Feeler Gauge Set, measure the piston ring-to-groove clearance.

repair4less

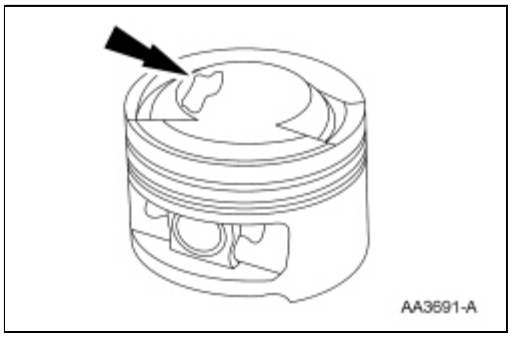
Piston Selection



3.5L, 3.7L and 5.0L (4V) Engines

1. Engines are equipped with a single grade size piston.

6.2L (2V) Engines



NOTE: The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.

2. Select a piston size based on the cylinder bore.

3. **NOTE:** For precision fit, new pistons are divided into 3 categories within each size range based on their relative position within the range. A paint spot or specific size grade on a new piston indicates the position within the size range.

   Choose the piston with the correct paint color or specific size grade.
   - Refer to the appropriate section in Group 303 for the procedure.

repair4less

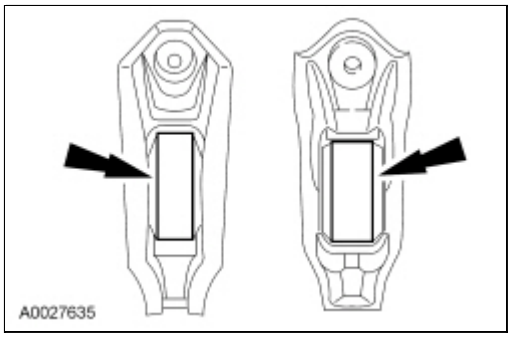
Piston To Cylinder Bore Clearance

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.

repair4less

Powertrain/Drivetrain Mount Neutralizing

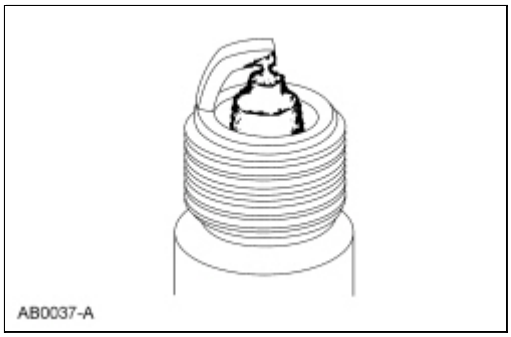


NOTE: Refer to the appropriate section and procedure for special instructions on loosening and tightening mount fasteners.

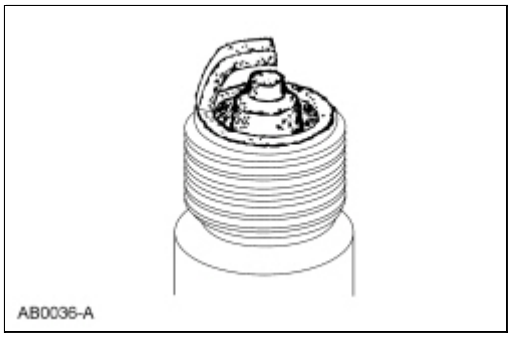
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.
4. ***NOTICE:*** **Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.**

   Start the vehicle and move it in forward 0.6-1.2 m (2-4 ft). Then move the vehicle in reverse the same distance.
5. Raise and support the vehicle.
6. Tighten the powertrain/drivetrain mount fasteners.
7. Lower the vehicle.
8. Test the system for normal operation.

Roller Follower Inspection

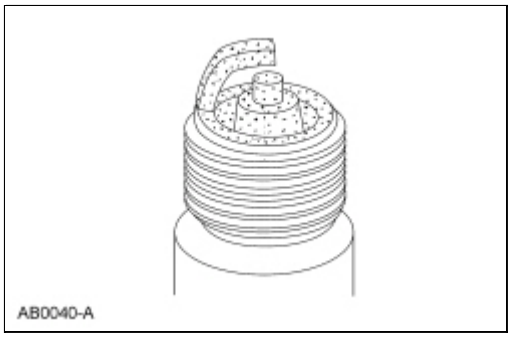


1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

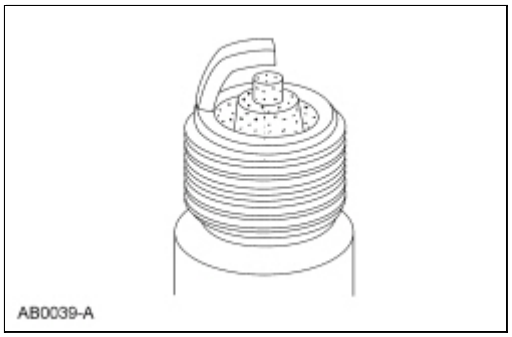


repair4less

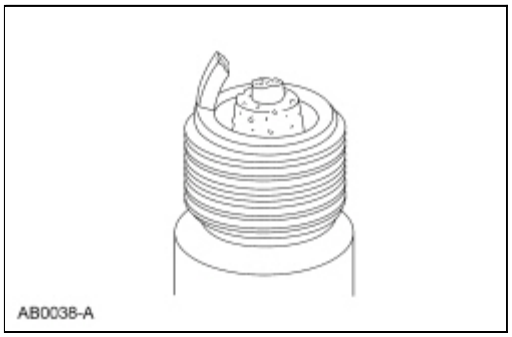
Spark Plug Inspection



1. Inspect the spark plug for a bridged gap.
    - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
    - Install a new spark plug.

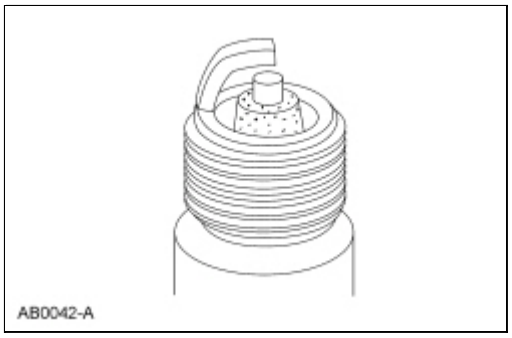


2. Check for oil fouling.
    - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
    - Correct the oil leak concern.
    - Install a new spark plug.

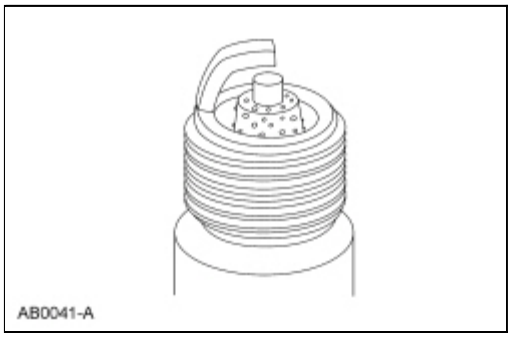


3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
    - Install new spark plugs.

4. Inspect for normal burning.
    - Check for light tan or gray deposits on the firing tip.

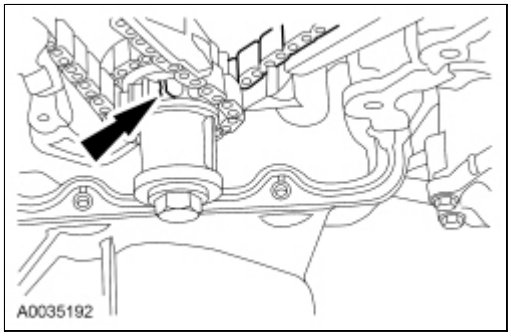


5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a heli-coil insert in place of the spark plug threads.
    - Install a new spark plug.



6. Inspect for overheating, identified by white or light gray spots and a bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.
    - Install a new spark plug.

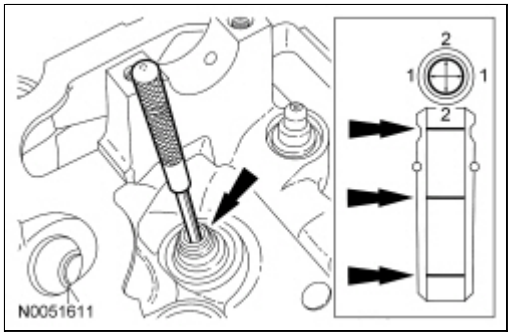
repair4less



7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.
    - Install new spark plugs.

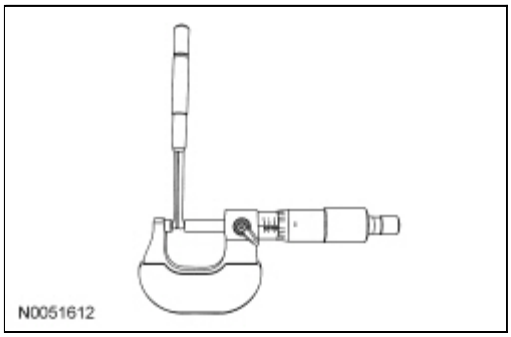
Sprockets

1. Inspect the sprockets for cracks and worn or chipped teeth.



repair4less

Valve Guide Inner Diameter

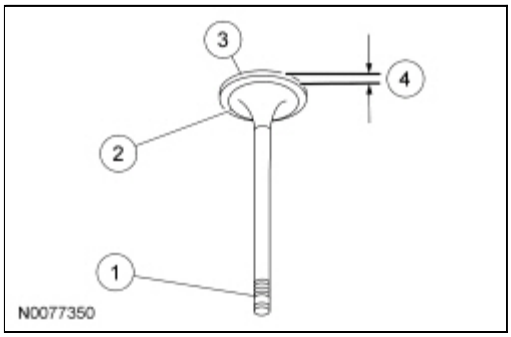


NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide, if necessary.

   Use a ball gauge to determine the inside diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

2. Measure the ball gauge with a micrometer.

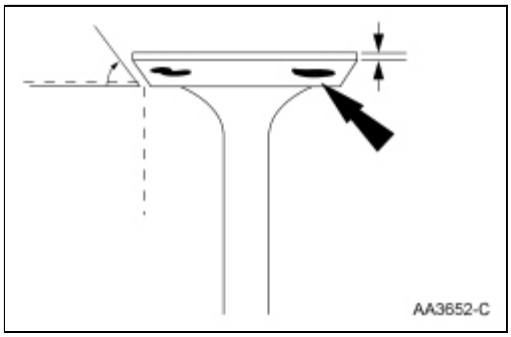


3. If the valve guide is not within specifications, install a new cylinder head assembly.

repair4less

Valve Inspection

1. Inspect the following valve areas:
    1. The end of the stem for grooves or scoring.
    2. The valve face and the edge for pits, grooves or scores.
    3. The valve head for signs of burning, erosion, warpage and cracking.
    4. The valve margin for wear.



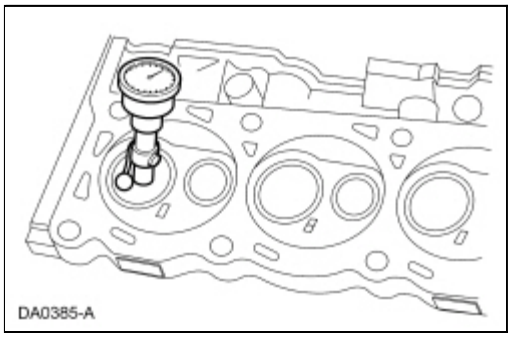
Valve Seat Inspection

Valve and Seat Refacing Measurements

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
    - Check valve angles.
    - Check margin width.
    - Be sure margin width is within specification.



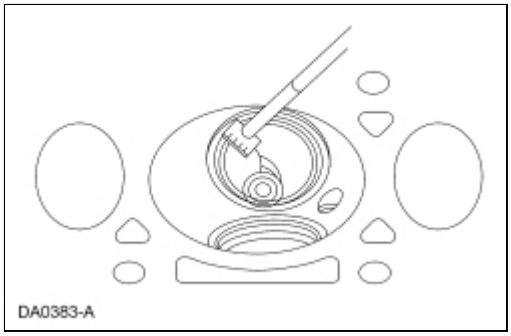
2. Inspect for abnormalities on the valve face and seat. Install a new cylinder head assembly if abnormalities are found.

repair4less

Valve Seat Runout

NOTE: Refer to the appropriate Section 303-01 for the specification.

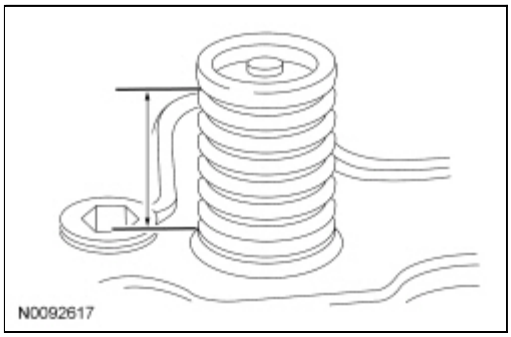
1. Use a valve seat runout gauge to check valve seat runout.



repair4less

Valve Seat Width

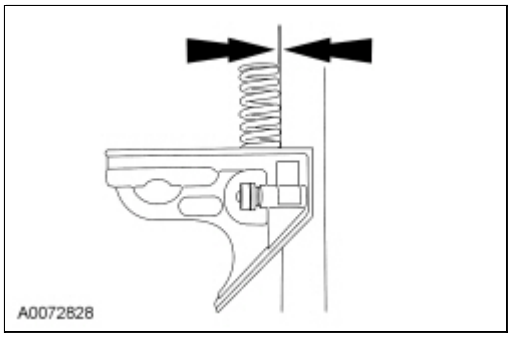
NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Measure the valve seat width. If necessary, grind the valve seat to specification.
    - Measure the intake valve seat width.
    - Measure the exhaust valve seat width.
    - Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.
    - Depending on the engine, check the valve lash. Refer to General Procedures in Section 303-01.

Valve Spring Installed Length

NOTE: Refer to the appropriate Section 303-01 for the specification.

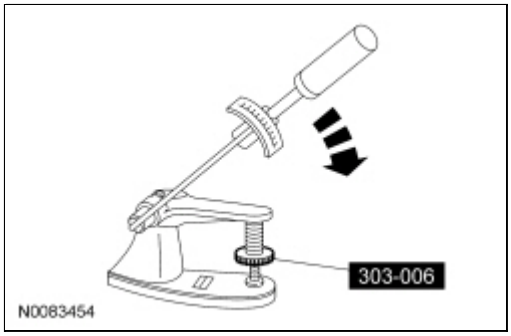


1. Measure the installed length of each valve spring.

repair4less

Valve Spring Squareness

1. Measure the out-of-square on each valve spring.
    - Turn the valve spring and observe the space between the top of the valve spring and the square.



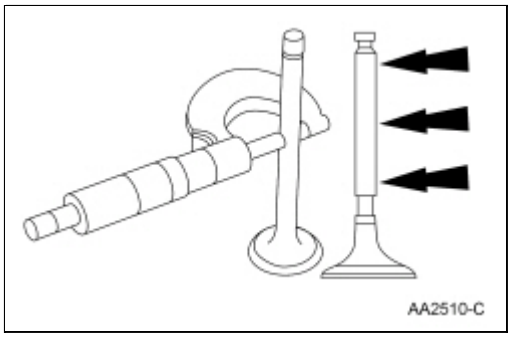
Valve Spring Strength

Special Tool(s)

 ST1278-A	Pressure Gauge, Valve/Clutch Spring 303-006 (TOOL-6513-DD) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

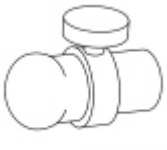
1. Use the Valve/Clutch Spring Pressure Gauge to check the valve spring for correct strength at the specified valve spring length.

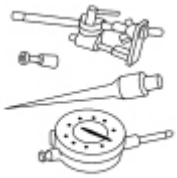


repair4less

Valve Stem Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.





1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.

repair4less

Valve Stem to Valve Guide Clearance

Special Tool(s)

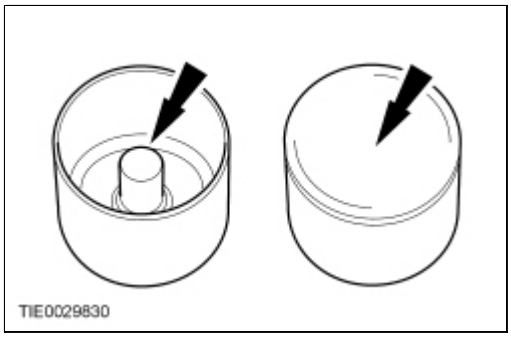
 ST1251-A	Clearance Gauge, Valve Guide 303-004 (TOOL-6505-E) or equivalent
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: The valve stem diameter must be within specifications before checking valve stem-to-valve guide clearance.

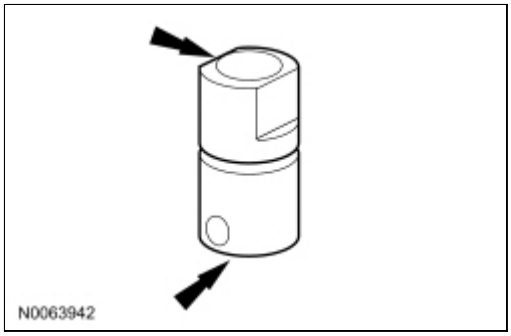
1. **NOTE:** If necessary, use a magnetic base.

   Install a Valve Guide Clearance Gauge on the valve stem and install a Dial Indicator Gauge with Holding Fixture. Lower the valve until the clearance gauge contacts the upper surface of the valve guide.



2. Move the Valve Guide Clearance Gauge toward the Dial Indicator Gauge with Holding Fixture and zero the Dial Indicator Gauge. Move the Valve Guide Clearance Gauge away from the Dial Indicator Gauge with Holding Fixture and note the reading. The reading will be DOUBLE the valve stem-to-valve guide clearance.

repair4less



Valve Tappet Inspection

OHC engines

1. Inspect the valve tappet for damage, especially in the indicated areas. If any damage is evident, inspect the camshaft lobes and valves for damage. Replace components as necessary.

Push rod engines

repair4less

General Specifications

Item	Specification
Engine	
Displacement	3.5L Gasoline Turbocharged Direct Injection (GTDI) (214 CID)
No. cylinders	6
Bore/stroke	92.5/86.7 mm (3.641/3.413 in)
Fire order	1-4-2-5-3-6
Spark plug	12405
Spark plug gap	0.889 mm (0.035 in)
Oil pressure	Minimum 30 psi @ 1,500 rpm with engine at normal operating temperature

Compression ratio	10.0:1
Engine weight (without accessory drive components)	189.01 kg (416.7 lb)
Cylinder Head and Valve Train	
Cylinder head gasket surface flatness	Flat within 0.08 mm (0.003 in) length end to end; area 150 mm (5.9 in) x 150 mm (5.9 in) (or full width) should be less than 0.05 mm (0.002 in)
Combustion chamber volume	55.84 cc (3.41 CI)
Valve tappet clearance — intake	0.15-0.25 mm (0.006-0.01 in)
Valve tappet clearance — exhaust	0.360-0.460 mm (0.0142-0.0181 in) Engine must be at room temperature before measuring
Valve guide bore inner diameter	5.519-5.549 mm (0.217-0.218 in)
Valve stem diameter — intake	5.479-5.497 mm (0.2157-0.2164 in)
Valve stem diameter — exhaust	5.466-5.484 mm (0.2151-0.2159 in)
Valve stem-to-guide clearance — intake	0.022-0.070 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance — exhaust	0.035-0.083 mm (0.0013-0.032 in)
Valve head diameter — intake	36.82-37.18 mm (1.44-1.46 in)
Valve head diameter — exhaust	30.82-31.18 mm (1.21-1.22 in)
Valve face runout	0.05 mm (0.0001 in)
Valve face angle	45.75-45.25 degrees
Valve seat width — intake	1.3-1.6 mm (0.051-0.063 in)
Valve seat width — exhaust	1.7-2.0 mm (0.067-0.079 in)
Valve seat runout	0.04 mm (0.0001 in) MAX
Valve seat angle	44.5-45.5 degrees
Valve spring free length (approx.)	55.16 mm (2.17 in)
Valve spring compression pressure (N @ spec. length)	465 N @ 28.0 mm (105 lb @ 1.10 in)
Valve spring installed height	37.0 mm (1.45 in)
Valve spring installed height pressure (N @ spec. length)	265 N @ 37.0 mm (60 lb @ 1.45 in)
Valve spring installed pressure — service limit	10% force loss @ specified height
Camshaft	
Theoretical valve lift @ 0 lash	9.49 mm (0.373 in)
Lobe lift — intake	9.49 mm (0.373 in)
Lobe lift — exhaust	9.49 mm (0.373 in)
Allowable lobe lift loss	0.062 mm (0.0024 in)
Camshaft journal bore inside diameter — 1st journal	39.0375-39.0625 mm (1.537-1.538 in)
Camshaft journal bore inside diameter — intermediate journals	25.9875-26.0125 mm (1.023-1.024 in)

repair4less

Camshaft bearing outside diameter — 1st journal	38.990-39.010 mm (1.535-1.536 in)
Camshaft bearing outside diameter — intermediate journals	25.937-25.963 mm (1.021-1.022 in)
Camshaft journal-to-bearing clearance, 1st journal — service limit	0.0725 mm (0.0029 in) MAX
Camshaft journal-to-bearing clearance, intermediate journals — service limit	0.0755 mm (0.0029 in) MAX
Runout	0.040 mm (0.0015 in) MAX
End play — standard	0.032-0.170 mm (0.0012-0.0066 in)
End play — service limit	0.190 mm (0.00748 in) MAX
Cylinder Block	
block main bore roundness	0.008 mm (0.003 in)
Cylinder bore diameter — grade 1	92.500-92.520 mm (3.641-3.642 in)
Cylinder bore roundness	0.013 mm (0.0005 in)
Cylinder bore taper	0.010 mm (0.0004 in) per 25.4 mm (1.000 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.8503-2.8513 in)
Head gasket surface flatness	Flat within 0.150 mm (0.005 in) overall 0.050 mm (0.001 in) per 150 mm (5.905 in) x 150 mm (5.905 in); 0.025 mm (0.0009 in) per 25 mm (0.984 in) x 25 mm (0.984 in)
Crankshaft	
Main bearing journal diameter	67.5 mm (2.657 in)
Main bearing journal maximum taper	0.004 mm (0.00015 in)
Main bearing journal maximum out-of-round	0.006 mm (0.00023 in)
Main bearing journal-to-cylinder block clearance	0.026-0.041 mm (0.0010-0.0016 in)
Connecting rod journal diameter	55.983-56.003 mm (2.204-2.205 in)
Connecting rod journal maximum taper	0.004 mm (0.00015 in)
Connecting rod journal maximum out-of-round	0.006 mm (0.00023 in)
Crankshaft maximum end play	0.101-0.291 mm (0.0039-0.0114 in)
Piston and Connecting Rod	
Piston diameter — single grade	92.476-92.490 mm (3.6407-3.6413 in)
Piston-to-cylinder bore clearance	0.010 to 0.044 mm (0.0003-0.0017 in)
Piston ring end gap — compression (top, gauge diameter)	0.17-0.27 mm (0.0067-0.0106 in)
Piston ring end gap — compression (bottom, gauge diameter)	0.30-0.55 mm (0.0118-0.0216 in)
Piston ring end gap — oil ring (steel rail, gauge diameter)	0.15-0.45 mm (0.0059-0.0177 in)
Piston ring groove width — compression (top)	1.230-1.25 mm (0.0484-0.0492 in)

Piston ring groove width — compression (bottom)	1.530-1.55 mm (0.0602-0.0610 in)
Piston ring groove width — oil ring	2.53-2.55 mm (0.0996-0.1003 in)
Piston ring width — upper compression ring	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring width — lower compression ring	1.47-1.49 mm (0.0578-0.0586 in)
Piston ring-to-groove clearance (upper and lower compression rings)	0.040-0.080 mm (0.0.0014-0.0031 in)
Piston pin bore diameter	23.004-23.008 mm (0.9056-0.9058 in)
Piston pin diameter	22.997-23.000 mm (0.9053-0.9055 in)
Piston pin length	2.343 in (59.512 mm)
Piston pin-to-piston fit	0.004-0.011 mm (0.00015-0.00043 in)
Piston-to-connecting rod clearance	3.3 mm (0.13 in)
Connecting rod-to-pin clearance — standard	0.007-0.022 mm (0.0002-0.0009 in)
Connecting rod pin bore diameter	23.007-23.019 mm (0.905-0.906 in)
Connecting rod length (center-to-center)	152.68 mm (6.01 in)
Connecting rod maximum allowed bend	0.038 mm (0.0014 in)
Connecting rod maximum allowed twist	0.050 mm (0.0019 in)
Connecting rod bearing bore diameter — grade 1	59.866-59.872 mm (2.3569-2.3571 in)
Connecting rod bearing bore diameter — grade 2	59.873-59.879 mm (2.3572-2.3574 in)
Connecting rod bearing bore diameter — grade 3	59.880-59.886 mm (2.3574-2.3577 in)
Connecting rod bearing-to-crankshaft clearance	0.020-0.054 mm (0.0007-0.0021 in)
Connecting rod side clearance (assembled to crank) — standard	0.175-0.425 mm (0.0068-0.0167 in)
Connecting rod side clearance (assembled to crank) — service limit	0.175-0.425 mm (0.0068-0.0167 in)

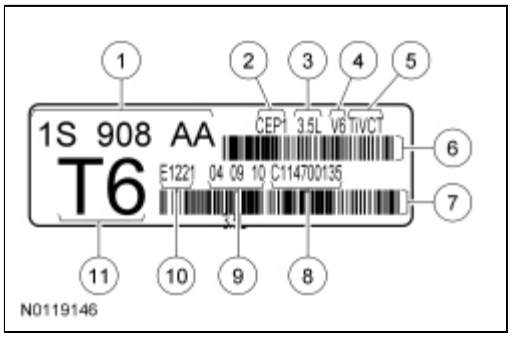
[a] Tighten to 20 Nm (177 lb-in) plus an additional 180 degrees.
[b] Tighten to 10 Nm (89 lb-in) plus an additional 720 degrees
[c] Discard original plug and O-ring seal. Install a new plug and O-ring seal to specified torque, no sealer or lubricant required.
[d] Refer to the procedure in this section.
[e] Tighten to 5 Nm (44 lb-in) plus an additional 180 degrees.
[f] 20 Nm (177 lb-in) plus an additional 60 degrees
[g] Refer to the assembly procedure in this section.

repair4less

Engine

The 3.5L Gasoline Turbocharged Direct Injection (GTDI) (4V) is a V-6 engine with the following features:

- Dual overhead camshafts
- Four valves per cylinder
- GTDI
- A composite intake manifold
- Aluminum cylinder heads
- An aluminum, 60-degree V-cylinder block
- Twin independent Variable Camshaft Timing (VCT) system
- The electronic ignition system with 6 ignition coils

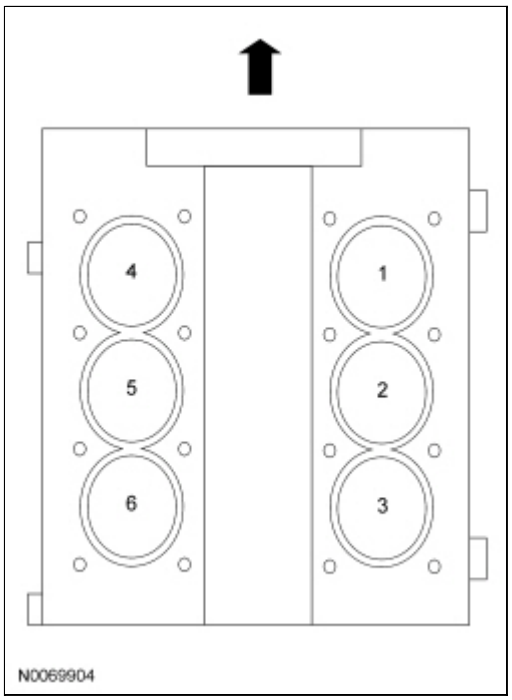


Engine Identification

For quick identification, refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.

Engine Code Information Label



The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Engine plant (Cleveland)
3	Engine displacement
4	Engine configuration
5	Twin independent Variable Camshaft Timing (VCT)
6	Bar code

7	Bar code
8	Running number
9	Engine build date (DDMMYY)
10	Plant shift line
11	Derivative code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The GTDI is Pulse Width Modulated (PWM).

Fuel is metered directly into each combustion chamber. Fuel injectors pulse to follow engine firing order, in accordance with engine demand.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

repair4less

Valve Train

The valve train uses Direct Acting Mechanical Buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Twin Independent Variable Camshaft Timing (VCT) System

The twin independent VCT system allows variable control of intake valve closing which optimizes combustion at full load providing improved power and low speed torque (broadening the torque curve) which enables variable valve overlap which provides better fuel economy and emissions and provides optimized cold start operation with improved exhaust emissions.

PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

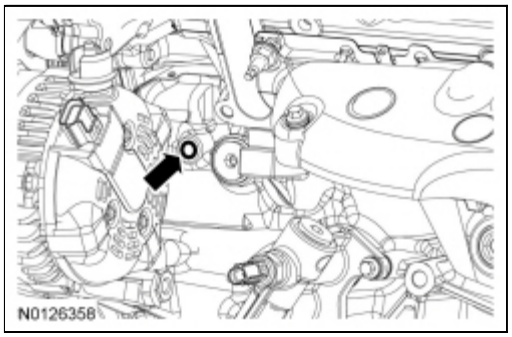
Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, piston cooling jets, turbochargers, timing chain tensioners and VCT solenoids. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the cylinder head, front camshaft cap.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump.



Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Cooling System

The engine cooling system includes the following:

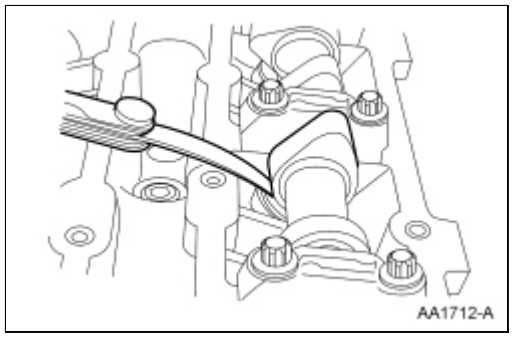
- Radiator
- Belt driven coolant pump
- Electric fan assembly(s)
- Degas bottle (aids in maintaining the correct volume of engine coolant)
- Coolant thermostat
- Coolant hoses

The channel cover plate is located under the engine front cover mounted to the cylinder block. It contains a timing chain idler and press-in-place gaskets separating engine coolant and engine oil. A weep hole is provided on the front left side of the engine behind the generator. If oil or coolant is leaking from the weep hole, then a gasket has failed and must be replaced.

---

repair4less

Engine



For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Valve Clearance Check

1. Remove the valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.

2. **NOTE:** Engine must be at room temperature before measuring. The valve clearance must be measured with the camshaft at base circle. The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.

   Use a feeler gauge to measure the clearance of each valve and record its location. A midrange clearance is the most desirable:
   - Intake: 0.15-0.25 mm (0.006-0.01 in)
   - Exhaust: 0.360-0.460 mm (0.0142-0.0181 in)

3. **NOTE:** The number on the valve tappet reflects the thickness of the valve tappet. For example, a tappet with the number 3.310 has the thickness of 3.31 mm (0.13 in).

   If any of the valve clearances are out of specification, select new tappets using this formula: tappet thickness = measured clearance + the base tappet thickness - most desirable thickness.
   Select the tappets and mark the installation location.

4. If required, install the new selected valve tappets in the marked locations. For additional information, refer to Valve Tappets in this section.

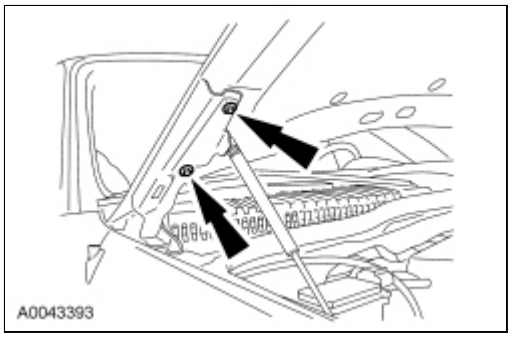
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-



repair4less

02 .

2. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

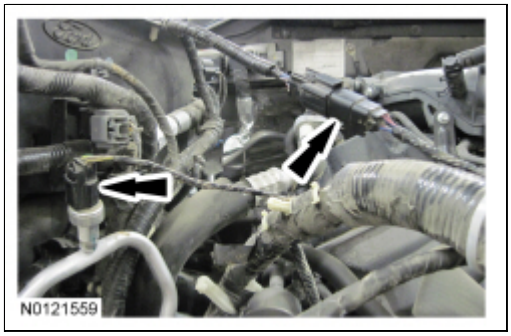
   NOTE: RH shown, LH similar.

   Remove the 4 bolts (2 shown) and the hood.

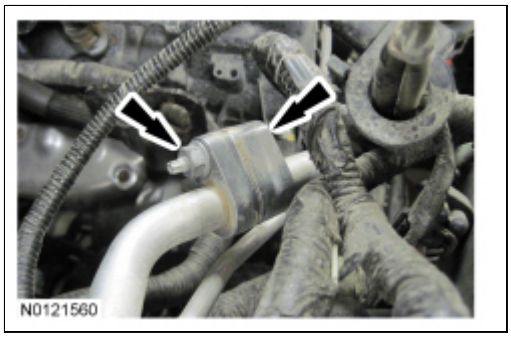
3. Release the fuel system pressure. For additional information, refer to Section 310-00 .

4. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

5. If equipped, disconnect the block heater electrical connector at the thermostat housing.
   - Detach the block heater wiring harness retainer from the LH valve cover stud bolt and position aside.

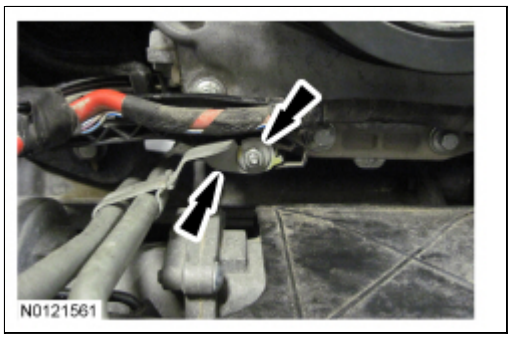


6. Remove the cooling module. For additional information, refer Section 303-03 .



7. Remove the LH and RH turbocharger intake tubes. For additional information, refer to 3.5L Gasoline Turbocharged Direct Injection (GTDI) Charge Air Cooler (CAC) and Tubes Exploded View in Section 303-12 .

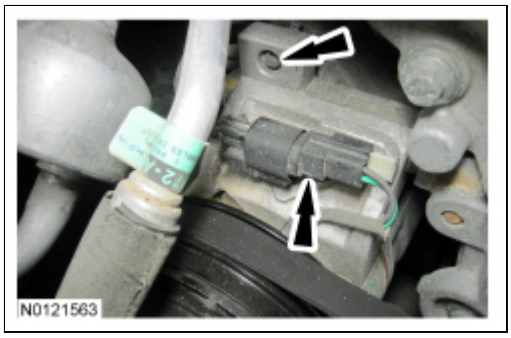
8. Remove the 2 Charge Air Cooler (CAC) inlet tubes and the CAC outlet tube. For additional information, refer to 3.5L Gasoline Turbocharged Direct Injection (GTDI) Charge Air Cooler (CAC) and Tubes Exploded View in Section 303-12 .



9. Disconnect the Battery Junction Box (BJB) wiring harness and the A/C pressure transducer electrical connectors.

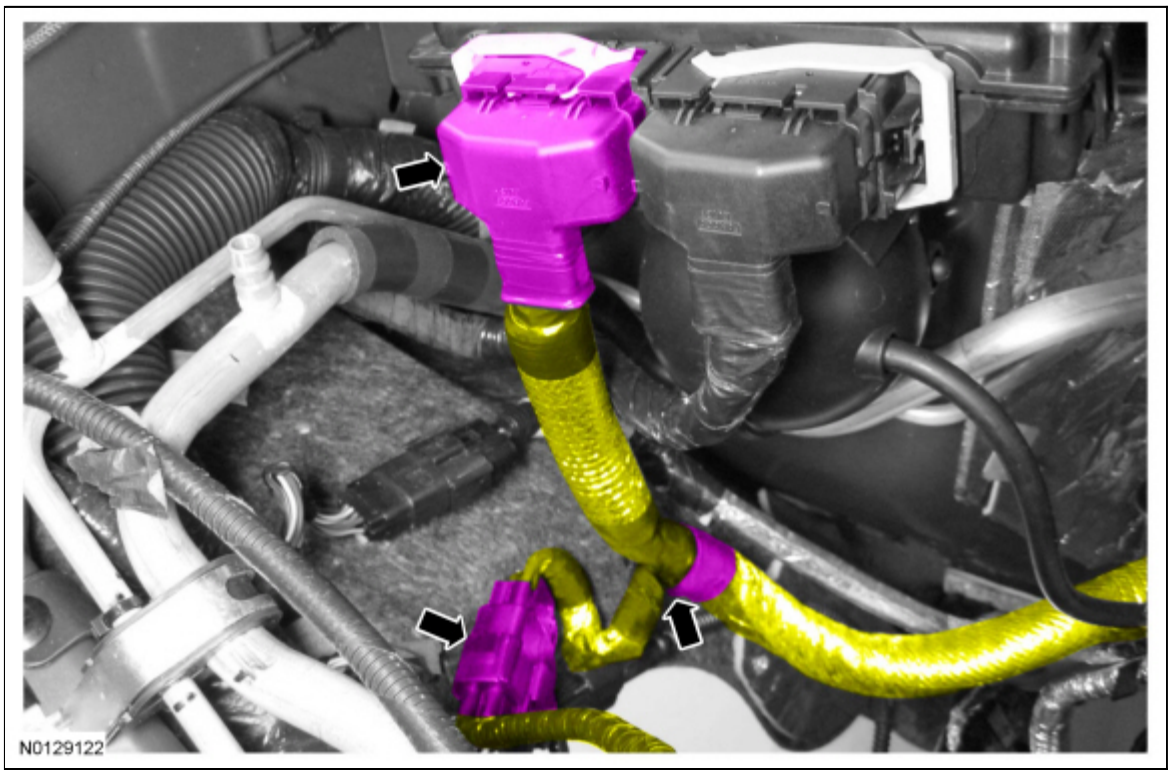
10. Remove the nut and disconnect the A/C tube.
    - Discard the O-ring seal and gasket seal.

11. Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.



12. Detach the generator wiring harness from the engine front cover.

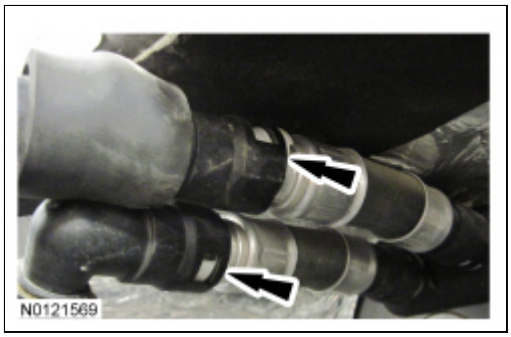
13. Disconnect the A/C compressor electrical connector.
    - Detach the A/C compressor wiring harness from the A/C compressor.



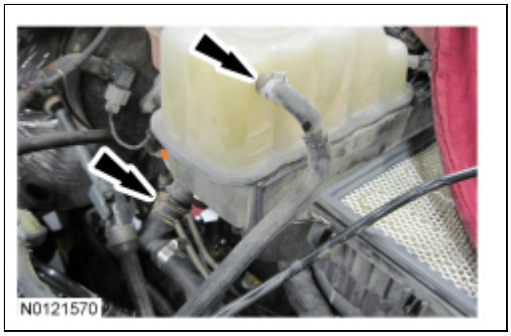
repair4less

14. Remove the generator. For additional information, refer to Section 414-00 .

15. Remove the A/C compressor belt. For additional information, refer to Section 303-05 .

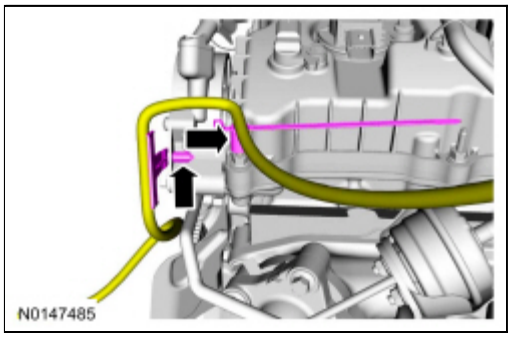


16. Disconnect the PCM electrical connector and the engine wire harness electrical connector.
    - Detach the wiring harness retainers from the fender splash shield.

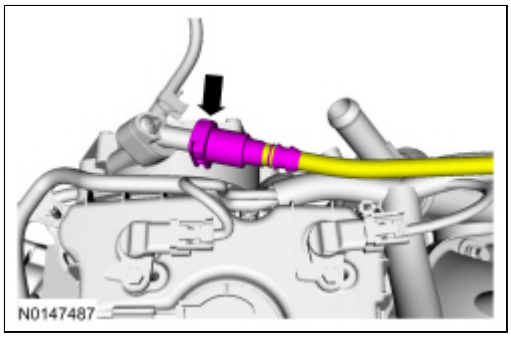


17. Remove the fuel injection pump. For additional information, refer to Section 303-04A .

18. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.

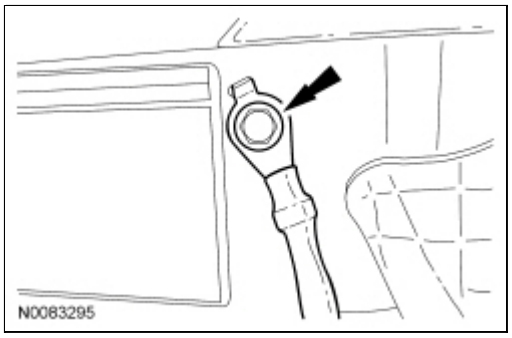


19. Disconnect the 2 heater hose couplings at the RH rear of the engine.



20. Disconnect the 2 coolant hoses from the degas bottle.

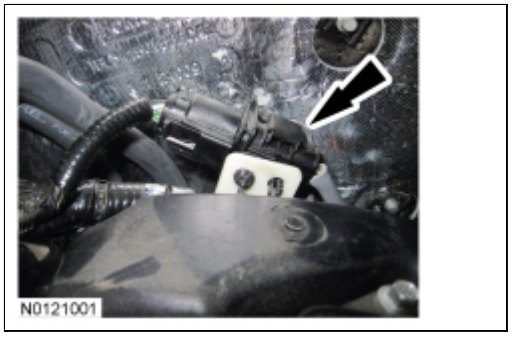
21. Detach the wiring harness retainers from the rear of the RH valve cover stud bolt and the rear of the vacuum pump.



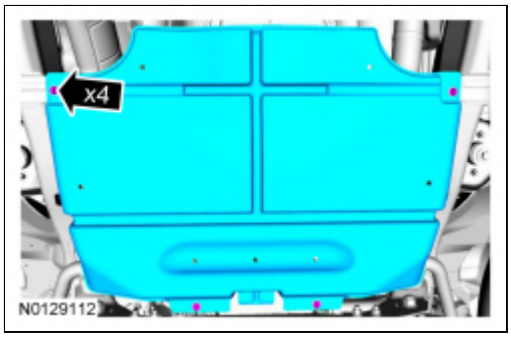
22. Disconnect the vacuum pump tube and position aside.

23. Remove the bolt and the ground strap from the cowl.

repair4less

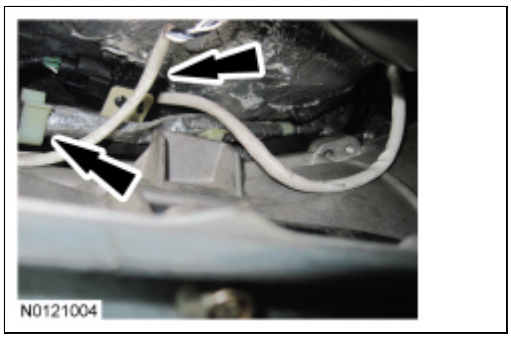


24. Remove the cowl panel grille. For additional information, refer to Section 501-02 .



25. Remove the 6 screws and release the 2 cowl panel clips and remove the cowl panel.

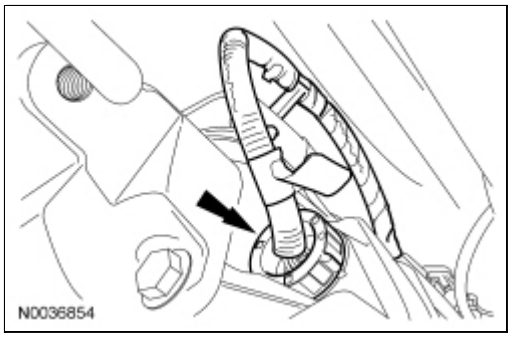
26. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector from the engine wiring harness at the rear of the LH cylinder head.
    - Disconnect the HO2S electrical connector from the wiring harness retainer.



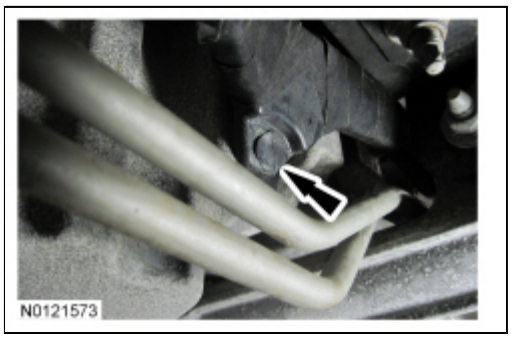
27. Release the 4 fasteners and the splash shield.

28. **NOTE:** Only one wire harness retainer and one electrical connector shown, others similar.

    Disconnect the 2 HO2S electrical connectors.
    - Disconnect the 2 HO2S electrical connector retainers.
    - If equipped, disconnect the 5 transmission wire harness retainers from the transfer case wire harness.

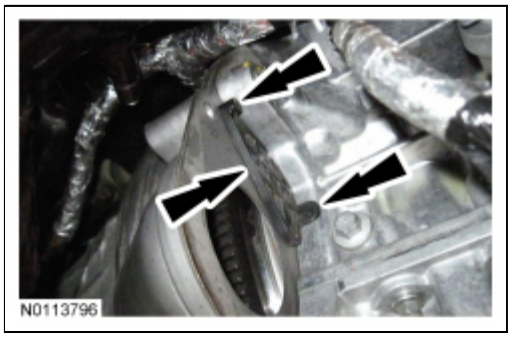


29. Disconnect the HO2S electrical connector at the LH rear of the transmission.
    - Disconnect the electrical connector retainer from the bracket at the rear of the transmission.



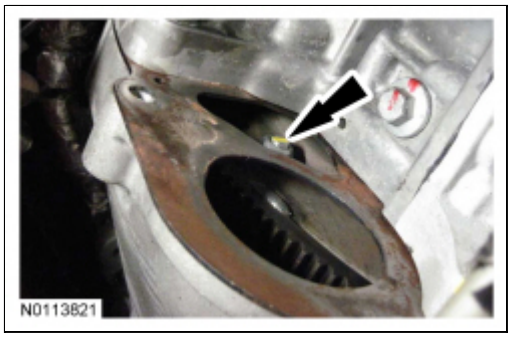
30. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

    Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.

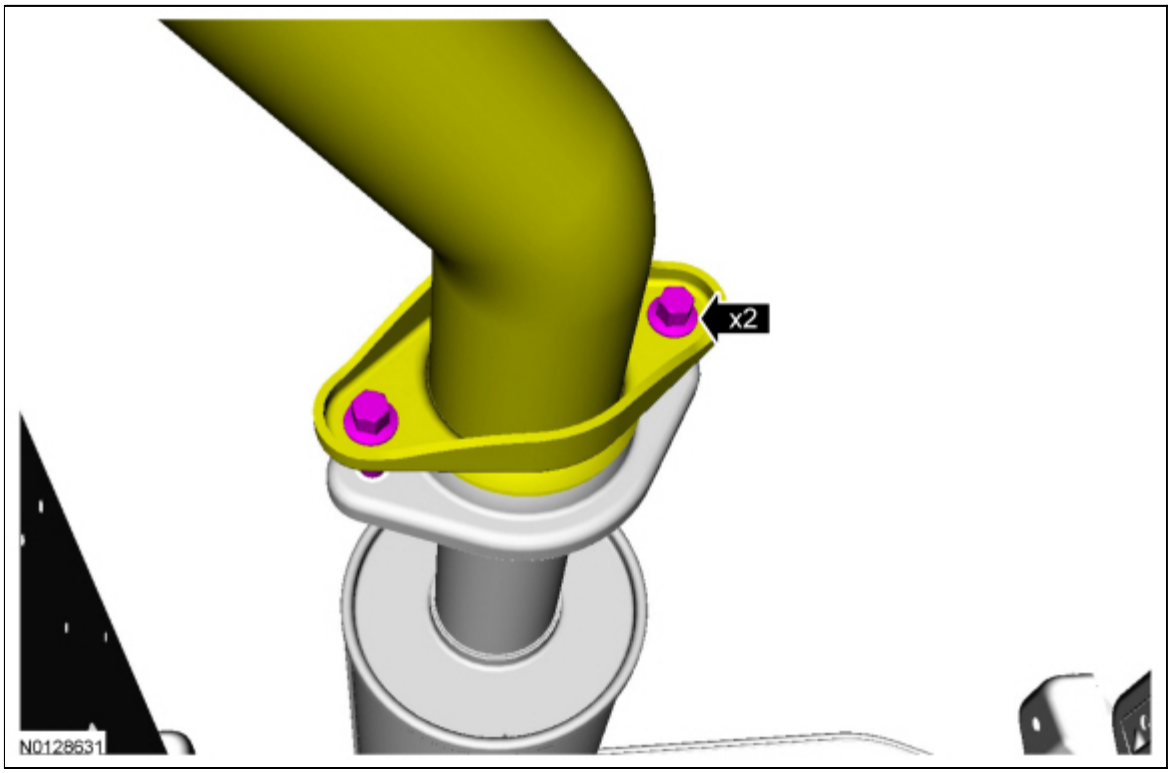


repair4less

31. Remove the 4 bolts and the skid plate.
32. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .
33. Remove the starter motor. For additional information, refer to Section 303-06 .
34. Detach the starter motor wiring harness retainer from the oil pan.

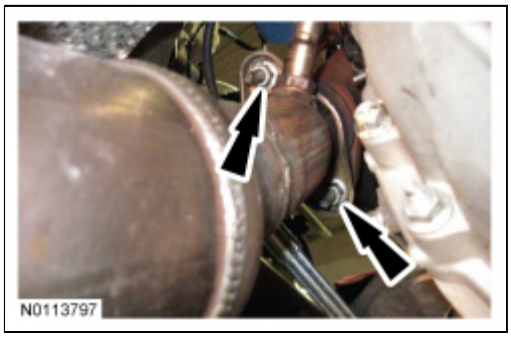


35. Remove the 2 pin-type retainers and the access cover.

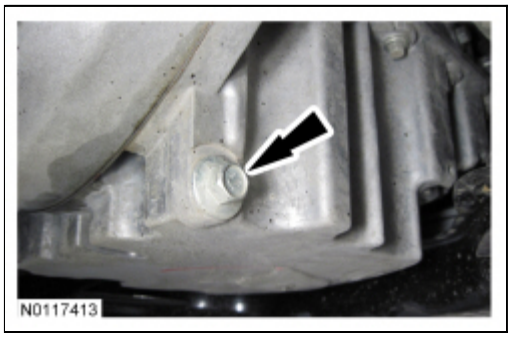


36. **NOTE:** Index-mark the end of one torque converter stud and the flexplate for installation.

    Remove the 4 torque converter nuts.



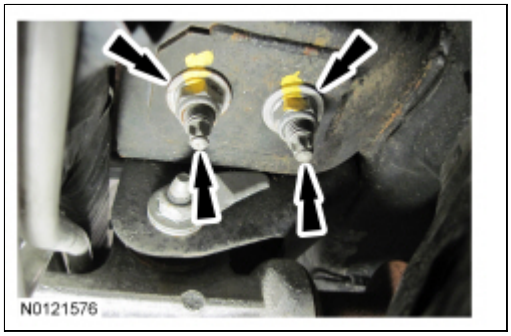
37. Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the bolts.



38. **NOTE:** LH shown, RH similar.

    Remove and discard the 2 LH and RH catalytic converter-to-exhaust manifold nuts.

repair4less

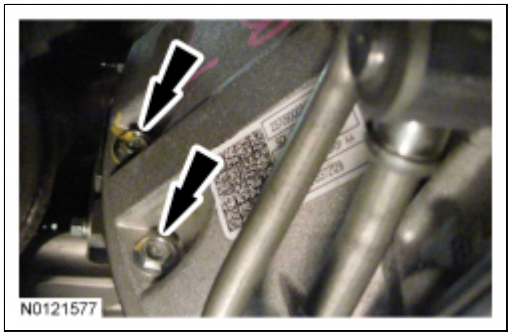


39. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).

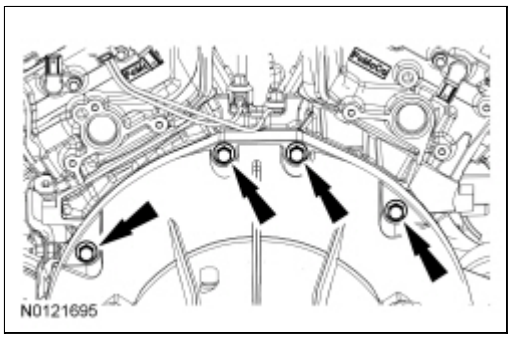
40. Remove and discard the engine oil filter.

41. ***NOTICE:*** **Only use hand tools when removing the engine support insulator nuts and studs or damage to the engine support insulator can occur.**

    Remove and discard the 2 RH engine support insulator nuts and the 2 studs.

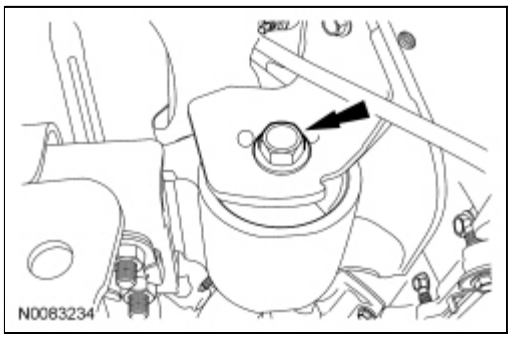


42. Remove the engine-to-bellhousing bolt.



43. Remove the oil pan-to-bellhousing bolt.

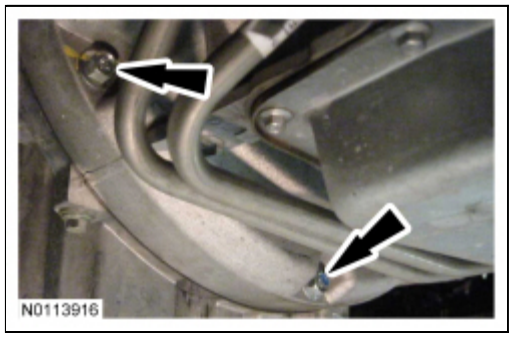
44. Remove the 2 LH bellhousing-to-engine bolts.



45. Remove the 4 upper bellhousing-to-engine bolts.

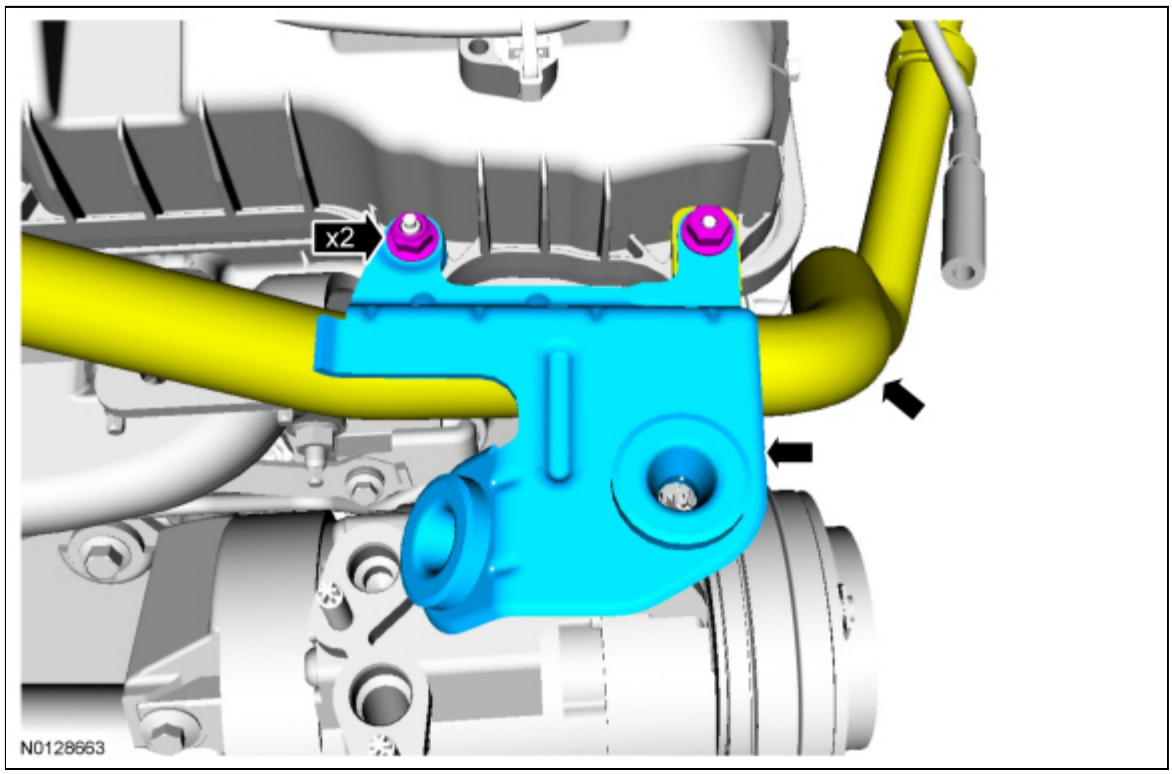
46. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove and discard the LH engine mount through bolt.



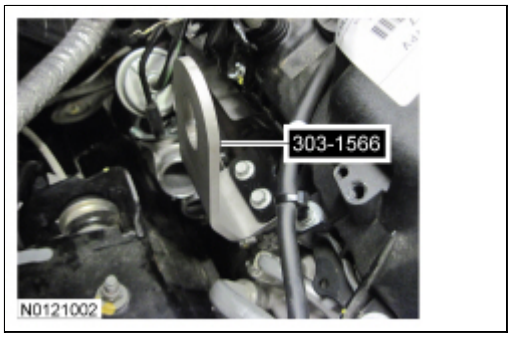
47. ***NOTICE:*** **Do not support the transmission by the fluid pan, failure to follow this instruction**

repair4less

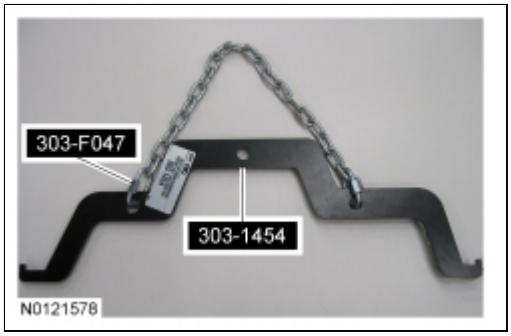


may result in serious damage to the transmission.

Support the bellhousing of the transmission with a suitable floor jack and a block of wood.

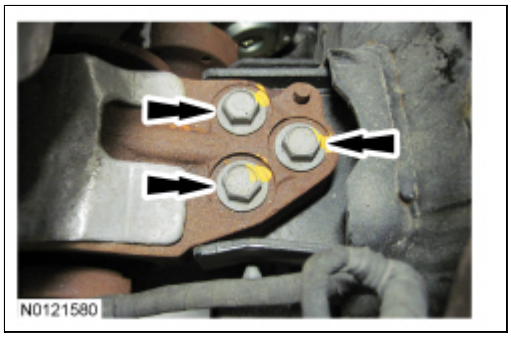


48. Remove the 2 LH bellhousing-to-oil pan bolts.



49. Remove the 2 nuts and the CAC tube bracket.
    - Disconnect the coolant hose from the valve cover stud.

50. Install the Right Front Lift Eye.

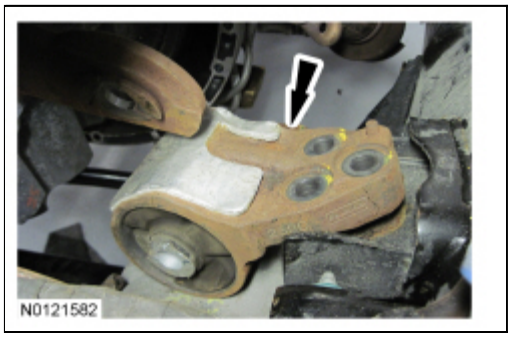


51. Using part of the Engine Lifting Bracket and a chain, assemble the Engine Spreader Bar as shown.

52. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

    NOTE: After removing the bolts leave the LH engine support insulator in place.

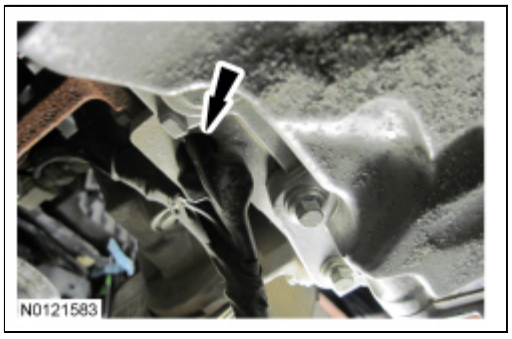
    Remove and discard the 3 bolts for the LH engine support insulator.



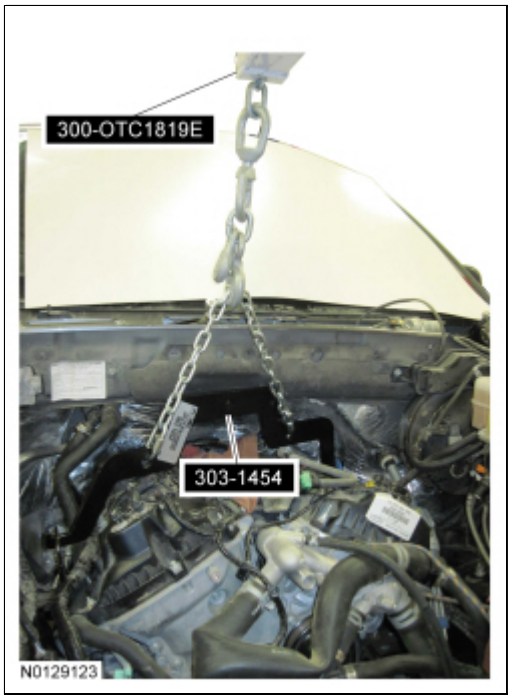
53. **NOTE:** The use of a ratchet strap may be needed to level the engine.

    Using the Floor Crane and Engine Spreader Bar assembly, lift the engine.

repair4less



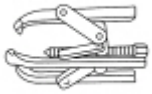
54. Remove the LH engine support insulator.



55. **NOTE:** The transmission wiring harness is part of the engine wiring harness.

    Detach the generator wiring harness retainer from the lower LH side of the engine block.
    - Position the transmission wiring harness on top of the engine for removal.

56. Using the Floor Crane and Engine Spreader Bar assembly, remove the engine.



57. Install the Torque Converter Retainer.

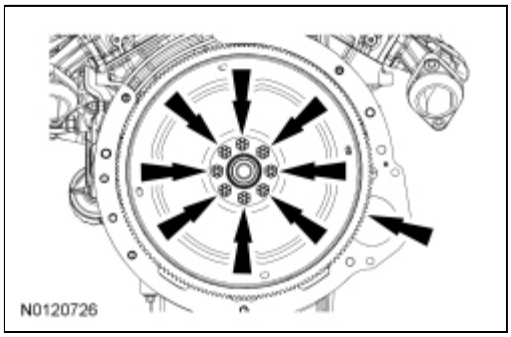
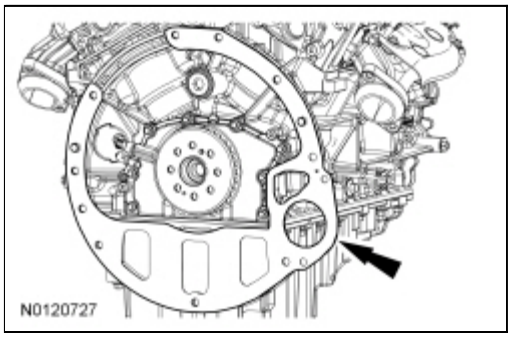
Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—

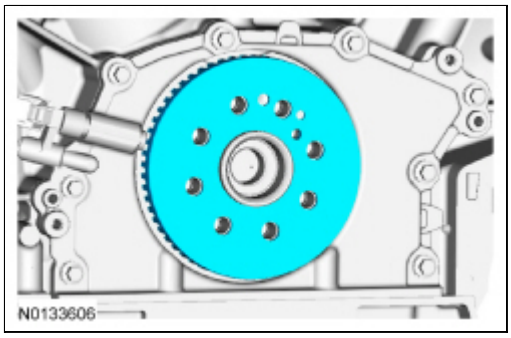
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**



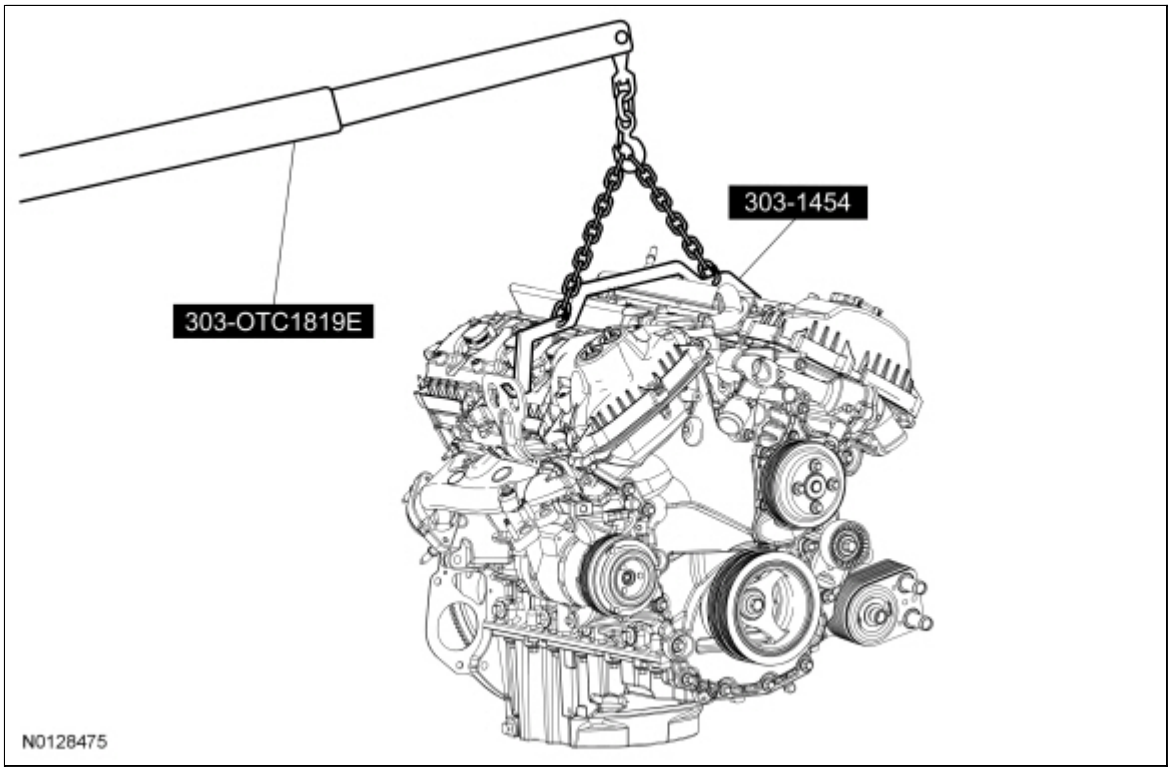
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.

All engines

1. Remove the 8 bolts and the flexplate.

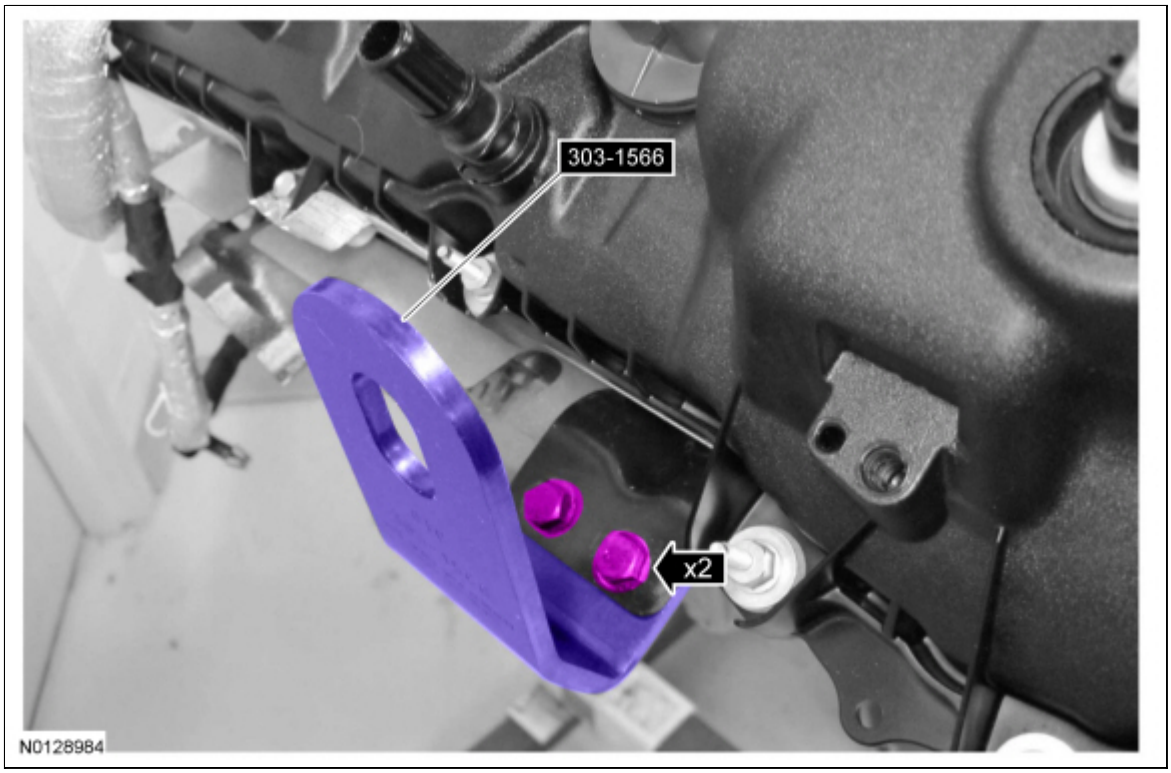


2. Remove the spacer plate.



3. Remove the crankshaft sensor ring.

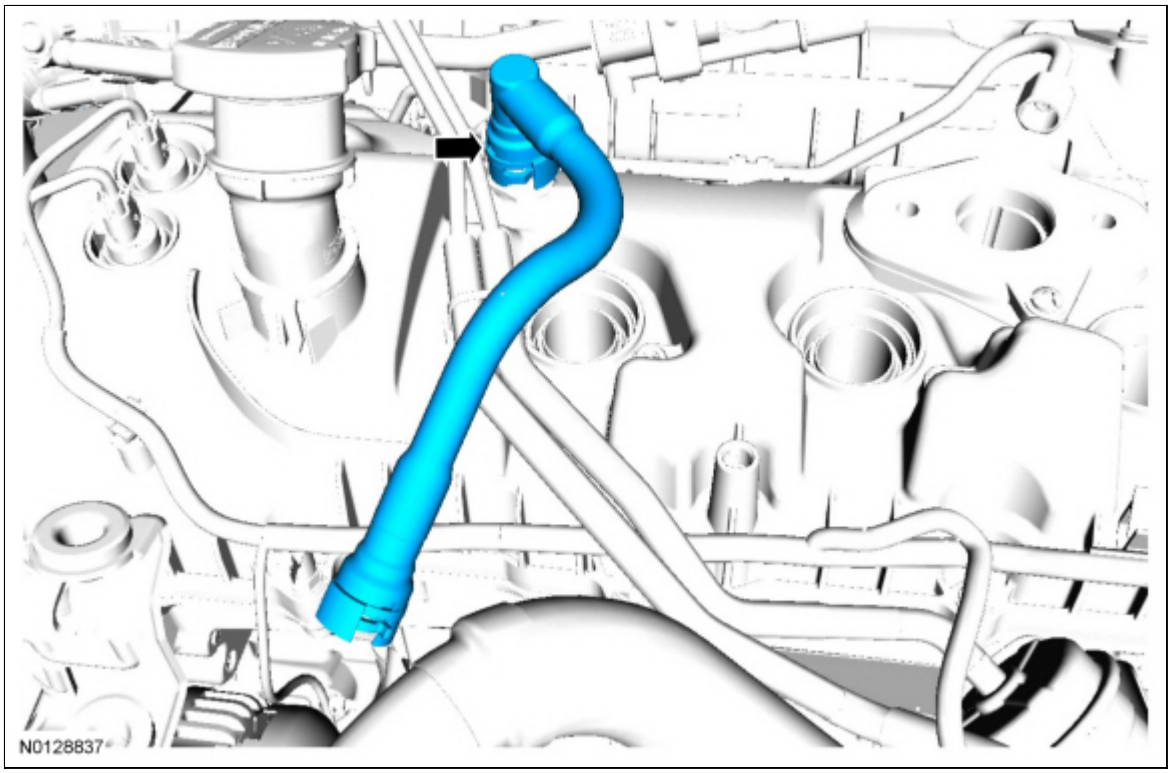
repair4less



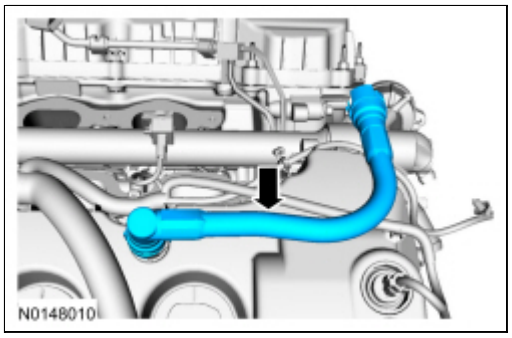
4. **NOTE:** Install the engine stand bolts into the cylinder block only. Do not install the bolts into the oil pan.

   Using the Floor Crane and Engine Spreader Bar, mount the engine on a suitable engine stand.

5. Remove the 2 bolts and the Right Front Lift Eye.

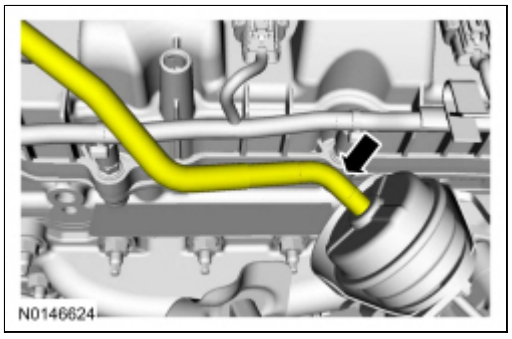


6. Remove the A/C compressor and the 3 bolts.

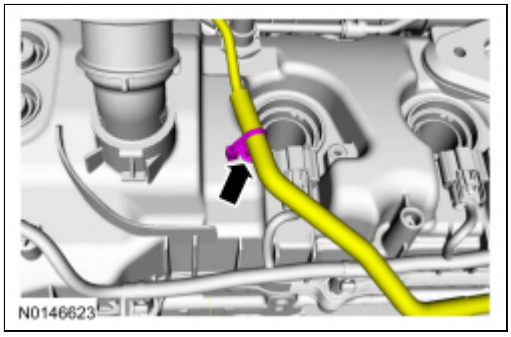


7. Remove the LH crankcase vent tube. For additional information, refer to Section 310-00 .

repair4less

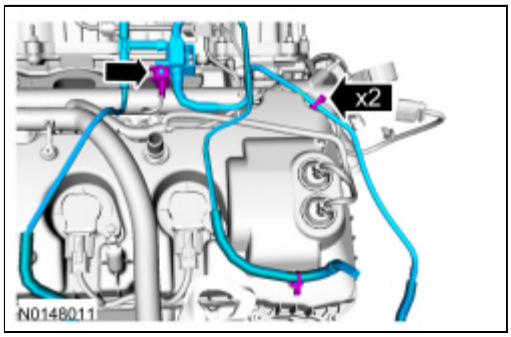


8. Remove the RH PCV tube. Refer to Section 310-00 .

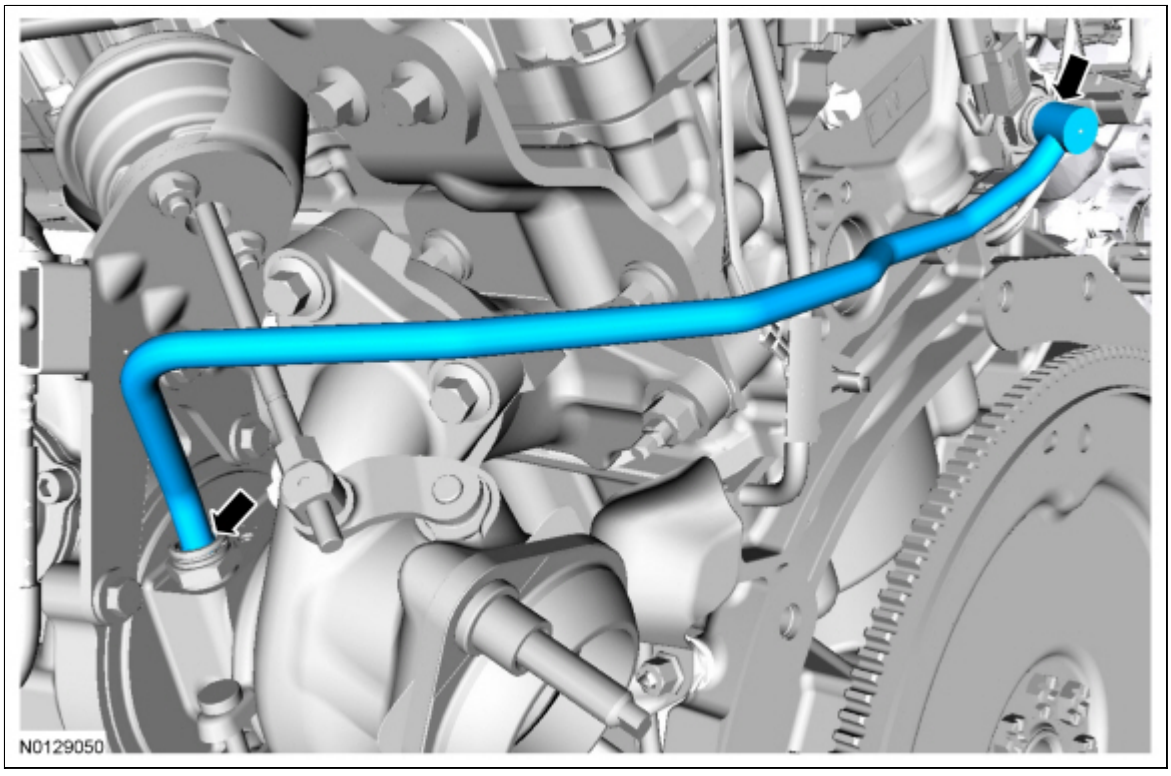


9. **NOTE:** LH shown, RH similar.

   Disconnect the 2 wastegate hoses at the turbochargers.

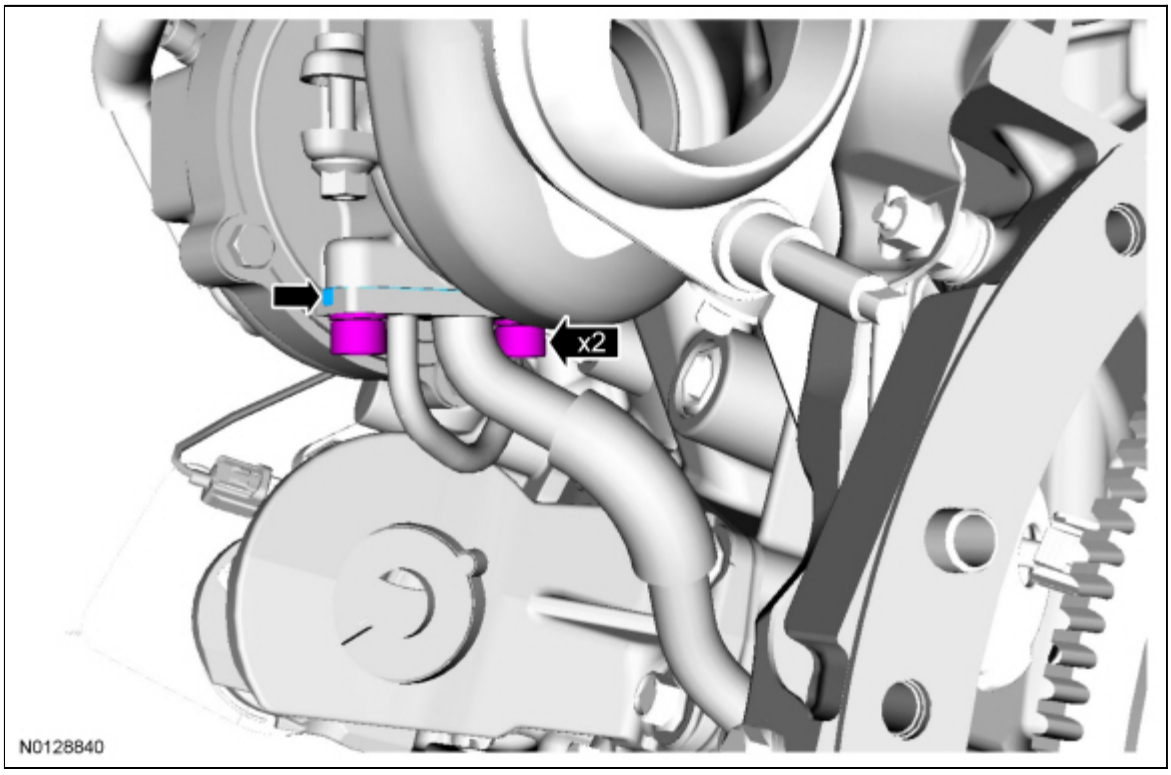


10. **NOTE:** LH shown, RH similar.

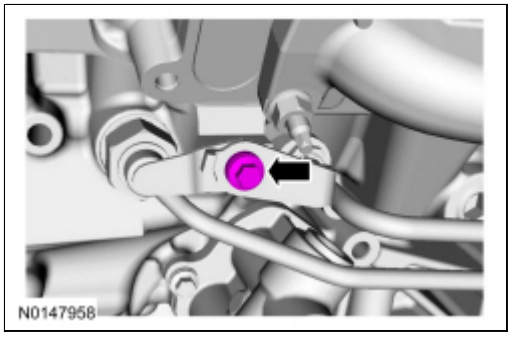


Remove the 2 tie straps for the wastegate hose assembly.

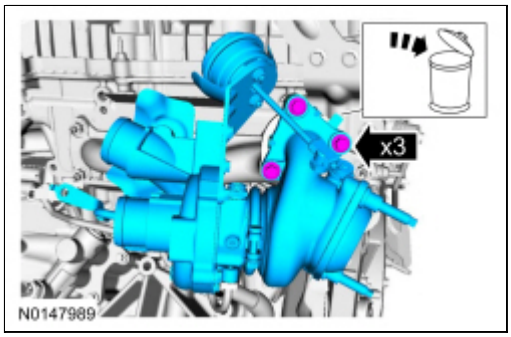
11. Disconnect the turbocharger pressure regulator electrical connector. Remove the 2 tie straps and the wastegate hose assembly.



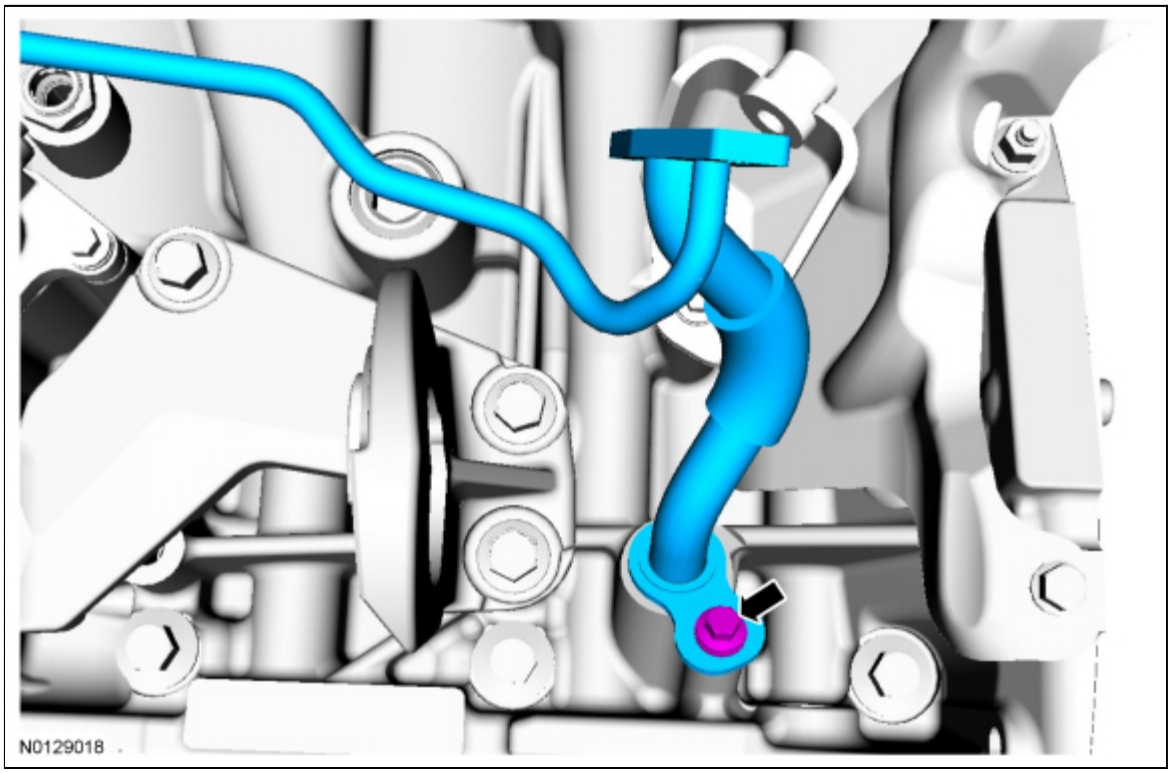
12. Using a commercially available quick disconnect tool, remove the LH turbocharger coolant supply tube.



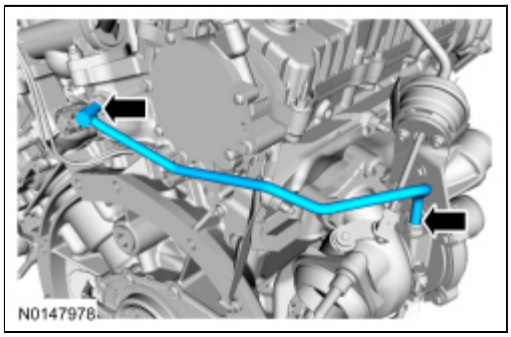
repair4less



13. Remove the 2 bolts at the LH turbocharger oil return tube.
    - Remove and discard the turbocharger return tube gasket.

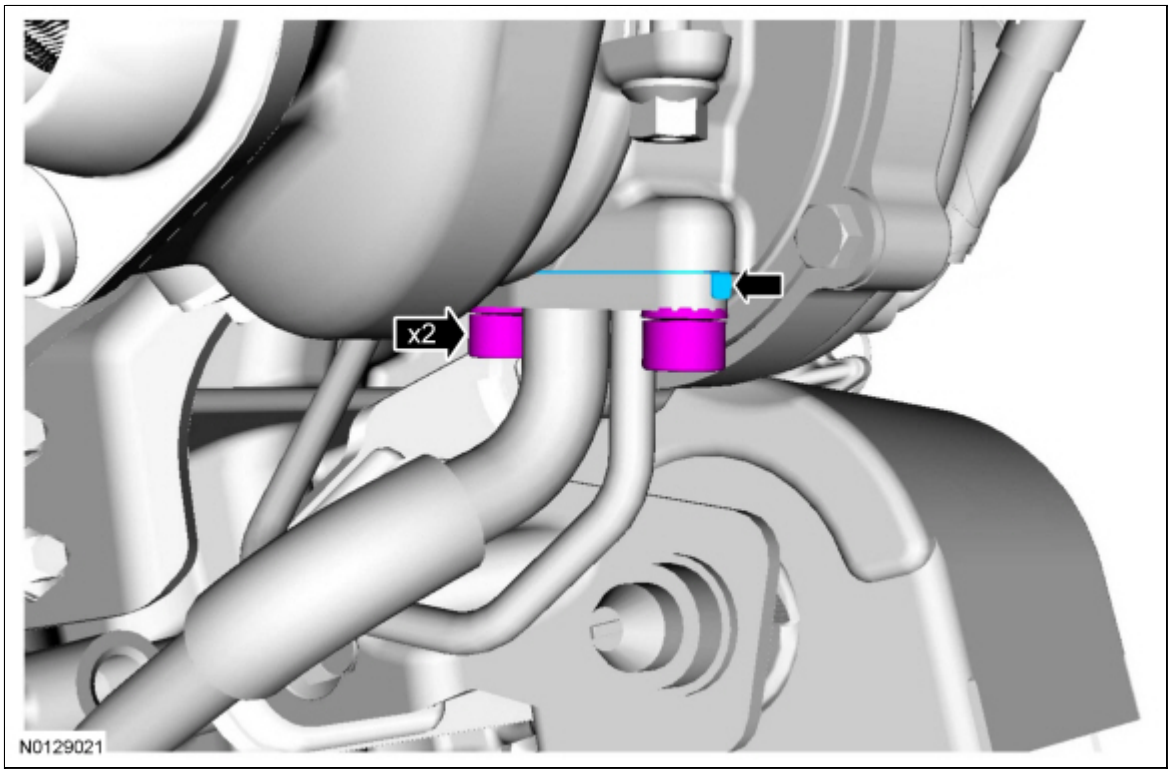


14. Remove the bolt for the LH turbocharger coolant and oil tubes.

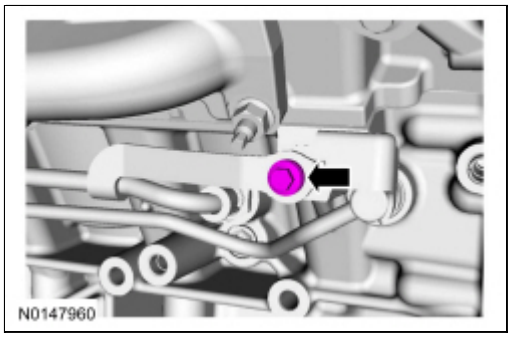


15. Remove the 3 bolts and the LH turbocharger.
    - Discard the turbocharger exhaust manifold gasket.

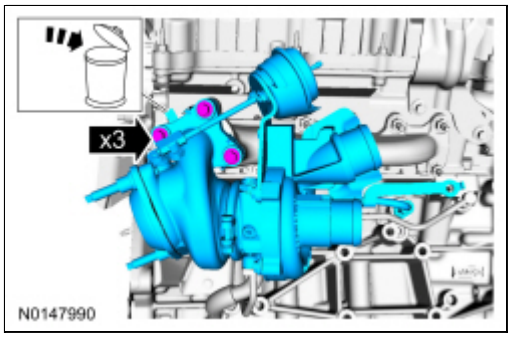
16. Remove the bolt and the LH oil turbocharger oil return tube.
    - Remove and discard the O-ring seal.



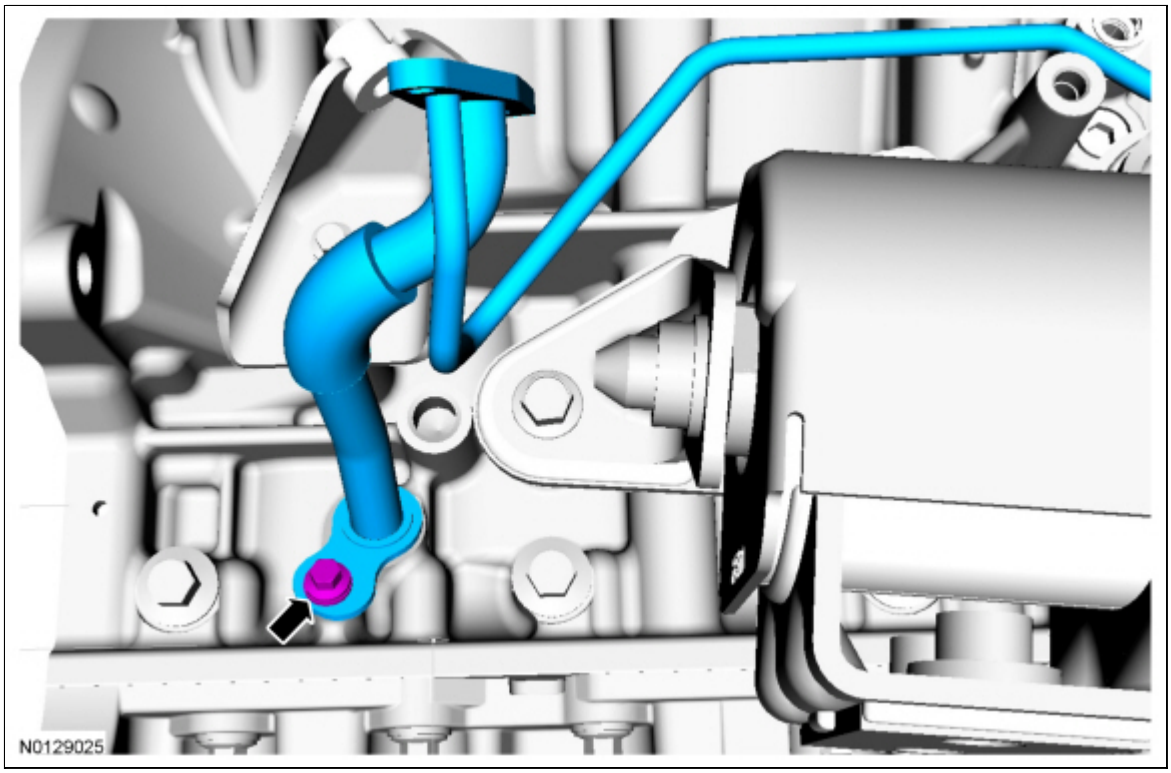
17. Using a commercially available quick disconnect tool, remove the RH turbocharger coolant supply tube.



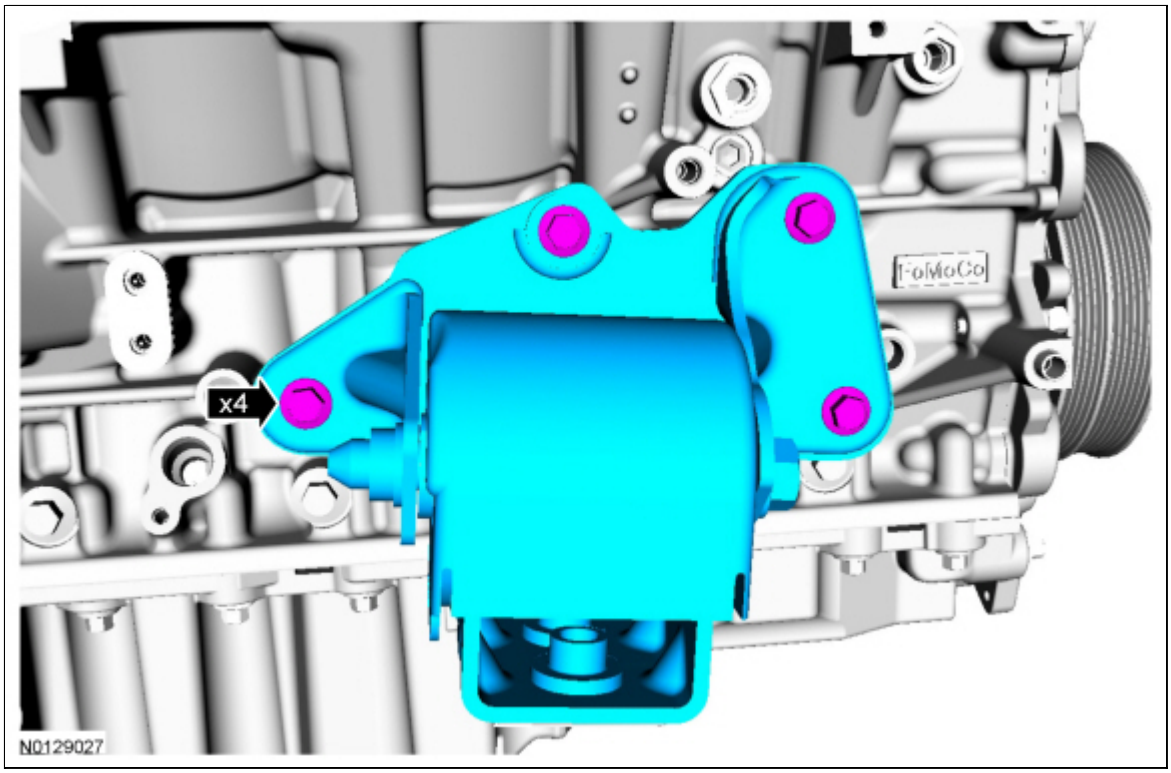
18. Remove the 2 bolts at the RH turbocharger oil return tube.
    - Remove and discard the turbocharger oil return tube gasket.



repair4less

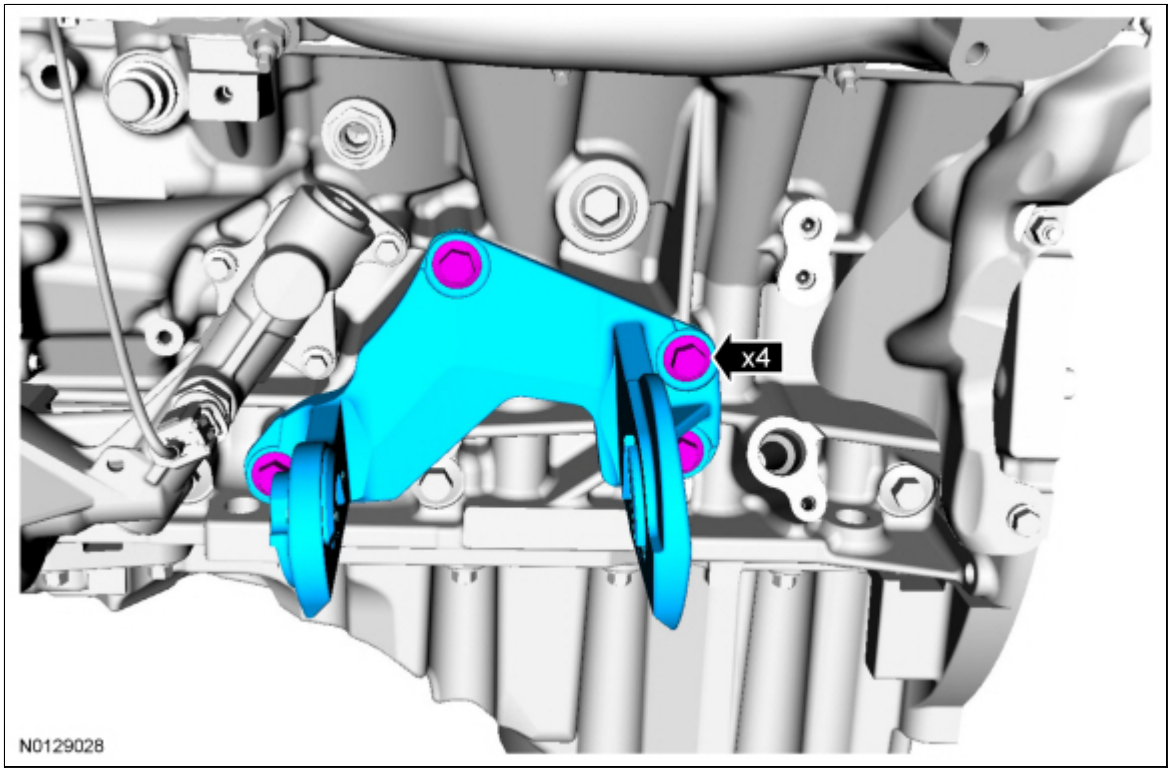


19. Remove the bolt for the RH turbocharger coolant and oil tubes.

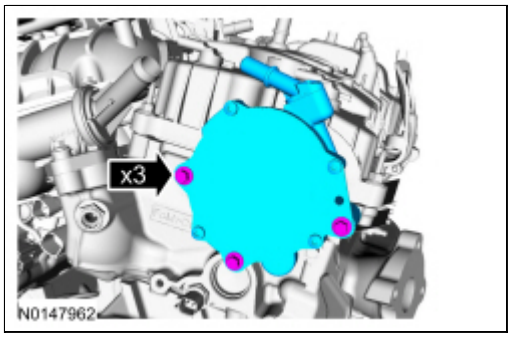


20. Remove the 3 bolts and the RH turbocharger.
    - Discard the turbocharger exhaust manifold gasket.

21. Remove the bolt and the RH turbocharger oil return tube.
    - Remove and discard the O-ring seal.

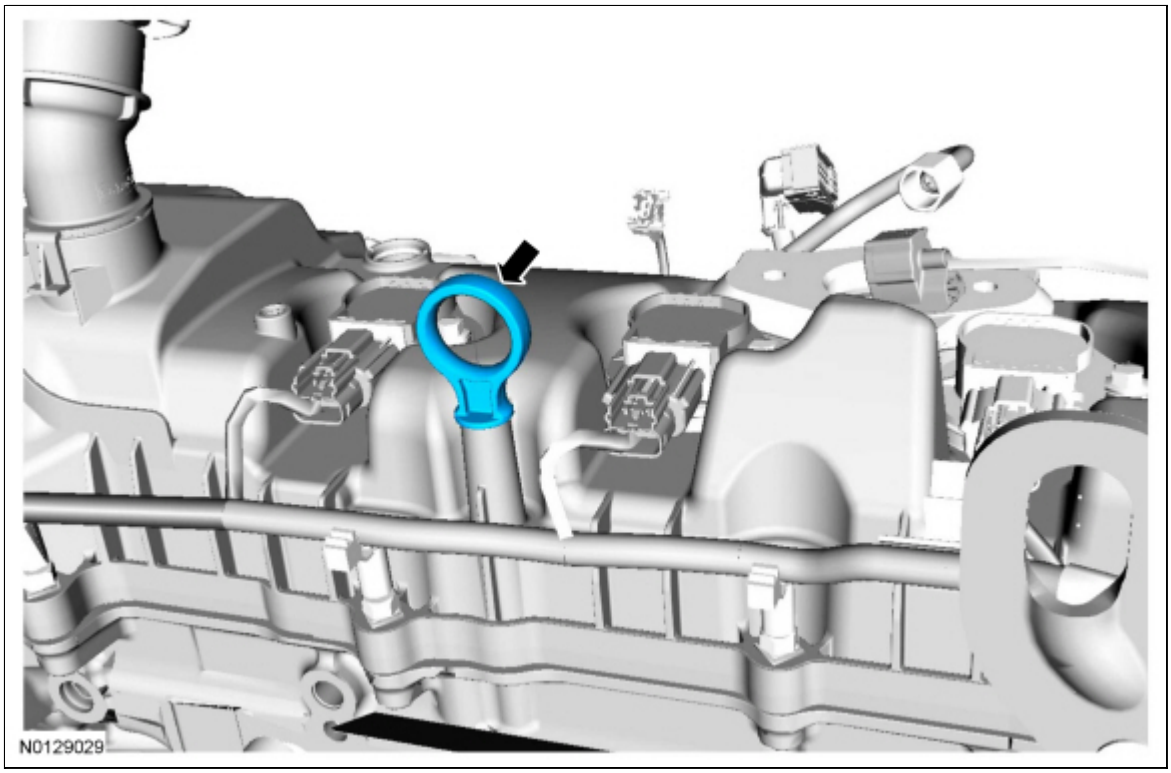


22. Remove the 4 bolts and the RH engine support insulator.
    - Discard the bolts.



23. Remove the 4 bolts and the LH engine support insulator-to-cylinder block bracket.
    - Discard the bolts.

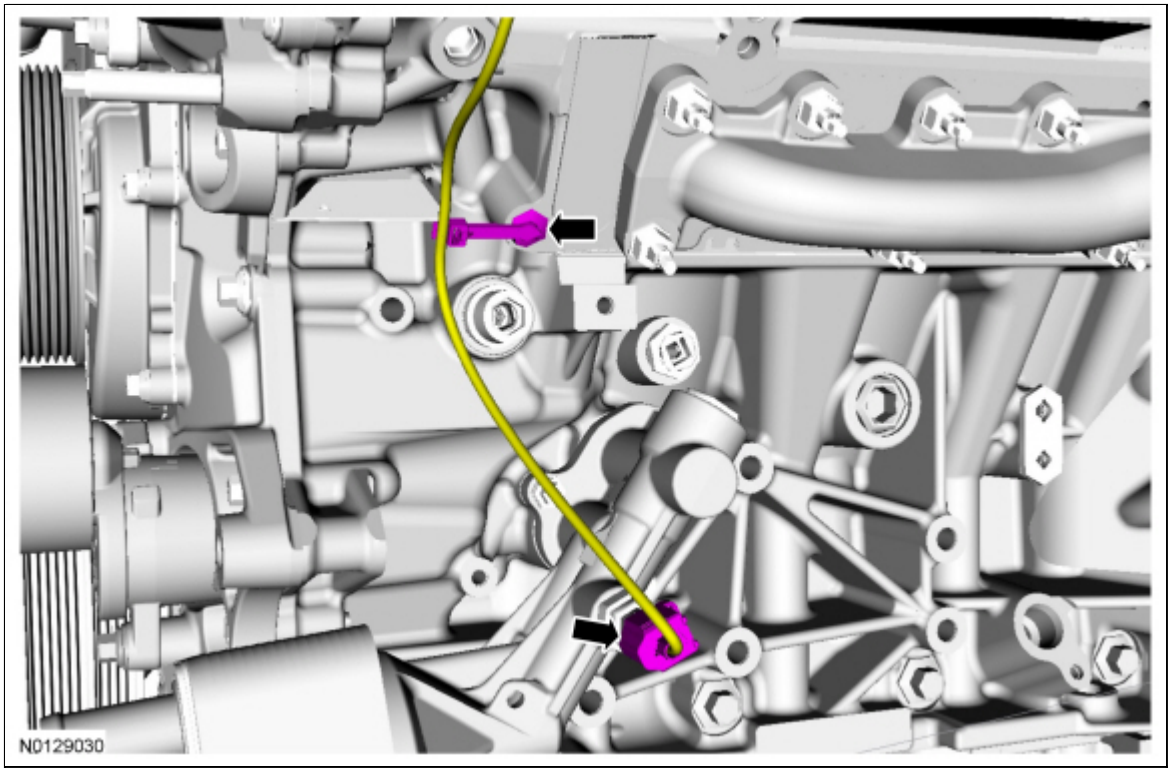
repair4less



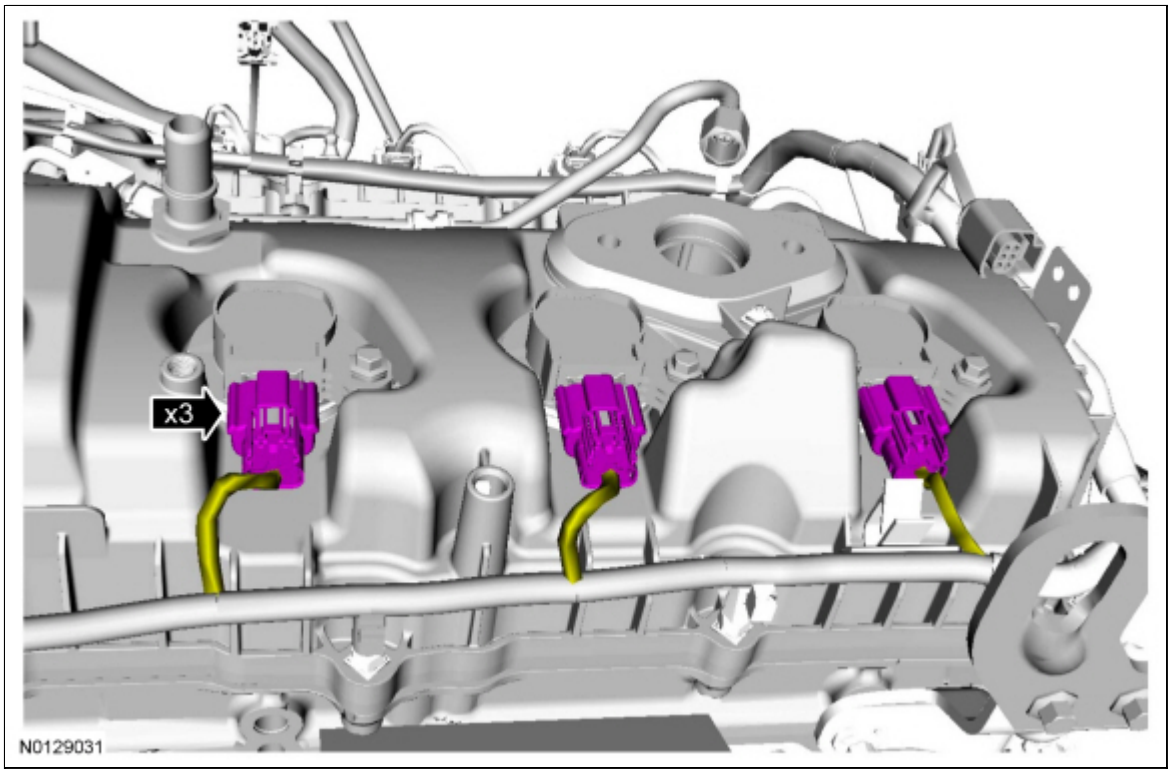
24. ***NOTICE:*** **Do not use excessive force when removing the vacuum pump or the vacuum pump oil tube may be dislodged from the vacuum pump causing internal oil seal damage to the pump. If the oil tube becomes dislodged from the pump, a new vacuum pump must be installed.**

    Remove the 3 bolts and the vacuum pump.

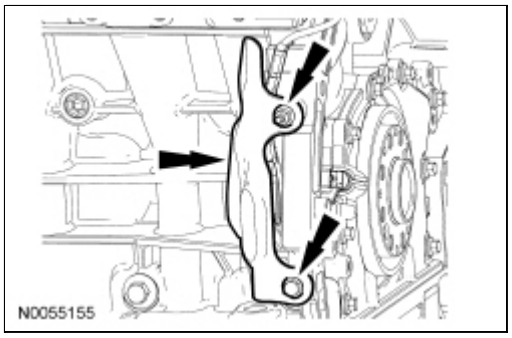
25. Remove the engine oil level indicator.



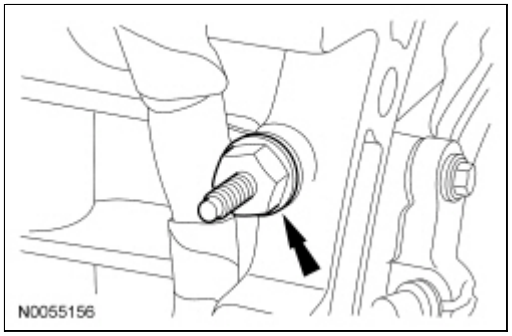
26. Disconnect the 2 LH Variable Camshaft Timing (VCT) solenoid electrical connectors. Remove the tie strap.



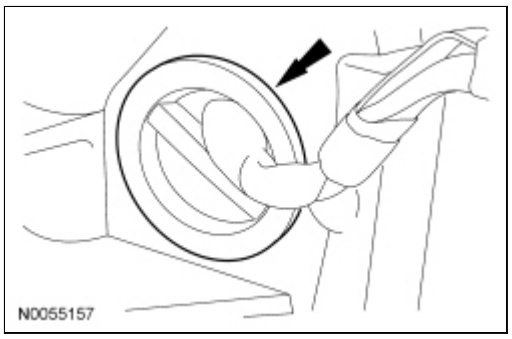
27. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.
    - Detach the EOP switch wiring harness retainer from the cylinder head.



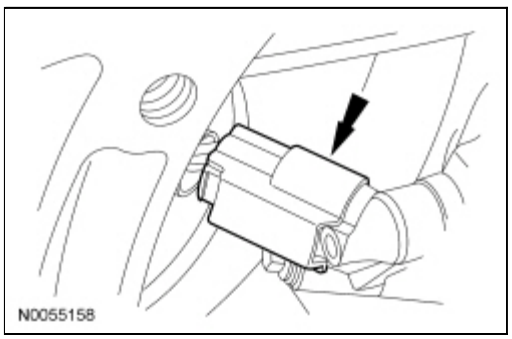
repair4less



28. Disconnect the 3 LH ignition coil-on-plug electrical connectors.

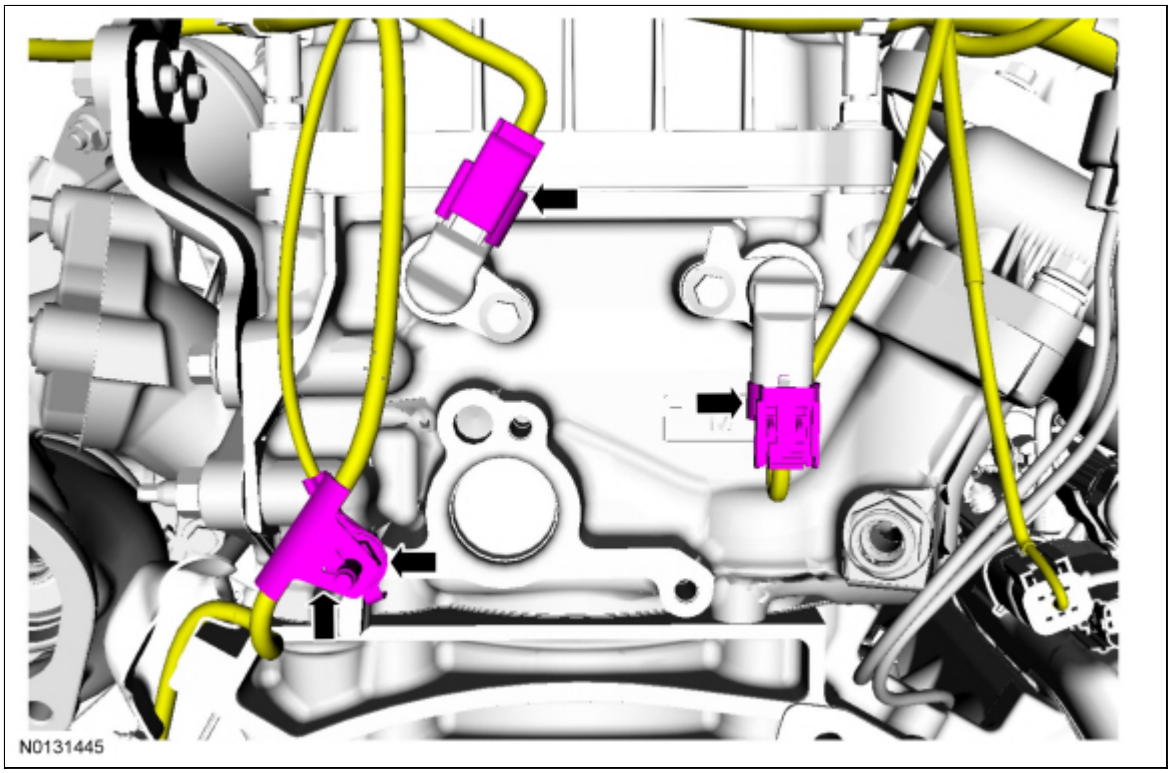


29. Remove the nut, the bolt and the CKP heat shield.

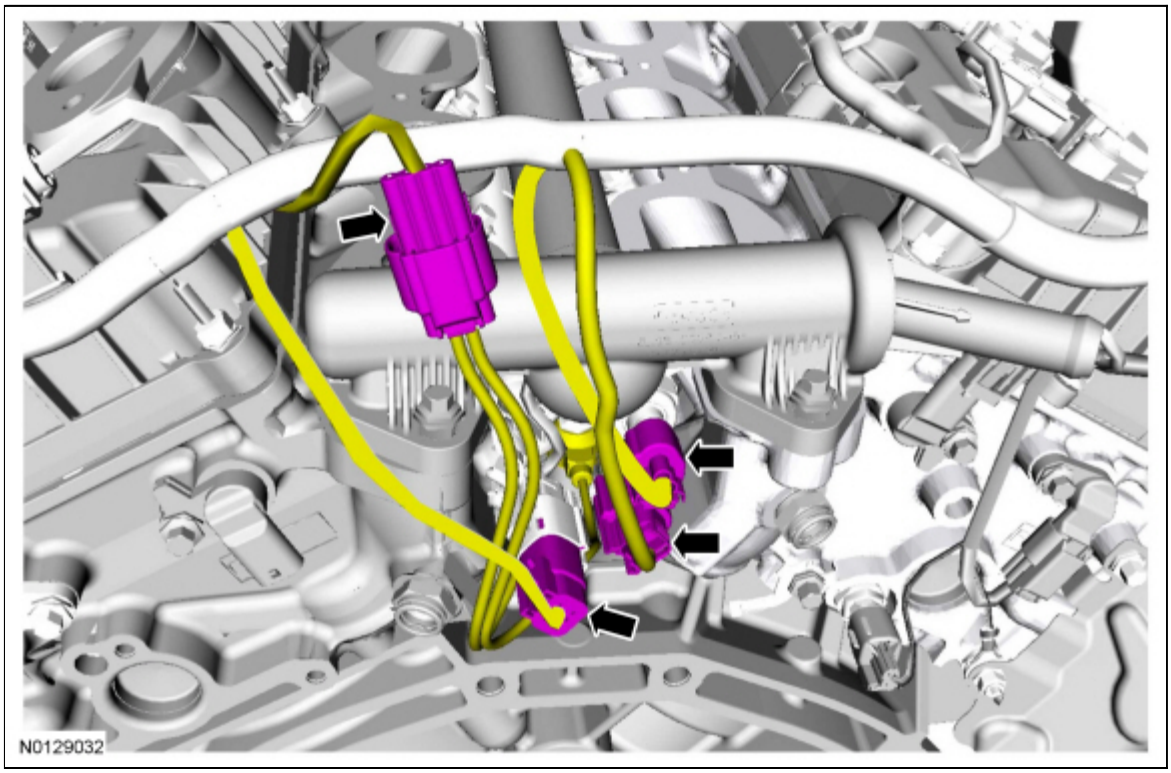


30. Remove the wiring harness retainer stud bolt.

31. Remove the wiring harness grommet.

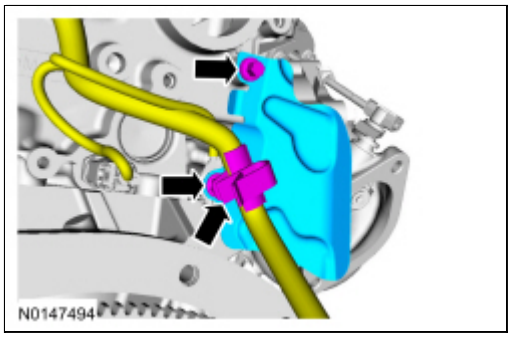


32. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

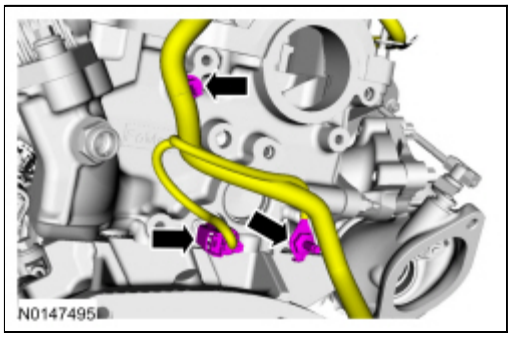


33. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.

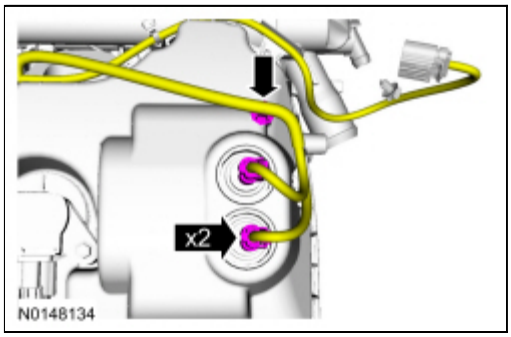
34. Disconnect the 2 LH Camshaft Position (CMP) sensor electrical connectors. Disconnect the CKP wire retainer. Remove the ground stud bolt.



repair4less

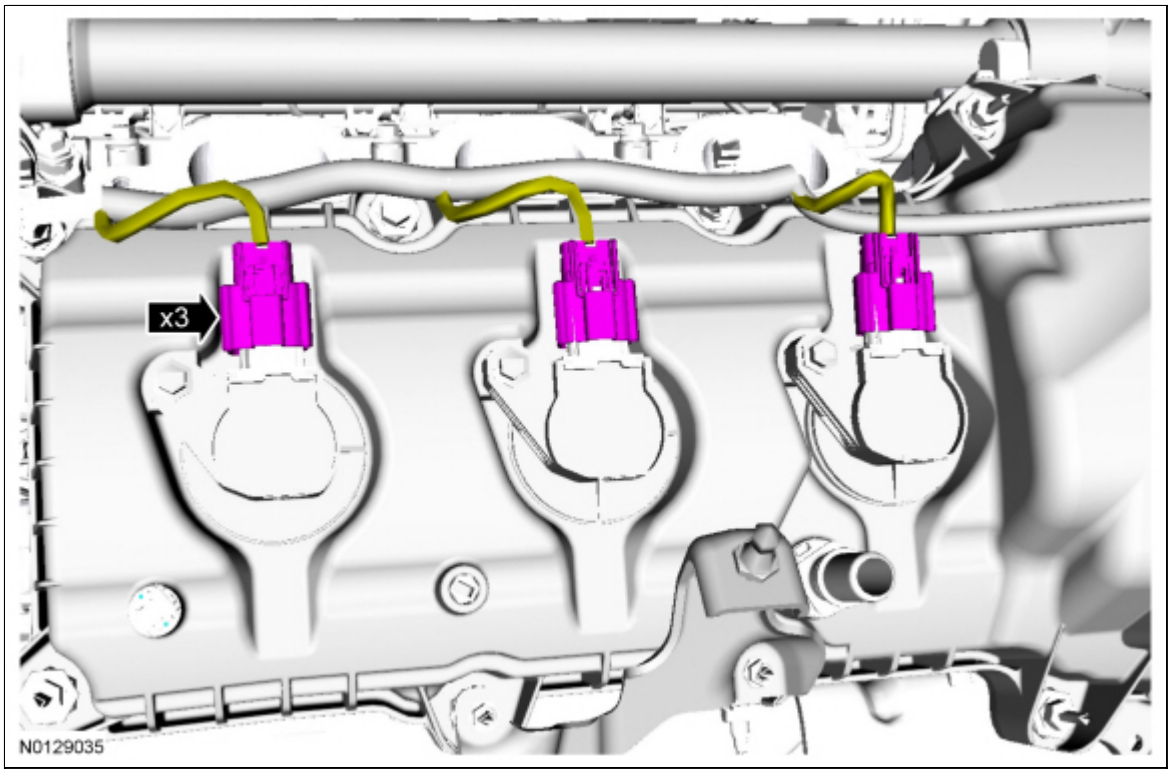


35. Disconnect the Knock Sensor (KS) sensor electrical connector. Disconnect the 2 fuel charge harness and the Fuel Rail Pressure (FRP) electrical connectors.

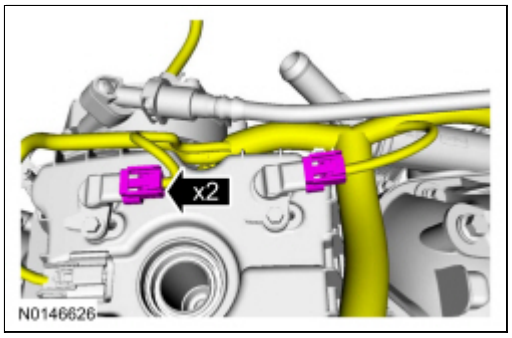


36. Disconnect the wire retainer. Remove the bolt, nut and the CMP heat shield.

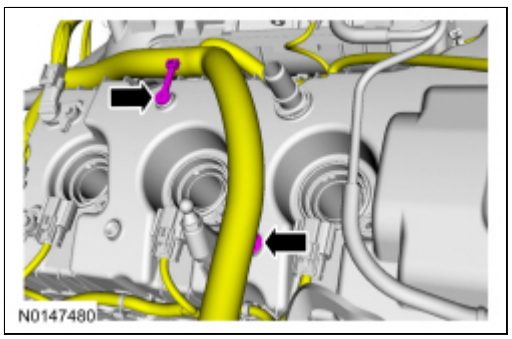
37. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector. Remove the ground stud bolt and the tie strap.



38. Disconnect the 2 RH VCT solenoid electrical connectors. Remove the tie strap.

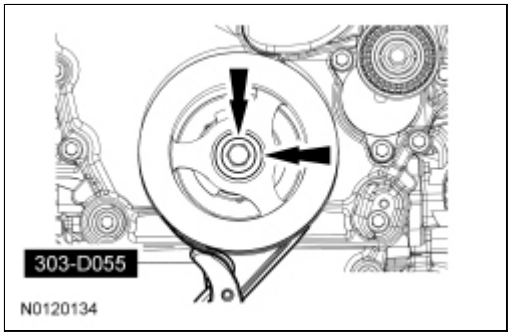


39. Disconnect the 3 RH ignition coil-on-plug electrical connectors.

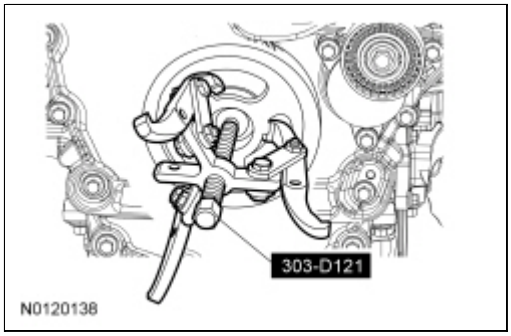


repair4less

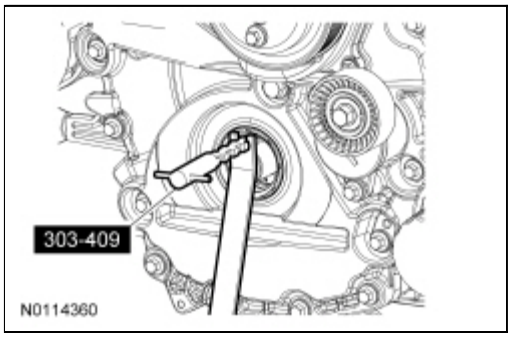
40. Disconnect the 2 RH CMP electrical connectors.



41. Disconnect the wire harness retainer and remove the tie strap.

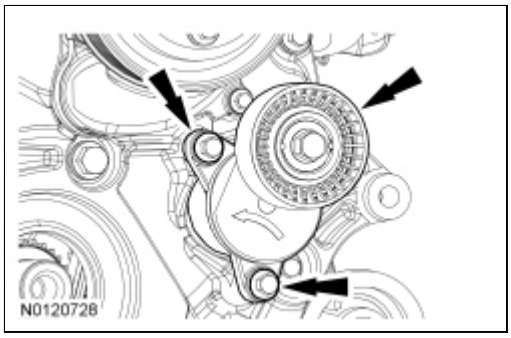


42. Detach all of the wiring harness retainers from the RH valve cover and stud bolts. Remove the engine wire harness.

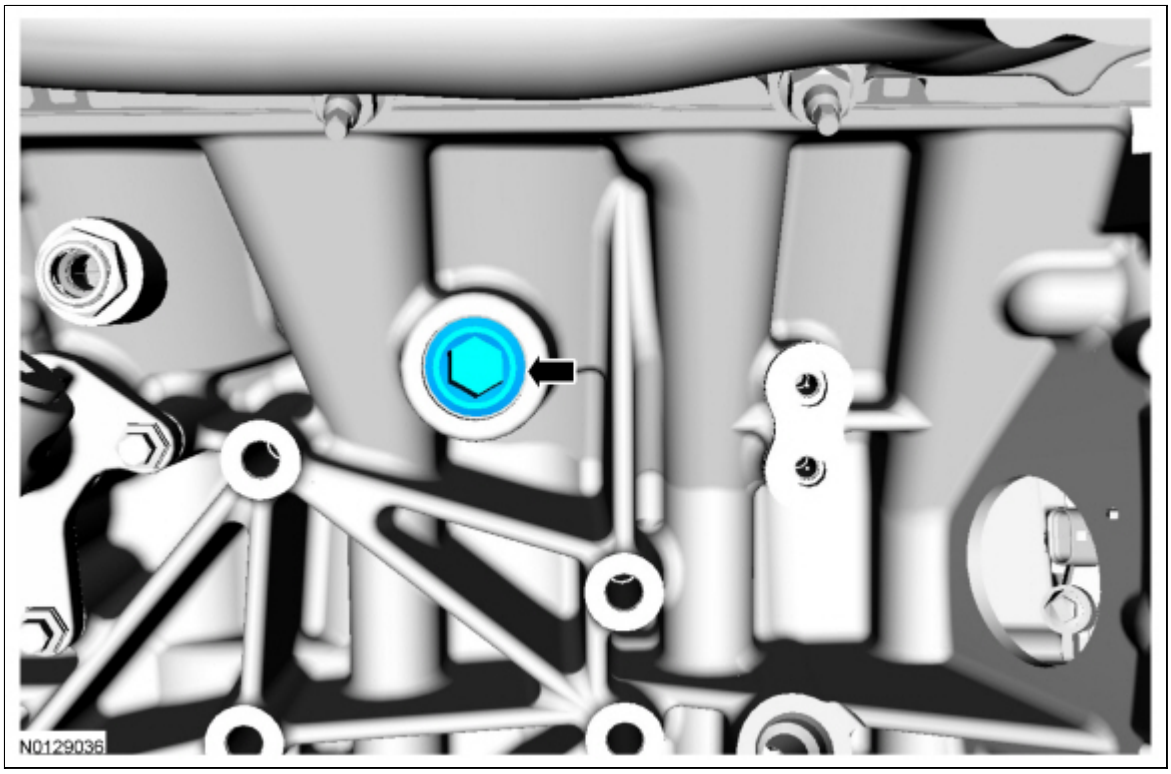


43. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
    - Inspect the crankshaft pulley sealing surface for nicks or scratches that may effect the crankshaft front seal lip, replace the crankshaft pulley if necessary.
    - Discard the bolt.

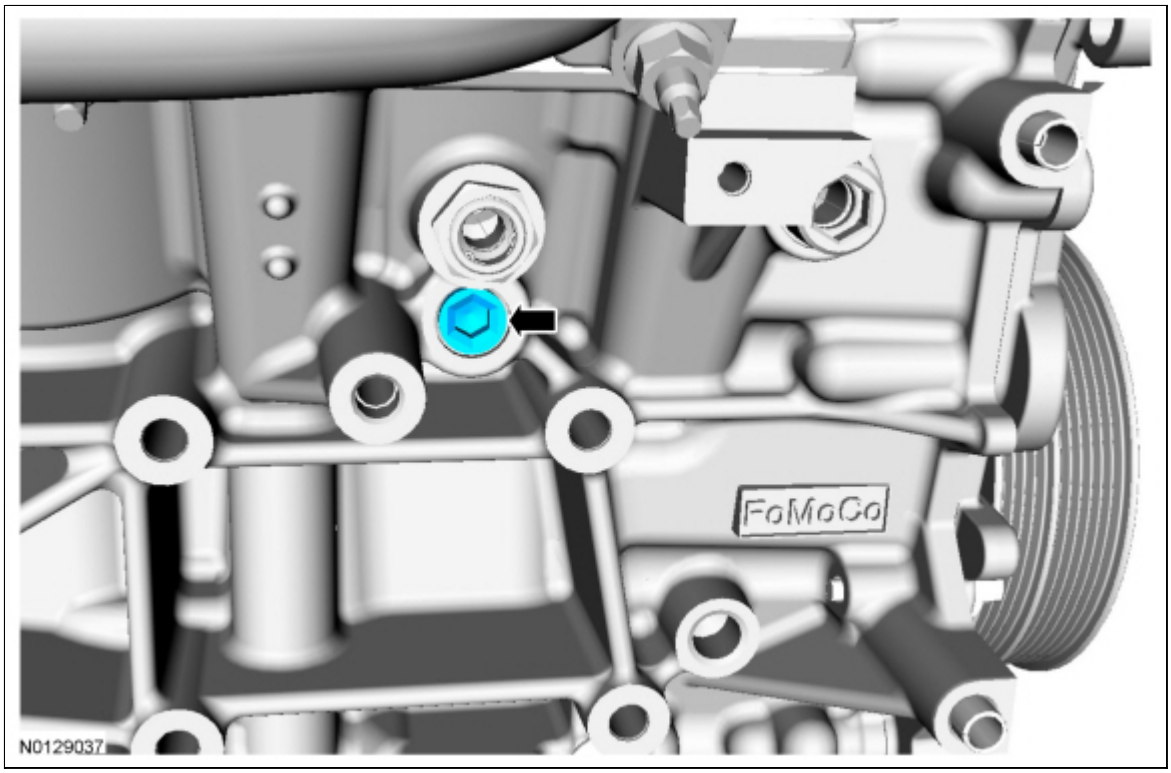
44. Using the 3 Jaw Puller, remove the crankshaft pulley.



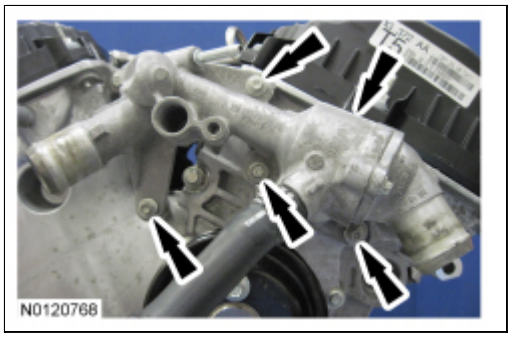
45. Using the Oil Seal Remover, remove and discard the crankshaft front seal.



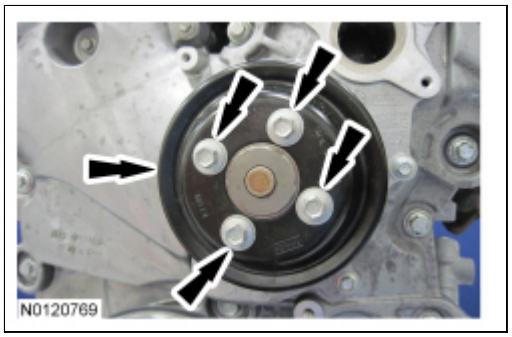
46. Remove the 2 bolts and the accessory drive belt tensioner.



repair4less

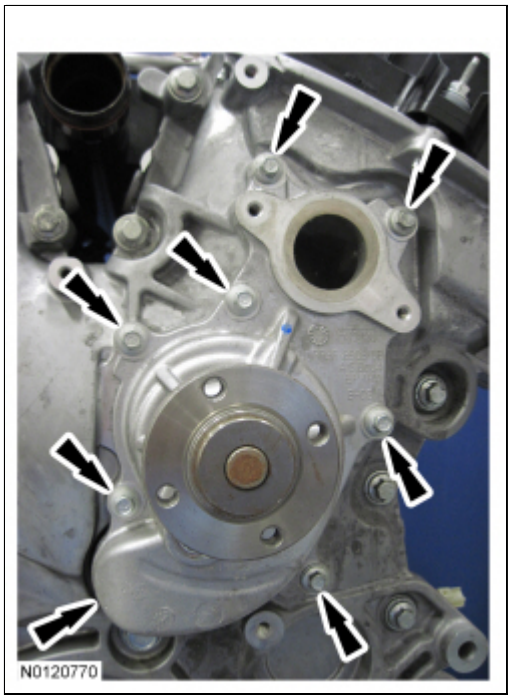


47. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

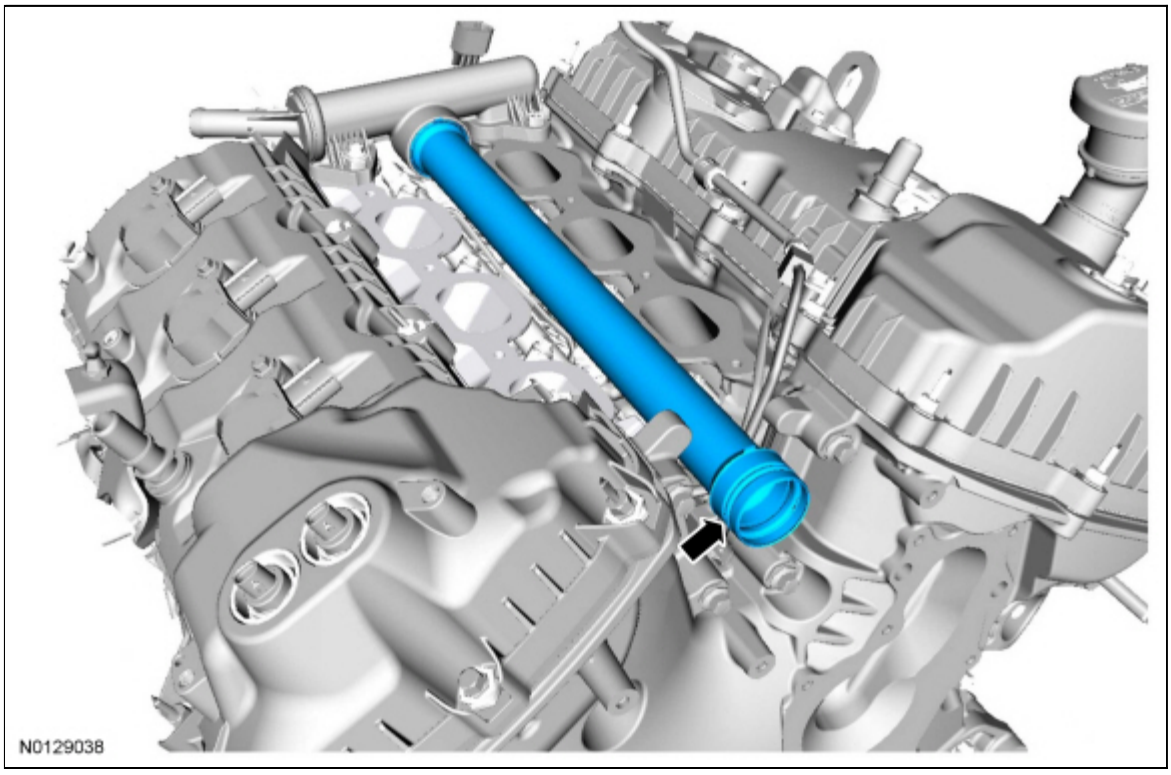


48. Remove the RH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

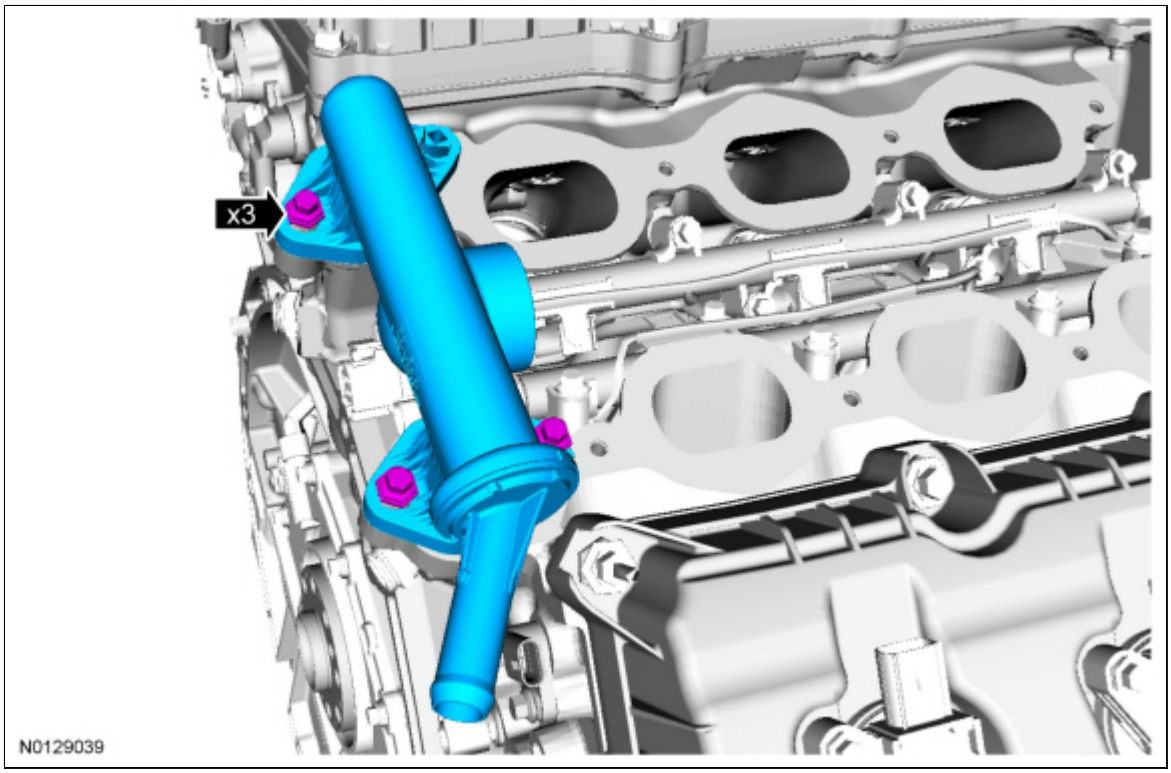
49. Remove the 4 bolts and the thermostat housing.
    - Discard the thermostat housing and coolant inlet tube O-ring seals.



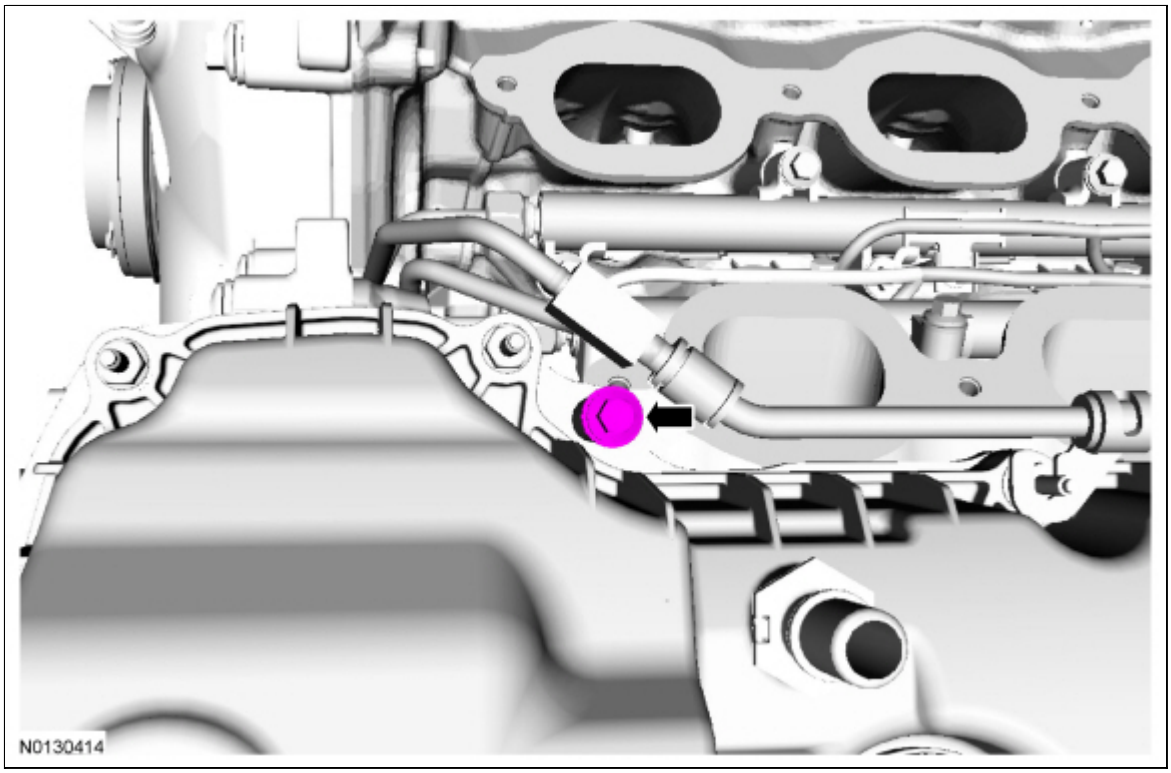
50. Remove the 4 bolts and the coolant pump pulley.



51. Remove the 7 bolts and the coolant pump.
    - Discard the coolant pump gasket and coolant pump O-ring seal.

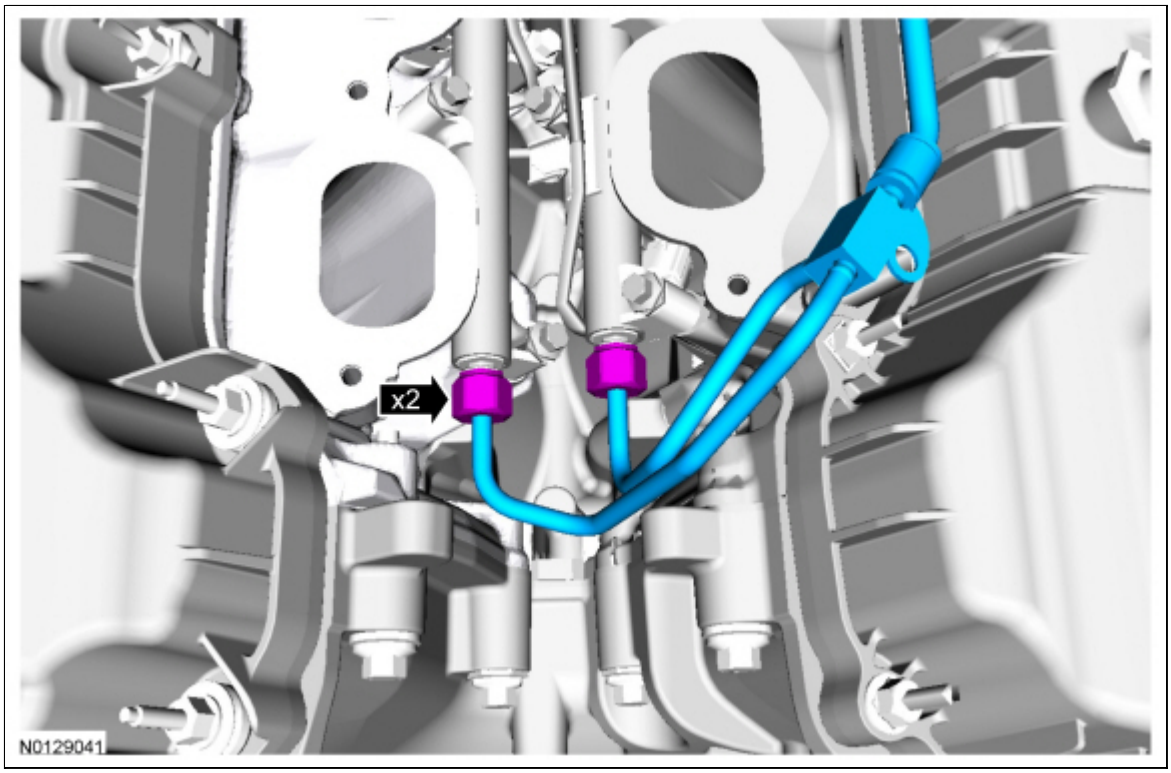


repair4less



52. Remove the coolant inlet pipe.
    - Remove and discard the coolant inlet pipe O-ring seals.

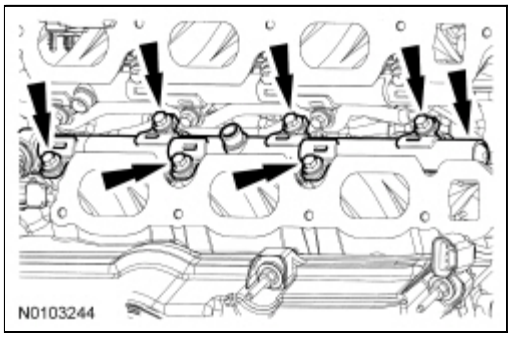
53. Remove the 3 bolts and the coolant crossover manifold assembly.
    - Remove and discard the 2 gaskets.



54. Remove the bolt for the high-pressure fuel tube.

55. Loosen the 2 flare nuts, remove and discard the high-pressure fuel tube assembly.

repair4less

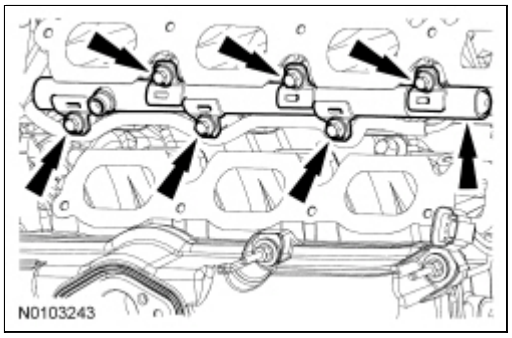


56. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors**

NOTE: When removing the fuel rails, the fuel injectors may remain in the fuel rails but normally remain lodged in the cylinder heads and require the use of a Fuel Injector Remover to extract.

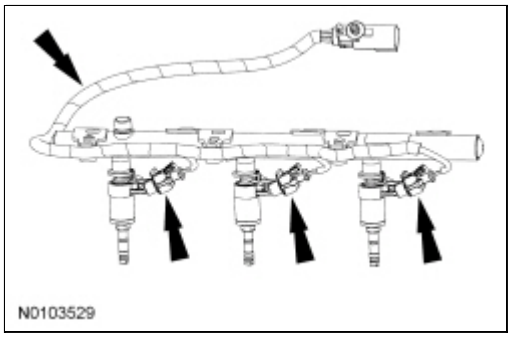
Remove the 6 bolts and the LH fuel rail.

- Discard the bolts.



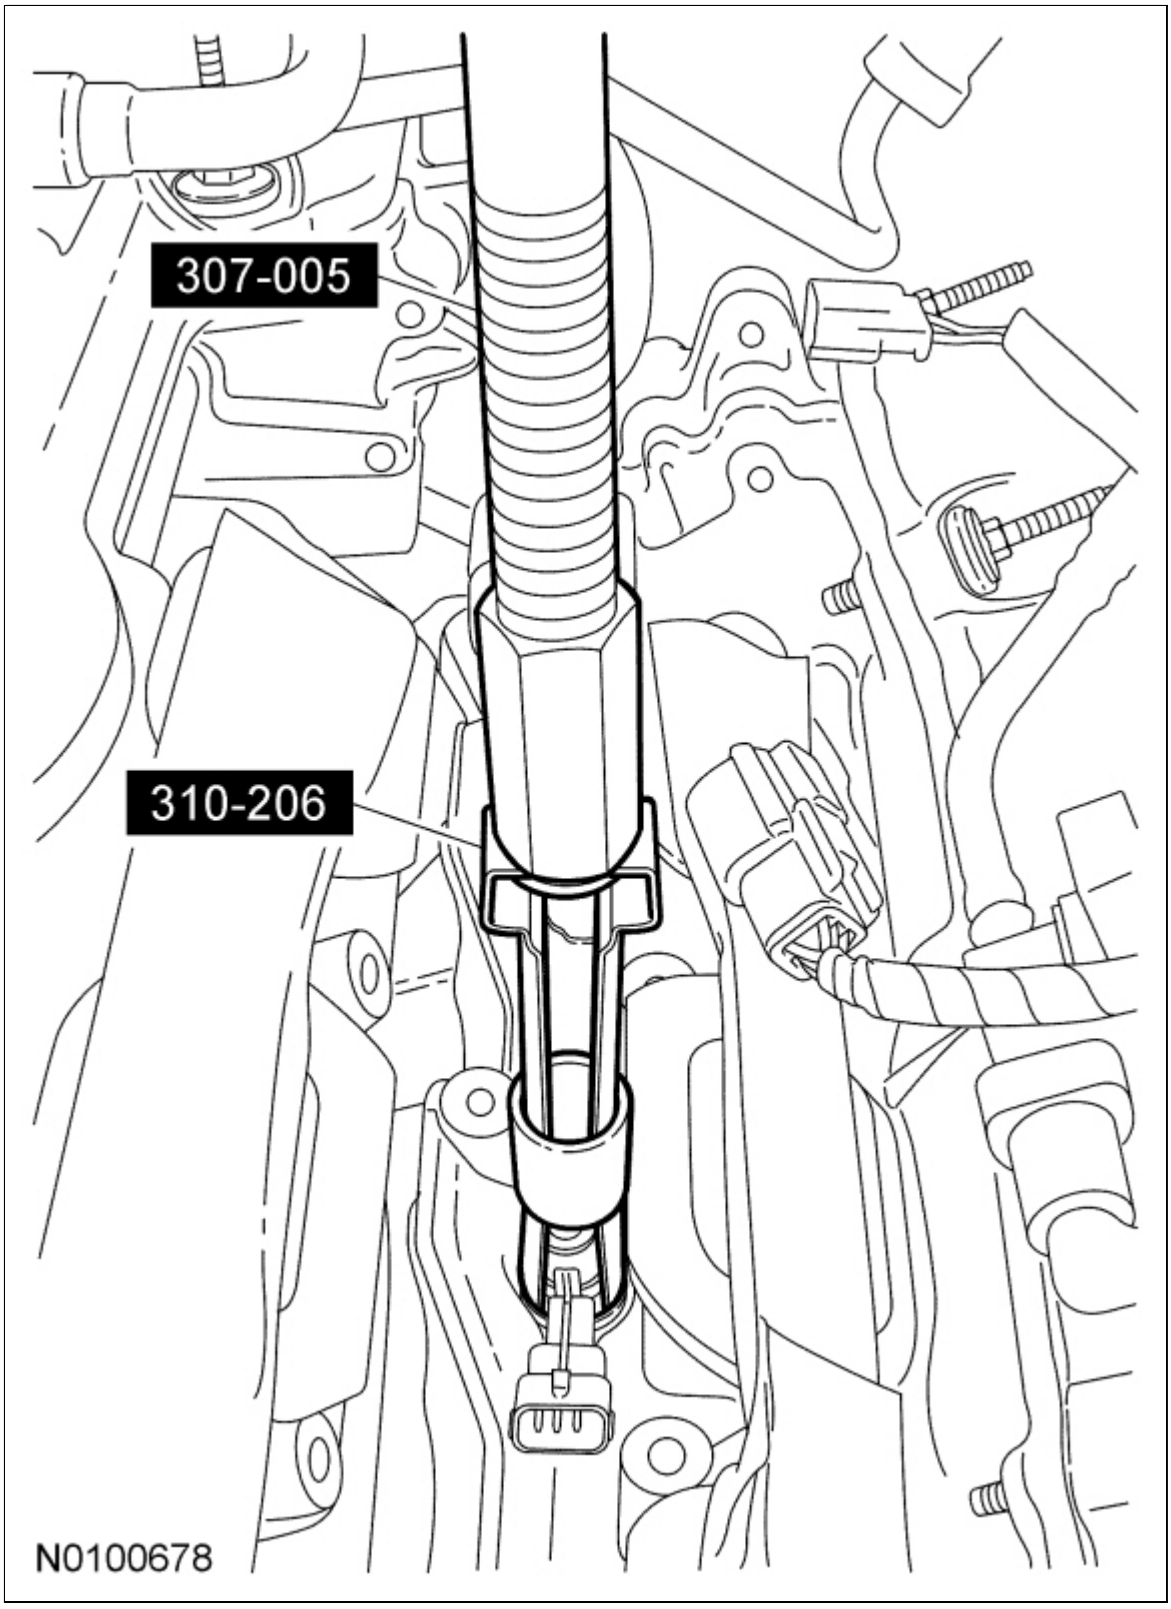
57. ***NOTICE:*** **Pull out the fuel rails in the direction of the fuel injector axis or damage may occur to the fuel injectors**

NOTE: When removing the fuel rails, the fuel injectors may remain in the fuel rails but normally remain lodged in the cylinder heads and require the use of a Fuel Injector Remover to extract.



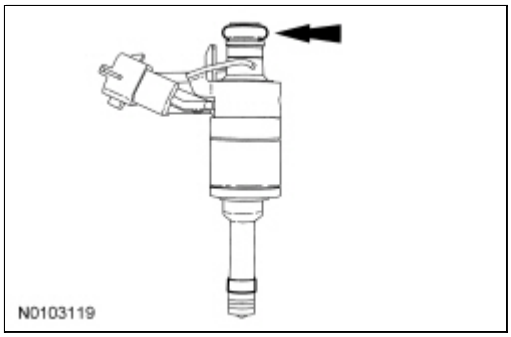
Remove the 6 bolts and the RH fuel rail.

- Discard the bolts.

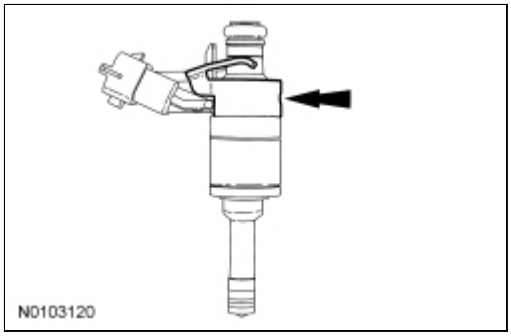


58. **NOTE:** RH shown, LH similar.

    Disconnect the 6 fuel injector electrical connectors and remove the 2 fuel injector wire harness.



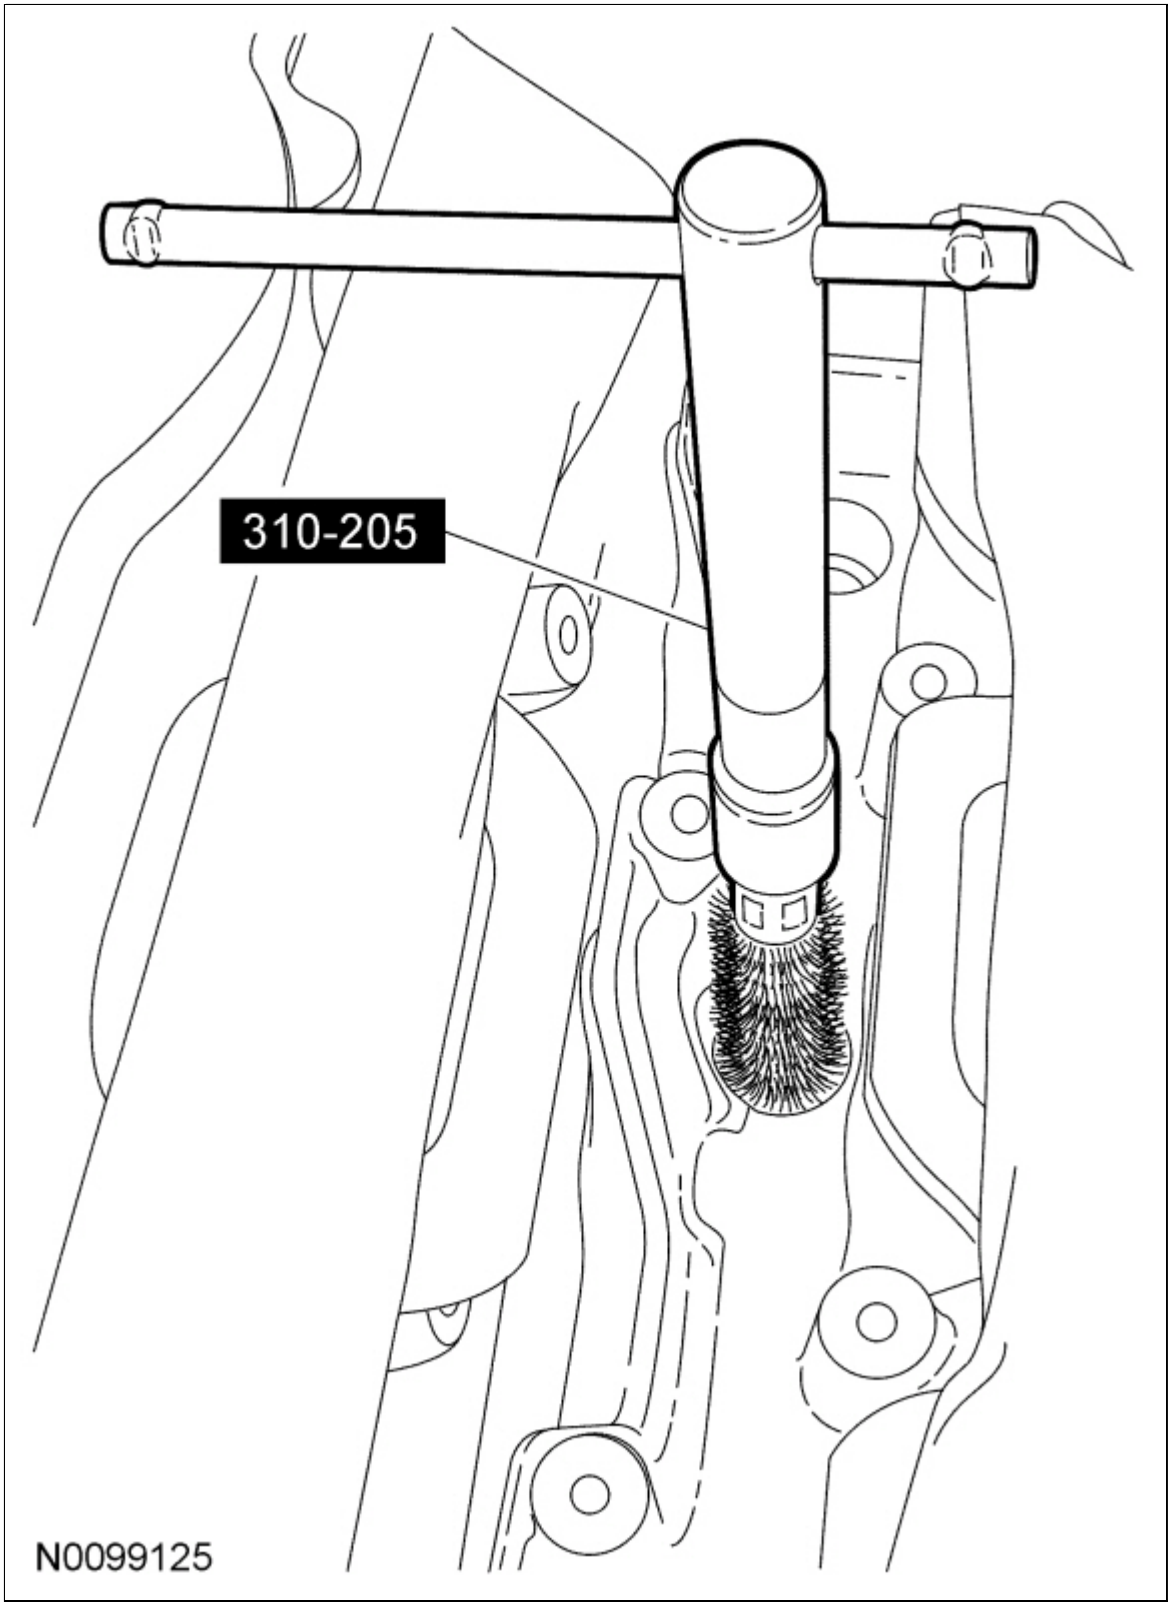
59. Using the Slide Hammer and the Fuel Injector Remover, remove any fuel injectors remaining in the cylinder head.



repair4less

60. Remove and discard the 6 upper fuel injector O-rings.

61. Remove and discard the 6 fuel injector clips.



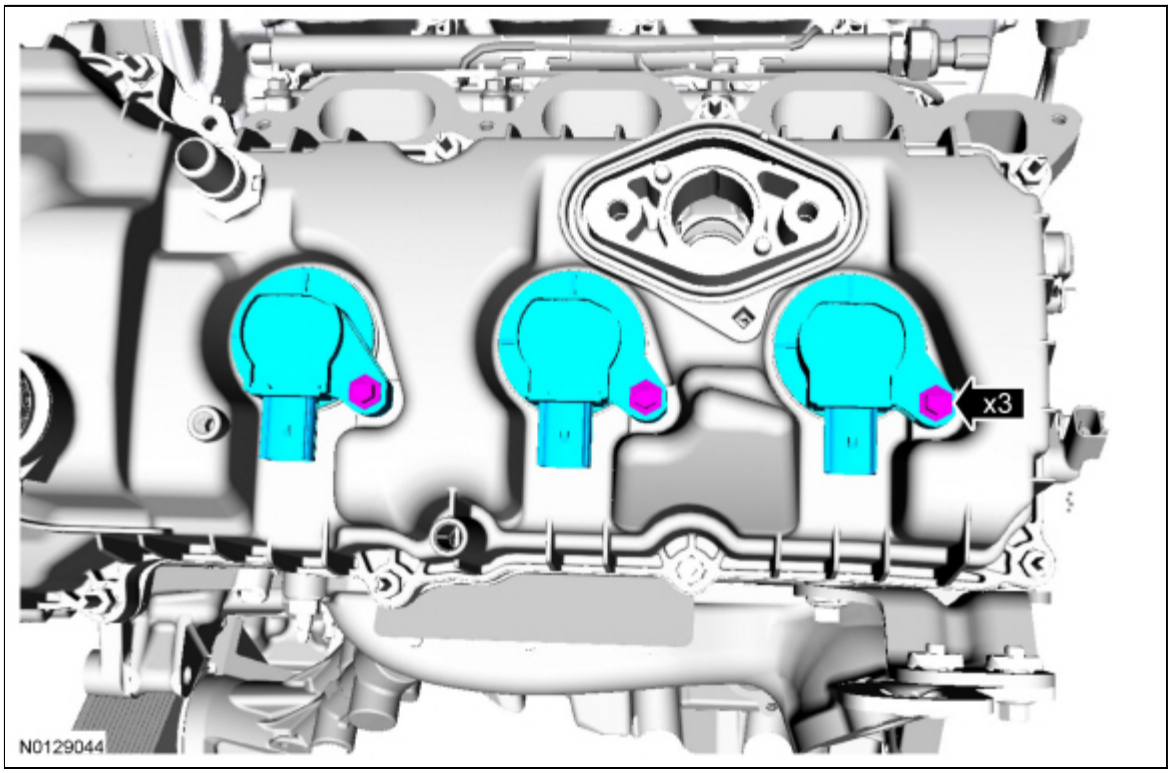
62. **NOTE:** Make sure to thoroughly clean any residual fuel or foreign material from the cylinder head, block and general surrounding area of the fuel rails and fuel injectors.

    NOTE: Do not use compressed air to clean the tip of the fuel injector.

    NOTE: Do not use the brush to clean the tip of the fuel injector.

    Using the Fuel Injector Brush, clean the 6 fuel injector bores in the cylinder heads.

repair4less



63. Remove the bolt and the fuel injection pump mounting plate.
    - Remove and discard the gaskets.

64. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

    Remove the 3 bolts and the 3 LH ignition coil-on-plugs.

repair4less

65. ***NOTICE:*** **Only use hand tools when removing the spark plugs, or damage may occur to the cylinder head or spark plug.**

    NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

    Remove the 3 LH spark plugs.

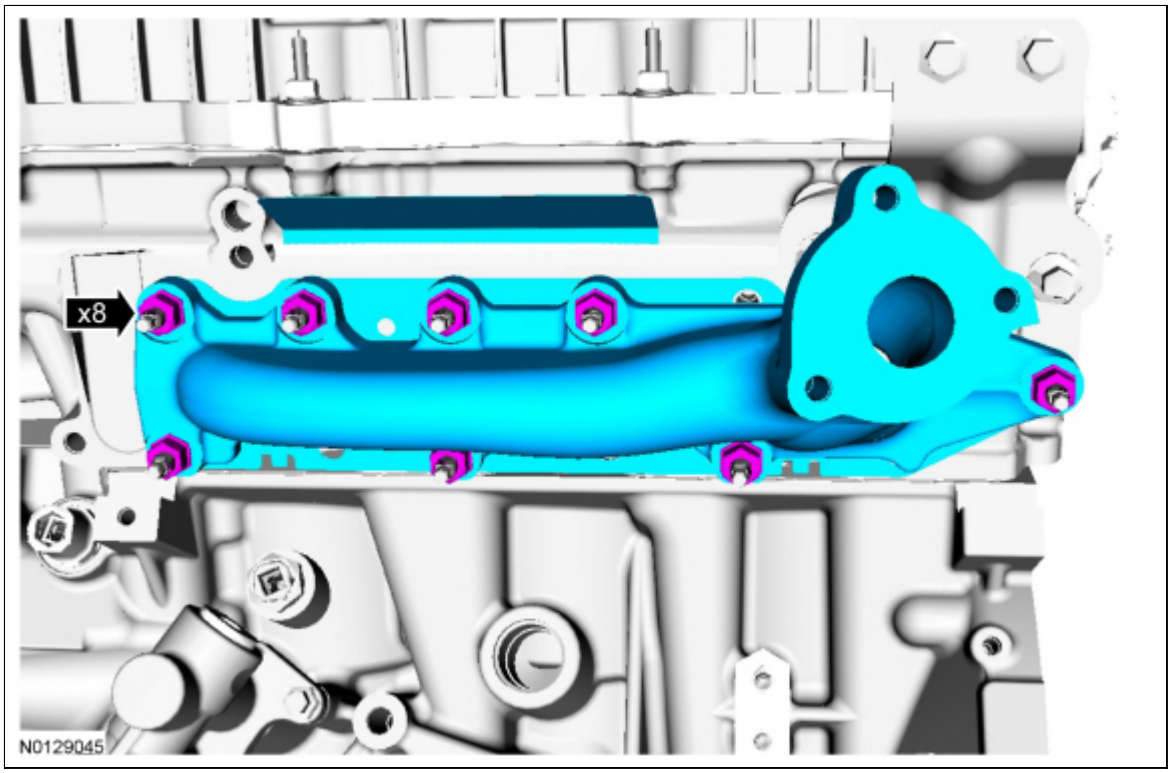
66. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

    NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT oil control solenoid may occur.**

    NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12 degrees inside the steel housing, which is normal.

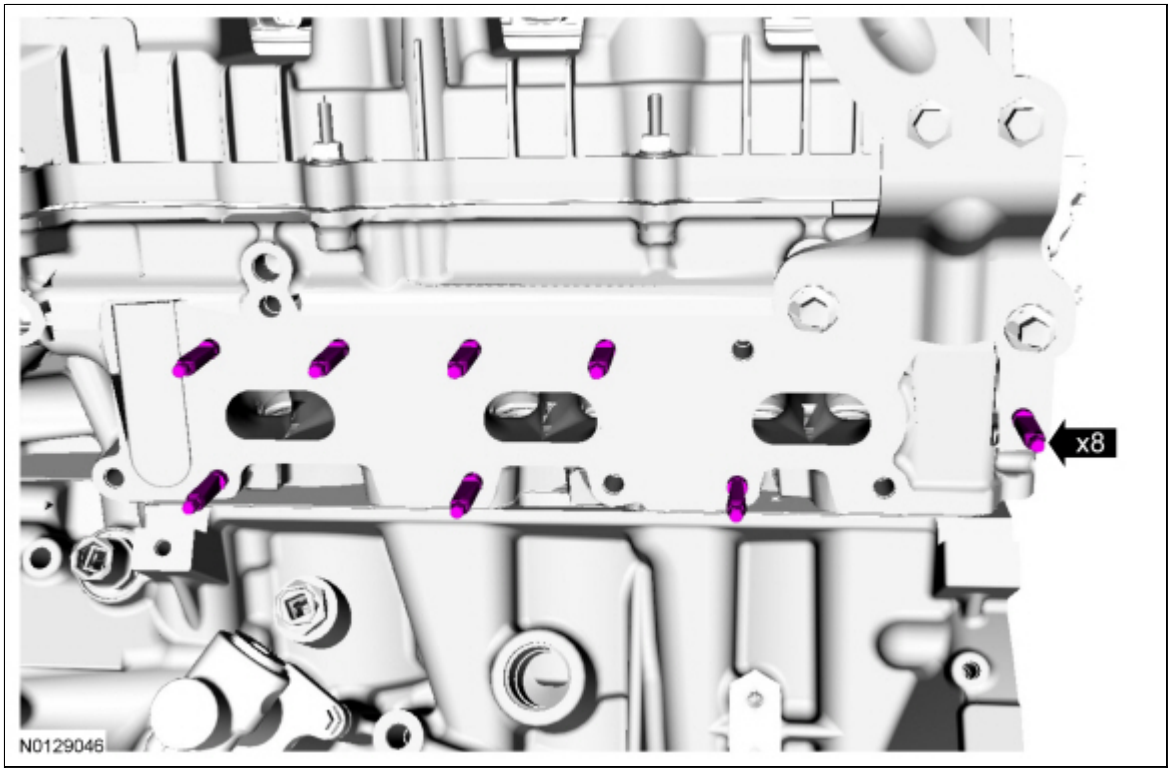
    Loosen the 11 stud bolts and remove the LH valve cover.
    - Discard the gasket.

67. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).



68. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

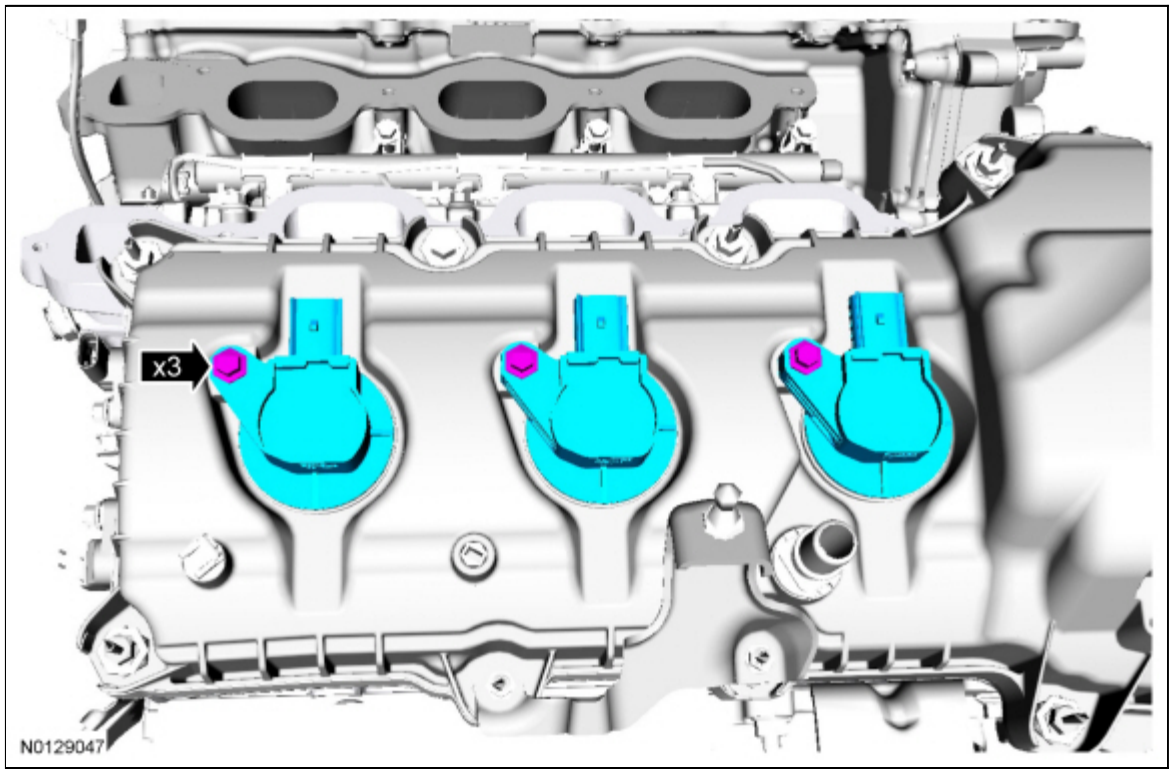
69. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.



70. Remove the 8 nuts and the LH exhaust manifold.
    - Discard the nuts and exhaust manifold gasket.

repair4less

71. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

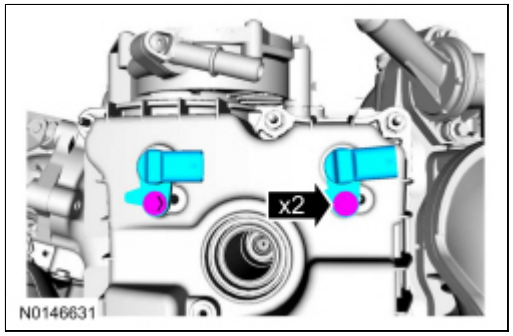


72. Remove and discard the 8 LH exhaust manifold studs.

73. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease

removal.

Remove the 3 bolts and the 3 RH ignition coil-on-plugs.



74. ***NOTICE:*** **Only use hand tools when removing the spark plugs, or damage may occur to the cylinder head or spark plug.**

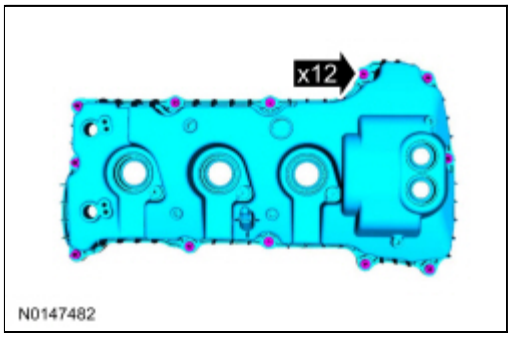
    NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

    Remove the 3 RH spark plugs.

75. Remove the 2 bolts and the CMP sensors.

76. ***NOTICE:*** **While removing the valve cover do not apply excessive force to the Variable Camshaft Timing (VCT) oil control solenoid or damage may occur.**

    NOTICE: **If the Variable Camshaft Timing (VCT) oil control solenoid sticks to the VCT seal, carefully wiggle the valve cover until the bond breaks free or damage to the VCT seal and VCT**

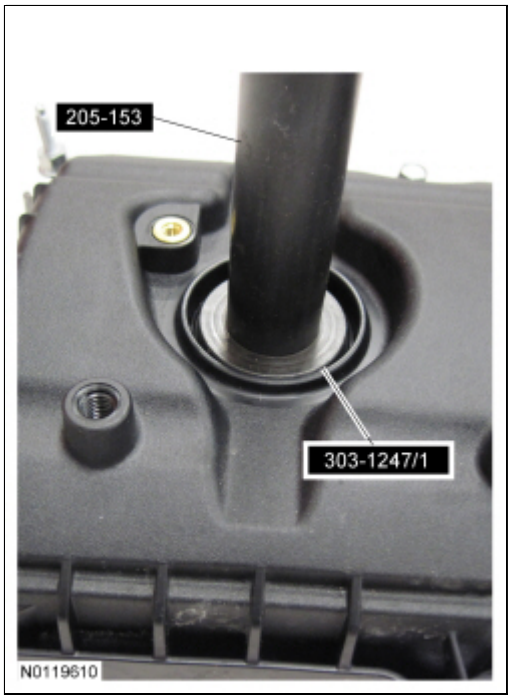


repair4less

oil control solenoid may occur.

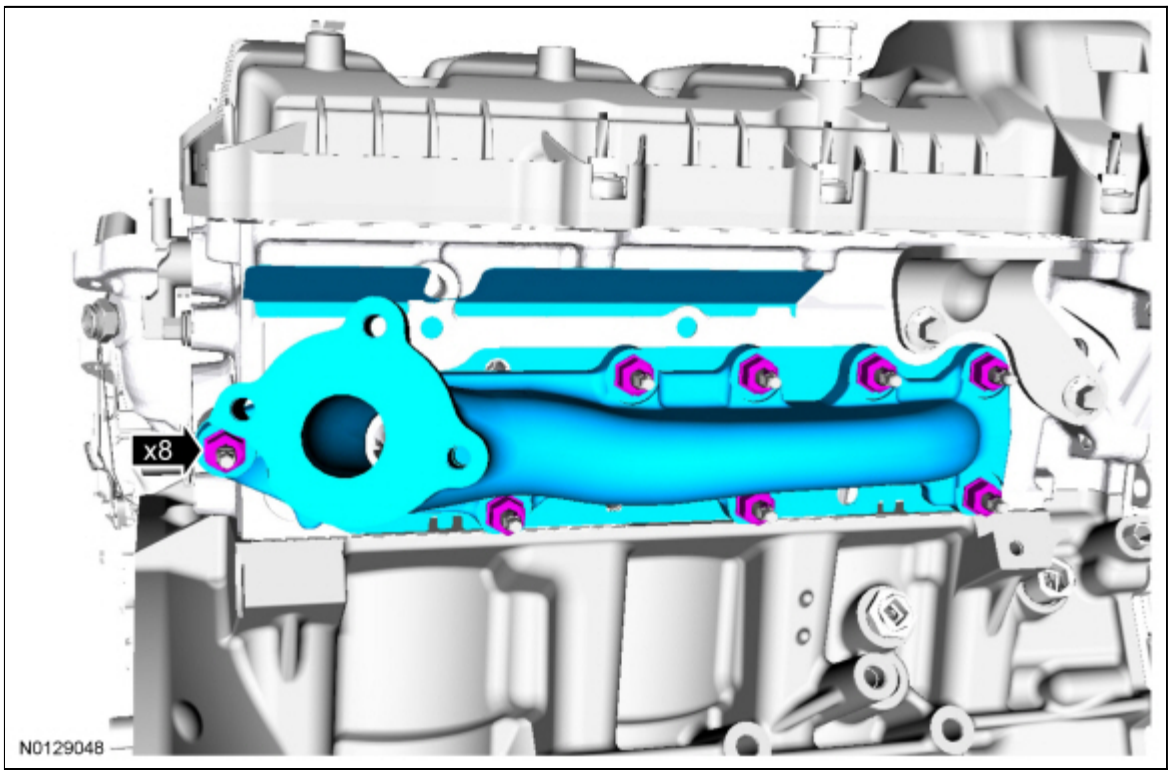
NOTE: The plastic electrical connector on the VCT oil control solenoid will rotate approximately 12 degrees inside the steel housing, which is normal.

Loosen the 12 stud bolts and remove the RH valve cover.



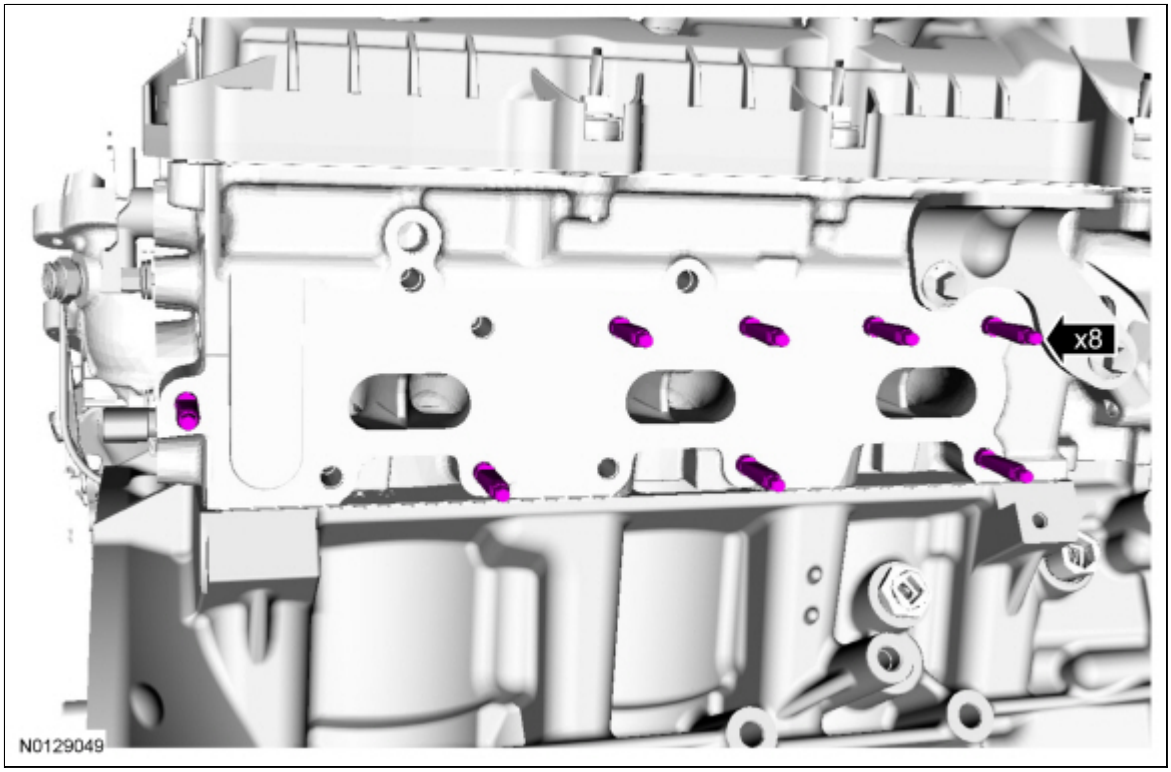
- Discard the gasket.

77. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

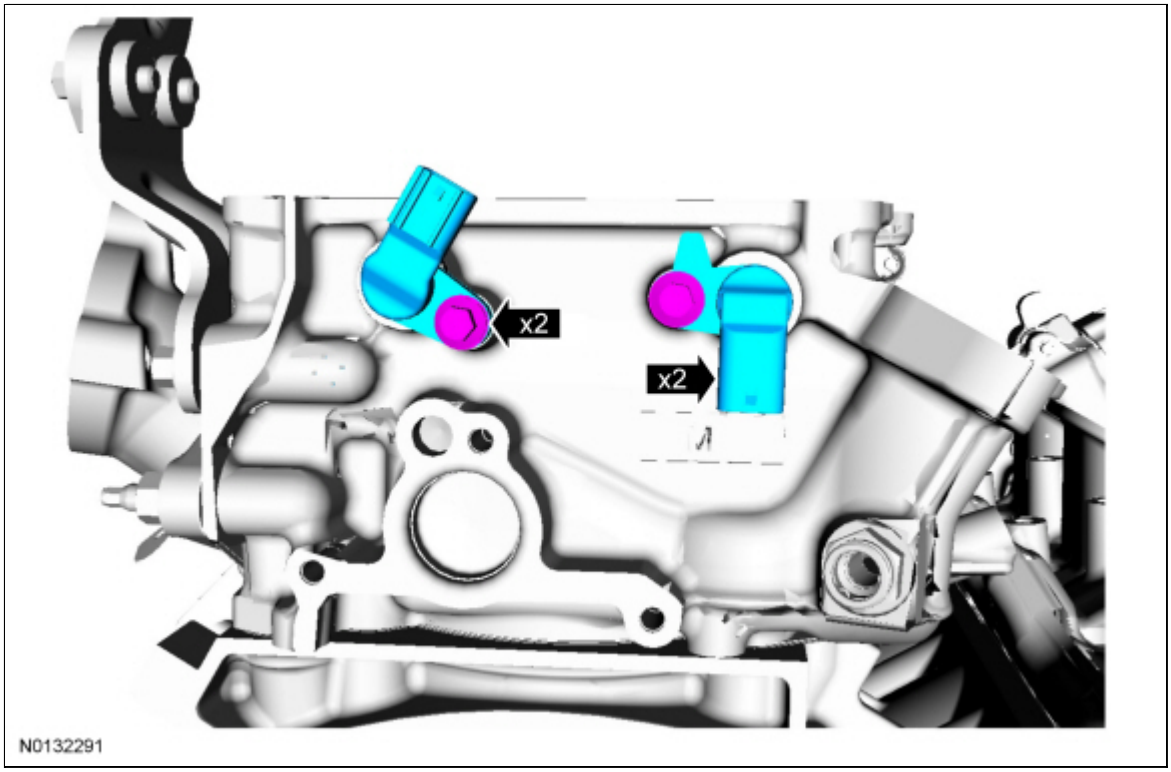


78. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

79. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

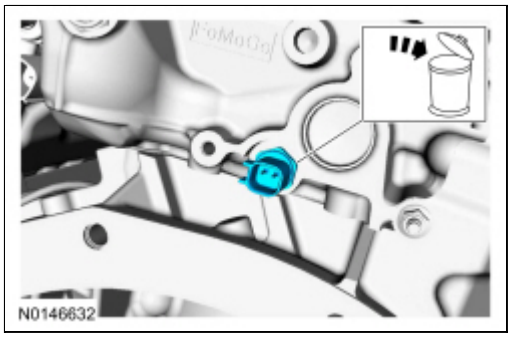


80. Remove the 8 nuts and the RH exhaust manifold.
    - Discard the nuts and exhaust manifold gasket.

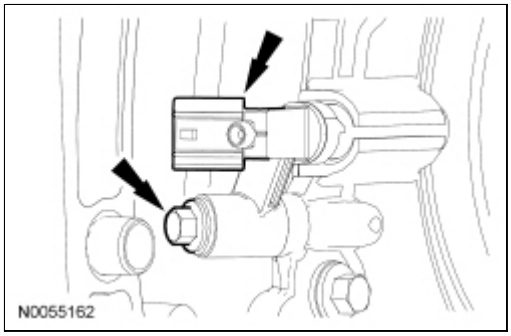


81. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

repair4less

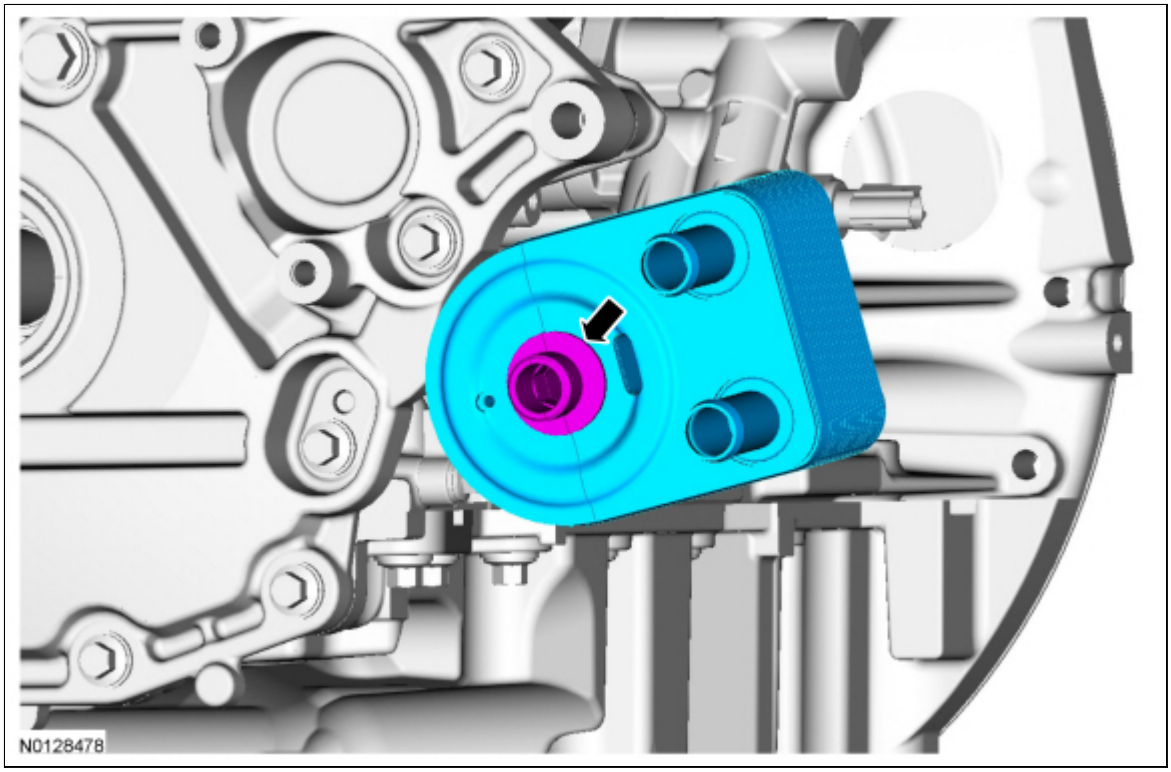


82. Remove and discard the 8 RH exhaust manifold studs.



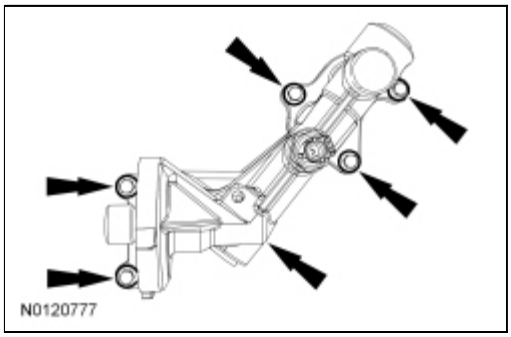
83. Remove the 2 bolts and the LH CMP sensors.

84. Remove and discard the CHT sensor



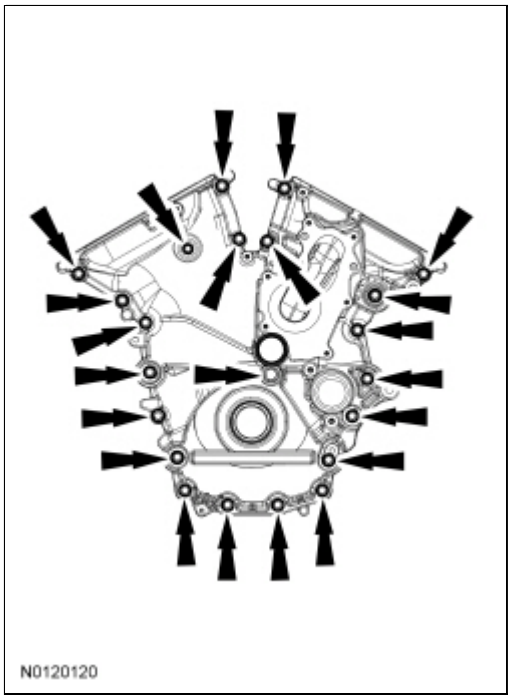
85. Remove the bolt and the CKP sensor.

86. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

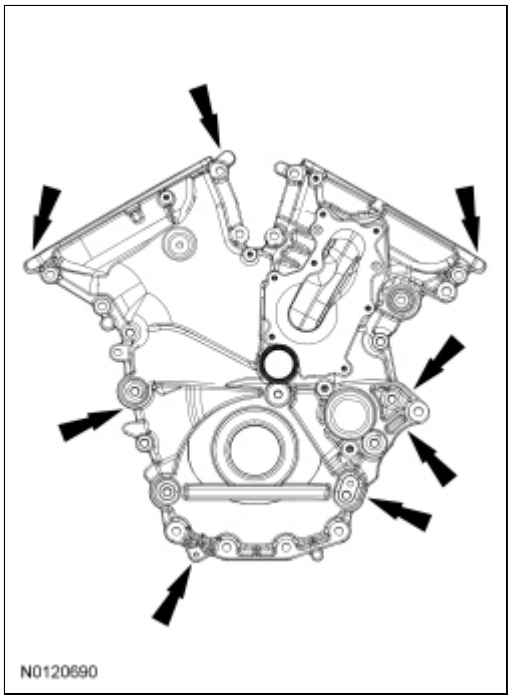


Remove the threaded shaft and the oil cooler.

- Discard the oil cooler.

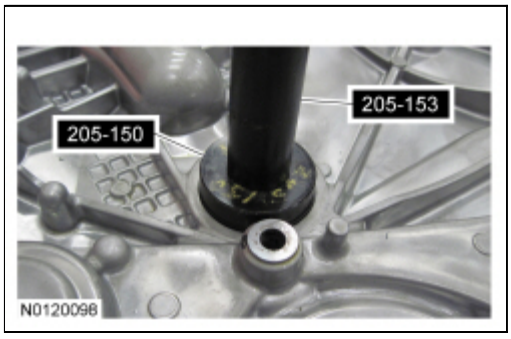


repair4less



87. Remove the 5 bolts and the oil filter adapter.
    - Discard the gasket.

88. Remove the 22 engine front cover bolts.

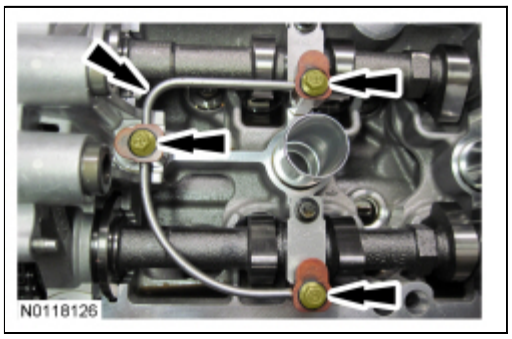


89. Using a suitable pry tool, locate the 7 pry pads shown and pry the engine front cover loose and remove.

90. **NOTE:** Inspect and replace the front cover radial seal as necessary.

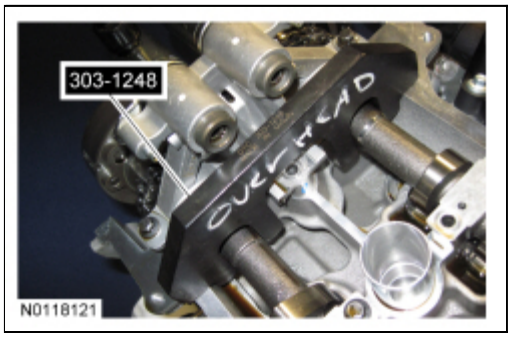
    NOTE: Use Spindle Bearing Installer 205-150 to remove the seal.

    Using the Spindle Bearing Installer and Handle, remove the front cover radial seal from the rear side of the front cover.

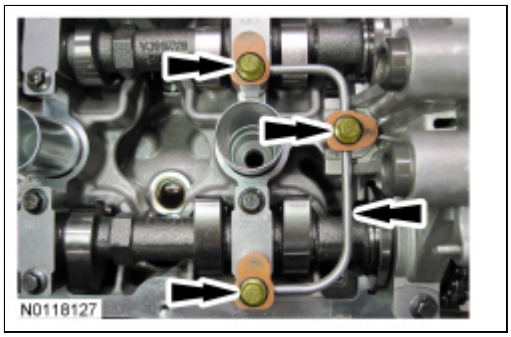


91. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

repair4less

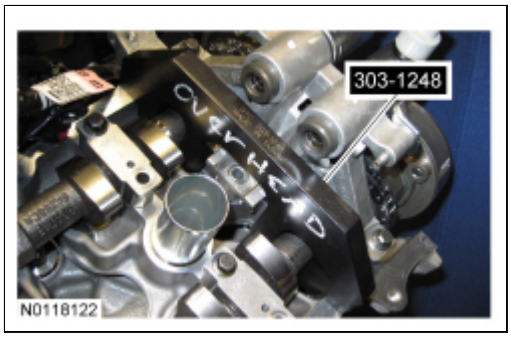


92. Remove the 3 bolts and the LH valve train oil tube.

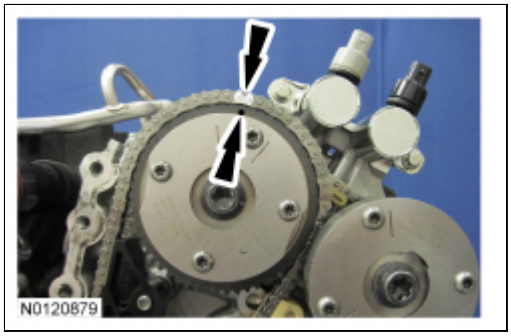


93. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

    Install the Camshaft Holding Tool onto the flats of the LH camshafts.

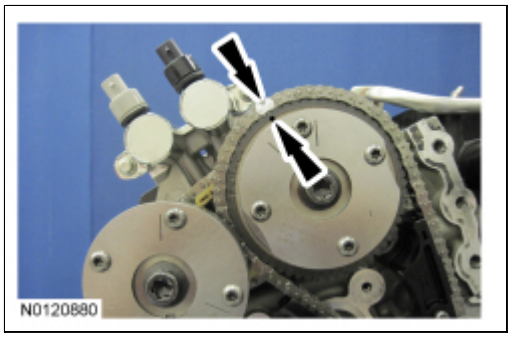


94. Remove the 3 bolts and the RH valve train oil tube.



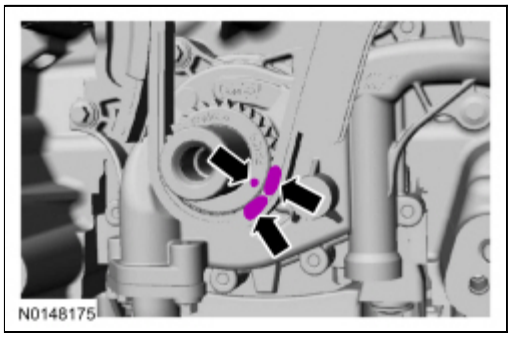
95. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the RH camshafts.

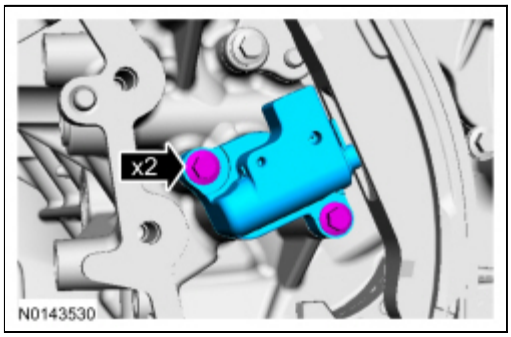


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

96. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



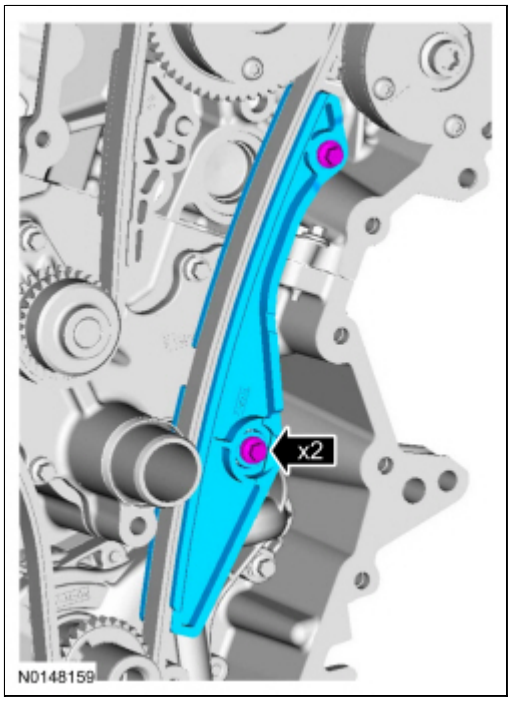
97. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



repair4less

98. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

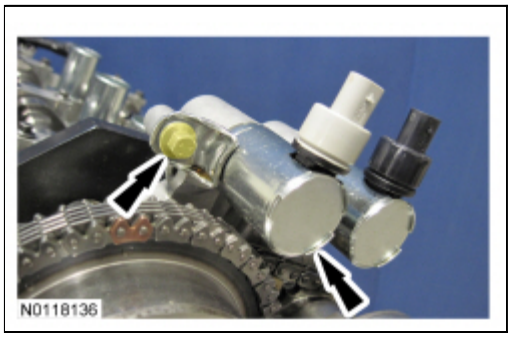
    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



99. Remove the 2 bolts and the primary timing chain tensioner.

100. Remove the primary timing chain tensioner arm.

101. Remove the 2 bolts and the lower LH primary timing chain guide.

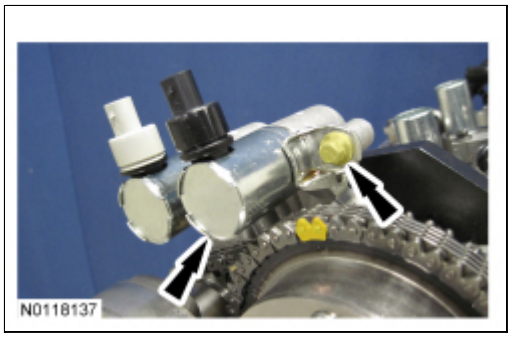


102. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

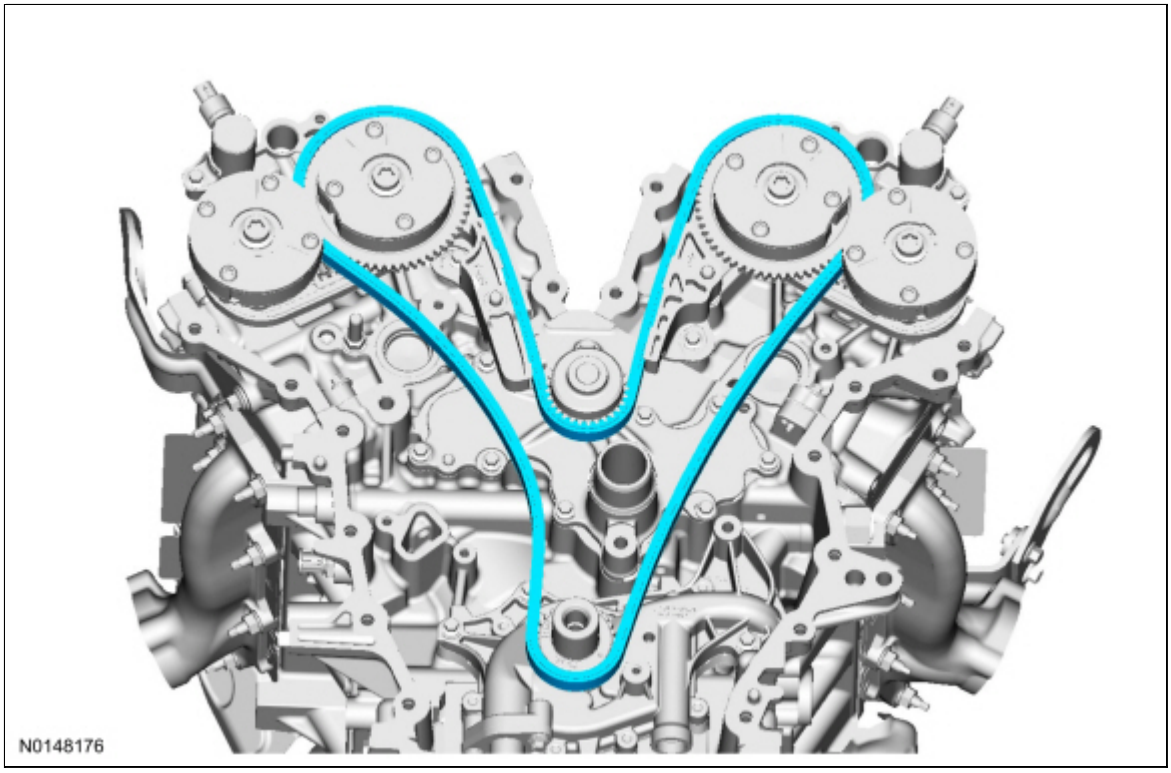
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Remove the bolt and the LH intake VCT oil control solenoid.



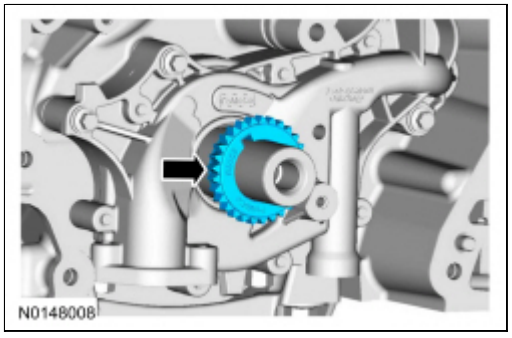
103. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.



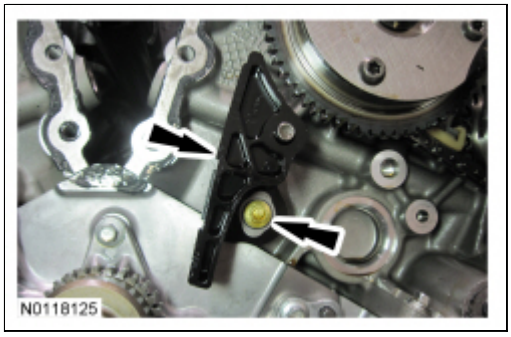
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Remove the bolt and the RH intake VCT oil control solenoid.



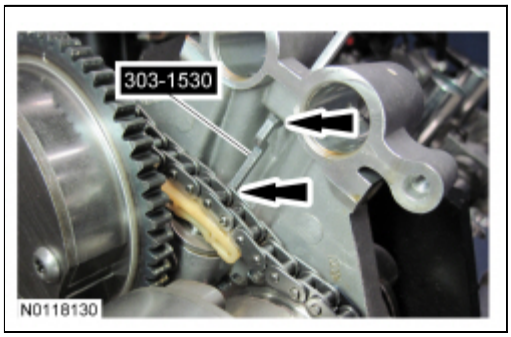
repair4less

104. Remove the primary timing chain.

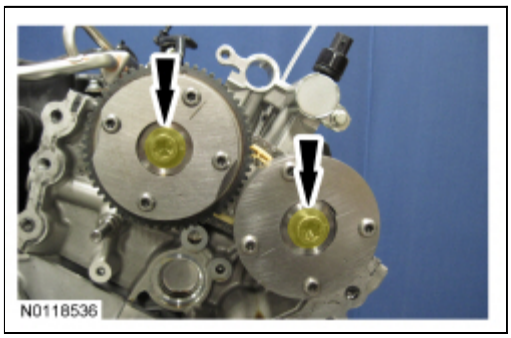


105. Remove the crankshaft timing chain sprocket.

106. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**



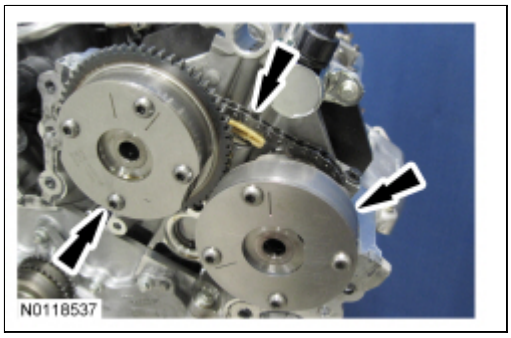
Remove the bolt and the upper LH primary timing chain guide.



107. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

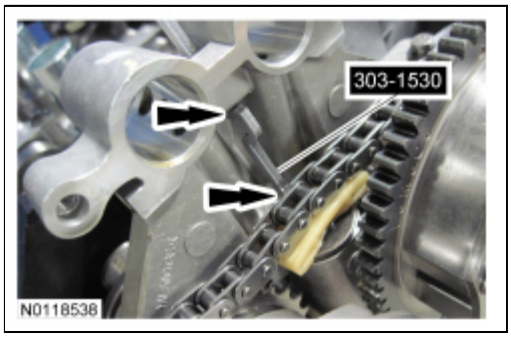
NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

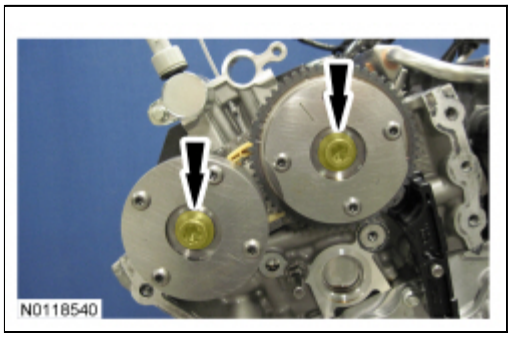


108. Remove and discard the 2 LH VCT assembly bolts.

109. Remove the 2 LH VCT assemblies and secondary timing chain.

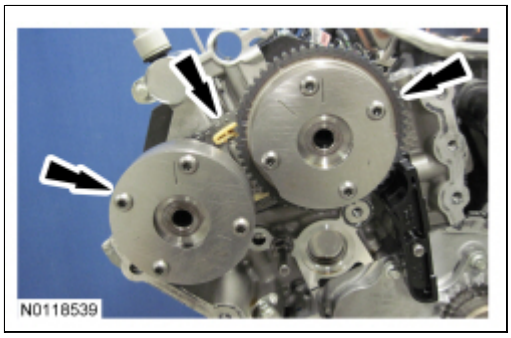


repair4less



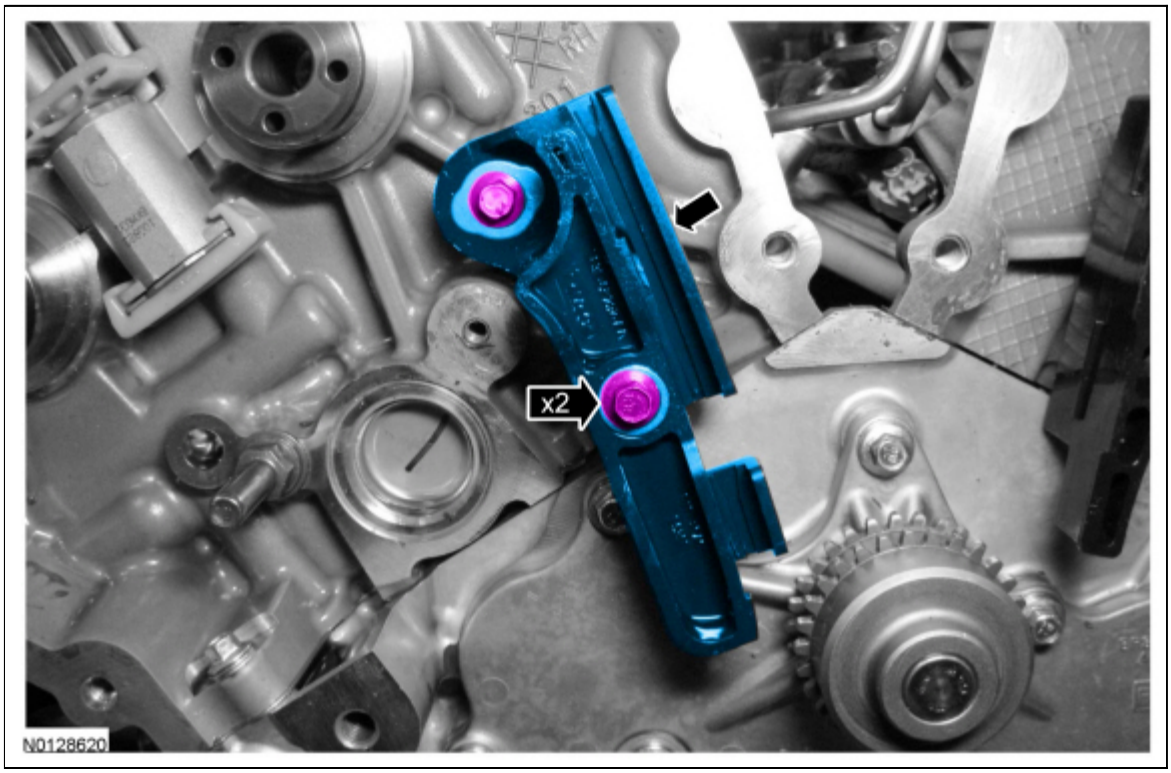
110. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

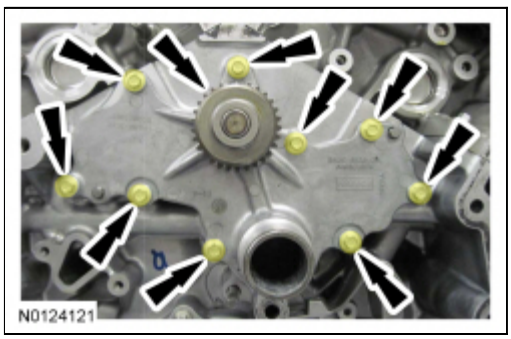


Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

111. Remove and discard the 2 RH VCT assembly bolts.



112. Remove the 2 RH VCT assemblies and secondary timing chain.

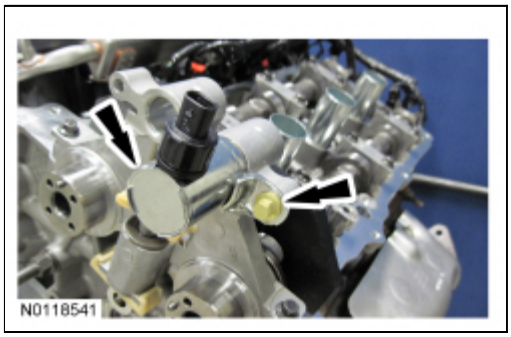


113. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.**

Remove the 2 bolts and the RH primary timing chain guide.

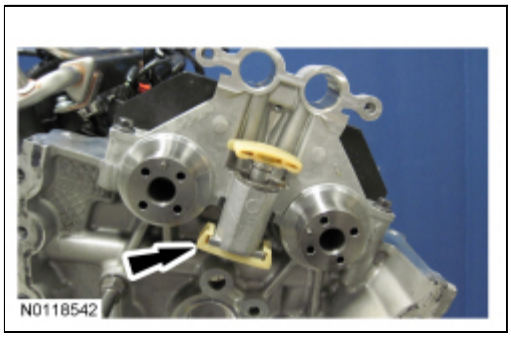
114. Remove the 9 bolts and the timing chain gear.
    - Discard the gasket.

repair4less



Engines with secondary timing chain tensioner removed

NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.**

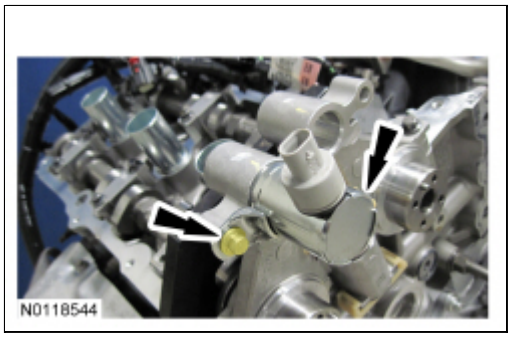


115. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

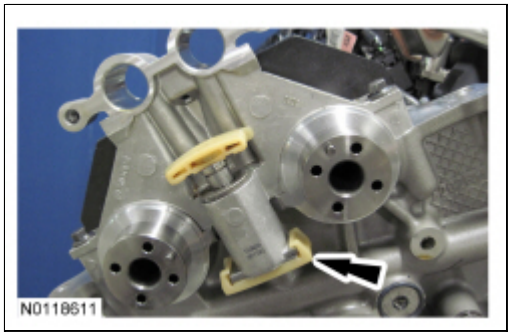
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the LH exhaust VCT oil control solenoid.

116. Remove the LH secondary timing chain tensioner shoe.



117. Remove the LH secondary timing chain tensioner by pushing up from the bottom and remove.

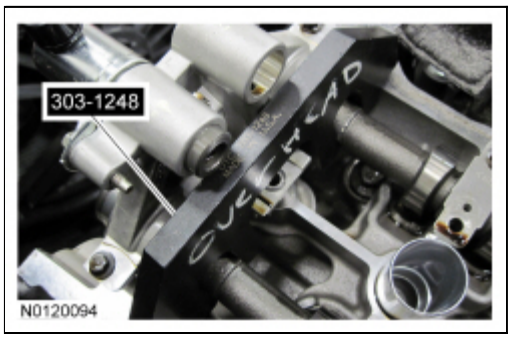


118. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the RH exhaust VCT oil control solenoid.

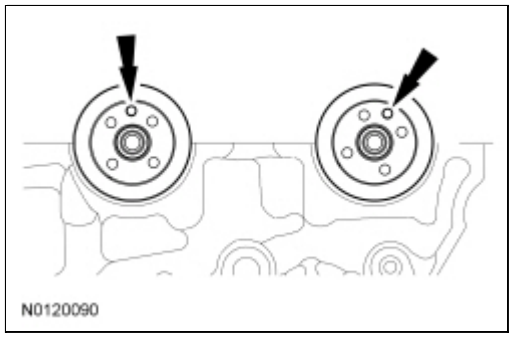
119. Remove the RH secondary timing chain tensioner shoe.



120. Remove the RH secondary timing chain tensioner by pushing up from the bottom and remove.

All engines

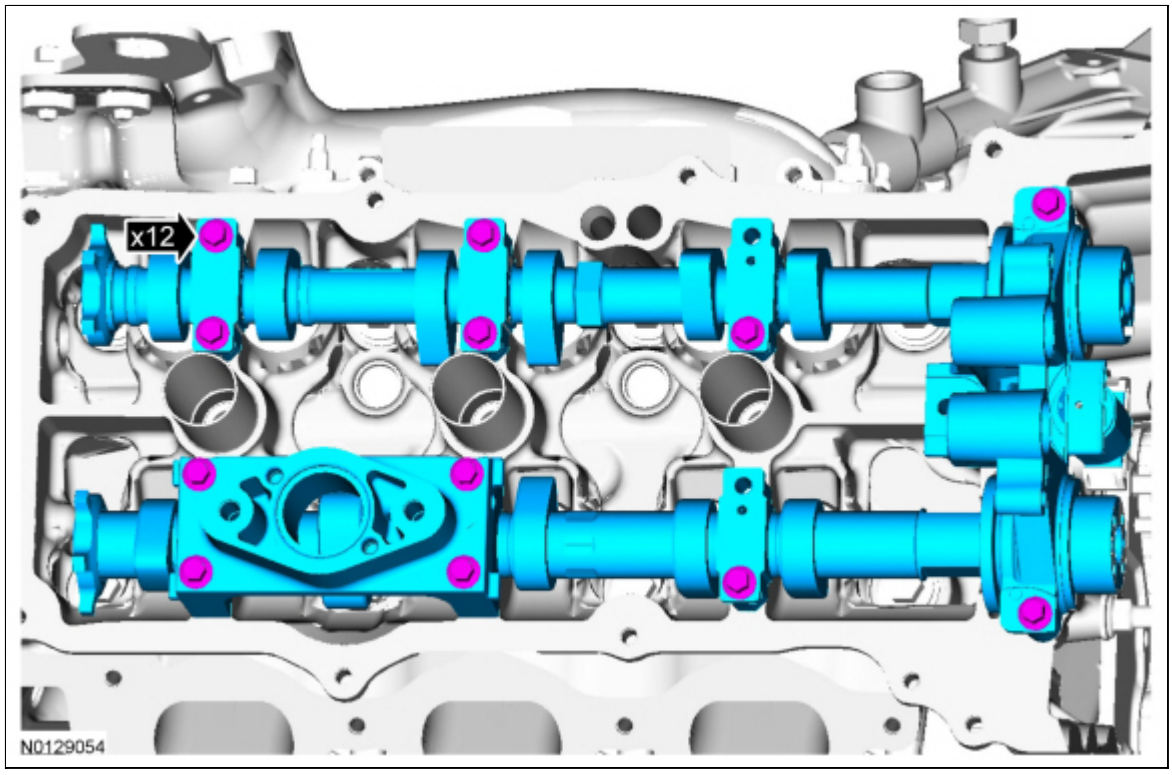
121. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the LH camshafts approximately 3 degrees to a neutral position.



Remove the Camshaft Holding Tool from the LH camshafts.

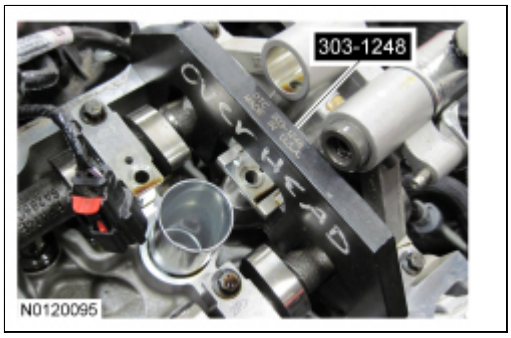
repair4less

122. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**



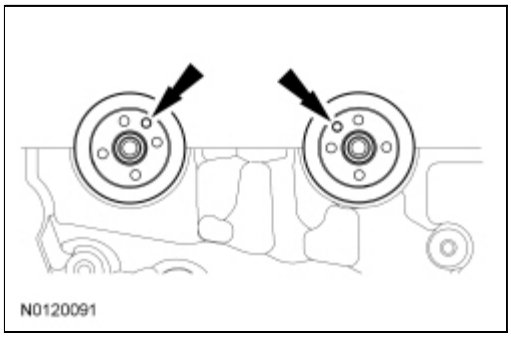
Verify the LH camshafts are in the neutral position.

123. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.



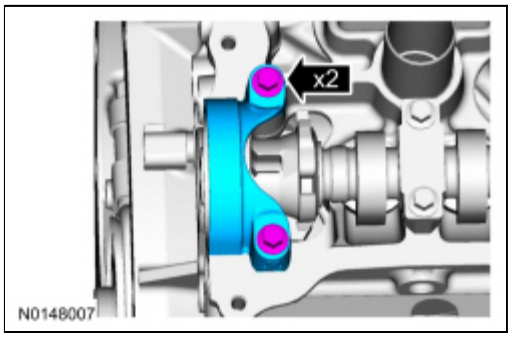
NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

Remove the 12 bolts, 6 camshaft caps, mega cap and the LH camshafts.



124. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the RH camshafts approximately 3 degrees to a neutral position.

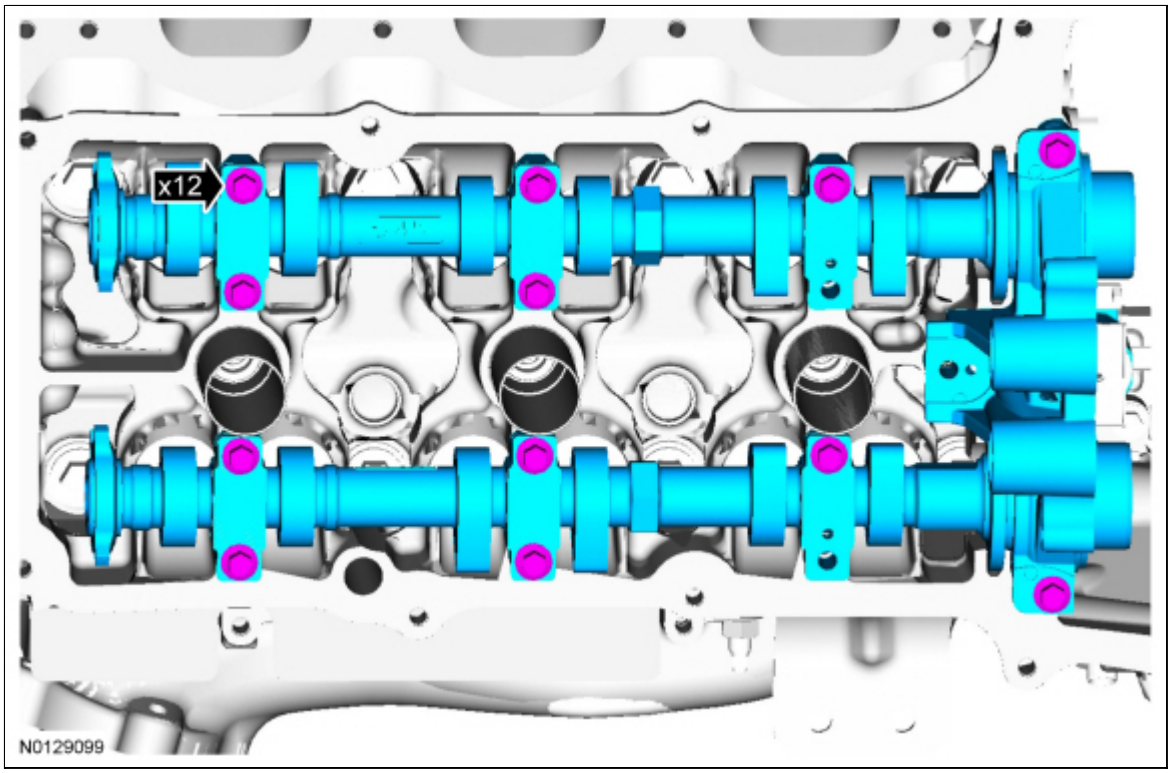
Remove the Camshaft Holding Tool from the RH camshafts.



125. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

Rotate the RH camshafts counterclockwise to the neutral position.

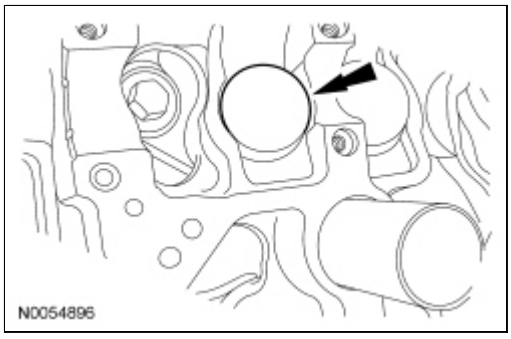
126. Remove the 2 bolts and the camshaft bearing cap assembly.



127. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

NOTE: Mark the exhaust and intake camshafts for installation into their original locations.

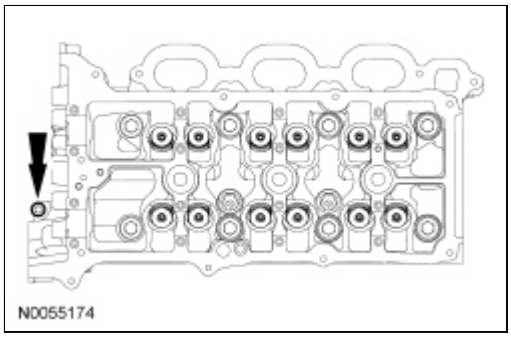
Remove the 12 bolts, 6 camshaft caps, mega cap and the RH camshafts.



repair4less

128. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

NOTE: LH shown, RH similar.



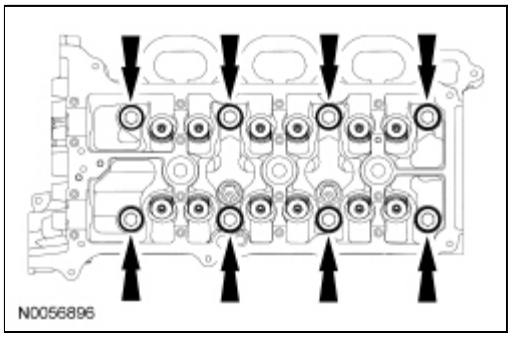
Remove the valve tappets from the cylinder heads.

129. Inspect the valve tappets. For additional information, refer to Section 303-00 .

130. **NOTE:** LH shown, RH similar.

Remove and discard the M6 bolt from each cylinder head.

131. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**



NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

NOTE: LH shown, RH similar.

Remove and discard the 8 bolts from each cylinder head.

- Remove the cylinder heads.
- Discard the cylinder head gaskets.

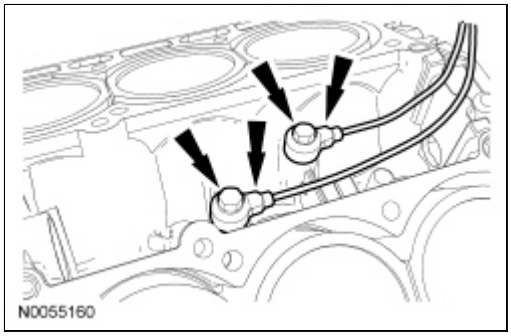
132. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

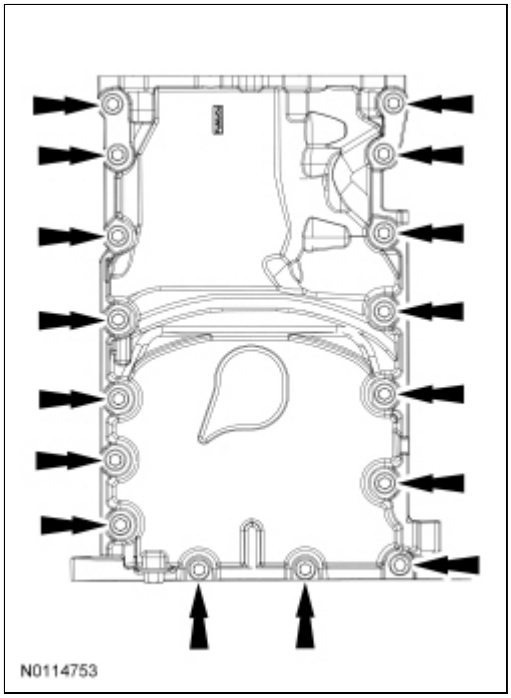
Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone



repair4less

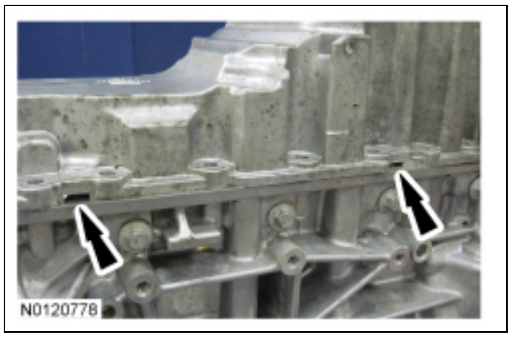
gasket remover may be required if residual traces of silicone or gasket material remain.



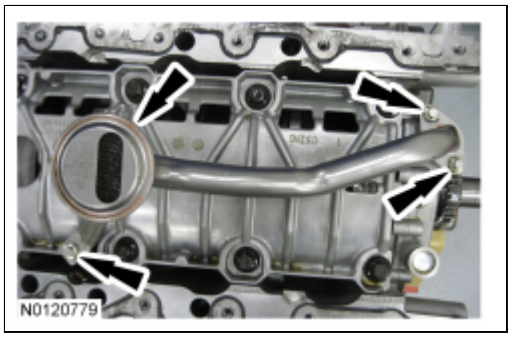
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

133. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

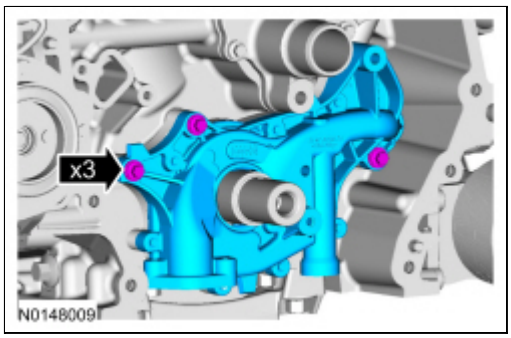
134. Remove the 2 bolts and the KS .



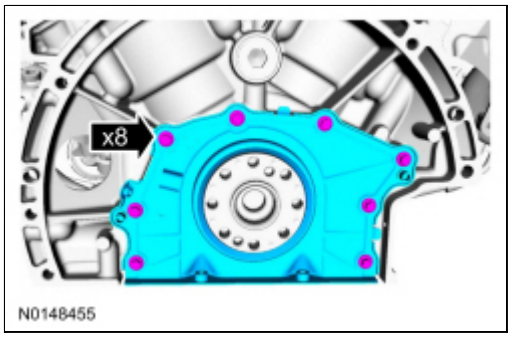
135. Remove the 16 oil pan bolts.



136. **NOTE:** RH shown, LH similar.



Using a suitable pry tool, locate the 2 pry pads at the LH and RH side of the oil pan and pry the oil pan loose and remove.

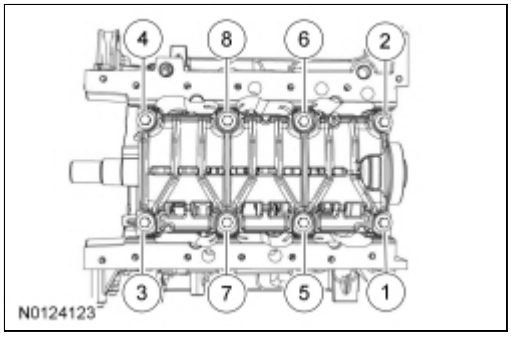


137. Remove the 3 bolts and the oil pump screen and the pickup tube.
    - Discard the O-ring seal.

138. Remove the 3 bolts and the oil pump.

139. Remove the 8 bolts and the crankshaft rear seal retainer plate.
    - Discard the plate and seal assembly.

140. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or

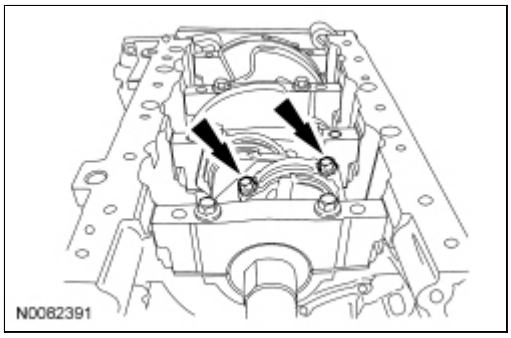


repair4less

carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

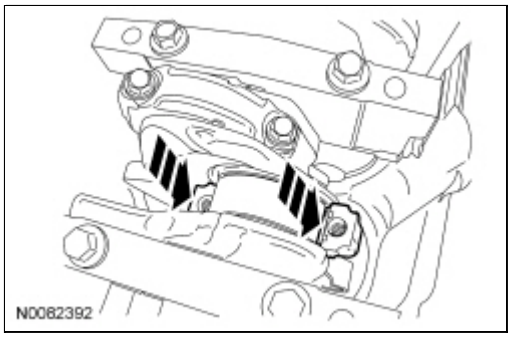
141. **NOTE:** The main bearing cap support brace bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

Remove the bolts in the sequence shown.



- Remove the main bearing cap support brace.
- Discard the bolts.

142. **NOTE:** The connecting rod cap bolts are a tighten-to-yield design. The original connecting rod cap bolts will be used when measuring the connecting rod large end bore during assembly. The connecting rod cap bolts will be discarded after measurement.

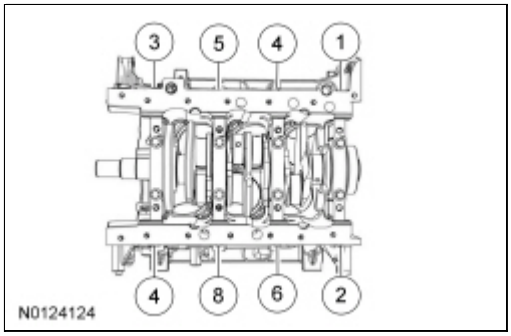


NOTE: Clearly mark the position and orientation of the connecting rods, connecting rod caps and connecting rod bearings for reassembly.

Remove the connecting rod cap bolts and cap.

143. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

Remove the piston/rod assembly from the engine block.



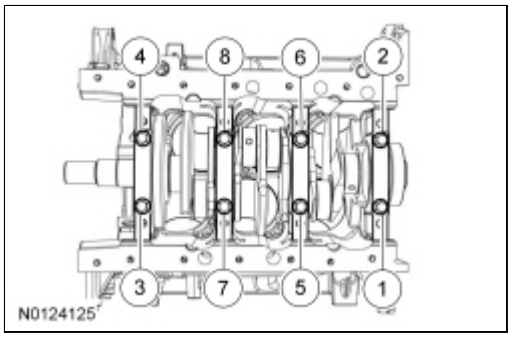
144. Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

145. **NOTE:** The 8 main bearing cap side bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.

Remove the 8 main bearing cap side bolts in the sequence shown.

- Discard the bolts.

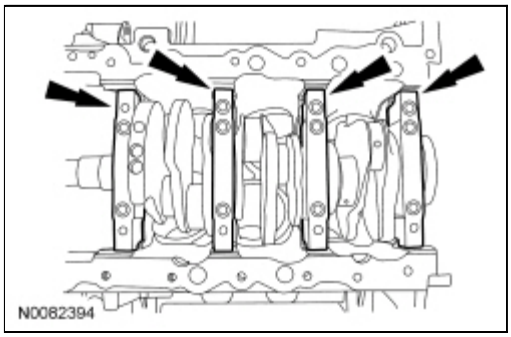


146. **NOTE:** The 8 main bearing cap bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.

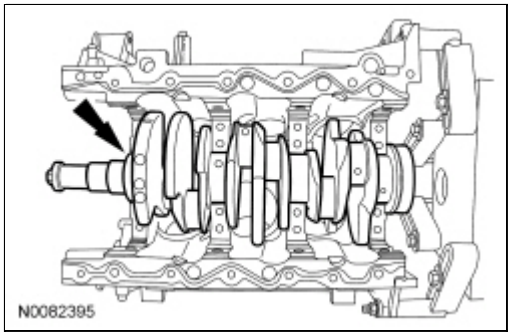
Remove the 8 main bearing cap bolts in the sequence shown.

- Discard the bolts.



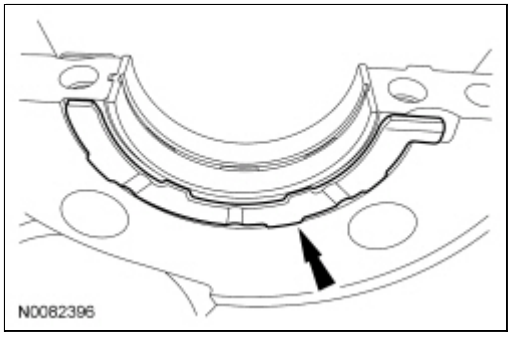
147. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

repair4less



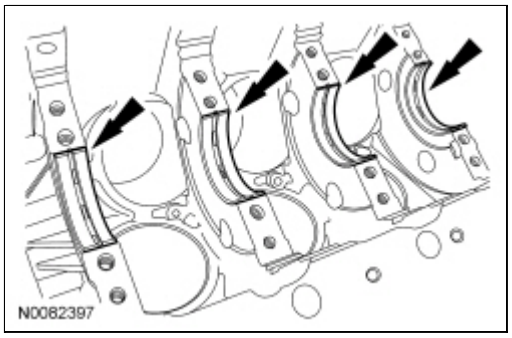
NOTE: Note the position of the thrust washer on the outside of the No. 4 rear main bearing cap.

Remove the 4 main bearing caps.



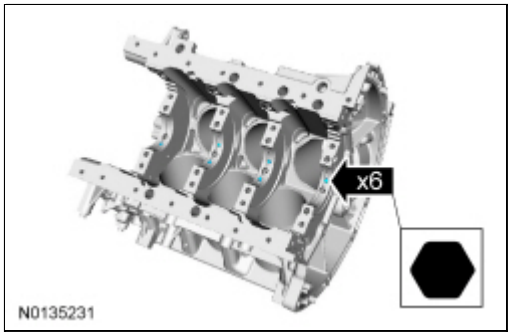
148. **NOTE:** Note the position of the 2 thrust washers on the inside and outside of the rear main bearing bulkhead.

Remove the crankshaft.



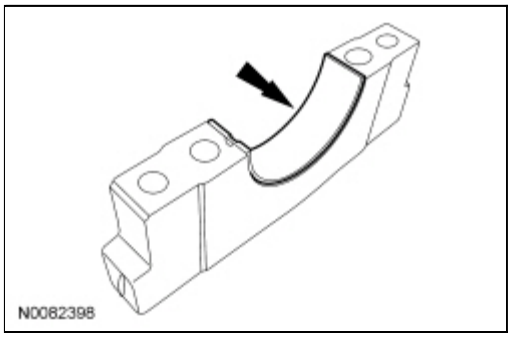
149. **NOTE:** Inside shown, outside similar.

Remove the 2 crankshaft thrust bearings from the rear main bearing bulkhead.



150. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

Remove the 4 crankshaft main bearings from the cylinder block.



151. Using a hexagonal screwdriver, remove the 6 piston oil cool valves.

152. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

Remove the 4 crankshaft main bearings from the main bearing caps.

153. Inspect the cylinder block, bearing cap support brace, pistons and connecting rods. For additional information, refer to Section 303-00 .

154. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

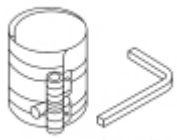
Clean the sealing surfaces of the cylinder heads, the cylinder block and the oil pan in the following sequence.

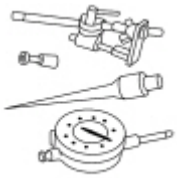
1. Remove any large deposits of silicone or gasket material.
2. Apply silicone gasket remover and allow to set for several minutes.
3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to

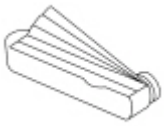
repair4less

bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

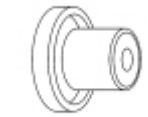


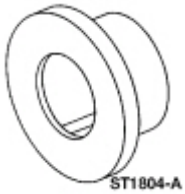


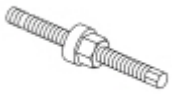


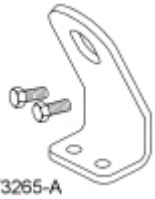
155. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover and oil pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover and oil pan. These tools cause scratches and gouges that make leak paths.**

Clean the engine front cover and oil pan using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.









- Thoroughly wash the engine front cover and oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

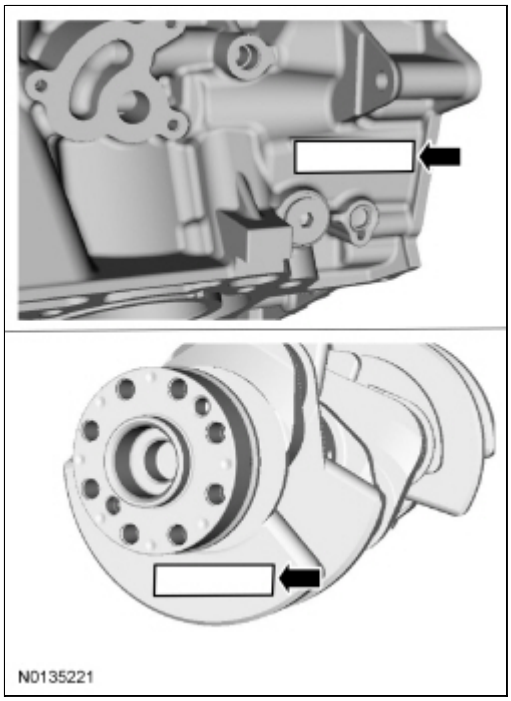
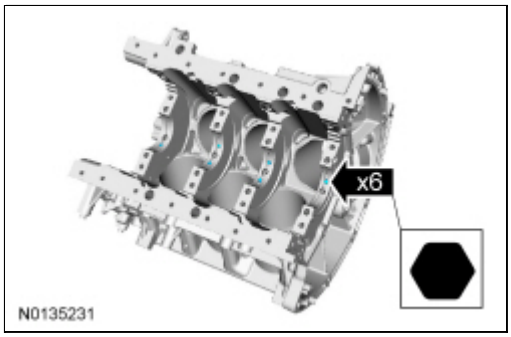
20	6C364	Main bearing cap support brace



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

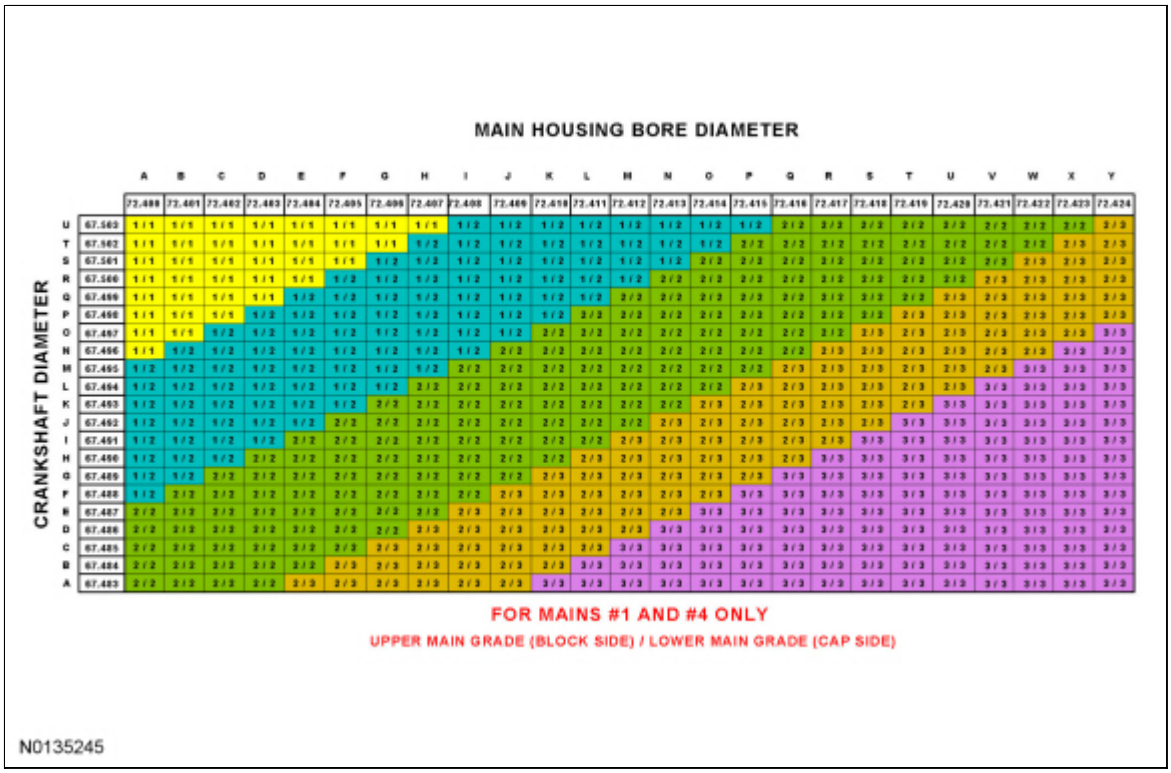
NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .



All engines

1. **NOTE:** This procedure is for selecting bearings using a new crankshaft.

   Select the crankshaft main bearings for each crankshaft journal.
   - Read the code on the crankshaft flange.
   - Read the code on the cylinder block face.
     - The first letter after the first asterisk makes up the code for main No. 1 and the next letter for main No. 2. The first letter after the second asterisk makes up the code for main No. 3 and the last letter for main No. 4.



2. Using a hexagonal screwdriver, install the 6 piston oil cool valves.
    - Tighten to 4 Nm (35 lb-in).

3. **NOTE:** This chart is for selecting main bearings 1 and 4 only, the remaining bearings will be selected using a different chart in the next step.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 1 and 4.
    - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
    - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.
    - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.
    - Repeat the above steps using the fourth letter of the block and crankshaft codes to select the No. 4 bearing.

repair4less

4. **NOTE:** This chart is for selecting main bearings 2 and 3 only.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 2 and 3.
   - Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the No. 2 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is "1".
   - Repeat the above steps using the third letter of the block and crankshaft codes to select the No. 3.

5. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

   Using the original connecting rod cap bolts, install the connecting rod caps and bolts.
   - Tighten the bolts in 3 stages.
   - Stage 1: Tighten to 23 Nm (17 lb-ft).
   - Stage 2: Tighten to 43 Nm (32 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.

6. Measure the connecting rod large end bore in 2 directions. For additional information, refer to Specifications in this section.
   - Remove the bolts and the rod cap.
     - Discard the connecting rod cap bolts.

7. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions. For additional information, refer to Specifications in this section.

repair4less

8. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.

		CONNECTING ROD LARGE END BORE (59.XXX)																				
		1	1	1	1	1	1	1	2	2	2	2	2	2	2	3	3	3	3	3	3	3

N0082806

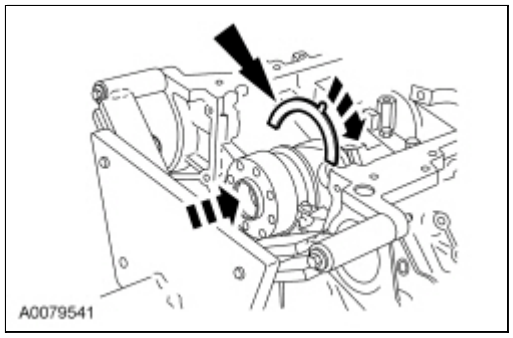
9. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Lubricate the upper crankshaft main bearings with clean engine oil and install the 4 crankshaft main bearings in the cylinder block.

10. **NOTE:** Do not install the upper thrust bearings until the crankshaft is installed.

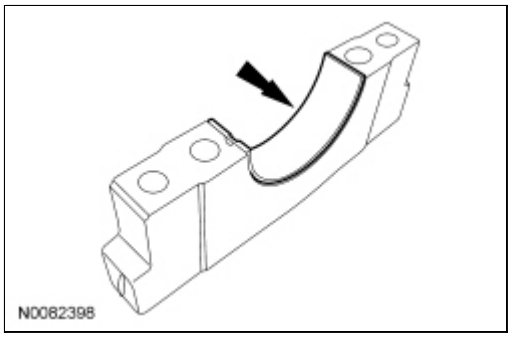
    NOTE: Lubricate the thrust surfaces of the crankshaft with clean engine oil.

    Install the crankshaft onto the upper main bearings.



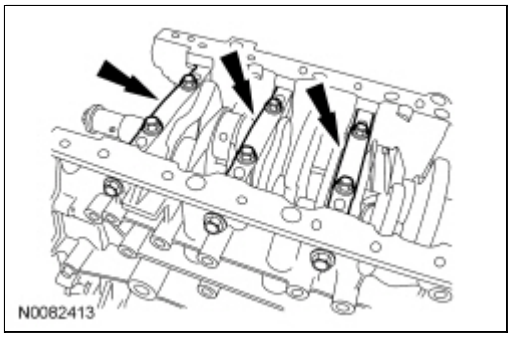
11. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 4 rear bulkhead.



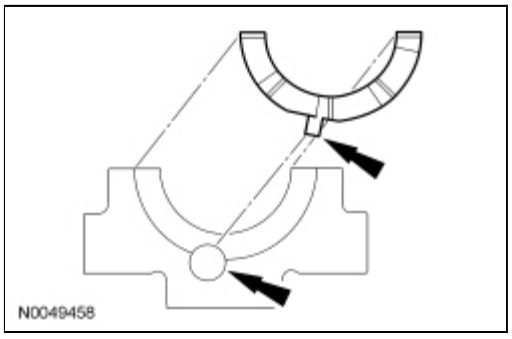
12. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 4 rear bulkhead.

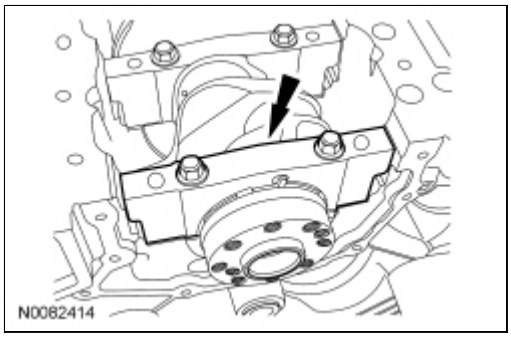


13. Lubricate the crankshaft lower main bearings with clean engine oil and install them into the main bearing caps. Visually check seating and squareness of the bearings to make sure of proper seating in caps.

repair4less



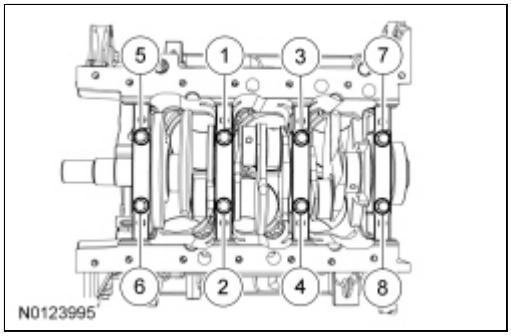
14. Position the No. 1, No. 2 and No. 3 main bearing caps on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the new bolts until the main bearing caps are seated.



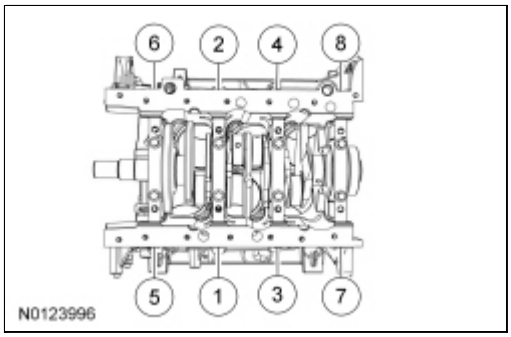
15. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    NOTE: To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

    Install the lower crankshaft thrust washer to the back side of the No. 4 rear main bearing cap, with the tab aligned with the cutout in the main bearing cap.



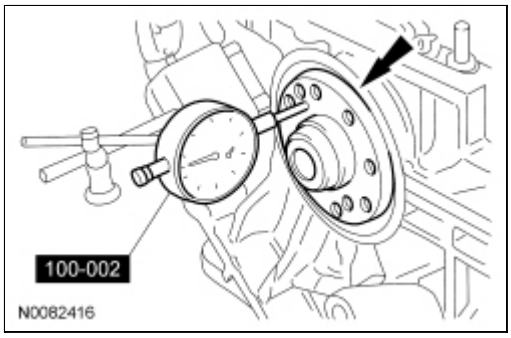
16. Position main bearing cap No. 4 on the cylinder block and keeping the cap as square as possible, alternately draw the cap down evenly using the new bolts until the main bearing cap is seated.



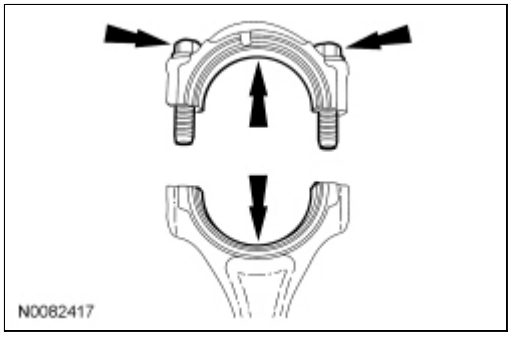
17. Loosen the No. 4 main bearing cap bolts.

18. **NOTE:** While tightening the main bearing vertical bolts, push the crankshaft forward and the No. 4 main bearing cap rearward to seat the crankshaft thrust washers.

    Tighten the main bearing bolts in 2 stages in the sequence shown.
    - Stage 1: Tighten fasteners 1 through 8 to 33 Nm (24 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 90 degrees.

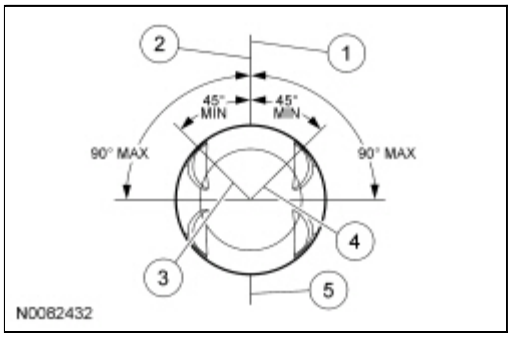


19. Install the new 8 main bearing cap side bolts. Tighten in 2 stages in the sequence shown.
    - Stage 1: Tighten fasteners 1 through 8 to 45 Nm (33 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 90 degrees.



20. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

repair4less



21. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

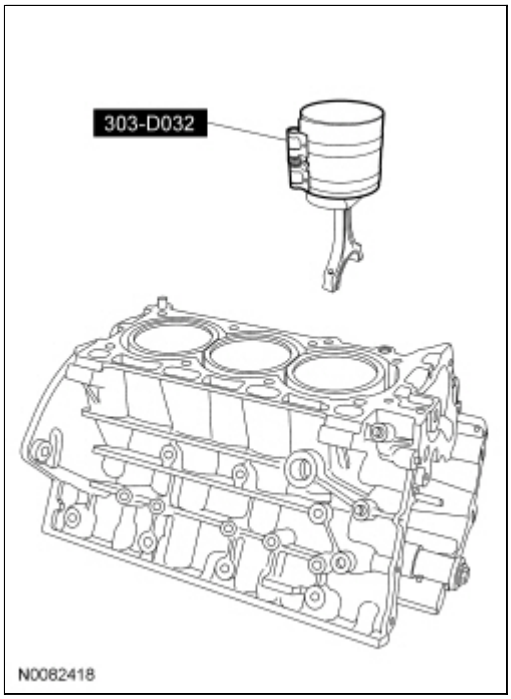
    Prepare the connecting rod and cap.
    - Insert the new bolts in the rod cap.
    - Insert the upper and lower rod bearings into the rod and cap.

22. Before installing the pistons into the cylinder block, verify proper ring gap location.
    1. Center line of the piston parallel to the wrist pin bore
    2. Upper compression ring gap location
    3. Upper oil control segment ring gap location
    4. Lower oil control segment ring gap location
    5. Expander ring and lower compression ring gap location

23. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: The next 3 steps are for all 6 connecting rods, rod caps and pistons. Only 1 connecting rod, rod cap and piston is shown.

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with



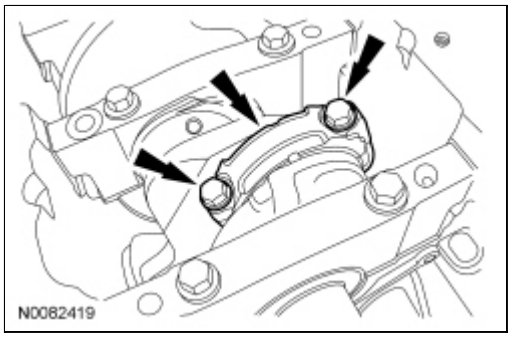
clean engine oil.

NOTE: Make sure the piston rings are positioned to specifications for installation. For additional information, refer to Disassembly and Assembly of Subassemblies - Piston in this section.

NOTE: If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

NOTE: If the piston and connecting rod are to be reinstalled, they must be installed in the same orientation as disassembled.

Using the Piston Ring Compressor, install the piston and connecting rod assemblies.



24. Seat the connecting rod on the crankshaft journal.

25. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

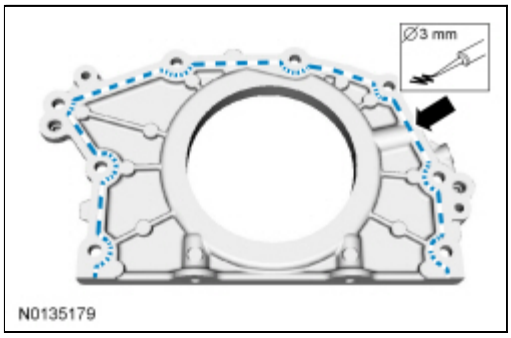
    NOTE: After installation of each piston, connecting rod, rod cap and bolts, rotate the crankshaft to verify smooth operation.

    Install the connecting rod cap and bolts. Tighten the bolts in 3 stages.
    - Stage 1: Tighten to 23 Nm (17 lb-ft).
    - Stage 2: Tighten to 43 Nm (32 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

repair4less

26. Repeat the previous 3 steps until all 6 piston, connecting rod and connecting rod cap assemblies are installed.

27. Install the main bearing cap support brace and the new bolts. Tighten in 2 stages in the sequence shown.
    - Stage 1: Tighten fasteners to 24 Nm (18 lb-ft).
    - Stage 2: Tighten fasteners an additional 180 degrees.

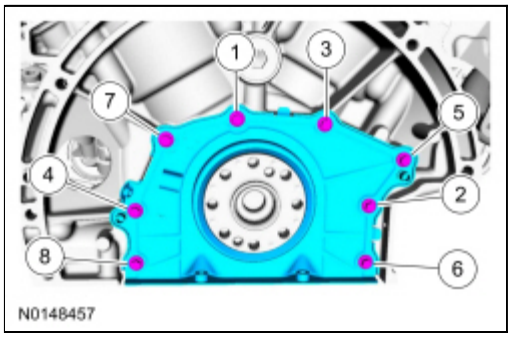


28. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

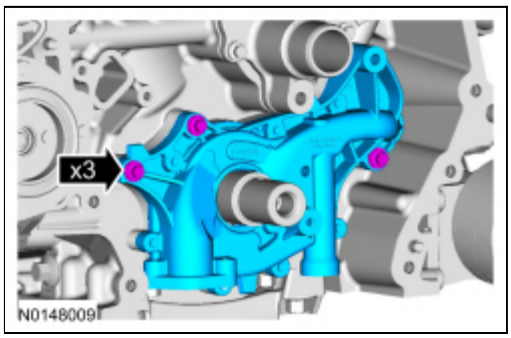
    NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

    NOTE: The stamped steel crankshaft rear seal retainer plate comes with the crankshaft rear seal.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

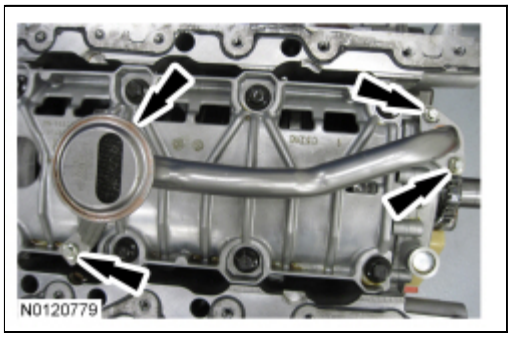


29. **NOTE:** Lubricate the crankshaft rear seal and the crankshaft with clean engine oil prior to installation.



NOTE: Use the handles during installation to avoid touching the sealant.

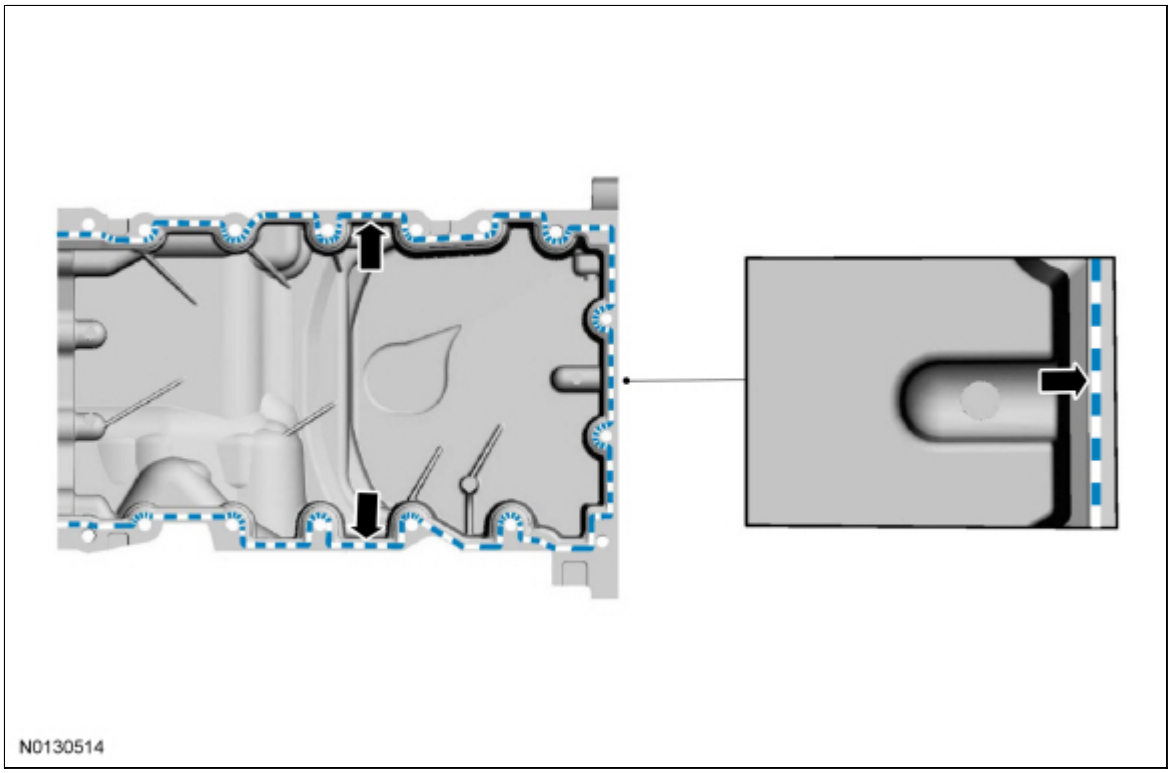
Install the 8 crankshaft rear seal retainer plate bolts. Tighten in the sequence shown.



- Tighten to 10 Nm (89 lb-in).

30. Install the oil pump and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

31. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

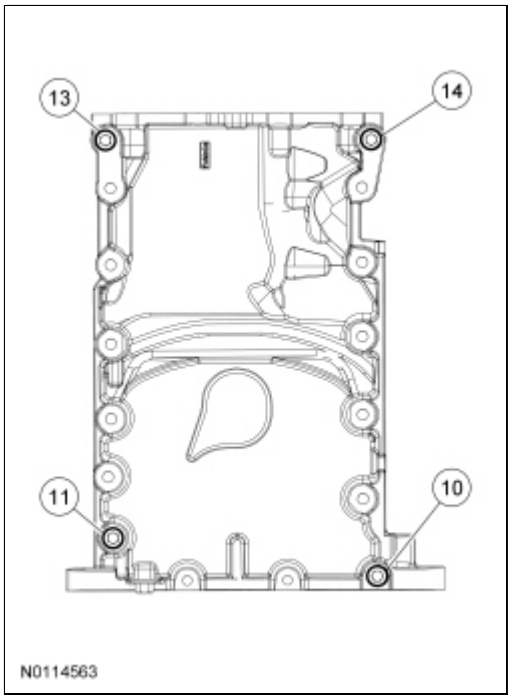


32. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

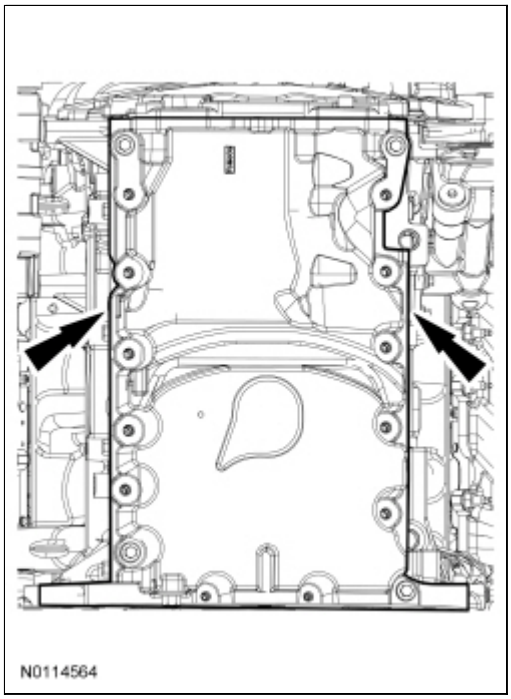
    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the oil pan to the sealing surface of the oil pan-to-engine block mating surface.

repair4less

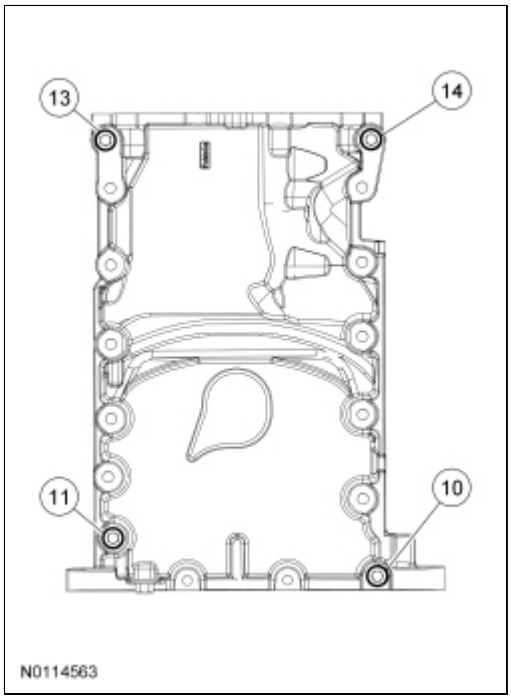


33. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

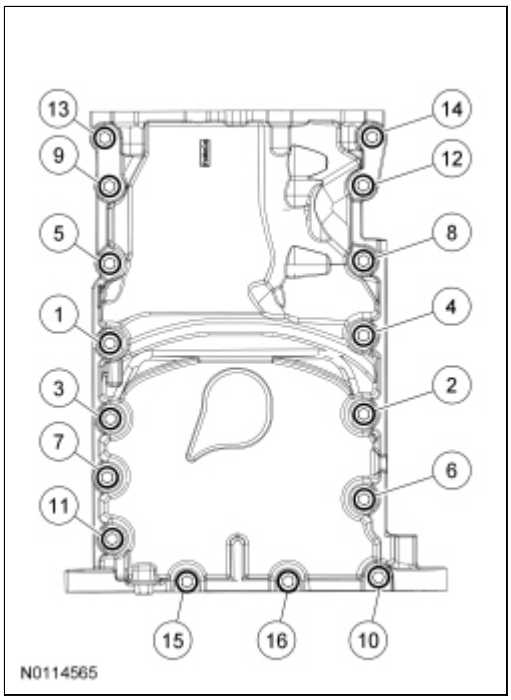


34. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.

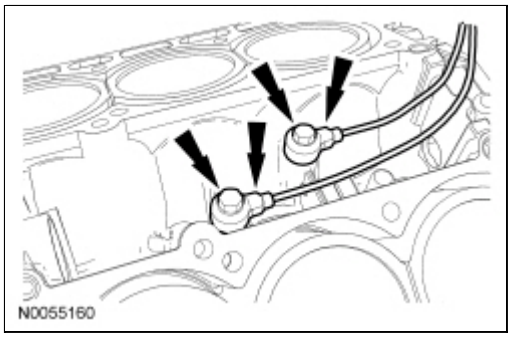
    Install the oil pan and bolts 10, 11, 13 and 14 finger tight.



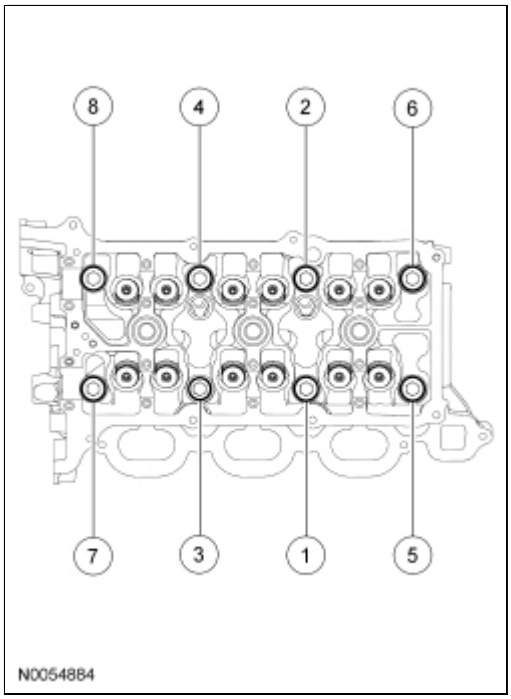
35. Laterally align the oil pan to the block. Make sure the oil pan is flush with the block at these 2 points.



36. Tighten bolts 10, 11, 13 and 14 in the sequence shown.
    - Tighten to 3 Nm (27 lb-in).

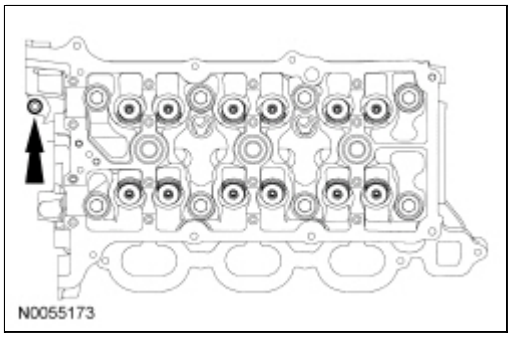


repair4less

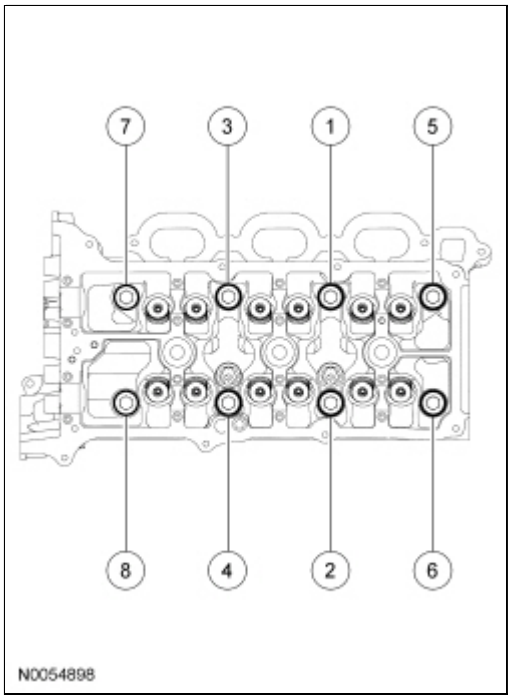


37. Install the remaining oil pan bolts and tighten in the sequence shown.
    - Tighten bolts 1-9 and 11-14 to 20 Nm (177 lb-in), then rotate an additional 45 degrees.
    - Tighten bolts 15 and 16 to 10 Nm (89 lb-in), then rotate an additional 45 degrees.
    - Tighten bolt 10 to 20 Nm (177 lb-in), then rotate an additional 90 degrees.

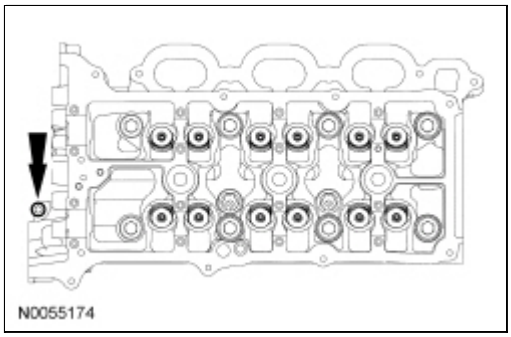
38. Install the Knock Sensor (KS) and the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).



39. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in 5 stages in the sequence shown.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



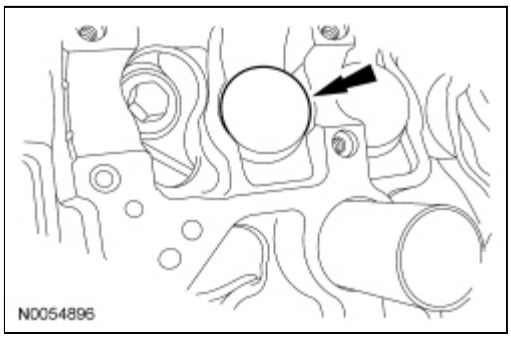
40. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).



repair4less

41. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in 5 stages in the sequence shown.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.

42. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).



43. **NOTE:** The valve tappets must be installed in their original positions.

    NOTE: Coat the valve tappets with clean engine oil prior to installation.

    NOTE: LH shown, RH similar.

    Install the valve tappets.

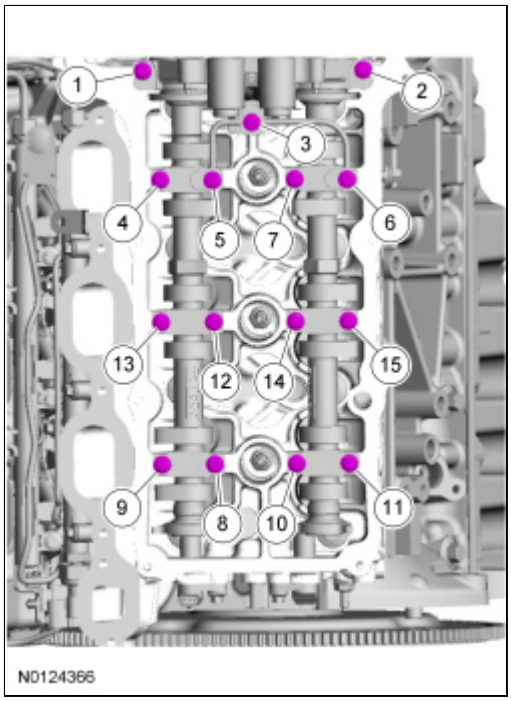
44. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

    Position the crankshaft dowel pin in the 9 o'clock position.

45. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

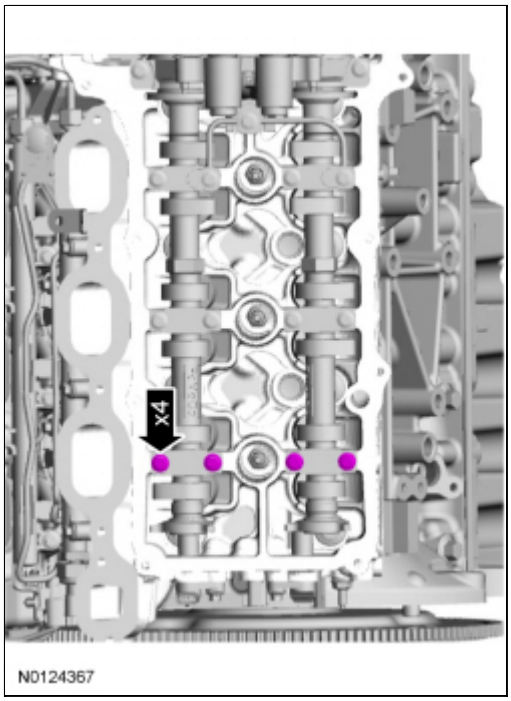
    Position the camshafts onto the RH cylinder head in the neutral position as shown.

repair4less



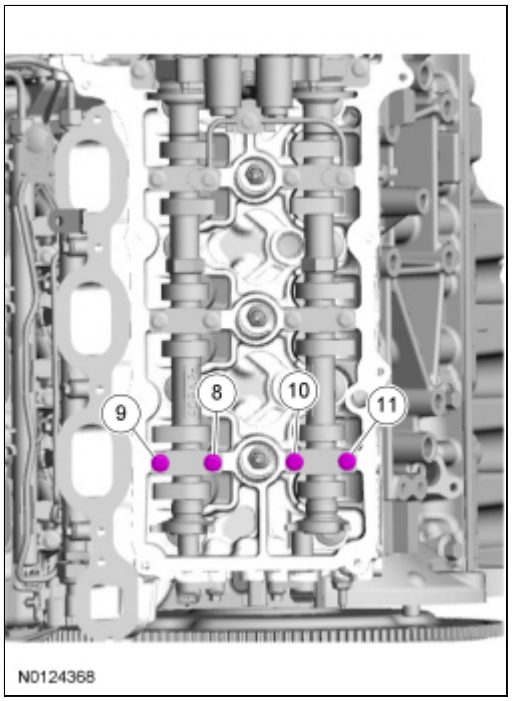
46. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

    Position the 4 camshaft seals gaps as shown.



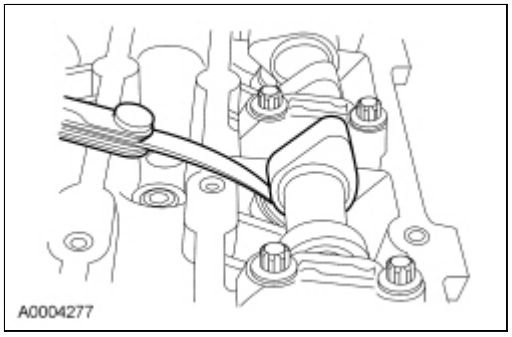
47. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.



48. Loosen the 4 camshaft caps bolts.

49. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then an additional 45 degrees.

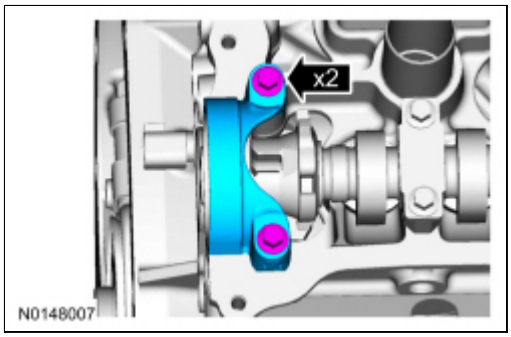


repair4less

50. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

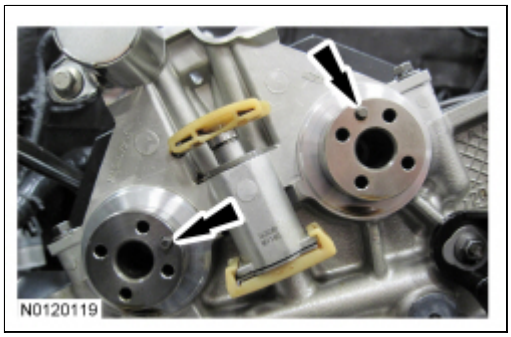
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet (s) of the correct size. For additional information, refer to Valve Clearance Check in this section.



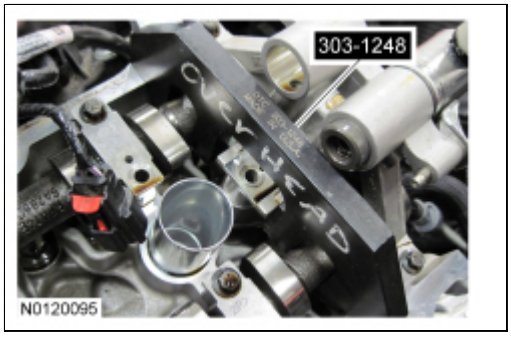
51. **NOTE:** The camshaft bearing cap assembly must be secured within 10 minutes of the Gasket Maker application. If the camshaft bearing cap assembly is not secured within 10 minutes, the sealant must be removed and the sealing area cleaned with Motorcraft® Metal Surface Prep.

    Apply a 3 mm (0.118 in) bead of sealant to the camshaft bearing cap assembly.



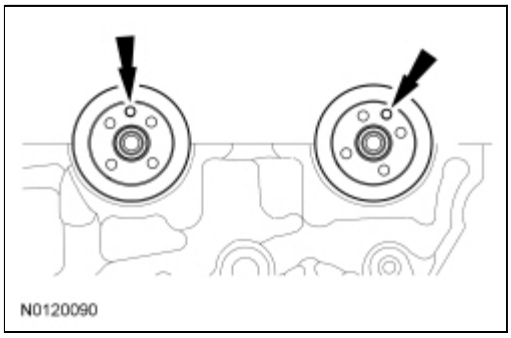
52. Install the camshaft bearing cap assembly and the 2 bolts.
    - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Remove the excess gasket maker.

53. Remove the 3 bolts and the RH valve train oil tube.



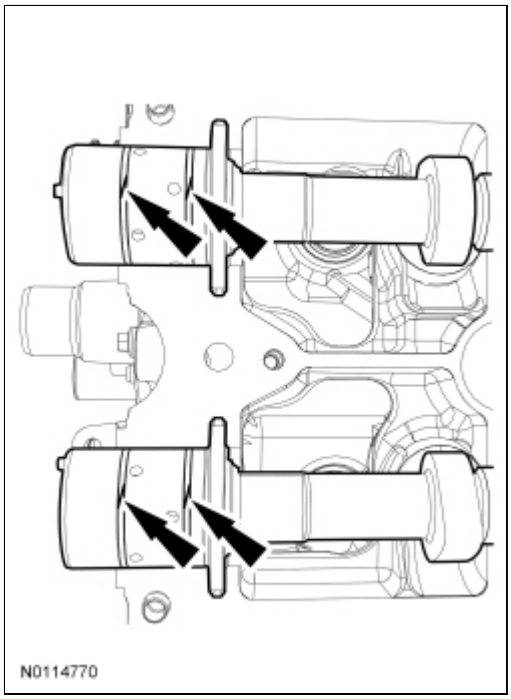
54. Rotate the RH camshafts to the Top Dead Center (TDC) position as shown.

55. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.



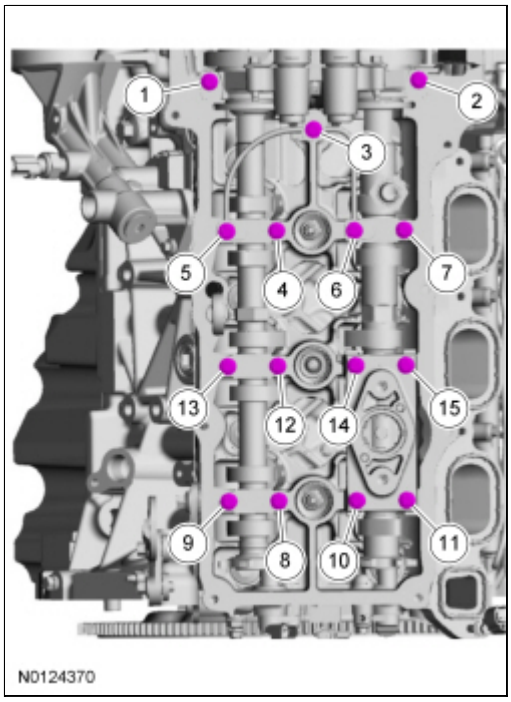
repair4less

Install the Camshaft Holding Tool onto the flats of the RH camshafts.



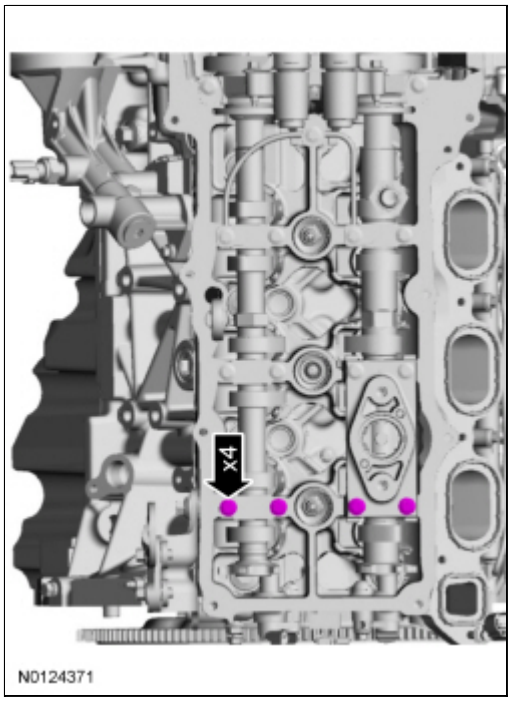
56. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

    Position the camshafts onto the LH cylinder head in the neutral position as shown.



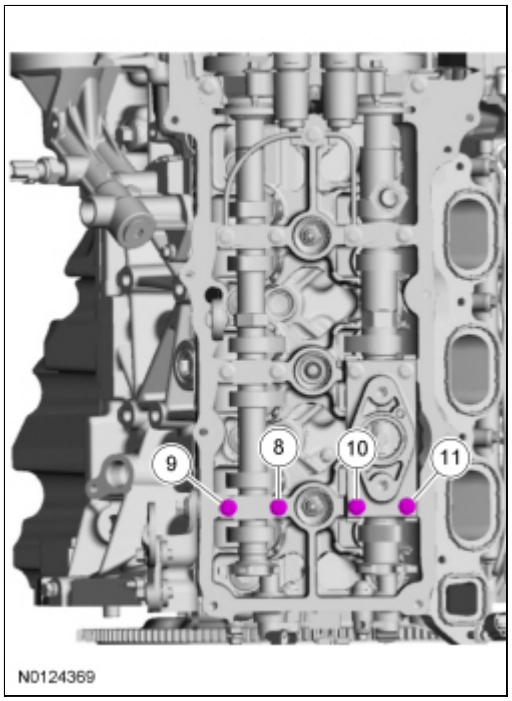
57. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

    Position the 4 camshaft seals gaps as shown.



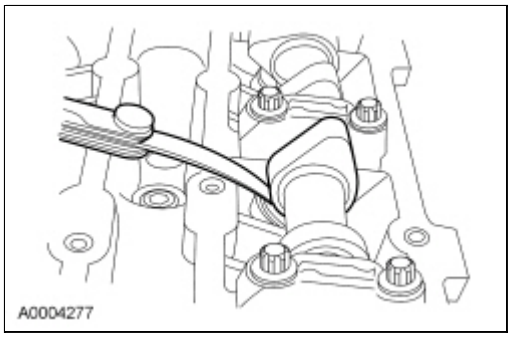
58. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.

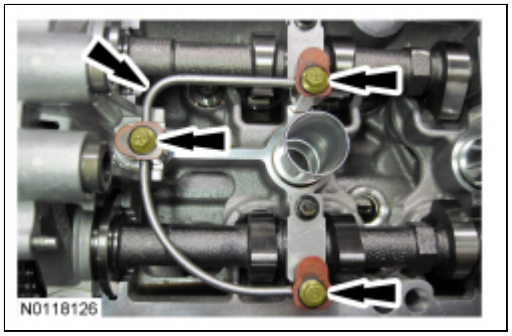


59. Loosen the 4 camshaft caps bolts.

60. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then an additional 45 degrees.



repair4less

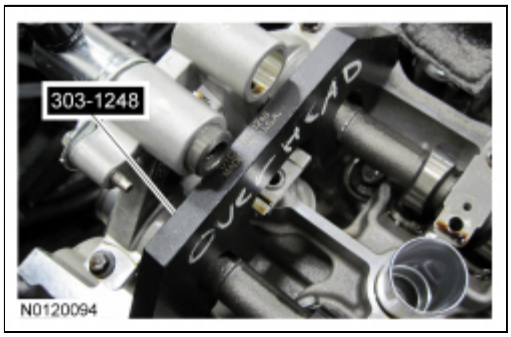


61. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

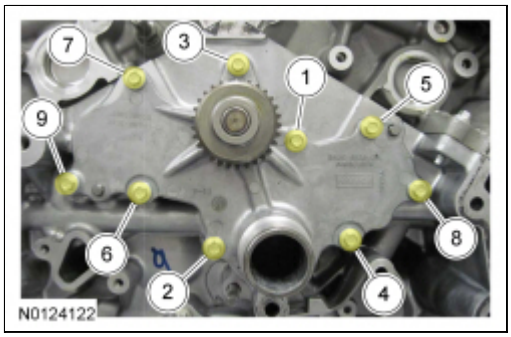
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet (s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

62. Remove the 3 bolts and the LH valve train oil tube.

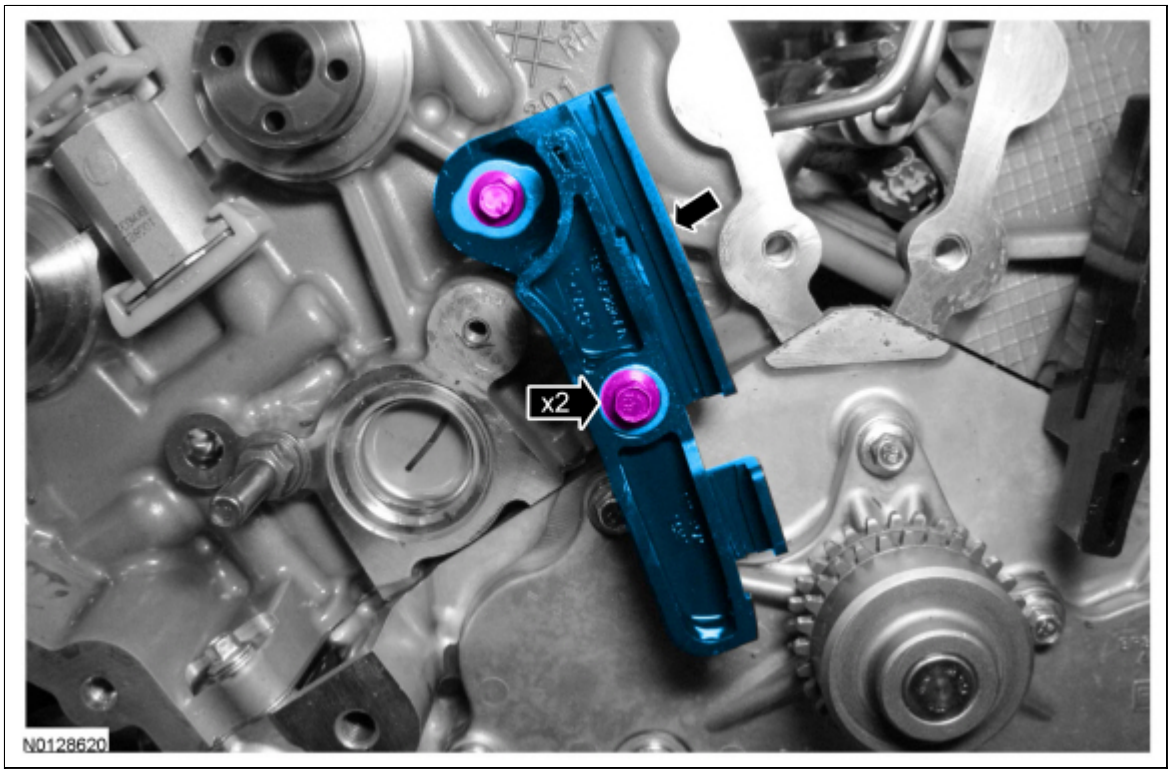


63. Rotate the LH camshafts to the TDC position as shown.



64. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

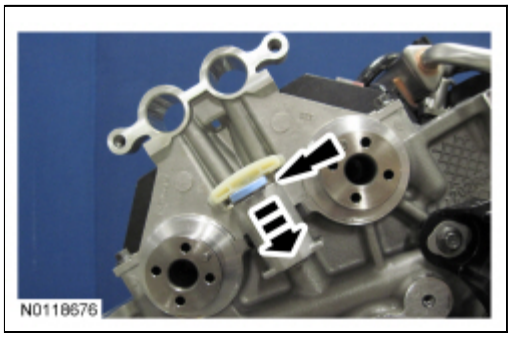
    Install the Camshaft Holding Tool onto the flats of the LH camshafts.



65. Using a new gasket, install the timing chain gear and the 9 bolts. Tighten in 2 stages in the sequence shown.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

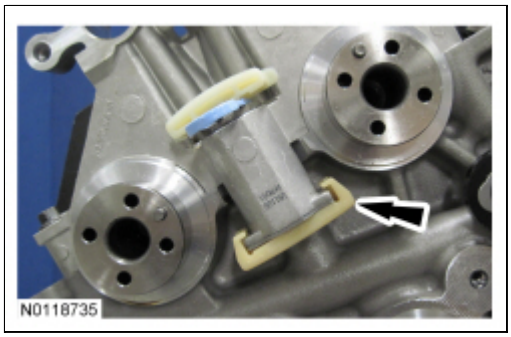
66. Install the RH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

repair4less



Engines with secondary timing chain tensioner removed

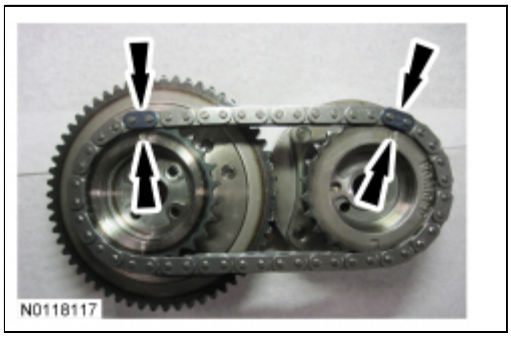
NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed or damage to the engine may occur.**



67. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

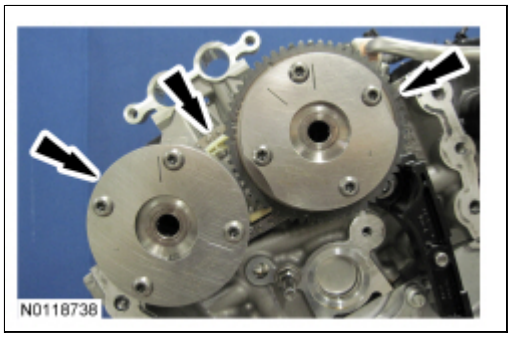
    NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

    Install the RH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

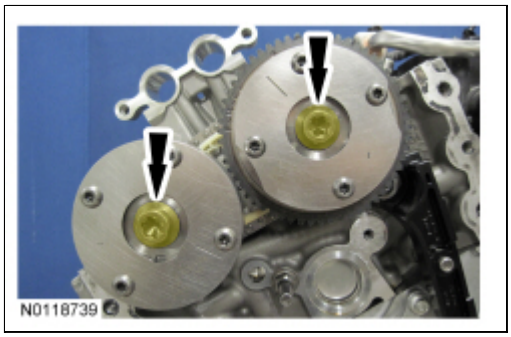


68. Install the RH secondary timing chain tensioner shoe.

69. Remove and discard the RH secondary timing chain tensioner shipping clip.

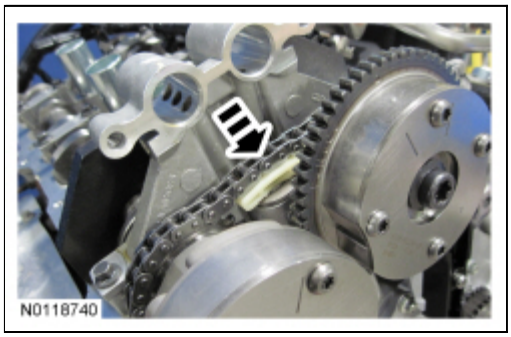


70. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



71. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

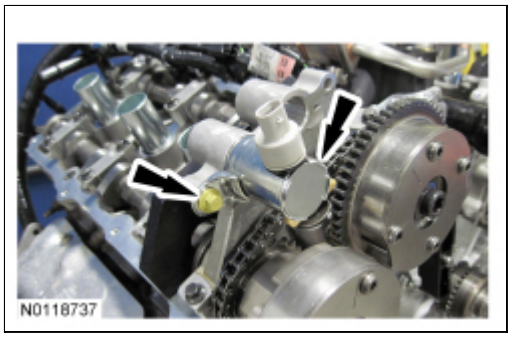
    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



repair4less

72. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

73. Activate the RH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

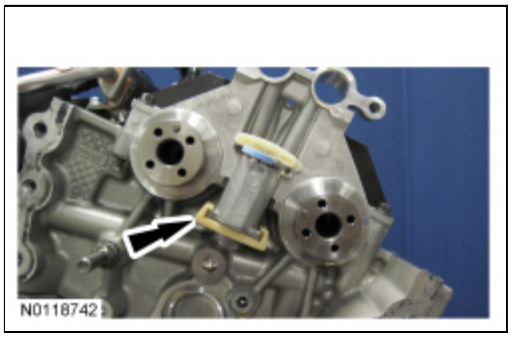


74. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

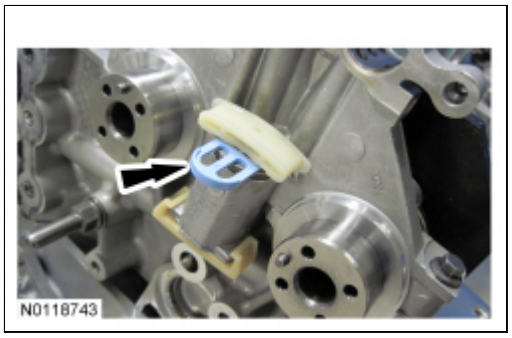
    Install the RH exhaust VCT oil control solenoid.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



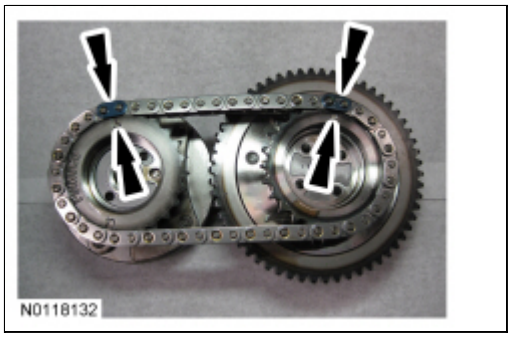
75. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

    NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

    Install the LH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

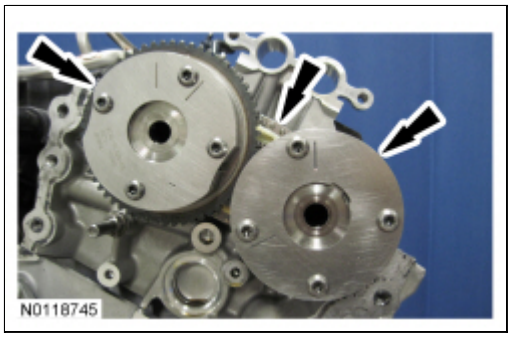


76. Install the LH secondary timing chain tensioner shoe.

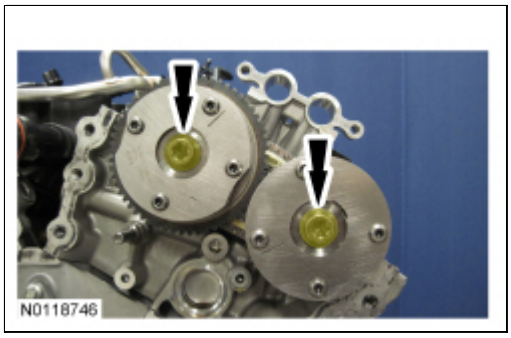


77. Remove and discard the LH secondary timing chain tensioner shipping clip.

repair4less



78. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

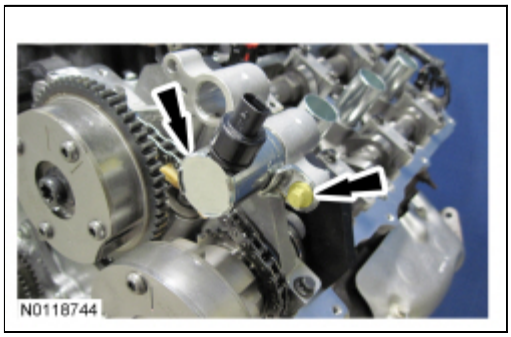


79. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

80. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

81. Activate the LH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

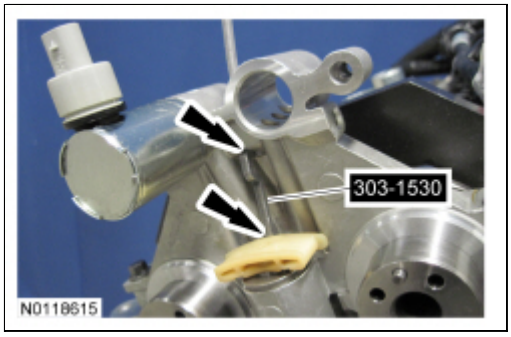


82. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

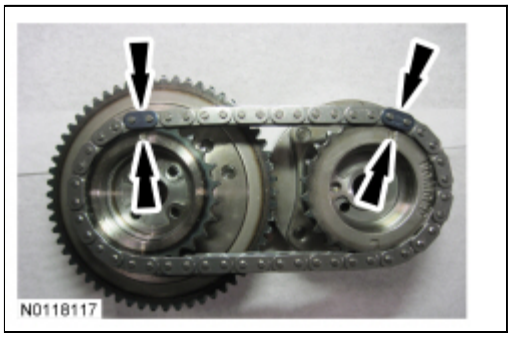
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the LH exhaust VCT oil control solenoid.



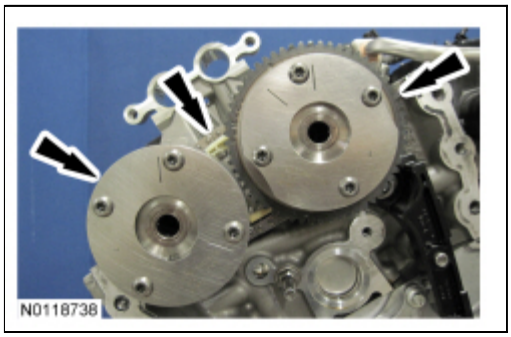
- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



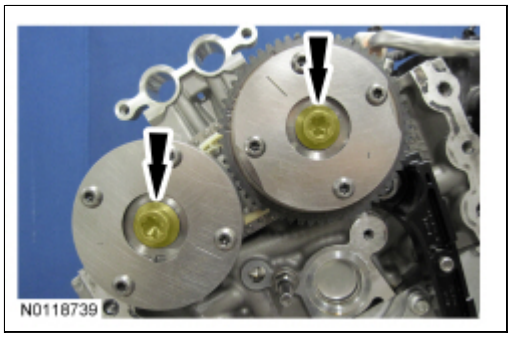
Engines with secondary timing chain tensioner not removed

83. Compress the RH secondary chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

repair4less

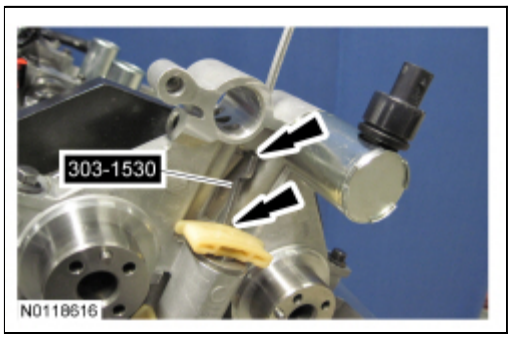


84. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

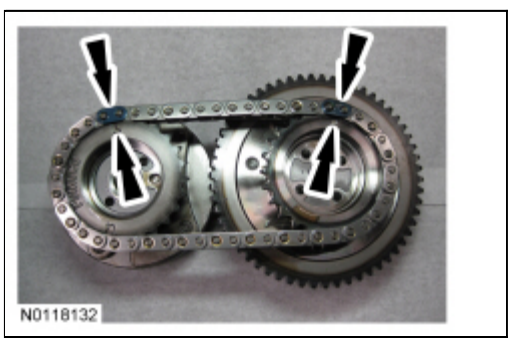


85. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

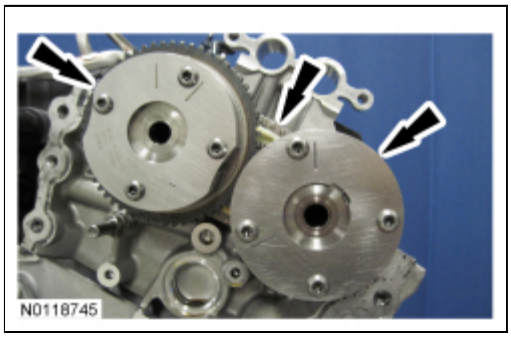


86. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

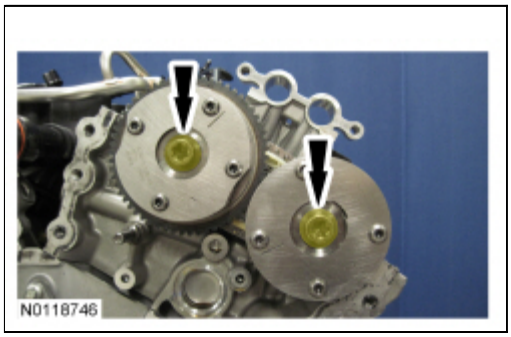


87. Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

88. Compress the LH secondary chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.



89. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

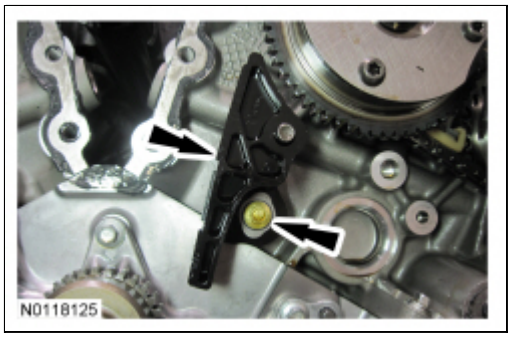


repair4less

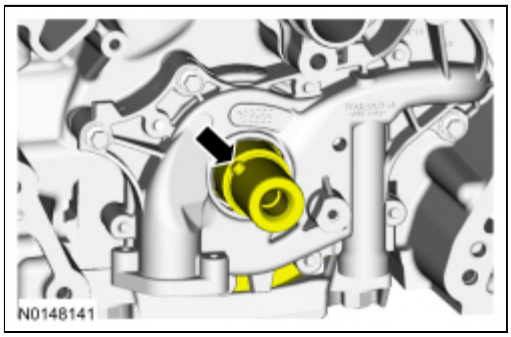
90. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

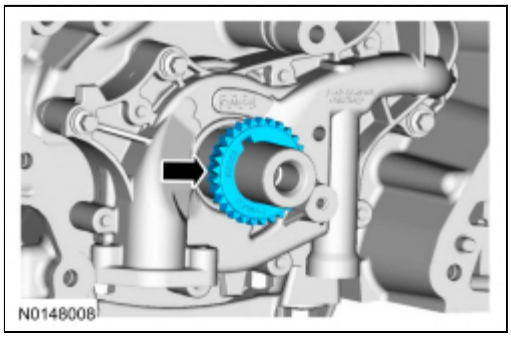
91. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.



92. Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

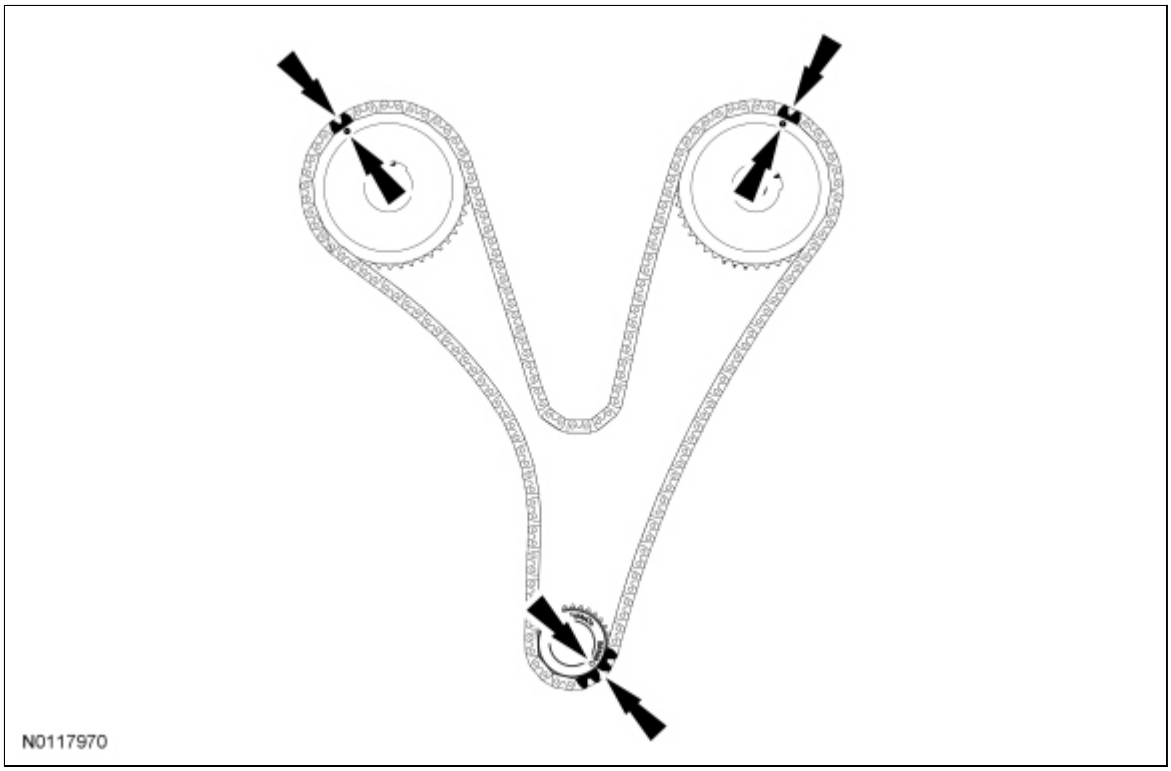


All engines

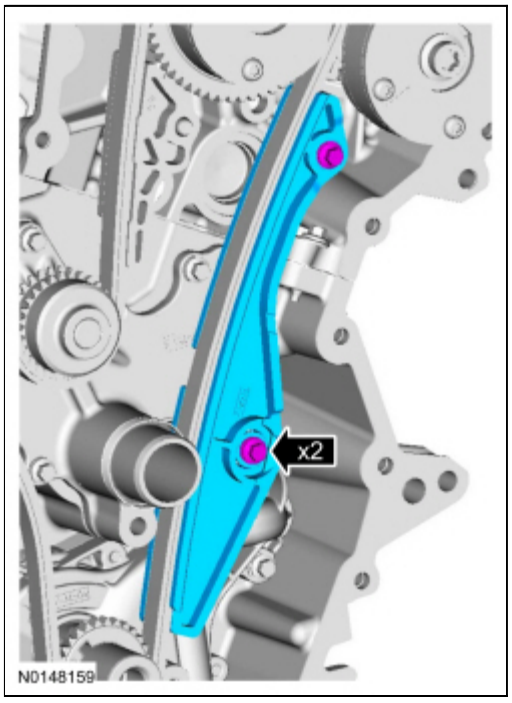


93. Install the upper LH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

94. Rotate the crankshaft 60 degrees to the Top Dead Center (TDC) position (crankshaft dowel at 11 o'clock).

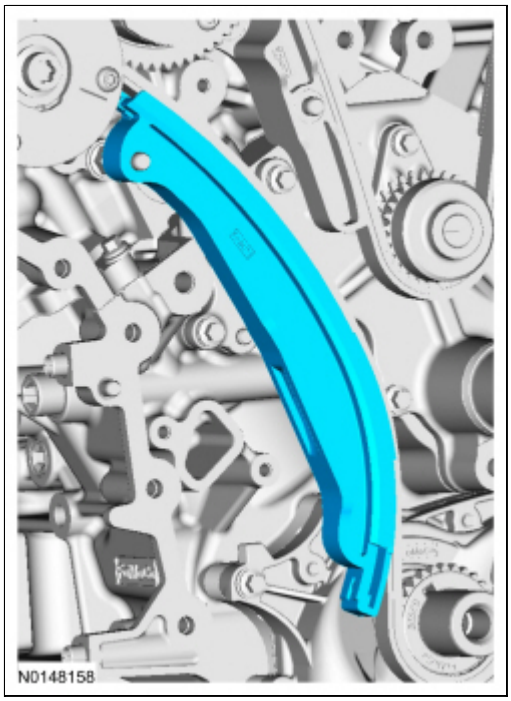


95. Install the crankshaft timing chain sprocket with timing dot mark out.

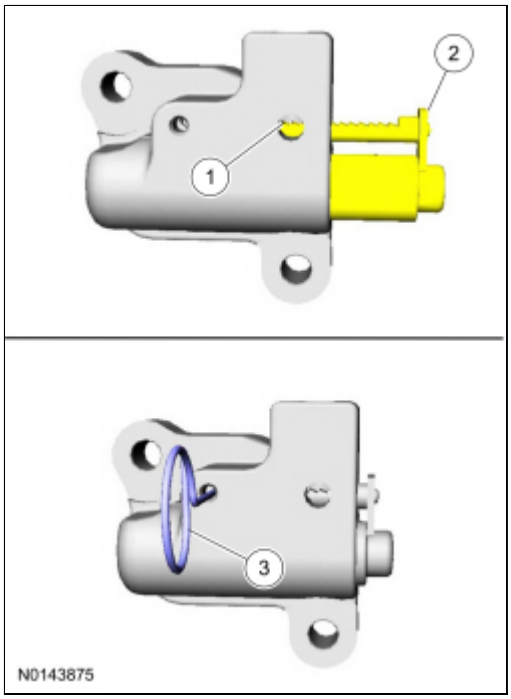


96. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



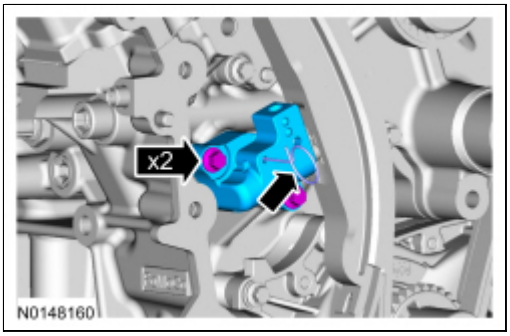
repair4less



97. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

98. Install the primary timing chain tensioner arm.

99. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.



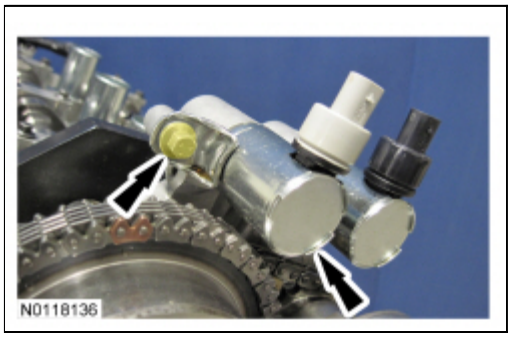
100. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

     Install the primary timing chain tensioner and the 2 bolts.

repair4less

- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

101. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).



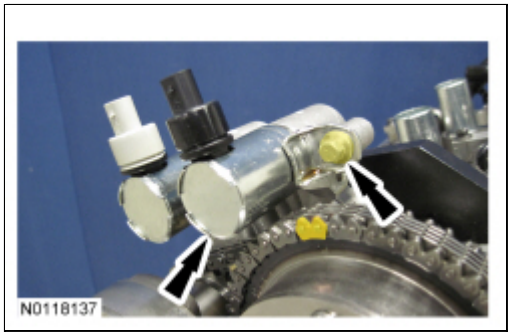
102. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

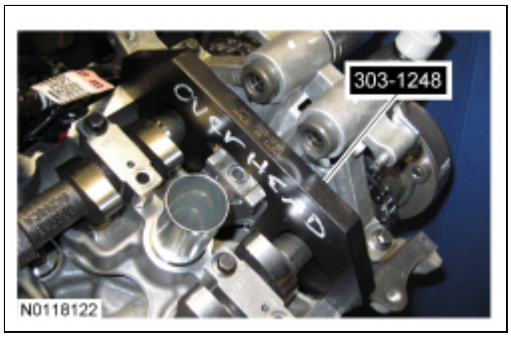
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



103. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

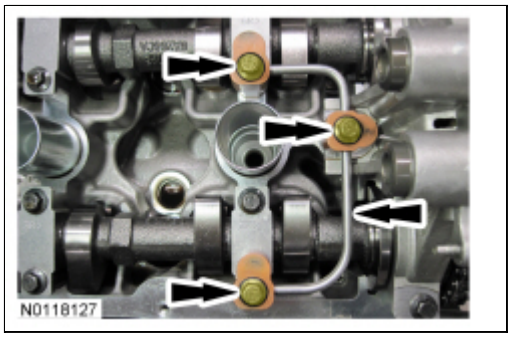
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.



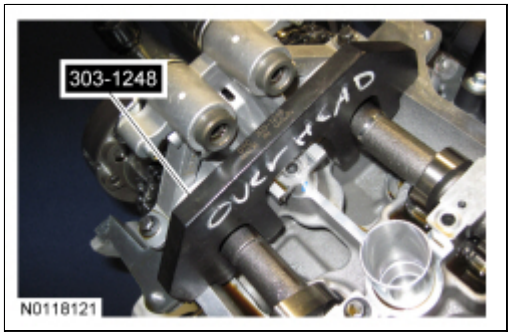
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

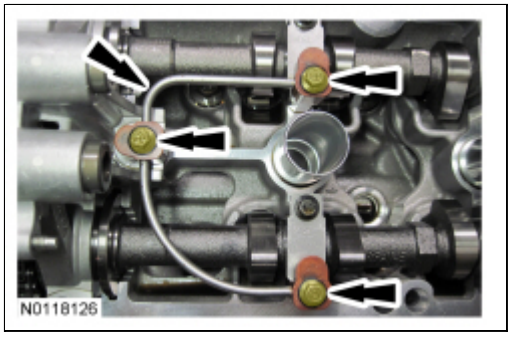


104. Remove the RH Camshaft Holding Tool.



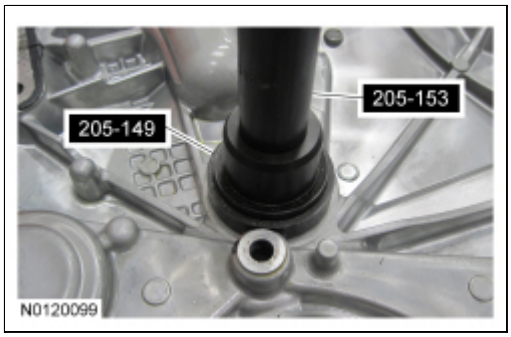
105. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.

- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.



repair4less

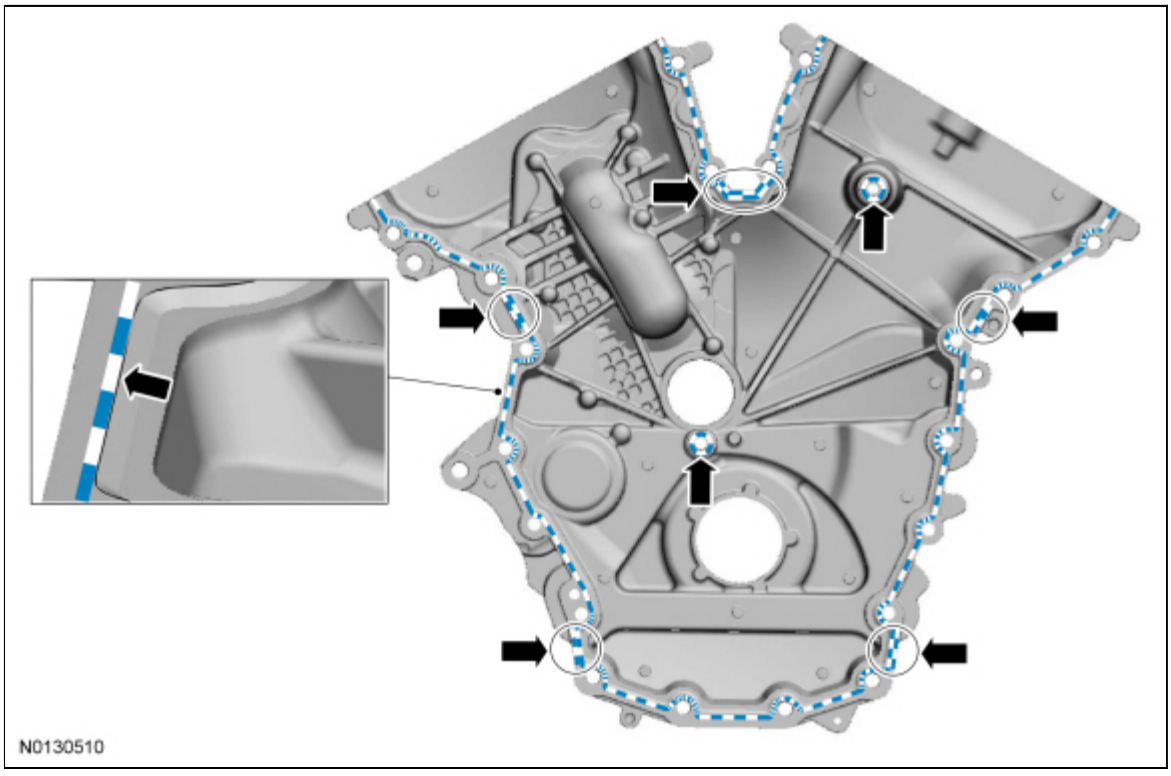
106. Remove the LH Camshaft Holding Tool.



107. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

108. **NOTE:** Use Spindle Bearing Installer 205-149 to install the seal.

    Using the Spindle Bearing Installer, install the front cover radial seal from the rear side of the front cover.



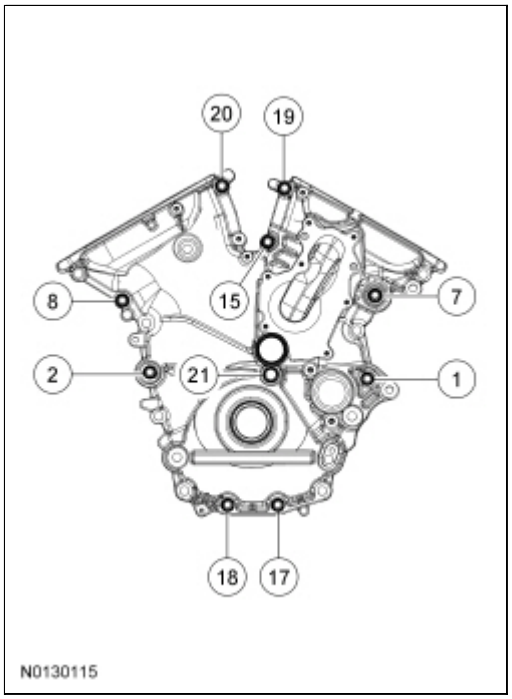
109. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

NOTICE: **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this procedure can cause engine oil leakage.**

NOTE: The engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 must be installed within 10 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

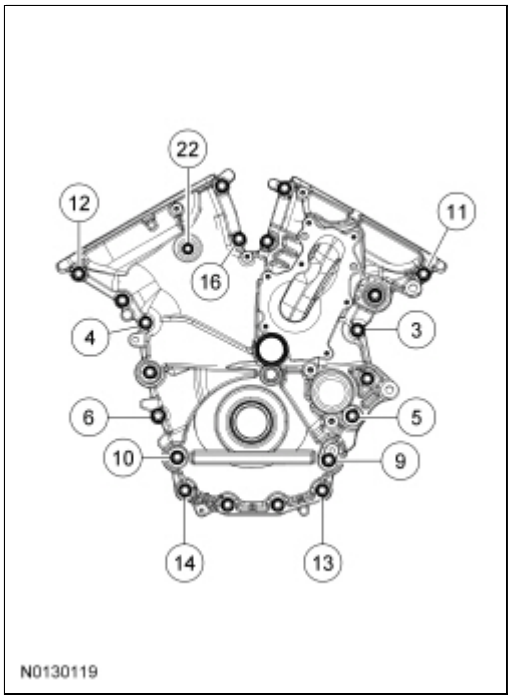
Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the engine front cover to the engine front cover sealing surfaces including the 2 engine front cover bolt bosses.

- Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



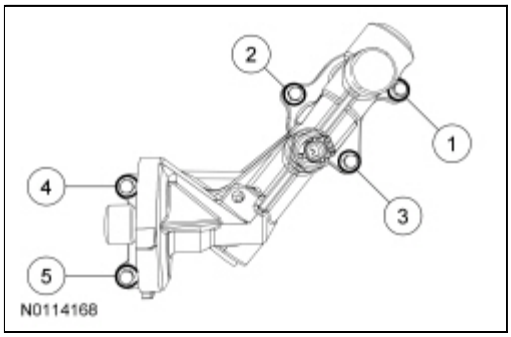
repair4less

110. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.



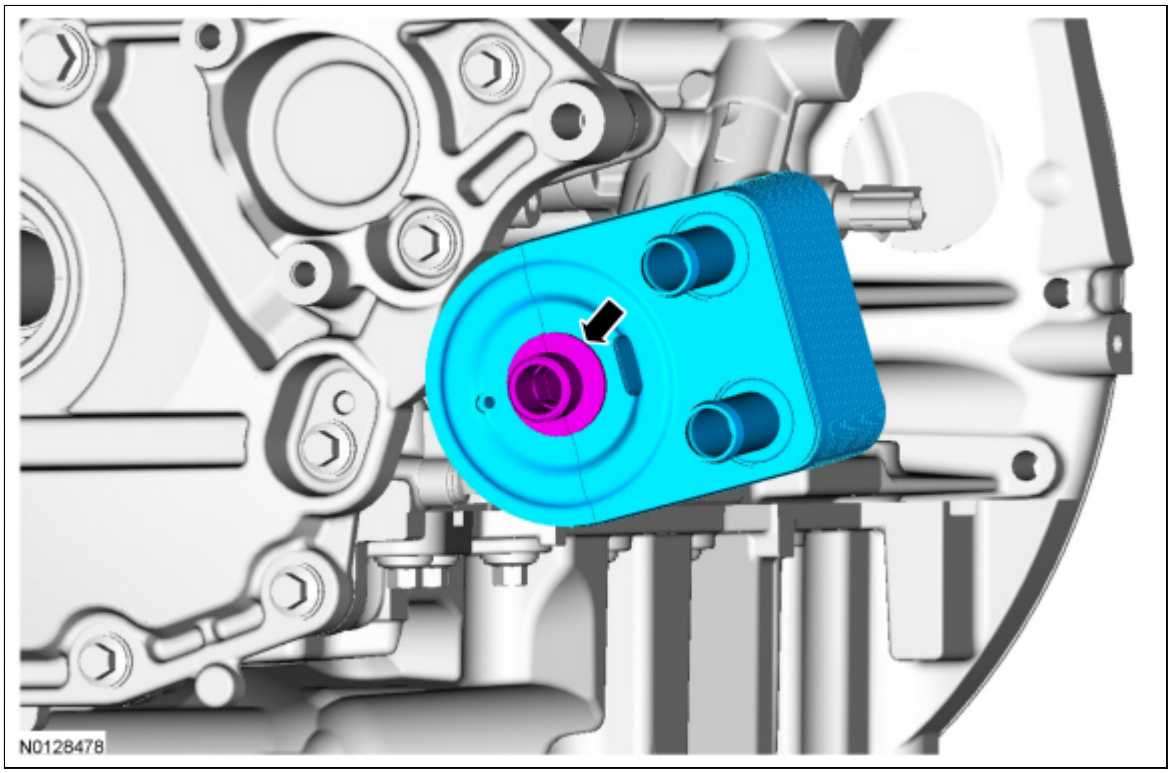
Install the engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 and tighten in the sequence shown in 3 stages:

- Stage 1: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 in sequence to 10 Nm (89 lb-in).
- Stage 2: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19 and 20 in sequence to 20 Nm (177 lb-in) then an additional 45 degrees.
- Stage 3: Tighten bolt 21 to 20 Nm (177 lb-in) then an additional 90 degrees.

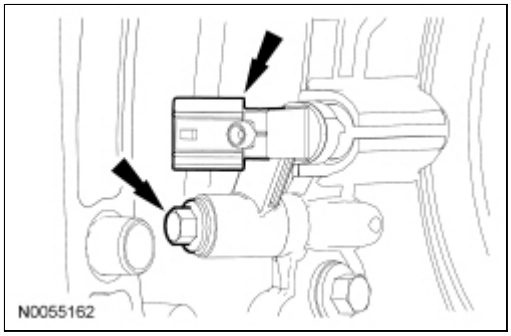


111. Install the remaining 12 engine front cover bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, 16, 22 and tighten in the sequence shown in 3 stages:

- Stage 1: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, and 16 to 10 Nm (89 lb-in).
- Stage 2: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, and 16 to 20 Nm (177 lb-in) then an additional 45 degrees.
- Stage 3: Tighten bolt 22 to 10 Nm (89 lb-in) then an additional 45 degrees.

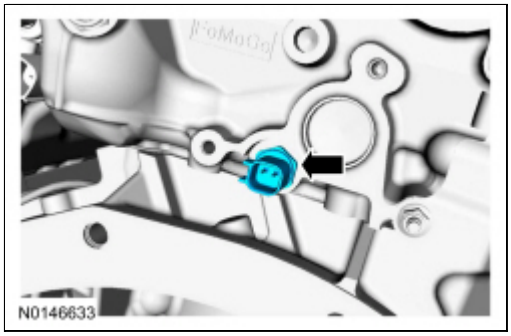


112. Using a new gasket, install the oil filter adapter and the 5 bolts and tighten in sequence shown.
    - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.



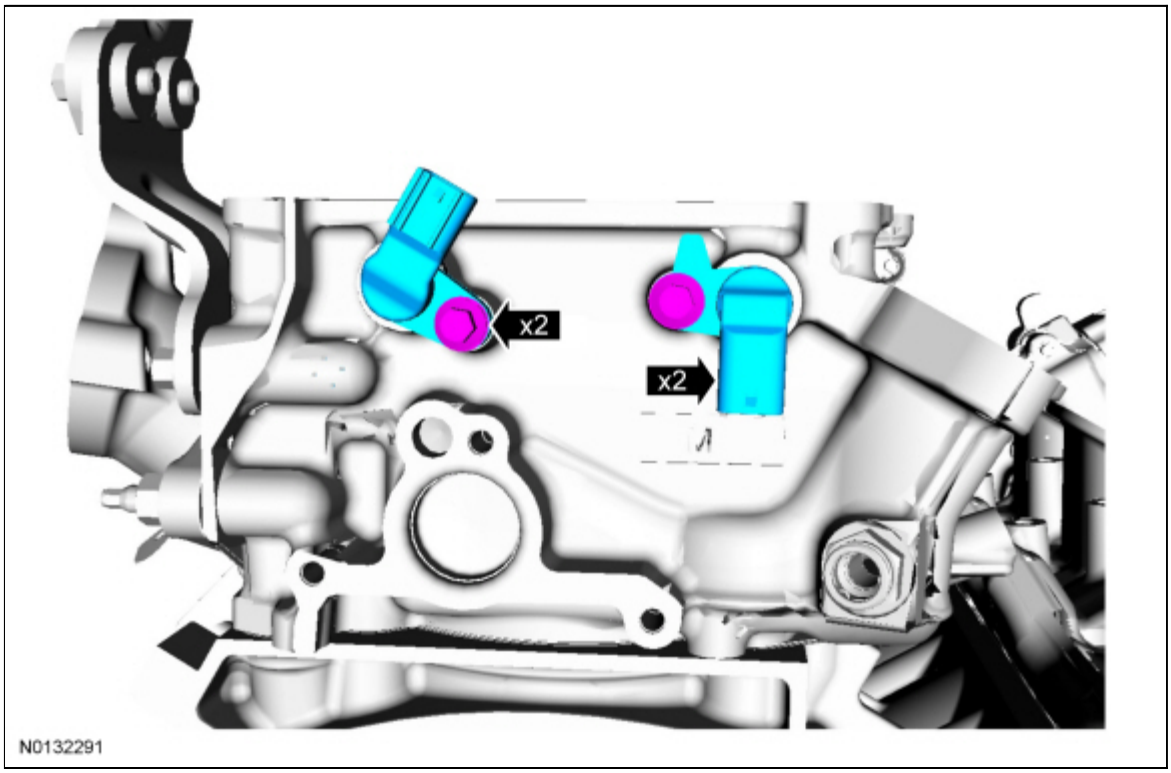
113. ***NOTICE:*** **A new oil cooler must be installed or severe damage to the engine can occur.**

    Install the new oil cooler and the oil cooler insert bolt.
    - Tighten to 58 Nm (43 lb-ft).

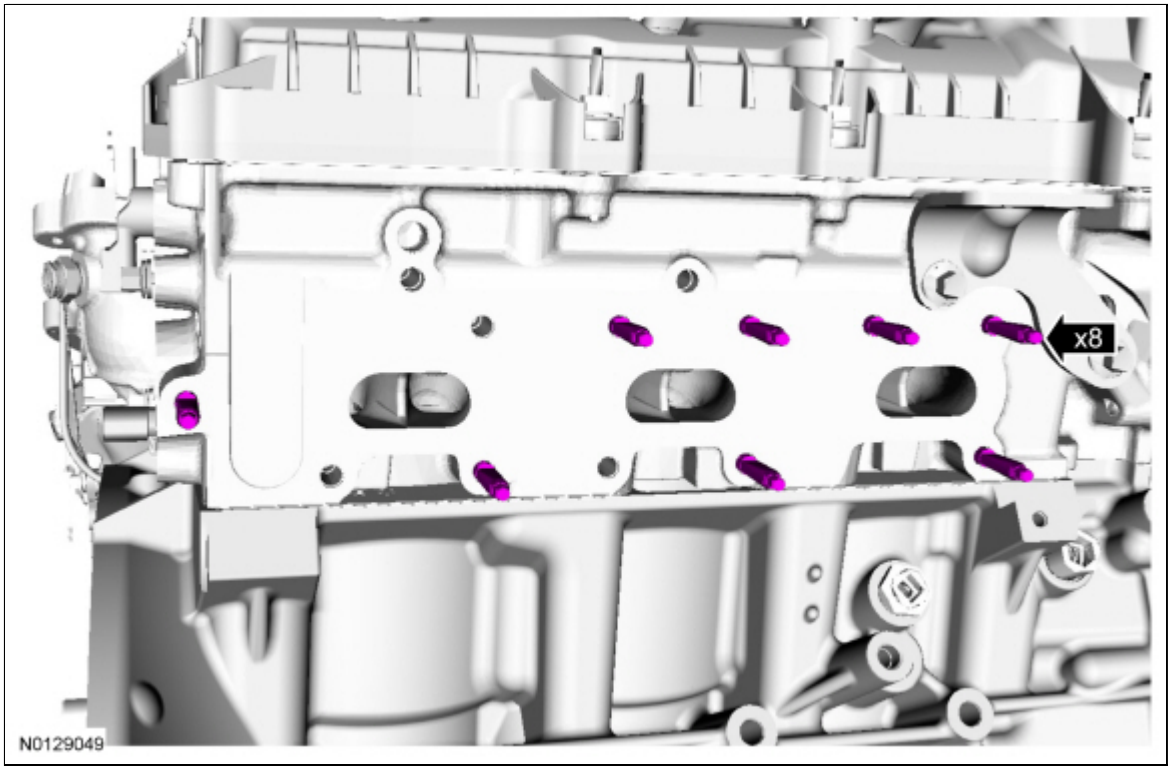


repair4less

114. Install the Crankshaft Position (CKP) sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



115. Install the new the Cylinder Head Temperature (CHT) sensor.
    - Tighten to 11 Nm (97 lb-in).

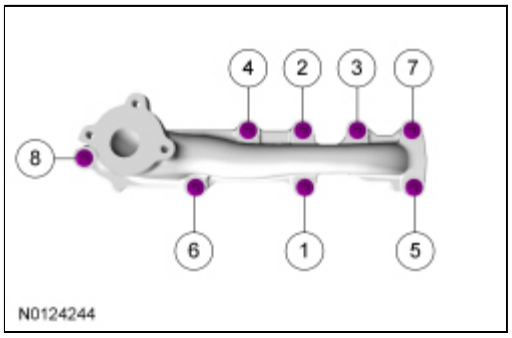


116. **NOTE:** Lubricate the 2 CMP sensor O-ring seals with clean engine oil.

Install the 2 LH CMP sensors and the bolts.

- Tighten to 10 Nm (89 lb-in).

117. Install the 8 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

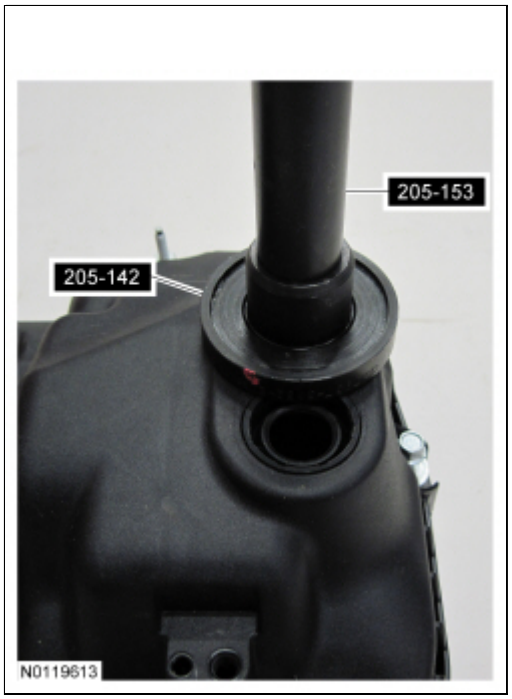


repair4less

118. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

Using a new gasket, install the RH exhaust manifold and the 8 new nuts. Tighten in 2 stages in the sequence shown.

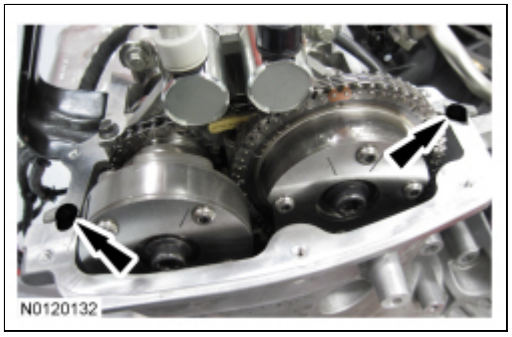
- Stage 1: Tighten to 19 Nm (168 lb-in).
- Stage 2: Tighten to 25 Nm (18 lb-ft).



119. **NOTE:** Installation of new seals is only required if damaged seals were removed.

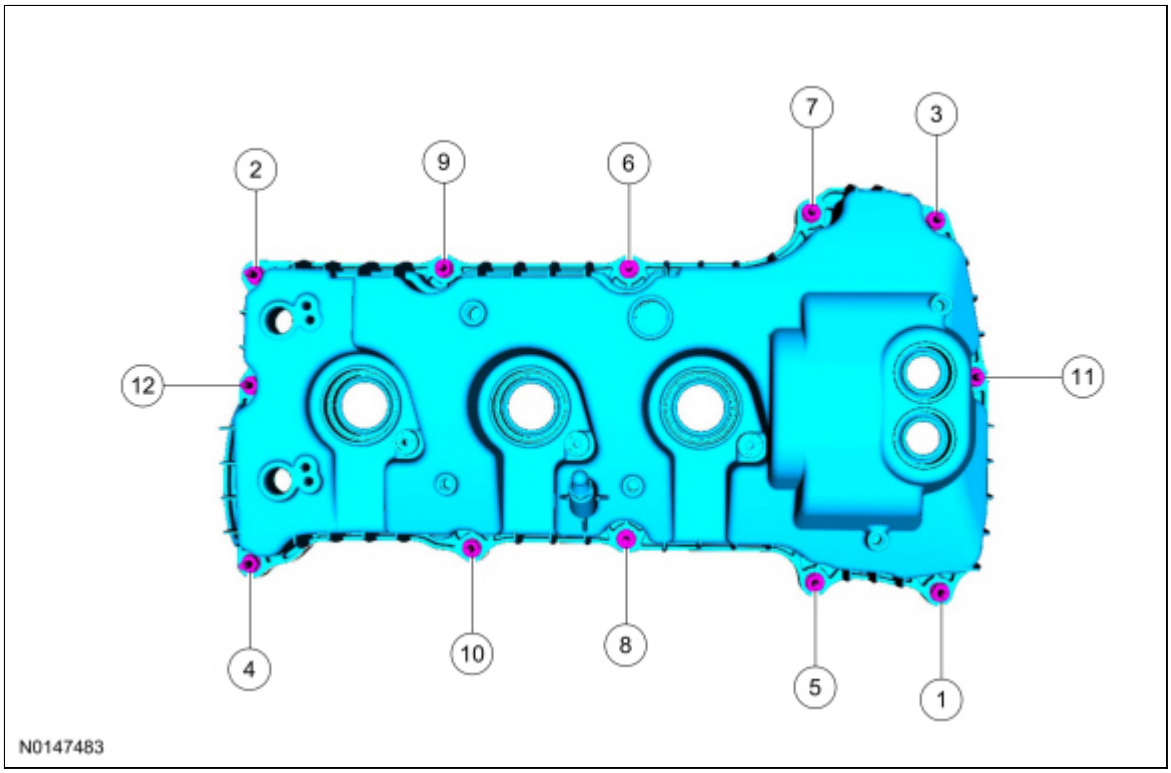
Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

120. **NOTE:** Installation of new seals is only required if damaged seals were removed.



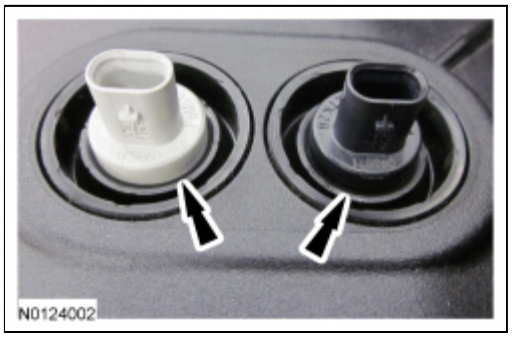
Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).

121. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**



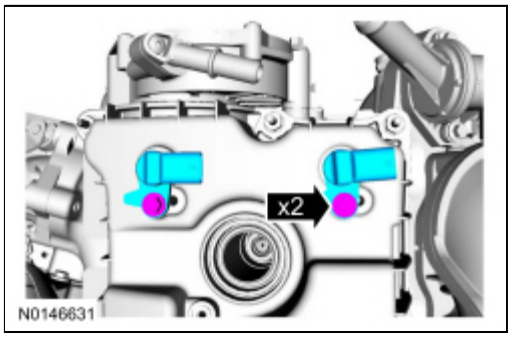
NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.



122. Using a new gasket, install the RH valve cover and tighten the 12 stud bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

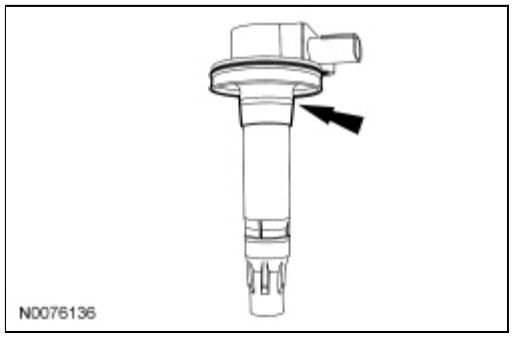
repair4less



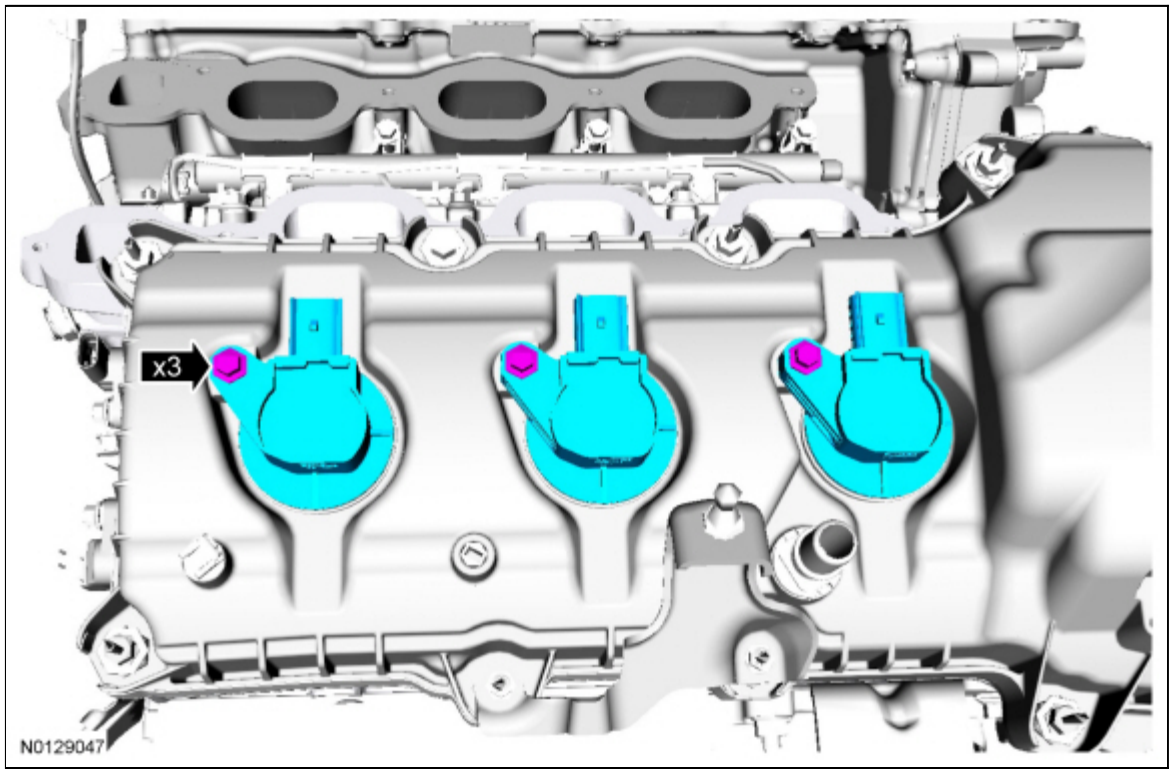
123. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

124. **NOTE:** Lubricate the 2 CMP sensor O-ring seals with clean engine oil.

Install the 2 RH CMP sensors and the bolts.



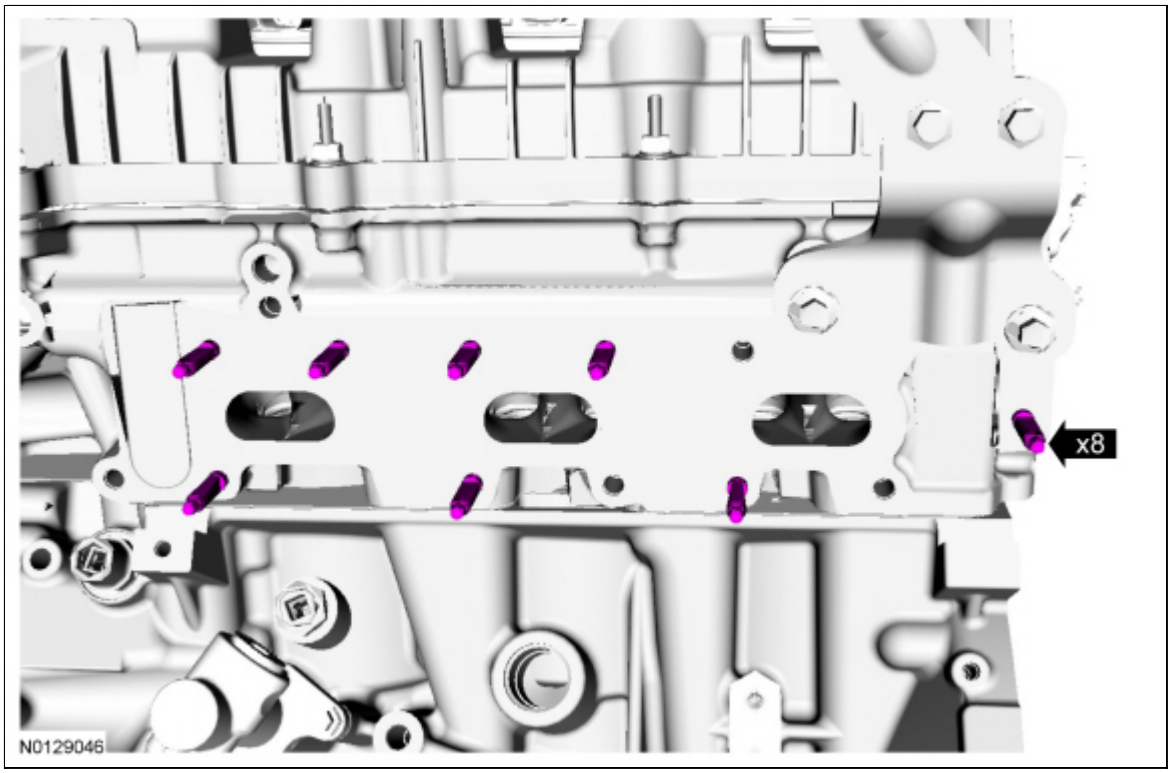
- Tighten to 7 Nm (62 lb-in).



125. ***NOTICE:*** **Only use hand tools when installing the spark plugs, or damage may occur to the cylinder head or spark plug.**

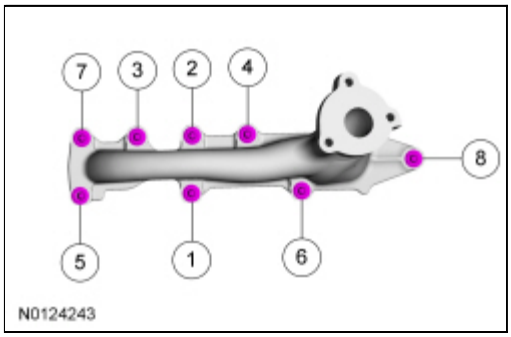
Install the 3 RH spark plugs.
- Tighten to 15 Nm (133 lb-in).

126. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
- To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.



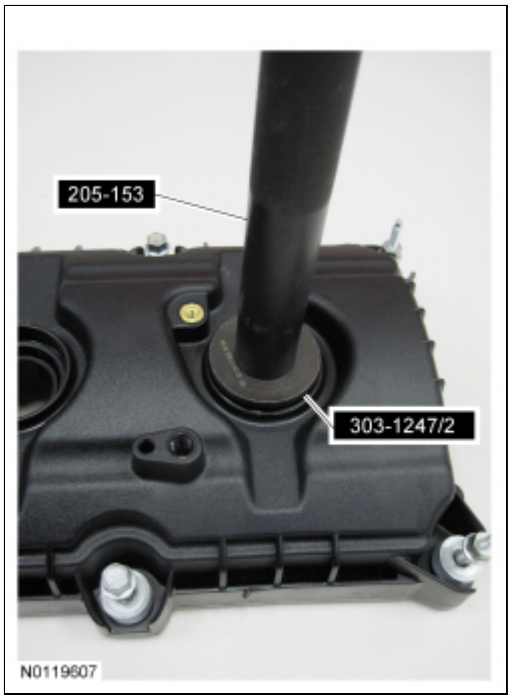
127. Install the 3 RH ignition coil-on-plug assemblies and the 3 bolts.
- Tighten to 7 Nm (62 lb-in) then an additional 45 degrees.

128. Install the 8 new LH exhaust manifold studs.
- Tighten to 12 Nm (106 lb-in).



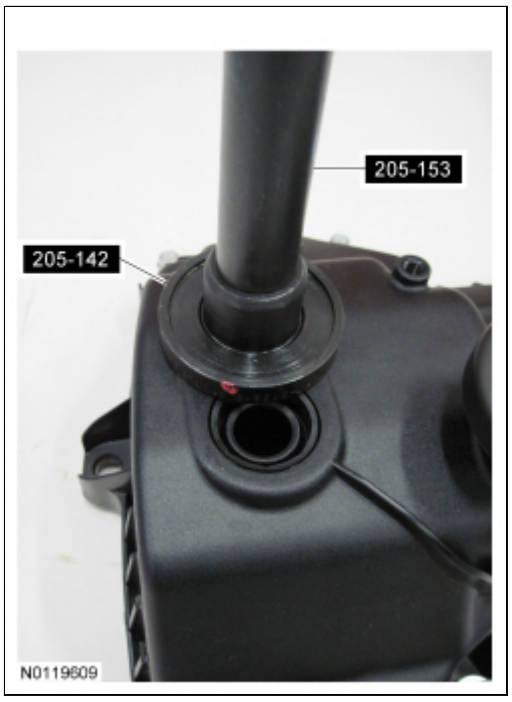
repair4less

129. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**



Using a new gasket, install the LH exhaust manifold and 8 new nuts. Tighten in 2 stages in the sequence shown.

- Stage 1: Tighten to 19 Nm (168 lb-in).
- Stage 2: Tighten to 25 Nm (18 lb-ft).

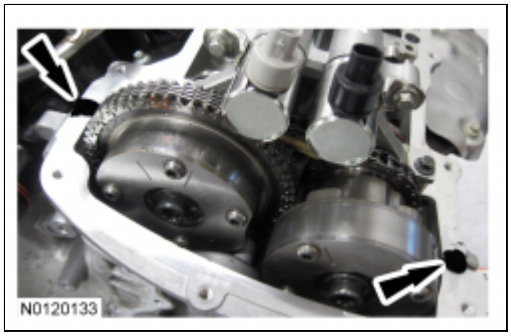


130. **NOTE:** Installation of new seals is only required if damaged seals were removed.

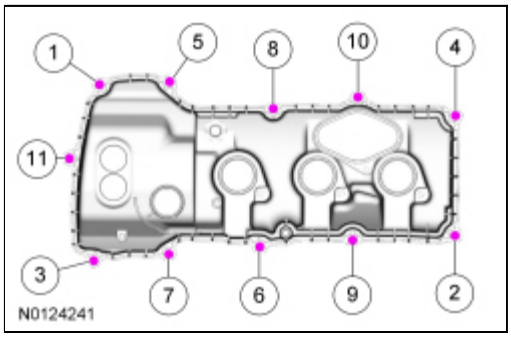
Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

131. **NOTE:** Installation of new seals is only required if damaged seals were removed.

Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).

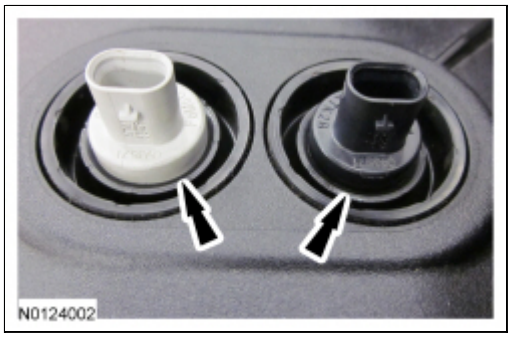


132. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**



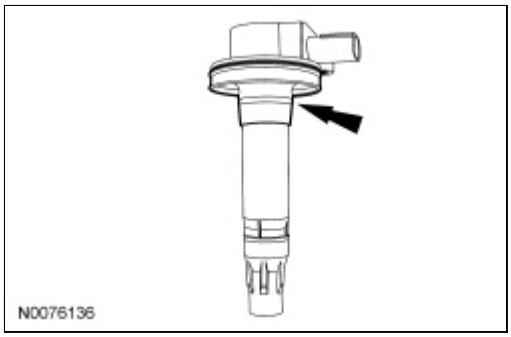
NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

repair4less

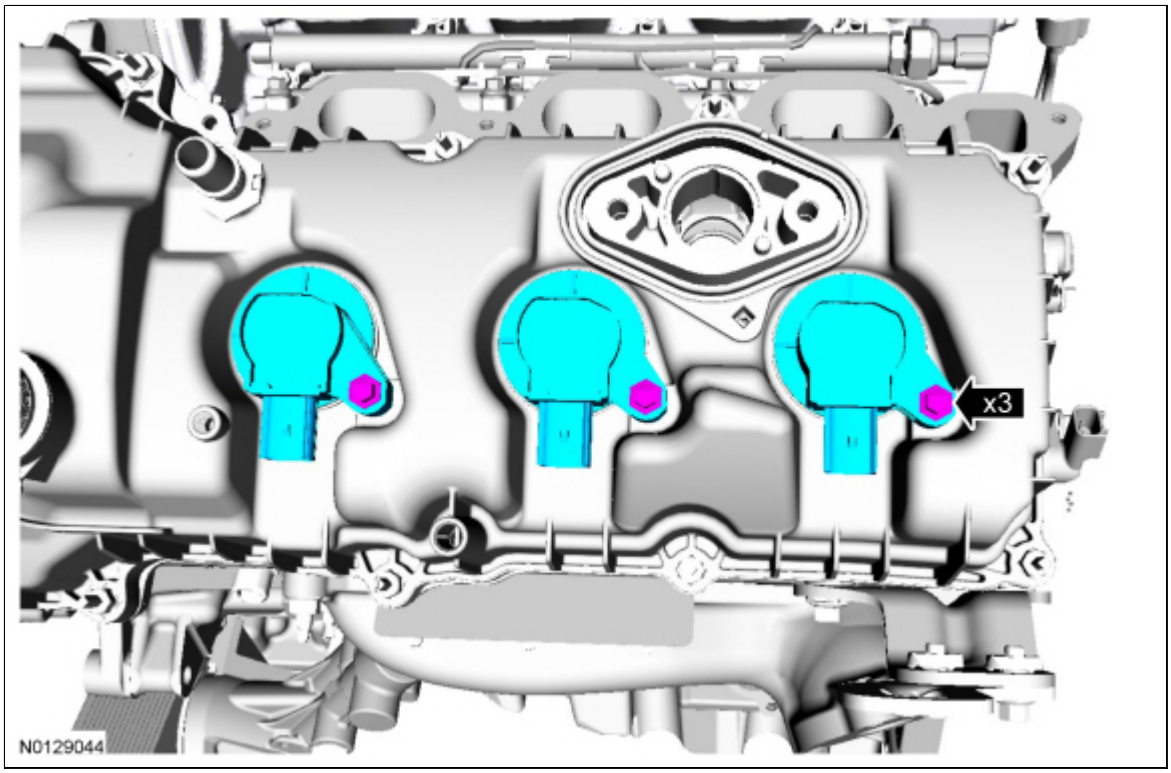


Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

133. Using a new gasket, install the LH valve cover and tighten the 11 stud bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



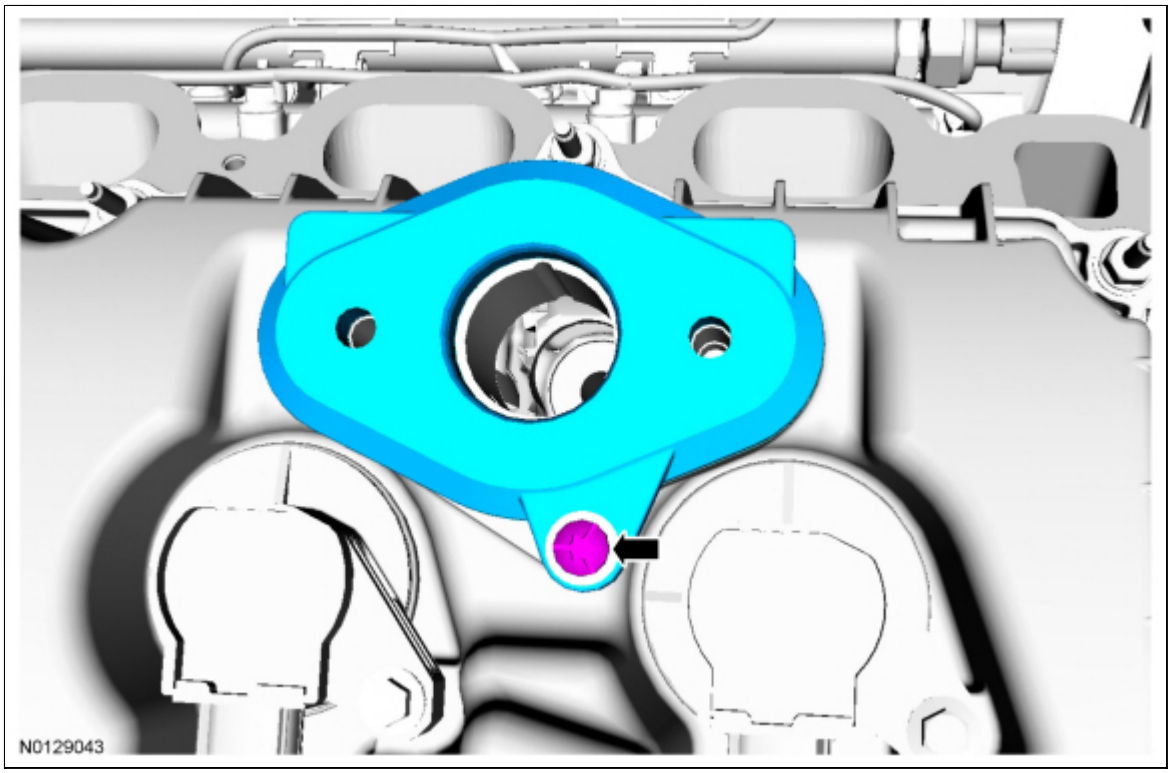
134. Ensure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.



135. ***NOTICE:*** **Only use hand tools when installing the spark plugs, or damage may occur to the cylinder head or spark plug.**

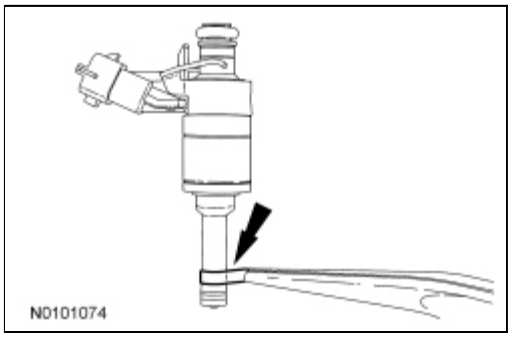
    Install the 3 LH spark plugs.
    - Tighten to 15 Nm (133 lb-in).

136. Inspect the coil seals for rips, nicks or tears. Remove and discard any damaged coil seals.
    - To install, slide the new coil seal onto the coil until it is fully seated at the top of the coil.

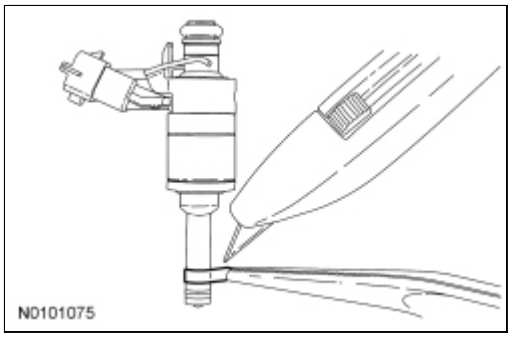


137. Install the 3 LH ignition coil-on-plug assemblies and the 3 bolts.
    - Tighten to 7 Nm (62 lb-in) then an additional 45 degrees.

138. Using new gaskets, install the fuel injection pump mounting plate and bolt.
    - Tighten finger-tight.

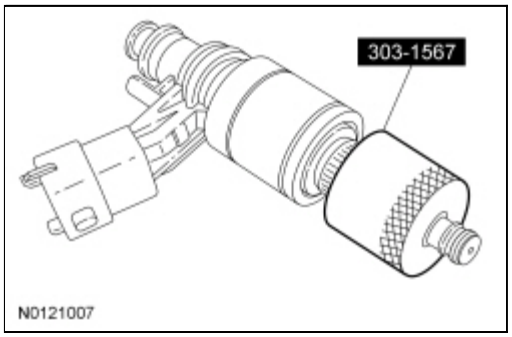


repair4less



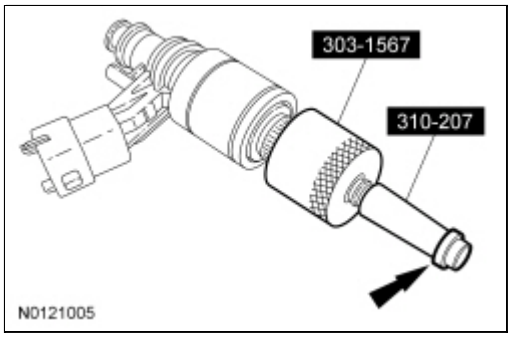
139. ***NOTICE:*** **Do not attempt to cut the lower Teflon® seal without pulling it away from the fuel injector or damage to the fuel injector may occur.**

NOTE: Be very careful when removing the lower Teflon® seals, not to scratch, nick or gouge the fuel injectors.



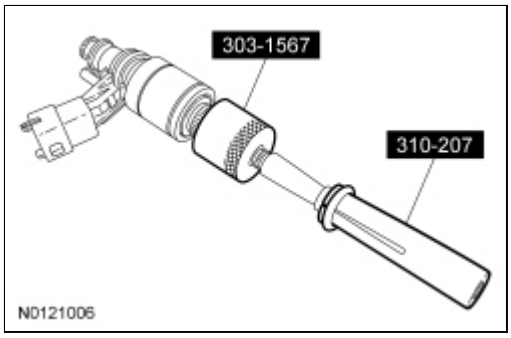
Pull the Teflon® seal away from the fuel injector with narrow tip pliers.

140. Carefully cut and discard the lower fuel injector Teflon® seals.



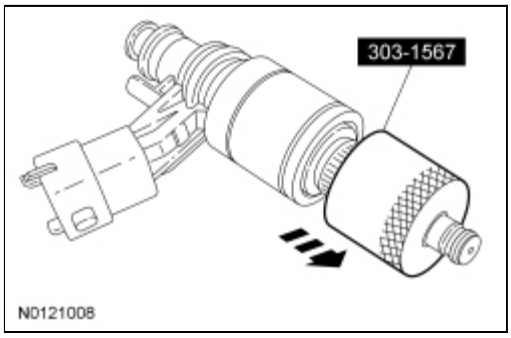
141. Place the Teflon® Seal Sizer, knurled side out, over the fuel injector tip until the fuel injector seal recess is exposed.

142. **NOTE:** Do not lubricate the new lower Teflon® fuel injector seals.



Install the new lower Teflon® seals on the narrow end of the Arbor (part of the Fuel Injector Seal Installer), then install the Arbor on the fuel injector tip.

143. ***NOTICE:*** **Once the Teflon® seal is installed on the Arbor, it should immediately be installed onto the fuel injector to avoid excessive expansion of the seal.**

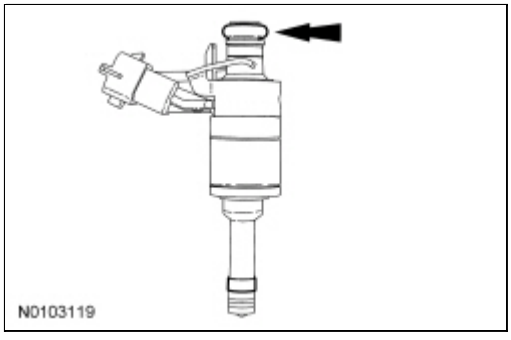


Using the Pusher Tool (part of the Fuel Injector Seal Installer), slide the Teflon® seals off of the Arbor and into the groove on the fuel injector.

repair4less

144. **NOTE:** Make sure the Teflon® seal is fully seated in the groove on the fuel injector before sizing the seal.

    Slide the Teflon® Seal Sizer off the end of the fuel injector to size the seal.

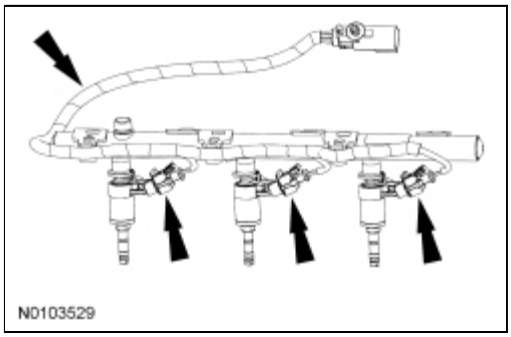


145. ***NOTICE:*** **Use fuel injector O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals may cause the fuel system to leak. Do not reuse the O-rings.**

    NOTE: Apply clean engine oil to the 6 new upper fuel injector O-ring seals.

    NOTE: Inspect the fuel injector support disk and replace if necessary.

    Install the 6 new upper fuel injector O-ring seals.

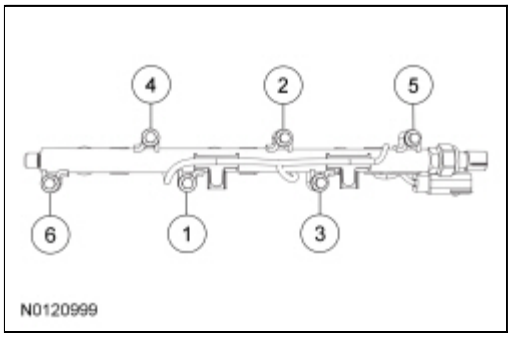


146. Install the 6 new fuel injector clips.

147. **NOTE:** RH shown, LH similar.

NOTE: The anti rotation device on the fuel injector has to slip into the groove of the fuel rail cup.

Install the 6 fuel injectors into the fuel rails and connect the fuel injector electrical connector.

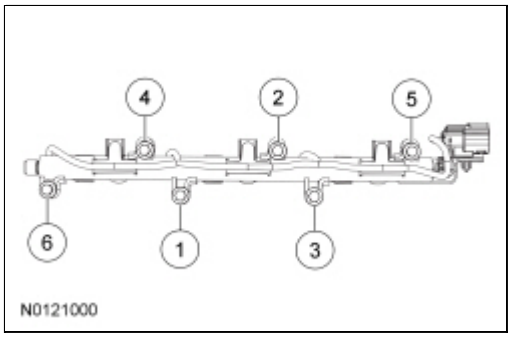


148. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

NOTE: Tighten the bolts using a method that draws the fuel rail evenly to the cylinder head, preventing a rocking motion.

Install the RH fuel rail assembly and the 6 new bolts. Tighten in 3 stages in the sequence shown.

- Stage 1: Push down on the fuel rail face above the fuel injectors.
- Stage 2: Tighten to 10 Nm (89 lb-in).
- Stage 3: Tighten an additional 45 degrees.

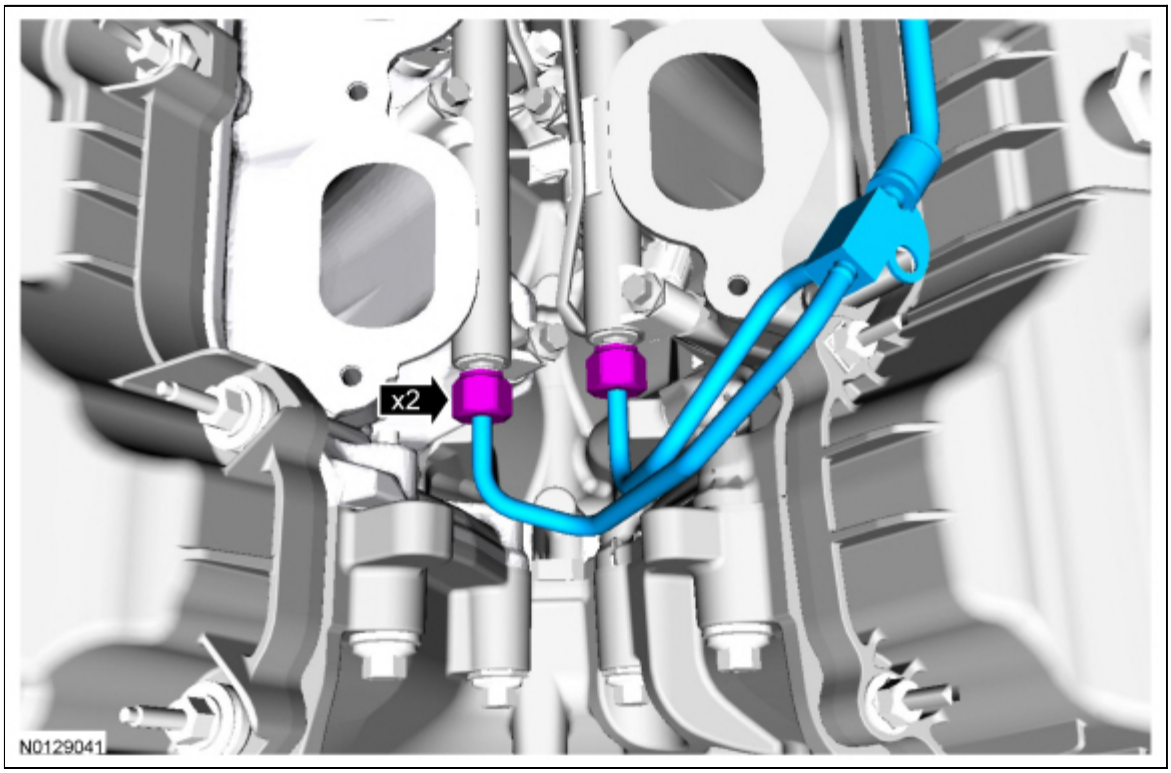


149. ***NOTICE:*** **It is very important to visually inspect the routing of the fuel charge wire harness to make sure that they will not be pinched or damaged between the fuel rail and the cylinder head during installation.**

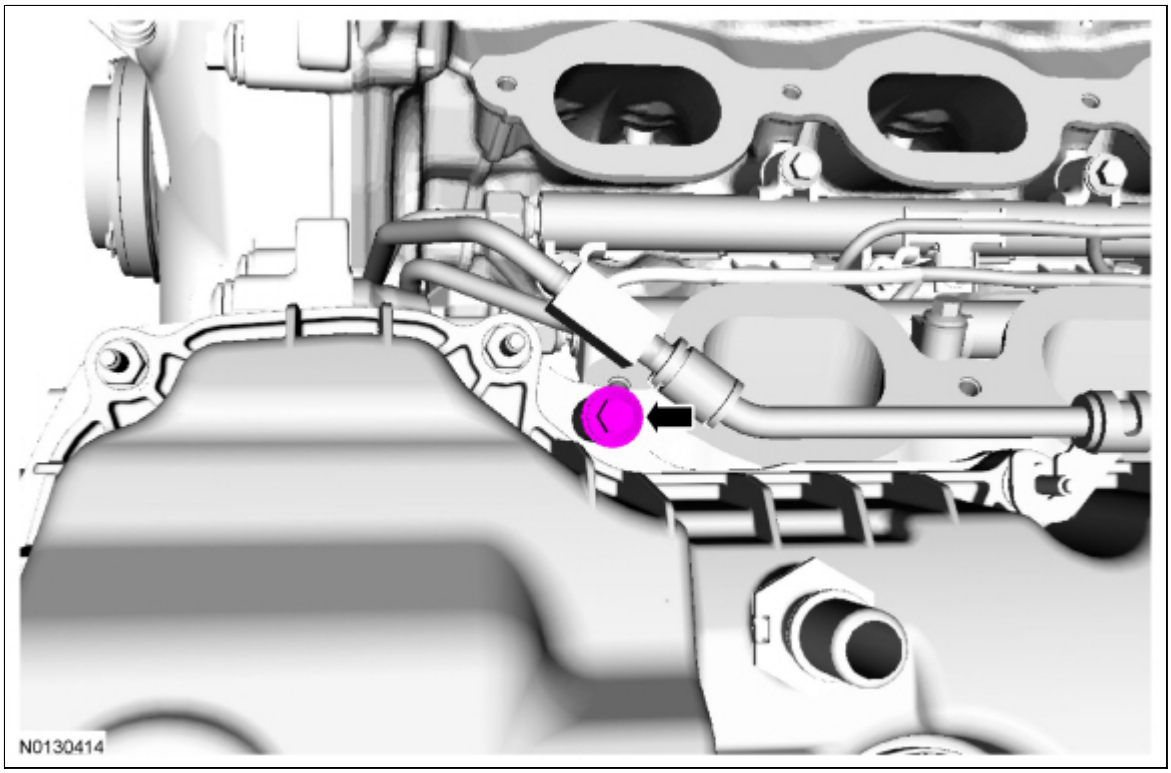
repair4less

NOTE: Tighten the bolts using a method that draws the fuel rail evenly to the cylinder head, preventing a rocking motion.

Install the LH fuel rail assembly and the 6 new bolts. Tighten in 3 stages in the sequence shown.



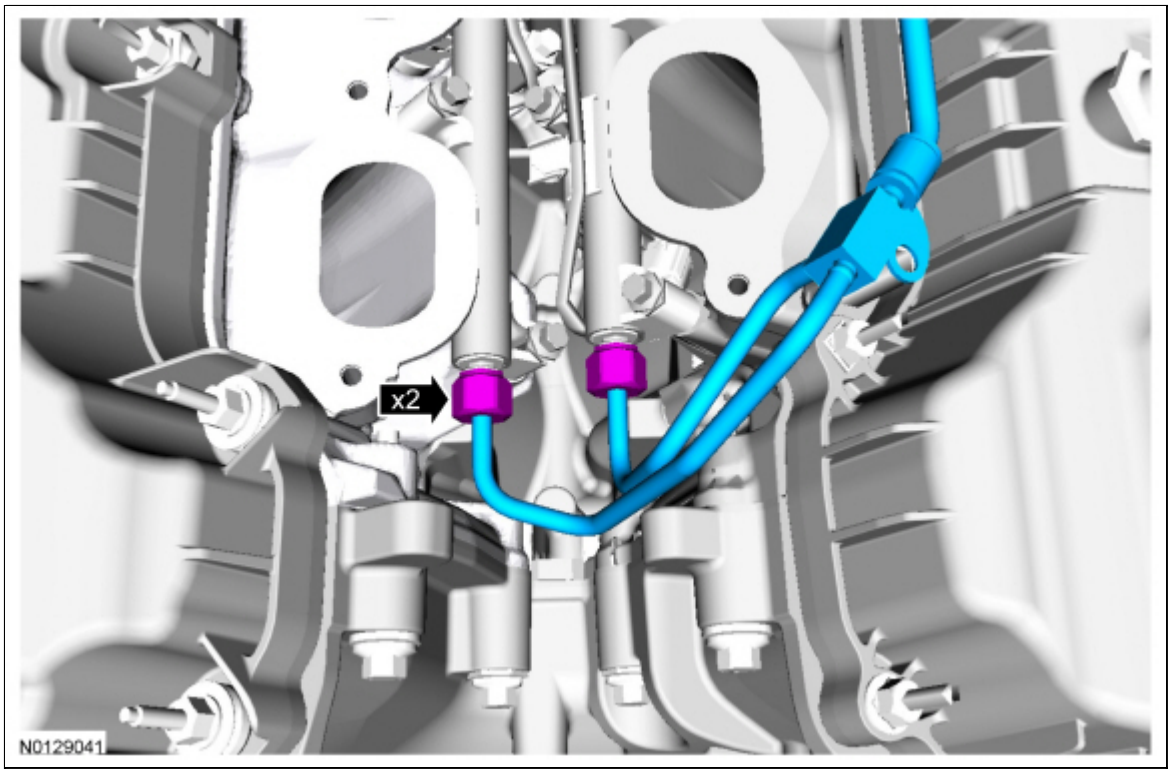
- Stage 1: Push down on the fuel rail face above the fuel injectors.
- Stage 2: Tighten to 10 Nm (89 lb-in).
- Stage 3: Tighten an additional 45 degrees.



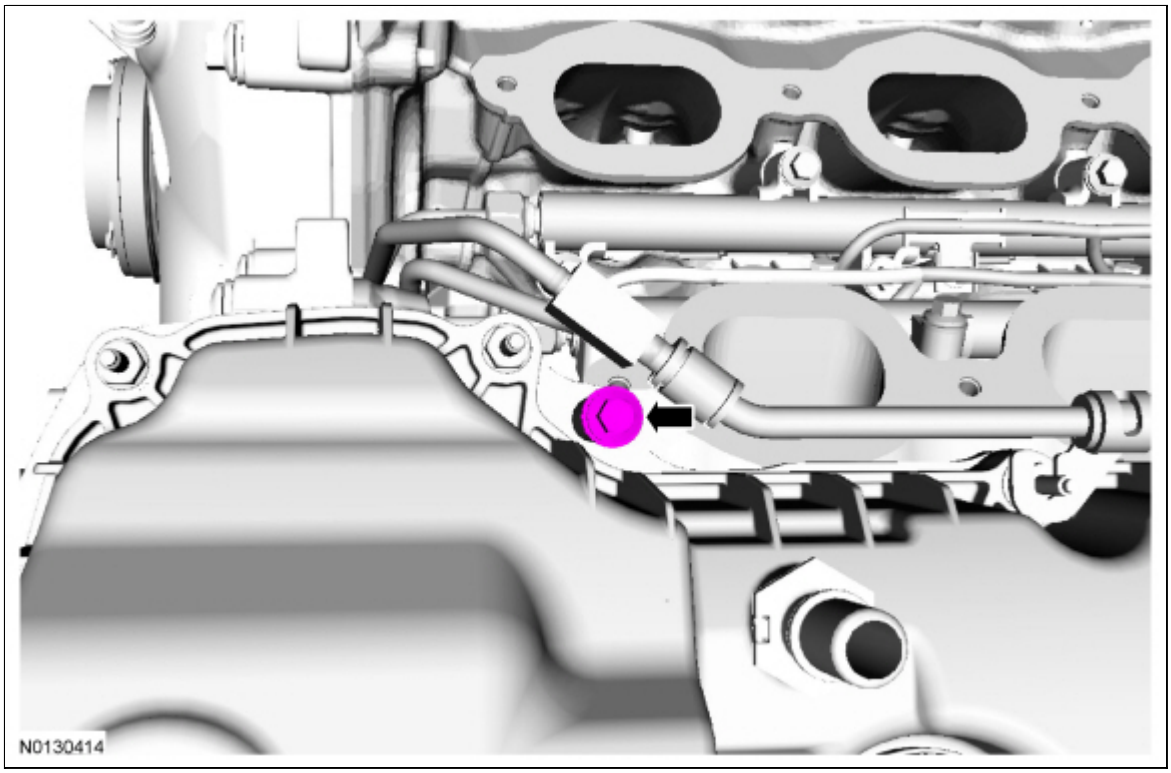
150. **NOTE:** Apply clean engine oil to the threads of the 2 high-pressure fuel tube flare nuts.

Position the new high-pressure fuel tube and hand start the flare nuts in 2 stages.

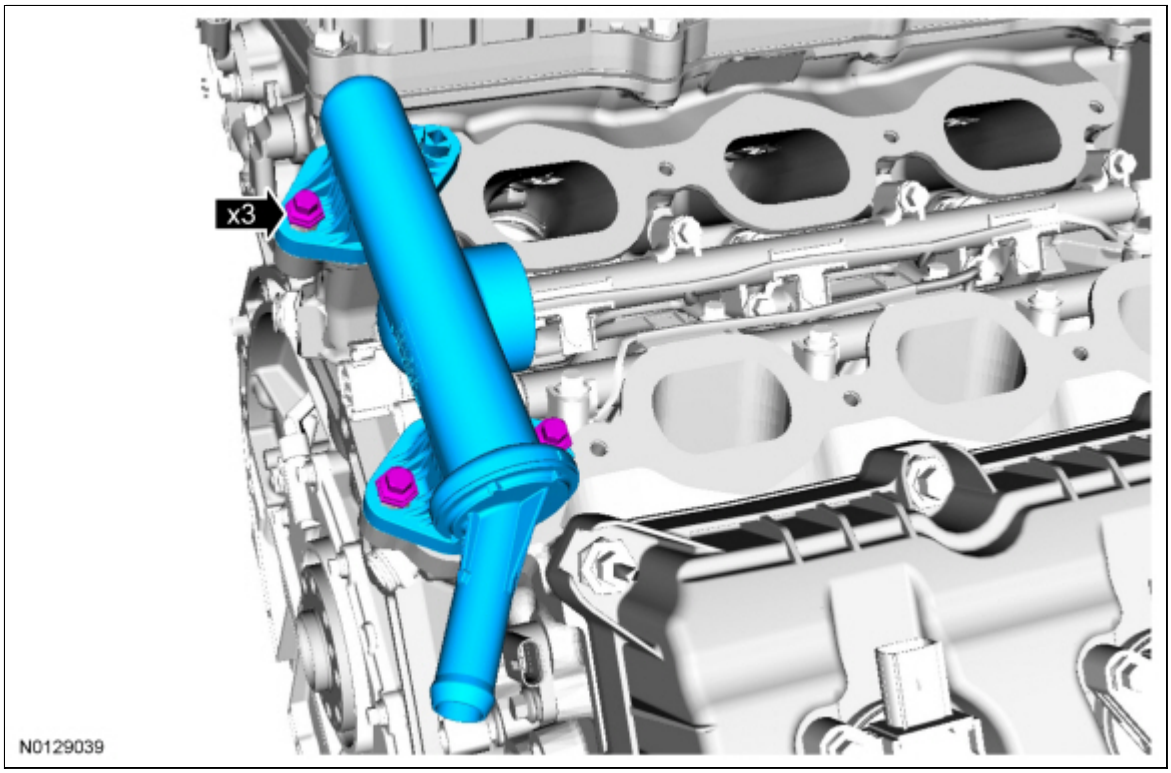
- Stage 1: Hand tighten the high-pressure fuel tube-to-RH fuel rail flare nut.
- Stage 2: Hand tighten the high-pressure fuel tube-to-LH fuel rail flare nut.



151. Loosely install the bolt for the high-pressure fuel tube.

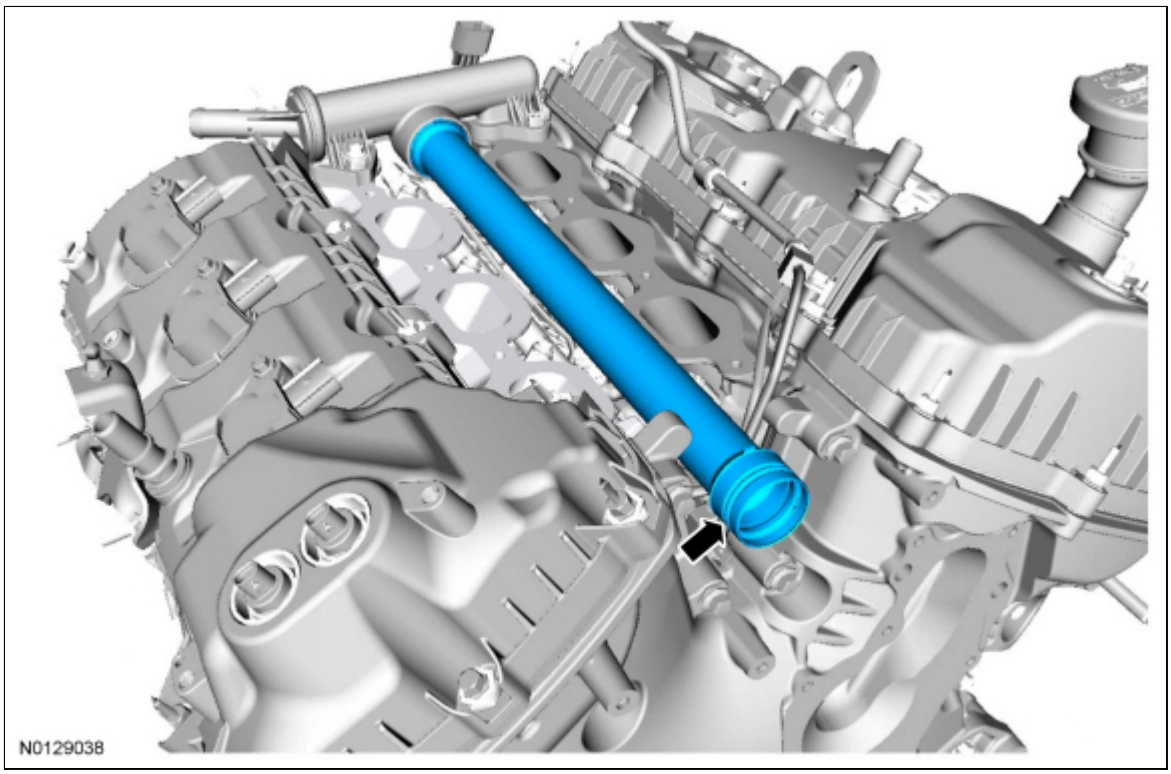


152. Connect the high-pressure fuel tube to the fuel rails. Tighten in 6 stages.
    - Stage 1: Tighten the high-pressure fuel tube-to-RH fuel rail flare nut to 15 Nm (133 lb-in).
    - Stage 2: Tighten an additional 30 degrees.
    - Stage 3: Tighten to 32 Nm (24 lb-ft).
    - Stage 4: Tighten the high-pressure fuel tube-to-LH fuel rail flare nut to 15 Nm (133 lb-in).
    - Stage 5: Tighten an additional 30 degrees.
    - Stage 6: Tighten to 32 Nm (24 lb-ft).



repair4less

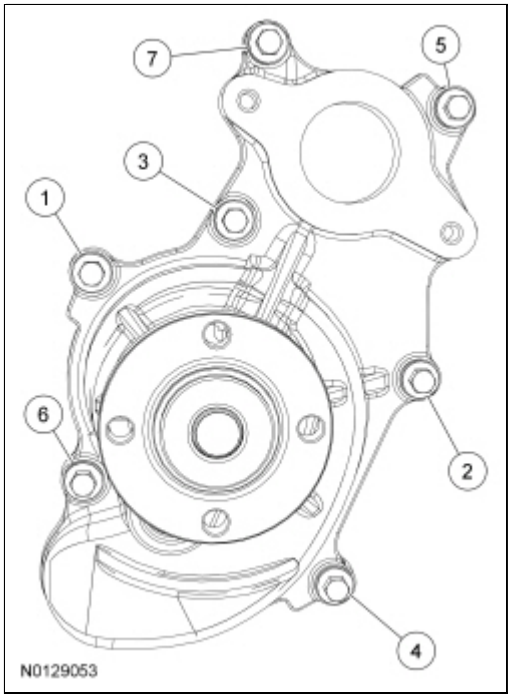
153. Tighten the bolt for the high-pressure fuel tube.
    - Tighten the bolt to 10 Nm (89 lb-in) then an additional 45 degrees.



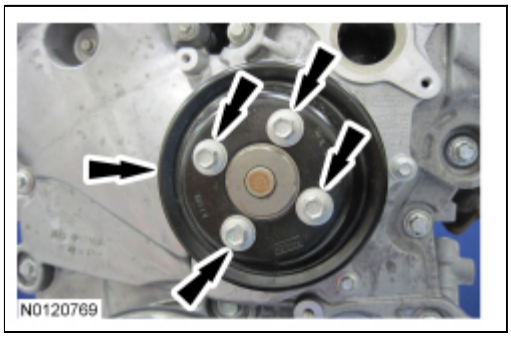
154. Using new gaskets, install the coolant crossover manifold assembly and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.

155. **NOTE:** Lubricate the O-ring seal with clean engine coolant.

Using new O-ring seals, install the coolant inlet pipe.



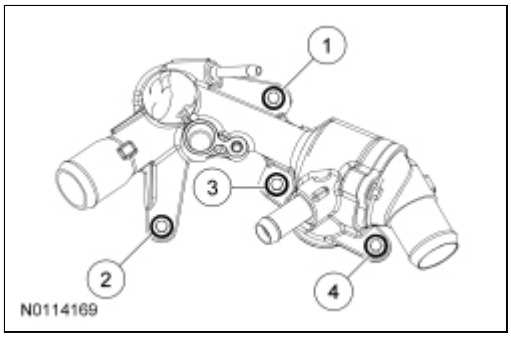
156. **NOTE:** Lubricate the O-ring seal with clean engine coolant.



repair4less

Using new coolant pump gasket and coolant pump O-ring seal, install the coolant pump and the 7 bolts and tighten in 2 stages in the sequence shown.

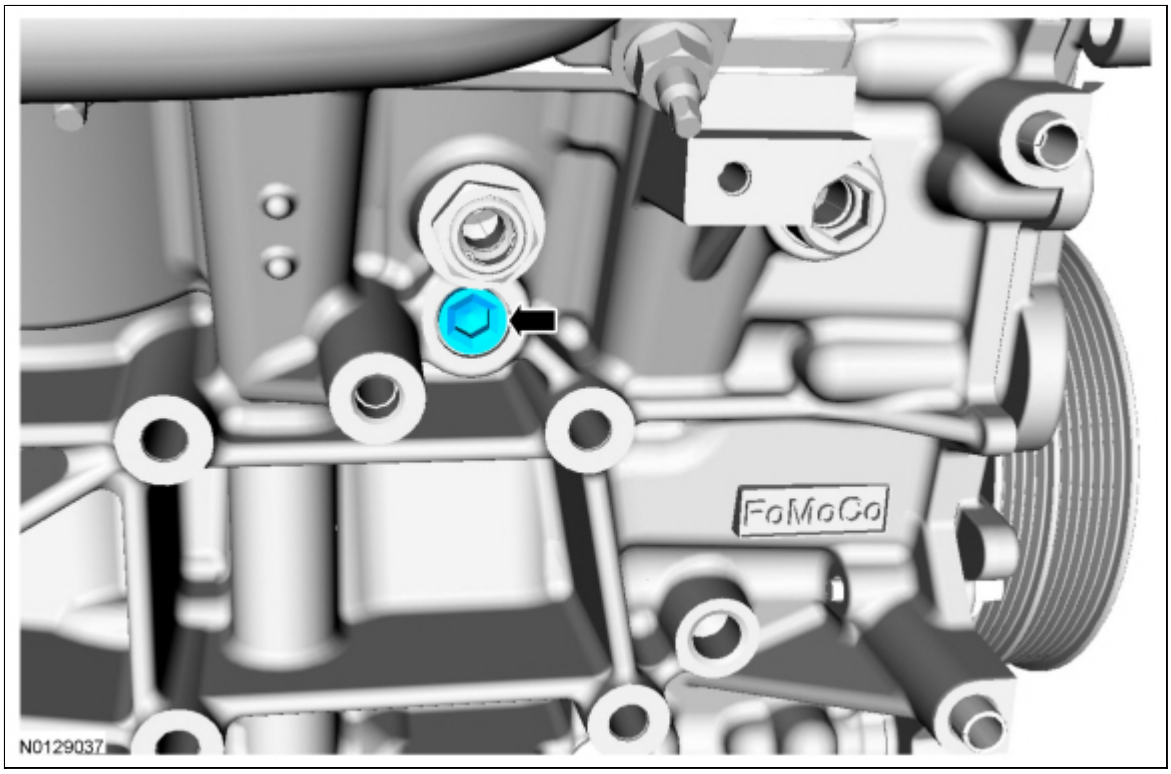
- Stage 1: Tighten to 10 Nm (89 lb-in).
- Stage 2: Tighten an additional 45 degrees.



157. Install the coolant pump pulley and the 4 bolts.
    - Tighten to 24 Nm (18 lb-ft).

158. **NOTE:** Lubricate the coolant inlet tube O-ring seal with clean engine coolant.

Install the thermostat housing and the 4 bolts and tighten in 2 stages in the sequence shown.

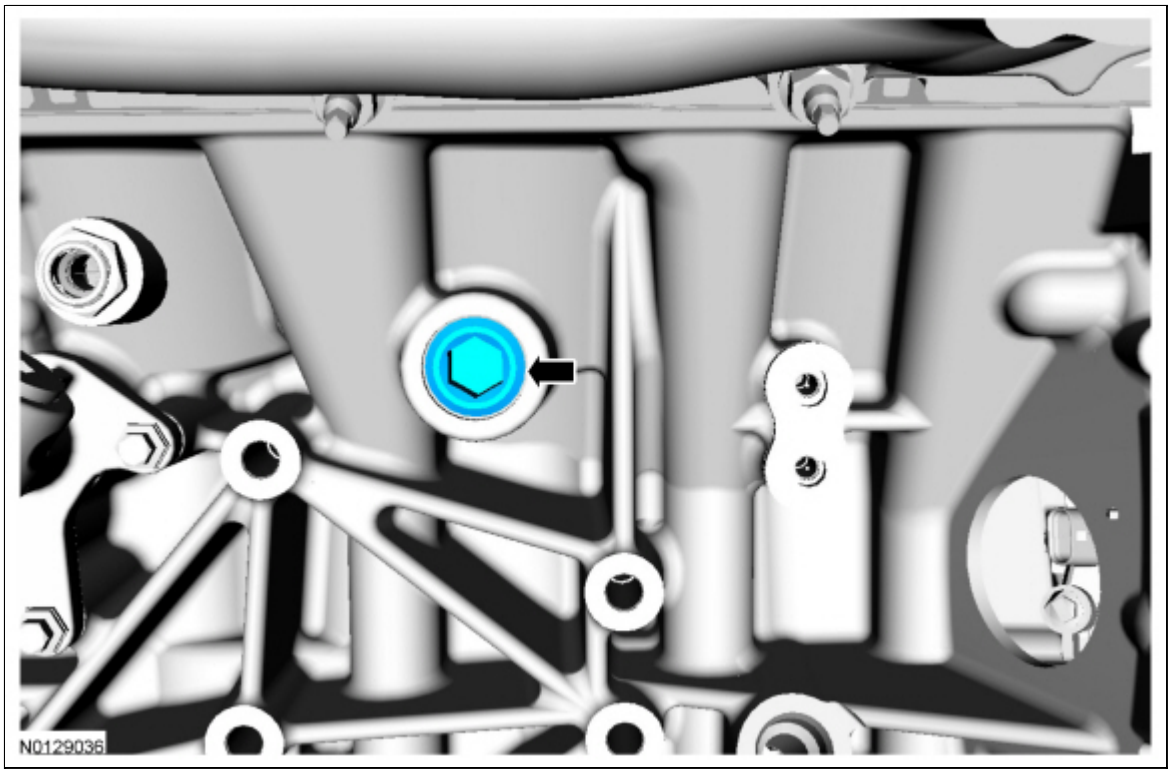


- Stage 1: Tighten to 8 Nm (71 lb-in).
- Stage 2: Tighten an additional 45 degrees.

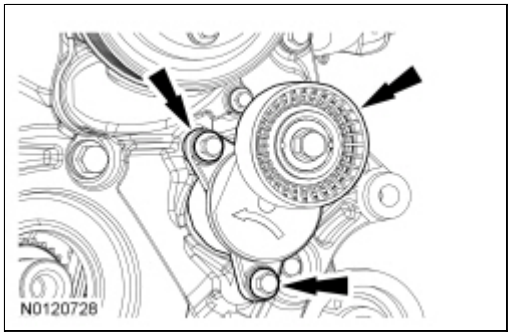
159. **NOTE:** Apply thread sealant with PTFE to the threads prior to installing the cylinder block drain plug.

Install the RH cylinder block drain plug.

- Tighten to 20 Nm (177 lb-in) then an additional 180 degrees.



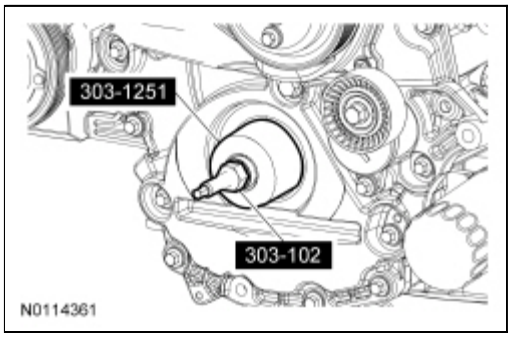
160. **NOTE:** Apply thread sealant with PTFE to the threads prior to installing the cylinder block drain plug.



Install the LH cylinder block drain plug.

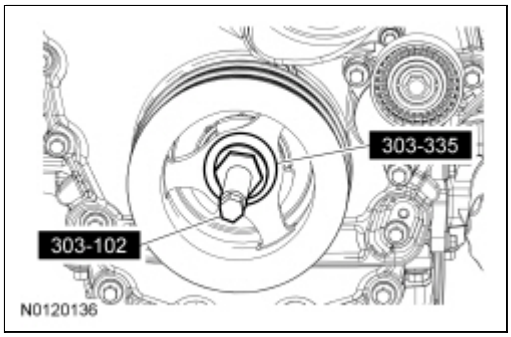
- Tighten the cylinder block drain plug to 10 Nm (89 lb-in) then an additional 720 degrees.

repair4less

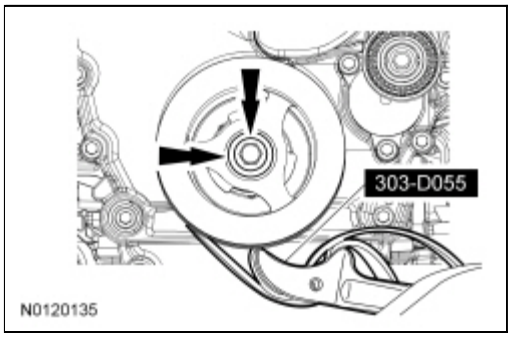


161. Install the accessory drive belt tensioner and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

162. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.



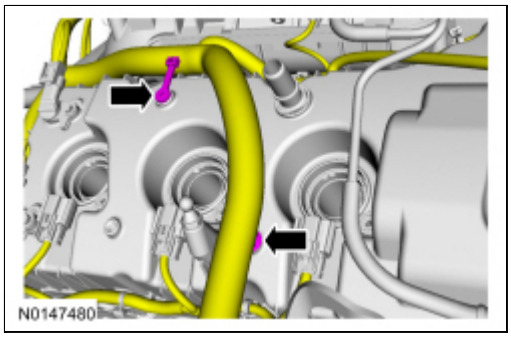
Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.



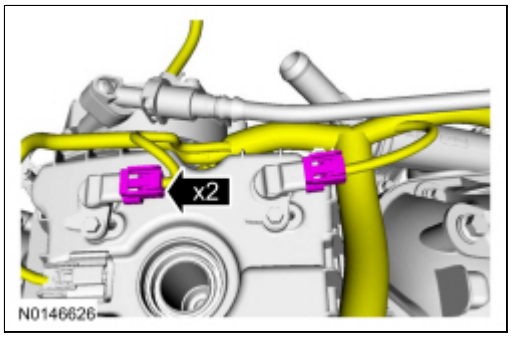
163. Lubricate the crankshaft front seal inner lip with clean engine oil.

164. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Replacer, install the crankshaft pulley.

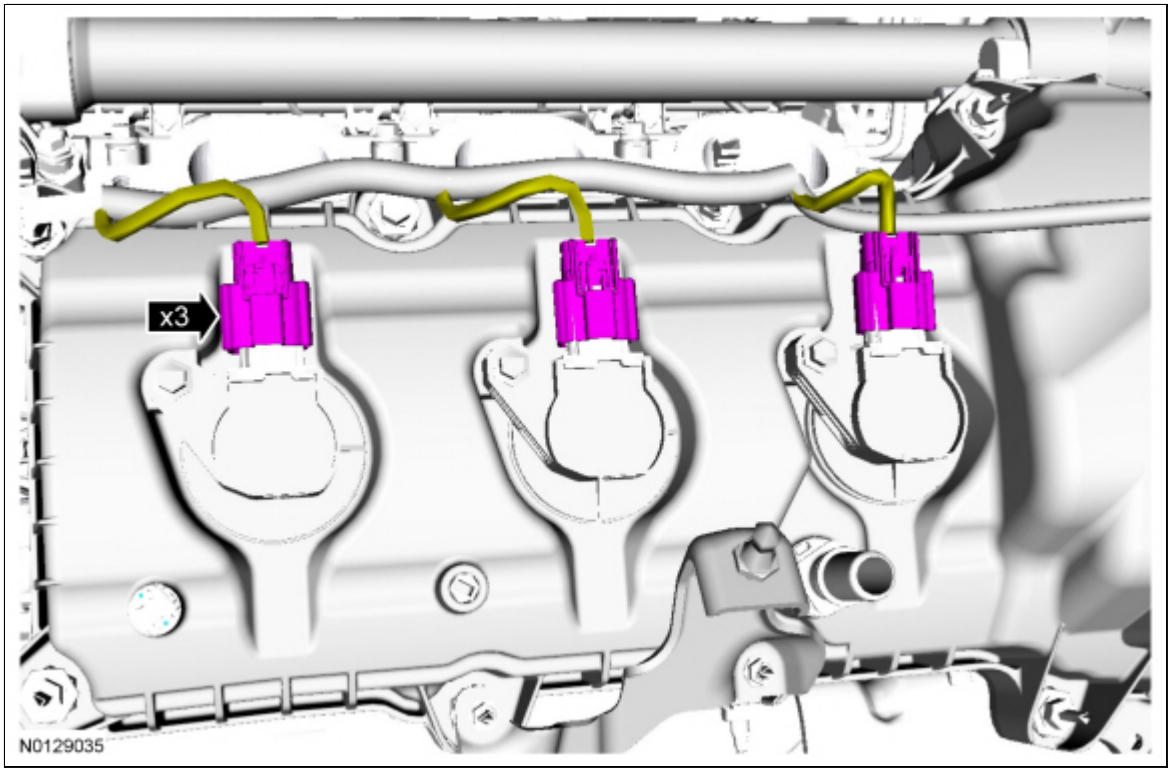


165. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
- Stage 1: Tighten to 120 Nm (89 lb-ft).
- Stage 2: Loosen one full turn.
- Stage 3: Tighten to 50 Nm (37 lb-ft).
- Stage 4: Tighten an additional 90 degrees.

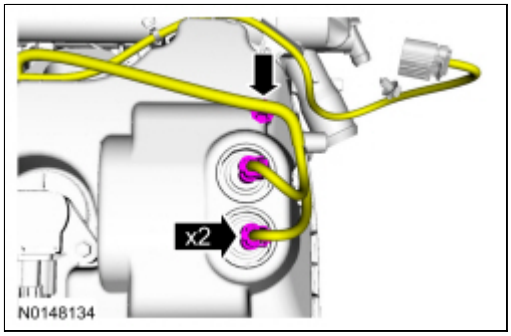


166. Position the engine wire harness on the engine. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.

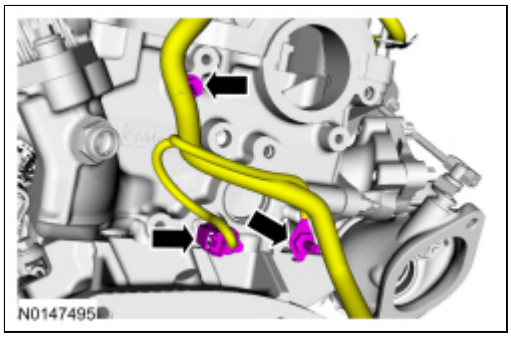
167. Connect the wire harness retainer and install the tie strap.



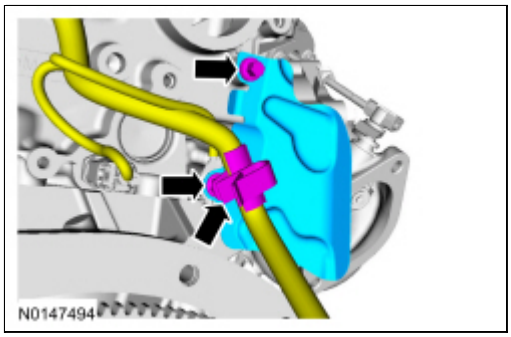
168. Connect the 2 RH CMP electrical connectors.



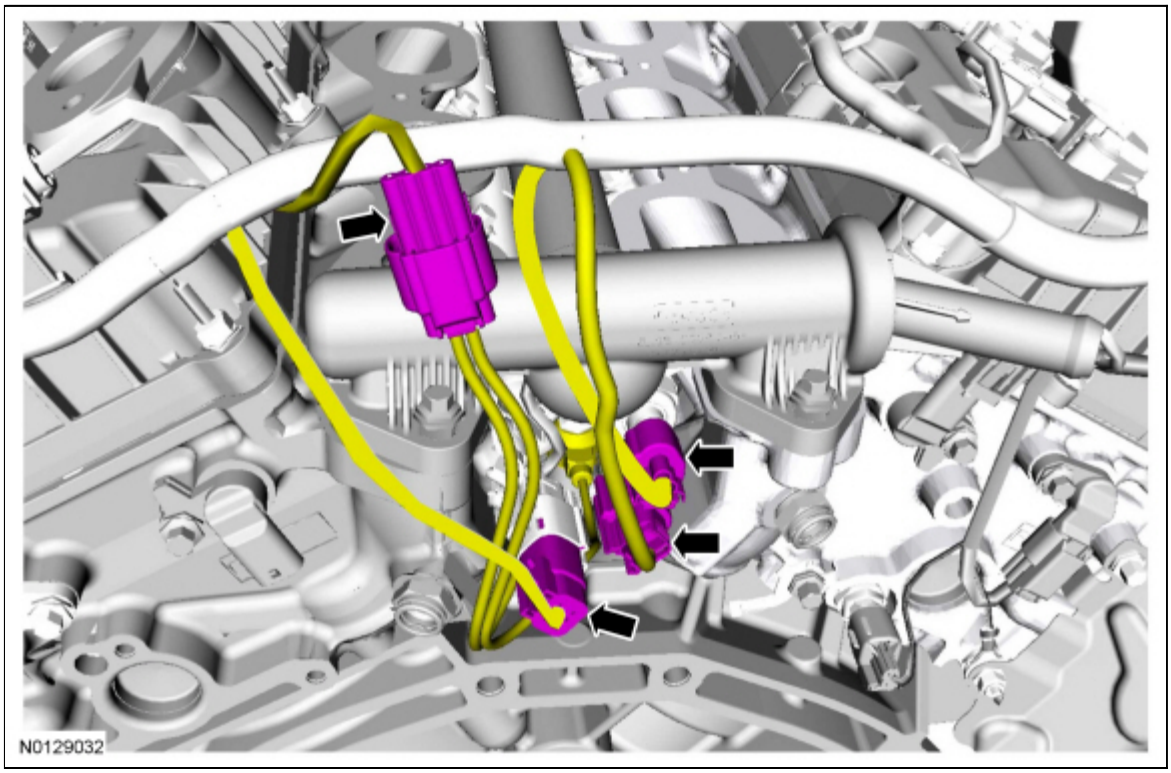
repair4less



169. Connect the 3 RH ignition coil-on-plug electrical connectors.

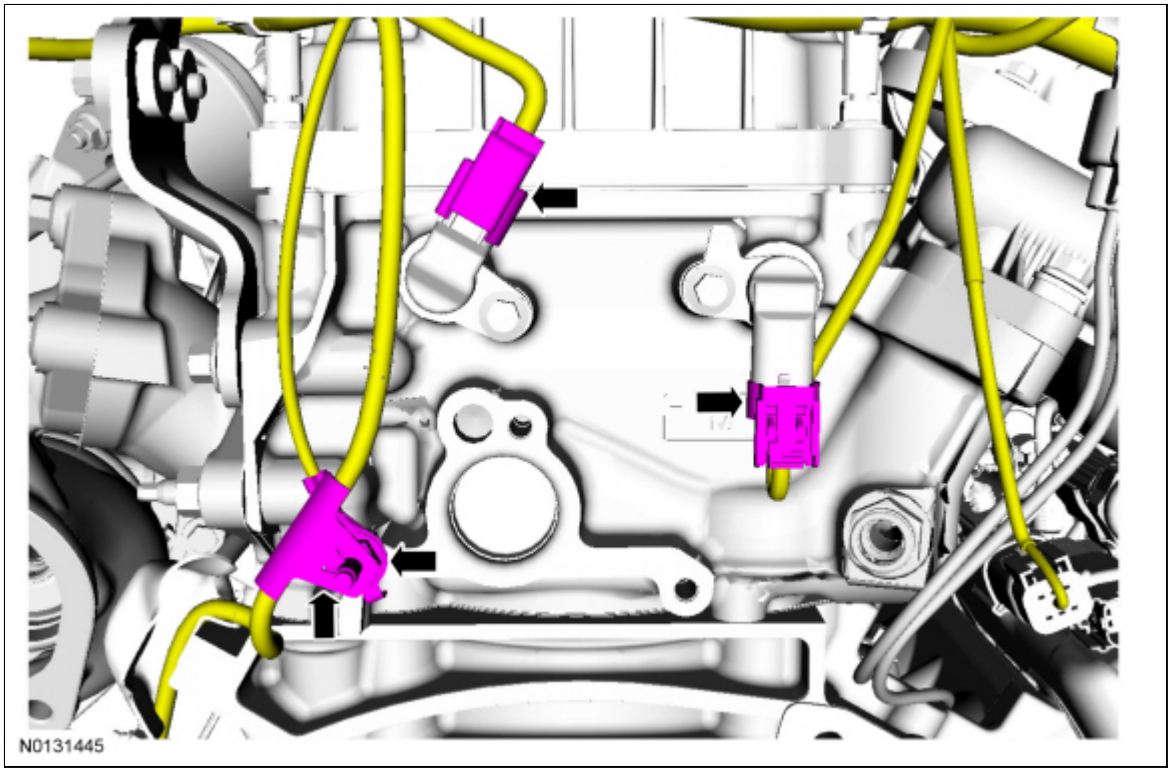


170. Connect the 2 RH VCT solenoid electrical connectors. Install the tie strap.

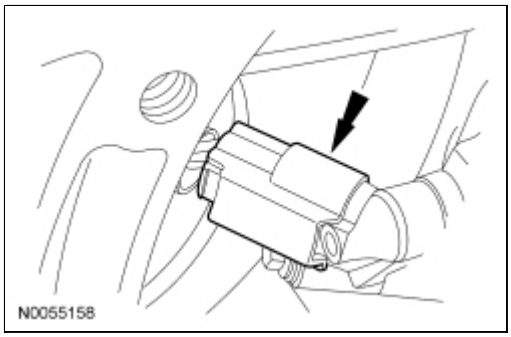


171. Connect the CHT sensor electrical connector. Install the ground stud bolt and the tie strap.
    - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.

172. Install the CMP heat shield, bolt and the nut. Connect the wire retainer.
    - Tighten the bolt to 10 Nm (89 lb-in).
    - Tighten the nut to 10 Nm (89 lb-in).

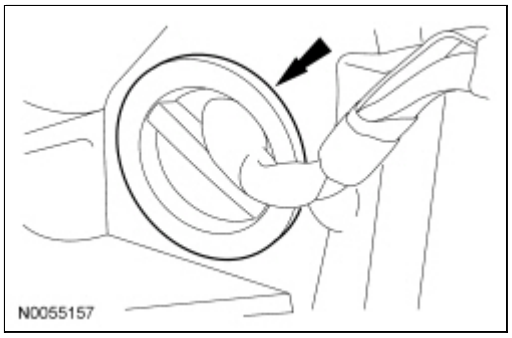


173. Connect the 2 fuel charge harness and the Fuel Rail Pressure (FRP) electrical connectors. Connect the KS sensor electrical connector.

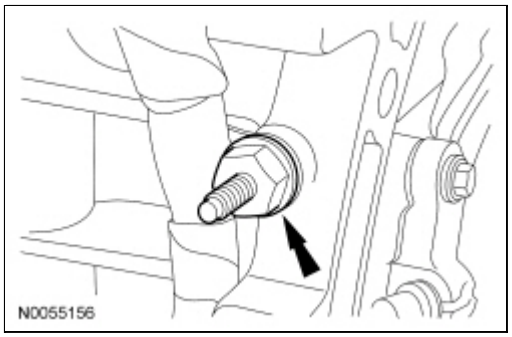


repair4less

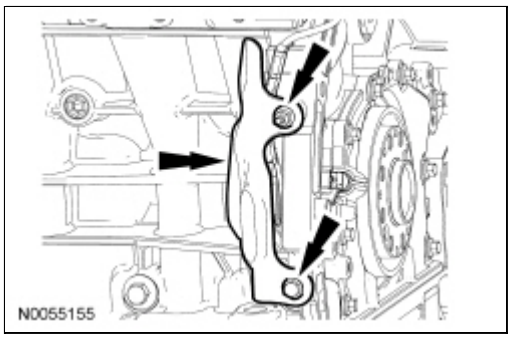
174. Connect the 2 LH CMP sensor electrical connectors. Install the ground stud bolt. Install the CKP wire retainer.
    - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.



175. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.

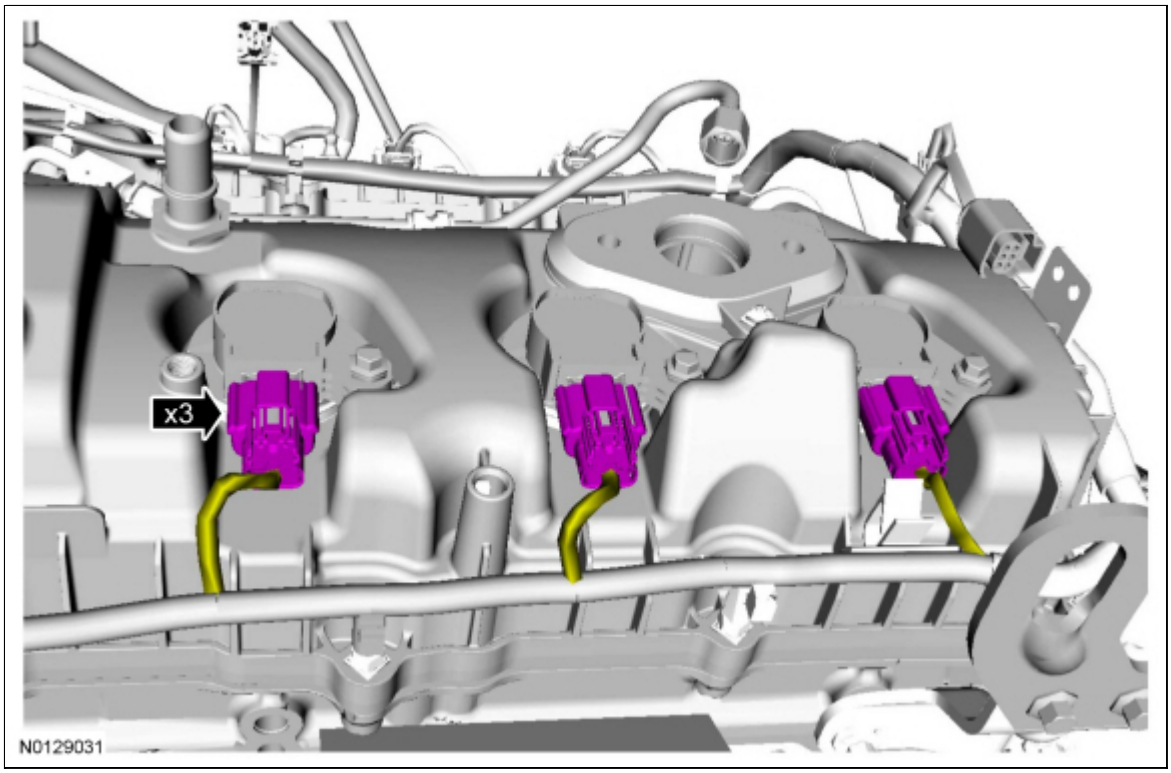


176. Connect the CKP sensor electrical connector.

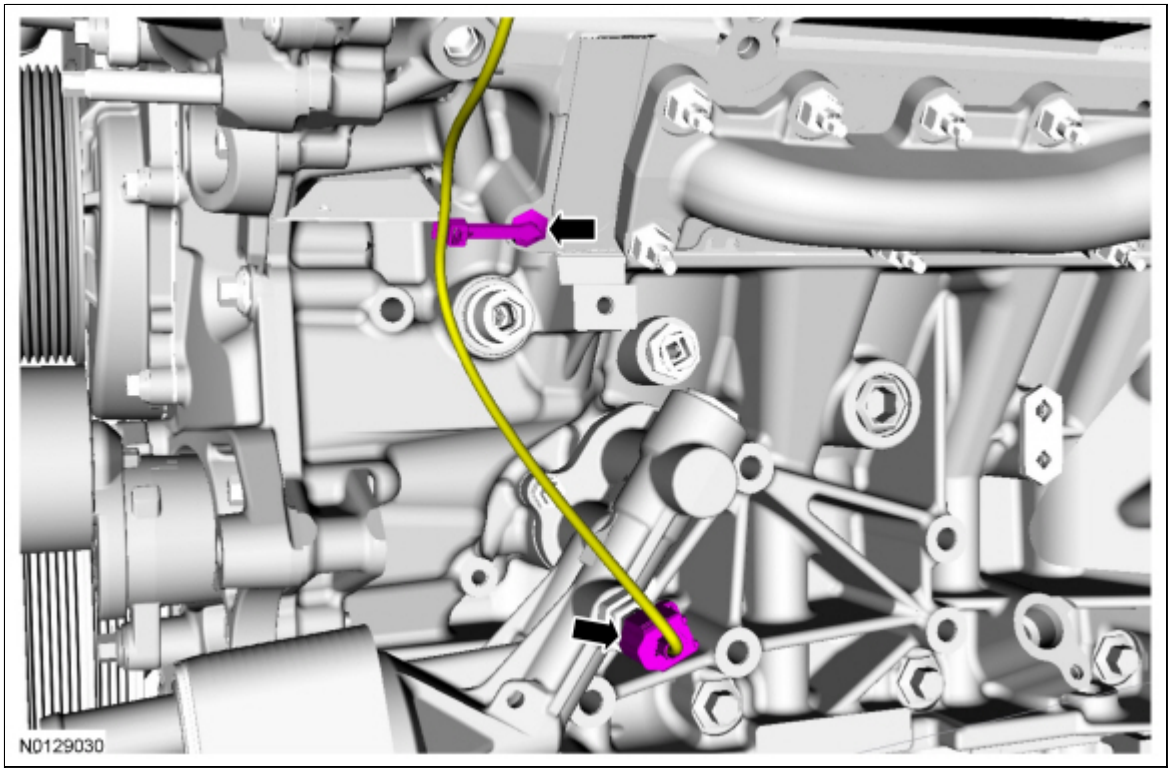


177. Install the wiring harness grommet.

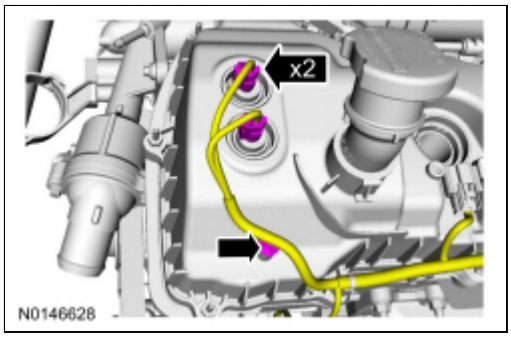
178. Install the wiring harness retainer stud bolt.
    - Tighten to 10 Nm (89 lb-in).



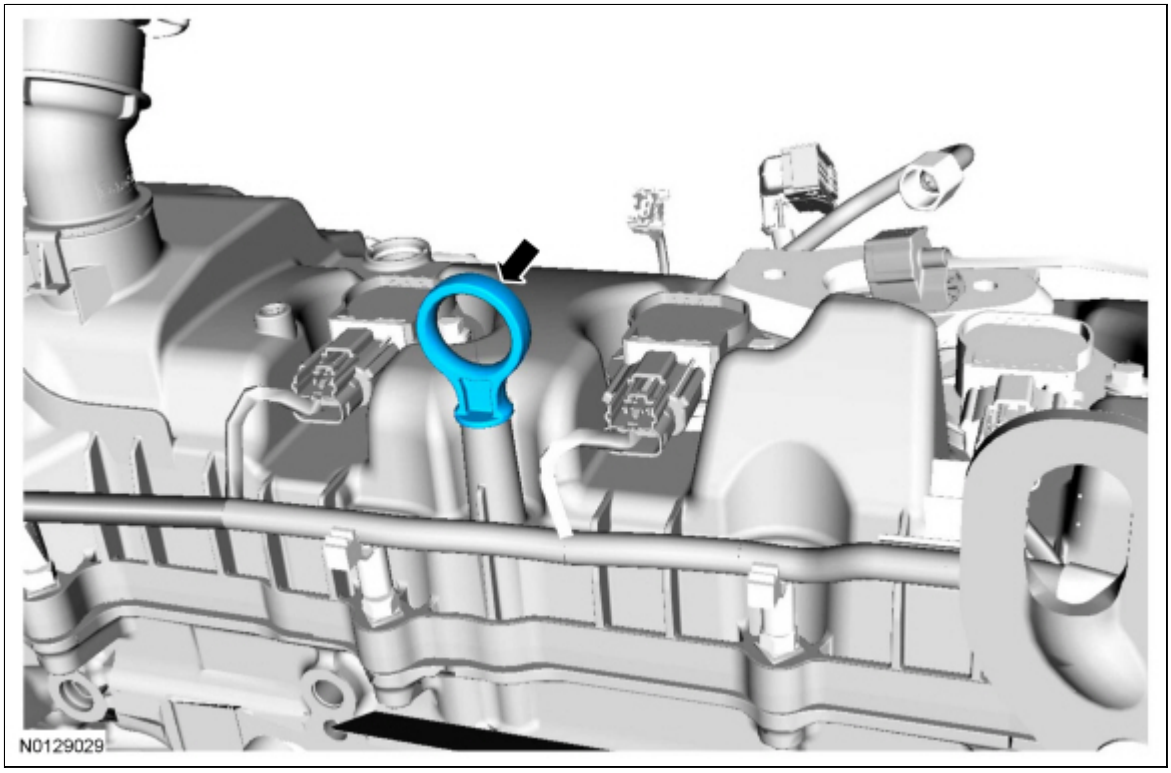
179. Install the CKP heat shield, the nut and the bolt.
    - Tighten to 10 Nm (89 lb-in).



180. Connect the 3 LH ignition coil-on-plug electrical connectors.

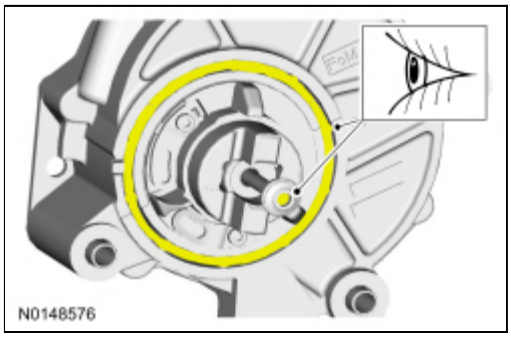


repair4less



181. Connect the Engine Oil Pressure (EOP) switch electrical connector.
    - Attach the EOP switch wiring harness retainer to the cylinder head.

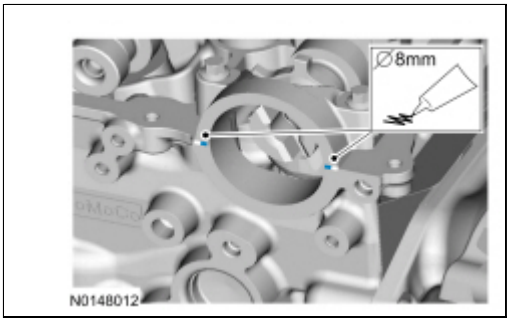
182. Connect the 2 LH VCT solenoid electrical connectors. Install the tie strap.



183. Install the engine oil level indicator.

184. ***NOTICE:*** **Make sure the oil tube filter screen is free of contaminants prior to the installation of the vacuum pump or damage to components may occur.**

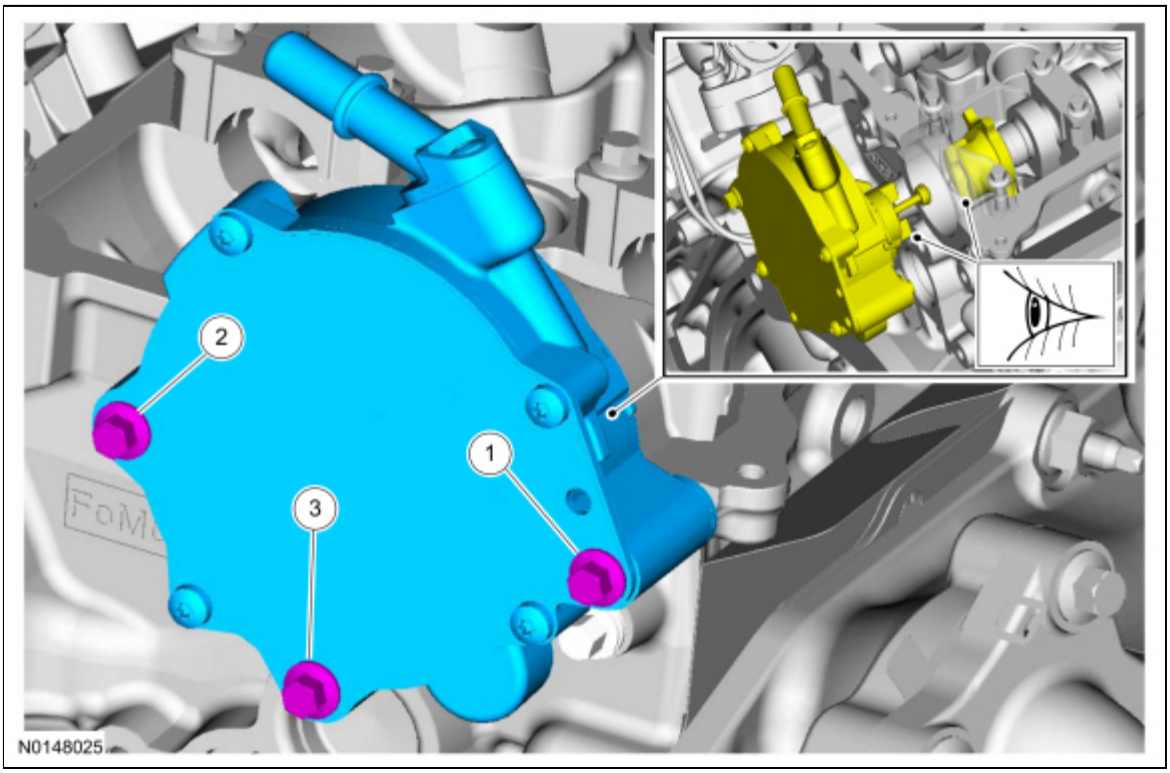
Visual check. Install a new gasket if necessary.



repair4less

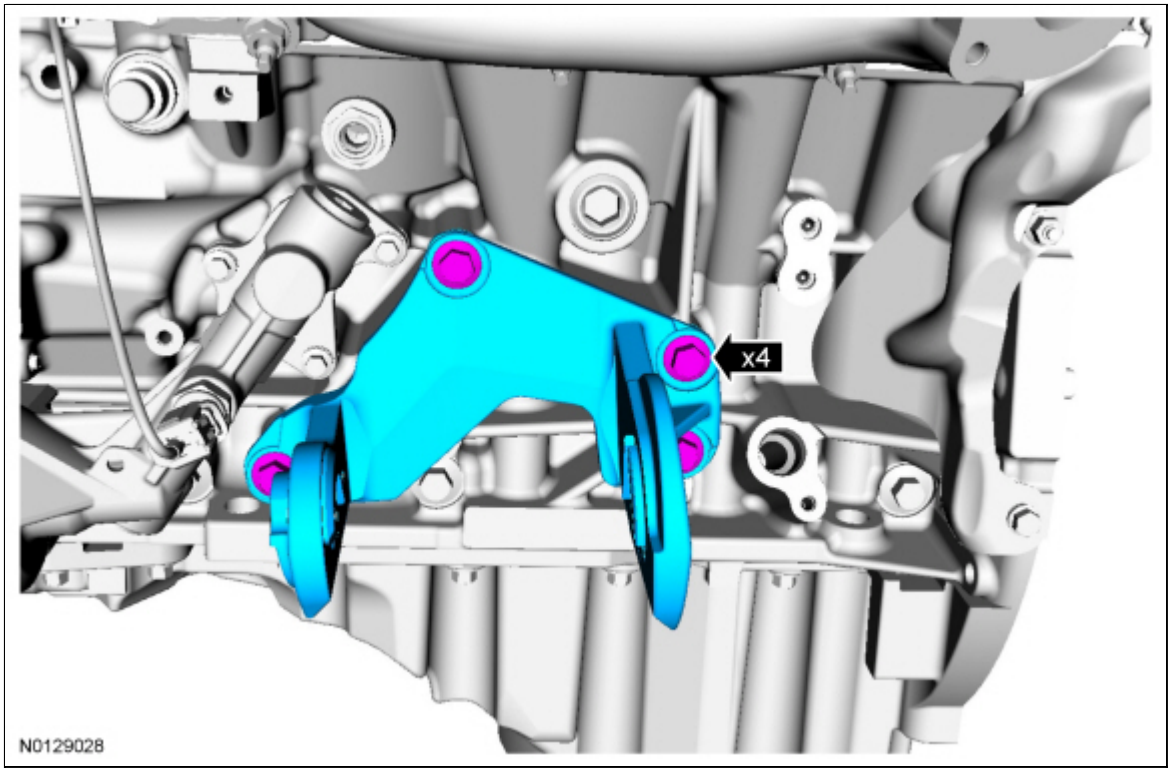
185. ***NOTICE:*** **If the brake vacuum pump is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Failure to follow this procedure can cause future oil leakage.**

NOTE: Make sure the mating surfaces are clean and free of foreign material.



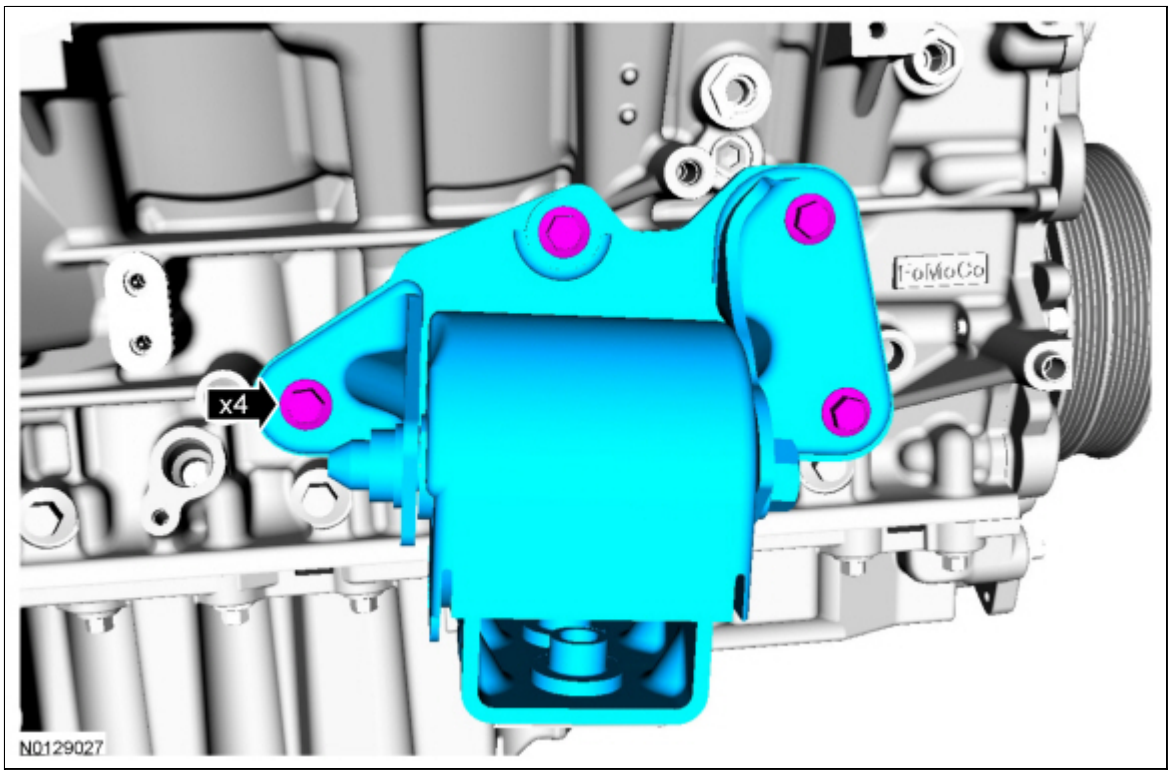
Apply a bead of the specified diameter from the specified tube.

186. **NOTE:** Manually align the brake vacuum pump drive key with the camshaft slot before installation.



Visual check.

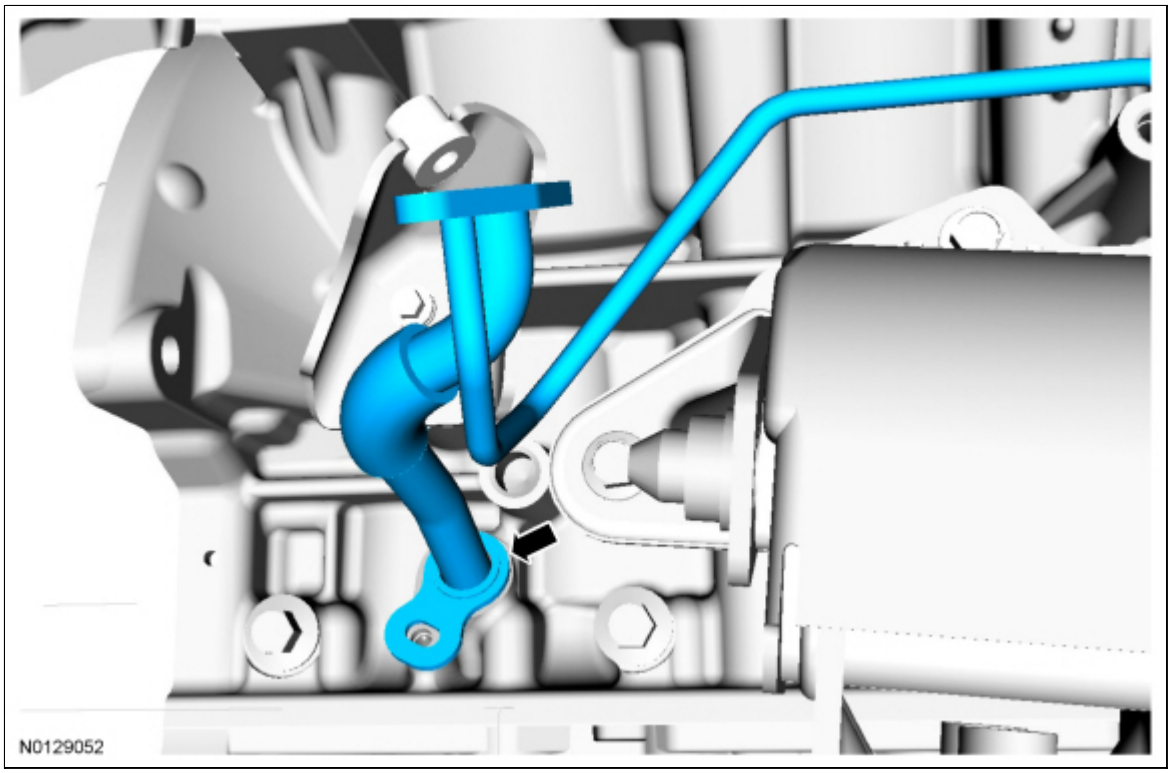
- Tighten in the sequence shown to 10 Nm (89 lb-in) then an additional 45 degrees.



187. Install the LH engine support insulator-to-cylinder block bracket and the 4 new bolts.

- Tighten to 63 Nm (46 lb-ft).

188. Install the RH engine support insulator and the 4 new bolts.
    - For standard payload package, tighten to 63 Nm (46 lb-ft).
    - For heavy duty payload package, tighten to 77 Nm (57 lb-ft).

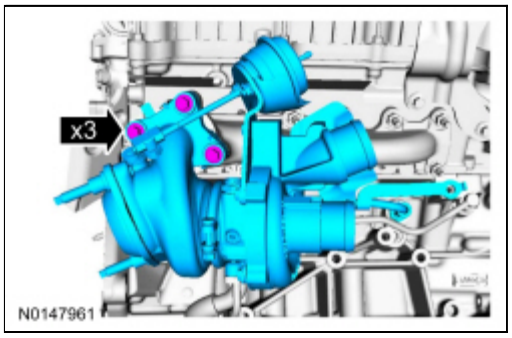


189. **NOTE:** Lubricate the cylinder block bore with clean engine oil.

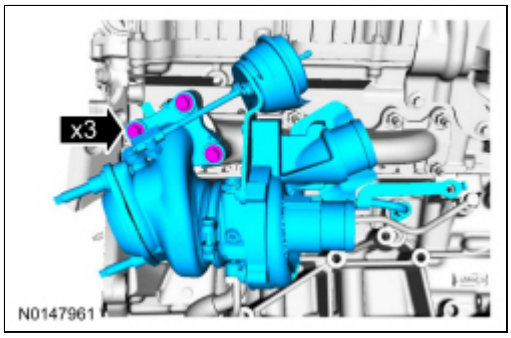
repair4less

NOTE: Apply clean engine oil to the O-ring seal.

NOTE: Make sure the turbocharger oil supply tube in positioned in the cylinder block during the installation of the turbocharger oil return tube.

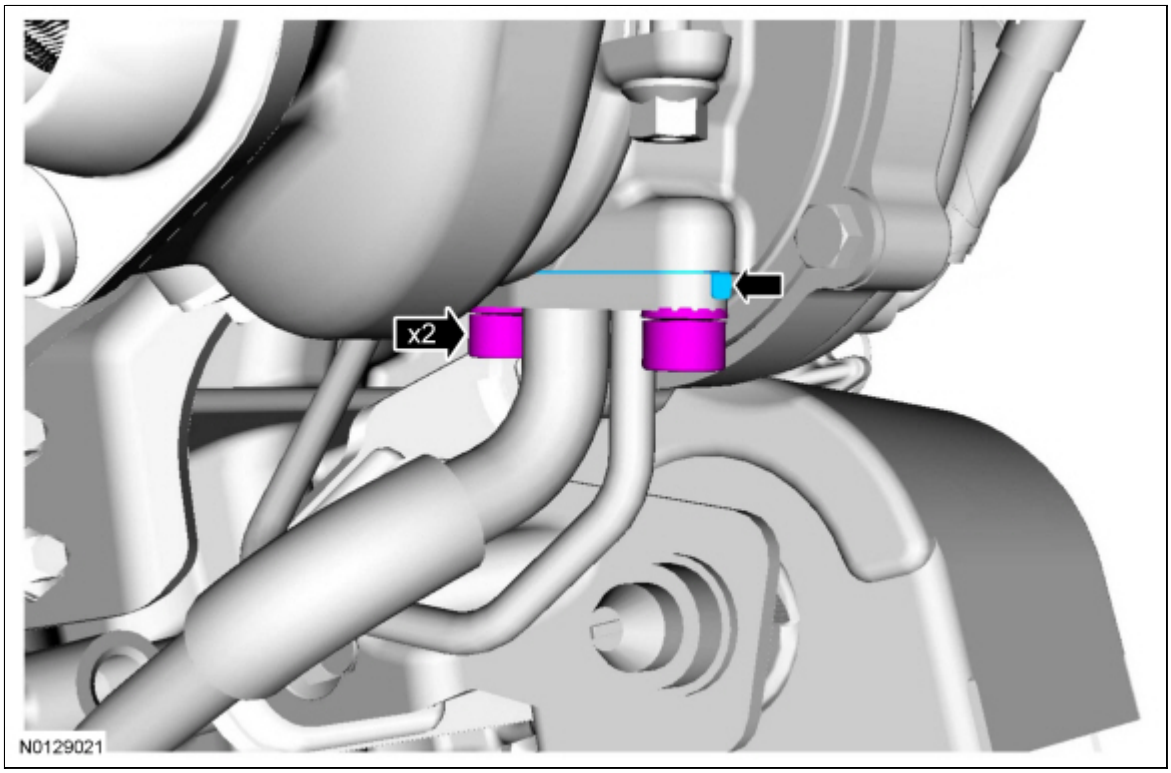


Using a new O-ring seal, install the RH turbocharger oil return tube.



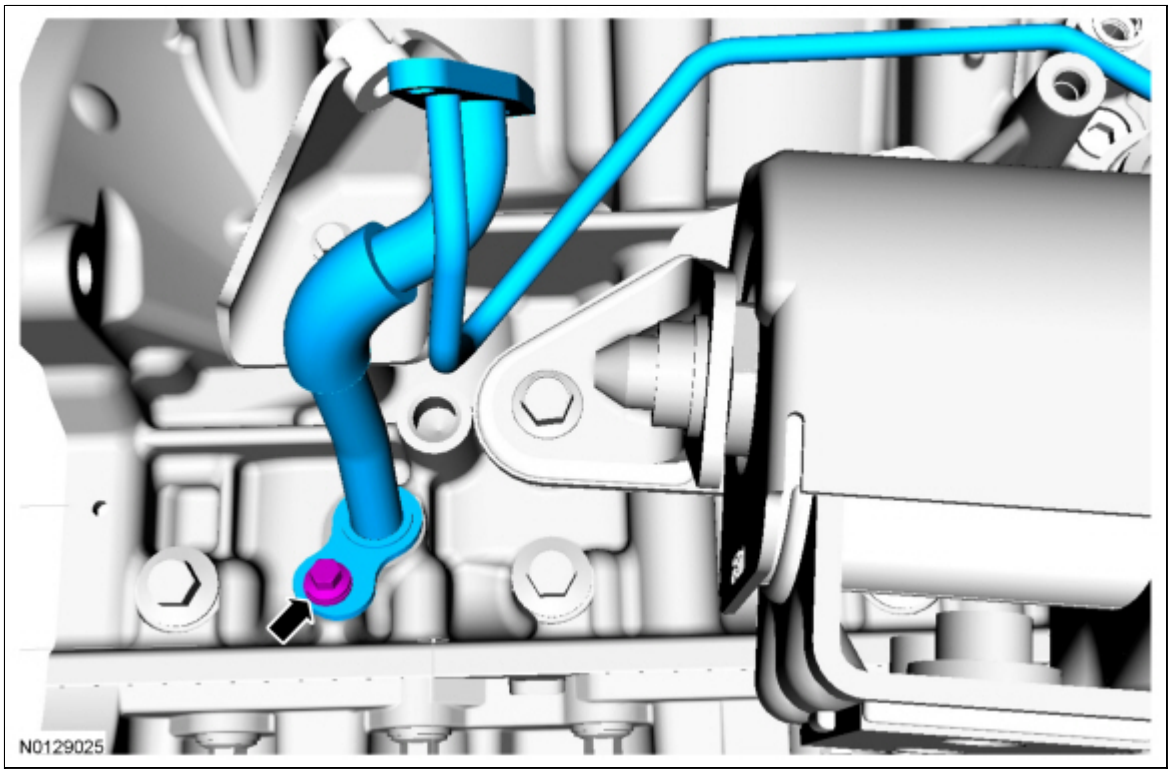
190. **NOTE:** Install the RH turbocharger coolant return tube in the turbocharger prior to installation.

Using a new turbocharger exhaust manifold gasket, install the RH turbocharger and the 3 bolts.

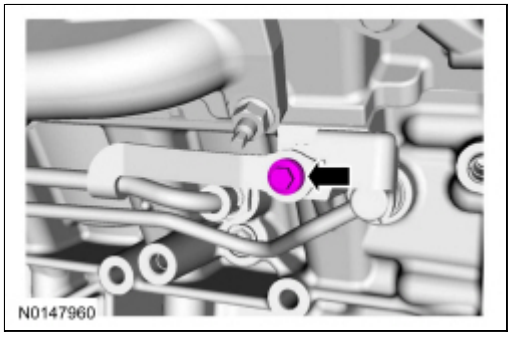


- Tighten finger-tight.

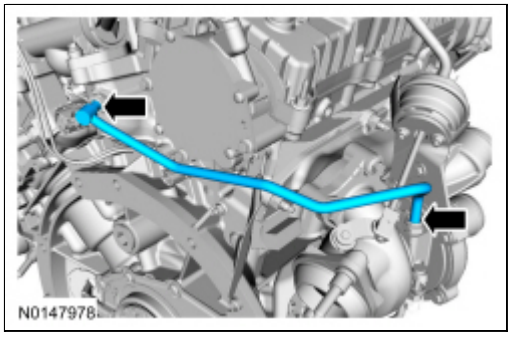
191. Tighten the RH turbocharger mounting bolts.
    - Tighten to 32 Nm (24 lb-ft).



192. Using a new turbocharger oil return tube gasket, install the 2 bolts at the turbocharger. Tighten in the following stages.
    - Stage 1: Install the bolt for the oil pressure tube side halfway.
    - Stage 2: Install the bolt for the oil drain tube side and tighten to 10 Nm (89 lb-in).
    - Stage 3: Tighten the bolt for the oil drain tube side an additional 30 degrees.
    - Stage 4: Tighten the bolt for the oil pressure tube side to 10 Nm (89 lb-in).
    - Stage 5: Tighten the bolt for the oil pressure tube side an additional 30 degrees.



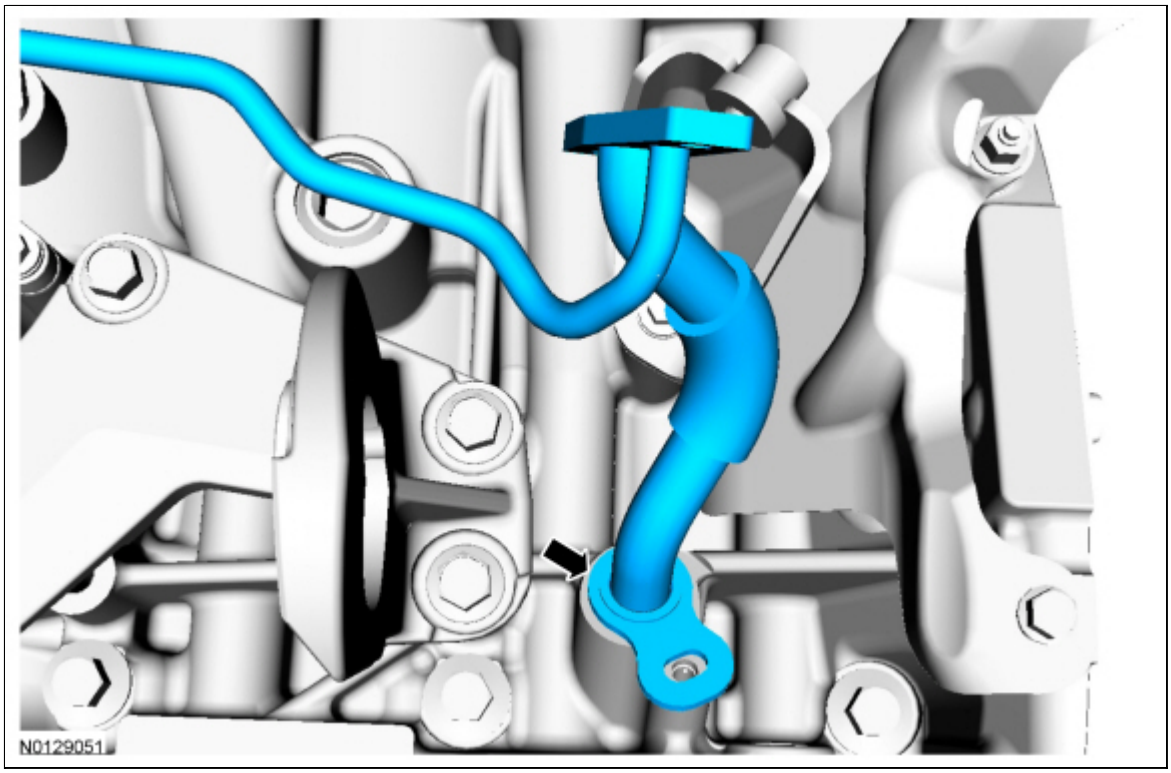
193. Install the RH turbocharger oil return tube bolt at the cylinder block. Tighten in the following stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.



repair4less

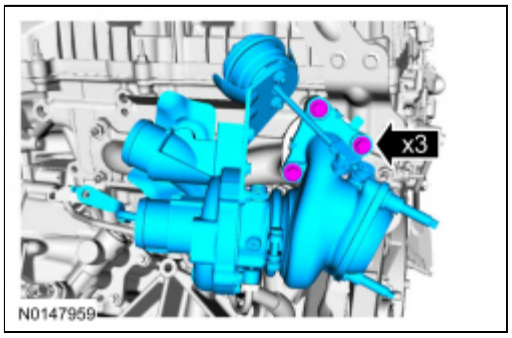
194. Install the bolt for the RH turbocharger coolant and oil tubes. Tighten in the following stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

195. Install the RH turbocharger coolant supply tube.



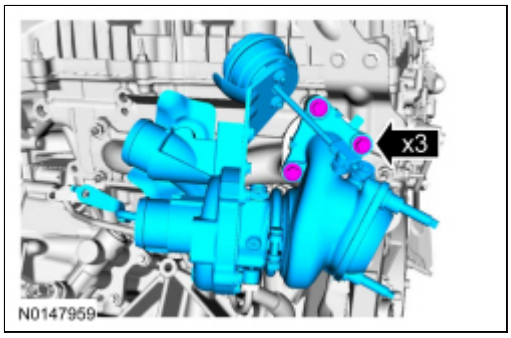
196. **NOTE:** Lubricate the cylinder block bore with clean engine oil.

NOTE: Apply clean engine oil to the O-ring seal.



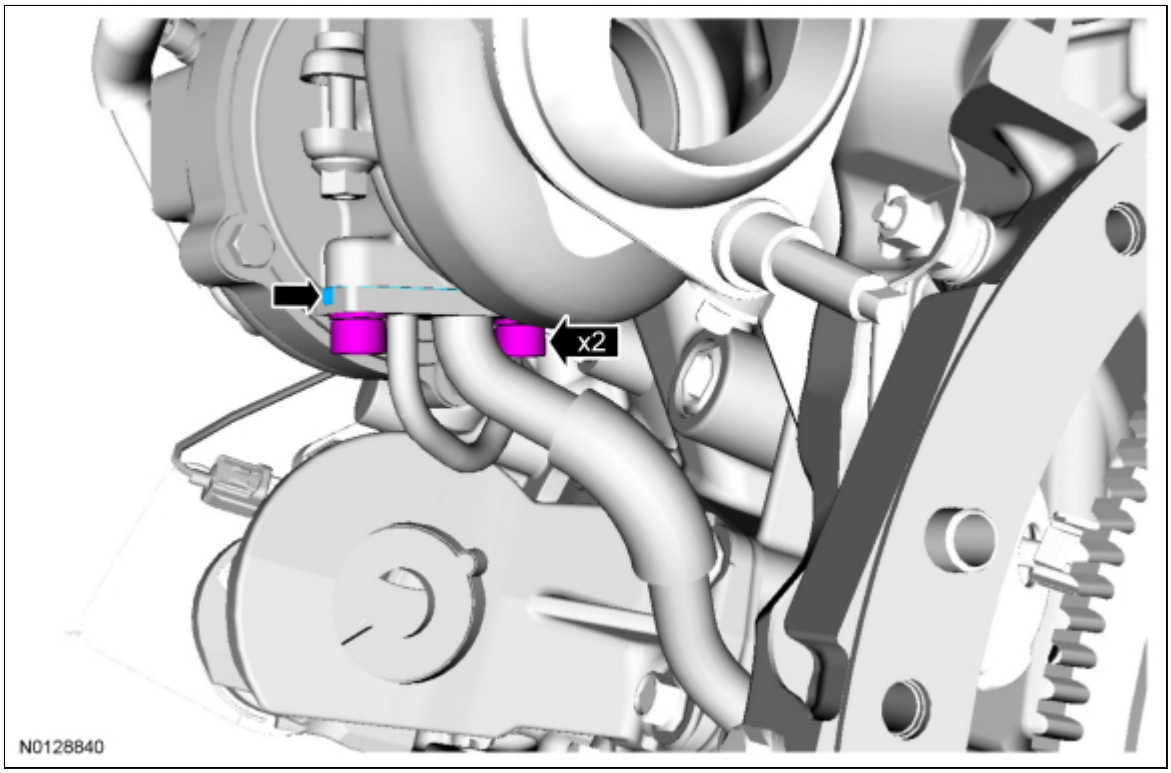
NOTE: Make sure the turbocharger oil supply tube in positioned in the cylinder block during the installation of the turbocharger oil return tube.

Using a new O-ring seal, install the LH turbocharger oil return tube.

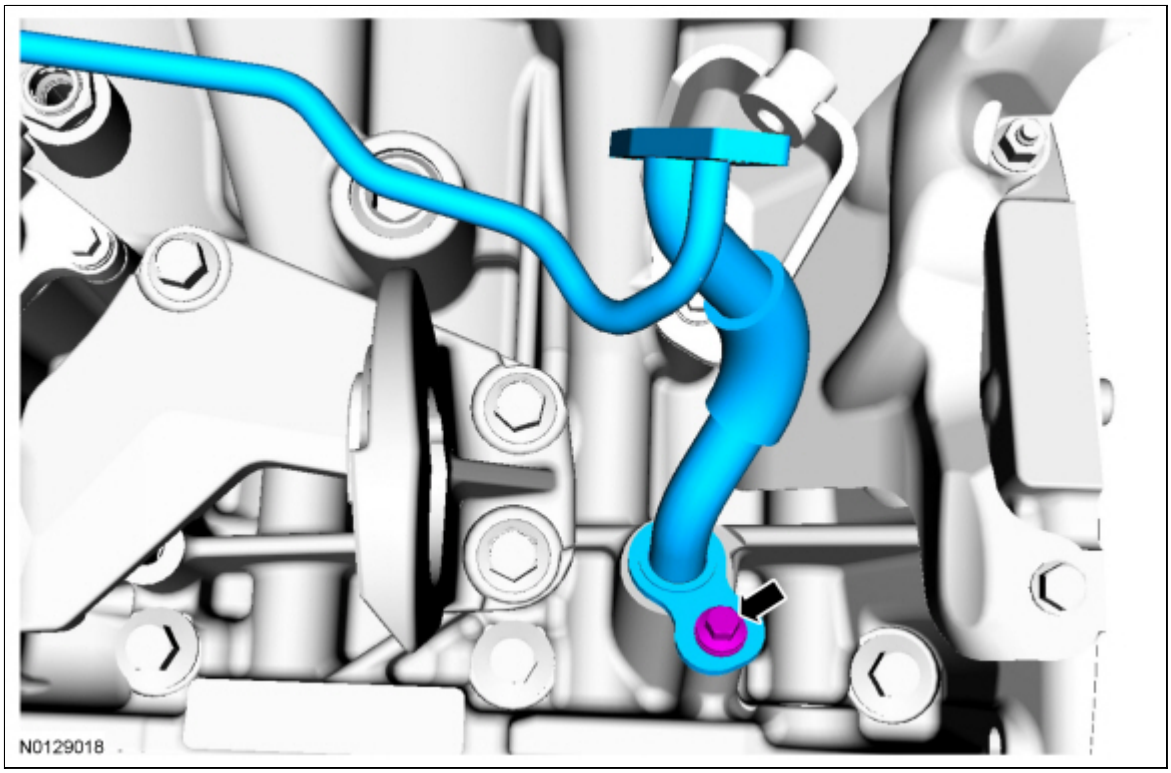


197. **NOTE:** Install the LH turbocharger coolant return tube in the turbocharger prior to installation.

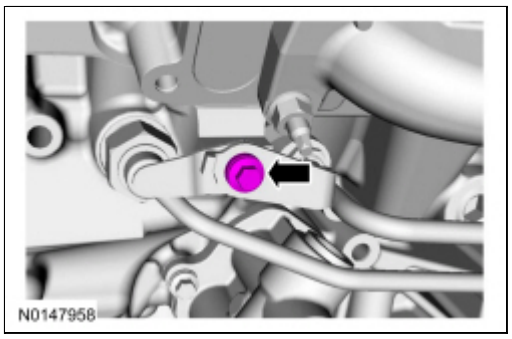
Using a new turbocharger exhaust manifold gasket, install the LH turbocharger and the 3 bolts.
- Tighten finger-tight.



198. Tighten the LH turbocharger mounting bolts.
- Tighten to 32 Nm (24 lb-ft).

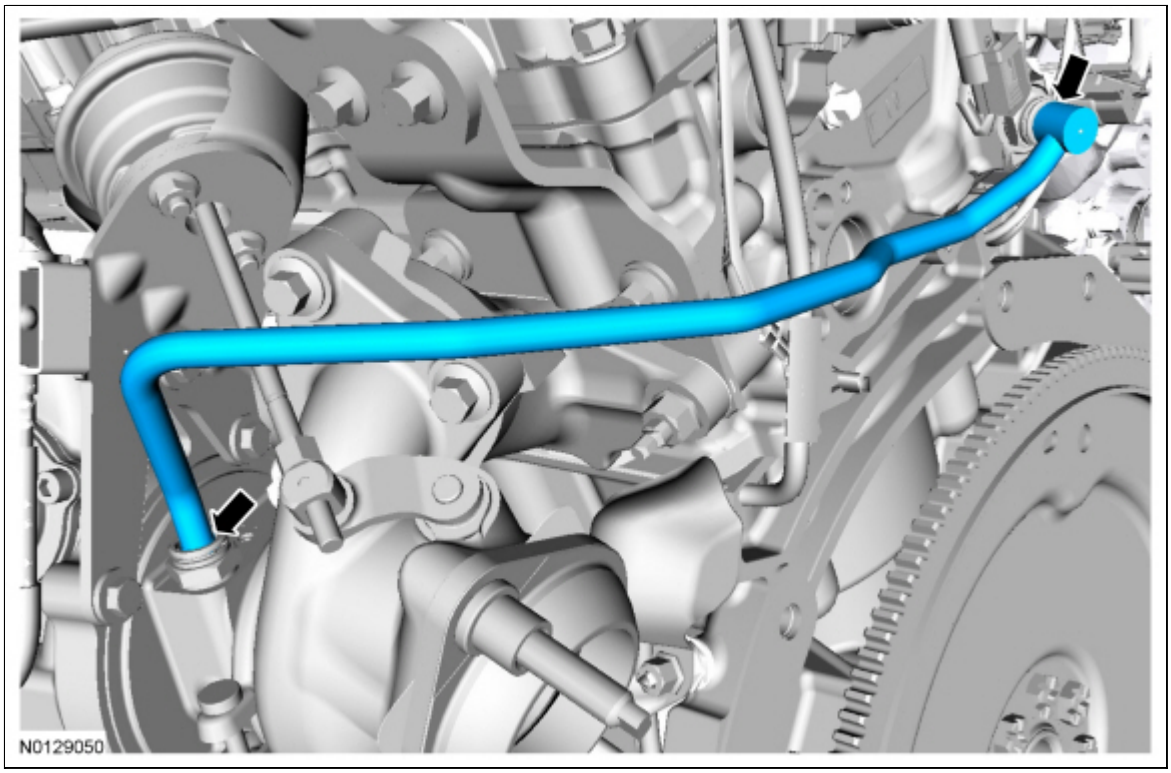


repair4less

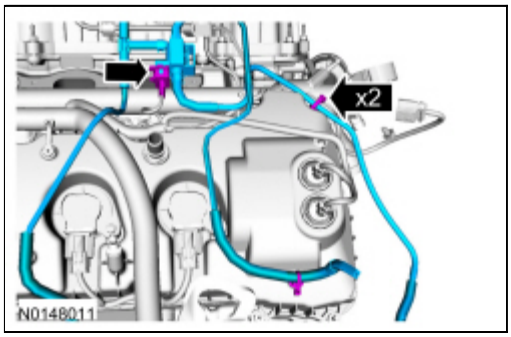


199. Using a new turbocharger oil return tube gasket, install the 2 bolts at the turbocharger. Tighten in the following stages.
    - Stage 1: Install the bolt for the oil pressure tube side halfway.
    - Stage 2: Install the bolt for the oil drain tube side and tighten to 10 Nm (89 lb-in).
    - Stage 3: Tighten the bolt for the oil drain tube side an additional 30 degrees.
    - Stage 4: Tighten the bolt for the oil pressure tube side to 10 Nm (89 lb-in).
    - Stage 5: Tighten the bolt for the oil pressure tube side an additional 30 degrees.

200. Install the LH turbocharger oil return tube bolt at the cylinder block. Tighten in the following stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

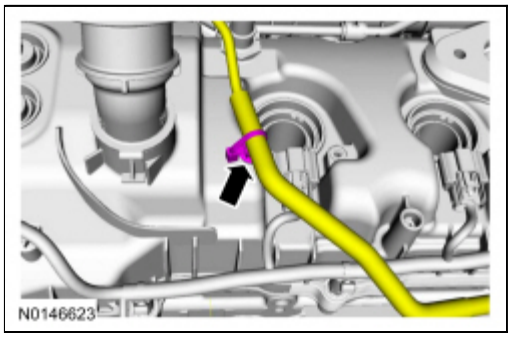


201. Remove the bolt for the LH turbocharger coolant and oil tubes. Tighten in the following stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 30 degrees.

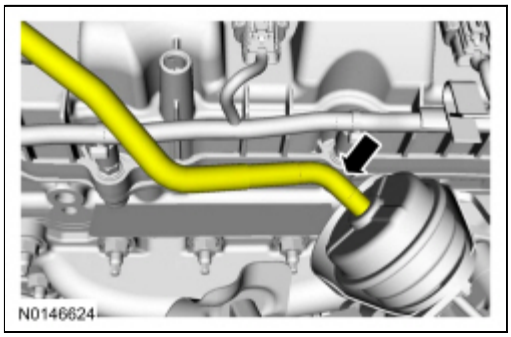


202. Install the LH turbocharger coolant supply tube.

repair4less

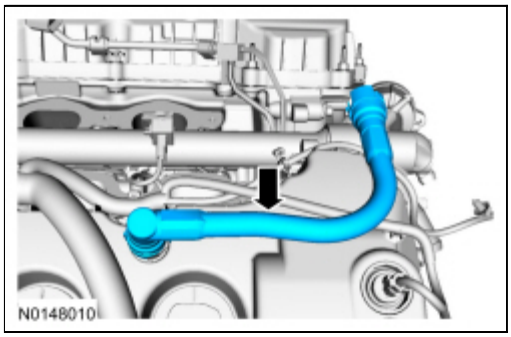


203. Install the wastegate hose assembly and 2 tie straps. Connect the turbocharger pressure regulator electrical connector.

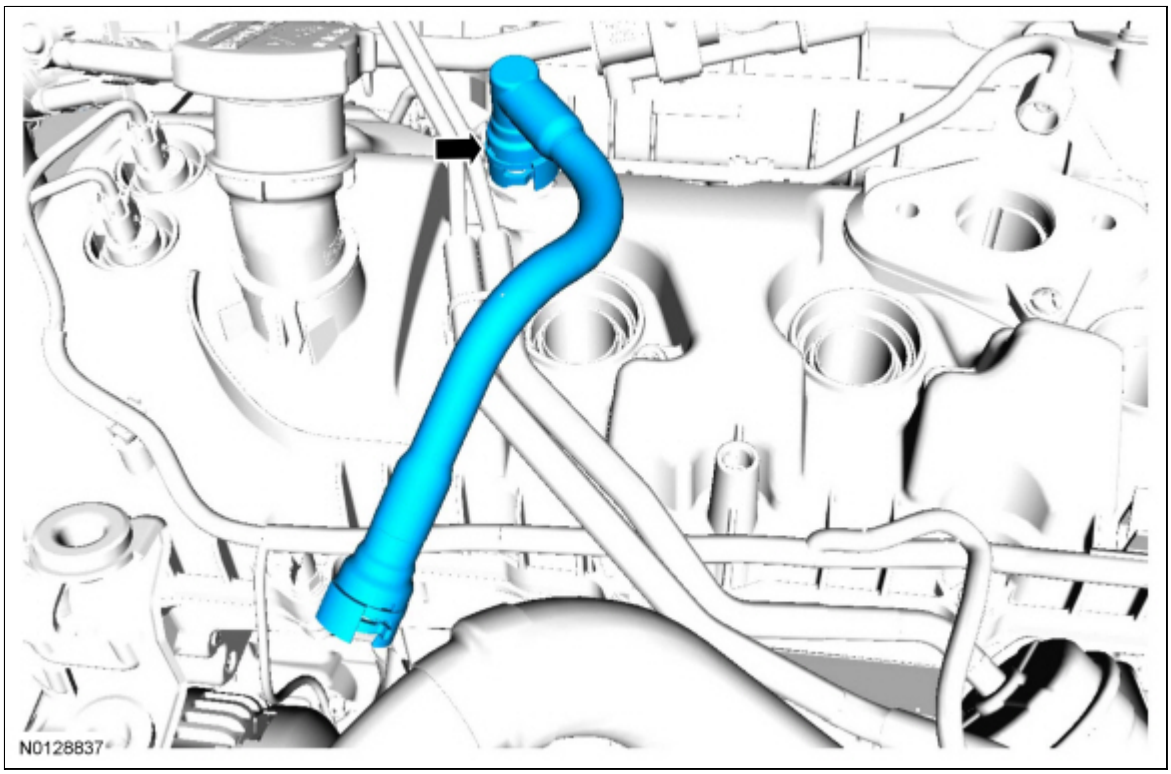


204. **NOTE:** LH shown, RH similar.

Position the wastegate hoses and install the 2 tie straps.

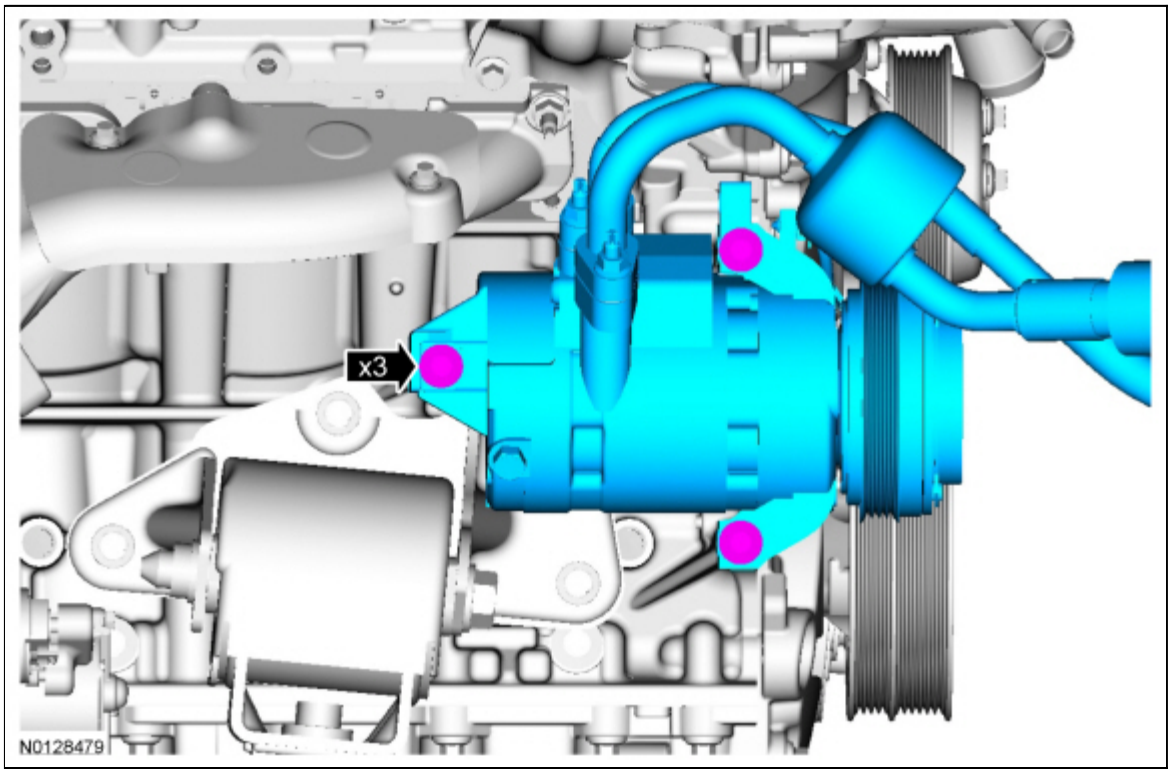


205. **NOTE:** LH shown, RH similar.

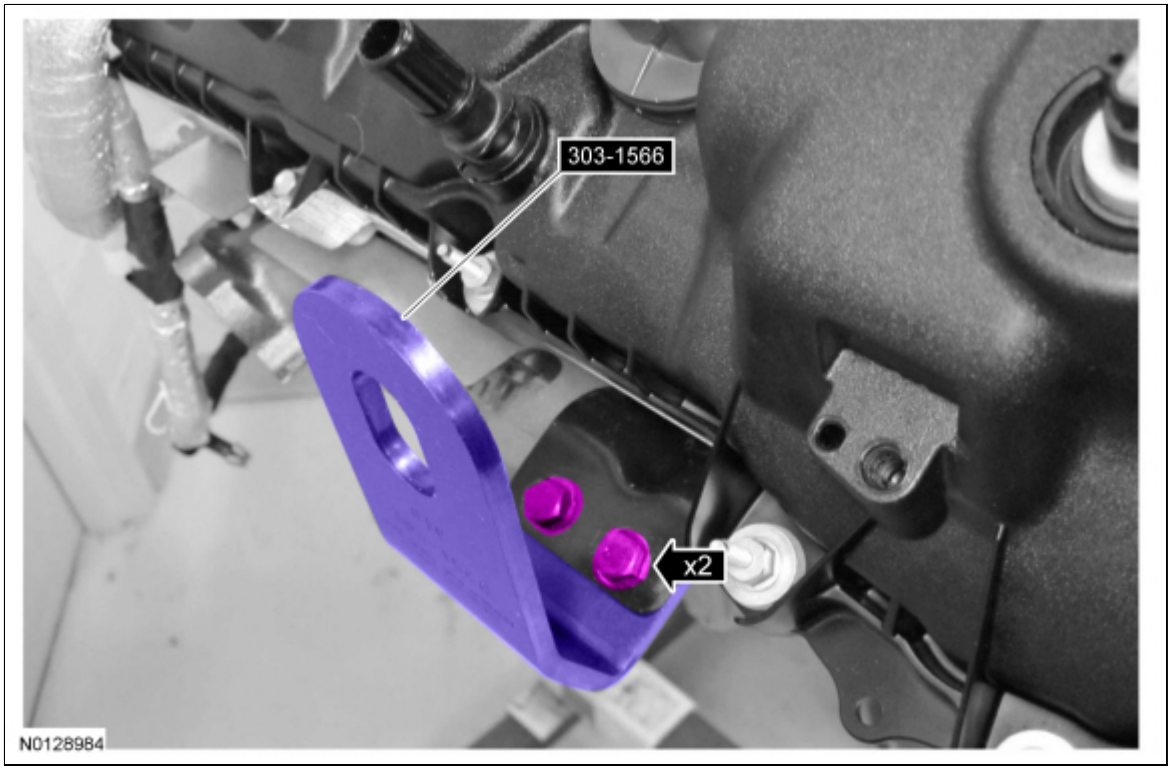


Connect the 2 wastegate hoses at the turbochargers.

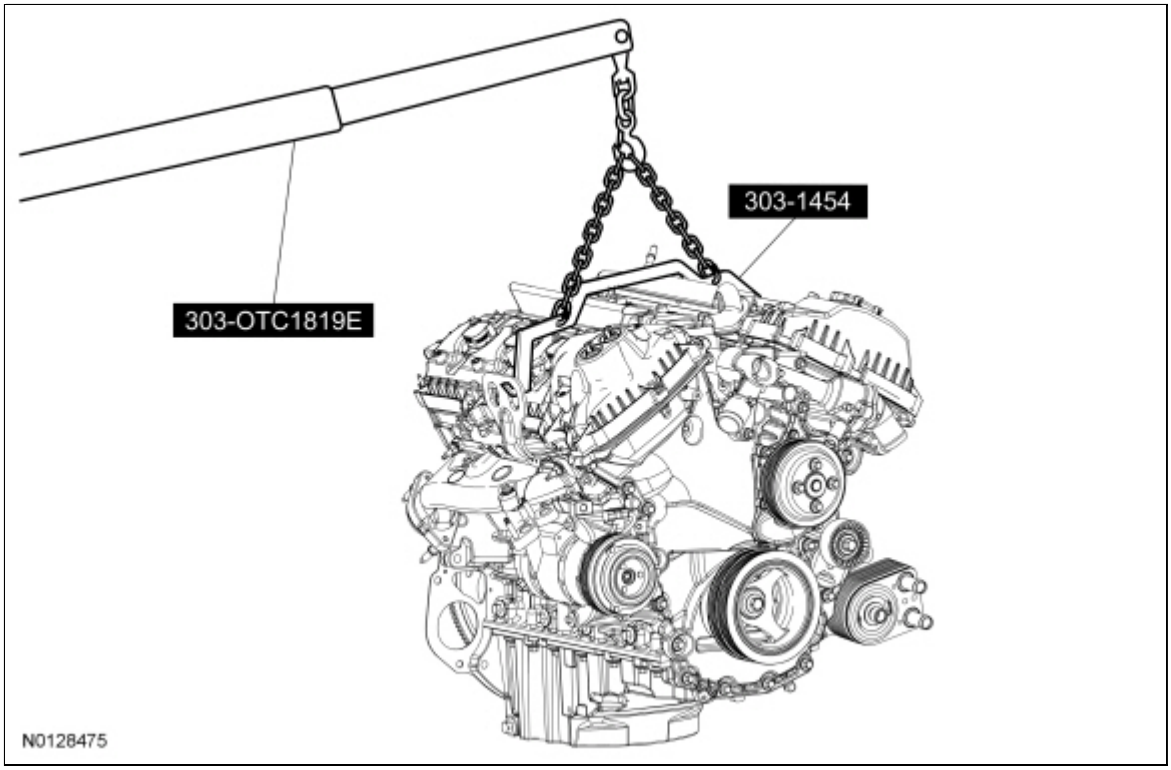
206. Install the RH PCV tube. For additional information, refer to Section 310-00 .



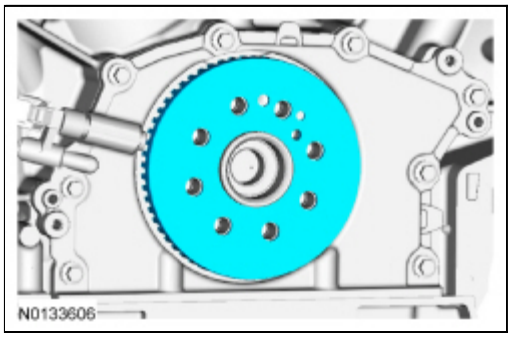
207. Install the LH crankcase vent tube. For additional information, refer to Section 310-00 .



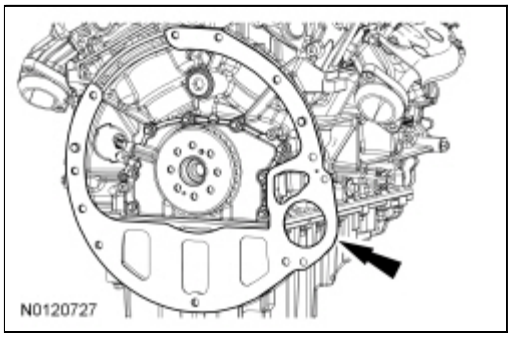
repair4less



208. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

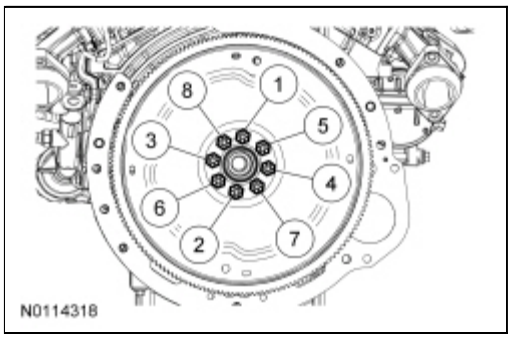


209. Install the Right Front Lifting Eye and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).



210. Using the Floor Crane and Engine Spreader Bar, remove the engine from the stand.

211. Install the crankshaft sensor ring.



212. Install the spacer plate.

213. Install the flexplate and the 8 bolts and tighten is sequence shown.

repair4less

- Tighten to 80 Nm (59 lb-ft).

Engine

Special Tool(s)

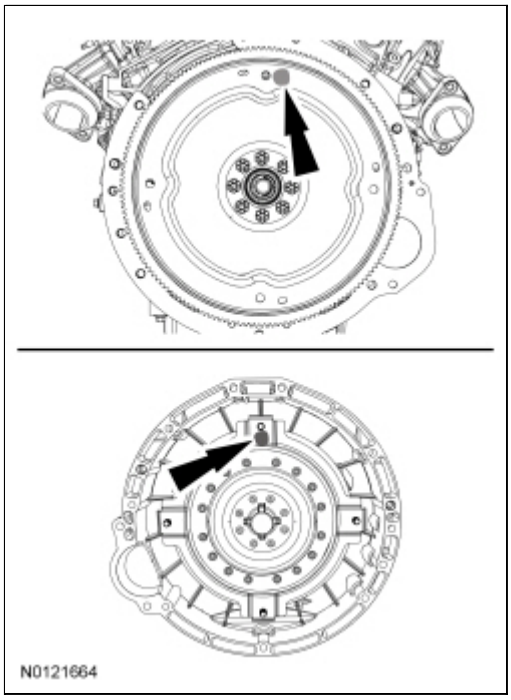
repair4less

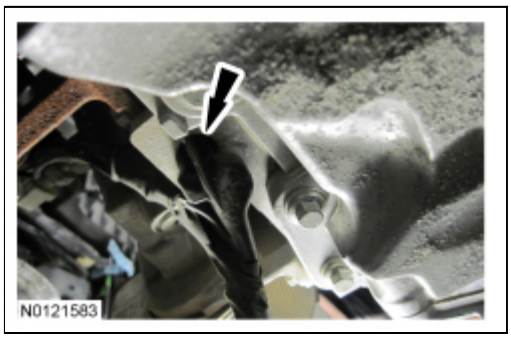


WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

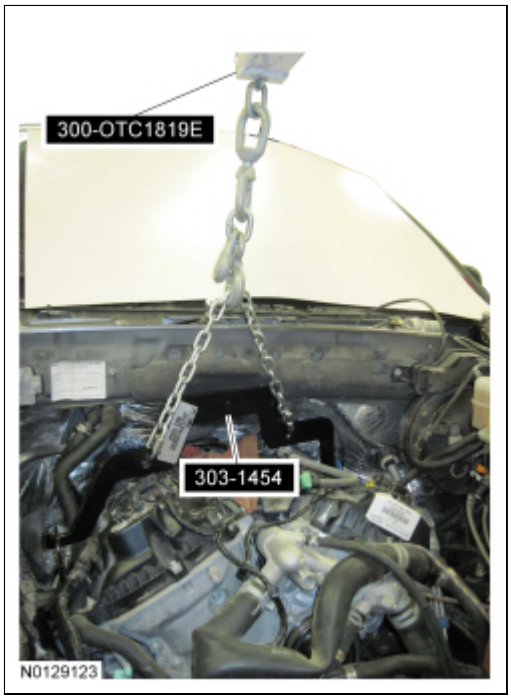
1. ***NOTICE:*** **Prior to installation of the engine, the torque converter pilot hub must be lubricated with multi-purpose grease or damage to the torque converter or the engine crankshaft can occur**

   Lubricate the torque converter pilot hub with multi-purpose grease.

2. Align the torque converter stud and flexplate hole near the paint marks at the 12 o'clock position.

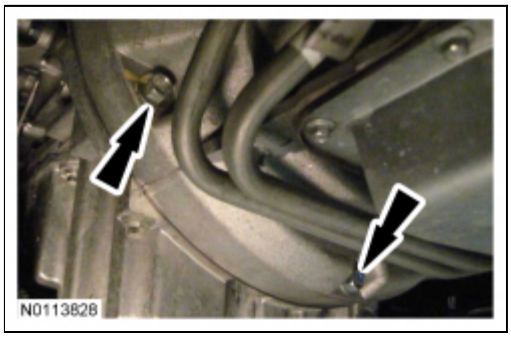


3. Using the Floor Crane and Engine Spreader Bar, position the engine in the engine compartment.

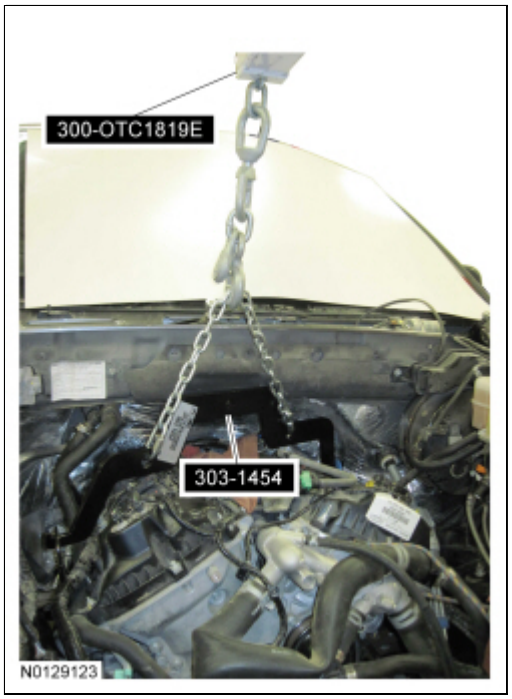


4. **NOTE:** The transmission wiring harness is part of the engine wiring harness.

   Attach the generator wiring harness retainer to the lower LH side of the engine block.
   - Position the transmission wiring harness along the side of the transmission for installation.

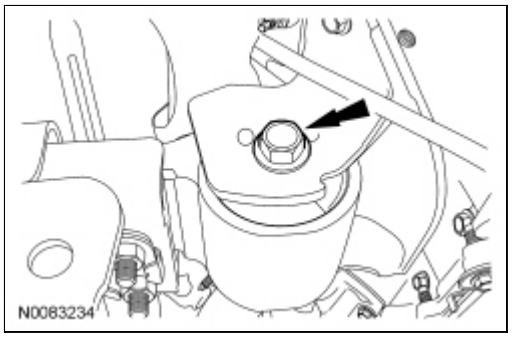


5. Using the Floor Crane and Engine Spreader Bar, position the engine to the transmission.



repair4less

6. Align the engine to the transmission and install the 2 LH bellhousing-to-oil pan bolts.
    - Tighten to 48 Nm (35 lb-ft).

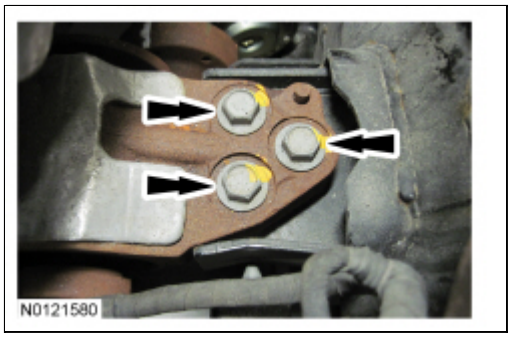


7. Using the Floor Crane and Engine Spreader Bar, raise the engine for clearance for the LH engine support insulator.

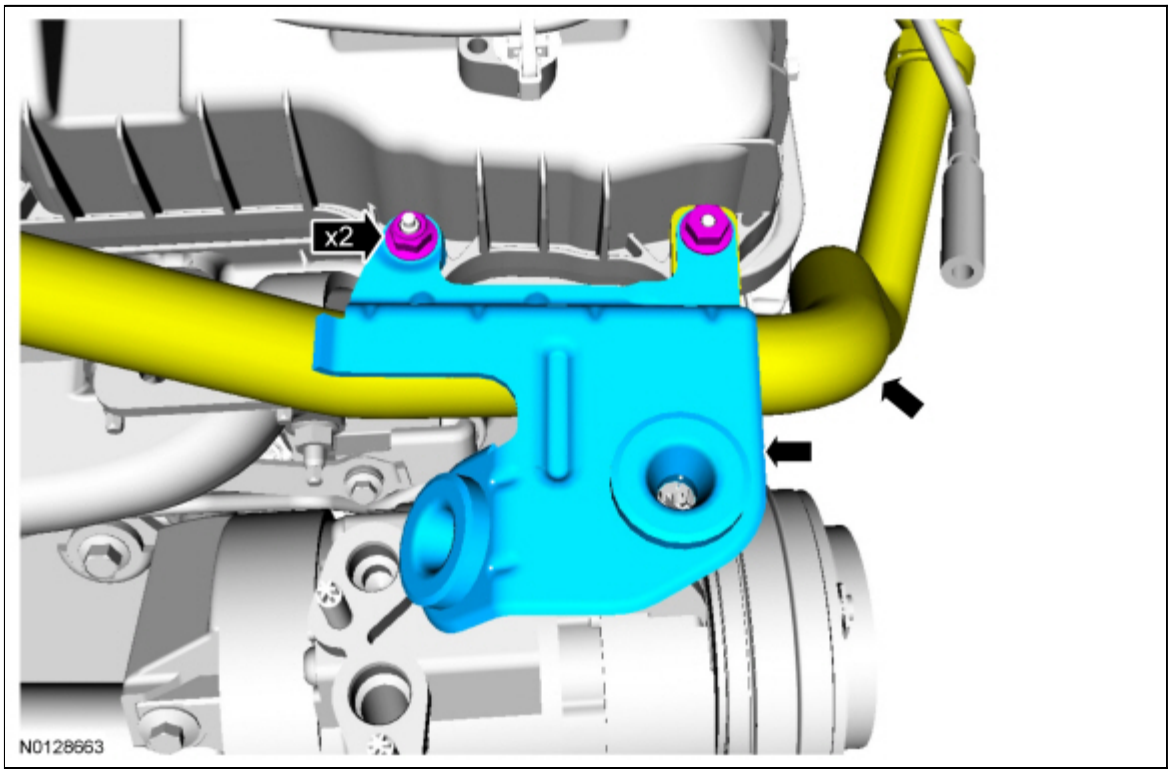
8. ***NOTICE:*** **Only use hand tools when loosening or tightening the LH engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

   NOTE: Clean the LH and RH engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

   Install the LH engine support insulator and the new through bolt.
   - Do not torque at this time.



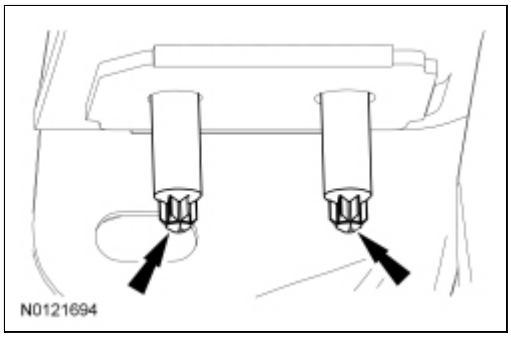
9. Lower the engine.



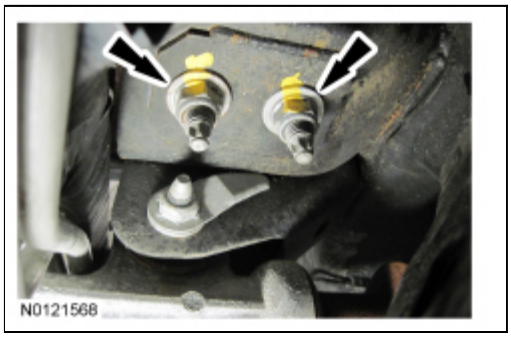
10. ***NOTICE:*** **Use only hand tools when removing or installing the engine support insulator-to-frame bolts or the damge to the engine support insulator-to-frame nut plate can occur.**

    Install the 3 new LH engine support insulator bolts.
    - Tighten to 175 Nm (129 lb-ft).

repair4less

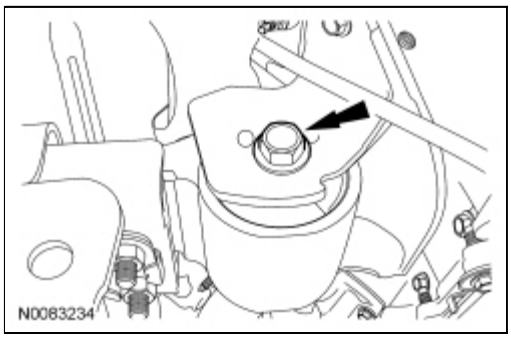


11. Position back the coolant hose to the valve cover stud. Install the Charge Air Cooler (CAC) bracket and 2 nuts.
    - Tighten to 6 Nm (53 lb-in).



12. ***NOTICE:*** **Use only hand tools when installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    Install the 2 new RH engine support insulator studs.
    - Tighten to 30 Nm (22 lb-ft).

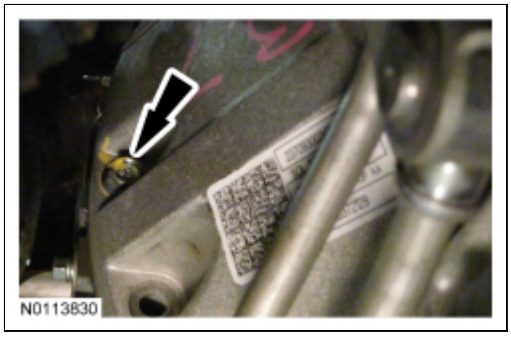


13. ***NOTICE:*** **Use only hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

    Install the 2 new RH engine support insulator nuts.
    - Tighten to 175 Nm (129 lb-ft).

14. ***NOTICE:*** **Only use hand tools when loosening or tightening the LH engine support insulator through bolt or damage to the engine support insulator-to-cylinder block bracket can occur.**

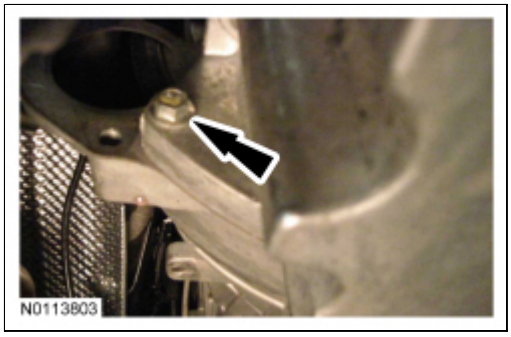
    Tighten the LH engine mount through bolt.
    - Tighten to 350 Nm (258 lb-ft).



15. **NOTE:** Do not lubricate the engine oil filter gasket.

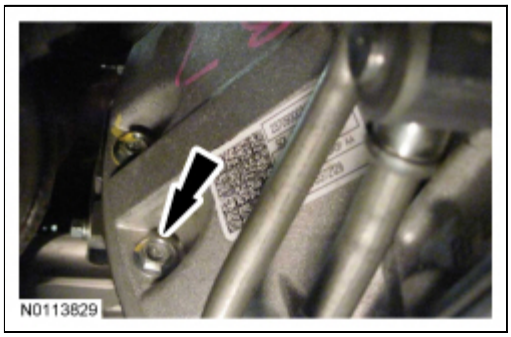
    Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

16. Install the LH bellhousing-to-engine bolt.
    - Tighten the bolt, it will be torqued at a later step.

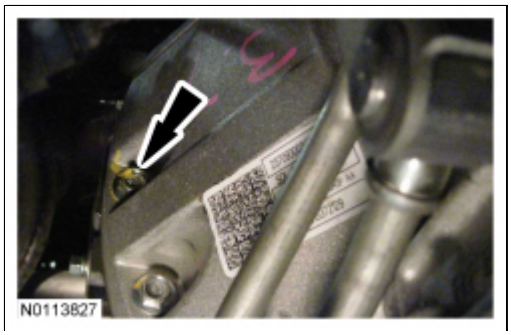


repair4less

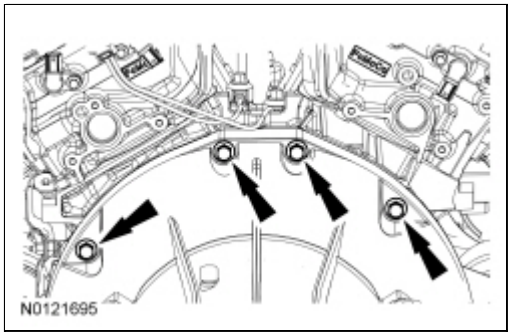
17. Install the engine-to-bellhousing bolt.
    - Tighten the bolt, it will be torqued at a later step.



18. Install the oil pan-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).

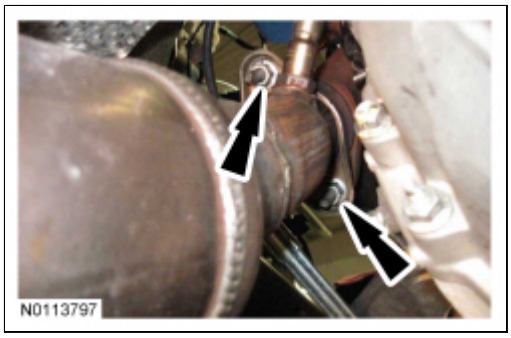


19. Tighten the engine-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).

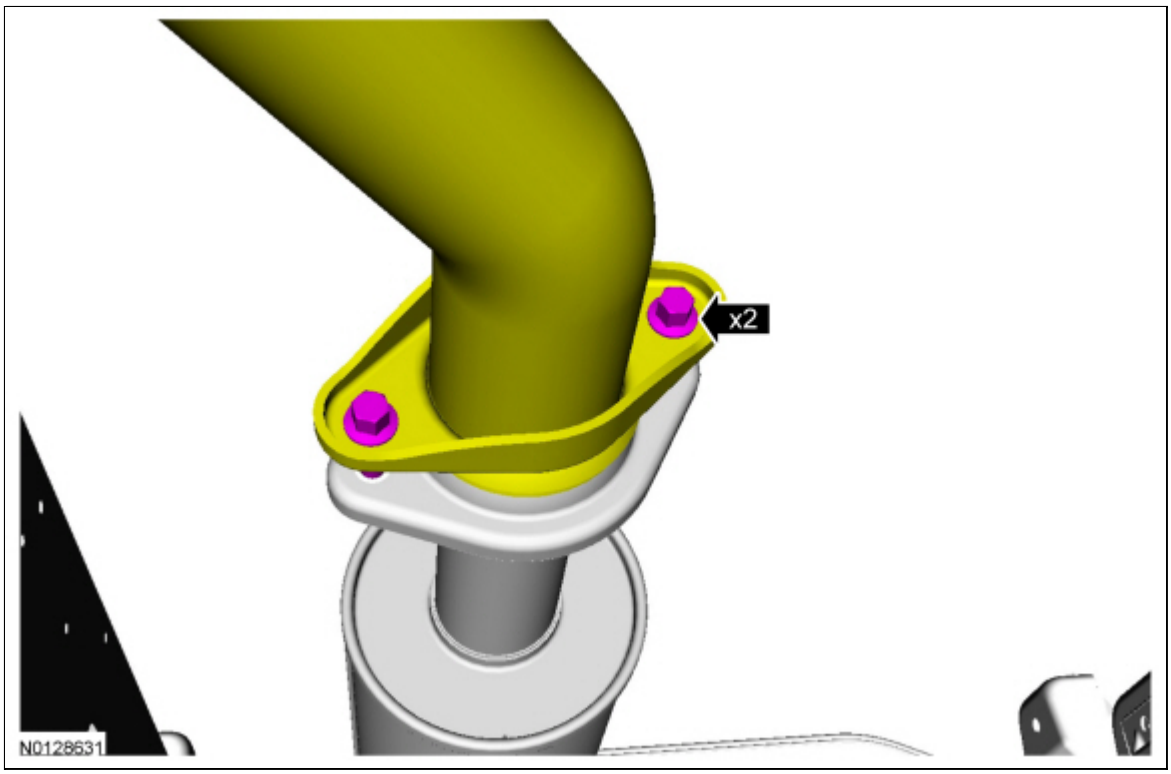


20. Install the LH bellhousing-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

21. Tighten the LH bellhousing-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

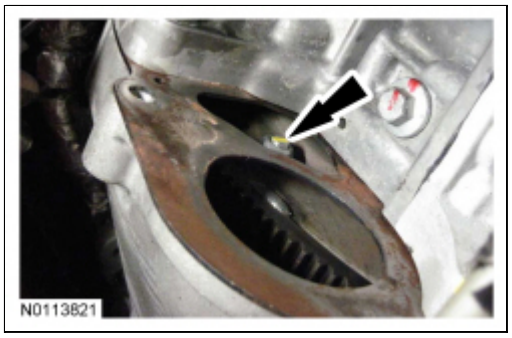


22. Install the 4 upper bellhousing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

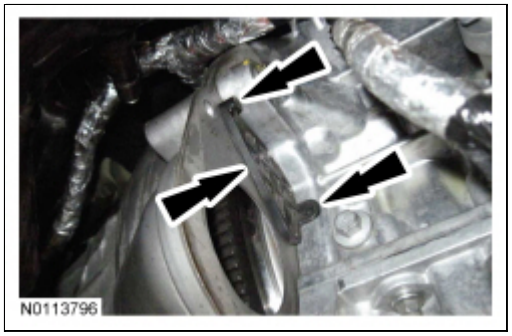


23. **NOTE:** LH shown, RH similar.

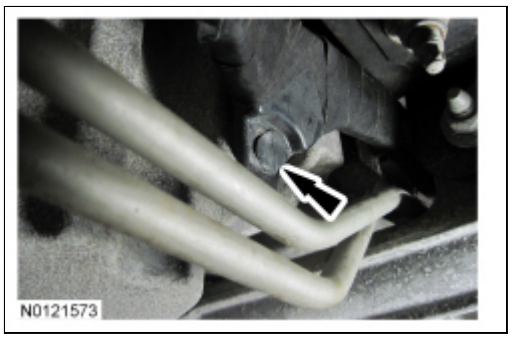
    Install the new 2 LH and RH catalytic converter-to-exhaust manifold nuts.
    - Tighten to 45 Nm (35 lb-ft).



repair4less



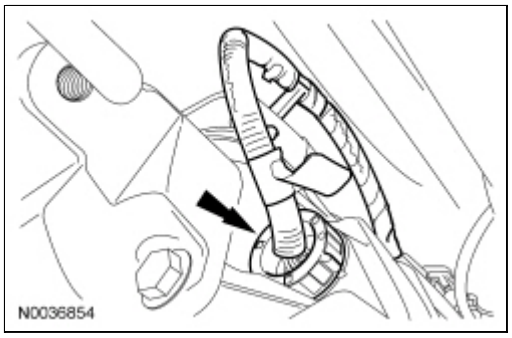
24. Position the exhaust Y-pipe dual catalytic converter-to-intermediate pipe and install the 2 bolts.
    - Tighten the inner exhaust Y-pipe catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



25. Install the 4 torque converter nuts.
    - Tighten to 44 Nm (32 lb-ft).

26. Install the access cover and the 2 pin-type retainers.

27. Attach the starter motor wiring harness retainer to the oil pan.



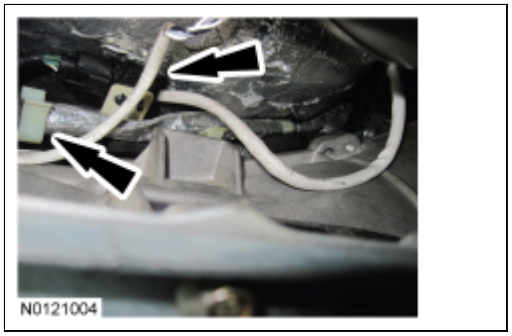
28. Install the starter motor. For additional information, refer to Section 303-06 .

29. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .

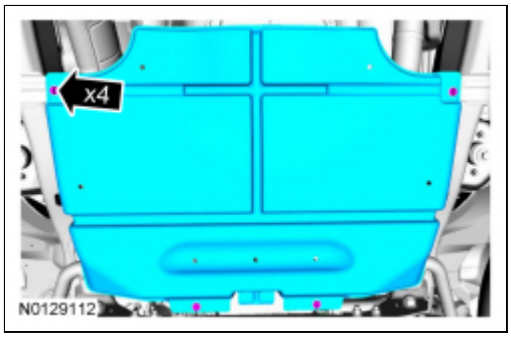
30. Install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

31. Connect the transmission vehicle harness connector by pushing the connector into the transmission and twisting the outer shell.

repair4less

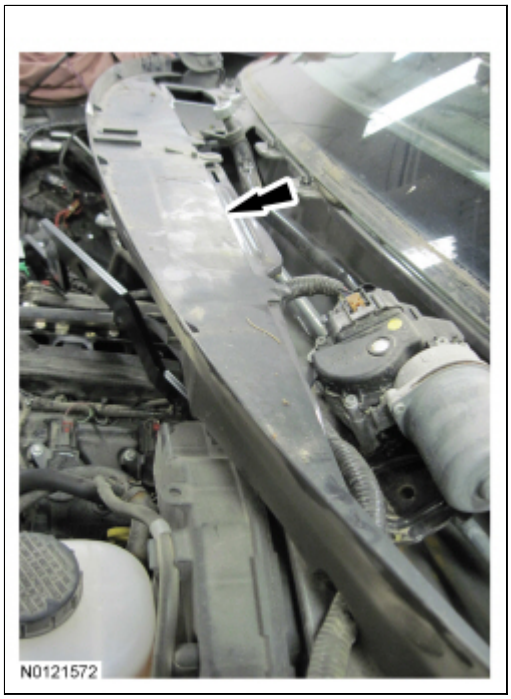


32. Connect the electrical connector retainer to the bracket at the rear of the transmission.
    - Connect the Heated Oxygen Sensor (HO2S) electrical connector.



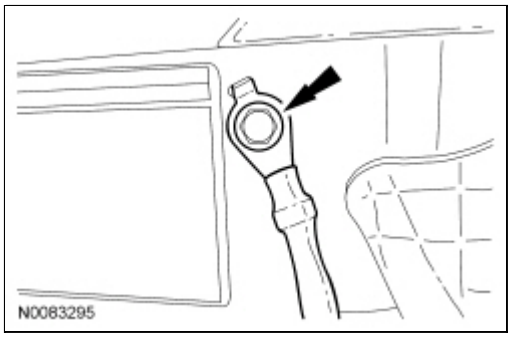
33. **NOTE:** Only one wire harness retainer and one electrical connector shown, others similar.

    If equipped, connect the 5 transmission wire harness retainers to the transfer case wire harness.
    - Connect the 2 HO2S electrical connector retainers.
    - Connect the 2 HO2S electrical connectors.

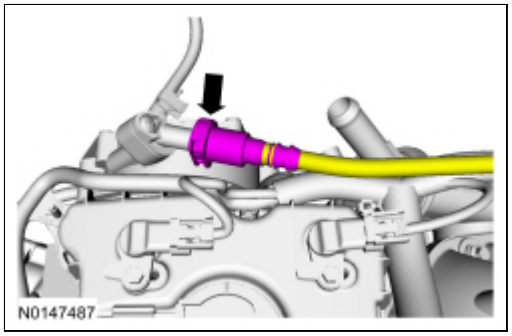


34. Install the splash shield and the 4 retainers.

35. Connect the HO2S electrical connector to the wiring harness retainer.
    - Connect the HO2S electrical connector to the engine wiring harness at the rear of the LH cylinder head.

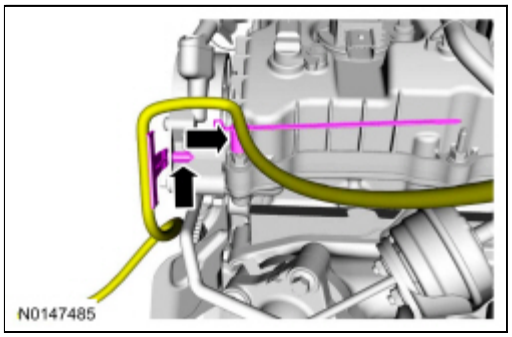


36. Install the cowl panel and attach the 2 clips and install the 6 screws.

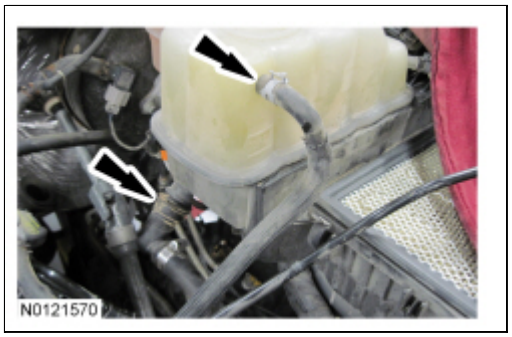


37. Install the cowl panel grille. For additional information, refer to Section 501-02 .

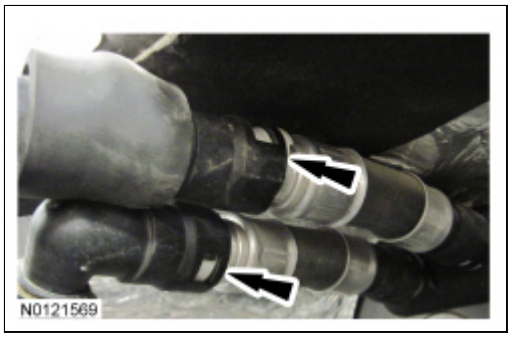
38. Install the ground strap and bolt to the cowl.
    - Tighten to 10 Nm (89 lb-in).



repair4less

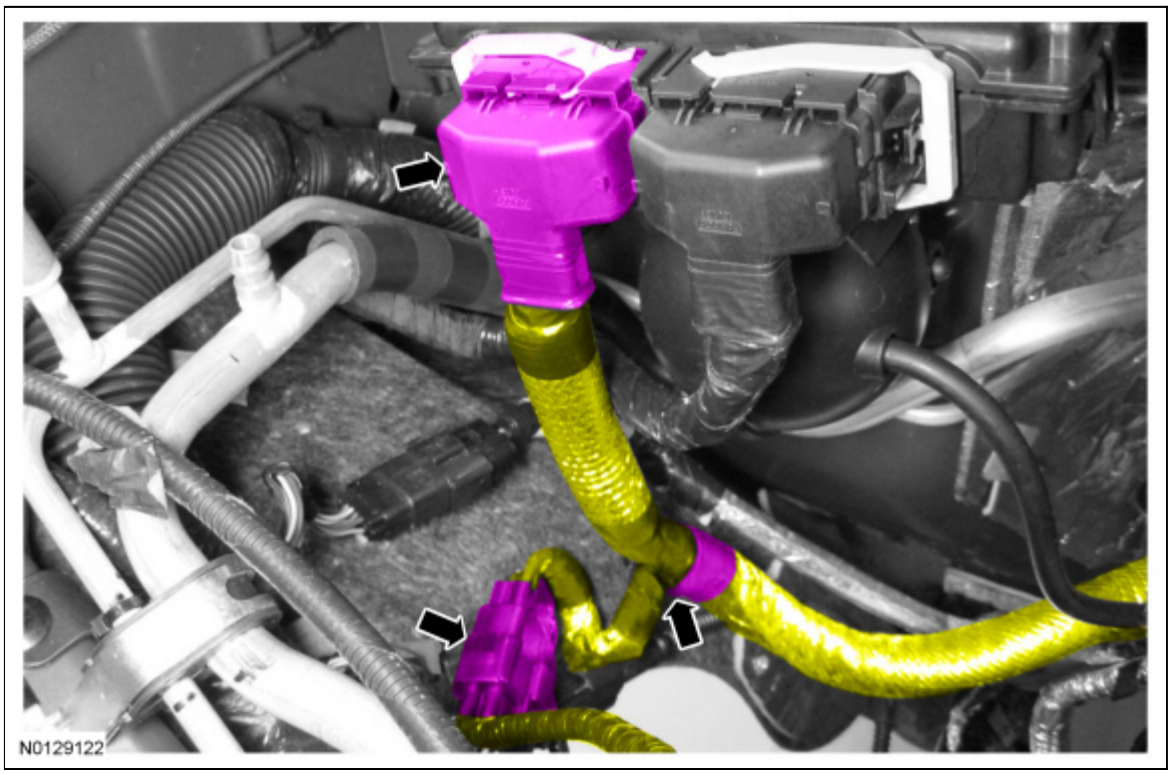


39. Connect the vacuum pump tube.



40. Attach the wiring harness retainers to the rear of the RH valve cover stud bolt and the rear of the vacuum pump.

41. Connect the 2 coolant hoses to the degas bottle.

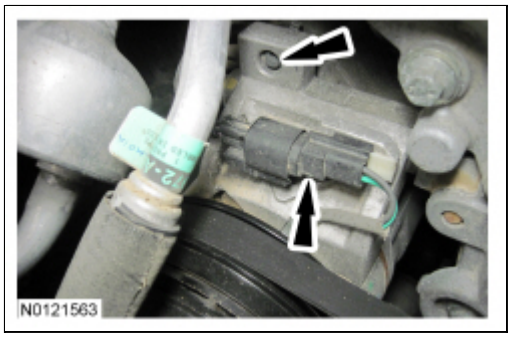


42. Connect the 2 heater hose couplings at the RH rear of the engine.

43. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

44. Install the fuel injection pump. For additional information, refer to Section 303-04A .

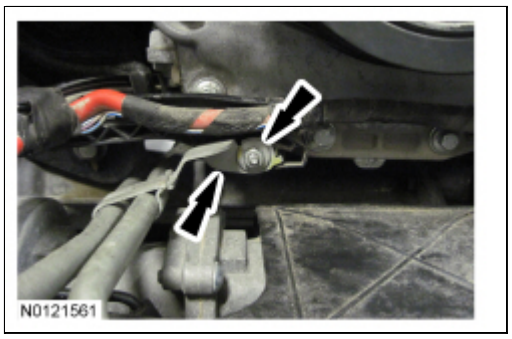
45. Connect the PCM electrical connector and the engine harness electrical connector.
    - Attach the wiring harness retainers to the fender splash shield.



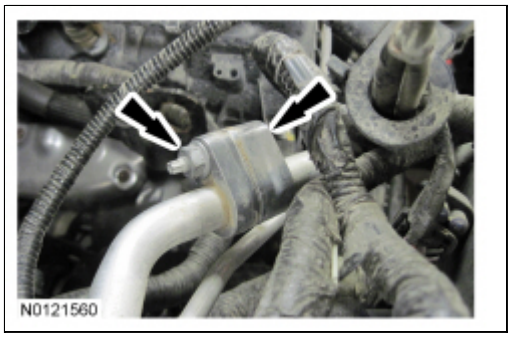
46. Install the A/C compressor belt. For additional information, refer to Section 303-05 .

47. Install the generator. For additional information, refer to Section 414-00 .

48. Connect the A/C compressor electrical connector.
    - Attach the A/C compressor wiring harness to the A/C compressor.

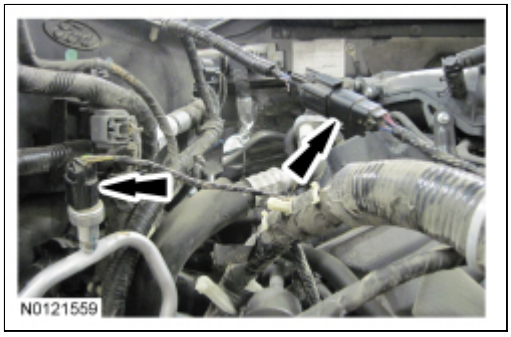


repair4less



49. Attach the generator wiring harness to the engine front cover.

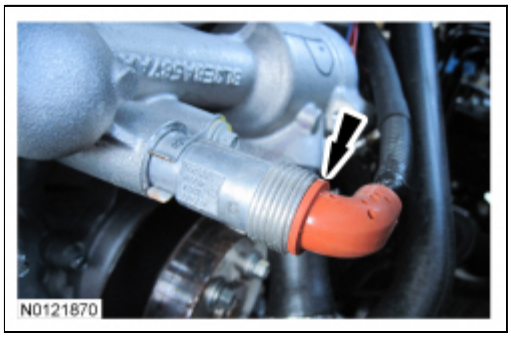
50. Install the transmission cooler line bracket and nut to the engine front cover stud bolt.
    - Tighten to 12 Nm (106 lb-in).



51. Using a new O-ring seal and gasket seal, install the A/C tube and the nut.
    - Tighten to 15 Nm (133 lb-in).

52. Connect the Battery Junction Box (BJB) wiring harness and the A/C pressure transducer electrical

connectors.



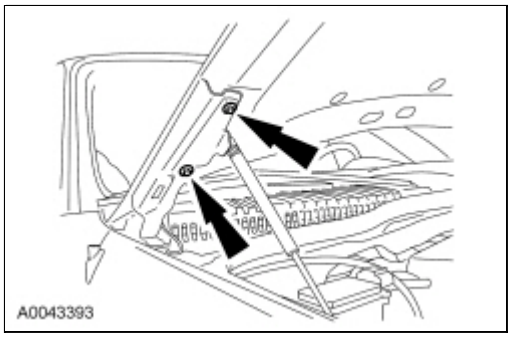
53. Fill the engine with clean engine oil.

54. Install the 2 Charge Air Cooler (CAC) inlet tubes and the CAC outlet tube. For additional information, refer to 3.5L Gasoline Turbocharged Direct Injection (GTDI) Charge Air Cooler (CAC) and Tubes Exploded View in Section 303-12 .

55. Install the LH and RH turbocharger intake tubes. For additional information, refer to 3.5L Gasoline Turbocharged Direct Injection (GTDI) Charge Air Cooler (CAC) and Tubes Exploded View in Section 303-12 .

56. Install the cooling module. For additional information, refer Section 303-03 .

57. If equipped, connect the block heater electrical connector at the thermostat housing.
    - Attach the block heater wiring harness retainer to the LH valve cover stud bolt.

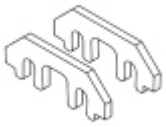


58. Connect the battery ground cable. For additional information, refer to Section 414-01 .

59. **NOTE:** Align the index marks made during hood removal.

    NOTE: RH shown, LH similar.

    Position the hood and install the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).



repair4less

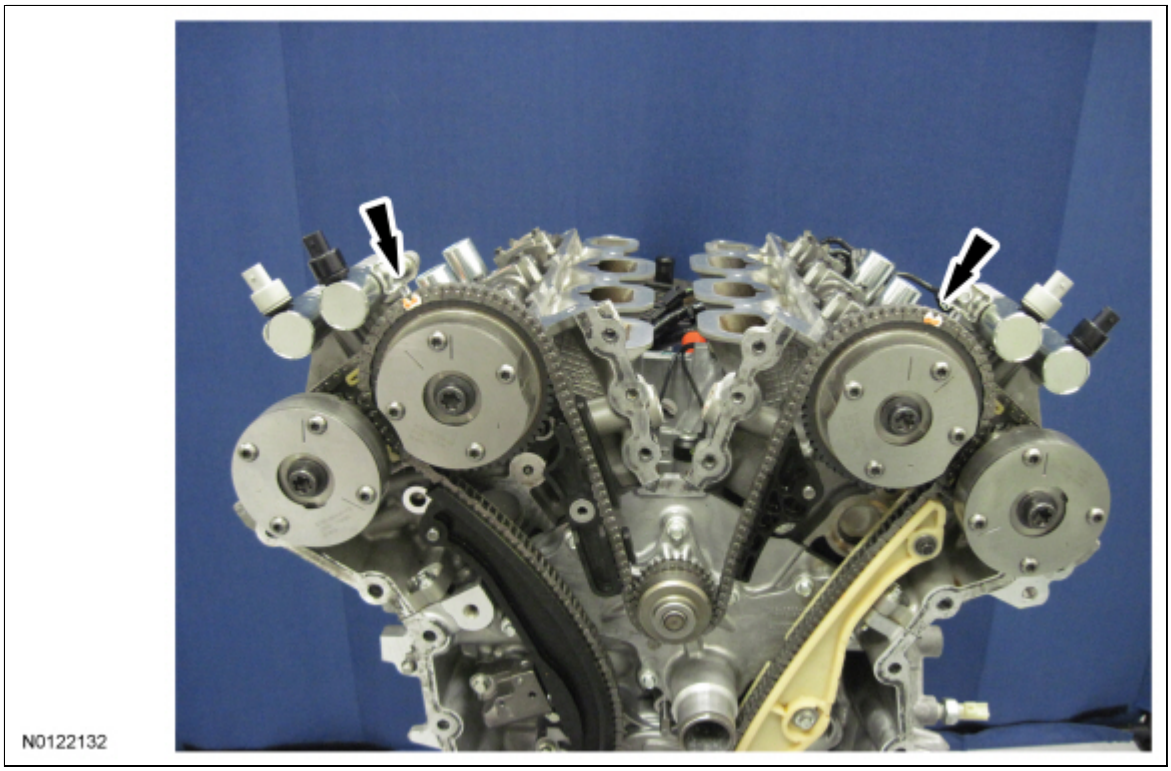
60. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Camshaft — LH

Special Tool(s)

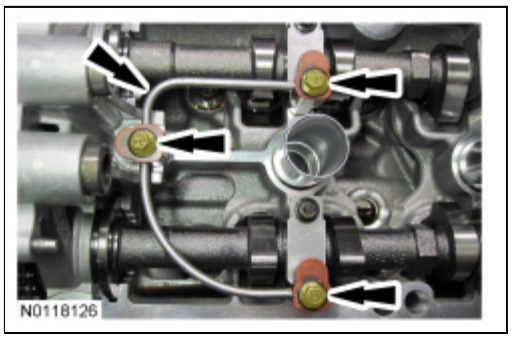
 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248

Material



Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A

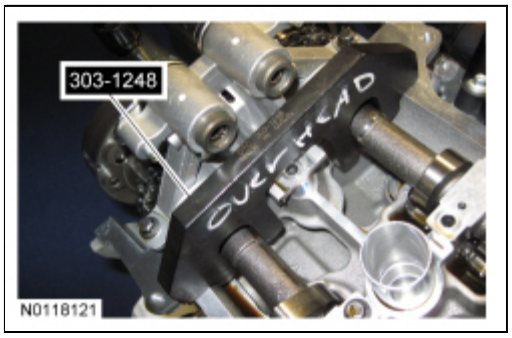
Removal



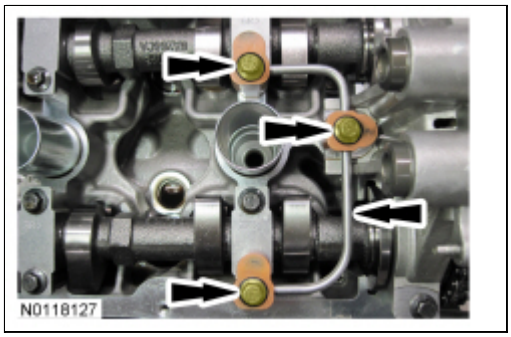
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

repair4less

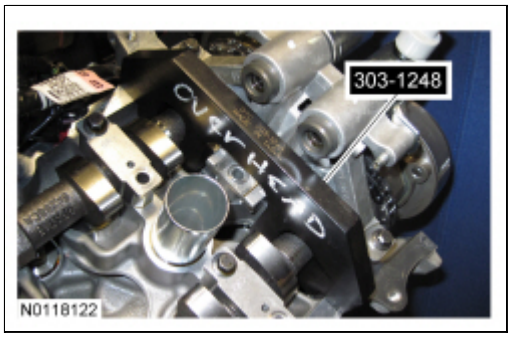


3. Remove the 3 bolts and the LH valve train oil tube.

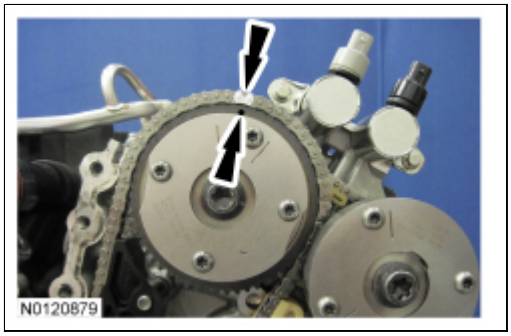


4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.

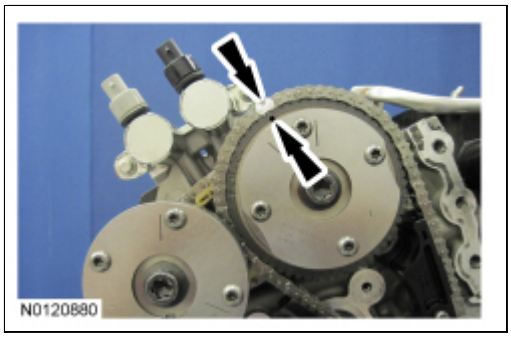


5. Remove the 3 bolts and the RH valve train oil tube.



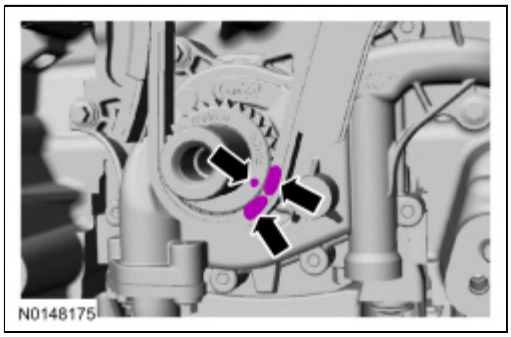
6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

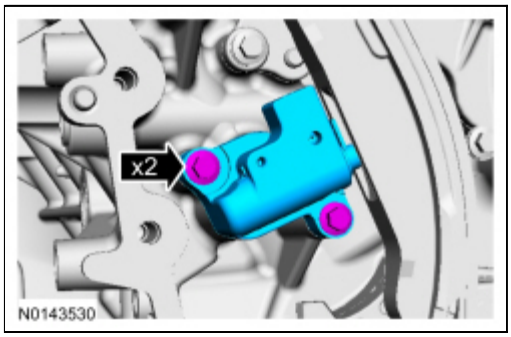


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



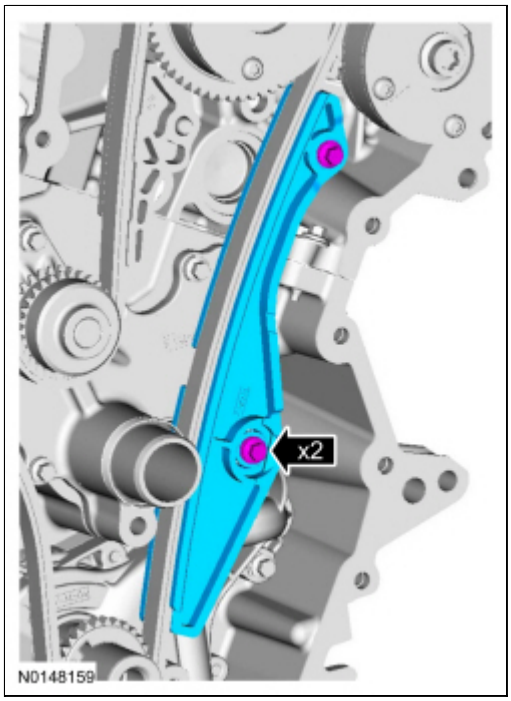
8. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



repair4less

9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

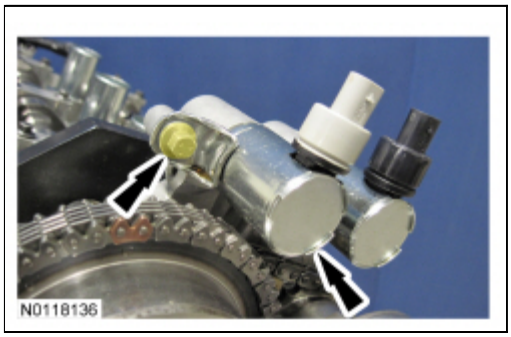
   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



10. Remove the 2 bolts and the primary timing chain tensioner.

11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.

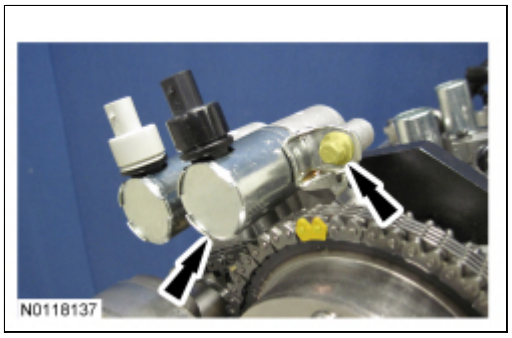


13. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.



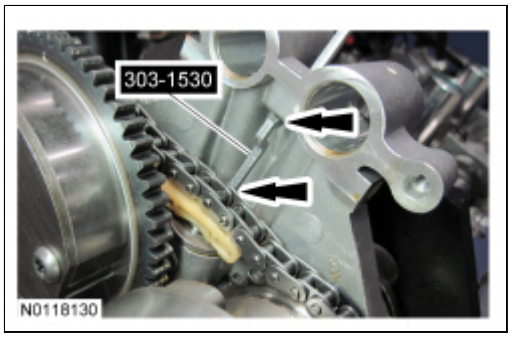
14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

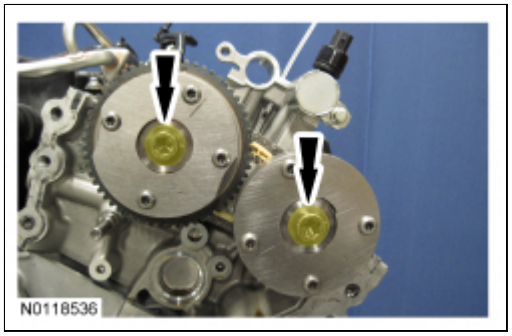
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

repair4less



15. Remove the primary timing chain.

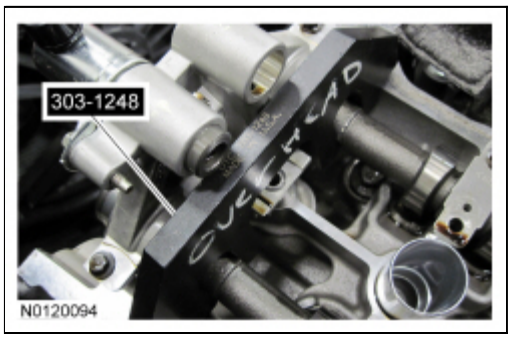


16. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

17. Remove and discard the 2 LH VCT assembly bolts.

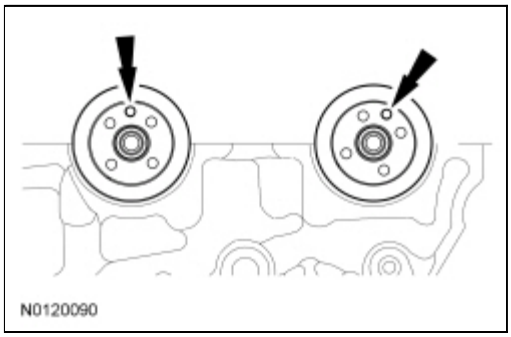


18. Remove the 2 LH VCT assemblies and secondary timing chain.

19. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the LH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the LH camshafts.

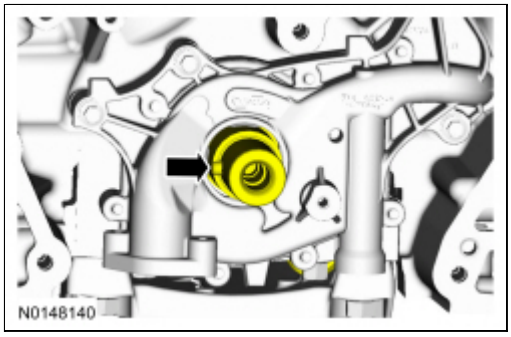
20. Remove the 12 camshaft cap bolts, the 6 camshaft caps, and the mega cap.



repair4less

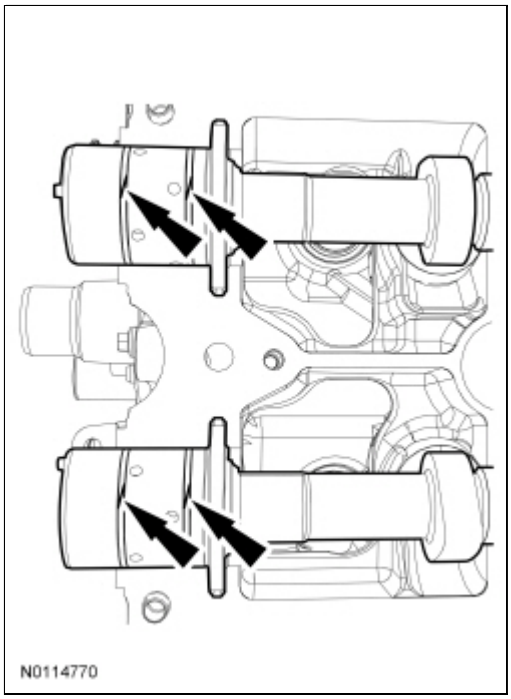
- Remove the LH camshafts.

Installation



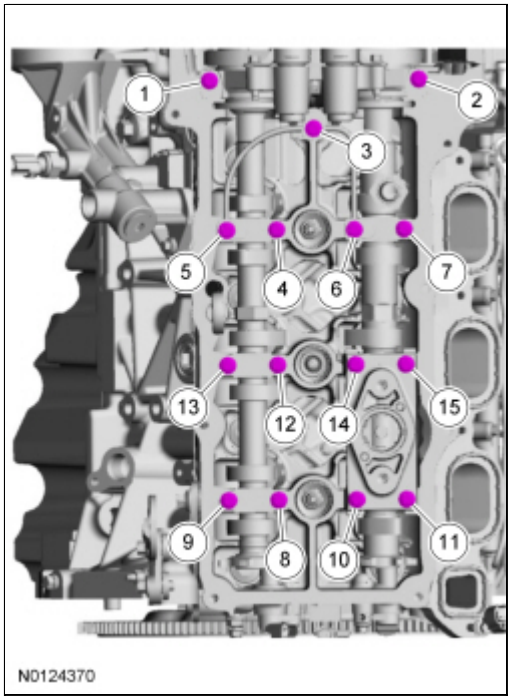
1. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

   Position the camshafts onto the LH cylinder head in the neutral position as shown.



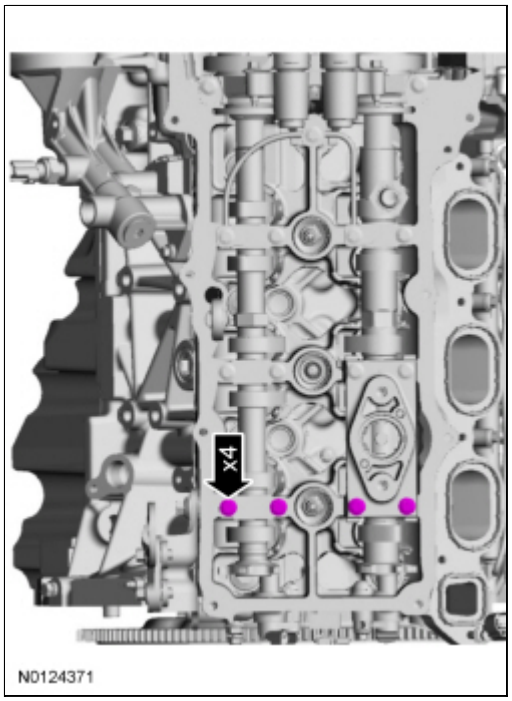
2. ***NOTICE:*** **The crankshaft must remain in the free wheeling position (crankshaft dowel pin at 9 o'clock) until the camshafts are installed and the valve clearance is checked/ adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

   Rotate the crankshaft couterclockwise until the crankshaft dowel pin is in the 9 o'clock position.



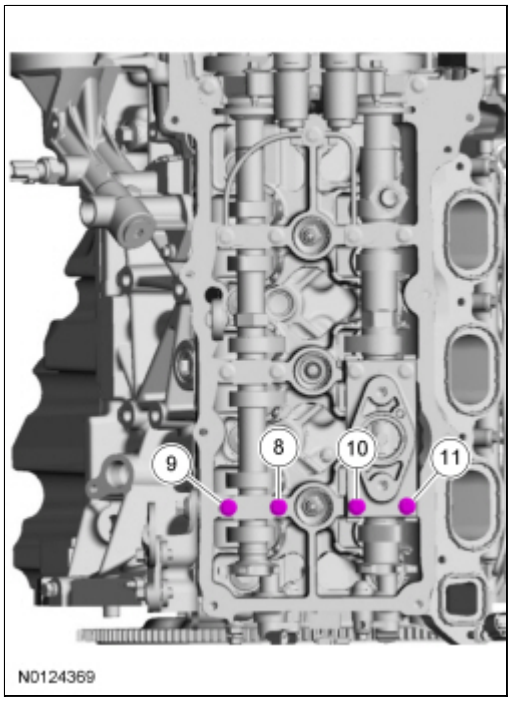
3. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

   Position the 4 camshaft seals gaps as shown.



4. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

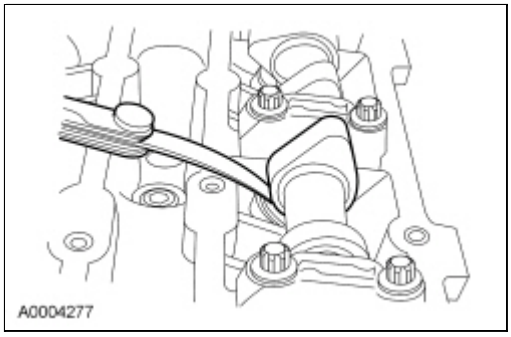
   Install the 5 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in) then additional 45 degrees.



5. Loosen the 4 camshaft caps bolts.

repair4less

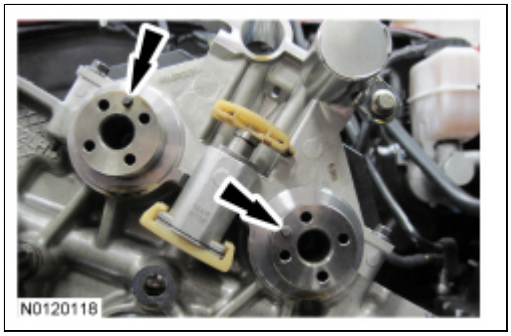
6. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then additional 45 degrees.



7. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

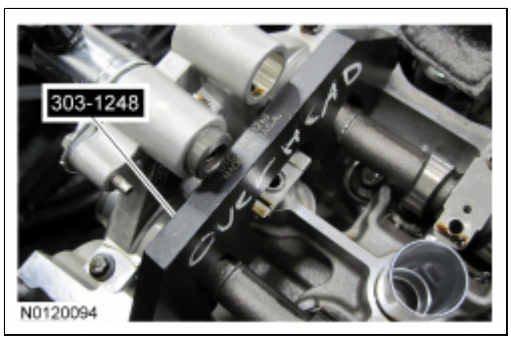
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet

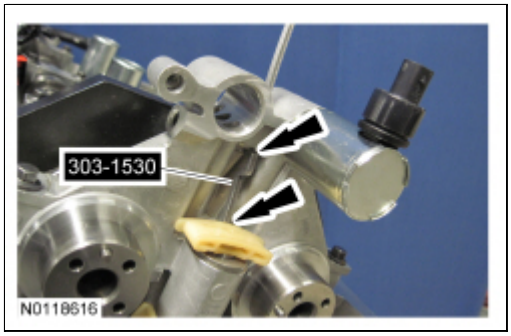


(s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

8. Remove the 3 bolts and the LH valve train oil tube.

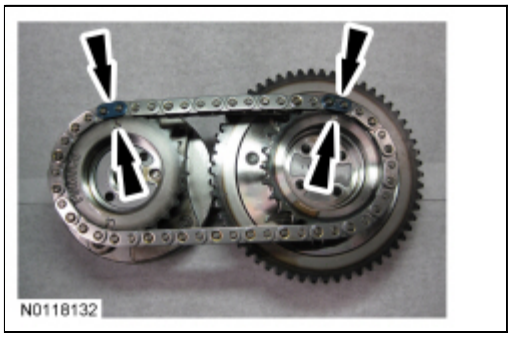


9. Rotate the LH camshafts to the TDC position as shown.



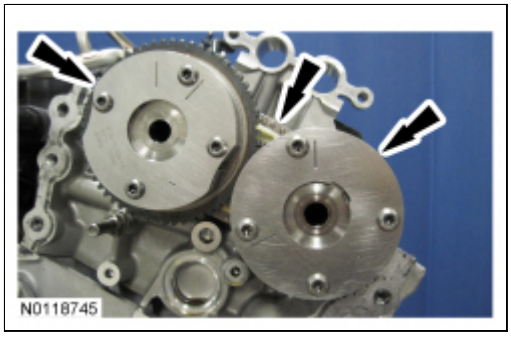
10. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the LH camshafts.

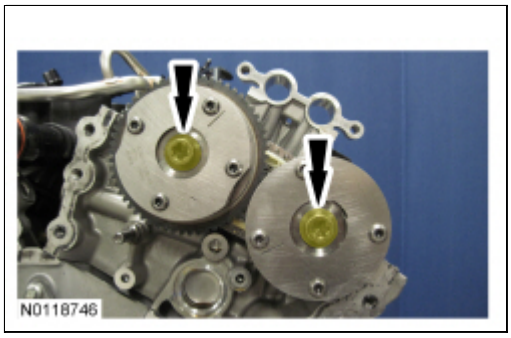


repair4less

11. Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

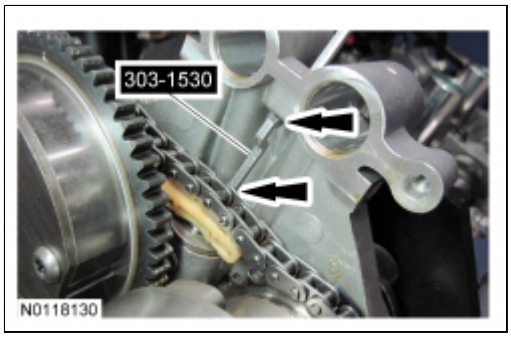


12. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.

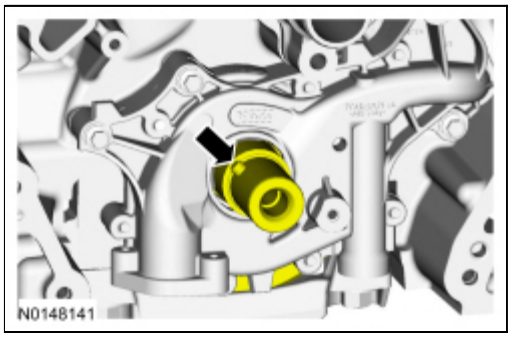


13. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

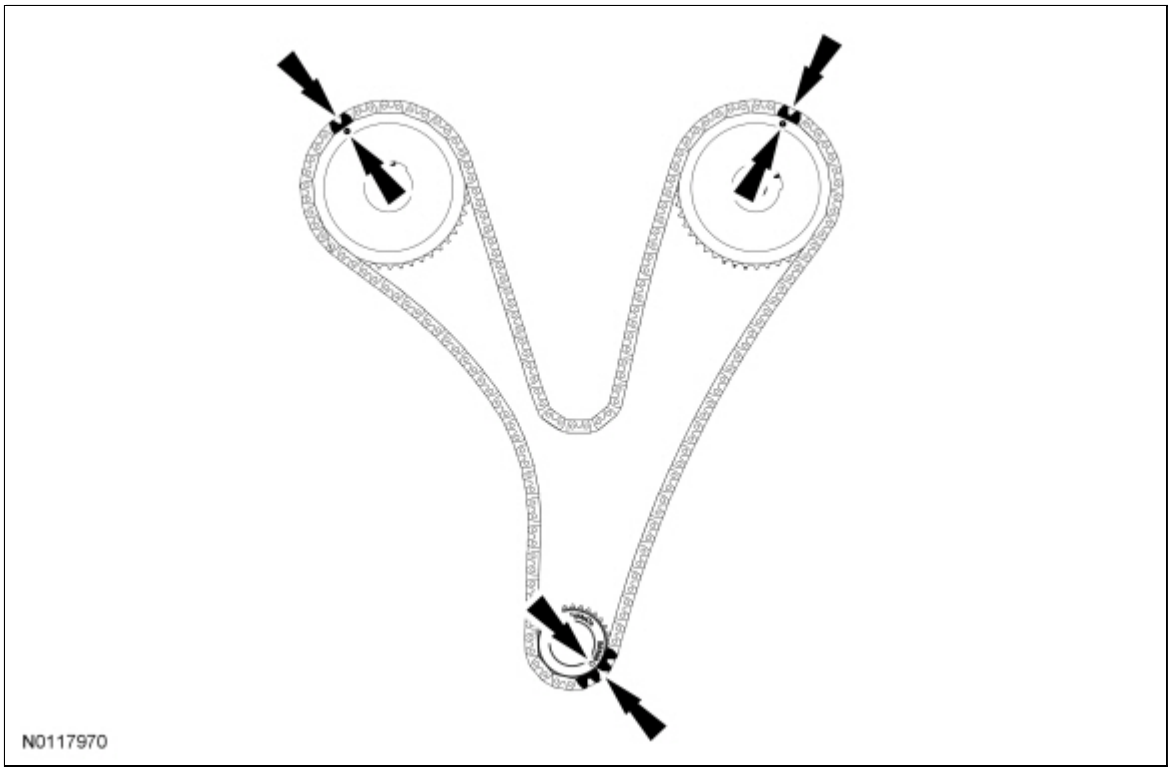


14. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

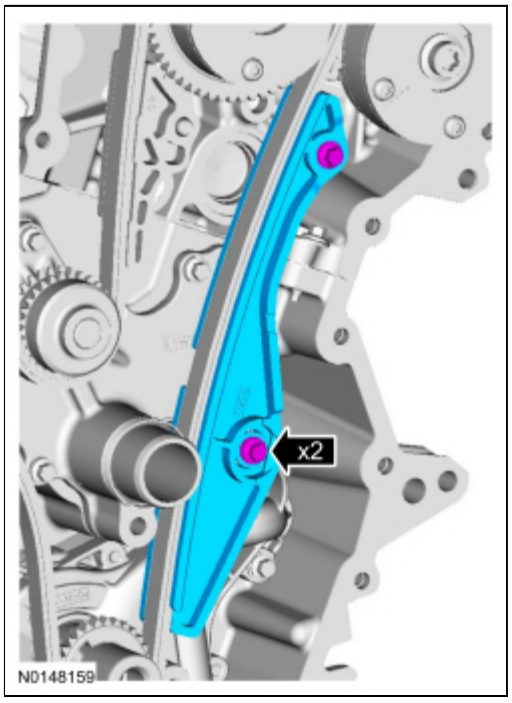


15. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

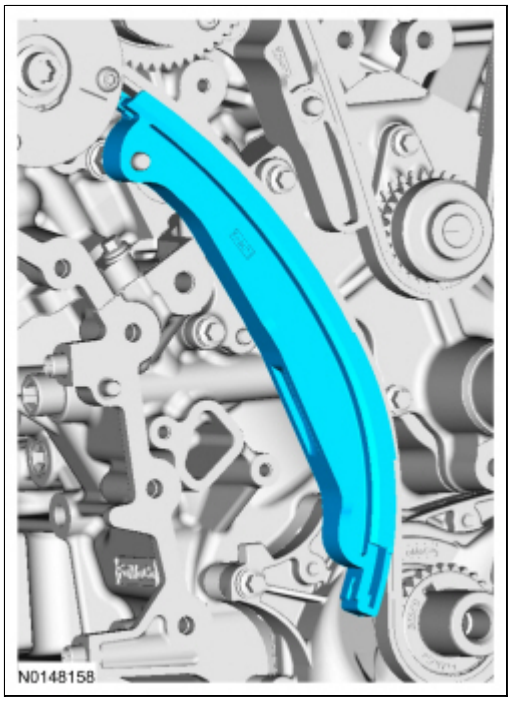


16. Rotate the crankshaft clockwise 60 degrees to TDC position (crankshaft dowel pin at the 11 o'clock position).

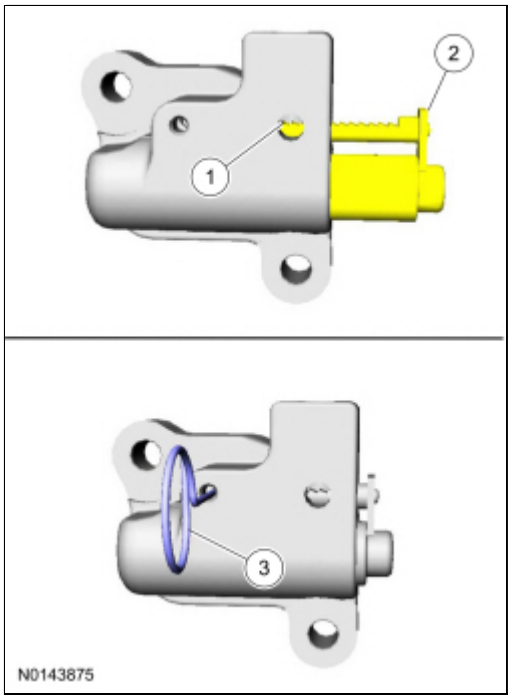


17. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



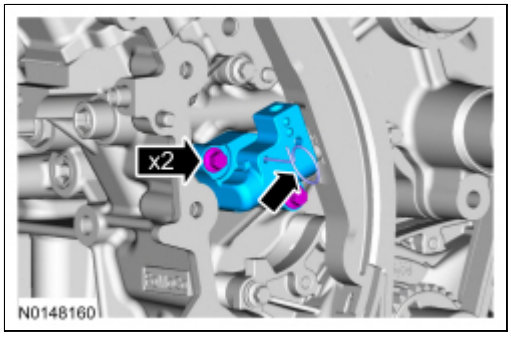
repair4less



18. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

19. Install the primary timing chain tensioner arm.

20. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and Install a suitable lockpin.



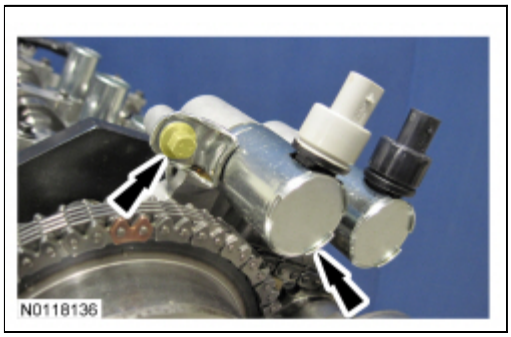
21. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary timing chain tensioner and the 2 bolts.

repair4less

- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

22. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).



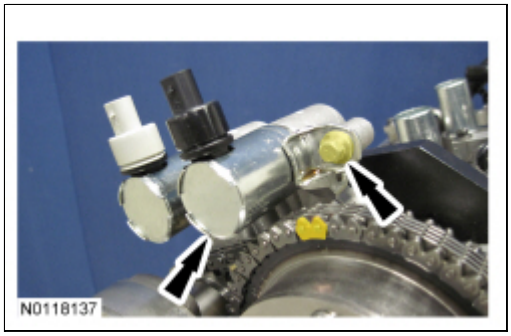
23. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

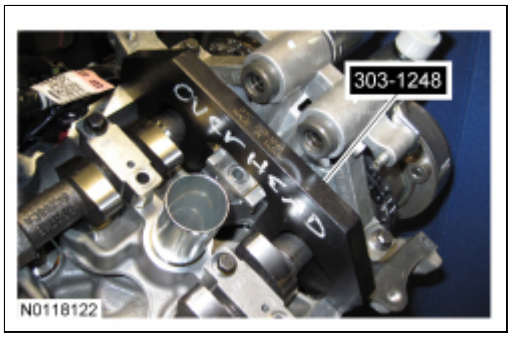
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



24. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

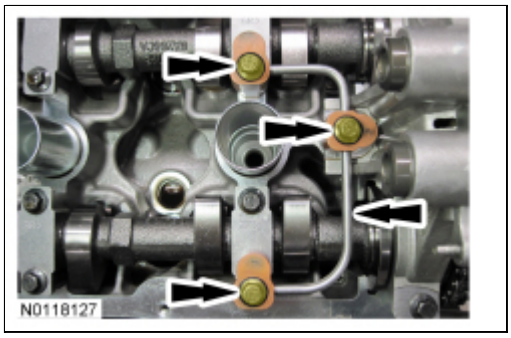
NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.



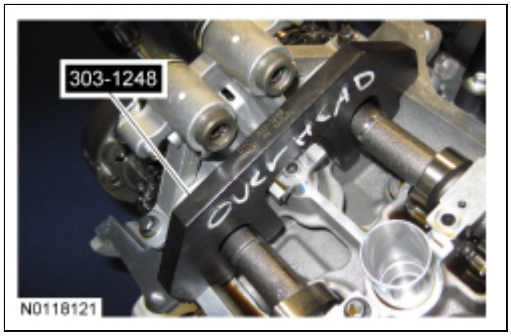
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH intake VCT oil control solenoid and the bolt.

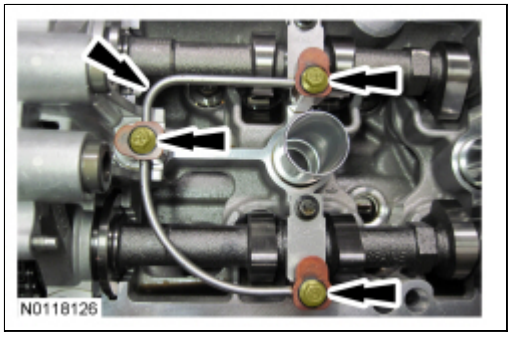
- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



25. Remove the RH Camshaft Holding Tool.



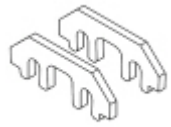
26. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



repair4less

27. Remove the LH Camshaft Holding Tool.

28. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



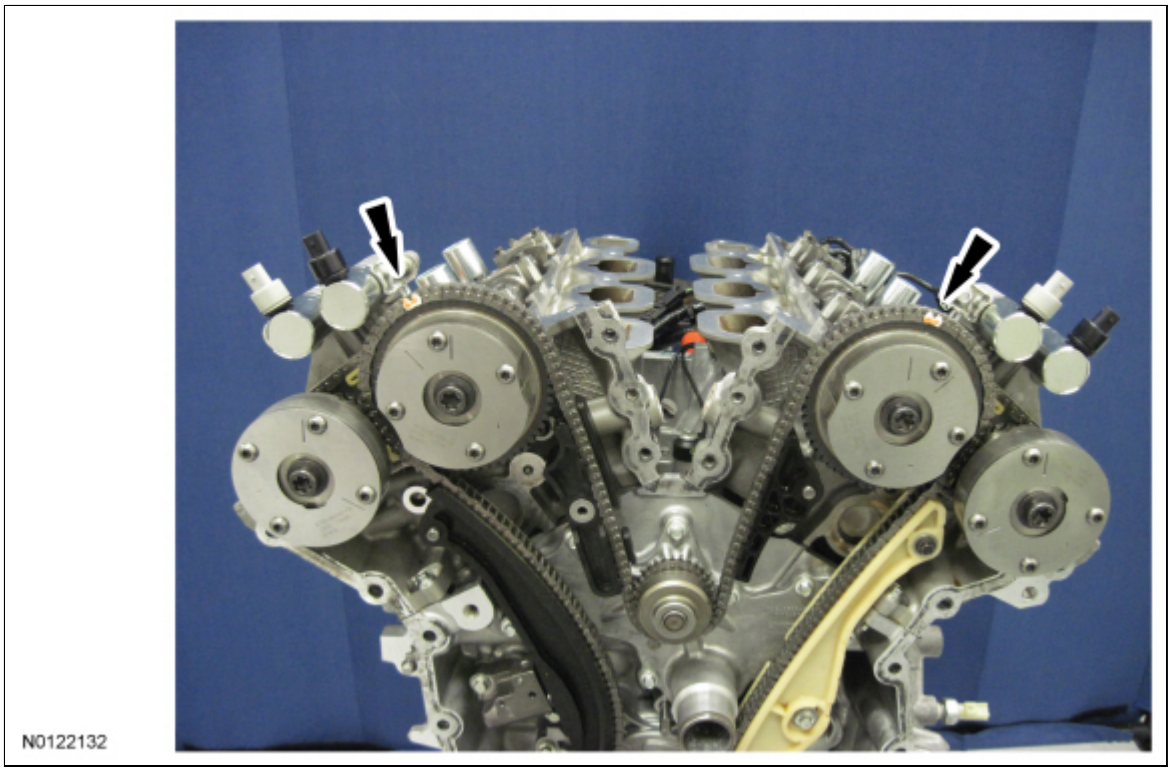
29. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

repair4less

Camshaft — RH

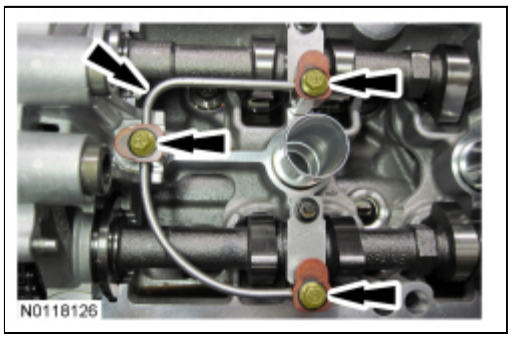
Special Tool(s)

 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248



Material

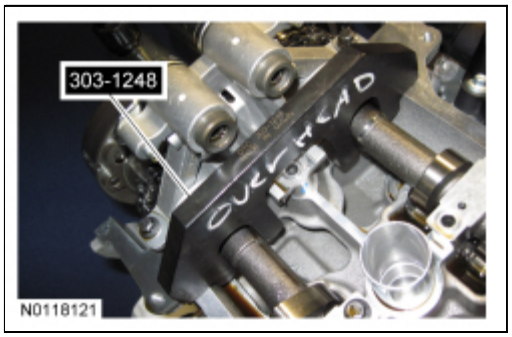
Item	Specification
Motorcraft® Gasket Maker TA-16	WSK-M2G348-A5
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A



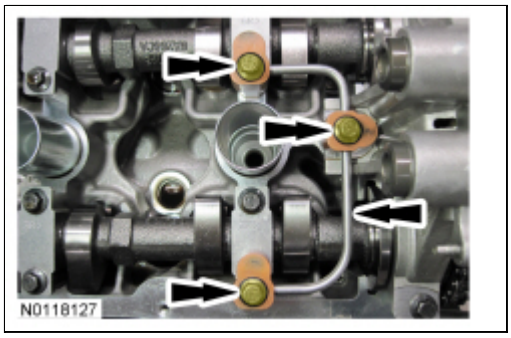
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Remove the vacuum pump. Refer to Section 206-07 .
3. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

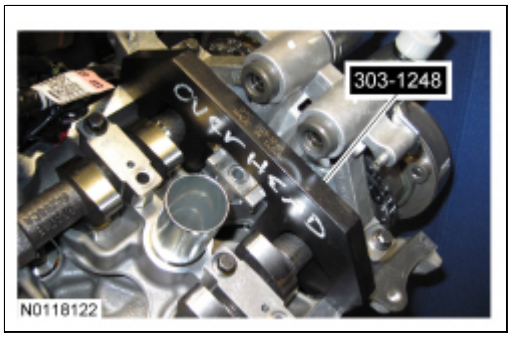


4. Remove the 3 bolts and the LH valve train oil tube.



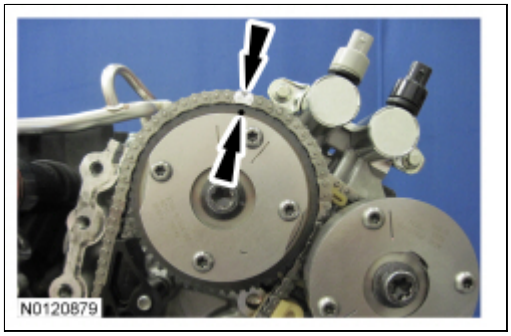
5. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



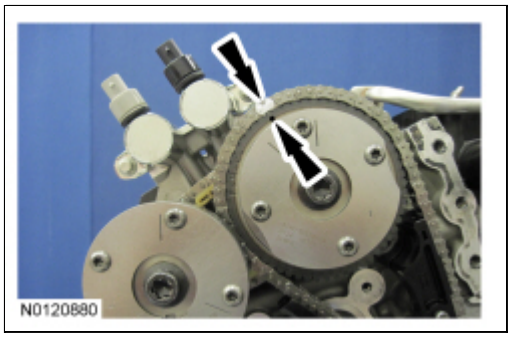
6. Remove the 3 bolts and the RH valve train oil tube.

repair4less



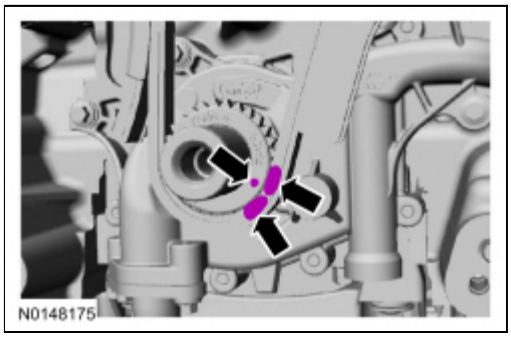
7. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

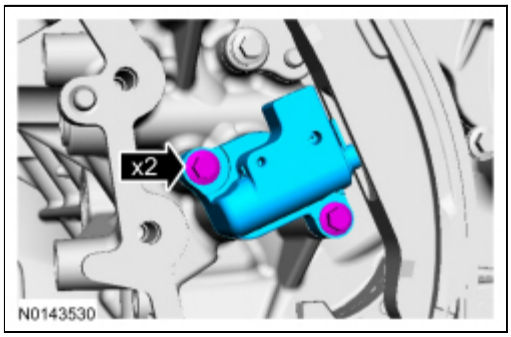


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



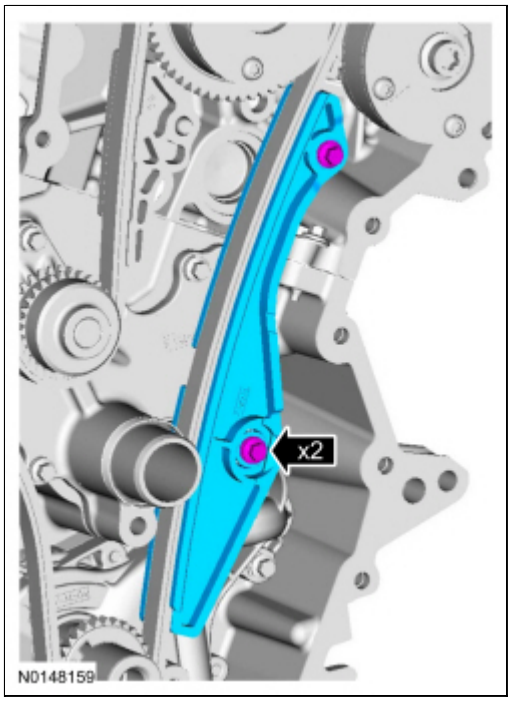
9. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



10. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.

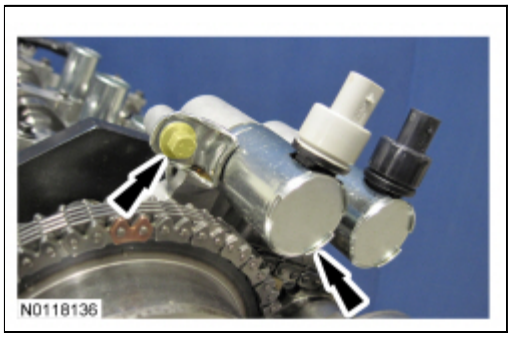
11. Remove the 2 bolts and the primary timing chain tensioner.



12. Remove the primary timing chain tensioner arm.

13. Remove the 2 bolts and the lower LH primary timing chain guide.

repair4less

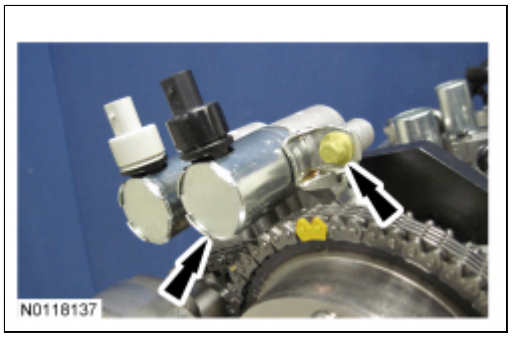


14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.



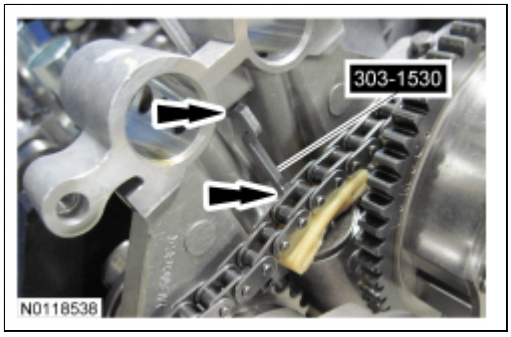
15. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

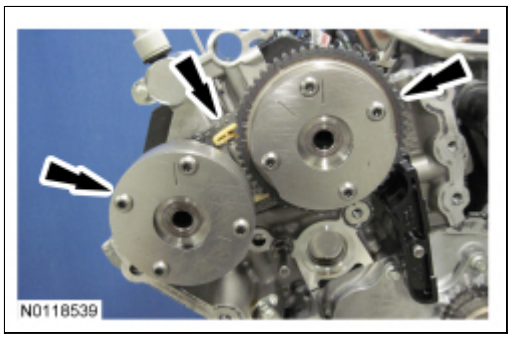
16. Remove the primary timing chain.



17. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

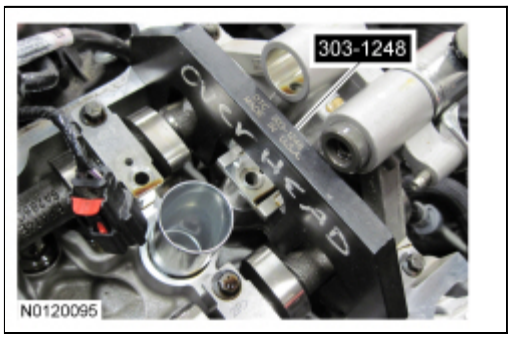
    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

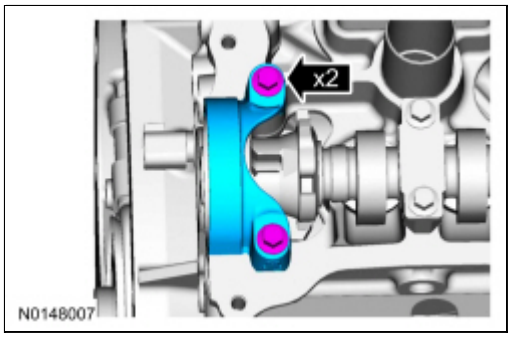


repair4less

18. Remove and discard the 2 RH VCT assembly bolts.



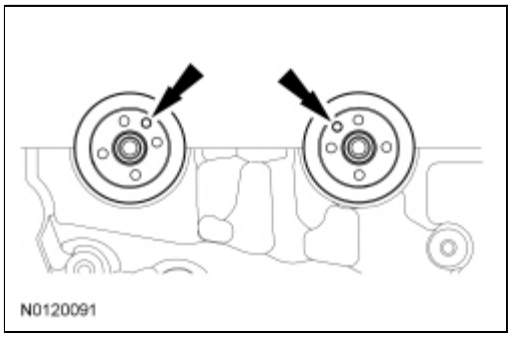
19. Remove the 2 RH VCT assemblies and secondary timing chain.



20. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure may rotate the RH camshafts approximately 3 degrees to a neutral position.

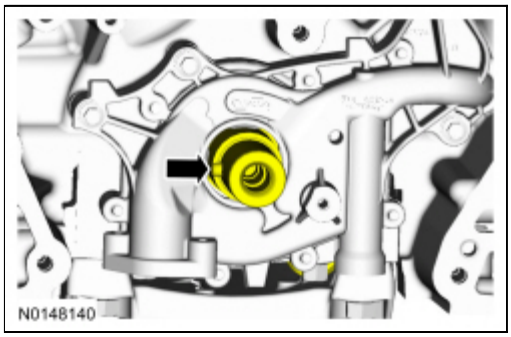
    Remove the Camshaft Holding Tool from the RH camshafts.

21. Remove the 2 bolts and the camshaft bearing cap assembly.



22. Remove the 12 camshaft cap bolts, the 6 camshaft caps, and the mega cap.
    - Remove the RH camshafts.

Installation



1. **NOTE:** Coat the camshafts with clean engine oil prior to installation.

   Position the camshafts onto the RH cylinder head in the neutral position as shown.

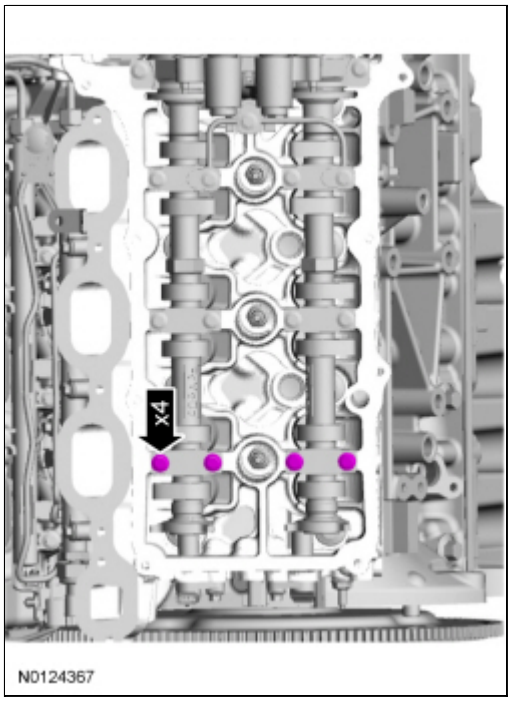
2. ***NOTICE:*** **The crankshaft must remain in the free wheeling position (crankshaft dowel pin at 9 o'clock) until the camshafts are installed and the valve clearance is checked/ adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

   Rotate the crankshaft couterclockwise until the crankshaft dowel pin is in the 9 o'clock position.

3. ***NOTICE:*** **The camshaft seal gaps must be at the 12 o'clock position or damage to the engine may occur.**

   Position the 4 camshaft seals gaps as shown.

repair4less

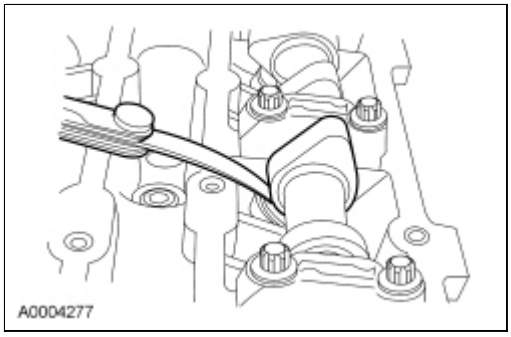


4. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

   Install the 6 camshaft caps, mega cap, valve train oil tube and the 15 bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.

5. Loosen the 4 camshaft caps bolts.

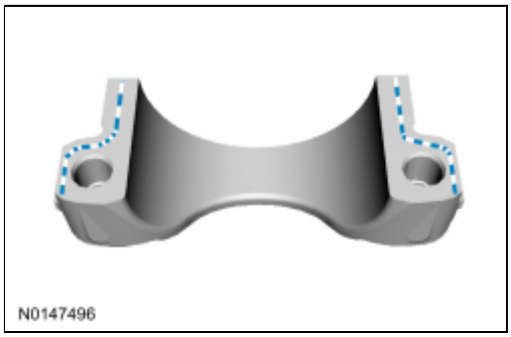
6. Tighten the 4 camshaft caps bolts in the sequence shown.
    - Tighten bolts 8, 9, 10 and 11 to 8 Nm (71 lb-in) then an additional 45 degrees.



7. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

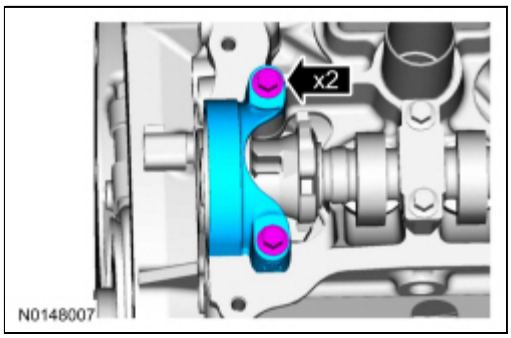
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet



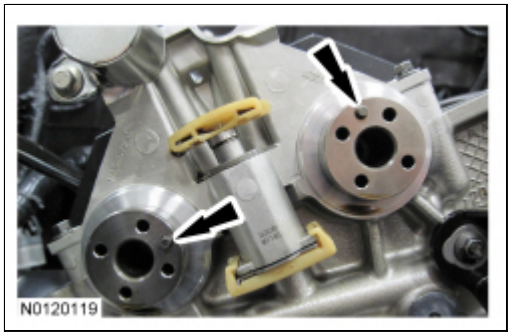
repair4less

(s) of the correct size. For additional information, refer to Valve Clearance Check in this section.



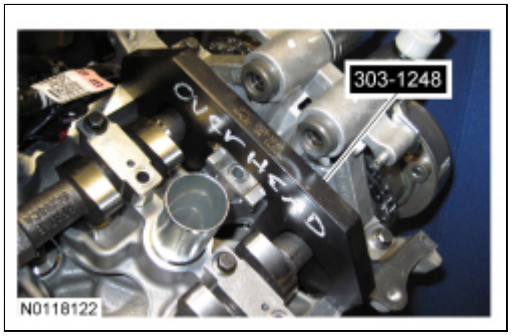
8. **NOTE:** The camshaft bearing cap assembly must be secured within 10 minutes of the Gasket Maker application. If the camshaft bearing cap assembly is not secured within 10 minutes, the sealant must be removed and the sealing area cleaned with Motorcraft® Metal Surface Prep.

   Apply a 3 mm (0.118 in) bead of sealant to the camshaft bearing cap assembly.

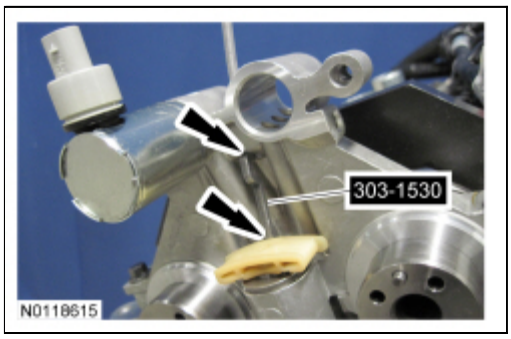


9. Install the camshaft bearing cap assembly and the 2 bolts.
   - Tighten to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Remove the excess gasket maker.

10. Remove the 3 bolts and the RH valve train oil tube.



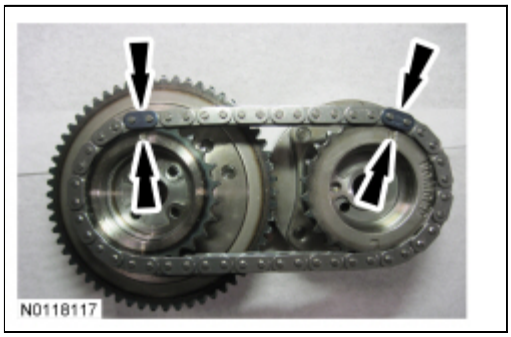
11. Rotate the RH camshafts to the TDC position as shown.



12. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

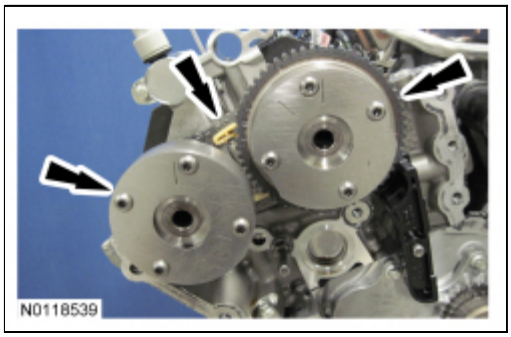
    Install the Camshaft Holding Tool onto the flats of the RH camshafts.

13. Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.



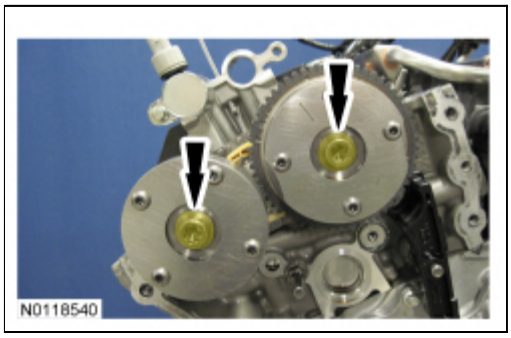
14. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing

repair4less



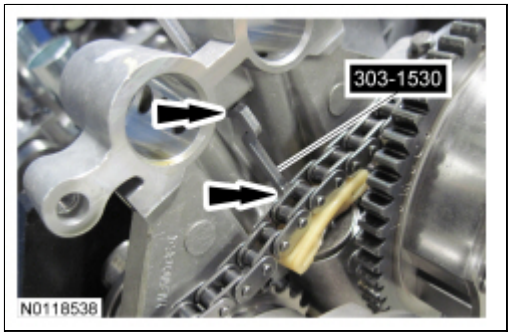
chain.

- Align the colored links with the timing marks.

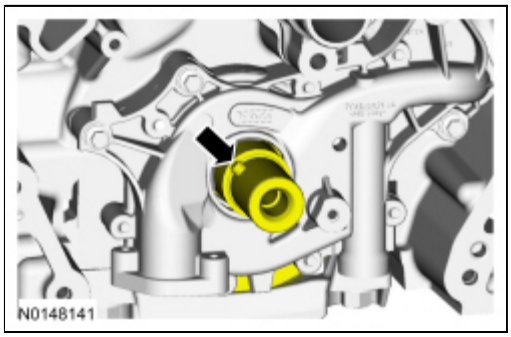


15. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

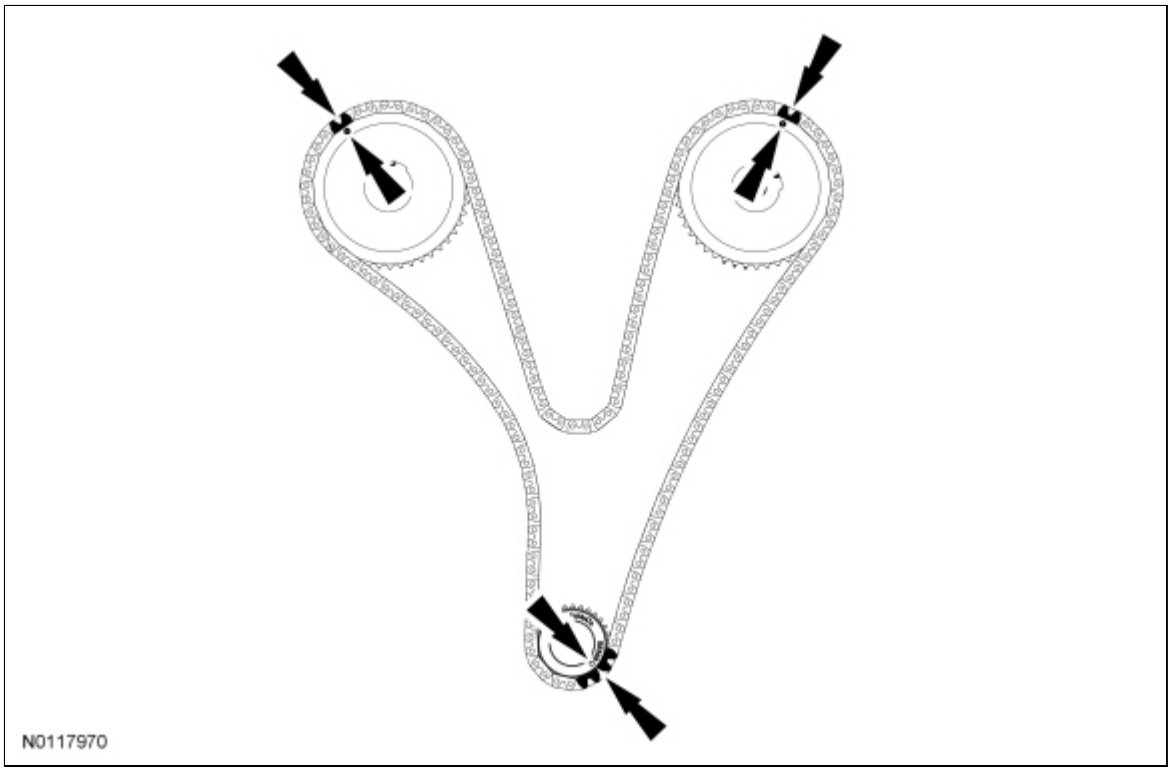


16. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

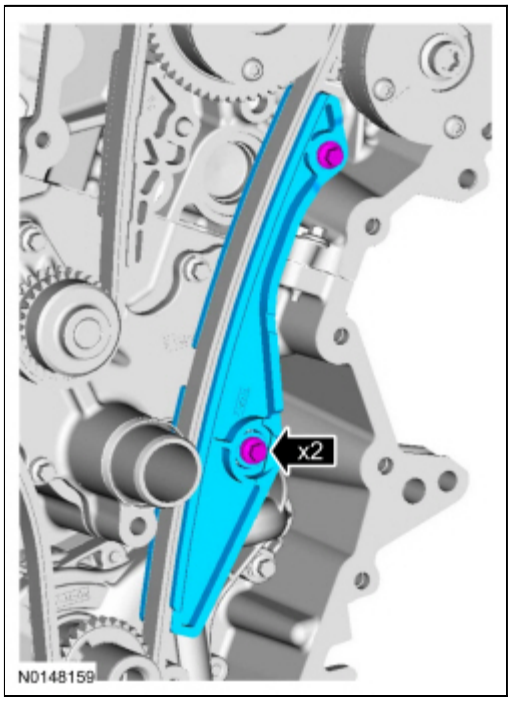


17. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

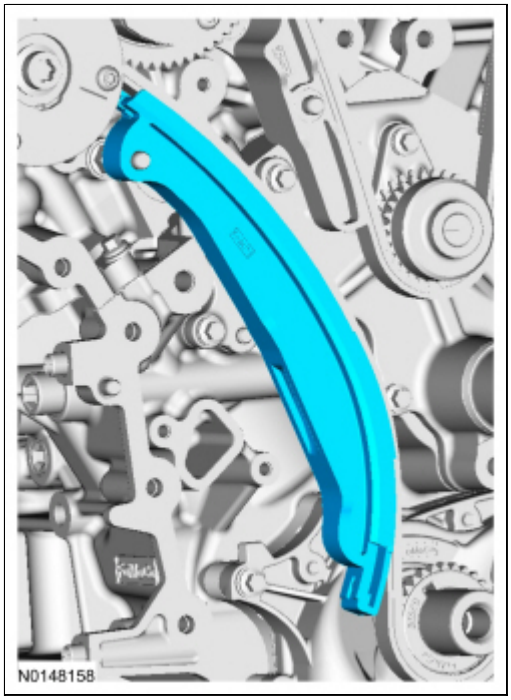


18. Rotate the crankshaft clockwise 60 degrees to TDC position (crankshaft dowel pin at the 11 o'clock position).

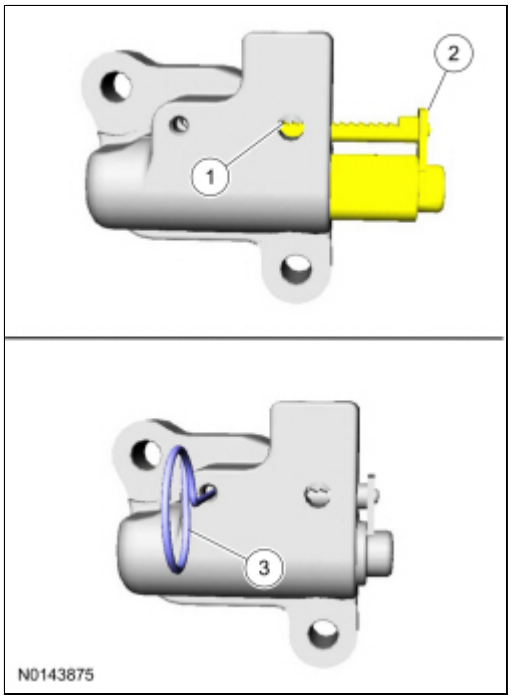


19. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

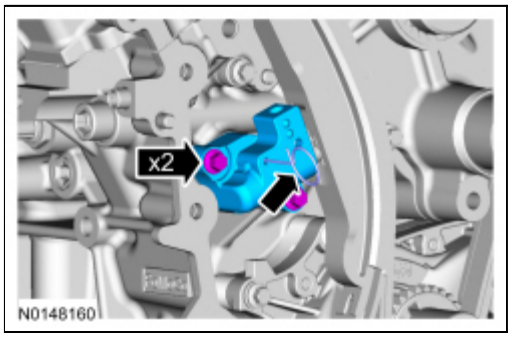


repair4less

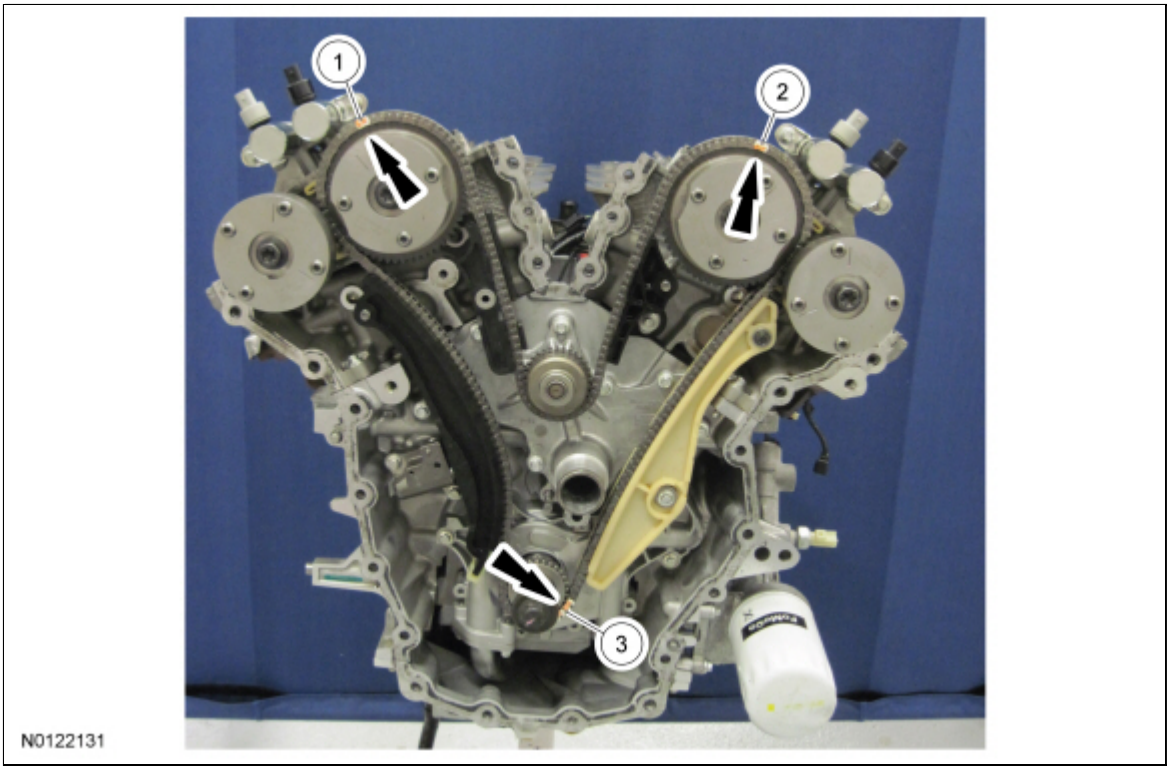


20. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

21. Install the primary timing chain tensioner arm.



22. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.

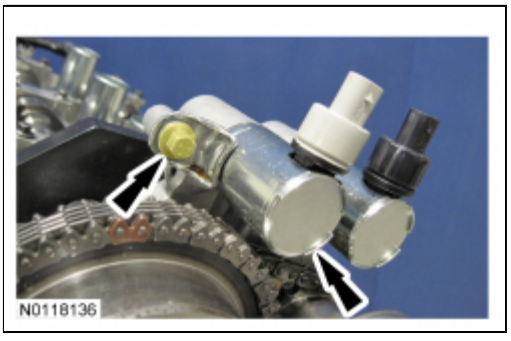


23. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
    - Remove the lockpin.

24. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).

repair4less



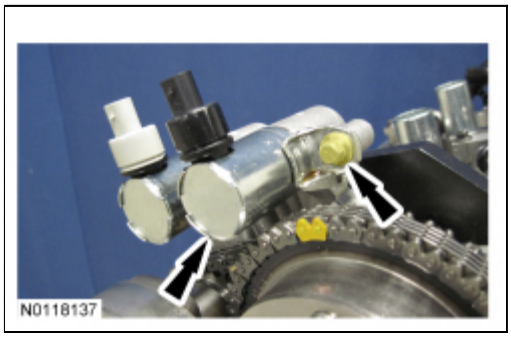
25. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

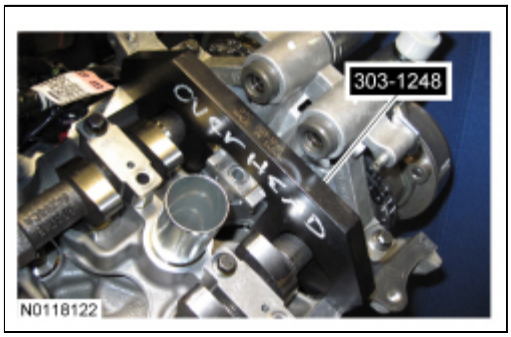
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



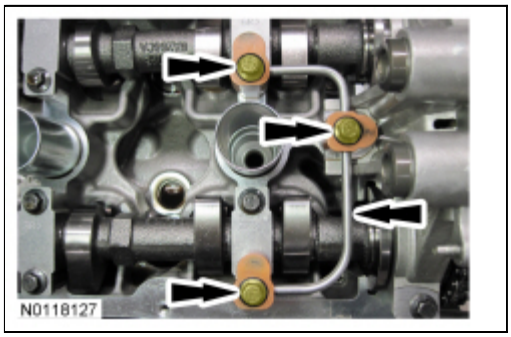
26. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.



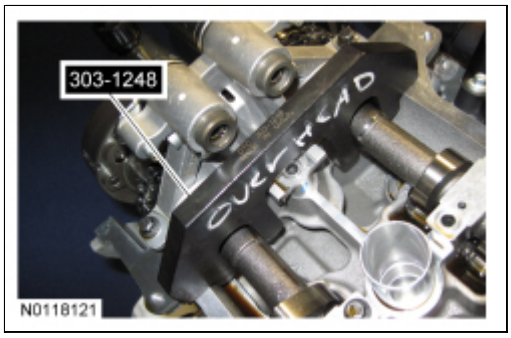
NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the RH intake VCT oil control solenoid and the bolt.

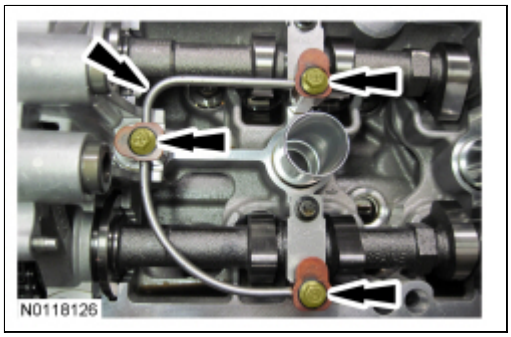


- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

27. Remove the RH Camshaft Holding Tool.



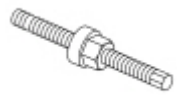
28. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



29. Remove the LH Camshaft Holding Tool.

repair4less

30. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



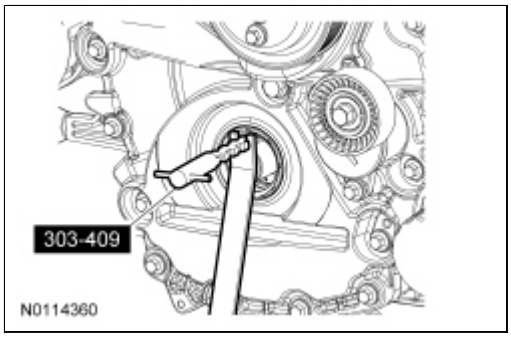
31. Install the vacuum pump. Refer to Section 206-07 .

32. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Crankshaft Front Seal

Special Tool(s)

 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2981-A	Installer, Front Crankshaft Seal 303-1251
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700CH)

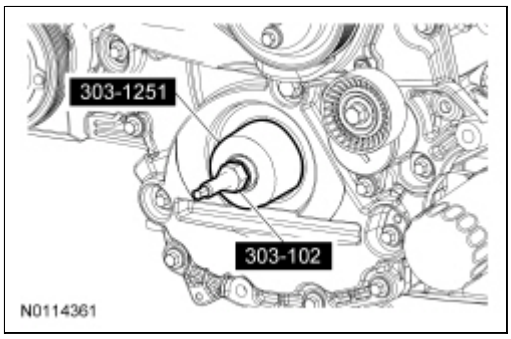


Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A

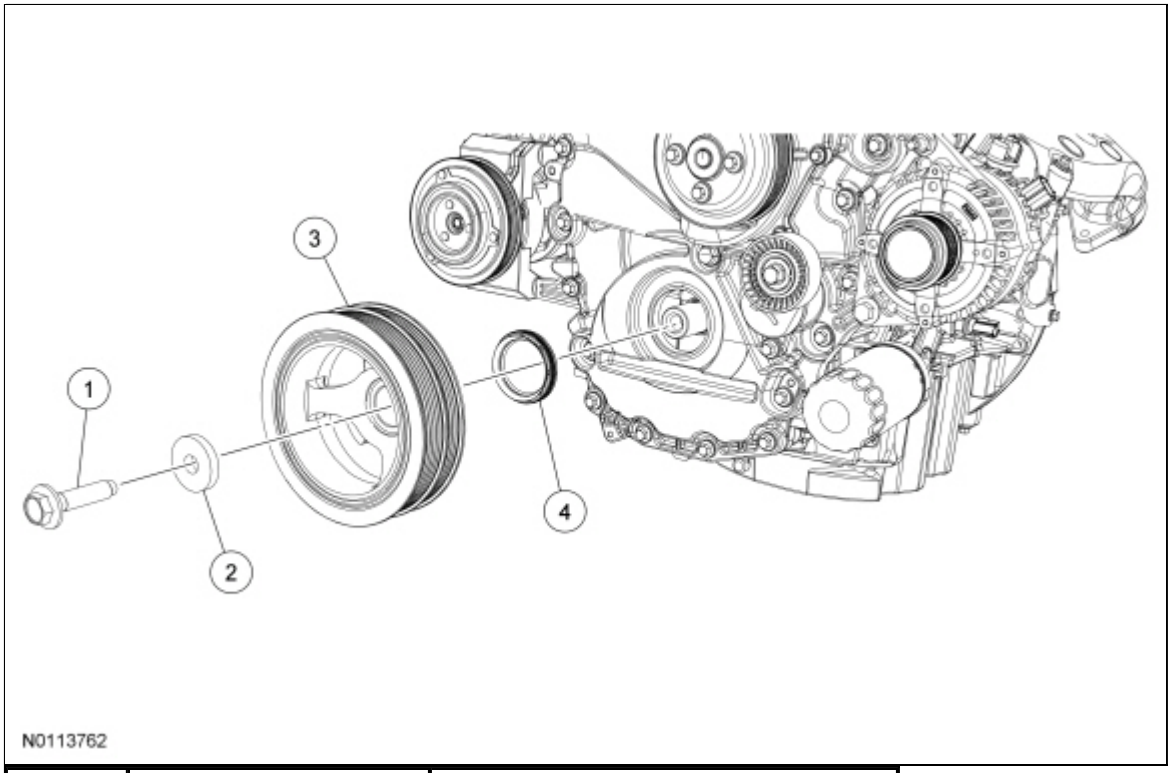
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
3. Using the Oil Seal Remover, remove and discard the crankshaft front seal.
    - Clean all sealing surfaces with metal surface prep.



repair4less

Installation

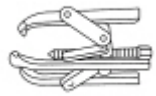


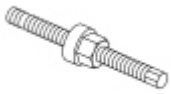
1. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

   Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Crankshaft Pulley and Crankshaft Front Seal — Exploded View





Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Washer
3	6312	Crankshaft pulley
4	6700	Crankshaft front seal

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

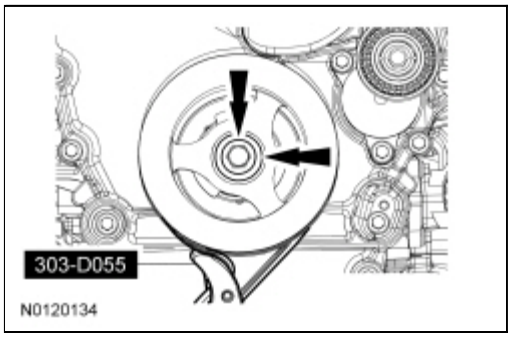
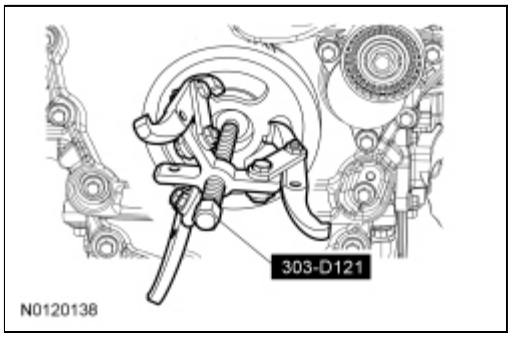
Removal



repair4less

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

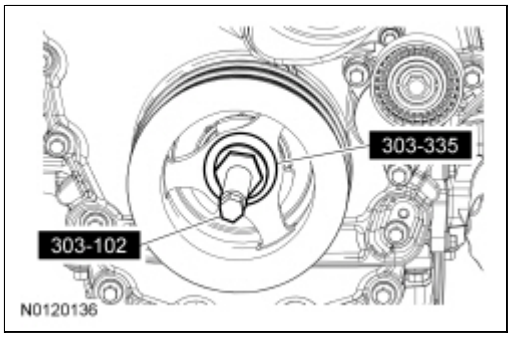


2. Remove the Air Cleaner (ACL) outlet pipe and the RH & LH ACL pipe-to-turbocharger pipes. Remove the LH turbocharger-to-Charge Air Cooler (CAC) tube and the CAC -to-Throttle Body (TB) pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .

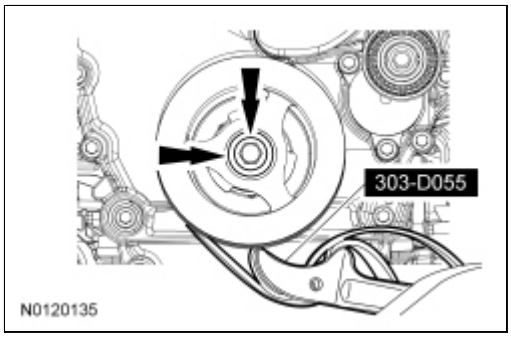
3. Remove the accessory drive belt and the A/C belt. For additional information, refer to Section 303-05 .

4. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
   - Discard the bolt.

5. Using the 3 Jaw Puller, remove the crankshaft pulley.



Installation



1. Lubricate the crankshaft front seal inner lip with clean engine oil.

2. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

   Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Replacer, install the crankshaft pulley.

3. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
   - Stage 1: Tighten to 120 Nm (89 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.

4. Install the accessory drive belt and the A/C belt. For additional information, refer to Section 303-05 .

5. Install the CAC -to- TB pipe and the LH turbocharger-to- CAC tube. Install the RH & LH ACL pipe-to-turbocharger pipes and the ACL outlet pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

6. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

repair4less

Crankshaft Rear Seal with Retainer Plate

Material

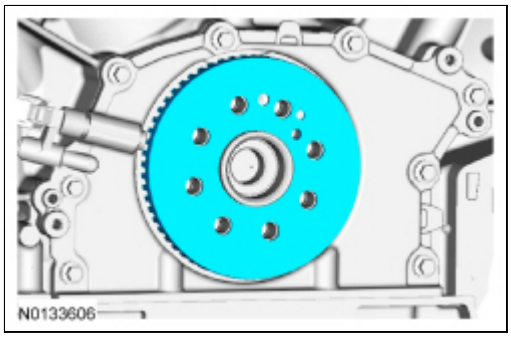
Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A
Motorcraft® Silicone Gasket Remover ZC-30	—

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTICE: **The engine is equipped with a cast aluminum (early build) or stamped steel (late build) crankshaft rear seal retainer plate. If the engine is equipped with a stamped steel retainer plate, the seal and plate must be removed as an assembly and discarded.**

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

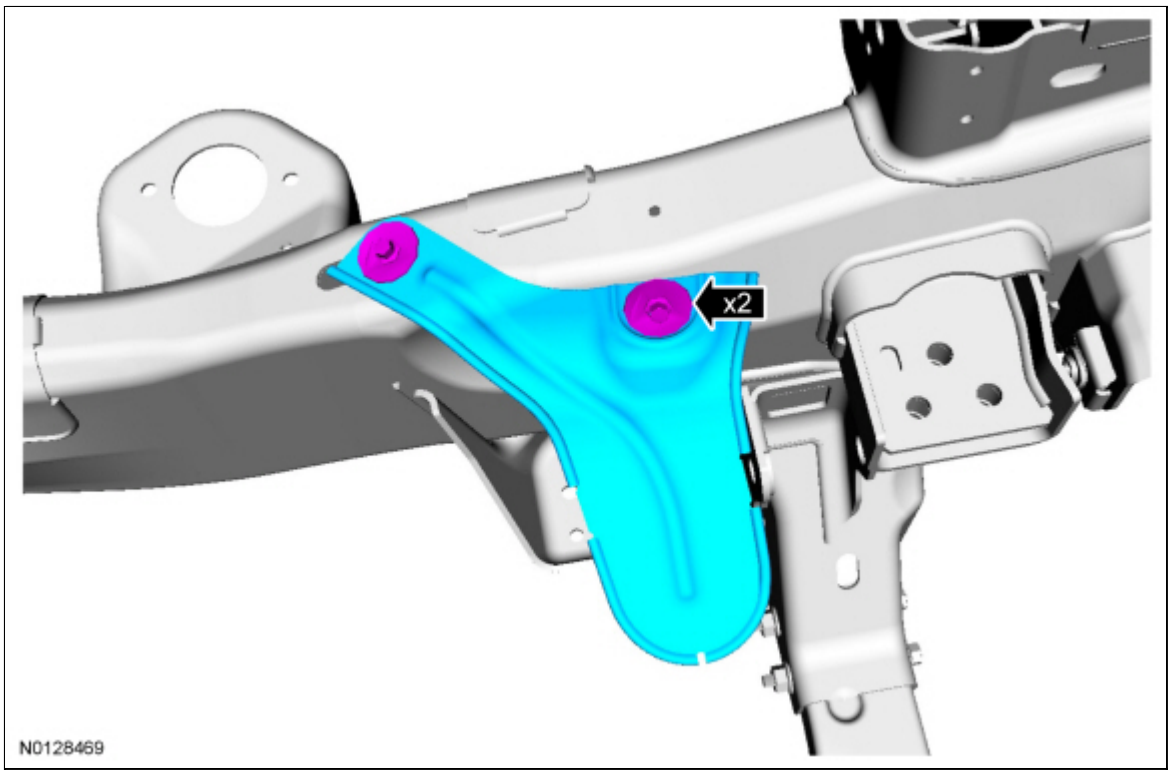


2. Remove the flexplate. Refer to Flexplate in this section.

3. **NOTE:** The engine can be equipped with a cast aluminum (early build) or stamped steel (late build) crankshaft rear seal retainer plate.

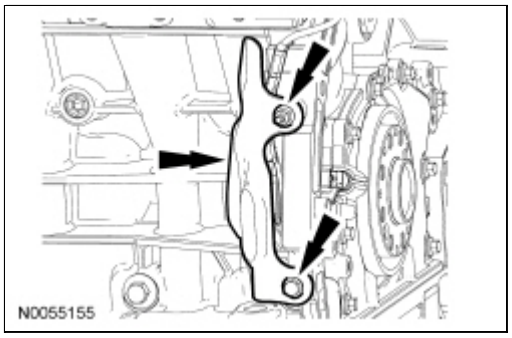
   NOTE: Cast aluminum crankshaft rear seal retainer plate shown, stamped steel crankshaft rear seal retainer plate similar.

   Remove the crankshaft sensor ring.

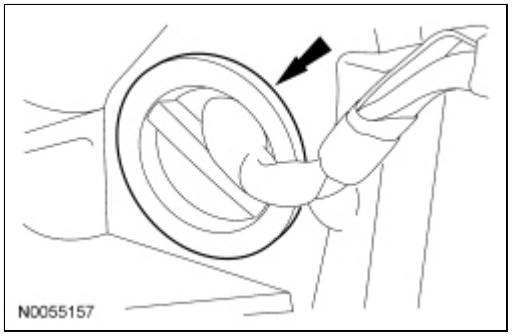


repair4less

4. Remove the engine-to-transmission spacer plate.

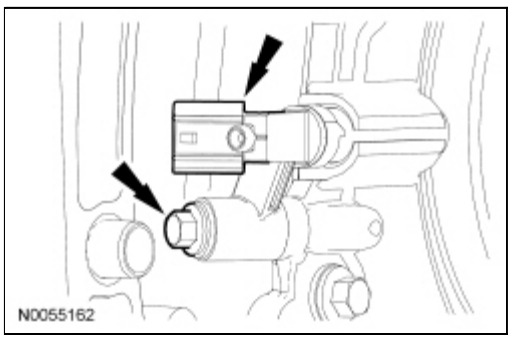


5. If equipped, remove the 2 bolts and the exhaust system heat shield.



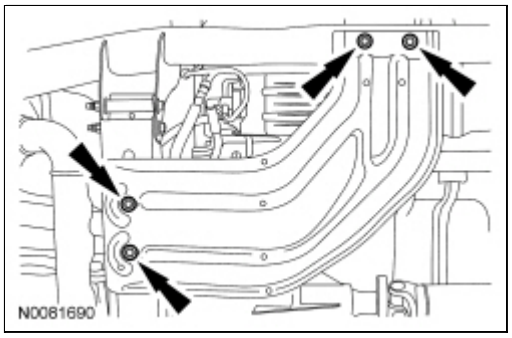
6. **NOTE:** The Crankshaft Position (CKP) heat shield is only positioned aside.

   Remove the nut and the bolt. Position the Crankshaft Position (CKP) heat shield aside.

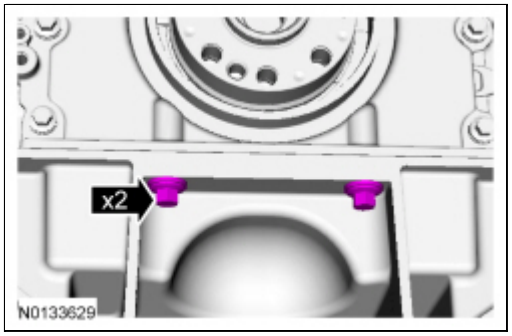


7. Remove the wiring harness grommet.

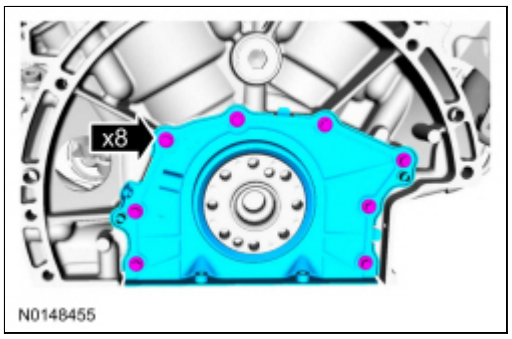
8. Disconnect the CKP sensor electrical connector.



9. Remove the bolt and the CKP sensor.



10. If equipped, remove the 4 bolts and the skid plate.



repair4less

11. Remove the 2 oil pan-to-crankshaft rear seal retainer plate bolts.

12. Remove the 8 bolts and the crankshaft rear seal retainer plate.
    - Discard the crankshaft rear seal retainer plate.

13. ***NOTICE:*** **Place clean, lint free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gaskets surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

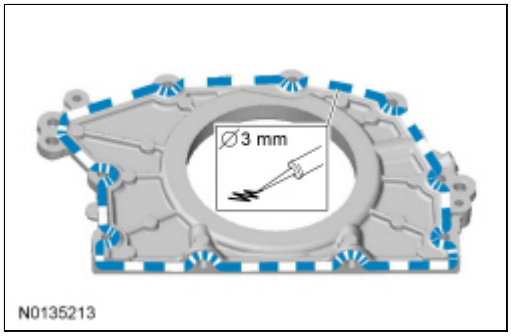
    Clean the sealing surfaces of the cylinder block and oil pan flange in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

1. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

   Apply a 5 mm (0.196 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 cylinder block/oil pan joints.

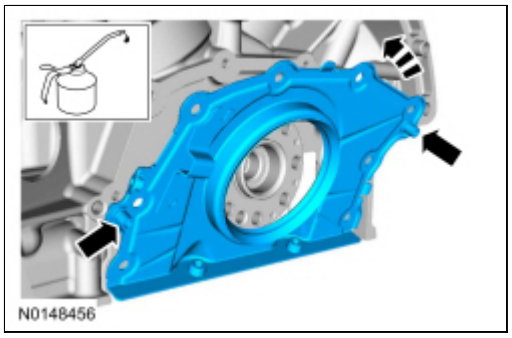


2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

   NOTE: The stamped steel crankshaft rear seal retainer plate comes with the crankshaft rear seal.

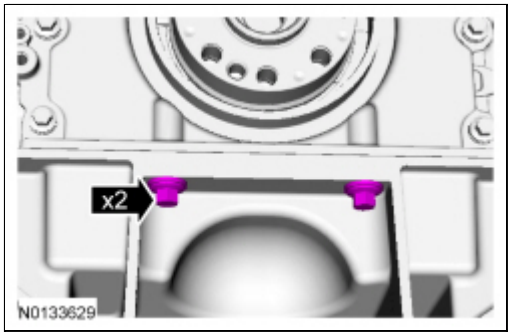
   Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.



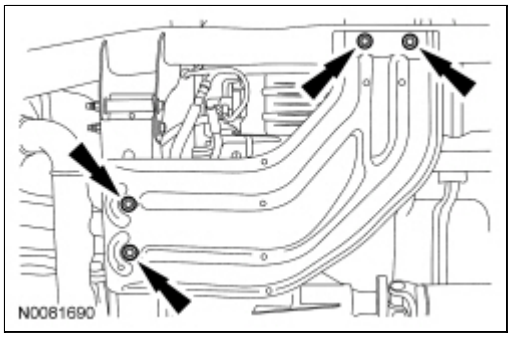
3. **NOTE:** Use the 2 handles during installation to avoid touching the sealant.

   NOTE: Lubricate the crankshaft rear seal with clean engine oil.

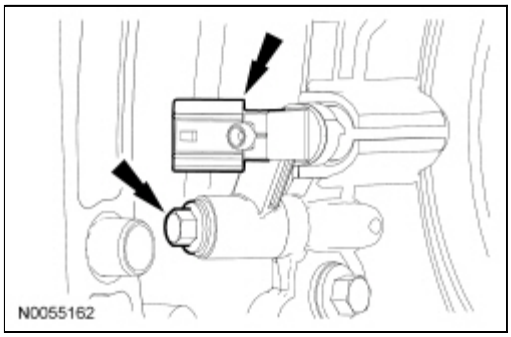
   Install the crankshaft rear seal retainer at an angle above the oil pan flange to avoid scraping off the sealer. Tilt the seal retainer up and onto the rear of the cylinder block.



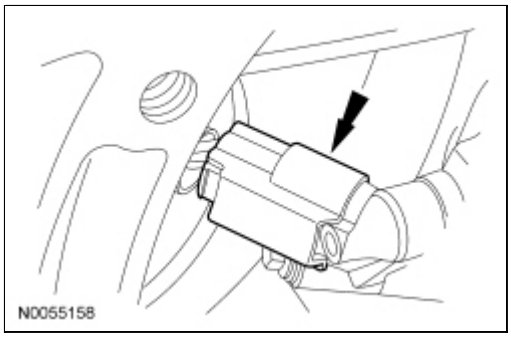
repair4less



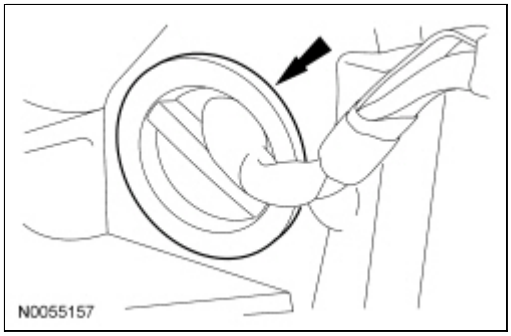
4. Install the 8 crankshaft rear seal retainer plate bolts. Tighten in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



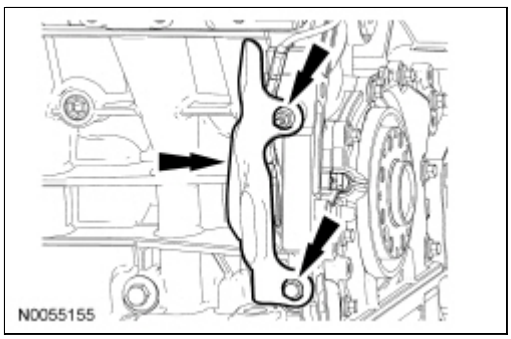
5. Install the 2 oil pan-to-crankshaft rear seal retainer plate bolts.
    - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.



6. If equipped, install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

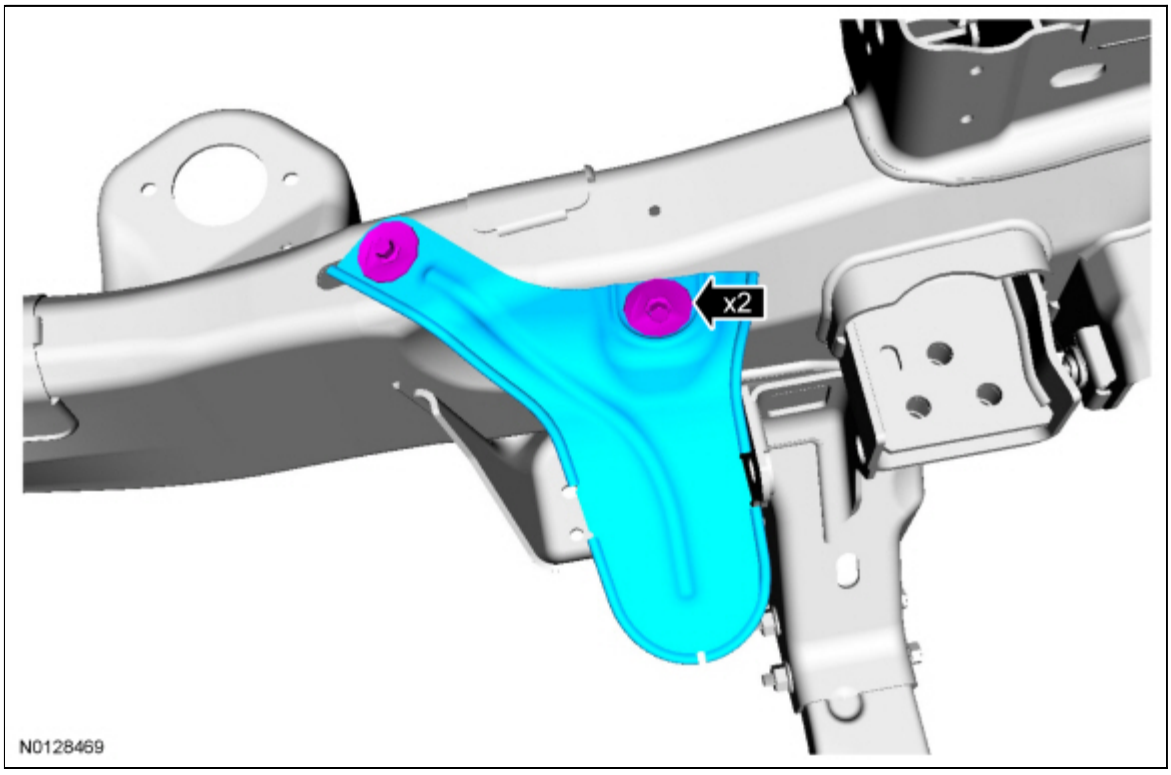


7. Install the CKP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

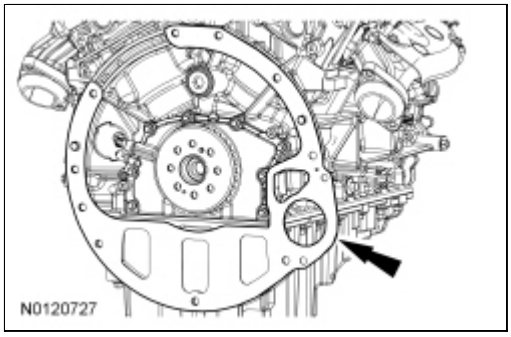


8. Connect the CKP sensor electrical connector.

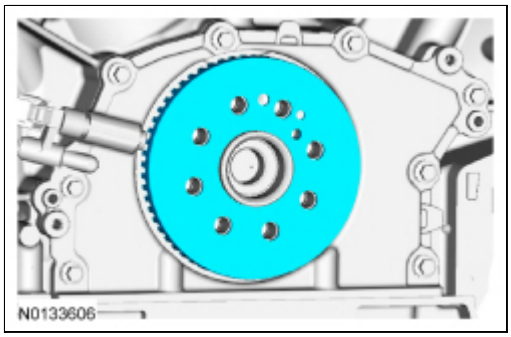
9. Install the wiring harness grommet.



10. Position back the CKP heat shield. Install the nut and bolt.
    - Tighten to 10 Nm (89 lb-in).



repair4less



11. If equipped, install the exhaust system heat shield and the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).

12. Install the engine-to-transmission spacer plate.

13. Install the crankshaft sensor ring.

14. Install the flexplate. Refer to Flexplate in this section.

15. After completing the repairs, use the scan tool to preform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Cylinder Head — LH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A
Motorcraft® Silicone Gasket Remover ZC-30	—

Item	Part Number	Description
1	W709818	LH upper primary timing chain guide bolt
2	6K297	LH upper primary timing chain guide
3	W710702	Cylinder head M6 bolt
4	6065	Cylinder head bolt (8 required)

5	6049	Cylinder head
6	6051	Cylinder head gasket

Removal

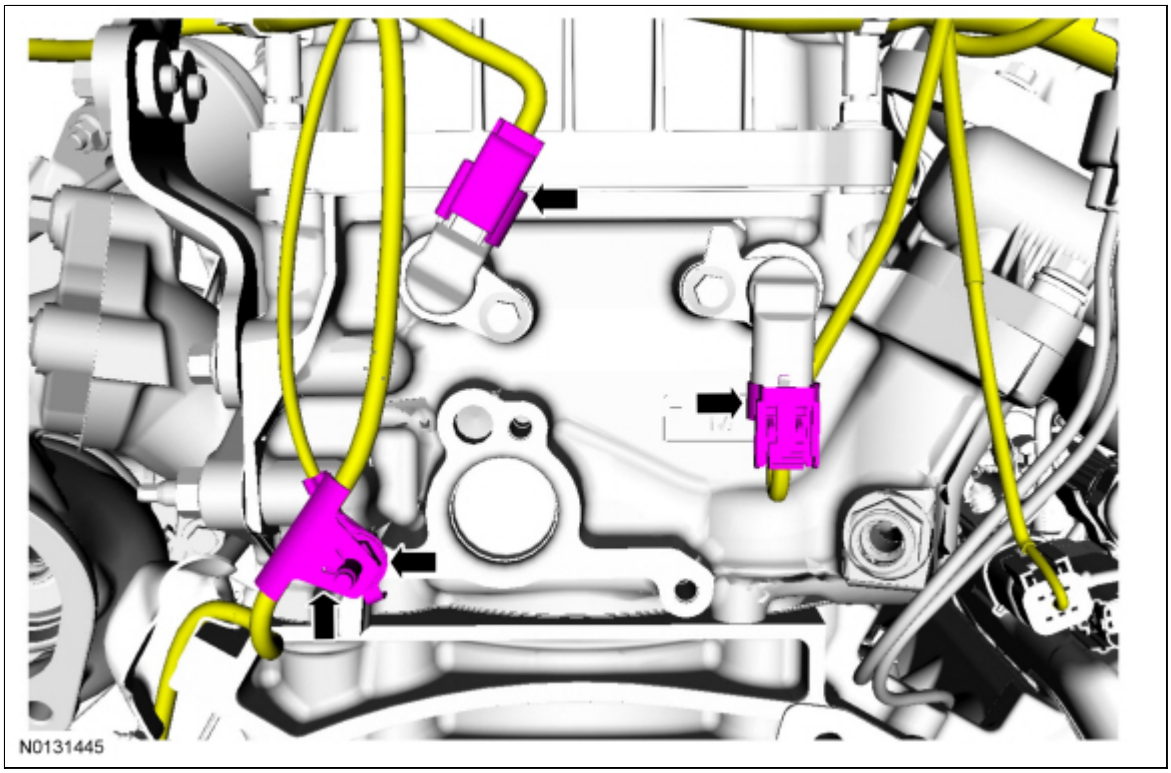
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

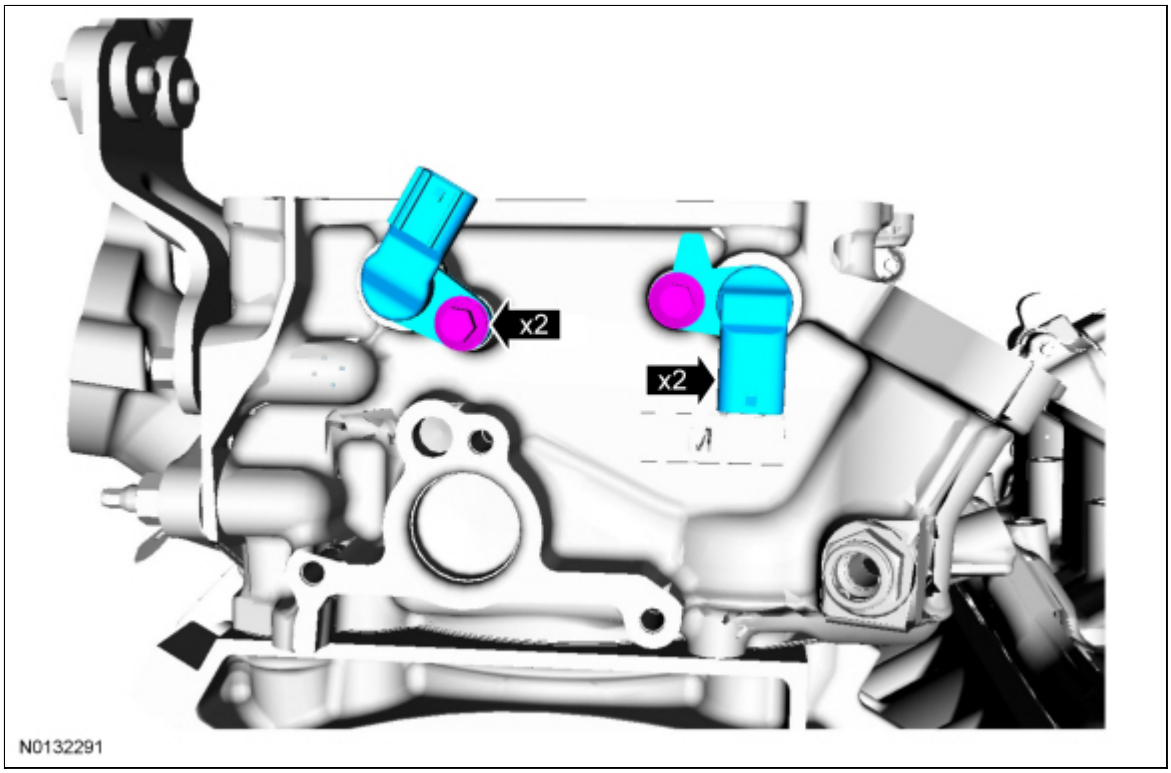
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.



***NOTICE:* During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

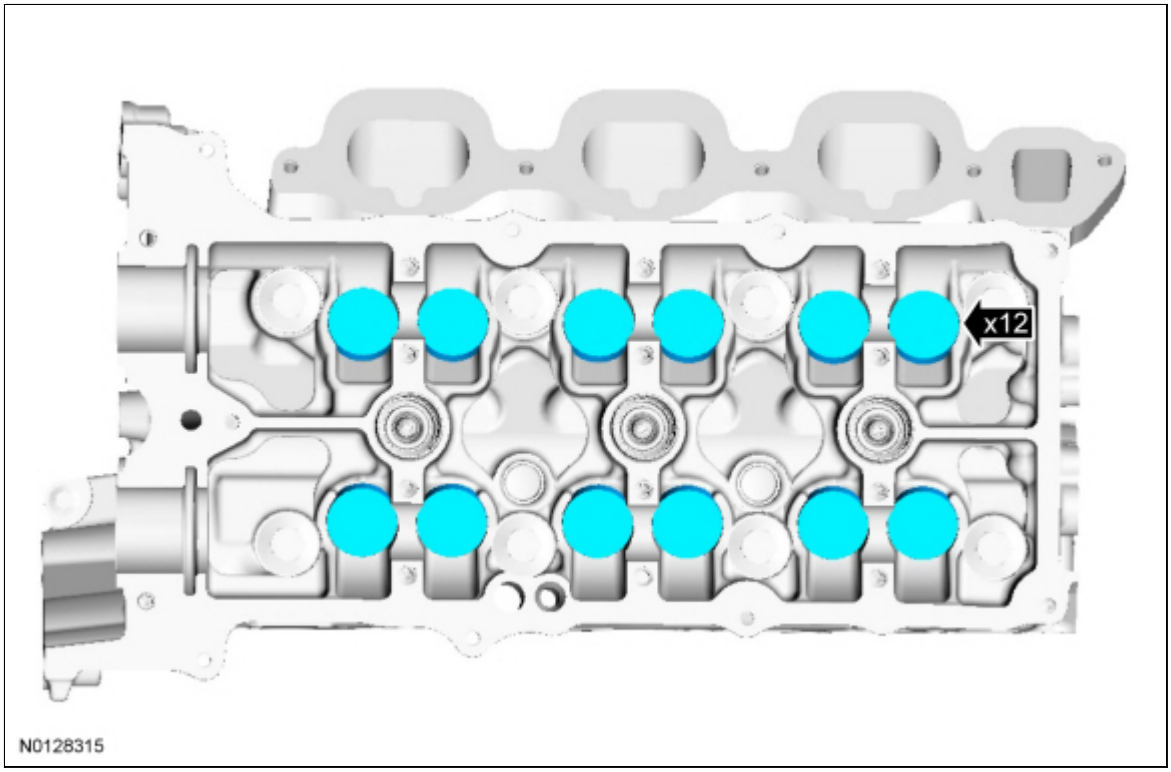
NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.



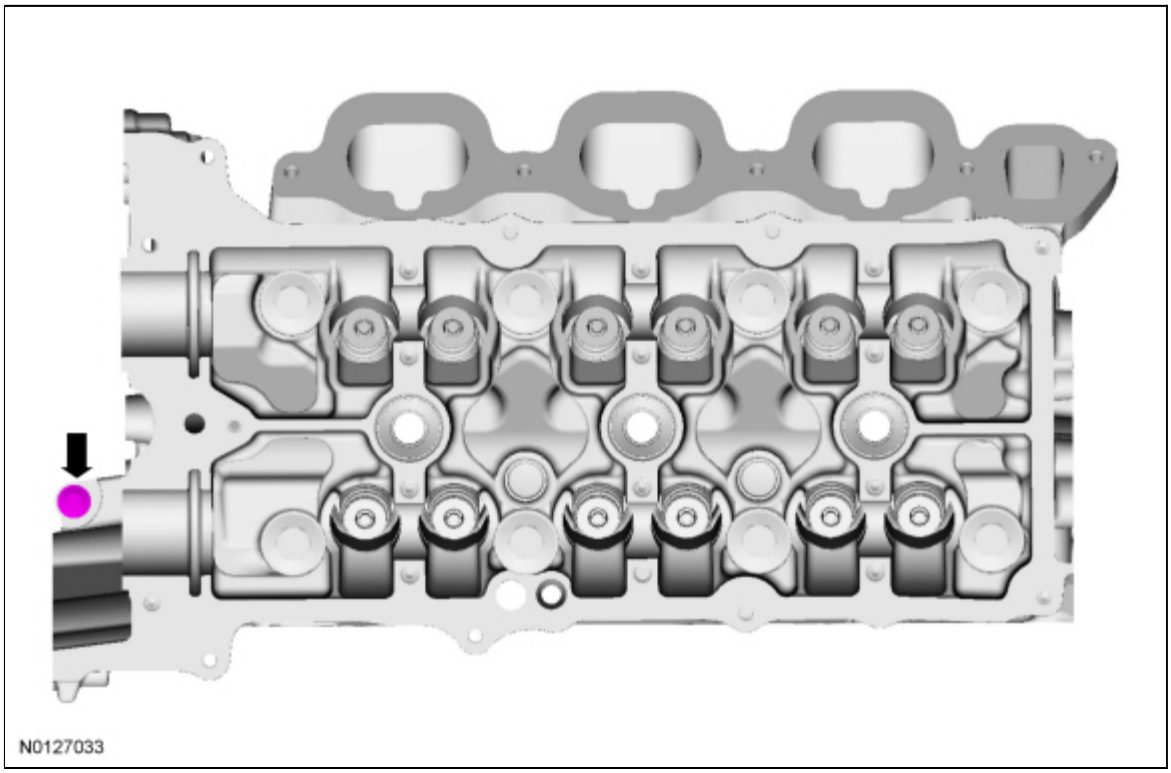
1. Release the fuel pressure. For additional information, refer to Section 310-00 .
2. Remove the LH turbocharger. For additional information, refer to Section 303-04E .
3. Remove the LH camshafts. For additional information, refer to Camshaft — LH in this section.
4. Remove the fuel rail. For additional information, refer to Section 303-04A .
5. ***NOTICE:* Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**

   Remove the bolt and the LH upper primary timing chain guide.
6. Disconnect the 2 LH Camshaft Position (CMP) sensor electrical connectors. Position back the Crankshaft Position (CKP) wire retainer. Remove the ground stud bolt.

repair4less



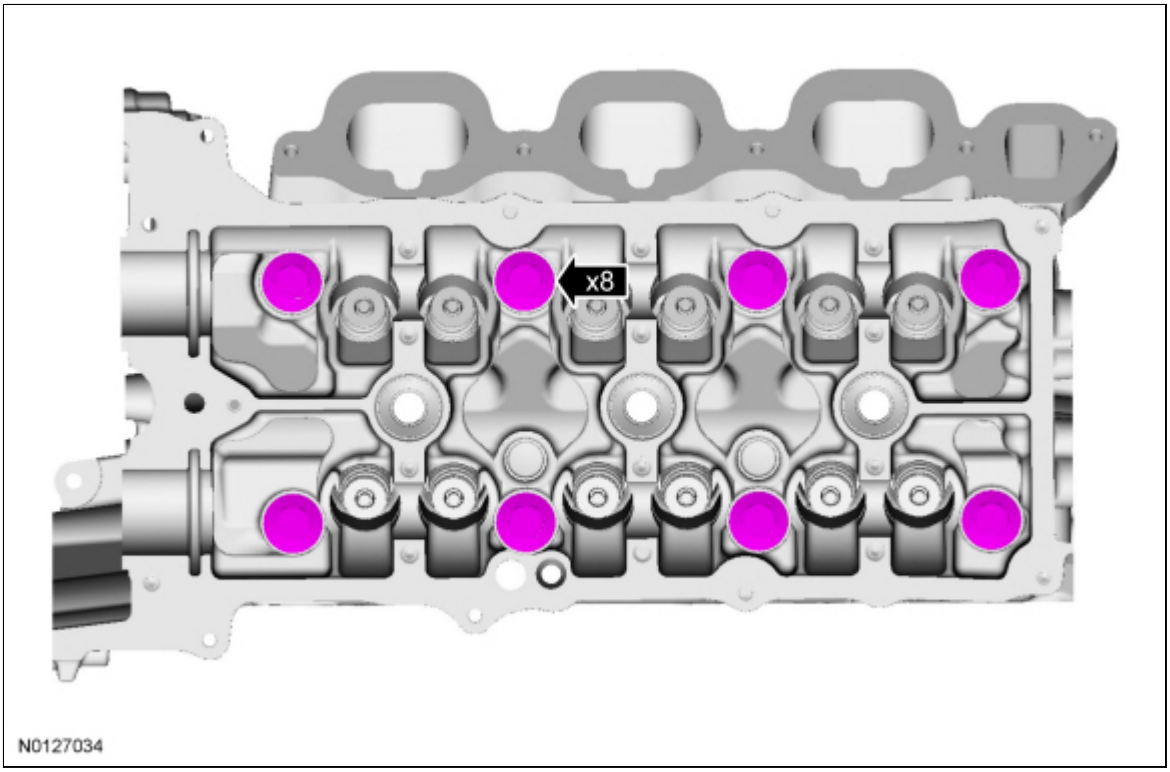
7. Remove the 2 bolts and the 2 LH CMP sensors.



8. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original positions.

Remove the valve tappets form the cylinder head.

9. Inspect the valve tappets. For additional information, refer to Section 303-00 .
10. Remove and discard the M6 bolt.



repair4less

11. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.

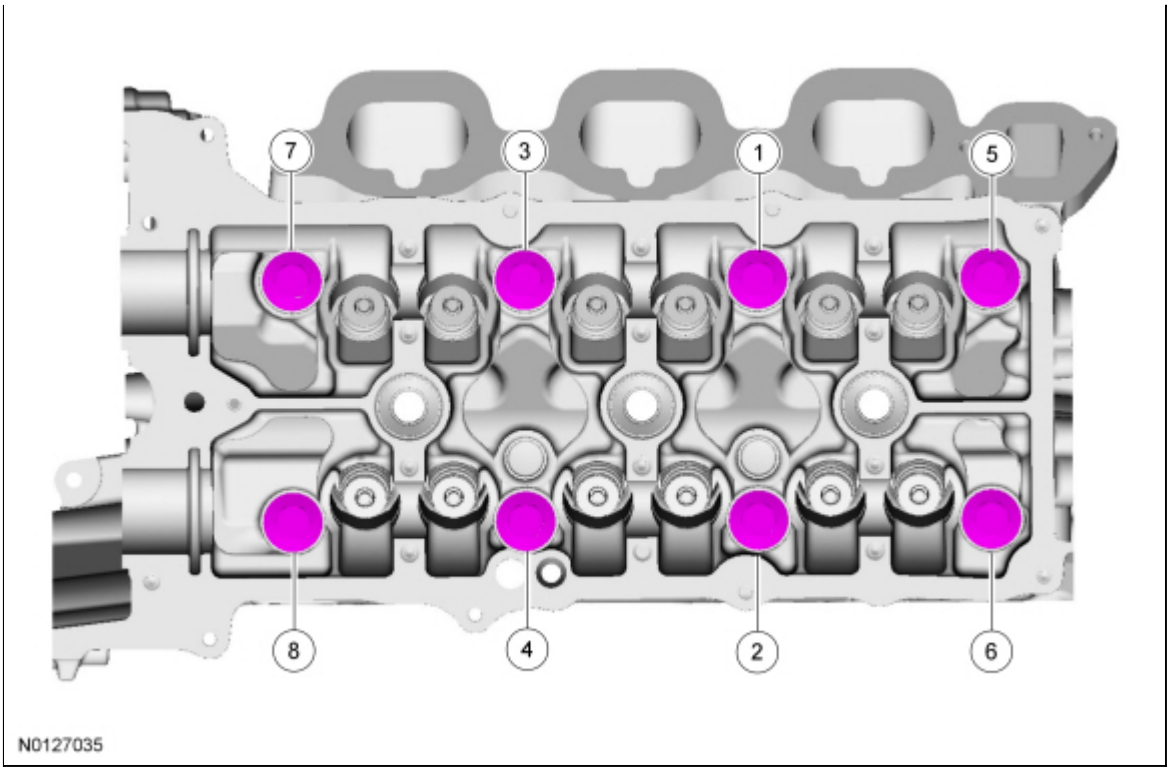
12. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone

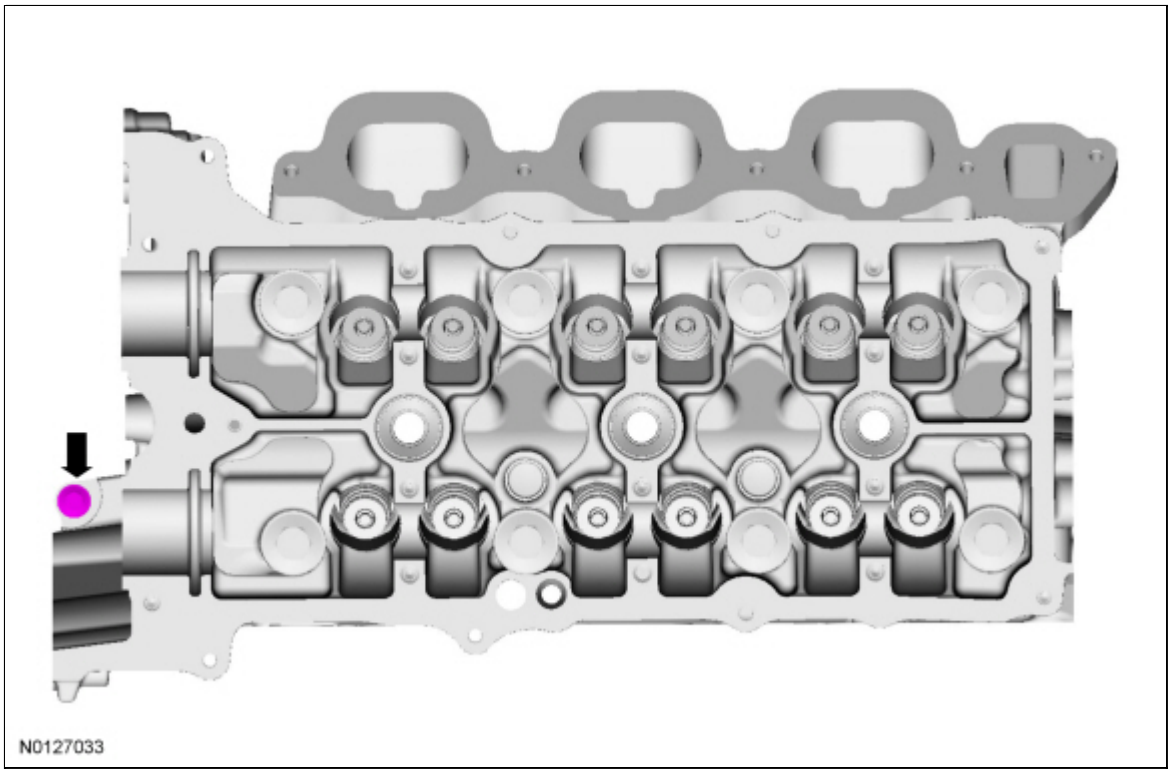
gasket remover may be required if residual traces of silicone or gasket material remain.



4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal

13. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

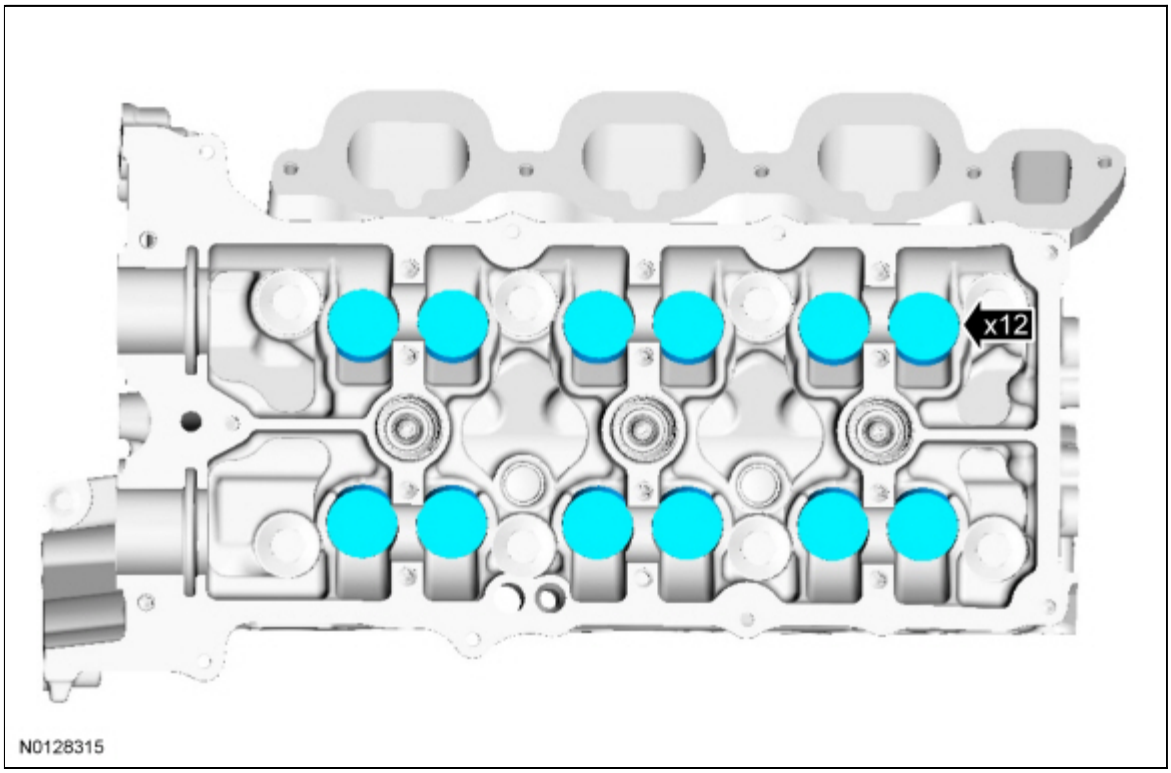
Installation



1. **NOTE:** If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

   Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 35 Nm (26 lb-ft).
   - Stage 3: Tighten 90 degrees.
   - Stage 4: Tighten 90 degrees
   - Stage 5: Tighten 45 degrees.

2. Install the new M6 bolt.
   - Tighten to 10 Nm (89 lb-in).

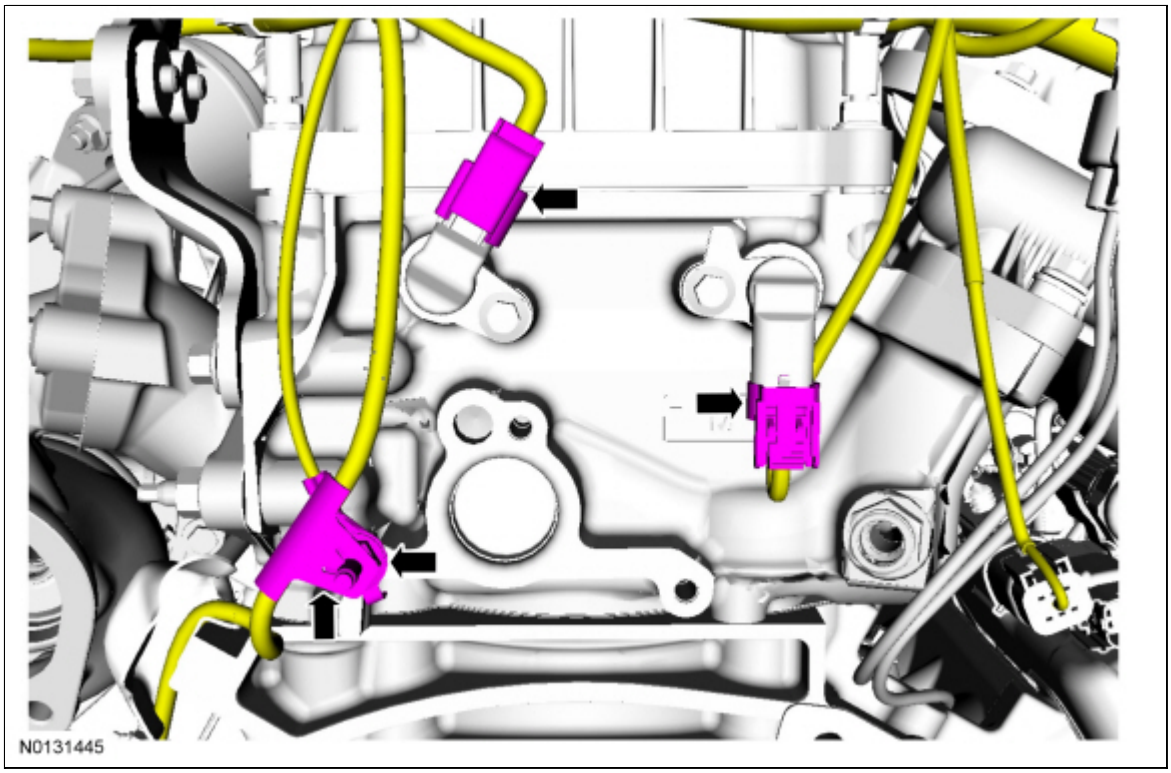


repair4less

3. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the valve tappets.



4. **NOTE:** Lubricate the 2 CMP sensor O-ring seals with clean engine oil.

   Install the 2 LH CMP sensors and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

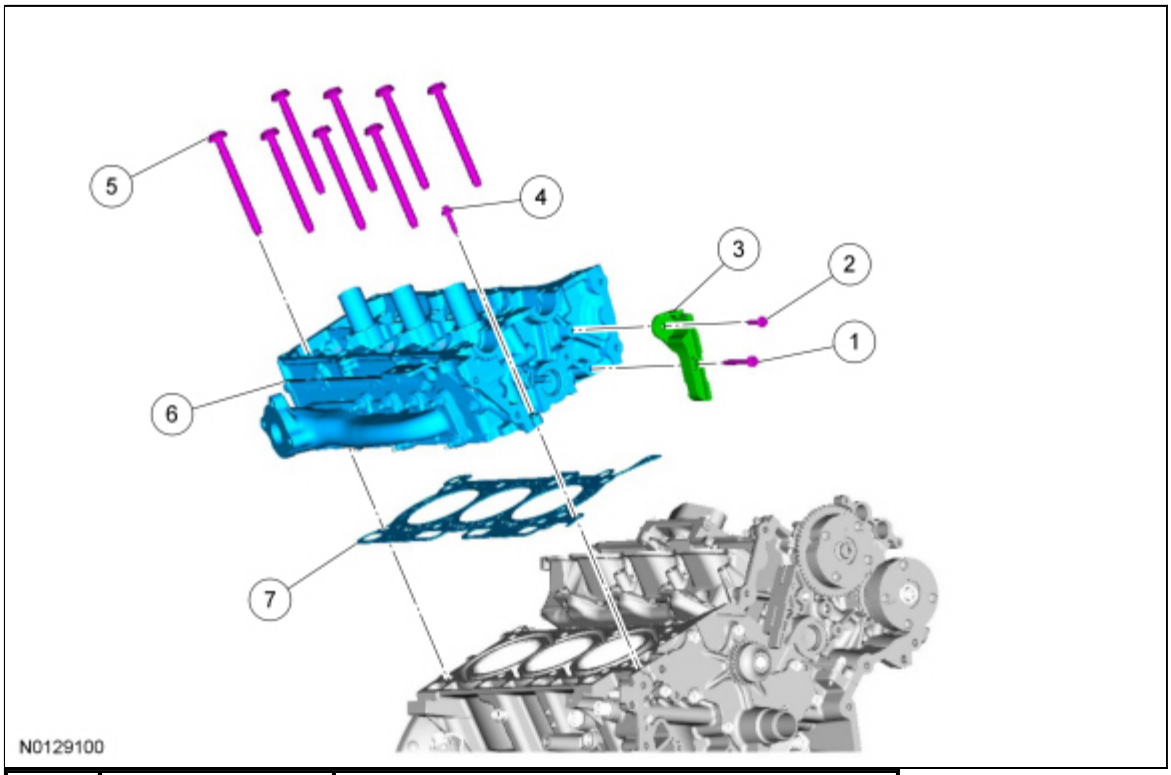
5. Install the ground stud bolt. Position back the CKP wire retainer. Connect the 2 LH CMP sensor electrical connectors.
   - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.

repair4less

6. Install the LH upper primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

7. Install the fuel rail. For additional information, refer to Section 303-04A .

8. Install the LH camshafts. For additional information, refer to Camshaft — LH in this section.



9. Install the LH turbocharger. For additional information, refer to Section 303-04E .

repair4less

Cylinder Head — RH

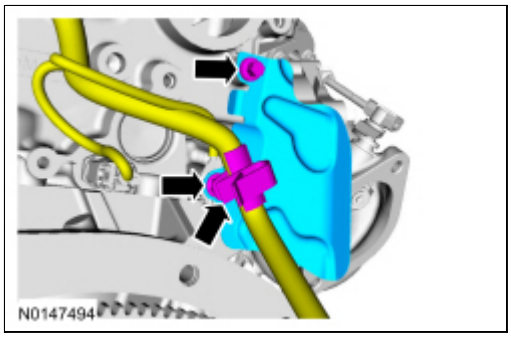
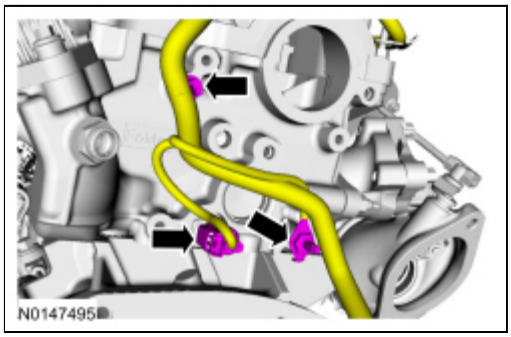
WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.



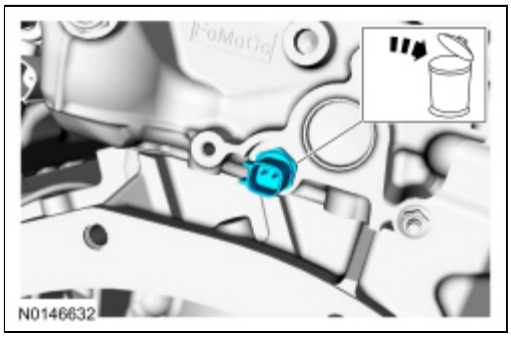
***NOTICE:* During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

NOTE: If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

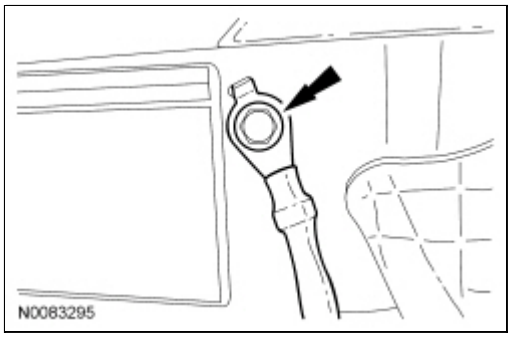


1. Release the fuel pressure. For additional information, refer to Section 310-00 .
2. Remove the RH turbocharger. For additional information, refer to Section 303-04E .
3. Remove the RH camshafts. For additional information, refer to Camshaft — RH in this section.
4. Remove the fuel rail. For additional information, refer to Section 303-04A .
5. ***NOTICE:* Do not use power tools to remove the bolts or damage to the RH primary timing chain guide may occur.**

   Remove the 2 bolts and the RH upper primary timing chain guide.
6. Disconnect the wire retainer. Remove the nut, bolt and the CMP heat shield.

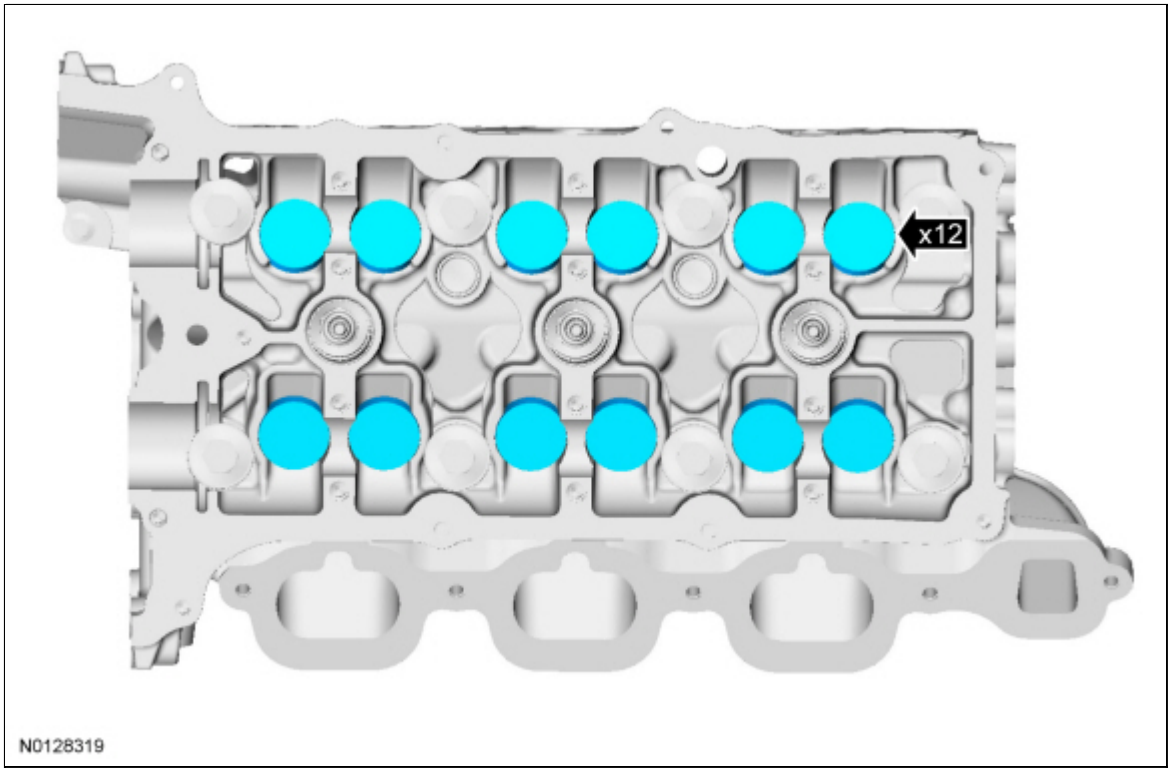


repair4less

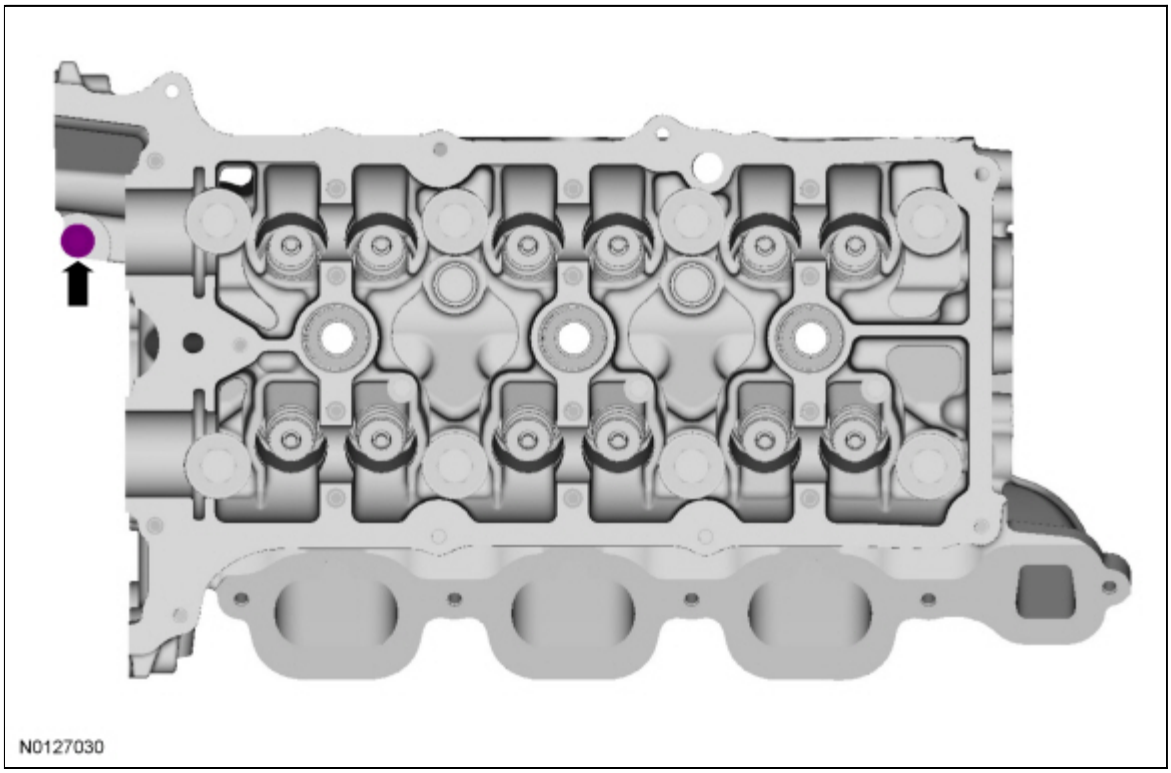


7. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector. Remove the ground stud bolt and the tie strap.

8. Remove and discard CHT sensor.



9. Remove the bolt and position aside the ground strap.

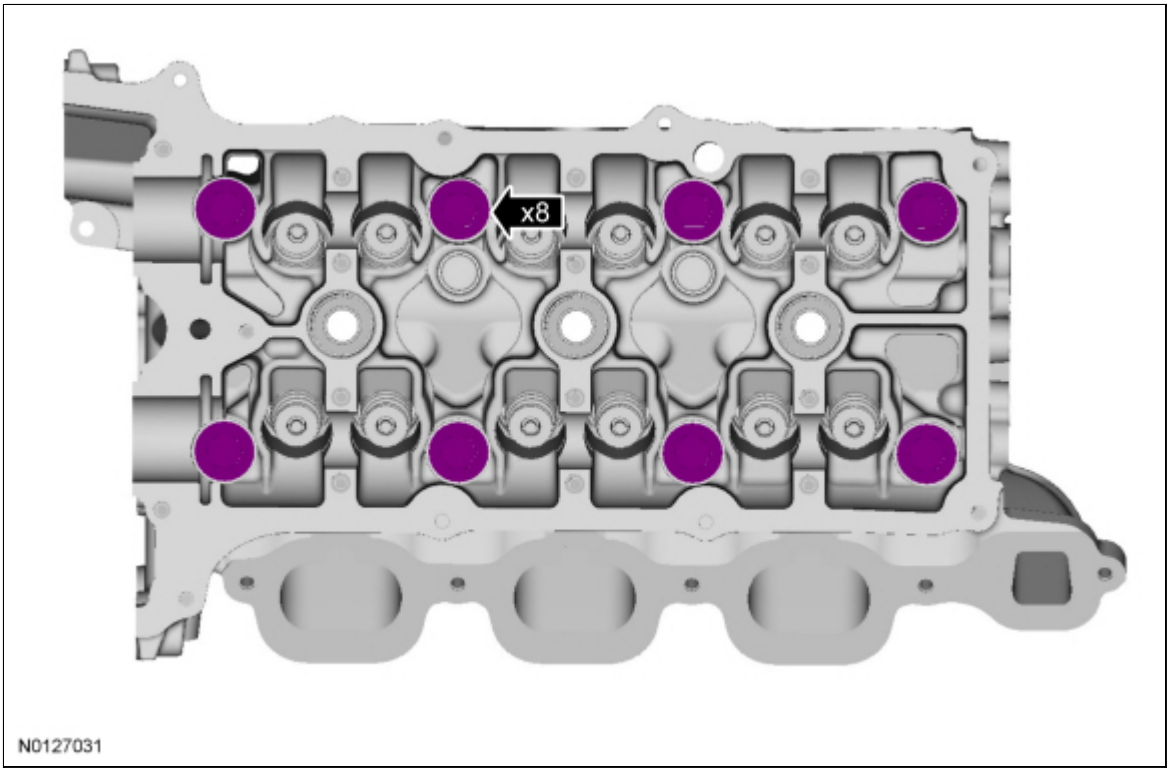


10. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original positions.

Remove the valve tappets form the cylinder head.

11. Inspect the valve tappets. For additional information, refer to Section 303-00 .

12. Remove and discard the M6 bolt.



repair4less

13. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.

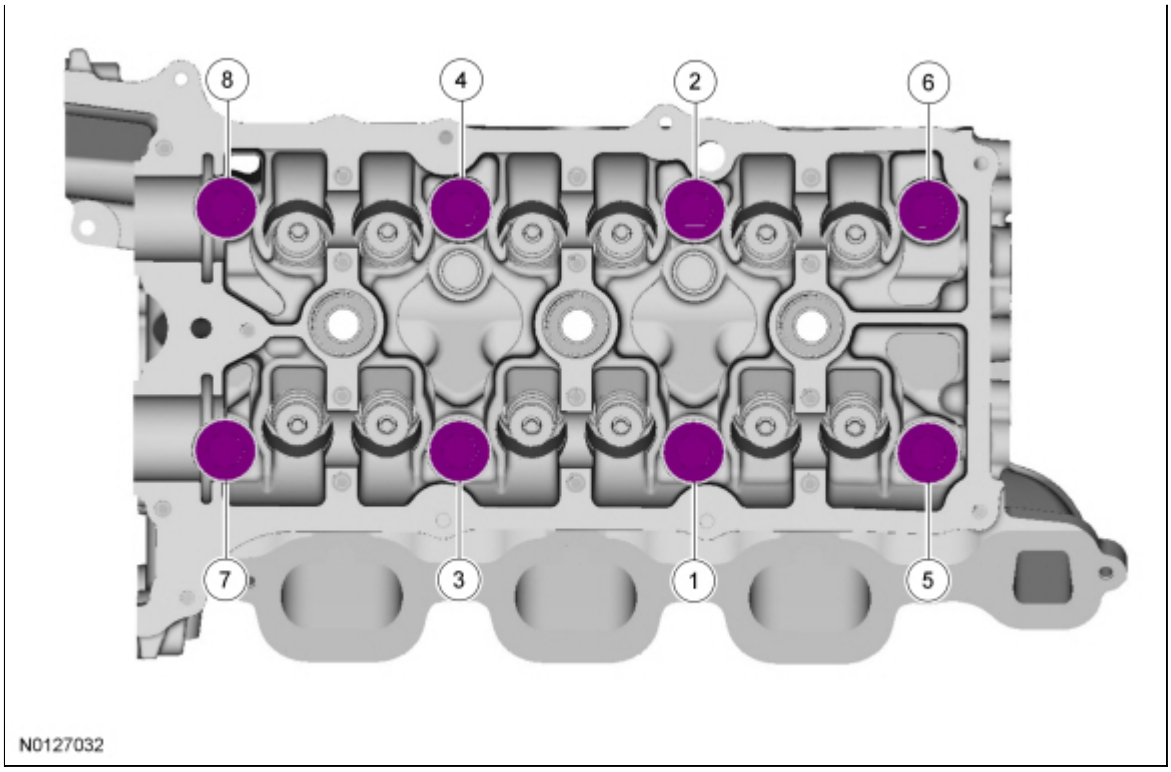
14. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone

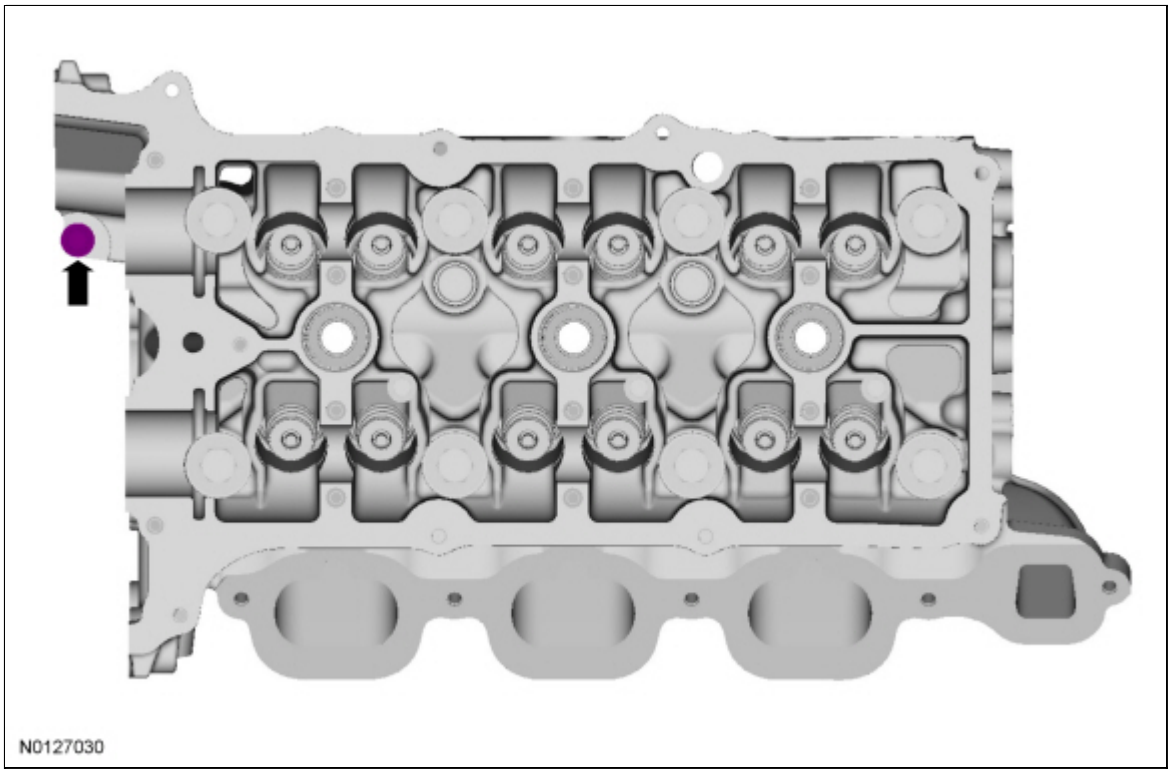
gasket remover may be required if residual traces of silicone or gasket material remain.



4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal

15. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

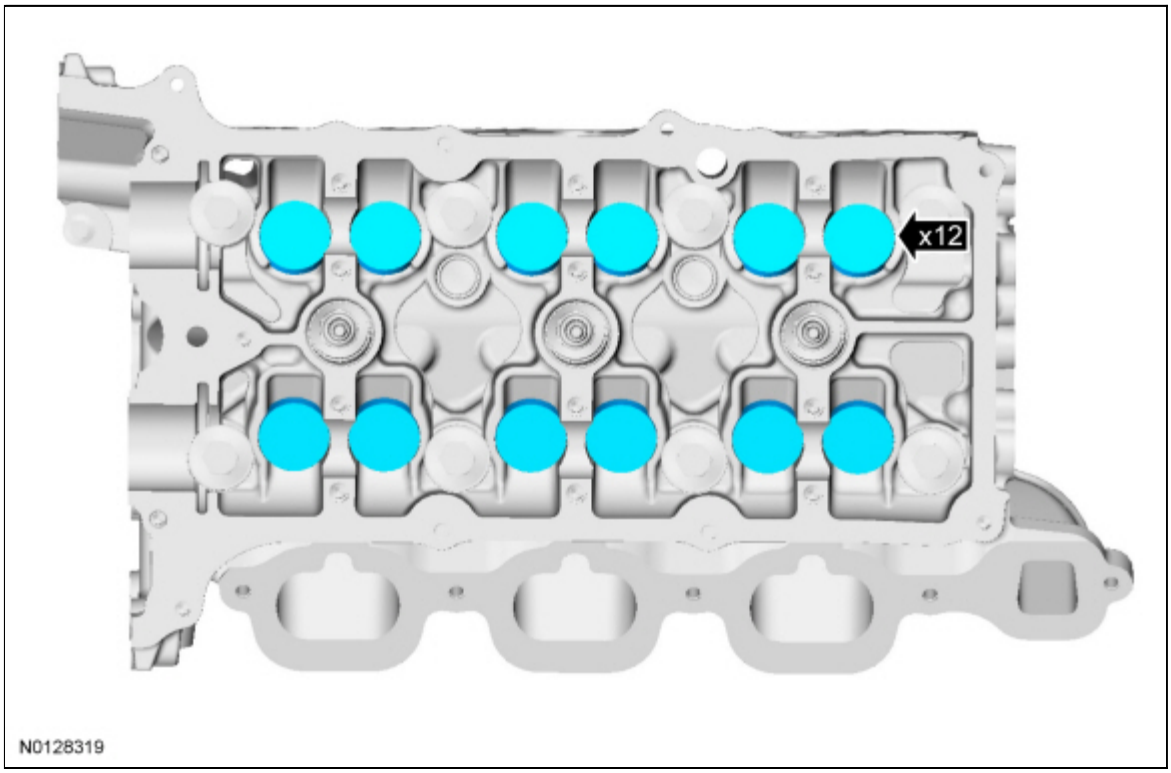
Installation



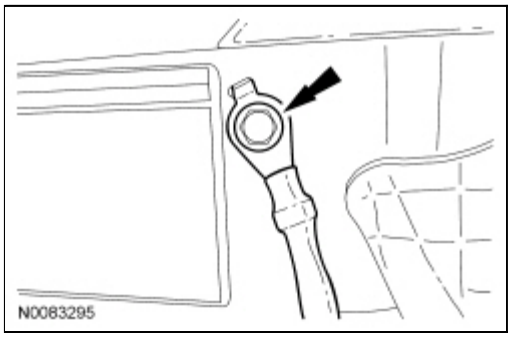
1. **NOTE:** If the cylinder head is replaced, a new secondary timing chain tensioner will need to be installed.

   Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 35 Nm (26 lb-ft).
   - Stage 3: Tighten 90 degrees.
   - Stage 4: Tighten 90 degrees
   - Stage 5: Tighten 45 degrees.

2. Install the new M6 bolt.
   - Tighten to 10 Nm (89 lb-in).



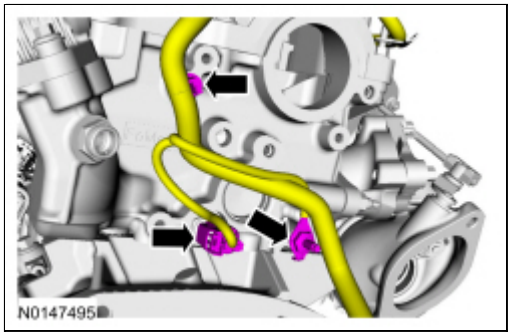
repair4less



3. **NOTE:** The valve tappets must be installed in their original positions.

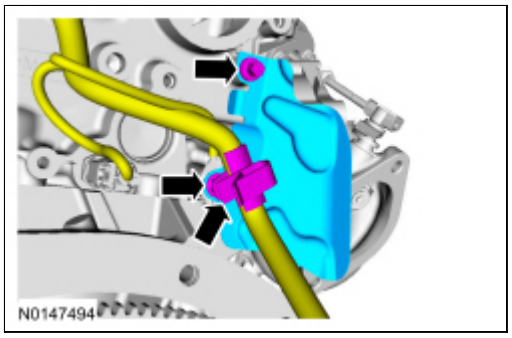
   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the valve tappets.



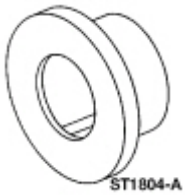
4. Position back the ground strap and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

5. Install a new CHT sensor.
    - Tighten to 11 Nm (97 lb-in).



6. Install the ground stud bolt and the tie strap. Connect the CHT sensor electrical connector.
    - Tighten to 10 Nm (89 lb-in) then an additional 45 degrees.

7. Install the CMP heat shield, nut and the bolt. Connect the wire retainer.
    - Tighten the bolt to 10 Nm (89 lb-in).
    - Tighten the nut to 10 Nm (89 lb-in).



repair4less

8. Install the RH upper primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).
9. Install the fuel rail. For additional information, refer to Section 303-04A .
10. Install the RH camshafts. For additional information, refer to Camshaft — RH in this section.
11. Install the RH turbocharger. For additional information, refer to Section 303-04E .

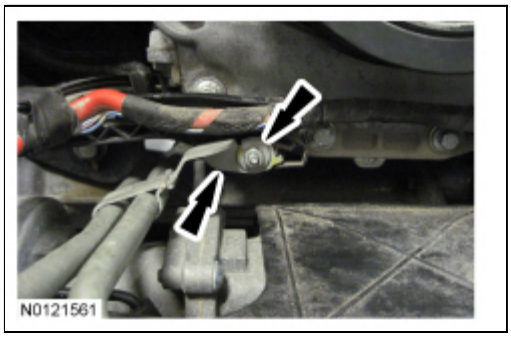
Removal

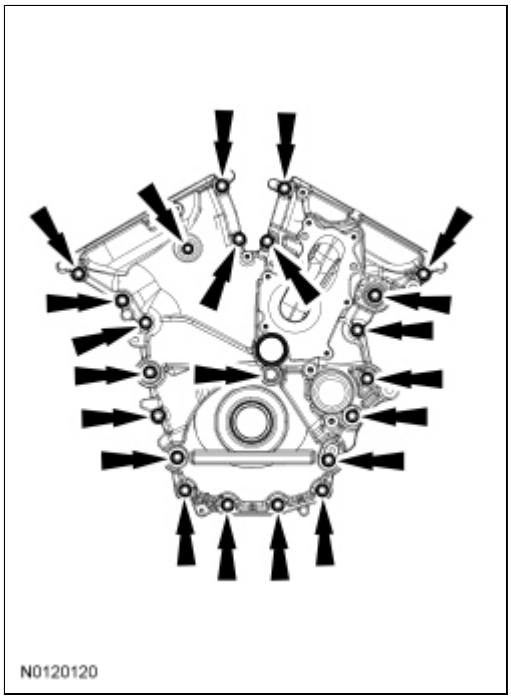
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**



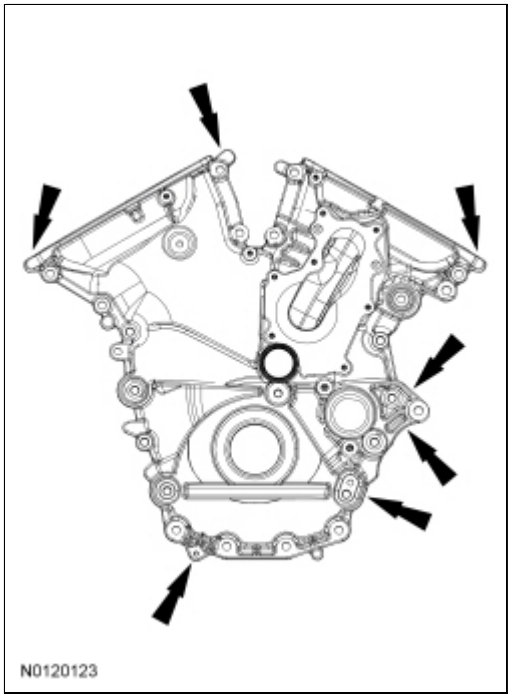
1. Release the fuel pressure. Refer to Section 310-00 .
2. Remove the Charge Air Cooler (CAC)-to-Throttle Body (TB) pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .
3. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
4. Remove the LH and RH valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.
5. Remove the drain plug and drain the engine oil.
   - Install the drain plug and tighten to 27 Nm (20 lb-ft).
6. Remove the coolant pump. For additional information, refer to Section 303-03 .

repair4less

7. Remove the bolt and position the generator aside.
8. Remove the generator stud.
9. Remove the 2 bolts and the accessory drive belt tensioner.
10. Remove the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.
11. Remove the pushpin retainer from the oil pan.

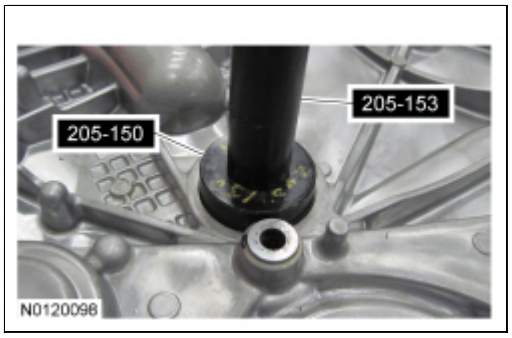


12. Remove the nut and the transmission cooler tube bracket from the engine front cover stud bolt.



13. Disconnect the generator wiring harness from the engine front cover and the stud bolt.

14. Remove the 22 engine front cover bolts.



15. Using a suitable pry tool, locate the 7 pry pads shown and pry the engine front cover loose and remove.

16. **NOTE:** Inspect and replace the front cover radial seal as necessary.

    Using the Spindle Bearing Installer and Handle, remove the front cover radial seal from the rear side of the front cover.

repair4less

Installation

1. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.**

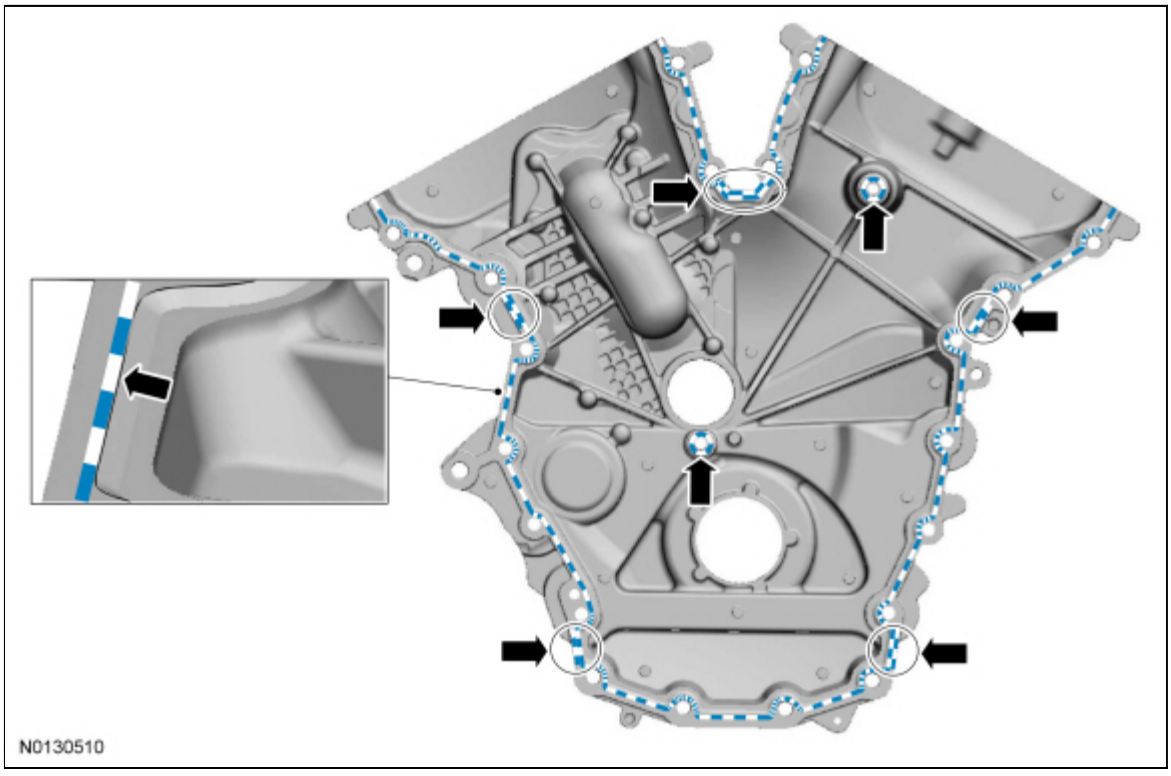
   Clean the engine front cover using 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.
   - Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.

2. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan may cause engine failure.**

   NOTICE: **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. These tools cause contamination that can cause premature engine failure. Remove all traces of sealant, including any sealant from the inner surface of the cylinder block and cylinder head.**

   Clean the sealing surfaces of the cylinder heads, the cylinder block and the oil pan in the following sequence.
   1. Remove any large deposits of silicone or gasket material.
   2. Apply silicone gasket remover and allow to sit for several minutes.
   3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
   4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
   5. Make sure the 2 locating pins are seated correctly in the cylinder block.

3. Using the Spindle Bearing Installer, install a new front cover radial seal from the rear side of the front cover.



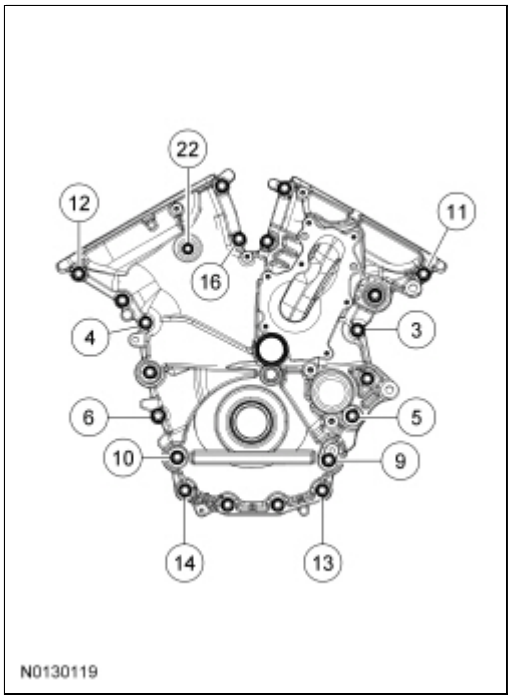
4. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTICE: **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this procedure can cause engine oil leakage.**

   NOTE: The engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 must be installed within 10 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply a 3.0 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the engine front cover to the engine front cover sealing surfaces including the 2 engine front cover bolt bosses.

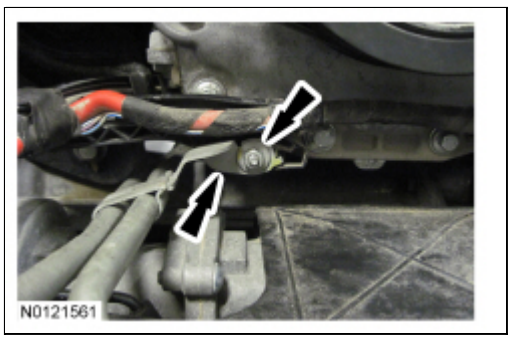
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



repair4less

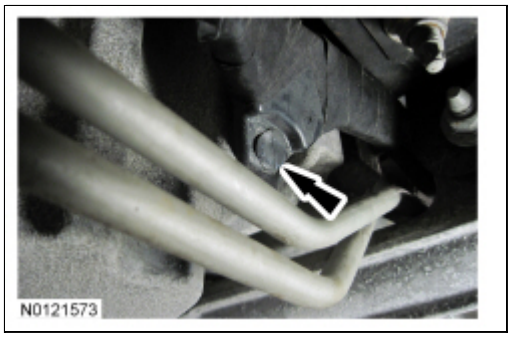
5. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

   Install the engine front cover and bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 and tighten in the sequence shown in 3 stages:
   - Stage 1: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19, 20 and 21 in sequence to 10 Nm (89 lb-in).
   - Stage 2: Tighten bolts 1, 2, 7, 8, 15, 17, 18, 19 and 20 in sequence to 20 Nm (177 lb-in) then an additional 45 degrees.
   - Stage 3: Tighten bolt 21 to 20 Nm (177 lb-in) then an additional 90 degrees.



6. Install the remaining 12 engine front cover bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, 16, 22 and tighten in the sequence shown in 3 stages:
   - Stage 1: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, and 16 to 10 Nm (89 lb-in).
   - Stage 2: Tighten bolts 3, 4, 5, 6, 9, 10, 11, 12, 13, 14, and 16 to 20 Nm (177 lb-in) then an additional 45 degrees.
   - Stage 3: Tighten bolt 22 to 10 Nm (89 lb-in) then an additional 45 degrees.

7. Position the generator wiring harness on the stud bolt and clip the engine harness on the engine front cover.



8. Install the transmission cooler tube bracket and the nut on the engine front cover stud bolt.
    - Tighten to 12 Nm (106 lb-in).

9. Install the pushpin retainer into the oil pan.

repair4less

10. Install the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.

11. Install the accessory drive belt tensioner and 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

12. Install the generator stud.
    - Tighten to 8 Nm (71 lb-in).

13. Position back the generator and install the bolt.
    - Tighten to 48 Nm (35 lb-ft).

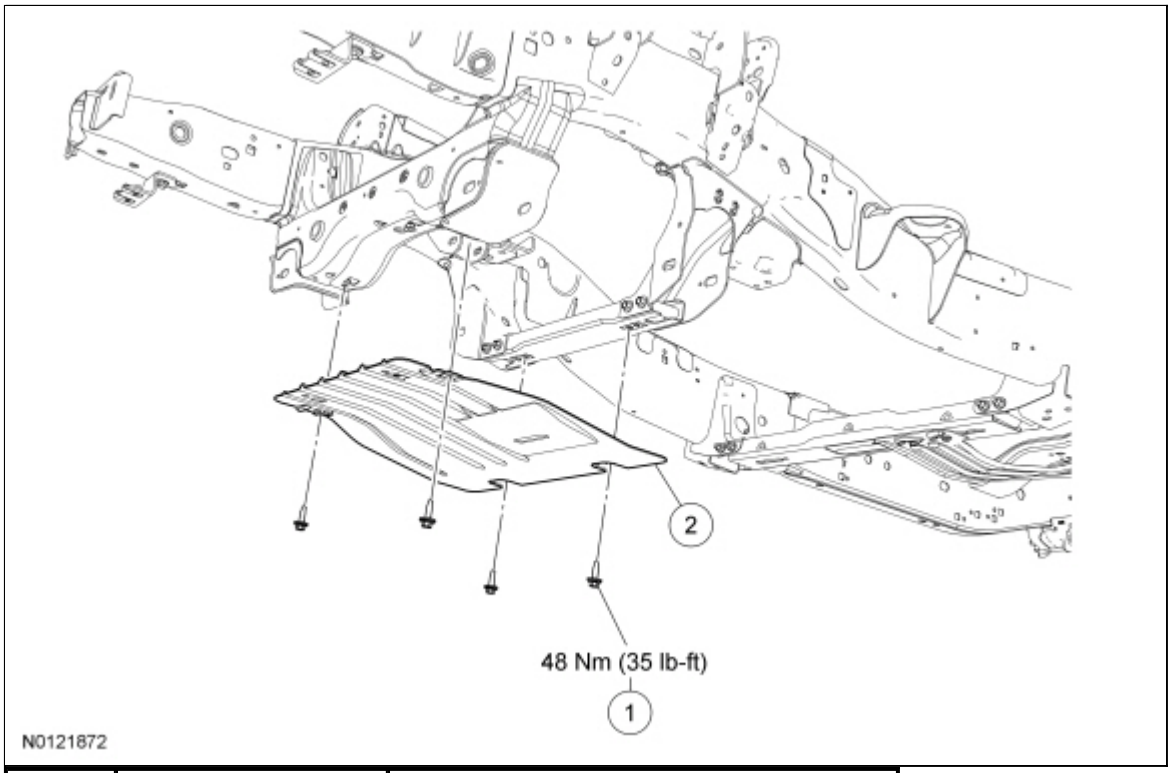
14. Install the coolant pump. For additional information, refer to Section 303-03 .

15. Install the LH and RH valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.

16. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

17. Install the CAC -to- TB pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .

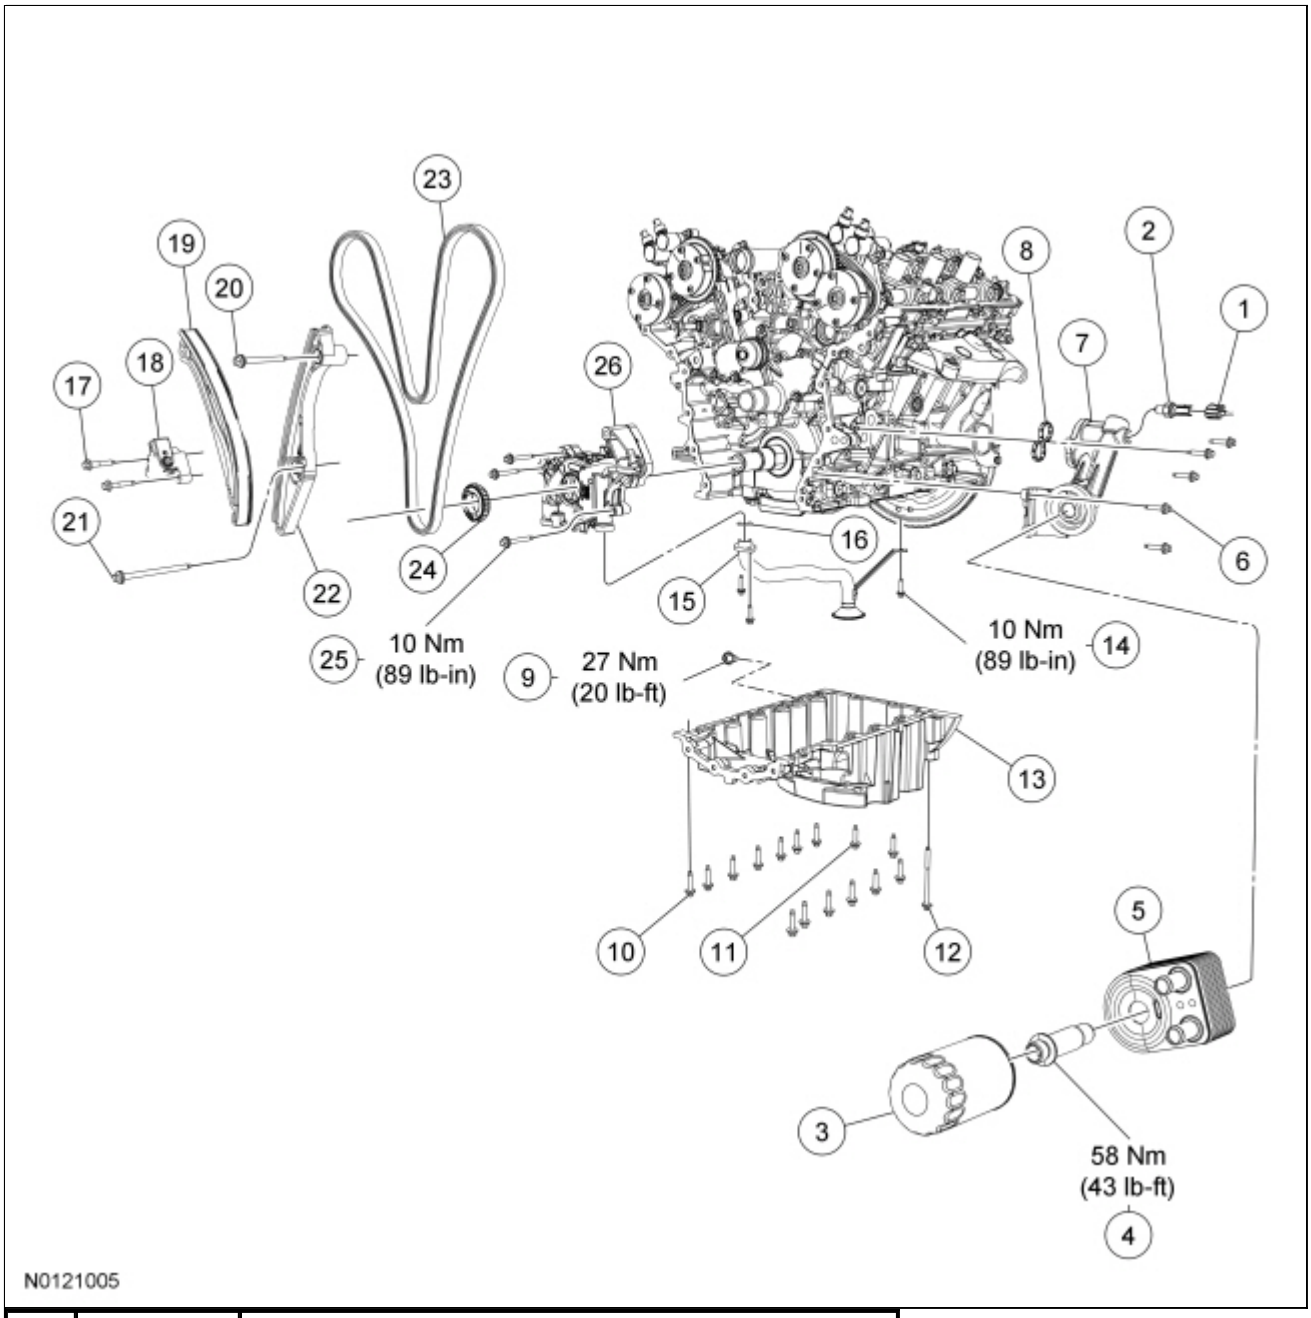
18. Connect the battery ground cable. For additional information, refer to Section 414-01 .



19. Fill the engine with clean engine oil.

repair4less

Engine Lubrication Components — Exploded View



Skid Plate

NOTE: For vehicles equipped with skid plate.

Item	Part Number	Description
1	W706894	Skid plate bolt (4 required)
2	5D032	Skid plate

Engine Lubrication Components

Item	Part Number	Description
1	—	Engine Oil Pressure (EOP) switch electrical connector (part of 14A411)
2	9278	EOP switch
3	6731	Engine oil filter
4	6L626	Oil cooler insert bolt
5	6A642	Oil cooler
6	W503278	Oil filter adapter bolt (5 required)
7	6881	Oil filter adapter
8	6840	Oil filter adapter gasket

repair4less

9	6730	Oil pan drain plug
10	W712943	Oil pan bolt (13 required)
11	W503279	Oil pan bolt (2 required)
12	W708221	Oil pan bolt
13	6675	Oil pan
14	W503278	Oil pump screen and pickup tube bolt (3 required)
15	6622	Oil pump screen and pickup tube
16	6625	Oil pump screen and pickup tube O-ring seal
17	W500300	Primary timing chain tensioner bolt (2 required)
18	6L266	Primary timing chain tensioner
19	6K255	RH primary timing chain tensioner arm
20	W503284	LH primary timing chain guide bolt
21	W714094	LH primary timing chain guide bolt
22	6B274	LH primary timing chain guide
23	6268	Primary timing chain
24	6306	Crankshaft timing sprocket
25	W503282	Oil pump bolt (3 required)
26	6600	Oil pump

1. Refer to the procedures and/or exploded views in this section for any Warnings, Notices, Notes, Materials, Specifications, and Special Tools. Items in the exploded views may not be listed in order of removal.

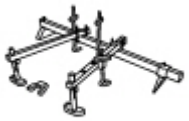
Engine Oil Pressure (EOP) Switch

Material

Item	Specification
Motorcraft® Thread Sealant with PTFE TA-24	WSK-M2G350-A2

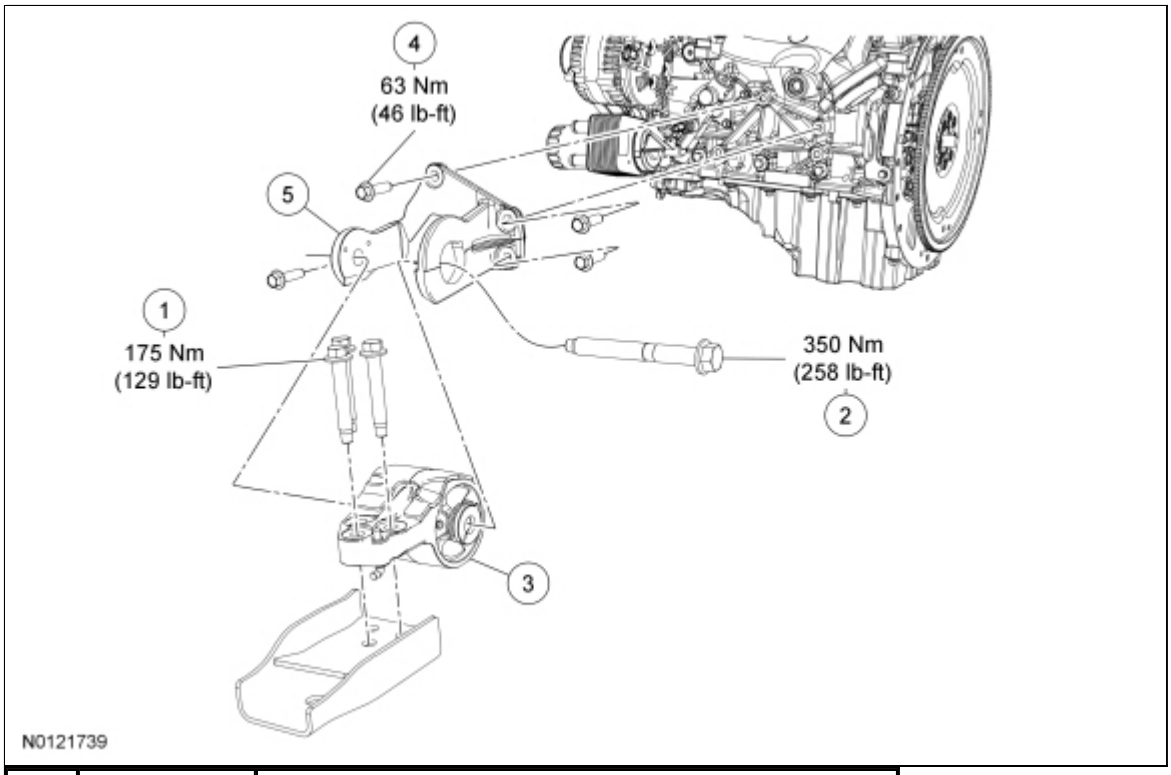
Removal and Installation

1. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.



2. Remove the EOP switch.
   - To install, tighten to 14 Nm (124 lb-in) then an additional 180 degrees.

3. To install, reverse the removal procedure.
   - Apply thread sealant with PTFE to the EOP switch threads prior to installation.

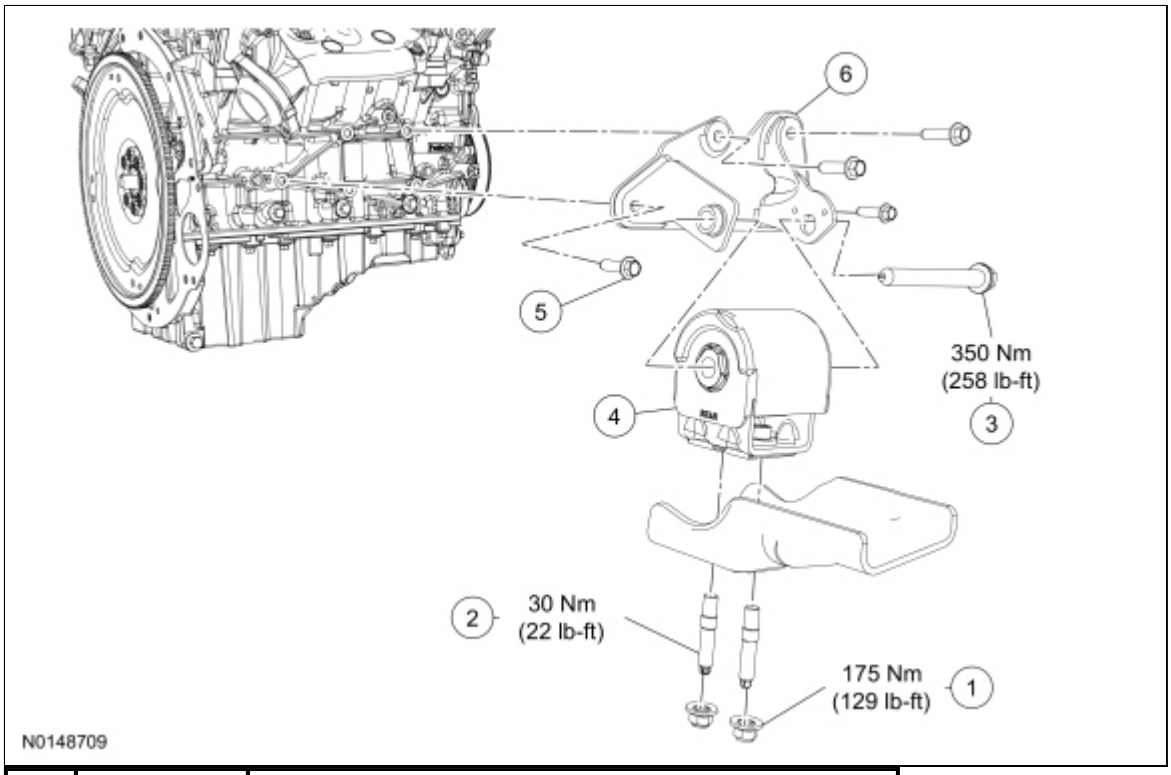


repair4less

Engine Support Insulators

Special Tool(s)

 ST3101-A	Bar, Engine Spreader 303-1454
 ST3265-A	Lift Eye, Right Front 303-1566
 ST2176-A	Support Bar, Engine 303-F070



Engine Support Insulator — LH

Item	Part Number	Description
1	W713244	LH engine support insulator bolt (3 required)
2	W715211	LH engine support insulator through bolt
3	6038	LH engine support insulator
4	W714735	LH engine support insulator bracket bolt (3 required)
5	6038	LH engine support insulator bracket

Engine Support Insulator — RH

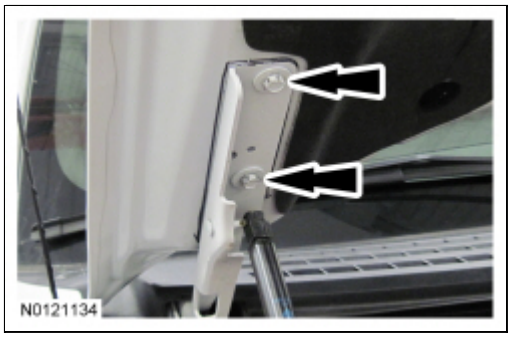
repair4less

Item	Part Number	Description
1	W707251	RH engine support insulator nut (2 required)
2	—	RH engine support insulator stud (part of 6038) (2 required)
3	—	RH engine support insulator through bolt (part of 6038)
4	6038	RH engine support insulator
5	W714735	RH engine support insulator bracket bolt (4 required)
6	—	RH engine support insulator bracket (part of 6038)

Removal

NOTICE: **Use care when positioning the front axle housing or the vacuum lines to the axle solenoid may become disconnected or damaged.**

NOTE: Discard all engine support insulator fasteners and install new fasteners.



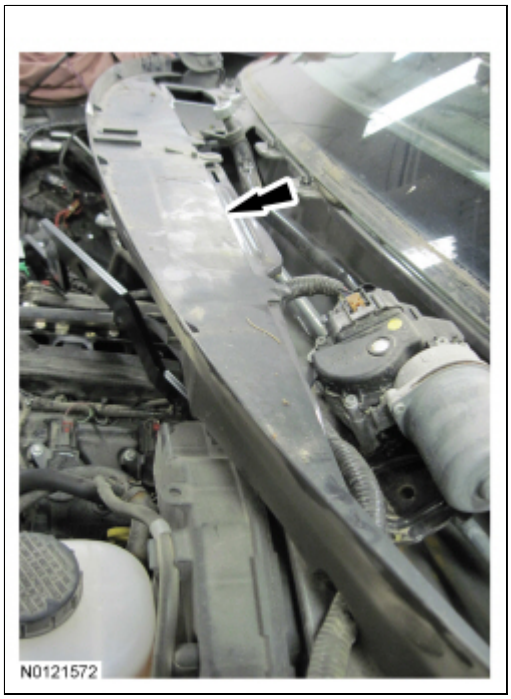
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

   NOTE: RH shown, LH similar.

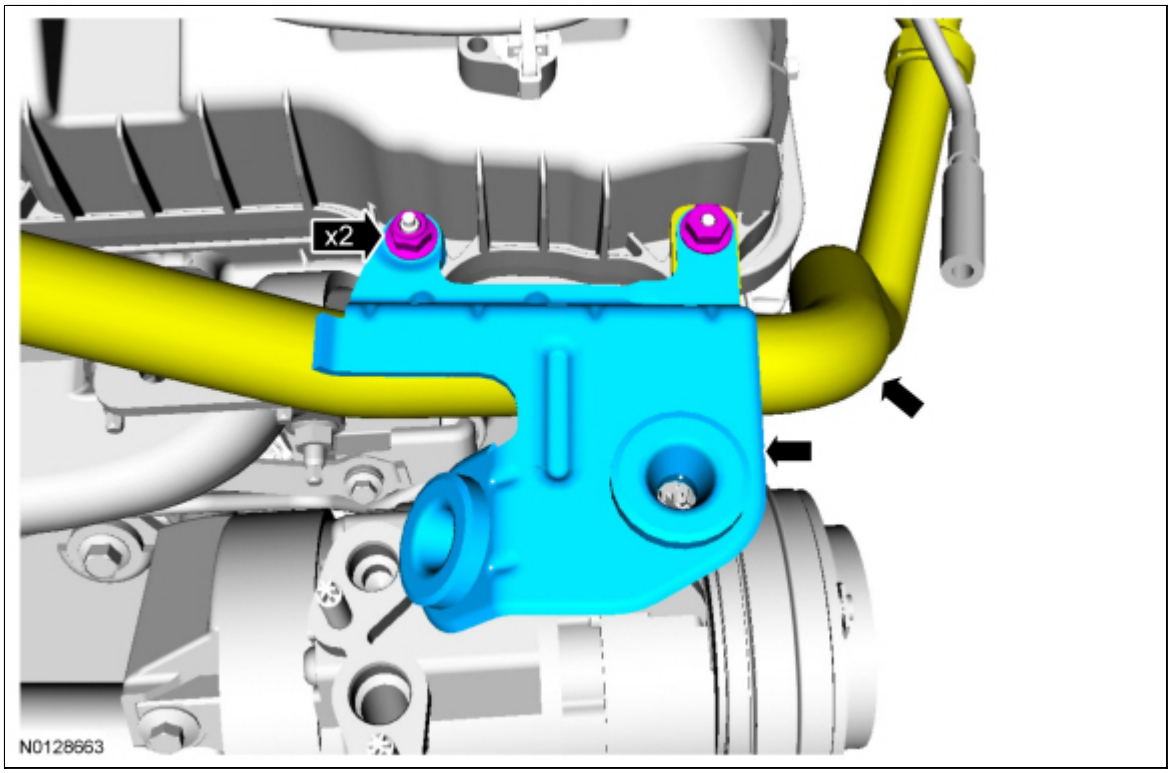
   Remove the 4 bolts (2 shown) and the hood.



3. Remove the Air Cleaner (ACL) outlet pipe, ACL pipe-to-turbocharger pipes, turbocharger bypass hoses and the turbocharger-to- Charge Air Cooler (CAC) pipes. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .

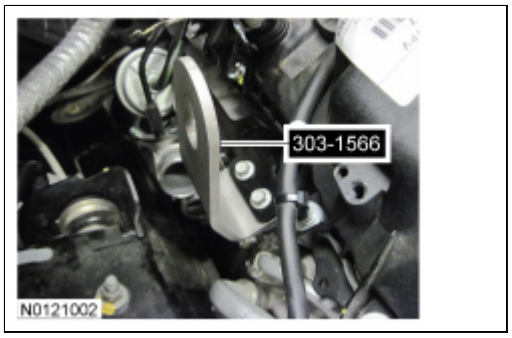
4. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.

5. Remove the high-pressure fuel pump. For addition information, refer to Section 303-04A .

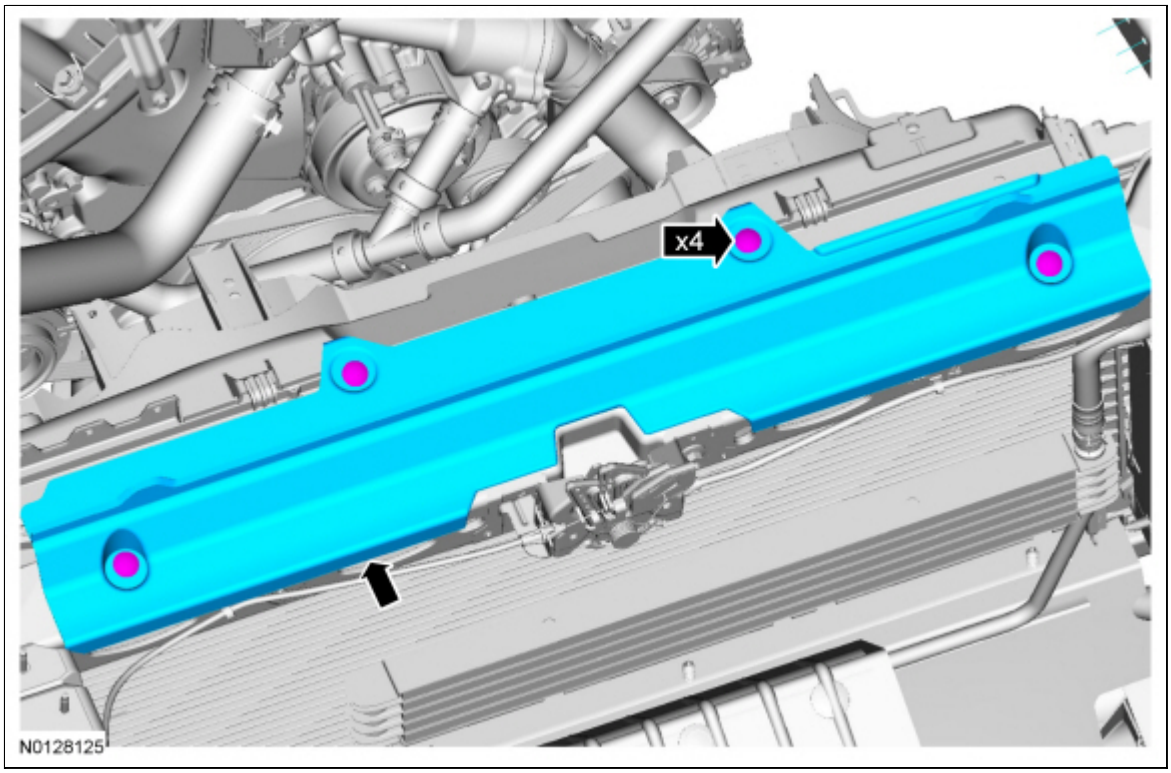


6. Remove the cowl panel grille. For additional information, refer to Section 501-02 .

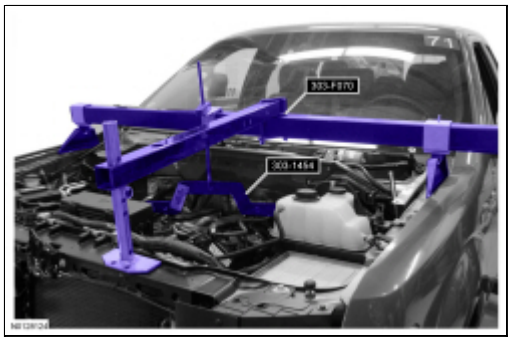
7. Remove the 6 screws and release the 2 cowl panel clips and remove the cowl panel.



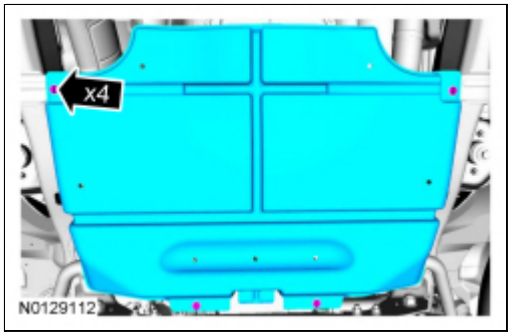
8. Remove the 2 nuts and the Charge Air Cooler (CAC) tube bracket.
    - Disconnect the coolant hose from the valve cover stud.



repair4less



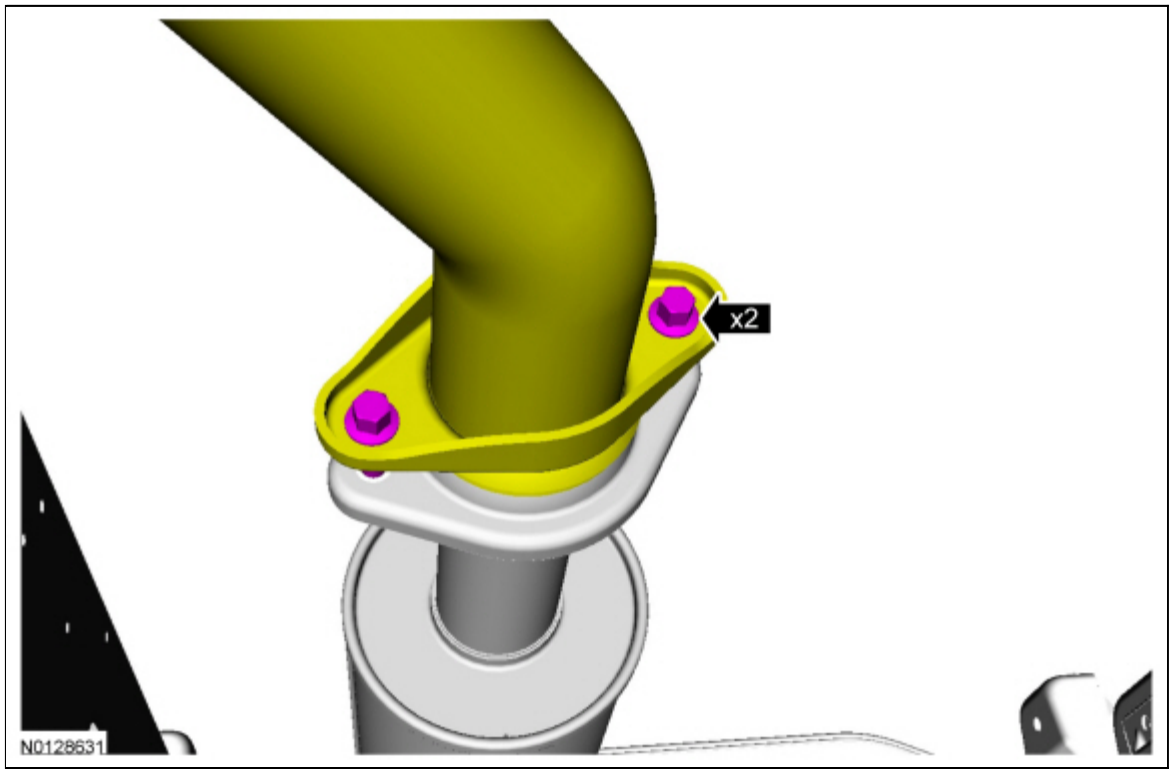
9. Install the Right Front Lift Eye and 2 bolts.



10. Remove the 4 pushpins and the upper radiator air deflector.

11. Install the Engine Support Bar.

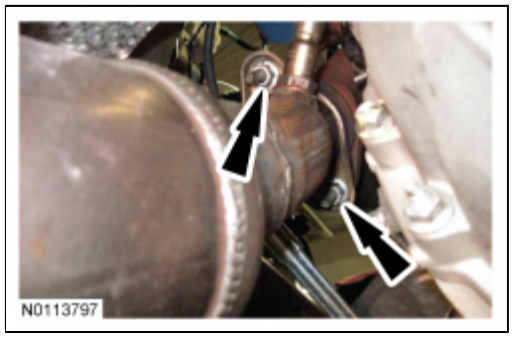
12. Release the 4 fasteners and remove the splash shield.



13. Remove the 4 bolts and the skid plate.

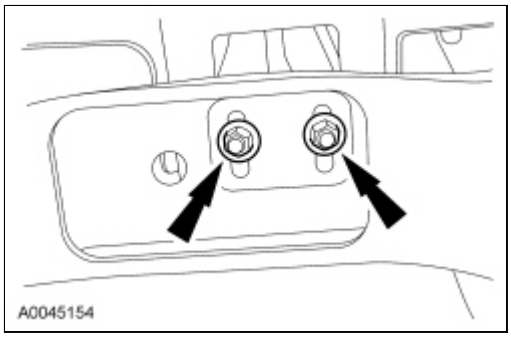
14. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .

repair4less



15. ***NOTICE:*** **Support the exhaust intermediate pipe prior to removing the bolts or damage to the flex pipe may occur.**

    Remove the 2 exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolts and separate.
    - Discard the 2 bolts.



16. **NOTE:** LH shown, RH similar.

    Remove and discard the 2 LH and the 2 RH catalytic converter-to-turbocharger nuts.

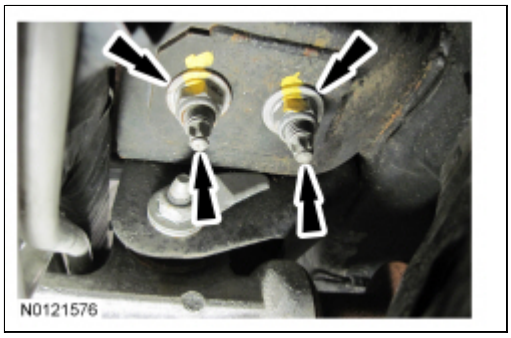
17. ***NOTICE:*** **Only use hand tools when removing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

    Loosen the 2 transmission mount-to-crossmember nuts.

RH engine support insulator

18. Remove the Air Conditioning (A/C) compressor belt . For additional information, refer to Section 303-05 .

19. Remove the 3 bolts and position the A/C compressor aside.



20. Remove the starter. For additional information, refer to Section 303-06 .

21. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Remove and discard the RH and LH engine support insulator through bolts.

22. Remove and discard the 2 RH engine support insulator nuts and the 2 studs.

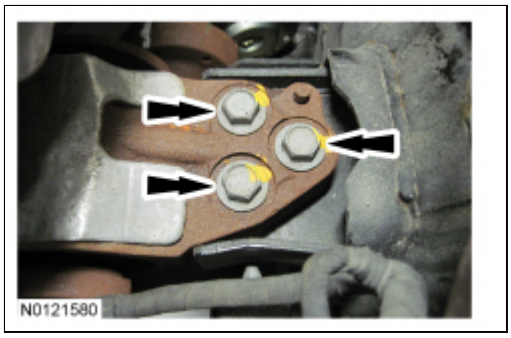
repair4less

23. Raise the engine approximately 30 mm (1.18 in).

24. Remove the 4 bolts and the RH engine support insulator-to-cylinder block bracket.
    - Discard the bolts.

25. Remove the RH engine support insulator.

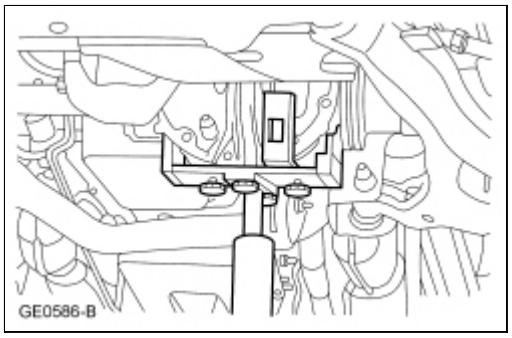
LH engine support insulator



26. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

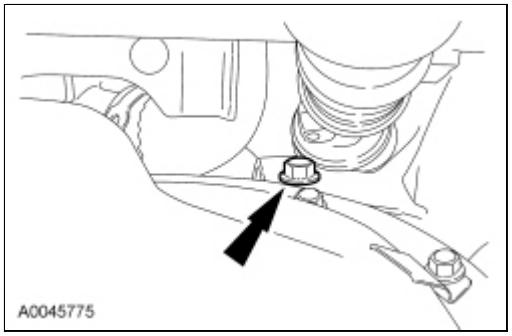
    Remove and discard the LH and RH engine support insulator through bolts.

27. Raise the engine approximately 30 mm (1.18 in).

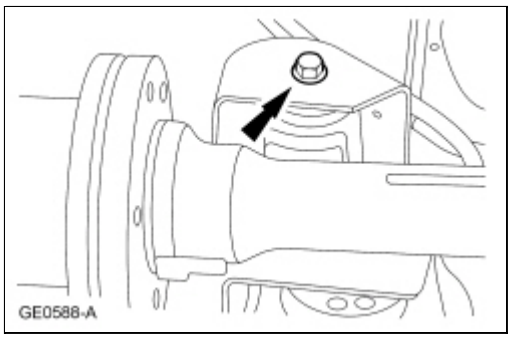


28. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

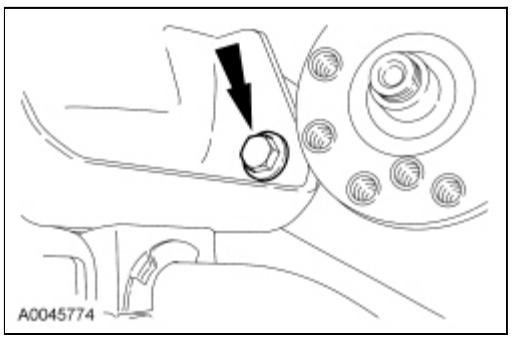
    Remove and discard the 3 LH engine support insulator-to-frame bolts.



Four-Wheel Drive (4WD) — LH engine support insulator



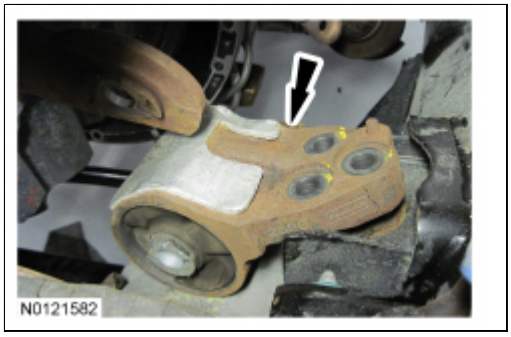
29. Position a suitable hydraulic jack under the front axle. Securely strap the axle to the jack.



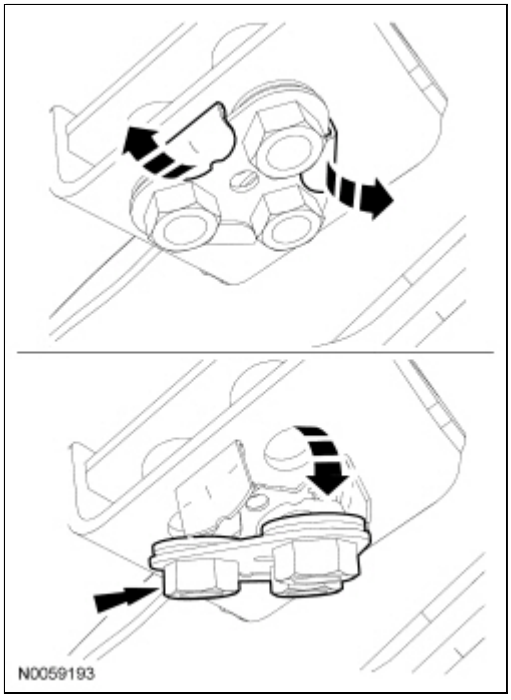
30. Remove the upper front axle carrier mounting bushing bolt.

31. Remove the axle shaft housing carrier bushing bolt.

32. Remove the lower front axle carrier mounting bushing bolt.



33. Lower the front axle to allow clearance to the LH engine support insulator.

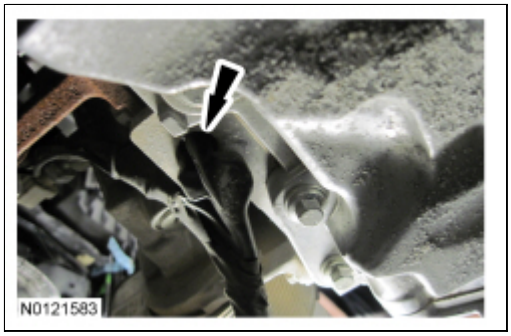


LH engine support insulator

repair4less

34. Remove the LH engine support insulator.

35. Inspect the engine support insulator-to-frame nut plate for thread damage. If the nut plate is damaged, bend 2 tabs back and remove the nut plate. Replace the nut plate with service part number 56190 and bend the 2 tabs back to the original position.



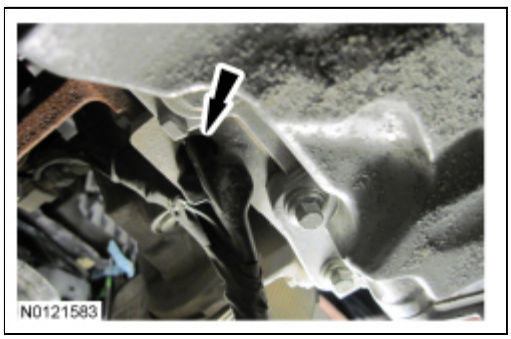
NOTE: If necessary, the following 3 steps are to remove the LH engine support insulator-to-cylinder block bracket.

36. Detach the generator wiring harness from the engine front cover.
    - Detach the generator wiring harness retainer from the oil filter adapter.

37. Detach the generator wiring harness retainer from the lower LH side of the engine block.

38. Remove the 4 bolts and the LH engine support insulator-to-cylinder block bracket.
    - Discard the bolts.

Installation



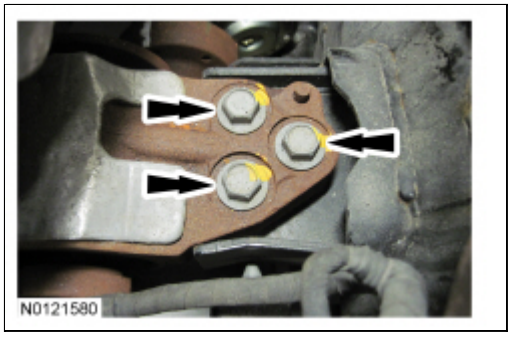
LH engine support insulator

1. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

NOTE: If removed, the following 3 steps are to install the LH engine support insulator-to-cylinder block bracket.

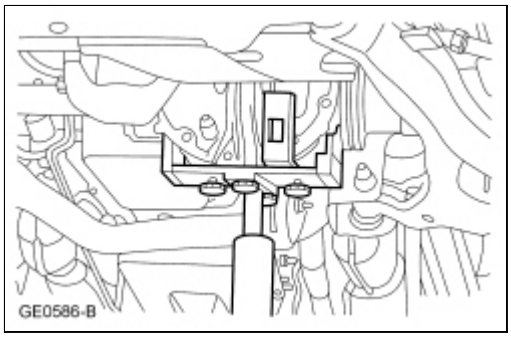
2. Install the LH engine support insulator-to-cylinder block bracket and install the 4 new bolts.
    - Tighten to 63 Nm (46 lb-ft).

3. Attach the generator wiring harness retainer to the lower LH side of the engine block.

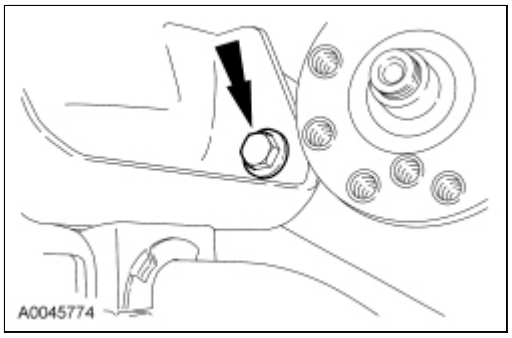


repair4less

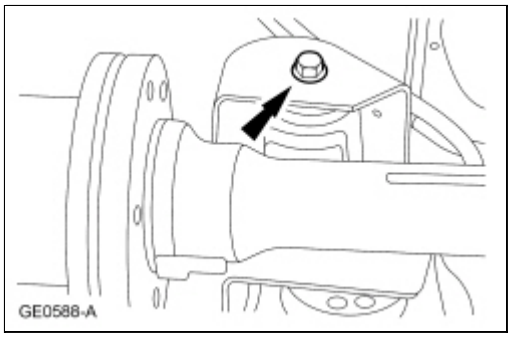
4. Attach the generator wiring harness to the engine front cover.
    - Attach the generator wiring harness retainer to the oil filter adapter.



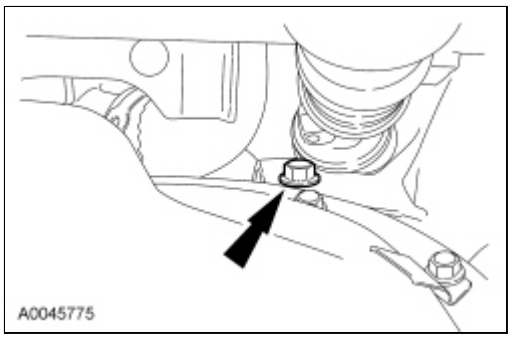
5. Position the LH engine support insulator and hand start the 3 new engine support insulator-to-frame bolts.
    - Do not torque at this time.



4WD — LH engine support insulator



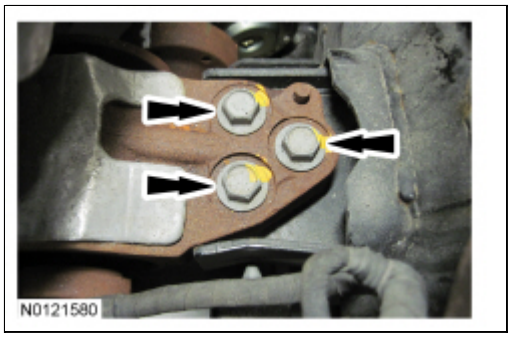
6. Raise the front axle carrier into position.



7. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

8. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

9. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



LH engine support insulator

10. ***NOTICE:*** **Only use hand tools when removing or installing the engine support insulator-to-frame bolts or damage to the engine support insulator-to-frame nut plate can occur.**

    Tighten the 3 LH engine support insulator-to-frame bolts to 175 Nm (129 lb-ft).

repair4less

11. Lower the engine to the installed position.

12. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Install the new RH and LH engine support insulator through bolts.
    - Tighten to 350 Nm (258 lb-ft).

RH engine support insulator

13. Clean the engine support insulator-to-cylinder block and engine support insulator-to-frame mating surfaces of any dirt or foreign material prior to installation.

14. Position the RH engine support insulator into the vehicle

15. Position the RH engine support insulator-to-cylinder block bracket and install the 4 new bolts.
    - For standard payload package, tighten to 63 Nm (46 lb-ft).
    - For heavy duty payload package, tighten to 77 Nm (57 lb-ft).

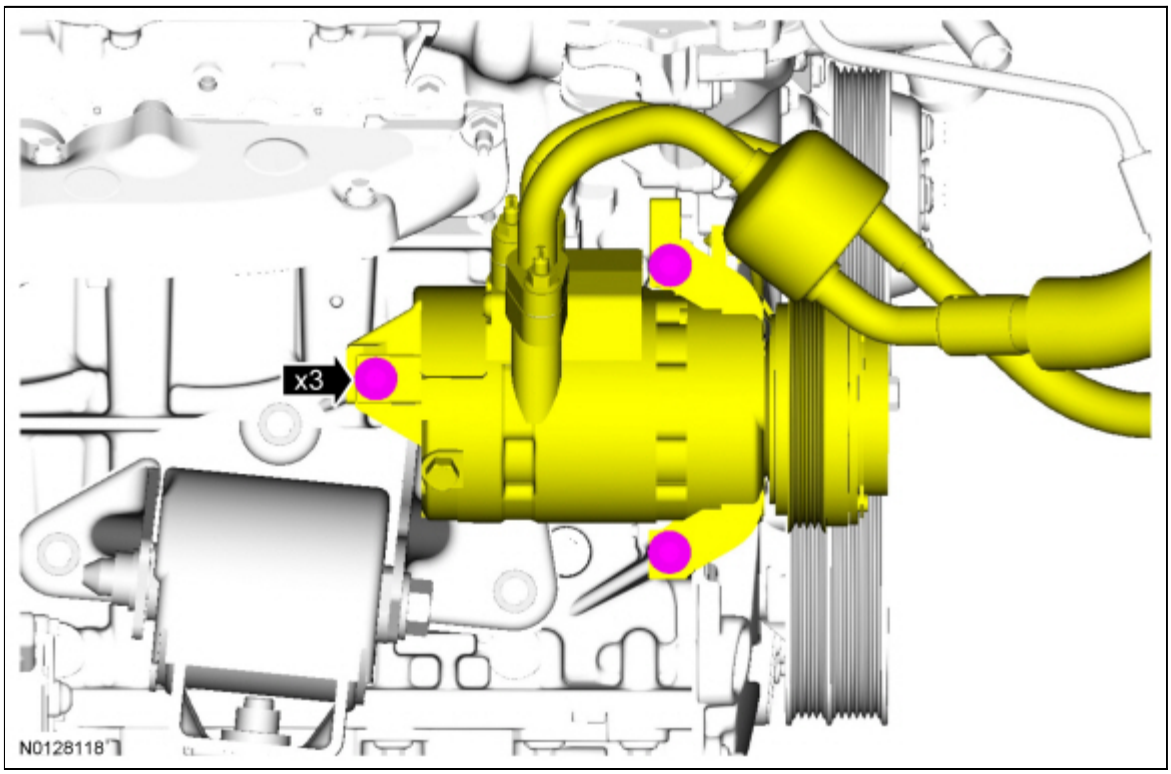
16. ***NOTICE:*** **Only use hand tools when installing the engine support insulator stud bolts or damage to the engine support insulator can occur.**

    Install the 2 new RH engine support insulator studs.
    - Tighten to 30 Nm (22 lb-ft).

17. ***NOTICE:*** **Only use hand tools when installing the RH engine support insulator nuts or damage to the engine support insulator can occur.**

    Install the 2 new RH engine support insulator nuts.
    - Tighten to 175 Nm (129 lb-ft).

18. Lower the engine to the installed position.



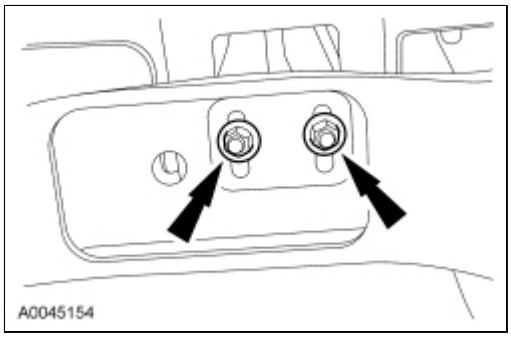
19. ***NOTICE:*** **Only use hand tools when loosening or tightening the engine support insulator through bolts or damage to the engine support insulator-to-cylinder block bracket can occur.**

    Install the new RH and LH engine support insulator through bolts.
    - Tighten to 350 Nm (258 lb-ft).

20. Install the starter. For additional information, refer to Section 303-06 .

21. Position the A/C compressor and install the 3 bolts.

- Tighten to 25 Nm (18 lb-ft).

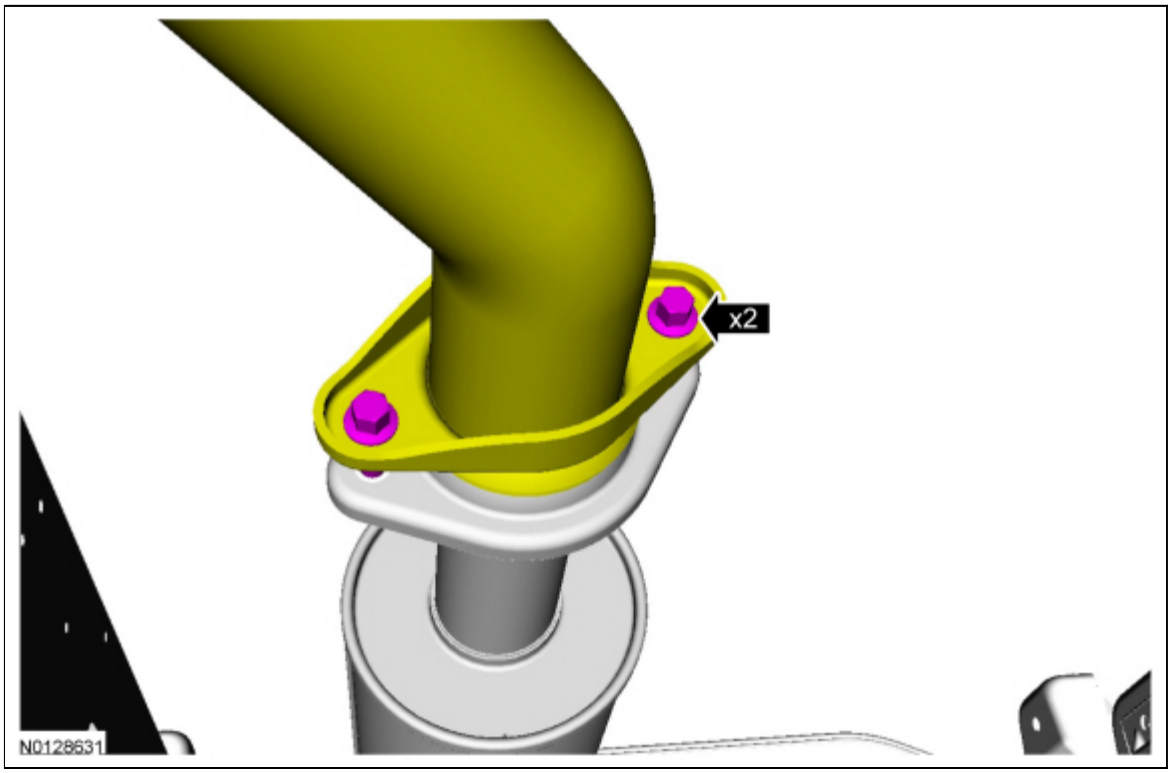


22. Install the A/C compressor belt. For additional information, refer to Section 303-05 .

All vehicles

23. ***NOTICE:*** **Only use hand tools when installing the transmission mount-to-crossmember nuts or damage to the transmission mount can occur.**

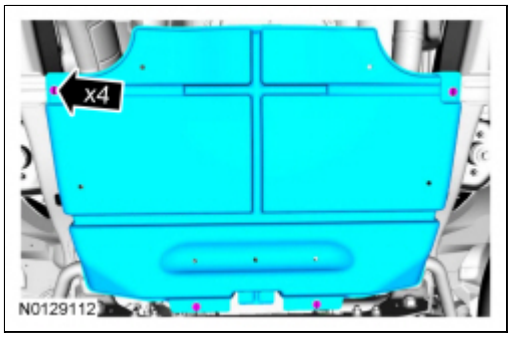
    Tighten the 2 transmission mount-to-crossmember nuts.
    - Tighten to 103 Nm (76 lb-ft).



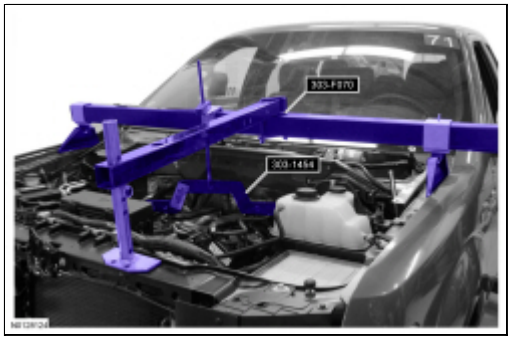
24. **NOTE:** LH shown, RH similar.

    Install the 2 new LH and the 2 new RH catalytic converter-to-turbocharger nuts.
    - Tighten to 45 Nm (35 lb-ft).

repair4less

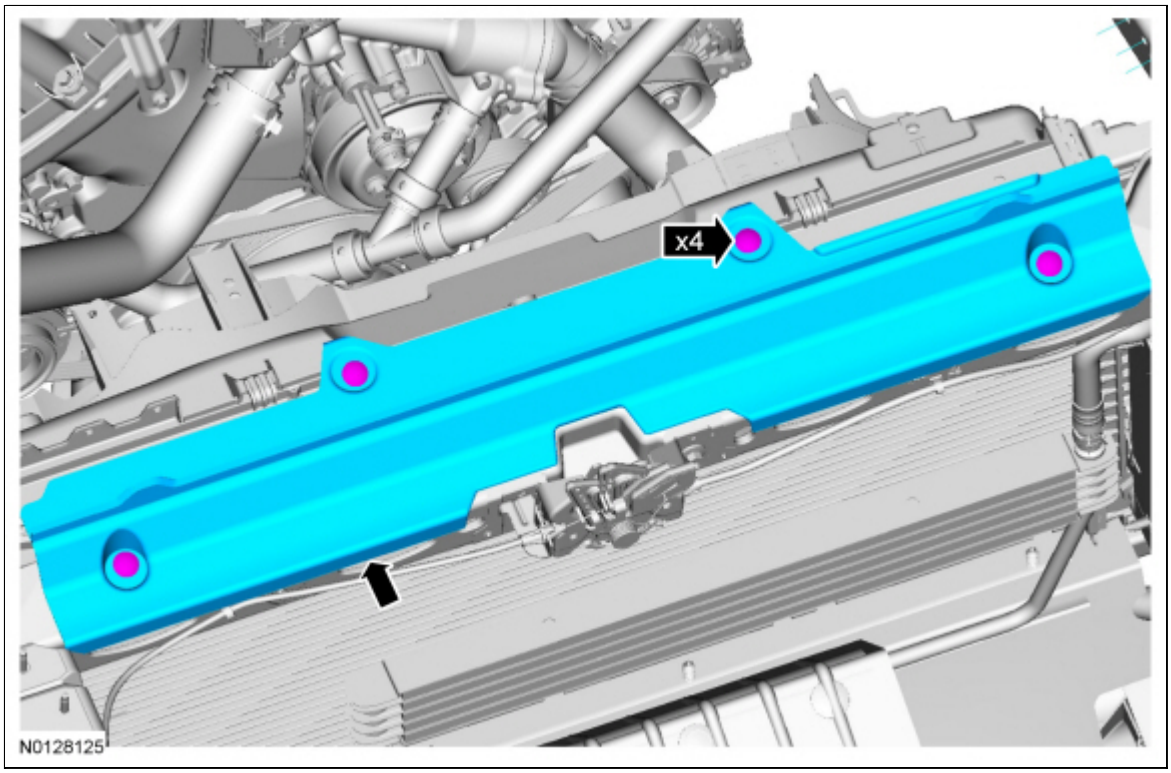


25. Position the exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe and install the 2 new bolts.
    - Tighten the inner exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).
    - Tighten the outer exhaust Y-pipe dual catalytic converter-to-exhaust intermediate pipe bolt to 63 Nm (46 lb-ft).



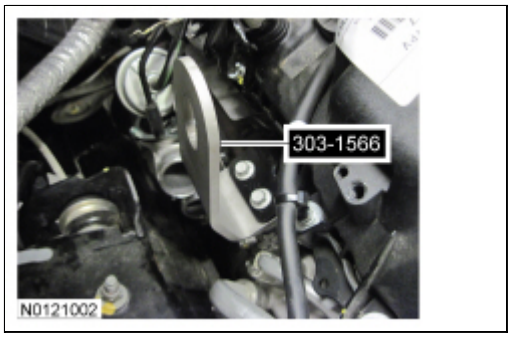
26. If equipped, install the front driveshaft. For additional information, refer to Section 205-01 .

27. Install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).

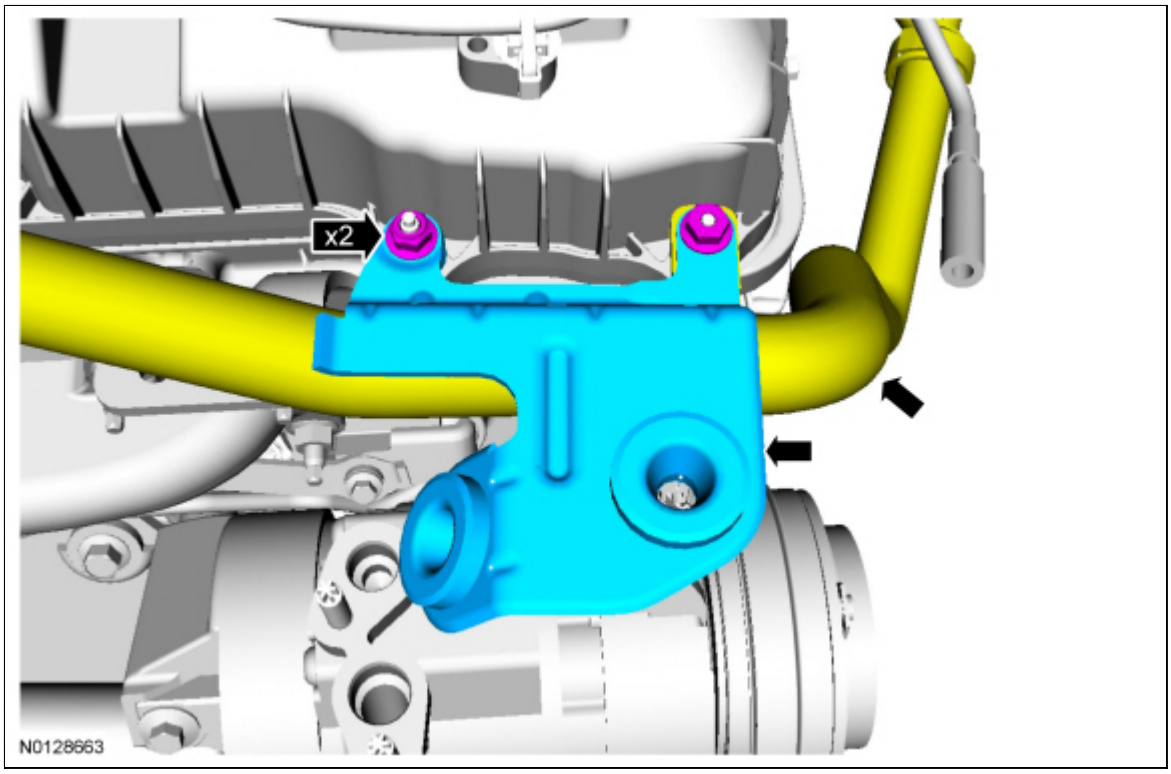


28. Install the splash shield and the 4 retainers.

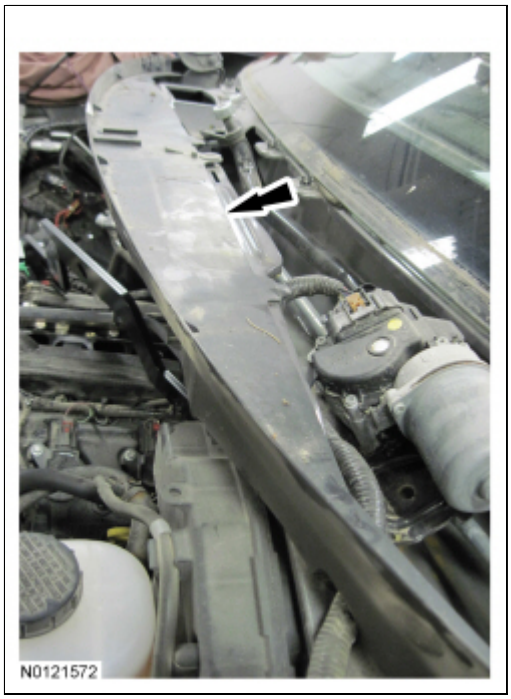
29. Remove the Engine Support Bar.



30. Install the upper radiator air deflector and the 4 pushpins.



31. Remove the 2 bolts and the Right Front Lift Eye.

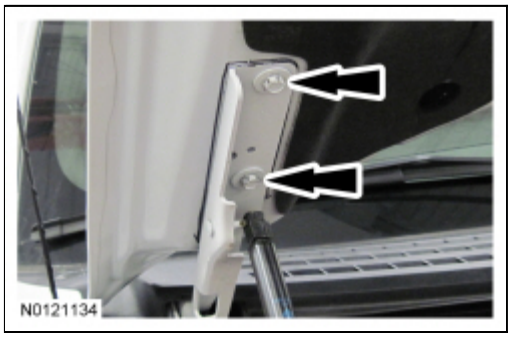


repair4less

32. Position back the coolant hose to the valve cover stud. Install the CAC tube bracket and the 2 nuts.
    - Tighten to 6 Nm (53 lb-in).

33. Install the cowl panel and attach the 2 clips and install the 6 screws.

34. Install the cowl panel grille. For additional information, refer to Section 501-02 .



35. Install the high-pressure fuel pump. For addition information, refer to Section 303-04A .

36. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

37. Install the Air Cleaner (ACL) outlet pipe, ACL pipe-to-turbocharger pipes, turbocharger bypass hoses and the turbocharger-to- Charge Air Cooler (CAC) pipes. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .

38. **NOTE:** RH shown, LH similar.

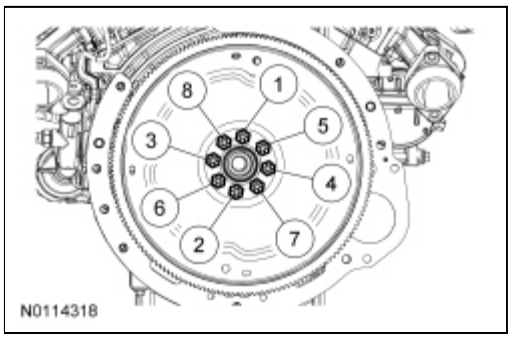
    Position the hood and install the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).

repair4less

Flexplate

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



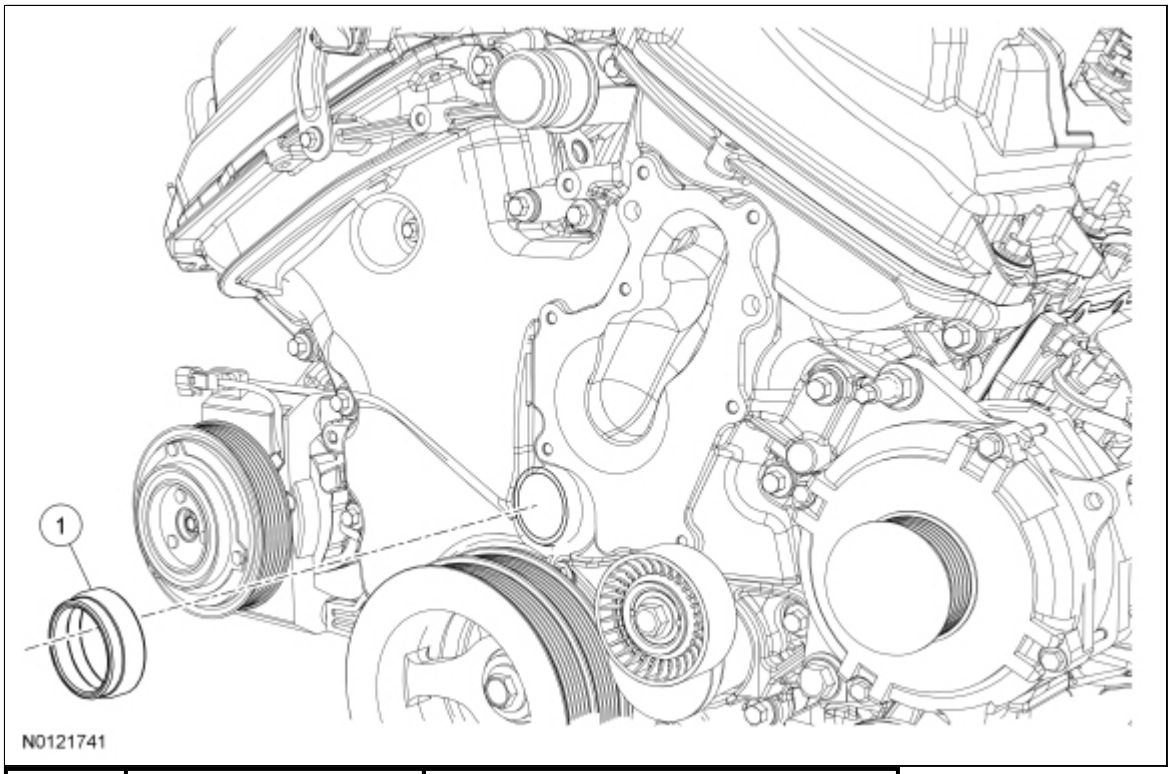
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the automatic transmission. For additional information, refer to Section 307-01 .
3. Remove the 8 bolts and the flexplate.

Installation

1. **NOTE:** One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.

   Install the flexplate and the 8 bolts and tighten in sequence shown.
   - Tighten to 80 Nm (59 lb-ft).



2. Install the automatic transmission. For additional information, refer to Section 307-01 .
3. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

repair4less

Front Cover Radial Seal

Special Tool(s)

 ST3232-A	Remover/Installer, Water Tube Seal 303-1528

Item	Part Number	Description
1	6020	Front cover radial seal

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the accessory drive and A/C compressor belt. For additional information, refer to Section 303-05 .
2. Remove the coolant pump. For additional information, refer to Section 303-03 .

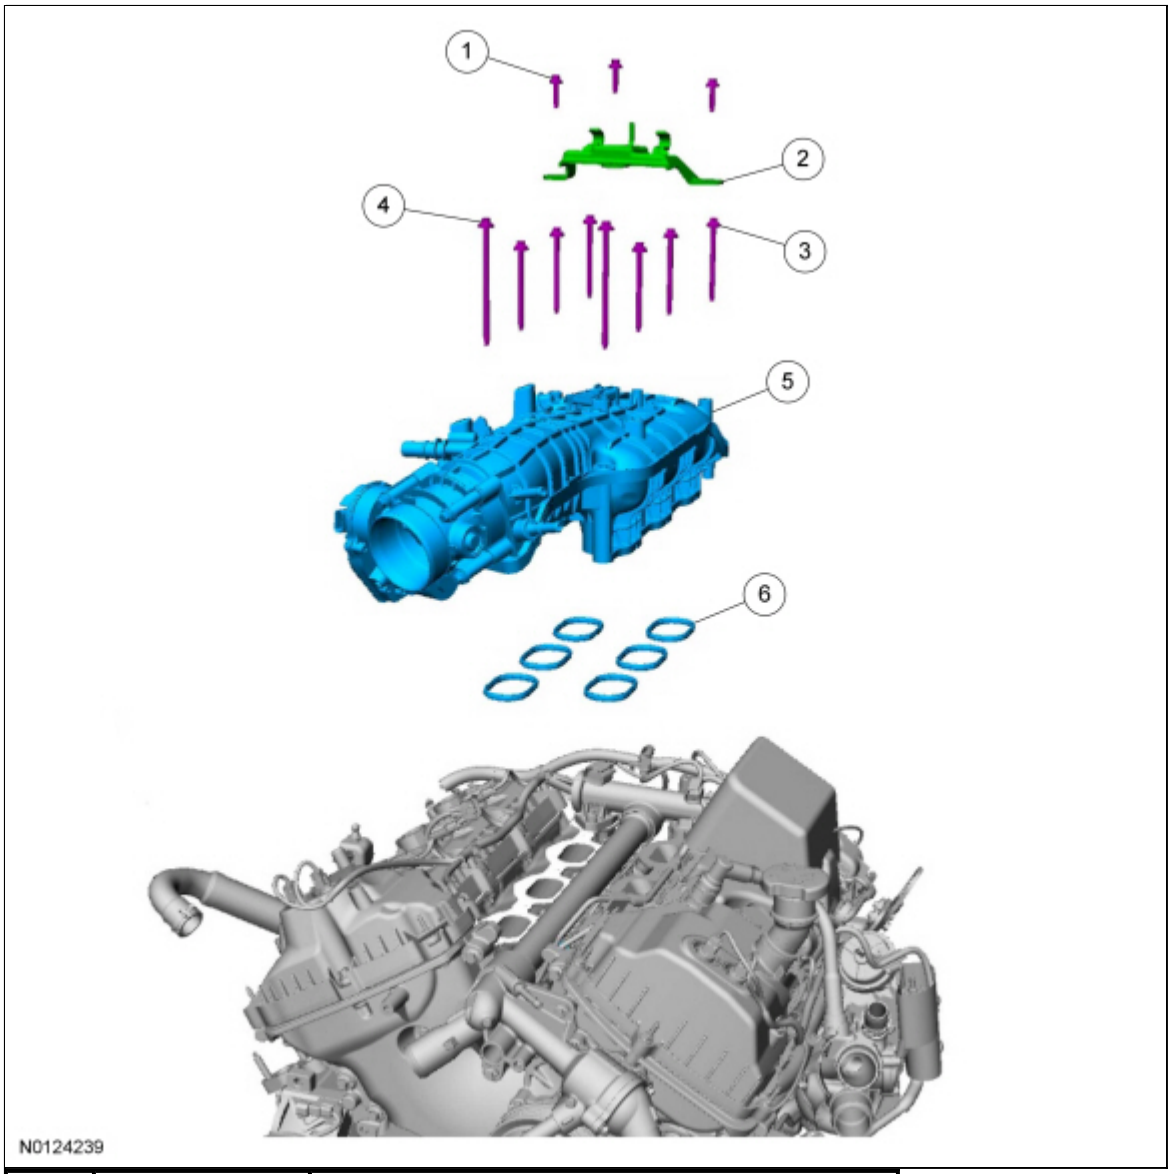
repair4less

3. Using the Water Tube Seal Remover, remove the front cover radial seal.
    - Reset the Water Tube Seal Remover center bolt to its retracted position.
    - Screw the Water Tube Seal Remover onto the front cover radial seal until it bottoms out.
    - Using a brass hammer, give the Water Tube Seal Remover a slight tap inward to break front cover radial seal lose.
    - Turn the Water Tube Seal Remover center bolt clockwise and remove the front cover radial seal.

4. Clean the engine front cover radial seal area.

Installation

1. Using the Water Tube Seal Installer, install the front cover radial seal.
    - Position the front cover radial seal on the Water Tube Seal Installer.
    - Position the Water Tube Seal Installer into the engine front cover.
    - Using a brass hammer, tap the Water Tube Seal Installer until the front cover radial seal bottoms out.



2. Inspect the front cover radial seal for proper installation or damage.
3. Install the coolant pump. For additional information, refer to Section 303-03 .
4. Install the accessory drive and A/C compressor belt. For additional information, refer to Section 303-05 .

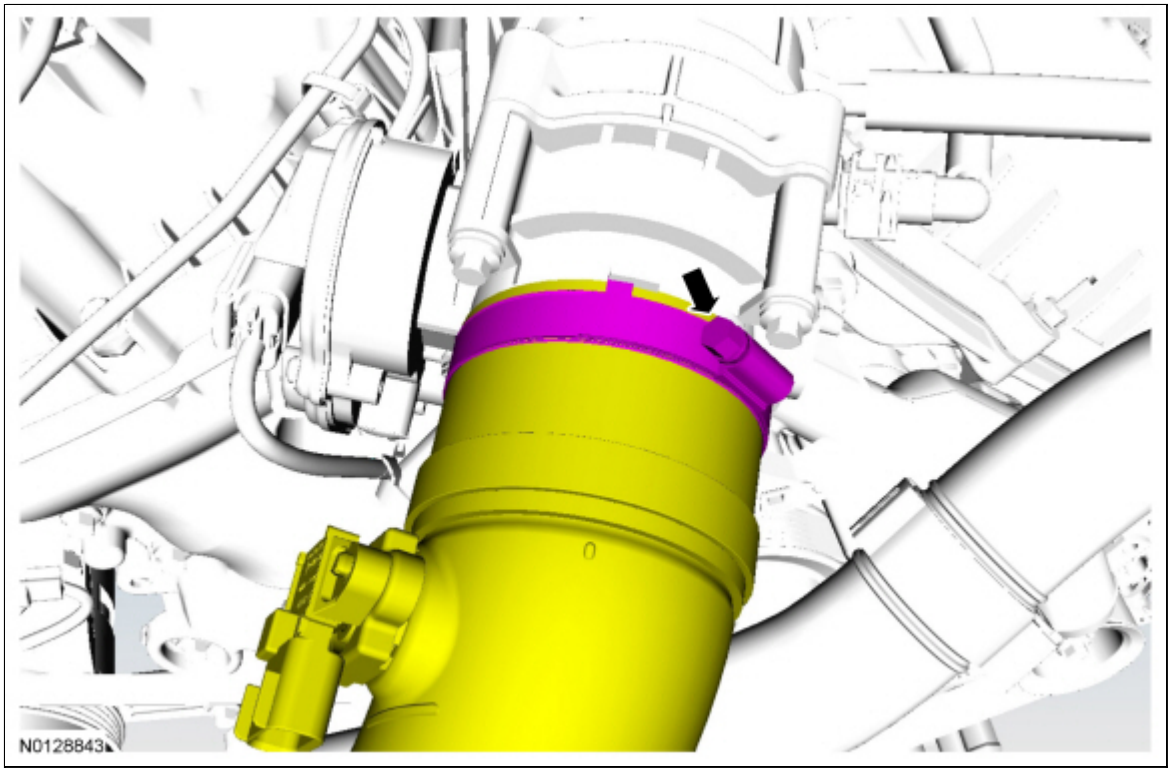
repair4less

Intake Manifold

NOTE: Refer to the on-line Workshop Manual to view this illustration as an interactive exploded view, requires Adobe® Acrobat® 8.0 or higher.

NOTE: Refer to the on-line Workshop Manual to learn about using an Interactive Illustration.

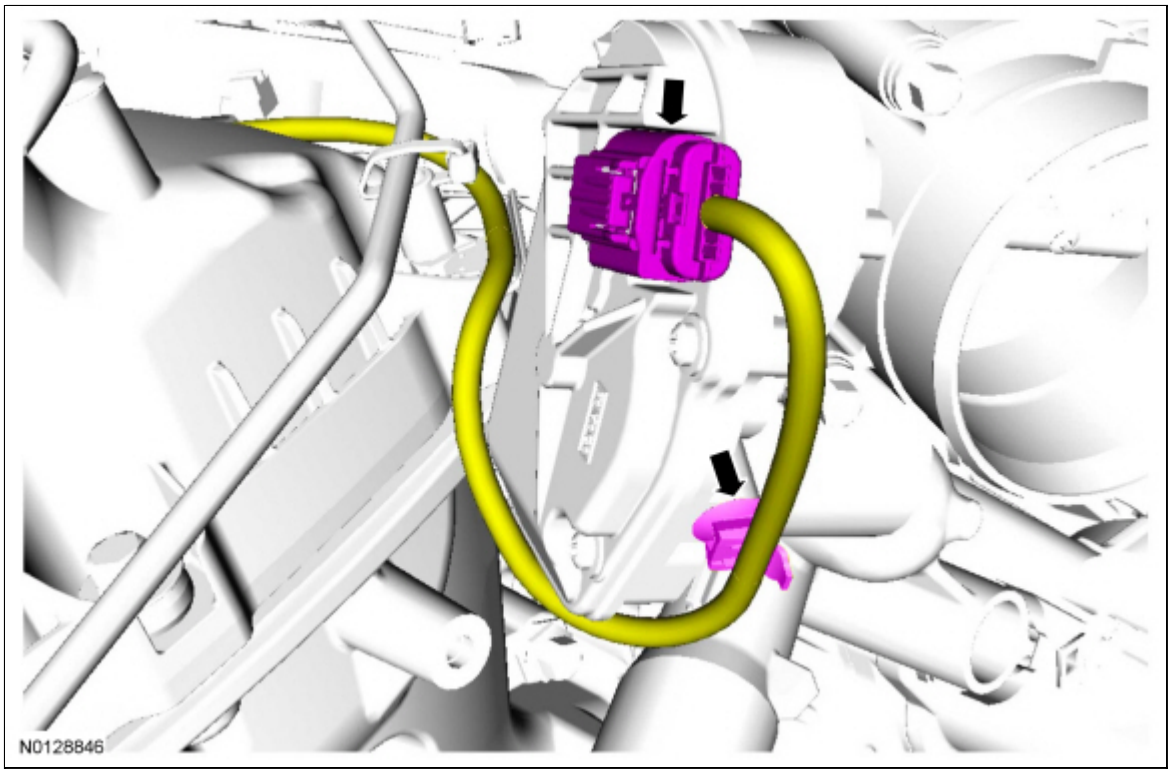
Item	Part Number	Description
1	W503277	Engine cover bracket bolts (3 required)
2	—	Engine cover bracket (part of 6A949)
3	W714988	Intake manifold bolt (6 required)
4	W715096	Intake manifold bolt (2 required)



5	9424	Intake manifold
6	9439	Intake manifold gasket

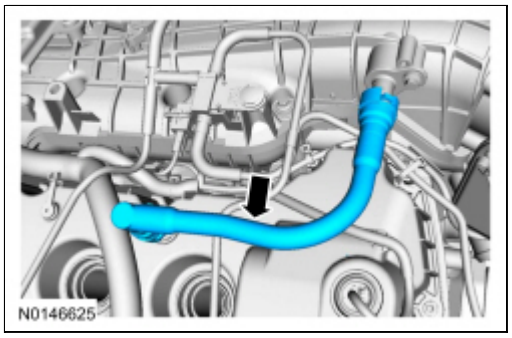
Removal

1. Remove the engine appearance cover.

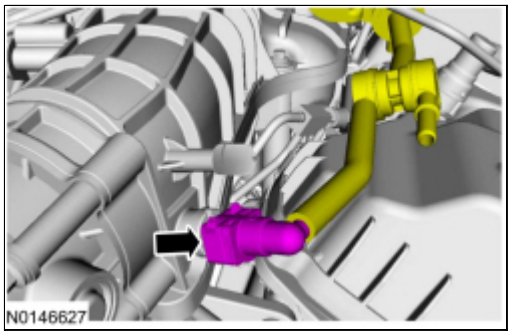


2. Remove the Air Cleaner (ACL) outlet pipe and the RH ACL pipe-to-turbocharger pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .

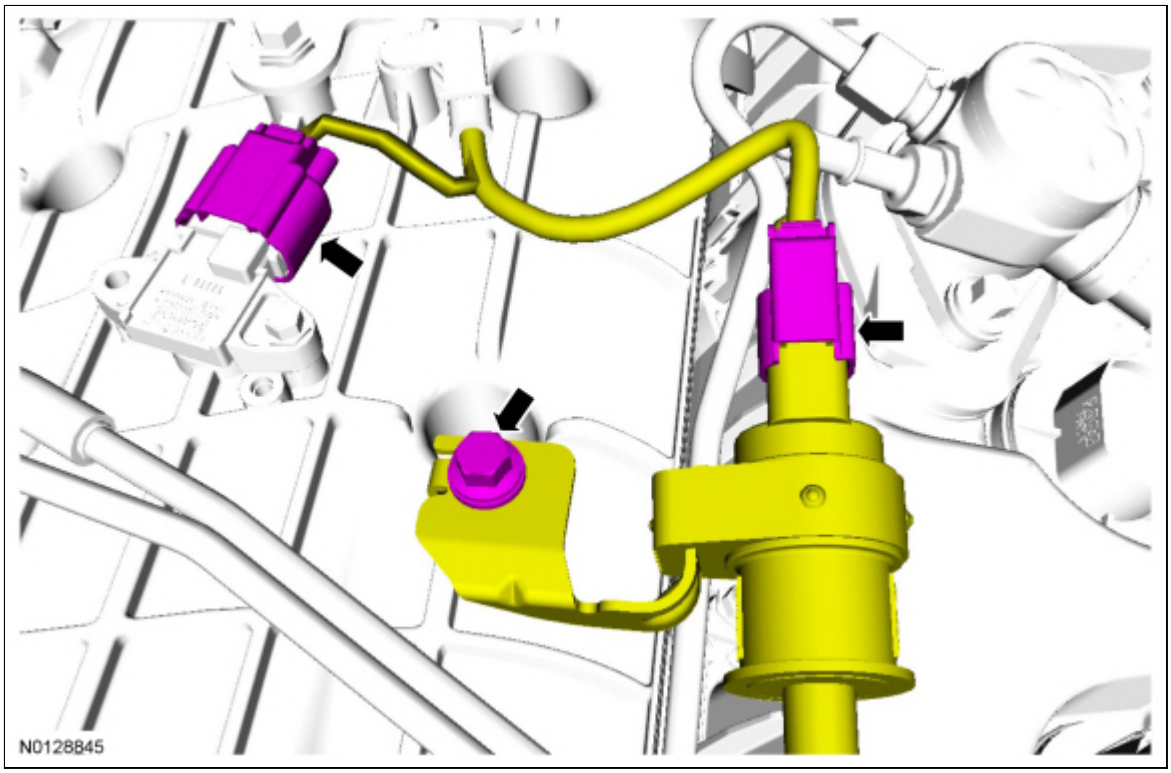
3. Loosen the clamp and disconnect the Charge Air Cooler (CAC)-to-Throttle Body (TB) pipe.



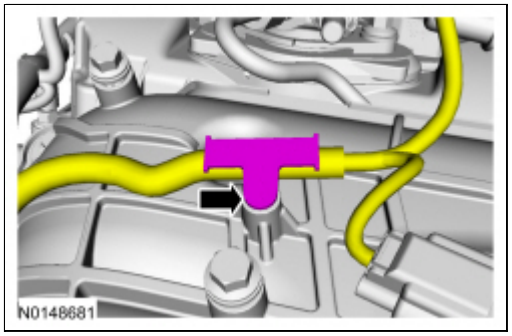
4. Disconnect the TB electrical connector.
   - Detach the TB electrical connector wiring harness retainer from the TB .



repair4less

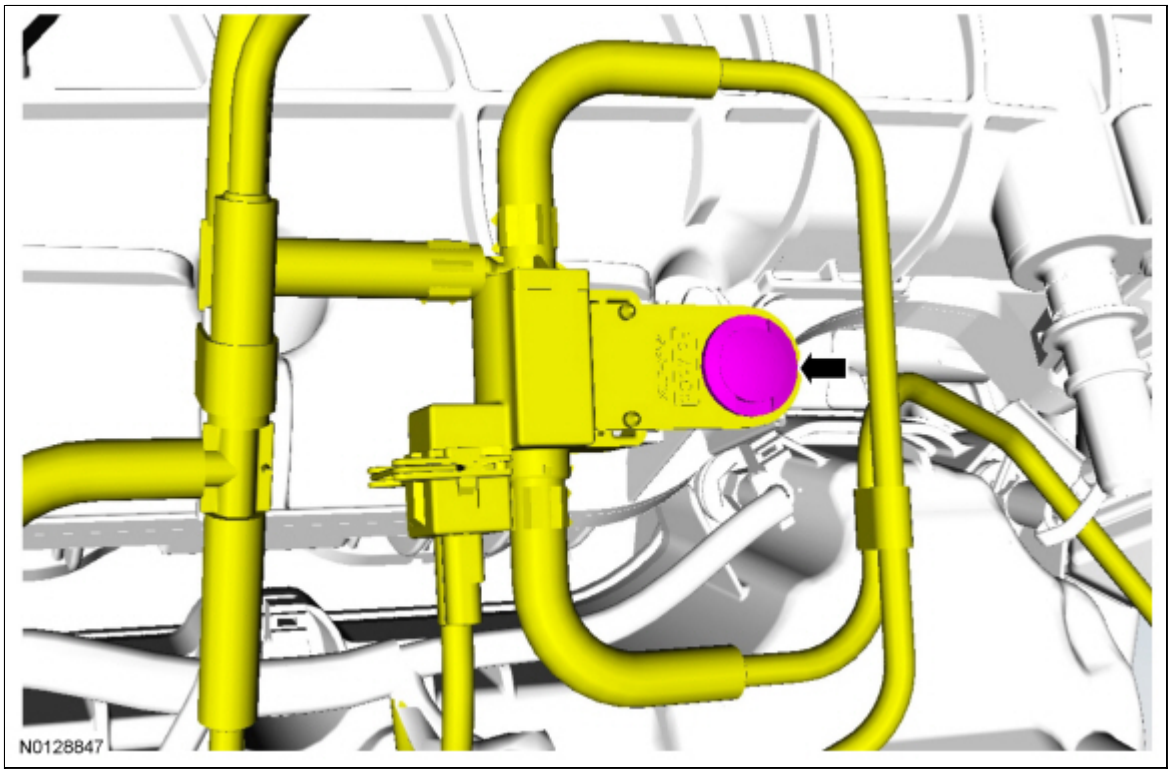


5. Remove the PCV tube. Refer to Section 310-00 .



6. Disconnect the Evaporative Emission (EVAP) hose from the intake manifold. Refer to Section 310-00 .

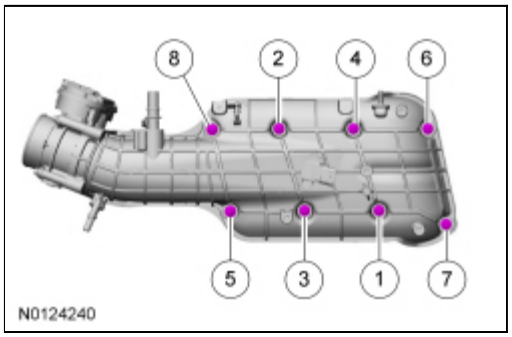
7. Disconnect the Manifold Absolute Pressure (MAP) sensor and the EVAP canister purge valve electrical connectors. Remove the bolt for the EVAP canister purge valve and position aside.



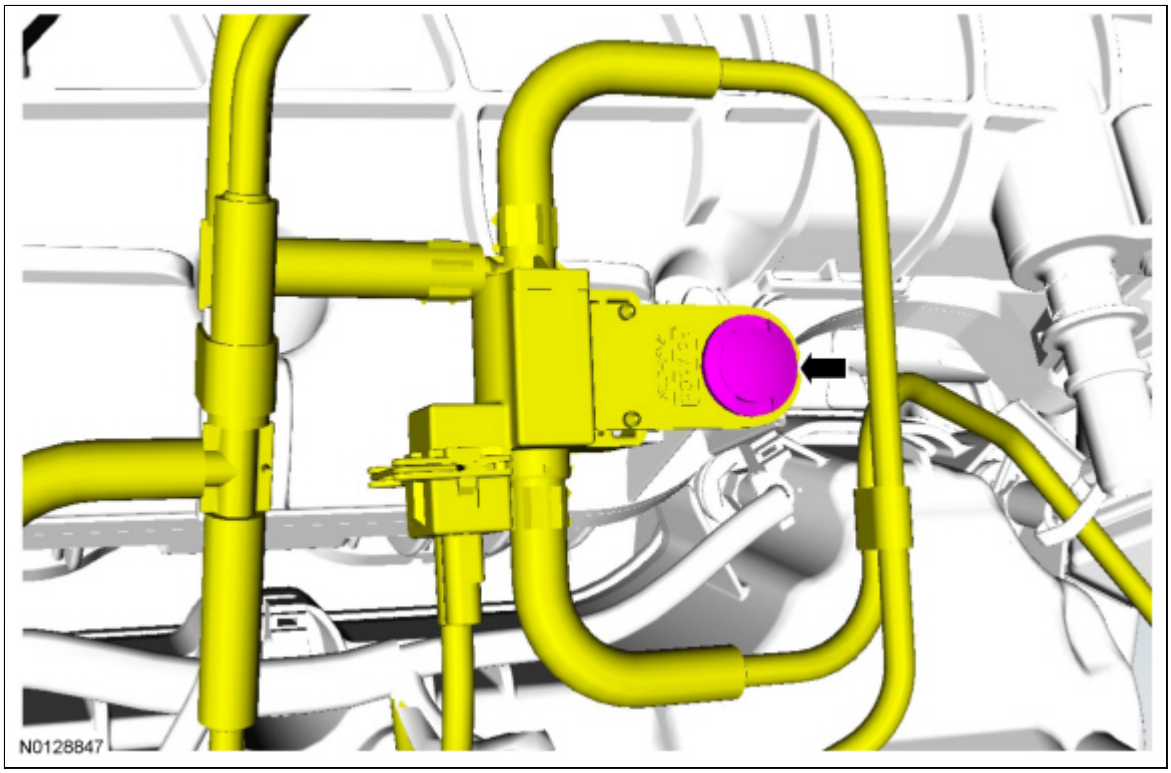
8. Remove the 3 bolts and the engine appearance cover bracket.
9. Disconnect the wire retainer from the intake manifold.

10. Remove the push pin and position the turbocharger vacuum regulator aside.

repair4less



11. Loosen the 8 bolts and remove the intake manifold.
    - Remove and discard the gaskets.
    - Clean and inspect all of the sealing surfaces of the cylinder heads and the intake manifold.

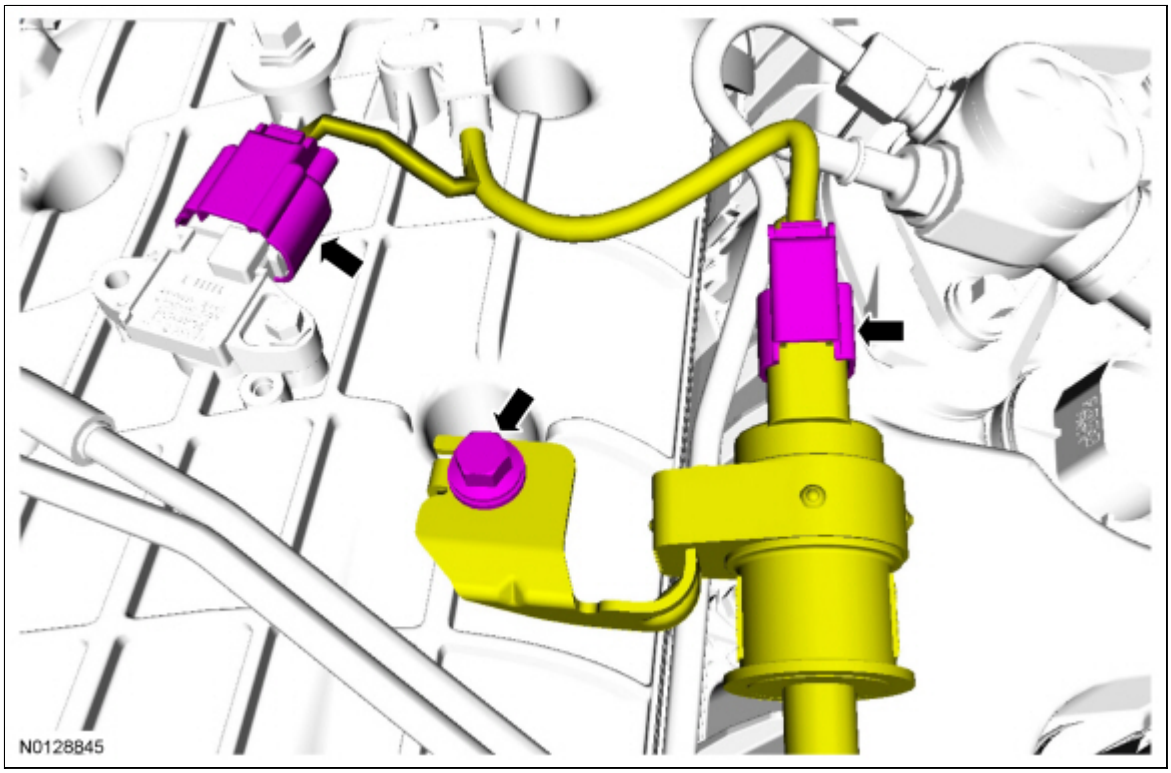


Installation

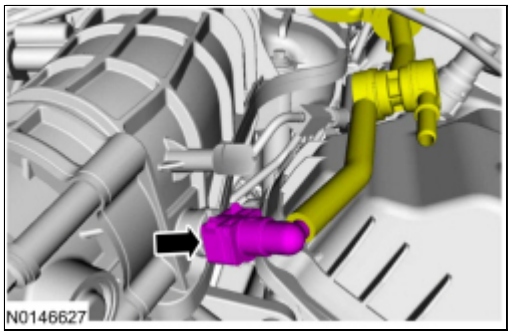
1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new gaskets, install the intake manifold and tighten the 8 bolts in the sequence shown.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

2. Position back turbocharger vacuum regulator and install the push pin.

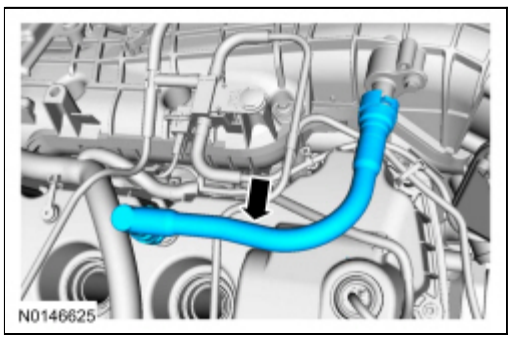


3. Connect the wire retainer to the intake manifold.

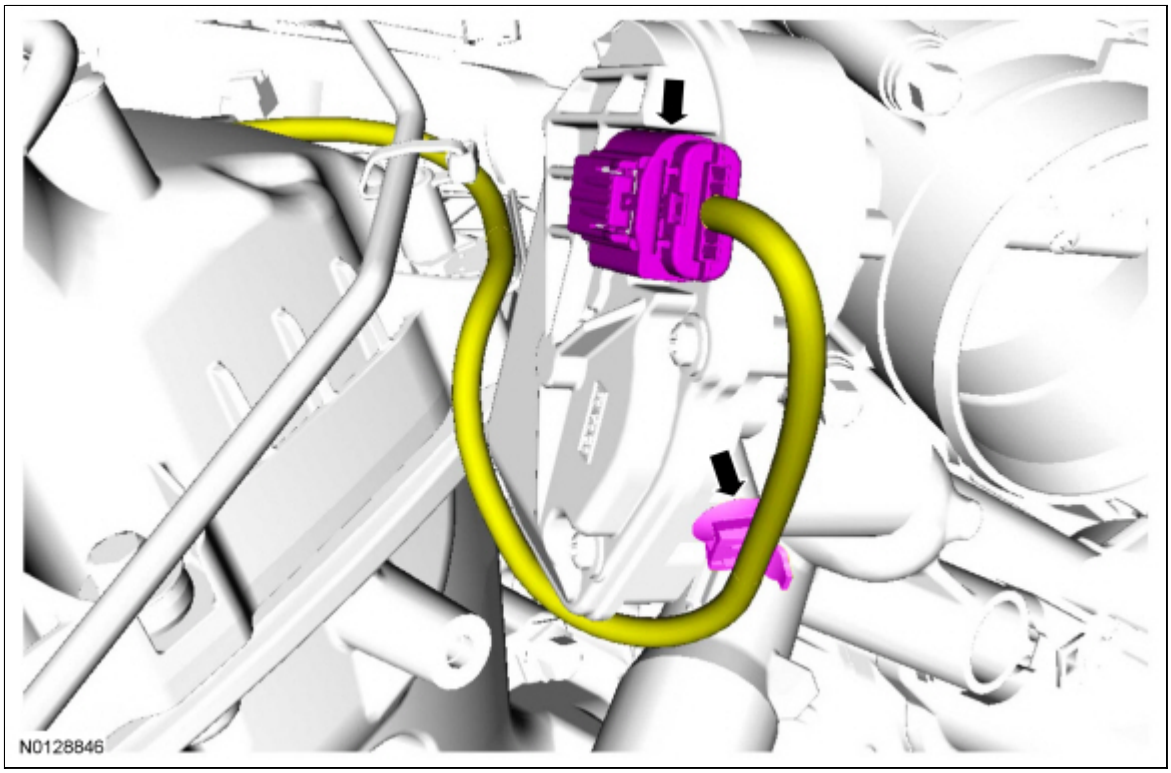


4. Install the engine appearance cover bracket and 3 bolts.
   - Tighten to 10 Nm (89 lb-in).

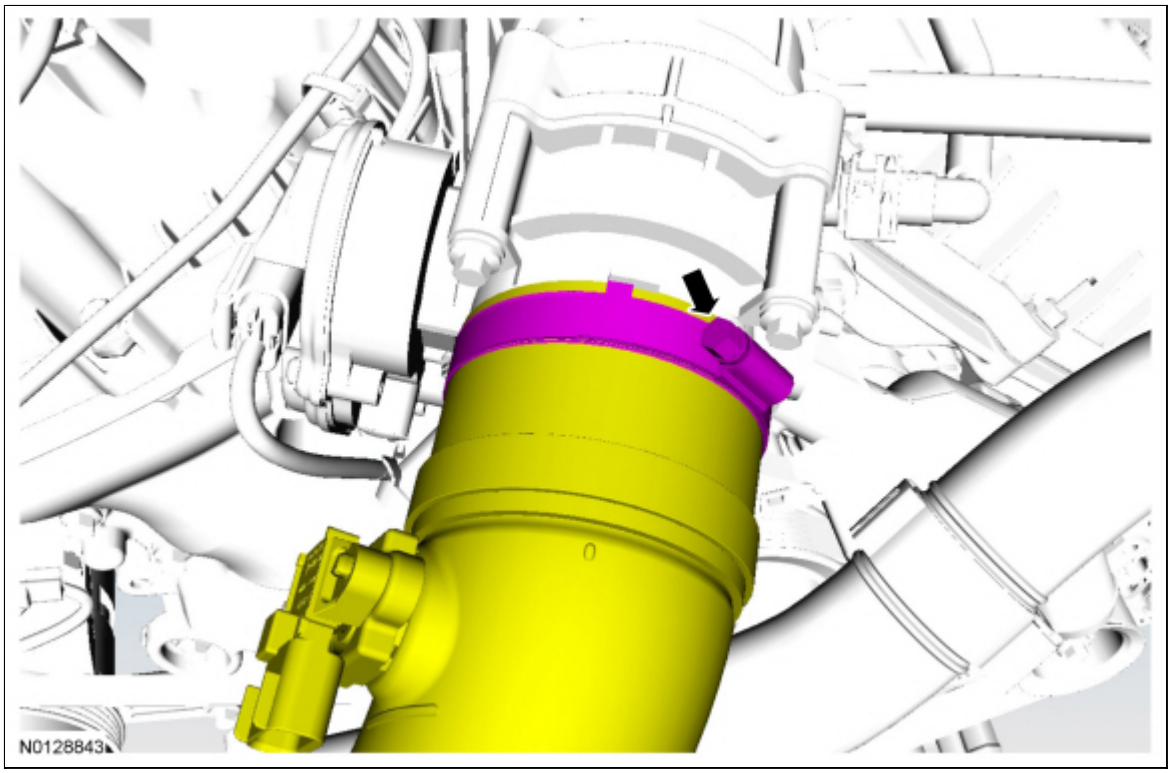
5. Position back the EVAP canister purge valve and install the bolt. Connect the MAP sensor and the EVAP canister purge valve electrical connectors.
   - Tighten to 10 Nm (89 lb-in).



repair4less



6. Connect the EVAP hose to the intake manifold. Refer to Section 310-00 .



7. Install the PCV tube. Refer to Section 310-00 .

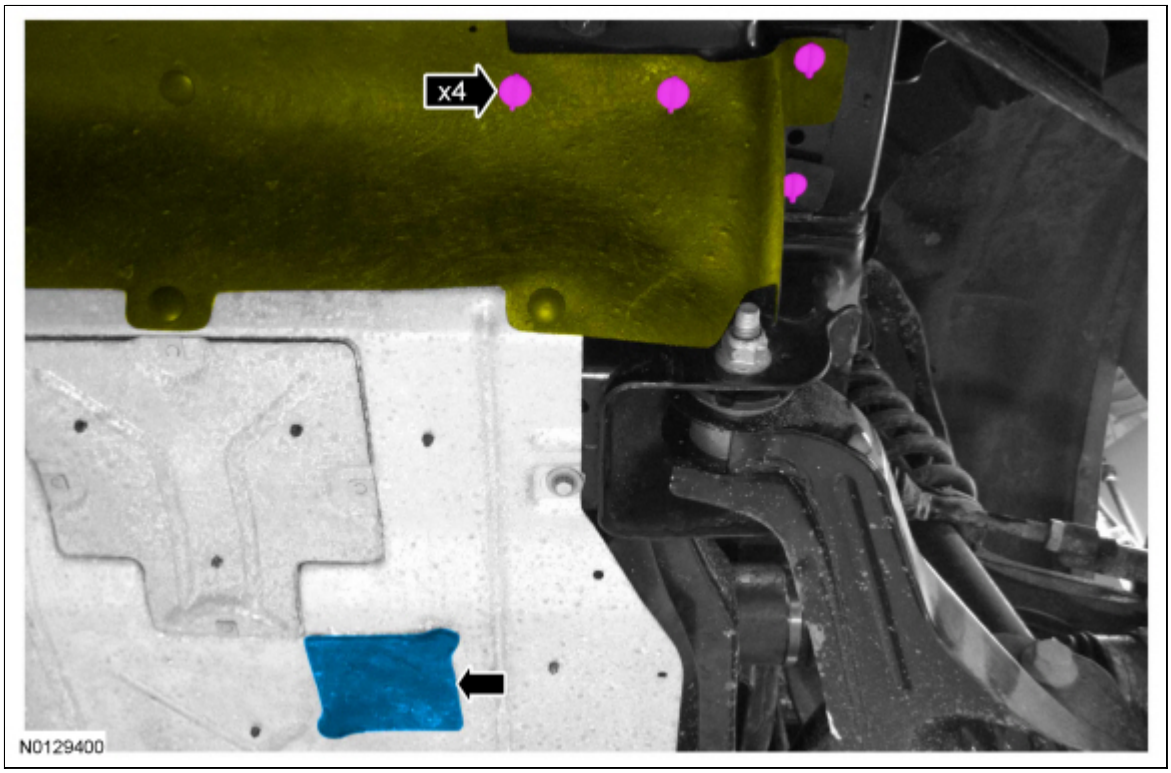
8. Connect the TB electrical connector.
    - Attach the TB electrical connector wiring harness pin-type retainer to the TB .

9. Connect the CAC -to- TB pipe and tighten the clamp.
    - Tighten to 5 Nm (44 lb-in).

10. Install the RH ACL pipe-to-turbocharger pipe and the ACL outlet pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L in Section 303-12 .

repair4less

11. Install the engine appearance cover.

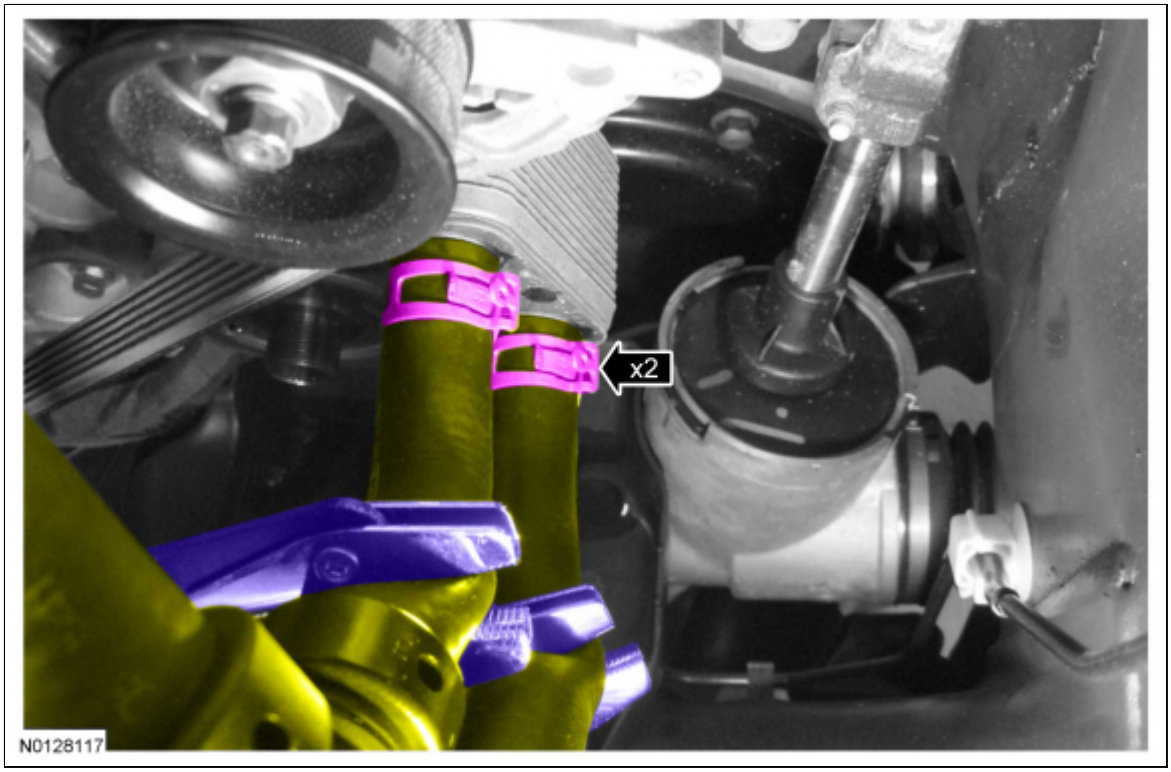


Oil Cooler

Removal

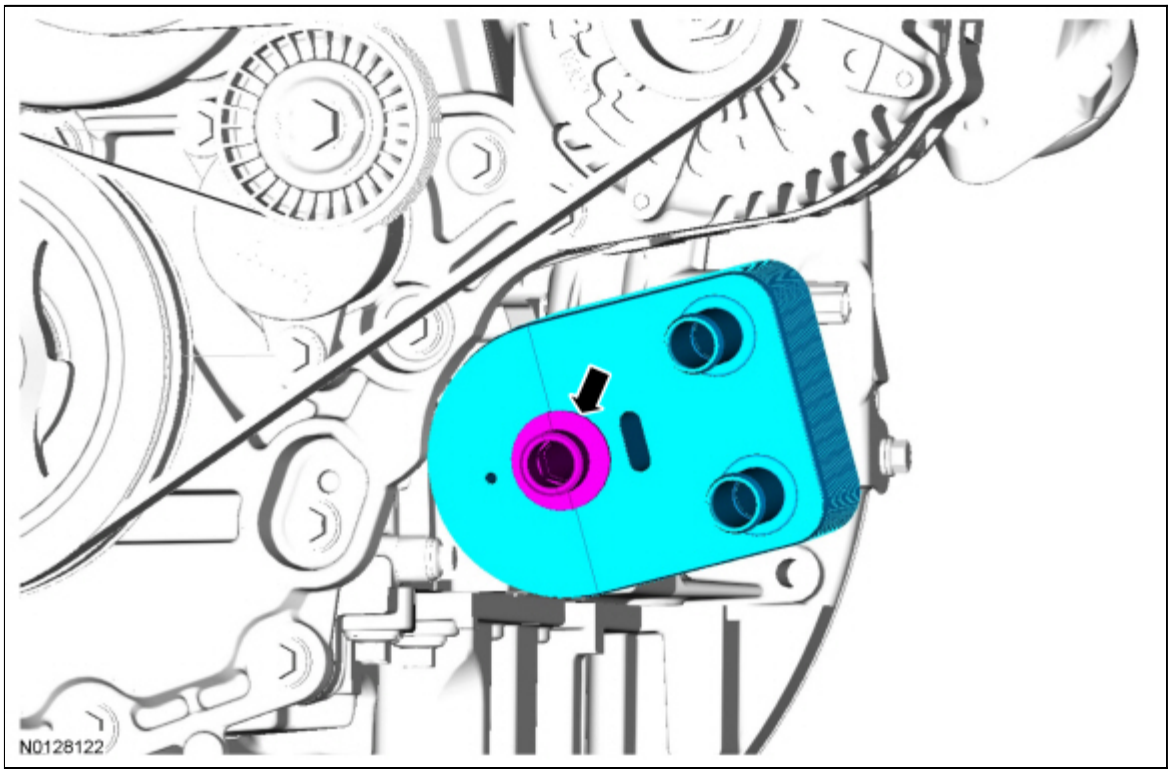
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information refer to Section 100-02 .

2. Remove the Air Cleaner (ACL) outlet pipe and the LH ACL -to-turbocharger pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .



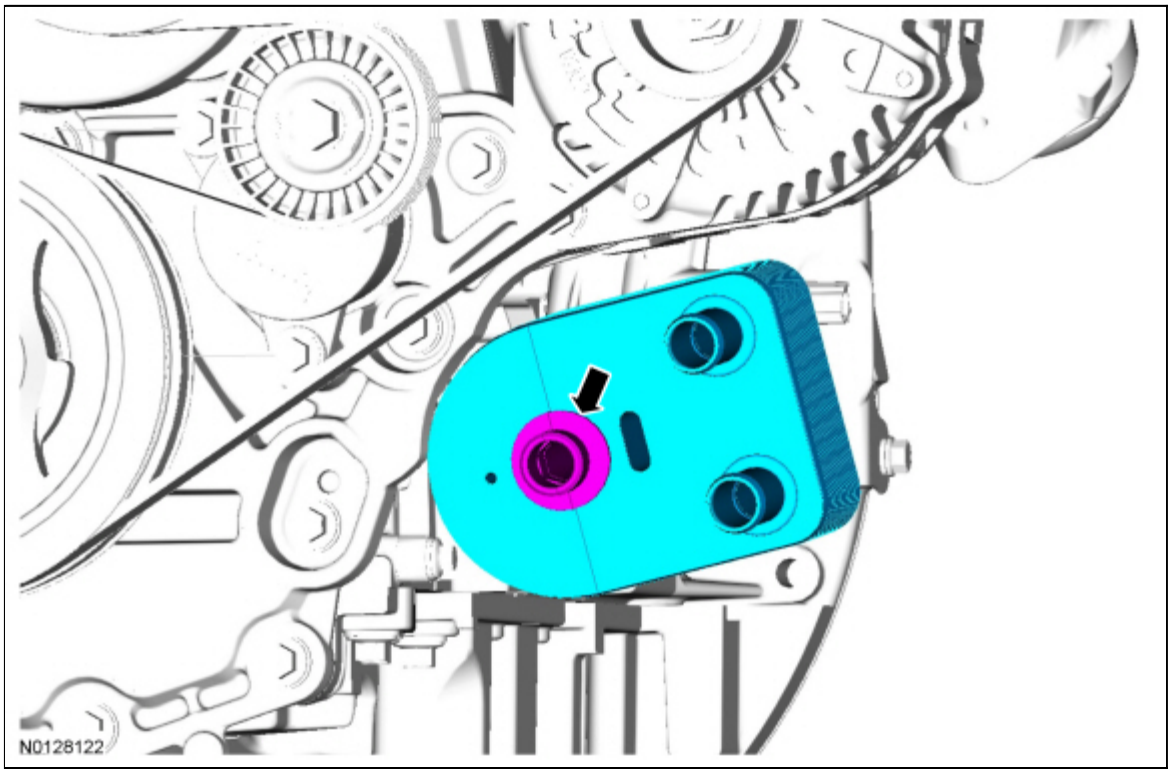
3. If equipped, rotate the 4 retainers and position the air deflector down. Rotate the skid plate cover counterclockwise and remove.

4. Remove and discard the engine oil filter.



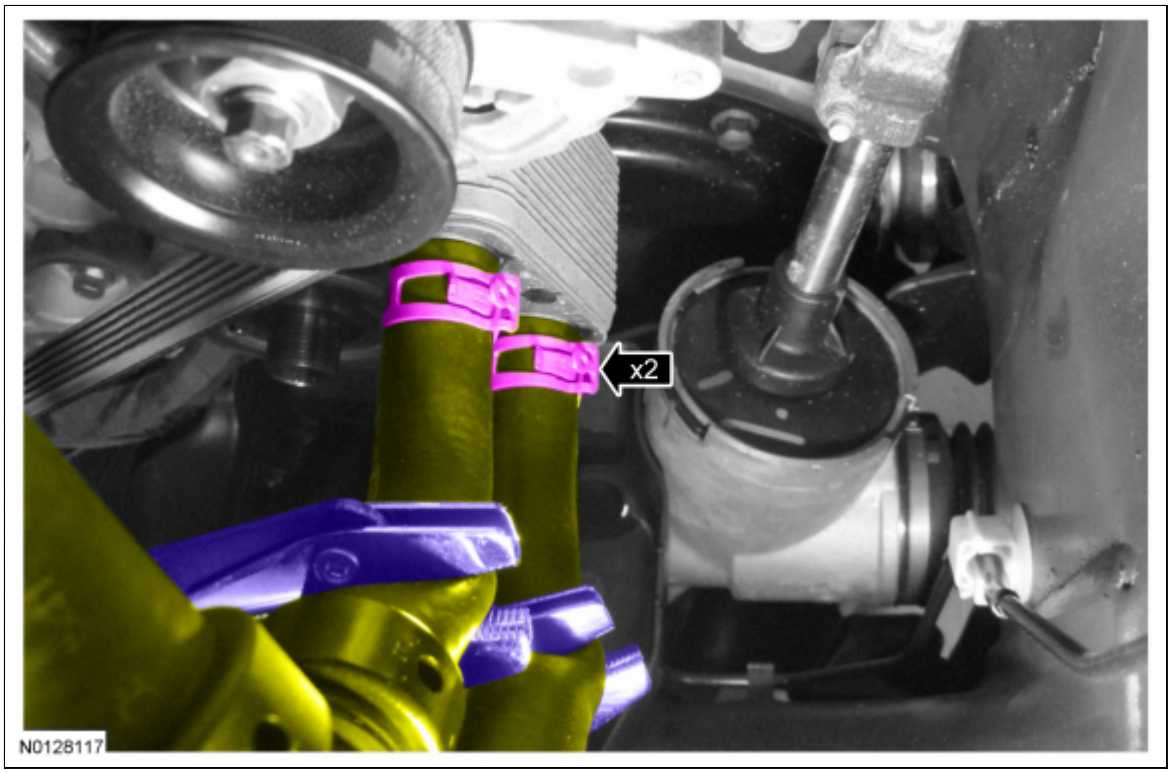
5. Using hose clamp pliers, clamp the 2 oil cooler coolant hoses.
   - Disconnect the 2 coolant hoses from the oil cooler.

repair4less



6. ***NOTICE:*** **If metal or foreign material is present in the oil cooler, mechanical concerns exist. To diagnose the mechanical concerns, refer to Section 303-00 .**

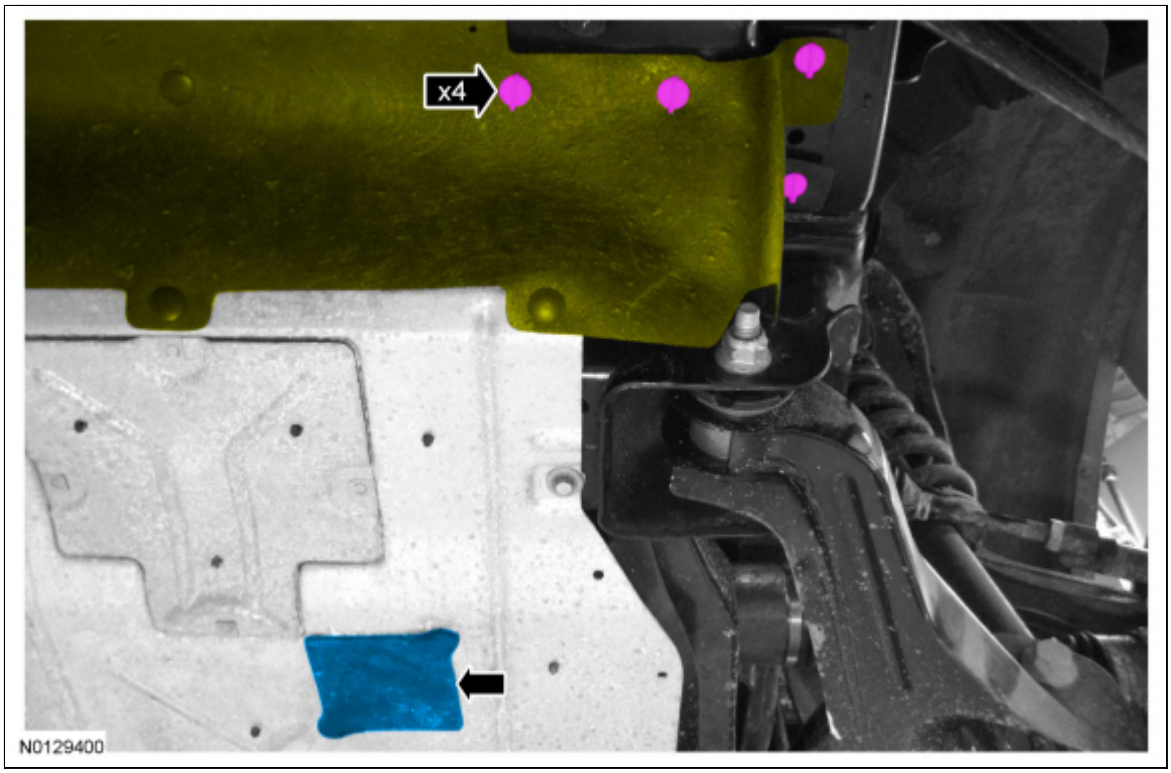
   Remove the oil cooler insert bolt and the oil cooler.
   - Inspect the oil cooler gasket, replace if necessary.



Installation

1. Align the oil cooler to the oil filter adapter and install the oil cooler insert bolt.
    - Tighten to 58 Nm (43 lb-ft).

2. Connect the oil cooler coolant hoses.
    - Remove the hose clamp pliers.



repair4less

3. **NOTE:** Do not lubricate the engine oil filter gasket.

   Install a new engine oil filter.
   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

4. If equipped, position the air deflector and fasten the 4 retainers. Install the skid plate cover.

5. Install the ACL outlet pipe and the LH ACL -to-turbocharger pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

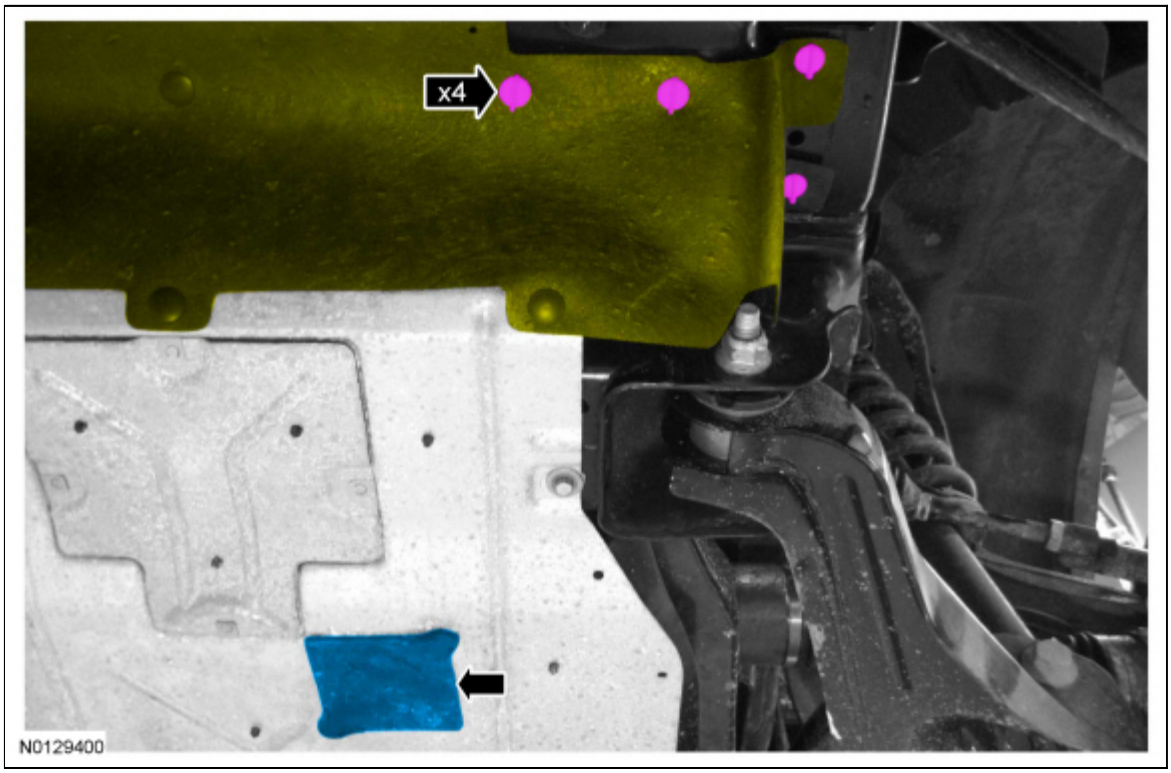
6. Inspect and adjust the coolant level in the degas bottle.

7. Inspect and adjust the engine oil level.

---

repair4less

Oil Filter Adapter



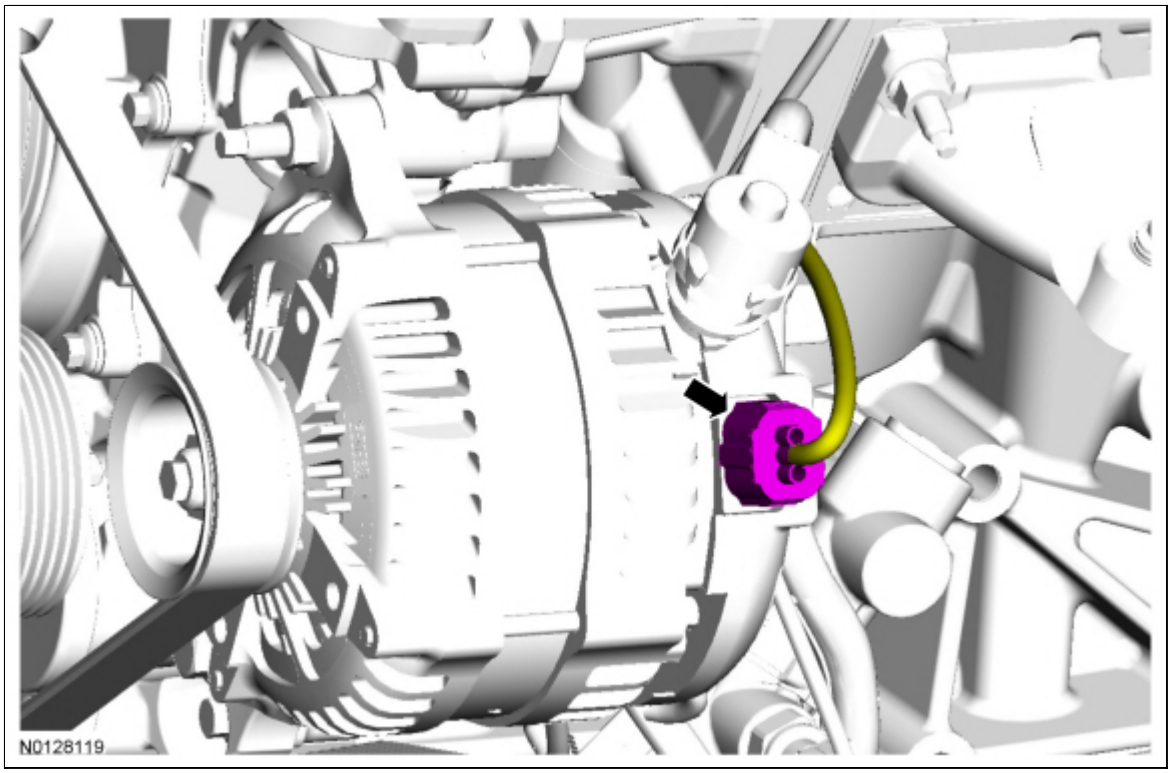
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information refer to Section 100-02 .

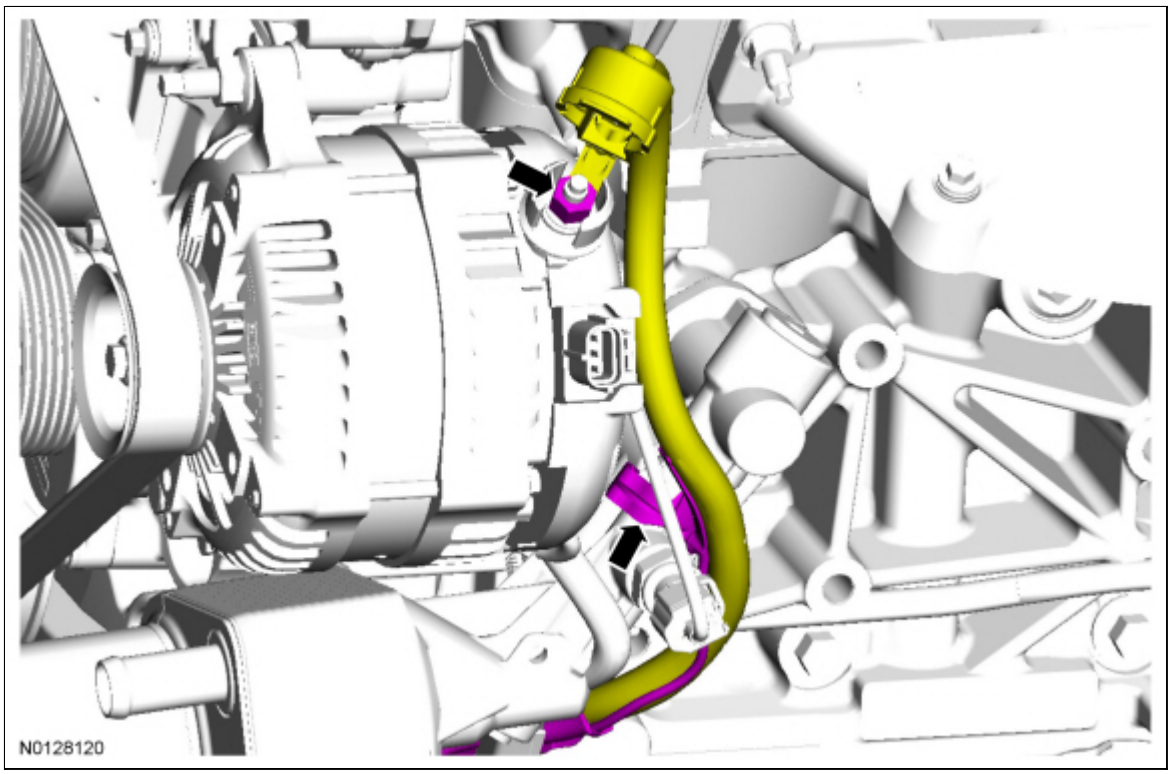
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the Air Cleaner (ACL) outlet pipe and the LH ACL -to-turbocharger pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .

4. If equipped, rotate the 4 retainers and position the air deflector down. Rotate the skid plate cover counterclockwise and remove.



5. Remove and discard the engine oil filter.

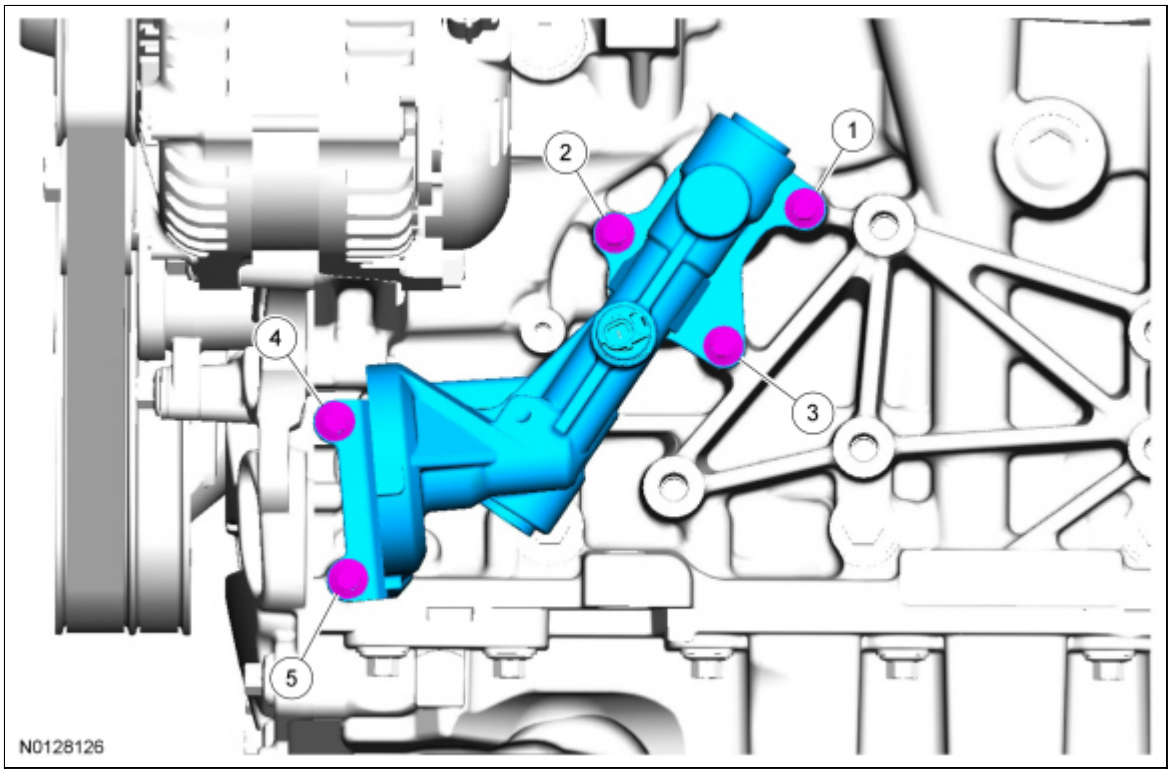


6. ***NOTICE:*** **If metal or foreign material is present in the oil cooler, mechanical concerns exist. To diagnose the mechanical concerns, refer to Section 303-00 .**

   Remove the oil cooler insert bolt and position the oil cooler aside.
   - Inspect the oil cooler gasket, replace if necessary.

7. Disconnect the generator electrical connector.

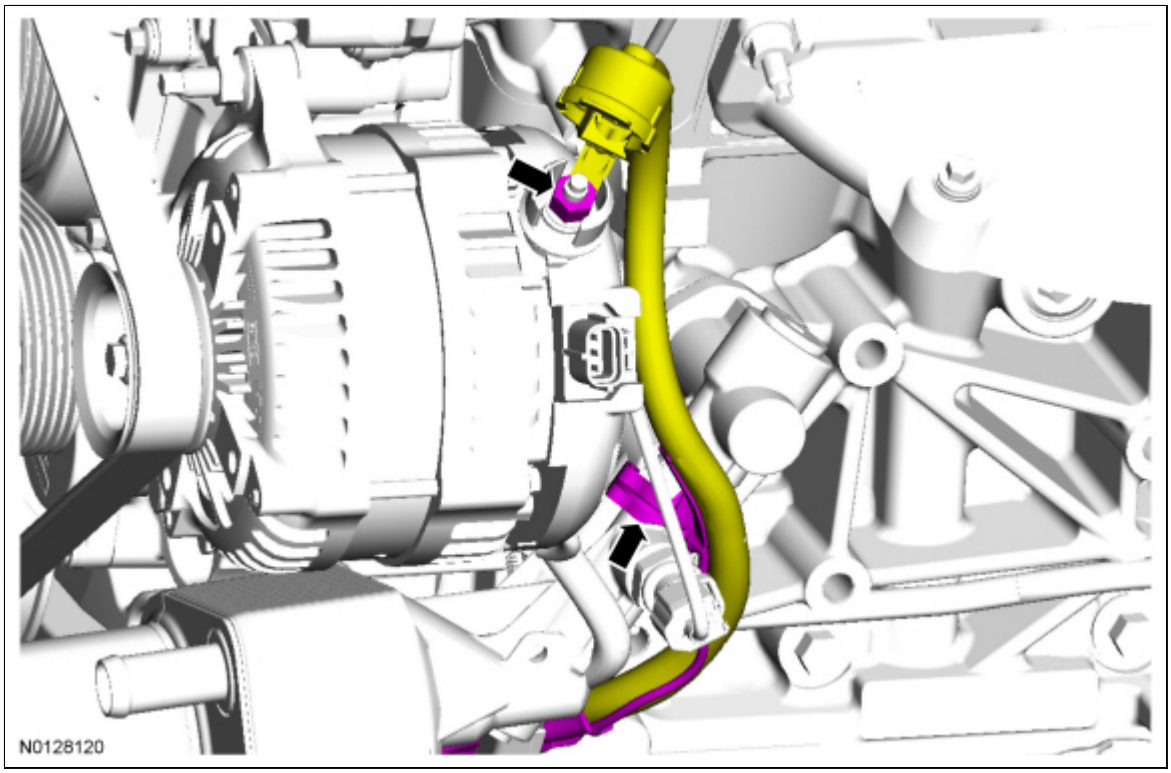
8. Position the generator B+ protective boot aside, remove the B+ nut and position the B+ terminal aside.
    - Detach the generator wiring harness retainer from the oil filter adapter and position the generator wiring harness aside.



repair4less

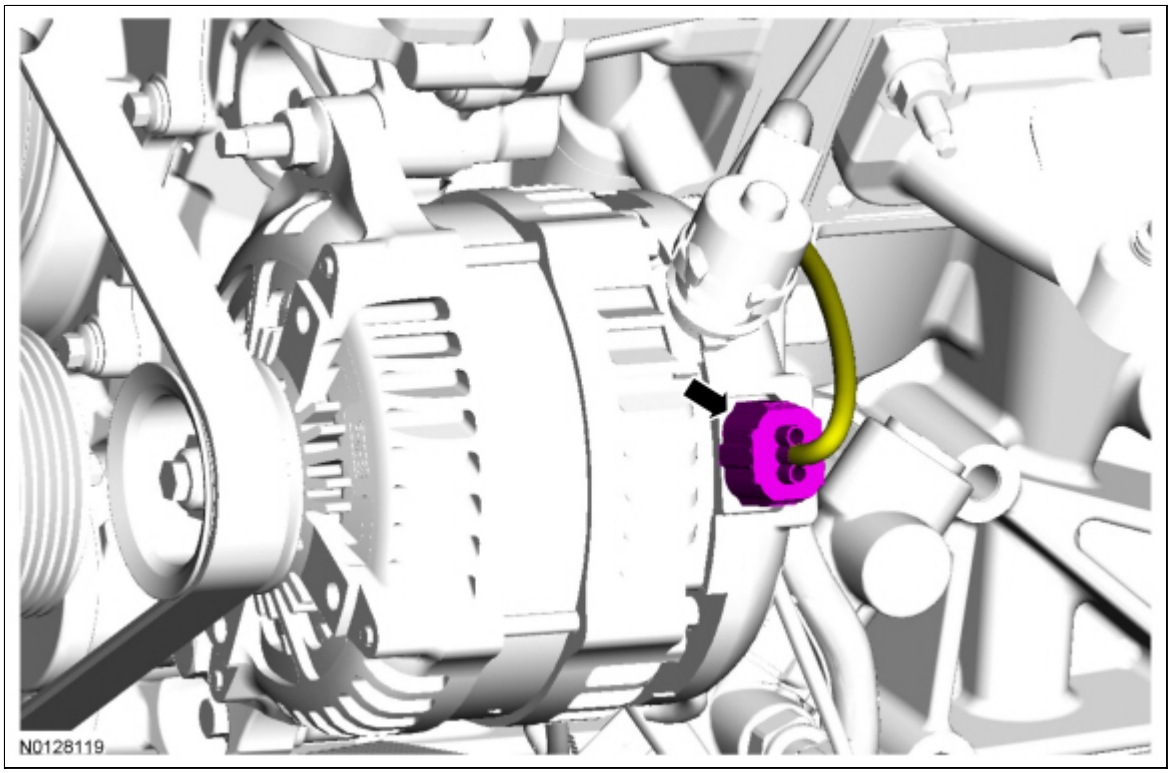
9. Disconnect the Engine Oil Pressure (EOP) electrical connector.

10. Remove the 5 bolts and the oil filter adapter.
    - Discard the gasket.
    - Clean and inspect all sealing surfaces.



Installation

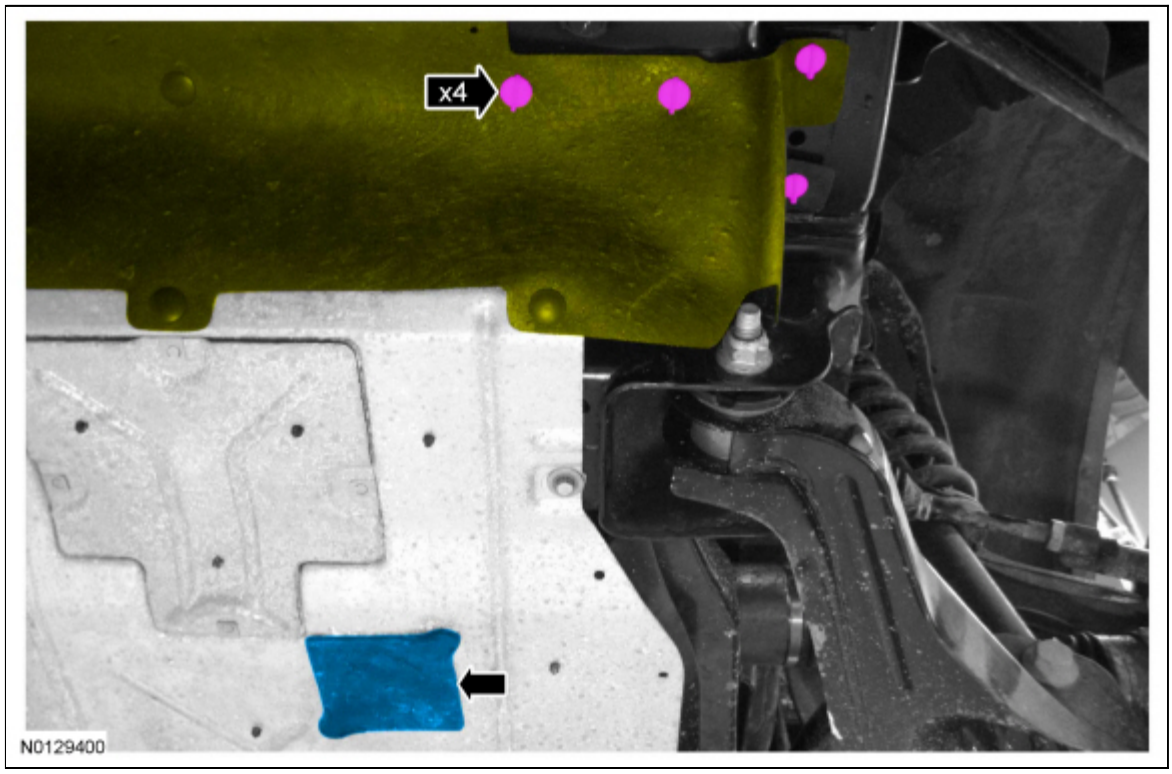
1. Using a new gasket, install the oil filter adapter and the 5 bolts. Tighten in sequence shown.
    - Tighten to 10 Nm (89 lb-in) and then an additional 45 degrees.



2. Connect the EOP electrical connector.

3. Position back the generator wiring harness and B+ terminal and install the nut.
    - Tighten to 17 Nm (150 lb-in).
    - Position back the generator B+ protective boot.
    - Attach the generator wiring harness retainer to the oil filter adapter.

4. Connect the generator electrical connector.



5. Position back the oil cooler and install the oil cooler insert bolt.
    - Tighten to 58 Nm (43 lb-ft).

repair4less

6. **NOTE:** Do not lubricate the engine oil filter gasket.

   Install the engine oil filter.
   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

7. If equipped, position the air deflector and fasten the 4 retainers. Install the skid plate cover.

8. Install the ACL outlet pipe and the LH ACL -to-turbocharger pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

10. Inspect and adjust the engine oil level.

repair4less

Oil Pan

Material

Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A
Motorcraft® Silicone Gasket Remover ZC-30	—

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

All vehicles

1. **NOTE:** This step does not apply if the front engine cover is removed.

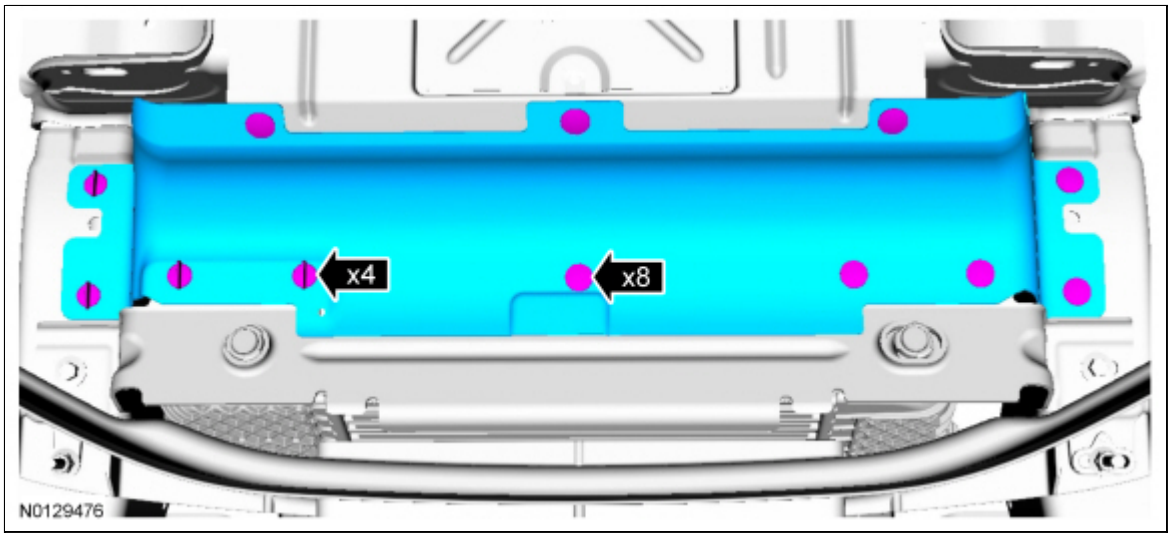
   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** This step does not apply if the front engine cover is removed.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** This step does not apply if the front engine cover is removed.

   Remove the oil level indicator.

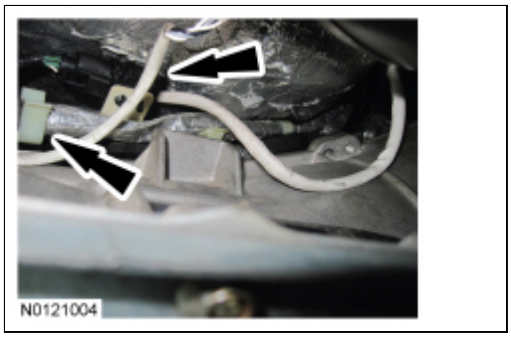


4. Release the 4 fasteners and remove the splash shield.

5. **NOTE:** This step does not apply if the front engine cover is removed.

   If equipped, turn the 4 quarter-turn retainers, detach the 8 pushpins and remove the lower air deflector.

repair4less



6. If equipped, Remove the 4 bolts and the skid plate.

7. Remove the front air dam. For additional information, refer to the Front End Body Panels — Exploded View in Section 501-02 .

8. **NOTE:** This step does not apply if the front engine cover is removed.

   NOTE: Only one wire harness retainer and one electrical connector shown, others similar.

   Disconnect the 2 HO2S electrical connectors.
   - Disconnect the 2 HO2S electrical connector retainers.
   - If equipped, disconnect the 5 transmission wire harness retainers from the transfer case wire harness.

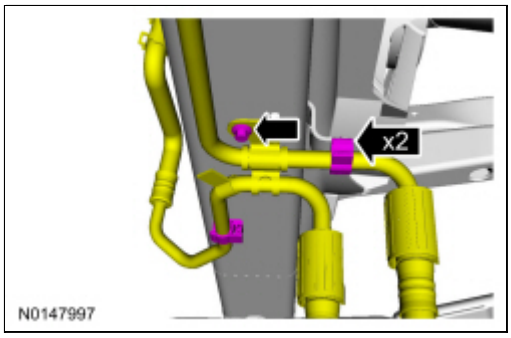
9. **NOTE:** This step does not apply if the front engine cover is removed.

   Disconnect the HO2S electrical connector at the LH rear of the transmission.
   - Disconnect the electrical connector retainer from the bracket at the rear of the transmission.

10. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

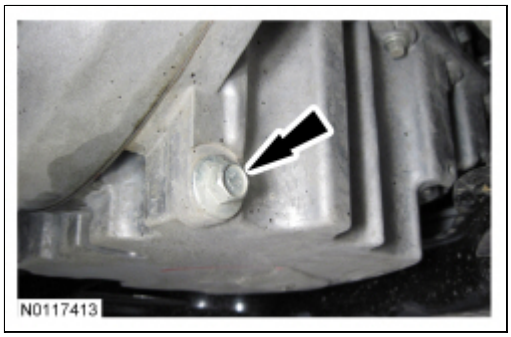
    NOTE: This step does not apply if the front engine cover is removed.

    Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.



11. **NOTE:** This step does not apply if the front engine cover is removed.

    Loosen the 4 upper bellhousing-to-engine bolts 5 mm (0.19 in).

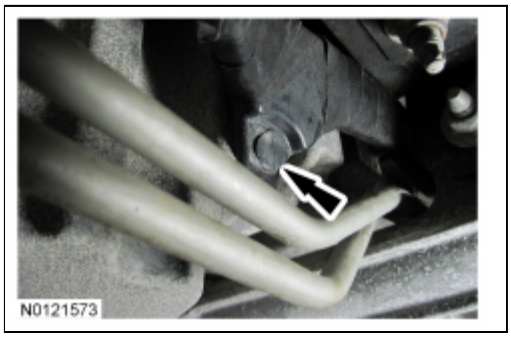


12. Remove the bolt and disconnect the 2 retainers for the transmission cooler tubes.

repair4less

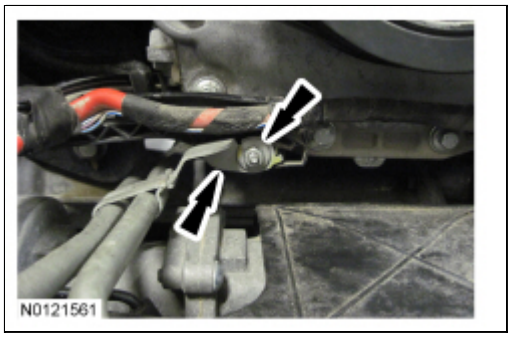
13. **NOTE:** This step does not apply if the front engine cover is removed.

    Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).



14. Remove and discard the engine oil filter.

15. Remove the starter motor. For additional information, refer to Section 303-06 .

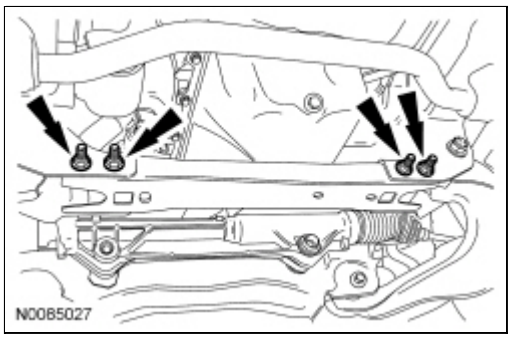


16. **NOTE:** This step does not apply if the front engine cover is removed.

    Detach the starter motor wiring harness retainer from the oil pan.

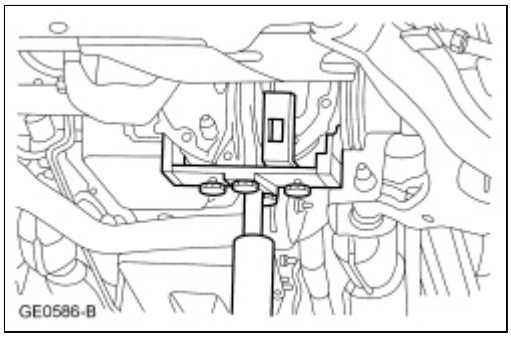
17. **NOTE:** This step does not apply if the front engine cover is removed.

    Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.

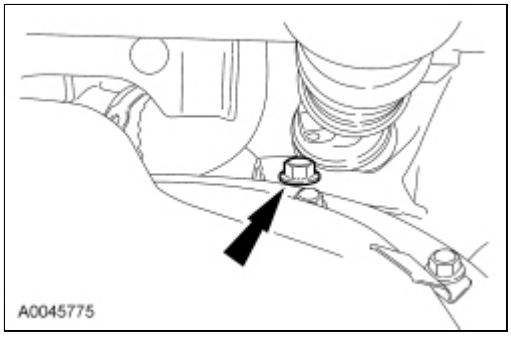


18. **NOTE:** This step does not apply if the front engine cover is removed.

    Detach the generator wiring harness from the engine front cover.

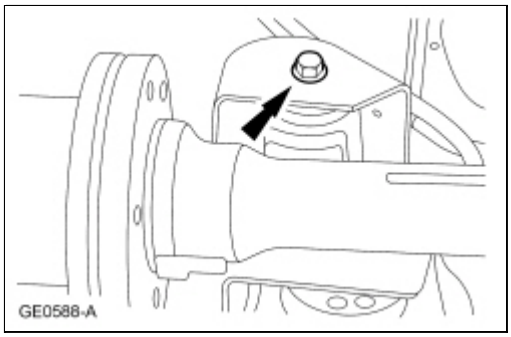


19. Remove the 4 nuts and bolts and the crossmember.



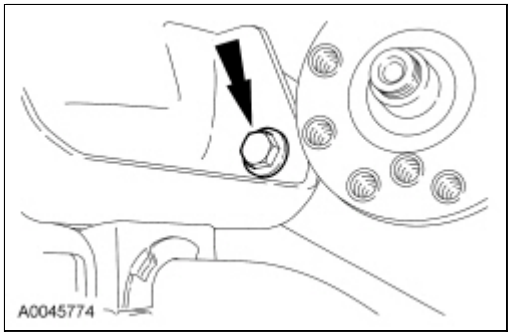
Four Wheel Drive (4X4) vehicles

20. Position a suitable hydraulic jack under the front axle. Securely strap the axle to the jack.



repair4less

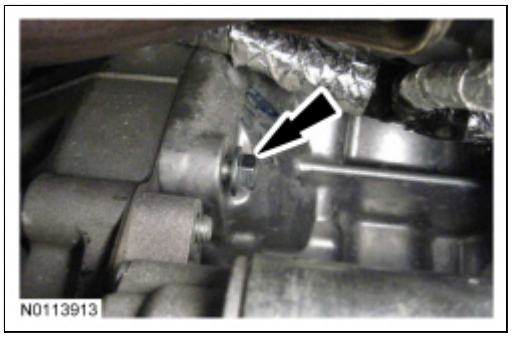
21. Remove the upper front axle carrier mounting bushing bolt.



22. Remove the axle shaft housing carrier bushing bolt.

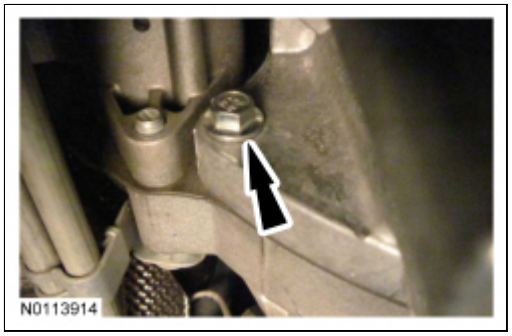
23. **NOTE:** Front driveshaft removed for clarity only.

    Remove the lower front axle carrier mounting bushing bolt.



24. ***NOTICE:*** **Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

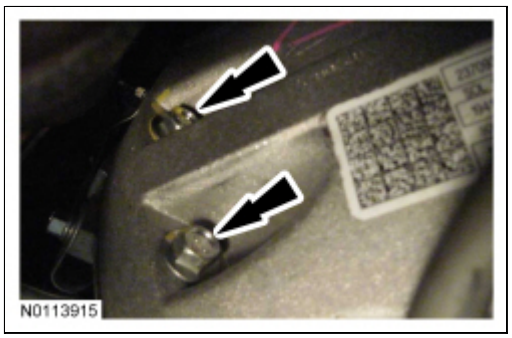
    Lower the axle to allow clearance for the oil pan to be removed.



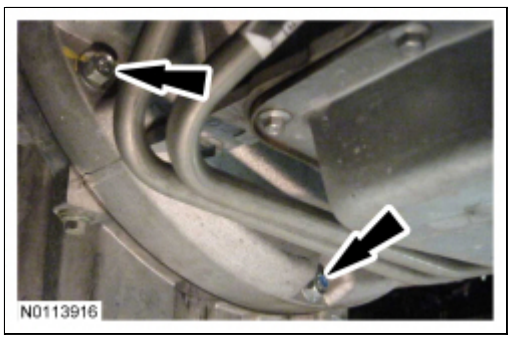
All vehicles

25. **NOTE:** This step does not apply if the front engine cover is removed.

    Loosen the engine-to-bellhousing bolt above the starter motor 5 mm (0.19 in).

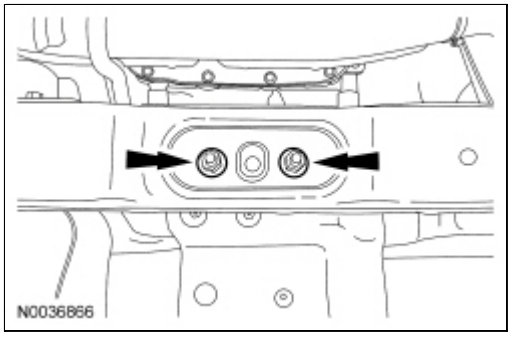


26. Remove the oil pan-to-bellhousing bolt from below the starter motor.



27. **NOTE:** This step does not apply if the front engine cover is removed.

    Loosen the 2 LH bellhousing-to-engine bolts 5 mm (0.19 in).

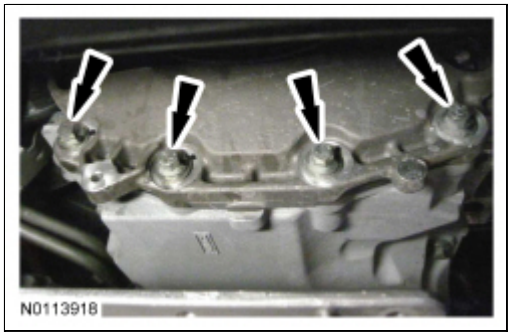


28. Remove the 2 LH bellhousing-to-oil pan bolts.

29. **NOTE:** This step does not apply if the front engine cover is removed.

repair4less

Loosen the 2 transmission crossmember nuts.

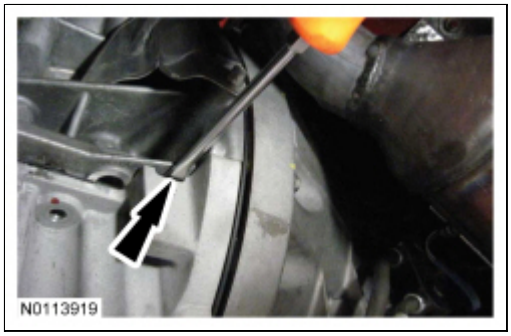


30. **NOTE:** This step does not apply if the front engine cover is removed.

    Slide the transmission rearward 5 mm (0.19 in).

31. **NOTE:** This step does not apply if the front engine cover is removed.

    Remove the 4 lower engine front cover bolts.



32. Remove the 16 oil pan bolts.

33. **NOTE:** LH rear shown, RH front similar.

    Using a suitable pry tool, locate the 2 pry pads at the LH and RH sides of the oil pan and pry the oil pan loose and remove.

34. **NOTE:** The generator wiring harness retainer is being removed for clearance to install the oil pan.

    Detach the generator wiring harness retainer from the engine block.

35. ***NOTICE:*** **Only use a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the oil**

repair4less

pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean. These tools cause scratches and gouges that make leak paths.

Clean the engine oil pan using a 3M™ Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

- Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

36. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3M™ Roloc® Bristle Disk (2-in white, part number 07528) to clean the cylinder block and engine front cover sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

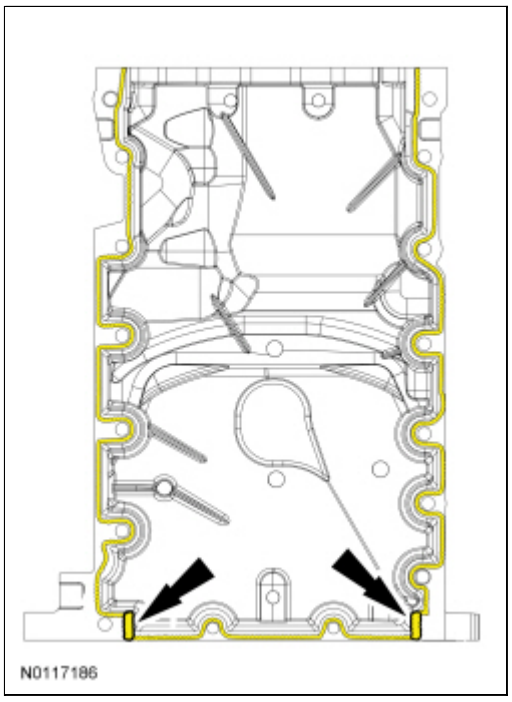
    Clean the sealing surfaces of the cylinder block and engine front cover in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

All vehicles

1. **NOTE:** This step does not apply if the front engine cover is removed.

    Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 engine front cover-to-cylinder block joint areas on the sealing surface of the oil pan.

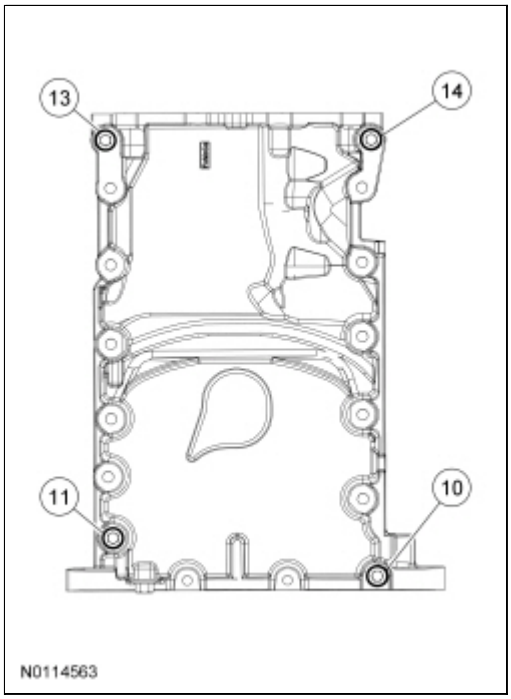


2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone on the inside edge of the oil pan to the sealing surface of the oil pan-to-engine block mating surface.

3. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

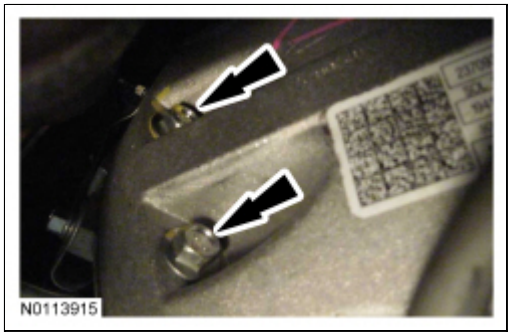


4. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.

   NOTE: Keep the oil pan as close as possible to the transmission while installing, then slide forward towards the engine front cover to prevent wiping off of the sealant.

repair4less

Install the oil pan and bolts 10, 11, 13 and 14.

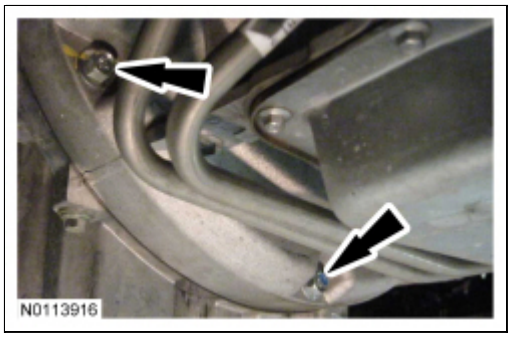


- Tighten finger-tight.

5. **NOTE:** This step does not apply if the front engine cover is removed.

   Install the 2 LH bellhousing-to-engine bolts.

   - Do not torque at this time.

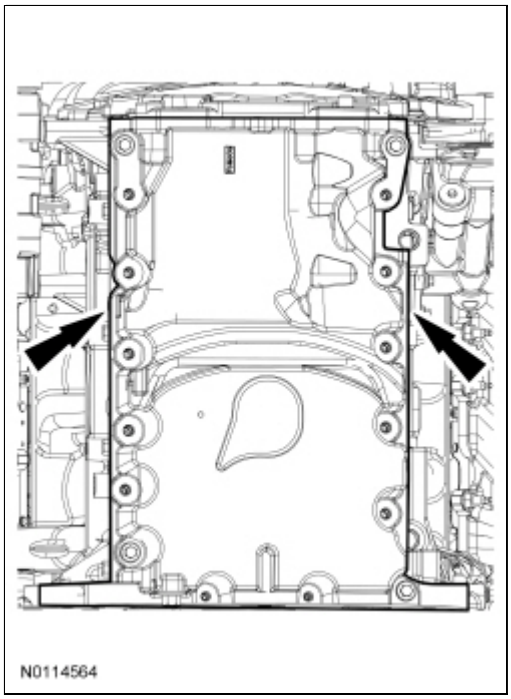


6. **NOTE:** This step does not apply if the front engine cover is removed.

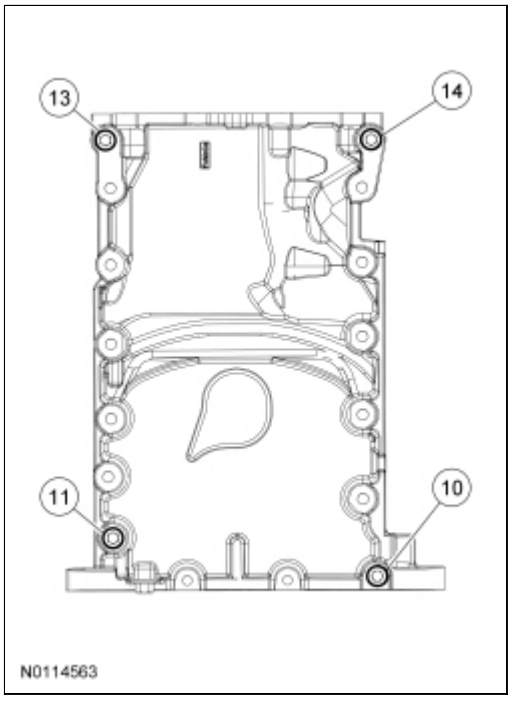
   Install the RH engine-to-bellhousing bolt.

   - Do not torque at this time.

7. Install the 2 LH bellhousing-to-oil pan bolts.
    - Do not torque at this time.

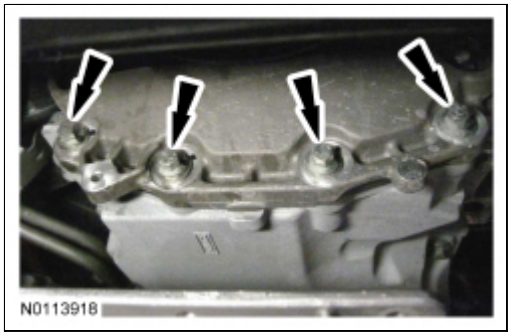


8. Install the RH oil pan-to-bellhousing bolt.
    - Do not torque at this time.

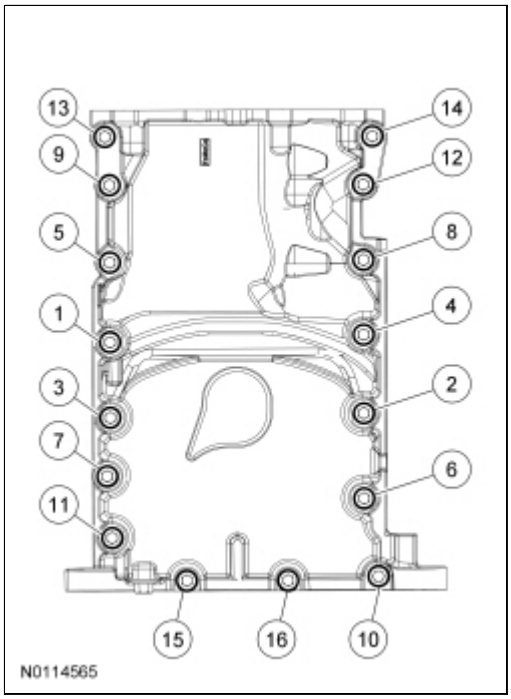


9. Laterally align the oil pan to the block. Make sure the oil pan is flush with the block at these 2 points.

repair4less

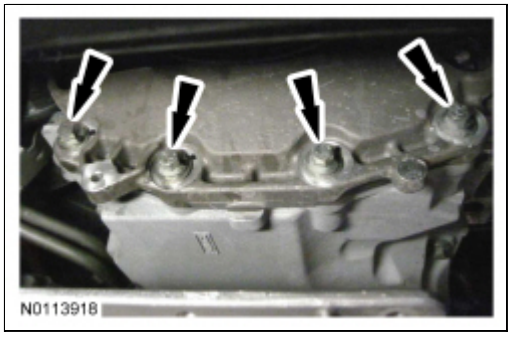


10. Tighten bolts 10, 11, 13 and 14 in the sequence shown.
    - Tighten to 3 Nm (27 lb-in).



11. **NOTE:** This step does not apply if the front engine cover is removed.

    Install the 4 lower engine front cover bolts.
    - Tighten finger-tight.

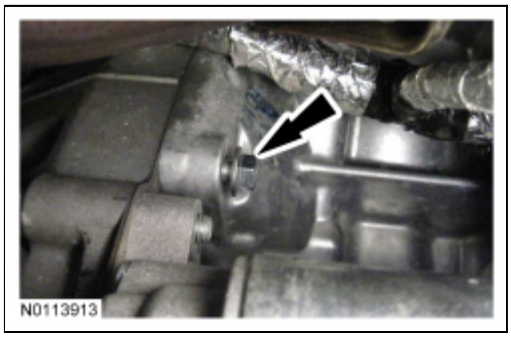


12. Install the remaining oil pan bolts. Tighten in 3 stages in the sequence shown.
    - Stage 1: Tighten bolts 1-9 and 11-14 to 20 Nm (177 lb-in), then rotate an additional 45 degrees.
    - Stage 2: Tighten bolts 15 and 16 to 10 Nm (89 lb-in), then rotate an additional 45 degrees.
    - Stage 3: Tighten bolt 10 to 20 Nm (177 lb-in), then rotate an additional 90 degrees.

13. **NOTE:** This step does not apply if the front engine cover is removed.

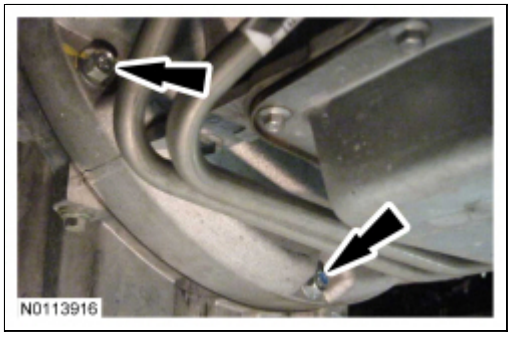
    Tighten the 4 lower engine front cover bolts.
    - Tighten to 24 Nm (18 lb-ft).

repair4less



14. **NOTE:** This step does not apply if the front engine cover is removed.

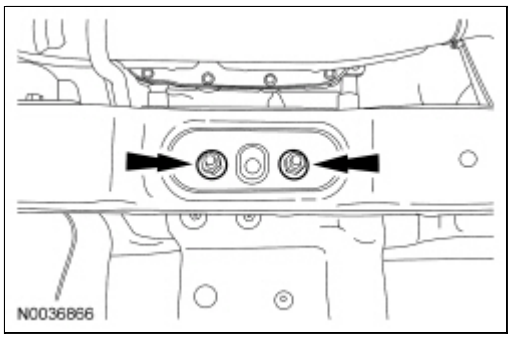
    Tighten the 2 LH bellhousing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



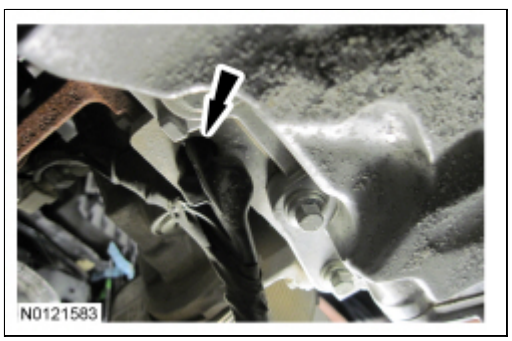
15. **NOTE:** This step does not apply if the front engine cover is removed.

    Tighten the RH engine-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).

16. Tighten the 2 LH bellhousing-to-oil pan bolts.
    - Tighten to 48 Nm (35 lb-ft).



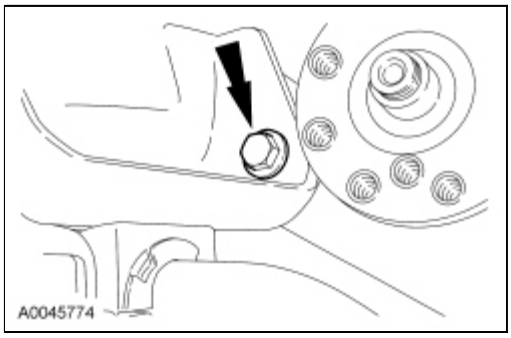
17. Tighten the RH oil pan-to-bellhousing bolt.
    - Tighten to 48 Nm (35 lb-ft).



18. **NOTE:** This step does not apply if the front engine cover is removed.

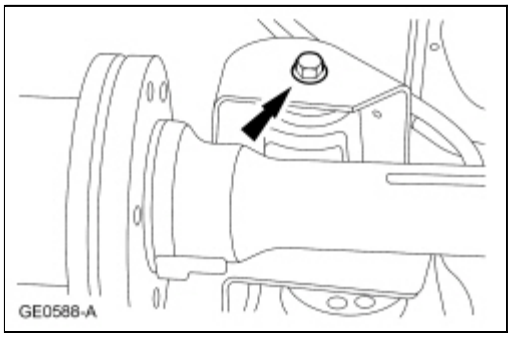
    Tighten the 2 transmission crossmember nuts.
    - Tighten to 103 Nm (75 lb-ft).

19. Attach the generator wiring harness retainer to the engine block.



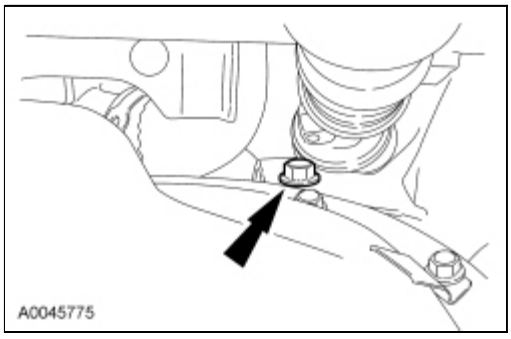
repair4less

Four Wheel Drive (4X4) vehicles



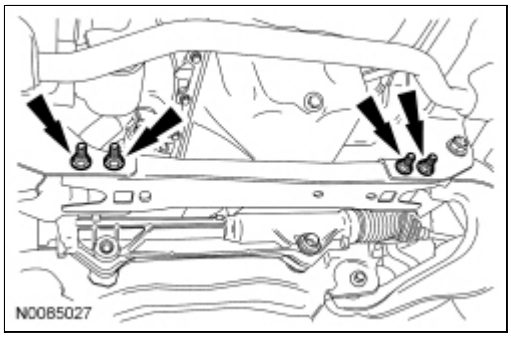
20. ***NOTICE:*** **Use care when positioning the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

    Raise the front axle carrier into position.



21. Install the lower front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

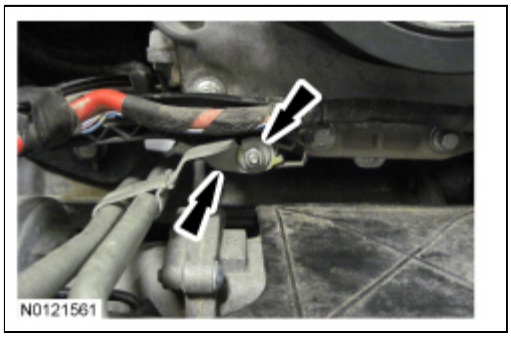
22. Install the axle shaft housing carrier bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).



23. Install the upper front axle carrier mounting bushing bolt.
    - Tighten to 115 Nm (85 lb-ft).

All vehicles

24. Position the crossmember and install the 4 nuts and bolts.
    - Tighten to 90 Nm (66 lb-ft).



25. **NOTE:** This step does not apply if the front engine cover is removed.

    Attach the generator wiring harness to the engine front cover.

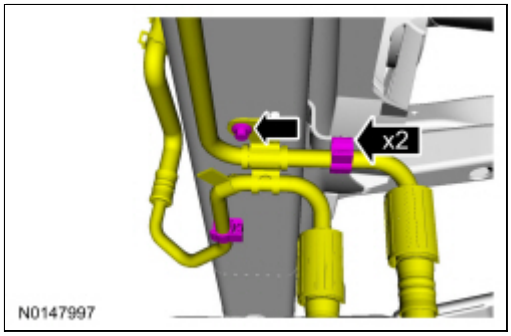
26. **NOTE:** This step does not apply if the front engine cover is removed.

    Install the transmission cooler line bracket and nut to the engine front cover stud bolt.
    - Tighten to 12 Nm (106 lb-in).

27. **NOTE:** This step does not apply if the front engine cover is removed.

    Attach the starter motor wiring harness retainer to the oil pan.

repair4less

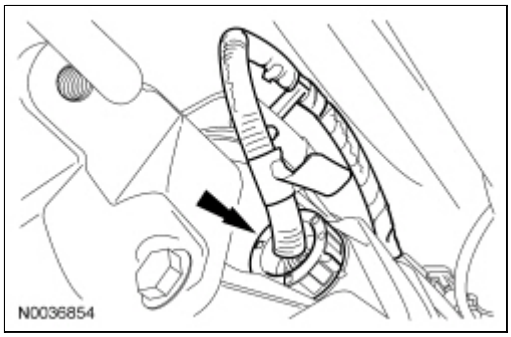


28. Install the starter motor. For additional information, refer to Section 303-06 .

29. **NOTE:** Do not lubricate the engine oil filter gasket.

    Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

30. Position the transmission cooler tubes and connect the 2 retainers. Install the bolt for the transmission cooler tube bracket.
    - Tighten to 12 Nm (106 lb-in).



31. **NOTE:** This step does not apply if the front engine cover is removed.

    Tighten the 4 upper bellhousing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

32. **NOTE:** This step does not apply if the front engine cover is removed.

    Connect the transmission vehicle harness connector by pushing the connector into the transmission and twisting the outer shell.

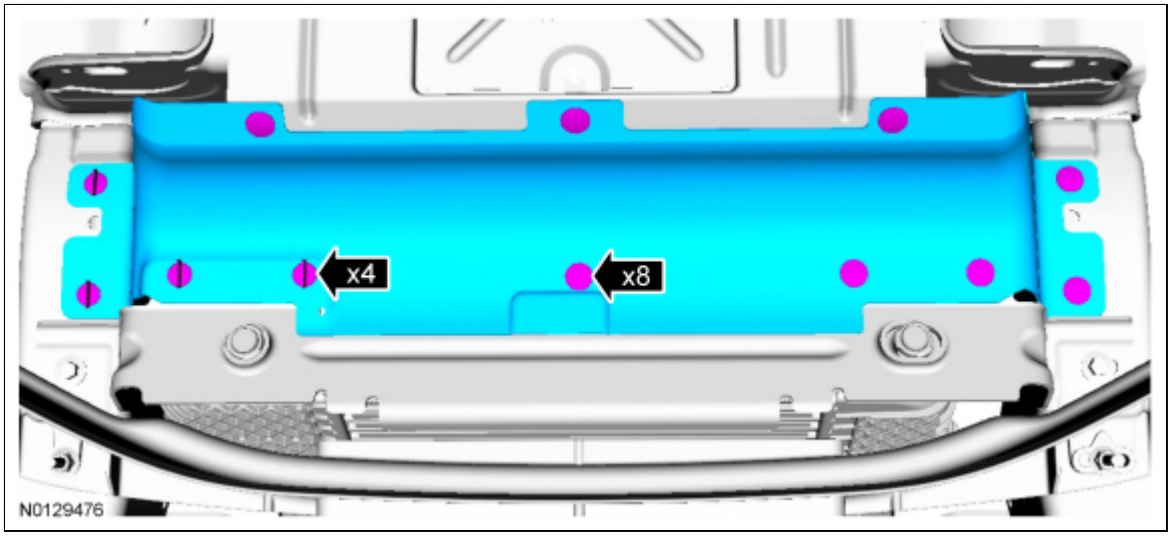
33. **NOTE:** This step does not apply if the front engine cover is removed.

    Connect the electrical connector retainer to the bracket at the rear of the transmission.
    - Connect the Heated Oxygen Sensor (HO2S) electrical connector.

34. **NOTE:** This step does not apply if the front engine cover is removed.

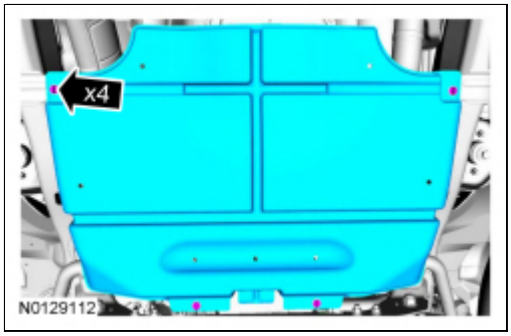
    NOTE: Only one wire harness retainer and one electrical connector shown, others similar.

    If equipped, connect the 5 transmission wire harness retainers to the transfer case wire harness.
    - Connect the 2 HO2S electrical connector retainers.
    - Connect the 2 HO2S electrical connectors.



35. Install the front air dam. For additional information, refer to the Front End Body Panels — Exploded View in Section 501-02 .

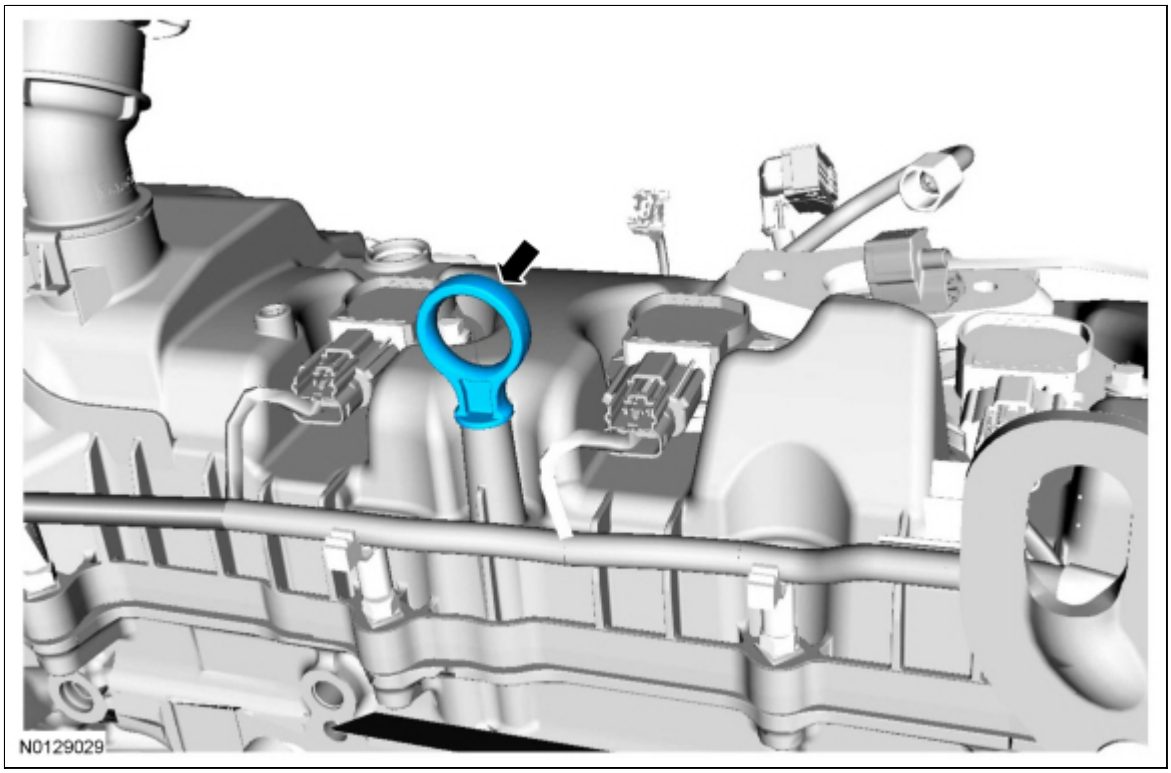
36. Install the skid plate and the 4 bolts.
    - Tighten to 48 Nm (35 lb-ft).



37. **NOTE:** This step does not apply if the front engine cover is removed.

repair4less

If equipped, install the lower air deflector and the 8 pushpins. Turn the 4 quarter-turn retainers.



38. If equipped, install the splash shield and the 4 fasteners.

39. **NOTE:** This step does not apply if the front engine cover is removed.

    Install the oil level indicator.

40. **NOTE:** This step does not apply if the front engine cover is removed.

    Fill the engine with clean engine oil.

41. **NOTE:** This step does not apply if the front engine cover is removed.

    Connect the battery ground cable. For additional information, refer to Section 414-01 .

repair4less

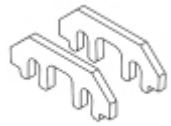
Oil Pump Screen and Pickup Tube

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.

2. Remove the 3 bolts and the oil pump screen and pickup tube.
   - Discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

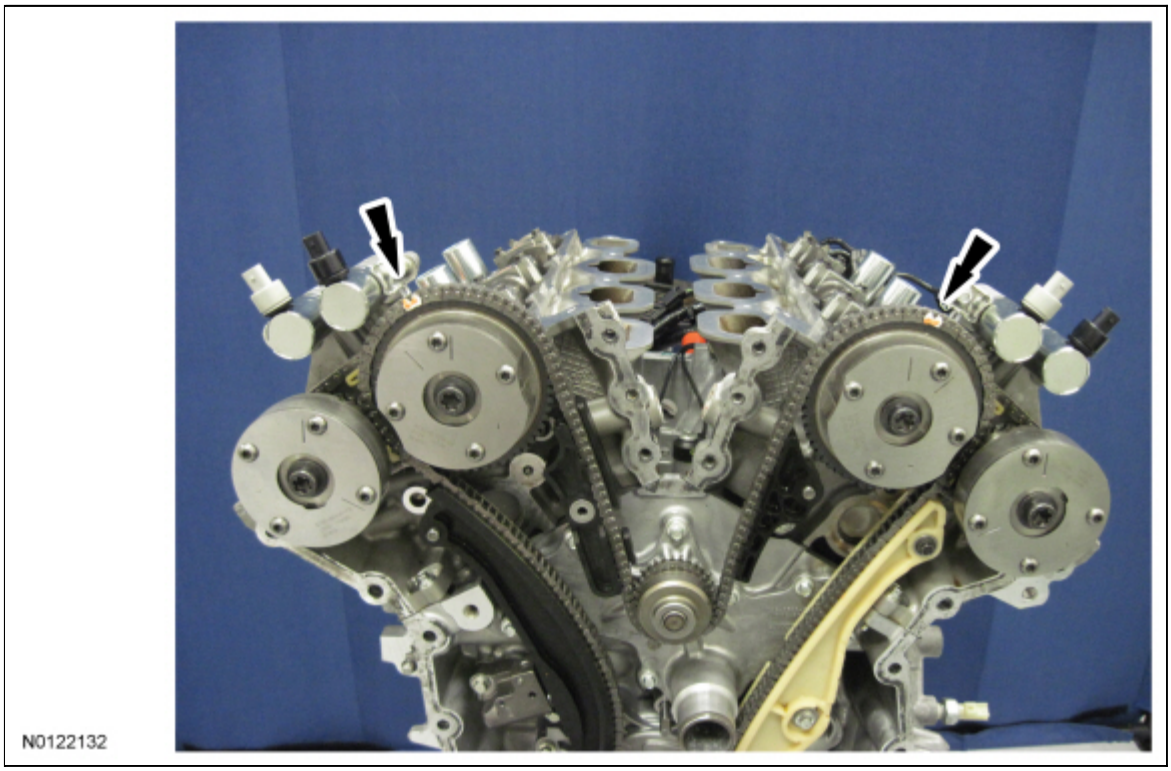


3. **NOTE:** Install a new O-ring seal.

   To install, reverse the removal procedure.

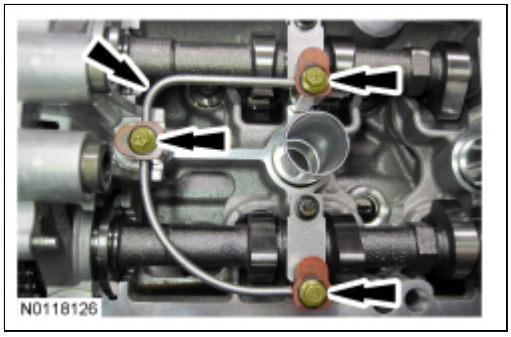
repair4less

Oil Pump



Special Tool(s)

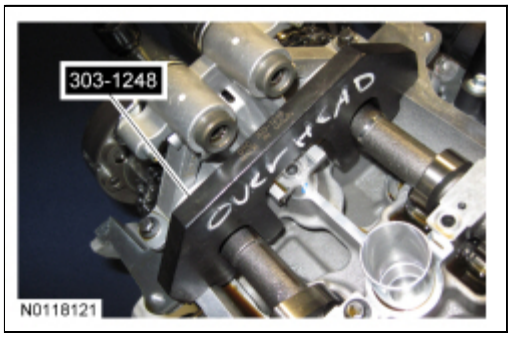
 ST2979-A	Tool, Camshaft Holding 303-1248



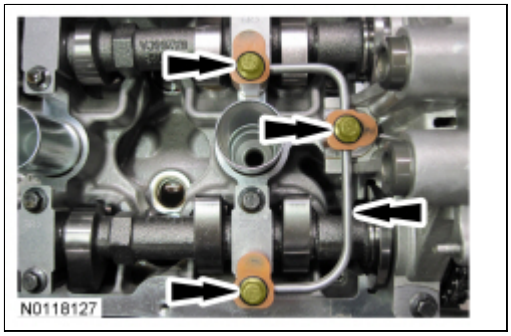
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
3. Rotate the crankshaft clockwise and align the timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.

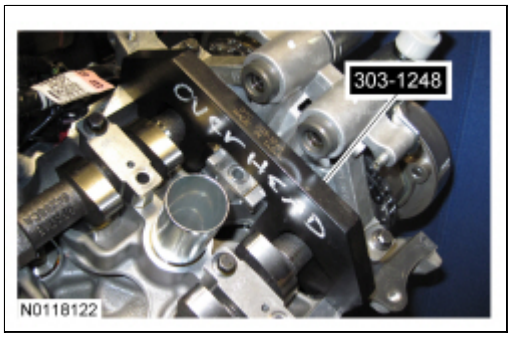


4. Remove the 3 bolts and the LH valve train oil tube.



5. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

   Install the Camshaft Holding Tool onto the flats of the LH camshafts.

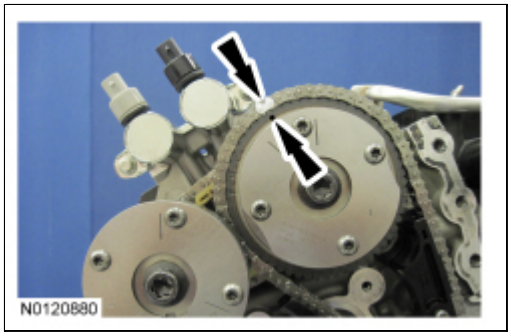


6. Remove the 3 bolts and the RH valve train oil tube.

7. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

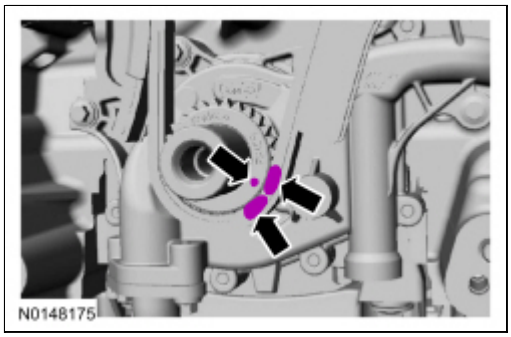
   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

repair4less

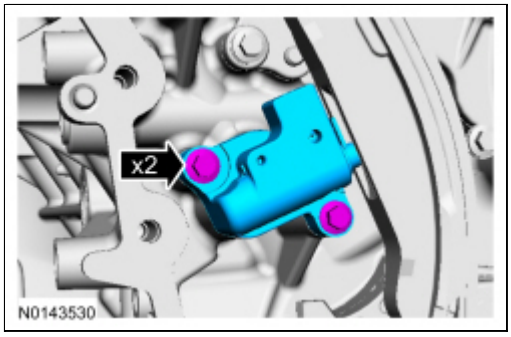


NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



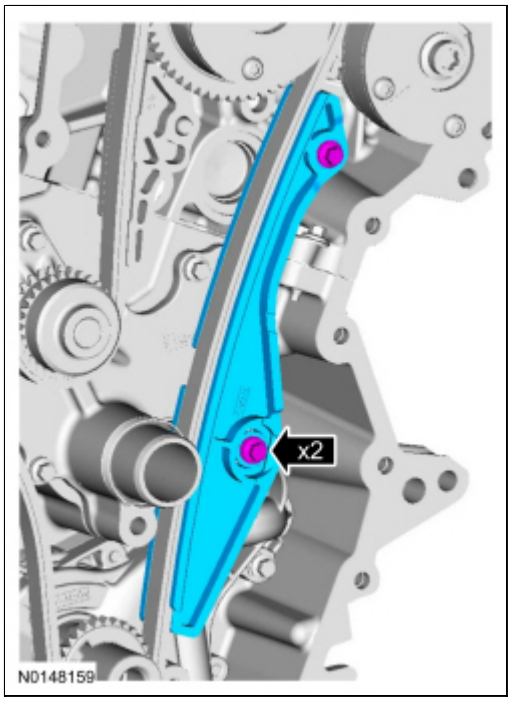
9. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



10. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.

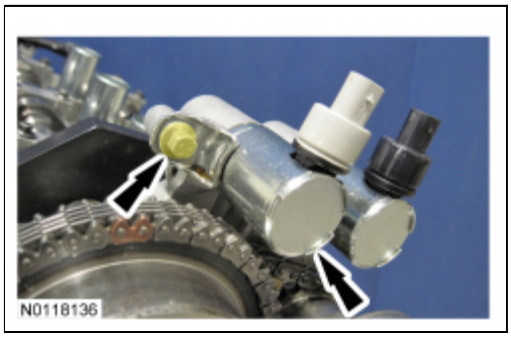
11. Remove the 2 bolts and the primary timing chain tensioner.



12. Remove the primary timing chain tensioner arm.

13. Remove the 2 bolts and the lower LH primary timing chain guide.

repair4less

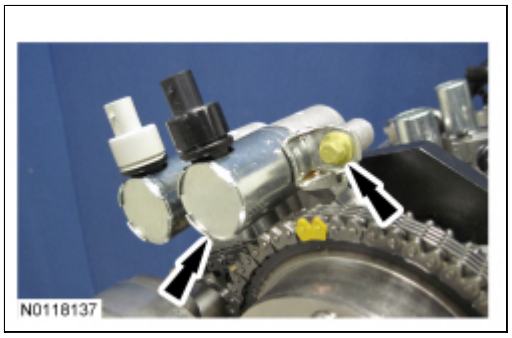


14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.

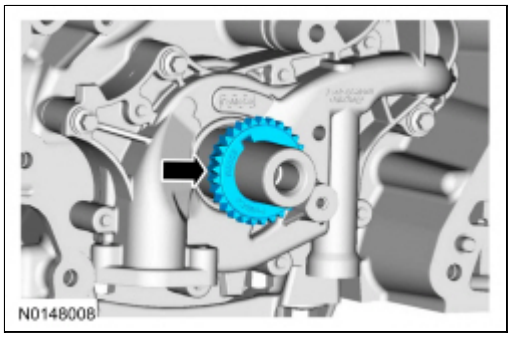


15. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

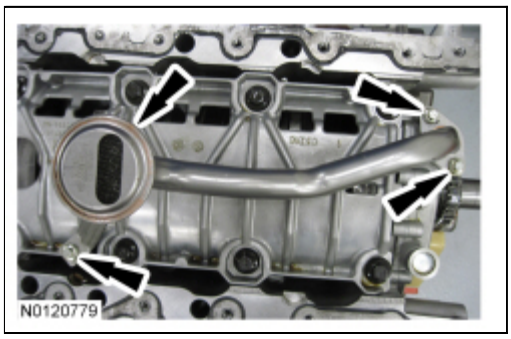
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

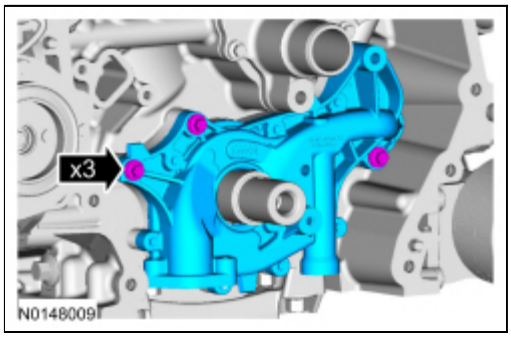


16. Remove the primary timing chain.

17. Remove the oil pan. For additional information, refer to Oil Pan in this section.



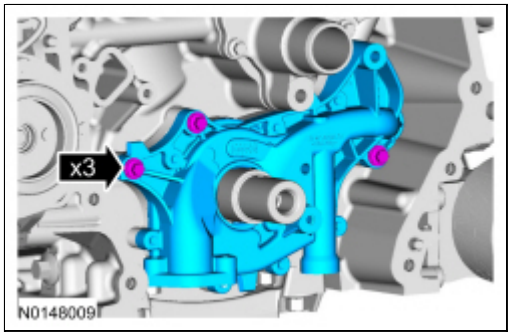
18. Remove the crankshaft timing chain sprocket.



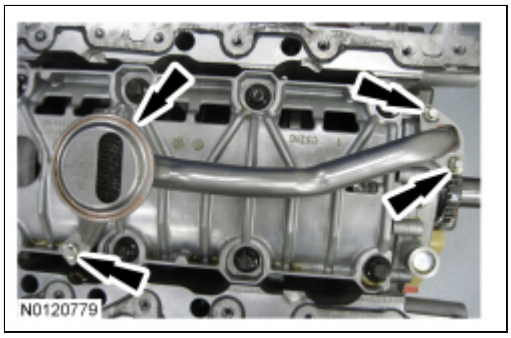
19. Remove the 3 bolts and the oil pump screen and pickup tube.

repair4less

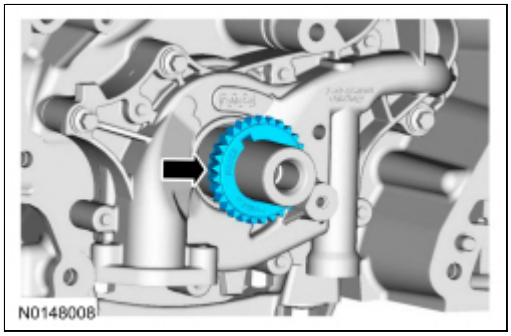
- Discard the O-ring seal.



20. Remove the 3 bolts and the oil pump.



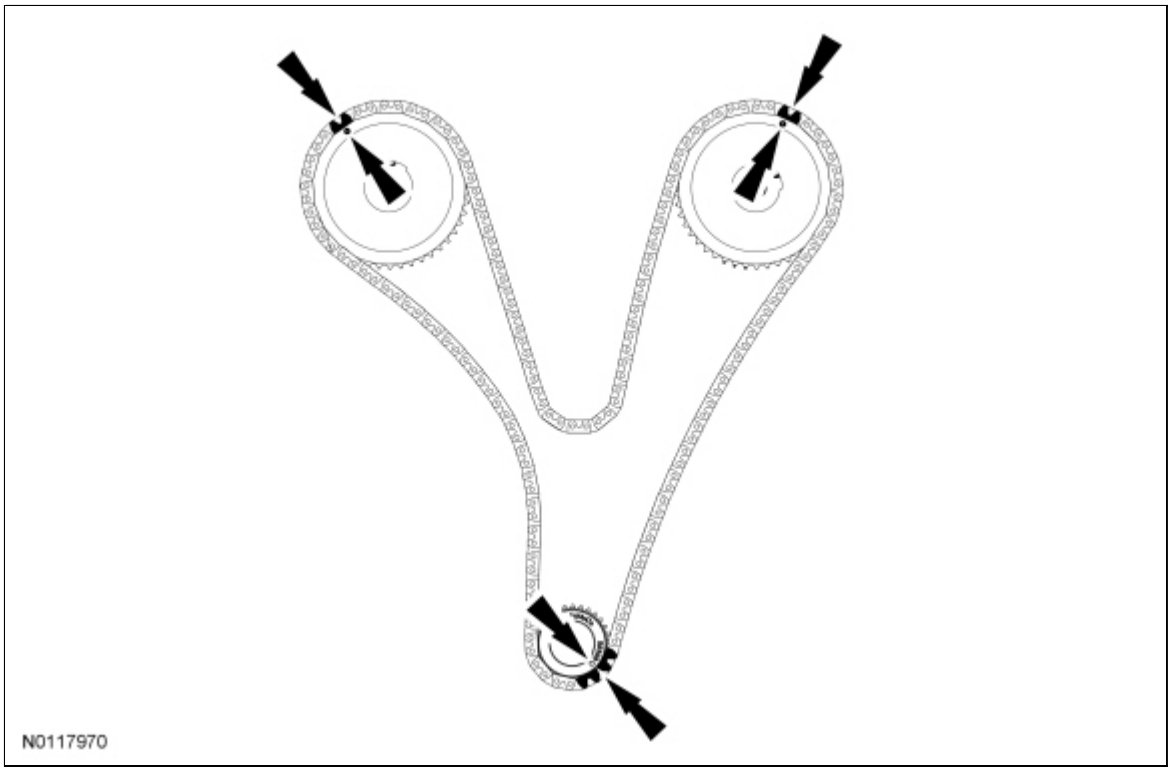
Installation



1. Install the oil pump and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

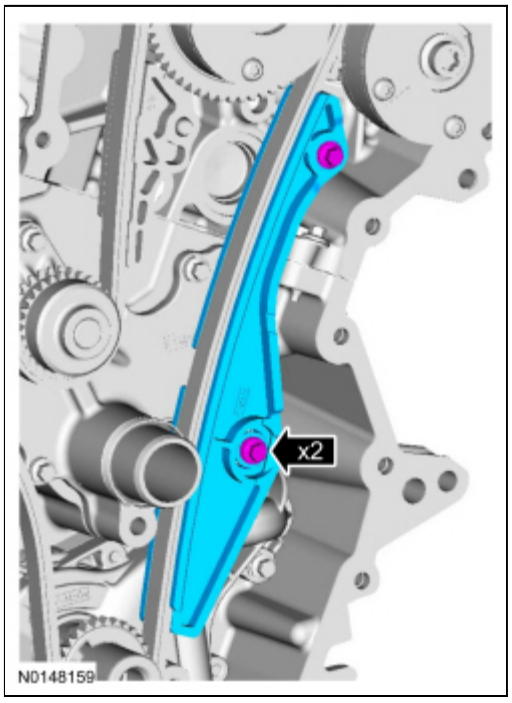
2. Using a new O-ring seal, install the oil pump screen and pickup tube and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

3. Install the crankshaft timing chain sprocket with timing dot mark out.



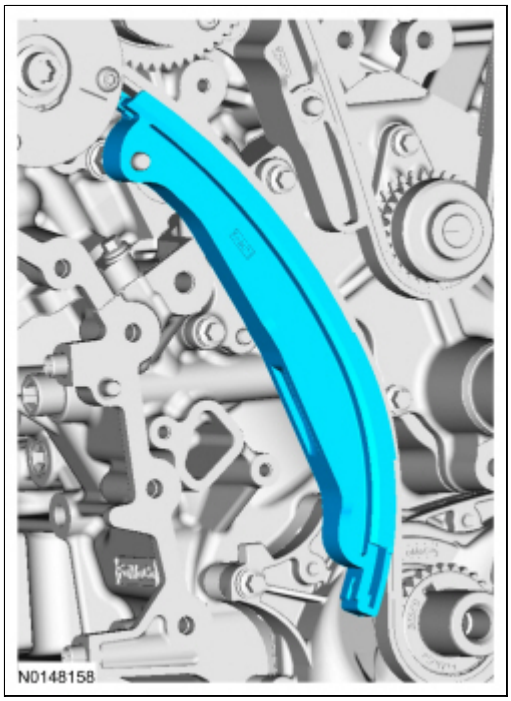
4. **NOTE:** Do not fill with clean engine oil until the engine front cover is installed.

   Install the oil pan. For additional information, refer to Oil Pan in this section.

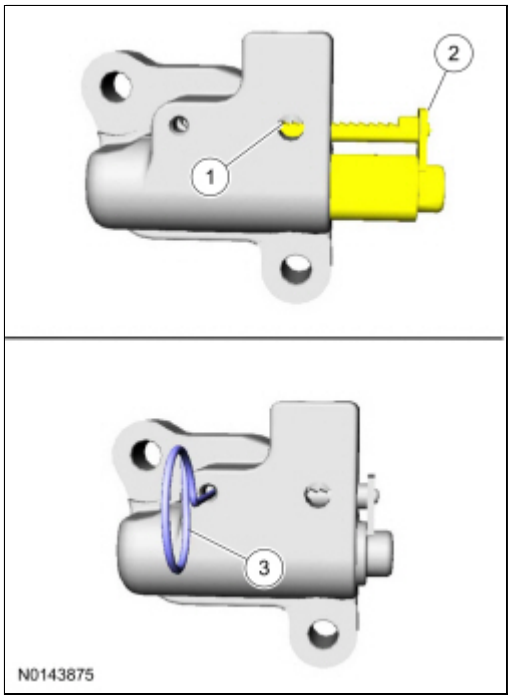


5. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

   Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



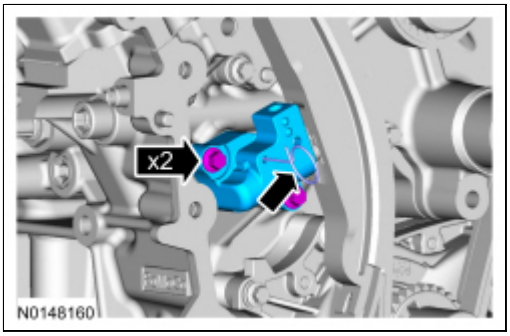
repair4less



6. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

7. Install the primary timing chain tensioner arm.

8. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin. .



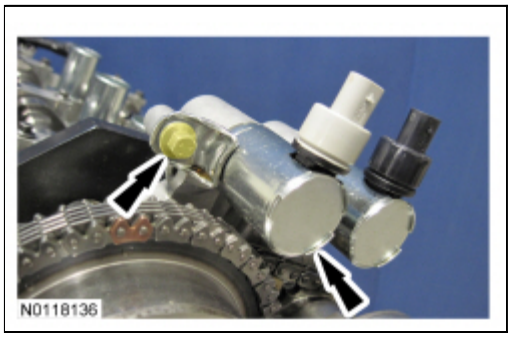
9. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary timing chain tensioner and the 2 bolts.

repair4less

- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

10. As a post-check, verify correct alignment of all timing marks.
    - There is 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There is 35 links in between RH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).



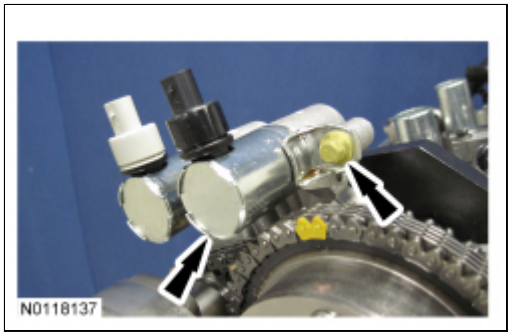
11. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



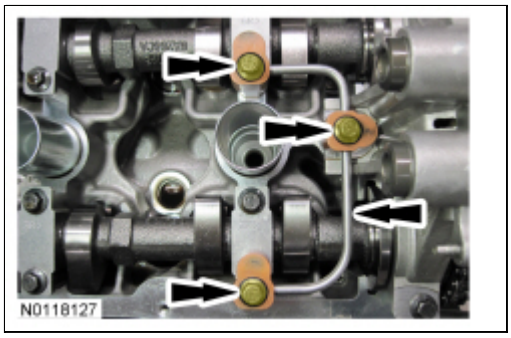
12. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

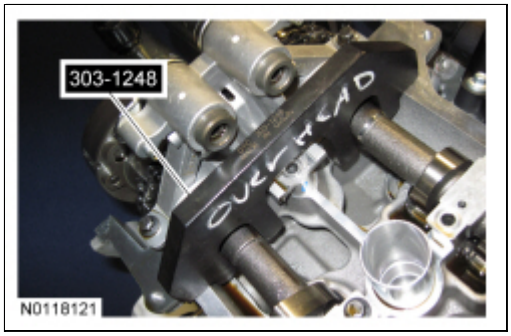
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the RH intake VCT oil control solenoid and the bolt.

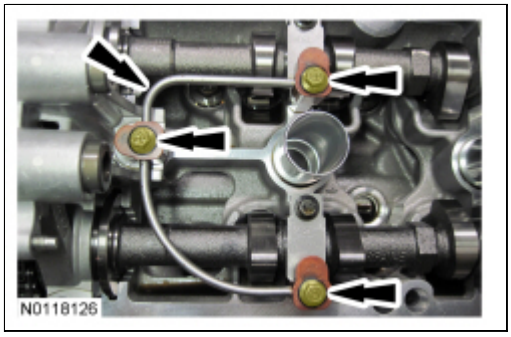
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



13. Remove the RH Camshaft Holding Tool.



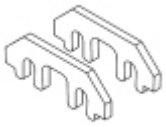
14. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



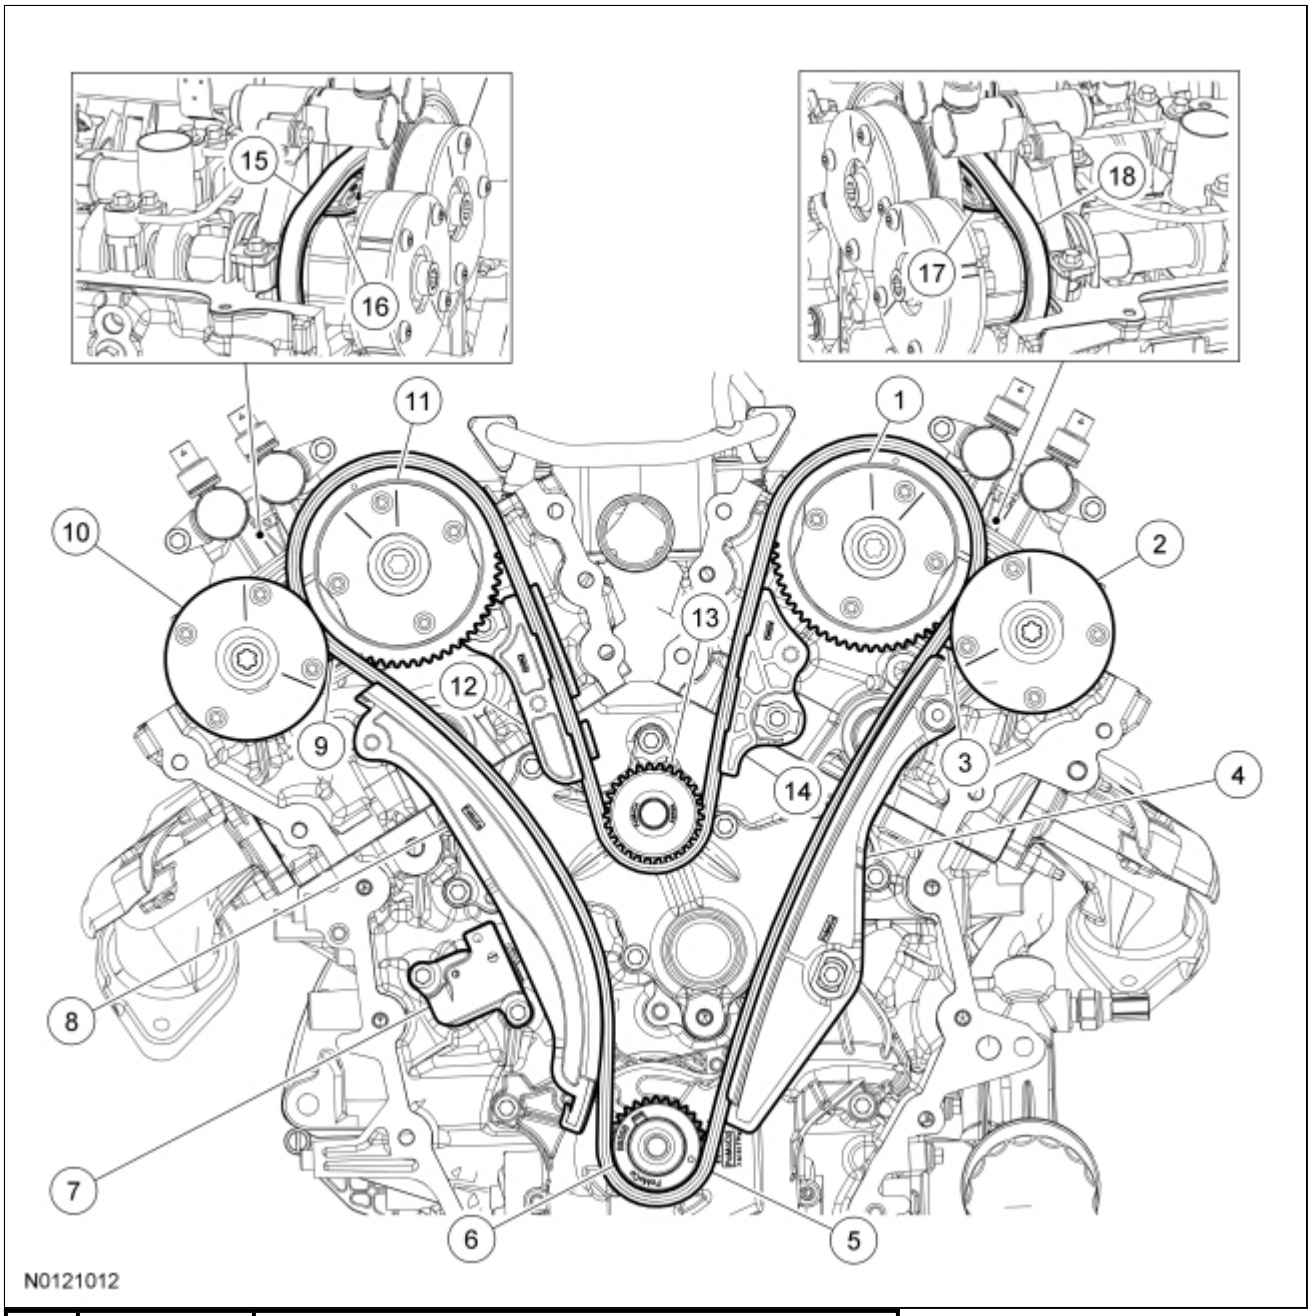
repair4less

15. Remove the LH Camshaft Holding Tool.

16. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.



17. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.



18. Fill the engine with clean engine oil.

repair4less

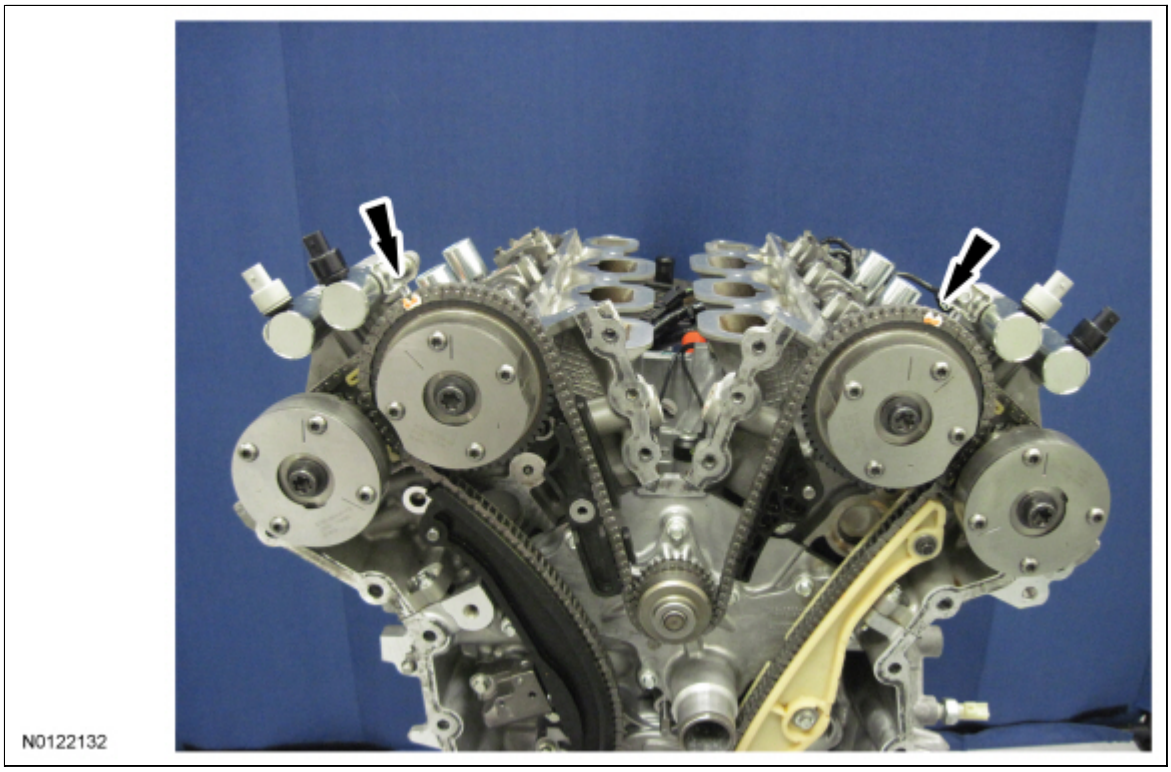
Timing Drive Components

Special Tool(s)

 ST3234-A	Hold Down, Secondary Chain 303-1530
 ST2979-A	Tool, Camshaft Holding 303-1248

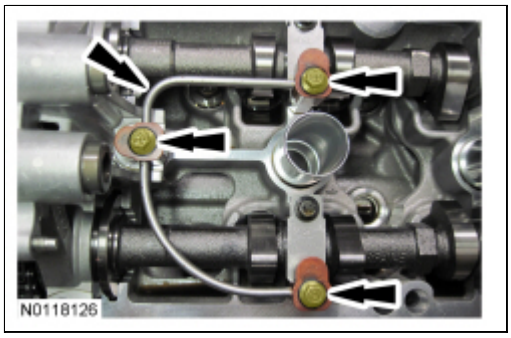
Item	Part Number	Description
1	6256	LH intake Variable Camshaft Timing (VCT) assembly
2	6C525	LH exhaust VCT assembly
3	6K297	LH secondary timing chain tensioner shoe
4	6B274	LH primary timing chain guide
5	6268	Primary timing chain
6	6306	Crankshaft timing chain sprocket
7	6L266	Primary timing chain tensioner
8	6K255	RH primary timing chain tensioner arm
9	6K297	RH secondary timing chain tensioner shoe

repair4less



10	6C525	RH exhaust VCT assembly
11	6256	RH intake VCT assembly
12	6K297	RH primary timing chain guide
13	8501	Timing chain gear
14	6K297	LH primary timing chain guide
15	6268	RH secondary timing chain
16	6K254	RH secondary timing chain tensioner
17	6K254	LH secondary timing chain tensioner
18	6268	LH secondary timing chain

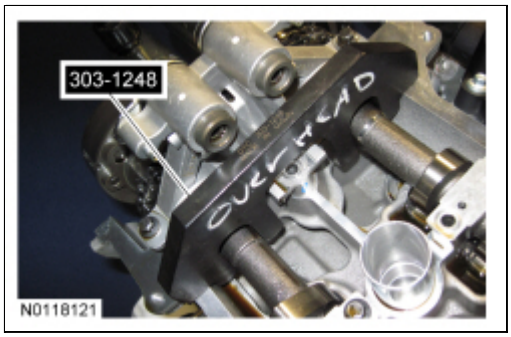
Removal



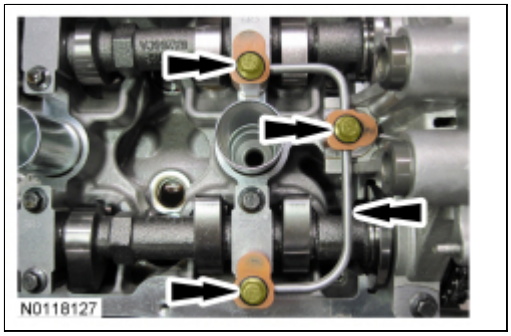
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

All engines

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
2. Rotate the crankshaft clockwise and align the timing marks on the intake Variable Camshaft Timing (VCT) assemblies as shown.

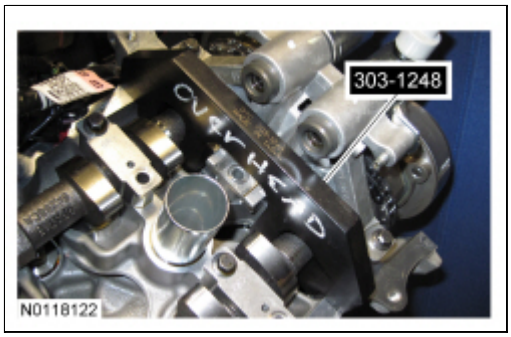


3. Remove the 3 bolts and the LH valve train oil tube.



4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

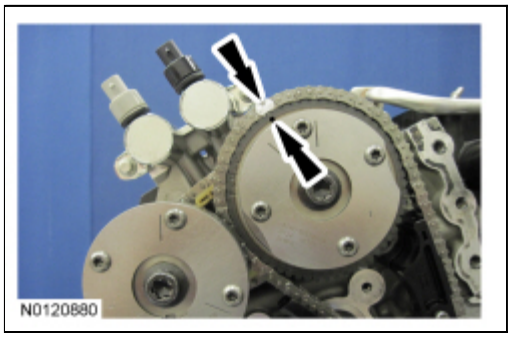
   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



5. Remove the 3 bolts and the RH valve train oil tube.

6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

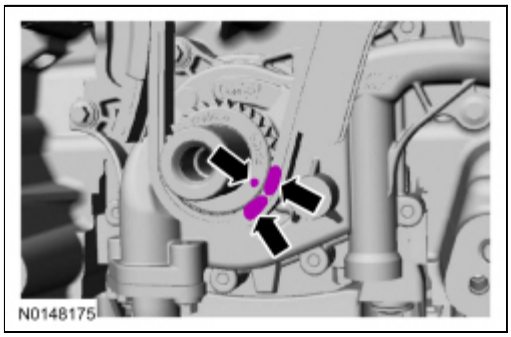
   Install the Camshaft Holding Tool onto the flats of the RH camshafts.



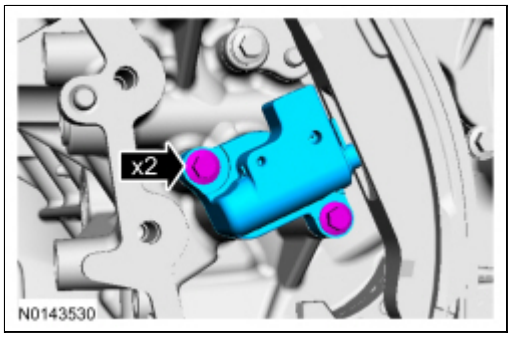
repair4less

NOTE: The following 3 steps are for primary timing chains that the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



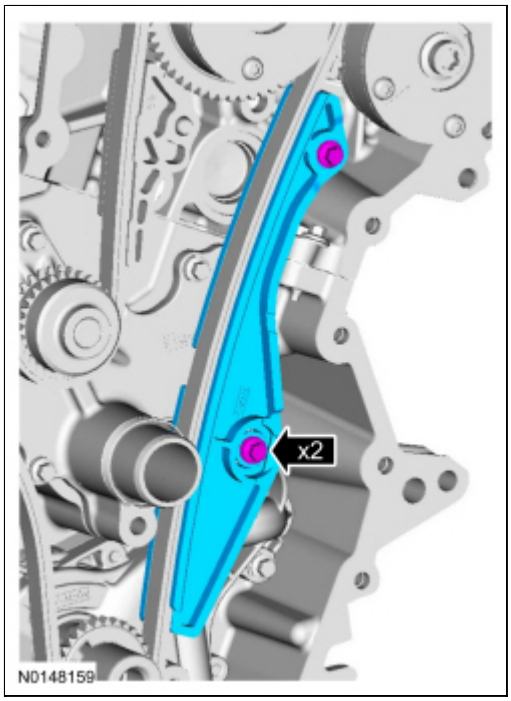
8. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.

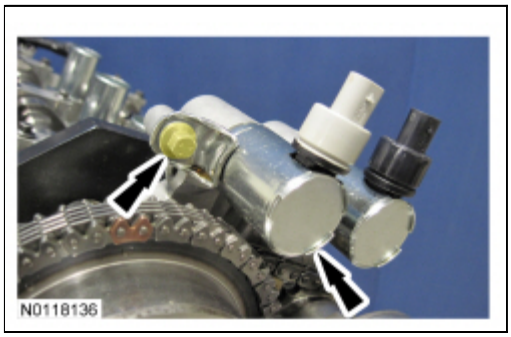
10. Remove the 2 bolts and the primary timing chain tensioner.



11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.

repair4less

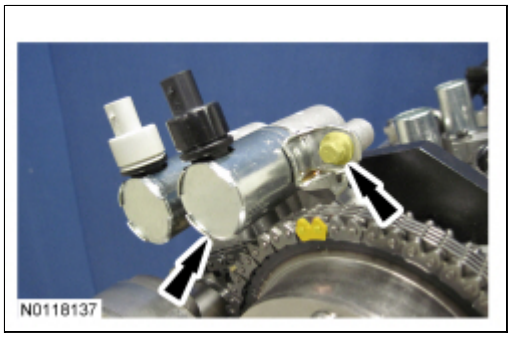


13. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the LH intake VCT oil control solenoid.



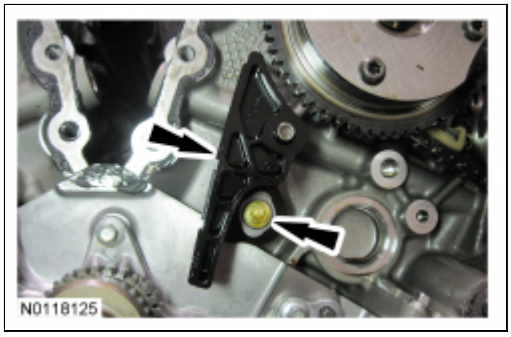
14. **NOTE:** Removal of the VCT oil control solenoid will aid in the removal of the primary timing chain.

    NOTE: A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the bolt and the RH intake VCT oil control solenoid.

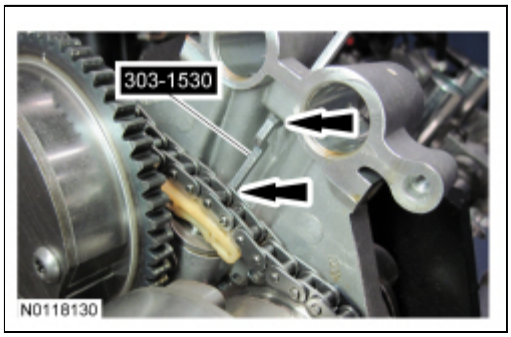
15. Remove the primary timing chain.



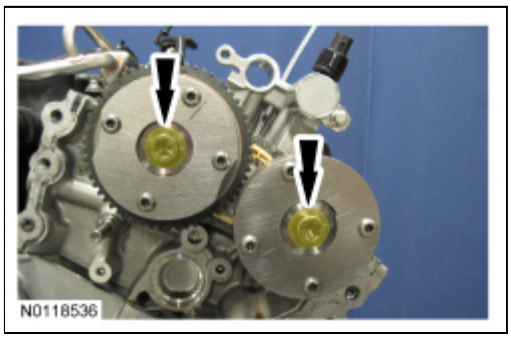
16. Remove the crankshaft timing chain sprocket.

17. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the LH primary timing chain guide may occur.**

repair4less



Remove the bolt and the upper LH primary timing chain guide.

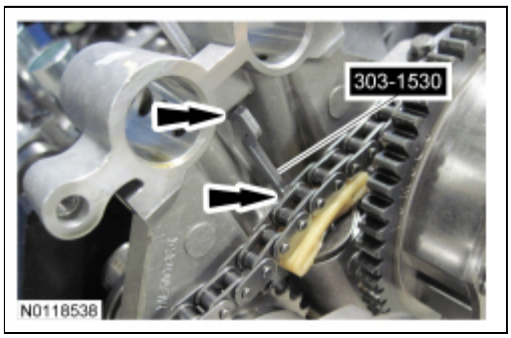


18. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

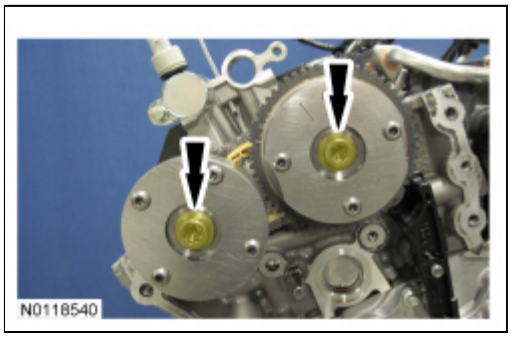
    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

19. Remove and discard the 2 LH VCT assembly bolts.



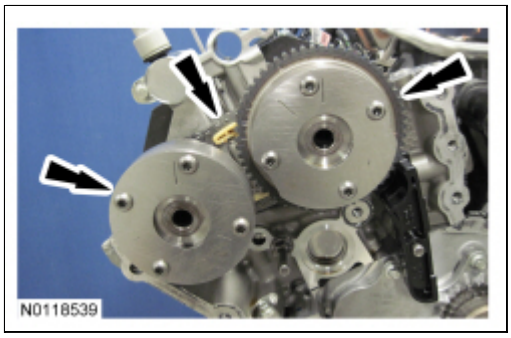
20. Remove the 2 LH VCT assemblies and secondary timing chain.



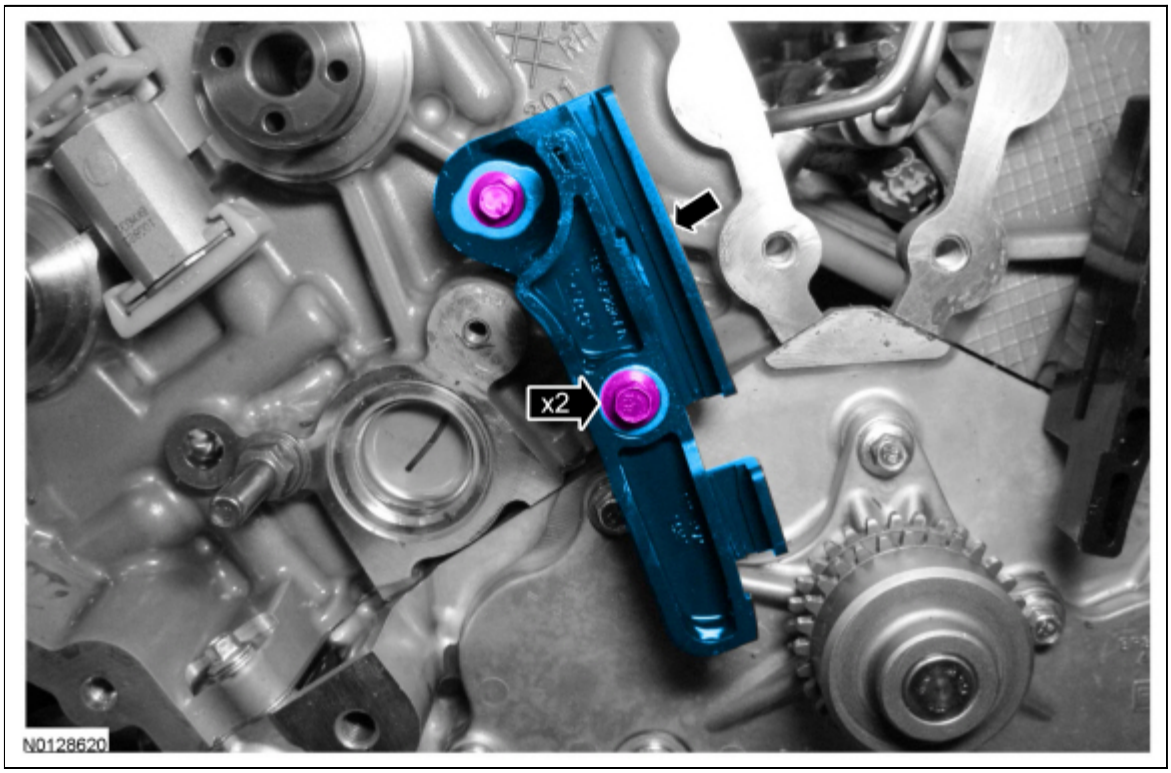
21. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    NOTE: The Secondary Chain Hold Down is inserted through a hole in the top of the mega cap.

    Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down in the hole on the rear of the secondary timing chain tensioner guide and let it hold against the mega cap to retain the tensioner in the collapsed position.

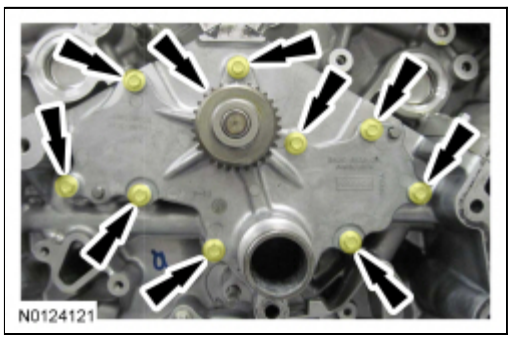


22. Remove and discard the 2 RH VCT assembly bolts.



23. Remove the 2 RH VCT assemblies and secondary timing chain.

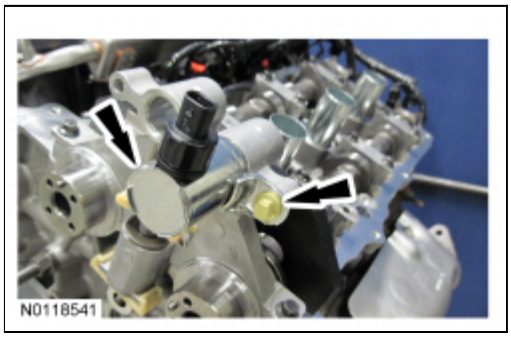
repair4less



24. ***NOTICE:*** **Do not use power tools to remove the bolt or damage to the RH primary timing chain guide may occur.**

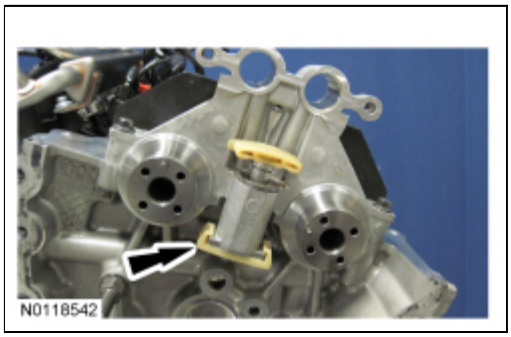
    Remove the 2 bolts and the RH primary timing chain guide.

25. Remove the 9 bolts and the timing chain gear.
    - Discard the gasket.



Engines with secondary timing chain tensioner removed

NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed, or damage to the engine may occur.**



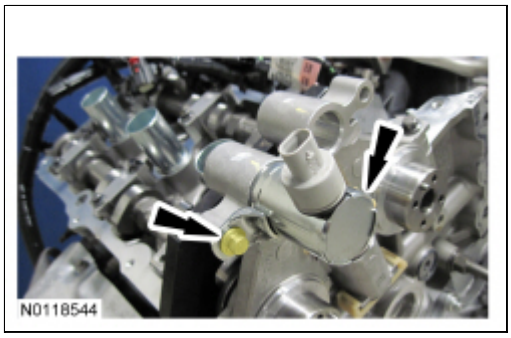
26. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the LH exhaust VCT oil control solenoid.

27. Remove the LH secondary timing chain tensioner shoe.

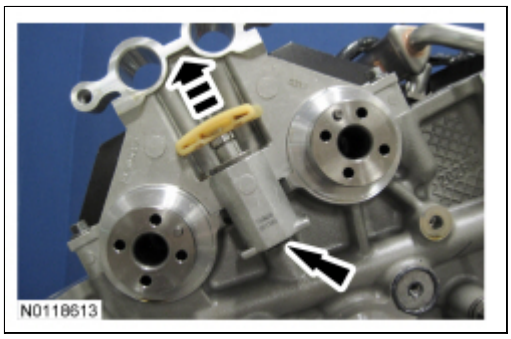
28. Remove the LH secondary timing chain tensioner by pushing up from the bottom and remove.



29. **NOTE:** A slight twisting motion will aid in the removal of the VCT oil control solenoid.

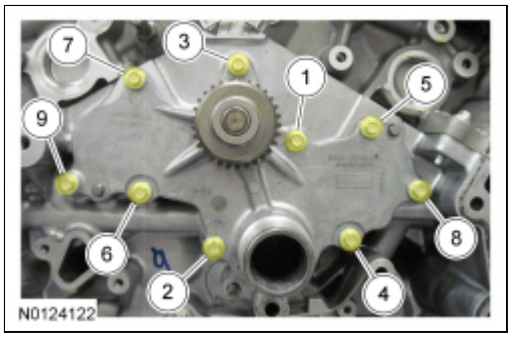
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Remove the RH exhaust VCT oil control solenoid.

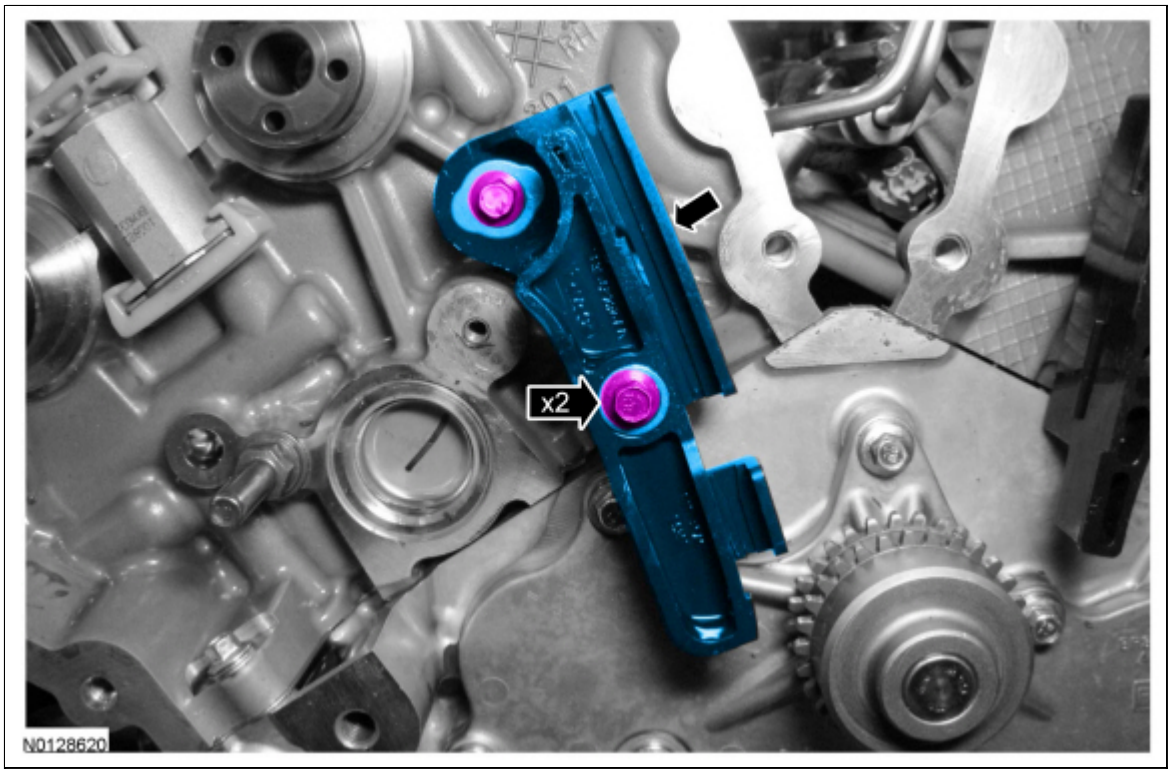


repair4less

30. Remove the RH secondary timing chain tensioner shoe.



31. Remove the RH secondary timing chain tensioner by pushing up from the bottom and remove.



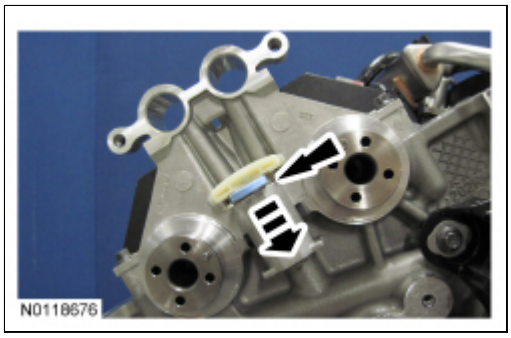
Installation

All engines

1. Using a new gasket, install the timing chain gear and the 9 bolts. Tighten in the sequence shown in 2 stages:
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten an additional 45 degrees.

2. Install the RH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

Engines with secondary timing chain tensioner removed

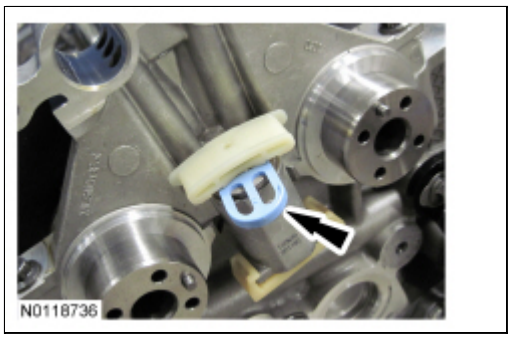


NOTICE: **The following steps are only for the replacement of the secondary timing chain tensioners. Do not reuse the secondary timing chain tensioners if removed or damage to the engine may occur.**

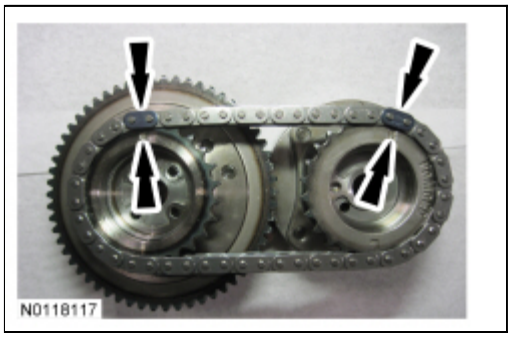
3. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

   NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

   Install the RH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

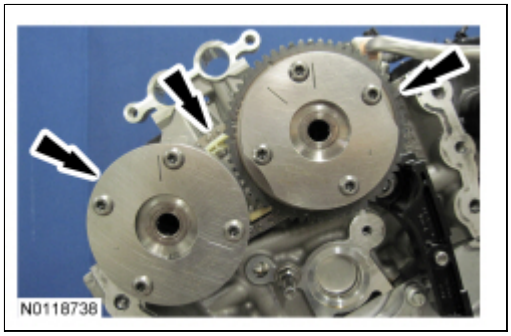


repair4less

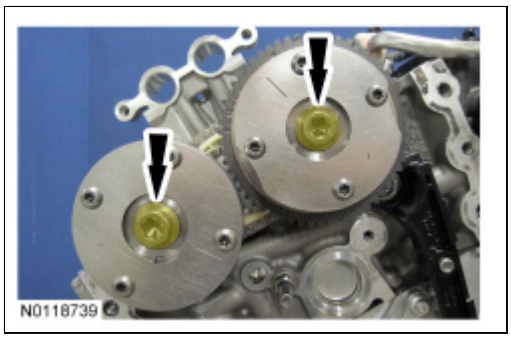


4. Install the RH secondary timing chain tensioner shoe.

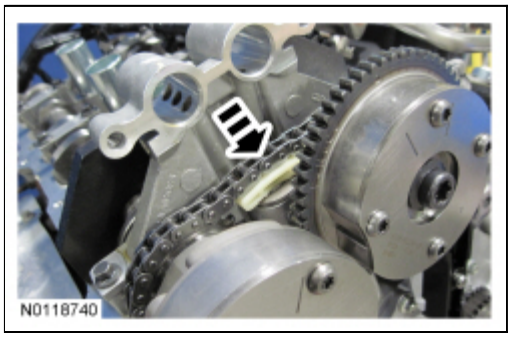
5. Remove and discard the RH secondary timing chain tensioner shipping clip.



6. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



7. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.



Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

8. Install the 2 new RH VCT bolts and tighten in 4 stages.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 25 Nm (18 lb-ft).
   - Stage 4: Tighten an additional 180 degrees.

9. Activate the RH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

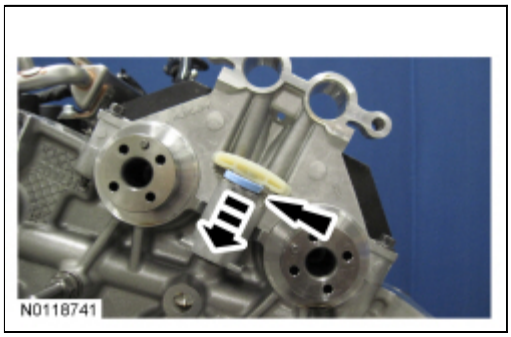
10. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

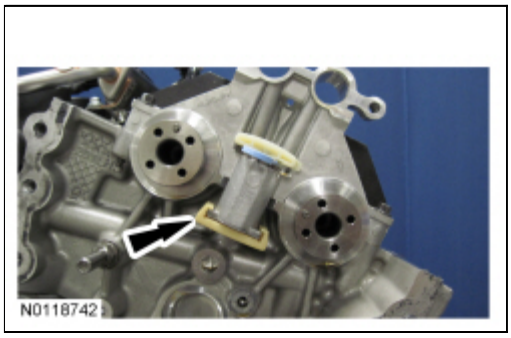
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

repair4less

Install the RH exhaust VCT oil control solenoid.



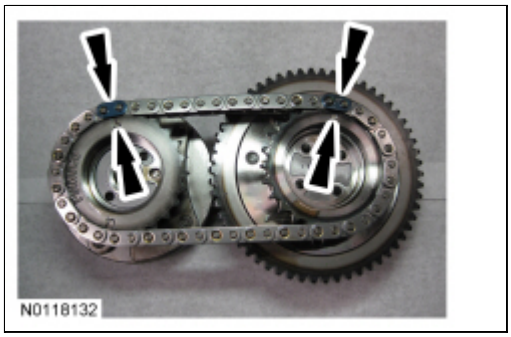
- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



11. **NOTE:** Apply clean engine oil to the secondary timing chain tensioner O-ring seals and mega cap bore.

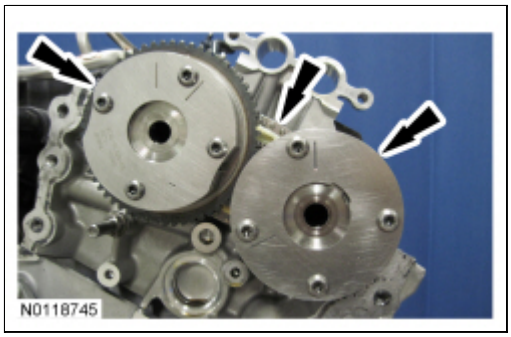
    NOTE: Do not remove the secondary timing chain tensioner shipping clip, until instructed to do so.

    Install the LH secondary timing chain tensioner by pushing it down all the way until a snap is heard and the tensioner is seated all the way down the mega cap bore.

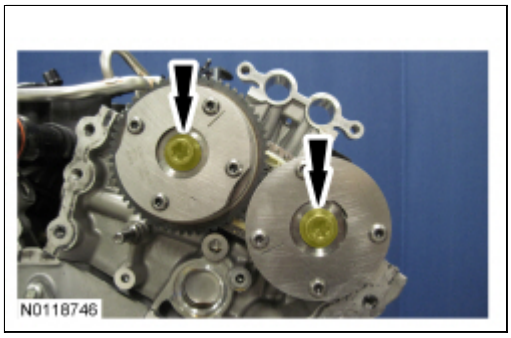


12. Install the LH secondary timing chain tensioner shoe.

13. Remove and discard the LH secondary timing chain tensioner shipping clip.

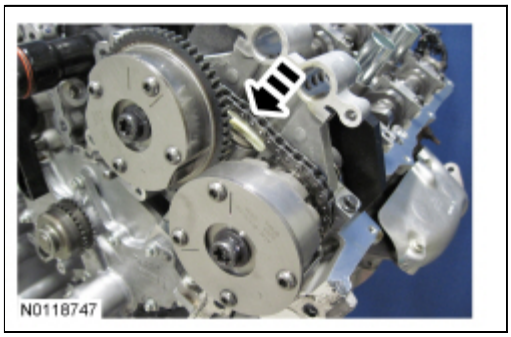


14. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.



15. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

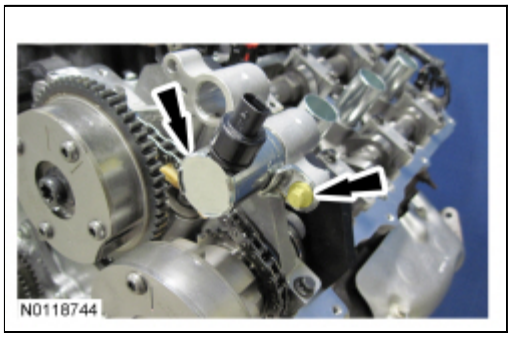
    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



16. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

repair4less

17. Activate the LH secondary timing chain tensioner by pressing down on the secondary tensioner shoe until it bottoms out, let go of the tensioner and it will spring up putting tension on the chain.

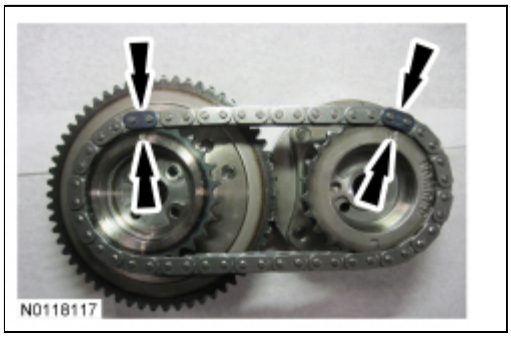


18. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

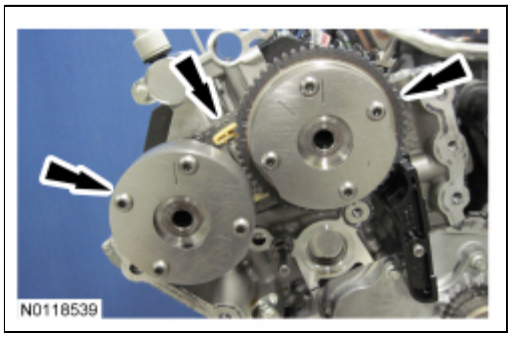
    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

    Install the LH exhaust VCT oil control solenoid.
    - Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.

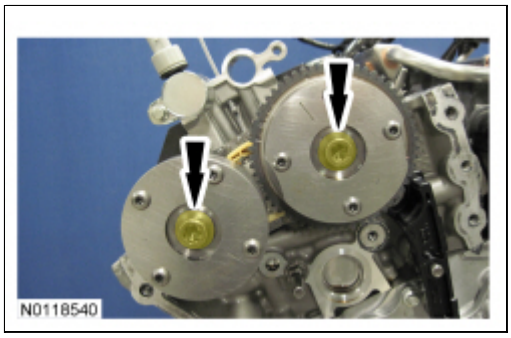


Engines with secondary timing chain tensioner not removed

19. Compress the RH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

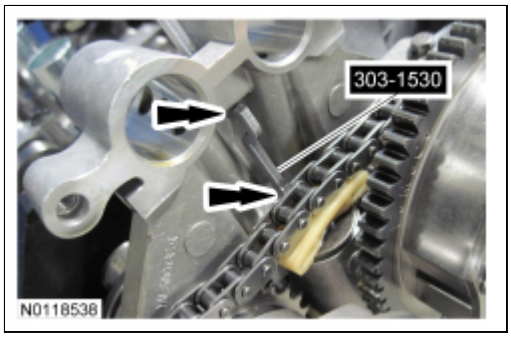


20. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.



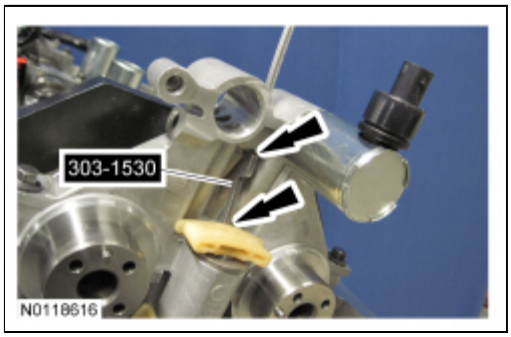
21. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the RH secondary timing assembly.

    Position the 2 RH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.



22. Install the 2 new RH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

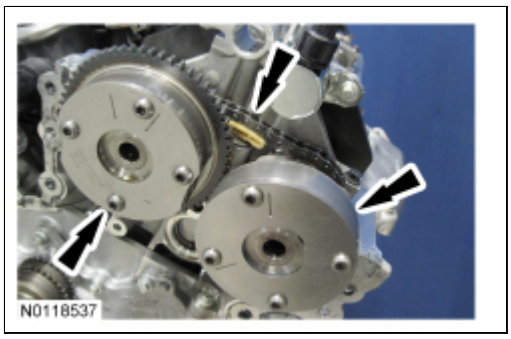
repair4less



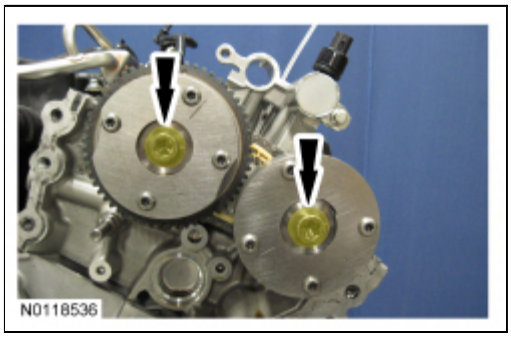
23. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

    Compress the RH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

24. Compress the LH secondary timing chain tensioner and install the Secondary Chain Hold Down to retain the tensioner in the collapsed position.

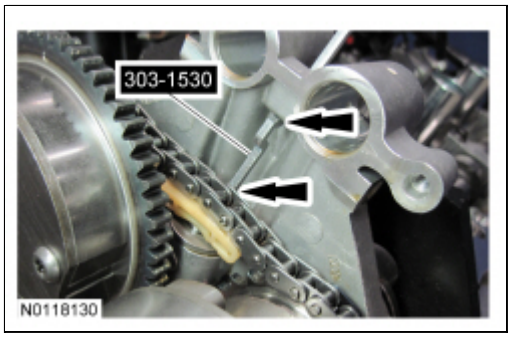


25. Assemble the 2 LH VCT assemblies and the LH secondary timing chain.
    - Align the colored links with the timing marks.



26. **NOTE:** It may be necessary to rotate the camshafts slightly, to install the LH secondary timing assembly.

    Position the 2 LH VCT assemblies and secondary timing chain onto the camshafts by aligning the holes in the VCT assemblies with the dowel pins in the camshafts.

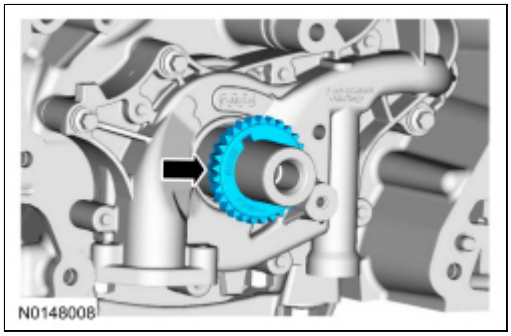


27. Install the 2 new LH VCT bolts and tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 25 Nm (18 lb-ft).
    - Stage 4: Tighten an additional 180 degrees.

28. **NOTE:** The 2 VCT oil control solenoids are removed for clarity.

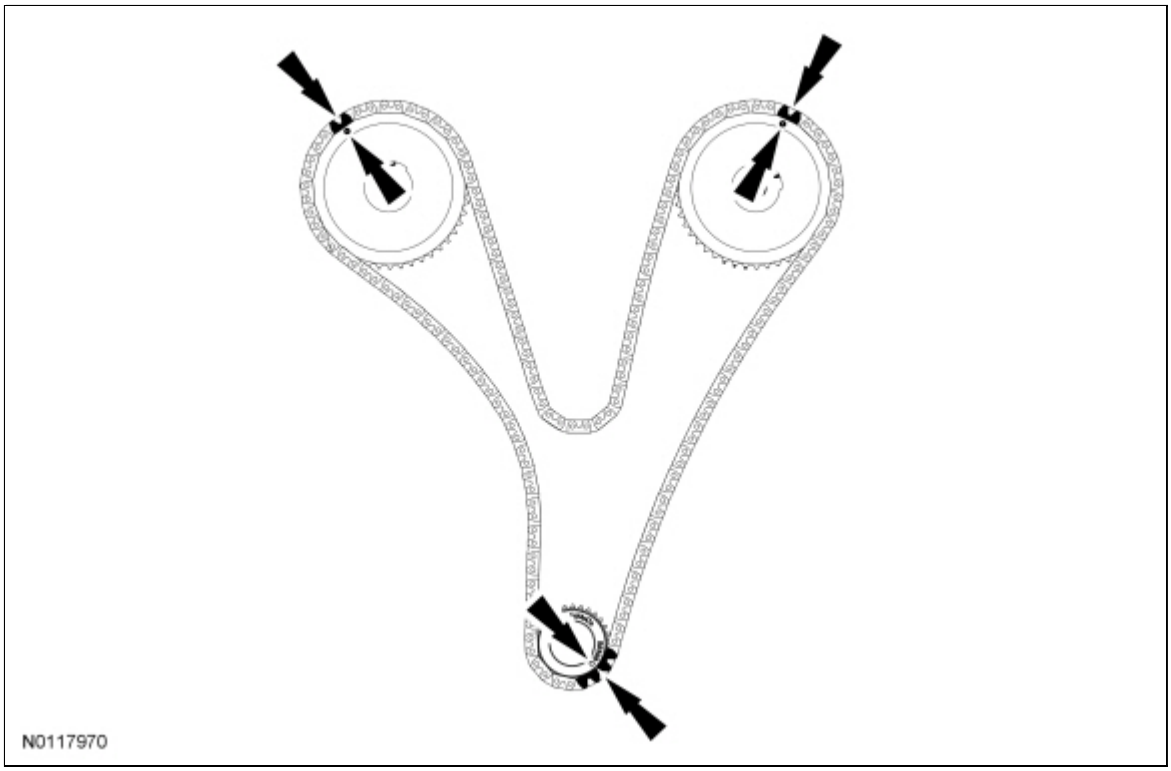
    Compress the LH secondary timing chain tensioner and remove the Secondary Chain Hold Down.
    - Make sure the secondary timing chain is centered on the timing chain tensioner guides.

repair4less

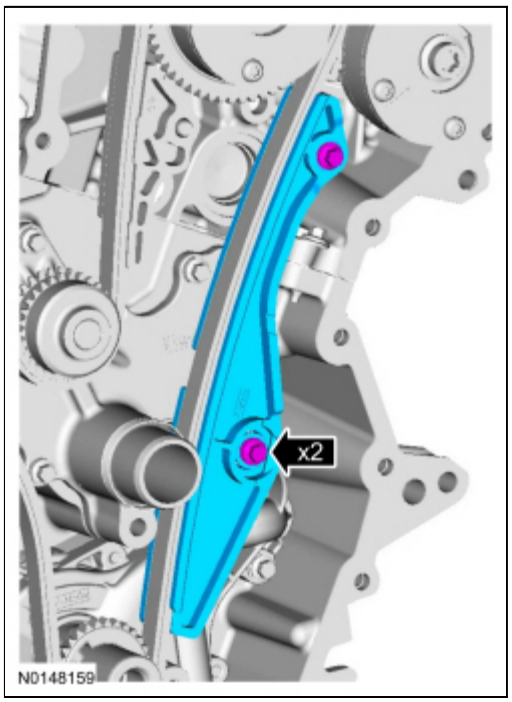


All engines

29. Install the upper LH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).

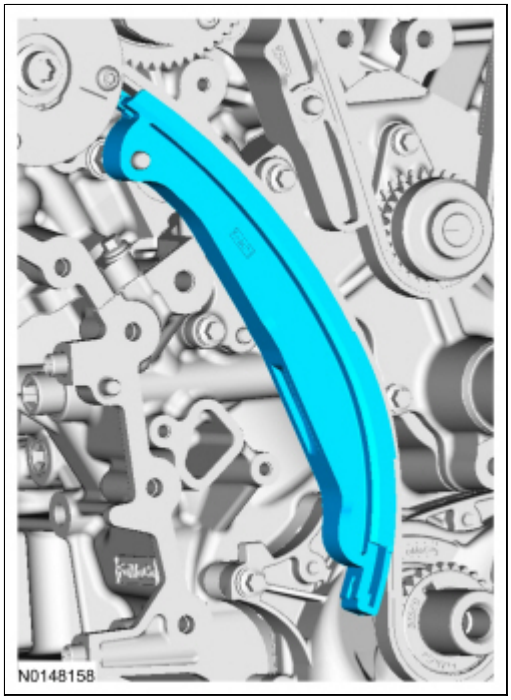


30. Install the crankshaft timing chain sprocket with timing dot mark out.

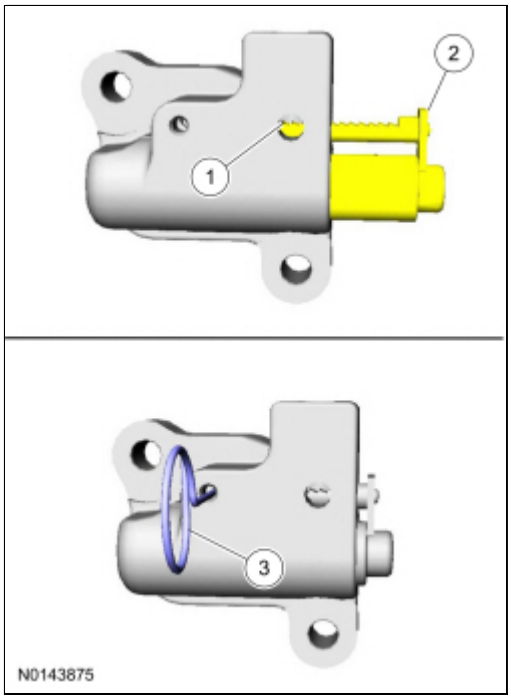


31. **NOTE:** It may be necessary to rotate the camshafts slightly, to align the timing marks.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

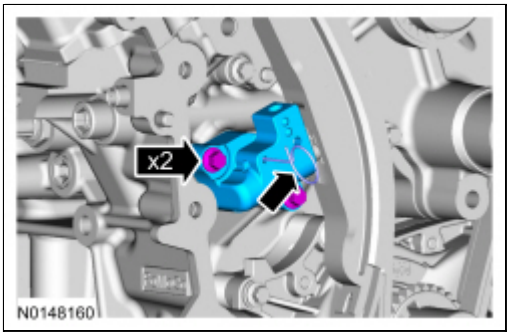


32. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

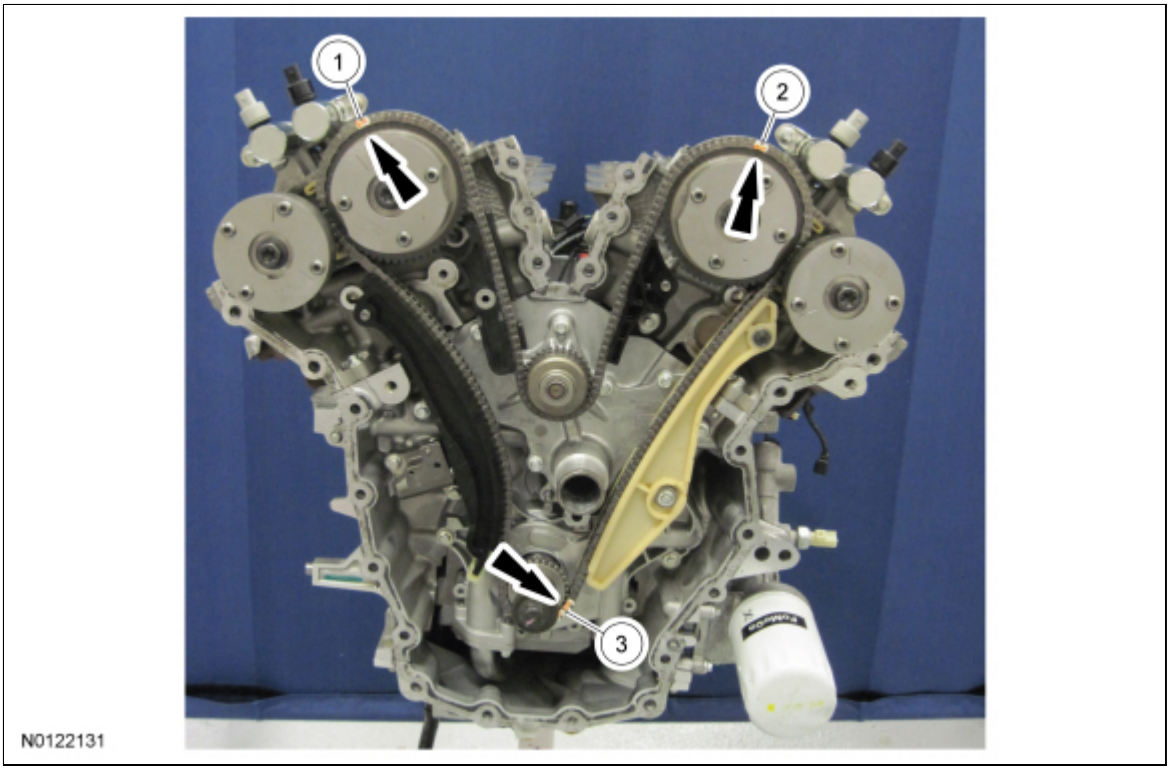


33. Install the primary timing chain tensioner arm.

repair4less



34. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.



35. **NOTE:** It may be necessary to rotate the camshafts slightly to remove slack from the timing chain to install the tensioner.

    Install the primary tensioner and the 2 bolts.

- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

36. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links in between LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket links (3).

37. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

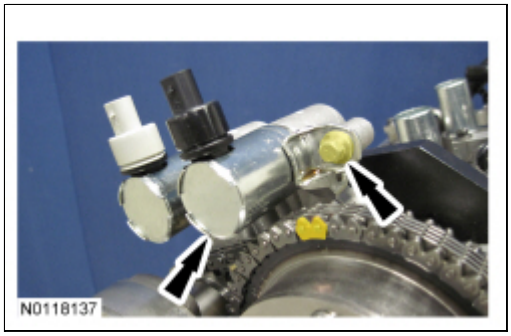
    NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

    NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

repair4less

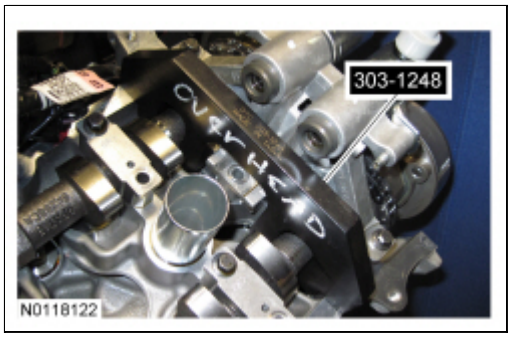
Install the LH intake VCT oil control solenoid and the bolt.

- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



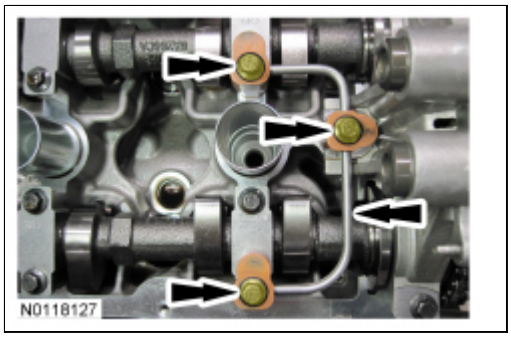
38. ***NOTICE:*** **Do not use excessive force when installing the Variable Camshaft Timing (VCT) oil control solenoid. Damage to the mega cap could cause the cylinder head to be inoperable. If difficult to install the VCT oil control solenoid, inspect the bore and VCT oil control solenoid to ensure there are no burrs, sharp edges or contaminants present on the mating surface. Only clean the external surfaces as necessary.**

NOTE: A slight twisting motion will aid in the installation of the VCT oil control solenoid.

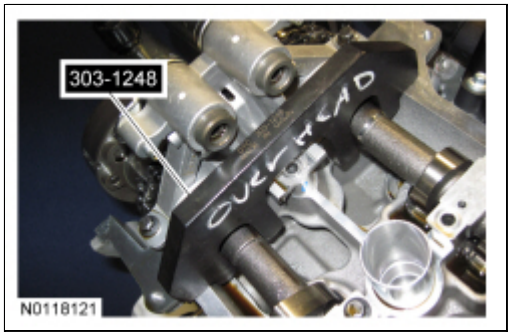


NOTE: Keep the VCT oil control solenoid clean of dirt and debris.

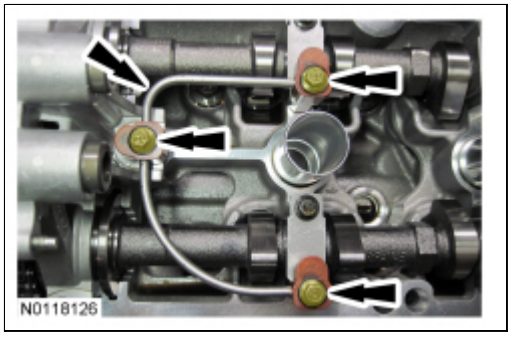
Install the RH intake VCT oil control solenoid and the bolt.



- Tighten to 8 Nm (71 lb-in) then an additional 20 degrees.



39. Remove the RH Camshaft Holding Tool.



40. Install the RH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

41. Remove the LH Camshaft Holding Tool.

42. Install the LH valve train oil tube and the 3 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 8 Nm (71 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

43. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

repair4less

Valve Cover — LH

Special Tool(s)

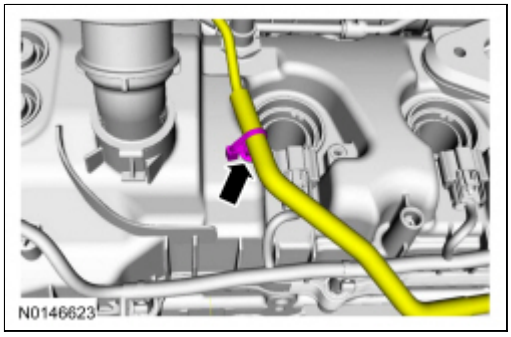
 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2212-A	Installer, Differential Bearing Cone 205-142 (T80T-4000-J)
 ST2983-A	Installer, Spark Plug Tube Seal 303-1247/2
 ST2982-A	Remover, Spark Plug Tube Seal 303-1247/1

Material

Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	—
Motorcraft® Silicone Gasket Remover ZC-30	—

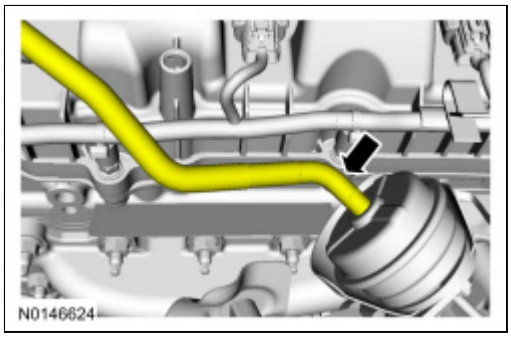
Valve Cover — LH

repair4less



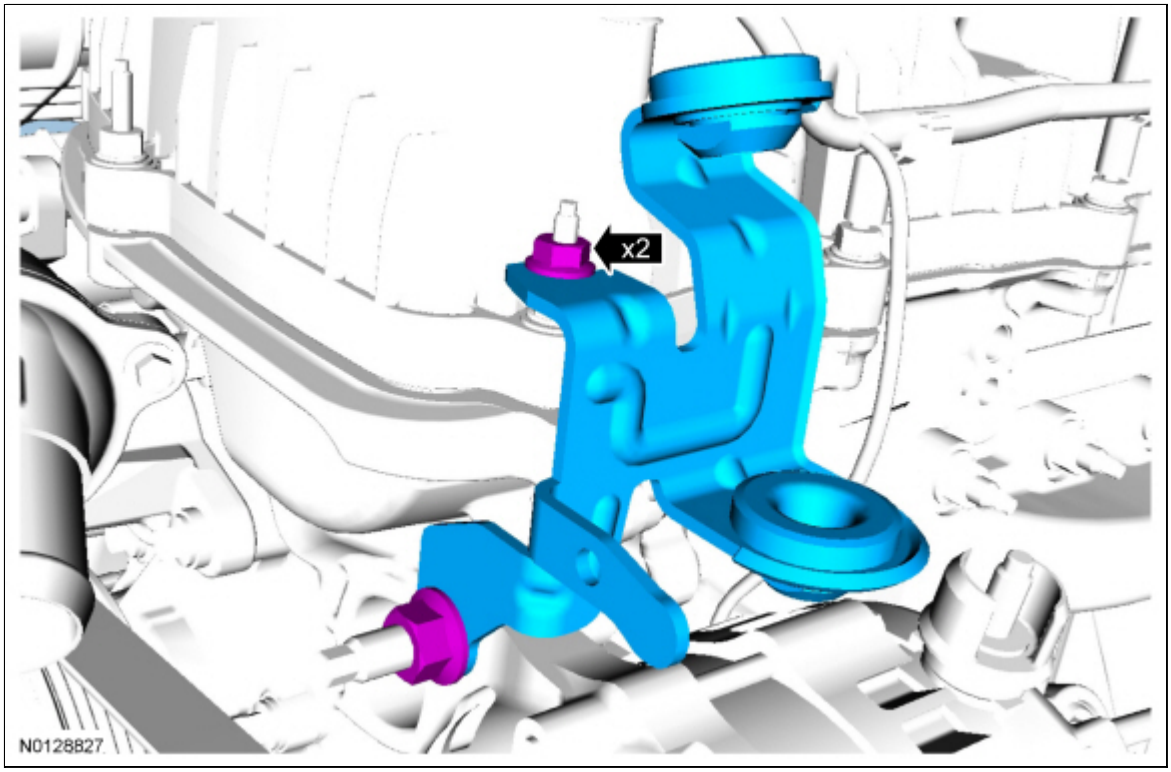
Item	Part Number	Description
1	6C535	Variable Camshaft Timing (VCT) solenoid seal (2 required)
2	6C535	Spark plug tube seal (3 required)
3	6582	LH valve cover
4	00812	Valve cover bolt and sleeve assembly (11 required)
5	6750	Oil level indicator
6	6584	LH valve cover gasket

Removal



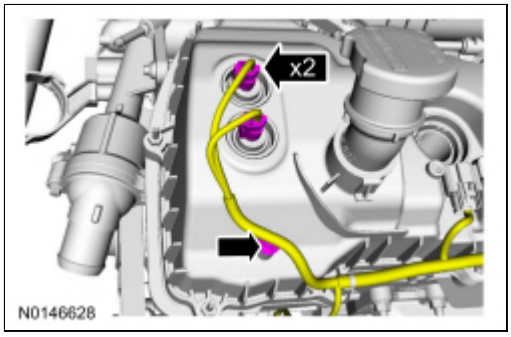
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the engine appearance cover.
2. Remove the Air Cleaner (ACL) outlet pipe and the LH ACL pipe-to-turbocharger pipe. Remove the LH turbocharger-to-Charge Air Cooler (CAC) tube. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .
3. Remove the fuel injection pump. For additional information, refer to Section 303-04A .
4. Remove the ignition coil-over-plugs. for additional information, refer to Section 303-07A .
5. Remove the engine oil level indicator.



6. Remove the tie strap for the turbocharger wastegate hose.

7. Disconnect the turbocharger wastegate hose and position aside.

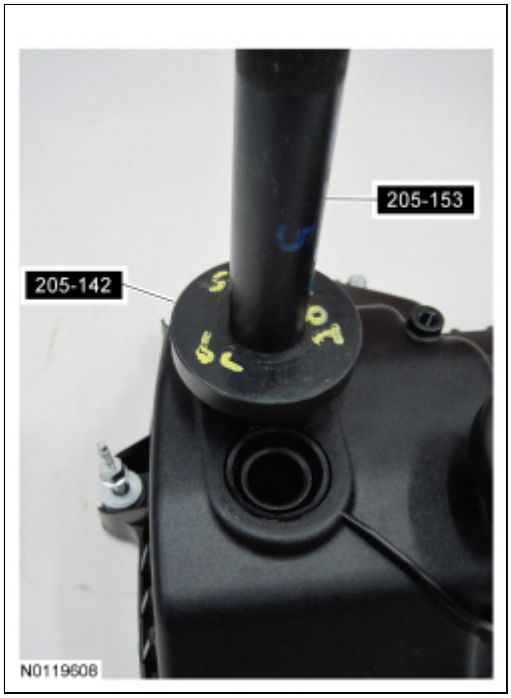


8. Remove the 2 nuts and the CAC tube bracket.

9. Disconnect the 2 LH Variable Camshaft Timing (VCT) solenoid electrical connectors. Remove the tie

repair4less

strap.



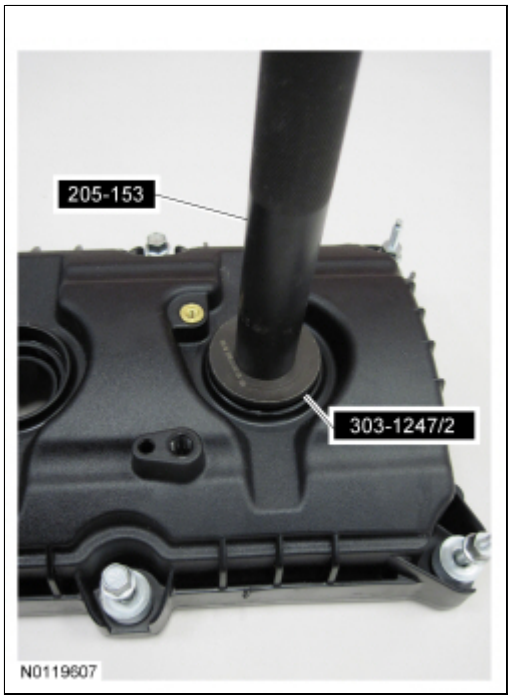
10. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.

11. **NOTE:** When removing the valve cover do not apply excessive force to the VCT oil control solenoid. If the VCT solenoid seal sticks to the VCT oil control solenoid carefully wiggle the valve cover until the seal breaks free. After the valve cover is removed, inspect and replace the VCT solenoids if damaged. The plastic electrical connector on the VCT solenoid will normally rotate approximately 12 degrees inside the steel housing.

    Loosen the 11 valve cover bolt and sleeve assemblies and remove the valve cover.
    - Discard the valve cover gasket.

12. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

13. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



14. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

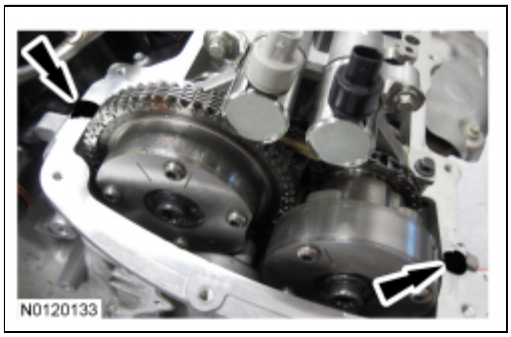
Installation

1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

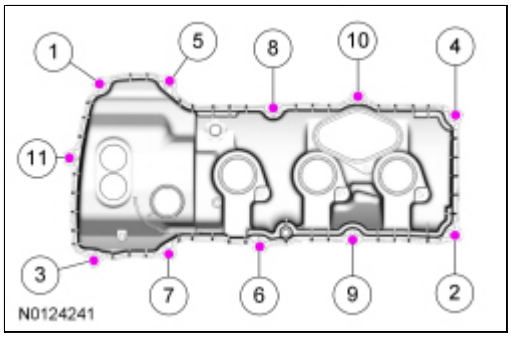
   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

repair4less



Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).

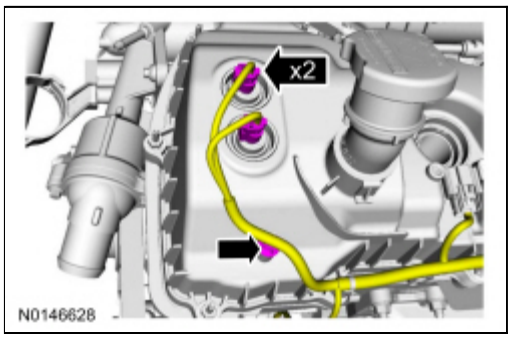


3. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

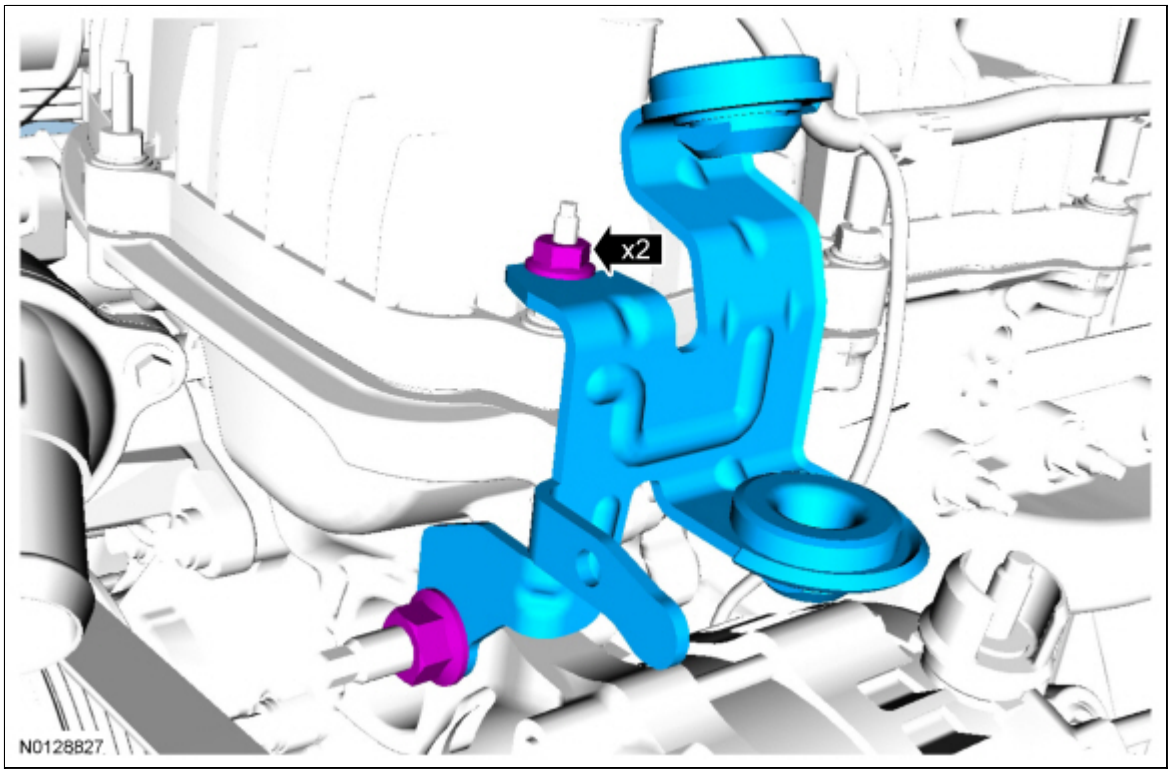
   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

4. Using a new gasket, install the LH valve cover and tighten the 11 bolt and sleeve assemblies in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

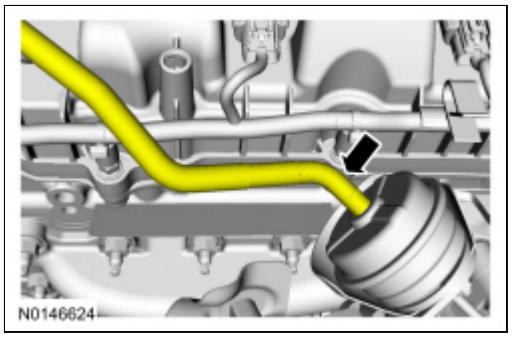


5. Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

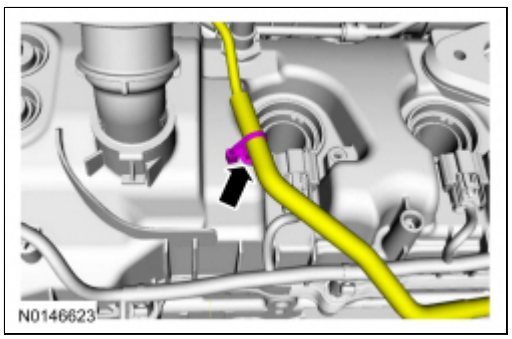


6. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.

7. Connect the 2 LH VCT solenoid electrical connectors. Install a tie strap.



8. Install the CAC tube bracket and the 2 nuts.
   - Tighten the M6 nut to 6 Nm (53 lb-in).
   - Tighten the M10 nut to 48 Nm (35 lb-ft).



repair4less

9. Connect the turbocharger wastegate hose.

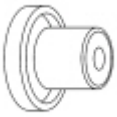
10. Install the tie strap for the turbocharger wastegate hose.

11. Install the engine oil level indicator.

12. Install the ignition coil-over-plugs. for additional information, refer to Section 303-07A .

13. Install the fuel injection pump. For additional information, refer to Section 303-04A .

14. Install the LH turbocharger-to- CAC tube. Install the LH ACL pipe-to-turbocharger pipe and the ACL outlet pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .



15. Install the engine appearance cover.

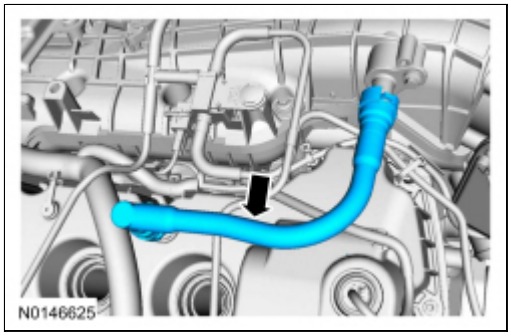
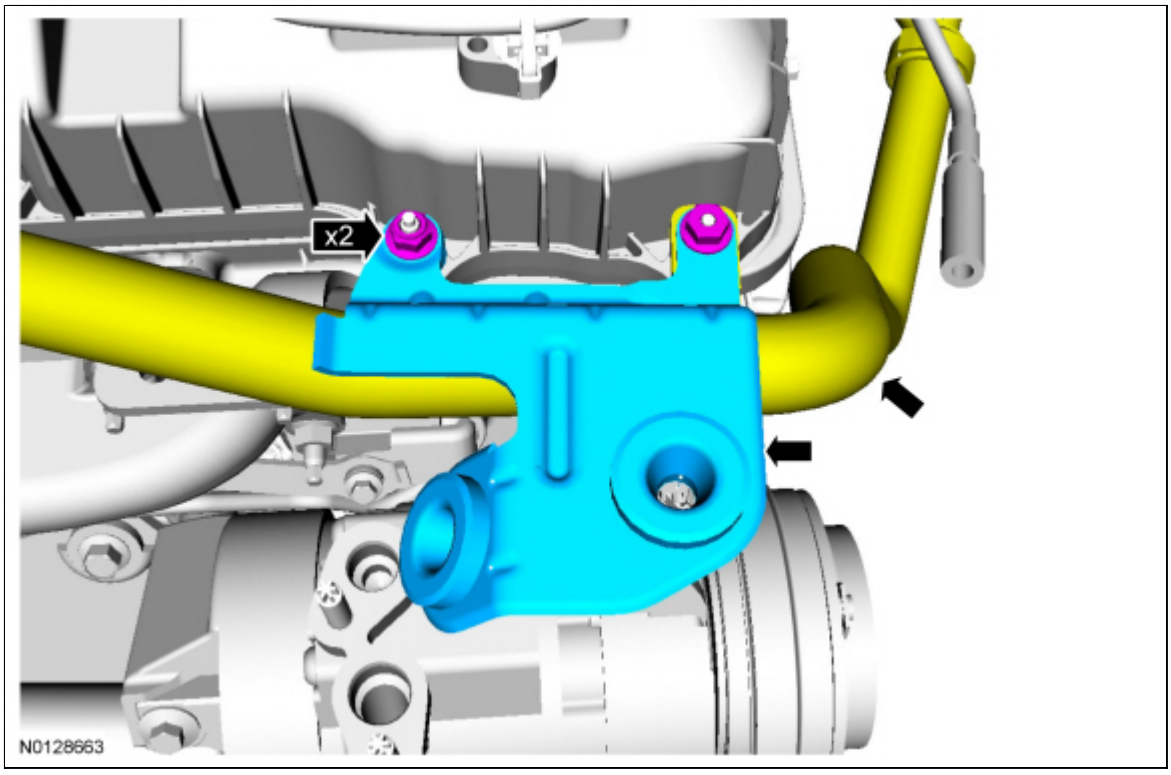
Removal



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

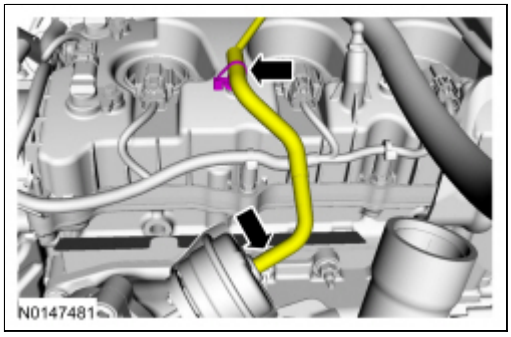
1. Remove the engine appearance cover.



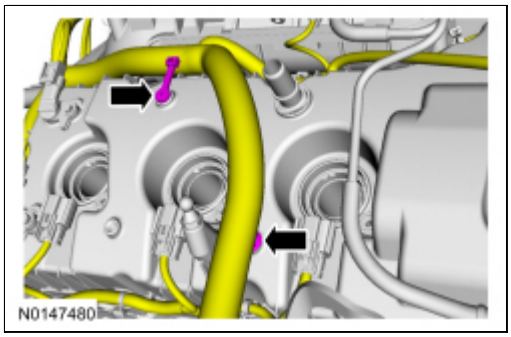
2. Remove the Air Cleaner (ACL) outlet pipe and the RH ACL pipe-to-turbocharger pipe. Remove the RH turbocharger-to-Charge Air Cooler (CAC) tube. For additional information, refer to Intake Air System Components — Exploded View, 3.5L Gasoline Turbocharged Direct Injection (GTDI) in Section 303-12 .

3. Remove the ignition coil-over-plugs. for additional information, refer to Section 303-07A .

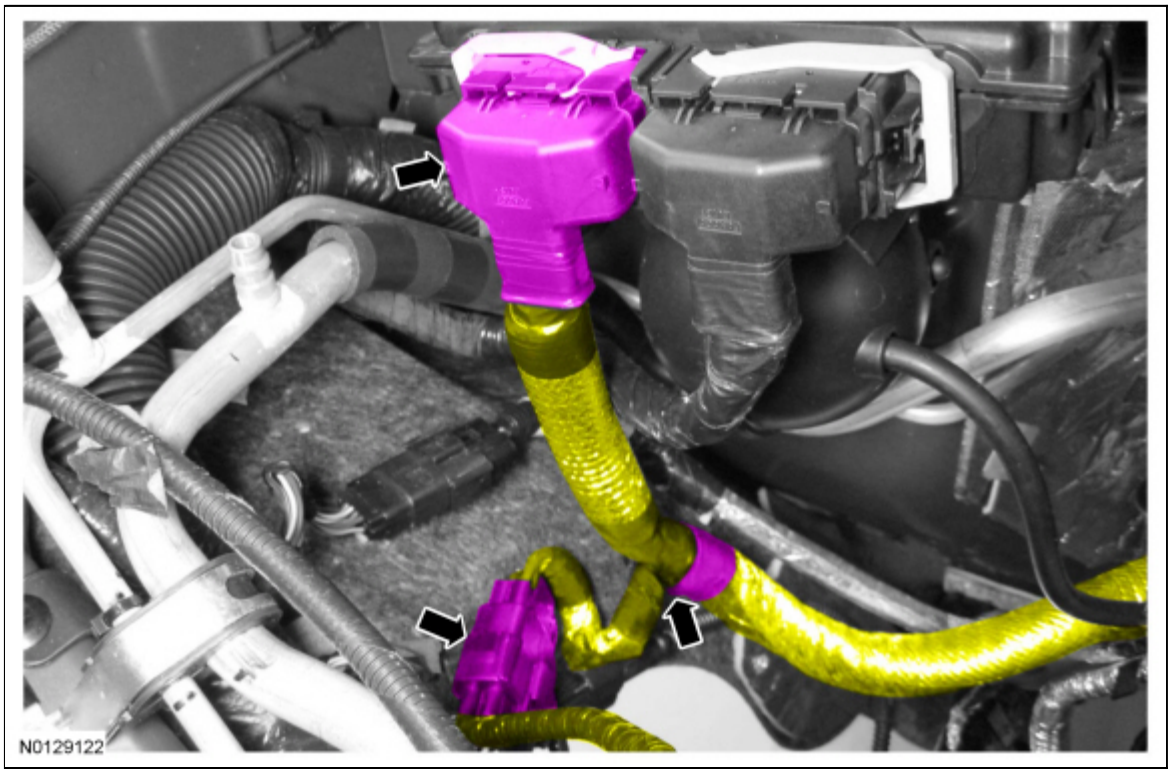
4. Remove the PCV tube. Refer to Section 310-00 .



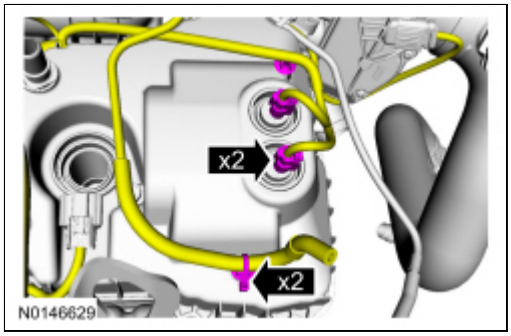
5. Remove the 2 nuts and the CAC tube bracket.
   - Disconnect the coolant hose from the valve cover stud.



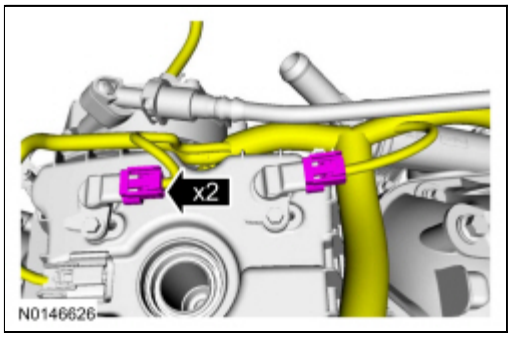
repair4less



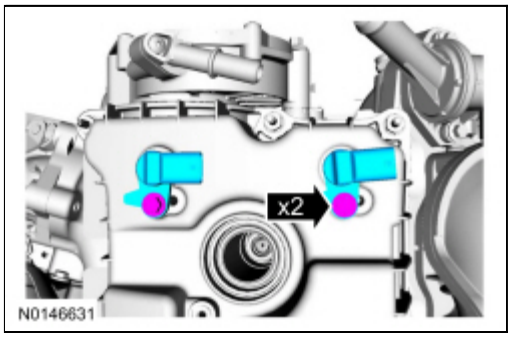
6. Remove the tie strap. Disconnect and position aside the turbocharger wastegate hose.



7. Remove the tie strap and disconnect the wire retainer from the valve cover.



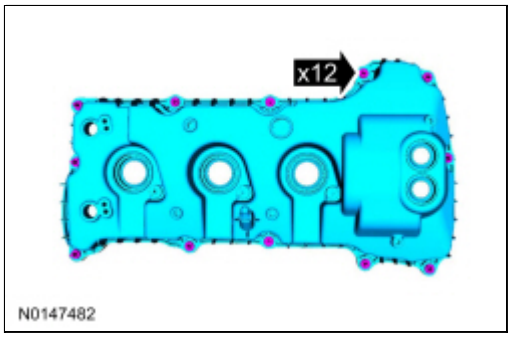
8. Disconnect the PCM electrical connector. Disconnect the electrical connector and the 2 wire retainers. Position aside the engine wire harness.



9. Disconnect the 2 RH Variable Camshaft Timing (VCT) solenoid electrical connectors. Remove the tie strap for the turbocharger wastegate hose and engine wiring.

10. Disconnect the 2 Camshaft Position (CMP) sensor electrical connectors.

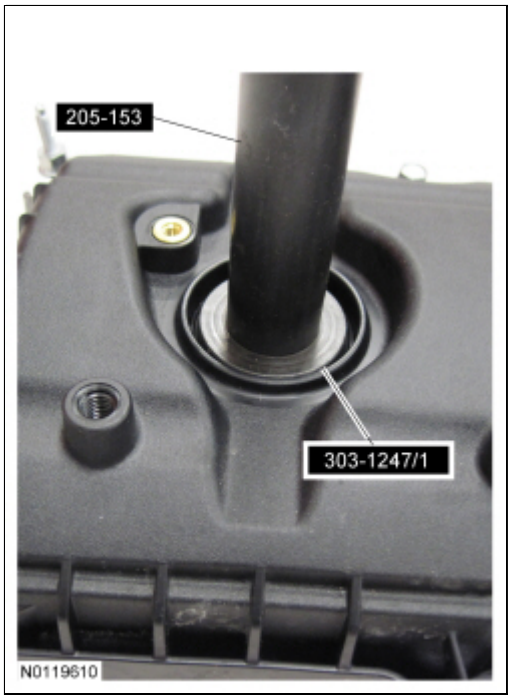
11. Remove the 2 bolts and the 2 CMP sensors.



12. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.

13. **NOTE:** When removing the valve cover do not apply excessive force to the VCT oil control solenoid. If the VCT solenoid seal sticks to the VCT oil control solenoid carefully wiggle the valve cover until the seal breaks free. After the valve cover is removed, inspect and replace the VCT solenoids if damaged. The plastic electrical connector on the VCT solenoid will normally rotate approximately 12 degrees inside the steel housing.

    Loosen the 12 valve cover stud bolts and remove the RH valve cover.
    - Discard the valve cover gasket.



repair4less

14. Inspect the 2 VCT solenoid seals. Remove any damaged seals.
    - Using the Differential Bearing Cone Installer and Handle, remove the seal(s).

15. Inspect the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

16. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

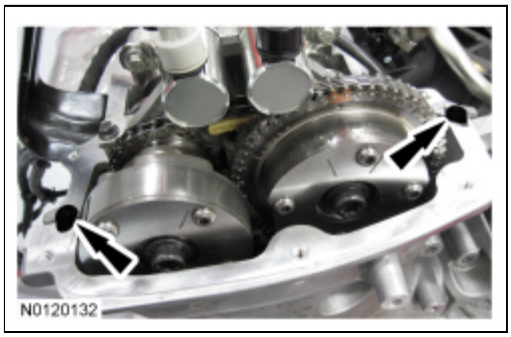
Installation

1. **NOTE:** Installation of new seals is only required if damaged seals were removed.

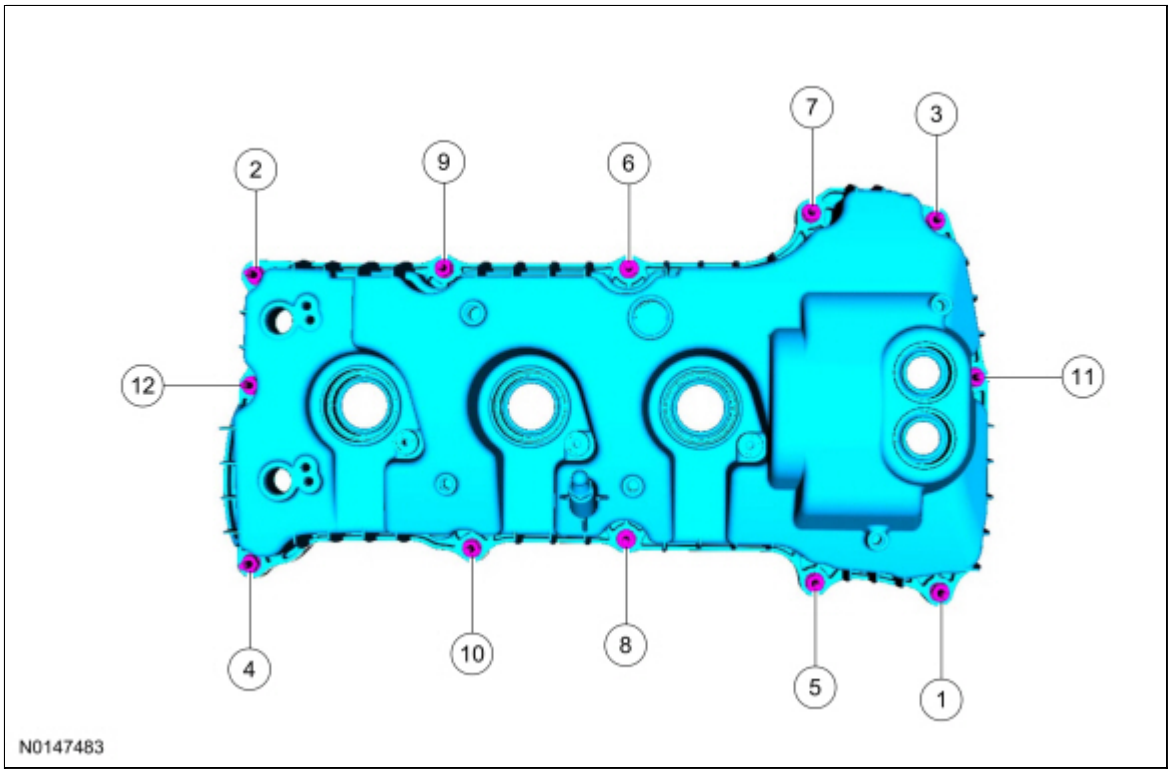
   Using the VCT Spark Plug Tube Seal Installer and Handle, install new spark plug tube seals.

2. **NOTE:** Installation of new seals is only required if damaged seals were removed.

repair4less



Using the Differential Bearing Cone Installer and Handle, install new VCT solenoid seal(s).



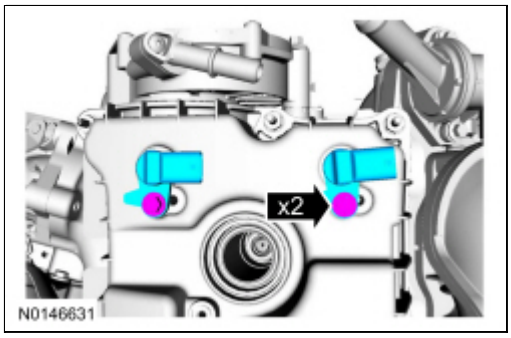
3. ***NOTICE:*** **Failure to use the correct Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

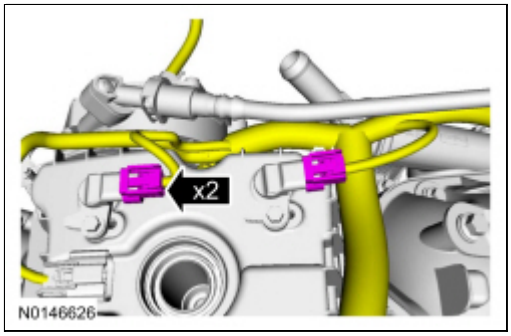
   Apply an 8 mm (0.31 in) bead of Motorcraft® High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

4. Using a new gasket, install the RH valve cover, tighten the 12 valve cover stud bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

5. Make sure the VCT seals in the valve cover are below the top of the VCT oil control solenoid electrical connector or the VCT seal may leak oil.

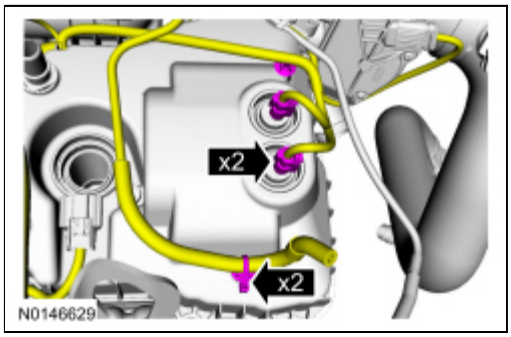


6. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.

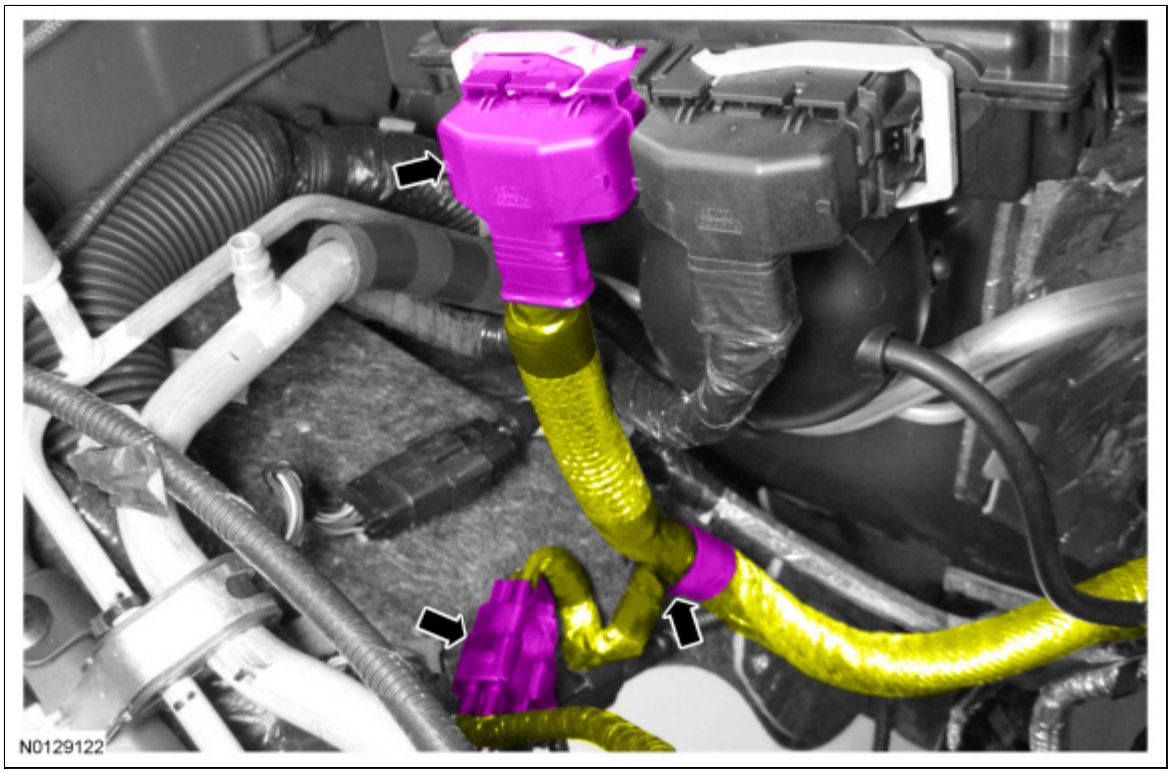


7. **NOTE:** Lubricate the 2 CMP sensor O-rings with clean engine oil.

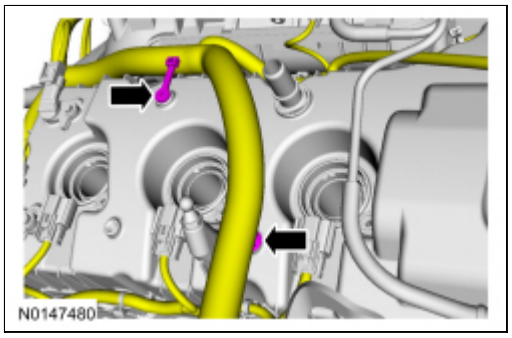
   Install the 2 CMP sensors and 2 bolts.
   - Tighten to 7 Nm (62 lb-in).



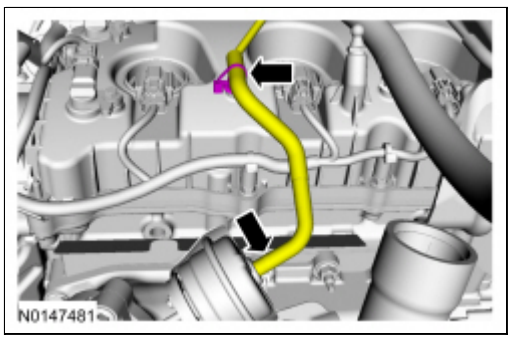
repair4less



8. Connect the 2 CMP sensor electrical connectors.

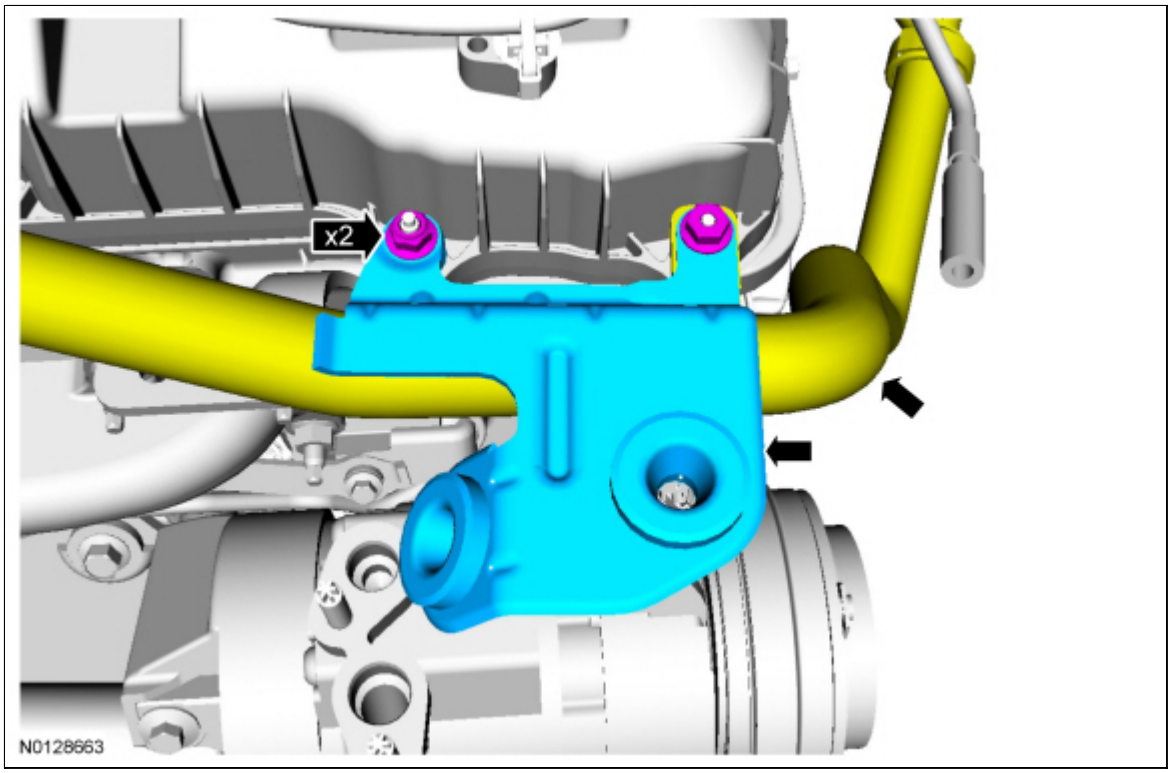


9. Connect the 2 RH VCT solenoid electrical connectors. Install a tie strap for the turbocharger wastegate hose and engine wiring.

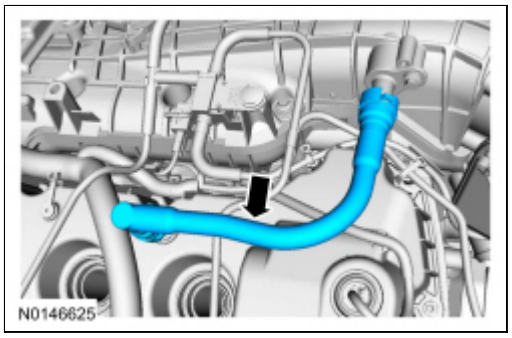


10. Connect the PCM electrical connector. Connect the electrical connector and the 2 wire retainers.

11. Connect the wire retainer to the valve cover. Install a tie strap



12. Connect the turbocharger wastegate hose. Install a the tie strap

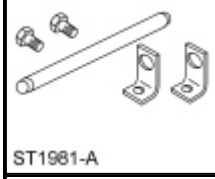


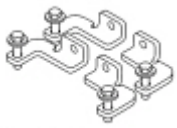
13. Position back the coolant hose to the valve cover stud. Install the CAC tube bracket and the 2 nuts.
    - Tighten to 6 Nm (53 lb-in).

repair4less

14. Install the PCV tube. Refer to Section 310-00 .

15. Install the ignition coil-over-plugs. for additional information, refer to Section 303-07A .





16. Install the RH turbocharger-to- CAC tube. Install the RH ACL pipe-to-turbocharger pipe and the ACL outlet pipe. For additional information, refer to Intake Air System Components — Exploded View, 3.5L GTDI in Section 303-12 .

17. Install the engine appearance cover.

repair4less

Valve Spring, Retainer and Seal

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)

 ST3028-A	Compressor, Valve Spring 303-1249
 ST1906-A	Installer, Valve Stem Oil Seal 303–470 (T94P-6510–CH)

Material

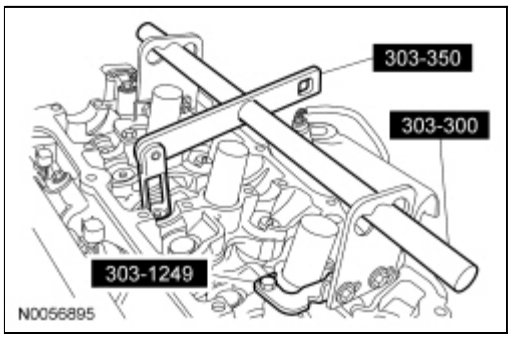
Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the valve tappets from the cylinder being serviced. For additional information, refer to Valve Tappets in this section.

2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.



3. ***NOTICE:*** **If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal or engine damage may occur.**

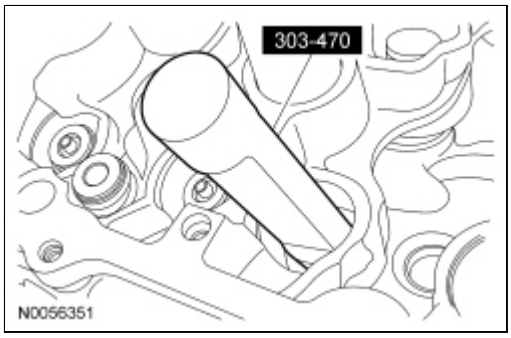
   NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head — RH or Cylinder Head — LH in this section.

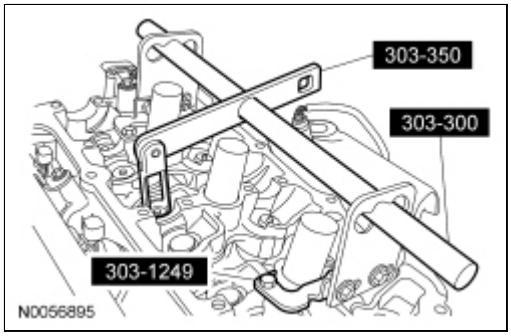
   Pressurize the cylinder using compressed air.

4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

5. Remove and discard the valve stem seal.



Installation



1. **NOTE:** Lubricate the valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

repair4less

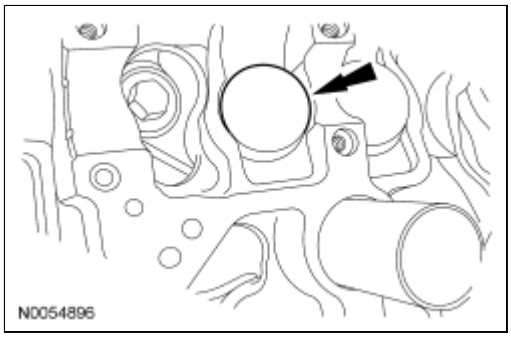
2. Using the Valve Spring Compressors, install the valve spring, retainer and key.

3. Install the valve tappets. For additional information, refer to Valve Tappets in this section.

Valve Tappets

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada)	WSS-M2C946-A



Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Depending on the valve tappets being serviced, remove the LH and/or the RH camshafts. For additional information, refer to Camshaft — RH and/or the Camshaft — LH in this section.

2. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   Remove the valve tappets from the cylinder head.

3. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   To install, reverse the removal procedure.

repair4less

15	W714090	Timing chain tensioner arm pin
16	6507	Intake valve (6 required)
17	6505	Exhaust valve (6 required)

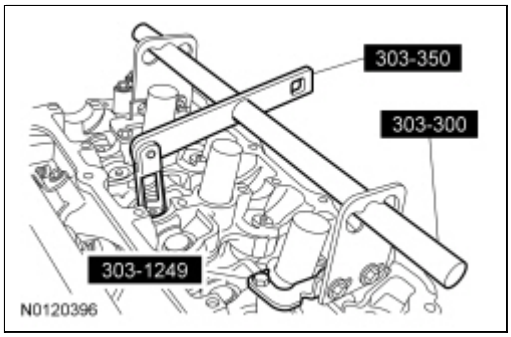
Disassembly

All cylinder heads

repair4less

1. Remove the 8 nuts and the exhaust manifold.
    - Discard the nuts and gasket.

2. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



3. Remove and discard the 8 exhaust manifold studs.

4. Remove the timing chain guide pin.

5. Remove the turbocharger coolant return fitting.

6. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   Using the Valve Spring Compressors, remove the keys, retainer and spring.

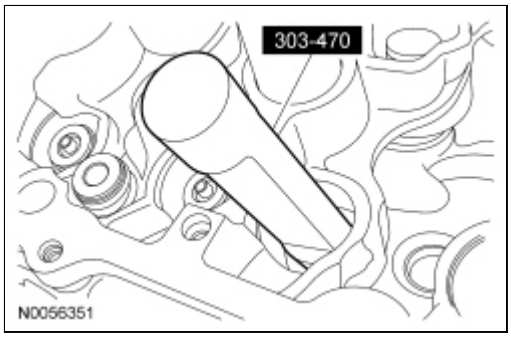
7. Remove the valve from the cylinder head.

8. Remove and discard the valve stem seal.

9. Repeat the above steps for each valve.

RH cylinder head

10. Remove the timing chain tensioner arm pin.



Assembly

All cylinder heads

1. **NOTE:** If the components are to being reinstalled, they must be installed into their original location.

   NOTE: Lubricate the valve stem and valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

2. Install the valve.

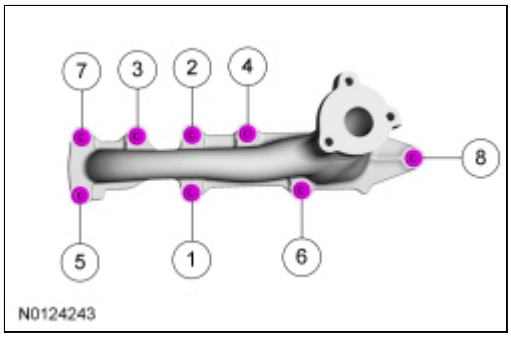
3. Using the Valve Spring Compressors, install the valve spring, retainer and key.

4. Repeat the above steps for each valve.

5. Install the timing chain guide pin and tighten in 2 stages.
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten an additional 60 degrees.

6. Install the turbocharger coolant return fitting.
   - Tighten to 18 Nm (159 lb-in).

LH cylinder head



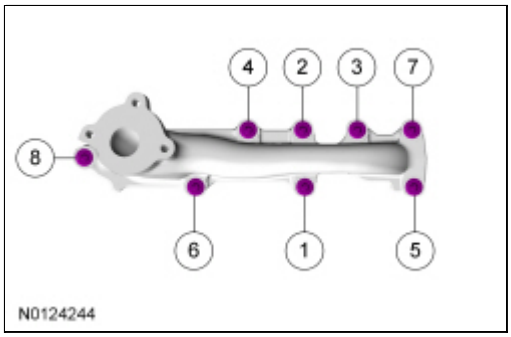
7. Install the timing chain tensioner arm pin and tighten in 2 stages.
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten an additional 60 degrees.

8. Install 8 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

9. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

   Using a new gasket, install the LH exhaust manifold and 8 new nuts. Tighten in 2 stages in the sequence shown:
   - Stage 1: Tighten to 19 Nm (168 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).

repair4less

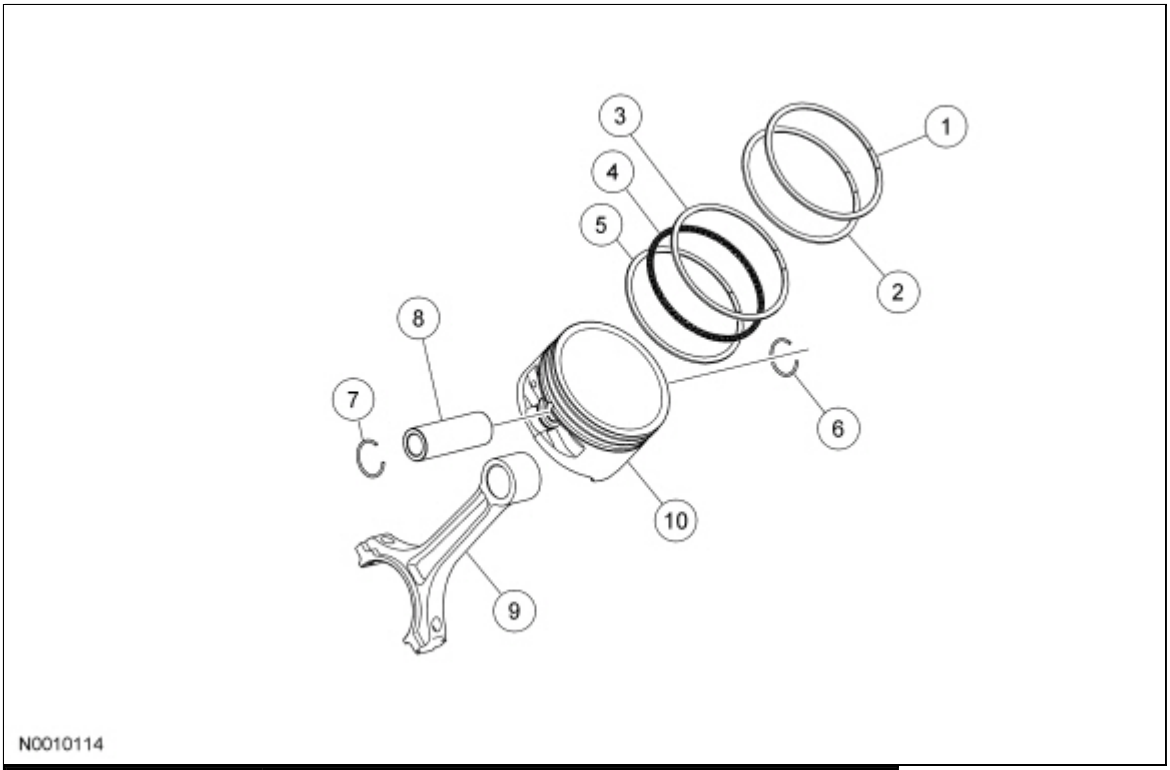


RH cylinder head

10. Install 8 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

11. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the RH exhaust manifold and 8 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 19 Nm (168 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



repair4less

Piston

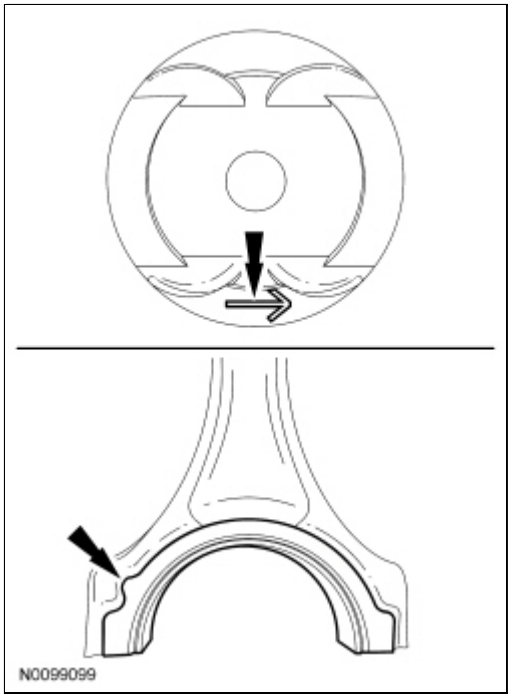
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	—	Piston compression upper ring (part of 6148)
2	—	Piston compression lower ring (part of 6148)
3	—	Piston oil control upper segment ring (part of 6148)
4	—	Piston oil control spacer (part of 6148)
5	—	Piston oil control lower segment ring (part of 6148)
6	6140	Piston pin retainer clip
7	6140	Piston pin retainer clip
8	6135	Piston pin

9	6200	Connecting rod
10	6110	Piston

Disassembly



1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.
   - Discard the 2 piston pin retainer clips.

3. **NOTE:** If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

   NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   Separate the piston from the connecting rod.

4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

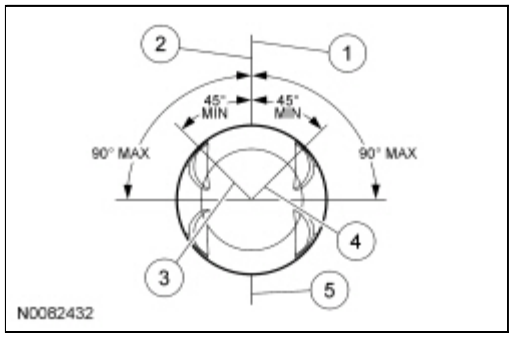
Assembly

1. Align the piston-to-connecting rod orientation marks and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.

4. Install the new piston pin retaining clips in the piston.



repair4less

- The piston pin retaining clip gap orientation must be toward the top or dome of piston.

5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression upper and lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

   Install the piston rings onto the piston as shown.
   1. Center line of the piston parallel to the wrist pin bore
   2. Upper compression ring gap location
   3. Upper oil control segment ring gap location
   4. Lower oil control segment ring gap location
   5. Expander ring and lower compression ring gap location

Engine weight (without accessory drive components)	161 kg (355 lb)
Engine and transaxle assembly weight (without accessory drive components)	260.8 kg (575 lb)
Cylinder Head and Valve Train	
Cylinder head gasket surface flatness	Flat within 0.08 mm (0.003 in) length end to end; area 150 mm (5.9 in) x 150 mm (5.9 in) (or full width) should be less than 0.05 mm (0.002 in)
Combustion chamber volume	56.651 cc (3.46 CI)
Valve tappet clearance — intake	0.15-0.25 mm (0.006-0.01 in)
Valve tappet clearance — exhaust	0.360-0.460 mm (0.0142-0.0181 in) Engine must be at room temperature before measuring
Valve guide bore inner diameter	5.519-5.549 mm (0.217-0.218 in)
Valve stem diameter — intake	5.479-5.497 mm (0.2157-0.2164 in)
Valve stem diameter — exhaust	5.466-5.484 mm (0.2151-0.2159 in)
Valve stem-to-guide clearance — intake	0.022-0.070 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance — exhaust	0.035-0.083 mm (0.0013-0.032 in)
Valve head diameter — intake	37.0 mm (1.46 in)
Valve head diameter — exhaust	31.0 mm (1.22 in)
Valve face runout	0.05 mm (0.0001 in)
Valve face angle	45.25-45.75°
Valve seat width — intake	1.3-1.5 mm (0.051-0.059 in)
Valve seat width — exhaust	1.7-2.0 mm (0.067-0.079 in)
Valve seat runout	0.04 mm (0.0001 in) MAX
Valve seat angle	44.5-45.5°
Valve spring free length (approx.)	48.0 mm (1.889 in)
Valve spring compression pressure (N @ spec. length)	525 N @ 27.0 mm (114.7 lb @ 1.06 in)
Valve spring installed height	37.0 mm (1.45 in)
Valve spring installed height pressure (N @ spec. length)	235 N @ 37.0 mm (53 lb @ 1.45 in)
Valve spring installed pressure — service limit	10% force loss @ specified height
Camshaft	
Theoretical valve lift @ 0 lash — Intake	10.0 mm (0.39 in)
Theoretical valve lift @ 0 lash — Exhaust	9.6798 mm (0.38 in)
Lobe lift — intake	10.0 mm (0.39 in)
Lobe lift — exhaust	9.6798 mm (0.38 in)
Allowable lobe lift loss	0.062 mm (0.0024 in)
Camshaft journal bore inside diameter — 1st journal	39.0375-39.0625 mm (1.536-1.537 in)

Camshaft journal bore inside diameter — intermediate journals	25.9875-26.0125 mm (1.023-1.024 in)
Camshaft bearing outside diameter — 1st journal	38.99-39.01 mm (1.5350-1.5358 in)
Camshaft bearing outside diameter — intermediate journals	25.937-25.963 mm (1.021-1.022 in)
Camshaft journal-to-bearing clearance, 1st journal — service limit	0.0725 mm (0.0029 in) MAX
Camshaft journal-to-bearing clearance, intermediate journals — service limit	0.0755 mm (0.0029 in) MAX
Runout camshaft journals	0.040 mm (0.0015 in) MAX
End play — standard	0.032-0.170 mm (0.0012-0.0066 in)
End play — service limit	0.190 mm (0.00748 in) MAX
Cylinder Block	
Cylinder bore diameter — grade 1	95.500-95.520 mm (3.760-3.761 in)
Cylinder bore roundness	0.013 mm (0.0005 in)
Cylinder bore taper	0.010 mm (0.0004 in) per 25.4 mm (1 in)
Block main bore roundness	0.008 mm (0.003 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.8503-2.8513 in)
Head gasket surface flatness	Flat within 0.150 mm (0.005 in) overall; 0.050 mm (0.001 in) per 150 mm (5.905 in) x 150 mm (5.905 in); 0.025 mm (0.0009 in) per 25 mm (0.98 in) x 25 mm (0.98 in)
Crankshaft	
Main bearing journal diameter	67.5 mm (2.657 in)
Main bearing journal maximum taper	0.004 mm (0.00015 in)
Main bearing journal maximum out-of-round	0.006 mm (0.00023 in)
Main bearing journal-to-main bearing clearance	0.026-0.041 mm (0.0010-0.0016 in)
Connecting rod journal diameter	55.983-56.003 mm (2.204-2.205 in)
Connecting rod journal maximum taper	0.004 mm (0.00015 in)
Connecting rod journal maximum out-of-round	0.006 mm (0.00023 in)
Crankshaft maximum end play	0.051-0.291 mm (0.0020-0.0114 in)
Piston and Connecting Rod	
Piston diameter — single grade	95.490-95.476 mm (3.7594-3.7589 in)
Piston-to-cylinder bore clearance	0.010 to 0.044 mm (0.0003-0.0017 in)
Piston ring end gap — compression (top, gauge diameter)	0.17-0.27 mm (0.0067-0.0106 in)
Piston ring end gap — compression (bottom, gauge diameter)	0.30-0.55 mm (0.0118-0.0216 in)
Piston ring end gap — oil ring (steel rail, gauge	0.15-0.45 mm (0.0059-0.0177 in)

repair4less

diameter)	
Piston ring groove width — compression (top)	1.230-1.25 mm (0.0484-0.0492 in)
Piston ring groove width — compression (bottom)	1.530-1.55 mm (0.0602-0.0610 in)
Piston ring groove width — oil ring	2.53-2.55 mm (0.0996-0.1004 in)
Piston ring width — upper compression ring	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring width — lower compression ring	1.47-1.49 mm (0.0578-0.0586 in)
Piston ring-to-groove clearance (upper and lower compression rings)	0.040-0.080 mm (0.0015-0.0031 in)
Piston pin bore diameter	23.004-23.008 mm (0.9056-0.9058 in)
Piston pin diameter	22.997-23.000 mm (0.9053-0.9055 in)
Piston pin length	55.975 mm (2.203 in)
Piston pin-to-piston fit	0.004 to 0.011 mm (0.00015-0.00043 in)
Piston-to-connecting rod clearance	2.7 mm (0.1 in)
Connecting rod-to-pin clearance — standard	0.007-0.022 mm (0.0002-0.0009 in)
Connecting rod pin bore diameter	23.007-23.019 mm (0.905-0.906 in)
Connecting rod length (center-to-center)	152.68 mm (6.01 in)
Connecting rod maximum allowed bend	0.038 mm (0.0014 in)
Connecting rod maximum allowed twist	0.050 mm (0.0019 in)
Connecting rod bearing bore diameter — grade 1	59.866-59.872 mm (2.3569-2.3571 in)
Connecting rod bearing bore diameter — grade 2	59.873-59.879 mm (2.3572-2.3574 in)
Connecting rod bearing bore diameter — grade 3	59.880-59.886 mm (2.3574-2.3577 in)
Connecting rod bearing-to-crankshaft clearance	0.020-0.054 mm (0.0007-0.0021 in)
Connecting rod side clearance (assembled to crank) — standard	0.175-0.425 mm (0.0068-0.0167 in)
Connecting rod side clearance (assembled to crank) — service limit	0.175-0.425 mm (0.0068-0.0167 in)

[a] Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.

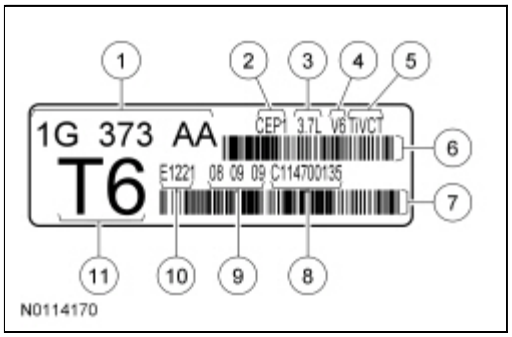
[b] Tighten to 10 Nm (89 lb-in) plus an additional 720 degrees.
[c] Discard original plug and O-ring seal. Install a new plug and O-ring seal to specified torque, no sealer or lubricant required.
[d] Refer to the procedure in this section.
[e] Tighten to 5 Nm (44 lb-in) plus an additional 180 degrees.

repair4less

Engine

The 3.7L (4V) is a (TiVct) V6 engine with the following features:

- Dual overhead camshafts
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- A composite lower intake manifold and upper intake manifold
- Aluminum cylinder heads
- An aluminum, 60-degree V-cylinder block
- Twin independent Variable Camshaft Timing (VCT) system
- The electronic ignition system with 6 ignition coils
- 305 horsepower

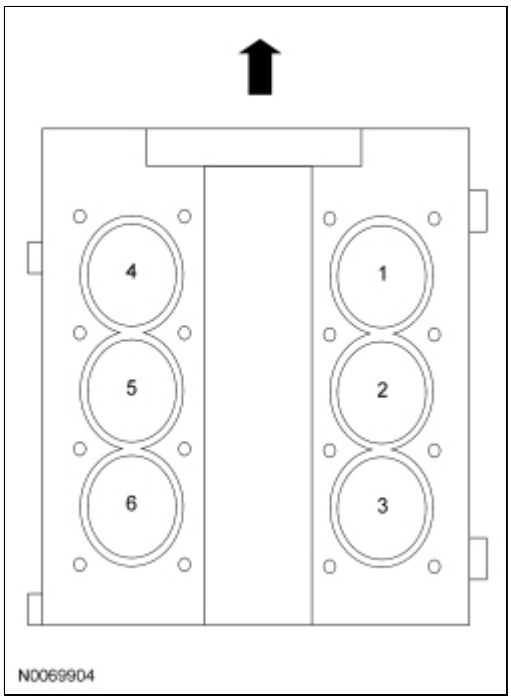


Engine Identification

For quick identification, refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.

Engine Code Information Label



The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Engine plant (Cleveland)
3	Engine displacement
4	Engine configuration
5	Twin independent VCT system

6	Bar code
7	Bar code
8	Running number
9	Engine build date (DDMMYY)
10	Plant shift line
11	Derivative code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 6 solenoid-operated fuel injectors:

- are mounted between the fuel rail and the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.

repair4less

Valve Train

The valve train uses Direct Acting Mechanical Buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Twin IndependentVariable Camshaft Timing (VCT) System

The twin independent VCT system allows variable control of intake valve closing which optimizes combustion at full load providing improved power and low speed torque (broadening the torque curve) which enables variable valve overlap which provides better fuel economy and emissions and provides optimized cold start operation with improved exhaust emissions.

PCV System

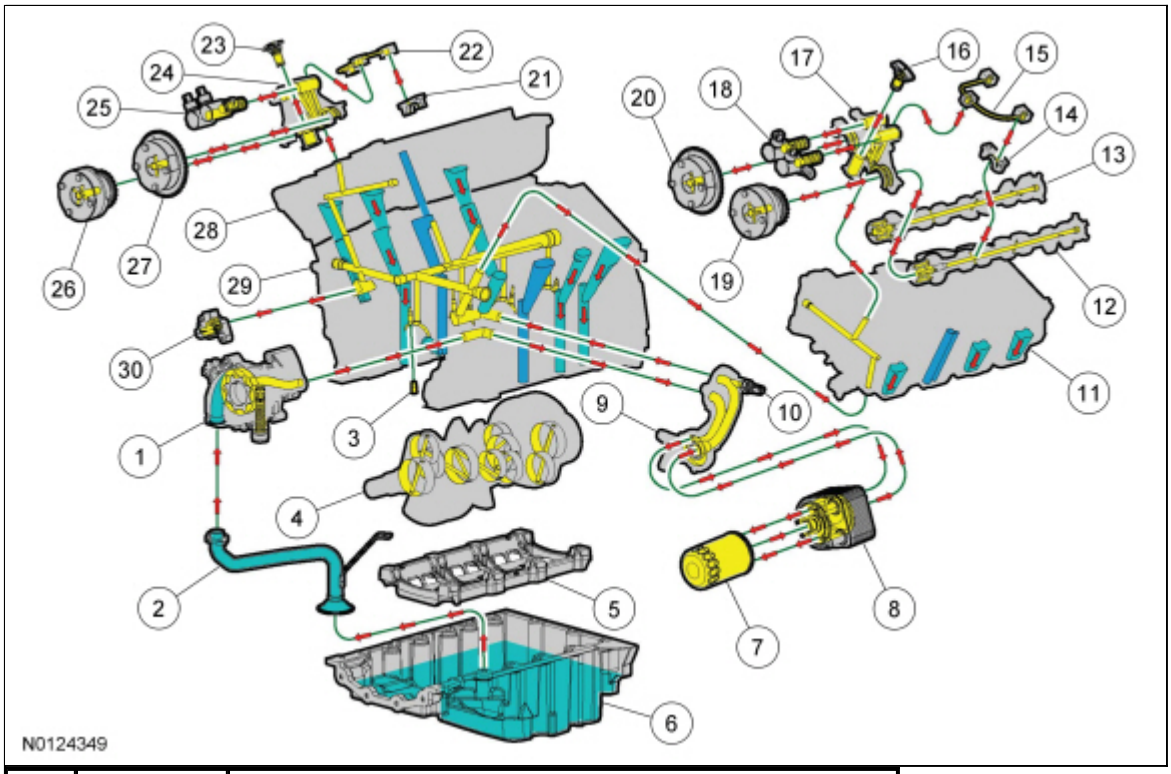
All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, timing chain tensioners and VCT solenoids. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the cylinder head, valve train oil feed tubes. Die cast aluminum deep sump oil pan for 10,000 mile oil change intervals.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.



The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to ensure correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

22	6K602	RH valve train oil feed tube
23	6C270	RH secondary timing chain tensioner
24	6B280	RH camshaft mega cap
25	6M280	RH intake and exhaust camshaft VCT oil control solenoid
26	6C525	RH exhaust camshaft VCT
27	6256	RH intake camshaft VCT
28	6049	RH cylinder head
29	6010	Cylinder block
30	6K254	Primary timing chain tensioner

Cooling System

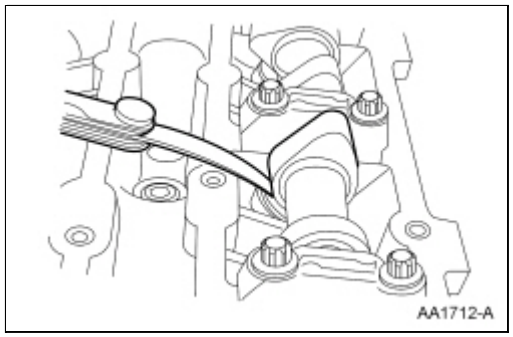
The engine cooling system includes the following:

- Radiator
- Coolant pump
- Electric fan assembly(s)
- Degas bottle (aids in maintaining the correct volume of engine coolant)
- Coolant thermostat
- Coolant hoses
- Engine oil cooler

The channel cover plate is located under the engine front cover mounted to the block. It contains a timing chain idler and press and place gaskets separating engine coolant and engine oil. A weep hole is provided on the front left side of the engine behind the generator. If oil or coolant is leaking from the weep hole, then a gasket has failed and must be replaced.

repair4less

Engine



For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Valve Clearance Check

1. Remove the valve covers. For additional information, refer to Valve Cover — LH and Valve Cover — RH in this section.

2. **NOTE:** Engine must be at room temperature before measuring. The valve clearance must be measured with the camshaft at base circle. The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.

   Use a feeler gauge to measure the clearance of each valve and record its location. A midrange clearance is the most desirable:
   - Intake: 0.15-0.25 mm (0.006-0.01 in)
   - Exhaust: 0.360-0.460 mm (0.0142-0.0181 in)

3. **NOTE:** The number on the valve tappet reflects the thickness of the valve tappet. For example, a tappet with the number 3.310 has the thickness of 3.31 mm (0.13 in).

   If any of the valve clearances are out of specification, select new tappets using this formula: tappet thickness = measured clearance + the base tappet thickness - most desirable thickness.
   Select the tappets and mark the installation location.

4. If required, install the new selected valve tappets in the marked locations. For additional information, refer to Valve Tappets in this section.

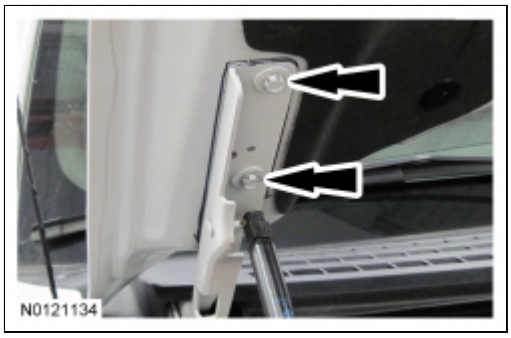
WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-



repair4less

02 .

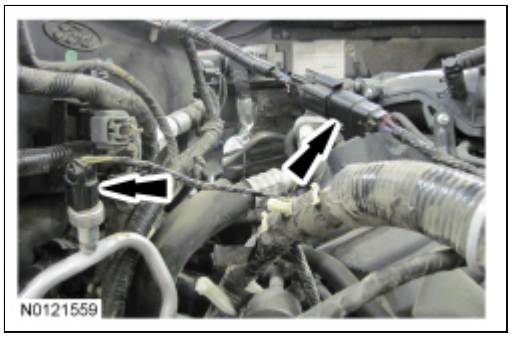
2. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

   NOTE: RH shown, LH similar.

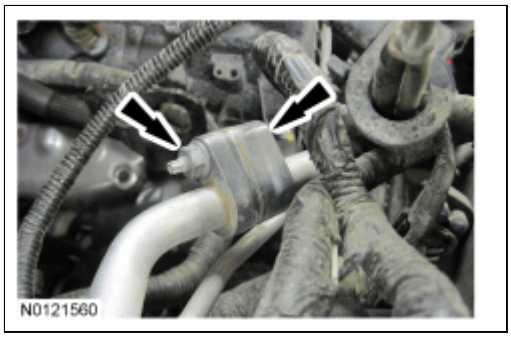
   Remove the 4 bolts (2 shown) and the hood.

3. Release the fuel system pressure. For additional information, refer to Section 310-00 .

4. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

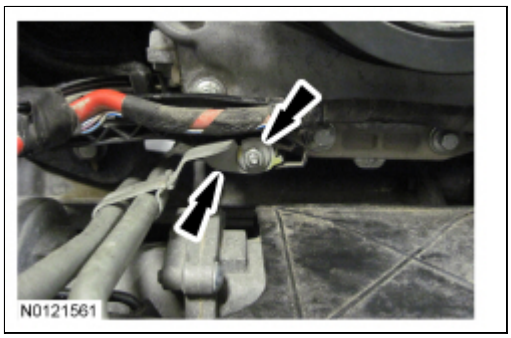


5. If equipped, disconnect the block heater electrical connector at the thermostat housing.
   - Detach the block heater wiring harness retainer from the LH valve cover stud bolt, generator wiring harness and position aside.



6. Remove the cooling module. For additional information, refer Section 303-03 .

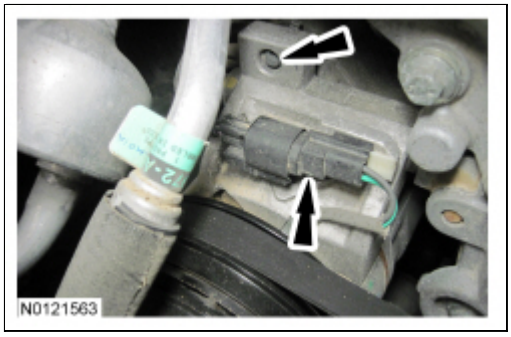
7. Remove the Air Cleaner (ACL) upper tray. For additional information, refer to Intake Air System Components — Exploded View, 3.7L in Section 303-12 .



8. Disconnect the Battery Junction Box (BJB) wiring harness and the A/C pressure transducer electrical connectors.

9. Remove the nut and disconnect the A/C tube.
    - Discard the O-ring seal and gasket seal.

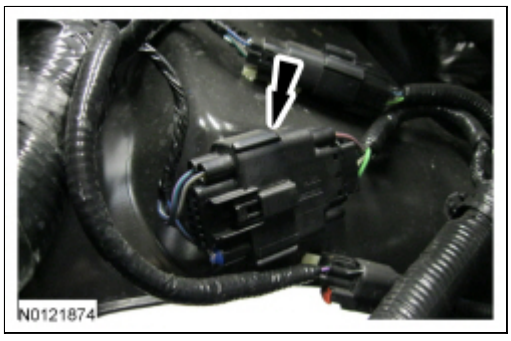
10. Remove the nut and the transmission cooler line bracket from the engine front cover stud bolt.



11. Detach the generator wiring harness from the engine front cover.

12. Disconnect the A/C compressor electrical connector.
    - Detach the A/C compressor wiring harness from the A/C compressor.

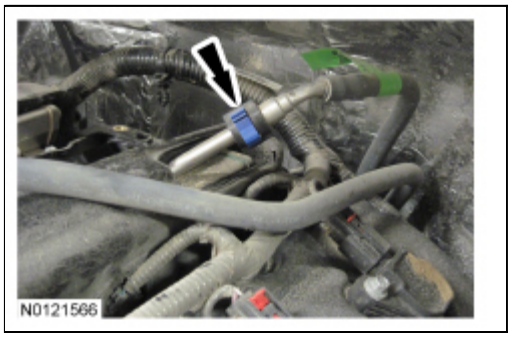
repair4less



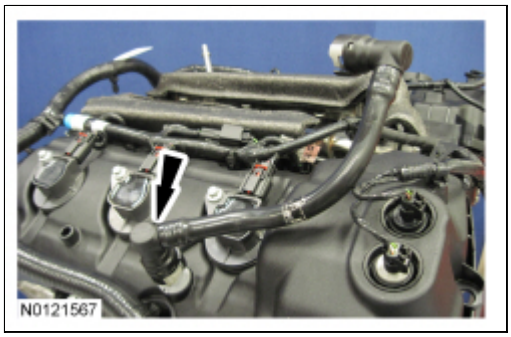
13. Remove the generator. For additional information, refer to Section 414-00 .

14. Remove the Air Conditioning (A/C) compressor belt. For additional information, refer to Section 303-05 .

15. Disconnect the middle PCM electrical connector.
    - Detach the wiring harness retainer from the fender splash shield.



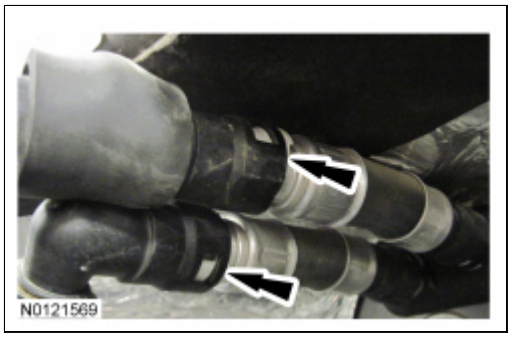
16. Detach and disconnect the engine harness electrical connector.



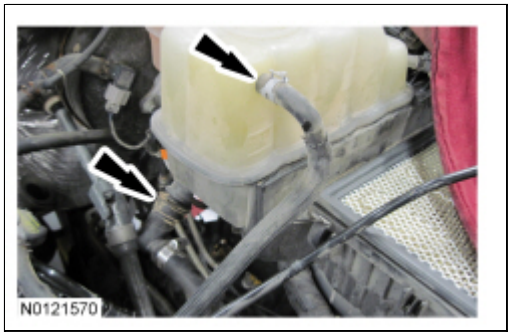
17. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.

18. Disconnect the fuel supply tube quick connect coupling from the fuel rail. For additional information, refer to Section 310-00 .

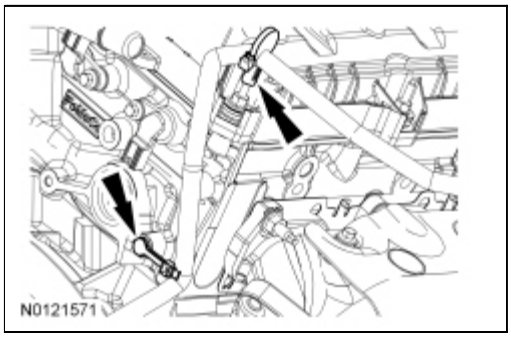
19. Remove the PVC tube quick connect coupling from RH valve cover. For additional information, refer to Section 310-00 .



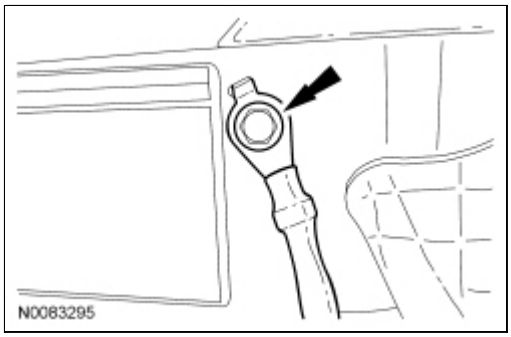
20. Remove the crankcase vent tube quick connect coupling from LH valve cover. For additional information, refer to Section 310-00 .



21. Disconnect the 2 heater hose couplings at the rear of the engine.

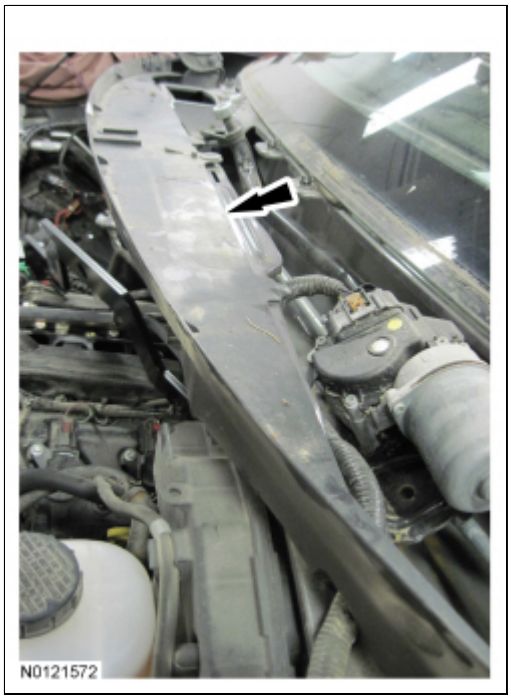


repair4less



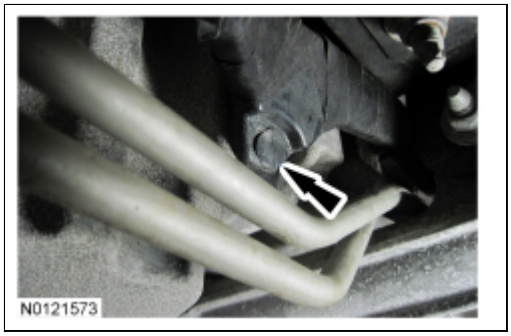
22. Disconnect the 2 coolant hoses from the degas bottle.

23. Detach the wiring harness retainers from the rear of the RH valve cover stud bolt and the rear of the RH cylinder head.

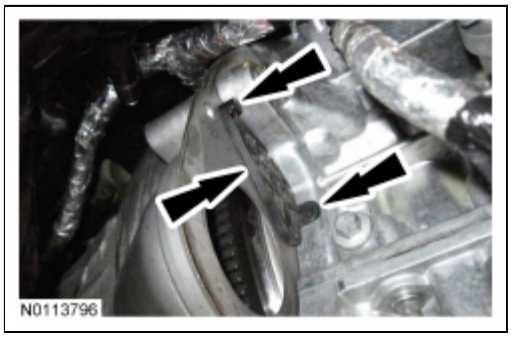


24. Remove the bolt and the ground strap from the cowl.

25. Remove the cowl panel grille. For additional information, refer to Section 501-02 .



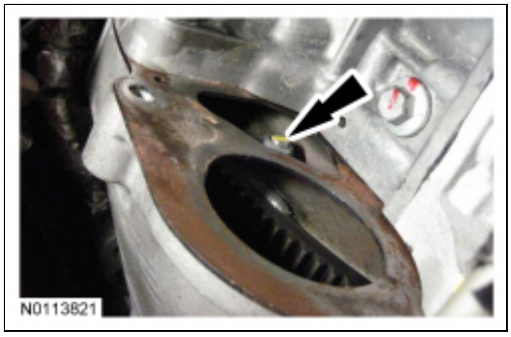
26. Remove the 6 screws and release the 2 cowl panel clips and remove the cowl panel.



27. If equipped, remove the front driveshaft. For additional information, refer to Section 205-01 .

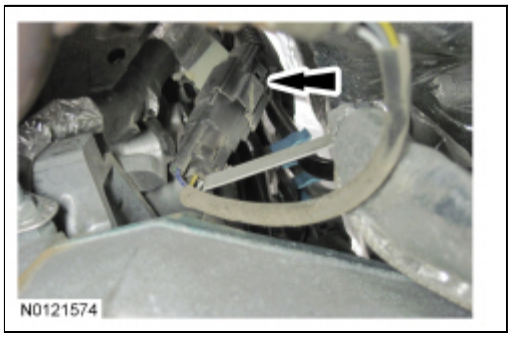
28. Remove the starter motor. For additional information, refer to Section 303-06 .

29. Detach the starter motor wiring harness retainer from the oil pan.



30. Remove the 2 pin-type retainers and the access cover.

31. **NOTE:** Index-mark the end of one torque converter stud and the flexplate for installation.



repair4less

Remove the 4 torque converter nuts.
